- `matcher`: the database and table that this event filter rule applies to. The syntax is the same as table filter.
- `ignore-event`: the event type to be ignored. This parameter accepts an array of strings. You can configure multiple event types. Currently, the following event types are supported:

| Event | Type | Alias | Description |
|---|---|---|---|
| all dml | | | Matches all DML events |
| all ddl | | | Matches all DDL events |
| insert | DML | | Matches `insert` DML event |
| update | DML | | Matches `update` DML event |
| delete | DML | | Matches `delete` DML event |
| create schema | DDL | create database | Matches `create database` event |

| Event | Type | Alias | Description |
|---|---|---|---|
| drop schema | DDL | drop database | Matches `drop database` event |
| create table | DDL | | Matches `create table` event |
| drop table | DDL | | Matches `drop table` event |
| rename table | DDL | | Matches `rename table` event |
| truncate table | DDL | | Matches `truncate table` event |
| alter table | DDL | | Matches `alter table` event, including all clauses of `alter table`, `create index` and `drop index` |
| add table partition | DDL | | Matches `add table partition` event |
| drop table partition | DDL | | Matches `drop table partition` event |
| truncate table partition | DDL | | Matches `truncate table` ↪ `partition` event |
| create view | DDL | | Matches `create view` event |
| drop view | DDL | | Matches `drop view` event |

- `ignore-sql`: the DDL statements to be ignored. This parameter accepts an array of strings, in which you can configure multiple regular expressions. This rule only applies to DDL events.
- `ignore-delete-value-expr`: this parameter accepts a SQL expression. This rule only applies to delete DML events with the specified value.
- `ignore-insert-value-expr`: this parameter accepts a SQL expression. This rule only applies to insert DML events with the specified value.
- `ignore-update-old-value-expr`: this parameter accepts a SQL expression. This rule only applies to update DML events whose old value contains the specified value.
- `ignore-update-new-value-expr`: this parameter accepts a SQL expression. This rule only applies to update DML events whose new value contains the specified value.

**Note:**

- When TiDB updates a value in the column of the clustered index, TiDB splits an `UPDATE` event into a `DELETE` event and an `INSERT` event. TiCDC does not identify such events as an `UPDATE` event and thus cannot correctly filter out such events.
- When you configure a SQL expression, make sure all tables that matches `matcher` contain all the columns specified in the SQL expression. Otherwise, the replication task cannot be created. In addition, if the table schema changes during the replication, which results in a table no longer containing a required column, the replication task fails and cannot be resumed automatically. In such a situation, you must manually modify the configuration and resume the task.

#### 13.9.3.5 Changefeed DDL Replication

This document describes the rules and special cases of DDL replication in TiCDC.

##### 13.9.3.5.1 DDL allow list

Currently, TiCDC uses an allow list to determine whether to replicate a DDL statement. Only the DDL statements in the allow list are replicated to the downstream. The DDL statements not in the allow list are not replicated.

The allow list of DDL statements supported by TiCDC is as follows:

- create database
- drop database
- create table
- drop table
- add column
- drop column
- create index / add index
- drop index
- truncate table
- modify column
- rename table
- alter column default value
- alter table comment
- rename index
- add partition
- drop partition
- truncate partition
- create view
- drop view

- alter table character set
- alter database character set
- recover table
- add primary key
- drop primary key
- rebase auto id
- alter table index visibility
- exchange partition
- reorganize partition
- alter table ttl
- alter table remove ttl

#### 13.9.3.5.2 DDL replication considerations

Asynchronous execution of `ADD INDEX` and `CREATE INDEX` DDLs

When the downstream is TiDB, TiCDC executes `ADD INDEX` and `CREATE INDEX` DDL operations asynchronously to minimize the impact on changefeed replication latency. This means that, after replicating `ADD INDEX` and `CREATE INDEX` DDLs to the downstream TiDB for execution, TiCDC returns immediately without waiting for the completion of the DDL execution. This avoids blocking subsequent DML executions.

During the execution of the `ADD INDEX` or `CREATE INDEX` DDL operation in the downstream, when TiCDC executes the next DDL operation of the same table, this DDL operation might be blocked in the `queueing` state for a long time. This can cause TiCDC to repeatedly execute this DDL operation, and if retries take too long, it might lead to replication task failure. Starting from v6.5.12, if TiCDC has the `SUPER` permission of the downstream database, it periodically runs `ADMIN SHOW DDL JOBS` to check the status of asynchronously executed DDL tasks. TiCDC will wait for index creation to complete before proceeding with replication. Although this might increase replication latency, it avoids replication task failure.

**Note:**

- If the execution of certain downstream DMLs relies on indexes that have not completed replication, these DMLs might be executed slowly, thereby affecting TiCDC replication latency.
- Before replicating DDLs to the downstream, if a TiCDC node crashes or if the downstream is performing other write operations, the DDL replication has an extremely low probability of failure. You can check the downstream to see whether that occurs.

DDL replication considerations for renaming tables

Due to the lack of some context during the replication process, TiCDC has some constraints on the replication of `RENAME TABLE` DDLs.

Rename a single table in a DDL statement

If a DDL statement renames a single table, TiCDC only replicates the DDL statement when the old table name matches the filter rule. The following is an example.

Assume that the configuration file of your changefeed is as follows:

```
[filter]
rules = ['test.t*']
```

TiCDC processes this type of DDL as follows:

| DDL | Whether to replicate | Reason for the handling |
|---|---|---|
| `RENAME TABLE test.t1 TO test.t2` | Replicate | `test.t1` matches the filter rule |

| DDL | Whether to replicate | Reason for the handling |
|---|---|---|
| `RENAME TABLE test . t1 TO ignore . t1` | Replicate | `test . t1` matches the filter rule |
| `RENAME TABLE ignore . t1 TO ignore . t2` | Ignore | `ignore . t1` does not match the filter rule |

| DDL | Whether to replicate | Reason for the handling |
|---|---|---|
| `RENAME TABLE test.n1 TO test.t1` | Report an error and exit the replication | The old table name `test.n1` does not match the filter rule, but the new table name `test.t1` matches the filter rule. This operation is illegal. In this case, refer to the |
| | 2605 | |

| DDL | Whether to replicate | Reason for the handling |
|---|---|---|
| `RENAME TABLE test.t1 TO test.t1 ignore .` | Report an error and exit the replication | Same reason as above. |

Rename multiple tables in a DDL statement

If a DDL statement renames multiple tables, TiCDC replicates the DDL statement only when the **old database name**, **old table names**, and **new database name** all match the filter rule.

In addition, TiCDC does not support the `RENAME TABLE` DDL that swaps the table names. The following is an example.

Assume that the configuration file of your changefeed is as follows:

```
[filter]
rules = ['test.t*']
```

TiCDC processes this type of DDL as follows:

| DDL | Whether to replicate | Reason for the handling |
|---|---|---|
| `RENAME TABLE test.t1 TO test.t2, test.t3 TO test.t4` | Replicated | All database names and table names match the filter rule. |

| DDL | Whether to replicate | Reason for the handling |
|---|---|---|
| `RENAME TABLE test.t1 TO test.ignore1, test.t3 TO test.ignore2` | Replicate | The old database name, the old table names, and the new database name match the filter rule. |

| DDL | Whether to replicate | Reason for the handling |
|---|---|---|
| `RENAME TABLE` ↪ `test` ↪ `.` ↪ `t1` ↪ `TO` ↪ `ignore` ↪ `.` ↪ `t1` ↪ `,` ↪ ↪ `test` ↪ `.` ↪ `t2` ↪ ↪ `TO` ↪ ↪ `test` ↪ `.` ↪ `t22` ↪ `;` ↪ | Report an error | The new database name `ignore` ↪ does not match the ↪ filter rule. |

| DDL | Whether to replicate | Reason for handling |
|---|---|---|
| `RENAME TABLE test.t1 TO test.t4, test.t3 TO test.t1, test.t4 TO test.t3, test.t1 TO test.t2, test.t2 TO test.t4;` | Report an error | The `RENAME TABLE` DDL swaps the names of `test.t1` and `test.t3` in one DDL statement, which TiCDC cannot handle correctly. In this case, refer to the error message for handling. |
| `RENAME TABLE test.t1 TO test.t2, test.t3 TO test.t4;` | 2610 | The `RENAME TABLE` DDL renames `test.t1` to `test.t2` and `test.t3` to `test.t4` in one DDL statement, which TiCDC cannot handle correctly. In this case, refer to the error message for handling. |

| DDL | Whether to replicate | Reason for the handling |
|---|---|---|

DDL statement considerations

When executing cross-database DDL statements (such as `CREATE TABLE db1.t1 LIKE t2`) in the upstream, it is recommended that you explicitly specify all relevant database names in DDL statements (such as `CREATE TABLE db1.t1 LIKE db2.t2`). Otherwise, cross-database DDL statements might not be executed correctly in the downstream due to the lack of database name information.

SQL mode

By default, TiCDC uses the default SQL mode of TiDB to parse DDL statements. If your upstream TiDB cluster uses a non-default SQL mode, you must specify the SQL mode in the TiCDC configuration file. Otherwise, TiCDC might fail to parse DDL statements correctly. For more information about TiDB SQL mode, see SQL Mode.

For example, if the upstream TiDB cluster uses the `ANSI_QUOTES` mode, you must specify the SQL mode in the changefeed configuration file as follows:

```
#### In the value, "ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,
    ↪ NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,
    ↪ NO_ENGINE_SUBSTITUTION" is the default SQL mode of TiDB.
#### "ANSI_QUOTES" is the SQL mode added to your upstream TiDB cluster.

sql-mode = "ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,
    ↪ NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,
    ↪ NO_ENGINE_SUBSTITUTION,ANSI_QUOTES"
```

If the SQL mode is not configured, TiCDC might fail to parse some DDL statements correctly. For example:

```
CREATE TABLE "t1" ("a" int PRIMARY KEY);
```

Because in the default SQL mode of TiDB, double quotation marks are treated as strings rather than identifiers, TiCDC fails to parse the DDL statement correctly.

Therefore, when creating a replication task, it is recommended that you specify the SQL mode used by the upstream TiDB cluster in the configuration file.

Notes on using event filter rules to filter DDL events

If a filtered DDL statement involves table creation or deletion, TiCDC only filters out the DDL statement without affecting the replication behavior of DML statements. The following is an example.

Assume that the configuration file of your changefeed is as follows:

```
[filter]
rules = ['test.t*']

[[filter.event-filters]]
matcher = ["test.t1"] # This filter rule applies only to the t1 table in the
    ↪ test database.
ignore-event = ["create table", "drop table", "truncate table", "rename
    ↪ table"]
```

| DDL | DDL behavior | DML behavior | Explanation |
|---|---|---|---|
| `CREATE` | Ignore | Replicate | `test` ↪ `.` ↪ `t1` ↪ matches the event filter rule, so the `CREATE` ↪ `TABLE` ↪ event is ignored. The replication of DML events remains unaffected. |
| ↪ `TABLE` | | | |
| ↪ `test` | | | |
| ↪ `.` | | | |
| ↪ `t1` | | | |
| ↪ `(` | | | |
| ↪ `id` | | | |
| ↪ `INT` | | | |
| ↪ `,` | | | |
| ↪ `name` | | | |
| ↪ `VARCHAR` | | | |
| ↪ `(50)` | | | |
| ↪ `)` | | | |
| ↪ `;` | | | |

| DDL | DDL behavior | DML behavior | Explanation |
|---|---|---|---|
| `CREATE TABLE test . t2 ( id INT , name VARCHAR (50) ) ;` | Replicate | Replicate | `test . t2` does not match the event filter rule. |

| DDL | DDL behavior | DML behavior | Explanation |
|---|---|---|---|
| `CREATE` | Ignore | Ignore | `test` ↪ `.` ↪ `ignore` ↪ ↪ `test` ↪ `.` ↪ `ignore` ↪ ↪ `(` ↪ `id` ↪ ↪ `INT` ↪ `,` ↪ ↪ `name` ↪ ↪ `VARCHAR` ↪ `(50)` ↪ `)` ↪ `;` ↪ |
| `TABLE` | | | matches the event filter rule, so both DDL and DML events are ignored. |

| DDL | DDL behavior | DML behavior | Explanation |
|---|---|---|---|
| `DROP TABLE test.t1;` | Ignore | - | `test.t1` matches the event filter rule, so the `DROP TABLE` event is ignored. Because the table is deleted, TiCDC no longer replicates DML events for `t1`. |

| DDL | DDL behavior | DML behavior | Explanation |
|---|---|---|---|
| `TRUNCATE TABLE test.t1;` | Ignore | Replicate | `test.t1` matches the event filter rule, so the `TRUNCATE TABLE` event is ignored. The replication of DML events remains unaffected. |

| DDL | DDL behavior | DML behavior | Explanation |
|---|---|---|---|
| `RENAME` | Ignore | Replicate | `test` ↪ `.` ↪ `t1` ↪ matches the event filter rule, so the `RENAME` ↪ ↪ `TABLE` ↪ event is ignored. The replication of DML events remains unaffected. |
| ↪ | | | |
| ↪ `TABLE` | | | |
| ↪ | | | |
| ↪ `test` | | | |
| ↪ `.` | | | |
| ↪ `t1` | | | |
| ↪ | | | |
| ↪ `TO` | | | |
| ↪ | | | |
| ↪ `test` | | | |
| ↪ `.` | | | |
| ↪ `t2` | | | |
| ↪ `;` | | | |
| ↪ | | | |

| DDL | DDL behavior | DML behavior | Explanation |
|---|---|---|---|
| `RENAME TABLE test . t1 TO test . ignore ;` | Ignore | Ignore | `test . t1` matches the event filter rule, so the `RENAME TABLE` event is ignored. `test . ignore` matches the event filter rule, so both DDL and DML events are ignored. |

**Note:**

- When replicating data to a database, use the event filter to filter DDL events with caution. Ensure that the upstream and downstream database schemas remain consistent during replication. Otherwise, TiCDC might report errors or cause undefined replication behavior.
- For versions earlier than v6.5.8, using the event filter to filter DDL events involving table creation or deletion affects DML replication. It is not recommended to use this feature in these versions.

#### 13.9.3.6 Bidirectional Replication

Starting from v6.5.0, TiCDC supports bi-directional replication among two TiDB clusters. Based on this feature, you can create a multi-active TiDB solution using TiCDC.

This section describes how to use bi-directional replication taking two TiDB clusters as an example.

##### 13.9.3.6.1 Deploy bi-directional replication

TiCDC only replicates incremental data changes that occur after a specified timestamp to the downstream cluster. Before starting the bi-directional replication, you need to take the following steps:

1. (Optional) According to your needs, import the data of the two TiDB clusters into each other using the data export tool Dumpling and data import tool TiDB Lightning.
2. Deploy two TiCDC clusters between the two TiDB clusters. The cluster topology is as follows. The arrows in the diagram indicate the directions of data flow.

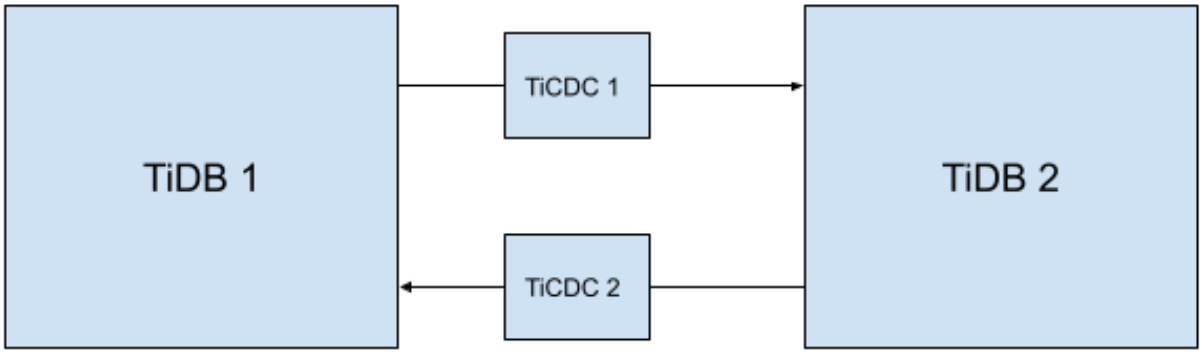

Figure 334: TiCDC bidirectional replication

3. Specify the starting time point of data replication for the upstream and downstream clusters.

    1. Check the time point of the upstream and downstream clusters. In the case of two TiDB clusters, make sure that data in the two clusters are consistent at certain time points. For example, the data of TiDB A at `ts=1` and the data of TiDB B at `ts=2` are consistent.
    2. When you create the changefeed, set the `--start-ts` of the changefeed for the upstream cluster to the corresponding `tso`. That is, if the upstream cluster is TiDB A, set `--start-ts=1`; if the upstream cluster is TiDB B, set `--start-ts =2`.

4. In the configuration file specified by the `--config` parameter, add the following configuration:

```
# Whether to enable the bi-directional replication mode
bdr-mode = true
```

After the configuration takes effect, the clusters can perform bi-directional replication.

#### 13.9.3.6.2 Execute DDL

After the bidirectional replication is enabled, TiCDC does not replicate any DDL statements. You need to execute DDL statements in the upstream and downstream clusters respectively.

Note that some DDL statements might cause table structure changes or data change time sequence problems, which might lead to data inconsistency after the replication. Therefore, after enabling bidirectional replication, only the DDL statements in the following table can be executed without stopping the write operations of the application.

| Event | Does it cause changefeed errors | Note |
| --- | --- | --- |
| create database | Yes | After you manually execute the DDL statements in the upstream and downstream clusters, the errors can be automatically recovered. |

| Event | Does it cause changefeed errors | Note |
|---|---|---|
| drop database | Yes | You need to manually restart the changefeed and specify `--overwrite-checkpoint-ts` as the `commitTs` of the DDL statement to recover the errors. |

| Event | Does it cause changefeed errors | Note |
| --- | --- | --- |
| create table | Yes | After you manually execute the DDL statements in the upstream and downstream clusters, the errors can be automatically recovered. |

| Event | Does it cause changefeed errors | Note |
|---|---|---|
| drop table | Yes | You need to manually restart the changefeed and specify `--overwrite-checkpoint-ts` as the `commitTs` of the DDL statement to recover the errors. |

| Event | Does it cause changefeed errors | Note |
|---|---|---|
| alter table comment | No | |
| rename index | No | |
| alter table index visibility | No | |

| Event | Does it cause changefeed errors | Note |
| --- | --- | --- |
| add partition | Yes | After you manually execute the DDL statements in the upstream and downstream clusters, the errors can be automatically recovered. |
| drop partition | No | |

| Event | Does it cause changefeed errors | Note |
|---|---|---|
| create view | No | |
| drop view | No | |
| alter column default value | No | |

| Event | Does it cause changefeed errors | Note |
| --- | --- | --- |
| reorganize partition | Yes | After you manually execute the DDL statements in the upstream and downstream clusters, the errors can be automatically recovered. |
| alter table ttl | No | |

| Event | Does it cause changefeed errors | Note |
|---|---|---|
| alter table remove ttl | No | |
| add **not unique** index | No | |
| drop **not unique** index | No | |

If you need to execute DDL statements that are not in the preceding table, take the following steps:

1. Pause the write operations in the tables that need to execute DDL in all clusters.
2. After the write operations of the corresponding tables in all clusters have been replicated to other clusters, manually execute all DDL statements in each TiDB cluster.
3. After the DDL statements are executed, resume the write operations.

#### 13.9.3.6.3 Stop bi-directional replication

After the application has stopped writing data, you can insert a special record into each cluster. By checking the two special records, you can make sure that data in two clusters are consistent.

After the check is completed, you can stop the changefeed to stop bi-directional replication.

#### 13.9.3.6.4 Limitations

- For the limitations of DDL, see Execute DDL.

- Bi-directional replication clusters cannot detect write conflicts, which might cause undefined behaviors. Therefore, you must ensure that there are no write conflicts from the application side.
- Bi-directional replication supports more than two clusters, but does not support multiple clusters in cascading mode, that is, a cyclic replication like TiDB A -> TiDB B -> TiDB C -> TiDB A. In such a topology, if one cluster fails, the whole data replication will be affected. Therefore, to enable bi-directional replication among multiple clusters, you need to connect each cluster with every other clusters, for example, `TiDB A <-> TiDB B`, `TiDB B <-> TiDB C`, `TiDB C <-> TiDB A`.

#### 13.9.3.7 Upstream and Downstream Clusters Data Validation and Snapshot Read

When you use TiCDC to build upstream and downstream clusters of TiDB, you might need to perform consistent snapshot read or data consistency validation on the upstream and downstream without stopping the replication. In the regular replication mode, TiCDC only guarantees that the data is eventually consistent, but cannot guarantee that the data is consistent during the replication process. Therefore, it is difficult to perform consistent read of dynamically changing data. To meet such a need, TiCDC provides the Syncpoint feature.

Syncpoint uses the snapshot feature provided by TiDB and enables TiCDC to maintain a `ts-map` that has consistency between upstream and downstream snapshots during the replication process. In this way, the issue of verifying the consistency of dynamic data is converted to the issue of verifying the consistency of static snapshot data, which achieves the effect of nearly real-time verification.

##### 13.9.3.7.1 Enable Syncpoint

After enabling the Syncpoint feature, you can use Consistent snapshot read and Data consistency validation.

To enable the Syncpoint feature, set the value of the TiCDC configuration item `enable-sync-point` to `true` when creating a replication task. After enabling Syncpoint, TiCDC writes the following information to the downstream TiDB cluster:

1. During the replication, TiCDC periodically (configured by `sync-point-interval`) aligns snapshots between the upstream and downstream and saves the upstream and downstream TSO correspondences in the downstream `tidb_cdc.syncpoint_v1` table.
2. During the replication, TiCDC also periodically (configured by `sync-point-interval`) executes `SET GLOBAL tidb_external_ts = @@tidb_current_ts`, which sets a consistent snapshot point that has been replicated in backup clusters.

The following TiCDC configuration example enables Syncpoint when creating a replication task:

```
#### Enables SyncPoint.
enable-sync-point = true

#### Aligns the upstream and downstream snapshots every 5 minutes
sync-point-interval = "5m"

#### Cleans up the ts-map data in the downstream tidb_cdc.syncpoint_v1 table
    ↪ every hour
sync-point-retention = "1h"
```

#### 13.9.3.7.2 Consistent snapshot read

> **Note:**
>
> Before you perform consistent snapshot read, make sure that you have enabled the Syncpoint feature. If multiple replication tasks use the same downstream TiDB cluster and have Syncpoint enabled, each of these tasks updates `tidb_external_ts` and `ts-map` based on their respective replication progress. In this case, you need to set up consistent snapshot read at the replication task level by reading records from the `ts-map` table. Meanwhile, you need to avoid downstream applications reading data using `tidb_enable_external_ts_read`, because multiple replication tasks might interfere with each other and result in inconsistent results.

When you need to query the data from the backup cluster, you can set `SET GLOBAL| ↪ SESSION tidb_enable_external_ts_read = ON;` for the application to obtain transactionally consistent data on the backup cluster.

In addition, you can also select a previous point in time for snapshot read by querying `ts-map`.

#### 13.9.3.7.3 Data consistency validation

> **Note:**
>
> Before you perform data consistency validation, make sure that you have enabled the Syncpoint feature.

To validate the data of upstream and downstream clusters, you only need to configure `snapshot` in sync-diff-inspector.

Step 1: obtain `ts-map`

You can execute the following SQL statement in the downstream TiDB cluster to obtain the upstream TSO (`primary_ts`) and downstream TSO (`secondary_ts`):

```
select * from tidb_cdc.syncpoint_v1;
+--
   ↪ ---------------+---------------+--------------------+--------------------+----
   ↪
| ticdc_cluster_id | changefeed | primary_ts      | secondary_ts     |
   ↪ created_at        |
+--
   ↪ ---------------+---------------+--------------------+--------------------+----
   ↪
| default        | test-2 | 435953225454059520 | 435953235516456963 |
   ↪ 2022-09-13 08:40:15 |
+--
   ↪ ---------------+---------------+--------------------+--------------------+----
   ↪
```

The fields in the preceding `syncpoint_v1` table are described as follows:

- `ticdc_cluster_id`: The ID of the TiCDC cluster in this record.
- `changefeed`: The ID of the changefeed in this record. Because different TiCDC clusters might have changefeeds with the same name, you need to confirm the `ts-map` inserted by a changefeed with the TiCDC cluster ID and changefeed ID.
- `primary_ts`: The timestamp of the upstream database snapshot.
- `secondary_ts`: The timestamp of the downstream database snapshot.
- `created_at`: The time when this record is inserted.

Step 2: configure snapshot

Then configure the snapshot information of the upstream and downstream databases by using the `ts-map` information obtained in Step 1.

Here is a configuration example of the `Datasource config` section:

```
############################# Datasource config ########################
[data-sources.uptidb]
    host = "172.16.0.1"
    port = 4000
    user = "root"
    password = ""
    snapshot = "435953225454059520"
```

```
[data-sources.downtidb]
    host = "172.16.0.2"
    port = 4000
    user = "root"
    snapshot = "435953235516456963"
```

#### 13.9.3.7.4 Notes

- Before TiCDC creates a changefeed, make sure that the value of the TiCDC configuration item `enable-sync-point` is set to `true`. Only in this way, Syncpoint is enabled and the `ts-map` is saved in the downstream. For the complete configuration, see TiCDC task configuration file.
- When you perform data validation using Syncpoint, you need to modify the Garbage Collection (GC) time of TiKV to ensure that the historical data corresponding to snapshot is not collected by GC during the data check. It is recommended that you modify the GC time to 1 hour and recover the setting after the check.
- The above example only shows the section of `Datasource config`. For complete configuration, refer to sync-diff-inspector User Guide.
- Since v6.4.0, only the changefeed with the `SYSTEM_VARIABLES_ADMIN` or `SUPER` privilege can use the TiCDC Syncpoint feature.

### 13.9.3.8 TiCDC Behavior in Splitting UPDATE Events

#### 13.9.3.8.1 Split `UPDATE` events for MySQL sinks

Starting from v6.5.10, when using the MySQL sink, any TiCDC node that receives a request for replicating a table will fetch the current timestamp `thresholdTS` from PD before starting the replication to the downstream. Based on the value of this timestamp, TiCDC decides whether to split `UPDATE` events:

- For transactions containing one or multiple `UPDATE` changes, if the transaction `commitTS` is less than `thresholdTS`, TiCDC splits the `UPDATE` event into a `DELETE` event and an `INSERT` event before writing them to the Sorter module.
- For `UPDATE` events with the transaction `commitTS` greater than or equal to `thresholdTS` ↪ , TiCDC does not split them. For more information, see GitHub issue #10918.

This behavior change addresses the issue of downstream data inconsistencies caused by the potentially incorrect order of `UPDATE` events received by TiCDC, which can lead to an incorrect order of split `DELETE` and `INSERT` events.

Take the following SQL statements as an example:

```
CREATE TABLE t (a INT PRIMARY KEY, b INT);
INSERT INTO t VALUES (1, 1);
INSERT INTO t VALUES (2, 2);

BEGIN;
UPDATE t SET a = 3 WHERE a = 2;
UPDATE t SET a = 2 WHERE a = 1;
COMMIT;
```

In this example, the two `UPDATE` statements within the transaction have a sequential dependency on execution. The primary key `a` is changed from `2` to `3`, and then the primary key `a` is changed from `1` to `2`. After this transaction is executed, the records in the upstream database are `(2, 1)` and `(3, 2)`.

However, the order of `UPDATE` events received by TiCDC might differ from the actual execution order of the upstream transaction. For example:

```
UPDATE t SET a = 2 WHERE a = 1;
UPDATE t SET a = 3 WHERE a = 2;
```

- Before this behavior change, TiCDC writes these `UPDATE` events to the Sorter module and then splits them into `DELETE` and `INSERT` events. After the split, the actual execution order of these events in the downstream is as follows:

  ```
  BEGIN;
  DELETE FROM t WHERE a = 1;
  REPLACE INTO t VALUES (2, 1);
  DELETE FROM t WHERE a = 2;
  REPLACE INTO t VALUES (3, 2);
  COMMIT;
  ```

  After the downstream executes the transaction, the records in the database are `(3, 2)`, which are different from the records in the upstream database (`(2, 1)` and `(3, 2)`), indicating a data inconsistency issue.

- After this behavior change, if the transaction `commitTS` is less than the `thresholdTS` ↪ fetched from PD when TiCDC starts replicating the corresponding table to the downstream, TiCDC splits these `UPDATE` events into `DELETE` and `INSERT` events before writing them to the Sorter module. After the sorting by the Sorter module, the actual execution order of these events in the downstream is as follows:

  ```
  BEGIN;
  DELETE FROM t WHERE a = 1;
  DELETE FROM t WHERE a = 2;
  REPLACE INTO t VALUES (2, 1);
  REPLACE INTO t VALUES (3, 2);
  ```

```
COMMIT;
```

After the downstream executes the transaction, the records in the downstream database are the same as those in the upstream database, which are `(2, 1)` and `(3, 2)`, ensuring data consistency.

As you can see from the preceding example, splitting the `UPDATE` event into `DELETE` and `INSERT` events before writing them to the Sorter module ensures that all `DELETE` events are executed before `INSERT` events after the split, thereby maintaining data consistency regardless of the order of `UPDATE` events received by TiCDC.

**Note:**

After this behavior change, when using the MySQL sink, TiCDC does not split the `UPDATE` event in most cases. Consequently, there might be primary key or unique key conflicts during changefeed runtime, causing the changefeed to restart automatically. After the restart, TiCDC will split the conflicting `UPDATE` events into `DELETE` and `INSERT` events before writing them to the Sorter module. This ensures that all events within the same transaction are correctly ordered, with all `DELETE` events preceding `INSERT` events, thus correctly completing data replication.

#### 13.9.3.8.2 Split primary or unique key `UPDATE` events for non-MySQL sinks

Transactions containing a single `UPDATE` change

Starting from v6.5.3, when using a non-MySQL sink, for transactions that only contain a single update change, if the primary key or non-null unique index value is modified in an `UPDATE` event, TiCDC splits this event into `DELETE` and `INSERT` events. For more information, see GitHub issue #9086.

This change primarily addresses the issue that TiCDC only outputs the new value without the old value by default when using the CSV and AVRO protocols. Due to this issue, when the primary key or non-null unique index value changes, the consumer can only receive the new value, making it impossible to process the value before the change (for example, delete the old value). Take the following SQL as an example:

```
CREATE TABLE t (a INT PRIMARY KEY, b INT);
INSERT INTO t VALUES (1, 1);
UPDATE t SET a = 2 WHERE a = 1;
```

In this example, the primary key `a` is updated from `1` to `2`. If the `UPDATE` event is not split, the consumer can only obtain the new value `a = 2` and cannot obtain the old

value `a = 1` when using the CSV and AVRO protocols. This might cause the downstream consumer to only insert the new value `2` without deleting the old value `1`.

Transactions containing multiple `UPDATE` changes

Starting from v6.5.4, for transactions containing multiple changes, if the primary key or non-null unique index value is modified in the `UPDATE` event, TiCDC splits the event into `DELETE` and `INSERT` events and ensures that all events follow the sequence of `DELETE` events preceding `INSERT` events. For more information, see GitHub issue #9430.

This change primarily addresses the potential issue of primary key or unique key conflicts that consumers might encounter when writing data changes from the Kafka sink or other sinks to a relational database or performing a similar operation. This issue is caused by the potentially incorrect order of `UPDATE` events received by TiCDC.

Take the following SQL as an example:

```
CREATE TABLE t (a INT PRIMARY KEY, b INT);
INSERT INTO t VALUES (1, 1);
INSERT INTO t VALUES (2, 2);

BEGIN;
UPDATE t SET a = 3 WHERE a = 1;
UPDATE t SET a = 1 WHERE a = 2;
UPDATE t SET a = 2 WHERE a = 3;
COMMIT;
```

In this example, by executing three SQL statements to swap the primary keys of two rows, TiCDC only receives two update change events, that is, changing the primary key `a` from `1` to `2` and changing the primary key `a` from `2` to `1`. If consumers directly write these two `UPDATE` events to the downstream, a primary key conflict will occur, leading to changefeed errors.

Therefore, TiCDC splits these two events into four events, that is, deleting records `(1, 1)` and `(2, 2)` and writing records `(2, 1)` and `(1, 2)`.

Control whether to split primary or unique key `UPDATE` events

Starting from v6.5.10, when using a non-MySQL sink, TiCDC supports controlling whether to split primary or unique key `UPDATE` events via the `output-raw-change-event` parameter, as described in the GitHub issue #11211. The specific behavior of this parameter is as follows:

- When you set `output-raw-change-event = false`, if the primary key or non-null unique index value is modified in an `UPDATE` event, TiCDC splits the event into `DELETE` and `INSERT` events and ensures that all events follow the sequence of `DELETE` events preceding `INSERT` events.
- When you set `output-raw-change-event = true`, TiCDC does not split `UPDATE` events, and the consumer side is responsible for dealing with the problems described

in Split primary or unique key UPDATE events for non-MySQL sinks. Otherwise there might be a risk of data inconsistency. Note that when the primary key of a table is a clustered index, updates to the primary key are still split into DELETE and INSERT events in TiDB, and such behavior is not affected by the output-raw-change-event parameter.

**Note**

In the following tables, UK/PK stands for primary key or unique key.

Release 6.5 compatibility

| Version | Protocol | Split UK/PK UPDATE events | Not split UK/PK UPDATE events | Comments |
|---|---|---|---|---|
| <= v6.5.2 | ALL | | | |
| v6.5.3 / v6.5.4 | Canal/Open | | | |
| v6.5.3 | CSV/Avro | | | Split but does not sort. See #9086 |

| Version | Protocol | Split UK/PK UPDATE events | Not split UK/PK UPDATE events | Comments |
|---|---|---|---|---|
| v6.5.4 | Canal/Open | | | Only split and sort transactions that contain multiple changes |
| v6.5.5 ~ v6.5.9 | ALL | | | |
| >= v6.5.10 | ALL | (Default value: `output`) | (Optional: `output` - `raw` - `change` - `event` = `true`) | |

### 13.9.4 Monitor and Alert

#### 13.9.4.1 Key Monitoring Metrics of TiCDC

If you use TiUP to deploy the TiDB cluster, you can see a sub-dashboard for TiCDC in the monitoring system which is deployed at the same time. You can get an overview of TiCDC's current status from the TiCDC dashboard, where the key metrics are displayed. This document provides a detailed description of these key metrics.

