#### # For the "mysql" driver, the DSN is a URL in the form of "USER:
↳ PASS@tcp(HOST:PORT)/".
#### If the URL is not specified, the TiDB server from the [tidb] section is
↳ used to
#### store the checkpoints. You should specify a different MySQL-compatible
```

```
#### database server to reduce the load of the target TiDB cluster.
#dsn = "/tmp/tidb_lightning_checkpoint.pb"

#### Whether to keep the checkpoints after all data are imported. If false,
    ↪ the
#### checkpoints are deleted. Keeping the checkpoints can aid debugging but
#### might leak metadata about the data source.
#### keep-after-success = false

[tikv-importer]
#### use the TiDB-backend.
backend = "tidb"

#### Action to do when trying to insert a duplicated entry in the "tidb"
    ↪ backend.
#### - replace: use new entry to replace the existing entry
#### - ignore: keep the existing entry, and ignore the new entry
#### - error: report error and quit the program
#### on-duplicate = "replace"

[mydumper]
#### Block size for file reading. Keep it longer than the longest string of
#### the data source.
#### read-block-size = "64KiB"

#### Minimum size (in terms of source data file) of each batch of import.
#### TiDB Lightning splits a large table into multiple data engine files
    ↪ according to this size.
#### batch-size = 107_374_182_400 # Byte (default = 100 GB)

#### Local source data directory or the URL of the external storage.
data-source-dir = "/data/my_database"

#### the input data in a "strict" format speeds up processing.
#### "strict-format = true" requires that:
#### in CSV, every value cannot contain literal new lines (U+000A and U+000D
    ↪ , or \r and \n) even
#### when quoted, which means new lines are strictly used to separate rows.
#### "Strict" format allows TiDB Lightning to quickly locate split positions
    ↪ of a large file for parallel processing.
#### However, if the input data is not "strict", it may split a valid data
    ↪ in half and
#### corrupt the result.
#### The default value is false for safety instead of speed.
strict-format = false
```

```
#### If strict-format is true, TiDB Lightning splits large CSV files into
↳ multiple chunks to process in
#### parallel. max-region-size is the maximum size of each chunk after
↳ splitting.
#### max-region-size = 268_435_456 # Byte (default = 256 MB)

#### Only import tables if these wildcard rules are matched. See the
↳ corresponding section for details.

#### Separator between fields, should be an ASCII character.
separator = ','
#### Quoting delimiter, can either be an ASCII character or empty string.
delimiter = ''
#### Whether the CSV files contain a header.
#### If `header` is true, the first line will be skipped.
header = true
#### Whether the CSV contains any NULL value.
#### If `not-null` is true, all columns from CSV cannot be NULL.
not-null = false
#### When `not-null` is false (that is, CSV can contain NULL),
#### fields equal to this value will be treated as NULL.
null = '\N'
#### Whether to interpret backslash escapes inside fields.
backslash-escape = true
#### If a line ends with a separator, remove it.
trim-last-separator = false

[tidb]
#### Configuration of any TiDB server from the cluster.
host = "172.16.31.1"
port = 4000
user = "root"
password = ""

#### The default SQL mode used to parse and execute the SQL statements.
sql-mode = "ONLY_FULL_GROUP_BY,NO_ENGINE_SUBSTITUTION"

#### Whether to use TLS for SQL connections. Valid values are:
#### * "" - force TLS (same as "cluster") if [tidb.security]
↳ section is populated, otherwise same as "false"
```

```

#### * "false"      - disable TLS
#### * "cluster"    - force TLS and verify the server's certificate with the
    ↪ CA specified in the [tidb.security] section
#### * "skip-verify" - force TLS but do not verify the server's certificate
    ↪ (insecure!)
#### * "preferred" - same as "skip-verify", but if the server does not
    ↪ support TLS, fallback to unencrypted connection
#### tls = ""

#### Specifies certificates and keys for TLS-enabled MySQL connections.
#### [tidb.security]

#### Public certificate of the CA. Set to empty string to disable TLS for
    ↪ SQL.
#### ca-path = "/path/to/ca.pem"

#### Public certificate of this service. Default to copy of `security.cert-
    ↪ path`
#### cert-path = "/path/to/lightning.pem"

#### Private key of this service. Default to copy of `security.key-path`
#### key-path = "/path/to/lightning.key"

#### Configures the background periodic actions.
#### Supported units: h (hour), m (minute), s (second).
[cron]

#### Duration between which an import progress is printed to the log.
log-progress = "5m"

```

For detailed descriptions of the configuration items, see [TiDB Lightning Configuration](#).

Conflict resolution

The TiDB-backend supports importing to an already-populated table. However, the new data might cause a unique key conflict with the old data. You can control how to resolve the conflict by using this task configuration.

```

[tikv-importer]
backend = "tidb"
on-duplicate = "replace" # or "error" or "ignore"

```

Setting	Behavior on conflict	Equivalent SQL statement
replace	New entries replace old ones	REPLACE INTO ...
ignore	Keep old entries and ignore new ones	INSERT IGNORE INTO ...
error	Abort import	INSERT INTO ...

Migrating from Loader to TiDB Lightning TiDB-backend

If you need to import data into a TiDB cluster, TiDB Lightning using the TiDB-backend can completely replace the functionalities of [Loader](#). The following list shows how to translate Loader configurations into [TiDB Lightning configurations](#).

Loader

TiDB Lightning

```
#### log level
log-level = "info"

#### The directory to which the log is output
log-file = "loader.log"

#### Prometheus
status-addr = ":8272"

#### concurrency
pool-size = 16
```

```
[lightning]
#### log level
level = "info"

#### The directory to which the log is output. If this directory is not
    ↪ specified, it defaults to the directory where the command is executed
    ↪ .
file = "tidb-lightning.log"

#### Prometheus
pprof-port = 8289

#### concurrency (better left as default)
#region-concurrency = 16
```

```
#### checkpoint database
checkpoint-schema = "tidb_loader"
```

```
[checkpoint]
#### checkpoint storage
enable = true
schema = "tidb_lightning_checkpoint"
#### by default the checkpoint is stored in
#### a local file, which is more efficient.
```

```
#### but you could still choose to store the
#### checkpoints in the target database with
#### this setting:
#driver = "mysql"
```

```
[tikv-importer]
#### use the TiDB-backend
backend = "tidb"
```

```
#### data source directory
dir = "/data/export/"
```

```
[mydumper]
#### data source directory
data-source-dir = "/data/export"
```

```
[db]
#### TiDB connection parameters
host = "127.0.0.1"
port = 4000

user = "root"
password = ""

#sql-mode = ""
```

```
[tidb]
#### TiDB connection parameters
host = "127.0.0.1"
port = 4000

#### In the TiDB-backend mode, this parameter is optional.
#### status-port = 10080
user = "root"
password = ""

#sql-mode = ""
```

```
#### [[route-rules]]
#### Table routes
#### schema-pattern = "shard_db_*"
#### table-pattern = "shard_table_*"
```

```
#### target-schema = "shard_db"

```

```
#### [[routes]]
#### schema-pattern = "shard_db_*"
#### table-pattern = "shard_table_*"
#### target-schema = "shard_db"
#### target-table = "shard_table"
```

11.8.6.4.4 TiDB Lightning Importer-backend

Deployment for Importer-backend mode

This section describes how to [deploy TiDB Lightning manually](#) in the Importer-backend mode:

Hardware requirements

`tidb-lightning` and `tikv-importer` are both resource-intensive programs. It is recommended to deploy them into two separate machines.

To achieve the best performance, it is recommended to use the following hardware configuration:

- `tidb-lightning`:
 - 32+ logical cores CPU
 - An SSD large enough to store the entire data source, preferring higher read speed
 - 10 Gigabit network card (capable of transferring at 300 MB/s)
 - `tidb-lightning` fully consumes all CPU cores when running, and deploying on a dedicated machine is highly recommended. If not possible, `tidb-lightning` could be deployed together with other components like `tidb-server`, and the CPU usage could be limited via the `region-concurrency` setting.
- `tikv-importer`:
 - 32+ logical cores CPU
 - 40 GB+ memory
 - 1 TB+ SSD, preferring higher IOPS (8000 is recommended)
 - * The disk should be larger than the total size of the top N tables, where $N = \max(\text{index-concurrency}, \text{table-concurrency})$.
 - 10 Gigabit network card (capable of transferring at 300 MB/s)
 - `tikv-importer` fully consumes all CPU, disk I/O and network bandwidth when running, and deploying on a dedicated machine is strongly recommended.

If you have sufficient machines, you can deploy multiple `tidb lightning + tikv importer` servers, with each working on a distinct set of tables, to import the data in parallel.

Deploy TiDB Lightning manually

Step 1: Deploy a TiDB cluster

Before importing data, you need to have a deployed TiDB cluster, with the cluster version 2.0.9 or above. It is highly recommended to use the latest version.

You can find deployment instructions in [TiDB Quick Start Guide](#).

Step 2: Download the TiDB Lightning installation package

Refer to the [TiDB enterprise tools download page](#) to download the TiDB Lightning package (choose the same version as that of the TiDB cluster).

Step 3: Start `tikv-importer`

1. Upload `bin/tikv-importer` from the installation package.
2. Configure `tikv-importer.toml`.

```
# TiKV Importer configuration file template

# Log file
log-file = "tikv-importer.log"
# Log level: trace, debug, info, warn, error, off.
log-level = "info"

# Listening address of the status server.
status-server-address = "0.0.0.0:8286"

[server]
# The listening address of tikv-importer. tidb-lightning needs to
  ↪ connect to
# this address to write data.
addr = "0.0.0.0:8287"

[import]
# The directory to store engine files.
import-dir = "/mnt/ssd/data.import/"
```

The above only shows the essential settings. See the [Configuration](#) section for the full list of settings.

3. Run `tikv-importer`.

```
nohup ./tikv-importer -C tikv-importer.toml > nohup.out &
```

Step 4: Start tidb-lightning

1. Upload bin/tidb-lightning and bin/tidb-lightning-ctl from the tool set.
2. Mount the data source onto the same machine.
3. Configure tidb-lightning.toml. For configurations that do not appear in the template below, TiDB Lightning writes a configuration error to the log file and exits.

```
[lightning]
# The concurrency number of data. It is set to the number of logical
  ↪ CPU
# cores by default. When deploying together with other components, you
  ↪ can
# set it to 75% of the size of logical CPU cores to limit the CPU usage
  ↪ .
# region-concurrency =

# Logging
level = "info"
file = "tidb-lightning.log"

[tikv-importer]
# The listening address of tikv-importer. Change it to the actual
  ↪ address.
addr = "172.16.31.10:8287"

[mydumper]
# mydumper local source data directory
data-source-dir = "/data/my_database"

[tidb]
# Configuration of any TiDB server from the cluster
host = "172.16.31.1"
port = 4000
user = "root"
password = ""
# Table schema information is fetched from TiDB via this status-port.
status-port = 10080
```

The above only shows the essential settings. See the [Configuration](#) section for the full list of settings.

4. Run tidb-lightning. If you directly run the command in the command-line, the process might exit because of the SIGHUP signal received. Instead, it's preferable to run a bash script that contains the nohup command:

```
nohup ./tidb-lightning -config tidb-lightning.toml > nohup.out &
```

11.8.6.5 Use TiDB Lightning to Import Data in Parallel

Since v5.3.0, the **Local-backend mode** of TiDB Lightning supports the parallel import of a single table or multiple tables. By simultaneously running multiple TiDB Lightning instances, you can import data in parallel from different single tables or multiple tables. In this way, TiDB Lightning provides the ability to scale horizontally, which can greatly reduce the time required to import large amounts of data.

In technical implementation, TiDB Lightning records the meta data of each instance and the data of each imported table in the target TiDB, and coordinates the Row ID allocation range of different instances, the record of global Checksum, and the configuration changes and recovery of TiKV and PD.

You can use TiDB Lightning to import data in parallel in the following scenarios:

- Import sharded schemas and sharded tables. In this scenario, multiple tables from multiple upstream database instances are imported into the downstream TiDB database by different TiDB Lightning instances in parallel.
- Import single tables in parallel. In this scenario, single tables stored in a certain directory or cloud storage (such as Amazon S3) are imported into the downstream TiDB cluster by different TiDB Lightning instances in parallel. This is a new feature introduced in TiDB 5.3.0.

Note:

- Parallel import only supports initialized empty tables in TiDB and does not support migrating data to tables with data written by existing services. Otherwise, data inconsistencies may occur.
- Parallel import is usually used in local-backend mode. You need to configure `incremental-import = true`.
- Apply only one backend at a time when using multiple TiDB Lightning instances to import data to the same target. For example, you cannot import data to the same TiDB cluster in both Local-backend and TiDB-backend modes at the same time.

11.8.6.5.1 Considerations

To use parallel import, you need to configure `incremental-import = true`. When TiDB Lightning is started, it registers meta data in the downstream TiDB cluster and

automatically detects whether there are other instances migrating data to the target cluster at the same time. If there is, it automatically enters the parallel import mode.

But when migrating data in parallel, you need to take the following into consideration:

- Handle conflicts between primary keys or unique indexes across multiple sharded tables
- Optimize import performance

Handle conflicts between primary keys or unique indexes

When using **Local-backend mode** to import in parallel, you need to ensure that there are no primary key or unique index conflicts between data sources, and between the tables in the target TiDB cluster. Ensure that there are no data writes in the target table during import. Otherwise, TiDB Lightning will not be able to guarantee the correctness of the imported data, and the target table will contain inconsistent indexes after the import is completed.

Optimize import performance

Because TiDB Lightning needs to upload the generated Key-Value data to the TiKV node where each copy of the corresponding Region is located, the import speed is limited by the size of the target cluster. It is recommended to ensure that the number of TiKV instances in the target TiDB cluster and the number of TiDB Lightning instances are greater than $n:1$ (n is the number of copies of the Region). At the same time, the following requirements should be met to achieve optimal import performance:

- Deploy each TiDB Lightning instance on a dedicated machine. Since one TiDB Lightning instance consumes all CPU resources by default, deploying multiple instances on a single machine cannot improve performance.
- The total size of source files for each TiDB Lightning instance performing parallel import should be smaller than 5 TiB
- The total number of TiDB Lightning instances should be smaller than 10.

When using TiDB Lightning to import shared databases and tables in parallel, choose an appropriate number of TiDB Lightning instances according to the amount of data.

- If the MySQL data volume is less than 2 TiB, you can use one TiDB Lightning instance for parallel import.
- If the MySQL data volume exceeds 2 TiB and the total number of MySQL instances is smaller than 10, it is recommended that you use one TiDB Lightning instance for each MySQL instance, and the number of parallel TiDB Lightning instances should not exceed 10.
- If the MySQL data volume exceeds 2 TiB and the total number of MySQL instances exceeds 10, it is recommended that you allocate 5 to 10 TiDB Lightning instances for importing the data exported by these MySQL instances.

Next, this document uses two examples to detail the operation steps of parallel import in different scenarios:

- Example 1: Use Dumpling + TiDB Lightning to import sharded databases and tables into TiDB in parallel
- Example 2: Import single tables in parallel

Restrictions

TiDB Lightning exclusively uses some resources when it is running. If you need to deploy multiple TiDB Lightning instances on a single machine (which is not recommended for production environments), or on a disk shared by multiple machines, be aware of the following usage restrictions.

- Set `tikv-importer.sorted-kv-dir` to a unique path for each TiDB Lightning instance. Multiple instances sharing the same path can lead to unintended behavior and may result in import failures or data errors.
- Store each TiDB Lightning checkpoint separately. For more information about checkpoint configurations, see [TiDB Lightning Checkpoints](#).
 - If you set `checkpoint.driver = "file"` (default), make sure that the path to the checkpoint is unique for each instance.
 - If you set `checkpoint.driver = "mysql"`, you need to set a unique schema for each instance.
- The log file for each TiDB Lightning should be set to a unique path. Sharing the same log file will impact log querying and troubleshooting.
- If you use the [Web Interface](#) or Debug API, you need to set `lightning.status-addr` to a unique address for each instance; otherwise, the TiDB Lightning process fails to start due to port conflict.

11.8.6.5.2 Example 1: Use Dumpling + TiDB Lightning to Import Sharded Databases and Tables into TiDB in Parallel

In this example, assume that the upstream is a MySQL cluster with 10 sharded tables, with a total size of 10 TiB. You can Use 5 TiDB Lightning instances to perform parallel import, and each instance imports 2 TiB. It is estimated that the total import time (excluding the time required for Dumpling export) can be reduced from about 40 hours to about 10 hours.

Assume that the upstream library is named `my_db`, and the name of each sharded table is `my_table_01 ~ my_table_10`. You want to merge and import them into the downstream `my_db.my_table` table. The specific steps are described in the following sections.

Step 1: Use Dumpling to export data

Export two sharded tables on the 5 nodes where TiDB Lightning is deployed:

- If the two sharded tables are in the same MySQL instance, you can use the `--filter` \leftrightarrow parameter of Dumpling to directly export them. When using TiDB Lightning to import, you can specify `data-source-dir` as the directory where Dumpling exports data to;

- If the data of the two sharded tables are distributed on different MySQL nodes, you need to use Dumpling to separately export them. The exported data needs to be placed in the same parent directory but in different sub-directories. When using TiDB Lightning to perform parallel import, you need to specify `data-source-dir` as the parent directory.

For more information on how to use Dumpling to export data, see [Dumpling](#).

Step 2: Configure TiDB Lightning data sources

Create a configuration file `tidb-lightning.toml`, and then add the following content:

```
[lightning]
status-addr = ":8289"

[mydumper]
#### Specify the path for Dumpling to export data. If Dumpling performs
  ↳ several times and the data belongs to different directories, you can
  ↳ place all the exported data in the same parent directory and specify
  ↳ this parent directory here.
data-source-dir = "/path/to/source-dir"

[tikv-importer]
#### Whether to allow importing data into tables that already have data. The
  ↳ default value is `false`.
#### When using parallel import, because multiple TiDB Lightning instances
  ↳ import a table at the same time, this configuration item must be set
  ↳ to `true`.
incremental-import = true
#### "local": The default mode. It applies to large dataset import, for
  ↳ example, greater than 1 TiB. However, during the import, downstream
  ↳ TiDB is not available to provide services.
#### "tidb": You can use this mode for small dataset import, for example,
  ↳ smaller than 1 TiB. During the import, downstream TiDB is available
  ↳ to provide services.
backend = "local"

#### Specify the path for local sorting data.
sorted-kv-dir = "/path/to/sorted-dir"

#### Specify the routes for shard schemas and tables.
[[routes]]
schema-pattern = "my_db"
table-pattern = "my_table_*"
target-schema = "my_db"
target-table = "my_table"
```

If the data source is stored in external storage such as Amazon S3 or GCS, see [External Storages](#).

Step 3: Start TiDB Lightning to import data

During parallel import, the server configuration requirements for each TiDB Lightning node are the same as the non-parallel import mode. Each TiDB Lightning node needs to consume the same resources. It is recommended to deploy them on different servers. For detailed deployment steps, see [Deploy TiDB Lightning](#).

Start TiDB Lightning on each server in turn. If you use `nohup` to directly start it from the command line, it might exit due to the SIGHUP signal. So it is recommended to put `nohup` in the script, for example:

```
#### !/bin/bash
nohup tiup tidb-lightning -config tidb-lightning.toml > nohup.out &
```

During parallel import, TiDB Lightning automatically performs the following checks after starting the task.

- Check whether there is enough space on the local disk (controlled by the `sort-kv-dir` configuration) and on the TiKV cluster for importing data. TiDB Lightning samples the data sources and estimates the percentage of the index size from the sample result. Because indexes are included in the estimation, there might be cases where the size of the source data is less than the available space on the local disk, but still the check fails.
- Check whether the regions in the TiKV cluster are distributed evenly and whether there are too many empty regions. If the number of empty regions exceeds $\max(1000, \text{number of tables} * 3)$, i.e. greater than the bigger one of “1000” or “3 times the number of tables”, then the import cannot be executed.
- Check whether the data is imported in order from the data sources. The size of `mydumper.batch-size` is automatically adjusted based on the result of the check. Therefore, the `mydumper.batch-size` configuration is no longer available.

You can also turn off the check and perform a forced import with the `lightning.check` ↪ `-requirements` configuration. For more detailed checks, see [TiDB Lightning prechecks](#)

Step 4: Check the import progress

After starting the import, you can check the progress in either of the following ways:

- Check the progress through the `grep` log keyword `progress`. It is updated every 5 minutes by default.
- Check the progress through the monitoring console. For details, see [TiDB Lightning Monitoring](#).

Wait for all TiDB Lightning instances to finish, then the entire import is completed.

11.8.6.5.3 Example 2: Import single tables in parallel

TiDB Lightning also supports parallel import of single tables. For example, import multiple single tables stored in Amazon S3 by different TiDB Lightning instances into the downstream TiDB cluster in parallel. This method can speed up the overall import speed. For more information on external storages, see [External Storages](#)).

Note:

In the local environment, you can use the `--filesize` or `--where` parameter of Dumping to divide the data of a single table into different parts and export it to the local disks of multiple servers in advance. This way, you can still perform parallel import. The configuration is the same as Example 1.

Assuming that the source files are stored in Amazon S3, the table files are `my_db. ↵ my_table.00001.sql ~ my_db.my_table.10000.sql`, a total of 10,000 SQL files. If you want to use 2 TiDB Lightning instances to speed up the import, you need to add the following settings in the configuration file:

```
[[mydumper.files]]
#### the db schema file
pattern = '(?i)^(?:[~/]*)*my_db-schema-create\.sql'
schema = "my_db"
type = "schema-schema"

[[mydumper.files]]
#### the table schema file
pattern = '(?i)^(?:[~/]*)*my_db\.my_table-schema\.sql'
schema = "my_db"
table = "my_table"
type = "table-schema"

[[mydumper.files]]
#### Only import 00001~05000 and ignore other files
pattern = '(?i)^(?:[~/]*)*my_db\.my_table\.(0[0-4][0-9][0-9][0-9]|05000)\.
↵ sql'
schema = "my_db"
table = "my_table"
type = "sql"

[[tikv-importer]]
#### Whether to allow importing data into tables that already have data. The
↵ default value is `false`.
```

```
#### When using parallel import, because multiple TiDB Lightning instances
↳ import a table at the same time, this configuration item must be set
↳ to `true`.
incremental-import = true
```

You can modify the configuration of the other instance to only import the 05001 ~
↳ 10000 data files.

For other steps, see the relevant steps in Example 1.

11.8.6.5.4 Handle errors

Some TiDB Lightning nodes exit abnormally

If one or more TiDB Lightning nodes exit abnormally during a parallel import, identify the cause based on the logged error, and handle the error according to the error type:

- If the error shows normal exit (for example, exit in response to a kill command) or termination by the operating system due to OOM, adjust the configuration and then restart the TiDB Lightning nodes.
- If the error has no impact on data accuracy, for example, network timeout, perform the following steps:
 1. Run the `checkpoint-error-ignore` command with the setting `--checkpoint-error-ignore=all` on all failed nodes to clean errors in the checkpoint source data.
 2. Restart these nodes to continue importing data from checkpoints.
- If you see errors in the log that result in data inaccuracies, such as a checksum mismatch indicating invalid data in the source file, you can perform the following steps to resolve this issue:
 1. Run the `checkpoint-error-destroy` command on all Lightning nodes, including successful nodes. This command removes the imported data from failed tables and resets the checkpoint status of these tables to “not yet started”.
 2. Reconfigure and import the data of failed tables by using the `filter` parameter on all TiDB Lightning nodes, including normally exiting nodes.

When you reconfigure the Lightning parallel import task, do not include the `checkpoint-error-destroy` command in the startup script of each Lightning node. Otherwise, this command deletes shared metadata used by multiple parallel import tasks, which might cause issues during data import. For example, if a second Lightning import task is started, it will delete the metadata written by the first task, leading to abnormal data import.

During an import, an error “Target table is calculating checksum. Please wait until the checksum is finished and try again” is reported

Some parallel imports involve a large number of tables or tables with a small volume of data. In this case, it is possible that before one or more tasks start processing a table, other tasks of this table have finished and data checksum is in progress. At this time, an error `Target table is calculating checksum. Please wait until the checksum is finished and try again` is reported. In this case, you can wait for the completion of checksum and then restart the failed tasks. The error disappears and data accuracy is not affected.

11.8.6.6 TiDB Lightning Error Resolution

Starting from v5.4.0, you can configure TiDB Lightning to skip errors like invalid type conversion and unique key conflicts, and to continue the data processing as if those wrong row data does not exist. A report will be generated for you to read and manually fix errors afterward. This is ideal for importing from a slightly dirty data source, where locating the errors manually is difficult and restarting TiDB Lightning on every encounter is costly.

This document introduces how to use the type error feature (`lightning.max-error`) and the duplicate resolution feature (`tikv-importer.duplicate-resolution`). It also introduces the database where these errors are stored (`lightning.task-info-schema-name`). At the end of this document, an example is provided.

11.8.6.6.1 Type error

Warning:

The TiDB Lightning type error (`lightning.max-error`) is an experimental feature. It is **NOT** recommended to only rely on it to resolve errors in the production environment.

You can use the `lightning.max-error` configuration to increase the tolerance of errors related to data types. If this configuration is set to N , TiDB Lightning allows and skips up to N errors from the data source before it exists. The default value 0 means that no error is allowed.

These errors are recorded in a database. After the import is completed, you can view the errors in the database and process them manually. For more information, see [Error Report](#).

```
[lightning]
max-error = 0
```

The above configuration covers the following errors:

- Invalid values (example: set 'Text' to an INT column).
- Numeric overflow (example: set 500 to a TINYINT column)
- String overflow (example: set 'Very Long Text' to a VARCHAR(5) column).
- Zero date-time (namely '0000-00-00' and '2021-12-00').
- Set NULL to a NOT NULL column.
- Failed to evaluate a generated column expression.
- Column count mismatch. The number of values in the row does not match the number of columns of the table.
- Unique/Primary key conflict in TiDB-backend, when `on-duplicate = "error"`.
- Any other SQL errors.

The following errors are always fatal, and cannot be skipped by changing `max-error`:

- Syntax error (such as unclosed quotation marks) in the original CSV, SQL or Parquet file.
- I/O, network or system permission errors.

Unique/Primary key conflict in the Local-backend is handled separately and explained in the next section.

11.8.6.6.2 Duplicate resolution in Local-backend mode

In the Local-backend mode, TiDB Lightning imports data by first converting them to KV pairs and ingesting the pairs into TiKV in batches. Unlike the TiDB-backend mode, duplicate rows are not detected until the end of a task. Therefore, duplicate errors in the Local-backend mode are not controlled by `max-error`, but rather by a separate configuration `duplicate-resolution`.

```
[tikv-importer]
duplicate-resolution = 'none'
```

The value options of `duplicate-resolution` are as follows:

- **'none'**: Does not detect duplicate data. If a unique/primary key conflict does exist, the imported table will have inconsistent data and index, and will fail checksum check.
- **'record'**: Detects duplicate data, but does not attempt to fix it. If a unique/primary key conflict does exist, the imported table will have inconsistent data and index, and will skip checksum and report the count of the conflict errors.
- **'remove'**: Detects duplicate data, and removes *all* duplicated rows. The imported table will be consistent, but the involved rows are ignored and have to be added back manually.

TiDB Lightning duplicate resolution can detect duplicate data only within the data source. This feature cannot handle conflict with existing data before running TiDB Lightning.

11.8.6.6.3 Error report

All errors are written to tables in the `lightning_task_info` database in the downstream TiDB cluster. After the import is completed, you can view the errors in the database and process them manually.

You can change the database name by configuring `lightning.task-info-schema-name`.

```
[lightning]
task-info-schema-name = 'lightning_task_info'
```

TiDB Lightning creates 3 tables in this database:

```
CREATE TABLE syntax_error_v1 (
  task_id    bigint NOT NULL,
  create_time datetime(6) NOT NULL DEFAULT now(6),
  table_name varchar(261) NOT NULL,
  path       varchar(2048) NOT NULL,
  offset     bigint NOT NULL,
  error      text NOT NULL,
  context    text
);

CREATE TABLE type_error_v1 (
  task_id    bigint NOT NULL,
  create_time datetime(6) NOT NULL DEFAULT now(6),
  table_name varchar(261) NOT NULL,
  path       varchar(2048) NOT NULL,
  offset     bigint NOT NULL,
  error      text NOT NULL,
  row_data   text NOT NULL
);

CREATE TABLE conflict_error_v1 (
  task_id    bigint NOT NULL,
  create_time datetime(6) NOT NULL DEFAULT now(6),
  table_name varchar(261) NOT NULL,
  index_name varchar(128) NOT NULL,
  key_data   text NOT NULL,
  row_data   text NOT NULL,
  raw_key    mediumblob NOT NULL,
  raw_value  mediumblob NOT NULL,
  raw_handle mediumblob NOT NULL,
  raw_row    mediumblob NOT NULL,
  KEY (task_id, table_name)
);
```

type_error_v1 records all **type errors** managed by the **max-error** configuration. There is one row per error.

conflict_error_v1 records all **unique/primary key conflict in the Local-backend**. There are 2 rows per pair of conflicts.

Column	Syntax	Type	Conflict	Description
task_id				The TiDB Lightning task ID that generates this error
create_time				The time at which the error is recorded
table_name				The name of the table that contains the error, in the form of <code>'`db`.`tbl`'</code>
path				The path of the file that contains the error
offset				The byte position in the file where the error is found
error				The error message
context				The text that surrounds the error
index_name				The name of the unique key in conflict. It is 'PRIMARY' for primary key conflicts.
key_data				The formatted key handle of the row that causes the error. The content is for human reference only, and not intended to be machine-readable.
row_data				The formatted row data that causes the error. The content is for human reference only, and not intended to be machine-readable
raw_key				The key of the conflicted KV pair
raw_value				The value of the conflicted KV pair
raw_handle				The row handle of the conflicted row
raw_row				The encoded value of the conflicted row

Note:

The error report records the file offset, not line/column number which is inefficient to obtain. You can quickly jump near a byte position (using 183 as example) using the following commands:

- shell, printing the first several lines.

```
head -c 183 file.csv | tail
```

- shell, printing the next several lines:

```
tail -c +183 file.csv | head
```

- vim — `:goto 183` or `183go`

11.8.6.6.4 Example

In this example, a data source is prepared with some known errors.

1. Prepare the database and table schema.

```
mkdir example && cd example

echo 'CREATE SCHEMA example;' > example-schema-create.sql
echo 'CREATE TABLE t(a TINYINT PRIMARY KEY, b VARCHAR(12) NOT NULL
  ↪ UNIQUE);' > example.t-schema.sql
```

2. Prepare the data.

```
cat <<EOF > example.t.1.sql

INSERT INTO t (a, b) VALUES
(0, NULL),           -- column is NOT NULL
(1, 'one'),
(2, 'two'),
(40, 'forty'),       -- conflicts with the other 40 below
(54, 'fifty-four'), -- conflicts with the other 'fifty-four' below
(77, 'seventy-seven'), -- the string is longer than 12 characters
(600, 'six hundred'), -- the number overflows TINYINT
(40, 'forty'),       -- conflicts with the other 40 above
(42, 'fifty-four'); -- conflicts with the other 'fifty-four' above

EOF
```

3. Configure TiDB Lightning to enable strict SQL mode, use the Local-backend to import data, delete duplicates, and skip up to 10 errors.

```
cat <<EOF > config.toml

[lightning]
max-error = 10

[tikv-importer]
backend = 'local'
sorted-kv-dir = '/tmp/lightning-tmp/'
duplicate-resolution = 'remove'

[mydumper]
data-source-dir = '.'

[tidb]
host = '127.0.0.1'
```

```
port = 4000
user = 'root'
password = ''
sql-mode = 'STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_ZERO_DATE'

EOF
```

4. Run TiDB Lightning. This command will exit successfully because all errors are skipped.

```
tiup tidb-lightning -c config.toml
```

5. Verify that the imported table only contains the two normal rows:

```
$ mysql -u root -h 127.0.0.1 -P 4000 -e 'select * from example.t'
+----+-----+
| a  | b    |
+----+-----+
| 1  | one  |
| 2  | two  |
+----+-----+
```

6. Check whether the `type_error_v1` table has caught the three rows involving type conversion:

```
$ mysql -u root -h 127.0.0.1 -P 4000 -e 'select * from
↳ lightning_task_info.type_error_v1;' -E

***** 1. row *****
  task_id: 1635888701843303564
 create_time: 2021-11-02 21:31:42.620090
 table_name: `example`.`t`
   path: example.t.1.sql
  offset: 46
  error: failed to cast value as varchar(12) CHARACTER SET utf8mb4
        ↳ COLLATE utf8mb4_bin for column `b` (#2): [table:1048]Column
        ↳ 'b' cannot be null
 row_data: (0,NULL)

***** 2. row *****
  task_id: 1635888701843303564
 create_time: 2021-11-02 21:31:42.627496
 table_name: `example`.`t`
   path: example.t.1.sql
  offset: 183
```

```

error: failed to cast value as varchar(12) CHARACTER SET utf8mb4
  ↳ COLLATE utf8mb4_bin for column `b` (#2): [types:1406]Data
  ↳ Too Long, field len 12, data len 13
row_data: (77, 'seventy-seven')

***** 3. row *****
task_id: 1635888701843303564
create_time: 2021-11-02 21:31:42.629929
table_name: `example`.`t`
path: example.t.1.sql
offset: 253
error: failed to cast value as tinyint(4) for column `a` (#1): [
  ↳ types:1690]constant 600 overflows tinyint
row_data: (600, 'six hundred')

```

7. Check whether the `conflict_error_v1` table has caught the four rows that have unique/primary key conflicts:

```

$ mysql -u root -h 127.0.0.1 -P 4000 -e 'select * from
  ↳ lightning_task_info.conflict_error_v1;' --binary-as-hex -E

***** 1. row *****
task_id: 1635888701843303564
create_time: 2021-11-02 21:31:42.669601
table_name: `example`.`t`
index_name: PRIMARY

```

11.8.6.7 TiDB Lightning Web Interface

TiDB Lightning provides a webpage for viewing the import progress and performing some simple task management. This is called the *server mode*.

To enable server mode, either start `tidb-lightning` with the `--server-mode` flag

```
./tidb-lightning --server-mode --status-addr :8289
```

or set the `lightning.server-mode` setting in the configuration file.

```
[lightning]
server-mode = true
status-addr = ':8289'
```

After TiDB Lightning is launched, visit `http://127.0.0.1:8289` to control the program (the actual URL depends on the `status-addr` setting).

In server mode, TiDB Lightning does not start running immediately. Rather, users submit (multiple) *tasks* via the web interface to import data.

11.8.6.7.1 Front page

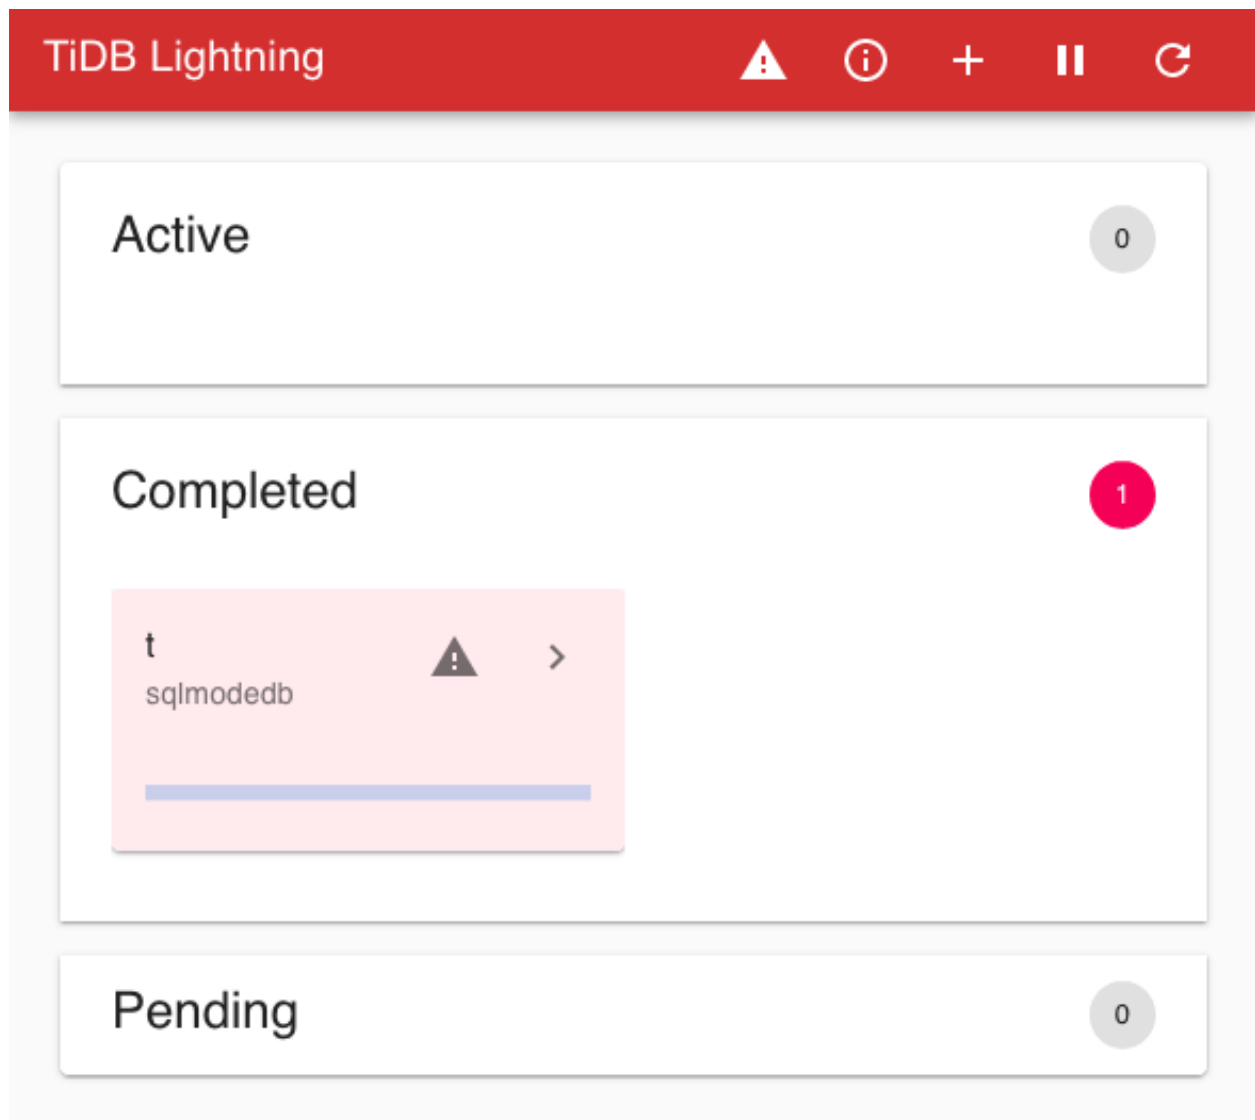

Figure 154: Front page of the web interface

Functions of the title bar, from left to right:

Icon	Function
“TiDB Lightning”	Click to go back to the front page Display any error message from <i>previous</i> task List current and queued tasks; a badge may appear here to indicate number of queued tasks
+	Submit a task
/	Pause/resume current execution

Icon	Function
	Configure auto-refresh of the web page

Three panels below the title bar show all tables in different states:

- Active: these tables are currently being imported
- Completed: these tables have been imported successfully or failed
- Pending: these tables are not yet processed

Each panel contains cards describing the status of the table.

11.8.6.7.2 Submit task

Click the + button on the title bar to submit a task.

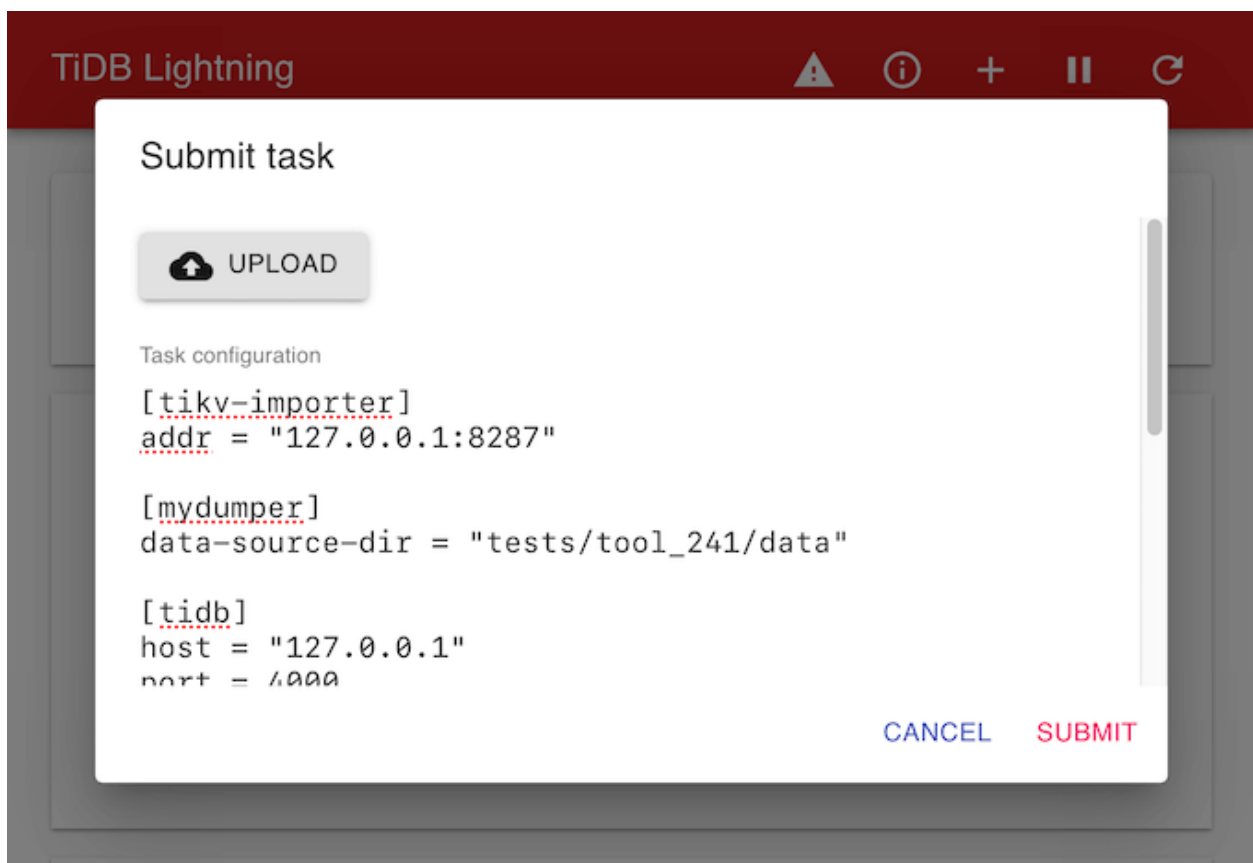

Figure 155: Submit task dialog

Tasks are TOML files described as **task configurations**. One could also open a local TOML file by clicking **UPLOAD**.

Click **SUBMIT** to run the task. If a task is already running, the new task will be queued and executed after the current task succeeds.

11.8.6.7.3 Table progress

Click the > button of a table card on the front page to view the detailed progress of a table.

Figure 156: Table progress

The page shows the import progress of every engine and data files associated with the table.

Click **TiDB Lightning** on the title bar to go back to the front page.

11.8.6.7.4 Task management

Click the  button on the title bar to manage the current and queued tasks.

Task Label	Timestamp	Configuration (JSON)
Current	8/12/2019 2:57:53 AM	{ "id": 1565549873900573000, "lightning": { "table-concurrency": 1, "index-concurrency": 2, "region-concurrency": 4, "io-concurrency": 5, "check-requirements": false }, "tidb": { "host": "127.0.0.1", "port": 4000, "user": "root", "status-port": 10080, "pd-addr": "127.0.0.1:2379", "sql-mode": "ONLY FULL GROUP BY STRICT TRANS TABLES M
Queue	8/12/2019 2:58:28 AM	

Figure 157: Task management page

Each task is labeled by the time it was submitted. Clicking the task would show the configuration formatted as JSON.

Manage tasks by clicking the `+` button next to a task. You can stop a task immediately, or reorder queued tasks.

11.8.7 TiDB Lightning Monitoring

`tidb-lightning` supports metrics collection via [Prometheus](#). This document introduces the monitor configuration and monitoring metrics of TiDB Lightning.

11.8.7.1 Monitor configuration

If TiDB Lightning is manually installed, follow the instructions below.

The metrics of `tidb-lightning` can be gathered directly by Prometheus as long as it is discovered. You can set the metrics port in `tidb-lightning.toml`:

```
[lightning]
### HTTP port for debugging and Prometheus metrics pulling (0 to disable)
pprof-port = 8289
```

```
...
```

and in `tikv-importer.toml`:

```
### Listening address of the status server.
status-server-address = '0.0.0.0:8286'
```

You need to configure Prometheus to make it discover the servers. For instance, you can directly add the server address to the `scrape_configs` section:

```
...
scrape_configs:
- job_name: 'tidb-lightning'
  static_configs:
    - targets: ['192.168.20.10:8289']
- job_name: 'tikv-importer'
  static_configs:
    - targets: ['192.168.20.9:8286']
```

11.8.7.2 Grafana dashboard

[Grafana](#) is a web interface to visualize Prometheus metrics as dashboards.

11.8.7.2.1 Row 1: Speed

Figure 158: Panels in first row

Panel	Series	Description
Import speed	write from TiDB Lightning	Speed of sending KVs from TiDB Lightning to TiKV Importer, which depends on each table's complexity
Import speed	upload to tikv	Total upload speed from TiKV Importer to all TiKV replicas
Chunk process duration		Average time needed to completely encode one single data file

Sometimes the import speed will drop to zero allowing other parts to catch up. This is

normal.

11.8.7.2.2 Row 2: Progress

Figure 159: Panels in second row

Panel	Description
Import progress	Percentage of data files encoded so far
Checksum progress	Percentage of tables are verified to be imported successfully
Failures	Number of failed tables and their point of failure, normally empty

11.8.7.2.3 Row 3: Resource

Figure 160: Panels in third row

Panel	Description
Memory usage	Amount of memory occupied by each service

Panel	Description
Number of TiDB Lightning Goroutines	Number of running goroutines used by TiDB Lightning
CPU%	Number of logical CPU cores utilized by each service

11.8.7.2.4 Row 4: Quota

Figure 161: Panels in fourth row

Panel	Series	Description
Idle work- ers	io	Number of unused io- concurrency , nor- mally close to con- figured value (de- fault 5), and close to 0 means the disk is too slow

Panel	Series	Description
Idle work- ers	closed- engine	Number of engines which is closed but not yet cleaned up, nor- mally close to index + table- concurrency (de- fault 8), and close to 0 means TiDB Light- ning is faster than TiKV Im- porter, which will cause TiDB Light- ning to stall

Panel	Series	Description
Idle work- ers	table	Number of unused table- ↳ concurrency ↳ , nor- mally 0 until the end of process
Idle work- ers	index	Number of unused index- ↳ concurrency ↳ , nor- mally 0 until the end of process
Idle work- ers	region	Number of unused region ↳ - ↳ concurrency ↳ , nor- mally 0 until the end of process

Panel	Series	Description
External re-sources	KV Encoder	Counts active KV encoders, normally the same as region ↔ - ↔ concurrency ↔ until the end of process
External re-sources	Importer Engines	Counts opened engine files, should never exceed the max-open engines setting ↔ open ↔ - ↔ engines ↔ setting

11.8.7.2.5 Row 5: Read speed

Figure 162: Panels in fifth row

Panel	Series	Description
Chunk parser read block duration	read block	Time taken to read one block of bytes to prepare for parsing
Chunk parser read block duration	apply worker	Time elapsed to wait for an idle io-concurrency
SQL process duration	row encode	Time taken to parse and encode a single row
SQL process duration	block deliver	Time taken to send a block of KV pairs to TiKV Importer

If any of the duration is too high, it indicates that the disk used by TiDB Lightning is too slow or busy with I/O.

11.8.7.2.6 Row 6: Storage

Figure 163: Panels in sixth row

Panel	Series	Description
SQL process rate	data deliver rate	Speed of delivery of data KV pairs to TiKV Importer
SQL process rate	index deliver rate	Speed of delivery of index KV pairs to TiKV Importer
SQL process rate	total deliver rate	The sum of two rates above

Panel	Series	Description
Total bytes	parser read size	Number of bytes being read by TiDB Lightning
Total bytes	data deliver size	Number of bytes of data KV pairs already delivered to TiKV Importer
Total bytes	index deliver size	Number of bytes of index KV pairs already delivered to TiKV Importer

Panel	Series	Description
Total bytes	storage_size / 3	Total size occupied by the TiKV cluster, divided by 3 (the default number of replicas)

11.8.7.2.7 Row 7: Import speed

Figure 164: Panels in seventh row

Panel	Series	Description
Delivery duration	Range delivery	Time taken to upload a range of KV pairs to the TiKV cluster

Panel	Series	Description
Delivery duration	SST delivery	Time taken to upload an SST file to the TiKV cluster
SST process duration	Split SST	Time taken to split the stream of KV pairs into SST files
SST process duration	SST upload	Time taken to upload an SST file
SST process duration	SST ingest	Time taken to ingest an uploaded SST file
SST process duration	SST size	File size of an SST file

11.8.7.3 Monitoring metrics

This section explains the monitoring metrics of `tikv-importer` and `tidb-lightning`, if you need to monitor other metrics not covered by the default Grafana dashboard.

11.8.7.3.1 tikv-importer

Metrics provided by `tikv-importer` are listed under the namespace `tikv_import_*`.

- **tikv_import_rpc_duration** (Histogram)
Bucketed histogram for the duration of an RPC action. Labels:
 - **request**: what kind of RPC is executed
 - * `switch_mode` — switched a TiKV node to import/normal mode
 - * `open_engine` — opened an engine file
 - * `write_engine` — received data and written into an engine
 - * `close_engine` — closed an engine file
 - * `import_engine` — imported an engine file into the TiKV cluster
 - * `cleanup_engine` — deleted an engine file
 - * `compact_cluster` — explicitly compacted the TiKV cluster
 - * `upload` — uploaded an SST file
 - * `ingest` — ingested an SST file
 - * `compact` — explicitly compacted a TiKV node
 - **result**: the execution result of the RPC
 - * `ok`
 - * `error`
- **tikv_import_write_chunk_bytes** (Histogram)
Bucketed histogram for the uncompressed size of a block of KV pairs received from TiDB Lightning.
- **tikv_import_write_chunk_duration** (Histogram)
Bucketed histogram for the time needed to receive a block of KV pairs from TiDB Lightning.
- **tikv_import_upload_chunk_bytes** (Histogram)
Bucketed histogram for the compressed size of a chunk of SST file uploaded to TiKV.
- **tikv_import_upload_chunk_duration** (Histogram)
Bucketed histogram for the time needed to upload a chunk of SST file to TiKV.
- **tikv_import_range_delivery_duration** (Histogram)
Bucketed histogram for the time needed to deliver a range of KV pairs into a `dispatch` \leftrightarrow `-job`.
- **tikv_import_split_sst_duration** (Histogram)
Bucketed histogram for the time needed to split off a range from the engine file into a single SST file.

- **tikv_import_sst_delivery_duration** (Histogram)
Bucketed histogram for the time needed to deliver an SST file from a `dispatch-job` to an `ImportSSTJob`.
- **tikv_import_sst_recv_duration** (Histogram)
Bucketed histogram for the time needed to receive an SST file from a `dispatch-job` in an `ImportSSTJob`.
- **tikv_import_sst_upload_duration** (Histogram)
Bucketed histogram for the time needed to upload an SST file from an `ImportSSTJob` to a TiKV node.
- **tikv_import_sst_chunk_bytes** (Histogram)
Bucketed histogram for the compressed size of the SST file uploaded to a TiKV node.
- **tikv_import_sst_ingest_duration** (Histogram)
Bucketed histogram for the time needed to ingest an SST file into TiKV.
- **tikv_import_each_phase** (Gauge)
Indicates the running phase. Possible values are 1, meaning running inside the phase, and 0, meaning outside the phase. Labels:
 - **phase**: `prepare/import`
- **tikv_import_wait_store_available_count** (Counter)
Counts the number of times a TiKV node is found to have insufficient space when uploading SST files. Labels:
 - **store_id**: The TiKV store ID.

11.8.7.3.2 tidb-lightning

Metrics provided by `tidb-lightning` are listed under the namespace `lightning_*`.

- **lightning_importer_engine** (Counter)
Counts open and closed engine files. Labels:
 - **type**:
 - * `open`
 - * `closed`
- **lightning_idle_workers** (Gauge)
Counts idle workers. Labels:

- **name:**
 - * **table** — the remainder of **table-concurrency**, normally 0 until the end of the process
 - * **index** — the remainder of **index-concurrency**, normally 0 until the end of the process
 - * **region** — the remainder of **region-concurrency**, normally 0 until the end of the process
 - * **io** — the remainder of **io-concurrency**, normally close to configured value (default 5), and close to 0 means the disk is too slow
 - * **closed-engine** — number of engines which have been closed but not yet cleaned up, normally close to **index + table-concurrency** (default 8). A value close to 0 means TiDB Lightning is faster than TiKV Importer, which might cause TiDB Lightning to stall

- **lightning_kv_encoder** (Counter)

Counts open and closed KV encoders. KV encoders are in-memory TiDB instances that convert SQL INSERT statements into KV pairs. The net values need to be bounded in a healthy situation. Labels:

- **type:**
 - * **open**
 - * **closed**

- **lightning_tables** (Counter)

Counts processed tables and their statuses. Labels:

- **state:** the status of the table, indicating which phase should be completed
 - * **pending** — not yet processed
 - * **written** — all data encoded and sent
 - * **closed** — all corresponding engine files closed
 - * **imported** — all engine files have been imported into the target cluster
 - * **altered_auto_inc** — AUTO_INCREMENT ID altered
 - * **checksum** — checksum performed
 - * **analyzed** — statistics analysis performed
 - * **completed** — the table has been fully imported and verified
- **result:** the result of the current phase
 - * **success** — the phase completed successfully
 - * **failure** — the phase failed (did not complete)

- **lightning_engines** (Counter)

Counts number of engine files processed and their status. Labels:

- **state:** the status of the engine, indicating which phase should be completed

- * **pending** — not yet processed
- * **written** — all data encoded and sent
- * **closed** — engine file closed
- * **imported** — the engine file has been imported into the target cluster
- * **completed** — the engine has been fully imported
- **result**: the result of the current phase
 - * **success** — the phase completed successfully
 - * **failure** — the phase failed (did not complete)
- **lightning_chunks** (Counter)
Counts number of chunks processed and their status. Labels:
 - **state**: a chunk's status, indicating which phase the chunk is in
 - * **estimated** — (not a state) this value gives total number of chunks in current task
 - * **pending** — loaded but not yet processed
 - * **running** — data are being encoded and sent
 - * **finished** — the entire chunk has been processed
 - * **failed** — errors happened during processing
- **lightning_import_seconds** (Histogram)
Bucketed histogram for the time needed to import a table.
- **lightning_row_read_bytes** (Histogram)
Bucketed histogram for the size of a single SQL row.
- **lightning_row_encode_seconds** (Histogram)
Bucketed histogram for the time needed to encode a single SQL row into KV pairs.
- **lightning_row_kv_deliver_seconds** (Histogram)
Bucketed histogram for the time needed to deliver a set of KV pairs corresponding to one single SQL row.
- **lightning_block_deliver_seconds** (Histogram)
Bucketed histogram for the time needed to deliver a block of KV pairs to Importer.
- **lightning_block_deliver_bytes** (Histogram)
Bucketed histogram for the uncompressed size of a block of KV pairs delivered to Importer.
- **lightning_chunk_parser_read_block_seconds** (Histogram)
Bucketed histogram for the time needed by the data file parser to read a block.

- **lightning_checksum_seconds** (Histogram)
Bucketed histogram for the time needed to compute the checksum of a table.
- **lightning_apply_worker_seconds** (Histogram)
Bucketed histogram for the time needed to acquire an idle worker (see also the `lightning_idle_workers` gauge). Labels:

 - * closed-engine

11.8.8 TiDB Lightning FAQs

11.8.8.1 What is the minimum TiDB/TiKV/PD cluster version supported by TiDB Lightning?

The version of TiDB Lightning should be the same as the cluster. If you use the Local-backend mode, the earliest available version is 4.0.0. If you use the Importer-backend mode or the TiDB-backend mode, the earliest available version is 2.0.9, but it is recommended to use the 3.0 stable version.

11.8.8.2 Does TiDB Lightning support importing multiple schemas (databases)?

Yes.

11.8.8.3 What are the privilege requirements for the target database?

TiDB Lightning requires the following privileges:

- SELECT
- UPDATE
- ALTER
- CREATE
- DROP

If the **TiDB-backend** is chosen, or the target database is used to store checkpoints, it additionally requires these privileges:

- INSERT
- DELETE

The Local-backend and Importer-backend do not require these two privileges because data is ingested into TiKV directly, which bypasses the entire TiDB privilege system. This is secure as long as the ports of TiKV, TiKV Importer and TiDB Lightning are not reachable outside the cluster.

If the `checksum` configuration of TiDB Lightning is set to `true`, then the admin user privileges in the downstream TiDB need to be granted to TiDB Lightning.

11.8.8.4 TiDB Lightning encountered an error when importing one table. Will it affect other tables? Will the process be terminated?

If only one table has an error encountered, the rest will still be processed normally.

11.8.8.5 How to properly restart TiDB Lightning?

If you are using Importer-backend, depending on the status of `tikv-importer`, the basic sequence of restarting TiDB Lightning is like this:

If `tikv-importer` is still running:

1. Stop `tidb-lightning`.
2. Perform the intended modifications, such as fixing the source data, changing settings, replacing hardware etc.
3. If the modification previously has changed any table, remove the corresponding checkpoint too.
4. Start `tidb-lightning`.

If `tikv-importer` needs to be restarted:

1. Stop `tidb-lightning`.
2. Stop `tikv-importer`.
3. Perform the intended modifications, such as fixing the source data, changing settings, replacing hardware etc.
4. Start `tikv-importer`.
5. Start `tidb-lightning` and wait until the program fails with `CHECKSUM` error, if any.
 - Restarting `tikv-importer` would destroy all engine files still being written, but `tidb-lightning` did not know about it. As of v3.0 the simplest way is to let `tidb-lightning` go on and retry.
6. Destroy the failed tables and checkpoints
7. Start `tidb-lightning` again.

If you are using Local-backend or TiDB-backend, the operations are the same as those of using Importer-backend when the `tikv-importer` is still running.

11.8.8.6 How to ensure the integrity of the imported data?

TiDB Lightning by default performs checksum on the local data source and the imported tables. If there is checksum mismatch, the process would be aborted. These checksum information can be read from the log.

You could also execute the `ADMIN CHECKSUM TABLE` SQL command on the target table to recompute the checksum of the imported data.

```
ADMIN CHECKSUM TABLE `schema`.`table`;
```

```
+-----+-----+-----+-----+-----+
| Db_name | Table_name | Checksum_crc64_xor | Total_kvs | Total_bytes |
+-----+-----+-----+-----+-----+
| schema | table      | 5505282386844578743 | 3         | 96          |
+-----+-----+-----+-----+-----+
1 row in set (0.01 sec)
```

11.8.8.7 What kinds of data source formats are supported by TiDB Lightning?

TiDB Lightning supports:

- Importing files exported by [Dumpling](#), CSV files, and [Apache Parquet files generated by Amazon Aurora](#).
- Reading data from a local disk or from the Amazon S3 storage. For details, see [External Storages](#).

11.8.8.8 Could TiDB Lightning skip creating schema and tables?

Yes. If you have already created the tables in the target database, you could set `no-schema = true` in the `[mydumper]` section in `tidb-lightning.toml`. This makes TiDB Lightning skip the `CREATE TABLE` invocations and fetch the metadata directly from the target database. TiDB Lightning will exit with error if a table is actually missing.

11.8.8.9 Can the Strict SQL Mode be disabled to allow importing invalid data?

Yes. By default, the `sql_mode` used by TiDB Lightning is `"STRICT_TRANS_TABLES, NO_ENGINE_SUBSTITUTION"`, which disallows invalid data such as the date `1970-00-00`. The mode can be changed by modifying the `sql-mode` setting in the `[tidb]` section in `tidb-lightning.toml`.

```
...
[tidb]
sql-mode = ""
...
```

11.8.8.10 Can one `tikv-importer` serve multiple `tidb-lightning` instances?

Yes, as long as every `tidb-lightning` instance operates on different tables.

11.8.8.11 How to stop the `tikv-importer` process?

To stop the `tikv-importer` process, you can choose the corresponding operation according to your deployment method.

- For manual deployment: if `tikv-importer` is running in foreground, press `Ctrl+C` to exit. Otherwise, obtain the process ID using the `ps aux | grep tikv-importer` command and then terminate the process using the `kill ${PID}` command.

11.8.8.12 How to stop the `tidb-lightning` process?

To stop the `tidb-lightning` process, you can choose the corresponding operation according to your deployment method.

- For manual deployment: if `tidb-lightning` is running in foreground, press `Ctrl+C` to exit. Otherwise, obtain the process ID using the `ps aux | grep tidb-lightning` command and then terminate the process using the `kill -2 ${PID}` command.

11.8.8.13 Why the `tidb-lightning` process suddenly quits while running in background?

It is potentially caused by starting `tidb-lightning` incorrectly, which causes the system to send a `SIGHUP` signal to stop the `tidb-lightning` process. In this situation, `tidb-lightning.log` usually outputs the following log:

```
[2018/08/10 07:29:08.310 +08:00] [INFO] [main.go:41] ["got signal to exit"]  
↪ [signal=hangup]
```

It is not recommended to directly use `nohup` in the command line to start `tidb-lightning`. You can **start `tidb-lightning`** by executing a script.

In addition, if the last log of TiDB Lightning shows that the error is “Context canceled”, you need to search for the first “ERROR” level log. This “ERROR” level log is usually followed by “got signal to exit”, which indicates that TiDB Lightning received an interrupt signal and then exited.

11.8.8.14 Why my TiDB cluster is using lots of CPU resources and running very slowly after using TiDB Lightning?

If `tidb-lightning` abnormally exited, the cluster might be stuck in the “import mode”, which is not suitable for production. The current mode can be retrieved using the following command:

```
tidb-lightning-ctl --config tidb-lightning.toml --fetch-mode
```

You can force the cluster back to “normal mode” using the following command:

```
tidb-lightning-ctl --config tidb-lightning.toml --fetch-mode
```

11.8.8.15 Can TiDB Lightning be used with 1-Gigabit network card?

The TiDB Lightning toolset is best used with a 10-Gigabit network card. 1-Gigabit network cards are *not recommended*, especially for `tikv-importer`.

1-Gigabit network cards can only provide a total bandwidth of 120 MB/s, which has to be shared among all target TiKV stores. TiDB Lightning can easily saturate all bandwidth of the 1-Gigabit network and bring down the cluster because PD is unable to be contacted anymore. To avoid this, set an *upload speed limit* in [Importer’s configuration](#):

```
[import]
### Restricts the total upload speed to TiKV to 100 MB/s or less
upload-speed-limit = "100MB"
```

11.8.8.16 Why TiDB Lightning requires so much free space in the target TiKV cluster?

With the default settings of 3 replicas, the space requirement of the target TiKV cluster is 6 times the size of data source. The extra multiple of “2” is a conservative estimation because the following factors are not reflected in the data source:

- The space occupied by indices
- Space amplification in RocksDB

11.8.8.17 Can TiKV Importer be restarted while TiDB Lightning is running?

No. TiKV Importer stores some information of engines in memory. If `tikv-importer` is restarted, `tidb-lightning` will be stopped due to lost connection. At this point, you need to [destroy the failed checkpoints](#) as those TiKV Importer-specific information is lost. You can restart TiDB Lightning afterwards.

See also [How to properly restart TiDB Lightning?](#) for the correct sequence.

11.8.8.18 How to completely destroy all intermediate data associated with TiDB Lightning?

1. Delete the checkpoint file.

```
tidb-lightning-ctl --config conf/tidb-lightning.toml --checkpoint-
  ↪ remove=all
```

If, for some reason, you cannot run this command, try manually deleting the file `/tmp ↵ /tidb_lightning_checkpoint.pb`.

2. If you are using Local-backend, delete the `sorted-kv-dir` directory in the configuration. If you are using Importer-backend, delete the entire `import` directory on the machine hosting `tikv-importer`.
3. Delete all tables and databases created on the TiDB cluster, if needed.
4. Clean up the residual metadata. You need to clean up the metadata schema manually if either of the following conditions exist.
 - For TiDB Lightning v5.1.x and v5.2.x versions, the `tidb-lightning-ctl` command does not clean up the metadata schema in the target cluster. You need to clean it up manually.
 - If you have deleted the checkpoint files manually, you need to clean up the downstream metadata schema manually; otherwise, the correctness of subsequent imports might be affected.

Use the following command to clean up the metadata:

```
DROP DATABASE IF EXISTS `lightning_metadata`;
```

11.8.8.19 Why does TiDB Lightning report the could not find first pair, this shouldn't happen error?

This error occurs possibly because the number of files opened by TiDB Lightning exceeds the system limit when TiDB Lightning reads the sorted local files. In the Linux system, you can use the `ulimit -n` command to confirm whether the value of this system limit is too small. It is recommended that you adjust this value to 1000000 (`ulimit -n 1000000`) during the import.

11.8.8.20 Import speed is too slow

Normally it takes TiDB Lightning 2 minutes per thread to import a 256 MB data file. If the speed is much slower than this, there is an error. You can check the time taken for each data file from the log mentioning `restore chunk ... takes`. This can also be observed from metrics on Grafana.

There are several reasons why TiDB Lightning becomes slow:

Cause 1: `region-concurrency` is set too high, which causes thread contention and reduces performance.

1. The setting can be found from the start of the log by searching `region-concurrency`.
2. If TiDB Lightning shares the same machine with other services (for example, TiKV Importer), `region-concurrency` must be **manually** set to 75% of the total number of CPU cores.

3. If there is a quota on CPU (for example, limited by Kubernetes settings), TiDB Lightning may not be able to read this out. In this case, `region-concurrency` must also be **manually** reduced.

Cause 2: The table schema is too complex.

Every additional index introduces a new KV pair for each row. If there are N indices, the actual size to be imported would be approximately (N+1) times the size of the Dumping output. If the indices are negligible, you may first remove them from the schema, and add them back using `CREATE INDEX` after the import is complete.

Cause 3: Each file is too large.

TiDB Lightning works the best when the data source is broken down into multiple files of size around 256 MB so that the data can be processed in parallel. If each file is too large, TiDB Lightning might not respond.

If the data source is CSV, and all CSV files have no fields containing newline control characters (U+000A and U+000D), you can turn on “strict format” to let TiDB Lightning automatically split the large files.

```
[mydumper]
strict-format = true
```

Cause 4: TiDB Lightning is too old.

Try the latest version! Maybe there is new speed improvement.

11.8.8.21 `checksum failed: checksum mismatched remote vs local`

Cause: The checksum of a table in the local data source and the remote imported database differ. This error has several deeper reasons. You can further locate the reason by checking the log that contains `checksum mismatched`.

The lines that contain `checksum mismatched` provide the information `total_kvs: x ↔ vs y`, where `x` indicates the number of key-value pairs (KV pairs) calculated by the target cluster after the import is completed, and `y` indicates the number of key-value pairs generated by the local data source.

- If `x` is greater, it means that there are more KV pairs in the target cluster.
 - It is possible that this table is not empty before the import and therefore affects the data checksum. It is also possible that TiDB Lightning has previously failed and shut down, but did not restart correctly.
- If `y` is greater, it means that there are more KV pairs in the local data source.
 - If the checksum of the target database is all 0, it means that no import has occurred. It is possible that the cluster is too busy to receive any data.

- It is possible that the exported data contains duplicate data, such as the UNIQUE and PRIMARY KEYs with duplicate values, or that the downstream table structure is case-insensitive while the data is case-sensitive.
- Other possible reasons
 - If the data source is machine-generated and not backed up by Dumpling, make sure the data conforms to the table limits. For example, the AUTO_INCREMENT column needs to be positive and not 0.

Solutions:

1. Delete the corrupted data using `tidb-lightning-ctl`, check the table structure and the data, and restart TiDB Lightning to import the affected tables again.

```
tidb-lightning-ctl --config conf/tidb-lightning.toml --checkpoint-error  
↪ -destroy=all
```

2. Consider using an external database to store the checkpoints (change `[checkpoint]` ↪ `dsn`) to reduce the target database's load.
3. If TiDB Lightning was improperly restarted, see also the “[How to properly restart TiDB Lightning](#)” section in the FAQ.

11.8.8.22 Checkpoint for ... has invalid status: (error code)

Cause: [Checkpoint](#) is enabled, and TiDB Lightning or TiKV Importer has previously abnormally exited. To prevent accidental data corruption, TiDB Lightning will not start until the error is addressed.

The error code is an integer smaller than 25, with possible values of 0, 3, 6, 9, 12, 14, 15, 17, 18, 20, and 21. The integer indicates the step where the unexpected exit occurs in the import process. The larger the integer is, the later step the exit occurs at.

Solutions:

If the error was caused by invalid data source, delete the imported data using `tidb-lightning-ctl` and start Lightning again.

```
tidb-lightning-ctl --config conf/tidb-lightning.toml --checkpoint-error-  
↪ destroy=all
```

See the [Checkpoints control](#) section for other options.

11.8.8.23 ResourceTemporarilyUnavailable("Too many open engines ...: ...")

Cause: The number of concurrent engine files exceeds the limit specified by `tikv-importer`. This could be caused by misconfiguration. Additionally, if `tidb-lightning` exited abnormally, an engine file might be left at a dangling open state, which could cause this error as well.

Solutions:

1. Increase the value of `max-open-engines` setting in `tikv-importer.toml`. This value is typically dictated by the available memory. This could be calculated by using:
Max Memory Usage $\text{max-open-engines} \times \text{write-buffer-size} \times \text{max-write-buffer-number}$
2. Decrease the value of `table-concurrency + index-concurrency` so it is less than `max-open-engines`.
3. Restart `tikv-importer` to forcefully remove all engine files (default to `./data.import` \hookrightarrow `/`). This also removes all partially imported tables, which requires TiDB Lightning to clear the outdated checkpoints.

```
tidb-lightning-ctl --config conf/tidb-lightning.toml --checkpoint-error  
 $\hookrightarrow$  -destroy=all
```

11.8.8.24 cannot guess encoding for input file, please convert to UTF-8 manually

Cause: TiDB Lightning only recognizes the UTF-8 and GB-18030 encodings for the table schemas. This error is emitted if the file isn't in any of these encodings. It is also possible that the file has mixed encoding, such as containing a string in UTF-8 and another string in GB-18030, due to historical `ALTER TABLE` executions.

Solutions:

1. Fix the schema so that the file is entirely in either UTF-8 or GB-18030.
2. Manually `CREATE` the affected tables in the target database, and then set `[mydumper] no-schema = true` to skip automatic table creation.
3. Set `[mydumper] character-set = "binary"` to skip the check. Note that this might introduce mojibake into the target database.

11.8.8.25 [sql2kv] sql encode error = [types:1292]invalid time format: '{1970 1 1 ...}'

Cause: A table contains a column with the `timestamp` type, but the time value itself does not exist. This is either because of DST changes or the time value has exceeded the supported range (Jan 1, 1970 to Jan 19, 2038).

Solutions:

1. Ensure TiDB Lightning and the source database are using the same time zone.

When executing TiDB Lightning directly, the time zone can be forced using the `$TZ` environment variable.

```
# Manual deployment, and force Asia/Shanghai.  
TZ='Asia/Shanghai' bin/tidb-lightning -config tidb-lightning.toml
```

2. When exporting data using Mydumper, make sure to include the `--skip-tz-utc` flag.
3. Ensure the entire cluster is using the same and latest version of `tzdata` (version 2018i or above).

On CentOS, run `yum info tzdata` to check the installed version and whether there is an update. Run `yum upgrade tzdata` to upgrade the package.

11.8.8.26 [Error 8025: entry too large, the max entry size is 6291456]

Cause: A single row of key-value pairs generated by TiDB Lightning exceeds the limit set by TiDB.

Solution:

To bypass this limit, modify the TiDB configuration item `txn-entry-size-limit` and the TiKV configuration item `raft-entry-max-size` to a value larger than the data to be imported and then retry.

11.8.8.27 Encounter rpc error: code = Unimplemented ... when TiDB Lightning switches the mode

Cause: Some node(s) in the cluster does not support `switch-mode`. For example, if the TiFlash version is earlier than `v4.0.0-rc.2`, [switch-mode is not supported](#).

Solutions:

- If there are TiFlash nodes in the cluster, you can update the cluster to `v4.0.0-rc.2` or higher versions.
- Temporarily disable TiFlash if you do not want to upgrade the cluster.

11.8.8.28 tidb lightning encountered error: TiDB version too old, expected '>=4.0.0', found '3.0.18'

TiDB Lightning Local-backend only supports importing data to TiDB clusters of `v4.0.0` and later versions. If you try to use Local-backend to import data to a `v2.x` or `v3.x` cluster, the above error is reported. At this time, you can modify the configuration to use Importer-backend or TiDB-backend for data import.

Some `nightly` versions might be similar to `v4.0.0-beta.2`. These `nightly` versions of TiDB Lightning actually support Local-backend. If you encounter this error when using

a `nightly` version, you can skip the version check by setting the configuration `check-requirements = false`. Before setting this parameter, make sure that the configuration of TiDB Lightning supports the corresponding version; otherwise, the import might fail.

11.8.8.29 `restore table test.district failed: unknown columns in header [...]`

This error occurs usually because the CSV data file does not contain a header (the first row is not column names but data). Therefore, you need to add the following configuration to the TiDB Lightning configuration file:

```
[mydumper.csv]
header = false
```

11.8.8.30 How to get the runtime goroutine information of TiDB Lightning

1. If `status-port` has been specified in the configuration file of TiDB Lightning, skip this step. Otherwise, you need to send the USR1 signal to TiDB Lightning to enable `status-port`.

Get the process ID (PID) of TiDB Lightning using commands like `ps`, and then run the following command:

```
kill -USR1 <lightning-pid>
```

Check the log of TiDB Lightning. The log of `starting HTTP server / start HTTP server / started HTTP server` shows the newly enabled `status-port`.

2. Access `http://<lightning-ip>:<status-port>/debug/pprof/goroutine?debug=2` to get the goroutine information.

11.8.9 TiDB Lightning Glossary

This page explains the special terms used in TiDB Lightning's logs, monitoring, configurations, and documentation.

11.8.9.1 A

11.8.9.1.1 Analyze

An operation to rebuild the `statistics` information of a TiDB table, which is running the `ANALYZE TABLE` statement.

Because TiDB Lightning imports data without going through TiDB, the statistics information is not automatically updated. Therefore, TiDB Lightning explicitly analyzes every table after importing. This step can be omitted by setting the `post-restore.analyze` configuration to `false`.

11.8.9.1.2 AUTO_INCREMENT_ID

Every table has an associated `AUTO_INCREMENT_ID` counter to provide the default value of an auto-incrementing column. In TiDB, this counter is additionally used to assign row IDs.

Because TiDB Lightning imports data without going through TiDB, the `AUTO_INCREMENT_ID` counter is not automatically updated. Therefore, TiDB Lightning explicitly alters `AUTO_INCREMENT_ID` to a valid value. This step is always performed, even if the table has no `AUTO_INCREMENT` columns.

11.8.9.2 B

11.8.9.2.1 Back end

Back end is the destination where TiDB Lightning sends the parsed result. Also spelled as “backend”.

See [TiDB Lightning Backends](#) for details.

11.8.9.3 C

11.8.9.3.1 Checkpoint

TiDB Lightning continuously saves its progress into a local file or a remote database while importing. This allows it to resume from an intermediate state should it crashes in the process. See the [Checkpoints](#) section for details.

11.8.9.3.2 Checksum

In TiDB Lightning, the checksum of a table is a set of 3 numbers calculated from the content of each KV pair in that table. These numbers are respectively:

- the number of KV pairs,
- total length of all KV pairs, and
- the bitwise-XOR of [CRC-64-ECMA](#) value each pair.

TiDB Lightning [validates the imported data](#) by comparing the [local](#) and [remote checksums](#) of every table. The program would stop if any pair does not match. You can skip this check by setting the `post-restore.checksum` configuration to `false`.

See also the [FAQs](#) for how to properly handle checksum mismatch.

11.8.9.3.3 Chunk

A continuous range of source data, normally equivalent to a single file in the data source.

When a file is too large, TiDB Lightning might split a file into multiple chunks.

11.8.9.3.4 Compaction

An operation that merges multiple small SST files into one large SST file, and cleans up the deleted entries. TiKV automatically compacts data in background while TiDB Lightning is importing.

Note:

For legacy reasons, you can still configure TiDB Lightning to explicitly trigger a compaction every time a table is imported. However, this is not recommended and the corresponding settings are disabled by default.

See [RocksDB's wiki page on Compaction](#) for its technical details.

11.8.9.4 D

11.8.9.4.1 Data engine

An [engine](#) for sorting actual row data.

When a table is very large, its data is placed into multiple data engines to improve task pipelining and save space of TiKV Importer. By default, a new data engine is opened for every 100 GB of SQL data, which can be configured through the `mydumper.batch-size` setting.

TiDB Lightning processes multiple data engines concurrently. This is controlled by the `lightning.table-concurrency` setting.

11.8.9.5 E

11.8.9.5.1 Engine

In TiKV Importer, an engine is a RocksDB instance for sorting KV pairs.

TiDB Lightning transfers data to TiKV Importer through engines. It first opens an engine, sends KV pairs to it (with no particular order), and finally closes the engine. The engine sorts the received KV pairs after it is closed. These closed engines can then be further uploaded to the TiKV stores for ingestion.

Engines use TiKV Importer's `import-dir` as temporary storage, which are sometimes referred to as “engine files”.

See also [data engine](#) and [index engine](#).

11.8.9.6 F

11.8.9.6.1 Filter

A configuration list that specifies which tables to be imported or excluded.

See [Table Filter](#) for details.

11.8.9.7 I

11.8.9.7.1 Import mode

A configuration that optimizes TiKV for writing at the cost of degraded read speed and space usage.

TiDB Lightning automatically switches to and off the import mode while running. However, if TiKV gets stuck in import mode, you can use `tidb-lightning-ctl` to [force revert to normal mode](#).

11.8.9.7.2 Index engine

An [engine](#) for sorting indices.

Regardless of number of indices, every table is associated with exactly one index engine.

TiDB Lightning processes multiple index engines concurrently. This is controlled by the `lightning.index-concurrency` setting. Since every table has exactly one index engine, this also configures the maximum number of tables to process at the same time.

11.8.9.7.3 Ingest

An operation which inserts the entire content of an [SST file](#) into the RocksDB (TiKV) store.

Ingestion is a very fast operation compared with inserting KV pairs one by one. This operation is the determinant factor for the performance of TiDB Lightning.

See [RocksDB's wiki page on Creating and Ingesting SST files](#) for its technical details.

11.8.9.8 K

11.8.9.8.1 KV pair

Abbreviation of “key-value pair”.

11.8.9.8.2 KV encoder

A routine which parses SQL or CSV rows to KV pairs. Multiple KV encoders run in parallel to speed up processing.

11.8.9.9 L

11.8.9.9.1 Local checksum

The **checksum** of a table calculated by TiDB Lightning itself before sending the KV pairs to TiKV Importer.

11.8.9.10 N

11.8.9.10.1 Normal mode

The mode where **import mode** is disabled.

11.8.9.11 P

11.8.9.11.1 Post-processing

The period of time after the entire data source is parsed and sent to TiKV Importer. TiDB Lightning is waiting for TiKV Importer to upload and **ingest** the **SST files**.

11.8.9.12 R

11.8.9.12.1 Remote checksum

The **checksum** of a table calculated by TiDB after it has been imported.

11.8.9.13 S

11.8.9.13.1 Scattering

An operation that randomly reassigns the leader and the peers of a **Region**. Scattering ensures that the imported data are distributed evenly among TiKV stores. This reduces stress on PD.

11.8.9.13.2 Splitting

An engine is typically very large (around 100 GB), which is not friendly to TiKV if treated as a single **region**. TiKV Importer splits an engine into multiple small **SST files** (configurable by TiKV Importer's `import.region-split-size` setting) before uploading.

11.8.9.13.3 SST file

SST is the abbreviation of “sorted string table”. An SST file is RocksDB's (and thus TiKV's) native storage format of a collection of KV pairs.

TiKV Importer produces SST files from a closed **engine**. These SST files are uploaded and then **ingested** into TiKV stores.

11.8.10 TiDB Lightning Log Message Explanation

This document provides an explanation of log messages for **TiDB Lightning v5.4** in **Local Backend mode**, based on a successful test data import. It dives deep into the origin and meaning of each log message. You can refer to this document to better understand TiDB Lightning logs.

To fully comprehend this document, you need to be already familiar with TiDB Lightning and have prior knowledge of its high-level workflow described in [TiDB Lightning Overview](#). If you come across unfamiliar terminology, refer to the [glossary](#).

You can use this document to quickly navigate through TiDB Lightning source code and gain insight into its internal workings and understand the significance behind each log message.

Note that only important logs are included in this document. Less important logs have been omitted.

11.8.10.1 Log message explanation

```

  ↳ -concurrency\":8,\"io-concurrency\":5,\"check-requirements\":true,\"
  ↳ meta-schema-name\":\"lightning_metadata\", ...}
```

[lightning.go:233](#): Print TiDB Lightning config information.

```
[INFO] [lightning.go:312] ["load data source start"]
```

[lightning.go:312](#): Start to [scan data source dir or external storage](#) defined in TiDB Lightning [mydumper data-source-dir](#) config field, and load all data source file meta info into [internal data structure](#) for future usage.

```
[INFO] [loader.go:289] ["[loader] file is filtered by file router"] [path=
  ↳ metadata]
```

[loader.go:289](#): Print data source files skipped based on [file router rules](#) defined in TiDB Lightning [mydumper files](#) config field or internal [default file router rules](#) if [file rules are not defined](#).

```
[INFO] [lightning.go:315] ["load data source completed"] [takeTime=273.964µs
  ↳ ] []
```

[lightning.go:315](#): Completed loading data source file info into [Mydumper File Loader](#) for later import.

```
[INFO] [checkpoints.go:977] ["open checkpoint file failed, going to create a
↳ new one"] [path=/tmp/tidb_lightning_checkpoint.pb] [error="open /tmp
↳ /tidb_lightning_checkpoint.pb: no such file or directory"]
```

[checkpoints.go:977](#): If TiDB Lightning uses files to store checkpoints, and cannot find any local checkpoint file, TiDB Lightning will create a new checkpoint.

```
[INFO] [restore.go:444] ["the whole procedure start"]
```

[restore.go:444](#): Start the import procedure.

```
[INFO] [restore.go:748] ["restore all schema start"]
```

[restore.go:748](#): Based on data source schema info, start to create databases and tables.

```
[INFO] [restore.go:767] ["restore all schema completed"] [takeTime
↳ =189.766729ms]
```

[restore.go:767](#): Completed to create databases and tables.

```
[INFO] [check_info.go:680] ["datafile to check"] [db=sysbench] [table=
↳ sbtest1] [path=sysbench.sbtest1.000000000.sql]
```

[check_info.go:680](#): As part of the precheck, TiDB Lightning uses the first data file of each table to check if the source data file and the target cluster table schema are matched.

```
[INFO] [version.go:360] ["detect server version"] [type=TiDB] [version
↳ =5.4.0]
```

[version.go:360](#): Detect and print the current TiDB server version. To import data in local backend mode, TiDB later than v4.0 is required. The same version check is also implemented for [detecting data conflicts](#).

```
[INFO] [check_info.go:995] ["sample file start"] [table=sbtest1]
```

[check_info.go:995](#): As part of the precheck, TiDB Lightning estimates the source data size to determine the following:

- [Whether the local disk has enough space if TiDB Lightning is in local backend mode.](#)
- [Whether the target cluster has enough space to store transformed KV pairs.](#)

TiDB Lightning estimates the size of transformed KV pairs by sampling the first source data file of each table and calculating the ratio between its size and KV pairs size. Then it uses the ratio, multiplied by the source data file size, to estimate the size of transformed KV pairs.

```
[INFO] [check_info.go:1080] ["Sample source data"] [table=sbtest1] [  
  ↪ IndexRatio=1.3037832180660969] [IsSourceOrder=true]
```

[check_info.go:1080](#): The ratio between the table source file size and the KV pairs size has been calculated.

```
[INFO] [pd.go:415] ["pause scheduler successful at beginning"] [name="[  
  ↪ balance-region-scheduler,balance-leader-scheduler,balance-hot-region-  
  ↪ scheduler]"]  
[INFO] [pd.go:423] ["pause configs successful at beginning"] [cfg="{\"enable  
  ↪ -location-replacement\": \"false\", \"leader-schedule-limit\": 4, \"max-  
  ↪ merge-region-keys\": 0, \"max-merge-region-size\": 0, \"max-pending-peer-  
  ↪ count\": 2147483647, \"max-snapshot-count\": 40, \"region-schedule-limit  
  ↪ \": 40}"]
```

[pd.go:415](#), [pd.go:423](#): In local backend mode, some PD schedulers are disabled and some configuration items are changed to split and scatter TiKV regions and ingest SSTs.

```
[INFO] [restore.go:1683] ["switch to import mode"]
```

[restore.go:1683](#): In local backend mode, TiDB Lightning turns each TiKV node into import mode to speed up the import process, but sacrifices its storage space. If it uses tidb backend mode, it does not need to switch TiKV to [import mode](#).

```
[INFO] [restore.go:1462] ["restore table start"] [table=`sysbench`.`sbtest1  
  ↪ `]
```

[restore.go:1462](#): Start to restore table `sysbench.sbtest1`. TiDB Lightning concurrently restores multiple tables based on the [index-concurrency](#) configuration. For each table, it concurrently restores data files in the table based on the [region-concurrency](#) configuration.

```
[INFO] [table_restore.go:91] ["load engines and files start"] [table=`  
  ↪ sysbench`.`sbtest1`]
```

[table_restore.go:91](#): Start to logically [split each table source data files](#) into multiple [chunks/table regions](#). Each table source data file will be [assigned to an engine](#) so source data files can be processed in parallel across different engines.

```
[INFO] [region.go:241] [makeTableRegions] [filesCount=8] [MaxRegionSize  
  ↪ =268435456] [RegionsCount=8] [BatchSize=107374182400] [cost=53.207µs]
```

[region.go:241](#): Prints the amount of table data files (`filesCount`) that have been processed, and the largest chunk size (`MaxRegionSize`) of the CSV file, the number of generated table regions/chunks (`RegionsCount`), and the `batchSize` that is used to assign different engines to process data files.

```
[INFO] [table_restore.go:129] ["load engines and files completed"] [table=`  
  ↪ sysbench`.`sbtest1`] [enginesCnt=2] [ime=75.563µs] []
```

[table_restore.go:129](#): Completed to logically split table data files.

```
[INFO] [backend.go:346] ["open engine"] [engineTag=`sysbench`.`sbtest1`:-1]
↳ [engineUUID=3942bab1-bd60-52e2-bf53-e17aebf962c6]
```

[backend.go:346](#): The engine with id -1 is the index engine. It will open the index engine at the beginning of the [restore engines process](#) for storing transformed index KV pairs.

```
[INFO] [table_restore.go:270] ["import whole table start"] [table=`sysbench
↳ `.`sbtest1`]
```

[table_restore.go:270](#): Start to concurrently [restore different data engines of a given table](#).

```
[INFO] [table_restore.go:317] ["restore engine start"] [table=`sysbench`.`
↳ sbtest1`] [engineNumber=0]
```

[table_restore.go:317](#): Start to restore engine 0. A non -1 engine id indicates a data engine. Note that “restore engine” and “import engine” (which appears later in the logs) refer to different processes. “restore engine” indicates the process of sending KV pairs to the allocated engine and sorting them, while “import engine” represents the process of ingesting sorted KV pairs in the engine file into the TiKV nodes.

```
[INFO] [table_restore.go:422] ["encode kv data and write start"] [table=`
↳ sysbench`.`sbtest1`] [engineNumber=0]
```

[table_restore.go:422](#): Start to [restore table data by chunks](#).

```
[INFO] [backend.go:346] ["open engine"] [engineTag=`sysbench`.`sbtest1`:0] [
↳ engineUUID=d173bb2e-b753-5da9-b72e-13a49a46f5d7]
```

[backend.go:346](#): Open data engine with id = 0 for storing transformed data KV pairs.

```
[INFO] [restore.go:2482] ["restore file start"] [table=`sysbench`.`sbtest1`]
↳ [engineNumber=0] [fileIndex=0] [path=sysbench.sbtest1.000000000.sql
↳ :0]
```

[restore.go:2482](#): This log may appear multiple times based on the data size of the imported table. Each log in this form indicates the start of restoring a chunk/table region. It concurrently [restores chunks](#) based on internal [region workers](#) defined by [region concurrency](#). For each chunk, the restoring process is as follows:

1. [Encodes SQL into KV pairs](#).
2. [Writes KV pairs into data engine and index engine](#).

```
[INFO] [engine.go:777] ["write data to local DB"] [size=134256327] [kvs

[restore.go:1143](#): Stop all [periodic actions](#) after the import is completed.

11.9 TiDB Data Migration

11.9.1 About TiDB Data Migration

11.9.1.1 Data Migration Overview

[TiDB Data Migration](#) (DM) is an integrated data migration task management platform, which supports the full data migration and the incremental data replication from MySQL-compatible databases (such as MySQL, MariaDB, and Aurora MySQL) into TiDB. It can help to reduce the operation cost of data migration and simplify the troubleshooting process. When using DM for data migration, you need to perform the following operations:

- Deploy a DM Cluster
- Create upstream data source and save data source access information
- Create data migration tasks to migrate data from data sources to TiDB

The data migration task includes two stages: full data migration and incremental data replication:

- Full data migration: Migrate the table structure of the corresponding table from the data source to TiDB, and then read the data stored in the data source and write it to the TiDB cluster.
- Incremental data replication: After the full data migration is completed, the corresponding table changes from the data source are read and then written to the TiDB cluster.

11.9.1.1.1 DM versions

This document is applicable to DM v5.4, the latest stable version of DM.

Before v5.4, the DM documentation is independent of the TiDB documentation. To access these earlier versions of the DM documentation, click one of the following links:

- [DM v5.3 documentation](#)
- [DM v2.0 documentation](#)

- [DM v1.0 documentation](#) (Not recommended, because it the earliest stable version of DM)

Note:

- Since October 2021, DM's GitHub repository has been moved to [pingcap/tiflow](#). If you see any issues with DM, submit your issue to the [pingcap/tiflow](#) repository for feedback.
- In earlier versions (v1.0 and v2.0), DM uses version numbers that are independent of TiDB. Since v5.3, DM uses the same version number as TiDB. The next version of DM v2.0 is DM v5.3. There are no compatibility changes from DM v2.0 to v5.3, and the upgrade process is no different from a normal upgrade, only an increase in version number.

11.9.1.1.2 Basic features

This section describes the basic data migration features provided by DM.

Figure 165: DM Core Features

Block and allow lists migration at the schema and table levels

The **block and allow lists filtering rule** is similar to the `replication-rules-db` \leftrightarrow `/replication-rules-table` feature of MySQL, which can be used to filter or replicate all operations of some databases only or some tables only.

Binlog event filtering

The [binlog event filtering](#) feature means that DM can filter certain types of SQL statements from certain tables in the source database. For example, you can filter all `INSERT` statements in the table `test.sbtest` or filter all `TRUNCATE TABLE` statements in the schema `test`.

Schema and table routing

The [schema and table routing](#) feature means that DM can migrate a certain table of the source database to the specified table in the downstream. For example, you can migrate the table structure and data from the table `test.sbtest1` in the source database to the table `test.sbtest2` in TiDB. This is also a core feature for merging and migrating sharded databases and tables.

11.9.1.1.3 Advanced features

Shard merge and migration

DM supports merging and migrating the original sharded instances and tables from the source databases into TiDB, but with some restrictions. For details, see [Sharding DDL usage restrictions in the pessimistic mode](#) and [Sharding DDL usage restrictions in the optimistic mode](#).

Optimization for third-party online-schema-change tools in the migration process

In the MySQL ecosystem, tools such as `gh-ost` and `pt-osc` are widely used. DM provides support for these tools to avoid migrating unnecessary intermediate data. For details, see [Online DDL Tools](#)

Filter certain row changes using SQL expressions

In the phase of incremental replication, DM supports the configuration of SQL expressions to filter out certain row changes, which lets you replicate the data with a greater granularity. For more information, refer to [Filter Certain Row Changes Using SQL Expressions](#).

11.9.1.1.4 Usage restrictions

Before using the DM tool, note the following restrictions:

- Database version requirements
 - MySQL version > 5.5
 - MariaDB version >= 10.1.2

Note:

If there is a primary-secondary migration structure between the upstream MySQL/MariaDB servers, then choose the following version.

- MySQL version > 5.7.1
- MariaDB version >= 10.1.3

Warning:

Migrating data from MySQL 8.0 to TiDB using DM is an experimental feature (introduced since DM v2.0). It is **NOT** recommended that you use it in a production environment.

- DDL syntax compatibility
 - Currently, TiDB is not compatible with all the DDL statements that MySQL supports. Because DM uses the TiDB parser to process DDL statements, it only supports the DDL syntax supported by the TiDB parser. For details, see [MySQL Compatibility](#).
 - DM reports an error when it encounters an incompatible DDL statement. To solve this error, you need to manually handle it using dmctl, either skipping this DDL statement or replacing it with a specified DDL statement(s). For details, see [Skip or replace abnormal SQL statements](#).
- Sharding merge with conflicts
 - If conflict exists between sharded tables, solve the conflict by referring to [handling conflicts of auto-increment primary key](#). Otherwise, data migration is not supported. Conflicting data can cover each other and cause data loss.
 - For other sharding DDL migration restrictions, see [Sharding DDL usage restrictions in the pessimistic mode](#) and [Sharding DDL usage restrictions in the optimistic mode](#).
- Switch of MySQL instances for data sources

When DM-worker connects the upstream MySQL instance via a virtual IP (VIP), if you switch the VIP connection to another MySQL instance, DM might connect to the new and old MySQL instances at the same time in different connections. In this situation, the binlog migrated to DM is not consistent with other upstream status that DM receives, causing unpredictable anomalies and even data damage. To make necessary changes to DM manually, see [Switch DM-worker connection via virtual IP](#).
- GBK character set compatibility
 - DM does not support migrating `charset=GBK` tables to TiDB clusters earlier than v5.4.0.

11.9.1.2 Basic Features

11.9.1.2.1 Key Features

This document describes the data migration features provided by TiDB Data Migration (DM) and introduces appropriate parameter configurations.

For different DM versions, pay attention to the different match rules of schema or table names in the table routing, block & allow lists, and binlog event filter features:

- For DM v1.0.5 or later versions, all the above features support the [wildcard match](#). For all versions of DM, note that there can be **only one *** in the wildcard expression, and *** must be placed at the end**.
- For DM versions earlier than v1.0.5, table routing and binlog event filter support the wildcard but do not support the [...] and [!...] expressions. The block & allow lists only supports the regular expression.

It is recommended that you use the wildcard for matching in simple scenarios.

Table routing

The table routing feature enables DM to migrate a certain table of the upstream MySQL or MariaDB instance to the specified table in the downstream.

Note:

- Configuring multiple different routing rules for a single table is not supported.
- The match rule of schema needs to be configured separately, which is used to migrate CREATE/DROP SCHEMA xx, as shown in rule-2 of the [parameter configuration](#).

Parameter configuration

```
routes:
  rule-1:
    schema-pattern: "test_*"
    table-pattern: "t_*"
    target-schema: "test"
    target-table: "t"
  rule-2:
    schema-pattern: "test_*"
    target-schema: "test"
```

Parameter explanation

DM migrates the upstream MySQL or MariaDB instance table that matches the **schema**
↔ **-pattern/table-pattern** rule provided by **Table selector** to the downstream **target-**
↔ **schema/target-table**.

Usage examples

This section shows the usage examples in different scenarios.

Merge sharded schemas and tables

Assuming in the scenario of sharded schemas and tables, you want to migrate the **test_**
↔ **{1,2,3...}.t_{1,2,3...}** tables in two upstream MySQL instances to the **test.t** table
in the downstream TiDB instance.

To migrate the upstream instances to the downstream **test.t**, you must create the following routing rules:

- **rule-1** is used to migrate DML or DDL statements of the table that matches **schema**
↔ **-pattern: "test_*** and **table-pattern: "t_*** to the downstream **test.t**.
- **rule-2** is used to migrate DDL statements of the schema that matches **schema-**
↔ **pattern: "test_***, such as **CREATE/DROP SCHEMA xx**.

Note:

- If the downstream **schema: test** already exists and is not to be deleted, you can omit **rule-2**.
- If the downstream **schema: test** does not exist and only **rule-1** is configured, then it reports the **schema test doesn't exist** error during migration.

```
rule-1:
  schema-pattern: "test_*"
  table-pattern: "t_*"
  target-schema: "test"
  target-table: "t"
rule-2:
  schema-pattern: "test_*"
  target-schema: "test"
```

Merge sharded schemas

Assuming in the scenario of sharded schemas, you want to migrate the **test_{1,2,3...}**
↔ **.t_{1,2,3...}** tables in the two upstream MySQL instances to the **test.t_{1,2,3...}**
tables in the downstream TiDB instance.

To migrate the upstream schemas to the downstream `test.t_[1,2,3]`, you only need to create one routing rule.

```
rule-1:
  schema-pattern: "test_*"
  target-schema: "test"
```

Incorrect table routing

Assuming that the following two routing rules are configured and `test_1_bak.t_1_bak` matches both `rule-1` and `rule-2`, an error is reported because the table routing configuration violates the number limitation.

```
rule-1:
  schema-pattern: "test_*"
  table-pattern: "t_*"
  target-schema: "test"
  target-table: "t"
rule-2:
  schema-pattern: "test_1_bak"
  table-pattern: "t_1_bak"
  target-schema: "test"
  target-table: "t_bak"
```

Block and allow table lists

The block and allow lists filtering rule of the upstream database instance tables is similar to MySQL replication-rules-db/tables, which can be used to filter or only migrate all operations of some databases or some tables.

Parameter configuration

```
block-allow-list:          # Use black-white-list if the DM version is
  ↪ earlier than or equal to v2.0.0-beta.2.
rule-1:
  do-dbs: ["test*"]        # Starting with characters other than "~"
  ↪ indicates that it is a wildcard;
  # v1.0.5 or later versions support the regular
  ↪ expression rules.
  do-tables:
  - db-name: "test[123]"  # Matches test1, test2, and test3.
    tbl-name: "t[1-5]"    # Matches t1, t2, t3, t4, and t5.
  - db-name: "test"
    tbl-name: "t"
rule-2:
  do-dbs: ["~^test.*"]    # Starting with "~" indicates that it is a
  ↪ regular expression.
  ignore-dbs: ["mysql"]
```

```
do-tables:
- db-name: "~^test.*"
  tbl-name: "~^t.*"
- db-name: "test"
  tbl-name: "t"
ignore-tables:
- db-name: "test"
  tbl-name: "log"
```

Parameter explanation

- **do-dbs**: allow lists of the schemas to be migrated, similar to [replicate-do-db](#) in MySQL
- **ignore-dbs**: block lists of the schemas to be migrated, similar to [replicate-ignore](#) ↔ **-db** in MySQL
- **do-tables**: allow lists of the tables to be migrated, similar to [replicate-do-table](#) in MySQL. Both **db-name** and **tbl-name** must be specified
- **ignore-tables**: block lists of the tables to be migrated, similar to [replicate-ignore](#) ↔ **-table** in MySQL. Both **db-name** and **tbl-name** must be specified

If a value of the above parameters starts with the ~ character, the subsequent characters of this value are treated as a [regular expression](#). You can use this parameter to match schema or table names.

Filtering process

The filtering rules corresponding to **do-dbs** and **ignore-dbs** are similar to the [Evaluation of Database-Level Replication and Binary Logging Options](#) in MySQL. The filtering rules corresponding to **do-tables** and **ignore-tables** are similar to the [Evaluation of Table-Level Replication Options](#) in MySQL.

Note:

In DM and in MySQL, the allow and block lists filtering rules are different in the following ways:

- In MySQL, [replicate-wild-do-table](#) and [replicate-wild-ignore](#) ↔ **table** support wildcard characters. In DM, some parameter values directly supports regular expressions that start with the ~ character.
- DM currently only supports binlogs in the ROW format, and does not support those in the STATEMENT or MIXED format. Therefore, the filtering rules in DM correspond to those in the ROW format in MySQL.

- MySQL determines a DDL statement only by the database name explicitly specified in the `USE` section of the statement. DM determines a statement first based on the database name section in the DDL statement. If the DDL statement does not contain such a section, DM determines the statement by the `USE` section. Suppose that the SQL statement to be determined is `USE test_db_2; CREATE TABLE test_db_1.test_table (c1 INT PRIMARY KEY);` that `replicate-do-db=test_db_1` is configured in MySQL and `do-dbs: ["test_db_1"]` is configured in DM. Then this rule only applies to DM and not to MySQL.

The filtering process is as follows:

1. Filter at the schema level:

- If `do-dbs` is not empty, judge whether a matched schema exists in `do-dbs`.
 - If yes, continue to filter at the table level.
 - If not, filter `test.t`.
- If `do-dbs` is empty and `ignore-dbs` is not empty, judge whether a matched schema exists in `ignore-dbs`.
 - If yes, filter `test.t`.
 - If not, continue to filter at the table level.
- If both `do-dbs` and `ignore-dbs` are empty, continue to filter at the table level.

2. Filter at the table level:

1. If `do-tables` is not empty, judge whether a matched table exists in `do-tables`.
 - If yes, migrate `test.t`.
 - If not, filter `test.t`.
2. If `ignore-tables` is not empty, judge whether a matched table exists in `ignore`
`↪ -tables`.
 - If yes, filter `test.t`.
 - If not, migrate `test.t`.
3. If both `do-tables` and `ignore-tables` are empty, migrate `test.t`.

Note:

To judge whether the schema `test` should be filtered, you only need to filter at the schema level.

Usage example

Assume that the upstream MySQL instances include the following tables:

```

`logs`.`messages_2016`
`logs`.`messages_2017`
`logs`.`messages_2018`
`forum`.`users`
`forum`.`messages`
`forum_backup_2016`.`messages`
`forum_backup_2017`.`messages`
`forum_backup_2018`.`messages`

```

The configuration is as follows:

```

block-allow-list: # Use black-white-list if the DM version is earlier than
↳ or equal to v2.0.0-beta.2.
bw-rule:
  do-dbs: ["forum_backup_2018", "forum"]
  ignore-dbs: ["~^forum_backup_"]
  do-tables:
    - db-name: "logs"
      tbl-name: "~_2018$"
    - db-name: "~^forum.*"
      tbl-name: "messages"
  ignore-tables:
    - db-name: "~.*"
      tbl-name: "^messages.*"

```

After using the bw-rule rule:

Table	Whether to filter	Why filter
logs	Yes	The schema
↳ .messages_2016		fails to match any do-dbs.
↳		
logs	Yes	The schema
↳ .messages_2017		fails to match any do-dbs.
↳		
logs	Yes	The schema
↳ .messages_2018		fails to match any do-dbs.
↳		

		Whether to
Table	filter	Why filter
forum_backup_2016	No	1. The schema forum_backup_2016
↪	.messages	↪ fails to
↪		match any do-dbs.
forum_backup_2017	No	1. The schema forum_backup_2017
↪	.messages	↪ fails to
↪		match any do-dbs.
forum	Yes	1. The schema forum matches do-dbs and continues to filter at the table level. 2. The schema and table fail to match any of do-tables and ignore-tables and do-tables is not empty.
↪	.users	
↪		
forum	No	1. The schema forum matches do-dbs and continues to filter at the table level. 2. The table messages is in the db-name: "~^
↪	.messages	↪ forum.*",
↪		↪ tbl-name:
		↪ "messages"
		of do-tables.

Table	filter	Whether to filter	Why filter
forum_backup_2018	.messages	↔	The schema matches forum_backup_2018
		↔	do-dbs and continues to filter at the table level. 2.
			The schema and table match the db-name: "~^↔ forum.*",
			↔ tbl-name:↔ "messages" of do-tables.

Binlog event filter

Binlog event filter is a more fine-grained filtering rule than the block and allow lists filtering rule. You can use statements like `INSERT` or `TRUNCATE TABLE` to specify the binlog events of `schema/table` that you need to migrate or filter out.

Note:

- If the same table matches multiple rules, these rules are applied in order and the block list has priority over the allow list. This means if both the Ignore and Do rules are applied to a table, the Ignore rule takes effect.
- Starting from DM v2.0.2, you can configure binlog event filters in the source configuration file. For details, see [Upstream Database Configuration File](#).

Parameter configuration

```
filters:
  rule-1:
    schema-pattern: "test_*"
    table-pattern: "t_*"
    events: ["truncate table", "drop table"]
    sql-pattern: ["^DROP\\s+PROCEDURE", "^CREATE\\s+PROCEDURE"]
    action: Ignore
```

Parameter explanation

- **schema-pattern/table-pattern**: the binlog events or DDL SQL statements of upstream MySQL or MariaDB instance tables that match **schema-pattern/table-pattern** are filtered by the rules below.
- **events**: the binlog event array. You can only select one or more Events from the following table:

Events	Type	Description
all		Includes all the events below
all dml		Includes all DML events below
all ddl		Includes all DDL events below
none		Includes none of the events below
none ddl		Includes none of the DDL events below
none dml		Includes none of the DML events below
insert	DML	The INSERT DML event
update	DML	The UPDATE DML event
delete	DML	The DELETE DML event
create database	DDL	The CREATE DATABASE DDL event
drop database	DDL	The DROP DATABASE DDL event
create table	DDL	The CREATE TABLE DDL event
create index	DDL	The CREATE INDEX DDL event
drop table	DDL	The DROP TABLE DDL event
truncate table	DDL	The TRUNCATE TABLE DDL event
rename table	DDL	The RENAME TABLE DDL event
drop index	DDL	The DROP INDEX DDL event
alter table	DDL	The ALTER TABLE DDL event

- **sql-pattern**: it is used to filter specified DDL SQL statements. The matching rule supports using a regular expression. For example, "`^DROP\\s+PROCEDURE`".
- **action**: the string (Do/Ignore). Based on the following rules, it judges whether to filter. If either of the two rules is satisfied, the binlog is filtered; otherwise, the binlog is not filtered.
 - **Do**: the allow list. The binlog is filtered in either of the following two conditions:
 - * The type of the event is not in the **event** list of the rule.
 - * The SQL statement of the event cannot be matched by **sql-pattern** of the rule.
 - **Ignore**: the block list. The binlog is filtered in either of the following two conditions:
 - * The type of the event is in the **event** list of the rule.
 - * The SQL statement of the event can be matched by **sql-pattern** of the rule.

Usage examples

This section shows the usage examples in the scenario of sharding (sharded schemas and tables).

Filter all sharding deletion operations

To filter out all deletion operations, configure the following two filtering rules:

- `filter-table-rule` filters out the `truncate table`, `drop table` and `delete` \rightarrow `statement` operations of all tables that match the `test_*.t_*` pattern.
- `filter-schema-rule` filters out the `drop database` operation of all schemas that match the `test_*` pattern.

```
filters:
  filter-table-rule:
    schema-pattern: "test_*"
    table-pattern: "t_*"
    events: ["truncate table", "drop table", "delete"]
    action: Ignore
  filter-schema-rule:
    schema-pattern: "test_*"
    events: ["drop database"]
    action: Ignore
```

Only migrate sharding DML statements

To only migrate sharding DML statements, configure the following two filtering rules:

- `do-table-rule` only migrates the `create table`, `insert`, `update` and `delete` statements of all tables that match the `test_*.t_*` pattern.
- `do-schema-rule` only migrates the `create database` statement of all schemas that match the `test_*` pattern.

Note:

The reason why the `create database/table` statement is migrated is that you can migrate DML statements only after the schema and table are created.

```
filters:
  do-table-rule:
    schema-pattern: "test_*"
    table-pattern: "t_*
```

```
events: ["create table", "all dml"]
action: Do
do-schema-rule:
  schema-pattern: "test_*"
  events: ["create database"]
  action: Do
```

Filter out the SQL statements that TiDB does not support

To filter out the PROCEDURE statements that TiDB does not support, configure the following `filter-procedure-rule`:

```
filters:
  filter-procedure-rule:
    schema-pattern: "test_*"
    table-pattern: "t_*"
    sql-pattern: ["^DROP\\s+PROCEDURE", "^CREATE\\s+PROCEDURE"]
    action: Ignore
```

`filter-procedure-rule` filters out the `^CREATE\\s+PROCEDURE` and `^DROP\\s+PROCEDURE` statements of all tables that match the `test_*.t_*` pattern.

Filter out the SQL statements that the TiDB parser does not support

For the SQL statements that the TiDB parser does not support, DM cannot parse them and get the `schema/table` information. So you must use the global filtering rule: `schema-pattern: "*" .`

Note:

To avoid filtering out data that need to be migrated, you must configure the global filtering rule as strictly as possible.

To filter out the PARTITION statements that the TiDB parser (of some version) does not support, configure the following filtering rule:

```
filters:
  filter-partition-rule:
    schema-pattern: "*"
    sql-pattern: ["ALTER\\s+TABLE[\\s\\S]*ADD\\s+PARTITION", "ALTER\\s+TABLE
    ↪ [\\s\\S]*DROP\\s+PARTITION"]
    action: Ignore
```

Online DDL tools

In the MySQL ecosystem, tools such as gh-ost and pt-osc are widely used. DM provides supports for these tools to avoid migrating unnecessary intermediate data.

Restrictions

- DM only supports gh-ost and pt-osc.
- When `online-ddl` is enabled, the checkpoint corresponding to incremental replication should not be in the process of online DDL execution. For example, if an upstream online DDL operation starts at `position-A` and ends at `position-B` of the binlog, the starting point of incremental replication should be earlier than `position-A` or later than `position-B`; otherwise, an error occurs. For details, refer to [FAQ](#).

Parameter configuration

In v2.0.5 and later versions, you need to use the `online-ddl` configuration item in the `task` configuration file.

- If the upstream MySQL/MariaDB (at the same time) uses the gh-ost or pt-osc tool, set `online-ddl` to `true` in the task configuration file:

```
online-ddl: true
```

Note:

Since v2.0.5, `online-ddl-scheme` has been deprecated, so you need to use `online-ddl` instead of `online-ddl-scheme`. That means that setting `online`
↪ `-ddl: true` overwrites `online-ddl-scheme`, and setting `online-ddl-`
↪ `scheme: "pt"` or `online-ddl-scheme: "gh-ost"` is converted to `online`
↪ `-ddl: true`.

Before v2.0.5 (not including v2.0.5), you need to use the `online-ddl-scheme` configuration item in the `task` configuration file.

- If the upstream MySQL/MariaDB uses the gh-ost tool, set it in the task configuration file:

```
online-ddl-scheme: "gh-ost"
```

- If the upstream MySQL/MariaDB uses the pt tool, set it in the task configuration file:

```
online-ddl-scheme: "pt"
```

Shard merge

DM supports merging the DML and DDL data in the upstream MySQL/MariaDB sharded tables and migrating the merged data to the downstream TiDB tables.

Restrictions

Currently, the shard merge feature is supported only in limited scenarios. For details, refer to [Sharding DDL usage Restrictions in the pessimistic mode](#) and [Sharding DDL usage Restrictions in the optimistic mode](#).

Parameter configuration

Set `shard-mode` to `pessimistic` in the task configuration file:

```
shard-mode: "pessimistic" # The shard merge mode. Optional modes are ""/"
↳ pessimistic"/"optimistic". The "" mode is used by default which means
↳ sharding DDL merge is disabled. If the task is a shard merge task,
↳ set it to the "pessimistic" mode. After getting a deep understanding
↳ of the principles and restrictions of the "optimistic" mode, you can
↳ set it to the "optimistic" mode.
```

Handle sharding DDL locks manually

In some abnormal scenarios, you need to [handle sharding DDL Locks manually](#).

11.9.1.3 Advanced Features

11.9.1.3.1 Merge and Migrate Data from Sharded Tables

Merge and Migrate Data from Sharded Tables

This document introduces the sharding support feature provided by Data Migration (DM). This feature allows you to merge and migrate the data of tables with the same or different table schemas in the upstream MySQL or MariaDB instances into one same table in the downstream TiDB. It supports not only migrating the upstream DML statements, but also coordinating to migrate the table schema change using DDL statements in multiple upstream sharded tables.

Overview

DM supports merging and migrating the data of multiple upstream sharded tables into one table in TiDB. During the migration, the DDL of each sharded table, and the DML before and after the DDL need to be coordinated. For the usage scenarios, DM supports two different modes: pessimistic mode and optimistic mode.

Note:

- To merge and migrate data from sharded tables, you must set `shard-↔ mode` in the task configuration file.
- DM uses the pessimistic mode by default for the merge of the sharding support feature. (If there is no special description in the document, use the pessimistic mode by default.)
- It is not recommended to use this mode if you do not understand the principles and restrictions of the optimistic mode. Otherwise, it may cause serious consequences such as migration interruption and even data inconsistency.

The pessimistic mode

When an upstream sharded table executes a DDL statement, the migration of this sharded table will be suspended. After all other sharded tables execute the same DDL, the DDL will be executed in the downstream and the data migration task will restart. The advantage of this mode is that it can ensure that the data migrated to the downstream will not go wrong. For details, refer to [shard merge in pessimistic mode](#). ##### The optimistic mode

DM will automatically modify the DDL executed on a sharded table into a statement compatible with other sharded tables, and then migrate to the downstream. This will not block the DML migration of any sharded tables. The advantage of this mode is that it will not block data migration when processing DDL. However, improper use will cause migration interruption or even data inconsistency. For details, refer to [shard merge in optimistic mode](#).

Contrast

Pessimistic mode	Optimistic mode
Sharded tables that executes DDL suspend DML migration	Sharded tables that executes DDL continue DML migration

Pessimistic mode	Optimistic mode
The DDL execution order and statements of each sharded table must be the same	Each sharded table only needs to keep the table schema compatible with each other
The DDL is migrated to the downstream after the entire shard group is consistent	The DDL of each sharded table immediately affects the downstream
Wrong DDL operations can be intercepted after the detection	Wrong DDL operations will be migrated to the downstream, which may cause inconsistency between the upstream and downstream data before the detection

Merge and Migrate Data from Sharded Tables in the Pessimistic Mode

This document introduces the sharding support feature provided by Data Migration (DM) in the pessimistic mode (the default mode). This feature allows you to merge and migrate the data of tables with the same table schema in the upstream MySQL or MariaDB instances into one same table in the downstream TiDB.

Restrictions

DM has the following sharding DDL usage restrictions in the pessimistic mode:

- For a logical **sharding group** (composed of all sharded tables that need to be merged and migrated into one same downstream table), it is limited to use one task containing

exactly the sources of sharded tables to perform the migration.

- In a logical **sharding group**, the same DDL statements must be executed in the same order in all upstream sharded tables (the schema name and the table name can be different), and the next DDL statement cannot be executed unless the current DDL operation is completely finished.
 - For example, if you add `column A` to `table_1` before you add `column B`, then you cannot add `column B` to `table_2` before you add `column A`. Executing the DDL statements in a different order is not supported.
- In a sharding group, the corresponding DDL statements should be executed in all upstream sharded tables.
 - For example, if DDL statements are not executed on one or more upstream sharded tables corresponding to `DM-worker-2`, then other DM-workers that have executed the DDL statements pause their migration task and wait for `DM-worker` ↪ `-2` to receive the upstream DDL statements.
- The sharding group migration task does not support `DROP DATABASE/DROP TABLE`.
 - The sync unit in DM-worker automatically ignores the `DROP DATABASE/DROP` ↪ `TABLE` statement of upstream sharded tables.
- The sharding group migration task does not support `TRUNCATE TABLE`.
 - The sync unit in DM-worker automatically ignores the `TRUNCATE TABLE` statement of upstream sharded tables.
- The sharding group migration task supports `RENAME TABLE`, but with the following limitations (online DDL is supported in another solution):
 - A table can only be renamed to a new name that is not used by any other table.
 - A single `RENAME TABLE` statement can only involve a single `RENAME` operation.
- The sharding group migration task requires each DDL statement to involve operations on only one table.
- The table schema of each sharded table must be the same at the starting point of the incremental replication task, so as to make sure the DML statements of different sharded tables can be migrated into the downstream with a definite table schema, and the subsequent sharding DDL statements can be correctly matched and migrated.
- If you need to change the **table routing** rule, you have to wait for the migration of all sharding DDL statements to complete.
 - During the migration of sharding DDL statements, an error is reported if you use `dmctl` to change `router-rules`.
- If you need to `CREATE` a new table to a sharding group where DDL statements are being executed, you have to make sure that the table schema is the same as the newly modified table schema.

- For example, both the original `table_1` and `table_2` have two columns (a, b) initially, and have three columns (a, b, c) after the sharding DDL operation, so after the migration the newly created table should also have three columns (a, b, c).
- Because the DM-worker that has received the DDL statements will pause the task to wait for other DM-workers to receive their DDL statements, the delay of data migration will be increased.

Background

Currently, DM uses the binlog in the ROW format to perform the migration task. The binlog does not contain the table schema information. When you use the ROW binlog to migrate data, if you have not migrated multiple upstream tables into the same downstream table, then there only exist DDL operations of one upstream table that can update the table schema of the downstream table. The ROW binlog can be considered to have the nature of self-description. During the migration process, the DML statements can be constructed accordingly with the column values and the downstream table schema.

However, in the process of merging and migrating sharded tables, if DDL statements are executed on the upstream tables to modify the table schema, then you need to perform extra operations to migrate the DDL statements so as to avoid the inconsistency between the DML statements produced by the column values and the actual downstream table schema.

Here is a simple example:

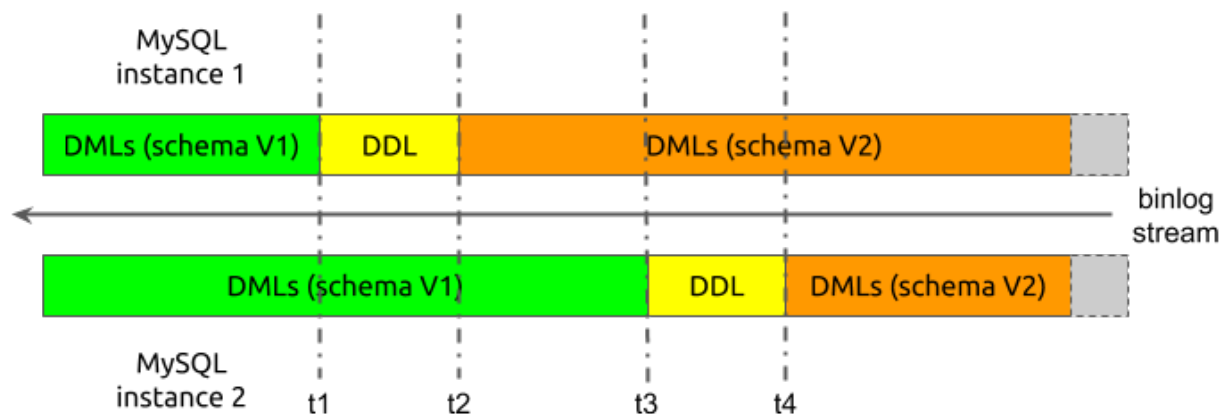

Figure 166: shard-ddl-example-1

In the above example, the merging process is simplified, where only two MySQL instances exist in the upstream and each instance has only one table. When the migration begins, the table schema version of two sharded tables is marked as `schema V1`, and the table schema version after executing DDL statements is marked as `schema V2`.

Now assume that in the migration process, the binlog data received from the two upstream sharded tables has the following time sequence:

1. When the migration begins, the sync unit in DM-worker receives the DML events of `schema V1` from the two sharded tables.
2. At t_1 , the sharding DDL events from instance 1 are received.
3. From t_2 on, the sync unit receives the DML events of `schema V2` from instance 1; but from instance 2, it still receives the DML events of `schema V1`.
4. At t_3 , the sharding DDL events from instance 2 are received.
5. From t_4 on, the sync unit receives the DML events of `schema V2` from instance 2 as well.

Assume that the DDL statements of sharded tables are not processed during the migration process. After DDL statements of instance 1 are migrated to the downstream, the downstream table schema is changed to `schema V2`. But for instance 2, the sync unit in DM-worker is still receiving DML events of `schema V1` from t_2 to t_3 . Therefore, when the DML statements of `schema V1` are migrated to the downstream, the inconsistency between the DML statements and the table schema can cause errors and the data cannot be migrated successfully.

Principles

This section shows how DM migrates DDL statements in the process of merging sharded tables based on the above example in the pessimistic mode.

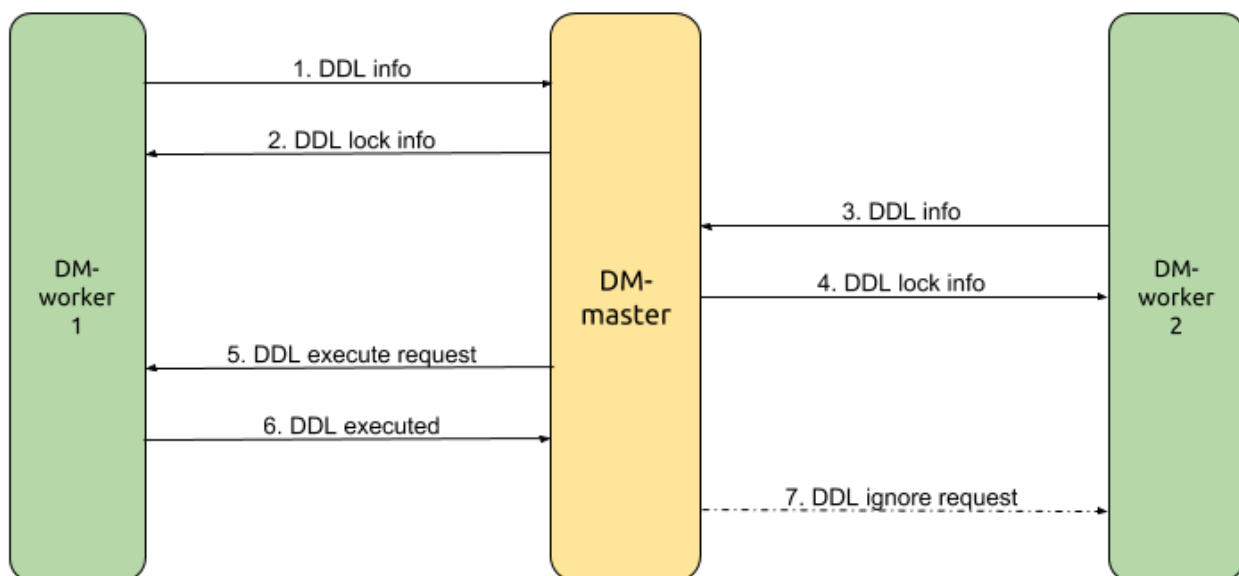

Figure 167: shard-ddl-flow

In this example, `DM-worker-1` migrates the data from MySQL instance 1 and `DM-worker-2` migrates the data from MySQL instance 2. `DM-master` coordinates the DDL migration

among multiple DM-workers. Starting from **DM-worker-1** receiving the DDL statements, the DDL migration process is simplified as follows:

1. **DM-worker-1** receives the DDL statement from MySQL instance 1 at t_1 , pauses the data migration of the corresponding DDL and DML statements, and sends the DDL information to **DM-master**.
2. **DM-master** decides that the migration of this DDL statement needs to be coordinated based on the received DDL information, creates a lock for this DDL statement, sends the DDL lock information back to **DM-worker-1** and marks **DM-worker-1** as the owner of this lock at the same time.
3. **DM-worker-2** continues migrating the DML statement until it receives the DDL statement from MySQL instance 2 at t_3 , pauses the data migration of this DDL statement, and sends the DDL information to **DM-master**.
4. **DM-master** decides that the lock of this DDL statement already exists based on the received DDL information, and sends the lock information directly to **DM-worker-2**.
5. Based on the configuration information when the task is started, the sharded table information in the upstream MySQL instances, and the deployment topology information, **DM-master** decides that it has received this DDL statement of all upstream sharded tables to be merged, and requests the owner of the DDL lock (**DM-worker-1**) to migrate this DDL statement to the downstream.
6. **DM-worker-1** verifies the DDL statement execution request based on the DDL lock information received at Step #2, migrates this DDL statement to the downstream, and sends the results to **DM-master**. If this operation is successful, **DM-worker-1** continues migrating the subsequent (starting from the binlog at t_2) DML statements.
7. **DM-master** receives the response from the lock owner that the DDL is successfully executed, and requests all other DM-workers (**DM-worker-2**) that are waiting for the DDL lock to ignore this DDL statement and then continue to migrate the subsequent (starting from the binlog at t_4) DML statements.

The characteristics of DM handling the sharding DDL migration among multiple DM-workers can be concluded as follows:

- Based on the task configuration and DM cluster deployment topology information, a logical sharding group is built in **DM-master** to coordinate DDL migration. The group members are DM-workers that handle each sub-task divided from the migration task).
- After receiving the DDL statement from the binlog event, each DM-worker sends the DDL information to **DM-master**.
- **DM-master** creates or updates the DDL lock based on the DDL information received from each DM-worker and the sharding group information.
- If all members of the sharding group receive a same specific DDL statement, this indicates that all DML statements before the DDL execution on the upstream sharded tables have been completely migrated, and this DDL statement can be executed. Then DM can continue to migrate the subsequent DML statements.

- After being converted by the **table router**, the DDL statement of the upstream sharded tables must be consistent with the DDL statement to be executed in the downstream. Therefore, this DDL statement only needs to be executed once by the DDL owner and all other DM-workers can ignore this DDL statement.

In the above example, only one sharded table needs to be merged in the upstream MySQL instance corresponding to each DM-worker. But in actual scenarios, there might be multiple sharded tables in multiple sharded schemas to be merged in one MySQL instance. And when this happens, it becomes more complex to coordinate the sharding DDL migration.

Assume that there are two sharded tables, namely `table_1` and `table_2`, to be merged in one MySQL instance:

Figure 168: shard-ddl-example-2

Because data comes from the same MySQL instance, all the data is obtained from the same binlog stream. In this case, the time sequence is as follows:

1. The sync unit in DM-worker receives the DML statements of `schema V1` from both sharded tables when the migration begins.
2. At `t1`, the sync unit in DM-worker receives the DDL statements of `table_1`.
3. From `t2` to `t3`, the received data includes the DML statements of `schema V2` from `table_1` and the DML statements of `schema V1` from `table_2`.
4. At `t3`, the sync unit in DM-worker receives the DDL statements of `table_2`.
5. From `t4` on, the sync unit in DM-worker receives the DML statements of `schema V2` from both tables.

If the DDL statements are not processed particularly during the data migration, when the DDL statement of `table_1` is migrated to the downstream and changes the downstream table schema, the DML statement of `schema V1` from `table_2` cannot be migrated successfully. Therefore, within a single DM-worker, a logical sharding group similar to that within `DM-master` \leftrightarrow `master` is created, except that members of this group are different sharded tables in the same upstream MySQL instance.

But when a DM-worker coordinates the migration of the sharding group within itself, it is not totally the same as that performed by `DM-master`. The reasons are as follows:

- When the DM-worker receives the DDL statement of `table_1`, it cannot pause the migration and needs to continue parsing the binlog to get the subsequent DDL statements of `table_2`. This means it needs to continue parsing between `t2` and `t3`.
- During the binlog parsing process between `t2` and `t3`, the DML statements of `schema V2` from `table_1` cannot be migrated to the downstream until the sharding DDL statement is migrated and successfully executed.

In DM, the simplified migration process of sharding DDL statements within the DM worker is as follows:

1. When receiving the DDL statement of `table_1` at `t1`, the DM-worker records the DDL information and the current position of the binlog.
2. DM-worker continues parsing the binlog between `t2` and `t3`.
3. DM-worker ignores the DML statement with the `schema V2` schema that belongs to `table_1`, and migrates the DML statement with the `schema V1` schema that belongs to `table_2` to the downstream.
4. When receiving the DDL statement of `table_2` at `t3`, the DM-worker records the DDL information and the current position of the binlog.
5. Based on the information of the migration task configuration and the upstream schemas and tables, the DM-worker decides that the DDL statements of all sharded tables in the MySQL instance have been received and migrates them to the downstream to modify the downstream table schema.
6. DM-worker sets the starting point of parsing the new binlog stream to be the position saved at Step #1.
7. DM-worker resumes parsing the binlog between `t2` and `t3`.
8. DM-worker migrates the DML statement with the `schema V2` schema that belongs to `table_1` to the downstream, and ignores the DML statement with the `schema V1` schema that belongs to `table_2`.
9. After parsing the binlog position saved at Step #4, the DM-worker decides that all DML statements that have been ignored in Step #3 have been migrated to the downstream again.
10. DM-worker resumes the migration starting from the binlog position at `t4`.

You can conclude from the above analysis that DM mainly uses two-level sharding groups for coordination and control when handling migration of the sharding DDL. Here is the simplified process:

1. Each DM-worker independently coordinates the DDL statements migration for the corresponding sharding group composed of multiple sharded tables within the upstream MySQL instance.
2. After the DM-worker receives the DDL statements of all sharded tables, it sends the DDL information to `DM-master`.
3. `DM-master` coordinates the DDL migration of the sharding group composed of the DM-workers based on the received DDL information.

4. After receiving the DDL information from all DM-workers, **DM-master** requests the DDL lock owner (a specific DM-worker) to execute the DDL statement.
5. The DDL lock owner executes the DDL statement and returns the result to **DM-master** \leftrightarrow . Then the owner restarts the migration of the previously ignored DML statements during the internal coordination of DDL migration.
6. After **DM-master** confirms that the owner has successfully executed the DDL statement, it asks all other DM-workers to continue the migration.
7. All other DM-workers separately restart the migration of the previously ignored DML statements during the internal coordination of DDL migration.
8. After finishing migrating the ignored DML statements again, all DM-workers resume the normal migration process.

Merge and Migrate Data from Sharded Tables in Optimistic Mode

This document introduces the sharding support feature provided by Data Migration (DM) in the optimistic mode. This feature allows you to merge and migrate the data of tables with the same or different table schema(s) in the upstream MySQL or MariaDB instances into one same table in the downstream TiDB.

Note:

If you do not have an in-depth understanding of the optimistic mode and its restrictions, it is **NOT** recommended to use this mode. Otherwise, migration interruption or even data inconsistency might occur.

Background

DM supports executing DDL statements on sharded tables online, which is called sharding DDL, and uses the “pessimistic mode” by default. In this mode, when a DDL statement is executed in an upstream sharded table, data migration of this table is paused until the same DDL statement is executed in all other sharded tables. Only by then this DDL statement is executed in the downstream and data migration resumes.

The pessimistic mode guarantees that the data migrated to the downstream is always correct, but it pauses the data migration, which is bad for making A/B changes in the upstream. In some cases, users might spend a long time executing DDL statements in a single sharded table and change the schemas of other sharded tables only after a period of validation. In the pessimistic mode, these DDL statements block data migration and cause many binlog events to pile up.

Therefore, an “optimistic mode” is needed. In this mode, a DDL statement executed on a sharded table is automatically converted to a statement that is compatible with other sharded tables, and then immediately migrated to the downstream. In this way, the DDL statement does not block any sharded table from executing DML migration.

Configuration of the optimistic mode

To use the optimistic mode, specify the `shard-mode` item in the task configuration file as `optimistic`. For the detailed sample configuration file, see [DM Advanced Task Configuration File](#).

Restrictions

It takes some risks to use the optimistic mode. Follow these rules when you use it:

- Ensure that the schema of every sharded table is consistent with each other before and after you execute a batch of DDL statements.
- If you perform an A/B test, perform the test **ONLY** on one sharded table.
- After the A/B test is finished, migrate only the most direct DDL statement(s) to the final schema. Do not re-execute every right or wrong step of the test.

For example, if you have executed `ADD COLUMN A INT; DROP COLUMN A; ADD COLUMN A ↔ A FLOAT`; in a sharded table, you only need to execute `ADD COLUMN A FLOAT` in other sharded tables. You do not need to execute all of the three DDL statements again.

- Observe the status of the DM migration when executing the DDL statement. When an error is reported, you need to determine whether this batch of DDL statements will cause data inconsistency.

Currently, the following statements are not supported in the optimistic mode:

- `ALTER TABLE table_name ADD COLUMN column_name datatype NOT NULL` (To add a NOT NULL column without a default value).
- `ALTER TABLE table_name ADD COLUMN column_name datetime DEFAULT NOW()` (To add a column with a varying value).
- `ALTER TABLE table_name ADD COLUMN col1 INT, DROP COLUMN col2` (Contains both `ADD COLUMN` and `DROP COLUMN` in one DDL statement).
- `ALTER TABLE table_name RENAME COLUMN column_1 TO column_2`; (To rename a column).
- `ALTER TABLE table_name RENAME INDEX index_1 TO index_2`; (To rename an index).

In addition, the following restrictions apply to both the optimistic mode and the pessimistic mode:

- In an incremental replication task, ensure that each sharded table's schema that corresponds to the binlog position at the start of the task is consistent with each other.
- The new table added to a sharding group must have a consistent table schema with that of other members. The `CREATE/RENAME TABLE` statement is forbidden when a batch of DDL statements is being executed.

- `DROP TABLE` or `DROP DATABASE` is not supported.
- `TRUNCATE TABLE` is not supported.
- Each DDL statement must involve operations on only one table.
- The DDL statement that is not supported in TiDB is also not supported in DM.
- The default value of a newly added column must not contain `current_timestamp` \leftrightarrow , `rand()`, `uuid()`; otherwise, data inconsistency between the upstream and the downstream might occur.

Risks

When you use the optimistic mode for a migration task, a DDL statement is migrated to the downstream immediately. If this mode is misused, data inconsistency between the upstream and the downstream might occur.

Operations that cause data inconsistency

- The schema of each sharded table is incompatible with each other. For example:
 - Two columns of the same name are added to two sharded tables respectively, but the columns are of different types.
 - Two columns of the same name are added to two sharded tables respectively, but the columns have different default values.
 - Two generated columns of the same name are added to two sharded tables respectively, but the columns are generated using different expressions.
 - Two indexes of the same name are added to two sharded tables respectively, but the keys are different.
 - Other different table schemas with the same name.
- Execute the DDL statement that can corrupt data in the sharded table and then try to roll back.

For example, drop a column X and then add this column back.

Example

Merge and migrate the following three sharded tables to TiDB:

tbl00		tbl01		tbl02		tbl	
ID	Name	ID	Name	ID	Name	ID	Name
1	Sarah	12	Paul	23	Bob	1	Sarah
5	Sophia	16	Jessica	24	Ben	5	Sophia
		19	Shaun			12	Paul
						16	Jessica
						19	Shaun
						23	Bob
						24	Ben

Figure 169: optimistic-ddl-fail-example-1

Add a new column `Age` in `tbl01` and set the default value of the column to 0:

```
ALTER TABLE `tbl01` ADD COLUMN `Age` INT DEFAULT 0;
```

tbl00		tbl01			tbl02		tbl		
ID	Name	ID	Name	Age	ID	Name	ID	Name	Age
1	Sarah	12	Paul	0	23	Bob	1	Sarah	0
5	Sophia	16	Jessica	0	24	Ben	5	Sophia	0
		19	Shaun	0			12	Paul	0
							16	Jessica	0
							19	Shaun	0
							23	Bob	0
							24	Ben	0

Figure 170: optimistic-ddl-fail-example-2

Add a new column `Age` in `tbl00` and set the default value of the column to -1:

```
ALTER TABLE `tbl00` ADD COLUMN `Age` INT DEFAULT -1;
```

tbl00			tbl01			tbl02		tbl		
ID	Name	Age	ID	Name	Age	ID	Name	ID	Name	Age
1	Sarah	-1	12	Paul	0	23	Bob	1	Sarah	0
5	Sophia	-1	16	Jessica	0	24	Ben	5	Sophia	0
			19	Shaun	0			12	Paul	0
								16	Jessica	0
								19	Shaun	0
								23	Bob	0
								24	Ben	0

Figure 171: optimistic-ddl-fail-example-3

By then, the `Age` column of `tbl00` is inconsistent because `DEFAULT 0` and `DEFAULT -1` are incompatible with each other. In this situation, DM will report the error, but you have to manually fix the data inconsistency.

Implementation principle

In the optimistic mode, after DM-worker receives the DDL statement from the upstream, it forwards the updated table schema to DM-master. DM-worker tracks the current schema of each sharded table, and DM-master merges these schemas into a composite schema that is compatible with DML statements of every sharded table. Then DM-master migrates the corresponding DDL statement to the downstream. DML statements are directly migrated to the downstream.

Figure 172: optimistic-ddl-flow

Examples

Assume the upstream MySQL has three sharded tables (`tbl00`, `tbl01`, and `tbl02`). Merge and migrate these sharded tables to the `tbl1` table in the downstream TiDB. See the following image:

tbl00		tbl01		tbl02		tbl	
ID	Name	ID	Name	ID	Name	ID	Name
1	Sarah	12	Paul	23	Bob	1	Sarah
5	Sophia	16	Jessica	24	Ben	5	Sophia
		19	Shaun			12	Paul
						16	Jessica
						19	Shaun
						23	Bob
						24	Ben

Figure 173: optimistic-ddl-example-1

Add a `Level` column in the upstream:

```
ALTER TABLE `tbl00` ADD COLUMN `Level` INT;
```

tbl00			tbl01		tbl02		tbl	
ID	Name	Level	ID	Name	ID	Name	ID	Name
1	Sarah	NULL	12	Paul	23	Bob	1	Sarah
5	Sophia	NULL	16	Jessica	24	Ben	5	Sophia
			19	Shaun			12	Paul
							16	Jessica
							19	Shaun
							23	Bob
							24	Ben

Figure 174: optimistic-ddl-example-2

Then TiDB will receive the DML statement from `tbl00` (with the `Level` column) and the DML statement from the `tbl01` and `tbl02` tables (without the `Level` column).

tbl00			tbl01		tbl02		tbl		
ID	Name	Level	ID	Name	ID	Name	ID	Name	Level
1	Sarah	NULL	12	Paul	23	Bob	1	Sarah	NULL
5	Sophia	NULL	16	Jessica	24	Ben	5	Sophia	NULL
			19	Shaun			12	Paul	NULL
							16	Jessica	NULL
							19	Shaun	NULL
							23	Bob	NULL
							24	Ben	NULL

Figure 175: optimistic-ddl-example-3

The following DML statements can be migrated to the downstream without any modification:

```
UPDATE `tbl00` SET `Level` = 9 WHERE `ID` = 1;
INSERT INTO `tbl02` (`ID`, `Name`) VALUES (27, 'Tony');
```

tbl00			tbl01		tbl02		tbl		
ID	Name	Level	ID	Name	ID	Name	ID	Name	Level
1	Sarah	9	12	Paul	23	Bob	1	Sarah	9
5	Sophia	NULL	16	Jessica	24	Ben	5	Sophia	NULL
			19	Shaun	27	Tony	12	Paul	NULL
							16	Jessica	NULL
							19	Shaun	NULL
							23	Bob	NULL
							24	Ben	NULL
							27	Tony	NULL

Figure 176: optimistic-ddl-example-4

Also add a Level column in tbl01:

```
ALTER TABLE `tbl01` ADD COLUMN `Level` INT;
```

tbl00			tbl01			tbl02		tbl		
ID	Name	Level	ID	Name	Level	ID	Name	ID	Name	Level
1	Sarah	9	12	Paul	NULL	23	Bob	1	Sarah	9
5	Sophia	NULL	16	Jessica	NULL	24	Ben	5	Sophia	NULL
			19	Shaun	NULL	27	Tony	12	Paul	NULL
								16	Jessica	NULL
								19	Shaun	NULL
								23	Bob	NULL
								24	Ben	NULL
								27	Tony	NULL

Figure 177: optimistic-ddl-example-5

At this time, the downstream already have had the same Level column, so DM-master performs no operation after comparing the table schemas.

Drop a Name column in tbl01:

```
ALTER TABLE `tbl01` DROP COLUMN `Name`;
```

tbl00			tbl01		tbl02		tbl		
ID	Name	Level	ID	Level	ID	Name	ID	Name	Level
1	Sarah	9	12	NULL	23	Bob	1	Sarah	9
5	Sophia	NULL	16	NULL	24	Ben	5	Sophia	NULL
			19	NULL	27	Tony	12	Paul	NULL
							16	Jessica	NULL
							19	Shaun	NULL
							23	Bob	NULL
							24	Ben	NULL
							27	Tony	NULL

Figure 178: optimistic-ddl-example-6

Then the downstream will receive the DML statements from `tbl00` and `tbl02` with the `Name` column, so this column is not immediately dropped.

In the same way, all DML statements can still be migrated to the downstream:

```
INSERT INTO `tbl01` (`ID`, `Level`) VALUES (15, 7);
UPDATE `tbl00` SET `Level` = 5 WHERE `ID` = 5;
```

tbl00			tbl01		tbl02		tbl		
ID	Name	Level	ID	Level	ID	Name	ID	Name	Level
1	Sarah	9	12	NULL	23	Bob	1	Sarah	9
5	Sophia	5	15	7	24	Ben	5	Sophia	5
			16	NULL	27	Tony	12	Paul	NULL
			19	NULL			15	NULL	7
							16	Jessica	NULL
							19	Shaun	NULL
							23	Bob	NULL
							24	Ben	NULL
							27	Tony	NULL

Figure 179: optimistic-ddl-example-7

Add a Level column in tbl02:

```
ALTER TABLE `tbl02` ADD COLUMN `Level` INT;
```

tbl00			tbl01		tbl02			tbl		
ID	Name	Level	ID	Level	ID	Name	Level	ID	Name	Level
1	Sarah	9	12	NULL	23	Bob	NULL	1	Sarah	9
5	Sophia	5	15	7	24	Ben	NULL	5	Sophia	5
			16	NULL	27	Tony	NULL	12	Paul	NULL
			19	NULL				15	NULL	7
								16	Jessica	NULL
								19	Shaun	NULL
								23	Bob	NULL
								24	Ben	NULL
								27	Tony	NULL

Figure 180: optimistic-ddl-example-8

By then, all sharded tables have the `Level` column.

Drop the `Name` columns in `tbl00` and `tbl02` respectively:

```
ALTER TABLE `tbl00` DROP COLUMN `Name`;
ALTER TABLE `tbl02` DROP COLUMN `Name`;
```

tbl00		tbl01		tbl02		tbl		
ID	Level	ID	Level	ID	Level	ID	Name	Level
1	9	12	NULL	23	NULL	1	Sarah	9
5	5	15	7	24	NULL	5	Sophia	5
		16	NULL	27	NULL	12	Paul	NULL
		19	NULL			15	NULL	7
						16	Jessica	NULL
						19	Shaun	NULL
						23	Bob	NULL
						24	Ben	NULL
						27	Tony	NULL

Figure 181: optimistic-ddl-example-9

By then, the `Name` columns are dropped from all sharded tables and can be safely dropped in the downstream:

```
ALTER TABLE `tbl` DROP COLUMN `Name`;
```

tbl00		tbl01		tbl02		tbl	
ID	Level	ID	Level	ID	Level	ID	Level
1	9	12	NULL	23	NULL	1	9
5	5	15	7	24	NULL	5	5
		16	NULL	27	NULL	12	NULL
		19	NULL			15	7
						16	NULL
						19	NULL
						23	NULL
						24	NULL
						27	NULL

Figure 182: optimistic-ddl-example-10

11.9.1.3.2 Migrate from Databases that Use GH-ost/PT-osc

In production scenarios, table locking during DDL execution can block the reads from or writes to the database to a certain extent. Therefore, online DDL tools are often used to execute DDLs to minimize the impact on reads and writes. Common DDL tools are [gh-ost](#) and [pt-osc](#).

When using DM to migrate data from MySQL to TiDB, you can enable `online-ddl` to allow collaboration of DM and `gh-ost` or `pt-osc`. For details about how to enable `online-ddl` and the workflow after enabling this option, see [Continuous Replication with gh-ost or pt-osc](#). This document focuses on the collaboration details of DM and online DDL tools.

Working details for DM with online DDL tools

This section describes the working details for DM with the online DDL tools [gh-ost](#) and [pt-osc](#) when implementing `online-schema-change`.

`online-schema-change`: `gh-ost`

When `gh-ost` implements `online-schema-change`, 3 types of tables are created:

- `gho`: used to apply DDLs. When the data is fully replicated and the `gho` table is consistent with the origin table, the origin table is replaced by renaming.
- `ghc`: used to store information that is related to `online-schema-change`.
- `del`: created by renaming the origin table.

In the process of migration, DM divides the above tables into 3 categories:

- ghostTable: `_ * _gho`
- trashTable: `_ * _ghc, _ * _del`
- realTable: the origin table that executes online-ddl.

The SQL statements mostly used by gh-ost and the corresponding operation of DM are as follows:

1. Create the `_ghc` table:

```
Create /* gh-ost */ table `test`.`_test4_ghc` (  
    id bigint auto_increment,  
    last_update timestamp not null DEFAULT  
        ↪ CURRENT_TIMESTAMP ON UPDATE  
        ↪ CURRENT_TIMESTAMP,  
    hint varchar(64) charset ascii not null,  
    value varchar(4096) charset ascii not null,  
    primary key(id),  
    unique key hint_uidx(hint)  
    ) auto_increment=256 ;
```

DM does not create the `_test4_ghc` table.

2. Create the `_gho` table:

```
Create /* gh-ost */ table `test`.`_test4_gho` like `test`.`test4` ;
```

DM does not create the `_test4_gho` table. DM deletes the `dm_meta.{task_name}_onlineddl` record in the downstream according to `ghost_schema`, `ghost_table`, and the `server_id` of `dm_worker`, and clears the related information in memory.

```
DELETE FROM dm_meta.{task_name}_onlineddl WHERE id = {server_id} and  
    ↪ ghost_schema = {ghost_schema} and ghost_table = {ghost_table};
```

3. Apply the DDL that needs to be executed in the `_gho` table:

```
Alter /* gh-ost */ table `test`.`_test4_gho` add column c11 varchar  
    ↪ (20) not null ;
```

DM does not perform the DDL operation of `_test4_gho`. It records this DDL in `dm_meta.{task_name}_onlineddl` and memory.

```
REPLACE INTO dm_meta.{task_name}_onlineddl (id, ghost_schema ,  
    ↪ ghost_table , ddls) VALUES (.....);
```

4. Write data to the `_ghc` table, and replicate the origin table data to the `_gho` table:

```

Insert /* gh-ost */ into `test`.`_test4_ghc` values (...);
Insert /* gh-ost `test`.`test4` */ ignore into `test`.`_test4_gho` (
  ↪ id`, `date`, `account_id`, `conversion_price`, `
  ↪ ocpc_matched_conversions`, `ad_cost`, `cl2`)
(select `id`, `date`, `account_id`, `conversion_price`, `
  ↪ ocpc_matched_conversions`, `ad_cost`, `cl2` from `test`.`test4`
  ↪ force index (`PRIMARY`)
where (((`id` > _binary'1') or ((`id` = _binary'1')))) and ((`id` <
  ↪ _binary'2') or ((`id` = _binary'2')))) lock in share mode
) ;

```

DM does not execute DML statements that are not for **realtable**.

5. After the migration is completed, both the origin table and `_gho` table are renamed, and the online DDL operation is completed:

```

Rename /* gh-ost */ table `test`.`test4` to `test`.`_test4_del`, `test
  ↪`.`_test4_gho` to `test`.`test4`;

```

DM performs the following two operations:

- DM splits the above rename operation into two SQL statements.

```

rename test.test4 to test._test4_del;
rename test._test4_gho to test.test4;

```

- DM does not execute `rename to _test4_del`. When executing `rename ↪ ghost_table to origin table`, DM takes the following steps:
 - Read the DDL recorded in memory in Step 3
 - Replace `ghost_table` and `ghost_schema` with `origin_table` and its corresponding schema
 - Execute the DDL that has been replaced

```

alter table test._test4_gho add column c1 varchar(20) not null;
-- Replaced with:
alter table test.test4 add column c1 varchar(20) not null;

```

Note:

The specific SQL statements of `gh-ost` vary with the parameters used in the execution. This document only lists the major SQL statements. For more details, refer to the [gh-ost documentation](#).

online-schema-change: pt

When pt-osc implements online-schema-change, 2 types of tables are created:

- **new**: used to apply DDL. When the data is fully replicated and the **new** table is consistent with the origin table, the origin table is replaced by renaming.
- **old**: created by renaming the origin table.
- 3 kinds of Trigger: `pt_osc_*_ins`, `pt_osc_*_upd`, `pt_osc_*_del`. In the process of `pt_osc`, the new data generated by the origin table is replicated to **new** by the Trigger.

In the process of migration, DM divides the above tables into 3 categories:

- **ghostTable**: `_*_new`
- **trashTable**: `_*_old`
- **realTable**: the origin table that executes online-ddl.

The SQL statements mostly used by pt-osc and the corresponding operation of DM are as follows:

1. Create the `_new` table:

```
CREATE TABLE `test`.`_test4_new` ( id int(11) NOT NULL AUTO_INCREMENT,
date date DEFAULT NULL, account_id bigint(20) DEFAULT NULL,
  ↪ conversion_price decimal(20,3) DEFAULT NULL,
  ↪ ocpc_matched_conversions bigint(20) DEFAULT NULL, ad_cost
  ↪ decimal(20,3) DEFAULT NULL, c12 varchar(20) COLLATE utf8mb4_bin
  ↪ NOT NULL, c11 varchar(20) COLLATE utf8mb4_bin NOT NULL, PRIMARY
  ↪ KEY (id) ) ENGINE=InnoDB AUTO_INCREMENT=3 DEFAULT CHARSET=
  ↪ utf8mb4 COLLATE=utf8mb4_bin ;
```

DM does not create the `_test4_new` table. DM deletes the `dm_meta.{task_name}_onlineddl` record in the downstream according to `ghost_schema`, `ghost_table`, and the `server_id` of `dm_worker`, and clears the related information in memory.

```
DELETE FROM dm_meta.{task_name}_onlineddl WHERE id = {server_id} and
  ↪ ghost_schema = {ghost_schema} and ghost_table = {ghost_table};
```

2. Execute DDL in the `_new` table:

```
ALTER TABLE `test`.`_test4_new` add column c3 int;
```

DM does not perform the DDL operation of `_test4_new`. Instead, it records this DDL in `dm_meta.{task_name}_onlineddl` and memory.

```
REPLACE INTO dm_meta.{task_name}_onlineddl (id, ghost_schema ,
  ↪ ghost_table , ddls) VALUES (.....);
```

3. Create 3 Triggers used for data migration:

```
CREATE TRIGGER `pt_osc_test_test4_del` AFTER DELETE ON `test`.`test4`
  ↪ ..... ;
CREATE TRIGGER `pt_osc_test_test4_upd` AFTER UPDATE ON `test`.`test4`
  ↪ ..... ;
CREATE TRIGGER `pt_osc_test_test4_ins` AFTER INSERT ON `test`.`test4`
  ↪ ..... ;
```

DM does not execute Trigger operations that are not supported in TiDB.

4. Replicate the origin table data to the `_new` table:

```
INSERT LOW_PRIORITY IGNORE INTO `test`.`_test4_new` (`id`, `date`, `
  ↪ account_id`, `conversion_price`, `ocpc_matched_conversions`, `
  ↪ ad_cost`, `c12`, `c11`) SELECT `id`, `date`, `account_id`, `
  ↪ conversion_price`, `ocpc_matched_conversions`, `ad_cost`, `c12`,
  ↪ `c11` FROM `test`.`test4` LOCK IN SHARE MODE /*pt-online-schema-
  ↪ change 3227 copy table*/
```

DM does not execute the DML statements that are not for **realtable**.

5. After the data migration is completed, the origin table and `_new` table are renamed, and the online DDL operation is completed:

```
RENAME TABLE `test`.`test4` TO `test`.`_test4_old`, `test`.`_test4_new`
  ↪ TO `test`.`test4`
```

DM performs the following two operations:

- DM splits the above rename operation into two SQL statements:

```
sql rename test.test4 to test._test4_old; rename test._test4_new
  ↪ to test.test4;
```
- DM does not execute `rename to _test4_old`. When executing `rename`

```
↪ ghost_table to origin table
```

, DM takes the following steps:
 - Read the DDL recorded in memory in Step 2
 - Replace `ghost_table` and `ghost_schema` with `origin_table` and its corresponding schema
 - Execute the DDL that has been replaced

```
ALTER TABLE `test`.`_test4_new` add column c3 int;
-- Replaced with:
ALTER TABLE `test`.`test4` add column c3 int;
```

6. Delete the `_old` table and 3 Triggers of the online DDL operation:

```
DROP TABLE IF EXISTS `test`.`_test4_old`;  
DROP TRIGGER IF EXISTS `pt_osc_test_test4_del` AFTER DELETE ON `test`  
  ↳ `.`test4` ..... ;  
DROP TRIGGER IF EXISTS `pt_osc_test_test4_upd` AFTER UPDATE ON `test`  
  ↳ `.`test4` ..... ;  
DROP TRIGGER IF EXISTS `pt_osc_test_test4_ins` AFTER INSERT ON `test`  
  ↳ `.`test4` ..... ;
```

DM does not delete `_test4_old` and Triggers.

Note:

The specific SQL statements of `pt-osc` vary with the parameters used in the execution. This document only lists the major SQL statements. For more details, refer to the [pt-osc documentation](#).

11.9.1.3.3 Filter DMLs Using SQL Expressions

Overview

In the process of incremental data migration, you can filter certain types of binlog events using the [Filter Binlog Events](#) feature. For example, for archiving or auditing purposes, you can filter out `DELETE` events when migrating data to the downstream. However, Binlog Event Filter cannot judge with a greater granularity on whether to filter out a specific row of `DELETE` events.

To solve the above issue, DM supports filtering data during incremental migration using `binlog value filter` since v2.0.5. The binlog in the `ROW` format supported by DM has the values of all columns in binlog events. You can configure SQL expressions according to these values. If the SQL expressions evaluate a row change as `TRUE`, DM will not migrate the row change downstream.

For detailed operation and implementation, see [Filter DML Events Using SQL Expressions](#).

11.9.1.4 Data Migration Architecture

This document introduces the architecture of Data Migration (DM).

DM consists of three components: DM-master, DM-worker, and `dmctl`.

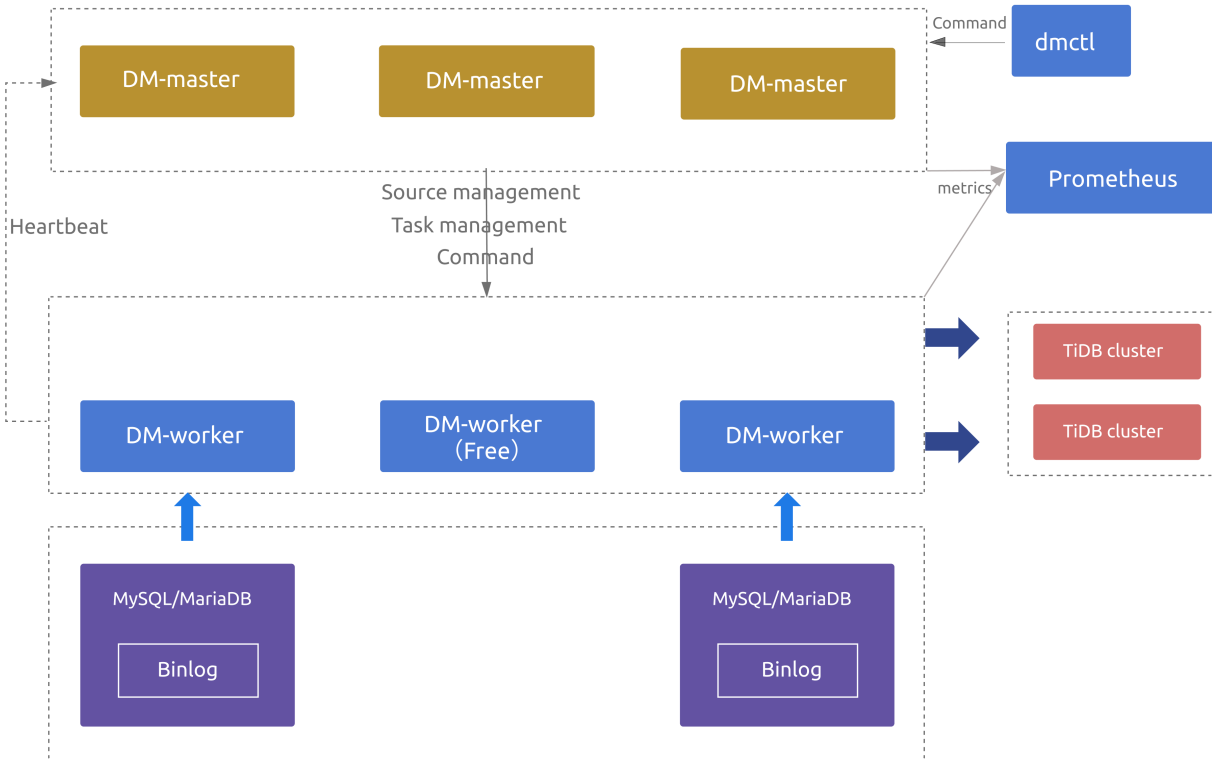

Figure 183: Data Migration architecture

11.9.1.4.1 Architecture components

DM-master

DM-master manages and schedules the operations of data migration tasks.

- Storing the topology information of the DM cluster
- Monitoring the running state of DM-worker processes
- Monitoring the running state of data migration tasks
- Providing a unified portal for the management of data migration tasks
- Coordinating the DDL migration of sharded tables in each instance under the sharding scenario

DM-worker

DM-worker executes specific data migration tasks.

- Persisting the binlog data to the local storage
- Storing the configuration information of the data migration subtasks
- Orchestrating the operation of the data migration subtasks
- Monitoring the running state of the data migration subtasks

For more details of DM-worker, see [DM-worker Introduction](#).

dmctl

dmctl is a command line tool used to control the DM cluster.

- Creating, updating, or dropping data migration tasks
- Checking the state of data migration tasks
- Handling errors of data migration tasks
- Verifying the configuration correctness of data migration tasks

11.9.1.4.2 Architecture features

High availability

When you deploy multiple DM-master nodes, all DM-master nodes use the embedded etcd to form a cluster. The DM-master cluster is used to store metadata such as cluster node information and task configuration. The leader node elected through etcd is used to provide services such as cluster management and data migration task management. Therefore, if the number of available DM-master nodes exceeds half of the deployed nodes, the DM cluster can normally provide services.

When the number of deployed DM-worker nodes exceeds the number of upstream MySQL/MariaDB nodes, the extra DM-worker nodes are idle by default. If a DM-worker node goes offline or is isolated from the DM-master leader, DM-master automatically schedules data migration tasks of the original DM-worker node to other idle DM-worker nodes. (If a DM-worker node is isolated, it automatically stops the data migration tasks on it); if there are no available idle DM-worker nodes, the data migration tasks of the original DM-worker are temporarily hung until one DM-worker node becomes idle, and then the tasks are automatically resumed.

Note:

When the data migration task is in the process of full export or import, the migration task does not support high availability. Here are the main reasons:

- For the full export, MySQL does not support exporting from a specific snapshot point yet. This means that after the data migration task is rescheduled or restarted, the export cannot resume from the previous interruption point.
- For the full import, DM-worker does not support reading exported full data across the nodes yet. This means that after the data migration task is scheduled to a new DM-worker node, you cannot read the exported full data on the original DM-worker node before the scheduling happens.

11.9.1.5 DM 5.4.0 Benchmark Report

The benchmark data of TiDB Data Migration (DM) v5.4.0 is nearly the same as that of DM v5.3.0. To learn the test purpose, environment, scenarios, and results of DM v5.3.0, refer to [DM 5.3.0 Benchmark Report](#).

11.9.2 Quick Start

11.9.2.1 Quick Start Guide for TiDB Data Migration

This document describes how to migrate data from MySQL to TiDB using [TiDB Data Migration](#) (DM).

If you need to deploy DM in the production environment, refer to the following documents:

- [Deploy a DM cluster Using TiUP](#)
- [Create a Data Source](#)
- [Create a Data Migration Task](#)

11.9.2.1.1 Sample scenario

Suppose you deploy DM-master and DM-worker instances in an on-premise environment, and migrate data from an upstream MySQL instance to a downstream TiDB instance.

The detailed information of each instance is as follows:

Instance	Server Address	Port
DM-master	127.0.0.1	8261, 8291 (Internal port)
DM-worker	127.0.0.1	8262
MySQL-3306	127.0.0.1	3306
TiDB	127.0.0.1	4000

11.9.2.1.2 Deploy DM using the binary package

Download DM binary package

Download DM latest binary package or compile the package manually.

Method 1: Download the latest version of binary package

```
wget http://download.pingcap.org/dm-nightly-linux-amd64.tar.gz
tar -xzvf dm-nightly-linux-amd64.tar.gz
cd dm-nightly-linux-amd64
```

Method 2: Compile the latest version of binary package

```
git clone https://github.com/pingcap/dm.git
cd dm
```

```
make
```

Deploy DM-master

Execute the following command to start the DM-master:

```
nohup bin/dm-master --master-addr='127.0.0.1:8261' --log-file=/tmp/dm-  
↪ master.log --name="master1" >> /tmp/dm-master.log 2>&1 &
```

Deploy DM-worker

Execute the following command to start the DM-worker:

```
nohup bin/dm-worker --worker-addr='127.0.0.1:8262' --log-file=/tmp/dm-  
↪ worker.log --join='127.0.0.1:8261' --name="worker1" >> /tmp/dm-worker  
↪ .log 2>&1 &
```

Check deployment status

To check whether the DM cluster has been deployed successfully, execute the following command:

```
bin/dmctl --master-addr=127.0.0.1:8261 list-member
```

A normal DM cluster returns the following information:

```
{  
  "result": true,  
  "msg": "",  
  "members": [  
    {  
      "leader": {  
        "msg": "",  
        "name": "master1",  
        "addr": "127.0.0.1:8261"  
      }  
    },  
    {  
      "master": {  
        "msg": "",  
        "masters": [  
          {  
            "name": "master1",  
            "memberID": "11007177379717700053",  
            "alive": true,  
            "peerURLs": [  
              "http://127.0.0.1:8291"  
            ],  
            "clientURLs": [  

```

```
        "http://127.0.0.1:8261"
      ]
    }
  ]
},
{
  "worker": {
    "msg": "",
    "workers": [
      {
        "name": "worker1",
        "addr": "127.0.0.1:8262",
        "stage": "free",
        "source": ""
      }
    ]
  }
}
]
```

11.9.2.1.3 Migrate data from MySQL to TiDB

Prepare sample data

Before using DM, insert the following sample data to MySQL-3306:

```
drop database if exists `testdm`;
create database `testdm`;
use `testdm`;
create table t1 (id bigint, uid int, name varchar(80), info varchar(100),
  ↪ primary key (`id`), unique key(`uid`)) DEFAULT CHARSET=utf8mb4;
create table t2 (id bigint, uid int, name varchar(80), info varchar(100),
  ↪ primary key (`id`), unique key(`uid`)) DEFAULT CHARSET=utf8mb4;
insert into t1 (id, uid, name) values (1, 10001, 'Gabriel García Márquez'),
  ↪ (2, 10002, 'Cien años de soledad');
insert into t2 (id, uid, name) values (3, 20001, 'José Arcadio Buendía'),
  ↪ (4, 20002, 'Úrsula Iguarán'), (5, 20003, 'José Arcadio');
```

Load data source configurations

Before running a data migration task, you need to first load the configuration file of the corresponding data source (that is, MySQL-3306 in the example) to DM.

Encrypt the data source password

Note:

- You can skip this step if the data source does not have a password.
- You can use the plaintext password to configure the data source information in DM v2.0 and later versions.

For safety reasons, it is recommended to configure and use encrypted passwords for data sources. Suppose the password is "123456":

```
./bin/dmctl --encrypt "123456"
```

```
fCxfQ9XKCezSzuCDOWf5dUD+LsKegSg=
```

Save this encrypted value, and use it for creating a MySQL data source in the following steps.

Edit the source configuration file of the MySQL instance

Write the following configurations to `conf/source1.yaml`.

```
#### MySQL1 Configuration.
source-id: "mysql-replica-01"
from:
  host: "127.0.0.1"
  user: "root"
  password: "fCxfQ9XKCezSzuCDOWf5dUD+LsKegSg="
  port: 3306
```

Load data source configuration file

To load the data source configuration file of MySQL to the DM cluster using `dmctl`, run the following command in the terminal:

```
./bin/dmctl --master-addr=127.0.0.1:8261 operate-source create conf/source1
↪ .yaml
```

The following is an example of the returned results:

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
```

```
        "source": "mysql-replica-01",
        "worker": "worker1"
    }
]
}
```

Now you successfully add the data source MySQL-3306 to the DM cluster.

Create a data migration task

After inserting the **sample data** into MySQL-3306, take the following steps to migrate the tables `testdm.t1` and `testdm.t2` to the downstream TiDB instance:

1. Create a task configuration file `testdm-task.yaml`, and add the following configurations to the file.

```
---
name: testdm
task-mode: all
target-database:
  host: "127.0.0.1"
  port: 4000
  user: "root"
  password: "" # If the password is not null, it is recommended to use
    ↪ password encrypted with dmctl.
mysql-instances:
  - source-id: "mysql-replica-01"
    block-allow-list: "ba-rule1"
block-allow-list:
  ba-rule1:
    do-dbs: ["testdm"]
```

2. Load the task configuration file using `dmctl`:

```
./bin/dmctl --master-addr 127.0.0.1:8261 start-task testdm-task.yaml
```

The following is an example of the returned results:

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-01",
      "worker": "worker1"
    }
  ]
}
```

```

    }
  ]
}

```

Now you successfully create a data migration task that migrates data from MySQL-3306 to the downstream TiDB instance.

Check status of the data migration task

After the data migration task is created, you can use `dmctl query-status` to check the status of the task. See the following example:

```
./bin/dmctl --master-addr 127.0.0.1:8261 query-status
```

The following is an example of the returned results:

```

{
  "result": true,
  "msg": "",
  "tasks": [
    {
      "taskName": "testdm",
      "taskStatus": "Running",
      "sources": [
        "mysql-replica-01"
      ]
    }
  ]
}

```

11.9.2.2 Deploy a DM Cluster Using TiUP

[TiUP](#) is a cluster operation and maintenance tool introduced in TiDB 4.0. TiUP provides [TiUP DM](#), a cluster management component written in Golang. By using TiUP DM, you can easily perform daily TiDB Data Migration (DM) operations, including deploying, starting, stopping, destroying, scaling, and upgrading a DM cluster, and manage DM cluster parameters.

TiUP supports deploying DM v2.0 or later DM versions. This document introduces how to deploy DM clusters of different topologies.

Note:

If your target machine's operating system supports SELinux, make sure that SELinux is **disabled**.

11.9.2.2.1 Prerequisites

When DM performs a full data replication task, the DM-worker is bound with only one upstream database. The DM-worker first exports the full amount of data locally, and then imports the data into the downstream database. Therefore, the worker's host space must be large enough to store all upstream tables to be exported. The storage path is specified later when you create the task.

In addition, you need to meet the [hardware and software requirements](#) when deploying a DM cluster.

11.9.2.2.2 Step 1: Install TiUP on the control machine

Log in to the control machine using a regular user account (take the `tidb` user as an example). All the following TiUP installation and cluster management operations can be performed by the `tidb` user.

1. Install TiUP by executing the following command:

```
curl --proto '=https' --tlsv1.2 -sSf https://tiup-mirrors.pingcap.com/  
  ↪ install.sh | sh
```

After the installing, `~/.bashrc` has been modified to add TiUP to PATH, so you need to open a new terminal or redeclare the global environment variables `source ~/.bashrc` to use it.

2. Install the TiUP DM component:

```
tiup install dm dmctl
```

11.9.2.2.3 Step 2: Edit the initialization configuration file

According to the intended cluster topology, you need to manually create and edit the cluster initialization configuration file.

You need to create a YAML configuration file (named `topology.yaml` for example) according to the [configuration file template](#). For other scenarios, edit the configuration accordingly.

You can use the command `tiup dm template > topology.yaml` to generate a configuration file template quickly.

The configuration of deploying three DM-masters, three DM-workers, and one monitoring component instance is as follows:

```
#### The global variables apply to all other components in the configuration  
  ↪ . If one specific value is missing in the component instance, the  
  ↪ corresponding global variable serves as the default value.  
global:
```

```
user: "tidb"
ssh_port: 22
deploy_dir: "/dm-deploy"
data_dir: "/dm-data"

server_configs:
  master:
    log-level: info
    # rpc-timeout: "30s"
    # rpc-rate-limit: 10.0
    # rpc-rate-burst: 40
  worker:
    log-level: info

master_servers:
- host: 10.0.1.11
  name: master1
  ssh_port: 22
  port: 8261
  # peer_port: 8291
  # deploy_dir: "/dm-deploy/dm-master-8261"
  # data_dir: "/dm-data/dm-master-8261"
  # log_dir: "/dm-deploy/dm-master-8261/log"
  # numa_node: "0,1"
  # The following configs are used to overwrite the `server_configs.master
  ↪ ` values.
  config:
    log-level: info
    # rpc-timeout: "30s"
    # rpc-rate-limit: 10.0
    # rpc-rate-burst: 40
- host: 10.0.1.18
  name: master2
  ssh_port: 22
  port: 8261
- host: 10.0.1.19
  name: master3
  ssh_port: 22
  port: 8261
#### If you do not need to ensure high availability of the DM cluster,
↪ deploy only one DM-master node, and the number of deployed DM-worker
↪ nodes must be no less than the number of upstream MySQL/MariaDB
↪ instances to be migrated.
#### To ensure high availability of the DM cluster, it is recommended to
↪ deploy three DM-master nodes, and the number of deployed DM-worker
```

↔ nodes must exceed the number of upstream MySQL/MariaDB instances to
↔ be migrated (for example, the number of DM-worker nodes is two more
↔ than the number of upstream instances).

worker_servers:

```
- host: 10.0.1.12
  ssh_port: 22
  port: 8262
  # deploy_dir: "/dm-deploy/dm-worker-8262"
  # log_dir: "/dm-deploy/dm-worker-8262/log"
  # numa_node: "0,1"
  # The following configs are used to overwrite the `server_configs.worker
    ↔ ` values.
  config:
    log-level: info
- host: 10.0.1.19
  ssh_port: 22
  port: 8262
```

monitoring_servers:

```
- host: 10.0.1.13
  ssh_port: 22
  port: 9090
  # deploy_dir: "/tidb-deploy/prometheus-8249"
  # data_dir: "/tidb-data/prometheus-8249"
  # log_dir: "/tidb-deploy/prometheus-8249/log"
```

grafana_servers:

```
- host: 10.0.1.14
  port: 3000
  # deploy_dir: /tidb-deploy/grafana-3000
```

alertmanager_servers:

```
- host: 10.0.1.15
  ssh_port: 22
  web_port: 9093
  # cluster_port: 9094
  # deploy_dir: "/tidb-deploy/alertmanager-9093"
  # data_dir: "/tidb-data/alertmanager-9093"
  # log_dir: "/tidb-deploy/alertmanager-9093/log"
```

Note:

- It is not recommended to run too many DM-workers on one host. Each DM-worker should be allocated at least 2 core CPU and 4 GiB memory.
- Make sure that the ports among the following components are interconnected:
 - The `peer_port` (8291 by default) among the DM-master nodes are interconnected.
 - Each DM-master node can connect to the port of all DM-worker nodes (8262 by default).
 - Each DM-worker node can connect to the port of all DM-master nodes (8261 by default).
 - The TiUP nodes can connect to the port of all DM-master nodes (8261 by default).
 - The TiUP nodes can connect to the port of all DM-worker nodes (8262 by default).

For more `master_servers.host.config` parameter description, refer to [master parameter](#). For more `worker_servers.host.config` parameter description, refer to [worker parameter](#).

11.9.2.2.4 Step 3: Execute the deployment command

Note:

You can use secret keys or interactive passwords for security authentication when you deploy TiDB using TiUP:

- If you use secret keys, you can specify the path of the keys through `-i` or `--identity_file`;
- If you use passwords, add the `-p` flag to enter the password interaction window;
- If password-free login to the target machine has been configured, no authentication is required.

```
tiup dm deploy ${name} ${version} ./topology.yaml -u ${ssh_user} [-p] [-i /  
↪ home/root/.ssh/gcp_rsa]
```

The parameters used in this step are as follows.

Parameter	Description
\$	The
↪	name
↪	name
↪	the
↪	DM
	clus-
	ter,
	eg:
	dm-
	test
\$	The

<code>topology</code>	topology
<code>configuration</code>	configuration
<code>file</code>	file.

Parameter	Description
-	Log
↪ in	
↪ to	
or the	
-- tar-	
↪ user	
↪ ma-	
chine	
as	
the	
root	
user	
or	
other	
user	
ac-	
count	
with	
ssh	
and	
sudo	
priv-	
i-	
leges	
to	
com-	
plete	
the	
clus-	
ter	
de-	
ploy-	
ment.	

Parameter	Description
-	The
↪	pass-
↪	word
or	of
--	tar-
↪	password
↪	hosts.
	If
	spec-
	i-
	fied,
	pass-
	word
	au-
	then-
	ti-
	ca-
	tion
	is
	used.

Parameter	Description
- path	The path of the SSH identity file.
-- identity_file	If specified, public key authentication is used (default "/root/.ssh/id_rsa").

At the end of the output log, you will see `Deployed cluster `dm-test` successfully`. This indicates that the deployment is successful.

11.9.2.2.5 Step 4: Check the clusters managed by TiUP

```
tiup dm list
```

TiUP supports managing multiple DM clusters. The command above outputs information of all the clusters currently managed by TiUP, including the name, deployment user, version, and secret key information:

Name	User	Version	Path	PrivateKey
dm-test	tidb	\${version}	/root/.tiup/storage/dm/clusters/dm-test	/root/.tiup ↪ /storage/dm/clusters/dm-test/ssh/id_rsa

11.9.2.2.6 Step 5: Check the status of the deployed DM cluster

To check the status of the `dm-test` cluster, execute the following command:

```
tiup dm display dm-test
```

Expected output includes the instance ID, role, host, listening port, and status (because the cluster is not started yet, so the status is `Down/inactive`), and directory information.

11.9.2.2.7 Step 6: Start the TiDB cluster

```
tiup dm start dm-test
```

If the output log includes `Started cluster `dm-test` successfully`, the start is successful.

11.9.2.2.8 Step 7: Verify the running status of the TiDB cluster

Check the DM cluster status using TiUP:

```
tiup dm display dm-test
```

If the `Status` is `Up` in the output, the cluster status is normal.

11.9.2.2.9 Step 8: Managing migration tasks using `dmctl`

`dmctl` is a command-line tool used to control DM clusters. You are recommended to [use `dmctl` via TiUP](#).

`dmctl` supports both the command mode and the interactive mode. For details, see [Maintain DM Clusters Using `dmctl`](#).

11.9.2.3 Create a Data Source

Note:

Before creating a data source, you need to [Deploy a DM Cluster Using TiUP](#).

The document describes how to create a data source for the data migration task of TiDB Data Migration (DM).

A data source contains the information for accessing the upstream migration task. Because a data migration task requires referring its corresponding data source to obtain the configuration information of access, you need to create the data source of a task before creating a data migration task. For specific data source management commands, refer to [Manage Data Source Configurations](#).

11.9.2.3.1 Step 1: Configure the data source

1. (optional) Encrypt the data source password

In DM configuration files, it is recommended to use the password encrypted with `dmctl`. You can follow the example below to obtain the encrypted password of the data source, which can be used to write the configuration file later.

```
tiup dmctl encrypt 'abc!@#123'
```

```
MKxn0Qo3m3X0yjCnhEMtsUCm83EhGQDZ/T4=
```

2. Write the configuration file of the data source

For each data source, you need an individual configuration file to create it. You can follow the example below to create a data source whose ID is “mysql-01”. First create the configuration file `./source-mysql-01.yaml`:

```
source-id: "mysql-01" # The ID of the data source, you can refer this
  ↳ source-id in the task configuration and dmctl command to
  ↳ associate the corresponding data source.

from:
  host: "127.0.0.1"
  port: 3306
  user: "root"
  password: "MKxn0Qo3m3X0yjCnhEMtsUCm83EhGQDZ/T4=" # The user password
    ↳ of the upstream data source. It is recommended to use the
    ↳ password encrypted with dmctl.
  security: # The TLS configuration of
    ↳ the upstream data source. If not necessary, it can be deleted.
  ssl-ca: "/path/to/ca.pem"
  ssl-cert: "/path/to/cert.pem"
  ssl-key: "/path/to/key.pem"
```

11.9.2.3.2 Step 2: Create a data source

You can use the following command to create a data source:

```
tiup dmctl --master-addr <master-addr> operate-source create ./source-mysql
↳ -01.yaml
```

For other configuration parameters, refer to [Upstream Database Configuration File](#).

The returned results are as follows:

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "source": "mysql-01",
      "worker": "dm-worker-1"
    }
  ]
}
```

11.9.2.3.3 Step 3: Query the data source you created

After creating a data source, you can use the following command to query the data source:

- If you know the `source-id` of the data source, you can use the `dmctl get-config` \leftrightarrow `source <source-id>` command to directly check the configuration of the data source:

```
tiup dmctl --master-addr <master-addr> get-config source mysql-01
```

```
{
  "result": true,
  "msg": "",
  "cfg": "enable-gtid: false
  flavor: mysql
  source-id: mysql-01
  from:
    host: 127.0.0.1
    port: 3306
    user: root
    password: '*****'
}
```

- If you do not know the `source-id`, you can use the `dmctl operate-source show` command to check the source database list, from which you can find the corresponding data source.

```
tiup dmctl --master-addr <master-addr> operate-source show
```

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "source is added but there is no free worker to bound
↪ ",
      "source": "mysql-02",
      "worker": ""
    },
    {
      "result": true,
      "msg": "",
      "source": "mysql-01",
      "worker": "dm-worker-1"
    }
  ]
}
```

11.9.3 Data Migration Scenario Overview

Note:

Before creating a data migration task, you need to perform the following operations:

1. [Deploy a DM Cluster Using TiUP.](#)
2. [Create a Data Source.](#)

This document introduces how to perform data migration tasks in different scenarios.

In addition to scenario-based documents, you can also refer to the following documents:

- For a complete example of data migration task configuration, refer to [DM Advanced Task Configuration File](#).
- For a data migration task configuration guide, refer to [Data Migration Task Configuration Guide](#).

11.9.3.1 Migrate data from Amazon Aurora to TiDB

When you migrate data from Aurora to a TiDB cluster deployed on AWS, your data migration takes two operations: full data migration and incremental replication. You can choose the corresponding operation according to your application needs.

[-Migrate Data from Amazon Aurora to TiDB](#)

11.9.3.2 Migrate data from MySQL to TiDB

If a cloud storage (S3) service is not used, the network connectivity is good, and the network latency is low, you can use the following method to migrate data from MySQL to TiDB.

- [Migrate MySQL of Small Datasets to TiDB](#)

If you have a high demand on migration speed, or if the data size is large (for example, larger than 1 TiB), and you do not allow other applications to write to TiDB during the migration period, you can use TiDB Lightning to quickly import data. Then, you can use DM to replicate incremental data (binlog) based on your application needs.

[Migrate MySQL of Large Datasets to TiDB](#)

11.9.3.3 Migrate and merge MySQL shards into TiDB

Suppose that your application uses MySQL shards for data storage, and you need to migrate these shards into TiDB as one table. In this case, you can use DM to perform the shard merge and migration.

- [Migrate and Merge MySQL Shards of Small Datasets to TiDB](#)

If the data size of the sharded tables is large (for example, larger than 1 TiB), and you do not allow other applications to write to TiDB during the migration period, you can use TiDB Lightning to quickly merge and import the sharded tables. Then, you can use DM to replicate incremental sharding data (binlog) based on your application needs.

- [Migrate and Merge MySQL Shards of Large Datasets to TiDB](#)

11.9.3.4 More advanced migration solutions

The following features can improve the migration process and meet more needs in your application.

- [Continuous Replication from Databases that Use gh-ost or pt-osc](#)
- [Migrate Data to a Downstream TiDB Table with More Columns](#)
- [Filter Binlog Events](#)
- [Filter DML Events Using SQL Expressions](#)

11.9.4 Deploy

11.9.4.1 Software and Hardware Requirements

TiDB Data Migration (DM) supports mainstream Linux operating systems. See the following table for specific version requirements:

Linux OS	Version
Red Hat Enterprise Linux	7.3 or later
CentOS	7.3 or later
Oracle Enterprise Linux	7.3 or later
Ubuntu LTS	16.04 or later

DM can be deployed and run on Intel architecture servers and mainstream virtualization environments.

11.9.4.1.1 Recommended server requirements

DM can be deployed and run on a 64-bit generic hardware server platform (Intel x86-64 architecture). For servers used in the development, testing, and production environments, this section illustrates recommended hardware configurations (these do not include the resources used by the operating system).

Development and test environments

	Number of Instances (Minimum)	Local Storage	Network
Development and test environments	4	8 SAS, 200 GB+	Gigabit network card

Component	CPU	Memory	Storage	Network	Number of Instances (Minimum Required)
DM-worker	8 core+	16 GB+	SAS, Gigabit network (Greater than the size of the migrated data)	Gigabit network card	The number of upstream MySQL instances

Note:

- In the test environment, DM-master and DM-worker used for functional verification can be deployed on the same server.
- To prevent interference with the accuracy of the performance test results, it is **not recommended** to use low-performance storage and network hardware configurations.
- If you need to verify the function only, you can deploy a DM-master on a single machine. The number of DM-worker deployed must be greater than or equal to the number of upstream MySQL instances. To ensure high availability, it is recommended to deploy more DM-workers.
- DM-worker stores full data in the `dump` and `load` phases. Therefore, the disk space for DM-worker needs to be greater than the total amount of data to be migrated. If the relay log is enabled for the migration task, DM-worker needs additional disk space to store upstream binlog data.

Production environment

Component	CPU	Memory	Hard Disk Type	Network	Number of Instances (Minimum Required)
DM-master	4	8 GB+	SAS, 200 GB+	Gigabit network card	1
DM-worker	16	32 GB+	SSD, 200 GB+ (Greater than the size of the migrated data)	10 Gi-bit network card	Greater than the number of upstream MySQL instances
Monitor	8	16 GB+	SAS, 200 GB+	Gigabit network card	1

Note:

- In the production environment, it is not recommended to deploy and run DM-master and DM-worker on the same server, because when DM-worker writes data to disks, it might interfere with the use of disks by DM-master's high availability component.
- If a performance issue occurs, you are recommended to modify the task configuration file according to the [Optimize Configuration of DM](#) document. If the performance is not effectively optimized by tuning the configuration file, you can try to upgrade the hardware of your server.

11.9.4.2 Deploy a DM Cluster

11.9.4.2.1 Deploy a DM Cluster Using TiUP

TiUP is a cluster operation and maintenance tool introduced in TiDB 4.0. TiUP provides **TiUP DM**, a cluster management component written in Golang. By using TiUP DM, you can easily perform daily TiDB Data Migration (DM) operations, including deploying, starting, stopping, destroying, scaling, and upgrading a DM cluster, and manage DM cluster parameters.

TiUP supports deploying DM v2.0 or later DM versions. This document introduces how to deploy DM clusters of different topologies.

Note:

If your target machine's operating system supports SELinux, make sure that SELinux is **disabled**.

Prerequisites

When DM performs a full data replication task, the DM-worker is bound with only one upstream database. The DM-worker first exports the full amount of data locally, and then imports the data into the downstream database. Therefore, the worker's host space must be large enough to store all upstream tables to be exported. The storage path is specified later when you create the task.

In addition, you need to meet the **hardware and software requirements** when deploying a DM cluster.

Step 1: Install TiUP on the control machine

Log in to the control machine using a regular user account (take the `tidb` user as an example). All the following TiUP installation and cluster management operations can be performed by the `tidb` user.

1. Install TiUP by executing the following command:

```
curl --proto '=https' --tlsv1.2 -sSf https://tiup-mirrors.pingcap.com/  
↪ install.sh | sh
```

After the installing, `~/.bashrc` has been modified to add TiUP to PATH, so you need to open a new terminal or redeclare the global environment variables `source ~/.bashrc` to use it.

2. Install the TiUP DM component:

```
tiup install dm dmctl
```

Step 2: Edit the initialization configuration file

According to the intended cluster topology, you need to manually create and edit the cluster initialization configuration file.

You need to create a YAML configuration file (named `topology.yaml` for example) according to the [configuration file template](#). For other scenarios, edit the configuration accordingly.

You can use the command `tiup dm template > topology.yaml` to generate a configuration file template quickly.

The configuration of deploying three DM-masters, three DM-workers, and one monitoring component instance is as follows:

```
##### The global variables apply to all other components in the
  ↪ configuration. If one specific value is missing in the component
  ↪ instance, the corresponding global variable serves as the default
  ↪ value.
global:
  user: "tidb"
  ssh_port: 22
  deploy_dir: "/dm-deploy"
  data_dir: "/dm-data"

server_configs:
  master:
    log-level: info
    # rpc-timeout: "30s"
    # rpc-rate-limit: 10.0
    # rpc-rate-burst: 40
  worker:
    log-level: info

master_servers:
- host: 10.0.1.11
  name: master1
  ssh_port: 22
  port: 8261
  # peer_port: 8291
  # deploy_dir: "/dm-deploy/dm-master-8261"
  # data_dir: "/dm-data/dm-master-8261"
  # log_dir: "/dm-deploy/dm-master-8261/log"
  # numa_node: "0,1"
  # The following configs are used to overwrite the `server_configs.master
  ↪ ` values.
  config:
    log-level: info
```

```
# rpc-timeout: "30s"
# rpc-rate-limit: 10.0
# rpc-rate-burst: 40
- host: 10.0.1.18
  name: master2
  ssh_port: 22
  port: 8261
- host: 10.0.1.19
  name: master3
  ssh_port: 22
  port: 8261
##### If you do not need to ensure high availability of the DM cluster,
  ↳ deploy only one DM-master node, and the number of deployed DM-worker
  ↳ nodes must be no less than the number of upstream MySQL/MariaDB
  ↳ instances to be migrated.
##### To ensure high availability of the DM cluster, it is recommended to
  ↳ deploy three DM-master nodes, and the number of deployed DM-worker
  ↳ nodes must exceed the number of upstream MySQL/MariaDB instances to
  ↳ be migrated (for example, the number of DM-worker nodes is two more
  ↳ than the number of upstream instances).
worker_servers:
- host: 10.0.1.12
  ssh_port: 22
  port: 8262
  # deploy_dir: "/dm-deploy/dm-worker-8262"
  # log_dir: "/dm-deploy/dm-worker-8262/log"
  # numa_node: "0,1"
  # The following configs are used to overwrite the `server_configs.worker
    ↳ ` values.
  config:
    log-level: info
- host: 10.0.1.19
  ssh_port: 22
  port: 8262

monitoring_servers:
- host: 10.0.1.13
  ssh_port: 22
  port: 9090
  # deploy_dir: "/tidb-deploy/prometheus-8249"
  # data_dir: "/tidb-data/prometheus-8249"
  # log_dir: "/tidb-deploy/prometheus-8249/log"

grafana_servers:
- host: 10.0.1.14
```

```
port: 3000
# deploy_dir: /tidb-deploy/grafana-3000

alertmanager_servers:
- host: 10.0.1.15
  ssh_port: 22
  web_port: 9093
  # cluster_port: 9094
  # deploy_dir: "/tidb-deploy/alertmanager-9093"
  # data_dir: "/tidb-data/alertmanager-9093"
  # log_dir: "/tidb-deploy/alertmanager-9093/log"
```

Note:

- It is not recommended to run too many DM-workers on one host. Each DM-worker should be allocated at least 2 core CPU and 4 GiB memory.
- Make sure that the ports among the following components are interconnected:
 - The `peer_port` (8291 by default) among the DM-master nodes are interconnected.
 - Each DM-master node can connect to the `port` of all DM-worker nodes (8262 by default).
 - Each DM-worker node can connect to the `port` of all DM-master nodes (8261 by default).
 - The TiUP nodes can connect to the `port` of all DM-master nodes (8261 by default).
 - The TiUP nodes can connect to the `port` of all DM-worker nodes (8262 by default).

For more `master_servers.host.config` parameter description, refer to [master parameter](#). For more `worker_servers.host.config` parameter description, refer to [worker parameter](#).

Step 3: Execute the deployment command

Note:

You can use secret keys or interactive passwords for security authentication when you deploy TiDB using TiUP:

- If you use secret keys, you can specify the path of the keys through `-i` or `--identity_file`;
- If you use passwords, add the `-p` flag to enter the password interaction window;
- If password-free login to the target machine has been configured, no authentication is required.

```
tiup dm deploy ${name} ${version} ./topology.yaml -u ${ssh_user} [-p] [-i /  
↪ home/root/.ssh/gcp_rsa]
```

The parameters used in this step are as follows.

Parameter	Description
\$	The
↪ name	name
↪ name	name
↪ the	the
↪ DM	DM
	cluster,
	eg:
	dm-
	test

Parameter	Description
\$	The
↪	ver-
↪	sion
↪	of
↪	the
	DM
	clus-
	ter.
	You
	can
	see
	other
	sup-
	ported
	ver-
	sions
	by
	run-
	ning
	tiup
↪	
↪	list
↪	
↪	dm
↪	-
↪	master
↪	.

to	
com-	
plete	
the	
clus-	
ter	
de-	
ploy-	
ment.	

Parameter	Description
-	The
↪	pass-
↪	word
or	of
--	tar-
↪	password
↪	hosts.
	If
	spec-
	i-
	fied,
	pass-
	word
	au-
	then-
	ti-
	ca-
	tion
	is
	used.

Parameter	Description
- path	The path of or the -- SSH identity_file
- identity_file	identity file. If specified, public key authentication is used (default "/root/.ssh/id_rsa").

At the end of the output log, you will see `Deployed cluster `dm-test` successfully`. This indicates that the deployment is successful.

Step 4: Check the clusters managed by TiUP

```
tiup dm list
```

TiUP supports managing multiple DM clusters. The command above outputs information of all the clusters currently managed by TiUP, including the name, deployment user, version, and secret key information:

Name	User	Version	Path	PrivateKey
----	----	-----	-----	-----
dm-test	tidb	\${version}	/root/.tiup/storage/dm/clusters/dm-test	/root/.tiup ↪ /storage/dm/clusters/dm-test/ssh/id_rsa

Step 5: Check the status of the deployed DM cluster

To check the status of the `dm-test` cluster, execute the following command:

```
tiup dm display dm-test
```

Expected output includes the instance ID, role, host, listening port, and status (because the cluster is not started yet, so the status is `Down/inactive`), and directory information.

Step 6: Start the TiDB cluster

```
tiup dm start dm-test
```

If the output log includes `Started cluster `dm-test` successfully`, the start is successful.

Step 7: Verify the running status of the TiDB cluster

Check the DM cluster status using TiUP:

```
tiup dm display dm-test
```

If the `Status` is `Up` in the output, the cluster status is normal.

Step 8: Managing migration tasks using `dmctl`

`dmctl` is a command-line tool used to control DM clusters. You are recommended to [use `dmctl` via TiUP](#).

`dmctl` supports both the command mode and the interactive mode. For details, see [Maintain DM Clusters Using `dmctl`](#).

11.9.4.2.2 Deploy a DM Cluster Offline Using TiUP

This document describes how to deploy a DM cluster offline using TiUP.

Step 1: Prepare the TiUP offline component package

- Install the TiUP package manager online.

1. Install the TiUP tool:

```
curl --proto '=https' --tlsv1.2 -sSf https://tiup-mirrors.pingcap.com/install.sh | sh
```

2. Redefine the global environment variables:

```
source .bash_profile
```

3. Confirm whether TiUP is installed:

```
which tiup
```

- Pull the mirror using TiUP

1. Pull the needed components on a machine that has access to the Internet:

```
# You can modify ${version} to the needed version.
tiup mirror clone tidb-dm-${version}-linux-amd64 --os=linux --arch=
↪ amd64 \
  --dm-master=${version} --dm-worker=${version} --dmctl=${version}
↪ } \
  --alertmanager=v0.17.0 --grafana=v4.0.3 --prometheus=v4.0.3 \
  --tiup=v$(tiup --version|grep 'tiup'|awk -F ' ' '{print $1}')
↪ --dm=v$(tiup --version|grep 'tiup'|awk -F ' ' '{print $1}
↪ }')
```

The command above creates a directory named `tidb-dm-${version}-linux-↪ amd64` in the current directory, which contains the component package managed by TiUP.

2. Pack the component package by using the `tar` command and send the package to the control machine in the isolated environment:

```
tar czvf tidb-dm-${version}-linux-amd64.tar.gz tidb-dm-${version}-
↪ linux-amd64
```

`tidb-dm-${version}-linux-amd64.tar.gz` is an independent offline environment package.

Step 2: Deploy the offline TiUP component

After sending the package to the control machine of the target cluster, install the TiUP component by running the following command:

```
##### You can modify ${version} to the needed version.
tar xzvf tidb-dm-${version}-linux-amd64.tar.gz
sh tidb-dm-${version}-linux-amd64/local_install.sh
source /home/tidb/.bash_profile
```

The `local_install.sh` script automatically executes the `tiup mirror set tidb-dm-↪ ${version}-linux-amd64` command to set the current mirror address to `tidb-dm-${↪ version}-linux-amd64`.

To switch the mirror to another directory, manually execute the `tiup mirror set ↪ <mirror-dir>` command. If you want to switch back to the official mirror, execute `tiup mirror set https://tiup-mirrors.pingcap.com`.

Step 3: Edit the initialization configuration file

You need to edit the cluster initialization configuration file according to different cluster topologies.

For the full configuration template, refer to the [TiUP configuration parameter template](#). Create a configuration file `topology.yaml`. In other combined scenarios, edit the configuration file as needed according to the templates.

The configuration of deploying three DM-masters, three DM-workers, and one monitoring component instance is as follows:

```
---
global:
  user: "tidb"
  ssh_port: 22
  deploy_dir: "/home/tidb/dm/deploy"
  data_dir: "/home/tidb/dm/data"
  # arch: "amd64"

master_servers:
- host: 172.19.0.101
- host: 172.19.0.102
- host: 172.19.0.103

worker_servers:
- host: 172.19.0.101
- host: 172.19.0.102
- host: 172.19.0.103

monitoring_servers:
- host: 172.19.0.101

grafana_servers:
- host: 172.19.0.101

alertmanager_servers:
- host: 172.19.0.101
```

Note:

- If you do not need to ensure high availability of the DM cluster, deploy only one DM-master node, and the number of deployed DM-worker nodes must be no less than the number of upstream MySQL/MariaDB instances to be migrated.
- To ensure high availability of the DM cluster, it is recommended to deploy three DM-master nodes, and the number of deployed DM-worker nodes must be greater than the number of upstream MySQL/MariaDB instances to be migrated (for example, the number of DM-worker nodes is two more than the number of upstream instances).

- For parameters that should be globally effective, configure these parameters of corresponding components in the `server_configs` section of the configuration file.
- For parameters that should be effective on a specific node, configure these parameters in `config` of this node.
- Use `.` to indicate the subcategory of the configuration, such as `log.slow` \leftrightarrow `-threshold`. For more formats, see [TiUP configuration template](#).
- For more parameter description, see [master config.toml.example](#) and [worker config.toml.example](#).
- Make sure that the ports among the following components are interconnected:
 - The `peer_port` (8291 by default) among the DM-master nodes are interconnected.
 - Each DM-master node can connect to the `port` of all DM-worker nodes (8262 by default).
 - Each DM-worker node can connect to the `port` of all DM-master nodes (8261 by default).
 - The TiUP nodes can connect to the `port` of all DM-master nodes (8261 by default).
 - The TiUP nodes can connect to the `port` of all DM-worker nodes (8262 by default).

Step 4: Execute the deployment command

Note:

You can use secret keys or interactive passwords for security authentication when you deploy DM using TiUP:

- If you use secret keys, you can specify the path of the keys through `-i` or `--identity_file`;
- If you use passwords, add the `-p` flag to enter the password interaction window;
- If password-free login to the target machine has been configured, no authentication is required.

```
tiup dm deploy dm-test ${version} ./topology.yaml --user root [-p] [-i /home  
   $\leftrightarrow$  /root/.ssh/gcp_rsa]
```

In the above command:

- The name of the deployed DM cluster is `dm-test`.
- The version of the DM cluster is `${version}`. You can view the latest versions supported by TiUP by running `tiup list dm-master`.
- The initialization configuration file is `topology.yaml`.
- `--user root`: Log in to the target machine through the `root` key to complete the cluster deployment, or you can use other users with `ssh` and `sudo` privileges to complete the deployment.
- `[-i]` and `[-p]`: optional. If you have configured login to the target machine without password, these parameters are not required. If not, choose one of the two parameters. `[-i]` is the private key of the `root` user (or other users specified by `--user`) that has access to the target machine. `[-p]` is used to input the user password interactively.
- TiUP DM uses the embedded SSH client. If you want to use the SSH client native to the control machine system, edit the configuration according to [using the system's native SSH client to connect to the cluster](#).

At the end of the output log, you will see `Deployed cluster `dm-test` successfully`. This indicates that the deployment is successful.

Step 5: Check the clusters managed by TiUP

```
tiup dm list
```

TiUP supports managing multiple DM clusters. The command above outputs information of all the clusters currently managed by TiUP, including the name, deployment user, version, and secret key information:

Name	User	Version	Path	PrivateKey
dm-test	tidb	\${version}	/root/.tiup/storage/dm/clusters/dm-test	/root/.tiup ↔ /storage/dm/clusters/dm-test/ssh/id_rsa

Step 6: Check the status of the deployed DM cluster

To check the status of the `dm-test` cluster, execute the following command:

```
tiup dm display dm-test
```

Expected output includes the instance ID, role, host, listening port, and status (because the cluster is not started yet, so the status is `Down/inactive`), and directory information of the `dm-test` cluster.

Step 7: Start the cluster

```
tiup dm start dm-test
```

If the output log includes `Started cluster `dm-test` successfully`, the start is successful.

Step 8: Verify the running status of the cluster

Check the DM cluster status using TiUP:

```
tiup dm display dm-test
```

If the `Status` is `Up` in the output, the cluster status is normal.

11.9.4.2.3 Deploy Data Migration Using DM Binary

This document introduces how to quickly deploy the Data Migration (DM) cluster using DM binary.

Note:

In the production environment, it is recommended to [use TiUP to deploy a DM cluster](#).

Preparations

Download the official binary using the download link in the following table:

Package name	OS	Architecture	SHA256 check-sum
<code>https://download.pingcap.org/dm- {version}-linux- amd64.tar.gz</code>	Linux	amd64	<code>https://download.pingcap.org/dm- {version}-linux- amd64.sha256</code>

Note:

`{version}` in the above download link indicates the version number of TiDB. For example, the download link for v1.0.1 is `https://download.pingcap.org/dm-v1.0.1-linux-amd64.tar.gz`. You can check the published DM versions in the [DM Release](#) page.

The downloaded files have two subdirectories, `bin` and `conf`. The `bin` directory contains the binary files of DM-master, DM-worker, and dmctl. The `conf` directory contains the sample configuration files.

Sample scenario

Suppose that you deploy a DM cluster based on this sample scenario:

Two DM-worker nodes and three DM-master nodes are deployed on five servers.

Here is the address of each node:

Instance	Server address	Port
DM-master1	192.168.0.4	8261
DM-master2	192.168.0.5	8261
DM-master3	192.168.0.6	8261
DM-worker1	192.168.0.7	8262
DM-worker2	192.168.0.8	8262

Based on this scenario, the following sections describe how to deploy the DM cluster.

Note:

- If you deploy multiple DM-master or DM-worker instances in a single server, the port and working directory of each instance must be unique.
- If you do not need to ensure high availability of the DM cluster, deploy only one DM-master node, and the number of deployed DM-worker nodes must be no less than the number of upstream MySQL/MariaDB instances to be migrated.
- To ensure high availability of the DM cluster, it is recommended to deploy three DM-master nodes, and the number of deployed DM-worker nodes must be greater than the number of upstream MySQL/MariaDB instances to be migrated (for example, the number of DM-worker nodes is two more than the number of upstream instances).
- Make sure that the ports among the following components are interconnected:
 - The 8291 ports among the DM-master nodes are interconnected.
 - Each DM-master node can connect to the 8262 ports of all DM-worker nodes.
 - Each DM-worker node can connect to the 8261 port of all DM-master nodes.

Deploy DM-master

You can configure DM-master by using [command-line parameters](#) or [the configuration file](#).

DM-master command-line parameters

The following is the description of DM-master command-line parameters:

```
./bin/dm-master --help
```

```
Usage of dm-master:
-L string
    log level: debug, info, warn, error, fatal (default "info")
-V      prints version and exit
-advertise-addr string
    advertise address for client traffic (default "${master-addr}")
-advertise-peer-urls string
    advertise URLs for peer traffic (default "${peer-urls}")
-config string
    path to config file
-data-dir string
    path to the data directory (default "default.${name}")
-initial-cluster string
    initial cluster configuration for bootstrapping, e.g. dm-master=http
    ↪ ://127.0.0.1:8291
-join string
    join to an existing cluster (usage: cluster's "${master-addr}" list,
    ↪ e.g. "127.0.0.1:8261,127.0.0.1:18261"
-log-file string
    log file path
-master-addr string
    master API server and status addr
-name string
    human-readable name for this DM-master member
-peer-urls string
    URLs for peer traffic (default "http://127.0.0.1:8291")
-print-sample-config
    print sample config file of dm-worker
```

Note:

In some situations, you cannot use the above method to configure DM-master because some configurations are not exposed to the command line. In such cases, use the configuration file instead.

DM-master configuration file

The following is the configuration file of DM-master. It is recommended that you configure DM-master by using this method.

1. Write the following configuration to `conf/dm-master1.toml`:

```
““toml # Master Configuration. name = “master1”
# Log configurations. log-level = “info” log-file = “dm-master.log”
# The listening address of DM-master. master-addr = “192.168.0.4:8261”
# The peer URLs of DM-master. peer-urls = “192.168.0.4:8291”
# The value of initial-cluster is the combination of the advertise-peer-
↔ urls value of all DM-master nodes in the initial cluster. initial-cluster = “mas-
ter1=http://192.168.0.4:8291,master2=http://192.168.0.5:8291,master3=http://192.168.0.6:8291”
““
```

2. Execute the following command in the terminal to run DM-master:

```
bash ./bin/dm-master -config conf/dm-master1.toml
```

Note:

The console does not output logs after this command is executed. If you want to view the runtime log, you can execute `tail -f dm-master.log`.

3. For DM-master2 and DM-master3, change `name` in the configuration file to `master2` ↔ and `master3` respectively, and change `peer-urls` to `192.168.0.5:8291` and `192.168.0.6:8291` respectively. Then repeat Step 2.

Deploy DM-worker

You can configure DM-worker by using [command-line parameters](#) or [the configuration file](#).

DM-worker command-line parameters

The following is the description of the DM-worker command-line parameters:

```
./bin/dm-worker --help
```

Usage of worker:

```
-L string
    log level: debug, info, warn, error, fatal (default "info")
-V      prints version and exit
-advertise-addr string
    advertise address for client traffic (default "${worker-addr}")
-config string
    path to config file
-join string
    join to an existing cluster (usage: dm-master cluster's "${master-
↔ addr}")
-keepalive-ttl int
```

```
dm-worker's TTL for keepalive with etcd (in seconds) (default 10)
-log-file string
    log file path
-name string
    human-readable name for DM-worker member
-print-sample-config
    print sample config file of dm-worker
-worker-addr string
    listen address for client traffic
```

Note:

In some situations, you cannot use the above method to configure DM-worker because some configurations are not exposed to the command line. In such cases, use the configuration file instead.

DM-worker configuration file

The following is the DM-worker configuration file. It is recommended that you configure DM-worker by using this method.

1. Write the following configuration to `conf/dm-worker1.toml`:

```
“toml # Worker Configuration. name = “worker1”
# Log configuration. log-level = “info” log-file = “dm-worker.log”
# DM-worker address. worker-addr = “:8262”
# The master-addr configuration of the DM-master nodes in the cluster. join =
“192.168.0.4:8261,192.168.0.5:8261,192.168.0.6:8261” ““
```

2. Execute the following command in the terminal to run DM-worker:

```
bash ./bin/dm-worker -config conf/dm-worker1.toml
```

3. For DM-worker2, change `name` in the configuration file to `worker2`. Then repeat Step 2.

Now, a DM cluster is successfully deployed.

11.9.4.2.4 Use Kubernetes

11.9.4.3 Migrate Data Using Data Migration

This guide shows how to migrate data using the Data Migration (DM) tool.

11.9.4.3.1 Step 1: Deploy the DM cluster

It is recommended to [deploy the DM cluster using TiUP](#). You can also [deploy the DM cluster using binary](#) for trial or test.

Note:

- For database passwords in all the DM configuration files, it is recommended to use the passwords encrypted by `dmctl`. If a database password is empty, it is unnecessary to encrypt it. See [Encrypt the database password using dmctl](#).
- The user of the upstream and downstream databases must have the corresponding read and write privileges.

11.9.4.3.2 Step 2: Check the cluster information

After the DM cluster is deployed using TiUP, the configuration information is like what is listed below.

- The configuration information of related components in the DM cluster:

Component	Host	Port
dm_worker1	172.16.10.72	8262
dm_worker2	172.16.10.73	8262
dm_master	172.16.10.71	8261

- The information of upstream and downstream database instances:

Database instance	Host	Port	Username	Encrypted password
Upstream MySQL-1	172.16.10.81	3306	root	VjX8cEeTX+qcvZ3bPaO4h0C80pe/1aU=
Upstream MySQL-2	172.16.10.82	3306	root	VjX8cEeTX+qcvZ3bPaO4h0C80pe/1aU=
Downstream TiDB	172.16.10.83	4000	root	

The list of privileges needed on the MySQL host can be found in the [precheck](#) documentation.

11.9.4.3.3 Step 3: Create data source

1. Write MySQL-1 related information to `conf/source1.yaml`:

```
# MySQL1 Configuration.

source-id: "mysql-replica-01"
# This indicates that whether DM-worker uses Global Transaction
  ↪ Identifier (GTID) to pull binlog. Before you use this
  ↪ configuration item, make sure that the GTID mode is enabled in
  ↪ the upstream MySQL.
enable-gtid: false

from:
  host: "172.16.10.81"
  user: "root"
  password: "VjX8cEeTX+qcvZ3bPa04h0C80pe/1aU="
  port: 3306
```

2. Execute the following command in the terminal, and use `tiup dmctl` to load the MySQL-1 data source configuration to the DM cluster:

```
tiup dmctl --master-addr 172.16.10.71:8261 operate-source create conf/
  ↪ source1.yaml
```

3. For MySQL-2, modify the relevant information in the configuration file and execute the same `dmctl` command.

11.9.4.3.4 Step 4: Configure the data migration task

The following example assumes that you need to migrate all the `test_table` table data in the `test_db` database of both the upstream MySQL-1 and MySQL-2 instances, to the downstream `test_table` table in the `test_db` database of TiDB, in the full data plus incremental data mode.

Edit the `task.yaml` task configuration file as below:

```
#### The task name. You need to use a different name for each of the
  ↪ multiple tasks that
#### run simultaneously.
name: "test"
#### The full data plus incremental data (all) migration mode.
task-mode: "all"
#### The downstream TiDB configuration information.
target-database:
  host: "172.16.10.83"
  port: 4000
  user: "root"
  password: ""
```

```
##### Configuration of all the upstream MySQL instances required by the
↳ current data migration task.
mysql-instances:
-
  # The ID of upstream instances or the migration group. You can refer to
  ↳ the configuration of `source_id` in the "inventory.ini" file or in
  ↳ the "dm-master.toml" file.
  source-id: "mysql-replica-01"
  # The configuration item name of the block and allow lists of the name of
  ↳ the
  # database/table to be migrated, used to quote the global block and allow
  # lists configuration that is set in the global block-allow-list below.
  block-allow-list: "global" # Use black-white-list if the DM version is
  ↳ earlier than or equal to v2.0.0-beta.2.
  # The configuration item name of the dump processing unit, used to quote
  ↳ the global configuration of the dump unit.
  mydumper-config-name: "global"
-
  source-id: "mysql-replica-02"
  block-allow-list: "global" # Use black-white-list if the DM version is
  ↳ earlier than or equal to v2.0.0-beta.2.
  mydumper-config-name: "global"

##### The global configuration of block and allow lists. Each instance can
↳ quote it by the
##### configuration item name.
block-allow-list:          # Use black-white-list if the DM version
↳ is earlier than or equal to v2.0.0-beta.2.
global:
  do-tables:              # The allow list of upstream tables to be
  ↳ migrated.
  - db-name: "test_db"    # The database name of the table to be
  ↳ migrated.
  tbl-name: "test_table"  # The name of the table to be migrated.

##### The global configuration of the dump unit. Each instance can quote it
↳ by the configuration item name.
mydumpers:
  global:
    extra-args: ""
```

11.9.4.3.5 Step 5: Start the data migration task

To detect possible errors of data migration configuration in advance, DM provides the precheck feature:

- DM automatically checks the corresponding privileges and configuration while starting the data migration task.
- You can also use the `check-task` command to manually precheck whether the upstream MySQL instance configuration satisfies the DM requirements.

For details about the precheck feature, see [Precheck the upstream MySQL instance configuration](#).

Note:

Before starting the data migration task for the first time, you should have got the upstream configured. Otherwise, an error is reported while you start the task.

Run the `tiup dmctl` command to start the data migration tasks. `task.yaml` is the configuration file that is edited above.

```
tiup dmctl --master-addr 172.16.10.71:8261 start-task ./task.yaml
```

- If the above command returns the following result, it indicates the task is successfully started.

```
{
  "result": true,
  "msg": "",
  "workers": [
    {
      "result": true,
      "worker": "172.16.10.72:8262",
      "msg": ""
    },
    {
      "result": true,
      "worker": "172.16.10.73:8262",
      "msg": ""
    }
  ]
}
```

- If you fail to start the data migration task, modify the configuration according to the returned prompt and then run the `start-task task.yaml` command to restart the task.

11.9.4.3.6 Step 6: Check the data migration task

If you need to check the task state or whether a certain data migration task is running in the DM cluster, run the following command in `tiup dmctl`:

```
tiup dmctl --master-addr 172.16.10.71:8261 query-status
```

11.9.4.3.7 Step 7: Stop the data migration task

If you do not need to migrate data any more, run the following command in `tiup dmctl` to stop the task:

```
tiup dmctl --master-addr 172.16.10.71:8261 stop-task test
```

`test` is the task name that you set in the `name` configuration item of the `task.yaml` configuration file.

11.9.4.3.8 Step 8: Monitor the task and check logs

Assuming that Prometheus, Alertmanager, and Grafana are successfully deployed along with the DM cluster deployment using TiUP, and the Grafana address is `172.16.10.71`. To view the alert information related to DM, you can open <http://172.16.10.71:9093> in a browser and enter into Alertmanager; to check monitoring metrics, go to <http://172.16.10.71:3000>, and choose the DM dashboard.

While the DM cluster is running, DM-master, DM-worker, and `dmctl` output the monitoring metrics information through logs. The log directory of each component is as follows:

- DM-master log directory: It is specified by the `--log-file` DM-master process parameter. If DM is deployed using TiUP, the log directory is `{log_dir}` in the DM-master node.
- DM-worker log directory: It is specified by the `--log-file` DM-worker process parameter. If DM is deployed using TiUP, the log directory is `{log_dir}` in the DM-worker node.

11.9.4.4 DM Cluster Performance Test

This document describes how to build a test scenario to do a performance test on the DM cluster, including the speed test and latency test regarding data migration.

11.9.4.4.1 Migration data flow

You can use a simple migration data flow, that is, MySQL -> DM -> TiDB, to test the data migration performance of the DM cluster.

11.9.4.4.2 Deploy test environment

- Deploy the TiDB test cluster using TiUP, with all default configurations.
- Deploy the MySQL service. Enable the ROW mode for binlog, and use default configurations for other configuration items.
- Deploy a DM cluster, with a DM-worker and a DM-master.

11.9.4.4.3 Performance test

Table schema

Use tables with the following schema for the performance test:

```
CREATE TABLE `sbtest` (
  `id` int(11) NOT NULL AUTO_INCREMENT,
  `k` int(11) NOT NULL DEFAULT '0',
  `c` char(120) CHARSET utf8mb4 COLLATE utf8mb4_bin NOT NULL DEFAULT '',
  `pad` char(60) CHARSET utf8mb4 COLLATE utf8mb4_bin NOT NULL DEFAULT '',
  PRIMARY KEY (`id`),
  KEY `k_1` (`k`)
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
```

Full import benchmark case

Generate test data

Use `sysbench` to create test tables upstream and generate test data for full import. Execute the following `sysbench` command to generate test data:

```
sysbench --test=oltp_insert --tables=4 --mysql-host=172.16.4.40 --mysql-
  ↪ port=3306 --mysql-user=root --mysql-db=dm_benchmark --db-driver=mysql
  ↪ --table-size=50000000 prepare
```

Create a data migration task

1. Create an upstream MySQL source and set `source-id` to `source-1`. For details, see [Load the Data Source Configurations](#).
2. Create a migration task (in `full` mode). The following is a task configuration template:

```
-----
“yaml
-----
name: test-full
task-mode: full
-----
```

Configure the migration task using the TiDB information of your actual test environ-

```
ment. target-database: host: "192.168.0.1" port: 4000 user: "root" password: ""
mysql-instances: - source-id: "source-1" block-allow-list: "instance" mydumper-config-
name: "global" loader-thread: 16
# Configure the name of the database where sysbench generates data. block-allow-list:
instance: do-dbs: ["dm_benchmark"]
mydumpers: global: rows: 32000 threads: 32 ""
For details about how to create a migration task, see Create a Data Migration Task.
```

Note:

- To enable concurrently exporting data from a single table using multi-thread, you can use the `rows` option in the `mydumpers` configuration item. This speeds up data export.
- To test the performance under different configurations, you can tune `loader-thread` in the `mysql-instances` configuration, as well as `rows` and `threads` in the `mydumpers` configuration item.

Get test results

Observe the DM-worker log. When you see **all data files have been finished**, it means that full data has been imported. In this case, you can see the time consumed to import data. The sample log is as follows:

```
[INFO] [loader.go:604] ["all data files have been finished"] [task=test] [
↪ unit=load] ["cost time"]=52.439796ms]
```

According to the size of the test data and the time consumed to import data, you can calculate the migration speed of the full data.

Incremental replication benchmark case

Initialize tables

Use `sysbench` to create test tables in the upstream.

Create a data migration task

1. Create the source of the upstream MySQL. Set `source-id` to `source-1` (if the source has been created in the [full import benchmark case](#), you do not need to create it again). For details, see [Load the Data Source Configurations](#).
2. Create a DM migration task (in `all` mode). The following is an example of the task configuration file:

```
-----  
"yaml"  
-----  
name: test-all  
task-mode: all  
-----
```

Configure the migration task using the TiDB information of your actual test environment. target-database: host: "192.168.0.1" port: 4000 user: "root" password: ""

mysql-instances: - source-id: "source-1" block-allow-list: "instance" syncer-config-name: "global"

Configure the name of the database where sysbench generates data. block-allow-list: instance: do-dbs: ["dm_benchmark"]

syncers: global: worker-count: 16 batch: 100 ""

For details about how to create a data migration task, see [Create a Data Migration Task](#).

Note:

To test the performance under different configurations, you can tune `worker` \leftrightarrow `-count` and `batch` in the `syncers` configuration item.

Generate incremental data

To continuously generate incremental data in the upstream, run the `sysbench` command:

```
sysbench --test=oltp_insert --tables=4 --num-threads=32 --mysql-host  
   $\leftrightarrow$  =172.17.4.40 --mysql-port=3306 --mysql-user=root --mysql-db=  
   $\leftrightarrow$  dm_benchmark --db-driver=mysql --report-interval=10 --time=1800 run
```

Note:

You can test the data migration performance under different scenarios by using different `sysbench` statements.

Get test results

To observe the migration status of DM, you can run the `query-status` command. To observe the monitoring metrics of DM, you can use Grafana. Here the monitoring metrics refer to `finished sqls jobs` (the number of jobs finished per unit time), etc. For more information, see [Binlog Migration Monitoring Metrics](#).

11.9.5 Maintain

11.9.5.1 Tools

11.9.5.1.1 Maintain a DM Cluster Using TiUP

This document introduces how to maintain a DM cluster using the TiUP DM component.

If you have not deployed a DM cluster yet, you can refer to [Deploy a DM Cluster Using TiUP](#) for instructions.

Note:

- Make sure that the ports among the following components are interconnected
 - The `peer_port` (8291 by default) among the DM-master nodes are interconnected.
 - Each DM-master node can connect to the `port` of all DM-worker nodes (8262 by default).
 - Each DM-worker node can connect to the `port` of all DM-master nodes (8261 by default).
 - The TiUP nodes can connect to the `port` of all DM-master nodes (8261 by default).
 - The TiUP nodes can connect to the `port` of all DM-worker nodes (8262 by default).

For the help information of the TiUP DM component, run the following command:

```
tiup dm --help
```

```
Deploy a DM cluster for production
```

```
Usage:
```

```
tiup dm [flags]  
tiup dm [command]
```

```
Available Commands:
```

```
deploy    Deploy a DM cluster for production  
start     Start a DM cluster  
stop      Stop a DM cluster  
restart   Restart a DM cluster  
list      List all clusters  
destroy   Destroy a specified DM cluster
```

```

audit      Show audit log of cluster operation
exec       Run shell command on host in the dm cluster
edit-config Edit DM cluster config
display    Display information of a DM cluster
reload     Reload a DM cluster's config and restart if needed
upgrade    Upgrade a specified DM cluster
patch      Replace the remote package with a specified package and restart
           ↪ the service
scale-out  Scale out a DM cluster
scale-in   Scale in a DM cluster
import     Import an exist DM 1.0 cluster from dm-ansible and re-deploy
           ↪ 2.0 version
help       Help about any command

```

Flags:

```

-h, --help          help for tiup-dm
--native-ssh        Use the native SSH client installed on local system
                   ↪ instead of the build-in one.
--ssh-timeout int   Timeout in seconds to connect host via SSH, ignored
                   ↪ for operations that don't need an SSH connection. (default 5)
-v, --version       version for tiup-dm
--wait-timeout int  Timeout in seconds to wait for an operation to
                   ↪ complete, ignored for operations that don't fit. (default 60)
-y, --yes           Skip all confirmations and assumes 'yes'

```

View the cluster list

After the cluster is successfully deployed, view the cluster list by running the following command:

```
tiup dm list
```

```

Name User Version Path                               PrivateKey
---- ---- -
prod-cluster tidb ${version} /root/.tiup/storage/dm/clusters/test /root/.
           ↪ tiup/storage/dm/clusters/test/ssh/id_rsa

```

Start the cluster

After the cluster is successfully deployed, start the cluster by running the following command:

```
tiup dm start prod-cluster
```

If you forget the name of your cluster, view the cluster list by running `tiup dm list`.

Check the cluster status

TiUP provides the `tiup dm display` command to view the status of each component in the cluster. With this command, you do not have to log in to each machine to see the component status. The usage of the command is as follows:

```
tiup dm display prod-cluster
```

```
dm Cluster: prod-cluster
dm Version: ${version}
ID           Role           Host           Ports           OS/Arch        Status

```

The **Status** column uses **Up** or **Down** to indicate whether the service is running normally.

For the DM-master component, **|L** might be appended to a status, which indicates that the DM-master node is a Leader. For the DM-worker component, **Free** indicates that the current DM-worker node is not bound to an upstream.

Scale in a cluster

Scaling in a cluster means making some node(s) offline. This operation removes the specified node(s) from the cluster and deletes the remaining data files.

When you scale in a cluster, DM operations on DM-master and DM-worker components are performed in the following order:

1. Stop component processes.
2. Call the API for DM-master to delete the member.

3. Clean up the data files related to the node.

The basic usage of the scale-in command:

```
tiup dm scale-in <cluster-name> -N <node-id>
```

To use this command, you need to specify at least two arguments: the cluster name and the node ID. The node ID can be obtained by using the `tiup dm display` command in the previous section.

For example, to scale in the DM-worker node on 172.16.5.140 (similar to scaling in DM-master), run the following command:

```
tiup dm scale-in prod-cluster -N 172.16.5.140:8262
```

Scale out a cluster

The scale-out operation has an inner logic similar to that of deployment: the TiUP DM component first ensures the SSH connection of the node, creates the required directories on the target node, then executes the deployment operation, and starts the node service.

For example, to scale out a DM-worker node in the `prod-cluster` cluster, take the following steps (scaling out DM-master has similar steps):

1. Create a `scale.yaml` file and add information of the new worker node:

Note:

You need to create a topology file, which includes only the description of the new nodes, not the existing nodes. For more configuration items (such as the deployment directory), refer to this [TiUP configuration parameter example](#).

```
---  
  
worker_servers:  
  - host: 172.16.5.140
```

2. Perform the scale-out operation. TiUP DM adds the corresponding nodes to the cluster according to the port, directory, and other information described in `scale.yaml`.

```
tiup dm scale-out prod-cluster scale.yaml
```

After the command is executed, you can check the status of the scaled-out cluster by running `tiup dm display prod-cluster`.

Rolling upgrade

Note:

Since v2.0.5, dmctl support [Export and Import Data Sources and Task Configuration of Clusters](#).

Before upgrading, you can use `config export` to export the configuration files of clusters. After upgrading, if you need to downgrade to an earlier version, you can first redeploy the earlier cluster and then use `config import` to import the previous configuration files.

For clusters earlier than v2.0.5, you can use dmctl v2.0.5 or later to export and import the data source and task configuration files.

For clusters later than v2.0.2, currently, it is not supported to automatically import the configuration related to relay worker. You can use `start-relay` command to manually [start relay log](#).

The rolling upgrade process is made as transparent as possible to the application, and does not affect the business. The operations vary with different nodes.

Upgrade command

You can run the `tiup dm upgrade` command to upgrade a DM cluster. For example, the following command upgrades the cluster to `${version}`. Modify `${version}` to your needed version before running this command:

```
tiup dm upgrade prod-cluster ${version}
```

Update configuration

If you want to dynamically update the component configurations, the TiUP DM component saves a current configuration for each cluster. To edit this configuration, execute the `tiup dm edit-config <cluster-name>` command. For example:

```
tiup dm edit-config prod-cluster
```

TiUP DM opens the configuration file in the vi editor. If you want to use other editors, use the `EDITOR` environment variable to customize the editor, such as `export EDITOR=nano ↵`. After editing the file, save the changes. To apply the new configuration to the cluster, execute the following command:

```
tiup dm reload prod-cluster
```

The command sends the configuration to the target machine and restarts the cluster to make the configuration take effect.

Update component

For normal upgrade, you can use the `upgrade` command. But in some scenarios, such as debugging, you might need to replace the currently running component with a temporary package. To achieve this, use the `patch` command:

```
tiup dm patch --help
```

Replace the remote package with a specified package and restart the service

Usage:

```
tiup dm patch <cluster-name> <package-path> [flags]
```

Flags:

```
-h, --help                help for patch
-N, --node strings        Specify the nodes
--overwrite               Use this package in the future scale-out
                           ↪ operations
-R, --role strings        Specify the role
--transfer-timeout int    Timeout in seconds when transferring dm-master
                           ↪ leaders (default 300)
```

Global Flags:

```
--native-ssh              Use the native SSH client installed on local system
                           ↪ instead of the build-in one.
--ssh-timeout int         Timeout in seconds to connect host via SSH, ignored
                           ↪ for operations that don't need an SSH connection. (default 5)
--wait-timeout int        Timeout in seconds to wait for an operation to
                           ↪ complete, ignored for operations that don't fit. (default 60)
-y, --yes                 Skip all confirmations and assumes 'yes'
```

If a DM-master hotfix package is in `/tmp/dm-master-hotfix.tar.gz` and you want to replace all the DM-master packages in the cluster, run the following command:

```
tiup dm patch prod-cluster /tmp/dm-master-hotfix.tar.gz -R dm-master
```

You can also replace only one DM-master package in the cluster:

```
tiup dm patch prod-cluster /tmp/dm--hotfix.tar.gz -N 172.16.4.5:8261
```

Import and upgrade a DM 1.0 cluster deployed using DM-Ansible

Note:

- TiUP does not support importing the DM Portal component in a DM 1.0 cluster.
- You need to stop the original cluster before importing.
- Don't run `stop-task` for tasks that need to be upgraded to 2.0.
- TiUP only supports importing to a DM cluster of v2.0.0-rc.2 or a later version.
- The `import` command is used to import data from a DM 1.0 cluster to a new DM 2.0 cluster. If you need to import DM migration tasks to an existing DM 2.0 cluster, refer to [Manually Upgrade TiDB Data Migration from v1.0.x to v2.0+](#).
- The deployment directories of some components are different from those of the original cluster. You can execute the `display` command to view the details.
- Run `tiup update --self && tiup update dm` before importing to make sure that the TiUP DM component is the latest version.
- Only one DM-master node exists in the cluster after importing. Refer to [Scale out a cluster](#) to scale out the DM-master.