The metric description in this document is based on the following replication task example, which replicates data to MySQL using the default configuration.

```
cdc cli changefeed create --server=http://10.0.10.25:8300 --sink-uri="mysql
    ↪ ://root:123456@127.0.0.1:3306/" --changefeed-id="simple-replication-
    ↪ task"
```

The TiCDC dashboard contains four monitoring panels. See the following screenshot:

Figure 335: TiCDC Dashboard - Overview

The description of each panel is as follows:

- **Server**: The summary information of TiKV nodes and TiCDC nodes in the TiDB cluster
- **Changefeed**: The detailed information of TiCDC replication tasks
- **Events**: The detail information about the data flow within the TiCDC cluster
- **TiKV**: TiKV information related to TiCDC

#### 13.9.4.1.1 Server

The following is an example of the **Server** panel:

Figure 336: TiCDC Dashboard - Server metrics

The description of each metric in the **Server** panel is as follows:

- Uptime: The time for which TiKV nodes and TiCDC nodes have been running
- Goroutine count: The number of goroutines of a TiCDC node
- Open FD count: The number of file handles opened by TiCDC nodes
- Ownership: The current status of nodes in the TiCDC cluster
- Ownership history: The ownership history of the TiCDC cluster
- CPU usage: The CPU usage of TiCDC nodes
- Memory usage: The memory usage of TiCDC nodes

#### 13.9.4.1.2 Changefeed

The following is an example of the **Changefeed** panel:

Figure 337: TiCDC Dashboard - Changefeed metrics 1

- Changefeed table count: The number of tables that each TiCDC node needs to replicate in the replication task
- Processor resolved ts: The timestamps that have been resolved in the TiCDC cluster
- Table resolved ts: The replication progress of each table in the replication task
- Changefeed checkpoint: The progress of replicating data to the downstream. Normally, the green bars are connected to the yellow line
- PD etcd requests/s: The number of requests that a TiCDC node sends to PD per second
- Exit error count/m: The number of errors that interrupt the replication task per minute
- Changefeed checkpoint lag: The progress lag of data replication (the unit is second) between the upstream and the downstream
- Processor resolved ts lag: The progress lag of data replication (the unit is second) between the upstream and TiCDC nodes

Figure 338: TiCDC Dashboard - Changefeed metrics 2

- Sink write duration: The histogram of the time spent by TiCDC writing a transaction change to the downstream
- Sink write duration percentile: The time (P95, P99, and P999) spent by TiCDC writing a transaction change to the downstream within one second
- Flush sink duration: The histogram of the time spent by TiCDC asynchronously flushing data to the downstream
- Flush sink duration percentile: The time (P95, P99, and P999) spent by TiCDC asynchronously flushing data to the downstream within one second

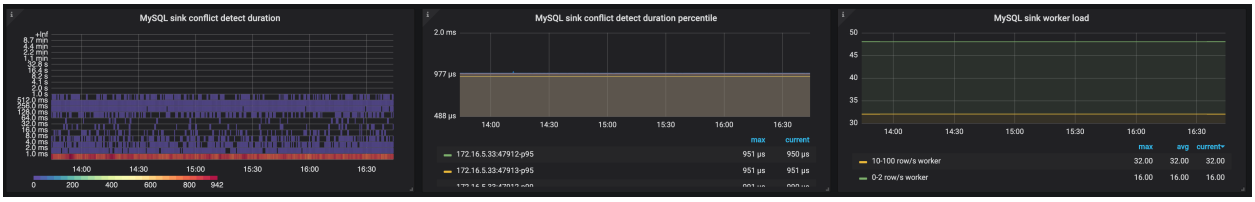

Figure 339: TiCDC Dashboard - Changefeed metrics 3

- MySQL sink conflict detect duration: The histogram of the time spent on detecting MySQL sink conflicts
- MySQL sink conflict detect duration percentile: The time (P95, P99, and P999) spent on detecting MySQL sink conflicts within one second
- MySQL sink worker load: The workload of MySQL sink workers of TiCDC nodes

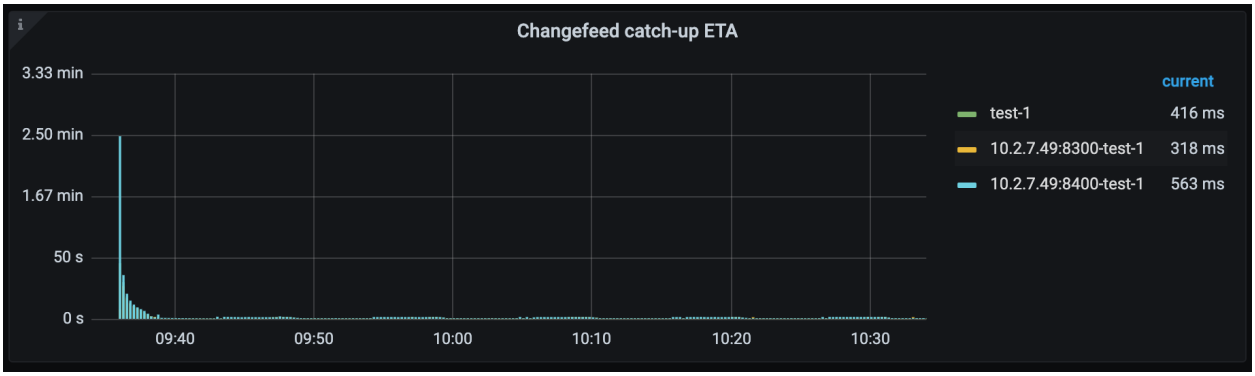

Figure 340: TiCDC Dashboard - Changefeed metrics 4

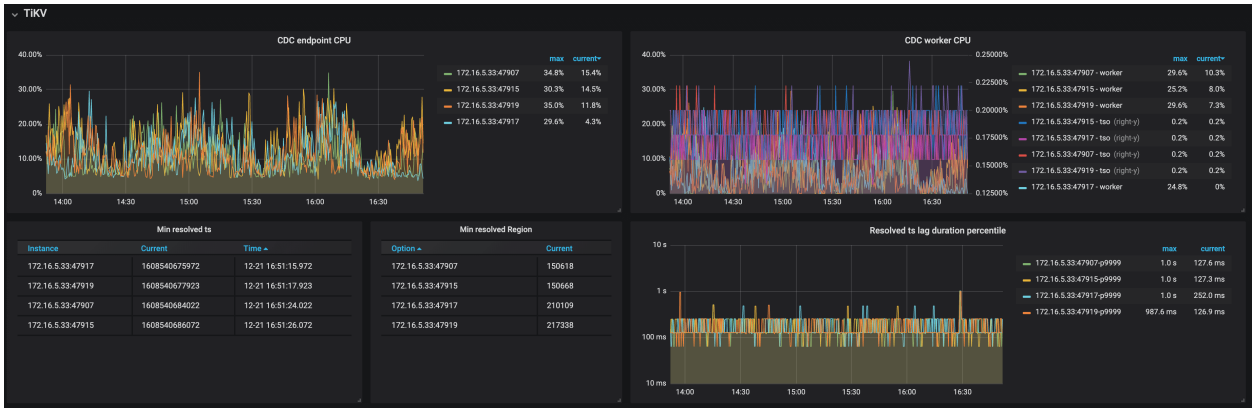
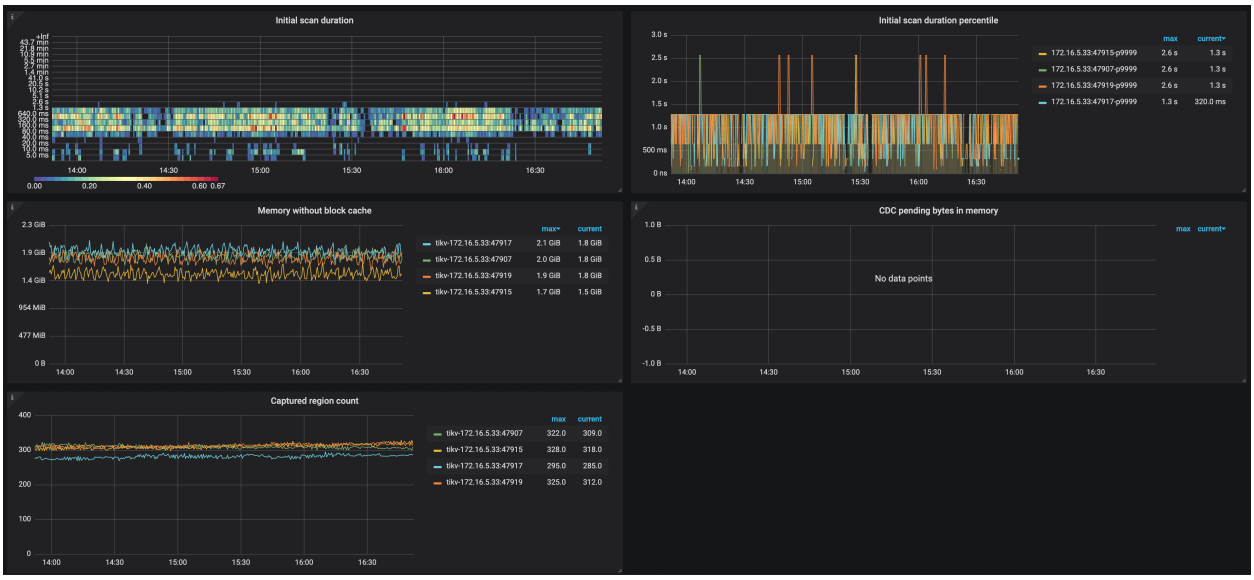
- Changefeed catch-up ETA: The estimated time needed for the replication task to catch up with the upstream cluster data. When the upstream write speed is faster than the TiCDC replication speed, the metric might be extremely large. Because TiCDC replication speed is subject to many factors, this metric is for reference only and might not be the actual replication time.

#### 13.9.4.1.3 Events

The following is an example of the **Events** panel:



The description of each metric in the **Events** panel is as follows:



- Eventfeed count: The number of Eventfeed RPC requests of TiCDC nodes
- Event size percentile: The event size (P95, P99, and P999) which TiCDC receives from TiKV within one second
- Eventfeed error/m: The number of errors reported by Eventfeed RPC requests of TiCDC nodes per minute
- KV client receive events/s: The number of events that the KV client module of TiCDC nodes receives from TiKV per second

- Puller receive events/s: The number of events that the Puller module of TiCDC nodes receives from the KV client per second
- Puller output events/s: The number of events that the Puller module of TiCDC nodes sends to the Sorter module per second
- Sink flush rows/s: The number of events that TiCDC nodes write to the downstream per second
- Puller buffer size: The number of events that TiCDC nodes cache in the Puller module
- Entry sorter buffer size: The number of events that TiCDC nodes cache in the Sorter module
- Processor/Mounter buffer size: The number of events that TiCDC nodes cache in the Processor module and the Mounter module
- Sink row buffer size: The number of events that TiCDC nodes cache in the Sink module
- Entry sorter sort duration: The histogram of the time spent by TiCDC nodes sorting events
- Entry sorter sort duration percentile: The time (P95, P99, and P999) spent by TiCDC sorting events within one second
- Entry sorter merge duration: The histogram of the time spent by TiCDC nodes merging sorted events
- Entry sorter merge duration percentile: The time (P95, P99, and P999) spent by TiCDC merging sorted events within one second
- Mounter unmarshal duration: The histogram of the time spent by TiCDC nodes unmarshaling events
- Mounter unmarshal duration percentile: The time (P95, P99, and P999) spent by TiCDC unmarshaling events within one second
- KV client dispatch events/s: The number of events that the KV client module dispatches among the TiCDC nodes
- KV client batch resolved size: The batch size of resolved timestamp messages that TiKV sends to TiCDC

#### 13.9.4.1.4 TiKV

The following is an example of the **TiKV** panel:

The description of each metric in the **TiKV** panel is as follows:

- CDC endpoint CPU: The CPU usage of the CDC endpoint threads on TiKV nodes
- CDC worker CPU: The CPU usage of the CDC worker threads on TiKV nodes
- Min resolved ts: The minimum resolved timestamp on TiKV nodes
- Min resolved region: The Region ID of the minimum resolved timestamp on TiKV nodes
- Resolved ts lag duration percentile: The lag between the minimum resolved timestamp on TiKV nodes and the current time
- Initial scan duration: The histogram of the time spent on incremental scan when TiKV nodes connect to TiCDC nodes
- Initial scan duration percentile: The time (P95, P99, and P999) spent on the incremental scan of TiKV nodes within one second
- Memory without block cache: The memory usage of TiKV nodes excluding the RocksDB block cache
- CDC pending bytes in memory: The memory usage of CDC module on TiKV nodes
- Captured region count: The number of event-capturing Regions on TiKV nodes

### 13.9.4.2 TiCDC Alert Rules

This document describes the TiCDC alert rules and the corresponding solutions. In descending order, the severity levels are: **Critical**, **Warning**.

#### 13.9.4.2.1 Critical alerts

This section introduces critical alerts and solutions.

`cdc_checkpoint_high_delay`

For critical alerts, you need to pay close attention to abnormal monitoring metrics.

- Alert rule:

  `ticdc_owner_checkpoint_ts_lag > 600`

- Description:

  A replication task is delayed more than 10 minutes.

- Solution:

  See TiCDC Handles Replication Interruption.

#### 13.9.4.2.2 `cdc_resolvedts_high_delay`

- Alert rule:

  `ticdc_owner_resolved_ts_lag > 300`

- Description:

  The Resolved TS of a replication task is delayed more than 5 minutes.

- Solution:

  See TiCDC Handles Replication Interruption.

`ticdc_changefeed_failed`

- Alert rule:

  `(max_over_time(ticdc_owner_status[1m])== 2)> 0`

- Description:

  A replication task encounters an unrecoverable error and enters the failed state.

- Solution:

  This alert is similar to replication interruption. See TiCDC Handles Replication Interruption.

`ticdc_processor_exit_with_error_count`

- Alert rule:

  `changes(ticdc_processor_exit_with_error_count[1m])> 0`

- Description:

  A replication task reports an error and exits.

- Solution:

  See TiCDC Handles Replication Interruption.

#### 13.9.4.2.3 Warning alerts

Warning alerts are a reminder for an issue or error.

`cdc_multiple_owners`

- Alert rule:

  `sum(rate(ticdc_owner_ownership_counter[30s]))>= 2`

- Description:

  There are multiple owners in the TiCDC cluster.

- Solution:

  Collect TiCDC logs to locate the root cause.

`ticdc_mounter_unmarshal_and_mount_time_more_than_1s`

- Alert rule:

```
histogram_quantile(0.9, rate(ticdc_mounter_unmarshal_and_mount_bucket[1m
↪ ]))* 1000 > 1000
```

- Description:

  It takes a replication task more than 1 second to unmarshal the data changes.

- Solution:

  Collect TiCDC logs to locate the root cause.

`cdc_sink_execute_duration_time_more_than_10s`

- Alert rule:

  `histogram_quantile(0.9, rate(ticdc_sink_txn_exec_duration_bucket[1m]))>`
  `↪ 10`

- Description:

  It takes a replication task more than 10 seconds to write data to the downstream database.

- Solution:

  Check whether there are problems in the downstream database.

`cdc_processor_checkpoint_tso_no_change_for_1m`

- Alert rule:

  ```
  changes(ticdc_processor_checkpoint_ts[1m])< 1
  ```

- Description:

  A replication task has not advanced for more than 1 minute.

- Solution:

  See TiCDC Handles Replication Interruption.

### ticdc_puller_entry_sorter_sort_bucket

- Alert rule:

  ```
  histogram_quantile(0.9, rate(ticdc_puller_entry_sorter_sort_bucket{}[1m
  ↪ ]))> 1
  ```

- Description:

  The delay of TiCDC puller entry sorter is too high.

- Solution:

  Collect TiCDC logs to locate the root cause.

### ticdc_puller_entry_sorter_merge_bucket

- Alert rule:

  ```
  histogram_quantile(0.9, rate(ticdc_puller_entry_sorter_merge_bucket{}[1
  ↪ m]))> 1
  ```

- Description:

  The delay of TiCDC puller entry sorter merge is too high.

- Solution:

  Collect TiCDC logs to locate the root cause.

### tikv_cdc_min_resolved_ts_no_change_for_1m

- Alert rule:

  ```
  changes(tikv_cdc_min_resolved_ts[1m])< 1 and ON (instance)tikv_cdc_region_resolve_s
  ↪ {status="resolved"} > 0 and ON (instance)tikv_cdc_captured_region_total
  ↪  > 0
  ```

- Description:

  The minimum Resolved TS 1 of TiKV CDC has not advanced for 1 minute.

- Solution:

  Collect TiKV logs to locate the root cause.

`tikv_cdc_scan_duration_seconds_more_than_10min`

- Alert rule:

  ```
  histogram_quantile(0.9, rate(tikv_cdc_scan_duration_seconds_bucket{}[1m
  ↪ ]))> 600
  ```

- Description:

  The TiKV CDC module has scanned for incremental replication for more than 10 minutes.

- Solution:

  Collect TiCDC monitoring metrics and TiKV logs to locate the root cause.

`ticdc_sink_mysql_execution_error`

- Alert rule:

  ```
  changes(ticdc_sink_mysql_execution_error[1m])> 0
  ```

- Description:

  An error occurs when a replication task writes data to the downstream MySQL.

- Solution:

  There are many possible root causes. See Troubleshoot TiCDC.

`ticdc_memory_abnormal`

- Alert rule:

  ```
  go_memstats_heap_alloc_bytes{job="ticdc"} > 1e+10
  ```

- Description:

  The TiCDC heap memory usage exceeds 10 GiB.

- Solution:

  Collect TiCDC logs to locate the root cause.

#### 13.9.4.3 Architecture and Principles of TiCDC

#### 13.9.4.3.1 TiCDC architecture

Consisting of multiple TiCDC nodes, a TiCDC cluster uses a distributed and stateless architecture. The design of TiCDC and its components is as follows:

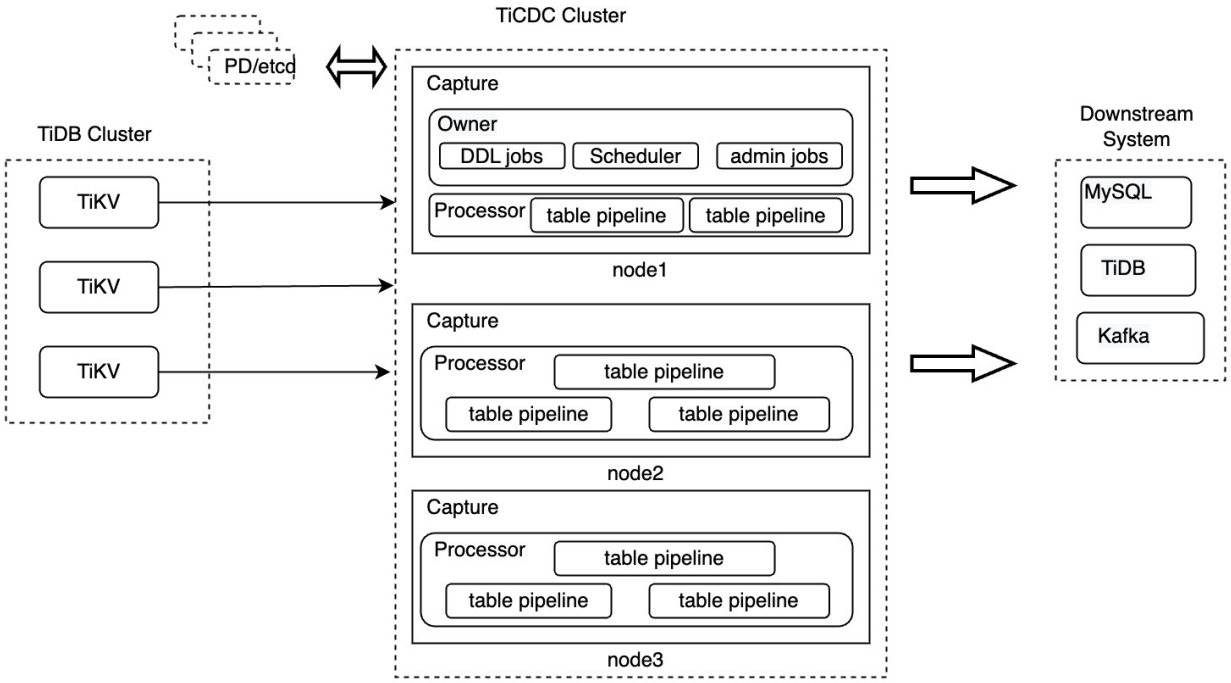


Figure 341: TiCDC architecture

#### 13.9.4.3.2 TiCDC components

In the preceding diagram, a TiCDC cluster consists of multiple nodes running TiCDC instances. Each TiCDC instance carries a Capture process. One of the Capture processes is elected as the owner Capture, which is responsible for scheduling workload, replicating DDL statements, and performing management tasks.

Each Capture process contains one or multiple Processor threads for replicating data from tables in the upstream TiDB. Because table is the minimum unit of data replication in TiCDC, a Processor is composed of multiple table pipelines.

Each pipeline contains the following components: Puller, Sorter, Mounter, and Sink.

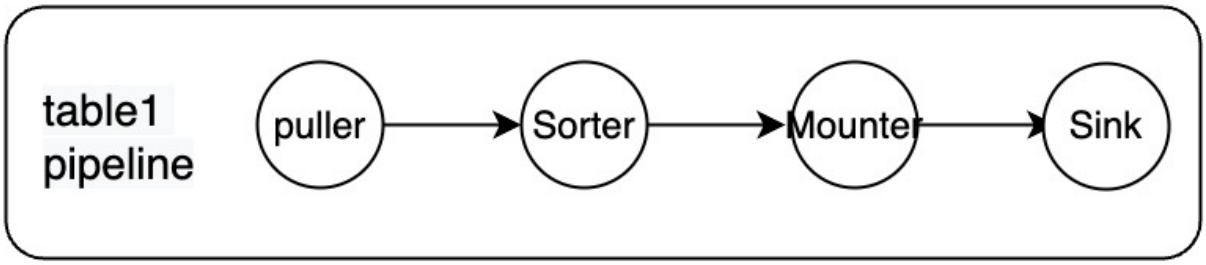

Figure 342: TiCDC architecture

These components work in serial with each other to complete the replication process, including pulling data, sorting data, loading data, and replicating data from the upstream to the downstream. The components are described as follows:

- Puller: pulls DDL and row changes from TiKV nodes.
- Sorter: sorts the changes received from TiKV nodes in ascending order of timestamps.
- Mounter: converts the changes into a format that TiCDC sink can process based on the schema information.
- Sink: replicates the changes to the downstream system.

To realize high availability, each TiCDC cluster runs multiple TiCDC nodes. These nodes regularly report their status to the etcd cluster in PD, and elect one of the nodes as the owner of the TiCDC cluster. The owner node schedules data based on the status stored in etcd and writes the scheduling results to etcd. The Processor completes tasks according to the status in etcd. If the node running the Processor fails, the cluster schedules tables to other nodes. If the owner node fails, the Capture processes in other nodes will elect a new owner. See the following figure:

*TiCDC architecture*

#### 13.9.4.3.3 Changefeeds and tasks

Changefeed and Task in TiCDC are two logical concepts. The specific description is as follows:

- Changefeed: Represents a replication task. It carries the information about the tables to be replicated and the downstream.
- Task: After TiCDC receives a replication task, it splits this task into several subtasks. Such a subtask is called Task. These Tasks are assigned to the Capture processes of the TiCDC nodes for processing.

For example:

```
cdc cli changefeed create --server="http://127.0.0.1:8300" --sink-uri="kafka
    ↪ ://127.0.0.1:9092/cdc-test?kafka-version=2.4.0&partition-num=6&max-
    ↪ message-bytes=67108864&replication-factor=1"
cat changefeed.toml
......
[sink]
dispatchers = [
    {matcher = ['test1.tab1', 'test2.tab2'], topic = "{schema}_{table}"},
    {matcher = ['test3.tab3', 'test4.tab4'], topic = "{schema}_{table}"},
]
```

For a detailed description of the parameters in the preceding `cdc cli changefeed create` command, see TiCDC Changefeed Configuration Parameters.

The preceding `cdc cli changefeed create` command creates a changefeed task that replicates `test1.tab1`, `test1.tab2`, `test3.tab3`, and `test4.tab4` to the Kafka cluster. The processing flow after TiCDC receives this command is as follows:

1. TiCDC sends this task to the owner Capture process.
2. The owner Capture process saves information about this changefeed task in etcd in PD.
3. The owner Capture process splits the changefeed task into several Tasks and notifies other Capture processes of the Tasks to be completed.
4. The Capture processes start pulling data from TiKV nodes, process the data, and complete replication.

The following is the TiCDC architecture diagram with Changefeed and Task included:

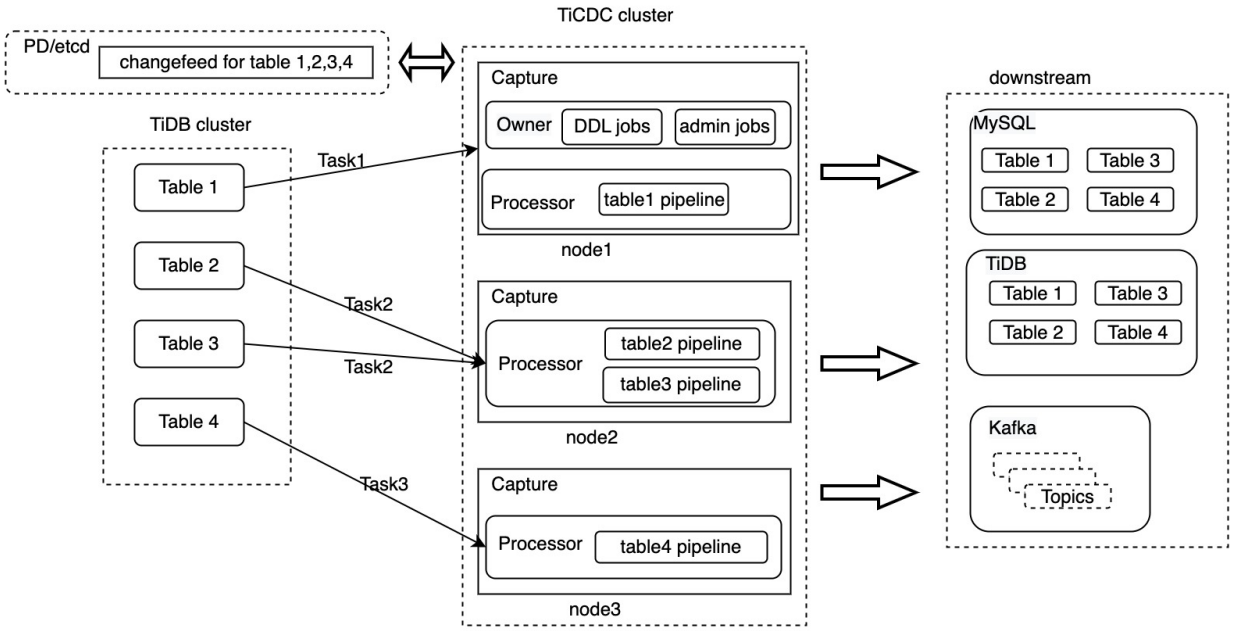

Figure 343: TiCDC architecture

In the preceding diagram, a changefeed is created to replicate four tables to downstream. This changefeed is split into three Tasks, which are sent to the three Capture processes respectively in the TiCDC cluster. After TiCDC processes the data, the data is replicated to the downstream system.

TiCDC supports replicating data to MySQL, TiDB, and Kafka databases. The preceding diagram only illustrates the process of data transfer at the changefeed level. The following sections describe in detail how TiCDC processes data, using Task1 that replicates table `table1` as an example.

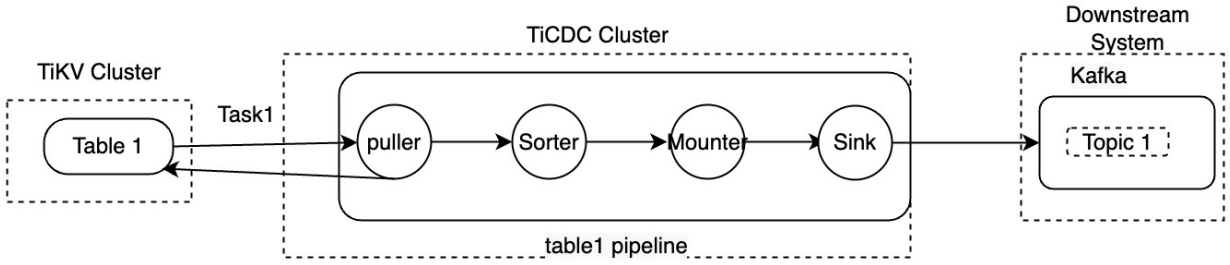

Figure 344: TiCDC architecture

1. Push data: When a data change occurs, TiKV pushes data to the Puller module.
2. Scan incremental data: The Puller module pulls data from TiKV when it finds the data changes received not continuous.

3. Sort data: The Sorter module sorts the data received from TiKV based on the timestamps and sends the sorted data to the Mounter module.
4. Mount data: After receiving the data changes, the Mounter module loads the data in a format that TiCDC sink can understand.
5. Replicate data: The Sink module replicates the data changes to the downstream.

The upstream of TiCDC is the distributed relational database TiDB that supports transactions. When TiCDC replicates data, it should ensure the consistency of data and that of transactions when replicating multiple tables, which is a great challenge. The following sections introduce the key technologies and concepts used by TiCDC to address this challenge.

#### 13.9.4.3.4 Key concepts of TiCDC

For the downstream relational databases, TiCDC ensures the consistency of transactions in a single table and eventual transaction consistency in multiple tables. In addition, TiCDC ensures that any data change that has occurred in the upstream TiDB cluster can be replicated to the downstream at least once.

Architecture-related concepts

- Capture: The process that runs the TiCDC node. Multiple Capture processes constitute a TiCDC cluster. Each Capture process is responsible for replicating data changes in TiKV, including receiving and actively pulling data changes, and replicating the data to the downstream.
- Capture Owner: The owner Capture among multiple Capture processes. Only one owner role exists in a TiCDC cluster at a time. The Capture Owner is responsible for scheduling data within the cluster.
- Processor: The logical thread inside Capture. Each Processor is responsible for processing the data of one or more tables in the same replication stream. A Capture node can run multiple Processors.
- Changefeed: A task that replicates data from an upstream TiDB cluster to a downstream system. A changefeed contains multiple Tasks, and each Task is processed by a Capture node.

Timestamp-related concepts

TiCDC introduces a series of timestamps (TS) to indicate the status of data replication. These timestamps are used to ensure that data is replicated to the downstream at least once and that the consistency of data is guaranteed.

ResolvedTS

This timestamp exists in both TiKV and TiCDC.

- ResolvedTS in TiKV: Represents the start time of the earliest transaction in a Region leader, that is, `ResolvedTS` = max(`ResolvedTS`, min(`StartTS`)). Because a TiDB

cluster contains multiple TiKV nodes, the minimum ResolvedTS of the Region leader on all TiKV nodes is called the global ResolvedTS. The TiDB cluster ensures that all transactions before the global ResolvedTS are committed. Alternatively, you can assume that there are no uncommitted transactions before this timestamp.

- ResolvedTS in TiCDC:
  - table ResolvedTS: Each table has a table-level ResolvedTS, which indicates all data changes in the table that are smaller than the Resolved TS have been received. To make it simple, this timestamp is the same as the minimum value of the ResolvedTS of all Regions corresponding to this table on the TiKV node.
  - global ResolvedTS: The minimum ResolvedTS of all Processors on all TiCDC nodes. Because each TiCDC node has one or more Processors, each Processor corresponds to multiple table pipelines.

  For TiCDC, the ResolvedTS sent by TiKV is a special event in the format of `<resolvedTS: timestamp>`. In general, the ResolvedTS satisfies the following constraints:

```
table ResolvedTS >= global ResolvedTS
```

CheckpointTS

This timestamp exists only in TiCDC. It means that the data changes that occur before this timestamp have been replicated to the downstream system.

- table CheckpointTS: Because TiCDC replicates data in tables, the table checkpointTS indicates all data changes that occur before CheckpointTS have been replicated at the table level.
- processor CheckpointTS: Indicates the minimum table CheckpointTS on a Processor.
- global CheckpointTS: Indicates the minimum CheckpointTS among all Processors.

Generally, a checkpointTS satisfies the following constraint:

```
table CheckpointTS >= global CheckpointTS
```

Because TiCDC only replicates data smaller than the global ResolvedTS to the downstream, the complete constraint is as follows:

```
table ResolvedTS >= global ResolvedTS >= table CheckpointTS >= global
    ↪ CheckpointTS
```

After data changes and transactions are committed, the ResolvedTS on the TiKV node will continue to advance, and the Puller module on the TiCDC node keeps receiving data pushed by TiKV. The Puller module also decides whether to scan incremental data based on

the data changes it has received, which ensures that all data changes are sent to the TiCDC node.

The Sorter module sorts data received by the Puller module in ascending order according to the timestamp. This process ensures data consistency at the table level. Next, the Mounter module assembles the data changes from the upstream into a format that the Sink module can consume, and sends it to the Sink module. The Sink module replicates the data changes between the CheckpointTS and the ResolvedTS to the downstream in the order of the timestamp, and advances the checkpointTS after the downstream receives the data changes.

The preceding sections only cover data changes of DML statements and do not include DDL statements. The following sections introduce the timestamp related to DDL statements.

Barrier TS

Barrier TS is generated when there are DDL change events or a Syncpoint is used.

- DDL change events: Barrier TS ensures that all changes before the DDL statement are replicated to the downstream. After this DDL statement is executed and replicated, TiCDC starts replicating other data changes. Because DDL statements are processed by the Capture Owner, the Barrier TS corresponding to a DDL statement is only generated by the owner node.
- Syncpoint: When you enable the Syncpoint feature of TiCDC, a Barrier TS is generated by TiCDC according to the `sync-point-interval` you specified. When all table changes before this Barrier TS are replicated, TiCDC inserts the current global CheckpointTS as the primary TS to the table recording tsMap in downstream. Then TiCDC continues data replication.

After a Barrier TS is generated, TiCDC ensures that only data changes that occur before this Barrier TS are replicated to downstream. Before these data changes are replicated to downstream, the replication task does not proceed. The owner TiCDC checks whether all target data has been replicated by continuously comparing the global CheckpointTS and the Barrier TS. If the global CheckpointTS equals to the Barrier TS, TiCDC continues replication after performing a designated operation (such as executing a DDL statement or recording the global CheckpointTS downstream). Otherwise, TiCDC waits for all data changes that occur before the Barrier TS to be replicated to the downstream.

#### 13.9.4.3.5 Major processes

This section describes the major processes of TiCDC to help you better understand its working principles.

Note that the following processes occur only within TiCDC and are transparent to users. Therefore, you do not need to care about which TiCDC node you are starting.

Start TiCDC

- For a TiCDC node that is not an owner, it works as follows:

    1. Starts the Capture process.
    2. Starts the Processor.
    3. Receives the Task scheduling command executed by the Owner.
    4. Starts or stops tablePipeline according to the scheduling command.

- For an owner TiCDC node, it works as follows:

    1. Starts the Capture process.
    2. The node is elected as the Owner and the corresponding thread is started.
    3. Reads the changefeed information.
    4. Starts the changefeed management process.
    5. Reads the schema information in TiKV according to the changefeed configuration and the latest CheckpointTS to determine the tables to be replicated.
    6. Reads the list of tables currently replicated by each Processor and distributes the tables to be added.
    7. Updates the replication progress.

Stop TiCDC

Usually, you stop a TiCDC node when you need to upgrade it or perform some planned maintenance operations. The process of stopping a TiCDC node is as follows:

1. The node receives the command to stop itself.
2. The node sets its service status to unavailable.
3. The node stops receiving new replication tasks.
4. The node notifies the Owner node to transfer its data replication tasks to other nodes.
5. The node stops after the replication tasks are transferred to other nodes.

#### 13.9.4.4 TiCDC Data Replication Capabilities

TiCDC (TiDB Change Data Capture) is a core component in the TiDB ecosystem for real-time data replication. This document provides a detailed explanation of TiCDC data replication capabilities.

##### 13.9.4.4.1 How TiCDC works

- TiCDC listens to TiKV change logs (Raft logs) and converts row-level data changes (`INSERT`, `UPDATE`, and `DELETE` operations) into downstream-compatible SQL statements. TiCDC does not rely on the original SQL statements executed on the upstream database. For details, see how TiCDC processes data changes.

- TiCDC generates logical operations (such as `INSERT`, `UPDATE`, and `DELETE`) equivalent to SQL semantics, rather than restoring the original SQL statements executed on the upstream database one by one. For details, see how TiCDC processes data changes.

- TiCDC ensures eventual consistency of transactions. With redo log enabled, TiCDC can guarantee eventual consistency in disaster recovery scenarios. With Syncpoint enabled, TiCDC supports consistent snapshot reads and data consistency validation.

#### 13.9.4.4.2 Supported downstream systems

TiCDC supports replicating data to various downstream systems, including the following:

- TiDB database or other MySQL-compatible databases
- Apache Kafka
- Storage services (Amazon S3, GCS, Azure Blob Storage, and NFS)
- Snowflake, ksqlDB, SQL Server via Confluent Cloud integration
- Apache Flink for consuming Kafka-replicated data

#### 13.9.4.4.3 Scope of data replication

TiCDC supports the following types of upstream data changes:

- **Supported:**
  - DDL and DML statements (excluding system tables).
  - Index operations (`ADD INDEX`, `CREATE INDEX`): to reduce the impact on changefeed replication latency, if the downstream is TiDB, TiCDC asynchronously executes the `ADD INDEX` and `CREATE INDEX` DDL operations.
  - Foreign key constraint DDL statements (`ADD FOREIGN KEY`): TiCDC does **not** replicate upstream system variable settings. You need to manually configure `foreign_key_checks` in the downstream to determine whether the downstream foreign key constraint check is enabled. Additionally, when writing data to the downstream, TiCDC automatically enables the session-level setting `SET SESSION foreign_key_checks = OFF;`. Therefore, even if global foreign key checks are enabled in the downstream, the data written by TiCDC will not trigger foreign key constraint validation.
- **Not supported**:
  - DDL and DML statements executed in upstream system tables (including `mysql.*` and `information_schema.*`).
  - DDL and DML statements executed in upstream temporary tables.
  - DQL (Data Query Language) and DCL (Data Control Language) statements.

#### 13.9.4.4.4 Limitations

- TiCDC does not support certain scenarios. For details, see unsupported scenarios.

- TiCDC only verifies the integrity of upstream data changes. It does not validate whether the changes conform to upstream or downstream constraints. If the data violates downstream constraints, TiCDC will return an error when writing to the downstream.

  For example: When a changefeed is configured to filter out all DDL events, if the upstream executes a `DROP COLUMN` operation but continues to write `INSERT` statements involving that column, TiCDC will fail to replicate these DML changes to the downstream because of table schema mismatches.

#### 13.9.4.5 TiCDC Server Configurations

This document describes the CLI and configuration file parameters used in TiCDC.

##### 13.9.4.5.1 `cdc server` CLI parameters

The following are descriptions of options available in a `cdc server` command:

- `addr`: The listening address of TiCDC, the HTTP API address, and the Prometheus address of the TiCDC service. The default value is `127.0.0.1:8300`.
- `advertise-addr`: The advertised address via which clients access TiCDC. If unspecified, the value is the same as that of `addr`.
- `pd`: A comma-separated list of PD endpoints.
- `config`: The address of the configuration file that TiCDC uses (optional). This option is supported since TiCDC v5.0.0. This option can be used in the TiCDC deployment since TiUP v1.4.0. For detailed configuration description, see TiCDC Changefeed Configurations
- `data-dir`: Specifies the directory that TiCDC uses when it needs to use disks to store files. The sort engine used by TiCDC and redo logs use this directory to store temporary files. It is recommended to ensure that the free disk space for this directory is greater than or equal to 500 GiB. If you are using TiUP, you can configure `data_dir` in the `cdc_servers` section, or directly use the default `data_dir` path in `global`.
- `gc-ttl`: The TTL (Time To Live) of the service level `GC safepoint` in PD set by TiCDC, and the duration that the replication task can suspend, in seconds. The default value is `86400`, which means 24 hours. Note: Suspending of the TiCDC replication task affects the progress of TiCDC GC safepoint, which means that it affects the progress of upstream TiDB GC, as detailed in Complete Behavior of TiCDC GC safepoint.
- `log-file`: The path to which logs are output when the TiCDC process is running. If this parameter is not specified, logs are written to the standard output (stdout).
- `log-level`: The log level when the TiCDC process is running. The default value is `"info"`.
- `ca`: Specifies the path of the CA certificate file in PEM format for TLS connection (optional).
- `cert`: Specifies the path of the certificate file in PEM format for TLS connection (optional).

- `cert-allowed-cn`: Specifies the path of the common name in PEM format for TLS connection (optional).
- `key`: Specifies the path of the private key file in PEM format for TLS connection (optional).
- `tz`: Time zone used by the TiCDC service. TiCDC uses this time zone when it internally converts time data types such as `TIMESTAMP` or when it replicates data to the downstream. The default is the local time zone in which the process runs. If you specify `time-zone` (in `sink-uri`) and `tz` at the same time, the internal TiCDC processes use the time zone specified by `tz`, and the sink uses the time zone specified by `time-zone` for replicating data to the downstream. Make sure that the time zone specified by `tz` is the same as that specified by `time-zone` (in `sink-uri`).
- `cluster-id`: (optional) The ID of the TiCDC cluster. The default value is `default`. `cluster-id` is the unique identifier of a TiCDC cluster. TiCDC nodes with the same `cluster-id` belong to the same cluster. The length of a `cluster-id` is 128 characters at most. `cluster-id` must follow the pattern of `^[a-zA-Z0-9]+(-[a-zA-Z0-9]+)*$` and cannot be one of the following: `owner`, `capture`, `task`, `changefeed`, `job`, and `meta`.

#### 13.9.4.5.2 `cdc server` configuration file parameters

The following describes the configuration file specified by the `config` option in the `cdc server` command:

```
#### The configuration method of the following parameters is the same as
   ↪ that of CLI parameters, but the CLI parameters have higher priorities
   ↪ .
addr = "127.0.0.1:8300"
advertise-addr = ""
log-file = ""
log-level = "info"
data-dir = ""
gc-ttl = 86400 # 24 h
tz = "System"
cluster-id = "default"
#### This parameter specifies the maximum memory threshold (in bytes) for
   ↪ tuning GOGC: Setting a smaller threshold increases the GC frequency.
   ↪ Setting a larger threshold reduces GC frequency and consumes more
   ↪ memory resources for the TiCDC process. Once the memory usage exceeds
   ↪  this threshold, GOGC Tuner stops working. The default value is 0,
   ↪ indicating that GOGC Tuner is disabled.
gc-tuner-memory-threshold = 0

[security]
  ca-path = ""
  cert-path = ""
  key-path = ""
```

```
#### The session duration between TiCDC and etcd services, measured in
   ↪ seconds. This parameter is optional and its default value is 10.
capture-session-ttl = 10 # 10s

#### The interval at which the Owner module in the TiCDC cluster attempts to
   ↪  push the replication progress. This parameter is optional and its
   ↪ default value is `50000000` nanoseconds (that is, 50 milliseconds).
   ↪ You can configure this parameter in two ways: specifying only the
   ↪ number (for example, configuring it as `40000000` represents 40000000
   ↪  nanoseconds, which is 40 milliseconds), or specifying both the
   ↪ number and unit (for example, directly configuring it as `40ms`).
owner-flush-interval = 50000000 # 50 ms

#### The interval at which the Processor module in the TiCDC cluster
   ↪ attempts to push the replication progress. This parameter is optional
   ↪  and its default value is `50000000` nanoseconds (that is, 50
   ↪ milliseconds). The configuration method of this parameter is the same
   ↪  as that of `owner-flush-interval`.
processor-flush-interval = 50000000 # 50 ms

#### [log]
#### # The output location for internal error logs of the zap log module.
   ↪ This parameter is optional and its default value is "stderr".
####  error-output = "stderr"
####  [log.file]
####    # The maximum size of a single log file, measured in MiB. This
   ↪ parameter is optional and its default value is 300.
####    max-size = 300 # 300 MiB
####    # The maximum number of days to retain log files. This parameter is
   ↪ optional and its default value is `0`, indicating never to delete.
####    max-days = 0
####    # The number of log files to retain. This parameter is optional and
   ↪ its default value is `0`, indicating to keep all log files.
####    max-backups = 0

#### [sorter]
#### The size of the shared pebble block cache in the Sorter module for the
   ↪ 8 pebble DBs started by default, measured in MiB. The default value
   ↪ is 128.
#### cache-size-in-mb = 128
#### The directory where sorter files are stored relative to the data
   ↪ directory (`data-dir`). This parameter is optional and its default
   ↪ value is "/tmp/sorter".
#### sorter-dir = "/tmp/sorter"
```

```
#### [kv-client]
####  The number of threads that can be used in a single Region worker.
   ↪ This parameter is optional and its default value is 8.
####  worker-concurrent = 8
####  The number of threads in the shared thread pool of TiCDC, mainly used
   ↪  for processing KV events. This parameter is optional and its default
   ↪  value is 0, indicating that the default pool size is twice the
   ↪ number of CPU cores.
####  worker-pool-size = 0
####  The retry duration of Region connections. This parameter is optional
   ↪ and its default value is `60000000000` nanoseconds (that is, 1 minute
   ↪ ). You can configure this parameter in two ways: specifying only the
   ↪ number (for example, configuring it as `50000000` represents 50000000
   ↪  nanoseconds, which is 50 milliseconds), or specifying both the
   ↪ number and unit (for example, directly configuring it as `50ms`).
####  region-retry-duration = 60000000000
```

#### 13.9.4.6 CLI and Configuration Parameters of TiCDC Changefeeds

##### 13.9.4.6.1 Changefeed CLI parameters

This section introduces the command-line parameters of TiCDC changefeeds by illustrating how to create a replication (changefeed) task:

```
cdc cli changefeed create --server=http://10.0.10.25:8300 --sink-uri="mysql
   ↪ ://root:123456@127.0.0.1:3306/" --changefeed-id="simple-replication-
   ↪ task"
```

```
Create changefeed successfully!
ID: simple-replication-task
Info: {"upstream_id":7178706266519722477,"namespace":"default","id":"simple-
   ↪ replication-task","sink_uri":"mysql://root:xxxxx@127.0.0.1:4000/?time
   ↪ -zone=","create_time":"2025-02-27T15:05:46.679218+08:00","start_ts
   ↪ ":438156275634929669,"engine":"unified","config":{"case_sensitive":
   ↪ false,"enable_old_value":true,"force_replicate":false,"
   ↪ ignore_ineligible_table":false,"check_gc_safe_point":true,"
   ↪ enable_sync_point":true,"bdr_mode":false,"sync_point_interval
   ↪ ":30000000000,"sync_point_retention":3600000000000,"filter":{"rules
   ↪ ":["test.*"],"event_filters":null},"mounter":{"worker_num":16},"sink
   ↪ ":{"protocol":"","schema_registry":"","csv":{"delimiter":",","quote
   ↪ ":"\"","null":"\\N","include_commit_ts":false},"column_selectors":
   ↪ null,"transaction_atomicity":"none","encoder_concurrency":16,"
   ↪ terminator":"\r\n","date_separator":"none","
```

```
    ↪ enable_partition_separator":false},"consistent":{"level":"none","
    ↪ max_log_size":64,"flush_interval":2000,"storage":""}},"state":"normal
    ↪ ","creator_version":"v6.5.12"}
```

- `--changefeed-id`: The ID of the replication task. The format must match the `^[ ↪ a-zA-Z0-9]+(\-[a-zA-Z0-9]+)*$` regular expression. If this ID is not specified, TiCDC automatically generates a UUID (the version 4 format) as the ID.
- `--sink-uri`: The downstream address of the replication task. Configure `--sink-uri` according to the following format. Currently, the scheme supports `mysql`, `tidb`, and `kafka`.

  ```
  [scheme]://[userinfo@][host]:[port][/path]?[query_parameters]
  ```

  When the sink URI contains special characters such as `! * ' ( ) ; : @ & = + $ ↪ , / ? % # [ ]`, you need to escape the special characters, for example, in URI Encoder.
- `--start-ts`: Specifies the starting TSO of the changefeed. From this TSO, the TiCDC cluster starts pulling data. The default value is the current time.
- `--target-ts`: Specifies the ending TSO of the changefeed. To this TSO, the TiCDC cluster stops pulling data. The default value is empty, which means that TiCDC does not automatically stop pulling data.
- `--config`: Specifies the configuration file of the changefeed.

#### 13.9.4.6.2 Changefeed configuration parameters

This section introduces the configuration of a replication task.

```
#### Specifies the memory quota (in bytes) that can be used in the capture
    ↪ server by the sink manager.
#### If the value is exceeded, the overused part will be recycled by the go
    ↪ runtime.
#### The default value is `1073741824` (1 GB).
#### memory-quota = 1073741824

#### Specifies whether the database names and tables in the configuration
    ↪ file are case-sensitive.
#### Starting from v6.5.6, the default value changes from true to false.
#### This configuration item affects configurations related to filter and
    ↪ sink.
case-sensitive = false

#### Specifies whether to output the old value. New in v4.0.5. Since v5.0,
    ↪ the default value is `true`.
```

```
enable-old-value = true

#### Specifies whether to enable the Syncpoint feature, which is supported
    ↪ since v6.3.0 and is disabled by default.
#### Since v6.4.0, only the changefeed with the SYSTEM_VARIABLES_ADMIN or
    ↪ SUPER privilege can use the TiCDC Syncpoint feature.
#### Note: This configuration item only takes effect if the downstream is
    ↪ TiDB.
#### enable-sync-point = false

#### Specifies the interval at which Syncpoint aligns the upstream and
    ↪ downstream snapshots.
#### The format is in h m s. For example, "1h30m30s".
#### The default value is "10m" and the minimum value is "30s".
#### Note: This configuration item only takes effect if the downstream is
    ↪ TiDB.
#### sync-point-interval = "5m"

#### Specifies how long the data is retained by Syncpoint in the downstream
    ↪ table. When this duration is exceeded, the data is cleaned up.
#### The format is in h m s. For example, "24h30m30s".
#### The default value is "24h".
#### Note: This configuration item only takes effect if the downstream is
    ↪ TiDB.
#### sync-point-retention = "1h"

#### Starting from v6.5.6, this configuration item specifies the SQL mode
    ↪ used when parsing DDL statements. Multiple modes are separated by
    ↪ commas.
#### The default value is the same as the default SQL mode of TiDB.
#### sql-mode = "ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,
    ↪ NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,
    ↪ NO_ENGINE_SUBSTITUTION"

#### The default value is false, indicating that the cluster is not in BDR
    ↪ mode.
#### If you want to build a BDR cluster using TiCDC, set this parameter to
    ↪ true and set the TiDB cluster to BDR mode.
#### For details, see https://docs.pingcap.com/tidb/v6.5/ticdc-bidirectional
    ↪ -replication
#### bdr-mode = false

#### Introduced in v6.5.6. The duration for which the changefeed is allowed
    ↪ to automatically retry when internal errors or exceptions occur. The
    ↪ default value is 30 minutes.
```

```
#### The changefeed enters the failed state if internal errors or exceptions
    ↪  occur in the changefeed and persist longer than the duration set by
    ↪ this parameter.
#### When the changefeed is in the failed state, you need to restart the
    ↪ changefeed manually for recovery.
#### The format of this parameter is "h m s", for example, "1h30m30s".
changefeed-error-stuck-duration = "30m"

[mounter]
#### The number of threads with which the mounter decodes KV data. The
    ↪ default value is 16.
#### worker-num = 16

[filter]
#### Ignores the transaction of specified start_ts.
#### ignore-txn-start-ts = [1, 2]

#### Filter rules.
#### Filter syntax: <https://docs.pingcap.com/tidb/stable/table-filter#
    ↪ syntax>.
#### The following rule replicates data from all databases except the `test`
    ↪  database.
rules = ['*.*', '!test.*']

#### Event filter rules.
#### The detailed syntax is described in <https://docs.pingcap.com/tidb/
    ↪ stable/ticdc-filter>
#### The first event filter rule.
#### [[filter.event-filters]]
#### matcher = ["test.worker"] # matcher is an allow list, which means this
    ↪ rule only applies to the worker table in the test database.
#### ignore-event = ["insert"] # Ignore insert events.
#### ignore-sql = ["^drop", "add column"] # Ignore DDLs that start with "
    ↪ drop" or contain "add column".
#### ignore-delete-value-expr = "name = 'john'" # Ignore delete DMLs that
    ↪ contain the condition "name = 'john'".
#### ignore-insert-value-expr = "id >= 100" # Ignore insert DMLs that
    ↪ contain the condition "id >= 100".
#### ignore-update-old-value-expr = "age < 18" # Ignore update DMLs whose
    ↪ old value contains "age < 18".
#### ignore-update-new-value-expr = "gender = 'male'" # Ignore update DMLs
    ↪ whose new value contains "gender = 'male'".

#### The second event filter rule.
#### matcher = ["test.fruit"] # matcher is an allow list, which means this
```

```
   ↪ rule only applies to the fruit table in the test database.
#### ignore-event = ["drop table", "delete"] # Ignore the `drop table` DDL
   ↪ events and the `delete` DML events. Note that when a value in the
   ↪ clustered index column is updated in TiDB, TiCDC splits an `UPDATE`
   ↪ event into `DELETE` and `INSERT` events. TiCDC cannot identify such
   ↪ events as `UPDATE` events and thus cannot correctly filter out such
   ↪ events.
#### ignore-sql = ["^drop table", "alter table"] # Ignore DDL statements
   ↪ that start with `drop table` or contain `alter table`.
#### ignore-insert-value-expr = "price > 1000 and origin = 'no where'" #
   ↪ Ignore insert DMLs that contain the conditions "price > 1000" and "
   ↪ origin = 'no where'".

[sink]
#### For the sink of MQ type, you can use dispatchers to configure the event
   ↪  dispatcher.
#### Since v6.1.0, TiDB supports two types of event dispatchers: partition
   ↪ and topic. For more information, see <partition and topic link>.
#### The matching syntax of matcher is the same as the filter rule syntax.
   ↪ For details about the matcher rules, see <>.
#### Note: This configuration item only takes effect if the downstream is MQ
   ↪ .
#### dispatchers = [
####    {matcher = ['test1.*', 'test2.*'], topic = "Topic expression 1",
   ↪ partition = "ts" },
####    {matcher = ['test3.*', 'test4.*'], topic = "Topic expression 2",
   ↪ partition = "index-value" },
####    {matcher = ['test1.*', 'test5.*'], topic = "Topic expression 3",
   ↪ partition = "table"},
####    {matcher = ['test6.*'], partition = "ts"}
#### ]

#### The protocol configuration item specifies the protocol format of the
   ↪ messages sent to the downstream.
#### When the downstream is Kafka, the protocol can only be canal-json or
   ↪ avro.
#### When the downstream is a storage service, the protocol can only be
   ↪ canal-json or csv.
#### Note: This configuration item only takes effect if the downstream is
   ↪ Kafka or a storage service.
#### protocol = "canal-json"

#### The following three configuration items are only used when you
   ↪ replicate data to storage sinks and can be ignored when replicating
   ↪ data to MQ or MySQL sinks.
```

```
#### Row terminator, used for separating two data change events. The default
    ↪  value is an empty string, which means "\r\n" is used.
#### terminator = ''
#### Date separator type used in the file directory. Value options are `none
    ↪ `, `year`, `month`, and `day`. For TiDB v6.5.0 ~ v6.5.2, `none` is
    ↪ the default value and means that the date is not separated. For v6
    ↪ .5.3 and later v6.5.x versions, `day` is the default value and means
    ↪ separating files by day. For more information, see <https://docs.
    ↪ pingcap.com/tidb/v6.5/ticdc-sink-to-cloud-storage#data-change-records
    ↪ >.
#### Note: This configuration item only takes effect if the downstream is a
    ↪ storage service.
date-separator = 'day'
#### Whether to use partitions as the separation string. The default value
    ↪ is true, which means that partitions in a table are stored in
    ↪ separate directories. It is recommended that you keep the value as `
    ↪ true` to avoid potential data loss in downstream partitioned tables <
    ↪ https://github.com/pingcap/tiflow/issues/8724>. For usage examples,
    ↪ see <https://docs.pingcap.com/tidb/dev/ticdc-sink-to-cloud-storage#
    ↪ data-change-records)>.
#### Note: This configuration item only takes effect if the downstream is a
    ↪ storage service.
enable-partition-separator = false

#### Schema registry URL.
#### Note: This configuration item only takes effect if the downstream is MQ
    ↪ .
#### schema-registry = "http://localhost:80801/subjects/{subject-name}/
    ↪ versions/{version-number}/schema"

#### Specifies the number of encoder threads used when encoding data.
#### Note: This configuration item only takes effect if the downstream is MQ
    ↪ .
#### The default value is 16.
#### encoder-concurrency = 16

#### Specifies whether to enable kafka-sink-v2 that uses the kafka-go sink
    ↪ library.
#### Note: This configuration item only takes effect if the downstream is MQ
    ↪ .
#### The default value is false.
#### enable-kafka-sink-v2 = false

#### Since v6.5.0, TiCDC supports saving data changes to storage services in
    ↪  CSV format. Ignore the following configurations if you replicate
```

```
   ↪ data to MQ or MySQL sinks.
#### [sink.csv]
#### The character used to separate fields in the CSV file. The value must
   ↪ be an ASCII character and defaults to `,`.
#### delimiter = ','
#### The quotation character used to surround fields in the CSV file. The
   ↪ default value is `"`. If the value is empty, no quotation is used.
#### quote = '"'
#### The character displayed when a CSV column is null. The default value is
   ↪  `\N`.
#### null = '\N'
#### Whether to include commit-ts in CSV rows. The default value is false.
#### include-commit-ts = false
#### The encoding method of binary data, which can be 'base64' or 'hex'. The
   ↪  default value is 'base64'.
#### binary-encoding-method = 'base64' (new in v6.5.4)

#### Specifies the replication consistency configurations for a changefeed
   ↪ when using the redo log. For more information, see https://docs.
   ↪ pingcap.com/tidb/stable/ticdc-sink-to-mysql#eventually-consistent-
   ↪ replication-in-disaster-scenarios.
#### Note: The consistency-related configuration items only take effect when
   ↪  the downstream is a database and the redo log feature is enabled.
[consistent]
#### The data consistency level. Available options are "none" and "eventual
   ↪ ". "none" means that the redo log is disabled.
#### The default value is "none".
level = "none"
#### The max redo log size in MB.
#### The default value is 64.
max-log-size = 64
#### The flush interval for redo log. The default value is 2000 milliseconds
   ↪ .
flush-interval = 2000
#### The storage URI of the redo log.
#### The default value is empty.
storage = ""
#### Specifies whether to store the redo log in a local file.
#### The default value is false.
use-file-backend = false
#### The number of encoding and decoding workers in the redo module.
#### The default value is 16.
encoding-worker-num = 16
#### The number of flushing workers in the redo module.
#### The default value is 8.
```

```
flush-worker-num = 8
#### The behavior to compress redo log files (introduced in v6.5.6).
#### Available options are "" and "lz4". The default value is "", which
    ↪ means no compression.
compression = ""
#### The concurrency for uploading a single redo file (introduced in v6.5.6)
    ↪ .
#### The default value is 1, which means concurrency is disabled.
flush-concurrency = 1

#### The following configuration items only take effect when the downstream
    ↪ is Kafka. Supported starting from v6.5.3.
[sink.kafka-config]
#### The mechanism of Kafka SASL authentication. The default value is empty,
    ↪  indicating that SASL authentication is not used.
sasl-mechanism = "OAUTHBEARER"
#### The client-id in the Kafka SASL OAUTHBEARER authentication. The default
    ↪  value is empty. This parameter is required when the OAUTHBEARER
    ↪ authentication is used.
sasl-oauth-client-id = "producer-kafka"
#### The client-secret in the Kafka SASL OAUTHBEARER authentication. The
    ↪ default value is empty. This parameter is required when the
    ↪ OAUTHBEARER authentication is used.
sasl-oauth-client-secret = "cHJvZHVjZXIta2Fma2E="
#### The token-url in the Kafka SASL OAUTHBEARER authentication to obtain
    ↪ the token. The default value is empty. This parameter is required
    ↪ when the OAUTHBEARER authentication is used.
sasl-oauth-token-url = "http://127.0.0.1:4444/oauth2/token"
#### The scopes in the Kafka SASL OAUTHBEARER authentication. The default
    ↪ value is empty. This parameter is optional when the OAUTHBEARER
    ↪ authentication is used.
sasl-oauth-scopes = ["producer.kafka", "consumer.kafka"]
#### The grant-type in the Kafka SASL OAUTHBEARER authentication. The
    ↪ default value is "client_credentials". This parameter is optional
    ↪ when the OAUTHBEARER authentication is used.
sasl-oauth-grant-type = "client_credentials"
#### The audience in the Kafka SASL OAUTHBEARER authentication. The default
    ↪ value is empty. This parameter is optional when the OAUTHBEARER
    ↪ authentication is used.
sasl-oauth-audience = "kafka"

#### The following configuration item controls whether to output the
    ↪ original data change event. The default value is false, which means
    ↪ that for a non-MySQL sink when the primary key or the non-null unique
    ↪  key is changed in an `UPDATE` event, TiCDC splits the event into two
```

```
    ↪  events, `DELETE` and `INSERT`, and ensures that all events are
    ↪ sorted in the order in which the `DELETE` event precedes the `INSERT`
    ↪  event. Setting it to true means that the original event is output
    ↪ directly without splitting.
#### output-raw-change-event = false

[sink.cloud-storage-config]
#### The concurrency for saving data changes to the downstream cloud storage
    ↪ .
#### The default value is 16.
worker-count = 16
#### The interval for saving data changes to the downstream cloud storage.
#### The default value is "2s".
flush-interval = "2s"
#### A data change file is saved to the cloud storage when the number of
    ↪ bytes in this file exceeds `file-size`.
#### The default value is 67108864 (this is, 64 MiB).
file-size = 67108864
#### The duration to retain files, which takes effect only when `date-
    ↪ separator` is configured as `day`. Assume that `file-expiration-days
    ↪ = 1` and `file-cleanup-cron-spec = "0 0 0 * * *"`, then TiCDC
    ↪ performs daily cleanup at 00:00:00 for files saved beyond 24 hours.
    ↪ For example, at 00:00:00 on 2023/12/02, TiCDC cleans up files
    ↪ generated before 2023/12/01, while files generated on 2023/12/01
    ↪ remain unaffected.
#### The default value is 0, which means file cleanup is disabled.
file-expiration-days = 0
#### The running cycle of the scheduled cleanup task, compatible with the
    ↪ crontab configuration, with a format of `<Second> <Minute> <Hour> <
    ↪ Day of the month> <Month> <Day of the week (Optional)>`
#### The default value is "0 0 2 * * *", which means that the cleanup task
    ↪ is executed every day at 2 AM.
file-cleanup-cron-spec = "0 0 2 * * *"
#### The concurrency for uploading a single file.
#### The default value is 1, which means concurrency is disabled.
flush-concurrency = 1
#### The following configuration item controls whether to output the
    ↪ original data change event. The default value is false, which means
    ↪ that for a non-MySQL sink when the primary key or the non-null unique
    ↪  key is changed in an `UPDATE` event, TiCDC splits the event into two
    ↪  events, `DELETE` and `INSERT`, and ensures that all events are
    ↪ sorted in the order in which the `DELETE` event precedes the `INSERT`
    ↪  event. Setting it to true means that the original event is output
    ↪ directly without splitting.
output-raw-change-event = false
```

#### 13.9.4.7 Output Protocols

##### 13.9.4.7.1 TiCDC Avro Protocol

Avro is a data exchange format protocol defined by Apache Avro™ and chosen by Confluent Platform as the default data exchange format. This document describes the implementation of the Avro data format in TiCDC, including TiDB extension fields, definition of the Avro data format, and the interaction between Avro and Confluent Schema Registry.

> **Warning:**
>
> When the Old Value feature is enabled (`enable-old-value = true`), the Avro data format cannot output the old value of change events.
>
> For more information, see What changes occur to the change event format when TiCDC enables the Old Value feature?.

Use Avro

When using Message Queue (MQ) as a downstream sink, you can specify Avro in `sink-uri`. TiCDC captures TiDB DML events, creates Avro messages from these events, and sends the messages downstream. When Avro detects a schema change, it registers the latest schema with Schema Registry.

The following is a configuration example using Avro:

```
cdc cli changefeed create --server=http://127.0.0.1:8300 --changefeed-id="
    ↪ kafka-avro" --sink-uri="kafka://127.0.0.1:9092/topic-name?protocol=
    ↪ avro" --schema-registry=http://127.0.0.1:8081 --config
    ↪ changefeed_config.toml
```

```
[sink]
dispatchers = [
 {matcher = ['*.*'], topic = "tidb_{schema}_{table}"},
]
```

The value of `--schema-registry` supports the `https` protocol and `username:password` authentication, for example, `--schema-registry=https://username:password@schema-registry-uri.com`. The username and password must be URL-encoded.

TiDB extension fields

By default, Avro only collects data of changed rows in DML events and does not collect the type of data changes or TiDB-specific CommitTS (the unique identifiers of transactions).

To address this issue, TiCDC introduces the following three TiDB extension fields to the Avro protocol message. When `enable-tidb-extension` is set to `true` (`false` by default) in `sink-uri`, TiCDC adds these three fields to the Avro messages during message generation.

- `_tidb_op`: The DML type. "c" indicates insert and "u" indicates updates.
- `_tidb_commit_ts`: The unique identifier of a transaction.
- `_tidb_commit_physical_time`: The physical timestamp in a transaction identifier.

The following is a configuration example:

```
cdc cli changefeed create --server=http://127.0.0.1:8300 --changefeed-id="
    ↪ kafka-avro-enable-extension" --sink-uri="kafka://127.0.0.1:9092/topic
    ↪ -name?protocol=avro&enable-tidb-extension=true" --schema-registry=
    ↪ http://127.0.0.1:8081 --config changefeed_config.toml
```

```
[sink]
dispatchers = [
 {matcher = ['*.*'], topic = "tidb_{schema}_{table}"},
]
```

Definition of the data format

TiCDC converts a DML event into a Kafka event, and the Key and Value of an event are encoded according to the Avro protocol.

Key data format

```
{
    "name":"{{TableName}}",
    "namespace":"{{Namespace}}",
    "type":"record",
    "fields":[
        {{ColumnValueBlock}},
        {{ColumnValueBlock}},
    ]
}
```

- `{{TableName}}` indicates the name of the table where the event occurs.
- `{{Namespace}}` is the namespace of Avro.
- `{{ColumnValueBlock}}` defines the format of each column of data.

The `fields` in the key contains only primary key columns or unique index columns.

Value data format

```
{
    "name":"{{TableName}}",
    "namespace":"{{Namespace}}",
    "type":"record",
    "fields":[
        {{ColumnValueBlock}},
        {{ColumnValueBlock}},
    ]
}
```

The data format of Value is the same as that of Key, by default. However, `fields` in the Value contains all columns, not just the primary key columns.

**Note:**

The Avro protocol encodes DML events as follows:

- For Delete events, Avro only encodes the Key part. The Value part is empty.
- For Insert events, Avro encodes all column data to the Value part.
- For Update events, Avro encodes only all column data that is updated to the Value part.

The Avro protocol does not encode the old values for Update and Delete events. Additionally, to be compatible with most Confluent sink connectors that rely on `null` records to identify deletions (`delete.on.null`), Delete events do not include extension information, such as `_tidb_commit_ts`, even when `enable-tidb-extension` is enabled. If you need these features, consider using other protocols such as Canal-JSON or Debezium.

After you enable `enable-tidb-extension`, the data format of the Value will be as follows:

```
{
    "name":"{{TableName}}",
    "namespace":"{{Namespace}}",
    "type":"record",
    "fields":[
        {{ColumnValueBlock}},
        {{ColumnValueBlock}},
        {
            "name":"_tidb_op",
```

```
            "type":"string"
        },
        {
            "name":"_tidb_commit_ts",
            "type":"long"
        },
        {
            "name":"_tidb_commit_physical_time",
            "type":"long"
        }
    ]
}
```

Compared with the Value data format with `enable-tidb-extension` disabled, three new fields are added: `_tidb_op`, `_tidb_commit_ts`, and `_tidb_commit_physical_time`.

Column data format

The Column data is the `{{ColumnValueBlock}}` part of the Key/Value data format. TiCDC generates the Column data format based on the SQL Type. The basic Column data format is as follows:

```
{
    "name":"{{ColumnName}}",
    "type":{
        "connect.parameters":{
            "tidb_type":"{{TIDB_TYPE}}"
        },
        "type":"{{AVRO_TYPE}}"
    }
}
```

If one column can be NULL, the Column data format can be:

```
{
    "default":null,
    "name":"{{ColumnName}}",
    "type":[
        "null",
        {
            "connect.parameters":{
                "tidb_type":"{{TIDB_TYPE}}"
            },
            "type":"{{AVRO_TYPE}}"
        }
    ]
}
```

- `{{ColumnName}}` indicates the column name.
- `{{TIDB_TYPE}}` indicates the type in TiDB, which is not a one-to-one mapping with the SQL type.
- `{{AVRO_TYPE}}` indicates the type in avro spec.

| SQL TYPE | TIDB_TYPE | AVRO_TYPE | Description |
|---|---|---|---|
| BOOL | INT | int | |
| TINYINT | INT | int | When it is unsigned, TIDB_TYPE is INT UNSIGNED. |
| SMALLINT | INT | int | When it is unsigned, TIDB_TYPE is INT UNSIGNED. |
| MEDIUMINT | INT | int | When it is unsigned, TIDB_TYPE is INT UNSIGNED. |
| INT | INT | int | When it is unsigned, TIDB_TYPE is INT UNSIGNED and AVRO_TYPE is long. |
| BIGINT | BIGINT | long | When it is unsigned, TIDB_TYPE is BIGINT UNSIGNED. If `avro-bigint-unsigned-handling-mode` is string, AVRO_TYPE is string. |
| TINYBLOB | BLOB | bytes | - |
| BLOB | BLOB | bytes | - |
| MEDIUMBLOB | BLOB | bytes | - |
| LONGBLOB | BLOB | bytes | - |
| BINARY | BLOB | bytes | - |
| VARBINARY | BLOB | bytes | - |
| TINYTEXT | TEXT | string | - |
| TEXT | TEXT | string | - |
| MEDIUMTEXT | TEXT | string | - |
| LONGTEXT | TEXT | string | - |
| CHAR | TEXT | string | - |
| VARCHAR | TEXT | string | - |
| FLOAT | FLOAT | double | - |
| DOUBLE | DOUBLE | double | - |
| DATE | DATE | string | - |
| DATETIME | DATETIME | string | - |
| TIMESTAMP | TIMESTAMP | string | - |
| TIME | TIME | string | - |
| YEAR | YEAR | int | - |
| BIT | BIT | bytes | - |
| JSON | JSON | string | - |
| ENUM | ENUM | string | - |
| SET | SET | string | - |
| DECIMAL | DECIMAL | bytes | When `avro-decimal-handling-mode` is string, AVRO_TYPE is string. |

In the Avro protocol, two other `sink-uri` parameters might affect the Column data for-

mat as well: `avro-decimal-handling-mode` and `avro-bigint-unsigned-handling-mode`.