Before TiUP is released, DM-Ansible is often used to deploy DM clusters. To enable TiUP to take over the DM 1.0 cluster deployed by DM-Ansible, use the `import` command.

For example, to import a cluster deployed using DM Ansible:

```
tiup dm import --dir=/path/to/dm-ansible --cluster-version ${version}
```

Execute `tiup list dm-master` to view the latest cluster version supported by TiUP.

The process of using the `import` command is as follows:

1. TiUP generates a topology file `topology.yml` based on the DM cluster previously deployed using DM-Ansible.
2. After confirming that the topology file has been generated, you can use it to deploy the DM cluster of v2.0 or later versions.

After the deployment is completed, you can execute the `tiup dm start` command to start the cluster and begin the process of upgrading the DM kernel.

View the operation log

To view the operation log, use the `audit` command. The usage of the `audit` command is as follows:

```
Usage:
  tiup dm audit [audit-id] [flags]

Flags:
  -h, --help help for audit
```

If the `[audit-id]` argument is not specified, the command shows a list of commands that have been executed. For example:

```
tiup dm audit
```

ID	Time	Command
4D5kQY	2020-08-13T05:38:19Z	tiup dm display test
4D5kNv	2020-08-13T05:36:13Z	tiup dm list
4D5kNr	2020-08-13T05:36:10Z	tiup dm deploy -p prod-cluster \${version} ./ ↳ examples/dm/minimal.yaml

The first column is `audit-id`. To view the execution log of a certain command, pass the `audit-id` argument as follows:

```
tiup dm audit 4D5kQY
```

Run commands on a host in the DM cluster

To run commands on a host in the DM cluster, use the `exec` command. The usage of the `exec` command is as follows:

```
Usage:
  tiup dm exec <cluster-name> [flags]

Flags:
  --command string the command run on cluster host (default "ls")
  -h, --help           help for exec
  -N, --node strings  Only exec on host with specified nodes
  -R, --role strings  Only exec on host with specified roles
  --sudo              use root permissions (default false)
```

For example, to execute `ls /tmp` on all DM nodes, run the following command:

```
tiup dm exec prod-cluster --command='ls /tmp'
```

`dmctl`

TiUP integrates the DM cluster controller `dmctl`.

Run the following command to use `dmctl`:

```
tiup dmctl [args]
```

Specify the version of `dmctl`. Modify `${version}` to your needed version before running this command:

```
tiup dmctl:${version} [args]
```

The previous `dmctl` command to add a source is `dmctl --master-addr master1:8261 ↪ operate-source create /tmp/source1.yml`. After `dmctl` is integrated into TiUP, the command is:

```
tiup dmctl --master-addr master1:8261 operate-source create /tmp/source1.  
↪ yml
```

Use the system's native SSH client to connect to cluster

All operations above performed on the cluster machine use the SSH client embedded in TiUP to connect to the cluster and execute commands. However, in some scenarios, you might also need to use the SSH client native to the control machine system to perform such cluster operations. For example:

- To use a SSH plug-in for authentication
- To use a customized SSH client

Then you can use the `--native-ssh` command-line flag to enable the system-native command-line tool:

- Deploy a cluster: `tiup dm deploy <cluster-name> <version> <topo> --native-ssh ↪ ssh`
- Start a cluster: `tiup dm start <cluster-name> --native-ssh`
- Upgrade a cluster: `tiup dm upgrade ... --native-ssh`

You can add `--native-ssh` in all cluster operation commands above to use the system's native SSH client.

To avoid adding such a flag in every command, you can use the `TIUP_NATIVE_SSH` system variable to specify whether to use the local SSH client:

```
export TIUP_NATIVE_SSH=true  
##### or  
export TIUP_NATIVE_SSH=1  
##### or  
export TIUP_NATIVE_SSH=enable
```

If you specify this environment variable and `--native-ssh` at the same time, `--native-ssh` has higher priority.

Note:

During the process of cluster deployment, if you need to use a password for connection or `passphrase` is configured in the key file, you must ensure that `sshpass` is installed on the control machine; otherwise, a timeout error is reported.

11.9.5.1.2 Maintain DM Clusters Using dmctl

Note:

For DM clusters deployed using TiUP, you are recommended to directly use `tiup dmctl` to maintain the clusters.

`dmctl` is a command line tool used to maintain DM clusters. It supports both the interactive mode and the command mode.

Interactive mode

Enter the interactive mode to interact with DM-master:

Note:

The interactive mode does not support Bash features. For example, you need to directly pass string flags instead of passing them in quotes.

```
./dmctl --master-addr 172.16.30.14:8261
```

```
Welcome to dmctl
Release Version: ${version}
Git Commit Hash: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
Git Branch: release-x.x
UTC Build Time: yyyy-mm-dd hh:mm:ss
Go Version: go version gox.xx linux/amd64

» help
DM control

Usage:
  dmctl [command]

Available Commands:
  check-task    Checks the configuration file of the task.
  config        Commands to import/export config.
  get-config    Gets the configuration.
  handle-error  `skip`/`replace`/`revert` the current error event or a
  ↪ specific binlog position (binlog-pos) event.
```

```
help          Gets help about any command.
list-member   Lists member information.
offline-member Offlines member which has been closed.
operate-leader `evict`/`cancel-evict` the leader.
operate-schema `get`/`set`/`remove` the schema for an upstream table.
operate-source `create`/`stop`/`show` upstream MySQL/MariaDB source.
pause-relay   Pauses DM-worker's relay unit.
pause-task    Pauses a specified running task.
purge-relay   Purges relay log files of the DM-worker according to the
              ↪ specified filename.
query-status  Queries task status.
resume-relay  Resumes DM-worker's relay unit.
resume-task   Resumes a specified paused task.
show-ddl-locks Shows un-resolved DDL locks.
start-task    Starts a task as defined in the configuration file.
stop-task     Stops a specified task.
unlock-ddl-lock Unlocks DDL lock forcefully.
```

Flags:

```
-h, --help          Help for dmctl.
-s, --source strings MySQL Source ID.
```

Use "dmctl [command] --help" for more information about a command.

Command mode

The command mode differs from the interactive mode in that you need to append the task operation right after the dmctl command. The parameters of the task operation in the command mode are the same as those in the interactive mode.

Note:

- A dmctl command must be followed by only one task operation.
- Starting from v2.0.4, DM supports reading the `-master-addr` parameter from the environment variable `DM_MASTER_ADDR`.

```
./dmctl --master-addr 172.16.30.14:8261 start-task task.yaml
./dmctl --master-addr 172.16.30.14:8261 stop-task task
./dmctl --master-addr 172.16.30.14:8261 query-status
```

```
export DM_MASTER_ADDR="172.16.30.14:8261"
./dmctl query-status
```

Available Commands:

```
check-task      check-task <config-file> [--error count] [--warn count]
config          commands to import/export config
get-config      get-config <task | master | worker | source> <name> [--
    ↪ file filename]
handle-error    handle-error <task-name | task-file> [-s source ...] [-
    ↪ b binlog-pos] <skip/replace/revert> [replace-sql1;replace-sql2;]
list-member     list-member [--leader] [--master] [--worker] [--name
    ↪ master-name/worker-name ...]
offline-member  offline-member <--master/--worker> <--name master-name/
    ↪ worker-name>
operate-leader  operate-leader <operate-type>
operate-schema  operate-schema <operate-type> <-s source ...> <task-
    ↪ name | task-file> <-d database> <-t table> [schema-file]
operate-source  operate-source <operate-type> [config-file ...] [--
    ↪ print-sample-config]
pause-relay     pause-relay <-s source ...>
pause-task      pause-task [-s source ...] <task-name | task-file>
purge-relay     purge-relay <-s source> <-f filename> [--sub-dir
    ↪ directory]
query-status    query-status [-s source ...] [task-name | task-file]
    ↪ [--more]
resume-relay    resume-relay <-s source ...>
resume-task     resume-task [-s source ...] <task-name | task-file>
show-ddl-locks  show-ddl-locks [-s source ...] [task-name | task-file]
start-task      start-task [-s source ...] [--remove-meta] <config-file
    ↪ >
stop-task       stop-task [-s source ...] <task-name | task-file>
unlock-ddl-lock unlock-ddl-lock <lock-ID>
```

Special Commands:

```
--encrypt Encrypts plaintext to ciphertext.
--decrypt Decrypts ciphertext to plaintext.
```

Global Options:

```
--V Prints version and exit.
--config Path to configuration file.
--master-addr Master API server addr.
--rpc-timeout RPC timeout, default is 10m.
--ssl-ca Path of file that contains list of trusted SSL CAs for connection
    ↪ .
--ssl-cert Path of file that contains X509 certificate in PEM format for
    ↪ connection.
--ssl-key Path of file that contains X509 key in PEM format for connection
```

↪ .

11.9.5.1.3 Maintain DM Clusters Using OpenAPI

DM provides the OpenAPI feature for easily querying and operating the DM cluster, which is similar to the feature of `dmctl tools`. If you need to enable this feature, add the following configuration in the DM-master configuration file:

```
openapi = true
```

Note:

- DM provides the [specification document](#) that meets the OpenAPI 3.0.0 standard. This document contains all the request parameters and returned values. You can copy the document yaml and preview it in [Swagger Editor](#).
- After you deploy the DM-master nodes, you can access `http://{master ↪ -addr}/api/v1/docs` to preview the documentation online.

You can use the APIs to perform the following maintenance operations on the DM cluster:

APIs for managing clusters

- [Get the information of a DM-master node](#)
- [Stop a DM-master node](#)
- [Get the information of a DM-worker node](#)
- [Stop a DM-worker node](#)

APIs for managing data sources

- [Create a data source](#)
- [Get the data source list](#)
- [Delete the data source](#)
- [Get the information of a data source](#)
- [Start the relay-log feature for data sources](#)
- [Stop the relay-log feature for data sources](#)
- [Pause the relay-log feature for data sources](#)
- [Resume the relay-log feature for data sources](#)
- [Change the bindings between the data source and DM-workers](#)

- Get the list of schema names of a data source
- Get the list of table names of a specified schema in a data source

APIs for managing replication tasks

- Create a replication task
- Get the replication task list
- Stop a replication task
- Get the information of a replication task
- Pause a replication task
- Resume a replication task
- Get the list of schema names of the data source that is associated with a replication task
- Get the list of table names of a specified schema in the data source that is associated with a replication task
- Get the CREATE statement for schemas of the data source that is associated with a replication task
- Update the CREATE statement for schemas of the data source that is associated with a replication task
- Delete a schema of the data source that is associated with a replication task

The following sections describe the specific usage of the APIs.

API error message template

After sending an API request, if an error occurs, the returned error message is in the following format:

```
{
  "error_msg": "",
  "error_code": ""
}
```

From the above JSON output, `error_msg` describes the error message and `error_code` is the corresponding error code.

Get the information of a DM-master node

This API is a synchronous interface. If the request is successful, the information of the corresponding node is returned.

Request URI

GET `/api/v1/cluster/masters`

Example

```
curl -X 'GET' \
'http://127.0.0.1:8261/api/v1/cluster/masters' \
-H 'accept: application/json'
```

```
{
  "total": 1,
  "data": [
    {
      "name": "master1",
      "alive": true,
      "leader": true,
      "addr": "127.0.0.1:8261"
    }
  ]
}
```

Stop a DM-master node

This API is a synchronous interface. If the request is successful, the status code of the returned body is 204.

Request URI

DELETE /api/v1/cluster/masters/{master-name}

Example

```
curl -X 'DELETE' \
'http://127.0.0.1:8261/api/v1/cluster/masters/master1' \
-H 'accept: */*'
```

Get the information of a DM-worker node

This API is a synchronous interface. If the request is successful, the information of the corresponding node is returned.

Request URI

GET /api/v1/cluster/workers

Example

```
curl -X 'GET' \
'http://127.0.0.1:8261/api/v1/cluster/workers' \
-H 'accept: application/json'
```

```
{
  "total": 1,
  "data": [
    {
      "name": "worker1",
      "addr": "127.0.0.1:8261",
      "bound_stage": "bound",
      "bound_source_name": "mysql-01"
    }
  ]
}
```

```
}  
]  
}
```

Stop a DM-worker node

This API is a synchronous interface. If the request is successful, the status code of the returned body is 204.

Request URI

DELETE /api/v1/cluster/workers/{worker-name}

Example

```
curl -X 'DELETE' \  
'http://127.0.0.1:8261/api/v1/cluster/workers/worker1' \  
-H 'accept: */*'
```

Create a data source

This API is a synchronous interface. If the request is successful, the information of the corresponding data source is returned.

Request URI

POST /api/v1/sources

Example

```
curl -X 'POST' \  
'http://127.0.0.1:8261/api/v1/sources' \  
-H 'accept: application/json' \  
-H 'Content-Type: application/json' \  
-d '{  
  "source_name": "mysql-01",  
  "host": "127.0.0.1",  
  "port": 3306,  
  "user": "root",  
  "password": "123456",  
  "enable_gtid": false,  
  "security": {  
    "ssl_ca_content": "",  
    "ssl_cert_content": "",  
    "ssl_key_content": "",  
    "cert_allowed_cn": [  
      "string"  
    ]  
  },  
  "purge": {  
    "interval": 3600,  
  }  
}
```

```
"expires": 0,  
"remain_space": 15  
}  
'
```

```
{  
"source_name": "mysql-01",  
"host": "127.0.0.1",  
"port": 3306,  
"user": "root",  
"password": "123456",  
"enable_gtid": false,  
"security": {  
  "ssl_ca_content": "",  
  "ssl_cert_content": "",  
  "ssl_key_content": "",  
  "cert_allowed_cn": [  
    "string"  
  ]  
},

```

Get the data source list

This API is a synchronous interface. If the request is successful, the data source list is

returned.

Request URI

GET /api/v1/sources

Example

```
curl -X 'GET' \  
  'http://127.0.0.1:8261/api/v1/sources?with_status=true' \  
  -H 'accept: application/json'
```

```
{  
  "data": [  
    {  
      "enable_gtid": false,  
      "host": "127.0.0.1",  
      "password": "*****",  
      "port": 3306,  
      "purge": {  
        "expires": 0,  
        "interval": 3600,  
        "remain_space": 15  
      },  
      "security": null,  
      "source_name": "mysql-01",  
      "user": "root"  
    },  
    {  
      "enable_gtid": false,  
      "host": "127.0.0.1",  
      "password": "*****",  
      "port": 3307,  
      "purge": {  
        "expires": 0,  
        "interval": 3600,  
        "remain_space": 15  
      },  
      "security": null,  
      "source_name": "mysql-02",  
      "user": "root"  
    }  
  ],  
  "total": 2  
}
```

Delete the data source

This API is a synchronous interface. If the request is successful, the status code of the returned body is 204.

Request URI

DELETE /api/v1/sources/{source-name}

Example

```
curl -X 'DELETE' \  
'http://127.0.0.1:8261/api/v1/sources/mysql-01?force=true' \  
-H 'accept: application/json'
```

Get the information of a data source

This API is a synchronous interface. If the request is successful, the information of the corresponding node is returned.

Request URI

GET /api/v1/sources/{source-name}/status

Example

```
curl -X 'GET' \  
'http://127.0.0.1:8261/api/v1/sources/mysql-replica-01/status' \  
-H 'accept: application/json'
```

```
{  
  "total": 1,  
  "data": [  
    {  
      "source_name": "mysql-replica-01",  
      "worker_name": "worker-1",  
      "relay_status": {  
        "master_binlog": "(mysql-bin.000001, 1979)",  
        "master_binlog_gtid": "e9a1fc22-ec08-11e9-b2ac-0242ac110003:1-7849",  
        "relay_dir": "./sub_dir",  
        "relay_binlog_gtid": "e9a1fc22-ec08-11e9-b2ac-0242ac110003:1-7849",  
        "relay_catch_up_master": true,  
        "stage": "Running"  
      },  
      "error_msg": "string"  
    }  
  ]  
}
```

Start the relay-log feature for data sources

This API is an asynchronous interface. If the request is successful, the status code of the returned body is 200. To learn about its latest status, You can [get the information of a](#)

data source.

Request URI

POST /api/v1/sources/{source-name}/start-relay

Example

```
curl -X 'POST' \  
  'http://127.0.0.1:8261/api/v1/sources/mysql-01/start-relay' \  
  -H 'accept: */*' \  
  -H 'Content-Type: application/json' \  
  -d '{  
    "worker_name_list": [  
      "worker-1"  
    ],  
    "relay_binlog_name": "mysql-bin.000002",  
    "relay_binlog_gtid": "e9a1fc22-ec08-11e9-b2ac-0242ac110003:1-7849",  
    "relay_dir": "./relay_log"  
  }'
```

Stop the relay-log feature for data sources

This API is an asynchronous interface. If the request is successful, the status code of the returned body is 200. To learn about its latest status, You can [get the information of a data source](#).

Request URI

POST /api/v1/sources/{source-name}/stop-relay

Example

```
curl -X 'POST' \  
  'http://127.0.0.1:8261/api/v1/sources/mysql-01/stop-relay' \  
  -H 'accept: */*' \  
  -H 'Content-Type: application/json' \  
  -d '{  
    "worker_name_list": [  
      "worker-1"  
    ]  
  }'
```

Pause the relay-log feature for data sources

This API is an asynchronous interface. If the request is successful, the status code of the returned body is 200. To learn about its latest status, You can [get the information of a data source](#).

Request URI

POST /api/v1/sources/{source-name}/pause-relay

Example

```
curl -X 'POST' \  
  'http://127.0.0.1:8261/api/v1/sources/mysql-01/pause-relay' \  
  -H 'accept: */*'
```

Resume the relay-log feature for data sources

This API is an asynchronous interface. If the request is successful, the status code of the returned body is 200. To learn about its latest status, You can [get the information of a data source](#).

Request URI

POST /api/v1/sources/{source-name}/resume-relay

Example

```
curl -X 'POST' \  
  'http://127.0.0.1:8261/api/v1/sources/mysql-01/resume-relay' \  
  -H 'accept: */*'
```

Change the bindings between the data source and DM-workers

This API is an asynchronous interface. If the request is successful, the status code of the returned body is 200. To learn about its latest status, You can [get the information of a DM-worker node](#).

Request URI

POST /api/v1/sources/{source-name}/transfer

Example

```
curl -X 'POST' \  
  'http://127.0.0.1:8261/api/v1/sources/mysql-01/transfer' \  
  -H 'accept: */*' \  
  -H 'Content-Type: application/json' \  
  -d '{  
    "worker_name": "worker-1"  
  }'
```

Get the list of schema names of a data source

This API is a synchronous interface. If the request is successful, the corresponding list is returned.

Request URI

GET /api/v1/sources/{source-name}/schemas

Example

```
curl -X 'GET' \  
'http://127.0.0.1:8261/api/v1/sources/source-1/schemas' \  
-H 'accept: application/json'
```

```
[  
  "db1"  
]
```

Get the list of table names of a specified schema in a data source

This API is a synchronous interface. If the request is successful, the corresponding list is returned.

Request URI

GET /api/v1/sources/{source-name}/schemas/{schema-name}

Example

```
curl -X 'GET' \  
'http://127.0.0.1:8261/api/v1/sources/source-1/schemas/db1' \  
-H 'accept: application/json'
```

```
[  
  "table1"  
]
```

Create a replication task

This API is an asynchronous interface. If the request is successful, the status code of the returned body is 200. To learn about its latest status, You can [get the information of a replication task](#).

Request URI

POST /api/v1/tasks

Example

```
curl -X 'POST' \  
'http://127.0.0.1:8261/api/v1/tasks' \  
-H 'accept: application/json' \  
-H 'Content-Type: application/json' \  
-d '{  
  "remove_meta": false,  
  "task": {  
    "name": "task-1",  
    "task_mode": "all",  
    "shard_mode": "pessimistic",

```

Pause a replication task

This API is an asynchronous interface. If the request is successful, the status code of

the returned body is 200. To learn about its latest status, You can [get the information of a replication task](#).

Request URI

POST /api/v1/tasks/task-1/pause

Example

```
curl -X 'POST' \  
'http://127.0.0.1:8261/api/v1/tasks/task-1/pause' \  
-H 'accept: */*' \  
-H 'Content-Type: application/json' \  
-d '[  
"source-1"  
]'
```

Resume a replication task

This API is an asynchronous interface. If the request is successful, the status code of the returned body is 200. To learn about its latest status, You can [get the information of a replication task](#).

Request URI

POST /api/v1/tasks/task-1/resume

Example

```
curl -X 'POST' \  
'http://127.0.0.1:8261/api/v1/tasks/task-1/resume' \  
-H 'accept: */*' \  
-H 'Content-Type: application/json' \  
-d '[  
"source-1"  
]'
```

Get the list of schema names of the data source that is associated with a replication task

This API is a synchronous interface. If the request is successful, the corresponding list is returned.

Request URI

GET /api/v1/tasks/{task-name}/sources/{source-name}/schemas

Example

```
curl -X 'GET' \  
'http://127.0.0.1:8261/api/v1/tasks/task-1/sources/source-1/schemas' \  
-H 'accept: application/json'
```

```
[  
  "db1"  
]
```

Get the list of table names of a specified schema in the data source that is associated with a replication task

This API is a synchronous interface. If the request is successful, the corresponding list is returned.

Request URI

```
GET /api/v1/tasks/{task-name}/sources/{source-name}/schemas/{schema-name  
↪ }
```

Example

```
curl -X 'GET' \  
  'http://127.0.0.1:8261/api/v1/tasks/task-1/sources/source-1/schemas/db1' \  
  -H 'accept: application/json'
```

```
[  
  "table1"  
]
```

Get the CREATE statement for schemas of the data source that is associated with a replication task

This API is a synchronous interface. If the request is successful, the corresponding CREATE statement is returned.

Request URI

```
GET /api/v1/tasks/{task-name}/sources/{source-name}/schemas/{schema-name  
↪ }/{table-name}
```

Example

```
curl -X 'GET' \  
  'http://127.0.0.1:8261/api/v1/tasks/task-1/sources/source-1/schemas/db1/  
  ↪ table1' \  
  -H 'accept: application/json'
```

```
{  
  "schema_name": "db1",  
  "table_name": "table1",  
  "schema_create_sql": "CREATE TABLE `t1` (`id` int(11) NOT NULL  
  ↪ AUTO_INCREMENT,PRIMARY KEY (`id`) /*T![clustered_index] CLUSTERED  
  ↪ */) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin"  
}
```

Update the CREATE statement for schemas of the data source that is associated with a replication task

This API is a synchronous interface. If the request is successful, the status code of the returned body is 200.

Request URI

```
POST /api/v1/tasks/{task-name}/sources/{source-name}/schemas/{schema-  
↪ name}/{table-name}
```

Example

```
curl -X 'PUT' \  
'http://127.0.0.1:8261/api/v1/tasks/task-1/sources/task-1/schemas/db1/  
↪ table1' \  
-H 'accept: */*' \  
-H 'Content-Type: application/json' \  
-d '{  
  "sql_content": "CREATE TABLE `t1` ( `c1` int(11) DEFAULT NULL, `c2` int  
↪ (11) DEFAULT NULL, `c3` int(11) DEFAULT NULL) ENGINE=InnoDB DEFAULT  
↪ CHARSET=utf8mb4 COLLATE=utf8mb4_bin;",  
  "flush": true,  
  "sync": true  
}'
```

Delete a schema of the data source that is associated with a replication task

This API is a synchronous interface. If the request is successful, the status code of the returned body is 200.

Request URI

```
DELETE /api/v1/tasks/{task-name}/sources/{source-name}/schemas/{schema-  
↪ name}/{table-name}
```

Example

```
curl -X 'DELETE' \  
'http://127.0.0.1:8261/api/v1/tasks/task-1/sources/source-1/schemas/db1/  
↪ table1' \  
-H 'accept: */*'
```

11.9.5.2 Cluster Upgrade

11.9.5.2.1 Manually Upgrade TiDB Data Migration from v1.0.x to v2.0+

This document introduces how to manually upgrade the TiDB DM tool from v1.0.x to v2.0+. The main idea is to use the global checkpoint information in v1.0.x to start a new data migration task in the v2.0+ cluster.

For how to automatically upgrade the TiDB DM tool from v1.0.x to v2.0+, refer to [Using TiUP to automatically import the 1.0 cluster deployed by DM-Ansible](#).

Note:

- Currently, upgrading DM from v1.0.x to v2.0+ is not supported when the data migration task is in the process of full export or full import.
- As the gRPC protocol used for interaction between the components of the DM cluster is updated greatly, you need to make sure that the DM components (including dmctl) use the same version before and after the upgrade.
- Because the metadata storage of the DM cluster (such as checkpoint, shard DDL lock status and online DDL metadata, etc.) is updated greatly, the metadata of v1.0.x cannot be reused automatically in v2.0+. So you need to make sure the following requirements are satisfied before performing the upgrade operation:
 - All data migration tasks are not in the process of shard DDL coordination.
 - All data migration tasks are not in the process of online DDL coordination.

The steps for manual upgrade are as follows.

Step 1: Prepare v2.0+ configuration file

The prepared configuration files of v2.0+ include the configuration files of the upstream database and the configuration files of the data migration task.

Upstream database configuration file

In v2.0+, the [upstream database configuration file](#) is separated from the process configuration of the DM-worker, so you need to obtain the source configuration based on the [v1.0.x DM-worker configuration](#).

Note:

If `enable-gtid` in the source configuration is enabled during the upgrade from v1.0.x to v2.0+, you need to parse the binlog or relay log file to obtain the GTID sets corresponding to the binlog position.

Upgrade a v1.0.x cluster deployed by DM-Ansible

Assume that the v1.0.x DM cluster is deployed by DM-Ansible, and the following `dm_worker_servers` configuration is in the `inventory.ini` file:

```
[dm_master_servers]
dm_worker1 ansible_host=172.16.10.72 server_id=101 source_id="mysql-replica
↳ -01" mysql_host=172.16.10.81 mysql_user=root mysql_password='
↳ VjX8cEeTX+qcvZ3bPa04h0C80pe/1aU=' mysql_port=3306
dm_worker2 ansible_host=172.16.10.73 server_id=102 source_id="mysql-replica
↳ -02" mysql_host=172.16.10.82 mysql_user=root mysql_password='
↳ VjX8cEeTX+qcvZ3bPa04h0C80pe/1aU=' mysql_port=3306
```

Then you can convert it to the following two source configuration files:

```
##### The source configuration corresponding to the original dm_worker1. For
↳ example, it is named as source1.yaml.
server-id: 101 # Corresponds to the original `
↳ server_id`.
source-id: "mysql-replica-01" # Corresponds to the original `
↳ source_id`.
from:
  host: "172.16.10.81" # Corresponds to the original `
↳ mysql_host`.
  port: 3306 # Corresponds to the original `
↳ mysql_port`.
  user: "root" # Corresponds to the original `
↳ mysql_user`.
  password: "VjX8cEeTX+qcvZ3bPa04h0C80pe/1aU=" # Corresponds to the original
↳ `mysql_password`.
```

```
##### The source configuration corresponding to the original dm_worker2. For
↳ example, it is named as source2.yaml.
server-id: 102 # Corresponds to the original `
↳ server_id`.
source-id: "mysql-replica-02" # Corresponds to the original `
↳ source_id`.
from:
  host: "172.16.10.82" # Corresponds to the original `
↳ mysql_host`.
  port: 3306 # Corresponds to the original `
↳ mysql_port`.
  user: "root" # Corresponds to the original `
↳ mysql_user`.
  password: "VjX8cEeTX+qcvZ3bPa04h0C80pe/1aU=" # Corresponds to the original
↳ `mysql_password`.
```

Upgrade a v1.0.x cluster deployed by binary

Assume that the v1.0.x DM cluster is deployed by binary, and the corresponding DM-worker configuration is as follows:

```
log-level = "info"
log-file = "dm-worker.log"
worker-addr = ":8262"
server-id = 101
source-id = "mysql-replica-01"
flavor = "mysql"
[from]
host = "172.16.10.81"
user = "root"
password = "VjX8cEeTX+qcvZ3bPa04h0C80pe/1aU="
port = 3306
```

Then you can convert it to the following source configuration file:

```
server-id: 101 # Corresponds to the original `
  ↪ server-id`.
source-id: "mysql-replica-01" # Corresponds to the original `
  ↪ source-id`.
flavor: "mysql" # Corresponds to the original `
  ↪ flavor`.
from:
  host: "172.16.10.81" # Corresponds to the original `
    ↪ from.host`.
  port: 3306 # Corresponds to the original `
    ↪ from.port`.
  user: "root" # Corresponds to the original `
    ↪ from.user`.
  password: "VjX8cEeTX+qcvZ3bPa04h0C80pe/1aU=" # Corresponds to the original
    ↪ `from.password`.
```

Data migration task configuration file

For [data migration task configuration guide](#), v2.0+ is basically compatible with v1.0.x. You can directly copy the configuration of v1.0.x.

Step 2: Deploy the v2.0+ cluster

Note:

Skip this step if you have other v2.0+ clusters available.

Use [TiUP](#) to deploy a new v2.0+ cluster according to the required number of nodes.

Step 3: Stop the v1.0.x cluster

If the original v1.0.x cluster is deployed by DM-Ansible, you need to use [DM-Ansible to stop the v1.0.x cluster](#).

If the original v1.0.x cluster is deployed by binary, you can stop the DM-worker and DM-master processes directly.

Step 4: Upgrade data migration task

1. Use the `operate-source` command to load the upstream database source configuration from [step 1](#) into the v2.0+ cluster.
2. In the downstream TiDB cluster, obtain the corresponding global checkpoint information from the incremental checkpoint table of the v1.0.x data migration task.
 - Assume that the v1.0.x data migration configuration does not specify `meta->schema` (or specify its value as the default `dm_meta`), and the corresponding task name is `task_v1`, the corresponding checkpoint information is in the ``dm_meta`.`task_v1_syncer_checkpoint`` table of the downstream TiDB.
 - Use the following SQL statements to obtain the global checkpoint information of all upstream database sources corresponding to the data migration task.

```
> SELECT `id`, `binlog_name`, `binlog_pos` FROM `dm_meta`.`
    ↪ task_v1_syncer_checkpoint` WHERE `is_global`=1;
```

id	binlog_name	binlog_pos
mysql-replica-01	mysql-bin 000001.000123	15847
mysql-replica-02	mysql-bin 000001.000456	10485

3. Update the v1.0.x data migration task configuration file to start a new v2.0+ data migration task.
 - If the data migration task configuration file of v1.0.x is `task_v1.yaml`, copy it and rename it to `task_v2.yaml`.
 - Make the following changes to `task_v2.yaml`:
 - Modify `name` to a new name, such as `task_v2`.
 - Change `task-mode` to `incremental`.
 - Set the starting point of incremental replication for each source according to the global checkpoint information obtained in step 2. For example:

```
mysql-instances:
  - source-id: "mysql-replica-01" # Corresponds to the `id`
    ↪ of the checkpoint information.
    meta:
```

```
binlog-name: "mysql-bin.000123" # Corresponds to the `
  ↳ binlog_name` in the checkpoint information,
  ↳ excluding the part of `|000001`.
binlog-pos: 15847                # Corresponds to `
  ↳ binlog_pos` in the checkpoint information.

- source-id: "mysql-replica-02"
  meta:
    binlog-name: "mysql-bin.000456"
    binlog-pos: 10485
```

Note:

If `enable-gtid` is enabled in the source configuration, currently you need to parse the binlog or relay log file to obtain the GTID sets corresponding to the binlog position, and set it to `binlog-
↳ gtid` in the meta.

4. Use the `start-task` command to start the upgraded data migration task through the v2.0+ data migration task configuration file.
5. Use the `query-status` command to confirm whether the data migration task is running normally.

If the data migration task runs normally, it indicates that the DM upgrade to v2.0+ is successful.

11.9.5.3 Manage Data Source Configurations

This document introduces how to manage data source configurations, including encrypting the MySQL password, operating the data source, and changing the bindings between upstream MySQL instances and DM-workers using `dmctl`.

11.9.5.3.1 Encrypt the database password

In DM configuration files, it is recommended to use the password encrypted with `dmctl`. For one original password, the encrypted password is different after each encryption.

```
./dmctl -encrypt 'abc!@#123'
```

```
MKxn0Qo3m3X0yjCnhEMtsUCm83EhGQDZ/T4=
```

11.9.5.3.2 Operate data source

You can use the `operate-source` command to load, list or remove the data source configurations to the DM cluster.

```
help operate-source
```

```
`create`/`stop`/`show` upstream MySQL/MariaDB source.
```

Usage:

```
dmctl operate-source <operate-type> [config-file ...] [--print-sample-  
↪ config] [flags]
```

Flags:

```
-h, --help                help for operate-source  
-p, --print-sample-config print sample config file of source
```

Global Flags:

```
-s, --source strings MySQL Source ID
```

Flags description

- **create:** Creates one or more upstream database sources. When creating multiple data sources fails, DM rolls back to the state where the command was not executed.
- **stop:** Stops one or more upstream database sources. When stopping multiple data sources fails, some data sources might be stopped.
- **show:** Shows the added data source and the corresponding DM-worker.
- **config-file:** Specifies the file path of `source.yaml` and can pass multiple file paths.
- **--print-sample-config:** Prints the sample configuration file. This parameter ignores other parameters.

Usage example

Use the following `operate-source` command to create a source configuration file:

```
operate-source create ./source.yaml
```

For the configuration of `source.yaml`, refer to [Upstream Database Configuration File Introduction](#).

The following is an example of the returned result:

```
{  
  "result": true,  
  "msg": "",
```

```
"sources": [  
  {  
    "result": true,  
    "msg": "",  
    "source": "mysql-replica-01",  
    "worker": "dm-worker-1"  
  }  
]  
}
```

Check data source configurations

Note:

The `get-config` command is only supported in DM v2.0.1 and later versions.

If you know the `source-id`, you can run `dmctl --master-addr <master-addr> get-config source <source-id>` to get the data source configuration.

```
get-config source mysql-replica-01
```

```
{  
  "result": true,  
  "msg": "",  
  "cfg": "enable-gtid: false  
  flavor: mysql  
  source-id: mysql-replica-01  
  from:  
    host: 127.0.0.1  
    port: 8407  
    user: root  
    password: '*****'  
}
```

If you don't know the `source-id`, you can run `dmctl --master-addr <master-addr> operate-source show` to list all data sources first.

```
operate-source show
```

```
{  
  "result": true,  
  "msg": "",  
  "sources": [  
    {  
      "result": true,  
      "msg": "",  
      "source": "mysql-replica-01",  
      "worker": "dm-worker-1"  
    }  
  ]  
}
```

```

    {
      "result": true,
      "msg": "source is added but there is no free worker to bound",
      "source": "mysql-replica-02",
      "worker": ""
    },
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-01",
      "worker": "dm-worker-1"
    }
  ]
}

```

11.9.5.3.3 Change the bindings between upstream MySQL instances and DM-workers

You can use the `transfer-source` command to change the bindings between upstream MySQL instances and DM-workers.

```
help transfer-source
```

Transfers an upstream MySQL/MariaDB source to a free worker.

Usage:

```
dmctl transfer-source <source-id> <worker-id> [flags]
```

Flags:

```
-h, --help help for transfer-source
```

Global Flags:

```
-s, --source strings MySQL Source ID.
```

Before transferring, DM checks whether the worker to be unbound still has running tasks. If the worker has any running tasks, you need to **pause the tasks** first, change the binding, and then **resume the tasks**.

Usage example

If you do not know the bindings of DM-workers, you can run `dmctl --master-addr <master-addr> list-member --worker` to list the current bindings of all workers.

```
list-member --worker
```

```

{
  "result": true,
  "msg": "",
  "members": [

```

```

{
  "worker": {
    "msg": "",
    "workers": [
      {
        "name": "dm-worker-1",
        "addr": "127.0.0.1:8262",
        "stage": "bound",
        "source": "mysql-replica-01"
      },
      {
        "name": "dm-worker-2",
        "addr": "127.0.0.1:8263",
        "stage": "free",
        "source": ""
      }
    ]
  }
}

```

In the above example, `mysql-replica-01` is bound to `dm-worker-1`. The below command transfers the binding worker of `mysql-replica-01` to `dm-worker-2`.

```
transfer-source mysql-replica-01 dm-worker-2
```

```

{
  "result": true,
  "msg": ""
}

```

Check whether the command takes effect by running `dmctl --master-addr <master-addr> list-member --worker`.

```
list-member --worker
```

```

{
  "result": true,
  "msg": "",
  "members": [
    {
      "worker": {
        "msg": "",
        "workers": [

```

```
- source-id: "mysql-replica-01" # Migrate data from the data source whose
  ↪ `source-id` is `mysql-replica-01`.
- source-id: "mysql-replica-02" # Migrate data from the data source whose
  ↪ `source-id` is `mysql-replica-02`.
```

Configure the downstream TiDB cluster

The following example of `target-database` shows how to configure the target TiDB cluster to be migrated to for the data migration task:

```
---
##### ***** Basic configuration *****
name: test          # The name of the task. Should be globally unique.

##### ***** Data source configuration *****
mysql-instances:
- source-id: "mysql-replica-01" # Migrate data from the data source whose
  ↪ `source-id` is `mysql-replica-01`.
- source-id: "mysql-replica-02" # Migrate data from the data source whose
  ↪ `source-id` is `mysql-replica-02`.

##### ***** Downstream TiDB database configuration *****
target-database:   # Configuration of target TiDB database.
  host: "127.0.0.1"
  port: 4000
  user: "root"
  password: ""     # If the password is not null, it is recommended to use
  ↪ a password encrypted with dmctl.
```

Configure tables to be migrated

Note:

If you do not need to filter specific tables or migrate specific tables, skip this configuration.

To configure the block and allow list of data source tables for the data migration task, perform the following steps:

1. Configure a global filter rule set of the block and allow list in the task configuration file.

```
block-allow-list:
  bw-rule-1:                # The name of the block and allow
    ↪ list rule.
  do-dbs: ["test.*", "user"] # The allow list of upstream schemas
    ↪ to be migrated. Wildcard characters (*?) are supported. You
    ↪ only need to configure either `do-dbs` or `ignore-dbs`. If
    ↪ both fields are configured, only `do-dbs` takes effect.
  # ignore-dbs: ["mysql", "account"] # The block list of upstream
    ↪ schemas to be migrated. Wildcard characters (*?) are
    ↪ supported.
  do-tables:                # The allow list of upstream tables
    ↪ to be migrated. You only need to configure either `do-tables`
    ↪ or `ignore-tables`. If both fields are configured, only `do-
    ↪ tables` takes effect.
  - db-name: "test.*"
    tbl-name: "t.*"
  - db-name: "user"
    tbl-name: "information"
  bw-rule-2:                # The name of the block allow list
    ↪ rule.
  ignore-tables:            # The block list of data source tables
    ↪ needs to be migrated.
  - db-name: "user"
    tbl-name: "log"
```

For detailed configuration rules, see [Block and allow table lists](#).

2. Reference the block and allow list rules in the data source configuration to filter tables to be migrated.

```
mysql-instances:
  - source-id: "mysql-replica-01" # Migrate data from the data source
    ↪ whose `source-id` is `mysql-replica-01`.
    block-allow-list: "bw-rule-1" # The name of the block and allow
      ↪ list rule. If the DM version is earlier than v2.0.0-beta.2,
      ↪ use `black-white-list` instead.
  - source-id: "mysql-replica-02" # Migrate data from the data source
    ↪ whose `source-id` is `mysql-replica-02`.
    block-allow-list: "bw-rule-2" # The name of the block and allow
      ↪ list rule. If the DM version is earlier than v2.0.0-beta.2,
      ↪ use `black-white-list` instead.
```

Configure binlog events to be migrated

Note:

If you do not need to filter specific binlog events of certain schemas or tables, skip this configuration.

To configure the filters of binlog events for the data migration task, perform the following steps:

1. Configure a global filter rule set of binlog events in the task configuration file.

```
filters: # The filter rule set of data
  ↪ source binlog events. You can set multiple rules at the same
  ↪ time.
filter-rule-1: # The name of the filtering
  ↪ rule.
  schema-pattern: "test_*" # The pattern of the data
  ↪ source schema name. Wildcard characters (*?) are supported.
  table-pattern: "t_*" # The pattern of the data
  ↪ source table name. Wildcard characters (*?) are supported.
  events: ["truncate table", "drop table"] # The event types to be
  ↪ filtered out in schemas or tables that match the `schema-
  ↪ pattern` or the `table-pattern`.
  action: Ignore # Whether to migrate (Do) or
  ↪ ignore (Ignore) the binlog that matches the filtering rule.
filter-rule-2:
  schema-pattern: "test"
  events: ["all dml"]
  action: Do
```

For detailed configuration rules, see [Binlog event filter](#).

2. Reference the binlog event filtering rules in the data source configuration to filter specified binlog events of specified tables or schemas in the data source.

```
mysql-instances:
- source-id: "mysql-replica-01" # Migrate data from the data source
  ↪ whose `source-id` is `mysql-replica-01`.
  block-allow-list: "bw-rule-1" # The name of the block and allow
  ↪ list rule. If the DM version is earlier than v2.0.0-beta.2,
  ↪ use `black-white-list` instead.
  filter-rules: ["filter-rule-1"] # The name of the rule that filters
  ↪ specific binlog events of the data source. You can configure
  ↪ multiple rules here.
```

```

- source-id: "mysql-replica-02" # Migrate data from the data source
  ↳ whose `source-id` is `mysql-replica-01`.
block-allow-list: "bw-rule-2" # The name of the block and allow
  ↳ list rule. If the DM version is earlier than v2.0.0-beta.2,
  ↳ use `black-white-list` instead.
filter-rules: ["filter-rule-2"] # The name of the rule that filters
  ↳ specific binlog events of the data source. You can configure
  ↳ multiple rules here.

```

Configure the mapping of data source tables to downstream TiDB tables

Note:

- If you do not need to migrate a certain table of the data source to the table with a different name in the downstream TiDB instance, skip this configuration.
- If it is a shard merge task, you **must** set mapping rules in the task configuration file.

To configure the routing mapping rules for migrating data source tables to specified downstream TiDB tables, perform the following steps:

1. Configure a global routing mapping rule set in the task configuration file.

```

routes: # The routing mapping rule set between
  ↳ the data source tables and downstream TiDB tables. You can set
  ↳ multiple rules at the same time.
route-rule-1: # The name of the routing mapping rule.
  schema-pattern: "test_*" # The pattern of the upstream schema name
    ↳ . Wildcard characters (*?) are supported.
  table-pattern: "t_*" # The pattern of the upstream table name.
    ↳ Wildcard characters (*?) are supported.
  target-schema: "test" # The name of the downstream TiDB schema.
  target-table: "t" # The name of the downstream TiDB table.
route-rule-2:
  schema-pattern: "test_*"
  target-schema: "test"

```

For detailed configuration rules, see [Table Routing](#).

2. Reference the routing mapping rules in the data source configuration to filter tables to be migrated.

```
mysql-instances:
- source-id: "mysql-replica-01"           # Migrate data from the
  ↪ data source whose `source-id` is `mysql-replica-01`.
  block-allow-list: "bw-rule-1"          # The name of the block
  ↪ and allow list rule. If the DM version is earlier than v2
  ↪ .0.0-beta.2, use `black-white-list` instead.
  filter-rules: ["filter-rule-1"]       # The name of the rule
  ↪ that filters specific binlog events of the data source. You
  ↪ can configure multiple rules here.
  route-rules: ["route-rule-1", "route-rule-2"] # The name of the
  ↪ routing mapping rule. You can configure multiple rules here.
- source-id: "mysql-replica-02"           # Migrate data from the
  ↪ data source whose `source-id` is `mysql-replica-02`.
  block-allow-list: "bw-rule-2"          # The name of the block
  ↪ and allow list rule. If the DM version is earlier than v2
  ↪ .0.0-beta.2, use `black-white-list` instead.
  filter-rules: ["filter-rule-2"]       # The name of the rule
  ↪ that filters specific binlog events of the data source. You
  ↪ can configure multiple rules here.
```

Configure a shard merge task

Note:

- If you need to migrate sharding DDL statements in a shard merge scenario, you **must** explicitly configure the `shard-mode` field. Otherwise, **DO NOT** configure `shard-mode` at all.
- Migrating sharding DDL statements is likely to cause many issues. Make sure you understand the principles and restrictions of DM migrating DDL statements before using this feature, and you **must** use this feature with caution.

The following example shows how to configure the task as a shard merge task:

```
---
##### ***** Basic information *****
name: test                               # The name of the task. Should be globally
  ↪ unique.
```

```
shard-mode: "pessimistic" # The shard merge mode. Optional modes are ""/"
↳ pessimistic"/"optimistic". The "" mode is used by default which means
↳ sharding DDL merge is disabled. If the task is a shard merge task,
↳ set it to the "pessimistic" mode. After getting a deep understanding
↳ of the principles and restrictions of the "optimistic" mode, you can
↳ set it to the "optimistic" mode.
```

Other configurations

The following is an overall task configuration example of this document. The complete task configuration template can be found in [DM task configuration file full introduction](#). For the usage and configuration of other configuration items, refer to [Features of Data Migration](#).

```
---

##### ***** Basic configuration *****
name: test # The name of the task. Should be globally
↳ unique.
shard-mode: "pessimistic" # The shard merge mode. Optional modes are ""/"
↳ pessimistic"/"optimistic". The "" mode is used by default which means
↳ sharding DDL merge is disabled. If the task is a shard merge task,
↳ set it to the "pessimistic" mode. After getting a deep understanding
↳ of the principles and restrictions of the "optimistic" mode, you can
↳ set it to the "optimistic" mode.
task-mode: all # The task mode. Can be set to `full`(only
↳ migrates full data)/`incremental`(replicates binlog synchronously)/`
↳ all` (replicates both full and incremental binlogs).
timezone: "UTC" # The timezone used in SQL Session. By default,
↳ DM uses the global timezone setting in the target cluster, which
↳ ensures the correctness automatically. A customized timezone does not
↳ affect data migration but is unnecessary.

##### ***** Data source configuration *****
mysql-instances:
- source-id: "mysql-replica-01" # Migrate data from the data
↳ source whose `source-id` is `mysql-replica-01`.
  block-allow-list: "bw-rule-1" # The name of the block and
↳ allow list rule. If the DM version is earlier than v2.0.0-beta.2,
↳ use `black-white-list` instead.
  filter-rules: ["filter-rule-1"] # The name of the rule that
↳ filters specific binlog events of the data source. You can
↳ configure multiple rules here.
  route-rules: ["route-rule-1", "route-rule-2"] # The name of the routing
↳ mapping rule. You can configure multiple rules here.
- source-id: "mysql-replica-02" # Migrate data from the data
↳ source whose `source-id` is `mysql-replica-02`.
```

```
block-allow-list: "bw-rule-2"          # The name of the block and
    ↪ allow list rule. If the DM version is earlier than v2.0.0-beta.2,
    ↪ use `black-white-list` instead.
filter-rules: ["filter-rule-2"]       # The name of the rule that
    ↪ filters specific binlog events of the data source. You can
    ↪ configure multiple rules here.
route-rules: ["route-rule-2"]        # The name of the routing
    ↪ mapping rule. You can configure multiple rules here.

##### ***** Downstream TiDB instance configuration *****
target-database: # Configuration of the downstream database instance.
  host: "127.0.0.1"
  port: 4000
  user: "root"
  password: "" # If the password is not null, it is recommended to use
    ↪ a password encrypted with dmctl.

##### ***** Feature configuration set *****
##### The filter rule set of tables to be migrated from the upstream
    ↪ database instance. You can set multiple rules at the same time.
block-allow-list: # Use black-white-list if the DM version
    ↪ is earlier than v2.0.0-beta.2.
bw-rule-1: # The name of the block and allow list
    ↪ rule.
do-dbs: ["test.*", "user"] # The allow list of upstream schemas to
    ↪ be migrated. Wildcard characters (*?) are supported. You only need
    ↪ to configure either `do-dbs` or `ignore-dbs`. If both fields are
    ↪ configured, only `do-dbs` takes effect.
# ignore-dbs: ["mysql", "account"] # The block list of upstream schemas
    ↪ to be migrated. Wildcard characters (*?) are supported.
do-tables: # The allow list of upstream tables to be
    ↪ migrated. You only need to configure either `do-tables` or `
    ↪ ignore-tables`. If both fields are configured, only `do-tables`
    ↪ takes effect.
- db-name: "test.*"
  tbl-name: "t.*"
- db-name: "user"
  tbl-name: "information"
bw-rule-2: # The name of the block allow list rule.
ignore-tables: # The block list of data source tables
    ↪ needs to be migrated.
- db-name: "user"
  tbl-name: "log"

##### The filter rule set of data source binlog events.
```

```

filters:                                # You can set multiple rules at
    ↪ the same time.
filter-rule-1:                          # The name of the filtering rule.
    schema-pattern: "test_*"            # The pattern of the data source
    ↪ schema name. Wildcard characters (*?) are supported.
    table-pattern: "t_*"               # The pattern of the data source
    ↪ table name. Wildcard characters (*?) are supported.
    events: ["truncate table", "drop table"] # The event types to be
    ↪ filtered out in schemas or tables that match the `schema-pattern`
    ↪ or the `table-pattern`.
    action: Ignore                      # Whether to migrate (Do) or
    ↪ ignore (Ignore) the binlog that matches the filtering rule.
filter-rule-2:
    schema-pattern: "test"
    events: ["all dml"]
    action: Do

##### The routing mapping rule set between the data source and target TiDB
    ↪ instance tables.
routes:                                  # You can set multiple rules at the same time.
    route-rule-1:                      # The name of the routing mapping rule.
        schema-pattern: "test_*"      # The pattern of the data source schema name.
        ↪ Wildcard characters (*?) are supported.
        table-pattern: "t_*"          # The pattern of the data source table name.
        ↪ Wildcard characters (*?) are supported.
        target-schema: "test"         # The name of the downstream TiDB schema.
        target-table: "t"            # The name of the downstream TiDB table.
    route-rule-2:
        schema-pattern: "test_*"
        target-schema: "test"

```

11.9.5.4.2 Precheck the Upstream MySQL Instance Configurations

This document introduces the precheck feature provided by DM. This feature is used to detect possible errors in the upstream MySQL instance configuration when the data migration task is started.

Command

`check-task` allows you to precheck whether the upstream MySQL instance configuration satisfies the DM requirements.

Checking items

Upstream and downstream database users must have the corresponding read and write privileges. DM checks the following privileges and configuration automatically while the data migration task is started:

- Database version
 - MySQL version > 5.5
 - MariaDB version >= 10.1.2

Warning:

Support for MySQL 8.0 is an experimental feature of TiDB Data Migration v2.0 and later versions. It is **NOT** recommended that you use it in a production environment.

- Database configuration
 - Whether `server_id` is configured
- MySQL binlog configuration
 - Whether the binlog is enabled (DM requires that the binlog must be enabled)
 - Whether `binlog_format=ROW` (DM only supports migration of the binlog in the ROW format)
 - Whether `binlog_row_image=FULL` (DM only supports `binlog_row_image=FULL`)
- The privileges of the upstream MySQL instance users

MySQL users in DM configuration need to have the following privileges at least:

 - REPLICATION SLAVE
 - REPLICATION CLIENT
 - RELOAD
 - SELECT
- The compatibility of the upstream MySQL table schema

TiDB differs from MySQL in compatibility in the following aspects:

 - TiDB does not support the foreign key.
 - **Character set compatibility differs.**

DM will also check whether the primary key or unique key restriction exists in all upstream tables. This check is introduced in v1.0.7.
- The consistency of the sharded tables in the multiple upstream MySQL instances
 - The schema consistency of all sharded tables
 - * Column size
 - * Column name

- * Column position
 - * Column type
 - * Primary key
 - * Unique index
- The conflict of the auto increment primary keys in the sharded tables
- * The check fails in the following two conditions:
 - The auto increment primary key exists in the sharded tables and its column type *is not* bigint.
 - The auto increment primary key exists in the sharded tables and its column type *is* bigint, but column mapping *is not* configured.
 - * The check succeeds in other conditions except the two above.

Disable checking items

DM checks items according to the task type, and you can use `ignore-checking-items` \hookrightarrow in the task configuration file to disable checking items. The list of element options for `ignore-checking-items` is as follows:

Element	Description
all	Disables all checks
dump_privileges	Disables checking dump-related privileges of the upstream MySQL instance user

Element	Description
replication_repl_privileges	Disables checking replication-related privileges of the upstream MySQL instance user
version	Disables checking the upstream database version
server_id	Disables checking the upstream database server_id
binlog_enabled	Disables checking whether the upstream database has binlog enabled

Element	Description
---------	-------------

binlog_format=row	Disables checking whether the binlog format of the upstream database is ROW
-------------------	---

binlog_row_image=FULL	Disables checking whether the binlog_row_image of the upstream database is FULL
-----------------------	---

table_schema_compatibility_check	Disables checking the compatibility of the upstream MySQL table schema
----------------------------------	--

Element	Description
schema_disabled_tables	check- ing whether the schemas of up- stream MySQL sharded tables are consis- tent in the multi- instance shard- ing sce- nario
auto_increment_ID	check- ing the con- flicts of auto- increment pri- mary keys of the up- stream MySQL shared tables in the multi- instance shard- ing sce- nario

11.9.5.4.3 Create a Data Migration Task

You can use the `start-task` command to create a data migration task. When the data migration task is started, DM [prechecks privileges and configurations](#).

```
help start-task
```

Starts a task as defined in the configuration file

Usage:

```
dmctl start-task [-s source ...] [--remove-meta] <config-file> [flags]
```

Flags:

```
-h, --help          Help for start-task
--remove-meta       Whether to remove task's metadata
```

Global Flags:

```
-s, --source strings MySQL Source ID
```

Usage example

```
start-task [ -s "mysql-replica-01" ] ./task.yaml
```

Flags description

- `-s`: (Optional) Specifies the MySQL source to execute `task.yaml`. If it is set, the command only starts the subtasks of the specified task on the MySQL source.
- `config-file`: (Required) Specifies the file path of `task.yaml`.
- `remove-meta`: (Optional) Specifies whether to remove the task's previous metadata when starting the task.

Returned results

```
start-task task.yaml
```

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-01",
      "worker": "worker1"
    }
  ]
}
```

11.9.5.4.4 Query Status

This document introduces how to use the `query-status` command to query the task status, and the subtask status of DM.

Query result

```
» query-status
```

```
{
  "result": true,    # Whether the query is successful.
  "msg": "",        # Describes the reason for the unsuccessful query.
  "tasks": [        # Migration task list.
    {
      "taskName": "test",    # The task name.
      "taskStatus": "Running", # The status of the task.
      "sources": [          # The upstream MySQL list.
        "mysql-replica-01",
        "mysql-replica-02"
      ]
    },
    {
      "taskName": "test2",
      "taskStatus": "Paused",
      "sources": [
        "mysql-replica-01",
        "mysql-replica-02"
      ]
    }
  ]
}
```

For detailed descriptions of `taskStatus` under the `tasks` section, refer to [Task status](#).

It is recommended that you use `query-status` by the following steps:

1. Use `query-status` to check whether each on-going task is in the normal state.
2. If any error occurs in a task, use the `query-status <taskName>` command to see detailed error information. `<taskName>` in this command indicates the name of the task that encounters the error.

Task status

The status of a DM migration task depends on the status of each subtask assigned to DM-worker. For detailed descriptions of subtask status, see [Subtask status](#). The table below shows how the subtask status is related to task status.

```

For the status description and status switch relationship of “stage” of “subTaskStatus” of “sources”, see the [subtask status](#).

For operation details of “unresolvedDDLLockID” of “subTaskStatus” of “sources”, see [Handle Sharding DDL Locks Manually](#).

Subtask status

Status description

- **New:**
 - The initial status.
 - If the subtask does not encounter an error, it is switched to **Running**; otherwise it is switched to **Paused**.
- **Running:** The normal running status.
- **Paused:**
 - The paused status.

- If the subtask encounters an error, it is switched to **Paused**.
- If you run `pause-task` when the subtask is in the **Running** status, the task is switched to **Paused**.
- When the subtask is in this status, you can run the `resume-task` command to resume the task.

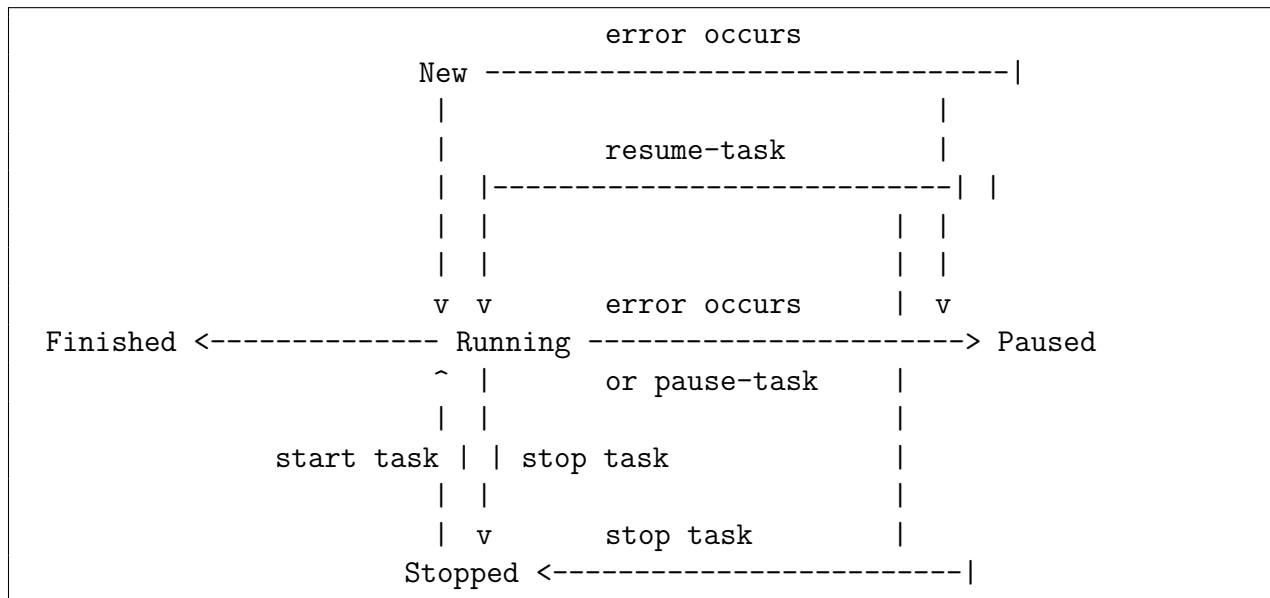

- **Stopped:**

- The stopped status.
- If you run `stop-task` when the subtask is in the **Running** or **Paused** status, the task is switched to **Stopped**.
- When the subtask is in this status, you cannot use `resume-task` to resume the task.

- **Finished:**

- The finished subtask status.
- Only when the full replication subtask is finished normally, the task is switched to this status.

Status switch diagram

11.9.5.4.5 Pause a Data Migration Task

You can use the `pause-task` command to pause a data migration task.

`pause-task` differs from `stop-task` in that:

- `pause-task` only pauses a migration task. You can query the status information (retained in the memory) of the task using `query-status`. `stop-task` terminates a

migration task and removes all information related to this task from the memory. This means you cannot use `query-status` to query the status information. `dm_meta` like “checkpoint” and data that have been migrated to the downstream are not removed.

- If `pause-task` is executed to pause the migration task, you cannot start a new task with the same name, neither can you get the relay log of the paused task removed, since this task does exist. If `stop-task` is executed to stop a task, you can start a new task with the same name, and you can get the relay log of the stopped task removed, since this task no longer exists.
- `pause-task` is usually used to pause a task for troubleshooting, while `stop-task` is to permanently remove a migration task, or to co-work with `start-task` to update the configuration information.

```
help pause-task
```

```
pause a specified running task
```

```
Usage:
```

```
dmctl pause-task [-s source ...] <task-name | task-file> [flags]
```

```
Flags:
```

```
-h, --help help for pause-task
```

```
Global Flags:
```

```
-s, --source strings MySQL Source ID
```

Usage example

```
pause-task [-s "mysql-replica-01"] task-name
```

Flags description

- `-s`: (Optional) Specifies the MySQL source where you want to pause the subtasks of the migration task. If it is set, this command pauses only the subtasks on the specified MySQL source.
- `task-name| task-file`: (Required) Specifies the task name or task file path.

Returned results

```
pause-task test
```

```
{
  "op": "Pause",
  "result": true,
  "msg": "",
  "sources": [
```

```
{
  {
    "result": true,
    "msg": "",
    "source": "mysql-replica-01",
    "worker": "worker1"
  }
]
```

11.9.5.4.6 Resume a Data Migration Task

You can use the `resume-task` command to resume a data migration task in the Paused \leftrightarrow state. This is generally used in scenarios where you want to manually resume a data migration task after handling the error that get the task paused.

```
help resume-task
```

```
resume a specified paused task
```

Usage:

```
dmctl resume-task [-s source ...] <task-name | task-file> [flags]
```

Flags:

```
-h, --help help for resume-task
```

Global Flags:

```
-s, --source strings MySQL Source ID
```

Usage example

```
resume-task [-s "mysql-replica-01"] task-name
```

Flags description

- `-s`: (Optional) Specifies the MySQL source where you want to resume the subtask of the migration task. If it is set, the command resumes only the subtasks on the specified MySQL source.
- `task-name | task-file`: (Required) Specifies the task name or task file path.

Returned results

```
resume-task test
```

```
{
  "op": "Resume",
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-01",
      "worker": "worker1"
    }
  ]
}
```

11.9.5.4.7 Stop a Data Migration Task

You can use the `stop-task` command to stop a data migration task. For differences between `stop-task` and `pause-task`, refer to [Pause a Data Migration Task](#).

```
help stop-task
```

```
stop a specified task
```

Usage:

```
dmctl stop-task [-s source ...] <task-name | task-file> [flags]
```

Flags:

```
-h, --help help for stop-task
```

Global Flags:

```
-s, --source strings MySQL Source ID
```

Usage example

```
stop-task [-s "mysql-replica-01"] task-name
```

Flags description

- `-s`: (Optional) Specifies the MySQL source where the subtasks of the migration task (that you want to stop) run. If it is set, only subtasks on the specified MySQL source are stopped.
- `task-name | task-file`: (Required) Specifies the task name or task file path.

Returned results

```
stop-task test
```

```
{
  "op": "Stop",
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-01",
      "worker": "worker1"
    }
  ]
}
```

11.9.5.4.8 Export and Import Data Sources and Task Configuration of Clusters

`config` command is used to export and import data sources and task configuration of clusters.

Note:

For clusters earlier than v2.0.5, you can use `dmctl` v2.0.5 or later to export and import the data source and task configuration files.

```
» help config
Commands to import/export config
Usage:
  dmctl config [command]
Available Commands:
  export      Export the configurations of sources and tasks.
  import      Import the configurations of sources and tasks.
Flags:
  -h, --help help for config
Global Flags:
  -s, --source strings MySQL Source ID.
Use "dmctl config [command] --help" for more information about a command.
```

Export the data source and task configuration of clusters

You can use `export` command to export the data source and task configuration of clusters to specified files.

```
config export [--dir directory]
```

Parameter explanation

- `dir:`
 - optional
 - specifies the file path for exporting
 - the default value is `./configs`

Returned results

```
config export -d /tmp/configs
```

```
export configs to directory `/tmp/configs` succeed
```

import the data source and task configuration of clusters

You can use `import` command to import the data source and task configuration of clusters from specified files.

```
config import [--dir directory]
```

Note:

For clusters later than v2.0.2, currently, it is not supported to automatically import the configuration related to relay worker. You can use `start-relay` command to manually [start relay log](#).

Parameter explanation

- `dir:`
 - optional
 - specifies the file path for importing
 - the default value is `./configs`

Returned results

```
config import -d /tmp/configs
```

```
start creating sources  
start creating tasks  
import configs from directory `/tmp/configs` succeed
```

11.9.5.4.9 Handle Failed DDL Statements

This document introduces how to handle failed DDL statements when you're using the TiDB Data Migration (DM) tool to migrate data.

Currently, TiDB is not completely compatible with all MySQL syntax (see [the DDL statements supported by TiDB](#)). Therefore, when DM is migrating data from MySQL to TiDB and TiDB does not support the corresponding DDL statement, an error might occur and break the migration process. In this case, you can use the `handle-error` command of DM to resume the migration.

Restrictions

If it is unacceptable in the actual production environment that the failed DDL statement is skipped in the downstream TiDB and it cannot be replaced with other DDL statements, then do not use this command.

For example, `DROP PRIMARY KEY`. In this scenario, you can only create a new table in the downstream with the new table schema (after executing the DDL statement), and re-import all the data into this new table.

Supported scenarios

During the migration, the DDL statement unsupported by TiDB is executed in the upstream and migrated to the downstream, and as a result, the migration task gets interrupted.

- If it is acceptable that this DDL statement is skipped in the downstream TiDB, then you can use `handle-error <task-name> skip` to skip migrating this DDL statement and resume the migration.
- If it is acceptable that this DDL statement is replaced with other DDL statements, then you can use `handle-error <task-name> replace` to replace this DDL statement and resume the migration.

Command

When you use `dmctl` to manually handle the failed DDL statements, the commonly used commands include `query-status` and `handle-error`.

`query-status`

The `query-status` command is used to query the current status of items such as the subtask and the relay unit in each MySQL instance. For details, see [query status](#).

`handle-error`

The `handle-error` command is used to handle the failed DDL statements.

Command usage

```
» handle-error -h
```

Usage:

```
dmctl handle-error <task-name | task-file> [-s source ...] [-b binlog-pos]
  ↪ <skip/replace/revert> [replace-sql1;replace-sql2;] [flags]
```

Flags:

```
-b, --binlog-pos string position used to match binlog event if matched the
  ↪ handler-error operation will be applied. The format like "mysql-bin
  ↪ |000001.000003:3270"
-h, --help                help for handle-error
```

Global Flags:

```
-s, --source strings MySQL Source ID
```

Flags descriptions

- **task-name:**
 - Non-flag parameter, string, required
 - **task-name** specifies the name of the task in which the preset operation is going to be executed.
- **source:**
 - Flag parameter, string, **--source**
 - **source** specifies the MySQL instance in which the preset operation is to be executed.
- **skip:** Skip the error
- **replace:** Replace the failed DDL statement
- **revert:** Reset the previous skip/replace operation before the error occurs (only reset it when the previous skip/replace operation has not finally taken effect)
- **binlog-pos:**
 - Flag parameter, string, **--binlog-pos**
 - If it is not specified, DM automatically handles the currently failed DDL statement.
 - If it is specified, the skip operation is executed when **binlog-pos** matches with the position of the binlog event. The format is **binlog-filename:binlog-pos**, for example, **mysql-bin|000001.000003:3270**.
 - After the migration returns an error, the binlog position can be obtained from **position** in **startLocation** returned by **query-status**. Before the migration returns an error, the binlog position can be obtained by using **SHOW BINLOG** ↪ **EVENTS** in the upstream MySQL instance.

Usage examples

Skip DDL if the migration gets interrupted

Non-shard-merge scenario

Assume that you need to migrate the upstream table `db1.tb11` to the downstream TiDB. The initial table schema is:

```
SHOW CREATE TABLE db1.tb11;
```

```
+-----+-----+
| Table | Create Table |
+-----+-----+
| tb11 | CREATE TABLE `tb11` (
  `c1` int(11) NOT NULL,
  `c2` decimal(11,3) DEFAULT NULL,
  PRIMARY KEY (`c1`)
) ENGINE=InnoDB DEFAULT CHARSET=latin1 |
+-----+-----+
```

Now, the following DDL statement is executed in the upstream to alter the table schema (namely, alter `DECIMAL(11, 3)` of `c2` into `DECIMAL(10, 3)`):

```
ALTER TABLE db1.tb11 CHANGE c2 c2 DECIMAL (10, 3);
```

Because this DDL statement is not supported by TiDB, the migration task of DM gets interrupted. Execute the `query-status <task-name>` command, and you can see the following error:

```
ERROR 8200 (HY000): Unsupported modify column: can't change decimal column
↳ precision
```

Assume that it is acceptable in the actual production environment that this DDL statement is not executed in the downstream TiDB (namely, the original table schema is retained). Then you can use `handle-error <task-name> skip` to skip this DDL statement to resume the migration. The procedures are as follows:

1. Execute `handle-error <task-name> skip` to skip the currently failed DDL statement:

```
» handle-error test skip
```

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
```

```
        "result": true,  
        "msg": "",  
        "source": "mysql-replica-01",  
        "worker": "worker1"  
    }  
]  
}
```

2. Execute `query-status <task-name>` to view the task status:

```
» query-status test
```

See the execution result.

```
{  
  "result": true,  
  "msg": "",  
  "sources": [  
    {  
      "result": true,  
      "msg": "",  
      "sourceStatus": {  
        "source": "mysql-replica-01",  
        "worker": "worker1",  
        "result": null,  
        "relayStatus": null  
      },  
      "subTaskStatus": [  
        {  
          "name": "test",  
          "stage": "Running",  
          "unit": "Sync",  
          "result": null,  
          "unresolvedDDLLockID": "",  
          "sync": {  
            "totalEvents": "4",  
            "totalTps": "0",  
            "recentTps": "0",  
            "masterBinlog": "(DESKTOP-T561TS0-bin.000001,  
              ↪ 2388)",  
            "masterBinlogGtid": "143bdef3-dd4a-11ea-8b00-00155  
              ↪ de45f57:1-10",  
            "syncerBinlog": "(DESKTOP-T561TS0-bin.000001,  
              ↪ 2388)",  
            "syncerBinlogGtid": "143bdef3-dd4a-11ea-8b00-00155  
              ↪ de45f57:1-4",  
          }  
        }  
      ]  
    }  
  ]  
}
```

```

        "blockingDDLs": [
        ],
        "unresolvedGroups": [
        ],
        "synced": true,
        "binlogType": "remote"
    }
}
]
}
]
}

```

You can see that the task runs normally and the wrong DDL is skipped.

Shard merge scenario

Assume that you need to merge and migrate the following four tables in the upstream to one same table `shard_db`.`shard_table` in the downstream. The task mode is “pessimistic”.

- MySQL instance 1 contains the `shard_db_1` schema, which includes the `shard_table_1` ↔ and `shard_table_2` tables.
- MySQL instance 2 contains the `shard_db_2` schema, which includes the `shard_table_1` ↔ and `shard_table_2` tables.

The initial table schema is:

```
SHOW CREATE TABLE shard_db.shard_table;
```

```

+--
↪ -----+-----
↪
| Table | Create Table
↪
↪ |
+--
↪ -----+-----
↪
| tb   | CREATE TABLE `shard_table` (
  `id` int(11) DEFAULT NULL,
  PRIMARY KEY (`id`)
) ENGINE=InnoDB DEFAULT CHARSET=latin1 COLLATE=latin1_bin |
+--
↪ -----+-----
↪

```

Now, execute the following DDL statement to all upstream sharded tables to alter their character set:

```
ALTER TABLE `shard_db_*`.`shard_table_*` CHARACTER SET LATIN1 COLLATE
↳ LATIN1_DANISH_CI;
```

Because this DDL statement is not supported by TiDB, the migration task of DM gets interrupted. Execute the `query-status` command, and you can see the following errors reported by the `shard_db_1.shard_table_1` table in MySQL instance 1 and the `shard_db_2` `↳ .shard_table_1` table in MySQL instance 2:

```
{
  "Message": "cannot track DDL: ALTER TABLE `shard_db_1`.`shard_table_1`
↳ CHARACTER SET UTF8 COLLATE UTF8_UNICODE_CI",
  "RawCause": "[ddl:8200]Unsupported modify charset from latin1 to utf8"
}
```

```
{
  "Message": "cannot track DDL: ALTER TABLE `shard_db_2`.`shard_table_1`
↳ CHARACTER SET UTF8 COLLATE UTF8_UNICODE_CI",
  "RawCause": "[ddl:8200]Unsupported modify charset from latin1 to utf8"
}
```

Assume that it is acceptable in the actual production environment that this DDL statement is not executed in the downstream TiDB (namely, the original table schema is retained). Then you can use `handle-error <task-name> skip` to skip this DDL statement to resume the migration. The procedures are as follows:

1. Execute `handle-error <task-name> skip` to skip the currently failed DDL statements in MySQL instance 1 and 2:

```
» handle-error test skip
```

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-01",
      "worker": "worker1"
    },
    {
      "result": true,
      "msg": "",

```

```
        "source": "mysql-replica-02",
        "worker": "worker2"
    }
]
}
```

2. Execute the `query-status` command, and you can see the errors reported by the `shard_db_1.shard_table_2` table in MySQL instance 1 and the `shard_db_2 ↔ .shard_table_2` table in MySQL instance 2:

```
{
  "Message": "cannot track DDL: ALTER TABLE `shard_db_1`.``
    ↔ shard_table_2` CHARACTER SET UTF8 COLLATE UTF8_UNICODE_CI",
  "RawCause": "[ddl:8200]Unsupported modify charset from latin1 to
    ↔ utf8"
}
```

```
{
  "Message": "cannot track DDL: ALTER TABLE `shard_db_2`.``
    ↔ shard_table_2` CHARACTER SET UTF8 COLLATE UTF8_UNICODE_CI",
  "RawCause": "[ddl:8200]Unsupported modify charset from latin1 to
    ↔ utf8"
}
```

3. Execute `handle-error <task-name> skip` again to skip the currently failed DDL statements in MySQL instance 1 and 2:

```
» handle-error test skip
```

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-01",
      "worker": "worker1"
    },
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-02",
      "worker": "worker2"
    }
  ]
}
```

```
]
}
```

4. Use `query-status <task-name>` to view the task status:

```
> query-status test
```

See the execution result.

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "sourceStatus": {
        "source": "mysql-replica-01",
        "worker": "worker1",
        "result": null,
        "relayStatus": null
      },
      "subTaskStatus": [
        {
          "name": "test",
          "stage": "Running",
          "unit": "Sync",
          "result": null,
          "unresolvedDDLLockID": "",
          "sync": {
            "totalEvents": "4",
            "totalTps": "0",
            "recentTps": "0",
            "masterBinlog": "(DESKTOP-T561TS0-bin.000001,
              ↪ 2388)",
            "masterBinlogGtid": "143bdef3-dd4a-11ea-8b00-00155
              ↪ de45f57:1-10",
            "syncerBinlog": "(DESKTOP-T561TS0-bin.000001,
              ↪ 2388)",
            "syncerBinlogGtid": "143bdef3-dd4a-11ea-8b00-00155
              ↪ de45f57:1-4",
            "blockingDDLs": [
              ],
            "unresolvedGroups": [
              ],
            "synced": true,

```

```
        "binlogType": "remote"
      }
    }
  ],
},
{
  "result": true,
  "msg": "",
  "sourceStatus": {
    "source": "mysql-replica-02",
    "worker": "worker2",
    "result": null,
    "relayStatus": null
  },
  "subTaskStatus": [
    {
      "name": "test",
      "stage": "Running",
      "unit": "Sync",
      "result": null,
      "unresolvedDDLLockID": "",
      "sync": {
        "totalEvents": "4",
        "totalTps": "0",
        "recentTps": "0",
        "masterBinlog": "(DESKTOP-T561TS0-bin.000001,
        ↪ 2388)",
        "masterBinlogGtid": "143bdef3-dd4a-11ea-8b00-00155
        ↪ de45f57:1-10",
        "syncerBinlog": "(DESKTOP-T561TS0-bin.000001,
        ↪ 2388)",
        "syncerBinlogGtid": "143bdef3-dd4a-11ea-8b00-00155
        ↪ de45f57:1-4",
        "blockingDDLs": [
        ],
        "unresolvedGroups": [
        ],
        "synced": true,
        "binlogType": "remote"
      }
    }
  ]
}
]
```

You can see that the task runs normally with no error and all four wrong DDL statements are skipped.

Replace DDL if the migration gets interrupted

Non-shard-merge scenario

Assume that you need to migrate the upstream table `db1.tb11` to the downstream TiDB. The initial table schema is:

```
SHOW CREATE TABLE db1.tb11;
```

```
+--
↪ -----+-----
↪
| Table | Create Table
↪
↪ |
+--
↪ -----+-----
↪
| tb   | CREATE TABLE `tb11` (
      | `id` int(11) DEFAULT NULL,
      | PRIMARY KEY (`id`)
      | ) ENGINE=InnoDB DEFAULT CHARSET=latin1 COLLATE=latin1_bin |
+--
↪ -----+-----
↪
```

Now, perform the following DDL operation in the upstream to add a new column with the UNIQUE constraint:

```
ALTER TABLE `db1`.`tb11` ADD COLUMN new_col INT UNIQUE;
```

Because this DDL statement is not supported by TiDB, the migration task gets interrupted. Execute the `query-status` command, and you can see the following error:

```
{
  "Message": "cannot track DDL: ALTER TABLE `db1`.`tb11` ADD COLUMN `
    ↪ new_col` INT UNIQUE KEY",
  "RawCause": "[ddl:8200]unsupported add column 'new_col' constraint
    ↪ UNIQUE KEY when altering 'db1.tb11'",
}
```

You can replace this DDL statement with two equivalent DDL statements. The steps are as follows:

1. Replace the wrong DDL statement by the following command:

```
» handle-error test replace "ALTER TABLE `db1`.`tbl1` ADD COLUMN `
↳ new_col` INT;ALTER TABLE `db1`.`tbl1` ADD UNIQUE(`new_col`);"
```

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-01",
      "worker": "worker1"
    }
  ]
}
```

2. Use query-status <task-name> to view the task status:

```
» query-status test
```

See the execution result.

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "sourceStatus": {
        "source": "mysql-replica-01",
        "worker": "worker1",
        "result": null,
        "relayStatus": null
      },
      "subTaskStatus": [
        {
          "name": "test",
          "stage": "Running",
          "unit": "Sync",
          "result": null,
          "unresolvedDDLLockID": "",
          "sync": {
            "totalEvents": "4",

```

```

        "totalTps": "0",
        "recentTps": "0",
        "masterBinlog": "(DESKTOP-T561TS0-bin.000001,
        ↪ 2388)",
        "masterBinlogGtid": "143bdef3-dd4a-11ea-8b00-00155
        ↪ de45f57:1-10",
        "syncerBinlog": "(DESKTOP-T561TS0-bin.000001,
        ↪ 2388)",
        "syncerBinlogGtid": "143bdef3-dd4a-11ea-8b00-00155
        ↪ de45f57:1-4",
        "blockingDDLs": [
        ],
        "unresolvedGroups": [
        ],
        "synced": true,
        "binlogType": "remote"
    }
}
]
}
}

```

You can see that the task runs normally and the wrong DDL statement is replaced by new DDL statements that execute successfully.

Shard merge scenario

Assume that you need to merge and migrate the following four tables in the upstream to one same table `shard_db`.`shard_table` in the downstream. The task mode is “pessimistic”.

- In the MySQL instance 1, there is a schema `shard_db_1`, which has two tables `shard_table_1` and `shard_table_2`.
- In the MySQL instance 2, there is a schema `shard_db_2`, which has two tables `shard_table_1` and `shard_table_2`.

The initial table schema is:

```
SHOW CREATE TABLE shard_db.shard_table;
```

```
+--
```

```
↪ -----+
```

```
↪
```

```

| Table | Create Table
  ↪
  ↪ |
+---
  ↪ -----+-----
  ↪
| tb   | CREATE TABLE `shard_table` (
  `id` int(11) DEFAULT NULL,
  PRIMARY KEY (`id`)
) ENGINE=InnoDB DEFAULT CHARSET=latin1 COLLATE=latin1_bin |
+---
  ↪ -----+-----
  ↪

```

Now, perform the following DDL operation to all upstream sharded tables to add a new column with the UNIQUE constraint:

```
ALTER TABLE `shard_db_*`.`shard_table_*` ADD COLUMN new_col INT UNIQUE;
```

Because this DDL statement is not supported by TiDB, the migration task gets interrupted. Execute the `query-status` command, and you can see the following errors reported by the `shard_db_1.shard_table_1` table in MySQL instance 1 and the `shard_db_2.shard_table_1` table in MySQL instance 2:

```
{
  "Message": "cannot track DDL: ALTER TABLE `shard_db_1`.`shard_table_1`
  ↪ ADD COLUMN `new_col` INT UNIQUE KEY",
  "RawCause": "[ddl:8200]unsupported add column 'new_col' constraint
  ↪ UNIQUE KEY when altering 'shard_db_1.shard_table_1'",
}
```

```
{
  "Message": "cannot track DDL: ALTER TABLE `shard_db_2`.`shard_table_1`
  ↪ ADD COLUMN `new_col` INT UNIQUE KEY",
  "RawCause": "[ddl:8200]unsupported add column 'new_col' constraint
  ↪ UNIQUE KEY when altering 'shard_db_2.shard_table_1'",
}
```

You can replace this DDL statement with two equivalent DDL statements. The steps are as follows:

1. Replace the wrong DDL statements respectively in MySQL instance 1 and MySQL instance 2 by the following commands:

```

» handle-error test -s mysql-replica-01 replace "ALTER TABLE `
  ↪ shard_db_1`.`shard_table_1` ADD COLUMN `new_col` INT;ALTER TABLE
  ↪ `shard_db_1`.`shard_table_1` ADD UNIQUE(`new_col`);"

```

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-01",
      "worker": "worker1"
    }
  ]
}
```

```
» handle-error test -s mysql-replica-02 replace "ALTER TABLE `
↳ shard_db_2`.`shard_table_1` ADD COLUMN `new_col` INT;ALTER TABLE
↳ `shard_db_2`.`shard_table_1` ADD UNIQUE(`new_col`);"
```

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-02",
      "worker": "worker2"
    }
  ]
}
```

2. Use `query-status <task-name>` to view the task status, and you can see the following errors reported by the `shard_db_1.shard_table_2` table in MySQL instance 1 and the `shard_db_2.shard_table_2` table in MySQL instance 2:

```
{
  "Message": "detect inconsistent DDL sequence from source ... ddls:
↳ [ALTER TABLE `shard_db`.`tb` ADD COLUMN `new_col` INT UNIQUE
↳ KEY] source: `shard_db_1`.`shard_table_2`, right DDL
↳ sequence should be ..."
}
```

```
{
  "Message": "detect inconsistent DDL sequence from source ... ddls:
↳ [ALTER TABLE `shard_db`.`tb` ADD COLUMN `new_col` INT UNIQUE
```

```
    ↪ KEY] source: `shard_db_2`.`shard_table_2`], right DDL
    ↪ sequence should be ..."
}
```

3. Execute `handle-error <task-name> replace` again to replace the wrong DDL statements in MySQL instance 1 and 2:

```
» handle-error test -s mysql-replica-01 replace "ALTER TABLE `
  ↪ shard_db_1`.`shard_table_2` ADD COLUMN `new_col` INT;ALTER TABLE
  ↪ `shard_db_1`.`shard_table_2` ADD UNIQUE(`new_col`);"
```

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-01",
      "worker": "worker1"
    }
  ]
}
```

```
» handle-error test -s mysql-replica-02 replace "ALTER TABLE `
  ↪ shard_db_2`.`shard_table_2` ADD COLUMN `new_col` INT;ALTER TABLE
  ↪ `shard_db_2`.`shard_table_2` ADD UNIQUE(`new_col`);"
```

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-02",
      "worker": "worker2"
    }
  ]
}
```

4. Use `query-status <task-name>` to view the task status:

```
» query-status test
```

See the execution result.

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "sourceStatus": {
        "source": "mysql-replica-01",
        "worker": "worker1",
        "result": null,
        "relayStatus": null
      },
      "subTaskStatus": [
        {
          "name": "test",
          "stage": "Running",
          "unit": "Sync",
          "result": null,
          "unresolvedDDLLockID": "",
          "sync": {
            "totalEvents": "4",
            "totalTps": "0",
            "recentTps": "0",
            "masterBinlog": "(DESKTOP-T561TS0-bin.000001,
              ↪ 2388)",
            "masterBinlogGtid": "143bdef3-dd4a-11ea-8b00-00155
              ↪ de45f57:1-10",
            "syncerBinlog": "(DESKTOP-T561TS0-bin.000001,
              ↪ 2388)",
            "syncerBinlogGtid": "143bdef3-dd4a-11ea-8b00-00155
              ↪ de45f57:1-4",
            "blockingDDLs": [
            ],
            "unresolvedGroups": [
            ],
            "unresolvedGroups": [
            ],
            "synced": true,
            "binlogType": "remote"
          }
        }
      ]
    }
  ]
}
```

```
  },
  {
    "result": true,
    "msg": "",
    "sourceStatus": {
      "source": "mysql-replica-02",
      "worker": "worker2",
      "result": null,
      "relayStatus": null
    },
    "subTaskStatus": [
      {
        "name": "test",
        "stage": "Running",
        "unit": "Sync",
        "result": null,
        "unresolvedDDLLockID": "",
        "sync": {
          "totalEvents": "4",
          "totalTps": "0",
          "recentTps": "0",
          "masterBinlog": "(DESKTOP-T561TS0-bin.000001,
            ↪ 2388)",
          "masterBinlogGtid": "143bdef3-dd4a-11ea-8b00-00155
            ↪ de45f57:1-10",
          "syncerBinlog": "(DESKTOP-T561TS0-bin.000001,
            ↪ 2388)",
          "syncerBinlogGtid": "143bdef3-dd4a-11ea-8b00-00155
            ↪ de45f57:1-4",
          "blockingDDLs": [
            ],
          "unresolvedGroups": [
            ],
          "unresolvedGroups": [
            ],
          "synced": true,
          "binlogType": "remote"
        }
      }
    ]
  }
]
```

You can see that the task runs normally with no error and all four wrong DDL state-

ments are replaced.

11.9.5.5 Handle Sharding DDL Locks Manually in DM

DM uses the sharding DDL lock to ensure operations are performed in the correct order. This locking mechanism resolves sharding DDL locks automatically in most cases, but you need to use the `unlock-ddl-lock` command to manually handle the abnormal DDL locks in some abnormal scenarios.

Note:

- This document only applies to the processing of sharding DDL lock in pessimistic coordination mode.
- The commands in the Command usage sections in this document are in interactive mode. In command-line mode, you need to add the escape characters to avoid an error report.
- Do not use `unlock-ddl-lock` or `break-ddl-lock` unless you are totally aware of the possible impacts brought by the command and you can accept them.
- Before manually handling the abnormal DDL locks, make sure that you have already read the DM [shard merge principles](#).

11.9.5.5.1 Command

`show-ddl-locks`

This command queries the current DDL lock information on DM-master.

Command usage

```
show-ddl-locks [--source=mysql-replica-01] [task-name | task-file]
```

Arguments description

- `source`:
 - Flag; string; `--source`; optional
 - It can be specified repeatedly multiple times.
 - If it is not specified, this command queries the lock information related to all MySQL sources; if it is specified, this command queries the lock information related only to the specified MySQL source.
- `task-name | task-file`:

- Non-flag; string; optional
- If it is not specified, this command queries the lock information related to all tasks; if it is specified, this command queries the lock information related only to the specified task.

Example of results

```

> show-ddl-locks test
{
  "result": true,                # The result of the
    ↪ query for the lock information.
  "msg": "",                    # The additional
    ↪ message for the failure to query the lock information or other
    ↪ descriptive information (for example, the lock task does not
    ↪ exist).
  "locks": [                   # The existing lock
    ↪ information list.
    {
      "ID": "test-`shard_db`.`shard_table`", # The lock ID, which is
        ↪ made up of the current task name and the schema/table
        ↪ information corresponding to the DDL.
      "task": "test",           # The name of the task
        ↪ to which the lock belongs.
      "mode": "pessimistic"     # The shard DDL mode.
        ↪ Can be set to "pessimistic" or "optimistic".
      "owner": "mysql-replica-01", # The owner of the lock
        ↪ (the ID of the first source that encounters this DDL
        ↪ operation in the pessimistic mode), which is always empty
        ↪ in the optimistic mode.
      "DDLs": [                # The list of DDL
        ↪ operations corresponding to the lock in the pessimistic
        ↪ mode, which is always empty in the optimistic mode.
        "USE `shard_db`; ALTER TABLE `shard_db`.`shard_table` DROP
        ↪ COLUMN `c2`;"
      ],
      "synced": [              # The list of sources
        ↪ that have received all sharding DDL events in the
        ↪ corresponding MySQL instance.
        "mysql-replica-01"
      ],
      "unsynced": [           # The list of sources
        ↪ that have not yet received all sharding DDL events in the
        ↪ corresponding MySQL instance.
        "mysql-replica-02"
      ]
    }
  ]
}

```

```
}  
  ]  
}
```

`unlock-ddl-lock`

This command actively requests `DM-master` to unlock the specified DDL lock, including requesting the owner to execute the DDL statement, requesting all other DM-workers that are not the owner to skip the DDL statement, and removing the lock information on `DM-master`.

Note:

Currently, `unlock DDL lock` takes effect only for the lock in the `pessimistic` mode.

Command usage

```
unlock-ddl-lock [--owner] [--force-remove] <lock-ID>
```

Arguments description

- `owner`:
 - Flag; string; `--owner`; optional
 - If it is not specified, this command requests for the default owner (the owner in the result of `show-ddl-locks`) to execute the DDL statement; if it is specified, this command requests for the MySQL source (the alternative of the default owner) to execute the DDL statement.
 - The new owner should not be specified unless the original owner is already removed from the cluster.
- `force-remove`:
 - Flag; boolean; `--force-remove`; optional
 - If it is not specified, this command removes the lock information only when the owner succeeds to execute the DDL statement; if it is specified, this command forcefully removes the lock information even though the owner fails to execute the DDL statement (after doing this you cannot query or operate on the lock again).
- `lock-ID`:
 - Non-flag; string; required

- It specifies the ID of the DDL lock that needs to be unlocked (the ID in the result of `show-ddl-locks`).

Example of results

```
» unlock-ddl-lock test-`shard_db`.`shard_table`
{
  "result": true,           # The result of the
    ↪ unlocking operation.
  "msg": "",               # The additional
    ↪ message for the failure to unlock the lock.
}
```

11.9.5.5.2 Supported scenarios

Currently, the `unlock-ddl-lock` command only supports handling sharding DDL locks in the following two abnormal scenarios.

Scenario 1: Some MySQL sources are removed

The reason for the abnormal lock

Before `DM-master` tries to automatically unlock the sharding DDL lock, all the MySQL sources need to receive the sharding DDL events (for details, see [shard merge principles](#)). If the sharding DDL event is already in the migration process, and some MySQL sources have been removed and are not to be reloaded (these MySQL sources have been removed according to the application demand), then the sharding DDL lock cannot be automatically migrated and unlocked because not all the DM-workers can receive the DDL event.

Note:

If you need to make some DM-workers offline when not in the process of migrating sharding DDL events, a better solution is to use `stop-task` to stop the running tasks first, make the DM-workers go offline, remove the corresponding configuration information from the task configuration file, and finally use `start-task` and the new task configuration to restart the migration task.

Manual solution

Suppose that there are two instances MySQL-1 (`mysql-replica-01`) and MySQL-2 (`mysql ↪ -replica-02`) in the upstream, and there are two tables `shard_db_1.shard_table_1` and `shard_db_1.shard_table_2` in MySQL-1 and two tables `shard_db_2.shard_table_1` and `shard_db_2.shard_table_2` in MySQL-2. Now we need to merge the four tables and migrate them into the table `shard_db.shard_table` in the downstream TiDB.

The initial table structure is:

```
SHOW CREATE TABLE shard_db_1.shard_table_1;
+-----+-----+
| Table          | Create Table                               |
+-----+-----+
| shard_table_1 | CREATE TABLE `shard_table_1` (
  `c1` int(11) NOT NULL,
  PRIMARY KEY (`c1`)
) ENGINE=InnoDB DEFAULT CHARSET=latin1 |
+-----+-----+
```

The following DDL operation will be executed on the upstream sharded tables to alter the table structure:

```
ALTER TABLE shard_db_*.shard_table_* ADD COLUMN c2 INT;
```

The operation processes of MySQL and DM are as follows:

1. The corresponding DDL operations are executed on the two sharded tables of mysql-
↔ replica-01 to alter the table structures.

```
ALTER TABLE shard_db_1.shard_table_1 ADD COLUMN c2 INT;
```

```
ALTER TABLE shard_db_1.shard_table_2 ADD COLUMN c2 INT;
```

2. DM-worker sends the received DDL information of the two sharded tables of mysql-
↔ replica-01 to DM-master, and DM-master creates the corresponding DDL lock.
3. Use show-ddl-lock to check the information of the current DDL lock.

```
» show-ddl-locks test
{
  "result": true,
  "msg": "",
  "locks": [
    {
      "ID": "test-`shard_db`.`shard_table`",
      "task": "test",
      "mode": "pessimistic"
      "owner": "mysql-replica-01",
      "DDLs": [
        "USE `shard_db`; ALTER TABLE `shard_db`.`shard_table` ADD
        ↔ COLUMN `c2` int(11);"
      ],
      "synced": [
        "mysql-replica-01"
      ]
    }
  ]
}
```

```

    ],
    "unsynced": [
        "mysql-replica-02"
    ]
  }
]
}

```

4. Due to the application demand, the data corresponding to `mysql-replica-02` is no longer needed to be migrated to the downstream TiDB, and `mysql-replica-02` is removed.
5. The lock whose ID is `test-`shard_db`.`shard_table`` on DM-master cannot receive the DDL information of `mysql-replica-02`.
 - The returned result `unsynced` by `show-ddl-locks` has always included the information of `mysql-replica-02`.
6. Use `unlock-ddl-lock` to ask DM-master to actively unlock the DDL lock.
 - If the owner of the DDL lock has gone offline, you can use the parameter `--owner` to specify another DM-worker as the new owner to execute the DDL.
 - If any MySQL source reports an error, `result` will be set to `false`, and at this point you should check carefully if the errors of each MySQL source is acceptable and within expectations.

```
unlock-ddl-lock test-`shard_db`.`shard_table`
```

```
{
  "result": true,
  "msg": ""
}
```

7. Use `show-ddl-locks` to confirm if the DDL lock is unlocked successfully.

```

>> show-ddl-locks test
{
  "result": true,
  "msg": "no DDL lock exists",
  "locks": [
  ]
}

```

8. Check whether the table structure is altered successfully in the downstream TiDB.

```
mysql> SHOW CREATE TABLE shard_db.shard_table;
+-----+-----+
| Table      | Create Table                                     |
+-----+-----+
| shard_table | CREATE TABLE `shard_table` (
  `c1` int(11) NOT NULL,
  `c2` int(11) DEFAULT NULL,
  PRIMARY KEY (`c1`)
) ENGINE=InnoDB DEFAULT CHARSET=latin1 COLLATE=latin1_bin |
+-----+-----+
```

9. Use `query-status` to confirm if the migration task is normal.

Impact

After you have manually unlocked the lock by using `unlock-ddl-lock`, if you don't deal with the offline MySQL sources included in the task configuration information, the lock might still be unable to be migrated automatically when the next sharding DDL event is received.

Therefore, after you have manually unlocked the DDL lock, you should perform the following operations:

1. Use `stop-task` to stop the running tasks.
2. Update the task configuration file, and remove the related information of the offline MySQL source from the configuration file.
3. Use `start-task` and the new task configuration file to restart the task.

Note:

After you run `unlock-ddl-lock`, if the MySQL source that went offline is reloaded and the DM-worker tries to migrate the data of the sharded tables, a match error between the data and the downstream table structure might occur.

Scenario 2: Some DM-workers stop abnormally or the network failure occurs during the DDL unlocking process

The reason for the abnormal lock

After `DM-master` receives the DDL events of all DM-workers, automatically running `unlock DDL lock` mainly include the following steps:

1. Ask the owner of the lock to execute the DDL and update the checkpoints of corresponding sharded tables.
2. Remove the DDL lock information stored on `DM-master` after the owner successfully executes the DDL.
3. Ask all other non-owners to skip the DDL and update the checkpoints of corresponding sharded tables after the owner successfully executes the DDL.
4. `DM-master` removes the corresponding DDL lock information after all the owners or non-owners' operations are successful.

Currently, the above unlocking process is not atomic. If the non-owner skips the DDL operation successfully, the `DM-worker` where the non-owner is located stops abnormally or a network anomaly occurs with the downstream TiDB, which can cause the checkpoint updating to fail.

When the MySQL source corresponding to the non-owner restores data migration, the non-owner tries to request the `DM-master` to re-coordinate the DDL operation that has been coordinated before the exception occurs and will never receives the corresponding DDL operation from other MySQL sources. This can cause the DDL operation to automatically unlock the corresponding lock.

Manual solution

Suppose that now we have the same upstream and downstream table structures and the same demand for merging tables and migration as in the manual solution of [Some MySQL sources are removed](#).

When `DM-master` automatically executes the unlocking process, the owner (`mysql-↔ replica-01`) successfully executes the DDL and continues the migration process. However, in the process of requesting the non-owner (`mysql-replica-02`) to skip the DDL operation, the checkpoint fails to update after the `DM-worker` skips the DDL operation because the corresponding `DM-worker` was restarted.

After the data migration subtask corresponding to `mysql-replica-02` restores, a new lock is created on the `DM-master`, but other MySQL sources have executed or skipped DDL operations and are performing subsequent migration.

The operation processes are:

1. Use `show-ddl-locks` to confirm if the corresponding lock of the DDL exists on `DM-↔ master`.

Only `mysql-replica-02` is at the `synced` state.

```
» show-ddl-locks
{
  "result": true,
  "msg": "",
  "locks": [
    {
```

```

    "ID": "test-`shard_db`.`shard_table`",
    "task": "test",
    "mode": "pessimistic"
    "owner": "mysql-replica-02",
    "DDLs": [
        "USE `shard_db`; ALTER TABLE `shard_db`.`shard_table` ADD
        ↪ COLUMN `c2` int(11);"
    ],
    "synced": [
        "mysql-replica-02"
    ],
    "unsynced": [
        "mysql-replica-01"
    ]
  }
]
}

```

2. Use `unlock-ddl-lock` to ask DM-master to unlock the lock.

- During the unlocking process, the owner tries to execute the DDL operation to the downstream again (the original owner before restarting has executed the DDL operation to the downstream once). Make sure that the DDL operation can be executed multiple times.

```

unlock-ddl-lock test-`shard_db`.`shard_table`
{
  "result": true,
  "msg": "",
}

```

3. Use `show-ddl-locks` to confirm if the DDL lock has been successfully unlocked.

4. Use `query-status` to confirm if the migration task is normal.

Impact

After manually unlocking the lock, the following sharding DDL can be migrated automatically and normally.

11.9.5.6 Switch DM-worker Connection between Upstream MySQL Instances

When the upstream MySQL instance that DM-worker connects to needs downtime maintenance or when the instance crashes unexpectedly, you need to switch the DM-worker connection to another MySQL instance within the same migration group.

Note:

- You can switch the DM-worker connection to only an instance within the same primary-secondary migration cluster.
- The MySQL instance to be newly connected to must have the binlog required by DM-worker.
- DM-worker must operate in the GTID sets mode, which means you must specify `enable-gtid: true` in the corresponding source configuration file.
- The connection switch only supports the following two scenarios. Strictly follow the procedures for each scenario. Otherwise, you might have to re-deploy the DM cluster according to the newly connected MySQL instance and perform the data migration task all over again.

For more details on GTID set, refer to [MySQL documentation](#).

11.9.5.6.1 Switch DM-worker connection via virtual IP

When DM-worker connects the upstream MySQL instance via a virtual IP (VIP), switching the VIP connection to another MySQL instance means switching the MySQL instance connected to DM-worker, without the upstream connection address changed.

Note:

Make necessary changes to DM in this scenario. Otherwise, when you switch the VIP connection to another MySQL instance, DM might connect to the new and old MySQL instances at the same time in different connections. In this situation, the binlog replicated to DM is not consistent with other upstream status that DM receives, causing unpredictable anomalies and even data damage.

To switch one upstream MySQL instance (when DM-worker connects to it via a VIP) to another, perform the following steps:

1. Use the `query-status` command to get the GTID sets (`syncerBinlogGtid`) corresponding to the binlog that the current processing unit of binlog replication has replicated to the downstream. Mark the sets as `gtid-S`.
2. Use the `SELECT @@GLOBAL.gtid_purged;` command on the new MySQL instance to get the GTID sets corresponding to the purged binlogs. Mark the sets as `gtid-P`.

3. Use the `SELECT @@GLOBAL.gtid_executed;` command on the new MySQL instance to get the GTID sets corresponding to all successfully executed transactions. Mark the sets as `gtid-E`.
4. Make sure that the following conditions are met. Otherwise, you cannot switch the DM-work connection to the new MySQL instance:
 - `gtid-S` contains `gtid-P`. `gtid-P` can be empty.
 - `gtid-E` contains `gtid-S`.
5. Use `pause-task` to pause all running tasks of data migration.
6. Change the VIP for it to direct at the new MySQL instance.
7. Use `resume-task` to resume the previous migration task.

11.9.5.6.2 Change the address of the upstream MySQL instance that DM-worker connects to

To make DM-worker connect to a new MySQL instance in the upstream by modifying the DM-worker configuration, perform the following steps:

1. Use the `query-status` command to get the GTID sets (`syncerBinlogGtid`) corresponding to the binlog that the current processing unit of binlog replication has replicated to the downstream. Mark this sets as `gtid-S`.
2. Use the `SELECT @@GLOBAL.gtid_purged;` command on the new MySQL instance to get the GTID sets corresponding to the purged binlogs. Mark this sets as `gtid-P`.
3. Use the `SELECT @@GLOBAL.gtid_executed;` command on the new MySQL instance to get the GTID sets corresponding to all successfully executed transactions. Mark this sets as `gtid-E`.
4. Make sure that the following conditions are met. Otherwise, you cannot switch the DM-work connection to the new MySQL instance:
 - `gtid-S` contains `gtid-P`. `gtid-P` can be empty.
 - `gtid-E` contains `gtid-S`.
5. Use `stop-task` to stop all running tasks of data migration.
6. Use the `operator-source stop` command to remove the source configuration corresponding to the address of the old MySQL instance from the DM cluster.
7. Update the address of the MySQL instance in the source configuration file and use the `operate-source create` command to reload the new source configuration in the DM cluster.
8. Use `start-task` to restart the migration task.

11.9.5.7 Manage Table Schemas of Tables to be Migrated

This document describes how to manage the schema of the table in DM during migration using `dmctl`.

11.9.5.7.1 Implementation principles

When you migrate tables using DM, DM performs the following operations on the table schema:

- For full export and import, DM directly exports the upstream table schema of the current time to SQL files and applies the table schema to the downstream.
- For incremental replication, the whole data link contains the following table schemas, which might be the same or different:

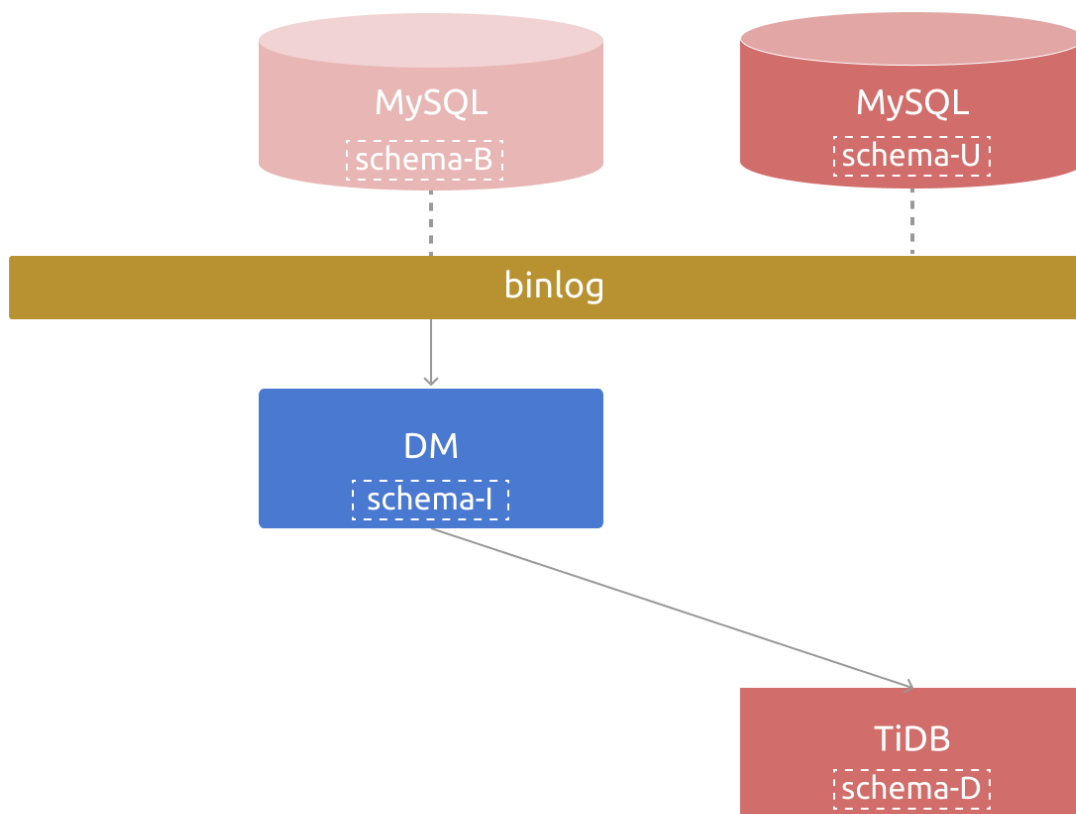

Figure 184: schema

- The upstream table schema at the current time, identified as `schema-U`.
- The table schema of the binlog event currently being consumed by DM, identified as `schema-B`. This schema corresponds to the upstream table schema at a historical time.
- The table schema currently maintained in DM (the schema tracker component), identified as `schema-I`.

- The table schema in the downstream TiDB cluster, identified as `schema-D`.

In most cases, the four table schemas above are the same.

When the upstream database performs a DDL operation to change the table schema, `schema-U` is changed. By applying the DDL operation to the internal schema tracker component and the downstream TiDB cluster, DM updates `schema-I` and `schema-D` in an orderly manner to keep them consistent with `schema-U`. Therefore, DM can then normally consume the binlog event corresponding to the `schema-B` table schema. That is, after the DDL operation is successfully migrated, `schema-U`, `schema-B`, `schema-I`, and `schema-D` are still consistent.

However, during the migration with **optimistic mode sharding DDL support** enabled, the `schema-D` of the downstream table might be inconsistent with the `schema-B` and `schema-I` of some upstream sharded tables. In such cases, DM still keeps `schema-I` and `schema-B` consistent to ensure that the binlog event corresponding to DML can be parsed normally.

In addition, in some scenarios (such as when the downstream table has more columns than the upstream table), `schema-D` might be inconsistent with `schema-B` and `schema-I`.

To support the scenarios mentioned above and handle other migration interruptions caused by schema inconsistency, DM provides the `operate-schema` command to obtain, modify, and delete the `schema-I` table schema maintained in DM.

11.9.5.7.2 Command

```
help operate-schema
```

```
`get`/`set`/`remove` the schema for an upstream table.
```

Usage:

```
dmctl operate-schema <operate-type> <-s source ...> <task-name | task-file  
↪ > <-d database> <-t table> [schema-file] [--flush] [--sync] [flags]
```

Flags:

```
-d, --database string database name of the table  
--flush          flush the table info and checkpoint immediately  
-h, --help      help for operate-schema  
--sync          sync the table info to master to resolve shard ddl  
↪ lock, only for optimistic mode now  
-t, --table string table name
```

Global Flags:

```
-s, --source strings MySQL Source ID.
```

Note:

- Because a table schema might change during data migration, to obtain a predictable table schema, currently the `operate-schema` command can be used only when the data migration task is in the `Paused` state.
- To avoid data loss due to mishandling, it is **strongly recommended** to get and backup the table schema firstly before you modify the schema.

11.9.5.7.3 Parameters

- `operate-type`:
 - Required.
 - Specifies the type of operation on the schema. The optional values are `get`, `set`, and `remove`.
- `-s`:
 - Required.
 - Specifies the MySQL source that the operation is applied to.
- `task-name | task-file`:
 - Required.
 - Specifies the task name or task file path.
- `-d`:
 - Required.
 - Specifies the name of the upstream database the table belongs to.
- `-t`:
 - Required.
 - Specifies the name of the upstream table corresponding to the table.
- `schema-file`:
 - Required when the operation type is `set`. Optional for other operation types.
 - The table schema file to be set. The file content should be a valid `CREATE TABLE` statement.
- `--flush`:
 - Optional.
 - Writes the schema to the checkpoint so that DM can load it after restarting the task.

- The default value is `true`.
- `--sync`:
 - Optional. Only used when an error occurs in the optimistic sharding DDL mode.
 - Updates the optimistic sharding metadata with this schema.

11.9.5.7.4 Usage example

Get the table schema

If you want to get the table schema of the ``db_single`.`t1`` table corresponding to the `mysql-replica-01` MySQL source in the `db_single` task, run the following command:

```
operate-schema get -s mysql-replica-01 task_single -d db_single -t t1
```

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "CREATE TABLE `t1` ( `c1` int(11) NOT NULL, `c2` int(11)
        ↪ DEFAULT NULL, PRIMARY KEY (`c1`)) ENGINE=InnoDB DEFAULT
        ↪ CHARSET=latin1 COLLATE=latin1_bin",
      "source": "mysql-replica-01",
      "worker": "127.0.0.1:8262"
    }
  ]
}
```

Set the table schema

If you want to set the table schema of the ``db_single`.`t1`` table corresponding to the `mysql-replica-01` MySQL source in the `db_single` task as follows:

```
CREATE TABLE `t1` (
  `c1` int(11) NOT NULL,
  `c2` bigint(11) DEFAULT NULL,
  PRIMARY KEY (`c1`)
) ENGINE=InnoDB DEFAULT CHARSET=latin1 COLLATE=latin1_bin
```

Save the CREATE TABLE statement above as a file (for example, `db_single.t1-schema.↪ sql`), and run the following command:

```
operate-schema set -s mysql-replica-01 task_single -d db_single -t t1
  ↪ db_single.t1-schema.sql
```

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-01",
      "worker": "127.0.0.1:8262"
    }
  ]
}
```

Delete table schema

Note:

After the table schema maintained in DM is deleted, if a DDL/DML statement related to this table needs to be migrated to the downstream, DM will try to get the table schema from the following three sources in an orderly manner:

- The `table_info` field in the checkpoint table
- The meta information in the optimistic sharding DDL
- The corresponding table in the downstream TiDB

If you want to delete the table schema of the ``db_single`.`t1`` table corresponding to the `mysql-replica-01` MySQL source in the `db_single` task, run the following command:

```
operate-schema remove -s mysql-replica-01 task_single -d db_single -t t1
```

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-01",
      "worker": "127.0.0.1:8262"
    }
  ]
}
```

11.9.5.8 Handle Alerts

This document introduces how to deal with the alert information in DM.

11.9.5.8.1 Alerts related to high availability

DM_master_all_down

- Description:
If all DM-master nodes are offline, this alert is triggered.
- Solution:
You can take the following steps to handle the alert:
 1. Check the environment of the cluster.
 2. Check the logs of all DM-master nodes for troubleshooting.

DM_worker_offline

- Description:
If a DM-worker node is offline for more than one hour, this alert is triggered. In a high-availability architecture, this alert might not directly interrupt the task but increases the risk of interruption.
- Solution:
You can take the following steps to handle the alert:
 1. View the working status of the corresponding DM-worker node.
 2. Check whether the node is connected.
 3. Troubleshoot errors through logs.

DM_DDL_error

- Description:
This error occurs when DM is processing the sharding DDL operations.
- Solution:
Refer to [Troubleshoot DM](#).

DM_pending_DDL

- Description:
If a sharding DDL operation is pending for more than one hour, this alert is triggered.
- Solution:
In some scenarios, the pending sharding DDL operation might be what users expect. Otherwise, refer to [Handle Sharding DDL Locks Manually in DM](#) for solution.

11.9.5.8.2 Alert rules related to task status

DM_task_state

- Description:
When a sub-task of DM-worker is in the **Paused** state for over 20 minutes, an alert is triggered.
- Solution:
Refer to [Troubleshoot DM](#).

11.9.5.8.3 Alert rules related to relay log

DM_relay_process_exits_with_error

- Description:
When the relay log processing unit encounters an error, this unit moves to **Paused** state, and an alert is triggered immediately.
- Solution:
Refer to [Troubleshoot DM](#).

DM_remain_storage_of_relay_log

- Description:
When the free space of the disk where the relay log is located is less than 10G, an alert is triggered.
- Solutions:
You can take the following methods to handle the alert:
 - Delete unwanted data manually to increase free disk space.
 - Reconfigure the [automatic data purge strategy of the relay log](#) or [purge data manually](#).
 - Execute the command `pause-relay` to pause the relay log pulling process. After there is enough free disk space, resume the process by running the command `resume-relay`. Note that you must not purge upstream binlog files that have not been pulled after the relay log pulling process is paused.

DM_relay_log_data_corruption

- Description:
When the relay log processing unit validates the binlog event read from the upstream and detects abnormal checksum information, this unit moves to the **Paused** state, and an alert is triggered immediately.

- Solution:
Refer to [Troubleshoot DM](#).

DM_fail_to_read_binlog_from_master

- Description:
If an error occurs when the relay log processing unit tries to read the binlog event from the upstream, this unit moves to the **Paused** state, and an alert is triggered immediately.
- Solution:
Refer to [Troubleshoot DM](#).

DM_fail_to_write_relay_log

- Description:
If an error occurs when the relay log processing unit tries to write the binlog event into the relay log file, this unit moves to the **Paused** state, and an alert is triggered immediately.
- Solution:
Refer to [Troubleshoot DM](#).

DM_binlog_file_gap_between_master_relay

- Description:
When the number of the binlog files in the current upstream MySQL/MariaDB exceeds that of the latest binlog files pulled by the relay log processing unit by **more than 1** for 10 minutes, and an alert is triggered.
- Solution:
Refer to [Troubleshoot DM](#).

11.9.5.8.4 Alert rules related to Dump/Load

DM_dump_process_exists_with_error

- Description:
When the Dump processing unit encounters an error, this unit moves to the **Paused** state, and an alert is triggered immediately.

- Solution:
Refer to [Troubleshoot DM](#).

DM_load_process_exists_with_error

- Description:
When the Load processing unit encounters an error, this unit moves to the Paused state, and an alert is triggered immediately.
- Solution:
Refer to [Troubleshoot DM](#).

11.9.5.8.5 Alert rules related to binlog replication

DM_sync_process_exists_with_error

- Description:
When the binlog replication processing unit encounters an error, this unit moves to the Paused state, and an alert is triggered immediately.
- Solution:
Refer to [Troubleshoot DM](#).

DM_binlog_file_gap_between_master_syncer

- Description:
When the number of the binlog files in the current upstream MySQL/MariaDB exceeds that of the latest binlog files processed by the relay log processing unit by **more than** 1 for 10 minutes, an alert is triggered.
- Solution:
Refer to [Handle Performance Issues](#).

DM_binlog_file_gap_between_relay_syncer

- Description:
When the number of the binlog files in the current relay log processing unit exceeds that of the latest binlog files processed by the binlog replication processing unit by **more than** 1 for 10 minutes, an alert is triggered.
- Solution:
Refer to [Handle Performance Issues](#).

11.9.5.9 Daily Check

This document summarizes how to perform a daily check on TiDB Data Migration (DM).

- Method 1: Execute the `query-status` command to check the running status of the task and the error output (if any). For details, see [Query Status](#).
- Method 2: If Prometheus and Grafana are correctly deployed when you deploy the DM cluster using TiUP, you can view DM monitoring metrics in Grafana. For example, suppose that the Grafana's address is `172.16.10.71`, go to <http://172.16.10.71:3000>, enter the Grafana dashboard, and select the DM Dashboard to check monitoring metrics of DM. For more information of these metrics, see [DM Monitoring Metrics](#).
- Method 3: Check the running status of DM and the error (if any) using the log file.
 - DM-master log directory: It is specified by the `--log-file` DM-master process parameter. If DM is deployed using TiUP, the log directory is `{log_dir}` in the DM-master node.
 - DM-worker log directory: It is specified by the `--log-file` DM-worker process parameter. If DM is deployed using TiUP, the log directory is `{log_dir}` in the DM-worker node.

11.9.5.10 Handle Errors

This document introduces the error system and how to handle common errors when you use DM.

11.9.5.10.1 Error system

In the error system, usually, the information of a specific error is as follows:

- **code**: error code.

DM uses the same error code for the same error type. An error code does not change as the DM version changes.

Some errors might be removed during the DM iteration, while the error codes are not. DM uses a new error code instead of an existing one for a new error.

- **class**: error type.

It is used to mark the component where an error occurs (error source).

The following table displays all error types, error sources, and error samples.

Error Type	Error Source	Error Sample
	↪	

```
:----- | :----- | :----- |
|
database | Database operations | [code=10003:class=database:scope=downstream
↳ :level=medium] database driver: invalid connection |
functional | Underlying functions of DM | [code=11005:class=functional:scope
↳ =internal:level=high] not allowed operation: alter multiple tables
↳ in one statement |
config | Incorrect configuration | [code=20005:class=config:scope=internal:
↳ level=medium] empty source-id not valid |
binlog-op | Binlog operations | [code=22001:class=binlog-op:scope=internal:
↳ level=high] empty UUIDs not valid |
checkpoint | checkpoint operations | [code=24002:class=checkpoint:scope=
↳ internal:level=high] save point bin.1234 is older than current pos
↳ bin.1371 |
task-check | Performing task check | [code=26003:class=task-check:scope=
↳ internal:level=medium] new table router error |
relay-event-lib| Executing the basic functions of the relay module | [code=28001:
↳ class=relay-event-lib:scope=internal:level=high] parse server-uuid.
↳ index |
relay-unit | relay processing unit | [code=30015:class=relay-unit:scope=
↳ upstream:level=high] TCPReader get event: ERROR 1236 (HY000): Could
↳ not open log file |
dump-unit | dump processing unit | [code=32001:class=dump-unit:scope=internal
↳ :level=high] mydumper runs with error: CRITICAL **: 15:12:17.559:
↳ Error connecting to database: Access denied for user 'root'@'172.17.0.1'
↳ (using password: NO) |
load-unit | load processing unit | [code=34002:class=load-unit:scope=internal
↳ :level=high] corresponding ending of sql: ')' not found |
sync-unit | sync processing unit | [code=36027:class=sync-unit:scope=internal
↳ :level=high] Column count doesn't match value count: 9 (columns)vs
↳ 10 (values) |
dm-master | DM-master service | [code=38008:class=dm-master:scope=internal
↳ :level=high] grpc request error: rpc error: code = Unavailable desc
↳ = all SubConns are in TransientFailure, latest connection error:
↳ connection error: desc = "transport: Error while dialing dial tcp
↳ 172.17.0.2:8262: connect: connection refused" |
dm-worker | DM-worker service | [code=40066:class=dm-worker:scope=internal
↳ :level=high] ExecuteDDL timeout, try use query-status to query
↳ whether the DDL is still blocking |
dm-tracer | DM-tracer service | [code=42004:class=dm-tracer:scope=internal:
↳ level=medium] trace event test.1 not found |
schema-tracker | schema-tracker (during incremental data replication) | [code
↳ =44006:class=schema-tracker:scope=internal:level=high], "cannot track
↳ DDL: ALTER TABLE test DROP COLUMN col1" |
scheduler | Scheduling operations (of data migration tasks) | [code=46001:class=
```

```
↪ scheduler:scope=internal:level=high], "the scheduler has not started"
|
dmctl | An error occurs within dmctl or when it interacts with other components |
[code=48001:class=dmctl:scope=internal:level=high], "can not create grpc
↪ connection" |
```

- **scope:** Error scope.

It is used to mark the scope and source of DM objects when an error occurs. `scope` includes four types: `not-set`, `upstream`, `downstream`, and `internal`.

If the logic of the error directly involves requests between upstream and downstream databases, the scope is set to `upstream` or `downstream`; otherwise, it is currently set to `internal`.

- **level:** Error level.

The severity level of the error, including `low`, `medium`, and `high`.

- The `low` level error usually relates to user operations and incorrect inputs. It does not affect migration tasks.
- The `medium` level error usually relates to user configurations. It affects some newly started services; however, it does not affect the existing DM migration status.
- The `high` level error usually needs your attention, since you need to resolve it to avoid the possible interruption of a migration task.

- **message:** Error descriptions.

Detailed descriptions of the error. To wrap and store every additional layer of error message on the error call chain, the `errors.Wrap` mode is adopted. The message description wrapped at the outermost layer indicates the error in DM and the message description wrapped at the innermost layer indicates the error source.

- **workaround:** Error handling methods (optional)

The handling methods for this error. For some confirmed errors (such as configuration errors), DM gives the corresponding manual handling methods in `workaround`.

- Error stack information (optional)

Whether DM outputs the error stack information depends on the error severity and the necessity. The error stack records the complete stack call information when the error occurs. If you cannot figure out the error cause based on the basic information and the error message, you can trace the execution path of the code when the error occurs using the error stack.

For the complete list of error codes, refer to the [error code lists](#).

11.9.5.10.2 Troubleshooting

If you encounter an error while running DM, take the following steps to troubleshoot this error:

1. Execute the `query-status` command to check the task running status and the error output.
2. Check the log files related to the error. The log files are on the DM-master and DM-worker nodes. To get key information about the error, refer to the [error system](#). Then check the [Handle Common Errors](#) section to find the solution.
3. If the error is not covered in this document, and you cannot solve the problem by checking the log or monitoring metrics, you can contact the R&D.
4. After the error is resolved, restart the task using `dmctl`.

```
resume-task ${task name}
```

However, you need to reset the data migration task in some cases. For details, refer to [Reset the Data Migration Task](#).

11.9.5.10.3 Handle common errors

|
Error Code

Error Description ↔ Handle	How to
-------------------------------	--------

code=10001	Abnormal database operation. Further analyze the error message and error stack.	
code=10002	The bad connection error from the underlying database. It usually indicates that the connection between DM and the downstream TiDB instance is abnormal (possibly caused by network failure, TiDB restart and so on) and the currently requested data is not sent to TiDB. DM provides automatic recovery for such error. If the recovery is not successful for a long time, check the network or TiDB status.	
code=10003	The invalid connection error from the underlying database. It usually indicates that the connection between DM and the downstream TiDB instance is abnormal (possibly caused by network failure, TiDB restart and so on) and the currently requested data is partly sent to TiDB. DM provides automatic recovery for such error. If the recovery is not successful for a long time, further check the error message and analyze the information based on the actual situation.	
code=10005	Occurs when performing the QUERY type SQL statements.	

`code=10006` | Occurs when performing the `EXECUTE` type SQL statements, including DDL statements and DML statements of the `INSERT`, `UPDATE` or `DELETE` type. For more detailed error information, check the error message which usually includes the error code and error information returned for database operations.

`code=11006` | Occurs when the built-in parser of DM parses the incompatible DDL statements. | Refer to [Data Migration - incompatible DDL statements](#) for solution. |

`code=20010` | Occurs when decrypting the database password that is provided in task configuration. | Check whether the downstream database password provided in the configuration task is [correctly encrypted using dmctl](#). |

`code=26002` | The task check fails to establish database connection. For more detailed error information, check the error message which usually includes the error code and error information returned for database operations. | Check whether the machine where DM-master is located has permission to access the upstream. |

`code=32001` | Abnormal dump processing unit | If the error message contains `mydumper: ↪ argument list too long.`, configure the table to be exported by manually adding the `--regex` regular expression in the Mydumper argument `extra-args` in the `task.yaml` file according to the block-allow list. For example, to export all tables named `hello`, add `↪ regex '.*\\.hello$'`; to export all tables, add `--regex '.*'`. |

`code=38008` | An error occurs in the gRPC communication among DM components. | Check `class`. Find out the error occurs in the interaction of which components. Determine the type of communication error. If the error occurs when establishing gRPC connection, check whether the communication server is working normally. |

What can I do when a migration task is interrupted with the `invalid connection` error returned?

Reason

The `invalid connection` error indicates that anomalies have occurred in the connection between DM and the downstream TiDB database (such as network failure, TiDB restart, TiKV busy and so on) and that a part of the data for the current request has been sent to TiDB.

Solutions

Because DM has the feature of concurrently migrating data to the downstream in migration tasks, several errors might occur when a task is interrupted. You can check these errors by using `query-status`.

- If only the `invalid connection` error occurs during the incremental replication process, DM retries the task automatically.
- If DM does not or fails to retry automatically because of version problems, use `stop-task` to stop the task and then use `start-task` to restart the task.

A migration task is interrupted with the `driver: bad connection` error returned

Reason

The `driver: bad connection` error indicates that anomalies have occurred in the connection between DM and the upstream TiDB database (such as network failure, TiDB restart and so on) and that the data of the current request has not yet been sent to TiDB at that moment.

Solution

The current version of DM automatically retries on error. If you use the previous version which does not support automatically retry, you can execute the `stop-task` command to stop the task. Then execute `start-task` to restart the task.

The relay unit throws error `event from * in * diff from passed-in event *` or a migration task is interrupted with failing to get or parse binlog errors like `get binlog error ERROR 1236 (HY000) and binlog checksum mismatch`, data may be corrupted returned

Reason

During the DM process of relay log pulling or incremental replication, this two errors might occur if the size of the upstream binlog file exceeds **4 GB**.

Cause: When writing relay logs, DM needs to perform event verification based on binlog positions and the size of the binlog file, and store the replicated binlog positions as checkpoints. However, the official MySQL uses `uint32` to store binlog positions. This means the binlog position for a binlog file over 4 GB overflows, and then the errors above occur.

Solutions

For relay units, manually recover migration using the following solution:

1. Identify in the upstream that the size of the corresponding binlog file has exceeded 4GB when the error occurs.
2. Stop the DM-worker.
3. Copy the corresponding binlog file in the upstream to the relay log directory as the relay log file.
4. In the relay log directory, update the corresponding `relay.meta` file to pull from the next binlog file. If you have specified `enable_gtid` to `true` for the DM-worker, you need to modify the GTID corresponding to the next binlog file when updating the `relay.meta` file. Otherwise, you don't need to modify the GTID.

Example: when the error occurs, `binlog-name = "mysql-bin.004451"` and `binlog-pos = 2453`. Update them respectively to `binlog-name = "mysql-bin.004452"`
↪ and `binlog-pos = 4`, and update `binlog-gtid` to `f0e914ef-54cf-11e7-813d-6c92bf2fa791:1-138218058`.

5. Restart the DM-worker.

For binlog replication processing units, manually recover migration using the following solution:

1. Identify in the upstream that the size of the corresponding binlog file has exceeded 4GB when the error occurs.
2. Stop the migration task using `stop-task`.
3. Update the `binlog_name` in the global checkpoints and in each table checkpoint of the downstream `dm_meta` database to the name of the binlog file in error; update `binlog_pos` to a valid position value for which migration has completed, for example, 4.

Example: the name of the task in error is `dm_test`, the corresponding `ssource-id` is `replica-1`, and the corresponding binlog file is `mysql-bin|000001.004451`. Execute the following command:

```
UPDATE dm_test_syncer_checkpoint SET binlog_name='mysql-bin
↳ |000001.004451', binlog_pos = 4 WHERE id='replica-1';
```

4. Specify `safe-mode: true` in the `syncers` section of the migration task configuration to ensure re-entrant.
5. Start the migration task using `start-task`.
6. View the status of the migration task using `query-status`. You can restore `safe-
↳ mode` to the original value and restart the migration task when migration is done for the original error-triggering relay log files.

`Access denied for user 'root'@'172.31.43.27' (using password: YES)` shows when you query the task or check the log

For database related passwords in all the DM configuration files, it is recommended to use the passwords encrypted by `dmctl`. If a database password is empty, it is unnecessary to encrypt it. For how to encrypt the plaintext password, see [Encrypt the database password using dmctl](#).

In addition, the user of the upstream and downstream databases must have the corresponding read and write privileges. Data Migration also [prechecks the corresponding privileges automatically](#) while starting the data migration task.

The load processing unit reports the error `packet for query is too large`. Try adjusting the `'max_allowed_packet'` variable

Reasons

- Both MySQL client and MySQL/TiDB server have the quota limits for `max_allowed_packet` `↳ .` If any `max_allowed_packet` exceeds a limit, the client receives the error message. Currently, for the latest version of DM and TiDB server, the default value of `max_allowed_packet` is 64M.
- The full data import processing unit in DM does not support splitting the SQL file exported by the Dump processing unit in DM.

Solutions

- It is recommended to set the `statement-size` option of `extra-args` for the Dump processing unit:

According to the default `--statement-size` setting, the default size of Insert `↔ Statement` generated by the Dump processing unit is about 1M. With this default setting, the load processing unit does not report the error `packet for query is ↔ too large`. Try adjusting the `'max_allowed_packet'` variable in most cases.

Sometimes you might receive the following WARN log during the data dump. This WARN log does not affect the dump process. This only means that wide tables are dumped.

```
Row bigger than statement_size for xxx
```

- If the single row of the wide table exceeds 64M, you need to modify the following configurations and make sure the configurations take effect.
 - Execute `set @@global.max_allowed_packet=134217728` (134217728 = 128 MB) in the TiDB server.
 - First add the `max-allowed-packet: 134217728` (128 MB) to the `target-↔ database` section in the DM task configuration file. Then, execute the `stop-task` command and execute the `start-task` command.

11.9.5.11 Handle Performance Issues

This document introduces common performance issues that might exist in DM and how to deal with them.

Before diagnosing an issue, you can refer to the [DM Benchmark Report](#).

When diagnosing and handling performance issues, make sure that:

- The DM monitoring component is correctly configured and installed.
- You can view [monitoring metrics](#) on the Grafana monitoring dashboard.
- The component you diagnose works well; otherwise, possible monitoring metrics exceptions might interfere with the diagnosis of performance issues.

In the case of a large latency in the data migration, to quickly figure out whether the bottleneck is inside the DM component or in the TiDB cluster, you can first check `DML ↔ queue remain length` in [Write SQL Statements to Downstream](#).

11.9.5.11.1 relay log unit

To diagnose performance issues in the relay log unit, you can check the `binlog file gap between master and relay` monitoring metric. For more information about this metric, refer to [monitoring metrics of the relay log](#). If this metric is greater than 1 for a long time, it usually indicates that there is a performance issue; if this metric is 0, it usually indicates that there is no performance issue.

If the value of `binlog file gap between master and relay` is 0, but you suspect that there is a performance issue, you can check `binlog pos`. If `master` in this metric is much larger than `relay`, a performance issue might exist. In this case, diagnose and handle this issue accordingly.

Read binlog data

`read binlog event duration` refers to the duration that the relay log reads binlog from the upstream database (MySQL/MariaDB). Ideally, this metric is close to the network latency between DM-worker and MySQL/MariaDB instances.

- For data migration in one data center, reading binlog data is not a performance bottleneck. If the value of `read binlog event duration` is too large, check the network connection between DM-worker and MySQL/MariaDB.
- For data migration in the geo-distributed environment, try to deploy DM-worker and MySQL/MariaDB in one data center, while deploying the TiDB cluster in the target data center.

The process of reading binlog data from the upstream database includes the following sub-processes:

- The upstream MySQL/MariaDB reads the binlog data locally and sends it through the network. When no exception occurs in the MySQL/MariaDB load, this sub-process usually does not become a bottleneck.
- The binlog data is transferred from the machine where MySQL/MariaDB is located to the machine where DM-worker is located via the network. Whether this sub-process becomes a bottleneck mainly depends on the network connection between DM-worker and the upstream MySQL/MariaDB.
- DM-worker reads binlog data from the network data stream and constructs it as a binlog event. When no exception occurs in the DM-worker load, this sub-process usually does not become a bottleneck.

Note:

If the value of `read binlog event duration` is large, another possible reason is that the upstream MySQL/MariaDB has a low load. This means that no binlog event needs to be sent to DM for a period of time, and the relay log unit stays in a wait state, thus this value includes additional waiting time.

binlog data decoding and verification

After reading the binlog event into the DM memory, DM's relay processing unit decodes and verifies data. This usually does not lead to performance bottleneck; therefore, there is no related performance metric on the monitoring dashboard by default. If you need to view this metric, you can manually add a monitoring item in Grafana. This monitoring item corresponds to `dm_relay_read_transform_duration`, a metric from Prometheus.

Write relay log files

When writing a binlog event to a relay log file, the relevant performance metric is `write relay log duration`. This value should be microseconds when `binlog event size` is not too large. If `write relay log duration` is too large, check the write performance of the disk. To avoid low write performance, use local SSDs for DM-worker.

11.9.5.11.2 Load unit

The main operations of the Load unit are to read the SQL file data from the local and write it to the downstream. The related performance metric is `transaction execution latency`. If this value is too large, check the downstream performance by checking the monitoring of the downstream database. You can also check whether there is a large network latency between DM and the downstream database.

11.9.5.11.3 Binlog replication unit

To diagnose performance issues in the Binlog replication unit, you can check the `binlog file gap between master and syncer` monitoring metric. For more information about this metric, refer to [monitoring metrics of the Binlog replication](#).

- If this metric is greater than 1 for a long time, it usually indicates that there is a performance issue.
- If this metric is 0, it usually indicates that there is no performance issue.

When `binlog file gap between master and syncer` is greater than 1 for a long time, check `binlog file gap between relay and syncer` to figure out which unit the latency mainly exists in. If this value is usually 0, the latency might exist in the relay log unit. Then you can refer to [relay log unit](#) to resolve this issue; otherwise, continue checking the Binlog replication unit.

Read binlog data

The Binlog replication unit decides whether to read the binlog event from the upstream MySQL/MariaDB or from the relay log file according to the configuration. The related performance metric is `read binlog event duration`, which generally ranges from a few microseconds to tens of microseconds.

- If DM's Binlog replication processing unit reads the binlog event from upstream MySQL/MariaDB, to locate and resolve the issue, refer to [read binlog data](#) in the "relay log unit" section.

- If DM's Binlog replication processing unit reads the binlog event from the relay log file, when `binlog event size` is not too large, the value of `read binlog event duration` \leftrightarrow should be microseconds. If `read binlog event duration` is too large, check the read performance of the disk. To avoid low write performance, use local SSDs for DM-worker.

binlog event conversion

The Binlog replication unit constructs DML, parses DDL, and performs **table router** conversion from binlog event data. The related metric is `transform binlog event duration`.

The duration is mainly affected by the write operations upstream. Take the `INSERT \leftrightarrow INTO` statement as an example, the time consumed to convert a single `VALUES` greatly differs from that to convert a lot of `VALUES`. The time consumed might range from tens of microseconds to hundreds of microseconds. However, usually this is not a bottleneck of the system.

Write SQL statements to downstream

When the Binlog replication unit writes the converted SQL statements to the downstream, the related performance metrics are `DML queue remain length` and `transaction \leftrightarrow execution latency`.

After constructing SQL statements from binlog event, DM uses `worker-count` queues to concurrently write these statements to the downstream. However, to avoid too many monitoring entries, DM performs the modulo 8 operation on the IDs of concurrent queues. This means that all concurrent queues correspond to one item from `q_0` to `q_7`.

`DML queue remain length` indicates in the concurrent processing queue, the number of DML statements that have not been consumed and have not started to be written downstream. Ideally, the curves corresponding to each `q_*` are almost the same. If not, it indicates that the concurrent load is extremely unbalanced.

If the load is not balanced, confirm whether tables need to be migrated have primary keys or unique keys. If these keys do not exist, add the primary keys or the unique keys; if these keys do exist while the load is not balanced, upgrade DM to v1.0.5 or later versions.

- When there is no noticeable latency in the entire data migration link, the corresponding curve of `DML queue remain length` is almost always 0, and the maximum does not exceed the value of `batch` in the task configuration file.
- If you find a noticeable latency in the data migration link, and the curve of `DML queue \leftrightarrow remain length` corresponding to each `q_*` is almost the same and is almost always 0, it means that DM fails to read, convert, or concurrently write the data from the upstream in time (the bottleneck might be in the relay log unit). For troubleshooting, refer to the previous sections of this document.

If the corresponding curve of `DML queue remain length` is not 0 (usually the maximum is not more than 1024), it indicates that there is a bottleneck when writing SQL statements to

the downstream. You can use `transaction execution latency` to view the time consumed to execute a single transaction to the downstream.

`transaction execution latency` is usually tens of milliseconds. If this value is too large, check the downstream performance based on the monitoring of the downstream database. You can also check whether there is a large network latency between DM and the downstream database.

To view the time consumed to write a single statement such as `BEGIN`, `INSERT`, `UPDATE`, `DELETE`, or `COMMIT` to the downstream, you can also check `statement execution latency`.

11.9.6 Performance Tuning

11.9.6.1 Optimize Configuration of DM

This document introduces how to optimize the configuration of the data migration task to improve the performance of data migration.

11.9.6.1.1 Full data export

`mydumpers` is the configuration item related to full data export. This section describes how to configure performance-related options.

`rows`

Setting the `rows` option enables concurrently exporting data from a single table using multi-thread. The value of `rows` is the maximum number of rows contained in each exported chunk. After this option is enabled, DM selects a column as the split benchmark when the data of a MySQL single table is concurrently exported. This column can be one of the following columns: the primary key column, the unique index column, and the normal index column (ordered from highest priority to lowest). Make sure this column is of integer type (for example, `INT`, `MEDIUMINT`, `BIGINT`).

The value of `rows` can be set to 10000. You can change this value according to the total number of rows in the table and the performance of the database. In addition, you need to set `threads` to control the number of concurrent threads. By default, the value of `threads` is 4. You can adjust this value as needed.

`chunk-filesize`

During full backup, DM splits the data of each table into multiple chunks according to the value of the `chunk-filesize` option. Each chunk is saved in a file with a size of about `chunk-filesize`. In this way, data is split into multiple files and you can use the parallel processing of the DM Load unit to improve the import speed. The default value of this option is 64 (in MB). Normally, you do not need to set this option. If you set it, adjust the value of this option according to the size of the full data.

Note:

- You cannot update the value of `mydumpers` after the migration task is created. Be sure about the value of each option before creating the task. If you need to update the value, stop the task using `dmctl`, update the configuration file, and re-create the task.
- `mydumpers.threads` can be replaced with the `mydumper-thread` configuration item for simplicity.
- If `rows` is set, DM ignores the value of `chunk-filesize`.

11.9.6.1.2 Full data import

`loaders` is the configuration item related to full data import. This section describes how to configure performance-related options.

`pool-size`

The `pool-size` option determines the number of threads in the DM Load unit. The default value is 16. Normally, you do not need to set this option. If you set it, adjust the value of this option according to the size of the full data and the performance of the database.

Note:

- You cannot update the value of `loaders` after the migration task is created. Be sure about the value of each option before creating the task. If you need to update the value, stop the task using `dmctl`, update the configuration file, and re-create the task.
- `loaders.pool-size` can be replaced with the `loader-thread` configuration item for simplicity.

11.9.6.1.3 Incremental data replication

`syncers` is the configuration item related to incremental data replication. This section describes how to configure performance-related options.

`worker-count`

`worker-count` determines the number of threads for concurrent replication of DMLs in the DM Sync unit. The default value is 16. To speed up data replication, increase the value of this option appropriately.

`batch`

`batch` determines the number of DMLs included in each transaction when the data is replicated to the downstream database during the DM Sync unit. The default value is 100. Normally, you do not need to change the value of this option.

Note:

- You cannot update the value of `syncers` after the replication task is created. Be sure about the value of each option before creating the task. If you need to update the value, stop the task using `dmctl`, update the configuration file, and re-create the task.
- `syncers.worker-count` can be replaced with the `syncer-thread` configuration item for simplicity.
- You can change the values of `worker-count` and `batch` according to the actual scenario. For example, if there is a high network delay between DM and the downstream database, you can increase the value of `worker` \rightarrow `-count` and decrease the value of `batch` appropriately.

11.9.7 Reference

11.9.7.1 Architecture

11.9.7.1.1 Data Migration Overview

[TiDB Data Migration](#) (DM) is an integrated data migration task management platform, which supports the full data migration and the incremental data replication from MySQL-compatible databases (such as MySQL, MariaDB, and Aurora MySQL) into TiDB. It can help to reduce the operation cost of data migration and simplify the troubleshooting process. When using DM for data migration, you need to perform the following operations:

- Deploy a DM Cluster
- Create upstream data source and save data source access information
- Create data migration tasks to migrate data from data sources to TiDB

The data migration task includes two stages: full data migration and incremental data replication:

- Full data migration: Migrate the table structure of the corresponding table from the data source to TiDB, and then read the data stored in the data source and write it to the TiDB cluster.
- Incremental data replication: After the full data migration is completed, the corresponding table changes from the data source are read and then written to the TiDB cluster.

DM versions

This document is applicable to DM v5.4, the latest stable version of DM.

Before v5.4, the DM documentation is independent of the TiDB documentation. To access these earlier versions of the DM documentation, click one of the following links:

- [DM v5.3 documentation](#)
- [DM v2.0 documentation](#)
- [DM v1.0 documentation](#) (Not recommended, because it the earliest stable version of DM)

Note:

- Since October 2021, DM's GitHub repository has been moved to [pingcap/tiflow](https://github.com/pingcap/tiflow). If you see any issues with DM, submit your issue to the [pingcap/tiflow](https://github.com/pingcap/tiflow) repository for feedback.
- In earlier versions (v1.0 and v2.0), DM uses version numbers that are independent of TiDB. Since v5.3, DM uses the same version number as TiDB. The next version of DM v2.0 is DM v5.3. There are no compatibility changes from DM v2.0 to v5.3, and the upgrade process is no different from a normal upgrade, only an increase in version number.

Basic features

This section describes the basic data migration features provided by DM.

Figure 185: DM Core Features

Block and allow lists migration at the schema and table levels

The [block and allow lists filtering rule](#) is similar to the `replication-rules-db` ↔ `/replication-rules-table` feature of MySQL, which can be used to filter or replicate all operations of some databases only or some tables only.

Binlog event filtering

The [binlog event filtering](#) feature means that DM can filter certain types of SQL statements from certain tables in the source database. For example, you can filter all `INSERT` statements in the table `test.sbtest` or filter all `TRUNCATE TABLE` statements in the schema `test`.

Schema and table routing

The [schema and table routing](#) feature means that DM can migrate a certain table of the source database to the specified table in the downstream. For example, you can migrate the table structure and data from the table `test.sbtest1` in the source database to the table `test.sbtest2` in TiDB. This is also a core feature for merging and migrating sharded databases and tables.

Advanced features

Shard merge and migration

DM supports merging and migrating the original sharded instances and tables from the source databases into TiDB, but with some restrictions. For details, see [Sharding DDL usage restrictions in the pessimistic mode](#) and [Sharding DDL usage restrictions in the optimistic mode](#).

Optimization for third-party online-schema-change tools in the migration process

In the MySQL ecosystem, tools such as `gh-ost` and `pt-osc` are widely used. DM provides support for these tools to avoid migrating unnecessary intermediate data. For details, see [Online DDL Tools](#)

Filter certain row changes using SQL expressions

In the phase of incremental replication, DM supports the configuration of SQL expressions to filter out certain row changes, which lets you replicate the data with a greater granularity. For more information, refer to [Filter Certain Row Changes Using SQL Expressions](#).

Usage restrictions

Before using the DM tool, note the following restrictions:

- Database version requirements
 - MySQL version > 5.5
 - MariaDB version >= 10.1.2

Note:

If there is a primary-secondary migration structure between the upstream MySQL/MariaDB servers, then choose the following version.

- MySQL version > 5.7.1
- MariaDB version >= 10.1.3

Warning:

Migrating data from MySQL 8.0 to TiDB using DM is an experimental feature (introduced since DM v2.0). It is **NOT** recommended that you use it in a production environment.

- DDL syntax compatibility
 - Currently, TiDB is not compatible with all the DDL statements that MySQL supports. Because DM uses the TiDB parser to process DDL statements, it only supports the DDL syntax supported by the TiDB parser. For details, see [MySQL Compatibility](#).
 - DM reports an error when it encounters an incompatible DDL statement. To solve this error, you need to manually handle it using dmctl, either skipping this DDL statement or replacing it with a specified DDL statement(s). For details, see [Skip or replace abnormal SQL statements](#).
- Sharding merge with conflicts
 - If conflict exists between sharded tables, solve the conflict by referring to [handling conflicts of auto-increment primary key](#). Otherwise, data migration is not supported. Conflicting data can cover each other and cause data loss.
 - For other sharding DDL migration restrictions, see [Sharding DDL usage restrictions in the pessimistic mode](#) and [Sharding DDL usage restrictions in the optimistic mode](#).
- Switch of MySQL instances for data sources

When DM-worker connects the upstream MySQL instance via a virtual IP (VIP), if you switch the VIP connection to another MySQL instance, DM might connect to the new and old MySQL instances at the same time in different connections. In this situation, the binlog migrated to DM is not consistent with other upstream status that DM receives, causing unpredictable anomalies and even data damage. To make necessary changes to DM manually, see [Switch DM-worker connection via virtual IP](#).
- GBK character set compatibility
 - DM does not support migrating `charset=GBK` tables to TiDB clusters earlier than v5.4.0.

11.9.7.1.2 DM-worker Introduction

DM-worker is a tool used to migrate data from MySQL/MariaDB to TiDB.

It has the following features:

- Acts as a secondary database of any MySQL or MariaDB instance
- Reads the binlog events from MySQL/MariaDB and persists them to the local storage
- A single DM-worker supports migrating the data of one MySQL/MariaDB instance to multiple TiDB instances
- Multiple DM-workers support migrating the data of multiple MySQL/MariaDB instances to one TiDB instance

DM-worker processing unit

A DM-worker task contains multiple logic units, including relay log, the dump processing unit, the load processing unit, and binlog replication.

Relay log

The relay log persistently stores the binlog data from the upstream MySQL/MariaDB and provides the feature of accessing binlog events for the binlog replication.

Its rationale and features are similar to the relay log of MySQL. For details, see [MySQL Relay Log](#).

Dump processing unit

The dump processing unit dumps the full data from the upstream MySQL/MariaDB to the local disk.

Load processing unit

The load processing unit reads the dumped files of the dump processing unit and then loads these files to the downstream TiDB.

Binlog replication/sync processing unit

Binlog replication/sync processing unit reads the binlog events of the upstream MySQL/MariaDB or the binlog events of the relay log, transforms these events to SQL statements, and then applies these statements to the downstream TiDB.

Privileges required by DM-worker

This section describes the upstream and downstream database users' privileges required by DM-worker, and the user privileges required by the respective processing unit.

Upstream database user privileges

The upstream database (MySQL/MariaDB) user must have the following privileges:

Privilege	Scope
SELECT	Tables

Privilege	Scope
RELOAD	Global
REPLICATION SLAVE	Global
REPLICATION CLIENT	Global

If you need to migrate the data from db1 to TiDB, execute the following GRANT statement:

```
GRANT RELOAD,REPLICATION SLAVE, REPLICATION CLIENT ON *.* TO 'your_user'@
↳ your_wildcard_of_host';
GRANT SELECT ON db1.* TO 'your_user'@'your_wildcard_of_host';
```

If you also need to migrate the data from other databases into TiDB, make sure the same privileges are granted to the user of the respective databases.

Downstream database user privileges

The downstream database (TiDB) user must have the following privileges:

Privilege	Scope
SELECT	Tables
INSERT	Tables
UPDATE	Tables
DELETE	Tables
CREATE	Databases, tables
DROP	Databases, tables
ALTER	Tables
INDEX	Tables

Execute the following GRANT statement for the databases or tables that you need to migrate:

```
GRANT SELECT,INSERT,UPDATE,DELETE,CREATE,DROP,ALTER,INDEX ON db.table TO '
↳ your_user'@'your_wildcard_of_host';
GRANT ALL ON dm_meta.* TO 'your_user'@'your_wildcard_of_host';
```

Minimal privilege required by each processing unit

	Minimal upstream (MySQL/MariaDB) privilege	Minimal downstream (TiDB) privilege	Minimal sys- tem privi- lege
Processing unit			
Relay log	REPLICATION SLAVE (reads the binlog) REPLICATION ↔ CLIENT (<code>show master</code> ↔ <code>status</code> , <code>show slave status</code>)	NULL	Read/Write local files
Dump	SELECTRELOAD (flushes tables with Read lock and unlocks tables)	NULL	Write local files
Load	NULL	SELECT (Query the checkpoint his- tory) CREATE (creates a database/table) DELETE ↔ (deletes check- point) INSERT (Inserts the Dump data)	Read/Write local files

Processing unit	Minimal upstream MySQL/MariaDB privilege	Minimal downstream (TiDB) privilege	Minimal system privilege
Binlog replication	REPLICATION SLAVE (reads the binlog) REPLICATION CLIENT (show master status, show slave status)	SELECT (shows the index and column) INSERT (DML) UPDATE DELETE CREATE (creates a database/table) DROP (drops databases/tables) ALTER (alters a table) INDEX (creates/-drops an index)	Read/Write local files

Note:

These privileges are not immutable and they change as the request changes.

11.9.7.1.3 Data Migration Relay Log

The Data Migration (DM) relay log consists of several sets of numbered files containing events that describe database changes, and an index file that contains the names of all used relay log files.

After relay log is enabled, DM-worker automatically migrates the upstream binlog to the local configuration directory (the default migration directory is `<deploy_dir>/<relay_log>` if DM is deployed using TiUP). The default value of `<relay_log>` is `relay-dir` and can be modified in [Upstream Database Configuration File](#). Since v5.4.0, you can configure the local configuration directory through `relay-dir` in the [DM-worker configuration file](#), which takes precedence over the configuration file of the upstream database.

When DM-worker is running, it migrates the upstream binlog to the local file in real time. The sync processing unit of DM-worker, reads the binlog events of the local relay log in real time, transforms these events to SQL statements, and then migrates these statements to the downstream database.

This document introduces the directory structure and initial migration rules DM relay logs, and how to pause, resume, and purge relay logs.

Note:

The relay log feature requires additional disk I/O operations, resulting in higher latency of data migration. If the disk I/O performance in the deployment environment is poor, the relay log feature may become a bottleneck of the migration task and thus slows the migration.

Directory structure

An example of the directory structure of the local storage for a relay log:

```
<deploy_dir>/<relay_log>/
|-- 7e427cc0-091c-11e9-9e45-72b7c59d52d7.000001
|   |-- mysql-bin.000001
|   |-- mysql-bin.000002
|   |-- mysql-bin.000003
|   |-- mysql-bin.000004
|   `-- relay.meta
|-- 842965eb-091c-11e9-9e45-9a3bff03fa39.000002
|   |-- mysql-bin.000001
|   `-- relay.meta
`-- server-uuid.index
```

- **subdir:**

- DM-worker stores the binlog migrated from the upstream database in the same directory. Each directory is a **subdir**.
- **subdir** is named `<Upstream database UUID>.<Local subdir serial number \leftrightarrow>`.
- After a switch between primary and secondary instances in the upstream, DM-worker generates a new **subdir** directory with an incremental serial number.

* In the above example, for the `7e427cc0-091c-11e9-9e45-72b7c59d52d7 \leftrightarrow .000001` directory, `7e427cc0-091c-11e9-9e45-72b7c59d52d7` is the upstream database UUID and `000001` is the local **subdir** serial number.

- `server-uuid.index`: Records a list of names of currently available subdir directory.
- `relay.meta`: Stores the information of the migrated binlog in each subdir. For example,

```

$ cat c0149e17-dff1-11e8-b6a8-0242ac110004.000001/relay.meta
binlog-name = "mysql-bin.000010"           # The name of the
    ↪ currently migrated binlog.
binlog-pos = 63083620                       # The position of
    ↪ the currently migrated binlog.
binlog-gtid = "c0149e17-dff1-11e8-b6a8-0242ac110004:1-3328" # GTID of
    ↪ the currently migrated binlog.
                                           # There might be
                                           ↪ multiple
                                           ↪ GTIDs.

$ cat 92acbd8a-c844-11e7-94a1-1866daf8accc.000001/relay.meta
binlog-name = "mysql-bin.018393"
binlog-pos = 277987307
binlog-gtid = "3ccc475b-2343-11e7-be21-6c0b84d59f30:1-14,406a3f61-690d

```

Initial migration rules

The starting position of the relay log migration is determined by the following rules:

- From the checkpoint of the downstream sync unit, DM firstly gets the earliest position from which the migration tasks need to replicate from the data source. If the position is later than any of the following positions, DM-worker starts the migration from this position.
- If a valid local relay log exists (a valid relay log is a relay log with valid `server-uuid.index`, `subdir` and `relay.meta` files), DM-worker resumes migration from a position recorded by `relay.meta`.
- If a valid local relay log does not exist, but `relay-binlog-name` or `relay-binlog-gtid` is specified in the source configuration file:
 - In the non-GTID mode, if `relay-binlog-name` is specified, DM-worker starts migration from the specified binlog file.
 - In the GTID mode, if `relay-binlog-gtid` is specified, DM-worker starts migration from the specified GTID.

- If a valid local relay log does not exist, and `relay-binlog-name` or `relay-binlog-gtid` is not specified in the DM configuration file:
 - In the non-GTID mode, DM-worker starts migration from the initial upstream binlog and migrates all the upstream binlog files to the latest successively.
 - In the GTID mode, DM-worker starts migration from the initial upstream GTID.

Note:

If the upstream relay log is purged, an error occurs. In this case, set `relay-binlog-gtid` to specify the starting position of migration.

Start and stop the relay log feature

In v5.4.0 and later versions, you can enable relay log by setting `enable-relay` to `true`. Since v5.4.0, when binding the upstream data source, DM-worker checks the `enable-relay` item in the configuration of the data source. If `enable-relay` is `true`, the relay log feature is enabled for this data source.

For the detailed configuration method, see [Upstream Database Configuration File](#).

In addition, you can also dynamically adjust the `enable-relay` configuration of the data source using the `start-relay` or `stop-relay` command to enable or disable relay log in time.

```
» start-relay -s mysql-replica-01
```

```
{  
  "result": true,  
  "msg": ""  
}
```

Note:

In DM v2.0.x later than DM v2.0.2 and in v5.3.0, the configuration item `enable-relay` in the source configuration file is no longer valid, and you can only use `start-relay` and `stop-relay` to enable and disable relay log. If DM finds that `enable-relay` is set to `true` when [loading the data source configuration](#), it outputs the following message:

```
Please use `start-relay` to specify which workers should pull  
  ↪ relay log of relay-enabled sources.
```

In the command `start-relay`, you can configure one or more DM-workers to migrate relay logs for the specified data source, but the DM-workers specified in the parameter must be free or have been bound to the upstream data source. Examples are as follows:

```
» start-relay -s mysql-replica-01 worker1 worker2
```

```
{
  "result": true,
  "msg": ""
}
```

```
» stop-relay -s mysql-replica-01 worker1 worker2
```

```
{
  "result": true,
  "msg": ""
}
```

In DM versions earlier than v2.0.2 (not including v2.0.2), DM checks the configuration item `enable-relay` in the source configuration file when binding a DM-worker to an upstream data source. If `enable-relay` is set to `true`, DM enables the relay log feature for the data source.

See [Upstream Database Configuration File](#) for how to set the configuration item `enable-relay`.

Query relay logs

You can use the command `query-status -s` to query the status of the relay log pulling process of an upstream data source. See the following example:

```
» query-status -s mysql-replica-01
```

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "no sub task started",
      "sourceStatus": {
        "source": "mysql-replica-01",
        "worker": "worker2",
        "result": null,
        "relayStatus": {
          "masterBinlog": "(mysql-bin.000005, 916)",
          "masterBinlogGtid": "09bec856-ba95-11ea-850a-58f2b4af5188
            ↪ :1-28",
```

```

        "relaySubDir": "09bec856-ba95-11ea-850a-58f2b4af5188
            ↪ .000001",
        "relayBinlog": "(mysql-bin.000005, 4)",
        "relayBinlogGtid": "09bec856-ba95-11ea-850a-58f2b4af5188
            ↪ :1-28",
        "relayCatchUpMaster": false,
        "stage": "Running",
        "result": null
    }
},
"subTaskStatus": [
]
},
{
    "result": true,
    "msg": "no sub task started",
    "sourceStatus": {
        "source": "mysql-replica-01",
        "worker": "worker1",
        "result": null,
        "relayStatus": {
            "masterBinlog": "(mysql-bin.000005, 916)",
            "masterBinlogGtid": "09bec856-ba95-11ea-850a-58f2b4af5188
                ↪ :1-28",
            "relaySubDir": "09bec856-ba95-11ea-850a-58f2b4af5188
                ↪ .000001",
            "relayBinlog": "(mysql-bin.000005, 916)",
            "relayBinlogGtid": "",
            "relayCatchUpMaster": true,
            "stage": "Running",
            "result": null
        }
    },
    "subTaskStatus": [
    ]
}
]
}

```

Pause and resume the relay log feature

You can use the command `pause-relay` to pause the pulling process of relay logs and use the command `resume-relay` to resume the process. You need to specify the `source-id` of the upstream data source when executing these two commands. See the following examples:

```
» pause-relay -s mysql-replica-01 -s mysql-replica-02
```

```
{
  "op": "PauseRelay",
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-01",
      "worker": "worker1"
    },
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-02",
      "worker": "worker2"
    }
  ]
}
```

```
» resume-relay -s mysql-replica-01
```

```
{
  "op": "ResumeRelay",
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-01",
      "worker": "worker1"
    }
  ]
}
```

Purge relay logs

Through the detection mechanism of reading and writing files, DM-worker does not purge the relay log that is being used or will be used later by the currently running data migration task.

The data purge methods for the relay log include automatic purge and manual purge.

Automatic data purge

You can enable automatic data purge and configure its strategy in the source configuration file. See the following example:

```
##### relay log purge strategy
purge:
  interval: 3600
  expires: 24
  remain-space: 15
```

- `purge.interval`
 - The interval of automatic purge in the background, in seconds.
 - “3600” by default, indicating a background purge task is performed every 3600 seconds.
- `purge.expires`
 - The number of hours for which the relay log (that has been previously written to the relay processing unit, and that is not being used or will not be read later by the currently running data migration task) can be retained before being purged in the automatic background purge.
 - “0” by default, indicating data purge is not performed according to the update time of the relay log.
- `purge.remain-space`
 - The amount of remaining disk space in GB less than which the specified DM-worker machine tries to purge the relay log that can be purged securely in the automatic background purge. If it is set to 0, data purge is not performed according to the remaining disk space.
 - “15” by default, indicating when the available disk space is less than 15GB, DM-master tries to purge the relay log securely.

Manual data purge

Manual data purge means using the `purge-relay` command provided by `dmctl` to specify `subdir` and the binlog name thus to purge all the relay logs **before** the specified binlog. If the `-subdir` option in the command is not specified, all relay logs **before** the current relay log sub-directory are purged.

Assuming that the directory structure of the current relay log is as follows:

```
$ tree .
.
|-- deb76a2b-09cc-11e9-9129-5242cf3bb246.000001
|   |-- mysql-bin.000001
|   |-- mysql-bin.000002
|   |-- mysql-bin.000003
```

```
| `-- relay.meta
|-- deb76a2b-09cc-11e9-9129-5242cf3bb246.000003
| |-- mysql-bin.000001
| `-- relay.meta
|-- e4e0e8ab-09cc-11e9-9220-82cc35207219.000002
| |-- mysql-bin.000001
| `-- relay.meta
`-- server-uuid.index
```

```
$ cat server-uuid.index
deb76a2b-09cc-11e9-9129-5242cf3bb246.000001
e4e0e8ab-09cc-11e9-9220-82cc35207219.000002
deb76a2b-09cc-11e9-9129-5242cf3bb246.000003
```

- Executing the following `purge-relay` command in `dmctl` purges all relay log files **before** `e4e0e8ab-09cc-11e9-9220-82cc35207219.000002/mysql-bin.000001`, which is all relay log files in `deb76a2b-09cc-11e9-9129-5242cf3bb246.000001`.

```
» purge-relay -s mysql-replica-01 --filename mysql-bin.000001 --sub-dir
↳ e4e0e8ab-09cc-11e9-9220-82cc35207219.000002
```

- Executing the following `purge-relay` command in `dmctl` purges all relay log file **before the current** (`deb76a2b-09cc-11e9-9129-5242cf3bb246.000003`) directory's `mysql-bin.000001`, which is all relay log files in `deb76a2b-09cc-11e9-9129-5242cf3bb246.000001` and `e4e0e8ab-09cc-11e9-9220-82cc35207219.000002`.

```
» purge-relay -s mysql-replica-01 --filename mysql-bin.000001
```

11.9.7.1.4 Special Handling of DM DDLs

When TiDB Data Migration (DM) migrates data, it parses the DDL statements and handles them according to the statement type and the current migration stage.

Skip DDL statements

The following statements are not supported by DM, so DM skips them directly after parsing.

```
<tr>
  <th>Description</th>
  <th>SQL</th>
</tr>
<tr>
  <td>transaction</td>
  <td><code>^SAVEPOINT</code></td>
</tr>
```

```

<tr>
  <td>skip all flush sqls</td>
  <td><code>^FLUSH</code></td>
</tr>
<tr>
  <td rowspan="3">table maintenance</td>
  <td><code>^OPTIMIZE\\s+TABLE</code></td>
</tr>
<tr>
  <td><code>^ANALYZE\\s+TABLE</code></td>
</tr>
<tr>
  <td><code>^REPAIR\\s+TABLE</code></td>
</tr>
<tr>
  <td>temporary table</td>
  <td><code>^DROP\\s+(\\|\\*\\!40005\\s+)?TEMPORARY\\s+(\\*\\|\\s+)?TABLE
    ↪ </code></td>
</tr>
<tr>
  <td rowspan="2">trigger</td>
  <td><code>^CREATE\\s+(DEFINER\\s?=\\s+)?TRIGGER</code></td>
</tr>
<tr>
  <td><code>^DROP\\s+TRIGGER</code></td>
</tr>
<tr>
  <td rowspan="3">procedure</td>
  <td><code>^DROP\\s+PROCEDURE</code></td>
</tr>
<tr>
  <td><code>^CREATE\\s+(DEFINER\\s?=\\s+)?PROCEDURE</code></td>
</tr>
<tr>
  <td><code>^ALTER\\s+PROCEDURE</code></td>
</tr>
<tr>
  <td rowspan="2">view</td>
  <td><code>^CREATE\\s*(OR REPLACE)?\\s+(ALGORITHM\\s?=\\s+)?(DEFINER\\s
    ↪ ?=\\s+)?\\s+(SQL SECURITY DEFINER)?VIEW</code></td>
</tr>
<tr>
  <td><code>^DROP\\s+VIEW</code></td>
</tr>
<tr>

```

```

        <td><code>^ALTER\\s+(ALGORITHM\\s?=\\.+)?(DEFINER\\s?=\\.+)?(SQL SECURITY
        ↪ DEFINER)?VIEW</code></td>
</tr>
<tr>
    <td rowspan="4">function</td>
    <td><code>^CREATE\\s+(AGGREGATE)?\\s*?FUNCTION</code></td>
</tr>
<tr>
    <td><code>^CREATE\\s+(DEFINER\\s?=\\.+)?FUNCTION</code></td>
</tr>
<tr>
    <td><code>^ALTER\\s+FUNCTION</code></td>
</tr>
<tr>
    <td><code>^DROP\\s+FUNCTION</code></td>
</tr>
<tr>
    <td rowspan="3">tableSpace</td>
    <td><code>^CREATE\\s+TABLESPACE</code></td>
</tr>
<tr>
    <td><code>^ALTER\\s+TABLESPACE</code></td>
</tr>
<tr>
    <td><code>^DROP\\s+TABLESPACE</code></td>
</tr>
<tr>
    <td rowspan="3">event</td>
    <td><code>^CREATE\\s+(DEFINER\\s?=\\.+)?EVENT</code></td>
</tr>
<tr>
    <td><code>^ALTER\\s+(DEFINER\\s?=\\.+)?EVENT</code></td>
</tr>
<tr>
    <td><code>^DROP\\s+EVENT</code></td>
</tr>
<tr>
    <td rowspan="7">account management</td>
    <td><code>^GRANT</code></td>
</tr>
<tr>
    <td><code>^REVOKE</code></td>
</tr>
<tr>
    <td><code>^CREATE\\s+USER</code></td>

```

```

</tr>
<tr>
  <td><code>^ALTER\\s+USER</code></td>
</tr>
<tr>
  <td><code>^RENAME\\s+USER</code></td>
</tr>
<tr>
  <td><code>^DROP\\s+USER</code></td>
</tr>
<tr>
  <td><code>^DROP\\s+USER</code></td>
</tr>

```

Rewrite DDL statements

The following statements are rewritten before being replicated to the downstream.

Original statement	Rewritten statement
<code>^CREATE DATABASE...</code>	<code>^CREATE DATABASE...IF NOT EXISTS</code>
<code>^CREATE TABLE...</code>	<code>^CREATE TABLE..IF NOT EXISTS</code>
<code>^DROP DATABASE...</code>	<code>^DROP DATABASE...IF EXISTS</code>
<code>^DROP TABLE...</code>	<code>^DROP TABLE...IF EXISTS</code>
<code>^DROP INDEX...</code>	<code>^DROP INDEX...IF EXISTS</code>

Shard merge migration tasks

When DM merges and migrates tables in pessimistic or optimistic mode, the behavior of DDL replication is different from that in other scenarios. For details, refer to [Pessimistic Mode](#) and [Optimistic Mode](#).

Online DDL

The Online DDL feature also handles DDL events in a special way. For details, refer to [Migrate from Databases that Use GH-ost/PT-osc](#).

11.9.7.2 Command-line Flags

This document introduces DM's command-line flags.

11.9.7.2.1 DM-master

`--advertise-addr`

- The external address of DM-master used to receive client requests
- The default value is "{master-addr}"

- Optional flag. It can be in the form of "domain-name:port"

`--advertise-peer-urls`

- The external address for communication between DM-master nodes
- The default value is "{peer-urls}"
- Optional flag. It can be in the form of "http(s)://domain-name:port"

`--config`

- The configuration file path of DM-master
- The default value is ""
- Optional flag

`--data-dir`

- The directory used to store data of DM-master
- The default value is "default.{name}"
- Optional flag

`--initial-cluster`

- The "{node name}={external address}" list used to bootstrap DM-master cluster
- The default value is "{name}={advertise-peer-urls}"
- This flag needs to be specified if the `join` flag is not specified. A configuration example of a 3-node cluster is "dm-master-1=http://172.16.15.11:8291,dm-master-2=http://172.16.15.12:8291,dm-master-3=http://172.16.15.13:8291"

`--join`

- The existing cluster's `advertise-addr` list when a DM-master node joins this cluster
- The default value is ""
- This flag needs to be specified if the `initial-cluster` flag is not specified. Suppose a new node joins a cluster that has 2 nodes, a configuration example is "172.16.15.11:8261,172.16.15.12:8261"

`--log-file`

- The output file name of the log
- The default value is ""
- Optional flag

`-L`

- The log level
- The default value is `"info"`
- Optional flag

`--master-addr`

- The address on which DM-master listens to the client's requests
- The default value is `""`
- Required flag

`--name`

- The name of a DM-master node
- The default value is `"dm-master-{hostname}"`
- Required flag

`--peer-urls`

- The listening address for communications between DM-master nodes
- The default value is `"http://127.0.0.1:8291"`
- Required flag

11.9.7.2.2 DM-worker

`--advertise-addr`

- The external address of DM-worker used to receive client requests
- The default value is `"{worker-addr}"`
- Optional flag. It can be in the form of `"domain-name:port"`

`--config`

- The configuration file path of DM-worker
- The default value is `""`
- Optional flag

`--join`

- The `{advertise-addr}` list of DM-master nodes in a cluster when a DM-worker registers to this cluster

- The default value is ""
- Required flag. A configuration example of 3-node (DM-master node) cluster is "172.16.15.11:8261,172.16.15.12:8261,172.16.15.13:8261"

`--log-file`

- The output file name of the log
- The default value is ""
- Optional flag

`-L`

- The log level
- The default value is "info"
- Optional flag

`--name`

- The name of a DM-worker node
- The default value is "{advertise-addr}"
- Required flag

`--worker-addr`

- The address on which DM-worker listens to the client's requests
- The default value is ""
- Required flag

11.9.7.2.3 dmctl

`--config`

- The configuration file path of dmctl
- The default value is ""
- Optional flag

`--master-addr`

- The {advertise-addr} of any DM-master node in the cluster to be connected by dmctl
- The default value is ""
- It is a required flag when dmctl interacts with DM-master

`--encrypt`

- Encrypts the plaintext database password into ciphertext
- The default value is ""
- When this flag is specified, it is only used to encrypt the plaintext without interacting with the DM-master

`--decrypt`

- Decrypts ciphertext encrypted with `dmctl` into plaintext
- The default value is ""
- When this flag is specified, it is only used to decrypt the ciphertext without interacting with the DM-master

11.9.7.3 Configuration

11.9.7.3.1 Data Migration Configuration File Overview

This document gives an overview of configuration files of DM (Data Migration).

DM process configuration files

- `dm-master.toml`: The configuration file of running the DM-master process, including the topology information and the logs of the DM-master. For more details, refer to [DM-master Configuration File](#).
- `dm-worker.toml`: The configuration file of running the DM-worker process, including the topology information and the logs of the DM-worker. For more details, refer to [DM-worker Configuration File](#).
- `source.yaml`: The configuration of the upstream database such as MySQL and MariaDB. For more details, refer to [Upstream Database Configuration File](#).

DM migration task configuration

Data migration task creation

You can take the following steps to create a data migration task:

1. [Load the data source configuration into the DM cluster using `dmctl`](#).
2. Refer to the description in the [Task Configuration Guide](#) and create the configuration file `your_task.yaml`.
3. [Create the data migration task using `dmctl`](#).

Important concepts

This section shows description of some important concepts.

Concept	Description	Configuration File
source ↔ <code>-id</code>	Uniquely represents a MySQL or MariaDB instance, or a migration group with the primary-secondary structure. The maximum length of <code>source-id</code> is 32.	<code>source_id</code> of <code>source.yaml</code> ; <code>source-id</code> of <code>task.yaml</code>
DM-master ID	Uniquely represents a DM-master (by the <code>master-addr</code> parameter of <code>dm-master</code> ↔ <code>.toml</code>)	<code>master-addr</code> of <code>dm-master</code> . ↔ <code>toml</code>
DM-worker ID	Uniquely represents a DM-worker (by the <code>worker-addr</code> parameter of <code>dm-worker</code> ↔ <code>.toml</code>)	<code>worker-addr</code> of <code>dm-worker</code> . ↔ <code>toml</code>

11.9.7.3.2 DM-master Configuration File

This document introduces the configuration of DM-master, including a configuration file template and a description of each configuration parameter in this file.

Configuration file template

The following is a configuration file template of DM-master.

```
name = "dm-master"

##### log configuration
log-level = "info"
log-file = "dm-master.log"

##### DM-master listening address
master-addr = ":8261"
advertise-addr = "127.0.0.1:8261"

##### URLs for peer traffic
peer-urls = "http://127.0.0.1:8291"
advertise-peer-urls = "http://127.0.0.1:8291"

##### cluster configuration
initial-cluster = "master1=http://127.0.0.1:8291,master2=http
  ↪ ://127.0.0.1:8292,master3=http://127.0.0.1:8293"
join = ""

ssl-ca = "/path/to/ca.pem"
ssl-cert = "/path/to/cert.pem"
ssl-key = "/path/to/key.pem"
cert-allowed-cn = ["dm"]
```

Configuration parameters

This section introduces the configuration parameters of DM-master.

Global configuration

Parameter	Description
<code>name</code>	The name of the DM-master.
<code>log-level</code>	Specifies a log level from <code>debug</code> , <code>info</code> , <code>warn</code> , <code>error</code> , and <code>fatal</code> . The default log level is <code>info</code> .
<code>log-file</code>	Specifies the log file directory. If the parameter is not specified, the logs are printed onto the standard output.
<code>master-addr</code>	Specifies the address of DM-master which provides services. You can omit the IP address and specify the port number only, such as “:8261”.
<code>advertise- ↪ addr</code>	Specifies the address that DM-master advertises to the outside world.

Parameter	Description
<code>peer-urls</code>	Specifies the peer URL of the DM-master node.
<code>advertise- ↔ peer-urls</code>	Specifies the peer URL that DM-master advertises to the outside world. The value of <code>advertise-peer-urls</code> is by default the same as that of <code>peer-urls</code> .
<code>initial- ↔ cluster</code>	The value of <code>initial-cluster</code> is the combination of the <code>advertise-peer-urls</code> value of all DM-master nodes in the initial cluster.
<code>join</code>	The value of <code>join</code> is the combination of the <code>advertise-peer-urls</code> value of the existed DM-master nodes in the cluster. If the DM-master node is newly added, replace <code>initial-cluster</code> with <code>join</code> .
<code>ssl-ca</code>	The path of the file that contains list of trusted SSL CAs for DM-master to connect with other components.
<code>ssl-cert</code>	The path of the file that contains X509 certificate in PEM format for DM-master to connect with other components.
<code>ssl-key</code>	The path of the file that contains X509 key in PEM format for DM-master to connect with other components.
<code>cert-allowed ↔ -cn</code>	Common Name list.

11.9.7.3.3 DM-worker Configuration File

This document introduces the configuration of DM worker, including a configuration file template and a description of each configuration parameter in this file.

Configuration file template

The following is a configuration file template of the DM-worker:

```
##### Worker Configuration.
name = "worker1"

##### Log configuration.
log-level = "info"
log-file = "dm-worker.log"

##### DM-worker listen address.
worker-addr = ":8262"
```

```

advertise-addr = "127.0.0.1:8262"
join = "http://127.0.0.1:8261,http://127.0.0.1:8361,http://127.0.0.1:8461"

keepalive-ttl = 60
relay-keepalive-ttl = 1800 # New in DM v2.0.2.
##### relay-dir = "relay_log" # New in 5.4.0. When you use a relative path,
    ↪ check the deployment and start method of DM-worker to determine the
    ↪ full path.

ssl-ca = "/path/to/ca.pem"
ssl-cert = "/path/to/cert.pem"
ssl-key = "/path/to/key.pem"
cert-allowed-cn = ["dm"]

```

Configuration parameters

Global

Parameter	Description
<code>name</code>	The name of the DM-worker.
<code>log-level</code>	Specifies a log level from <code>debug</code> , <code>info</code> , <code>warn</code> , <code>error</code> , and <code>fatal</code> . The default log level is <code>info</code> .
<code>log-file</code>	Specifies the log file directory. If this parameter is not specified, the logs are printed onto the standard output.
<code>worker-addr</code>	Specifies the address of DM-worker which provides services. You can omit the IP address and specify the port number only, such as “:8262”.
<code>advertise- ↪ addr</code>	Specifies the address that DM-worker advertises to the outside world.
<code>join</code>	Corresponds to one or more <code>master-addrs</code> in the DM-master configuration file.
<code>keepalive- ↪ ttl</code>	The keepalive time (in seconds) of a DM-worker node to the DM-master node if the upstream data source of the DM-worker node does not enable the relay log. The default value is 60s.
<code>relay- ↪ keepalive ↪ -ttl</code>	The keepalive time (in seconds) of a DM-worker node to the DM-master node if the upstream data source of the DM-worker node enables the relay log. The default value is 1800s. This parameter is added since DM v2.0.2.

Parameter	Description
<code>relay-dir</code>	When relay log is enabled in the bound upstream data source, DM-worker stores the relay log in this directory. This parameter is new in v5.4.0 and takes precedence over the configuration of the upstream data source.
<code>ssl-ca</code>	The path of the file that contains list of trusted SSL CAs for DM-worker to connect with other components.
<code>ssl-cert</code>	The path of the file that contains X509 certificate in PEM format for DM-worker to connect with other components.
<code>ssl-key</code>	The path of the file that contains X509 key in PEM format for DM-worker to connect with other components.
<code>cert-allowed</code>	Common Name list. ↪ <code>-cn</code>

11.9.7.3.4 Upstream Database Configuration File

This document introduces the configuration file of the upstream database, including a configuration file template and the description of each configuration parameter in this file.

Configuration file template

The following is a configuration file template of the upstream database:

```
source-id: "mysql-replica-01"

##### Whether to enable GTID.
enable-gtid: false

##### Whether to enable relay log.
enable-relay: false # Since DM v2.0.2, this configuration item is
    ↪ deprecated. To enable the relay log feature, use the `start-relay`
    ↪ command instead.
relay-binlog-name: "" # The file name from which DM-worker starts to pull
    ↪ the binlog.
relay-binlog-gtid: "" # The GTID from which DM-worker starts to pull the
    ↪ binlog.
relay-dir: "relay-dir" # The directory used to store relay log. The default
    ↪ value is "relay-dir".

from:
```

```
host: "127.0.0.1"
port: 3306
user: "root"
password: "ZqMLjZ2j5khNe1DEfDoUhkD5aV5fIJ0e0fiog9w=" # The user password
    ↪ of the upstream database. It is recommended to use the password
    ↪ encrypted with dmctl.
security: # The TLS configuration of the upstream
    ↪ database
ssl-ca: "/path/to/ca.pem"
ssl-cert: "/path/to/cert.pem"
ssl-key: "/path/to/key.pem"

##### purge:
##### interval: 3600
##### expires: 0
##### remain-space: 15

##### checker:
##### check-enable: true
##### backoff-rollback: 5m0s
##### backoff-max: 5m0s # The maximum value of backoff, should be larger
    ↪ than 1s

##### Configure binlog event filters. New in DM v2.0.2
##### case-sensitive: false
##### filters:
##### - schema-pattern: dmctl
##### table-pattern: t_1
##### events: []
##### sql-pattern:
##### - alter table .* add column `aaa` int
##### action: Ignore
```

Note:

In DM v2.0.1, DO NOT set `enable-gtid` and `enable-relay` to `true` at the same time. Otherwise, it may cause loss of incremental data.

Configuration parameters

This section describes each configuration parameter in the configuration file.

Global configuration

Parameter	Description
<code>source-id</code>	Represents a MySQL instance ID.
<code>enable-gtid</code>	Determines whether to pull binlog from the upstream using GTID. The default value is <code>false</code> . In general, you do not need to configure <code>enable-gtid</code> manually. However, if GTID is enabled in the upstream database, and the primary/secondary switch is required, you need to set <code>enable-gtid</code> to <code>true</code> .
<code>enable-relay</code>	Determines whether to enable the relay log feature. The default value is <code>false</code> . Since DM v2.0.2, this configuration item is deprecated. To enable the relay log feature , use the <code>start-relay</code> command instead.
<code>relay-binlog</code> ↪ <code>-name</code>	Specifies the file name from which DM-worker starts to pull the binlog. For example, "mysql-bin.000002". It only works when <code>enable_gtid</code> is <code>false</code> . If this parameter is not specified, DM-worker will pull the binlogs starting from the latest one.
<code>relay-binlog</code> ↪ <code>-gtid</code>	Specifies the GTID from which DM-worker starts to pull the binlog. For example, "e9a1fc22-ec08-11e9-b2ac-0242 ↪ ac110003:1-7849". It only works when <code>enable_gtid</code> is <code>true</code> . If this parameter is not specified, DM-worker will pull the binlogs starting from the latest GTID.
<code>relay-dir</code>	Specifies the relay log directory.
<code>host</code>	Specifies the host of the upstream database.
<code>port</code>	Specifies the port of the upstream database.
<code>user</code>	Specifies the username of the upstream database.
<code>password</code>	Specifies the user password of the upstream database. It is recommended to use the password encrypted with <code>dmctl</code> .
<code>security</code>	Specifies the TLS config of the upstream database. The configured file paths of the certificates must be accessible to all nodes. If the configured file paths are local paths, then all the nodes in the cluster need to store a copy of the certificates in the same path of each host.

Relay log cleanup strategy configuration (**purge**)

Generally, there is no need to manually configure these parameters unless there is a large amount of relay logs and disk capacity is insufficient.

Parameter	Description	Default value
interval	Sets the time interval at which relay logs are regularly checked for expiration, in seconds.	3600
expires	Sets the expiration time for relay logs, in hours. The relay log that is not written by the relay processing unit, or does not need to be read by the existing data migration task will be deleted by DM if it exceeds the expiration time. If this parameter is not specified, the automatic purge is not performed.	0
remain-space	Sets the minimum amount of free disk space, in gigabytes. When the available disk space is smaller than this value, DM-worker tries to delete relay logs.	15

Note:

The automatic data purge strategy only takes effect when **interval** is not 0 and at least one of the two configuration items **expires** and **remain-space** is not 0.

Task status checker configuration (**checker**)

DM periodically checks the current task status and error message to determine if resuming the task will eliminate the error. If needed, DM automatically retries to resume the task. DM adjusts the checking interval using the exponential backoff strategy. Its behaviors can be adjusted by the following configuration.

Parameter	Description
check-enable	Whether to enable this feature.
backoff-rollback	If the current checking interval of backoff strategy is larger than this value and the task status is normal, DM will try to decrease the interval.

Parameter	Description
<code>backoff-max</code>	The maximum value of checking interval of backoff strategy, must be larger than 1 second.

Binlog event filter

Starting from DM v2.0.2, you can configure binlog event filters in the source configuration file.

Parameter	Description
<code>case-sensitive</code> filters	Determines whether the filtering rules are case-sensitive. The default value is <code>false</code> . Sets binlog event filtering rules. For details, see Binlog event filter parameter explanation .

11.9.7.3.5 Table Selector

Table selector provides a match rule based on [wildcard characters](#) for schema/table. To match a specified table, configure `schema-pattern/table-pattern`.

Wildcard character

Table selector uses the following two wildcard characters in `schema-pattern/table-pattern`:

- The asterisk character (`*`, also called “star”)
 - `*` matches zero or more characters. For example, `doc*` matches `doc` and `document` but not `dodo`.
 - `*` can only be placed at the end of the word. For example, `doc*` is supported, while `do*c` is not supported.
- The question mark (`?`)
 - ? matches exactly one character except the empty character.

Match rules

- `schema-pattern` cannot be empty.
- `table-pattern` can be empty. When you configure it as empty, only `schema` is matched according to `schema-pattern`.
- When `table-pattern` is not empty, the `schema` is matched according to `schema-pattern` and `table` is matched according to `table-pattern`. Only when both `schema` and `table` are successfully matched, you can get the match result.

Usage examples

- Matching all schemas and tables that have a `schema_` prefix in the schema name:

```
schema-pattern: "schema_*"
table-pattern: ""
```

- Matching all tables that have a `schema_` prefix in the schema name and a `table_` prefix in the table name:

```
schema-pattern = "schema_*"
table-pattern = "table_*
```

11.9.7.4 Compatibility Catalog of TiDB Data Migration

DM supports migrating data from different sources to TiDB clusters. Based on the data source type, DM has four compatibility levels:

- **Generally available (GA):** The application scenario has been verified and passed the GA test.
- **Experimental:** Although the application scenario has been verified, the test does not cover all scenarios or involves only a limited number of users. The application scenario might encounter problems occasionally.
- **Not tested:** DM is expected to be always compatible with MySQL during iteration. However, due to resource constraints, not all MySQL forks are tested with DM. Therefore, the *not tested* source or target is technically compatible with DM, but is not fully tested, which means you need to verify its compatibility before you use.
- **Incompatible:** DM is proved to be incompatible with the data source and the application is not recommended for use in production environments.

11.9.7.4.1 Data sources

Data source	Compatibility level	Remarks
MySQL 5.5	Not tested	
MySQL 5.6	GA	
MySQL 5.7	GA	
MySQL 8.0	Experimental	
MariaDB < 10.1.2	Incompatible	Incompatible with binlog of the time type
MariaDB 10.1.2 ~ 10.5.10	Experimental	
MariaDB > 10.5.10	Incompatible	Permission errors reported in the check procedure

11.9.7.4.2 Target databases

Warning:

DM v5.3.0 is not recommended. If you have enabled GTID replication but do not enable relay log in DM v5.3.0, data replication fails with low probability.

Target database	Compatibility level	DM version
TiDB 6.0	GA	5.3.1
TiDB 5.4	GA	5.3.1
TiDB 5.3	GA	5.3.1
TiDB 5.2	GA	2.0.7, recommended: 5.4
TiDB 5.1	GA	2.0.4, recommended: 5.4
TiDB 5.0	GA	2.0.4, recommended: 5.4
TiDB 4.x	GA	2.0.1, recommended: 2.0.7
TiDB 3.x	GA	2.0.1, recommended: 2.0.7
MySQL	Experimental	
MariaDB	Experimental	

11.9.8 Secure

11.9.8.1 Enable TLS for DM Connections

This document describes how to enable encrypted data transmission for DM connections, including connections between the DM-master, DM-worker, and dmctl components, and connections between DM and the upstream or downstream database.

11.9.8.1.1 Enable encrypted data transmission between DM-master, DM-worker, and dmctl

This section introduces how to enable encrypted data transmission between DM-master, DM-worker, and dmctl.

Configure and enable encrypted data transmission

1. Prepare certificates.

It is recommended to prepare a server certificate for DM-master and DM-worker separately. Make sure that the two components can authenticate each other. You can choose to share one client certificate for dmctl.

To generate self-signed certificates, you can use `openssl`, `cfssl` and other tools based on `openssl`, such as `easy-rsa`.

If you choose `openssl`, you can refer to [generating self-signed certificates](#).

2. Configure certificates.

Note:

You can configure DM-master, DM-worker, and dmctl to use the same set of certificates.

- DM-master

Configure in the configuration file or command-line arguments:

```
ssl-ca = "/path/to/ca.pem"  
ssl-cert = "/path/to/master-cert.pem"  
ssl-key = "/path/to/master-key.pem"
```

- DM-worker

Configure in the configuration file or command-line arguments:

```
ssl-ca = "/path/to/ca.pem"  
ssl-cert = "/path/to/worker-cert.pem"  
ssl-key = "/path/to/worker-key.pem"
```

- dmctl

After enabling encrypted transmission in a DM cluster, if you need to connect to the cluster using dmctl, specify the client certificate. For example:

```
./dmctl --master-addr=127.0.0.1:8261 --ssl-ca /path/to/ca.pem --ssl  
  ↪ -cert /path/to/client-cert.pem --ssl-key /path/to/client-key  
  ↪ .pem
```

Verify component caller's identity

The Common Name is used for caller verification. In general, the callee needs to verify the caller's identity, in addition to verifying the key, the certificates, and the CA provided by the caller. For example, DM-worker can only be accessed by DM-master, and other visitors are blocked even though they have legitimate certificates.

To verify component caller's identity, you need to mark the certificate user identity using **Common Name (CN)** when generating the certificate, and to check the caller's identity by configuring the **Common Name** list for the callee.

- DM-master

Configure in the configuration file or command-line arguments:

```
cert-allowed-cn = ["dm"]
```

- DM-worker

Configure in the configuration file or command-line arguments:

```
cert-allowed-cn = ["dm"]
```

Reload certificates

To reload the certificates and the keys, DM-master, DM-worker, and dmctl reread the current certificates and the key files each time a new connection is created.

When the files specified by `ssl-ca`, `ssl-cert` or `ssl-key` are updated, restart DM components to reload the certificates and the key files and reconnect with each other.

11.9.8.1.2 Enable encrypted data transmission between DM components and the upstream or downstream database

This section introduces how to enable encrypted data transmission between DM components and the upstream or downstream database.

Enable encrypted data transmission for upstream database

1. Configure the upstream database, enable the encryption support, and set the server certificate. For detailed operations, see [Using encrypted connections](#).
2. Set the MySQL client certificate in the source configuration file:

Note:

Make sure that all DM-master and DM-worker components can read the certificates and the key files via specified paths.

```
from:
  security:
    ssl-ca: "/path/to/mysql-ca.pem"
    ssl-cert: "/path/to/mysql-cert.pem"
    ssl-key: "/path/to/mysql-key.pem"
```

Enable encrypted data transmission for downstream TiDB

1. Configure the downstream TiDB to use encrypted connections. For detailed operations, refer to [Configure TiDB server to use secure connections](#).
2. Set the TiDB client certificate in the task configuration file:

Note:

Make sure that all DM-master and DM-worker components can read the certificates and the key files via specified paths.

```
target-database:
  security:
    ssl-ca: "/path/to/tidb-ca.pem"
    ssl-cert: "/path/to/tidb-client-cert.pem"
    ssl-key: "/path/to/tidb-client-key.pem"
```

11.9.8.2 Generate Self-signed Certificates

This document provides an example of using `openssl` to generate a self-signed certificate. You can also generate certificates and keys that meet requirements according to your demands.

Assume that the topology of the instance cluster is as follows:

Name	Host IP	Services
node1	172.16.10.11	DM-master1
node2	172.16.10.12	DM-master2
node3	172.16.10.13	DM-master3
node4	172.16.10.14	DM-worker1
node5	172.16.10.15	DM-worker2
node6	172.16.10.16	DM-worker3

11.9.8.2.1 Install OpenSSL

- For Debian or Ubuntu OS:

```
apt install openssl
```

- For RedHat or CentOS OS:

```
yum install openssl
```

You can also refer to OpenSSL's official [download document](#) for installation.

11.9.8.2.2 Generate the CA certificate

A certificate authority (CA) is a trusted entity that issues digital certificates. In practice, contact your administrator to issue the certificate or use a trusted CA. CA manages multiple certificate pairs. Here you only need to generate an original pair of certificates as follows.

1. Generate the CA key:

```
openssl genrsa -out ca-key.pem 4096
```

2. Generate the CA certificates:

```
openssl req -new -x509 -days 1000 -key ca-key.pem -out ca.pem
```

3. Validate the CA certificates:

```
openssl x509 -text -in ca.pem -noout
```

11.9.8.2.3 Issue certificates for individual components

Certificates that might be used in the cluster

- The **master** certificate used by DM-master to authenticate DM-master for other components.
- The **worker** certificate used by DM-worker to authenticate DM-worker for other components.
- The **client** certificate used by dmctl to authenticate clients for DM-master and DM-worker.

Issue certificates for DM-master

To issue a certificate to a DM-master instance, perform the following steps:

1. Generate the private key corresponding to the certificate:

```
openssl genrsa -out master-key.pem 2048
```

2. Make a copy of the OpenSSL configuration template file (Refer to the actual location of your template file because it might have more than one location):

```
cp /usr/lib/ssl/openssl.cnf .
```

If you do not know the actual location, look for it in the root directory:

```
find / -name openssl.cnf
```

3. Edit `openssl.cnf`, add `req_extensions = v3_req` under the `[req]` field, and add `subjectAltName = @alt_names` under the `[v3_req]` field. Finally, create a new field and edit the information of Subject Alternative Name (SAN) according to the cluster topology description above.

```
[ alt_names ]
IP.1 = 127.0.0.1
IP.2 = 172.16.10.11
IP.3 = 172.16.10.12
IP.4 = 172.16.10.13
```

The following checking items of SAN are currently supported:

- IP
- DNS
- URI

Note:

If a special IP such as 0.0.0.0 is to be used for connection or communication, you must also add it to `alt_names`.

4. Save the `openssl.cnf` file, and generate the certificate request file: (When giving input to `Common Name` (e.g. `server FQDN` or `YOUR name`) [], you assign a `Common Name` (CN) to the certificate, such as `dm`. It is used by the server to validate the identity of the client. Each component does not enable the validation by default. You can enable it in the configuration file.)

```
openssl req -new -key master-key.pem -out master-cert.pem -config
↳ openssl.cnf
```

5. Issue and generate the certificate:

```
openssl x509 -req -days 365 -CA ca.pem -CAkey ca-key.pem -
↳ CACreateserial -in master-cert.pem -out master-cert.pem -
↳ extensions v3_req -extfile openssl.cnf
```

6. Verify that the certificate includes the SAN field (optional):

```
openssl x509 -text -in master-cert.pem -noout
```

7. Confirm that the following files exist in your current directory:

```
ca.pem
master-cert.pem
master-key.pem
```

Note:

The process of issuing certificates for the DM-worker instance is similar and will not be repeated in this document.

Issue certificates for the client (dmctl)

To issue a certificate to the client (dmctl), perform the following steps:

1. Generate the private key corresponding to the certificate:

```
openssl genrsa -out client-key.pem 2048
```

2. Generate the certificate request file (in this step, you can also assign a Common Name to the certificate, which is used to allow the server to validate the identity of the client. Each component does not enable the validation by default, and you can enable it in the configuration file):

```
openssl req -new -key client-key.pem -out client-cert.pem
```

3. Issue and generate the certificate:

```
openssl x509 -req -days 365 -CA ca.pem -CAkey ca-key.pem -  
↳ Ccreateserial -in client-cert.pem -out client-cert.pem
```

11.9.9 Data Migration Monitoring Metrics

If your DM cluster is deployed using TiUP, the **monitoring system** is also deployed at the same time. This document describes the monitoring metrics provided by DM-worker.

11.9.9.1 Task

In the Grafana dashboard, the default name of DM is **DM-task**.

11.9.9.1.1 overview

Overview contains some monitoring metrics of all the DM-worker and DM-master instances or sources in the currently selected task. The current default alert rule is only for a single DM-worker/DM-master instance/source.

Metric name	Description	Alert	Severity level
task state	The state of subtasks for migration	N/A	N/A
storage capacity	The total storage capacity of the disk occupied by relay logs	N/A	N/A
storage remain	The remaining storage capacity of the disk occupied by relay logs	N/A	N/A
binlog file gap between master and relay load progress	The number of binlog files by which the relay processing unit is behind the upstream master master. The value is between 0%~100%	N/A	N/A

Metric name	Description	Alert	Severity level
binlog file gap between master and syncer	The number of binlog files by which the binlog replication unit is behind the upstream master	N/A	N/A
shard lock resolving	Whether the current subtask is waiting for sharding DDL migration. A value greater than 0 means that the current subtask is waiting for sharding DDL migration	N/A	N/A

11.9.9.1.2 Operation errors

Metric name	Description	Alert	Severity level
before any operate error	The number of errors before any operation	N/A	N/A
source bound error	The number of errors of data source binding operations	N/A	N/A

Metric name	Description	Alert	Severity level
start error	The number of errors during the start of a subtask	N/A	N/A
pause error	The number of errors during the pause of a subtask	N/A	N/A
resume error	The number of errors during the resuming of a subtask	N/A	N/A
auto-resume error	The number of errors during the auto-resuming of a subtask	N/A	N/A
update error	The number of errors during the update of a subtask	N/A	N/A
stop error	The number of errors during the stop of a subtask	N/A	N/A

11.9.9.1.3 High availability

Metric name	Description	Alert	Severity level
number of dm-masters start leader components per minute	The number of DM-master attempts to enable leader related components per minute	N/A	N/A
number of workers in different state	The number of DM-workers in different states	Some DM-worker(s) has (have) been offline for more than one hour	critical
workers' state	The state of the DM-worker	N/A	N/A
number of worker event error	The number of different types of DM-worker errors	N/A	N/A
shard ddl error per minute	The number of different types of sharding DDL errors per minute	Any sharding DDL error occurs	critical

Metric name	Description	Alert	Severity level
number of pending shard ddl	The number of pending sharding DDL operations	Any pending sharding DDL operation has existed for more than one hour	critical

11.9.9.1.4 Task state

Metric name	Description	Alert	Severity level
task state	The state of subtasks	An alert occurs when the sub-task has been in the Paused state for more than 20 minutes	critical

11.9.9.1.5 Dump/Load unit

The following metrics show only when `task-mode` is in the `full` or `all` mode.

Metric name	Description	Alert	Severity level
load progress	The percentage of the completed loading process of the load unit. The value range is 0%~100%	N/A	N/A
data file size	The total size of the data files (includes the <code>INSERT INTO</code> statement) in the full data imported by the load unit	N/A	N/A
dump process exits with error	The dump unit encounters an error within the DM-worker and exits	Immediate	Critical alerts
load process exits with error	The load unit encounters an error within the DM-worker and exits	Immediate	Critical alerts
table count	The total number of tables in the full data imported by the load unit	N/A	N/A

Metric name	Description	Alert	Severity level
data file count	The total number of data files (includes the INSERT INTO statement) in the full data imported by the load unit	N/A	N/A
transaction execution latency	The latency of executing a transaction by the load unit (in seconds)	N/A	N/A
statement execution latency	The duration of executing a statement by the load unit (in seconds)	N/A	N/A
remaining time	The remaining time of replicating data by the load unit (in seconds)	N/A	N/A

11.9.9.1.6 Binlog replication

The following metrics show only when `task-mode` is in the `incremental` or `all` mode.

Metric name	Description	Alert	Severity level
remaining time to sync	The predicted remaining time it takes for <code>syncer</code> to be completely migrated with the upstream master (in minutes)	N/A	N/A
replicate lag gauge	The latency time it takes to replicate the binlog from upstream to downstream (in seconds)	N/A	N/A
replicate lag histogram	The histogram of replicating the binlog from upstream to downstream (in seconds). Note that due to different statistical mechanisms, the data might be inaccurate	N/A	N/A

Metric name	Description	Alert	Severity level
process exist with error	The binlog replication unit encounters an error within the DM-worker and exits	Immediate alerts	Critical

Metric name	Description	Alert	Severity level
binlog file gap between master and syncer	The number of binlog files by which the syncer processing unit is behind the upstream master	An alert occurs when the number of binlog files by which the syncer processing unit is behind the upstream master exceeds one (>1) and the condition lasts over 10 minutes	critical

Metric name	Description	Alert	Severity level
binlog file gap between relay and syncer	The number of binlog files by which syncer is behind relay	An alert occurs when the number of binlog files by which the syncer \hookrightarrow processing unit is behind the relay processing unit exceeds one (>1) and the condition lasts over 10 minutes	critical

Metric name	Description	Alert	Severity level
binlog event QPS	The number of binlog events received per unit of time (this number does not include the events that need to be skipped)	N/A	N/A
skipped binlog event QPS	The number of binlog events received per unit of time that need to be skipped	N/A	N/A
read binlog event duration	The duration that the binlog replication unit reads the binlog from the relay log or the upstream MySQL (in seconds)	N/A	N/A
transform binlog event duration	The duration that the binlog replication unit parses and transforms the binlog into SQL statements (in seconds)	N/A	N/A

Metric name	Description	Alert	Severity level
dispatch binlog event duration	The duration that the binlog replication unit dispatches a binlog event (in seconds)	N/A	N/A
transaction execution latency	The duration that the binlog replication unit executes the transaction to the downstream (in seconds)	N/A	N/A
binlog event size	The size of a binlog event that the binlog replication unit reads from the relay log or the upstream MySQL	N/A	N/A
DML queue remain length	The length of the remaining DML job queue	N/A	N/A
total sqls jobs	The number of newly added jobs per unit of time	N/A	N/A
finished sqls jobs	The number of finished jobs per unit of time	N/A	N/A

Metric name	Description	Alert	Severity level
statement execution latency	The duration that the binlog replication unit executes the statement to the downstream (in seconds)	N/A	N/A
add job duration	The duration that the binlog replication unit adds a job to the queue (in seconds)	N/A	N/A
DML conflict detect duration	The duration that the binlog replication unit detects the conflict in DML (in seconds)	N/A	N/A
skipped event duration	The duration that the binlog replication unit skips a binlog event (in seconds)	N/A	N/A
unsynced tables	The number of tables that have not received the shard DDL statement in the current subtask	N/A	N/A

Metric name	Description	Alert	Severity level
shard lock resolving	Whether the current subtask is waiting for the shard DDL lock to be resolved. A value greater than 0 indicates that it is waiting for the shard DDL lock to be resolved.	N/A	N/A
ideal QPS	The highest QPS that can be achieved when the running time of DM is 0	N/A	N/A
binlog event row finished	The number of rows in a binlog event	N/A	N/A
transaction total	The number of finished transactions in total	N/A	N/A
replication transaction batch	The number of sql rows in the transaction executed to the downstream	N/A	N/A
flush checkpoints time interval	The time interval for flushing the checkpoints (in seconds)	N/A	N/A

11.9.9.1.7 Relay log

Note:

Currently, DM v2.0 does not support enabling the relay log feature.

Metric name	Description	Alert	Severity level
storage capacity	The storage capacity of the disk occupied by the relay log	N/A	N/A
storage remain	The remaining storage capacity of the disk occupied by the relay log	An alert is needed once the value is smaller than 10G	critical
process exits with error	The relay log encounters an error within the DM-worker and exits	Immediate alerts	critical
relay log data corruption	The number of corrupted relay log files	Immediate alerts	emergency

Metric name	Description	Alert	Severity level
fail to read binlog from master	The number of errors encountered when the relay log reads the binlog from the upstream MySQL	Immediate alerts	Critical
fail to write relay log	The number of errors encountered when the relay log writes the binlog to disks	Immediate alerts	Critical
binlog file index	The largest index number of relay log files. For example, “value = 1” indicates “relay-log.000001”	N/A	N/A

Metric name	Description	Alert	Severity level
binlog file gap between master and relay	The number of binlog files in the relay log that are behind the upstream master	An alert occurs when the number of binlog files by which the relay processing unit is behind the upstream master exceeds one (>1) and the condition lasts over 10 minutes	critical
binlog pos	The write offset of the latest relay log file	N/A	N/A

Metric name	Description	Alert	Severity level
read binlog event duration	The duration that the relay log reads binlog from the upstream MySQL (in seconds)	N/A	N/A
write relay log duration	The duration that the relay log writes binlog into the disks each time (in seconds)	N/A	N/A
binlog event size	The size of a single binlog event that the relay log writes into the disks	N/A	N/A

11.9.9.2 Instance

In the Grafana dashboard, the default name of an instance is `DM-instance`.

11.9.9.2.1 Relay log

Metric name	Description	Alert	Severity level
storage capacity	The total storage capacity of the disk occupied by the relay log	N/A	N/A

Metric name	Description	Alert	Severity level
storage re-main	The remaining storage capacity within the disk occupied by the relay log	An alert occurs once the value is smaller than 10G	critical
process exits with error	The relay log encounters an error in DM-worker and exits	Immediate alerts	critical
relay log data corruption	The number of corrupted relay logs	Immediate alerts	emergency
fail to read binlog from master	The number of errors encountered when relay log reads the binlog from the upstream MySQL	Immediate alerts	critical
fail to write relay log	The number of errors encountered when the relay log writes the binlog to disks	Immediate alerts	critical

Metric name	Description	Alert	Severity level
binlog file index	The largest index number of relay log files. For example, “value = 1” indicates “relay-log.000001”	N/A	N/A

Metric name	Description	Alert	Severity level
binlog file gap between master and relay	The number of binlog files by which the relay processing unit is behind the upstream master	An alert occurs when the number of binlog files by which the relay processing unit is behind the upstream master exceeds one (>1) and the condition lasts over 10 minutes	critical
binlog pos	The write offset of the latest relay log file	N/A	N/A

Metric name	Description	Alert	Severity level
read binlog duration	The duration that the relay log reads the binlog from the upstream MySQL (in seconds)	N/A	N/A
write relay log duration	The duration that the relay log writes the binlog into the disk each time (in seconds)	N/A	N/A
binlog size	The size of a single binlog event that the relay log writes into the disks	N/A	N/A

11.9.9.2.2 Task

Metric name	Description	Alert	Severity level
task state	The state of subtasks for migration	An alert occurs when the sub-task has been paused for more than 10 minutes	critical

Metric name	Description	Alert	Severity level
load progress	The percentage of the completed loading process of the load unit. The value range is 0%~100%	N/A	N/A
binlog file gap between master and syncer	The number of binlog files by which the binlog replication unit is behind the upstream master	N/A	N/A
shard lock resolving	Whether the current subtask is waiting for sharding DDL migration. A value greater than 0 means that the current subtask is waiting for sharding DDL migration	N/A	N/A

11.9.10 DM Alert Information

The [alert system](#) is deployed by default when you deploy a DM cluster using TiUP.

For more information about DM alert rules and the solutions, refer to [handle alerts](#).

Both DM alert information and monitoring metrics are based on Prometheus. For more

information about their relationship, refer to [DM monitoring metrics](#).

11.9.11 Handle Errors

This document introduces the error system and how to handle common errors when you use DM.

11.9.11.1 Error system

In the error system, usually, the information of a specific error is as follows:

- **code:** error code.

DM uses the same error code for the same error type. An error code does not change as the DM version changes.

Some errors might be removed during the DM iteration, while the error codes are not. DM uses a new error code instead of an existing one for a new error.

- **class:** error type.

It is used to mark the component where an error occurs (error source).

The following table displays all error types, error sources, and error samples.

Error Type	Error Source	Error Sample
database	Database operations	[code=10003:class=database:scope=downstream ↔ :level=medium] database driver: invalid connection
functional	Underlying functions of DM	[code=11005:class=functional:scope ↔ =internal:level=high] not allowed operation: alter multiple tables ↔ in one statement
config	Incorrect configuration	[code=20005:class=config:scope=internal: ↔ level=medium] empty source-id not valid
binlog-op	Binlog operations	[code=22001:class=binlog-op:scope=internal: ↔ level=high] empty UUIDs not valid
checkpoint	checkpoint operations	[code=24002:class=checkpoint:scope= ↔ internal:level=high] save point bin.1234 is older than current pos ↔ bin.1371
task-check	Performing task check	[code=26003:class=task-check:scope= ↔ internal:level=medium] new table router error

```

relay-event-lib| Executing the basic functions of the relay module | [code=28001:
↳ class=relay-event-lib:scope=internal:level=high] parse server-uuid.
↳ index |
relay-unit | relay processing unit | [code=30015:class=relay-unit:scope=
↳ upstream:level=high] TCPReader get event: ERROR 1236 (HY000): Could
↳ not open log file |
dump-unit | dump processing unit | [code=32001:class=dump-unit:scope=internal
↳ :level=high] mydumper runs with error: CRITICAL **: 15:12:17.559:
↳ Error connecting to database: Access denied for user 'root'@'172.17.0.1'
↳ (using password: NO) |

↳ scheduler:scope=internal:level=high],"the scheduler has not started"
|
dmctl | An error occurs within dmctl or when it interacts with other components |
[code=48001:class=dmctl:scope=internal:level=high],"can not create grpc
↳ connection" |

```

- **scope:** Error scope.

It is used to mark the scope and source of DM objects when an error occurs. **scope** includes four types: **not-set**, **upstream**, **downstream**, and **internal**.

If the logic of the error directly involves requests between upstream and downstream databases, the scope is set to **upstream** or **downstream**; otherwise, it is currently set to **internal**.

- **level:** Error level.

The severity level of the error, including **low**, **medium**, and **high**.

- The **low** level error usually relates to user operations and incorrect inputs. It does not affect migration tasks.
- The **medium** level error usually relates to user configurations. It affects some newly started services; however, it does not affect the existing DM migration status.
- The **high** level error usually needs your attention, since you need to resolve it to avoid the possible interruption of a migration task.

- **message:** Error descriptions.

Detailed descriptions of the error. To wrap and store every additional layer of error message on the error call chain, the `errors.Wrap` mode is adopted. The message description wrapped at the outermost layer indicates the error in DM and the message description wrapped at the innermost layer indicates the error source.

- **workaround:** Error handling methods (optional)

The handling methods for this error. For some confirmed errors (such as configuration errors), DM gives the corresponding manual handling methods in `workaround`.

- Error stack information (optional)

Whether DM outputs the error stack information depends on the error severity and the necessity. The error stack records the complete stack call information when the error occurs. If you cannot figure out the error cause based on the basic information and the error message, you can trace the execution path of the code when the error occurs using the error stack.

For the complete list of error codes, refer to the [error code lists](#).

11.9.11.2 Troubleshooting

If you encounter an error while running DM, take the following steps to troubleshoot this error:

1. Execute the `query-status` command to check the task running status and the error output.
2. Check the log files related to the error. The log files are on the DM-master and DM-worker nodes. To get key information about the error, refer to the [error system](#). Then check the [Handle Common Errors](#) section to find the solution.
3. If the error is not covered in this document, and you cannot solve the problem by checking the log or monitoring metrics, you can contact the R&D.
4. After the error is resolved, restart the task using `dmctl`.

```
resume-task ${task name}
```

However, you need to reset the data migration task in some cases. For details, refer to [Reset the Data Migration Task](#).

11.9.11.3 Handle common errors

Error Code

Error Description ↪ Handle	How to
-------------------------------	--------

`code=10001` | Abnormal database operation. | Further analyze the error message and error stack. |

`code=10002` | The `bad connection` error from the underlying database. It usually indicates that the connection between DM and the downstream TiDB instance is abnormal (possibly caused by network failure, TiDB restart and so on) and the currently requested data is not sent to TiDB. | DM provides automatic recovery for such error. If the recovery is not successful for a long time, check the network or TiDB status. |

`code=10003` | The `invalid connection` error from the underlying database. It usually indicates that the connection between DM and the downstream TiDB instance is abnormal (possibly caused by network failure, TiDB restart and so on) and the currently requested data is partly sent to TiDB. | DM provides automatic recovery for such error. If the recovery is not successful for a long time, further check the error message and analyze the information based on the actual situation. |

`code=10005` | Occurs when performing the `QUERY` type SQL statements. | |

`code=10006` | Occurs when performing the `EXECUTE` type SQL statements, including DDL statements and DML statements of the `INSERT`, `UPDATE` or `DELETE` type. For more detailed error information, check the error message which usually includes the error code and error information returned for database operations. |

`code=11006` | Occurs when the built-in parser of DM parses the incompatible DDL statements. | Refer to [Data Migration - incompatible DDL statements](#) for solution. |

`code=20010` | Occurs when decrypting the database password that is provided in task configuration. | Check whether the downstream database password provided in the configuration task is [correctly encrypted using dmctl](#). |

`code=26002` | The task check fails to establish database connection. For more detailed error information, check the error message which usually includes the error code and error information returned for database operations. | Check whether the machine where DM-master is located has permission to access the upstream. |

`code=32001` | Abnormal dump processing unit | If the error message contains `mydumper: ↪ argument list too long.`, configure the table to be exported by manually adding the `--regex` regular expression in the Mydumper argument `extra-args` in the `task.yaml` file according to the block-allow list. For example, to export all tables named `hello`, add `↪ regex '.*\\.hello$'`; to export all tables, add `--regex '.*'`. |

`code=38008` | An error occurs in the gRPC communication among DM components. | Check `class`. Find out the error occurs in the interaction of which components. Determine the type of communication error. If the error occurs when establishing gRPC connection, check

whether the communication server is working normally. |

11.9.11.3.1 What can I do when a migration task is interrupted with the `invalid connection` error returned?

Reason

The `invalid connection` error indicates that anomalies have occurred in the connection between DM and the downstream TiDB database (such as network failure, TiDB restart, TiKV busy and so on) and that a part of the data for the current request has been sent to TiDB.

Solutions

Because DM has the feature of concurrently migrating data to the downstream in migration tasks, several errors might occur when a task is interrupted. You can check these errors by using `query-status`.

- If only the `invalid connection` error occurs during the incremental replication process, DM retries the task automatically.
- If DM does not or fails to retry automatically because of version problems, use `stop-task` → `task` to stop the task and then use `start-task` to restart the task.

11.9.11.3.2 A migration task is interrupted with the `driver: bad connection` error returned

Reason

The `driver: bad connection` error indicates that anomalies have occurred in the connection between DM and the upstream TiDB database (such as network failure, TiDB restart and so on) and that the data of the current request has not yet been sent to TiDB at that moment.

Solution

The current version of DM automatically retries on error. If you use the previous version which does not support automatically retry, you can execute the `stop-task` command to stop the task. Then execute `start-task` to restart the task.

11.9.11.3.3 The relay unit throws error event from `* in * diff from passed-in event *` or a migration task is interrupted with failing to get or parse binlog errors like `get binlog error ERROR 1236 (HY000) and binlog checksum mismatch, data may be corrupted` returned

Reason

During the DM process of relay log pulling or incremental replication, this two errors might occur if the size of the upstream binlog file exceeds **4 GB**.

Cause: When writing relay logs, DM needs to perform event verification based on binlog positions and the size of the binlog file, and store the replicated binlog positions as checkpoints. However, the official MySQL uses `uint32` to store binlog positions. This means the binlog position for a binlog file over 4 GB overflows, and then the errors above occur.

Solutions

For relay units, manually recover migration using the following solution:

1. Identify in the upstream that the size of the corresponding binlog file has exceeded 4GB when the error occurs.
2. Stop the DM-worker.
3. Copy the corresponding binlog file in the upstream to the relay log directory as the relay log file.
4. In the relay log directory, update the corresponding `relay.meta` file to pull from the next binlog file. If you have specified `enable_gtid` to `true` for the DM-worker, you need to modify the GTID corresponding to the next binlog file when updating the `relay.meta` file. Otherwise, you don't need to modify the GTID.

Example: when the error occurs, `binlog-name = "mysql-bin.004451"` and `binlog-pos = 2453`. Update them respectively to `binlog-name = "mysql-bin.004452"` and `binlog-pos = 4`, and update `binlog-gtid` to `f0e914ef-54cf-11e7-813d-6c92bf2fa791:1-138218058`.

5. Restart the DM-worker.

For binlog replication processing units, manually recover migration using the following solution:

1. Identify in the upstream that the size of the corresponding binlog file has exceeded 4GB when the error occurs.
2. Stop the migration task using `stop-task`.
3. Update the `binlog_name` in the global checkpoints and in each table checkpoint of the downstream `dm_meta` database to the name of the binlog file in error; update `binlog_pos` to a valid position value for which migration has completed, for example, 4.

Example: the name of the task in error is `dm_test`, the corresponding `source-id` is `replica-1`, and the corresponding binlog file is `mysql-bin|000001.004451`. Execute the following command:

```
UPDATE dm_test_syncer_checkpoint SET binlog_name='mysql-bin
↳ |000001.004451', binlog_pos = 4 WHERE id='replica-1';
```

4. Specify `safe-mode: true` in the `syncers` section of the migration task configuration to ensure re-entrant.
5. Start the migration task using `start-task`.
6. View the status of the migration task using `query-status`. You can restore `safe-mode` to the original value and restart the migration task when migration is done for the original error-triggering relay log files.

11.9.11.3.4 Access denied for user 'root'@'172.31.43.27' (using password: YES) shows when you query the task or check the log

For database related passwords in all the DM configuration files, it is recommended to use the passwords encrypted by `dmctl`. If a database password is empty, it is unnecessary to encrypt it. For how to encrypt the plaintext password, see [Encrypt the database password using dmctl](#).

In addition, the user of the upstream and downstream databases must have the corresponding read and write privileges. Data Migration also [prechecks the corresponding privileges automatically](#) while starting the data migration task.

11.9.11.3.5 The load processing unit reports the error packet for query is too large. Try adjusting the 'max_allowed_packet' variable

Reasons

- Both MySQL client and MySQL/TiDB server have the quota limits for `max_allowed_packet` \leftrightarrow . If any `max_allowed_packet` exceeds a limit, the client receives the error message. Currently, for the latest version of DM and TiDB server, the default value of `max_allowed_packet` is 64M.
- The full data import processing unit in DM does not support splitting the SQL file exported by the Dump processing unit in DM.

Solutions

- It is recommended to set the `statement-size` option of `extra-args` for the Dump processing unit:

According to the default `--statement-size` setting, the default size of `Insert` \leftrightarrow `Statement` generated by the Dump processing unit is about 1M. With this default setting, the load processing unit does not report the error packet for query is \leftrightarrow `too large. Try adjusting the 'max_allowed_packet' variable` in most cases.

Sometimes you might receive the following WARN log during the data dump. This WARN log does not affect the dump process. This only means that wide tables are dumped.

`Row bigger than statement_size for xxx`

- If the single row of the wide table exceeds 64M, you need to modify the following configurations and make sure the configurations take effect.
 - Execute `set @@global.max_allowed_packet=134217728` (134217728 = 128 MB) in the TiDB server.
 - First add the `max-allowed-packet: 134217728` (128 MB) to the `target-
↪ database` section in the DM task configuration file. Then, execute the `stop-task` command and execute the `start-task` command.

11.9.12 TiDB Data Migration FAQ

This document collects the frequently asked questions (FAQs) about TiDB Data Migration (DM).

11.9.12.1 Does DM support migrating data from Alibaba RDS or other cloud databases?

Currently, DM only supports decoding the standard version of MySQL or MariaDB binlog. It has not been tested for Alibaba Cloud RDS or other cloud databases. If you are confirmed that its binlog is in standard format, then it is supported.

It is a known issue that for an upstream table with no primary key in Alibaba Cloud RDS, its binlog still contains a hidden primary key column, which is inconsistent with the original table structure.

Here are some known incompatible issues:

- In **Alibaba Cloud RDS**, for an upstream table with no primary key, its binlog still contains a hidden primary key column, which is inconsistent with the original table structure.
- In **HUAWEI Cloud RDS**, directly reading binlog files is not supported. For more details, see [Can HUAWEI Cloud RDS Directly Read Binlog Backup Files?](#)

11.9.12.2 Does the regular expression of the block and allow list in the task configuration support non-capturing (?!)?

Currently, DM does not support it and only supports the regular expressions of the Golang standard library. See regular expressions supported by Golang via [re2-syntax](#).

11.9.12.3 If a statement executed upstream contains multiple DDL operations, does DM support such migration?

DM will attempt to split a single statement containing multiple DDL change operations into multiple statements containing only one DDL operation, but might not cover all cases. It is recommended to include only one DDL operation in a statement executed upstream, or verify it in the test environment. If it is not supported, you can file an [issue](#) to the DM repository.

11.9.12.4 How to handle incompatible DDL statements?

When you encounter a DDL statement unsupported by TiDB, you need to manually handle it using `dmctl` (skipping the DDL statement or replacing the DDL statement with a specified DDL statement). For details, see [Handle failed DDL statements](#).

Note:

Currently, TiDB is not compatible with all the DDL statements that MySQL supports. See [MySQL Compatibility](#).

11.9.12.5 How to reset the data migration task?

When an exception occurs during data migration and the data migration task cannot be resumed, you need to reset the task and re-migrate the data:

1. Execute the `stop-task` command to stop the abnormal data migration task.
2. Purge the data migrated to the downstream.
3. Use one of the following ways to restart the data migration task.
 - Specify a new task name in the task configuration file. Then execute `start-task { ↵ task-config-file}`.
 - Execute `start-task --remove-meta {task-config-file}`.

11.9.12.6 How to handle the error returned by the DDL operation related to the `gh-ost` table, after `online-ddl-scheme: "gh-ost"` is set?