- `avro-decimal-handling-mode` controls how Avro handles decimal fields, including:
  - string: Avro handles decimal fields as strings.
  - precise: Avro handles decimal fields as bytes.
- `avro-bigint-unsigned-handling-mode` controls how Avro handles BIGINT UNSIGNED fields, including:
  - string: Avro handles BIGINT UNSIGNED fields as strings.
  - long: Avro handles BIGINT UNSIGNED fields as 64-bit signed integers. When the value is greater than 9223372036854775807, overflow will occur.

The following is a configuration example:

```
cdc cli changefeed create --server=http://127.0.0.1:8300 --changefeed-id="
    ↪ kafka-avro-string-option" --sink-uri="kafka://127.0.0.1:9092/topic-
    ↪ name?protocol=avro&avro-decimal-handling-mode=string&avro-bigint-
    ↪ unsigned-handling-mode=string" --schema-registry=http
    ↪ ://127.0.0.1:8081 --config changefeed_config.toml
```

```
[sink]
dispatchers = [
 {matcher = ['*.*'], topic = "tidb_{schema}_{table}"},
]
```

Most SQL types are mapped to the base Column data format. Some other SQL types extend the base data format to provide more information.

BIT(64)

```
{
    "name":"{{ColumnName}}",
    "type":{
        "connect.parameters":{
            "tidb_type":"BIT",
            "length":"64"
        },
        "type":"bytes"
    }
}
```

ENUM/SET(a,b,c)

```
{
    "name":"{{ColumnName}}",
    "type":{
        "connect.parameters":{
            "tidb_type":"ENUM/SET",
            "allowed":"a,b,c"
        },
        "type":"string"
    }
}
```

DECIMAL(10, 4)

```
{
    "name":"{{ColumnName}}",
    "type":{
        "connect.parameters":{
            "tidb_type":"DECIMAL",
        },
        "logicalType":"decimal",
        "precision":10,
        "scale":4,
        "type":"bytes"
    }
}
```

DDL events and schema changes

Avro does not generate DDL events downstream. It checks whether a schema changes each time a DML event occurs. If a schema changes, Avro generates a new schema and registers it with the Schema Registry. If the schema change does not pass the compatibility check, the registration fails. TiCDC does not resolve any schema compatibility issues.

Note that, even if a schema change passes the compatibility check and a new version is registered, the data producers and consumers still need to perform an upgrade to ensure normal running of the system.

Assume that the default compatibility policy of Confluent Schema Registry is `BACKWARD` and add a non-empty column to the source table. In this situation, Avro generates a new schema but fails to register it with Schema Registry due to compatibility issues. At this time, the changefeed enters an error state.

For more information about schemas, refer to Schema Registry related documents.

Topic distribution

Schema Registry supports three Subject Name Strategies: TopicNameStrategy, RecordNameStrategy, and TopicRecordNameStrategy. Currently, TiCDC Avro only supports TopicNameStrategy, which means that a Kafka topic can only receive data in one data format.

Therefore, TiCDC Avro prohibits mapping multiple tables to the same topic. When you create a changefeed, an error will be reported if the topic rule does not include the `{schema}` and `{table}` placeholders in the configured distribution rule.

Compatibility

When upgrading the TiCDC cluster to v6.5.2 or a later v6.5.x version, if a table replicated using Avro contains the `FLOAT` data type, you need to manually adjust the compatibility policy of Confluent Schema Registry to `None` before upgrading so that the changefeed can successfully update the schema. Otherwise, after upgrading, the changefeed will be unable to update the schema and enter an error state. For more information, see #8490.

#### 13.9.4.7.2 TiCDC Canal-JSON Protocol

Canal-JSON is a data exchange format protocol defined by Alibaba Canal. In this document, you can learn how Canal-JSON data formats are implemented in TiCDC, including the TiDB extension field, the definitions of the Canal-JSON data formats, and comparison with the official Canal.

Use Canal-JSON

When using Message Queue (MQ) as the downstream Sink, you can specify Canal-JSON in `sink-uri`. TiCDC wraps and constructs Canal-JSON messages with Event as the basic unit, and sends TiDB data change Events to the downstream.

There are three types of Events:

- DDL Event: Represents a DDL change record. It is sent after an upstream DDL statement is successfully executed. The DDL Event is sent to the MQ Partition with the index being 0.
- DML Event: Represents a row data change record. This type of Event is sent when a row change occurs. It contains the information about the row after the change occurs.
- WATERMARK Event: Represents a special time point. It indicates that the Events received before this point is complete. It applies only to the TiDB extension field and takes effect when you set `enable-tidb-extension` to `true` in `sink-uri`.

The following is an example of using `Canal-JSON`:

```
cdc cli changefeed create --server=http://127.0.0.1:8300 --changefeed-id="
    ↪ kafka-canal-json" --sink-uri="kafka://127.0.0.1:9092/topic-name?kafka
    ↪ -version=2.4.0&protocol=canal-json"
```

TiDB extension field

The Canal-JSON protocol is originally designed for MySQL. It does not contain important fields such as the TiDB-specific unique identifier for the CommitTS transaction. To solve this problem, TiCDC appends a TiDB extension field to the Canal-JSON protocol format. After you set `enable-tidb-extension` to `true` (`false` by default) in `sink-uri`, TiCDC behaves as follows when generating Canal-JSON messages:

- TiCDC sends DML Event and DDL Event messages that contain a field named `_tidb`.
- TiCDC sends WATERMARK Event messages.

The following is an example:

```
cdc cli changefeed create --server=http://127.0.0.1:8300 --changefeed-id="
    ↪ kafka-canal-json-enable-tidb-extension" --sink-uri="kafka
    ↪ ://127.0.0.1:9092/topic-name?kafka-version=2.4.0&protocol=canal-json&
    ↪ enable-tidb-extension=true"
```

Definitions of message formats

This section describes the formats of DDL Event, DML Event and WATERMARK Event, and how the data is parsed on the consumer side.

DDL Event

TiCDC encodes a DDL Event into the following Canal-JSON format.

```
{
    "id": 0,
    "database": "test",
    "table": "",
    "pkNames": null,
    "isDdl": true,
    "type": "QUERY",
    "es": 1639633094670,
    "ts": 1639633095489,
    "sql": "drop database if exists test",
    "sqlType": null,
    "mysqlType": null,
    "data": null,
    "old": null,
    "_tidb": {   // TiDB extension field
        "commitTs": 429918007904436226 // A TiDB TSO timestamp
    }
}
```

The fields are explained as follows.

| Field | Type | Description |
|---|---|---|
| id | Number | The default value is 0 in TiCDC. |
| database | String | The name of the database where the row is located |
| table | String | The name of the table where the row is located |
| pkNames | Array | The names of all the columns that make up the primary key |
| isDdl | Bool | Whether the message is a DDL event |
| type | String | Event types defined by Canal-JSON |

| Field | Type | Description |
|---|---|---|
| es | Number | 13-bit (millisecond) timestamp when the event that generated the message happened |
| ts | Number | 13-bit (millisecond) timestamp when TiCDC generated the message |
| sql | String | When isDdl is `true`, records the corresponding DDL statement |
| sqlType | Object | When isDdl is `false`, records how the data type of each column is represented in Java |
| mysqlType | object | When isDdl is `false`, records how the data type of each column is represented in MySQL |
| data | Object | When isDdl is `false`, records the name of each column and its data value |
| old | Object | Only if the message is generated by an update Event, records the name of each column and the data value before the update |
| _tidb | Object | TiDB extension field. It exists only if you set `enable-tidb-extension` to `true`. The value of `commitTs` is the TSO of the transaction that caused the row to change. |

DML Event

TiCDC encodes a row of DML data change event as follows:

```
{
    "id": 0,
    "database": "test",
    "table": "tp_int",
    "pkNames": [
        "id"
    ],
    "isDdl": false,
    "type": "INSERT",
    "es": 1639633141221,
    "ts": 1639633142960,
    "sql": "",
    "sqlType": {
        "c_bigint": -5,
        "c_int": 4,
        "c_mediumint": 4,
        "c_smallint": 5,
        "c_tinyint": -6,
        "id": 4
    },
    "mysqlType": {
        "c_bigint": "bigint",
        "c_int": "int",
```

```
        "c_mediumint": "mediumint",
        "c_smallint": "smallint",
        "c_tinyint": "tinyint",
        "id": "int"
    },
    "data": [
        {
            "c_bigint": "9223372036854775807",
            "c_int": "2147483647",
            "c_mediumint": "8388607",
            "c_smallint": "32767",
            "c_tinyint": "127",
            "id": "2"
        }
    ],
    "old": null,
    "_tidb": {   // TiDB extension field
        "commitTs": 429918007904436226 // A TiDB TSO timestamp
    }
}
```

WATERMARK Event

TiCDC sends a WATERMARK Event only when you set `enable-tidb-extension` to `true`. The value of the `type` field is `TIDB_WATERMARK`. The Event contains the `_tidb` field, and the field contains only one parameter `watermarkTs`. The value of `watermarkTs` is the TSO recorded when the Event is sent.

When you receive an Event of this type, all Events with `commitTs` less than `watermarkTs` have been sent. Because TiCDC provides the "At Least Once" semantics, data might be sent repeatedly. If a subsequent Event with `commitTs` less than `watermarkTs` is received, you can safely ignore this Event.

The following is an example of the WATERMARK Event.

```
{
    "id": 0,
    "database": "",
    "table": "",
    "pkNames": null,
    "isDdl": false,
    "type": "TIDB_WATERMARK",
    "es": 1640007049196,
    "ts": 1640007050284,
    "sql": "",
    "sqlType": null,
    "mysqlType": null,
```

```
    "data": null,
    "old": null,
    "_tidb": {   // TiDB extension field
        "watermarkTs": 429918007904436226 // A TiDB TSO timestamp
    }
}
```

Data parsing on the consumer side

As you can see from the example above, Canal-JSON has a unified data format, with different field filling rules for different Event types. Consumers can parse data in this JSON format using a unified method, and then determine the Event type by checking the field values:

- When `isDdl` is `true`, the message contains a DDL Event.
- When `isDdl` is `false`, you need to further check the `type` field. If `type` is `TIDB_WATERMARK`, it is a WATERMARK Event; otherwise, it is a DML Event.

Field descriptions

The Canal-JSON format records the corresponding data type in the `mysqlType` field and the `sqlType` field.

MySQL Type field

In the `mysqlType` field, the Canal-JSON format records the string of MySQL Type in each column. For more information, see TiDB Data Types.

SQL Type field

In the `sqlType` field, the Canal-JSON format records Java SQL Type of each column, which is the data type corresponding to the data in JDBC. Its value can be calculated by MySQL Type and the specific data value. The mapping is as follows:

| MySQL Type | Java SQL Type Code |
|---|---|
| Boolean | -6 |
| Float | 7 |
| Double | 8 |
| Decimal | 3 |
| Char | 1 |
| Varchar | 12 |
| Binary | 2004 |
| Varbinary | 2004 |
| Tinytext | 2005 |
| Text | 2005 |
| Mediumtext | 2005 |
| Longtext | 2005 |
| Tinyblob | 2004 |

| MySQL Type | Java SQL Type Code |
|---|---|
| Blob | 2004 |
| Mediumblob | 2004 |
| Longblob | 2004 |
| Date | 91 |
| Datetime | 93 |
| Timestamp | 93 |
| Time | 92 |
| Year | 12 |
| Enum | 4 |
| Set | -7 |
| Bit | -7 |
| JSON | 12 |

Integer types

You need to consider whether integer types have the `Unsigned` constraint and the value size, which corresponds to different Java SQL Type Codes respectively, as shown in the following table.

| MySQL Type String | Value Range | Java SQL Type Code |
|---|---|---|
| tinyint | [-128, 127] | -6 |
| tinyint unsigned | [0, 127] | -6 |
| tinyint unsigned | [128, 255] | 5 |
| smallint | [-32768, 32767] | 5 |
| smallint unsigned | [0, 32767] | 5 |
| smallint unsigned | [32768, 65535] | 4 |
| mediumint | [-8388608, 8388607] | 4 |
| mediumint unsigned | [0, 8388607] | 4 |
| mediumint unsigned | [8388608, 16777215] | 4 |
| int | [-2147483648, 2147483647] | 4 |
| int unsigned | [0, 2147483647] | 4 |
| int unsigned | [2147483648, 4294967295] | -5 |
| bigint | [-9223372036854775808, 9223372036854775807] | -5 |
| bigint unsigned | [0, 9223372036854775807] | -5 |
| bigint unsigned | [9223372036854775808, 18446744073709551615] | 3 |

The following table shows the mapping relationships between Java SQL Types in TiCDC and their codes.

| Java SQL Type | Java SQL Type Code |
|---|---|
| CHAR | 1 |
| DECIMAL | 3 |

| Java SQL Type | Java SQL Type Code |
|---|---|
| INTEGER | 4 |
| SMALLINT | 5 |
| REAL | 7 |
| DOUBLE | 8 |
| VARCHAR | 12 |
| DATE | 91 |
| TIME | 92 |
| TIMESTAMP | 93 |
| BLOB | 2004 |
| CLOB | 2005 |
| BIGINT | -5 |
| TINYINT | -6 |
| Bit | -7 |

For more information about Java SQL Types, see Java SQL Class Types.

Comparison of TiCDC Canal-JSON and the official Canal

The way that TiCDC implements the Canal-JSON data format, including the `Update` Event and the `mysqlType` field, differs from the official Canal. The following table shows the main differences.

| Item | TiCDC Canal-JSON | Canal |
|---|---|---|
| Event of `Update` Type | The `old` field contains all the column data | The `old` field contains only the modified column data |
| `mysqlType` field | For types with parameters, it does not contain the information of the type parameter | For types with parameters, it contains the full information of the type parameter |

Compatibility with the official Canal

Starting from v6.5.6, TiCDC Canal-JSON supports compatibility with the data format of the official Canal. When creating a changefeed, you can set `content-compatible=true` in `sink-uri` to enable this feature. In this mode, TiCDC outputs Canal-JSON format data that is compatible with the official Canal. The specific changes are as follows:

- The `mysqlType` field contains the full information of the type parameter for each type.
- An Event of `Update` Type only outputs the modified column data.

Event of `Update` Type

For an Event of `Update` Type:

- In TiCDC, the `old` field contains all the column data
- In the official Canal, the `old` field contains only the modified column data

Assume that the following SQL statements are executed sequentially in the upstream TiDB:

```
create table tp_int
(
    id         int auto_increment,
    c_tinyint  tinyint  null,
    c_smallint smallint null,
    c_mediumint mediumint null,
    c_int      int      null,
    c_bigint   bigint   null,
    constraint pk
        primary key (id)
);

insert into tp_int(c_tinyint, c_smallint, c_mediumint, c_int, c_bigint)
values (127, 32767, 8388607, 2147483647, 9223372036854775807);

update tp_int set c_int = 0, c_tinyint = 0 where c_smallint = 32767;
```

For the `update` statement, TiCDC outputs an Event message with `type` as `UPDATE`, as shown below. The `update` statement only modifies the `c_int` and `c_tinyint` columns. The `old` field in the output event message contains all the column data.

```
{
    "id": 0,
    ...
    "type": "UPDATE",
    ...
    "sqlType": {
        ...
    },
    "mysqlType": {
        ...
    },
    "data": [
        {
            "c_bigint": "9223372036854775807",
            "c_int": "0",
            "c_mediumint": "8388607",
            "c_smallint": "32767",
            "c_tinyint": "0",
            "id": "2"
```

```
        }
    ],
    "old": [                          // In TiCDC, this field contains all
        ↪ the column data.
        {
            "c_bigint": "9223372036854775807",
            "c_int": "2147483647",    // Modified column
            "c_mediumint": "8388607",
            "c_smallint": "32767",
            "c_tinyint": "127",       // Modified column
            "id": "2"
        }
    ]
}
```

For the official Canal, the `old` field in the output event message contains only the modified column data, as shown below.

```
{
    "id": 0,
    ...
    "type": "UPDATE",
    ...
    "sqlType": {
        ...
    },
    "mysqlType": {
        ...
    },
    "data": [
        {
            "c_bigint": "9223372036854775807",
            "c_int": "0",
            "c_mediumint": "8388607",
            "c_smallint": "32767",
            "c_tinyint": "0",
            "id": "2"
        }
    ],
    "old": [                          // In Canal, this field contains only
        ↪ the modified column data.
        {
            "c_int": "2147483647",    // Modified column
            "c_tinyint": "127",       // Modified column
        }
```

```
    ]
}
```

`mysqlType` field

For the `mysqlType` field, if a type contains parameters, the official Canal contains the full information of the type parameter. TiCDC does not contain such information.

In the following example, the table-defining SQL statement contains a parameter for each column, such as the ones for `decimal`, `char`, `varchar` and `enum`. By comparing the Canal-JSON formats generated by TiCDC and the official Canal, you can see that TiCDC only contains the basic MySQL information in the `mysqlType` field. If you need the full information of the type parameter, you need to implement it by other means.

Assume that the following SQL statements are executed sequentially in the upstream TiDB:

```
create table t (
    id    int auto_increment,
    c_decimal  decimal(10, 4) null,
    c_char     char(16)    null,
    c_varchar  varchar(16) null,
    c_binary   binary(16)  null,
    c_varbinary varbinary(16) null,
    c_enum enum('a','b','c') null,
    c_set set('a','b','c') null,
    c_bit bit(64)          null,
    constraint pk
        primary key (id)
);

insert into t (c_decimal, c_char, c_varchar, c_binary, c_varbinary, c_enum,
    ↪ c_set, c_bit)
values (123.456, "abc", "abc", "abc", "abc", 'a', 'a,b', b'1000001');
```

The output of TiCDC is as follows:

```
{
    "id": 0,
    ...
    "isDdl": false,
    "sqlType": {
        ...
    },
    "mysqlType": {
        "c_binary": "binary",
        "c_bit": "bit",
        "c_char": "char",
```

```
        "c_decimal": "decimal",
        "c_enum": "enum",
        "c_set": "set",
        "c_varbinary": "varbinary",
        "c_varchar": "varchar",
        "id": "int"
    },
    "data": [
        {
            ...
        }
    ],
    "old": null,
}
```

The output of the official Canal is as follows:

```
{
    "id": 0,
    ...
    "isDdl": false,
    "sqlType": {
        ...
    },
    "mysqlType": {
        "c_binary": "binary(16)",
        "c_bit": "bit(64)",
        "c_char": "char(16)",
        "c_decimal": "decimal(10, 4)",
        "c_enum": "enum('a','b','c')",
        "c_set": "set('a','b','c')",
        "c_varbinary": "varbinary(16)",
        "c_varchar": "varchar(16)",
        "id": "int"
    },
    "data": [
        {
            ...
        }
    ],
    "old": null,
}
```

Changes in TiCDC Canal-JSON

Changes in the `Old` field of the `Delete` events

From v5.4.0, the `old` field of the `Delete` events has changed.

The following is a `Delete` event message. Before v5.4.0, the `old` field contains the same content as the "data" field. In v5.4.0 and later versions, the `old` field is set to null. You can get the deleted data by using the "data" field.

```
{
    "id": 0,
    "database": "test",
    ...
    "type": "DELETE",
    ...
    "sqlType": {
        ...
    },
    "mysqlType": {
        ...
    },
    "data": [
        {
            "c_bigint": "9223372036854775807",
            "c_int": "0",
            "c_mediumint": "8388607",
            "c_smallint": "32767",
            "c_tinyint": "0",
            "id": "2"
        }
    ],
    "old": null,
    // The following is an example before v5.4.0. The `old` field contains
        ↪ the same content as the "data" field.
    "old": [
        {
            "c_bigint": "9223372036854775807",
            "c_int": "0",
            "c_mediumint": "8388607",
            "c_smallint": "32767",
            "c_tinyint": "0",
            "id": "2"
        }
    ]
}
```

#### 13.9.4.7.3 TiCDC Open Protocol

TiCDC Open Protocol is a row-level data change notification protocol that provides data

sources for monitoring, caching, full-text indexing, analysis engines, and primary-secondary replication between different databases. TiCDC complies with TiCDC Open Protocol and replicates data changes of TiDB to third-party data medium such as MQ (Message Queue).

TiCDC Open Protocol uses Event as the basic unit to replicate data change events to the downstream. The Event is divided into three categories:

- Row Changed Event: Represents the data change in a row. When a row is changed, this Event is sent and contains information about the changed row.
- DDL Event: Represents the DDL change. This Event is sent after a DDL statement is successfully executed in the upstream. The DDL Event is broadcasted to every MQ Partition.
- Resolved Event: Represents a special time point before which the Event received is complete.

Restrictions

- In most cases, the Row Changed Event of a version is sent only once, but in special situations such as node failure and network partition, the Row Changed Event of the same version might be sent multiple times.
- On the same table, the Row Changed Events of each version which is first sent are incremented in the order of timestamps (TS) in the Event stream.
- Resolved Events are periodically broadcasted to each MQ Partition. The Resolved Event means that any Event with a TS earlier than Resolved Event TS has been sent to the downstream.
- DDL Events are broadcasted to each MQ Partition.
- Multiple Row Changed Events of a row are sent to the same MQ Partition.

Message format

A Message contains one or more Events, arranged in the following format:

Key:

| Offset(Byte) | 0~7 | 8~15 | 16~(15+length1) | ... | ... |
|---|---|---|---|---|---|
| Parameter | Protocol version | Length1 | Event Key1 | LengthN | Event KeyN |

Value:

| Offset(Byte) | 0~7 | 8~(7+length1) | ... | ... |
|---|---|---|---|---|
| Parameter | Length1 | Event Value1 | LengthN | Event ValueN |

- `LengthN` represents the length of the `N`th key/value.
- The length and protocol version are the big-endian `int64` type.

- The version of the current protocol is `1`.

Event format

This section introduces the formats of Row Changed Event, DDL Event, and Resolved Event.

Row Changed Event

- **Key:**

```
{
    "ts":<TS>,
    "scm":<Schema Name>,
    "tbl":<Table Name>,
    "t":1
}
```

| Parameter | Type | Description |
|---|---|---|
| TS | Number | The timestamp of the transaction that causes the row change. |
| Schema Name | String | The name of the schema where the row is in. |
| Table Name | String | The name of the table where the row is in. |

- **Value:**

`Insert` event. The newly added row data is output.

```
{
    "u":{
        <Column Name>:{
            "t":<Column Type>,
            "h":<Where Handle>,
            "f":<Flag>,
            "v":<Column Value>
        },
        <Column Name>:{
            "t":<Column Type>,
            "h":<Where Handle>,
            "f":<Flag>,
            "v":<Column Value>
        }
    }
}
```

`Update` event. The newly added row data ("u") and the row data before the update ("p") are output. The latter ("p") is output only when the old value feature is enabled.

```
{
    "u":{
        <Column Name>:{
            "t":<Column Type>,
            "h":<Where Handle>,
            "f":<Flag>,
            "v":<Column Value>
        },
        <Column Name>:{
            "t":<Column Type>,
            "h":<Where Handle>,
            "f":<Flag>,
            "v":<Column Value>
        }
    },
    "p":{
        <Column Name>:{
            "t":<Column Type>,
            "h":<Where Handle>,
            "f":<Flag>,
            "v":<Column Value>
        },
        <Column Name>:{
            "t":<Column Type>,
            "h":<Where Handle>,
            "f":<Flag>,
            "v":<Column Value>
        }
    }
}
```

`Delete` event. The deleted row data is output. When the old value feature is enabled, the `Delete` event includes all the columns of the deleted row data; when this feature is disabled, the `Delete` event only includes the HandleKey column.

```
{
    "d":{
        <Column Name>:{
            "t":<Column Type>,
            "h":<Where Handle>,
            "f":<Flag>,
            "v":<Column Value>
        },
        <Column Name>:{
            "t":<Column Type>,
```

```
            "h":<Where Handle>,
            "f":<Flag>,
            "v":<Column Value>
        }
    }
}
```

| Parameter | Type | Description |
|---|---|---|
| Column Name | String | The column name. |
| Column Type | Number | The column type. For details, see Column Type Code. |
| Where Handle | Boolean | Determines whether this column can be the filter condition of the `Where` clause. When this column is unique on the table, `Where Handle` is `true`. |
| Flag | Number | The bit flags of columns. For details, see Bit flags of columns. |
| Column Value | Any | The Column value. |

DDL Event

- **Key:**

```
{
    "ts":<TS>,
    "scm":<Schema Name>,
    "tbl":<Table Name>,
    "t":2
}
```

| Parameter | Type | Description |
|---|---|---|
| TS | Number | The timestamp of the transaction that performs the DDL change. |
| Schema Name | String | The schema name of the DDL change, which might be an empty string. |

| Parameter | Type | Description |
|---|---|---|
| Table Name | String | The table name of the DDL change, which might be am empty string. |

- **Value:**

```
{
    "q":<DDL Query>,
    "t":<DDL Type>
}
```

| Parameter | Type | Description |
|---|---|---|
| DDL Query | String | DDL Query SQL |
| DDL Type | String | The DDL type. For details, see DDL Type Code. |

Resolved Event

- **Key:**

```
{
    "ts":<TS>,
    "t":3
}
```

| Parameter | Type | Description |
|---|---|---|
| TS | Number | The Resolved timestamp. Any TS earlier than this Event has been sent. |

- **Value:** None

Examples of the Event stream output

This section shows and displays the output logs of the Event stream.

Suppose that you execute the following SQL statement in the upstream and the MQ Partition number is 2:

```
CREATE TABLE test.t1(id int primary key, val varchar(16));
```

From the following Log 1 and Log 3, you can see that the DDL Event is broadcasted to all MQ Partitions, and that the Resolved Event is periodically broadcasted to each MQ Partition.

```
1. [partition=0] [key="{\"ts\":415508856908021766,\"scm\":\"test\",\"tbl
   ↪ \":\"t1\",\"t\":2}"] [value="{\"q\":\"CREATE TABLE test.t1(id int
   ↪ primary key, val varchar(16))\",\"t\":3}"]
2. [partition=0] [key="{\"ts\":415508856908021766,\"t\":3}"] [value=]
3. [partition=1] [key="{\"ts\":415508856908021766,\"scm\":\"test\",\"tbl
   ↪ \":\"t1\",\"t\":2}"] [value="{\"q\":\"CREATE TABLE test.t1(id int
   ↪ primary key, val varchar(16))\",\"t\":3}"]
4. [partition=1] [key="{\"ts\":415508856908021766,\"t\":3}"] [value=]
```

Execute the following SQL statements in the upstream:

```
BEGIN;
INSERT INTO test.t1(id, val) VALUES (1, 'aa');
INSERT INTO test.t1(id, val) VALUES (2, 'aa');
UPDATE test.t1 SET val = 'bb' WHERE id = 2;
INSERT INTO test.t1(id, val) VALUES (3, 'cc');
COMMIT;
```

- From the following Log 5 and Log 6, you can see that Row Changed Events on the same table might be sent to different partitions based on the primary key, but changes to the same row are sent to the same partition so that the downstream can easily process the Event concurrently.
- From Log 6, multiple changes to the same row in a transaction are only sent in one Row Changed Event.
- Log 8 is a repeated event of Log 7. Row Changed Event might be repeated, but the first Event of each version is sent orderly.

```
5. [partition=0] [key="{\"ts\":415508878783938562,\"scm\":\"test\",\"tbl
   ↪ \":\"t1\",\"t\":1}"] [value="{\"u\":{\"id\":{\"t\":3,\"h\":true,\"v
   ↪ \":1},\"val\":{\"t\":15,\"v\":\"aa\"}}}"]
6. [partition=1] [key="{\"ts\":415508878783938562,\"scm\":\"test\",\"tbl
   ↪ \":\"t1\",\"t\":1}"] [value="{\"u\":{\"id\":{\"t\":3,\"h\":true,\"v
   ↪ \":2},\"val\":{\"t\":15,\"v\":\"bb\"}}}"]
7. [partition=0] [key="{\"ts\":415508878783938562,\"scm\":\"test\",\"tbl
   ↪ \":\"t1\",\"t\":1}"] [value="{\"u\":{\"id\":{\"t\":3,\"h\":true,\"v
   ↪ \":3},\"val\":{\"t\":15,\"v\":\"cc\"}}}"]
8. [partition=0] [key="{\"ts\":415508878783938562,\"scm\":\"test\",\"tbl
   ↪ \":\"t1\",\"t\":1}"] [value="{\"u\":{\"id\":{\"t\":3,\"h\":true,\"v
   ↪ \":3},\"val\":{\"t\":15,\"v\":\"cc\"}}}"]
```

Execute the following SQL statements in the upstream:

```
BEGIN;
DELETE FROM test.t1 WHERE id = 1;
UPDATE test.t1 SET val = 'dd' WHERE id = 3;
```

```
UPDATE test.t1 SET id = 4, val = 'ee' WHERE id = 2;
COMMIT;
```

- Log 9 is the Row Changed Event of the `Delete` type. This type of Event only contains primary key columns or unique index columns.
- Log 13 and Log 14 are Resolved Events. The Resolved Event means that in this Partition, any events smaller than the Resolved TS (including Row Changed Event and DDL Event) have been sent.

```
9. [partition=0] [key="{\"ts\":415508881418485761,\"scm\":\"test\",\"tbl
   ↪ \":\"t1\",\"t\":1}"] [value="{\"d\":{\"id\":{\"t\":3,\"h\":true,\"v
   ↪ \":1}}}"]
10. [partition=1] [key="{\"ts\":415508881418485761,\"scm\":\"test\",\"tbl
   ↪ \":\"t1\",\"t\":1}"] [value="{\"d\":{\"id\":{\"t\":3,\"h\":true,\"v
   ↪ \":2}}}"]
11. [partition=0] [key="{\"ts\":415508881418485761,\"scm\":\"test\",\"tbl
   ↪ \":\"t1\",\"t\":1}"] [value="{\"u\":{\"id\":{\"t\":3,\"h\":true,\"v
   ↪ \":3},\"val\":{\"t\":15,\"v\":\"ZGQ=\"}}}"]
12. [partition=0] [key="{\"ts\":415508881418485761,\"scm\":\"test\",\"tbl
   ↪ \":\"t1\",\"t\":1}"] [value="{\"u\":{\"id\":{\"t\":3,\"h\":true,\"v
   ↪ \":4},\"val\":{\"t\":15,\"v\":\"ZWU=\"}}}"]
13. [partition=0] [key="{\"ts\":415508881038376963,\"t\":3}"] [value=]
14. [partition=1] [key="{\"ts\":415508881038376963,\"t\":3}"] [value=]
```

Protocol parsing for consumers

Currently, TiCDC does not provide the standard parsing library for TiCDC Open Protocol, but the Golang version and Java version of parsing examples are provided. You can refer to the data format provided in this document and the following examples to implement the protocol parsing for consumers.

- Golang examples
- Java examples

Column type code

`Column Type Code` represents the column data type of the Row Changed Event.

| Type | Code | Output Example | Description |
|---|---|---|---|
| TINYINT/BOOLEAN | 1 | {“t”:1,“v”:1} | |
| SMALLINT | 2 | {“t”:2,“v”:1} | |
| INT | 3 | {“t”:3,“v”:123} | |

| Type | Code | Output Example | Description |
|---|---|---|---|
| FLOAT | 4 | {“t”:4,“v”:153.123} | |
| DOUBLE | 5 | {“t”:5,“v”:153.123} | |
| NULL | 6 | {“t”:6,“v”:null} | |
| TIMESTAMP | 7 | {“t”:7,“v”:“1973-12-30 15:30:00”} | |
| BIGINT | 8 | {“t”:8,“v”:123} | |
| MEDIUMINT | 9 | {“t”:9,“v”:123} | |
| DATE | 10/14 | {“t”:10,“v”:“2000-01-01”} | |
| TIME | 11 | {“t”:11,“v”:“23:59:59”} | |
| DATETIME | 12 | {“t”:12,“v”:“2015-12-20 23:58:58”} | |
| YEAR | 13 | {“t”:13,“v”:1970} | |
| VARCHAR/VARBINARY | 15/253 | {“t”:15,“v”:“test”} / {“t”:15,“v”:“\\x89PNG\\r\\n\\x1a\\n”} | The value is encoded in UTF-8. When the upstream type is VARBINARY, invisible characters are escaped. |
| BIT | 16 | {“t”:16,“v”:81} | |

| Type | Code | Output Example | Description |
|---|---|---|---|
| JSON | 245 | {“t”:245,“v”:“{\”key1\“:\”value1\“}”} | |
| DECIMAL | 246 | {“t”:246,“v”:“129012.1230000”} | |
| ENUM | 247 | {“t”:247,“v”:1} | |
| SET | 248 | {“t”:248,“v”:3} | |
| TINYTEXT/TINYBLOB | 249 | {“t”:249,“v”:“Th5rWL6K+VdGV4dA==”} | value is encoded in Base64. |
| MEDIUMTEXT/MEDIUMBLOB | 250 | {“t”:250,“v”:“Th5rWL6K+VdGV4dA==”} | value is encoded in Base64. |
| LONGTEXT/LONGBLOB | 251 | {“t”:251,“v”:“Th5rWL6K+VdGV4dA==”} | value is encoded in Base64. |
| TEXT/BLOB | 252 | {“t”:252,“v”:“Th5rWL6K+VdGV4dA==”} | value is encoded in Base64. |

| Type | Code | Output Example | Description |
|---|---|---|---|
| CHAR/BINARY | 254 | {“t”:254,“v”:“Test”} / {“t”:254,“v”:“\\x89PNG\\r\\n\\x1a\\n”} | The value encoded in UTF-8. When the upstream type is BINARY, invisible characters are escaped. |
| GEOMETRY | 255 | | Unsupported |

DDL Type Code

`DDL Type Code` represents the DDL statement type of the DDL Event.

| Type | Code |
|---|---|
| Create Schema | 1 |
| Drop Schema | 2 |
| Create Table | 3 |
| Drop Table | 4 |
| Add Column | 5 |
| Drop Column | 6 |
| Add Index | 7 |
| Drop Index | 8 |
| Add Foreign Key | 9 |

| Type | Code |
|---|---|
| Drop Foreign Key | 10 |
| Truncate Table | 11 |
| Modify Column | 12 |
| Rebase Auto ID | 13 |
| Rename Table | 14 |
| Set Default Value | 15 |
| Shard RowID | 16 |
| Modify Table Comment | 17 |
| Rename Index | 18 |
| Add Table Partition | 19 |
| Drop Table Partition | 20 |
| Create View | 21 |
| Modify Table Charset And Collate | 22 |
| Truncate Table Partition | 23 |
| Drop View | 24 |
| Recover Table | 25 |
| Modify Schema Charset And Collate | 26 |
| Lock Table | 27 |
| Unlock Table | 28 |
| Repair Table | 29 |
| Set TiFlash Replica | 30 |
| Update TiFlash Replica Status | 31 |
| Add Primary Key | 32 |
| Drop Primary Key | 33 |
| Create Sequence | 34 |
| Alter Sequence | 35 |
| Drop Sequence | 36 |

Bit flags of columns

The bit flags represent specific attributes of columns.

| Bit | Value | Name | Description |
|---|---|---|---|
| 1 | 0x01 | BinaryFlag | Whether the column is a binary-encoded column. |
| 2 | 0x02 | HandleKeyFlag | Whether the column is a Handle index column. |
| 3 | 0x04 | GeneratedColumnFlag | Whether the column is a generated column. |
| 4 | 0x08 | PrimaryKeyFlag | Whether the column is a primary key column. |
| 5 | 0x10 | UniqueKeyFlag | Whether the column is a unique index column. |
| 6 | 0x20 | MultipleKeyFlag | Whether the column is a composite index column. |
| 7 | 0x40 | NullableFlag | Whether the column is a nullable column. |
| 8 | 0x80 | UnsignedFlag | Whether the column is an unsigned column. |

Example:

If the value of a column flag is `85`, the column is a nullable column, a unique index column, a generated column, and a binary-encoded column.

```
85 == 0b_101_0101
   == NullableFlag | UniqueKeyFlag | GeneratedColumnFlag | BinaryFlag
```

If the value of a column is `46`, the column is a composite index column, a primary key column, a generated column, and a Handle key column.

```
46 == 0b_010_1110
   == MultipleKeyFlag | PrimaryKeyFlag | GeneratedColumnFlag | HandleKeyFlag
```

**Note:**

- `BinaryFlag` is meaningful only when the column type is BLOB/TEXT (including TINYBLOB/TINYTEXT and BINARY/CHAR). When the upstream column is the BLOB type, the `BinaryFlag` value is set to `1`. When the upstream column is the TEXT type, the `BinaryFlag` value is set to `0`.
- To replicate a table from the upstream, TiCDC selects a valid index as the Handle index. The `HandleKeyFlag` value of the Handle index column is set to `1`.

#### 13.9.4.7.4 TiCDC CSV Protocol

When using a cloud storage service as the downstream sink, you can send DML events to the cloud storage service in CSV format.

**Warning:**

When the Old Value feature is enabled (`enable-old-value = true`), the CSV data format cannot output the old value of change events.

For more information, see What changes occur to the change event format when TiCDC enables the Old Value feature?.

Use CSV

The following is an example of the configuration when using the CSV protocol:

```
cdc cli changefeed create --server=http://127.0.0.1:8300 --changefeed-id="
    ↪ csv-test" --sink-uri="s3://bucket/prefix" --config changefeed.toml
```

The configuration in the `changefeed.toml` file is as follows:

```
[sink]
protocol = "csv"
terminator = "\n"

[sink.csv]
delimiter = ','
quote = '"'
null = '\N'
include-commit-ts = true
```

Transactional constraints

- In a single CSV file, the `commit-ts` of a row is equal to or smaller than that of the subsequent row.
- The same transactions of a single table are stored in the same CSV file.
- Multiple tables of the same transaction can be stored in different CSV files.

Definition of the data format

In the CSV file, each column is defined as follows:

- Column 1: The operation-type indicator, including `I`, `U`, and `D`. `I` means `INSERT`, `U` means `UPDATE`, and `D` means `DELETE`.
- Column 2: Table name.
- Column 3: Schema name.
- Column 4: The `commit-ts` of the source transaction. This column is optional.
- Column 5 to the last column: One or more columns that represent data to be changed.

Assume that table `hr.employee` is defined as follows:

```
CREATE TABLE `employee` (
  `Id` int NOT NULL,
  `LastName` varchar(20) DEFAULT NULL,
  `FirstName` varchar(30) DEFAULT NULL,
  `HireDate` date DEFAULT NULL,
  `OfficeLocation` varchar(20) DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4;
```

The DML events of this table are stored in the CSV format as follows:

```
"I","employee","hr",433305438660591626,101,"Smith","Bob","2014-06-04","New
    ↪ York"
"U","employee","hr",433305438660591627,101,"Smith","Bob","2015-10-08","Los
    ↪ Angeles"
"D","employee","hr",433305438660591629,101,"Smith","Bob","2017-03-13","
    ↪ Dallas"
"I","employee","hr",433305438660591630,102,"Alex","Alice","2017-03-14","
    ↪ Shanghai"
"U","employee","hr",433305438660591630,102,"Alex","Alice","2018-06-15","
    ↪ Beijing"
```

Data type mapping

| MySQL type | CSV type | Example | Description |
|---|---|---|---|
| `BOOLEAN/TINYINT/SMALLINT ↪ /INT/MEDIUMINT/BIGINT` | Integer | `123` | - |
| `FLOAT/DOUBLE` | Float | `153.123` | - |
| `NULL` | Null | `\N` | - |
| `TIMESTAMP/DATETIME` | String | `"1973-12-30 ↪ 15:30:00.123456" ↪` | Format: `yyyy-MM-dd HH:mm:ss.%06d` |
| `DATE` | String | `"2000-01-01"` | Format: `yyyy-MM-dd` |
| `TIME` | String | `"23:59:59"` | Format: `yyyy-MM-dd` |
| `YEAR` | Integer | `1970` | - |
| `VARCHAR/JSON/TINYTEXT ↪ /MEDIUMTEXT/LONGTEXT ↪ /TEXT/CHAR` | String | `"test"` | UTF-8 encoded |
| `VARBINARY/TINYBLOB ↪ /MEDIUMBLOB/LONGBLOB ↪ /BLOB/BINARY` | String | `"6Zi/5pav"` or `"e998bfe696af"` | Base64 or hex encoded |
| `BIT` | Integer | `81` | - |
| `DECIMAL` | String | `"129012.1230000" ↪` | - |
| `ENUM` | String | `"a"` | - |
| `SET` | String | `"a,b"` | - |

#### 13.9.4.8 TiCDC OpenAPI v2

TiCDC provides the OpenAPI feature for querying and operating the TiCDC cluster. The OpenAPI feature is a subset of the `cdc cli` tool.

**Note:**

- TiCDC supports OpenAPI v2 starting from v6.5.2 for v6.5.x release series. If your TiCDC version is v6.5.0 or v6.5.1, use TiCDC OpenAPI v1 instead.
- TiCDC OpenAPI v1 will be removed in future releases. It is recommended to use TiCDC OpenAPI v2.

You can use the APIs to perform the following maintenance operations on the TiCDC cluster:

- Get the status information of a TiCDC node
- Check the health status of a TiCDC cluster
- Create a replication task
- Remove a replication task
- Update the replication configuration
- Query the replication task list
- Query a specific replication task
- Pause a replication task
- Resume a replication task
- Query the replication subtask list
- Query a specific replication subtask
- Query the TiCDC service process list
- Evict an owner node
- Dynamically adjust the log level of the TiCDC server

The request body and returned values of all APIs are in JSON format. A successful request returns a `200 OK` message. The following sections describe the specific usage of the APIs.

In the following examples, the listening IP address of the TiCDC server is `127.0.0.1` ↪ and the port is `8300`. You can specify the IP address and port bound to TiCDC via `--addr=ip:port` when starting the TiCDC server.

#### 13.9.4.8.1 API error message template

After an API request is sent, if an error occurs, the returned error message is in the following format:

```
{
    "error_msg": "",
    "error_code": ""
}
```

In the above JSON output, `error_msg` describes the error message and `error_code` is the corresponding error code.

#### 13.9.4.8.2 Return format of the API List interface

If an API request returns a list of resources (for example, a list of all `Captures`), the TiCDC return format is as follows:

```
{
  "total": 2,
  "items": [
    {
      "id": "d2912e63-3349-447c-90ba-wwww",
      "is_owner": true,
      "address": "127.0.0.1:8300"
    },
    {
      "id": "d2912e63-3349-447c-90ba-xxxx",
      "is_owner": false,
      "address": "127.0.0.1:8302"
    }
  ]
}
```

In the above example:

- `total`: indicates the total number of resources.
- `items`: an array that contains all the resources returned by this request. All elements of the array are of the same resource.

#### 13.9.4.8.3 Get the status information of a TiCDC node

This API is a synchronous interface. If the request is successful, the status information of the corresponding node is returned.

Request URI

`GET /api/v2/status`

Example

The following request gets the status information of the TiCDC node whose IP address is `127.0.0.1` and port number is `8300`.

```
curl -X GET http://127.0.0.1:8300/api/v2/status
```

```
{
  "version": "v7.0.0-master-dirty",
```

```
  "git_hash": "10413bded1bdb2850aa6d7b94eb375102e9c44dc",
  "id": "d2912e63-3349-447c-90ba-72a4e04b5e9e",
  "pid": 1447,
  "is_owner": true,
  "liveness": 0
}
```

The parameters of the above output are described as follows:

- `version`: the current version number of TiCDC.
- `git_hash`: the Git hash value.
- `id`: the capture ID of the node.
- `pid`: the capture process ID (PID) of the node.
- `is_owner`: indicates whether the node is an owner.
- `liveness`: whether this node is live. `0` means normal. `1` means that the node is in the `graceful shutdown` state.

#### 13.9.4.8.4 Check the health status of a TiCDC cluster

This API is a synchronous interface. If the cluster is healthy, `200 OK` is returned.

Request URI

`GET /api/v2/health`

Example

```
curl -X GET http://127.0.0.1:8300/api/v2/health
```

If the cluster is healthy, the response is `200 OK` and an empty JSON object:

```
{}
```

If the cluster is not healthy, the response is a JSON object containing the error message.

#### 13.9.4.8.5 Create a replication task

This interface is used to submit a replication task to TiCDC. If the request is successful, `200 OK` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

Request URI

`POST /api/v2/changefeeds`

Parameter descriptions

```
{
  "changefeed_id": "string",
  "replica_config": {
```

```
"bdr_mode": true,
"case_sensitive": false,
"check_gc_safe_point": true,
"consistent": {
  "flush_interval": 0,
  "level": "string",
  "max_log_size": 0,
  "storage": "string"
},
"enable_old_value": true,
"enable_sync_point": true,
"filter": {
  "do_dbs": [
    "string"
  ],

      {
        "columns": [
          "string"
        ],
        "matcher": [
          "string"
        ]
      }
    ],
    "csv": {
      "delimiter": "string",
      "include_commit_ts": true,
      "null": "string",
      "quote": "string"
    },
    "date_separator": "string",
    "dispatchers": [
      {
        "matcher": [
          "string"
        ],
        "partition": "string",
        "topic": "string"
      }
    ],
    "enable_partition_separator": true,
    "encoder_concurrency": 0,
    "protocol": "string",
```

```
    "schema_registry": "string",
    "terminator": "string",
    "transaction_atomicity": "string"
   },
   "sync_point_interval": "string",
   "sync_point_retention": "string"
  },
  "sink_uri": "string",
  "start_ts": 0,
  "target_ts": 0
}
```

The parameters are described as follows:

| Parameter name | Description |
|---|---|
| `changefeed_id` | `STRING` type. The ID of the replication task. (Optional) |
| `replica_config` | Configuration parameters for the replication task. (Optional) |
| **`sink_uri`** | `STRING` type. The downstream address of the replication task. (**Required**) |
| `start_ts` | `UINT64` type. Specifies the start TSO of the changefeed. The TiCDC cluster will start pulling data from this TSO. The default value is the current time. (Optional) |
| `target_ts` | `UINT64` type. Specifies the target TSO of the changefeed. The TiCDC cluster stops pulling data when reaching this TSO. The default value is empty, meaning TiCDC does not stop automatically. (Optional) |

The meaning and format of `changefeed_id`, `start_ts`, `target_ts`, and `sink_uri` are the same as those described in the Use `cdc cli` to create a replication task document. For the detailed description of these parameters, see that document. Note that when you specify the certificate path in `sink_uri`, make sure you have uploaded the corresponding certificate to the corresponding TiCDC server.

The descriptions of the `replica_config` parameters are as follows.

| Parameter name | Description |
|---|---|
| `bdr_mode` | `BOOLEAN` type. Determines whether to enable bidirectional replication. The default value is `false`. (Optional) |
| `case_sensitive` | `BOOLEAN` type. Determines whether to be case-sensitive when filtering table names. Starting from v6.5.6, the default value changes from `true` to `false`. (Optional) |

| Parameter name | Description |
| --- | --- |
| `check_gc_safe_point` | `BOOLEAN` type. Determines whether to check that the start time of the replication task is earlier than the GC time. The default value is `true`. (Optional) |
| `consistent` | The configuration parameters of redo log. (Optional) |
| `enable_old_value` | `BOOLEAN` type. Determines whether to output the old value (that is, the value before the update). The default value is `true`. (Optional) |
| `enable_sync_point` | `BOOLEAN` type. Determines whether to enable `sync point`. (Optional) |
| `filter` | The configuration parameters of `filter`. (Optional) |
| `force_replicate` | `BOOLEAN` type. The default value is `false`. When you set it to `true`, the replication task forcibly replicates the tables without unique indexes. (Optional) |
| `ignore_ineligible_table` ↪ | `BOOLEAN` type. The default value is `false`. When you set it to `true`, the replication task ignores the tables that cannot be replicated. (Optional) |
| `memory_quota` | `UINT64` type. The memory quota for the replication task. (Optional) |
| `mounter` | The configuration parameters of `mounter`. (Optional) |
| `sink` | The configuration parameters of `sink`. (Optional) |
| `sync_point_interval` | `STRING` type. Note that the returned value is a time in nanosecond of the `UINT64` type. When the `sync point` feature is enabled, this parameter specifies the interval at which Syncpoint aligns the upstream and downstream snapshots. The default value is `10m` and the minimum value is `30s`. (Optional) |
| `sync_point_retention` | `STRING` type. Note that the returned value is a time in nanosecond of the `UINT64` type. When the `sync point` feature is enabled, this parameter specifies how long the data is retained by Syncpoint in the downstream table. When this duration is exceeded, the data is cleaned up. The default value is `24h`. (Optional) |

The `consistent` parameters are described as follows:

| Parameter name | Description |
| --- | --- |
| `flush_interval` | `UINT64` type. The interval to flush redo log files. (Optional) |
| `level` | `STRING` type. The consistency level of the replicated data. (Optional) |
| `max_log_size` | `UINT64` type. The maximum value of redo log. (Optional) |

| Parameter name | Description |
| --- | --- |
| `storage` | `STRING` type. The destination address of the storage. (Optional) |
| `use_file_backend` | `BOOL` type. Specifies whether to store the redo log in a local file. (Optional) |
| `encoding_worker_num` ↪ | `INT` type. The number of encoding and decoding workers in the redo module. (Optional) |
| `flush_worker_num` | `INT` type. The number of flushing workers in the redo module. (Optional) |
| `compression` | `STRING` type. The behavior to compress redo log files. Available options are `""` and `"lz4"`. The default value is `""`, which means no compression. (Optional) |
| `flush_concurrency` ↪ | `INT` type. The concurrency for uploading a single file. The default value is `1`, which means concurrency is disabled. (Optional) |

The `filter` parameters are described as follows:

| Parameter name | Description |
| --- | --- |
| `do_dbs` | `STRING ARRAY` type. The databases to be replicated. (Optional) |
| `do_tables` | The tables to be replicated. (Optional) |
| `ignore_dbs` | `STRING ARRAY` type. The databases to be ignored. (Optional) |
| `ignore_tables` | The tables to be ignored. (Optional) |
| `event_filters` | The configuration to filter events. (Optional) |
| `ignore_txn_start_ts` ↪ | `UINT64 ARRAY` type. Specifying this will ignore transactions that specify `start_ts`, such as `[1, 2]`. (Optional) |
| `rules` | `STRING ARRAY` type. The rules for table schema filtering, such as `['foo*.*', 'bar*.*']`. For more information, see Table Filter. (Optional) |

The `filter.event_filters` parameters are described as follows. For more information, see Changefeed Log Filters.

| Parameter name | Description |
| --- | --- |
| `ignore_delete_value_expr` | `STRING ARRAY` type. For example, `"name = 'john'"` means to filter out DELETE DML statements containing the `name = 'john'` condition. (Optional) |
| `ignore_event` | `STRING ARRAY` type. For example, `["insert"]` indicates that the INSERT events are filtered out. (Optional) |
| `ignore_insert_value_expr` | `STRING ARRAY` type. For example, `"id >= 100"` means to filter out INSERT DML statements that match the `id >= 100` condition. (Optional) |
| `ignore_sql` | `STRING ARRAY` type. For example, `["^drop", "add column"]` means to filter out DDL statements that start with `DROP` or contain `ADD COLUMN`. (Optional) |
| `ignore_update_new_value_expr` | `STRING ARRAY` type. For example, `"gender = 'male'"` means to filter out the UPDATE DML statements with the new value `gender = 'male'`. (Optional) |
| `ignore_update_old_value_expr` | `STRING ARRAY` type. For example, `"age < 18"` means to filter out the UPDATE DML statements with the old value `age < 18`. (Optional) |
| `matcher` | `STRING ARRAY` type. It works as an allowlist. For example, `["test.worker"]` means that the filter rule applies only to the `worker` table in the `test` database. (Optional) |

The `mounter` parameter is described as follows:

| Parameter name | Description |
| --- | --- |
| `worker_num` | `INT` type. The number of Mounter threads. Mounter is used to decode the data output from TiKV. The default value is `16`. (Optional) |

The `sink` parameters are described as follows:

| Parameter name | Description |
| --- | --- |
| `column_selectors` | The column selector configuration. (Optional) |

| Parameter name | Description |
| --- | --- |
| `csv` | The CSV configuration. (Optional) |
| `date_separator` | `STRING` type. Indicates the date separator type of the file directory. Value options are `none`, `year`, `month`, and `day`. `none` is the default value and means that the date is not separated. (Optional) |
| `dispatchers` | An configuration array for event dispatching. (Optional) |
| `encoder_concurrency` ↪ | `INT` type. The number of encoder threads in the MQ sink. The default value is `16`. (Optional) |
| `protocol` | `STRING` type. For MQ sinks, you can specify the protocol format of the message. The following protocols are currently supported: `canal-json`, `open-protocol`, and `avro`. |
| `schema_registry` | `STRING` type. The schema registry address. (Optional) |
| `terminator` | `STRING` type. The terminator is used to separate two data change events. The default value is null, which means `"\r\n"` is used as the terminator. (Optional) |
| `transaction_atomicity` ↪ | `STRING` type. The atomicity level of the transaction. (Optional) |
| `cloud_storage_config` ↪ | The storage sink configuration. (Optional) |

`sink.column_selectors` is an array. The parameters are described as follows:

| Parameter name | Description |
| --- | --- |
| `columns` | `STRING ARRAY` type. The column array. |
| `matcher` | `STRING ARRAY` type. The matcher configuration. It has the same matching syntax as the filter rule does. |

The `sink.csv` parameters are described as follows:

| Parameter name | Description |
| --- | --- |
| `delimiter` | `STRING` type. The character used to separate fields in the CSV file. The value must be an ASCII character and defaults to `,`. |

| Parameter name | Description |
| --- | --- |
| `include_commit_ts` ↪ | `BOOLEAN` type. Whether to include commit-ts in CSV rows. The default value is `false`. |
| `null` | `STRING` type. The character that is displayed when a CSV column is null. The default value is `\N`. |
| `quote` | `STRING` type. The quotation character used to surround fields in the CSV file. If the value is empty, no quotation is used. The default value is `"`. |
| `binary_encoding_method` ↪ | `STRING` type. The encoding method of binary data, which can be `"base64"` or `"hex"`. The default value is `"base64"`. |

`sink.dispatchers`: for the sink of MQ type, you can use this parameter to configure the event dispatcher. The following dispatchers are supported: `default`, `ts`, `index-value`, and `table`. The dispatcher rules are as follows:

- `default`: when multiple unique indexes (including the primary key) exist, events are dispatched in the table mode. When only one unique index (or the primary key) exists, events are dispatched in the rowid mode. If the Old Value feature is enabled, events are dispatched in the table mode.
- `ts`: uses the commitTs of the row change to create the hash value and dispatch events.
- `index-value`: uses the name and value of the selected HandleKey column to create the hash value and dispatch events.
- `table`: uses the schema name of the table and the table name to create the hash value and dispatch events.

`sink.dispatchers` is an array. The parameters are described as follows:

| Parameter name | Description |
| --- | --- |
| `matcher` | `STRING ARRAY` type. It has the same matching syntax as the filter rule does. |
| `partition` | `STRING` type. The target partition for dispatching events. |
| `topic` | `STRING` type. The target topic for dispatching events. |

`sink.cloud_storage_config` parameters are described as follows:

| Parameter name | Description |
| --- | --- |
| `worker_count` | `INT` type. The concurrency for saving data changes to the downstream cloud storage. |
| `flush_interval` | `STRING` type. The interval for saving data changes to the downstream cloud storage. |
| `file_size` | `INT` type. A data change file is saved to the cloud storage when the number of bytes in this file exceeds the value of this parameter. |
| `file_expiration_days` | `INT` type. The duration to retain files, which takes effect only when `date-separator` is configured as `day`. |
| `file_cleanup_cron_spec` | `STRING` type. The running cycle of the scheduled cleanup task, compatible with the crontab configuration, with a format of `<Second> <Minute> <Hour> <Day of the month> <Month> <Day of the week (Optional)>`. |
| `flush_concurrency` | `INT` type. The concurrency for uploading a single file. |
| `output_raw_change_event` | `BOOLEAN` type. Controls whether to output the original data change event for a non-MySQL sink. |

Example

The following request creates a replication task with an ID of `test5` and `sink_uri` of `blackhome://`.

```
curl -X POST -H "'Content-type':'application/json'" http://127.0.0.1:8300/
    ↪ api/v2/changefeeds -d '{"changefeed_id":"test5","sink_uri":"blackhole
    ↪ ://"}'
```

If the request is successful, `200 OK` is returned. If the request fails, an error message and error code are returned.

Response body format

```
{
  "admin_job_type": 0,
  "checkpoint_time": "string",
  "checkpoint_ts": 0,
  "config": {
    "bdr_mode": true,
    "case_sensitive": false,
    "check_gc_safe_point": true,
    "consistent": {
```

```
    "flush_interval": 0,
    "level": "string",
    "max_log_size": 0,
    "storage": "string"
  },
  "enable_old_value": true,
  "enable_sync_point": true,
  "filter": {
    "do_dbs": [
      "string"
    ],
    "do_tables": [
      {
        "database_name": "string",
        "table_name": "string"
      }
    ],
    "event_filters": [

  "state": "string",
  "target_ts": 0,
  "task_status": [
    {
      "capture_id": "string",
      "table_ids": [
        0
      ]
    }
  ]
}
```

The parameters are described as follows:

| Parameter name | Description |
|---|---|
| `admin_job_type` | `INTEGER` type. The admin job type. |
| `checkpoint_time` | `STRING` type. The formatted time of the current checkpoint for the replication task. |
| `checkpoint_ts` | `STRING` type. The TSO of the current checkpoint for the replication task. |
| `config` | The replication task configuration. The structure and meaning are the same as that of the `replica_config` configuration in creating the replication task. |
| `create_time` | `STRING` type. The time when the replication task is created. |
| `creator_version` | `STRING` type. The TiCDC version when the replication task is created. |
| `error` | The replication task error. |
| `id` | `STRING` type. The replication task ID. |

| Parameter name | Description |
|---|---|
| `resolved_ts` | `UINT64` type. The replication task resolved ts. |
| `sink_uri` | `STRING` type. The replication task sink URI. |
| `start_ts` | `UINT64` type. The replication task start ts. |
| `state` | `STRING` type. The replication task status. It can be `normal`, `stopped`, `error`, `failed`, or `finished`. |
| `target_ts` | `UINT64` type. The replication task target ts. |
| `task_status` | The detailed status of dispatching the replication task. |

The `task_status` parameters are described as follows:

| Parameter name | Description |
|---|---|
| `capture_id` | `STRING` type. The capture ID. |
| `table_ids` | `UINT64 ARRAY` type. The ID of the table being replicated on this capture. |

The `error` parameters are described as follows:

| Parameter name | Description |
|---|---|
| `addr` | `STRING` type. The capture address. |
| `code` | `STRING` type. The error code. |
| `message` | `STRING` type. The details of the error. |

#### 13.9.4.8.6 Remove a replication task

This API is an idempotent interface (that is, it can be applied multiple times without changing the result beyond the initial application) for removing a replication task. If the request is successful, `200 OK` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

Request URI

```
DELETE /api/v2/changefeeds/{changefeed_id}
```

Parameter descriptions

Path parameters

| Parameter name | Description |
|---|---|
| `changefeed_id` | The ID of the replication task (changefeed) to be removed. |

Example

The following request removes the replication task with the ID `test1`.

```
curl -X DELETE http://127.0.0.1:8300/api/v2/changefeeds/test1
```

If the request is successful, `200 OK` is returned. If the request fails, an error message and error code are returned.

#### 13.9.4.8.7 Update the replication configuration

This API is used for updating a replication task. If the request is successful, `200 OK` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

To modify the changefeed configuration, follow the steps of `pause the replication task -> modify the configuration -> resume the replication task`.

Request URI

`PUT /api/v2/changefeeds/{changefeed_id}`

Parameter descriptions

Path parameters

| Parameter name | Description |
| --- | --- |
| `changefeed_id` | The ID of the replication task (changefeed) to be updated. |

Parameters for the request body

```
{
  "replica_config": {
    "bdr_mode": true,
    "case_sensitive": false,
    "check_gc_safe_point": true,
    "consistent": {
      "flush_interval": 0,
      "level": "string",
      "max_log_size": 0,
      "storage": "string"
    },
    "enable_old_value": true,
    "enable_sync_point": true,
    "filter": {
      "do_dbs": [
        "string"
      ],
      "do_tables": [
```

```
      {
        "database_name": "string",
        "table_name": "string"
      }
    ],
    "event_filters": [
      {
        "ignore_delete_value_expr": "string",
        "ignore_event": [
          "string"
        ],
        "ignore_insert_value_expr": "string",
        "ignore_sql": [
          "string"
        ],
        "ignore_update_new_value_expr": "string",
        "ignore_update_old_value_expr": "string",
        "matcher": [
          "string"
        ]
      }
    ],
    "ignore_dbs": [
      "string"
    ],
    "ignore_tables": [
      {
        "database_name": "string",
        "table_name": "string"
      }
    ],
    "ignore_txn_start_ts": [
      0
    ],
    "rules": [
      "string"
    ]
  },
  "force_replicate": true,
  "ignore_ineligible_table": true,
  "memory_quota": 0,
  "mounter": {
    "worker_num": 0
  },
  "sink": {
```

```
      "column_selectors": [
        {
          "columns": [
            "string"
          ],
          "matcher": [
            "string"
          ]
        }
      ],
      "csv": {
        "delimiter": "string",
        "include_commit_ts": true,
        "null": "string",
        "quote": "string"
      },
      "date_separator": "string",
      "dispatchers": [
        {
          "matcher": [
            "string"
          ],
          "partition": "string",
          "topic": "string"
        }
      ],
      "enable_partition_separator": true,
      "encoder_concurrency": 0,
      "protocol": "string",
      "schema_registry": "string",
      "terminator": "string",
      "transaction_atomicity": "string"
    },
    "sync_point_interval": "string",
    "sync_point_retention": "string"
  },
  "sink_uri": "string",
  "target_ts": 0
}
```

Currently, only the following configurations can be modified via the API.

| Parameter name | Description |
| --- | --- |
| `target_ts` | `UINT64` type. Specifies the target TSO of the changefeed. (Optional) |

| Parameter name | Description |
|---|---|
| `sink_uri` | `STRING` type. The downstream address of the replication task. (Optional) |
| `replica_config` | The configuration parameters of sink. It must be complete. (Optional) |

The meanings of the above parameters are the same as those in the Create a replication task section. See that section for details.

Example

The following request updates the `target_ts` of the replication task with the ID `test1` to 32.

```
curl -X PUT -H "'Content-type':'application/json'" http://127.0.0.1:8300/
    ↪ api/v2/changefeeds/test1 -d '{"target_ts":32}'
```

If the request is successful, `200 OK` is returned. If the request fails, an error message and error code are returned. The meanings of the JSON response body are the same as those in the Create a replication task section. See that section for details.

#### 13.9.4.8.8 Query the replication task list

This API is a synchronous interface. If the request is successful, the basic information of all replication tasks (changefeed) in the TiCDC cluster is returned.

Request URI

`GET /api/v2/changefeeds`

Parameter descriptions

Query parameter

| Parameter name | Description |
|---|---|
| `state` | When this parameter is specified, the information of replication tasks in this specified state is returned. (Optional) |

The value options for `state` are `all`, `normal`, `stopped`, `error`, `failed`, and `finished`.

If this parameter is not specified, the basic information of replication tasks in the `normal`, `stopped`, or `failed` state is returned by default.

Example

The following request queries the basic information of all replication tasks in the `normal` state.

```
curl -X GET http://127.0.0.1:8300/api/v2/changefeeds?state=normal
```

```
{
  "total": 2,
  "items": [
    {
      "id": "test",
      "state": "normal",
      "checkpoint_tso": 439749918821711874,
      "checkpoint_time": "2023-02-27 23:46:52.888",
      "error": null
    },
    {
      "id": "test2",
      "state": "normal",
      "checkpoint_tso": 439749918821711874,
      "checkpoint_time": "2023-02-27 23:46:52.888",
      "error": null
    }
  ]
}
```

The parameters in the returned result above are described as follows:

- `id`: the ID of the replication task.
- `state`: the current state of the replication task.
- `checkpoint_tso`: the TSO of the current checkpoint of the replication task.
- `checkpoint_time`: the formatted time of the current checkpoint of the replication task.
- `error`: the error information of the replication task.

#### 13.9.4.8.9 Query a specific replication task

This API is a synchronous interface. If the request is successful, the detailed information of the specified replication task (changefeed) is returned.

Request URI

`GET /api/v2/changefeeds/{changefeed_id}`

Parameter description

Path parameter

| Parameter name | Description |
|---|---|
| `changefeed_id` | The ID of the replication task (changefeed) to be queried. |

Example

The following request queries the detailed information of the replication task with the ID `test1`.

```
curl -X GET http://127.0.0.1:8300/api/v2/changefeeds/test1
```

The meanings of the JSON response body are the same as those in the Create a replication task section. See that section for details.

#### 13.9.4.8.10 Query whether a specific replication task is completed

This API is a synchronous interface. If the request is successful, it returns the synchronization status of the specified replication task (changefeed), including whether the task is completed and additional details.

Request URI

`GET /api/v2/changefeed/{changefeed_id}/synced`

Parameter description

Path parameter

| Parameter name | Description |
|---|---|
| `changefeed_id` | The ID of the replication task (changefeed) to be queried. |

Examples

The following request queries the synchronization status of the replication task with the ID `test1`.

```
curl -X GET http://127.0.0.1:8300/api/v2/changefeed/test1/synced
```

**Example 1: The synchronization is completed**

```
{
  "synced": true,
  "sink_checkpoint_ts": "2023-11-30 15:14:11.015",
  "puller_resolved_ts": "2023-11-30 15:14:12.215",
  "last_synced_ts": "2023-11-30 15:08:35.510",
  "now_ts": "2023-11-30 15:14:11.511",
  "info": "Data syncing is finished"
}
```

The response includes the following fields:

- `synced`: whether this replication task is completed. `true` means the task is completed, and `false` means potential incompleteness. If it is `false`, you need to check both the `info` field and other fields for the specific status.

- `sink_checkpoint_ts`: the checkpoint-ts value of the sink module, in PD time.
- `puller_resolved_ts`: the resolved-ts value of the puller module, in PD time.
- `last_synced_ts`: the commit-ts value of the latest data processed by TiCDC, in PD time.
- `now_ts`: current PD time.
- `info`: supplementary information to assist in determining the synchronization status, especially when `synced` is `false`.

**Example 2: The synchronization is not completed**

```
{
  "synced": false,
  "sink_checkpoint_ts": "2023-11-30 15:26:31.519",
  "puller_resolved_ts": "2023-11-30 15:26:23.525",
  "last_synced_ts": "2023-11-30 15:24:30.115",
  "now_ts": "2023-11-30 15:26:31.511",
  "info": "The data syncing is not finished, please wait"
}
```

This example shows the response of an ongoing replication task. By checking both `synced` and `info` fields, you can learn that the replication task is not completed yet and further waiting is expected.

**Example 3: The synchronization status needs further check**

```
{
  "synced":false,
  "sink_checkpoint_ts":"2023-12-13 11:45:13.515",
  "puller_resolved_ts":"2023-12-13 11:45:13.525",
  "last_synced_ts":"2023-12-13 11:45:07.575",
  "now_ts":"2023-12-13 11:50:24.875",
  "info":"Please check whether PD is online and TiKV Regions are all
     ↪ available. If PD is offline or some TiKV regions are not available,
     ↪ it means that the data syncing process is complete. To check whether
     ↪  TiKV regions are all available, you can view 'TiKV-Details' > '
     ↪ Resolved-Ts' > 'Max Leader Resolved TS gap' on Grafana. If the gap
     ↪ is large, such as a few minutes, it means that some regions in TiKV
     ↪ are unavailable. Otherwise, if the gap is small and PD is online, it
     ↪  means the data syncing is incomplete, so please wait"
}
```

This API enables you to query the synchronization status even when the upstream cluster encounters disasters. In certain situations, you might not be able to directly determine whether the current data replication task of TiCDC is completed or not. In such cases, you can request this API, and then check both the `info` field in the response and the current status of the upstream cluster to determine the specific status.

In this example, `sink_checkpoint_ts` is behind `now_ts` in time, either because TiCDC is still catching up with data replication, or because the PD or TiKV has failed. If this is due to TiCDC still catching up with data replication, it means that the replication task is not completed yet. If this is due to a PD or TiKV failure, it means that the replication task is completed. Therefore, you need to check the `info` field to assist in determining the cluster status.

**Example 4: Query error**

```
{
  "error_msg": "[CDC:ErrPDEtcdAPIError]etcd api call error: context deadline
    ↪  exceeded",
  "error_code": "CDC:ErrPDEtcdAPIError"
}
```

In cases where PD in the upstream cluster fails for a long period of time, querying this API might return an error similar to the preceding one, which provides no information for further check. Because PD failures directly affect TiCDC data replication, when getting such errors, you can assume that TiCDC has completed the data replication as much as possible, but data loss might still occur in the downstream cluster due to PD failures.

#### 13.9.4.8.11 Pause a replication task

This API pauses a replication task. If the request is successful, `200 OK` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

Request URI

`POST /api/v2/changefeeds/{changefeed_id}/pause`

Parameter description

Path parameter

| Parameter name | Description |
|---|---|
| `changefeed_id` | The ID of the replication task (changefeed) to be paused. |

Example

The following request pauses the replication task with the ID `test1`.

```
curl -X POST http://127.0.0.1:8300/api/v2/changefeeds/test1/pause
```

If the request is successful, `200 OK` is returned. If the request fails, an error message and error code are returned.