```
[unit=Sync] ["error information"="{\"msg\": \"[code=36046:class=sync-unit:
↵ scope=internal:level=high] online ddls on ghost table `xxx`.`
↵ _xxxx_gho`\\ngithub.com/pingcap/dm/pkg/terror.(*Error).Generate
↵ ....."
```

The above error can be caused by the following reason:

In the last `rename ghost_table to origin table` step, DM reads the DDL information in memory, and restores it to the DDL of the origin table.

However, the DDL information in memory is obtained in either of the two ways:

- DM processes the `gh-ost table` during the `alter ghost_table operation` and records the DDL information of `ghost_table`;
- When DM-worker is restarted to start the task, DM reads the DDL from `dm_meta.{task_name}_onlineddl`.

Therefore, in the process of incremental replication, if the specified Pos has skipped the `alter ghost_table` DDL but the Pos is still in the online-ddl process of `gh-ost`, the `ghost_table` is not written into memory or `dm_meta.{task_name}_onlineddl` correctly. In such cases, the above error is returned.

You can avoid this error by the following steps:

1. Remove the `online-ddl-scheme` configuration of the task.
2. Configure `_{table_name}_gho`, `_{table_name}_ghc`, and `_{table_name}_del` in `block-allow-list.ignore-tables`.
3. Execute the upstream DDL in the downstream TiDB manually.
4. After the Pos is replicated to the position after the `gh-ost` process, re-enable the `online`
↔ `-ddl-scheme` and comment out `block-allow-list.ignore-tables`.

11.9.12.7 How to add tables to the existing data migration tasks?

If you need to add tables to a data migration task that is running, you can address it in the following ways according to the stage of the task.

Note:

Because adding tables to an existing data migration task is complex, it is recommended that you perform this operation only when necessary.

11.9.12.7.1 In the Dump stage

Since MySQL cannot specify a snapshot for export, it does not support updating data migration tasks during the export and then restarting to resume the export through the checkpoint. Therefore, you cannot dynamically add tables that need to be migrated at the Dump stage.

If you really need to add tables for migration, it is recommended to restart the task directly using the new configuration file.

11.9.12.7.2 In the Load stage

During the export, multiple data migration tasks usually have different binlog positions. If you merge the tasks in the Load stage, they might not be able to reach consensus on binlog positions. Therefore, it is not recommended to add tables to a data migration task in the Load stage.

11.9.12.7.3 In the Sync stage

When the data migration task is in the Sync stage, if you add additional tables to the configuration file and restart the task, DM does not re-execute full export and import for the newly added tables. Instead, DM continues incremental replication from the previous checkpoint.

Therefore, if the full data of the newly added table has not been imported to the downstream, you need to use a separate data migration task to export and import the full data to the downstream.

Record the position information in the global checkpoint (`is_global=1`) corresponding to the existing migration task as `checkpoint-T`, such as (`mysql-bin.000100, 1234`). Record the position information of the full export `metadata` (or the checkpoint of another data migration task in the Sync stage) of the table to be added to the migration task as `checkpoint-S`, such as (`mysql-bin.000099, 5678`). You can add the table to the migration task by the following steps:

1. Use `stop-task` to stop an existing migration task. If the table to be added belongs to another running migration task, stop that task as well.
2. Use a MySQL client to connect the downstream TiDB database and manually update the information in the checkpoint table corresponding to the existing migration task to the smaller value between `checkpoint-T` and `checkpoint-S`. In this example, it is (`mysql-bin.000099, 5678`).
 - The checkpoint table to be updated is `{task-name}_syncer_checkpoint` in the `{dm_meta}` schema.
 - The checkpoint rows to be updated match `id=(source-id)` and `is_global=1`.
 - The checkpoint columns to be updated are `binlog_name` and `binlog_pos`.
3. Set `safe-mode: true` for the `syncers` in the task to ensure reentrant execution.
4. Start the task using `start-task`.
5. Observe the task status through `query-status`. When `syncerBinlog` exceeds the larger value of `checkpoint-T` and `checkpoint-S`, restore `safe-mode` to the original value and restart the task. In this example, it is (`mysql-bin.000100, 1234`).

11.9.12.8 How to handle the error packet for query is too large. Try adjusting the 'max_allowed_packet' variable that occurs during the full import?

Set the parameters below to a value larger than the default 67108864 (64M).

- The global variable of the TiDB server: `max_allowed_packet`.
- The configuration item in the task configuration file: `target-database.max-allowed`
↪ `-packet`. For details, refer to [DM Advanced Task Configuration File](#).

11.9.12.9 How to handle the error Error 1054: Unknown column 'binlog_gtid' in 'field list' that occurs when existing DM migration tasks of an DM 1.0 cluster are running on a DM 2.0 or newer cluster?

Since DM v2.0, if you directly run the `start-task` command with the task configuration file of the DM 1.0 cluster to continue the incremental data replication, the error Error 1054: ↪ Unknown column 'binlog_gtid' in 'field list' occurs.

This error can be handled by [manually importing DM migration tasks of a DM 1.0 cluster to a DM 2.0 cluster](#).

11.9.12.10 Why does TiUP fail to deploy some versions of DM (for example, v2.0.0-hotfix) ?

You can use the `tiup list dm-master` command to view the DM versions that TiUP supports to deploy. TiUP does not manage DM versions which are not shown by this command.

11.9.12.11 How to handle the error parse mydumper metadata error: EOF that occurs when DM is replicating data ?

You need to check the error message and log files to further analyze this error. The cause might be that the dump unit does not produce the correct metadata file due to a lack of permissions.

11.9.12.12 Why does DM report no fatal error when replicating sharded schemas and tables, but downstream data is lost?

Check the configuration items `block-allow-list` and `table-route`:

- You need to configure the names of upstream databases and tables under `block-allow`
↪ `-list`. You can add “~” before `do-tables` to use regular expressions to match names.
- `table-route` uses wildcard characters instead of regular expressions to match table names. For example, `table_parttern_[0-63]` only matches 7 tables, from `table_parttern_0` to `table_pattern_6`.

11.9.12.13 Why does the `replicate lag` monitor metric show no data when DM is not replicating from upstream?

In DM 1.0, you need to enable `enable-heartbeat` to generate the monitor data. In DM 2.0 and later versions, it is expected to have no data in the monitor metric `replicate lag` because this feature is not supported.

11.9.12.14 How to handle the error `fail to initial unit Sync of subtask` when DM is starting a task, with the `RawCause` in the error message showing `context deadline exceeded`?

This is a known issue in DM 2.0.0 version and will be fixed in DM 2.0.1 version. It is likely to be triggered when a replication task has a lot of tables to process. If you use TiUP to deploy DM, you can upgrade DM to the nightly version to fix this issue. Or you can download the 2.0.0-hotfix version from [the release page of DM](#) on GitHub and manually replace the executable files.

11.9.12.15 How to handle the error `duplicate entry` when DM is replicating data?

You need to first check and confirm the following things:

- `disable-detect` is not configured in the replication task (in v2.0.7 and earlier versions).
- The data is not inserted manually or by other replication programs.
- No DML filter associated with this table is configured.

To facilitate troubleshooting, you can first collect general log files of the downstream TiDB instance and then ask for technical support at [TiDB Community slack channel](#). The following example shows how to collect general log files:

```
### Enable general log collection
curl -X POST -d "tidb_general_log=1" http://{TiDBIP}:10080/settings
### Disable general log collection
curl -X POST -d "tidb_general_log=0" http://{TiDBIP}:10080/settings
```

When the `duplicate entry` error occurs, you need to check the log files for the records that contain conflict data.

11.9.12.16 Why do some monitoring panels show `No data point`?

It is normal for some panels to have no data. For example, when there is no error reported, no DDL lock, or the relay log feature is not enabled, the corresponding panels show `No data point`. For detailed description of each panel, see [DM Monitoring Metrics](#).

11.9.12.17 In DM v1.0, why does the command `sql-skip` fail to skip some statements when the task is in error?

You need to first check whether the binlog position is still advancing after you execute `sql-skip`. If so, it means that `sql-skip` has taken effect. The reason why this error keeps occurring is that the upstream sends multiple unsupported DDL statements. You can use `sql-skip -s <sql-pattern>` to set a pattern to match these statements.

Sometimes, the error message contains the `parse statement` information, for example:

```
if the DDL is not needed, you can use a filter rule with \"*\"/>

```

The reason for this type of error is that the TiDB parser cannot parse DDL statements sent by the upstream, such as `ALTER EVENT`, so `sql-skip` does not take effect as expected. You can add **binlog event filters** in the configuration file to filter those statements and set `schema-pattern: "*"` . Starting from DM v2.0.1, DM pre-filters statements related to `EVENT`.

Since DM v2.0, `handle-error` replaces `sql-skip`. You can use `handle-error` instead to avoid this issue.

11.9.12.18 Why do `REPLACE` statements keep appearing in the downstream when DM is replicating?

You need to check whether the **safe mode** is automatically enabled for the task. If the task is automatically resumed after an error, or if there is high availability scheduling, then the safe mode is enabled because it is within 1 minutes after the task is started or resumed.

You can check the DM-worker log file and search for a line containing **change count**. If the **new count** in the line is not zero, the safe mode is enabled. To find out why it is enabled, check when it happens and if any errors are reported before.

11.9.12.19 In DM v2.0, why does the full import task fail if DM restarts during the task?

In DM v2.0.1 and earlier versions, if DM restarts before the full import completes, the bindings between upstream data sources and DM-worker nodes might change. For example, it is possible that the intermediate data of the dump unit is on DM-worker node A but the load unit is run by DM-worker node B, thus causing the operation to fail.

The following are two solutions to this issue:

- If the data volume is small (less than 1 TB) or the task merges sharded tables, take these steps:
 1. Clean up the imported data in the downstream database.

2. Remove all files in the directory of exported data.
3. Delete the task using `dmctl` and run the command `start-task --remove-meta` to create a new task.

After the new task starts, it is recommended to ensure that there is no redundant DM worker node and avoid restarting or upgrading the DM cluster during the full import.

- If the data volume is large (more than 1 TB), take these steps:
 1. Clean up the imported data in the downstream database.
 2. Deploy TiDB-Lightning to the DM worker nodes that process the data.
 3. Use the Local-backend mode of TiDB-Lightning to import data that DM dump units export.
 4. After the full import completes, edit the task configuration file in the following ways and restart the task:
 - Change `task-mode` to `incremental`.
 - Set the value of `mysql-instance.meta.pos` to the position recorded in the metadata file that the dump unit outputs.

11.9.12.20 Why does DM report the error ERROR 1236 (HY000): The slave is connecting using CHANGE MASTER TO MASTER_AUTO_POSITION = 1, but the master has purged binary logs containing GTIDs that the slave requires. if it restarts during an incremental task?

This error indicates that the upstream binlog position recorded in the metadata file output by the dump unit has been purged during the full migration.

If this issue occurs, you need to pause the task, delete all migrated data in the downstream database, and start a new task with the `--remove-meta` option.

You can avoid this issue in advance by configuring in the following ways:

1. Increase the value of `expire_logs_days` in the upstream MySQL database to avoid wrongly purging needed binlog files before the full migration task completes. If the data volume is large, it is recommended to use dumping and TiDB-Lightning at the same time to speed up the task.
2. Enable the relay log feature for this task so that DM can read data from relay logs even though the binlog position is purged.

11.9.12.21 Why does the Grafana dashboard of a DM cluster display failed to fetch dashboard if the cluster is deployed using TiUP v1.3.0 or v1.3.1?

This is a known bug of TiUP, which is fixed in TiUP v1.3.2. The following are two solutions to this issue:

- Solution one:

1. Upgrade TiUP to a later version using the command `tiup update --self &&`
`↪ tiup update dm.`
 2. Scale in and then scale out Grafana nodes in the cluster to restart the Grafana service.
- Solution two:
 1. Back up the `deploy/grafana-$port/bin/public` folder.
 2. Download the [TiUP DM offline package](#) and unpack it.
 3. Unpack the `grafana-v4.0.3-**.tar.gz` in the offline package.
 4. Replace the folder `deploy/grafana-$port/bin/public` with the `public` folder in `grafana-v4.0.3-**.tar.gz`.
 5. Execute `tiup dm restart $cluster_name -R grafana` to restart the Grafana service.

11.9.12.22 In DM v2.0, why does the query result of the command `query-status` show that the Syncer checkpoint GTIDs are inconsecutive if the task has `enable-relay` and `enable-gtid` enabled at the same time?

This is a known bug in DM, which is fixed in DM v2.0.2. The bug is triggered when the following two conditions are fully met at the same time:

1. Parameters `enable-relay` and `enable-gtid` are set to `true` in the source configuration file.
2. The upstream database is a **MySQL secondary database**. If you execute the command `show binlog events in '<newest-binlog>' limit 2` to query the `previous_gtid`s of the database, the result is inconsecutive, such as the following example:

```
mysql> show binlog events in 'mysql-bin.000005' limit 2;
+-----+-----+-----+-----+-----+-----+
↪
| Log_name          | Pos | Event_type  | Server_id | End_log_pos | Info
↪
+-----+-----+-----+-----+-----+-----+
↪
| mysql-bin.000005 | 4   | Format_desc | 123452    | 123         | Server ver:
↪ 5.7.32-35-log, Binlog ver: 4
| mysql-bin.000005 | 123 | Previous_gtid | 123452    | 194         | d3618e68
↪ -6052-11eb-a68b-0242ac110002:6-7
+-----+-----+-----+-----+-----+-----+
↪
```

The bug occurs if you run `query-status <task>` in `dmctl` to query task information and find that `subTaskStatus.sync.syncerBinlogGtid` is inconsecutive but `subTaskStatus ↪ .sync.masterBinlogGtid` is consecutive. See the following example:

```
query-status test
{
  ...
  "sources": [
    {
      ...
      "sourceStatus": {
        "source": "mysql1",
        ...
        "relayStatus": {
          "masterBinlog": "(mysql-bin.000006, 744)",
          "masterBinlogGtid": "f8004e25-6067-11eb-9fa3-0242ac110003
            ↪ :1-50",
          ...
        }
      },
      "subTaskStatus": [
        {
          ...
          "sync": {
            ...
            "masterBinlog": "(mysql-bin.000006, 744)",
            "masterBinlogGtid": "f8004e25-6067-11eb-9fa3-0242
              ↪ ac110003:1-50",
            "syncerBinlog": "(mysql-bin|000001.000006, 738)",
            "syncerBinlogGtid": "f8004e25-6067-11eb-9fa3-0242
              ↪ ac110003:1-20:40-49",
            ...
            "synced": false,
            "binlogType": "local"
          }
        }
      ]
    },
    {
      ...
      "sourceStatus": {
        "source": "mysql2",
        ...
        "relayStatus": {
          "masterBinlog": "(mysql-bin.000007, 1979)",
          "masterBinlogGtid": "ddb8974e-6064-11eb-8357-0242ac110002
            ↪ :1-25",
          ...
        }
      }
    }
  ]
}
```

```

    }
  },
  "subTaskStatus": [
    {
      ...
      "sync": {
        "masterBinlog": "(mysql-bin.000007, 1979)",
        "masterBinlogGtid": "ddb8974e-6064-11eb-8357-0242
          ↪ ac110002:1-25",
        "syncerBinlog": "(mysql-bin|000001.000008, 1979)",
        "syncerBinlogGtid": "ddb8974e-6064-11eb-8357-0242
          ↪ ac110002:1-25",
        ...
        "synced": true,
        "binlogType": "local"
      }
    }
  ]
}

```

In the example, the `syncerBinlogGtid` of the data source `mysql1` is inconsecutive. In this case, you can do one of the following to handle the data loss:

- If upstream binlogs from the current time to the position recorded in the metadata of the full export task have not been purged, you can take these steps:
 1. Stop the current task and delete all data sources with inconsecutive GTIDs.
 2. Set `enable-relay` to `false` in all source configuration files.
 3. For data sources with inconsecutive GTIDs (such as `mysql1` in the above example), change the task to an incremental task and configure related `mysql-instances`.
 - ↪ `meta` with metadata information of each full export task, including the `binlog`
 - ↪ `-name`, `binlog-pos`, and `binlog-gtid` information.
 4. Set `syncers.safe-mode` to `true` in `task.yaml` of the incremental task and restart the task.
 5. After the incremental task replicates all missing data to the downstream, stop the task and change `safe-mode` to `false` in the `task.yaml`.
 6. Restart the task again.
- If upstream binlogs have been purged but local relay logs remain, you can take these steps:
 1. Stop the current task.

2. For data sources with inconsecutive GTIDs (such as `mysql1` in the above example), change the task to an incremental task and configure related `mysql-instances`.
 - ↪ `meta` with metadata information of each full export task, including the `binlog`
 - ↪ `-name`, `binlog-pos`, and `binlog-gtid` information.
 3. In the `task.yaml` of the incremental task, change the previous value of `binlog`
 - ↪ `gtid` to the previous value of `previous_gtids`. For the above example, change `1-y` to `6-y`.
 4. Set `syncers.safe-mode` to `true` in the `task.yaml` and restart the task.
 5. After the incremental task replicates all missing data to the downstream, stop the task and change `safe-mode` to `false` in the `task.yaml`.
 6. Restart the task again.
 7. Restart the data source and set either `enable-relay` or `enable-gtid` to `false` in the source configuration file.
- If none of the above conditions is met or if the data volume of the task is small, you can take these steps:
 1. Clean up imported data in the downstream database.
 2. Restart the data source and set either `enable-relay` or `enable-gtid` to `false` in the source configuration file.
 3. Create a new task and run the command `start-task task.yaml --remove-↪ meta` to migrate data from the beginning again.

For data sources that can be replicated normally (such as `mysql2` in the above example) in the first and second solutions above, configure related `mysql-instances.meta` with `syncerBinlog` and `syncerBinlogGtid` information from `subTaskStatus.sync` when setting the incremental task.

11.9.12.23 In DM v2.0, how do I handle the error “heartbeat config is different from previous used: serverID not equal” when switching the connection between DM-workers and MySQL instances in a virtual IP environment with the heartbeat feature enabled?

The `heartbeat` feature is disabled by default in DM v2.0 and later versions. If you enable the feature in the task configuration file, it interferes with the high availability feature. To solve this issue, you can disable the `heartbeat` feature by setting `enable-heartbeat` to `false` in the task configuration file, and then reload the task configuration file. DM will forcibly disable the `heartbeat` feature in subsequent releases.

11.9.12.24 Why does a DM-master fail to join the cluster after it restarts and DM reports the error “fail to start embed etcd, RawCause: member xxx has already been bootstrapped”?

When a DM-master starts, DM records the `etcd` information in the current directory. If the directory changes after the DM-master restarts, DM cannot get access to the `etcd` information, and thus the restart fails.

To solve this issue, you are recommended to maintain DM clusters using TiUP. In the case that you need to deploy using binary files, you need to configure `data-dir` with absolute paths in the configuration file of the DM-master, or pay attention to the current directory where you run the command.

11.9.12.25 Why DM-master cannot be connected when I use dmctl to execute commands?

When using `dmctl` execute commands, you might find the connection to DM master fails (even if you have specified the parameter value of `--master-addr` in the command), and the error message is like `RawCause: context deadline exceeded, Workaround: please ↪ check your network connection..` But after checking the network connection using commands like `telnet <master-addr>`, no exception is found.

In this case, you can check the environment variable `https_proxy` (note that it is **https**). If this variable is configured, `dmctl` automatically connects the host and port specified by `https_proxy`. If the host does not have a corresponding proxy forwarding service, the connection fails.

To solve this issue, check whether `https_proxy` is mandatory. If not, cancel the setting. Otherwise, add the environment variable setting `https_proxy="" ./dmctl --master-addr ↪ "x.x.x.x:8261"` before the original `dmctl` commands.

Note:

The environment variables related to proxy include `http_proxy`, `https_proxy`, and `no_proxy`. If the connection error persists after you perform the above steps, check whether the configuration parameters of `http_proxy` and `no_proxy` are correct.

11.9.12.26 How to handle the returned error when executing start-relay command for DM versions from 2.0.2 to 2.0.6?

```
flush local meta, Rawcause: open relay-dir/xxx.000001/relay.metayyyy: no
↪ such file or directory
```

The above error might be made in the following cases:

- DM has been upgraded from v2.0.1 and earlier to v2.0.2 - v2.0.6, and relay log is started before the upgrade and restarted after the upgrade.
- Execute the `stop-relay` command to pause the relay log and then restart it.

You can avoid this error by the following options:

- Restart relay log:

```
» stop-relay -s sourceID workerName
» start-relay -s sourceID workerName
```

- Upgrade DM to v2.0.7 or later versions.

11.9.13 TiDB Data Migration Glossary

This document lists the terms used in the logs, monitoring, configurations, and documentation of TiDB Data Migration (DM).

11.9.13.1 B

11.9.13.1.1 Binlog

In TiDB DM, binlogs refer to the binary log files generated in the TiDB database. It has the same indications as that in MySQL or MariaDB. Refer to [MySQL Binary Log](#) and [MariaDB Binary Log](#) for details.

11.9.13.1.2 Binlog event

Binlog events are information about data modification made to a MySQL or MariaDB server instance. These binlog events are stored in the binlog files. Refer to [MySQL Binlog Event](#) and [MariaDB Binlog Event](#) for details.

11.9.13.1.3 Binlog event filter

Binlog event filter is a more fine-grained filtering feature than the block and allow lists filtering rule. Refer to [binlog event filter](#) for details.

11.9.13.1.4 Binlog position

The binlog position is the offset information of a binlog event in a binlog file. Refer to [MySQL SHOW BINLOG EVENTS](#) and [MariaDB SHOW BINLOG EVENTS](#) for details.

11.9.13.1.5 Binlog replication processing unit/sync unit

Binlog replication processing unit is the processing unit used in DM-worker to read upstream binlogs or local relay logs, and to migrate these logs to the downstream. Each subtask corresponds to a binlog replication processing unit. In the current documentation, the binlog replication processing unit is also referred to as the sync processing unit.

11.9.13.1.6 Block & allow table list

Block & allow table list is the feature that filters or only migrates all operations of some databases or some tables. Refer to [block & allow table lists](#) for details. This feature is similar to [MySQL Replication Filtering](#) and [MariaDB Replication Filters](#).

11.9.13.2 C

11.9.13.2.1 Checkpoint

A checkpoint indicates the position from which a full data import or an incremental replication task is paused and resumed, or is stopped and restarted.

- In a full import task, a checkpoint corresponds to the offset and other information of the successfully imported data in a file that is being imported. A checkpoint is updated synchronously with the data import task.
- In an incremental replication, a checkpoint corresponds to the [binlog position](#) and other information of a [binlog event](#) that is successfully parsed and migrated to the downstream. A checkpoint is updated after the DDL operation is successfully migrated or 30 seconds after the last update.

In addition, the `relay.meta` information corresponding to a [relay processing unit](#) works similarly to a checkpoint. A relay processing unit pulls the [binlog event](#) from the upstream and writes this event to the [relay log](#), and writes the [binlog position](#) or the GTID information corresponding to this event to `relay.meta`.

11.9.13.3 D

11.9.13.3.1 Dump processing unit/dump unit

The dump processing unit is the processing unit used in DM-worker to export all data from the upstream. Each subtask corresponds to a dump processing unit.

11.9.13.4 G

11.9.13.4.1 GTID

The GTID is the global transaction ID of MySQL or MariaDB. With this feature enabled, the GTID information is recorded in the binlog files. Multiple GTIDs form a GTID set. Refer to [MySQL GTID Format and Storage](#) and [MariaDB Global Transaction ID](#) for details.

11.9.13.5 L

11.9.13.5.1 Load processing unit/load unit

The load processing unit is the processing unit used in DM-worker to import the fully exported data to the downstream. Each subtask corresponds to a load processing unit. In the current documentation, the load processing unit is also referred to as the import processing unit.

11.9.13.6 M

11.9.13.6.1 Migrate/migration

The process of using the TiDB Data Migration tool to copy the **full data** of the upstream database to the downstream database.

In the case of clearly mentioning “full”, not explicitly mentioning “full or incremental”, and clearly mentioning “full + incremental”, use migrate/migration instead of replicate/replication.

11.9.13.7 R

11.9.13.7.1 Relay log

The relay log refers to the binlog files that DM-worker pulls from the upstream MySQL or MariaDB, and stores in the local disk. The format of the relay log is the standard binlog file, which can be parsed by tools such as [mysqlbinlog](#) of a compatible version. Its role is similar to [MySQL Relay Log](#) and [MariaDB Relay Log](#).

For more details such as the relay log’s directory structure, initial migration rules, and data purge in TiDB DM, see [TiDB DM relay log](#).

11.9.13.7.2 Relay processing unit

The relay processing unit is the processing unit used in DM-worker to pull binlog files from the upstream and write data into relay logs. Each DM-worker instance has only one relay processing unit.

11.9.13.7.3 Replicate/replication

The process of using the TiDB Data Migration tool to copy the **incremental data** of the upstream database to the downstream database.

In the case of clearly mentioning “incremental”, use replicate/replication instead of migrate/migration.

11.9.13.8 S

11.9.13.8.1 Safe mode

Safe mode is the mode in which DML statements can be imported more than once when the primary key or unique index exists in the table schema. In this mode, some statements from the upstream are migrated to the downstream only after they are re-written. The `INSERT` statement is re-written as `REPLACE`; the `UPDATE` statement is re-written as `DELETE` and `REPLACE`.

This mode is enabled in any of the following situations:

- The safe mode remains enabled when the `safe-mode` parameter in the task configuration file is set to `true`.
- In shard merge scenarios, the safe mode remains enabled before DDL statements are replicated in all sharded tables.
- If the argument `--consistency none` is configured for the dump processing unit of a full migration task, it cannot be determined whether the binlog changes at the beginning of the export affect the exported data or not. Therefore, the safe mode remains enabled for the incremental replication of these binlog changes.
- If the task is paused by error and then resumed, the operations on some data might be executed twice.

11.9.13.8.2 Shard DDL

The shard DDL is the DDL statement that is executed on the upstream sharded tables. It needs to be coordinated and migrated by TiDB DM in the process of merging the sharded tables. In the current documentation, the shard DDL is also referred to as the sharding DDL.

11.9.13.8.3 Shard DDL lock

The shard DDL lock is the lock mechanism that coordinates the migration of shard DDL. Refer to [the implementation principles of merging and migrating data from sharded tables in the pessimistic mode](#) for details. In the current documentation, the shard DDL lock is also referred to as the sharding DDL lock.

11.9.13.8.4 Shard group

A shard group is all the upstream sharded tables to be merged and migrated to the same table in the downstream. Two-level shard groups are used for implementation of TiDB DM. Refer to [the implementation principles of merging and migrating data from sharded tables in the pessimistic mode](#) for details. In the current documentation, the shard group is also referred to as the sharding group.

11.9.13.8.5 Subtask

The subtask is a part of a data migration task that is running on each DM-worker instance. In different task configurations, a single data migration task might have one subtask or multiple subtasks.

11.9.13.8.6 Subtask status

The subtask status is the status of a data migration subtask. The current status options include `New`, `Running`, `Paused`, `Stopped`, and `Finished`. Refer to [subtask status](#) for more details about the status of a data migration task or subtask.

11.9.13.9 T

11.9.13.9.1 Table routing

The table routing feature enables DM to migrate a certain table of the upstream MySQL or MariaDB instance to the specified table in the downstream, which can be used to merge and migrate sharded tables. Refer to [table routing](#) for details.

11.9.13.9.2 Task

The data migration task, which is started after you successfully execute a `start-task` ↪ command. In different task configurations, a single migration task can run on a single DM-worker instance or on multiple DM-worker instances at the same time.

11.9.13.9.3 Task status

The task status refers to the status of a data migration task. The task status depends on the statuses of all its subtasks. Refer to [subtask status](#) for details.

11.9.14 Example

11.9.14.1 Create a Data Migration Task

This document describes how to create a simple data migration task after the DM cluster is successfully deployed.

11.9.14.1.1 Sample scenario

Suppose that you create a data migration task based on this sample scenario:

- Deploy two MySQL instances with binlog enabled and one TiDB instance locally
- Use a DM-master of the DM cluster to manage the cluster and data migration tasks.

The information of each node is as follows.

Instance	Server Address	Port
MySQL1	127.0.0.1	3306
MySQL2	127.0.0.1	3307
TiDB	127.0.0.1	4000
DM-master	127.0.0.1	8261

Based on this scenario, the following sections describe how to create a data migration task.

Start upstream MySQL

Prepare 2 runnable MySQL instances. You can also use Docker to quickly start MySQL. The commands are as follows:

```
docker run --rm --name mysql-3306 -p 3306:3306 -e MYSQL_ALLOW_EMPTY_PASSWORD
↳ =true mysql:5.7.22 --log-bin=mysql-bin --port=3306 --bind-address
↳ =0.0.0.0 --binlog-format=ROW --server-id=1 --gtid_mode=ON --enforce-
↳ gtid-consistency=true > mysql.3306.log 2>&1 &
docker run --rm --name mysql-3307 -p 3307:3307 -e MYSQL_ALLOW_EMPTY_PASSWORD
↳ =true mysql:5.7.22 --log-bin=mysql-bin --port=3307 --bind-address
↳ =0.0.0.0 --binlog-format=ROW --server-id=1 --gtid_mode=ON --enforce-
↳ gtid-consistency=true > mysql.3307.log 2>&1 &
```

Prepare data

- Write example data into mysql-3306:

```
drop database if exists `sharding1`;
create database `sharding1`;
use `sharding1`;
create table t1 (id bigint, uid int, name varchar(80), info varchar
↳ (100), primary key (`id`), unique key(`uid`)) DEFAULT CHARSET=
↳ utf8mb4;
create table t2 (id bigint, uid int, name varchar(80), info varchar
↳ (100), primary key (`id`), unique key(`uid`)) DEFAULT CHARSET=
↳ utf8mb4;
insert into t1 (id, uid, name) values (1, 10001, 'Gabriel García
↳ Márquez'), (2, 10002, 'Cien años de soledad');
insert into t2 (id, uid, name) values (3, 20001, 'José Arcadio Buendía'
↳ ), (4, 20002, 'Úrsula Iguarán'), (5, 20003, 'José Arcadio');
```

- Write example data into mysql-3307:

```
drop database if exists `sharding2`;
create database `sharding2`;
use `sharding2`;
create table t2 (id bigint, uid int, name varchar(80), info varchar
↳ (100), primary key (`id`), unique key(`uid`)) DEFAULT CHARSET=
↳ utf8mb4;
create table t3 (id bigint, uid int, name varchar(80), info varchar
↳ (100), primary key (`id`), unique key(`uid`)) DEFAULT CHARSET=
↳ utf8mb4;
insert into t2 (id, uid, name, info) values (6, 40000, 'Remedios
↳ Moscote', '{}');
```

```
insert into t3 (id, uid, name, info) values (7, 30001, 'Aureliano José'  
↳ ', '{}'), (8, 30002, 'Santa Sofía de la Piedad', '{}'), (9,  
↳ 30003, '17 Aurelianos', NULL);
```

Start downstream TiDB

To run a TiDB server, use the following command:

```
wget https://download.pingcap.org/tidb-latest-linux-amd64.tar.gz  
tar -xzvf tidb-latest-linux-amd64.tar.gz  
mv tidb-latest-linux-amd64/bin/tidb-server ./  
./tidb-server
```

Warning:

The deployment method of TiDB in this document **do not apply** to production or development environments.

11.9.14.1.2 Configure the MySQL data source

Before starting a data migration task, you need to configure the MySQL data source.

Encrypt the password

Note:

- You can skip this step if the database does not have a password.
- You can use the plaintext password to configure the source information in DM v1.0.6 and later versions.

For safety reasons, it is recommended to configure and use encrypted passwords. You can use `dmctl` to encrypt the MySQL/TiDB password. Suppose the password is “123456”:

```
./bin/dmctl encrypt "123456"
```

```
fCxfQ9XKCezSzuCD0Wf5dUD+LsKegSg=
```

Save this encrypted value, and use it for creating a MySQL data source in the following steps.

Edit the source configuration file

Write the following configurations to `conf/source1.yaml`.

```
#### MySQL1 Configuration.

source-id: "mysql-replica-01"

#### Indicates whether GTID is enabled
enable-gtid: true

from:
  host: "127.0.0.1"
  user: "root"
  password: "fCxfQ9XKCezSzuCDOWf5dUD+LsKegSg="
  port: 3306
```

In MySQL2 data source, copy the above configurations to `conf/source2.yaml`. You need to change `name` to `mysql-replica-02` and change `password` and `port` to appropriate values.

Create a source

To load the data source configurations of MySQL1 into the DM cluster using `dmctl`, run the following command in the terminal:

```
./bin/dmctl --master-addr=127.0.0.1:8261 operate-source create conf/source1
↪ .yaml
```

For MySQL2, replace the configuration file in the above command with that of MySQL2.

11.9.14.1.3 Create a data migration task

After importing **prepared data**, there are several sharded tables on both MySQL1 and MySQL2 instances. These tables have identical structure and the same prefix “t” in the table names; the databases where these tables are located are all prefixed with “sharding”; and there is no conflict between the primary keys or the unique keys (in each sharded table, the primary keys or the unique keys are different from those of other tables).

Now, suppose that you need to migrate these sharded tables to the `db_target.t_target` table in TiDB. The steps are as follows.

1. Create the configuration file of the task:

```
---
name: test
task-mode: all
shard-mode: "pessimistic"
target-database:
  host: "127.0.0.1"
  port: 4000
```

```
user: "root"
password: "" # It is recommended to use password encrypted with dmctl
    ↪ if the password is not empty.

mysql-instances:
- source-id: "mysql-replica-01"
  block-allow-list: "instance" # This configuration applies to DM
    ↪ versions higher than v2.0.0-beta.2. Use black-white-list
    ↪ otherwise.
  route-rules: ["sharding-route-rules-table", "sharding-route-rules-
    ↪ schema"]
  mydumper-thread: 4
  loader-thread: 16
  syncer-thread: 16
- source-id: "mysql-replica-02"
  block-allow-list: "instance" # This configuration applies to DM
    ↪ versions higher than v2.0.0-beta.2. Use black-white-list
    ↪ otherwise.
  route-rules: ["sharding-route-rules-table", "sharding-route-rules-
    ↪ schema"]
  mydumper-thread: 4
  loader-thread: 16
  syncer-thread: 16
block-allow-list: # This configuration applies to DM versions higher
    ↪ than v2.0.0-beta.2. Use black-white-list otherwise.
instance:
  do-dbs: ["~^sharding[\\d]+" ]
  do-tables:
  - db-name: "~^sharding[\\d]+"
    tbl-name: "~^t[\\d]+"
routes:
  sharding-route-rules-table:
    schema-pattern: sharding*
    table-pattern: t*
    target-schema: db_target
    target-table: t_target
  sharding-route-rules-schema:
    schema-pattern: sharding*
    target-schema: db_target
```

2. To create a task using dmctl, write the above configurations to the conf/task.yaml file:

```
./bin/dmctl --master-addr 127.0.0.1:8261 start-task conf/task.yaml
```

```
{
  "result": true,
  "msg": "",
  "sources": [
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-01",
      "worker": "worker1"
    },
    {
      "result": true,
      "msg": "",
      "source": "mysql-replica-02",
      "worker": "worker2"
    }
  ]
}
```

Now, you have successfully created a task to migrate the sharded tables from the MySQL1 and MySQL2 instances to TiDB.

11.9.14.1.4 Verify data

You can modify data in the upstream MySQL sharded tables. Then use [sync-diff-inspector](#) to check whether the upstream and downstream data are consistent. Consistent data means that the migration task works well, which also indicates that the cluster works well.

11.9.14.2 Best Practices of Data Migration in the Shard Merge Scenario

This document describes the features and limitations of [TiDB Data Migration \(DM\)](#) in the shard merge scenario and provides a data migration best practice guide for your application (the default “pessimistic” mode is used).

11.9.14.2.1 Use a separate data migration task

In the [Merge and Migrate Data from Sharded Tables](#) document, the definition of “sharding group” is given: A sharding group consists of all upstream tables that need to be merged and migrated into the same downstream table.

The current sharding DDL mechanism has some [usage restrictions](#) to coordinate the schema changes brought by DDL operations in different sharded tables. If these restrictions are violated due to unexpected reasons, you need to [handle sharding DDL locks manually in DM](#), or even redo the entire data migration task.

To mitigate the impact on data migration when an exception occurs, it is recommended to merge and migrate each sharding group as a separate data migration task. **This might enable that only a small number of data migration tasks need to be handled manually while others remain unaffected.**

11.9.14.2.2 Handle sharding DDL locks manually

You can easily conclude from [Merge and Migrate Data from Sharded Tables](#) that DM's sharding DDL lock is a mechanism for coordinating the execution of DDL operations to the downstream from multiple upstream sharded tables.

Therefore, when you find any sharding DDL lock on DM-master through `show-ddl-locks` ↪ command, or any `unresolvedGroups` or `blockingDDLs` on some DM-workers through `query-status` command, do not rush to manually release the sharding DDL lock through `unlock-ddl-lock` commands.

Instead, you can:

- Follow the corresponding manual solution to handle the scenario if the failure of automatically releasing the sharding DDL lock is one of the [listed abnormal scenarios](#).
- Redo the entire data migration task if it is an unsupported scenario: First, empty the data in the downstream database and the `dm_meta` information associated with the migration task; then, re-execute the full and incremental data replication.

11.9.14.2.3 Handle conflicts between primary keys or unique indexes across multiple sharded tables

Data from multiple sharded tables might cause conflicts between the primary keys or unique indexes. You need to check each primary key or unique index based on the sharding logic of these sharded tables. The following are three cases related to primary keys or unique indexes:

- **Shard key:** Usually, the same shard key only exists in one sharded table, which means no data conflict is caused on shard key.
- **Auto-increment primary key:** The auto-increment primary key of each sharded tables counts separately, so their range might overlap. In this case, you need to refer to the next section [Handle conflicts of auto-increment primary key](#) to solve it.
- **Other primary keys or unique indexes:** you need to analyze them based on the business logic. If data conflict, you can also refer to the next section [Handle conflicts of auto-increment primary key](#) to solve it.

11.9.14.2.4 Handle conflicts of auto-increment primary key

This section introduces two recommended solutions to handle conflicts of auto-increment primary key.

Remove the `PRIMARY KEY` attribute from the column

Assume that the upstream schemas are as follows:

```
CREATE TABLE `tbl_no_pk` (  
  `auto_pk_c1` bigint(20) NOT NULL,  
  `uk_c2` bigint(20) NOT NULL,  
  `content_c3` text,  
  PRIMARY KEY (`auto_pk_c1`),  
  UNIQUE KEY `uk_c2` (`uk_c2`)  
) ENGINE=InnoDB DEFAULT CHARSET=latin1
```

If the following requirements are satisfied:

- The `auto_pk_c1` column has no impact on the application and does not depend on the column's `PRIMARY KEY` attribute.
- The `uk_c2` column has the `UNIQUE KEY` attribute, and it is globally unique in all upstream sharded tables.

Then you can perform the following steps to fix the `ERROR 1062 (23000): Duplicate entry '***' for key 'PRIMARY'` error that is possibly caused by the `auto_pk_c1` column when you merge sharded tables.

1. Before the full data migration, create a table in the downstream database for merging and migrating data, and modify the `PRIMARY KEY` attribute of the `auto_pk_c1` column to normal index.

```
CREATE TABLE `tbl_no_pk_2` (  
  `auto_pk_c1` bigint(20) NOT NULL,  
  `uk_c2` bigint(20) NOT NULL,  
  `content_c3` text,  
  INDEX (`auto_pk_c1`),  
  UNIQUE KEY `uk_c2` (`uk_c2`)  
) ENGINE=InnoDB DEFAULT CHARSET=latin1
```

2. Add the following configuration in `task.yaml` to skip the check of auto-increment primary key conflict:

```
ignore-checking-items: ["auto_increment_ID"]
```

3. Start the full and incremental data replication task.
4. Run `query-status` to verify whether the data migration task is successfully processed and whether the data from the upstream has already been merged and migrated to the downstream database.

Use a composite primary key

Assume that the upstream schemas are as follows:

```
CREATE TABLE `tbl_multi_pk` (  
  `auto_pk_c1` bigint(20) NOT NULL,  
  `uuid_c2` bigint(20) NOT NULL,  
  `content_c3` text,  
  PRIMARY KEY (`auto_pk_c1`)  
) ENGINE=InnoDB DEFAULT CHARSET=latin1
```

If the following requirements are satisfied:

- The application does not depend on the PRIMARY KEY attribute of the `auto_pk_c1` column.
- The composite primary key that consists of the `auto_pk_c1` and `uuid_c2` columns is globally unique.
- It is acceptable to use a composite primary key in the application.

Then you can perform the following steps to fix the ERROR 1062 (23000): Duplicate ↪ entry '***' for key 'PRIMARY' error that is possibly caused by the `auto_pk_c1` column when you merge sharded tables.

1. Before the full data migration, create a table in the downstream database for merging and migrating data. Do not specify the PRIMARY KEY attribute for the `auto_pk_c1` ↪ column, but use the `auto_pk_c1` and `uuid_c2` columns to make up a composite primary key.

```
CREATE TABLE `tbl_multi_pk_c2` (  
  `auto_pk_c1` bigint(20) NOT NULL,  
  `uuid_c2` bigint(20) NOT NULL,  
  `content_c3` text,  
  PRIMARY KEY (`auto_pk_c1`,`uuid_c2`)  
) ENGINE=InnoDB DEFAULT CHARSET=latin1
```

2. Start the full and incremental data migration task.
3. Run `query-status` to verify whether the data migration task is successfully processed and whether the data from upstream has already been merged and migrated to the downstream database.

11.9.14.2.5 Special processing when the upstream RDS contains sharded tables

If the upstream data source is an RDS and it contains sharded tables, the table names in MySQL binlog might be invisible when connecting to a SQL client. For example, if the upstream is a UCloud distributed database, the table name in the binlog might have an extra prefix `_0001`. Therefore, you need to configure **table routing** based on the table names in binlog, instead of those in the SQL client.

11.9.14.2.6 Create/drop tables in the upstream

In [Merge and Migrate Data from Sharded Tables](#), it is clear that the coordination of sharding DDL lock depends on whether the downstream database receives the DDL statements of all upstream sharded tables. In addition, DM currently **does not support** dynamically creating or dropping sharded tables in the upstream. Therefore, to create or drop sharded tables in the upstream, it is recommended to perform the following steps.

Create sharded tables in the upstream

If you need to create a new sharded table in the upstream, perform the following steps:

1. Wait for the coordination of all executed sharding DDL in the upstream sharded tables to finish.
2. Run `stop-task` to stop the data migration task.
3. Create a new sharded table in the upstream.
4. Make sure that the configuration in the `task.yaml` file allows the newly added sharded table to be merged in one downstream table with other existing sharded tables.
5. Run `start-task` to start the task.
6. Run `query-status` to verify whether the data migration task is successfully processed and whether the data from upstream has already been merged and migrated to the downstream database.

Drop sharded tables in the upstream

If you need to drop a sharded table in the upstream, perform the following steps:

1. Drop the sharded table, run `SHOW BINLOG EVENTS` to fetch the `End_log_pos` corresponding to the `DROP TABLE` statement in the binlog events, and mark it as *Pos-M*.
2. Run `query-status` to fetch the position (`syncerBinlog`) corresponding to the binlog event that has been processed by DM, and mark it as *Pos-S*.
3. When *Pos-S* is greater than *Pos-M*, it means that DM has processed all of the `DROP TABLE` statements, and the data of the table before dropping has been migrated to the downstream, so the subsequent operation can be performed. Otherwise, wait for DM to finish migrating the data.
4. Run `stop-task` to stop the task.
5. Make sure that the configuration in the `task.yaml` file ignores the dropped sharded table in the upstream.
6. Run `start-task` to start the task.
7. Run `query-status` to verify whether the data migration task is successfully processed.

11.9.14.2.7 Speed limits and traffic flow control

When data from multiple upstream MySQL or MariaDB instances is merged and migrated to the same TiDB cluster in the downstream, every DM-worker corresponding to each upstream instance executes full and incremental data replication concurrently. This means that the default degree of concurrency (`pool-size` in full data migration and `worker-count` in incremental data replication) accumulates as the number of DM-workers increases, which might overload the downstream database. In this case, you need to conduct a preliminary performance analysis based on TiDB and DM monitoring metrics and adjust the value of each concurrency parameter. In the future, DM is expected to support partially automated traffic flow control.

11.9.15 TiDB Data Migration Release Notes

Since DM v5.4, the Release Notes of TiDB Data Migration have been merged into TiDB Release Notes of the same version number.

- To read the DM Release Notes of v5.4 or a later version, see the DM related content in the corresponding TiDB Release Notes.
- To read the DM Release Notes of v5.3.0 or an earlier version, refer to the following links.

11.10 TiCDC

11.10.1 TiCDC Overview

[TiCDC](#) is a tool used for replicating incremental data of TiDB. Specifically, TiCDC pulls TiKV change logs, sorts captured data, and exports row-based incremental data to downstream databases.

11.10.1.1 Usage scenarios

- Database disaster recovery: TiCDC can be used for disaster recovery between homogeneous databases to ensure eventual data consistency of primary and secondary databases after a disaster event. This function works only with TiDB primary and secondary clusters.
- Data integration: TiCDC provides [TiCDC Canal-JSON Protocol](#), which allows other systems to subscribe data changes from TiCDC. In this way, TiCDC provides data sources for various scenarios such as monitoring, caching, global indexing, data analysis, and primary-secondary replication between heterogeneous databases.

11.10.1.2 TiCDC architecture

When TiCDC is running, it is a stateless node that achieves high availability through etcd in PD. The TiCDC cluster supports creating multiple replication tasks to replicate data to multiple different downstream platforms.

The architecture of TiCDC is shown in the following figure:

Figure 186: TiCDC architecture

11.10.1.2.1 System roles

- **TiKV CDC component:** Only outputs key-value (KV) change logs.
 - Assembles KV change logs in the internal logic.
 - Provides the interface to output KV change logs. The data sent includes real-time change logs and incremental scan change logs.
- **capture:** The operating process of TiCDC. Multiple **captures** form a TiCDC cluster that replicates KV change logs.
 - Each **capture** pulls a part of KV change logs.
 - Sorts the pulled KV change log(s).
 - Restores the transaction to downstream or outputs the log based on the TiCDC open protocol.

11.10.1.3 Replication features

This section introduces the replication features of TiCDC.

11.10.1.3.1 Sink support

Currently, the TiCDC sink component supports replicating data to the following downstream platforms:

- Databases compatible with MySQL protocol. The sink component provides the final consistency support.
- Kafka based on the TiCDC Open Protocol. The sink component ensures the row-level order, final consistency or strict transactional consistency.

11.10.1.3.2 Ensure replication order and consistency

Replication order

- For all DDL or DML statements, TiCDC outputs them **at least once**.
- When the TiKV or TiCDC cluster encounters failure, TiCDC might send the same DDL/DML statement repeatedly. For duplicated DDL/DML statements:
 - MySQL sink can execute DDL statements repeatedly. For DDL statements that can be executed repeatedly in the downstream, such as `truncate table`, the statement is executed successfully. For those that cannot be executed repeatedly, such as `create table`, the execution fails, and TiCDC ignores the error and continues the replication.
 - Kafka sink sends messages repeatedly, but the duplicate messages do not affect the constraints of `Resolved Ts`. Users can filter the duplicated messages from Kafka consumers.

Replication consistency

- MySQL sink
 - TiCDC does not split single-table transactions and **ensures** the atomicity of single-table transactions.
 - TiCDC does **not ensure** that the execution order of downstream transactions is the same as that of upstream transactions.
 - TiCDC splits cross-table transactions in the unit of table and does **not ensure** the atomicity of cross-table transactions.
 - TiCDC **ensures** that the order of single-row updates is consistent with that in the upstream.
- Kafka sink
 - TiCDC provides different strategies for data distribution. You can distribute data to different Kafka partitions based on the table, primary key, or timestamp.
 - For different distribution strategies, the different consumer implementations can achieve different levels of consistency, including row-level consistency, eventual consistency, or cross-table transactional consistency.
 - TiCDC does not have an implementation of Kafka consumers, but only provides **TiCDC Open Protocol**. You can implement the Kafka consumer according to this protocol.

11.10.1.4 Restrictions

There are some restrictions when using TiCDC.

11.10.1.4.1 Requirements for valid index

TiCDC only replicates the table that has at least one **valid index**. A **valid index** is defined as follows:

- The primary key (**PRIMARY KEY**) is a valid index.
- The unique index (**UNIQUE INDEX**) that meets the following conditions at the same time is a valid index:
 - Every column of the index is explicitly defined as non-nullable (**NOT NULL**).
 - The index does not have the virtual generated column (**VIRTUAL GENERATED** \hookrightarrow **COLUMNS**).

11.10.1.4.2 Unsupported scenarios

Currently, the following scenarios are not supported:

- The TiKV cluster that uses RawKV alone.
- The **DDL operation CREATE SEQUENCE** and the **SEQUENCE function** in TiDB. When the upstream TiDB uses **SEQUENCE**, TiCDC ignores **SEQUENCE** DDL operations/functions performed upstream. However, DML operations using **SEQUENCE** functions can be correctly replicated.

TiCDC only provides partial support for scenarios of large transactions in the upstream. For details, refer to [FAQ: Does TiCDC support replicating large transactions? Is there any risk?](#).

Note:

Since v5.3.0, TiCDC no longer supports the cyclic replication feature.

11.10.1.5 Install and deploy TiCDC

You can either deploy TiCDC along with a new TiDB cluster or add the TiCDC component to an existing TiDB cluster. For details, see [Deploy TiCDC](#).

11.10.1.6 Manage TiCDC Cluster and Replication Tasks

Currently, you can use the `cdc cli` tool to manage the status of a TiCDC cluster and data replication tasks. For details, see:

- [Use cdc cli to manage cluster status and data replication task](#)
- [Use OpenAPI to manage cluster status and data replication task](#)

11.10.1.7 TiCDC Open Protocol

TiCDC Open Protocol is a row-level data change notification protocol that provides data sources for monitoring, caching, full-text indexing, analysis engines, and primary-secondary replication between different databases. TiCDC complies with TiCDC Open Protocol and replicates data changes of TiDB to third-party data medium such as MQ (Message Queue). For more information, see [TiCDC Open Protocol](#).

11.10.1.8 Compatibility notes

11.10.1.8.1 Incompatibility issue caused by using the TiCDC v5.0.0-rc `cdc cli` tool to operate a v4.0.x cluster

When using the `cdc cli` tool of TiCDC v5.0.0-rc to operate a v4.0.x TiCDC cluster, you might encounter the following abnormal situations:

- If the TiCDC cluster is v4.0.8 or an earlier version, using the v5.0.0-rc `cdc cli` tool to create a replication task might cause cluster anomalies and get the replication task stuck.
- If the TiCDC cluster is v4.0.9 or a later version, using the v5.0.0-rc `cdc cli` tool to create a replication task will cause the old value and unified sorter features to be unexpectedly enabled by default.

Solutions: Use the `cdc` executable file corresponding to the TiCDC cluster version to perform the following operations:

1. Delete the changefeed created using the v5.0.0-rc `cdc cli` tool. For example, run the `tiup cdc:v4.0.9 cli changefeed remove -c xxxx --pd=xxxxx --force` command.
2. If the replication task is stuck, restart the TiCDC cluster. For example, run the `tiup cluster restart <cluster_name> -R cdc` command.
3. Re-create the changefeed. For example, run the `tiup cdc:v4.0.9 cli changefeed create --sink-uri=xxxx --pd=xxx` command.

Note:

The above issue exists only when `cdc cli` is v5.0.0-rc. Other v5.0.x `cdc cli` tool can be compatible with v4.0.x clusters.

11.10.1.8.2 Compatibility notes for `sort-dir` and `data-dir`

The `sort-dir` configuration is used to specify the temporary file directory for the TiCDC sorter. Its functionalities might vary in different versions. The following table lists `sort-dir`'s compatibility changes across versions.

---------	-------	------	----------------

11.10.1.8.3 Compatibility with temporary tables

Since v5.3.0, TiCDC supports [global temporary tables](#). Replicating global temporary tables to the downstream using TiCDC of a version earlier than v5.3.0 causes table definition error.

If the upstream cluster contains a global temporary table, the downstream TiDB cluster is expected to be v5.3.0 or a later version. Otherwise, an error occurs during the replication process.

11.10.1.9 Troubleshoot TiCDC

For details, refer to [Troubleshoot TiCDC](#).

11.10.2 Deploy TiCDC

This document describes how to deploy a TiCDC cluster and the hardware and software recommendations for deploying and running it. You can either deploy TiCDC along with a new TiDB cluster or add the TiCDC component to an existing TiDB cluster. Generally, it is recommended that you deploy TiCDC using TiUP. In addition, you can also deploy it using binary as needed.

11.10.2.1 Software and hardware recommendations

In production environments, the recommendations of software and hardware for TiCDC are as follows:

Linux OS	Version
Red Hat Enterprise Linux	7.3 or later versions
CentOS	7.3 or later versions

				Number of TiCDC cluster instances (minimum requirements for production environment)	
CPU	Memory	Disk type	Network	Network	
16 core+	64 GB+	SSD	10 Gbit network card (2 preferred)	2	

For more information, see [Software and Hardware Recommendations](#).

11.10.2.2 Deploy a new TiDB cluster that includes TiCDC using TiUP

When you deploy a new TiDB cluster using TiUP, you can also deploy TiCDC at the same time. You only need to add the `cdc_servers` section in the initialization configuration file that TiUP uses to start the TiDB cluster. For detailed operations, see [Edit the initialization configuration file](#). For detailed configurable fields, see [Configure `cdc_servers` using TiUP](#).

11.10.2.3 Add TiCDC to an existing TiDB cluster using TiUP

You can also use TiUP to add the TiCDC component to an existing TiDB cluster. Take the following procedures:

1. Make sure that the current TiDB version supports TiCDC; otherwise, you need to upgrade the TiDB cluster to `v4.0.0-rc.1` or later versions. Since `v4.0.6`, TiCDC has become a feature for general availability (GA). It is recommended that you use `v4.0.6` or later versions.
2. To deploy TiCDC, refer to [Scale out a TiCDC cluster](#).

11.10.2.4 Add TiCDC to an existing TiDB cluster using binary (not recommended)

Suppose that the PD cluster has a PD node (the client URL is `10.0.10.25:2379`) that can provide services. If you want to deploy three TiCDC nodes, start the TiCDC cluster by executing the following commands. You only need to specify the same PD address, and the newly started nodes automatically join the TiCDC cluster.

```
cdc server --pd=http://10.0.10.25:2379 --log-file=ticdc_1.log --addr
↳ =0.0.0.0:8301 --advertise-addr=127.0.0.1:8301
cdc server --pd=http://10.0.10.25:2379 --log-file=ticdc_2.log --addr
↳ =0.0.0.0:8302 --advertise-addr=127.0.0.1:8302
cdc server --pd=http://10.0.10.25:2379 --log-file=ticdc_3.log --addr
↳ =0.0.0.0:8303 --advertise-addr=127.0.0.1:8303
```

11.10.2.5 Description of TiCDC `cdc server` command-line parameters

The following are descriptions of options available in the `cdc server` command:

- **addr**: The listening address of TiCDC, the HTTP API address, and the Prometheus address of the TiCDC service. The default value is `127.0.0.1:8300`.
- **advertise-addr**: The advertised address via which clients access TiCDC. If unspecified, the value is the same as that of **addr**.
- **pd**: A comma-separated list of PD endpoints.
- **config**: The address of the configuration file that TiCDC uses (optional). This option is supported since TiCDC `v5.0.0`. This option can be used in the TiCDC deployment since TiUP `v1.4.0`.
- **data-dir**: Specifies the directory that TiCDC uses when it needs to use disks to store files. Unified Sorter uses this directory to store temporary files. It is recommended to ensure that the free disk space for this directory is greater than or equal to 500 GiB. For more details, see [Unified Sorter](#). If you are using TiUP, you can configure `data_dir` in the `cdc_servers` section, or directly use the default `data_dir` path in `global`.

- `gc-ttl`: The TTL (Time To Live) of the service level GC safepoint in PD set by TiCDC, and the duration that the replication task can suspend, in seconds. The default value is 86400, which means 24 hours. Note: Suspending of the TiCDC replication task affects the progress of TiCDC GC safepoint, which means that it affects the progress of upstream TiDB GC, as detailed in [Complete Behavior of TiCDC GC safepoint](#).
- `log-file`: The path to which logs are output when the TiCDC process is running. If this parameter is not specified, logs are written to the standard output (stdout).
- `log-level`: The log level when the TiCDC process is running. The default value is "info".
- `ca`: Specifies the path of the CA certificate file in PEM format for TLS connection (optional).
- `cert`: Specifies the path of the certificate file in PEM format for TLS connection (optional).
- `cert-allowed-cn`: Specifies the path of the common name in PEM format for TLS connection (optional).
- `key`: Specifies the path of the private key file in PEM format for TLS connection (optional).
- `tz`: Time zone used by the TiCDC service. TiCDC uses this time zone when it internally converts time data types such as `TIMESTAMP` or when it replicates data to the downstream. The default is the local time zone in which the process runs. If you specify `time-zone` (in `sink-uri`) and `tz` at the time, the internal TiCDC processes use the time zone specified by `tz`, and the sink uses the time zone specified by `time-zone` for replicating data to the downstream.

11.10.3 Manage TiCDC Cluster and Replication Tasks

This document describes how to upgrade TiCDC cluster and modify the configuration of TiCDC cluster using TiUP, and how to manage the TiCDC cluster and replication tasks using the command-line tool `cdc cli`.

You can also use the HTTP interface (the TiCDC OpenAPI feature) to manage the TiCDC cluster and replication tasks. For details, see [TiCDC OpenAPI](#).

11.10.3.1 Upgrade TiCDC using TiUP

This section introduces how to upgrade the TiCDC cluster using TiUP. In the following example, assume that you need to upgrade TiCDC and the entire TiDB cluster to v5.4.3.

```
tiup update --self && \  
tiup update --all && \  
tiup cluster upgrade <cluster-name> v5.4.3
```

11.10.3.1.1 Notes for upgrade

- The `changefeed` configuration has changed in TiCDC v4.0.2. See [Compatibility notes for the configuration file](#) for details.

- If you encounter any issues, see [Upgrade TiDB using TiUP - FAQ](#).

11.10.3.2 Modify TiCDC configuration using TiUP

This section introduces how to modify the configuration of TiCDC cluster using the `tiup cluster edit-config` command of TiUP. The following example changes the value of `gc-ttl` from the default 86400 to 3600, namely, one hour.

First, execute the following command. You need to replace `<cluster-name>` with your actual cluster name.

```
tiup cluster edit-config <cluster-name>
```

Then, enter the vi editor page and modify the `cdc` configuration under `server-configs`. The configuration is shown below:

```
server_configs:
  tidb: {}
  tikv: {}
  pd: {}
  tiflash: {}
  tiflash-learner: {}
  pump: {}
  drainer: {}
  cdc:
    gc-ttl: 3600
```

After the modification, execute the `tiup cluster reload -R cdc` command to reload the configuration.

11.10.3.3 Use TLS

For details about using encrypted data transmission (TLS), see [Enable TLS Between TiDB Components](#).

11.10.3.4 Use `cdc cli` to manage cluster status and data replication task

This section introduces how to use `cdc cli` to manage a TiCDC cluster and data replication tasks. `cdc cli` is the `cli` sub-command executed using the `cdc` binary. The following description assumes that:

- `cli` commands are executed directly using the `cdc` binary;
- PD listens on 10.0.10.25 and the port is 2379.

Note:

The IP address and port that PD listens on correspond to the `advertise` ↪ `-client-urls` parameter specified during the `pd-server` startup. Multiple `pd-servers` have multiple `advertise-client-urls` parameters and you can specify one or multiple parameters. For example, -- ↪ `pd=http://10.0.10.25:2379` or `--pd=http://10.0.10.25:2379,http` ↪ `:://10.0.10.26:2379,http://10.0.10.27:2379`.

If you deploy TiCDC using TiUP, replace `cdc cli` in the following commands with `tiup ctl:<cluster-version> cdc`.

11.10.3.4.1 Manage TiCDC service progress (capture)

- Query the capture list:

```
cdc cli capture list --pd=http://10.0.10.25:2379
```

```
[
  {
    "id": "806e3a1b-0e31-477f-9dd6-f3f2c570abdd",
    "is-owner": true,
    "address": "127.0.0.1:8300"
  },
  {
    "id": "ea2a4203-56fe-43a6-b442-7b295f458ebc",
    "is-owner": false,
    "address": "127.0.0.1:8301"
  }
]
```

- `id`: The ID of the service process.
- `is-owner`: Indicates whether the service process is the owner node.
- `address`: The address via which the service process provides interface to the outside.

11.10.3.4.2 Manage replication tasks (changefeed)

State transfer of replication tasks

The state of a replication task represents the running status of the replication task. During the running of TiCDC, replication tasks might fail with errors, be manually paused, resumed, or reach the specified `TargetTs`. These behaviors can lead to the change of the

replication task state. This section describes the states of TiCDC replication tasks and the transfer relationships between states.

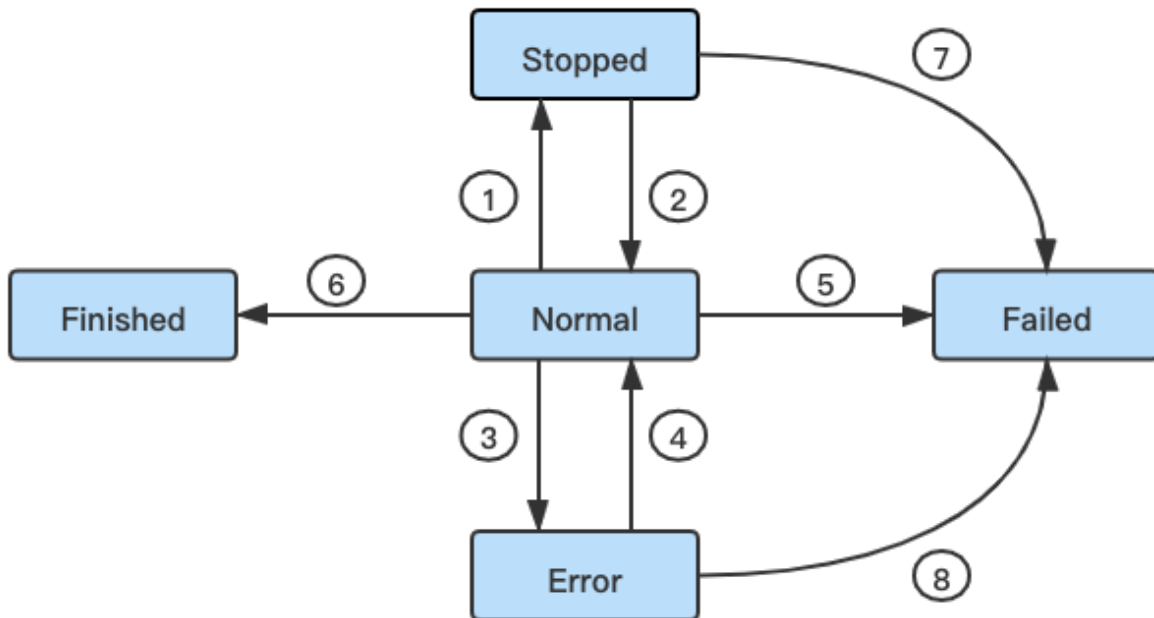

Figure 187: TiCDC state transfer

The states in the above state transfer diagram are described as follows:

- **Normal:** The replication task runs normally and the checkpoint-ts proceeds normally.
- **Stopped:** The replication task is stopped, because the user manually pauses the changefeed. The changefeed in this state blocks GC operations.
- **Error:** The replication task returns an error. The replication cannot continue due to some recoverable errors. The changefeed in this state keeps trying to resume until the state transfers to **Normal**. The changefeed in this state blocks GC operations.
- **Finished:** The replication task is finished and has reached the preset `TargetTs`. The changefeed in this state does not block GC operations.
- **Failed:** The replication task fails. Due to some unrecoverable errors, the replication task cannot resume and cannot be recovered. The changefeed in this state does not block GC operations.

The numbers in the above state transfer diagram are described as follows.

- Execute the `changefeed pause` command.
- Execute the `changefeed resume` command to resume the replication task.

- Recoverable errors occur during the `changefeed` operation, and the operation is resumed automatically.
- Execute the `changefeed resume` command to resume the replication task.
- Unrecoverable errors occur during the `changefeed` operation.
- `changefeed` has reached the preset `TargetTs`, and the replication is automatically stopped.
- `changefeed` suspended longer than the duration specified by `gc-ttl`, and cannot be resumed.
- `changefeed` experienced an unrecoverable error when trying to execute automatic recovery.

Create a replication task

Execute the following commands to create a replication task:

```
cdc cli changefeed create --pd=http://10.0.10.25:2379 --sink-uri="mysql://
↳ root:123456@127.0.0.1:3306/" --changefeed-id="simple-replication-task
↳ " --sort-engine="unified"
```

```
Create changefeed successfully!
ID: simple-replication-task
Info: {"sink-uri":"mysql://root:123456@127.0.0.1:3306/","opts":{},"create-
↳ time":"2020-03-12T22:04:08.103600025+08:00","start-ts
↳ ":415241823337054209,"target-ts":0,"admin-job-type":0,"sort-engine":"
↳ unified","sort-dir":".","config":{"case-sensitive":true,"filter":{"
↳ rules":["*.*"],"ignore-txn-start-ts":null,"ddl-allow-list":null},"
↳ mounter":{"worker-num":16},"sink":{"dispatchers":null},"scheduler":{"
↳ type":"table-number","polling-time":-1},"state":"normal","history":
↳ null,"error":null}
```

- `--changefeed-id`: The ID of the replication task. The format must match the `^[a-zA-Z0-9]+(\-[a-zA-Z0-9]+)*$` regular expression. If this ID is not specified, TiCDC automatically generates a UUID (the version 4 format) as the ID.
- `--sink-uri`: The downstream address of the replication task. Configure `--sink-uri` according to the following format. Currently, the scheme supports `mysql/tidb/kafka` `↳ /pulsar/s3/local`.

```
[scheme]://[userinfo@][host]:[port][/path]?[query_parameters]
```

When a URI contains special characters, you need to process these special characters using URL encoding.

- `--start-ts`: Specifies the starting TSO of the `changefeed`. From this TSO, the TiCDC cluster starts pulling data. The default value is the current time.

- `--target-ts`: Specifies the ending TSO of the `changefeed`. To this TSO, the TiCDC cluster stops pulling data. The default value is empty, which means that TiCDC does not automatically stop pulling data.
- `--sort-engine`: Specifies the sorting engine for the `changefeed`. Because TiDB and TiKV adopt distributed architectures, TiCDC must sort the data changes before writing them to the sink. This option supports `unified` (by default)/`memory`/`file`.
 - `unified`: When `unified` is used, TiCDC prefers data sorting in memory. If the memory is insufficient, TiCDC automatically uses the disk to store the temporary data. This is the default value of `--sort-engine`.
 - `memory`: Sorts data changes in memory. It is **NOT recommended** to use this sorting engine, because OOM is easily triggered when you replicate a large amount of data.
 - `file`: Entirely uses the disk to store the temporary data. This feature is **deprecated**. It is **NOT recommended** to use it in **any** situation.
- `--config`: Specifies the configuration file of the `changefeed`.
- `sort-dir`: Specifies the temporary file directory used by the sorting engine. **Note that this option is not supported since TiDB v4.0.13, v5.0.3 and v5.1.0. Do not use it any more.**

Configure sink URI with `mysql/tidb`

Sample configuration:

```
--sink-uri="mysql://root:123456@127.0.0.1:3306/?worker-count=16&max-txn-row
↪ =5000"
```

The following are descriptions of parameters and parameter values that can be configured for the sink URI with `mysql/tidb`:

Parameter/Parameter Value	Description
<code>root</code>	The username of the downstream database
<code>123456</code>	The password of the downstream database
<code>127.0.0.1</code>	The IP address of the downstream database
<code>3306</code>	The port for the downstream data
<code>worker-count</code>	The number of SQL statements that can be concurrently executed to the downstream (optional, 16 by default)
<code>max-txn-row</code>	The size of a transaction batch that can be executed to the downstream (optional, 256 by default)
<code>ssl-ca</code>	The path of the CA certificate file needed to connect to the downstream MySQL instance (optional)

Parameter/Parameter Value	Description
<code>ssl-cert</code>	The path of the certificate file needed to connect to the downstream MySQL instance (optional)
<code>ssl-key</code>	The path of the certificate key file needed to connect to the downstream MySQL instance (optional)
<code>time-zone</code>	The time zone used when connecting to the downstream MySQL instance, which is effective since v4.0.8. This is an optional parameter. If this parameter is not specified, the time zone of TiCDC service processes is used. If this parameter is set to an empty value, no time zone is specified when TiCDC connects to the downstream MySQL instance and the default time zone of the downstream is used.

Configure sink URI with `kafka`

Sample configuration:

```
--sink-uri="kafka://127.0.0.1:9092/topic-name?kafka-version=2.4.0&partition-
↳ num=6&max-message-bytes=67108864&replication-factor=1"
```

The following are descriptions of parameters and parameter values that can be configured for the sink URI with `kafka`:

Parameter/Parameter Value	Description
<code>127.0.0.1</code>	The IP address of the downstream Kafka services
<code>9092</code>	The port for the downstream Kafka
<code>topic-name</code>	Variable. The name of the Kafka topic
<code>kafka-version</code>	The version of the downstream Kafka (optional, 2.4.0 by default. Currently, the earliest supported Kafka version is 0.11.0.2 and the latest one is 3.1.0. This value needs to be consistent with the actual version of the downstream Kafka)
<code>kafka-client-id</code>	Specifies the Kafka client ID of the replication task (optional. TiCDC_ <code>sarama_producer_replication</code> ID by default)
<code>partition-num</code>	The number of the downstream Kafka partitions (optional. The value must be no greater than the actual number of partitions; otherwise, the replication task cannot be created successfully. 3 by default)
<code>max-message-bytes</code>	The maximum size of data that is sent to Kafka broker each time (optional, 10MB by default). From v5.0.6 and v4.0.6, the default value has changed from 64MB and 256MB to 10MB.
<code>replication- ↳ factor</code>	The number of Kafka message replicas that can be saved (optional, 1 by default)

Parameter/Parameter Value	Description
<code>compression</code>	The compression algorithm used when sending messages (value options are <code>none</code> , <code>lz4</code> , <code>gzip</code> , <code>snappy</code> , and <code>zstd</code> ; <code>none</code> by default).
<code>protocol</code>	The protocol with which messages are output to Kafka. The value options are <code>canal-json</code> , <code>open-protocol</code> , and <code>avro</code> .
<code>auto-create-topic</code>	Determines whether TiCDC creates the topic automatically when the <code>topic-name</code> passed in does not exist in the Kafka cluster (optional, <code>true</code> by default)
<code>enable-tidb- ↔ extension</code>	When the output protocol is <code>canal-json</code> , if the value is <code>true</code> , TiCDC sends Resolved events and adds the TiDB extension field to the Kafka message. (optional, <code>false</code> by default)
<code>max-batch-size</code>	New in v4.0.9. If the message protocol supports outputting multiple data changes to one Kafka message, this parameter specifies the maximum number of data changes in one Kafka message. It currently takes effect only when Kafka's <code>protocol</code> is <code>open-protocol</code> . (optional, <code>16</code> by default)
<code>ca</code>	The path of the CA certificate file needed to connect to the downstream Kafka instance (optional)
<code>cert</code>	The path of the certificate file needed to connect to the downstream Kafka instance (optional)
<code>key</code>	The path of the certificate key file needed to connect to the downstream Kafka instance (optional)
<code>sasl-user</code>	The identity (authcid) of SASL/SCRAM authentication needed to connect to the downstream Kafka instance (optional)
<code>sasl-password</code>	The password of SASL/SCRAM authentication needed to connect to the downstream Kafka instance (optional)
<code>sasl-mechanism</code>	The name of SASL/SCRAM authentication needed to connect to the downstream Kafka instance (optional)

Best practices:

- It is recommended that you create your own Kafka Topic. At a minimum, you need to set the maximum amount of data of each message that the Topic can send to the Kafka broker, and the number of downstream Kafka partitions. When you create a changefeed, these two settings correspond to `max-message-bytes` and `partition-num`, respectively.
- If you create a changefeed with a Topic that does not yet exist, TiCDC will try to create the Topic using the `partition-num` and `replication-factor` parameters. It is recommended that you specify these parameters explicitly.
- In most cases, it is recommended to use the `canal-json` protocol.

Note:

When `protocol` is `open-protocol`, TiCDC tries to avoid generating messages that exceed `max-message-bytes` in length. However, if a row is so large that a single change alone exceeds `max-message-bytes` in length, to avoid silent failure, TiCDC tries to output this message and prints a warning in the log.

Integrate TiCDC with Kafka Connect (Confluent Platform)

Warning:

This is still an experimental feature. Do **NOT** use it in a production environment.

Sample configuration:

```
--sink-uri="kafka://127.0.0.1:9092/topic-name?protocol=canal-json&kafka-  
  ↪ version=2.4.0&protocol=avro&partition-num=6&max-message-bytes  
  ↪ =67108864&replication-factor=1"  
--opts registry="http://127.0.0.1:8081"
```

To use the [data connectors](#) provided by Confluent to stream data to relational or non-relational databases, you should use the `avro` protocol and provide a URL for [Confluent Schema Registry](#) in `opts`. Note that the `avro` protocol and Confluent integration are **experimental**.

For detailed integration guide, see [Quick Start Guide on Integrating TiDB with Confluent Platform](#).

Configure sink URI with `pulsar`

Warning:

This is still an experimental feature. Do **NOT** use it in a production environment.

Sample configuration:

```
--sink-uri="pulsar://127.0.0.1:6650/topic-name?connectionTimeout=2s"
```

The following are descriptions of parameters that can be configured for the sink URI with pulsar:

Parameter	Description
<code>connectionTimeout</code>	The timeout for establishing a connection to the downstream Pulsar, which is optional and defaults to 30 (seconds)
<code>operationTimeout</code>	The timeout for performing an operation on the downstream Pulsar, which is optional and defaults to 30 (seconds)
<code>tlsTrustCertsFilePath</code>	The path of the CA certificate file needed to connect to the downstream Pulsar instance (optional)
<code>tlsAllowInsecureConnection</code>	Determines whether to allow unencrypted connection after TLS is enabled (optional)
<code>tlsValidateHostname</code>	Determines whether to verify the host name of the certificate from the downstream Pulsar (optional)
<code>maxConnectionsPerBroker</code>	Maximum number of connections allowed to a single downstream Pulsar broker, which is optional and defaults to 1
<code>auth.tls</code>	Uses the TLS mode to verify the downstream Pulsar (optional). For example, <code>auth=tls&auth.tlsCertFile=/path/to/cert&auth.tlsKeyFile=/path/to/key</code> .
<code>auth.token</code>	Uses the token mode to verify the downstream Pulsar (optional). For example, <code>auth=token&auth.token=secret-token</code> or <code>auth=token&auth.file=path/to/secret-token-file</code> .
<code>name</code>	The name of Pulsar producer in TiCDC (optional)
<code>protocol</code>	The protocol with which messages are output to Pulsar. The value options are <code>canal-json</code> , <code>open-protocol</code> , and <code>avro</code> .
<code>maxPendingMessages</code>	Sets the maximum size of the pending message queue, which is optional and defaults to 1000. For example, pending for the confirmation message from Pulsar.
<code>disableBatching</code>	Disables automatically sending messages in batches (optional)
<code>batchingMaxPublishDelay</code>	Sets the duration within which the messages sent are batched (default: 10ms)
<code>compressionType</code>	Sets the compression algorithm used for sending messages (optional). The value options are <code>NONE</code> , <code>LZ4</code> , <code>ZLIB</code> , and <code>ZSTD</code> . (<code>NONE</code> by default)
<code>hashingScheme</code>	The hash algorithm used for choosing the partition to which a message is sent (optional). The value options are <code>JavaStringHash</code> (default) and <code>Murmur3</code> .
<code>properties.*</code>	The customized properties added to the Pulsar producer in TiCDC (optional). For example, <code>properties.location=Hangzhou</code> .

For more parameters of Pulsar, see [pulsar-client-go ClientOptions](#) and [pulsar-client-go ProducerOptions](#).

Use the task configuration file

For more replication configuration (for example, specify replicating a single table), see [Task configuration file](#).

You can use a configuration file to create a replication task in the following way:

```
cdc cli changefeed create --pd=http://10.0.10.25:2379 --sink-uri="mysql://
↳ root:123456@127.0.0.1:3306/" --config changefeed.toml
```

In the command above, `changefeed.toml` is the configuration file for the replication task.

Query the replication task list

Execute the following command to query the replication task list:

```
cdc cli changefeed list --pd=http://10.0.10.25:2379
```

```
[{
  "id": "simple-replication-task",
  "summary": {
    "state": "normal",
    "tso": 417886179132964865,
    "checkpoint": "2020-07-07 16:07:44.881",
    "error": null
  }
}]
```

- **checkpoint** indicates that TiCDC has already replicated data before this time point to the downstream.
- **state** indicates the state of the replication task.
 - **normal**: The replication task runs normally.
 - **stopped**: The replication task is stopped (manually paused).
 - **error**: The replication task is stopped (by an error).
 - **removed**: The replication task is removed. Tasks of this state are displayed only when you have specified the `--all` option. To see these tasks when this option is not specified, execute the `changefeed query` command.
 - **finished**: The replication task is finished (data is replicated to the `target-ts`). Tasks of this state are displayed only when you have specified the `--all` option. To see these tasks when this option is not specified, execute the `changefeed ↳ query` command.

Query a specific replication task

To query a specific replication task, execute the `changefeed query` command. The query result includes the task information and the task state. You can specify the `--simple ↳` or `-s` argument to simplify the query result that will only include the basic replication state and the checkpoint information. If you do not specify this argument, detailed task configuration, replication states, and replication table information are output.

```
cdc cli changefeed query -s --pd=http://10.0.10.25:2379 --changefeed-id=
↳ simple-replication-task
```

```
{
  "state": "normal",
  "tso": 419035700154597378,
  "checkpoint": "2020-08-27 10:12:19.579",
  "error": null
}
```

In the command and result above:

- **state** is the replication state of the current **changefeed**. Each state must be consistent with the state in **changefeed list**.
- **tso** represents the largest transaction TSO in the current **changefeed** that has been successfully replicated to the downstream.
- **checkpoint** represents the corresponding time of the largest transaction TSO in the current **changefeed** that has been successfully replicated to the downstream.
- **error** records whether an error has occurred in the current **changefeed**.

```
cdc cli changefeed query --pd=http://10.0.10.25:2379 --changefeed-id=simple-
↳ replication-task
```

```
{
  "info": {
    "sink-uri": "mysql://127.0.0.1:3306/?max-txn-row=20\u0026worker-number
      ↳ =4",
    "opts": {},
    "create-time": "2020-08-27T10:33:41.687983832+08:00",
    "start-ts": 419036036249681921,
    "target-ts": 0,
    "admin-job-type": 0,
    "sort-engine": "unified",

      },
      "operation": null,
      "admin-job-type": 0
    }
  }
]
}
```

In the command and result above:

- **info** is the replication configuration of the queried **changefeed**.
- **status** is the replication state of the queried **changefeed**.
 - **resolved-ts**: The largest transaction TS in the current **changefeed**. Note that this TS has been successfully sent from TiKV to TiCDC.

- **checkpoint-ts**: The largest transaction TS in the current **changefeed**. Note that this TS has been successfully written to the downstream.
- **admin-job-type**: The status of a **changefeed**:
 - * 0: The state is normal.
 - * 1: The task is paused. When the task is paused, all replicated **processors** exit. The configuration and the replication status of the task are retained, so you can resume the task from **checkpoint-ts**.
 - * 2: The task is resumed. The replication task resumes from **checkpoint-ts**.
 - * 3: The task is removed. When the task is removed, all replicated **processors** are ended, and the configuration information of the replication task is cleared up. Only the replication status is retained for later queries.
- **task-status** indicates the state of each replication sub-task in the queried **changefeed**
↪ .

Pause a replication task

Execute the following command to pause a replication task:

```
cdc cli changefeed pause --pd=http://10.0.10.25:2379 --changefeed-id simple-  
↪ replication-task
```

In the above command:

- **--changefeed-id=uuid** represents the ID of the **changefeed** that corresponds to the replication task you want to pause.

Resume a replication task

Execute the following command to resume a paused replication task:

```
cdc cli changefeed resume --pd=http://10.0.10.25:2379 --changefeed-id simple  
↪ -replication-task
```

In the above command:

- **--changefeed-id=uuid** represents the ID of the **changefeed** that corresponds to the replication task you want to resume.

Remove a replication task

Execute the following command to remove a replication task:

```
cdc cli changefeed remove --pd=http://10.0.10.25:2379 --changefeed-id simple  
↪ -replication-task
```

In the above command:

- **--changefeed-id=uuid** represents the ID of the **changefeed** that corresponds to the replication task you want to remove.

11.10.3.4.3 Update task configuration

Starting from v4.0.4, TiCDC supports modifying the configuration of the replication task (not dynamically). To modify the `changefeed` configuration, pause the task, modify the configuration, and then resume the task.

```
cdc cli changefeed pause -c test-cf --pd=http://10.0.10.25:2379
cdc cli changefeed update -c test-cf --pd=http://10.0.10.25:2379 --sink-uri
  ↪ "mysql://127.0.0.1:3306/?max-txn-row=20&worker-number=8" --config=
  ↪ changefeed.toml
cdc cli changefeed resume -c test-cf --pd=http://10.0.10.25:2379
```

Currently, you can modify the following configuration items:

- `sink-uri` of the `changefeed`.
- The `changefeed` configuration file and all configuration items in the file.
- Whether to use the file sorting feature and the sorting directory.
- The `target-ts` of the `changefeed`.

11.10.3.4.4 Manage processing units of replication sub-tasks (processor)

- Query the processor list:

```
cdc cli processor list --pd=http://10.0.10.25:2379
```

```
[
  {
    "id": "9f84ff74-abf9-407f-a6e2-56aa35b33888",
    "capture-id": "b293999a-4168-4988-a4f4-35d9589b226b",
    "changefeed-id": "simple-replication-task"
  }
]
```

- Query a specific `changefeed` which corresponds to the status of a specific replication task:

```
cdc cli processor query --pd=http://10.0.10.25:2379 --changefeed-id=
  ↪ simple-replication-task --capture-id=b293999a-4168-4988-a4f4-35
  ↪ d9589b226b
```

```
{
  "status": {
    "tables": {
      "56": { # ID of the replication table, corresponding to
        ↪ tidb_table_id of a table in TiDB
      "start-ts": 417474117955485702
```

```
    }
  },
  "operation": null,
  "admin-job-type": 0
},
"position": {
  "checkpoint-ts": 417474143881789441,
  "resolved-ts": 417474143881789441,
  "count": 0
}
}
```

In the command above:

- `status.tables`: Each key number represents the ID of the replication table, corresponding to `tidb_table_id` of a table in TiDB.
- `resolved-ts`: The largest TSO among the sorted data in the current processor.
- `checkpoint-ts`: The largest TSO that has been successfully written to the downstream in the current processor.

11.10.3.5 Task configuration file

This section introduces the configuration of a replication task.

```
### Specifies whether the database names and tables in the configuration
↳ file are case-sensitive.
### The default value is true.
### This configuration item affects configurations related to filter and
↳ sink.
case-sensitive = true

### Specifies whether to output the old value. New in v4.0.5. Since v5.0,
↳ the default value is `true`.
enable-old-value = true

[filter]
### Ignores the transaction of specified start_ts.
ignore-txn-start-ts = [1, 2]

### Filter rules.
### Filter syntax: https://docs.pingcap.com/tidb/stable/table-filter#syntax.
rules = ['*.*', '!test.*']

[mounter]
### mounter thread counts, which is used to decode the TiKV output data.
worker-num = 16
```

```
[sink]
### For the sink of MQ type, you can use dispatchers to configure the event
  ↳ dispatcher.
### Supports four dispatchers: default, ts, rowid, and table.
### The dispatcher rules are as follows:
### - default: When multiple unique indexes (including the primary key)
  ↳ exist or the Old Value feature is enabled, events are dispatched in
  ↳ the table mode. When only one unique index (or the primary key)
  ↳ exists, events are dispatched in the rowid mode.
### - ts: Use the commitTs of the row change to create Hash and dispatch
  ↳ events.
### - index-value: Use the value of the primary key or the unique index of
  ↳ the table to create Hash and dispatch events.
### - table: Use the schema name of the table and the table name to create
  ↳ Hash and dispatch events.
### The matching syntax of matcher is the same as the filter rule syntax.
dispatchers = [
  {matcher = ['test1.*', 'test2.*'], dispatcher = "ts"},
  {matcher = ['test3.*', 'test4.*'], dispatcher = "rowid"},
]
### For the sink of MQ type, you can specify the protocol format of the
  ↳ message.
### Currently the following protocols are supported: canal-json, open-
  ↳ protocol, and avro.
protocol = "canal-json"
```

11.10.3.5.1 Notes for compatibility

- In TiCDC v4.0.0, `ignore-txn-commit-ts` is removed and `ignore-txn-start-ts` is added, which uses `start_ts` to filter transactions.
- In TiCDC v4.0.2, `db-dbs/db-tables/ignore-dbs/ignore-tables` are removed and `rules` is added, which uses new filter rules for databases and tables. For detailed filter syntax, see [Table Filter](#).

11.10.3.6 Output the historical value of a Row Changed Event New in v4.0.5

In the default configuration, the Row Changed Event of TiCDC Open Protocol output in a replication task only contains the changed value, not the value before the change. Therefore, the output value cannot be used by the consumer ends of TiCDC Open Protocol as the historical value of a Row Changed Event.

Starting from v4.0.5, TiCDC supports outputting the historical value of a Row Changed Event. To enable this feature, specify the following configuration in the `changefeed` configuration file at the root level:

```
enable-old-value = true
```

This feature is enabled by default since v5.0. To learn the output format of the TiCDC Open Protocol after this feature is enabled, see [TiCDC Open Protocol - Row Changed Event](#).

11.10.3.7 Replicate tables with the new framework for collations enabled

Starting from v4.0.15, v5.0.4, v5.1.1 and v5.2.0, TiCDC supports tables that have enabled [new framework for collations](#).

11.10.3.8 Replicate tables without a valid index

Since v4.0.8, TiCDC supports replicating tables that have no valid index by modifying the task configuration. To enable this feature, configure in the `changefeed` configuration file as follows:

```
enable-old-value = true
force-replicate = true
```

Warning:

For tables without a valid index, operations such as `INSERT` and `REPLACE` are not reentrant, so there is a risk of data redundancy. TiCDC guarantees that data is distributed only at least once during the replication process. Therefore, enabling this feature to replicate tables without a valid index will definitely cause data redundancy. If you do not accept data redundancy, it is recommended to add an effective index, such as adding a primary key column with the `AUTO RANDOM` attribute.

11.10.3.9 Unified Sorter

Unified sorter is the sorting engine in TiCDC. It can mitigate OOM problems caused by the following scenarios:

- The data replication task in TiCDC is paused for a long time, during which a large amount of incremental data is accumulated and needs to be replicated.
- The data replication task is started from an early timestamp so it becomes necessary to replicate a large amount of incremental data.

For the changefeeds created using `cdc cli` after v4.0.13, Unified Sorter is enabled by default; for the changefeeds that have existed before v4.0.13, the previous configuration is used.

To check whether or not the Unified Sorter feature is enabled on a changefeed, you can execute the following example command (assuming the IP address of the PD instance is `http://10.0.10.25:2379`):

```
cdc cli --pd="http://10.0.10.25:2379" changefeed query --changefeed-id=  
↳ simple-replication-task | grep 'sort-engine'
```

In the output of the above command, if the value of `sort-engine` is “unified”, it means that Unified Sorter is enabled on the changefeed.

Note:

- If your servers use mechanical hard drives or other storage devices that have high latency or limited bandwidth, use the unified sorter with caution.
- By default, Unified Sorter uses `data_dir` to store temporary files. It is recommended to ensure that the free disk space is greater than or equal to 500 GiB. For production environments, it is recommended to ensure that the free disk space on each node is greater than (the maximum `checkpoint-ts` delay allowed by the business) * (upstream write traffic at business peak hours). In addition, if you plan to replicate a large amount of historical data after `changefeed` is created, make sure that the free space on each node is greater than the amount of replicated data.
- Unified sorter is enabled by default. If your servers do not match the above requirements and you want to disable the unified sorter, you need to manually set `sort-engine` to `memory` for the changefeed.
- To enable Unified Sorter on an existing changefeed that uses `memory` to sort, see the methods provided in [How do I handle the OOM that occurs after TiCDC is restarted after a task interruption?](#).

11.10.3.10 Eventually consistent replication in disaster scenarios

Warning:

In v5.3.0 and v5.4.0, it is not recommended that you use eventually consistent replication in disaster scenarios. For details, see [#6189](#). This issue has been fixed in v6.1.1 and later. Therefore, it is recommended that you use v6.1.1 or a later version.

Starting from v5.3.0, TiCDC supports backing up incremental data from an upstream TiDB cluster to S3 storage or an NFS file system of a downstream cluster. When the upstream cluster encounters a disaster and becomes unavailable, TiCDC can restore the downstream data to the recent eventually consistent state. This is the eventually consistent replication capability provided by TiCDC. With this capability, you can switch applications to the downstream cluster quickly, avoiding long-time downtime and improving service continuity.

Currently, TiCDC can replicate incremental data from a TiDB cluster to another TiDB cluster or a MySQL-compatible database system (including Aurora, MySQL, and MariaDB). In case the upstream cluster crashes, TiCDC can restore data in the downstream cluster within 5 minutes, given the conditions that before the disaster the replication status of TiCDC is normal and the replication lag is small. It allows data loss of 10s at most, that is, $RTO \leq 5 \text{ min}$, and $P95 \text{ RPO} \leq 10\text{s}$.

TiCDC replication lag increases in the following scenarios:

- The TPS increases significantly in a short time
- Large or long transactions occur in the upstream
- The TiKV or TiCDC cluster in the upstream is reloaded or upgraded
- Time-consuming DDL statements, such as `add index`, are executed in the upstream
- The PD is configured with aggressive scheduling strategies, resulting in frequent transfer of Region leaders, or frequent Region merge or Region split

11.10.3.10.1 Prerequisites

- Prepare a highly available Amazon S3 storage or NFS system for storing TiCDC's real-time incremental data backup files. These files can be accessed in case of an primary cluster disaster.
- Enable this feature for changefeeds that need to have eventual consistency in disaster scenarios. To enable it, you can add the following configuration to the changefeed configuration file.

```
[consistent]
### Consistency level. Options include:
### - none: the default value. In a non-disaster scenario, eventual
    ↪ consistency is only guaranteed if and only if finished-ts is
    ↪ specified.
### - eventual: Uses redo log to guarantee eventual consistency in case of
    ↪ the primary cluster disasters.
level = "eventual"

### Individual redo log file size, in MiB. By default, it's 64. It is
    ↪ recommended to be no more than 128.
max-log-size = 64
```

```
### The interval for flushing or uploading redo logs to S3, in milliseconds.
  ↪ By default, it's 1000. The recommended range is 500-2000.
flush-interval = 1000

### Form of storing redo log, including nfs (NFS directory) and S3 (
  ↪ uploading to S3).
storage = "s3://logbucket/test-changefeed?endpoint=http://$S3_ENDPOINT/"
```

11.10.3.10.2 Disaster recovery

When a disaster happens in the primary cluster, you need to recover manually in the secondary cluster by running the `cdc redo` command. The recovery process is as follows.

1. Ensure that all the TiCDC processes have exited. This is to prevent the primary cluster from resuming service during data recovery and prevent TiCDC from restarting data synchronization.
2. Use `cdc` binary for data recovery. Run the following command:

```
cdc redo apply --tmp-dir="/tmp/cdc/redo/apply" \  
  --storage="s3://logbucket/test-changefeed?endpoint=http \  
  ↪ ://10.0.10.25:24927/" \  
  --sink-uri="mysql://normal:123456@10.0.10.55:3306/"
```

In this command:

- `tmp-dir`: Specifies the temporary directory for downloading TiCDC incremental data backup files.
- `storage`: Specifies the address for storing the TiCDC incremental data backup files, either an Amazon S3 storage or an NFS directory.
- `sink-uri`: Specifies the secondary cluster address to restore the data to. Scheme can only be `mysql`.

11.10.4 Troubleshoot TiCDC

This document introduces the common issues and errors that you might encounter when using TiCDC, and the corresponding maintenance and troubleshooting methods.

Note:

In this document, the PD address specified in `cdc cli` commands is `--pd ↪ =http://10.0.10.25:2379`. When you use the command, replace the address with your actual PD address.

11.10.4.1 How do I choose `start-ts` when creating a task in TiCDC?

The `start-ts` of a replication task corresponds to a Timestamp Oracle (TSO) in the upstream TiDB cluster. TiCDC requests data from this TSO in a replication task. Therefore, the `start-ts` of the replication task must meet the following requirements:

- The value of `start-ts` is larger than the `tikv_gc_safe_point` value of the current TiDB cluster. Otherwise, an error occurs when you create a task.
- Before starting a task, ensure that the downstream has all data before `start-ts`. For scenarios such as replicating data to message queues, if the data consistency between upstream and downstream is not required, you can relax this requirement according to your application need.

If you do not specify `start-ts`, or specify `start-ts` as 0, when a replication task is started, TiCDC gets a current TSO and starts the task from this TSO.

11.10.4.2 Why can't some tables be replicated when I create a task in TiCDC?

When you execute `cdc cli changefeed create` to create a replication task, TiCDC checks whether the upstream tables meet the **replication restrictions**. If some tables do not meet the restrictions, `some tables are not eligible to replicate` is returned with a list of ineligible tables. You can choose Y or y to continue creating the task, and all updates on these tables are automatically ignored during the replication. If you choose an input other than Y or y, the replication task is not created.

11.10.4.3 How do I view the state of TiCDC replication tasks?

To view the status of TiCDC replication tasks, use `cdc cli`. For example:

```
cdc cli changefeed list --pd=http://10.0.10.25:2379
```

The expected output is as follows:

```
[{
  "id": "4e24dde6-53c1-40b6-badf-63620e4940dc",
  "summary": {
    "state": "normal",
    "tso": 417886179132964865,
    "checkpoint": "2020-07-07 16:07:44.881",
    "error": null
  }
}]
```

- **checkpoint**: TiCDC has replicated all data before this timestamp to downstream.

- **state**: The state of this replication task:
 - **normal**: The task runs normally.
 - **stopped**: The task is stopped manually or encounters an error.
 - **removed**: The task is removed.

Note:

This feature is introduced in TiCDC 4.0.3.

11.10.4.4 TiCDC replication interruptions

11.10.4.4.1 How do I know whether a TiCDC replication task is interrupted?

- Check the `changefeed_checkpoint` monitoring metric of the replication task (choose the right `changefeed id`) in the Grafana dashboard. If the metric value stays unchanged, or the `checkpoint_lag` metric keeps increasing, the replication task might be interrupted.
- Check the `exit_error_count` monitoring metric. If the metric value is greater than 0, an error has occurred in the replication task.
- Execute `cdc cli changefeed list` and `cdc cli changefeed query` to check the status of the replication task. `stopped` means the task has stopped, and the `error` item provides the detailed error message. After the error occurs, you can search `error` → `on running processor` in the TiCDC server log to see the error stack for troubleshooting.
- In some extreme cases, the TiCDC service is restarted. You can search the `FATAL` level log in the TiCDC server log for troubleshooting.

11.10.4.4.2 How do I know whether the replication task is stopped manually?

You can know whether the replication task is stopped manually by executing `cdc cli`. For example:

```
cdc cli changefeed query --pd=http://10.0.10.25:2379 --changefeed-id 28
↪ c43ffc-2316-4f4f-a70b-d1a7c59ba79f
```

In the output of the above command, `admin-job-type` shows the state of this replication task:

- 0: In progress, which means that the task is not stopped manually.

- 1: Paused. When the task is paused, all replicated `processors` exit. The configuration and the replication status of the task are retained, so you can resume the task from `checkpoint-ts`.
- 2: Resumed. The replication task resumes from `checkpoint-ts`.
- 3: Removed. When the task is removed, all replicated `processors` are ended, and the configuration information of the replication task is cleared up. The replication status is retained only for later queries.

11.10.4.4.3 How do I handle replication interruptions?

A replication task might be interrupted in the following known scenarios:

- The downstream continues to be abnormal, and TiCDC still fails after many retries.
 - In this scenario, TiCDC saves the task information. Because TiCDC has set the service GC safepoint in PD, the data after the task checkpoint is not cleaned by TiKV GC within the valid period of `gc-ttl`.
 - Handling method: You can resume the replication task via the HTTP interface after the downstream is back to normal.
- Replication cannot continue because of incompatible SQL statement(s) in the downstream.
 - In this scenario, TiCDC saves the task information. Because TiCDC has set the service GC safepoint in PD, the data after the task checkpoint is not cleaned by TiKV GC within the valid period of `gc-ttl`.
 - Handling procedures:
 1. Query the status information of the replication task using the `cdc cli` \hookrightarrow `changefeed query` command and record the value of `checkpoint-ts`.
 2. Use the new task configuration file and add the `ignore-txn-start-ts` parameter to skip the transaction corresponding to the specified `start-ts`.
 3. Stop the old replication task via HTTP API. Execute `cdc cli changefeed` \hookrightarrow `create` to create a new task and specify the new task configuration file. Specify `checkpoint-ts` recorded in step 1 as the `start-ts` and start a new task to resume the replication.
- In TiCDC v4.0.13 and earlier versions, when TiCDC replicates the partitioned table, it might encounter an error that leads to replication interruption.
 - In this scenario, TiCDC saves the task information. Because TiCDC has set the service GC safepoint in PD, the data after the task checkpoint is not cleaned by TiKV GC within the valid period of `gc-ttl`.
 - Handling procedures:
 1. Pause the replication task by executing `cdc cli changefeed pause -c <changefeed-id>`.
 2. Wait for about one minute, and then resume the replication task by executing `cdc cli changefeed resume -c <changefeed-id>`.

11.10.4.4 What should I do to handle the OOM that occurs after TiCDC is restarted after a task interruption?

- Update your TiDB cluster and TiCDC cluster to the latest versions. The OOM problem has already been resolved in **v4.0.14 and later v4.0 versions, v5.0.2 and later v5.0 versions, and the latest versions.**

11.10.4.5 What is `gc-ttl` in TiCDC?

Since v4.0.0-rc.1, PD supports external services in setting the service-level GC safepoint. Any service can register and update its GC safepoint. PD ensures that the key-value data later than this GC safepoint is not cleaned by GC.

When the replication task is unavailable or interrupted, this feature ensures that the data to be consumed by TiCDC is retained in TiKV without being cleaned by GC.

When starting the TiCDC server, you can specify the Time To Live (TTL) duration of GC safepoint by configuring `gc-ttl`. You can also [use TiUP to modify `gc-ttl`](#). The default value is 24 hours. In TiCDC, this value means:

- The maximum time the GC safepoint is retained at the PD after the TiCDC service is stopped.
- The maximum time a replication task can be suspended after the task is interrupted or manually stopped. If the time for a suspended replication task is longer than the value set by `gc-ttl`, the replication task enters the `failed` status, cannot be resumed, and cannot continue to affect the progress of the GC safepoint.

The second behavior above is introduced in TiCDC v4.0.13 and later versions. The purpose is to prevent a replication task in TiCDC from suspending for too long, causing the GC safepoint of the upstream TiKV cluster not to continue for a long time and retaining too many outdated data versions, thus affecting the performance of the upstream cluster.

Note:

In some scenarios, for example, when you use TiCDC for incremental replication after full replication with Dumping/BR, the default 24 hours of `gc-ttl` may not be sufficient. You need to specify an appropriate value for `gc-ttl` when you start the TiCDC server.

11.10.4.6 What is the complete behavior of TiCDC garbage collection (GC) safepoint?

If a replication task starts after the TiCDC service starts, the TiCDC owner updates the PD service GC safepoint with the smallest value of `checkpoint-ts` among all replication

tasks. The service GC safepoint ensures that TiCDC does not delete data generated at that time and after that time. If the replication task is interrupted, or manually stopped, the `checkpoint-ts` of this task does not change. Meanwhile, PD's corresponding service GC safepoint is not updated either.

If the replication task is suspended longer than the time specified by `gc-ttl`, the replication task enters the `failed` status and cannot be resumed. The PD corresponding service GC safepoint will continue.

The Time-To-Live (TTL) that TiCDC sets for a service GC safepoint is 24 hours, which means that the GC mechanism does not delete any data if the TiCDC service can be recovered within 24 hours after it is interrupted.

11.10.4.7 How do I handle the Error 1298: Unknown or incorrect time zone: 'UTC' error when creating the replication task or replicating data to MySQL?

This error is returned when the downstream MySQL does not load the time zone. You can load the time zone by running `mysql_tzinfo_to_sql`. After loading the time zone, you can create tasks and replicate data normally.

```
mysql_tzinfo_to_sql /usr/share/zoneinfo | mysql -u root mysql -p
```

If the output of the command above is similar to the following one, the import is successful:

```
Enter password:
Warning: Unable to load '/usr/share/zoneinfo/iso3166.tab' as time zone.
↳ Skipping it.
Warning: Unable to load '/usr/share/zoneinfo/leap-seconds.list' as time zone
↳ . Skipping it.
Warning: Unable to load '/usr/share/zoneinfo/zone.tab' as time zone.
↳ Skipping it.
Warning: Unable to load '/usr/share/zoneinfo/zone1970.tab' as time zone.
↳ Skipping it.
```

If the downstream is a special MySQL environment (a public cloud RDS or some MySQL derivative versions) and importing the time zone using the above method fails, you need to specify the MySQL time zone of the downstream using the `time-zone` parameter in `sink-
↳ uri`. You can first query the time zone used by MySQL:

1. Query the time zone used by MySQL:

```
show variables like '%time_zone%';
```

```
+-----+-----+
| Variable_name | Value |
+-----+-----+
```

```
| system_time_zone | CST |
| time_zone        | SYSTEM |
+-----+-----+
```

- Specify the time zone when you create the replication task and create the TiCDC service:

```
cdc cli changefeed create --sink-uri="mysql://root@127.0.0.1:3306/?time
↳ -zone=CST" --pd=http://10.0.10.25:2379
```

Note:

CST might be an abbreviation for the following four different time zones:

- Central Standard Time (USA) UT-6:00
- Central Standard Time (Australia) UT+9:30
- China Standard Time UT+8:00
- Cuba Standard Time UT-4:00

In China, CST usually stands for China Standard Time.

11.10.4.8 How to understand the relationship between the TiCDC time zone and the time zones of the upstream/downstream databases?

	Upstream	TiCDC	Downstream
	time	time	time
	zone	zone	zone
	Configuration	Configuration	Configuration
method	Time	us-	us-
	Zone	ing	ing
	Sup-	the	the
	port	--	time
	↳ tz	↳ -	
	↳	↳ zone	
	pa-	↳	
	ram-	pa-	
	e-	ram-	
	ter	e-	
	when	ter	
	you	in	
	start	sink	
	the	↳ -	
	TiCDC	↳ uri	
	server	↳	

	Upstream time zone	TiCDC time zone	Downstream time zone
Description	The time as-zone of the up-stream TiDB, which affects DML operations of the time-zone type and DDL operations of the time-zone type on columns.	The time as-zone of the up-stream TiDB, which affects DML operations of the time-zone type and DDL operations of the time-zone type on columns.	The time as-zone of the up-stream TiDB, which affects DML operations of the time-zone type and DDL operations of the time-zone type on columns.

Note:

Be careful when you set the time zone of the TiCDC server, because this time zone is used for converting the time type. Keep the upstream time zone, TiCDC time zone, and the downstream time zone consistent. The TiCDC server chooses its time zone in the following priority:

- TiCDC first uses the time zone specified using `--tz`.
- When `--tz` is not available, TiCDC tries to read the time zone set using the TZ environment variable.
- When the TZ environment variable is not available, TiCDC uses the default time zone of the machine.

11.10.4.9 What is the default behavior of TiCDC if I create a replication task without specifying the configuration file in `--config`?

If you use the `cdc cli changefeed create` command without specifying the `-config` parameter, TiCDC creates the replication task in the following default behaviors:

- Replicates all tables except system tables
- Enables the Old Value feature
- Skips replicating tables that do not contain [valid indexes](#)

11.10.4.10 How do I handle the incompatibility issue of configuration files caused by TiCDC upgrade?

Refer to [Notes for compatibility](#).

11.10.4.11 Does TiCDC support outputting data changes in the Canal protocol?

Yes. Note that for the Canal protocol, TiCDC only supports the JSON output format, while the protobuf format is not officially supported yet. To enable Canal output, specify `protocol` as `canal-json` in the `--sink-uri` configuration. For example:

```
cdc cli changefeed create --pd=http://10.0.10.25:2379 --sink-uri="kafka
↳ ://127.0.0.1:9092/cdc-test?kafka-version=2.4.0&protocol=canal-json"
↳ --config changefeed.toml
```

Note:

- This feature is introduced in TiCDC 4.0.2.
- TiCDC currently supports outputting data changes in the Canal-JSON format only to MQ sinks such as Kafka and Pulsar.

For more information, refer to [Create a replication task](#).

11.10.4.12 Why does the latency from TiCDC to Kafka become higher and higher?

- Check [how do I view the state of TiCDC replication tasks](#).
- Adjust the following parameters of Kafka:
 - Increase the `message.max.bytes` value in `server.properties` to 1073741824 (1 GB).
 - Increase the `replica.fetch.max.bytes` value in `server.properties` to 1073741824 (1 GB).
 - Increase the `fetch.message.max.bytes` value in `consumer.properties` to make it larger than the `message.max.bytes` value.

11.10.4.13 When TiCDC replicates data to Kafka, does it write all the changes in a transaction into one message? If not, on what basis does it divide the changes?

No. According to the different distribution strategies configured, TiCDC divides the changes on different bases, including `default`, `row id`, `table`, and `ts`.

For more information, refer to [Replication task configuration file](#).

11.10.4.14 When TiCDC replicates data to Kafka, can I control the maximum size of a single message in TiDB?

Yes. You can set the `max-message-bytes` parameter to control the maximum size of data sent to the Kafka broker each time (optional, 10MB by default). You can also set `max-batch-size` to specify the maximum number of change records in each Kafka message. Currently, the setting only takes effect when Kafka's `protocol` is `open-protocol` (optional, 16 by default).

11.10.4.15 When TiCDC replicates data to Kafka, does a message contain multiple types of data changes?

Yes. A single message might contain multiple updates or deletes, and update and delete might co-exist.

11.10.4.16 When TiCDC replicates data to Kafka, how do I view the timestamp, table name, and schema name in the output of TiCDC Open Protocol?

The information is included in the key of Kafka messages. For example:

```
{
  "ts":<TS>,
  "scm":<Schema Name>,
  "tbl":<Table Name>,
  "t":1
}
```

For more information, refer to [TiCDC Open Protocol event format](#).

11.10.4.17 When TiCDC replicates data to Kafka, how do I know the timestamp of the data changes in a message?

You can get the unix timestamp by moving `ts` in the key of the Kafka message by 18 bits to the right.

11.10.4.18 How does TiCDC Open Protocol represent null?

In TiCDC Open Protocol, the type code 6 represents `null`.

Type	Code	Output Example	Note
Null	6	<code>{"t":6,"v":null}</code>	

For more information, refer to [TiCDC Open Protocol column type code](#).

11.10.4.19 The `start-ts` timestamp of the TiCDC task is quite different from the current time. During the execution of this task, replication is interrupted and an error `[CDC:ErrBufferReachLimit]` occurs

Since v4.0.9, you can try to enable the unified sorter feature in your replication task, or use the BR tool for an incremental backup and restore, and then start the TiCDC replication task from a new time.

11.10.4.20 How can I tell if a Row Changed Event of TiCDC Open Protocol is an INSERT event or an UPDATE event?

If the Old Value feature is not enabled, you cannot tell whether a Row Changed Event of TiCDC Open Protocol is an INSERT event or an UPDATE event. If the feature is enabled, you can determine the event type by the fields it contains:

- UPDATE event contains both "p" and "u" fields
- INSERT event only contains the "u" field
- DELETE event only contains the "d" field

For more information, refer to [Open protocol Row Changed Event format](#).

11.10.4.21 How much PD storage does TiCDC use?

TiCDC uses etcd in PD to store and regularly update the metadata. Because the time interval between the MVCC of etcd and PD's default compaction is one hour, the amount of PD storage that TiCDC uses is proportional to the amount of metadata versions generated within this hour. However, in v4.0.5, v4.0.6, and v4.0.7, TiCDC has a problem of frequent writing, so if there are 1000 tables created or scheduled in an hour, it then takes up all the etcd storage and returns the `etcdserver: mvcc: database space exceeded` error. You need to clean up the etcd storage after getting this error. See [etcd maintaince space-quota](#) for details. It is recommended to upgrade your cluster to v4.0.9 or later versions.

11.10.4.22 Does TiCDC support replicating large transactions? Is there any risk?

TiCDC provides partial support for large transactions (more than 5 GB in size). Depending on different scenarios, the following risks might exist:

- When TiCDC's internal processing capacity is insufficient, the replication task error `ErrBufferReachLimit` might occur.
- When TiCDC's internal processing capacity is insufficient or the throughput capacity of TiCDC's downstream is insufficient, out of memory (OOM) might occur.

If you encounter an error above, it is recommended to use BR to restore the incremental data of large transactions. The detailed operations are as follows:

1. Record the `checkpoint-ts` of the changefeed that is terminated due to large transactions, use this TSO as the `--lastbackupts` of the BR incremental backup, and execute [incremental data backup](#).
2. After backing up the incremental data, you can find a log record similar to `["Full backup Failed summary : total backup ranges: 0, total success: ↪ 0, total failed: 0"] [BackupTS=421758868510212097]` in the BR log output. Record the BackupTS in this log.
3. [Restore the incremental data](#).
4. Create a new changefeed and start the replication task from BackupTS.
5. Delete the old changefeed.

11.10.4.23 When the downstream of a changefeed is a database similar to MySQL and TiCDC executes a time-consuming DDL statement, all other changefeeds are blocked. How should I handle the issue?

1. Pause the execution of the changefeed that contains the time-consuming DDL statement. Then you can see that other changefeeds are no longer blocked.
2. Search for the `apply job` field in the TiCDC log and confirm the `start-ts` of the time-consuming DDL statement.

3. Manually execute the DDL statement in the downstream. After the execution finishes, go on performing the following operations.
4. Modify the changefeed configuration and add the above `start-ts` to the `ignore-txn` \leftrightarrow `-start-ts` configuration item.
5. Resume the paused changefeed.

11.10.4.24 After I upgrade the TiCDC cluster to v4.0.8, the [CDC:ErrKafkaInvalidConfig] Can requires old value to be enabled error is reported when I execute a changefeed

Since v4.0.8, if the `canal-json` protocol is used for output in a changefeed, TiCDC enables the old value feature automatically. However, if you have upgraded TiCDC from an earlier version to v4.0.8 or later, when the changefeed uses the `canal-json` protocol and the old value feature is disabled, this error is reported.

To fix the error, take the following steps:

1. Set the value of `enable-old-value` in the changefeed configuration file to `true`.
2. Execute `cdc cli changefeed pause` to pause the replication task.

```
cdc cli changefeed pause -c test-cf --pd=http://10.0.10.25:2379
```

3. Execute `cdc cli changefeed update` to update the original changefeed configuration.

```
cdc cli changefeed update -c test-cf --pd=http://10.0.10.25:2379 --sink  
   $\leftrightarrow$  -uri="mysql://127.0.0.1:3306/?max-txn-row=20&worker-number=8" --  
   $\leftrightarrow$  config=changefeed.toml
```

4. Execute `cdc cli changefeed resume` to resume the replication task.

```
cdc cli changefeed resume -c test-cf --pd=http://10.0.10.25:2379
```

11.10.4.25 The [tikv:9006]GC life time is shorter than transaction duration, transaction starts at xx, GC safe point is yy error is reported when I use TiCDC to create a changefeed

Solution: You need to execute the `pd-ctl service-gc-safepoint --pd <pd-addr>` command to query the current GC safepoint and service GC safepoint. If the GC safepoint is smaller than the `start-ts` of the TiCDC replication task (changefeed), you can directly add the `--disable-gc-check` option to the `cdc cli create changefeed` command to create a changefeed.

If the result of `pd-ctl service-gc-safepoint --pd <pd-addr>` does not have `gc_worker service_id`:

- If your PD version is v4.0.8 or earlier, refer to [PD issue #3128](#) for details.
- If your PD is upgraded from v4.0.8 or an earlier version to a later version, refer to [PD issue #3366](#) for details.

11.10.4.26 `enable-old-value` is set to `true` when I create a TiCDC replication task, but `INSERT/UPDATE` statements from the upstream become `REPLACE INTO` after being replicated to the downstream

When a changefeed is created in TiCDC, the `safe-mode` setting defaults to `true`, which generates the `REPLACE INTO` statement to execute for the upstream `INSERT/UPDATE` statements.

Currently, users cannot modify the `safe-mode` setting, so this issue currently has no solution.

11.10.4.27 When I use TiCDC to replicate messages to Kafka, Kafka returns the `Message was too large` error

For TiCDC v4.0.8 or earlier versions, you cannot effectively control the size of the message output to Kafka only by configuring the `max-message-bytes` setting for Kafka in the Sink URI. To control the message size, you also need to increase the limit on the bytes of messages to be received by Kafka. To add such a limit, add the following configuration to the Kafka server configuration.

```
### The maximum byte number of a message that the broker receives
message.max.bytes=2147483648
### The maximum byte number of a message that the broker copies
replica.fetch.max.bytes=2147483648
### The maximum message byte number that the consumer side reads
fetch.message.max.bytes=2147483648
```

11.10.4.28 How can I find out whether a DDL statement fails to execute in downstream during TiCDC replication? How to resume the replication?

If a DDL statement fails to execute, the replication task (changefeed) automatically stops. The `checkpoint-ts` is the DDL statement's `finish-ts` minus one. If you want TiCDC to retry executing this statement in the downstream, use `cdc cli changefeed resume` to resume the replication task. For example:

```
cdc cli changefeed resume -c test-cf --pd=http://10.0.10.25:2379
```

If you want to skip this DDL statement that goes wrong, set the `start-ts` of the changefeed to the `checkpoint-ts` (the timestamp at which the DDL statement goes wrong) plus one. For example, if the `checkpoint-ts` at which the DDL statement goes wrong is `415241823337054209`, execute the following commands to skip this DDL statement:

```
cdc cli changefeed update -c test-cf --pd=http://10.0.10.25:2379 --start-ts
↪ 415241823337054210
cdc cli changefeed resume -c test-cf --pd=http://10.0.10.25:2379
```

11.10.4.29 The default value of the time type field is inconsistent when replicating a DDL statement to the downstream MySQL 5.7. What can I do?

Suppose that the create table test (id int primary key, ts timestamp) statement is executed in the upstream TiDB. When TiCDC replicates this statement to the downstream MySQL 5.7, MySQL uses the default configuration. The table schema after the replication is as follows. The default value of the timestamp field becomes CURRENT_TIMESTAMP:

```
mysql root@127.0.0.1:test> show create table test;
+---+
| Table | Create Table |
+---+
| test | CREATE TABLE `test` (
|   |   `id` int(11) NOT NULL,
|   |   `ts` timestamp NOT NULL DEFAULT CURRENT_TIMESTAMP ON UPDATE
|   |   CURRENT_TIMESTAMP, |
|   |   PRIMARY KEY (`id`)
|   | ) ENGINE=InnoDB DEFAULT CHARSET=latin1
+---+
1 row in set
```

From the result, you can see that the table schema before and after the replication is inconsistent. This is because the default value of `explicit_defaults_for_timestamp` in TiDB is different from that in MySQL. See [MySQL Compatibility](#) for details.

Since v5.0.1 or v4.0.13, for each replication to MySQL, TiCDC automatically sets `explicit_defaults_for_timestamp = ON` to ensure that the time type is consistent between the upstream and downstream. For versions earlier than v5.0.1 or v4.0.13, pay attention to the compatibility issue caused by the inconsistent `explicit_defaults_for_timestamp` value when using TiCDC to replicate the time type data.

11.10.4.30 When the sink of the replication downstream is TiDB or MySQL, what permissions do users of the downstream database need?

When the sink is TiDB or MySQL, the users of the downstream database need the following permissions:

- Select
- Index
- Insert
- Update
- Delete
- Create
- Drop
- Alter
- Create View

If you need to replicate `recover table` to the downstream TiDB, you should have the Super permission.

11.10.5 Key Monitoring Metrics of TiCDC

If you use TiUP to deploy the TiDB cluster, you can see a sub-dashboard for TiCDC in the monitoring system which is deployed at the same time. You can get an overview of TiCDC's current status from the TiCDC dashboard, where the key metrics are displayed. This document provides a detailed description of these key metrics.

The metric description in this document is based on the following replication task example, which replicates data to MySQL using the default configuration.

```
cdc cli changefeed create --pd=http://10.0.10.25:2379 --sink-uri="mysql://
↵ root:123456@127.0.0.1:3306/" --changefeed-id="simple-replication-task
↵ "
```

The TiCDC dashboard contains four monitoring panels. See the following screenshot:

Figure 188: TiCDC Dashboard - Overview

The description of each panel is as follows:

- **Server**: The summary information of TiKV nodes and TiCDC nodes in the TiDB cluster
- **Changefeed**: The detailed information of TiCDC replication tasks
- **Events**: The detail information about the data flow within the TiCDC cluster
- **TiKV**: TiKV information related to TiCDC

11.10.5.1 Server

The following is an example of the **Server** panel:

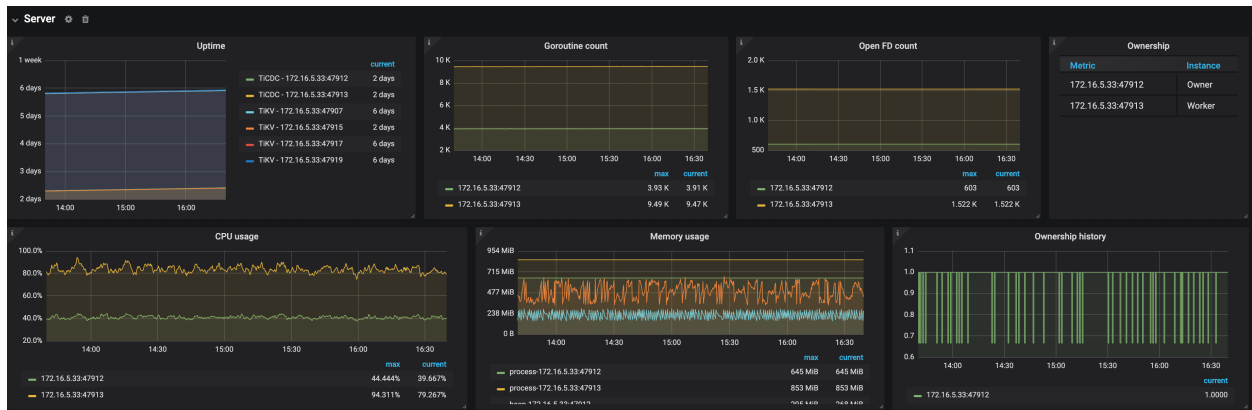

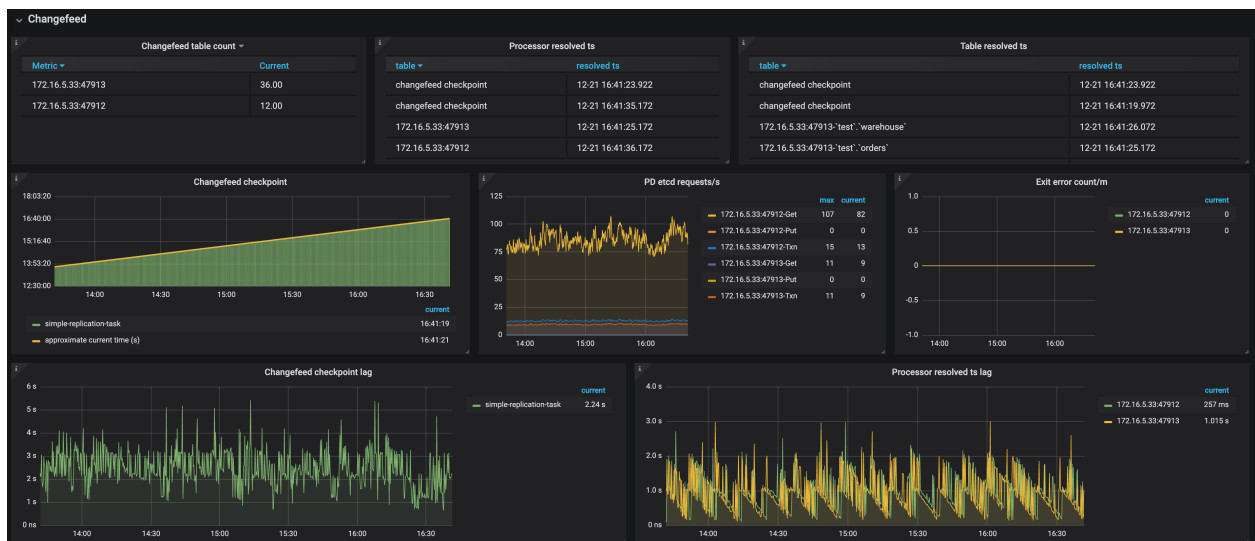

Figure 189: TiCDC Dashboard - Server metrics

The description of each metric in the **Server** panel is as follows:

- Uptime: The time for which TiKV nodes and TiCDC nodes have been running
- Goroutine count: The number of goroutines of a TiCDC node
- Open FD count: The number of file handles opened by TiCDC nodes
- Ownership: The current status of nodes in the TiCDC cluster
- Ownership history: The ownership history of the TiCDC cluster
- CPU usage: The CPU usage of TiCDC nodes
- Memory usage: The memory usage of TiCDC nodes

11.10.5.2 Changefeed

The following is an example of the **Changefeed** panel:

The description of each metric in the **Changefeed** panel is as follows:

- Changefeed table count: The number of tables that each TiCDC node needs to replicate in the replication task
- Processor resolved ts: The timestamps that have been resolved in the TiCDC cluster
- Table resolved ts: The replication progress of each table in the replication task
- Changefeed checkpoint: The progress of replicating data to the downstream. Normally, the green bars are connected to the yellow line
- PD etcd requests/s: The number of requests that a TiCDC node sends to PD per second
- Exit error count: The number of errors that interrupt the replication task per minute
- Changefeed checkpoint lag: The progress lag of data replication (the unit is second) between the upstream and the downstream
- Changefeed resolved ts lag: The progress lag of data replication (the unit is second) between the upstream and TiCDC nodes
- Flush sink duration: The histogram of the time spent by TiCDC asynchronously flushing data to the downstream
- Flush sink duration percentile: The time (P95, P99, and P999) spent by TiCDC asynchronously flushing data to the downstream within one second
- Sink write duration: The histogram of the time spent by TiCDC writing a transaction change to the downstream
- Sink write duration percentile: The time (P95, P99, and P999) spent by TiCDC writing a transaction change to the downstream within one second
- MySQL sink conflict detect duration: The histogram of the time spent on detecting

MySQL sink conflicts

- MySQL sink conflict detect duration percentile: The time (P95, P99, and P999) spent on detecting MySQL sink conflicts within one second
- MySQL sink worker load: The workload of MySQL sink workers of TiCDC nodes

11.10.5.3 Events

The following is an example of the **Events** panel:

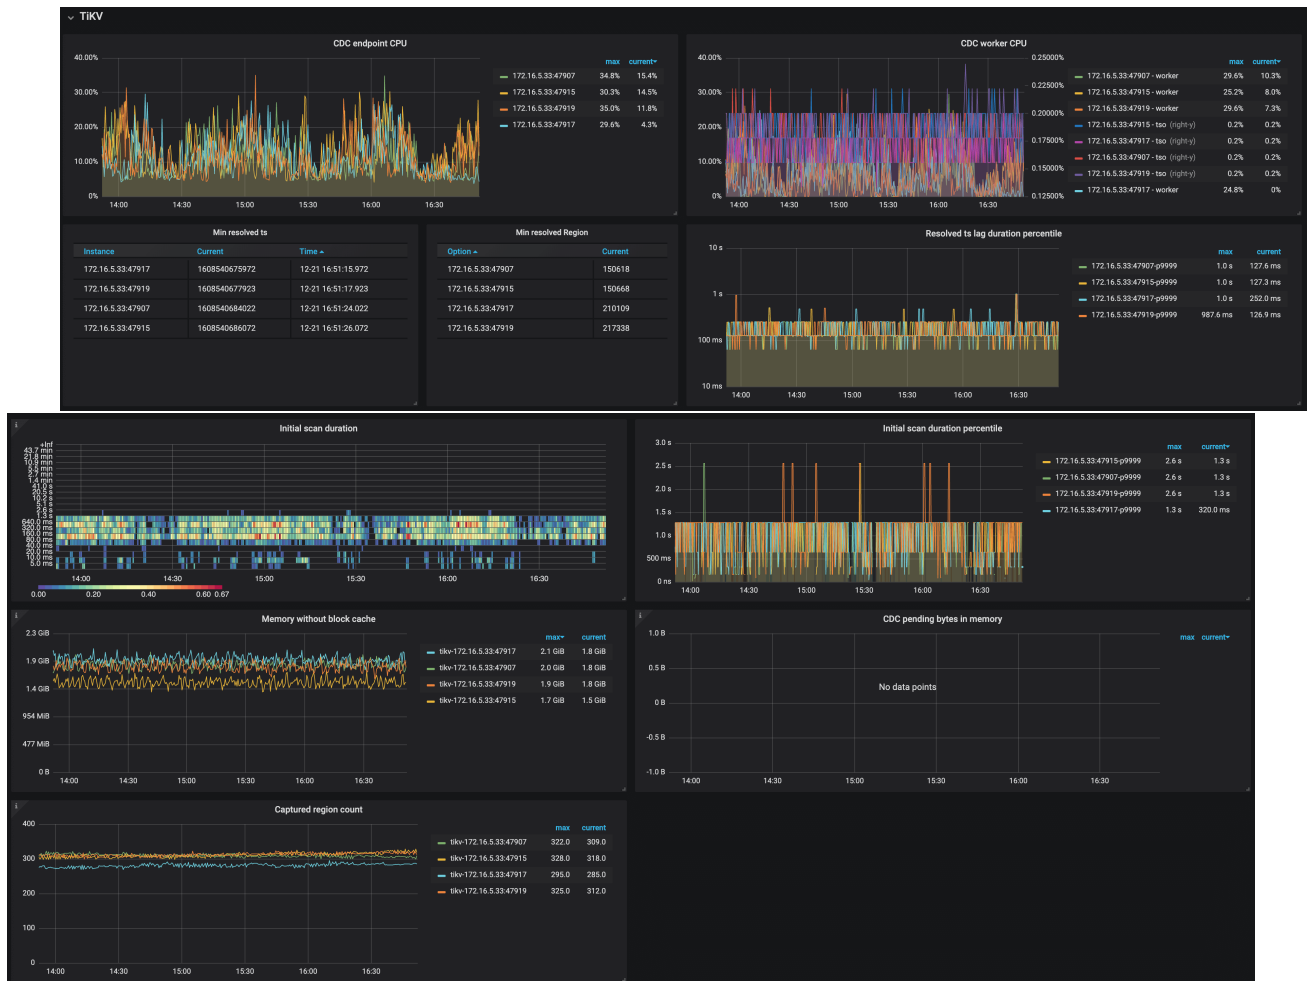

The description of each metric in the **Events** panel is as follows:

- Eventfeed count: The number of Eventfeed RPC requests of TiCDC nodes
- Event size percentile: The event size (P95, P99, and P999) which TiCDC receives from TiKV within one second
- Eventfeed error/m: The number of errors reported by Eventfeed RPC requests of TiCDC nodes per minute
- KV client receive events/s: The number of events that the KV client module of TiCDC nodes receives from TiKV per second
- Puller receive events/s: The number of events that the Puller module of TiCDC nodes receives from the KV client per second
- Puller output events/s: The number of events that the Puller module of TiCDC nodes sends to the Sorter module per second
- Sink flush rows/s: The number of events that TiCDC nodes write to the downstream per second
- Puller buffer size: The number of events that TiCDC nodes cache in the Puller module
- Entry sorter buffer size: The number of events that TiCDC nodes cache in the Sorter module
- Processor/Mounter buffer size: The number of events that TiCDC nodes cache in the Processor module and the Mounter module
- Sink row buffer size: The number of events that TiCDC nodes cache in the Sink module
- Entry sorter sort duration: The histogram of the time spent by TiCDC nodes sorting events
- Entry sorter sort duration percentile: The time (P95, P99, and P999) spent by TiCDC sorting events within one second
- Entry sorter merge duration: The histogram of the time spent by TiCDC nodes merging sorted events
- Entry sorter merge duration percentile: The time (P95, P99, and P999) spent by TiCDC merging sorted events within one second
- Mounter unmarshal duration: The histogram of the time spent by TiCDC nodes unmarshaling events
- Mounter unmarshal duration percentile: The time (P95, P99, and P999) spent by TiCDC unmarshaling events within one second
- KV client dispatch events/s: The number of events that the KV client module dispatches among the TiCDC nodes
- KV client batch resolved size: The batch size of resolved timestamp messages that TiKV sends to TiCDC

11.10.5.4 TiKV

The following is an example of the **TiKV** panel:

The description of each metric in the **TiKV** panel is as follows:

- CDC endpoint CPU: The CPU usage of the CDC endpoint threads on TiKV nodes
- CDC worker CPU: The CPU usage of the CDC worker threads on TiKV nodes
- Min resolved ts: The minimum resolved timestamp on TiKV nodes
- Min resolved region: The Region ID of the minimum resolved timestamp on TiKV nodes
- Resolved ts lag duration percentile: The lag between the minimum resolved timestamp on TiKV nodes and the current time
- Initial scan duration: The histogram of the time spent on incremental scan when TiKV nodes connect to TiCDC nodes
- Initial scan duration percentile: The time (P95, P99, and P999) spent on the incremental scan of TiKV nodes within one second
- Memory without block cache: The memory usage of TiKV nodes excluding the RocksDB block cache
- CDC pending bytes in memory: The memory usage of CDC module on TiKV nodes
- Captured region count: The number of event-capturing Regions on TiKV nodes

11.10.6 TiCDC Alert Rules

This document describes the TiCDC alert rules and the corresponding solutions. In descending order, the severity levels are: **Critical**, **Warning**.

11.10.6.1 Critical alerts

This section introduces critical alerts and solutions.

11.10.6.1.1 `cdc_checkpoint_high_delay`

For critical alerts, you need to pay close attention to abnormal monitoring metrics.

- Alert rule:
 $(\text{time}() - \text{ticdc_processor_checkpoint_ts} / 1000) > 600$
- Description:
A replication task is delayed more than 10 minutes.
- Solution:
See [TiCDC Handle Replication Interruption](#).

11.10.6.2 `cdc_resolvedts_high_delay`

- Alert rule:
 $(\text{time}() - \text{ticdc_processor_resolved_ts} / 1000) > 300$
- Description:
The Resolved TS of a replication task is delayed more than 5 minutes.
- Solution:
See [TiCDC Handle Replication Interruption](#).

11.10.6.2.1 `ticdc_processor_exit_with_error_count`

- Alert rule:
 $\text{changes}(\text{ticdc_processor_exit_with_error_count}[1\text{m}]) > 0$
- Description:
A replication task reports an error and exits.
- Solution:
See [TiCDC Handle Replication Interruption](#).

11.10.6.3 Warning alerts

Warning alerts are a reminder for an issue or error.

11.10.6.3.1 `cdc_multiple_owners`

- Alert rule:
`sum(rate(ticdc_owner_ownership_counter[30s]))>= 2`
- Description:
There are multiple owners in the TiCDC cluster.
- Solution:
Collect TiCDC logs to locate the root cause.

11.10.6.3.2 `ticdc_mounter_unmarshal_and_mount_time_more_than_1s`

- Alert rule:
`histogram_quantile(0.9, rate(ticdc_mounter_unmarshal_and_mount_bucket[1m ↵]))* 1000 > 1000`
- Description:
It takes a replication task more than 1 second to unmarshal the data changes.
- Solution:
Collect TiCDC logs to locate the root cause.

11.10.6.3.3 `cdc_sink_execute_duration_time_more_than_10s`

- Alert rule:
`histogram_quantile(0.9, rate(ticdc_sink_txn_exec_duration_bucket[1m]))> ↵ 10`
- Description:
It takes a replication task more than 10 seconds to write data to the downstream database.
- Solution:
Check whether there are problems in the downstream database.

11.10.6.3.4 `cdc_processor_checkpoint_tso_no_change_for_1m`

- Alert rule:
`changes(ticdc_processor_checkpoint_ts[1m]) < 1`
- Description:
A replication task has not advanced for more than 1 minute.
- Solution:
See [TiCDC Handle Replication Interruption](#).

11.10.6.3.5 `ticdc_puller_entry_sorter_sort_bucket`

- Alert rule:
`histogram_quantile(0.9, rate(ticdc_puller_entry_sorter_sort_bucket{ }[1m ↪])) > 1`
- Description:
The delay of TiCDC puller entry sorter is too high.
- Solution:
Collect TiCDC logs to locate the root cause.

11.10.6.3.6 `ticdc_puller_entry_sorter_merge_bucket`

- Alert rule:
`histogram_quantile(0.9, rate(ticdc_puller_entry_sorter_merge_bucket{ }[1 ↪ m])) > 1`
- Description:
The delay of TiCDC puller entry sorter merge is too high.
- Solution:
Collect TiCDC logs to locate the root cause.

11.10.6.3.7 tikv_cdc_min_resolved_ts_no_change_for_1m

- Alert rule:

```
changes(tikv_cdc_min_resolved_ts[1m]) < 1 and ON (instance) tikv_cdc_region_resolve_status <=> {status="resolved"} > 0
```

- Description:

The minimum Resolved TS 1 of TiKV CDC has not advanced for 1 minute.

- Solution:

Collect TiKV logs to locate the root cause.

11.10.6.3.8 tikv_cdc_scan_duration_seconds_more_than_10min

- Alert rule:

```
histogram_quantile(0.9, rate(tikv_cdc_scan_duration_seconds_bucket{ }[1m] <=> ])) > 600
```

- Description:

The TiKV CDC module has scanned for incremental replication for more than 10 minutes.

- Solution:

Collect TiCDC monitoring metrics and TiKV logs to locate the root cause.

11.10.6.3.9 ticdc_sink_mysql_execution_error

- Alert rule:

```
changes(ticdc_sink_mysql_execution_error[1m]) > 0
```

- Description:

An error occurs when a replication task writes data to the downstream MySQL.

- Solution:

There are many possible root causes. See [Troubleshoot TiCDC](#).

11.10.6.3.10 `ticdc_memory_abnormal`

- Alert rule:
`go_memstats_heap_alloc_bytes{job="ticdc"} > 1e+10`
- Description:
The TiCDC heap memory usage exceeds 10 GiB.
- Solution:
Collect TiCDC logs to locate the root cause.

11.10.7 TiCDC OpenAPI

TiCDC provides the OpenAPI feature for querying and operating the TiCDC cluster, which is similar to the feature of `cdc cli tool`.

You can use the APIs to perform the following maintenance operations on the TiCDC cluster:

- Get the status information of a TiCDC node
- Check the health status of a TiCDC cluster
- Create a replication task
- Remove a replication task
- Update the replication configuration
- Query the replication task list
- Query a specific replication task
- Pause a replication task
- Resume a replication task
- Query the replication subtask list
- Query a specific replication subtask
- Query the TiCDC service process list
- Evict an owner node
- Manually trigger the load balancing of all tables in a replication task
- Manually schedule a table to another node
- Dynamically adjust the log level of the TiCDC server

The request body and returned value of all APIs are in JSON format. The following sections describe the specific usage of the APIs.

In the following examples, the listening IP address of the TiCDC server is `127.0.0.1` and the port is `8300`. You can bind a specified IP and port via `--addr=ip:port` when starting the TiCDC server.

11.10.7.1 API error message template

After sending an API request, if an error occurs, the returned error message is in the following format:

```
{
  "error_msg": "",
  "error_code": ""
}
```

From the above JSON output, `error_msg` describes the error message and `error_code` is the corresponding error code.

11.10.7.2 Get the status information of a TiCDC node

This API is a synchronous interface. If the request is successful, the status information of the corresponding node is returned.

11.10.7.2.1 Request URI

GET `/api/v1/status`

11.10.7.2.2 Example

The following request gets the status information of the TiCDC node whose IP address is 127.0.0.1 and port number is 8300.

```
curl -X GET http://127.0.0.1:8300/api/v1/status
```

```
{
  "version": "v5.2.0-master-dirty",
  "git_hash": "f191cd00c53fdf7a2b1c9308a355092f9bf8824e",
  "id": "c6a43c16-0717-45af-afd6-8b3e01e44f5d",
  "pid": 25432,
  "is_owner": true
}
```

The fields of the above output are described as follows:

- `version`: The current TiCDC version number.
- `git_hash`: The Git hash value.
- `id`: The capture ID of the node.
- `pid`: The capture process PID of the node.
- `is_owner`: Indicates whether the node is an owner.

11.10.7.3 Check the health status of a TiCDC cluster

This API is a synchronous interface. If the cluster is healthy, 200 OK is returned.

11.10.7.3.1 Request URI

GET /api/v1/health

11.10.7.3.2 Example

```
curl -X GET http://127.0.0.1:8300/api/v1/health
```

11.10.7.4 Create a replication task

This API is an asynchronous interface. If the request is successful, `202 Accepted` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

11.10.7.4.1 Request URI

POST /api/v1/changefeeds

11.10.7.4.2 Parameter description

Compared to the optional parameters for creating a replication task using the `cli` command, the optional parameters for creating such task using the API are not as complete. This API supports the following parameters.

Parameters for the request body

Parameter name	Description
<code>changefeed_id</code>	STRING type. The ID of the replication task. (Optional)
<code>start_ts</code>	UINT64 type. Specifies the start TSO of the changefeed. (Optional)
<code>target_ts</code>	UINT64 type. Specifies the target TSO of the changefeed. (Optional)
<code>sink_uri</code>	STRING type. The downstream address of the replication task. (Required)
<code>force_replicate</code>	BOOLEAN type. Determines whether to forcibly replicate the tables without unique indexes. (Optional)
<code>ignore_ineligible_table</code>	BOOLEAN type. Determines whether to ignore the tables that cannot be replicated. (Optional)
<code>filter_rules</code>	STRING type array. The rules for table schema filtering. (Optional)
<code>ignore_txn_start_ts</code>	UINT64 type array. Ignores the transaction of a specified <code>start_ts</code> . (Optional)
<code>mounter_worker_num</code>	INT type. The mounter thread number. (Optional)
<code>sink_config</code>	The configuration parameters of sink. (Optional)

The meaning and format of `changefeed_id`, `start_ts`, `target_ts`, and `sink_uri` are the same as those described in the [Use `cdc cli` to create a replication task](#) document. For the detailed description of these parameters, see this document. Note that when you specify the certificate path in `sink_uri`, make sure you have uploaded the corresponding certificate to the corresponding TiCDC server.

Some other parameters in the above table are described further as follows.

force_replicate: This parameter defaults to `false`. When it is specified as `true`, TiCDC tries to forcibly replicate tables that do not have a unique index.

ignore_ineligible_table: This parameter defaults to `false`. When it is specified as `true`, TiCDC ignores tables that cannot be replicated.

filter_rules: The rules for table schema filtering, such as `filter_rules = ['foo ↪ *.*', 'bar*.*']`. For details, see the [Table Filter](#) document.

ignore_txn_start_ts: When this parameter is specified, the specified `start_ts` is ignored. For example, `ignore-txn-start-ts = [1, 2]`.

mounter_worker_num: The thread number of mounter. Mounter is used to decode the data output from TiKV. The default value is 16.

The configuration parameters of sink are as follows:

```
{
  "dispatchers": [
    {"matcher": ["test1.*", "test2.*"], "dispatcher": "ts"},
    {"matcher": ["test3.*", "test4.*"], "dispatcher": "rowid"}
  ],
  "protocol": "canal-json"
}
```

dispatchers: For the sink of MQ type, you can use dispatchers to configure the event dispatcher. Four dispatchers are supported: `default`, `ts`, `rowid`, and `table`. The dispatcher rules are as follows:

- **default:** When multiple unique indexes (including the primary key) exist or the Old Value feature is enabled, events are dispatched in the `table` mode. When only one unique index (or the primary key) exists, events are dispatched in the `rowid` mode.
- **ts:** Uses the commitTs of the row change to create the hash value and dispatch events.
- **rowid:** Uses the name and value of the selected `HandleKey` column to create the hash value and dispatch events.
- **table:** Uses the schema name of the table and the table name to create the hash value and dispatch events.

matcher: The matching syntax of `matcher` is the same as the filter rule syntax.

protocol: For the sink of MQ type, you can specify the protocol format of the message. Currently the following protocols are supported: `canal-json`, `open-protocol`, and `avro`.

11.10.7.4.3 Example

The following request creates a replication task with an ID of `test5` and a `sink_uri` of `blackhome://`.

```
curl -X POST -H "Content-type:'application/json'" http://127.0.0.1:8300/  
  ↪ api/v1/changefeeds -d '{"changefeed_id":"test5","sink_uri":"blackhole  
  ↪ ://"}'
```

If the request is successful, `202 Accepted` is returned. If the request fails, an error message and error code are returned.

11.10.7.5 Remove a replication task

This API is an asynchronous interface. If the request is successful, `202 Accepted` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

11.10.7.5.1 Request URI

DELETE /api/v1/changefeeds/{changefeed_id}

11.10.7.5.2 Parameter description

Path parameters

Parameter name	Description
changefeed_id	The ID of the replication task (changefeed) to be removed.

11.10.7.5.3 Example

The following request removes the replication task with the ID `test1`.

```
curl -X DELETE http://127.0.0.1:8300/api/v1/changefeeds/test1
```

If the request is successful, `202 Accepted` is returned. If the request fails, an error message and error code are returned.

11.10.7.6 Update the replication configuration

This API is an asynchronous interface. If the request is successful, `202 Accepted` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

To modify the changefeed configuration, follow the steps of `pause the replication task` → `modify the configuration` → `resume the replication task`.

11.10.7.6.1 Request URI

PUT /api/v1/changefeeds/{changefeed_id}

11.10.7.6.2 Parameter description

Path parameters

Parameter name	Description
<code>changefeed_id</code>	The ID of the replication task (changefeed) to be updated.

Parameters for the request body

Currently, only the following configuration can be modified via the API.

Parameter name	Description
<code>target_ts</code>	UINT64 type. Specifies the target TSO of the changefeed. (Optional)
<code>sink_uri</code>	STRING type. The downstream address of the replication task. (Optional)
<code>filter_rules</code>	STRING type array. The rules for table schema filtering. (Optional)
<code>ignore_txn_start_ts</code>	UINT64 type array. Ignores the transaction of a specified start_ts. (Optional)
<code>mounter_worker_num</code>	INT type. The mounter thread number. (Optional)
<code>sink_config</code>	The configuration parameters of sink. (Optional)

The meanings of the above parameters are the same as those in the [Create a replication task](#) section. See that section for details.

11.10.7.6.3 Example

The following request updates the `mounter_worker_num` of the replication task with the ID `test1` to 32.

```
curl -X PUT -H "'Content-type':'application/json'" http://127.0.0.1:8300/
  ↪ api/v1/changefeeds/test1 -d '{"mounter_worker_num":32}'
```

If the request is successful, 202 Accepted is returned. If the request fails, an error message and error code are returned.

11.10.7.7 Query the replication task list

This API is a synchronous interface. If the request is successful, the basic information of all nodes in the TiCDC cluster is returned.

11.10.7.7.1 Request URI

GET `/api/v1/changefeeds`

11.10.7.7.2 Parameter description

Query parameters

Parameter name	Description
<code>state</code>	When this parameter is specified, the replication status information only of this state is returned.(Optional)

The value options for `state` are `all`, `normal`, `stopped`, `error`, `failed`, and `finished`.

If this parameter is not specified, the basic information of replication tasks whose state is `normal`, `stopped`, or `failed` is returned by default.

11.10.7.7.3 Example

The following request queries the basic information of all replication tasks whose state is `normal`.

```
curl -X GET http://127.0.0.1:8300/api/v1/changefeeds?state=normal
```

```
[
  {
    "id": "test1",
    "state": "normal",
    "checkpoint_tso": 426921294362574849,
    "checkpoint_time": "2021-08-10 14:04:54.242",
    "error": null
  },
  {
    "id": "test2",
    "state": "normal",
    "checkpoint_tso": 426921294362574849,
    "checkpoint_time": "2021-08-10 14:04:54.242",
    "error": null
  }
]
```

The fields in the returned result above are described as follows:

- `id`: The ID of the replication task.
- `state`: The current `state` of the replication task.
- `checkpoint_tso`: The TSO representation of the current checkpoint of the replication task.
- `checkpoint_time`: The formatted time representation of the current checkpoint of the replication task.
- `error`: The error information of the replication task.

11.10.7.8 Query a specific replication task

This API is a synchronous interface. If the request is successful, the detailed information of the specified replication task is returned.

11.10.7.8.1 Request URI

GET /api/v1/changefeeds/{changefeed_id}

11.10.7.8.2 Parameter description

Path parameters

Parameter name	Description
changefeed_id	The ID of the replication task (changefeed) to be queried.

11.10.7.8.3 Example

The following request queries the detailed information of the replication task with the ID test1.

```
curl -X GET http://127.0.0.1:8300/api/v1/changefeeds/test1
```

```
{
  "id": "test1",
  "sink_uri": "blackhole://",
  "create_time": "2021-08-10 11:41:30.642",
  "start_ts": 426919038970232833,
  "target_ts": 0,
  "checkpoint_tso": 426921014615867393,
  "checkpoint_time": "2021-08-10 13:47:07.093",
  "sort_engine": "unified",
  "state": "normal",
  "error": null,
  "error_history": null,
  "creator_version": "",
  "task_status": [
    {
      "capture_id": "d8924259-f52f-4dfb-97a9-c48d26395945",
      "table_ids": [
        63,
        65
      ],
      "table_operations": {}
    }
  ]
}
```

11.10.7.9 Pause a replication task

This API is an asynchronous interface. If the request is successful, 202 Accepted is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

11.10.7.9.1 Request URI

POST /api/v1/changefeeds/{changefeed_id}/pause

11.10.7.9.2 Parameter description

Path parameters

Parameter name	Description
changefeed_id	The ID of the replication task (changefeed) to be paused.

11.10.7.9.3 Example

The following request pauses the replication task with the ID test1.

```
curl -X POST http://127.0.0.1:8300/api/v1/changefeeds/test1/pause
```

If the request is successful, 202 Accepted is returned. If the request fails, an error message and error code are returned.

11.10.7.10 Resume a replication task

This API is an asynchronous interface. If the request is successful, 202 Accepted is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

11.10.7.10.1 Request URI

POST /api/v1/changefeeds/{changefeed_id}/resume

11.10.7.10.2 Parameter description

Path parameters

Parameter name	Description
changefeed_id	The ID of the replication task (changefeed) to be resumed.

11.10.7.10.3 Example

The following request resumes the replication task with the ID test1.

```
curl -X POST http://127.0.0.1:8300/api/v1/changefeeds/test1/resume
```

If the request is successful, `202 Accepted` is returned. If the request fails, an error message and error code are returned.

11.10.7.11 Query the replication subtask list

This API is a synchronous interface. If the request is successful, the basic information of all replication subtasks (`processor`) is returned.

11.10.7.11.1 Request URI

GET `/api/v1/processors`

11.10.7.11.2 Example

```
curl -X GET http://127.0.0.1:8300/api/v1/processors
```

```
[
  {
    "changefeed_id": "test1",
    "capture_id": "561c3784-77f0-4863-ad52-65a3436db6af"
  }
]
```

11.10.7.12 Query a specific replication subtask

This API is a synchronous interface. If the request is successful, the detailed information of the specified replication subtask (`processor`) is returned.

11.10.7.12.1 Request URI

GET `/api/v1/processors/{changefeed_id}/{capture_id}`

11.10.7.12.2 Parameter description

Path parameters

Parameter name	Description
<code>changefeed_id</code>	The changefeed ID of the replication subtask to be queried.
<code>capture_id</code>	The capture ID of the replication subtask to be queried.

11.10.7.12.3 Example

The following request queries the detailed information of a subtask whose `changefeed_id`

is `test` and `capture_id` is `561c3784-77f0-4863-ad52-65a3436db6af`. A subtask can be indentified by `changefeed_id` and `capture_id`.

```
curl -X GET http://127.0.0.1:8300/api/v1/processors/test1/561c3784-77f0
↳ -4863-ad52-65a3436db6af
```

```
{
  "checkpoint_ts": 426919123303006208,
  "resolved_ts": 426919123369066496,
  "table_ids": [
    63,
    65
  ],
  "error": null
}
```

11.10.7.13 Query the TiCDC service process list

This API is a synchronous interface. If the request is successful, the basic information of all replication processes (`capture`) is returned.

11.10.7.13.1 Request URI

GET `/api/v1/captures`

11.10.7.13.2 Example

```
curl -X GET http://127.0.0.1:8300/api/v1/captures
```

```
[
  {
    "id": "561c3784-77f0-4863-ad52-65a3436db6af",
    "is_owner": true,
    "address": "127.0.0.1:8300"
  }
]
```

11.10.7.14 Evict an owner node

This API is an asynchronous interface. If the request is successful, `202 Accepted` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

11.10.7.14.1 Request URI

POST `/api/v1/owner/resign`

11.10.7.14.2 Example

The following request evicts the current owner node of TiCDC and triggers a new round of elections to generate a new owner node.

```
curl -X POST http://127.0.0.1:8300/api/v1/owner/resign
```

If the request is successful, `202 Accepted` is returned. If the request fails, an error message and error code are returned.

11.10.7.15 Manually trigger the load balancing of all tables in a replication task

This API is an asynchronous interface. If the request is successful, `202 Accepted` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

11.10.7.15.1 Request URI

`POST /api/v1/changefeeds/{changefeed_id}/tables/rebalance_table`

11.10.7.15.2 Parameter description

Path parameters

Parameter name	Description
<code>changefeed_id</code>	The ID of the replication task (changefeed) to be scheduled.

11.10.7.15.3 Example

The following request triggers the load balancing of all tables in the changefeed with the ID `test1`.

```
curl -X POST http://127.0.0.1:8300/api/v1/changefeeds/test1/tables/  
↪ rebalance_table
```

If the request is successful, `202 Accepted` is returned. If the request fails, an error message and error code are returned.

11.10.7.16 Manually schedule a table to another node

This API is an asynchronous interface. If the request is successful, `202 Accepted` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

11.10.7.16.1 Request URI

POST /api/v1/changefeeds/{changefeed_id}/tables/move_table

11.10.7.16.2 Parameter description

Path parameters

Parameter name	Description
<code>changefeed_id</code>	The ID of the replication task (changefeed) to be scheduled.

Parameters for the request body

Parameter name	Description
<code>target_capture_id</code>	The ID of the target capture.
<code>table_id</code>	The ID of the table to be scheduled.

11.10.7.16.3 Example

The following request schedules the table with the ID 49 in the changefeed with the ID `test1` to the capture with the ID `6f19a6d9-0f8c-4dc9-b299-3ba7c0f216f5`.

```
curl -X POST -H "'Content-type': 'application/json'" http://127.0.0.1:8300/  
  ↪ api/v1/changefeeds/changefeed-test1/tables/move_table -d '{"  
  ↪ capture_id": "6f19a6d9-0f8c-4dc9-b299-3ba7c0f216f5", "table_id": 49}'
```

If the request is successful, 202 Accepted is returned. If the request fails, an error message and error code are returned.

11.10.7.17 Dynamically adjust the log level of the TiCDC server

This API is a synchronous interface. If the request is successful, 202 OK is returned.

11.10.7.17.1 Request URI

POST /api/v1/log

11.10.7.17.2 Request parameters

Parameters for the request body

Parameter name	Description
<code>log_level</code>	The log level you want to set.

`log_level` supports the [log levels provided by zap](#): “debug”, “info”, “warn”, “error”, “dpanic”, “panic”, and “fatal”.

11.10.7.17.3 Example

```
curl -X POST -H "Content-type:'application/json'" http://127.0.0.1:8300/  
  ↪ api/v1/log -d '{"log_level":"debug"}'
```

If the request is successful, 202 OK is returned. If the request fails, an error message and error code are returned.

11.10.8 TiCDC Open Protocol

TiCDC Open Protocol is a row-level data change notification protocol that provides data sources for monitoring, caching, full-text indexing, analysis engines, and primary-secondary replication between different databases. TiCDC complies with TiCDC Open Protocol and replicates data changes of TiDB to third-party data medium such as MQ (Message Queue).

TiCDC Open Protocol uses Event as the basic unit to replicate data change events to the downstream. The Event is divided into three categories:

- Row Changed Event: Represents the data change in a row. When a row is changed, this Event is sent and contains information about the changed row.
- DDL Event: Represents the DDL change. This Event is sent after a DDL statement is successfully executed in the upstream. The DDL Event is broadcasted to every MQ Partition.
- Resolved Event: Represents a special time point before which the Event received is complete.

11.10.8.1 Restrictions

- In most cases, the Row Changed Event of a version is sent only once, but in special situations such as node failure and network partition, the Row Changed Event of the same version might be sent multiple times.
- On the same table, the Row Changed Events of each version which is first sent are incremented in the order of timestamps (TS) in the Event stream.
- Resolved Events are periodically broadcasted to each MQ Partition. The Resolved Event means that any Event with a TS earlier than Resolved Event TS has been sent to the downstream.
- DDL Events are broadcasted to each MQ Partition.
- Multiple Row Changed Events of a row are sent to the same MQ Partition.

11.10.8.2 Message format

A Message contains one or more Events, arranged in the following format:

Key:

Offset(Byte)	0~7	8~15	16~(15+length1)
Parameter	Protocol version	Length1	Event Key1	LengthN	Event KeyN

Value:

Offset(Byte)	0~7	8~(7+length1)
Parameter	Length1	Event Value1	LengthN	Event ValueN

- `LengthN` represents the length of the `N`th key/value.
- The length and protocol version are the big-endian `int64` type.
- The version of the current protocol is 1.

11.10.8.3 Event format

This section introduces the formats of Row Changed Event, DDL Event, and Resolved Event.

11.10.8.3.1 Row Changed Event

- **Key:**

```
{
  "ts":<TS>,
  "scm":<Schema Name>,
  "tbl":<Table Name>,
  "t":1
}
```

Parameter	Type	Description
TS	Number	The timestamp of the transaction that causes the row change.
Schema Name	String	The name of the schema where the row is in.
Table Name	String	The name of the table where the row is in.

- **Value:**

Insert event. The newly added row data is output.

```
{
  "u":{
    <Column Name>:{
      "t":<Column Type>,
      "h":<Where Handle>,

```

```
        "f":<Flag>,\n        "v":<Column Value>\n    },\n    <Column Name>:{\n        "t":<Column Type>,\n        "h":<Where Handle>,\n        "f":<Flag>,\n        "v":<Column Value>\n    }\n}\n}
```

Update event. The newly added row data (“u”) and the row data before the update (“p”) are output. The latter (“p”) is output only when the old value feature is enabled.

```
{\n  "u":{\n    <Column Name>:{\n      "t":<Column Type>,\n      "h":<Where Handle>,\n      "f":<Flag>,\n      "v":<Column Value>\n    },\n    <Column Name>:{\n      "t":<Column Type>,\n      "h":<Where Handle>,\n      "f":<Flag>,\n      "v":<Column Value>\n    }\n  },\n  "p":{\n    <Column Name>:{\n      "t":<Column Type>,\n      "h":<Where Handle>,\n      "f":<Flag>,\n      "v":<Column Value>\n    },\n    <Column Name>:{\n      "t":<Column Type>,\n      "h":<Where Handle>,\n      "f":<Flag>,\n      "v":<Column Value>\n    }\n  }\n}
```

Delete event. The deleted row data is output. When the old value feature is enabled, the **Delete** event includes all the columns of the deleted row data; when this feature is disabled, the **Delete** event only includes the **HandleKey** column.

```
{
  "d":{
    <Column Name>:{
      "t":<Column Type>,
      "h":<Where Handle>,
      "f":<Flag>,
      "v":<Column Value>
    },
    <Column Name>:{
      "t":<Column Type>,
      "h":<Where Handle>,
      "f":<Flag>,
      "v":<Column Value>
    }
  }
}
```

Parameter	Type	Description
Column Name	String	The column name.
Column Type	Number	The column type. For details, see Column Type Code .
Where Handle	Boolean	Determines whether this column can be the filter condition of the Where clause. When this column is unique on the table, Where Handle is true .
Flag	Number	The bit flags of columns. For details, see Bit flags of columns .
Column Value	Any	The Column value.

11.10.8.3.2 DDL Event

- **Key:**

```
{
  "ts":<TS>,
  "scm":<Schema Name>,
  "tbl":<Table Name>,
  "t":2
}
```

Parameter	Type	Description
TS	Number	The timestamp of the transaction that performs the DDL change.
Schema Name	String	The schema name of the DDL change, which might be an empty string.
Table Name	String	The table name of the DDL change, which might be an empty string.

- **Value:**

```
{
  "q":<DDL Query>,
  "t":<DDL Type>
}
```

Parameter	Type	Description
DDL Query	String	DDL Query SQL
DDL Type	String	The DDL type. For details, see DDL Type Code .

11.10.8.3.3 Resolved Event

- **Key:**

```
{
  "ts":<TS>,
  "t":3
}
```

Parameter	Type	Description
TS	Number	The Resolved timestamp. Any TS earlier than this Event has been sent.

- **Value:** None

11.10.8.4 Examples of the Event stream output

This section shows and displays the output logs of the Event stream.

Suppose that you execute the following SQL statement in the upstream and the MQ Partition number is 2:

```
CREATE TABLE test.t1(id int primary key, val varchar(16));
```

From the following Log 1 and Log 3, you can see that the DDL Event is broadcasted to all MQ Partitions, and that the Resolved Event is periodically broadcasted to each MQ Partition.

```
1. [partition=0] [key="{\"ts\":415508856908021766,\"scm\": \"test\", \"tbl
  ↪ \": \"t1\", \"t\":2}"] [value="{\"q\": \"CREATE TABLE test.t1(id int
  ↪ primary key, val varchar(16))\", \"t\":3}"]
2. [partition=0] [key="{\"ts\":415508856908021766,\"t\":3}"] [value=]
3. [partition=1] [key="{\"ts\":415508856908021766,\"scm\": \"test\", \"tbl
  ↪ \": \"t1\", \"t\":2}"] [value="{\"q\": \"CREATE TABLE test.t1(id int
  ↪ primary key, val varchar(16))\", \"t\":3}"]
4. [partition=1] [key="{\"ts\":415508856908021766,\"t\":3}"] [value=]
```

Execute the following SQL statements in the upstream:

```
BEGIN;
INSERT INTO test.t1(id, val) VALUES (1, 'aa');
INSERT INTO test.t1(id, val) VALUES (2, 'aa');
UPDATE test.t1 SET val = 'bb' WHERE id = 2;
INSERT INTO test.t1(id, val) VALUES (3, 'cc');
COMMIT;
```

- From the following Log 5 and Log 6, you can see that Row Changed Events on the same table might be sent to different partitions based on the primary key, but changes to the same row are sent to the same partition so that the downstream can easily process the Event concurrently.
- From Log 6, multiple changes to the same row in a transaction are only sent in one Row Changed Event.
- Log 8 is a repeated event of Log 7. Row Changed Event might be repeated, but the first Event of each version is sent orderly.

```
5. [partition=0] [key="{\"ts\":415508878783938562,\"scm\": \"test\", \"tbl
  ↪ \": \"t1\", \"t\":1}"] [value="{\"u\": {\"id\": {\"t\":3, \"h\": true, \"v
  ↪ \":1}, \"val\": {\"t\":15, \"v\": \"YWE=\\\"}}}]"]
6. [partition=1] [key="{\"ts\":415508878783938562,\"scm\": \"test\", \"tbl
  ↪ \": \"t1\", \"t\":1}"] [value="{\"u\": {\"id\": {\"t\":3, \"h\": true, \"v
  ↪ \":2}, \"val\": {\"t\":15, \"v\": \"YmI=\\\"}}}]"]
```

- ```

7. [partition=0] [key="{\"ts\":415508878783938562,\"scm\": \"test\", \"tbl
 ↪ \": \"t1\", \"t\": 1}"] [value="{\"u\": {\"id\": {\"t\": 3, \"h\": true, \"v
 ↪ \": 3}, \"val\": {\"t\": 15, \"v\": \"Y2M=\\\"}}}]
8. [partition=0] [key="{\"ts\":415508878783938562,\"scm\": \"test\", \"tbl
 ↪ \": \"t1\", \"t\": 1}"] [value="{\"u\": {\"id\": {\"t\": 3, \"h\": true, \"v
 ↪ \": 3}, \"val\": {\"t\": 15, \"v\": \"Y2M=\\\"}}}]

```

Execute the following SQL statements in the upstream:

```

BEGIN;
DELETE FROM test.t1 WHERE id = 1;
UPDATE test.t1 SET val = 'dd' WHERE id = 3;
UPDATE test.t1 SET id = 4, val = 'ee' WHERE id = 2;
COMMIT;

```

- Log 9 is the Row Changed Event of the Delete type. This type of Event only contains primary key columns or unique index columns.
- Log 13 and Log 14 are Resolved Events. The Resolved Event means that in this Partition, any events smaller than the Resolved TS (including Row Changed Event and DDL Event) have been sent.

- ```

9. [partition=0] [key="{\"ts\":415508881418485761,\"scm\": \"test\", \"tbl
  ↪ \": \"t1\", \"t\": 1}"] [value="{\"d\": {\"id\": {\"t\": 3, \"h\": true, \"v
  ↪ \": 1}}}]
10. [partition=1] [key="{\"ts\":415508881418485761,\"scm\": \"test\", \"tbl
  ↪ \": \"t1\", \"t\": 1}"] [value="{\"d\": {\"id\": {\"t\": 3, \"h\": true, \"v
  ↪ \": 2}}}]
11. [partition=0] [key="{\"ts\":415508881418485761,\"scm\": \"test\", \"tbl
  ↪ \": \"t1\", \"t\": 1}"] [value="{\"u\": {\"id\": {\"t\": 3, \"h\": true, \"v
  ↪ \": 3}, \"val\": {\"t\": 15, \"v\": \"ZGQ=\\\"}}}]
12. [partition=0] [key="{\"ts\":415508881418485761,\"scm\": \"test\", \"tbl
  ↪ \": \"t1\", \"t\": 1}"] [value="{\"u\": {\"id\": {\"t\": 3, \"h\": true, \"v
  ↪ \": 4}, \"val\": {\"t\": 15, \"v\": \"ZWU=\\\"}}}]
13. [partition=0] [key="{\"ts\":415508881038376963,\"t\": 3}"] [value=]
14. [partition=1] [key="{\"ts\":415508881038376963,\"t\": 3}"] [value=]

```

11.10.8.5 Protocol parsing for consumers

Currently, TiCDC does not provide the standard parsing library for TiCDC Open Protocol, but the Golang version and Java version of parsing examples are provided. You can refer to the data format provided in this document and the following examples to implement the protocol parsing for consumers.

- [Golang examples](#)
- [Java examples](#)

11.10.8.6 Column type code

Column Type Code represents the column data type of the Row Changed Event.

Type	Code	Output Example	Description
TINYINT/BOOLEAN	1	{"t":1,"v":1}	
SMALLINT	2	{"t":2,"v":1}	
INT	3	{"t":3,"v":123}	
FLOAT	4	{"t":4,"v":153.123}	
DOUBLE	5	{"t":5,"v":153.123}	
NULL	6	{"t":6,"v":null}	
TIMESTAMP	7	{"t":7,"v":"1973-12-30 15:30:00"}	
BIGINT	8	{"t":8,"v":123}	
MEDIUMINT	9	{"t":9,"v":123}	
DATE	10/14	{"t":10,"v":"2000-01-01"}	
TIME	11	{"t":11,"v":"23:59:59"}	
DATETIME	12	{"t":12,"v":"2015-12-20 23:58:58"}	
YEAR	13	{"t":13,"v":1970}	

Type	Code	Output Example	Description
VARCHAR/VARBINARY	253	{“t”:15,“v”: / is“\x89PNG\r\n\x1a\n”}	The test value is an encoded in UTF-8. When the upstream type is VARBINARY, invisible characters are escaped.
BIT	16	{“t”:16,“v”:81}	
JSON	245	{“t”:245,“v”:{“key1\“: \”value1\”}}	
DECIMAL	246	{“t”:246,“v”：“129012.1230000”}	
ENUM	247	{“t”:247,“v”:1}	
SET	248	{“t”:248,“v”:3}	
TINYTEXT/TINYBLOB	249	{“t”:249,“v”: value is en- coded in Base64.	The test value is encoded in Base64.

Type	Code	Output Example	Description
MEDIUMTEXT/MEDIUMBLOB	250	{“t”:250,“v”:“The5rWL6K+VdGV4dA==”}	value is encoded in Base64.
LONGTEXT/LONGBLOB	251	{“t”:251,“v”:“The5rWL6K+VdGV4dA==”}	value is encoded in Base64.
TEXT/BLOB	252	{“t”:252,“v”:“The5rWL6K+VdGV4dA==”}	value is encoded in Base64.

Type	Code	Output Example	Description
CHAR/BINARY	254	{“t”:254,“v”:“The test”} / {“t”:254,“v”:“\\x89PNG\\r\\n\\x1a\\n”}	When the upstream type is BINARY, invisible characters are escaped.
GEOMETRY	255		Unsupported

11.10.8.7 DDL Type Code

DDL Type Code represents the DDL statement type of the DDL Event.

Type	Code
Create Schema	1
Drop Schema	2
Create Table	3
Drop Table	4
Add Column	5
Drop Column	6
Add Index	7
Drop Index	8
Add Foreign Key	9

Type	Code
Drop Foreign Key	10
Truncate Table	11
Modify Column	12
Rebase Auto ID	13
Rename Table	14
Set Default Value	15
Shard RowID	16
Modify Table Comment	17
Rename Index	18
Add Table Partition	19
Drop Table Partition	20
Create View	21
Modify Table Charset And Collate	22
Truncate Table Partition	23
Drop View	24
Recover Table	25
Modify Schema Charset And Collate	26
Lock Table	27
Unlock Table	28
Repair Table	29
Set TiFlash Replica	30
Update TiFlash Replica Status	31
Add Primary Key	32
Drop Primary Key	33
Create Sequence	34
Alter Sequence	35
Drop Sequence	36

11.10.8.8 Bit flags of columns

The bit flags represent specific attributes of columns.

Bit	Value	Name	Description
1	0x01	BinaryFlag	Whether the column is a binary-encoded column.
2	0x02	HandleKeyFlag	Whether the column is a Handle index column.
3	0x04	GeneratedColumnFlag	Whether the column is a generated column.
4	0x08	PrimaryKeyFlag	Whether the column is a primary key column.
5	0x10	UniqueKeyFlag	Whether the column is a unique index column.
6	0x20	MultipleKeyFlag	Whether the column is a composite index column.
7	0x40	NullableFlag	Whether the column is a nullable column.
8	0x80	UnsignedFlag	Whether the column is an unsigned column.

Example:

If the value of a column flag is 85, the column is a nullable column, a unique index column, a generated column, and a binary-encoded column.

```
85 == 0b_101_0101
    == NullableFlag | UniqueKeyFlag | GeneratedColumnFlag | BinaryFlag
```

If the value of a column is 46, the column is a composite index column, a primary key column, a generated column, and a Handle key column.

```
46 == 0b_010_1110
    == MultipleKeyFlag | PrimaryKeyFlag | GeneratedColumnFlag | HandleKeyFlag
```

Note:

- `BinaryFlag` is meaningful only when the column type is BLOB/TEXT (including TINYBLOB/TINYTEXT and BINARY/CHAR). When the upstream column is the BLOB type, the `BinaryFlag` value is set to 1. When the upstream column is the TEXT type, the `BinaryFlag` value is set to 0.
- To replicate a table from the upstream, TiCDC selects a **valid index** as the Handle index. The `HandleKeyFlag` value of the Handle index column is set to 1.

11.10.9 TiCDC Canal-JSON Protocol

Canal-JSON is a data exchange format protocol defined by [Alibaba Canal](#). In this document, you can learn how Canal-JSON data formats are implemented in TiCDC, including the TiDB extension field, the definitions of the Canal-JSON data formats, and comparison with the official Canal.

11.10.9.1 Use Canal-JSON

When using Message Queue (MQ) as the downstream Sink, you can specify Canal-JSON in `sink-uri`. TiCDC wraps and constructs Canal-JSON messages with Event as the basic unit, and sends TiDB data change Events to the downstream.

There are three types of Events:

- DDL Event: Represents a DDL change record. It is sent after an upstream DDL statement is successfully executed. The DDL Event is sent to the MQ Partition with the index being 0.

- DML Event: Represents a row data change record. This type of Event is sent when a row change occurs. It contains the information about the row after the change occurs.
- WATERMARK Event: Represents a special time point. It indicates that the Events received before this point is complete. It applies only to the TiDB extension field and takes effect when you set `enable-tidb-extension` to `true` in `sink-uri`.

The following is an example of using Canal-JSON:

```
cdc cli changefeed create --pd=http://127.0.0.1:2379 --changefeed-id="kafka-
↳ canal-json" --sink-uri="kafka://127.0.0.1:9092/topic-name?kafka-
↳ version=2.4.0&protocol=canal-json"
```

11.10.9.2 TiDB extension field

The Canal-JSON protocol is originally designed for MySQL. It does not contain important fields such as the TiDB-specific unique identifier for the CommitTS transaction. To solve this problem, TiCDC appends a TiDB extension field to the Canal-JSON protocol format. After you set `enable-tidb-extension` to `true` in `sink-uri`, TiCDC behaves as follows when generating Canal-JSON messages:

- TiCDC sends DML Event and DDL Event messages that contain a field named `_tidb`.
- TiCDC sends WATERMARK Event messages.

The following is an example:

```
cdc cli changefeed create --pd=http://127.0.0.1:2379 --changefeed-id="kafka-
↳ canal-json-enable-tidb-extension" --sink-uri="kafka://127.0.0.1:9092/
↳ topic-name?kafka-version=2.4.0&protocol=canal-json&enable-tidb-
↳ extension=true"
```

By default, the value of `enable-tidb-extension` is `false`. It only takes effect when you use Canal-JSON.

11.10.9.3 Definitions of message formats

This section describes the formats of DDL Event, DML Event and WATERMARK Event, and how the data is resolved on the consumer side.

11.10.9.3.1 DDL Event

TiCDC encodes a DDL Event into the following Canal-JSON format.

```
{
  "id": 0,
  "database": "test",
  "table": "",
```

```

"pkNames": null,
"isDdl": true,
"type": "QUERY",
"es": 1639633094670,
"ts": 1639633095489,
"sql": "drop database if exists test",
"sqlType": null,
"mysqlType": null,
"data": null,
"old": null,
"_tidb": { // TiDB extension field
  "commitTs": 429918007904436226 // A TiDB TSO timestamp
}
}

```

The fields are explained as follows.

Field	Type	Description
id	Number	The default value is 0 in TiCDC.
database	String	The name of the database where the row is located
table	String	The name of the table where the row is located
pkNames	Array	The names of all the columns that make up the primary key
isDdl	Bool	Whether the message is a DDL event
type	String	Event types defined by Canal-JSON
es	Number	13-bit (millisecond) timestamp when the event that generated the message happened
ts	Number	13-bit (millisecond) timestamp when TiCDC generated the message
sql	String	When isDdl is true , records the corresponding DDL statement
sqlType	Object	When isDdl is false , records how the data type of each column is represented in Java
mysqlType	object	When isDdl is false , records how the data type of each column is represented in MySQL
data	Object	When isDdl is false , records the name of each column and its data value
old	Object	Only if the message is generated by an update Event, records the name of each column and the data value before the update
_tidb	Object	TiDB extension field. It exists only if you set <code>enable-tidb-extension</code> to true . The value of <code>commitTs</code> is the TSO of the transaction that caused the row to change.

11.10.9.3.2 DML Event

TiCDC encodes a row of DML data change event as follows:

```
{
  "id": 0,
  "database": "test",
  "table": "tp_int",
  "pkNames": [
    "id"
  ],
  "isDdl": false,
  "type": "INSERT",
  "es": 1639633141221,
  "ts": 1639633142960,
  "sql": "",
  "sqlType": {
    "c_bigint": -5,
    "c_int": 4,
    "c_mediumint": 4,
    "c_smallint": 5,
    "c_tinyint": -6,
    "id": 4
  },
  "mysqlType": {
    "c_bigint": "bigint",
    "c_int": "int",
    "c_mediumint": "mediumint",
    "c_smallint": "smallint",
    "c_tinyint": "tinyint",
    "id": "int"
  },
  "data": [
    {
      "c_bigint": "9223372036854775807",
      "c_int": "2147483647",
      "c_mediumint": "8388607",
      "c_smallint": "32767",
      "c_tinyint": "127",
      "id": "2"
    }
  ],
  "old": null,
  "_tidb": { // TiDB extension field
    "commitTs": 429918007904436226 // A TiDB TSO timestamp
  }
}
```

11.10.9.3.3 WATERMARK Event

TiCDC sends a WATERMARK Event only when you set `enable-tidb-extension` to `true`. The value of the `type` field is `TIDB_WATERMARK`. The Event contains the `_tidb` field, and the field contains only one parameter `watermarkTs`. The value of `watermarkTs` is the TSO recorded when the Event is sent.

When you receive an Event of this type, all Events with `commitTs` less than `watermarkTs` have been sent. Because TiCDC provides the “At Least Once” semantics, data might be sent repeatedly. If a subsequent Event with `commitTs` less than `watermarkTs` is received, you can safely ignore this Event.

The following is an example of the WATERMARK Event.

```
{
  "id": 0,
  "database": "",
  "table": "",
  "pkNames": null,
  "isDdl": false,
  "type": "TIDB_WATERMARK",
  "es": 1640007049196,
  "ts": 1640007050284,
  "sql": "",
  "sqlType": null,
  "mysqlType": null,
  "data": null,
  "old": null,
  "_tidb": { // TiDB extension field
    "watermarkTs": 429918007904436226 // A TiDB TSO timestamp
  }
}
```

11.10.9.3.4 Data resolution on the consumer side

As you can see from the example above, Canal-JSON has a uniform data format, with different field filling rules for different Event types. You can use a uniform method to resolve this JSON format data, and then determine the Event type by checking the field values.

- When `isDdl` is `true`, the message contains a DDL Event.
- When `isDdl` is `false`, you need to further check the `type` field. If `type` is `TIDB_WATERMARK`, it is a WATERMARK Event; otherwise, it is a DML Event.

11.10.9.4 Field descriptions

The Canal-JSON format records the corresponding data type in the `mysqlType` field and the `sqlType` field.

11.10.9.4.1 MySQL Type field

In the `mysqlType` field, the Canal-JSON format records the string of MySQL Type in each column. For more information, see [TiDB Data Types](#).

11.10.9.4.2 SQL Type field

In the `sqlType` field, the Canal-JSON format records Java SQL Type of each column, which is the data type corresponding to the data in JDBC. Its value can be calculated by MySQL Type and the specific data value. The mapping is as follows:

MySQL Type	Java SQL Type Code
Boolean	-6
Float	7
Double	8
Decimal	3
Char	1
Varchar	12
Binary	2004
Varbinary	2004
Tinytext	2005
Text	2005
Mediumtext	2005
Longtext	2005
Tinyblob	2004
Blob	2004
Mediumblob	2004
Longblob	2004
Date	91
Datetime	93
Timestamp	93
Time	92
Year	12
Enum	4
Set	-7
Bit	-7
JSON	12

11.10.9.5 Integer types

You need to consider whether [integer types](#) have the `Unsigned` constraint and the value size, which corresponds to different Java SQL Type Codes respectively, as shown in the following table.

MySQL Type String	Value Range	Java SQL Type Code
tinyint	[-128, 127]	-6
tinyint unsigned	[0, 127]	-6
tinyint unsigned	[128, 255]	5
smallint	[-32768, 32767]	5
smallint unsigned	[0, 32767]	5
smallint unsigned	[32768, 65535]	4
mediumint	[-8388608, 8388607]	4
mediumint unsigned	[0, 8388607]	4
mediumint unsigned	[8388608, 16777215]	4
int	[-2147483648, 2147483647]	4
int unsigned	[0, 2147483647]	4
int unsigned	[2147483648, 4294967295]	-5
bigint	[-9223372036854775808, 9223372036854775807]	-5
bigint unsigned	[0, 9223372036854775807]	-5
bigint unsigned	[9223372036854775808, 18446744073709551615]	3

The following table shows the mapping relationships between Java SQL Types in TiCDC and their codes.

Java SQL Type	Java SQL Type Code
CHAR	1
DECIMAL	3
INTEGER	4
SMALLINT	5
REAL	7
DOUBLE	8
VARCHAR	12
DATE	91
TIME	92
TIMESTAMP	93
BLOB	2004
CLOB	2005
BIGINT	-5
TINYINT	-6
Bit	-7

For more information about Java SQL Types, see [Java SQL Class Types](#).

11.10.9.6 Comparison of TiCDC Canal-JSON and the official Canal

The way that TiCDC implements the Canal-JSON data format, including the Update Event and the `mysqlType` field, differs from the official Canal. The following table shows the

main differences.

Item	TiCDC Canal-JSON	Canal
Event of Update Type	The <code>old</code> field contains all the column data	The <code>old</code> field contains only the modified column data
<code>mysqlType</code> field	For types with parameters, it does not contain the information of the type parameter	For types with parameters, it contains the full information of the type parameter

11.10.9.6.1 Event of Update Type

For an Event of Update Type:

- In TiCDC, the `old` field contains all the column data
- In the official Canal, the `old` field contains only the modified column data

Assume that the following SQL statements are executed sequentially in the upstream TiDB:

```
create table tp_int
(
  id          int auto_increment,
  c_tinyint  tinyint null,
  c_smallint smallint null,
  c_mediumint mediumint null,
  c_int      int      null,
  c_bigint   bigint   null,
  constraint pk
             primary key (id)
);

insert into tp_int(c_tinyint, c_smallint, c_mediumint, c_int, c_bigint)
values (127, 32767, 8388607, 2147483647, 9223372036854775807);

update tp_int set c_int = 0, c_tinyint = 0 where c_smallint = 32767;
```

For the `update` statement, TiCDC outputs an Event message with `type` as `UPDATE`, as shown below. The `update` statement only modifies the `c_int` and `c_tinyint` columns. The `old` field in the output event message contains all the column data.

```
{
  "id": 0,
  ...
  "type": "UPDATE",
```

```

...
"sqlType": {
  ...
},
"mysqlType": {
  ...
},
"data": [
  {
    "c_bigint": "9223372036854775807",
    "c_int": "0",
    "c_mediumint": "8388607",
    "c_smallint": "32767",
    "c_tinyint": "0",
    "id": "2"
  }
],
"old": [                                     // In TiCDC, this field contains all
  ↔ the column data.
  {
    "c_bigint": "9223372036854775807",
    "c_int": "2147483647",    // Modified column
    "c_mediumint": "8388607",
    "c_smallint": "32767",
    "c_tinyint": "127",     // Modified column
    "id": "2"
  }
]
}

```

For the official Canal, the old field in the output event message contains only the modified column data, as shown below.

```

{
  "id": 0,
  ...
  "type": "UPDATE",
  ...
  "sqlType": {
    ...
  },
  "mysqlType": {
    ...
  },
  "data": [

```

```

    {
      "c_bigint": "9223372036854775807",
      "c_int": "0",
      "c_mediumint": "8388607",
      "c_smallint": "32767",
      "c_tinyint": "0",
      "id": "2"
    }
  ],
  "old": [                                // In Canal, this field contains only
    ↪ the modified column data.
    {
      "c_int": "2147483647",              // Modified column
      "c_tinyint": "127",                // Modified column
    }
  ]
}

```

11.10.9.6.2 mysqlType field

For the `mysqlType` field, if a type contains parameters, the official Canal contains the full information of the type parameter. TiCDC does not contain such information.

In the following example, the table-defining SQL statement contains a parameter for each column, such as the ones for `decimal`, `char`, `varchar` and `enum`. By comparing the Canal-JSON formats generated by TiCDC and the official Canal, you can see that TiCDC only contains the basic MySQL information in the `mysqlType` field. If you need the full information of the type parameter, you need to implement it by other means.

Assume that the following SQL statements are executed sequentially in the upstream TiDB:

```

create table t (
  id      int auto_increment,
  c_decimal decimal(10, 4) null,
  c_char   char(16) null,
  c_varchar varchar(16) null,
  c_binary binary(16) null,
  c_varbinary varbinary(16) null,
  c_enum  enum('a','b','c') null,
  c_set   set('a','b','c') null,
  c_bit   bit(64) null,
  constraint pk
    primary key (id)
);

```

```
insert into t (c_decimal, c_char, c_varchar, c_binary, c_varbinary, c_enum,  
↪ c_set, c_bit)  
values (123.456, "abc", "abc", "abc", "abc", 'a', 'a,b', b'1000001');
```

The output of TiCDC is as follows:

```
{  
  "id": 0,  
  ...  
  "isDdl": false,  
  "sqlType": {  
    ...  
  },  
  "mysqlType": {  
    "c_binary": "binary",  
    "c_bit": "bit",  
    "c_char": "char",  
    "c_decimal": "decimal",  
    "c_enum": "enum",  
    "c_set": "set",  
    "c_varbinary": "varbinary",  
    "c_varchar": "varchar",  
    "id": "int"  
  },  
  "data": [  
    {  
      ...  
    }  
  ],  
  "old": null,  
}
```

The output of the official Canal is as follows:

```
{  
  "id": 0,  
  ...  
  "isDdl": false,  
  "sqlType": {  
    ...  
  },  
  "mysqlType": {  
    "c_binary": "binary(16)",  
    "c_bit": "bit(64)",  
    "c_char": "char(16)",  
    "c_decimal": "decimal(10, 4)",  
  },  
}
```

```
    "c_enum": "enum('a','b','c')",
    "c_set": "set('a','b','c')",
    "c_varbinary": "varbinary(16)",
    "c_varchar": "varchar(16)",
    "id": "int"
  },
  "data": [
    {
      ...
    }
  ],
  "old": null,
}
```

11.10.9.7 Changes in TiCDC Canal-JSON

11.10.9.7.1 Changes in the `old` field of the `Delete` events

From v5.4.0, the `old` field of the `Delete` events has changed.

The following is a `Delete` event message. Before v5.4.0, the `old` field contains the same content as the “`data`” field. In v5.4.0 and later versions, the `old` field is set to null. You can get the deleted data by using the “`data`” field.

```
{
  "id": 0,
  "database": "test",
  ...
  "type": "DELETE",
  ...
  "sqlType": {
    ...
  },
  "mysqlType": {
    ...
  },
  "data": [
    {
      "c_bigint": "9223372036854775807",
      "c_int": "0",
      "c_mediumint": "8388607",
      "c_smallint": "32767",
      "c_tinyint": "0",
      "id": "2"
    }
  ]
}
```

```
],
"old": null,
// The following is an example before v5.4.0. The `old` field contains
  ↪ the same content as the "data" field.
"old": [
  {
    "c_bigint": "9223372036854775807",
    "c_int": "0",
    "c_mediumint": "8388607",
    "c_smallint": "32767",
    "c_tinyint": "0",
    "id": "2"
  }
]
}
```

11.10.10 Quick Start Guide on Integrating TiDB with Confluent Platform

This document introduces how to integrate TiDB to Confluent Platform using [TiCDC](#).

Warning:

This is still an experimental feature. Do **NOT** use it in a production environment.

[Confluent Platform](#) is a data streaming platform with Apache Kafka at its core. With many official and third-party sink connectors, Confluent Platform enables you to easily connect stream sources to relational or non-relational databases.

To integrate TiDB with Confluent Platform, you can use the TiCDC component with the Avro protocol. TiCDC can stream data changes to Kafka in the format that Confluent Platform recognizes. For the detailed integration guide, see the following sections:

11.10.10.1 Prerequisites

Note:

In this tutorial, the [JDBC sink connector](#) is used to replicate TiDB data to a downstream relational database. To make it simple, **SQLite** is used here as an example.

- Make sure that Zookeeper, Kafka, and Schema Registry are properly installed. It is recommended that you follow the [Confluent Platform Quick Start Guide](#) to deploy a local test environment.
- Make sure that JDBC sink connector is installed by running the following command. The result should contain `jdbc-sink`.

```
confluent local services connect connector list
```

11.10.10.2 Integration procedures

1. Save the following configuration into `jdbc-sink-connector.json`:

```
{
  "name": "jdbc-sink-connector",
  "config": {
    "connector.class": "io.confluent.connect.jdbc.JdbcSinkConnector",
    "tasks.max": "1",
    "topics": "testdb_test",
    "connection.url": "jdbc:sqlite:/tmp/test.db",
    "connection.ds.pool.size": 5,
    "table.name.format": "test",
    "auto.create": true,
    "auto.evolve": true
  }
}
```

2. Create an instance of the JDBC sink connector by running the following command (assuming Kafka is listening on `127.0.0.1:8083`):

```
curl -X POST -H "Content-Type: application/json" -d @jdbc-sink-
  ↪ connector.json http://127.0.0.1:8083/connectors
```

3. Deploy TiCDC in one of the following ways. If TiCDC is already deployed, you can skip this step.

- [Deploy a new TiDB cluster that includes TiCDC using TiUP](#)
- [Add TiCDC to an existing TiDB cluster using TiUP](#)
- [Add TiCDC to an existing TiDB cluster using binary \(not recommended\)](#)

Make sure that your TiDB and TiCDC clusters are healthy before proceeding.

4. Create a `changefeed` by running the `cdc cli` command:

```
./cdc cli changefeed create --pd="http://127.0.0.1:2379" --sink-uri="
  ↪ kafka://127.0.0.1:9092/testdb_test?protocol=avro" --opts "
  ↪ registry=http://127.0.0.1:8081"
```

Note:

Make sure that PD, Kafka, and Schema Registry are running on their respective default ports.

11.10.10.3 Test data replication

After TiDB is integrated with Confluent Platform, you can follow the example procedures below to test the data replication.

1. Create the `testdb` database in your TiDB cluster:

```
CREATE DATABASE IF NOT EXISTS testdb;
```

Create the `test` table in `testdb`:

```
USE testdb;
CREATE TABLE test (
  id INT PRIMARY KEY,
  v TEXT
);
```

Note:

If you need to change the database name or the table name, change topics in `jdbc-sink-connector.json` accordingly.

2. Insert data into TiDB:

```
INSERT INTO test (id, v) values (1, 'a');
INSERT INTO test (id, v) values (2, 'b');
INSERT INTO test (id, v) values (3, 'c');
INSERT INTO test (id, v) values (4, 'd');
```

3. Wait a moment for data to be replicated to the downstream. Then check the downstream for data:

```
sqlite3 test.db
sqlite> SELECT * from test;
```

11.10.11 TiCDC Glossary

This glossary provides TiCDC-related terms and definitions. These terms appears in TiCDC logs, monitoring metrics, configurations, and documents.

For TiDB-related terms and definitions, refer to [TiDB glossary](#).

11.10.11.1 C

11.10.11.1.1 Capture

A single TiCDC instance on which the replication task of the cluster runs. Multiple captures form a TiCDC cluster.

11.10.11.1.2 Changed data

The data to be written to TiCDC from the upstream TiDB cluster, including the DML-caused data changes and the DDL-caused table schema changes.

11.10.11.1.3 Changefeed

An incremental replication task in TiCDC, which outputs the data change logs of several tables in a TiDB cluster to the designated downstream.

11.10.11.2 O

11.10.11.2.1 Owner

A [capture](#) of a special role that manages the TiCDC cluster and schedules replication tasks of the cluster. An owner is elected by captures and there is at most one owner at any time.

11.10.11.3 P

11.10.11.3.1 Processor

TiCDC replication tasks allocate data tables on TiCDC instances, and the processor refers to the replication processing unit of these tables. Processor tasks include pulling, sorting, restoring, and distributing changed data.

11.11 Use Dumpling to Export Data

This document introduces the data export tool - [Dumpling](#). Dumpling exports data stored in TiDB/MySQL as SQL or CSV data files and can be used to make a logical full backup or export. Dumpling also supports exporting data to Amazon S3.

You can get Dumpling using [TiUP](#) by running `tiup install dumpling`. Afterwards, you can use `tiup dumpling ...` to run Dumpling.

The Dumpling installation package is included in the TiDB Toolkit. To download the TiDB Toolkit, see [Download TiDB Tools](#).

For detailed usage of Dumpling, use the `--help` option or refer to [Option list of Dumpling](#).

When using Dumpling, you need to execute the export command on a running cluster. TiDB also provides other tools that you can choose to use as needed.

- For backups of SST files (key-value pairs) or backups of incremental data that are not sensitive to latency, refer to [BR](#).
- For real-time backups of incremental data, refer to [TiCDC](#).
- All exported data can be imported back to TiDB using [TiDB Lightning](#).

Note:

PingCAP previously maintained a fork of the [mydumper project](#) with enhancements specific to TiDB. For more information on Mydumper, refer to [v4.0 Mydumper documentation](#). Starting from v7.5.0, [Mydumper](#) is deprecated and most of its features have been replaced by [Dumpling](#). It is strongly recommended that you use Dumpling instead of Mydumper.

Compared to Mydumper, Dumpling has the following improvements:

- Support exporting data in multiple formats, including SQL and CSV.
- Support the [table-filter](#) feature, which makes it easier to filter data.
- Support exporting data to Amazon S3 cloud storage.
- More optimizations are made for TiDB:
 - Support configuring the memory limit of a single TiDB SQL statement.
 - Support automatic adjustment of TiDB GC time for TiDB v4.0.0 and later versions.
 - Use TiDB's hidden column `_tidb_rowid` to optimize the performance of concurrent data export from a single table.
 - For TiDB, you can set the value of `tidb_snapshot` to specify the time point of the data backup. This ensures the consistency of the backup, instead of using `FLUSH TABLES WITH READ LOCK` to ensure the consistency.

11.11.1 Export data from TiDB or MySQL

11.11.1.1 Required privileges

- SELECT
- RELOAD
- LOCK TABLES
- REPLICATION CLIENT
- PROCESS

11.11.1.2 Export to SQL files

This document assumes that there is a TiDB instance on the 127.0.0.1:4000 host and that this TiDB instance has a root user without a password.

Dumpling exports data to SQL files by default. You can also export data to SQL files by adding the `--filetype sql` flag:

```
dumpling -u root -P 4000 -h 127.0.0.1 --filetype sql -t 8 -o /tmp/test -r  
↪ 200000 -F 256MiB
```

In the command above:

- The `-h`, `-p`, and `-u` option respectively mean the address, the port, and the user. If a password is required for authentication, you can use `-p $YOUR_SECRET_PASSWORD` to pass the password to Dumpling.
- The `-o` option specifies the export directory of the storage, which supports a local file path or a [URL of an external storage](#).
- The `-t` option specifies the number of threads for the export. Increasing the number of threads improves the concurrency of Dumpling and the export speed, and also increases the database's memory consumption. Therefore, it is not recommended to set the number too large. Usually, it's less than 64.
- The `-r` option specifies the maximum number of rows in a single file. With this option specified, Dumpling enables the in-table concurrency to speed up the export and reduce the memory usage. When the upstream database is TiDB v3.0 or later versions, a value of this parameter greater than 0 indicates that the TiDB region information is used for splitting and the value specified here will no longer take effect.
- The `-F` option is used to specify the maximum size of a single file (the unit here is MiB; inputs like 5GiB or 8KB are also acceptable). It is recommended to keep its value to 256 MiB or less if you plan to use TiDB Lightning to load this file into a TiDB instance.

Note:

If the size of a single exported table exceeds 10 GB, it is **strongly recommended to use** the `-r` and `-F` options.

11.11.1.3 Export to CSV files

You can export data to CSV files by adding the `--filetype csv` argument.

When you export data to CSV files, you can use `--sql <SQL>` to filter the records with the SQL statements. For example, you can export all records that match `id < 100` in `test.sbtest1` using the following command:

```
./dumpling -u root -P 4000 -h 127.0.0.1 -o /tmp/test --filetype csv --sql '
↳ select * from `test`.`sbtest1` where id < 100' -F 100MiB --output-
↳ filename-template 'test.sbtest1.{{.Index}}'
```

In the command above:

- The `--sql` option can be used only for exporting to CSV files. The command above executes the `SELECT * FROM <table-name> WHERE id <100` statement on all tables to be exported. If a table does not have the specified field, the export fails.
- When you use the `--sql` option, Dumpling cannot obtain the exported table and schema information. You can specify the file name format of the CSV files using the `--output-filename-template` option, which facilitates the subsequent use of [TiDB Lightning](#) to import the data file. For example, `--output-filename-template='↳ test.sbtest1.{{.Index}}'` specifies that the exported CSV files are named as `test.sbtest1.000000000` or `test.sbtest1.000000001`.
- You can use options like `--csv-separator` and `--csv-delimiter` to configure the CSV file format. For details, refer to the [Dumpling option list](#).

Note:

Strings and *keywords* are not distinguished by Dumpling. If the imported data is the Boolean type, the value of `true` is converted to 1 and the value of `false` is converted to 0.

11.11.1.4 Format of exported files

- `metadata`: The start time of the exported files and the position of the master binary log.

```
cat metadata
```

```
Started dump at: 2020-11-10 10:40:19
SHOW MASTER STATUS:
  Log: tidb-binlog
  Pos: 420747102018863124
Finished dump at: 2020-11-10 10:40:20
```

- `{schema}-schema-create.sql`: The SQL file used to create the schema

```
cat test-schema-create.sql
```

```
CREATE DATABASE `test` /*!40100 DEFAULT CHARACTER SET utf8mb4 */;
```

- `{schema}.{table}-schema.sql`: The SQL file used to create the table

```
cat test.t1-schema.sql
```

```
CREATE TABLE `t1` (  
  `id` int(11) DEFAULT NULL  
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin;
```

- `{schema}.{table}.{0001}.{sql|csv}`: The data source file

```
cat test.t1.0.sql
```

```
/*!40101 SET NAMES binary*/;  
INSERT INTO `t1` VALUES  
(1);
```

- `*-schema-view.sql`, `*-schema-trigger.sql`, `*-schema-post.sql`: Other exported files

11.11.1.5 Export data to Amazon S3 cloud storage

Starting from v4.0.8, Dumpling supports exporting data to cloud storages. If you need to back up data to Amazon S3, you need to specify the Amazon S3 storage path in the `-o` parameter.

You need to create an Amazon S3 bucket in the specified region (see the [Amazon documentation - How do I create an S3 Bucket](#)). If you also need to create a folder in the bucket, see the [Amazon documentation - Creating a folder](#).

Pass `SecretKey` and `AccessKey` of the account with the permission to access the Amazon S3 backend storage to the Dumpling node as environment variables.

```
export AWS_ACCESS_KEY_ID=${AccessKey}  
export AWS_SECRET_ACCESS_KEY=${SecretKey}
```

Dumpling also supports reading credential files from `~/.aws/credentials`. For more Dumpling configuration, see the configuration of [External storages](#).

When you back up data using Dumpling, explicitly specify the `--s3.region` parameter, which means the region of the S3 storage (for example, `ap-northeast-1`):

```
./dumpling -u root -P 4000 -h 127.0.0.1 -r 200000 -o "s3://${Bucket}/${  
↪ Folder}" --s3.region "${region}"
```

11.11.1.6 Filter the exported data

11.11.1.6.1 Use the `--where` option to filter data

By default, Dumpling exports all databases except system databases (including `mysql`, `sys`, `INFORMATION_SCHEMA`, `PERFORMANCE_SCHEMA`, `METRICS_SCHEMA`, and `INSPECTION_SCHEMA`). You can use `--where <SQL where expression>` to select the records to be exported.

```
./dumpling -u root -P 4000 -h 127.0.0.1 -o /tmp/test --where "id < 100"
```

The above command exports the data that matches `id < 100` from each table. Note that you cannot use the `--where` parameter together with `--sql`.

11.11.1.6.2 Use the `--filter` option to filter data

Dumpling can filter specific databases or tables by specifying the table filter with the `--filter` option. The syntax of table filters is similar to that of `.gitignore`. For details, see [Table Filter](#).

```
./dumpling -u root -P 4000 -h 127.0.0.1 -o /tmp/test -r 200000 --filter "  
↪ employees.*" --filter "*.WorkOrder"
```

The above command exports all the tables in the `employees` database and the `WorkOrder` tables in all databases.

11.11.1.6.3 Use the `-B` or `-T` option to filter data

Dumpling can also export specific databases with the `-B` option or specific tables with the `-T` option.

Note:

- The `--filter` option and the `-T` option cannot be used at the same time.
- The `-T` option can only accept a complete form of inputs like `database ↪ -name.table-name`, and inputs with only the table name are not accepted. Example: Dumpling cannot recognize `-T WorkOrder`.

Examples:

- `-B employees` exports the `employees` database.
- `-T employees.WorkOrder` exports the `employees.WorkOrder` table.

11.11.1.7 Improve export efficiency through concurrency

The exported file is stored in the `./export-<current local time>` directory by default. Commonly used options are as follows:

- The `-t` option specifies the number of threads for the export. Increasing the number of threads improves the concurrency of Dumping and the export speed, and also increases the database's memory consumption. Therefore, it is not recommended to set the number too large.
- The `-r` option specifies the maximum number of records (or the number of rows in the database) for a single file. When it is enabled, Dumping enables concurrency in the table to improve the speed of exporting large tables. When the upstream database is TiDB v3.0 or later versions, a value of this parameter greater than 0 indicates that the TiDB region information is used for splitting and the value specified here will no longer take effect.
- The `--compress gzip` option can be used to compress the dump. This can help to speed up dumping of data if storage is the bottleneck or if storage capacity is a concern. The drawback of this is an increase in CPU usage. Each file is compressed individually.

With the above options specified, Dumping can have a quicker speed of data export.

11.11.1.8 Adjust Dumping's data consistency options

Note:

The default value is `auto` for the data consistency option. In most scenarios, you do not need to adjust the default data consistency options of Dumping.

Dumping uses the `--consistency <consistency level>` option to control the way in which data is exported for “consistency assurance”. When using snapshot for consistency, you can use the `--snapshot` option to specify the timestamp to be backed up. You can also use the following levels of consistency:

- `flush`: Use `FLUSH TABLES WITH READ LOCK` to temporarily interrupt the DML and DDL operations of the replica database, to ensure the global consistency of the backup connection, and to record the binlog position (POS) information. The lock is released after all backup connections start transactions. It is recommended to perform full backups during off-peak hours or on the MySQL replica database.
- `snapshot`: Get a consistent snapshot of the specified timestamp and export it.
- `lock`: Add read locks on all tables to be exported.
- `none`: No guarantee for consistency.

- `auto`: Use `flush` for MySQL and `snapshot` for TiDB.

After everything is done, you can see the exported file in `/tmp/test`:

```
ls -lh /tmp/test | awk '{print $5 "\t" $9}'
```

```
140B metadata
66B test-schema-create.sql
300B test.sbtest1-schema.sql
190K test.sbtest1.0.sql
300B test.sbtest2-schema.sql
190K test.sbtest2.0.sql
300B test.sbtest3-schema.sql
190K test.sbtest3.0.sql
```

11.11.1.9 Export historical data snapshots of TiDB

Dumpling can export the data of a certain `tidb_snapshot` with the `--snapshot` option specified.

The `--snapshot` option can be set to a TSO (the `Position` field output by the `SHOW MASTER STATUS` command) or a valid time of the `datetime` data type (in the form of `YYYY-MM-DD hh:mm:ss`), for example:

```
./dumpling --snapshot 417773951312461825
./dumpling --snapshot "2020-07-02 17:12:45"
```

The TiDB historical data snapshots when the TSO is `417773951312461825` and the time is `2020-07-02 17:12:45` are exported.

11.11.1.10 Control the memory usage of exporting large tables

When Dumpling is exporting a large single table from TiDB, Out of Memory (OOM) might occur because the exported data size is too large, which causes connection abort and export failure. You can use the following parameters to reduce the memory usage of TiDB:

- Setting `-r` to split the data to be exported into chunks. This reduces the memory overhead of TiDB's data scan and enables concurrent table data dump to improve export efficiency. When the upstream database is TiDB v3.0 or later versions, a value of this parameter greater than 0 indicates that the TiDB region information is used for splitting and the value specified here will no longer take effect.
- Reduce the value of `--tidb-mem-quota-query` to `8589934592` (8 GB) or lower. `--tidb-mem-quota-query` controls the memory usage of a single query statement in TiDB.
- Adjust the `--params "tidb_distsql_scan_concurrency=5"` parameter. `tidb_distsql_scan_concurrency` is a session variable which controls the concurrency of the scan operations in TiDB.

11.11.1.11 Set TiDB GC when exporting a large volume of data (more than 1 TB)

When exporting data from TiDB (more than 1 TB), if the TiDB version is later than or equal to v4.0.0 and Dumpling can access the PD address of the TiDB cluster, Dumpling automatically extends the GC time without affecting the original cluster.

In other scenarios, if the data size is very large, to avoid export failure due to GC during the export process, you can extend the GC time in advance:

```
SET GLOBAL tidb_gc_life_time = '720h';
```

After your operation is completed, set the GC time back (the default value is 10m):

```
SET GLOBAL tidb_gc_life_time = '10m';
```

11.11.2 Option list of Dumpling

Options Usage	Default value
-V or Output the Dumpling version and exit directly -- ↪ version	
-B or Export specified databases -- ↪ database	
-T or Export specified tables -- ↪ tables ↪ - ↪ list ↪	

Options Usage	Default value
-f or Export tables that match the filter pattern. For the filter syntax, -- see table-filter . ↳ filter ↳	[*\\.*,!/^(↳ mysql ↳ | ↳ sys ↳ | ↳ INFORMATION_SCHEMA ↳ | ↳ PERFORMANCE_SCHEMA ↳ | ↳ METRICS_SCHEMA ↳ | ↳ INSPECTION_SCHEMA ↳)\$ ↳ /.*] ↳ (export all databases or tables exclud- ing system schemas) false (case- insensitive)
-- whether table-filter is case-sensitive ↳ case ↳ - ↳ sensitive ↳	false (case- insensitive)
-h or The IP address of the connected database host -- ↳ host ↳	“127.0.0.1”
-t or The number of concurrent backup threads -- ↳ threads ↳	4
-r or Split the table into rows with a specified number of rows (generally -- applicable for concurrent operations of splitting a large table into ↳ rows multiple files. When the upstream database is TiDB v3.0 or later ↳ versions, a value of this parameter greater than 0 indicates that the TiDB region information is used for splitting and the value specified here will no longer take effect.	

Options Usage	Default value
-L or Log output address. If it is empty, the log will be output to the -- console ↪ logfile ↪	""
-- Log level {debug,info,warn,error,dpanic,panic,fatal} ↪ loglevel ↪	"info"
-- Log output format {text,json} ↪ logfmt ↪	"text"
-d or Do not export data (suitable for scenarios where only the schema is --no- exported) ↪ data ↪	
--no- Export CSV files of the tables without generating header ↪ header ↪	
-W or Do not export the views --no- ↪ views ↪	true
-m or Do not export the schema with only the data exported --no- ↪ schemas ↪	
-s or Control the size of the INSERT statements; the unit is bytes -- ↪ statement ↪ - ↪ size ↪	
-F or The file size of the divided tables. The unit must be specified such -- as 128B, 64KiB, 32MiB, and 1.5GiB. ↪ filesize ↪	
-- Exported file type (csv/sql) ↪ filetype ↪	"sql"
-o or The path of exported local files or the URL of the external storage -- ↪ output ↪	"/export- \${time}"

Options Usage	Default value
<p><code>-S</code> or <code>--sql</code> Export data according to the specified SQL statement. This command does not support concurrent export.</p> <p><code>--flush</code> flush: use FTWRL before the dump snapshot: dump the TiDB data consistency specific snapshot of a TSO lock: execute <code>lock tables read on all tables</code> to be dumped none: dump without adding locks, which cannot guarantee consistency auto: use <code>--consistency flush</code> for MySQL; use <code>--consistency snapshot</code> for TiDB</p> <p><code>--Snapshot TSO</code>; valid only when <code>consistency=snapshot</code></p> <p>↳ <code>snapshot</code></p> <p>↳</p> <p><code>--where</code> Specify the scope of the table backup through the <code>where</code> condition</p> <p>↳ <code>where</code></p> <p>↳</p> <p><code>-p</code> or <code>--password</code> The password of the connected database host</p> <p>↳ <code>password</code></p> <p>↳</p> <p><code>-P</code> or <code>--port</code> The port of the connected database host</p> <p>↳ <code>port</code></p> <p>↳</p> <p><code>-u</code> or <code>--user</code> The username of the connected database host</p> <p>↳ <code>user</code></p> <p>↳</p> <p><code>--dump-empty-database</code> Export the <code>CREATE DATABASE</code> statements of the empty databases</p> <p>↳ <code>dump-empty-database</code></p> <p>↳</p> <p><code>--cert</code> The address of the certificate authority file for TLS connection</p> <p><code>--client-cert</code> The address of the client certificate file for TLS connection</p> <p>↳ <code>cert</code></p> <p>↳</p> <p><code>--key</code> The address of the client private key file for TLS connection</p> <p><code>--csv-delimiter</code> Delimiter of character type variables in CSV files</p> <p>↳ <code>delimiter</code></p> <p>↳</p>	<p>“auto”</p> <p>4000</p> <p>“root”</p> <p>true</p> <p>“”</p>

<p>-- The memory limit of exporting SQL statements by a single line of Dumping command, and the unit is byte. For v4.0.10 or later versions, if you do not set this parameter, TiDB uses the value of the <code>mem-quota-query</code> configuration item as the memory limit value by default. For versions earlier than v4.0.10, the parameter value defaults to 32 GB.</p> <p>↳ <code>tidb</code></p> <p>↳ -</p> <p>↳ <code>mem</code></p> <p>↳ -</p> <p>↳ <code>quota</code></p> <p>↳</p> <p>↳ <code>query</code></p> <p>↳</p>	<code>34359738368</code>
<p>-- Specifies the session variable for the connection of the database to be exported. The required format is <code>"character_set_client=latin1,character_set_connection=latin1"</code></p> <p>↳ <code>params</code></p> <p>↳</p>	

11.12 sync-diff-inspector

11.12.1 sync-diff-inspector User Guide

`sync-diff-inspector` is a tool used to compare data stored in the databases with the MySQL protocol. For example, it can compare the data in MySQL with that in TiDB, the data in MySQL with that in MySQL, or the data in TiDB with that in TiDB. In addition, you can also use this tool to repair data in the scenario where a small amount of data is inconsistent.

This guide introduces the key features of `sync-diff-inspector` and describes how to configure and use this tool. To download `sync-diff-inspector`, use one of the following methods:

- Binary package. Click [tidb-community-toolkit-v5.4.3-linux-amd64](#) to download.
- Docker image. Execute the following command to download:

```
docker pull pingcap/tidb-enterprise-tools:nightly
```

11.12.1.1 Key features

- Compare the table schema and data
- Generate the SQL statements used to repair data if the data inconsistency exists
- Support [data check for tables with different schema or table names](#)
- Support [data check in the sharding scenario](#)
- Support [data check for TiDB upstream-downstream clusters](#)
- Support [data check in the DM replication scenario](#)

11.12.1.2 Restrictions of sync-diff-inspector

- Online check is not supported for data migration between MySQL and TiDB. Ensure that no data is written into the upstream-downstream checklist, and that data in a certain range is not changed. You can check data in this range by setting `range`.
- Data of the JSON type is not supported. When you perform a data check, you need to set `ignore-columns` to skip checking this type of data.
- In TiDB and MySQL, `FLOAT`, `DOUBLE` and other floating-point types are implemented differently. `FLOAT` and `DOUBLE` respectively take 6 and 15 significant digits for calculating checksum. If you do not want to use this feature, set `ignore-columns` to skip checking these columns.
- Support checking tables that do not contain the primary key or the unique index. However, if data is inconsistent, the generated SQL statements might not be able to repair the data correctly.

11.12.1.3 Database privileges for sync-diff-inspector

sync-diff-inspector needs to obtain the information of table schema and to query data. The required database privileges are as follows:

- Upstream database
 - SELECT (checks data for comparison)
 - SHOW_DATABASES (views database name)
 - RELOAD (views table schema)
- Downstream database
 - SELECT (checks data for comparison)
 - SHOW_DATABASES (views database name)
 - RELOAD (views table schema)

11.12.1.4 Configuration file description

The configuration of sync-diff-inspector consists of the following parts:

- **Global config:** General configurations, such as number of threads to check, whether to export SQL statement to fix inconsistent tables, and whether to compare the data.
- **Databases config:** Configures the instances of the upstream and downstream databases.
- **Routes:** Rules for upstream multiple schema names to match downstream single schema names (**optional**).
- **Task config:** Configures the tables for checking. If some tables have a certain mapping relationship between the upstream and downstream databases or have some special requirements, you must configure these tables.
- **Table config:** Special configurations for specific tables, such as specified ranges and columns to be ignored (**optional**).

Below is the description of a complete configuration file:

- Note: configurations with **s** after their name can have multiple values, so you need to use square brackets `[]` to contain the configuration values.

```
### Diff Configuration.

##### Global config #####
### The number of goroutines created to check data. The number of
    ↪ connections between sync-diff-inspector and upstream/downstream
    ↪ databases is slightly greater than this value.
check-thread-count = 4
```

```
### If enabled, SQL statements is exported to fix inconsistent tables.
export-fix-sql = true

### Only compares the table structure instead of the data.
check-struct-only = false

##### Datasource config #####
[data-sources]
[data-sources.mysql1] # mysql1 is the only custom ID for the database
    ↪ instance. It is used for the following `task.source-instances/task.`
    ↪ target-instance` configuration.
    host = "127.0.0.1"
    port = 3306
    user = "root"
    password = ""

    # (optional) Use mapping rules to match multiple upstream sharded tables
    ↪ . Rule1 and rule2 are configured in the following Routes section.
    route-rules = ["rule1", "rule2"]

[data-sources.tidb0]
    host = "127.0.0.1"
    port = 4000
    user = "root"
    password = ""
    # (optional) Uses the snapshot feature. If enabled, historical data is
    ↪ used for comparison
    # snapshot = "386902609362944000"

##### Routes #####
### To compare the data of a large number of tables with different schema
    ↪ names or table names, or check the data of multiple upstream sharded
    ↪ tables and downstream table family, use the table-rule to configure
    ↪ the mapping relationship. You can configure the mapping rule only for
    ↪ the schema or table. Also, you can configure the mapping rules for
    ↪ both the schema and the table.

[routes]
[routes.rule1] # rule1 is the only custom ID for the configuration. It is
    ↪ used for the above `data-sources.route-rules` configuration.
schema-pattern = "test_*" # Matches the schema name of the data source.
    ↪ Supports the wildcards "*" and "?"
table-pattern = "t_*" # Matches the table name of the data source.
    ↪ Supports the wildcards "*" and "?"
target-schema = "test" # The name of the schema in the target database
target-table = "t" # The name of the target table
```

```
[routes.rule2]
schema-pattern = "test2_*" # Matches the schema name of the data source.
    ↳ Supports the wildcards "*" and "?"
table-pattern = "t2_*"     # Matches the table name of the data source.
    ↳ Supports the wildcards "*" and "?"
target-schema = "test2"    # The name of the schema in the target database
target-table = "t2"        # The name of the target table

##### task config #####
### Configures the tables of the target database that need to be compared.
[task]
# output-dir saves the following information:
# 1 sql: The SQL file to fix tables that is generated after error is
    ↳ detected. One chunk corresponds to one SQL file.
# 2 log: sync-diff.log
# 3 summary: summary.txt
# 4 checkpoint: a dir
output-dir = "./output"
# The upstream database. The value is the unique ID declared by data-
    ↳ sources.
source-instances = ["mysql1"]
# The downstream database. The value is the unique ID declared by data-
    ↳ sources.
target-instance = "tidb0"
# The tables of downstream databases to be compared. Each table needs to
    ↳ contain the schema name and the table name, separated by '.'
# Use "?" to match any character and "*" to match characters of any
    ↳ length.
# For detailed match rules, refer to golang regexp pkg: https://github.com/google/re2/wiki/Syntax.
    ↳
target-check-tables = ["schema*.table*", "!c.*", "test2.t2"]
# (optional) Extra configurations for some tables, Config1 is defined in
    ↳ the following table config example.
target-configs = ["config1"]

##### Table config #####
### Special configurations for specific tables. The tables to be configured
    ↳ must be in `task.target-check-tables`.
[table-configs.config1] # config1 is the only custom ID for this
    ↳ configuration. It is used for the above `task.target-configs`
    ↳ configuration.
### The name of the target table, you can use regular expressions to match
    ↳ multiple tables, but one table is not allowed to be matched by
    ↳ multiple special configurations at the same time.
target-tables = ["schema*.test*", "test2.t2"]
```

```
### (optional) Specifies the range of the data to be checked
### It needs to comply with the syntax of the WHERE clause in SQL.
range = "age > 10 AND age < 20"
### (optional) Specifies the column used to divide data into chunks. If you
    ↪ do not configure it,
### sync-diff-inspector chooses an appropriate column (primary key, unique
    ↪ key, or a field with index).
index-fields = ["col1","col2"]
### (optional) Ignores checking some columns such as some types (json, bit,
    ↪ blob, etc.)
### that sync-diff-inspector does not currently support.
### The floating-point data type behaves differently in TiDB and MySQL. You
    ↪ can use
### `ignore-columns` to skip checking these columns.
ignore-columns = ["",""]
### (optional) Specifies the size of the chunk for dividing the table. If
    ↪ not specified, this configuration can be deleted or be set as 0.
chunk-size = 0
### (optional) Specifies the "collation" for the table. If not specified,
    ↪ this configuration can be deleted or be set as an empty string.
collation = ""
```

11.12.1.5 Run sync-diff-inspector

Run the following command:

```
./bin/sync_diff_inspector --config=./config.toml
```

This command outputs a check report `summary.txt` in the `output-dir` of `config.toml` and the log `sync_diff.log`. In the `output-dir`, a folder named by the hash value of the `config.toml` file is also generated. This folder includes the checkpoint node information of breakpoints and the SQL file generated when the data is inconsistent.

11.12.1.5.1 Progress information

`sync-diff-inspector` sends progress information to `stdout` when running. Progress information includes the comparison results of table structures, comparison results of table data and the progress bar.

Note:

To ensure the display effect, keep the display window width above 80 characters.

```
A total of 2 tables need to be compared
```

```
Comparing the table structure of ``sbtest`.`sbtest96`` ... equivalent
Comparing the table structure of ``sbtest`.`sbtest99`` ... equivalent
Comparing the table data of ``sbtest`.`sbtest96`` ... failure
Comparing the table data of ``sbtest`.`sbtest99`` ...
```

```
↪
```

```
Progress [=====>--] 98%
```

```
↪ 193/200
```

```
A total of 2 tables need to be compared
```

```
Comparing the table structure of ``sbtest`.`sbtest96`` ... equivalent
Comparing the table structure of ``sbtest`.`sbtest99`` ... equivalent
Comparing the table data of ``sbtest`.`sbtest96`` ... failure
Comparing the table data of ``sbtest`.`sbtest99`` ... failure
```

```
↪
```

```
Progress [=====>] 100%
```

```
↪ 100% 0/0
```

```
The data of `sbtest`.`sbtest99` is not equal
```

```
The data of `sbtest`.`sbtest96` is not equal
```

```
The rest of tables are all equal.
```

```
The patch file has been generated in
```

```
'output/fix-on-tidb2/'
```

```
You can view the comparison details through 'output/sync_diff.log'
```

11.12.1.5.2 Output file

The directory structure of the output file is as follows:

```
output/
|-- checkpoint # Saves the breakpoint information
| |-- bbfec8cc8d1f58a5800e63aa73e5 # Config hash. The placeholder file which
|   ↪ identifies the configuration file corresponding to the output
|   ↪ directory (output/)
| |-- DO_NOT_EDIT_THIS_DIR
|   -- sync_diff_checkpoints.pb # The breakpoint information
|
|-- fix-on-target # Saves SQL files to fix data inconsistency
| |-- xxx.sql
| |-- xxx.sql
```

```
| -- xxx.sql
|
|-- summary.txt # Saves the summary of the check results
-- sync_diff.log # Saves the output log information when sync-diff-
  ↳ inspector is running
```

11.12.1.5.3 Log

The log of sync-diff-inspector is saved in `${output}/sync_diff.log`, among which `${output}` ↳ `output` is the value of `output-dir` in the `config.toml` file.

11.12.1.5.4 Progress

The running sync-diff-inspector periodically (every 10 seconds) prints the progress in checkpoint, which is located at `${output}/checkpoint/sync_diff_checkpoints.pb`, among which `${output}` is the value of `output-dir` in the `config.toml` file.

11.12.1.5.5 Result

After the check is finished, sync-diff-inspector outputs a report. It is located at `${output}/summary.txt`, and `${output}` is the value of `output-dir` in the `config.toml` file.

```
+-----+-----+-----+-----+-----+
↳
|      TABLE      | STRUCTURE EQUALITY | DATA DIFF ROWS | UPCOUNT |
↳ DOWNCOUNT |
+-----+-----+-----+-----+-----+
↳
| `sbtest`.`sbtest99` | true          | +97/-97        | 999999 | 999999 |
| `sbtest`.`sbtest96` | true          | +0/-101       | 999999 | 1000100 |
+-----+-----+-----+-----+-----+
↳
Time Cost: 16.75370462s
Average Speed: 113.277149MB/s
```

- **TABLE:** The corresponding database and table names
- **STRUCTURE EQUALITY:** Checks whether the table structure is the same
- **DATA DIFF ROWS:** `rowAdd` / `rowDelete`. Indicates the number of rows that need to be added/deleted to fix the table
- **UPCOUNT:** The number of rows in this table in the upstream data source
- **DOWNCOUNT:** The number of rows in this table in the downstream data source

11.12.1.5.6 SQL statements to fix inconsistent data

If different rows exist during the data checking process, the SQL statements will be generated to fix them. If the data inconsistency exists in a chunk, a SQL file named by `chunk.Index` will be generated. The SQL file is located at `${output}/fix-on-{instance}`, and `{instance}` is the value of `task.target-instance` in the `config.toml` file.

A SQL file contains the table to which the chunk belong and the range information. For the SQL files, you should consider the following three situations:

- If the rows in the downstream database are missing, REPLACE statements will be applied
- If the rows in the downstream database are redundant, DELETE statements will be applied
- If some data of the rows in the downstream database is inconsistent, REPLACE statements will be applied and inconsistent columns will be marked with annotation in the SQL file

```

-- table: sbtest.sbtest99
-- range in sequence: (3690708) < (id) <= (3720581)
/*
DIFF COLUMNS  `K`                `C`                `PAD`

↪
source data  2501808  'hello'                'world'

↪
target data  5003616  '0709824117-9809973320-4456050422'
↪ '1714066100-7057807621-1425865505'

↪
*/
REPLACE INTO `sbtest`.`sbtest99`(`id`,`k`,`c`,`pad`) VALUES
↪ (3700000,2501808,'hello','world');

```

11.12.1.6 Note

- sync-diff-inspector consumes a certain amount of server resources when checking data. Avoid using sync-diff-inspector to check data during peak business hours.
- Before comparing the data in MySQL with that in TiDB, pay attention to the collation configuration of the tables. If the primary key or unique key is the `varchar` type and the collation configuration in MySQL differs from that in TiDB, the final check result might be incorrect because of the collation issue. You need to add collation to the sync-diff-inspector configuration file.

- sync-diff-inspector divides data into chunks first according to TiDB statistics and you need to guarantee the accuracy of the statistics. You can manually run the `analyze` \leftrightarrow `table {table_name}` command when the TiDB server's *workload is light*.
- Pay special attention to `table-rules`. If you configure `schema-pattern="test1"`, `table-pattern = "t_1"`, `target-schema="test2"` and `target-table = "t_2"`, the `test1.t_1` schema in the source database and the `test2.t_2` schema in the target database are compared. Sharding is enabled by default in sync-diff-inspector, so if the source database has a `test2.t_2` table, the `test1.t_1` table and `test2.t_2` table in the source database serving as sharding are compared with the `test2.t_2` table in the target database.
- The generated SQL file is only used as a reference for repairing data, and you need to confirm it before executing these SQL statements to repair data.

11.12.2 Data Check for Tables with Different Schema or Table Names

When using replication tools such as [TiDB Data Migration](#), you can set `route-rules` to replicate data to a specified table in the downstream. sync-diff-inspector enables you to verify tables with different schema names or table names by setting rules.

The following is a simple configuration example. To learn the complete configuration, refer to [Sync-diff-inspector User Guide](#).

```
##### Datasource config #####
[data-sources.mysql1]
  host = "127.0.0.1"
  port = 3306
  user = "root"
  password = ""
  route-rules = ["rule1"]

[data-sources.tidb0]
  host = "127.0.0.1"
  port = 4000
  user = "root"
  password = ""
##### Routes #####
[routes.rule1]
schema-pattern = "test_1" # Matches the schema name of the data source.
   $\leftrightarrow$  Supports the wildcards "*" and "?"
table-pattern = "t_1" # Matches the table name of the data source.
   $\leftrightarrow$  Supports the wildcards "*" and "?"
target-schema = "test_2" # The name of the schema in the target database
target-table = "t_2" # The name of the target table
```

This configuration can be used to check `test_2.t_2` in the downstream and `test_1.t_1` in the `mysql1` instance.

To check a large number of tables with different schema names or table names, you can simplify the configuration by setting the mapping relationship by using **rules**. You can configure the mapping relationship of either schema or table, or of both. For example, all the tables in the upstream `test_1` database are replicated to the downstream `test_2` database, which can be checked through the following configuration:

```
##### Datasource config #####
[data-sources.mysql1]
  host = "127.0.0.1"
  port = 3306
  user = "root"
  password = ""
  route-rules = ["rule1"]

[data-sources.tidb0]
  host = "127.0.0.1"
  port = 4000
  user = "root"
  password = ""
##### Routes #####
[routes.rule1]
schema-pattern = "test_1" # Matches the schema name of the data source.
  ↳ Supports the wildcards "*" and "?"
table-pattern = "*"      # Matches the table name of the data source.
  ↳ Supports the wildcards "*" and "?"
target-schema = "test_2" # The name of the schema in the target database
target-table = "t_2"    # The name of the target table
```

11.12.2.1 Note

If `test_2.t_2` exists in the upstream database, the downstream database also compares this table.

11.12.3 Data Check in the Sharding Scenario

`sync-diff-inspector` supports data check in the sharding scenario. Assume that you use the [TiDB Data Migration](#) tool to replicate data from multiple MySQL instances into TiDB, you can use `sync-diff-inspector` to check upstream and downstream data.

For scenarios where the number of upstream sharded tables is small and the naming rules of sharded tables do not have a pattern as shown below, you can use `Datasource config` to configure `table-0`, set corresponding **rules** and configure the tables that have the mapping relationship between the upstream and downstream databases. This configuration method requires setting all sharded tables.

Figure 190: shard-table-replica-1

Below is a complete example of the sync-diff-inspector configuration.

```

### Diff Configuration.

##### Global config #####

### The number of goroutines created to check data. The number of
↳ connections between upstream and downstream databases are slightly
↳ greater than this value
check-thread-count = 4

### If enabled, SQL statements is exported to fix inconsistent tables
export-fix-sql = true

### Only compares the table structure instead of the data
check-struct-only = false

##### Datasource config #####
[data-sources.mysql1]
  host = "127.0.0.1"
  port = 3306
  user = "root"
  password = ""

  route-rules = ["rule1"]

[data-sources.mysql2]
  host = "127.0.0.1"
  port = 3306
  user = "root"
  password = ""
  
```

```
route-rules = ["rule2"]

[data-sources.tidb0]
  host = "127.0.0.1"
  port = 4000
  user = "root"
  password = ""

##### Routes #####
[routes.rule1]
schema-pattern = "test"    # Matches the schema name of the data source.
  ↳ Supports the wildcards "*" and "?"
table-pattern = "table-[1-2]" # Matches the table name of the data source.
  ↳ Supports the wildcards "*" and "?"
target-schema = "test"     # The name of the schema in the target database
target-table = "table-0"   # The name of the target table

[routes.rule2]
schema-pattern = "test"    # Matches the schema name of the data source.
  ↳ Supports the wildcards "*" and "?"
table-pattern = "table-3" # Matches the table name of the data source.
  ↳ Supports the wildcards "*" and "?"
target-schema = "test"     # The name of the schema in the target database
target-table = "table-0"   # The name of the target table

##### Task config #####
[task]
  output-dir = "./output"

  source-instances = ["mysql1", "mysql2"]

  target-instance = "tidb0"

  # The tables of downstream databases to be compared. Each table needs to
  ↳ contain the schema name and the table name, separated by '.'
  target-check-tables = ["test.table-0"]
```

You can use `table-rules` for configuration when there are a large number of upstream sharded tables and the naming rules of all sharded tables have a pattern, as shown below:

Figure 191: shard-table-replica-2

Below is a complete example of the sync-diff-inspector configuration.

```

### Diff Configuration.
##### Global config #####

### The number of goroutines created to check data. The number of
↳ connections between upstream and downstream databases are slightly
↳ greater than this value.
check-thread-count = 4

### If enabled, SQL statements is exported to fix inconsistent tables.
export-fix-sql = true

### Only compares the table structure instead of the data.
check-struct-only = false

##### Datasource config #####
[data-sources.mysql1]
  host = "127.0.0.1"
  port = 3306
  user = "root"
  password = ""

[data-sources.mysql2]
  host = "127.0.0.1"
  port = 3306
  user = "root"
  
```

```
password = ""

[data-sources.tidb0]
  host = "127.0.0.1"
  port = 4000
  user = "root"
  password = ""

##### Routes #####
[routes.rule1]
schema-pattern = "test" # Matches the schema name of the data source.
  ↳ Supports the wildcards "*" and "?"
table-pattern = "table-*" # Matches the table name of the data source.
  ↳ Supports the wildcards "*" and "?"
target-schema = "test" # The name of the schema in the target database
target-table = "table-0" # The name of the target table

##### Task config #####
[task]
  output-dir = "./output"
  source-instances = ["mysql1", "mysql2"]

  target-instance = "tidb0"

  # The tables of downstream databases to be compared. Each table needs to
  ↳ contain the schema name and the table name, separated by '.'
  target-check-tables = ["test.table-0"]
```

11.12.3.1 Note

If `test.table-0` exists in the upstream database, the downstream database also compares this table.

11.12.4 Data Check for TiDB Upstream and Downstream Clusters

You can use TiDB Binlog to build upstream and downstream clusters of TiDB. When Drainer replicates data to TiDB, the checkpoint is saved and the TSO mapping relationship between the upstream and downstream is also saved as `ts-map`. To check data between the upstream and downstream, configure `snapshot` in `sync-diff-inspector`.

11.12.4.1 Step 1: obtain `ts-map`

To obtain `ts-map`, execute the following SQL statement in the downstream TiDB cluster:

```
mysql> select * from tidb_binlog.checkpoint;
+---+
| clusterID          | checkPoint |
+---+
| 6711243465327639221 | {"commitTS":409622383615541249,"ts-map":{"primary-ts":409621863377928194,"secondary-ts":409621863377928345}} |
+---+
```

11.12.4.2 Step 2: configure snapshot

Then configure the snapshot information of the upstream and downstream databases by using the `ts-map` information obtained in [Step 1](#).

Here is a configuration example of the `Datasource` config section:

```
##### Datasource config #####
[data-sources.uptidb]
  host = "172.16.0.1"
  port = 4000
  user = "root"
  password = ""
  snapshot = "409621863377928194"

[data-sources.downtidb]
  host = "172.16.0.2"
  port = 4000
  user = "root"
  snapshot = "409621863377928345"
```

Note:

- Set `db-type` of Drainer to `tidb` to ensure that `ts-map` is saved in the checkpoint.

- Modify the Garbage Collection (GC) time of TiKV to ensure that the historical data corresponding to snapshot is not collected by GC during the data check. It is recommended that you modify the GC time to 1 hour and recover the setting after the check.
- In some versions of TiDB Binlog, `master-ts` and `slave-ts` are stored in `ts-map`. `master-ts` is equivalent to `primary-ts` and `slave-ts` is equivalent to `secondary-ts`.
- The above example only shows the section of `Datasource` config. For complete configuration, refer to [sync-diff-inspector User Guide](#).

11.12.5 Data Check in the DM Replication Scenario

When using replication tools such as [TiDB Data Migration](#), you need to check the data consistency before and after the replication process. You can set a specific `task-name` configuration from `DM-master` to perform a data check.

The following is a simple configuration example. To learn the complete configuration, refer to [Sync-diff-inspector User Guide](#).

```
### Diff Configuration.