#### 13.9.4.8.12 Resume a replication task

This API resumes a replication task. If the request is successful, `200 OK` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

Request URI

`POST /api/v2/changefeeds/{changefeed_id}/resume`

Parameter description

Path parameter

| Parameter name | Description |
| --- | --- |
| `changefeed_id` | The ID of the replication task (changefeed) to be resumed. |

Parameters for the request body

```
{
  "overwrite_checkpoint_ts": 0
}
```

| Parameter name | Description |
| --- | --- |
| `overwrite_checkpoint_ts` | `UINT64` type. Reassign a checkpoint TSO when resuming a replication task (changefeed). |

Example

The following request resumes the replication task with the ID `test1`.

```
curl -X POST http://127.0.0.1:8300/api/v2/changefeeds/test1/resume -d '{}'
```

If the request is successful, `200 OK` is returned. If the request fails, an error message and error code are returned.

#### 13.9.4.8.13 Query the replication subtask list

This API is a synchronous interface. If the request is successful, the basic information of all replication subtasks (`processor`) is returned.

Request URI

`GET /api/v2/processors`

Example

```
curl -X GET http://127.0.0.1:8300/api/v2/processors
```

```
{
  "total": 3,
  "items": [
    {
      "changefeed_id": "test2",
      "capture_id": "d2912e63-3349-447c-90ba-72a4e04b5e9e"
    },
    {
      "changefeed_id": "test1",
      "capture_id": "d2912e63-3349-447c-90ba-72a4e04b5e9e"
    },
    {
      "changefeed_id": "test",
      "capture_id": "d2912e63-3349-447c-90ba-72a4e04b5e9e"
    }
  ]
}
```

The parameters are described as follows:

- `changefeed_id`: the changefeed ID.
- `capture_id`: the capture ID.

#### 13.9.4.8.14 Query a specific replication subtask

This API is a synchronous interface. If the request is successful, the detailed information of the specified replication subtask (`processor`) is returned.

Request URI

`GET /api/v2/processors/{changefeed_id}/{capture_id}`

Parameter descriptions

Path parameters

| Parameter name | Description |
|---|---|
| `changefeed_id` | The changefeed ID of the replication subtask to be queried. |
| `capture_id` | The capture ID of the replication subtask to be queried. |

Example

The following request queries the detailed information of a subtask whose `changefeed_id` is `test` and `capture_id` is `561c3784-77f0-4863-ad52-65a3436db6af`. A subtask can be identified by `changefeed_id` and `capture_id`.

```
curl -X GET http://127.0.0.1:8300/api/v2/processors/test/561c3784-77f0-4863-
    ↪ ad52-65a3436db6af
```

```
{
  "table_ids": [
    80
  ]
}
```

The parameter is described as follows:

- `table_ids`: The table ID to be replicated on this capture.

#### 13.9.4.8.15 Query the TiCDC service process list

This API is a synchronous interface. If the request is successful, the basic information of all replication processes (`capture`) is returned.

Request URI

`GET /api/v2/captures`

Example

```
curl -X GET http://127.0.0.1:8300/api/v2/captures
```

```
{
  "total": 1,
  "items": [
    {
      "id": "d2912e63-3349-447c-90ba-72a4e04b5e9e",
      "is_owner": true,
      "address": "127.0.0.1:8300"
    }
  ]
}
```

The parameters are described as follows:

- `id`: the capture ID.
- `is_owner`: whether the capture is the owner.
- `address`: the address of the capture.

#### 13.9.4.8.16 Evict an owner node

This API is an asynchronous interface. If the request is successful, `200 OK` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

Request URI

`POST /api/v2/owner/resign`

Example

The following request evicts the current owner node of TiCDC and triggers a new round of elections to generate a new owner node.

```
curl -X POST http://127.0.0.1:8300/api/v2/owner/resign
```

If the request is successful, `200 OK` is returned. If the request fails, an error message and error code are returned.

#### 13.9.4.8.17 Dynamically adjust the log level of the TiCDC server

This API is a synchronous interface. If the request is successful, `200 OK` is returned.

Request URI

`POST /api/v2/log`

Request parameter

Parameter for the request body

| Parameter name | Description |
|---|---|
| `log_level` | The log level you want to set. |

`log_level` supports the log levels provided by zap: “debug”, “info”, “warn”, “error”, “dpanic” , “panic”, and “fatal”.

Example

```
curl -X POST -H "'Content-type':'application/json'" http://127.0.0.1:8300/
    ↪ api/v2/log -d '{"log_level":"debug"}'
```

If the request is successful, `200 OK` is returned. If the request fails, an error message and error code are returned.

### 13.9.4.9 TiCDC OpenAPI v1

**Note**

TiCDC OpenAPI v1 is deprecated and will be deleted in the future. It is recommended to use TiCDC OpenAPI v2.

TiCDC provides the OpenAPI feature for querying and operating the TiCDC cluster, which is similar to the feature of `cdc cli` tool.

You can use the APIs to perform the following maintenance operations on the TiCDC cluster:

- Get the status information of a TiCDC node
- Check the health status of a TiCDC cluster
- Create a replication task
- Remove a replication task
- Update the replication configuration
- Query the replication task list
- Query a specific replication task
- Pause a replication task
- Resume a replication task
- Query the replication subtask list
- Query a specific replication subtask
- Query the TiCDC service process list
- Evict an owner node
- Manually trigger the load balancing of all tables in a replication task
- Manually schedule a table to another node
- Dynamically adjust the log level of the TiCDC server

The request body and returned value of all APIs are in JSON format. The following sections describe the specific usage of the APIs.

In the following examples, the listening IP address of the TiCDC server is `127.0.0.1` and the port is `8300`. You can bind a specified IP and port via `--addr=ip:port` when starting the TiCDC server.

#### 13.9.4.9.1 API error message template

After sending an API request, if an error occurs, the returned error message is in the following format:

```
{
    "error_msg": "",
    "error_code": ""
}
```

From the above JSON output, `error_msg` describes the error message and `error_code` is the corresponding error code.

#### 13.9.4.9.2 Get the status information of a TiCDC node

This API is a synchronous interface. If the request is successful, the status information of the corresponding node is returned.

Request URI

`GET /api/v1/status`

Example

The following request gets the status information of the TiCDC node whose IP address is `127.0.0.1` and port number is `8300`.

```
curl -X GET http://127.0.0.1:8300/api/v1/status
```

```
{
    "version": "v5.2.0-master-dirty",
    "git_hash": "f191cd00c53fdf7a2b1c9308a355092f9bf8824e",
    "id": "c6a43c16-0717-45af-afd6-8b3e01e44f5d",
    "pid": 25432,
    "is_owner": true
}
```

The fields of the above output are described as follows:

- version: The current TiCDC version number.
- git_hash: The Git hash value.
- id: The capture ID of the node.
- pid: The capture process PID of the node.
- is_owner: Indicates whether the node is an owner.

#### 13.9.4.9.3 Check the health status of a TiCDC cluster

This API is a synchronous interface. If the cluster is healthy, `200 OK` is returned.

Request URI

`GET /api/v1/health`

Example

```
curl -X GET http://127.0.0.1:8300/api/v1/health
```

#### 13.9.4.9.4 Create a replication task

This API is an asynchronous interface. If the request is successful, `202 Accepted` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

Request URI

`POST /api/v1/changefeeds`

Parameter description

Compared to the optional parameters for creating a replication task using the `cli` command, the optional parameters for creating such task using the API are not as complete. This API supports the following parameters.

Parameters for the request body

Parameter name | Description |
:———————— | :————————- ——————————- |
`changefeed_id` | `STRING` type. The ID of the replication task. (Optional) |
`start_ts` | `UINT64` type. Specifies the start TSO of the changefeed. (Optional) |
`target_ts` | `UINT64` type. Specifies the target TSO of the changefeed. (Optional) |
**`sink_uri`** | `STRING` type. The downstream address of the replication task. (**Required**) |
`force_replicate` | `BOOLEAN` type. Determines whether to forcibly replicate the tables without unique indexes. (Optional) |
`ignore_ineligible_table` | `BOOLEAN` type. Determines whether to ignore the tables that cannot be replicated. (Optional) |
`filter_rules` | `STRING` type array. The rules for table schema filtering. (Optional) |
`ignore_txn_start_ts` | `UINT64` type array. Ignores the transaction of a specified start_ts. (Optional) |
`mounter_worker_num` | `INT` type. The mounter thread number. (Optional) |
`sink_config` | The configuration parameters of sink. (Optional) |

The meaning and format of `changefeed_id`, `start_ts`, `target_ts`, and `sink_uri` are the same as those described in the Use `cdc cli` to create a replication task document. For the detailed description of these parameters, see this document. Note that when you specify the certificate path in `sink_uri`, make sure you have uploaded the corresponding certificate to the corresponding TiCDC server.

Some other parameters in the above table are described further as follows.

`force_replicate`: This parameter defaults to `false`. When it is specified as `true`, TiCDC tries to forcibly replicate tables that do not have a unique index.

`ignore_ineligible_table`: This parameter defaults to `false`. When it is specified as `true`, TiCDC ignores tables that cannot be replicated.

`filter_rules`: The rules for table schema filtering, such as `filter_rules = ['foo *.*','bar*.*']`. For details, see the Table Filter document.

`ignore_txn_start_ts`: When this parameter is specified, the specified start_ts is ignored. For example, `ignore-txn-start-ts = [1, 2]`.

`mounter_worker_num`: The thread number of mounter. Mounter is used to decode the data output from TiKV. The default value is `16`.

The configuration parameters of sink are as follows:

```
{
  "dispatchers":[
    {"matcher":["test1.*", "test2.*"], "dispatcher":"ts"},
    {"matcher":["test3.*", "test4.*"], "dispatcher":"index-value"}
  ],
  "protocal":"canal-json"
}
```

`dispatchers`: For the sink of MQ type, you can use dispatchers to configure the event dispatcher. Four dispatchers are supported: `default`, `ts`, `index-value`, and `table`. The dispatcher rules are as follows:

- `default`: dispatches events in the `table` mode.
- `ts`: uses the commitTs of the row change to create the hash value and dispatch events.
- `index-value`: uses the name and value of the selected HandleKey column to create the hash value and dispatch events.
- `table`: uses the schema name of the table and the table name to create the hash value and dispatch events.

`matcher`: The matching syntax of matcher is the same as the filter rule syntax.

`protocol`: For the sink of MQ type, you can specify the protocol format of the message. Currently the following protocols are supported: `canal-json`, `open-protocol`, and `avro`.

Example

The following request creates a replication task with an ID of `test5` and a `sink_uri` of `blackhole://`.

```
curl -X POST -H "'Content-type':'application/json'" http://127.0.0.1:8300/
    ↪ api/v1/changefeeds -d '{"changefeed_id":"test5","sink_uri":"blackhole
    ↪ ://"}'
```

If the request is successful, `202 Accepted` is returned. If the request fails, an error message and error code are returned.

#### 13.9.4.9.5 Remove a replication task

This API is an asynchronous interface. If the request is successful, `202 Accepted` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

Request URI

`DELETE /api/v1/changefeeds/{changefeed_id}`

Parameter description

Path parameters

| Parameter name | Description |
|---|---|
| `changefeed_id` | The ID of the replication task (changefeed) to be removed. |

Example

The following request removes the replication task with the ID `test1`.

```
curl -X DELETE http://127.0.0.1:8300/api/v1/changefeeds/test1
```

If the request is successful, `202 Accepted` is returned. If the request fails, an error message and error code are returned.

#### 13.9.4.9.6 Update the replication configuration

This API is an asynchronous interface. If the request is successful, `202 Accepted` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

To modify the changefeed configuration, follow the steps of `pause the replication task -> modify the configuration -> resume the replication task`.

Request URI

`PUT /api/v1/changefeeds/{changefeed_id}`

Parameter description

Path parameters

| Parameter name | Description |
|---|---|
| `changefeed_id` | The ID of the replication task (changefeed) to be updated. |

Parameters for the request body

Currently, only the following configuration can be modified via the API.

Parameter name | Description |
:——————— | :———————— ———————— |
`target_ts` | `UINT64` type. Specifies the target TSO of the changefeed. (Optional) |
`sink_uri` | `STRING` type. The downstream address of the replication task. (Optional) |
`filter_rules` | `STRING` type array. The rules for table schema filtering. (Optional) |
`ignore_txn_start_ts` | `UINT64` type array. Ignores the transaction of a specified start_ts. (Optional) |

`mounter_worker_num` | `INT` type. The mounter thread number. (Optional) |
`sink_config` | The configuration parameters of sink. (Optional) |

The meanings of the above parameters are the same as those in the Create a replication task section. See that section for details.

Example

The following request updates the `mounter_worker_num` of the replication task with the ID `test1` to 32.

```
curl -X PUT -H "'Content-type':'application/json'" http://127.0.0.1:8300/
    ↪ api/v1/changefeeds/test1 -d '{"mounter_worker_num":32}'
```

If the request is successful, `202 Accepted` is returned. If the request fails, an error message and error code are returned.

#### 13.9.4.9.7 Query the replication task list

This API is a synchronous interface. If the request is successful, the basic information of all nodes in the TiCDC cluster is returned.

Request URI

`GET /api/v1/changefeeds`

Parameter description

Query parameters

Parameter name | Description |
:—— | :————————————- —— |
`state` | When this parameter is specified, the replication status information only of this state is returned.(Optional) |

The value options for `state` are `all`, `normal`, `stopped`, `error`, `failed`, and `finished`.

If this parameter is not specified, the basic information of replication tasks whose state is normal, stopped, or failed is returned by default.

Example

The following request queries the basic information of all replication tasks whose state is `normal`.

```
curl -X GET http://127.0.0.1:8300/api/v1/changefeeds?state=normal
```

```
[
    {
        "id": "test1",
        "state": "normal",
        "checkpoint_tso": 426921294362574849,
        "checkpoint_time": "2021-08-10 14:04:54.242",
```

```
        "error": null
    },
    {
        "id": "test2",
        "state": "normal",
        "checkpoint_tso": 426921294362574849,
        "checkpoint_time": "2021-08-10 14:04:54.242",
        "error": null
    }
]
```

The fields in the returned result above are described as follows:

- id: The ID of the replication task.
- state: The current state of the replication task.
- checkpoint_tso: The TSO representation of the current checkpoint of the replication task.
- checkpoint_time: The formatted time representation of the current checkpoint of the replication task.
- error: The error information of the replication task.

#### 13.9.4.9.8 Query a specific replication task

This API is a synchronous interface. If the request is successful, the detailed information of the specified replication task is returned.

Request URI

`GET /api/v1/changefeeds/{changefeed_id}`

Parameter description

Path parameters

| Parameter name | Description |
|---|---|
| `changefeed_id` | The ID of the replication task (changefeed) to be queried. |

Example

The following request queries the detailed information of the replication task with the ID `test1`.

```
curl -X GET http://127.0.0.1:8300/api/v1/changefeeds/test1
```

```
{
    "id": "test1",
    "sink_uri": "blackhole://",
```

```
    "create_time": "2021-08-10 11:41:30.642",
    "start_ts": 426919038970232833,
    "target_ts": 0,
    "checkpoint_tso": 426921014615867393,
    "checkpoint_time": "2021-08-10 13:47:07.093",
    "sort_engine": "unified",
    "state": "normal",
    "error": null,
    "error_history": null,
    "creator_version": "",
    "task_status": [
        {
            "capture_id": "d8924259-f52f-4dfb-97a9-c48d26395945",
            "table_ids": [
                63,
                65
            ],
            "table_operations": {}
        }
    ]
}
```

#### 13.9.4.9.9 Pause a replication task

This API is an asynchronous interface. If the request is successful, `202 Accepted` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

Request URI

`POST /api/v1/changefeeds/{changefeed_id}/pause`

Parameter description

Path parameters

| Parameter name | Description |
|---|---|
| `changefeed_id` | The ID of the replication task (changefeed) to be paused. |

Example

The following request pauses the replication task with the ID `test1`.

```
curl -X POST http://127.0.0.1:8300/api/v1/changefeeds/test1/pause
```

If the request is successful, `202 Accepted` is returned. If the request fails, an error message and error code are returned.

#### 13.9.4.9.10 Resume a replication task

This API is an asynchronous interface. If the request is successful, `202 Accepted` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

Request URI

`POST /api/v1/changefeeds/{changefeed_id}/resume`

Parameter description

Path parameters

| Parameter name | Description |
|---|---|
| `changefeed_id` | The ID of the replication task (changefeed) to be resumed. |

Example

The following request resumes the replication task with the ID `test1`.

```
curl -X POST http://127.0.0.1:8300/api/v1/changefeeds/test1/resume
```

If the request is successful, `202 Accepted` is returned. If the request fails, an error message and error code are returned.

#### 13.9.4.9.11 Query the replication subtask list

This API is a synchronous interface. If the request is successful, the basic information of all replication subtasks (`processor`) is returned.

Request URI

`GET /api/v1/processors`

Example

```
curl -X GET http://127.0.0.1:8300/api/v1/processors
```

```
[
    {
        "changefeed_id": "test1",
        "capture_id": "561c3784-77f0-4863-ad52-65a3436db6af"
    }
]
```

#### 13.9.4.9.12 Query a specific replication subtask

This API is a synchronous interface. If the request is successful, the detailed information of the specified replication subtask (`processor`) is returned.

Request URI

`GET /api/v1/processors/{changefeed_id}/{capture_id}`

Parameter description

Path parameters

| Parameter name | Description |
|---|---|
| `changefeed_id` | The changefeed ID of the replication subtask to be queried. |
| `capture_id` | The capture ID of the replication subtask to be queried. |

Example

The following request queries the detailed information of a subtask whose `changefeed_id` is `test` and `capture_id` is `561c3784-77f0-4863-ad52-65a3436db6af`. A subtask can be indentifed by `changefeed_id` and `capture_id`.

```
curl -X GET http://127.0.0.1:8300/api/v1/processors/test1/561c3784-77f0
    ↪ -4863-ad52-65a3436db6af
```

```
{
    "checkpoint_ts": 426919123303006208,
    "resolved_ts": 426919123369066496,
    "table_ids": [
        63,
        65
    ],
    "error": null
}
```

#### 13.9.4.9.13 Query the TiCDC service process list

This API is a synchronous interface. If the request is successful, the basic information of all replication processes (`capture`) is returned.

Request URI

`GET /api/v1/captures`

Example

```
curl -X GET http://127.0.0.1:8300/api/v1/captures
```

```
[
    {
        "id": "561c3784-77f0-4863-ad52-65a3436db6af",
        "is_owner": true,
```

```
        "address": "127.0.0.1:8300"
    }
]
```

#### 13.9.4.9.14 Evict an owner node

This API is an asynchronous interface. If the request is successful, `202 Accepted` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

Request URI

`POST /api/v1/owner/resign`

Example

The following request evicts the current owner node of TiCDC and triggers a new round of elections to generate a new owner node.

```
curl -X POST http://127.0.0.1:8300/api/v1/owner/resign
```

If the request is successful, `202 Accepted` is returned. If the request fails, an error message and error code are returned.

#### 13.9.4.9.15 Manually trigger the load balancing of all tables in a replication task

This API is an asynchronous interface. If the request is successful, `202 Accepted` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

Request URI

`POST /api/v1/changefeeds/{changefeed_id}/tables/rebalance_table`

Parameter description

Path parameters

| Parameter name | Description |
|---|---|
| `changefeed_id` | The ID of the replication task (changefeed) to be scheduled. |

Example

The following request triggers the load balancing of all tables in the changefeed with the ID `test1`.

```
curl -X POST http://127.0.0.1:8300/api/v1/changefeeds/test1/tables/
    ↪ rebalance_table
```

If the request is successful, `202 Accepted` is returned. If the request fails, an error message and error code are returned.

#### 13.9.4.9.16 Manually schedule a table to another node

This API is an asynchronous interface. If the request is successful, `202 Accepted` is returned. The returned result only means that the server agrees to run the command but does not guarantee that the command will be run successfully.

Request URI

`POST /api/v1/changefeeds/{changefeed_id}/tables/move_table`

Parameter description

Path parameters

| Parameter name | Description |
|---|---|
| `changefeed_id` | The ID of the replication task (changefeed) to be scheduled. |

Parameters for the request body

| Parameter name | Description |
|---|---|
| `target_capture_id` | The ID of the target capture. |
| `table_id` | The ID of the table to be scheduled. |

Example

The following request schedules the table with the ID `49` in the changefeed with the ID `test1` to the capture with the ID `6f19a6d9-0f8c-4dc9-b299-3ba7c0f216f5`.

```
curl -X POST -H "'Content-type':'application/json'" http://127.0.0.1:8300/
    ↪ api/v1/changefeeds/changefeed-test1/tables/move_table -d '{"
    ↪ capture_id":"6f19a6d9-0f8c-4dc9-b299-3ba7c0f216f5","table_id":49}'
```

If the request is successful, `202 Accepted` is returned. If the request fails, an error message and error code are returned.

#### 13.9.4.9.17 Dynamically adjust the log level of the TiCDC server

This API is a synchronous interface. If the request is successful, `202 OK` is returned.

Request URI

`POST /api/v1/log`

Request parameters

Parameters for the request body

| Parameter name | Description |
|---|---|
| `log_level` | The log level you want to set. |

`log_level` supports the log levels provided by zap: "debug", "info", "warn", "error", "dpanic" , "panic", and "fatal".

Example

```
curl -X POST -H "'Content-type':'application/json'" http://127.0.0.1:8300/
    ↪ api/v1/log -d '{"log_level":"debug"}'
```

If the request is successful, `202 OK` is returned. If the request fails, an error message and error code are returned.

#### 13.9.4.10 Guide for Developing a Storage Sink Consumer

This document describes how to design and implement a TiDB data change consumer.

> **Note:**
>
> The storage sink cannot handle the `DROP DATABASE` DDL. Therefore, avoid executing this DDL. If you do need to execute this DDL, execute it manually in the downstream MySQL.

TiCDC does not provide any standard way for implementing a consumer. This document provides a consumer example program written in Golang. This program can read data from the storage service and write the data to a MySQL-compatible database. You can refer to the data format and instructions provided in this example to implement a consumer on your own.

Consumer program written in Golang

##### 13.9.4.10.1 Design a consumer

The following diagram shows the overall consumption process of the consumer:

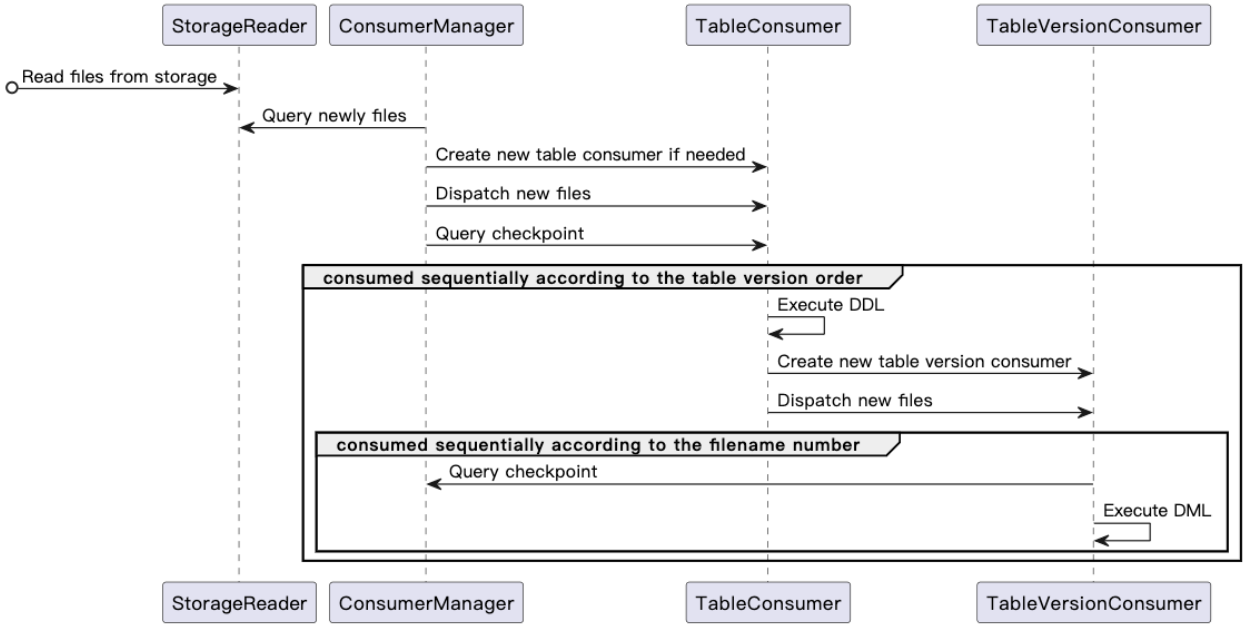

Figure 345: TiCDC storage consumer overview

The components of the consumer and their features are described as follows:

```
type StorageReader struct {
}
// Read the files from storage.
// Add new files and delete files that do not exist in storage.
func (c *StorageReader) ReadFiles() {}

// Query newly added files and the latest checkpoint from storage. One file
    ↪ can only be returned once.
func (c *StorageReader) ExposeNewFiles() (int64, []string) {}

// ConsumerManager is responsible for assigning tasks to TableConsumer.
// Different consumers can consume data concurrently,
// but data of one table must be processed by the same TableConsumer.
type ConsumerManager struct {
  // StorageCheckpoint is recorded in the metadata file, and it can be
      ↪ fetched by calling `StorageReader.ExposeNewFiles()`.
  // This checkpoint indicates that the data whose transaction commit time
      ↪ is less than this checkpoint has been stored in storage.
  StorageCheckpoint int64
  // This checkpoint indicates where the consumer has consumed.
  // ConsumerManager periodically collects TableConsumer.Checkpoint,
  // then Checkpoint is updated to the minimum value of all TableConsumer.
      ↪ Checkpoint.
```

```
  Checkpoint int64

  tableFiles[schema][table]*TableConsumer
}

// Query newly added files from StorageReader.
// For a newly created table, create a TableConsumer for it.
// If any, send new files to the corresponding TableConsumer.
func (c *ConsumerManager) Dispatch() {}
type TableConsumer struct {
  // This checkpoint indicates where this TableConsumer has consumed.
  // Its initial value is ConsumerManager.Checkpoint.
  // TableConsumer.Checkpoint is equal to TableVersionConsumer.Checkpoint.
  Checkpoint int64

  schema,table string
  // Must be consumed sequentially according to the order of table versions.
  verConsumers map[version int64]*TableVersionConsumer
  currentVer, previousVer int64
}

// Send newly added files to the corresponding TableVersionConsumer.
// For any DDL, assign a TableVersionConsumer for the new table version.
func (tc *TableConsumer) Dispatch() {}

// If DDL query is empty or its tableVersion is less than TableConsumer.
   ↪ Checkpoint,
// - ignore this DDL, and consume the data under the table version.
// Otherwise,
// - execute the DDL first, and then consume the data under the table
   ↪ version.
// - For tables that are dropped, auto-recycling is performed after the drop
   ↪  table DDL is executed.
func (tc *TableConsumer) ExecuteDDL() {}

type TableVersionConsumer struct {
  // This checkpoint indicates where the TableVersionConsumer has consumed.
  // Its initial value is TableConsumer.Checkpoint.
  Checkpoint int64

  schema,table,version string
  // For the same table version, data in different partitions can be
     ↪ consumed concurrently.
  # partitionNum int64
  // Must be consumed sequentially according to the data file number.
```

```
  fileSet map[filename string]*TableVersionConsumer
  currentVersion
}
// If data commit ts is less than TableConsumer.Checkpoint
// or bigger than ConsumerManager.StorageCheckpoint,
// - ignore this data.
// Otherwise,
// - process this data and write it to MySQL.
func (tc *TableVersionConsumer) ExecuteDML() {}
```

#### 13.9.4.10.2 Process DDL events

The consumer traverses the directory for the first time. The following is an example:

```
├── metadata
├── test
    ├── tbl_1
        ├── 437752935075545091
            ├── CDC000001.json
            ├── schema.json
```

The consumer parses the table schema of the `schema.json` file and obtains the DDL Query statements:

- If no Query statement is found or `TableVersion` is less than the consumer checkpoint, the consumer skips this statement.
- If Query statements exist or `TableVersion` is equal to or greater than the consumer checkpoint, the consumer executes the DDL statements in the downstream MySQL.

Then the consumer starts replicating the `CDC000001.json` file.

In the following example, the DDL Query statement in the `test/tbl_1/437752935075545091/schema.json` file is not empty:

```
{
    "Table":"test",
    "Schema":"tbl_1",
    "Version": 1,
    "TableVersion":437752935075545091,
    "Query": "create table tbl_1 (Id int primary key, LastName char(20),
        ↪ FirstName varchar(30), HireDate datetime, OfficeLocation Blob(20))
        ↪ ",
    "TableColumns":[
        {
            "ColumnName":"Id",
            "ColumnType":"INT",
```

```
            "ColumnNullable":"false",
            "ColumnIsPk":"true"
        },
        {
            "ColumnName":"LastName",
            "ColumnType":"CHAR",
            "ColumnLength":"20"
        },
        {
            "ColumnName":"FirstName",
            "ColumnType":"VARCHAR",
            "ColumnLength":"30"
        },
        {
            "ColumnName":"HireDate",
            "ColumnType":"DATETIME"
        },
        {
            "ColumnName":"OfficeLocation",
            "ColumnType":"BLOB",
            "ColumnLength":"20"
        }
    ],
    "TableColumnsTotal":"5"
}
```

When the consumer traverses the directory again, it finds a new version directory of the table. Note that the consumer can consume data in the new directory only after all files in the `test/tbl_1/437752935075545091` directory have been consumed.

```
├── metadata
├── test
    ├── tbl_1
        ├── 437752935075545091
            ├── CDC000001.json
            ├── schema.json
        ├── 437752935075546092
            ├── CDC000001.json
            ├── schema.json
```

The consumption logic is consistent. Specifically, the consumer parses the table schema of the `schema.json` file and obtains and processes DDL Query statements accordingly. Then the consumer starts replicating the `CDC000001.json` file.

#### 13.9.4.10.3 Process DML events

After DDL events are properly processed, you can process DML events in the `{schema}/{table}/{table-version-separator}/` directory based on the specific file format (CSV or Canal-JSON) and file number.

TiCDC ensures that data is replicated at least once. Therefore, there might be duplicate data. You need to compare the commit ts of the change data with the consumer checkpoint. If the commit ts is less than the consumer checkpoint, you need to perform deduplication.

#### 13.9.4.11 TiCDC Compatibility

This section describes compatibility issues related to TiCDC and how to handle them.

##### 13.9.4.11.1 Compatibility with TiDB Lightning

TiDB Lightning provides two data import modes: logical import mode and physical import mode. This section describes the compatibility of these modes with TiCDC and the steps to use TiDB Lightning and TiCDC together in a cluster.

In the logical import mode, TiDB Lightning imports data by executing SQL statements. This mode is compatible with TiCDC. To use TiDB Lightning's logical import mode with TiCDC for data replication, perform the following steps:

1. Create a changefeed. For more information, see Create a replication task.
2. Start TiDB Lightning and import data using the logical import mode. For more information, see Use logical import mode.

In the physical import mode, TiDB Lightning imports data by inserting SST files into TiKV. TiCDC is not compatible with this mode and does not support replicating data imported through physical import mode. If you need to use both TiDB Lightning's physical import mode and TiCDC, choose one of the following solutions based on your downstream system:

- If the downstream is a TiDB cluster, perform the following steps:

    1. Use TiDB Lightning to import data into both the upstream and downstream TiDB clusters to ensure data consistency.
    2. Create a changefeed to replicate subsequent incremental data written through SQL. For more information, see Create a replication task.

- If the downstream is not a TiDB cluster, perform the following steps:

    1. Use the offline import tool provided by your downstream system to import TiDB Lightning's input files.
    2. Create a changefeed to replicate subsequent incremental data written through SQL. For more information, see Create a replication task.

#### 13.9.4.11.2 CLI and configuration file compatibility

- In TiCDC v4.0.0, `ignore-txn-commit-ts` is removed and `ignore-txn-start-ts` is added, which uses start_ts to filter transactions.
- In TiCDC v4.0.2, `db-dbs/db-tables/ignore-dbs/ignore-tables` are removed and `rules` is added, which uses new filter rules for databases and tables. For detailed filter syntax, see Table Filter.
- Starting from TiCDC v6.2.0, `cdc cli` can directly interact with TiCDC server via TiCDC Open API. You can specify the address of the TiCDC server using the `--server` parameter. `--pd` is deprecated.
- Since v6.4.0, only the changefeed with the `SYSTEM_VARIABLES_ADMIN` or `SUPER` privilege can use the TiCDC Syncpoint feature.

#### 13.9.4.11.3 Handle compatibility issues

This section describes compatibility issues related to TiCDC and how to handle them.

Incompatibility issue caused by using the TiCDC v5.0.0-rc `cdc cli` tool to operate a v4.0.x cluster

When using the `cdc cli` tool of TiCDC v5.0.0-rc to operate a v4.0.x TiCDC cluster, you might encounter the following abnormal situations:

- If the TiCDC cluster is v4.0.8 or an earlier version, using the v5.0.0-rc `cdc cli` tool to create a replication task might cause cluster anomalies and get the replication task stuck.
- If the TiCDC cluster is v4.0.9 or a later version, using the v5.0.0-rc `cdc cli` tool to create a replication task will cause the old value and unified sorter features to be unexpectedly enabled by default.

Solutions:

Use the `cdc` executable file corresponding to the TiCDC cluster version to perform the following operations:

1. Delete the changefeed created using the v5.0.0-rc `cdc cli` tool. For example, run the `tiup cdc:v4.0.9 cli changefeed remove -c xxxx --pd=xxxxx --force` command.
2. If the replication task is stuck, restart the TiCDC cluster. For example, run the `tiup cluster restart <cluster_name> -R cdc` command.
3. Re-create the changefeed. For example, run the `tiup cdc:v4.0.9 cli changefeed create --sink-uri=xxxx --pd=xxx` command.

**Note:**

This issue exists only when `cdc cli` is v5.0.0-rc. `cdc cli` tool of other v5.0.x versions is compatible with v4.0.x clusters.