##### Global config #####

### The number of goroutines created to check data. The number of
    ↪ connections between upstream and downstream databases are slightly
    ↪ greater than this value.
check-thread-count = 4

### If enabled, SQL statements is exported to fix inconsistent tables.
export-fix-sql = true

### Only compares the table structure instead of the data.
check-struct-only = false

### The IP address of dm-master and the format is "http://127.0.0.1:8261".
dm-addr = "http://127.0.0.1:8261"

### Specifies the `task-name` of DM.
dm-task = "test"

##### Task config #####
[task]
    output-dir = "./output"
```

```
# The tables of downstream databases to be compared. Each table needs to
  ↪ contain the schema name and the table name, separated by '.'
target-check-tables = ["hb_test.*"]
```

This example is configured in `dm-task = "test"`, which checks all the tables of `hb_test` schema under the "test" task. It automatically gets the regular matching of the schemas between upstream and downstream databases to verify the data consistency after DM replication.

11.13 TiSpark

11.13.1 TiSpark User Guide

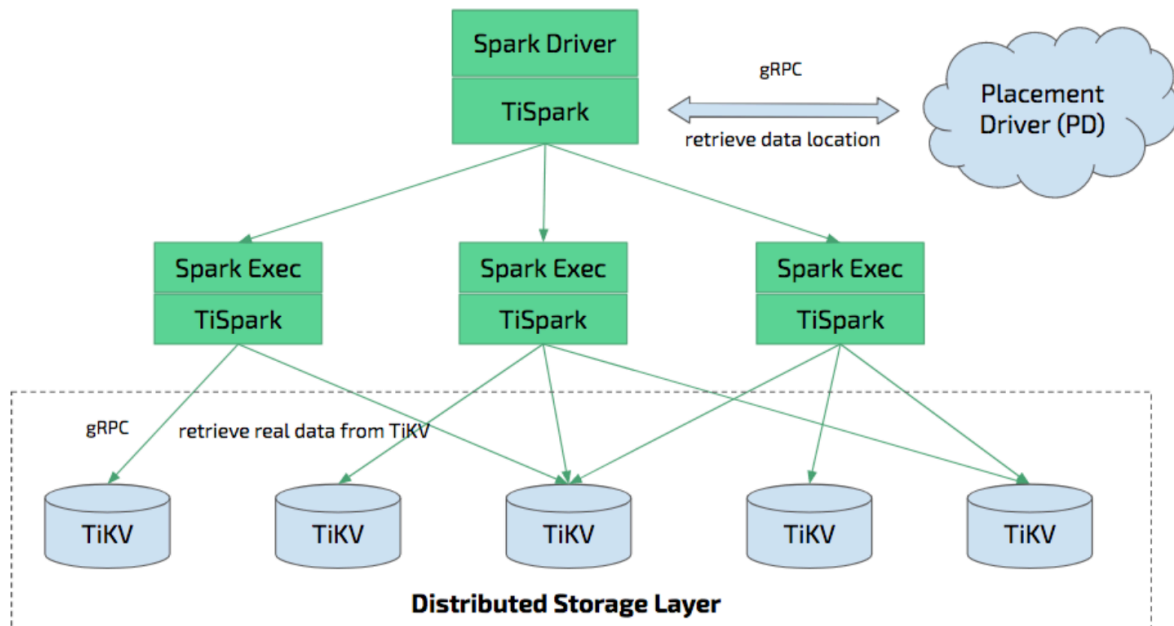

Figure 192: TiSpark architecture

TiSpark is a thin layer built for running Apache Spark on top of TiDB/TiKV to answer the complex OLAP queries. It takes advantages of both the Spark platform and the distributed TiKV cluster and seamlessly glues to TiDB, the distributed OLTP database, to provide a Hybrid Transactional/Analytical Processing (HTAP) solution to serve as a one-stop solution for both online transactions and analysis.

TiFlash is another tool that enables HTAP. Both TiFlash and TiSpark allow the use of multiple hosts to execute OLAP queries on OLTP data. TiFlash stores data in a columnar

format, which allows more efficient analytical queries. TiFlash and TiSpark can be used together.

TiSpark depends on the TiKV cluster and the PD cluster. You also need to set up a Spark cluster. This document provides a brief introduction to how to setup and use TiSpark. It requires some basic knowledge of Apache Spark. For more information, see [Apache Spark website](#).

Deeply integrating with Spark Catalyst Engine, TiSpark provides precise control on computing. This allows Spark to read data from TiKV efficiently. TiSpark also supports index seek, which enables high-speed point query.

TiSpark accelerates data queries by pushing computing to TiKV so as to reduce the volume of data to be processed by Spark SQL. Meanwhile, TiSpark can use TiDB built-in statistics to select the best query plan.

With TiSpark and TiDB, you can run both transaction and analysis tasks on the same platform without building and maintaining ETLs. This simplifies the system architecture and reduces the cost of maintenance.

You can use tools of the Spark ecosystem for data processing on TiDB:

- TiSpark: Data analysis and ETLs
- TiKV: Data retrieval
- Scheduling system: Report generation

Also, TiSpark supports distributed writes to TiKV. Compared with writes to TiDB by using Spark and JDBC, distributed writes to TiKV can implement transactions (either all data are written successfully or all writes fail), and the writes are faster.

Warning:

Because TiSpark accesses TiKV directly, the access control mechanisms used by TiDB Server are not applicable to TiSpark. Since TiSpark v2.5.0, TiSpark supports user authentication and authorization, for more information, see [Security](#).

11.13.1.1 Environment setup

The following table lists the compatibility information of the supported TiSpark versions. You can choose a TiSpark version according to your need.

TiSpark version	TiDB, TiKV, and PD versions	Spark version	Scala version
2.4.x-scala_2.11	5.x, 4.x	2.3.x, 2.4.x	2.11

TiSpark version	TiDB, TiKV, and PD versions	Spark version	Scala version
2.4.x-scala_2.12	5.x, 4.x	2.4.x	2.12
2.5.x	5.x, 4.x	3.0.x, 3.1.x	2.12
3.0.x	5.x, 4.x	3.0.x, 3.1.x, 3.2.x	2.12

TiSpark runs in any Spark mode such as YARN, Mesos, and Standalone.

11.13.1.2 Recommended configuration

This section describes the recommended configuration of independent deployment of TiKV and TiSpark, independent deployment of Spark and TiSpark, and co-deployed TiKV and TiSpark.

See also [TiSpark Deployment Topology](#) for more details about how to deploy TiSpark using TiUP.

11.13.1.2.1 Configuration of independent deployment of TiKV and TiSpark

For independent deployment of TiKV and TiSpark, it is recommended to refer to the following recommendations:

- Hardware configuration
 - For general purposes, refer to the TiDB and TiKV hardware configuration [recommendations](#).
 - If the usage is more focused on the analysis scenarios, you can increase the memory of the TiKV nodes to at least 64G.

11.13.1.2.2 Configuration of independent deployment of Spark and TiSpark

See the [Spark official website](#) for the detail hardware recommendations. The following is a short overview of TiSpark configuration:

- It is recommended to allocate 32G memory for Spark, and reserve at least 25% of the memory for the operating system and buffer cache.
- It is recommended to provision at least 8 to 16 cores on per machine for Spark. Initially, you can assign all the CPU cores to Spark.

11.13.1.2.3 Configuration of co-deployed TiKV and TiSpark

To co-deploy TiKV and TiSpark, add TiSpark required resources to the TiKV reserved resources, and allocate 25% of the memory for the system.

11.13.1.3 Deploy the TiSpark cluster

Download TiSpark's jar package [here](#) and place it in the `$SPARKPATH/jars` folder.

Note:

TiSpark v2.1.x and older versions have file names that look like `tispark-
↪ core-2.1.9-spark_2.4-jar-with-dependencies.jar`. Please check the [releases page on GitHub](#) for the exact file name for the version you want.

The following is a short example of how to install TiSpark v2.4.1:

```
wget https://github.com/pingcap/tispark/releases/download/v2.4.1/tispark-  
↪ assembly-2.4.1.jar  
mv tispark-assembly-2.4.1.jar $SPARKPATH/jars/
```

Copy the `spark-defaults.conf` from the `spark-defaults.conf.template` file:

```
cp conf/spark-defaults.conf.template conf/spark-defaults.conf
```

In the `spark-defaults.conf` file, add the following lines:

```
spark.tispark.pd.addresses $pd_host:$pd_port  
spark.sql.extensions org.apache.spark.sql.TiExtensions
```

The `spark.tispark.pd.addresses` configuration allows you to put in multiple PD servers. Specify the port number for each of them. For example, when you have multiple PD servers on `10.16.20.1,10.16.20.2,10.16.20.3` with the port `2379`, put it as `10.16.20.1:2379,10.16.20.2:2379,10.16.20.3:2379`.

Note:

If TiSpark could not communicate properly, please check your firewall configuration. You can adjust the firewall rules or disable it on your need.

11.13.1.3.1 Deploy TiSpark on an existing Spark cluster

Running TiSpark on an existing Spark cluster does not require a reboot of the cluster. You can use Spark's `--jars` parameter to introduce TiSpark as a dependency:

```
spark-shell --jars $TISPARK_FOLDER/tispark-${name_with_version}.jar
```

11.13.1.3.2 Deploy TiSpark without a Spark cluster

If you do not have a Spark cluster, we recommend using the standalone mode. For more information, see [Spark Standalone](#). If you encounter any problem, see [Spark official website](#). And you are welcome to [file an issue](#) on our GitHub.

11.13.1.4 Use Spark Shell and Spark SQL

Assume that you have successfully started the TiSpark cluster as described above. The following describes how to use Spark SQL for OLAP analysis on a table named `lineitem` in the `tpch` database.

To generate the test data via a TiDB server available on `192.168.1.101`:

```
tiup bench tpch prepare --host 192.168.1.101 --user root
```

Assuming that your PD node is located at `192.168.1.100`, port `2379`, add the following command to `$SPARK_HOME/conf/spark-defaults.conf`:

```
spark.tispark.pd.addresses 192.168.1.100:2379
spark.sql.extensions org.apache.spark.sql.TiExtensions
```

Start the Spark Shell:

```
./bin/spark-shell
```

And then enter the following command in the Spark Shell as in native Apache Spark:

```
spark.sql("use tpch")
spark.sql("select count(*) from lineitem").show
```

The result is:

```
+-----+
| Count (1) |
+-----+
| 2000      |
+-----+
```

Besides Spark Shell, there is also Spark SQL available. To use Spark SQL, run:

```
./bin/spark-sql
```

You can run the same query:

```
use tpch;
select count(*) from lineitem;
```

The result is:

```
2000
Time taken: 0.673 seconds, Fetched 1 row(s)
```

11.13.1.5 Use JDBC support with ThriftServer

You can use Spark Shell or Spark SQL without JDBC support. However, JDBC support is required for tools like beeline. JDBC support is provided by Thrift server. To use Spark's Thrift server, run:

```
./sbin/start-thriftserver.sh
```

To connect JDBC with Thrift server, you can use JDBC supported tools including beeline.

For example, to use it with beeline:

```
./bin/beeline jdbc:hive2://localhost:10000
```

If the following message is displayed, you have enabled beeline successfully.

```
Beeline version 1.2.2 by Apache Hive
```

Then, you can run the query command:

```
1: jdbc:hive2://localhost:10000> use testdb;
+-----+
| Result |
+-----+
+-----+
No rows selected (0.013 seconds)

select count(*) from account;
+-----+
| count(1) |
+-----+
| 1000000 |
+-----+
1 row selected (1.97 seconds)
```

11.13.1.6 Use TiSpark together with Hive

You can use TiSpark together with Hive. Before starting Spark, you need to set the HADOOP_CONF_DIR environment variable to your Hadoop configuration folder and copy `hive ↪ -site.xml` to the `spark/conf` folder.

```
val tisparkDF = spark.sql("select * from tispark_table").toDF
tisparkDF.write.saveAsTable("hive_table") // save table to hive
spark.sql("select * from hive_table a, tispark_table b where a.col1 = b.
↪ col1").show // join table across Hive and Tispark
```

11.13.1.7 Batch write DataFrames into TiDB using TiSpark

Starting from v2.3, TiSpark natively supports batch writing DataFrames into TiDB clusters. This writing mode is implemented through the two-phase commit protocol of TiKV.

Compared with the writing through Spark + JDBC, the TiSpark batch writing has the following advantages:

Aspects to compare	TiSpark batch writes	Spark + JDBC writes
Atomicity	The DataFrames either are all written successfully or all fail to write.	If the Spark task fails and exits during the writing process, a part of the data might be written successfully.
Isolation	During the writing process, the data being written is invisible to other transactions.	During the writing process, some successfully written data is visible to other transactions.

Aspects to compare	TiSpark batch writes	Spark + JDBC writes
Error recovery	If the batch write fails, you only need to re-run Spark.	An application is required to achieve idempotence. For example, if the batch write fails, you need to clean up the part of the successfully written data and re-run Spark. You need to set <code>spark.task.maxFailures</code> \hookrightarrow <code>=1</code> to prevent data duplication caused by task retry.
Speed	Data is directly written into TiKV, which is faster.	Data is written to TiKV through TiDB, which affects the speed.

The following example shows how to batch write data using TiSpark via the scala API:

```
// select data to write
val df = spark.sql("select * from tpch.ORDERS")

// write data to tidb
df.write
  format("tidb")
  option("tidb.addr", "127.0.0.1")
  option("tidb.port", "4000")
  option("tidb.user", "root")
  option("tidb.password", "")
  option("database", "tpch")
  option("table", "target_orders")
```

```
mode("append").  
save()
```

If the amount of data to write is large and the writing time exceeds ten minutes, you need to ensure that the GC time is longer than the writing time.

```
UPDATE mysql.tidb SET VARIABLE_VALUE="6h" WHERE VARIABLE_NAME="  
↳ tikv_gc_life_time";
```

Refer to [this document](#) for details.

11.13.1.8 Load Spark Dataframe into TiDB using JDBC

In addition to using TiSpark to batch write DataFrames into the TiDB cluster, you can also use Spark's native JDBC support for the data writing:

```
import org.apache.spark.sql.execution.datasources.jdbc.JDBCOptions  
  
val customer = spark.sql("select * from customer limit 100000")  
// You might repartition the source to make it balance across nodes  
// and increase the concurrency.  
val df = customer.repartition(32)  
df.write  
  .mode(saveMode = "append")  
  .format("jdbc")  
  .option("driver", "com.mysql.jdbc.Driver")  
  // Replace the host and port with that of your own and be sure to use the  
  ↳ rewrite batch  
  .option("url", "jdbc:mysql://127.0.0.1:4000/test?rewriteBatchedStatements=  
  ↳ true")  
  .option("useSSL", "false")  
  // As tested, 150 is good practice  
  .option(JDBCOptions.JDBC_BATCH_INSERT_SIZE, 150)  
  .option("dbtable", s"cust_test_select") // database name and table name  
  ↳ here  
  .option("isolationLevel", "NONE") // recommended to set isolationLevel to  
  ↳ NONE if you have a large DF to load.  
  .option("user", "root") // TiDB user here  
  .save()
```

It is recommended to set `isolationLevel` to `NONE` to avoid large single transactions which might potentially lead to TiDB OOM.

Note:

When you use JDBC, the default value of `isolationLevel` is `READ_UNCOMMITTED`, which causes the error of unsupported isolation level transactions. It is recommended to set the value of `isolationLevel` to `NONE`.

11.13.1.9 Statistics information

TiSpark uses TiDB statistic information for the following items:

1. Determining which index to use in your query plan with the estimated lowest cost.
2. Small table broadcasting, which enables efficient broadcast join.

If you would like TiSpark to use statistic information, first you need to make sure that concerning tables have already been analyzed. Read more about [how to analyze tables](#).

Starting from TiSpark 2.0, statistics information is default to auto load.

11.13.1.10 Security

If you are using TiSpark v2.5.0 or a later version, you can authenticate and authorize TiSpark users by using TiDB.

The authentication and authorization feature is disabled by default. To enable it, add the following configurations to the Spark configuration file `spark-defaults.conf`.

```
// Enable authentication and authorization
spark.sql.auth.enable true

// Configure TiDB information
spark.sql.tidb.addr $your_tidb_server_address
spark.sql.tidb.port $your_tidb_server_port
spark.sql.tidb.user $your_tidb_server_user
spark.sql.tidb.password $your_tidb_server_password
```

For more information, see [Authorization and authentication through TiDB server](#).

Note:

After enabling the authentication and authorization feature, TiSpark Spark SQL can only use TiDB as the data source, so switching to other data sources (such as Hive) makes tables invisible.

11.13.1.11 TiSpark FAQ

Q: What are the pros/cons of independent deployment as opposed to a shared resource with an existing Spark / Hadoop cluster?

A: You can use the existing Spark cluster without a separate deployment, but if the existing cluster is busy, TiSpark will not be able to achieve the desired speed.

Q: Can I mix Spark with TiKV?

A: If TiDB and TiKV are overloaded and run critical online tasks, consider deploying TiSpark separately. You also need to consider using different NICs to ensure that OLTP's network resources are not compromised and affect online business. If the online business requirements are not high or the loading is not large enough, you can consider mixing TiSpark with TiKV deployment.

Q: What can I do if `warning: WARN ObjectStore:568 - Failed to get database` is returned when executing SQL statements using TiSpark?

A: You can ignore this warning. It occurs because Spark tries to load two non-existent databases (`default` and `global_temp`) in its catalog. If you want to mute this warning, modify `log4j` by adding `log4j.logger.org.apache.hadoop.hive.metastore.ObjectStore=ERROR` to the `log4j` file in `tispark/conf`. You can add the parameter to the `log4j` file of the `config` under Spark. If the suffix is `template`, you can use the `mv` command to change it to `properties`.

Q: What can I do if `java.sql.BatchUpdateException: Data Truncated` is returned when executing SQL statements using TiSpark?

A: This error occurs because the length of the data written exceeds the length of the data type defined by the database. You can check the field length and adjust it accordingly.

Q: Does TiSpark read Hive metadata by default?

A: By default, TiSpark searches for the Hive database by reading the Hive metadata in `hive-site`. If the search task fails, it searches for the TiDB database instead, by reading the TiDB metadata.

If you do not need this default behavior, do not configure the Hive metadata in `hive-site`.

Q: What can I do if `Error: java.io.InvalidClassException: com.pingcap.tikv.region.TiRegion; local class incompatible: stream classdesc serialVersionUID` is returned when TiSpark is executing a Spark task?

A: The error message shows a `serialVersionUID` conflict, which occurs because you have used `class` and `TiRegion` of different versions. Because `TiRegion` only exists in TiSpark, multiple versions of TiSpark packages might be used. To fix this error, you need to make sure the version of TiSpark dependency is consistent among all nodes in the cluster.

12 Reference

12.1 Cluster Architecture

12.1.1 TiDB Architecture

Compared with the traditional standalone databases, TiDB has the following advantages:

- Has a distributed architecture with flexible and elastic scalability.
- Fully compatible with the MySQL 5.7 protocol, common features and syntax of MySQL. To migrate your applications to TiDB, you do not need to change a single line of code in many cases.
- Supports high availability with automatic failover when a minority of replicas fail; transparent to applications.
- Supports ACID transactions, suitable for scenarios requiring strong consistency such as bank transfer.
- Provides a rich series of **data migration tools** for migrating, replicating, or backing up data.

As a distributed database, TiDB is designed to consist of multiple components. These components communicate with each other and form a complete TiDB system. The architecture is as follows:

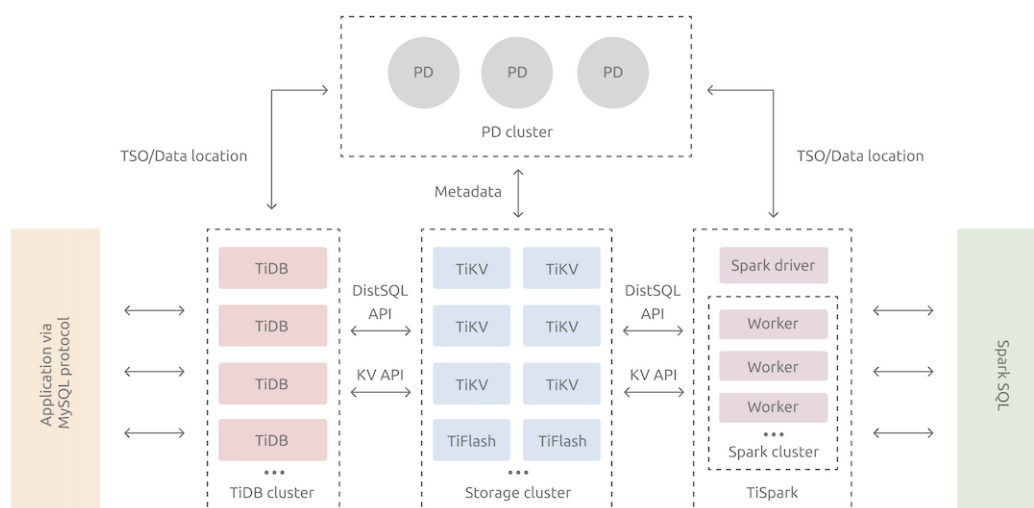

Figure 193: TiDB Architecture

12.1.1.1 TiDB server

The TiDB server is a stateless SQL layer that exposes the connection endpoint of the MySQL protocol to the outside. The TiDB server receives SQL requests, performs SQL parsing and optimization, and ultimately generates a distributed execution plan. It is horizontally scalable and provides the unified interface to the outside through the load balancing components such as Linux Virtual Server (LVS), HAProxy, or F5. It does not store data and is only for computing and SQL analyzing, transmitting actual data read request to TiKV nodes (or TiFlash nodes).

12.1.1.2 Placement Driver (PD) server

The PD server is the metadata managing component of the entire cluster. It stores metadata of real-time data distribution of every single TiKV node and the topology structure of the entire TiDB cluster, provides the TiDB Dashboard management UI, and allocates transaction IDs to distributed transactions. The PD server is “the brain” of the entire TiDB cluster because it not only stores metadata of the cluster, but also sends data scheduling command to specific TiKV nodes according to the data distribution state reported by TiKV nodes in real time. In addition, the PD server consists of three nodes at least and has high availability. It is recommended to deploy an odd number of PD nodes.

12.1.1.3 Storage servers

12.1.1.3.1 TiKV server

The TiKV server is responsible for storing data. TiKV is a distributed transactional key-value storage engine.

Region is the basic unit to store data. Each Region stores the data for a particular Key Range which is a left-closed and right-open interval from StartKey to EndKey.

Multiple Regions exist in each TiKV node. TiKV APIs provide native support to distributed transactions at the key-value pair level and supports the Snapshot Isolation level isolation by default. This is the core of how TiDB supports distributed transactions at the SQL level. After processing SQL statements, the TiDB server converts the SQL execution plan to an actual call to the TiKV API. Therefore, data is stored in TiKV. All the data in TiKV is automatically maintained in multiple replicas (three replicas by default), so TiKV has native high availability and supports automatic failover.

12.1.1.3.2 TiFlash server

The TiFlash Server is a special type of storage server. Unlike ordinary TiKV nodes, TiFlash stores data by column, mainly designed to accelerate analytical processing.

12.1.2 TiDB Storage

This document introduces some design ideas and key concepts of [TiKV](#).

Figure 194: storage-architecture

12.1.2.1 Key-Value pairs

The first thing to decide for a data storage system is the data storage model, that is, in what form the data is saved. TiKV's choice is the Key-Value model and provides an ordered traversal method. There are two key points for TiKV data storage model:

- This is a huge Map (similar to `std::Map` in C++), which stores Key-Value pairs.
- The Key-Value pair in the Map is ordered according to Keys' binary order, which means you can Seek the position of a particular Key and then call the Next method to get the Key-Value pairs larger than this Key in incremental order.

Note that the KV storage model for TiKV described in this document has nothing to do with tables of SQL. This document does not discuss any concepts related to SQL and only focuses on how to implement a high-performance, high-reliability, distributed Key-Value storage such as TiKV.

12.1.2.2 Local storage (RocksDB)

For any persistent storage engine, data is eventually saved on disk, and TiKV is no exception. TiKV does not write data directly on the disk, but stores data in RocksDB,

which is responsible for the data storage. The reason is that it costs a lot to develop a standalone storage engine, especially a high-performance standalone engine that requires careful optimization.

RocksDB is an excellent standalone storage engine open-sourced by Facebook. This engine can meet various requirements of TiKV for a single engine. Here, you can simply consider RocksDB as a single persistent Key-Value Map.

12.1.2.3 Raft protocol

What's more, the implementation of TiKV faces a more difficult thing: to secure data safety in case a single machine fails.

A simple way is to replicate data to multiple machines, so that even if one machine fails, the replicas on other machines are still available. In other words, you need a data replication scheme that is reliable, efficient, and able to handle the situation of a failed replica. All of these are made possible by the Raft algorithm.

Raft is a consensus algorithm. This document only briefly introduces Raft. For more details, you can see [In Search of an Understandable Consensus Algorithm](#). The Raft has several important features:

- Leader election
- Membership changes (such as adding replicas, deleting replicas, transferring leaders, and so on)
- Log replication

TiKV use Raft to perform data replication. Each data change will be recorded as a Raft log. Through Raft log replication, data is safely and reliably replicated to multiple nodes of the Raft group. However, according to Raft protocol, successful writes only need that data is replicated to the majority of nodes.

Figure 195: Raft in TiDB

In summary, TiKV can quickly store data on disk via the standalone machine RocksDB, and replicate data to multiple machines via Raft in case of machine failure. Data is written through the interface of Raft instead of to RocksDB. With the implementation of Raft, TiKV becomes a distributed Key-Value storage. Even with a few machine failures, TiKV can automatically complete replicas by virtue of the native Raft protocol, which does not impact the application.

12.1.2.4 Region

To make it easy to understand, let's assume that all data only has one replica. As mentioned earlier, TiKV can be regarded as a large, orderly KV Map, so data is distributed across multiple machines in order to achieve horizontal scalability. For a KV system, there are two typical solutions to distributing data across multiple machines:

- Hash: Create Hash by Key and select the corresponding storage node according to the Hash value.
- Range: Divide ranges by Key, where a segment of serial Key is stored on a node.

TiKV chooses the second solution that divides the whole Key-Value space into a series of consecutive Key segments. Each segment is called a Region. There is a size limit for each Region to store data (the default value is 96 MB and the size can be configured). Each Region can be described by $[\text{StartKey}, \text{EndKey})$, a left-closed and right-open interval.

Figure 196: Region in TiDB

Note that the Region here has nothing to do with the table in SQL. In this document, forget about SQL and focus on KV for now. After dividing data into Regions, TiKV will perform two important tasks:

- Distributing data to all nodes in the cluster and use Region as the basic unit. Try its best to ensure that the number of Regions on each node is roughly similar.
- Performing Raft replication and membership management in Region.

These two tasks are very important and will be introduced one by one.

- First, data is divided into many Regions according to Key, and the data for each Region is stored on only one node (ignoring multiple replicas). The TiDB system has a PD component that is responsible for spreading Regions as evenly as possible across all nodes in the cluster. In this way, on one hand, the storage capacity is scaled horizontally (Regions on the other nodes are automatically scheduled to the newly added node); on the other hand, load balancing is achieved (the situation where one node has a lot of data while the others have little will not occur).

At the same time, in order to ensure that the upper client can access the needed data, there is a component (PD) in the system to record the distribution of Regions on the node, that is, the exact Region of a Key and the node of that Region placed through any Key.

- For the second task, TiKV replicates data in Regions, which means that data in one Region will have multiple replicas with the name “Replica”. Multiple Replicas of a

Regions are stored on different nodes to form a Raft Group, which is kept consistent through the Raft algorithm.

One of the Replicas serves as the Leader of the Group and other as the Follower. By default, all reads and writes are processed through the Leader, where reads are done and writes are replicated to followers. The following diagram shows the whole picture about Region and Raft group.

Figure 197: TiDB Storage

As we distribute and replicate data in Regions, we have a distributed Key-Value system that, to some extent, has the capability of disaster recovery. You no longer need to worry about the capacity, or disk failure and data loss.

12.1.2.5 MVCC

Many databases implement multi-version concurrency control (MVCC), and TiKV is no exception. Imagine the situation where two clients modify the value of a Key at the same time. Without MVCC, the data needs to be locked. In a distributed scenario, it might cause performance and deadlock problems. TiKV's MVCC implementation is achieved by appending a version number to Key. In short, without MVCC, TiKV's data layout can be seen as:

```
Key1 -> Value
Key2 -> Value
```

```
.....  
KeyN -> Value
```

With MVCC, the key array of TiKV is like this:

```
Key1_Version3 -> Value  
Key1_Version2 -> Value  
Key1_Version1 -> Value  
.....  
Key2_Version4 -> Value  
Key2_Version3 -> Value  
Key2_Version2 -> Value  
Key2_Version1 -> Value  
.....  
KeyN_Version2 -> Value  
KeyN_Version1 -> Value  
.....
```

Note that for multiple versions of the same Key, versions with larger numbers are placed first (see the [Key-Value](#) section where Keys are arranged in order), so that when you obtain Value through Key + Version, the Key of MVCC can be constructed with Key and Version, which is `Key_Version`. Then you can directly locate the first position greater than or equal to this `Key_Version` through RocksDB's `SeekPrefix(Key_Version)` API.

12.1.2.6 Distributed ACID transaction

Transaction of TiKV adopts the model used by Google in BigTable: [Percolator](#). TiKV's implementation is inspired by this paper, with a lot of optimizations. See [transaction overview](#) for details.

12.1.3 TiDB Computing

Based on the distributed storage provided by TiKV, TiDB builds the computing engine that combines great capability of transactional processing with that of data analysis. This document starts by introducing a data mapping algorithm that maps data from TiDB database tables to (Key, Value) key-value pairs in TiKV, then introduces how TiDB manages metadata, and finally illustrates the architecture of the TiDB SQL layer.

For the storage solution on which the computing layer is dependent, this document only introduces the row-based storage structure of TiKV. For OLAP services, TiDB introduces a column-based storage solution [TiFlash](#) as a TiKV extension.

12.1.3.1 Mapping table data to Key-Value

This section describes the scheme for mapping data to (Key, Value) key-value pairs in TiDB. Data to be mapped here includes the following two types:

- Data of each row in the table, hereinafter referred to as table data.
- Data of all indexes in the table, hereinafter referred to as index data.

12.1.3.1.1 Mapping of table data to Key-Value

In a relational database, a table might have many columns. To map the data of each column in a row to a (Key, Value) key-value pair, you need to consider how to construct the Key. First of all, in OLTP scenarios, there are many operations such as adding, deleting, changing, and searching for data on a single or multiple rows, which needs the database to read a row of data quickly. Therefore, each key should have a unique ID (either explicit or implicit) to make it quick to locate. Then, many OLAP queries require a full table scan. If you can encode the keys of all rows in a table into a range, the whole table can be efficiently scanned by range queries.

Based on the considerations above, the mapping of table data to Key-Value in TiDB is designed as follows:

- To ensure that data from the same table is kept together for easy searching, TiDB assigns a table ID to each table represented by `TableID`. Table ID is an integer that is unique throughout the cluster.
- TiDB assigns a row ID, represented by `RowID`, to each row of data in the table. The row ID is also an integer, unique within the table. For row ID, TiDB has made a small optimization: if a table has an integer type primary key, TiDB uses the value of this primary key as the row ID.

Each row of data is encoded as a (Key, Value) key-value pair according to the following rule:

```
Key:  tablePrefix{TableID}_recordPrefixSep{RowID}
Value: [col1, col2, col3, col4]
```

`tablePrefix` and `recordPrefixSep` are both special string constants used to distinguish other data in Key space. The exact values of the string constants are introduced in [Summary of mapping relationships](#).

12.1.3.1.2 Mapping of indexed data to Key-Value

TiDB supports both primary keys and secondary indexes (both unique and non-unique indexes). Similar to the table data mapping scheme, TiDB assigns an index ID to each index of the table represented by `IndexID`.

For primary keys and unique indexes, it is needed to quickly locate the corresponding `RowID` based on the key-value pair, so such a key-value pair is encoded as follows.

```
Key:  tablePrefix{tableID}_indexPrefixSep{indexID}_indexedColumnsValue
Value: RowID
```

For ordinary secondary indexes that do not need to satisfy the uniqueness constraint, a single key might correspond to multiple rows. It needs to query corresponding RowID according to the range of keys. Therefore, the key-value pair must be encoded according to the following rule:

```
Key:  tablePrefix{TableID}_indexPrefixSep{IndexID}_indexedColumnsValue_{
      ↪ RowID}
Value: null
```

12.1.3.1.3 Summary of mapping relationships

`tablePrefix`, `recordPrefixSep`, and `indexPrefixSep` in all of the above encoding rules are string constants that are used to distinguish a KV from other data in the Key space, which are defined as follows:

```
tablePrefix    = []byte{'t'}
recordPrefixSep = []byte{'r'}
indexPrefixSep = []byte{'i'}
```

Also note that in the above encoding schemes, no matter table data or index data key encoding scheme, all rows in a table have the same key prefix, and all data of an index also has the same prefix. Data with the same prefixes are thus arranged together in TiKV's key space. Therefore, by carefully designing the encoding scheme of the suffix part to ensure that the pre-encoding and post-encoding comparisons remain the same, the table data or index data can be stored in TiKV in an ordered manner. Using this encoding scheme, all row data in a table is arranged orderly by RowID in the TiKV's key space, and the data of a particular index is also arranged sequentially in the key space according to the specific value of the index data (`indexedColumnsValue`).

12.1.3.1.4 Example of Key-Value mapping relationship

This section shows a simple example for you to understand the Key-Value mapping relationship of TiDB. Suppose the following table exists in TiDB.

```
CREATE TABLE User (
  ID int,
  Name varchar(20),
  Role varchar(20),
  Age int,
  PRIMARY KEY (ID),
  KEY idxAge (Age)
);
```

Suppose there are 3 rows of data in the table.

```
1, "TiDB", "SQL Layer", 10
2, "TiKV", "KV Engine", 20
```

```
3, "PD", "Manager", 30
```

Each row of data is mapped to a (Key, Value) key-value pair, and the table has an `int` type primary key, so the value of `RowID` is the value of this primary key. Suppose the table's `TableID` is 10, and then its table data stored on TiKV is:

```
t10_r1 --> ["TiDB", "SQL Layer", 10]
t10_r2 --> ["TiKV", "KV Engine", 20]
t10_r3 --> ["PD", " Manager", 30]
```

In addition to the primary key, the table has a non-unique ordinary secondary index, `idxAge`. Suppose the `IndexID` is 1, and then its index data stored on TiKV is:

```
t10_i1_10_1 --> null
t10_i1_20_2 --> null
t10_i1_30_3 --> null
```

The above example shows the mapping rule from a relational model to a Key-Value model in TiDB, and the consideration behind this mapping scheme.

12.1.3.2 Metadata management

Each database and table in TiDB has metadata that indicates its definition and various attributes. This information also needs to be persisted, and TiDB stores this information in TiKV as well.

Each database or table is assigned a unique ID. As the unique identifier, when table data is encoded to Key-Value, this ID is encoded in the Key with the `m_` prefix. This constructs a key-value pair with the serialized metadata stored in it.

In addition, TiDB also uses a dedicated (Key, Value) key-value pair to store the latest version number of structure information of all tables. This key-value pair is global, and its version number is increased by 1 each time the state of the DDL operation changes. TiDB stores this key-value pair persistently in the PD server with the key of `/tidb/ddl` \leftrightarrow `/global_schema_version`, and Value is the version number value of the `int64` type. Meanwhile, because TiDB applies schema changes online, it keeps a background thread that constantly checks whether the version number of the table structure information stored in the PD server changes. This thread also ensures that the changes of version can be obtained within a certain period of time.

12.1.3.3 SQL layer overview

TiDB's SQL layer, TiDB Server, translates SQL statements into Key-Value operations, forwards the operations to TiKV, the distributed Key-Value storage layer, assembles the results returned by TiKV, and finally returns the query results to the client.

The nodes at this layer are stateless. These nodes themselves do not store data and are completely equivalent.

12.1.3.3.1 SQL computing

The simplest solution to SQL computing is the **mapping of table data to Key-Value** as described in the previous section, which maps SQL queries to KV queries, acquires the corresponding data through the KV interface, and performs various computations.

For example, to execute the `select count(*) from user where name = "TiDB"` SQL statement, TiDB needs to read all data in the table, then checks whether the `name` field is TiDB, and if so, returns this row. The process is as follows:

1. Construct the Key Range: all RowID in a table are in $[0, \text{MaxInt64})$ range. According to the row data Key encoding rule, using 0 and `MaxInt64` can construct a $[\text{StartKey} \rightarrow, \text{EndKey})$ range that is left-closed and right-open.
2. Scan Key Range: read the data in TiKV according to the key range constructed above.
3. Filter data: for each row of data read, calculate the `name = "TiDB"` expression. If the result is `true`, return to this row. If not, skip this row.
4. Calculate `Count(*)`: for each row that meets the requirements, add up to the result of `Count(*)`.

The entire process is illustrated as follows:

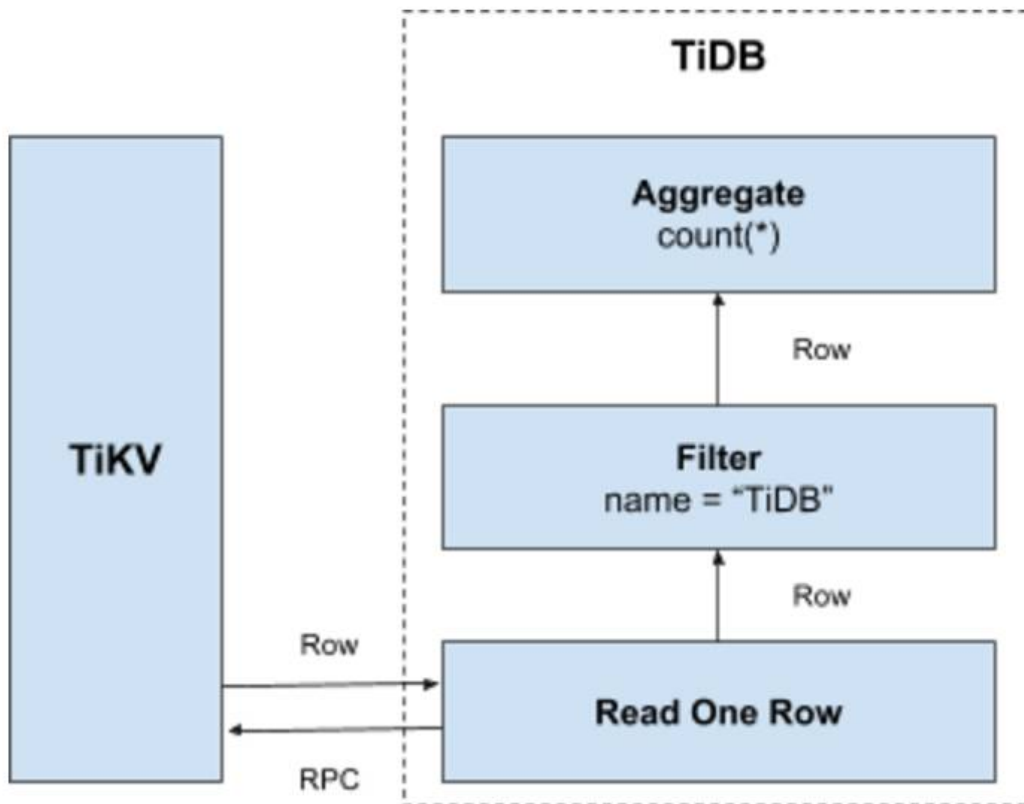

Figure 198: naive sql flow

This solution is intuitive and feasible, but has some obvious problems in a distributed database scenario:

- As the data is being scanned, each row is read from TiKV via a KV operation with at least one RPC overhead, which can be very high if there is a large amount of data to be scanned.
- It is not applicable to all rows. Data that does not meet the conditions does not need to be read.
- From the returned result of this query, only the number of rows that match the requirements is needed, not the value of those rows.

12.1.3.3.2 Distributed SQL operations

To solve the problems above, the computation should be as close to the storage node as possible to avoid a large number of RPC callings. First of all, the SQL predicate condition `name = "TiDB"` should be pushed down to the storage node for computation, so that only valid rows are returned, which avoids meaningless network transfers. Then, the aggregation function `Count(*)` can also be pushed down to the storage nodes for pre-aggregation, and each node only has to return a result of `Count(*)`. The SQL layer will sum up the `Count(*)` results returned by each node.

The following image shows how data returns layer by layer:

Figure 199: dist sql flow

12.1.3.3.3 Architecture of SQL layer

The previous sections introduce some functions of the SQL layer and I hope you have a basic understanding of how SQL statements are handled. In fact, TiDB's SQL layer is much more complicated, with many modules and layers. The following diagram lists the important modules and calling relationships:

Figure 200: tidb sql layer

The user's SQL request is sent to TiDB Server either directly or via Load Balancer. TiDB Server will parse MySQL Protocol Packet, get the content of requests, parse the SQL request syntactically and semantically, develop and optimize query plans, execute a query plan, get and process the data. All data is stored in the TiKV cluster, so in this process, TiDB Server needs to interact with TiKV and get the data. Finally, TiDB Server needs to return the query results to the user.

12.1.4 TiDB Scheduling

The Placement Driver (PD) works as the manager in a TiDB cluster, and it also schedules Regions in the cluster. This article introduces the design and core concepts of the PD scheduling component.

12.1.4.1 Scheduling situations

TiKV is the distributed key-value storage engine used by TiDB. In TiKV, data is organized as Regions, which are replicated on several stores. In all replicas, a leader is responsible for reading and writing, and followers are responsible for replicating Raft logs from the leader.

Now consider about the following situations:

- To utilize storage space in a high-efficient way, multiple Replicas of the same Region need to be properly distributed on different nodes according to the Region size;
- For multiple data center topologies, one data center failure only causes one replica to fail for all Regions;
- When a new TiKV store is added, data can be rebalanced to it;
- When a TiKV store fails, PD needs to consider:

- Recovery time of the failed store.
 - * If it's short (for example, the service is restarted), whether scheduling is necessary or not.
 - * If it's long (for example, disk fault, data is lost, etc.), how to do scheduling.
- Replicas of all Regions.
 - * If the number of replicas is not enough for some Regions, PD needs to complete them.
 - * If the number of replicas is more than expected (for example, the failed store re-joins into the cluster after recovery), PD needs to delete them.
- Read/Write operations are performed on leaders, which can not be distributed only on a few individual stores;
- Not all Regions are hot, so loads of all TiKV stores need to be balanced;
- When Regions are in balancing, data transferring utilizes much network/disk traffic and CPU time, which can influence online services.

These situations can occur at the same time, which makes it harder to resolve. Also, the whole system is changing dynamically, so a scheduler is needed to collect all information about the cluster, and then adjust the cluster. So, PD is introduced into the TiDB cluster.

12.1.4.2 Scheduling requirements

The above situations can be classified into two types:

1. A distributed and highly available storage system must meet the following requirements:
 - The right number of replicas.
 - Replicas need to be distributed on different machines according to different topologies.
 - The cluster can perform automatic disaster recovery from TiKV peers' failure.
2. A good distributed system needs to have the following optimizations:
 - All Region leaders are distributed evenly on stores;
 - Storage capacity of all TiKV peers are balanced;
 - Hot spots are balanced;
 - Speed of load balancing for the Regions needs to be limited to ensure that online services are stable;
 - Maintainers are able to take peers online/offline manually.

After the first type of requirements is satisfied, the system will be failure tolerable. After the second type of requirements is satisfied, resources will be utilized more efficiently and the system will have better scalability.

To achieve the goals, PD needs to collect information firstly, such as state of peers, information about Raft groups and the statistics of accessing the peers. Then we need to specify some strategies for PD, so that PD can make scheduling plans from these information and strategies. Finally, PD distributes some operators to TiKV peers to complete scheduling plans.

12.1.4.3 Basic scheduling operators

All scheduling plans contain three basic operators:

- Add a new replica
- Remove a replica
- Transfer a Region leader between replicas in a Raft group

They are implemented by the Raft commands `AddReplica`, `RemoveReplica`, and `TransferLeader`.

12.1.4.4 Information collection

Scheduling is based on information collection. In short, the PD scheduling component needs to know the states of all TiKV peers and all Regions. TiKV peers report the following information to PD:

- State information reported by each TiKV peer:

Each TiKV peer sends heartbeats to PD periodically. PD not only checks whether the store is alive, but also collects `StoreState` in the heartbeat message. `StoreState` includes:

- Total disk space
- Available disk space
- The number of Regions
- Data read/write speed
- The number of snapshots that are sent/received (The data might be replicated between replicas through snapshots)
- Whether the store is overloaded
- Labels (See [Perception of Topology](#))

You can use PD control to check the status of a TiKV store, which can be Up, Disconnect, Offline, Down, or Tombstone. The following is a description of all statuses and their relationship.

- **Up**: The TiKV store is in service.
- **Disconnect**: Heartbeat messages between the PD and the TiKV store are lost for more than 20 seconds. If the lost period exceeds the time specified by `max-store-down-time`, the status “Disconnect” changes to “Down”.

- **Down:** Heartbeat messages between the PD and the TiKV store are lost for a time longer than `max-store-down-time` (30 minutes by default). In this status, the TiKV store starts replenishing replicas of each Region on the surviving store.
- **Offline:** A TiKV store is manually taken offline through PD Control. This is only an intermediate status for the store to go offline. The store in this status moves all its Regions to other “Up” stores that meet the relocation conditions. When `leader_count` and `region_count` (obtained through PD Control) both show 0, the store status changes to “Tombstone” from “Offline”. In the “Offline” status, **do not** disable the store service or the physical server where the store is located. During the process that the store goes offline, if the cluster does not have target stores to relocate the Regions (for example, inadequate stores to hold replicas in the cluster), the store is always in the “Offline” status.
- **Tombstone:** The TiKV store is completely offline. You can use the `remove-tombstone` interface to safely clean up TiKV in this status.

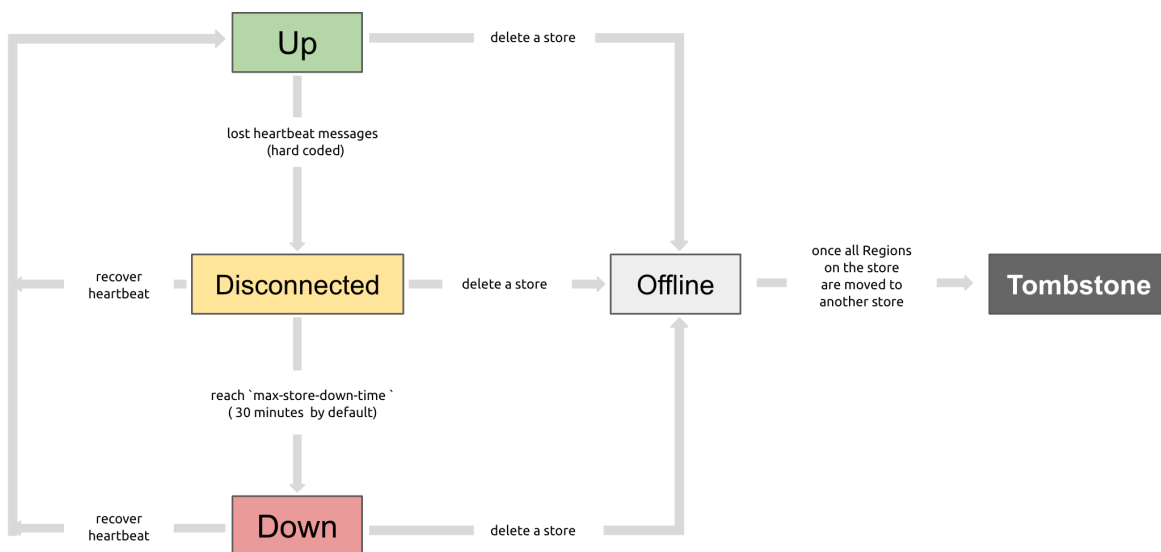

Figure 201: TiKV store status relationship

- Information reported by Region leaders:

Each Region leader sends heartbeats to PD periodically to report `RegionState`, including:

- Position of the leader itself
- Positions of other replicas
- The number of offline replicas

- data read/write speed

PD collects cluster information by the two types of heartbeats and then makes decision based on it.

Besides, PD can get more information from an expanded interface to make a more precise decision. For example, if a store's heartbeats are broken, PD can't know whether the peer steps down temporarily or forever. It just waits a while (by default 30min) and then treats the store as offline if there are still no heartbeats received. Then PD balances all regions on the store to other stores.

But sometimes stores are manually set offline by a maintainer, so the maintainer can tell PD this by the PD control interface. Then PD can balance all regions immediately.

12.1.4.5 Scheduling strategies

After collecting the information, PD needs some strategies to make scheduling plans.

Strategy 1: The number of replicas of a Region needs to be correct

PD can know that the replica count of a Region is incorrect from the Region leader's heartbeat. If it happens, PD can adjust the replica count by adding/removing replica(s). The reason for incorrect replica count can be:

- Store failure, so some Region's replica count is less than expected;
- Store recovery after failure, so some Region's replica count could be more than expected;
- `max-replicas` is changed.

Strategy 2: Replicas of a Region need to be at different positions

Note that here "position" is different from "machine". Generally PD can only ensure that replicas of a Region are not at a same peer to avoid that the peer's failure causes more than one replicas to become lost. However in production, you might have the following requirements:

- Multiple TiKV peers are on one machine;
- TiKV peers are on multiple racks, and the system is expected to be available even if a rack fails;
- TiKV peers are in multiple data centers, and the system is expected to be available even if a data center fails;

The key to these requirements is that peers can have the same "position", which is the smallest unit for failure toleration. Replicas of a Region must not be in one unit. So, we can configure `labels` for the TiKV peers, and set `location-labels` on PD to specify which labels are used for marking positions.

Strategy 3: Replicas need to be balanced between stores

The size limit of a Region replica is fixed, so keeping the replicas balanced between stores is helpful for data size balance.

Strategy 4: Leaders need to be balanced between stores

Read and write operations are performed on leaders according to the Raft protocol, so that PD needs to distribute leaders into the whole cluster instead of several peers.

Strategy 5: Hot spots need to be balanced between stores

PD can detect hot spots from store heartbeats and Region heartbeats, so that PD can distribute hot spots.

Strategy 6: Storage size needs to be balanced between stores

When started up, a TiKV store reports capacity of storage, which indicates the store's space limit. PD will consider this when scheduling.

Strategy 7: Adjust scheduling speed to stabilize online services

Scheduling utilizes CPU, memory, network and I/O traffic. Too much resource utilization will influence online services. Therefore, PD needs to limit the number of the concurrent scheduling tasks. By default this strategy is conservative, while it can be changed if quicker scheduling is required.

12.1.4.6 Scheduling implementation

PD collects cluster information from store heartbeats and Region heartbeats, and then makes scheduling plans from the information and strategies. Scheduling plans are a sequence of basic operators. Every time PD receives a Region heartbeat from a Region leader, it checks whether there is a pending operator on the Region or not. If PD needs to dispatch a new operator to a Region, it puts the operator into heartbeat responses, and monitors the operator by checking follow-up Region heartbeats.

Note that here “operators” are only suggestions to the Region leader, which can be skipped by Regions. Leader of Regions can decide whether to skip a scheduling operator or not based on its current status.

12.2 Storage Engine - TiKV

12.2.1 TiKV Overview

TiKV is a distributed and transactional key-value database, which provides transactional APIs with ACID compliance. With the implementation of the [Raft consensus algorithm](#) and consensus state stored in RocksDB, TiKV guarantees data consistency between multiple replicas and high availability. As the storage layer of the TiDB distributed database, TiKV provides the read and write service, and persist the written data from applications. It also stores the statistics data of the TiDB cluster.

12.2.1.1 Architecture Overview

TiKV implements the multi-raft-group replica mechanism based on the design of Google Spanner. A Region is a basic unit of the key-value data movement and refers to a data range in a Store. Each Region is replicated to multiple nodes. These multiple replicas form a Raft group. A replica of a Region is called a Peer. Typically there are 3 peers in a Region. One of them is the leader, which provides the read and write services. The PD component balances all the Regions automatically to guarantee that the read and write throughput is balanced among all the nodes in the TiKV cluster. With PD and carefully designed Raft groups, TiKV excels in horizontal scalability and can easily scale to store more than 100 TBs of data.

Figure 202: TiKV Architecture

12.2.1.1.1 Region and RocksDB

There is a RocksDB database within each Store and it stores data into the local disk. All the Region data are stored in the same RocksDB instance in each Store. All the logs used for the Raft consensus algorithm is stored in another RocksDB instance in each Store. This is because the performance of sequential I/O is better than random I/O. With different RocksDB instances storing raft logs and Region data, TiKV combines all the data write operations of raft logs and TiKV Regions into one I/O operation to improve the performance.

12.2.1.1.2 Region and Raft Consensus Algorithm

Data consistency between replicas of a Region is guaranteed by the Raft Consensus Algorithm. Only the leader of the Region can provide the writing service, and only when the data is written to the majority of replicas of a Region, the write operation succeeds.

When the size of a Region exceeds a threshold, which is 144 MB by default, TiKV splits it to two or more Regions. This operation guarantees the size of all the Regions in the cluster is nearly the same, which helps the PD component to balance Regions among nodes in a TiKV cluster. When the size of a Region is smaller than the threshold, TiKV merges the two smaller adjacent Regions into one Region.

When PD moves a replica from one TiKV node to another, it firstly adds a Learner replica on the target node, after the data in the Learner replica is nearly the same as that in the Leader replica, PD changes it to a Follower replica and removes the Follower replica on the source node.

Moving Leader replica from one node to another has a similar mechanism. The difference is that after the Learner replica becomes the Follower replica, there is a “Leader Transfer” operation in which the Follower replica actively proposes an election to elect itself as the Leader. Finally, the new Leader removes the old Leader replica in the source node.

12.2.1.2 Distributed Transaction

TiKV supports distributed transactions. Users (or TiDB) can write multiple key-value pairs without worrying about whether they belong to the same Region. TiKV uses two-phase commit to achieve ACID constraints. See [TiDB Optimistic Transaction Model](#) for details.

12.2.1.3 TiKV Coprocessor

TiDB pushes some data computation logic to TiKV Coprocessor. TiKV Coprocessor processes the computation for each Region. Each request sent to TiKV Coprocessor only involves the data of one Region.

12.2.2 RocksDB Overview

[RocksDB](#) is an LSM-tree storage engine that provides key-value store and read-write functions. It is developed by Facebook and based on LevelDB. Key-value pairs written by the user are firstly inserted into Write Ahead Log (WAL) and then written to the SkipList in memory (a data structure called MemTable). LSM-tree engines convert the random modification (insertion) to sequential writes to the WAL file, so they provide better write throughput than B-tree engines.

Once the data in memory reaches a certain size, RocksDB flushes the content into a Sorted String Table (SST) file in the disk. SST files are organized in multiple levels (the default is up to 6 levels). When the total size of a level reaches the threshold, RocksDB chooses part of the SST files and merges them into the next level. Each subsequent level is 10 times larger than the previous one, so 90% of the data is stored in the last layer.

RocksDB allows users to create multiple Column Families (CFs). CFs have their own SkipList and SST files, and they share the same WAL file. In this way, different CFs can have different settings according to the application characteristics. It does not increase the number of writes to WAL at the same time.

12.2.2.1 TiKV architecture

The architecture of TiKV is illustrated as follows:

TiKV Architecture

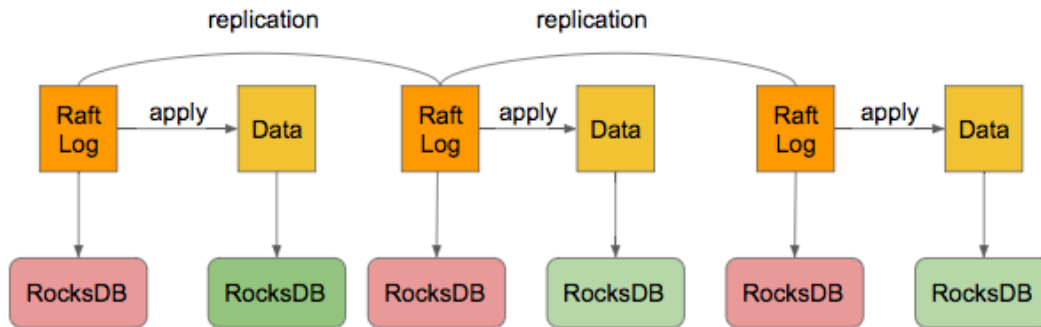

Figure 203: TiKV RocksDB

As the storage engine of TiKV, RocksDB is used to store Raft logs and user data. All data in a TiKV node shares two RocksDB instances. One is for Raft log (often called raftdb), and the other is for user data and MVCC metadata (often called kvdb). There are four CFs in kvdb: raft, lock, default, and write:

- raft CF: Store metadata of each Region. It occupies only a very small amount of space, and users do not need to care.
- lock CF: Store the pessimistic lock of pessimistic transactions and the Prewrite lock for distributed transactions. After the transaction is committed, the corresponding data in lock CF is deleted quickly. Therefore, the size of data in lock CF is usually very small (less than 1 GB). If the data in lock CF increases a lot, it means that a large number of transactions are waiting to be committed, and that the system meets a bug or failure.
- write CF: Store the user's real written data and MVCC metadata (the start timestamp and commit timestamp of the transaction to which the data belongs). When the user writes a row of data, it is stored in the write CF if the data length is less than 255 bytes. Otherwise, it is stored in the default CF. In TiDB, the secondary index only occupies the space of write CF, since the value stored in the non-unique index is empty and the value stored in the unique index is the primary key index.
- default CF: Store data longer than 255 bytes.

12.2.2.2 RocksDB memory usage

To improve the reading performance and reduce the reading operations to the disk, RocksDB divides the files stored on the disk into blocks based on a certain size (the default is 64 KB). When reading a block, it first checks if the data already exists in BlockCache in memory. If true, it can read the data directly from memory without accessing the disk.

BlockCache discards the least recently used data according to the LRU algorithm. By default, TiKV devotes 45% of the system memory to BlockCache. Users can also modify the `storage.block-cache.capacity` configuration to an appropriate value by themselves. However, it is not recommended to exceed 60% of the total system memory.

The data written to RocksDB is written to MemTable firstly. When the size of a MemTable exceeds 128 MB, it switches to a new MemTable. There are 2 RocksDB instances in TiKV, a total of 4 CFs. The size limit of a single MemTable for each CF is 128 MB. A maximum of 5 MemTables can exist at the same time; otherwise, the foreground writes is blocked. The memory occupied by this part is at most 2.5 GB (4 x 5 x 128 MB). It is not recommended to change this limit since it costs less memory.

12.2.2.3 RocksDB space usage

- Multi-version: As RocksDB is a key-value storage engine with LSM-tree structure, the data in MemTable is flushed to L0 first. Because the file is arranged in the order of which they are generated, there might be overlap between the ranges of SSTs at the L0. As a result, the same key might have multiple versions in L0. When a file is merged from L0 to L1, it is cut into multiple files in a certain size (the default is 8 MB). The key range of each file on the same level does not overlap with each other, so there is only one version for each key on L1 and subsequent levels.
- Space amplification: The total size of files on each level is x (the default is 10) times that of the previous level, so 90% of the data is stored in the last level. It also means that the space amplification of RocksDB does not exceed 1.11 (L0 has fewer data and can be ignored).
- Space amplification of TiKV: TiKV has its own MVCC strategy. When a user writes a key, the real data written to RocksDB is `key + commit_ts`, that is to say, the update and deletion also write a new key to RocksDB. TiKV deletes the old version of the data (through the Delete interface of RocksDB) at intervals, so it can be considered that the actual space of the data stored by the user on TiKV is enlarged to 1.11 plus the data written in the last 10 minutes (assuming that TiKV cleans up the old data promptly).

12.2.2.4 RocksDB background threads and compaction

In RocksDB, operations such as converting the MemTable into SST files and merging SST files at various levels are performed in the background thread pool. The default size of the background thread pool is 8. When the number of CPUs in the machine is less than or equal to 8, the default size of the background thread pool is the number of CPUs minus one.

Generally speaking, users do not need to change this configuration. If the user deploys multiple TiKV instances on a machine, or the machine has a relatively high read load and a

low write load, you can adjust the `rocksdb/max-background-jobs` to 3 or 4 as appropriate.

12.2.2.5 WriteStall

The L0 of RocksDB is different from other levels. The SSTs of L0 are arranged in the order of generation. The key ranges between the SSTs can overlap. Therefore, each SST in L0 must be queried in turn when a query is performed. In order not to affect query performance, WriteStall is triggered to block writing when there are too many files in L0.

When encountering a sudden sharp increase in write delay, you can first check the **WriteStall Reason** metric on the Grafana RocksDB KV panel. If it is a WriteStall caused by too many L0 files, you can adjust the following configurations to 64.

```
rocksdb.defaultcf.level0-slowdown-writes-trigger
rocksdb.writecf.level0-slowdown-writes-trigger
rocksdb.lockcf.level0-slowdown-writes-trigger
rocksdb.defaultcf.level0-stop-writes-trigger
rocksdb.writecf.level0-stop-writes-trigger
rocksdb.lockcf.level0-stop-writes-trigger
```

12.2.3 Titan Overview

[Titan](#) is a high-performance [RocksDB](#) plugin for key-value separation. Titan can reduce write amplification in RocksDB when large values are used.

When the value size in Key-Value pairs is large (larger than 1 KB or 512 B), Titan performs better than RocksDB in write, update, and point read scenarios. However, Titan gets a higher write performance by sacrificing storage space and range query performance. As the price of SSDs continues to decrease, this trade-off will be more and more meaningful.

12.2.3.1 Key features

- Reduce write amplification by separating values from the log-structured merge-tree (LSM-tree) and storing them independently.
- Seamlessly upgrade RocksDB instances to Titan. The upgrade does not require human intervention and does not impact online services.
- Achieve 100% compatibility with all RocksDB features used by the current TiKV.

12.2.3.2 Usage scenarios

Titan is suitable for the scenarios where a huge volume of data is written to the TiKV foreground:

- RocksDB triggers a large amount of compactions, which consumes a lot of I/O bandwidth or CPU resources. This causes poor read and write performance of the foreground.

- The RocksDB compaction lags much behind (due to the I/O bandwidth limit or CPU bottleneck) and frequently causes write stalls.
- RocksDB triggers a large amount of compactions, which causes a lot of I/O writes and affects the life of the SSD disk.

12.2.3.3 Prerequisites

The prerequisites for enabling Titan are as follows:

- The average size of values is large, or the size of all large values accounts for much of the total value size. Currently, the size of a value greater than 1 KB is considered as a large value. In some situations, this number (1 KB) can be 512 B. Note that a single value written to TiKV cannot exceed 8 MB due to the limitation of the TiKV Raft layer. You can adjust the `raft-entry-max-size` configuration value to relax the limit.
- No range query will be performed or you do not need a high performance of range query. Because the data stored in Titan is not well-ordered, its performance of range query is poorer than that of RocksDB, especially for the query of a large range. According to PingCAP's internal test, Titan's range query performance is 40% to a few times lower than that of RocksDB.
- Sufficient disk space (consider reserving a space twice of the RocksDB disk consumption with the same data volume). This is because Titan reduces write amplification at the cost of disk space. In addition, Titan compresses values one by one, and its compression rate is lower than that of RocksDB. RocksDB compresses blocks one by one. Therefore, Titan consumes more storage space than RocksDB, which is expected and normal. In some situations, Titan's storage consumption can be twice that of RocksDB.

If you want to improve the performance of Titan, see the blog post [Titan: A RocksDB Plugin to Reduce Write Amplification](#).

12.2.3.4 Architecture and implementation

The following figure shows the architecture of Titan:

Figure 204: Titan Architecture

During flush and compaction operations, Titan separates values from the LSM-tree. The advantage of this approach is that the write process is consistent with RocksDB, which reduces the chance of invasive changes to RocksDB.

12.2.3.4.1 BlobFile

When Titan separates the value file from the LSM-tree, it stores the value file in the BlobFile. The following figure shows the BlobFile format:

Figure 205: BlobFile Format

A blob file mainly consists of blob records, meta blocks, a meta index block, and a footer. Each block record stores a Key-Value pair. The meta blocks are used for scalability, and store properties related to the blob file. The meta index block is used for meta block searching.

Note:

- The Key-Value pairs in the blob file are stored in order, so that when the Iterator is implemented, the sequential reading performance can be improved via prefetching.
- Each blob record keeps a copy of the user key corresponding to the value. This way, when Titan performs Garbage Collection (GC), it can query the user key and identify whether the corresponding value is outdated. However, this process introduces some write amplification.

- BlobFile supports compression at the blob record level. Titan supports multiple compression algorithms, such as [Snappy](#), [LZ4](#), and [Zstd](#). Currently, the default compression algorithm Titan uses is LZ4.

12.2.3.4.2 TitanTableBuilder

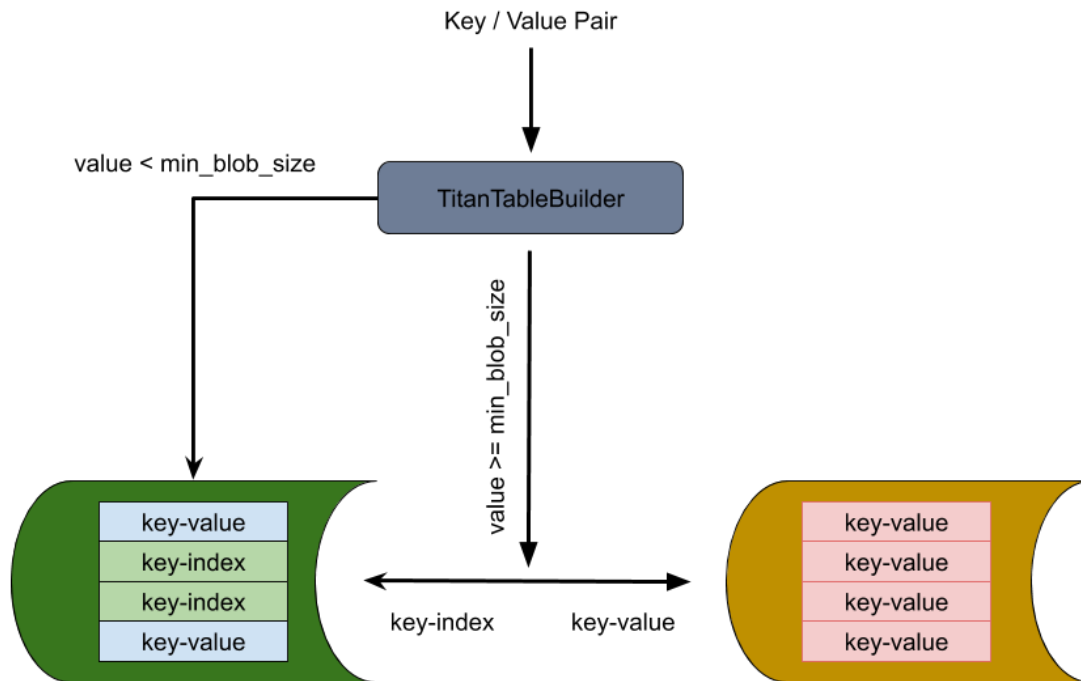

Figure 206: TitanTableBuilder

TitanTableBuilder is the key to achieving Key-Value separation. TitanTableBuilder determines the Key-Pair value size, and based on that, decides whether to separate the value from the Key-Value pair and store it in the blob file.

- If the value size is greater than or equal to `min_blob_size`, TitanTableBuilder separates the value and stores it in the blob file. TitanTableBuilder also generates an index and writes it into the SST.
- If the value size is smaller than `min_blob_size`, TitanTableBuilder writes the value directly into the SST.

Titan can also be downgraded to RocksDB in the process above. When RocksDB is performing compactions, the separated value can be written back to the newly generated SST files.

12.2.3.5 Garbage Collection

Titan uses Garbage Collection (GC) to reclaim space. As the keys are being reclaimed in the LSM-tree compaction, some values stored in blob files are not deleted at the same time. Therefore, Titan needs to perform GC periodically to delete outdated values. Titan provides the following two types of GC:

- Blob files are periodically integrated and rewritten to delete outdated values. This is the regular way of performing GC.
- Blob files are rewritten while the LSM-tree compaction is performed at the same time. This is the feature of Level Merge.

12.2.3.5.1 Regular GC

Titan uses the TablePropertiesCollector and EventListener components of RocksDB to collect the information for GC.

TablePropertiesCollector

RocksDB supports using BlobFileSizeCollector, a custom table property collector, to collect properties from the SST which are written into corresponding SST files. The collected properties are named BlobFileSizeProperties. The following figure shows the BlobFileSizeCollector workflow and data formats:

Figure 207: BlobFileSizeProperties

On the left is the SST index format. The first column is the blob file ID; the second column is the offset for the blob record in the blob file; the third column is the blob record size.

On the right is the BlobFileSizeProperties format. Each line represents a blob file and how much data is saved in this blob file. The first column is the blob file ID; the second column is the size of the data.

EventListener

RocksDB uses compaction to discard old data and reclaim space. After each compaction, some blob files in Titan might contain partly or entirely outdated data. Therefore, you can

trigger GC by listening to compaction events. During compaction, you can collect and compare the input/output blob file size properties of SST to determine which blob files require GC. The following figure shows the general process:

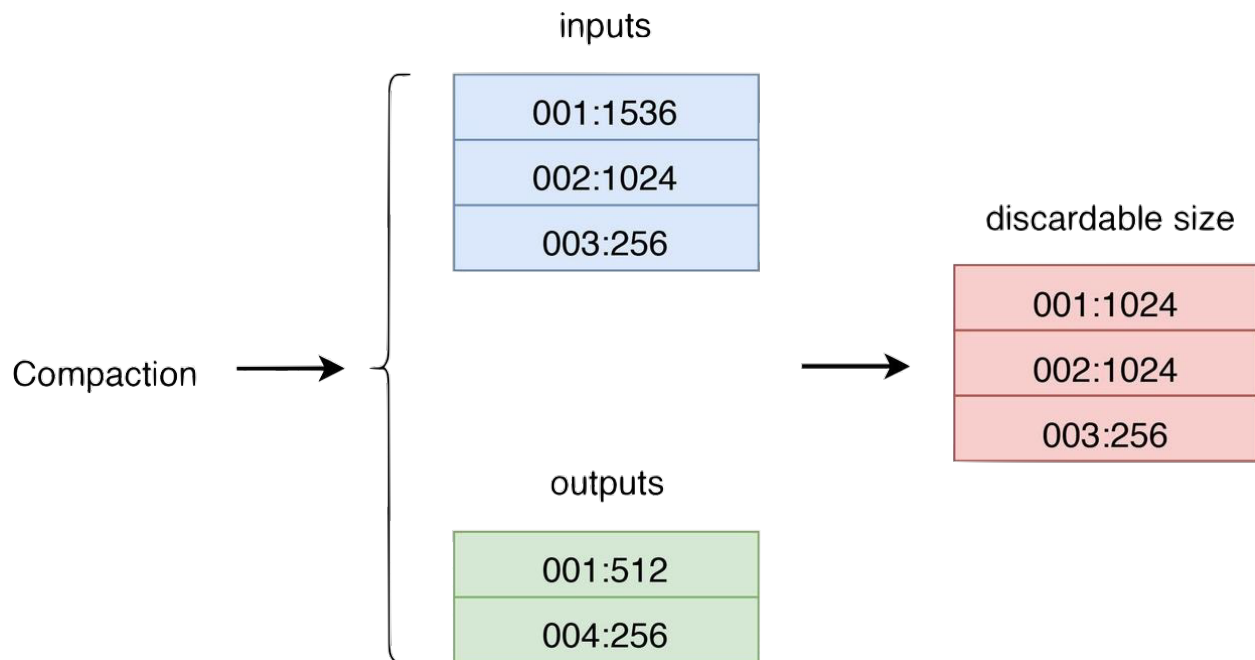

Figure 208: EventListener

- *inputs* stands for the blob file size properties for all SSTs that participate in the compaction.
- *outputs* stands for the blob file size properties for all SSTs generated in the compaction.
- *discardable size* is the size of the file to be discarded for each blob file, calculated based on inputs and outputs. The first column is the blob file ID. The second column is the size of the file to be discarded.

For each valid blob file, Titan maintains a discardable size variable in memory. After each compaction, this variable is accumulated for the corresponding blob file. Each time when GC starts, it picks the blob file with the greatest discardable size as the candidate file for GC. To reduce write amplification, a certain level of space amplification is allowed, which means GC can be started on a blob file only when the discardable file has reached a specific proportion in size.

For the selected blob file, Titan checks whether the blob index of the key corresponding to each value exists or has been updated to determine whether this value is outdated. If the value is not outdated, Titan merges and sorts the value into a new blob file, and writes the updated blob index into SST using WriteCallback or MergeOperator. Then, Titan records the latest sequence number of RocksDB and does not delete the old blob file until the sequence of the oldest snapshot exceeds the recorded sequence number. The reason is

that after the blob index is written back to SST, the old blob index is still accessible via the previous snapshot. Therefore, we need to ensure that no snapshot will access the old blob index before GC can safely delete the corresponding blob file.

12.2.3.5.2 Level Merge

Level Merge is a newly introduced algorithm in Titan. According to the implementation principle of Level Merge, Titan merges and rewrites blob file that corresponds to the SST file, and generates new blob file while compactions are performed in LSM-tree. The following figure shows the general process:

Figure 209: LevelMerge General Process

When compactions are performed on the SSTs of level $z-1$ and level z , Titan reads and writes Key-Value pairs in order. Then it writes the values of the selected blob files into new blob files in order, and updates the blob indexes of keys when new SSTs are generated. For the keys deleted in compactions, the corresponding values will not be written to the new blob file, which works similar to GC.

Compared with the regular way of GC, the Level Merge approach completes the blob GC while compactions are performed in LSM-tree. In this way, Titan no longer needs to check the status of blob index in LSM-tree or to write the new blob index into LSM-tree. This reduces the impact of GC on the foreground operations. As the blob file is repeatedly rewritten, fewer files overlap with each other, which makes the whole system in better order and improves the performance of scan.

However, layering blob files similar to tiering compaction brings write amplification. Because 99% of the data in LSM-tree is stored at the lowest two levels, Titan performs the Level Merge operation on the blob files corresponding to the data that is compacted only to the lowest two levels of LSM-tree.

Range Merge

Range Merge is an optimized approach of GC based on Level Merge. However, the bottom level of LSM-tree might be in poorer order in the following situations:

- When `level_compaction_dynamic_level_bytes` is enabled, data volume at each level of LSM-tree dynamically increases, and the sorted runs at the bottom level keep increasing.
- A specific range of data is frequently compacted, and this causes a lot of sorted runs in that range.

Figure 210: RangeMerge

Therefore, the Range Merge operation is needed to keep the number of sorted runs within a certain level. At the time of `OnCompactionComplete`, Titan counts the number of sorted runs in a range. If the number is large, Titan marks the corresponding blob file as `ToMerge` and rewrites it in the next compaction.

12.2.4 Titan Configuration

This document introduces how to enable and disable **Titan** using the corresponding configuration items, as well as the relevant parameters and the Level Merge feature.

12.2.4.1 Enable Titan

Titan is compatible with RocksDB, so you can directly enable Titan on the existing TiKV instances that use RocksDB. You can use one of the following two methods to enable Titan:

- Method 1: If you have deployed the cluster using TiUP, you can execute the `tiup ↪ cluster edit-config ${cluster-name}` command and edit the TiKV configuration file as the following example shows:

```
tikv:
  rocksdb.titan.enabled: true
```

Reload the configuration and TiKV will be rolling restarted online:

```
tiup cluster reload ${cluster-name} -R tikv
```

For the detailed command, see [Modify the configuration using TiUP](#).

- Method 2: Directly edit the TiKV configuration file to enable Titan (**NOT** recommended for the production environment).

```
[rocksdb.titan]  
enabled = true
```

After Titan is enabled, the existing data stored in RocksDB is not immediately moved to the Titan engine. As new data is written to the TiKV foreground and RocksDB performs compaction, the values are progressively separated from keys and written to Titan. You can view the **TiKV Details** -> **Titan kv** -> **blob file size** panel to confirm the size of the data stored in Titan.

If you want to speed up the writing process, compact data of the whole TiKV cluster manually using `tikv-ctl`. For details, see [manual compaction](#).

Note:

When Titan is disabled, RocksDB cannot read data that has been migrated to Titan. If Titan is incorrectly disabled on a TiKV instance with Titan already enabled (mistakenly set `rocksdb.titan.enabled` to `false`), TiKV will fail to start, and the `You have disabled titan when its data directory is not empty` error appears in the TiKV log. To correctly disabled Titan, see [Disable Titan](#).

12.2.4.2 Parameters

To adjust Titan-related parameters using TiUP, refer to [Modify the configuration](#).

- Titan GC thread count.

From the **TiKV Details** -> **Thread CPU** -> **RocksDB CPU** panel, if you observe that the Titan GC threads are at full capacity for a long time, consider increasing the size of the Titan GC thread pool.

```
[rocksdb.titan]  
max-background-gc = 1
```

- Value size threshold.

When the size of the value written to the foreground is smaller than the threshold, this value is stored in RocksDB; otherwise, this value is stored in the blob file of Titan. Based on the distribution of value sizes, if you increase the threshold, more values are stored in RocksDB and TiKV performs better in reading small values. If you decrease the threshold, more values go to Titan, which further reduces RocksDB compactions.

```
[rocksdb.defaultcf.titan]
min-blob-size = "1KB"
```

- The algorithm used for compressing values in Titan, which takes value as the unit.

```
[rocksdb.defaultcf.titan]
blob-file-compression = "lz4"
```

- The size of value caches in Titan.

Larger cache size means higher read performance of Titan. However, too large a cache size causes Out of Memory (OOM). It is recommended to set the value of `storage` \leftrightarrow `.block-cache.capacity` to the store size minus the blob file size and set `blob` \leftrightarrow `cache-size` to `memory size * 50% - block cache size` according to the monitoring metrics when the database is running stably. This maximizes the blob cache size when the block cache is large enough for the whole RocksDB engine.

```
[rocksdb.defaultcf.titan]
blob-cache-size = 0
```

- When the ratio of discardable data (the corresponding key has been updated or deleted) in a blob file exceeds the following threshold, Titan GC is triggered.

```
discardable-ratio = 0.5
```

When Titan writes the useful data of this blob file to another file, you can use the `discardable-ratio` value to estimate the upper limits of write amplification and space amplification (assuming the compression is disabled).

Upper limit of write amplification = $1 / \text{discardable_ratio}$

Upper limit of space amplification = $1 / (1 - \text{discardable_ratio})$

From the two equations above, you can see that decreasing the value of `discardable_ratio` \leftrightarrow can reduce space amplification but causes GC to be more frequent in Titan. Increasing the value reduces Titan GC, the corresponding I/O bandwidth, and CPU consumption but increases disk usage.

- The following option limits the I/O rate of RocksDB compaction. During peak traffic, limiting RocksDB compaction, its I/O bandwidth, and its CPU consumption reduces its impact on the write and read performance of the foreground.

When Titan is enabled, this option limits the summed I/O rates of RocksDB compaction and Titan GC. If you find that the I/O and/or CPU consumption of RocksDB compaction and Titan GC is too large, set this option to a suitable value according the disk I/O bandwidth and the actual write traffic.

```
[rocksdb]
rate-bytes-per-sec = 0
```

12.2.4.3 Disable Titan (experimental)

To disable Titan, you can configure the `rocksdb.defaultcf.titan.blob-run-mode` option. The optional values for `blob-run-mode` are as follows:

- When the option is set to `normal`, Titan performs read and write operations normally.
- When the option is set to `read-only`, all newly written values are written into RocksDB, regardless of the value size.
- When the option is set to `fallback`, all newly written values are written into RocksDB, regardless of the value size. Also, all compacted values stored in the Titan blob file are automatically moved back to RocksDB.

To disable Titan, perform the following steps:

1. Update the configuration file of the TiKV nodes you wish to disable Titan for and restart TiKV:

```
[rocksdb.defaultcf.titan]
blob-run-mode = "fallback"
discardable-ratio = 1.0
merge-small-file-threshold = "0KB"
```

2. Perform a full compaction using `tikv-ctl`. This process will consume large amount of I/O and CPU resources.

```
tikv-ctl --pd <PD_ADDR> compact-cluster --bottommost force
```

3. After the compaction is finished, wait until the **Blob file count** metrics under **TiKV-Details/Titan - kv** decrease to 0.
4. Update the configuration of these TiKV nodes to disable Titan.

```
[rocksdb.titan]
enabled = false
```

Warning:

Disabling Titan is an experimental feature. It is **NOT** recommended to use it if not necessary.

12.2.4.4 Level Merge (experimental)

In TiKV 4.0, **Level Merge**, a new algorithm, is introduced to improve the performance of range query and to reduce the impact of Titan GC on the foreground write operations. You can enable Level Merge using the following option:

```
[rocksdb.defaultcf.titan]
level-merge = true
```

Enabling Level Merge has the following benefits:

- Greatly improve the performance of Titan range query.
- Reduce the impact of Titan GC on the foreground write operations and improve write performance.
- Reduce space amplification of Titan and the disk usage (compared to the disk usage with the default configuration).

Accordingly, the write amplification with Level Merge enabled is slightly higher than that of Titan but is still lower than that of the native RocksDB.

12.3 Storage Engine - TiFlash

12.3.1 TiFlash Overview

TiFlash is the key component that makes TiDB essentially an Hybrid Transactional/-Analytical Processing (HTAP) database. As a columnar storage extension of TiKV, TiFlash provides both good isolation level and strong consistency guarantee.

In TiFlash, the columnar replicas are asynchronously replicated according to the Raft Learner consensus algorithm. When these replicas are read, the Snapshot Isolation level of consistency is achieved by validating Raft index and multi-version concurrency control (MVCC).

12.3.1.1 Architecture

Figure 211: TiFlash Architecture

The above figure is the architecture of TiDB in its HTAP form, including TiFlash nodes.

TiFlash provides the columnar storage, with a layer of coprocessors efficiently implemented by ClickHouse. Similar to TiKV, TiFlash also has a Multi-Raft system, which supports replicating and distributing data in the unit of Region (see [Data Storage](#) for details).

TiFlash conducts real-time replication of data in the TiKV nodes at a low cost that does not block writes in TiKV. Meanwhile, it provides the same read consistency as in TiKV and ensures that the latest data is read. The Region replica in TiFlash is logically identical to those in TiKV, and is split and merged along with the Leader replica in TiKV at the same time.

TiFlash is compatible with both TiDB and TiSpark, which enables you to freely choose between these two computing engines.

It is recommended that you deploy TiFlash in different nodes from TiKV to ensure workload isolation. It is also acceptable to deploy TiFlash and TiKV in the same node if no business isolation is required.

Currently, data cannot be written directly into TiFlash. You need to write data in TiKV and then replicate it to TiFlash, because it connects to the TiDB cluster as a Learner role.

TiFlash supports data replication in the unit of table, but no data is replicated by default after deployment.

To replicate data of a specified table, see [Create TiFlash replicas for tables](#).

TiFlash has three components: the columnar storage module, `tiflash proxy`, and `pd buddy`. `tiflash proxy` is responsible for the communication using the Multi-Raft consensus algorithm. `pd buddy` works with PD to replicate data from TiKV to TiFlash in the unit of table.

When TiDB receives the DDL command to create replicas in TiFlash, the `pd buddy` component acquires the information of the table to be replicated via the status port of TiDB, and sends the information to PD. Then PD performs the corresponding data scheduling according to the information provided by `pd buddy`.

12.3.1.2 Key features

TiFlash has the following key features:

- [Asynchronous replication](#)
- [Consistency](#)
- [Intelligent choice](#)
- [Computing acceleration](#)

12.3.1.2.1 Asynchronous replication

The replica in TiFlash is asynchronously replicated as a special role, Raft Learner. This means when the TiFlash node is down or high network latency occurs, applications in TiKV can still proceed normally.

This replication mechanism inherits two advantages of TiKV: automatic load balancing and high availability.

- TiFlash does not rely on additional replication channels, but directly receives data from TiKV in a many-to-many manner.
- As long as the data is not lost in TiKV, you can restore the replica in TiFlash at any time.

12.3.1.2.2 Consistency

TiFlash provides the same Snapshot Isolation level of consistency as TiKV, and ensures that the latest data is read, which means that you can read the data previously written in TiKV. Such consistency is achieved by validating the data replication progress.

Every time TiFlash receives a read request, the Region replica sends a progress validation request (a lightweight RPC request) to the Leader replica. TiFlash performs the read operation only after the current replication progress includes the data covered by the timestamp of the read request.

12.3.1.2.3 Intelligent choice

TiDB can automatically choose to use TiFlash (column-wise) or TiKV (row-wise), or use both of them in one query to ensure the best performance.

This selection mechanism is similar to that of TiDB which chooses different indexes to execute query. TiDB optimizer makes the appropriate choice based on statistics of the read cost.

12.3.1.2.4 Computing acceleration

TiFlash accelerates the computing of TiDB in two ways:

- The columnar storage engine is more efficient in performing read operation.
- TiFlash shares part of the computing workload of TiDB.

TiFlash shares the computing workload in the same way as the TiKV Coprocessor does: TiDB pushes down the computing that can be completed in the storage layer. Whether the computing can be pushed down depends on the support of TiFlash.

For details, see [Supported pushdown calculations](#).

12.3.1.3 See also

- To deploy a new cluster with TiFlash nodes, see [Deploy a TiDB cluster using TiUP](#).
- To add a TiFlash node in a deployed cluster, see [Scale out a TiFlash cluster](#).
- [Use TiFlash](#).
- [Maintain a TiFlash cluster](#).
- [Tune TiFlash performance](#).
- [Configure TiFlash](#).
- [Monitor the TiFlash cluster](#).
- Learn [TiFlash alert rules](#).
- [Troubleshoot a TiFlash cluster](#).

To experience the whole process from importing data to querying in a TPC-H dataset, refer to [Quick Start Guide for TiDB HTAP](#).

12.3.2 Use TiFlash

After TiFlash is deployed, data replication does not automatically begin. You need to manually specify the tables to be replicated.

You can either use TiDB to read TiFlash replicas for medium-scale analytical processing, or use TiSpark to read TiFlash replicas for large-scale analytical processing, which is based on your own needs. See the following sections for details:

- [Use TiDB to read TiFlash replicas](#)
- [Use TiSpark to read TiFlash replicas](#)

12.3.2.1 Create TiFlash replicas for tables

After TiFlash is connected to the TiKV cluster, data replication by default does not begin. You can send a DDL statement to TiDB through a MySQL client to create a TiFlash replica for a specific table:

```
ALTER TABLE table_name SET TIFLASH REPLICA count;
```

The parameter of the above command is described as follows:

- `count` indicates the number of replicas. When the value is 0, the replica is deleted.

If you execute multiple DDL statements on the same table, only the last statement is ensured to take effect. In the following example, two DDL statements are executed on the table `tpch50`, but only the second statement (to delete the replica) takes effect.

Create two replicas for the table:

```
ALTER TABLE `tpch50`.`lineitem` SET TIFLASH REPLICA 2;
```

Delete the replica:

```
ALTER TABLE `tpch50`.`lineitem` SET TIFLASH REPLICA 0;
```

Notes:

- If the table `t` is replicated to TiFlash through the above DDL statements, the table created using the following statement will also be automatically replicated to TiFlash:

```
CREATE TABLE table_name like t;
```

- For versions earlier than v4.0.6, if you create the TiFlash replica before using TiDB Lightning to import the data, the data import will fail. You must import data to the table before creating the TiFlash replica for the table.
- If TiDB and TiDB Lightning are both v4.0.6 or later, no matter a table has TiFlash replica(s) or not, you can import data to that table using TiDB Lightning. Note that this might slow the TiDB Lightning procedure, which depends on the NIC bandwidth on the lightning host, the CPU and disk load of the TiFlash node, and the number of TiFlash replicas.
- It is recommended that you do not replicate more than 1,000 tables because this lowers the PD scheduling performance. This limit will be removed in later versions.
- In v5.1 and later versions, setting the replicas for the system tables is no longer supported. Before upgrading the cluster, you need to clear the replicas of the relevant system tables. Otherwise, you cannot modify the replica settings of the system tables after you upgrade the cluster to a later version.

12.3.2.1.1 Check replication progress

You can check the status of the TiFlash replicas of a specific table using the following statement. The table is specified using the `WHERE` clause. If you remove the `WHERE` clause, you will check the replica status of all tables.

```
SELECT * FROM information_schema.tiflash_replica WHERE TABLE_SCHEMA = '<
↳ db_name>' and TABLE_NAME = '<table_name>';
```

In the result of above statement:

- `AVAILABLE` indicates whether the TiFlash replicas of this table are available or not. 1 means available and 0 means unavailable. Once the replicas become available, this status does not change. If you use DDL statements to modify the number of replicas, the replication status will be recalculated.
- `PROGRESS` means the progress of the replication. The value is between 0.0 and 1.0. 1 means at least one replica is replicated.

12.3.2.1.2 Speed up TiFlash replication

Before TiFlash replicas are added, each TiKV instance performs a full table scan and sends the scanned data to TiFlash as a “snapshot” to create replicas. By default, TiFlash replicas are added slowly with fewer resources usage in order to minimize the impact on the online service. If there are spare CPU and disk IO resources in your TiKV and TiFlash nodes, you can accelerate TiFlash replication by performing the following steps.

1. Temporarily increase the snapshot write speed limit for each TiKV and TiFlash instance by adjusting the TiFlash Proxy and TiKV configuration. For example, when using TiUP to manage configurations, the configuration is as below:

```
yaml  tikv:      server.snap-max-write-bytes-per-sec: 300MiB # Default to
↳ 100MiB. tiflash-learner: raftstore.snap-handle-pool-size: 10 # Default
↳ to 2. Can be adjusted to >= node's CPU num * 0.6. raftstore.apply-low-
↳ priority-pool-size: 10 # Default to 1. Can be adjusted to >= node's CPU
↳ num * 0.6. server.snap-max-write-bytes-per-sec: 300MiB # Default to 100
↳ MiB.
```

The configuration change takes effect after restarting the TiFlash and TiKV instances. The TiKV configuration can be also changed online by using the [Dynamic Config SQL statement](#), which takes effect immediately without restarting TiKV instances:

```
sql  SET CONFIG tikv `server.snap-max-write-bytes-per-sec` = '300MiB';
```

After adjusting the preceding configurations, you cannot observe the acceleration for now, as the replication speed is still restricted by the PD limit globally.

2. Use [PD Control](#) to progressively ease the new replica speed limit.

The default new replica speed limit is 30, which means, approximately 30 Regions add TiFlash replicas every minute. Executing the following command will adjust the limit to 60 for all TiFlash instances, which doubles the original speed:

```
shell tiup ctl:v<CLUSTER_VERSION> pd -u http://<PD_ADDRESS>:2379 store  
↪ limit all engine tiflash 60 add-peer
```

In the preceding command, you need to replace `<CLUSTER_VERSION>` with the actual cluster version and `<PD_ADDRESS>:2379` with the address of any PD node. For example:

```
tiup ctl:v6.1.1 pd -u http://192.168.1.4:2379 store limit all  
↪ engine tiflash 60 add-peer
```

Within a few minutes, you will observe a significant increase in CPU and disk IO resource usage of the TiFlash nodes, and TiFlash should create replicas faster. At the same time, the TiKV nodes' CPU and disk IO resource usage increases as well.

If the TiKV and TiFlash nodes still have spare resources at this point and the latency of your online service does not increase significantly, you can further ease the limit, for example, triple the original speed:

```
shell tiup ctl:v<CLUSTER_VERSION> pd -u http://<PD_ADDRESS>:2379 store  
↪ limit all engine tiflash 90 add-peer
```

3. After the TiFlash replication is complete, revert to the default configuration to reduce the impact on online services.

Execute the following PD Control command to restore the default new replica speed limit:

```
shell tiup ctl:v<CLUSTER_VERSION> pd -u http://<PD_ADDRESS>:2379 store  
↪ limit all engine tiflash 30 add-peer
```

Comment out the changed configuration in TiUP to restore the default snapshot write speed limit:

```
yaml # tikv: # server.snap-max-write-bytes-per-sec: 300MiB # tiflash  
↪ -learner: # raftstore.snap-handle-pool-size: 10 # raftstore.apply-low-  
↪ priority-pool-size: 10 # server.snap-max-write-bytes-per-sec: 300MiB
```

12.3.2.1.3 Set available zones

When configuring replicas, if you need to distribute TiFlash replicas to multiple data centers for disaster recovery, you can configure available zones by following the steps below:

1. Specify labels for TiFlash nodes in the cluster configuration file.

```
tiflash_servers:
- host: 172.16.5.81
  config:
    flash.proxy.labels: zone=z1
- host: 172.16.5.82
  config:
    flash.proxy.labels: zone=z1
- host: 172.16.5.85
  config:
    flash.proxy.labels: zone=z2
```

2. After starting a cluster, specify the labels when creating replicas.

```
ALTER TABLE table_name SET TIFLASH REPLICA count LOCATION LABELS
↔ location_labels;
```

For example:

```
ALTER TABLE t SET TIFLASH REPLICA 2 LOCATION LABELS "zone";
```

3. PD schedules the replicas based on the labels. In this example, PD respectively schedules two replicas of the table `t` to two available zones. You can use `pd-ctl` to view the scheduling.

```
> tiup ctl:v<CLUSTER_VERSION> pd -u http://<PD_ADDRESS>:2379 store

...
"address": "172.16.5.82:23913",
"labels": [
  { "key": "engine", "value": "tiflash"},
  { "key": "zone", "value": "z1" }
],
"region_count": 4,

...
"address": "172.16.5.81:23913",
"labels": [
  { "key": "engine", "value": "tiflash"},
  { "key": "zone", "value": "z1" }
],
"region_count": 5,
...

"address": "172.16.5.85:23913",
```

```

"labels": [
  { "key": "engine", "value": "tiflash"},
  { "key": "zone", "value": "z2" }
],
"region_count": 9,
...

```

For more information about scheduling replicas by using labels, see [Schedule Replicas by Topology Labels](#), [Multiple Data Centers in One City Deployment](#), and [Three Data Centers in Two Cities Deployment](#).

12.3.2.2 Use TiDB to read TiFlash replicas

TiDB provides three ways to read TiFlash replicas. If you have added a TiFlash replica without any engine configuration, the CBO (cost-based optimization) mode is used by default.

12.3.2.2.1 Smart selection

For tables with TiFlash replicas, the TiDB optimizer automatically determines whether to use TiFlash replicas based on the cost estimation. You can use the `desc` or `explain` \rightarrow `analyze` statement to check whether or not a TiFlash replica is selected. For example:

```
desc select count(*) from test.t;
```

```

+-----+-----+-----+-----+
  ↪
| id          | estRows | task      | access object | operator
  ↪ info      |
+-----+-----+-----+-----+
  ↪
| StreamAgg_9 | 1.00    | root      |                | funcs:count(1)
  ↪ ->Column#4 |
| -TableReader_17 | 1.00    | root      |                | data:
  ↪ TableFullScan_16 |
|   -TableFullScan_16 | 1.00    | cop[tiflash] | table:t        | keep order:
  ↪ false, stats:pseudo |
+-----+-----+-----+-----+
  ↪
3 rows in set (0.00 sec)

```

```
explain analyze select count(*) from test.t;
```

```

↪
| id          | estRows | actRows | task      | access object |
↪ execution info | operator
↪ info        | memory  | disk    |
+-----+-----+-----+-----+-----+
↪
| StreamAgg_9 | 1.00    | 1       | root      |               | time
↪ :83.8372ms, loops:2 | funcs:count
↪ (1)->Column#4 | 372 Bytes | N/A    |
| -TableReader_17 | 1.00    | 1       | root      |               | time
↪ :83.7776ms, loops:2, rpc num: 1, rpc time:83.5701ms, proc keys:0 |
↪ data:TableFullScan_16 | 152 Bytes | N/A    |
| -TableFullScan_16 | 1.00    | 1       | cop[tiflash] | table:t      | time
↪ :43ms, loops:1 | keep order:
↪ false, stats:pseudo | N/A    | N/A    |
+-----+-----+-----+-----+
↪

```

`cop[tiflash]` means that the task will be sent to TiFlash for processing. If you have not selected a TiFlash replica, you can try to update the statistics using the `analyze table` statement, and then check the result using the `explain analyze` statement.

Note that if a table has only a single TiFlash replica and the related node cannot provide service, queries in the CBO mode will repeatedly retry. In this situation, you need to specify the engine or use the manual hint to read data from the TiKV replica.

12.3.2.2.2 Engine isolation

Engine isolation is to specify that all queries use a replica of the specified engine by configuring the corresponding variable. The optional engines are “tikv”, “tidb” (indicates the internal memory table area of TiDB, which stores some TiDB system tables and cannot be actively used by users), and “tiflash”, with the following two configuration levels:

- TiDB instance-level, namely, INSTANCE level. Add the following configuration item in the TiDB configuration file:

```
[isolation-read]
engines = ["tikv", "tidb", "tiflash"]
```

The INSTANCE-level default configuration is `["tikv", "tidb", "tiflash"]`
↪ .

- SESSION level. Use the following statement to configure:

```
set @@session.tidb_isolation_read_engines = "engine list separated by  
↳ commas";
```

or

```
set SESSION tidb_isolation_read_engines = "engine list separated by  
↳ commas";
```

The default configuration of the SESSION level inherits from the configuration of the TiDB INSTANCE level.

The final engine configuration is the session-level configuration, that is, the session-level configuration overrides the instance-level configuration. For example, if you have configured “tikv” in the INSTANCE level and “tiflash” in the SESSION level, then the TiFlash replicas are read. If the final engine configuration is “tikv” and “tiflash”, then the TiKV and TiFlash replicas are both read, and the optimizer automatically selects a better engine to execute.

Note:

Because [TiDB Dashboard](#) and other components need to read some system tables stored in the TiDB memory table area, it is recommended to always add the “tidb” engine to the instance-level engine configuration.

If the queried table does not have a replica of the specified engine (for example, the engine is configured as “tiflash” but the table does not have a TiFlash replica), the query returns an error.

12.3.2.2.3 Manual hint

Manual hint can force TiDB to use specified replicas for specific table(s) on the premise of satisfying engine isolation. Here is an example of using the manual hint:

```
select /*+ read_from_storage(tiflash[table_name]) */ ... from table_name;
```

If you set an alias to a table in a query statement, you must use the alias in the statement that includes a hint for the hint to take effect. For example:

```
select /*+ read_from_storage(tiflash[alias_a,alias_b]) */ ... from  
↳ table_name_1 as alias_a, table_name_2 as alias_b where alias_a.  
↳ column_1 = alias_b.column_2;
```

In the above statements, `tiflash[]` prompts the optimizer to read the TiFlash replicas. You can also use `tikv[]` to prompt the optimizer to read the TiKV replicas as needed. For hint syntax details, refer to [READ_FROM_STORAGE](#).

If the table specified by a hint does not have a replica of the specified engine, the hint is ignored and a warning is reported. In addition, a hint only takes effect on the premise of engine isolation. If the engine specified in a hint is not in the engine isolation list, the hint is also ignored and a warning is reported.

Note:

The MySQL client of 5.7.7 or earlier versions clears optimizer hints by default. To use the hint syntax in these early versions, start the client with the `--comments` option, for example, `mysql -h 127.0.0.1 -P 4000 -uroot --comments`.

12.3.2.2.4 The relationship of smart selection, engine isolation, and manual hint

In the above three ways of reading TiFlash replicas, engine isolation specifies the overall range of available replicas of engines; within this range, manual hint provides statement-level and table-level engine selection that is more fine-grained; finally, CBO makes the decision and selects a replica of an engine based on cost estimation within the specified engine list.

Note:

Before v4.0.3, the behavior of reading from TiFlash replica in a non-read-only SQL statement (for example, `INSERT INTO ... SELECT, SELECT ... FOR UPDATE, UPDATE ... , DELETE ...`) is undefined. In v4.0.3 and later versions, internally TiDB ignores the TiFlash replica for a non-read-only SQL statement to guarantee the data correctness. That is, for [smart selection](#), TiDB automatically selects the non-TiFlash replica; for [engine isolation](#) that specifies TiFlash replica **only**, TiDB reports an error; and for [manual hint](#), TiDB ignores the hint.

12.3.2.3 Use TiSpark to read TiFlash replicas

Currently, you can use TiSpark to read TiFlash replicas in a method similar to the engine isolation in TiDB. This method is to configure the `spark.tispark.isolation_read_engines` parameter. The parameter value defaults to `tikv,tiflash`,

which means that TiDB reads data from TiFlash or from TiKV according to CBO's selection. If you set the parameter value to `tiflash`, it means that TiDB forcibly reads data from TiFlash.

Note:

When this parameter is set to `tiflash`, only the TiFlash replicas of all tables involved in the query are read and these tables must have TiFlash replicas; for tables that do not have TiFlash replicas, an error is reported. When this parameter is set to `tikv`, only the TiKV replica is read.

You can configure this parameter in one of the following ways:

- Add the following item in the `spark-defaults.conf` file:

```
spark.tispark.isolation_read_engines tiflash
```

- Add `--conf spark.tispark.isolation_read_engines=tiflash` in the initialization command when initializing Spark shell or Thrift server.
- Set `spark.conf.set("spark.tispark.isolation_read_engines", "tiflash")` in Spark shell in a real-time manner.
- Set `set spark.tispark.isolation_read_engines=tiflash` in Thrift server after the server is connected via beeline.

12.3.2.4 Supported push-down calculations

TiFlash supports the push-down of the following operators:

- TableScan: Reads data from tables.
- Selection: Filters data.
- HashAgg: Performs data aggregation based on the [Hash Aggregation](#) algorithm.
- StreamAgg: Performs data aggregation based on the [Stream Aggregation](#) algorithm. StreamAgg only supports the aggregation without the `GROUP BY` condition.
- TopN: Performs the TopN calculation.
- Limit: Performs the limit calculation.
- Project: Performs the projection calculation.
- HashJoin (Equi Join): Performs the join calculation based on the [Hash Join](#) algorithm, but with the following conditions:
 - The operator can be pushed down only in the [MPP mode](#).
 - The push-down of `Full Outer Join` is not supported.

- HashJoin (Non-Equi Join): Performs the Cartesian Join algorithm, but with the following conditions:
 - The operator can be pushed down only in the **MPP mode**.
 - Cartesian Join is supported only in Broadcast Join.

In TiDB, operators are organized in a tree structure. For an operator to be pushed down to TiFlash, all of the following prerequisites must be met:

- All of its child operators can be pushed down to TiFlash.
- If an operator contains expressions (most of the operators contain expressions), all expressions of the operator can be pushed down to TiFlash.

Currently, TiFlash supports the following push-down expressions:

- Mathematical functions: `+`, `-`, `/`, `*`, `%`, `>=`, `<=`, `=`, `!=`, `<`, `>`, `round`, `abs`,
↪ `floor(int)`, `ceil(int)`, `ceiling(int)`, `sqrt`, `log`, `log2`, `log10`, `ln`, `exp`
↪ `,` `pow`, `sign`, `radians`, `degrees`, `conv`, `crc32`
- Logical functions: `and`, `or`, `not`, `case when`, `if`, `ifnull`, `isnull`, `in`, `like`,
↪ `coalesce`
- Bitwise operations: `bitand`, `bitor`, `bigneg`, `bitxor`
- String functions: `substr`, `char_length`, `replace`, `concat`, `concat_ws`, `left`,
↪ `right`, `ascii`, `length`, `trim`, `ltrim`, `rtrim`, `position`, `format`, `lower`,
↪ `ucase`, `upper`, `substring_index`, `lpad`, `rpadd`, `strcmp`
- Date functions: `date_format`, `timestampdiff`, `from_unixtime`, `unix_timestamp`
↪ `(int)`, `unix_timestamp(decimal)`, `str_to_date(date)`, `str_to_date(
↪ datetime)`, `datediff`, `year`, `month`, `day`, `extract(datetime)`, `date`, `hour`
↪ `,` `microsecond`, `minute`, `second`, `sysdate`, `date_add/adddate(datetime,`
↪ `int)`, `date_add/adddate(string, int)`, `date_add/adddate(string, real)`
↪ `,` `date_sub/subdate(datetime, int)`, `date_sub/subdate(string, int)`,
↪ `date_sub/subdate(string, real)`, `quarter`
- JSON function: `json_length`
- Conversion functions: `cast(int as double)`, `cast(int as decimal)`, `cast(int
↪ as string)`, `cast(int as time)`, `cast(double as int)`, `cast(double as
↪ decimal)`, `cast(double as string)`, `cast(double as time)`, `cast(string
↪ as int)`, `cast(string as double)`, `cast(string as decimal)`, `cast(
↪ string as time)`, `cast(decimal as int)`, `cast(decimal as string)`, `cast(
↪ (decimal as time)`, `cast(time as int)`, `cast(time as decimal)`, `cast(
↪ time as string)`, `cast(time as real)`
- Aggregate functions: `min`, `max`, `sum`, `count`, `avg`, `approx_count_distinct`,
↪ `group_concat`
- Miscellaneous functions: `inetntoa`, `inetaton`, `inet6ntoa`, `inet6aton`

12.3.2.4.1 Other restrictions

- Expressions that contain the Bit, Set, and Geometry types cannot be pushed down to TiFlash.
- The `date_add`, `date_sub`, `adddate`, and `subdate` functions support the following interval types only. If other interval types are used, TiFlash reports errors.
 - DAY
 - WEEK
 - MONTH
 - YEAR
 - HOUR
 - MINUTE
 - SECOND

If a query encounters unsupported push-down calculations, TiDB needs to complete the remaining calculations, which might greatly affect the TiFlash acceleration effect. The currently unsupported operators and expressions might be supported in future versions.

12.3.2.5 Use the MPP mode

TiFlash supports using the MPP mode to execute queries, which introduces cross-node data exchange (data shuffle process) into the computation. TiDB automatically determines whether to select the MPP mode using the optimizer's cost estimation. You can change the selection strategy by modifying the values of `tidb_allow_mpp` and `tidb_enforce_mpp`.

12.3.2.5.1 Control whether to select the MPP mode

The `tidb_allow_mpp` variable controls whether TiDB can select the MPP mode to execute queries. The `tidb_enforce_mpp` variable controls whether the optimizer's cost estimation is ignored and the MPP mode of TiFlash is forcibly used to execute queries.

The results corresponding to all values of these two variables are as follows:

	<code>tidb_allow_mpp=off</code>	<code>tidb_allow_mpp=on</code> (by default)
<code>tidb_enforce_mpp=off</code> (by default)	The MPP mode is not used.	The optimizer selects the MPP mode based on cost estimation. (by default)
<code>tidb_enforce_mpp=on</code>	The MPP mode is not used.	TiDB ignores the cost estimation and selects the MPP mode.

For example, if you do not want to use the MPP mode, you can execute the following statements:

```
set @@session.tidb_allow_mpp=1;
set @@session.tidb_enforce_mpp=0;
```

If you want TiDB's cost-based optimizer to automatically decide whether to use the MPP mode (by default), you can execute the following statements:

```
set @@session.tidb_allow_mpp=1;
set @@session.tidb_enforce_mpp=0;
```

If you want TiDB to ignore the optimizer's cost estimation and to forcibly select the MPP mode, you can execute the following statements:

```
set @@session.tidb_allow_mpp=1;
set @@session.tidb_enforce_mpp=1;
```

The initial value of the `tidb_enforce_mpp` session variable is equal to the `enforce-mpp` configuration value of this `tidb-server` instance (which is `false` by default). If multiple `tidb-server` instances in a TiDB cluster only perform analytical queries and you want to make sure that the MPP mode is used on these instances, you can change their `enforce-mpp` configuration values to `true`.

Note:

When `tidb_enforce_mpp=1` takes effect, the TiDB optimizer will ignore the cost estimation to choose the MPP mode. However, if other factors block the MPP mode, TiDB will not select the MPP mode. These factors include the absence of TiFlash replica, unfinished replication of TiFlash replicas, and statements containing operators or functions that are not supported by the MPP mode.

If TiDB optimizer cannot select the MPP mode due to reasons other than cost estimation, when you use the `EXPLAIN` statement to check out the execution plan, a warning is returned to explain the reason. For example:

```
set @@session.tidb_enforce_mpp=1;
create table t(a int);
explain select count(*) from t;
show warnings;
```

```
+-----+-----+-----+
| Level | Code | Message
|-----|-----|-----|
+-----+-----+-----+
|      |      |      |
+-----+-----+-----+
```

```
| Warning | 1105 | MPP mode may be blocked because there aren't
  ↳ tiflash replicas of table `t`. |
+-----+-----+-----+-----+-----+-----+-----+-----+
  ↳
```

12.3.2.5.2 Algorithm support for the MPP mode

The MPP mode supports these physical algorithms: Broadcast Hash Join, Shuffled Hash Join, Shuffled Hash Aggregation, Union All, TopN, and Limit. The optimizer automatically determines which algorithm to be used in a query. To check the specific query execution plan, you can execute the `EXPLAIN` statement. If the result of the `EXPLAIN` statement shows `ExchangeSender` and `ExchangeReceiver` operators, it indicates that the MPP mode has taken effect.

The following statement takes the table structure in the TPC-H test set as an example:

```
explain select count(*) from customer c join nation n on c.c_nationkey=n.
  ↳ n_nationkey;
+--
  ↳ -----+-----+-----+-----+-----+-----+-----+-----+
  ↳
| id          | id          | estRows  | task          | access
  ↳ object | operator info
  ↳
+--
  ↳ -----+-----+-----+-----+-----+-----+-----+-----+
  ↳
| HashAgg_23  |          | 1.00    | root          |
  ↳          | funcs:count(Column#16)->Column#15
  ↳
| -TableReader_25 |          | 1.00    | root          |
  ↳          | data:ExchangeSender_24
  ↳
| -ExchangeSender_24 |          | 1.00    | batchCop[tiflash] |
  ↳          | ExchangeType: PassThrough
  ↳
| -HashAgg_12  |          | 1.00    | batchCop[tiflash] |
  ↳          | funcs:count(1)->Column#16
  ↳
| -HashJoin_17 |          | 3000000.00 | batchCop[tiflash] |
  ↳          | inner join, equal:[eq(tpch.nation.n_nationkey, tpch.
  ↳ customer.c_nationkey)] |
```

```

|      -ExchangeReceiver_21(Build) | 25.00      | batchCop[tiflash] |
↪      |
↪
|      -ExchangeSender_20          | 25.00      | batchCop[tiflash] |
↪      | ExchangeType: Broadcast
↪
|      -TableFullScan_18          | 25.00      | batchCop[tiflash] |
↪ table:n | keep order:false
↪
|      -TableFullScan_22(Probe)   | 3000000.00 | batchCop[tiflash] |
↪ table:c | keep order:false
↪
+--
↪ -----+-----+-----+
↪
9 rows in set (0.00 sec)

```

In the example execution plan, the `ExchangeReceiver` and `ExchangeSender` operators are included. The execution plan indicates that after the `nation` table is read, the `ExchangeSender` operator broadcasts the table to each node, the `HashJoin` and `HashAgg` operations are performed on the `nation` table and the `customer` table, and then the results are returned to TiDB.

TiFlash provides the following two global/session variables to control whether to use Broadcast Hash Join:

- `tidb_broadcast_join_threshold_size`: The unit of the value is bytes. If the table size (in the unit of bytes) is less than the value of the variable, the Broadcast Hash Join algorithm is used. Otherwise, the Shuffled Hash Join algorithm is used.
- `tidb_broadcast_join_threshold_count`: The unit of the value is rows. If the objects of the join operation belong to a subquery, the optimizer cannot estimate the size of the subquery result set, so the size is determined by the number of rows in the result set. If the estimated number of rows in the subquery is less than the value of this variable, the Broadcast Hash Join algorithm is used. Otherwise, the Shuffled Hash Join algorithm is used.

12.3.2.5.3 Known issues of MPP

In the current version, TiFlash uses the `start_ts` of a query as the unique key of the query. In most cases, the `start_ts` of each query can uniquely identify a query, but in the following cases, different queries have the same `start_ts`:

- All queries in the same transaction have the same `start_ts`.
- When you use `tidb_snapshot` to read data at a specific historical time point, the same time point is manually specified.

- When **Stale Read** is enabled, the same time point is manually specified.

When `start_ts` cannot uniquely represent the MPP query, if TiFlash detects that different queries have the same `start_ts` at a given time, TiFlash might report an error. Typical error cases are as follows:

- When multiple queries with the same `start_ts` are sent to TiFlash at the same time, you might encounter the `task has been registered` error.
- When multiple simple queries with `LIMIT` are executed continuously in the same transaction, once the `LIMIT` condition is met, TiDB sends a cancel request to TiFlash to cancel the query. This request also uses `start_ts` to identify the query to be canceled. If there are other queries with the same `start_ts` in TiFlash, these queries might be canceled by mistake. An example of this issue can be found in [#43426](#).

This issue is fixed in TiDB v6.6.0. It is recommended to use the [latest LTS version](#).

12.3.2.6 Data validation

12.3.2.6.1 User scenarios

Data corruptions are usually caused by serious hardware failures. In such cases, even if you attempt to manually recover data, your data become less reliable.

To ensure data integrity, by default, TiFlash performs basic data validation on data files, using the `City128` algorithm. In the event of any data validation failure, TiFlash immediately reports an error and exits, avoiding secondary disasters caused by inconsistent data. At this time, you need to manually intervene and replicate the data again before you can restore the TiFlash node.

Starting from v5.4.0, TiFlash introduces more advanced data validation features. TiFlash uses the `XXH3` algorithm by default and allows you to customize the validation frame and algorithm.

12.3.2.6.2 Validation mechanism

The validation mechanism builds upon the DeltaTree File (DTFile). DTFile is the storage file that persists TiFlash data. DTFile has three formats:

Version	State	Validation mechanism Notes
V1	Deprecated	Hashes are embedded in data files.
V2	Default	Hashes Compared are to V1, V2 adds in statistics of column data.
V3	Manual	By New in v5.4.0. contains meta-data and token data checksum, and supports multiple hash algorithms.

DTFile is stored in the `stable` folder in the data file directory. All formats currently enabled are in folder format, which means the data is stored in multiple files under a folder with a name like `dmf_<file id>`.

Use data validation

TiFlash supports both automatic and manual data validation:

- Automatic data validation:
 - TiFlash enables the V2 validation mechanism by default.
 - To enable V3 validation mechanism, refer to [TiFlash configuration file](#).
- Manual data validation. Refer to [DTTool inspect](#).

Warning:

After you enable the V3 validation mechanism, the newly generated DTFile cannot be directly read by TiFlash earlier than v5.4.0. Since v5.4.0, TiFlash supports both V2 and V3 and does not actively upgrade or downgrade versions. If you need to upgrade or downgrade versions for existing files, you need to manually [switch versions](#).

Validation tool

In addition to automatic data validation performed when TiFlash reads data, a tool for manually checking data integrity is introduced in v5.4.0. For details, refer to [DTTool](#).

12.3.2.7 Notes

TiFlash is incompatible with TiDB in the following situations:

- In the TiFlash computation layer:
 - Checking overflowed numerical values is not supported. For example, adding two maximum values of the `BIGINT` type `9223372036854775807 + ↪ 9223372036854775807`. The expected behavior of this calculation in TiDB is to return the `ERROR 1690 (22003): BIGINT value is out of range error`. However, if this calculation is performed in TiFlash, an overflow value of `-2` is returned without any error.
 - The window function is not supported.
 - Reading data from TiKV is not supported.

- Currently, the `sum` function in TiFlash does not support the string-type argument. But TiDB cannot identify whether any string-type argument has been passed into the `sum` function during the compiling. Therefore, when you execute statements similar to `select sum(string_col)from t`, TiFlash returns the `[FLASH:Coprocessor:Unimplemented] CastStringAsReal is not supported ↪ .` error. To avoid such an error in this case, you need to modify this SQL statement to `select sum(cast(string_col as double))from t`.
- Currently, TiFlash's decimal division calculation is incompatible with that of TiDB. For example, when dividing decimal, TiFlash performs the calculation always using the type inferred from the compiling. However, TiDB performs this calculation using a type that is more precise than that inferred from the compiling. Therefore, some SQL statements involving the decimal division return different execution results when executed in TiDB + TiKV and in TiDB + TiFlash. For example:

```
mysql> create table t (a decimal(3,0), b decimal(10, 0));
Query OK, 0 rows affected (0.07 sec)
mysql> insert into t values (43, 1044774912);
Query OK, 1 row affected (0.03 sec)
mysql> alter table t set tiflash replica 1;
Query OK, 0 rows affected (0.07 sec)
mysql> set session tidb_isolation_read_engines='tikv';
Query OK, 0 rows affected (0.00 sec)
mysql> select a/b, a/b + 0.00000000000001 from t where a/b;
+-----+-----+
| a/b   | a/b + 0.00000000000001 |
+-----+-----+
| 0.0000 |      0.0000000410001 |
+-----+-----+
1 row in set (0.00 sec)
mysql> set session tidb_isolation_read_engines='tiflash';
Query OK, 0 rows affected (0.00 sec)
mysql> select a/b, a/b + 0.00000000000001 from t where a/b;
Empty set (0.01 sec)
```

In the example above, `a/b`'s inferred type from the compiling is `Decimal(7,4)` both in TiDB and in TiFlash. Constrained by `Decimal(7,4)`, `a/b`'s returned type should be `0.0000`. In TiDB, `a/b`'s runtime precision is higher than `Decimal(7,4)`, so the original table data is not filtered by the `where a/b` condition. However, in TiFlash, the calculation of `a/b` uses `Decimal(7,4)` as the result type, so the original table data is filtered by the `where a/b` condition.

12.4 System Variables

TiDB system variables behave similar to MySQL with some differences, in that settings might apply on a `SESSION`, `INSTANCE`, or `GLOBAL` scope, or on a scope that combines `SESSION`, `INSTANCE`, or `GLOBAL`.

- Changes to `GLOBAL` scoped variables **only apply to new connection sessions with TiDB**. Currently active connection sessions are not affected. These changes are persisted and valid after restarts.
- Changes to `INSTANCE` scoped variables apply to all active or new connection sessions with the current TiDB instance immediately after the changes are made. Other TiDB instances are not affected. These changes are not persisted and become invalid after TiDB restarts.
- Variables can also have `NONE` scope. These variables are read-only, and are typically used to convey static information that will not change after a TiDB server has started.

Variables can be set with the **SET statement** on a per-session, instance or global basis:

```
## These two identical statements change a session variable
SET tidb_distsql_scan_concurrency = 10;
SET SESSION tidb_distsql_scan_concurrency = 10;

## These two identical statements change a global variable
SET @@global.tidb_distsql_scan_concurrency = 10;
SET GLOBAL tidb_distsql_scan_concurrency = 10;
```

Note:

Executing `SET GLOBAL` applies immediately on the TiDB server where the statement was issued. A notification is then sent to all TiDB servers to refresh their system variable cache, which will start immediately as a background operation. Because there is a risk that some TiDB servers might miss the notification, the system variable cache is also refreshed automatically every 30 seconds. This helps ensure that all servers are operating with the same configuration.

TiDB differs from MySQL in that `GLOBAL` scoped variables **persist** through TiDB server restarts. Additionally, TiDB presents several MySQL variables as both readable and settable. This is required for compatibility, because it is common for both applications and connectors to read MySQL variables. For example, JDBC connectors both read and set query cache settings, despite not relying on the behavior.

Note:

Larger values do not always yield better performance. It is also important to consider the number of concurrent connections that are executing statements, because most settings apply to each connection.

Consider the unit of a variable when you determine safe values:

- For threads, safe values are typically up to the number of CPU cores.
- For bytes, safe values are typically less than the amount of system memory.
- For time, pay attention that the unit might be seconds or milliseconds.

Variables using the same unit might compete for the same set of resources.

12.4.1 Variable Reference

12.4.1.1 `allow_auto_random_explicit_insert` New in v4.0.3

- Scope: `SESSION` | `GLOBAL`
- Default value: `OFF`
- Determines whether to allow explicitly specifying the values of the column with the `AUTO_RANDOM` attribute in the `INSERT` statement.

12.4.1.2 `auto_increment_increment`

- Scope: `SESSION` | `GLOBAL`
- Default value: `1`
- Range: `[1, 65535]`
- Controls the step size of `AUTO_INCREMENT` values to be allocated to a column. It is often used in combination with `auto_increment_offset`.

12.4.1.3 `auto_increment_offset`

- Scope: `SESSION` | `GLOBAL`
- Default value: `1`
- Range: `[1, 65535]`
- Controls the initial offset of `AUTO_INCREMENT` values to be allocated to a column. This setting is often used in combination with `auto_increment_increment`. For example:

```
mysql> CREATE TABLE t1 (a int not null primary key auto_increment);
Query OK, 0 rows affected (0.10 sec)

mysql> set auto_increment_offset=1;
Query OK, 0 rows affected (0.00 sec)

mysql> set auto_increment_increment=3;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (),(),(),();
Query OK, 4 rows affected (0.04 sec)
Records: 4 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+-----+
| a |
+-----+
| 1 |
| 4 |
| 7 |
| 10 |
+-----+
4 rows in set (0.00 sec)
```

12.4.1.4 autocommit

- Scope: SESSION | GLOBAL
- Default value: ON
- Controls whether statements should automatically commit when not in an explicit transaction. See [Transaction Overview](#) for more information.

12.4.1.5 block_encryption_mode

- Scope: SESSION | GLOBAL
- Default value: aes-128-ecb
- Defines the encryption mode for the AES_ENCRYPT() and AES_DECRYPT() functions.

12.4.1.6 character_set_client

- Scope: SESSION | GLOBAL
- Default value: utf8mb4

- The character set for data sent from the client. See [Character Set and Collation](#) for details on the use of character sets and collations in TiDB. It is recommended to use `SET NAMES` to change the character set when needed.

12.4.1.7 `character_set_connection`

- Scope: SESSION | GLOBAL
- Default value: `utf8mb4`
- The character set for string literals that do not have a specified character set.

12.4.1.8 `character_set_database`

- Scope: SESSION | GLOBAL
- Default value: `utf8mb4`
- This variable indicates the character set of the default database in use. **It is NOT recommended to set this variable.** When a new default database is selected, the server changes the variable value.

12.4.1.9 `character_set_results`

- Scope: SESSION | GLOBAL
- Default value: `utf8mb4`
- The character set that is used when data is sent to the client.

12.4.1.10 `character_set_server`

- Scope: SESSION | GLOBAL
- Default value: `utf8mb4`
- The default character set for the server.

12.4.1.11 `collation_connection`

- Scope: SESSION | GLOBAL
- Default value: `utf8mb4_bin`
- This variable indicates the collation for string literals that do not have a specified collation.

12.4.1.12 `collation_database`

- Scope: SESSION | GLOBAL
- Default value: `utf8mb4_bin`
- This variable indicates the collation of the default database in use. **It is NOT recommended to set this variable.** When a new default database is selected, the server changes the variable value.

12.4.1.13 collation_server

- Scope: SESSION | GLOBAL
- Default value: utf8mb4_bin
- The default collation for the server.

12.4.1.14 cte_max_recursion_depth

- Scope: SESSION | GLOBAL
- Default value: 1000
- Range: [0, 4294967295]
- Controls the maximum recursion depth in Common Table Expressions.

12.4.1.15 datadir

- Scope: NONE
- Default value: /tmp/tidb
- This variable indicates the location where data is stored. This location can be a local path or point to a PD server if the data is stored on TiKV.
- A value in the format of `ip_address:port` indicates the PD server that TiDB connects to on startup.

12.4.1.16 ddl_slow_threshold

- Scope: INSTANCE
- Default value: 300
- Unit: Milliseconds
- Log DDL operations whose execution time exceeds the threshold value.

12.4.1.17 default_authentication_plugin

- Scope: GLOBAL
- Default value: mysql_native_password
- Possible values: mysql_native_password, caching_sha2_password
- This variable sets the authentication method that the server advertises when the server-client connection is being established. Possible values for this variable are documented in [Authentication plugin status](#).
- Value options: mysql_native_password and caching_sha2_password. For more details, see [Authentication plugin status](#).

12.4.1.18 `default_week_format`

- Scope: SESSION | GLOBAL
- Default value: 0
- Range: [0, 7]
- Sets the week format used by the `WEEK()` function.

12.4.1.19 `error_count`

- Scope: NONE
- Type: Integer
- A read-only variable that indicates the number of errors that resulted from the last statement that generated messages.

12.4.1.20 `foreign_key_checks`

- Scope: SESSION | GLOBAL
- Default value: OFF
- For compatibility, TiDB returns foreign key checks as OFF.

12.4.1.21 `group_concat_max_len`

- Scope: SESSION | GLOBAL
- Default value: 1024
- Range: [4, 18446744073709551615]
- The maximum buffer size for items in the `GROUP_CONCAT()` function.

12.4.1.22 `have_openssl`

- Scope: NONE
- Default value: DISABLED
- A read-only variable for MySQL compatibility. Set to YES by the server when the server has TLS enabled.

12.4.1.23 `have_ssl`

- Scope: NONE
- Default value: DISABLED
- A read-only variable for MySQL compatibility. Set to YES by the server when the server has TLS enabled.

12.4.1.24 hostname

- Scope: NONE
- Default value: (system hostname)
- The hostname of the TiDB server as a read-only variable.

12.4.1.25 identity

This variable is an alias for `last_insert_id`.

12.4.1.26 init_connect

- Scope: GLOBAL
- Default value: “”
- The `init_connect` feature permits a SQL statement to be automatically executed when you first connect to a TiDB server. If you have the `CONNECTION_ADMIN` or `SUPER` privileges, this `init_connect` statement will not be executed. If the `init_connect` statement results in an error, your user connection will be terminated.

12.4.1.27 innodb_lock_wait_timeout

- Scope: SESSION | GLOBAL
- Default value: 50
- Range: [1, 1073741824]
- Unit: Seconds
- The lock wait timeout for pessimistic transactions (default).

12.4.1.28 interactive_timeout

- Scope: SESSION | GLOBAL
- Default value: 28800
- Range: [1, 31536000]
- Unit: Seconds
- This variable represents the idle timeout of the interactive user session. Interactive user session refers to the session established by calling `mysql_real_connect()` API using the `CLIENT_INTERACTIVE` option (for example, MySQL Shell and MySQL Client). This variable is fully compatible with MySQL.

12.4.1.29 last_insert_id

- Scope: SESSION
- Default value: 0

- This variable returns the last `AUTO_INCREMENT` or `AUTO_RANDOM` value generated by an insert statement.
- The value of `last_insert_id` is the same as the value returned by the function `LAST_INSERT_ID()`.

12.4.1.30 `last_plan_from_binding` New in v4.0

- Scope: `SESSION`
- Default value: `OFF`
- This variable is used to show whether the execution plan used in the previous statement was influenced by a [plan binding](#)

12.4.1.31 `last_plan_from_cache` New in v4.0

- Scope: `SESSION`
- Default value: `OFF`
- This variable is used to show whether the execution plan used in the previous `execute` statement is taken directly from the plan cache.

12.4.1.32 `license`

- Scope: `NONE`
- Default value: `Apache License 2.0`
- This variable indicates the license of your TiDB server installation.

12.4.1.33 `log_bin`

- Scope: `NONE`
- Default value: `OFF`
- This variable indicates whether [TiDB Binlog](#) is used.

12.4.1.34 `max_allowed_packet`

- Scope: `SESSION | GLOBAL`
- Default value: `67108864`
- Range: `[1024, 1073741824]`
- Unit: Bytes
- The maximum size of a packet for the MySQL protocol.

12.4.1.35 `max_connections`

- Scope: GLOBAL
- Persists to cluster: No
- Type: Integer
- Default value: 0
- Range: [0, 100000]
- The maximum number of connections permitted for a single TiDB instance.
- The value of 0 means no limit.

12.4.1.36 `max_execution_time`

- Scope: SESSION | GLOBAL
- Default value: 0
- Range: [0, 2147483647]
- Unit: Milliseconds
- The maximum execution time of a statement. The default value is unlimited (zero).

Note:

Unlike in MySQL, the `max_execution_time` system variable currently works on all kinds of statements in TiDB, not only restricted to the `SELECT` statement. The precision of the timeout value is roughly 100ms. This means the statement might not be terminated in accurate milliseconds as you specify.

12.4.1.37 `placement_checks` New in v5.3.0

- Scope: SESSION | GLOBAL
- Default value: ON
- This variable controls whether DDL statements validate [Placement Rules in SQL](#).
- It is intended to be used by logical dump/restore tools to ensure that tables can always be created even if placement rules are violated. This is similar to how `mysqldump` writes `SET FOREIGN_KEY_CHECKS=0;` to the start of every dump file.

12.4.1.38 `plugin_dir`

- Scope: INSTANCE
- Default value: ""
- Indicates the directory to load plugins as specified by a command-line flag.

12.4.1.39 `plugin_load`

- Scope: INSTANCE
- Default value: “”
- Indicates the plugins to load when TiDB is started. These plugins are specified by a command-line flag and separated by commas.

12.4.1.40 `port`

- Scope: NONE
- Default value: 4000
- Range: [0, 65535]
- The port that the `tidb-server` is listening on when speaking the MySQL protocol.

12.4.1.41 `rand_seed1`

- Scope: SESSION
- Default value: 0
- Range: [0, 2147483647]
- This variable is used to seed the random value generator used in the `RAND()` SQL function.
- The behavior of this variable is MySQL compatible.

12.4.1.42 `rand_seed2`

- Scope: SESSION
- Default value: 0
- Range: [0, 2147483647]
- This variable is used to seed the random value generator used in the `RAND()` SQL function.
- The behavior of this variable is MySQL compatible.

12.4.1.43 `skip_name_resolve` New in v5.2.0

- Scope: GLOBAL
- Default value: OFF
- This variable controls whether the `tidb-server` instance resolves hostnames as a part of the connection handshake.
- When the DNS is unreliable, you can enable this option to improve network performance.

Note:

When `skip_name_resolve=ON`, users with a hostname in their identity will no longer be able to log into the server. For example:

```
CREATE USER 'appuser'@'apphost' IDENTIFIED BY 'app-password';
```

In this example, it is recommended to replace `apphost` with an IP address or the wildcard (`%`).

12.4.1.44 socket

- Scope: NONE
- Default value: “”
- The local unix socket file that the `tidb-server` is listening on when speaking the MySQL protocol.

12.4.1.45 sql_log_bin

- Scope: SESSION | GLOBAL
- Default value: ON
- Indicates whether to write changes to [TiDB Binlog](#) or not.

Note:

It is not recommended to set `sql_log_bin` as a global variable because the future versions of TiDB might only allow setting this as a session variable.

12.4.1.46 sql_mode

- Scope: SESSION | GLOBAL
- Default value: `ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,NO_ENGINE_SUBSTITUTION`
- This variable controls a number of MySQL compatibility behaviors. See [SQL Mode](#) for more information.

12.4.1.47 `sql_select_limit` New in v4.0.2

- Scope: SESSION | GLOBAL
- Default value: 18446744073709551615
- Range: [0, 18446744073709551615]
- Unit: Rows
- The maximum number of rows returned by the `SELECT` statements.

12.4.1.48 `ssl_ca`

- Scope: NONE
- Default value: “”
- The location of the certificate authority file (if there is one). The value of this variable is defined by the TiDB configuration item `ssl-ca`.

12.4.1.49 `ssl_cert`

- Scope: NONE
- Default value: “”
- The location of the certificate file (if there is a file) that is used for SSL/TLS connections. The value of this variable is defined by the TiDB configuration item `ssl-cert`.

12.4.1.50 `ssl_key`

- Scope: NONE
- Default value: “”
- The location of the private key file (if there is one) that is used for SSL/TLS connections. The value of this variable is defined by TiDB configuration item `ssl-key`.

12.4.1.51 `system_time_zone`

- Scope: NONE
- Default value: (system dependent)
- This variable shows the system time zone from when TiDB was first bootstrapped. See also `time_zone`.

12.4.1.52 `tidb_allow_batch_cop` New in v4.0

- Scope: SESSION | GLOBAL
- Default value: 1

- Range: [0, 2]
- This variable is used to control how TiDB sends a coprocessor request to TiFlash. It has the following values:
 - 0: Never send requests in batches
 - 1: Aggregation and join requests are sent in batches
 - 2: All coprocessor requests are sent in batches

12.4.1.53 `tidb_allow_fallback_to_tikv` New in v5.0

- Scope: SESSION | GLOBAL
- Default value: ""
- This variable is used to specify a list of storage engines that might fall back to TiKV. If the execution of a SQL statement fails due to a failure of the specified storage engine in the list, TiDB retries executing this SQL statement with TiKV. This variable can be set to "" or "tiflash". When this variable is set to "tiflash", if TiFlash returns a timeout error (error code: ErrTiFlashServerTimeout), TiDB retries executing this SQL statement with TiKV.

12.4.1.54 `tidb_allow_function_for_expression_index` New in v5.2.0

- Scope: NONE
- Default value: lower, md5, reverse, upper, vitess_hash
- This variable is used to show the functions that are allowed to be used for creating expression indexes.

12.4.1.55 `tidb_allow_mpp` New in v5.0

- Scope: SESSION | GLOBAL
- Default value: ON
- Controls whether to use the MPP mode of TiFlash to execute queries. The value options are as follows:
 - 0 or OFF, which means that the MPP mode will not be used.
 - 1 or ON, which means that the optimizer determines whether to use the MPP mode based on the cost estimation (by default).

MPP is a distributed computing framework provided by the TiFlash engine, which allows data exchange between nodes and provides high-performance, high-throughput SQL algorithms.

For details about the selection of the MPP mode, refer to [Control whether to select the MPP mode](#).

12.4.1.56 `tidb_allow_remove_auto_inc` New in v2.1.18 and v3.0.4

- Scope: SESSION
- Default value: OFF
- This variable is used to set whether the `AUTO_INCREMENT` property of a column is allowed to be removed by executing `ALTER TABLE MODIFY` or `ALTER TABLE CHANGE` statements. It is not allowed by default.

12.4.1.57 `tidb_analyze_version` New in v5.1.0

- Scope: SESSION | GLOBAL
- Default value: 2
- Range: [1, 2]
- Controls how TiDB collects statistics.
- In v5.3.0 and later versions, the default value of this variable is 2. If your cluster is upgraded from a version earlier than v5.3.0 to v5.3.0 or later, the default value of `tidb_analyze_version` does not change. For detailed introduction, see [Introduction to Statistics](#).

12.4.1.58 `tidb_auto_analyze_end_time`

- Scope: GLOBAL
- Default value: 23:59 +0000
- This variable is used to restrict the time window that the automatic update of statistics is permitted. For example, to only allow automatic statistics updates between 1AM and 3AM, set `tidb_auto_analyze_start_time='01:00 +0000'` and `tidb_auto_analyze_end_time='03:00 +0000'`.

12.4.1.59 `tidb_auto_analyze_ratio`

- Scope: GLOBAL
- Default value: 0.5
- This variable is used to set the threshold when TiDB automatically executes `ANALYZE` \hookrightarrow `TABLE` in a background thread to update table statistics. For example, a value of 0.5 means that auto-analyze is triggered when greater than 50% of the rows in a table have been modified. Auto-analyze can be restricted to only execute during certain hours of the day by specifying `tidb_auto_analyze_start_time` and `tidb_auto_analyze_end_time`.

Note:

Only when the `run-auto-analyze` option is enabled in the starting configuration file of TiDB, the `auto_analyze` feature can be triggered.

12.4.1.60 `tidb_auto_analyze_start_time`

- Scope: GLOBAL
- Default value: 00:00 +0000
- This variable is used to restrict the time window that the automatic update of statistics is permitted. For example, to only allow automatic statistics updates between 1AM and 3AM, set `tidb_auto_analyze_start_time='01:00 +0000'` and `tidb_auto_analyze_end_time='03:00 +0000'`.

12.4.1.61 `tidb_backoff_lock_fast`

- Scope: SESSION | GLOBAL
- Default value: 10
- Range: [1, 2147483647]
- This variable is used to set the `backoff` time when the read request meets a lock.

12.4.1.62 `tidb_backoff_weight`

- Scope: SESSION | GLOBAL
- Default value: 2
- Range: [1, 2147483647]
- This variable is used to increase the weight of the maximum time of TiDB `backoff`, that is, the maximum retry time for sending a retry request when an internal network or other component (TiKV, PD) failure is encountered. This variable can be used to adjust the maximum retry time and the minimum value is 1.

For example, the base timeout for TiDB to take TSO from PD is 15 seconds. When `tidb_backoff_weight = 2`, the maximum timeout for taking TSO is: *base time * 2 = 30 seconds*.

In the case of a poor network environment, appropriately increasing the value of this variable can effectively alleviate error reporting to the application end caused by timeout. If the application end wants to receive the error information more quickly, minimize the value of this variable.

12.4.1.63 `tidb_batch_insert`

- Scope: SESSION
- Default value: OFF
- This variable permits `tidb_dml_batch_size` to be used in `INSERT` statements.
- Only the value `OFF` provides ACID compliance. Setting this to any other value breaks the atomicity and isolation guarantees of TiDB, because an individual `INSERT` statement will be split into smaller transactions.

12.4.1.64 `tidb_broadcast_join_threshold_count` New in v5.0

- Scope: SESSION | GLOBAL
- Default value: 10240
- Range: [0, 9223372036854775807]
- Unit: Rows
- If the objects of the join operation belong to a subquery, the optimizer cannot estimate the size of the subquery result set. In this situation, the size is determined by the number of rows in the result set. If the estimated number of rows in the subquery is less than the value of this variable, the Broadcast Hash Join algorithm is used. Otherwise, the Shuffled Hash Join algorithm is used.

12.4.1.65 `tidb_broadcast_join_threshold_size` New in v5.0

- Scope: SESSION | GLOBAL
- Default value: 104857600 (100 MiB)
- Range: [0, 9223372036854775807]
- Unit: Bytes
- If the table size is less than the value of the variable, the Broadcast Hash Join algorithm is used. Otherwise, the Shuffled Hash Join algorithm is used.

12.4.1.66 `tidb_build_stats_concurrency`

- Scope: SESSION | GLOBAL
- Default value: 4
- Unit: Threads
- This variable is used to set the concurrency of executing the `ANALYZE` statement.
- When the variable is set to a larger value, the execution performance of other queries is affected.

12.4.1.67 `tidb_capture_plan_baselines` New in v4.0

- Scope: SESSION | GLOBAL
- Default value: OFF
- This variable is used to control whether to enable the **baseline capturing** feature. This feature depends on the statement summary, so you need to enable the statement summary before you use baseline capturing.
- After this feature is enabled, the historical SQL statements in the statement summary are traversed periodically, and bindings are automatically created for SQL statements that appear at least twice.

12.4.1.68 `tidb_check_mb4_value_in_utf8`

- Scope: INSTANCE
- Default value: `ON`
- This variable is used to enforce that the `utf8` character set only stores values from the [Basic Multilingual Plane \(BMP\)](#). To store characters outside the BMP, it is recommended to use the `utf8mb4` character set.
- You might need to disable this option when upgrading your cluster from an earlier version of TiDB where the `utf8` checking was more relaxed. For details, see [FAQs After Upgrade](#).

12.4.1.69 `tidb_checksum_table_concurrency`

- Scope: SESSION
- Default value: 4
- Unit: Threads
- This variable is used to set the scan index concurrency of executing the `ADMIN` \leftrightarrow `CHECKSUM TABLE` statement.
- When the variable is set to a larger value, the execution performance of other queries is affected.

12.4.1.70 `tidb_config`

- Scope: SESSION
- Default value: “”
- This variable is read-only. It is used to obtain the configuration information of the current TiDB server.

12.4.1.71 `tidb_constraint_check_in_place`

- Scope: SESSION | GLOBAL
- Default value: `OFF`
- This setting only applies to optimistic transactions. When this variable is set to `OFF` \leftrightarrow , checking for duplicate values in `UNIQUE` indexes is deferred until the transaction commits. This helps improve performance, but might be an unexpected behavior for some applications. See [Constraints](#) for details.
 - When set to zero and using optimistic transactions:

```
tidb> create table t (i int key);
tidb> insert into t values (1);
tidb> begin optimistic;
tidb> insert into t values (1);
Query OK, 1 row affected
tidb> commit; -- Check only when a transaction is committed.
ERROR 1062 : Duplicate entry '1' for key 'PRIMARY'
```

- When set to 1 and using optimistic transactions:

```
tidb> set @@tidb_constraint_check_in_place=1;
tidb> begin optimistic;
tidb> insert into t values (1);
ERROR 1062 : Duplicate entry '1' for key 'PRIMARY'
```

Constraint checking is always performed in place for pessimistic transactions (default).

12.4.1.72 `tidb_current_ts`

- Scope: SESSION
- Default value: 0
- This variable is read-only. It is used to obtain the timestamp of the current transaction.

12.4.1.73 `tidb_ddl_error_count_limit`

- Scope: GLOBAL
- Default value: 512
- Range: [0, 9223372036854775807]
- This variable is used to set the number of retries when the DDL operation fails. When the number of retries exceeds the parameter value, the wrong DDL operation is canceled.

12.4.1.74 `tidb_ddl_reorg_batch_size`

- Scope: GLOBAL
- Default value: 256
- Range: [32, 10240]
- Unit: Rows
- This variable is used to set the batch size during the `re-organize` phase of the DDL operation. For example, when TiDB executes the `ADD INDEX` operation, the index data needs to be backfilled by `tidb_ddl_reorg_worker_cnt` (the number) concurrent workers. Each worker backfills the index data in batches.

- If many updating operations such as `UPDATE` and `REPLACE` exist during the `ADD` \leftrightarrow `INDEX` operation, a larger batch size indicates a larger probability of transaction conflicts. In this case, you need to adjust the batch size to a smaller value. The minimum value is 32.
- If the transaction conflict does not exist, you can set the batch size to a large value (consider the worker count. See [Interaction Test on Online Workloads and ADD \$\leftrightarrow\$ INDEX Operations](#) for reference). This can increase the speed of the backfilling data, but the write pressure on TiKV also becomes higher.

12.4.1.75 `tidb_ddl_reorg_priority`

- Scope: `SESSION`
- Default value: `PRIORITY_LOW`
- This variable is used to set the priority of executing the `ADD INDEX` operation in the `re-organize` phase.
- You can set the value of this variable to `PRIORITY_LOW`, `PRIORITY_NORMAL` or `PRIORITY_HIGH`.

12.4.1.76 `tidb_ddl_reorg_worker_cnt`

- Scope: `GLOBAL`
- Default value: 4
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency of the DDL operation in the `re-organize` phase.

12.4.1.77 `tidb_disable_txn_auto_retry`

- Scope: `SESSION | GLOBAL`
- Default value: `ON`
- This variable is used to set whether to disable the automatic retry of explicit optimistic transactions. The default value of `ON` means that transactions will not automatically retry in TiDB and `COMMIT` statements might return errors that need to be handled in the application layer.

Setting the value to `OFF` means that TiDB will automatically retry transactions, resulting in fewer errors from `COMMIT` statements. Be careful when making this change, because it might result in lost updates.

This variable does not affect automatically committed implicit transactions and internally executed transactions in TiDB. The maximum retry count of these transactions is determined by the value of `tidb_retry_limit`.

For more details, see [limits of retry](#).

This variable only applies to optimistic transactions, not to pessimistic transactions. The number of retries for pessimistic transactions is controlled by [max_retry_count](#).

12.4.1.78 `tidb_distsql_scan_concurrency`

- Scope: SESSION | GLOBAL
- Default value: 15
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency of the `scan` operation.
- Use a bigger value in OLAP scenarios, and a smaller value in OLTP scenarios.
- For OLAP scenarios, the maximum value should not exceed the number of CPU cores of all the TiKV nodes.
- If a table has a lot of partitions, you can reduce the variable value appropriately (determined by the size of the data to be scanned and the frequency of the scan) to avoid TiKV becoming out of memory (OOM).

12.4.1.79 `tidb_dml_batch_size`

- Scope: SESSION | GLOBAL
- Default value: 0
- Range: [0, 2147483647]
- Unit: Rows
- When this value is greater than 0, TiDB will batch commit statements such as `INSERT` or `LOAD DATA` into smaller transactions. This reduces memory usage and helps ensure that the `txn-total-size-limit` is not reached by bulk modifications.
- To use `tidb_dml_batch_size` in `INSERT` statements, you also need to set the system variable `tidb_batch_insert` to `ON`.
- Only the value 0 provides ACID compliance. Setting this to any other value will break the atomicity and isolation guarantees of TiDB.

12.4.1.80 `tidb_enable_1pc` New in v5.0

- Scope: SESSION | GLOBAL
- Default value: `ON`
- This variable is used to specify whether to enable the one-phase commit feature for transactions that only affect one Region. Compared with the often-used two-phase commit, one-phase commit can greatly reduce the latency of transaction commit and increase the throughput.

Note:

- The default value of `ON` only applies to new clusters. If your cluster was upgraded from an earlier version of TiDB, the value `OFF` will be used instead.
- If you have enabled TiDB Binlog, enabling this variable cannot improve the performance. To improve the performance, it is recommended to use [TiCDC](#) instead.
- Enabling this parameter only means that one-phase commit becomes an optional mode of transaction commit. In fact, the most suitable mode of transaction commit is determined by TiDB.

12.4.1.81 `tidb_enable_alter_placement`

Warning:

Currently, Placement Rules in SQL is an experimental feature. It is not recommended that you use it in production environments.

- Scope: GLOBAL
- Default value: `OFF`
- This variable enables or disables [Placement Rules in SQL](#).

12.4.1.82 `tidb_enable_amend_pessimistic_txn` New in v4.0.7

- Scope: SESSION | GLOBAL
- Default value: `OFF`
- This variable is used to control whether to enable the `AMEND TRANSACTION` feature. If you enable the `AMEND TRANSACTION` feature in a pessimistic transaction, when concurrent DDL operations and `SCHEMA VERSION` changes exist on tables associated with this transaction, TiDB attempts to amend the transaction. TiDB corrects the transaction commit to make the commit consistent with the latest valid `SCHEMA VERSION` so that the transaction can be successfully committed without getting the `Information schema is changed` error. This feature is effective on the following concurrent DDL operations:

- `ADD COLUMN` or `DROP COLUMN` operations.
- `MODIFY COLUMN` or `CHANGE COLUMN` operations which increase the length of a field.
- `ADD INDEX` or `DROP INDEX` operations in which the index column is created before the transaction is opened.

Note:

Currently, this feature is incompatible with TiDB Binlog in some scenarios and might cause semantic changes on a transaction. For more usage precautions of this feature, refer to [Incompatibility issues about transaction semantic](#) and [Incompatibility issues about TiDB Binlog](#).

12.4.1.83 `tidb_enable_async_commit` New in v5.0

- Scope: `SESSION` | `GLOBAL`
- Default value: `ON`
- This variable controls whether to enable the async commit feature for the second phase of the two-phase transaction commit to perform asynchronously in the background. Enabling this feature can reduce the latency of transaction commit.

Note:

- The default value of `ON` only applies to new clusters. If your cluster was upgraded from an earlier version of TiDB, the value `OFF` will be used instead.
- If you have enabled TiDB Binlog, enabling this variable cannot improve the performance. To improve the performance, it is recommended to use [TiCDC](#) instead.
- Enabling this parameter only means that Async Commit becomes an optional mode of transaction commit. In fact, the most suitable mode of transaction commit is determined by TiDB.

12.4.1.84 `tidb_enable_auto_increment_in_generated`

- Scope: `SESSION` | `GLOBAL`
- Default value: `OFF`
- This variable is used to determine whether to include the `AUTO_INCREMENT` columns when creating a generated column or an expression index.

12.4.1.85 `tidb_enable_change_multi_schema`

Warning:

TiDB will support more types of multi-schema changes in the future. This system variable will be deleted in a future release of TiDB.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable is used to control whether multiple columns or indexes can be altered in one `ALTER TABLE` statement. When the value of this variable is `ON`, only the following multi-schema changes are supported:
 - Add multiple columns. For example, `ALTER TABLE t ADD COLUMN c1 INT, ADD ↵ COLUMN c2 INT;`
 - Drop multiple columns. For example, `ALTER TABLE t DROP COLUMN c1, DROP ↵ COLUMN c2;`
 - Drop multiple indexes. For example, `ALTER TABLE t DROP INDEX i1, DROP ↵ INDEX i2;`
 - Drop a column covered by a single-column index. For example, `ALTER TABLE t ↵ DROP COLUMN c1`, in which the schema contains `INDEX idx(c1)`.

12.4.1.86 `tidb_enable_cascades_planner`

Warning:

Currently, cascades planner is an experimental feature. It is not recommended that you use it in production environments.

- Scope: SESSION | GLOBAL
- Default value: OFF
- This variable is used to control whether to enable the cascades planner.

12.4.1.87 `tidb_enable_chunk_rpc` New in v4.0

- Scope: SESSION
- Default value: ON
- This variable is used to control whether to enable the `Chunk` data encoding format in Coprocessor.

12.4.1.88 `tidb_enable_clustered_index` New in v5.0

- Scope: SESSION | GLOBAL
- Default value: INT_ONLY
- Possible values: OFF, ON, INT_ONLY
- This variable is used to control whether to create the primary key as a **clustered index** by default. “By default” here means that the statement does not explicitly specify the keyword CLUSTERED/NONCLUSTERED. Supported values are OFF, ON, and INT_ONLY:
 - OFF indicates that primary keys are created as non-clustered indexes by default.
 - ON indicates that primary keys are created as clustered indexes by default.
 - INT_ONLY indicates that the behavior is controlled by the configuration item `alter ↪ -primary-key`. If `alter-primary-key` is set to `true`, all primary keys are created as non-clustered indexes by default. If it is set to `false`, only the primary keys which consist of an integer column are created as clustered indexes.

12.4.1.89 `tidb_enable_collect_execution_info`

- Scope: INSTANCE
- Default value: ON
- This variable controls whether to record the execution information of each operator in the slow query log.

12.4.1.90 `tidb_enable_column_tracking` New in v5.4.0

Warning:

Currently, collecting statistics on PREDICATE COLUMNS is an experimental feature. It is not recommended that you use it in production environments.

- Scope: GLOBAL
- Default value: OFF
- This variable controls whether to enable TiDB to collect PREDICATE COLUMNS. After enabling the collection, if you disable it, the information of previously collected PREDICATE COLUMNS is cleared. For details, see [Collect statistics on some columns](#).

12.4.1.91 `tidb_enable_enhanced_security`

- Scope: NONE
- Default value: OFF

- This variable indicates whether the TiDB server you are connected to has the Security Enhanced Mode (SEM) enabled. To change its value, you need to modify the value of `enable-sem` in your TiDB server configuration file and restart the TiDB server.
- SEM is inspired by the design of systems such as [Security-Enhanced Linux](#). It reduces the abilities of users with the MySQL `SUPER` privilege and instead requires `RESTRICTED` fine-grained privileges to be granted as a replacement. These fine-grained privileges include:
 - `RESTRICTED_TABLES_ADMIN`: The ability to write data to system tables in the `mysql` schema and to see sensitive columns on `information_schema` tables.
 - `RESTRICTED_STATUS_ADMIN`: The ability to see sensitive variables in the command `SHOW STATUS`.
 - `RESTRICTED_VARIABLES_ADMIN`: The ability to see and set sensitive variables in `SHOW [GLOBAL] VARIABLES` and `SET`.
 - `RESTRICTED_USER_ADMIN`: The ability to prevent other users from making changes or dropping a user account.

12.4.1.92 `tidb_enable_fast_analyze`

Warning:

Currently, `Fast Analyze` is an experimental feature. It is not recommended that you use it in production environments.

- Scope: `SESSION` | `GLOBAL`
- Default value: `OFF`
- This variable is used to set whether to enable the statistics `Fast Analyze` feature.
- If the statistics `Fast Analyze` feature is enabled, TiDB randomly samples about 10,000 rows of data as statistics. When the data is distributed unevenly or the data size is small, the statistics accuracy is low. This might lead to a non-optimal execution plan, for example, selecting a wrong index. If the execution time of the regular `Analyze` statement is acceptable, it is recommended to disable the `Fast Analyze` feature.

12.4.1.93 `tidb_enable_index_merge` New in v4.0

- Scope: `SESSION` | `GLOBAL`
- Default value: `ON`
- This variable is used to control whether to enable the index merge feature.

Note:

- After upgrading a TiDB cluster from versions earlier than v4.0.0 to v5.4.0 or later, this variable is disabled by default to prevent performance regression due to changes of execution plans.
- After upgrading a TiDB cluster from v4.0.0 or later to v5.4.0 or later, this variable remains the setting before the upgrade.
- Since v5.4.0, for a newly deployed TiDB cluster, this variable is enabled by default.

12.4.1.94 tidb_enable_list_partition New in v5.0**Warning:**

Currently, List partition and List COLUMNS partition are experimental features. It is not recommended that you use it in production environments.

- Scope: SESSION | GLOBAL
- Default value: OFF
- This variable is used to set whether to enable the LIST (COLUMNS)TABLE PARTITION feature.

12.4.1.95 tidb_enable_noop_functions New in v4.0

- Scope: SESSION | GLOBAL
- Default value: OFF
- Possible values: OFF, ON, WARN
- By default, TiDB returns an error when you attempt to use the syntax for functionality that is not yet implemented. When the variable value is set to ON, TiDB silently ignores such cases of unavailable functionality, which is helpful if you cannot make changes to the SQL code.
- Enabling noop functions controls the following behaviors:
 - `get_lock` and `release_lock` functions
 - `LOCK IN SHARE MODE` syntax
 - `SQL_CALC_FOUND_ROWS` syntax
 - `START TRANSACTION READ ONLY` and `SET TRANSACTION READ ONLY` syntax

- The `tx_read_only`, `transaction_read_only`, `offline_mode`, `super_read_only`
↔ `, read_only` and `sql_auto_is_null` system variables
- `GROUP BY <expr> ASC|DESC` syntax

Warning:

Only the default value of `OFF` can be considered safe. Setting `tidb_enable_noop_functions=1` might lead to unexpected behaviors in your application, because it permits TiDB to ignore certain syntax without providing an error. For example, the syntax `START TRANSACTION READ ONLY` is permitted, but the transaction remains in read-write mode.

12.4.1.96 `tidb_enable_paging` New in v5.4.0

- Scope: `SESSION | GLOBAL`
- Default value: `OFF`
- This variable controls whether to use the method of paging to send coprocessor requests in `IndexLookup` operator.
- User scenarios: For read queries that use `IndexLookup` and `Limit` and that `Limit` ↔ cannot be pushed down to `IndexScan`, there might be high latency for the read queries and high CPU usage for TiKV's unified read pool. In such cases, because the `Limit` operator only requires a small set of data, if you set `tidb_enable_paging` to `ON`, TiDB processes less data, which reduces query latency and resource consumption.
- When `tidb_enable_paging` is enabled, for the `IndexLookup` requests with `Limit` that cannot be pushed down and are fewer than 960, TiDB uses the method of paging to send coprocessor requests. The fewer `Limit`, the more obvious the optimization.

12.4.1.97 `tidb_enable_parallel_apply` New in v5.0

- Scope: `SESSION | GLOBAL`
- Default value: `OFF`
- This variable controls whether to enable concurrency for the `Apply` operator. The number of concurrencies is controlled by the `tidb_executor_concurrency` variable. The `Apply` operator processes correlated subqueries and has no concurrency by default, so the execution speed is slow. Setting this variable value to 1 can increase concurrency and speed up execution. Currently, concurrency for `Apply` is disabled by default.

12.4.1.98 `tidb_enable_pseudo_for_outdated_stats` New in v5.3.0

- Scope: `SESSION | GLOBAL`

- Default value: `ON`
- This variable controls the behavior of the optimizer on using statistics of a table when the statistics are outdated.
- The optimizer determines whether the statistics of a table is outdated in this way: since the last time `ANALYZE` is executed on a table to get the statistics, if 80% of the table rows are modified (the modified row count divided by the total row count), the optimizer determines that the statistics of this table is outdated. You can change this ratio using the `pseudo-estimate-ratio` configuration.
- By default (with the variable value `ON`), when the statistics of a table is outdated, the optimizer determines that the statistics of the table is no longer reliable except for the total row count. Then, the optimizer uses the pseudo statistics. If you set the variable value to `OFF`, even if the statistics of a table are outdated, the optimizer still keeps using the statistics.
- If the data on a table is frequently modified without executing `ANALYZE` on this table in time, to keep the execution plan stable, you can set the variable value to `OFF`.

12.4.1.99 `tidb_enable_rate_limit_action`

Note:

This variable is enabled by default, which makes the memory usage not under the control of `tidb_mem_quota_query` in some cases. Therefore, it is recommended to set the value of `tidb_enable_rate_limit_action` to `OFF`.

- Scope: `SESSION | GLOBAL`
- Default value: `ON`
- This variable controls whether to enable the dynamic memory control feature for the operator that reads data. By default, this operator enables the maximum number of threads that `tidb_distsql_scan_concurrency` allows to read data. When the memory usage of a single SQL statement exceeds `tidb_mem_quota_query` each time, the operator that reads data stops one thread.
- When the operator that reads data has only one thread left and the memory usage of a single SQL statement continues to exceed `tidb_mem_quota_query`, this SQL statement triggers other memory control behaviors, such as `spilling data to disk`.

12.4.1.100 `tidb_enable_slow_log`

- Scope: `INSTANCE`
- Default value: `ON`
- This variable is used to control whether to enable the slow log feature.

12.4.1.101 `tidb_enable_stmt_summary` New in v3.0.4

- Scope: SESSION | GLOBAL
- Default value: ON
- This variable is used to control whether to enable the statement summary feature. If enabled, SQL execution information like time consumption is recorded to the `information_schema.STATEMENTS_SUMMARY` system table to identify and troubleshoot SQL performance issues.

12.4.1.102 `tidb_enable_strict_double_type_check` New in v5.0

- Scope: SESSION | GLOBAL
- Default value: ON
- This variable is used to control if tables can be created with invalid definitions of type `DOUBLE`. This setting is intended to provide an upgrade path from earlier versions of TiDB, which were less strict in validating types.
- The default value of ON is compatible with MySQL.

For example, the type `DOUBLE(10)` is now considered invalid because the precision of floating point types is not guaranteed. After changing `tidb_enable_strict_double_type_check` \leftrightarrow to `OFF`, the table is created:

```
mysql> CREATE TABLE t1 (id int, c double(10));
ERROR 1149 (42000): You have an error in your SQL syntax; check the manual
  ↪ that corresponds to your MySQL server version for the right syntax to
  ↪ use

mysql> SET tidb_enable_strict_double_type_check = 'OFF';
Query OK, 0 rows affected (0.00 sec)

mysql> CREATE TABLE t1 (id int, c double(10));
Query OK, 0 rows affected (0.09 sec)
```

Note:

This setting only applies to the type `DOUBLE` since MySQL permits precision for `FLOAT` types. This behavior is deprecated starting with MySQL 8.0.17, and it is not recommended to specify precision for either `FLOAT` or `DOUBLE` types.

12.4.1.103 `tidb_enable_table_partition`

- Scope: `SESSION` | `GLOBAL`
- Default value: `ON`
- Possible values: `OFF`, `ON`, `AUTO`
- This variable is used to set whether to enable the `TABLE PARTITION` feature:
 - `ON` indicates enabling Range partitioning, Hash partitioning, and Range column partitioning with one single column.
 - `AUTO` functions the same way as `ON` does.
 - `OFF` indicates disabling the `TABLE PARTITION` feature. In this case, the syntax that creates a partition table can be executed, but the table created is not a partitioned one.

12.4.1.104 `tidb_enable_telemetry` New in v4.0.2

- Scope: `GLOBAL`
- Default value: `ON`
- This variable is used to dynamically control whether the telemetry collection in TiDB is enabled. By setting the value to `OFF`, the telemetry collection is disabled. If the `enable-telemetry` TiDB configuration item is set to `false` on all TiDB instances, the telemetry collection is always disabled and this system variable will not take effect. See [Telemetry](#) for details.

12.4.1.105 `tidb_enable_tso_follower_proxy` New in v5.3.0

- Scope: `GLOBAL`
- Default value: `OFF`
- This variable is used to enable the TSO Follower Proxy feature. When the value is `OFF`, TiDB only gets TSO from the PD leader. After this feature is enabled, TiDB gets TSO by evenly sending requests to all PD nodes and forwarding TSO requests through PD followers. This helps reduce the CPU pressure of PD leader.
- Scenarios for enabling TSO Follower Proxy:
 - Due to the high pressure of TSO requests, the CPU of the PD leader reaches a bottleneck, which causes high latency of TSO RPC requests.
 - The TiDB cluster has many TiDB instances, and increasing the value of `tidb_tso_client_batch_max_wait_time` cannot alleviate the high latency issue of TSO RPC requests.

Note:

Suppose that the TSO RPC latency increases for reasons other than a CPU usage bottleneck of the PD leader (such as network issues). In this case, enabling the TSO Follower Proxy might increase the execution latency in TiDB and affect the QPS performance of the cluster.

12.4.1.106 `tidb_enable_vectorized_expression` New in v4.0

- Scope: SESSION | GLOBAL
- Default value: ON
- This variable is used to control whether to enable vectorized execution.

12.4.1.107 `tidb_enable_window_function`

- Scope: SESSION | GLOBAL
- Default value: ON
- This variable is used to control whether to enable the support for window functions. Note that window functions may use reserved keywords. This might cause SQL statements that could be executed normally cannot be parsed after upgrading TiDB. In this case, you can set `tidb_enable_window_function` to OFF.

12.4.1.108 `tidb_enforce_mpp` New in v5.1

- Scope: SESSION
- Default value: OFF
- To change this default value, modify the `performance.enforce-mpp` configuration value.
- Controls whether to ignore the optimizer's cost estimation and to forcibly use TiFlash's MPP mode for query execution. The value options are as follows:
 - 0 or OFF, which means that the MPP mode is not forcibly used (by default).
 - 1 or ON, which means that the cost estimation is ignored and the MPP mode is forcibly used. Note that this setting only takes effect when `tidb_allow_mpp` \hookrightarrow true.

MPP is a distributed computing framework provided by the TiFlash engine, which allows data exchange between nodes and provides high-performance, high-throughput SQL algorithms.

For details about the selection of the MPP mode, refer to [Control whether to select the MPP mode](#).

12.4.1.109 `tidb_evolve_plan_baselines` New in v4.0

- Scope: SESSION | GLOBAL
- Default value: OFF
- This variable is used to control whether to enable the baseline evolution feature. For detailed introduction or usage, see [Baseline Evolution](#).
- To reduce the impact of baseline evolution on the cluster, use the following configurations:
 - Set `tidb_evolve_plan_task_max_time` to limit the maximum execution time of each execution plan. The default value is 600s.
 - Set `tidb_evolve_plan_task_start_time` and `tidb_evolve_plan_task_end_time` ↪ to limit the time window. The default values are respectively 00:00 +0000 and 23:59 +0000.

12.4.1.110 `tidb_evolve_plan_task_end_time` New in v4.0

- Scope: GLOBAL
- Default value: 23:59 +0000
- This variable is used to set the end time of baseline evolution in a day.

12.4.1.111 `tidb_evolve_plan_task_max_time` New in v4.0

- Scope: GLOBAL
- Default value: 600
- Range: [-1, 9223372036854775807]
- Unit: Seconds
- This variable is used to limit the maximum execution time of each execution plan in the baseline evolution feature.

12.4.1.112 `tidb_evolve_plan_task_start_time` New in v4.0

- Scope: GLOBAL
- Default value: 00:00 +0000
- This variable is used to set the start time of baseline evolution in a day.

12.4.1.113 `tidb_executor_concurrency` New in v5.0

- Scope: SESSION | GLOBAL
- Default value: 5
- Range: [1, 256]
- Unit: Threads

This variable is used to set the concurrency of the following SQL operators (to one value):

- `index lookup`
- `index lookup join`
- `hash join`
- `hash aggregation` (the `partial` and `final` phases)
- `window`
- `projection`

`tidb_executor_concurrency` incorporates the following existing system variables as a whole for easier management:

- `tidb_index_lookup_concurrency`
- `tidb_index_lookup_join_concurrency`
- `tidb_hash_join_concurrency`
- `tidb_hashagg_partial_concurrency`
- `tidb_hashagg_final_concurrency`
- `tidb_projection_concurrency`
- `tidb_window_concurrency`

Since v5.0, you can still separately modify the system variables listed above (with a deprecation warning returned) and your modification only affects the corresponding single operators. After that, if you use `tidb_executor_concurrency` to modify the operator concurrency, the separately modified operators will not be affected. If you want to use `tidb_executor_concurrency` to modify the concurrency of all operators, you can set the values of all variables listed above to `-1`.

For a system upgraded to v5.0 from an earlier version, if you have not modified any value of the variables listed above (which means that the `tidb_hash_join_concurrency` value is 5 and the values of the rest are 4), the operator concurrency previously managed by these variables will automatically be managed by `tidb_executor_concurrency`. If you have modified any of these variables, the concurrency of the corresponding operators will still be controlled by the modified variables.

12.4.1.114 `tidb_expensive_query_time_threshold`

- Scope: `INSTANCE`
- Default value: `60`
- Range: `[10, 2147483647]`
- Unit: `Seconds`
- This variable is used to set the threshold value that determines whether to print expensive query logs. The difference between expensive query logs and slow query logs is:
 - Slow logs are printed after the statement is executed.
 - Expensive query logs print the statements that are being executed, with execution time exceeding the threshold value, and their related information.

12.4.1.115 `tidb_force_priority`

- Scope: INSTANCE
- Default value: `NO_PRIORITY`
- This variable is used to change the default priority for statements executed on a TiDB server. A use case is to ensure that a particular user that is performing OLAP queries receives lower priority than users performing OLTP queries.
- You can set the value of this variable to `NO_PRIORITY`, `LOW_PRIORITY`, `DELAYED` or `HIGH_PRIORITY`.

12.4.1.116 `tidb_gc_concurrency` New in v5.0

- Scope: GLOBAL
- Default value: `-1`
- Range: `[1, 256]`
- Unit: Threads
- Specifies the number of threads in the **Resolve Locks** step of GC. A value of `-1` means that TiDB will automatically decide the number of garbage collection threads to use.

12.4.1.117 `tidb_gc_enable` New in v5.0

- Scope: GLOBAL
- Default value: `ON`
- Enables garbage collection for TiKV. Disabling garbage collection will reduce system performance, as old versions of rows will no longer be purged.

12.4.1.118 `tidb_gc_life_time` New in v5.0

- Scope: GLOBAL
- Default value: `10m0s`
- Range: `[10m0s, 8760h0m0s]`
- The time limit during which data is retained for each GC, in the format of Go Duration. When a GC happens, the current time minus this value is the safe point.

Note:

- In scenarios of frequent updates, a large value (days or even months) for `tidb_gc_life_time` may cause potential issues, such as:
 - Larger storage use

- A large amount of history data may affect performance to a certain degree, especially for range queries such as `select count(*) from t`
- If there is any transaction that has been running longer than `tidb_gc_life_time`, during GC, the data since `start_ts` is retained for this transaction to continue execution. For example, if `tidb_gc_life_time` is configured to 10 minutes, among all transactions being executed, the transaction that starts earliest has been running for 15 minutes, GC will retain data of the recent 15 minutes.

12.4.1.119 `tidb_gc_run_interval` New in v5.0

- Scope: GLOBAL
- Default value: 10m0s
- Range: [10m0s, 8760h0m0s]
- Specifies the GC interval, in the format of Go Duration, for example, "1h30m", and "15m"

12.4.1.120 `tidb_gc_scan_lock_mode` New in v5.0

Warning:

Currently, Green GC is an experimental feature. It is not recommended that you use it in production environments.

- Scope: GLOBAL
- Default value: LEGACY
- Possible values: PHYSICAL, LEGACY
 - LEGACY: Uses the old way of scanning, that is, disable Green GC.
 - PHYSICAL: Uses the physical scanning method, that is, enable Green GC.
- This variable specifies the way of scanning locks in the Resolve Locks step of GC. When the variable value is set to LEGACY, TiDB scans locks by Regions. When the value PHYSICAL is used, it enables each TiKV node to bypass the Raft layer and directly scan data, which can effectively mitigate the impact of GC waking up all Regions when the **Hibernate Region** feature is enabled, thus improving the execution speed in the Resolve Locks step.

12.4.1.121 `tidb_general_log`

- Scope: INSTANCE
- Default value: OFF
- This variable is used to set whether to record all SQL statements in the `log`. This feature is disabled by default. If maintenance personnel needs to trace all SQL statements when locating issues, they can enable this feature.
- To see all records of this feature in the log, you need to set the TiDB configuration item `log.level` to "info" or "debug" and then query the "GENERAL_LOG" string. The following information is recorded:
 - `conn`: The ID of the current session.
 - `user`: The current session user.
 - `schemaVersion`: The current schema version.
 - `txnStartTS`: The timestamp at which the current transaction starts.
 - `forUpdateTS`: In the pessimistic transactional mode, `forUpdateTS` is the current timestamp of the SQL statement. When a write conflict occurs in the pessimistic transaction, TiDB retries the SQL statement currently being executed and updates this timestamp. You can configure the number of retries via `max-retry-count`. In the optimistic transactional model, `forUpdateTS` is equivalent to `txnStartTS`.
 - `isReadConsistency`: Indicates whether the current transactional isolation level is Read Committed (RC).
 - `current_db`: The name of the current database.
 - `txn_mode`: The transactional mode. Value options are OPTIMISTIC and PESSIMISTIC.
 - `sql`: The SQL statement corresponding to the current query.

12.4.1.122 `tidb_hash_join_concurrency`

Warning:

Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Default value: -1
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency of the `hash join` algorithm.
- A value of -1 means that the value of `tidb_executor_concurrency` will be used instead.

12.4.1.123 `tidb_hashagg_final_concurrency`

Warning:

Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Default value: -1
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency of executing the concurrent hash \leftrightarrow aggregation algorithm in the final phase.
- When the parameter of the aggregate function is not distinct, HashAgg is run concurrently and respectively in two phases - the partial phase and the final phase.
- A value of -1 means that the value of `tidb_executor_concurrency` will be used instead.

12.4.1.124 `tidb_hashagg_partial_concurrency`

Warning:

Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Default value: -1
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency of executing the concurrent hash \leftrightarrow aggregation algorithm in the partial phase.
- When the parameter of the aggregate function is not distinct, HashAgg is run concurrently and respectively in two phases - the partial phase and the final phase.
- A value of -1 means that the value of `tidb_executor_concurrency` will be used instead.

12.4.1.125 `tidb_index_join_batch_size`

- Scope: SESSION | GLOBAL
- Default value: 25000
- Range: [1, 2147483647]
- Unit: Rows
- This variable is used to set the batch size of the `index lookup join` operation.
- Use a bigger value in OLAP scenarios, and a smaller value in OLTP scenarios.

12.4.1.126 `tidb_index_lookup_concurrency`

Warning:

Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Default value: -1
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency of the `index lookup` operation.
- Use a bigger value in OLAP scenarios, and a smaller value in OLTP scenarios.
- A value of -1 means that the value of `tidb_executor_concurrency` will be used instead.

12.4.1.127 `tidb_index_lookup_join_concurrency`

Warning:

Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Default value: -1
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency of the `index lookup join` algorithm.
- A value of -1 means that the value of `tidb_executor_concurrency` will be used instead.

12.4.1.128 `tidb_index_lookup_size`

- Scope: SESSION | GLOBAL
- Default value: 20000
- Range: [1, 2147483647]
- Unit: Rows
- This variable is used to set the batch size of the `index lookup` operation.
- Use a bigger value in OLAP scenarios, and a smaller value in OLTP scenarios.

12.4.1.129 `tidb_index_serial_scan_concurrency`

- Scope: SESSION | GLOBAL
- Default value: 1
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency of the `serial scan` operation.
- Use a bigger value in OLAP scenarios, and a smaller value in OLTP scenarios.

12.4.1.130 `tidb_init_chunk_size`

- Scope: SESSION | GLOBAL
- Default value: 32
- Range: [1, 32]
- Unit: Rows
- This variable is used to set the number of rows for the initial chunk during the execution process.

12.4.1.131 `tidb_isolation_read_engines` New in v4.0

- Scope: SESSION
- Default value: `tikv,tiflash,tidb`
- This variable is used to set the storage engine list that TiDB can use when reading data.

12.4.1.132 `tidb_log_file_max_days` New in v5.3.0

- Scope: SESSION
- Default value: 0
- Range: [0, 2147483647]
- This variable is used to adjust the maximum days of logger on the current TiDB instance. Its value defaults to the value of the `max-days` configuration in the configuration file. Changing the variable value only affects the current TiDB instance. After TiDB is restarted, the variable value is reset and the configuration value is not affected.

12.4.1.133 `tidb_low_resolution_tso`

- Scope: SESSION
- Default value: OFF
- This variable is used to set whether to enable the low precision TSO feature. After this feature is enabled, new transactions use a timestamp updated every 2 seconds to read data.
- The main applicable scenario is to reduce the overhead of acquiring TSO for small read-only transactions when reading old data is acceptable.

12.4.1.134 `tidb_max_chunk_size`

- Scope: SESSION | GLOBAL
- Default value: 1024
- Range: [32, 2147483647]
- Unit: Rows
- This variable is used to set the maximum number of rows in a chunk during the execution process. Setting to too large of a value may cause cache locality issues.

12.4.1.135 `tidb_max_delta_schema_count` New in v2.1.18 and v3.0.5

- Scope: GLOBAL
- Default value: 1024
- Range: [100, 16384]
- This variable is used to set the maximum number of schema versions (the table IDs modified for corresponding versions) allowed to be cached. The value range is 100 ~ 16384.

12.4.1.136 `tidb_mem_quota_apply_cache` New in v5.0

- Scope: SESSION | GLOBAL
- Default value: 33554432 (32 MiB)
- Range: [0, 9223372036854775807]
- Unit: Bytes
- This variable is used to set the memory usage threshold of the local cache in the `Apply` operator.
- The local cache in the `Apply` operator is used to speed up the computation of the `Apply` operator. You can set the variable to 0 to disable the `Apply` cache feature.

12.4.1.137 `tidb_mem_quota_query`

- Scope: SESSION
- Default value: 1073741824 (1 GiB)
- Range: [-1, 9223372036854775807]
- Unit: Bytes
- This variable is used to set the threshold value of memory quota for a query.
- If the memory quota of a query during execution exceeds the threshold value, TiDB performs the operation designated by the `OOMAction` option in the configuration file.

- The initial value of this variable is configured by `mem-quota-query`.

12.4.1.138 `tidb_memory_usage_alarm_ratio`

- Scope: INSTANCE
- Default value: 0.8

- TiDB triggers an alarm when the percentage of the memory it takes exceeds a certain threshold. For the detailed usage description of this feature, see `memory-usage-alarm` ↪ `-ratio`.
- You can set the initial value of this variable by configuring `memory-usage-alarm-` ↪ `ratio`.

12.4.1.139 `tidb_metric_query_range_duration` New in v4.0

- Scope: SESSION
- Default value: 60
- Range: [10, 216000]
- Unit: Seconds
- This variable is used to set the range duration of the Prometheus statement generated when querying `METRICS_SCHEMA`.

12.4.1.140 `tidb_metric_query_step` New in v4.0

- Scope: SESSION
- Default value: 60
- Range: [10, 216000]
- Unit: Seconds
- This variable is used to set the step of the Prometheus statement generated when querying `METRICS_SCHEMA`.

12.4.1.141 `tidb_multi_statement_mode` New in v4.0.11

- Scope: `SESSION` | `GLOBAL`
- Default value: `OFF`
- Possible values: `OFF`, `ON`, `WARN`
- This variable controls whether to allow multiple queries to be executed in the same `COM_QUERY` call.
- To reduce the impact of SQL injection attacks, TiDB now prevents multiple queries from being executed in the same `COM_QUERY` call by default. This variable is intended to be used as part of an upgrade path from earlier versions of TiDB. The following behaviors apply:

Client setting	<code>tidb_multi_statement_mode</code> value	Multiple statements permitted?
Multiple Statements = ON	<code>OFF</code>	Yes
Multiple Statements = ON	<code>ON</code>	Yes
Multiple Statements = ON	<code>WARN</code>	Yes
Multiple Statements = OFF	<code>OFF</code>	No
Multiple Statements = OFF	<code>ON</code>	Yes
Multiple Statements = OFF	<code>WARN</code>	Yes (+warning returned)

Note:

Only the default value of `OFF` can be considered safe. Setting `tidb_multi_statement_mode=ON` might be required if your application was specifically designed for an earlier version of TiDB. If your application requires multiple statement support, it is recommended to use the setting provided by your client library instead of the `tidb_multi_statement_mode` option. For example:

- [go-sql-driver](#) (`multiStatements`)
- [Connector/J](#) (`allowMultiQueries`)
- PHP [mysqli](#) (`mysqli_multi_query`)

12.4.1.142 `tidb_opt_agg_push_down`

- Scope: `SESSION`
- Default value: `OFF`
- This variable is used to set whether the optimizer executes the optimization operation of pushing down the aggregate function to the position before Join, Projection, and UnionAll.

- When the aggregate operation is slow in query, you can set the variable value to ON.

12.4.1.143 `tidb_opt_correlation_exp_factor`

- Scope: SESSION | GLOBAL
- Default value: 1
- Range: [0, 2147483647]
- When the method that estimates the number of rows based on column order correlation is not available, the heuristic estimation method is used. This variable is used to control the behavior of the heuristic method.
 - When the value is 0, the heuristic method is not used.
 - When the value is greater than 0:
 - * A larger value indicates that an index scan will probably be used in the heuristic method.
 - * A smaller value indicates that a table scan will probably be used in the heuristic method.

12.4.1.144 `tidb_opt_correlation_threshold`

- Scope: SESSION | GLOBAL
- Default value: 0.9
- This variable is used to set the threshold value that determines whether to enable estimating the row count by using column order correlation. If the order correlation between the current column and the `handle` column exceeds the threshold value, this method is enabled.

12.4.1.145 `tidb_opt_distinct_agg_push_down`

- Scope: SESSION
- Default value: OFF
- This variable is used to set whether the optimizer executes the optimization operation of pushing down the aggregate function with `distinct` (such as `select count(distinct ↪ a)from t`) to Coprocessor.
- When the aggregate function with the `distinct` operation is slow in the query, you can set the variable value to 1.

In the following example, before `tidb_opt_distinct_agg_push_down` is enabled, TiDB needs to read all data from TiKV and execute `distinct` on the TiDB side. After `tidb_opt_distinct_agg_push_down` is enabled, `distinct a` is pushed down to Coprocessor, and a `group by` column `test.t.a` is added to `HashAgg_5`.

```
mysql> desc select count(distinct a) from test.t;
+---
↪ -----+-----+-----+-----+
↪
| id          | estRows | task   | access object | operator info
↪          |         |       |              |
+---
↪ -----+-----+-----+-----+
↪
| StreamAgg_6 | 1.00    | root   |              | funcs:count(
↪   distinct test.t.a)->Column#4 |
| -TableReader_10 | 10000.00 | root   |              | data:
↪   TableFullScan_9 |         |       |              |
| -TableFullScan_9 | 10000.00 | cop[tikv] | table:t | keep order:false
↪   , stats:pseudo |
+---
↪ -----+-----+-----+-----+
↪
3 rows in set (0.01 sec)

mysql> set session tidb_opt_distinct_agg_push_down = 1;
Query OK, 0 rows affected (0.00 sec)

mysql> desc select count(distinct a) from test.t;
+---
↪ -----+-----+-----+-----+
↪
| id          | estRows | task   | access object | operator info
↪          |         |       |              |
+---
↪ -----+-----+-----+-----+
↪
| HashAgg_8   | 1.00    | root   |              | funcs:count(
↪   distinct test.t.a)->Column#3 |
| -TableReader_9 | 1.00    | root   |              | data:HashAgg_5
↪          |         |       |              |
| -HashAgg_5   | 1.00    | cop[tikv] |              | group by:test.

↪   false, stats:pseudo |
+---
↪ -----+-----+-----+-----+
↪
4 rows in set (0.00 sec)
```

12.4.1.146 `tidb_opt_enable_correlation_adjustment`

- Scope: SESSION | GLOBAL
- Default value: ON
- This variable is used to control whether the optimizer estimates the number of rows based on column order correlation

12.4.1.147 `tidb_opt_insubq_to_join_and_agg`

- Scope: SESSION | GLOBAL
- Default value: ON
- This variable is used to set whether to enable the optimization rule that converts a subquery to join and aggregation.
- For example, after you enable this optimization rule, the subquery is converted as follows:

```
select * from t where t.a in (select aa from t1);
```

The subquery is converted to join as follows:

```
select t.* from t, (select aa from t1 group by aa) tmp_t where t.a =  
    ↪ tmp_t.aa;
```

If `t1` is limited to be unique and not null in the `aa` column. You can use the following statement, without aggregation.

```
select t.* from t, t1 where t.a=t1.aa;
```

12.4.1.148 `tidb_opt_limit_push_down_threshold`

- Scope: SESSION | GLOBAL
- Default value: 100
- Range: [0, 2147483647]
- This variable is used to set the threshold that determines whether to push the Limit or TopN operator down to TiKV.
- If the value of the Limit or TopN operator is smaller than or equal to this threshold, these operators are forcibly pushed down to TiKV. This variable resolves the issue that the Limit or TopN operator cannot be pushed down to TiKV partly due to wrong estimation.

12.4.1.149 tidb_opt_prefer_range_scan New in v5.0

- Scope: SESSION | GLOBAL
- Default value: OFF
- After you set the value of this variable to ON, the optimizer always prefers range scans over full table scans.
- In the following example, before you enable `tidb_opt_prefer_range_scan`, the TiDB optimizer performs a full table scan. After you enable `tidb_opt_prefer_range_scan`, the optimizer selects an index range scan.

```

explain select * from t where age=5;
+---+
| id | estRows | task | access object | operator info |
+---+
| TableReader_7 | 1048576.00 | root | | data:
  ↳ Selection_6 |
| -Selection_6 | 1048576.00 | cop[tikv] | | eq(test.t.age,
  ↳ 5) |
| -TableFullScan_5 | 1048576.00 | cop[tikv] | table:t | keep order:
  ↳ false |
+---+
3 rows in set (0.00 sec)

set session tidb_opt_prefer_range_scan = 1;

explain select * from t where age=5;
+---+
| id | estRows | task | access object |
| operator info |
+---+
| IndexLookUp_7 | 1048576.00 | root | |
| -IndexRangeScan_5(Build) | 1048576.00 | cop[tikv] | table:t, index:
  ↳ idx_age(age) | range:[5,5], keep order:false |

```

```
| -TableRowIDScan_6(Probe) | 1048576.00 | cop[tikv] | table:t
| ↩                      | keep order:false |
+---
| ↩ -----+-----+-----+-----+-----+-----+-----+-----+-----+
| ↩
```

3 rows in set (0.00 sec)

12.4.1.150 tidb_opt_write_row_id

- Scope: SESSION
- Default value: OFF
- This variable is used to control whether to allow INSERT, REPLACE, and UPDATE statements to operate on the `_tidb_rowid` column. This variable can be used only when you import data using TiDB tools.

12.4.1.151 tidb_partition_prune_mode New in v5.1

Warning:

Currently, the dynamic pruning mode for partitioned tables is an experimental feature. It is not recommended that you use it in production environments.

- Scope: SESSION | GLOBAL
- Default value: `static`
- Specifies whether to enable `dynamic` mode for partitioned tables. For details about the dynamic pruning mode, see [Dynamic Pruning Mode for Partitioned Tables](#).

12.4.1.152 tidb_persist_analyze_options New in v5.4.0

- Scope: GLOBAL
- Default value: ON
- This variable controls whether to enable the [ANALYZE configuration persistence](#) feature.

12.4.1.153 `tidb_pprof_sql_cpu` New in v4.0

- Scope: INSTANCE
- Default value: 0
- Range: [0, 1]
- This variable is used to control whether to mark the corresponding SQL statement in the profile output to identify and troubleshoot performance issues.

12.4.1.154 `tidb_projection_concurrency`

Warning:

Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Default value: -1
- Range: [-1, 256]
- Unit: Threads
- This variable is used to set the concurrency of the `Projection` operator.
- A value of -1 means that the value of `tidb_executor_concurrency` will be used instead.

12.4.1.155 `tidb_query_log_max_len`

- Scope: INSTANCE
- Default value: 4096 (4 KiB)
- Range: [-1, 9223372036854775807]
- Unit: Bytes
- The maximum length of the SQL statement output. When the output length of a statement is larger than the `tidb_query-log-max-len` value, the statement is truncated to output.

Usage example:

```
SET tidb_query_log_max_len = 20
```

12.4.1.156 `tidb_read_consistency` New in v5.4.0

- Scope: SESSION
- Persists to cluster: No
- Type: String
- Default value: `strict`
- This variable is used to control the read consistency for an auto-commit read statement.
- If the variable value is set to `weak`, the locks encountered by the read statement are skipped directly and the read execution might be faster, which is the weak consistency read mode. However, the transaction semantics (such as atomicity) and distributed consistency (such as linearizability) are not guaranteed.
- For user scenarios where the auto-commit read needs to return fast and weak consistency read results are acceptable, you can use the weak consistency read mode.

12.4.1.157 `tidb_read_staleness` New in v5.4.0

- Scope: SESSION
- Default value: 0
- This variable is used to set the time range of historical data that TiDB can read in the current session. After setting the value, TiDB selects a timestamp as new as possible from the range allowed by this variable, and all subsequent read operations are performed against this timestamp. For example, if the value of this variable is set to `-5`, on the condition that TiKV has the corresponding historical version's data, TiDB selects a timestamp as new as possible within a 5-second time range.

12.4.1.158 `tidb_record_plan_in_slow_log`

- Scope: INSTANCE
- Default value: `ON`
- This variable is used to control whether to include the execution plan of slow queries in the slow log.

12.4.1.159 `tidb_redact_log`

- Scope: SESSION | GLOBAL
- Default value: `OFF`
- This variable controls whether to hide user information in the SQL statement being recorded into the TiDB log and slow log.
- When you set the variable to 1, user information is hidden. For example, if the executed SQL statement is `insert into t values (1,2)`, the statement is recorded as `insert ↪ into t values (?,?)` in the log.

12.4.1.160 `tidb_regard_null_as_point` New in v5.4.0

- Scope: SESSION | GLOBAL
- Default value: ON
- This variable controls whether the optimizer can use a query condition including null equivalence as a prefix condition for index access.
- This variable is enabled by default. When it is enabled, the optimizer can reduce the volume of index data to be accessed, which accelerates query execution. For example, if a query involves multiple-column indexes `index(a, b)` and the query condition contains `a<=>null` and `b=1`, the optimizer can use both `a<=>null` and `b=1` in the query condition for index access. If the variable is disabled, because `a<=>null` and `b ↪ =1` includes the null equivalence condition, the optimizer does not use `b=1` for index access.

12.4.1.161 `tidb_replica_read` New in v4.0

- Scope: SESSION | GLOBAL
- Default value: leader
- Possible values: leader, follower, leader-and-follower, closest-replicas
- This variable is used to control where TiDB reads data. Here are three options:
 - leader: Read only from leader node
 - follower: Read only from follower node
 - leader-and-follower: Read from leader or follower node
- See [follower reads](#) for additional details.

12.4.1.162 `tidb_restricted_read_only` New in v5.2.0

Warning:

For TiDB versions earlier than v5.3.1 or v5.4.1, this variable has a defect and using it might cause unexpected results. Ensure that you use this variable ONLY in TiDB versions later than v5.3.1 or v5.4.1.

- Scope: GLOBAL
- Default value: OFF
- `tidb_restricted_read_only` and `tidb_super_read_only` behave similarly. In most cases, you should use `tidb_super_read_only` only.
- Users with the SUPER or SYSTEM_VARIABLES_ADMIN privilege can modify this variable. However, if the [Security Enhanced Mode](#) is enabled, the additional RESTRICTED_VARIABLES_ADMIN privilege is required to read or modify this variable.

- `tidb_restricted_read_only` affects `tidb_super_read_only` in the following cases:
 - Setting `tidb_restricted_read_only` to ON will update `tidb_super_read_only` to ON.
 - Setting `tidb_restricted_read_only` to OFF leaves `tidb_super_read_only` unchanged.
 - If `tidb_restricted_read_only` is ON, `tidb_super_read_only` cannot be set to OFF.
- For DBaaS providers of TiDB, if a TiDB cluster is a downstream database of another database, to make the TiDB cluster read-only, you might need to use `tidb_restricted_read_only` with `Security Enhanced Mode` enabled, which prevents your customers from using `tidb_super_read_only` to make the cluster writable. To achieve this, you need to enable `Security Enhanced Mode`, use an admin user with the `SYSTEM_VARIABLES_ADMIN` and `RESTRICTED_VARIABLES_ADMIN` privileges to control `tidb_restricted_read_only`, and let your database users use the root user with the `SUPER` privilege to control `tidb_super_read_only` only.
- This variable controls the read-only status of the entire cluster. When the variable is ON, all TiDB servers in the entire cluster are in the read-only mode. In this case, TiDB only executes the statements that do not modify data, such as `SELECT`, `USE`, and `SHOW`. For other statements such as `INSERT` and `UPDATE`, TiDB rejects executing those statements in the read-only mode.
- Enabling the read-only mode using this variable only ensures that the entire cluster finally enters the read-only status. If you have changed the value of this variable in a TiDB cluster but the change has not yet propagated to other TiDB servers, the un-updated TiDB servers are still **not** in the read-only mode.
- When this variable is enabled, the SQL statements being executed are not affected. TiDB only performs the read-only check for the SQL statements **to be** executed.
- When this variable is enabled, TiDB handles the uncommitted transactions in the following ways:
 - For uncommitted read-only transactions, you can commit the transactions normally.
 - For uncommitted transactions that are not read-only, SQL statements that perform write operations in these transactions are rejected.
 - For uncommitted read-only transactions with modified data, the commit of these transactions is rejected.
- After the read-only mode is enabled, all users (including the users with the `SUPER` privilege) cannot execute the SQL statements that might write data unless the user is explicitly granted the `RESTRICTED_REPLICA_WRITER_ADMIN` privilege.

12.4.1.163 `tidb_retry_limit`

- Scope: `SESSION` | `GLOBAL`
- Default value: 10

- Range: [-1, 9223372036854775807]
- This variable is used to set the maximum number of the retries for optimistic transactions. When a transaction encounters retryable errors (such as transaction conflicts, very slow transaction commit, or table schema changes), this transaction is re-executed according to this variable. Note that setting `tidb_retry_limit` to 0 disables the automatic retry. This variable only applies to optimistic transactions, not to pessimistic transactions.

12.4.1.164 `tidb_row_format_version`

- Scope: GLOBAL
- Default value: 2
- Range: [1, 2]
- Controls the format version of the newly saved data in the table. In TiDB v4.0, the [new storage row format](#) version 2 is used by default to save new data.
- If you upgrade from a TiDB version earlier than 4.0.0 to 4.0.0, the format version is not changed, and TiDB continues to use the old format of version 1 to write data to the table, which means that **only newly created clusters use the new data format by default**.
- Note that modifying this variable does not affect the old data that has been saved, but applies the corresponding version format only to the newly written data after modifying this variable.

12.4.1.165 `tidb_scatter_region`

- Scope: GLOBAL
- Default value: OFF
- By default, Regions are split for a new table when it is being created in TiDB. After this variable is enabled, the newly split Regions are scattered immediately during the execution of the `CREATE TABLE` statement. This applies to the scenario where data need to be written in batches right after the tables are created in batches, because the newly split Regions can be scattered in TiKV beforehand and do not have to wait to be scheduled by PD. To ensure the continuous stability of writing data in batches, the `CREATE TABLE` statement returns success only after the Regions are successfully scattered. This makes the statement's execution time multiple times longer than that when you disable this variable.
- Note that if `SHARD_ROW_ID_BITS` and `PRE_SPLIT_REGIONS` have been set when a table is created, the specified number of Regions are evenly split after the table creation.

12.4.1.166 `tidb_skip_ascii_check` New in v5.0

- Scope: SESSION | GLOBAL
- Default value: OFF

- This variable is used to set whether to skip ASCII validation.
- Validating ASCII characters affects the performance. When you are sure that the input characters are valid ASCII characters, you can set the variable value to `ON`.

12.4.1.167 `tidb_skip_isolation_level_check`

- Scope: SESSION | GLOBAL
- Default value: `OFF`
- After this switch is enabled, if an isolation level unsupported by TiDB is assigned to `tx_isolation`, no error is reported. This helps improve compatibility with applications that set (but do not depend on) a different isolation level.

```
tidb> set tx_isolation='serializable';
ERROR 8048 (HY000): The isolation level 'serializable' is not supported.
  ↳ Set tidb_skip_isolation_level_check=1 to skip this error
tidb> set tidb_skip_isolation_level_check=1;
Query OK, 0 rows affected (0.00 sec)

tidb> set tx_isolation='serializable';
Query OK, 0 rows affected, 1 warning (0.00 sec)
```

12.4.1.168 `tidb_skip_utf8_check`

- Scope: SESSION | GLOBAL
- Default value: `OFF`
- This variable is used to set whether to skip UTF-8 validation.
- Validating UTF-8 characters affects the performance. When you are sure that the input characters are valid UTF-8 characters, you can set the variable value to `ON`.

Note:

If the character check is skipped, TiDB might fail to detect illegal UTF-8 characters written by the application, cause decoding errors when `ANALYZE` is executed, and introduce other unknown encoding issues. If your application cannot guarantee the validity of the written string, it is not recommended to skip the character check.

12.4.1.169 `tidb_slow_log_threshold`

- Scope: INSTANCE
- Default value: 300
- Range: [-1, 9223372036854775807]
- Unit: Milliseconds
- This variable outputs the threshold value of the time consumed by the slow log, and is set to 300 milliseconds by default. When the time consumed by a query is larger than this value, this query is considered as a slow query and its log is output to the slow query log. Note that when the output level of `log.level` is "debug", all queries are recorded in the slow query log, regardless of the setting of this variable.

Usage example:

```
SET tidb_slow_log_threshold = 200;
```

12.4.1.170 `tidb_slow_query_file`

- Scope: SESSION
- Default value: ""
- When `INFORMATION_SCHEMA.SLOW_QUERY` is queried, only the slow query log name set by `slow-query-file` in the configuration file is parsed. The default slow query log name is "tidb-slow.log". To parse other logs, set the `tidb_slow_query_file` session variable to a specific file path, and then query `INFORMATION_SCHEMA.SLOW_QUERY` to parse the slow query log based on the set file path.

For details, see [Identify Slow Queries](#).

12.4.1.171 `tidb_snapshot`

- Scope: SESSION
- Default value: ""
- This variable is used to set the time point at which the data is read by the session. For example, when you set the variable to "2017-11-11 20:20:20" or a TSO number like "400036290571534337", the current session reads the data of this moment.

12.4.1.172 `tidb_stats_load_sync_wait` New in v5.4.0

WARNING:

Currently, synchronously loading statistics is an experimental feature. It is not recommended that you use it in production environments.

- Scope: SESSION | GLOBAL
- Default value: 0
- Unit: milliseconds
- Range: [0, 4294967295]
- This variable controls whether to enable the synchronously loading statistics feature. The default value 0 means that the feature is disabled. To enable the feature, you can set this variable to a timeout (in milliseconds) that SQL optimization can wait for at most to synchronously load complete column statistics. For details, see [Load statistics](#).

12.4.1.173 `tidb_stats_load_pseudo_timeout` New in v5.4.0

WARNING:

Currently, synchronously loading statistics is an experimental feature. It is not recommended that you use it in production environments.

- Scope: GLOBAL
- Default value: OFF
- This variable controls how TiDB behaves when the waiting time of SQL optimization reaches the timeout to synchronously load complete column statistics. The default value OFF means that SQL execution fails after the timeout. If you set this variable to ON, the SQL optimization gets back to using pseudo statistics after the timeout.

12.4.1.174 `tidb_stmt_summary_history_size` New in v4.0

- Scope: SESSION | GLOBAL
- Default value: 24
- Range: [0, 255]
- This variable is used to set the history capacity of [statement summary tables](#).

12.4.1.175 `tidb_stmt_summary_internal_query` New in v4.0

- Scope: SESSION | GLOBAL
- Default value: OFF
- This variable is used to control whether to include the SQL information of TiDB in [statement summary tables](#).

12.4.1.176 `tidb_stmt_summary_max_sql_length` New in v4.0

- Scope: SESSION | GLOBAL
- Default value: 4096
- Range: [0, 2147483647]
- This variable is used to control the length of the SQL string in [statement summary tables](#).

12.4.1.177 `tidb_stmt_summary_max_stmt_count` New in v4.0

- Scope: SESSION | GLOBAL
- Default value: 3000
- Range: [1, 32767]
- This variable is used to set the maximum number of statements that [statement summary tables](#) store in memory.

12.4.1.178 `tidb_stmt_summary_refresh_interval` New in v4.0

- Scope: SESSION | GLOBAL
- Default value: 1800
- Range: [1, 2147483647]
- Unit: Seconds
- This variable is used to set the refresh time of [statement summary tables](#).

12.4.1.179 `tidb_enable_top_sql` New in v5.4.0

- Scope: GLOBAL
- Default value: OFF
- This variable is used to control whether to enable the [Top SQL](#) feature.

Warning:

Currently, Top SQL is an experimental feature. It is not recommended that you use it for production environments.

12.4.1.180 `tidb_store_limit` New in v3.0.4 and v4.0

- Scope: GLOBAL
- Default value: 0
- Range: [0, 9223372036854775807]
- This variable is used to limit the maximum number of requests TiDB can send to TiKV at the same time. 0 means no limit.

12.4.1.181 `tidb_super_read_only` New in v5.3.1

Warning:

For TiDB versions earlier than v5.3.1 or v5.4.1, this variable has a defect and using it might cause unexpected results. Ensure that you use this variable **ONLY** in TiDB versions later than v5.3.1 or v5.4.1.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- `tidb_super_read_only` aims to be implemented as a replacement of the MySQL variable `super_read_only`. However, because TiDB is a distributed database, `tidb_super_read_only` does not make the database read-only immediately after execution, but eventually.
- Users with the `SUPER` or `SYSTEM_VARIABLES_ADMIN` privilege can modify this variable.
- This variable controls the read-only status of the entire cluster. When the variable is `ON`, all TiDB servers in the entire cluster are in the read-only mode. In this case, TiDB only executes the statements that do not modify data, such as `SELECT`, `USE`, and `SHOW`. For other statements such as `INSERT` and `UPDATE`, TiDB rejects executing those statements in the read-only mode.
- Enabling the read-only mode using this variable only ensures that the entire cluster finally enters the read-only status. If you have changed the value of this variable in a TiDB cluster but the change has not yet propagated to other TiDB servers, the un-updated TiDB servers are still **not** in the read-only mode.
- When this variable is enabled, the SQL statements being executed are not affected. TiDB only performs the read-only check for the SQL statements **to be** executed.
- When this variable is enabled, TiDB handles the uncommitted transactions in the following ways:
 - For uncommitted read-only transactions, you can commit the transactions normally.
 - For uncommitted transactions that are not read-only, SQL statements that perform write operations in these transactions are rejected.
 - For uncommitted read-only transactions with modified data, the commit of these transactions is rejected.
- After the read-only mode is enabled, all users (including the users with the `SUPER` privilege) cannot execute the SQL statements that might write data unless the user is explicitly granted the `RESTRICTED_REPLICA_WRITER_ADMIN` privilege.
- When the `tidb_restricted_read_only` system variable is set to `ON`, `tidb_super_read_only` ↔ is affected by `tidb_restricted_read_only` in some cases. For detailed impact, see the description of `tidb_restricted_read_only`.

12.4.1.182 `tidb_tmp_table_max_size` New in v5.3.0

- Scope: SESSION | GLOBAL
- Default value: 67108864
- Range: [1048576, 137438953472]
- Unit: Bytes
- This variable is used to set the maximum size of a single **temporary table**. Any temporary table with a size larger than this variable value causes error.

12.4.1.183 `tidb_tso_client_batch_max_wait_time` New in v5.3.0

- Scope: GLOBAL
- Default value: 0
- Range: [0, 10]
- Unit: Milliseconds
- This variable is used to set the maximum waiting time for a batch operation when TiDB requests TSO from PD. The default value is 0, which means no extra waiting time.
- When obtaining TSO requests from PD each time, PD Client, used by TiDB, collects as many TSO requests received at the same time as possible. Then, PD Client merges the collected requests in batch into one RPC request and sends the request to PD. This helps reduce the pressure on PD.
- After setting this variable to a value greater than 0, TiDB waits for the maximum duration of this value before the end of each batch merge. This is to collect more TSO requests and improve the effect of batch operations.
- Scenarios for increasing the value of this variable:
 - Due to the high pressure of TSO requests, the CPU of the PD leader reaches a bottleneck, which causes high latency of TSO RPC requests.
 - There are not many TiDB instances in the cluster, but every TiDB instance is in high concurrency.
- It is recommended to set this variable to a value as small as possible.

Note:

Suppose that the TSO RPC latency increases for reasons other than a CPU usage bottleneck of the PD leader (such as network issues). In this case, increasing the value of `tidb_tso_client_batch_max_wait_time` might increase the execution latency in TiDB and affect the QPS performance of the cluster.

12.4.1.184 `tidb_txn_mode`

- Scope: SESSION | GLOBAL
- Default value: `pessimistic`
- Possible values: `pessimistic`, `optimistic`
- This variable is used to set the transaction mode. TiDB 3.0 supports the pessimistic transactions. Since TiDB 3.0.8, the `pessimistic transaction mode` is enabled by default.
- If you upgrade TiDB from v3.0.7 or earlier versions to v3.0.8 or later versions, the default transaction mode does not change. **Only the newly created clusters use the pessimistic transaction mode by default.**
- If this variable is set to “`optimistic`” or “”, TiDB uses the `optimistic transaction mode`.

12.4.1.185 `tidb_use_plan_baselines` New in v4.0

- Scope: SESSION | GLOBAL
- Default value: `ON`
- This variable is used to control whether to enable the execution plan binding feature. It is enabled by default, and can be disabled by assigning the `OFF` value. For the use of the execution plan binding, see [Execution Plan Binding](#).

12.4.1.186 `tidb_wait_split_region_finish`

- Scope: SESSION
- Default value: `ON`
- It usually takes a long time to scatter Regions, which is determined by PD scheduling and TiKV loads. This variable is used to set whether to return the result to the client after all Regions are scattered completely when the `SPLIT REGION` statement is being executed:
 - `ON` requires that the `SPLIT REGIONS` statement waits until all Regions are scattered.
 - `OFF` permits the `SPLIT REGIONS` statement to return before finishing scattering all Regions.
- Note that when scattering Regions, the write and read performances for the Region that is being scattered might be affected. In batch-write or data importing scenarios, it is recommended to import data after Regions scattering is finished.

12.4.1.187 `tidb_wait_split_region_timeout`

- Scope: SESSION
- Default value: `300`
- Range: `[1, 2147483647]`
- Unit: Seconds

- This variable is used to set the timeout for executing the `SPLIT REGION` statement. If a statement is not executed completely within the specified time value, a timeout error is returned.

12.4.1.188 `tidb_window_concurrency` New in v4.0

Warning:

Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Default value: -1
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency degree of the window operator.
- A value of -1 means that the value of `tidb_executor_concurrency` will be used instead.

12.4.1.189 `time_zone`

- Scope: SESSION | GLOBAL
- Default value: SYSTEM
- This variable returns the current time zone. Values can be specified as either an offset such as '-8:00' or a named zone 'America/Los_Angeles'.
- The value SYSTEM means that the time zone should be the same as the system host, which is available via the `system_time_zone` variable.

12.4.1.190 `timestamp`

- Scope: SESSION
- Default value: 0
- A non-empty value of this variable indicates the UNIX epoch that is used as the timestamp for `CURRENT_TIMESTAMP()`, `NOW()`, and other functions. This variable might be used in data restore or replication.

12.4.1.191 `transaction_isolation`

- Scope: SESSION | GLOBAL
- Default value: REPEATABLE-READ

- Possible values: READ-UNCOMMITTED, READ-COMMITTED, REPEATABLE-READ, SERIALIZABLE
↔
- This variable sets the transaction isolation. TiDB advertises REPEATABLE-READ for compatibility with MySQL, but the actual isolation level is Snapshot Isolation. See [transaction isolation levels](#) for further details.

12.4.1.192 tx_isolation

This variable is an alias for `transaction_isolation`.

12.4.1.193 version

- Scope: NONE
- Default value: 5.7.25-TiDB-(tidb version)
- This variable returns the MySQL version, followed by the TiDB version. For example ‘5.7.25-TiDB-v4.0.0-beta.2-716-g25e003253’.

12.4.1.194 version_comment

- Scope: NONE
- Default value: (string)
- This variable returns additional details about the TiDB version. For example, ‘TiDB Server (Apache License 2.0) Community Edition, MySQL 5.7 compatible’.

12.4.1.195 version_compile_machine

- Scope: NONE
- Default value: (string)
- This variable returns the name of the CPU architecture on which TiDB is running.

12.4.1.196 version_compile_os

- Scope: NONE
- Default value: (string)
- This variable returns the name of the OS on which TiDB is running.

12.4.1.197 wait_timeout

- Scope: SESSION | GLOBAL
- Default value: 28800
- Range: [0, 31536000]
- Unit: Seconds
- This variable controls the idle timeout of user sessions. A zero-value means unlimited.

12.4.1.198 `warning_count`

- Scope: SESSION
- Default value: 0
- This read-only variable indicates the number of warnings that occurred in the statement that was previously executed.

12.4.1.199 `windowing_use_high_precision`

- Scope: SESSION | GLOBAL
- Default value: ON
- This variable controls whether to use the high precision mode when computing the window functions.

12.5 Configuration File Parameters

12.5.1 TiDB Configuration File

The TiDB configuration file supports more options than command-line parameters. You can download the default configuration file [config.toml.example](#) and rename it to `config` ↪ `.toml`. This document describes only the options that are not involved in [command line options](#).

12.5.1.0.1 `split-table`

- Determines whether to create a separate Region for each table.
- Default value: `true`
- It is recommended to set it to `false` if you need to create a large number of tables (for example, more than 100 thousand tables).

12.5.1.0.2 `token-limit`

- The number of sessions that can execute requests concurrently.
- Type: Integer
- Default value: 1000
- Minimum value: 1
- Maximum Value (64-bit platforms): 18446744073709551615
- Maximum Value (32-bit platforms): 4294967295

12.5.1.0.3 mem-quota-query

- The maximum memory available for a single SQL statement.
- Default value: 1073741824 (in bytes)
- Note: When you upgrade the cluster from v2.0.x or v3.0.x to v4.0.9 or later versions, the default value of this configuration is 34359738368.
- Requests that require more memory than this value are handled based on the behavior defined by `oom-action`.
- This value is the initial value of the system variable `tidb_mem_quota_query`.

12.5.1.0.4 oom-use-tmp-storage

- Controls whether to enable the temporary storage for some operators when a single SQL statement exceeds the memory quota specified by `mem-quota-query`.
- Default value: `true`

12.5.1.0.5 tmp-storage-path

- Specifies the temporary storage path for some operators when a single SQL statement exceeds the memory quota specified by `mem-quota-query`.
- Default value: `<temporary directory of OS>/<OS user ID>_tidb/MC4wLjAuMDoOMDAwLzAuMC4wLjA6MTAwODA=`
↪ `=/tmp-storage. MC4wLjAuMDoOMDAwLzAuMC4wLjA6MTAwODA=` is the Base64 encoding result of `<host>:<port>/<statusHost>:<statusPort>`.
- This configuration takes effect only when `oom-use-tmp-storage` is `true`.

12.5.1.0.6 tmp-storage-quota

- Specifies the quota for the storage in `tmp-storage-path`. The unit is byte.
- When a single SQL statement uses a temporary disk and the total volume of the temporary disk of the TiDB server exceeds this configuration value, the current SQL operation is cancelled and the `Out of Global Storage Quota!` error is returned.
- When the value of this configuration is smaller than 0, the above check and limit do not apply.
- Default value: `-1`
- When the remaining available storage in `tmp-storage-path` is lower than the value defined by `tmp-storage-quota`, the TiDB server reports an error when it is started, and exits.

12.5.1.0.7 oom-action

- Specifies what operation TiDB performs when a single SQL statement exceeds the memory quota specified by `mem-quota-query` and cannot be spilled over to disk.

- Default value: "cancel" (In TiDB v4.0.2 and earlier versions, the default value is "log")
- The valid options are "log" and "cancel". When `oom-action="log"`, it prints the log only. When `oom-action="cancel"`, it cancels the operation and outputs the log.

12.5.1.0.8 `lower-case-table-names`

- Configures the value of the `lower_case_table_names` system variable.
- Default value: 2
- For details, see the [MySQL description](#) of this variable.

Note:

Currently, TiDB only supports setting the value of this option to 2. This means it is case-sensitive when you save a table name, but case-insensitive when you compare table names. The comparison is based on the lower case.

12.5.1.0.9 `lease`

- The timeout of the DDL lease.
- Default value: 45s
- Unit: second

12.5.1.0.10 `compatible-kill-query`

- Determines whether to set the KILL statement to be MySQL compatible.
- Default value: `false`
- The behavior of `KILL xxx` in TiDB differs from the behavior in MySQL. TiDB requires the `TIDB` keyword, namely, `KILL TIDB xxx`. If `compatible-kill-query` is set to `true`, the `TIDB` keyword is not needed.
- This distinction is important because the default behavior of the MySQL command-line client, when the user hits `Ctrl+C`, is to create a new connection to the backend and execute the KILL statement in that new connection. If a load balancer or proxy has sent the new connection to a different TiDB server instance than the original session, the wrong session could be terminated, which could cause interruption to applications using the cluster. Enable `compatible-kill-query` only if you are certain that the connection you refer to in your KILL statement is on the same server to which you send the KILL statement.

12.5.1.0.11 `check-mb4-value-in-utf8`

- Determines whether to enable the `utf8mb4` character check. When this feature is enabled, if the character set is `utf8` and the `mb4` characters are inserted in `utf8`, an error is returned.
- Default value: `false`

12.5.1.0.12 `treat-old-version-utf8-as-utf8mb4`

- Determines whether to treat the `utf8` character set in old tables as `utf8mb4`.
- Default value: `true`

12.5.1.0.13 `alter-primary-key` (Deprecated)

- Determines whether to add or remove the primary key constraint to or from a column.
- Default value: `false`
- With this default setting, adding or removing the primary key constraint is not supported. You can enable this feature by setting `alter-primary-key` to `true`. However, if a table already exists before the switch is on, and the data type of its primary key column is an integer, dropping the primary key from the column is not possible even if you set this configuration item to `true`.

Note:

This configuration item has been deprecated, and currently takes effect only when the value of `@tidb_enable_clustered_index` is `INT_ONLY`. If you need to add or remove the primary key, use the `NONCLUSTERED` keyword instead when creating the table. For more details about the primary key of the `CLUSTERED` type, refer to [clustered index](#).

12.5.1.0.14 `server-version`

- Modifies the version string returned by TiDB in the following situations:
 - When the built-in `VERSION()` function is used.
 - When TiDB establishes the initial connection to the client and returns the initial handshake packet with version string of the server. For details, see [MySQL Initial Handshake Packet](#).
- Default value: “”
- By default, the format of the TiDB version string is `5.7.${mysql_latest_minor_version} ↪ -TiDB-${tidb_version}`.

12.5.1.0.15 `repair-mode`

- Determines whether to enable the untrusted repair mode. When the `repair-mode` is set to `true`, bad tables in the `repair-table-list` cannot be loaded.
- Default value: `false`
- The `repair` syntax is not supported by default. This means that all tables are loaded when TiDB is started.

12.5.1.0.16 `repair-table-list`

- `repair-table-list` is only valid when `repair-mode` is set to `true`. `repair-table-list` is a list of bad tables that need to be repaired in an instance. An example of the list is: `[“db.table1”,“db.table2”...]`.
- Default value: `[]`
- The list is empty by default. This means that there are no bad tables that need to be repaired.

12.5.1.0.17 `new_collations_enabled_on_first_bootstrap`

- Enables or disables the new collation support.
- Default value: `false`
- Note: This configuration takes effect only for the TiDB cluster that is first initialized. After the initialization, you cannot use this configuration item to enable or disable the new collation support. When a TiDB cluster is upgraded to v4.0, because the cluster has been initialized before, both `true` and `false` values of this configuration item are taken as `false`.

12.5.1.0.18 `max-server-connections`

- The maximum number of concurrent client connections allowed in TiDB. It is used to control resources.
- Default value: 0
- By default, TiDB does not set limit on the number of concurrent client connections. When the value of this configuration item is greater than 0 and the number of actual client connections reaches this value, the TiDB server rejects new client connections.

12.5.1.0.19 `max-index-length`

- Sets the maximum allowable length of the newly created index.
- Default value: 3072
- Unit: byte

- Currently, the valid value range is [3072, 3072*4]. MySQL and TiDB (version < v3.0.11) do not have this configuration item, but both limit the length of the newly created index. This limit in MySQL is 3072. In TiDB (version =< 3.0.7), this limit is 3072*4. In TiDB (3.0.7 < version < 3.0.11), this limit is 3072. This configuration is added to be compatible with MySQL and earlier versions of TiDB.

12.5.1.0.20 `table-column-count-limit` New in v5.0

- Sets the limit on the number of columns in a single table.
- Default value: 1017
- Currently, the valid value range is [1017, 4096].

12.5.1.0.21 `index-limit` New in v5.0

- Sets the limit on the number of indexes in a single table.
- Default value: 64
- Currently, the valid value range is [64, 512].

12.5.1.0.22 `enable-telemetry` New in v4.0.2

- Enables or disables the telemetry collection in TiDB.
- Default value: `true`
- When this configuration is set to `false` on all TiDB instances, the telemetry collection in TiDB is disabled and the `tidb_enable_telemetry` system variable does not take effect. See [Telemetry](#) for details.

12.5.1.0.23 `enable-tcp4-only` New in v5.0

- Enables or disables listening on TCP4 only.
- Default value: `false`
- Enabling this option is useful when TiDB is used with LVS for load balancing because the [real client IP from the TCP header](#) can be correctly parsed by the “tcp4” protocol.

12.5.1.0.24 `enable-enum-length-limit` New in v5.0

- Determines whether to limit the maximum length of a single ENUM element and a single SET element.
- Default value: `true`
- When this configuration value is `true`, the maximum length of a single ENUM element and a single SET element is 255 characters, which is compatible with [MySQL 8.0](#). When this configuration value is `false`, there is no limit on the length of a single element, which is compatible with TiDB (earlier than v5.0).

`graceful-wait-before-shutdown` New in v5.0

- Specifies the number of seconds that TiDB waits when you shut down the server, which allows the clients to disconnect.
- Default value: 0
- When TiDB is waiting for shutdown (in the grace period), the HTTP status will indicate a failure, which allows the load balancers to reroute traffic.

12.5.1.0.25 `enable-forwarding` New in v5.0.0

- Controls whether the PD client and TiKV client in TiDB forward requests to the leader via the followers in the case of possible network isolation.
- Default value: `false`
- If the environment might have isolated network, enabling this parameter can reduce the window of service unavailability.
- If you cannot accurately determine whether isolation, network interruption, or downtime has occurred, using this mechanism has the risk of misjudgment and causes reduced availability and performance. If network failure has never occurred, it is not recommended to enable this parameter.

12.5.1.0.26 `enable-table-lock` New in v4.0.0

Warning:

The table lock is an experimental feature. It is not recommended that you use it in the production environment.

- Controls whether to enable the table lock feature.
- Default value: `false`
- The table lock is used to coordinate concurrent access to the same table among multiple sessions. Currently, the `READ`, `WRITE`, and `WRITE LOCAL` lock types are supported. When the configuration item is set to `false`, executing the `LOCK TABLES` or `UNLOCK TABLES` statement does not take effect and returns the “LOCK/UNLOCK TABLES is not supported” warning. For more information, see [LOCK TABLES and UNLOCK TABLES](#).

12.5.1.1 Log

Configuration items related to log.

12.5.1.1.1 `level`

- Specifies the log output level.
- Value options: `debug`, `info`, `warn`, `error`, and `fatal`.
- Default value: `info`

12.5.1.1.2 `format`

- Specifies the log output format.
- Value options: `json` and `text`.
- Default value: `text`

12.5.1.1.3 `enable-timestamp`

- Determines whether to enable timestamp output in the log.
- Default value: `null`
- If you set the value to `false`, the log does not output timestamp.

Note:

- To be backward compatible, the initial `disable-timestamp` configuration item remains valid. But if the value of `disable-timestamp` semantically conflicts with the value of `enable-timestamp` (for example, if both `enable-timestamp` and `disable-timestamp` are set to `true`), TiDB ignores the value for `disable-timestamp`.
- Currently, TiDB use `disable-timestamp` to determine whether to output timestamps in the log. In this situation, the value of `enable-timestamp` is `null`.
- In later versions, the `disable-timestamp` configuration will be removed. Discard `disable-timestamp` and use `enable-timestamp` which is semantically easier to understand.

12.5.1.1.4 `enable-slow-log`

- Determines whether to enable the slow query log.
- Default value: `true`
- To enable the slow query log, set `enable-slow-log` to `true`. Otherwise, set it to `false`.

12.5.1.1.5 `slow-query-file`

- The file name of the slow query log.
- Default value: `tidb-slow.log`
- The format of the slow log is updated in TiDB v2.1.8, so the slow log is output to the slow log file separately. In versions before v2.1.8, this variable is set to "" by default.
- After you set it, the slow query log is output to this file separately.

12.5.1.1.6 `slow-threshold`

- Outputs the threshold value of consumed time in the slow log.
- Default value: 300
- Unit: Milliseconds
- When the time consumed by a query is larger than this value, this query is considered as a slow query and its log is output to the slow query log. Note that when the output level of `log.level` is "debug", all queries are recorded in the slow query log, regardless of the setting of this parameter.

12.5.1.1.7 `record-plan-in-slow-log`

- Determines whether to record execution plans in the slow log.
- Default value: 1
- 0 means to disable, and 1 (by default) means to enable. The value of this parameter is the initial value of the `tidb_record_plan_in_slow_log` system variable.

12.5.1.1.8 `expensive-threshold`

- Outputs the threshold value of the number of rows for the `expensive` operation.
- Default value: 10000
- When the number of query rows (including the intermediate results based on statistics) is larger than this value, it is an `expensive` operation and outputs log with the [`↔ EXPENSIVE_QUERY`] prefix.

12.5.1.1.9 `query-log-max-len`

- The maximum length of SQL output.
- Default value: 4096
- When the length of the statement is longer than `query-log-max-len`, the statement is truncated to output.

12.5.1.2 log.file

Configuration items related to log files.

filename

- The file name of the general log file.
- Default value: “”
- If you set it, the log is output to this file.

max-size

- The size limit of the log file.
- Default value: 300
- Unit: MB
- The maximum value is 4096.

max-days

- The maximum number of days that the log is retained.
- Default value: 0
- The log is retained by default. If you set the value, the expired log is cleaned up after **max-days**.

max-backups

- The maximum number of retained logs.
- Default value: 0
- All the log files are retained by default. If you set it to 7, seven log files are retained at maximum.

12.5.1.3 Security

Configuration items related to security.

12.5.1.3.1 **require-secure-transport**

- Determines whether to require the client to use the secure mode for data transport.
- Default value: **false**

12.5.1.3.2 **enable-sem**

- Enables the Security Enhanced Mode (SEM).
- Default value: **false**
- The status of SEM is available via the system variable **tidb_enable_enhanced_security**
↪ .

12.5.1.3.3 `ssl-ca`

- The file path of the trusted CA certificate in the PEM format.
- Default value: “”
- If you set this option and `--ssl-cert`, `--ssl-key` at the same time, TiDB authenticates the client certificate based on the list of trusted CAs specified by this option when the client presents the certificate. If the authentication fails, the connection is terminated.
- If you set this option but the client does not present the certificate, the secure connection continues without client certificate authentication.

12.5.1.3.4 `ssl-cert`

- The file path of the SSL certificate in the PEM format.
- Default value: “”
- If you set this option and `--ssl-key` at the same time, TiDB allows (but not forces) the client to securely connect to TiDB using TLS.
- If the specified certificate or private key is invalid, TiDB starts as usual but cannot receive secure connection.

12.5.1.3.5 `ssl-key`

- The file path of the SSL certificate key in the PEM format, that is, the private key of the certificate specified by `--ssl-cert`.
- Default value: “”
- Currently, TiDB does not support loading the private keys protected by passwords.

12.5.1.3.6 `cluster-ssl-ca`

- The CA root certificate used to connect TiKV or PD with TLS.
- Default value: “”

12.5.1.3.7 `cluster-ssl-cert`

- The path of the SSL certificate file used to connect TiKV or PD with TLS.
- Default value: “”

12.5.1.3.8 `cluster-ssl-key`

- The path of the SSL private key file used to connect TiKV or PD with TLS.
- Default value: “”

12.5.1.3.9 `spilled-file-encryption-method`

- Determines the encryption method used for saving the spilled files to disk.
- Default value: "plaintext", which disables encryption.
- Optional values: "plaintext" and "aes128-ctr"

12.5.1.3.10 `auto-tls`

- Determines whether to automatically generate the TLS certificates on startup.
- Default value: false

12.5.1.3.11 `tls-version`

- Set the minimum TLS version for MySQL Protocol connections.
- Default value: "", which allows TLSv1.1 or higher.
- Optional values: "TLSv1.0", "TLSv1.1", "TLSv1.2" and "TLSv1.3"

12.5.1.4 Performance

Configuration items related to performance.

12.5.1.4.1 `max-procs`

- The number of CPUs used by TiDB.
- Default value: 0
- The default 0 indicates using all the CPUs on the machine. You can also set it to n, and then TiDB uses n CPUs.

12.5.1.4.2 `server-memory-quota` **New in v4.0.9**

Warning:

`server-memory-quota` is still an experimental feature. It is **NOT** recommended that you use it in a production environment.

- The memory usage limit of tidb-server instances.
- Default value: 0 (in bytes), which means no memory limit.

12.5.1.4.3 `memory-usage-alarm-ratio` New in v4.0.9

- TiDB triggers an alarm when the memory usage of tidb-server instance exceeds a certain threshold. The valid value for this configuration item ranges from 0 to 1. If it is configured as 0 or 1, this alarm feature is disabled.
- Default value: 0.8
- When the memory usage alarm is enabled, if `server-memory-quota` is not set, then the threshold of memory usage is the ``memory-usage-alarm-ratio`` value * the \hookrightarrow system memory size; if `server-memory-quota` is set to a value greater than 0, then the threshold of memory usage is the ``memory-usage-alarm-ratio`` value * \hookrightarrow the ``server-memory-quota`` value.
- When TiDB detects that the memory usage of the tidb-server instance exceeds the threshold, it considers that there might be a risk of OOM. Therefore, it records ten SQL statements with the highest memory usage, ten SQL statements with the longest running time, and the heap profile among all SQL statements currently being executed to the directory `tmp-storage-path/record` and outputs a log containing the keyword `tidb-server has the risk of OOM`.
- The value of this configuration item is the initial value of the system variable `tidb_memory_usage_alarm_ratio`.

12.5.1.4.4 `max-txn-ttl`

- The longest time that a single transaction can hold locks. If this time is exceeded, the locks of a transaction might be cleared by other transactions so that this transaction cannot be successfully committed.
- Default value: 3600000
- Unit: Millisecond
- The transaction that holds locks longer than this time can only be committed or rolled back. The commit might not be successful.

12.5.1.4.5 `committer-concurrency`

- The number of goroutines for requests related to executing commit in the commit phase of the single transaction.
- Default value: 128
- If the transaction to commit is too large, the waiting time for the flow control queue when the transaction is committed might be too long. In this situation, you can increase the configuration value to speed up the commit.

12.5.1.4.6 `stmt-count-limit`

- The maximum number of statements allowed in a single TiDB transaction.
- Default value: 5000

- If a transaction does not roll back or commit after the number of statements exceeds `stmt-count-limit`, TiDB returns the `statement count 5001 exceeds the transaction limitation, autoccommit = false` error. This configuration takes effect **only** in the retryable optimistic transaction. If you use the pessimistic transaction or have disabled the transaction retry, the number of statements in a transaction is not limited by this configuration.

12.5.1.4.7 `txn-entry-size-limit` New in v4.0.10 and v5.0.0

- The size limit of a single row of data in TiDB.
- Default value: 6291456 (in bytes)
- The size limit of a single key-value record in a transaction. If the size limit is exceeded, TiDB returns the `entry too large` error. The maximum value of this configuration item does not exceed 125829120 (120 MB).
- Note that TiKV has a similar limit. If the data size of a single write request exceeds `raft-entry-max-size`, which is 8 MB by default, TiKV refuses to process this request. When a table has a row of large size, you need to modify both configurations at the same time.

12.5.1.4.8 `txn-total-size-limit`

- The size limit of a single transaction in TiDB.
- Default value: 104857600 (in bytes)
- In a single transaction, the total size of key-value records cannot exceed this value. The maximum value of this parameter is 1099511627776 (1 TB). Note that if you have used the binlog to serve the downstream consumer Kafka (such as the `arbiter` cluster), the value of this parameter must be no more than 1073741824 (1 GB). This is because 1 GB is the upper limit of a single message size that Kafka can process. Otherwise, an error is returned if this limit is exceeded.

12.5.1.4.9 `tcp-keep-alive`

- Determines whether to enable `keepalive` in the TCP layer.
- Default value: `true`

12.5.1.4.10 `tcp-no-delay`

- Determines whether to enable `TCP_NODELAY` at the TCP layer. After it is enabled, TiDB disables the Nagle algorithm in the TCP/IP protocol and allows sending small data packets to reduce network latency. This is suitable for latency-sensitive applications with a small transmission volume of data.
- Default value: `true`

12.5.1.4.11 cross-join

- Default value: `true`
- TiDB supports executing the `JOIN` statement without any condition (the `WHERE` field) of both sides tables by default; if you set the value to `false`, the server refuses to execute when such a `JOIN` statement appears.

12.5.1.4.12 stats-lease

- The time interval of reloading statistics, updating the number of table rows, checking whether it is needed to perform the automatic analysis, using feedback to update statistics and loading statistics of columns.
- Default value: `3s`
 - At intervals of `stats-lease` time, TiDB checks the statistics for updates and updates them to the memory if updates exist.
 - At intervals of `20 * stats-lease` time, TiDB updates the total number of rows generated by DML and the number of modified rows to the system table.
 - At intervals of `stats-lease`, TiDB checks for tables and indexes that need to be automatically analyzed.
 - At intervals of `stats-lease`, TiDB checks for column statistics that need to be loaded to the memory.
 - At intervals of `200 * stats-lease`, TiDB writes the feedback cached in the memory to the system table.
 - At intervals of `5 * stats-lease`, TiDB reads the feedback in the system table, and updates the statistics cached in the memory.
- When `stats-lease` is set to `0s`, TiDB periodically reads the feedback in the system table, and updates the statistics cached in the memory every three seconds. But TiDB no longer automatically modifies the following statistics-related system tables:
 - `mysql.stats_meta`: TiDB no longer automatically records the number of table rows that are modified by the transaction and updates it to this system table.
 - `mysql.stats_histograms/mysql.stats_buckets` and `mysql.stats_top_n`: TiDB no longer automatically analyzes and proactively updates statistics.
 - `mysql.stats_feedback`: TiDB no longer updates the statistics of the tables and indexes according to a part of statistics returned by the queried data.

12.5.1.4.13 run-auto-analyze

- Determines whether TiDB executes automatic analysis.
- Default value: `true`

12.5.1.4.14 `feedback-probability`

Warning:

This feature has been deprecated since v5.4. It is not recommended to enable this feature.

- The probability that TiDB collects the feedback statistics of each query.
- Default value: 0
- This feature is disabled by default, and it is not recommended to enable this feature. If it is enabled, TiDB collects the feedback of each query at the probability of `feedback` \leftrightarrow `-probability`, to update statistics.

12.5.1.4.15 `query-feedback-limit`

- The maximum pieces of query feedback that can be cached in memory. Extra pieces of feedback that exceed this limit are discarded.
- Default value: 1024

12.5.1.4.16 `pseudo-estimate-ratio`

- The ratio of (number of modified rows)/(total number of rows) in a table. If the value is exceeded, the system assumes that the statistics have expired and the pseudo statistics will be used.
- Default value: 0.8
- The minimum value is 0 and the maximum value is 1.

12.5.1.4.17 `force-priority`

- Sets the priority for all statements.
- Default: `NO_PRIORITY`
- Optional values: `NO_PRIORITY`, `LOW_PRIORITY`, `HIGH_PRIORITY` and `DELAYED`.

12.5.1.4.18 `distinct-agg-push-down`

- Determines whether the optimizer executes the operation that pushes down the aggregation function with `Distinct` (such as `select count(distinct a)from t`) to Coprocessors.
- Default: `false`
- This variable is the initial value of the system variable `tidb_opt_distinct_agg_push_down` \leftrightarrow .

12.5.1.4.19 `enforce-mpp`

- Determines whether to ignore the optimizer's cost estimation and to forcibly use TiFlash's MPP mode for query execution.
- Default value: `false`
- This configuration item controls the initial value of `tidb_enforce_mpp`. For example, when this configuration item is set to `true`, the default value of `tidb_enforce_mpp` is `ON`.

12.5.1.5 `prepared-plan-cache`

The `plan cache` configuration of the `PREPARE` statement.

12.5.1.5.1 `enabled`

- Determines whether to enable Plan Cache of the `PREPARE` statement.
- Default value: `false`

12.5.1.5.2 `capacity`

- The number of cached statements.
- Default value: 1000
- The type is `UINT`. Values less than 0 are converted to large integers.

12.5.1.5.3 `memory-guard-ratio`

- It is used to prevent `performance.max-memory` from being exceeded. When `max-memory * (1 - prepared-plan-cache.memory-guard-ratio)` is exceeded, the elements in the LRU are removed.
- Default value: 0.1
- The minimum value is 0; the maximum value is 1.

12.5.1.6 `opentracing`

Configuration items related to opentracing.

12.5.1.6.1 `enable`

- Enables opentracing to trace the call overhead of some TiDB components. Note that enabling opentracing causes some performance loss.
- Default value: `false`

12.5.1.6.2 `rpc-metrics`

- Enables RPC metrics.
- Default value: `false`

12.5.1.7 `opentracing.sampler`

Configuration items related to `opentracing.sampler`.

12.5.1.7.1 `type`

- Specifies the type of the opentracing sampler. The string value is case-insensitive.
- Default value: `"const"`
- Value options: `"const"`, `"probabilistic"`, `"ratelimiting"`, `"remote"`

12.5.1.7.2 `param`

- The parameter of the opentracing sampler.
 - For the `const` type, the value can be 0 or 1, which indicates whether to enable the `const` sampler.
 - For the `probabilistic` type, the parameter specifies the sampling probability, which can be a float number between 0 and 1.
 - For the `ratelimiting` type, the parameter specifies the number of spans sampled per second.
 - For the `remote` type, the parameter specifies the sampling probability, which can be a float number between 0 and 1.
- Default value: `1.0`

12.5.1.7.3 `sampling-server-url`

- The HTTP URL of the jaeger-agent sampling server.
- Default value: `""`

12.5.1.7.4 `max-operations`

- The maximum number of operations that the sampler can trace. If an operation is not traced, the default probabilistic sampler is used.
- Default value: `0`

12.5.1.7.5 `sampling-refresh-interval`

- Controls the frequency of polling the jaeger-agent sampling policy.
- Default value: `0`

12.5.1.8 `opentracing.reporter`

Configuration items related to `opentracing.reporter`.

12.5.1.8.1 `queue-size`

- The queue size with which the reporter records spans in memory.
- Default value: 0

12.5.1.8.2 `buffer-flush-interval`

- The interval at which the reporter flushes the spans in memory to the storage.
- Default value: 0

12.5.1.8.3 `log-spans`

- Determines whether to print the log for all submitted spans.
- Default value: `false`

12.5.1.8.4 `local-agent-host-port`

- The address at which the reporter sends spans to the jaeger-agent.
- Default value: ""

12.5.1.9 `tikv-client`

12.5.1.9.1 `grpc-connection-count`

- The maximum number of connections established with each TiKV.
- Default value: 4

12.5.1.9.2 `grpc-keepalive-time`

- The `keepalive` time interval of the RPC connection between TiDB and TiKV nodes. If there is no network packet within the specified time interval, the gRPC client executes `ping` command to TiKV to see if it is alive.
- Default: 10
- Unit: second

12.5.1.9.3 `grpc-keepalive-timeout`

- The timeout of the RPC `keepalive` check between TiDB and TiKV nodes.
- Default value: 3
- Unit: second

12.5.1.9.4 `commit-timeout`

- The maximum timeout when executing a transaction commit.
- Default value: 41s
- It is required to set this value larger than twice of the Raft election timeout.

12.5.1.9.5 `max-batch-size`

- The maximum number of RPC packets sent in batch. If the value is not 0, the `BatchCommands` API is used to send requests to TiKV, and the RPC latency can be reduced in the case of high concurrency. It is recommended that you do not modify this value.
- Default value: 128

12.5.1.9.6 `max-batch-wait-time`

- Waits for `max-batch-wait-time` to encapsulate the data packets into a large packet in batch and send it to the TiKV node. It is valid only when the value of `tikv-client.max-batch-size` is greater than 0. It is recommended not to modify this value.
- Default value: 0
- Unit: nanoseconds

12.5.1.9.7 `batch-wait-size`

- The maximum number of packets sent to TiKV in batch. It is recommended not to modify this value.
- Default value: 8
- If the value is 0, this feature is disabled.

12.5.1.9.8 `overload-threshold`

- The threshold of the TiKV load. If the TiKV load exceeds this threshold, more `batch` packets are collected to relieve the pressure of TiKV. It is valid only when the value of `tikv-client.max-batch-size` is greater than 0. It is recommended not to modify this value.
- Default value: 200

12.5.1.10 `tikv-client.copr-cache` New in v4.0.0

This section introduces configuration items related to the Coprocessor Cache feature.

12.5.1.10.1 `capacity-mb`

- The total size of the cached data. When the cache space is full, old cache entries are evicted. When the value is 0.0, the Coprocessor Cache feature is disabled.
- Default value: 1000.0
- Unit: MB
- Type: Float

12.5.1.11 `txn-local-latches`

Configuration related to the transaction latch. It is recommended to enable it when many local transaction conflicts occur.

12.5.1.11.1 `enabled`

- Determines whether to enable the memory lock of transactions.
- Default value: `false`

12.5.1.11.2 `capacity`

- The number of slots corresponding to Hash, which automatically adjusts upward to an exponential multiple of 2. Each slot occupies 32 Bytes of memory. If set too small, it might result in slower running speed and poor performance in the scenario where data writing covers a relatively large range (such as importing data).
- Default value: 2048000

12.5.1.12 `binlog`

Configurations related to TiDB Binlog.

12.5.1.12.1 `enable`

- Enables or disables binlog.
- Default value: `false`

12.5.1.12.2 `write-timeout`

- The timeout of writing binlog into Pump. It is not recommended to modify this value.
- Default: 15s
- unit: second

12.5.1.12.3 ignore-error

- Determines whether to ignore errors occurred in the process of writing binlog into Pump. It is not recommended to modify this value.
- Default value: `false`
- When the value is set to `true` and an error occurs, TiDB stops writing binlog and add 1 to the count of the `tidb_server_critical_error_total` monitoring item. When the value is set to `false`, the binlog writing fails and the entire TiDB service is stopped.

12.5.1.12.4 binlog-socket

- The network address to which binlog is exported.
- Default value: `“”`

12.5.1.12.5 strategy

- The strategy of Pump selection when binlog is exported. Currently, only the `hash` and `range` methods are supported.
- Default value: `range`

12.5.1.13 status

Configuration related to the status of TiDB service.

12.5.1.13.1 report-status

- Enables or disables the HTTP API service.
- Default value: `true`

12.5.1.13.2 record-db-qps

- Determines whether to transmit the database-related QPS metrics to Prometheus.
- Default value: `false`

12.5.1.14 stmt-summary **New in v3.0.4**

Configurations related to [statement summary tables](#).

12.5.1.14.1 max-stmt-count

- The maximum number of SQL categories allowed to be saved in [statement summary tables](#).
- Default value: 3000

12.5.1.14.2 max-sql-length

- The longest display length for the DIGEST_TEXT and QUERY_SAMPLE_TEXT columns in [statement summary tables](#).
- Default value: 4096

12.5.1.15 pessimistic-txn

For pessimistic transaction usage, refer to [TiDB Pessimistic Transaction Mode](#).

12.5.1.15.1 max-retry-count

- The maximum number of retries of each statement in pessimistic transactions. If the number of retries exceeds this limit, an error occurs.
- Default value: 256

12.5.1.15.2 deadlock-history-capacity

- The maximum number of deadlock events that can be recorded in the [INFORMATION_SCHEMA](#) \hookrightarrow [.DEADLOCKS](#) table of a single TiDB server. If this table is in full volume and an additional deadlock event occurs, the earliest record in the table will be removed to make place for the newest error.
- Default value: 10
- Minimum value: 0
- Maximum value: 10000

12.5.1.15.3 deadlock-history-collect-retryable

- Controls whether the [INFORMATION_SCHEMA.DEADLOCKS](#) table collects the information of retryable deadlock errors. For the description of retryable deadlock errors, see [Retryable deadlock errors](#).
- Default value: `false`

12.5.1.16 isolation-read

Configuration items related to read isolation.

12.5.1.16.1 engines

- Controls from which engine TiDB allows to read data.
- Default value: `["tikv", "tiflash", "tidb"]`, indicating that the engine is automatically selected by the optimizer.
- Value options: Any combinations of "tikv", "tiflash", and "tidb", for example, `["tikv", "tidb"]` or `["tiflash", "tidb"]`

12.5.1.17 proxy-protocol

Configuration items related to the PROXY protocol.

12.5.1.17.1 networks

- The list of proxy server's IP addresses allowed to connect to TiDB using the [PROXY protocol](#)
- Default value: ""
- In general cases, when you access TiDB behind a reverse proxy, TiDB takes the IP address of the reverse proxy server as the IP address of the client. By enabling the PROXY protocol, reverse proxies that support this protocol, such as HAProxy, can pass the real client IP address to TiDB.
- After configuring this parameter, TiDB allows the configured source IP address to connect to TiDB using the PROXY protocol; if a protocol other than PROXY is used, this connection will be denied. If this parameter is left empty, no IP address can connect to TiDB using the PROXY protocol. The value can be an IP address (192.168.1.50) or CIDR (192.168.1.0/24) with , as the separator. * means any IP addresses.

Warning:

Use * with caution because it might introduce security risks by allowing a client of any IP address to report its IP address. In addition, using * might also cause the internal component that directly connects to TiDB (such as TiDB Dashboard) to be unavailable.

12.5.1.18 experimental

The `experimental` section, introduced in v3.1.0, describes the configurations related to the experimental features of TiDB.

12.5.1.18.1 allow-expression-index New in v4.0.0

- Controls whether an expression index can be created. Since TiDB v5.2.0, if the function in an expression is safe, you can create an expression index directly based on this function without enabling this configuration. If you want to create an expression index based on other functions, you can enable this configuration, but correctness issues might exist. By querying the `tidb_allow_function_for_expression_index` variable, you can get the functions that are safe to be directly used for creating an expression.
- Default value: `false`

12.5.1.18.2 `stats-load-concurrency` New in v5.4.0

WARNING:

Currently, synchronously loading statistics is an experimental feature. It is not recommended that you use it in production environments.

- The maximum number of columns that the TiDB synchronously loading statistics feature can process concurrently.
- Default value: 5
- Currently, the valid value range is [1, 128].

12.5.1.18.3 `stats-load-queue-size` New in v5.4.0

WARNING:

Currently, synchronously loading statistics is an experimental feature. It is not recommended that you use it in production environments.

- The maximum number of column requests that the TiDB synchronously loading statistics feature can cache.
- Default value: 1000
- Currently, the valid value range is [1, 100000].

12.5.2 TiKV Configuration File

The TiKV configuration file supports more options than command-line parameters. You can find the default configuration file in [etc/config-template.toml](#) and rename it to `config` ↪ `.toml`.

This document only describes the parameters that are not included in command-line parameters. For more details, see [command-line parameter](#).

12.5.2.1 Global configuration

12.5.2.1.1 `abort-on-panic`

- Sets whether to call `abort()` to exit the process when TiKV panics. This option affects whether TiKV allows the system to generate core dump files.
 - If the value of this configuration item is `false`, when TiKV panics, it calls `exit()` to exit the process.
 - If the value of this configuration item is `true`, when TiKV panics, TiKV calls `abort()` to exit the process. At this time, TiKV allows the system to generate core dump files when exiting. To generate the core dump file, you also need to perform the system configuration related to core dump (for example, setting the size limit of the core dump file via `ulimit -c` command, and configure the core dump path. Different operating systems have different related configurations). To avoid the core dump files occupying too much disk space and causing insufficient TiKV disk space, it is recommended to set the core dump generation path to a disk partition different to that of TiKV data.
- Default value: `false`

12.5.2.1.2 `slow-log-file`

- The file that stores slow logs
- If this configuration item is not set, but `log.file.filename` is set, slow logs are output to the log file specified by `log.file.filename`.
- If neither `slow-log-file` nor `log.file.filename` are set, all logs are output to “stderr” by default.
- If both configuration items are set, ordinary logs are output to the log file specified by `log.file.filename`, and slow logs are output to the log file set by `slow-log-file`.
- Default value: `""`

12.5.2.1.3 `slow-log-threshold`

- The threshold for outputting slow logs. If the processing time is longer than this threshold, slow logs are output.
- Default value: `"1s"`

12.5.2.2 `log` New in v5.4.0

- Configuration items related to the log.
- From v5.4.0, to make the log configuration items of TiKV and TiDB consistent, TiKV deprecates the former configuration item `log-rotation-timespan` and changes `log-rotation-timespan` ↪ `level`, `log-format`, `log-file`, `log-rotation-size` to the following ones. If you only set the old configuration items, and their values are set to non-default values, the old items remain compatible with the new items. If both old and new configuration items are set, the new items take effect.

12.5.2.2.1 `level` New in v5.4.0

- The log level
- Optional values: "debug", "info", "warn", "error", "fatal"
- Default value: "info"

12.5.2.2.2 `format` New in v5.4.0

- The log format
- Optional values: "json", "text"
- Default value: "text"

12.5.2.2.3 `enable-timestamp` New in v5.4.0

- Determines whether to enable or disable the timestamp in the log
- Optional values: true, false
- Default value: true

12.5.2.3 `log.file` New in v5.4.0

- Configuration items related to the log file.

12.5.2.3.1 `filename` New in v5.4.0

- The log file. If this configuration item is not set, logs are output to “stderr” by default. If this configuration item is set, logs are output to the corresponding file.
- Default value: ""

12.5.2.3.2 `max-size` New in v5.4.0

- The maximum size of a single log file. When the file size is larger than the value set by this configuration item, the system automatically splits the single file into multiple files.
- Default value: 300
- Maximum value: 4096
- Unit: MiB

12.5.2.3.3 `max-days` New in v5.4.0

- The maximum number of days that TiKV keeps log files.
 - If the configuration item is not set, or the value of it is set to the default value 0, TiKV does not clean log files.
 - If the parameter is set to a value other than 0, TiKV cleans up the expired log files after `max-days`.
- Default value: 0

12.5.2.3.4 `max-backups` New in v5.4.0

- The maximum number of log files that TiKV keeps.
 - If the configuration item is not set, or the value of it is set to the default value 0, TiKV keeps all log files.
 - If the configuration item is set to a value other than 0, TiKV keeps at most the number of old log files specified by `max-backups`. For example, if the value is set to 7, TiKV keeps up to 7 old log files.
- Default value: 0

12.5.2.3.5 `pd.enable-forwarding` New in v5.0.0

- Controls whether the PD client in TiKV forwards requests to the leader via the followers in the case of possible network isolation.
- Default value: `false`
- If the environment might have isolated network, enabling this parameter can reduce the window of service unavailability.
- If you cannot accurately determine whether isolation, network interruption, or downtime has occurred, using this mechanism has the risk of misjudgment and causes reduced availability and performance. If network failure has never occurred, it is not recommended to enable this parameter.

12.5.2.4 `server`

- Configuration items related to the server.

12.5.2.4.1 `status-thread-pool-size`

- The number of worker threads for the HTTP API service
- Default value: 1
- Minimum value: 1

12.5.2.4.2 `grpc-compression-type`

- The compression algorithm for gRPC messages
- Optional values: "none", "deflate", "gzip"
- Default value: "none"
- Note: When the value is `gzip`, TiDB Dashboard will have a display error because it might not complete the corresponding compression algorithm in some cases. If you adjust the value back to the default `none`, TiDB Dashboard will display normally.

12.5.2.4.3 `grpc-concurrency`

- The number of gRPC worker threads. When you modify the size of the gRPC thread pool, refer to [Performance tuning for TiKV thread pools](#).
- Default value: 5
- Minimum value: 1

12.5.2.4.4 `grpc-concurrent-stream`

- The maximum number of concurrent requests allowed in a gRPC stream
- Default value: 1024
- Minimum value: 1

12.5.2.4.5 `grpc-memory-pool-quota`

- Limits the memory size that can be used by gRPC
- Default value: No limit
- Limit the memory in case OOM is observed. Note that limit the usage can lead to potential stall

12.5.2.4.6 `grpc-raft-conn-num`

- The maximum number of connections between TiKV nodes for Raft communication
- Default value: 1
- Minimum value: 1

12.5.2.4.7 `max-grpc-send-msg-len`

- Sets the maximum length of a gRPC message that can be sent
- Default value: 10485760
- Unit: Bytes
- Maximum value: 2147483647

12.5.2.4.8 `grpc-stream-initial-window-size`

- The window size of the gRPC stream
- Default value: 2MB
- Unit: KB|MB|GB
- Minimum value: "1KB"

12.5.2.4.9 `grpc-keepalive-time`

- The time interval at which that gRPC sends `keepalive` Ping messages
- Default value: "10s"
- Minimum value: "1s"

12.5.2.4.10 `grpc-keepalive-timeout`

- Disables the timeout for gRPC streams
- Default value: "3s"
- Minimum value: "1s"

12.5.2.4.11 `concurrent-send-snap-limit`

- The maximum number of snapshots sent at the same time
- Default value: 32
- Minimum value: 1

12.5.2.4.12 `concurrent-recv-snap-limit`

- The maximum number of snapshots received at the same time
- Default value: 32
- Minimum value: 1

12.5.2.4.13 `end-point-recursion-limit`

- The maximum number of recursive levels allowed when TiKV decodes the Coprocessor DAG expression
- Default value: 1000
- Minimum value: 1

12.5.2.4.14 `end-point-request-max-handle-duration`

- The longest duration allowed for a TiDB's push down request to TiKV for processing tasks
- Default value: "60s"
- Minimum value: "1s"

12.5.2.4.15 `snap-max-write-bytes-per-sec`

- The maximum allowable disk bandwidth when processing snapshots
- Default value: "100MB"
- Unit: KB|MB|GB
- Minimum value: "1KB"

12.5.2.4.16 `end-point-slow-log-threshold`

- The time threshold for a TiDB's push-down request to output slow log. If the processing time is longer than this threshold, the slow logs are output.
- Default value: "1s"
- Minimum value: 0

12.5.2.4.17 `raft-client-queue-size`

- Specifies the queue size of the Raft messages in TiKV. If too many messages not sent in time result in a full buffer, or messages discarded, you can specify a greater value to improve system stability.
- Default value: 8192

12.5.2.4.18 `forward-max-connections-per-address` New in v5.0.0

- Sets the size of the connection pool for service and forwarding requests to the server. Setting it to too small a value affects the request latency and load balancing.
- Default value: 4

12.5.2.5 `readpool.unified`

Configuration items related to the single thread pool serving read requests. This thread pool supersedes the original storage thread pool and coprocessor thread pool since the 4.0 version.

12.5.2.5.1 `min-thread-count`

- The minimal working thread count of the unified read pool
- Default value: 1

12.5.2.5.2 `max-thread-count`

- The maximum working thread count of the unified read pool or the UnifyReadPool thread pool. When you modify the size of this thread pool, refer to [Performance tuning for TiKV thread pools](#).
- Default value: $\text{MAX}(4, \text{CPU} * 0.8)$

12.5.2.5.3 `stack-size`

- The stack size of the threads in the unified thread pool
- Type: Integer + Unit
- Default value: "10MB"
- Unit: KB|MB|GB
- Minimum value: "2MB"
- Maximum value: The number of Kbytes output in the result of the `ulimit -sH` command executed in the system.

12.5.2.5.4 `max-tasks-per-worker`

- The maximum number of tasks allowed for a single thread in the unified read pool. `Server Is Busy` is returned when the value is exceeded.
- Default value: 2000
- Minimum value: 2

12.5.2.6 `readpool.storage`

Configuration items related to storage thread pool.

12.5.2.6.1 `use-unified-pool`

- Determines whether to use the unified thread pool (configured in `readpool.unified`) for storage requests. If the value of this parameter is `false`, a separate thread pool is used, which is configured through the rest parameters in this section (`readpool.storage`).
- Default value: If this section (`readpool.storage`) has no other configurations, the default value is `true`. Otherwise, for the backward compatibility, the default value is `false`. Change the configuration in `readpool.unified` as needed before enabling this option.

12.5.2.6.2 `high-concurrency`

- The allowable number of concurrent threads that handle high-priority read requests
- When `8 <= cpu_num <= 16`, the default value is `cpu_num * 0.5`; when `cpu_num` is smaller than 8, the default value is 4; when `cpu_num` is greater than 16, the default value is 8.
- Minimum value: 1

12.5.2.6.3 `normal-concurrency`

- The allowable number of concurrent threads that handle normal-priority read requests
- When `8 <= cpu_num <= 16`, the default value is `cpu_num * 0.5`; when `cpu_num` is smaller than 8, the default value is 4; when `cpu_num` is greater than 16, the default value is 8.
- Minimum value: 1

12.5.2.6.4 `low-concurrency`

- The allowable number of concurrent threads that handle low-priority read requests
- When `cpu_num` is 16, the default value is `cpu_num * 0.5`; when `cpu_num` is smaller than 8, the default value is 4; when `cpu_num` is greater than 16, the default value is 8.
- Minimum value: 1

12.5.2.6.5 `max-tasks-per-worker-high`

- The maximum number of tasks allowed for a single thread in a high-priority thread pool. `Server Is Busy` is returned when the value is exceeded.
- Default value: 2000
- Minimum value: 2

12.5.2.6.6 `max-tasks-per-worker-normal`

- The maximum number of tasks allowed for a single thread in a normal-priority thread pool. `Server Is Busy` is returned when the value is exceeded.
- Default value: 2000
- Minimum value: 2

12.5.2.6.7 `max-tasks-per-worker-low`

- The maximum number of tasks allowed for a single thread in a low-priority thread pool. `Server Is Busy` is returned when the value is exceeded.
- Default value: 2000
- Minimum value: 2

12.5.2.6.8 `stack-size`

- The stack size of threads in the Storage read thread pool
- Type: Integer + Unit
- Default value: "10MB"
- Unit: KB|MB|GB
- Minimum value: "2MB"
- Maximum value: The number of Kbytes output in the result of the `ulimit -sH` command executed in the system.

12.5.2.7 `readpool.coprocessor`

Configuration items related to the Coprocessor thread pool.

12.5.2.7.1 use-unified-pool

- Determines whether to use the unified thread pool (configured in `readpool.unified` \leftrightarrow) for coprocessor requests. If the value of this parameter is `false`, a separate thread pool is used, which is configured through the rest parameters in this section (`readpool.coprocessor`).
- Default value: If none of the parameters in this section (`readpool.coprocessor`) are set, the default value is `true`. Otherwise, the default value is `false` for the backward compatibility. Adjust the configuration items in `readpool.unified` before enabling this parameter.

12.5.2.7.2 high-concurrency

- The allowable number of concurrent threads that handle high-priority Coprocessor requests, such as checkpoints
- Default value: `CPU * 0.8`
- Minimum value: 1

12.5.2.7.3 normal-concurrency

- The allowable number of concurrent threads that handle normal-priority Coprocessor requests
- Default value: `CPU * 0.8`
- Minimum value: 1

12.5.2.7.4 low-concurrency

- The allowable number of concurrent threads that handle low-priority Coprocessor requests, such as table scan
- Default value: `CPU * 0.8`
- Minimum value: 1

12.5.2.7.5 max-tasks-per-worker-high

- The number of tasks allowed for a single thread in a high-priority thread pool. When this number is exceeded, `Server Is Busy` is returned.
- Default value: 2000
- Minimum value: 2

12.5.2.7.6 max-tasks-per-worker-normal

- The number of tasks allowed for a single thread in a normal-priority thread pool. When this number is exceeded, `Server Is Busy` is returned.
- Default value: 2000
- Minimum value: 2

12.5.2.7.7 `max-tasks-per-worker-low`

- The number of tasks allowed for a single thread in a low-priority thread pool. When this number is exceeded, `Server Is Busy` is returned.
- Default value: 2000
- Minimum value: 2

12.5.2.7.8 `stack-size`

- The stack size of the thread in the Coprocessor thread pool
- Type: Integer + Unit
- Default value: "10MB"
- Unit: KB|MB|GB
- Minimum value: "2MB"
- Maximum value: The number of Kbytes output in the result of the `ulimit -sH` command executed in the system.

12.5.2.8 `storage`

Configuration items related to storage.

12.5.2.8.1 `scheduler-concurrency`

- A built-in memory lock mechanism to prevent simultaneous operations on a key. Each key has a hash in a different slot.
- Default value: 524288
- Minimum value: 1

12.5.2.8.2 `scheduler-worker-pool-size`

- The number of `scheduler` threads, mainly used for checking transaction consistency before data writing. If the number of CPU cores is greater than or equal to 16, the default value is 8; otherwise, the default value is 4. When you modify the size of the Scheduler thread pool, refer to [Performance tuning for TiKV thread pools](#).
- Default value: 4
- Minimum value: 1

12.5.2.8.3 `scheduler-pending-write-threshold`

- The maximum size of the write queue. A `Server Is Busy` error is returned for a new write to TiKV when this value is exceeded.
- Default value: "100MB"
- Unit: MB|GB

12.5.2.8.4 `reserve-space`

- When TiKV is started, some space is reserved on the disk as disk protection. When the remaining disk space is less than the reserved space, TiKV restricts some write operations. The reserved space is divided into two parts: 80% of the reserved space is used as the extra disk space required for operations when the disk space is insufficient, and the other 20% is used to store the temporary file. In the process of reclaiming space, if the storage is exhausted by using too much extra disk space, this temporary file serves as the last protection for restoring services.
- The name of the temporary file is `space_placeholder_file`, located in the `storage`. ↪ `data-dir` directory. When TiKV goes offline because its disk space ran out, if you restart TiKV, the temporary file is automatically deleted and TiKV tries to reclaim the space.
- When the remaining space is insufficient, TiKV does not create the temporary file. The effectiveness of the protection is related to the size of the reserved space. The size of the reserved space is the larger value between 5% of the disk capacity and this configuration value. When the value of this configuration item is "OMB", TiKV disables this disk protection feature.
- Default value: "5GB"
- Unit: MB|GB

12.5.2.8.5 `enable-ttl`

Warning:

- Set `enable-ttl` to `true` or `false` **ONLY WHEN** deploying a new TiKV cluster. **DO NOT** modify the value of this configuration item in an existing TiKV cluster. TiKV clusters with different `enable-ttl` values use different data formats. Therefore, if you modify the value of this item in an existing TiKV cluster, the cluster will store data in different formats, which causes the “can’t enable TTL on a non-ttl” error when you restart the TiKV cluster.
 - Use `enable-ttl` **ONLY IN** a TiKV cluster. **DO NOT** use this configuration item in a cluster that has TiDB nodes (which means setting `enable-ttl` to `true` in such clusters). Otherwise, critical issues such as data corruption and the upgrade failure of TiDB clusters will occur.
- TTL is short for “Time to live”. If this item is enabled, TiKV automatically deletes data that reaches its TTL. To set the value of TTL, you need to specify it in the requests when writing data via the client. If the TTL is not specified, it means that TiKV does not automatically delete the corresponding data.
 - Default value: `false`

12.5.2.8.6 `t1-check-poll-interval`

- The interval of checking data to reclaim physical spaces. If data reaches its TTL, TiKV forcibly reclaims its physical space during the check.
- Default value: "12h"
- Minimum value: "0s"

12.5.2.9 `storage.block-cache`

Configuration items related to the sharing of block cache among multiple RocksDB Column Families (CF). When these configuration items are enabled, block cache separately configured for each column family is disabled.

12.5.2.9.1 `shared`

- Enables or disables the sharing of block cache.
- Default value: `true`

12.5.2.9.2 `capacity`

- The size of the shared block cache.
- Default value: 45% of the size of total system memory
- Unit: KB|MB|GB

12.5.2.10 `storage.flow-control`

Configuration items related to the flow control mechanism in TiKV. This mechanism replaces the write stall mechanism in RocksDB and controls flow at the scheduler layer, which avoids secondary disasters caused by the stuck Raftstore or Apply threads.

12.5.2.10.1 `enable`

- Determines whether to enable the flow control mechanism. After it is enabled, TiKV automatically disables the write stall mechanism of KvDB and the write stall mechanism of RaftDB (excluding memtable).
- Default value: `true`

12.5.2.10.2 `memtables-threshold`

- When the number of kvDB memtables reaches this threshold, the flow control mechanism starts to work. When `enable` is set to `true`, this configuration item overrides `rocksdb.(default|writecf|lockcf).max-write-buffer-number`.
- Default value: 5

12.5.2.10.3 10-files-threshold

- When the number of kvDB L0 files reaches this threshold, the flow control mechanism starts to work. When `enable` is set to `true`, this configuration item overrides `rocksdb.(defaultcf|writecf|lockcf).level0-slowdown-writes-trigger`.
↪ `.(defaultcf|writecf|lockcf).level0-slowdown-writes-trigger`.
- Default value: 20

12.5.2.10.4 soft-pending-compaction-bytes-limit

- When the pending compaction bytes in KvDB reach this threshold, the flow control mechanism starts to reject some write requests and reports the `ServerIsBusy` error. When `enable` is set to `true`, this configuration item overrides `rocksdb.(defaultcf|writecf|lockcf).soft-pending-compaction-bytes-limit`.
↪ `writecf|lockcf).soft-pending-compaction-bytes-limit`.
- Default value: "192GB"

12.5.2.10.5 hard-pending-compaction-bytes-limit

- When the pending compaction bytes in KvDB reach this threshold, the flow control mechanism rejects all write requests and reports the `ServerIsBusy` error. When `enable` is set to `true`, this configuration item overrides `rocksdb.(defaultcf|writecf|lockcf).hard-pending-compaction-bytes-limit`.
↪ `|lockcf).hard-pending-compaction-bytes-limit`.
- Default value: "1024GB"

12.5.2.11 storage.io-rate-limit

Configuration items related to the I/O rate limiter.

12.5.2.11.1 max-bytes-per-sec

- Limits the maximum I/O bytes that a server can write to or read from the disk (determined by the `mode` configuration item below) in one second. When this limit is reached, TiKV prefers throttling background operations over foreground ones. The value of this configuration item should be set to the disk's optimal I/O bandwidth, for example, the maximum I/O bandwidth specified by your cloud disk vendor. When this configuration value is set to zero, disk I/O operations are not limited.
- Default value: "0MB"

12.5.2.11.2 mode

- Determines which types of I/O operations are counted and restrained below the `max-bytes-per-sec` threshold. Currently, only the write-only mode is supported.
- Optional value: "write-only"
- Default value: "write-only"

12.5.2.12 raftstore

Configuration items related to Raftstore.

12.5.2.12.1 prevote

- Enables or disables `prevote`. Enabling this feature helps reduce jitter on the system after recovery from network partition.
- Default value: `true`

12.5.2.12.2 capacity

- The storage capacity, which is the maximum size allowed to store data. If `capacity` is left unspecified, the capacity of the current disk prevails. To deploy multiple TiKV instances on the same physical disk, add this parameter to the TiKV configuration. For details, see [Key parameters of the hybrid deployment](#).
- Default value: `0`

12.5.2.12.3 raftdb-path

- The path to the Raft library, which is `storage.data-dir/raft` by default
- Default value: `""`

12.5.2.12.4 raft-base-tick-interval

Note:

This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The time interval at which the Raft state machine ticks
- Default value: `"1s"`
- Minimum value: greater than `0`

12.5.2.12.5 raft-heartbeat-ticks

Note:

This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The number of passed ticks when the heartbeat is sent. This means that a heartbeat is sent at the time interval of `raft-base-tick-interval * raft-heartbeat-ticks`.
- Default value: 2
- Minimum value: greater than 0

12.5.2.12.6 `raft-election-timeout-ticks`

Note:

This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The number of passed ticks when Raft election is initiated. This means that if Raft group is missing the leader, a leader election is initiated approximately after the time interval of `raft-base-tick-interval * raft-election-timeout-ticks`.
- Default value: 10
- Minimum value: `raft-heartbeat-ticks`

12.5.2.12.7 `raft-min-election-timeout-ticks`

Note:

This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The minimum number of ticks during which the Raft election is initiated. If the number is 0, the value of `raft-election-timeout-ticks` is used. The value of this parameter must be greater than or equal to `raft-election-timeout-ticks`.
- Default value: 0
- Minimum value: 0

12.5.2.12.8 `raft-max-election-timeout-ticks`

Note:

This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The maximum number of ticks during which the Raft election is initiated. If the number is 0, the value of `raft-election-timeout-ticks` * 2 is used.
- Default value: 0
- Minimum value: 0

12.5.2.12.9 `raft-max-size-per-msg`

Note:

This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The soft limit on the size of a single message packet
- Default value: "1MB"
- Minimum value: 0
- Unit: MB

12.5.2.12.10 `raft-max-inflight-msgs`

Note:

This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The number of Raft logs to be confirmed. If this number is exceeded, log sending slows down.
- Default value: 256
- Minimum value: greater than 0

12.5.2.12.11 `raft-entry-max-size`

- The hard limit on the maximum size of a single log
- Default value: "8MB"
- Minimum value: 0
- Unit: MB|GB

12.5.2.12.12 raft-log-compact-sync-interval New in v5.3

- The time interval to compact unnecessary Raft logs
- Default value: "2s"
- Minimum value: "0s"

12.5.2.12.13 raft-log-gc-tick-interval

- The time interval at which the polling task of deleting Raft logs is scheduled. 0 means that this feature is disabled.
- Default value: "3s"
- Minimum value: "0s"

12.5.2.12.14 raft-log-gc-threshold

- The soft limit on the maximum allowable count of residual Raft logs
- Default value: 50
- Minimum value: 1

12.5.2.12.15 raft-log-gc-count-limit

- The hard limit on the allowable number of residual Raft logs
- Default value: the log number that can be accommodated in the 3/4 Region size (calculated as 1MB for each log)
- Minimum value: 0

12.5.2.12.16 raft-log-gc-size-limit

- The hard limit on the allowable size of residual Raft logs
- Default value: 3/4 of the Region size
- Minimum value: greater than 0

12.5.2.12.17 raft-log-reserve-max-ticks New in v5.3

- After the number of ticks set by this configuration item passes, even if the number of residual Raft logs does not reach the value set by `raft-log-gc-threshold`, TiKV still performs garbage collection (GC) to these logs.
- Default value: 6
- Minimum value: greater than 0

12.5.2.12.18 raft-entry-cache-life-time

- The maximum remaining time allowed for the log cache in memory.
- Default value: "30s"
- Minimum value: 0

12.5.2.12.19 hibernate-regions

- Enables or disables Hibernate Region. When this option is enabled, a Region idle for a long time is automatically set as hibernated. This reduces the extra overhead caused by heartbeat messages between the Raft leader and the followers for idle Regions. You can use `peer-stale-state-check-interval` to modify the heartbeat interval between the leader and the followers of hibernated Regions.
- Default value: `true` in v5.0.2 and later versions; `false` in versions before v5.0.2

12.5.2.12.20 split-region-check-tick-interval

- Specifies the interval at which to check whether the Region split is needed. 0 means that this feature is disabled.
- Default value: "10s"
- Minimum value: 0

12.5.2.12.21 region-split-check-diff

- The maximum value by which the Region data is allowed to exceed before Region split
- Default value: 1/16 of the Region size.
- Minimum value: 0

12.5.2.12.22 region-compact-check-interval

- The time interval at which to check whether it is necessary to manually trigger RocksDB compaction. 0 means that this feature is disabled.
- Default value: "5m"
- Minimum value: 0

12.5.2.12.23 region-compact-check-step

- The number of Regions checked at one time for each round of manual compaction
- Default value: 100
- Minimum value: 0

12.5.2.12.24 region-compact-min-tombstones

- The number of tombstones required to trigger RocksDB compaction
- Default value: 10000
- Minimum value: 0

12.5.2.12.25 region-compact-tombstones-percent

- The proportion of tombstone required to trigger RocksDB compaction
- Default value: 30
- Minimum value: 1
- Maximum value: 100

12.5.2.12.26 pd-heartbeat-tick-interval

- The time interval at which a Region's heartbeat to PD is triggered. 0 means that this feature is disabled.
- Default value: "1m"
- Minimum value: 0

12.5.2.12.27 pd-store-heartbeat-tick-interval

- The time interval at which a store's heartbeat to PD is triggered. 0 means that this feature is disabled.
- Default value: "10s"
- Minimum value: 0

12.5.2.12.28 snap-mgr-gc-tick-interval

- The time interval at which the recycle of expired snapshot files is triggered. 0 means that this feature is disabled.
- Default value: "1m"
- Minimum value: 0

12.5.2.12.29 snap-gc-timeout

- The longest time for which a snapshot file is saved
- Default value: "4h"
- Minimum value: 0

12.5.2.12.30 `snap-generator-pool-size` New in v5.4.0

- Configures the size of the `snap-generator` thread pool.
- To make Regions generate snapshot faster in TiKV in recovery scenarios, you need to increase the count of the `snap-generator` threads of the corresponding worker. You can use this configuration item to increase the size of the `snap-generator` thread pool.
- Default value: 2
- Minimum value: 1

12.5.2.12.31 `lock-cf-compact-interval`

- The time interval at which TiKV triggers a manual compaction for the Lock Column Family
- Default value: "10m"
- Minimum value: 0

12.5.2.12.32 `lock-cf-compact-bytes-threshold`

- The size out of which TiKV triggers a manual compaction for the Lock Column Family
- Default value: "256MB"
- Minimum value: 0
- Unit: MB

12.5.2.12.33 `notify-capacity`

- The longest length of the Region message queue.
- Default value: 40960
- Minimum value: 0

12.5.2.12.34 `messages-per-tick`

- The maximum number of messages processed per batch
- Default value: 4096
- Minimum value: 0

12.5.2.12.35 `max-peer-down-duration`

- The longest inactive duration allowed for a peer. A peer with timeout is marked as `down`, and PD tries to delete it later.
- Default value: "10m"
- Minimum value: When Hibernate Region is enabled, the minimum value is `peer-stale` \leftrightarrow `-state-check-interval * 2`; when Hibernate Region is disabled, the minimum value is 0.

12.5.2.12.36 max-leader-missing-duration

- The longest duration allowed for a peer to be in the state where a Raft group is missing the leader. If this value is exceeded, the peer verifies with PD whether the peer has been deleted.
- Default value: "2h"
- Minimum value: greater than abnormal-leader-missing-duration

12.5.2.12.37 abnormal-leader-missing-duration

- The longest duration allowed for a peer to be in the state where a Raft group is missing the leader. If this value is exceeded, the peer is seen as abnormal and marked in metrics and logs.
- Default value: "10m"
- Minimum value: greater than peer-stale-state-check-interval

12.5.2.12.38 peer-stale-state-check-interval

- The time interval to trigger the check for whether a peer is in the state where a Raft group is missing the leader.
- Default value: "5m"
- Minimum value: greater than $2 * election-timeout$

12.5.2.12.39 leader-transfer-max-log-lag

- The maximum number of missing logs allowed for the transferee during a Raft leader transfer
- Default value: 128
- Minimum value: 10

12.5.2.12.40 snap-apply-batch-size

- The memory cache size required when the imported snapshot file is written into the disk
- Default value: "10MB"
- Minimum value: 0
- Unit: MB

12.5.2.12.41 consistency-check-interval

Warning:

It is **NOT** recommended to enable the consistency check in production environments, because it affects cluster performance and is incompatible with the garbage collection in TiDB.

- The time interval at which the consistency check is triggered. 0 means that this feature is disabled.
- Default value: "0s"
- Minimum value: 0

12.5.2.12.42 raft-store-max-leader-lease

- The longest trusted period of a Raft leader
- Default value: "9s"
- Minimum value: 0

12.5.2.12.43 right-derive-when-split

- Specifies the start key of the new Region when a Region is split. When this configuration item is set to **true**, the start key is the maximum split key. When this configuration item is set to **false**, the start key is the original Region's start key.
- Default value: true

12.5.2.12.44 merge-max-log-gap

- The maximum number of missing logs allowed when **merge** is performed
- Default value: 10
- Minimum value: greater than **raft-log-gc-count-limit**

12.5.2.12.45 merge-check-tick-interval

- The time interval at which TiKV checks whether a Region needs merge
- Default value: "2s"
- Minimum value: greater than 0

12.5.2.12.46 use-delete-range

- Determines whether to delete data from the rocksdb **delete_range** interface
- Default value: **false**

12.5.2.12.47 `cleanup-import-sst-interval`

- The time interval at which the expired SST file is checked. 0 means that this feature is disabled.
- Default value: "10m"
- Minimum value: 0

12.5.2.12.48 `local-read-batch-size`

- The maximum number of read requests processed in one batch
- Default value: 1024
- Minimum value: greater than 0

12.5.2.12.49 `apply-max-batch-size`

- The maximum number of requests for data flushing in one batch
- Default value: 256
- Minimum value: greater than 0

12.5.2.12.50 `apply-pool-size`

- The allowable number of threads in the pool that flushes data to storage. When you modify the size of this thread pool, refer to [Performance tuning for TiKV thread pools](#).
- Default value: 2
- Minimum value: greater than 0

12.5.2.12.51 `store-max-batch-size`

- The maximum number of requests processed in one batch
- If `hibernate-regions` is enabled, the default value is 256. If `hibernate-regions` is disabled, the default value is 1024.
- Minimum value: greater than 0

12.5.2.12.52 `store-pool-size`

- The allowable number of threads that process Raft, which is the size of the Raftstore thread pool. When you modify the size of this thread pool, refer to [Performance tuning for TiKV thread pools](#).
- Default value: 2
- Minimum value: greater than 0

12.5.2.12.53 `store-io-pool-size` New in v5.3.0

- The allowable number of threads that process Raft I/O tasks, which is the size of the StoreWriter thread pool. When you modify the size of this thread pool, refer to [Performance tuning for TiKV thread pools](#).
- Default value: 0
- Minimum value: 0

12.5.2.12.54 `future-poll-size`

- The allowable number of threads that drive `future`
- Default value: 1
- Minimum value: greater than 0

12.5.2.12.55 `cmd-batch`

- Controls whether to enable batch processing of the requests. When it is enabled, the write performance is significantly improved.
- Default value: `true`

12.5.2.12.56 `inspect-interval`

- At a certain interval, TiKV inspects the latency of the Raftstore component. This parameter specifies the interval of the inspection. If the latency exceeds this value, this inspection is marked as timeout.
- Judges whether the TiKV node is slow based on the ratio of timeout inspection.
- Default value: `"500ms"`
- Minimum value: `"1ms"`

12.5.2.12.57 `raft-write-size-limit` New in v5.3.0

- Determines the threshold at which Raft data is written into the disk. If the data size is larger than the value of this configuration item, the data is written to the disk. When the value of `store-io-pool-size` is 0, this configuration item does not take effect.
- Default value: 1MB
- Minimum value: 0

12.5.2.13 `coprocessor`

Configuration items related to Coprocessor.

12.5.2.13.1 `split-region-on-table`

- Determines whether to split Region by table. It is recommended for you to use the feature only in TiDB mode.
- Default value: `false`

12.5.2.13.2 `batch-split-limit`

- The threshold of Region split in batches. Increasing this value speeds up Region split.
- Default value: 10
- Minimum value: 1

12.5.2.13.3 `region-max-size`

- The maximum size of a Region. When the value is exceeded, the Region splits into many.
- Default value: "144MB"
- Unit: KB|MB|GB

12.5.2.13.4 `region-split-size`

- The size of the newly split Region. This value is an estimate.
- Default value: "96MB"
- Unit: KB|MB|GB

12.5.2.13.5 `region-max-keys`

- The maximum allowable number of keys in a Region. When this value is exceeded, the Region splits into many.
- Default value: 1440000

12.5.2.13.6 `region-split-keys`

- The number of keys in the newly split Region. This value is an estimate.
- Default value: 960000

12.5.2.14 `rocksdb`

Configuration items related to RocksDB

12.5.2.14.1 `max-background-jobs`

- The number of background threads in RocksDB. When you modify the size of the RocksDB thread pool, refer to [Performance tuning for TiKV thread pools](#).
- Default value: 8
- Minimum value: 2

12.5.2.14.2 `max-background-flushes`

- The maximum number of concurrent background memtable flush jobs
- Default value: 2
- Minimum value: 1

12.5.2.14.3 `max-sub-compactions`

- The number of sub-compaction operations performed concurrently in RocksDB
- Default value: 3
- Minimum value: 1

12.5.2.14.4 `max-open-files`

- The total number of files that RocksDB can open
- Default value: 40960
- Minimum value: -1

12.5.2.14.5 `max-manifest-file-size`

- The maximum size of a RocksDB Manifest file
- Default value: "128MB"
- Minimum value: 0
- Unit: B|KB|MB|GB

12.5.2.14.6 `create-if-missing`

- Determines whether to automatically create a DB switch
- Default value: true

12.5.2.14.7 wal-recovery-mode

- WAL recovery mode
- Optional values:
 - "tolerate-corrupted-tail-records": tolerates and discards the records that have incomplete trailing data on all logs
 - "absolute-consistency": abandons recovery when corrupted logs are found
 - "point-in-time": recovers logs sequentially until the first corrupted log is encountered
 - "skip-any-corrupted-records": post-disaster recovery. The data is recovered as much as possible, and corrupted records are skipped.
- Default value: "point-in-time"

12.5.2.14.8 wal-dir

- The directory in which WAL files are stored. If not specified, the WAL files will be stored in the same directory as the data.
- Default value: ""

12.5.2.14.9 wal-ttl-seconds

- The living time of the archived WAL files. When the value is exceeded, the system deletes these files.
- Default value: 0
- Minimum value: 0
- unit: second

12.5.2.14.10 wal-size-limit

- The size limit of the archived WAL files. When the value is exceeded, the system deletes these files.
- Default value: 0
- Minimum value: 0
- Unit: B|KB|MB|GB

12.5.2.14.11 enable-statistics

- Determines whether to enable the statistics of RocksDB
- Default value: true

12.5.2.14.12 stats-dump-period

- The interval at which statistics are output to the log.
- Default value: 10m

12.5.2.14.13 compaction-readahead-size

- Enables the readahead feature during RocksDB compaction and specifies the size of readahead data. If you are using mechanical disks, it is recommended to set the value to 2MB at least.
- Default value: 0
- Minimum value: 0
- Unit: B|KB|MB|GB

12.5.2.14.14 writable-file-max-buffer-size

- The maximum buffer size used in WritableFileWrite
- Default value: "1MB"
- Minimum value: 0
- Unit: B|KB|MB|GB

12.5.2.14.15 use-direct-io-for-flush-and-compaction

- Determines whether to use `O_DIRECT` for both reads and writes in the background flush and compactions. The performance impact of this option: enabling `O_DIRECT` bypasses and prevents contamination of the OS buffer cache, but the subsequent file reads require re-reading the contents to the buffer cache.
- Default value: `false`

12.5.2.14.16 rate-bytes-per-sec

- The maximum rate permitted by RocksDB's compaction rate limiter
- Default value: 10GB
- Minimum value: 0
- Unit: B|KB|MB|GB

12.5.2.14.17 rate-limiter-mode

- RocksDB's compaction rate limiter mode
- Optional values: "read-only", "write-only", "all-io"
- Default value: "write-only"

12.5.2.14.18 `rate-limiter-auto-tuned` New in v5.0

- Determines whether to automatically optimize the configuration of the RocksDB's compaction rate limiter based on recent workload. When this configuration is enabled, compaction pending bytes will be slightly higher than usual.
- Default value: `true`

12.5.2.14.19 `enable-pipelined-write`

- Enables or disables Pipelined Write
- Default value: `true`

12.5.2.14.20 `bytes-per-sync`

- The rate at which OS incrementally synchronizes files to disk while these files are being written asynchronously
- Default value: `"1MB"`
- Minimum value: `0`
- Unit: `B|KB|MB|GB`

12.5.2.14.21 `wal-bytes-per-sync`

- The rate at which OS incrementally synchronizes WAL files to disk while the WAL files are being written
- Default value: `"512KB"`
- Minimum value: `0`
- Unit: `B|KB|MB|GB`

12.5.2.14.22 `info-log-max-size`

Warning:

Starting from v5.4.0, RocksDB logs are managed by the logging module of TiKV. Therefore, this configuration item is deprecated, and its function is replaced by the configuration item `log.file.max-size`.

- The maximum size of Info log
- Default value: `"1GB"`
- Minimum value: `0`
- Unit: `B|KB|MB|GB`

12.5.2.14.23 info-log-roll-time

Warning:

Starting from v5.4.0, RocksDB logs are managed by the logging module of TiKV. Therefore, this configuration item is deprecated. TiKV no longer supports automatic log splitting based on time. Instead, you can use the configuration item `log.file.max-size` to set the threshold for automatic log splitting based on file size.

- The time interval at which Info logs are truncated. If the value is `0s`, logs are not truncated.
- Default value: `"0s"`

12.5.2.14.24 info-log-keep-log-file-num

Warning:

Starting from v5.4.0, RocksDB logs are managed by the logging module of TiKV. Therefore, this configuration item is deprecated, and its function is replaced by the configuration item `log.file.max-backups`.

- The maximum number of kept log files
- Default value: `10`
- Minimum value: `0`

12.5.2.14.25 info-log-dir

- The directory in which logs are stored
- Default value: `""`

12.5.2.14.26 info-log-level

Warning:

Starting from v5.4.0, RocksDB logs are managed by the logging module of TiKV. Therefore, this configuration item is deprecated, and its function is replaced by the configuration item `log.level`.

- Log levels of RocksDB
- Default value: "info"

12.5.2.15 rocksdb.titan

Configuration items related to Titan.

12.5.2.15.1 enabled

- Enables or disables Titan
- Default value: false

12.5.2.15.2 dirname

- The directory in which the Titan Blob file is stored
- Default value: "titandb"

12.5.2.15.3 disable-gc

- Determines whether to disable Garbage Collection (GC) that Titan performs to Blob files
- Default value: false

12.5.2.15.4 max-background-gc

- The maximum number of GC threads in Titan
- Default value: 4
- Minimum value: 1

12.5.2.16 rocksdb.defaultcf | rocksdb.writecf | rocksdb.lockcf

Configuration items related to rocksdb.defaultcf, rocksdb.writecf, and rocksdb.
↪ lockcf.

12.5.2.16.1 block-size

- The default size of a RocksDB block
- Default value for defaultcf and writecf: "64KB"
- Default value for lockcf: "16KB"
- Minimum value: "1KB"
- Unit: KB|MB|GB

12.5.2.16.2 block-cache-size

- The cache size of a RocksDB block
- Default value for defaultcf: Total machine memory * 25%
- Default value for writecf: Total machine memory * 15%
- Default value for lockcf: Total machine memory * 2%
- Minimum value: 0
- Unit: KB|MB|GB

12.5.2.16.3 disable-block-cache

- Enables or disables block cache
- Default value: false

12.5.2.16.4 cache-index-and-filter-blocks

- Enables or disables caching index and filter
- Default value: true

12.5.2.16.5 pin-l0-filter-and-index-blocks

- Determines whether to pin the index and filter blocks of the level 0 SST files in memory.
- Default value: true

12.5.2.16.6 use-bloom-filter

- Enables or disables bloom filter
- Default value: true

12.5.2.16.7 optimize-filters-for-hits

- Determines whether to optimize the hit ratio of filters
- Default value for defaultcf: true
- Default value for writecf and lockcf: false

12.5.2.16.8 whole-key-filtering

- Determines whether to put the entire key to bloom filter
- Default value for defaultcf and lockcf: true
- Default value for writecf: false

12.5.2.16.9 bloom-filter-bits-per-key

- The length that bloom filter reserves for each key
- Default value: 10
- Unit: byte

12.5.2.16.10 block-based-bloom-filter

- Determines whether each block creates a bloom filter
- Default value: `false`

12.5.2.16.11 read-amp-bytes-per-bit

- Enables or disables statistics of read amplification.
- Optional values: 0 (disabled), > 0 (enabled).
- Default value: 0
- Minimum value: 0

12.5.2.16.12 compression-per-level

- The default compression algorithm for each level
- Default value for `defaultcf`: ["no", "no", "lz4", "lz4", "lz4", "zstd", "zstd"]
- Default value for `writetcf`: ["no", "no", "lz4", "lz4", "lz4", "zstd", "zstd"]
- Default value for `lockcf`: ["no", "no", "no", "no", "no", "no", "no"]

12.5.2.16.13 bottommost-level-compression

- Sets the compression algorithm of the bottommost layer. This configuration item overrides the `compression-per-level` setting.
- Ever since data is written to LSM-tree, RocksDB does not directly adopt the last compression algorithm specified in the `compression-per-level` array for the bottommost layer. `bottommost-level-compression` enables the bottommost layer to use the compression algorithm of the best compression effect from the beginning.
- If you do not want to set the compression algorithm for the bottommost layer, set the value of this configuration item to `disable`.
- Default value: `"zstd"`

12.5.2.16.14 write-buffer-size

- Memtable size
- Default value for `defaultcf` and `writetcf`: `"128MB"`
- Default value for `lockcf`: `"32MB"`
- Minimum value: 0
- Unit: KB|MB|GB

12.5.2.16.15 `max-write-buffer-number`

- The maximum number of memtables. When `storage.flow-control.enable` is set to `true`, `storage.flow-control.memtables-threshold` overrides this configuration item.
- Default value: 5
- Minimum value: 0

12.5.2.16.16 `min-write-buffer-number-to-merge`

- The minimum number of memtables required to trigger flush
- Default value: 1
- Minimum value: 0

12.5.2.16.17 `max-bytes-for-level-base`

- The maximum number of bytes at base level (L1). Generally, it is set to 4 times the size of a memtable.
- Default value for `defaulttcf` and `writetcf`: "512MB"
- Default value for `lockcf`: "128MB"
- Minimum value: 0
- Unit: KB|MB|GB

12.5.2.16.18 `target-file-size-base`

- The size of the target file at base level. This value is overridden by `compaction-guard` \leftrightarrow `-max-output-file-size` when the `enable-compaction-guard` value is `true`.
- Default value: "8MB"
- Minimum value: 0
- Unit: KB|MB|GB

12.5.2.16.19 `level0-file-num-compaction-trigger`

- The maximum number of files at L0 that trigger compaction
- Default value for `defaulttcf` and `writetcf`: 4
- Default value for `lockcf`: 1
- Minimum value: 0

12.5.2.16.20 `level0-slowdown-writes-trigger`

- The maximum number of files at L0 that trigger write stall. When `storage.flow` \leftrightarrow `-control.enable` is set to `true`, `storage.flow-control.l0-files-threshold` overrides this configuration item.
- Default value: 20
- Minimum value: 0

12.5.2.16.21 `level0-stop-writes-trigger`

- The maximum number of files at L0 required to completely block write
- Default value: 36
- Minimum value: 0

12.5.2.16.22 `max-compaction-bytes`

- The maximum number of bytes written into disk per compaction
- Default value: "2GB"
- Minimum value: 0
- Unit: KB|MB|GB

12.5.2.16.23 `compaction-pri`

- The priority type of compaction
- Optional values:
 - "by-compensated-size": compact files in order of file size and large files are compacted with higher priority.
 - "oldest-largest-seq-first": prioritize compaction on files with the oldest update time. Use this value **only** when updating hot keys in small ranges.
 - "oldest-smallest-seq-first": prioritize compaction on files with ranges that are not compacted to the next level for a long time. If you randomly update hot keys across the key space, this value can slightly reduce write amplification.
 - "min-overlapping-ratio": prioritize compaction on files with a high overlap ratio. When a file is small in different levels (the result of **the file size in the** \leftrightarrow **next level** \div **the file size in this level** is small), TiKV compacts this file first. In many cases, this value can effectively reduce write amplification.
- Default value for `defaultcf` and `writecf`: "min-overlapping-ratio"
- Default value for `lockcf`: "by-compensated-size"

12.5.2.16.24 `dynamic-level-bytes`

- Determines whether to optimize dynamic level bytes
- Default value: `true`

12.5.2.16.25 `num-levels`

- The maximum number of levels in a RocksDB file
- Default value: 7

12.5.2.16.26 `max-bytes-for-level-multiplier`

- The default amplification multiple for each layer
- Default value: 10

12.5.2.16.27 `compaction-style`

- Compaction method
- Optional values: "level", "universal", "fifo"
- Default value: "level"

12.5.2.16.28 `disable-auto-compactions`

- Determines whether to disable auto compaction.
- Default value: `false`

12.5.2.16.29 `soft-pending-compaction-bytes-limit`

- The soft limit on the pending compaction bytes. When `storage.flow-control.enable` is set to `true`, `storage.flow-control.soft-pending-compaction-bytes-limit` overrides this configuration item.
- Default value: "192GB"
- Unit: KB|MB|GB

12.5.2.16.30 `hard-pending-compaction-bytes-limit`

- The hard limit on the pending compaction bytes. When `storage.flow-control.enable` is set to `true`, `storage.flow-control.hard-pending-compaction-bytes-limit` overrides this configuration item.
- Default value: "256GB"
- Unit: KB|MB|GB

12.5.2.16.31 `enable-compaction-guard`

- Enables or disables the compaction guard, which is an optimization to split SST files at TiKV Region boundaries. This optimization can help reduce compaction I/O and allows TiKV to use larger SST file size (thus less SST files overall) and at the time efficiently clean up stale data when migrating Regions.
- Default value for `defaultcf` and `writecf`: `true`
- Default value for `lockcf`: `false`

12.5.2.16.32 `compaction-guard-min-output-file-size`

- The minimum SST file size when the compaction guard is enabled. This configuration prevents SST files from being too small when the compaction guard is enabled.
- Default value: "8MB"
- Unit: KB|MB|GB

12.5.2.16.33 `compaction-guard-max-output-file-size`

- The maximum SST file size when the compaction guard is enabled. The configuration prevents SST files from being too large when the compaction guard is enabled. This configuration overrides `target-file-size-base` for the same column family.
- Default value: "128MB"
- Unit: KB|MB|GB

12.5.2.17 `rocksdb.defaultcf.titan`

Configuration items related to `rocksdb.defaultcf.titan`.

12.5.2.17.1 `min-blob-size`

- The smallest value stored in a Blob file. Values smaller than the specified size are stored in the LSM-Tree.
- Default value: "1KB"
- Minimum value: 0
- Unit: KB|MB|GB

12.5.2.17.2 `blob-file-compression`

- The compression algorithm used in a Blob file
- Optional values: "no", "snappy", "zlib", "bzip2", "lz4", "lz4hc", "zstd"
- Default value: "lz4"

12.5.2.17.3 `blob-cache-size`

- The cache size of a Blob file
- Default value: "0GB"
- Minimum value: 0
- Unit: KB|MB|GB

12.5.2.17.4 min-gc-batch-size

- The minimum total size of Blob files required to perform GC for one time
- Default value: "16MB"
- Minimum value: 0
- Unit: KB|MB|GB

12.5.2.17.5 max-gc-batch-size

- The maximum total size of Blob files allowed to perform GC for one time
- Default value: "64MB"
- Minimum value: 0
- Unit: KB|MB|GB

12.5.2.17.6 discardable-ratio

- The ratio at which GC is triggered for Blob files. The Blob file can be selected for GC only if the proportion of the invalid values in a Blob file exceeds this ratio.
- Default value: 0.5
- Minimum value: 0
- Maximum value: 1

12.5.2.17.7 sample-ratio

- The ratio of (data read from a Blob file/the entire Blob file) when sampling the file during GC
- Default value: 0.1
- Minimum value: 0
- Maximum value: 1

12.5.2.17.8 merge-small-file-threshold

- When the size of a Blob file is smaller than this value, the Blob file might still be selected for GC. In this situation, `discardable-ratio` is ignored.
- Default value: "8MB"
- Minimum value: 0
- Unit: KB|MB|GB

12.5.2.17.9 blob-run-mode

- Specifies the running mode of Titan.
- Optional values:
 - `normal`: Writes data to the blob file when the value size exceeds `min-blob-size`.
 - `read_only`: Refuses to write new data to the blob file, but still reads the original data from the blob file.
 - `fallback`: Writes data in the blob file back to LSM.
- Default value: `normal`

12.5.2.17.10 level-merge

- Determines whether to optimize the read performance. When `level-merge` is enabled, there is more write amplification.
- Default value: `false`

12.5.2.17.11 gc-merge-rewrite

- Determines whether to use the merge operator to write back blob indexes for Titan GC. When `gc-merge-rewrite` is enabled, it reduces the effect of Titan GC on the writes in the foreground.
- Default value: `false`

12.5.2.18 raftdb

Configuration items related to `raftdb`

12.5.2.18.1 max-background-jobs

- The number of background threads in RocksDB. When you modify the size of the RocksDB thread pool, refer to [Performance tuning for TiKV thread pools](#).
- Default value: 4
- Minimum value: 2

12.5.2.18.2 max-sub-compactions

- The number of concurrent sub-compaction operations performed in RocksDB
- Default value: 2
- Minimum value: 1

12.5.2.18.3 wal-dir

- The directory in which WAL files are stored
- Default value: `"/tmp/tikv/store"`

12.5.2.19 raft-engine

Configuration items related to Raft Engine.

Warning:

Raft Engine is an experimental feature. It is not recommended to use it in the production environment.

12.5.2.19.1 enable

- Determines whether to use Raft Engine to store Raft logs. When it is enabled, configurations of `raftdb` are ignored.
- Default value: `false`

12.5.2.19.2 dir

- The directory at which raft log files are stored. If the directory does not exist, it will be created when TiKV is started.
- When this configuration is not set, `{data-dir}/raft-engine` is used.
- If there are multiple disks on your machine, it is recommended to store the data of Raft Engine on a different disk to improve TiKV performance.
- Default value: `""`

12.5.2.19.3 batch-compression-threshold

- Specifies the threshold size of a log batch. A log batch larger than this configuration is compressed. If you set this configuration item to `0`, compression is disabled.
- Default value: `"8KB"`

12.5.2.19.4 bytes-per-sync

- Specifies the maximum accumulative size of buffered writes. When this configuration value is exceeded, buffered writes are flushed to the disk.
- If you set this configuration item to `0`, incremental sync is disabled.
- Default value: `"4MB"`

12.5.2.19.5 `target-file-size`

- Specifies the maximum size of log files. When a log file is larger than this value, it is rotated.
- Default value: "128MB"

12.5.2.19.6 `purge-threshold`

- Specifies the threshold size of the main log queue. When this configuration value is exceeded, the main log queue is purged.
- This configuration can be used to adjust the disk space usage of Raft Engine.
- Default value: "10GB"

12.5.2.19.7 `recovery-mode`

- Determines how to deal with file corruption during recovery.
- Value options: "absolute-consistency", "tolerate-tail-corruption", "tolerate-any-corruption"
- Default value: "tolerate-tail-corruption"

12.5.2.19.8 `recovery-read-block-size`

- The minimum I/O size for reading log files during recovery.
- Default value: "16KB"
- Minimum value: "512B"

12.5.2.19.9 `recovery-threads`

- The number of threads used to scan and recover log files.
- Default value: 4
- Minimum value: 1

12.5.2.20 `security`

Configuration items related to security.

12.5.2.20.1 `ca-path`

- The path of the CA file
- Default value: ""

12.5.2.20.2 `cert-path`

- The path of the Privacy Enhanced Mail (PEM) file that contains the X.509 certificate
- Default value: ""

12.5.2.20.3 `key-path`

- The path of the PEM file that contains the X.509 key
- Default value: ""

12.5.2.20.4 `cert-allowed-cn`

- A list of acceptable X.509 Common Names in certificates presented by clients. Requests are permitted only when the presented Common Name is an exact match with one of the entries in the list.
- Default value: []. This means that the client certificate CN check is disabled by default.

12.5.2.20.5 `redact-info-log` New in v4.0.8

- This configuration item enables or disables log redaction. If the configuration value is set to `true`, all user data in the log will be replaced by `?`.
- Default value: `false`

12.5.2.21 `security.encryption`

Configuration items related to **encryption at rest** (TDE).

12.5.2.21.1 `data-encryption-method`

- The encryption method for data files
- Value options: "plaintext", "aes128-ctr", "aes192-ctr", and "aes256-ctr"
- A value other than "plaintext" means that encryption is enabled, in which case the master key must be specified.
- Default value: "plaintext"

12.5.2.21.2 `data-key-rotation-period`

- Specifies how often TiKV rotates the data encryption key.
- Default value: 7d

12.5.2.21.3 `enable-file-dictionary-log`

- Enables the optimization to reduce I/O and mutex contention when TiKV manages the encryption metadata.
- To avoid possible compatibility issues when this configuration parameter is enabled (by default), see [Encryption at Rest - Compatibility between TiKV versions](#) for details.
- Default value: `true`

12.5.2.21.4 `master-key`

- Specifies the master key if encryption is enabled. To learn how to configure a master key, see [Encryption at Rest - Configure encryption](#).

12.5.2.21.5 `previous-master-key`

- Specifies the old master key when rotating the new master key. The configuration format is the same as that of `master-key`. To learn how to configure a master key, see [Encryption at Rest - Configure encryption](#).

12.5.2.22 `import`

Configuration items related to TiDB Lightning import and BR restore.

12.5.2.22.1 `num-threads`

- The number of threads to process RPC requests
- Default value: 8
- Minimum value: 1

12.5.2.23 `gc`

12.5.2.23.1 `enable-compaction-filter` New in v5.0

- Controls whether to enable the GC in Compaction Filter feature
- Default value: `true`

12.5.2.24 `backup`

Configuration items related to BR backup.

12.5.2.24.1 `num-threads`

- The number of worker threads to process backup
- Default value: $\text{MIN}(\text{CPU} * 0.5, 8)$.
- Minimum value: 1

12.5.2.24.2 `enable-auto-tune` New in v5.4.0

- Controls whether to limit the resources used by backup tasks to reduce the impact on the cluster when the cluster resource utilization is high. For more information, refer to [BR Auto-Tune](#).
- Default value: `true`

12.5.2.24.3 `s3-multi-part-size` New in v5.3.2

Note:

This configuration is introduced to address backup failures caused by S3 rate limiting. This problem has been fixed by [refining the backup data storage structure](#). Therefore, this configuration is deprecated from v6.1.1 and is no longer recommended.

- The part size used when you perform multipart upload to S3 during backup. You can adjust the value of this configuration to control the number of requests sent to S3.
- If data is backed up to S3 and the backup file is larger than the value of this configuration item, [multipart upload](#) is automatically enabled. Based on the compression ratio, the backup file generated by a 96-MiB Region is approximately 10 MiB to 30 MiB.
- Default value: 5MiB

12.5.2.25 `cdc`

Configuration items related to TiCDC.

12.5.2.25.1 `min-ts-interval`

- The interval at which Resolved TS is calculated and forwarded.
- Default value: `"1s"`

12.5.2.25.2 `old-value-cache-memory-quota`

- The upper limit of memory usage by TiCDC old values.
- Default value: 512MB

12.5.2.25.3 sink-memory-quota

- The upper limit of memory usage by TiCDC data change events.
- Default value: 512MB

12.5.2.25.4 incremental-scan-speed-limit

- The maximum speed at which historical data is incrementally scanned.
- Default value: "128MB", which means 128 MB per second.

12.5.2.25.5 incremental-scan-threads

- The number of threads for the task of incrementally scanning historical data.
- Default value: 4, which means 4 threads.

12.5.2.25.6 incremental-scan-concurrency

- The maximum number of concurrent executions for the tasks of incrementally scanning historical data.
- Default value: 6, which means 6 tasks can be concurrent executed at most.
- Note: The value of `incremental-scan-concurrency` must be greater than or equal to that of `incremental-scan-threads`; otherwise, TiKV will report an error at startup.

12.5.2.26 resolved-ts

Configuration items related to maintaining the Resolved TS to serve Stale Read requests.

12.5.2.26.1 enable

- Determines whether to maintain the Resolved TS for all Regions.
- Default value: `true`

12.5.2.26.2 advance-ts-interval

- The interval at which Resolved TS is calculated and forwarded.
- Default value: "1s"

12.5.2.26.3 scan-lock-pool-size

- The number of threads that TiKV uses to scan the MVCC (multi-version concurrency control) lock data when initializing the Resolved TS.
- Default value: 2, which means 2 threads.

12.5.2.27 pessimistic-txn

For pessimistic transaction usage, refer to [TiDB Pessimistic Transaction Mode](#).

12.5.2.27.1 wait-for-lock-timeout

- The longest time that a pessimistic transaction in TiKV waits for other transactions to release the lock. If the time is out, an error is returned to TiDB, and TiDB retries to add a lock. The lock wait timeout is set by `innodb_lock_wait_timeout`.
- Default value: "1s"
- Minimum value: "1ms"

12.5.2.27.2 wake-up-delay-duration

- When pessimistic transactions release the lock, among all the transactions waiting for lock, only the transaction with the smallest `start_ts` is woken up. Other transactions will be woken up after `wake-up-delay-duration`.
- Default value: "20ms"

12.5.2.27.3 pipelined

- This configuration item enables the pipelined process of adding the pessimistic lock. With this feature enabled, after detecting that data can be locked, TiKV immediately notifies TiDB to execute the subsequent requests and write the pessimistic lock asynchronously, which reduces most of the latency and significantly improves the performance of pessimistic transactions. But there is a still low probability that the asynchronous write of the pessimistic lock fails, which might cause the failure of pessimistic transaction commits.
- Default value: `true`

12.5.3 Configure TiFlash

This document introduces the configuration parameters related to the deployment and use of TiFlash.

12.5.3.1 PD scheduling parameters

You can adjust the PD scheduling parameters using `pd-ctl`. Note that you can use `tiup` \rightarrow `ctl:<cluster-version> pd` to replace `pd-ctl -u <pd_ip:pd_port>` when using `tiup` to deploy and manage your cluster.

- `replica-schedule-limit`: determines the rate at which the replica-related operator is generated. The parameter affects operations such as making nodes offline and add replicas.

Note:

The value of this parameter should be less than that of `region-schedule` \hookrightarrow `-limit`. Otherwise, the normal Region scheduling among TiKV nodes is affected.

- `store-balance-rate`: limits the rate at which Regions of each TiKV/TiFlash store are scheduled. Note that this parameter takes effect only when the stores have newly joined the cluster. If you want to change the setting for existing stores, use the following command.

Note:

Since v4.0.2, the `store-balance-rate` parameter has been deprecated and changes have been made to the `store limit` command. See [store-limit](#) for details.

- Execute the `pd-ctl -u <pd_ip:pd_port> store limit <store_id> <value>` command to set the scheduling rate of a specified store. (To get `store_id`, you can execute the `pd-ctl -u <pd_ip:pd_port> store` command.)
 - If you do not set the scheduling rate for Regions of a specified store, this store inherits the setting of `store-balance-rate`.
 - You can execute the `pd-ctl -u <pd_ip:pd_port> store limit` command to view the current setting value of `store-balance-rate`.
- `replication.location-labels`: indicates the topological relationship of TiKV instances. The order of the keys indicates the layering relationship of different labels. If TiFlash is enabled, you need to use `pd-ctl config placement-rules` to set the default value. For details, see [geo-distributed-deployment-topology](#).

12.5.3.2 TiFlash configuration parameters

This section introduces the configuration parameters of TiFlash.

12.5.3.2.1 Configure the `tiflash.toml` file

```
#### The listening host for supporting services such as TPC/HTTP. It is
  ↪ recommended to configure it as "0.0.0.0", which means to listen on
  ↪ all IP addresses of this machine.
listen_host = "0.0.0.0"
#### The TiFlash TCP service port.
tcp_port = 9000
#### The TiFlash HTTP service port.
http_port = 8123
```

```
#### The cache size limit of the metadata of a data block. Generally, you do
  ↳ not need to change this value.
mark_cache_size = 5368709120
#### The cache size limit of the min-max index of a data block. Generally,
  ↳ you do not need to change this value.
minmax_index_cache_size = 5368709120
#### The cache size limit of the DeltaIndex. The default value is 0, which
  ↳ means no limit.
delta_index_cache_size = 0

#### The storage path of TiFlash data. If there are multiple directories,
  ↳ separate each directory with a comma.
#### path and path_realtime_mode are deprecated since v4.0.9. Use the
  ↳ configurations
#### in the [storage] section to get better performance in the multi-disk
  ↳ deployment scenarios
#### Since TiDB v5.2.0, if you need to use the storage.io_rate_limit
  ↳ configuration, you need to set the storage path of TiFlash data to
  ↳ storage.main.dir at the same time.
#### When the [storage] configurations exist, both path and
  ↳ path_realtime_mode configurations are ignored.
### path = "/tidb-data/tiflash-9000"
#### or
### path = "/ssd0/tidb-data/tiflash,/ssd1/tidb-data/tiflash,/ssd2/tidb-data/
  ↳ tiflash"
#### The default value is false. If you set it to true and multiple
  ↳ directories
#### are set in the path, the latest data is stored in the first directory
  ↳ and older
#### data is stored in the rest directories.
### path_realtime_mode = false

#### The path in which the TiFlash temporary files are stored. Usually, it
  ↳ is set to the first directory in `path`
#### or in `storage.latest.dir` appended with "/tmp".
tmp_path = "/tidb-data/tiflash-9000/tmp"

#### Storage paths settings take effect starting from v4.0.9
[storage]

  ## DTFile format
  ## * format_version = 2, the default format.
  ## * format_version = 3, the new format, which provides more data
    ↳ validation features.
  # format_version = 2
```

```
[storage.main]
## The list of directories to store the main data. More than 90% of the
  ↳ total data is stored in
## the directory list.
dir = [ "/tidb-data/tiflash-9000" ]
## or
# dir = [ "/ssd0/tidb-data/tiflash", "/ssd1/tidb-data/tiflash" ]

## The maximum storage capacity of each directory in storage.main.dir.
## If it is not set, or is set to multiple 0, the actual disk (the disk
  ↳ where the directory is located) capacity is used.
## Note that human-readable numbers such as "10GB" are not supported yet
  ↳ .
## Numbers are specified in bytes.
## The size of the capacity list should be the same with the dir size.
## For example:
# capacity = [ 10737418240, 10737418240 ]

[storage.latest]
## The list of directories to store the latest data. About 10% of the
  ↳ total data is stored in
## the directory list. The directories (or directory) listed here
  ↳ require higher IOPS
## metrics than those in storage.main.dir.
## If it is not set (by default), the values of storage.main.dir are
  ↳ used.
# dir = [ ]
## The maximum storage capacity of each directory in storage.latest.dir.
## If it is not set, or is set to multiple 0, the actual disk (the disk
  ↳ where the directory is located) capacity is used.
# capacity = [ 10737418240, 10737418240 ]

## [storage.io_rate_limit] settings are new in v5.2.0.
[storage.io_rate_limit]
## This configuration item determines whether to limit the I/O traffic,
  ↳ which is disabled by default. This traffic limit in TiFlash is
  ↳ suitable for cloud storage that has the disk bandwidth of a small
  ↳ and specific size.
## The total I/O bandwidth for disk reads and writes. The unit is bytes
  ↳ and the default value is 0, which means the I/O traffic is not
  ↳ limited by default.
# max_bytes_per_sec = 0
## max_read_bytes_per_sec and max_write_bytes_per_sec have similar
  ↳ meanings to max_bytes_per_sec. max_read_bytes_per_sec means the
```

```
    ↪ total I/O bandwidth for disk reads, and max_write_bytes_per_sec
    ↪ means the total I/O bandwidth for disk writes.
## These configuration items limit I/O bandwidth for disk reads and
    ↪ writes separately. You can use them for cloud storage that
    ↪ calculates the limit of I/O bandwidth for disk reads and writes
    ↪ separately, such as the Persistent Disk provided by Google Cloud
    ↪ Platform.
## When the value of max_bytes_per_sec is not 0, max_bytes_per_sec is
    ↪ prioritized.
# max_read_bytes_per_sec = 0
# max_write_bytes_per_sec = 0

## The following parameters control the bandwidth weights assigned to
    ↪ different I/O traffic types. Generally, you do not need to adjust
    ↪ these parameters.
## TiFlash internally divides I/O requests into four types: foreground
    ↪ writes, background writes, foreground reads, background reads.
## When the I/O traffic limit is initialized, TiFlash assigns the
    ↪ bandwidth according to the following weight ratio.
## The following default configurations indicate that each type of
    ↪ traffic gets a weight of 25% (25 / (25 + 25 + 25 + 25) = 25%).
## If the weight is configured to 0, the corresponding I/O traffic is
    ↪ not limited.
# foreground_write_weight = 25
# background_write_weight = 25
# foreground_read_weight = 25
# background_read_weight = 25
## TiFlash supports automatically tuning the traffic limit for different
    ↪ I/O types according to the current I/O load. Sometimes, the tuned
    ↪ bandwidth might exceed the weight ratio set above.
## auto_tune_sec indicates the interval of automatic tuning. The unit is
    ↪ seconds. If the value of auto_tune_sec is 0, the automatic tuning
    ↪ is disabled.
# auto_tune_sec = 5

[flash]
tidb_status_addr = TiDB status port and address. # Multiple addresses
    ↪ are separated with commas.
service_addr = The listening address of TiFlash Raft services and
    ↪ coprocessor services.

#### Multiple TiFlash nodes elect a master to add or delete placement rules
    ↪ to PD,
#### and the configurations in flash.flash_cluster control this process.
[flash.flash_cluster]
```

refresh_interval = Master regularly refreshes the valid period.
update_rule_interval = Master regularly gets the status of TiFlash
 ↪ replicas and interacts with PD.
master_ttl = The valid period of the elected master.
cluster_manager_path = The absolute path of the pd buddy directory.
log = The pd buddy log path.

[flash.proxy]

addr = The listening address of proxy. If it is left empty,
 ↪ 127.0.0.1:20170 is used by default.
advertise-addr = The external access address of addr. If it is left
 ↪ empty, "addr" is used by default.
data-dir = The data storage path of proxy.
config = The configuration file path of proxy.
log-file = The log path of proxy.
log-level = The log level of proxy. "info" is used by default.
status-addr = The listening address from which the proxy pulls metrics |
 ↪ status information. If it is left empty, 127.0.0.1:20292 is used
 ↪ by default.
advertise-status-addr = The external access address of status-addr. If
 ↪ it is left empty, "status-addr" is used by default.

[logger]

log level (available options: trace, debug, information, warning,
 ↪ error). The default value is `debug`.
level = debug
log = TiFlash log path
errorlog = TiFlash error log path
Size of a single log file. The default value is "100M".
size = "100M"
Maximum number of log files to save. The default value is 10.
count = 10

[raft]

PD service address. Multiple addresses are separated with commas.
pd_addr = "10.0.1.11:2379,10.0.1.12:2379,10.0.1.13:2379"

[status]

The port through which Prometheus pulls metrics information. The
 ↪ default value is 8234.
metrics_port = 8234

[profiles]

[profiles.default]

```
## The default value is true. This parameter determines whether the
  ↪ segment
## of DeltaTree Storage Engine uses logical split.
## Using the logical split can reduce the write amplification, and
  ↪ improve the write speed.
## However, these are at the cost of disk space waste.
dt_enable_logical_split = true

## The memory usage limit for the generated intermediate data when a
  ↪ single
## coprocessor query is executed. The default value is 0, which means no
  ↪ limit.
max_memory_usage = 0

## The memory usage limit for the generated intermediate data when all
  ↪ queries
## are executed. The default value is 0 (in bytes), which means no limit
  ↪ .
max_memory_usage_for_all_queries = 0

## New in v5.0. This item specifies the maximum number of cop requests
  ↪ that TiFlash Coprocessor executes at the same time. If the number
  ↪ of requests exceeds the specified value, the exceeded requests
  ↪ will queue. If the configuration value is set to 0 or not set, the
  ↪ default value is used, which is twice the number of physical
  ↪ cores.
cop_pool_size = 0
## New in v5.0. This item specifies the maximum number of batch requests
  ↪ that TiFlash Coprocessor executes at the same time. If the number
  ↪ of requests exceeds the specified value, the exceeded requests
  ↪ will queue. If the configuration value is set to 0 or not set, the
  ↪ default value is used, which is twice the number of physical
  ↪ cores.
batch_cop_pool_size = 0
## New in v5.4.0. This item enables or disables the elastic thread pool
  ↪ feature, which significantly improves CPU utilization in high
  ↪ concurrency scenarios of TiFlash. The default value is false. The
  ↪ elastic thread pool feature is experimental and not recommended
  ↪ for production environments.
enable_elastic_threadpool = false

#### Security settings take effect starting from v4.0.5.
[security]
## New in v5.0. This configuration item enables or disables log
  ↪ redaction. If the configuration value
```

```
## is set to true, all user data in the log will be replaced by ?.
## Note that you also need to set security.redact-info-log for tiflash-
  ↪ learner's logging in tiflash-learner.toml.
# redact_info_log = false

## Path of the file that contains a list of trusted SSL CAs. If set, the
  ↪ following settings
## cert_path and key_path are also needed.
# ca_path = "/path/to/ca.pem"
## Path of the file that contains X509 certificate in PEM format.
# cert_path = "/path/to/tiflash-server.pem"
## Path of the file that contains X509 key in PEM format.
# key_path = "/path/to/tiflash-server-key.pem"
```

12.5.3.2.2 Configure the tiflash-learner.toml file

```
[server]
  engine-addr = The external access address of the TiFlash coprocessor
    ↪ service.
[raftstore]
  ## The allowable number of threads in the pool that flushes Raft data to
    ↪ storage.
  apply-pool-size = 4

  ## The allowable number of threads that process Raft, which is the size
    ↪ of the Raftstore thread pool.
  store-pool-size = 4

  ## The number of threads that handle snapshots.
  ## The default number is 2.
  ## If you set it to 0, the multi-thread optimization is disabled.
  snap-handle-pool-size = 2

  ## The shortest interval at which Raft store persists WAL.
  ## You can properly increase the latency to reduce IOPS usage.
  ## The default value is "4ms".
  ## If you set it to 0ms, the optimization is disabled.
  store-batch-retry-recv-timeout = "4ms"
[security]
  ## New in v5.0. This configuration item enables or disables log
    ↪ redaction.
  ## If the configuration value is set to true,
  ## all user data in the log will be replaced by ?. The default value is
    ↪ false.
```

```
redact-info-log = false
```

In addition to the items above, other parameters are the same as those of TiKV. Note that the `label` whose key is `engine` is reserved and cannot be configured manually.

12.5.3.2.3 Multi-disk deployment

TiFlash supports multi-disk deployment. If there are multiple disks in your TiFlash node, you can make full use of those disks by configuring the parameters described in the following sections. For TiFlash's configuration template to be used for TiUP, see [The complex template for the TiFlash topology](#).

Multi-disk deployment with TiDB version earlier than v4.0.9

For TiDB clusters earlier than v4.0.9, TiFlash only supports storing the main data of the storage engine on multiple disks. You can set up a TiFlash node on multiple disks by specifying the `path` (`data_dir` in TiUP) and `path_realtime_mode` configuration.

If there are multiple data storage directories in `path`, separate each with a comma. For example, `/nvme_ssd_a/data/tiflash,/sata_ssd_b/data/tiflash,/sata_ssd_c/data/ ↪ tiflash`. If there are multiple disks in your environment, it is recommended that each directory corresponds to one disk and you put disks with the best performance at the front to maximize the performance of all disks.

If there are multiple disks with similar I/O metrics on your TiFlash node, you can leave the `path_realtime_mode` parameter to the default value (or you can explicitly set it to `false` ↪). It means that data will be evenly distributed among all storage directories. However, the latest data is written only to the first directory, so the corresponding disk is busier than other disks.

If there are multiple disks with different I/O metrics on your TiFlash node, it is recommended to set `path_realtime_mode` to `true` and put disks with the best I/O metrics at the front of `path`. It means that the first directory only stores the latest data, and the older data are evenly distributed among the other directories. Note that in this case, the capacity of the first directory should be planned as 10% of the total capacity of all directories.

Multi-disk deployment with TiDB v4.0.9 or later

For TiDB clusters with v4.0.9 or later versions, TiFlash supports storing the main data and the latest data of the storage engine on multiple disks. If you want to deploy a TiFlash node on multiple disks, it is recommended to specify your storage directories in the `[storage ↪]` section to make full use of your node. Note that the configurations earlier than v4.0.9 (`path` and `path_realtime_mode`) are still supported.

If there are multiple disks with similar I/O metrics on your TiFlash node, it is recommended to specify corresponding directories in the `storage.main.dir` list and leave `storage ↪ .latest.dir` empty. TiFlash will distribute I/O pressure and data among all directories.

If there are multiple disks with different I/O metrics on your TiFlash node, it is recommended to specify directories with higher metrics in the `storage.latest.dir` list, and spec-

ify directories with lower metrics in the `storage.main.dir` list. For example, for one NVMe-SSD and two SATA-SSDs, you can set `storage.latest.dir` to `["/nvme_ssd_a/data/tiflash"]` and `storage.main.dir` to `["/sata_ssd_b/data/tiflash", "/sata_ssd_c/data/tiflash"]`. TiFlash will distribute I/O pressure and data among these two directories list respectively. Note that in this case, the capacity of `storage.latest.dir` should be planned as 10% of the total planned capacity.

Warning:

The `[storage]` configuration is supported in TiUP since v1.2.5. If your TiDB cluster version is v4.0.9 or later, make sure that your TiUP version is v1.2.5 or later. Otherwise, the data directories defined in `[storage]` will not be managed by TiUP.

12.5.4 PD Configuration File

The PD configuration file supports more options than command-line parameters. You can find the default configuration file [here](#).

This document only describes parameters that are not included in command-line parameters. Check [here](#) for the command line parameters.

12.5.4.0.1 `name`

- The unique name of a PD node
- Default value: "pd"
- To start multiply PD nodes, use a unique name for each node.

12.5.4.0.2 `data-dir`

- The directory in which PD stores data
- Default value: `default.${name}`"

12.5.4.0.3 `client-urls`

- The list of client URLs to be listened to by PD
- Default value: "http://127.0.0.1:2379"
- When you deploy a cluster, you must specify the IP address of the current host as `client-urls` (for example, "http://192.168.100.113:2379"). If the cluster runs on Docker, specify the IP address of Docker as "http://0.0.0.0:2379".

12.5.4.0.4 `advertise-client-urls`

- The list of advertise URLs for the client to access PD
- Default value: "`#{client-urls}`"
- In some situations such as in the Docker or NAT network environment, if a client cannot access PD through the default client URLs listened to by PD, you must manually set the advertise client URLs.
- For example, the internal IP address of Docker is 172.17.0.1, while the IP address of the host is 192.168.100.113 and the port mapping is set to `-p 2380:2380`. In this case, you can set `advertise-client-urls` to "`http://192.168.100.113:2380`". The client can find this service through "`http://192.168.100.113:2380`".

12.5.4.0.5 `peer-urls`

- The list of peer URLs to be listened to by a PD node
- Default value: "`http://127.0.0.1:2380`"
- When you deploy a cluster, you must specify `peer-urls` as the IP address of the current host, such as "`http://192.168.100.113:2380`". If the cluster runs on Docker, specify the IP address of Docker as "`http://0.0.0.0:2380`".

12.5.4.0.6 `advertise-peer-urls`

- The list of advertise URLs for other PD nodes (peers) to access a PD node
- Default: "`#{peer-urls}`"
- In some situations such as in the Docker or NAT network environment, if the other nodes (peers) cannot access the PD node through the default peer URLs listened to by this PD node, you must manually set the advertise peer URLs.
- For example, the internal IP address of Docker is 172.17.0.1, while the IP address of the host is 192.168.100.113 and the port mapping is set to `-p 2380:2380`. In this case, you can set `advertise-peer-urls` to "`http://192.168.100.113:2380`". The other PD nodes can find this service through "`http://192.168.100.113:2380`".

12.5.4.0.7 `initial-cluster`

- The initial cluster configuration for bootstrapping
- Default value: "`{name}=http://{advertise-peer-url}`"
- For example, if name is "pd", and `advertise-peer-urls` is "`http://192.168.100.113:2380`"
↪ , the `initial-cluster` is "`pd=http://192.168.100.113:2380`".
- If you need to start three PD servers, the `initial-cluster` might be:

```
pd1=http://192.168.100.113:2380, pd2=http://192.168.100.114:2380, pd3
↪ =192.168.100.115:2380
```

12.5.4.0.8 `initial-cluster-state`

- The initial state of the cluster
- Default value: `"new"`

12.5.4.0.9 `initial-cluster-token`

- Identifies different clusters during the bootstrap phase
- Default value: `"pd-cluster"`
- If multiple clusters that have nodes with same configurations are deployed successively, you must specify different tokens to isolate different cluster nodes.

12.5.4.0.10 `lease`

- The timeout of the PD Leader Key lease. After the timeout, the system re-elects a Leader.
- Default value: 3
- Unit: second

12.5.4.0.11 `quota-backend-bytes`

- The storage size of the meta-information database, which is 8GiB by default
- Default value: 8589934592

12.5.4.0.12 `auto-compaction-mod`

- The automatic compaction modes of the meta-information database
- Available options: `periodic` (by cycle) and `revision` (by version number).
- Default value: `periodic`

12.5.4.0.13 `auto-compaction-retention`

- The time interval for automatic compaction of the meta-information database when `auto-compaction-retention` is `periodic`. When the compaction mode is set to `revision`, this parameter indicates the version number for the automatic compaction.
- Default value: 1h

12.5.4.0.14 `force-new-cluster`

- Determines whether to force PD to start as a new cluster and modify the number of Raft members to 1
- Default value: `false`

12.5.4.1 pd-server

Configuration items related to pd-server

12.5.4.1.1 flow-round-by-digit New in TiDB 5.1

- Default value: 3
- PD rounds the lowest digits of the flow number, which reduces the update of statistics caused by the changes of the Region flow information. This configuration item is used to specify the number of lowest digits to round for the Region flow information. For example, the flow 100512 will be rounded to 101000 because the default value is 3. This configuration replaces `trace-region-flow`.

Note:

If you have upgraded your cluster from a TiDB 4.0 version to the current version, the behavior of `flow-round-by-digit` after the upgrading and the behavior of `trace-region-flow` before the upgrading are consistent by default. This means that if the value of `trace-region-flow` is false before the upgrading, the value of `flow-round-by-digit` after the upgrading is 127; if the value of `trace-region-flow` is true before the upgrading, the value of `flow-round-by-digit` after the upgrading is 3.

12.5.4.2 security

Configuration items related to security

12.5.4.2.1 cacert-path

- The path of the CA file
- Default value: ""

12.5.4.2.2 cert-path

- The path of the Privacy Enhanced Mail (PEM) file that contains the X509 certificate
- Default value: ""

12.5.4.2.3 key-path

- The path of the PEM file that contains the X509 key
- Default value: ""

12.5.4.2.4 `redact-info-log` New in v5.0

- Controls whether to enable log redaction in the PD log
- When you set the configuration value to `true`, user data is redacted in the PD log.
- Default value: `false`

12.5.4.3 `log`

Configuration items related to log

12.5.4.3.1 `level`

- Specifies the level of the output log
- Optional value: `"debug"`, `"info"`, `"warn"`, `"error"`, `"fatal"`
- Default value: `"info"`

12.5.4.3.2 `format`

- The log format
- Optional value: `"text"`, `"json"`
- Default value: `"text"`

12.5.4.3.3 `disable-timestamp`

- Whether to disable the automatically generated timestamp in the log
- Default value: `false`

12.5.4.4 `log.file`

Configuration items related to the log file

12.5.4.4.1 `max-size`

- The maximum size of a single log file. When this value is exceeded, the system automatically splits the log into several files.
- Default value: 300
- Unit: MiB
- Minimum value: 1

12.5.4.4.2 `max-days`

- The maximum number of days in which a log is kept
- If the configuration item is not set, or the value of it is set to the default value 0, PD does not clean log files.
- Default value: 0

12.5.4.4.3 `max-backups`

- The maximum number of log files to keep
- If the configuration item is not set, or the value of it is set to the default value 0, PD keeps all log files.
- Default value: 0

12.5.4.5 `metric`

Configuration items related to monitoring

12.5.4.5.1 `interval`

- The interval at which monitoring metric data is pushed to Prometheus
- Default value: 15s

12.5.4.6 `schedule`

Configuration items related to scheduling

Note:

To modify these PD configuration items related to `schedule`, choose one of the following methods based on your cluster status:

- For clusters to be newly deployed, you can modify the PD configuration file directly.
- For existing clusters, use the command-line tool [PD Control](#) to make changes instead. Direct modifications to these PD configuration items related to `schedule` in the configuration file do not take effect on existing clusters.

12.5.4.6.1 `max-merge-region-size`

- Controls the size limit of `Region Merge`. When the `Region` size is greater than the specified value, PD does not merge the `Region` with the adjacent `Regions`.
- Default value: 20
- Unit: MiB

12.5.4.6.2 `max-merge-region-keys`

- Specifies the upper limit of the `Region Merge` key. When the `Region` key is greater than the specified value, the PD does not merge the `Region` with its adjacent `Regions`.
- Default value: 200000

12.5.4.6.3 `patrol-region-interval`

- Controls the running frequency at which `replicaChecker` checks the health state of a `Region`. The smaller this value is, the faster `replicaChecker` runs. Normally, you do not need to adjust this parameter.
- Default value: 10ms

12.5.4.6.4 `split-merge-interval`

- Controls the time interval between the `split` and `merge` operations on the same `Region`. That means a newly split `Region` will not be merged for a while.
- Default value: 1h

12.5.4.6.5 `max-snapshot-count`

- Controls the maximum number of snapshots that a single store receives or sends at the same time. PD schedulers depend on this configuration to prevent the resources used for normal traffic from being preempted.
- Default value value: 64

12.5.4.6.6 `max-pending-peer-count`

- Controls the maximum number of pending peers in a single store. PD schedulers depend on this configuration to prevent too many `Regions` with outdated logs from being generated on some nodes.
- Default value: 64

12.5.4.6.7 `max-store-down-time`

- The downtime after which PD judges that the disconnected store can not be recovered. When PD fails to receive the heartbeat from a store after the specified period of time, it adds replicas at other nodes.
- Default value: 30m

12.5.4.6.8 leader-schedule-limit

- The number of Leader scheduling tasks performed at the same time
- Default value: 4

12.5.4.6.9 region-schedule-limit

- The number of Region scheduling tasks performed at the same time
- Default value: 2048

12.5.4.6.10 hot-region-schedule-limit

- Controls the hot Region scheduling tasks that are running at the same time. It is independent of the Region scheduling.
- Default value: 4

12.5.4.6.11 hot-region-cache-hits-threshold

- The threshold used to set the number of minutes required to identify a hot Region. PD can participate in the hotspot scheduling only after the Region is in the hotspot state for more than this number of minutes.
- Default value: 3

12.5.4.6.12 replica-schedule-limit

- The number of Replica scheduling tasks performed at the same time
- Default value: 64

12.5.4.6.13 merge-schedule-limit

- The number of the Region Merge scheduling tasks performed at the same time. Set this parameter to 0 to disable Region Merge.
- Default value: 8

12.5.4.6.14 high-space-ratio

- The threshold ratio below which the capacity of the store is sufficient. If the space occupancy ratio of the store is smaller than this threshold value, PD ignores the remaining space of the store when performing scheduling, and balances load mainly based on the Region size. This configuration takes effect only when `region-score-formula-version` is set to v1.
- Default value: 0.7
- Minimum value: greater than 0
- Maximum value: less than 1

12.5.4.6.15 `low-space-ratio`

- The threshold ratio above which the capacity of the store is insufficient. If the space occupancy ratio of a store exceeds this threshold value, PD avoids migrating data to this store as much as possible. Meanwhile, to avoid the disk space of the corresponding store being exhausted, PD performs scheduling mainly based on the remaining space of the store.
- Default value: 0.8
- Minimum value: greater than 0
- Maximum value: less than 1

12.5.4.6.16 `tolerant-size-ratio`

- Controls the `balance` buffer size
- Default value: 0 (automatically adjusts the buffer size)
- Minimum value: 0

12.5.4.6.17 `enable-cross-table-merge`

- Determines whether to enable the merging of cross-table Regions
- Default value: `true`

12.5.4.6.18 `region-score-formula-version` New in v5.0

- Controls the version of the Region score formula
- Default value: `v2`
- Optional values: `v1` and `v2`. Compared to `v1`, the changes in `v2` are smoother, and the scheduling jitter caused by space reclaim is improved.

Note:

If you have upgraded your cluster from a TiDB 4.0 version to the current version, the new formula version is automatically disabled by default to ensure consistent PD behavior before and after the upgrading. If you want to change the formula version, you need to manually switch through the `pd-ctl` setting. For details, refer to [PD Control](#).

12.5.4.6.19 `enable-joint-consensus` New in v5.0

- Controls whether to use Joint Consensus for replica scheduling. If this configuration is disabled, PD schedules one replica at a time.
- Default value: `true`

12.5.4.6.20 `hot-regions-write-interval` New in v5.4.0

- The time interval at which PD stores hot Region information.
- Default value: 10m

Note:

The information about hot Regions is updated every three minutes. If the interval is set to less than three minutes, updates during the interval might be meaningless.

12.5.4.6.21 `hot-regions-reserved-days` New in v5.4.0

- Specifies how many days the hot Region information is retained.
- Default value: 7

12.5.4.7 `replication`

Configuration items related to replicas

12.5.4.7.1 `max-replicas`

- The number of replicas, that is, the sum of the number of leaders and followers. The default value 3 means 1 leader and 2 followers. When this configuration is modified online, PD will schedule Regions in the background so that the number of replicas matches this configuration.
- Default value: 3

12.5.4.7.2 `location-labels`

- The topology information of a TiKV cluster
- Default value: []
- [Cluster topology configuration](#)

12.5.4.7.3 `isolation-level`

- The minimum topological isolation level of a TiKV cluster
- Default value: ""
- [Cluster topology configuration](#)

12.5.4.7.4 `strictly-match-label`

- Enables the strict check for whether the TiKV label matches PD's `location-labels`.
- Default value: `false`

12.5.4.7.5 `enable-placement-rules`

- Enables `placement-rules`.
- Default value: `true`
- See [Placement Rules](#).

12.5.4.8 `label-property` (deprecated)

Configuration items related to labels, which only support the `reject-leader` type.

Note:

Starting from v5.2, the configuration items related to labels are deprecated. It is recommended to use [Placement Rules](#) to configure the replica policy.

12.5.4.8.1 `key` (deprecated)

- The label key for the store that rejected the Leader
- Default value: `""`

12.5.4.8.2 `value` (deprecated)

- The label value for the store that rejected the Leader
- Default value: `""`

12.5.4.9 `dashboard`

Configuration items related to the [TiDB Dashboard](#) built in PD.

12.5.4.9.1 `tidb-cacert-path`

- The path of the root CA certificate file. You can configure this path when you connect to TiDB's SQL services using TLS.
- Default value: `""`

12.5.4.9.2 `tidb-cert-path`

- The path of the SSL certificate file. You can configure this path when you connect to TiDB's SQL services using TLS.
- Default value: ""

12.5.4.9.3 `tidb-key-path`

- The path of the SSL private key file. You can configure this path when you connect to TiDB's SQL services using TLS.
- Default value: ""

12.5.4.9.4 `public-path-prefix`

- When TiDB Dashboard is accessed behind a reverse proxy, this item sets the public URL path prefix for all web resources.
- Default value: `/dashboard`
- Do **not** modify this configuration item when TiDB Dashboard is accessed not behind a reverse proxy; otherwise, access issues might occur. See [Use TiDB Dashboard behind a Reverse Proxy](#) for details.

12.5.4.9.5 `enable-telemetry`

- Determines whether to enable the telemetry collection feature in TiDB Dashboard.
- Default value: `true`
- See [Telemetry](#) for details.

12.5.4.10 `replication-mode`

Configuration items related to the replication mode of all Regions. See [Enable the DR Auto-Sync mode](#) for details.

12.6 CLI

12.6.1 TiKV Control User Guide

TiKV Control (`tikv-ctl`) is a command line tool of TiKV, used to manage the cluster. Its installation directory is as follows:

- If the cluster is deployed using TiUP, `tikv-ctl` directory is in the in `~/.tiup/ ↵ components/ctl/{VERSION}/` directory.

12.6.1.1 Use TiKV Control in TiUP

Note:

It is recommended that the version of the Control tool you use is consistent with the version of the cluster.

`tikv-ctl` is also integrated in the `tiup` command. Execute the following command to call the `tikv-ctl` tool:

```
tiup ctl:<cluster-version> tikv
```

```
Starting component `ctl`: /home/tidb/.tiup/components/ctl/v4.0.8/ctl tikv
TiKV Control (tikv-ctl)
Release Version: 4.0.8
Edition:         Community
Git Commit Hash: 83091173e960e5a0f5f417e921a0801d2f6635ae
Git Commit Branch: heads/refs/tags/v4.0.8
UTC Build Time:  2020-10-30 08:40:33
Rust Version:    rustc 1.42.0-nightly (0de96d37f 2019-12-19)
Enable Features: jemalloc mem-profiling portable sse protobuf-codec
Profile:        dist_release
```

A tool for interacting with TiKV deployments.

USAGE:

```
TiKV Control (tikv-ctl) [FLAGS] [OPTIONS] [SUBCOMMAND]
```

FLAGS:

```
-h, --help                Prints help information
--skip-paranoid-checks    Skip paranoid checks when open rocksdb
-V, --version             Prints version information
```

OPTIONS:

```
--ca-path <ca_path>      Set the CA certificate path
--cert-path <cert_path>  Set the certificate path
--config <config>        Set the config for rocksdb
--db <db>                Set the rocksdb path
--decode <decode>        Decode a key in escaped format
--encode <encode>        Encode a key in escaped format
--to-hex <escaped-to-hex> Convert an escaped key to hex key
--to-escaped <hex-to-escaped> Convert a hex key to escaped key
--host <host>            Set the remote host
--key-path <key_path>    Set the private key path
--pd <pd>               Set the address of pd
--raftdb <raftdb>       Set the raft rocksdb path
```

SUBCOMMANDS:	
bad-regions	Get all regions with corrupt raft
cluster	Print the cluster id
compact	Compact a column family in a specified range
compact-cluster	Compact the whole cluster in a specified range in one ↳ or more column families
consistency-check	Force a consistency-check for a specified region
decrypt-file	Decrypt an encrypted file
diff	Calculate difference of region keys from different ↳ dbs
dump-snap-meta	Dump snapshot meta file
encryption-meta	Dump encryption metadata
fail	Inject failures to TiKV and recovery
help	Prints this message or the help of the given ↳ subcommand(s)
metrics	Print the metrics
modify-tikv-config	Modify tikv config, eg. tikv-ctl --host ip:port ↳ modify-tikv-config -n rocksdb.defaultcf.disable-auto-compactions -v true
mvcc	Print the mvcc value
print	Print the raw value
raft	Print a raft log entry
raw-scan	Print all raw keys in the range
recover-mvcc	Recover mvcc data on one node by deleting corrupted ↳ keys
recreate-region	Recreate a region with given metadata, but alloc new ↳ id for it
region-properties	Show region properties
scan	Print the range db range
size	Print region size
split-region	Split the region
store	Print the store id
tombstone	Set some regions on the node to tombstone by manual
unsafe-recover	Unsafely recover the cluster when the majority ↳ replicas are failed

You can add corresponding parameters and subcommands after `tiup ctl:<cluster-
↳ version> tikv`.

12.6.1.2 General options

`tikv-ctl` provides two operation modes:

- Remote mode: use the `--host` option to accept the service address of TiKV as the argument

For this mode, if SSL is enabled in TiKV, `tikv-ctl` also needs to specify the related certificate file. For example:

```
$ tikv-ctl --ca-path ca.pem --cert-path client.pem --key-path client-  
  ↪ key.pem --host 127.0.0.1:20160 <subcommands>
```

However, sometimes `tikv-ctl` communicates with PD instead of TiKV. In this case, you need to use the `--pd` option instead of `--host`. Here is an example:

```
$ tikv-ctl --pd 127.0.0.1:2379 compact-cluster  
store:"127.0.0.1:20160" compact db:KV cf:default range:([], []) success  
  ↪ !
```

- Local mode: Use the `--data-dir` option to specify the local TiKV data directory path. In this mode, you need to stop the running TiKV instance.

Unless otherwise noted, all commands support both the remote mode and the local mode.

Additionally, `tikv-ctl` has two simple commands `--to-hex` and `--to-escaped`, which are used to make simple changes to the form of the key.

Generally, use the `escaped` form of the key. For example:

```
$ tikv-ctl --to-escaped 0xaaff  
\252\377  
$ tikv-ctl --to-hex "\252\377"  
AAFF
```

Note:

When you specify the `escaped` form of the key in a command line, it is required to enclose it in double quotes. Otherwise, bash eats the backslash and a wrong result is returned.

12.6.1.3 Subcommands, some options and flags

This section describes the subcommands that `tikv-ctl` supports in detail. Some subcommands support a lot of options. For all details, run `tikv-ctl --help <subcommand>`.

12.6.1.3.1 View information of the Raft state machine

Use the `raft` subcommand to view the status of the Raft state machine at a specific moment. The status information includes two parts: three structs (**RegionLocalState**,

RaftLocalState, and **RegionApplyState**) and the corresponding Entries of a certain piece of log.

Use the **region** and **log** subcommands to obtain the above information respectively. The two subcommands both support the remote mode and the local mode at the same time. Their usage and output are as follows:

```
$ tikv-ctl --host 127.0.0.1:20160 raft region -r 2
region id: 2
region state key: \001\003\000\000\000\000\000\000\000\002\001
region state: Some(region {id: 2 region_epoch {conf_ver: 3 version: 1} peers
  ↪ {id: 3 store_id: 1} peers {id: 5 store_id: 4} peers {id: 7 store_id:
  ↪ 6}})
raft state key: \001\002\000\000\000\000\000\000\000\002\002
raft state: Some(hard_state {term: 307 vote: 5 commit: 314617} last_index:
  ↪ 314617)
apply state key: \001\002\000\000\000\000\000\000\000\002\003
apply state: Some(applied_index: 314617 truncated_state {index: 313474 term:
  ↪ 151})
```

12.6.1.3.2 View the Region size

Use the **size** command to view the Region size:

```
$ tikv-ctl --data-dir /path/to/tikv size -r 2
region id: 2
cf default region size: 799.703 MB
cf write region size: 41.250 MB
cf lock region size: 27616
```

12.6.1.3.3 Scan to view MVCC of a specific range

The **--from** and **--to** options of the **scan** command accept two escaped forms of raw key, and use the **--show-cf** flag to specify the column families that you need to view.

```
$ tikv-ctl --data-dir /path/to/tikv scan --from 'zm' --limit 2 --show-cf
  ↪ lock,default,write
key: zmBootstr\377a\377pKey
  ↪ \000\000\377\000\000\373\000\000\000\000\000\000\377\000\000s
  ↪ \000\000\000\000\000\372
  write cf value: start_ts: 399650102814441473 commit_ts:
  ↪ 399650102814441475 short_value: "20"
key: zmDB:29\000\000\377\000\374\000\000\000\000\000\000\000\377\000H
  ↪ \000\000\000\000\000\000\371

  ↪ \000\000\000\000\000\000\000\002"
```

```
write cf value: start_ts: 399650105199951882 commit_ts:
↳ 399650105213059076 short_value: "
↳ \000\000\000\000\000\000\000\001"
```

12.6.1.3.4 View MVCC of a given key

Similar to the `scan` command, the `mvcc` command can be used to view MVCC of a given key.

```
$ tikv-ctl --data-dir /path/to/tikv mvcc -k "zmDB
↳ :29\000\000\377\000\374\000\000\000\000\000\000\377\000H
↳ \000\000\000\000\000\000\371" --show-cf=lock,write,default
key: zmDB:29\000\000\377\000\374\000\000\000\000\000\000\377\000H
↳ \000\000\000\000\000\000\371
  write cf value: start_ts: 399650105239273474 commit_ts:
    ↳ 399650105239273475 short_value: "
    ↳ \000\000\000\000\000\000\000\002"
  write cf value: start_ts: 399650105199951882 commit_ts:
    ↳ 399650105213059076 short_value: "
    ↳ \000\000\000\000\000\000\000\001"
```

In this command, the key is also the escaped form of raw key.

12.6.1.3.5 Scan raw keys

The `raw-scan` command scans directly from the RocksDB. Note that to scan data keys you need to add a 'z' prefix to keys.

Use `--from` and `--to` options to specify the range to scan (unbounded by default). Use `--limit` to limit at most how many keys to print out (30 by default). Use `--cf` to specify which cf to scan (can be `default`, `write` or `lock`).

```
$ ./tikv-ctl --data-dir /var/lib/tikv raw-scan --from 'zt' --limit 2 --cf
↳ default
key: "zt\200\000\000\000\000\000\000\377\005_r
↳ \200\000\000\000\000\377\000\000\001\000\000\000\000\000\372\372b2
↳ ,^\033\377\364", value: "\010\002\002\002%\010\004\002\010root
↳ \010\006\002\000\010\010\t\002\010\n\t\002\010\014\t\002\010\016\t
↳ \002\010\020\t\002\010\022\t\002\010\024\t\002\010\026\t\002\010\030\
↳ t\002\010\032\t\002\010\034\t\002\010\036\t\002\010 \t\002\010"\t
↳ \002\010s\t\002\010&\t\002\010(\t\002\010*\t\002\010,\t\002\010.\t
↳ \002\0100\t\002\0102\t\002\0104\t\002"
key: "zt\200\000\000\000\000\000\000\377\025_r
↳ \200\000\000\000\000\377\000\000\023\000\000\000\000\372\372b2
↳ ,^\033\377\364", value: "\010\002\002&slow_query_log_file\010\004\002
↳ P/usr/local/mysql/data/localhost-slow.log"
```

```
Total scanned keys: 2
```

12.6.1.3.6 Print a specific key value

To print the value of a key, use the `print` command.

12.6.1.3.7 Print some properties about Region

In order to record Region state details, TiKV writes some statistics into the SST files of Regions. To view these properties, run `tikv-ctl` with the `region-properties` sub-command:

```
$ tikv-ctl --host localhost:20160 region-properties -r 2
num_files: 0
num_entries: 0
num_deletes: 0
mvcc.min_ts: 18446744073709551615
mvcc.max_ts: 0
mvcc.num_rows: 0
mvcc.num_puts: 0
mvcc.num_versions: 0
mvcc.max_row_versions: 0
middle_key_by_approximate_size:
```

The properties can be used to check whether the Region is healthy or not. If not, you can use them to fix the Region. For example, splitting the Region manually by `middle_key_approximate_size`.

12.6.1.3.8 Compact data of each TiKV manually

Use the `compact` command to manually compact data of each TiKV.

- Use the `--from` and `--to` options to specify the compaction range in the form of escaped raw key. If not set, the whole range will be compacted.
- Use the `--region` option to compact the range of a specific region. If set, `--from` and `--to` will be ignored.
- Use the `-c` option to specify the column family name. The default value is `default`. The optional values are `default`, `lock`, and `write`.
- Use the `-d` option to specify the RocksDB that performs compaction. The default value is `kv`. The optional values are `kv` and `raft`.

- Use the `--threads` option allows you to specify the concurrency for the TiKV compaction and its default value is 8. Generally, a higher concurrency comes with a faster compaction speed, which might yet affect the service. You need to choose an appropriate concurrency count based on your scenario.
- Use the `--bottommost` option to include or exclude the bottommost files when TiKV performs compaction. The value options are `default`, `skip`, and `force`. The default value is `default`.
 - `default` means that the bottommost files are included only when the Compaction Filter feature is enabled.
 - `skip` means that the bottommost files are excluded when TiKV performs compaction.
 - `force` means that the bottommost files are always included when TiKV performs compaction.
- To compact data in the local mode, use the following command:

```
tikv-ctl --data-dir /path/to/tikv compact -d kv
```

- To compact data in the remote mode, use the following command:

```
tikv-ctl --host ip:port compact -d kv
```

12.6.1.3.9 Compact data of the whole TiKV cluster manually

Use the `compact-cluster` command to manually compact data of the whole TiKV cluster. The flags of this command have the same meanings and usage as those of the `compact` command. The only difference is as follows:

- For the `compact-cluster` command, use `--pd` to specify the address of the PD, so that `tikv-ctl` can locate all TiKV nodes in the cluster as the compact target.
- For the `compact` command, use `--data-dir` or `--host` to specify a single TiKV as the compact target.

12.6.1.3.10 Set a Region to tombstone

The `tombstone` command is usually used in circumstances where the sync-log is not enabled, and some data written in the Raft state machine is lost caused by power down.

In a TiKV instance, you can use this command to set the status of some Regions to tombstone. Then when you restart the instance, those Regions are skipped to avoid the restart failure caused by damaged Raft state machines of those Regions. Those Regions need to have enough healthy replicas in other TiKV instances to be able to continue the reads and writes through the Raft mechanism.

In general cases, you can remove the corresponding Peer of this Region using the `remove` ↪ `-peer` command:

```
pd-ctl operator add remove-peer <region_id> <store_id>
```

Then use the `tikv-ctl` tool to set a Region to tombstone on the corresponding TiKV instance to skip the health check for this Region at startup:

```
tikv-ctl --data-dir /path/to/tikv tombstone -p 127.0.0.1:2379 -r <region_id>
```

```
success!
```

However, in some cases, you cannot easily remove this Peer of this Region from PD, so you can specify the `--force` option in `tikv-ctl` to forcibly set the Peer to tombstone:

```
tikv-ctl --data-dir /path/to/tikv tombstone -p 127.0.0.1:2379 -r <region_id  
↪ >,<region_id> --force
```

```
success!
```

Note:

- The `tombstone` command only supports the local mode.
- The argument of the `-p` option specifies the PD endpoints without the `http` prefix. Specifying the PD endpoints is to query whether PD can safely switch to Tombstone.

12.6.1.3.11 Send a consistency-check request to TiKV

Use the `consistency-check` command to execute a consistency check among replicas in the corresponding Raft of a specific Region. If the check fails, TiKV itself panics. If the TiKV instance specified by `--host` is not the Region leader, an error is reported.

```
$ tikv-ctl --host 127.0.0.1:20160 consistency-check -r 2  
success!  
$ tikv-ctl --host 127.0.0.1:20161 consistency-check -r 2  
DebugClient::check_region_consistency: RpcFailure(RpcStatus { status:  
↪ Unknown, details: Some("StringError(\"Leader is on store 1\")") })
```

Note:

- It is **NOT** recommended to use the `consistency-check` command, because it is incompatible with the garbage collection in TiDB and might mistakenly report an error.
- This command only supports the remote mode.
- Even if this command returns `success!`, you need to check whether TiKV panics. This is because this command is only a proposal that requests a consistency check for the leader, and you cannot know from the client whether the whole check process is successful or not.

12.6.1.3.12 Dump snapshot meta

This sub-command is used to parse a snapshot meta file at given path and print the result.

12.6.1.3.13 Print the Regions where the Raft state machine corrupts

To avoid checking the Regions while TiKV is started, you can use the `tombstone` command to set the Regions where the Raft state machine reports an error to Tombstone. Before running this command, use the `bad-regions` command to find out the Regions with errors, so as to combine multiple tools for automated processing.

```
$ tikv-ctl --data-dir /path/to/tikv bad-regions
all regions are healthy
```

If the command is successfully executed, it prints the above information. If the command fails, it prints the list of bad Regions. Currently, the errors that can be detected include the mismatches between `last index`, `commit index` and `apply index`, and the loss of Raft log. Other conditions like the damage of snapshot files still need further support.

12.6.1.3.14 View Region properties

- To view in local the properties of Region 2 on the TiKV instance that is deployed in `/path/to/tikv`:

```
$ tikv-ctl --data-dir /path/to/tikv/data region-properties -r 2
```

- To view online the properties of Region 2 on the TiKV instance that is running on `127.0.0.1:20160`:

```
$ tikv-ctl --host 127.0.0.1:20160 region-properties -r 2
```

12.6.1.3.15 Modify the TiKV configuration dynamically

You can use the `modify-tikv-config` command to dynamically modify the configuration arguments. Currently, the TiKV configuration items that can be dynamically modified and the detailed modification are consistent with modifying configuration using SQL statements. For details, see [Modify TiKV configuration online](#).

- `-n` is used to specify the full name of the configuration item. For the list of configuration items that can be modified online, see [Modify TiKV configuration online](#).
- `-v` is used to specify the configuration value.

Set the size of shared block cache:

```
tikv-ctl --host ip:port modify-tikv-config -n storage.block-cache.capacity -  
↳ v 10GB
```

```
success
```

When shared block cache is disabled, set block cache size for the write CF:

```
tikv-ctl --host ip:port modify-tikv-config -n rocksdb.writecf.block-cache-  
↳ size -v 256MB
```

```
success
```

```
tikv-ctl --host ip:port modify-tikv-config -n raftdb.defaultcf.disable-auto-  
↳ compactions -v true
```

```
success
```

```
tikv-ctl --host ip:port modify-tikv-config -n raftstore.sync-log -v false
```

```
success
```

When the compaction rate limit causes accumulated compaction pending bytes, disable the `rate-limiter-auto-tuned` mode or set a higher limit for the compaction flow:

```
tikv-ctl --host ip:port modify-tikv-config -n rocksdb.rate-limiter-auto-  
↳ tuned -v false
```

```
success
```

```
tikv-ctl --host ip:port modify-tikv-config -n rocksdb.rate-bytes-per-sec -v  
↳ "1GB"
```

```
success
```

12.6.1.3.16 Force Regions to recover services from failure of multiple replicas (use with caution)

You can use the `unsafe-recover remove-fail-stores` command to remove the failed machines from the peer list of Regions. Before running this command, you need to stop the service of the target TiKV store to release file locks.

The `-s` option accepts multiple `store_id` separated by comma and uses the `-r` flag to specify involved Regions. If you need to perform this operation on all Regions in a specific store, you can simply specify `--all-regions`.

Warning:

- If any misoperation is performed, it might be hard to recover the cluster. Be aware of the potential risks and avoid using this feature in a production environment.
- If the `--all-regions` option is used, you are expected to run this command on all the remaining stores connected to the cluster. You need to ensure that these healthy stores stop providing services before recovering the damaged stores. Otherwise, the inconsistent peer lists in Region replicas will cause errors when you run `split-region` or `remove-peer`. This further causes inconsistency between other metadata, and finally, the Regions will become unavailable.
- Once you have run `remove-fail-stores`, you cannot restart the removed nodes or add these nodes to the cluster. Otherwise, the metadata will be inconsistent, and finally, the Regions will be unavailable.

```
tikv-ctl --data-dir /path/to/tikv unsafe-recover remove-fail-stores -s 3 -r  
↪ 1001,1002
```

```
success!
```

```
tikv-ctl --data-dir /path/to/tikv unsafe-recover remove-fail-stores -s 4,5  
↪ --all-regions
```

Then, after you restart TiKV, the Regions can continue providing services with the remaining healthy replicas. This command is commonly used when multiple TiKV stores are damaged or deleted.

Note:

- You are expected to run this command for all stores where the specified Regions' peers are located.
- This command only supports the local mode. It prints **success!** when successfully run.

12.6.1.3.17 Recover from MVCC data corruption

Use the `recover-mvcc` command in circumstances where TiKV cannot run normally caused by MVCC data corruption. It cross-checks 3 CFs (“default”, “write”, “lock”) to recover from various kinds of inconsistency.

- Use the `-r` option to specify involved Regions by `region_id`.
- Use the `-p` option to specify PD endpoints.

```
$ tikv-ctl --data-dir /path/to/tikv recover-mvcc -r 1001,1002 -p  
  ↪ 127.0.0.1:2379  
success!
```

Note:

- This command only supports the local mode. It prints **success!** when successfully run.
- The argument of the `-p` option specifies the PD endpoints without the `http` prefix. Specifying the PD endpoints is to query whether the specified `region_id` is validated or not.
- You need to run this command for all stores where specified Regions' peers are located.

12.6.1.3.18 Ldb Command

The `ldb` command line tool offers multiple data access and database administration commands. Some examples are listed below. For more information, refer to the help message displayed when running `tikv-ctl ldb` or check the documents from RocksDB.

Examples of data access sequence:

To dump an existing RocksDB in HEX:

```
$ tikv-ctl ldb --hex --db=/tmp/db dump
```

To dump the manifest of an existing RocksDB:

```
$ tikv-ctl ldb --hex manifest_dump --path=/tmp/db/MANIFEST-000001
```

You can specify the column family that your query is against using the `--column_family` \hookrightarrow `=<string>` command line.

`--try_load_options` loads the database options file to open the database. It is recommended to always keep this option on when the database is running. If you open the database with default options, the LSM-tree might be messed up, which cannot be recovered automatically.

12.6.1.3.19 Dump encryption metadata

Use the `encryption-meta` subcommand to dump encryption metadata. The subcommand can dump two types of metadata: encryption info for data files, and the list of data encryption keys used.

To dump encryption info for data files, use the `encryption-meta dump-file` subcommand. You need to create a TiKV config file to specify `data-dir` for the TiKV deployment:

```
### conf.toml
[storage]
data-dir = "/path/to/tikv/data"
```

The `--path` option can be used to specify an absolute or relative path to the data file of interest. The command might give empty output if the data file is not encrypted. If `--path` is not provided, encryption info for all data files will be printed.

```
$ tikv-ctl --config=./conf.toml encryption-meta dump-file --path=/path/to/
   $\hookrightarrow$  tikv/data/db/CURRENT
/path/to/tikv/data/db/CURRENT: key_id: 9291156302549018620 iv:
   $\hookrightarrow$  E3C2FDBF63FC03BFC28F265D7E78283F method: Aes128Ctr
```

To dump data encryption keys, use the `encryption-meta dump-key` subcommand. In addition to `data-dir`, you also need to specify the current master key used in the config file. For how to config master key, refer to [Encryption-At-Rest](#). Also with this command, the `security.encryption.previous-master-key` config will be ignored, and the master key rotation will not be triggered.

```
### conf.toml
[storage]
data-dir = "/path/to/tikv/data"

[security.encryption.master-key]
type = "kms"
key-id = "0987dcba-09fe-87dc-65ba-ab0987654321"
region = "us-west-2"
```

Note if the master key is a AWS KMS key, `tikv-ctl` needs to have access to the KMS key. Access to a AWS KMS key can be granted to `tikv-ctl` via environment variable, AWS default config file, or IAM role, whichever is suitable. Refer to AWS document for usage.

The `--ids` option can be used to specified a list of comma-separated data encryption key ids to print. If `--ids` is not provided, all data encryption keys will be printed, along with current key id, which is the id of the latest active data encryption key.

When using the command, you will see a prompt warning that the action will expose sensitive information. Type “I consent” to continue.

```
$ ./tikv-ctl --config=./conf.toml encryption-meta dump-key
This action will expose encryption key(s) as plaintext. Do not output the
  ↪ result in file on disk.
Type "I consent" to continue, anything else to exit: I consent
current key id: 9291156302549018620
9291156302549018620: key: 8B6B6B8F83D36BE2467ED55D72AE808B method: Aes128Ctr
  ↪ creation_time: 1592938357
```

```
$ ./tikv-ctl --config=./conf.toml encryption-meta dump-key --ids
  ↪ =9291156302549018620
This action will expose encryption key(s) as plaintext. Do not output the
  ↪ result in file on disk.
Type "I consent" to continue, anything else to exit: I consent
9291156302549018620: key: 8B6B6B8F83D36BE2467ED55D72AE808B method: Aes128Ctr
  ↪ creation_time: 1592938357
```

Note:

The command will expose data encryption keys as plaintext. In production, DO NOT redirect the output to a file. Even deleting the output file afterward may not cleanly wipe out the content from disk.

12.6.1.3.20 Print information related to damaged SST files

Damaged SST files in TiKV might cause the TiKV process to panic. To clean up the damaged SST files, you will need the information of these files. To get the information, you can execute the `bad-ssts` command in TiKV Control. The needed information is shown in the output. The following is an example command and output.

Note:

Before running this command, stop the running TiKV instance.

```
tikv-ctl --data-dir </path/to/tikv> bad-ssts --pd <endpoint>
```

```
-----
corruption info:
data/tikv-21107/db/000014.sst: Corruption: Bad table magic number: expected
  ↪ 9863518390377041911, found 759105309091689679 in data/tikv-21107/db
  ↪ /000014.sst

sst meta:
14:552997[1 .. 5520]['0101' seq:1, type:1 .. '7
  ↪ A74800000000000000FF0F5F728000000000FF000216000000000FAFA13AB33020BFFFA
  ↪ ' seq:2032, type:1] at level 0 for Column family "default" (ID 0)
it isn't easy to handle local data, start key:0101

overlap region:
RegionInfo { region: id: 4 end_key: 7480000000000000FF0500000000000000F8
  ↪ region_epoch { conf_ver: 1 version: 2 } peers { id: 5 store_id: 1 },
  ↪ leader: Some(id: 5 store_id: 1) }

suggested operations:
tikv-ctl ldb --db=data/tikv-21107/db unsafe_remove_sst_file "data/tikv
  ↪ -21107/db/000014.sst"
tikv-ctl --db=data/tikv-21107/db tombstone -r 4 --pd <endpoint>
-----
corruption analysis has completed
```

From the output above, you can see that the information of the damaged SST file is printed first and then the meta-information is printed.

- In the `sst meta` part, 14 means the SST file number; 552997 means the file size, followed by the smallest and largest sequence numbers and other meta-information.
- The `overlap region` part shows the information of the Region involved. This information is obtained through the PD server.
- The `suggested operations` part provides you suggestion to clean up the damaged SST file. You can take the suggestion to clean up files and restart the TiKV instance.

12.6.2 PD Control User Guide

As a command line tool of PD, PD Control obtains the state information of the cluster and tunes the cluster.

12.6.2.1 Install PD Control

Note:

It is recommended that the version of the Control tool you use is consistent with the version of the cluster.

12.6.2.1.1 Use TiUP command

To use PD Control, execute the `tiup ctl:<cluster-version> pd -u http://<pd_ip> ↪ >:<pd_port> [-i]` command.

12.6.2.1.2 Download TiDB installation package

If you want to download the latest version of `pd-ctl`, directly download the TiDB package, because `pd-ctl` is included in the TiDB package.

Package download link	OS Architecture	SHA256 checksum
<a href="https://download.pingcap.org/tidb-
↪ tidb-
↪ tar.gz
(pd-ctl)">{version}-linux-amd64.tar.gz">https://download.pingcap.org/ ↪ tidb- ↪ tar.gz (pd-ctl)	Linuxamd64	<a href="https://download.pingcap.org/tidb-
↪ org/tidb-
↪ -amd64.sha256">{version}-linux-amd64.sha256">https://download.pingcap. ↪ org/tidb- ↪ -amd64.sha256

Note:

{version} indicates the version number of TiDB. For example, if {version} is v5.4.3, the package download link is `https://download.pingcap.org/ ↪ tidb-v5.4.3-linux-amd64.tar.gz`.

12.6.2.1.3 Compile from source code

1. Go Version 1.13 or later because the Go modules are used.
2. In the root directory of the [PD project](#), use the `make` or `make pd-ctl` command to compile and generate `bin/pd-ctl`.

12.6.2.2 Usage

Single-command mode:

```
tiup ctl:<cluster-version> pd store -u http://127.0.0.1:2379
```

Interactive mode:

```
tiup ctl:<cluster-version> pd -i -u http://127.0.0.1:2379
```

Use environment variables:

```
export PD_ADDR=http://127.0.0.1:2379
tiup ctl:<cluster-version> pd
```

Use TLS to encrypt:

```
tiup ctl:<cluster-version> pd -u https://127.0.0.1:2379 --cacert="path/to/ca"
↔ " --cert="path/to/cert" --key="path/to/key"
```

12.6.2.3 Command line flags

12.6.2.3.1 --cacert

- Specifies the path to the certificate file of the trusted CA in PEM format
- Default: ""

12.6.2.3.2 --cert

- Specifies the path to the certificate of SSL in PEM format
- Default: ""

12.6.2.3.3 --detach / -d

- Uses the single command line mode (not entering readline)
- Default: true

12.6.2.3.4 --help / -h

- Outputs the help information
- Default: false

12.6.2.3.5 --interact / -i

- Uses the interactive mode (entering readline)
- Default: false

12.6.2.3.6 --key

- Specifies the path to the certificate key file of SSL in PEM format, which is the private key of the certificate specified by --cert
- Default: ""

12.6.2.3.7 --pd / -u

- Specifies the PD address
- Default address: `http://127.0.0.1:2379`
- Environment variable: `PD_ADDR`

12.6.2.3.8 --version / -V

- Prints the version information and exit
- Default: false

12.6.2.4 Command

12.6.2.4.1 cluster

Use this command to view the basic information of the cluster.

Usage:

```
>> cluster // To show the cluster information
{
  "id": 6493707687106161130,
  "max_peer_count": 3
}
```

12.6.2.4.2 config [show | set <option> <value> | placement-rules]

Use this command to view or modify the configuration information.

Usage:

```
>> config show // Display the config information
↳ of the scheduling
{
  "replication": {
    "enable-placement-rules": "true",
    "isolation-level": "",
    "location-labels": "",
    "max-replicas": 3,
```

```

    "strictly-match-label": "false"
  },
  "schedule": {
    "enable-cross-table-merge": "true",

>> config show cluster-version // Display the current version of
    ↪ the cluster, which is the current minimum version of TiKV nodes in
    ↪ the cluster and does not correspond to the binary version.
"5.2.2"

```

- `max-snapshot-count` controls the maximum number of snapshots that a single store receives or sends out at the same time. The scheduler is restricted by this configuration to avoid taking up normal application resources. When you need to improve the speed

of adding replicas or balancing, increase this value.

```
config set max-snapshot-count 64 // Set the maximum number of snapshots  
↪ to 64
```

- `max-pending-peer-count` controls the maximum number of pending peers in a single store. The scheduler is restricted by this configuration to avoid producing a large number of Regions without the latest log in some nodes. When you need to improve the speed of adding replicas or balancing, increase this value. Setting it to 0 indicates no limit.

```
config set max-pending-peer-count 64 // Set the maximum number of  
↪ pending peers to 64
```

- `max-merge-region-size` controls the upper limit on the size of Region Merge (the unit is MiB). When `regionSize` exceeds the specified value, PD does not merge it with the adjacent Region. Setting it to 0 indicates disabling Region Merge.

```
config set max-merge-region-size 16 // Set the upper limit on the size  
↪ of Region Merge to 16 MiB
```

- `max-merge-region-keys` controls the upper limit on the key count of Region Merge. When `regionKeyCount` exceeds the specified value, PD does not merge it with the adjacent Region.

```
config set max-merge-region-keys 50000 // Set the the upper limit on  
↪ keyCount to 50000
```

- `split-merge-interval` controls the interval between the `split` and `merge` operations on a same Region. This means the newly split Region won't be merged within a period of time.

```
config set split-merge-interval 24h // Set the interval between `split`  
↪ and `merge` to one day
```

- `enable-one-way-merge` controls whether PD only allows a Region to merge with the next Region. When you set it to `false`, PD allows a Region to merge with the adjacent two Regions.

```
config set enable-one-way-merge true // Enables one-way merging.
```

- `enable-cross-table-merge` is used to enable the merging of cross-table Regions. When you set it to `false`, PD does not merge the Regions from different tables. This option only works when key type is "table".

```
config set enable-cross-table-merge true // Enable cross table merge.
```

- **key-type** specifies the key encoding type used for the cluster. The supported options are [“table”, “raw”, “txn”], and the default value is “table”.
 - If no TiDB instance exists in the cluster, **key-type** will be “raw” or “txn”, and PD is allowed to merge Regions across tables regardless of the **enable-cross-table-merge** setting.
 - If any TiDB instance exists in the cluster, **key-type** should be “table”. Whether PD can merge Regions across tables is determined by **enable-cross-table-merge**. If **key-type** is “raw”, placement rules do not work.

```
config set key-type raw // Enable cross table merge.
```

- **region-score-formula-version** controls the version of the Region score formula. The value options are v1 and v2. The version 2 of the formula helps to reduce redundant balance Region scheduling in some scenarios, such as taking TiKV nodes online or offline.

```
config set region-score-formula-version v2
```

- **patrol-region-interval** controls the execution frequency that **replicaChecker** checks the health status of Regions. A shorter interval indicates a higher execution frequency. Generally, you do not need to adjust it.

```
config set patrol-region-interval 10ms // Set the execution frequency  
↳ of replicaChecker to 10ms
```

- **max-store-down-time** controls the time that PD decides the disconnected store cannot be restored if exceeded. If PD does not receive heartbeats from a store within the specified period of time, PD adds replicas in other nodes.

```
config set max-store-down-time 30m // Set the time within which PD  
↳ receives no heartbeats and after which PD starts to add replicas  
↳ to 30 minutes
```

- **leader-schedule-limit** controls the number of tasks scheduling the leader at the same time. This value affects the speed of leader balance. A larger value means a higher speed and setting the value to 0 closes the scheduling. Usually the leader scheduling has a small load, and you can increase the value in need.

```
config set leader-schedule-limit 4 // 4 tasks of leader scheduling  
↳ at the same time at most
```

- **region-schedule-limit** controls the number of tasks of scheduling Regions at the same time. This value avoids too many Region balance operators being created. The default value is 2048 which is enough for all sizes of clusters, and setting the value to 0

closes the scheduling. Usually, the Region scheduling speed is limited by `store-limit`, but it is recommended that you do not customize this value unless you know exactly what you are doing.

```
config set region-schedule-limit 2 // 2 tasks of Region scheduling
↳ at the same time at most
```

- `replica-schedule-limit` controls the number of tasks scheduling the replica at the same time. This value affects the scheduling speed when the node is down or removed. A larger value means a higher speed and setting the value to 0 closes the scheduling. Usually the replica scheduling has a large load, so do not set a too large value. Note that this configuration item is usually kept at the default value. If you want to change the value, you need to try a few values to see which one works best according to the real situation.

```
config set replica-schedule-limit 4 // 4 tasks of replica scheduling
↳ at the same time at most
```

- `merge-schedule-limit` controls the number of Region Merge scheduling tasks. Setting the value to 0 closes Region Merge. Usually the Merge scheduling has a large load, so do not set a too large value. Note that this configuration item is usually kept at the default value. If you want to change the value, you need to try a few values to see which one works best according to the real situation.

```
config set merge-schedule-limit 16 // 16 tasks of Merge scheduling at
↳ the same time at most
```

- `hot-region-schedule-limit` controls the hot Region scheduling tasks that are running at the same time. Setting its value to 0 means disabling the scheduling. It is not recommended to set a too large value. Otherwise, it might affect the system performance. Note that this configuration item is usually kept at the default value. If you want to change the value, you need to try a few values to see which one works best according to the real situation.

```
config set hot-region-schedule-limit 4 // 4 tasks of hot Region
↳ scheduling at the same time at most
```

- `hot-region-cache-hits-threshold` is used to set the number of minutes required to identify a hot Region. PD can participate in the hotspot scheduling only after the Region is in the hotspot state for more than this number of minutes.
- `tolerant-size-ratio` controls the size of the balance buffer area. When the score difference between the leader or Region of the two stores is less than specified multiple times of the Region size, it is considered in balance by PD.

```
config set tolerant-size-ratio 20 // Set the size of the buffer area
↳ to about 20 times of the average Region Size
```

- `low-space-ratio` controls the threshold value that is considered as insufficient store space. When the ratio of the space occupied by the node exceeds the specified value, PD tries to avoid migrating data to the corresponding node as much as possible. At the same time, PD mainly schedules the remaining space to avoid using up the disk space of the corresponding node.

```
config set low-space-ratio 0.9          // Set the threshold value of
↳ insufficient space to 0.9
```

- `high-space-ratio` controls the threshold value that is considered as sufficient store space. This configuration takes effect only when `region-score-formula-version` is set to `v1`. When the ratio of the space occupied by the node is less than the specified value, PD ignores the remaining space and mainly schedules the actual data volume.

```
config set high-space-ratio 0.5        // Set the threshold value of
↳ sufficient space to 0.5
```

- `cluster-version` is the version of the cluster, which is used to enable or disable some features and to deal with the compatibility issues. By default, it is the minimum version of all normally running TiKV nodes in the cluster. You can set it manually only when you need to roll it back to an earlier version.

```
config set cluster-version 1.0.8       // Set the version of the
↳ cluster to 1.0.8
```

- `replication-mode` controls the replication mode of Regions in the dual data center scenario. See [Enable the DR Auto-Sync mode](#) for details.
- `leader-schedule-policy` is used to select the scheduling strategy for the leader. You can schedule the leader according to `size` or `count`.
- `scheduler-max-waiting-operator` is used to control the number of waiting operators in each scheduler.
- `enable-remove-down-replica` is used to enable the feature of automatically deleting DownReplica. When you set it to `false`, PD does not automatically clean up the downtime replicas.
- `enable-replace-offline-replica` is used to enable the feature of migrating OfflineReplica. When you set it to `false`, PD does not migrate the offline replicas.
- `enable-make-up-replica` is used to enable the feature of making up replicas. When you set it to `false`, PD does not add replicas for Regions without sufficient replicas.
- `enable-remove-extra-replica` is used to enable the feature of removing extra replicas. When you set it to `false`, PD does not remove extra replicas for Regions with redundant replicas.

- `enable-location-replacement` is used to enable the isolation level checking. When you set it to `false`, PD does not increase the isolation level of a Region replica through scheduling.
- `enable-debug-metrics` is used to enable the metrics for debugging. When you set it to `true`, PD enables some metrics such as `balance-tolerant-size`.
- `enable-placement-rules` is used to enable placement rules, which is enabled by default in v5.0 and later versions.
- `store-limit-mode` is used to control the mode of limiting the store speed. The optional modes are `auto` and `manual`. In `auto` mode, the stores are automatically balanced according to the load (experimental).
- PD rounds the lowest digits of the flow number, which reduces the update of statistics caused by the changes of the Region flow information. This configuration item is used to specify the number of lowest digits to round for the Region flow information. For example, the flow 100512 will be rounded to 101000 because the default value is 3. This configuration replaces `trace-region-flow`.
- For example, set the value of `flow-round-by-digit` to 4:

```
config set flow-round-by-digit 4
```

```
config placement-rules [disable | enable | load | save | show | rule-group]
```

For the usage of `config placement-rules [disable | enable | load | save | show | rule-group]`, see [Configure placement rules](#).

12.6.2.4.3 health

Use this command to view the health information of the cluster.

Usage:

```
>> health // Display the health information
[
  {
    "name": "pd",
    "member_id": 13195394291058371180,
    "client_urls": [
      "http://127.0.0.1:2379"
      .....
    ],
    "health": true
  }
  .....
]
```

12.6.2.4.4 hot [read | write | store | history <start_time> <end_time> [<key> <value>]]

Use this command to view the hot spot information of the cluster.

Usage:

```
>> hot read // Display hot spot for the read
    ↪ operation
>> hot write // Display hot spot for the write
    ↪ operation
>> hot store // Display hot spot for all the read
    ↪ and write operations
>> hot history 1629294000000 1631980800000 // Display history hot spot for
    ↪ the specified period (milliseconds). 1629294000000 is the start time
    ↪ and 1631980800000 is the end time.
{

    "query_rate": 305,
    "start_key": "7480000000000000FF53000000000000F8",
    "end_key": "7480000000000000FF56000000000000F8"
  },
  ...
]
```

12.6.2.4.5 label [store <name> <value>]

Use this command to view the label information of the cluster.

Usage:

```
>> label // Display all labels
>> label store zone cn // Display all stores including the "zone
↪ ":"cn" label
```

12.6.2.4.6 member [delete | leader_priority | leader [show | resign | transfer <member_name>]]

Use this command to view the PD members, remove a specified member, or configure the priority of leader.

Usage:

```
>> member // Display the information of all members
{
  "header": {.....},
  "members": [.....],
  "leader": {.....},
  "etcd_leader": {.....},
}
>> member delete name pd2 // Delete "pd2"
Success!
>> member delete id 1319539429105371180 // Delete a node using id
Success!
>> member leader show // Display the leader information
{
  "name": "pd",
  "member_id": 13155432540099656863,
```

```
"peer_urls": [.....],
"client_urls": [.....]
}
>> member leader resign // Move leader away from the current member
.....
>> member leader transfer pd3 // Migrate leader to a specified member
.....
```

12.6.2.4.7 operator [check | show | add | remove]

Use this command to view and control the scheduling operation.

Usage:

```
>> operator show // Display all operators
>> operator show admin // Display all admin
    ↪ operators
>> operator show leader // Display all leader
    ↪ operators
>> operator show region // Display all Region
    ↪ operators
>> operator add add-peer 1 2 // Add a replica of Region
    ↪ 1 on store 2
>> operator add add-learner 1 2 // Add a learner replica of
    ↪ Region 1 on store 2
>> operator add remove-peer 1 2 // Remove a replica of
    ↪ Region 1 on store 2
>> operator add transfer-leader 1 2 // Schedule the leader of
    ↪ Region 1 to store 2
>> operator add transfer-region 1 2 3 4 // Schedule Region 1 to
    ↪ stores 2,3,4
>> operator add transfer-peer 1 2 3 // Schedule the replica of
    ↪ Region 1 on store 2 to store 3
>> operator add merge-region 1 2 // Merge Region 1 with
    ↪ Region 2
>> operator add split-region 1 --policy=approximate // Split Region 1 into
    ↪ two Regions in halves, based on approximately estimated value
>> operator add split-region 1 --policy=scan // Split Region 1 into two
    ↪ Regions in halves, based on accurate scan value
>> operator remove 1 // Remove the scheduling
    ↪ operation of Region 1
>> operator check 1 // Check the status of the
    ↪ operators related to Region 1
```

The splitting of Regions starts from the position as close as possible to the middle. You can locate this position using two strategies, namely “scan” and “approximate”. The

difference between them is that the former determines the middle key by scanning the Region, and the latter obtains the approximate position by checking the statistics recorded in the SST file. Generally, the former is more accurate, while the latter consumes less I/O and can be completed faster.

12.6.2.4.8 ping

Use this command to view the time that ping PD takes.

Usage:

```
>> ping
time: 43.12698ms
```

12.6.2.4.9 region <region_id> [--jq="<query string>"]

Use this command to view the Region information. For a jq formatted output, see [jq-formatted-json-output-usage](#).

Usage:

```
>> region                                // Display the information of all
    ↪ Regions
{
  "count": 1,
  "regions": [.....]
}

>> region 2                              // Display the information of the Region
    ↪ with the ID of 2
{
  "id": 2,
  "start_key": "7480000000000000FF1D0000000000000F8",

  "epoch": {
    "conf_ver": 1,
    "version": 15
  },
  "peers": [
    {
      "id": 40,
      "store_id": 3
    }
  ],
  "leader": {
    "id": 40,
    "store_id": 3
  }
}
```

```
},  
  "written_bytes": 0,  
  "read_bytes": 0,  
  "written_keys": 0,  
  "read_keys": 0,  
  "approximate_size": 1,  
  "approximate_keys": 0  
}
```

12.6.2.4.10 region key [--format=raw|encode|hex] <key>

Use this command to query the Region that a specific key resides in. It supports the raw, encoding, and hex formats. And you need to use single quotes around the key when it is in the encoding format.

Hex format usage (default):

```
>> region key 7480000000000000FF1300000000000000F8  
{  
  "region": {  
    "id": 2,  
    .....  
  }  
}
```

Raw format usage:

```
>> region key --format=raw abc  
{  
  "region": {  
    "id": 2,  
    .....  
  }  
}
```

Encoding format usage:

```
>> region key --format=encode 't\200\000\000\000\000\000\000\377\035_r  
  ↪ \200\000\000\000\000\377\017U\320\000\000\000\000\000\372'  
{  
  "region": {  
    "id": 2,  
    .....  
  }  
}
```

12.6.2.4.11 region scan

Use this command to get all Regions.

Usage:

```
>> region scan
{
  "count": 20,
  "regions": [.....],
}
```

12.6.2.4.12 region sibling <region_id>

Use this command to check the adjacent Regions of a specific Region.

Usage:

```
>> region sibling 2
{
  "count": 2,
  "regions": [.....],
}
```

12.6.2.4.13 region keys [--format=raw|encode|hex] <start_key> <end_key> <limit>

Use this command to query all Regions in a given range [startkey, endkey). Ranges without endKeys are supported.

The limit parameter limits the number of keys. The default value of limit is 16, and the value of -1 means unlimited keys.

Usage:

```
>> region keys --format=raw a // Display all Regions that start from the
  ↪ key a with a default limit count of 16
{
  "count": 16,
  "regions": [.....],
}

>> region keys --format=raw a z // Display all Regions in the range [a, z)
  ↪ with a default limit count of 16
{
  "count": 16,
  "regions": [.....],
}
```

```
>> region keys --format=raw a z -1 // Display all Regions in the range [a,
  ↪ z) without a limit count
{
  "count": ...,
  "regions": [.....],
}

>> region keys --format=raw a "" 20 // Display all Regions that start from
  ↪ the key a with a limit count of 20
{
  "count": 20,
  "regions": [.....],
}
```

12.6.2.4.14 region store <store_id>

Use this command to list all Regions of a specific store.

Usage:

```
>> region store 2
{
  "count": 10,
  "regions": [.....],
}
```

12.6.2.4.15 region topread [limit]

Use this command to list Regions with top read flow. The default value of the limit is 16.

Usage:

```
>> region topread
{
  "count": 16,
  "regions": [.....],
}
```

12.6.2.4.16 region topwrite [limit]

Use this command to list Regions with top write flow. The default value of the limit is 16.

Usage:

```
>> region topwrite
{
  "count": 16,
  "regions": [.....],
}
```

12.6.2.4.17 region topconfver [limit]

Use this command to list Regions with top conf version. The default value of the limit is 16.

Usage:

```
>> region topconfver
{
  "count": 16,
  "regions": [.....],
}
```

12.6.2.4.18 region topversion [limit]

Use this command to list Regions with top version. The default value of the limit is 16.

Usage:

```
>> region topversion
{
  "count": 16,
  "regions": [.....],
}
```

12.6.2.4.19 region topsize [limit]

Use this command to list Regions with top approximate size. The default value of the limit is 16.

Usage:

```
>> region topsize
{
  "count": 16,
  "regions": [.....],
}
```

12.6.2.4.20 region check [miss-peer | extra-peer | down-peer | pending-peer | offline-peer | empty-region | hist-size | hist-keys]

Use this command to check the Regions in abnormal conditions.

Description of various types:

- miss-peer: the Region without enough replicas
- extra-peer: the Region with extra replicas
- down-peer: the Region in which some replicas are Down
- pending-peer: the Region in which some replicas are Pending

Usage:

```
>> region check miss-peer
{
  "count": 2,
  "regions": [.....],
}
```

12.6.2.4.21 scheduler [show | add | remove | pause | resume | config]

Use this command to view and control the scheduling policy.

Usage:

```
>> scheduler show // Display all
  ↪ schedulers
>> scheduler add grant-leader-scheduler 1 // Schedule all the
  ↪ leaders of the Regions on store 1 to store 1
>> scheduler add evict-leader-scheduler 1 // Move all the Region
  ↪ leaders on store 1 out
>> scheduler config evict-leader-scheduler // Display the stores in
  ↪ which the scheduler is located since v4.0.0
>> scheduler config evict-leader-scheduler add-store 2 // Add leader
  ↪ eviction scheduling for store 2
>> scheduler config evict-leader-scheduler delete-store 2 // Remove leader
  ↪ eviction scheduling for store 2
>> scheduler add evict-slow-store-scheduler // When there is one and only
  ↪ one slow store, evict all Region leaders of that store
>> scheduler remove grant-leader-scheduler-1 // Remove the corresponding
  ↪ scheduler, and `-1` corresponds to the store ID
>> scheduler pause balance-region-scheduler 10 // Pause the balance-region
  ↪ scheduler for 10 seconds
>> scheduler pause all 10 // Pause all schedulers for 10
  ↪ seconds
```

```
>> scheduler resume balance-region-scheduler // Continue to run the balance-
    ↪ region scheduler
>> scheduler resume all // Continue to run all
    ↪ schedulers
>> scheduler config balance-hot-region-scheduler // Display the
    ↪ configuration of the balance-hot-region scheduler
```

```
scheduler config balance-hot-region-scheduler
```

Use this command to view and control the `balance-hot-region-scheduler` policy.

Usage:

```
>> scheduler config balance-hot-region-scheduler // Display all
    ↪ configuration of the balance-hot-region scheduler
{
  "min-hot-byte-rate": 100,
  "min-hot-key-rate": 10,
  "min-hot-query-rate": 10,
  "max-zombie-rounds": 3,
  "max-peer-number": 1000,
  "byte-rate-rank-step-ratio": 0.05,
  "key-rate-rank-step-ratio": 0.05,
  "query-rate-rank-step-ratio": 0.05,
  "count-rank-step-ratio": 0.01,
  "great-dec-ratio": 0.95,
  "minor-dec-ratio": 0.99,
  "src-tolerance-ratio": 1.05,
  "dst-tolerance-ratio": 1.05,
  "read-priorities": [
    "query",
    "byte"
  ],
  "write-leader-priorities": [
    "key",
    "byte"
  ],
  "write-peer-priorities": [
    "byte",
    "key"
  ],
  "strict-picking-store": "true",
  "enable-for-tiflash": "true"
}
```

- `min-hot-byte-rate` means the smallest number of bytes to be counted, which is usu-

ally 100.

```
scheduler config balance-hot-region-scheduler set min-hot-byte-rate 100
```

- `min-hot-key-rate` means the smallest number of keys to be counted, which is usually 10.

```
scheduler config balance-hot-region-scheduler set min-hot-key-rate 10
```

- `min-hot-query-rate` means the smallest number of queries to be counted, which is usually 10.

```
scheduler config balance-hot-region-scheduler set min-hot-query-rate 10
```

- `max-zombie-rounds` means the maximum number of heartbeats with which an operator can be considered as the pending influence. If you set it to a larger value, more operators might be included in the pending influence. Usually, you do not need to adjust its value. Pending influence refers to the operator influence that is generated during scheduling but still has an effect.

```
scheduler config balance-hot-region-scheduler set max-zombie-rounds 3
```

- `max-peer-number` means the maximum number of peers to be solved, which prevents the scheduler from being too slow.

```
scheduler config balance-hot-region-scheduler set max-peer-number 1000
```

- `byte-rate-rank-step-ratio`, `key-rate-rank-step-ratio`, `query-rate-rank-step-ratio`, and `count-rank-step-ratio` respectively mean the step ranks of byte, key, query, and count. The rank-step-ratio decides the step when the rank is calculated. `great-dec-ratio` and `minor-dec-ratio` are used to determine the dec rank. Usually, you do not need to modify these items.

```
scheduler config balance-hot-region-scheduler set byte-rate-rank-step-  
↔ ratio 0.05
```

- `src-tolerance-ratio` and `dst-tolerance-ratio` are configuration items for the expectation scheduler. The smaller the `tolerance-ratio`, the easier it is for scheduling. When redundant scheduling occurs, you can appropriately increase this value.

```
scheduler config balance-hot-region-scheduler set src-tolerance-ratio  
↔ 1.1
```

- `read-priorities`, `write-leader-priorities`, and `write-peer-priorities` control which dimension the scheduler prioritizes for hot Region scheduling. Two dimensions are supported for configuration.

- `read-priorities` and `write-leader-priorities` control which dimensions the scheduler prioritizes for scheduling hot Regions of the read and write-leader types. The dimension options are `query`, `byte`, and `key`.
- `write-peer-priorities` controls which dimensions the scheduler prioritizes for scheduling hot Regions of the write-peer type. The dimension options are `byte` and `key`.

Note:

If a cluster component is earlier than v5.2, the configuration of `query` dimension does not take effect. If some components are upgraded to v5.2 or later, the `byte` and `key` dimensions still by default have the priority for hot Region scheduling. After all components of the cluster are upgraded to v5.2 or later, such a configuration still takes effect for compatibility. You can view the real-time configuration using the `pd-ctl` command. Usually, you do not need to modify these configurations.

```
scheduler config balance-hot-region-scheduler set read-priorities query  
↔ ,byte
```

- `strict-picking-store` controls the search space of hot Region scheduling. Usually, it is enabled. When it is enabled, hot Region scheduling ensures hotspot balance on the two configured dimensions. When it is disabled, hot Region scheduling only ensures the balance on the dimension with the first priority, which might reduce balance on other dimensions. Usually, you do not need to modify this configuration.

```
scheduler config balance-hot-region-scheduler set strict-picking-store  
↔ true
```

- `enable-for-tiflash` controls whether hot Region scheduling takes effect for TiFlash instances. Usually, it is enabled. When it is disabled, the hot Region scheduling between TiFlash instances is not performed.

```
scheduler config balance-hot-region-scheduler set enable-for-tiflash  
↔ true
```

12.6.2.4.22 service-gc-safepoint

Use this command to query the current GC safepoint and service GC safepoint. The output is as follows:

```
{  
  "service_gc_safe_points": [  
    {
```

```
    "service_id": "gc_worker",
    "expired_at": 9223372036854775807,
    "safe_point": 439923410637160448
  }
],
"gc_safe_point": 0
}
```

12.6.2.4.23 scheduler config evict-leader-scheduler

Use this command to view and manage the configuration of the `evict-leader-scheduler`.

- When an `evict-leader-scheduler` already exists, use the `add-store` subcommand to add leader eviction scheduling for the specified store:

```
scheduler config evict-leader-scheduler add-store 2 // Add leader
  ↪ eviction scheduling for store 2
```

- When an `evict-leader-scheduler` already exists, use the `delete-store` subcommand to remove leader eviction scheduling for the specified store:

```
scheduler config evict-leader-scheduler delete-store 2 // Remove leader
  ↪ eviction scheduling for store 2
```

If all store configurations of an `evict-leader-scheduler` are removed, the scheduler itself is automatically removed.

12.6.2.4.24 store [delete | label | weight | remove-tombstone | limit] <store_id> [--jq="<query string>"]

Use this command to view the store information or remove a specified store. For a jq formatted output, see [jq-formatted-json-output-usage](#).

Usage:

```
>> store // Display information of all stores
{
  "count": 3,
  "stores": [...]
}
>> store 1 // Get the store with the store id of 1
.....
>> store delete 1 // Delete the store with the store id of
  ↪ 1
.....
```

```
>> store label 1 zone cn          // Set the value of the label with the "
    ↪ zone" key to "cn" for the store with the store id of 1
>> store weight 1 5 10          // Set the leader weight to 5 and Region
    ↪ weight to 10 for the store with the store id of 1
>> store remove-tombstone        // Remove stores that are in tombstone
    ↪ state
>> store limit                   // Show the speed limit of adding-peer
    ↪ operations and the limit of removing-peer operations per minute in
    ↪ all stores
>> store limit add-peer          // Show the speed limit of adding-peer
    ↪ operations per minute in all stores
>> store limit remove-peer       // Show the limit of removing-peer
    ↪ operations per minute in all stores
>> store limit all 5            // Set the limit of adding-peer
    ↪ operations to 5 and the limit of removing-peer operations to 5 per
    ↪ minute for all stores
>> store limit 1 5              // Set the limit of adding-peer
    ↪ operations to 5 and the limit of removing-peer operations to 5 per
    ↪ minute for store 1
>> store limit all 5 add-peer    // Set the limit of adding-peer
    ↪ operations to 5 per minute for all stores
>> store limit 1 5 add-peer      // Set the limit of adding-peer
    ↪ operations to 5 per minute for store 1
>> store limit 1 5 remove-peer   // Set the limit of removing-peer
    ↪ operations to 5 per minute for store 1
>> store limit all 5 remove-peer // Set the limit of removing-peer
    ↪ operations to 5 per minute for all stores
```

Note:

You can use `pd-ctl` to check the status (Up, Disconnect, Offline, Down, or Tombstone) of a TiKV store. For the relationship between each status, refer to [Relationship between each status of a TiKV store](#).

12.6.2.4.25 `log [fatal | error | warn | info | debug]`

Use this command to set the log level of the PD leader.

Usage:

```
log warn
```

12.6.2.4.26 tso

Use this command to parse the physical and logical time of TSO.

Usage:

```
>> tso 395181938313123110    // Parse TSO
system: 2017-10-09 05:50:59 +0800 CST
logic: 120102
```

12.6.2.4.27 unsafe remove-failed-stores [store-ids | show | history]

Warning:

- This feature is a lossy recovery, so TiKV cannot guarantee data integrity and data indexes integrity after using the feature.
- Online Unsafe Recovery is an experimental feature, and it is **NOT** recommended to use it in the production environment. The interface, strategy, and internal implementation of this feature might change when it becomes generally available (GA). Although this feature has been tested in some scenarios, it is not thoroughly validated and might cause system unavailability.
- It is recommended to perform the feature-related operations with the support from the TiDB team. If any misoperation is performed, it might be hard to recover the cluster.

Use this command to perform lossy recovery operations when permanently damaged replicas cause data to be unavailable. For example:

Execute Online Unsafe Recovery to remove permanently damaged stores:

```
unsafe remove-failed-stores 101,102,103
```

```
Success!
```

Show the current or historical state of Online Unsafe Recovery:

```
unsafe remove-failed-stores show
```

```
[
  "Collecting cluster info from all alive stores, 10/12.",
  "Stores that have reports to PD: 1, 2, 3, ...",
  "Stores that have not reported to PD: 11, 12",
]
```

```
>> unsafe remove-failed-stores history
```

```
[
  "Store reports collection:",
  "Store 7: region 3 [start_key, end_key), {peer1, peer2, peer3} region 4
    ↪ ...",
  "Store 8: region ...",
  "...",
  "Recovery Plan:",
  "Store 7, creates: region 11, region 12, ...; updates: region 21, region
    ↪ 22, ... deletes: ... ",
  "Store 8, ..."
  "...",
  "Execution Progress:",
  "Store 10 finished,",
  "Store 7 not yet finished",
  "...",
]
```

12.6.2.5 Jq formatted JSON output usage

12.6.2.5.1 Simplify the output of store

```
>> store --jq=".stores[].store | { id, address, state_name}"
{"id":1,"address":"127.0.0.1:20161","state_name":"Up"}
{"id":30,"address":"127.0.0.1:20162","state_name":"Up"}
...
```

12.6.2.5.2 Query the remaining space of the node

```
>> store --jq=".stores[] | {id: .store.id, available: .status.available}"
{"id":1,"available":"10 GiB"}
{"id":30,"available":"10 GiB"}
...
```

12.6.2.5.3 Query all nodes whose status is not Up

```
store --jq='.stores[].store | select(.state_name!="Up") | { id, address,
  ↪ state_name}'
```

```
{"id":1,"address":"127.0.0.1:20161""state_name":"Offline"}
{"id":5,"address":"127.0.0.1:20162""state_name":"Offline"}
...
```

12.6.2.5.4 Query all TiFlash nodes

```
store --jq='.stores[].store | select(.labels | length>0 and contains(["key  
↪ ":"engine","value":"tiflash"])) | { id, address, state_name}'
```

```
{"id":1,"address":"127.0.0.1:20161""state_name":"Up"}  
{"id":5,"address":"127.0.0.1:20162""state_name":"Up"}  
...
```

12.6.2.5.5 Query the distribution status of the Region replicas

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id]}"  
{"id":2,"peer_stores":[1,30,31]}  
{"id":4,"peer_stores":[1,31,34]}  
...
```

12.6.2.5.6 Filter Regions according to the number of replicas

For example, to filter out all Regions whose number of replicas is not 3:

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id] |  
↪ select(length != 3)}"  
{"id":12,"peer_stores":[30,32]}  
{"id":2,"peer_stores":[1,30,31,32]}
```

12.6.2.5.7 Filter Regions according to the store ID of replicas

For example, to filter out all Regions that have a replica on store30:

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id] |  
↪ select(any(==30))}"  
{"id":6,"peer_stores":[1,30,31]}  
{"id":22,"peer_stores":[1,30,32]}  
...
```

You can also find out all Regions that have a replica on store30 or store31 in the same way:

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id] |  
↪ select(any(==(30,31)))}"  
{"id":16,"peer_stores":[1,30,34]}  
{"id":28,"peer_stores":[1,30,32]}  
{"id":12,"peer_stores":[30,32]}  
...
```

12.6.2.5.8 Look for relevant Regions when restoring data

For example, when [store1, store30, store31] is unavailable at its downtime, you can find all Regions whose Down replicas are more than normal replicas:

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id] |
  ↪ select(length as $total | map(if .==(1,30,31) then . else empty end)
  ↪ | length>=$total-length) }"
{"id":2,"peer_stores":[1,30,31,32]}
{"id":12,"peer_stores":[30,32]}
{"id":14,"peer_stores":[1,30,32]}
...
```

Or when [store1, store30, store31] fails to start, you can find Regions where the data can be manually removed safely on store1. In this way, you can filter out all Regions that have a replica on store1 but don't have other DownPeers:

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id] |
  ↪ select(length>1 and any(.==1) and all(.!=(30,31)))}"
{"id":24,"peer_stores":[1,32,33]}
```

When [store30, store31] is down, find out all Regions that can be safely processed by creating the `remove-peer` Operator, that is, Regions with one and only DownPeer:

```
>> region --jq=".regions[] | {id: .id, remove_peer: [.peers[].store_id] |
  ↪ select(length>1) | map(if .==(30,31) then . else empty end) | select(
  ↪ length==1)}"
{"id":12,"remove_peer":[30]}
{"id":4,"remove_peer":[31]}
{"id":22,"remove_peer":[30]}
...
```

12.6.3 TiDB Control User Guide

TiDB Control is a command-line tool of TiDB, usually used to obtain the status information of TiDB for debugging. This document introduces the features of TiDB Control and how to use these features.

Note:

TiDB Control is specifically designed for debugging purposes and might not be fully compatible with future capabilities introduced in TiDB. It's not recommended to include this tool in applications or utilities development to get information.

12.6.3.1 Get TiDB Control

You can get TiDB Control by installing it using TiUP or by compiling it from source code.

Note:

It is recommended that the version of the Control tool you use is consistent with the version of the cluster.

12.6.3.1.1 Install TiDB Control using TiUP

After installing TiUP, you can use `tiup ctl:<cluster-version> tidb` command to get and execute TiDB Control.

12.6.3.1.2 Compile from source code

- Compilation environment requirement: [Go](#) Version 1.13 or later
- Compilation procedures: Go to the root directory of the [TiDB Control project](#), use the `make` command to compile, and generate `tidb-ctl`.
- Compilation documentation: you can find the help files in the `doc` directory; if the help files are lost or you want to update them, use the `make doc` command to generate the help files.

12.6.3.2 Usage introduction

This section describes how to use commands, subcommands, options, and flags in `tidb ↵ -ctl`.

- command: characters without `-` or `--`
- subcommand: characters without `-` or `--` that follow a command
- option: characters with `-` or `--`
- flag: characters exactly following a command/subcommand or option, passing value to the command/subcommand or option

Usage example: `tidb-ctl schema in mysql -n db`

- `schema`: the command
- `in`: the subcommand of `schema`
- `mysql`: the flag of `in`
- `-n`: the option
- `db`: the flag of `-n`

Currently, TiDB Control has the following subcommands:

- `tidb-ctl base64decode`: used for BASE64 decoding
- `tidb-ctl decoder`: used for KEY decoding
- `tidb-ctl etcd`: used for operating etcd
- `tidb-ctl log`: used to format the log file to expand the single-line stack information
- `tidb-ctl mvcc`: used to get the MVCC information
- `tidb-ctl region`: used to get the Region information
- `tidb-ctl schema`: used to get the schema information
- `tidb-ctl table`: used to get the table information

12.6.3.2.1 Get help

Use `tidb-ctl -h/--help` to get usage information.

TiDB Control consists of multiple layers of commands. You can use `-h/--help` after each command/subcommand to get its respective usage information.

The following example shows how to obtain the schema information:

Use `tidb-ctl schema -h` to get usage details. The `schema` command itself has two subcommands: `in` and `tid`.

- `in` is used to obtain the table schema of all tables in the database through the database name.
- `tid` is used to obtain the table schema by using the unique `table_id` in the whole database.

12.6.3.2.2 Global options

`tidb-ctl` has the following connection-related global options:

- `--host`: TiDB Service address (default 127.0.0.1)
- `--port`: TiDB status port (default 10080)
- `--pdhost`: PD Service address (default 127.0.0.1)
- `--pdport`: PD Service port (default 2379)
- `--ca`: The CA file path used for the TLS connection
- `--ssl-key`: The key file path used for the TLS connection
- `--ssl-cert`: The certificate file path used for the TLS connection

`--pdhost` and `--pdport` are mainly used in the `etcd` subcommand. For example, `tidb-ctl etcd ddlinfo`. If you do not specify the address and the port, the following default value is used:

- The default service address of TiDB and PD: 127.0.0.1. The service address must be an IP address.
- The default service port of TiDB: 10080.
- The default service port of PD: 2379.

12.6.3.2.3 The schema command

The `in` subcommand

`in` is used to obtain the table schema of all tables in the database through the database name.

```
tidb-ctl schema in <database name>
```

For example, running `tidb-ctl schema in mysql` returns the following result:

```
[
  {
    "id": 13,
    "name": {
      "O": "columns_priv",
      "L": "columns_priv"
    },
    ...
    "update_timestamp": 399494726837600268,
    "ShardRowIDBits": 0,
    "Partition": null
  }
]
```

The result is displayed in the JSON format. (The above output is truncated.)

- If you want to specify the table name, use `tidb-ctl schema in <database> -n <table name>` to filter.

For example, `tidb-ctl schema in mysql -n db` returns the table schema of the `db` table in the `mysql` database:

```
{
  "id": 9,
  "name": {
    "O": "db",
    "L": "db"
  },
  ...
  "Partition": null
}
```

(The above output is also truncated.)

If you do not want to use the default TiDB service address and port, use the `--host` and `--port` options to configure. For example, `tidb-ctl --host 172.16.55.88 --port 8898 schema in mysql -n db`.

The `tid` subcommand

`tid` is used to obtain the table schema by using the unique `table_id` in the whole database. You can use the `in` subcommand to get all table IDs of certain schema and use the `tid` subcommand to get the detailed table information.

For example, the table ID of `mysql.stat_meta` is 21. You can use `tidb-ctl schema` ↪ `tid -i 21` to obtain the detail of `mysql.stat_meta`.

```
{
  "id": 21,
  "name": {
    "O": "stats_meta",
    "L": "stats_meta"
  },
  "charset": "utf8mb4",
  "collate": "utf8mb4_bin",
  ...
}
```

Like the `in` subcommand, if you do not want to use the default TiDB service address and status port, use the `--host` and `--port` options to specify the host and port.

The `base64decode` command

`base64decode` is used to decode base64 data.

```
tidb-ctl base64decode [base64_data]
tidb-ctl base64decode [db_name.table_name] [base64_data]
tidb-ctl base64decode [table_id] [base64_data]
```

1. Execute the following SQL statement to prepare the environment:

```
use test;
create table t (a int, b varchar(20), c datetime default
  ↪ current_timestamp, d timestamp default current_timestamp,
  ↪ unique index(a));
insert into t (a,b,c) values(1,"哈哈 hello",NULL);
alter table t add column e varchar(20);
```

2. Obtain MVCC data using the HTTP API interface:

```
$ curl "http://$IP:10080/mvcc/index/test/t/a/1?a=1"
{
  "info": {
    "writes": [
      {
        "start_ts": 407306449994645510,
```

```

    "commit_ts": 407306449994645513,
    "short_value": "AAAAAAAAAAE=" # The unique index a stores the
        ↪ handle id of the corresponding row.
    }
  ]
}
}%

$ curl "http://$IP:10080/mvcc/key/test/t/1"
{
  "info": {
    "writes": [
      {
        "start_ts": 407306588892692486,
        "commit_ts": 407306588892692489,
        "short_value": "CAIIAggEAhjl4jlk4ggaGVsbG8IBgAICAmAgIDwjYuuORk=" #
            ↪ Row data that handle id is 1.
      }
    ]
  }
}
}%

```

3. Decode handle id (uint64) using `base64decode`.

```

$ tidb-ctl base64decode AAAAAAAAAAAE=
hex: 0000000000000001
uint64: 1

```

4. Decode row data using base64decode.

```

$ ./tidb-ctl base64decode test.t
  ↪ CAIIAggEAhjl4jlk4ggaGVsbG8IBgAICAmAgIDwjYuuORk=
a:      1
b:      哈哈 hello
c is NULL
d:      2019-03-28 05:35:30
e not found in data

# if the table id of test.t is 60, you can also use below command to do
  ↪ the same thing.
$ ./tidb-ctl base64decode 60
  ↪ CAIIAggEAhjl4jlk4ggaGVsbG8IBgAICAmAgIDwjYuuORk=
a:      1
b:      哈哈 hello
c is NULL

```

```
d:    2019-03-28 05:35:30
e not found in data
```

12.6.3.2.4 The decoder command

- The following example shows how to decode the row key, similar to decoding the index key.

```
$ ./tidb-ctl decoder "t\x00\x00\x00\x00\x00\x00\x00\x1c_r\x00\x00\x00\
  ↪ x00\x00\x00\x00\xfa"
format: table_row
table_id: -9223372036854775780  table_id: -9223372036854775780
row_id: -9223372036854775558   row_id: -9223372036854775558
```

- The following example shows how to decode value.

```
$ ./tidb-ctl decoder AhZoZWxsbyB3b3JsZAiAEA==
format: index_value
type: bigint, value: 1024  index_value[0]: {type: bytes, value: hello
  ↪ world}
index_value[1]: {type: bigint, value: 1024}
```

12.6.3.2.5 The etcd command

- `tidb-ctl etcd ddlinfo` is used to obtain DDL information.
- `tidb-ctl etcd putkey KEY VALUE` is used to add KEY VALUE to etcd (All the KEYS are added to the `/tidb/ddl/all_schema_versions/` directory).

```
tidb-ctl etcd putkey "foo" "bar"
```

In fact, a key-value pair is added to the etcd whose KEY is `/tidb/ddl/all_schema_versions/foo` and VALUE is `bar`.

- `tidb-ctl etcd delkey` deletes the KEY in etcd. Only those KEYS with the `/tidb/ddl/fg/owner/` or `/tidb/ddl/all_schema_versions/` prefix can be deleted.

```
tidb-ctl etcd delkey "/tidb/ddl/fg/owner/foo"
tidb-ctl etcd delkey "/tidb/ddl/all_schema_versions/bar"
```

12.6.3.2.6 The log command

The stack information for the TiDB error log is in one line format. You could use `tidb-ctl log` to change its format to multiple lines.

12.6.3.2.7 The keyrange command

The `keyrange` subcommand is used to query the global or table-related key range information, which is output in the hexadecimal form.

- Execute the `tidb-ctl keyrange` command to check the global key range information:

```
tidb-ctl keyrange
```

```
global ranges:  
meta: (6d, 6e)  
table: (74, 75)
```

- Add the `--encode` option to display encoded keys (in the same format as in TiKV and PD):

```
tidb-ctl keyrange --encode
```

```
global ranges:  
meta: (6d00000000000000f8, 6e00000000000000f8)  
table: (7400000000000000f8, 7500000000000000f8)
```

- Execute the `tidb-ctl keyrange --database={db} --table={tbl}` command to check the global and table-related key range information:

```
tidb-ctl keyrange --database test --table ttt
```

```
global ranges:  
meta: (6d, 6e)  
table: (74, 75)  
table ttt ranges: (NOTE: key range might be changed after DDL)  
table: (74800000000000002f, 748000000000000030)  
table indexes: (74800000000000002f5f69, 74800000000000002f5f72)  
index c2: (74800000000000002f5f698000000000000001,  
↪ 74800000000000002f5f69800000000000000002)  
index c3: (74800000000000002f5f698000000000000002,  
↪ 74800000000000002f5f69800000000000000003)  
index c4: (74800000000000002f5f698000000000000003,  
↪ 74800000000000002f5f69800000000000000004)  
table rows: (74800000000000002f5f72, 748000000000000030)
```

12.6.4 PD Recover User Guide

PD Recover is a disaster recovery tool of PD, used to recover the PD cluster which cannot start or provide services normally.

12.6.4.1 Compile from source code

- [Go](#) Version 1.16 or later is required because the Go modules are used.
- In the root directory of the [PD project](#), use the `make pd-recover` command to compile and generate `bin/pd-recover`.

Note:

Generally, you do not need to compile source code because the PD Control tool already exists in the released binary or Docker. However, developer users can refer to the instructions above for compiling source code.

12.6.4.2 Download TiDB installation package

To download the latest version of PD Recover, directly download the TiDB package, because PD Recover is included in the TiDB package.

Package name	OS	Architecture	SHA256 checksum
https://github.com/pingcap/tidb	Linux	amd64	https://github.com/pingcap/tidb/releases/download/v6.0.0-beta.1/tidb-linux-amd64.tar.gz

(pd-recover)

Note:

{version} indicates the version number of TiDB. For example, if {version} is v5.4.3, the package download link is <https://download.pingcap.org/>
↪ `tidb-v5.4.3-linux-amd64.tar.gz`.

12.6.4.3 Quick Start

This section describes how to use PD Recover to recover a PD cluster.

12.6.4.3.1 Get cluster ID

The cluster ID can be obtained from the log of PD, TiKV or TiDB. To get the cluster ID, you can view the log directly on the server.

Get cluster ID from PD log (recommended)

To get the cluster ID from the PD log, run the following command:

```
cat {/path/to}/pd.log | grep "init cluster id"
```

```
[2019/10/14 10:35:38.880 +00:00] [INFO] [server.go:212] ["init cluster id"]  
↪ [cluster-id=6747551640615446306]  
...
```

Get cluster ID from TiDB log

To get the cluster ID from the TiDB log, run the following command:

```
cat {/path/to}/tidb.log | grep "init cluster id"
```

```
2019/10/14 19:23:04.688 client.go:161: [info] [pd] init cluster id  
↪ 6747551640615446306  
...
```

Get cluster ID from TiKV log

To get the cluster ID from the TiKV log, run the following command:

```
cat {/path/to}/tikv.log | grep "connect to PD cluster"
```

```
[2019/10/14 07:06:35.278 +00:00] [INFO] [tikv-server.rs:464] ["connect to PD  
↪ cluster 6747551640615446306"]  
...
```

12.6.4.3.2 Get allocated ID

The allocated ID value you specify must be larger than the currently largest allocated ID value. To get allocated ID, you can either get it from the monitor, or view the log directly on the server.

Get allocated ID from the monitor (recommended)

To get allocated ID from the monitor, you need to make sure that the metrics you are viewing are the metrics of **the last PD leader**, and you can get the largest allocated ID from the **Current ID allocation** panel in PD dashboard.

Get allocated ID from PD log

To get the allocated ID from the PD log, you need to make sure that the log you are viewing is the log of **the last PD leader**, and you can get the maximum allocated ID by running the following command:

```
cat {/path/to}/pd*.log | grep "idAllocator allocates a new id" | awk -F
↳ '=' '{print $2}' | awk -F']' '{print $1}' | sort -r -n | head -n 1
```

```
4000
...
```

Or you can simply run the above command in all PD servers to find the largest one.

12.6.4.3.3 Deploy a new PD cluster

Before deploying a new PD cluster, you need to stop the the existing PD cluster and then delete the previous data directory or specify a new data directory using `--data-dir`.

12.6.4.3.4 Use pd-recover

You only need to run `pd-recover` on one PD node.

```
./pd-recover -endpoints http://10.0.1.13:2379 -cluster-id
↳ 6747551640615446306 -alloc-id 10000
```

12.6.4.3.5 Restart the whole cluster

When you see the prompted information that the recovery is successful, restart the whole cluster.

12.6.4.4 FAQ

12.6.4.4.1 Multiple cluster IDs are found when getting the cluster ID

When a PD cluster is created, a new cluster ID is generated. You can determine the cluster ID of the old cluster by viewing the log.

12.6.4.4.2 The error dial tcp 10.0.1.13:2379: connect: connection refused is returned when executing pd-recover

The PD service is required when you execute `pd-recover`. Deploy and start the PD cluster before you use PD Recover.

12.7 Command Line Flags

12.7.1 Configuration Options

When you start the TiDB cluster, you can use command-line options or environment variables to configure it. This document introduces TiDB's command options. The default TiDB ports are 4000 for client requests and 10080 for status report.

12.7.1.1 `--advertise-address`

- The IP address through which to log into the TiDB server
- Default: ""
- This address must be accessible by the rest of the TiDB cluster and the user.

12.7.1.2 `--config`

- The configuration file
- Default: ""
- If you have specified the configuration file, TiDB reads the configuration file. If the corresponding configuration also exists in the command line options, TiDB uses the configuration in the command line options to overwrite that in the configuration file. For detailed configuration information, see [TiDB Configuration File Description](#).

12.7.1.3 `--config-check`

- Checks the validity of the configuration file and exits
- Default: `false`

12.7.1.4 `--config-strict`

- Enforces the validity of the configuration file
- Default: `false`

12.7.1.5 `--cors`

- Specifies the `Access-Control-Allow-Origin` value for Cross-Origin Request Sharing (CORS) request of the TiDB HTTP status service
- Default: ""

12.7.1.6 `--host`

- The host address that the TiDB server monitors
- Default: "0.0.0.0"
- The TiDB server monitors this address.
- The "0.0.0.0" address monitors all network cards by default. If you have multiple network cards, specify the network card that provides service, such as 192.168.100.113.

12.7.1.7 `--enable-binlog`

- Enables or disables TiDB binlog generation
- Default: `false`

12.7.1.8 `-L`

- The log level
- Default: "info"
- Optional values: "debug", "info", "warn", "error", "fatal"

12.7.1.9 `--lease`

- The duration of the schema lease. It is **dangerous** to change the value unless you know what you do.
- Default: 45s

12.7.1.10 `--log-file`

- The log file
- Default: ""
- If this option is not set, logs are output to "stderr". If this option is set, logs are output to the corresponding file.

12.7.1.11 `--log-slow-query`

- The directory for the slow query log
- Default: ""
- If this option is not set, logs are output to the file specified by `--log-file` by default.

12.7.1.12 `--metrics-addr`

- The Prometheus Pushgateway address
- Default: ""
- Leaving it empty stops the Prometheus client from pushing.
- The format is `--metrics-addr=192.168.100.115:9091`.

12.7.1.13 `--metrics-interval`

- The Prometheus client push interval in seconds
- Default: 15s
- Setting the value to 0 stops the Prometheus client from pushing.

12.7.1.14 `-P`

- The monitoring port of TiDB services
- Default: "4000"
- The TiDB server accepts MySQL client requests from this port.

12.7.1.15 `--path`

- The path to the data directory for local storage engine like “unistore”
- For `--store = tikv`, you must specify the path; for `--store = unistore`, the default value is used if you do not specify the path.
- For the distributed storage engine like TiKV, `--path` specifies the actual PD address. Assuming that you deploy the PD server on 192.168.100.113:2379, 192.168.100.114:2379 and 192.168.100.115:2379, the value of `--path` is “192.168.100.113:2379, 192.168.100.114:2379, 192.168.100.115:2379”.
- Default: `"/tmp/tidb"`
- You can use `tidb-server --store=unistore --path=""` to enable a pure in-memory TiDB.

12.7.1.16 `--proxy-protocol-networks`

- The list of proxy server’s IP addresses allowed to connect to TiDB using the [PROXY protocol](#).
- Default: ""
- In general cases, when you access TiDB behind a reverse proxy, TiDB takes the IP address of the reverse proxy server as the IP address of the client. By enabling the PROXY protocol, reverse proxies that support this protocol such as HAProxy can pass the real client IP address to TiDB.
- After configuring this flag, TiDB allows the configured source IP address to connect to TiDB using the PROXY protocol; if a protocol other than PROXY is used, this connection will be denied. If this flag is left empty, no IP address can connect to TiDB using the PROXY protocol. The value can be the IP address (192.168.1.50) or CIDR (192.168.1.0/24) with `,` as the separator. `*` means any IP addresses.

Warning:

Use `*` with caution because it might introduce security risks by allowing a client of any IP address to report its IP address. In addition, using `*` might also cause the internal component that directly connects to TiDB (such as TiDB Dashboard) to be unavailable.

12.7.1.17 --proxy-protocol-header-timeout

- Timeout for the PROXY protocol header read
- Default: 5 (seconds)

Note:

Do not set the value to 0. Use the default value except for special situations.

12.7.1.18 --report-status

- Enables (`true`) or disables (`false`) the status report and pprof tool
- Default: `true`
- When set to `true`, this parameter enables metrics and pprof. When set to `false`, this parameter disables metrics and pprof.

12.7.1.19 --run-ddl

- To see whether the `tidb-server` runs DDL statements, and set when the number of `tidb-server` is over two in the cluster
- Default: `true`
- The value can be (`true`) or (`false`). (`true`) indicates the `tidb-server` runs DDL itself. (`false`) indicates the `tidb-server` does not run DDL itself.

12.7.1.20 --socket string

- The TiDB services use the unix socket file for external connections.
- Default: `""`
- Use `/tmp/tidb.sock` to open the unix socket file.

12.7.1.21 `--status`

- The status report port for TiDB server
- Default: "10080"
- This port is used to get server internal data. The data includes [Prometheus metrics](#) and [pprof](#).
- Prometheus metrics can be accessed by "http://host:status_port/metrics".
- pprof data can be accessed by "http://host:status_port/debug/pprof".

12.7.1.22 `--status-host`

- The HOST used to monitor the status of TiDB service
- Default: 0.0.0.0

12.7.1.23 `--store`

- Specifies the storage engine used by TiDB in the bottom layer
- Default: "unistore"
- You can choose "unistore" or "tikv". ("unistore" is the local storage engine; "tikv" is a distributed storage engine)

12.7.1.24 `--token-limit`

- The number of sessions allowed to run concurrently in TiDB. It is used for traffic control.
- Default: 1000
- If the number of the concurrent sessions is larger than `token-limit`, the request is blocked and waiting for the operations which have been finished to release tokens.

12.7.1.25 `-V`

- Outputs the version of TiDB
- Default: ""

12.7.1.26 `--plugin-dir`

- The storage directory for plugins.
- Default: "/data/deploy/plugin"

12.7.1.27 `--plugin-load`

- The names of the plugins to be loaded, each separated by a comma.
- Default: ""

12.7.1.28 `--affinity-cpus`

- Sets the CPU affinity of TiDB servers, which is separated by commas. For example, "1,2,3".
- Default: ""

12.7.1.29 `--repair-mode`

- Determines whether to enable the repair mode, which is only used in the data repair scenario.
- Default: `false`

12.7.1.30 `--repair-list`

- The names of the tables to be repaired in the repair mode.
- Default: ""

12.7.1.31 `--require-secure-transport`

- Determines whether to require the client to use the secure mode for data transport.
- Default: `false`

12.7.2 TiKV Configuration Flags

TiKV supports some readable unit conversions for command line parameters.

- File size (based on byte): KB, MB, GB, TB, PB (or lowercase)
- Time (based on ms): ms, s, m, h

12.7.2.1 `-A, --addr`

- The address that the TiKV server monitors
- Default: "127.0.0.1:20160"
- To deploy a cluster, you must use `--addr` to specify the IP address of the current host, such as "192.168.100.113:20160". If the cluster is run on Docker, specify the IP address of Docker as "0.0.0.0:20160".

12.7.2.2 `--advertise-addr`

- The server advertise address for client traffic from outside
- Default: `${addr}`
- If the client cannot connect to TiKV through the `--addr` address because of Docker or NAT network, you must manually set the `--advertise-addr` address.
- For example, the internal IP address of Docker is 172.17.0.1, while the IP address of the host is 192.168.100.113 and the port mapping is set to `-p 20160:20160`. In this case, you can set `--advertise-addr` to "192.168.100.113:20160". The client can find this service through 192.168.100.113:20160.

12.7.2.3 `--status-addr`

- The port through which the TiKV service status is listened
- Default: "20180"
- The Prometheus can access this status information via `http://host:status_port/`
↪ `metrics`.
- The Profile can access this status information via `http://host:status_port/debug`
↪ `/pprof/profile`.

12.7.2.4 `--advertise-status-addr`

- The address through which TiKV accesses service status from outside.
- Default: The value of `--status-addr` is used.
- If the client cannot connect to TiKV through the `--status-addr` address because of Docker or NAT network, you must manually set the `--advertise-status-addr` address.
- For example, the internal IP address of Docker is 172.17.0.1, while the IP address of the host is 192.168.100.113 and the port mapping is set to `-p 20180:20180`. In this case, set `--advertise-status-addr="192.168.100.113:20180"`. The client can find this service through 192.168.100.113:20180.

12.7.2.5 `-C, --config`

- The config file
- Default: ""
- If you set the configuration using the command line, the same setting in the config file will be overwritten.

12.7.2.6 `--capacity`

- The store capacity
- Default: 0 (unlimited)
- PD uses this flag to determine how to balance the TiKV servers. (Tip: you can use 10GB instead of 1073741824)

12.7.2.7 `--data-dir`

- The path to the data directory
- Default: `"/tmp/tikv/store"`

12.7.2.8 `-L`

- The log level
- Default: `"info"`
- Optional values: `"debug"`, `"info"`, `"warn"`, `"error"`, `"fatal"`

12.7.2.9 `--log-file`

- The log file
- Default: `""`
- If this flag is not set, logs will be written to `"stderr"`. If this flag is set, logs are output to the corresponding file.

12.7.2.10 `--pd`

- The address list of PD servers
- Default: `""`
- To make TiKV work, you must use the value of `--pd` to connect the TiKV server to the PD server. Separate multiple PD addresses using comma, for example `"192.168.100.113:2379, 192.168.100.114:2379, 192.168.100.115:2379"`.

12.7.3 TiFlash Command-Line Flags

This document introduces the command-line flags that you can use when you launch TiFlash.

12.7.3.1 `server --config-file`

- Specifies the path of the TiFlash configuration file
- Default: `""`
- You must specify the configuration file. For detailed configuration items, refer to [TiFlash configuration parameters](#).

12.7.3.2 dttool migrate

- Migrates the file format of DTFile (for testing or downgrading). Data is migrated in the unit of a single DTFile. If you want to migrate the whole table, you need to locate all the paths similar to `<data dir>/t_<table id>/stable/dmf_<file id>` and migrate them one by one. You can use scripts to automate the migration.
- User scenarios:
 - If you need to downgrade TiFlash from a version \geq v5.4.0 that has enabled data validation to a version $<$ v5.4.0, you can use this tool to downgrade the data format of the DTFile.
 - If you upgrade TiFlash to a version \geq v5.4.0, and if you hope to enable data validation for existing data, you can use this tool to upgrade the data format of the DTFile.
 - Test the space usage and read speed of the DTFile in different configurations.
- Parameters:
 - `--imitative`: When you do not use the encryption feature of the DTFile, you can use this flag to avoid using the configuration file and connecting to PD.
 - `--version`: The version of DTFile. The value options are 1 and 2 (default). 1 is the old version, and 2 is the version corresponding to the new checksum.
 - `--algorithm`: The hash algorithm used for data validation. The value options are `xxh3` (default), `city128`, `crc32`, `crc64`, and `none`. This parameter is effective only when `version` is 2.
 - `--frame`: The size of the validation frame. The default value is 1048576. This parameter is effective only when `version` is 2.
 - `--compression`: The target compression algorithm. The value options are `lz4` (default), `lz4hc`, `zstd`, and `none`.
 - `--level`: The target compression level. The default value is -1, which means automatic mode. The value range varies with different compression algorithms.
 - `--config-file`: The configuration file of `dttool migrate` is the same as the [configuration file of server](#). When you use the configuration file, exit the local TiFlash server instance. For more information, see `--imitative`.
 - `--file-id`: The ID of the DTFile. For example, the ID of the DTFile `dmf_123` is 123.
 - `--workdir`: The parent directory of `dmf_xxx`.
 - `--dry`: The dry run mode. Only the migration process is output.
 - `--nokeep`: Does not keep the original data. When this option is not enabled, `dmf_xxx.old` files are created.

Warning:

TiFlash can read DTFile that uses custom compression algorithms and compression levels. However, only the lz4 algorithm with the default compression level is officially supported. Custom compression parameters have not been thoroughly tested and are only experimental.

Note:

For security reasons, DTTool attempts to add a lock to the working directory in the migration mode. Therefore, in the same directory, only one DTTool can perform the migration task at the same time. If you forcibly stop DTTool where the lock is not released, then when you try to rerun DTTool later, it might refuse to perform the migration task.

If you encounter this situation, and if you are aware that removing the LOCK file does not cause any data corruption, you can manually delete the LOCK file in the working directory to release the lock.

12.7.3.3 dttool bench

- Provides a basic I/O speed test for the DTFile.
- Parameters:
 - `--version`: The version of DTFile. See `--version` in `dttool migrate`.
 - `--algorithm`: The hash algorithm used for data validation. See `--algorithm` in `dttool migrate`.
 - `--frame`: The size of the validation frame. See `--frame` in `dttool migrate`.
 - `--column`: The columns of the table to be tested. The default value is 100.
 - `--size`: The rows of the table to be tested. The default value is 1000.
 - `--field`: The field length limit of the table to be tested. The default value is 1024.
 - `--random`: The random seed. If you do not specify this parameter, the random seed is drawn from the system entropy pool.
 - `--encryption`: Enables the encryption feature.
 - `--repeat`: The number of times to repeat the test. The default value is 5.
 - `--workdir`: The temporary data directory, which points to a path in the file system to be tested. The default value is `/tmp/test`.

12.7.3.4 dttool inspect

- Checks the integrity of the DTFile. Data validation is performed in the unit of a single DTFile. If you want to validate the whole table, you need to locate all the paths similar to `<data dir>/t_<table id>/stable/dmf_<file id>` and validate them one by one. You can use scripts to automate the validation.
- User scenarios:
 - After you perform a format upgrade or downgrade, you can validate the data integrity of the DTFile.
 - After you migrate the DTFile to a new environment, you can validate the data integrity of the DTFile.
- Parameters:
 - `--config-file`: The configuration file of `dttool bench`. See `--config-file` in `dttool migrate`.
 - `--check`: Performs hash validation.
 - `--file-id`: The ID of the DTFile. See `--file-id` in `dttool migrate`.
 - `--imitative`: Imitates the database context. See `--imitative` in `dttool ↪ migrate`.
 - `--workdir`: The data directory. See `--workdir` in `dttool migrate`.

12.7.4 PD Configuration Flags

PD is configurable using command-line flags and environment variables.

12.7.4.1 --advertise-client-urls

- The list of advertise URLs for the client to access PD
- Default: `"${client-urls}"`
- In some situations such as in the Docker or NAT network environment, if a client cannot access PD through the default client URLs listened to by PD, you must manually set the advertise client URLs.
- For example, the internal IP address of Docker is `172.17.0.1`, while the IP address of the host is `192.168.100.113` and the port mapping is set to `-p 2379:2379`. In this case, you can set `--advertise-client-urls` to `"http://192.168.100.113:2379"`. The client can find this service through `"http://192.168.100.113:2379"`.

12.7.4.2 --advertise-peer-urls

- The list of advertise URLs for other PD nodes (peers) to access a PD node
- Default: `"${peer-urls}"`

- In some situations such as in the Docker or NAT network environment, if the other nodes (peers) cannot access the PD node through the default peer URLs listened to by this PD node, you must manually set the advertise peer URLs.
- For example, the internal IP address of Docker is 172.17.0.1, while the IP address of the host is 192.168.100.113 and the port mapping is set to `-p 2380:2380`. In this case, you can set `--advertise-peer-urls` to `"http://192.168.100.113:2380"`. The other PD nodes can find this service through `"http://192.168.100.113:2380"`.

12.7.4.3 `--client-urls`

- The list of client URLs to be listened to by PD
- Default: `"http://127.0.0.1:2379"`
- When you deploy a cluster, you must specify the IP address of the current host as `--client-urls` (for example, `"http://192.168.100.113:2379"`). If the cluster runs on Docker, specify the IP address of Docker as `"http://0.0.0.0:2379"`.

12.7.4.4 `--peer-urls`

- The list of peer URLs to be listened to by a PD node
- Default: `"http://127.0.0.1:2380"`
- When you deploy a cluster, you must specify `--peer-urls` as the IP address of the current host, such as `"http://192.168.100.113:2380"`. If the cluster runs on Docker, specify the IP address of Docker as `"http://0.0.0.0:2380"`.

12.7.4.5 `--config`

- The configuration file
- Default: `""`
- If you set the configuration using the command line, the same setting in the configuration file will be overwritten.

12.7.4.6 `--data-dir`

- The path to the data directory
- Default: `"default.${name}"`

12.7.4.7 `--initial-cluster`

- The initial cluster configuration for bootstrapping
- Default: `"{name}=http://{advertise-peer-url}"`

- For example, if `name` is “pd”, and `advertise-peer-urls` is “`http://192.168.100.113:2380`”
↪ , the `initial-cluster` is “`pd=http://192.168.100.113:2380`”.
- If you need to start three PD servers, the `initial-cluster` might be:

```
pd1=http://192.168.100.113:2380, pd2=http://192.168.100.114:2380, pd3  
↪ =192.168.100.115:2380
```

12.7.4.8 --join

- Join the cluster dynamically
- Default: “”
- If you want to join an existing cluster, you can use `--join="{advertise-client-
↪ urls}"`, the `advertise-client-url` is any existing PD’s, multiply advertise client
urls are separated by comma.

12.7.4.9 -L

- The log level
- Default: “info”
- Optional values: “debug”, “info”, “warn”, “error”, “fatal”

12.7.4.10 --log-file

- The log file
- Default: “”
- If this flag is not set, logs will be written to “stderr”. If this flag is set, logs are output
to the corresponding file.

12.7.4.11 --log-rotate

- To enable or disable log rotation
- Default: `true`
- When the value is true, follow the `[log.file]` in PD configuration files.

12.7.4.12 --name

- The human-readable unique name for this PD member
- Default: “`pd-{hostname}”`”
- If you want to start multiply PDs, you must use different name for each one.

12.7.4.13 `--cacert`

- The file path of CA, used to enable TLS
- Default: ""

12.7.4.14 `--cert`

- The path of the PEM file including the X509 certificate, used to enable TLS
- Default: ""

12.7.4.15 `--key`

- The path of the PEM file including the X509 key, used to enable TLS
- Default: ""

12.7.4.16 `--metrics-addr`

- The address of Prometheus Pushgateway, which does not push data to Prometheus by default.
- Default: ""

12.8 Key Monitoring Metrics

12.8.1 Key Metrics

If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus & Grafana) is deployed at the same time. For more information, see [TiDB Monitoring Framework Overview](#).

The Grafana dashboard is divided into a series of sub dashboards which include Overview, PD, TiDB, TiKV, Node_exporter, Disk Performance, and so on. A lot of metrics are there to help you diagnose.

For routine operations, you can get an overview of the component (PD, TiDB, TiKV) status and the entire cluster from the Overview dashboard, where the key metrics are displayed. This document provides a detailed description of these key metrics.

12.8.1.1 Key metrics description

To understand the key metrics displayed on the Overview dashboard, check the following table:

Service Panel Name	Description	Normal Range
Services Services Up Port Sta- tus	The online nodes number of each service.	
PD PD role	The role of the current PD.	
PD Storage capacity	The total storage capacity of the TiDB cluster.	
PD Current storage size	The occupied storage capacity of the TiDB cluster, including the space occupied by TiKV replicas.	
PD Normal stores	The number of nodes in the normal state.	
PD Abnormal stores	The number of nodes in the abnormal state.	0
PD Number of Regions	The total number of Regions in the current cluster. Note that the number of Regions has nothing to do with the number of replicas.	
PD 99% completed_cmds_duration	The 99th percentile duration to complete a pd-server request.	less than 5ms
PD Handle_requests_duration	The network duration of a PD request.	less than 20ms
PD Region health	The state of each Region.	Generally, the number of pending peers is less than 100, and that of the missing peers cannot always be greater than 0.
PD Hot write Region's leader distribution	The total number of leaders who are the write hotspots on each TiKV instance.	
PD Hot read Region's leader distribution	The total number of leaders who are the read hotspots on each TiKV instance.	
PD Region heartbeat report	The count of heartbeats reported to PD per instance.	
PD 99% Region heartbeat latency	The heartbeat latency per TiKV instance (P99).	

Service Panel Name	Description	Normal Range
TiDB Statement OPS	The number of different types of SQL statements executed per second, which is counted according to <code>SELECT</code> , <code>INSERT</code> , <code>UPDATE</code> , and other types of statements.	
TiDB Duration	The execution time.1. The duration between the time that the client's network request is sent to TiDB and the time that the request is returned to the client after TiDB has executed the request. In general, client requests are sent in the form of SQL statements; however, this duration can include the execution time of commands such as <code>COM_PING</code> , <code>COM_SLEEP</code> , <code>COM_STMT_FETCH</code> , and <code>COM_SEND_LONG_DATA</code> .2. Because TiDB supports Multi-Query, TiDB supports sending multiple SQL statements at one time, such as <code>select 1; select 1; select 1;</code> . In this case, the total execution time of this query includes the execution time of all SQL statements.	
TiDB CPS By Instance	CPS By Instance: the command statistics on each TiDB instance, which is classified according to the success or failure of command execution results.	
TiDB Failed Query OPM	The statistics of error types (such as syntax errors and primary key conflicts) based on the errors occurred when executing SQL statements per second on each TiDB instance. The module in which the error occurs and the error code are included.	
TiDB Connection Count	The connection number of each TiDB instance.	

Service Panel Name	Description	Normal Range
TiDB Memory Usage	The memory usage statistics of each TiDB instance, which is divided into the memory occupied by processes and the memory applied by Golang on the heap.	
TiDB Transaction OPS	The number of transactions executed per second.	
TiDB Transaction Duration	The execution time of a transaction	
TiDB KV Cmd OPS	The number of executed KV commands.	
TiDB KV Cmd Duration 99	The execution time of the KV command.	
TiDB PD TSO OPS	The number of TSO that TiDB obtains from PD per second.	
TiDB PD TSO Wait Duration	The duration that TiDB waits for PD to return TSO.	
TiDB TiClient Region Error OPS	The number of Region related errors returned by TiKV.	
TiDB Lock Resolve OPS	The number of TiDB operations that resolve locks. When TiDB's read or write request encounters a lock, it tries to resolve the lock.	
TiDB KV Backoff OPS	The number of errors returned by TiKV.	
TiKV leader	The number of leaders on each TiKV node.	
TiKV region	The number of Regions on each TiKV node.	
TiKV CPU	The CPU usage ratio on each TiKV node.	
TiKV Memory	The memory usage on each TiKV node.	
TiKV store size	The size of storage space used by each TiKV instance.	
TiKV cf size	The size of each column family (CF for short).	
TiKV channel full	The number of "channel full" errors on each TiKV instance.	0
TiKV server report failures	The number of error messages reported by each TiKV instance.	0

Service Panel Name	Description	Normal Range
TiKV scheduler pending commands	The number of pending commands on each TiKV instance.	
TiKV coprocessor executor count	The number of coprocessor operations received by TiKV per second. Each type of coprocessor is counted separately.	
TiKV coprocessor request duration	The time consumed to process read requests of coprocessor.	
TiKV raft store CPU	The CPU usage ratio of the raftstore thread	The default number of threads is 2 (configured by <code>raftstore.store-pool-size</code>). A value of over 80% for a single thread indicates that the CPU usage ratio is very high.
TiKV Coprocessor CPU	The CPU usage ratio of the coprocessor thread.	
System Vcores Info	The number of CPU cores.	
System Memory Info	The total memory.	
System CPU Usage Info	The CPU usage ratio, 100% at a maximum.	
System Load [1m] Info	The overload within 1 minute.	
System Memory Info Available	The size of the available memory.	
System Network Traffic Info	The statistics of the network traffic.	
System TCP Retrans Info	The frequency of the TOC retransmission.	
System IO Util Info	The disk usage ratio, 100% at a maximum; generally you need to consider adding a new node when the usage ratio is up to 80% ~ 90%.	

12.8.1.2 Interface of the Overview dashboard

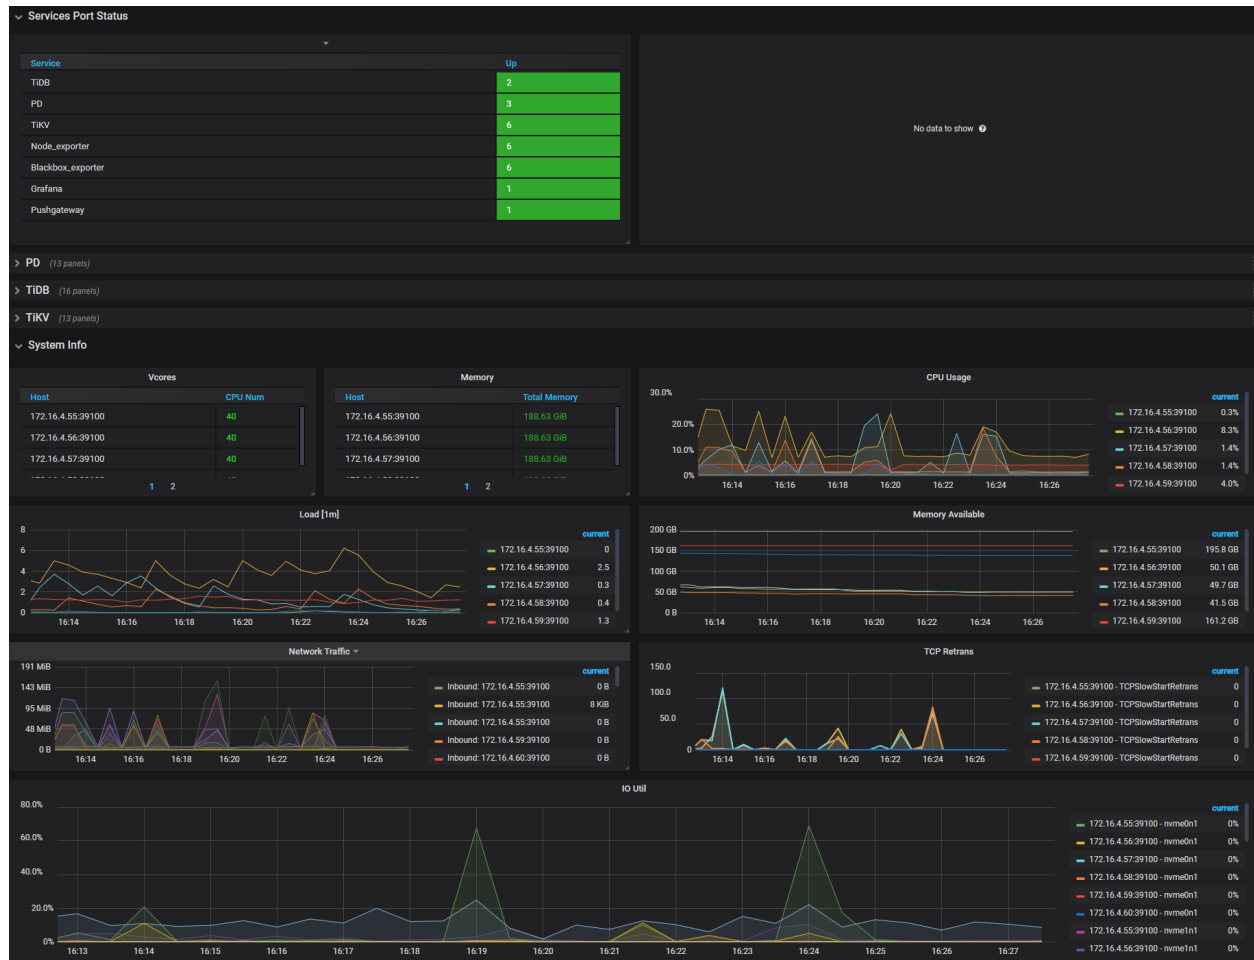

Figure 212: overview

12.8.2 TiDB Monitoring Metrics

If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus & Grafana) is deployed at the same time. For the monitoring architecture, see [TiDB Monitoring Framework Overview](#).

The Grafana dashboard is divided into a series of sub dashboards which include Overview, PD, TiDB, TiKV, Node_exporter, Disk Performance, and so on. The TiDB dashboard consists of the TiDB panel and the TiDB Summary panel. The differences between the two panels are different in the following aspects:

- TiDB panel: provides as comprehensive information as possible for troubleshooting cluster anomalies.

- TiDB Summary Panel: extracts parts of the TiDB panel information with which users are most concerned, with some modifications. It provides data (such as QPS, TPS, response delay) that users care about in the daily database operations, which serves as the monitoring information to be displayed or reported.

This document describes some key monitoring metrics displayed on the TiDB dashboard.

12.8.2.1 Key metrics description

To understand the key metrics displayed on the TiDB dashboard, check the following list:

- Query Summary
 - Duration: execution time
 - * The duration between the time that the client's network request is sent to TiDB and the time that the request is returned to the client after TiDB has executed it. In general, client requests are sent in the form of SQL statements, but can also include the execution time of commands such as `COM_PING`, `COM_SLEEP`, `COM_STMT_FETCH`, and `COM_SEND_LONG_DATA`
 - * Because TiDB supports Multi-Query, it supports sending multiple SQL statements at one time, such as `select 1; select 1; select 1;`. In this case, the total execution time of this query includes the execution time of all SQL statements
 - Command Per Second: the number of commands processed by TiDB per second, which is classified according to the success or failure of command execution results
 - QPS: the number of SQL statements executed per second on all TiDB instances, which is counted according to `SELECT`, `INSERT`, `UPDATE`, and other types of statements
 - CPS By Instance: the command statistics on each TiDB instance, which is classified according to the success or failure of command execution results
 - Failed Query OPM: the statistics of error types (such as syntax errors and primary key conflicts) according to the errors occurred when executing SQL statements per minute on each TiDB instance. It contains the module in which the error occurs and the error code
 - Slow query: the statistics of the processing time of slow queries (the time cost of the entire slow query, the time cost of Coprocessor, and the waiting time for Coprocessor scheduling). Slow queries are classified into internal and general SQL statements
 - Connection Idle Duration: the duration of idle connections
 - 999/99/95/80 Duration: the statistics of the execution time for different types of SQL statements (different percentiles)
- Query Detail

- Duration 80/95/99/999 By Instance: the statistics of the execution time for SQL statements on each TiDB instance (different percentiles)
 - Failed Query OPM Detail: the statistics of error types (such as syntax errors and primary key conflicts) according to the errors occurred when executing SQL statements per minute on each TiDB instance
 - Internal SQL OPS: the internal SQL statements executed per second in the entire TiDB cluster. The internal SQL statements are internally executed and are generally triggered by user SQL statements or internally scheduled tasks.
- Server
 - Uptime: the runtime of each TiDB instance
 - Memory Usage: the memory usage statistics of each TiDB instance, which is divided into the memory occupied by processes and the memory applied by Golang on the heap
 - CPU Usage: the statistics of CPU usage of each TiDB instance
 - Connection Count: the number of clients connected to each TiDB instance
 - Open FD Count: the statistics of opened file descriptors of each TiDB instance
 - Disconnection Count: the number of clients disconnected to each TiDB instance
 - Events OPM: the statistics of key events, such as “start”, “close”, “graceful-shutdown”, “kill”, “hang”, and so on
 - Goroutine Count: the number of Goroutines on each TiDB instance
 - Prepare Statement Count: the number of `Prepare` statements that are executed on each TiDB instance and the total count of them
 - Keep Alive OPM: the number of times that the metrics are refreshed every minute on each TiDB instance. It usually needs no attention.
 - Panic And Critical Error: the number of panics and critical errors occurred in TiDB
 - Time Jump Back OPS: the number of times that the operating system rewinds every second on each TiDB instance
 - Get Token Duration: the time cost of getting Token on each connection
 - Skip Binlog Count: the number of binlog write failures in TiDB
 - Client Data Traffic: data traffic statistics of TiDB and the client
 - Transaction
 - Transaction OPS: the number of transactions executed per second
 - Duration: the execution duration of a transaction
 - Transaction Statement Num: the number of SQL statements in a transaction
 - Transaction Retry Num: the number of times that a transaction retries
 - Session Retry Error OPS: the number of errors encountered during the transaction retry per second. This metric includes two error types: retry failure and exceeding the maximum number of retries
 - Commit Token Wait Duration: the wait duration in the flow control queue during the transaction commit. If the wait duration is long, it means that the transaction to commit is too large and the flow is controlled. If the system still has resources

- available, you can speed up the commit process by increasing the `committer-concurrency` value in the TiDB configuration file
- KV Transaction OPS: the number of transactions executed per second within each TiDB instance
 - * A user transaction might trigger multiple transaction executions in TiDB, including reading internal metadata, atomic retries of the user transaction, and so on
 - * TiDB's internally scheduled tasks also operate on the database through transactions, which are also included in this panel
 - KV Transaction Duration: the time spent on executing transactions within each TiDB
 - Transaction Regions Num: the number of Regions operated in the transaction
 - Transaction Write KV Num Rate and Sum: the rate at which KVs are written and the sum of these written KVs in the transaction
 - Transaction Write KV Num: the number of KVs operated in the transaction
 - Statement Lock Keys: the number of locks for a single statement
 - Send HeartBeat Duration: the duration for the transaction to send heartbeats
 - Transaction Write Size Bytes Rate and sum: the rate at which bytes are written and the sum of these written bytes in the transaction
 - Transaction Write Size Bytes: the size of the data written in the transaction
 - Acquire Pessimistic Locks Duration: the time consumed by adding locks
 - TTL Lifetime Reach Counter: the number of transactions that reach the upper limit of TTL. The default value of the TTL upper limit is 1 hour. It means that 1 hour has passed since the first lock of a pessimistic transaction or the first prewrite of an optimistic transaction. The default value of the upper limit of TTL is 1 hour. The upper limit of TTL life can be changed by modifying `max-txn-TTL` in the TiDB configuration file
 - Load Safepoint OPS: the number of times that `Safepoint` is loaded. `Safepoint` is to ensure that the data before `Safepoint` is not read when the transaction reads data, thus ensuring data safety. The data before `Safepoint` might be cleaned up by the GC
 - Pessimistic Statement Retry OPS: the number of retry attempts for pessimistic statements. When the statement tries to add lock, it might encounter a write conflict. At this time, the statement will acquire a new snapshot and add lock again
 - Transaction Types Per Seconds: the number of transactions committed per second using the two-phase commit (2PC), async commit, and one-phase commit (1PC) mechanisms, including both success and failure transactions
- Executor
 - Parse Duration: the statistics of the parsing time of SQL statements
 - Compile Duration: the statistics of the time of compiling the parsed SQL AST to the execution plan
 - Execution Duration: the statistics of the execution time for SQL statements

- Expensive Executor OPS: the statistics of the operators that consume many system resources per second, including Merge Join, Hash Join, Index Look Up
↔ Join, Hash Agg, Stream Agg, Sort, TopN, and so on
- Queries Using Plan Cache OPS: the statistics of queries using the Plan Cache per second
- Distsql
 - Distsql Duration: the processing time of Distsql statements
 - Distsql QPS: the statistics of Distsql statements
 - Distsql Partial QPS: the number of Partial results every second
 - Scan Keys Num: the number of keys that each query scans
 - Scan Keys Partial Num: the number of keys that each Partial result scans
 - Partial Num: the number of Partial results for each SQL statement
- KV Errors
 - KV Backoff Duration: the total duration that a KV retry request lasts. TiDB might encounter an error when sending a request to TiKV. TiDB has a retry mechanism for every request to TiKV. This KV Backoff Duration item records the total time of a request retry.
 - TiClient Region Error OPS: the number of Region related error messages returned by TiKV
 - KV Backoff OPS: the number of error messages returned by TiKV
 - Lock Resolve OPS: the number of TiDB operations to resolve locks. When TiDB's read or write request encounters a lock, it tries to resolve the lock
 - Other Errors OPS: the number of other types of errors, including clearing locks and updating SafePoint
- KV Request
 - KV Request OPS: the execution times of a KV request, displayed according to TiKV
 - KV Request Duration 99 by store: the execution time of a KV request, displayed according to TiKV
 - KV Request Duration 99 by type: the execution time of a KV request, displayed according to the request type
- PD Client
 - PD Client CMD OPS: the statistics of commands executed by PD Client per second
 - PD Client CMD Duration: the time it takes for PD Client to execute commands
 - PD Client CMD Fail OPS: the statistics of failed commands executed by PD Client per second
 - PD TSO OPS: the number of TSO that TiDB obtains from PD per second
 - PD TSO Wait Duration: the time that TiDB waits for PD to return TSO
 - PD TSO RPC duration: the duration from the time that TiDB sends request to PD (to get TSO) to the time that TiDB receives TSO

- Start TSO Wait Duration: the duration from the time that TiDB sends request to PD (to get `start TSO`) to the time that TiDB receives `start TSO`
- Schema Load
 - Load Schema Duration: the time it takes TiDB to obtain the schema from TiKV
 - Load Schema OPS: the statistics of the schemas that TiDB obtains from TiKV per second
 - Schema Lease Error OPM: the Schema Lease errors include two types: `change` and `outdate`. `change` means that the schema has changed, and `outdate` means that the schema cannot be updated, which is a more serious error and triggers an alert.
 - Load Privilege OPS: the statistics of the number of privilege information obtained by TiDB from TiKV per second
- DDL
 - DDL Duration 95: 95% quantile of DDL statement processing time
 - Batch Add Index Duration 100: statistics of the maximum time spent by each Batch on creating an index
 - DDL Waiting Jobs Count: the number of DDL tasks that are waiting
 - DDL META OPM: the number of times that a DDL obtains META every minute
 - DDL Worker Duration 99: 99% quantile of the execution time of each DDL worker
 - Deploy Syncer Duration: the time consumed by Schema Version Syncer initialization, restart, and clearing up operations
 - Owner Handle Syncer Duration: the time that it takes the DDL Owner to update, obtain, and check the Schema Version
 - Update Self Version Duration: the time consumed by updating the version information of Schema Version Syncer
 - DDL OPM: the number of DDL executions per second
 - DDL backfill progress in percentage: the progress of backfilling DDL tasks
- Statistics
 - Auto Analyze Duration 95: the time consumed by automatic `ANALYZE`
 - Auto Analyze QPS: the statistics of automatic `ANALYZE`
 - Stats Inaccuracy Rate: the information of the statistics inaccuracy rate
 - Pseudo Estimation OPS: the number of the SQL statements optimized using pseudo statistics
 - Dump Feedback OPS: the number of stored statistical feedbacks
 - Store Query Feedback QPS: the number of operations per second to store the feedback information of the union query, which is performed in TiDB memory
 - Significant Feedback: the number of significant feedback pieces that update the statistics information
 - Update Stats OPS: the number of operations of updating statistics with feedback
 - Fast Analyze Status 100: the status for quickly collecting statistical information
- Owner

- New ETCD Session Duration 95: the time it takes to create a new etcd session. TiDB connects to etcd in PD through etcd client to save/read some metadata information. This records the time spent creating the session
- Owner Watcher OPS: the number of Goroutine operations per second of DDL owner watch PD's etcd metadata
- Meta
 - AutoID QPS: AutoID related statistics, including three operations (global ID allocation, a single table AutoID allocation, a single table AutoID Rebase)
 - AutoID Duration: the time consumed by AutoID related operations
 - Region Cache Error OPS: the number of errors encountered per second by the cached Region information in TiDB
 - Meta Operations Duration 99: the latency of Meta operations
- GC
 - Worker Action OPM: the number of GC related operations, including `run_job`, `resolve_lock`, and `delete_range`
 - Duration 99: the time consumed by GC related operations
 - Config: the configuration of GC data life time and GC running interval
 - GC Failure OPM: the number of failed GC related operations
 - Delete Range Failure OPM: the number of times the `Delete Range` has failed
 - Too Many Locks Error OPM: the number of the error that GC clears up too many locks
 - Action Result OPM: the number of results of GC-related operations
 - Delete Range Task Status: the task status of `Delete Range`, including completion and failure
 - Push Task Duration 95: the time spent pushing GC subtasks to GC workers
- Batch Client
 - Pending Request Count by TiKV: the number of Batch messages that are pending processing
 - Batch Client Unavailable Duration 95: the unavailable time of the Batch client
 - No Available Connection Counter: the number of times the Batch client cannot find an available link

12.8.3 Key Monitoring Metrics of PD

If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus & Grafana) is deployed at the same time. For more information, see [Overview of the Monitoring Framework](#).

The Grafana dashboard is divided into a series of sub dashboards which include Overview, PD, TiDB, TiKV, Node_exporter, Disk Performance, and so on. A lot of metrics are there to help you diagnose.

You can get an overview of the component PD status from the PD dashboard, where the key metrics are displayed. This document provides a detailed description of these key metrics.

The following is the description of PD Dashboard metrics items:

- PD role: The role of the current PD instance
- Storage capacity: The total storage capacity for this TiDB cluster
- Current storage size: The storage size that is currently used by the TiDB cluster
- Current storage usage: The current storage usage rate
- Normal stores: The count of healthy storage instances
- Number of Regions: The total count of cluster Regions
- Abnormal stores: The count of unhealthy stores. The normal value is 0. If the number is bigger than 0, it means at least one instance is abnormal.
- Region health: The health status of Regions indicated via the count of unusual Regions including pending peers, down peers, extra peers, offline peers, missing peers, learner peers and incorrect namespaces. Generally, the number of pending peers should be less than 100. The missing peers should not be persistently greater than 0. If many empty Regions exist, enable Region Merge in time.

- Current peer count: The current count of all cluster peers

12.8.3.1 Key metrics description

12.8.3.2 Cluster

- PD scheduler config: The list of PD scheduler configurations
- Cluster ID: The unique identifier of the cluster
- Current TSO: The physical part of current allocated TSO
- Current ID allocation: The maximum allocatable ID for new store/peer
- Region label isolation level: The number of Regions in different label levels
- Label distribution: The distribution status of the labels in the cluster
- Store Limit: The flow control limitation of scheduling on the Store

Figure 213: PD Dashboard - Cluster metrics

12.8.3.3 Operator

- Schedule operator create: The number of newly created operators per type
- Schedule operator check: The number of checked operator per type. It mainly checks whether the current step is finished; if yes, it returns the next step to be executed
- Schedule operator finish: The number of finished operators per type
- Schedule operator timeout: The number of timeout operators per type
- Schedule operator replaced or canceled: The number of replaced or canceled operators per type
- Schedule operators count by state: The number of operators per state
- Operator finish duration: The maximum duration of finished operators
- Operator step duration: The maximum duration of finished operator steps

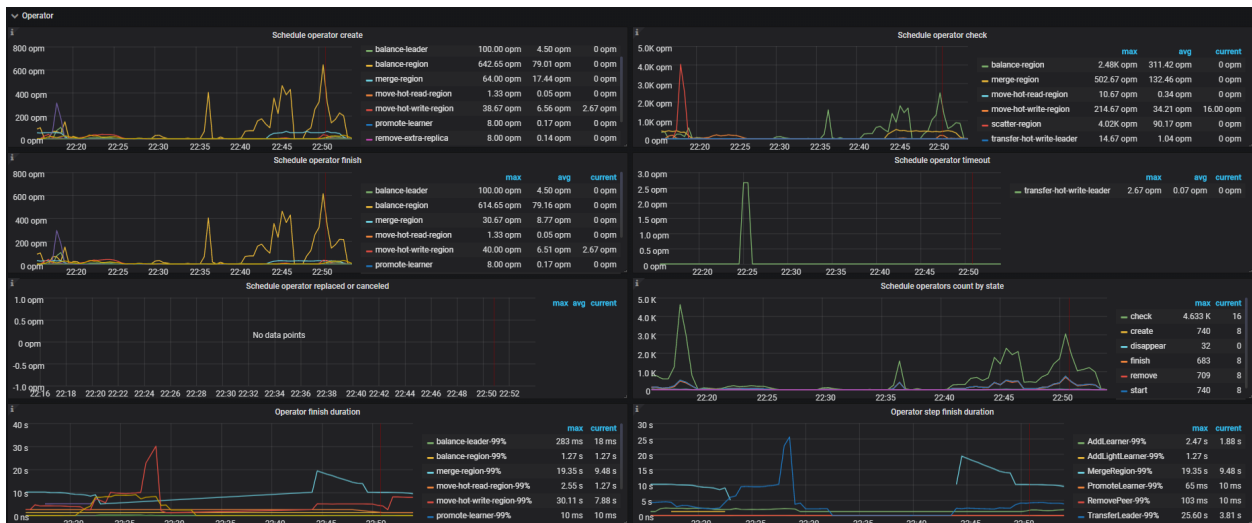

Figure 214: PD Dashboard - Operator metrics

12.8.3.4 Statistics - Balance

- Store capacity: The capacity size per TiKV instance

- Store available: The available capacity size per TiKV instance
- Store used: The used capacity size per TiKV instance
- Size amplification: The size amplification ratio per TiKV instance, which is equal to (Store Region size)/(Store used capacity size)
- Size available ratio: The size availability ratio per TiKV instance, which is equal to (Store available capacity size)/(Store capacity size)
- Store leader score: The leader score per TiKV instance
- Store Region score: The Region score per TiKV instance
- Store leader size: The total leader size per TiKV instance
- Store Region size: The total Region size per TiKV instance
- Store leader count: The leader count per TiKV instance
- Store Region count: The Region count per TiKV instance

Figure 215: PD Dashboard - Balance metrics

12.8.3.5 Statistics - hot write

- Hot Region's leader distribution: The total number of leader Regions that have become write hotspots on each TiKV instance
- Total written bytes on hot leader Regions: The total written bytes by leader Regions that have become write hotspots on each TiKV instance

- Hot write Region's peer distribution: The total number of peer Regions that have become write hotspots on each TiKV instance
- Total written bytes on hot peer Regions: The written bytes of all peer Regions that have become write hotspots on each TiKV instance
- Store Write rate bytes: The total written bytes on each TiKV instance
- Store Write rate keys: The total written keys on each TiKV instance
- Hot cache write entry number: The number of peers on each TiKV instance that are in the write hotspot statistics module
- Selector events: The event count of Selector in the hotspot scheduling module
- Direction of hotspot move leader: The direction of leader movement in the hotspot scheduling. The positive number means scheduling into the instance. The negative number means scheduling out of the instance
- Direction of hotspot move peer: The direction of peer movement in the hotspot scheduling. The positive number means scheduling into the instance. The negative number means scheduling out of the instance

Figure 216: PD Dashboard - Hot write metrics

12.8.3.6 Statistics - hot read

- Hot Region's peer distribution: The total number of peer Regions that have become read hotspots on each TiKV instance
- Total read bytes on hot peer Regions: The total read bytes of peers that have become read hotspots on each TiKV instance
- Store read rate bytes: The total read bytes of each TiKV instance
- Store read rate keys: The total read keys of each TiKV instance
- Hot cache read entry number: The number of peers that are in the read hotspot statistics module on each TiKV instance

Figure 217: PD Dashboard - Hot read metrics

12.8.3.7 Scheduler

- Scheduler is running: The current running schedulers
- Balance leader movement: The leader movement details among TiKV instances
- Balance Region movement: The Region movement details among TiKV instances
- Balance leader event: The count of balance leader events
- Balance Region event: The count of balance Region events
- Balance leader scheduler: The inner status of balance leader scheduler
- Balance Region scheduler: The inner status of balance Region scheduler
- Replica checker: The replica checker's status
- Rule checker: The rule checker's status
- Region merge checker: The merge checker's status
- Filter target: The number of attempts that the store is selected as the scheduling target but failed to pass the filter
- Filter source: The number of attempts that the store is selected as the scheduling source but failed to pass the filter
- Balance Direction: The number of times that the Store is selected as the target or source of scheduling

Figure 218: PD Dashboard - Scheduler metrics

12.8.3.8 gRPC

- Completed commands rate: The rate per command type at which gRPC commands are completed
- 99% Completed commands duration: The rate per command type at which gRPC commands are completed (P99)

Figure 219: PD Dashboard - gRPC metrics

12.8.3.9 etcd

- Handle transactions count: The rate at which etcd handles transactions
- 99% Handle transactions duration: The transaction handling rate (P99)
- 99% WAL fsync duration: The time consumed for writing WAL into the persistent storage. It is less than **1s** (P99)
- 99% Peer round trip time seconds: The network latency for etcd (P99) | The value is less than **1s**
- etcd disk WAL fsync rate: The rate of writing WAL into the persistent storage
- Raft term: The current term of Raft
- Raft committed index: The last committed index of Raft
- Raft applied index: The last applied index of Raft

Figure 220: PD Dashboard - etcd metrics

12.8.3.10 TiDB

- PD Server TSO handle time and Client rcv time: The duration between PD receiving the TSO request and the PD client getting the TSO response
- Handle requests count: The count of TiDB requests
- Handle requests duration: The time consumed for handling TiDB requests. It should be less than 100ms (P99)

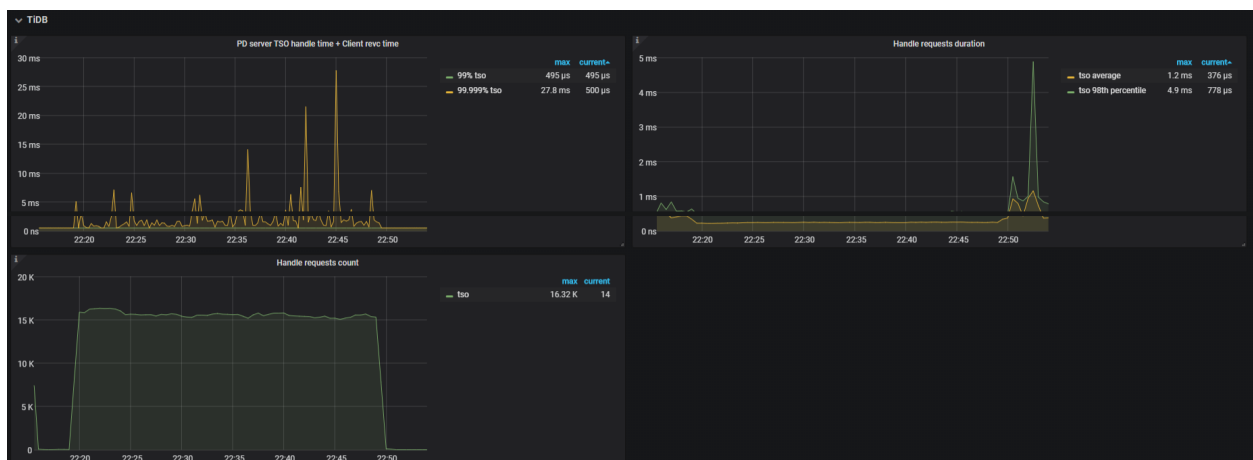

Figure 221: PD Dashboard - TiDB metrics

12.8.3.11 Heartbeat

- Heartbeat region event QPS: The QPS of handling heartbeat messages, including updating the cache and persisting data
- Region heartbeat report: The count of heartbeats reported to PD per instance
- Region heartbeat report error: The count of heartbeats with the **error** status
- Region heartbeat report active: The count of heartbeats with the **ok** status
- Region schedule push: The count of corresponding schedule commands sent from PD per TiKV instance
- 99% Region heartbeat latency: The heartbeat latency per TiKV instance (P99)

Figure 222: PD Dashboard - Heartbeat metrics

12.8.3.12 Region storage

- Syncer Index: The maximum index in the Region change history recorded by the leader
- history last index: The last index where the Region change history is synchronized successfully with the follower

Figure 223: PD Dashboard - Region storage

12.8.4 Key Monitoring Metrics of TiKV

If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus/-Grafana) is deployed at the same time. For more information, see [Overview of the Monitoring Framework](#).

The Grafana dashboard is divided into a series of sub dashboards which include Overview, PD, TiDB, TiKV, Node_exporter, and so on. A lot of metrics are there to help you diagnose.

You can get an overview of the component TiKV status from the **TiKV-Details** dashboard, where the key metrics are displayed. According to the [Performance Map](#), you can check whether the status of the cluster is as expected.

This document provides a detailed description of these key metrics on the **TiKV-Details** dashboard.

12.8.4.1 Cluster

- Store size: The storage size per TiKV instance
- Available size: The available capacity per TiKV instance
- Capacity size: The capacity size per TiKV instance
- CPU: The CPU utilization per TiKV instance
- Memory: The memory usage per TiKV instance
- IO utilization: The I/O utilization per TiKV instance
- MBps: The total bytes of read and write in each TiKV instance
- QPS: The QPS per command in each TiKV instance
- Errps: The rate of gRPC message failures
- leader: The number of leaders per TiKV instance
- Region: The number of Regions per TiKV instance
- Uptime: The runtime of TiKV since last restart

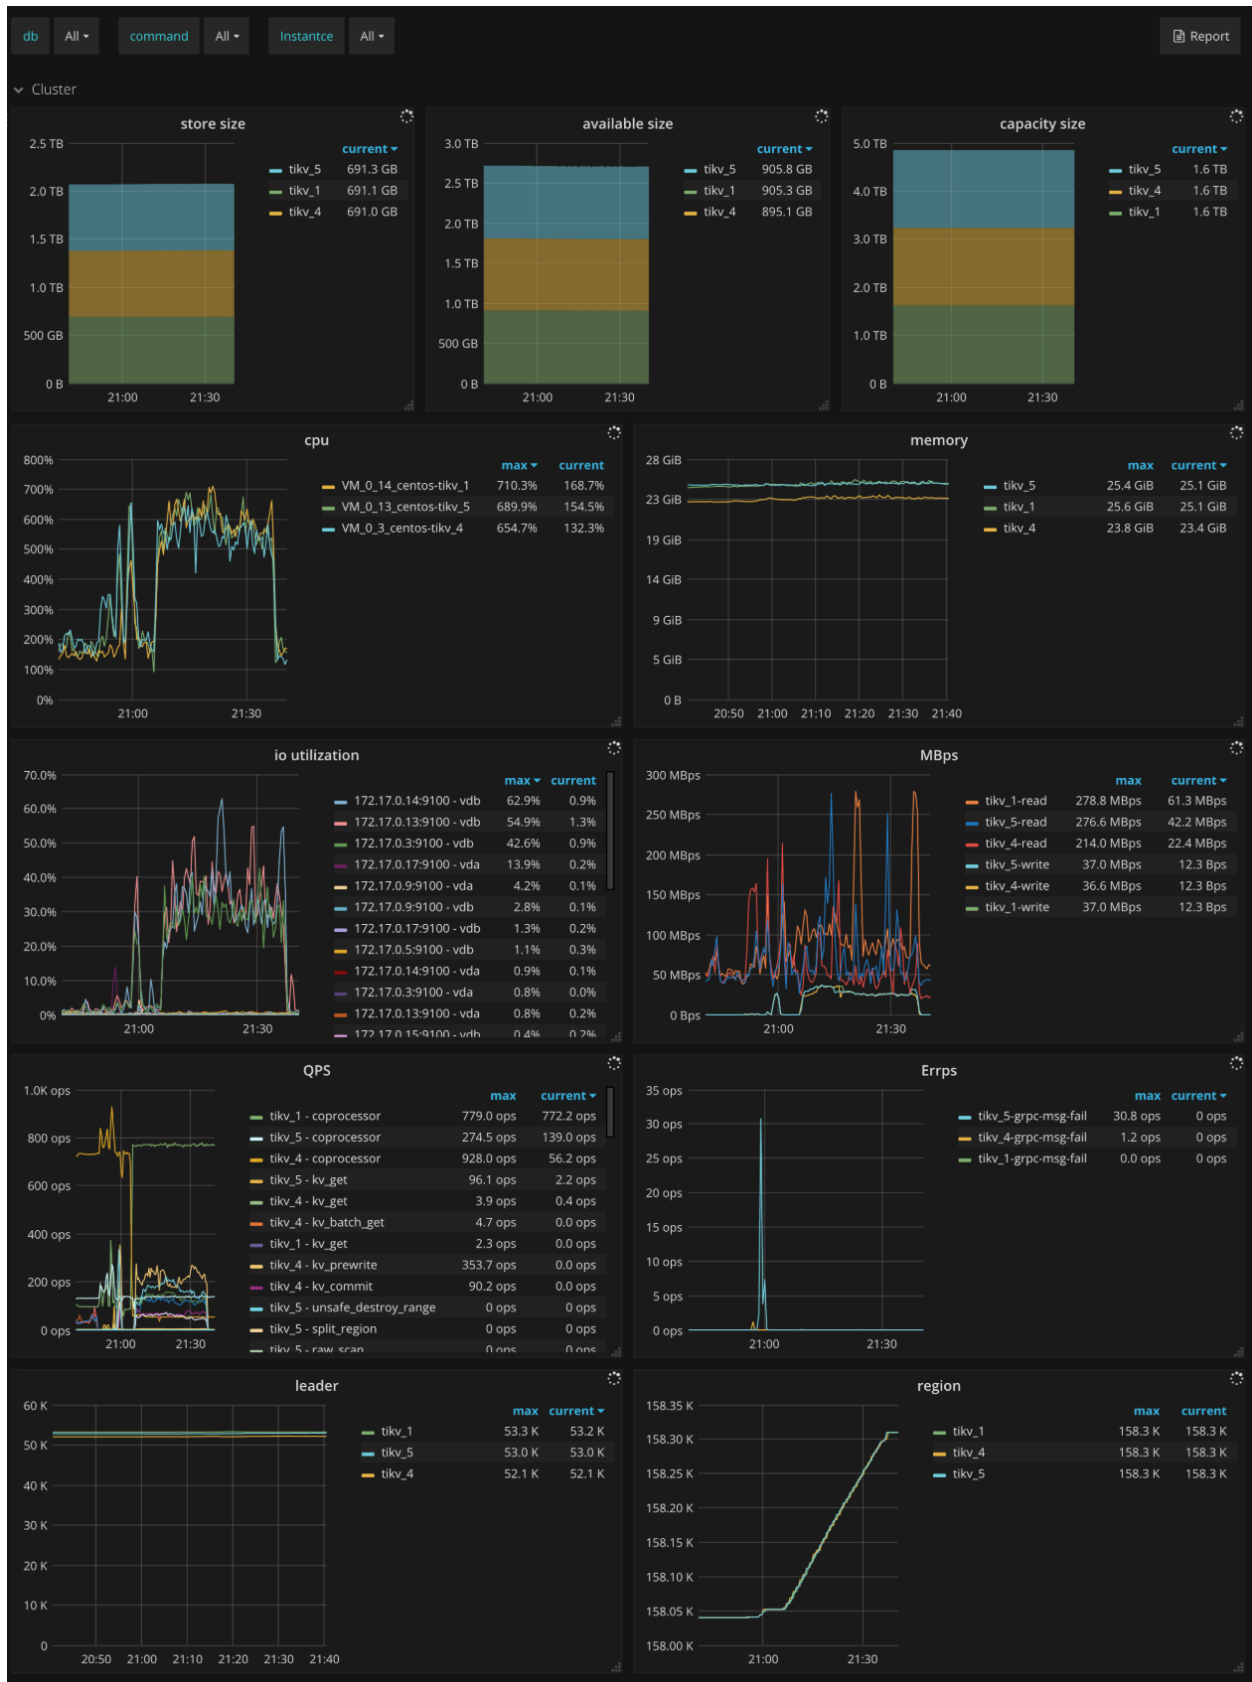

Figure 224: TiKV Dashboard - Cluster metrics
2206

12.8.4.2 Errors

- Critical error: The number of critical errors
- Server is busy: Indicates occurrences of events that make the TiKV instance unavailable temporarily, such as Write Stall, Channel Full, and so on. It should be 0 in normal case.
- Server report failures: The number of error messages reported by server. It should be 0 in normal case.
- Raftstore error: The number of Raftstore errors per type on each TiKV instance
- Scheduler error: The number of scheduler errors per type on each TiKV instance
- Coprocessor error: The number of coprocessor errors per type on each TiKV instance
- gRPC message error: The number of gRPC message errors per type on each TiKV instance
- Leader drop: The count of dropped leaders per TiKV instance
- Leader missing: The count of missing leaders per TiKV instance

Figure 225: TiKV Dashboard - Errors metrics

12.8.4.3 Server

- CF size: The size of each column family
- Store size: The storage size per TiKV instance
- Channel full: The number of Channel Full errors per TiKV instance. It should be 0 in normal case.
- Active written leaders: The number of leaders being written on each TiKV instance
- Approximate Region size: The approximate Region size
- Approximate Region size Histogram: The histogram of each approximate Region size
- Region average written keys: The average number of written keys to Regions per TiKV instance
- Region average written bytes: The average written bytes to Regions per TiKV instance

Figure 226: TiKV Dashboard - Server metrics

12.8.4.4 gRPC

- gRPC message count: The rate of gRPC messages per type
- gRPC message failed: The rate of failed gRPC messages
- 99% gRPC message duration: The gRPC message duration per message type (P99)
- Average gRPC message duration: The average execution time of gRPC messages
- gRPC batch size: The batch size of gRPC messages between TiDB and TiKV
- Raft message batch size: The batch size of Raft messages between TiKV instances

12.8.4.5 Thread CPU

- Raft store CPU: The CPU utilization of the `raftstore` thread. The CPU utilization should be less than $80\% * \text{raftstore.store-pool-size}$ in normal case.
- Async apply CPU: The CPU utilization of the `async apply` thread. The CPU utilization should be less than $90\% * \text{raftstore.apply-pool-size}$ in normal cases.
- Scheduler worker CPU: The CPU utilization of the `scheduler worker` thread. The CPU utilization should be less than $90\% * \text{storage.scheduler-worker-pool-size}$ in normal cases.
- gRPC poll CPU: The CPU utilization of the `gRPC` thread. The CPU utilization should be less than $80\% * \text{server.grpc-concurrency}$ in normal cases.
- Unified read pool CPU: The CPU utilization of the `unified read pool` thread
- Storage ReadPool CPU: The CPU utilization of the `storage read pool` thread
- Coprocessor CPU: The CPU utilization of the `coprocessor` thread
- RocksDB CPU: The CPU utilization of the RocksDB thread
- GC worker CPU: The CPU utilization of the `GC worker` thread
- Background worker CPU: The CPU utilization of the `background worker` thread

12.8.4.6 PD

- PD requests: The rate at which TiKV sends to PD
- PD request duration (average): The average duration of processing requests that TiKV sends to PD
- PD heartbeats: The rate at which heartbeat messages are sent from TiKV to PD
- PD validate peers: The rate at which messages are sent from TiKV to PD to validate TiKV peers

12.8.4.7 Raft IO

- Apply log duration: The time consumed for Raft to apply logs
- Apply log duration per server: The time consumed for Raft to apply logs per TiKV instance
- Append log duration: The time consumed for Raft to append logs

- Append log duration per server: The time consumed for Raft to append logs per TiKV instance
- Commit log duration: The time consumed by Raft to commit logs
- Commit log duration per server: The time consumed by Raft to commit logs per TiKV instance

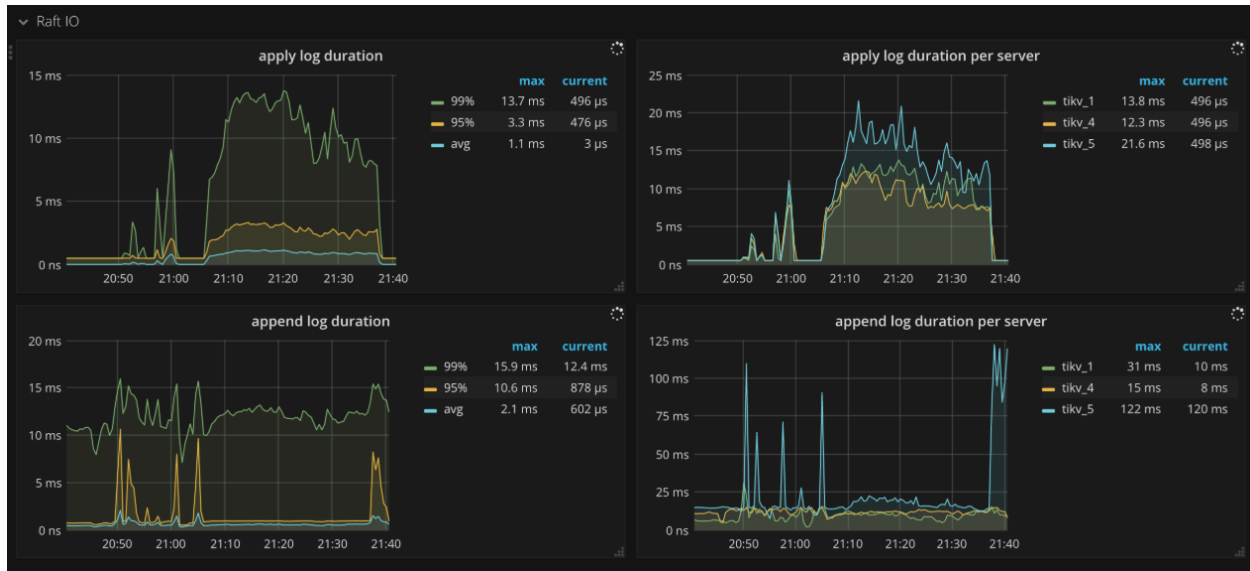

Figure 227: TiKV Dashboard - Raft IO metrics

12.8.4.8 Raft process

- Ready handled: The number of handled ready operations per type per second
 - count: The number of handled ready operations per second
 - has_ready_region: The number of Regions that have ready per second
 - pending_region: The operations per second of the Regions being checked for whether it has ready. This metric is deprecated since v3.0.0
 - message: The number of messages that the ready operations per second contain
 - append: The number of Raft log entries that the ready operations per second contain
 - commit: The number of committed Raft log entries that the ready operations per second contain
 - snapshot: The number of snapshots that the ready operations per second contains
- 0.99 Duration of Raft store events: The time consumed by Raftstore events (P99)
- Process ready duration: The time consumed for processes to be ready in Raft
- Process ready duration per server: The time consumed for peer processes to be ready in Raft per TiKV instance. It should be less than 2 seconds (P99.99).

Figure 228: TiKV Dashboard - Raft process metrics

12.8.4.9 Raft message

- Sent messages per server: The number of Raft messages sent by each TiKV instance per second
- Flush messages per server: The number of Raft messages flushed by the Raft client in each TiKV instance per second
- Receive messages per server: The number of Raft messages received by each TiKV instance per second
- Messages: The number of Raft messages sent per type per second
- Vote: The number of Vote messages sent in Raft per second
- Raft dropped messages: The number of dropped Raft messages per type per second

Figure 229: TiKV Dashboard - Raft message metrics

12.8.4.10 Raft propose

- Raft apply proposals per ready: The histogram of the number of proposals that each ready operation contains in a batch while applying proposal.
- Raft read/write proposals: The number of proposals per type per second
- Raft read proposals per server: The number of read proposals made by each TiKV instance per second
- Raft write proposals per server: The number of write proposals made by each TiKV instance per second
- Propose wait duration: The histogram of waiting time of each proposal
- Propose wait duration per server: The histogram of waiting time of each proposal per TiKV instance
- Apply wait duration: The histogram of apply time of each proposal
- Apply wait duration per server: The histogram of apply time of each proposal per TiKV instance
- Raft log speed: The average rate at which peers propose logs

Figure 230: TiKV Dashboard - Raft propose metrics

12.8.4.11 Raft admin

- Admin proposals: The number of admin proposals per second
- Admin apply: The number of processed apply commands per second
- Check split: The number of Raftstore split check commands per second
- 99.99% Check split duration: The time consumed when running split check commands (P99.99)

Figure 231: TiKV Dashboard - Raft admin metrics

12.8.4.12 Local reader

- Local reader requests: The number of total requests and the number of rejections from the local read thread

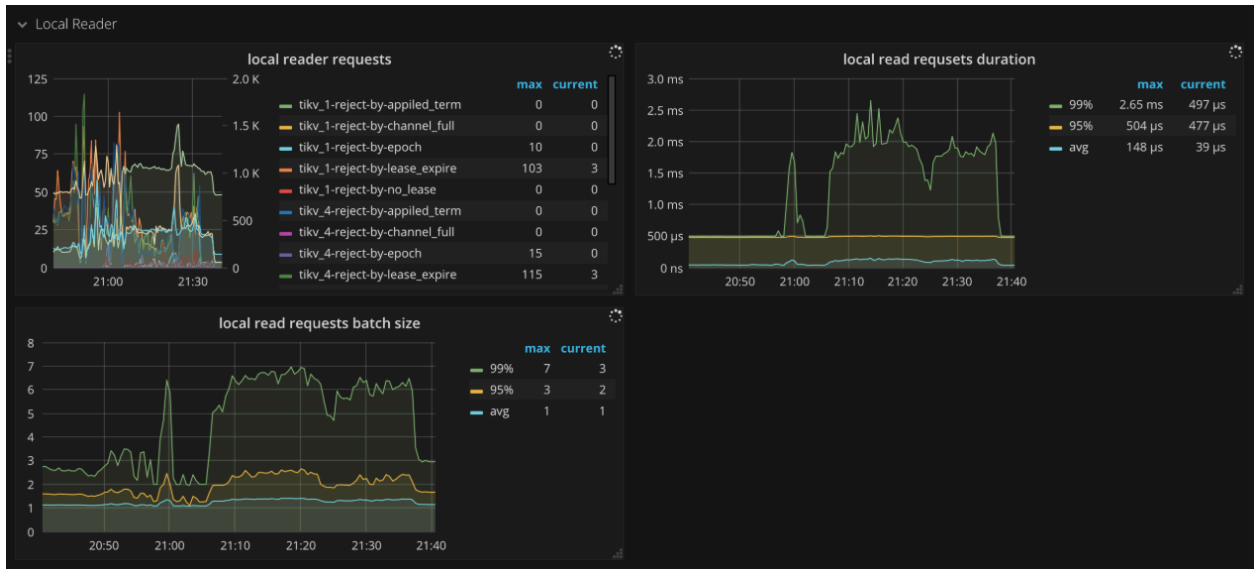

Figure 232: TiKV Dashboard - Local reader metrics

12.8.4.13 Unified Read Pool

- Time used by level: The time consumed for each level in the unified read pool. Level 0 means small queries.
- Level 0 chance: The proportion of level 0 tasks in unified read pool
- Running tasks: The number of tasks running concurrently in the unified read pool

12.8.4.14 Storage

- Storage command total: The number of received command by type per second
- Storage async request error: The number of engine asynchronous request errors per second
- Storage async snapshot duration: The time consumed by processing asynchronous snapshot requests. It should be less than **1s** in **.99**.
- Storage async write duration: The time consumed by processing asynchronous write requests. It should be less than **1s** in **.99**.

Figure 233: TiKV Dashboard - Storage metrics

12.8.4.15 Scheduler

- Scheduler stage total: The number of commands at each stage per second. There should not be a lot of errors in a short time.
- Scheduler writing bytes: The total written bytes by commands processed on each TiKV instance
- Scheduler priority commands: The count of different priority commands per second
- Scheduler pending commands: The count of pending commands per TiKV instance per second

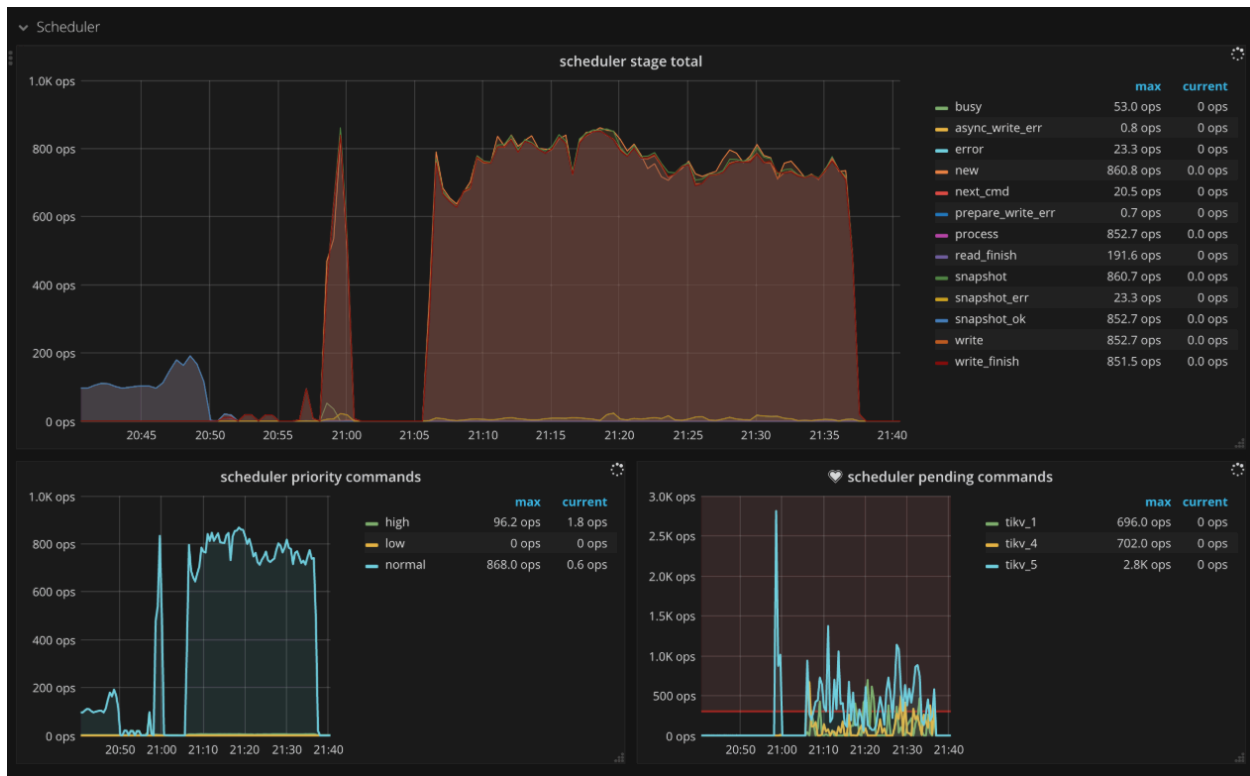

Figure 234: TiKV Dashboard - Scheduler metrics

12.8.4.16 Scheduler - commit

- Scheduler stage total: The number of commands at each stage per second when executing the commit command. There should not be a lot of errors in a short time.
- Scheduler command duration: The time consumed when executing the commit command. It should be less than 1s.
- Scheduler latch wait duration: The waiting time caused by latch when executing the commit command. It should be less than 1s.
- Scheduler keys read: The count of keys read by a commit command
- Scheduler keys written: The count of keys written by a commit command
- Scheduler scan details: The keys scan details of each CF when executing the commit command.
- Scheduler scan details [lock]: The keys scan details of lock CF when executing the commit command
- Scheduler scan details write: The keys scan details of write CF when executing the commit command
- Scheduler scan details [default]: The keys scan details of default CF when executing the commit command

Figure 235: TiKV Dashboard - Scheduler commit metrics

12.8.4.17 Scheduler - pessimistic_rollback

- Scheduler stage total: The number of commands at each stage per second when executing the `pessimistic_rollback` command. There should not be a lot of errors in a short time.
- Scheduler command duration: The time consumed when executing the `pessimistic_rollback` \leftrightarrow command. It should be less than 1s.

- Scheduler latch wait duration: The waiting time caused by latch when executing the `pessimistic_rollback` command. It should be less than `1s`.
- Scheduler keys read: The count of keys read by a `pessimistic_rollback` command
- Scheduler keys written: The count of keys written by a `pessimistic_rollback` command
- Scheduler scan details: The keys scan details of each CF when executing the `pessimistic_rollback` command.
- Scheduler scan details [lock]: The keys scan details of lock CF when executing the `pessimistic_rollback` command
- Scheduler scan details `write`: The keys scan details of write CF when executing the `pessimistic_rollback` command
- Scheduler scan details [default]: The keys scan details of default CF when executing the `pessimistic_rollback` command

12.8.4.18 Scheduler - prewrite

- Scheduler stage total: The number of commands at each stage per second when executing the prewrite command. There should not be a lot of errors in a short time.
- Scheduler command duration: The time consumed when executing the prewrite command. It should be less than `1s`.
- Scheduler latch wait duration: The waiting time caused by latch when executing the prewrite command. It should be less than `1s`.
- Scheduler keys read: The count of keys read by a prewrite command
- Scheduler keys written: The count of keys written by a prewrite command
- Scheduler scan details: The keys scan details of each CF when executing the prewrite command.
- Scheduler scan details [lock]: The keys scan details of lock CF when executing the prewrite command
- Scheduler scan details `write`: The keys scan details of write CF when executing the prewrite command
- Scheduler scan details [default]: The keys scan details of default CF when executing the prewrite command

12.8.4.19 Scheduler - rollback

- Scheduler stage total: The number of commands at each stage per second when executing the rollback command. There should not be a lot of errors in a short time.
- Scheduler command duration: The time consumed when executing the rollback command. It should be less than `1s`.
- Scheduler latch wait duration: The waiting time caused by latch when executing the rollback command. It should be less than `1s`.
- Scheduler keys read: The count of keys read by a rollback command
- Scheduler keys written: The count of keys written by a rollback command

- Scheduler scan details: The keys scan details of each CF when executing the rollback command.
- Scheduler scan details [lock]: The keys scan details of lock CF when executing the rollback command
- Scheduler scan details write: The keys scan details of write CF when executing the rollback command
- Scheduler scan details [default]: The keys scan details of default CF when executing the rollback command

12.8.4.20 GC

- GC tasks: The count of GC tasks processed by gc_worker
- GC tasks Duration: The time consumed when executing GC tasks
- TiDB GC seconds: The GC duration
- TiDB GC worker actions: The count of TiDB GC worker actions
- ResolveLocks Progress: The progress of the first phase of GC (Resolve Locks)
- TiKV Auto GC Progress: The progress of the second phase of GC
- GC speed: The number of keys deleted by GC per second
- TiKV Auto GC SafePoint: The value of TiKV GC safe point. The safe point is the current GC timestamp
- GC lifetime: The lifetime of TiDB GC
- GC interval: The interval of TiDB GC
- GC in Compaction Filter: The count of filtered versions in the compaction filter of write CF.

12.8.4.21 Snapshot

- Rate snapshot message: The rate at which Raft snapshot messages are sent
- 99% Handle snapshot duration: The time consumed to handle snapshots (P99)
- Snapshot state count: The number of snapshots per state
- 99.99% Snapshot size: The snapshot size (P99.99)
- 99.99% Snapshot KV count: The number of KV within a snapshot (P99.99)

12.8.4.22 Task

- Worker handled tasks: The number of tasks handled by worker per second
- Worker pending tasks: Current number of pending and running tasks of worker per second. It should be less than 1000 in normal case.
- FuturePool handled tasks: The number of tasks handled by future pool per second
- FuturePool pending tasks: Current number of pending and running tasks of future pool per second

12.8.4.23 Coprocessor Overview

- Request duration: The total duration from the time of receiving the coprocessor request to the time of finishing processing the request
- Total Requests: The number of requests by type per second
- Handle duration: The histogram of time spent actually processing coprocessor requests per minute
- Total Request Errors: The number of request errors of Coprocessor per second. There should not be a lot of errors in a short time.
- Total KV Cursor Operations: The total number of the KV cursor operations by type per second, such as `select`, `index`, `analyze_table`, `analyze_index`, `checksum_table` \rightarrow , `checksum_index`, and so on.
- KV Cursor Operations: The histogram of KV cursor operations by type per second
- Total RocksDB Perf Statistics: The statistics of RocksDB performance
- Total Response Size: The total size of coprocessor response

12.8.4.24 Coprocessor Detail

- Handle duration: The histogram of time spent actually processing coprocessor requests per minute
- 95% Handle duration by store: The time consumed to handle coprocessor requests per TiKV instance per second (P95)
- Wait duration: The time consumed when coprocessor requests are waiting to be handled. It should be less than 10s (P99.99).
- 95% Wait duration by store: The time consumed when coprocessor requests are waiting to be handled per TiKV instance per second (P95)
- Total DAG Requests: The total number of DAG requests per second
- Total DAG Executors: The total number of DAG executors per second
- Total Ops Details (Table Scan): The number of RocksDB internal operations per second when executing select scan in coprocessor
- Total Ops Details (Index Scan): The number of RocksDB internal operations per second when executing index scan in coprocessor
- Total Ops Details by CF (Table Scan): The number of RocksDB internal operations for each CF per second when executing select scan in coprocessor
- Total Ops Details by CF (Index Scan): The number of RocksDB internal operations for each CF per second when executing index scan in coprocessor

12.8.4.25 Threads

- Threads state: The state of TiKV threads
- Threads IO: The I/O traffic of each TiKV thread
- Thread Voluntary Context Switches: The number of TiKV threads voluntary context switches
- Thread Nonvoluntary Context Switches: The number of TiKV threads nonvoluntary context switches

12.8.4.26 RocksDB - kv/raft

- Get operations: The count of get operations per second
- Get duration: The time consumed when executing get operations
- Seek operations: The count of seek operations per second
- Seek duration: The time consumed when executing seek operations
- Write operations: The count of write operations per second
- Write duration: The time consumed when executing write operations
- WAL sync operations: The count of WAL sync operations per second
- Write WAL duration: The time consumed for writing WAL
- WAL sync duration: The time consumed when executing WAL sync operations
- Compaction operations: The count of compaction and flush operations per second
- Compaction duration: The time consumed when executing the compaction and flush operations
- SST read duration: The time consumed when reading SST files
- Write stall duration: Write stall duration. It should be 0 in normal case.
- Memtable size: The memtable size of each column family
- Memtable hit: The hit rate of memtable
- Block cache size: The block cache size. Broken down by column family if shared block cache is disabled.
- Block cache hit: The hit rate of block cache
- Block cache flow: The flow rate of block cache operations per type
- Block cache operations: The count of block cache operations per type
- Keys flow: The flow rate of operations on keys per type
- Total keys: The count of keys in each column family
- Read flow: The flow rate of read operations per type
- Bytes / Read: The bytes per read operation
- Write flow: The flow rate of write operations per type
- Bytes / Write: The bytes per write operation
- Compaction flow: The flow rate of compaction operations per type
- Compaction pending bytes: The pending bytes to be compacted
- Read amplification: The read amplification per TiKV instance
- Compression ratio: The compression ratio of each level
- Number of snapshots: The number of snapshots per TiKV instance
- Oldest snapshots duration: The time that the oldest unreleased snapshot survivals
- Number files at each level: The number of SST files for different column families in each level
- Ingest SST duration seconds: The time consumed to ingest SST files
- Stall conditions changed of each CF: Stall conditions changed of each column family

12.8.4.27 Titan - All

- Blob file count: The number of Titan blob files
- Blob file size: The total size of Titan blob file

- Live blob size: The total size of valid blob record
- Blob cache hit: The hit rate of Titan block cache
- Iter touched blob file count: The number of blob file involved in a single iterator
- Blob file discardable ratio distribution: The ratio distribution of blob record failure of blob files
- Blob key size: The size of Titan blob keys
- Blob value size: The size of Titan blob values
- Blob get operations: The count of get operations in Titan blob
- Blob get duration: The time consumed when executing get operations in Titan blob
- Blob iter operations: The time consumed when executing iter operations in Titan blob
- Blob seek duration: The time consumed when executing seek operations in Titan blob
- Blob next duration: The time consumed when executing next operations in Titan blob
- Blob prev duration: The time consumed when executing prev operations in Titan blob
- Blob keys flow: The flow rate of operations on Titan blob keys
- Blob bytes flow: The flow rate of bytes on Titan blob keys
- Blob file read duration: The time consumed when reading Titan blob file
- Blob file write duration: The time consumed when writing Titan blob file
- Blob file sync operations: The count of blob file sync operations
- Blob file sync duration: The time consumed when synchronizing blob file
- Blob GC action: The count of Titan GC actions
- Blob GC duration: The Titan GC duration
- Blob GC keys flow: The flow rate of keys read and written by Titan GC
- Blob GC bytes flow: The flow rate of bytes read and written by Titan GC
- Blob GC input file size: The size of Titan GC input file
- Blob GC output file size: The size of Titan GC output file
- Blob GC file count: The count of blob files involved in Titan GC

12.8.4.28 Lock manager

- Thread CPU: The CPU utilization of the lock manager thread
- Handled tasks: The number of tasks handled by lock manager
- Waiter lifetime duration: The waiting time of the transaction for the lock to be released
- Wait table: The status information of wait table, including the number of locks and the number of transactions waiting for the lock
- Deadlock detect duration: The time consumed for detecting deadlock
- Detect error: The number of errors encountered when detecting deadlock, including the number of deadlocks
- Deadlock detector leader: The information of the node where the deadlock detector leader is located

12.8.4.29 Memory

- Allocator Stats: The statistics of the memory allocator

12.8.4.30 Backup

- Backup CPU: The CPU utilization of the backup thread
- Range Size: The histogram of backup range size
- Backup Duration: The time consumed for backup
- Backup Flow: The total bytes of backup
- Disk Throughput: The disk throughput per instance
- Backup Range Duration: The time consumed for backing up a range
- Backup Errors: The number of errors encountered during a backup

12.8.4.31 Encryption

- Encryption data keys: The total number of encrypted data keys
- Encrypted files: The number of encrypted files
- Encryption initialized: Shows whether encryption is enabled. 1 means enabled.
- Encryption meta files size: The size of the encryption meta file
- Encrypt/decrypt data nanos: The histogram of duration on encrypting/decrypting data each time
- Read/write encryption meta duration: The time consumed for reading/writing encryption meta files

12.8.4.32 Explanation of Common Parameters

12.8.4.32.1 gRPC Message Type

1. Transactional API:

- kv_get: The command of getting the latest version of data specified by `ts`
- kv_scan: The command of scanning a range of data
- kv_prewrite: The command of prewriting the data to be committed at first phase of 2PC
- kv_pessimistic_lock: The command of adding a pessimistic lock to the key to prevent other transaction from modifying this key
- kv_pessimistic_rollback: The command of deleting the pessimistic lock on the key
- kv_txn_heart_beat: The command of updating `lock_ttl` for pessimistic transactions or large transactions to prevent them from rolling back
- kv_check_txn_status: The command of checking the status of the transaction
- kv_commit: The command of committing the data written by the prewrite command
- kv_cleanup: The command of rolling back a transaction, which is deprecated in v4.0

- `kv_batch_get`: The command of getting the value of batch key at once, similar to `kv_get`
- `kv_batch_rollback`: The command of batch rollback of multiple prewrite transactions
- `kv_scan_lock`: The command of scanning all locks with a version number before `max_version` to clean up expired transactions
- `kv_resolve_lock`: The command of committing or rollback the transaction lock, according to the transaction status.
- `kv_gc`: The command of GC
- `kv_delete_range`: The command of deleting a range of data from TiKV

2. Raw API:

- `raw_get`: The command of getting the value of key
- `raw_batch_get`: The command of getting the value of batch keys
- `raw_scan`: The command of scanning a range of data
- `raw_batch_scan`: The command of scanning multiple consecutive data range
- `raw_put`: The command of writing a key/value pair
- `raw_batch_put`: The command of writing a batch of key/value pairs
- `raw_delete`: The command of deleting a key/value pair
- `raw_batch_delete`: The command of a batch of key/value pairs
- `raw_delete_range`: The command of deleting a range of data

12.8.5 Monitor the TiFlash Cluster

This document describes the monitoring items of TiFlash.

If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus & Grafana) is deployed at the same time. For more information, see [Overview of the Monitoring Framework](#).

The Grafana dashboard is divided into a series of sub dashboards which include Overview, PD, TiDB, TiKV, Node_exporter, and so on. A lot of metrics are there to help you diagnose.

TiFlash has three dashboard panels: **TiFlash-Summary**, **TiFlash-Proxy-Summary**, and **TiFlash-Proxy-Details**. The metrics on these panels indicate the current status of TiFlash. The **TiFlash-Proxy-Summary** and **TiFlash-Proxy-Details** panels mainly show the information of the Raft layer and the metrics are detailed in [Key Monitoring Metrics of TiKV](#).

Note:

It is recommended that you use TiDB v4.0.5 or later versions for improved monitor on TiFlash.

The following sections introduce the default monitoring information of **TiFlash-Summary**.

12.8.5.1 Server

- Store size: The storage size used by each TiFlash instance.
- Available size: The storage size available for each TiFlash instance.
- Capacity size: The storage capacity for each TiFlash instance.
- Uptime: The runtime of TiFlash since last restart.
- Memory: The memory usage per TiFlash instance.
- CPU Usage: The CPU utilization per TiFlash instance.
- FSync OPS: The number of fsync operations per TiFlash instance per second.
- File Open OPS: The number of `open` operations per TiFlash instance per second.
- Opened File Count: The number of file descriptors currently opened by each TiFlash instance.

Note:

Store size, FSync OPS, File Open OPS, and Opened File Count currently only cover the monitoring information of the TiFlash storage layer and do not cover that in TiFlash-Proxy.

12.8.5.2 Coprocessor

- Request QPS: The number of coprocessor requests received by all TiFlash instances. `batch` is the number of batch requests. `batch_cop` is the number of coprocessor requests in the batch requests. `cop` is the number of coprocessor requests that are sent directly via the coprocessor interface. `cop_dag` is the number of dag requests in all coprocessor requests. `super_batch` is the number of requests to enable the Super Batch feature.
- Executor QPS: The number of each type of dag executors in the requests received by all TiFlash instances. `table_scan` is the table scan executor. `selection` is the selection executor. `aggregation` is the aggregation executor. `top_n` is the TopN executor. `limit` is the limit executor.
- Request Duration: The total duration of all TiFlash instances processing coprocessor requests. The total duration is from the time that the coprocessor request is received to the time that the response to the request is completed.
- Error QPS: The number of errors of all TiFlash instances processing coprocessor requests. `meet_lock` means that the read data is locked. `region_not_found` means that the Region does not exist. `epoch_not_match` means the read Region epoch is inconsistent with the local epoch. `kv_client_error` means that the communication

with TiKV returns an error. `internal_error` is the internal system error of TiFlash. `other` is other types of errors.

- Request Handle Duration: The duration of all TiFlash instances processing coprocessor requests. The processing time is from starting to execute the coprocessor request to completing the execution.
- Response Bytes/Seconds: The total bytes of the response from all TiFlash instances.
- Cop task memory usage: The total memory usage of all TiFlash instances processing coprocessor requests.
- Handling Request Number: The total number of all TiFlash instances processing coprocessor requests. The classification of the requests is the same as that of Request QPS.

12.8.5.3 DDL

- Schema Version: The version of the schema currently cached in each TiFlash instance.
- Schema Apply OPM: The number of TiDB `schema diff` synchronized in `apply` operations by all TiFlash instances per minute. This item includes the count of three types of `apply`: `diff apply`, `full apply`, and `failed apply`. `diff apply` is the normal process of a single `apply`. If `diff apply` fails, `failed apply` increases by 1, and TiFlash rolls back to `full apply` and pulls the latest schema information to update the schema version of TiFlash.
- Schema Internal DDL OPM: The number of specific DDL operations executed per minute in all TiFlash instances.
- Schema Apply Duration: The time used for a single `apply schema` operation in all TiFlash instances.

12.8.5.4 Storage

- Write Command OPS: The number of write requests received per second by the storage layer of all TiFlash instances.
- Write Amplification: Write amplification of each TiFlash instance (the actual bytes of disk writes divided by the written bytes of logical data). `total` is the write amplification since this start, and `5min` is the write amplification in the last 5 minutes.
- Read Tasks OPS: The number of read tasks in the storage layer per second for each TiFlash instance.
- Rough Set Filter Rate: The proportion of the number of packets read by each TiFlash instance in the last minute that are filtered by the rough set index of the storage layer.
- Internal Tasks OPS: The number of times that all TiFlash instances perform internal data sorting tasks per second.
- Internal Tasks Duration: The time consumed by all TiFlash instances for internal data sorting tasks.
- Page GC Tasks OPM: The number of times that all TiFlash instances perform Delta data sorting tasks per minute.

- Page GC Tasks Duration: The distribution of time consumed by all TiFlash instances to perform Delta data sorting tasks.
- Disk Write OPS: The number of disk writes per second by all TiFlash instances.
- Disk Read OPS: The number of disk reads per second by all TiFlash instances.
- Write flow: The traffic of disk writes by all TiFlash instances.
- Read flow: The traffic of disk reads by all TiFlash instances.

Note:

These metrics only cover the monitoring information of the TiFlash storage layer and do not cover that in TiFlash-Proxy.

12.8.5.5 Storage Write Stall

- Write & Delta Management Throughput: The throughput of write and data compaction for all instances.
 - `throughput_write` means the throughput of data synchronization through Raft.
 - `throughput_delta-management` means the throughput of data compaction.
 - `total_write` means the total bytes written since the last start.
 - `total_delta-management` means the total bytes of data compacted since the last start.
- Write Stall Duration: The stall duration of write and removing Region data (deleting ranges) by instance.
- Write Throughput By Instance: The throughput of write by instance. It includes the throughput by applying the Raft write commands and Raft snapshots.
- Write Command OPS By Instance: The total count of different kinds of commands received by instance.
 - `write block` means the data logs synchronized through Raft.
 - `delete_range` means that some Regions are removed from or moved to this instance.
 - `ingest` means some Region snapshots are applied to this instance.

12.8.5.6 Raft

- Read Index OPS: The number of times that each TiFlash instance triggers the `read_index` request per second, which equals to the number of Regions triggered.
- Read Index Duration: The time used by `read_index` for all TiFlash instances. Most time is used for interaction with the Region leader and retry.
- Wait Index Duration: The time used by `wait_index` for all TiFlash instances, namely the time used to wait until local index \geq `read_index` after the `read_index` request is received.

12.9 Privileges

12.9.1 Security Compatibility with MySQL

TiDB supports similar security functionality to MySQL 5.7, with the following exceptions:

- Column level permissions are not supported
- Password expiry, as well as password last-changed tracking and password lifetime are not supported [#9709](#)
- The permission attributes `max_questions`, `max_updated`, `max_connections`, `max_user_connections` are not supported
- Password validation is not currently supported [#9741](#)

12.9.1.1 Authentication plugin status

TiDB supports multiple authentication methods. These methods can be specified on a per user basis using `CREATE USER` and `ALTER USER`. These methods are compatible with the authentication methods of MySQL with the same names.

You can use one of the following supported authentication methods in the table. To specify a default method that the server advertises when the client-server connection is being established, set the `default_authentication_plugin` variable.

The support for TLS authentication is configured differently. For detailed information, see [Enable TLS between TiDB Clients and Servers](#).

Authentication Method	Supported
<code>mysql_native_password</code>	Yes
<code>sha256_password</code>	No
<code>caching_sha2_password</code>	Yes, since 5.2.0
<code>auth_socket</code>	Yes, since 5.3.0
[TLS Certificates]	Yes
LDAP	No
PAM	No
ed25519 (MariaDB)	No
GSSAPI (MariaDB)	No
FIDO	No

12.9.2 Privilege Management

TiDB supports MySQL 5.7's privilege management system, including the syntax and privilege types. The following features from MySQL 8.0 are also supported:

- SQL Roles, starting with TiDB 3.0.

- Dynamic privileges, starting with TiDB 5.1.

This document introduces privilege-related TiDB operations, privileges required for TiDB operations and implementation of the privilege system.

12.9.2.1 Privilege-related operations

12.9.2.1.1 Grant privileges

The `GRANT` statement grants privileges to the user accounts.

For example, use the following statement to grant the `xxx` user the privilege to read the `test` database.

```
GRANT SELECT ON test.* TO 'xxx'@'%';
```

Use the following statement to grant the `xxx` user all privileges on all databases:

```
GRANT ALL PRIVILEGES ON *.* TO 'xxx'@'%';
```

By default, `GRANT` statements will return an error if the user specified does not exist. This behavior depends on if the SQL Mode `NO_AUTO_CREATE_USER` is specified:

```
mysql> SET sql_mode=DEFAULT;
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT @@sql_mode;
+---+
| @@sql_mode
|
+---+
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_ZERO_DATE,
  ↳ ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,NO_ENGINE_SUBSTITUTION
  ↳
+---+
1 row in set (0.00 sec)

mysql> SELECT * FROM mysql.user WHERE user='idontexist';
Empty set (0.00 sec)
```

```
mysql> GRANT ALL PRIVILEGES ON test.* TO 'idontexist';
ERROR 1105 (HY000): You are not allowed to create a user with GRANT

mysql> SELECT user,host,authentication_string FROM mysql.user WHERE user='
↳ idontexist';
Empty set (0.00 sec)
```

In the following example, the user `idontexist` is automatically created with an empty password because the SQL Mode `NO_AUTO_CREATE_USER` was not set. This is **not recommended** since it presents a security risk: miss-spelling a username will result in a new user created with an empty password:

```
mysql> SET @@sql_mode='ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,
↳ NO_ZERO_IN_DATE,NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,
↳ NO_ENGINE_SUBSTITUTION';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT @@sql_mode;
+---
↳ -----
↳
| @@sql_mode
↳
↳ |
+---
↳ -----
↳
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_ZERO_DATE,
↳ ERROR_FOR_DIVISION_BY_ZERO,NO_ENGINE_SUBSTITUTION |
+---
↳ -----
↳
1 row in set (0.00 sec)

mysql> SELECT * FROM mysql.user WHERE user='idontexist';
Empty set (0.00 sec)

mysql> GRANT ALL PRIVILEGES ON test.* TO 'idontexist';
Query OK, 1 row affected (0.05 sec)

mysql> SELECT user,host,authentication_string FROM mysql.user WHERE user='
↳ idontexist';
+-----+-----+-----+
| user      | host | authentication_string |
+-----+-----+-----+
```

```
| idontexist | % |
+-----+-----+-----+
1 row in set (0.01 sec)
```

You can use fuzzy matching in GRANT to grant privileges to databases.

```
mysql> GRANT ALL PRIVILEGES ON `te%`.* TO genius;
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT user,host,db FROM mysql.db WHERE user='genius';
+-----+-----+-----+
| user  | host  | db  |
+-----+-----+-----+
| genius | %    | te% |
+-----+-----+-----+
1 row in set (0.00 sec)
```

In this example, because of the % in `te%`, all the databases starting with `te` are granted the privilege.

12.9.2.1.2 Revoke privileges

The REVOKE statement enables system administrators to revoke privileges from the user accounts.

The REVOKE statement corresponds with the REVOKE statement:

```
REVOKE ALL PRIVILEGES ON `test`.* FROM 'genius'@'localhost';
```

Note:

To revoke privileges, you need the exact match. If the matching result cannot be found, an error will be displayed:

```
mysql> REVOKE ALL PRIVILEGES ON `te%`.* FROM 'genius'@'%';
ERROR 1141 (42000): There is no such grant defined for user 'genius' on
↪ host '%'
```

About fuzzy matching, escape, string and identifier:

```
mysql> GRANT ALL PRIVILEGES ON `te\%`.* TO 'genius'@'localhost';
Query OK, 0 rows affected (0.00 sec)
```

This example uses exact match to find the database named `te%`. Note that the `%` uses the `\` escape character so that `%` is not considered as a wildcard.

A string is enclosed in single quotation marks (`'`), while an identifier is enclosed in backticks (```). See the differences below:

```
mysql> GRANT ALL PRIVILEGES ON 'test'.* TO 'genius'@'localhost';
ERROR 1064 (42000): You have an error in your SQL syntax; check the
manual that corresponds to your MySQL server version for the right
syntax to use near ''test'.* to 'genius'@'localhost'' at line 1

mysql> GRANT ALL PRIVILEGES ON `test`.* TO 'genius'@'localhost';
Query OK, 0 rows affected (0.00 sec)
```

If you want to use special keywords as table names, enclose them in backticks (```). For example:

```
mysql> CREATE TABLE `select` (id int);
Query OK, 0 rows affected (0.27 sec)
```

12.9.2.1.3 Check privileges granted to users

You can use the `SHOW GRANTS` statement to see what privileges are granted to a user. For example:

```
SHOW GRANTS; -- show grants for the current user

+-----+
| Grants for User |
+-----+
| GRANT ALL PRIVILEGES ON *.* TO 'root'@'%' WITH GRANT OPTION |
+-----+
SHOW GRANTS FOR 'root'@'%'; -- show grants for a specific user
```

For example, create a user `rw_user@192.168.%` and grant the user with write privilege on the `test.write_table` table and global read privilege.

```
CREATE USER `rw_user`@`192.168.%`;
GRANT SELECT ON *.* TO `rw_user`@`192.168.%`;
GRANT INSERT, UPDATE ON `test`.`write_table` TO `rw_user`@`192.168.%`;
```

Show granted privileges of the `rw_user@192.168.%` user:

```
SHOW GRANTS FOR `rw_user`@`192.168.%`;

+-----+
| Grants for rw_user@192.168.% |
+-----+
```

```
| GRANT Select ON *.* TO 'rw_user'@'192.168.%' |
| GRANT Insert,Update ON test.write_table TO 'rw_user'@'192.168.%' |
+-----+-----+-----+-----+-----+-----+
```

12.9.2.1.4 Dynamic privileges

Since v5.1, TiDB features support dynamic privileges, a feature borrowed from MySQL 8.0. Dynamic privileges are intended to replace the `SUPER` privilege by implementing more fine-grained access to certain operations. For example, using dynamic privileges, system administrators can create a user account that can only perform `BACKUP` and `RESTORE` operations.

Dynamic privileges include:

- `BACKUP_ADMIN`
- `RESTORE_ADMIN`
- `ROLE_ADMIN`
- `CONNECTION_ADMIN`
- `SYSTEM_VARIABLES_ADMIN`
- `RESTRICTED_REPLICA_WRITER_ADMIN` allows privilege owners to perform write or update operations without being affected when the read-only mode is enabled in the TiDB cluster. For details, see [tidb_restricted_read_only](#).

To see the full set of dynamic privileges, execute the `SHOW PRIVILEGES` statement. Because plugins are permitted to add new privileges, the list of privileges that are assignable might differ based on your TiDB installation.

12.9.2.2 Privileges required for TiDB operations

You can check privileges of TiDB users in the `INFORMATION_SCHEMA.USER_PRIVILEGES` table. For example:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.USER_PRIVILEGES WHERE grantee = ''
↳ root'@'%'";
+-----+-----+-----+-----+-----+-----+
| GRANTEE   | TABLE_CATALOG | PRIVILEGE_TYPE      | IS_GRANTABLE |
+-----+-----+-----+-----+-----+-----+
| 'root'@'%' | def            | Select              | YES          |
| 'root'@'%' | def            | Insert              | YES          |
| 'root'@'%' | def            | Update              | YES          |
| 'root'@'%' | def            | Delete              | YES          |
| 'root'@'%' | def            | Create              | YES          |
| 'root'@'%' | def            | Drop                | YES          |
| 'root'@'%' | def            | Process             | YES          |
| 'root'@'%' | def            | References          | YES          |
```

```

| 'root'@'%' | def      | Alter          | YES |
| 'root'@'%' | def      | Show Databases | YES |
| 'root'@'%' | def      | Super         | YES |
| 'root'@'%' | def      | Execute       | YES |
| 'root'@'%' | def      | Index         | YES |
| 'root'@'%' | def      | Create User   | YES |
| 'root'@'%' | def      | Create Tablespace | YES |
| 'root'@'%' | def      | Trigger       | YES |
| 'root'@'%' | def      | Create View   | YES |
| 'root'@'%' | def      | Show View     | YES |
| 'root'@'%' | def      | Create Role   | YES |
| 'root'@'%' | def      | Drop Role     | YES |
| 'root'@'%' | def      | CREATE TEMPORARY TABLES | YES |
| 'root'@'%' | def      | LOCK TABLES | YES |
| 'root'@'%' | def      | CREATE ROUTINE | YES |
| 'root'@'%' | def      | ALTER ROUTINE | YES |
| 'root'@'%' | def      | EVENT        | YES |
| 'root'@'%' | def      | SHUTDOWN     | YES |
| 'root'@'%' | def      | RELOAD       | YES |
| 'root'@'%' | def      | FILE         | YES |
| 'root'@'%' | def      | CONFIG       | YES |
| 'root'@'%' | def      | REPLICATION CLIENT | YES |
| 'root'@'%' | def      | REPLICATION SLAVE | YES |
+-----+-----+-----+-----+
31 rows in set (0.00 sec)

```

12.9.2.2.1 ALTER

- For all ALTER statements, users must have the ALTER privilege for the corresponding table.
- For statements except ALTER...DROP and ALTER...RENAME TO, users must have the INSERT and CREATE privileges for the corresponding table.
- For the ALTER...DROP statement, users must have the DROP privilege for the corresponding table.
- For the ALTER...RENAME TO statement, users must have the DROP privilege for the table before renaming, and the CREATE and INSERT privileges for the table after renaming.

Note:

In MySQL 5.7 documentation, users need INSERT and CREATE privileges to perform the ALTER operation on a table. But in reality for MySQL 5.7.25, only the ALTER privilege is required in this case. Currently, the ALTER privilege in TiDB is consistent with the actual behavior in MySQL.

12.9.2.2.2 BACKUP

Requires the `SUPER` or `BACKUP_ADMIN` privilege.

12.9.2.2.3 CREATE DATABASE

Requires the `CREATE` privilege for the database.

12.9.2.2.4 CREATE INDEX

Requires the `INDEX` privilege for the table.

12.9.2.2.5 CREATE TABLE

Requires the `CREATE` privilege for the table.

To execute the `CREATE TABLE...LIKE...` statement, the `SELECT` privilege for the table is required.

12.9.2.2.6 CREATE VIEW

Requires the `CREATE VIEW` privilege.

Note:

If the current user is not the user that creates the View, both the `CREATE VIEW` and `SUPER` privileges are required.

12.9.2.2.7 DROP DATABASE

Requires the `DROP` privilege for the table.

12.9.2.2.8 DROP INDEX

Requires the `INDEX` privilege for the table.

12.9.2.2.9 DROP TABLES

Requires the `DROP` privilege for the table.

12.9.2.2.10 LOAD DATA

Requires the `INSERT` privilege for the table.

12.9.2.2.11 TRUNCATE TABLE

Requires the DROP privilege for the table.

12.9.2.2.12 RENAME TABLE

Requires the ALTER and DROP privileges for the table before renaming and the CREATE and INSERT privileges for the table after renaming.

12.9.2.2.13 ANALYZE TABLE

Requires the INSERT and SELECT privileges for the table.

12.9.2.2.14 SHOW

SHOW CREATE TABLE requires any single privilege to the table.

SHOW CREATE VIEW requires the SHOW VIEW privilege.

SHOW GRANTS requires the SELECT privilege to the mysql database. If the target user is current user, SHOW GRANTS does not require any privilege.

SHOW PROCESSLIST requires SUPER to show connections belonging to other users.

12.9.2.2.15 CREATE ROLE/USER

CREATE ROLE requires the CREATE ROLE privilege.

CREATE USER requires the CREATE USER privilege.

12.9.2.2.16 DROP ROLE/USER

DROP ROLE requires the DROP ROLE privilege.

DROP USER requires the CREATE USER privilege.

12.9.2.2.17 ALTER USER

Requires the CREATE USER privilege.

12.9.2.2.18 GRANT

Requires the GRANT privilege with the privileges granted by GRANT.

Requires additional CREATE USER privilege to create a user implicitly.

GRANT ROLE requires SUPER or ROLE_ADMIN privilege.

12.9.2.2.19 REVOKE

Requires the GRANT privilege and those privileges targeted by the REVOKE statement.

REVOKE ROLE requires SUPER or ROLE_ADMIN privilege.

12.9.2.2.20 SET GLOBAL

Requires SUPER or SYSTEM_VARIABLES_ADMIN privilege to set global variables.

12.9.2.2.21 ADMIN

Requires SUPER privilege.

12.9.2.2.22 SET DEFAULT ROLE

Requires SUPER privilege.

12.9.2.2.23 KILL

Requires SUPER or CONNECTION_ADMIN privilege to kill other user sessions.

12.9.2.3 Implementation of the privilege system

12.9.2.3.1 Privilege table

The following system tables are special because all the privilege-related data is stored in them:

- `mysql.user` (user account, global privilege)
- `mysql.db` (database-level privilege)
- `mysql.tables_priv` (table-level privilege)
- `mysql.columns_priv` (column-level privilege; not currently supported)

These tables contain the effective range and privilege information of the data. For example, in the `mysql.user` table:

```
mysql> SELECT User,Host,Select_priv,Insert_priv FROM mysql.user LIMIT 1;
+-----+-----+-----+-----+
| User | Host | Select_priv | Insert_priv |
+-----+-----+-----+-----+
| root | %   | Y           | Y           |
+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

In this record, `Host` and `User` determine that the connection request sent by the `root` user from any host (`%`) can be accepted. `Select_priv` and `Insert_priv` mean that the user has global `Select` and `Insert` privilege. The effective range in the `mysql.user` table is global.

`Host` and `User` in `mysql.db` determine which databases users can access. The effective range is the database.

Note:

It is recommended to only update the privilege tables via the supplied syntax such as `GRANT`, `CREATE USER` and `DROP USER`. Making direct edits to the underlying privilege tables will not automatically update the privilege cache, leading to unpredictable behavior until `FLUSH PRIVILEGES` is executed.

12.9.2.3.2 Connection verification

When the client sends a connection request, TiDB server will verify the login operation. TiDB server first checks the `mysql.user` table. If a record of `User` and `Host` matches the connection request, TiDB server then verifies the `authentication_string`.

User identity is based on two pieces of information: `Host`, the host that initiates the connection, and `User`, the user name. If the user name is not empty, the exact match of user named is a must.

`User+Host` may match several rows in `user` table. To deal with this scenario, the rows in the `user` table are sorted. The table rows will be checked one by one when the client connects; the first matched row will be used to verify. When sorting, `Host` is ranked before `User`.

12.9.2.3.3 Request verification

When the connection is successful, the request verification process checks whether the operation has the privilege.

For database-related requests (`INSERT`, `UPDATE`), the request verification process first checks the user's global privileges in the `mysql.user` table. If the privilege is granted, you can access directly. If not, check the `mysql.db` table.

The `user` table has global privileges regardless of the default database. For example, the `DELETE` privilege in `user` can apply to any row, table, or database.

In the `db` table, an empty user is to match the anonymous user name. Wildcards are not allowed in the `User` column. The value for the `Host` and `Db` columns can use `%` and `_`, which can use pattern matching.

Data in the `user` and `db` tables is also sorted when loaded into memory.

The use of `%` in `tables_priv` and `columns_priv` is similar, but column value in `Db`, `Table_name` and `Column_name` cannot contain `%`. The sorting is also similar when loaded.

12.9.2.3.4 Time of effect

When TiDB starts, some privilege-check tables are loaded into memory, and then the cached data is used to verify the privileges. Executing privilege management statements such as `GRANT`, `REVOKE`, `CREATE USER`, `DROP USER` will take effect immediately.

Manually editing tables such as `mysql.user` with statements such as `INSERT`, `DELETE`, `UPDATE` will not take effect immediately. This behavior is compatible with MySQL, and privilege cache can be updated with the following statement:

```
FLUSH PRIVILEGES;
```

12.9.3 TiDB User Account Management

This document describes how to manage a TiDB user account.

12.9.3.1 User names and passwords

TiDB stores the user accounts in the table of the `mysql.user` system database. Each account is identified by a user name and the client host. Each account may have a password.

You can connect to the TiDB server using the MySQL client, and use the specified account and password to login:

```
shell> mysql --port 4000 --user xxx --password
```

Or use the abbreviation of command line parameters:

```
shell> mysql -P 4000 -u xxx -p
```

12.9.3.2 Add user accounts

You can create TiDB accounts in two ways:

- By using the standard account-management SQL statements intended for creating accounts and establishing their privileges, such as `CREATE USER` and `GRANT`.
- By manipulating the privilege tables directly with statements such as `INSERT`, `UPDATE`, or `DELETE`.

It is recommended to use the account-management statements, because manipulating the privilege tables directly can lead to incomplete updates. You can also create accounts by using third party GUI tools.

```
CREATE USER [IF NOT EXISTS] user [IDENTIFIED BY 'auth_string'];
```

After you assign the password, TiDB encrypts and stores the `auth_string` in the `mysql` `↔` `.user` table.

```
CREATE USER 'test'@'127.0.0.1' IDENTIFIED BY 'xxx';
```

The name of a TiDB account consists of a user name and a hostname. The syntax of the account name is 'user_name'@'host_name'.

- `user_name` is case sensitive.
- `host_name` is a hostname or IP address, which supports the wild card % or _. For example, the hostname '%' matches all hosts, and the hostname '192.168.1.%' matches all hosts in the subnet.

The host supports fuzzy matching:

```
CREATE USER 'test'@'192.168.10.%';
```

The `test` user is allowed to log in from any hosts on the 192.168.10 subnet.

If the host is not specified, the user is allowed to log in from any IP. If no password is specified, the default is empty password:

```
CREATE USER 'test';
```

Equivalent to:

```
CREATE USER 'test'@'%' IDENTIFIED BY '';
```

If the specified user does not exist, the behavior of automatically creating users depends on `sql_mode`. If the `sql_mode` includes `NO_AUTO_CREATE_USER`, the `GRANT` statement will not create users with an error returned.

For example, assume that the `sql_mode` does not include `NO_AUTO_CREATE_USER`, and you use the following `CREATE USER` and `GRANT` statements to create four accounts:

```
CREATE USER 'finley'@'localhost' IDENTIFIED BY 'some_pass';
```

```
GRANT ALL PRIVILEGES ON *.* TO 'finley'@'localhost' WITH GRANT OPTION;
```

```
CREATE USER 'finley'@'%' IDENTIFIED BY 'some_pass';
```

```
GRANT ALL PRIVILEGES ON *.* TO 'finley'@'%' WITH GRANT OPTION;
```

```
CREATE USER 'admin'@'localhost' IDENTIFIED BY 'admin_pass';
```

```
GRANT RELOAD,PROCESS ON *.* TO 'admin'@'localhost';
```

```
CREATE USER 'dummy'@'localhost';
```

To see the privileges granted for an account, use the `SHOW GRANTS` statement:

```
SHOW GRANTS FOR 'admin'@'localhost';
```

```
+-----+
| Grants for admin@localhost          |
+-----+
| GRANT RELOAD, PROCESS ON *.* TO 'admin'@'localhost' |
+-----+
```

12.9.3.3 Remove user accounts

To remove a user account, use the `DROP USER` statement:

```
DROP USER 'test'@'localhost';
```

This operation clears the user's records in the `mysql.user` table and the related records in the privilege table.

12.9.3.4 Reserved user accounts

TiDB creates the `'root'@'%'` default account during the database initialization.

12.9.3.5 Set account resource limits

Currently, TiDB does not support setting account resource limits.

12.9.3.6 Assign account passwords

TiDB stores passwords in the `mysql.user` system database. Operations that assign or update passwords are permitted only to users with the `CREATE USER` privilege, or, alternatively, privileges for the `mysql` database (`INSERT` privilege to create new accounts, `UPDATE` privilege to update existing accounts).

- To assign a password when you create a new account, use `CREATE USER` and include an `IDENTIFIED BY` clause:

```
CREATE USER 'test'@'localhost' IDENTIFIED BY 'mypass';
```

- To assign or change a password for an existing account, use `SET PASSWORD FOR` or `ALTER USER`:

```
SET PASSWORD FOR 'root'@'%' = 'xxx';
```

Or:

```
ALTER USER 'test'@'localhost' IDENTIFIED BY 'mypass';
```

12.9.3.7 Forget the root password

1. Modify the configuration file by adding `skip-grant-table` in the `security` part:

```
[security]
skip-grant-table = true
```

2. Start TiDB with the modified configuration. Use `root` to log in and then modify the password:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

When the `skip-grant-table` is set, starting the TiDB process will check whether the user is an administrator of the operating system, and only the `root` user of the operating system can start the TiDB process.

12.9.3.8 FLUSH PRIVILEGES

Information related to users and privileges is stored in the TiKV server, and TiDB caches this information inside the process. Generally, modification of the related information through `CREATE USER`, `GRANT`, and other statements takes effect quickly within the entire cluster. If the operation is affected by some factors such as temporarily unavailable network, the modification will take effect in about 15 minutes because TiDB will periodically reload the cache information.

If you modified the privilege tables directly, run the following command to apply changes immediately:

```
FLUSH PRIVILEGES;
```

For details, see [Privilege Management](#).

12.9.4 Role-Based Access Control

The implementation of TiDB's role-based access control (RBAC) system is similar to that of MySQL 8.0. TiDB is compatible with most RBAC syntax of MySQL.

This document introduces TiDB RBAC-related operations and implementation.

12.9.4.1 RBAC operations

A role is a collection of a series of privileges. You can do the following operations:

- Create a role.
- Delete a role.
- Grant a privilege to a role.
- Grant a role to another user. That user can obtain the privileges involved in the role, after enabling the role.

12.9.4.1.1 Create a role

For example, you can use the following statement to create the roles `app_developer`, `app_read`, and `app_write`:

```
CREATE ROLE 'app_developer', 'app_read', 'app_write';
```

For the role naming format and rule, see [TiDB User Account Management](#).

Roles are stored in the `mysql.user` table and the host name part of the role name (if omitted) defaults to `'%'`. The name of the role you are trying to create must be unique; otherwise, an error is reported.

To create a role, you need the `CREATE ROLE` or `CREATE USER` privilege.

12.9.4.1.2 Grant a privilege to a role

The operation of granting a privilege to a role is the same with that of granting a privilege to a user. For details, see [TiDB Privilege Management](#).

For example, you can use the following statement to grant the `app_read` role the privilege to read the `app_db` database:

```
GRANT SELECT ON app_db.* TO 'app_read'@'%';
```

You can use the following statement to grant the `app_write` role the privilege to write data to the `app_db` database:

```
GRANT INSERT, UPDATE, DELETE ON app_db.* TO 'app_write'@'%';
```

You can use the following statement to grant the `app_developer` role all privileges on the `app_db` database:

```
GRANT ALL ON app_db.* TO 'app_developer';
```

12.9.4.1.3 Grant a role to a user

Assume that a user `dev1` has the developer role with all the privileges on `app_db`; two users `read_user1` and `read_user2` have the read-only privilege on `app_db`; and a user `rw_user1` has read and write privileges on `app_db`.

Use `CREATE USER` to create the users:

```
CREATE USER 'dev1'@'localhost' IDENTIFIED BY 'dev1pass';  
CREATE USER 'read_user1'@'localhost' IDENTIFIED BY 'read_user1pass';  
CREATE USER 'read_user2'@'localhost' IDENTIFIED BY 'read_user2pass';  
CREATE USER 'rw_user1'@'localhost' IDENTIFIED BY 'rw_user1pass';
```

Then use `GRANT` to grant roles to users

```
GRANT 'app_developer' TO 'dev1'@'localhost';
GRANT 'app_read' TO 'read_user1'@'localhost', 'read_user2'@'localhost';
GRANT 'app_read', 'app_write' TO 'rw_user1'@'localhost';
```

To grant a role to another user or revoke a role, you need the SUPER privilege.

Granting a role to a user does not mean enabling the role immediately. Enabling a role is another operation.

The following operations might form a “relation loop:”

```
CREATE USER 'u1', 'u2';
CREATE ROLE 'r1', 'r2';

GRANT 'u1' TO 'u1';
GRANT 'r1' TO 'r1';

GRANT 'r2' TO 'u2';
GRANT 'u2' TO 'r2';
```

TiDB supports this multi-level authorization relationship. You can use it to implement privilege inheritance.

12.9.4.1.4 Check a role’s privileges

You can use the SHOW GRANTS statement to check what privileges have been granted to the user.

To check privilege-related information of another user, you need the SELECT privilege on the mysql database.

```
SHOW GRANTS FOR 'dev1'@'localhost';
```

```
+-----+
| Grants for dev1@localhost          |
+-----+
| GRANT USAGE ON *.* TO `dev1`@`localhost` |
| GRANT `app_developer`@`%` TO `dev1`@`localhost` |
+-----+
```

You can use the USING option in SHOW GRANTS to check a role’s privileges:

```
SHOW GRANTS FOR 'dev1'@'localhost' USING 'app_developer';
```

```
+-----+
| Grants for dev1@localhost          |
+-----+
```

```
| GRANT USAGE ON *.* TO `dev1`@`localhost` |
| GRANT ALL PRIVILEGES ON `app_db`.* TO `dev1`@`localhost` |
| GRANT `app_developer`@`%` TO `dev1`@`localhost` |
+-----+
```

```
SHOW GRANTS FOR 'rw_user1'@'localhost' USING 'app_read', 'app_write';
```

```
+-----+
↪
| Grants for rw_user1@localhost |
+-----+
↪
| GRANT USAGE ON *.* TO `rw_user1`@`localhost` |
| GRANT SELECT, INSERT, UPDATE, DELETE ON `app_db`.* TO `rw_user1`@`
↪ localhost` |
| GRANT `app_read`@`%`,`app_write`@`%` TO `rw_user1`@`localhost` |
+-----+
↪
```

```
SHOW GRANTS FOR 'read_user1'@'localhost' USING 'app_read';
```

```
+-----+
| Grants for read_user1@localhost |
+-----+
| GRANT USAGE ON *.* TO `read_user1`@`localhost` |
| GRANT SELECT ON `app_db`.* TO `read_user1`@`localhost` |
| GRANT `app_read`@`%` TO `read_user1`@`localhost` |
+-----+
```

You can use `SHOW GRANTS` or `SHOW GRANTS FOR CURRENT_USER()` to check the current user's privileges. `SHOW GRANTS` and `SHOW GRANTS FOR CURRENT_USER()` are different in the following aspects:

- `SHOW GRANTS` shows the privilege of the enabled role for the current user.
- `SHOW GRANTS FOR CURRENT_USER()` does not show the enabled role's privilege.

12.9.4.1.5 Set the default role

After a role is granted to a user, it does not take effect immediately. Only after the user enables this role, he can use the privilege the role owns.

You can set default roles for a user. When the user logs in, the default roles are automatically enabled.

```
SET DEFAULT ROLE
{NONE | ALL | role [, role ] ...}
TO user [, user ]
```

For example, you can use the following statement to set default roles of `rw_user1@localhost` ↪ to `app_read` and `app_write`:

```
SET DEFAULT ROLE app_read, app_write TO 'rw_user1'@'localhost';
```

You can use the following statement to set default roles of `dev1@localhost` to all roles:

```
SET DEFAULT ROLE ALL TO 'dev1'@'localhost';
```

You can use the following statement to disable all default roles of `dev1@localhost`:

```
SET DEFAULT ROLE NONE TO 'dev1'@'localhost';
```

Note:

You need to grant the role to the user before you set the default role to this role.

12.9.4.1.6 Enable a role in the current session

You can enable some role(s) in the current session.

```
SET ROLE {
  DEFAULT
| NONE
| ALL
| ALL EXCEPT role [, role ] ...
| role [, role ] ...
}
```

For example, after `rw_user1` logs in, you can use the following statement to enable roles `app_read` and `app_write` that are valid only in the current session:

```
SET ROLE 'app_read', 'app_write';
```

You can use the following statement to enable the default role of the current user:

```
SET ROLE DEFAULT
```

You can use the following statement to enable all roles granted to the current user:

```
SET ROLE ALL
```

You can use the following statement to disable all roles:

```
SET ROLE NONE
```

You can use the following statement to enable roles except `app_read`:

```
SET ROLE ALL EXCEPT 'app_read'
```

Note:

If you use `SET ROLE` to enable a role, this role is valid only in the current session.

12.9.4.1.7 Check the current enabled role

The current user can use the `CURRENT_ROLE()` function to check which role has been enabled by the current user.

For example, you can grant default roles to `rw_user1'@'localhost`:

```
SET DEFAULT ROLE ALL TO 'rw_user1'@'localhost';
```

After `rw_user1@localhost` logs in, you can execute the following statement:

```
SELECT CURRENT_ROLE();
```

```
+-----+
| CURRENT_ROLE()          |
+-----+
| `app_read`@`%`,`app_write`@`%` |
+-----+
```

```
SET ROLE 'app_read'; SELECT CURRENT_ROLE();
```

```
+-----+
| CURRENT_ROLE() |
+-----+
| `app_read`@`%` |
+-----+
```

12.9.4.1.8 Revoke a role

You can use the following statement to revoke the `app_read` role granted to the users `read_user1@localhost` and `read_user2@localhost`:

```
REVOKE 'app_read' FROM 'read_user1'@'localhost', 'read_user2'@'localhost';
```

You can use the following statement to revoke the roles `app_read` and `app_write` granted to the `rw_user1@localhost` user:

```
REVOKE 'app_read', 'app_write' FROM 'rw_user1'@'localhost';
```

The operation of revoking a role from a user is atomic. If you fail to revoke a role, this operation rolls back.

12.9.4.1.9 Revoke a privilege

The `REVOKE` statement is reverse to `GRANT`. You can use `REVOKE` to revoke the privileges of `app_write`.

```
REVOKE INSERT, UPDATE, DELETE ON app_db.* FROM 'app_write';
```

For details, see [TiDB Privilege Management](#).

12.9.4.1.10 Delete a role

You can use the following statement to delete roles `app_read` and `app_write`:

```
DROP ROLE 'app_read', 'app_write';
```

This operation deletes the role records of `app_read` and `app_write` in the `mysql.user` table and related records in the authorization table, and terminates the authorization related to the two roles.

To delete a role, you need the `DROP ROLE` or `DROP USER` privilege.

12.9.4.1.11 Authorization table

In addition to four system [privilege tables](#), the RBAC system introduces two new system privilege tables:

- `mysql.role_edges`: records the authorization relationship of the role and user.
- `mysql.default_roles`: records default roles of each user.

`mysql.role_edges`

`mysql.role_edges` contains the following data:

```
SELECT * FROM mysql.role_edges;
```

```

+-----+-----+-----+-----+-----+
| FROM_HOST | FROM_USER | TO_HOST | TO_USER | WITH_ADMIN_OPTION |
+-----+-----+-----+-----+-----+
| %         | r_1       | %       | u_1     | N                 |
+-----+-----+-----+-----+-----+
1 row in set (0.00 sec)

```

- FROM_HOST and FROM_USER indicate the role's host name and user name respectively.
- TO_HOST and TO_USER indicate the host name and user name of the user to which a role is granted.

mysql.default_roles

mysql.default_roles shows which roles have been enabled by default for each user.

```
SELECT * FROM mysql.default_roles;
```

```

+-----+-----+-----+-----+-----+
| HOST | USER | DEFAULT_ROLE_HOST | DEFAULT_ROLE_USER |
+-----+-----+-----+-----+-----+
| %    | u_1  | %                 | r_1                |
| %    | u_1  | %                 | r_2                |
+-----+-----+-----+-----+-----+
2 rows in set (0.00 sec)

```

- HOST and USER indicate the user's host name and user name respectively.
- DEFAULT_ROLE_HOST and DEFAULT_ROLE_USER indicate the host name and user name of the default role respectively.

12.9.4.1.12 References

Because RBAC, user management, and privilege management are closely related, you can refer to operation details in the following resources:

- [TiDB Privilege Management](#)
- [TiDB User Account Management](#)

12.9.5 Certificate-Based Authentication for Login

TiDB supports a certificate-based authentication method for users to log into TiDB. With this method, TiDB issues certificates to different users, uses encrypted connections to transfer data, and verifies certificates when users log in. This approach is more secure than

the traditional password-based authentication method commonly used by MySQL users and is thus adopted by an increasing number of users.

To use certificate-based authentication, you might need to perform the following operations:

- Create security keys and certificates
- Configure certificates for TiDB and the client
- Configure the user certificate information to be verified when the user logs in
- Update and replace certificates

The rest of the document introduces in detail how to perform these operations.

12.9.5.1 Create security keys and certificates

It is recommended that you use [OpenSSL](#) to create keys and certificates. The certificate generation process is similar to the process described in [Enable TLS Between TiDB Clients and Servers](#). The following paragraphs demonstrate how to configure more attribute fields that need to be verified in the certificate.

12.9.5.1.1 Generate CA key and certificate

1. Execute the following command to generate the CA key:

```
sudo openssl genrsa 2048 > ca-key.pem
```

The output of the above command:

```
Generating RSA private key, 2048 bit long modulus (2 primes)
.....+++++
.....+++++
e is 65537 (0x010001)
```

2. Execute the following command to generate the certificate corresponding to the CA key:

```
sudo openssl req -new -x509 -nodes -days 365000 -key ca-key.pem -out ca
↳ -cert.pem
```

3. Enter detailed certificate information. For example:

```
Country Name (2 letter code) [AU]:US
State or Province Name (full name) [Some-State]:California
Locality Name (e.g. city) []:San Francisco
Organization Name (e.g. company) [Internet Widgits Pty Ltd]:PingCAP Inc
↳ .
```

```
Organizational Unit Name (e.g. section) []:TiDB
Common Name (e.g. server FQDN or YOUR name) []:TiDB admin
Email Address []:s@pingcap.com
```

Note:

In the above certificate details, texts after : are the entered information.

12.9.5.1.2 Generate server key and certificate

1. Execute the following command to generate the server key:

```
sudo openssl req -newkey rsa:2048 -days 365000 -nodes -keyout server-
↳ key.pem -out server-req.pem
```

2. Enter detailed certificate information. For example:

```
Country Name (2 letter code) [AU]:US
State or Province Name (full name) [Some-State]:California
Locality Name (e.g. city) []:San Francisco
Organization Name (e.g. company) [Internet Widgits Pty Ltd]:PingCAP Inc
↳ .
Organizational Unit Name (e.g. section) []:TiKV
Common Name (e.g. server FQDN or YOUR name) []:TiKV Test Server
Email Address []:k@pingcap.com

Please enter the following 'extra' attributes
to be sent with your certificate request
A challenge password []:
An optional company name []:
```

3. Execute the following command to generate the RSA key of the server:

```
sudo openssl rsa -in server-key.pem -out server-key.pem
```

The output of the above command:

```
writing RSA key
```

4. Use the CA certificate signature to generate the signed server certificate:

```
sudo openssl x509 -req -in server-req.pem -days 365000 -CA ca-cert.pem
↳ -CAkey ca-key.pem -set_serial 01 -out server-cert.pem
```

The output of the above command (for example):

```
Signature ok
subject=C = US, ST = California, L = San Francisco, O = PingCAP Inc.,
  ↪ OU = TiKV, CN = TiKV Test Server, emailAddress = k@pingcap.com
Getting CA Private Key
```

Note:

When you log in, TiDB checks whether the information in the `subject` section of the above output is consistent or not.

12.9.5.1.3 Generate client key and certificate

After generating the server key and certificate, you need to generate the key and certificate for the client. It is often necessary to generate different keys and certificates for different users.

1. Execute the following command to generate the client key:

```
sudo openssl req -newkey rsa:2048 -days 365000 -nodes -keyout client-
  ↪ key.pem -out client-req.pem
```

2. Enter detailed certificate information. For example:

```
Country Name (2 letter code) [AU]:US
State or Province Name (full name) [Some-State]:California
Locality Name (e.g. city) []:San Francisco
Organization Name (e.g. company) [Internet Widgits Pty Ltd]:PingCAP Inc
  ↪ .
Organizational Unit Name (e.g. section) []:TiDB
Common Name (e.g. server FQDN or YOUR name) []:tpch-user1
Email Address []:zz@pingcap.com

Please enter the following 'extra' attributes
to be sent with your certificate request
A challenge password []:
An optional company name []:
```

3. Execute the following command to generate the RSA key of the client:

```
sudo openssl rsa -in client-key.pem -out client-key.pem
```

The output of the above command:

```
writing RSA key
```

4. Use the CA certificate signature to generate the client certificate:

```
sudo openssl x509 -req -in client-req.pem -days 365000 -CA ca-cert.pem  
↳ -CAkey ca-key.pem -set_serial 01 -out client-cert.pem
```

The output of the above command (for example):

```
Signature ok  
subject=C = US, ST = California, L = San Francisco, O = PingCAP Inc.,  
↳ OU = TiDB, CN = tpch-user1, emailAddress = zz@pingcap.com  
Getting CA Private Key
```

Note:

The information of the **subject** section in the above output is used for **certificate configuration for login verification** in the **require** section.

12.9.5.1.4 Verify certificate

Execute the following command to verify certificate:

```
openssl verify -CAfile ca-cert.pem server-cert.pem client-cert.pem
```

If the certificate is verified, you will see the following result:

```
server-cert.pem: OK  
client-cert.pem: OK
```

12.9.5.2 Configure TiDB and the client to use certificates

After generating the certificates, you need to configure the TiDB server and the client to use the corresponding server certificate or client certificate.

12.9.5.2.1 Configure TiDB to use server certificate

Modify the `[security]` section in the TiDB configuration file. This step specifies the directory in which the CA certificate, the server key, and the server certificate are stored. You can replace `path/to/server-cert.pem`, `path/to/server-key.pem`, `path/to/ca-cert.pem` with your own directory.

```
[security]  
ssl-cert = "path/to/server-cert.pem"  
ssl-key = "path/to/server-key.pem"  
ssl-ca = "path/to/ca-cert.pem"
```

Start TiDB and check logs. If the following information is displayed in the log, the configuration is successful:

```
[INFO] [server.go:264] ["secure connection is enabled"] ["client  
↪ verification enabled"]=true]
```

12.9.5.2.2 Configure the client to use client certificate

Configure the client so that the client uses the client key and certificate for login.

Taking the MySQL client as an example, you can use the newly created client certificate, client key and CA by specifying `ssl-cert`, `ssl-key`, and `ssl-ca`:

```
mysql -utest -h0.0.0.0 -P4000 --ssl-cert /path/to/client-cert.new.pem --ssl-  
↪ key /path/to/client-key.new.pem --ssl-ca /path/to/ca-cert.pem
```

Note:

`/path/to/client-cert.new.pem`, `/path/to/client-key.new.pem`, and `/path/to/ca-cert.pem` are the directory of the CA certificate, client key, and client certificate. You can replace them with your own directory.

12.9.5.3 Configure the user certificate information for login verification

First, connect TiDB using the client to configure the login verification. Then, you can get and configure the user certificate information to be verified.

12.9.5.3.1 Get user certificate information

The user certificate information can be specified by `require subject`, `require issuer`, `require san`, and `require cipher`, which are used to check the X509 certificate attributes.

- `require subject`: Specifies the `subject` information of the client certificate when you log in. With this option specified, you do not need to configure `require ssl` or `x509`. The information to be specified is consistent with the entered `subject` information in [Generate client keys and certificates](#).

To get this option, execute the following command:

```
openssl x509 -noout -subject -in client-cert.pem | sed 's/.\{8\}//' |  
↪ sed 's/, /\//g' | sed 's/ = /=/g' | sed 's/^/\//'
```

- `require issuer`: Specifies the `subject` information of the CA certificate that issues the user certificate. The information to be specified is consistent with the entered `subject` information in [Generate CA key and certificate](#).

To get this option, execute the following command:

```
openssl x509 -noout -subject -in ca-cert.pem | sed 's/.\{8\}//' | sed '
↳ s/, /\//g' | sed 's/ = /=/g' | sed 's/~/\//'
```

- **require san:** Specifies the Subject Alternative Name information of the CA certificate that issues the user certificate. The information to be specified is consistent with the [alt_names](#) of the `openssl.cnf` configuration file used to generate the client certificate.

- Execute the following command to get the information of the `require san` item in the generated certificate:

```
openssl x509 -noout -extensions subjectAltName -in client.crt
```

- `require san` currently supports the following Subject Alternative Name check items:
 - * URI
 - * IP
 - * DNS
- Multiple check items can be configured after they are connected by commas. For example, configure `require san` as follows for the `u1` user:

```
create user 'u1'@'%' require san 'DNS:d1,URI:spiffe://example.org/
↳ myservice1,URI:spiffe://example.org/myservice2';
```

The above configuration only allows the `u1` user to log in to TiDB using the certificate with the URI item `spiffe://example.org/myservice1` or `spiffe://example.org/myservice2` and the DNS item `d1`.

- **require cipher:** Checks the cipher method supported by the client. Use the following statement to check the list of supported cipher methods:

```
SHOW SESSION STATUS LIKE 'Ssl_cipher_list';
```

12.9.5.3.2 Configure user certificate information

After getting the user certificate information (`require subject`, `require issuer`, `require san`, `require cipher`), configure these information to be verified when creating a user, granting privileges, or altering a user. Replace `<replaceable>` with the corresponding information in the following statements.

You can configure one option or multiple options using the space or `and` as the separator.

- Configure user certificate when creating a user (`create user`):

```
create user 'u1'@'%' require issuer '<replaceable>' subject '<
↳ replaceable>' san '<replaceable>' cipher '<replaceable>';
```

- Configure user certificate when granting privileges:

```
grant all on *.* to 'u1'@'%' require issuer '<replaceable>' subject '<
  ↪ replaceable>' san '<replaceable>' cipher '<replaceable>';
```

- Configure user certificate when altering a user:

```
alter user 'u1'@'%' require issuer '<replaceable>' subject '<
  ↪ replaceable>' san '<replaceable>' cipher '<replaceable>';
```

After the above configuration, the following items will be verified when you log in:

- SSL is used; the CA that issues the client certificate is consistent with the CA configured in the server.
- The issuer information of the client certificate matches the information specified in `require issuer`.
- The subject information of the client certificate matches the information specified in `require cipher`.
- The Subject Alternative Name information of the client certificate matches the information specified in `require san`.

You can log into TiDB only after all the above items are verified. Otherwise, the `ERROR ↪ 1045 (28000): Access denied` error is returned. You can use the following command to check the TLS version, the cipher algorithm and whether the current connection uses the certificate for the login.

Connect the MySQL client and execute the following statement:

```
\s
```

The output:

```
-----
mysql Ver 15.1 Distrib 10.4.10-MariaDB, for Linux (x86_64) using readline
  ↪ 5.1

Connection id:      1
Current database:  test
Current user:       root@127.0.0.1
SSL:                Cipher in use is TLS_AES_256_GCM_SHA384
```

Then execute the following statement:

```
show variables like '%ssl%';
```

The output:

```

+-----+-----+
| Variable_name | Value |
+-----+-----+
| ssl_cert      | /path/to/server-cert.pem |
| ssl_ca        | /path/to/ca-cert.pem     |
| have_ssl      | YES                       |
| have_openssl  | YES                       |
| ssl_key       | /path/to/server-key.pem  |
+-----+-----+
6 rows in set (0.067 sec)

```

12.9.5.4 Update and replace certificate

The key and certificate are updated regularly. The following sections introduce how to update the key and certificate.

The CA certificate is the basis for mutual verification between the client and server. To replace the CA certificate, generate a combined certificate that supports the authentication for both old and new certificates. On the client and server, first replace the CA certificate, then replace the client/server key and certificate.

12.9.5.4.1 Update CA key and certificate

1. Back up the old CA key and certificate (suppose that `ca-key.pem` is stolen):

```
mv ca-key.pem ca-key.old.pem && \
mv ca-cert.pem ca-cert.old.pem
```

2. Generate the new CA key:

```
sudo openssl genrsa 2048 > ca-key.pem
```

3. Generate the new CA certificate using the newly generated CA key:

```
sudo openssl req -new -x509 -nodes -days 365000 -key ca-key.pem -out ca
↳ -cert.new.pem
```

Note:

Generating the new CA certificate is to replace the keys and certificates on the client and server, and to ensure that online users are not affected. Therefore, the appended information in the above command must be consistent with the `require issuer` information.

4. Generate the combined CA certificate:

```
cat ca-cert.new.pem ca-cert.old.pem > ca-cert.pem
```

After the above operations, restart the TiDB server with the newly created combined CA certificate. Then the server accepts both the new and old CA certificates.

Also replace the old CA certificate with the combined certificate so that the client accepts both the old and new CA certificates.

12.9.5.4.2 Update client key and certificate

Note:

Perform the following steps **only after** you have replaced the old CA certificate on the client and server with the combined CA certificate.

1. Generate the new RSA key of the client:

```
sudo openssl req -newkey rsa:2048 -days 365000 -nodes -keyout client-  
  ↪ key.new.pem -out client-req.new.pem && \  
sudo openssl rsa -in client-key.new.pem -out client-key.new.pem
```

Note:

The above command is to replace the client key and certificate, and to ensure that the online users are not affected. Therefore, the appended information in the above command must be consistent with the `require ↪ subject` information.

2. Use the combined certificate and the new CA key to generate the new client certificate:

```
sudo openssl x509 -req -in client-req.new.pem -days 365000 -CA ca-cert.  
  ↪ pem -CAkey ca-key.pem -set_serial 01 -out client-cert.new.pem
```

3. Make the client (for example, MySQL) connect TiDB with the new client key and certificate:

```
mysql -utest -h0.0.0.0 -P4000 --ssl-cert /path/to/client-cert.new.pem  
  ↪ --ssl-key /path/to/client-key.new.pem --ssl-ca /path/to/ca-cert.  
  ↪ pem
```

Note:

`/path/to/client-cert.new.pem`, `/path/to/client-key.new.pem`, and `/path/to/ca-cert.pem` specify the directory of the CA certificate, client key, and client certificate. You can replace them with your own directory.

12.9.5.4.3 Update the server key and certificate

1. Generate the new RSA key of the server:

```
sudo openssl req -newkey rsa:2048 -days 365000 -nodes -keyout server-  
  ↪ key.new.pem -out server-req.new.pem && \  
sudo openssl rsa -in server-key.new.pem -out server-key.new.pem
```

2. Use the combined CA certificate and the new CA key to generate the new server certificate:

```
sudo openssl x509 -req -in server-req.new.pem -days 365000 -CA ca-cert.  
  ↪ pem -CAkey ca-key.pem -set_serial 01 -out server-cert.new.pem
```

3. Configure the TiDB server to use the new server key and certificate. See [Configure TiDB server](#) for details.

12.10 SQL

12.10.1 SQL Language Structure and Syntax

12.10.1.1 Attributes

12.10.1.1.1 AUTO_INCREMENT

This document introduces the `AUTO_INCREMENT` column attribute, including its concept, implementation principles, auto-increment related features, and restrictions.

Note:

The `AUTO_INCREMENT` attribute might cause hotspot in production environments. See [Troubleshoot HotSpot Issues](#) for details. It is recommended to use `AUTO_RANDOM` instead.

Concept

`AUTO_INCREMENT` is a column attribute that is used to automatically fill in default column values. When the `INSERT` statement does not specify values for the `AUTO_INCREMENT` column, the system automatically assigns values to this column.

For performance reasons, `AUTO_INCREMENT` numbers are allocated in a batch of values (30 thousand by default) to each TiDB server. This means that while `AUTO_INCREMENT` numbers are guaranteed to be unique, values assigned to an `INSERT` statement will only be monotonic on a per TiDB server basis.

The following is a basic example of `AUTO_INCREMENT`:

```
CREATE TABLE t(id int PRIMARY KEY AUTO_INCREMENT, c int);
```

```
INSERT INTO t(c) VALUES (1);
INSERT INTO t(c) VALUES (2);
INSERT INTO t(c) VALUES (3), (4), (5);
```

```
mysql> SELECT * FROM t;
+----+----+
| id | c |
+----+----+
| 1 | 1 |
| 2 | 2 |
| 3 | 3 |
| 4 | 4 |
| 5 | 5 |
+----+----+
5 rows in set (0.01 sec)
```

In addition, `AUTO_INCREMENT` also supports the `INSERT` statements that explicitly specify column values. In such cases, TiDB stores the explicitly specified values:

```
INSERT INTO t(id, c) VALUES (6, 6);
```

```
mysql> SELECT * FROM t;
+----+----+
| id | c |
+----+----+
| 1 | 1 |
| 2 | 2 |
| 3 | 3 |
| 4 | 4 |
| 5 | 5 |
| 6 | 6 |
+----+----+
6 rows in set (0.01 sec)
```

The usage above is the same as that of `AUTO_INCREMENT` in MySQL. However, in terms of the specific value that is implicitly assigned, TiDB differs from MySQL significantly.

Implementation principles

TiDB implements the `AUTO_INCREMENT` implicit assignment in the following way:

For each auto-increment column, a globally visible key-value pair is used to record the maximum ID that has been assigned. In a distributed environment, communication between nodes has some overhead. Therefore, to avoid the issue of write amplification, each TiDB node applies for a batch of consecutive IDs as caches when assigning IDs, and then applies for the next batch of IDs after the first batch is assigned. Therefore, TiDB nodes do not apply to the storage node for IDs when assigning IDs each time. For example:

```
CREATE TABLE t(id int UNIQUE KEY AUTO_INCREMENT, c int);
```

Assume two TiDB instances, A and B, in the cluster. If you execute an `INSERT` statement on the `t` table on A and B respectively:

```
INSERT INTO t (c) VALUES (1)
```

Instance A might cache the auto-increment IDs of `[1,30000]`, and instance B might cache the auto-increment IDs of `[30001,60000]`. In `INSERT` statements to be executed, these cached IDs of each instance will be assigned to the `AUTO_INCREMENT` column as the default values.

Basic Features

Uniqueness

Warning:

When the cluster has multiple TiDB instances, if the table schema contains the auto-increment IDs, it is recommended not to use explicit insert and implicit assignment at the same time, which means using the default values of the auto-increment column and the custom values. Otherwise, it might break the uniqueness of implicitly assigned values.

In the example above, perform the following operations in order:

1. The client inserts a statement `INSERT INTO t VALUES (2, 1)` to instance B, which sets `id` to 2. The statement is successfully executed.
2. The client sends a statement `INSERT INTO t (c)(1)` to instance A. This statement does not specify the value of `id`, so the ID is assigned by A. At present, because A caches the IDs of `[1, 30000]`, it might assign 2 as the value of the auto-increment ID, and increases the local counter by 1. At this time, the data whose ID is 2 already exists in the database, so the `Duplicated Error` error is returned.

Monotonicity

TiDB guarantees that `AUTO_INCREMENT` values are monotonic (always increasing) on a per-server basis. Consider the following example where consecutive `AUTO_INCREMENT` values of 1-3 are generated:

```
CREATE TABLE t (a int PRIMARY KEY AUTO_INCREMENT, b timestamp NOT NULL
  ↪ DEFAULT NOW());
INSERT INTO t (a) VALUES (NULL), (NULL), (NULL);
SELECT * FROM t;
```

Query OK, 0 rows affected (0.11 sec)

Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0

```
+----+-----+
| a | b                |
+----+-----+
| 1 | 2020-09-09 20:38:22 |
| 2 | 2020-09-09 20:38:22 |
| 3 | 2020-09-09 20:38:22 |
+----+-----+
3 rows in set (0.00 sec)
```

Monotonicity is not the same guarantee as consecutive. Consider the following example:

```
CREATE TABLE t (id INT NOT NULL PRIMARY KEY auto_increment, a VARCHAR(10),
  ↪ cnt INT NOT NULL DEFAULT 1, UNIQUE KEY (a));
INSERT INTO t (a) VALUES ('A'), ('B');
SELECT * FROM t;
INSERT INTO t (a) VALUES ('A'), ('C') ON DUPLICATE KEY UPDATE cnt = cnt +
  ↪ 1;
SELECT * FROM t;
```

Query OK, 0 rows affected (0.00 sec)

Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0

```
+----+-----+-----+
| id | a  | cnt |
+----+-----+-----+
| 1 | A  | 1   |
| 2 | B  | 1   |
+----+-----+-----+
```

```

2 rows in set (0.00 sec)

Query OK, 3 rows affected (0.00 sec)
Records: 2 Duplicates: 1 Warnings: 0

+-----+-----+-----+
| id | a  | cnt |
+-----+-----+-----+
| 1 | A  | 2   |
| 2 | B  | 1   |
| 4 | C  | 1   |
+-----+-----+-----+
3 rows in set (0.00 sec)

```

In this example, the `AUTO_INCREMENT` value of 3 is allocated for the `INSERT` of the key A in `INSERT INTO t (a)VALUES ('A'), ('C')ON DUPLICATE KEY UPDATE cnt = cnt + \hookrightarrow 1`; but never used because this `INSERT` statement contains a duplicate key A. This leads to a gap where the sequence is non-consecutive. This behavior is considered legal, even though it differs from MySQL. MySQL will also have gaps in the sequence in other scenarios such as transactions being aborted and rolled back.

AUTO_ID_CACHE

The `AUTO_INCREMENT` sequence might appear to *jump* dramatically if an `INSERT` operation is performed against a different TiDB server. This is caused by the fact that each server has its own cache of `AUTO_INCREMENT` values:

```

CREATE TABLE t (a int PRIMARY KEY AUTO_INCREMENT, b timestamp NOT NULL
 $\hookrightarrow$  DEFAULT NOW());
INSERT INTO t (a) VALUES (NULL), (NULL), (NULL);
INSERT INTO t (a) VALUES (NULL);
SELECT * FROM t;

```

```

Query OK, 1 row affected (0.03 sec)

+-----+-----+-----+
| a      | b                |
+-----+-----+-----+
|      1 | 2020-09-09 20:38:22 |
|      2 | 2020-09-09 20:38:22 |
|      3 | 2020-09-09 20:38:22 |
| 2000001 | 2020-09-09 20:43:43 |
+-----+-----+-----+
4 rows in set (0.00 sec)

```

A new `INSERT` operation against the initial TiDB server generates the `AUTO_INCREMENT` value of 4. This is because the initial TiDB server still has space left in the `AUTO_INCREMENT`

↔ cache for allocation. In this case, the sequence of values cannot be considered globally monotonic, because the value of 4 is inserted after the value of 2000001:

```
mysql> INSERT INTO t (a) VALUES (NULL);
Query OK, 1 row affected (0.01 sec)
```

```
mysql> SELECT * FROM t ORDER BY b;
```

```
+-----+-----+
| a      | b                |
+-----+-----+
|      1 | 2020-09-09 20:38:22 |
|      2 | 2020-09-09 20:38:22 |
|      3 | 2020-09-09 20:38:22 |
| 2000001 | 2020-09-09 20:43:43 |
|      4 | 2020-09-09 20:44:43 |
+-----+-----+
5 rows in set (0.00 sec)
```

The `AUTO_INCREMENT` cache does not persist across TiDB server restarts. The following `INSERT` statement is performed after the initial TiDB server is restarted:

```
mysql> INSERT INTO t (a) VALUES (NULL);
Query OK, 1 row affected (0.01 sec)
```

```
mysql> SELECT * FROM t ORDER BY b;
```

```
+-----+-----+
| a      | b                |
+-----+-----+
|      1 | 2020-09-09 20:38:22 |
|      2 | 2020-09-09 20:38:22 |
|      3 | 2020-09-09 20:38:22 |
| 2000001 | 2020-09-09 20:43:43 |
|      4 | 2020-09-09 20:44:43 |
| 2030001 | 2020-09-09 20:54:11 |
+-----+-----+
6 rows in set (0.00 sec)
```

A high rate of TiDB server restarts might contribute to the exhaustion of `AUTO_INCREMENT` values. In the above example, the initial TiDB server still has values [5-30000] free in its cache. These values are lost, and will not be reallocated.

It is not recommended to rely on `AUTO_INCREMENT` values being continuous. Consider the following example, where a TiDB server has a cache of values [2000001-2030000]. By manually inserting the value 2029998, you can see the behavior as a new cache range is retrieved:

```
mysql> INSERT INTO t (a) VALUES (2029998);
```

```
Query OK, 1 row affected (0.01 sec)

mysql> INSERT INTO t (a) VALUES (NULL);
Query OK, 1 row affected (0.01 sec)

mysql> INSERT INTO t (a) VALUES (NULL);
Query OK, 1 row affected (0.00 sec)

mysql> INSERT INTO t (a) VALUES (NULL);
Query OK, 1 row affected (0.02 sec)

mysql> INSERT INTO t (a) VALUES (NULL);
Query OK, 1 row affected (0.01 sec)

mysql> SELECT * FROM t ORDER BY b;
+-----+-----+
| a      | b                |
+-----+-----+
|      1 | 2020-09-09 20:38:22 |
|      2 | 2020-09-09 20:38:22 |
|      3 | 2020-09-09 20:38:22 |
| 2000001 | 2020-09-09 20:43:43 |
|      4 | 2020-09-09 20:44:43 |
| 2030001 | 2020-09-09 20:54:11 |
| 2029998 | 2020-09-09 21:08:11 |
| 2029999 | 2020-09-09 21:08:11 |
| 2030000 | 2020-09-09 21:08:11 |
| 2060001 | 2020-09-09 21:08:11 |
| 2060002 | 2020-09-09 21:08:11 |
+-----+-----+
11 rows in set (0.00 sec)
```

After the value 2030000 is inserted, the next value is 2060001. This jump in sequence is due to another TiDB server obtaining the intermediate cache range of [2030001-2060000] \leftrightarrow . When multiple TiDB servers are deployed, there will be gaps in the `AUTO_INCREMENT` sequence because cache requests are interleaved.

Cache size control

In earlier versions of TiDB, the cache size of the auto-increment ID was transparent to users. Starting from v3.0.14, v3.1.2, and v4.0.rc-2, TiDB has introduced the `AUTO_ID_CACHE` table option to allow users to set the cache size for allocating the auto-increment ID.

```
CREATE TABLE t(a int AUTO_INCREMENT key) AUTO_ID_CACHE 100;
Query OK, 0 rows affected (0.02 sec)

INSERT INTO t values();
```

Query OK, 1 row affected (0.00 sec)

```
SELECT * FROM t;
```

```
+-----+
```

```
| a |
```

```
+-----+
```

```
| 1 |
```

```
+-----+
```

1 row in set (0.01 sec)

```
SHOW CREATE TABLE t;
```

```
+---
```

```
↪ -----+
```

```
↪
```

```
| Table | Create Table
```

```
↪
```

```
↪ |
```

```
+---
```

```
↪ -----+
```

```
↪
```

```
| t | CREATE TABLE `t` (
```

```
  `a` int(11) NOT NULL AUTO_INCREMENT,
```

```
  PRIMARY KEY (`a`) /*T![clustered_index] CLUSTERED */
```

```
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin AUTO_INCREMENT
```

```
  ↪ =101 /*T![auto_id_cache] AUTO_ID_CACHE=100 */ |
```

```
+---
```

```
↪ -----+
```

```
↪
```

1 row in set (0.00 sec)

At this time, if you restart TiDB, the auto-increment ID cache will be lost, and new insert operations will allocate IDs starting from a higher value beyond the previously cached range.

```
INSERT INTO t VALUES();
```

Query OK, 1 row affected (0.00 sec)

```
SELECT * FROM t;
```

```
+-----+
```

```
| a |
```

```
+-----+
```

```
| 1 |
```

```
| 101 |
```

```
+-----+
```

2 rows in set (0.01 sec)

The newly allocated value is 101. This shows that the size of cache for allocating auto-increment IDs is 100.

In addition, when the length of consecutive IDs in a batch `INSERT` statement exceeds the length of `AUTO_ID_CACHE`, TiDB increases the cache size accordingly to ensure that the statement can insert data properly.

Clear the auto-increment ID cache

In some scenarios, you might need to clear the auto-increment ID cache to ensure data consistency. For example:

- In the scenario of incremental replication using [Data Migration \(DM\)](#), once the replication is complete, data writing to the downstream TiDB switches from DM to your application's write operations. Meanwhile, the ID writing mode of the auto-increment column usually switches from explicit insertion to implicit allocation.
- When your application involves both explicit ID insertion and implicit ID allocation, you need to clear the auto-increment ID cache to avoid conflicts between future implicitly allocated IDs and previously explicitly inserted IDs, which could result in primary key conflict errors. For more information, see [Uniqueness](#).

To clear the auto-increment ID cache on all TiDB nodes in the cluster, you can execute the `ALTER TABLE` statement with `AUTO_INCREMENT = 0`. For example:

```
CREATE TABLE t(a int AUTO_INCREMENT key) AUTO_ID_CACHE 100;
Query OK, 0 rows affected (0.02 sec)
```

```
INSERT INTO t VALUES();
Query OK, 1 row affected (0.02 sec)
```

```
INSERT INTO t VALUES(50);
Query OK, 1 row affected (0.00 sec)
```

```
SELECT * FROM t;
+-----+
| a |
+-----+
| 1 |
| 50 |
+-----+
2 rows in set (0.01 sec)
```

```
ALTER TABLE t AUTO_INCREMENT = 0;
Query OK, 0 rows affected, 1 warning (0.07 sec)
```

```

SHOW WARNINGS;
+---+
| Level | Code | Message |
+---+
| Warning | 1105 | Can't reset AUTO_INCREMENT to 0 without FORCE option,
| using 101 instead |
+---+
1 row in set (0.01 sec)

INSERT INTO t VALUES();
Query OK, 1 row affected (0.02 sec)

SELECT * FROM t;
+-----+
| a |
+-----+
| 1 |
| 50 |
| 101 |
+-----+
3 rows in set (0.01 sec)

```

Auto-increment step size and offset

Starting from v3.0.9 and v4.0.0-rc.1, similar to the behavior of MySQL, the value implicitly assigned to the auto-increment column is controlled by the @@auto_increment_increment ↪ and @@auto_increment_offset session variables.

The value (ID) implicitly assigned to auto-increment columns satisfies the following equation:

$$(ID - \text{auto_increment_offset}) \% \text{auto_increment_increment} == 0$$

Restrictions

Currently, AUTO_INCREMENT has the following restrictions when used in TiDB:

- It must be defined on the first column of a primary key or the first column of an index.
- It must be defined on the column of INTEGER, FLOAT, or DOUBLE type.
- It cannot be specified on the same column with the DEFAULT column value.
- ALTER TABLE cannot be used to add the AUTO_INCREMENT attribute.

- `ALTER TABLE` can be used to remove the `AUTO_INCREMENT` attribute. However, starting from v2.1.18 and v3.0.4, TiDB uses the session variable `@@tidb_allow_remove_auto_inc` \leftrightarrow to control whether `ALTER TABLE MODIFY` or `ALTER TABLE CHANGE` can be used to remove the `AUTO_INCREMENT` attribute of a column. By default, you cannot use `ALTER TABLE MODIFY` or `ALTER TABLE CHANGE` to remove the `AUTO_INCREMENT` attribute.

12.10.1.1.2 `AUTO_RANDOM` New in v3.1.0

Note:

`AUTO_RANDOM` was marked as stable since v4.0.3.

User scenario

When you write data intensively into TiDB and TiDB has a table with the primary key of the auto-increment integer type, hotspot issue might occur. To solve the hotspot issue, you can use the `AUTO_RANDOM` attribute.

For more information, see [Highly Concurrent Write Best Practices](#).

Take the following created table as an example:

```
CREATE TABLE t (a bigint PRIMARY KEY AUTO_INCREMENT, b varchar(255))
```

On this `t` table, you execute a large number of `INSERT` statements that do not specify the values of the primary key as below:

```
INSERT INTO t(b) VALUES ('a'), ('b'), ('c')
```

In the above statement, values of the primary key (column `a`) are not specified, so TiDB uses the continuous auto-increment row values as the row IDs, which might cause write hotspot in a single TiKV node and affect the performance. To avoid such write hotspot, you can specify the `AUTO_RANDOM` attribute rather than the `AUTO_INCREMENT` attribute for the column `a` when you create the table. See the follow examples:

```
CREATE TABLE t (a bigint PRIMARY KEY AUTO_RANDOM, b varchar(255))
```

or

```
CREATE TABLE t (a bigint AUTO_RANDOM, b varchar(255), PRIMARY KEY (a))
```

Then execute the `INSERT` statement such as `INSERT INTO t(b)VALUES...`. Now the results will be as follows:

- Implicitly allocating values: If the `INSERT` statement does not specify the values of the integer primary key column (column `a`) or specify the value as `NULL`, TiDB automatically allocates values to this column. These values are not necessarily auto-increment or continuous but are unique, which avoids the hotspot problem caused by continuous row IDs.
- Explicitly inserting values: If the `INSERT` statement explicitly specifies the values of the integer primary key column, TiDB saves these values, which works similarly to the `AUTO_INCREMENT` attribute. Note that if you do not set `NO_AUTO_VALUE_ON_ZERO` in the `@@sql_mode` system variable, TiDB will automatically allocate values to this column even if you explicitly specify the value of the integer primary key column as 0.

Note:

Since v4.0.3, if you want to insert values explicitly, set the value of the `@@allow_auto_random_explicit_insert` system variable to 1 (0 by default). This explicit insertion is not supported by default and the reason is documented in the [restrictions](#) section.

TiDB automatically allocates values in the following way:

The highest five digits (ignoring the sign bit) of the row value in binary (namely, shard bits) are determined by the starting time of the current transaction. The remaining digits are allocated values in an auto-increment order.

To use different number of shard bits, append a pair of parentheses to `AUTO_RANDOM` and specify the desired number of shard bits in the parentheses. See the following example:

```
CREATE TABLE t (a bigint PRIMARY KEY AUTO_RANDOM(3), b varchar(255))
```

In the above `CREATE TABLE` statement, 3 shard bits are specified. The range of the number of shard bits is [1, 16).

After creating the table, use the `SHOW WARNINGS` statement to see the maximum number of implicit allocations supported by the current table:

```
SHOW WARNINGS
```

```
+--
  ↳ -----+-----+-----+-----+-----+-----+-----+-----+-----+
  ↳
  | Level | Code | Message |
  +--
  ↳ -----+-----+-----+-----+-----+-----+-----+-----+-----+
  ↳
  | Note | 1105 | Available implicit allocation times: 1152921504606846976 |
```

Note:

Since v4.0.3, the type of the `AUTO_RANDOM` column can only be `BIGINT`. This is to ensure the maximum number of implicit allocations.

In addition, to view the shard bit number of the table with the `AUTO_RANDOM` attribute, you can see the value of the `PK_AUTO_RANDOM_BITS=x` mode in the `TIDB_ROW_ID_SHARDING_INFO` column in the `information_schema.tables` system table. `x` is the number of shard bits.

Values allocated to the `AUTO_RANDOM` column affect `last_insert_id()`. You can use `SELECT last_insert_id()` to get the ID that TiDB last implicitly allocates. For example:

```
INSERT INTO t (b) VALUES ("b")
SELECT * FROM t;
SELECT last_insert_id()
```

You might see the following result:

```
+-----+-----+
| a          | b |
+-----+-----+
| 1073741825 | b |
+-----+-----+
+-----+-----+
| last_insert_id() |
+-----+-----+
| 1073741825      |
+-----+-----+
```

Compatibility

TiDB supports parsing the version comment syntax. See the following example:

```
CREATE TABLE t (a bigint PRIMARY KEY /*T![auto_rand] auto_random */)

```

```
CREATE TABLE t (a bigint PRIMARY KEY AUTO_RANDOM)

```

The above two statements have the same meaning.

In the result of `SHOW CREATE TABLE`, the `AUTO_RANDOM` attribute is commented out. This comment includes an attribute identifier (for example, `/*T![auto_rand] auto_random */` \leftrightarrow). Here `auto_rand` represents the `AUTO_RANDOM` attribute. Only the version of TiDB that implements the feature corresponding to this identifier can parse the SQL statement fragment properly.

This attribute supports forward compatibility, namely, downgrade compatibility. TiDB of earlier versions that do not implement this feature ignore the `AUTO_RANDOM` attribute of a table (with the above comment) and can also use the table with the attribute.

Restrictions

Pay attention to the following restrictions when you use `AUTO_RANDOM`:

- Specify this attribute for the primary key column **ONLY** of integer type. Otherwise, an error might occur. In addition, when the attribute of the primary key is `NONCLUSTERED`, `AUTO_RANDOM` is not supported even on the integer primary key. For more details about the primary key of the `CLUSTERED` type, refer to [clustered index](#).
- You cannot use `ALTER TABLE` to modify the `AUTO_RANDOM` attribute, including adding or removing this attribute.
- You cannot change the column type of the primary key column that is specified with `AUTO_RANDOM` attribute.
- You cannot specify `AUTO_RANDOM` and `AUTO_INCREMENT` for the same column at the same time.
- You cannot specify `AUTO_RANDOM` and `DEFAULT` (the default value of a column) for the same column at the same time.
- It is **not** recommended that you explicitly specify a value for the column with the `AUTO_RANDOM` attribute when you insert data. Otherwise, the numeral values that can be automatically allocated for this table might be used up in advance.

12.10.1.1.3 SHARD_ROW_ID_BITS

This document introduces the `SHARD_ROW_ID_BITS` table attribute, which is used to set the number of bits of the shards after the implicit `_tidb_rowid` is sharded.

Concept

For the tables with a non-integer primary key or no primary key, TiDB uses an implicit auto-increment row ID. When a large number of `INSERT` operations are performed, the data is written into a single Region, causing a write hot spot.

To mitigate the hot spot issue, you can configure `SHARD_ROW_ID_BITS`. The row IDs are scattered and the data are written into multiple different Regions.

- `SHARD_ROW_ID_BITS = 4` indicates 16 shards
- `SHARD_ROW_ID_BITS = 6` indicates 64 shards
- `SHARD_ROW_ID_BITS = 0` indicates the default 1 shard

Examples

- CREATE TABLE: `CREATE TABLE t (c int)SHARD_ROW_ID_BITS = 4;`
- ALTER TABLE: `ALTER TABLE t SHARD_ROW_ID_BITS = 4;`

12.10.1.2 Literal Values

TiDB literal values include character literals, numeric literals, time and date literals, hexadecimal, binary literals, and NULL literals. This document introduces each of these literal values.

This document describes String literals, Numeric literals, NULL values, Hexadecimal literals, Date and time literals, Boolean literals, and Bit-value literals.

12.10.1.2.1 String literals

A string is a sequence of bytes or characters, enclosed within either single quote ' or double quote " characters. For example:

```
'example string'  
"example string"
```

Quoted strings placed next to each other are concatenated to a single string. The following lines are equivalent:

```
'a string'  
'a' ' ' 'string'  
"a" ' ' "string"
```

If the `ANSI_QUOTES SQL MODE` is enabled, string literals can be quoted only within single quotation marks because a string quoted within double quotation marks is interpreted as an identifier.

The string is divided into the following two types:

- Binary string: It consists of a sequence of bytes, whose charset and collation are both **binary**, and uses **byte** as the unit when compared with each other.
- Non-binary string: It consists of a sequence of characters and has various charsets and collations other than **binary**. When compared with each other, non-binary strings use **characters** as the unit. A character might contain multiple bytes, depending on the charset.

A string literal may have an optional `character set introducer` and `COLLATE clause`, to designate it as a string that uses a specific character set and collation.

```
[_charset_name]'string' [COLLATE collation_name]
```

For example:

```
SELECT _latin1'string';
SELECT _binary'string';
SELECT _utf8'string' COLLATE utf8_bin;
```

You can use N'literal' (or n'literal') to create a string in the national character set. The following statements are equivalent:

```
SELECT N'some text';
SELECT n'some text';
SELECT _utf8'some text';
```

To represent some special characters in a string, you can use escape characters to escape:

Escape Characters	Meaning
\0	An ASCII NUL (X'00') character
\'	A single quote ' character
\“	A double quote " character
\b	A backspace character
\n	A line break (newline) character
\r	A carriage return character
\t	A tab character
\z	ASCII 26 (Ctrl + Z)
\\	A backslash \ character
\%	A % character
_	A _ character

If you want to represent " in the string surrounded by ', or ' in the string surrounded by ", you do not need to use escape characters.

For more information, see [String Literals in MySQL](#).

12.10.1.2.2 Numeric literals

Numeric literals include integer and DECIMAL literals and floating-point literals.

Integer may include . as a decimal separator. Numbers may be preceded by - or + to indicate a negative or positive value respectively.

Exact-value numeric literals can be represented as 1, .2, 3.4, -5, -6.78, +9.10.

Numeric literals can also be represented in scientific notation, such as 1.2E3, 1.2E-3, ↪ -1.2E3, -1.2E-3.

For more information, see [Numeric Literals in MySQL](#).

12.10.1.2.3 Date and time literals

Date and time literal values can be represented in several formats, such as quoted strings or as numbers. When TiDB expects a date, it interprets any of '2017-08-24', '20170824' and 20170824 as a date.

TiDB supports the following date formats:

- 'YYYY-MM-DD' or 'YY-MM-DD': The - delimiter here is not strict. It can be any punctuation. For example, '2017-08-24', '2017&08&24', '2012@12^31' are all valid date formats. The only special punctuation is '.', which is treated as a decimal point to separate the integer and fractional parts. Date and time can be separated by T or a white space. For example, 2017-8-24 10:42:00 and 2017-8-24T10:42:00 represents the same date and time.
- 'YYYYMMDDHHMMSS' or 'YYMMDDHHMMSS': For example, '20170824104520' and '170824104520' are regarded as '2017-08-24 10:45:20'. However, if you provide a value out of range, such as '170824304520', it is not treated as a valid date. Note that incorrect formats such as YYYYMMDD HHMMSS, YYYYMMDD HH:MM:DD, or YYYY-MM-DD HHMMSS will fail to insert.
- YYYYMMDDHHMMSS or YYMMDDHHMMSS: Note that these formats have no single or double quotes, but a number. For example, 20170824104520 is interpreted as '2017-08-24 ↪ 10:45:20'.

DATETIME or TIMESTAMP values can be followed by a fractional part, used to represent microseconds precision (6 digits). The fractional part should always be separated from the rest of the time by a decimal point ..

The year value containing only two digits is ambiguous. It is recommended to use the four-digit year format. TiDB interprets the two-digit year value according to the following rules:

- If the year value is in the range of 70-99, it is converted to 1970-1999.
- If the year value is in the range of 00-69, it is converted to 2000-2069.

For month or day values less than 10, '2017-8-4' is the same as '2017-08-04'. The same is true for Time. For example, '2017-08-24 1:2:3' is the same as '2017-08-24 ↪ 01:02:03'.

When the date or time value is required, TiDB selects the specified format according to the length of the value:

- 6 digits: YYMMDD.
- 12 digits: YYMMDDHHMMSS.
- 8 digits: YYYYMMDD.
- 14 digits: YYYYMMDDHHMMSS.

TiDB supports the following formats for time values:

- 'D HH:MM:SS', or 'HH:MM:SS', 'HH:MM', 'D HH:MM', 'D HH', 'SS': D means days and the valid value range is 0-34.
- A number in HHMMSS format: For example, 231010 is interpreted as '23:10:10'.
- A number in any of SS, MMSS, and HHMMSS formats can be regarded as time.

The decimal point of the Time type is also ., with a precision of up to 6 digits after the decimal point.

See [MySQL date and time literals](#) for more details.

12.10.1.2.4 Boolean Literals

The constants TRUE and FALSE are equal to 1 and 0 respectively, which are not case sensitive.

```
SELECT TRUE, true, tRuE, FALSE, FaLsE, false;
```

```
+-----+-----+-----+-----+-----+-----+
| TRUE | true | tRuE | FALSE | FaLsE | false |
+-----+-----+-----+-----+-----+-----+
|  1  |  1  |  1  |  0  |  0  |  0  |
+-----+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

12.10.1.2.5 Hexadecimal literals

Hexadecimal literal values are written using X'val' or 0xval notation, where val contains hexadecimal digits. A leading 0x is case sensitive and cannot be written as 0X.

Legal hexadecimal literals:

```
X'ac12'
X'12AC'
x'ac12'
x'12AC'
0xac12
0x12AC
```

Illegal hexadecimal literals:

```
X'1z' (z is not a hexadecimal legal digit)
0X12AC (0X must be written as 0x)
```

Hexadecimal literals written using X'val' notation must contain an even number of digits. If the length of val is an odd number (for example, X'A' or X'11A'), to avoid the syntax error, pad the value with a leading zero:

```
mysql> select X'aff';
ERROR 1105 (HY000): line 0 column 13 near ""hex literal: invalid
    ↪ hexadecimal format, must even numbers, but 3 (total length 13)
mysql> select X'0aff';
+-----+
| X'0aff' |
+-----+
| 0x0aff |
+-----+
1 row in set (0.00 sec)
```

By default, a hexadecimal literal is a binary string.

To convert a string or a number to a string in hexadecimal format, use the `HEX()` function:

```
mysql> SELECT HEX('TiDB');
+-----+
| HEX('TiDB') |
+-----+
| 54694442 |
+-----+
1 row in set (0.01 sec)

mysql> SELECT X'54694442';
+-----+
| X'54694442' |
+-----+
| TiDB |
+-----+
1 row in set (0.00 sec)
```

12.10.1.2.6 Bit-value literals

Bit-value literals are written using `b'val'` or `0bval` notation. The `val` is a binary value written using zeros and ones. A leading `0b` is case sensitive and cannot be written as `0B`.

Legal bit-value literals:

```
b'01'
B'01'
0b01
```

Illegal bit-value literals:

```
b'2' (2 is not a binary digit; it must be 0 or 1)
0B01 (0B must be written as 0b)
```

By default, a bit-value literal is a binary string.

Bit values are returned as binary values, which may not display well in the MySQL client. To convert a bit value to printable form, you can use a conversion function such as `BIN()` or `HEX()`.

```
CREATE TABLE t (b BIT(8));
INSERT INTO t SET b = b'00010011';
INSERT INTO t SET b = b'1110';
INSERT INTO t SET b = b'100101';

mysql> SELECT b+0, BIN(b), HEX(b) FROM t;
+-----+-----+-----+
| b+0 | BIN(b) | HEX(b) |
+-----+-----+-----+
| 19 | 10011 | 13      |
| 14 | 1110  | E       |
| 37 | 100101 | 25     |
+-----+-----+-----+
3 rows in set (0.00 sec)
```

12.10.1.2.7 NULL Values

NULL means the data is empty, which is case-insensitive, and is synonymous with `\N` (case-sensitive).

Note:

NULL is not the same as 0, nor the empty string ''.

12.10.1.3 Schema Object Names

This document introduces schema object names in TiDB SQL statements.

Schema object names are used to name all schema objects in TiDB, including database, table, index, column, alias, and so on. You can quote these objects using identifiers in SQL statements.

You can use backticks to enclose the identifier. For example, `SELECT * FROM t` can also be written as `SELECT * FROM `t``. But if the identifier includes one or more special characters or is a reserved keyword, it must be enclosed in backticks to quote the schema object it represents.

```
SELECT * FROM `table` WHERE `table`.id = 20;
```

If you set `ANSI_QUOTES` in SQL MODE, TiDB will recognize the string enclosed in double quotation marks " as an identifier.

```
CREATE TABLE "test" (a varchar(10));
```

```
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual
↳ that corresponds to your TiDB version for the right syntax to use
↳ line 1 column 19 near ""test" (a varchar(10))"
```

```
SET SESSION sql_mode='ANSI_QUOTES';
```

```
Query OK, 0 rows affected (0.000 sec)
```

```
CREATE TABLE "test" (a varchar(10));
```

```
Query OK, 0 rows affected (0.012 sec)
```

If you want to use the backtick character in the quoted identifier, repeat the backtick twice. For example, to create a table a`b:

```
CREATE TABLE `a``b` (a int);
```

In a SELECT statement, you can use an identifier or a string to specify an alias:

```
SELECT 1 AS `identifier`, 2 AS 'string';
```

```
+-----+-----+
| identifier | string |
+-----+-----+
|          1 |        2 |
+-----+-----+
1 row in set (0.00 sec)
```

For more information, see [MySQL Schema Object Names](#).

12.10.1.3.1 Identifier qualifiers

Object names can be unqualified or qualified. For example, the following statement creates a table without a qualified name:

```
CREATE TABLE t (i int);
```

If you have not used the USE statement or the connection parameter to configure the database, the ERROR 1046 (3D000): No database selected error is displayed. At this time, you can specify the database qualified name:

```
CREATE TABLE test.t (i int);
```

White spaces can exist around `.. table_name.col_name` and `table_name . col_name` are equivalent.

To quote this identifier, use:

```
`table_name`.`col_name`
```

Instead of:

```
`table_name.col_name`
```

For more information, see [MySQL Identifier Qualifiers](#).

12.10.1.4 Keywords

This article introduces the keywords in TiDB, the differences between reserved words and non-reserved words and summarizes all keywords for the query.

Keywords are words that have special meanings in SQL statements, such as `SELECT`, `UPDATE`, and `DELETE`. Some of them can be used as identifiers directly, which are called **non-reserved keywords**. Some of them require special treatment before being used as identifiers, which are called **reserved keywords**.

To use the reserved keywords as identifiers, you must enclose them in backticks ```:

```
CREATE TABLE select (a INT);
```

```
ERROR 1105 (HY000): line 0 column 19 near " (a INT)" (total length 27)
```

```
CREATE TABLE `select` (a INT);
```

```
Query OK, 0 rows affected (0.09 sec)
```

The non-reserved keywords do not require backticks, such as `BEGIN` and `END`, which can be successfully used as identifiers in the following statement:

```
CREATE TABLE `select` (BEGIN int, END int);
```

```
Query OK, 0 rows affected (0.09 sec)
```

In the special case, the reserved keywords do not need backticks if they are used with the `.` delimiter:

```
CREATE TABLE test.select (BEGIN int, END int);
```

```
Query OK, 0 rows affected (0.08 sec)
```

The following list shows the keywords in TiDB. Reserved keywords are marked with (R). Reserved keywords for [Window Functions](#) are marked with (R-Window):

A

- ACCOUNT
- ACTION
- ADD (R)

12.10.1.5 User-Defined Variables

This document describes the concept of user-defined variables in TiDB and the methods to set and read the user-defined variables.

Warning:

User-defined variables are still an experimental feature. It is **NOT** recommended that you use them in the production environment.

The format of the user-defined variables is `@var_name`. The characters that compose `var_name` can be any characters that can compose an identifier, including the numbers 0-9 `↔`, the letters `a-zA-Z`, the underscore `_`, the dollar sign `$`, and the UTF-8 characters. In addition, it also includes the English period `.`. The user-defined variables are case-insensitive.

The user-defined variables are session-specific, which means a user variable defined by one client connection cannot be seen or used by other client connections.

12.10.1.5.1 Set the user-defined variables

You can use the `SET` statement to set a user-defined variable, and the syntax is `SET ↔ @var_name = expr [, @var_name = expr] ...;`. For example:

```
SET @favorite_db = 'TiDB';
```

```
SET @a = 'a', @b = 'b', @c = 'c';
```

For the assignment operator, you can also use `:=`. For example:

```
SET @favorite_db := 'TiDB';
```

The content to the right of the assignment operator can be any valid expression. For example:

```
SET @c = @a + @b;
```

```
set @c = b'1000001' + b'1000001';
```

12.10.1.5.2 Read the user-defined variables

To read a user-defined variable, you can use the `SELECT` statement to query:

```
SELECT @a1, @a2, @a3
```

```
+-----+-----+-----+
| @a1 | @a2 | @a3 |
+-----+-----+-----+
|  1  |  2  |  4  |
+-----+-----+-----+
```

You can also assign values in the `SELECT` statement:

```
SELECT @a1, @a2, @a3, @a4 := @a1+@a2+@a3;
```

```
+-----+-----+-----+-----+
| @a1 | @a2 | @a3 | @a4 := @a1+@a2+@a3 |
+-----+-----+-----+-----+
|  1  |  2  |  4  |                7  |
+-----+-----+-----+-----+
```

Before the variable `@a4` is modified or the connection is closed, its value is always 7.

If a hexadecimal literal or binary literal is used when setting the user-defined variable, TiDB will treat it as a binary string. If you want to set it to a number, you can manually add the `CAST` conversion, or use the numeric operator in the expression:

```
SET @v1 = b'1000001';
SET @v2 = b'1000001'+0;
SET @v3 = CAST(b'1000001' AS UNSIGNED);
```

```
SELECT @v1, @v2, @v3;
```

```
+-----+-----+-----+
| @v1 | @v2 | @v3 |
+-----+-----+-----+
| A   | 65  | 65  |
+-----+-----+-----+
```

If you refer to a user-defined variable that has not been initialized, it has a value of `NULL` and a type of string.

```
SELECT @not_exist;
```

```
+-----+
| @not_exist |
+-----+
| NULL      |
+-----+
```

In addition to using the `SELECT` statement to read the user-defined variables, another common usage is the `PREPARE` statement. For example:

```
SET @s = 'SELECT SQRT(POW(?,2) + POW(?,2)) AS hypotenuse';
PREPARE stmt FROM @s;
SET @a = 6;
SET @b = 8;
EXECUTE stmt USING @a, @b;
```

```
+-----+
| hypotenuse |
+-----+
|          10 |
+-----+
```

The contents of the user-defined variables are not recognized as identifiers in the SQL statements. For example:

```
SELECT * from t;
```

```
+----+
| a |
+----+
| 1 |
+----+
```

```
SET @col = "`a`";
SELECT @col FROM t;
```

```
+-----+
| @col |
+-----+
| `a` |
+-----+
```

12.10.1.5.3 MySQL compatibility

Except for `SELECT ... INTO <variable>`, the syntax supported in MySQL and TiDB is identical.

For more information, see [User-Defined Variables in MySQL](#).

12.10.1.6 Expression Syntax

An expression is a combination of one or more values, operators, or functions. In TiDB, expressions are mainly used in various clauses of the `SELECT` statement, including Group by clause, Where clause, Having clause, Join condition and window function. In addition, some DDL statements also use expressions, such as the setting of the default values, columns, and partition rules when creating tables.

The expressions can be divided into the following types:

- Identifier. For reference, see [Schema object names](#).

- Predicates, numeric values, strings, date expressions. The **Literal values** of these types are also expressions.
- Function calls and window functions. For reference, see **Functions and operators overview** and **Window functions**
- ParamMarker (?), system variables, user variables and CASE expressions.

The following rules are the expression syntax, which is based on the [parser.y](#) rules of TiDB parser. For the navigable version of the following syntax diagram, refer to [TiDB SQL Syntax Diagram](#).

```

Expression ::=
    ( singleAtIdentifier assignmentEq | 'NOT' | Expression ( logOr | 'XOR' |
        ↪ logAnd ) ) Expression
| 'MATCH' '(' ColumnNameList ')' 'AGAINST' '(' BitExpr
    ↪ FulltextSearchModifierOpt ')'
| PredicateExpr ( IsOrNotOp 'NULL' | CompareOp ( ( singleAtIdentifier
    ↪ assignmentEq )? PredicateExpr | AnyOrAll SubSelect ) ) * ( IsOrNotOp (
    ↪ trueKwd | falseKwd | 'UNKNOWN' ) )?

PredicateExpr ::=
    BitExpr ( BetweenOrNotOp BitExpr 'AND' BitExpr ) * ( InOrNotOp ( '('
        ↪ ExpressionList ')' | SubSelect ) | LikeOrNotOp SimpleExpr
        ↪ LikeEscapeOpt | RegexpOrNotOp SimpleExpr )?

BitExpr ::=
    BitExpr ( ( '|' | '&' | '<<' | '>>' | '*' | '/' | '%' | 'DIV' | 'MOD' |
        ↪ '^' ) BitExpr | ( '+' | '-' ) ( BitExpr | "INTERVAL" Expression
        ↪ TimeUnit ) )
| SimpleExpr

SimpleExpr ::=
    SimpleIdent ( ( '->' | '->>' ) stringLit )?
| FunctionCallKeyword
| FunctionCallNonKeyword
| FunctionCallGeneric
| SimpleExpr ( 'COLLATE' CollationName | pipes SimpleExpr )
| WindowFuncCall
| Literal
| paramMarker
| Variable
| SumExpr
| ( '!' | '~' | '-' | '+' | 'NOT' | 'BINARY' ) SimpleExpr
| 'EXISTS'? SubSelect

```

```
| ( ( '(' ( ExpressionList ',' )? | 'ROW' '(' ExpressionList ',' )
  ↳ Expression | builtinCast '(' Expression 'AS' CastType | ( 'DEFAULT' |
  ↳ 'VALUES' ) '(' SimpleIdent | 'CONVERT' '(' Expression ( ',' CastType
  ↳ | 'USING' CharSetName ) ) )'
| 'CASE' ExpressionOpt WhenClause+ ElseOpt 'END'
```

12.10.1.7 Comment Syntax

This document describes the comment syntax supported by TiDB.

TiDB supports three comment styles:

- Use # to comment a line:

```
SELECT 1+1;  # comments
```

```
+-----+
| 1+1 |
+-----+
|   2 |
+-----+
1 row in set (0.00 sec)
```

- Use -- to comment a line:

```
SELECT 1+1;  -- comments
```

```
+-----+
| 1+1 |
+-----+
|   2 |
+-----+
1 row in set (0.00 sec)
```

And this style requires at least one whitespace after --:

```
SELECT 1+1--1;
```

```
+-----+
| 1+1--1 |
+-----+
|     3 |
+-----+
1 row in set (0.01 sec)
```

- Use `/* */` to comment a block or multiple lines:

```
SELECT 1 /* this is an in-line comment */ + 1;
```

```
+-----+
| 1 + 1 |
+-----+
|      2 |
+-----+
1 row in set (0.01 sec)
```

```
SELECT 1+
/*
/*> this is a
/*> multiple-line comment
/*> */
1;
```

```
+-----+
| 1+
      1 |
+-----+
|              2 |
+-----+
1 row in set (0.001 sec)
```

12.10.1.7.1 MySQL-compatible comment syntax

The same as MySQL, TiDB supports a variant of C comment style:

```
/*! Specific code */
```

or

```
/*!50110 Specific code */
```

In this style, TiDB runs the statements in the comment.

For example:

```
SELECT /*! STRAIGHT_JOIN */ col1 FROM table1,table2 WHERE ...
```

In TiDB, you can also use another version:

```
SELECT STRAIGHT_JOIN col1 FROM table1,table2 WHERE ...
```

If the server version number is specified in the comment, for example, `/*!50110 ↵ KEY_BLOCK_SIZE=1024 */`, in MySQL it means that the contents in this comment are processed only when the MySQL version is or higher than 5.1.10. But in TiDB, the MySQL version number does not work and all contents in the comment are processed.

12.10.1.7.2 TiDB specific comment syntax

TiDB has its own comment syntax (that is, TiDB specific comment syntax), which can be divided into the following two types:

- `/*T! Specific code */`: This syntax can only be parsed and executed by TiDB, and be ignored in other databases.
- `/*T![feature_id] Specific code */`: This syntax is used to ensure compatibility between different versions of TiDB. TiDB can parse the SQL fragment in this comment only if it implements the corresponding feature of `feature_id` in the current version. For example, as the `AUTO_RANDOM` feature is introduced in v3.1.1, this version of TiDB can parse `/*T![auto_rand] auto_random */` into `auto_random`. Because the `AUTO_RANDOM` feature is not implemented in v3.0.0, the SQL statement fragment above is ignored. **Do not leave any space inside the `/*T!` characters.**

12.10.1.7.3 Optimizer comment syntax

Another type of comment is specially treated as an optimizer hint:

```
SELECT /*+ hint */ FROM ...;
```

For details about the optimizer hints that TiDB supports, see [Optimizer hints](#).

Note:

In MySQL client, the TiDB-specific comment syntax is treated as comments and cleared by default. In MySQL client before 5.7.7, hints are also seen as comments and are cleared by default. It is recommended to use the `-- ↵ comments` option when you start the client. For example, `mysql -h ↵ 127.0.0.1 -P 4000 -uroot --comments`.

For more information, see [Comment Syntax](#).

12.10.2 SQL Statements

12.10.2.1 ADD COLUMN

The `ALTER TABLE.. ADD COLUMN` statement adds a column to an existing table. This operation is online in TiDB, which means that neither reads or writes to the table are blocked by adding a column.

12.10.2.1.1 Synopsis

```

AlterTableStmt
    ::= 'ALTER' 'IGNORE'? 'TABLE' TableName AddColumnSpec ( ','
        ↪ AddColumnSpec )*

TableName ::=
    Identifier ( '.' Identifier)?

AddColumnSpec
    ::= 'ADD' 'COLUMN' 'IF NOT EXISTS'? ColumnName ColumnType
        ↪ ColumnOption+ ( 'FIRST' | 'AFTER' ColumnName )?

ColumnType
    ::= NumericType
        | StringType
        | DateAndTimeType
        | 'SERIAL'

ColumnOption
    ::= 'NOT'? 'NULL'
        | 'AUTO_INCREMENT'
        | 'PRIMARY'? 'KEY' ( 'CLUSTERED' | 'NONCLUSTERED' )?
        | 'UNIQUE' 'KEY'?
        | 'DEFAULT' ( NowSymOptionFraction | SignedLiteral |
            ↪ NextValueForSequence )
        | 'SERIAL' 'DEFAULT' 'VALUE'
        | 'ON' 'UPDATE' NowSymOptionFraction
        | 'COMMENT' stringLit
        | ( 'CONSTRAINT' Identifier? )? 'CHECK' '(' Expression ')' ( 'NOT
            ↪ '? ( 'ENFORCED' | 'NULL' ) )?
        | 'GENERATED' 'ALWAYS' 'AS' '(' Expression ')' ( 'VIRTUAL' | '
            ↪ STORED' )?
        | 'REFERENCES' TableName ( '(' IndexPartSpecificationList ')' )?
            ↪ Match? OnDeleteUpdateOpt
        | 'COLLATE' CollationName
        | 'COLUMN_FORMAT' ColumnFormat
        | 'STORAGE' StorageMedia
        | 'AUTO_RANDOM' ( '(' LengthNum ')' )?

```

12.10.2.1.2 Examples

```

mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT);
Query OK, 0 rows affected (0.11 sec)

```

```
mysql> INSERT INTO t1 VALUES (NULL);
Query OK, 1 row affected (0.02 sec)

mysql> SELECT * FROM t1;
+-----+
| id |
+-----+
| 1 |
+-----+
1 row in set (0.00 sec)

mysql> ALTER TABLE t1 ADD COLUMN c1 INT NOT NULL;
Query OK, 0 rows affected (0.28 sec)

mysql> SELECT * FROM t1;
+-----+-----+
| id | c1 |
+-----+-----+
| 1 | 0 |
+-----+-----+
1 row in set (0.00 sec)

mysql> ALTER TABLE t1 ADD c2 INT NOT NULL AFTER c1;
Query OK, 0 rows affected (0.28 sec)

mysql> SELECT * FROM t1;
+-----+-----+-----+
| id | c1 | c2 |
+-----+-----+-----+
| 1 | 0 | 0 |
+-----+-----+-----+
1 row in set (0.00 sec)
```

12.10.2.1.3 MySQL compatibility

- Adding multiple columns at the same time in a statement is currently not supported.
- Adding a new column and setting it to the PRIMARY KEY is not supported.
- Adding a new column and setting it to AUTO_INCREMENT is not supported.
- There are limitations on adding generated columns, refer to: [generated column limitations](#).

12.10.2.1.4 See also

- [ADD INDEX](#)

- **CREATE TABLE**

12.10.2.2 ADD INDEX

The ALTER TABLE.. ADD INDEX statement adds an index to an existing table. This operation is online in TiDB, which means that neither reads or writes to the table are blocked by adding an index.

Warning:

- **DO NOT** upgrade a TiDB cluster when a DDL statement is being executed in the cluster (usually for the time-consuming DDL statements such as ADD INDEX and the column type changes).
- Before the upgrade, it is recommended to use the **ADMIN SHOW DDL** command to check whether the TiDB cluster has an ongoing DDL job. If the cluster has a DDL job, to upgrade the cluster, wait until the DDL execution is finished or use the **ADMIN CANCEL DDL** command to cancel the DDL job before you upgrade the cluster.
- In addition, during the cluster upgrade, **DO NOT** execute any DDL statement. Otherwise, the issue of undefined behavior might occur.

12.10.2.2.1 Synopsis

```
AlterTableStmt ::=
  'ALTER' IgnoreOptional 'TABLE' TableName ( AlterTableSpecListOpt
    ↪ AlterTablePartitionOpt | 'ANALYZE' 'PARTITION' PartitionNameList (
    ↪ 'INDEX' IndexNameList )? AnalyzeOptionListOpt )

```

12.10.2.2.3 MySQL compatibility

- FULLTEXT, HASH and SPATIAL indexes are not supported.
- Descending indexes are not supported (similar to MySQL 5.7).
- Adding multiple indexes at the same time is currently not supported.
- Adding the primary key of the CLUSTERED type to a table is not supported. For more details about the primary key of the CLUSTERED type, refer to [clustered index](#).

12.10.2.3 ADMIN

This statement is a TiDB extension syntax, used to view the status of TiDB and check the data of tables in TiDB.

12.10.2.3.1 DDL related statement

Statement	Description
<code>ADMIN CANCEL DDL JOBS</code>	Cancels a currently running DDL job
<code>ADMIN CHECKSUM TABLE</code> [ADMIN CHECK [TABLE INDEX]](#admin-check-[table index])	Calculates the CRC64 of all rows + i
<code>ADMIN SHOW DDL [JOBS QUERIES]](#admin-show-ddl-[jobs job-queries])</code>	

12.10.2.3.2 ADMIN RELOAD statement

```
ADMIN RELOAD expr_pushdown_blacklist;
```

The above statement is used to reload the blacklist pushed down by the expression.

```
ADMIN RELOAD opt_rule_blacklist;
```

The above statement is used to reload the blacklist of logic optimization rules.

12.10.2.3.3 ADMIN PLUGINS related statement

```
ADMIN PLUGINS ENABLE plugin_name [, plugin_name] ...;
```

The above statement is used to enable the `plugin_name` plugin.

```
ADMIN PLUGINS DISABLE plugin_name [, plugin_name] ...;
```

The above statement is used to disable the `plugin_name` plugin.

12.10.2.3.4 ADMIN BINDINGS related statement

```
ADMIN FLUSH bindings;
```

The above statement is used to persist SQL Plan binding information.

```
ADMIN CAPTURE bindings;
```

The above statement can generate the binding of SQL Plan from the **SELECT** statement that occurs more than once.

```
ADMIN EVOLVE bindings;
```

After the automatic binding feature is enabled, the evolution of SQL Plan binding information is triggered every **bind-info-leave** (the default value is **3s**). The above statement is used to proactively trigger this evolution.

```
ADMIN RELOAD bindings;
```

The above statement is used to reload SQL Plan binding information.

12.10.2.3.5 ADMIN REPAIR statement

To overwrite the metadata of the stored table in an untrusted way in extreme cases, use **ADMIN REPAIR TABLE**:

```
ADMIN REPAIR TABLE tbl_name CREATE TABLE STATEMENT;
```

Here “untrusted” means that you need to manually ensure that the metadata of the original table can be covered by the **CREATE TABLE STATEMENT** operation. To use this **REPAIR** statement, enable the **repair-mode** configuration item, and make sure that the tables to be repaired are listed in the **repair-table-list**.

12.10.2.3.6 ADMIN SHOW SLOW statement

```
ADMIN SHOW SLOW RECENT N;
```

```
ADMIN SHOW SLOW TOP [INTERNAL | ALL] N;
```

For details, refer to [admin show slow statement](#)

12.10.2.3.7 Synopsis

```
AdminStmt ::=
```

```
'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
↳ 'QUERIES' NumList )? | TableName 'NEXT_ROW_ID' | 'SLOW'
↳ AdminShowSlow ) | 'CHECK' ( 'TABLE' TableNameList | 'INDEX'

```

- **JOB_ID**: each DDL operation corresponds to one DDL job. **JOB_ID** is globally unique.
- **DB_NAME**: the name of the database on which the DDL operations are performed.
- **TABLE_NAME**: the name of the table on which the DDL operations are performed.
- **JOB_TYPE**: the type of the DDL operations.
- **SCHEMA_STATE**: the current state of the schema. If the **JOB_TYPE** is `add index`, it is the state of the index; if the **JOB_TYPE** is `add column`, it is the state of the column; if the **JOB_TYPE** is `create table`, it is the state of the table. The common states include:
 - **none**: it indicates not existing. When the `drop` or `create` operation fails and rolls back, it usually becomes the `none` state.
 - **delete only**, **write only**, **delete reorganization**, **write reorganization**: these four states are intermediate states. These states are not visible in common operations, because the conversion from the intermediate states is so quick. You can see the `write reorganization` state only in `add index` operations, which means that the index data is being added.
 - **public**: it indicates existing and usable. When operations like `create table` and `add index/column` are finished, it usually becomes the `public` state, which

means that the created table/column/index can be normally read and written now.

- **SCHEMA_ID**: the ID of the database on which the DDL operations are performed.
- **TABLE_ID**: the ID of the table on which the DDL operations are performed.
- **ROW_COUNT**: the number of the data rows that have been added when running the `add index` operation.
- **START_TIME**: the start time of the DDL operations.
- **END_TIME**: the end time of the DDL operations.
- **STATE**: the state of the DDL operations. The common states include:
 - **none**: it indicates that the operation task has been put in the DDL job queue but has not been performed yet, because it is waiting for the previous tasks to complete. Another reason might be that it becomes the **none** state after running the drop operation, but it will soon be updated to the **synced** state, which means that all TiDB instances have been synced to this state.
 - **running**: it indicates that the operation is being performed.
 - **synced**: it indicates that the operation has been performed successfully and all TiDB instances have been synced to this state.
 - **rollback done**: it indicates that the operation has failed and has finished rolling back.
 - **rollingback**: it indicates that the operation has failed and is rolling back.
 - **cancelling**: it indicates that the operation is being cancelled. This state only occurs when you cancel DDL jobs using the `ADMIN CANCEL DDL JOBS` command.

12.10.2.3.9 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.4 ADMIN CANCEL DDL

The `ADMIN CANCEL DDL` statement allows you to cancel a running DDL job. The `job_id` can be found by running `ADMIN SHOW DDL JOBS`.

12.10.2.4.1 Synopsis

```
AdminStmt ::=
  'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
    ↪ 'QUERIES' NumList )? | TableName 'NEXT_ROW_ID' | 'SLOW'
    ↪ AdminShowSlow ) | 'CHECK' ( 'TABLE' TableNameList | 'INDEX'
    ↪ TableName Identifier ( HandleRange ( ',' HandleRange )* )? ) | '
    ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ( 'INDEX'
    ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList ) | 'CHECKSUM'
    ↪ 'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
    ↪ ( 'EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS' )
    ↪ | 'PLUGINS' ( 'ENABLE' | 'DISABLE' ) PluginNameList | 'REPAIR' ' '
```

```
↪ TABLE' TableName CreateTableStmt | ( 'FLUSH' | 'CAPTURE' | 'EVOLVE  
↪ ' ) 'BINDINGS' )
```

```
NumList ::=  
  Int64Num ( ',' Int64Num )*
```

12.10.2.4.2 Examples

To cancel the currently running DDL jobs and return whether the corresponding jobs are successfully cancelled, use `ADMIN CANCEL DDL JOBS`:

```
ADMIN CANCEL DDL JOBS job_id [, job_id] ...;
```

If the operation fails to cancel the jobs, specific reasons are displayed.

Note:

- Only this operation can cancel DDL jobs. All other operations and environment changes (such as machine restart and cluster restart) cannot cancel these jobs.
- This operation can cancel multiple DDL jobs at the same time. You can get the ID of DDL jobs using the `ADMIN SHOW DDL JOBS` statement.
- If the jobs you want to cancel are finished, the cancellation operation fails.

12.10.2.4.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.4.4 See also

- [ADMIN SHOW DDL \[JOBS|JOB QUERIES\]](#)

12.10.2.5 ADMIN CHECKSUM TABLE

The `ADMIN CHECKSUM TABLE` statement calculates a CRC64 checksum for the data and indexes of a table. This statement is used by programs such as TiDB Lightning to ensure that import operations have completed successfully.

12.10.2.5.1 Synopsis

```
AdminStmt ::=
  'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
    ↪ 'QUERIES' NumList )? | TableName 'NEXT_ROW_ID' | 'SLOW'
    ↪ AdminShowSlow ) | 'CHECK' ( 'TABLE' TableNameList | 'INDEX'
    ↪ TableName Identifier ( HandleRange ( ',' HandleRange )* )? ) | '
    ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ( 'INDEX'
    ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList ) | 'CHECKSUM'
    ↪ 'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
    ↪ ( 'EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS' )
    ↪ | 'PLUGINS' ( 'ENABLE' | 'DISABLE' ) PluginNameList | 'REPAIR' '
    ↪ TABLE' TableName CreateTableStmt | ( 'FLUSH' | 'CAPTURE' | 'EVOLVE'
    ↪ ' ) 'BINDINGS' )
```

```
TableNameList ::=
  TableName ( ',' TableName )*
```

12.10.2.5.2 Examples

Calculate the checksum for a table:

```
CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY auto_increment);
INSERT INTO t1 VALUES (1),(2),(3);
ADMIN CHECKSUM TABLE t1;
```

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY auto_increment);
Query OK, 0 rows affected (0.11 sec)
```

```
mysql> INSERT INTO t1 VALUES (1),(2),(3);
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0
```

```
mysql> ADMIN CHECKSUM TABLE t1;
```

```
+-----+-----+-----+-----+-----+
| Db_name | Table_name | Checksum_crc64_xor | Total_kvs | Total_bytes |
+-----+-----+-----+-----+-----+
| test   | t1         | 10909174369497628533 | 3         | 75         |
+-----+-----+-----+-----+-----+
```

```
1 row in set (0.00 sec)
```

12.10.2.5.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.6 ADMIN CHECK [TABLE|INDEX]

The ADMIN CHECK [TABLE|INDEX] statement checks for data consistency of tables and indexes.

12.10.2.6.1 Synopsis

```
AdminStmt ::=
  'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
    ↪ 'QUERIES' NumList )? | TableName 'NEXT_ROW_ID' | 'SLOW'
    ↪ AdminShowSlow ) | 'CHECK' ( 'TABLE' TableNameList | 'INDEX'
    ↪ TableName Identifier ( HandleRange ( ',' HandleRange )* )? ) | '
    ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ( 'INDEX'
    ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList ) | 'CHECKSUM'
    ↪ 'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
    ↪ ( 'EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS' )
    ↪ | 'PLUGINS' ( 'ENABLE' | 'DISABLE' ) PluginNameList | 'REPAIR' '
    ↪ TABLE' TableName CreateTableStmt | ( 'FLUSH' | 'CAPTURE' | 'EVOLVE'
    ↪ ' ) 'BINDINGS' )

TableNameList ::=
  TableName ( ',' TableName )*
```

12.10.2.6.2 Examples

To check the consistency of all the data and corresponding indexes in the `tbl_name` table, use ADMIN CHECK TABLE:

```
ADMIN CHECK TABLE tbl_name [, tbl_name] ...;
```

If the consistency check is passed, an empty result is returned. Otherwise, an error message is returned indicating that the data is inconsistent.

```
ADMIN CHECK INDEX tbl_name idx_name;
```

The above statement is used to check the consistency of the column data and index data corresponding to the `idx_name` index in the `tbl_name` table. If the consistency check is passed, an empty result is returned; otherwise, an error message is returned indicating that the data is inconsistent.

```
ADMIN CHECK INDEX tbl_name idx_name (lower_val, upper_val) [, (lower_val,
  ↪ upper_val)] ...;
```

The above statement is used to check the consistency of the column data and index data corresponding to the `idx_name` index in the `tbl_name` table, with the data range (to be checked) specified. If the consistency check is passed, an empty result is returned. Otherwise, an error message is returned indicating that the data is inconsistent.

12.10.2.6.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.6.4 See also

- [ADMIN REPAIR](#)

12.10.2.7 ADMIN CLEANUP INDEX

The ADMIN CLEANUP INDEX statement is used to delete redundant indexes from a table when the table has inconsistent data and index. Note that this syntax does not support foreign key constraints yet.

12.10.2.7.1 Synopsis

```
AdminCleanupStmt ::=
  'ADMIN' 'CLEANUP' ( 'INDEX' TableName IndexName | 'TABLE' 'LOCK'
    ↪ TableNameList )

TableNameList ::=
  TableName ( ',' TableName )*
```

12.10.2.7.2 Examples

Assume that the `tbl` table in a database has inconsistent data and index due to some reasons (for example, some row data is lost in the cluster in a disaster recovery scenario):

```
SELECT * FROM tbl;
ERROR 1105 (HY000): inconsistent index idx handle count 3 isn't equal to
  ↪ value count 2

ADMIN CHECK INDEX tbl idx ;
ERROR 1105 (HY000): handle &kv.CommonHandle{encoded:[]uint8{0x1, 0x0, 0x0, 0
  ↪ x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0xf8}, colEndOffsets:[]uint16{0xa}},
  ↪ index:types.Datum{k:0x5, decimal:0x0, length:0x0, i:0, collation:"
  ↪ utf8mb4_bin", b:[]uint8{0x0}, x:interface {}(nil)} != record:<nil>
```

It can be seen from the error message of the `SELECT` query that, the `tbl` table contains two rows of data and three rows of index data, which means inconsistent row and index data. At the same time, at least one index is in dangling state. In this case, you can use the ADMIN CLEANUP INDEX statement to delete the dangling index:

```
ADMIN CLEANUP INDEX tbl idx;
```

The execution result is as follows:

```
ADMIN CLEANUP INDEX tbl idx;
```

```
+-----+  
| REMOVED_COUNT |  
+-----+  
|           1 |  
+-----+
```

You can execute the `ADMIN CHECK INDEX` statement again to check the consistency of data and index, and verify whether the data has been restored to a normal state:

```
ADMIN CHECK INDEX tbl idx;  
Query OK, 0 rows affected (0.01 sec)
```

Note:

When the data and index are inconsistent due to the loss of replicas:

- There might be a loss of both row data and index data. To restore the consistency, use the `ADMIN CLEANUP INDEX` and `ADMIN RECOVER INDEX` statements together.
- The `ADMIN CLEANUP INDEX` statement is always executed in a single thread. When the table data is large, it is recommended to recover the index data by rebuilding the index.
- When you execute the `ADMIN CLEANUP INDEX` statement, the corresponding table or index is not locked and TiDB allows other sessions to modify the table records at the same time. However, in this case, `ADMIN CLEANUP INDEX` might not be able to handle all table records correctly. Therefore, when you execute `ADMIN CLEANUP INDEX`, avoid modifying the table data at the same time.
- If you use the enterprise edition of TiDB, you can [submit a request](#) to contact the support engineer for help.

The `ADMIN CLEANUP INDEX` statement is not atomic: if the statement is interrupted during execution, it is recommended to execute it again until it succeeds.

12.10.2.7.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.7.4 See also

- [ADMIN CHECK TABLE/INDEX](#)
- [ADMIN RECOVER INDEX](#)

12.10.2.8 ADMIN RECOVER INDEX

When the row data and index data are inconsistent, you can use the `ADMIN RECOVER` \leftrightarrow `INDEX` statement to recover the consistency based on the redundant indexes. Note that this syntax does not support foreign key constraints yet.

12.10.2.8.1 Synopsis

```
AdminCleanupStmt ::=
  'ADMIN' 'RECOVER' 'INDEX' TableName IndexName
```

12.10.2.8.2 Examples

Assume that the `tbl` table in a database has inconsistent row data and index due to some reasons (for example, some row data is lost in the cluster in a disaster recovery scenario):

```
SELECT * FROM tbl;
ERROR 1105 (HY000): inconsistent index idx handle count 2 isn't equal to
  ↳ value count 3

ADMIN CHECK INDEX tbl idx ;
ERROR 1105 (HY000): handle &kv.CommonHandle{encoded:[]uint8{0x1, 0x0, 0x0, 0
  ↳ x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0xf8}, colEndOffsets:[]uint16{0xa}},
  ↳ index:types.Datum{k:0x5, decimal:0x0, length:0x0, i:0, collation:"
  ↳ utf8mb4_bin", b:[]uint8{0x0}, x:interface {}(nil)} != record:<nil>
```

It can be seen from the error message of the `SELECT` query that, the `tbl` table contains three rows of data and two rows of index data, which means inconsistent row data and index data. At the same time, at least one row of data has no corresponding index. In this case, you can use the `ADMIN RECOVER INDEX` statement to supplement the missing index:

```
ADMIN RECOVER INDEX tbl idx;
```

The execution result is as follows:

```
ADMIN RECOVER INDEX tbl idx;
+-----+-----+
| ADDED_COUNT | SCAN_COUNT |
+-----+-----+
|          1 |          3 |
+-----+-----+
1 row in set (0.00 sec)
```

You can execute the `ADMIN CHECK INDEX` statement again to check the consistency of data and index, and verify whether the data has been restored to normal state:

```
ADMIN CHECK INDEX tbl idx;  
Query OK, 0 rows affected (0.01 sec)
```

Note:

When the data and index are inconsistent due to the loss of replicas:

- There might be a loss of both row data and index data. To address the issue, use the `ADMIN CLEANUP INDEX` and `ADMIN RECOVER INDEX` statements together to recover the consistency of row data and index data.
- The `ADMIN RECOVER INDEX` statement is always executed in a single thread. When the table data is large, it is recommended to recover the index data by rebuilding the index.
- When you execute the `ADMIN RECOVER INDEX` statement, the corresponding table or index is not locked and TiDB allows other sessions to modify the table records at the same time. However, in this case, `ADMIN RECOVER INDEX` might not be able to handle all table records correctly. Therefore, when you execute `ADMIN RECOVER INDEX`, avoid modifying the table data at the same time.
- If you use the enterprise edition of TiDB, you can [submit a request](#) to contact the support engineer for help.

The `ADMIN RECOVER INDEX` statement is not atomic: if the statement is interrupted during execution, it is recommended to execute it again until it succeeds.

12.10.2.8.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.8.4 See also

- `ADMIN CLEANUP INDEX`

12.10.2.9 ADMIN SHOW DDL [JOBS|JOB QUERIES]

The `ADMIN SHOW DDL [JOBS|JOB QUERIES]` statement shows information about running and recently completed DDL jobs.

12.10.2.9.1 Synopsis

```

AdminStmt ::=
  'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
    ↪ 'QUERIES' NumList )? | TableName 'NEXT_ROW_ID' | 'SLOW'
    ↪ AdminShowSlow ) | 'CHECK' ( 'TABLE' TableNameList | 'INDEX'
    ↪ TableName Identifier ( HandleRange ( ',' HandleRange )* )? ) | '
    ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ( 'INDEX'
    ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList ) | 'CHECKSUM'
    ↪ 'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
    ↪ ( 'EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS' )
    ↪ | 'PLUGINS' ( 'ENABLE' | 'DISABLE' ) PluginNameList | 'REPAIR' '
    ↪ TABLE' TableName CreateTableStmt | ( 'FLUSH' | 'CAPTURE' | 'EVOLVE'
    ↪ ' ) 'BINDINGS' )

NumList ::=
  Int64Num ( ',' Int64Num )*

WhereClauseOptional ::=
  WhereClause?

```

12.10.2.9.2 Examples

ADMIN SHOW DDL

To view the currently running DDL jobs, use ADMIN SHOW DDL:

```
ADMIN SHOW DDL;
```

```

mysql> ADMIN SHOW DDL;
+---
↪ -----+-----+-----+
↪
| SCHEMA_VER | OWNER_ID | OWNER_ADDRESS | RUNNING_JOBS
↪ | SELF_ID | QUERY |

| 48 | test | t1 | create table | public |
↪ 1 | 47 | 0 | 2020-08-17 07:33:37 | 2020-08-17
```

```

↪ 07:33:37 | synced |
| 46 | mysql | stats_extended | create table | public |
↪ 3 | 45 | 0 | 2020-08-17 06:42:38 | 2020-08-17
↪ 06:42:38 | synced |
| 44 | mysql | opt_rule_blacklist | create table | public |
↪ 3 | 43 | 0 | 2020-08-17 06:42:38 | 2020-08-17
↪ 06:42:38 | synced |
+--
↪ -----+-----+-----+-----+-----+
↪
12 rows in set (0.00 sec)

```

From the output above:

- Job 59 is currently in progress (STATE of **running**). The schema state is currently in **write reorganization**, but will switch to **public** once the task is completed to note that the change can be observed publicly by user sessions. The **end_time** column is also **NULL** indicating that the completion time for the job is currently not known.
- Job 60 is an **add index** job, which is currently queued waiting for job 59 to complete. When job 59 completes, the **STATE** of job 60 will switch to **running**.
- For destructive changes such as dropping an index or dropping a table, the **SCHEMA_STATE** will change to **none** when the job is complete. For additive changes, the **SCHEMA_STATE** will change to **public**.

To limit the number of rows shown, specify a number and a where condition:

```
ADMIN SHOW DDL JOBS [NUM] [WHERE where_condition];
```

- **NUM**: to view the last NUM results in the completed DDL job queue. If not specified, NUM is by default 10.
- **WHERE**: to add filter conditions.

ADMIN SHOW DDL JOB QUERIES

To view the original SQL statements of the DDL job corresponding to **job_id**, use **ADMIN SHOW DDL JOB QUERIES**:

```
ADMIN SHOW DDL JOBS;
ADMIN SHOW DDL JOB QUERIES 51;
```

```
mysql> ADMIN SHOW DDL JOB QUERIES 51;
```

```

+-----+
| QUERY |

```

```
+-----+
| CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY auto_increment) |
+-----+
1 row in set (0.02 sec)
```

You can only search the running DDL job corresponding to `job_id` within the last ten results in the DDL history job queue.

12.10.2.9.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.10.3 MySQL compatibility

The ADMIN statement is a TiDB extension to MySQL syntax.

12.10.2.10.4 See also

- [Telemetry](#)
- [tidb_enable_telemetry System Variable](#)

12.10.2.11 ALTER DATABASE

ALTER DATABASE is used to specify or modify the default character set and collation of the current database. ALTER SCHEMA has the same effect as ALTER DATABASE.

12.10.2.11.1 Synopsis

```
AlterDatabaseStmt ::=
  'ALTER' 'DATABASE' DBName? DatabaseOptionList

DatabaseOption ::=
  DefaultKwdOpt ( CharsetKw '='? CharsetName | 'COLLATE' '='?
    ↪ CollationName | 'ENCRYPTION' '='? EncryptionOpt )
```

12.10.2.11.2 Examples

Modify the test database schema to use the utf8mb4 character set:

```
ALTER DATABASE test DEFAULT CHARACTER SET = utf8mb4;
```

```
Query OK, 0 rows affected (0.00 sec)
```

Currently, TiDB only supports some character sets and collations. See [Character Set and Collation Support](#) for details.

12.10.2.11.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.11.4 See also

- [CREATE DATABASE](#)
- [SHOW DATABASES](#)

12.10.2.12 ALTER INDEX

The ALTER INDEX statement is used to modify the visibility of the index to `Visible` or `Invisible`. Invisible indexes are maintained by DML statements, but will not be used by the query optimizer. This is useful in scenarios where you want to double-check before removing an index permanently.

12.10.2.12.1 Synopsis

```
AlterTableStmt ::=
  'ALTER' IgnoreOptional 'TABLE' TableName ( AlterTableSpecListOpt
    ↪ AlterTablePartitionOpt | 'ANALYZE' 'PARTITION' PartitionNameList (
    ↪ 'INDEX' IndexNameList )? AnalyzeOptionListOpt )

AlterTableSpec ::=
```

```

TableOptionList
| 'SET' 'TIFLASH' 'REPLICA' LengthNum LocationLabelList
| 'CONVERT' 'TO' CharsetKw ( CharsetName | 'DEFAULT' ) OptCollate
| 'ADD' ( ColumnKeywordOpt IfNotExists ( ColumnDef ColumnPosition | '('
↳ TableElementList ')' ) | Constraint | 'PARTITION' IfNotExists
↳ NoWriteToBinLogAliasOpt ( PartitionDefinitionListOpt | 'PARTITIONS'
↳ NUM ) )
| ( ( 'CHECK' | 'TRUNCATE' ) 'PARTITION' | ( 'OPTIMIZE' | 'REPAIR' | '
↳ REBUILD' ) 'PARTITION' NoWriteToBinLogAliasOpt )
↳ AllOrPartitionNameList
| 'COALESCE' 'PARTITION' NoWriteToBinLogAliasOpt NUM
| 'DROP' ( ColumnKeywordOpt IfExists ColumnName RestrictOrCascadeOpt | '
↳ PRIMARY' 'KEY' | 'PARTITION' IfExists PartitionNameList | (
↳ KeyOrIndex IfExists | 'CHECK' ) Identifier | 'FOREIGN' 'KEY' IfExists
↳ Symbol )
| 'EXCHANGE' 'PARTITION' Identifier 'WITH' 'TABLE' TableName
↳ WithValidationOpt
| ( 'IMPORT' | 'DISCARD' ) ( 'PARTITION' AllOrPartitionNameList )? '
↳ TABLESPACE'
| 'REORGANIZE' 'PARTITION' NoWriteToBinLogAliasOpt
↳ ReorganizePartitionRuleOpt
| 'ORDER' 'BY' AlterOrderItem ( ',' AlterOrderItem )*
| ( 'DISABLE' | 'ENABLE' ) 'KEYS'
| ( 'MODIFY' ColumnKeywordOpt IfExists | 'CHANGE' ColumnKeywordOpt
↳ IfExists ColumnName ) ColumnDef ColumnPosition
| 'ALTER' ( ColumnKeywordOpt ColumnName ( 'SET' 'DEFAULT' ( SignedLiteral
↳ | '(' Expression ')' ) | 'DROP' 'DEFAULT' ) | 'CHECK' Identifier
↳ EnforcedOrNot | 'INDEX' Identifier IndexInvisible )
| 'RENAME' ( ( 'COLUMN' | KeyOrIndex ) Identifier 'TO' Identifier | ( 'TO'
↳ | '='? | 'AS' ) TableName )
| LockClause
| AlgorithmClause
| 'FORCE'
| ( 'WITH' | 'WITHOUT' ) 'VALIDATION'
| 'SECONDARY_LOAD'
| 'SECONDARY_UNLOAD'

IndexInvisible ::=
    'VISIBLE'
| 'INVISIBLE'

```

12.10.2.12.2 Examples

You can modify the visibility of an index using the ALTER TABLE ... ALTER INDEX ...

statement.

```
CREATE TABLE t1 (c1 INT, UNIQUE(c1));
ALTER TABLE t1 ALTER INDEX c1 INVISIBLE;
```

Query OK, 0 rows affected (0.02 sec)

```
SHOW CREATE TABLE t1;
```

```
+--
  ↪ -----+-----
  ↪
| Table | Create Table
      |
+--
  ↪ -----+-----
  ↪
| t1    | CREATE TABLE `t1` (
      | `c1` int(11) DEFAULT NULL,
      | UNIQUE KEY `c1` (`c1`) /*!80000 INVISIBLE */
      | ) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin |
+--
  ↪ -----+-----
  ↪
1 row in set (0.00 sec)
```

The optimizer cannot use the **invisible index** of c1.

```
EXPLAIN SELECT c1 FROM t1 ORDER BY c1;
```

```
+--
  ↪ -----+-----+-----+-----+-----
  ↪
| id          | estRows | task    | access object | operator info
      |
+--
  ↪ -----+-----+-----+-----+-----
  ↪
| Sort_4      | 10000.00 | root   |               | test.t1.c1:asc
      |
| -TableReader_8 | 10000.00 | root   |               | data:
  ↪ TableFullScan_7 |
|   -TableFullScan_7 | 10000.00 | cop[tikv] | table:t1 | keep order:false
  ↪ , stats:pseudo |
+--
  ↪ -----+-----+-----+-----+-----
  ↪
```

```
3 rows in set (0.00 sec)
```

By comparison, c2 is a **visible index** and can be used by the optimizer.

```
EXPLAIN SELECT c2 FROM t1 ORDER BY c2;
```

```
+--
  ↪ -----+-----+-----+-----+-----+
  ↪
| id          | estRows | task  | access object | operator
  ↪ info          |         |      |               |
+--
  ↪ -----+-----+-----+-----+
  ↪
| IndexReader_13 | 10000.00 | root  |               | index:
  ↪ IndexFullScan_12 |         |      |               |
| -IndexFullScan_12 | 10000.00 | cop[tikv] | table:t1, index:c2(c2) |
  ↪ keep order:true, stats:pseudo |
+--
  ↪ -----+-----+-----+-----+
  ↪
2 rows in set (0.00 sec)
```

Even if you use the `USE INDEX` SQL hint to forcibly use indexes, the optimizer still cannot use invisible indexes; otherwise, an error is returned.

```
SELECT * FROM t1 USE INDEX(c1);
```

```
ERROR 1176 (42000): Key 'c1' doesn't exist in table 't1'
```

Note:

“Invisible” here means invisible only to the optimizer. You can still modify or delete invisible indexes.

```
ALTER TABLE t1 DROP INDEX c1;
```

```
Query OK, 0 rows affected (0.02 sec)
```

12.10.2.12.3 MySQL compatibility

- Invisible indexes in TiDB are modeled on the equivalent feature from MySQL 8.0.
- Similar to MySQL, TiDB does not permit `PRIMARY KEY` indexes to be made invisible.
- MySQL provides an optimizer switch `use_invisible_indexes=on` to make all invisible indexes *visible* again. This functionality is not available in TiDB.

12.10.2.12.4 See also

- [CREATE TABLE](#)
- [CREATE INDEX](#)
- [ADD INDEX](#)
- [DROP INDEX](#)
- [RENAME INDEX](#)

12.10.2.13 ALTER INSTANCE

The `ALTER INSTANCE` statement is used to make changes to a single TiDB instance. Currently, TiDB only supports the `RELOAD TLS` clause.

12.10.2.13.1 RELOAD TLS

You can execute the `ALTER INSTANCE RELOAD TLS` statement to reload the certificate (`ssl-cert`), the key (`ssl-key`), and the CA (`ssl-ca`) from the original configuration path.

The newly loaded certificate, key, and CA take effect on the connection that is established after the statement is successfully executed. The connection established before this statement execution is not affected.

When an error occurs during reloading, by default, this error message is returned and the previous key and certificate continue to be used. However, if you have added the optional `NO ROLLBACK ON ERROR`, when an error occurs during reloading, the error is not returned, and the subsequent requests are handled with the TLS security connection disabled.

12.10.2.13.2 Syntax diagram

AlterInstanceStmt:

```
AlterInstanceStmt ::=
    'ALTER' 'INSTANCE' InstanceOption

InstanceOption ::=
    'RELOAD' 'TLS' ('NO' 'ROLLBACK' 'ON' 'ERROR')?
```

12.10.2.13.3 Example

```
ALTER INSTANCE RELOAD TLS;
```

12.10.2.13.4 MySQL compatibility

The `ALTER INSTANCE RELOAD TLS` statement only supports reloading from the original configuration path. It does not support dynamically modifying the loading path or dynamically enabling the TLS encrypted connection feature when TiDB is started. This feature is disabled by default when you restart TiDB.

12.10.2.13.5 See also

[Enable TLS Between TiDB Clients and Servers.](#)

12.10.2.14 ALTER PLACEMENT POLICY

Warning:

Placement Rules in SQL is an experimental feature. The syntax might change before its GA, and there might also be bugs.

If you understand the risks, you can enable this experiment feature by executing `SET GLOBAL tidb_enable_alter_placement = 1;`

`ALTER PLACEMENT POLICY` is used to modify existing placement policies that have previously been created. All the tables and partitions which use the placement policy will automatically be updated.

12.10.2.14.1 Synopsis

```
AlterPolicyStmt ::=
    "ALTER" "PLACEMENT" "POLICY" IfExists PolicyName PlacementOptionList

PolicyName ::=
    Identifier

PlacementOptionList ::=
    DirectPlacementOption
| PlacementOptionList DirectPlacementOption
| PlacementOptionList ',' DirectPlacementOption

DirectPlacementOption ::=
```

```

"PRIMARY_REGION" EqOpt stringLit
| "REGIONS" EqOpt stringLit
| "FOLLOWERS" EqOpt LengthNum
| "VOTERS" EqOpt LengthNum
| "LEARNERS" EqOpt LengthNum
| "SCHEDULE" EqOpt stringLit
| "CONSTRAINTS" EqOpt stringLit
| "LEADER_CONSTRAINTS" EqOpt stringLit
| "FOLLOWER_CONSTRAINTS" EqOpt stringLit
| "VOTER_CONSTRAINTS" EqOpt stringLit
| "LEARNER_CONSTRAINTS" EqOpt stringLit

```

12.10.2.14.2 Examples

Note:

To know which regions are available in your cluster, see [SHOW PLACEMENT](#) ↪ [LABELS](#).

If you do not see any available regions, your TiKV installation might not have labels set correctly.

```

CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us-
↪ -west-1";
ALTER PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us-
↪ west-1,us-west-2" FOLLOWERS=4;
SHOW CREATE PLACEMENT POLICY p1\G

```

Query OK, 0 rows affected (0.08 sec)

Query OK, 0 rows affected (0.10 sec)

```

***** 1. row *****
      Policy: p1
Create Policy: CREATE PLACEMENT POLICY `p1` PRIMARY_REGION="us-east-1"
↪ REGIONS="us-east-1,us-west-1,us-west-2" FOLLOWERS=4
1 row in set (0.00 sec)

```

12.10.2.14.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.14.4 See also

- [CREATE PLACEMENT POLICY](#)
- [DROP PLACEMENT POLICY](#)

12.10.2.15 ALTER TABLE

This statement modifies an existing table to conform to a new table structure. The statement ALTER TABLE can be used to:

- [ADD](#), [DROP](#), or [RENAME](#) indexes
- [ADD](#), [DROP](#), [MODIFY](#) or [CHANGE](#) columns

12.10.2.15.1 Synopsis

```
AlterTableStmt ::=
  'ALTER' IgnoreOptional 'TABLE' TableName ( AlterTableSpecListOpt
    ↪ AlterTablePartitionOpt | 'ANALYZE' 'PARTITION' PartitionNameList (
    ↪ 'INDEX' IndexNameList )? AnalyzeOptionListOpt )

TableName ::=
  Identifier ('.' Identifier)?

AlterTableSpec ::=

| 'SET' 'TIFLASH' 'REPLICA' LengthNum LocationLabelList
| 'CONVERT' 'TO' CharsetKw ( CharsetName | 'DEFAULT' ) OptCollate
| 'ADD' ( ColumnKeywordOpt IfNotExists ( ColumnDef ColumnPosition | '('
  ↪ TableElementList ')' ) | Constraint | 'PARTITION' IfNotExists
  ↪ NoWriteToBinLogAliasOpt ( PartitionDefinitionListOpt | 'PARTITIONS'
  ↪ NUM ) )
| ( ( 'CHECK' | 'TRUNCATE' ) 'PARTITION' | ( 'OPTIMIZE' | 'REPAIR' | '
  ↪ REBUILD' ) 'PARTITION' NoWriteToBinLogAliasOpt )
  ↪ AllOrPartitionNameList
| 'COALESCE' 'PARTITION' NoWriteToBinLogAliasOpt NUM
| 'DROP' ( ColumnKeywordOpt IfExists ColumnName RestrictOrCascadeOpt | '
  ↪ PRIMARY' 'KEY' | 'PARTITION' IfExists PartitionNameList | (
  ↪ KeyOrIndex IfExists | 'CHECK' ) Identifier | 'FOREIGN' 'KEY' IfExists
  ↪ Symbol )
| 'EXCHANGE' 'PARTITION' Identifier 'WITH' 'TABLE' TableName
  ↪ WithValidationOpt
| ( 'IMPORT' | 'DISCARD' ) ( 'PARTITION' AllOrPartitionNameList )? '
  ↪ TABLESPACE'
```

```

| 'REORGANIZE' 'PARTITION' NoWriteToBinLogAliasOpt
↳ ReorganizePartitionRuleOpt
| 'ORDER' 'BY' AlterOrderItem ( ',' AlterOrderItem )*
| ( 'DISABLE' | 'ENABLE' ) 'KEYS'
| ( 'MODIFY' ColumnKeywordOpt IfExists | 'CHANGE' ColumnKeywordOpt
↳ IfExists ColumnName ) ColumnDef ColumnPosition
| 'ALTER' ( ColumnKeywordOpt ColumnName ( 'SET' 'DEFAULT' ( SignedLiteral
↳ | '(' Expression ')' ) | 'DROP' 'DEFAULT' ) | 'CHECK' Identifier
↳ EnforcedOrNot | 'INDEX' Identifier IndexInvisible )
| 'RENAME' ( ( 'COLUMN' | KeyOrIndex ) Identifier 'TO' Identifier | ( 'TO'
↳ | '='? | 'AS' ) TableName )
| LockClause
| AlgorithmClause
| 'FORCE'
| ( 'WITH' | 'WITHOUT' ) 'VALIDATION'
| 'SECONDARY_LOAD'
| 'SECONDARY_UNLOAD'
| ( 'AUTO_INCREMENT' | 'AUTO_ID_CACHE' | 'AUTO_RANDOM_BASE' | '
↳ SHARD_ROW_ID_BITS' ) EqOpt LengthNum

```

12.10.2.15.2 Examples

Create a table with some initial data:

```

CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT NOT
↳ NULL);
INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);

```

Query OK, 0 rows affected (0.11 sec)

Query OK, 5 rows affected (0.03 sec)

Records: 5 Duplicates: 0 Warnings: 0

The following query requires a full table scan because the column c1 is not indexed:

```

EXPLAIN SELECT * FROM t1 WHERE c1 = 3;

```

```

+---
↳ -----+-----+-----+-----+
↳
| id          | estRows | task    | access object | operator info
↳
+---
↳ -----+-----+-----+-----+
↳

```

```

| TableReader_7          | 10.00 | root      |          | data:Selection_6
  ↳ |
| -Selection_6          | 10.00 | cop[tikv] |          | eq(test.t1.c1,
  ↳ 3) |
| -TableFullScan_5     | 10000.00 | cop[tikv] | table:t1 | keep order:false
  ↳ , stats:pseudo |
+--
  ↳ -----+-----+-----+-----+
  ↳
3 rows in set (0.00 sec)

```

The statement `ALTER TABLE .. ADD INDEX` can be used to add an index on the table `t1`. `EXPLAIN` confirms that the original query now uses an index range scan, which is more efficient:

```

ALTER TABLE t1 ADD INDEX (c1);
EXPLAIN SELECT * FROM t1 WHERE c1 = 3;

```

```

Query OK, 0 rows affected (0.30 sec)

+--
  ↳ -----+-----+-----+-----+
  ↳
| id              | estRows | task    | access object      | operator
  ↳ info              |         |         |                    |
+--
  ↳ -----+-----+-----+-----+
  ↳
| IndexReader_6   | 10.00 | root    |                    | index:
  ↳ IndexRangeScan_5 |         |         |                    |
| -IndexRangeScan_5 | 10.00 | cop[tikv] | table:t1, index:c1(c1) | range
  ↳ :[3,3], keep order:false, stats:pseudo |
+--
  ↳ -----+-----+-----+-----+
  ↳
2 rows in set (0.00 sec)

```

TiDB supports the ability to assert that DDL changes will use a particular `ALTER` algorithm. This is only an assertion, and does not change the actual algorithm which will be used to modify the table. It can be useful if you only want to permit instant DDL changes during the peak hours of your cluster:

```

ALTER TABLE t1 DROP INDEX c1, ALGORITHM=INSTANT;

```

```

Query OK, 0 rows affected (0.24 sec)

```

Using the `ALGORITHM=INSTANT` assertion on an operation that requires the `INPLACE` algorithm results in a statement error:

```
ALTER TABLE t1 ADD INDEX (c1), ALGORITHM=INSTANT;
```

```
ERROR 1846 (0A000): ALGORITHM=INSTANT is not supported. Reason: Cannot
↳ alter table by INSTANT. Try ALGORITHM=INPLACE.
```

However, using the `ALGORITHM=COPY` assertion for an `INPLACE` operation generates a warning instead of an error. This is because TiDB interprets the assertion as *this algorithm or better*. This behavior difference is useful for MySQL compatibility because the algorithm TiDB uses might differ from MySQL:

```
ALTER TABLE t1 ADD INDEX (c1), ALGORITHM=COPY;
SHOW WARNINGS;
```

```
Query OK, 0 rows affected, 1 warning (0.25 sec)
```

```
+---
↳ -----+-----+
↳
| Level | Code | Message
↳
↳ |
+---
↳ -----+-----+
↳
| Error | 1846 | ALGORITHM=COPY is not supported. Reason: Cannot alter
↳ table by COPY. Try ALGORITHM=INPLACE. |
+---
↳ -----+-----+
↳
1 row in set (0.00 sec)
```

12.10.2.15.3 MySQL compatibility

The following major restrictions apply to `ALTER TABLE` in TiDB:

- Making multiple changes in a single `ALTER TABLE` statement is currently not supported.
- Changes of the [Reorg-Data](#) types on primary key columns are not supported.
- Changes of column types on partitioned tables are not supported.
- Changes of column types on generated columns are not supported.

- Changes of some data types (for example, some TIME, Bit, Set, Enum, and JSON types) are not supported due to the compatibility issues of the CAST function's behavior between TiDB and MySQL.
- Spatial data types are not supported.

For further restrictions, see [MySQL Compatibility](#).

12.10.2.15.4 See also

- [MySQL Compatibility](#)

- [DROP TABLE](#)
- [SHOW CREATE TABLE](#)

12.10.2.16 ALTER USER

This statement changes an existing user inside the TiDB privilege system. In the MySQL privilege system, a user is the combination of a username and the host from which they are connecting from. Thus, it is possible to create a user 'newuser2'@'192.168.1.1' who is only able to connect from the IP address 192.168.1.1. It is also possible to have two users have the same user-portion, and different permissions as they login from different hosts.

12.10.2.16.1 Synopsis

```
AlterUserStmt ::=
  'ALTER' 'USER' IfExists (UserSpecList RequireClauseOpt ConnectionOptions
    ↪ PasswordOrLockOptions | 'USER' '(' ')' 'IDENTIFIED' 'BY'
    ↪ AuthString)

UserSpecList ::=
  UserSpec ( ',' UserSpec )*

UserSpec ::=
  Username AuthOption

Username ::=
  StringName ('@' StringName | singleAtIdentifier)? | 'CURRENT_USER'
    ↪ OptionalBraces
```

```
AuthOption ::=
  ( 'IDENTIFIED' ( 'BY' ( AuthString | 'PASSWORD' HashString ) | 'WITH'
    ↪ StringName ( 'BY' AuthString | 'AS' HashString )? ) )?
```

12.10.2.16.2 Examples

```
mysql> CREATE USER 'newuser' IDENTIFIED BY 'newuserpassword';
Query OK, 1 row affected (0.01 sec)

mysql> SHOW CREATE USER 'newuser';
+---
↪ -----
↪
| CREATE USER for newuser@%
↪
↪ |
+---
↪ -----
↪
| CREATE USER 'newuser'@'%' IDENTIFIED WITH 'mysql_native_password' AS '
↪ *5806E04BBEE79E1899964C6A04D68BCA69B1A879' REQUIRE NONE PASSWORD
↪ EXPIRE DEFAULT ACCOUNT UNLOCK |
+---
↪ -----
↪
1 row in set (0.00 sec)

mysql> ALTER USER 'newuser' IDENTIFIED BY 'newnewpassword';
Query OK, 0 rows affected (0.02 sec)

mysql> SHOW CREATE USER 'newuser';
+---
↪ -----
↪
| CREATE USER for newuser@%
↪
↪ |
+---
↪ -----
↪
| CREATE USER 'newuser'@'%' IDENTIFIED WITH 'mysql_native_password' AS '*
↪ FB8A1EA1353E8775CA836233E367FBDFCB37BE73' REQUIRE NONE PASSWORD
↪ EXPIRE DEFAULT ACCOUNT UNLOCK |
```

```
+--
↪ -----
↪
1 row in set (0.00 sec)
```

12.10.2.16.3 MySQL compatibility

- In MySQL this statement is used to change attributes such as to expire a password. This functionality is not yet supported by TiDB.

12.10.2.16.4 See also

- [Security Compatibility with MySQL](#)
- [CREATE USER](#)
- [DROP USER](#)
- [SHOW CREATE USER](#)

12.10.2.17 ANALYZE

This statement updates the statistics that TiDB builds on tables and indexes. It is recommended to run `ANALYZE` after performing a large batch update or import of records, or when you notice that query execution plans are sub-optimal.

TiDB will also automatically update its statistics over time as it discovers that they are inconsistent with its own estimates.

Currently, TiDB collects statistical information in two ways: full collection (implemented using the `ANALYZE TABLE` statement) and incremental collection (implemented using the `ANALYZE INCREMENTAL TABLE` statement). For detailed usage of these two statements, refer to [introduction to statistics](#)

12.10.2.17.1 Synopsis

```
AnalyzeTableStmt ::=
  'ANALYZE' ( 'TABLE' ( TableNameList ( 'ALL COLUMNS' | 'PREDICATE COLUMNS
    ↪ ' ) | TableName ( 'INDEX' IndexNameList? | AnalyzeColumnOption | '
    ↪ PARTITION' PartitionNameList ( 'INDEX' IndexNameList? |
    ↪ AnalyzeColumnOption )? )? ) | 'INCREMENTAL' 'TABLE' TableName ( '
    ↪ PARTITION' PartitionNameList )? 'INDEX' IndexNameList? )
    ↪ AnalyzeOptionListOpt

AnalyzeOptionListOpt ::=
( WITH AnalyzeOptionList )?
```

```

AnalyzeOptionList ::=
AnalyzeOption ( ',' AnalyzeOption )*

AnalyzeOption ::=
( NUM ( 'BUCKETS' | 'TOPN' | ( 'CMSKETCH' ( 'DEPTH' | 'WIDTH' ) ) | 'SAMPLES
  ↪ ' ) ) | ( FLOATNUM 'SAMPLERATE' )

AnalyzeColumnOption ::=
( 'ALL COLUMNS' | 'PREDICATE COLUMNS' | 'COLUMNS' ColumnNameList )

TableNameList ::=
  TableName ( ',' TableName)*

TableName ::=
  Identifier ( '.' Identifier )?

ColumnNameList ::=
  Identifier ( ',' Identifier )*

IndexNameList ::=
  Identifier ( ',' Identifier )*

PartitionNameList ::=
  Identifier ( ',' Identifier )*

```

12.10.2.17.2 Examples

```

mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
  ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> ALTER TABLE t1 ADD INDEX (c1);
Query OK, 0 rows affected (0.30 sec)

mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
+---
  ↪ -----+-----+-----+-----+-----+-----+-----+-----+
  ↪
| id          | estRows | task  | access object | operator
  ↪ info          |         |      |              |

```

```

+--
↪ -----+-----+-----+-----+
↪
| IndexReader_6      | 10.00 | root      | | index:
↪ IndexRangeScan_5 |      |           | |
| -IndexRangeScan_5 | 10.00 | cop[tikv] | table:t1, index:c1(c1) | range
↪ :[3,3], keep order:false, stats:pseudo |
+--
↪ -----+-----+-----+-----+
↪
2 rows in set (0.00 sec)

mysql> analyze table t1;
Query OK, 0 rows affected (0.13 sec)

mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
+--
↪ -----+-----+-----+-----+
↪
| id                | estRows | task      | access object      | operator
↪ info              |         |           |                    |
+--
↪ -----+-----+-----+-----+
↪
| IndexReader_6      | 1.00   | root      | | index:
↪ IndexRangeScan_5  |        |           | |
| -IndexRangeScan_5 | 1.00   | cop[tikv] | table:t1, index:c1(c1) | range
↪ :[3,3], keep order:false |
+--
↪ -----+-----+-----+-----+
↪
2 rows in set (0.00 sec)

```

12.10.2.17.3 MySQL compatibility

TiDB differs from MySQL in **both** the statistics it collects and how it makes use of statistics during query execution. While this statement is syntactically similar to MySQL, the following differences apply:

1. TiDB might not include very recently committed changes when running `ANALYZE TABLE`. After a batch-update of rows, you might need to `sleep(1)` before executing `ANALYZE TABLE` in order for the statistics update to reflect these changes. [#16570](#).
2. `ANALYZE TABLE` takes significantly longer to execute in TiDB than MySQL. This performance difference can be partially mitigated by enabling fast analyze with `SET GLOBAL`

↪ `tidb_enable_fast_analyze=1`. Fast analyze makes use of sampling, leading to less accurate statistics. Its usage is still considered experimental.

MySQL does not support the `ANALYZE INCREMENTAL TABLE` statement. TiDB supports incremental collection of statistics. For detailed usage, refer to [incremental collection](#).

12.10.2.17.4 See also

- [EXPLAIN](#)
- [EXPLAIN ANALYZE](#)

12.10.2.18 BACKUP

This statement is used to perform a distributed backup of the TiDB cluster.

The `BACKUP` statement uses the same engine as the [BR tool](#) does, except that the backup process is driven by TiDB itself rather than a separate BR tool. All benefits and warnings of BR also apply in this statement.

Warning:

This feature is experimental. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an [issue](#) on GitHub.

Executing `BACKUP` requires either the `BACKUP_ADMIN` or `SUPER` privilege. Additionally, both the TiDB node executing the backup and all TiKV nodes in the cluster must have read or write permission to the destination. Local storage (storage paths starting with `local://`) is not permitted when [Security Enhanced Mode](#) is enabled.

The `BACKUP` statement is blocked until the entire backup task is finished, failed, or canceled. A long-lasting connection should be prepared for executing `BACKUP`. The task can be canceled using the `KILL TIDB QUERY` statement.

Only one `BACKUP` and `RESTORE` task can be executed at a time. If a `BACKUP` or `RESTORE` statement is already being executed on the same TiDB server, the new `BACKUP` execution will wait until all previous tasks are finished.

`BACKUP` can only be used with “tikv” storage engine. Using `BACKUP` with the “unistore” engine will fail.

12.10.2.18.1 Synopsis

```

BackupStmt ::=
    "BACKUP" BRIETables "TO" stringLit BackupOption*

BRIETables ::=
    "DATABASE" ( '*' | DBName (',' DBName)* )
| "TABLE" TableNameList

BackupOption ::=
    "RATE_LIMIT" '='? LengthNum "MB" '/' "SECOND"
| "CONCURRENCY" '='? LengthNum
| "CHECKSUM" '='? Boolean
| "SEND_CREDENTIALS_TO_TIKV" '='? Boolean
| "LAST_BACKUP" '='? BackupTSO
| "SNAPSHOT" '='? ( BackupTSO | LengthNum TimestampUnit "AGO" )

Boolean ::=
    NUM | "TRUE" | "FALSE"

BackupTSO ::=
    LengthNum | stringLit

```

12.10.2.18.2 Examples

Back up databases

```
BACKUP DATABASE `test` TO 'local:///mnt/backup/2020/04/';
```

```

+--
↪ -----+-----+-----+
↪
| Destination          | Size      | BackupTS      | Queue Time      |
↪ Execution Time      |
+--
↪ -----+-----+-----+
↪
| local:///mnt/backup/2020/04/ | 248665063 | 416099531454472 | 2020-04-12
↪ 23:09:48 | 2020-04-12 23:09:48 |
+--
↪ -----+-----+-----+
↪
1 row in set (58.453 sec)

```

In the example above, the `test` database is backed up into the local filesystem. The data is saved as SST files in the `/mnt/backup/2020/04/` directories distributed among all

TiDB and TiKV nodes.

The first row of the result above is described as follows:

Column	Description
Destination ↪	The destination URL
Size	The total size of the backup archive, in bytes
BackupTS	The TSO of the snapshot when the backup is created (useful for incremental backup)
Queue ↪ Time	The timestamp (in current time zone) when the BACKUP task is queued.
Execution ↪ Time	The timestamp (in current time zone) when the BACKUP task starts to run.

Back up tables

```
BACKUP TABLE `test`.`sbtest01` TO 'local:///mnt/backup/sbtest01/';
```

```
BACKUP TABLE sbtest02, sbtest03, sbtest04 TO 'local:///mnt/backup/sbtest/';
```

Back up the entire cluster

```
BACKUP DATABASE * TO 'local:///mnt/backup/full/';
```

Note that the system tables (`mysql.*`, `INFORMATION_SCHEMA.*`, `PERFORMANCE_SCHEMA.*`, ...) will not be included into the backup.

External storages

BR supports backing up data to S3 or GCS:

```
BACKUP DATABASE `test` TO 's3://example-bucket-2020/backup-05/?region=us-
↳ west-2&access-key={YOUR_ACCESS_KEY}&secret-access-key={
↳ YOUR_SECRET_KEY}';
```

The URL syntax is further explained in [External Storages](#).

When running on cloud environment where credentials should not be distributed, set the `SEND_CREDENTIALS_TO_TIKV` option to `FALSE`:

```
BACKUP DATABASE `test` TO 's3://example-bucket-2020/backup-05/?region=us-
↳ west-2'
SEND_CREDENTIALS_TO_TIKV = FALSE;
```

Performance fine-tuning

Use `RATE_LIMIT` to limit the average upload speed per TiKV node to reduce network bandwidth.

By default, every TiKV node would run 4 backup threads. This value can be adjusted with the `CONCURRENCY` option.

Before backup is completed, `BACKUP` would perform a checksum against the data on the cluster to verify correctness. This step can be disabled with the `CHECKSUM` option if you are confident that this is unnecessary.

```
BACKUP DATABASE `test` TO 's3://example-bucket-2020/backup-06/'
RATE_LIMIT = 120 MB/SECOND
CONCURRENCY = 8
CHECKSUM = FALSE;
```

Snapshot

Specify a timestamp, TSO or relative time to backup historical data.

```
-- relative time
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist01'
SNAPSHOT = 36 HOUR AGO;

-- timestamp (in current time zone)
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist02'
SNAPSHOT = '2020-04-01 12:00:00';
```

```
-- timestamp oracle
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist03'
  SNAPSHOT = 415685305958400;
```

The supported units for relative time are:

- MICROSECOND
- SECOND
- MINUTE
- HOUR
- DAY
- WEEK

Note that, following SQL standard, the units are always singular.

Incremental backup

Supply the `LAST_BACKUP` option to only backup the changes between the last backup to the current snapshot.

```
-- timestamp (in current time zone)
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist02'
  LAST_BACKUP = '2020-04-01 12:00:00';

-- timestamp oracle
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist03'
  LAST_BACKUP = 415685305958400;
```

12.10.2.18.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.18.4 See also

- [RESTORE](#)
- [SHOW BACKUPS](#)

12.10.2.19 BEGIN

This statement starts a new transaction inside of TiDB. It is similar to the statements `START TRANSACTION` and `SET autocommit=0`.

In the absence of a `BEGIN` statement, every statement will by default autocommit in its own transaction. This behavior ensures MySQL compatibility.

12.10.2.19.1 Synopsis

```
BeginTransactionStmt ::=  
  'BEGIN' ( 'PESSIMISTIC' | 'OPTIMISTIC' )?  
| 'START' 'TRANSACTION' ( 'READ' ( 'WRITE' | 'ONLY' ( 'WITH' 'TIMESTAMP' '  
  ↪ BOUND' TimestampBound )? ) | 'WITH' 'CONSISTENT' 'SNAPSHOT' )?
```

12.10.2.19.2 Examples

```
mysql> CREATE TABLE t1 (a int NOT NULL PRIMARY KEY);  
Query OK, 0 rows affected (0.12 sec)  
  
mysql> BEGIN;  
Query OK, 0 rows affected (0.00 sec)  
  
mysql> INSERT INTO t1 VALUES (1);  
Query OK, 1 row affected (0.00 sec)  
  
mysql> COMMIT;  
Query OK, 0 rows affected (0.01 sec)
```

12.10.2.19.3 MySQL compatibility

TiDB supports the syntax extension of `BEGIN PESSIMISTIC` or `BEGIN OPTIMISTIC`. This enables you to override the default transactional model for your transaction.

12.10.2.19.4 See also

12.10.2.20 CHANGE COLUMN

The `ALTER TABLE... CHANGE COLUMN` statement changes a column on an existing table. The change can include both renaming the column, and changing the data type to a compatible type.

Since v5.1.0, TiDB has supported changing the Reorg data type, including but not limited to:

- Changing `VARCHAR` to `BIGINT`
- Modifying the `DECIMAL` precision
- Compressing the length of `VARCHAR(10)` to `VARCHAR(5)`

12.10.2.20.1 Synopsis

```

AlterTableStmt ::=
    'ALTER' IgnoreOptional 'TABLE' TableName ( AlterTableSpecListOpt
        ⇨ AlterTablePartitionOpt | 'ANALYZE' 'PARTITION' PartitionNameList (
        ⇨ 'INDEX' IndexNameList )? AnalyzeOptionListOpt )

AlterTableSpec ::=
    TableOptionList
| 'SET' 'TIFLASH' 'REPLICA' LengthNum LocationLabellList
| 'CONVERT' 'TO' CharsetName ( CharsetName | 'DEFAULT' ) OptCollate
| 'ADD' ( ColumnKeywordOpt IfNotExists ( ColumnDef ColumnPosition | '('
    ⇨ TableElementList ')' ) | Constraint | 'PARTITION' IfNotExists
    ⇨ NoWriteToBinLogAliasOpt ( PartitionDefinitionListOpt | 'PARTITIONS'
    ⇨ NUM ) )
| ( ( 'CHECK' | 'TRUNCATE' ) 'PARTITION' | ( 'OPTIMIZE' | 'REPAIR' | '
    ⇨ REBUILD' ) 'PARTITION' NoWriteToBinLogAliasOpt )
    ⇨ AllOrPartitionNameList
| 'COALESCE' 'PARTITION' NoWriteToBinLogAliasOpt NUM
| 'DROP' ( ColumnKeywordOpt IfExists ColumnName RestrictOrCascadeOpt | '
    ⇨ PRIMARY' 'KEY' | 'PARTITION' IfExists PartitionNameList | (
    ⇨ KeyOrIndex IfExists | 'CHECK' ) Identifier | 'FOREIGN' 'KEY' IfExists
    ⇨ Symbol )
| 'EXCHANGE' 'PARTITION' Identifier 'WITH' 'TABLE' TableName
    ⇨ WithValidationOpt
| ( 'IMPORT' | 'DISCARD' ) ( 'PARTITION' AllOrPartitionNameList )? '
    ⇨ TABLESPACE'

    ⇨ ReorganizePartitionRuleOpt
| 'ORDER' 'BY' AlterOrderItem ( ',' AlterOrderItem )*
| ( 'DISABLE' | 'ENABLE' ) 'KEYS'
| ( 'MODIFY' ColumnKeywordOpt IfExists | 'CHANGE' ColumnKeywordOpt
    ⇨ IfExists ColumnName ) ColumnDef ColumnPosition
| 'ALTER' ( ColumnKeywordOpt ColumnName ( 'SET' 'DEFAULT' ( SignedLiteral
    ⇨ | '(' Expression ')' ) | 'DROP' 'DEFAULT' ) | 'CHECK' Identifier
    ⇨ EnforcedOrNot | 'INDEX' Identifier IndexInvisible )
| 'RENAME' ( ( 'COLUMN' | KeyOrIndex ) Identifier 'TO' Identifier | ( 'TO'
    ⇨ | '='? | 'AS' ) TableName )
| LockClause
| AlgorithmClause
| 'FORCE'
| ( 'WITH' | 'WITHOUT' ) 'VALIDATION'
| 'SECONDARY_LOAD'
| 'SECONDARY_UNLOAD'

```

```
ColumnName ::=
    Identifier ( '.' Identifier ( '.' Identifier )? )?

ColumnDef ::=
    ColumnName ( Type | 'SERIAL' ) ColumnOptionListOpt

ColumnPosition ::=
    ( 'FIRST' | 'AFTER' ColumnName )?
```

12.10.2.20.2 Examples

```
CREATE TABLE t1 (id int not null primary key AUTO_INCREMENT, col1 INT);
```

Query OK, 0 rows affected (0.11 sec)

```
INSERT INTO t1 (col1) VALUES (1),(2),(3),(4),(5);
```

Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0

```
ALTER TABLE t1 CHANGE col1 col2 INT;
```

Query OK, 0 rows affected (0.09 sec)

```
ALTER TABLE t1 CHANGE col2 col3 BIGINT, ALGORITHM=INSTANT;
```

Query OK, 0 rows affected (0.08 sec)

```
ALTER TABLE t1 CHANGE col3 col4 BIGINT, CHANGE id id2 INT NOT NULL;
```

ERROR 1105 (HY000): can't run multi schema change

```
CREATE TABLE t (a int primary key);
ALTER TABLE t CHANGE COLUMN a a VARCHAR(10);
```

ERROR 8200 (HY000): Unsupported modify column: column has primary key flag

```
CREATE TABLE t (c1 INT, c2 INT, c3 INT) partition by range columns(c1) (
    ↪ partition p0 values less than (10), partition p1 values less than (
    ↪ maxvalue));
ALTER TABLE t CHANGE COLUMN c1 c1 DATETIME;
```

ERROR 8200 (HY000): Unsupported modify column: table is partition table

```
CREATE TABLE t (a INT, b INT as (a+1));
ALTER TABLE t CHANGE COLUMN b b VARCHAR(10);
```

```
ERROR 8200 (HY000): Unsupported modify column: column is generated
```

```
CREATE TABLE t (a DECIMAL(13, 7));
ALTER TABLE t CHANGE COLUMN a a DATETIME;
```

```
ERROR 8200 (HY000): Unsupported modify column: change from original type
↳ decimal(13,7) to datetime is currently unsupported yet
```

12.10.2.20.3 MySQL compatibility

- Making multiple changes in a single ALTER TABLE statement is currently not supported.
- Changes of **Reorg-Data** types on primary key columns are not supported.
- Changes of column types on partitioned tables are not supported.
- Changes of column types on generated columns are not supported.
- Changes of some data types (for example, some TIME, Bit, Set, Enum, and JSON types) are not supported due to the compatibility issues of the CAST function's behavior between TiDB and MySQL.

12.10.2.20.4 See also

- CREATE TABLE
- SHOW CREATE TABLE
- ADD COLUMN
- DROP COLUMN
- MODIFY COLUMN

12.10.2.21 COMMIT

This statement commits a transaction inside of the TiDB server.

In the absence of a BEGIN or START TRANSACTION statement, the default behavior of TiDB is that every statement will be its own transaction and autocommit. This behavior ensures MySQL compatibility.

12.10.2.21.1 Synopsis

```
CommitStmt ::=
    'COMMIT' CompletionTypeWithinTransaction?

CompletionTypeWithinTransaction ::=
```

```
'AND' ( 'CHAIN' ( 'NO' 'RELEASE' )? | 'NO' 'CHAIN' ( 'NO'? 'RELEASE' )?
  ↔ )
| 'NO'? 'RELEASE'
```

12.10.2.21.2 Examples

```
mysql> CREATE TABLE t1 (a INT NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.12 sec)

mysql> START TRANSACTION;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.00 sec)

mysql> COMMIT;
Query OK, 0 rows affected (0.01 sec)
```

12.10.2.21.3 MySQL compatibility

- Currently, TiDB does not use Metadata Locking (MDL) to prevent DDL statements from modifying tables used by transactions. If the definition of a table has changed, committing a transaction will result in an `Information schema is changed` error. In this event, the transaction is rolled back automatically.
- By default, TiDB 3.0.8 and later versions use **Pessimistic Locking**. When using **Optimistic Locking**, it is important to consider that a `COMMIT` statement might fail because rows have been modified by another transaction.
- When Optimistic Locking is enabled, `UNIQUE` and `PRIMARY KEY` constraint checks are deferred until statement commit. This results in additional situations where a `COMMIT` statement might fail. This behavior can be changed by setting `tidb_constraint_check_in_place=TRUE`.
- TiDB parses but ignores the syntax `ROLLBACK AND [NO] RELEASE`. This functionality is used in MySQL to disconnect the client session immediately after committing the transaction. In TiDB, it is recommended to instead use the `mysql_close()` functionality of your client driver.
- TiDB parses but ignores the syntax `ROLLBACK AND [NO] CHAIN`. This functionality is used in MySQL to immediately start a new transaction with the same isolation level while the current transaction is being committed. In TiDB, it is recommended to instead start a new transaction.

- **START TRANSACTION**

- **ROLLBACK**
- **BEGIN**
- **Lazy checking of constraints**

12.10.2.22 CHANGE DRAINER

The `CHANGE DRAINER` statement modifies the status information for Drainer in the cluster.

Tip:

Drainer's state is automatically reported to PD while running. Only when Drainer is under abnormal circumstances and its state is inconsistent with the state information stored in PD, you can use the `CHANGE DRAINER` statement to modify the state information stored in PD.

12.10.2.22.1 Examples

```
SHOW DRAINER STATUS;
```

```
+--
  ↪ -----/-----/-----/-----/-----/
  ↪
| NodeID | Address | State | Max_Commit_Ts | Update_Time |
+--
  ↪ -----/-----/-----/-----/-----/
  ↪
| drainer1 | 127.0.0.3:8249 | Online | 408553768673342532 | 2019-04-30
  ↪ 00:00:03 |
+--
  ↪ -----/-----/-----/-----/-----/
  ↪
| drainer2 | 127.0.0.4:8249 | Online | 408553768673345531 | 2019-05-01
  ↪ 00:00:04 |
+--
  ↪ -----/-----/-----/-----/-----/
  ↪
2 rows in set (0.00 sec)
```

It can be seen that `drainer1`'s state has not been updated for more than a day, the Drainer is in an abnormal state, but the `State` remains `Online`. After using `CHANGE DRAINER`, the Drainer's `State` is changed to 'paused':

```
CHANGE DRAINER TO NODE_STATE ='paused' FOR NODE_ID 'drainer1';
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
SHOW DRAINER STATUS;
```

```
+--
  ↪ -----/-----/-----/-----/-----/
  ↪
| NodeID | Address | State | Max_Commit_Ts | Update_Time |
+--
  ↪ -----/-----/-----/-----/-----/
  ↪
| drainer1 | 127.0.0.3:8249 | Paused | 408553768673342532 | 2019-04-30
  ↪ 00:00:03 |
+--
  ↪ -----/-----/-----/-----/-----/
  ↪
| drainer2 | 127.0.0.4:8249 | Online | 408553768673345531 | 2019-05-01
  ↪ 00:00:04 |
+--
  ↪ -----/-----/-----/-----/-----/
  ↪
2 rows in set (0.00 sec)
```

12.10.2.22.2 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.22.3 See also

- [SHOW PUMP STATUS](#)
- [SHOW DRAINER STATUS](#)
- [CHANGE PUMP STATUS](#)

12.10.2.23 CHANGE PUMP

The `CHANGE PUMP` statement modifies the status information for Pump in the cluster.

Tip:

Pump's state is automatically reported to PD while running. Only when Pump is under abnormal circumstances and its state is inconsistent with the state information stored in PD, you can use the **CHANGE PUMP** statement to modify the state information stored in PD.

12.10.2.23.1 Examples

```
SHOW PUMP STATUS;
```

```
+--
  ↪ -----/-----/-----/-----/-----/
  ↪
| NodeID | Address | State | Max_Commit_Ts | Update_Time |
+--
  ↪ -----/-----/-----/-----/-----/
  ↪
| pump1 | 127.0.0.1:8250 | Online | 408553768673342237 | 2019-04-30 00:00:01
  ↪ |
+--
  ↪ -----/-----/-----/-----/-----/
  ↪
| pump2 | 127.0.0.2:8250 | Online | 408553768673342335 | 2019-05-01 00:00:02
  ↪ |
+--
  ↪ -----/-----/-----/-----/-----/
  ↪
2 rows in set (0.00 sec)
```

It can be seen that pump1's state has not been updated for more than a day, the Pump is in an abnormal state, but the State remains Online. After using **CHANGE PUMP**, the Pump's State is changed to 'paused' :

```
CHANGE PUMP TO NODE_STATE = 'paused' FOR NODE_ID 'pump1';
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
SHOW PUMP STATUS;
```

```
+--
  ↪ -----/-----/-----/-----/-----/
  ↪
```

```

| NodeID | Address | State | Max_Commit_Ts | Update_Time |
+---+
| pump1 | 127.0.0.1:8250 | Paused | 408553768673342237 | 2019-04-30 00:00:01
+---+
| pump2 | 127.0.0.2:8250 | Online | 408553768673342335 | 2019-05-01 00:00:02
+---+
2 rows in set (0.00 sec)

```

12.10.2.23.2 MySQL compatibility

12.10.2.24 CREATE [GLOBAL|SESSION] BINDING

This statement creates a new execution plan binding in TiDB. Binding can be used to inject a hint into a statement without requiring changes to the underlying query.

A `BINDING` can be on either a `GLOBAL` or `SESSION` basis. The default is `SESSION`.

The bound SQL statement is parameterized and stored in the system table. When a SQL query is processed, as long as the parameterized SQL statement and a bound one in the system table are consistent and the system variable `tidb_use_plan_baselines` is set to `ON` (default), the corresponding optimizer hint is available. If multiple execution plans are available, the optimizer chooses to bind the plan with the least cost.

12.10.2.24.1 Synopsis

```

CreateBindingStmt ::=
    'CREATE' GlobalScope 'BINDING' 'FOR' BindableStmt 'USING' BindableStmt

GlobalScope ::=

```

```
( 'GLOBAL' | 'SESSION' )?
```

```
BindableStmt ::=
```

```
( SelectStmt | UpdateStmt | InsertIntoStmt | ReplaceIntoStmt |  
  ↪ DeleteStmt )
```

12.10.2.24.2 Examples

```
mysql> CREATE TABLE t1 (  
  -> id INT NOT NULL PRIMARY KEY auto_increment,  
  -> b INT NOT NULL,  
  -> pad VARBINARY(255),  
  -> INDEX(b)  
  -> );  
Query OK, 0 rows affected (0.07 sec)  
  
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)  
  ↪ FROM dual;

12.10.2.25 CREATE DATABASE

This statement creates a new database in TiDB. The MySQL terminology for ‘database’ most closely maps to a schema in the SQL standard.

12.10.2.25.1 Synopsis

```
CreateDatabaseStmt ::=
    'CREATE' 'DATABASE' IfNotExists DBName DatabaseOptionListOpt

IfNotExists ::=
    ( 'IF' 'NOT' 'EXISTS' )?

DBName ::=
    Identifier

DatabaseOptionListOpt ::=
    DatabaseOptionList?
```

12.10.2.25.2 Syntax

The `CREATE DATABASE` statement is used to create a database, and to specify the default properties of the database, such as the default character set and collation. `CREATE SCHEMA` is a synonym for `CREATE DATABASE`.

```
CREATE {DATABASE | SCHEMA} [IF NOT EXISTS] db_name
    [create_specification] ...

create_specification:
    [DEFAULT] CHARACTER SET [=] charset_name
    | [DEFAULT] COLLATE [=] collation_name
```

If you create an existing database and does not specify `IF NOT EXISTS`, an error is displayed.

The `create_specification` option is used to specify the specific `CHARACTER SET` and `COLLATE` in the database. Currently, TiDB only supports some of the character sets and collations. For details, see [Character Set and Collation Support](#).

12.10.2.25.3 Examples

```
mysql> CREATE DATABASE mynewdatabase;
Query OK, 0 rows affected (0.09 sec)

mysql> USE mynewdatabase;
Database changed
mysql> CREATE TABLE t1 (a int);
Query OK, 0 rows affected (0.11 sec)

mysql> SHOW TABLES;
+-----+
```

```

| Tables_in_mynewdatabase |
+-----+
| t1 |
+-----+
1 row in set (0.00 sec)

```

12.10.2.25.4 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.26 CREATE INDEX

This statement adds a new index to an existing table. It is an alternative syntax to ALTER TABLE .. ADD INDEX, and included for MySQL compatibility.

12.10.2.26.1 Synopsis

```

CreateIndexStmt ::=
    'CREATE' IndexKeyTypeOpt 'INDEX' IfNotExists Identifier IndexTypeOpt 'ON
    ↪ ' TableName '(' IndexPartSpecificationList ')' IndexOptionList
    ↪ IndexLockAndAlgorithmOpt

IndexKeyTypeOpt ::=
    ( 'UNIQUE' | 'SPATIAL' | 'FULLTEXT' )?

IfNotExists ::=
    ( 'IF' 'NOT' 'EXISTS' )?

IndexTypeOpt ::=
    IndexType?

IndexPartSpecificationList ::=
    IndexPartSpecification ( ',' IndexPartSpecification )*

IndexOptionList ::=
    IndexOption*

```

```
IndexLockAndAlgorithmOpt ::=
    ( LockClause AlgorithmClause? | AlgorithmClause LockClause? )?

IndexType ::=

+---+
↪ -----+-----+-----+-----+
↪
2 rows in set (0.00 sec)

mysql> ALTER TABLE t1 DROP INDEX c1;
Query OK, 0 rows affected (0.30 sec)

mysql> CREATE UNIQUE INDEX c1 ON t1 (c1);
```

```
Query OK, 0 rows affected (0.31 sec)
```

12.10.2.26.3 Expression index

In some scenarios, the filtering condition of a query is based on a certain expression. In these scenarios, the query performance is relatively poor because ordinary indexes cannot take effect, the query can only be executed by scanning the entire table. The expression index is a type of special index that can be created on an expression. Once an expression index is created, TiDB can use the index for the expression-based query, which significantly improves the query performance.

For example, if you want to create an index based on `lower(col1)`, execute the following SQL statement:

```
CREATE INDEX idx1 ON t1 ((lower(col1)));
```

Or you can execute the following equivalent statement:

```
ALTER TABLE t1 ADD INDEX idx1((lower(col1)));
```

You can also specify the expression index when you create the table:

```
CREATE TABLE t1(col1 char(10), col2 char(10), index((lower(col1))));
```

Note:

The expression in an expression index must be surrounded by ‘(’ and ‘)’. Otherwise, a syntax error is reported.

You can drop an expression index in the same way as dropping an ordinary index:

```
DROP INDEX idx1 ON t1;
```

Expression index involves various kinds of expressions. To ensure correctness, only some fully tested functions are allowed for creating an expression index. This means that only these functions are allowed in expressions in a production environment. You can get these functions by querying `tidb_allow_function_for_expression_index` variable. In future versions, more functions might be added to the list.

```
mysql> select @@tidb_allow_function_for_expression_index;
+-----+
| @@tidb_allow_function_for_expression_index |
+-----+
| lower, md5, reverse, upper, vitess_hash |
```

```
+-----+
1 row in set (0.00 sec)
```

For the functions that are not included in the returned result above, those functions are not fully tested and not recommended for a production environment, which can be seen as experimental. Other expressions such as operators, `cast`, and `case when` are also seen as experimental and not recommended for production.

If you still want to use those experimental expressions, you can make the following configuration in the [TiDB configuration file](#):

```
allow-expression-index = true
```

Note:

An expression index cannot be created on a primary key.

The expression in an expression index cannot contain the following content:

- Volatile functions, such as `rand()` and `now()`.
- System variables and user variables.
- Subqueries.
- `AUTO_INCREMENT` column. You can remove this restriction by setting the value of `tidb_enable_auto_increment_in_generated` (system variable) to `true`.
- Window functions.
- ROW functions, such as `create table t (j json, key k (((j,j))) ↪);`.
- Aggregate functions.

An expression index implicitly takes up a name (for example, `_V${ ↪ index_name}_{index_offset}`). If you try to create a new expression index with the name that a column has already had, an error occurs. In addition, if you add a new column with the same name, an error also occurs.

Make sure that the number of function parameters in the expression of an expression index is correct.

When the expression of an index contains a string-related function, affected by the returned type and the length, creating the expression index might fail. In this situation, you can use the `cast()` function to explicitly specify the returned type and the length. For example, to create an expression index based on the `repeat(a, 3)` expression, you need to modify this expression to `cast(repeat(a, 3)as char(20))`.

When the expression in a query statement matches the expression in an expression index, the optimizer can choose the expression index for the query. In some cases, the optimizer might not choose an expression index depending on statistics. In this situation, you can force the optimizer to select an expression index by using optimizer hints.

In the following examples, suppose that you create the expression index `idx` on the expression `lower(col1)`:

If the results of the query statement are the same expressions, the expression index applies. Take the following statement as an example:

```
SELECT lower(col1) FROM t;
```

If the same expression is included in the filtering conditions, the expression index applies. Take the following statements as an example:

```
SELECT * FROM t WHERE lower(col1) = "a";
SELECT * FROM t WHERE lower(col1) > "a";
SELECT * FROM t WHERE lower(col1) BETWEEN "a" AND "b";
SELECT * FROM t WHERE lower(col1) in ("a", "b");
SELECT * FROM t WHERE lower(col1) > "a" AND lower(col1) < "b";
SELECT * FROM t WHERE lower(col1) > "b" OR lower(col1) < "a";
```

When the queries are sorted by the same expression, the expression index applies. Take the following statement as an example:

```
SELECT * FROM t ORDER BY lower(col1);
```

If the same expression is included in the aggregate (`GROUP BY`) functions, the expression index applies. Take the following statements as an example:

```
SELECT max(lower(col1)) FROM t;
SELECT min(col1) FROM t GROUP BY lower(col1);
```

To see the expression corresponding to the expression index, execute `show index ↪`, or check the system tables `information_schema.tidb_indexes` and the table `information_schema.STATISTICS`. The `Expression` column in the output indicates the corresponded expression. For the non-expression indexes, the column shows `NULL`.

The cost of maintaining an expression index is higher than that of maintaining other indexes, because the value of the expression needs to be calculated whenever a row is inserted or updated. The value of the expression is already stored in the index, so this value does not require recalculation when the optimizer selects the expression index.

Therefore, when the query performance outweighs the insert and update performance, you can consider indexing the expressions.

Expression indexes have the same syntax and limitations as in MySQL. They are implemented by creating indexes on generated virtual columns that are invisible, so the supported expressions inherit all [limitations of virtual generated columns](#).

12.10.2.26.4 Invisible index

Invisible indexes are indexes that are ignored by the query optimizer:

```
CREATE TABLE t1 (c1 INT, c2 INT, UNIQUE(c2));
CREATE UNIQUE INDEX c1 ON t1 (c1) INVISIBLE;
```

For details, see [ALTER INDEX](#).

12.10.2.26.5 Associated system variables

The system variables associated with the `CREATE INDEX` statement are `tidb_ddl_reorg_worker_cnt` \leftrightarrow , `tidb_ddl_reorg_batch_size`, `tidb_enable_auto_increment_in_generated`, and `tidb_ddl_reorg_priority`. Refer to [system variables](#) for details.

12.10.2.26.6 MySQL compatibility

- `FULLTEXT`, `HASH` and `SPATIAL` indexes are not supported.
- Descending indexes are not supported (similar to MySQL 5.7).
- Adding the primary key of the `CLUSTERED` type to a table is not supported. For more details about the primary key of the `CLUSTERED` type, refer to [clustered index](#).
- Expression indexes are incompatible with views. When a query is executed using a view, the expression index cannot be used at the same time.
- Expression indexes have compatibility issues with bindings. When the expression of an expression index has a constant, the binding created for the corresponding query expands its scope. For example, suppose that the expression in the expression index is `a+1`, and the corresponding query condition is `a+1 > 2`. In this case, the created binding is `a+? > ?`, which means that the query with the condition such as `a+2 > 2` is also forced to use the expression index and results in a poor execution plan. In addition, this also affects the baseline capturing and baseline evolution in SQL Plan Management (SPM).

12.10.2.27 CREATE PLACEMENT POLICY

Warning:

Placement Rules in SQL is an experimental feature. The syntax might change before its GA, and there might also be bugs.

If you understand the risks, you can enable this experiment feature by executing `SET GLOBAL tidb_enable_alter_placement = 1;`

`CREATE PLACEMENT POLICY` is used to create a named placement policy that can later be assigned to tables, partitions, or database schemas.

12.10.2.27.1 Synopsis

```
CreatePolicyStmt ::=
    "CREATE" "PLACEMENT" "POLICY" IfNotExists PolicyName PlacementOptionList

PolicyName ::=
    Identifier

PlacementOptionList ::=
    DirectPlacementOption
| PlacementOptionList DirectPlacementOption
| PlacementOptionList ',' DirectPlacementOption

DirectPlacementOption ::=
    "PRIMARY_REGION" EqOpt stringLit
| "REGIONS" EqOpt stringLit
| "FOLLOWERS" EqOpt LengthNum
| "VOTERS" EqOpt LengthNum
| "LEARNERS" EqOpt LengthNum
| "SCHEDULE" EqOpt stringLit
| "CONSTRAINTS" EqOpt stringLit
| "LEADER_CONSTRAINTS" EqOpt stringLit
| "FOLLOWER_CONSTRAINTS" EqOpt stringLit
| "VOTER_CONSTRAINTS" EqOpt stringLit
| "LEARNER_CONSTRAINTS" EqOpt stringLit
```

12.10.2.27.2 Examples

Note:

To know which regions are available in your cluster, see [SHOW PLACEMENT](#)
 ↪ [LABELS](#).

If you do not see any available regions, your TiKV installation might not have labels set correctly.

```
CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us
  ↪ -west-1" FOLLOWERS=4;
CREATE TABLE t1 (a INT) PLACEMENT POLICY=p1;
SHOW CREATE PLACEMENT POLICY p1;
```

Query OK, 0 rows affected (0.08 sec)

Query OK, 0 rows affected (0.10 sec)

```
+-----+-----+
  ↪
| Policy | Create Policy
  ↪
  ↪ |
+-----+-----+
  ↪
| p1     | CREATE PLACEMENT POLICY `p1` PRIMARY_REGION="us-east-1" REGIONS="
  ↪ us-east-1,us-west-1" FOLLOWERS=4 |
+-----+-----+
  ↪
1 row in set (0.00 sec)
```

12.10.2.27.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

- [DROP PLACEMENT POLICY](#)

12.10.2.28 CREATE ROLE

This statement creates a new role, which can be assigned to users as part of role-based access control.