Compatibility notes for `sort-dir` and `data-dir`

The `sort-dir` configuration is used to specify the temporary file directory for the TiCDC sorter. Its functionalities might vary in different versions. The following table lists `sort-dir`'s compatibility changes across versions.

| | sort ↪ - ↪ engine ↪ function- ality | Note | Recommendation |
|---|---|---|---|
| Version | | | |
| | sort ↪ - ↪ engine ↪ function- ality | Note | Recommendation |
| v4.0.11 or an earlier v4.0 version, v5.0.0-rc | It is a changefeed configuration item and specifies temporary file directory for the file sorter and unified ↪ sorter. | In these versions, file ↪ sorter and unified ↪ sorter are **experimental features** and **NOT** recommended for the production environment. If mul- | It is not recommended to use unified ↪ sorter in the production environment. |
| | | 2754 | |

| | sort ↪ - ↪ engine ↪ functionality | Note | Recommendation |
|---|---|---|---|
| v4.0.12, v4.0.13, v5.0.0, and v5.0.1 | It is a configuration item of changefeed or of cdc ↪ server ↪ . | By default, the sort ↪ - ↪ dir ↪ configuration item of a changefeed does not take effect, and the sort ↪ - ↪ dir ↪ configuration of cdc ↪ ↪ server ↪ defaults to / | You need to configure sort ↪ - ↪ dir ↪ using the cdc ↪ ↪ server ↪ command-line parameter (or TiUP). |
| | 2755 | | |

| Version | sort ↪ - ↪ engine ↪ functionality | Note | Recommendation |
|---|---|---|---|
| v4.0.14 and later v4.0 versions, v5.0.3 and later v5.0 versions, later TiDB versions | sort ↪ - ↪ dir ↪ is deprecated. It is recommended to configure data ↪ - ↪ dir ↪ . | You can configure data ↪ - ↪ dir ↪ using the latest version of TiUP. In these TiDB versions, unified sorter is enabled by default. Make sure that data ↪ - ↪ dir ↪ has been con- | You need to configure data ↪ - ↪ dir ↪ using the cdc ↪ ↪ server ↪ ↪ command-line parameter (ed TiUP). |

| Version | functionality | Note | Recommendation |
|---|---|---|---|
| | `sort-engine` | | |
| v6.0.0 and later versions | `data-dir` is used for saving the temporary files generated by TiCDC. | Starting from v6.0.0, TiCDC uses `db sorter` as the sort engine by default. `data-dir` is the disk directory for this engine. | You need to configure `data-dir` using the `cdc server` command-line parameter (or TiUP). |

Compatibility with temporary tables

Since v5.3.0, TiCDC supports global temporary tables. Replicating global temporary tables to the downstream using TiCDC of a version earlier than v5.3.0 causes table definition error.

If the upstream cluster contains a global temporary table, the downstream TiDB cluster

is expected to be v5.3.0 or a later version. Otherwise, an error occurs during the replication process.

### 13.9.5 Troubleshoot TiCDC

This document introduces the common errors you might encounter when using TiCDC, and the corresponding maintenance and troubleshooting methods.

> **Note:**
>
> In this document, the server address specified in `cdc cli` commands is `server =http://127.0.0.1:8300`. When you use the command, replace the address with your actual TiCDC Server address.

#### 13.9.5.1 TiCDC replication interruptions

##### 13.9.5.1.1 How do I know whether a TiCDC replication task is interrupted?

- Check the `changefeed checkpoint` monitoring metric of the replication task (choose the right `changefeed id`) in the Grafana dashboard. If the metric value stays unchanged, or the `checkpoint lag` metric keeps increasing, the replication task might be interrupted.
- Check the `exit error count` monitoring metric. If the metric value is greater than `0`, an error has occurred in the replication task.
- Execute `cdc cli changefeed list` and `cdc cli changefeed query` to check the status of the replication task. `stopped` means the task has stopped, and the `error` item provides the detailed error message. After the error occurs, you can search `error on running processor` in the TiCDC server log to see the error stack for troubleshooting.
- In some extreme cases, the TiCDC service is restarted. You can search the `FATAL` level log in the TiCDC server log for troubleshooting.

##### 13.9.5.1.2 How do I know whether the replication task is stopped manually?

You can know whether the replication task is stopped manually by executing `cdc cli`. For example:

```
cdc cli changefeed query --server=http://127.0.0.1:8300 --changefeed-id 28
    ↪ c43ffc-2316-4f4f-a70b-d1a7c59ba79f
```

In the output of the above command, `admin-job-type` shows the state of this replication task. For more information about each state and its meaning, see Changefeed states.

#### 13.9.5.1.3 How do I handle replication interruptions?

A replication task might be interrupted in the following known scenarios:

- The downstream continues to be abnormal, and TiCDC still fails after many retries.
    - In this scenario, TiCDC saves the task information. Because TiCDC has set the service GC safepoint in PD, the data after the task checkpoint is not cleaned by TiKV GC within the valid period of `gc-ttl`.
    - Handling method: You can resume the replication task by executing `cdc cli changefeed resume` after the downstream is back to normal.
- Replication cannot continue because of incompatible SQL statement(s) in the downstream.
    - In this scenario, TiCDC saves the task information. Because TiCDC has set the service GC safepoint in PD, the data after the task checkpoint is not cleaned by TiKV GC within the valid period of `gc-ttl`.
    - Handling procedures:
        1. Query the status information of the replication task using the `cdc cli changefeed query` command and record the value of `checkpoint-ts`.
        2. Use the new task configuration file and add the `ignore-txn-start-ts` parameter to skip the transaction corresponding to the specified `start-ts`.
        3. Pause the replication task by executing `cdc cli changefeed pause -c <changefeed-id>`.
        4. Specify the new task configuration file by executing `cdc cli changefeed update -c <changefeed-id> --config <config-file-path>`.
        5. Resume the replication task by executing `cdc cli changefeed resume -c <changefeed-id>`.

#### 13.9.5.1.4 What should I do to handle the OOM that occurs after TiCDC is restarted after a task interruption?

- Update your TiDB cluster and TiCDC cluster to the latest versions. The OOM problem has already been resolved in **v4.0.14 and later v4.0 versions, v5.0.2 and later v5.0 versions, and the latest versions**.

#### 13.9.5.2 How do I handle the `Error 1298: Unknown or incorrect time zone: 'UTC'` error when creating the replication task or replicating data to MySQL?

This error is returned when the downstream MySQL does not load the time zone. You can load the time zone by running `mysql_tzinfo_to_sql`. After loading the time zone, you can create tasks and replicate data normally.

```
mysql_tzinfo_to_sql /usr/share/zoneinfo | mysql -u root mysql -p
```

If the output of the command above is similar to the following one, the import is successful:

```
Enter password:
Warning: Unable to load '/usr/share/zoneinfo/iso3166.tab' as time zone.
    ↪ Skipping it.
Warning: Unable to load '/usr/share/zoneinfo/leap-seconds.list' as time zone
    ↪ . Skipping it.
Warning: Unable to load '/usr/share/zoneinfo/zone.tab' as time zone.
    ↪ Skipping it.
Warning: Unable to load '/usr/share/zoneinfo/zone1970.tab' as time zone.
    ↪ Skipping it.
```

If the downstream is a special MySQL environment (a public cloud RDS or some MySQL derivative versions) and importing the time zone using the preceding method fails, you can use the default time zone of the downstream by setting `time-zone` to an empty value, such as `time-zone=""`.

When using time zones in TiCDC, it is recommended to explicitly specify the time zone, such as `time-zone="Asia/Shanghai"`. Also, make sure that the `tz` specified in TiCDC server configurations and the `time-zone` specified in Sink URI are consistent with the time zone configuration of the downstream database. This prevents data inconsistency caused by inconsistent time zones.

#### 13.9.5.3 How do I handle the incompatibility issue of configuration files caused by TiCDC upgrade?

Refer to Notes for compatibility.

#### 13.9.5.4 The `start-ts` timestamp of the TiCDC task is quite different from the current time. During the execution of this task, replication is interrupted and an error `[CDC:ErrBufferReachLimit]` occurs. What should I do?

Since v4.0.9, you can try to enable the unified sorter feature in your replication task, or use the BR tool for an incremental backup and restore, and then start the TiCDC replication task from a new time.

#### 13.9.5.5 When the downstream of a changefeed is a database similar to MySQL and TiCDC executes a time-consuming DDL statement, all other changefeeds are blocked. What should I do?

1. Pause the execution of the changefeed that contains the time-consuming DDL statement. Then you can see that other changefeeds are no longer blocked.
2. Search for the `apply job` field in the TiCDC log and confirm the `start-ts` of the time-consuming DDL statement.
3. Manually execute the DDL statement in the downstream. After the execution finishes, go on performing the following operations.
4. Modify the changefeed configuration and add the above `start-ts` to the `ignore-txn-start-ts` configuration item.
5. Resume the paused changefeed.

#### 13.9.5.6 After I upgrade the TiCDC cluster to v4.0.8, the `[CDC:ErrKafkaInvalidConfig]Canal requires old value to be enabled` error is reported when I execute a changefeed. What should I do?

Since v4.0.8, if the `canal-json` protocol is used for output in a changefeed, TiCDC enables the old value feature automatically. However, if you have upgraded TiCDC from an earlier version to v4.0.8 or later, when the changefeed uses the `canal-json` protocol and the old value feature is disabled, this error is reported.

To fix the error, take the following steps:

1. Set the value of `enable-old-value` in the changefeed configuration file to `true`.
2. Execute `cdc cli changefeed pause` to pause the replication task.

```
cdc cli changefeed pause -c test-cf --server=http://127.0.0.1:8300
```

3. Execute `cdc cli changefeed update` to update the original changefeed configuration.

```
cdc cli changefeed update -c test-cf --server=http://127.0.0.1:8300 --
    ↪ sink-uri="mysql://127.0.0.1:3306/?max-txn-row=20&worker-number=8"
    ↪  --config=changefeed.toml
```

4. Execute `cdc cli changfeed resume` to resume the replication task.

```
cdc cli changefeed resume -c test-cf --server=http://127.0.0.1:8300
```

#### 13.9.5.7 The `[tikv:9006]GC life time is shorter than transaction duration, transaction starts at xx, GC safe point is yy` error is reported when I use TiCDC to create a changefeed. What should I do?

You need to run the `pd-ctl service-gc-safepoint --pd <pd-addrs>` command to query the current GC safepoint and service GC safepoint. If the GC safepoint is smaller than the `start-ts` of the TiCDC replication task (changefeed), you can directly add the `--disable-gc-check` option to the `cdc cli create changefeed` command to create a changefeed.

If the result of `pd-ctl service-gc-safepoint --pd <pd-addrs>` does not have `gc_worker service_id`:

- If your PD version is v4.0.8 or earlier, refer to PD issue #3128 for details.
- If your PD is upgraded from v4.0.8 or an earlier version to a later version, refer to PD issue #3366 for details.

#### 13.9.5.8 When I use TiCDC to replicate messages to Kafka, Kafka returns the `Message was too large` error. Why?

For TiCDC v4.0.8 or earlier versions, you cannot effectively control the size of the message output to Kafka only by configuring the `max-message-bytes` setting for Kafka in the Sink URI. To control the message size, you also need to increase the limit on the bytes of messages to be received by Kafka. To add such a limit, add the following configuration to the Kafka server configuration.

```
### The maximum byte number of a message that the broker receives
message.max.bytes=2147483648
### The maximum byte number of a message that the broker copies
replica.fetch.max.bytes=2147483648
### The maximum message byte number that the consumer side reads
fetch.message.max.bytes=2147483648
```

#### 13.9.5.9 How can I find out whether a DDL statement fails to execute in downstream during TiCDC replication? How to resume the replication?

If a DDL statement fails to execute, the replication task (changefeed) automatically stops. The checkpoint-ts is the DDL statement's finish-ts. If you want TiCDC to retry executing this statement in the downstream, use `cdc cli changefeed resume` to resume the replication task. For example:

```
cdc cli changefeed resume -c test-cf --server=http://127.0.0.1:8300
```

If you want to skip this DDL statement that goes wrong, set the start-ts of the changefeed to the checkpoint-ts (the timestamp at which the DDL statement goes wrong) plus one, and then run the `cdc cli changefeed create` command to create a new changefeed task. For example, if the checkpoint-ts at which the DDL statement goes wrong is `415241823337054209`, run the following commands to skip this DDL statement:

To skip this DDL statement that goes wrong, you can configure the `ignore-txn-start-ts` parameter to skip the transactions corresponding to the specified `start-ts`. For example:

1. Search the TiCDC log for the `apply job` field, and identify the `start-ts` of the DDLs that are taking a long time.
2. Modify the changefeed configuration. Add the above `start-ts` to the `ignore-txn-start-ts` configuration item.
3. Resume the suspended changefeed.

> **Note:**
>
> Although setting the changefeed `start-ts` to the value of `checkpoint-ts` (at the time of the error) plus one and then recreating the task can skip the DDL statement, it can also cause TiCDC to lose the DML data change at the time of `checkpointTs+1`. Therefore, this operation is strictly prohibited in production environments.

```
cdc cli changefeed remove --server=http://127.0.0.1:8300 --changefeed-id
    ↪ simple-replication-task
cdc cli changefeed create --server=http://127.0.0.1:8300 --sink-uri="mysql
    ↪ ://root:123456@127.0.0.1:3306/" --changefeed-id="simple-replication-
    ↪ task" --sort-engine="unified" --start-ts 415241823337054210
```

### 13.9.6 TiCDC FAQs

This document introduces the common questions that you might encounter when using TiCDC.

> **Note:**
>
> In this document, the server address specified in `cdc cli` commands is `--server=http://127.0.0.1:8300`. When you use the command, replace the address with your actual PD address.

#### 13.9.6.1 How do I choose `start-ts` when creating a task in TiCDC?

The `start-ts` of a replication task corresponds to a Timestamp Oracle (TSO) in the upstream TiDB cluster. TiCDC requests data from this TSO in a replication task. Therefore, the `start-ts` of the replication task must meet the following requirements:

- The value of `start-ts` is larger than the `tikv_gc_safe_point` value of the current TiDB cluster. Otherwise, an error occurs when you create a task.

- Before starting a task, ensure that the downstream has all data before `start-ts`. For scenarios such as replicating data to message queues, if the data consistency between upstream and downstream is not required, you can relax this requirement according to your application need.

If you do not specify `start-ts`, or specify `start-ts` as `0`, when a replication task is started, TiCDC gets a current TSO and starts the task from this TSO.

#### 13.9.6.2 Why can't some tables be replicated when I create a task in TiCDC?

When you execute `cdc cli changefeed create` to create a replication task, TiCDC checks whether the upstream tables meet the replication requirements. If some tables do not meet the requirements, `some tables are not eligible to replicate` is returned with a list of ineligible tables. You can choose `Y` or `y` to continue creating the task, and all updates on these tables are automatically ignored during the replication. If you choose an input other than `Y` or `y`, the replication task is not created.

#### 13.9.6.3 How do I view the state of TiCDC replication tasks?

To view the status of TiCDC replication tasks, use `cdc cli`. For example:

```
cdc cli changefeed list --server=http://127.0.0.1:8300
```

The expected output is as follows:

```
[{
    "id": "4e24dde6-53c1-40b6-badf-63620e4940dc",
    "summary": {
      "state": "normal",
      "tso": 417886179132964865,
      "checkpoint": "2020-07-07 16:07:44.881",
      "error": null
    }
}]
```

- `checkpoint`: TiCDC has replicated all data before this timestamp to downstream.
- `state`: The state of this replication task. For more information about each state and its meaning, see Changefeed states.

> **Note:**
>
> This feature is introduced in TiCDC 4.0.3.

#### 13.9.6.4 How to verify if TiCDC has replicated all updates after upstream stops updating?

After the upstream TiDB cluster stops updating, you can verify if replication is complete by comparing the latest TSO timestamp of the upstream TiDB cluster with the replication progress in TiCDC. If the TiCDC replication progress timestamp is greater than or equal to the upstream TiDB cluster's TSO, then all updates have been replicated. To verify replication completeness, perform the following steps:

1. Get the latest TSO timestamp from the upstream TiDB cluster.

> **Note:**
> Use the `TIDB_CURRENT_TSO()` function to get the current TSO, instead of using functions like `NOW()` that return the current time.

The following example uses `TIDB_PARSE_TSO()` to convert the TSO to a readable time format for further comparison:

```
BEGIN;
SELECT TIDB_PARSE_TSO(TIDB_CURRENT_TSO());
ROLLBACK;
```

The output is as follows:

```
+-----------------------------------+
| TIDB_PARSE_TSO(TIDB_CURRENT_TSO()) |
+-----------------------------------+
| 2024-11-12 20:35:34.848000     |
+-----------------------------------+
```

2. Get the replication progress in TiCDC.

   You can check the replication progress in TiCDC using one of the following methods:

   - **Method 1**: query the checkpoint of the changefeed (recommended).

     Use the TiCDC command-line tool `cdc cli` to view the checkpoint for all replication tasks:

     ```
     cdc cli changefeed list --server=http://127.0.0.1:8300
     ```

     The output is as follows:

     ```
     [
       {
         "id": "syncpoint",
         "namespace": "default",
     ```

```
    "summary": {
      "state": "normal",
      "tso": 453880043653562372,
      "checkpoint": "2024-11-12 20:36:01.447",
      "error": null
    }
  }
]
```

In the output, `"checkpoint": "2024-11-12 20:36:01.447"` indicates that TiCDC has replicated all upstream TiDB changes before this time. If this timestamp is greater than or equal to the upstream TiDB cluster's TSO obtained in step 1, then all updates have been replicated downstream.

- **Method 2**: query Syncpoint from the downstream TiDB.

  If the downstream is a TiDB cluster and the TiCDC Syncpoint feature is enabled, you can get the replication progress by querying the Syncpoint in the downstream TiDB.

> **Note:**
> The Syncpoint update interval is controlled by the `sync-point-interval` configuration item. For the most up-to-date replication progress, use method 1.

Execute the following SQL statement in the downstream TiDB to get the upstream TSO (`primary_ts`) and downstream TSO (`secondary_ts`):

```
SELECT * FROM tidb_cdc.syncpoint_v1;
```

The output is as follows:

```
+--
   ↪ ---------------+------------+--------------------+--------------------
   ↪
| ticdc_cluster_id | changefeed | primary_ts   | secondary_ts     |
   ↪ created_at        |
+--
   ↪ ---------------+------------+--------------------+--------------------
   ↪
| default          | syncpoint | 453879870259200000 |
   ↪ 453879870545461257 | 2024-11-12 20:25:01 |
| default          | syncpoint | 453879948902400000 |
   ↪ 453879949214351361 | 2024-11-12 20:30:01 |
| default          | syncpoint | 453880027545600000 |
   ↪ 453880027751907329 | 2024-11-12 20:35:00 |
```

```
+--
    ↪ ----------------+------------+--------------------+--------------------
    ↪
```

In the output, each row shows the upstream TiDB snapshot at `primary_ts` matches the downstream TiDB snapshot at `secondary_ts`.

To view the replication progress, convert the latest `primary_ts` to a readable time format:

```
SELECT TIDB_PARSE_TSO(453880027545600000);
```

The output is as follows:

```
+-----------------------------------+
| TIDB_PARSE_TSO(453880027545600000) |
+-----------------------------------+
| 2024-11-12 20:35:00               |
+-----------------------------------+
```

If the time corresponding to the latest `primary_ts` is greater than or equal to the upstream TiDB cluster's TSO obtained in step 1, then TiCDC has replicated all updates downstream.

#### 13.9.6.5 What is `gc-ttl` in TiCDC?

Since v4.0.0-rc.1, PD supports external services in setting the service-level GC safepoint. Any service can register and update its GC safepoint. PD ensures that the key-value data later than this GC safepoint is not cleaned by GC.

When the replication task is unavailable or interrupted, this feature ensures that the data to be consumed by TiCDC is retained in TiKV without being cleaned by GC.

When starting the TiCDC server, you can specify the Time To Live (TTL) duration of GC safepoint by configuring `gc-ttl`. You can also use TiUP to modify `gc-ttl`. The default value is 24 hours. In TiCDC, this value means:

- The maximum time the GC safepoint is retained at the PD after the TiCDC service is stopped.
- The maximum time a replication task can be suspended after the task is interrupted or manually stopped. If the time for a suspended replication task is longer than the value set by `gc-ttl`, the replication task enters the `failed` status, cannot be resumed, and cannot continue to affect the progress of the GC safepoint.

The second behavior above is introduced in TiCDC v4.0.13 and later versions. The purpose is to prevent a replication task in TiCDC from suspending for too long, causing the GC safepoint of the upstream TiKV cluster not to continue for a long time and retaining too many outdated data versions, thus affecting the performance of the upstream cluster.

**Note:**

In some scenarios, for example, when you use TiCDC for incremental replication after full replication with Dumpling/BR, the default 24 hours of `gc-ttl` may not be sufficient. You need to specify an appropriate value for `gc-ttl` when you start the TiCDC server.

#### 13.9.6.6 What is the complete behavior of TiCDC garbage collection (GC) safepoint?

If a replication task starts after the TiCDC service starts, the TiCDC owner updates the PD service GC safepoint with the smallest value of `checkpoint-ts` among all replication tasks. The service GC safepoint ensures that TiCDC does not delete data generated at that time and after that time. If the replication task is interrupted, or manually stopped, the `checkpoint-ts` of this task does not change. Meanwhile, PD's corresponding service GC safepoint is not updated either.

If the replication task is suspended longer than the time specified by `gc-ttl`, the replication task enters the `failed` status and cannot be resumed. The PD corresponding service GC safepoint will continue.

The Time-To-Live (TTL) that TiCDC sets for a service GC safepoint is 24 hours, which means that the GC mechanism does not delete any data if the TiCDC service can be recovered within 24 hours after it is interrupted.

#### 13.9.6.7 How to understand the relationship between the TiCDC time zone and the time zones of the upstream/downstream databases?

| Configuration method | Upstream TiDB time zone | TiCDC Server Time Zone Support | TiCDC Configured using the `--tz` parameter when you start the TiCDC server | Downstream time zone | Configured using the `time-zone` parameter in `sink-uri` |
|---|---|---|---|---|---|

| | Upstream time zone | TiCDC time zone | Downstream time zone |
| --- | --- | --- | --- |
| Description | The time zone of the upstream TiDB, which affects DML operations of the timestamp type and DDL operations related to timestamp type columns. | TiCDC assumes that the upstream TiDB's time zone is the same as the TiCDC time zone configuration, and performs related operations on the timestamp column. | The downstream MySQL processes the timestamp in the DML and DDL operations according to the downstream time zone setting. |

**Note:**

Be careful when you set the time zone of the TiCDC server, because this time zone is used for converting the time type. Keep the upstream time zone, TiCDC time zone, and the downstream time zone consistent. The TiCDC server chooses its time zone in the following priority:

- TiCDC first uses the time zone specified using `--tz`.
- When `--tz` is not available, TiCDC tries to read the time zone set using the `TZ` environment variable.
- When the `TZ` environment variable is not available, TiCDC uses the default time zone of the machine.

#### 13.9.6.8 What is the default behavior of TiCDC if I create a replication task without specifying the configuration file in `--config`?

If you use the `cdc cli changefeed create` command without specifying the `-config` parameter, TiCDC creates the replication task in the following default behaviors:

- Replicates all tables except system tables
- Enables the Old Value feature
- Only replicates tables that contain valid indexes

#### 13.9.6.9 Does TiCDC support outputting data changes in the Canal protocol?

Yes. Note that for the Canal protocol, TiCDC only supports the JSON output format, while the protobuf format is not officially supported yet. To enable Canal output, specify `protocol` as `canal-json` in the `--sink-uri` configuration. For example:

```
cdc cli changefeed create --server=http://127.0.0.1:8300 --sink-uri="kafka
    ↪ ://127.0.0.1:9092/cdc-test?kafka-version=2.4.0&protocol=canal-json"
    ↪ --config changefeed.toml
```

**Note:**

- This feature is introduced in TiCDC 4.0.2.
- TiCDC currently supports outputting data changes in the Canal-JSON format only to MQ sinks such as Kafka.

For more information, refer to TiCDC changefeed configurations.

#### 13.9.6.10 Why does the latency from TiCDC to Kafka become higher and higher?

- Check how do I view the state of TiCDC replication tasks.
- Adjust the following parameters of Kafka:
    - Increase the `message.max.bytes` value in `server.properties` to `1073741824` (1 GB).
    - Increase the `replica.fetch.max.bytes` value in `server.properties` to `1073741824` (1 GB).
    - Increase the `fetch.message.max.bytes` value in `consumer.properties` to make it larger than the `message.max.bytes` value.

#### 13.9.6.11 When TiCDC replicates data to Kafka, can I control the maximum size of a single message in TiDB?

When `protocol` is set to `avro` or `canal-json`, messages are sent per row change. A single Kafka message contains only one row change and is generally no larger than Kafka's limit. Therefore, there is no need to limit the size of a single message. If the size of a single Kafka message does exceed Kakfa's limit, refer to Why does the latency from TiCDC to Kafka become higher and higher?.

When `protocol` is set to `open-protocol`, messages are sent in batches. Therefore, one Kafka message might be excessively large. To avoid this situation, you can configure the `max-message-bytes` parameter to control the maximum size of data sent to the Kafka broker each time (optional, `10MB` by default). You can also configure the `max-batch-size` parameter (optional, `16` by default) to specify the maximum number of change records in each Kafka message.

#### 13.9.6.12 If I modify a row multiple times in a transaction, will TiCDC output multiple row change events?

No. When you modify the same row in one transaction multiple times, TiDB only sends the latest modification to TiKV. Therefore, TiCDC can only obtain the result of the latest modification.

#### 13.9.6.13 When TiCDC replicates data to Kafka, does a message contain multiple types of data changes?

Yes. A single message might contain multiple `updates` or `deletes`, and `update` and `delete` might co-exist.

#### 13.9.6.14 When TiCDC replicates data to Kafka, how do I view the timestamp, table name, and schema name in the output of TiCDC Open Protocol?

The information is included in the key of Kafka messages. For example:

```
{
    "ts":<TS>,
    "scm":<Schema Name>,
    "tbl":<Table Name>,
    "t":1
}
```

For more information, refer to TiCDC Open Protocol event format.

#### 13.9.6.15 When TiCDC replicates data to Kafka, how do I know the timestamp of the data changes in a message?

You can get the unix timestamp by moving `ts` in the key of the Kafka message by 18 bits to the right.

#### 13.9.6.16 How does TiCDC Open Protocol represent `null`?

In TiCDC Open Protocol, the type code `6` represents `null`.

| Type | Code | Output Example | Note |
|---|---|---|---|
| Null | 6 | `{"t":6,"v":null}` | |

For more information, refer to TiCDC Open Protocol column type code.

#### 13.9.6.17 How can I tell if a Row Changed Event of TiCDC Open Protocol is an `INSERT` event or an `UPDATE` event?

If the Old Value feature is not enabled, you cannot tell whether a Row Changed Event of TiCDC Open Protocol is an `INSERT` event or an `UPDATE` event. If the feature is enabled, you can determine the event type by the fields it contains:

- `UPDATE` event contains both `"p"` and `"u"` fields
- `INSERT` event only contains the `"u"` field
- `DELETE` event only contains the `"d"` field

For more information, refer to Open protocol Row Changed Event format.

#### 13.9.6.18 How much PD storage does TiCDC use?

When using TiCDC, you might encounter the `etcdserver: mvcc: database space exceeded` error, which is primarily related to the mechanism that TiCDC uses etcd in PD to store metadata.

etcd uses Multi-Version Concurrency Control (MVCC) to store data, and the default compaction interval in PD is 1 hour. This means that etcd retains multiple versions of all data for 1 hour before compaction.

Before v6.0.0, TiCDC uses etcd in PD to store and update metadata for all tables in a changefeed. Therefore, the PD storage space used by TiCDC is proportional to the number of tables being replicated by the changefeed. When TiCDC is replicating a large number of tables, the etcd storage space could fill up quickly, increasing the probability of the `etcdserver: mvcc: database space exceeded` error.

If you encounter this error, refer to etcd maintenance space-quota to clean up the etcd storage space.

Starting from v6.0.0, TiCDC optimizes its metadata storage mechanism, effectively avoiding the etcd storage space issues caused by the preceding reasons. If your TiCDC version is earlier than v6.0.0, it is recommended to upgrade to v6.0.0 or later versions.

#### 13.9.6.19 Does TiCDC support replicating large transactions? Is there any risk?

TiCDC provides partial support for large transactions (more than 5 GB in size). Depending on different scenarios, the following risks might exist:

- The latency of primary-secondary replication might greatly increase.
- When TiCDC's internal processing capacity is insufficient, the replication task error `ErrBufferReachLimit` might occur.
- When TiCDC's internal processing capacity is insufficient or the throughput capacity of TiCDC's downstream is insufficient, out of memory (OOM) might occur.

Since v6.2, TiCDC supports splitting a single-table transaction into multiple transactions. This can greatly reduce the latency and memory consumption of replicating large transactions. Therefore, if your application does not have a high requirement on transaction atomicity, it is recommended to enable the splitting of large transactions to avoid possible replication latency and OOM. To enable the splitting, set the value of the sink uri parameter `transaction-atomicity` to `none`.

If you still encounter an error above, it is recommended to use BR to restore the incremental data of large transactions. The detailed operations are as follows:

1. Record the `checkpoint-ts` of the changefeed that is terminated due to large transactions, use this TSO as the `--lastbackupts` of the BR incremental backup, and execute incremental data backup.

2. After backing up the incremental data, you can find a log record similar to `["Full backup Failed summary : total backup ranges: 0, total success: 0, total failed: 0"] [BackupTS=421758868510212097]` in the BR log output. Record the `BackupTS` in this log.
3. Restore the incremental data.
4. Create a new changefeed and start the replication task from `BackupTS`.
5. Delete the old changefeed.

#### 13.9.6.20 The default value of the time type field is inconsistent when replicating a DDL statement to the downstream MySQL 5.7. What can I do?

Suppose that the `create table test (id int primary key, ts timestamp)` statement is executed in the upstream TiDB. When TiCDC replicates this statement to the downstream MySQL 5.7, MySQL uses the default configuration. The table schema after the replication is as follows. The default value of the `timestamp` field becomes `CURRENT_TIMESTAMP`:

```
mysql root@127.0.0.1:test> show create table test;
+--
   ↪ -----+-----------------------------------------------------------------------
   ↪
| Table | Create Table
   ↪                                                                    |
+--
   ↪ -----+-----------------------------------------------------------------------
   ↪
| test | CREATE TABLE `test` (
   ↪                                                        |
|      |   `id` int(11) NOT NULL,
   ↪                                                      |
|      |   `ts` timestamp NOT NULL DEFAULT CURRENT_TIMESTAMP ON UPDATE
   ↪ CURRENT_TIMESTAMP, |
|      |   PRIMARY KEY (`id`)
   ↪                                                       |
|      | ) ENGINE=InnoDB DEFAULT CHARSET=latin1
   ↪                                    |
+--
   ↪ -----+-----------------------------------------------------------------------
   ↪
1 row in set
```

From the result, you can see that the table schema before and after the replication is inconsistent. This is because the default value of `explicit_defaults_for_timestamp` in TiDB is different from that in MySQL. See MySQL Compatibility for details.

Since v5.0.1 or v4.0.13, for each replication to MySQL, TiCDC automatically sets `explicit_defaults_for_timestamp = ON` to ensure that the time type is consistent

between the upstream and downstream. For versions earlier than v5.0.1 or v4.0.13, pay attention to the compatibility issue caused by the inconsistent `explicit_defaults_for_timestamp` value when using TiCDC to replicate the time type data.

#### 13.9.6.21 Why do `INSERT/UPDATE` statements from the upstream become `REPLACE INTO` after being replicated to the downstream if I set `safe-mode` to `true` when I create a TiCDC replication task?

TiCDC guarantees that all data is replicated at least once. When there is duplicate data in the downstream, write conflicts occur. To avoid this problem, TiCDC converts `INSERT` and `UPDATE` statements into `REPLACE INTO` statements. This behavior is controlled by the `safe-mode` parameter.

In versions earlier than v6.1.3, the default value of `safe-mode` is `true`, which means all `INSERT` and `UPDATE` statements are converted into `REPLACE INTO` statements.

In v6.1.3 and later versions, the default value of `safe-mode` changes to `false`, and TiCDC can automatically determine whether the downstream has duplicate data. If no duplicate data is detected, TiCDC directly replicates `INSERT` and `UPDATE` statements without conversion; otherwise, TiCDC converts `INSERT` and `UPDATE` statements into `REPLACE INTO` statements and then replicates them.

#### 13.9.6.22 When the sink of the replication downstream is TiDB or MySQL, what permissions do users of the downstream database need?

When the sink is TiDB or MySQL, the users of the downstream database need the following permissions:

- `Select`
- `Index`
- `Insert`
- `Update`
- `Delete`
- `Create`
- `Drop`
- `Alter`
- `Create View`

If you need to replicate `recover table` to the downstream TiDB, you should have the `Super` permission.

#### 13.9.6.23 Why does TiCDC use disks? When does TiCDC write to disks? Does TiCDC use memory buffer to improve replication performance?

When upstream write traffic is at peak hours, the downstream may fail to consume all data in a timely manner, resulting in data pile-up. TiCDC uses disks to process the data

that is piled up. TiCDC needs to write data to disks during normal operation. However, this is not usually the bottleneck for replication throughput and replication latency, given that writing to disks only results in latency within a hundred milliseconds. TiCDC also uses memory to accelerate reading data from disks to improve replication performance.

#### 13.9.6.24 Why does replication using TiCDC stall or even stop after data restore using TiDB Lightning and BR from upstream?

Currently, TiCDC is not yet fully compatible with TiDB Lightning and BR. Therefore, avoid using TiDB Lightning and BR on tables that are replicated by TiCDC. Otherwise, unknown errors might occur, such as TiCDC replication getting stuck, a significant spike in replication latency, or data loss.

If you need to use TiDB Lightning or BR to restore data for some tables replicated by TiCDC, take these steps:

1. Remove the TiCDC replication task related to these tables.
2. Use TiDB Lightning or BR to restore data separately in the upstream and downstream clusters of TiCDC.
3. After the restoration is complete and data consistency between the upstream and downstream clusters is verified, create a new TiCDC replication task for incremental replication, with the timestamp (TSO) from the upstream backup as the `start-ts` for the task. For example, assuming the snapshot timestamp of the BR backup in the upstream cluster is `431434047157698561`, you can create a new TiCDC replication task using the following command:

```
cdc cli changefeed create -c "upstream-to-downstream-some-tables" --
    ↪ start-ts=431434047157698561 --sink-uri="mysql://root@127
    ↪ .0.0.1:4000? time-zone="
```

#### 13.9.6.25 After a changefeed resumes from pause, its replication latency gets higher and higher and returns to normal only after a few minutes. Why?

When a changefeed is resumed, TiCDC needs to scan the historical versions of data in TiKV to catch up with the incremental data logs generated during the pause. The replication process proceeds only after the scan is completed. The scan process might take several to tens of minutes.

#### 13.9.6.26 How should I deploy TiCDC to replicate data between two TiDB cluster located in different regions?

For TiCDC versions earlier than v6.5.2, it is recommended that you deploy TiCDC in the downstream TiDB cluster. If the network latency between the upstream and downstream is high, for example, more than 100 ms, the latency produced when TiCDC executes SQL

statements to the downstream might increase dramatically due to the MySQL transmission protocol issues. This results in a decrease in system throughput. However, deploying TiCDC in the downstream can greatly ease this problem. After optimization, starting from TiCDC v6.5.2, it is recommended that you deploy TiCDC in the upstream TiDB cluster.