12.10.2.28.1 Synopsis

```
CreateRoleStmt ::=
    'CREATE' 'ROLE' IfNotExists RoleSpec (',' RoleSpec)*

IfNotExists ::=
    ('IF' 'NOT' 'EXISTS')?

RoleSpec ::=
    Rolename
```

12.10.2.28.2 Examples

Create a new role for the analytics team, and a new user called jennifer:

```
$ mysql -uroot
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 37
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
↳ License 2.0) Community Edition, MySQL 5.7 compatible

Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
↳ .

Oracle is a registered trademark of Oracle Corporation and/or its
affiliates. Other names may be trademarks of their respective
owners.

Type 'help;' or '\h' for help. Type '\c' to clear the current input
↳ statement.

mysql> CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

mysql> GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

mysql> CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

mysql> GRANT analyticsteam TO jennifer;
```

```
Query OK, 0 rows affected (0.01 sec)
```

Note that by default `jennifer` needs to SET ROLE `analyticsteam` in order to be able to use the privileges associated with the role:

```
$ mysql -ujennifer
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 32
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
  ↳ License 2.0) Community Edition, MySQL 5.7 compatible

Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
  ↳ .

Oracle is a registered trademark of Oracle Corporation and/or its
affiliates. Other names may be trademarks of their respective
owners.

Type 'help;' or '\h' for help. Type '\c' to clear the current input
  ↳ statement.

mysql> SHOW GRANTS;
+-----+
| Grants for User          |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
2 rows in set (0.00 sec)

mysql> SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
mysql> SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW GRANTS;
+-----+
| Grants for User          |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT Select ON test.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
3 rows in set (0.00 sec)
```

```
mysql> SHOW TABLES IN test;
+-----+
| Tables_in_test |
+-----+
| t1              |
+-----+
1 row in set (0.00 sec)
```

The statement `SET DEFAULT ROLE` can be used to associate a role to `jennifer` so that she will not have to execute the statement `SET ROLE` in order to assume the privileges associated with the role:

```
$ mysql -uroot
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 34
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
  ↪ License 2.0) Community Edition, MySQL 5.7 compatible

Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
  ↪ .

12.10.2.29 CREATE SEQUENCE

The `CREATE SEQUENCE` statement creates sequence objects in TiDB. The sequence is a database object that is on a par with the table and the `View` object. The sequence is used to generate serialized IDs in a customized way.

12.10.2.29.1 Synopsis

```
CreateSequenceStmt ::=
```

```

'CREATE' 'SEQUENCE' IfNotExists TableName CreateSequenceOptionListOpt
    ↪ CreateTableOptionListOpt

IfNotExists ::=
    ('IF' 'NOT' 'EXISTS')?

TableName ::=
    Identifier ('.' Identifier)?

CreateSequenceOptionListOpt ::=
    SequenceOption*

SequenceOptionList ::=
    SequenceOption

SequenceOption ::=
    ( 'INCREMENT' ( '='? | 'BY' ) | 'START' ( '='? | 'WITH' ) | ( 'MINVALUE'
        ↪ | 'MAXVALUE' | 'CACHE' ) '='? ) SignedNum
| 'NOMINVALUE'
| 'NO' ( 'MINVALUE' | 'MAXVALUE' | 'CACHE' | 'CYCLE' )
| 'NOMAXVALUE'
| 'NOCACHE'
| 'CYCLE'
| 'NOCYCLE'

```

12.10.2.29.2 Syntax

```

CREATE [TEMPORARY] SEQUENCE [IF NOT EXISTS] sequence_name
    [ INCREMENT [ BY | = ] increment ]
    [ MINVALUE [=] minvalue | NO MINVALUE | NOMINVALUE ]
    [ MAXVALUE [=] maxvalue | NO MAXVALUE | NOMAXVALUE ]
    [ START [ WITH | = ] start ]
    [ CACHE [=] cache | NOCACHE | NO CACHE]
    [ CYCLE | NOCYCLE | NO CYCLE]
    [table_options]

```

12.10.2.29.3 Parameters

Parameter	Default value	Description
<code>TEMPORARY</code>	<code>OFF</code>	<p>TiDB currently does not support the <code>TEMPORARY</code> option and provides only syntax compatibility for it.</p>

	Default	
Parameter	Value	Description
INCREMENT ↪		Specifies the increment of a sequence. Its positive or negative values can control the growth direction of the sequence.

Parameter	Default	Description
MINVALUE		Specifies
↪	-9223372036854775807	
	↪	min- i- mum value of a se- quence. When INCREMENT ↪ > 0, the de- fault value is 1. When INCREMENT ↪ < 0, the de- fault value is -9223372036854775807 ↪ .

Parameter	Default value	Description
MAXVALUE	9223372036854775806	Specifies the maximum value of a sequence. When INCREMENT \rightarrow > 0 , the default value is 9223372036854775806. When INCREMENT \rightarrow < 0 , the default value is -1.

Parameter	Default value	Description
START MINVALUE		Specifies the or initial value of a sequence. When INCREMENT
	\hookrightarrow	\hookrightarrow the
		or ini-
MAXVALUE		value
	\hookrightarrow	of a
		se-
		quence.
		When
		INCREMENT
	\hookrightarrow	\hookrightarrow
		> 0 ,
		the
		de-
		fault
		value
		is
		MINVALUE
	\hookrightarrow	\hookrightarrow .
		When
		INCREMENT
	\hookrightarrow	\hookrightarrow
		< 0 ,
		the
		de-
		fault
		value
		is
		MAXVALUE
	\hookrightarrow	\hookrightarrow .
CACHE 1000		Specifies
	\hookrightarrow	the
		lo-
		cal
		cache
		size
		of a
		se-
		quence
		in
		TiDB.

Parameter	Default	Description
CYCLE NO		Specifies
↔	↔	Whether
	↔	a se-
		quence
		restarts
		from
		the
		min-
		i-
		mum
		value
		(or
		max-
		i-
		mum
		for
		the
		de-
		scend-
		ing
		se-
		quence).
		When
		INCREMENT
	↔	
		> 0,
		the
		de-
		fault
		value
		is
		MINVALUE
	↔	.
		When
		INCREMENT
	↔	
		< 0,
		the
		de-
		fault
		value
		is
		MAXVALUE
	↔	.

Parameter	Default value	Description
-----------	---------------	-------------

12.10.2.29.4 SEQUENCE function

You can control a sequence through the following expression functions:

- NEXTVAL or NEXT VALUE FOR

Essentially, both are the `nextval()` function that gets the next valid value of a sequence object. The parameter of the `nextval()` function is the `identifier` of the sequence.

- LASTVAL

This function gets the last used value of this session. If the value does not exist, `NULL` is used. The parameter of this function is the `identifier` of the sequence.

- SETVAL

This function sets the progression of the current value for a sequence. The first parameter of this function is the `identifier` of the sequence; the second parameter is `num`.

Note:

In the implementation of a sequence in TiDB, the `SETVAL` function cannot change the initial progression or cycle progression of this sequence. This function only returns the next valid value based on this progression.

12.10.2.29.5 Examples

- Create a sequence object with the default parameter:

```
CREATE SEQUENCE seq;
```

```
Query OK, 0 rows affected (0.06 sec)
```

- Use the `nextval()` function to get the next value of the sequence object:

```
SELECT nextval(seq);
```

```
+-----+
| nextval(seq) |
+-----+
|           1 |
+-----+
1 row in set (0.02 sec)
```

- Use the `lastval()` function to get the value generated by the last call to a sequence object in this session:

```
SELECT lastval(seq);
```

```
+-----+
| lastval(seq) |
+-----+
|           1 |
+-----+
1 row in set (0.02 sec)
```

- Use the `setval()` function to set the current value (or the current position) of the sequence object:

```
SELECT setval(seq, 10);
```

```
+-----+
| setval(seq, 10) |
+-----+
|           10 |
+-----+
1 row in set (0.01 sec)
```

- You can also use the `next value for` syntax to get the next value of the sequence:

```
SELECT next value for seq;
```

```
+-----+
| next value for seq |
+-----+
|           11 |
+-----+
1 row in set (0.00 sec)
```

- Create a sequence object with default custom parameters:

```
CREATE SEQUENCE seq2 start 3 increment 2 minvalue 1 maxvalue 10 cache  
↪ 3;
```

```
Query OK, 0 rows affected (0.01 sec)
```

- When the sequence object has not been used in this session, the `lastval()` function returns a `NULL` value.

```
SELECT lastval(seq2);
```

```
+-----+  
| lastval(seq2) |  
+-----+  
|          NULL |  
+-----+  
1 row in set (0.01 sec)
```

- The first valid value of the `nextval()` function for the sequence object is the value of `START` parameter.

```
SELECT nextval(seq2);
```

```
+-----+  
| nextval(seq2) |  
+-----+  
|           3 |  
+-----+  
1 row in set (0.00 sec)
```

- Although the `setval()` function can change the current value of the sequence object, it cannot change the arithmetic progression rule for the next value.

```
SELECT setval(seq2, 6);
```

```
+-----+  
| setval(seq2, 6) |  
+-----+  
|           6 |  
+-----+  
1 row in set (0.00 sec)
```

- When you use `nextval()` to get the next value, the next value will follow the arithmetic progression rule defined by the sequence.

```
SELECT next value for seq2;
```

```

+-----+
| next value for seq2 |
+-----+
|           7 |
+-----+
1 row in set (0.00 sec)

```

- You can use the next value of the sequence as the default value for the column, as in the following example.

```
CREATE table t(a int default next value for seq2);
```

```
Query OK, 0 rows affected (0.02 sec)
```

- In the following example, the value is not specified, so the default value of `seq2` is used.

```
INSERT into t values();
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SELECT * from t;
```

```

+-----+
| a |
+-----+
|  9 |
+-----+
1 row in set (0.00 sec)

```

- In the following example, the value is not specified, so the default value of `seq2` is used. But the next value of `seq2` is not within the range defined in the above example (`CREATE SEQUENCE seq2 start 3 increment 2 minvalue 1 maxvalue 10 ↪ cache 3;`), so an error is returned.

```
INSERT into t values();
```

```
ERROR 4135 (HY000): Sequence 'test.seq2' has run out
```

12.10.2.29.6 MySQL compatibility

This statement is a TiDB extension. The implementation is modeled on sequences available in MariaDB.

Except for the `SETVAL` function, all other functions have the same *progressions* as MariaDB. Here “progression” means that the numbers in a sequence follow a certain arithmetic

progression rule defined by the sequence. Although you can use `SETVAL` to set the current value of a sequence, the subsequent values of the sequence still follow the original progression rule.

For example:

```
1, 3, 5, ...           // The sequence starts from 1 and increments by 2.
select setval(seq, 6) // Sets the current value of a sequence to 6.
7, 9, 11, ...         // Subsequent values still follow the progression rule.
```

In the `CYCLE` mode, the initial value of a sequence in the first round is the value of the `START` parameter, and the initial value in the subsequent rounds is the value of `MinValue` (`INCREMENT > 0`) or `MaxValue` (`INCREMENT < 0`).

- [DROP SEQUENCE](#)
- [SHOW CREATE SEQUENCE](#)

12.10.2.30 CREATE TABLE LIKE

This statement copies the definition of an existing table, without copying any data.

12.10.2.30.1 Synopsis

```
CreateTableLikeStmt ::=
  'CREATE' OptTemporary 'TABLE' IfNotExists TableName
  ↔ LikeTableWithOrWithoutParen OnCommitOpt

OptTemporary ::=
  ( 'TEMPORARY' | ('GLOBAL' 'TEMPORARY') )?

LikeTableWithOrWithoutParen ::=
  'LIKE' TableName
| '(' 'LIKE' TableName ')'

OnCommitOpt ::=
  ('ON' 'COMMIT' 'DELETE' 'ROWS')?
```

12.10.2.30.2 Examples

```
mysql> CREATE TABLE t1 (a INT NOT NULL);
Query OK, 0 rows affected (0.13 sec)

mysql> INSERT INTO t1 VALUES (1),(2),(3),(4),(5);
```

```
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0
```

```
mysql> SELECT * FROM t1;
```

```
+----+
```

```
| a |
```

```
+----+
```

```
| 1 |
```

```
| 2 |
```

```
| 3 |
```

```
| 4 |
```

```
| 5 |
```

```
+----+
```

```
5 rows in set (0.00 sec)
```

```
mysql> CREATE TABLE t2 LIKE t1;
```

```
Query OK, 0 rows affected (0.10 sec)
```

```
mysql> SELECT * FROM t2;
```

```
Empty set (0.00 sec)
```

12.10.2.30.3 Pre-split region

If the table to be copied is defined with the `PRE_SPLIT_REGIONS` attribute, the table created using the `CREATE TABLE LIKE` statement inherits this attribute, and the Region on the new table will be split. For details of `PRE_SPLIT_REGIONS`, see [CREATE TABLE Statement](#).

12.10.2.30.4 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.30.5 See also

- [CREATE TABLE](#)
- [SHOW CREATE TABLE](#)

12.10.2.31 CREATE TABLE

This statement creates a new table in the currently selected database. It behaves similarly to the `CREATE TABLE` statement in MySQL.

12.10.2.31.1 Synopsis

```

CreateTableStmt ::=
    'CREATE' OptTemporary 'TABLE' IfNotExists TableName (
        ↪ TableElementListOpt CreateTableOptionListOpt PartitionOpt
        ↪ DuplicateOpt AsOpt CreateTableSelectOpt |
        ↪ LikeTableWithOrWithoutParen ) OnCommitOpt

OptTemporary ::=
    ( 'TEMPORARY' | ('GLOBAL' 'TEMPORARY') )?

IfNotExists ::=
    ('IF' 'NOT' 'EXISTS')?

TableName ::=
    Identifier ( '.' Identifier )?

TableElementListOpt ::=
    ( '(' TableElementList ')' )?

TableElementList ::=
    TableElement ( ',' TableElement )*

TableElement ::=
    ColumnDef
| Constraint

ColumnDef ::=
    ColumnName ( Type | 'SERIAL' ) ColumnOptionListOpt

ColumnOptionListOpt ::=
    ColumnOption*

ColumnOptionList ::=
    ColumnOption*

ColumnOption ::=
    'NOT'? 'NULL'
| 'AUTO_INCREMENT'
| PrimaryOpt 'KEY'
| 'UNIQUE' 'KEY'?
| 'DEFAULT' DefaultValueExpr
| 'SERIAL' 'DEFAULT' 'VALUE'
| 'ON' 'UPDATE' NowSymOptionFraction
| 'COMMENT' stringLit

```

```

| ConstraintKeywordOpt 'CHECK' '(' Expression ')'
↳ EnforcedOrNotOrNotNullOpt
| GeneratedAlways 'AS' '(' Expression ')' VirtualOrStored
| ReferDef
| 'COLLATE' CollationName
| 'COLUMN_FORMAT' ColumnFormat
| 'STORAGE' StorageMedia
| 'AUTO_RANDOM' OptFieldLen

CreateTableOptionListOpt ::=
    TableOptionList?

PartitionOpt ::=
    ( 'PARTITION' 'BY' PartitionMethod PartitionNumOpt SubPartitionOpt
      ↳ PartitionDefinitionListOpt )?

DuplicateOpt ::=
    ( 'IGNORE' | 'REPLACE' )?

TableOptionList ::=
    TableOption ( ','? TableOption )*

TableOption ::=
    PartDefOption
| DefaultKwdOpt ( CharsetKw EqOpt CharsetName | 'COLLATE' EqOpt
↳ CollationName )
| ( 'AUTO_INCREMENT' | 'AUTO_ID_CACHE' | 'AUTO_RANDOM_BASE' | '
↳ AVG_ROW_LENGTH' | 'CHECKSUM' | 'TABLE_CHECKSUM' | 'KEY_BLOCK_SIZE' |
↳ 'DELAY_KEY_WRITE' | 'SHARD_ROW_ID_BITS' | 'PRE_SPLIT_REGIONS' ) EqOpt
↳ LengthNum
| ( 'CONNECTION' | 'PASSWORD' | 'COMPRESSION' ) EqOpt stringLit
| RowFormat
| ( 'STATS_PERSISTENT' | 'PACK_KEYS' ) EqOpt StatsPersistentVal
| ( 'STATS_AUTO_RECALC' | 'STATS_SAMPLE_PAGES' ) EqOpt ( LengthNum | '
↳ DEFAULT' )
| 'STORAGE' ( 'MEMORY' | 'DISK' )
| 'SECONDARY_ENGINE' EqOpt ( 'NULL' | StringName )
| 'UNION' EqOpt '(' TableNameListOpt ')'
| 'ENCRYPTION' EqOpt EncryptionOpt

OnCommitOpt ::=
    ( 'ON' 'COMMIT' 'DELETE' 'ROWS' )?

```

The following *table_options* are supported. Other options such as AVG_ROW_LENGTH
↳ , CHECKSUM, COMPRESSION, CONNECTION, DELAY_KEY_WRITE, ENGINE, KEY_BLOCK_SIZE,

MAX_ROWS, MIN_ROWS, ROW_FORMAT and STATS_PERSISTENT are parsed but ignored.

Options	Description	Example
AUTO_INCREMENT ↔	The initial value of the increment field	AUTO_INCREMENT ↔ = 5
SHARD_ROW_ID_BITS ↔	To set the number of bits for the implicit <code>_tidb_rowid</code> shards	SHARD_ROW_ID_BITS ↔ = 4
PRE_SPLIT_REGIONS ↔	Pre-split Regions when creating a table	PRE_SPLIT_REGIONS ↔ = 4
AUTO_ID_CACHE ↔	To set the auto ID cache size in a TiDB instance. By default, TiDB automatically changes this size according to allocation speed of auto ID	AUTO_ID_CACHE ↔ = 200

Options	Description	Example
AUTO_RANDOM_BASE ↔	Set the initial incremental part value of auto_random. This option can be considered as a part of the internal interface. Users can ignore this parameter	AUTO_RANDOM_BASE ↔ = 0
CHARACTER ↔ SET	To specify the character set for the table	CHARACTER ↔ ↔ SET = 'utf8mb4'
COMMENT	The comment information	COMMENT ↔ = 'comment info'

Note:

The `split-table` configuration option is enabled by default. When it is enabled, a separate Region is created for each newly created table. For details, see [TiDB configuration file](#).

12.10.2.31.2 Examples

Creating a simple table and inserting one row:

```
CREATE TABLE t1 (a INT);
DESC t1;
SHOW CREATE TABLE t1\G
INSERT INTO t1 (a) VALUES (1);
SELECT * FROM t1;
```

```
mysql> drop table if exists t1;
Query OK, 0 rows affected (0.23 sec)

mysql> CREATE TABLE t1 (a int);
Query OK, 0 rows affected (0.09 sec)

mysql> DESC t1;
+-----+-----+-----+-----+-----+-----+
| Field | Type  | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
| a     | int(11) | YES  |     | NULL    |      |
+-----+-----+-----+-----+-----+
1 row in set (0.00 sec)

mysql> SHOW CREATE TABLE t1\G
***** 1. row *****
      Table: t1
Create Table: CREATE TABLE `t1` (
  `a` int(11) DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
1 row in set (0.00 sec)

mysql> INSERT INTO t1 (a) VALUES (1);
Query OK, 1 row affected (0.03 sec)

mysql> SELECT * FROM t1;
+-----+
| a    |
+-----+
| 1    |
+-----+
1 row in set (0.00 sec)
```

Dropping a table if it exists, and conditionally creating a table if it does not exist:

```
DROP TABLE IF EXISTS t1;
CREATE TABLE IF NOT EXISTS t1 (
  id BIGINT NOT NULL PRIMARY KEY auto_increment,
  b VARCHAR(200) NOT NULL
);
DESC t1;
```

```
mysql> DROP TABLE IF EXISTS t1;
Query OK, 0 rows affected (0.22 sec)
```

```
mysql> CREATE TABLE IF NOT EXISTS t1 (
  -> id BIGINT NOT NULL PRIMARY KEY auto_increment,
  -> b VARCHAR(200) NOT NULL
  -> );
```

Query OK, 0 rows affected (0.08 sec)

```
mysql> DESC t1;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type          | Null | Key | Default | Extra          |
+-----+-----+-----+-----+-----+-----+
| id    | bigint(20)    | NO   | PRI | NULL    | auto_increment |
| b     | varchar(200) | NO   |     | NULL    |                |
+-----+-----+-----+-----+-----+-----+
```

2 rows in set (0.00 sec)

12.10.2.31.3 MySQL compatibility

- All of the data types except spatial types are supported.
- FULLTEXT, HASH and SPATIAL indexes are not supported.
- For compatibility, the `index_col_name` attribute supports the length option with a maximum length limit of 3072 bytes by default. The length limit can be changed through the `max-index-length` configuration option. For details, see [TiDB configuration file](#).
- The `[ASC | DESC]` in `index_col_name` is currently parsed but ignored (MySQL 5.7 compatible behavior).
- The `COMMENT` attribute does not support the `WITH PARSER` option.
- TiDB supports 1017 columns in a single table by default and 4096 columns at most. The corresponding number limit in InnoDB is 1017 columns, and the hard limit in MySQL is 4096 columns. For details, see [TiDB Limitations](#).
- For partitioned tables, only Range, Hash and Range Columns (single column) are supported. For details, see [partitioned table](#).
- CHECK constraints are parsed but ignored (MySQL 5.7 compatible behavior). For details, see [Constraints](#).
- FOREIGN KEY constraints are parsed and stored, but not enforced by DML statements. For details, see [Constraints](#).

- [Data Types](#)
- [DROP TABLE](#)
- [CREATE TABLE LIKE](#)
- [SHOW CREATE TABLE](#)

12.10.2.32 CREATE USER

This statement creates a new user, specified with a password. In the MySQL privilege system, a user is the combination of a username and the host from which they are connecting from. Thus, it is possible to create a user 'newuser2'@'192.168.1.1' who is only able to connect from the IP address 192.168.1.1. It is also possible to have two users have the same user-portion, and different permissions as they login from different hosts.

12.10.2.32.1 Synopsis

```

CreateUserStmt ::=
    'CREATE' 'USER' IfNotExists UserSpecList RequireClauseOpt
        ↪ ConnectionOptions PasswordOrLockOptions

IfNotExists ::=
    ('IF' 'NOT' 'EXISTS')?

UserSpecList ::=
    UserSpec ( ',' UserSpec )*

UserSpec ::=
    Username AuthOption

AuthOption ::=
    ( 'IDENTIFIED' ( 'BY' ( AuthString | 'PASSWORD' HashString ) | 'WITH'
        ↪ StringName ( 'BY' AuthString | 'AS' HashString )? ) )?

StringName ::=
    stringLit
| Identifier

```

12.10.2.32.2 Examples

Create a user with the newuserpassword password.

```

mysql> CREATE USER 'newuser' IDENTIFIED BY 'newuserpassword';
Query OK, 1 row affected (0.04 sec)

```

Create a user who can only log in to 192.168.1.1.

```

mysql> CREATE USER 'newuser2'@'192.168.1.1' IDENTIFIED BY 'newuserpassword'
    ↪ ;
Query OK, 1 row affected (0.02 sec)

```

Create a user who is enforced to log in using TLS connection.

```
CREATE USER 'newuser3'@'%' REQUIRE SSL IDENTIFIED BY 'newuserpassword';
Query OK, 1 row affected (0.02 sec)
```

Create a user who is required to use X.509 certificate at login.

```
CREATE USER 'newuser4'@'%' REQUIRE ISSUER '/C=US/ST=California/L=San
↳ Francisco/O=PingCAP' IDENTIFIED BY 'newuserpassword';
Query OK, 1 row affected (0.02 sec)
```

12.10.2.32.3 MySQL compatibility

The following CREATE USER options are not yet supported by TiDB, and will be parsed but ignored:

- TiDB does not support WITH MAX_QUERIES_PER_HOUR, WITH MAX_UPDATES_PER_HOUR, and WITH MAX_USER_CONNECTIONS options.
- TiDB does not support the DEFAULT ROLE option.
- TiDB does not support PASSWORD EXPIRE, PASSWORD HISTORY or other options related to password.
- TiDB does not support the ACCOUNT LOCK and ACCOUNT UNLOCK options.

12.10.2.32.4 See also

- [Security Compatibility with MySQL](#)
- [DROP USER](#)
- [SHOW CREATE USER](#)
- [ALTER USER](#)
- [Privilege Management](#)

12.10.2.33 CREATE VIEW

The CREATE VIEW statement saves a SELECT statement as a queryable object, similar to a table. Views in TiDB are non-materialized. This means that as a view is queried, TiDB will internally rewrite the query to combine the view definition with the SQL query.

12.10.2.33.1 Synopsis

```
CreateViewStmt ::=
  'CREATE' OrReplace ViewAlgorithm ViewDefiner ViewSQLSecurity 'VIEW'
  ↳ ViewName ViewFieldList 'AS' CreateViewSelectOpt ViewCheckOption

OrReplace ::=
  ( 'OR' 'REPLACE' )?
```

```

ViewAlgorithm ::=
    ( 'ALGORITHM' '=' ( 'UNDEFINED' | 'MERGE' | 'TEMPTABLE' ) )?

ViewDefiner ::=
    ( 'DEFINER' '=' Username )?

ViewSQLSecurity ::=
    ( 'SQL' 'SECURITY' ( 'DEFINER' | 'INVOKER' ) )?

ViewName ::= TableName

ViewFieldList ::=
    ( '(' Identifier ( ',' Identifier )* ')' )?

ViewCheckOption ::=
    ( 'WITH' ( 'CASCADED' | 'LOCAL' ) 'CHECK' 'OPTION' )?

```

12.10.2.33.2 Examples

```

mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> CREATE VIEW v1 AS SELECT * FROM t1 WHERE c1 > 2;
Query OK, 0 rows affected (0.11 sec)

mysql> SELECT * FROM t1;
+----+-----+
| id | c1 |
+----+-----+
| 1 | 1 |
| 2 | 2 |
| 3 | 3 |
| 4 | 4 |
| 5 | 5 |
+----+-----+
5 rows in set (0.00 sec)

mysql> SELECT * FROM v1;
+----+-----+

```

```
| id | c1 |
+----+----+
| 3 | 3 |
| 4 | 4 |
| 5 | 5 |
+----+----+
3 rows in set (0.00 sec)

mysql> INSERT INTO t1 (c1) VALUES (6);
Query OK, 1 row affected (0.01 sec)

mysql> SELECT * FROM v1;
+----+----+
| id | c1 |
+----+----+
| 3 | 3 |
| 4 | 4 |
| 5 | 5 |
| 6 | 6 |
+----+----+
4 rows in set (0.00 sec)

mysql> INSERT INTO v1 (c1) VALUES (7);
ERROR 1105 (HY000): insert into view v1 is not supported now.
```

12.10.2.33.3 MySQL compatibility

- Currently, any view in TiDB cannot be inserted or updated (that is, `INSERT VIEW` and `UPDATE VIEW` are not supported). `WITH CHECK OPTION` is only syntactically compatible but does not take effect.
- Currently, the view in TiDB does not support `ALTER VIEW`, but you can use `CREATE` \rightarrow `OR REPLACE` instead.
- Currently, the `ALGORITHM` field is only syntactically compatible in TiDB but does not take effect. TiDB currently only supports the `MERGE` algorithm.

12.10.2.33.4 See also

- [DROP VIEW](#)
- [CREATE TABLE](#)
- [SHOW CREATE TABLE](#)
- [DROP TABLE](#)

12.10.2.34 DEALLOCATE

The DEALLOCATE statement provides an SQL interface to server-side prepared statements.

12.10.2.34.1 Synopsis

```
DeallocateStmt ::=
    DeallocateSym 'PREPARE' Identifier

DeallocateSym ::=
    'DEALLOCATE'
| 'DROP'

Identifier ::=
    identifier
| UnReservedKeyword
| NotKeywordToken
| TiDBKeyword
```

12.10.2.34.2 Examples

```
mysql> PREPARE mystmt FROM 'SELECT ? as num FROM DUAL';
Query OK, 0 rows affected (0.00 sec)

mysql> SET @number = 5;
Query OK, 0 rows affected (0.00 sec)

mysql> EXECUTE mystmt USING @number;
+-----+
| num |
+-----+
| 5   |
+-----+
1 row in set (0.00 sec)

mysql> DEALLOCATE PREPARE mystmt;
Query OK, 0 rows affected (0.00 sec)
```

12.10.2.34.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.34.4 See also

- [PREPARE](#)
- [EXECUTE](#)

12.10.2.35 DELETE

The DELETE statement removes rows from a specified table.

12.10.2.35.1 Synopsis

```
DeleteFromStmt ::=  
  'DELETE' TableOptimizerHints PriorityOpt QuickOptional IgnoreOptional (  
    ↪ 'FROM' ( TableName TableAsNameOpt IndexHintListOpt  
    ↪ WhereClauseOptional OrderByOptional LimitClause |  
    ↪ TableAliasRefList 'USING' TableRefs WhereClauseOptional ) |  
    ↪ TableAliasRefList 'FROM' TableRefs WhereClauseOptional )
```

12.10.2.35.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT  
  ↪ NOT NULL);  
Query OK, 0 rows affected (0.11 sec)  
  
mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);  
Query OK, 5 rows affected (0.03 sec)  
Records: 5 Duplicates: 0 Warnings: 0  
  
mysql> SELECT * FROM t1;  
+----+-----+  
| id | c1 |  
+----+-----+  
| 1 | 1 |  
| 2 | 2 |  
| 3 | 3 |  
| 4 | 4 |  
| 5 | 5 |  
+----+-----+  
5 rows in set (0.00 sec)  
  
mysql> DELETE FROM t1 WHERE id = 4;  
Query OK, 1 row affected (0.02 sec)  
  
mysql> SELECT * FROM t1;  
+----+-----+
```

```
| id | c1 |
+---+---+
| 1 | 1 |
| 2 | 2 |
| 3 | 3 |
| 5 | 5 |
+---+---+
4 rows in set (0.00 sec)
```

12.10.2.35.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.35.4 See also

- [INSERT](#)
- [SELECT](#)
- [UPDATE](#)
- [REPLACE](#)

12.10.2.36 DESC

This statement is an alias to [EXPLAIN](#). It is included for compatibility with MySQL.

12.10.2.37 DESCRIBE

This statement is an alias to [EXPLAIN](#). It is included for compatibility with MySQL.

12.10.2.38 DO

DO executes the expressions but does not return any results. In most cases, DO is equivalent to `SELECT expr, ...` that does not return a result.

Note:

DO only executes expressions. It cannot be used in all cases where `SELECT` can be used. For example, `DO id FROM t1` is invalid because it references a table.

In MySQL, a common use case is to execute stored procedure or trigger. Since TiDB does not provide stored procedure or trigger, this function has a limited use.

12.10.2.38.1 Synopsis

```

DoStmt ::= 'DO' ExpressionList

ExpressionList ::=
    Expression ( ',' Expression )*

Expression ::=
    ( singleAtIdentifier assignmentEq | 'NOT' | Expression ( logOr | 'XOR' |
        ↪ logAnd ) ) Expression
| 'MATCH' '(' ColumnNameList ')' 'AGAINST' '(' BitExpr
    ↪ FulltextSearchModifierOpt ')'
| PredicateExpr ( IsOrNotOp 'NULL' | CompareOp ( ( singleAtIdentifier
    ↪ assignmentEq )? PredicateExpr | AnyOrAll SubSelect ) )* ( IsOrNotOp (
    ↪ trueKwd | falseKwd | 'UNKNOWN' ) )?

```

12.10.2.38.2 Examples

This SELECT statement pauses, but also produces a result set.

```

mysql> SELECT SLEEP(5);
+-----+
| SLEEP(5) |
+-----+
|          0 |
+-----+
1 row in set (5.00 sec)

```

DO, on the other hand, pauses without producing a result set.

```

mysql> DO SLEEP(5);
Query OK, 0 rows affected (5.00 sec)

mysql> DO SLEEP(1), SLEEP(1.5);
Query OK, 0 rows affected (2.50 sec)

```

12.10.2.38.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.38.4 See also

- [SELECT](#)

12.10.2.39 DROP [GLOBAL|SESSION] BINDING

This statement removes a binding from a specific SQL statement. Bindings can be used to inject a hint into a statement without requiring changes to the underlying query.

A `BINDING` can be on either a `GLOBAL` or `SESSION` basis. The default is `SESSION`.

12.10.2.39.1 Synopsis

```
DropBindingStmt ::=
  'DROP' GlobalScope 'BINDING' 'FOR' BindableStmt ( 'USING' BindableStmt )
  ↪ ?

GlobalScope ::=
  ( 'GLOBAL' | 'SESSION' )?

BindableStmt ::=
  ( SelectStmt | UpdateStmt | InsertIntoStmt | ReplaceIntoStmt |
    ↪ DeleteStmt )
```

12.10.2.39.2 Syntax description

```
mysql> CREATE TABLE t1 (
  -> id INT NOT NULL PRIMARY KEY auto_increment,
  -> b INT NOT NULL,
  -> pad VARBINARY(255),
  -> INDEX(b)
  -> );
Query OK, 0 rows affected (0.07 sec)

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)

12.10.2.40 DROP COLUMN

This statement drops a column from a specified table. DROP COLUMN is online in TiDB, which means that it does not block read or write operations.

12.10.2.40.1 Synopsis

```
AlterTableStmt ::=
  'ALTER' IgnoreOptional 'TABLE' TableName ( AlterTableSpecListOpt
    ↪ AlterTablePartitionOpt | 'ANALYZE' 'PARTITION' PartitionNameList (
    ↪ 'INDEX' IndexNameList )? AnalyzeOptionListOpt )

AlterTableSpec ::=
  TableOptionList
| 'SET' 'TIFLASH' 'REPLICA' LengthNum LocationLabelList
| 'CONVERT' 'TO' CharsetKw ( CharsetName | 'DEFAULT' ) OptCollate
| 'ADD' ( ColumnKeywordOpt IfNotExists ( ColumnDef ColumnPosition | '('
  ↪ TableElementList ')' ) | Constraint | 'PARTITION' IfNotExists
  ↪ NoWriteToBinLogAliasOpt ( PartitionDefinitionListOpt | 'PARTITIONS'
  ↪ NUM ) )
| ( ( 'CHECK' | 'TRUNCATE' ) 'PARTITION' | ( 'OPTIMIZE' | 'REPAIR' | '
  ↪ REBUILD' ) 'PARTITION' NoWriteToBinLogAliasOpt )
  ↪ AllOrPartitionNameList
| 'COALESCE' 'PARTITION' NoWriteToBinLogAliasOpt NUM
| 'DROP' ( ColumnKeywordOpt IfExists ColumnName RestrictOrCascadeOpt | '
  ↪ PRIMARY' 'KEY' | 'PARTITION' IfExists PartitionNameList | (
  ↪ KeyOrIndex IfExists | 'CHECK' ) Identifier | 'FOREIGN' 'KEY' IfExists
  ↪ Symbol )
| 'EXCHANGE' 'PARTITION' Identifier 'WITH' 'TABLE' TableName
  ↪ WithValidationOpt
| ( 'IMPORT' | 'DISCARD' ) ( 'PARTITION' AllOrPartitionNameList )? '
  ↪ TABLESPACE'
| 'REORGANIZE' 'PARTITION' NoWriteToBinLogAliasOpt
  ↪ ReorganizePartitionRuleOpt
| 'ORDER' 'BY' AlterOrderItem ( ',' AlterOrderItem )*
```

```

| ( 'DISABLE' | 'ENABLE' ) 'KEYS'
| ( 'MODIFY' ColumnKeywordOpt IfExists | 'CHANGE' ColumnKeywordOpt
  ↳ IfExists ColumnName ) ColumnDef ColumnPosition
| 'ALTER' ( ColumnKeywordOpt ColumnName ( 'SET' 'DEFAULT' ( SignedLiteral
  ↳ | '(' Expression ')' ) | 'DROP' 'DEFAULT' ) | 'CHECK' Identifier
  ↳ EnforcedOrNot | 'INDEX' Identifier IndexInvisible )
| 'RENAME' ( ( 'COLUMN' | KeyOrIndex ) Identifier 'TO' Identifier | ( 'TO'
  ↳ | '='? | 'AS' ) TableName )
| LockClause
| AlgorithmClause
| 'FORCE'
| ( 'WITH' | 'WITHOUT' ) 'VALIDATION'
| 'SECONDARY_LOAD'
| 'SECONDARY_UNLOAD'

```

```

ColumnName ::=
  Identifier ( '.' Identifier ( '.' Identifier )? )?

```

12.10.2.40.2 Examples

```

mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, col1
  ↳ INT NOT NULL, col2 INT NOT NULL);

```

Query OK, 0 rows affected (0.12 sec)

```

mysql> INSERT INTO t1 (col1,col2) VALUES (1,1),(2,2),(3,3),(4,4),(5,5);

```

Query OK, 5 rows affected (0.02 sec)

Records: 5 Duplicates: 0 Warnings: 0

```

mysql> SELECT * FROM t1;

```

```

+----+-----+-----+
| id | col1 | col2 |
+----+-----+-----+

| 1 | 1 |
| 2 | 2 |
| 3 | 3 |
| 4 | 4 |
| 5 | 5 |
+----+-----+
5 rows in set (0.00 sec)
```

12.10.2.40.3 MySQL compatibility

- Dropping multiple columns in the same statement is not supported.
- Dropping primary key columns or columns covered by the composite index is not supported.

12.10.2.40.4 See also

- [ADD COLUMN](#)
- [SHOW CREATE TABLE](#)
- [CREATE TABLE](#)

12.10.2.41 DROP DATABASE

The `DROP DATABASE` statement permanently removes a specified database schema, and all of the tables and views that were created inside. User privileges that are associated with the dropped database remain unaffected.

12.10.2.41.1 Synopsis

```
DropDatabaseStmt ::=  
    'DROP' 'DATABASE' IfExists DBName  
  
IfExists ::= ( 'IF' 'EXISTS' )?
```

12.10.2.41.2 Examples

```
mysql> SHOW DATABASES;  
+-----+  
| Database          |  
+-----+  
| INFORMATION_SCHEMA |  
| PERFORMANCE_SCHEMA |  
| mysql             |  
| test              |  
+-----+  
4 rows in set (0.00 sec)  
  
mysql> DROP DATABASE test;  
Query OK, 0 rows affected (0.25 sec)  
  
mysql> SHOW DATABASES;  
+-----+  
| Database          |  
+-----+  
| INFORMATION_SCHEMA |  
| PERFORMANCE_SCHEMA |  
| mysql             |  
+-----+  
3 rows in set (0.00 sec)
```

12.10.2.41.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.41.4 See also

- [CREATE DATABASE](#)
- [ALTER DATABASE](#)

12.10.2.42 DROP INDEX

This statement removes an index from a specified table, marking space as free in TiKV.

12.10.2.42.1 Synopsis

```
DropIndexStmt ::=
  "DROP" "INDEX" IfExists Identifier "ON" TableName
  ↪ IndexLockAndAlgorithmOpt

IfExists ::=
  ( 'IF' 'EXISTS' )?

IndexLockAndAlgorithmOpt ::=
  ( LockClause AlgorithmClause? | AlgorithmClause LockClause? )?
```

12.10.2.42.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
  ↪ NOT NULL);
Query OK, 0 rows affected (0.10 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
+--

- [SHOW INDEX](#)
- [CREATE INDEX](#)
- [ADD INDEX](#)
- [RENAME INDEX](#)
- [ALTER INDEX](#)

12.10.2.43 DROP PLACEMENT POLICY

Warning:

Placement Rules in SQL is an experimental feature. The syntax might change before its GA, and there might also be bugs.

If you understand the risks, you can enable this experiment feature by executing `SET GLOBAL tidb_enable_alter_placement = 1;`

`DROP PLACEMENT POLICY` is used to drop a previously created placement policy.

12.10.2.43.1 Synopsis

```
DropPolicyStmt ::=
  "DROP" "PLACEMENT" "POLICY" IfExists PolicyName

PolicyName ::=
  Identifier
```

12.10.2.43.2 Examples

Placement policies can only be dropped when they are not referenced by any tables or partitions.

```
CREATE PLACEMENT POLICY p1 FOLLOWERS=4;
CREATE TABLE t1 (a INT PRIMARY KEY) PLACEMENT POLICY=p1;
DROP PLACEMENT POLICY p1; -- This statement fails because the placement
  ↳ policy p1 is referenced.

-- Finds which tables and partitions reference the placement policy.
SELECT table_schema, table_name FROM information_schema.tables WHERE
  ↳ tidb_placement_policy_name='p1';
SELECT table_schema, table_name FROM information_schema.partitions WHERE
  ↳ tidb_placement_policy_name='p1';

ALTER TABLE t1 PLACEMENT POLICY=default; -- Removes the placement policy
  ↳ from t1.
DROP PLACEMENT POLICY p1; -- Succeeds.
```

```
Query OK, 0 rows affected (0.10 sec)
```

```
Query OK, 0 rows affected (0.11 sec)
```

```
ERROR 8241 (HY000): Placement policy 'p1' is still in use
```

```

+-----+-----+
| table_schema | table_name |
+-----+-----+
| test        | t1         |
+-----+-----+
1 row in set (0.00 sec)

Empty set (0.01 sec)

Query OK, 0 rows affected (0.08 sec)

Query OK, 0 rows affected (0.21 sec)

```

12.10.2.43.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.43.4 See also

- [Placement Rules in SQL](#)
- [SHOW PLACEMENT](#)
- [CREATE PLACEMENT POLICY](#)
- [ALTER PLACEMENT POLICY](#)

12.10.2.44 DROP ROLE

This statement removes a role, that was previously created with `CREATE ROLE`.

12.10.2.44.1 Synopsis

```

DropRoleStmt ::=
  'DROP' 'ROLE' ( 'IF' 'EXISTS' )? RolenameList

RolenameList ::=
  Rolename ( ',' Rolename )*

```

12.10.2.44.2 Examples

Create a new role for the analytics team, and a new user called jennifer:

```

$ mysql -uroot
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 37
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
↳ License 2.0) Community Edition, MySQL 5.7 compatible

```

```
Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
↪ .
```

```
Oracle is a registered trademark of Oracle Corporation and/or its
affiliates. Other names may be trademarks of their respective
owners.
```

```
Type 'help;' or '\h' for help. Type '\c' to clear the current input
↪ statement.
```

```
mysql> CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)
```

```
mysql> GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)
```

```
mysql> CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)
```

```
mysql> GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Note that by default `jennifer` needs to `SET ROLE analyticsteam` in order to be able to use the privileges associated with the role:

```
$ mysql -ujennifer
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 32
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
↪ License 2.0) Community Edition, MySQL 5.7 compatible
```

```
Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
↪ .
```

```
Oracle is a registered trademark of Oracle Corporation and/or its
affiliates. Other names may be trademarks of their respective
owners.
```

```
Type 'help;' or '\h' for help. Type '\c' to clear the current input
↪ statement.
```

```
mysql> SHOW GRANTS;
```

```
+-----+
| Grants for User |
```

```

+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
2 rows in set (0.00 sec)

mysql> SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
mysql> SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW GRANTS;
+-----+
| Grants for User          |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT Select ON test.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
3 rows in set (0.00 sec)

mysql> SHOW TABLES IN test;
+-----+
| Tables_in_test |
+-----+
| t1              |
+-----+
1 row in set (0.00 sec)

```

The statement `SET DEFAULT ROLE` can be used to associated a role to jennifer so that she will not have to execute the statement `SET ROLE` in order to assume the privileges associated with the role:

```

$ mysql -uroot
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 34
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
  ↪ License 2.0) Community Edition, MySQL 5.7 compatible

Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
  ↪ .

Oracle is a registered trademark of Oracle Corporation and/or its
affiliates. Other names may be trademarks of their respective
owners.

```

```
Type 'help;' or '\h' for help. Type '\c' to clear the current input
↳ statement.
```

```
mysql> SET DEFAULT ROLE analyticsteam TO jennifer;
Query OK, 0 rows affected (0.02 sec)
```

```
$ mysql -ujennifer
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 35
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
↳ License 2.0) Community Edition, MySQL 5.7 compatible

Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
↳ .
```

Oracle is a registered trademark of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

```
Type 'help;' or '\h' for help. Type '\c' to clear the current input
↳ statement.
```

```
mysql> SHOW GRANTS;
```

```
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@ '%' |
| GRANT Select ON test.* TO 'jennifer'@ '%' |
| GRANT 'analyticsteam'@ '%' TO 'jennifer'@ '%' |
+-----+
3 rows in set (0.00 sec)
```

```
mysql> SHOW TABLES IN test;
```

```
+-----+
| Tables_in_test |
+-----+
| t1 |
+-----+
1 row in set (0.00 sec)
```

Drop the role for the analyticsteam:

```
$ mysql -uroot
Welcome to the MySQL monitor. Commands end with ; or \g.
```

```
Your MySQL connection id is 41
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
  ↳ License 2.0) Community Edition, MySQL 5.7 compatible

Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
  ↳ .

Oracle is a registered trademark of Oracle Corporation and/or its
affiliates. Other names may be trademarks of their respective
owners.

Type 'help;' or '\h' for help. Type '\c' to clear the current input
  ↳ statement.

mysql> DROP ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)
```

Jennifer no longer has the default role of analyticsteam associated, or can set the role to analyticsteam:

```
$ mysql -ujennifer
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 42
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
  ↳ License 2.0) Community Edition, MySQL 5.7 compatible

Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
  ↳ .

Oracle is a registered trademark of Oracle Corporation and/or its
affiliates. Other names may be trademarks of their respective
owners.

Type 'help;' or '\h' for help. Type '\c' to clear the current input
  ↳ statement.

mysql> SHOW GRANTS;
+-----+
| Grants for User          |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@%' |
+-----+
1 row in set (0.00 sec)

mysql> SET ROLE analyticsteam;
```

```
ERROR 3530 (HY000): `analyticsteam`@`%` is is not granted to jennifer@%
```

12.10.2.44.3 MySQL compatibility

This statement is understood to be fully compatible with roles, which are a feature of MySQL 8.0. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.44.4 See also

- [CREATE ROLE](#)
- [GRANT <role>](#)
- [REVOKE <role>](#)
- [SET ROLE](#)
- [SET DEFAULT ROLE](#)
- [Role-Based Access Control](#)

12.10.2.45 DROP SEQUENCE

The DROP SEQUENCE statement drops the sequence object in TiDB.

12.10.2.45.1 Synopsis

```
DropSequenceStmt ::=
  'DROP' 'SEQUENCE' IfExists TableNameList

IfExists ::= ( 'IF' 'EXISTS' )?

TableNameList ::=
  TableName ( ',' TableName )*

TableName ::=
  Identifier ( '.' Identifier )?
```

12.10.2.45.2 Examples

```
DROP SEQUENCE seq;
```

```
Query OK, 0 rows affected (0.10 sec)
```

```
DROP SEQUENCE seq, seq2;
```

```
Query OK, 0 rows affected (0.03 sec)
```

12.10.2.45.3 MySQL compatibility

This statement is a TiDB extension. The implementation is modeled on sequences available in MariaDB.

12.10.2.45.4 See also

- [CREATE SEQUENCE](#)
- [SHOW CREATE SEQUENCE](#)

12.10.2.46 DROP STATS

The `DROP STATS` statement is used to delete the statistics of the selected table from the selected database.

12.10.2.46.1 Synopsis

```
DropStatsStmt ::=
  'DROP' 'STATS' TableName

TableName ::=
  Identifier ('.' Identifier)?
```

12.10.2.46.2 Examples

```
CREATE TABLE t(a INT);
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
SHOW STATS_META WHERE db_name='test' and table_name='t';
```

```

Empty set (0.00 sec)
```

12.10.2.46.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.46.4 See also

- [Introduction to Statistics](#)

12.10.2.47 DROP TABLE

This statement drops a table from the currently selected database. An error is returned if the table does not exist, unless the `IF EXISTS` modifier is used.

12.10.2.47.1 Synopsis

```
DropTableStmt ::=
  'DROP' OptTemporary TableOrTables IfExists TableNameList
  ↪ RestrictOrCascadeOpt

OptTemporary ::=
  ( 'TEMPORARY' | ('GLOBAL' 'TEMPORARY') )?

TableOrTables ::=
  'TABLE'
| 'TABLES'

TableNameList ::=
  TableName ( ',' TableName )*
```

12.10.2.47.2 Drop temporary tables

You can use the following syntax to drop ordinary tables and temporary tables:

- Use `DROP TEMPORARY TABLE` to drop local temporary tables.
- Use `DROP GLOBAL TEMPORARY TABLE` to drop global temporary tables.
- Use `DROP TABLE` to drop ordinary tables or temporary tables.

12.10.2.47.3 Examples

```
mysql> CREATE TABLE t1 (a INT);
Query OK, 0 rows affected (0.11 sec)

mysql> DROP TABLE t1;
Query OK, 0 rows affected (0.22 sec)

mysql> DROP TABLE table_not_exists;
ERROR 1051 (42S02): Unknown table 'test.table_not_exists'
mysql> DROP TABLE IF EXISTS table_not_exists;
Query OK, 0 rows affected (0.01 sec)

mysql> CREATE VIEW v1 AS SELECT 1;
Query OK, 0 rows affected (0.10 sec)

mysql> DROP TABLE v1;
Query OK, 0 rows affected (0.23 sec)
```

12.10.2.47.4 MySQL compatibility

- Dropping a table with IF EXISTS does not return a warning when attempting to drop a table that does not exist. [Issue #7867](#)
- Currently RESTRICT and CASCADE are only supported syntactically.

12.10.2.47.5 See also

- [CREATE TABLE](#)
- [SHOW CREATE TABLE](#)
- [SHOW TABLES](#)

12.10.2.48 DROP USER

This statement removes a user from the TiDB system database. The optional keyword IF EXISTS can be used to silence an error if the user does not exist. This statement requires the CREATE USER privilege.

12.10.2.48.1 Synopsis

```
DropUserStmt ::=
  'DROP' 'USER' ( 'IF' 'EXISTS' )? UsernameList

Username ::=
  StringName ('@' StringName | singleAtIdentifier)? | 'CURRENT_USER'
  ↪ OptionalBraces
```

12.10.2.48.2 Examples

```
mysql> DROP USER idontexist;
ERROR 1396 (HY000): Operation DROP USER failed for idontexist@%

mysql> DROP USER IF EXISTS 'idontexist';
Query OK, 0 rows affected (0.01 sec)

mysql> CREATE USER 'newuser' IDENTIFIED BY 'mypassword';
Query OK, 1 row affected (0.02 sec)

mysql> GRANT ALL ON test.* TO 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-----+
| Grants for newuser@%          |
+-----+
| GRANT USAGE ON *.* TO 'newuser'@'%' |
| GRANT ALL PRIVILEGES ON test.* TO 'newuser'@'%' |
+-----+
2 rows in set (0.00 sec)

mysql> REVOKE ALL ON test.* FROM 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-----+
| Grants for newuser@%          |
+-----+
| GRANT USAGE ON *.* TO 'newuser'@'%' |
+-----+
1 row in set (0.00 sec)

mysql> DROP USER 'newuser';
Query OK, 0 rows affected (0.14 sec)

mysql> SHOW GRANTS FOR 'newuser';
ERROR 1141 (42000): There is no such grant defined for user 'newuser' on
↪ host '%'
```

12.10.2.48.3 MySQL compatibility

- Dropping a user that does not exist with IF EXISTS will not create a warning in TiDB. [Issue #10196](#).

12.10.2.49 DROP VIEW

This statement drops an view object from the currently selected database. It does not effect any base tables that a view references.

12.10.2.49.1 Synopsis

```
DropViewStmt ::=
  'DROP' 'VIEW' ( 'IF' 'EXISTS' )? TableNameList RestrictOrCascadeOpt

TableNameList ::=
  TableName ( ',' TableName )*

TableName ::=
  Identifier ( '.' Identifier)?
```

12.10.2.49.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
↳ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> CREATE VIEW v1 AS SELECT * FROM t1 WHERE c1 > 2;
Query OK, 0 rows affected (0.11 sec)

mysql> SELECT * FROM t1;
+----+-----+
| id | c1 |
+----+-----+
| 1 | 1 |
| 2 | 2 |
| 3 | 3 |
| 4 | 4 |
| 5 | 5 |
```

```
+-----+-----+
5 rows in set (0.00 sec)

mysql> SELECT * FROM v1;
+-----+-----+
| id | c1 |
+-----+-----+
| 3 | 3 |
| 4 | 4 |
| 5 | 5 |
+-----+-----+
3 rows in set (0.00 sec)

mysql> DROP VIEW v1;
Query OK, 0 rows affected (0.23 sec)

mysql> SELECT * FROM t1;
+-----+-----+
| id | c1 |
+-----+-----+
| 1 | 1 |
| 2 | 2 |
| 3 | 3 |
| 4 | 4 |
| 5 | 5 |
+-----+-----+
5 rows in set (0.00 sec)
```

12.10.2.49.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.49.4 See also

- [CREATE VIEW](#)
- [DROP TABLE](#)

12.10.2.50 EXECUTE

The EXECUTE statement provides an SQL interface to server-side prepared statements.

12.10.2.50.1 Synopsis

```
ExecuteStmt ::=  
  'EXECUTE' Identifier ( 'USING' UserVariable ( ',' UserVariable )* )?
```

12.10.2.50.2 Examples

```
mysql> PREPARE mystmt FROM 'SELECT ? as num FROM DUAL';  
Query OK, 0 rows affected (0.00 sec)  
  
mysql> SET @number = 5;  
Query OK, 0 rows affected (0.00 sec)  
  
mysql> EXECUTE mystmt USING @number;  
+-----+  
| num |  
+-----+  
| 5   |  
+-----+  
1 row in set (0.00 sec)  
  
mysql> DEALLOCATE PREPARE mystmt;  
Query OK, 0 rows affected (0.00 sec)
```

12.10.2.50.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.50.4 See also

- [PREPARE](#)
- [DEALLOCATE](#)

12.10.2.51 EXPLAIN ANALYZE

The EXPLAIN ANALYZE statement works similar to EXPLAIN, with the major difference being that it will actually execute the statement. This allows you to compare the estimates used as part of query planning to actual values encountered during execution. If the estimates differ significantly from the actual values, you should consider running ANALYZE TABLE on the affected tables.

Note:

When you use `EXPLAIN ANALYZE` to execute DML statements, modification to data is normally executed. Currently, the execution plan for DML statements **cannot** be shown yet.

12.10.2.51.1 Synopsis

```

ExplainSym ::=
    'EXPLAIN'
  | 'DESCRIBE'
  | 'DESC'

ExplainStmt ::=
    ExplainSym ( TableName ColumnName? | 'ANALYZE'? ExplainableStmt | 'FOR'
        ↪ 'CONNECTION' NUM | 'FORMAT' '=' ( stringLit | ExplainFormatType )
        ↪ ( 'FOR' 'CONNECTION' NUM | ExplainableStmt ) )

ExplainableStmt ::=
    SelectStmt
  | DeleteFromStmt
  | UpdateStmt
  | InsertIntoStmt
  | ReplaceIntoStmt
  | UnionStmt

```

12.10.2.51.2 EXPLAIN ANALYZE output format

Different from `EXPLAIN`, `EXPLAIN ANALYZE` executes the corresponding SQL statement, records its runtime information, and returns the information together with the execution plan. Therefore, you can regard `EXPLAIN ANALYZE` as an extension of the `EXPLAIN` statement. Compared to `EXPLAIN` (for debugging query execution), the return results of `EXPLAIN` ↪ `ANALYZE` also include columns of information such as `actRows`, `execution info`, `memory`, and `disk`. The details of these columns are shown as follows:

attribute name	description
<code>actRows</code>	Number of rows output by the operator.

attribute name	description
execution info	Execution information of the operator. <code>time</code> represents the total wall time from entering the operator to leaving the operator, including the total execution time of all sub-operators. If the operator is called many times by the parent operator (in loops), then the time refers to the accumulated time. <code>loops</code> is the number of times the current operator is called by the parent operator.
memory	Memory space occupied by the operator.
disk	Disk space occupied by the operator.

12.10.2.51.3 Examples

```
CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT NOT
↳ NULL);
```

```
Query OK, 0 rows affected (0.12 sec)
```

```
INSERT INTO t1 (c1) VALUES (1), (2), (3);
```

```
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0
```

```
EXPLAIN ANALYZE SELECT * FROM t1 WHERE id = 1;
```

```
+--

```

12.10.2.51.4 Execution information of operators

In addition to the basic time and loop execution information, execution info also contains operator-specific execution information, which mainly includes the time consumed for the operator to send RPC requests and the duration of other steps.

Point_Get

The execution information from a Point_Get operator will typically contain the following information:

- **Get**:{num_rpc:1, total_time:697.051µs}: The number of the Get RPC requests (num_rpc) sent to TiKV and the total duration (total_time) of all RPC requests.
- **ResolveLock**:{num_rpc:1, total_time:12.117495ms}: If TiDB encounters a lock when reading data, it has to resolve the lock first, which generally occurs in the scenario of read-write conflict. This information indicates the duration of resolving locks.

- `regionMiss_backoff`: {num:11, total_time:2010 ms}, `tikvRPC_backoff`: {num ↵ :11, total_time:10691 ms}: When an RPC request fails, TiDB will wait the backoff time before retrying the request. Backoff statistics include the type of backoff (such as `regionMiss` and `tikvRPC`), the total waiting time (`total_time`), and the total number of backoffs (`num`).

Batch_Point_Get

The execution information of the `Batch_Point_Get` operator is similar to that of the `Point_Get` operator, but `Batch_Point_Get` generally sends `BatchGet` RPC requests to TiKV to read data.

`BatchGet`: {num_rpc:2, total_time:83.13µs}: The number of RPC requests (`num_rpc`) of the `BatchGet` type sent to TiKV and the total time consumed (`total_time`) for all RPC requests.

TableReader

The execution information of a `TableReader` operator is typically as follows:

```
cop_task: {num: 6, max: 1.07587ms, min: 844.312µs, avg: 919.601µs, p95:
  ↵ 1.07587ms, max_proc_keys: 16, p95_proc_keys: 16, tot_proc: 1ms,
  ↵ tot_wait: 1ms, rpc_num: 6, rpc_time: 5.313996 ms,
  ↵ copr_cache_hit_ratio: 0.00}
```

- `cop_task`: Contains the execution information of cop tasks. For example:
 - `num`: The number of cop tasks.
 - `max`, `min`, `avg`, `p95`: The maximum, minimum, average, and P95 values of the execution time consumed for executing cop tasks.
 - `max_proc_keys` and `p95_proc_keys`: The maximum and P95 key-values scanned by TiKV in all cop tasks. If the difference between the maximum value and the P95 value is large, the data distribution might be imbalanced.
 - `rpc_num`, `rpc_time`: The total number and total time consumed for Cop RPC requests sent to TiKV.
 - `copr_cache_hit_ratio`: The hit rate of Coprocessor Cache for cop task requests.
- `backoff`: Contains different types of backoff and the total waiting time of backoff.

Insert

The execution information of an `Insert` operator is typically as follows:

```
prepare:109.616µs, check_insert:{total_time:1.431678ms, mem_insert_time
  ↵ :667.878µs, prefetch:763.8µs, rpc:{BatchGet:{num_rpc:1, total_time
  ↵ :699.166µs},Get:{num_rpc:1, total_time:378.276µs }}}
```

- **prepare**: The time consumed for preparing to write, including expression, default value and auto-increment value calculations.
- **check_insert**: This information generally appears in `insert ignore` and `insert ↔ on duplicate` statements, including conflict checking and the time consumed for writing data to TiDB transaction cache. Note that this time consumption does not include the time consumed for transaction commit. It contains the following information:
 - **total_time**: The total time spent on the `check_insert` step.
 - **mem_insert_time**: The time consumed for writing data to the TiDB transaction cache.
 - **prefetch**: The duration of retrieving the data that needs to be checked for conflicts from TiKV. This step sends a `Batch_Get` RPC request to TiKV to retrieve data.
 - **rpc**: The total time consumed for sending RPC requests to TiKV, which generally includes two types of RPC time, `BatchGet` and `Get`, among which:
 - * `BatchGet` RPC request is sent in the `prefetch` step.
 - * `Get` RPC request is sent when the `insert on duplicate` statement executes `duplicate update`.
- **backoff**: Contains different types of backoff and the total waiting time of backoff.

IndexJoin

The `IndexJoin` operator has 1 outer worker and N inner workers for concurrent execution. The join result preserves the order of the outer table. The detailed execution process is as follows:

1. The outer worker reads N outer rows, then wraps it into a task, and sends it to the result channel and the inner worker channel.
2. The inner worker receives the task, build key ranges from the task, and fetches inner rows according to the key ranges. It then builds the inner row hash table.
3. The main `IndexJoin` thread receives the task from the result channel and waits for the inner worker to finish handling the task.
4. The main `IndexJoin` thread joins each outer row by looking up to the inner rows' hash table.

The `IndexJoin` operator contains the following execution information:

```
inner:{total:4.297515932s, concurrency:5, task:17, construct:97.96291ms,
↔ fetch:4.164310088s, build:35.219574ms}, probe:53.574945ms
```

- **Inner**: The execution information of inner worker:
 - **total**: The total time consumed by the inner worker.

- **concurrency**: The number of concurrent inner workers.
 - **task**: The total number of tasks processed by the inner worker.
 - **construct**: The preparation time before the inner worker reads the inner table rows corresponding to the task.
 - **fetch**: The total time consumed for it takes for the inner worker to read inner table rows.
 - **Build**: The total time consumed for it takes for the inner worker to construct the hash table of the corresponding inner table rows.
- **probe**: The total time consumed by the main `IndexJoin` thread to perform join operations with the hash table of the outer table rows and the inner table rows.

IndexHashJoin

The execution process of the `IndexHashJoin` operator is similar to that of the `IndexJoin` operator. `IndexHashJoin` operator also has 1 outer worker and N inner workers to execute in parallel, but the output order is not guaranteed to be consistent with that of the outer table. The detailed execution process is as follows:

1. The outer worker reads N outer rows, builds a task, and sends it to the inner worker channel.
2. The inner worker receives the tasks from the inner worker channel and performs the following three operations in order for every task:
 - a. Build a hash table from the outer rows
 - b. Build key ranges from outer rows and fetches inner rows
 - c. Probe the hash table and sends the join result to the result channel. Note: step a and step b are running concurrently.
3. The main thread of `IndexHashJoin` receives the join results from the result channel.

The `IndexHashJoin` operator contains the following execution information:

```
inner:{total:4.429220003s, concurrency:5, task:17, construct:96.207725ms,  
↪ fetch:4.239324006s, build:24.567801ms, join:93.607362ms}
```

- **Inner**: the execution information of inner worker:
 - **total**: the total time consumed by the inner worker.
 - **concurrency**: the number of inner workers.
 - **task**: The total number of tasks processed by the inner worker.
 - **construct**: The preparation time before the inner worker reads the inner table rows.
 - **fetch**: The total time consumed for inner worker to read inner table rows.

- **Build**: The total time consumed for inner worker to construct the hash table of the outer table rows.
- **join**: The total time consumed for inner worker to do join with the inner table rows and the hash table of outer table rows.

HashJoin

The `HashJoin` operator has an inner worker, an outer worker, and N join workers. The detailed execution process is as follows:

1. The inner worker reads inner table rows and constructs a hash table.
2. The outer worker reads the outer table rows, then wraps it into a task and sends it to the join worker.
3. The join worker waits for the hash table construction in step 1 to finish.
4. The join worker uses the outer table rows and hash table in the task to perform join operations, and then sends the join result to the result channel.
5. The main thread of `HashJoin` receives the join result from the result channel.

The `HashJoin` operator contains the following execution information:

```
build_hash_table:{total:146.071334ms, fetch:110.338509ms, build:35.732825ms
  ↪ }, probe:{concurrency:5, total:857.162518ms, max:171.48271ms, probe
  ↪ :125.341665ms, fetch:731.820853ms}
```

- **build_hash_table**: Reads the data of the inner table and constructs the execution information of the hash table:
 - **total**: The total time consumption.
 - **fetch**: The total time spent reading inner table data.
 - **build**: The total time spent constructing a hash table.
- **probe**: The execution information of join workers:
 - **concurrency**: The number of join workers.
 - **total**: The total time consumed by all join workers.
 - **max**: The longest time for a single join worker to execute.
 - **probe**: The total time consumed for joining with outer table rows and the hash table.
 - **fetch**: The total time that the join worker waits to read the outer table rows data.

lock_keys execution information

When a DML statement is executed in a pessimistic transaction, the execution information of the operator might also include the execution information of `lock_keys`. For example:

```
lock_keys: {time:94.096168ms, region:6, keys:8, lock_rpc:274.503214ms,  
  ↪ rpc_count:6}
```

- **time**: The total duration of executing the `lock_keys` operation.
- **region**: The number of Regions involved in executing the `lock_keys` operation.
- **keys**: The number of Keys that need Lock.
- **lock_rpc**: The total time spent sending an RPC request of the Lock type to TiKV. Because multiple RPC requests can be sent in parallel, the total RPC time consumption might be greater than the total time consumption of the `lock_keys` operation.
- **rpc_count**: The total number of RPC requests of the Lock type sent to TiKV.

`commit_txn` execution information

When a write-type DML statement is executed in a transaction with `autocommit=1`, the execution information of the write operator will also include the duration information of the transaction commit. For example:

```
commit_txn: {prewrite:48.564544ms, wait_prewrite_binlog:47.821579,  
  ↪ get_commit_ts:4.277455ms, commit:50.431774ms, region_num:7,  
  ↪ write_keys:16, write_byte:536}
```

- **prewrite**: The time consumed for the `prewrite` phase of the 2PC commit of the transaction.
- **wait_prewrite_binlog**:: The time consumed for waiting to write the prewrite Binlog.
- **get_commit_ts**: The time consumed for getting the transaction commit timestamp.
- **commit**: The time consumed for the `commit` phase during the 2PC commit of the transaction.
- **write_keys**: The total `keys` written in the transaction.
- **write_byte**: The total bytes of `key-value` written in the transaction, and the unit is byte.

12.10.2.51.5 MySQL compatibility

`EXPLAIN ANALYZE` is a feature of MySQL 8.0, but both the output format and the potential execution plans in TiDB differ substantially from MySQL.

12.10.2.51.6 See also

- [Understanding the Query Execution Plan](#)
- `EXPLAIN`
- `ANALYZE TABLE`
- `TRACE`

12.10.2.52 EXPLAIN

The `EXPLAIN` statement shows the execution plan for a query without executing it. It is complimented by `EXPLAIN ANALYZE` which will execute the query. If the output of `EXPLAIN` does not match the expected result, consider executing `ANALYZE TABLE` on each table in the query.

The statements `DESC` and `DESCRIBE` are aliases of this statement. The alternative usage of `EXPLAIN <tableName>` is documented under [SHOW \[FULL\] COLUMNS FROM](#).

TiDB supports the `EXPLAIN [options] FOR CONNECTION connection_id` statement. However, this statement is different from the `EXPLAIN FOR` statement in MySQL. For more details, see [EXPLAIN FOR CONNECTION](#).

12.10.2.52.1 Synopsis

```

ExplainSym ::=
  'EXPLAIN'
| 'DESCRIBE'
| 'DESC'

ExplainStmt ::=
  ExplainSym ( TableName ColumnName? | 'ANALYZE'? ExplainableStmt | 'FOR'
    ↪ 'CONNECTION' NUM | 'FORMAT' '=' ( stringLit | ExplainFormatType )
    ↪ ( 'FOR' 'CONNECTION' NUM | ExplainableStmt ) )

ExplainableStmt ::=
  SelectStmt
| DeleteFromStmt
| UpdateStmt
| InsertIntoStmt
| ReplaceIntoStmt
| UnionStmt

```

12.10.2.52.2 EXPLAIN output format

Note:

When you use the MySQL client to connect to TiDB, to read the output result in a clearer way without line wrapping, you can use the `pager less` ↪ `-S` command. Then, after the `EXPLAIN` result is output, you can press the right arrow → button on your keyboard to horizontally scroll through the output.

Currently, `EXPLAIN` in TiDB outputs 5 columns: `id`, `estRows`, `task`, `access object`, `operator info`. Each operator in the execution plan is described by these attributes, with each row in the `EXPLAIN` output describing an operator. The description of each attribute is as follows:

Attribute name	Description
<code>id</code>	The operator ID is the unique identifier of the operator in the entire execution plan. In TiDB 2.1, the ID is formatted to display the tree structure of the operator. Data flows from the child node to the parent node. One and only one parent node for each operator.
<code>estRows</code>	The number of rows that the operator is expected to output. This number is estimated according to the statistics and the operator's logic. <code>estRows</code> is called <code>count</code> in the earlier versions of TiDB 4.0.
<code>task</code>	The type of task the operator belongs to. Currently, the execution plans are divided into two tasks: root task, which is executed on <code>tidb-server</code> , and cop task, which is performed in parallel on TiKV or TiFlash. The topology of the execution plan at the task level is that a root task followed by many cop tasks. The root task uses the output of cop tasks as input. The cop tasks refer to tasks that TiDB pushes down to TiKV or TiFlash. Each cop task is distributed in the TiKV cluster or the TiFlash cluster, and is executed by multiple processes.
<code>access object</code>	Data item information accessed by the operator. The information includes <code>table</code> , <code>partition</code> , and <code>index</code> (if any). Only operators that directly access the data have such information.
<code>operator info</code>	Other information about the operator. <code>operator info</code> of each operator is different. You can refer to the following examples.

12.10.2.52.3 Examples

```

  ↪ false, stats:pseudo |
+--
  ↪ -----+-----+-----+-----+
  ↪
4 rows in set (0.01 sec)

```

To specify the content and format of the output, you can use the `FORMAT = xxx` syntax in the `EXPLAIN` statement.

If you do not specify the `FORMAT` in `EXPLAIN`, or specify `FORMAT = "row"`, `EXPLAIN` statement will output the results in a tabular format. See [Understand the Query Execution Plan](#) for more information.

If you specify `FORMAT = "brief"` in `EXPLAIN`, the operator IDs in the output are simplified compared with that without `FORMAT` specified.

```
EXPLAIN FORMAT = "brief" DELETE FROM t1 WHERE c1 = 3;
```

```
+--
↪ -----+-----+-----+-----+
↪
| id          | estRows | task   | access object | operator info
↪          |         |        |               |
+--

```

If the `dot` program (in the `graphviz` package) is installed on your computer, you can generate a PNG file using the following method:

```
dot xx.dot -T png -O
```

The `xx.dot` is the result returned by the above statement.

If the `dot` program is not installed on your computer, copy the result to [this website](#) to get a tree diagram:

Figure 236: Explain Dot

12.10.2.52.4 MySQL compatibility

- Both the format of EXPLAIN and the potential execution plans in TiDB differ substantially from MySQL.
- TiDB does not support the FORMAT=JSON or FORMAT=TREE options.

EXPLAIN FOR CONNECTION

EXPLAIN FOR CONNECTION is used to get the execution plan of the currently executed SQL query or the last executed SQL query in a connection. The output format is the same as that of EXPLAIN. However, the implementation of EXPLAIN FOR CONNECTION in TiDB is

different from that in MySQL. Their differences (apart from the output format) are listed as follows:

- If the connection is sleeping, MySQL returns an empty result, while TiDB returns the last executed query plan.
- If you try to get the execution plan of the current session, MySQL returns an error, while TiDB returns the result normally.
- MySQL requires the login user to be the same as the connection being queried, or the login user has the **PROCESS** privilege; while TiDB requires the login user to be the same as the connection being queried, or the login user has the **SUPER** privilege.

- [ANALYZE TABLE](#)
- [TRACE](#)

12.10.2.53 FLASHBACK TABLE

The **FLASHBACK TABLE** syntax is introduced since TiDB 4.0. You can use the **FLASHBACK** \leftrightarrow **TABLE** statement to restore the tables and data dropped by the **DROP** or **TRUNCATE** operation within the Garbage Collection (GC) lifetime.

The system variable `tidb_gc_life_time` (default: 10m0s) defines the retention time of earlier versions of rows. The current `safePoint` of where garbage collection has been performed up to can be obtained with the following query:

```
SELECT * FROM mysql.tidb WHERE variable_name = 'tikv_gc_safe_point';
```

As long as the table is dropped by **DROP** or **TRUNCATE** statements after the `tikv_gc_safe_point` time, you can restore the table using the **FLASHBACK TABLE** statement.

12.10.2.53.1 Syntax

```
FLASHBACK TABLE table_name [TO other_table_name]
```

12.10.2.53.2 Synopsis

```
FlashbackTableStmt ::=  
    'FLASHBACK' 'TABLE' TableName FlashbackToNewName  
  
TableName ::=  
    Identifier ( '.' Identifier )?
```

```
FlashbackToNewName ::=  
  ( 'TO' Identifier )?
```

12.10.2.53.3 Notes

If a table is dropped and the GC lifetime has passed, you can no longer use the `FLASHBACK TABLE` statement to recover the dropped data. Otherwise, an error like `Can't`
↪ `find dropped / truncated table 't' in GC safe point 2020-03-16 16:34:52`
↪ `+0800 CST` will be returned.

Pay attention to the following conditions and requirements when you enable TiDB Binlog and use the `FLASHBACK TABLE` statement:

- The downstream secondary cluster must also support `FLASHBACK TABLE`.
- The GC lifetime of the secondary cluster must be longer than that of the primary cluster.
- The delay of replication between the upstream and downstream might also cause the failure to recover data to the downstream.
- If an error occurs when TiDB Binlog is replicating a table, you need to filter that table in TiDB Binlog and manually import all data of that table.

12.10.2.53.4 Example

- Recover the table data dropped by the `DROP` operation:

```
DROP TABLE t;
```

```
FLASHBACK TABLE t;
```

- Recover the table data dropped by the `TRUNCATE` operation. Because the truncated table `t` still exists, you need to rename the table `t` to be recovered. Otherwise, an error will be returned because the table `t` already exists.

```
TRUNCATE TABLE t;
```

```
FLASHBACK TABLE t TO t1;
```

12.10.2.53.5 Implementation principle

When deleting a table, TiDB only deletes the table metadata, and writes the table data (row data and index data) to be deleted to the `mysql.gc_delete_range` table. The GC Worker in the TiDB background periodically removes from the `mysql.gc_delete_range` table the keys that exceed the GC lifetime.

Therefore, to recover a table, you only need to recover the table metadata and delete the corresponding row record in the `mysql.gc_delete_range` table before the GC Worker deletes the table data. You can use a snapshot read of TiDB to recover the table metadata. For details of snapshot read, refer to [Read Historical Data](#).

The following is the working process of `FLASHBACK TABLE t TO t1`:

1. TiDB searches the recent DDL history jobs and locates the first DDL operation of the `DROP TABLE` or the `truncate table` type on table `t`. If TiDB fails to locate one, an error is returned.
2. TiDB checks whether the starting time of the DDL job is before `tikv_gc_safe_point`. If it is before `tikv_gc_safe_point`, it means that the table dropped by the `DROP` or `TRUNCATE` operation has been cleaned up by the GC and an error is returned.
3. TiDB uses the starting time of the DDL job as the snapshot to read historical data and read table metadata.
4. TiDB deletes GC tasks related to table `t` in `mysql.gc_delete_range`.
5. TiDB changes `name` in the table's metadata to `t1`, and uses this metadata to create a new table. Note that only the table name is changed but not the table ID. The table ID is the same as that of the previously dropped table `t`.

From the above process, you can see that TiDB always operates on the metadata of the table, and the user data of the table has never been modified. The restored table `t1` has the same ID as the previously dropped table `t`, so `t1` can read the user data of `t`.

Note:

You cannot use `FLASHBACK` statements to restore the same deleted table multiple times, because the ID of the restored table is the same ID of the dropped table, and TiDB requires that all existing tables must have a globally unique table ID.

The `FLASHBACK TABLE` operation is done by TiDB obtaining the table metadata through snapshot read, and then going through the process of table creation similar to `CREATE TABLE`. Therefore, `FLASHBACK TABLE` is, in essence, a kind of DDL operation.

12.10.2.53.6 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.54 FLUSH PRIVILEGES

This statement triggers TiDB to reload the in-memory copy of privileges from the privilege tables. You should execute `FLUSH PRIVILEGES` after making manual edits to tables such as `mysql.user`. Executing this statement is not required after using privilege statements such as `GRANT` or `REVOKE`. Executing this statement requires the `RELOAD` privilege.

12.10.2.54.1 Synopsis

```
FlushStmt ::=
    'FLUSH' NoWriteToBinLogAliasOpt FlushOption

NoWriteToBinLogAliasOpt ::=
    ( 'NO_WRITE_TO_BINLOG' | 'LOCAL' )?

FlushOption ::=
    'PRIVILEGES'
| 'STATUS'
| 'TIDB' 'PLUGINS' PluginNameList
| 'HOSTS'
| LogTypeOpt 'LOGS'
| TableOrTables TableNameListOpt WithReadLockOpt
```

12.10.2.54.2 Examples

```
mysql> FLUSH PRIVILEGES;
Query OK, 0 rows affected (0.01 sec)
```

12.10.2.54.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.54.4 See also

- [Privilege Management](#)

12.10.2.55 FLUSH STATUS

This statement is included for compatibility with MySQL. It has no effect on TiDB, which uses Prometheus and Grafana for centralized metrics collection instead of `SHOW STATUS`.

12.10.2.55.1 Synopsis

```
FlushStmt ::=
    'FLUSH' NoWriteToBinLogAliasOpt FlushOption

NoWriteToBinLogAliasOpt ::=
    ( 'NO_WRITE_TO_BINLOG' | 'LOCAL' )?

FlushOption ::=
```

```
'PRIVILEGES'
| 'STATUS'
| 'TIDB' 'PLUGINS' PluginNameList
| 'HOSTS'
| LogTypeOpt 'LOGS'
| TableOrTables TableNameListOpt WithReadLockOpt
```

12.10.2.55.2 Examples

```
mysql> show status;
+-----+-----+
| Variable_name | Value |
+-----+-----+
| Ssl_cipher_list | |
| server_id | 93e2e07d-6bb4-4a1b-90b7-e035fae154fe |
| ddl_schema_version | 141 |
| Ssl_verify_mode | 0 |
| Ssl_version | |
| Ssl_cipher | |
+-----+-----+
6 rows in set (0.01 sec)

mysql> show global status;
+-----+-----+
| Variable_name | Value |
+-----+-----+
| Ssl_cipher | |
| Ssl_cipher_list | |
| Ssl_verify_mode | 0 |
| Ssl_version | |
| server_id | 93e2e07d-6bb4-4a1b-90b7-e035fae154fe |
| ddl_schema_version | 141 |
+-----+-----+
6 rows in set (0.00 sec)

mysql> flush status;
Query OK, 0 rows affected (0.00 sec)

mysql> show status;
+-----+-----+
| Variable_name | Value |
+-----+-----+
| Ssl_cipher | |
| Ssl_cipher_list | |
```

```

| Ssl_verify_mode | 0 |
| Ssl_version      | |
| ddl_schema_version | 141 |
| server_id        | 93e2e07d-6bb4-4a1b-90b7-e035fae154fe |
+-----+-----+
6 rows in set (0.00 sec)

```

12.10.2.55.3 MySQL compatibility

- This statement is included only for compatibility with MySQL.

12.10.2.55.4 See also

- [SHOW \[GLOBAL|SESSION\] STATUS](#)

12.10.2.56 FLUSH TABLES

This statement is included for compatibility with MySQL. It has no effective usage in TiDB.

12.10.2.56.1 Synopsis

```

FlushStmt ::=
    'FLUSH' NoWriteToBinLogAliasOpt FlushOption

NoWriteToBinLogAliasOpt ::=
    ( 'NO_WRITE_TO_BINLOG' | 'LOCAL' )?

FlushOption ::=
    'PRIVILEGES'
| 'STATUS'
| 'TIDB' 'PLUGINS' PluginNameList
| 'HOSTS'
| LogTypeOpt 'LOGS'
| TableOrTables TableNameListOpt WithReadLockOpt

LogTypeOpt ::=
    ( 'BINARY' | 'ENGINE' | 'ERROR' | 'GENERAL' | 'SLOW' )?

TableOrTables ::=
    'TABLE'
| 'TABLES'

```

```
TableNameListOpt ::=
    TableNameList?

WithReadLockOpt ::=
    ( 'WITH' 'READ' 'LOCK' )?
```

12.10.2.56.2 Examples

```
mysql> FLUSH TABLES;
Query OK, 0 rows affected (0.00 sec)

mysql> FLUSH TABLES WITH READ LOCK;
ERROR 1105 (HY000): FLUSH TABLES WITH READ LOCK is not supported. Please
↪ use @@tidb_snapshot
```

12.10.2.56.3 MySQL compatibility

- TiDB does not have a concept of table cache as in MySQL. Thus, `FLUSH TABLES` is parsed but ignored in TiDB for compatibility.
- The statement `FLUSH TABLES WITH READ LOCK` produces an error, as TiDB does not currently support locking tables. It is recommended to use [Historical reads](#) for this purpose instead.

12.10.2.56.4 See also

- [Read historical data](#)

12.10.2.57 GRANT <privileges>

This statement allocates privileges to a pre-existing user in TiDB. The privilege system in TiDB follows MySQL, where credentials are assigned based on a database/table pattern. Executing this statement requires the `GRANT OPTION` privilege and all privileges you allocate.

12.10.2.57.1 Synopsis

```
GrantStmt ::=
    'GRANT' PrivElemList 'ON' ObjectType PrivLevel 'TO' UserSpecList
    ↪ RequireClauseOpt WithGrantOptionOpt

PrivElemList ::=
    PrivElem ( ',' PrivElem )*

PrivElem ::=
```

```

PrivType ( '(' ColumnNameList ')' )?

PrivType ::=
  'ALL' 'PRIVILEGES'?
|  'ALTER' 'ROUTINE'?
|  'CREATE' ( 'USER' | 'TEMPORARY' 'TABLES' | 'VIEW' | 'ROLE' | 'ROUTINE' )
  ↪ ?
|  'TRIGGER'
|  'DELETE'
|  'DROP' 'ROLE'?
|  'PROCESS'
|  'EXECUTE'
|  'INDEX'
|  'INSERT'
|  'SELECT'
|  'SUPER'
|  'SHOW' ( 'DATABASES' | 'VIEW' )
|  'UPDATE'
|  'GRANT' 'OPTION'
|  'REFERENCES'
|  'REPLICATION' ( 'SLAVE' | 'CLIENT' )
|  'USAGE'
|  'RELOAD'
|  'FILE'
|  'CONFIG'
|  'LOCK' 'TABLES'
|  'EVENT'
|  'SHUTDOWN'

ObjectType ::=
  'TABLE'?

PrivLevel ::=
  '*' ( '.' '*' )?
|  Identifier ( '.' ( '*' | Identifier ) )?

UserSpecList ::=
  UserSpec ( ',' UserSpec )*

```

12.10.2.57.2 Examples

```

mysql> CREATE USER 'newuser' IDENTIFIED BY 'mypassword';
Query OK, 1 row affected (0.02 sec)

```

```
mysql> GRANT ALL ON test.* TO 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-----+
| Grants for newuser@%          |
+-----+
| GRANT USAGE ON *.* TO 'newuser'@'%' |
| GRANT ALL PRIVILEGES ON test.* TO 'newuser'@'%' |
+-----+
2 rows in set (0.00 sec)
```

12.10.2.57.3 MySQL compatibility

- Similar to MySQL, the USAGE privilege denotes the ability to log into a TiDB server.
- Column level privileges are not currently supported.
- Similar to MySQL, when the NO_AUTO_CREATE_USER sql mode is not present, the GRANT statement will automatically create a new user with an empty password when a user does not exist. Removing this sql-mode (it is enabled by default) presents a security risk.

12.10.2.57.4 See also

- [GRANT <role>](#)
- [REVOKE <privileges>](#)
- [SHOW GRANTS](#)
- [Privilege Management](#)

12.10.2.58 GRANT <role>

Assigns a previously created role to an existing user. The user can use then use the statement SET ROLE <rolename> to assume the privileges of the role, or SET ROLE ALL to assume all roles that have been assigned.

12.10.2.58.1 Synopsis

```
GrantRoleStmt ::=
  'GRANT' RolenameList 'TO' UsernameList

RolenameList ::=
  Rolename ( ',' Rolename )*

UsernameList ::=
  Username ( ',' Username )*
```

12.10.2.58.2 Examples

Create a new role for the analytics team, and a new user called jennifer:

```
$ mysql -uroot
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 37
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
  ↳ License 2.0) Community Edition, MySQL 5.7 compatible

Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
  ↳ .

affiliates. Other names may be trademarks of their respective
owners.

Type 'help;' or '\h' for help. Type '\c' to clear the current input
  ↳ statement.

mysql> CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

mysql> GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

mysql> CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

mysql> GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Note that by default jennifer needs to SET ROLE analyticsteam in order to be able to use the privileges associated with the role:

```
$ mysql -ujennifer
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 32
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
  ↳ License 2.0) Community Edition, MySQL 5.7 compatible

Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
  ↳ .

Oracle is a registered trademark of Oracle Corporation and/or its
affiliates. Other names may be trademarks of their respective
owners.
```

```

Type 'help;' or '\h' for help. Type '\c' to clear the current input
  ↪ statement.

mysql> SHOW GRANTS;
+-----+
| Grants for User          |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
2 rows in set (0.00 sec)

mysql> SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
mysql> SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW GRANTS;
+-----+
| Grants for User          |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT Select ON test.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
3 rows in set (0.00 sec)

mysql> SHOW TABLES IN test;
+-----+
| Tables_in_test |
+-----+
| t1              |
+-----+
1 row in set (0.00 sec)

```

The statement `SET DEFAULT ROLE` can be used to associated a role to `jennifer` so that she will not have to execute the statement `SET ROLE` in order to assume the privileges associated with the role:

```

$ mysql -uroot
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 34
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
  ↪ License 2.0) Community Edition, MySQL 5.7 compatible

```

```
Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
↪ .
```

Oracle is a registered trademark of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

```
Type 'help;' or '\h' for help. Type '\c' to clear the current input
↪ statement.
```

```
mysql> SET DEFAULT ROLE analyticsteam TO jennifer;
Query OK, 0 rows affected (0.02 sec)
```

```
$ mysql -ujennifer
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 35
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache

12.10.2.59 INSERT

This statement inserts new rows into a table.

12.10.2.59.1 Synopsis

```
InsertIntoStmt ::=
  'INSERT' TableOptimizerHints PriorityOpt IgnoreOptional IntoOpt
    ↪ TableName PartitionNameListOpt InsertValues OnDuplicateKeyUpdate

TableOptimizerHints ::=
  hintComment?

PriorityOpt ::=
  ( 'LOW_PRIORITY' | 'HIGH_PRIORITY' | 'DELAYED' )?

IgnoreOptional ::=
  'IGNORE'?

IntoOpt ::= 'INTO'?

TableName ::=
  Identifier ( '.' Identifier )?

PartitionNameListOpt ::=
  ( 'PARTITION' '(' Identifier ( ',' Identifier )* ')' )?
```

```
InsertValues ::=
    '(' ( ColumnNameListOpt ')' ( ValueSym ValuesList | SelectStmt | '('
        ↪ SelectStmt ')' | UnionStmt ) | SelectStmt ')' )
| ValueSym ValuesList
| SelectStmt
| UnionStmt
| 'SET' ColumnSetValue? ( ',' ColumnSetValue )*

OnDuplicateKeyUpdate ::=
    ( 'ON' 'DUPLICATE' 'KEY' 'UPDATE' AssignmentList )?
```

12.10.2.59.2 Examples

```
mysql> CREATE TABLE t1 (a INT);
Query OK, 0 rows affected (0.11 sec)

mysql> CREATE TABLE t2 LIKE t1;
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.02 sec)

mysql> INSERT INTO t1 (a) VALUES (1);
Query OK, 1 row affected (0.01 sec)

mysql> INSERT INTO t2 SELECT * FROM t1;
Query OK, 2 rows affected (0.01 sec)
Records: 2 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+-----+
| a    |
+-----+
|    1 |
|    1 |
+-----+
2 rows in set (0.00 sec)

mysql> SELECT * FROM t2;
+-----+

12.10.2.60 KILL TIDB

The statement KILL TIDB is used to terminate connections in TiDB.

12.10.2.60.1 Synopsis

```
KillStmt ::= KillOrKillTiDB ( 'CONNECTION' | 'QUERY' )? NUM
```

```
KillOrKillTiDB ::= 'KILL' 'TIDB'?
```

12.10.2.60.2 Examples

```
mysql> SHOW PROCESSLIST;
+---
↪ -----+-----+-----+-----+-----+-----+-----+-----+
↪
| Id | User | Host      | db  | Command | Time | State | Info          |
+---
↪ -----+-----+-----+-----+-----+-----+-----+-----+
↪
|  1 | root | 127.0.0.1 | test | Query   | 0 | 2    | SHOW PROCESSLIST |
|  2 | root | 127.0.0.1 |      | Sleep   | 4 | 2    |                |
+---
↪ -----+-----+-----+-----+-----+-----+-----+-----+
↪
2 rows in set (0.00 sec)
```

You can get the TiDB Server details of a session to be killed by querying the `INSTANCE` column of `INFORMATION_SCHEMA.CLUSTER_PROCESSLIST`:

```
SELECT ID, USER, INSTANCE, INFO FROM INFORMATION_SCHEMA.CLUSTER_PROCESSLIST
↪ ;
```

```
+---
↪ -----+-----+-----+-----+-----+-----+-----+-----+
↪
| ID | USER | INSTANCE | INFO |
+---
↪ -----+-----+-----+-----+-----+-----+-----+-----+
↪
| 1 | root | 127.0.0.1:10082 | SELECT ID, USER, INSTANCE, INFO FROM
↪ INFORMATION_SCHEMA.CLUSTER_PROCESSLIST |
| 2 | root | 127.0.0.1:10080 | |
+---
↪ -----+-----+-----+-----+-----+-----+-----+-----+
↪
2 rows in set (0.00 sec)
```

To execute the `KILL TIDB` statement, connect to the TiDB node where the session needs to be killed:

```
mysql -h 127.0.0.1 -P 10080 -u root -p
```

```
KILL TIDB 2;
Query OK, 0 rows affected (0.00 sec)
```

12.10.2.60.3 MySQL compatibility

- By design, KILL is not compatible with MySQL by default. This helps prevent against a case of a connection being terminated on the wrong TiDB server, because it is common to place multiple TiDB servers behind a load balancer.
- DO NOT set `compatible-kill-query = true` in your configuration file UNLESS you are certain that clients will be always connected to the same TiDB node. This is because pressing ctrl+c in the default MySQL client opens a new connection in which KILL is executed. If there are proxies in between, the new connection might be routed to a different TiDB node, which possibly kills a different session.
- The KILL TIDB statement is a TiDB extension. The feature of this statement is similar to the MySQL KILL [CONNECTION|QUERY] command and the MySQL command-line ctrl+c feature. It is safe to use KILL TIDB on the same TiDB node.

- [CLUSTER_PROCESSLIST](#)

12.10.2.61 LOAD DATA

The LOAD DATA statement batch loads data into a TiDB table.

12.10.2.61.1 Synopsis

```
LoadDataStmt ::=
  'LOAD' 'DATA' LocalOpt 'INFILE' stringLit DuplicateOpt 'INTO' 'TABLE'
    ↪ TableName CharsetOpt Fields Lines IgnoreLines
    ↪ ColumnNameOrUserVarListOptWithBrackets LoadDataSetSpecOpt
```

12.10.2.61.2 Parameters

LocalOpt

You can specify that the imported data file is located on the client or on the server by configuring the `LocalOpt` parameter. Currently, TiDB only supports data import from the client. Therefore, when importing data, set the value of `LocalOpt` to `Local`.

Fields and Lines

You can specify how to process the data format by configuring the `Fields` and `Lines` parameters.

- **FIELDS TERMINATED BY:** Specifies the separating character of each data.
- **FIELDS ENCLOSED BY:** Specifies the enclosing character of each data.
- **LINES TERMINATED BY:** Specifies the line terminator, if you want to end a line with a certain character.

Take the following data format as an example:

```
"bob","20","street 1"\r\n
"alice","33","street 1"\r\n
```

If you want to extract `bob`, `20`, and `street 1`, specify the separating character as `,`, and the enclosing character as `'\''`:

```
FIELDS TERMINATED BY ',' ENCLOSED BY '\'' LINES TERMINATED BY '\r\n'
```

If you do not specify the parameters above, the imported data is processed in the following way by default:

```
FIELDS TERMINATED BY '\t' ENCLOSED BY ''
LINES TERMINATED BY '\n'
```

IGNORE number LINES

You can ignore the first `number` lines of a file by configuring the `IGNORE number LINES` parameter. For example, if you configure `IGNORE 1 LINES`, the first line of a file is ignored.

In addition, TiDB currently only supports parsing the syntax of the `DuplicateOpt`, `CharsetOpt`, and `LoadDataSetSpecOpt` parameters.

12.10.2.61.3 Examples

```
CREATE TABLE trips (
  trip_id bigint NOT NULL PRIMARY KEY AUTO_INCREMENT,
  duration integer not null,
  start_date datetime,
  end_date datetime,
  start_station_number integer,
  start_station varchar(255),
  end_station_number integer,
  end_station varchar(255),
  bike_number varchar(255),
  member_type varchar(255)
);
```

```
Query OK, 0 rows affected (0.14 sec)
```

The following example imports data using `LOAD DATA`. Comma is specified as the separating character. The double quotation marks that enclose the data is ignored. The first line of the file is ignored.

If you see the error message `ERROR 1148 (42000): the used command is not allowed with this TiDB version`, refer to [ERROR 1148 \(42000\): the used command is not allowed with this TiDB version](#).

```
LOAD DATA LOCAL INFILE '/mnt/evo970/data-sets/bikeshare-data/2017Q4-
↳ capitalbikeshare-tripdata.csv' INTO TABLE trips FIELDS TERMINATED BY
↳ ',' ENCLOSED BY '\"' LINES TERMINATED BY '\r\n' IGNORE 1 LINES (
↳ duration, start_date, end_date, start_station_number, start_station,
↳ end_station_number, end_station, bike_number, member_type);
```

```
Query OK, 815264 rows affected (39.63 sec)
Records: 815264 Deleted: 0 Skipped: 0 Warnings: 0
```

`LOAD DATA` also supports using hexadecimal ASCII character expressions or binary ASCII character expressions as the parameters for `FIELDS ENCLOSED BY` and `FIELDS TERMINATED BY`. See the following example:

```
LOAD DATA LOCAL INFILE '/mnt/evo970/data-sets/bikeshare-data/2017Q4-
↳ capitalbikeshare-tripdata.csv' INTO TABLE trips FIELDS TERMINATED BY
↳ x'2c' ENCLOSED BY b'100010' LINES TERMINATED BY '\r\n' IGNORE 1 LINES
↳ (duration, start_date, end_date, start_station_number, start_station
↳ , end_station_number, end_station, bike_number, member_type);
```

In the above example, `x'2c'` is the hexadecimal representation of the `,` character and `b'100010'` is the binary representation of the `"` character.

12.10.2.61.4 MySQL compatibility

The syntax of this statement is compatible with MySQL except for the `LOAD DATA... REPLACE INTO` syntax [#24515](#). Any other syntax compatibility differences should be [reported via an issue](#) on GitHub.

Note:

- In earlier releases of TiDB, `LOAD DATA` committed every 20000 rows. By default, TiDB now commits all rows in one transaction. This can result in the error `ERROR 8004 (HY000)at line 1: Transaction is too large, size: 100000058` after upgrading from TiDB 4.0 or earlier versions. The recommended way to resolve this error is to increase the `txn-total-size-limit` value in your `tidb.toml` file. If you are unable to increase this limit, you can also restore the previous behavior by setting `tidb_dml_batch_size` to 20000.

- No matter how many rows are committed in a transaction, `LOAD DATA` is not rolled back by the `ROLLBACK` statement in an explicit transaction.
- The `LOAD DATA` statement is always executed in optimistic transaction mode, regardless of the TiDB transaction mode configuration.

12.10.2.61.5 See also

- [INSERT](#)

- [TiDB Optimistic Transaction Model](#)
- [TiDB Pessimistic Transaction Mode](#)
- [TiDB Lightning](#)

12.10.2.62 LOAD STATS

The `LOAD STATS` statement is used to load the statistics into TiDB.

12.10.2.62.1 Synopsis

```
LoadStatsStmt ::=  
  'LOAD' 'STATS' stringLit
```

12.10.2.62.2 Examples

You can access the address `http://${tidb-server-ip}:${tidb-server-status-port}↵ /stats/dump/${db_name}/${table_name}` to download the TiDB instance's statistics.

You can also use `LOAD STATS ${stats_path}` to load the specific statistics file.

The `${stats_path}` can be an absolute path or a relative path. If you use a relative path, the corresponding file is found starting from the path where `tidb-server` is started. Here is an example:

```
LOAD STATS '/tmp/stats.json';
```

```
Query OK, 0 rows affected (0.00 sec)
```

12.10.2.62.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.62.4 See also

- [Statistics](#)

12.10.2.63 LOCK TABLES and UNLOCK TABLES

Warning:

LOCK TABLES and UNLOCK TABLES are experimental features for the current version. It is not recommended to use it in the production environment.

TiDB enables client sessions to acquire table locks for the purpose of cooperating with other sessions for access to tables, or to prevent other sessions from modifying tables. A session can acquire or release locks only for itself. One session cannot acquire locks for another session or release locks held by another session.

LOCK TABLES acquires table locks for the current client session. If you have the LOCK ↪ TABLES and SELECT privileges for each object to be locked, you can acquire table locks for common tables.

UNLOCK TABLES explicitly releases any table locks held by the current session. LOCK ↪ TABLES implicitly releases all table locks held by the current session before acquiring new locks.

A table lock protects against reads or writes by other sessions. A session that holds a WRITE lock can perform table-level operations such as DROP TABLE or TRUNCATE TABLE.

Warning:

To enable table locks, you need to set `enable-table-lock` to `true` in the configuration files of all TiDB instances.

12.10.2.63.1 Synopsis

```

LockTablesDef
    ::= 'LOCK' ( 'TABLES' | 'TABLE' ) TableName LockType ( ',' TableName
        ↪ LockType)*

UnlockTablesDef
    ::= 'UNLOCK' 'TABLES'

LockType
    ::= 'READ' ('LOCAL')?
        | 'WRITE' ('LOCAL')?
    
```

12.10.2.63.2 Acquire table locks

You can acquire table locks within the current session by using the `LOCK TABLES` statement. The following lock types are available:

`READ` lock:

- The session that holds this lock can read the table, but cannot write it.
- Multiple sessions can acquire a `READ` lock from the same table at the same time.
- Other sessions can read the table without explicitly acquiring a `READ` lock.

The `READ LOCAL` lock is only for syntax compatibility with MySQL and is not supported.

`WRITE` lock:

- The session that holds this lock can read and write the table.
- Only the session that holds this lock can access the table. No other sessions can access it until the lock is released.

`WRITE LOCAL` lock:

- The session that holds this lock can read and write the table.
- Only the session that holds this lock can access the table. Other sessions can read the table, but cannot write it.

If the lock that the `LOCK TABLES` statement needs is held by another session, the `LOCK TABLES` statement must wait, and an error is returned upon the execution of this statement, for example:

```
> LOCK TABLES t1 READ;
ERROR 8020 (HY000): Table 't1' was locked in WRITE by server: f4799bcb-cad7
↳ -4285-8a6d-23d3555173f1_session: 2199023255959
```

The preceding error message indicates that the session with ID 2199023255959 in TiDB f4799bcb-cad7-4285-8a6d-23d3555173f1 already holds a `WRITE` lock on table `t1`. Therefore, the current session cannot acquire a `READ` lock on table `t1`.

You cannot acquire the same table lock multiple times in a single `LOCK TABLES` statement.

```
> LOCK TABLES t WRITE, t READ;
ERROR 1066 (42000): Not unique table/alias: 't'
```

12.10.2.63.3 Release table locks

When the table locks held by a session are released, they are all released at the same time. A session can release its locks explicitly or implicitly.

- A session can release its locks explicitly with `UNLOCK TABLES`.
- If a session issues a `LOCK TABLES` statement to acquire a lock while already holding locks, its existing locks are released implicitly before the new locks are acquired.

If the connection for a client session terminates, whether normally or abnormally, TiDB implicitly releases all table locks held by the session. If the client reconnects, the locks are no longer in effect. For this reason, it is not recommended to enable auto-reconnection on the client. If you enable auto-reconnection, the client is not notified when reconnection occurs, and all table locks or current transactions are lost. By contrast, with auto-reconnection disabled, if the connection drops, an error occurs when the next statement is issued. The client can detect the error and take appropriate action such as reacquiring the locks or redoing the transaction.

12.10.2.63.4 Table-locking restrictions and conditions

You can safely use `KILL` to terminate a session that holds a table lock.

You cannot acquire table locks on tables in the following databases:

- `INFORMATION_SCHEMA`
- `PERFORMANCE_SCHEMA`
- `METRICS_SCHEMA`
- `mysql`

12.10.2.63.5 MySQL compatibility

Table lock acquisition

- In TiDB, if session A has already held a table lock, an error is returned if session B attempts to write to the table. In MySQL, the write request of session B is blocked until session A releases the table lock, and requests for locking the table from other sessions are blocked until the current session releases the `WRITE` lock.
- In TiDB, if the lock that the `LOCK TABLES` statement needs is held by another session, the `LOCK TABLES` statement must wait, and an error is returned upon the execution of this statement. In MySQL, this statement is blocked until the lock is acquired.
- In TiDB, the `LOCK TABLES` statement is effective in the whole cluster. In MySQL, this statement is effective only in the current MySQL server, and is not compatible with the NDB cluster.

Table lock release

When a transaction is explicitly started in a TiDB session (for example, with the `BEGIN` statement), TiDB does not implicitly release the table locks held by the session; but MySQL does.

12.10.2.64 MODIFY COLUMN

The ALTER TABLE... MODIFY COLUMN statement modifies a column on an existing table. The modification can include changing the data type and attributes. To rename at the same time, use the **CHANGE COLUMN** statement instead.

Since v5.1.0, TiDB has supported changes of data types for Reorg data, including but not limited to:

- Changing VARCHAR to BIGINT
- Modifying the DECIMAL precision
- Compressing the length of VARCHAR(10) to VARCHAR(5)

12.10.2.64.1 Synopsis

```
AlterTableStmt ::=
  'ALTER' IgnoreOptional 'TABLE' TableName ( AlterTableSpecListOpt
    ↪ AlterTablePartitionOpt | 'ANALYZE' 'PARTITION' PartitionNameList (
    ↪ 'INDEX' IndexNameList )? AnalyzeOptionListOpt )

AlterTableSpec ::=
  TableOptionList
| 'SET' 'TIFLASH' 'REPLICA' LengthNum LocationLabelList
| 'CONVERT' 'TO' CharsetKw ( CharsetName | 'DEFAULT' ) OptCollate

| 'RENAME' ( ( 'COLUMN' | KeyOrIndex ) Identifier 'TO' Identifier | ( 'TO'
↳ | '='? | 'AS' ) TableName )
| LockClause
| AlgorithmClause
| 'FORCE'
| ( 'WITH' | 'WITHOUT' ) 'VALIDATION'
| 'SECONDARY_LOAD'
| 'SECONDARY_UNLOAD'

ColumnKeywordOpt ::= 'COLUMN'?

ColumnDef ::=
    ColumnName ( Type | 'SERIAL' ) ColumnOptionListOpt

ColumnPosition ::=
    ( 'FIRST' | 'AFTER' ColumnName )?

```

12.10.2.64.2 Examples

Meta-Only Change

```
CREATE TABLE t1 (id int not null primary key AUTO_INCREMENT, col1 INT);
```

```
Query OK, 0 rows affected (0.11 sec)
```

```
INSERT INTO t1 (col1) VALUES (1),(2),(3),(4),(5);
```

```
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0
```

```
ALTER TABLE t1 MODIFY col1 BIGINT;
```

```
Query OK, 0 rows affected (0.09 sec)
```

```
SHOW CREATE TABLE t1\G;
```

```

***** 1. row *****
      Table: t1
Create Table: CREATE TABLE `t1` (
  `id` int(11) NOT NULL AUTO_INCREMENT,
  `col1` bigint(20) DEFAULT NULL,

```

```

PRIMARY KEY (`id`)
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin AUTO_INCREMENT
  ↳ =30001
1 row in set (0.00 sec)

```

Reorg-Data Change

```
CREATE TABLE t1 (id int not null primary key AUTO_INCREMENT, col1 INT);
```

```
Query OK, 0 rows affected (0.11 sec)
```

```
INSERT INTO t1 (col1) VALUES (12345),(67890);
```

```
Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0
```

```
ALTER TABLE t1 MODIFY col1 VARCHAR(5);
```

```
Query OK, 0 rows affected (2.52 sec)
```

```
SHOW CREATE TABLE t1\G;
```

```

***** 1. row *****
      Table: t1
CREATE TABLE `t1` (
  `id` int(11) NOT NULL AUTO_INCREMENT,
  `col1` varchar(5) DEFAULT NULL,
  PRIMARY KEY (`id`) /*T![clustered_index] CLUSTERED */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin AUTO_INCREMENT
  ↳ =30001
1 row in set (0.00 sec)

```

Note:

- TiDB returns an error when the changed data type conflicts with an existing data row. In the above example, TiDB returns the following error:

```

alter table t1 modify column col1 varchar(4); ERROR 1406
↳ (22001): Data Too Long, field len 4, data len 5

```

- Due to the compatibility with the Async Commit feature, the DDL statement waits for a period of time (about 2.5s) before starting to process into Reorg Data.

```
Query OK, 0 rows affected (2.52 sec)
```

12.10.2.64.3 MySQL compatibility

- Does not support modifying multiple columns using a single ALTER TABLE statement. For example:

```
ALTER TABLE t1 MODIFY col1 BIGINT, MODIFY id BIGINT NOT NULL;  
ERROR 1105 (HY000): Unsupported multi schema change
```

- Does not support modifying the Reorg-Data types on the primary key columns but supports modifying the Meta-Only types. For example:

```
CREATE TABLE t (a int primary key);  
ALTER TABLE t MODIFY COLUMN a VARCHAR(10);  
ERROR 8200 (HY000): Unsupported modify column: column has primary key  
↪ flag
```

```
CREATE TABLE t (a int primary key);  
ALTER TABLE t MODIFY COLUMN a bigint;  
Query OK, 0 rows affected (0.01 sec)
```

- Does not support modifying the column types on generated columns. For example:

```
CREATE TABLE t (a INT, b INT as (a+1));  
ALTER TABLE t MODIFY COLUMN b VARCHAR(10);  
ERROR 8200 (HY000): Unsupported modify column: column is generated
```

- Does not support modifying the column types on the partitioned tables. For example:

```
CREATE TABLE t (c1 INT, c2 INT, c3 INT) partition by range columns(c1)  
↪ ( partition p0 values less than (10), partition p1 values less  
↪ than (maxvalue));  
ALTER TABLE t MODIFY COLUMN c1 DATETIME;  
ERROR 8200 (HY000): Unsupported modify column: table is partition  
↪ table
```

- Does not support modifying some data types (for example, some TIME types, Bit, Set, Enum, JSON) are not supported due to some compatibility issues of the cast function's behavior between TiDB and MySQL.

```
CREATE TABLE t (a DECIMAL(13, 7));
ALTER TABLE t MODIFY COLUMN a DATETIME;
ERROR 8200 (HY000): Unsupported modify column: change from original
↪ type decimal(13,7) to datetime is currently unsupported yet
```

12.10.2.65 PREPARE

The PREPARE statement provides an SQL interface to server-side prepared statements.

12.10.2.65.1 Synopsis

```
PreparedStmt ::=
  'PREPARE' Identifier 'FROM' PrepareSQL

PrepareSQL ::=
  stringLit
| UserVariable
```

12.10.2.65.2 Examples

```
mysql> PREPARE mystmt FROM 'SELECT ? as num FROM DUAL';
Query OK, 0 rows affected (0.00 sec)

mysql> SET @number = 5;
Query OK, 0 rows affected (0.00 sec)

mysql> EXECUTE mystmt USING @number;
+-----+
| num |
+-----+
| 5   |
+-----+
1 row in set (0.00 sec)

mysql> DEALLOCATE PREPARE mystmt;
```

```
Query OK, 0 rows affected (0.00 sec)
```

12.10.2.65.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

- [DEALLOCATE](#)

12.10.2.66 RECOVER TABLE

RECOVER TABLE is used to recover a deleted table and the data on it within the GC (Garbage Collection) life time after the DROP TABLE statement is executed.

12.10.2.66.1 Syntax

```
RECOVER TABLE table_name;
```

```
RECOVER TABLE BY JOB JOB_ID;
```

12.10.2.66.2 Synopsis

```
RecoverTableStmt ::=
  'RECOVER' 'TABLE' ( 'BY' 'JOB' Int64Num | TableName Int64Num? )

TableName ::=
  Identifier ( '.' Identifier )?

Int64Num ::= NUM

NUM ::= intLit
```

Note:

- If a table is deleted and the GC lifetime is out, the table cannot be recovered with RECOVER TABLE. Execution of RECOVER TABLE in this scenario returns an error like: `snapshot is older than GC safe point`
↪ 2019-07-10 13:45:57 +0800 CST.

- If the TiDB version is 3.0.0 or later, it is not recommended for you to use `RECOVER TABLE` when TiDB Binlog is used.
- `RECOVER TABLE` is supported in the Binlog version 3.0.1, so you can use `RECOVER TABLE` in the following three situations:
 - Binlog version is 3.0.1 or later.
 - TiDB 3.0 is used both in the upstream cluster and the downstream cluster.
 - The GC life time of the secondary cluster must be longer than that of the primary cluster. However, as latency occurs during data replication between upstream and downstream databases, data recovery might fail in the downstream.

Troubleshoot errors during TiDB Binlog replication

When you use `RECOVER TABLE` in the upstream TiDB during TiDB Binlog replication, TiDB Binlog might be interrupted in the following three situations:

- The downstream database does not support the `RECOVER TABLE` statement. An error instance: `check the manual that corresponds to your MySQL server version ↪ for the right syntax to use near 'RECOVER TABLE table_name'`.
- The GC life time is not consistent between the upstream database and the downstream database. An error instance: `snapshot is older than GC safe point 2019-07-10 ↪ 13:45:57 +0800 CST`.
- Latency occurs during replication between upstream and downstream databases. An error instance: `snapshot is older than GC safe point 2019-07-10 13:45:57 ↪ +0800 CST`.

For the above three situations, you can resume data replication from TiDB Binlog with a [full import of the deleted table](#).

12.10.2.66.3 Examples

- Recover the deleted table according to the table name.

```
DROP TABLE t;
```

```
RECOVER TABLE t;
```

This method searches the recent DDL job history and locates the first DDL operation of the `DROP TABLE` type, and then recovers the deleted table with the name identical to the one table name specified in the `RECOVER TABLE` statement.

- Recover the deleted table according to the table's DDL JOB ID used.

Suppose that you had deleted the table `t` and created another `t`, and again you deleted the newly created `t`. Then, if you want to recover the `t` deleted in the first place, you must use the method that specifies the DDL JOB ID.

```
DROP TABLE t;
```

```
ADMIN SHOW DDL JOBS 1;
```

The second statement above is used to search for the table's DDL JOB ID to delete `t`. In the following example, the ID is 53.

JOB_ID	DB_NAME	TABLE_NAME	JOB_TYPE	SCHEMA_STATE	SCHEMA_ID
TABLE_ID	ROW_COUNT	START_TIME	STATE		
53	test		drop table	none	1
	0	2019-07-10 13:23:18.277 +0800 CST	syncd		41

```
RECOVER TABLE BY JOB 53;
```

This method recovers the deleted table via the DDL JOB ID. If the corresponding DDL job is not of the DROP TABLE type, an error occurs.

12.10.2.66.4 Implementation principle

When deleting a table, TiDB only deletes the table metadata, and writes the table data (row data and index data) to be deleted to the `mysql.gc_delete_range` table. The GC Worker in the TiDB background periodically removes from the `mysql.gc_delete_range` table the keys that exceed the GC life time.

Therefore, to recover a table, you only need to recover the table metadata and delete the corresponding row record in the `mysql.gc_delete_range` table before the GC Worker deletes the table data. You can use a snapshot read of TiDB to recover the table metadata. Refer to [Read Historical Data](#) for details.

Table recovery is done by TiDB obtaining the table metadata through snapshot read, and then going through the process of table creation similar to CREATE TABLE. Therefore, RECOVER TABLE itself is, in essence, a kind of DDL operation.

12.10.2.66.5 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.67 RENAME USER

RENAME USER is used to rename an existing user.

12.10.2.67.1 Synopsis

```
RenameUserStmt ::=
  'RENAME' 'USER' UserToUser ( ',' UserToUser )*
UserToUser ::=
  Username 'TO' Username
Username ::=
  StringName ('@' StringName | singleAtIdentifier)? | 'CURRENT_USER'
  ↪ OptionalBraces
```

12.10.2.67.2 Examples

```
CREATE USER 'newuser' IDENTIFIED BY 'mypassword';
```

Query OK, 1 row affected (0.02 sec)

```
SHOW GRANTS FOR 'newuser';
```

```
+-----+
| Grants for newuser@%          |
+-----+
| GRANT USAGE ON *.* TO 'newuser'@'%' |
+-----+
1 row in set (0.00 sec)
```

```
RENAME USER 'newuser' TO 'testuser';
```

Query OK, 0 rows affected (0.08 sec)

```
SHOW GRANTS FOR 'testuser';
```

```
+-----+
| Grants for testuser@%         |
+-----+
| GRANT USAGE ON *.* TO 'testuser'@'%' |
+-----+
1 row in set (0.00 sec)
```

```
SHOW GRANTS FOR 'newuser';
```

```
ERROR 1141 (42000): There is no such grant defined for user 'newuser' on
  ↪ host '%'
```

12.10.2.67.3 MySQL compatibility

RENAME USER is expected to be fully compatible with MySQL. If you find any compatibility difference, submit a GitHub [issue](#).

- [CREATE USER](#)
- [SHOW GRANTS](#)
- [DROP USER](#)

12.10.2.68 RENAME INDEX

The statement ALTER TABLE .. RENAME INDEX renames an existing index to a new name. This operation is instant in TiDB, and requires only a meta data change.

12.10.2.68.1 Synopsis

```
AlterTableStmt ::=
  'ALTER' IgnoreOptional 'TABLE' TableName ( AlterTableSpecListOpt
    ↪ AlterTablePartitionOpt | 'ANALYZE' 'PARTITION' PartitionNameList (
    ↪ 'INDEX' IndexNameList )? AnalyzeOptionListOpt )

KeyOrIndex ::=
  'KEY'
| 'INDEX'
```

12.10.2.68.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
  ↪ NOT NULL, INDEX col1 (c1));
Query OK, 0 rows affected (0.11 sec)

mysql> SHOW CREATE TABLE t1\G
***** 1. row *****
      Table: t1
Create Table: CREATE TABLE `t1` (
  `id` int(11) NOT NULL AUTO_INCREMENT,
  `c1` int(11) NOT NULL,
  PRIMARY KEY (`id`),
  KEY `col1` (`c1`)
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
1 row in set (0.00 sec)

mysql> ALTER TABLE t1 RENAME INDEX col1 TO c1;
```

```
Query OK, 0 rows affected (0.09 sec)
```

```
mysql> SHOW CREATE TABLE t1\G
***** 1. row *****
      Table: t1
Create Table: CREATE TABLE `t1` (
  `id` int(11) NOT NULL AUTO_INCREMENT,
  `c1` int(11) NOT NULL,
  PRIMARY KEY (`id`),
  KEY `c1` (`c1`)
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
1 row in set (0.00 sec)
```

12.10.2.68.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.69 RENAME TABLE

This statement renames an existing table to a new name.

12.10.2.69.1 Synopsis

```
RenameTableStmt ::=
  'RENAME' 'TABLE' TableToTable ( ',' TableToTable )*

TableToTable ::=
  TableName 'TO' TableName
```

12.10.2.69.2 Examples

```
mysql> CREATE TABLE t1 (a int);
Query OK, 0 rows affected (0.12 sec)

mysql> SHOW TABLES;
```

```

+-----+
| Tables_in_test |
+-----+
| t1             |
+-----+
1 row in set (0.00 sec)

mysql> RENAME TABLE t1 TO t2;
Query OK, 0 rows affected (0.08 sec)

mysql> SHOW TABLES;
+-----+
| Tables_in_test |
+-----+
| t2             |
+-----+
1 row in set (0.00 sec)

```

12.10.2.69.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.70 REPLACE

The REPLACE statement is semantically a combined DELETE+INSERT statement. It can be used to simplify application code.

12.10.2.70.1 Synopsis

```

ReplaceIntoStmt ::=
  'REPLACE' PriorityOpt IntoOpt TableName PartitionNameListOpt
  ↔ InsertValues

PriorityOpt ::=
  ( 'LOW_PRIORITY' | 'HIGH_PRIORITY' | 'DELAYED' )?

IntoOpt ::= 'INTO'?

```

```

TableName ::=
    Identifier ( '.' Identifier )?

PartitionNameListOpt ::=
    ( 'PARTITION' '(' Identifier ( ',' Identifier )* ')' )?

InsertValues ::=
    '(' ( ColumnNameListOpt ')' ( ValueSym ValuesList | SelectStmt | '('
        ↪ SelectStmt ')' | UnionStmt ) | SelectStmt ')' )
| ValueSym ValuesList
| SelectStmt
| UnionStmt
| 'SET' ColumnSetValue? ( ',' ColumnSetValue )*

```

12.10.2.70.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
↪ NOT NULL);
```

Query OK, 0 rows affected (0.12 sec)

```
mysql> INSERT INTO t1 (c1) VALUES (1), (2), (3);
```

Query OK, 3 rows affected (0.02 sec)

Records: 3 Duplicates: 0 Warnings: 0

```
mysql> SELECT * FROM t1;
```

```
+-----+-----+
```

```
| id | c1 |
```

```
+-----+-----+
```

```
| 1 | 1 |
```

```
| 2 | 2 |
```

```
| 3 | 3 |
```

```
+-----+-----+
```

3 rows in set (0.00 sec)

```
mysql> REPLACE INTO t1 (id, c1) VALUES(3, 99);
```

Query OK, 2 rows affected (0.01 sec)

```
mysql> SELECT * FROM t1;
```

```
+-----+-----+
```

```
| id | c1 |
```

```
+-----+-----+
```

```
| 1 | 1 |
```

```
| 2 | 2 |
```

```
| 3 | 99 |  
+-----+  
3 rows in set (0.00 sec)
```

12.10.2.70.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.70.4 See also

- [DELETE](#)

- [UPDATE](#)

12.10.2.71 RESTORE

This statement performs a distributed restore from a backup archive previously produced by a [BACKUP statement](#).

Warning:

This feature is experimental. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an [issue](#) on GitHub.

The **RESTORE** statement uses the same engine as the [BR tool](#), except that the restore process is driven by TiDB itself rather than a separate BR tool. All benefits and caveats of BR also apply here. In particular, **RESTORE is currently not ACID-compliant**. Before running **RESTORE**, ensure that the following requirements are met:

- The cluster is “offline”, and the current TiDB session is the only active SQL connection to access all tables being restored.
- When a full restore is being performed, the tables being restored should not already exist, because existing data might be overridden and causes inconsistency between the data and indices.
- When an incremental restore is being performed, the tables should be at the exact same state as the `LAST_BACKUP` timestamp when the backup is created.

Running `RESTORE` requires either the `RESTORE_ADMIN` or `SUPER` privilege. Additionally, both the TiDB node executing the restore and all TiKV nodes in the cluster must have read permission from the destination.

The `RESTORE` statement is blocking, and will finish only after the entire restore task is finished, failed, or canceled. A long-lasting connection should be prepared for running `RESTORE`. The task can be canceled using the `KILL TIDB QUERY` statement.

Only one `BACKUP` and `RESTORE` task can be executed at a time. If a `BACKUP` or `RESTORE` task is already running on the same TiDB server, the new `RESTORE` execution will wait until all previous tasks are done.

`RESTORE` can only be used with “tikv” storage engine. Using `RESTORE` with the “unistore” engine will fail.

12.10.2.71.1 Synopsis

```
RestoreStmt ::=
    "RESTORE" BRIETables "FROM" stringLit RestoreOption*

BRIETables ::=
    "DATABASE" ( '*' | DBName (',' DBName)* )
| "TABLE" TableNameList

RestoreOption ::=
    "RATE_LIMIT" '='? LengthNum "MB" '/' "SECOND"
| "CONCURRENCY" '='? LengthNum
| "CHECKSUM" '='? Boolean
| "SEND_CREDENTIALS_TO_TIKV" '='? Boolean

Boolean ::=
    NUM | "TRUE" | "FALSE"
```

12.10.2.71.2 Examples

Restore from backup archive

```
RESTORE DATABASE * FROM 'local:///mnt/backup/2020/04/';
```

```
+--
  ↪ -----+-----+-----+-----+
  ↪
| Destination          | Size      | BackupTS | Queue Time      |
  ↪ Execution Time    |
+--
  ↪ -----+-----+-----+-----+
  ↪
```

```

| local:///mnt/backup/2020/04/ | 248665063 | 0 | 2020-04-21 17:16:55 |
  ↳ 2020-04-21 17:16:55 |
+--
  ↳ -----+-----+-----+-----+
  ↳
1 row in set (28.961 sec)

```

In the example above, all data is restored from a backup archive at the local filesystem. The data is read as SST files from the `/mnt/backup/2020/04/` directories distributed among all TiDB and TiKV nodes.

The first row of the result above is described as follows:

Column	Description
<code>Destination</code> ↳	The destination URL to read from
<code>Size</code>	The total size of the backup archive, in bytes
<code>BackupTS</code>	(not used)
<code>Queue</code> ↳ <code>Time</code>	The timestamp (in current time zone) when the RESTORE task was queued.
<code>Execution</code> ↳ <code>Time</code>	The timestamp (in current time zone) when the RESTORE task starts to run.

Partial restore

You can specify which databases or tables to restore. If some databases or tables are missing from the backup archive, they will be ignored, and thus RESTORE would complete

without doing anything.

```
RESTORE DATABASE `test` FROM 'local:///mnt/backup/2020/04/';
```

```
RESTORE TABLE `test`.`sbtest01`, `test`.`sbtest02` FROM 'local:///mnt/  
↳ backup/2020/04/';
```

External storages

BR supports restoring data from S3 or GCS:

```
RESTORE DATABASE * FROM 's3://example-bucket-2020/backup-05/?region=us-west  
↳ -2';
```

The URL syntax is further explained in [External Storages](#).

When running on cloud environment where credentials should not be distributed, set the `SEND_CREDENTIALS_TO_TIKV` option to `FALSE`:

```
RESTORE DATABASE * FROM 's3://example-bucket-2020/backup-05/?region=us-west  
↳ -2'  
SEND_CREDENTIALS_TO_TIKV = FALSE;
```

Performance fine-tuning

Use `RATE_LIMIT` to limit the average download speed per TiKV node to reduce network bandwidth.

By default, TiDB node would run 128 restore threads. This value can be adjusted with the `CONCURRENCY` option.

Before restore is completed, `RESTORE` would perform a checksum against the data from the archive to verify correctness. This step can be disabled with the `CHECKSUM` option if you are confident that this is unnecessary.

```
RESTORE DATABASE * FROM 's3://example-bucket-2020/backup-06/'  
RATE_LIMIT = 120 MB/SECOND  
CONCURRENCY = 64  
CHECKSUM = FALSE;
```

Incremental restore

There is no special syntax to perform incremental restore. TiDB will recognize whether the backup archive is full or incremental and take appropriate action. You only need to apply each incremental restore in correct order.

For instance, if a backup task is created as follows:

```
BACKUP DATABASE `test` TO 's3://example-bucket/full-backup' SNAPSHOT =  
↳ 413612900352000;  
BACKUP DATABASE `test` TO 's3://example-bucket/inc-backup-1' SNAPSHOT =  
↳ 414971854848000 LAST_BACKUP = 413612900352000;
```

```
BACKUP DATABASE `test` TO 's3://example-bucket/inc-backup-2' SNAPSHOT =  
  ↪ 416353458585600 LAST_BACKUP = 414971854848000;
```

then the same order should be applied in the restore:

```
RESTORE DATABASE * FROM 's3://example-bucket/full-backup';  
RESTORE DATABASE * FROM 's3://example-bucket/inc-backup-1';  
RESTORE DATABASE * FROM 's3://example-bucket/inc-backup-2';
```

12.10.2.71.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.72 REVOKE <privileges>

This statement removes privileges from an existing user. Executing this statement requires the GRANT OPTION privilege and all privileges you revoke.

12.10.2.72.1 Synopsis

```
GrantStmt ::=  
  'GRANT' PrivElemList 'ON' ObjectType PrivLevel 'TO' UserSpecList  
  ↪ RequireClauseOpt WithGrantOptionOpt  
  
PrivElemList ::=  
  PrivElem ( ',' PrivElem ) *  
  
PrivElem ::=  
  PrivType ( '(' ColumnNameList ')' ) ?  
  
PrivType ::=  
  'ALL' 'PRIVILEGES' ?  
| 'ALTER' 'ROUTINE' ?  
| 'CREATE' ( 'USER' | 'TEMPORARY' 'TABLES' | 'VIEW' | 'ROLE' | 'ROUTINE' )  
  ↪ ?  
| 'TRIGGER'  
| 'DELETE'  
| 'DROP' 'ROLE' ?  
| 'PROCESS'  
| 'EXECUTE'
```

```

| 'INDEX'
| 'INSERT'
| 'SELECT'
| 'SUPER'
| 'SHOW' ( 'DATABASES' | 'VIEW' )
| 'UPDATE'
| 'GRANT' 'OPTION'
| 'REFERENCES'
| 'REPLICATION' ( 'SLAVE' | 'CLIENT' )
| 'USAGE'
| 'RELOAD'
| 'FILE'
| 'CONFIG'
| 'LOCK' 'TABLES'
| 'EVENT'
| 'SHUTDOWN'

ObjectType ::=
    'TABLE'?

PrivLevel ::=
    '*' ( '.' '*' )?
| Identifier ( '.' ( '*' | Identifier ) )?

UserSpecList ::=
    UserSpec ( ',' UserSpec )*

```

12.10.2.72.2 Examples

```

mysql> CREATE USER 'newuser' IDENTIFIED BY 'mypassword';
Query OK, 1 row affected (0.02 sec)

mysql> GRANT ALL ON test.* TO 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-----+-----+
| Grants for newuser@%          |
+-----+-----+
| GRANT USAGE ON *.* TO 'newuser'@%'          |
| GRANT ALL PRIVILEGES ON test.* TO 'newuser'@%' |
+-----+-----+
2 rows in set (0.00 sec)

```

```
mysql> REVOKE ALL ON test.* FROM 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-----+
| Grants for newuser@%          |
+-----+
| GRANT USAGE ON *.* TO 'newuser'@'%' |
+-----+
1 row in set (0.00 sec)

mysql> DROP USER 'newuser';
Query OK, 0 rows affected (0.14 sec)

mysql> SHOW GRANTS FOR 'newuser';
ERROR 1141 (42000): There is no such grant defined for user 'newuser' on
↪ host '%'
```

12.10.2.72.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.72.4 See also

- [GRANT <privileges>](#)
- [SHOW GRANTS](#)

12.10.2.73 REVOKE <role>

This statement removes a previously assigned role from a specified user (or list of users).

12.10.2.73.1 Synopsis

```
RevokeRoleStmt ::=
    'REVOKE' RolenameList 'FROM' UsernameList

RolenameList ::=
    Rolename ( ',' Rolename )*

UsernameList ::=
    Username ( ',' Username )*
```

12.10.2.73.2 Examples

Create a new role for the analytics team, and a new user called jennifer:

```
$ mysql -uroot
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 37
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
  ↪ License 2.0) Community Edition, MySQL 5.7 compatible

Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
  ↪ .

Oracle is a registered trademark of Oracle Corporation and/or its
affiliates. Other names may be trademarks of their respective
owners.

Type 'help;' or '\h' for help. Type '\c' to clear the current input
  ↪ statement.

mysql> CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

mysql> GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

mysql> CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

mysql> GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Note that by default jennifer needs to SET ROLE analyticsteam in order to be able to use the privileges associated with the role:

```
$ mysql -ujennifer
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 32
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
  ↪ License 2.0) Community Edition, MySQL 5.7 compatible

Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
  ↪ .

Oracle is a registered trademark of Oracle Corporation and/or its
affiliates. Other names may be trademarks of their respective
owners.
```

```

Type 'help;' or '\h' for help. Type '\c' to clear the current input
  ↪ statement.

mysql> SHOW GRANTS;
+-----+
| Grants for User          |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
2 rows in set (0.00 sec)

mysql> SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
mysql> SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW GRANTS;
+-----+
| Grants for User          |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT Select ON test.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
3 rows in set (0.00 sec)

mysql> SHOW TABLES IN test;
+-----+
| Tables_in_test |
+-----+
| t1              |
+-----+
1 row in set (0.00 sec)

```

The statement `SET DEFAULT ROLE` can be used to associated a role to `jennifer` so that she will not have to execute the statement `SET ROLE` in order to assume the privileges associated with the role:

```

$ mysql -uroot
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 34
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
  ↪ License 2.0) Community Edition, MySQL 5.7 compatible

```

```
Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
↪ .
```

Oracle is a registered trademark of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

```
Type 'help;' or '\h' for help. Type '\c' to clear the current input
↪ statement.
```

```
mysql> SET DEFAULT ROLE analyticsteam TO jennifer;
Query OK, 0 rows affected (0.02 sec)
```

```
$ mysql -ujennifer
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 35
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
↪ License 2.0) Community Edition, MySQL 5.7 compatible
```

```
Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
↪ .
```

Oracle is a registered trademark of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

```
Type 'help;' or '\h' for help. Type '\c' to clear the current input
↪ statement.
```

```
mysql> SHOW GRANTS;
```

```
+-----+
| Grants for User          |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@%' |
| GRANT Select ON test.* TO 'jennifer'@%' |
| GRANT 'analyticsteam'@%' TO 'jennifer'@%' |
+-----+
```

```
3 rows in set (0.00 sec)
```

```
mysql> SHOW TABLES IN test;
```

```
+-----+
| Tables_in_test |
+-----+
| t1              |
```

```
+-----+  
1 row in set (0.00 sec)
```

Revoke the role of analyticsteam from jennifer:

```
$ mysql -uroot  
Welcome to the MySQL monitor. Commands end with ; or \g.

| GRANT USAGE ON *.* TO 'jennifer'@%' |
```

```
+-----+
1 row in set (0.00 sec)
```

12.10.2.73.3 MySQL compatibility

This statement is understood to be fully compatible with roles, which are a feature of MySQL 8.0. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.73.4 See also

- [CREATE ROLE](#)
- [DROP ROLE](#)
- [GRANT <role>](#)
- [SET ROLE](#)
- [SET DEFAULT ROLE](#)
- [Role-Based Access Control](#)

12.10.2.74 ROLLBACK

This statement reverts all changes in the current transaction inside of TiDB. It is the opposite of a COMMIT statement.

12.10.2.74.1 Synopsis

```
RollbackStmt ::=
  'ROLLBACK' CompletionTypeWithinTransaction?

CompletionTypeWithinTransaction ::=
  'AND' ( 'CHAIN' ( 'NO' 'RELEASE' )? | 'NO' 'CHAIN' ( 'NO'? 'RELEASE' )?
    ↔ )
| 'NO'? 'RELEASE'
```

12.10.2.74.2 Examples

```
mysql> CREATE TABLE t1 (a INT NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.12 sec)

mysql> BEGIN;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.00 sec)

mysql> ROLLBACK;
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
mysql> SELECT * FROM t1;
Empty set (0.01 sec)
```

12.10.2.74.3 MySQL compatibility

- TiDB does not support savepoints or the syntax `ROLLBACK TO SAVEPOINT`.
- TiDB parses but ignores the syntax `ROLLBACK AND [NO] RELEASE`. This functionality is used in MySQL to disconnect the client session immediately after rolling back the transaction. In TiDB, it is recommended to instead use the `mysql_close()` functionality of your client driver.
- TiDB parses but ignores the syntax `ROLLBACK AND [NO] CHAIN`. This functionality is used in MySQL to immediately start a new transaction with the same isolation level while the current transaction is being rolled back. In TiDB, it is recommended to instead start a new transaction.

WindowClauseOptional

Figure 250: WindowClauseOptional

12.10.2.75.2 Description of the syntax elements

Syntax Element	Description
<code>TableOptimizerHints</code>	This is the hint to control the behavior of TiDB's optimizer. For more information, refer to Optimizer Hints .
<code>ALL, DISTINCT, DISTINCTROW</code>	The <code>ALL</code> , <code>DISTINCT</code> / <code>DISTINCTROW</code> modifiers specify whether duplicate rows should be returned. <code>ALL</code> (the default) specifies that all matching rows should be returned.
<code>HIGH_PRIORITY</code>	<code>HIGH_PRIORITY</code> gives the current statement higher priority than other statements.
<code>SQL_CALC_FOUND_ROWS</code>	TiDB does not support this feature, and will return an error unless <code>tidb_enable_noop_functions=1</code> is set.
<code>SQL_CACHE, SQL_NO_CACHE</code>	<code>SQL_CACHE</code> and <code>SQL_NO_CACHE</code> are used to control whether to cache the request results to the <code>BlockCache</code> of TiKV (RocksDB). For a one-time query on a large amount of data, such as the <code>count(*)</code> query, it is recommended to fill in <code>SQL_NO_CACHE</code> to avoid flushing the hot user data in <code>BlockCache</code> .
<code>STRAIGHT_JOIN</code>	<code>STRAIGHT_JOIN</code> forces the optimizer to do a union query in the order of the tables used in the <code>FROM</code> clause. When the optimizer chooses a join order that is not good, you can use this syntax to speed up the execution of the query.
<code>select_expr</code>	Each <code>select_expr</code> indicates a column to retrieve, including the column names and expressions. <code>*</code> represents all the columns.
<code>FROM</code> ↪ <code>table_references</code>	The <code>FROM table_references</code> clause indicates the table (such as <code>select * from t;</code>), or tables (such as <code>select * from t1 join t2;</code>) or even 0 tables (such as <code>select 1+1 from dual;</code> which is equivalent to <code>select 1+1;</code>) from which to retrieve rows.
<code>WHERE</code> ↪ <code>where_condition</code>	The <code>WHERE</code> clause, if given, indicates the condition or conditions that rows must satisfy to be selected. The result contains only the data that meets the condition(s).
<code>GROUP BY</code> <code>HAVING</code> ↪ <code>where_condition</code>	The <code>GROUP BY</code> statement is used to group the result-set. The <code>HAVING</code> clause and the <code>WHERE</code> clause are both used to filter the results. The <code>HAVING</code> clause filters the results of <code>GROUP BY</code> , while the <code>WHERE</code> clause filter the results before aggregation.
<code>ORDER BY</code>	The <code>ORDER BY</code> clause is used to sort the data in ascending or descending order, based on columns, expressions or items in the <code>select_expr</code> list.

Syntax Element	Description
LIMIT	The <code>LIMIT</code> clause can be used to constrain the number of rows. <code>LIMIT</code> takes one or two numeric arguments. With one argument, the argument specifies the maximum number of rows to return, the first row to return is the first row of the table by default; with two arguments, the first argument specifies the offset of the first row to return, and the second specifies the maximum number of rows to return. TiDB also supports the <code>FETCH FIRST/NEXT n ROW/ROWS ONLY</code> syntax, which has the same effect as <code>LIMIT n</code> . You can omit <code>n</code> in this syntax and its effect is the same as <code>LIMIT 1</code> .
Window ↪ <code>window_definition</code>	This is the syntax for window function, which is usually used to do some analytical computation. For more information, refer to Window Function .
FOR UPDATE	The <code>SELECT FOR UPDATE</code> clause locks all the data in the result sets to detect concurrent updates from other transactions. Data that match the query conditions but do not exist in the result sets are not read-locked, such as the row data written by other transactions after the current transaction is started. TiDB uses the Optimistic Transaction Model . The transaction conflicts are not detected in the statement execution phase. Therefore, the current transaction does not block other transactions from executing <code>UPDATE</code> , <code>DELETE</code> or <code>SELECT FOR UPDATE</code> like other databases such as PostgreSQL. In the committing phase, the rows read by <code>SELECT FOR UPDATE</code> are committed in two phases, which means they can also join the conflict detection. If write conflicts occur, the commit fails for all transactions that include the <code>SELECT FOR UPDATE</code> clause. If no conflict is detected, the commit succeeds. And a new version is generated for the locked rows, so that write conflicts can be detected when other uncommitted transactions are being committed later. When using pessimistic transaction mode, the behavior is basically the same as other databases. Refer to Difference with MySQL InnoDB to see the details. TiDB supports the <code>NOWAIT</code> modifier for <code>FOR UPDATE</code> . See TiDB Pessimistic Transaction Mode for details.
LOCK IN SHARE MODE	To guarantee compatibility, TiDB parses these three modifiers, but will ignore them.

12.10.2.75.3 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
  ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+----+-----+
| id | c1 |
+----+-----+
| 1 | 1 |
| 2 | 2 |
| 3 | 3 |
| 4 | 4 |
| 5 | 5 |
+----+-----+
5 rows in set (0.00 sec)
```

12.10.2.75.4 MySQL compatibility

- The syntax `SELECT ... INTO @variable` is not supported.
- The syntax `SELECT ... GROUP BY ... WITH ROLLUP` is not supported.
- The syntax `SELECT .. GROUP BY expr` does not imply `GROUP BY expr ORDER BY ↪ expr` as it does in MySQL 5.7. TiDB instead matches the behavior of MySQL 8.0 and does not imply a default order.

12.10.2.75.5 See also

- [INSERT](#)
- [DELETE](#)
- [UPDATE](#)
- [REPLACE](#)

12.10.2.76 SET DEFAULT ROLE

This statement sets a specific role to be applied to a user by default. Thus, they will automatically have the permissions associated with a role without having to execute `SET ↪ ROLE <rolename>` or `SET ROLE ALL`.

12.10.2.76.1 Synopsis

SetDefaultRoleStmt:

Figure 251: SetDefaultRoleStmt

SetDefaultRoleOpt:

Figure 252: SetDefaultRoleOpt

RolenameList:

Figure 253: RolenameList

UsernameList:

Figure 254: UsernameList

12.10.2.76.2 Examples

Create a new role for the analytics team, and a new user called `jennifer`:

```
$ mysql -uroot
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 37
```

```
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
↳ License 2.0) Community Edition, MySQL 5.7 compatible

Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
↳ .

Oracle is a registered trademark of Oracle Corporation and/or its
affiliates. Other names may be trademarks of their respective
owners.

Type 'help;' or '\h' for help. Type '\c' to clear the current input
↳ statement.

mysql> CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

mysql> GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

mysql> CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

mysql> GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Note that by default jennifer needs to SET ROLE analyticsteam in order to be able to use the privileges associated with the role:

```
$ mysql -ujennifer
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 32
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
↳ License 2.0) Community Edition, MySQL 5.7 compatible

Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
↳ .

Oracle is a registered trademark of Oracle Corporation and/or its
affiliates. Other names may be trademarks of their respective
owners.

Type 'help;' or '\h' for help. Type '\c' to clear the current input
↳ statement.

mysql> SHOW GRANTS;
```

```

+-----+
| Grants for User          |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
2 rows in set (0.00 sec)

mysql> SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
mysql> SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW GRANTS;
+-----+
| Grants for User          |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT Select ON test.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
3 rows in set (0.00 sec)

mysql> SHOW TABLES IN test;
+-----+
| Tables_in_test |
+-----+
| t1              |
+-----+
1 row in set (0.00 sec)

```

The statement `SET DEFAULT ROLE` can be used to associated a role to `jennifer` so that she will not have to execute the statement `SET ROLE` in order to assume the privileges associated with the role:

```

$ mysql -uroot
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 34
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
  ↳ License 2.0) Community Edition, MySQL 5.7 compatible

Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
  ↳ .

Oracle is a registered trademark of Oracle Corporation and/or its

```

affiliates. Other **names** may be trademarks of their respective owners.

Type **'help;'** or **'\h'** for help. Type **'\c'** to clear the current **input**
↪ statement.

```
mysql> SET DEFAULT ROLE analyticsteam TO jennifer;
Query OK, 0 rows affected (0.02 sec)
```

```
$ mysql -ujennifer
Welcome to the MySQL monitor. Commands end with ; or \g.
Your MySQL connection id is 35
Server version: 5.7.25-TiDB-v4.0.0-beta.2-728-ga9177fe84 TiDB Server (Apache
↪ License 2.0) Community Edition, MySQL 5.7 compatible
```

```
Copyright (c) 2000, 2020, Oracle and/or its affiliates. All rights reserved
↪ .
```

Oracle is a registered trademark of Oracle Corporation and/or its affiliates. Other **names** may be trademarks of their respective owners.

Type **'help;'** or **'\h'** for help. Type **'\c'** to clear the current **input**
↪ statement.

```
mysql> SHOW GRANTS;
```

```
+-----+
| Grants for User          |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT Select ON test.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
```

```
3 rows in set (0.00 sec)
```

```
mysql> SHOW TABLES IN test;
```

```
+-----+
| Tables_in_test |
+-----+
| t1              |
+-----+
```

```
1 row in set (0.00 sec)
```

SET DEFAULT ROLE will not automatically GRANT the associated role to the user. Attempting to SET DEFAULT ROLE for a role that jennifer does not have granted results in

the following error:

```
mysql> SET DEFAULT ROLE analyticsteam TO jennifer;
ERROR 3530 (HY000): `analyticsteam`@`%` is is not granted to jennifer@%
```

12.10.2.76.3 MySQL compatibility

This statement is understood to be fully compatible with roles, which are a feature of MySQL 8.0. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.79 SET ROLE

The SET ROLE statement is used to enable roles in the current session. After enabling roles, users can use the privileges of the role(s).

12.10.2.79.1 Synopsis

SetRoleStmt:

Figure 263: SetRoleStmt

SetRoleOpt:

Figure 264: SetRoleOpt

SetDefaultRoleOpt:

Figure 265: SetDefaultRoleOpt

12.10.2.79.2 Examples

Create a user 'u1'@'%' and three roles: 'r1'@'%', 'r2'@'%' and 'r3'@'%'. Grant these roles to 'u1'@'%' and set 'r1'@'%' as the default role of 'u1'@'%'.

```
CREATE USER 'u1'@'%';
CREATE ROLE 'r1', 'r2', 'r3';
GRANT 'r1', 'r2', 'r3' TO 'u1'@'%';
SET DEFAULT ROLE 'r1' TO 'u1'@'%';
```

Log in as 'u1'@'%' and execute the following SET ROLE statement to enable all roles.

```
SET ROLE ALL;
SELECT CURRENT_ROLE();
```

```
+-----+
| CURRENT_ROLE()          |
+-----+
| `r1`@`%`,`r2`@`%`,`r3`@`%` |
+-----+
1 row in set (0.000 sec)
```

Execute the following SET ROLE statement to enable 'r2' and 'r3'.

```
SET ROLE 'r2', 'r3';
SELECT CURRENT_ROLE();
```

```
+-----+
| CURRENT_ROLE() |
+-----+
| `r2`@`%`, `r3`@`%` |
+-----+
1 row in set (0.000 sec)
```

Execute the following SET ROLE statement to enable the default role(s).

```
SET ROLE DEFAULT;
SELECT CURRENT_ROLE();
```

```
+-----+
| CURRENT_ROLE() |
+-----+
| `r1`@`%`      |
+-----+
1 row in set (0.000 sec)
```

Execute the following SET ROLE statement to cancel all enabled role(s).

```
SET ROLE NONE;
SELECT CURRENT_ROLE();
```

```
+-----+
| CURRENT_ROLE() |
+-----+
|                |
+-----+
1 row in set (0.000 sec)
```

12.10.2.79.3 MySQL compatibility

This statement is understood to be fully compatible with roles, which are a feature of MySQL 8.0. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.80 SET TRANSACTION

The SET TRANSACTION statement can be used to change the current isolation level on a GLOBAL or SESSION basis. This syntax is an alternative to SET transaction_isolation='↪ new-value' and is included for compatibility with both MySQL, and the SQL standards.

12.10.2.80.1 Synopsis

```

SetStmt ::=
  'SET' ( VariableAssignmentList |
  'PASSWORD' ('FOR' Username)? '=' PasswordOpt |
  ( 'GLOBAL'| 'SESSION' )? 'TRANSACTION' TransactionChars |
  'CONFIG' ( Identifier | stringLit) ConfigItemName EqOrAssignmentEq
  ↪ SetExpr )

TransactionChars ::=
  ( 'ISOLATION' 'LEVEL' IsolationLevel | 'READ' 'WRITE' | 'READ' 'ONLY'
  ↪ AsOfClause? )

IsolationLevel ::=
  ( 'REPEATABLE' 'READ' | 'READ' ( 'COMMITTED' | 'UNCOMMITTED' ) | '
  ↪ SERIALIZABLE' )

AsOfClause ::=
  ( 'AS' 'OF' 'TIMESTAMP' Expression)

```

12.10.2.80.2 Examples

```

mysql> SHOW SESSION VARIABLES LIKE 'transaction_isolation';
+-----+-----+
| Variable_name      | Value          |
+-----+-----+
| transaction_isolation | REPEATABLE-READ |
+-----+-----+
1 row in set (0.00 sec)

mysql> SET SESSION TRANSACTION ISOLATION LEVEL READ COMMITTED;
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW SESSION VARIABLES LIKE 'transaction_isolation';
+-----+-----+
| Variable_name      | Value          |
+-----+-----+
| transaction_isolation | READ-COMMITTED |
+-----+-----+

```

```
1 row in set (0.01 sec)

mysql> SET SESSION transaction_isolation = 'REPEATABLE-READ';
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW SESSION VARIABLES LIKE 'transaction_isolation';
+-----+-----+
| Variable_name      | Value          |
+-----+-----+
| transaction_isolation | REPEATABLE-READ |
+-----+-----+
1 row in set (0.00 sec)
```

12.10.2.80.3 MySQL compatibility

- TiDB supports the ability to set a transaction as read-only in syntax only.
- The isolation levels `READ-UNCOMMITTED` and `SERIALIZABLE` are not supported.
- The `REPEATABLE-READ` isolation level is achieved through using the snapshot isolation technology, which is partly compatible with MySQL.
- In pessimistic transactions, TiDB supports two isolation levels compatible with MySQL: `REPEATABLE-READ` and `READ-COMMITTED`. For a detailed description, see [Isolation Levels](#).

12.10.2.80.4 See also

- [SET \[GLOBAL|SESSION\] <variable>](#)
- [Isolation Levels](#)

12.10.2.81 SET [GLOBAL|SESSION] <variable>

The statement `SET [GLOBAL|SESSION]` modifies one of TiDB's built in variables, of either `SESSION` or `GLOBAL` scope.

Note:

Similar to MySQL, changes to `GLOBAL` variables do not apply to either existing connections, or the local connection. Only new sessions reflect the changes to the value.

12.10.2.81.1 Synopsis

SetStmt:

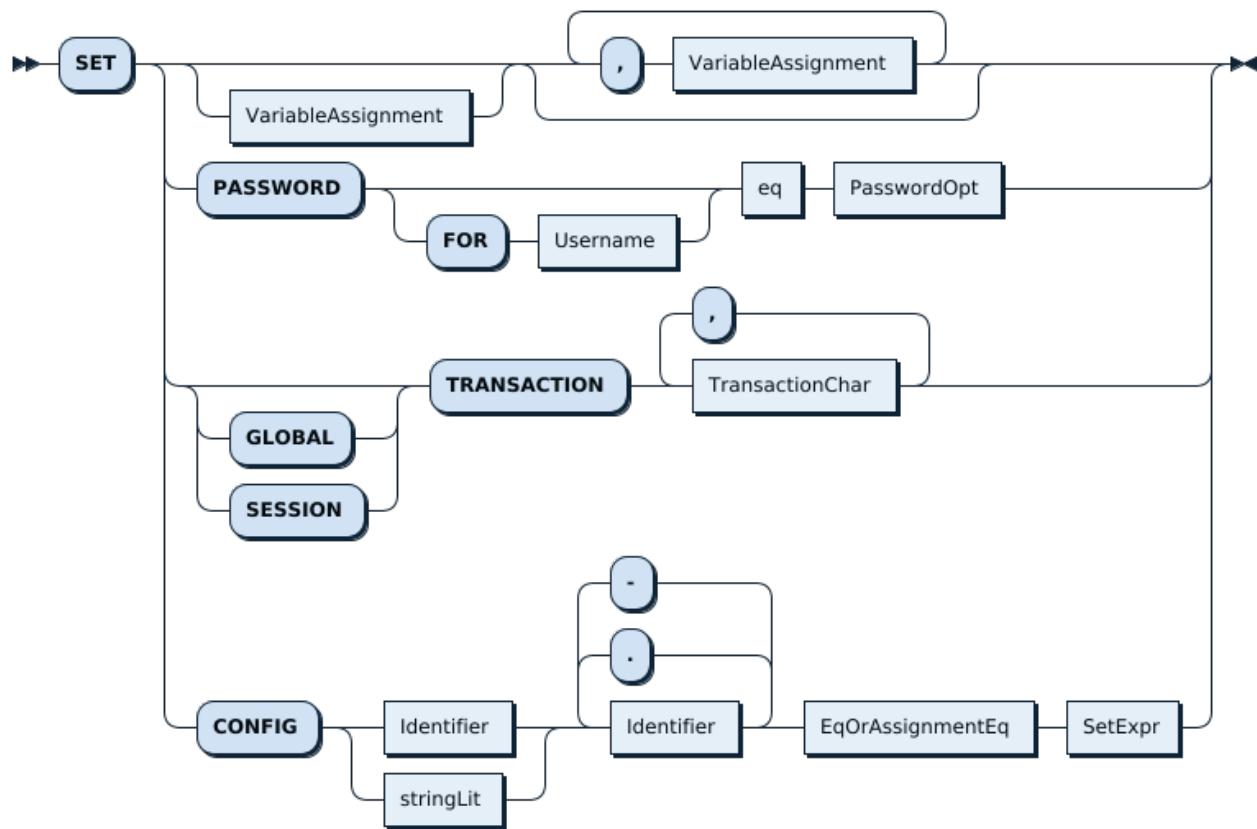

Figure 266: SetStmt

VariableAssignment:

Figure 267: VariableAssignment

12.10.2.81.2 Examples

Get the value of `sql_mode`.

```
mysql> SHOW GLOBAL VARIABLES LIKE 'sql_mode';
+---
↪ -----+
↪
| Variable_name | Value
↪
↪ |
+---
↪ -----+
↪
| sql_mode      | ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,
↪ NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,
↪ NO_ENGINE_SUBSTITUTION |
+---
↪ -----+
↪
1 row in set (0.00 sec)

mysql> SHOW SESSION VARIABLES LIKE 'sql_mode';
+---
↪ -----+
↪
| Variable_name | Value
↪
↪ |
+---
↪ -----+
↪
| sql_mode      | ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,
↪ NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,
↪ NO_ENGINE_SUBSTITUTION |
+---
↪ -----+
↪
1 row in set (0.00 sec)
```

Update the value of `sql_mode` globally. If you check the value of `SQL_mode` after the update, you can see that the value of `SESSION` level has not been updated:

```
mysql> SET GLOBAL sql_mode = 'STRICT_TRANS_TABLES,NO_AUTO_CREATE_USER';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GLOBAL VARIABLES LIKE 'sql_mode';
```

```

+-----+
| Variable_name | Value |
+-----+
| sql_mode     | STRICT_TRANS_TABLES,NO_AUTO_CREATE_USER |
+-----+
1 row in set (0.00 sec)

mysql> SHOW SESSION VARIABLES LIKE 'sql_mode';
+--
↪ -----+
↪
| Variable_name | Value |
↪
↪ |
+--
↪ -----+
↪
| sql_mode     | ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,
↪ NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,
↪ NO_ENGINE_SUBSTITUTION |
+--
↪ -----+
↪
1 row in set (0.00 sec)

```

Using SET SESSION takes effect immediately:

```

mysql> SET SESSION sql_mode = 'STRICT_TRANS_TABLES,NO_AUTO_CREATE_USER';
Query OK, 0 rows affected (0.01 sec)

mysql> SHOW SESSION VARIABLES LIKE 'sql_mode';
+-----+
| Variable_name | Value |
+-----+
| sql_mode     | STRICT_TRANS_TABLES,NO_AUTO_CREATE_USER |
+-----+
1 row in set (0.00 sec)

```

12.10.2.81.3 MySQL compatibility

The following behavior differences apply:

- Changes made with SET GLOBAL will be propagated to all TiDB instances in the cluster. This differs from MySQL, where changes do not propagate to replicas.

- TiDB presents several variables as both readable and settable. This is required for MySQL compatibility, because it is common for both applications and connectors to read MySQL variables. For example: JDBC connectors both read and set query cache settings, despite not relying on the behavior.
- Changes made with `SET GLOBAL` will persist through TiDB server restarts. This means that `SET GLOBAL` in TiDB behaves more similar to `SET PERSIST` as available in MySQL 8.0 and above.

12.10.2.81.4 See also

- [SHOW \[GLOBAL|SESSION\] VARIABLES](#)

12.10.2.82 SHOW ANALYZE STATUS

The `SHOW ANALYZE STATUS` statement shows the statistics collection tasks being executed by TiDB and a limited number of historical task records.

12.10.2.82.1 Synopsis

ShowStmt:

Figure 268: ShowStmt

ShowTargetFilterable:

  ↪ 2020-05-25 17:23:55 | finished |
| test | t | p2 | analyze columns | 0 |
  ↪ 2020-05-25 17:23:55 | finished |
+--
  ↪ -----+-----+-----+-----+
  ↪
8 rows in set (0.00 sec)
```

12.10.2.82.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.82.4 See also

- [ANALYZE_STATUS table](#)

12.10.2.83 SHOW [BACKUPS|RESTORES]

These statements show a list of all queued, running and recently finished **BACKUP** and **RESTORE** tasks that were executed on a TiDB instance.

Both statements require **SUPER** privilege to run.

Use **SHOW BACKUPS** to query **BACKUP** tasks and use **SHOW RESTORES** to query **RESTORE** tasks.

Backups and restores that were started with the **br** commandline tool are not shown.

12.10.2.83.1 Synopsis

```
ShowBRIEStmt ::=
  "SHOW" ("BACKUPS" | "RESTORES") ShowLikeOrWhere?

ShowLikeOrWhere ::=
  "LIKE" SimpleExpr
| "WHERE" Expression
```

12.10.2.83.2 Examples

In one connection, execute the following statement:

```
BACKUP DATABASE `test` TO 's3://example-bucket/backup-01/?region=us-west-1';
```

Before the backup completes, run **SHOW BACKUPS** in a new connection:

```
SHOW BACKUPS;
```

```
+--
  ↪ -----+-----+-----+-----+
  ↪
| Destination          | State | Progress | Queue_time   |
  ↪ Execution_time    | Finish_time | Connection | Message |
+--
  ↪ -----+-----+-----+-----+
  ↪
| s3://example-bucket/backup-01/ | Backup | 98.38 | 2020-04-12 23:09:03 |
  ↪ 2020-04-12 23:09:25 | NULL | 4 | NULL |
+--
  ↪ -----+-----+-----+-----+
  ↪
1 row in set (0.00 sec)
```

The first row of the result above is described as follows:

Column	Description
<code>Destination</code>	The destination URL (with all parameters stripped to avoid leaking secret keys)
<code>State</code>	State of the task
<code>Progress</code>	Estimated progress in the current state as a percentage
<code>Queue_time</code>	When the task was queued
<code>Execution_time</code>	When the task was started; the value is 0000-00-00 ↳ ↳ 00:00:00 ↳ for queueing tasks
<code>Finish_time</code>	The timestamp when the task finished; the value is 0000-00-00 ↳ ↳ 00:00:00 ↳ for queueing and running tasks

Column	Description
Connection ↔	Connection ID running this task
Message	Message with details

The possible states are:

State	Description
Backup	Making a backup
Wait	Waiting for execution
Checksum	Running a checksum operation

The connection ID can be used to cancel a backup/restore task via the **KILL TIDB QUERY** statement.

```
KILL TIDB QUERY 4;
```

```
Query OK, 0 rows affected (0.00 sec)
```

Filtering

Use the **LIKE** clause to filter out tasks by matching the destination URL against a wildcard expression.

```
SHOW BACKUPS LIKE 's3://%';
```

Use the **WHERE** clause to filter by columns.

```
SHOW BACKUPS WHERE `Progress` < 25.0;
```

12.10.2.84 SHOW [GLOBAL|SESSION] BINDINGS

The **SHOW BINDINGS** statement is used to display information about created SQL bindings. A **BINDING** can be on either a **GLOBAL** or **SESSION** basis. The default is **SESSION**.

12.10.2.84.1 Synopsis

ShowStmt:

Figure 270: ShowStmt

ShowTargetFilterable:

Figure 271: ShowTargetFilterable

GlobalScope:

Figure 272: GlobalScope

ShowLikeOrWhereOpt

Figure 273: ShowLikeOrWhereOpt

12.10.2.84.2 Syntax description

```
SHOW [GLOBAL | SESSION] BINDINGS [ShowLikeOrWhereOpt];
```

This statement outputs the execution plan bindings at the GLOBAL or SESSION level. The default scope is SESSION. Currently SHOW BINDINGS outputs eight columns, as shown below:

Column Name	Description
original_sql	Original SQL statement after parameterization
bind_sql	Bound SQL statement with hints
default_db	Default database
status	Status including 'Using', 'Deleted', 'Invalid', 'Rejected', and 'Pending verification'

Column Name	Description
create_time	Created time
update_time	Updated time
charset	Character set
collation	Sorting rule
source	The way in which a binding is created, including manual (created by the create ↪ [global] ↪ binding SQL statement), capture (captured automatically by TiDB), and evolve (evolved automatically by TiDB)

12.10.2.84.3 Examples

```
mysql> CREATE TABLE t1 (
  -> id INT NOT NULL PRIMARY KEY auto_increment,
  -> b INT NOT NULL,
  -> pad VARBINARY(255),
  -> INDEX(b)
  -> );
Query OK, 0 rows affected (0.07 sec)

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
  ↪ FROM dual;
Query OK, 1 row affected (0.01 sec)
Records: 1 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
  ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 1 row affected (0.00 sec)
Records: 1 Duplicates: 0 Warnings: 0
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
  ↳ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 8 rows affected (0.00 sec)
Records: 8 Duplicates: 0 Warnings: 0
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
  ↳ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 1000 rows affected (0.04 sec)
Records: 1000 Duplicates: 0 Warnings: 0
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
  ↳ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 100000 rows affected (1.74 sec)
Records: 100000 Duplicates: 0 Warnings: 0
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
  ↳ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 100000 rows affected (2.15 sec)
Records: 100000 Duplicates: 0 Warnings: 0
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
  ↳ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 100000 rows affected (2.64 sec)
Records: 100000 Duplicates: 0 Warnings: 0
```

```
mysql> SELECT SLEEP(1);
```

```
+-----+
| SLEEP(1) |
+-----+

12.10.2.85.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.86 SHOW CHARACTER SET

This statement provides a static list of available character sets in TiDB. The output does not reflect any attributes of the current connection or user.

12.10.2.86.1 Synopsis

ShowCharsetStmt:

Figure 275: ShowCharsetStmt

CharsetKw:

Figure 276: CharsetKw

12.10.2.86.2 Examples

```

mysql> SHOW CHARACTER SET;
+-----+-----+-----+-----+
| Charset | Description | Default collation | Maxlen |
+-----+-----+-----+-----+
| utf8    | UTF-8 Unicode | utf8_bin          | 3      |
| utf8mb4 | UTF-8 Unicode | utf8mb4_bin       | 4      |
| ascii   | US ASCII      | ascii_bin         | 1      |
| latin1  | Latin1       | latin1_bin        | 1      |

```

```
| binary | binary      | binary      | 1 |
+-----+-----+-----+---+
5 rows in set (0.00 sec)
```

12.10.2.86.3 MySQL compatibility

The usage of this statement is understood to be fully compatible with MySQL. However, charsets in TiDB may have different default collations compared with MySQL. For details, refer to [Compatibility with MySQL](#). Any other compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.86.4 See also

- [SHOW COLLATION](#)
- [Character Set and Collation](#)

12.10.2.87 SHOW COLLATION

This statement provides a static list of collations, and is included to provide compatibility with MySQL client libraries.

Note:

Results of `SHOW COLLATION` vary when the “[new collation framework](#)” is enabled. For new collation framework details, refer to [Character Set and Collation](#).

12.10.2.87.1 Synopsis

ShowCollationStmt:

Figure 277: ShowCollationStmt

12.10.2.87.2 Examples

When new collation framework is disabled, only binary collations are displayed.

```
mysql> SHOW COLLATION;
+-----+-----+-----+-----+-----+-----+
| Collation | Charset | Id | Default | Compiled | Sortlen |
+-----+-----+-----+-----+-----+-----+
| utf8mb4_bin | utf8mb4 | 46 | Yes | Yes | 1 |
| latin1_bin | latin1 | 47 | Yes | Yes | 1 |
| binary | binary | 63 | Yes | Yes | 1 |
| ascii_bin | ascii | 65 | Yes | Yes | 1 |
| utf8_bin | utf8 | 83 | Yes | Yes | 1 |
+-----+-----+-----+-----+-----+-----+
5 rows in set (0.02 sec)
```

When new collation framework is enabled, `utf8_general_ci` and `utf8mb4_general_ci` are additionally supported.

```
mysql> SHOW COLLATION;
+-----+-----+-----+-----+-----+-----+
| Collation          | Charset | Id | Default | Compiled | Sortlen |
+-----+-----+-----+-----+-----+-----+
| utf8mb4_bin       | utf8mb4 | 46 | Yes | Yes | 1 |
| latin1_bin        | latin1  | 47 | Yes | Yes | 1 |

12.10.2.87.3 MySQL compatibility

The usage of this statement is understood to be fully compatible with MySQL. However, charsets in TiDB may have different default collations compared with MySQL. For details, refer to [Compatibility with MySQL](#). Any other compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.87.4 See also

- [SHOW CHARACTER SET](#)
- [Character Set and Collation](#)

12.10.2.88 SHOW [FULL] COLUMNS FROM

The statement `SHOW [FULL] COLUMNS FROM <table_name>` describes the columns of a table or view in a useful tabular format. The optional keyword `FULL` displays the privileges the current user has to that column, and the comment from the table definition.

The statements `SHOW [FULL] FIELDS FROM <table_name>`, `DESC <table_name>`, `DESCRIBE <table_name>`, and `EXPLAIN <table_name>` are aliases of this statement.

Note:

`DESC TABLE <table_name>`, `DESCRIBE TABLE <table_name>`, and `EXPLAIN ↷ TABLE <table_name>` are not equivalent to the above statements. They are aliases of `DESC SELECT * FROM <table_name>`.

12.10.2.88.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.88.4 See also

- [SHOW CREATE TABLE](#)

12.10.2.89 SHOW CONFIG

The `SHOW CONFIG` statement is used to show the current configuration of various components of TiDB. Note that the configuration and system variables act on different dimensions and should not be mixed up. If you want to obtain the system variable information, use the [SHOW VARIABLES](#) syntax.

12.10.2.89.1 Synopsis

ShowStmt:

Figure 288: ShowStmt

ShowTargetFilterable:

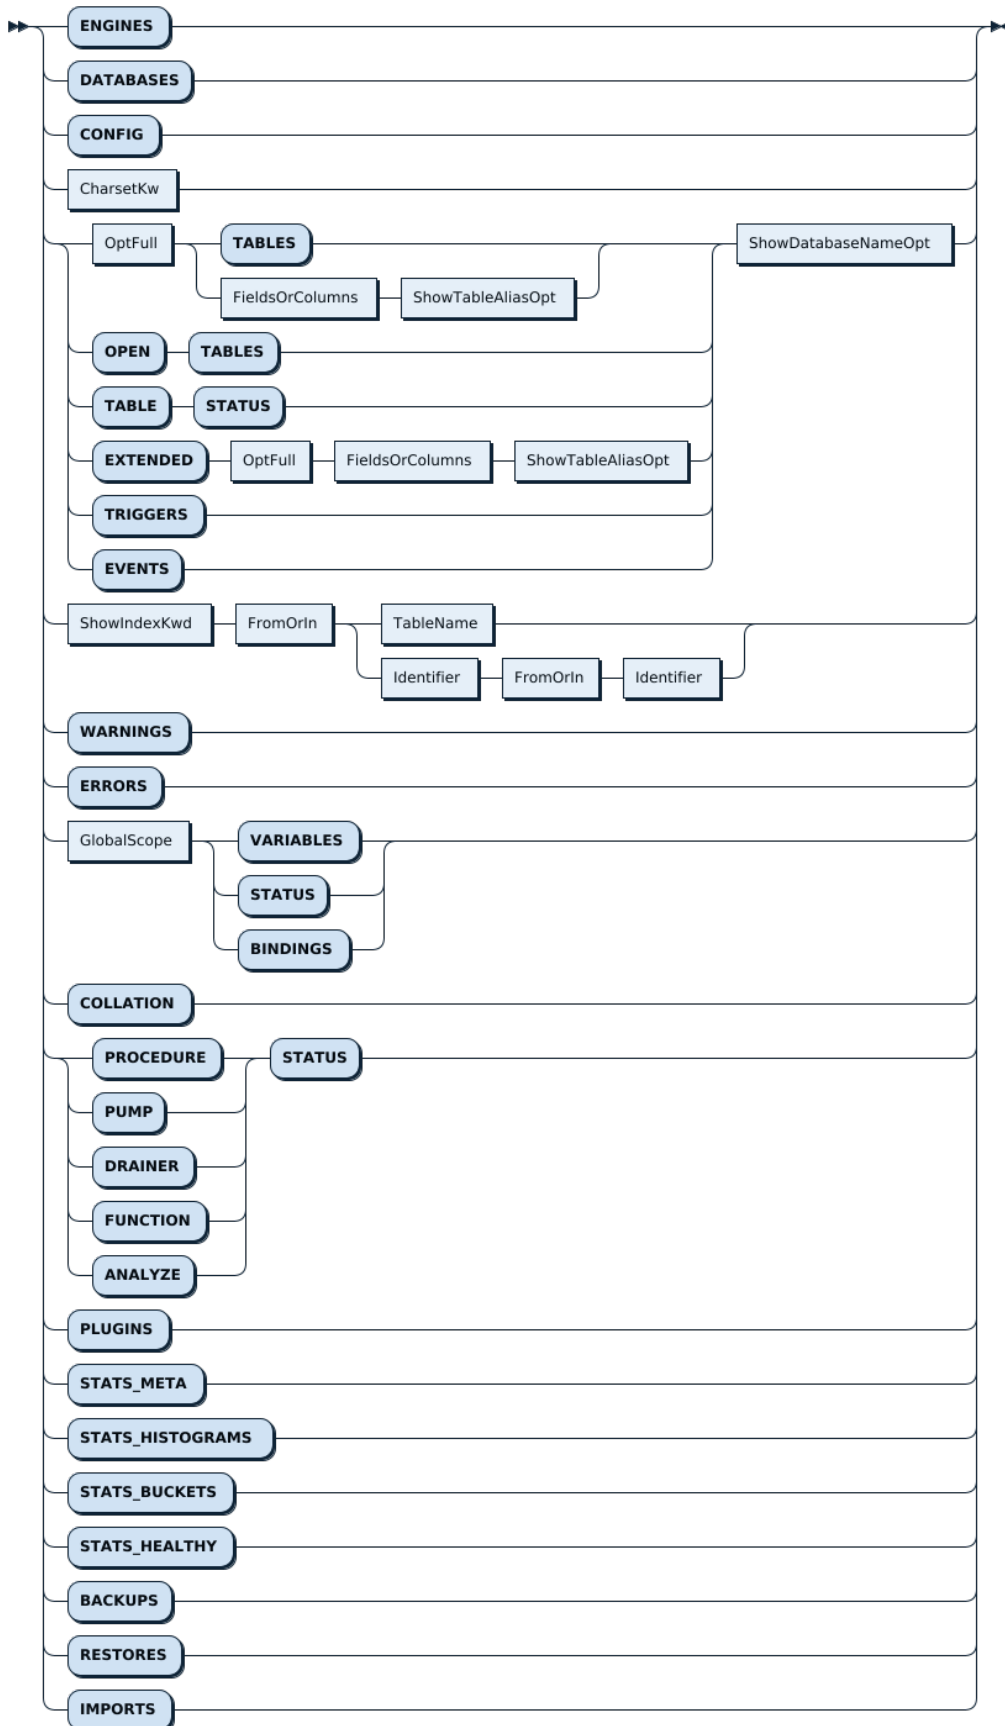

Figure 289: ShowTargetFilterable

12.10.2.89.2 Examples

Show all configurations:

```
SHOW CONFIG;
```

```
+-----+-----+-----+-----+
  ↪
| Type | Instance   | Name                               | Value
  ↪
+-----+-----+-----+-----+
  ↪
| tidb | 127.0.0.1:4000 | advertise-address                 | 127.0.0.1
  ↪
| tidb | 127.0.0.1:4000 | binlog.binlog-socket              |
  ↪
| tidb | 127.0.0.1:4000 | binlog.enable                      | false
  ↪
...
120 rows in set (0.01 sec)
```

Show the configuration where the type is tidb:

```
SHOW CONFIG WHERE type = 'tidb' AND name = 'advertise-address';
```

```
+-----+-----+-----+-----+
| Type | Instance   | Name                               | Value |
+-----+-----+-----+-----+
| tidb | 127.0.0.1:4000 | advertise-address                 | 127.0.0.1 |
+-----+-----+-----+-----+
1 row in set (0.05 sec)
```

You can also use the LIKE clause to show the configuration where the type is tidb:

```
SHOW CONFIG LIKE 'tidb';
```

```
+-----+-----+-----+-----+
  ↪
| Type | Instance   | Name                               | Value
  ↪
+-----+-----+-----+-----+
  ↪
| tidb | 127.0.0.1:4000 | advertise-address                 | 127.0.0.1
  ↪
| tidb | 127.0.0.1:4000 | binlog.binlog-socket              |
  ↪
```

```
| tidb | 127.0.0.1:4000 | binlog.enable | false
↪
...
40 rows in set (0.01 sec)
```

12.10.2.89.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.89.4 See also

- [SHOW VARIABLES](#)

12.10.2.90 SHOW CREATE PLACEMENT POLICY

Warning:

Placement Rules in SQL is an experimental feature. The syntax might change before its GA, and there might also be bugs.

If you understand the risks, you can enable this experiment feature by executing `SET GLOBAL tidb_enable_alter_placement = 1;`

`SHOW CREATE PLACEMENT POLICY` is used to show the definition of a placement policy. This can be used to see the current definition of a placement policy and recreate it in another TiDB cluster.

12.10.2.90.1 Synopsis

```
ShowCreatePlacementPolicyStmt ::=
    "SHOW" "CREATE" "PLACEMENT" "POLICY" PolicyName

PolicyName ::=
    Identifier
```

12.10.2.90.2 Examples

```
CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us
↪ -west-1" FOLLOWERS=4;
CREATE TABLE t1 (a INT) PLACEMENT POLICY=p1;
SHOW CREATE PLACEMENT POLICY p1\G
```

```

Query OK, 0 rows affected (0.08 sec)

Query OK, 0 rows affected (0.10 sec)

***** 1. row *****
      Policy: p1
Create Policy: CREATE PLACEMENT POLICY `p1` PRIMARY_REGION="us-east-1"
      ↪ REGIONS="us-east-1,us-west-1" FOLLOWERS=4
1 row in set (0.00 sec)

```

12.10.2.90.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.91 SHOW CREATE SEQUENCE

The SHOW CREATE SEQUENCE shows the detailed information of a sequence, which is similar to SHOW CREATE TABLE.

12.10.2.91.1 Synopsis

ShowCreateSequenceStmt:

Figure 290: ShowCreateSequenceStmt

TableName:

Figure 291: TableName

12.10.2.91.2 Examples

```
CREATE SEQUENCE seq;
```

```
Query OK, 0 rows affected (0.03 sec)
```

```
SHOW CREATE SEQUENCE seq;
```

```
+-----+-----+
↪
| Table | Create Table
↪
↪ |
+-----+-----+
↪
| seq | CREATE SEQUENCE `seq` start with 1 minvalue 1 maxvalue
↪ 9223372036854775806 increment by 1 cache 1000 nocycle ENGINE=InnoDB |
+-----+-----+
↪
1 row in set (0.00 sec)
```

12.10.2.91.3 MySQL compatibility

This statement is a TiDB extension. The implementation is modeled on sequences available in MariaDB.

12.10.2.91.4 See also

- [CREATE SEQUENCE](#)
- [DROP SEQUENCE](#)

12.10.2.92 SHOW CREATE TABLE

This statement shows the exact statement to recreate an existing table using SQL.

12.10.2.92.1 Synopsis

ShowCreateTableStmt:

Figure 292: ShowCreateTableStmt

TableName:

Figure 293: TableName

12.10.2.92.2 Examples

```

mysql> CREATE TABLE t1 (a INT);
Query OK, 0 rows affected (0.12 sec)

mysql> SHOW CREATE TABLE t1;
+---+
| Table | Create Table
+---+
| t1    | CREATE TABLE `t1` (
  `a` int(11) DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin |
+---+
1 row in set (0.00 sec)

```

12.10.2.92.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.92.4 See also

- [CREATE TABLE](#)
- [DROP TABLE](#)
- [SHOW TABLES](#)
- [SHOW COLUMNS FROM](#)

12.10.2.93 SHOW CREATE USER

This statement shows how to re-create a user using the `CREATE USER` syntax.

12.10.2.93.1 Synopsis

ShowCreateUserStmt:

Figure 294: ShowCreateUserStmt

Username:

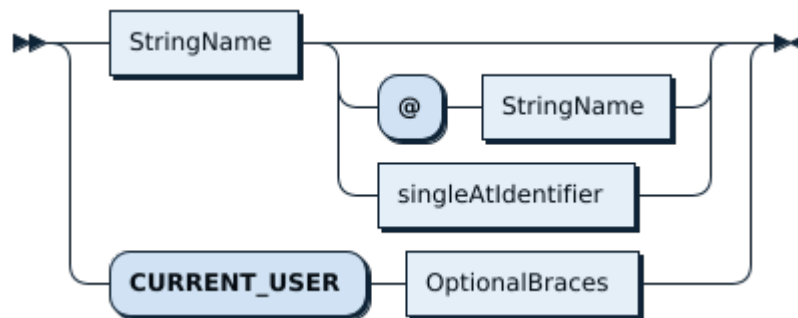

Figure 295: Username

12.10.2.93.2 Examples

```
mysql> SHOW CREATE USER 'root';
+--
↪ -----
↪
| CREATE USER for root@%
↪
↪ |
+--
↪ -----
↪
| CREATE USER 'root'@'%' IDENTIFIED WITH 'mysql_native_password' AS ''
↪ REQUIRE NONE PASSWORD EXPIRE DEFAULT ACCOUNT UNLOCK |
+--
↪ -----
↪
1 row in set (0.00 sec)

mysql> SHOW GRANTS FOR 'root';
+-----+
| Grants for root@% |
+-----+
| GRANT ALL PRIVILEGES ON *.* TO 'root'@'%' |
```

```
+-----+
1 row in set (0.00 sec)
```

12.10.2.93.3 MySQL compatibility

- The output of `SHOW CREATE USER` is designed to match MySQL, but several of the `CREATE` options are not yet supported by TiDB. Not yet supported options will be parsed but ignored. See [security compatibility] for more details.

12.10.2.93.4 See also

- [CREATE USER](#)
- [SHOW GRANTS](#)
- [DROP USER](#)

12.10.2.94 SHOW DATABASES

This statement shows a list of databases that the current user has privileges to. Databases which the current user does not have access to will appear hidden from the list. The `information_schema` database always appears first in the list of databases.

`SHOW SCHEMAS` is an alias of this statement.

12.10.2.94.1 Synopsis

ShowDatabasesStmt:

Figure 296: ShowDatabasesStmt

ShowLikeOrWhereOpt:

Figure 297: ShowLikeOrWhereOpt

12.10.2.94.2 Examples

```
mysql> SHOW DATABASES;
+-----+
| Database          |
+-----+
| INFORMATION_SCHEMA |
| PERFORMANCE_SCHEMA |
| mysql             |
| test              |
+-----+
4 rows in set (0.00 sec)

mysql> CREATE DATABASE mynewdb;
Query OK, 0 rows affected (0.10 sec)

mysql> SHOW DATABASES;
+-----+
| Database          |
+-----+
| INFORMATION_SCHEMA |
| PERFORMANCE_SCHEMA |
| mynewdb           |
| mysql             |
| test              |
+-----+
5 rows in set (0.00 sec)
```

12.10.2.94.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.94.4 See also

- [SHOW SCHEMAS](#)
- [DROP DATABASE](#)
- [CREATE DATABASE](#)

12.10.2.95 SHOW DRAINER STATUS

The SHOW DRAINER STATUS statement displays the status information for all Drainer nodes in the cluster.

12.10.2.95.1 Examples

```
SHOW DRAINER STATUS;
```

```
+--
  ↪ -----/-----/-----/-----/-----/
  ↪
| NodeID |      Address   | State | Max_Commit_Ts | Update_Time |
+--
  ↪ -----/-----/-----/-----/-----/
  ↪
| drainer1 | 127.0.0.3:8249 | Online | 408553768673342532 | 2019-05-01
  ↪ 00:00:03 |
+--
  ↪ -----/-----/-----/-----/-----/
  ↪
| drainer2 | 127.0.0.4:8249 | Online | 408553768673345531 | 2019-05-01
  ↪ 00:00:04 |
+--
  ↪ -----/-----/-----/-----/-----/
  ↪
2 rows in set (0.00 sec)
```

12.10.2.95.2 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.95.3 See also

- [SHOW PUMP STATUS](#)
- [CHANGE PUMP STATUS](#)
- [CHANGE DRAINER STATUS](#)

12.10.2.96 SHOW ENGINES

This statement is used to list all supported storage engines. The syntax is included only for compatibility with MySQL.

12.10.2.96.1 Synopsis

ShowEnginesStmt:

Figure 298: ShowEnginesStmt

```
SHOW ENGINES;
```

12.10.2.96.2 Examples

```
mysql> SHOW ENGINES;
+--
  ↪ -----+-----+-----+-----+-----+-----+
  ↪
 | Engine | Support | Comment |
  ↪ Transactions | XA | Savepoints |
+--
  ↪ -----+-----+-----+-----+-----+-----+
  ↪
 | InnoDB | DEFAULT | Supports transactions, row-level locking, and foreign
  ↪ keys | YES | YES | YES |
+--
  ↪ -----+-----+-----+-----+-----+-----+
  ↪
1 row in set (0.00 sec)
```

12.10.2.96.3 MySQL compatibility

- This statement will always only return InnoDB as the supported engine. Internally, TiDB will typically use TiKV as the storage engine.

12.10.2.97 SHOW ERRORS

This statement shows error(s) from previously executed statements. The error buffer is cleared as soon as a statement executes successfully. In which case, `SHOW ERRORS` will return an empty set.

The behavior of which statements generate errors vs. warnings is highly influenced by the current `sql_mode`.

12.10.2.97.1 Synopsis

ShowErrorsStmt:

Figure 299: ShowErrorsStmt

12.10.2.97.2 Examples

```
mysql> select invalid;
ERROR 1054 (42S22): Unknown column 'invalid' in 'field list'
mysql> create invalid;
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual
  ↳ that corresponds to your TiDB version for the right syntax to use

- [SHOW CREATE USER](#)
- [GRANT](#)

12.10.2.100 SHOW INDEX [FROM|IN]

This statement is an alias to [SHOW INDEXES \[FROM|IN\]](#). It is included for compatibility with MySQL.

12.10.2.101 SHOW INDEXES [FROM|IN]

The statement [SHOW INDEXES \[FROM|IN\]](#) lists the indexes on a specified table. The statements [SHOW INDEX \[FROM|IN\]](#), [SHOW KEYS \[FROM|IN\]](#) are aliases of this statement, and included for compatibility with MySQL.

12.10.2.101.1 Synopsis

ShowIndexStmt:

Figure 305: ShowIndexStmt

ShowIndexKwd:

Figure 306: ShowIndexKwd

  ↳ | NULL | NULL | YES | BTREE | | YES
  ↳ | NULL |
+---
  ↳ -----+-----+-----+-----+-----+
  ↳
2 rows in set (0.00 sec)

```

12.10.2.101.3 MySQL compatibility

The `Cardinality` column in MySQL shows the number of different values on the index. In TiDB, the `Cardinality` column always shows 0.

12.10.2.101.4 See also

- [SHOW CREATE TABLE](#)
- [DROP INDEX](#)
- [CREATE INDEX](#)

12.10.2.102 SHOW KEYS [FROM|IN]

This statement is an alias to [SHOW INDEXES \[FROM|IN\]](#). It is included for compatibility with MySQL.

12.10.2.103 SHOW MASTER STATUS

The `SHOW MASTER STATUS` statement displays the latest TSO in the cluster.

12.10.2.103.1 Examples

```
SHOW MASTER STATUS;
```

```

+---
  ↳ -----+-----+-----+-----+-----+
  ↳

```

File	Position	Binlog_Do_DB	Binlog_Ignore_DB
↪ Executed_Gtid_Set			
+--			
↪ -----+-----+-----+-----+-----			
↪			
tidb-binlog	416916363252072450		
↪			
+--			
↪ -----+-----+-----+-----+-----			
↪			

1 row in set (0.00 sec)

12.10.2.103.2 MySQL compatibility

The output of `SHOW MASTER STATUS` is designed to match MySQL. However, the execution results are different in that the MySQL result is the binlog location information and the TiDB result is the latest TSO information.

12.10.2.104 SHOW PLACEMENT

Warning:

Placement Rules in SQL is an experimental feature. The syntax might change before its GA, and there might also be bugs.

If you understand the risks, you can enable this experiment feature by executing `SET GLOBAL tidb_enable_alter_placement = 1;`.

`SHOW PLACEMENT` summarizes all placement options from direct placement and placement policies, and presents them in canonical form.

12.10.2.104.1 Synopsis

```
ShowStmt ::=
  "PLACEMENT"
```

12.10.2.104.2 Examples

```
CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us
↳ -west-1" FOLLOWERS=4;
CREATE TABLE t1 (a INT) PLACEMENT POLICY=p1;
CREATE TABLE t2 (a INT) PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us-
↳ west-1" FOLLOWERS=4;
SHOW PLACEMENT;
```

12.10.2.105 SHOW PLACEMENT FOR

Warning:

Placement Rules in SQL is an experimental feature. The syntax might change before its GA, and there might also be bugs.

If you understand the risks, you can enable this experiment feature by executing `SET GLOBAL tidb_enable_alter_placement = 1;`

`SHOW PLACEMENT FOR` summarizes all placement options from direct placement and placement policies, and presents them in the canonical form for a specific table, database schema, or partition.

12.10.2.105.1 Synopsis

```
ShowStmt ::=
    "PLACEMENT" "FOR" ShowPlacementTarget

ShowPlacementTarget ::=
    DatabaseSym DBName
| "TABLE" TableName
| "TABLE" TableName "PARTITION" Identifier
```

12.10.2.105.2 Examples

12.10.2.108.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.108.4 See also

- [SHOW GRANTS](#)
- [GRANT <privileges>](#)

12.10.2.109 SHOW [FULL] PROCESSLIST

This statement lists the current sessions connected to the same TiDB server. The Info column contains the query text, which will be truncated unless the optional keyword FULL is specified.

12.10.2.109.1 Synopsis

ShowProcesslistStmt:

Figure 313: ShowProcesslistStmt

OptFull:

Figure 314: OptFull

12.10.2.109.2 Examples

```
mysql> SHOW PROCESSLIST;
+---+
↪ -----+-----+-----+-----+-----+-----+-----+-----+
↪
| Id | User | Host          | db | Command | Time | State | Info
↪
+---+
↪ -----+-----+-----+-----+-----+-----+-----+-----+
↪
|  5 | root | 127.0.0.1:45970 | test | Query | 0 | autocommit | SHOW
↪ PROCESSLIST |
+---+
↪ -----+-----+-----+-----+-----+-----+-----+-----+
↪
1 rows in set (0.00 sec)
```

12.10.2.109.3 MySQL compatibility

- The State column in TiDB is non-descriptive. Representing state as a single value is more complex in TiDB, since queries are executed in parallel and each goroutine will have a different state at any one time.

12.10.2.109.4 See also

- [KILL \[TIDB\]](#)

12.10.2.110 SHOW PROFILES

The SHOW PROFILES statement currently only returns an empty result.

12.10.2.110.1 Synopsis

ShowStmt:

Figure 315: ShowStmt

12.10.2.110.2 Examples

```
SHOW PROFILES;
```

```
Empty set (0.00 sec)
```

12.10.2.110.3 MySQL compatibility

This statement is included only for compatibility with MySQL. Executing SHOW ↵ PROFILES always returns an empty result.

12.10.2.111 SHOW PUMP STATUS

The SHOW PUMP STATUS statement displays the status information for all Pump nodes in the cluster.

12.10.2.111.1 Examples

```
SHOW PUMP STATUS;
```

```

+---
↵  -----/-----/-----/-----/-----/
↵
| NodeID | Address | State | Max_Commit_Ts | Update_Time |
+---
↵  -----/-----/-----/-----/-----/

+--
  ↪ -----/-----/-----/-----/-----/
  ↪
2 rows in set (0.00 sec)

```

12.10.2.111.2 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.111.3 See also

- [SHOW DRAINER STATUS](#)
- [CHANGE PUMP STATUS](#)
- [CHANGE DRAINER STATUS](#)

12.10.2.112 SHOW SCHEMAS

This statement is an alias to [SHOW DATABASES](#). It is included for compatibility with MySQL.

12.10.2.113 SHOW STATS_HEALTHY

The `SHOW STATS_HEALTHY` statement shows an estimation of how accurate statistics are believed to be. Tables with a low percentage health may generate sub-optimal query execution plans.

The health of a table can be improved by running the `ANALYZE` table command. `ANALYZE` runs automatically when the health drops below the `tidb_auto_analyze_ratio` threshold.

12.10.2.113.1 Synopsis

ShowStmt

Figure 316: ShowStmt

ShowTargetFiltertable

Figure 317: ShowTargetFilterable

ShowLikeOrWhereOpt

Figure 318: ShowLikeOrWhereOpt

12.10.2.113.2 Examples

Load example data and run ANALYZE:

```
CREATE TABLE t1 (
  id INT NOT NULL PRIMARY KEY auto_increment,
  b INT NOT NULL,
  pad VARBINARY(255),
  INDEX(b)
);

INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM dual
↪ ;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
↪ JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
↪ JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
↪ JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
↪ JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
↪ JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
↪ JOIN t1 b JOIN t1 c LIMIT 100000;
SELECT SLEEP(1);
ANALYZE TABLE t1;
SHOW STATS_HEALTHY; # should be 100% healthy
```

```
...
mysql> SHOW STATS_HEALTHY;
+-----+-----+-----+-----+
| Db_name | Table_name | Partition_name | Healthy |
+-----+-----+-----+-----+
| test   | t1         |                | 100    |
+-----+-----+-----+-----+
```

```
1 row in set (0.00 sec)
```

Perform a bulk update deleting approximately 30% of the records. Check the health of the statistics:

```
DELETE FROM t1 WHERE id BETWEEN 101010 AND 201010; # delete about 30% of
↪ records
SHOW STATS_HEALTHY;
```

```
mysql> SHOW STATS_HEALTHY;
+-----+-----+-----+-----+
| Db_name | Table_name | Partition_name | Healthy |
+-----+-----+-----+-----+
| test   | t1         |                | 50      |
+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

12.10.2.115 SHOW STATS_META

You can use `SHOW STATS_META` to view how many rows are in a table and how many rows are changed in that table. When using this statement, you can filter the needed information by the `ShowLikeOrWhere` clause.

Currently, the `SHOW STATS_META` statement outputs 6 columns:

Column name	Description
<code>db_name</code>	Database name
<code>table_name</code>	Table name
<code>partition_name</code>	Partition name
<code>update_time</code>	Last updated time
<code>modify_count</code>	The number of rows modified
<code>row_count</code>	The total row count

注意:

The `update_time` is updated when TiDB updates the `modify_count` and `row_count` fields according to DML statements. So `update_time` is not the last execution time of the `ANALYZE` statement.

12.10.2.117 SHOW TABLE NEXT_ROW_ID

SHOW TABLE NEXT_ROW_ID is used to show the details of some special columns of a table, including:

- AUTO_INCREMENT column automatically created by TiDB, namely, `_tidb_rowid` column.
- AUTO_INCREMENT column created by users.
- **AUTO_RANDOM** column created by users.
- **SEQUENCE** created by users.

12.10.2.117.1 Synopsis

ShowTableNextRowIDStmt:

Figure 328: ShowTableNextRowIDStmt

TableName:

Figure 329: TableName

12.10.2.117.2 Examples

For newly created tables, NEXT_GLOBAL_ROW_ID is 1 because no Row ID is allocated.

```
create table t(a int);
Query OK, 0 rows affected (0.06 sec)
```

```
show table t next_row_id;
+-----+-----+-----+-----+
| DB_NAME | TABLE_NAME | COLUMN_NAME | NEXT_GLOBAL_ROW_ID |
+-----+-----+-----+-----+
| test   | t           | _tidb_rowid | 1                   |
+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

Data have been written to the table. The TiDB server that inserts the data allocates and caches 30000 IDs at once. Thus, NEXT_GLOBAL_ROW_ID is 30001 now.

```
insert into t values (), (), ();
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0
```

```
show table t next_row_id;
+-----+-----+-----+-----+
| DB_NAME | TABLE_NAME | COLUMN_NAME | NEXT_GLOBAL_ROW_ID |
+-----+-----+-----+-----+
| test   | t           | _tidb_rowid |          30001     |
+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

12.10.2.118 SHOW TABLE REGIONS

The SHOW TABLE REGIONS statement is used to show the Region information of a table in TiDB.

12.10.2.118.1 Syntax

```
SHOW TABLE [table_name] REGIONS [WhereClauseOptional];
SHOW TABLE [table_name] INDEX [index_name] REGIONS [WhereClauseOptional];
```

12.10.2.118.2 Synopsis

ShowTableRegionStmt:

Figure 330: ShowTableRegionStmt

TableName:

Figure 331: TableName

PartitionNameListOpt:

Figure 332: PartitionNameListOpt

WhereClauseOptional:

Figure 333: WhereClauseOptional

WhereClause:

Figure 334: WhereClause

Executing `SHOW TABLE REGIONS` returns the following columns:

- `REGION_ID`: The Region ID.
- `START_KEY`: The start key of the Region.
- `END_KEY`: The end key of the Region.
- `LEADER_ID`: The Leader ID of the Region.
- `LEADER_STORE_ID`: The ID of the store (TiKV) where the Region leader is located.
- `PEERS`: The IDs of all Region replicas.
- `SCATTERING`: Whether the Region is being scheduled. 1 means true.

- **WRITTEN_BYTES**: The estimated amount of data written into the Region within one heartbeat cycle. The unit is byte.
- **READ_BYTES**: The estimated amount of data read from the Region within one heartbeat cycle. The unit is byte.
- **APPROXIMATE_SIZE(MB)**: The estimated amount of data in the Region. The unit is megabytes (MB).
- **APPROXIMATE_KEYS**: The estimated number of Keys in the Region.

Note:

The values of **WRITTEN_BYTES**, **READ_BYTES**, **APPROXIMATE_SIZE(MB)**, **APPROXIMATE_KEYS** are not accurate data. They are estimated data from PD based on the heartbeat information that PD receives from the Region.

12.10.2.118.3 Examples

Create an example table with enough data that fills a few Regions:

```
CREATE TABLE t1 (  
  id INT NOT NULL PRIMARY KEY auto_increment,  
  b INT NOT NULL,  
  pad1 VARBINARY(1024),  
  pad2 VARBINARY(1024),  
  pad3 VARBINARY(1024)  
);  
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),  
  ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM dual;  
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),  
  ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c  
  ↪ LIMIT 10000;  
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),  
  ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c  
  ↪ LIMIT 10000;  
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),  
  ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c  
  ↪ LIMIT 10000;  
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),  
  ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c  
  ↪ LIMIT 10000;
```

```

INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
↳ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
↳ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
↳ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
↳ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
↳ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
↳ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
↳ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
↳ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
↳ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
↳ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
↳ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
↳ LIMIT 10000;
SELECT SLEEP(5);
SHOW TABLE t1 REGIONS;

```

The output should show that the table is split into Regions. The REGION_ID, START_KEY and END_KEY may not match exactly:

```

...
mysql> SHOW TABLE t1 REGIONS;
+---
↳ -----+-----+-----+-----+-----+-----+
↳
| REGION_ID | START_KEY | END_KEY | LEADER_ID | LEADER_STORE_ID | PEERS |
↳ SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB) |
↳ APPROXIMATE_KEYS |
+---
↳ -----+-----+-----+-----+-----+-----+
↳
| 94 | t_75_ | t_75_r_31717 | 95 | 1 | 95 |
↳ 0 | 0 | 0 | 112 |
↳ 207465 |
| 96 | t_75_r_31717 | t_75_r_63434 | 97 | 1 | 97 |
↳ 0 | 0 | 0 | 97 |
↳ 0 |
| 2 | t_75_r_63434 | | 3 | 1 | 3 |
↳ 0 | 269323514 | 66346110 | 245 |
↳ 162020 |
+---

```

```
↪ -----+-----+-----+-----+-----+-----+-----+
↪
3 rows in set (0.00 sec)
```

In the output above, a `START_KEY` of `t_75_r_31717` and `END_KEY` of `t_75_r_63434` shows that data with a PRIMARY KEY between 31717 and 63434 is stored in this Region. The prefix `t_75_` indicates that this is the Region for a table (`t`) which has an internal table ID of 75. An empty key value for `START_KEY` or `END_KEY` indicates negative infinity or positive infinity respectively.

TiDB automatically rebalances Regions as needed. For manual rebalancing, use the `SPLIT TABLE REGION` statement:

```
mysql> SPLIT TABLE t1 BETWEEN (31717) AND (63434) REGIONS 2;
+-----+-----+-----+-----+-----+-----+-----+
| TOTAL_SPLIT_REGION | SCATTER_FINISH_RATIO |
+-----+-----+-----+-----+-----+-----+
|           1 |           1 |
+-----+-----+-----+-----+-----+
1 row in set (42.34 sec)

mysql> SHOW TABLE t1 REGIONS;
+---
↪ -----+-----+-----+-----+-----+-----+-----+
↪
| REGION_ID | START_KEY | END_KEY | LEADER_ID | LEADER_STORE_ID | PEERS |
↪ SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB) |
↪ APPROXIMATE_KEYS |
+---
↪ -----+-----+-----+-----+-----+-----+-----+
↪
|    94 | t_75_ | t_75_r_31717 | 95 | 1 | 95 |
↪ 0 | 0 | 0 | 112 |
↪ 207465 |
|    98 | t_75_r_31717 | t_75_r_47575 | 99 | 1 | 99 |
↪ 0 | 1325 | 0 | 53 |
↪ 12052 |
|    96 | t_75_r_47575 | t_75_r_63434 | 97 | 1 | 97 |
↪ 0 | 1526 | 0 | 48 |
↪ 0 |
|    2 | t_75_r_63434 | | 3 | 1 | 3 |
↪ 0 | 0 | 55752049 | 60 |
↪ 0 |
+---
↪ -----+-----+-----+-----+-----+-----+-----+
↪
```

```
4 rows in set (0.00 sec)
```

The above output shows that Region 96 was split, with a new Region 98 being created. The remaining Regions in the table were unaffected by the split operation. This is confirmed by the output statistics:

- **TOTAL_SPLIT_REGION** indicates the number of newly split Regions. In this example, the number is 1.
- **SCATTER_FINISH_RATIO** indicates the rate at which the newly split Regions are successfully scattered. 1.0 means that all Regions are scattered.

For a more detailed example:

```
mysql> show table t regions;
+---
↪ -----+-----+-----+-----+
↪
| REGION_ID | START_KEY | END_KEY    | LEADER_ID | LEADER_STORE_ID | PEERS
↪   | SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB) |
↪ APPROXIMATE_KEYS |
+---
↪ -----+-----+-----+-----+
↪
| 102      | t_43_r    | t_43_r_20000 | 118      | 7                | 105, 118,
↪ 119 | 0          | 0            | 0        | 1                | 0
↪
| 106      | t_43_r_20000 | t_43_r_40000 | 120      | 7                | 107, 108,
↪ 120 | 0          | 23          | 0        | 1                | 0
↪
| 110      | t_43_r_40000 | t_43_r_60000 | 112      | 9                | 112, 113,
↪ 121 | 0          | 0            | 0        | 1                | 0
↪
| 114      | t_43_r_60000 | t_43_r_80000 | 122      | 7                | 115, 122,
↪ 123 | 0          | 35          | 0        | 1                | 0
↪
| 3        | t_43_r_80000 |              | 93       | 8                | 5, 73, 93
↪   | 0          | 0            | 0        | 1                | 0
↪
| 98       | t_43_     | t_43_r      | 99       | 1                | 99, 100,
↪ 101 | 0          | 0            | 0        | 1                | 0
↪
+---
↪ -----+-----+-----+-----+
↪
6 rows in set
```

In the above example:

- Table `t` corresponds to six Regions. In these Regions, 102, 106, 110, 114, and 3 store the row data and 98 stores the index data.
- For `START_KEY` and `END_KEY` of Region 102, `t_43` indicates the table prefix and ID. `_r` is the prefix of the record data in table `t`. `_i` is the prefix of the index data.
- In Region 102, `START_KEY` and `END_KEY` mean that record data in the range of `[-inf, ↪ 20000)` is stored. In similar way, the ranges of data storage in Regions (106, 110, 114, 3) can also be calculated.
- Region 98 stores the index data. The start key of table `t`'s index data is `t_43_i`, which is in the range of Region 98.

To check the Region that corresponds to table `t` in store 1, use the `WHERE` clause:

```
test> show table t regions where leader_store_id =1;
```

```
+--  
↪ -----+-----+-----+-----+-----+-----+-----+  
↪  
| REGION_ID | START_KEY | END_KEY | LEADER_ID | LEADER_STORE_ID | PEERS |  
↪ SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB) |  
↪ APPROXIMATE_KEYS |  
+--  
↪ -----+-----+-----+-----+-----+-----+  
↪  
| 98      | t_43_    | t_43_r  | 99      | 1              | 99, 100, 101 | 0  
↪      | 0        | 0        | 1        | 0              | 0              |  
+--  
↪ -----+-----+-----+-----+-----+-----+  
↪
```

Use `SPLIT TABLE REGION` to split the index data into Regions. In the following example, the index data name of table `t` is split into two Regions in the range of `[a,z]`.

```
test> split table t index name between ("a") and ("z") regions 2;
```

```
+-----+-----+  
| TOTAL_SPLIT_REGION | SCATTER_FINISH_RATIO |  
+-----+-----+  
| 2                 | 1.0                   |  
+-----+-----+  
1 row in set
```

Now table `t` corresponds to seven Regions. Five of them (102, 106, 110, 114, 3) store the record data of table `t` and another two (135, 98) store the index data name.

```
test> show table t regions;
```

```

+--
↳ -----+-----+-----+-----+-----+-----+-----+-----+-----+
↳
| REGION_ID | START_KEY          | END_KEY          | LEADER_ID |
↳ LEADER_STORE_ID | PEERS    | SCATTERING | WRITTEN_BYTES | READ_BYTES
↳ | APPROXIMATE_SIZE(MB) | APPROXIMATE_KEYS |
+--
↳ -----+-----+-----+-----+-----+-----+-----+-----+-----+
↳
| 102      | t_43_r            | t_43_r_20000    | 118      |
↳ 7        | 105, 118, 119 | 0              | 0        | 1
↳          | 0              |                |          |
| 106      | t_43_r_20000     | t_43_r_40000    | 120      |
↳ 7        | 108, 120, 126 | 0              | 0        | 1
↳          | 0              |                |          |
| 110      | t_43_r_40000     | t_43_r_60000    | 112      |
↳ 9        | 112, 113, 121 | 0              | 0        | 1

12.10.2.123 SHUTDOWN

The SHUTDOWN statement is used to perform a shutdown operation in TiDB. Execution of the SHUTDOWN statement requires the user to have SHUTDOWN privilege.

12.10.2.123.1 Synopsis

Statement:

Figure 346: Statement

12.10.2.123.2 Examples

```
SHUTDOWN;
```

```
Query OK, 0 rows affected (0.00 sec)
```

12.10.2.123.3 MySQL compatibility

Note:

Because TiDB is a distributed database, the shutdown operation in TiDB stops the client-connected TiDB instance, not the entire TiDB cluster.

The SHUTDOWN statement is partly compatible with MySQL. If you encounter any compatibility issues, you can report the issues [on GitHub](#).

12.10.2.124 Split Region

For each new table created in TiDB, one **Region** is segmented by default to store the data of this table. This default behavior is controlled by `split-table` in the TiDB configuration file. When the data in this Region exceeds the default Region size limit, the Region starts to split into two.

In the above case, because there is only one Region at the beginning, all write requests occur on the TiKV where the Region is located. If there are a large number of writes for the newly created table, hotspots are caused.

To solve the hotspot problem in the above scenario, TiDB introduces the pre-split function, which can pre-split multiple Regions for a certain table according to the specified parameters and scatter them to each TiKV node.

12.10.2.124.1 Synopsis

Figure 353: Int64Num

12.10.2.124.2 Usage of Split Region

There are two types of Split Region syntax:

- The syntax of even split:

```
SPLIT TABLE table_name [INDEX index_name] BETWEEN (lower_value) AND (
    ↪ upper_value) REGIONS region_num
```

`BETWEEN lower_value AND upper_value REGIONS region_num` defines the upper boundary, the lower boundary, and the Region amount. Then the current region will be evenly split into the number of regions (as specified in `region_num`) between the upper and lower boundaries.

- The syntax of uneven split:

```
SPLIT TABLE table_name [INDEX index_name] BY (value_list) [, (
    ↪ value_list)] ...
```

`BY value_list...` specifies a series of points manually, based on which the current Region is split. It is suitable for scenarios with unevenly distributed data.

The following example shows the result of the `SPLIT` statement:

TOTAL_SPLIT_REGION	SCATTER_FINISH_RATIO
4	1.0

- `TOTAL_SPLIT_REGION`: the number of newly split Regions.
- `SCATTER_FINISH_RATIO`: the completion rate of scattering for newly split Regions. 1.0 means that all Regions are scattered. 0.5 means that only half of the Regions are scattered and the rest are being scattered.

Note:

The following two session variables might affect the behavior of the `SPLIT` statement:

- `tidb_wait_split_region_finish`: It might take a while to scatter the Regions. This duration depends on PD scheduling and TiKV loads. This variable is used to control when executing the `SPLIT REGION` statement whether to return the results to the client until all Regions are scattered. If its value is set to 1 (by default), TiDB returns the results only after the scattering is completed. If its value is set to 0, TiDB returns the results regardless of the scattering status.
- `tidb_wait_split_region_timeout`: This variable is to set the execution timeout of the `SPLIT REGION` statement, in seconds. The default value is 300s. If the `split` operation is not completed within the duration, TiDB returns a timeout error.

Split Table Region

The key of row data in each table is encoded by `table_id` and `row_id`. The format is as follows:

```
t[table_id]_r[row_id]
```

For example, when `table_id` is 22 and `row_id` is 11:

```
t22_r11
```

Row data in the same table have the same `table_id`, but each row has its unique `row_id` that can be used for Region split.

Even Split

Because `row_id` is an integer, the value of the key to be split can be calculated according to the specified `lower_value`, `upper_value`, and `region_num`. TiDB first calculates the step value ($\text{step} = (\text{upper_value} - \text{lower_value}) / \text{region_num}$). Then split will be done evenly per each “step” between `lower_value` and `upper_value` to generate the number of Regions as specified by `region_num`.

For example, if you want 16 evenly split Regions split from key `rangeminInt64~maxInt64` for table `t`, you can use this statement:

```
SPLIT TABLE t BETWEEN (-9223372036854775808) AND (9223372036854775807)
↳ REGIONS 16;
```

This statement splits table `t` into 16 Regions between `minInt64` and `maxInt64`. If the given primary key range is smaller than the specified one, for example, `0~1000000000`, you can use `0` and `1000000000` take place of `minInt64` and `maxInt64` respectively to split Regions.

```
SPLIT TABLE t BETWEEN (0) AND (1000000000) REGIONS 16;
```

Uneven split

If the known data is unevenly distributed, and you want a Region to be split respectively in key ranges `-inf ~ 10000`, `10000 ~ 90000`, and `90000 ~ +inf`, you can achieve this by setting fixed points, as shown below:

```
SPLIT TABLE t BY (10000), (90000);
```

Split index Region

The key of the index data in the table is encoded by `table_id`, `index_id`, and the value of the index column. The format is as follows:

```
t[table_id]_i[index_id][index_value]
```

For example, when `table_id` is 22, `index_id` is 5, and `index_value` is `abc`:

```
t22_i5abc
```

The `table_id` and `index_id` of the same index data in one table is the same. To split index Regions, you need to split Regions based on `index_value`.

Even Spilt

The way to split index evenly works the same as splitting data evenly. However, calculating the value of step is more complicated, because `index_value` might not be an integer.

The values of `upper` and `lower` are encoded into a byte array firstly. After removing the longest common prefix of `lower` and `upper` byte array, the first 8 bytes of `lower` and `upper` are converted into the `uint64` format. Then $\text{step} = (\text{upper} - \text{lower}) / \text{num}$ is calculated. After that, the calculated step is encoded into a byte array, which is appended to the longest common prefix of the `lower` and `upper` byte array for index split. Here is an example:

If the column of the `idx` index is of the integer type, you can use the following SQL statement to split index data:

```
SPLIT TABLE t INDEX idx BETWEEN (-9223372036854775808) AND  
↪ (9223372036854775807) REGIONS 16;
```

This statement splits the Region of index `idx` in table `t` into 16 Regions from `minInt64` to `maxInt64`.

If the column of index `idx1` is of `varchar` type, and you want to split index data by prefix letters.

```
SPLIT TABLE t INDEX idx1 BETWEEN ("a") AND ("z") REGIONS 25;
```

This statement splits index `idx1` into 25 Regions from `a~z`. The range of Region 1 is [`minIndexValue`, `b`); the range of Region 2 is [`b`, `c`); ... the range of Region 25 is [`y`, `↪ minIndexValue`]. For the `idx` index, data with the `a` prefix is written into Region 1, and data with the `b` prefix is written into Region 2, and so on.

In the split method above, both data with the `y` and `z` prefixes are written into Region 25, because the upper bound is not `z`, but `{` (the character next to `z` in ASCII). Therefore, a more accurate split method is as follows:

```
SPLIT TABLE t INDEX idx1 BETWEEN ("a") AND ("{" REGIONS 26;
```

This statement splits index `idx1` of the table `t` into 26 Regions from `a~{`. The range of Region 1 is [`minIndexValue`, `b`); the range of Region 2 is [`b`, `c`); ... the range of Region 25 is [`y`, `z`), and the range of Region 26 is [`z`, `maxIndexValue`).

If the column of index `idx2` is of time type like `timestamp/datetime`, and you want to split index Region by year:

```
SPLIT TABLE t INDEX idx2 BETWEEN ("2010-01-01 00:00:00") AND ("2020-01-01  
↪ 00:00:00") REGIONS 10;
```

This statement splits the Region of index `idx2` in table `t` into 10 Regions from `2010-01-01 00:00:00` to `2020-01-01 00:00:00`. The range of Region 1 is [`minIndexValue` `↪` , `2011-01-01 00:00:00`); the range of Region 2 is [`2011-01-01 00:00:00`, `↪ 2012-01-01 00:00:00`) and so on.

If you want to split the index Region by day, see the following example:

```
SPLIT TABLE t INDEX idx2 BETWEEN ("2020-06-01 00:00:00") AND ("2020-07-01  
↪ 00:00:00") REGIONS 30;
```

This statement splits the data of June 2020 of index `idx2` in table `t` into 30 Regions, each Region representing 1 day.

Region split methods for other types of index columns are similar.

For data Region split of joint indexes, the only difference is that you can specify multiple columns values.

For example, index `idx3` (a, b) contains 2 columns, with column a of timestamp type and column b int. If you just want to do a time range split according to column a, you can use the SQL statement for splitting time index of a single column. In this case, do not specify the value of column b in `lower_value` and `upper_value`.

```
SPLIT TABLE t INDEX idx3 BETWEEN ("2010-01-01 00:00:00") AND ("2020-01-01
↳ 00:00:00") REGIONS 10;
```

Within the same range of time, if you want to do one more split according to column b column. Just specify the value for column b when splitting.

```
SPLIT TABLE t INDEX idx3 BETWEEN ("2010-01-01 00:00:00", "a") AND ("
↳ 2010-01-01 00:00:00", "z") REGIONS 10;
```

This statement splits 10 Regions in the range of a~z according to the value of column b, with the same time prefix as column a. If the value specified for column a is different, the value of column b might not be used in this case.

If the primary key of the table is a **non-clustered index**, you need to use backticks ` to escape the PRIMARY keyword when splitting Regions. For example:

```
SPLIT TABLE t INDEX `PRIMARY` BETWEEN (-9223372036854775808) AND
↳ (9223372036854775807) REGIONS 16;
```

Uneven Split

Index data can also be split by specified index values.

For example, there is `idx4` (a,b), with column a of the varchar type and column b of the timestamp type.

```
SPLIT TABLE t1 INDEX idx4 BY ("a", "2000-01-01 00:00:01"), ("b", "
↳ 2019-04-17 14:26:19"), ("c", "");
```

This statement specifies 3 values to split 4 Regions. The range of each Region is as follows:

```
region1 [ minIndexValue           , ("a", "2000-01-01 00:00:01"))
region2 [("a", "2000-01-01 00:00:01") , ("b", "2019-04-17 14:26:19"))
region3 [("b", "2019-04-17 14:26:19") , ("c", "")           )
region4 [("c", "")                   , maxIndexValue           )
```

Split Regions for partitioned tables

Splitting Regions for partitioned tables is the same as splitting Regions for ordinary tables. The only difference is that the same split operation is performed for every partition.

- The syntax of even split:

```
SPLIT [PARTITION] TABLE t [PARTITION] [(partition_name_list...)] [INDEX
  ↪ index_name] BETWEEN (lower_value) AND (upper_value) REGIONS
  ↪ region_num
```

- The syntax of uneven split:

```
SPLIT [PARTITION] TABLE table_name [PARTITION (partition_name_list...)]
  ↪ [INDEX index_name] BY (value_list) [, (value_list)] ...
```

Examples of Split Regions for partitioned tables

1. Create a partitioned table `t`. Suppose that you want to create a Hash table divided into two partitions. The example statement is as follows:

```
create table t (a int,b int,index idx(a)) partition by hash(a)
  ↪ partitions 2;
```

After creating the table `t`, a Region is split for each partition. Use the `SHOW TABLE` `↪ REGIONS` syntax to view the Regions of this table:

```
show table t regions;
```

```
+--
  ↪ -----+-----+-----+-----+-----+
  ↪
| REGION_ID | START_KEY | END_KEY | LEADER_ID | LEADER_STORE_ID | PEERS
  ↪ | SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB
  ↪ ) | APPROXIMATE_KEYS |
+--
  ↪ -----+-----+-----+-----+
  ↪
| 1978      | t_1400_   | t_1401_ | 1979      | 4                | 1979, 1980,
  ↪ 1981 | 0         | 0         | 0         | 1                | 0
  ↪
| 6         | t_1401_   |         | 17        | 4                | 17, 18, 21
  ↪   | 0         | 223      | 0         | 1                | 0
  ↪
+--
  ↪ -----+-----+-----+-----+
  ↪
```

2. Use the `SPLIT` syntax to split a Region for each partition. Suppose that you want to split the data in the `[0,10000]` range of each partition into four Regions. The example statement is as follows:

```
split partition table t between (0) and (10000) regions 4;
```

In the above statement, 0 and 10000 respectively represent the `row_id` of the upper and lower boundaries corresponding to the hotspot data you want to scatter.

Note:

This example only applies to scenarios where hotspot data is evenly distributed. If the hotspot data is unevenly distributed in a specified data range, refer to the syntax of uneven split in [Split Regions for partitioned tables](#).

- Use the `SHOW TABLE REGIONS` syntax to view the Regions of this table again. You can see that this table now has ten Regions, each partition with five Regions, four of which are the row data and one is the index data.

```
show table t regions;
```

```
+--
  ↪ -----+-----+-----+-----+-----+
  ↪
| REGION_ID | START_KEY | END_KEY      | LEADER_ID | LEADER_STORE_ID |
  ↪ PEERS      | SCATTERING | WRITTEN_BYTES | READ_BYTES |
  ↪ APPROXIMATE_SIZE(MB) | APPROXIMATE_KEYS |
+--
  ↪ -----+-----+-----+-----+

  ↪                | 0          |                |            |                  |
| 1990      | t_1401_r    | t_1401_r_2500 | 1992      | 2                |
  ↪ 1991, 1992, 2020 | 0          | 120            | 0          | 1                |
  ↪                | 0          |                |            |                  |
```

1994	t_1401_r_2500	t_1401_r_5000	1997	5	
↪	1996, 1997, 2021	0	129	0	1
↪		0			
2002	t_1401_r_5000	t_1401_r_7500	2003	4	
↪	2003, 2023, 2022	0	141	0	1
↪		0			
6	t_1401_r_7500		17	4	17,
↪	18, 21	0	601	0	1
↪		0			
1986	t_1401_	t_1401_r	1989	5	
↪	1989, 2018, 2019	0	123	0	1
↪		0			
+--					
↪	-----+-----+-----+-----+-----+				
↪					

4. You can also split Regions for the index of each partition. For example, you can split the [1000,10000] range of the `idx` index into two Regions. The example statement is as follows:

```
split partition table t index idx between (1000) and (10000) regions
↪ 2;
```

Examples of Split Region for a single partition

You can specify the partition to be split.

1. Create a partitioned table. Suppose that you want to create a Range partitioned table split into three partitions. The example statement is as follows:

```
create table t ( a int, b int, index idx(b)) partition by range( a ) (
  partition p1 values less than (10000),
  partition p2 values less than (20000),
  partition p3 values less than (MAXVALUE) );
```

2. Suppose that you want to split the data in the [0,10000] range of the p1 partition into two Regions. The example statement is as follows:

```
split partition table t partition (p1) between (0) and (10000) regions
↪ 2;
```

3. Suppose that you want to split the data in the [10000,20000] range of the p2 partition into two Regions. The example statement is as follows:

```
split partition table t partition (p2) between (10000) and (20000)
↪ regions 2;
```

4. You can use the `SHOW TABLE REGIONS` syntax to view the Regions of this table:

```
show table t regions;
```

```
+--
↪ -----+-----+-----+-----+
↪
| REGION_ID | START_KEY  | END_KEY      | LEADER_ID | LEADER_STORE_ID |
↪ PEERS      | SCATTERING | WRITTEN_BYTES | READ_BYTES |
↪ APPROXIMATE_SIZE(MB) | APPROXIMATE_KEYS |
+--

↪ 2043, 2045, 2044 | 0          | 0              | 0          | 1                |
↪                | 0          |                |            |                  |
| 2032      | t_1406_r_5000 | t_1407_      | 2033      | 4                |
↪ 2033, 2034, 2035 | 0          | 0              | 0          | 1                |
↪                | 0          |                |            |                  |
| 2046      | t_1407_    | t_1407_r_15000 | 2048      | 2                |
↪ 2047, 2048, 2050 | 0          | 35             | 0          | 1                |
↪                | 0          |                |            |                  |
| 2036      | t_1407_r_15000 | t_1408_      | 2037      | 4                |
↪ 2037, 2038, 2039 | 0          | 0              | 0          | 1                |
↪                | 0          |                |            |                  |
| 6         | t_1408_    |                | 17        | 4                |
↪ 17, 18, 21      | 0          | 214            | 0          | 1                |
↪                | 0          |                |            |                  |
+--
↪ -----+-----+-----+-----+
↪
```

5. Suppose that you want to split the `[0,20000]` range of the `idx` index of the `p1` and `p2` partitions into two Regions. The example statement is as follows:

```
split partition table t partition (p1,p2) index idx between (0) and
↪ (20000) regions 2;
```

12.10.2.124.3 pre_split_regions

To have evenly split Regions when a table is created, it is recommended you use `SHARD_ROW_ID_BITS` together with `PRE_SPLIT_REGIONS`. When a table is created successfully, `PRE_SPLIT_REGIONS` pre-splits tables into the number of Regions as specified by `2^(PRE_SPLIT_REGIONS)`.

Note:

The value of `PRE_SPLIT_REGIONS` must be less than or equal to that of `SHARD_ROW_ID_BITS`.

The `tidb_scatter_region` global variable affects the behavior of `PRE_SPLIT_REGIONS` \leftrightarrow . This variable controls whether to wait for Regions to be pre-split and scattered before returning results after the table creation. If there are intensive writes after creating the table, you need to set the value of this variable to 1, then TiDB will not return the results to the client until all the Regions are split and scattered. Otherwise, TiDB writes the data before the scattering is completed, which will have a significant impact on write performance.

Examples of `pre_split_regions`

```
create table t (a int, b int, index idx1(a)) shard_row_id_bits = 4
 $\leftrightarrow$  pre_split_regions=2;
```

After building the table, this statement splits 4 + 1 Regions for table t. 4 (2^2) Regions are used to save table row data, and 1 Region is for saving the index data of `idx1`.

The ranges of the 4 table Regions are as follows:

```
region1: [ -inf      , 1<<61 )
region2: [ 1<<61     , 2<<61 )
region3: [ 2<<61     , 3<<61 )
region4: [ 3<<61     , +inf  )
```

Note:

The Region split by the Split Region statement is controlled by the **Region merge** scheduler in PD. To avoid PD re-merging the newly split Region soon after, you need to **dynamically modify** configuration items related to the Region merge feature.

12.10.2.124.4 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

12.10.2.124.5 See also

- **SHOW TABLE REGIONS**

- Session variables: `tidb_scatter_region`, `tidb_wait_split_region_finish` and `tidb_wait_split_region_timeout`.

12.10.2.125 START TRANSACTION

This statement starts a new transaction inside of TiDB. It is similar to the statement `BEGIN`.

In the absence of a `START TRANSACTION` statement, every statement will by default autocommit in its own transaction. This behavior ensures MySQL compatibility.

12.10.2.125.1 Synopsis

BeginTransactionStmt:

```
BeginTransactionStmt ::=
  'BEGIN' ( 'PESSIMISTIC' | 'OPTIMISTIC' )?
| 'START' 'TRANSACTION' ( 'READ' ( 'WRITE' | 'ONLY' ( ( 'WITH' 'TIMESTAMP'
  ↳ 'BOUND' TimestampBound )? | AsOfClause ) ) | 'WITH' 'CONSISTENT' '
  ↳ SNAPSHOT' | 'WITH' 'CAUSAL' 'CONSISTENCY' 'ONLY' )?

AsOfClause ::=
  ( 'AS' 'OF' 'TIMESTAMP' Expression)
```

12.10.2.125.2 Examples

```
mysql> CREATE TABLE t1 (a int NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.12 sec)

mysql> START TRANSACTION;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.00 sec)

mysql> COMMIT;
Query OK, 0 rows affected (0.01 sec)
```

12.10.2.125.3 MySQL compatibility

- `START TRANSACTION` immediately starts a transaction inside TiDB. This differs from MySQL, where `START TRANSACTION` lazily creates a transaction. But `START TRANSACTION` in TiDB is equivalent to MySQL's `START TRANSACTION WITH CONSISTENT SNAPSHOT`.
- The statement `START TRANSACTION READ ONLY` is parsed for compatibility with MySQL, but still allows write operations.

- [ROLLBACK](#)
- [BEGIN](#)
- [START TRANSACTION WITH CAUSAL CONSISTENCY ONLY](#)

12.10.2.126 TABLE

The TABLE statement can be used instead of SELECT * FROM when no aggregation or complex filtering is needed.

12.10.2.126.1 Synopsis

```
TableStmt ::=  
  "TABLE" Table ( "ORDER BY" Column )? ( "LIMIT" NUM )?
```

12.10.2.126.2 Examples

```
CREATE TABLE t1(id INT PRIMARY KEY);
```

```
Query OK, 0 rows affected (0.31 sec)
```

```
INSERT INTO t1 VALUES (1),(2),(3);
```

```
Query OK, 3 rows affected (0.06 sec)  
Records: 3 Duplicates: 0 Warnings: 0
```

```
TABLE t1;
```

```
+----+  
| id |  
+----+  
| 1 |  
| 2 |  
| 3 |  
+----+  
3 rows in set (0.01 sec)
```

```
TABLE t1 ORDER BY id DESC;
```

```
+-----+
| id |
+-----+
| 3 |
| 2 |
| 1 |
+-----+
3 rows in set (0.01 sec)
```

```
TABLE t1 LIMIT 1;
```

```
+-----+
| id |
+-----+
| 1 |
+-----+
1 row in set (0.01 sec)
```

12.10.2.126.3 MySQL compatibility

The TABLE statement was introduced in MySQL 8.0.19.

- [EXPLAIN ANALYZE](#)

12.10.2.128 TRUNCATE

The TRUNCATE statement removes all data from the table in a non-transactional way. TRUNCATE can be thought of as semantically the same as DROP TABLE + CREATE TABLE with the previous definition.

Both TRUNCATE TABLE `tableName` and TRUNCATE `tableName` are valid syntax.

12.10.2.128.1 Synopsis

TruncateTableStmt:

Figure 358: TruncateTableStmt

OptTable:

Figure 359: OptTable

12.10.2.128.2 Examples

```
mysql> CREATE TABLE t1 (a INT NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.01 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+----+
| a |
+----+
| 1 |
| 2 |
| 3 |
| 4 |
| 5 |
+----+
5 rows in set (0.00 sec)

mysql> TRUNCATE t1;
Query OK, 0 rows affected (0.11 sec)
```

```
mysql> SELECT * FROM t1;
Empty set (0.00 sec)

mysql> INSERT INTO t1 VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.01 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> TRUNCATE TABLE t1;
Query OK, 0 rows affected (0.11 sec)
```

12.10.2.128.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

12.10.2.129.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
  ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1), (2), (3);
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+----+-----+
| id | c1 |
+----+-----+
| 1 | 1 |
| 2 | 2 |
| 3 | 3 |
+----+-----+
3 rows in set (0.00 sec)

mysql> UPDATE t1 SET c1=5 WHERE c1=3;
Query OK, 1 row affected (0.01 sec)
Rows matched: 1 Changed: 1 Warnings: 0

mysql> SELECT * FROM t1;
+----+-----+
| id | c1 |
+----+-----+
| 1 | 1 |
| 2 | 2 |
| 3 | 5 |
+----+-----+
3 rows in set (0.00 sec)
```

12.10.2.129.3 MySQL compatibility

TiDB always uses the original value of a column when evaluating expressions. For example:

```
CREATE TABLE t (a int, b int);
INSERT INTO t VALUES (1,2);
UPDATE t SET a = a+1,b=a;
```

In MySQL, the column `b` is updated to 2 because it is set to the value of `a`, and the value of `a` (which is 1) is updated to `a+1` (which is 2) in the same statement.

TiDB follows the more standard SQL behavior, and updates `b` to 1.

12.10.2.131 WITH

A Common Table Expression (CTE) is a temporary result set that can be referred multiple times within a SQL statement to improve the statement's readability and execution efficiency. You can apply the `WITH` statement to use Common Table Expressions.

12.10.2.131.1 Synopsis

WithClause:

```
WithClause ::=
    "WITH" WithList
|    "WITH" recursive WithList
```

WithList:

```
WithList ::=
    WithList ',' CommonTableExpr
|    CommonTableExpr
```

CommonTableExpr:

```
CommonTableExpr ::=
    Identifier IdentListWithParenOpt "AS" SubSelect
```

IdentListWithParenOpt:

```
IdentListWithParenOpt ::=
    ( '(' IdentList ')' )?
```

12.10.2.131.2 Examples

Non-recursive CTE:

```
WITH CTE AS (SELECT 1, 2) SELECT * FROM cte t1, cte t2;
```

```
+---+---+---+---+
| 1 | 2 | 1 | 2 |
+---+---+---+---+
| 1 | 2 | 1 | 2 |
+---+---+---+---+
1 row in set (0.00 sec)
```

Recursive CTE:

```
WITH RECURSIVE cte(a) AS (SELECT 1 UNION SELECT a+1 FROM cte WHERE a < 5)
↪ SELECT * FROM cte;
```

```
+----+
| a |
+----+
| 1 |
| 2 |
| 3 |
| 4 |
| 5 |
+----+
5 rows in set (0.00 sec)
```

12.10.2.131.3 MySQL compatibility

- In strict mode, when the data length recursively calculated exceeds the data length of the seed part, TiDB returns a warning while MySQL returns an error. In non-strict mode, the behavior of TiDB is consistent with that of MySQL.
- The data type for recursive CTE is determined by the seed part. The data type of the seed part is not completely consistent with MySQL in some cases (such as functions).
- In the case of multiple UNION / UNION ALL operators, MySQL does not allow UNION to be followed by UNION ALL, but TiDB does.
- If there is a problem with the definition of a CTE, TiDB will report an error, while MySQL will not if the CTE is not referred.

12.10.3 Data Types

12.10.3.1 Data Types

TiDB supports all the data types in MySQL except the SPATIAL type. This includes all the [numeric types](#), [string types](#), [date & time types](#), and [the JSON type](#).

The definitions used for datatypes are specified as T(M[, D]). Where by:

- T indicates the specific data type.

- **M** indicates the maximum display width for integer types. For floating-point and fixed-point types, **M** is the total number of digits that can be stored (the precision). For string types, **M** is the maximum length. The maximum permissible value of **M** depends on the data type.
- **D** applies to floating-point and fixed-point types and indicates the number of digits following the decimal point (the scale).
- **fsp** applies to the **TIME**, **DATETIME**, and **TIMESTAMP** types and represents the fractional seconds precision. The **fsp** value, if given, must be in the range 0 to 6. A value of 0 signifies that there is no fractional part. If omitted, the default precision is 0.

12.10.3.2 Default Values

The **DEFAULT** value clause in a data type specification indicates a default value for a column. The default value must be a constant and cannot be a function or an expression. But for the time type, you can specify the **NOW**, **CURRENT_TIMESTAMP**, **LOCALTIME**, and **LOCALTIMESTAMP** functions as the default for **TIMESTAMP** and **DATETIME** columns.

The **BLOB**, **TEXT**, and **JSON** columns **cannot** be assigned a default value.

If a column definition includes no explicit **DEFAULT** value, TiDB determines the default value as follows:

- If the column can take **NULL** as a value, the column is defined with an explicit **DEFAULT** \hookrightarrow **NULL** clause.
- If the column cannot take **NULL** as the value, TiDB defines the column with no explicit **DEFAULT** clause.

For data entry into a **NOT NULL** column that has no explicit **DEFAULT** clause, if an **INSERT** or **REPLACE** statement includes no value for the column, TiDB handles the column according to the SQL mode in effect at the time:

- If strict SQL mode is enabled, an error occurs for transactional tables, and the statement is rolled back. For nontransactional tables, an error occurs.
- If strict mode is not enabled, TiDB sets the column to the implicit default value for the column data type.

Implicit defaults are defined as follows:

- For numeric types, the default is 0. If declared with the **AUTO_INCREMENT** attribute, the default is the next value in the sequence.
- For date and time types other than **TIMESTAMP**, the default is the appropriate “zero” value for the type. For **TIMESTAMP**, the default value is the current date and time.
- For string types other than **ENUM**, the default value is the empty string. For **ENUM**, the default is the first enumeration value.

12.10.3.3 Numeric Types

TiDB supports all the MySQL numeric types, including:

- **Integer Types** (Exact Value)
- **Floating-Point Types** (Approximate Value)
- **Fixed-Point Types** (Exact Value)

12.10.3.3.1 Integer types

TiDB supports all the MySQL integer types, including `INTEGER/INT`, `TINYINT`, `SMALLINT` \leftrightarrow , `MEDIUMINT`, and `BIGINT`. For more information, see [Integer Data Type Syntax in MySQL](#).

The following table summarizes field descriptions:

Syntax Element	Description
M	the display width of the type. Optional.
UNSIGNED	UNSIGNED. If omitted, it is SIGNED.
ZEROFILL	If you specify ZEROFILL for a numeric column, TiDB automatically adds the UNSIGNED attribute to the column.

The following table summarizes the required storage and range for integer types supported by TiDB:

Data Type	Storage Required (bytes)	Minimum Value (signed/unsigned)	Maximum value (signed/unsigned)
TINYINT \leftrightarrow	1	-128 / 0	127 / 255
SMALLINT \leftrightarrow	2	-32768 / 0	32767 / 65535
MEDIUMINT \leftrightarrow	3	-8388608 / 0	8388607 / 16777215
INT	4	-2147483648 / 0	2147483647 / 4294967295

Data Type	Storage Required (bytes)	Minimum Value (signed/unsigned)	Maximum value (signed/unsigned)
BIGINT	8	-9223372036854775808 / 0	9223372036854775807 / 18446744073709551615

BIT type

The BIT data type. A type of BIT(M) enables the storage of M-bit values. M can range from 1 to 64, with the default value of 1:

```
BIT[(M)]
```

BOOLEAN type

The BOOLEAN type and its alias BOOL are equivalent to TINYINT(1). If the value is 0, it is considered as False; otherwise, it is considered True. As in MySQL, True is 1 and False is 0:

```
BOOLEAN
```

TINYINT type

The TINYINT data type stores signed values of range [-128, 127] and unsigned values of range [0, 255]:

```
TINYINT[(M)] [UNSIGNED] [ZEROFILL]
```

SMALLINT type

The SMALLINT data type stores signed values of range [-32768, 32767], and unsigned values of range [0, 65535]:

```
SMALLINT[(M)] [UNSIGNED] [ZEROFILL]
```

MEDIUMINT type

The MEDIUMINT data type stores signed values of range [-8388608, 8388607], and unsigned values of range [0, 16777215]:

```
MEDIUMINT[(M)] [UNSIGNED] [ZEROFILL]
```

INTEGER type

The INTEGER type and its alias INT stores signed values of range [-2147483648, 2147483647], and unsigned values of range [0, 4294967295]:

```
INT[(M)] [UNSIGNED] [ZEROFILL]
```

You can also use another form:

`INTEGER[(M)] [UNSIGNED] [ZEROFILL]`

BIGINT type

The `BIGINT` data type stores signed values of range `[-9223372036854775808, 9223372036854775807]`, and unsigned values of range `[0, 18446744073709551615]`:

`BIGINT[(M)] [UNSIGNED] [ZEROFILL]`

12.10.3.3.2 Floating-point types

TiDB supports all the MySQL floating-point types, including `FLOAT`, and `DOUBLE`. For more information, see [Floating-Point Types \(Approximate Value\) - FLOAT, DOUBLE in MySQL](#).

The following table summarizes field descriptions:

Syntax Element	Description
M	the total number of digits
D	the number of digits following the decimal point
UNSIGNED	UNSIGNED. If omitted, it is SIGNED.
ZEROFILL	If you specify ZEROFILL for a numeric column, TiDB automatically adds the UNSIGNED attribute to the column.

The following table summarizes the required storage for floating-point types supported by TiDB:

Data Type	Storage Required (bytes)
<code>FLOAT</code>	4
<code>FLOAT(p)</code>	If $0 \leq p \leq 24$, it is 4; if $25 \leq p \leq 53$, it is 8
<code>DOUBLE</code>	8

FLOAT type

The `FLOAT` type stores a single-precision floating-point number. Permissible values are `-3.402823466E+38` to `-1.175494351E-38`, `0`, and `1.175494351E-38` to `3.402823466E+38`. These are the theoretical limits, based on the IEEE standard. The actual range might be slightly

smaller depending on your hardware or operating system.

`FLOAT(p)` can be used to represent the required precision in bits. TiDB uses this value only to determine whether to use `FLOAT` or `DOUBLE` for the resulting data type. If `p` is from 0 to 24, the data type becomes `FLOAT` with no `M` or `D` values. If `p` is from 25 to 53, the data type becomes `DOUBLE` with no `M` or `D` values. The range of the resulting column is the same as for the single-precision `FLOAT` or double-precision `DOUBLE` data type.

```
FLOAT[(M,D)] [UNSIGNED] [ZEROFILL]
FLOAT(p) [UNSIGNED] [ZEROFILL]
```

Note:

As in MySQL, the `FLOAT` data type stores approximate values. For values such as currency, it is recommended to use the `DECIMAL` type instead.

In TiDB, the default precision of the `FLOAT` data type is 8 digits, but in MySQL, the default precision is 6 digits. For example, assuming that you insert 123456789 and 1.23456789 into columns of the `FLOAT` type in both TiDB and MySQL, when you query the corresponding values in MySQL, you get 123457000 and 1.23457, while in TiDB, you get 123456790 and 1.2345679.

DOUBLE type

The `DOUBLE` type, and its alias `DOUBLE PRECISION` stores a double-precision floating-point number. Permissible values are -1.7976931348623157E+308 to -2.2250738585072014E-308, 0, and 2.2250738585072014E-308 to 1.7976931348623157E+308. These are the theoretical limits, based on the IEEE standard. The actual range might be slightly smaller depending on your hardware or operating system.

```
DOUBLE[(M,D)] [UNSIGNED] [ZEROFILL]
DOUBLE PRECISION [(M,D)] [UNSIGNED] [ZEROFILL], REAL[(M,D)] [UNSIGNED] [
↪ ZEROFILL]
```

Warning:

As in MySQL, the `DOUBLE` data type stores approximate values. For values such as currency, it is recommended to use the `DECIMAL` type instead.

12.10.3.3.3 Fixed-point types

TiDB supports all the MySQL floating-point types, including `DECIMAL`, and `NUMERIC`. For more information, see [Fixed-Point Types \(Exact Value\) - DECIMAL, NUMERIC in MySQL](#).

The meaning of the fields:

Syntax Element	Description
M	the total number of decimal digits
D	the number of digits after the decimal point
<code>UNSIGNED</code>	<code>UNSIGNED</code> . If omitted, it is <code>SIGNED</code> .
<code>ZEROFILL</code>	If you specify <code>ZEROFILL</code> for a numeric column, TiDB automatically adds the <code>UNSIGNED</code> attribute to the column.

DECIMAL type

`DECIMAL` and its alias `NUMERIC` store a packed “exact” fixed-point number. M is the total number of decimal digits (the precision), and D is the number of digits after the decimal point (the scale). The decimal point and (for negative numbers) the - sign are not counted in M. If D is 0, values have no decimal point or fractional part. The maximum number of digits (M) for `DECIMAL` is 65. The maximum number of supported decimals (D) is 30. If D is omitted, the default is 0. If M is omitted, the default is 10.

```
DECIMAL[(M[,D])] [UNSIGNED] [ZEROFILL]
NUMERIC[(M[,D])] [UNSIGNED] [ZEROFILL]
```

12.10.3.4 Date and Time Types

TiDB supports all MySQL date and time data types to store temporal values: `DATE`, `TIME`, `DATETIME`, `TIMESTAMP`, and `YEAR`. For more information, see [Date and Time Data Types in MySQL](#).

Each of these types has its range of valid values, and uses a zero value to indicate that it is an invalid value. In addition, the `TIMESTAMP` and `DATETIME` types can automatically generate new time values on modification.

When dealing with date and time value types, note:

- Although TiDB tries to interpret different formats, the date-portion must be in the format of year-month-day (for example, ‘1998-09-04’), rather than month-day-year or day-month-year.

- If the year-portion of a date is specified as 2 digits, TiDB converts it based on **specific rules**.
- If a numeric value is needed in the context, TiDB automatically converts the date or time value into a numeric type. For example:

```
mysql> SELECT NOW(), NOW()+0, NOW(3)+0;
+-----+-----+-----+
| NOW()          | NOW()+0      | NOW(3)+0      |
+-----+-----+-----+
| 2012-08-15 09:28:00 | 20120815092800 | 20120815092800.889 |
+-----+-----+-----+
```

- TiDB might automatically convert invalid values or values beyond the supported range to a zero value of that type. This behavior is dependent on the SQL Mode set. For example:

```
mysql> show create table t1;
+---
|<
|<
| Table | Create Table
|<
|< |
+---
|<
|<
| t1    | CREATE TABLE `t1` (
|< `a` time DEFAULT NULL
|< ) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin |
+---
|<
|<
1 row in set (0.00 sec)

mysql> select @@sql_mode;
+---
|<
|<
| @@sql_mode
|<
|< |
+---
|<
|<
```

```

| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_ZERO_DATE,
  ↳ ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,
  ↳ NO_ENGINE_SUBSTITUTION |
+---
  ↳ -----
  ↳
1 row in set (0.00 sec)

mysql> insert into t1 values ('2090-11-32:22:33:44');
ERROR 1292 (22007): Truncated incorrect time value: '
  ↳ 2090-11-32:22:33:44'
mysql> set @@sql_mode='';
  ↳
  ↳ Query OK, 0 rows affected (0.01 sec)

mysql> insert into t1 values ('2090-11-32:22:33:44');
Query OK, 1 row affected, 1 warning (0.01 sec)

mysql> select * from t1;
+-----+
| a      |
+-----+
| 00:00:00 |
+-----+
1 row in set (0.01 sec)

```

- Setting different SQL modes can change TiDB behaviors.
- If the SQL mode `NO_ZERO_DATE` is not enabled, TiDB allows month or day in the columns of `DATE` and `DATETIME` to be zero value, for example, '2009-00-00' or '2009-01-00'. If this date type is to be calculated in a function, for example, in `DATE_SUB()` or `DATE_ADD()`, the result can be incorrect.
- By default, TiDB enables the SQL mode `NO_ZERO_DATE`. This mode prevents storing zero values such as '0000-00-00'.

Different types of zero value are shown in the following table:

Date Type	“Zero” Value
DATE	'0000-00-00'
TIME	'00:00:00'
DATETIME	'0000-00-00 00:00:00'
TIMESTAMP	'0000-00-00 00:00:00'
YEAR	0000

Invalid `DATE`, `DATETIME`, `TIMESTAMP` values are automatically converted to the corresponding type of zero value (`'0000-00-00'` or `'0000-00-00 00:00:00'`) if the SQL mode permits such usage.

12.10.3.4.1 Supported types

DATE type

`DATE` only contains date-portion and no time-portion, displayed in `YYYY-MM-DD` format. The supported range is `'0000-01-01'` to `'9999-12-31'`:

```
DATE
```

TIME type

For the `TIME` type, the format is `HH:MM:SS[.fraction]` and valid values range from `'-838:59:59.000000'` to `'838:59:59.000000'`. `TIME` is used not only to indicate the time within a day but also to indicate the time interval between 2 events. An optional `fsp` value in the range from 0 to 6 may be given to specify fractional seconds precision. If omitted, the default precision is 0:

```
TIME[(fsp)]
```

Note:

Pay attention to the abbreviated form of `TIME`. For example, `'11:12'` means `'11:12:00'` instead of `'00:11:12'`. However, `'1112'` means `'00:11:12'`. These differences are caused by the presence or absence of the `:` character.

DATETIME type

`DATETIME` contains both date-portion and time-portion. Valid values range from `'0000-01-01 00:00:00.000000'` to `'9999-12-31 23:59:59.999999'`.

TiDB displays `DATETIME` values in `YYYY-MM-DD HH:MM:SS[.fraction]` format, but permits assignment of values to `DATETIME` columns using either strings or numbers. An optional `fsp` value in the range from 0 to 6 may be given to specify fractional seconds precision. If omitted, the default precision is 0:

```
DATETIME[(fsp)]
```

TIMESTAMP type

`TIMESTAMP` contains both date-portion and time-portion. Valid values range from `'1970-01-01 00:00:01.000000'` to `'2038-01-19 03:14:07.999999'` in UTC time. An optional `fsp` value

in the range from 0 to 6 may be given to specify fractional seconds precision. If omitted, the default precision is 0.

In `TIMESTAMP`, zero is not permitted to appear in the month-portion or day-portion. The only exception is zero value itself `'0000-00-00 00:00:00'`.

```
TIMESTAMP[(fsp)]
```

Timezone Handling

When `TIMESTAMP` is to be stored, TiDB converts the `TIMESTAMP` value from the current time zone to UTC time zone. When `TIMESTAMP` is to be retrieved, TiDB converts the stored `TIMESTAMP` value from UTC time zone to the current time zone (Note: `DATETIME` is not handled in this way). The default time zone for each connection is the server's local time zone, which can be modified by the environment variable `time_zone`.

Warning:

As in MySQL, the `TIMESTAMP` data type suffers from the [Year 2038 Problem](#). For storing values that may span beyond 2038, please consider using the `DATETIME` type instead.

YEAR type

The `YEAR` type is specified in the format `'YYYY'`. Supported values range from 1901 to 2155, or the zero value of 0000:

```
YEAR[(4)]
```

`YEAR` follows the following format rules:

- Four-digit numeral ranges from 1901 to 2155
- Four-digit string ranges from `'1901'` to `'2155'`
- One-digit or two-digit numeral ranges from 1 to 99. Accordingly, 1-69 is converted to 2001-2069 and 70-99 is converted to 1970-1999
- One-digit or two-digit string ranges from `'0'` to `'99'`
- Value 0 is taken as 0000 whereas the string `'0'` or `'00'` is taken as 2000

Invalid `YEAR` value is automatically converted to 0000 (if users are not using the `NO_ZERO_DATE` SQL mode).

12.10.3.4.2 Automatic initialization and update of `TIMESTAMP` and `DATETIME`

Columns with `TIMESTAMP` or `DATETIME` value type can be automatically initialized or updated to the current time.

For any column with `TIMESTAMP` or `DATETIME` value type in the table, you can set the default or auto-update value as current timestamp.

These properties can be set by setting `DEFAULT CURRENT_TIMESTAMP` and `ON UPDATE CURRENT_TIMESTAMP` when the column is being defined. `DEFAULT` can also be set as a specific value, such as `DEFAULT 0` or `DEFAULT '2000-01-01 00:00:00'`.

```
CREATE TABLE t1 (  
  ts TIMESTAMP DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP,  
  dt DATETIME DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP  
);
```

The default value for `DATETIME` is `NULL` unless it is specified as `NOT NULL`. For the latter situation, if no default value is set, the default value is `0`.

```
CREATE TABLE t1 (  
  dt1 DATETIME ON UPDATE CURRENT_TIMESTAMP, -- default NULL  
  dt2 DATETIME NOT NULL ON UPDATE CURRENT_TIMESTAMP -- default 0  
);
```

12.10.3.4.3 Decimal part of time value

`DATETIME` and `TIMESTAMP` values can contain a fractional part of up to 6 digits which is accurate to milliseconds. In any column of `DATETIME` or `TIMESTAMP` types, a fractional part is stored instead of being discarded. With a fractional part, the value is in the format of `'YYYY-MM-DD HH:MM:SS[.fraction]'`, and the fraction ranges from 000000 to 999999. A decimal point must be used to separate the fraction from the rest.

- Use `type_name(fsp)` to define a column that supports fractional precision, where `type_name` can be `TIME`, `DATETIME` or `TIMESTAMP`. For example,

```
CREATE TABLE t1 (t TIME(3), dt DATETIME(6));
```

`fsp` must range from 0 to 6.

0 means there is no fractional part. If `fsp` is omitted, the default is 0.

- When inserting `TIME`, `DATETIME` or `TIMESTAMP` which contain a fractional part, if the number of digit of the fraction is too few, or too many, rounding might be needed in the situation. For example:

```
mysql> CREATE TABLE fractest( c1 TIME(2), c2 DATETIME(2), c3 TIMESTAMP
  ↪ (2) );
Query OK, 0 rows affected (0.33 sec)

mysql> INSERT INTO fractest VALUES
  ↪ ('17:51:04.777', '2014-09-08 17:51:04.777', '2014-09-08
  ↪ 17:51:04.777');
Query OK, 1 row affected (0.03 sec)

mysql> SELECT * FROM fractest;
+-----+-----+-----+
| c1          | c2          | c3          |
+-----+-----+-----+
| 17:51:04.78 | 2014-09-08 17:51:04.78 | 2014-09-08 17:51:04.78 |
+-----+-----+-----+
1 row in set (0.00 sec)
```

12.10.3.4.4 Conversions between date and time types

Sometimes we need to make conversions between date and time types. But some conversions might lead to information loss. For example, `DATE`, `DATETIME` and `TIMESTAMP` values all have their own respective ranges. `TIMESTAMP` should be no earlier than the year 1970 in UTC time or no later than UTC time '2038-01-19 03:14:07'. Based on this rule, '1968-01-01' is a valid date value of `DATE` or `DATETIME`, but becomes 0 when it is converted to `TIMESTAMP`.

The conversions of `DATE`:

- When `DATE` is converted to `DATETIME` or `TIMESTAMP`, a time-portion '00:00:00' is added, because `DATE` does not contain any time information
- When `DATE` is converted to `TIME`, the result is '00:00:00'

Conversions of `DATETIME` or `TIMESTAMP`:

- When `DATETIME` or `TIMESTAMP` is converted to `DATE`, the time and fractional part is discarded. For example, '1999-12-31 23:59:59.499' is converted to '1999-12-31'
- When `DATETIME` or `TIMESTAMP` is converted to `TIME`, the date-portion is discarded, because `TIME` does not contain any date information

When we convert `TIME` to other time and date formats, the date-portion is automatically specified as `CURRENT_DATE()`. The final converted result is a date that consists of `TIME` and `CURRENT_DATE()`. This is to say that if the value of `TIME` is beyond the range from '00:00:00' to '23:59:59', the converted date-portion does not indicate the current day.

When `TIME` is converted to `DATE`, the process is similar, and the time-portion is discarded.

Using the `CAST()` function can explicitly convert a value to a `DATE` type. For example:

```
date_col = CAST(datetime_col AS DATE)
```

Converting TIME and DATETIME to numeric format. For example:

```
mysql> SELECT CURTIME(), CURTIME()+0, CURTIME(3)+0;
+-----+-----+-----+
| CURTIME() | CURTIME()+0 | CURTIME(3)+0 |
+-----+-----+-----+
| 09:28:00 |          92800 | 92800.887 |
+-----+-----+-----+
mysql> SELECT NOW(), NOW()+0, NOW(3)+0;
+-----+-----+-----+
| NOW()          | NOW()+0          | NOW(3)+0          |
+-----+-----+-----+
| 2012-08-15 09:28:00 | 20120815092800 | 20120815092800.889 |
+-----+-----+-----+
```

12.10.3.4.5 Two-digit year-portion contained in the date

The two-digit year-portion contained in date does not explicitly indicate the actual year and is ambiguous.

For DATETIME, DATE and TIMESTAMP types, TiDB follows the following rules to eliminate ambiguity:

- Values between 01 and 69 is converted to a value between 2001 and 2069
- Values between 70 and 99 is converted to a value between 1970 and 1999

These rules also apply to the YEAR type, with one exception:

When numeral 00 is inserted to YEAR(4), the result is 0000 rather than 2000.

If you want the result to be 2000, specify the value to be 2000.

The two-digit year-portion might not be properly calculated in some functions such MIN() and MAX(). For these functions, the four-digit format suites better.

12.10.3.5 String Types

TiDB supports all the MySQL string types, including CHAR, VARCHAR, BINARY, VARBINARY ↪ , BLOB, TEXT, ENUM, and SET. For more information, see [String Types in MySQL](#).

12.10.3.5.1 Supported types

CHAR type

CHAR is a fixed length string. M represents the column-length in characters (not bytes). The range of M is 0 to 255. Different from the VARCHAR type, when data is inserted into a CHAR column, the trailing spaces are truncated.

```
[NATIONAL] CHAR[(M)] [CHARACTER SET charset_name] [COLLATE collation_name]
```

VARCHAR type

VARCHAR is a string of variable-length. M represents the maximum column length in characters (not bytes). The maximum size of VARCHAR cannot exceed 65,535 bytes. The maximum row length and the character set being used determine the VARCHAR length.

The space occupied by a single character might differ for different character sets. The following table shows the bytes consumed by a single character, and the range of the VARCHAR column length in each character set:

Character Set	Byte(s) per Character	Range of the Maximum VARCHAR Column Length
ascii	1	(0, 65535]
latin1	1	(0, 65535]
binary	1	(0, 65535]
utf8	3	(0, 21845]
utf8mb4	4	(0, 16383]

```
[NATIONAL] VARCHAR(M) [CHARACTER SET charset_name] [COLLATE collation_name]
```

TEXT type

TEXT is a string of variable-length. M represents the maximum column length in characters, ranging from 0 to 65,535. The maximum row length and the character set being used determine the TEXT length.

```
TEXT[(M)] [CHARACTER SET charset_name] [COLLATE collation_name]
```

TINYTEXT type

The TINYTEXT type is similar to the **TEXT** type. The difference is that the maximum column length of TINYTEXT is 255.

```
TINYTEXT [CHARACTER SET charset_name] [COLLATE collation_name]
```

MEDIUMTEXT type

The MEDIUMTEXT type is similar to the **TEXT** type. The difference is that the maximum column length of MEDIUMTEXT is 16,777,215.

```
MEDIUMTEXT [CHARACTER SET charset_name] [COLLATE collation_name]
```

LONGTEXT type

The LONGTEXT type is similar to the **TEXT** type. The difference is that the maximum column length of LONGTEXT is 4,294,967,295. But due to the limitation of **txn-entry-size** \leftrightarrow **-limit**, the maximum storage size of a single row in TiDB is 6 MiB by default and can be increased to 120 MiB by changing the configuration.

```
LONGTEXT [CHARACTER SET charset_name] [COLLATE collation_name]
```

BINARY type

The BINARY type is similar to the CHAR type. The difference is that BINARY stores binary byte strings.

```
BINARY(M)
```

VARBINARY type

The VARBINARY type is similar to the VARCHAR type. The difference is that the VARBINARY stores binary byte strings.

```
VARBINARY(M)
```

BLOB type

BLOB is a large binary file. M represents the maximum column length in bytes, ranging from 0 to 65,535.

```
BLOB [(M)]
```

TINYBLOB type

The TINYBLOB type is similar to the BLOB type. The difference is that the maximum column length of TINYBLOB is 255.

```
TINYBLOB
```

MEDIUMBLOB type

The MEDIUMBLOB type is similar to the BLOB type. The difference is that the maximum column length of MEDIUMBLOB is 16,777,215.

```
MEDIUMBLOB
```

LOB type

The LOB type is similar to the BLOB type. The difference is that the maximum column length of LOB is 4,294,967,295. But due to the limitation of `txn-entry-size` \leftrightarrow `-limit`, the maximum storage size of a single row in TiDB is 6 MiB by default and can be increased to 120 MiB by changing the configuration.

```
LOB
```

ENUM type

An ENUM is a string object with a value chosen from a list of permitted values that are enumerated explicitly in the column specification when the table is created. The syntax is:

```
ENUM('value1', 'value2', ...) [CHARACTER SET charset_name] [COLLATE
  ↪ collation_name]
```

For example:

```
ENUM('apple', 'orange', 'pear')
```

The value of the ENUM data type is stored as numbers. Each value is converted to a number according to the definition order. In the previous example, each string is mapped to a number:

Value	Number
NULL	NULL
"	0
'apple'	1
'orange'	2
'pear'	3

For more information, see [the ENUM type in MySQL](#).

SET type

A SET is a string object that can have zero or more values, each of which must be chosen from a list of permitted values specified when the table is created. The syntax is:

```
SET('value1', 'value2', ...) [CHARACTER SET charset_name] [COLLATE
  ↪ collation_name]
```

For example:

```
SET('1', '2') NOT NULL
```

In the example, any of the following values can be valid:

```
' '
'1'
'2'
'1,2'
```

In TiDB, the values of the SET type is internally converted to Int64. The existence of each element is represented using a binary: 0 or 1. For a column specified as SET('a', 'b' ↪ ', 'c', 'd'), the members have the following decimal and binary values.

Member	Decimal Value	Binary Value
'a'	1	0001
'b'	2	0010
'c'	4	0100

Member	Decimal Value	Binary Value
'd'	8	1000

In this case, for an element of ('a', 'c'), it is 0101 in binary.

For more information, see [the SET type in MySQL](#).

12.10.3.6 JSON Type

Warning:

This is still an experimental feature. It is **NOT** recommended that you use it in the production environment.

TiDB supports the JSON (JavaScript Object Notation) data type, which is useful for storing semi-structured data. The JSON data type provides the following advantages over storing JSON-format strings in a string column:

- Use the Binary format for serialization. The internal format permits quick read access to JSON document elements.
- Automatic validation of the JSON documents stored in JSON columns. Only valid documents can be stored.

JSON columns, like columns of other binary types, are not indexed directly, but you can index the fields in the JSON document in the form of generated column:

```
CREATE TABLE city (  
  id INT PRIMARY KEY,  
  detail JSON,  
  population INT AS (JSON_EXTRACT(detail, '$.population')),  
  index index_name (population)  
);  
INSERT INTO city (id,detail) VALUES (1, '{"name": "Beijing", "population":  
  ↪ 100}');  
SELECT id FROM city WHERE population >= 100;
```

For more information, see [JSON Functions](#) and [Generated Columns](#).

12.10.4 Functions and Operators

12.10.4.1 Function and Operator Reference

The usage of the functions and operators in TiDB is similar to MySQL. See [Functions and Operators in MySQL](#).

In SQL statements, expressions can be used on the `ORDER BY` and `HAVING` clauses of the `SELECT` statement, the `WHERE` clause of `SELECT/DELETE/UPDATE` statements, and `SET` statements.

You can write expressions using literals, column names, `NULL`, built-in functions, operators and so on. For expressions that TiDB supports pushing down to TiKV, see [List of Expressions for Pushdown](#).

12.10.4.2 Type Conversion in Expression Evaluation

TiDB behaves the same as MySQL: <https://dev.mysql.com/doc/refman/5.7/en/type-conversion.html>

12.10.4.3 Operators

This document describes the operators precedence, comparison functions and operators, logical operators, and assignment operators.

- [Operator precedence](#)
- [Comparison functions and operators](#)
- [Logical operators](#)
- [Assignment operators](#)

Name	Description
<code>AND</code> , <code>&&</code>	Logical AND
<code>=</code>	Assign a value (as part of a <code>SET</code> statement, or as part of the <code>SET</code> clause in an <code>UPDATE</code> statement)
<code>:=</code>	Assign a value
<code>BETWEEN ... AND ...</code>	Check whether a value is within a range of values
<code>BINARY</code>	Cast a string to a binary string
<code>&</code>	Bitwise AND
<code>~</code>	Bitwise inversion
<code> </code>	Bitwise OR
<code>[^]</code> (https://dev.mysql.com/doc/refman/5.7/en/bitwise-functions.html#operator_bitwise-xor)	Bitwise XOR
<code>CASE</code>	Case operator
<code>DIV</code>	Integer division

Name	Description
/	Division operator
=	Equal operator
<=>	NULL-safe equal to operator
>	Greater than operator
>=	Greater than or equal operator
IS	Test a value against a boolean
IS NOT	Test a value against a boolean
IS NOT NULL	NOT NULL value test
IS NULL	NULL value test
->	Return value from JSON column after evaluating path; equivalent to <code>JSON_EXTRACT()</code>
->>	Return value from JSON column after evaluating path and unquoting the result; equivalent to <code>JSON_UNQUOTE(JSON_EXTRACT())</code>
<<	Left shift
<	Less than operator
<=	Less than or equal operator
LIKE	Simple pattern matching
-	Minus operator
%, MOD	Modulo operator
NOT, !	Negates value
NOT BETWEEN ... AND ...	Check whether a value is not within a range of values
!=, <>	Not equal operator
NOT LIKE	Negation of simple pattern matching
NOT REGEXP	Negation of REGEXP
, OR	Logical OR
+	Addition operator
REGEXP	Pattern matching using regular expressions
>>	Right shift
RLIKE	Synonym for REGEXP
*	Multiplication operator
-	Change the sign of the argument
XOR	Logical XOR

12.10.4.3.1 Unsupported operators

- [SOUNDS LIKE](#)

12.10.4.3.2 Operator precedence

Operator precedences are shown in the following list, from highest precedence to the lowest. Operators that are shown together on a line have the same precedence.

```

INTERVAL
BINARY, COLLATE
!
- (unary minus), ~ (unary bit inversion)
^
*, /, DIV, %, MOD
-, +
<<, >>
&
|
= (comparison), <=>, >=, >, <=, <, <>, !=, IS, LIKE, REGEXP, IN
BETWEEN, CASE, WHEN, THEN, ELSE
NOT
AND, &&
XOR
OR, ||
= (assignment), :=

```

For details, see [Operator Precedence](#).

12.10.4.3.3 Comparison functions and operators

Name	Description
BETWEEN ... AND ...	Check whether a value is within a range of values
COALESCE()	Return the first non-NULL argument
=	Equal operator
<=>	NULL-safe equal to operator
>	Greater than operator
>=	Greater than or equal operator
GREATEST()	Return the largest argument
IN()	Check whether a value is within a set of values
INTERVAL()	Return the index of the argument that is less than the first argument
IS	Test a value against a boolean
IS NOT	Test a value against a boolean
IS NOT NULL	NOT NULL value test
IS NULL	NULL value test
ISNULL()	Test whether the argument is NULL
LEAST()	Return the smallest argument
<	Less than operator
<=	Less than or equal operator
LIKE	Simple pattern matching
NOT BETWEEN ... AND ...	Check whether a value is not within a range of values

Name	Description
<code>!=, <></code>	Not equal operator
<code>NOT IN()</code>	Check whether a value is not within a set of values
<code>NOT LIKE</code>	Negation of simple pattern matching
<code>STRCMP()</code>	Compare two strings

For details, see [Comparison Functions and Operators](#).

12.10.4.3.4 Logical operators

Name	Description
<code>AND, &&</code>	Logical AND
<code>NOT, !</code>	Negates value
<code> , OR</code>	Logical OR
<code>XOR</code>	Logical XOR

For details, see [MySQL Handling of GROUP BY](#).

12.10.4.3.5 Assignment operators

Name	Description
<code>=</code>	Assign a value (as part of a SET statement, or as part of the SET clause in an UPDATE statement)
<code>:=</code>	Assign a value

For details, see [Detection of Functional Dependence](#).

12.10.4.4 Control Flow Functions

TiDB supports all of the [control flow functions](#) available in MySQL 5.7.

Name	Description
<code>CASE</code>	Case operator
<code>IF()</code>	If/else construct
<code>IFNULL()</code>	Null if/else construct
<code>NULLIF()</code>	Return NULL if <code>expr1 = expr2</code>

12.10.4.5 String Functions

TiDB supports most of the [string functions](#) available in MySQL 5.7 and some of the [functions](#) available in Oracle 21.

For comparisons between functions and syntax of Oracle and TiDB, see [Comparisons between Functions and Syntax of Oracle and TiDB](#).

12.10.4.5.1 Supported functions

Name	Description
ASCII()	Return numeric value of left-most character
BIN()	Return a string containing binary representation of a number
BIT_LENGTH()	Return length of argument in bits
CHAR()	Return the character for each integer passed
CHAR_LENGTH()	Return number of characters in argument
CHARACTER_LENGTH()	Synonym for CHAR_LENGTH()
CONCAT()	Return concatenated string
CONCAT_WS()	Return concatenate with separator
ELT()	Return string at index number
EXPORT_SET()	Return a string such that for every bit set in the value bits, you get an on string and for every unset bit, you get an off string
FIELD()	Return the index (position) of the first argument in the subsequent arguments
FIND_IN_SET()	Return the index position of the first argument within the second argument
FORMAT()	Return a number formatted to specified number of decimal places
FROM_BASE64()	Decode to a base-64 string and return result
HEX()	Return a hexadecimal representation of a decimal or string value
INSERT()	Insert a substring at the specified position up to the specified number of characters
INSTR()	Return the index of the first occurrence of substring
LCASE()	Synonym for LOWER()
LEFT()	Return the leftmost number of characters as specified
LENGTH()	Return the length of a string in bytes
LIKE	Simple pattern matching
LOCATE()	Return the position of the first occurrence of substring

Name	Description
<code>LOWER()</code>	Return the argument in lowercase
<code>LPAD()</code>	Return the string argument, left-padded with the specified string
<code>LTRIM()</code>	Remove leading spaces
<code>MAKE_SET()</code>	Return a set of comma-separated strings that have the corresponding bit in bits set
<code>MID()</code>	Return a substring starting from the specified position
<code>NOT LIKE</code>	Negation of simple pattern matching
<code>NOT REGEXP</code>	Negation of <code>REGEXP</code>
<code>OCT()</code>	Return a string containing octal representation of a number
<code>OCTET_LENGTH()</code>	Synonym for <code>LENGTH()</code>
<code>ORD()</code>	Return character code for leftmost character of the argument
<code>POSITION()</code>	Synonym for <code>LOCATE()</code>
<code>QUOTE()</code>	Escape the argument for use in an SQL statement
<code>REGEXP</code>	Pattern matching using regular expressions
<code>REPEAT()</code>	Repeat a string the specified number of times
<code>REPLACE()</code>	Replace occurrences of a specified string
<code>REVERSE()</code>	Reverse the characters in a string
<code>RIGHT()</code>	Return the specified rightmost number of characters
<code>RLIKE</code>	Synonym for <code>REGEXP</code>
<code>RPAD()</code>	Append string the specified number of times
<code>RTRIM()</code>	Remove trailing spaces
<code>SPACE()</code>	Return a string of the specified number of spaces
<code>STRCMP()</code>	Compare two strings
<code>SUBSTR()</code>	Return the substring as specified
<code>SUBSTRING()</code>	Return the substring as specified
<code>SUBSTRING_INDEX()</code>	Return a substring from a string before the specified number of occurrences of the delimiter
<code>TO_BASE64()</code>	Return the argument converted to a base-64 string

Name	Description
TRANSLATE()	Replace all occurrences of characters by other characters in a string. It does not treat empty strings as NULL as Oracle does.
TRIM()	Remove leading and trailing spaces
UCASE()	Synonym for UPPER()
UNHEX()	Return a string containing hex representation of a number
UPPER()	Convert to uppercase

12.10.4.5.2 Unsupported functions

- [LOAD_FILE\(\)](#)
- [MATCH\(\)](#)
- [SOUNDEX\(\)](#)
- [WEIGHT_STRING\(\)](#)

12.10.4.6 Numeric Functions and Operators

TiDB supports all of the [numeric functions and operators](#) available in MySQL 5.7.

12.10.4.6.1 Arithmetic operators

Name	Description
+	Addition operator
-	Minus operator
*	Multiplication operator
/	Division operator
DIV	Integer division
1stinlineMOD!	Modulo operator
-	Change the sign of the argument

12.10.4.6.2 Mathematical functions

Name	Description
POW()	Return the argument raised to the specified power
POWER()	Return the argument raised to the specified power
EXP()	Raise to the power of
SQRT()	Return the square root of the argument
LN()	Return the natural logarithm of the argument

Name	Description
LOG()	Return the natural logarithm of the first argument
LOG2()	Return the base-2 logarithm of the argument
LOG10()	Return the base-10 logarithm of the argument
PI()	Return the value of pi
TAN()	Return the tangent of the argument
COT()	Return the cotangent
SIN()	Return the sine of the argument
COS()	Return the cosine
ATAN()	Return the arc tangent
ATAN2() , ATAN()	Return the arc tangent of the two arguments
ASIN()	Return the arc sine
ACOS()	Return the arc cosine
RADIANS()	Return argument converted to radians
DEGREES()	Convert radians to degrees
MOD()	Return the remainder
ABS()	Return the absolute value
CEIL()	Return the smallest integer value not less than the argument
CEILING()	Return the smallest integer value not less than the argument
FLOOR()	Return the largest integer value not greater than the argument
ROUND()	Round the argument
RAND()	Return a random floating-point value
SIGN()	Return the sign of the argument
CONV()	Convert numbers between different number bases
TRUNCATE()	Truncate to specified number of decimal places
CRC32()	Compute a cyclic redundancy check value

12.10.4.7 Date and Time Functions

TiDB supports all of the [date and time functions](#) available in MySQL 5.7.

Note:

- MySQL will often accept the incorrectly formatted date and time values. For example, '2020-01-01\n\t01:01:01' and '2020-01_01\n\t01:01' are treated as valid date and time values.
- TiDB makes the best effort to match MySQL's behavior, but it might not match in all instances. It is recommended to correctly format dates, because the intended behavior for incorrectly formatted values is not documented, and is often inconsistent.

Date/Time functions:

Name	Description
<code>ADDDATE()</code>	Add time values (intervals) to a date value
<code>ADDTIME()</code>	Add time
<code>CONVERT_TZ()</code>	Convert from one time zone to another
<code>CURDATE()</code>	Return the current date
<code>CURRENT_DATE()</code> , <code>CURRENT_DATE</code>	Synonyms for <code>CURDATE()</code>
<code>CURRENT_TIME()</code> , <code>CURRENT_TIME</code>	Synonyms for <code>CURTIME()</code>
<code>CURRENT_TIMESTAMP()</code> , <code>CURRENT_TIMESTAMP</code>	Synonyms for <code>NOW()</code>
<code>CURTIME()</code>	Return the current time
<code>DATE()</code>	Extract the date part of a date or datetime expression
<code>DATE_ADD()</code>	Add time values (intervals) to a date value
<code>DATE_FORMAT()</code>	Format date as specified
<code>DATE_SUB()</code>	Subtract a time value (interval) from a date
<code>DATEDIFF()</code>	Subtract two dates
<code>DAY()</code>	Synonym for <code>DAYOFMONTH()</code>
<code>DAYNAME()</code>	Return the name of the weekday
<code>DAYOFMONTH()</code>	Return the day of the month (0-31)
<code>DAYOFWEEK()</code>	Return the weekday index of the argument
<code>DAYOFYEAR()</code>	Return the day of the year (1-366)
<code>EXTRACT()</code>	Extract part of a date
<code>FROM_DAYS()</code>	Convert a day number to a date
<code>FROM_UNIXTIME()</code>	Format Unix timestamp as a date
<code>GET_FORMAT()</code>	Return a date format string
<code>HOUR()</code>	Extract the hour
<code>LAST_DAY</code>	Return the last day of the month for the argument
<code>LOCALTIME()</code> , <code>LOCALTIME</code>	Synonym for <code>NOW()</code>
<code>LOCALTIMESTAMP</code> , <code>LOCALTIMESTAMP()</code>	Synonym for <code>NOW()</code>
<code>MAKEDATE()</code>	Create a date from the year and day of year
<code>MAKETIME()</code>	Create time from hour, minute, second
<code>MICROSECOND()</code>	Return the microseconds from argument
<code>MINUTE()</code>	Return the minute from the argument
<code>MONTH()</code>	Return the month from the date passed
<code>MONTHNAME()</code>	Return the name of the month
<code>NOW()</code>	Return the current date and time
<code>PERIOD_ADD()</code>	Add a period to a year-month
<code>PERIOD_DIFF()</code>	Return the number of months between periods

Name	Description
<code>QUARTER()</code>	Return the quarter from a date argument
<code>SEC_TO_TIME()</code>	Converts seconds to 'HH:MM:SS' format
<code>SECOND()</code>	Return the second (0-59)
<code>STR_TO_DATE()</code>	Convert a string to a date
<code>SUBDATE()</code>	Synonym for <code>DATE_SUB()</code> when invoked with three arguments
<code>SUBTIME()</code>	Subtract times
<code>SYSDATE()</code>	Return the time at which the function executes
<code>TIME()</code>	Extract the time portion of the expression passed
<code>TIME_FORMAT()</code>	Format as time
<code>TIME_TO_SEC()</code>	Return the argument converted to seconds
<code>TIMEDIFF()</code>	Subtract time
<code>TIMESTAMP()</code>	With a single argument, this function returns the date or datetime expression; with two arguments, the sum of the arguments
<code>TIMESTAMPADD()</code>	Add an interval to a datetime expression
<code>TIMESTAMPDIFF()</code>	Subtract an interval from a datetime expression
<code>TO_DAYS()</code>	Return the date argument converted to days
<code>TO_SECONDS()</code>	Return the date or datetime argument converted to seconds since Year 0
<code>UNIX_TIMESTAMP()</code>	Return a Unix timestamp
<code>UTC_DATE()</code>	Return the current UTC date
<code>UTC_TIME()</code>	Return the current UTC time
<code>UTC_TIMESTAMP()</code>	Return the current UTC date and time
<code>WEEK()</code>	Return the week number
<code>WEEKDAY()</code>	Return the weekday index
<code>WEEKOFYEAR()</code>	Return the calendar week of the date (1-53)
<code>YEAR()</code>	Return the year
<code>YEARWEEK()</code>	Return the year and week

For details, see [Date and Time Functions](#).

12.10.4.7.1 MySQL compatibility

The function `str_to_date()` is supported by TiDB, but is unable to parse all date and time values. In addition, the following date and time formatting options are **not implemented**:

Format	Description
“%a”	Abbreviated weekday name (Sun..Sat)
“%D”	Day of the month with English suffix (0th, 1st, 2nd, 3rd)
“%U”	Week (00..53), where Sunday is the first day of the week; WEEK() mode 0
“%u”	Week (00..53), where Monday is the first day of the week; WEEK() mode 1
“%V”	Week (01..53), where Sunday is the first day of the week; WEEK() mode 2; used with %X
“%v”	Week (01..53), where Monday is the first day of the week; WEEK() mode 3; used with %x
“%W”	Weekday name (Sunday..Saturday)
“%w”	Day of the week (0=Sunday..6=Saturday)
“%X”	Year for the week where Sunday is the first day of the week, numeric, four digits.
“%x”	Year for the week, where Monday is the first day of the week, numeric, four digits.

See [issue #30082](#) for more details.

12.10.4.7.2 Related system variables

The `default_week_format` variable affects the `WEEK()` function.

12.10.4.8 Bit Functions and Operators

TiDB supports all of the [bit functions and operators](#) available in MySQL 5.7.

Bit functions and operators:

Name	Description
BIT_COUNT	Return the number of bits that are set as 1
\leftrightarrow ()	
&	Bitwise AND
~	Bitwise inversion
 	Bitwise OR
^	Bitwise XOR
<<	Left shift
>>	Right shift

12.10.4.9 Cast Functions and Operators

TiDB supports all of the [cast functions and operators](#) available in MySQL 5.7.

Name	Description
BINARY	Cast a string to a binary string
CAST()	Cast a value as a certain type
CONVERT()	Cast a value as a certain type

Cast functions and operators enable conversion of values from one data type to another.

12.10.4.10 Encryption and Compression Functions

TiDB supports most of the [encryption and compression functions](#) available in MySQL 5.7.

12.10.4.10.1 Supported functions

Name	Description
MD5()	Calculate MD5 checksum
PASSWORD()	Calculate and return a password string
RANDOM_BYTES()	Return a random byte vector
SHA1() , SHA()	Calculate an SHA-1 160-bit checksum
SHA2()	Calculate an SHA-2 checksum
AES_DECRYPT()	Decrypt using AES
AES_ENCRYPT()	Encrypt using AES
COMPRESS()	Return result as a binary string
UNCOMPRESS()	Uncompress a string compressed
UNCOMPRESSED_LENGTH()	Return the length of a string before compression

12.10.4.10.2 Related system variables

The `block_encryption_mode` variable sets the encryption mode that is used for `AES_ENCRYPT()` and `AES_DECRYPT()`.

12.10.4.10.3 Unsupported functions

- `DES_DECRYPT()`, `DES_ENCRYPT()`, `OLD_PASSWORD()`, `ENCRYPT()`: these functions were deprecated in MySQL 5.7 and removed in 8.0.
- `VALIDATE_PASSWORD_STRENGTH()`.
- Functions only available in MySQL Enterprise [Issue #2632](#).

12.10.4.11 Information Functions

TiDB supports most of the [information functions](#) available in MySQL 5.7.

12.10.4.11.1 Supported functions

Name	Description
BENCHMARK	Execute an expression in a loop
↪ ()	
CONNECTION_ID	Return the connection ID (thread ID) for the connection
↪ ()	
CURRENT_USER	Return the authenticated user name and host name
↪ ()	
CURRENT_USER	name and host name
↪ ()	
DATABASE	Return the default (current) database name
↪ ()	
FOUND_ROWS	For a SELECT with a LIMIT clause, the number of the rows that are returned if there is no LIMIT clause
↪ ()	
LAST_INSERTED_ID	Return the value of the AUTOINCREMENT column for the last INSERT
↪ ()	
ROW_COUNT	The number of rows affected
↪ ()	
SCHEMA	Synonym for DATABASE()
↪ ()	
SESSION_USER	Synonym for USER()
↪ ()	
SYSTEM_USER	Synonym for USER()
↪ ()	

Name	Description
<code>USER()</code>	Return the user name and host name provided by the client
<code>VERSION</code> <code>↔ ()</code>	Return a string that indicates the MySQL server version

12.10.4.11.2 Unsupported functions

- `CHARSET()`
- `COERCIBILITY()`
- `COLLATION()`

12.10.4.12 JSON Functions

Warning:

This is still an experimental feature. It is **NOT** recommended that you use it in the production environment.

TiDB supports most of the JSON functions that shipped with the GA release of MySQL 5.7.

12.10.4.12.1 Functions that create JSON values

Function Name	Description
<code>JSON_ARRAY([val[, val] ...])</code>	Evaluates a (possibly empty) list of values and returns a JSON array containing those values

Function Name	Description
<code>JSON_OBJECT(key, val[, key, val ...])</code>	Evaluates a (possibly empty) list of key-value pairs and returns a JSON object containing those pairs
<code>JSON_QUOTE(string)</code>	Returns a string as a JSON value with quotes

12.10.4.12.2 Functions that search JSON values

Function Name	Description
<code>JSON_CONTAINS(target, candidate[, path])</code>	Indicates by returning 1 or 0 whether a given candidate JSON document is contained within a target JSON document
<code>JSON_CONTAINS_PATH(json_doc, one_or_all, path[, path] ...)</code>	Returns 0 or 1 to indicate whether a JSON document contains data at a given path or paths

Function Name	Description
<code>JSON_EXTRACT(json_doc, path[, path] ...)</code>	Returns data from a JSON document, selected from the parts of the document matched by the <code>path</code> arguments
<code>-></code>	Returns the value from a JSON column after the evaluating path; an alias for <code>JSON_EXTRACT</code> <code>↪ (doc,</code> <code>↪ path_literal</code> <code>↪)</code>
<code>->></code>	Returns the value from a JSON column after the evaluating path and unquoting the result; an alias for <code>JSON_UNQUOTE</code> <code>↪ (</code> <code>↪ JSON_EXTRACT</code> <code>↪ (doc,</code> <code>↪ path_literal</code> <code>↪))</code>

Function Name	Description
<code>JSON_KEYS(json_doc[, path])</code>	Returns the keys from the top-level value of a JSON object as a JSON array, or, if a path argument is given, the top-level keys from the selected path
<code>JSON_SEARCH(json_doc, one_or_all, search_string)</code>	Search a JSON document for one or all matches of a string

12.10.4.12.3 Functions that modify JSON values

Function Name	Description
<code>JSON_APPEND(json_doc, path, value)</code>	An alias to <code>JSON_ARRAY_APPEND</code> ↔
<code>JSON_ARRAY_APPEND(json_doc, path, value)</code>	Appends a value to the end of a JSON array at a specified path
<code>JSON_ARRAY_INSERT(json_doc, path, val[, path, val] ...)</code>	Inserts an array into the json document and returns the modified document

Function Name	Description
<code>JSON_INSERT(json_doc, path, val[, path, val] ...)</code>	Inserts data into a JSON document and returns the result
<code>JSON_MERGE(json_doc, json_doc[, json_doc] ...)</code>	A deprecated alias for <code>JSON_MERGE_PRESERVE</code>
<code>JSON_MERGE_PATCH(json_doc, json_doc[, json_doc] ...)</code>	Merge JSON documents
<code>JSON_MERGE_PRESERVE(json_doc, json_doc[, json_doc] ...)</code>	Merges two or more JSON documents and returns the merged result
<code>JSON_REMOVE(json_doc, path[, path] ...)</code>	Removes data from a JSON document and returns the result
<code>JSON_REPLACE(json_doc, path, val[, path, val] ...)</code>	Replaces existing values in a JSON document and returns the result
<code>JSON_SET(json_doc, path, val[, path, val] ...)</code>	Inserts or updates data in a JSON document and returns the result

Function Name	Description
<code>JSON_UNQUOTE(json_val)</code>	Unquotes a JSON value and returns the result as a string
<code>JSON_ARRAY_APPEND(json_doc, path, val[, path, val] ...)</code>	Appends values to the end of the indicated arrays within a JSON document and returns the result
<code>JSON_ARRAY_INSERT(json_doc, path, val[, path, val] ...)</code>	Insert values into the specified location of a JSON document and returns the result

12.10.4.12.4 Functions that return JSON value attributes

Function Name	Description
<code>JSON_DEPTH(json_doc)</code>	Returns the maximum depth of a JSON document
<code>JSON_LENGTH(json_doc[, path])</code>	Returns the length of a JSON document, or, if a path argument is given, the length of the value within the path

Function Name	Description
JSON_TYPE(json_val)	Returns a string indicating the type of a JSON value
JSON_VALID(json_doc)	Checks if a json_doc is valid JSON. Useful for checking a column before converting it to the json type.

12.10.4.12.5 Utility Functions

Function Name	Description
JSON_PRETTY(json_doc)	Pretty formatting of a JSON document
JSON_STORAGE_SIZE(json_doc)	Returns an approximate size of bytes required to store the json value. As the size does not account for TiKV using compression, the output of this function is not strictly compatible with MySQL.

12.10.4.12.6 Aggregate Functions

Function Name	Description
JSON_ARRAYAGG(key)	Provides an aggregation of keys.
JSON_OBJECTAGG(key, value)	Provides an aggregation of values for a given key.

12.10.4.12.7 See also

- [JSON Function Reference](#)
- [JSON Data Type](#)

12.10.4.13 Aggregate (GROUP BY) Functions

This document describes details about the supported aggregate functions in TiDB.

12.10.4.13.1 Supported aggregate functions

This section describes the supported MySQL GROUP BY aggregate functions in TiDB.

Name	Description
COUNT()	Return a count of the number of rows returned
COUNT(DISTINCT)	Return the count of a number of different values
SUM()	Return the sum
AVG()	Return the average value of the argument
MAX()	Return the maximum value
MIN()	Return the minimum value
GROUP_CONCAT()	Return a concatenated string
VARIANCE() , VAR_POP()	Return the population standard variance
STD() , STDDEV() , STDDEV_POP()	Return the population standard deviation
VAR_SAMP()	Return the sample variance
STDDEV_SAMP()	Return the sample standard deviation

Name	Description
<code>JSON_OBJECTAGG(key, value)</code>	Return the result set as a single JSON object containing key-value pairs

- Unless otherwise stated, group functions ignore NULL values.
- If you use a group function in a statement containing no **GROUP BY** clause, it is equivalent to grouping on all rows.

In addition, TiDB also provides the following aggregate functions:

- `APPROX_PERCENTILE(expr, constant_integer_expr)`

This function returns the percentile of `expr`. The `constant_integer_expr` argument indicates the percentage value which is a constant integer in the range of [1,100]. A percentile `Pk` (`k` represents percentage) indicates that there are at least `k%` values in the data set that are less than or equal to `Pk`.

This function only supports the **numeric type** and the **date and time type** as the returned type of `expr`. For other returned types, `APPROX_PERCENTILE` only returns NULL.

The following example shows how to calculate the fiftieth percentile of a INT column:

```
drop table if exists t;
create table t(a int);
insert into t values(1), (2), (3);
```

```
select approx_percentile(a, 50) from t;
```

```
+-----+
| approx_percentile(a, 50) |
+-----+
|                          2 |
+-----+
1 row in set (0.00 sec)
```

Except for the `GROUP_CONCAT()` and `APPROX_PERCENTILE()` functions, all the preceding functions can serve as **Window functions**.

12.10.4.13.2 GROUP BY modifiers

TiDB does not currently support **GROUP BY** modifiers such as `WITH ROLLUP`. We plan to add support in the future. See [TiDB #4250](#).

12.10.4.13.3 SQL mode support

TiDB supports the SQL Mode `ONLY_FULL_GROUP_BY`, and when enabled TiDB will refuse queries with ambiguous non-aggregated columns. For example, this query is illegal with `ONLY_FULL_GROUP_BY` enabled because the non-aggregated column “b” in the `SELECT` list does not appear in the `GROUP BY` statement:

```
drop table if exists t;
create table t(a bigint, b bigint, c bigint);
insert into t values(1, 2, 3), (2, 2, 3), (3, 2, 3);

mysql> select a, b, sum(c) from t group by a;
+-----+-----+-----+
| a    | b    | sum(c) |
+-----+-----+-----+
| 1    | 2    | 3      |
| 2    | 2    | 3      |
| 3    | 2    | 3      |
+-----+-----+-----+
3 rows in set (0.01 sec)

mysql> set sql_mode = 'ONLY_FULL_GROUP_BY';
Query OK, 0 rows affected (0.00 sec)

mysql> select a, b, sum(c) from t group by a;
ERROR 1055 (42000): Expression #2 of SELECT list is not in GROUP BY clause
↳ and contains nonaggregated column 'b' which is not functionally
↳ dependent on columns in GROUP BY clause; this is incompatible with
↳ sql_mode=only_full_group_by
```

TiDB currently enables the `ONLY_FULL_GROUP_BY` mode by default.

Differences from MySQL

The current implementation of `ONLY_FULL_GROUP_BY` is less strict than that in MySQL 5.7. For example, suppose that we execute the following query, expecting the results to be ordered by “c”:

```
drop table if exists t;
create table t(a bigint, b bigint, c bigint);
insert into t values(1, 2, 1), (1, 2, 2), (1, 3, 1), (1, 3, 2);
select distinct a, b from t order by c;
```

To order the result, duplicates must be eliminated first. But to do so, which row should we keep? This choice influences the retained value of “c”, which in turn influences ordering and makes it arbitrary as well.

In MySQL, a query that has `DISTINCT` and `ORDER BY` is rejected as invalid if any `ORDER BY` expression does not satisfy at least one of these conditions:

- The expression is equal to one in the **SELECT** list
- All columns referenced by the expression and belonging to the query's selected tables are elements of the **SELECT** list

But in TiDB, the above query is legal, for more information see [#4254](#).

Another TiDB extension to standard SQL permits references in the **HAVING** clause to aliased expressions in the **SELECT** list. For example, the following query returns “name” values that occur only once in table “orders”:

```
select name, count(name) from orders
group by name
having count(name) = 1;
```

The TiDB extension permits the use of an alias in the **HAVING** clause for the aggregated column:

```
select name, count(name) as c from orders
group by name
having c = 1;
```

Standard SQL permits only column expressions in **GROUP BY** clauses, so a statement such as this is invalid because “**FLOOR**(value/100)” is a noncolumn expression:

```
select id, floor(value/100)
from tbl_name
group by id, floor(value/100);
```

TiDB extends standard SQL to permit noncolumn expressions in **GROUP BY** clauses and considers the preceding statement valid.

Standard SQL also does not permit aliases in **GROUP BY** clauses. TiDB extends standard SQL to permit aliases, so another way to write the query is as follows:

```
select id, floor(value/100) as val
from tbl_name
group by id, val;
```

12.10.4.13.4 Unsupported aggregate functions

The following aggregate functions are currently unsupported in TiDB. You can track our progress in [TiDB #7623](#):

- **JSON_ARRAYAGG**

12.10.4.13.5 Related system variables

The **group_concat_max_len** variable sets the maximum number of items for the **GROUP_CONCAT()** function.

12.10.4.14 Window Functions

The usage of window functions in TiDB is similar to that in MySQL 8.0. For details, see [MySQL Window Functions](#).

Because window functions reserve additional words in the parser, TiDB provides an option to disable window functions. If you receive errors parsing SQL statements after upgrading, try setting `tidb_enable_window_function=0`.

Except for `GROUP_CONCAT()` and `APPROX_PERCENTILE()`, TiDB supports all **GROUP BY aggregate functions**. In addition, TiDB supports the following window functions:

Function name	Feature description
<code>CUME_DIST()</code>	Returns the cumulative distribution of a value within a group of values.
<code>DENSE_RANK()</code>	Returns the rank of the current row within the partition, and the rank is without gaps.
<code>FIRST_VALUE()</code>	Returns the expression value of the first row in the current window.
<code>LAG()</code>	Returns the expression value from the row that precedes the current row by N rows within the partition.
<code>LAST_VALUE()</code>	Returns the expression value of the last row in the current window.
<code>LEAD()</code>	Returns the expression value from the row that follows the current row by N rows within the partition.
<code>NTH_VALUE()</code>	Returns the expression value from the N-th row of the current window.
<code>NTILE()</code>	Divides a partition into N buckets, assigns the bucket number to each row in the partition, and returns the bucket number of the current row within the partition.
<code>PERCENT_RANK()</code>	Returns the percentage of partition values that are less than the value in the current row.
<code>RANK()</code>	Returns the rank of the current row within the partition. The rank may be with gaps.
<code>ROW_NUMBER()</code>	Returns the number of the current row in the partition.

12.10.4.15 Miscellaneous Functions

TiDB supports most of the [miscellaneous functions](#) available in MySQL 5.7.

12.10.4.15.1 Supported functions

Name	Description
ANY_VALUE()	Suppress ONLY_FULL_GROUP_BY value rejection
BIN_TO_UUID()	Convert UUID from binary format to text format
DEFAULT()	Returns the default value for a table column
INET_ATON()	Return the numeric value of an IP address
INET_NTOA()	Return the IP address from a numeric value
INET6_ATON()	Return the numeric value of an IPv6 address
INET6_NTOA()	Return the IPv6 address from a numeric value
IS_IPV4()	Whether argument is an IPv4 address
IS_IPV4_COMPAT()	Whether argument is an IPv4-compatible address
IS_IPV4_MAPPED()	Whether argument is an IPv4-mapped address
IS_IPV6()	Whether argument is an IPv6 address
NAME_CONST()	Can be used to rename a column name
SLEEP()	Sleep for a number of seconds
UUID()	Return a Universal Unique Identifier (UUID)
UUID_TO_BIN()	Convert UUID from text format to binary format
VALUES()	Defines the values to be used during an INSERT

12.10.4.15.2 Unsupported functions

Name	Description
GET_LOCK()	Get a named lock TiDB #10929
RELEASE_LOCK()	Releases the named lock TiDB #10929
UUID_SHORT()	Provides a UUID that is unique given certain assumptions not present in TiDB TiDB #4620
MASTER_WAIT_FOR_SLAVE_TO_CONNECT()	Relates to MySQL replication

12.10.4.16 Precision Math

The precision math support in TiDB is consistent with MySQL. For more information, see [Precision Math in MySQL](#).

12.10.4.16.1 Numeric types

The scope of precision math for exact-value operations includes the exact-value data types (integer and DECIMAL types) and exact-value numeric literals. Approximate-value data types and numeric literals are handled as floating-point numbers.

Exact-value numeric literals have an integer part or fractional part, or both. They may be signed. Examples: 1, .2, 3.4, -5, -6.78, +9.10.

Approximate-value numeric literals are represented in scientific notation (power-of-10) with a mantissa and exponent. Either or both parts may be signed. Examples: 1.2E3, 1.2E-3, -1.2E3, -1.2E-3.

Two numbers that look similar might be treated differently. For example, 2.34 is an exact-value (fixed-point) number, whereas 2.34E0 is an approximate-value (floating-point) number.

The DECIMAL data type is a fixed-point type and the calculations are exact. The FLOAT and DOUBLE data types are floating-point types and calculations are approximate.

12.10.4.16.2 DECIMAL data type characteristics

This section discusses the following topics of the characteristics of the DECIMAL data type (and its synonyms):

- Maximum number of digits
- Storage format
- Storage requirements

The declaration syntax for a DECIMAL column is DECIMAL(M,D). The ranges of values for the arguments are as follows:

- M is the maximum number of digits (the precision). $1 \leq M \leq 65$.
- D is the number of digits to the right of the decimal point (the scale). $1 \leq D \leq 30$ and D must be no larger than M.

The maximum value of 65 for M means that calculations on DECIMAL values are accurate up to 65 digits. This limit of 65 digits of precision also applies to exact-value numeric literals.

Values for DECIMAL columns are stored using a binary format that packs 9 decimal digits into 4 bytes. The storage requirements for the integer and fractional parts of each value are determined separately. Each multiple of 9 digits requires 4 bytes, and any remaining digits left over require some fraction of 4 bytes. The storage required for remaining digits is given by the following table.

Leftover Digits	Number of Bytes
0	0
1–2	1
3–4	2
5–6	3
7–9	4

For example, a `DECIMAL(18,9)` column has 9 digits on each side of the decimal point, so the integer part and the fractional part each require 4 bytes. A `DECIMAL(20,6)` column has 14 integer digits and 6 fractional digits. The integer digits require 4 bytes for 9 of the digits and 3 bytes for the remaining 5 digits. The 6 fractional digits require 3 bytes.

`DECIMAL` columns do not store a leading `+` character or `-` character or leading 0 digits. If you insert `+0003.1` into a `DECIMAL(5,1)` column, it is stored as `3.1`. For negative numbers, a literal `-` character is not stored.

`DECIMAL` columns do not permit values larger than the range implied by the column definition. For example, a `DECIMAL(3,0)` column supports a range of `-999` to `999`. A `DECIMAL(M,D)` column permits at most `M - D` digits to the left of the decimal point.

For more information about the internal format of the `DECIMAL` values, see [mydecimal](#) ↪ `.go` in TiDB source code.

12.10.4.16.3 Expression handling

For expressions with precision math, TiDB uses the exact-value numbers as given whenever possible. For example, numbers in comparisons are used exactly as given without a change in value. In strict SQL mode, if you add an exact data type into a column, a number is inserted with its exact value if it is within the column range. When retrieved, the value is the same as what is inserted. If strict SQL mode is not enabled, truncation for `INSERT` is permitted in TiDB.

How to handle a numeric expression depends on the values of the expression:

- If the expression contains any approximate values, the result is approximate. TiDB evaluates the expression using floating-point arithmetic.
- If the expression contains no approximate values are present, which means only exact values are contained, and if any exact value contains a fractional part, the expression is evaluated using `DECIMAL` exact arithmetic and has a precision of 65 digits.
- Otherwise, the expression contains only integer values. The expression is exact. TiDB evaluates the expression using integer arithmetic and has a precision the same as `BIGINT` (64 bits).

If a numeric expression contains strings, the strings are converted to double-precision floating-point values and the result of the expression is approximate.

Inserts into numeric columns are affected by the SQL mode. The following discussions mention strict mode and `ERROR_FOR_DIVISION_BY_ZERO`. To turn on all the restrictions, you can simply use the `TRADITIONAL` mode, which includes both strict mode values and `ERROR_FOR_DIVISION_BY_ZERO`:

```
SET sql_mode = 'TRADITIONAL`;
```

If a number is inserted into an exact type column (`DECIMAL` or integer), it is inserted with its exact value if it is within the column range. For this number:

- If the value has too many digits in the fractional part, rounding occurs and a warning is generated.
- If the value has too many digits in the integer part, it is too large and is handled as follows:
 - If strict mode is not enabled, the value is truncated to the nearest legal value and a warning is generated.
 - If strict mode is enabled, an overflow error occurs.

To insert strings into numeric columns, TiDB handles the conversion from string to number as follows if the string has nonnumeric contents:

- In strict mode, a string (including an empty string) that does not begin with a number cannot be used as a number. An error, or a warning occurs.
- A string that begins with a number can be converted, but the trailing nonnumeric portion is truncated. In strict mode, if the truncated portion contains anything other than spaces, an error, or a warning occurs.

By default, the result of the division by 0 is NULL and no warning. By setting the SQL mode appropriately, division by 0 can be restricted. If you enable the `ERROR_FOR_DIVISION_BY_ZERO` SQL mode, TiDB handles division by 0 differently:

- In strict mode, inserts and updates are prohibited, and an error occurs.
- If it's not in the strict mode, a warning occurs.

In the following SQL statement:

```
INSERT INTO t SET i = 1/0;
```

The following results are returned in different SQL modes:

sql_mode Value	Result
"	No warning, no error; i is set to NULL.
strict	No warning, no error; i is set to NULL.
<code>ERROR_FOR_DIVISION_BY_ZERO</code>	Warning, no error; i is set to NULL.
strict, <code>ERROR_FOR_DIVISION_BY_ZERO</code>	Error; no row is inserted.

12.10.4.16.4 Rounding behavior

The result of the `ROUND()` function depends on whether its argument is exact or approximate:

- For exact-value numbers, the `ROUND()` function uses the “round half up” rule.

- For approximate-value numbers, the results in TiDB differs from that in MySQL:

```
TiDB > SELECT ROUND(2.5), ROUND(25E-1);
+-----+-----+
| ROUND(2.5) | ROUND(25E-1) |
+-----+-----+
|          3 |          3 |
+-----+-----+
1 row in set (0.00 sec)
```

For inserts into a DECIMAL or integer column, the rounding uses [round half away from zero](#).

```
TiDB > CREATE TABLE t (d DECIMAL(10,0));
Query OK, 0 rows affected (0.01 sec)

TiDB > INSERT INTO t VALUES(2.5),(2.5E0);
Query OK, 2 rows affected, 2 warnings (0.00 sec)

TiDB > SELECT d FROM t;
+-----+
| d    |
+-----+
|    3 |
|    3 |
+-----+
2 rows in set (0.00 sec)
```

12.10.4.17 Set Operations

TiDB supports three set operations using the UNION, EXCEPT, and INTERSECT operators. The smallest unit of a set is a [SELECT statement](#).

12.10.4.17.1 UNION operator

In mathematics, the union of two sets A and B consists of all elements that are in A or in B. For example:

```
select 1 union select 2;
+----+
| 1 |
+----+
| 2 |
| 1 |
+----+
2 rows in set (0.00 sec)
```

TiDB supports both UNION DISTINCT and UNION ALL operators. UNION DISTINCT removes duplicate records from the result set, while UNION ALL keeps all records including duplicates. UNION DISTINCT is used by default in TiDB.

```
create table t1 (a int);
create table t2 (a int);
insert into t1 values (1),(2);
insert into t2 values (1),(3);
```

Examples for UNION DISTINCT and UNION ALL queries are respectively as follows:

```
select * from t1 union distinct select * from t2;
+----+
| a |
+----+
| 1 |
| 2 |
| 3 |
+----+
3 rows in set (0.00 sec)
select * from t1 union all select * from t2;
+----+
| a |
+----+
| 1 |
| 2 |
| 1 |
| 3 |
+----+
4 rows in set (0.00 sec)
```

12.10.4.17.2 EXCEPT operator

If A and B are two sets, EXCEPT returns the difference set of A and B which consists of elements that are in A but not in B.

```
select * from t1 except select * from t2;
+----+
| a |
+----+
| 2 |
+----+
1 rows in set (0.00 sec)
```

EXCEPT ALL operator is not yet supported.

12.10.4.17.3 INTERSECT operator

In mathematics, the intersection of two sets A and B consists of all elements that are both in A and B, and no other elements.

```
select * from t1 intersect select * from t2;
+----+
| a |
+----+
| 1 |
+----+
1 rows in set (0.00 sec)
```

INTERSECT ALL operator is not yet supported. INTERSECT operator has higher precedence over EXCEPT and UNION operators.

```
select * from t1 union all select * from t1 intersect select * from t2;
+----+
| a |
+----+
| 1 |
| 1 |
| 2 |
+----+
3 rows in set (0.00 sec)
```

12.10.4.17.4 Parentheses

TiDB supports using parentheses to specify the precedence of set operations. Expressions in parentheses are processed first.

```
(select * from t1 union all select * from t1) intersect select * from t2;
+----+
| a |
+----+
| 1 |
+----+
1 rows in set (0.00 sec)
```

12.10.4.17.5 Use Order By and Limit

TiDB supports using `ORDER BY` or `LIMIT` clause in set operations. These two clauses must be at the end of the entire statement.

```
(select * from t1 union all select * from t1 intersect select * from t2)
↪ order by a limit 2;
+----+
```

```

| a |
+---+
| 1 |
| 1 |
+---+
2 rows in set (0.00 sec)

```

12.10.4.18 List of Expressions for Pushdown

When TiDB reads data from TiKV, TiDB tries to push down some expressions (including calculations of functions or operators) to be processed to TiKV. This reduces the amount of transferred data and offloads processing from a single TiDB node. This document introduces the expressions that TiDB already supports pushing down and how to prohibit specific expressions from being pushed down using blocklist.

12.10.4.18.1 Supported expressions for pushdown

Expression Type	Operations
Logical operators	AND (&&), OR (), NOT (!)
Comparison functions and operators	<, <=, =, != (<>), >, >=, <=>, IN(), IS NULL, LIKE, IS TRUE, IS FALSE, COALESCE()
Numeric functions and operators	+, -, *, /, ABS(), CEIL(), CEILING(), FLOOR()
Control flow functions	CASE, IF(), IFNULL()
JSON functions	JSON_TYPE(json_val), JSON_EXTRACT(json_doc, path[, path] ...), JSON_OBJECT(key, val[, key, val] ...), JSON_ARRAY([val[, val] ...]), JSON_MERGE(json_doc, json_doc[, json_doc] ...), JSON_SET(json_doc, path, val[, path, val] ...), JSON_INSERT(json_doc, path, val[, path, val] ...), JSON_REMOVE(json_doc, path[, path] ...)
Date and time functions	DATE_FORMAT()

12.10.4.18.2 Blocklist specific expressions

If unexpected behavior occurs during the calculation of a function caused by its push-down, you can quickly restore the application by blocklisting that function. Specifically, you can prohibit an expression from being pushed down by adding the corresponding functions or operator to the blacklist `mysql.expr_pushdown_blacklist`.

The schema of `mysql.expr_pushdown_blacklist` is as follows:

```

tidb> desc mysql.expr_pushdown_blacklist;
+-----+-----+-----+-----+-----+-----+
| Field      | Type          | Null | Key | Default          | Extra |
+-----+-----+-----+-----+-----+-----+
| name       | char(100)     | NO   |     | NULL             |       |
| store_type | char(100)     | NO   |     | tikv,tiflash,tidb |       |
| reason     | varchar(200)  | YES  |     | NULL             |       |
+-----+-----+-----+-----+-----+-----+
3 rows in set (0.00 sec)

```

Field description:

- **name**: the name of the function that is prohibited from being pushed down.
- **store_type**: specifies to which storage engine the function is prohibited from being pushed down. Currently, TiDB supports the three storage engines: `tikv`, `tidb`, and `tiflash`. `store_type` is case-insensitive. If a function is prohibited from being pushed down to multiple storage engines, use a comma to separate each engine.
- **reason** : The reason why the function is blocklisted.

Add to the blacklist

To add one or more functions or operators to the blacklist, perform the following steps:

1. Insert the function or operator name and the collection of storage types to be prohibited from the function pushdown to `mysql.expr_pushdown_blacklist`.
2. Execute the `admin reload expr_pushdown_blacklist;` command.

Remove from the blacklist

To remove one or more functions or operators from the blacklist, perform the following steps:

1. Delete the function or operator name in `mysql.expr_pushdown_blacklist`.
2. Execute the `admin reload expr_pushdown_blacklist;` command.

Blocklist usage examples

The following example demonstrates how to add the < and > operators to the blocklist, then remove > from the blocklist.

You can see whether the blocklist takes effect by checking the results returned by EXPLAIN statement (See [Understanding EXPLAIN results](#)).

```

tidb> create table t(a int);
Query OK, 0 rows affected (0.06 sec)

tidb> explain select * from t where a < 2 and a > 2;
+---+
| id | estRows | task | access object | operator info |
+---+
| TableReader_7 | 0.00 | root | | data:Selection_6 |
| -Selection_6 | 0.00 | cop[tikv] | | gt(ssb_1.t.a, 2) |
| -TableFullScan_5 | 10000.00 | cop[tikv] | table:t | keep order:false |
+---+
3 rows in set (0.00 sec)

tidb> insert into mysql.expr_pushdown_blacklist values('<', 'tikv',''), ('>
Query OK, 2 rows affected (0.01 sec)
Records: 2 Duplicates: 0 Warnings: 0

tidb> admin reload expr_pushdown_blacklist;
Query OK, 0 rows affected (0.00 sec)

tidb> explain select * from t where a < 2 and a > 2;
+---+
| id | estRows | task | access object | operator info |
+---+

```

```

↪
| Selection_7          | 10000.00 | root   |          | gt(ssb_1.t.a, 2),
↪ lt(ssb_1.t.a, 2) |
| -TableReader_6     | 10000.00 | root   |          | data:
↪ TableFullScan_5   |          |
| -TableFullScan_5   | 10000.00 | cop[tikv] | table:t | keep order:false
↪ , stats:pseudo |
+--
↪ -----+-----+-----+-----+
↪
3 rows in set (0.00 sec)

tidb> delete from mysql.expr_pushdown_blacklist where name = '>';
Query OK, 1 row affected (0.01 sec)

tidb> admin reload expr_pushdown_blacklist;
Query OK, 0 rows affected (0.00 sec)

tidb> explain select * from t where a < 2 and a > 2;
+--
↪ -----+-----+-----+-----+
↪
| id                | estRows | task   | access object | operator info
↪                |
+--
↪ -----+-----+-----+-----+
↪
| Selection_8        | 0.00    | root   |          | lt(ssb_1.t.a,
↪ 2)                |
| -TableReader_7     | 0.00    | root   |          | data:
↪ Selection_6        |          |
| -Selection_6       | 0.00    | cop[tikv] |          | gt(ssb_1.t.a,
↪ 2)                |
| -TableFullScan_5   | 10000.00 | cop[tikv] | table:t | keep order:
↪ false, stats:pseudo |
+--
↪ -----+-----+-----+-----+
↪
4 rows in set (0.00 sec)

```

Note:

- `admin reload expr_pushdown_blacklist` only takes effect on the TiDB server that executes this SQL statement. To make it apply to all TiDB servers, execute the SQL statement on each TiDB server.
- The feature of blocklisting specific expressions is supported in TiDB 3.0.0 or later versions.
- TiDB 3.0.3 or earlier versions does not support adding some of the operators (such as “>”, “+”, “is null”) to the blacklist by using their original names. You need to use their aliases (case-sensitive) instead, as shown in the following table:

Operator Name	Aliases
<	lt
>	gt
<=	le
>=	ge
=	eq
!=	ne
<>	ne
<=>	nulleq
	bitor
&&	bitand
	or
!	not
in	in
+	plus
-	minus
	mul
/	div
DIV	intdiv
IS NULL	isnull
IS TRUE	istrue
IS FALSE	isfalse

12.10.4.19 TiDB Specific Functions

The following functions are TiDB extensions, and are not present in MySQL:

Function name	Function description
<code>TIDB_BOUNDED_STALENESS</code> ↪ <code>()</code>	The <code>TIDB_BOUNDED_STALENESS</code> function instructs TiDB to read the data as new as possible within the time range. See also: Read Historical Data Using the AS OF TIMESTAMP Clause
<code>TIDB_DECODE_KEY</code> ↪ <code>(str)</code>	The <code>TIDB_DECODE_KEY</code> function can be used to decode a TiDB-encoded key entry into a JSON structure containing <code>_tidb_rowid</code> and <code>table_id</code> . These encoded keys can be found in some system tables and in logging outputs.
<code>TIDB_DECODE_PLAN</code> ↪ <code>(str)</code>	The <code>TIDB_DECODE_PLAN</code> function can be used to decode a TiDB execution plan.
<code>TIDB_IS_DDL_OWNER</code> ↪ <code>()</code>	The <code>TIDB_IS_DDL_OWNER</code> function can be used to check whether or not the TiDB instance you are connected to is the one that is the DDL Owner. The DDL Owner is the TiDB instance that is tasked with executing DDL statements on behalf of all other nodes in the cluster.
<code>TIDB_PARSE_TSO</code> ↪ <code>(num)</code>	The <code>TIDB_PARSE_TSO</code> function can be used to extract the physical timestamp from a TiDB TSO timestamp. See also: tidb_current_ts .
<code>TIDB_VERSION()</code>	The <code>TIDB_VERSION</code> function returns the TiDB version with additional build information.
<code>TIDB_DECODE_SQL_DIGESTS</code> ↪ <code>(digests, stmtTruncateLength)</code>	The <code>TIDB_DECODE_SQL_DIGESTS()</code> function is used to query the normalized SQL statements (a form without formats and arguments) corresponding to the set of SQL digests in the cluster.
<code>VITNESS_HASH()</code> ↪ <code>str</code>	The <code>VITNESS_HASH</code> function returns the hash of a string that is compatible with Vitess' <code>HASH</code> function. This is intended to help the data migration from Vitess.

12.10.4.19.1 Examples

This section provides examples for some of the functions above.

`TIDB_DECODE_KEY`

In the following example, the table `t1` has a hidden `rowid` that is generated by TiDB.

The TIDB_DECODE_KEY is used in the statement. From the result, you can see that the hidden rowid is decoded and output, which is a typical result for the non-clustered primary key.

```
SELECT START_KEY, TIDB_DECODE_KEY(START_KEY) FROM information_schema.
↪ tikv_region_status WHERE table_name='t1' AND REGION_ID=2\G
```

```
***** 1. row *****
      START_KEY: 7480000000000000
        ↪ FF3B5F728000000000FF1DE3F1000000000FA
TIDB_DECODE_KEY(START_KEY): {"_tidb_rowid":1958897,"table_id":"59"}
1 row in set (0.00 sec)
```

In the following example, the table t2 has a compound clustered primary key. From the JSON output, you can see a handle that contains the name and value for both of the columns that are part of the primary key.

```
show create table t2\G
```

```
***** 1. row *****
      Table: t2
Create Table: CREATE TABLE `t2` (
  `id` binary(36) NOT NULL,
  `a` tinyint(3) unsigned NOT NULL,
  `v` varchar(512) DEFAULT NULL,
  PRIMARY KEY (`a`,`id`) /*T![clustered_index] CLUSTERED */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
1 row in set (0.001 sec)
```

```
select * from information_schema.tikv_region_status where table_name='t2'
↪ limit 1\G
```

```
***** 1. row *****
      REGION_ID: 48
      START_KEY: 7480000000000000
        ↪ FF3E5F720400000000FF0000000601633430FF3338646232FF2D64FF3531632D3131
        ↪
      END_KEY:
      TABLE_ID: 62
      DB_NAME: test
      TABLE_NAME: t2
      IS_INDEX: 0
      INDEX_ID: NULL
      INDEX_NAME: NULL
      EPOCH_CONF_VER: 1
      EPOCH_VERSION: 38
      WRITTEN_BYTES: 0
```

```

      READ_BYTES: 0
      APPROXIMATE_SIZE: 136
      APPROXIMATE_KEYS: 479905
      REPLICATIONSTATUS_STATE: NULL
      REPLICATIONSTATUS_STATEID: NULL
1 row in set (0.005 sec)

```

```

select tidb_decode_key('7480000000000000
  ↪ FF3E5F720400000000FF0000000601633430FF3338646232FF2D64FF3531632D3131FF65FF622D3863
  ↪ ');

```

```

+---
  ↪ -----
  ↪
| tidb_decode_key('7480000000000000
  ↪ FF3E5F720400000000FF0000000601633430FF3338646232FF2D64FF3531632D3131FF65FF622D3863
  ↪ ') |
+---
  ↪ -----

  ↪ :62}
  ↪
  ↪ |
+---
  ↪ -----
  ↪
1 row in set (0.001 sec)

```

TIDB_DECODE_PLAN

You can find TiDB execution plans in encoded form in the slow query log. The `TIDB_DECODE_PLAN()` function is then used to decode the encoded plans into a human-readable form.

This function is useful because a plan is captured at the time the statement is executed. Re-executing the statement in `EXPLAIN` might produce different results as data distribution and statistics evolves over time.

```

SELECT tidb_decode_plan('8
  ↪ QIYMAkzMV83CQEH8E85LjAOCWRhdGE6U2VsZWN0aW9uXzYJOTYwCXRpbWU6NzEzLjHCtXMsIGxvb3BzOjJ
  ↪ ')\G

```

```

***** 1. row *****
tidb_decode_plan('8
  ↪ QIYMAkzMV83CQEH8E85LjAOCWRhdGE6U2VsZWN0aW9uXzYJOTYwCXRpbWU6NzEzLjHCtXMsIGxvb3BzOjJ

```

```

↪ : id task estRows operator info                                actRows
↪ execution info
↪
↪ memory      disk
TableReader_7      root          319.04    data:Selection_6
  ↪              960            time:713.1µs, loops:2, cop_task: {
  ↪ num: 1, max: 568.5µs, proc_keys: 0, rpc_num: 1, rpc_time: 549.1µs,
  ↪ copr_cache_hit_ratio: 0.00} 3.99 KB N/A
- Selection_6      cop[tikv]    319.04    lt(test.t.a, 10000)
  ↪              960            tikv_task:{time:313.8µs, loops:960}
  ↪
  ↪ N/A          N/A
- TableFullScan_5 cop[tikv]    960      table:t, keep order:false,
  ↪ stats:pseudo 960      tikv_task:{time:153µs, loops:960}
  ↪
  ↪ N/A          N/A

```

TIDB_PARSE_TSO

The `TIDB_PARSE_TSO` function can be used to extract the physical timestamp from a TiDB TSO timestamp. TSO stands for Time Stamp Oracle and is a monotonically increasing timestamp given out by PD (Placement Driver) for every transaction.

A TSO is a number that consists of two parts:

- A physical timestamp
- A logical counter

```

BEGIN;
SELECT TIDB_PARSE_TSO(@@tidb_current_ts);
ROLLBACK;

```

```

+-----+
| TIDB_PARSE_TSO(@@tidb_current_ts) |
+-----+
| 2021-05-26 11:33:37.776000      |
+-----+
1 row in set (0.0012 sec)

```

Here `TIDB_PARSE_TSO` is used to extract the physical timestamp from the timestamp number that is available in the `tidb_current_ts` session variable. Because timestamps are given out per transaction, this function is running in a transaction.

TIDB_VERSION

The `TIDB_VERSION` function can be used to get the version and build details of the TiDB server that you are connected to. You can use this function when reporting issues on GitHub.

```
SELECT TIDB_VERSION()\G
```

```
***** 1. row *****
TIDB_VERSION(): Release Version: v5.1.0-alpha-13-gd5e0ed0aa-dirty

```

TIDB_DECODE_SQL_DIGESTS

The `TIDB_DECODE_SQL_DIGESTS()` function is used to query the normalized SQL statements (a form without formats and arguments) corresponding to the set of SQL digests in the cluster. This function accepts 1 or 2 arguments:

- **digests**: A string. This parameter is in the format of a JSON string array, and each string in the array is a SQL digest.
- **stmtTruncateLength**: An integer (optional). It is used to limit the length of each SQL statement in the returned result. If a SQL statement exceeds the specified length, the statement is truncated. 0 means that the length is unlimited.

This function returns a string, which is in the format of a JSON string array. The i -th item in the array is the normalized SQL statement corresponding to the i -th element in the **digests** parameter. If an element in the **digests** parameter is not a valid SQL digest or the system cannot find the corresponding SQL statement, the corresponding item in the returned result is `null`. If the truncation length is specified (`stmtTruncateLength > 0`), for each statement in the returned result that exceeds this length, the first `stmtTruncateLength` characters are retained and the suffix `"..."` is added at the end to indicate the truncation. If the **digests** parameter is `NULL`, the returned value of the function is `NULL`.

Note:

- Only users with the `PROCESS` privilege can use this function.
- When `TIDB_DECODE_SQL_DIGESTS` is executed, TiDB queries the statement corresponding to each SQL digest from the statement summary tables, so there is no guarantee that the corresponding statement can always be found for any SQL digest. Only the statements that have been

executed in the cluster can be found, and whether these SQL statements can be queried or not is also affected by the related configuration of the statement summary tables. For the detailed description of the statement summary table, see [Statement Summary Tables](#).

- This function has a high overhead. In queries with a large number of rows (for example, querying the full table of `information_schema.cluster_tidb_trx` on a large and busy cluster), using this function might cause the queries to run for too long. Use it with caution.
 - This function has a high overhead because every time it is called, it internally queries the `STATEMENTS_SUMMARY`, `STATEMENTS_SUMMARY_HISTORY`, `CLUSTER_STATEMENTS_SUMMARY`, and `CLUSTER_STATEMENTS_SUMMARY_HISTORY` tables, and the query involves the `UNION` operation. This function currently does not support vectorization, that is, when calling this function for multiple rows of data, the above query is performed separately for each row.

```
set @digests = '[
  ↪ e6f07d43b5c21db0fbb9a31feac2dc599787763393dd5acbfad80e247eb02ad5","38
  ↪ b03afa5debbdf0326a014dbe5012a62c51957f1982b3093e748460f8b00821","
  ↪ e5796985ccafe2f71126ed6c0ac939ffa015a8c0744a24b7aee6d587103fd2f7]';

select tidb_decode_sql_digests(@digests);
```

```
+-----+
| tidb_decode_sql_digests(@digests) |
+-----+
| ["begin",null,"select * from `t`"] |
+-----+
1 row in set (0.00 sec)
```

In the above example, the parameter is a JSON array containing 3 SQL digests, and the corresponding SQL statements are the three items in the query results. But the SQL statement corresponding to the second SQL digest cannot be found from the cluster, so the second item in the result is `null`.

```
select tidb_decode_sql_digests(@digests, 10);
```

```
+-----+
| tidb_decode_sql_digests(@digests, 10) |
+-----+
| ["begin",null,"select * f..."] |
+-----+
```

```
1 row in set (0.01 sec)
```

The above call specifies the second parameter (that is, the truncation length) as 10, and the length of the third statement in the query result is greater than 10. Therefore, only the first 10 characters are retained, and "... " is added at the end, which indicates the truncation.

12.10.4.20 Comparisons between Functions and Syntax of Oracle and TiDB

This document describes the comparisons between functions and syntax of Oracle and TiDB. It helps you find the corresponding TiDB functions based on the Oracle functions, and understand the syntax differences between Oracle and TiDB.

Note:

The functions and syntax in this document are based on Oracle 12.2.0.1.0 and TiDB v5.4.0. They might be different in other versions.

12.10.4.20.1 Comparisons of functions

The following table shows the comparisons between some Oracle and TiDB functions.

Function	Oracle syntax	TiDB syntax	Note
----------	---------------	-------------	------

| Cast a value as a certain type |

TO_NUMBER(key)

TO_CHAR(key)

| CONVERT(key, dataType) | TiDB supports casting a value as one of the following types:

BINARY, CHAR, DATE, DATETIME, TIME, SIGNED INTEGER, UNSIGNED INTEGER and DECIMAL. |

| Convert a date to a string |

TO_CHAR(SYSDATE, 'yyyy-MM-dd hh24:mi:ss')

TO_CHAR(SYSDATE, 'yyyy-MM-dd')

|

DATE_FORMAT(NOW(), '%Y-%m-%d %H:%i:%s')

```
DATE_FORMAT(NOW(), '%Y-%m-%d')
```

| The format string of TiDB is case-sensitive. || Convert a string to a date |

```
TO_DATE('2021-05-28 17:31:37', 'yyyy-MM-dd hh24:mi:ss')
```

```
TO_DATE('2021-05-28', 'yyyy-MM-dd hh24:mi:ss')
```

|

```
STR_TO_DATE('2021-05-28 17:31:37', '%Y-%m-%d %H:%i:%s')
```

```
STR_TO_DATE('2021-05-28', '%Y-%m-%d%T')
```

| The format string of TiDB is case-sensitive. || Get the current system time in second precision | SYSDATE | NOW() || Get the current system time in microsecond precision | SYSTIMESTAMP | CURRENT_TIMESTAMP(6) || Get the number of days between two dates | date1 - date2 | DATEDIFF(date1, date2) || Get the number of months between two dates | MONTHS_BETWEEN(ENDDATE, SYSDATE) | TIMESTAMPDIFF(MONTH, SYSDATE, ENDDATE) | The results of MONTHS_BETWEEN() in Oracle and TIMESTAMPDIFF() in TiDB are different. TIMESTAMPDIFF() returns an integer. Note that the parameters in the two functions are swapped. || Add n days to a date | DATEVAL + n | DATE_ADD(dateVal, INTERVAL n DAY) | n can be a negative value. | Add n months to a date | ADD_MONTHS(dateVal, n) | DATE_ADD ⇨ (dateVal, INTERVAL n MONTH) | n can be a negative value. || Get the day of a date | TRUNC(SYSDATE) |

```
CAST(NOW() AS DATE)
```

```
DATE_FORMAT(NOW(), '%Y-%m-%d')
```

| In TiDB, CAST and DATE_FORMAT return the same result. || Get the month of a date | TRUNC(SYSDATE, 'mm') | DATE_ADD(CURDATE(), interval - day(CURDATE()) + 1 day) || Truncate a value | TRUNC(2.136) = 2 | TRUNC(2.136, 2) = 2.13 | TRUNCATE(2.136, 0) = 2 ⇨ TRUNCATE(2.136, 2) = 2.13 | Data precision is preserved. Truncate the corresponding decimal places without rounding. || Get the next value in a sequence | sequence_name ⇨ .NEXTVAL | NEXTVAL(sequence_name) || Get a random sequence value | SYS_GUID ⇨ () | UUID() | TiDB returns a Universal Unique Identifier (UUID). || Left join or right join | SELECT * FROM a, b WHERE a.id = b.id(+); SELECT * FROM a, b WHERE a ⇨ .id(+) = b.id; | SELECT * FROM a LEFT JOIN b ON a.id = b.id; SELECT * FROM a ⇨ RIGHT JOIN b ON a.id = b.id; | In a correlated query, TiDB does not support using (+) to left join or right join. You can use LEFT JOIN or RIGHT JOIN instead. || NVL() | NVL(key, val) | IFNULL(key, val) | If the value of the field is NULL, it returns val; otherwise, it returns the value of the field. || NVL2() | NVL2(key, val1, val2) | IF(key is NULL, ⇨ val1, val2) | If the value of the field is not NULL, it returns val1; otherwise, it returns val2. || DECODE() |

```
DECODE(key, val1, val2, val3)
```

```
DECODE(value, if1, val1, if2, val2, ..., ifn, valn, val)
```

|

```
IF(key=val1, val2, val3)
```

```

CASE WHEN value=if1 THEN val1 WHEN value=if2 THEN val2,...,WHEN value=
↪ ifn THEN valn ELSE val END

```

|

If the value of the field is val1, then it returns val2; otherwise it returns val3.

When the value of the field satisfies condition 1 (if1), it returns val1. When it satisfies condition 2 (if2), it returns val2. When it satisfies condition 3 (if3), it returns val3.

```

|| Concatenate the string a and b | 'a' || 'b' | CONCAT('a','b') || | Get the length of
a string | LENGTH(str) | CHAR_LENGTH(str) || | Get the substring as specified | SUBSTR('
↪ abcdefg',0,2)= 'ab' SUBSTR('abcdefg',1,2)= 'ab' | SUBSTRING('abcdefg',0,2)
↪ = ''SUBSTRING('abcdefg',1,2)= 'ab' |

```

In Oracle, the starting position 0 has the same effect as 1.

In TiDB, the starting position 0 returns an empty string. If you want to get a substring from the beginning, the starting position should be 1.

```

|| Get the position of a substring | INSTR('abcdefg','b',1,1) | INSTR('abcdefg
↪ ','b') | Search from the first character of 'abcdefg' and return the position of the
first occurrence of 'b'. || Get the position of a substring | INSTR('stst','s',1,2) |
LENGTH(SUBSTRING_INDEX('stst','s',2))+ 1 | Search from the first character of 'stst
↪ ' and return the position of the second occurrence of 's'. || Get the position of a
substring | INSTR('abcabc','b',2,1) | LOCATE('b','abcabc',2) | Search from the second
character of abcabc and return the position of the first occurrence of b. || Concatenate values
of a column | LISTAGG(CONCAT(E.dimensionid,'---',E.DIMENSIONNAME),'***')within
↪ GROUP(ORDER BY DIMENSIONNAME) | GROUP_CONCAT(CONCAT(E.dimensionid,'---',E.
↪ DIMENSIONNAME)ORDER BY DIMENSIONNAME SEPARATOR '***') | Concatenate values of
a specified column to one row with the *** delimiter. || Convert an ASCII code to a character
| CHR(n) | CHAR(n) | The Tab (CHR(9)), LF (CHR(10)), and CR (CHR(13)) characters in
Oracle correspond to CHAR(9), CHAR(10), and CHAR(13) in TiDB. |

```

12.10.4.20.2 Comparisons of syntax

This section describes some syntax differences between Oracle and TiDB.

String syntax

In Oracle, a string can only be enclosed in single quotes ("). For example 'a'.

In TiDB, a string can be enclosed in single quotes (") or double quotes ("""). For example, 'a' and "a".

Difference between NULL and an empty string

Oracle does not distinguish between NULL and an empty string '', that is, NULL is equivalent to ''.

TiDB distinguishes between NULL and an empty string ''.

Read and write to the same table in an INSERT statement

Oracle supports reading and writing to the same table in an INSERT statement. For example:

```
INSERT INTO table1 VALUES (feild1,(SELECT feild2 FROM table1 WHERE...))
```

TiDB does not support reading and writing to the same table in a INSERT statement. For example:

```
INSERT INTO table1 VALUES (feild1,(SELECT T.fields2 FROM table1 T WHERE...)  
↪ )
```

Get the first n rows from a query

In Oracle, to get the first n rows from a query, you can use the `ROWNUM <= n` clause. For example `ROWNUM <= 10`.

In TiDB, to get the first n rows from a query, you can use the `LIMIT n` clause. For example `LIMIT 10`. The Hibernate Query Language (HQL) running SQL statements with `LIMIT` results in an error. You need to change the Hibernate statements to SQL statements.

Update multiple tables in an UPDATE statement

In Oracle, it is not necessary to list the specific field update relationship when updating multiple tables. For example:

```
UPDATE test1 SET(test1.name,test1.age) = (SELECT test2.name,test2.age FROM  
↪ test2 WHERE test2.id=test1.id)
```

In TiDB, when updating multiple tables, you need to list all the specific field update relationships in `SET`. For example:

```
UPDATE test1,test2 SET test1.name=test2.name,test1.age=test2.age WHERE  
↪ test1.id=test2.id
```

Derived table alias

In Oracle, when querying multiple tables, it is unnecessary to add an alias to the derived table. For example:

```
SELECT * FROM (SELECT * FROM test)
```

In TiDB, when querying multiple tables, every derived table must have its own alias. For example:

```
SELECT * FROM (SELECT * FROM test) t
```

Set operations

In Oracle, to get the rows that are in the first query result but not in the second, you can use the `MINUS` set operation. For example:

```
SELECT * FROM t1 MINUS SELECT * FROM t2
```

TiDB does not support the `MINUS` operation. You can use the `EXCEPT` set operation. For example:

```
SELECT * FROM t1 EXCEPT SELECT * FROM t2
```

Comment syntax

In Oracle, the comment syntax is `--Comment`.

In TiDB, the comment syntax is `-- Comment`. Note that there is a white space after `--` in TiDB.

Pagination

In Oracle, you can use the `OFFSET m ROWS` to skip `m` rows and use the `FETCH NEXT n` \leftrightarrow `ROWS ONLY` to fetch `n` rows. For example:

```
SELECT * FROM tables OFFSET 0 ROWS FETCH NEXT 2000 ROWS ONLY
```

In TiDB, you can use the `LIMIT n OFFSET m` to replace `OFFSET m ROWS FETCH NEXT` \leftrightarrow `n ROWS ONLY`. For example:

```
SELECT * FROM tables LIMIT 2000 OFFSET 0
```

Sorting order on NULL values

In Oracle, NULL values are sorted by the `ORDER BY` clause in the following cases:

- In the `ORDER BY column ASC` statement, NULL values are returned last.
- In the `ORDER BY column DESC` statement, NULL values are returned first.
- In the `ORDER BY column [ASC|DESC] NULLS FIRST` statement, NULL values are returned before non-NULL values. Non-NULL values are returned in ascending order or descending order specified in `ASC|DESC`.
- In the `ORDER BY column [ASC|DESC] NULLS LAST` statement, NULL values are returned after non-NULL values. Non-NULL values are returned in ascending order or descending order specified in `ASC|DESC`.

In TiDB, NULL values are sorted by the `ORDER BY` clause in the following cases:

- In the `ORDER BY column ASC` statement, NULL values are returned first.
- In the `ORDER BY column DESC` statement, NULL values are returned last.

The following table shows some examples of equivalent `ORDER BY` statements in Oracle and TiDB:

ORDER BY in Oracle	Equivalent statements in TiDB
SELECT * FROM t1 ↪ ORDER BY name ↪ NULLS FIRST;	SELECT * FROM t1 ↪ ORDER BY ↪ name;
SELECT * FROM t1 ↪ ORDER BY name ↪ DESC NULLS LAST ↪ ;	SELECT * FROM t1 ↪ ORDER BY ↪ name DESC;
SELECT * FROM t1 ↪ ORDER BY name ↪ DESC NULLS ↪ FIRST;	SELECT * FROM t1 ↪ ORDER BY ↪ ISNULL(name) ↪ DESC, name ↪ DESC;
SELECT * FROM t1 ↪ ORDER BY name ↪ ASC NULLS LAST;	SELECT * FROM t1 ↪ ORDER BY ↪ ISNULL(name), ↪ name;

12.10.5 Clustered Indexes

TiDB supports the clustered index feature since v5.0. This feature controls how data is stored in tables containing primary keys. It provides TiDB the ability to organize tables in a way that can improve the performance of certain queries.

The term *clustered* in this context refers to the *organization of how data is stored* and not *a group of database servers working together*. Some database management systems refer to clustered indexes as *index-organized tables* (IOT).

Currently, tables containing primary keys in TiDB are divided into the following two categories:

- **NONCLUSTERED:** The primary key of the table is non-clustered index. In tables with non-clustered indexes, the keys for row data consist of internal `_tidb_rowid` implicitly assigned by TiDB. Because primary keys are essentially unique indexes, tables with non-clustered indexes need at least two key-value pairs to store a row, which are:
 - `_tidb_rowid` (key) - row data (value)
 - Primary key data (key) - `_tidb_rowid` (value)
- **CLUSTERED:** The primary key of the table is clustered index. In tables with clustered indexes, the keys for row data consist of primary key data given by the user. Therefore, tables with clustered indexes need only one key-value pair to store a row, which is:
 - Primary key data (key) - row data (value)

Note:

TiDB supports clustering only by a table's **PRIMARY KEY**. With clustered indexes enabled, the terms *the PRIMARY KEY* and *the clustered index* might be used interchangeably. **PRIMARY KEY** refers to the constraint (a logical property), and clustered index describes the physical implementation of how the data is stored.

12.10.5.1 User scenarios

Compared to tables with non-clustered indexes, tables with clustered indexes offer greater performance and throughput advantages in the following scenarios:

- When data is inserted, the clustered index reduces one write of the index data from the network.
- When a query with an equivalent condition only involves the primary key, the clustered index reduces one read of index data from the network.
- When a query with a range condition only involves the primary key, the clustered index reduces multiple reads of index data from the network.
- When a query with an equivalent or range condition only involves the primary key prefix, the clustered index reduces multiple reads of index data from the network.

On the other hand, tables with clustered indexes have certain disadvantages. See the following:

- There might be write hotspot issues when inserting a large number of primary keys with close values.
- The table data takes up more storage space if the data type of the primary key is larger than 64 bits, especially when there are multiple secondary indexes.

12.10.5.2 Usages

12.10.5.3 Create a table with clustered indexes

Since TiDB v5.0, you can add non-reserved keywords **CLUSTERED** or **NONCLUSTERED** after **PRIMARY KEY** in a **CREATE TABLE** statement to specify whether the table's primary key is a clustered index. For example:

```
CREATE TABLE t (a BIGINT PRIMARY KEY CLUSTERED, b VARCHAR(255));
CREATE TABLE t (a BIGINT PRIMARY KEY NONCLUSTERED, b VARCHAR(255));
CREATE TABLE t (a BIGINT KEY CLUSTERED, b VARCHAR(255));
CREATE TABLE t (a BIGINT KEY NONCLUSTERED, b VARCHAR(255));
```

```
CREATE TABLE t (a BIGINT, b VARCHAR(255), PRIMARY KEY(a, b) CLUSTERED);
CREATE TABLE t (a BIGINT, b VARCHAR(255), PRIMARY KEY(a, b) NONCLUSTERED);
```

Note that keywords `KEY` and `PRIMARY KEY` have the same meaning in the column definition.

You can also use the [comment syntax](#) in TiDB to specify the type of the primary key. For example:

```
CREATE TABLE t (a BIGINT PRIMARY KEY /*T![clustered_index] CLUSTERED */, b
↳ VARCHAR(255));
CREATE TABLE t (a BIGINT PRIMARY KEY /*T![clustered_index] NONCLUSTERED */
↳ , b VARCHAR(255));
CREATE TABLE t (a BIGINT, b VARCHAR(255), PRIMARY KEY(a, b) /*T![
↳ clustered_index] CLUSTERED */);
CREATE TABLE t (a BIGINT, b VARCHAR(255), PRIMARY KEY(a, b) /*T![
↳ clustered_index] NONCLUSTERED */);
```

For statements that do not explicitly specify the keyword `CLUSTERED/NONCLUSTERED`, the default behavior is controlled by the system variable `@@global.tidb_enable_clustered_index` `↳` . Supported values for this variable are as follows:

- `OFF` indicates that primary keys are created as non-clustered indexes by default.
- `ON` indicates that primary keys are created as clustered indexes by default.
- `INT_ONLY` indicates that the behavior is controlled by the configuration item `alter-↳ primary-key`. If `alter-primary-key` is set to `true`, primary keys are created as non-clustered indexes by default. If it is set to `false`, only the primary keys which consist of an integer column are created as clustered indexes.

The default value of `@@global.tidb_enable_clustered_index` is `INT_ONLY`.

12.10.5.3.1 Add or drop clustered indexes

TiDB does not support adding or dropping clustered indexes after tables are created. Nor does it support the mutual conversion between clustered indexes and non-clustered indexes. For example:

```
ALTER TABLE t ADD PRIMARY KEY(b, a) CLUSTERED; -- Currently not supported.
ALTER TABLE t DROP PRIMARY KEY; -- If the primary key is a clustered index
↳ , then not supported.
ALTER TABLE t DROP INDEX `PRIMARY`; -- If the primary key is a clustered
↳ index, then not supported.
```

12.10.5.3.2 Add or drop non-clustered indexes

TiDB supports adding or dropping non-clustered indexes after tables are created. You can explicitly specify the keyword `NONCLUSTERED` or omit it. For example:

```
ALTER TABLE t ADD PRIMARY KEY(b, a) NONCLUSTERED;
ALTER TABLE t ADD PRIMARY KEY(b, a); -- If you omit the keyword, the
    ↪ primary key is a non-clustered index by default.
ALTER TABLE t DROP PRIMARY KEY;
ALTER TABLE t DROP INDEX `PRIMARY`;
```

12.10.5.3.3 Check whether the primary key is a clustered index

You can check whether the primary key of a table is a clustered index using one of the following methods:

- Execute the command `SHOW CREATE TABLE`.
- Execute the command `SHOW INDEX FROM`.
- Query the `TIDB_PK_TYPE` column in the system table `information_schema.tables`.

By running the command `SHOW CREATE TABLE`, you can see whether the attribute of `PRIMARY KEY` is `CLUSTERED` or `NONCLUSTERED`. For example:

```
mysql> SHOW CREATE TABLE t;
+--
↪ -----+-----
↪
| Table | Create Table
↪
↪ |
+--
↪ -----+-----
↪
| t      | CREATE TABLE `t` (
| `a` bigint(20) NOT NULL,
| `b` varchar(255) DEFAULT NULL,
| PRIMARY KEY (`a`) /*T![clustered_index] CLUSTERED */
| ) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin |
+--
↪ -----+-----
↪
1 row in set (0.01 sec)
```

By running the command `SHOW INDEX FROM`, you can check whether the result in the column `Clustered` shows `YES` or `NO`. For example:

```
mysql> SHOW INDEX FROM t;
+---+
↪ -----+-----+-----+-----+-----+-----+-----+-----+
↪
| Table | Non_unique | Key_name | Seq_in_index | Column_name | Collation |
↪ Cardinality | Sub_part | Packed | Null | Index_type | Comment |
↪ Index_comment | Visible | Expression | Clustered |
+---+
↪ -----+-----+-----+-----+-----+-----+-----+-----+
↪
| t      |          0 | PRIMARY |           1 | a           | A         |
↪ |      NULL | NULL    |         | BTREE      |           | YES      |
↪ NULL    | YES     |
+---+
↪ -----+-----+-----+-----+-----+-----+-----+-----+
↪
1 row in set (0.01 sec)
```

You can also query the column `TIDB_PK_TYPE` in the system table `information_schema.tables` to see whether the result is `CLUSTERED` or `NONCLUSTERED`. For example:

```
mysql> SELECT TIDB_PK_TYPE FROM information_schema.tables WHERE
↪ table_schema = 'test' AND table_name = 't';
+-----+
| TIDB_PK_TYPE |
+-----+
| CLUSTERED   |
+-----+
1 row in set (0.03 sec)
```

12.10.5.4 Limitations

Currently, there are several different types of limitations for the clustered index feature. See the following:

- Situations that are not supported and not in the support plan:
 - Using clustered indexes together with the attribute `SHARD_ROW_ID_BITS` is not supported. Also, the attribute `PRE_SPLIT_REGIONS` does not take effect on tables with clustered indexes.
 - Downgrading tables with clustered indexes is not supported. If you need to downgrade such tables, use logical backup tools to migrate data instead.
- Situations that are not supported yet but in the support plan:

- Adding, dropping, and altering clustered indexes using `ALTER TABLE` statements are not supported.
- Limitations for specific versions:
 - In v5.0, using the clustered index feature together with TiDB Binlog is not supported. After TiDB Binlog is enabled, TiDB only allows creating a single integer column as the clustered index of a primary key. TiDB Binlog does not replicate data changes (such as insertion, deletion, and update) on existing tables with clustered indexes to the downstream. If you need to replicate tables with clustered indexes to the downstream, upgrade your cluster to v5.1 or use [TiCDC](#) for replication instead.

After TiDB Binlog is enabled, if the clustered index you create is not a single integer primary key, TiDB returns the following error:

```
mysql> CREATE TABLE t (a VARCHAR(255) PRIMARY KEY CLUSTERED);
ERROR 8200 (HY000): Cannot create clustered index table when the binlog is
↪ ON
```

If you use clustered indexes together with the attribute `SHARD_ROW_ID_BITS`, TiDB reports the following error:

```
mysql> CREATE TABLE t (a VARCHAR(255) PRIMARY KEY CLUSTERED)
↪ SHARD_ROW_ID_BITS = 3;
ERROR 8200 (HY000): Unsupported shard_row_id_bits for table with primary
↪ key as row id
```

12.10.5.5 Compatibility

12.10.5.5.1 Compatibility with earlier and later TiDB versions

TiDB supports upgrading tables with clustered indexes but not downgrading such tables, which means that data in tables with clustered indexes on a later TiDB version is not available on an earlier one.

The clustered index feature is partially supported in TiDB v3.0 and v4.0. It is enabled by default when the following requirements are fully met:

- The table contains a `PRIMARY KEY`.
- The `PRIMARY KEY` consists of only one column.
- The `PRIMARY KEY` is an `INTEGER`.

Since TiDB v5.0, the clustered index feature is fully supported for all types of primary keys, but the default behavior is consistent with TiDB v3.0 and v4.0. To change the default behavior, you can configure the system variable `@@tidb_enable_clustered_index` to `ON` or `OFF`. For more details, see [Create a table with clustered indexes](#).

12.10.5.5.2 Compatibility with MySQL

TiDB specific comment syntax supports wrapping the keywords `CLUSTERED` and `NONCLUSTERED` in a comment. The result of `SHOW CREATE TABLE` also contains TiDB specific SQL comments. MySQL databases and TiDB databases of an earlier version will ignore these comments.

12.10.5.5.3 Compatibility with TiDB migration tools

The clustered index feature is only compatible with the following migration tools in v5.0 and later versions:

- Backup and restore tools: BR, Dumpling, and TiDB Lightning.
- Data migration and replication tools: DM and TiCDC.

However, you cannot convert a table with non-clustered indexes to a table with clustered indexes by backing up and restoring the table using the v5.0 BR tool, and vice versa.

12.10.5.5.4 Compatibility with other TiDB features

For a table with a combined primary key or a single non-integer primary key, if you change the primary key from a non-clustered index to a clustered index, the keys of its row data change as well. Therefore, `SPLIT TABLE BY/BETWEEN` statements that are executable in TiDB versions earlier than v5.0 are no longer workable in v5.0 and later versions of TiDB. If you want to split a table with clustered indexes using `SPLIT TABLE BY/BETWEEN`, you need to provide the value of the primary key column, instead of specifying an integer value. See the following example:

```
mysql> create table t (a int, b varchar(255), primary key(a, b) clustered);
Query OK, 0 rows affected (0.01 sec)
mysql> split table t between (0) and (1000000) regions 5;
ERROR 1105 (HY000): Split table region lower value count should be 2
mysql> split table t by (0), (50000), (100000);
ERROR 1136 (21S01): Column count doesn't match value count at row 0
mysql> split table t between (0, 'aaa') and (1000000, 'zzz') regions 5;
+-----+-----+
| TOTAL_SPLIT_REGION | SCATTER_FINISH_RATIO |
+-----+-----+
|          4 |          1 |
+-----+-----+
1 row in set (0.00 sec)
mysql> split table t by (0, ''), (50000, ''), (100000, '');
+-----+-----+
| TOTAL_SPLIT_REGION | SCATTER_FINISH_RATIO |
+-----+-----+
|          3 |          1 |
+-----+-----+
```

```
+-----+-----+
1 row in set (0.01 sec)
```

The attribute `AUTO_RANDOM` can only be used on clustered indexes. Otherwise, TiDB returns the following error:

```
mysql> create table t (a bigint primary key nonclustered auto_random);
ERROR 8216 (HY000): Invalid auto random: column a is not the integer
↳ primary key, or the primary key is nonclustered
```

12.10.6 Constraints

TiDB supports almost the same constraint as MySQL.

12.10.6.1 NOT NULL

NOT NULL constraints supported by TiDB are the same as those supported by MySQL.

For example:

```
CREATE TABLE users (
  id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
  age INT NOT NULL,
  last_login TIMESTAMP
);
```

```
INSERT INTO users (id,age,last_login) VALUES (NULL,123,NOW());
```

```
Query OK, 1 row affected (0.02 sec)
```

```
INSERT INTO users (id,age,last_login) VALUES (NULL,NULL,NOW());
```

```
ERROR 1048 (23000): Column 'age' cannot be null
```

```
INSERT INTO users (id,age,last_login) VALUES (NULL,123,NULL);
```

```
Query OK, 1 row affected (0.03 sec)
```

- The first INSERT statement succeeds because it is possible to assign NULL to the `AUTO_INCREMENT` column. TiDB generates sequence numbers automatically.
- The second INSERT statement fails because the `age` column is defined as NOT NULL.
- The third INSERT statement succeeds because the `last_login` column is not explicitly defined as NOT NULL. NULL values are allowed by default.

12.10.6.2 CHECK

TiDB parses but ignores CHECK constraints. This is MySQL 5.7 compatible behavior.

For example:

```
DROP TABLE IF EXISTS users;
CREATE TABLE users (
  id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
  username VARCHAR(60) NOT NULL,
  UNIQUE KEY (username),
  CONSTRAINT min_username_length CHECK (CHARACTER_LENGTH(username) >=4)
);
INSERT INTO users (username) VALUES ('a');
SELECT * FROM users;
```

12.10.6.3 UNIQUE KEY

Depending on the transaction mode and the value of `tidb_constraint_check_in_place` \leftrightarrow , TiDB might check UNIQUE constraints lazily. This helps improve performance by batching network access.

For example:

```
DROP TABLE IF EXISTS users;
CREATE TABLE users (
  id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
  username VARCHAR(60) NOT NULL,
  UNIQUE KEY (username)
);
INSERT INTO users (username) VALUES ('dave'), ('sarah'), ('bill');
```

With the default of pessimistic locking:

```
BEGIN;
INSERT INTO users (username) VALUES ('jane'), ('chris'), ('bill');
```

```
ERROR 1062 (23000): Duplicate entry 'bill' for key 'username'
```

With optimistic locking and `tidb_constraint_check_in_place=0`:

```
BEGIN OPTIMISTIC;
INSERT INTO users (username) VALUES ('jane'), ('chris'), ('bill');
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
Query OK, 3 rows affected (0.00 sec)
```

```
Records: 3 Duplicates: 0 Warnings: 0
```

```
INSERT INTO users (username) VALUES ('steve'),('elizabeth');
```

```
Query OK, 2 rows affected (0.00 sec)  
Records: 2 Duplicates: 0 Warnings: 0
```

```
COMMIT;
```

```
ERROR 1062 (23000): Duplicate entry 'bill' for key 'username'
```

In the optimistic example, the unique check was delayed until the transaction is committed. This resulted in a duplicate key error, because the value `bill` was already present.

You can disable this behavior by setting `tidb_constraint_check_in_place` to 1. This variable setting does not take effect on pessimistic transactions, because in the pessimistic transaction mode the constraints are always checked when the statement is executed. When `tidb_constraint_check_in_place=1`, the unique constraint is checked when the statement is executed.

For example:

```
DROP TABLE IF EXISTS users;  
CREATE TABLE users (  
  id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,  
  username VARCHAR(60) NOT NULL,  
  UNIQUE KEY (username)  
);  
INSERT INTO users (username) VALUES ('dave'), ('sarah'), ('bill');
```

```
SET tidb_constraint_check_in_place = 1;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
BEGIN OPTIMISTIC;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
INSERT INTO users (username) VALUES ('jane'), ('chris'), ('bill');
```

```
ERROR 1062 (23000): Duplicate entry 'bill' for key 'username'
```

```
..
```

The first `INSERT` statement caused a duplicate key error. This causes additional network communication overhead and may reduce the throughput of insert operations.

12.10.6.4 PRIMARY KEY

Like MySQL, primary key constraints contain unique constraints, that is, creating a primary key constraint is equivalent to having a unique constraint. In addition, other primary key constraints of TiDB are also similar to those of MySQL.

For example:

```
CREATE TABLE t1 (a INT NOT NULL PRIMARY KEY);
```

```
Query OK, 0 rows affected (0.12 sec)
```

```
CREATE TABLE t2 (a INT NULL PRIMARY KEY);
```

```
ERROR 1171 (42000): All parts of a PRIMARY KEY must be NOT NULL; if you need  
↳ NULL in a key, use UNIQUE instead
```

```
CREATE TABLE t3 (a INT NOT NULL PRIMARY KEY, b INT NOT NULL PRIMARY KEY);
```

```
ERROR 1068 (42000): Multiple primary key defined
```

```
CREATE TABLE t4 (a INT NOT NULL, b INT NOT NULL, PRIMARY KEY (a,b));
```

```
Query OK, 0 rows affected (0.10 sec)
```

- Table `t2` failed to be created, because column `a` is defined as the primary key and does not allow `NULL` values.
- Table `t3` failed to be created, because a table can only have one primary key.
- Table `t4` was created successfully, because even though there can be only one primary key, TiDB supports defining multiple columns as the composite primary key.

In addition to the rules above, TiDB currently only supports adding and deleting the primary keys of the `NONCLUSTERED` type. For example:

```
CREATE TABLE t5 (a INT NOT NULL, b INT NOT NULL, PRIMARY KEY (a,b)  
↳ CLUSTERED);  
ALTER TABLE t5 DROP PRIMARY KEY;
```

```
ERROR 8200 (HY000): Unsupported drop primary key when the table is using  
↳ clustered index
```

```
CREATE TABLE t5 (a INT NOT NULL, b INT NOT NULL, PRIMARY KEY (a,b)  
↳ NONCLUSTERED);  
ALTER TABLE t5 DROP PRIMARY KEY;
```

```
Query OK, 0 rows affected (0.10 sec)
```

For more details about the primary key of the `CLUSTERED` type, refer to [clustered index](#).

12.10.6.5 FOREIGN KEY

Note:

TiDB has limited support for foreign key constraints.

TiDB supports creating FOREIGN KEY constraints in DDL commands.

For example:

```
CREATE TABLE users (
  id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
  doc JSON
);
CREATE TABLE orders (
  id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
  user_id INT NOT NULL,
  doc JSON,
  FOREIGN KEY fk_user_id (user_id) REFERENCES users(id)
);
```

```
SELECT table_name, column_name, constraint_name, referenced_table_name,
       ↪ referenced_column_name
FROM information_schema.key_column_usage WHERE table_name IN ('users', '
       ↪ orders');
```

```
+-----+-----+-----+-----+
↪
| table_name | column_name | constraint_name | referenced_table_name |
↪ referenced_column_name |
+-----+-----+-----+-----+
↪
| users      | id          | PRIMARY        | NULL                  | NULL
↪
| orders     | id          | PRIMARY        | NULL                  | NULL
↪
| orders     | user_id     | fk_user_id     | users                 | id
↪
+-----+-----+-----+-----+
↪
3 rows in set (0.00 sec)
```

TiDB also supports the syntax to DROP FOREIGN KEY and ADD FOREIGN KEY via the ALTER TABLE command.

```
ALTER TABLE orders DROP FOREIGN KEY fk_user_id;
ALTER TABLE orders ADD FOREIGN KEY fk_user_id (user_id) REFERENCES users(id
↪ );
```

12.10.6.5.1 Notes

- TiDB supports foreign keys to avoid errors caused by this syntax when you migrate data from other databases to TiDB.

However, TiDB does not perform constraint checking on foreign keys in DML statements. For example, even if there is no record with `id=123` in the `users` table, the following transactions can be submitted successfully.

```
START TRANSACTION;
INSERT INTO orders (user_id, doc) VALUES (123, NULL);
COMMIT;
```

12.10.7 Generated Columns

Warning:

This is still an experimental feature. It is **NOT** recommended that you use it in the production environment.

This document introduces the concept and usage of generated columns.

12.10.7.1 Basic concepts

Unlike general columns, the value of the generated column is calculated by the expression in the column definition. When inserting or updating a generated column, you cannot assign a value, but only use `DEFAULT`.

There are two kinds of generated columns: virtual and stored. A virtual generated column occupies no storage and is computed when it is read. A stored generated column is computed when it is written (inserted or updated) and occupies storage. Compared with the virtual generated columns, the stored generated columns have better read performance, but take up more disk space.

You can create an index on a generated column whether it is virtual or stored.

12.10.7.2 Usage

One of the main usage of generated columns is to extract data from the JSON data type and indexing the data.

In both MySQL 5.7 and TiDB, columns of type JSON can not be indexed directly. That is, the following table schema is **not supported**:

```
CREATE TABLE person (
  id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
  name VARCHAR(255) NOT NULL,
  address_info JSON,
  KEY (address_info)
);
```

To index a JSON column, you must extract it as a generated column first.

Using the city field in address_info as an example, you can create a virtual generated column and add an index for it:

```
CREATE TABLE person (
  id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
  name VARCHAR(255) NOT NULL,
  address_info JSON,
  city VARCHAR(64) AS (JSON_UNQUOTE(JSON_EXTRACT(address_info, '$.city')))
  ↪ , -- virtual generated column
  -- city VARCHAR(64) AS (JSON_UNQUOTE(JSON_EXTRACT(address_info, '$.city
  ↪ '))) VIRTUAL, -- virtual generated column
  -- city VARCHAR(64) AS (JSON_UNQUOTE(JSON_EXTRACT(address_info, '$.city
  ↪ '))) STORED, -- stored generated column
  KEY (city)
);
```

In this table, the city column is a **virtual generated column** and has an index. The following query can use the index to speed up the execution:

```
SELECT name, id FROM person WHERE city = 'Beijing';
```

```
EXPLAIN SELECT name, id FROM person WHERE city = 'Beijing';
```

```
+-----+-----+-----+-----+
↪
| id          | estRows | task  | access object |
↪          | operator info |
+-----+-----+-----+-----+
↪
| Projection_4 | 10.00  | root  |               |
↪          | test.person.name, test.person.id |
↪          |
```

```

| -IndexLookUp_10          | 10.00 | root | |
| ↪                         |       |      | |
| ↪                         |       |      | |
| -IndexRangeScan_8(Build) | 10.00 | cop[tikv] | table:person, index:
| ↪ city(city) | range:["Beijing","Beijing"], keep order:false, stats:
| ↪ pseudo |
| -TableRowIDScan_9(Probe) | 10.00 | cop[tikv] | table:person
| ↪           | keep order:false, stats:pseudo |
+-----+-----+-----+-----+
| ↪

```

From the query execution plan, it can be seen that the `city` index is used to read the `HANDLE` of the row that meets the condition `city = 'Beijing'`, and then it uses this `HANDLE` to read the data of the row.

If no data exists at path `$.city`, `JSON_EXTRACT` returns `NULL`. If you want to enforce a constraint that `city` must be `NOT NULL`, you can define the virtual generated column as follows:

```

CREATE TABLE person (
  id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
  name VARCHAR(255) NOT NULL,
  address_info JSON,
  city VARCHAR(64) AS (JSON_UNQUOTE(JSON_EXTRACT(address_info, '$.city')))
  ↪ NOT NULL,
  KEY (city)
);

```

12.10.7.3 Validation of generated columns

Both `INSERT` and `UPDATE` statements check virtual column definitions. Rows that do not pass validation return errors:

```

mysql> INSERT INTO person (name, address_info) VALUES ('Morgan',
  ↪ JSON_OBJECT('Country', 'Canada'));
ERROR 1048 (23000): Column 'city' cannot be null

```

12.10.7.4 Generated columns index replacement rule

When an expression in a query is equivalent to a generated column with an index, TiDB replaces the expression with the corresponding generated column, so that the optimizer can take that index into account during execution plan construction.

For example, the following example creates a generated column for the expression `a+1` and adds an index:

```

create table t(a int);
desc select a+1 from t where a+1=3;
+--
↪ -----+-----+-----+-----+
↪
| id                | estRows | task   | access object | operator info
↪                |
+--
↪ -----+-----+-----+-----+
↪
| Projection_4      | 8000.00 | root   |               | plus(test.t.a,
↪ 1)->Column#3 |
| -TableReader_7   | 8000.00 | root   |               | data:
↪ Selection_6      |         |        |               |
| -Selection_6     | 8000.00 | cop[tikv] |               | eq(plus(test.t
↪ .a, 1), 3) |
| -TableFullScan_5 | 10000.00 | cop[tikv] | table:t | keep order:
↪ false, stats:pseudo |
+--
↪ -----+-----+-----+-----+
↪
4 rows in set (0.00 sec)

alter table t add column b bigint as (a+1) virtual;
alter table t add index idx_b(b);
desc select a+1 from t where a+1=3;
+--
↪ -----+-----+-----+-----+
↪
| id                | estRows | task   | access object | operator
↪ info                |
+--
↪ -----+-----+-----+-----+
↪
| IndexReader_6     | 10.00   | root   |               | index:
↪ IndexRangeScan_5 |         |        |               |
| -IndexRangeScan_5 | 10.00   | cop[tikv] | table:t, index:idx_b(b) |
↪ range:[3,3], keep order:false, stats:pseudo |
+--
↪ -----+-----+-----+-----+
↪
2 rows in set (0.01 sec)

```

Note:

Only when the expression type and the generated column type are strictly equal, the replacement is performed.

In the above example, the column type of `a` is `int` and the column type of `a+1` is `bigint`. If the type of the generated column is set to `int`, the replacement will not occur.

For type conversion rules, see [Type Conversion of Expression Evaluation](#).

12.10.7.5 Limitations

The current limitations of JSON and generated columns are as follows:

- You cannot add a stored generated column through `ALTER TABLE`.
- You can neither convert a stored generated column to a normal column through the `ALTER TABLE` statement nor convert a normal column to a stored generated column.
- You cannot modify the expression of a stored generated column through the `ALTER ↔ TABLE` statement.
- Not all [JSON functions](#) are supported;
- Currently, the generated column index replacement rule is valid only when the generated column is a virtual generated column. It is not valid on the stored generated column, but the index can still be used by directly using the generated column itself.

— title: SQL Mode summary: Learn SQL mode. —

12.10.8 SQL Mode

TiDB servers operate in different SQL modes and apply these modes differently for different clients. SQL mode defines the SQL syntaxes that TiDB supports and the type of data validation check to perform, as described below:

After TiDB is started, modify `SET [SESSION | GLOBAL] sql_mode='modes'` to set SQL mode.

Ensure that you have `SUPER` privilege when setting SQL mode at `GLOBAL` level, and your setting at this level only affects the connections established afterwards. Changes to SQL mode at `SESSION` level only affect the current client.

`Modes` are a series of different modes separated by commas (`','`). You can use the `SELECT ↔ @@sql_mode` statement to check the current SQL mode. The default value of SQL mode: `ONLY_FULL_GROUP_BY, STRICT_TRANS_TABLES, NO_ZERO_IN_DATE, NO_ZERO_DATE, ↔ ERROR_FOR_DIVISION_BY_ZERO, NO_AUTO_CREATE_USER, NO_ENGINE_SUBSTITUTION`.

12.10.8.1 Important `sql_mode` values

- **ANSI:** This mode complies with standard SQL. In this mode, data is checked. If data does not comply with the defined type or length, the data type is adjusted or trimmed and a **warning** is returned.
- **STRICT_TRANS_TABLES:** Strict mode, where data is strictly checked. When any incorrect data is inserted into a table, an error is returned.
- **TRADITIONAL:** In this mode, TiDB behaves like a “traditional” SQL database system. An error instead of a warning is returned when any incorrect value is inserted into a column. Then, the **INSERT** or **UPDATE** statement is immediately stopped.

12.10.8.2 SQL mode table

Name	Description
<code>PIPES_AS_CONCAT</code>	“ ” as a string concatenation operator (+) (the same as <code>CONCAT</code>)
<code>OR</code>	(full support)

Name	Description
<code>ANSI_QUOTES</code>	
<code>↔</code>	" as an identifier. If <code>ANSI_QUOTES</code> <code>↔</code> is enabled, only single quotes are treated as string literals, and double quotes are treated as identifiers. Therefore, double quotes cannot be used to quote strings. (full support)

Name	Description
------	-------------

IGNORE_SPACE	
---------------------	--

↔	this mode is enabled, the system ignores space. For example: “user” and “user” are the same. (full support)
---	---

Name	Description
------	-------------

ONLY_FULL_GROUP_BY	
--------------------	--

↪ non-aggregated column that is referred to in SELECT ↪ , HAVING ↪ , or ORDER ↪ ↪ BY ↪ is absent in GROUP ↪ ↪ BY ↪ , this SQL statement is invalid, because it is abnormal for a column to be absent in GROUP

2728 ↪

↪ BY

↪

<u>Name</u>	<u>Description</u>
<code>NO_UNSIGNED_SUBTRACTION</code>	
↔	not mark the re- sult as <code>UNSIGNED</code>
↔	if an operand has no sym- bol in sub- trac- tion. (full sup- port)

Name	Description
NO_DIR_INDEX_CREATE	
↔	all INDEX ↔ ↔ DIRECTORY ↔ and DATA ↔ ↔ DIRECTORY ↔ direc- tives when a table is cre- ated. This op- tion is only use- ful for sec- ondary repli- ca- tion servers (syn- tax sup- port only)

Name	Description
NO_KEY_OPTIONS	
↔	you use the SHOW
↔	
↔	CREATE
↔	
↔	TABLE
↔	
	statement, MySQL-specific syntaxes such as ENGINE
↔	
	are not exported. Consider this option when migrating across DB types using <code>mysql-dump</code> . (syntax support only)

Name	Description
<code>NO_FIELD_OPTIONS</code>	you use the <code>SHOW CREATE TABLE</code> statement, MySQL-specific syntaxes such as <code>ENGINE</code> are not exported. Consider this option when migrating across DB types using <code>mysql-dump</code> . (syntax support only)

Name	Description
<code>NO_TABLE_OPTIONS</code>	you use the <code>SHOW CREATE TABLE</code> statement, MySQL-specific syntaxes such as <code>ENGINE</code> are not exported. Consider this option when migrating across DB types using <code>mysql-dump</code> . (syntax support only)

<u>Name</u>	<u>Description</u>
<code>NO_AUTO_INCREMENT</code>	↔ this mode is enabled, when the value passed in the <code>AUTO_INCREMENT</code>
<code>NO_AUTO_INCREMENT</code>	↔ column is 0 or a specific value, the system directly writes this value to this column. When <code>NULL</code> is passed, the system automatically generates the next serial

<u>Name</u>	<u>Description</u>
<code>NO_BACKSLASH_ESCAPES</code>	
↔	this mode is enabled, the \ backslash symbol only stands for itself. (full support)

Name	Description
<code>STRICT_TRANS_TABLES</code>	↔ the strict mode for the transaction storage engine and rolls back the entire statement after an illegal value is inserted. (full support)

<u>Name</u>	<u>Description</u>
STRICT_FULL_TABLES	
↔	trans- ac- tional ta- bles, rolls back the en- tire trans- ac- tion state- ment after an il- legal value is in- serted. (full sup- port)

Name	Description
------	-------------

<code>NO_ZERO_IN_DATE</code>	
------------------------------	--

↔ mode, where dates with a month or day part of 0 are not accepted. If you use the `IGNORE`

↔ option, TiDB inserts '0000-00-00' for a similar date. In non-strict mode, this date is accepted but a warning is returned. (full sup-

Name	Description
<code>NO_ZERO_DATE</code>	
↔	not use '0000-00-00' as a legal date in strict mode. You can still insert a zero date with the IGNORE
↔	option. In non-strict mode, this date is accepted but a warning is returned. (full support)

<u>Name</u>	<u>Description</u>
<u>ALLOW_INVALID_DATES</u>	
↔	this mode, the system does not check the validity of all dates. It only checks the month value ranging from 1 to 12 and the date value ranging from 1 to 31. The mode only applies to DATE and DATETIME
↔	columns.
↔	All
↔	TIMESTAMP
↔	

Name	Description
<code>ERROR_HANDLER_DIVISION_BY_ZERO</code>	

↔ this mode is enabled, the system returns an error when handling division by 0 in data-change operations (INSERT ↔ or UPDATE ↔). If this mode is not enabled, the system returns a warning and NULL is used .

<u>Name</u>	<u>Description</u>
<code>NO_AUTO_CREATE_USER</code>	
↔	<code>GRANT</code>
	↔
	from auto- mati- cally creat- ing new users, ex- cept for the speci- fied pass- word (full sup- port)

Name	Description

12.10.9 Table Attributes

The Table Attributes feature is introduced in TiDB v5.3.0. Using this feature, you can add specific attributes to a table or partition to perform the operations corresponding to the attributes. For example, you can use table attributes to control the Region merge behavior.

Currently, TiDB only supports adding the `merge_option` attribute to a table or partition to control the Region merge behavior. The `merge_option` attribute is only part of how to deal with hotspots. For more information, refer to [Troubleshoot Hotspot Issues](#).

Note:

- When you use TiDB Binlog or TiCDC to perform replication or use BR to perform incremental backup, the replication or backup operations skip the DDL statement that sets table attributes. To use table attributes in the downstream or in the backup cluster, you need to manually execute the DDL statement in the downstream or in the backup cluster.
- TiDB v5.4.0 **does not support** Index Region. For details of Index Region, refer to [Split Index Region](#).

- In TiDB v5.4.0, adding table attributes **only** takes effect on existing partitions. To add or delete partitions after adding table attributes, you need to reset table attributes. For detailed methods, see [How to use table attributes](#).

12.10.9.1 Usage

The table attribute is in the form of `key=value`. Multiple attributes are separated by commas. In the following examples, `t` is the name of the table to be modified, `p` is the name of the partition to be modified. Items in `[]` are optional.

- Set attributes for a table or partition:

```
ALTER TABLE t [PARTITION p] ATTRIBUTES [=] 'key=value[, key1=value1...]  
↪ ';
```

- Reset attributes for a table or partition:

```
ALTER TABLE t [PARTITION p] ATTRIBUTES [=] DEFAULT;
```

- See the attributes of all tables and partitions:

```
SELECT * FROM information_schema.attributes;
```

- See the attribute configured to a table or partition:

```
SELECT * FROM information_schema.attributes WHERE id='schema/t[/p]';
```

- See all tables and partitions that have a specific attribute:

```
SELECT * FROM information_schema.attributes WHERE attributes LIKE '%  
↪ key%';
```

12.10.9.2 Attribute override rules

The attribute configured to a table takes effect on all partitions of the table. However, there is one exception: If the table and partition are configured with the same attribute but different attribute values, the partition attribute overrides the table attribute. For example, suppose that the table `t` is configured with the `key=value` attribute, and the partition `p` is configured with `key=value1`.

```
ALTER TABLE t ATTRIBUTES [=] 'key=value';  
ALTER TABLE t PARTITION p ATTRIBUTES [=] 'key=value1';
```

In this case, `key=value1` is the attribute that actually takes effect on the `p1` partition.

12.10.9.3 Control the Region merge behavior using table attributes

12.10.9.3.1 User scenarios

If there is a write hotspot or read hotspot, you can use table attributes to control the Region merge behavior. You can first add the `merge_option` attribute to a table or partition and then set its value to `deny`. The two scenarios are as follows.

Write hotspot on a newly created table or partition

If a hotspot issue occurs when data is written to a newly created table or partition, you usually need to split and scatter Regions. However, if there is a certain time interval between the split/scatter operation and writes, these operations do not truly avoid the write hotspot. This is because the split operation performed when the table or partition is created produces empty Regions, so if the time interval exists, the split Regions might be merged. To handle this case, you can add the `merge_option` attribute to the table or partition and set the attribute value to `deny`.

Periodic read hotspot in read-only scenarios

Suppose that in a read-only scenario, you try to reduce the periodic read hotspot that occurs on a table or partition by manually splitting Regions, and you do not want the manually split Regions to be merged after the hotspot issue is resolved. In this case, you can add the `merge_option` attribute to the table or partition and set its value to `deny`.

12.10.9.3.2 Usage

- Prevent the Regions of a table from merging:

```
ALTER TABLE t ATTRIBUTES 'merge_option=deny';
```

- Allow merging Regions belonging to a table:

```
ALTER TABLE t ATTRIBUTES 'merge_option=allow';
```

- Reset attributes of a table:

```
ALTER TABLE t ATTRIBUTES DEFAULT;
```

- Prevent the Regions of a partition from merging:

```
ALTER TABLE t PARTITION p ATTRIBUTES 'merge_option=deny';
```

- Allow merging Regions belonging to a partition:

```
ALTER TABLE t PARTITION p ATTRIBUTES 'merge_option=allow';
```

- See all tables or partitions configured the `merge_option` attribution:

```
SELECT * FROM information_schema.attributes WHERE attributes LIKE '%  
↪ merge_option%';
```

12.10.9.3.3 Attribute override rules

```
ALTER TABLE t ATTRIBUTES 'merge_option=deny';  
ALTER TABLE t PARTITION p ATTRIBUTES 'merge_option=allow';
```

When the above two attributes are configured at the same time, the Regions belonging to the partition `p` can actually be merged. When the attribute of the partition is reset, the partition `p` inherits the attribute from the table `t`, and the Regions cannot be merged.

Note:

- When there is now only an attribute of a partition, even if the `merge_option=allow` attribute is configured, the partition is still split into multiple Regions by default according to the actual number of partitions. To merge all Regions, you need to **reset the attribute of the table**.
- When using the `merge_option` attribute, you need to pay attention to the PD configuration parameter `split-merge-interval`. Suppose that the `merge_option` attribute is not configured. In this case, if Regions meet conditions, Regions can be merged after the interval specified by `split-merge-interval`. If the `merge_option` attribute is configured, PD decides whether to merge Regions after the specified interval according to the `merge_option` configuration.

Note:

- When there is now only an attribute of a partition, even if the `merge_option=allow` attribute is configured, the partition is still split into multiple Regions by default according to the actual number of partitions. To merge all Regions, you need to **reset the attribute of the table**.
- Suppose that the `merge_option` attribute is not configured. In this case, if Regions meet conditions, Regions can be merged after one hour. If the `merge_option` attribute is configured, PD decides whether to merge Regions after one hour according to the `merge_option` configuration.

12.10.10 Transactions

12.10.10.1 Transactions

TiDB supports distributed transactions using either **pessimistic** or **optimistic** transaction mode. Starting from TiDB 3.0.8, TiDB uses the pessimistic transaction mode by default.

This document introduces commonly used transaction-related statements, explicit and implicit transactions, isolation levels, lazy check for constraints, and transaction sizes.

The common variables include **autocommit**, **tidb_disable_txn_auto_retry**, **tidb_retry_limit**, and **tidb_txn_mode**.

Note:

The **tidb_disable_txn_auto_retry** and **tidb_retry_limit** variables only apply to optimistic transactions, not to pessimistic transactions.

12.10.10.1.1 Common statements

Starting a transaction

The statements **BEGIN** and **START TRANSACTION** can be used interchangeably to explicitly start a new transaction.

Syntax:

```
BEGIN;
```

```
START TRANSACTION;
```

```
START TRANSACTION WITH CONSISTENT SNAPSHOT;
```

```
START TRANSACTION WITH CAUSAL CONSISTENCY ONLY;
```

If the current session is in the process of a transaction when one of these statements is executed, TiDB automatically commits the current transaction before starting a new transaction.

Note:

Unlike MySQL, TiDB takes a snapshot of the current database after executing the statements above. MySQL's **BEGIN** and **START TRANSACTION** take a

snapshot after executing the first `SELECT` statement (not `SELECT FOR UPDATE` \leftrightarrow) that reads data from InnoDB after a transaction is started. `START` \leftrightarrow `TRANSACTION WITH CONSISTENT SNAPSHOT` takes a snapshot during the execution of the statement. As a result, `BEGIN`, `START TRANSACTION`, and `START TRANSACTION WITH CONSISTENT SNAPSHOT` are equivalent to `START` \leftrightarrow `TRANSACTION WITH CONSISTENT SNAPSHOT` in MySQL.

Committing a transaction

The statement `COMMIT` instructs TiDB to apply all changes made in the current transaction.

Syntax:

```
COMMIT;
```

Tip:

Make sure that your application correctly handles that a `COMMIT` statement could return an error before enabling `optimistic transactions`. If you are unsure of how your application handles this, it is recommended to instead use the default of `pessimistic transactions`.

Rolling back a transaction

The statement `ROLLBACK` rolls back and cancels all changes in the current transaction.

Syntax:

```
ROLLBACK;
```

Transactions are also automatically rolled back if the client connection is aborted or closed.

12.10.10.1.2 Autocommit

As required for MySQL compatibility, TiDB will by default *autocommit* statements immediately following their execution.

For example:

```
mysql> CREATE TABLE t1 (  
-> id INT NOT NULL PRIMARY KEY auto_increment,
```

```
-> pad1 VARCHAR(100)
-> );
Query OK, 0 rows affected (0.09 sec)

mysql> SELECT @@autocommit;
+-----+
| @@autocommit |
+-----+
| 1           |
+-----+
1 row in set (0.00 sec)

mysql> INSERT INTO t1 VALUES (1, 'test');
Query OK, 1 row affected (0.02 sec)

mysql> ROLLBACK;
Query OK, 0 rows affected (0.01 sec)

mysql> SELECT * FROM t1;
+----+-----+
| id | pad1 |
+----+-----+
| 1  | test |
+----+-----+
1 row in set (0.00 sec)
```

In the above example, the ROLLBACK statement has no effect. This is because the INSERT statement is executed in autocommit. That is, it was the equivalent of the following single-statement transaction:

```
START TRANSACTION;
INSERT INTO t1 VALUES (1, 'test');
COMMIT;
```

Autocommit will not apply if a transaction has been explicitly started. In the following example, the ROLLBACK statement successfully reverts the INSERT statement:

```
mysql> CREATE TABLE t2 (
-> id INT NOT NULL PRIMARY KEY auto_increment,
-> pad1 VARCHAR(100)
-> );
Query OK, 0 rows affected (0.10 sec)

mysql> SELECT @@autocommit;
+-----+
| @@autocommit |
```

```
+-----+
| 1      |
+-----+
1 row in set (0.00 sec)

mysql> START TRANSACTION;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t2 VALUES (1, 'test');
Query OK, 1 row affected (0.02 sec)

mysql> ROLLBACK;
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT * FROM t2;
Empty set (0.00 sec)
```

The `autocommit` system variable can be changed on either a global or session basis.

For example:

```
SET autocommit = 0;
```

```
SET GLOBAL autocommit = 0;
```

12.10.10.1.3 Explicit and implicit transaction

Note:

Some statements are committed implicitly. For example, executing `[BEGIN|START TRANSACTION]` implicitly commits the last transaction and starts a new transaction. This behavior is required for MySQL compatibility. Refer to [implicit commit](#) for more details.

TiDB supports explicit transactions (use `[BEGIN|START TRANSACTION]` and `COMMIT` to define the start and end of the transaction) and implicit transactions (`SET autocommit = 1`).

If you set the value of `autocommit` to 1 and start a new transaction through the `[BEGIN|START TRANSACTION]` statement, the `autocommit` is disabled before `COMMIT` or `ROLLBACK` which makes the transaction becomes explicit.

For DDL statements, the transaction is committed automatically and does not support rollback. If you run the DDL statement while the current session is in the process of a transaction, the DDL statement is executed after the current transaction is committed.

12.10.10.1.4 Lazy check of constraints

By default, optimistic transactions will not check the **primary key** or **unique constraints** when a DML statement is executed. These checks are instead performed on transaction COMMIT.

For example:

```
CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY);
INSERT INTO t1 VALUES (1);
BEGIN OPTIMISTIC;
INSERT INTO t1 VALUES (1); -- MySQL returns an error; TiDB returns success
↪ .
INSERT INTO t1 VALUES (2);
COMMIT; -- It is successfully committed in MySQL; TiDB returns an error
↪ and the transaction rolls back.
SELECT * FROM t1; -- MySQL returns 1 2; TiDB returns 1.
```

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.10 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.02 sec)

mysql> BEGIN OPTIMISTIC;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (1); -- MySQL returns an error; TiDB returns
↪ success.
Query OK, 1 row affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (2);
Query OK, 1 row affected (0.00 sec)

mysql> COMMIT; -- It is successfully committed in MySQL; TiDB returns an
↪ error and the transaction rolls back.
ERROR 1062 (23000): Duplicate entry '1' for key 'PRIMARY'
mysql> SELECT * FROM t1; -- MySQL returns 1 2; TiDB returns 1.
+----+
| id |
+----+
| 1 |
+----+
1 row in set (0.01 sec)
```

The lazy check optimization improves performance by batching constraint checks and reducing network communication. The behavior can be disabled by setting

`tidb_constraint_check_in_place=TRUE.`

Note:

- This optimization only applies to optimistic transactions.
- This optimization does not take effect for `INSERT IGNORE` and `INSERT ON DUPLICATE KEY UPDATE`, but only for normal `INSERT` statements.

12.10.10.1.5 Statement rollback

TiDB supports atomic rollback after statement execution failure. If a statement results in an error, the changes it made will not take effect. The transaction will remain open, and additional changes can be made before issuing a `COMMIT` or `ROLLBACK` statement.

```
CREATE TABLE test (id INT NOT NULL PRIMARY KEY);
BEGIN;
INSERT INTO test VALUES (1);
INSERT INTO tset VALUES (2); -- Statement does not take effect because "
    ↪ test" is misspelled as "tset".
INSERT INTO test VALUES (1),(2); -- Entire statement does not take effect
    ↪ because it violates a PRIMARY KEY constraint
INSERT INTO test VALUES (3);
COMMIT;
SELECT * FROM test;
```

```
mysql> CREATE TABLE test (id INT NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.09 sec)

mysql> BEGIN;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO test VALUES (1);
Query OK, 1 row affected (0.02 sec)

mysql> INSERT INTO tset VALUES (2); -- Statement does not take effect
    ↪ because "test" is misspelled as "tset".
ERROR 1146 (42S02): Table 'test.tset' doesn't exist
mysql> INSERT INTO test VALUES (1),(2); -- Entire statement does not take
    ↪ effect because it violates a PRIMARY KEY constraint
ERROR 1062 (23000): Duplicate entry '1' for key 'PRIMARY'
mysql> INSERT INTO test VALUES (3);
Query OK, 1 row affected (0.00 sec)
```

```
mysql> COMMIT;
Query OK, 0 rows affected (0.01 sec)

mysql> SELECT * FROM test;
+-----+
| id |
+-----+
| 1 |
| 3 |
+-----+
2 rows in set (0.00 sec)
```

In the above example, the transaction remains open after the failed `INSERT` statements. The final insert statement is then successful and changes are committed.

12.10.10.1.6 Transaction size limit

Due to the limitations of the underlying storage engine, TiDB requires a single row to be no more than 6 MB. All columns of a row are converted to bytes according to their data types and summed up to estimate the size of a single row.

TiDB supports both optimistic and pessimistic transactions, and optimistic transactions are the basis for pessimistic transactions. Because optimistic transactions first cache the changes in private memory, TiDB limits the size of a single transaction.

By default, TiDB sets the total size of a single transaction to no more than 100 MB. You can modify this default value via `txn-total-size-limit` in the configuration file. The maximum value of `txn-total-size-limit` is 1 TB. The individual transaction size limit also depends on the size of remaining memory available in the server. This is because when a transaction is executed, the memory usage of the TiDB process is scaled up comparing with the transaction size, up to two to three times or more of the transaction size.

TiDB previously limited the total number of key-value pairs for a single transaction to 300,000. This restriction was removed in TiDB v4.0.

Note:

Usually, TiDB Binlog is enabled to replicate data to the downstream. In some scenarios, message middleware such as Kafka is used to consume binlogs that are replicated to the downstream.

Taking Kafka as an example, the upper limit of Kafka's single message processing capability is 1 GB. Therefore, when `txn-total-size-limit` is set to more than 1 GB, it might happen that the transaction is successfully executed in TiDB, but the downstream Kafka reports an error. To avoid this situation,

you need to decide the actual value of `txn-total-size-limit` according to the limit of the end consumer. For example, if Kafka is used downstream, `txn-total-size-limit` must not exceed 1 GB.

12.10.10.1.7 Causal consistency

Note:

Transactions with causal consistency take effect only when the async commit and one-phase commit features are enabled. For details of the two features, see `tidb_enable_async_commit` and `tidb_enable_1pc`.

TiDB supports enabling causal consistency for transactions. Transactions with causal consistency, when committed, do not need to get timestamp from PD and have lower commit latency. The syntax to enable causal consistency is as follows:

```
START TRANSACTION WITH CAUSAL CONSISTENCY ONLY;
```

By default, TiDB guarantees linear consistency. In the case of linear consistency, if transaction 2 is committed after transaction 1 is committed, logically, transaction 2 should occur after transaction 1. Causal consistency is weaker than linear consistency. In the case of causal consistency, the commit order and occurrence order of two transactions can be guaranteed consistent only when the data locked or written by transaction 1 and transaction 2 have an intersection, which means that the two transactions have a causal relationship known to the database. Currently, TiDB does not support passing in external causal relationship.

Two transactions with causal consistency enabled have the following characteristics:

- Transactions with potential causal relationship have the consistent logical order and physical commit order
- Transactions with no causal relationship do not guarantee consistent logical order and physical commit order
- Reads without lock do not create causal relationship

Transactions with potential causal relationship have the consistent logical order and physical commit order

Assume that both transaction 1 and transaction 2 adopt causal consistency and have the following statements executed:

Transaction 1	Transaction 2
START	START
TRANS-	TRANS-
AC-	AC-
TION	TION
WITH	WITH
CAUSAL	CAUSAL
CON-	CON-
SIS-	SIS-
TENCY	TENCY
ONLY	ONLY
x = SE-	
LECT v	
FROM	
t	
WHERE	
id = 1	
FOR	
UP-	
DATE	
UPDATE	
t set v	
=	
\$(x + 1)	
WHERE	
id = 2	
COMMIT	
	UPDATE
	t SET v
	= 2
	WHERE
	id = 1
	COMMIT

In the example above, transaction 1 locks the `id = 1` record and transaction 2 modifies the `id = 1` record. Therefore, transaction 1 and transaction 2 have a potential causal relationship. Even with the causal consistency enabled, as long as transaction 2 is committed after transaction 1 is successfully committed, logically, transaction 2 must occur after transaction 1. Therefore, it is impossible that a transaction reads transaction 2's modification on the `id = 1` record without reading transaction 1's modification on the `id = 2` record.

Transactions with no causal relationship do not guarantee consistent logical order and physical commit order

Assume that the initial values of `id = 1` and `id = 2` are both 0. Assume that both transaction 1 and transaction 2 adopt causal consistency and have the following statements executed:

Transaction 1	Transaction 2	Transaction 3
START	START	
TRANS- AC- TION WITH CAUSAL CON- SIS- TENCY ONLY	TRANS- AC- TION WITH CAUSAL CON- SIS- TENCY ONLY	
UPDATE t set v = 3 WHERE id = 2		
	UPDATE t SET v = 2 WHERE id = 1	
COMMIT		BEGIN
	COMMIT	
		SELECT v FROM t WHERE id IN (1, 2)

In the example above, transaction 1 does not read the `id = 1` record, so transaction 1 and transaction 2 have no causal relationship known to the database. With causal consistency enabled for the transactions, even if transaction 2 is committed after transaction 1 is committed in terms of physical time order, TiDB does not guarantee that transaction 2 logically occurs after transaction 1.

If transaction 3 begins before transaction 1 is committed, and if transaction 3 reads the `id = 1` and `id = 2` records after transaction 2 is committed, transaction 3 might read the

value of `id = 1` to be 2 but the value of `id = 2` to be 0.

Reads without lock do not create causal relationship

Assume that both transaction 1 and transaction 2 adopt causal consistency and have the following statements executed:

Transaction 1	Transaction 2
START	START
TRANS- AC- TION WITH CAUSAL CON- SIS- TENCY ONLY	TRANS- AC- TION WITH CAUSAL CON- SIS- TENCY ONLY UPDATE t SET v = 2 WHERE id = 1
SELECT v FROM t WHERE id = 1 UPDATE t set v = 3 WHERE id = 2	COMMIT
COMMIT	

In the example above, reads without lock do not create causal relationship. Transaction 1 and transaction 2 have created write skew. In this case, it would have been unreasonable if the two transactions still had causal relationship. Therefore, the two transactions with causal consistency enabled have no definite logical order.

12.10.10.2 TiDB Transaction Isolation Levels

Transaction isolation is one of the foundations of database transaction processing. Isolation is one of the four key properties of a transaction (commonly referred as **ACID**).

The SQL-92 standard defines four levels of transaction isolation: Read Uncommitted, Read Committed, Repeatable Read, and Serializable. See the following table for details:

Isolation Level	Dirty Write	Dirty Read	Fuzzy Read	Phantom
READ UNCOMMITTED	Not Possible	Possible	Possible	Possible
READ COMMITTED	Not Possible	Not possible	Possible	Possible
REPEATABLE READ	Not Possible	Not possible	Not possible	Possible
SERIALIZABLE	Not Possible	Not possible	Not possible	Not possible

TiDB implements Snapshot Isolation (SI) consistency, which it advertises as **REPEATABLE** \leftrightarrow **-READ** for compatibility with MySQL. This differs from the **ANSI Repeatable Read isolation level** and the **MySQL Repeatable Read level**.

Note:

Starting from TiDB v3.0, the automatic retry of transactions is disabled by default. It is not recommended to enable the automatic retry because it might **break the transaction isolation level**. Refer to **Transaction Retry** for details.

Starting from TiDB v3.0.8, newly created TiDB clusters use the **pessimistic transaction mode** by default. The current read (for update read) is **non-repeatable read**. Refer to **pessimistic transaction mode** for details.

12.10.10.2.1 Repeatable Read isolation level

The Repeatable Read isolation level only sees data committed before the transaction begins, and it never sees either uncommitted data or changes committed during transaction execution by concurrent transactions. However, the transaction statement does see the effects of previous updates executed within its own transaction, even though they are not yet committed.

For transactions running on different nodes, the start and commit order depends on the order that the timestamp is obtained from PD.

Transactions of the Repeatable Read isolation level cannot concurrently update a same row. When committing, if the transaction finds that the row has been updated by another transaction after it starts, then the transaction rolls back. For example:

```
create table t1(id int);
insert into t1 values(0);
```

<pre>start transaction; select * from t1; update t1 set id=id+1; commit;</pre>	<pre> </pre>	<pre>start transaction; select * from t1; update t1 set id=id+1; -- In commit; -- The transaction commit</pre> <p>↪ <i>pessimistic transactions, the `update` statement executed later</i></p> <p>↪ <i>waits for the lock until the transaction holding the lock commits or</i></p> <p>↪ <i>rolls back and releases the row lock.</i></p> <p>↪ <i>fails and rolls back. Pessimistic</i></p> <p>↪ <i>transactions can commit successfully.</i></p>
--	----------------------	---

Difference between TiDB and ANSI Repeatable Read

The Repeatable Read isolation level in TiDB differs from ANSI Repeatable Read isolation level, though they sharing the same name. According to the standard described in the [A Critique of ANSI SQL Isolation Levels](#) paper, TiDB implements the Snapshot Isolation level. This isolation level does not allow strict phantoms (A3) but allows broad phantoms (P3) and write skews. In contrast, the ANSI Repeatable Read isolation level allows phantom reads but does not allow write skews.

Difference between TiDB and MySQL Repeatable Read

The Repeatable Read isolation level in TiDB differs from that in MySQL. The MySQL Repeatable Read isolation level does not check whether the current version is visible when updating, which means it can continue to update even if the row has been updated after the transaction starts. In contrast, if the row has been updated after the transaction starts, the TiDB optimistic transaction is rolled back and retried. Transaction retries in TiDB's optimistic concurrency control might fail, leading to a final failure of the transaction, while in TiDB's pessimistic concurrency control and MySQL, the updating transaction can be successful.

12.10.10.2.2 Read Committed isolation level

Starting from TiDB v4.0.0-beta, TiDB supports the Read Committed isolation level.

For historical reasons, the Read Committed isolation level of current mainstream databases is essentially the [Consistent Read isolation level defined by Oracle](#). In order to adapt to this situation, the Read Committed isolation level in TiDB pessimistic transactions is also a consistent read behavior in essence.

Note:

The Read Committed isolation level only takes effect in the **pessimistic transaction mode**. In the **optimistic transaction mode**, setting the transaction

isolation level to `Read Committed` does not take effect and transactions still use the `Repeatable Read` isolation level.

12.10.10.2.3 Difference between TiDB and MySQL Read Committed

The MySQL `Read Committed` isolation level is in line with the `Consistent Read` features in most cases. There are also exceptions, such as [semi-consistent read](#). This special behavior is not supported in TiDB.

12.10.10.3 TiDB Optimistic Transaction Model

With optimistic transactions, conflicting changes are detected as part of a transaction commit. This helps improve the performance when concurrent transactions are infrequently modifying the same rows, because the process of acquiring row locks can be skipped. In the case that concurrent transactions frequently modify the same rows (a conflict), optimistic transactions may perform worse than [Pessimistic Transactions](#).

Before enabling optimistic transactions, make sure that your application correctly handles that a `COMMIT` statement could return errors. If you are unsure of how your application handles this, it is recommended to instead use `Pessimistic Transactions`.

Note:

Starting from v3.0.8, TiDB uses the [pessimistic transaction mode](#) by default. However, this does not affect your existing cluster if you upgrade it from v3.0.7 or earlier to v3.0.8 or later. In other words, **only newly created clusters default to using the pessimistic transaction mode.**

12.10.10.3.1 Principles of optimistic transactions

To support distributed transactions, TiDB adopts two-phase commit (2PC) in optimistic transactions. The procedure is as follows:

Figure 369: 2PC in TiDB

1. The client begins a transaction.

TiDB gets a timestamp (monotonically increasing in time and globally unique) from PD as the unique transaction ID of the current transaction, which is called `start_ts`. TiDB implements multi-version concurrency control, so `start_ts` also serves as the version of the database snapshot obtained by this transaction. This means that the transaction can only read the data from the database at `start_ts`.

2. The client issues a read request.

1. TiDB receives routing information (how data is distributed among TiKV nodes) from PD.
 2. TiDB receives the data of the `start_ts` version from TiKV.
3. The client issues a write request.
- TiDB checks whether the written data satisfies constraints (to ensure the data types are correct, the NOT NULL constraint is met, etc.). **Valid data is stored in the private memory of this transaction in TiDB.**
4. The client issues a commit request.
 5. TiDB begins 2PC, and persists data in store while guaranteeing the atomicity of transactions.
 1. TiDB selects a Primary Key from the data to be written.
 2. TiDB receives the information of Region distribution from PD, and groups all keys by Region accordingly.
 3. TiDB sends prewrite requests to all TiKV nodes involved. Then, TiKV checks whether there are conflict or expired versions. Valid data is locked.
 4. TiDB receives all responses in the prewrite phase and the prewrite is successful.
 5. TiDB receives a commit version number from PD and marks it as `commit_ts`.
 6. TiDB initiates the second commit to the TiKV node where Primary Key is located. TiKV checks the data, and cleans the locks left in the prewrite phase.
 7. TiDB receives the message that reports the second phase is successfully finished.
 6. TiDB returns a message to inform the client that the transaction is successfully committed.
 7. TiDB asynchronously cleans the locks left in this transaction.

12.10.10.3.2 Advantages and disadvantages

From the process of transactions in TiDB above, it is clear that TiDB transactions have the following advantages:

- Simple to understand
- Implement cross-node transaction based on single-row transaction
- Decentralized lock management

However, TiDB transactions also have the following disadvantages:

- Transaction latency due to 2PC
- In need of a centralized timestamp allocation service
- OOM (out of memory) when extensive data is written in the memory

12.10.10.3.3 Transaction retries

In the optimistic transaction model, transactions might fail to be committed because of write–write conflict in heavy contention scenarios. TiDB uses optimistic concurrency control by default, whereas MySQL applies pessimistic concurrency control. This means that MySQL adds locks during the execution of write-type SQL statements, and its Repeatable Read isolation level allows for current reads, so commits generally do not encounter exceptions. To lower the difficulty of adapting applications, TiDB provides an internal retry mechanism.

Automatic retry

If a write-write conflict occurs during the transaction commit, TiDB automatically retries the SQL statement that includes write operations. You can enable the automatic retry by setting `tidb_disable_txn_auto_retry` to `OFF` and set the retry limit by configuring `tidb_retry_limit`:

```
#### Whether to disable automatic retry. ("on" by default)
tidb_disable_txn_auto_retry = OFF
#### Set the maximum number of the retries. ("10" by default)
#### When "tidb_retry_limit = 0", automatic retry is completely disabled.
tidb_retry_limit = 10
```

You can enable the automatic retry in either session level or global level:

1. Session level:

```
SET tidb_disable_txn_auto_retry = OFF;
```

```
SET tidb_retry_limit = 10;
```

2. Global level:

```
SET GLOBAL tidb_disable_txn_auto_retry = OFF;
```

```
SET GLOBAL tidb_retry_limit = 10;
```

Note:

The `tidb_retry_limit` variable decides the maximum number of retries. When this variable is set to 0, none of the transactions automatically retries, including the implicit single statement transactions that are automatically committed. This is the way to completely disable the automatic retry mechanism in TiDB. After the automatic retry is disabled, all conflicting transactions report failures (including the `try again later` message) to the application layer in the fastest way.

Limits of retry

By default, TiDB will not retry transactions because this might lead to lost updates and damaged **REPEATABLE READ isolation**.

The reason can be observed from the procedures of retry:

1. Allocate a new timestamp and mark it as `start_ts`.
2. Retry the SQL statements that contain write operations.
3. Implement the two-phase commit.

In Step 2, TiDB only retries SQL statements that contain write operations. However, during retrying, TiDB receives a new version number to mark the beginning of the transaction. This means that TiDB retries SQL statements with the data in the new `start_ts` version. In this case, if the transaction updates data using other query results, the results might be inconsistent because the **REPEATABLE READ isolation** is violated.

If your application can tolerate lost updates, and does not require **REPEATABLE READ isolation consistency**, you can enable this feature by setting `tidb_disable_txn_auto_retry` \leftrightarrow = **OFF**.

12.10.10.3.4 Conflict detection

As a distributed database, TiDB performs in-memory conflict detection in the TiKV layer, mainly in the prewrite phase. TiDB instances are stateless and unaware of each other, which means they cannot know whether their writes result in conflicts across the cluster. Therefore, conflict detection is performed in the TiKV layer.

The configuration is as follows:

```
#### Controls the number of slots. ("2048000" by default )
scheduler-concurrency = 2048000
```

In addition, TiKV supports monitoring the time spent on waiting latches in the scheduler.

Figure 370: Scheduler latch wait duration

When `Scheduler latch wait duration` is high and there are no slow writes, it can be safely concluded that there are many write conflicts at this time.

12.10.10.4 TiDB Pessimistic Transaction Mode

To make the usage of TiDB closer to traditional databases and reduce the cost of migration, starting from v3.0, TiDB supports the pessimistic transaction mode on top of the optimistic transaction model. This document describes the features of the TiDB pessimistic transaction mode.

Note:

Starting from v3.0.8, newly created TiDB clusters use the pessimistic transaction mode by default. However, this does not affect your existing cluster if you upgrade it from v3.0.7 or earlier to v3.0.8 or later. In other words, **only newly created clusters default to using the pessimistic transaction mode.**

12.10.10.4.1 Switch transaction mode

You can set the transaction mode by configuring the `tidb_txn_mode` system variable. The following command sets all explicit transactions (that is, non-autocommit transactions) executed by newly created sessions in the cluster to the pessimistic transaction mode:

```
SET GLOBAL tidb_txn_mode = 'pessimistic';
```

You can also explicitly enable the pessimistic transaction mode by executing the following SQL statements:

```
BEGIN PESSIMISTIC;
```

```
BEGIN /*T! PESSIMISTIC */;
```

The `BEGIN PESSIMISTIC;` and `BEGIN OPTIMISTIC;` statements take precedence over the `tidb_txn_mode` system variable. Transactions started with these two statements ignore the system variable and support using both the pessimistic and optimistic transaction modes.

12.10.10.4.2 Behaviors

Pessimistic transactions in TiDB behave similarly to those in MySQL. See the minor differences in [Difference with MySQL InnoDB](#).

- For pessimistic transactions, TiDB introduces snapshot read and current read.

- Snapshot read: it is an unlocked read that reads a version committed before the transaction starts. The read in the `SELECT` statement is a snapshot read.
- Current read: it is a locked read that reads the latest committed version. The read in the `UPDATE`, `DELETE`, `INSERT`, or `SELECT FOR UPDATE` statement is a current read.

The following examples provide a detailed description of snapshot read and current read.

Session 1	Session 2	Session 3
<pre> CREATE TA- BLE t (a INT); INSERT INTO T VAL- UES(1); BEGIN PES- SIMISTIC; UPDATE t SET a = a + 1; </pre>	<pre> BEGIN PES- SIMISTIC; </pre>

re-

turns

a=1.

- When you execute UPDATE, DELETE or INSERT statements, the **latest** committed data is read, data is modified, and a pessimistic lock is applied on the modified rows.
- For SELECT FOR UPDATE statements, a pessimistic lock is applied on the latest version of the committed data, instead of on the modified rows.
- Locks will be released when the transaction is committed or rolled back. Other transactions attempting to modify the data are blocked and have to wait for the lock to be released. Transactions attempting to *read* the data are not blocked, because TiDB uses multi-version concurrency control (MVCC).
- If several transactions are trying to acquire each other's respective locks, a deadlock will occur. This is automatically detected, and one of the transactions will randomly

be terminated with a MySQL-compatible error code 1213 returned.

- Transactions will wait up to `innodb_lock_wait_timeout` seconds (default: 50) to acquire new locks. When this timeout is reached, a MySQL-compatible error code 1205 is returned. If multiple transactions are waiting for the same lock, the order of priority is approximately based on the `start ts` of the transaction.
- TiDB supports both the optimistic transaction mode and pessimistic transaction mode in the same cluster. You can specify either mode for transaction execution.
- TiDB supports the `FOR UPDATE NOWAIT` syntax and does not block and wait for locks to be released. Instead, a MySQL-compatible error code 3572 is returned.
- If the `Point Get` and `Batch Point Get` operators do not read data, they still lock the given primary key or unique key, which blocks other transactions from locking or writing data to the same primary key or unique key.
- TiDB supports the `FOR UPDATE OF TABLES` syntax. For a statement that joins multiple tables, TiDB only applies pessimistic locks on the rows that are associated with the tables in `OF TABLES`.

12.10.10.4.3 Difference with MySQL InnoDB

1. When TiDB executes DML or `SELECT FOR UPDATE` statements that use range in the `WHERE` clause, concurrent DML statements within the range are not blocked.

For example:

```
CREATE TABLE t1 (
  id INT NOT NULL PRIMARY KEY,
  pad1 VARCHAR(100)
);
INSERT INTO t1 (id) VALUES (1),(5),(10);
```

```
BEGIN /*T! PESSIMISTIC */;
SELECT * FROM t1 WHERE id BETWEEN 1 AND 10 FOR UPDATE;
```

```
BEGIN /*T! PESSIMISTIC */;
INSERT INTO t1 (id) VALUES (6); -- blocks only in MySQL
UPDATE t1 SET pad1='new value' WHERE id = 5; -- blocks waiting in both
↳ MySQL and TiDB
```

This behavior is because TiDB does not currently support *gap locking*.

2. TiDB does not support `SELECT LOCK IN SHARE MODE`.

When `SELECT LOCK IN SHARE MODE` is executed, it has the same effect as that without the lock, so the read or write operation of other transactions is not blocked.

3. DDL may result in failure of the pessimistic transaction commit.

When DDL is executed in MySQL, it might be blocked by the transaction that is being executed. However, in this scenario, the DDL operation is not blocked in TiDB, which leads to failure of the pessimistic transaction commit: `ERROR 1105 (HY000) ↔ : Information schema is changed. [try again later]`. TiDB executes the `TRUNCATE TABLE` statement during the transaction execution, which might result in the `table doesn't exist` error.

4. After executing `START TRANSACTION WITH CONSISTENT SNAPSHOT`, MySQL can still read the tables that are created later in other transactions, while TiDB cannot.

5. The autocommit transactions prefer the optimistic locking.

When using the pessimistic model, the autocommit transactions first try to commit the statement using the optimistic model that has less overhead. If a write conflict occurs, the pessimistic model is used for transaction retry. Therefore, if `tidb_retry_limit` is set to 0, the autocommit transaction still reports the `Write Conflict` error when a write conflict occurs.

The autocommit `SELECT FOR UPDATE` statement does not wait for lock.

6. The data read by `EMBEDDED SELECT` in the statement is not locked.

7. Open transactions in TiDB do not block garbage collection (GC). By default, this limits the maximum execution time of pessimistic transactions to 1 hour. You can modify this limit by editing `max-txn-ttl` under `[performance]` in the TiDB configuration file.

12.10.10.4.4 Isolation level

TiDB supports the following two isolation levels in the pessimistic transaction mode:

- **Repeatable Read** by default, which is the same as MySQL.

Note:

In this isolation level, DML operations are performed based on the latest committed data. The behavior is the same as MySQL, but differs from the optimistic transaction mode in TiDB. See [Difference between TiDB and MySQL Repeatable Read](#).

- **Read Committed**. You can set this isolation level using the `SET TRANSACTION` statement.

12.10.10.4.5 Pessimistic transaction commit process

In the transaction commit process, pessimistic transactions and optimistic transactions have the same logic. Both transactions adopt the two-phase commit (2PC) mode. The important adaptation of pessimistic transactions is DML execution.

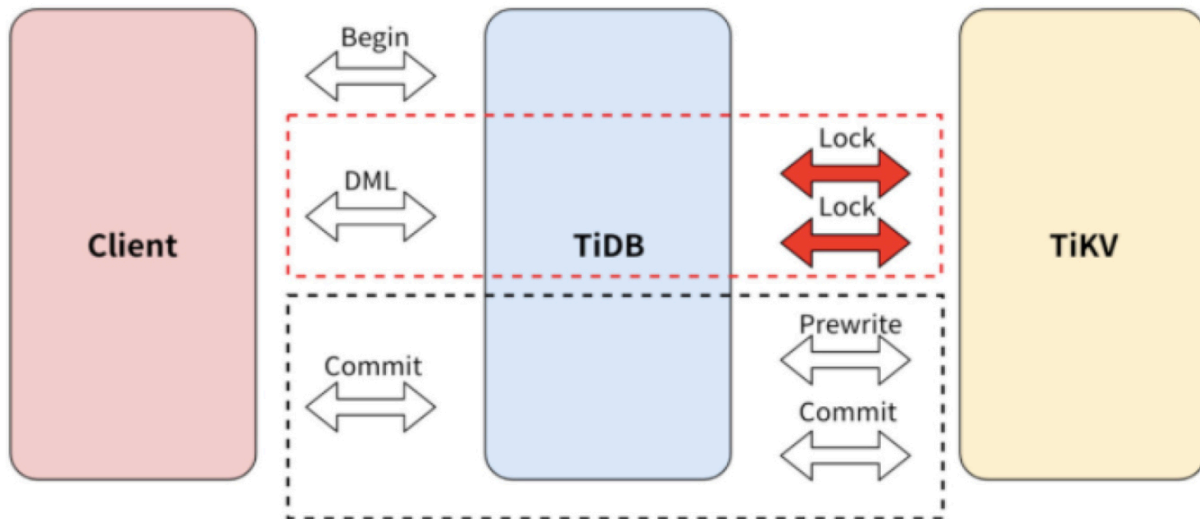

Figure 371: TiDB pessimistic transaction commit process

The pessimistic transaction adds an **Acquire Pessimistic Lock** phase before 2PC. This phase includes the following steps:

1. (Same as the optimistic transaction mode) TiDB receives the `begin` request from the client, and the current timestamp is this transaction's `start_ts`.
2. When the TiDB server receives a writing request from the client, the TiDB server initiates a pessimistic lock request to the TiKV server, and the lock is persisted to the TiKV server.
3. (Same as the optimistic transaction mode) When the client sends the commit request, TiDB starts to perform the two-phase commit similar to the optimistic transaction mode.

Pessimistic Transaction in TiDB

Figure 372: Pessimistic transactions in TiDB

12.10.10.4.6 Pipelined locking process

Adding a pessimistic lock requires writing data into TiKV. The response of successfully adding a lock can only be returned to TiDB after commit and apply through Raft. Therefore, compared with optimistic transactions, the pessimistic transaction mode inevitably has higher latency.

To reduce the overhead of locking, TiKV implements the pipelined locking process: when the data meets the requirements for locking, TiKV immediately notifies TiDB to execute subsequent requests and writes into the pessimistic lock asynchronously. This process reduces most latency and significantly improves the performance of pessimistic transactions. However, when network partition occurs in TiKV or a TiKV node is down, the asynchronous write into the pessimistic lock might fail and affect the following aspects:

- Other transactions that modify the same data cannot be blocked. If the application logic relies on locking or lock waiting mechanisms, the correctness of the application logic is affected.
- There is a low probability that the transaction commit fails, but it does not affect the correctness of the transactions.

If the application logic relies on the locking or lock waiting mechanisms, or if you want to guarantee as much as possible the success rate of transaction commits even in the case of TiKV cluster anomalies, you should disable the pipelined locking feature.

pipelined pessimistic lock

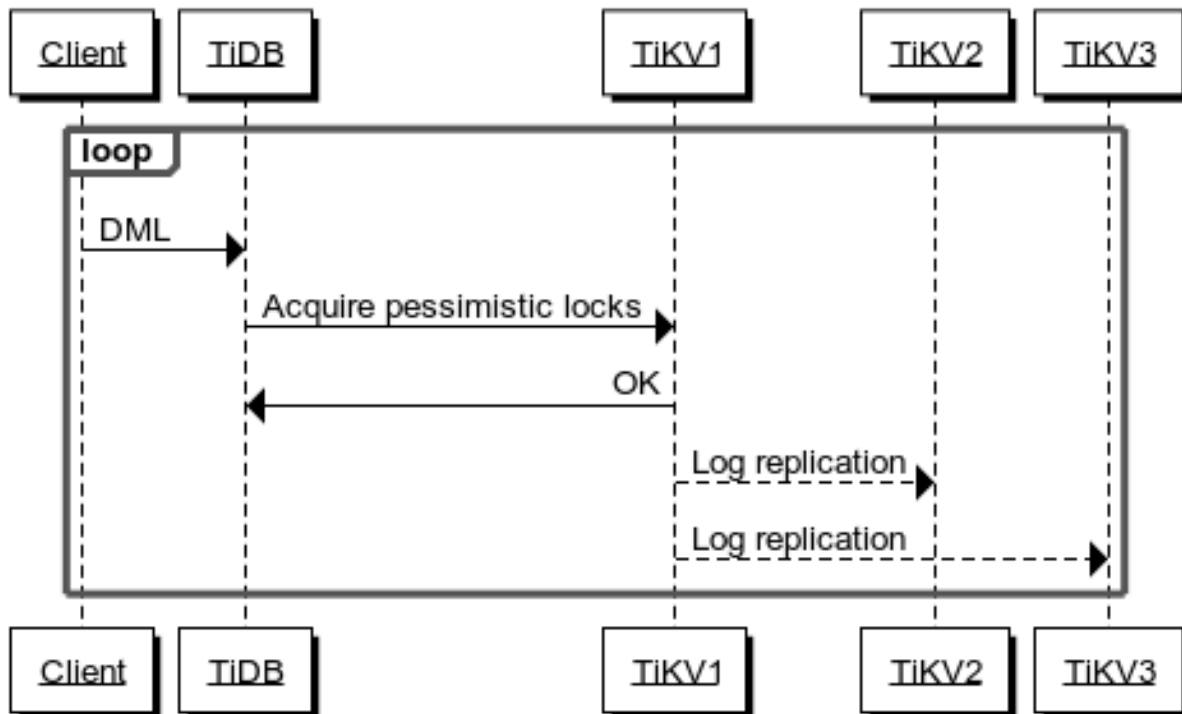

Figure 373: Pipelined pessimistic lock

This feature is enabled by default. To disable it, modify the TiKV configuration:

```
[pessimistic-txn]
pipelined = false
```

If the TiKV cluster is v4.0.9 or later, you can also dynamically disable this feature by [modifying TiKV configuration online](#):

```
set config tikv pessimistic-txn.pipelined='false';
```

If the application logic relies on the locking or lock waiting mechanisms, or if you want to guarantee as much as possible the success rate of transaction commits even in the case of TiKV cluster anomalies, you can contact PingCAP Support to disable the pipelined locking feature.

12.10.11 Garbage Collection (GC)

12.10.11.1 GC Overview

TiDB uses MVCC to control transaction concurrency. When you update the data, the original data is not deleted immediately but is kept together with the new data, with a timestamp to distinguish the version. The goal of Garbage Collection (GC) is to clear the obsolete data.

12.10.11.1.1 GC process

Each TiDB cluster contains a TiDB instance that is selected as the GC leader, which controls the GC process.

GC runs periodically on TiDB. For each GC, TiDB firstly calculates a timestamp called “safe point”. Then, TiDB clears the obsolete data under the premise that all the snapshots after the safe point retain the integrity of the data. Specifically, there are three steps involved in each GC process:

1. Resolve Locks. During this step, TiDB scans locks before the safe point on all Regions and clears these locks.
2. Delete Ranges. During this step, the obsolete data of the entire range generated from the `DROP TABLE/DROP INDEX` operation is quickly cleared.
3. Do GC. During this step, each TiKV node scans data on it and deletes unneeded old versions of each key.

In the default configuration, GC is triggered every 10 minutes. Each GC retains data of the recent 10 minutes, which means that the GC life time is 10 minutes by default (safe point = the current time - GC life time). If one round of GC has been running for too long, before this round of GC is completed, the next round of GC will not start even if it is time to trigger the next GC. In addition, for long-duration transactions to run properly after exceeding the GC life time, the safe point does not exceed the start time (`start_ts`) of the ongoing transactions.

12.10.11.1.2 Implementation details

Resolve Locks

The TiDB transaction model is implemented based on [Google's Percolator](#). It's mainly a two-phase commit protocol with some practical optimizations. When the first phase is finished, all the related keys are locked. Among these locks, one is the primary lock and the others are secondary locks which contain a pointer to the primary lock; in the second phase, the key with the primary lock gets a write record and its lock is removed. The write record indicates the write or delete operation in the history or the transactional rollback record of this key. The type of write record that replaces the primary lock indicates whether the corresponding transaction is committed successfully. Then all the secondary locks are replaced successively. If, for some reason such as failure, these secondary locks are retained and not replaced, you can still find the primary key based on the information in the secondary locks and determines whether the entire transaction is committed based on whether the primary key is committed. However, if the primary key information is cleared by GC and

this transaction has uncommitted secondary locks, you will never learn whether these locks can be committed. As a result, data integrity cannot be guaranteed.

The Resolve Locks step clears the locks before the safe point. This means that if the primary key of a lock is committed, this lock needs to be committed; otherwise, it needs to be rolled back. If the primary key is still locked (not committed or rolled back), this transaction is seen as timing out and rolled back.

The Resolve Locks step is implemented in either of the following two ways, which can be configured using the system variable `tidb_gc_scan_lock_mode`:

Warning:

Currently, **PHYSICAL** (Green GC) is an experimental feature. It is not recommended that you use it in the production environment.

- **LEGACY** (default): The GC leader sends requests to all Regions to scan obsolete locks, checks the primary key statuses of scanned locks, and sends requests to commit or roll back the corresponding transaction.
- **PHYSICAL**: TiDB bypasses the Raft layer and directly scans data on each TiKV node.

Delete Ranges

A great amount of data with consecutive keys is removed during operations such as `DROP TABLE/INDEX`. Removing each key and performing GC later for them can result in low execution efficiency on storage reclaiming. In such scenarios, TiDB actually does not delete each key. Instead, it only records the range to be removed and the timestamp of the deletion. Then the Delete Ranges step performs a fast physical deletion on the ranges whose timestamp is before the safe point.

Do GC

The Do GC step clears the outdated versions for all keys. To guarantee that all timestamps after the safe point have consistent snapshots, this step deletes the data committed before the safe point, but retains the last write for each key before the safe point as long as it is not a deletion.

In this step, TiDB only needs to send the safe point to PD, and then the whole round of GC is completed. TiKV automatically detects the change of safe point and performs GC for all Region leaders on the current node. At the same time, the GC leader can continue to trigger the next round of GC.

Note:

Starting with TiDB 5.0, the Do GC step will always use the `DISTRIBUTED` gc mode. This replaces the earlier `CENTRAL` gc mode, which was implemented by TiDB servers sending GC requests to each Region.

12.10.11.2 Garbage Collection Configuration

Garbage collection is configured via the following system variables:

- `tidb_gc_enable`
- `tidb_gc_run_interval`
- `tidb_gc_life_time`
- `tidb_gc_concurrency`
- `tidb_gc_scan_lock_mode`

12.10.11.2.1 GC I/O limit

TiKV supports the GC I/O limit. You can configure `gc.max-write-bytes-per-sec` to limit writes of a GC worker per second, and thus to reduce the impact on normal requests.

0 indicates disabling this feature.

You can dynamically modify this configuration using `tikv-ctl`:

```
tikv-ctl --host=ip:port modify-tikv-config -n gc.max-write-bytes-per-sec -v  
↪ 10MB
```

12.10.11.2.2 Changes in TiDB 5.0

In previous releases of TiDB, garbage collection was configured via the `mysql.tidb` system table. While changes to this table continue to be supported, it is recommended to use the system variables provided. This helps ensure that any changes to configuration can be validated, and prevent unexpected behavior ([#20655](#)).

The `CENTRAL` garbage collection mode is no longer supported. The `DISTRIBUTED` GC mode (which has been the default since TiDB 3.0) will automatically be used in its place. This mode is more efficient, since TiDB no longer needs to send requests to each TiKV region to trigger garbage collection.

For information on changes in previous releases, refer to earlier versions of this document using the *TiDB version selector* in the left hand menu.

GC in Compaction Filter

Based on the `DISTRIBUTED` GC mode, the mechanism of GC in Compaction Filter uses the compaction process of RocksDB, instead of a separate GC worker thread, to run GC.

This new GC mechanism helps to avoid extra disk read caused by GC. Also, after clearing the obsolete data, it avoids a large number of left tombstone marks which degrade the sequential scan performance. The following example shows how to enable the mechanism in the TiKV configuration file:

```
[gc]
enable-compaction-filter = true
```

You can also enable this GC mechanism by modifying the configuration online. See the following example:

```
show config where type = 'tikv' and name like '%enable-compaction-filter%';
```

```
+-----+-----+-----+-----+
| Type | Instance      | Name                               | Value |
+-----+-----+-----+-----+
| tikv | 172.16.5.37:20163 | gc.enable-compaction-filter | false |
| tikv | 172.16.5.36:20163 | gc.enable-compaction-filter | false |
| tikv | 172.16.5.35:20163 | gc.enable-compaction-filter | false |
+-----+-----+-----+-----+
```

```
set config tikv gc.enable-compaction-filter = true;
show config where type = 'tikv' and name like '%enable-compaction-filter%';
```

```
+-----+-----+-----+-----+
| Type | Instance      | Name                               | Value |
+-----+-----+-----+-----+
| tikv | 172.16.5.37:20163 | gc.enable-compaction-filter | true  |
| tikv | 172.16.5.36:20163 | gc.enable-compaction-filter | true  |
| tikv | 172.16.5.35:20163 | gc.enable-compaction-filter | true  |
+-----+-----+-----+-----+
```

12.10.12 Views

TiDB supports views. A view acts as a virtual table, whose schema is defined by the `SELECT` statement that creates the view. Using views has the following benefits:

- Exposing only safe fields and data to users to ensure security of sensitive fields and data stored in the underlying table.
- Defining complex queries that frequently appear as views to make complex queries easier and more convenient.

12.10.12.1 Query views

Querying a view is similar to querying an ordinary table. However, when TiDB queries a view, it actually queries the `SELECT` statement associated with the view.

12.10.12.2 Show metadata

To obtain the metadata of views, choose any of the following methods.

12.10.12.2.1 Use the SHOW CREATE TABLE `view_name` or SHOW CREATE VIEW `view_name` statement

Usage example:

```
show create view v;
```

This statement shows the CREATE VIEW statement corresponding to this view and the value of the `character_set_client` and `collation_connection` system variables when the view was created.

```
+--
  ↳ -----+-----
  ↳
  | View | Create View
  ↳
  ↳ | character_set_client | collation_connection |
+--
  ↳ -----+-----
  ↳
  | v   | CREATE ALGORITHM=UNDEFINED DEFINER=`root`@`127.0.0.1` SQL SECURITY
  ↳ DEFINER VIEW `v` (`a`) AS SELECT `s`.`a` FROM `test`.`t` LEFT JOIN `
  ↳ test`.`s` ON `t`.`a`=`s`.`a` | utf8 | utf8_general_ci |
+--
  ↳ -----+-----
  ↳
  1 row in set (0.00 sec)
```

12.10.12.2.2 Query the INFORMATION_SCHEMA.VIEWS table

Usage example:

```
select * from information_schema.views;
```

You can view the relevant meta information of the view by querying this table, such as `TABLE_CATALOG`, `TABLE_SCHEMA`, `TABLE_NAME`, `VIEW_DEFINITION`, `CHECK_OPTION`, `IS_UPDATABLE`, `DEFINER`, `SECURITY_TYPE`, `CHARACTER_SET_CLIENT`, and `COLLATION_CONNECTION`

```
+--
  ↳ -----+-----+-----+-----+
  ↳
```

```

| TABLE_CATALOG | TABLE_SCHEMA | TABLE_NAME | VIEW_DEFINITION
  ↳                                     | CHECK_OPTION | IS_UPDATABLE
  ↳ | DEFINER   | SECURITY_TYPE | CHARACTER_SET_CLIENT |
  ↳ COLLATION_CONNECTION |
+--
  ↳ -----+-----+-----+-----
  ↳
| def           | test          | v           | SELECT `s`.`a` FROM `test`.`t` LEFT
  ↳ JOIN `test`.`s` ON `t`.`a`=`s`.`a` | CASCADED | NO | root@127.0.0.1
  ↳ | DEFINER   | utf8          | utf8_general_ci |
+--
  ↳ -----+-----+-----+-----
  ↳
1 row in set (0.00 sec)

```

12.10.12.2.3 Use the HTTP APIs

Usage example:

```
curl http://127.0.0.1:10080/schema/test/v
```

By visiting `http://{TiDBIP}:10080/schema/{db}/{view}`, you can get all the meta-data for the view.

12.10.12.3 Example

The following example creates a view, queries this view, and delete this view:

```
create table t(a int, b int);
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
insert into t values(1, 1),(2,2),(3,3);
```

```
Query OK, 3 rows affected (0.00 sec)  
Records: 3 Duplicates: 0 Warnings: 0
```

```
create table s(a int);
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
insert into s values(2),(3);
```

```
Query OK, 2 rows affected (0.01 sec)  
Records: 2 Duplicates: 0 Warnings: 0
```

```
create view v as select s.a from t left join s on t.a = s.a;
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
select * from v;
```

```
+-----+  
| a     |  
+-----+  
| NULL  |  
| 2     |
```

```
| 3 |  
+-----+  
3 rows in set (0.00 sec)
```

```
drop view v;
```

```
Query OK, 0 rows affected (0.02 sec)
```

12.10.12.4 Limitations

Currently, views in TiDB are subject to the following limitations:

- Materialized views are not supported yet.
- Views in TiDB are read-only and do not support write operations such as UPDATE, INSERT, DELETE, and TRUNCATE.
- For created views, the only supported DDL operation is DROP [VIEW | TABLE]

12.10.12.5 See also

- [CREATE VIEW](#)
- [DROP VIEW](#)

12.10.13 Partitioning

This document introduces TiDB's implementation of partitioning.

12.10.13.1 Partitioning types

This section introduces the types of partitioning in TiDB. Currently, TiDB supports [Range partitioning](#), [List partitioning](#), [List COLUMNS partitioning](#), and [Hash partitioning](#).

Range partitioning, List partitioning and List COLUMNS partitioning are used to resolve the performance issues caused by a large amount of deletions in the application, and support fast drop partition operations. Hash partitioning is used to scatter the data when there are a large amount of writes.

12.10.13.1.1 Range partitioning

When a table is partitioned by Range, each partition contains rows for which the partitioning expression value lies within a given Range. Ranges have to be contiguous but not overlapping. You can define it by using `VALUES LESS THAN`.

Assume you need to create a table that contains personnel records as follows:

```
CREATE TABLE employees (  
  id INT NOT NULL,  
  fname VARCHAR(30),  
  lname VARCHAR(30),  
  hired DATE NOT NULL DEFAULT '1970-01-01',  
  separated DATE DEFAULT '9999-12-31',  
  job_code INT,  
  store_id INT NOT NULL  
);
```

You can partition a table by Range in various ways as needed. For example, you can partition it by using the `store_id` column:

```
CREATE TABLE employees (  
  id INT NOT NULL,  
  fname VARCHAR(30),  
  lname VARCHAR(30),  
  hired DATE NOT NULL DEFAULT '1970-01-01',  
  separated DATE DEFAULT '9999-12-31',  
  job_code INT,  
  store_id INT NOT NULL  
)  
  
PARTITION BY RANGE (store_id) (  
  PARTITION p0 VALUES LESS THAN (6),  
  PARTITION p1 VALUES LESS THAN (11),  
  PARTITION p2 VALUES LESS THAN (16),  
  PARTITION p3 VALUES LESS THAN (21)  
);
```

In this partition scheme, all rows corresponding to employees whose `store_id` is 1 through 5 are stored in the `p0` partition while all employees whose `store_id` is 6 through 10 are stored in `p1`. Range partitioning requires the partitions to be ordered, from lowest to highest.

If you insert a row of data (72, 'Tom', 'John', '2015-06-25', NULL, NULL, 15), it falls in the `p2` partition. But if you insert a record whose `store_id` is larger than 20, an error is reported because TiDB can not know which partition this record should be inserted into. In this case, you can use `MAXVALUE` when creating a table:

```
CREATE TABLE employees (  
  id INT NOT NULL,  
  fname VARCHAR(30),  
  lname VARCHAR(30),  
  hired DATE NOT NULL DEFAULT '1970-01-01',  
  separated DATE DEFAULT '9999-12-31',  
  job_code INT,  
  store_id INT NOT NULL  
)  
  
PARTITION BY RANGE (store_id) (  
  PARTITION p0 VALUES LESS THAN (6),  
  PARTITION p1 VALUES LESS THAN (11),  
  PARTITION p2 VALUES LESS THAN (16),  
  PARTITION p3 VALUES LESS THAN (21),  
  PARTITION p4 VALUES LESS THAN (MAXVALUE)  
);
```

```
    job_code INT,  
    store_id INT NOT NULL  
)  
  
PARTITION BY RANGE (store_id) (  
    PARTITION p0 VALUES LESS THAN (6),  
    PARTITION p1 VALUES LESS THAN (11),  
    PARTITION p2 VALUES LESS THAN (16),  
    PARTITION p3 VALUES LESS THAN MAXVALUE  
);
```

MAXVALUE represents an integer value that is larger than all other integer values. Now, all records whose `store_id` is equal to or larger than 16 (the highest value defined) are stored in the `p3` partition.

You can also partition a table by employees' job codes, which are the values of the `job_code` column. Assume that two-digit job codes stand for regular employees, three-digit codes stand for office and customer support personnel, and four-digit codes stand for managerial personnel. Then you can create a partitioned table like this:

```
CREATE TABLE employees (  
    id INT NOT NULL,  
    fname VARCHAR(30),  
    lname VARCHAR(30),  
    hired DATE NOT NULL DEFAULT '1970-01-01',  
    separated DATE DEFAULT '9999-12-31',  
    job_code INT,  
    store_id INT NOT NULL  
)  
  
PARTITION BY RANGE (job_code) (  
    PARTITION p0 VALUES LESS THAN (100),  
    PARTITION p1 VALUES LESS THAN (1000),  
    PARTITION p2 VALUES LESS THAN (10000)  
);
```

In this example, all rows relating to regular employees are stored in the `p0` partition, all office and customer support personnel in the `p1` partition, and all managerial personnel in the `p2` partition.

Besides splitting up the table by `store_id`, you can also partition a table by dates. For example, you can partition by employees' separation year:

```
CREATE TABLE employees (  
    id INT NOT NULL,  
    fname VARCHAR(30),  
    lname VARCHAR(30),
```

```
hired DATE NOT NULL DEFAULT '1970-01-01',
separated DATE DEFAULT '9999-12-31',
job_code INT,
store_id INT
)

PARTITION BY RANGE ( YEAR(separated) ) (
PARTITION p0 VALUES LESS THAN (1991),
PARTITION p1 VALUES LESS THAN (1996),
PARTITION p2 VALUES LESS THAN (2001),
PARTITION p3 VALUES LESS THAN MAXVALUE
);
```

In Range partitioning, you can partition based on the values of the `timestamp` column and use the `unix_timestamp()` function, for example:

```
CREATE TABLE quarterly_report_status (
report_id INT NOT NULL,
report_status VARCHAR(20) NOT NULL,
report_updated TIMESTAMP NOT NULL DEFAULT CURRENT_TIMESTAMP ON UPDATE
    ↪ CURRENT_TIMESTAMP
)

PARTITION BY RANGE ( UNIX_TIMESTAMP(report_updated) ) (
PARTITION p0 VALUES LESS THAN ( UNIX_TIMESTAMP('2008-01-01 00:00:00') ),
PARTITION p1 VALUES LESS THAN ( UNIX_TIMESTAMP('2008-04-01 00:00:00') ),
PARTITION p2 VALUES LESS THAN ( UNIX_TIMESTAMP('2008-07-01 00:00:00') ),
PARTITION p3 VALUES LESS THAN ( UNIX_TIMESTAMP('2008-10-01 00:00:00') ),
PARTITION p4 VALUES LESS THAN ( UNIX_TIMESTAMP('2009-01-01 00:00:00') ),
PARTITION p5 VALUES LESS THAN ( UNIX_TIMESTAMP('2009-04-01 00:00:00') ),
PARTITION p6 VALUES LESS THAN ( UNIX_TIMESTAMP('2009-07-01 00:00:00') ),
PARTITION p7 VALUES LESS THAN ( UNIX_TIMESTAMP('2009-10-01 00:00:00') ),
PARTITION p8 VALUES LESS THAN ( UNIX_TIMESTAMP('2010-01-01 00:00:00') ),
PARTITION p9 VALUES LESS THAN (MAXVALUE)
);
```

It is not allowed to use any other partitioning expression that contains the timestamp column.

Range partitioning is particularly useful when one or more of the following conditions are satisfied:

- You want to delete the old data. If you use the `employees` table in the previous example, you can delete all records of employees who left this company before the year 1991 by simply using `ALTER TABLE employees DROP PARTITION p0;`. It is faster than executing the `DELETE FROM employees WHERE YEAR(separated) <= 1990;` operation.

- You want to use a column that contains time or date values, or containing values arising from some other series.
- You need to frequently run queries on the columns used for partitioning. For example, when executing a query like `EXPLAIN SELECT COUNT(*)FROM employees WHERE ↪ separated BETWEEN '2000-01-01' AND '2000-12-31' GROUP BY store_id;`, TiDB can quickly know that only the data in the p2 partition needs to be scanned, because the other partitions do not match the `WHERE` condition.

12.10.13.1.2 List partitioning

Warning:

List partitioning is an experimental feature. It is not recommended that you use it in the production environment.

Before creating a List partitioned table, you need to set the value of the session variable `tidb_enable_list_partition` to `ON`.

```
set @@session.tidb_enable_list_partition = ON
```

Also, make sure that `tidb_enable_table_partition` is set to `ON`, which is the default setting.

List partitioning is similar to Range partitioning. Unlike Range partitioning, in List partitioning, the partitioning expression values for all rows in each partition are in a given value set. This value set defined for each partition can have any number of values but cannot have duplicate values. You can use the `PARTITION ... VALUES IN (...)` clause to define a value set.

Suppose that you want to create a personnel record table. You can create a table as follows:

```
CREATE TABLE employees (
  id INT NOT NULL,
  hired DATE NOT NULL DEFAULT '1970-01-01',
  store_id INT
);
```

Suppose that there are 20 stores distributed in 4 districts, as shown in the table below:

Region	Store ID Numbers
North	1, 2, 3, 4, 5
East	6, 7, 8, 9, 10

```
| West   | 11, 12, 13, 14, 15 |  
| Central | 16, 17, 18, 19, 20 |
```

If you want to store the personnel data of employees of the same region in the same partition, you can create a List partitioned table based on `store_id`:

```
CREATE TABLE employees (  
  id INT NOT NULL,  
  hired DATE NOT NULL DEFAULT '1970-01-01',  
  store_id INT  
)  
PARTITION BY LIST (store_id) (  
  PARTITION pNorth VALUES IN (1, 2, 3, 4, 5),  
  PARTITION pEast VALUES IN (6, 7, 8, 9, 10),  
  PARTITION pWest VALUES IN (11, 12, 13, 14, 15),  
  PARTITION pCentral VALUES IN (16, 17, 18, 19, 20)  
);
```

After creating the partitions as above, you can easily add or delete records related to a specific region in the table. For example, suppose that all stores in the East region (East) are sold to another company. Then all the row data related to the store employees of this region can be deleted by executing `ALTER TABLE employees TRUNCATE PARTITION pEast`, which is much more efficient than the equivalent statement `DELETE FROM employees WHERE store_id IN (6, 7, 8, 9, 10)`.

You can also execute `ALTER TABLE employees DROP PARTITION pEast` to delete all related rows, but this statement also deletes the `pEast` partition from the table definition. In this situation, you must execute the `ALTER TABLE ... ADD PARTITION` statement to recover the original partitioning scheme of the table.

Unlike Range partitioning, List partitioning does not have a similar `MAXVALUE` partition to store all values that do not belong to other partitions. Instead, all expected values of the partition expression must be included in the `PARTITION ... VALUES IN (...)` clause. If the value to be inserted in an `INSERT` statement does not match the column value set of any partition, the statement fails to execute and an error is reported. See the following example:

```
test> CREATE TABLE t (  
  -> a INT,  
  -> b INT  
  -> )  
  -> PARTITION BY LIST (a) (  
  -> PARTITION p0 VALUES IN (1, 2, 3),  
  -> PARTITION p1 VALUES IN (4, 5, 6)  
  -> );  
Query OK, 0 rows affected (0.11 sec)  
  
test> INSERT INTO t VALUES (7, 7);
```

```
ERROR 1525 (HY000): Table has no partition for value 7
```

To ignore the error type above, you can use the `IGNORE` keyword. After using this keyword, if a row contains values that do not match the column value set of any partition, this row will not be inserted. Instead, any row with matched values is inserted, and no error is reported:

```
test> TRUNCATE t;
Query OK, 1 row affected (0.00 sec)

test> INSERT IGNORE INTO t VALUES (1, 1), (7, 7), (8, 8), (3, 3), (5, 5);
Query OK, 3 rows affected, 2 warnings (0.01 sec)
Records: 5 Duplicates: 2 Warnings: 2

test> select * from t;
+-----+-----+
| a    | b    |
+-----+-----+
| 5    | 5    |
| 1    | 1    |
| 3    | 3    |
+-----+-----+
3 rows in set (0.01 sec)
```

12.10.13.1.3 List COLUMNS partitioning

Warning:

List COLUMNS partitioning is an experimental feature. It is not recommended that you use it in the production environment.

List COLUMNS partitioning is a variant of List partitioning. You can use multiple columns as partition keys. Besides the integer data type, you can also use the columns in the string, `DATE`, and `DATETIME` data types as partition columns.

Suppose that you want to divide the store employees from the following 12 cities into 4 regions, as shown in the following table:

Region	Cities
1	LosAngeles, Seattle, Houston
2	Chicago, Columbus, Boston
3	NewYork, LongIsland, Baltimore

| 4 | Atlanta, Raleigh, Cincinnati |

You can use List COLUMNS partitioning to create a table and store each row in the partition that corresponds to the employee's city, as shown below:

```
CREATE TABLE employees_1 (  
  id INT NOT NULL,  
  fname VARCHAR(30),  
  lname VARCHAR(30),  
  hired DATE NOT NULL DEFAULT '1970-01-01',  
  separated DATE DEFAULT '9999-12-31',  
  job_code INT,  
  store_id INT,  
  city VARCHAR(15)  
)  
PARTITION BY LIST COLUMNS(city) (  
  PARTITION pRegion_1 VALUES IN('LosAngeles', 'Seattle', 'Houston'),  
  PARTITION pRegion_2 VALUES IN('Chicago', 'Columbus', 'Boston'),  
  PARTITION pRegion_3 VALUES IN('NewYork', 'LongIsland', 'Baltimore'),  
  PARTITION pRegion_4 VALUES IN('Atlanta', 'Raleigh', 'Cincinnati')  
);
```

Unlike List partitioning, in List COLUMNS partitioning, you do not need to use the expression in the COLUMNS() clause to convert column values to integers.

List COLUMNS partitioning can also be implemented using columns of the DATE and DATETIME types, as shown in the following example. This example uses the same names and columns as the previous employees_1 table, but uses List COLUMNS partitioning based on the hired column:

```
CREATE TABLE employees_2 (  
  id INT NOT NULL,  
  fname VARCHAR(30),  
  lname VARCHAR(30),  
  hired DATE NOT NULL DEFAULT '1970-01-01',  
  separated DATE DEFAULT '9999-12-31',  
  job_code INT,  
  store_id INT,  
  city VARCHAR(15)  
)  
PARTITION BY LIST COLUMNS(hired) (  
  PARTITION pWeek_1 VALUES IN('2020-02-01', '2020-02-02', '2020-02-03',  
    '2020-02-04', '2020-02-05', '2020-02-06', '2020-02-07'),  
  PARTITION pWeek_2 VALUES IN('2020-02-08', '2020-02-09', '2020-02-10',  
    '2020-02-11', '2020-02-12', '2020-02-13', '2020-02-14'),  
  PARTITION pWeek_3 VALUES IN('2020-02-15', '2020-02-16', '2020-02-17',
```

```
'2020-02-18', '2020-02-19', '2020-02-20', '2020-02-21'),  
PARTITION pWeek_4 VALUES IN('2020-02-22', '2020-02-23', '2020-02-24',  
    '2020-02-25', '2020-02-26', '2020-02-27', '2020-02-28')  
);
```

In addition, you can also add multiple columns in the `COLUMNS()` clause. For example:

```
CREATE TABLE t (  
    id int,  
    name varchar(10)  
)  
PARTITION BY LIST COLUMNS(id,name) (  
    partition p0 values IN ((1,'a'),(2,'b')),  
    partition p1 values IN ((3,'c'),(4,'d')),  
    partition p3 values IN ((5,'e'),(null,null))  
);
```

12.10.13.1.4 Hash partitioning

Hash partitioning is used to make sure that data is evenly scattered into a certain number of partitions. With Range partitioning, you must specify the range of the column values for each partition when you use Range partitioning, while you just need to specify the number of partitions when you use Hash partitioning.

Partitioning by Hash requires you to append a `PARTITION BY HASH (expr)` clause to the `CREATE TABLE` statement. `expr` is an expression that returns an integer. It can be a column name if the type of this column is integer. In addition, you might also need to append `PARTITIONS num`, where `num` is a positive integer indicating how many partitions a table is divided into.

The following operation creates a Hash partitioned table, which is divided into 4 partitions by `store_id`:

```
CREATE TABLE employees (  
    id INT NOT NULL,  
    fname VARCHAR(30),  
    lname VARCHAR(30),  
    hired DATE NOT NULL DEFAULT '1970-01-01',  
    separated DATE DEFAULT '9999-12-31',  
    job_code INT,  
    store_id INT  
)  
  
PARTITION BY HASH(store_id)  
PARTITIONS 4;
```

If `PARTITIONS num` is not specified, the default number of partitions is 1.

You can also use an SQL expression that returns an integer for `expr`. For example, you can partition a table by the hire year:

```
CREATE TABLE employees (  
  id INT NOT NULL,  
  fname VARCHAR(30),  
  lname VARCHAR(30),  
  hired DATE NOT NULL DEFAULT '1970-01-01',  
  separated DATE DEFAULT '9999-12-31',  
  job_code INT,  
  store_id INT  
)  
  
PARTITION BY HASH( YEAR(hired) )  
PARTITIONS 4;
```

The most efficient Hash function is one which operates upon a single table column, and whose value increases or decreases consistently with the column value.

For example, `date_col` is a column whose type is `DATE`, and the value of the `TO_DAYS` \rightarrow `(date_col)` expression varies with the value of `date_col`. `YEAR(date_col)` is different from `TO_DAYS(date_col)`, because not every possible change in `date_col` produces an equivalent change in `YEAR(date_col)`.

In contrast, assume that you have an `int_col` column whose type is `INT`. Now consider about the expression `POW(5-int_col,3)+ 6`. It is not a good Hash function though, because as the value of `int_col` changes, the result of the expression does not change proportionally. A value change in `int_col` might result in a huge change in the expression result. For example, when `int_col` changes from 5 to 6, the change of the expression result is -1. But the result change might be -7 when `int_col` changes from 6 to 7.

In conclusion, when the expression has a form that is closer to $y = cx$, it is more suitable to be a Hash function. Because the more non-linear an expression is, the more unevenly scattered the data among the partitions tends to be.

In theory, pruning is also possible for expressions involving more than one column value, but determining which of such expressions are suitable can be quite difficult and time-consuming. For this reason, the use of hashing expressions involving multiple columns is not particularly recommended.

When using `PARTITION BY HASH`, TiDB decides which partition the data should fall into based on the modulus of the result of the expression. In other words, if a partitioning expression is `expr` and the number of partitions is `num`, `MOD(expr, num)` decides the partition in which the data is stored. Assume that `t1` is defined as follows:

```
CREATE TABLE t1 (col1 INT, col2 CHAR(5), col3 DATE)  
PARTITION BY HASH( YEAR(col3) )  
PARTITIONS 4;
```

When you insert a row of data into `t1` and the value of `col3` is '2005-09-15', then this row is inserted into partition 1:

```
MOD(YEAR('2005-09-01'),4)
= MOD(2005,4)
= 1
```

12.10.13.1.5 How TiDB partitioning handles NULL

It is allowed in TiDB to use NULL as the calculation result of a partitioning expression.

Note:

NULL is not an integer. TiDB's partitioning implementation treats NULL as being less than any other integer values, just as ORDER BY does.

Handling of NULL with Range partitioning

When you insert a row into a table partitioned by Range, and the column value used to determine the partition is NULL, then this row is inserted into the lowest partition.

```
CREATE TABLE t1 (
  c1 INT,
  c2 VARCHAR(20)
)
PARTITION BY RANGE(c1) (
  PARTITION p0 VALUES LESS THAN (0),
  PARTITION p1 VALUES LESS THAN (10),
  PARTITION p2 VALUES LESS THAN MAXVALUE
);
```

```
Query OK, 0 rows affected (0.09 sec)
```

```
select * from t1 partition(p0);
```

```
+-----+-----+
| c1  | c2    |
+-----+-----+
| NULL | mothra |
+-----+-----+
1 row in set (0.00 sec)
```

```
select * from t1 partition(p1);
```

```
Empty set (0.00 sec)
```

```
select * from t1 partition(p2);
```

```
Empty set (0.00 sec)
```

Drop the p0 partition and verify the result:

```
alter table t1 drop partition p0;
```

```
Query OK, 0 rows affected (0.08 sec)
```

```
select * from t1;
```

```
Empty set (0.00 sec)
```

Handling of NULL with Hash partitioning

When partitioning tables by Hash, there is a different way of handling NULL value - if the calculation result of the partitioning expression is NULL, it is considered as 0.

```
CREATE TABLE th (  
  c1 INT,  
  c2 VARCHAR(20)  
)
```

```
PARTITION BY HASH(c1)  
PARTITIONS 2;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
INSERT INTO th VALUES (NULL, 'mothra'), (0, 'gigan');
```

```
Query OK, 2 rows affected (0.04 sec)
```

```
select * from th partition (p0);
```

```
+-----+-----+  
| c1 | c2 |  
+-----+-----+  
| NULL | mothra |  
| 0 | gigan |  
+-----+-----+  
2 rows in set (0.00 sec)
```

```
select * from th partition (p1);
```

```
Empty set (0.00 sec)
```

You can see that the inserted record (NULL, 'mothra') falls into the same partition as (0, 'gigan').

Note: NULL values by Hash partitions in TiDB are handled in the same way as described in [How MySQL Partitioning Handles NULL](#), which, however, is not consistent with the actual behavior of MySQL. In other words, MySQL's implementation in this case is not consistent with its documentation.

In this case, the actual behavior of TiDB is in line with the description of this document.

12.10.13.2 Partition management

For LIST and RANGE partitioned tables, you can add and drop partitions using the ALTER TABLE <table name> ADD PARTITION (<partition specification>) or ALTER ↵ TABLE <table name> DROP PARTITION <list of partitions> statement.

For LIST and RANGE partitioned tables, REORGANIZE PARTITION is not yet supported.

For HASH partitioned tables, COALESCE PARTITION and ADD PARTITION are not yet supported.

EXCHANGE PARTITION works by swapping a partition and a non-partitioned table, similar to how renaming a table like RENAME TABLE t1 TO t1_tmp, t2 TO t1, t1_tmp TO t2 works.

For example, ALTER TABLE partitioned_table EXCHANGE PARTITION p1 WITH ↵ TABLE non_partitioned_table swaps the non_partitioned_table table in the p1 partition with the partitioned_table table.

Ensure that all rows that you are exchanging into the partition match the partition definition; otherwise, these rows will not be found and cause unexpected issues.

Warning:

EXCHANGE PARTITION is an experimental feature. It is not recommended to use it in a production environment. To enable it, set the tidb_enable_exchange_partition system variable to ON.

12.10.13.2.1 Range partition management

Create a partitioned table:

```
CREATE TABLE members (  
  id INT,  
  fname VARCHAR(25),  
  lname VARCHAR(25),  
  dob DATE  
)  
  
PARTITION BY RANGE( YEAR(dob) ) (  
  PARTITION p0 VALUES LESS THAN (1980),  
  PARTITION p1 VALUES LESS THAN (1990),  
  PARTITION p2 VALUES LESS THAN (2000)  
);
```

Drop a partition:

```
ALTER TABLE members DROP PARTITION p2;
```

```
Query OK, 0 rows affected (0.03 sec)
```

Empty a partition:

```
ALTER TABLE members TRUNCATE PARTITION p1;
```

```
Query OK, 0 rows affected (0.03 sec)
```

Note:

ALTER TABLE ... REORGANIZE PARTITION is currently unsupported in TiDB.

Add a partition:

```
ALTER TABLE members ADD PARTITION (PARTITION p3 VALUES LESS THAN (2010));
```

When partitioning tables by Range, ADD PARTITION can be only appended to the very end of a partition list. If it is appended to an existing Range partition, an error is reported:

```
ALTER TABLE members  
  ADD PARTITION (  
    PARTITION n VALUES LESS THAN (1970));
```

```
ERROR 1463 (HY000): VALUES LESS THAN value must be strictly >
increasing for each partition
```

12.10.13.2.2 Hash partition management

Unlike Range partitioning, `DROP PARTITION` is not supported in Hash partitioning.

Currently, `ALTER TABLE ... COALESCE PARTITION` is not supported in TiDB as well. For partition management statements that are not currently supported, TiDB returns an error.

```
alter table members optimize partition p0;
```

```
ERROR 8200 (HY000): Unsupported optimize partition
```

12.10.13.3 Partition pruning

Partition pruning is an optimization which is based on a very simple idea - do not scan the partitions that do not match.

Assume that you create a partitioned table `t1`:

```
CREATE TABLE t1 (
  fname VARCHAR(50) NOT NULL,
  lname VARCHAR(50) NOT NULL,
  region_code TINYINT UNSIGNED NOT NULL,
  dob DATE NOT NULL
)
PARTITION BY RANGE( region_code ) (
  PARTITION p0 VALUES LESS THAN (64),
  PARTITION p1 VALUES LESS THAN (128),
  PARTITION p2 VALUES LESS THAN (192),
  PARTITION p3 VALUES LESS THAN MAXVALUE
);
```

If you want to get the result of this `SELECT` statement:

```
SELECT fname, lname, region_code, dob
FROM t1
WHERE region_code > 125 AND region_code < 130;
```

It is evident that the result falls in either the `p1` or the `p2` partition, that is, you just need to search for the matching rows in `p1` and `p2`. Excluding the unneeded partitions is so-called “pruning”. If the optimizer is able to prune a part of partitions, the execution of the query in the partitioned table will be much faster than that in a non-partitioned table.

The optimizer can prune partitions through `WHERE` conditions in the following two scenarios:

- `partition_column = constant`
- `partition_column IN (constant1, constant2, ..., constantN)`

12.10.13.3.1 Some cases for partition pruning to take effect

1. Partition pruning uses the query conditions on the partitioned table, so if the query conditions can not be pushed down to the partitioned table according to the planner's optimization rules, partition pruning does not apply for this query.

For example:

```
create table t1 (x int) partition by range (x) (  
    partition p0 values less than (5),  
    partition p1 values less than (10));  
create table t2 (x int);
```

```
explain select * from t1 left join t2 on t1.x = t2.x where t2.x > 5;
```

In this query, the left out join is converted to the inner join, and then `t1.x > 5` is derived from `t1.x = t2.x` and `t2.x > 5`, so it could be used in partition pruning and only the partition `p1` remains.

```
explain select * from t1 left join t2 on t1.x = t2.x and t2.x > 5;
```

In this query, `t2.x > 5` can not be pushed down to the `t1` partitioned table, so partition pruning would not take effect for this query.

2. Since partition pruning is done during the plan optimizing phase, it does not apply for those cases that filter conditions are unknown until the execution phase.

For example:

```
create table t1 (x int) partition by range (x) (  
    partition p0 values less than (5),  
    partition p1 values less than (10));
```

```
explain select * from t2 where x < (select * from t1 where t2.x < t1.x  
    ↪ and t2.x < 2);
```

This query reads a row from `t2` and uses the result for the subquery on `t1`. Theoretically, partition pruning could benefit from `t1.x > val` expression in the subquery, but it does not take effect there as that happens in the execution phase.

3. As a result of a limitation from current implementation, if a query condition can not be pushed down to TiKV, it can not be used by the partition pruning.

Take the `fn(col)` expression as an example. If the TiKV coprocessor supports this `fn` function, `fn(col)` may be pushed down to the leaf node (that is, partitioned table) according to the predicate push-down rule during the plan optimizing phase, and partition pruning can use it.

If the TiKV coprocessor does not support this `fn` function, `fn(col)` would not be pushed down to the leaf node. Instead, it becomes a `Selection` node above the leaf node. The current partition pruning implementation does not support this kind of plan tree.

4. For Hash partition, the only query supported by partition pruning is the equal condition.
5. For Range partition, for partition pruning to take effect, the partition expression must be in those forms: `col` or `fn(col)`, and the query condition must be one of `>`, `<`, `=`, `>=`, and `<=`. If the partition expression is in the form of `fn(col)`, the `fn` function must be monotonous.

If the `fn` function is monotonous, for any `x` and `y`, if `x > y`, then `fn(x) > fn(y)`. Then this `fn` function can be called strictly monotonous. For any `x` and `y`, if `x > y`, then `fn(x) >= fn(y)`. In this case, `fn` could also be called “monotonous”. In theory, all monotonous functions are supported by partition pruning.

Currently, partition pruning in TiDB only support those monotonous functions:

```
unix_timestamp
to_days
```

For example, the partition expression is a simple column:

```
create table t (id int) partition by range (id) (
  partition p0 values less than (5),
  partition p1 values less than (10));
select * from t where id > 6;
```

Or the partition expression is in the form of `fn(col)` where `fn` is `to_days`:

```
create table t (dt datetime) partition by range (to_days(id)) (
  partition p0 values less than (to_days('2020-04-01')),
  partition p1 values less than (to_days('2020-05-01')));
select * from t where dt > '2020-04-18';
```

An exception is `floor(unix_timestamp())` as the partition expression. TiDB does some optimization for that case by case, so it is supported by partition pruning.

```
create table t (ts timestamp(3) not null default current_timestamp(3))
partition by range (floor(unix_timestamp(ts))) (
```

```

partition p0 values less than (unix_timestamp('2020-04-01
    ↪ 00:00:00')),
partition p1 values less than (unix_timestamp('2020-05-01
    ↪ 00:00:00')));
select * from t where ts > '2020-04-18 02:00:42.123';

```

12.10.13.4 Partition selection

SELECT statements support partition selection, which is implemented by using a PARTITION option.

```

SET @@sql_mode = '';

CREATE TABLE employees (
  id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
  fname VARCHAR(25) NOT NULL,
  lname VARCHAR(25) NOT NULL,
  store_id INT NOT NULL,
  department_id INT NOT NULL
)

PARTITION BY RANGE(id) (
  PARTITION p0 VALUES LESS THAN (5),
  PARTITION p1 VALUES LESS THAN (10),
  PARTITION p2 VALUES LESS THAN (15),
  PARTITION p3 VALUES LESS THAN MAXVALUE
);

INSERT INTO employees VALUES
(' ', 'Bob', 'Taylor', 3, 2), (' ', 'Frank', 'Williams', 1, 2),
(' ', 'Ellen', 'Johnson', 3, 4), (' ', 'Jim', 'Smith', 2, 4),
(' ', 'Mary', 'Jones', 1, 1), (' ', 'Linda', 'Black', 2, 3),
(' ', 'Ed', 'Jones', 2, 1), (' ', 'June', 'Wilson', 3, 1),
(' ', 'Andy', 'Smith', 1, 3), (' ', 'Lou', 'Waters', 2, 4),
(' ', 'Jill', 'Stone', 1, 4), (' ', 'Roger', 'White', 3, 2),
(' ', 'Howard', 'Andrews', 1, 2), (' ', 'Fred', 'Goldberg', 3, 3),
(' ', 'Barbara', 'Brown', 2, 3), (' ', 'Alice', 'Rogers', 2, 2),
(' ', 'Mark', 'Morgan', 3, 3), (' ', 'Karen', 'Cole', 3, 2);

```

You can view the rows stored in the p1 partition:

```
SELECT * FROM employees PARTITION (p1);
```

```

+----+-----+-----+-----+-----+
| id | fname | lname | store_id | department_id |

```

```

+----+|-----+|-----+|-----+|-----+
| 5 | Mary | Jones |      1 |      1 |
| 6 | Linda | Black |      2 |      3 |
| 7 | Ed   | Jones |      2 |      1 |
| 8 | June | Wilson |      3 |      1 |
| 9 | Andy | Smith |      1 |      3 |
+----+|-----+|-----+|-----+|-----+
5 rows in set (0.00 sec)

```

If you want to get the rows in multiple partitions, you can use a list of partition names which are separated by commas. For example, `SELECT * FROM employees PARTITION (p1 ↵ , p2)` returns all rows in the p1 and p2 partitions.

When you use partition selection, you can still use `WHERE` conditions and options such as `ORDER BY` and `LIMIT`. It is also supported to use aggregation options such as `HAVING` and `GROUP BY`.

```

SELECT * FROM employees PARTITION (p0, p2)
WHERE lname LIKE 'S%';

```

```

+----+|-----+|-----+|-----+|-----+
| id | fname | lname | store_id | department_id |
+----+|-----+|-----+|-----+|-----+
| 4  | Jim   | Smith |      2   |      4        |
| 11 | Jill  | Stone |      1   |      4        |
+----+|-----+|-----+|-----+|-----+
2 rows in set (0.00 sec)

```

```

SELECT id, CONCAT(fname, ' ', lname) AS name
FROM employees PARTITION (p0) ORDER BY lname;

```

```

+----+|-----+
| id | name          |
+----+|-----+
| 3  | Ellen Johnson |
| 4  | Jim Smith     |
| 1  | Bob Taylor    |
| 2  | Frank Williams |
+----+|-----+
4 rows in set (0.06 sec)

```

```

SELECT store_id, COUNT(department_id) AS c
FROM employees PARTITION (p1,p2,p3)
GROUP BY store_id HAVING c > 4;

```

```

+---|-----+
| c | store_id |
+---|-----+
| 5 |      2 |
| 5 |      3 |
+---|-----+
2 rows in set (0.00 sec)

```

Partition selection is supported for all types of table partitioning, including Range partitioning and Hash partitioning. For Hash partitions, if partition names are not specified, `p0`, `p1`, `p2`, ..., or `pN-1` is automatically used as the partition name.

`SELECT` in `INSERT ... SELECT` can also use partition selection.

12.10.13.5 Restrictions and limitations on partitions

This section introduces some restrictions and limitations on partitioned tables in TiDB.

12.10.13.5.1 Partitioning keys, primary keys and unique keys

This section discusses the relationship of partitioning keys with primary keys and unique keys. The rule governing this relationship can be expressed as follows: **Every unique key on the table must use every column in the table's partitioning expression.** This also includes the table's primary key, because it is by definition a unique key.

For example, the following table creation statements are invalid:

```

CREATE TABLE t1 (
  col1 INT NOT NULL,
  col2 DATE NOT NULL,
  col3 INT NOT NULL,
  col4 INT NOT NULL,
  UNIQUE KEY (col1, col2)
)

PARTITION BY HASH(col3)
PARTITIONS 4;

CREATE TABLE t2 (
  col1 INT NOT NULL,
  col2 DATE NOT NULL,
  col3 INT NOT NULL,
  col4 INT NOT NULL,
  UNIQUE KEY (col1),
  UNIQUE KEY (col3)
)

```

```
PARTITION BY HASH(col1 + col3)
PARTITIONS 4;
```

In each case, the proposed table has at least one unique key that does not include all columns used in the partitioning expression.

The valid statements are as follows:

```
CREATE TABLE t1 (
  col1 INT NOT NULL,
  col2 DATE NOT NULL,
  col3 INT NOT NULL,
  col4 INT NOT NULL,
  UNIQUE KEY (col1, col2, col3)
)

PARTITION BY HASH(col3)
PARTITIONS 4;

CREATE TABLE t2 (
  col1 INT NOT NULL,
  col2 DATE NOT NULL,
  col3 INT NOT NULL,
  col4 INT NOT NULL,
  UNIQUE KEY (col1, col3)
)

PARTITION BY HASH(col1 + col3)
PARTITIONS 4;
```

The following example displays an error:

```
CREATE TABLE t3 (
  col1 INT NOT NULL,
  col2 DATE NOT NULL,
  col3 INT NOT NULL,
  col4 INT NOT NULL,
  UNIQUE KEY (col1, col2),
  UNIQUE KEY (col3)
)

PARTITION BY HASH(col1 + col3)
PARTITIONS 4;
```

```
ERROR 1491 (HY000): A PRIMARY KEY must include all columns in the table's
↪ partitioning function
```

The CREATE TABLE statement fails because both `col1` and `col3` are included in the proposed partitioning key, but neither of these columns is part of both of unique keys on the table. After the following modifications, the CREATE TABLE statement becomes valid:

```
CREATE TABLE t3 (  
  col1 INT NOT NULL,  
  col2 DATE NOT NULL,  
  col3 INT NOT NULL,  
  col4 INT NOT NULL,  
  UNIQUE KEY (col1, col2, col3),  
  UNIQUE KEY (col1, col3)  
)  
PARTITION BY HASH(col1 + col3)  
PARTITIONS 4;
```

The following table cannot be partitioned at all, because there is no way to include in a partitioning key any columns that belong to both unique keys:

```
CREATE TABLE t4 (  
  col1 INT NOT NULL,  
  col2 INT NOT NULL,  
  col3 INT NOT NULL,  
  col4 INT NOT NULL,  
  UNIQUE KEY (col1, col3),  
  UNIQUE KEY (col2, col4)  
);
```

Because every primary key is by definition a unique key, so the next two statements are invalid:

```
CREATE TABLE t5 (  
  col1 INT NOT NULL,  
  col2 DATE NOT NULL,  
  col3 INT NOT NULL,  
  col4 INT NOT NULL,  
  PRIMARY KEY(col1, col2)  
)  
  
PARTITION BY HASH(col3)  
PARTITIONS 4;  
  
CREATE TABLE t6 (  
  col1 INT NOT NULL,  
  col2 DATE NOT NULL,  
  col3 INT NOT NULL,  
  col4 INT NOT NULL,
```

```
    PRIMARY KEY(col1, col3),
    UNIQUE KEY(col2)
)
PARTITION BY HASH( YEAR(col2) )
PARTITIONS 4;
```

In the above examples, the primary key does not include all columns referenced in the partitioning expression. After adding the missing column in the primary key, the `CREATE` \rightarrow `TABLE` statement becomes valid:

```
CREATE TABLE t5 (
  col1 INT NOT NULL,
  col2 DATE NOT NULL,
  col3 INT NOT NULL,
  col4 INT NOT NULL,
  PRIMARY KEY(col1, col2, col3)
)
PARTITION BY HASH(col3)
PARTITIONS 4;
CREATE TABLE t6 (
  col1 INT NOT NULL,
  col2 DATE NOT NULL,
  col3 INT NOT NULL,
  col4 INT NOT NULL,