#### 13.9.6.27 What is the order of executing DML and DDL statements?

Currently, TiCDC adopts the following order:

1. TiCDC blocks the replication progress of the tables affected by DDL statements until the DDL `commitTS`. This ensures that DML statements executed before DDL `commitTS` can be successfully replicated to the downstream first.
2. TiCDC continues with the replication of DDL statements. If there are multiple DDL statements, TiCDC replicates them in a serial manner.
3. After the DDL statements are executed in the downstream, TiCDC will continue with the replication of DML statements executed after DDL `commitTS`.

#### 13.9.6.28 How should I check whether the upstream and downstream data is consistent?

If the downstream is a TiDB cluster or MySQL instance, it is recommended that you compare the data using sync-diff-inspector.

#### 13.9.6.29 Replication of a single table can only be run on a single TiCDC node. Will it be possible to use multiple TiCDC nodes to replicate data of multiple tables?

This feature is currently not supported, which might be supported in a future release. By then, TiCDC might replicate data change logs by TiKV Region, which means scalable processing capability.

#### 13.9.6.30 Does TiCDC replication get stuck if the upstream has long-running uncommitted transactions?

TiDB has a transaction timeout mechanism. When a transaction runs for a period longer than `max-txn-ttl`, TiDB forcibly rolls it back. TiCDC waits for the transaction to be committed before proceeding with the replication, which causes replication delay.

#### 13.9.6.31 What changes occur to the change event format when TiCDC enables the Old Value feature?

In the following description, the definition of a valid index is as follows:

- A primary key (`PRIMARY KEY`) is a valid index.

- A unique index (`UNIQUE INDEX`) is valid if every column of the index is explicitly defined as non-nullable (`NOT NULL`) and the index does not have a virtual generated column (`VIRTUAL GENERATED COLUMNS`).

TiDB supports the clustered index feature starting from v5.0. This feature controls how data is stored in tables containing primary keys. For more information, see Clustered indexes.

After you enable the Old Value feature, TiCDC behaves as follows:

- For change events on invalid index columns, the output contains both new and old values.
- For change events on valid index columns, the output varies based on certain conditions:
  - If a unique index column (`UNIQUE INDEX`) is updated and the table has no primary key, the output contains both new and old values.
  - If the clustered index is disabled in the upstream TiDB cluster, and a non-INT type primary key column is updated, the output contains both new and old values.
  - Otherwise, the change event is split into a delete event for the old value and an insert event for the new value.

The preceding behavior change might lead to the following issues.

#### 13.9.6.31.1 When change events on a valid index column contains both new and old values, the distribution behavior of Kafka Sink might not guarantee that change events with the same index columns are distributed to the same partition

The index-value mode of Kafka Sink distributes events according to the value of the index column. When change events contain both new and old values, the value of the index column changes, which might cause change events with the same index column to be distributed to different partitions. The following is an example:

Create table `t` when the TiDB clustered index feature is disabled:

```
CREATE TABLE t (a VARCHAR(255) PRIMARY KEY NONCLUSTERED);
```

Execute the following DML statements:

```
INSERT INTO t VALUES ("2");
UPDATE t SET a="1" WHERE a="2";
INSERT INTO t VALUES ("2");
UPDATE t SET a="3" WHERE a="2";
```

- When the Old Value feature is disabled, the change event is split into a delete event for the old value and an insert event for the new value. The index-value dispatcher of Kafka Sink calculates the corresponding partition for each event. The preceding DML events will be distributed to the following partitions:

| partition-1 | partition-2 | partition-3 |
|---|---|---|
| INSERT a = 2<br>DELETE a = 2<br>INSERT a = 2<br>DELETE a = 2 | INSERT a = 1 | INSERT a = 3 |

Because Kafka guarantees message order in each partition, consumers can independently process data in each partition, and get the same result as the DML execution order.

- When the Old Value feature is enabled, the index-value dispatcher of Kafka Sink distributes change events with the same index columns to different partitions. Therefore, the preceding DML will be distributed to the following partitions (change events contain both new and old values):

| partition-1 | partition-2 | partition-3 |
|---|---|---|
| INSERT a = 2<br>INSERT a = 2 | UPDATE a = 1 WHERE a = 2 | UPDATE a = 3 WHERE a = 2 |

Because Kafka does not guarantee message order between partitions, the preceding DML might not preserve the update order of the index column during consumption. To maintain the order of index column updates when the output contains both new and old values, you can use the default dispatcher when enabling the Old Value feature.

#### 13.9.6.31.2 When change events on an invalid index column and change events on a valid index column both contain new and old values, the Avro format of Kafka Sink cannot correctly output the old value

In the Avro implementation, Kafka message values only contain the current column values. Therefore, old values cannot be output correctly when an event contains both new and old values. To output the old value, you can disable the Old Value feature to get the split delete and insert events.

#### 13.9.6.31.3 When change events on an invalid index column and change events on a valid index column both contain new and old values, the CSV format of Cloud Storage Sink cannot correctly output the old value

Because a CSV file has a fixed number of columns, old values cannot be output correctly when an event contains both new and old values. To output the old value, you can use the Canal-JSON format.

### 13.9.6.32 Why can't I use the `cdc cli` command to operate a TiCDC cluster deployed by TiDB Operator?

This is because the default port number of the TiCDC cluster deployed by TiDB Operator is `8301`, while the default port number of the `cdc cli` command to connect to the TiCDC server is `8300`. When using the `cdc cli` command to operate the TiCDC cluster deployed by TiDB Operator, you need to explicitly specify the `--server` parameter, as follows:

```
./cdc cli changefeed list --server "127.0.0.1:8301"
[
  {
    "id": "4k-table",
    "namespace": "default",
    "summary": {
      "state": "stopped",
      "tso": 441832628003799353,
      "checkpoint": "2023-05-30 22:41:57.910",
      "error": null
    }
  },
  {
    "id": "big-table",
    "namespace": "default",
    "summary": {
      "state": "normal",
      "tso": 441872834546892882,
      "checkpoint": "2023-06-01 17:18:13.700",
      "error": null
    }
  }
]
```

#### 13.9.6.33 Does TiCDC replicate generated columns of DML operations?

Generated columns include virtual generated columns and stored generated columns. TiCDC ignores virtual generated columns and only replicates stored generated columns to the downstream. However, stored generated columns are also ignored when the downstream is MySQL or another MySQL-compatible database (rather than Kafka or other storage services).

> **Note:**
>
> When replicating stored generated columns to Kafka or a storage service and then writing them back to MySQL, `Error 3105 (HY000): The value ↪ specified for generated column 'xx' in table 'xxx' is not ↪ allowed` might occur. To avoid this error, you can use Open Protocol for

replication. The output of this protocol includes bit flags of columns, which can distinguish whether a column is a generated column.

#### 13.9.6.34 How do I resolve frequent `CDC:ErrMySQLDuplicateEntryCDC` errors?

When using TiCDC to replicate data to TiDB or MySQL, you might encounter the following error if SQL statements in the upstream are executed in a specific pattern:

```
CDC:ErrMySQLDuplicateEntryCDC
```

The cause of the error: TiDB combines `DELETE + INSERT` operations on the same row within the same transaction into a single `UPDATE` row change. When TiCDC replicates these changes as updates to the downstream, the `UPDATE` operations attempting to swap unique key values might result in conflicts.

Taking the following table as an example:

```
CREATE TABLE data_table (
    id BIGINT(20) NOT NULL PRIMARY KEY,
    value BINARY(16) NOT NULL,
    UNIQUE KEY value_index (value)
) CHARSET=utf8mb4 COLLATE=utf8mb4_bin;
```

If the upstream attempts to swap the `value` field of the two rows in the table:

```
DELETE FROM data_table WHERE id = 1;
DELETE FROM data_table WHERE id = 2;
INSERT INTO data_table (id, value) VALUES (1, 'v3');
INSERT INTO data_table (id, value) VALUES (2, 'v1');
```

TiDB generates two `UPDATE` row changes, so TiCDC converts them into two `UPDATE` statements for replication to the downstream:

```
UPDATE data_table SET value = 'v3' WHERE id = 1;
UPDATE data_table SET value = 'v1' WHERE id = 2;
```

If the downstream table still contains `v1` when executing the second `UPDATE` statement, it violates the unique key constraint on the `value` column, resulting in the `CDC:ErrMySQLDuplicateEntryCDC` error.

If the `CDC:ErrMySQLDuplicateEntryCDC` error occurs frequently, you can enable TiCDC safe mode by setting the `safe-mode=true` parameter in the `sink-uri` configuration:

```
mysql://user:password@host:port/?safe-mode=true
```

In safe mode, TiCDC splits the `UPDATE` operation into `DELETE + REPLACE INTO` for execution, thus avoiding the unique key conflict error.

### 13.9.7 TiCDC Glossary

This glossary provides TiCDC-related terms and definitions. These terms appears in TiCDC logs, monitoring metrics, configurations, and documents.

For TiDB-related terms and definitions, refer to TiDB glossary.

#### 13.9.7.1 C

##### 13.9.7.1.1 Capture

A single TiCDC instance on which the replication task of the cluster runs. Multiple captures form a TiCDC cluster.

##### 13.9.7.1.2 Changed data

The data to be written to TiCDC from the upstream TiDB cluster, including the DML-caused data changes and the DDL-caused table schema changes.

##### 13.9.7.1.3 Changefeed

An incremental replication task in TiCDC, which outputs the data change logs of several tables in a TiDB cluster to the designated downstream.

#### 13.9.7.2 O

##### 13.9.7.2.1 Owner

A capture of a special role that manages the TiCDC cluster and schedules replication tasks of the cluster. An owner is elected by captures and there is at most one owner at any time.

#### 13.9.7.3 P

##### 13.9.7.3.1 Processor

TiCDC replication tasks allocate data tables on TiCDC instances, and the processor refers to the replication processing unit of these tables. Processor tasks include pulling, sorting, restoring, and distributing changed data.

## 13.10 TiDB Binlog

### 13.10.1 TiDB Binlog Cluster Overview

This document introduces the architecture and the deployment of the cluster version of TiDB Binlog.

TiDB Binlog is a tool used to collect binlog data from TiDB and provide near real-time backup and replication to downstream platforms.

TiDB Binlog has the following features:

- **Data replication:** replicate the data in the TiDB cluster to other databases
- **Real-time backup and restoration:** back up the data in the TiDB cluster and restore the TiDB cluster when the cluster fails

> **Note:**
>
> TiDB Binlog is not compatible with some features introduced in TiDB v5.0 and they cannot be used together. For details, see Notes. It is recommended to use TiCDC instead of TiDB Binlog.

#### 13.10.1.1 TiDB Binlog architecture

The TiDB Binlog architecture is as follows:

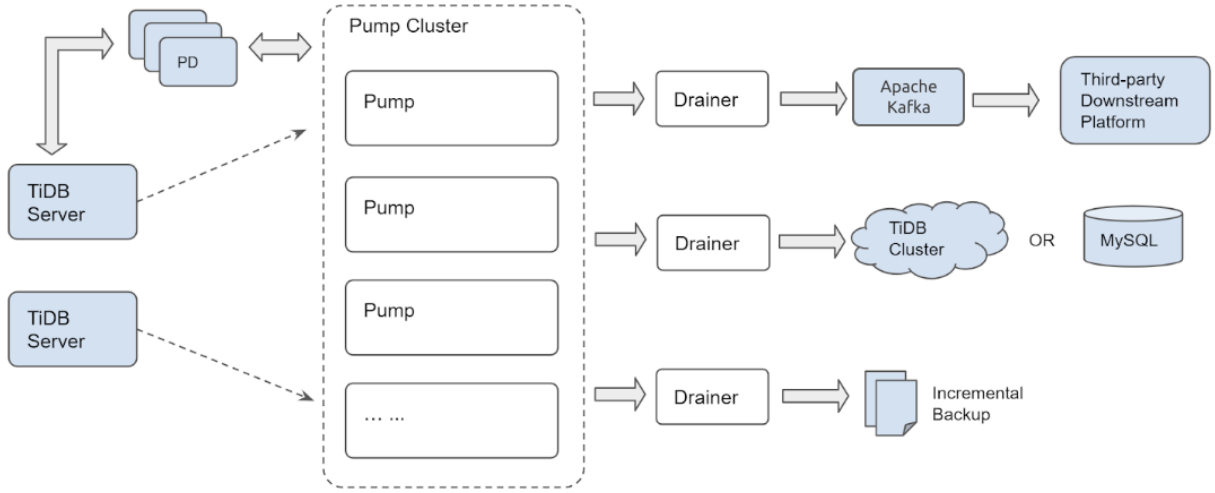

Figure 346: TiDB Binlog architecture

The TiDB Binlog cluster is composed of Pump and Drainer.

##### 13.10.1.1.1 Pump

Pump is used to record the binlogs generated in TiDB, sort the binlogs based on the commit time of the transaction, and send binlogs to Drainer for consumption.

#### 13.10.1.1.2 Drainer

Drainer collects and merges binlogs from each Pump, converts the binlog to SQL or data of a specific format, and replicates the data to a specific downstream platform.

#### 13.10.1.1.3 `binlogctl` guide

`binlogctl` is an operations tool for TiDB Binlog with the following features:

- Obtaining the current `tso` of TiDB cluster
- Checking the Pump/Drainer state
- Modifying the Pump/Drainer state
- Pausing or closing Pump/Drainer

### 13.10.1.2 Main features

- Multiple Pumps form a cluster which can scale out horizontally
- TiDB uses the built-in Pump Client to send the binlog to each Pump
- Pump stores binlogs and sends the binlogs to Drainer in order
- Drainer reads binlogs of each Pump, merges and sorts the binlogs, and sends the binlogs downstream
- Drainer supports relay log. By the relay log, Drainer ensures that the downstream clusters are in a consistent state.

### 13.10.1.3 Notes

- In v5.1, the incompatibility between the clustered index feature introduced in v5.0 and TiDB Binlog has been resolved. After you upgrade TiDB Binlog and TiDB Server to v5.1 and enable TiDB Binlog, TiDB will support creating tables with clustered indexes; data insertion, deletion, and update on the created tables with clustered indexes will be replicated to the downstream via TiDB Binlog. When you use TiDB Binlog to replicate the tables with clustered indexes, pay attention to the following:
    - If you have upgraded the cluster to v5.1 from v5.0 by manually controlling the upgrade sequence, make sure that TiDB binlog is upgraded to v5.1 before upgrading the TiDB server to v5.1.
    - It is recommended to configure the system variable `tidb_enable_clustered_index` ↪ to a same value to ensure that the structure of TiDB clustered index tables between the upstream and downstream is consistent.
- TiDB Binlog is incompatible with the following features introduced in TiDB v5.0 and they cannot be used together.

    - TiDB Clustered Index: After TiDB Binlog is enabled, TiDB does not allow creating clustered indexes with non-single integer columns as primary keys; data insertion, deletion, and update of the created clustered index tables will not be replicated downstream via TiDB Binlog. If you need to replicate tables with clustered indexes, upgrade your cluster to v5.1 or use TiCDC instead.
    - TiDB system variable tidb_enable_async_commit: After TiDB Binlog is enabled, performance cannot be improved by enabling this option. It is recommended to use TiCDC instead of TiDB Binlog.
    - TiDB system variable tidb_enable_1pc: After TiDB Binlog is enabled, performance cannot be improved by enabling this option. It is recommended to use TiCDC instead of TiDB Binlog.

- TiDB Binlog is incompatible with the following feature introduced in TiDB v4.0.7 and they cannot be used together:

    - TiDB system variable tidb_enable_amend_pessimistic_txn: The two features have compatibility issues. Using them together might cause the issue that TiDB Binlog replicates data inconsistently.

- Drainer supports replicating binlogs to MySQL, TiDB, Kafka or local files. If you need to replicate binlogs to other Drainer unsuppored destinations, you can set Drainer to replicate the binlog to Kafka and read the data in Kafka for customized processing according to binlog consumer protocol. See Binlog Consumer Client User Guide.

- To use TiDB Binlog for recovering incremental data, set the config `db-type` to `file` ↪ (local files in the proto buffer format). Drainer converts the binlog to data in the specified proto buffer format and writes the data to local files. In this way, you can use Reparo to recover data incrementally.

  Pay attention to the value of `db-type`:

    - If your TiDB version is earlier than 2.1.9, set `db-type="pb"`.
    - If your TiDB version is 2.1.9 or later, set `db-type="file"` or `db-type="pb"`.

- If the downstream is MySQL, MariaDB, or another TiDB cluster, you can use sync-diff-inspector to verify the data after data replication.

### 13.10.2 TiDB Binlog Tutorial

This tutorial starts with a simple TiDB Binlog deployment with a single node of each component (Placement Driver, TiKV Server, TiDB Server, Pump, and Drainer), set up to push data into a MariaDB Server instance.

This tutorial is targeted toward users who have some familiarity with the TiDB Architecture, who may have already set up a TiDB cluster (not mandatory), and who wants to gain hands-on experience with TiDB Binlog. This tutorial is a good way to "kick the tires" of TiDB Binlog and to familiarize yourself with the concepts of its architecture.

**Warning:**

The instructions to deploy TiDB in this tutorial should **not** be used to deploy TiDB in a production or development setting.

This tutorial assumes you're using a modern Linux distribution on x86-64. A minimal CentOS 7 installation running in VMware is used in this tutorial for the examples. It's recommended that you start from a clean install, so that you aren't impacted by quirks of your existing environment. If you don't want to use local virtualization, you can easily start a CentOS 7 VM using your cloud service.

#### 13.10.2.1 TiDB Binlog Overview

TiDB Binlog is a solution to collect binary log data from TiDB and provide real-time data backup and replication. It pushes incremental data updates from a TiDB Server cluster into downstream platforms.

You can use TiDB Binlog for incremental backups, to replicate data from one TiDB cluster to another, or to send TiDB updates through Kafka to a downstream platform of your choice.

TiDB Binlog is particularly useful when you migrate data from MySQL or MariaDB to TiDB, in which case you may use the TiDB DM (Data Migration) platform to get data from a MySQL/MariaDB cluster into TiDB, and then use TiDB Binlog to keep a separate, downstream MySQL/MariaDB instance/cluster in sync with your TiDB cluster. TiDB Binlog enables application traffic to TiDB to be pushed to a downstream MySQL or MariaDB instance/cluster, which reduces the risk of a migration to TiDB because you can easily revert the application to MySQL or MariaDB without downtime or data loss.

See TiDB Binlog Cluster User Guide for more information.

#### 13.10.2.2 Architecture

TiDB Binlog comprises two components: the **Pump** and the **Drainer**. Several Pump nodes make up a pump cluster. Each Pump node connects to TiDB Server instances and receives updates made to each of the TiDB Server instances in a cluster. A Drainer connects to the Pump cluster and transforms the received updates into the correct format for a particular downstream destination, for example, Kafka, another TiDB Cluster or a MySQL/MariaDB server.

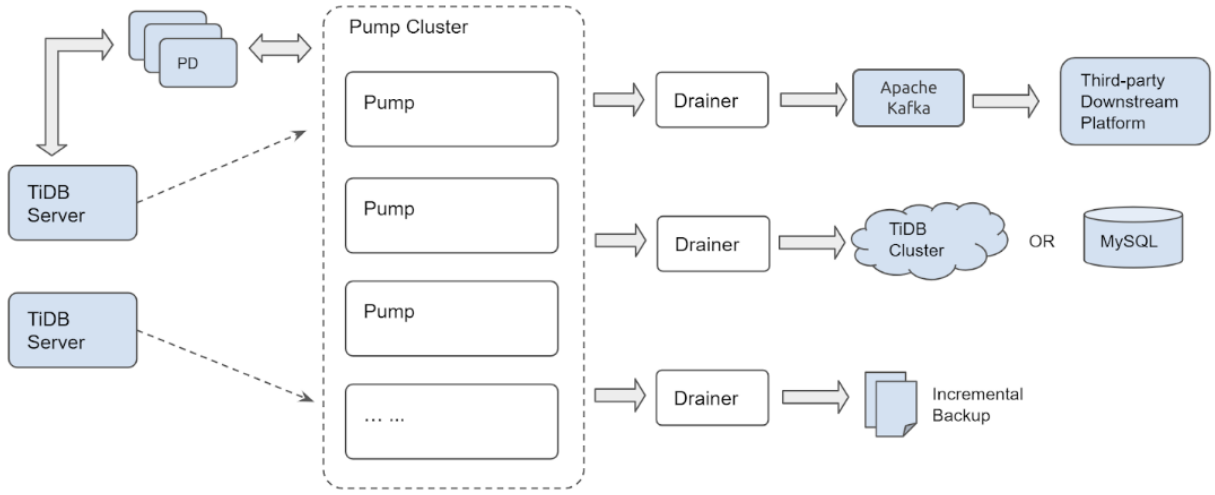

Figure 347: TiDB-Binlog architecture

The clustered architecture of Pump ensures that updates won't be lost as new TiDB Server instances join or leave the TiDB Cluster or Pump nodes join or leave the Pump cluster.

#### 13.10.2.3 Installation

We're using MariaDB Server in this case instead of MySQL Server because RHEL/CentOS 7 includes MariaDB Server in their default package repositories. We'll need the client as well as the server for later use. Let's install them now:

```
sudo yum install -y mariadb-server
```

```
curl -L https://download.pingcap.org/tidb-community-server-v6.5.12-linux-
    ↪ amd64.tar.gz | tar xzf -
cd tidb-latest-linux-amd64
```

Expected output:

```
[kolbe@localhost ~]$ curl -LO https://download.pingcap.org/tidb-latest-linux
    ↪ -amd64.tar.gz | tar xzf -
  % Total    % Received % Xferd Average Speed Time  Time    Time Current
                                Dload Upload  Total  Spent   Left Speed
100  368M 100  368M   0     0  8394k     0  0:00:44 0:00:44 --:--:-- 11.1M
[kolbe@localhost ~]$ cd tidb-latest-linux-amd64
[kolbe@localhost tidb-latest-linux-amd64]$
```

#### 13.10.2.4 Configuration

Now we'll start a simple TiDB cluster, with a single instance for each of `pd-server`, `tikv-server`, and `tidb-server`.

Populate the config files using:

```
printf > pd.toml %s\\n 'log-file="pd.log"' 'data-dir="pd.data"'
printf > tikv.toml %s\\n 'log-file="tikv.log"' '[storage]' 'data-dir="tikv.
    ↪ data"' '[pd]' 'endpoints=["127.0.0.1:2379"]' '[rocksdb]' max-open-
    ↪ files=1024 '[raftdb]' max-open-files=1024
printf > pump.toml %s\\n 'log-file="pump.log"' 'data-dir="pump.data"' 'addr
    ↪ ="127.0.0.1:8250"' 'advertise-addr="127.0.0.1:8250"' 'pd-urls="http
    ↪ ://127.0.0.1:2379"'
printf > tidb.toml %s\\n 'store="tikv"' 'path="127.0.0.1:2379"' '[log.file
    ↪ ]' 'filename="tidb.log"' '[binlog]' 'enable=true'
printf > drainer.toml %s\\n 'log-file="drainer.log"' '[syncer]' 'db-type="
    ↪ mysql"' '[syncer.to]' 'host="127.0.0.1"' 'user="root"' 'password=""'
    ↪ 'port=3306'
```

Use the following commands to see the configuration details:

```
for f in *.toml; do echo "$f:"; cat "$f"; echo; done
```

Expected output:

```
drainer.toml:
log-file="drainer.log"
[syncer]
db-type="mysql"
[syncer.to]
host="127.0.0.1"
user="root"
password=""
port=3306

pd.toml:
log-file="pd.log"
data-dir="pd.data"

pump.toml:
log-file="pump.log"
data-dir="pump.data"
addr="127.0.0.1:8250"
advertise-addr="127.0.0.1:8250"
pd-urls="http://127.0.0.1:2379"

tidb.toml:
```

```
store="tikv"
path="127.0.0.1:2379"
[log.file]
filename="tidb.log"
[binlog]
enable=true

tikv.toml:
log-file="tikv.log"
[storage]
data-dir="tikv.data"
[pd]
endpoints=["127.0.0.1:2379"]
[rocksdb]
max-open-files=1024
[raftdb]
max-open-files=1024
```

#### 13.10.2.5 Bootstrapping

Now we can start each component. This is best done in a specific order - firstly the Placement Driver (PD), then TiKV Server, then Pump (because TiDB must connect to the Pump service to send the binary log), and finally the TiDB Server.

Start all the services using:

```
./bin/pd-server --config=pd.toml &>pd.out &
./bin/tikv-server --config=tikv.toml &>tikv.out &
./pump --config=pump.toml &>pump.out &
sleep 3
./bin/tidb-server --config=tidb.toml &>tidb.out &
```

Expected output:

```
[kolbe@localhost tidb-latest-linux-amd64]$ ./bin/pd-server --config=pd.toml
    ↪ &>pd.out &
[1] 20935
[kolbe@localhost tidb-latest-linux-amd64]$ ./bin/tikv-server --config=tikv.
    ↪ toml &>tikv.out &
[2] 20944
[kolbe@localhost tidb-latest-linux-amd64]$ ./pump --config=pump.toml &>pump.
    ↪ out &
[3] 21050
[kolbe@localhost tidb-latest-linux-amd64]$ sleep 3
[kolbe@localhost tidb-latest-linux-amd64]$ ./bin/tidb-server --config=tidb.
    ↪ toml &>tidb.out &
```

```
[4] 21058
```

If you execute `jobs`, you should see a list of running daemons:

```
[kolbe@localhost tidb-latest-linux-amd64]$ jobs
[1]   Running                 ./bin/pd-server --config=pd.toml &>pd.out &
[2]   Running                 ./bin/tikv-server --config=tikv.toml &>tikv.out &
[3]-  Running                 ./pump --config=pump.toml &>pump.out &
[4]+  Running                 ./bin/tidb-server --config=tidb.toml &>tidb.out &
```

If one of the services has failed to start (if you see "`Exit 1`" instead of "`Running`", for example), try to restart that individual service.

#### 13.10.2.6 Connecting

You should have all 4 components of our TiDB Cluster running now, and you can now connect to the TiDB Server on port 4000 using the MariaDB/MySQL command-line client:

```
mysql -h 127.0.0.1 -P 4000 -u root -e 'select tidb_version()\G'
```

Expected output:

```
[kolbe@localhost tidb-latest-linux-amd64]$ mysql -h 127.0.0.1 -P 4000 -u
   ↪ root -e 'select tidb_version()\G'
*************************** 1. row ***************************
tidb_version(): Release Version: v3.0.0-beta.1-154-gd5afff70c
Git Commit Hash: d5afff70cdd825d5fab125c8e52e686cc5fb9a6e
Git Branch: master
UTC Build Time: 2019-04-24 03:10:00
GoVersion: go version go1.12 linux/amd64
Race Enabled: false
TiKV Min Version: 2.1.0-alpha.1-ff3dd160846b7d1aed9079c389fc188f7f5ea13e
Check Table Before Drop: false
```

At this point we have a TiDB Cluster running, and we have `pump` reading binary logs from the cluster and storing them as relay logs in its data directory. The next step is to start a MariaDB server that `drainer` can write to.

Start `drainer` using:

```
sudo systemctl start mariadb
./drainer --config=drainer.toml &>drainer.out &
```

If you are using an operating system that makes it easier to install MySQL server, that's also OK. Just make sure it's listening on port 3306 and that you can either connect to it as user "root" with an empty password, or adjust drainer.toml as necessary.

```
mysql -h 127.0.0.1 -P 3306 -u root
```

```
show databases;
```

Expected output:

```
[kolbe@localhost ~]$ mysql -h 127.0.0.1 -P 3306 -u root
Welcome to the MariaDB monitor. Commands end with ; or \g.
Your MariaDB connection id is 20
Server version: 5.5.60-MariaDB MariaDB Server

Copyright (c) 2000, 2018, Oracle, MariaDB Corporation Ab and others.

Type 'help;' or '\h' for help. Type '\c' to clear the current input
    ↪ statement.

MariaDB [(none)]> show databases;
+--------------------+
| Database           |
+--------------------+
| information_schema |
| mysql              |
| performance_schema |
| test               |
| tidb_binlog        |
+--------------------+
5 rows in set (0.01 sec)
```

Here we can already see the `tidb_binlog` database, which contains the `checkpoint` table used by `drainer` to record up to what point binary logs from the TiDB cluster have been applied.

```
MariaDB [tidb_binlog]> use tidb_binlog;
Database changed
MariaDB [tidb_binlog]> select * from checkpoint;
+--------------------+-------------------------------------------------+
| clusterID          | checkPoint                                      |
+--------------------+-------------------------------------------------+
| 6678715361817107733 | {"commitTS":407637466476445697,"ts-map":{}} |
+--------------------+-------------------------------------------------+
1 row in set (0.00 sec)
```

Now, let's open another client connection to the TiDB server, so that we can create a table and insert some rows into it. (It's recommended that you do this under a GNU screen so you can keep multiple clients open at the same time.)

```
mysql -h 127.0.0.1 -P 4000 --prompt='TiDB [\d]> ' -u root
```

```
create database tidbtest;
use tidbtest;
create table t1 (id int unsigned not null AUTO_INCREMENT primary key);
insert into t1 () values (),(),(),(),();
select * from t1;
```

Expected output:

```
TiDB [(none)]> create database tidbtest;
Query OK, 0 rows affected (0.12 sec)

TiDB [(none)]> use tidbtest;
Database changed
TiDB [tidbtest]> create table t1 (id int unsigned not null AUTO_INCREMENT
    ↪ primary key);
Query OK, 0 rows affected (0.11 sec)

TiDB [tidbtest]> insert into t1 () values (),(),(),(),();
Query OK, 5 rows affected (0.01 sec)
Records: 5 Duplicates: 0 Warnings: 0

TiDB [tidbtest]> select * from t1;
+----+
| id |
+----+
|  1 |
|  2 |
|  3 |
|  4 |
|  5 |
+----+
5 rows in set (0.00 sec)
```

Switching back to the MariaDB client, we should find the new database, new table, and the newly inserted rows:

```
use tidbtest;
show tables;
select * from t1;
```

Expected output:

```
MariaDB [(none)]> use tidbtest;
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A
```

```
Database changed
MariaDB [tidbtest]> show tables;
+--------------------+
| Tables_in_tidbtest |
+--------------------+
| t1                 |
+--------------------+
1 row in set (0.00 sec)

MariaDB [tidbtest]> select * from t1;
+----+
| id |
+----+
|  1 |
|  2 |
|  3 |
|  4 |
|  5 |
+----+
5 rows in set (0.00 sec)
```

You should see the same rows that you inserted into TiDB when querying the MariaDB server. Congratulations! You've just set up TiDB Binlog!

#### 13.10.2.7 binlogctl

Information about Pumps and Drainers that have joined the cluster is stored in PD. You can use the binlogctl tool query and manipulate information about their states. See binlogctl guide for more information.

Use `binlogctl` to get a view of the current status of Pumps and Drainers in the cluster:

```
./binlogctl -cmd drainers
./binlogctl -cmd pumps
```

Expected output:

```
[kolbe@localhost tidb-latest-linux-amd64]$ ./binlogctl -cmd drainers
[2019/04/11 17:44:10.861 -04:00] [INFO] [nodes.go:47] ["query node"] [type=
    ↪ drainer] [node="{NodeID: localhost.localdomain:8249, Addr:
    ↪ 192.168.236.128:8249, State: online, MaxCommitTS: 407638907719778305,
    ↪  UpdateTime: 2019-04-11 17:44:10 -0400 EDT}"]

[kolbe@localhost tidb-latest-linux-amd64]$ ./binlogctl -cmd pumps
[2019/04/11 17:44:13.904 -04:00] [INFO] [nodes.go:47] ["query node"] [type=
    ↪ pump] [node="{NodeID: localhost.localdomain:8250, Addr:
```

```
    ↪ 192.168.236.128:8250, State: online, MaxCommitTS: 407638914024079361,
    ↪  UpdateTime: 2019-04-11 17:44:13 -0400 EDT}"]
```

If you kill a Drainer, the cluster puts it in the "paused" state, which means that the cluster expects it to rejoin:

```
pkill drainer
./binlogctl -cmd drainers
```

Expected output:

```
[kolbe@localhost tidb-latest-linux-amd64]$ pkill drainer
[kolbe@localhost tidb-latest-linux-amd64]$ ./binlogctl -cmd drainers
[2019/04/11 17:44:22.640 -04:00] [INFO] [nodes.go:47] ["query node"] [type=
    ↪ drainer] [node="{NodeID: localhost.localdomain:8249, Addr:
    ↪ 192.168.236.128:8249, State: paused, MaxCommitTS: 407638915597467649,
    ↪  UpdateTime: 2019-04-11 17:44:18 -0400 EDT}"]
```

You can use "NodeIDs" with `binlogctl` to control individual nodes. In this case, the NodeID of the drainer is "localhost.localdomain:8249" and the NodeID of the Pump is "localhost.localdomain:8250".

The main use of `binlogctl` in this tutorial is likely to be in the event of a cluster restart. If you end all processes in the TiDB cluster and try to restart them (not including the downstream MySQL/MariaDB server or Drainer), Pump will refuse to start because it cannot contact Drainer and believe that Drainer is still "online".

There are 3 solutions to this issue:

- Stop Drainer using `binlogctl` instead of killing the process:

  ```
  ./binlogctl --pd-urls=http://127.0.0.1:2379 --cmd=drainers
  ./binlogctl --pd-urls=http://127.0.0.1:2379 --cmd=offline-drainer --
      ↪ node-id=localhost.localdomain:8249
  ```

- Start Drainer *before* starting Pump.

- Use `binlogctl` after starting PD (but before starting Drainer and Pump) to update the state of the paused Drainer:

  ```
  ./binlogctl --pd-urls=http://127.0.0.1:2379 --cmd=update-drainer --node
      ↪ -id=localhost.localdomain:8249 --state=offline
  ```

#### 13.10.2.8 Cleanup

To stop the TiDB cluster and TiDB Binlog processes, you can execute `pkill -P $$` in the shell where you started all the processes that form the cluster (pd-server, tikv-server, pump, tidb-server, drainer). To give each component enough time to shut down cleanly, it's helpful to stop them in a particular order:

```
for p in tidb-server drainer pump tikv-server pd-server; do pkill "$p";
   ↪ sleep 1; done
```

Expected output:

```
kolbe@localhost tidb-latest-linux-amd64]$ for p in tidb-server drainer pump
   ↪ tikv-server pd-server; do pkill "$p"; sleep 1; done
[4]- Done                    ./bin/tidb-server --config=tidb.toml &>tidb.out
[5]+ Done                    ./drainer --config=drainer.toml &>drainer.out
[3]+ Done                    ./pump --config=pump.toml &>pump.out
[2]+ Done                    ./bin/tikv-server --config=tikv.toml &>tikv.out
[1]+ Done                    ./bin/pd-server --config=pd.toml &>pd.out
```

If you wish to restart the cluster after all services exit, use the same commands you ran originally to start the services. As discussed in the binlogctl section above, you'll need to start `drainer` before `pump`, and `pump` before `tidb-server`.

```
./bin/pd-server --config=pd.toml &>pd.out &
./bin/tikv-server --config=tikv.toml &>tikv.out &
./drainer --config=drainer.toml &>drainer.out &
sleep 3
./pump --config=pump.toml &>pump.out &
sleep 3
./bin/tidb-server --config=tidb.toml &>tidb.out &
```

If any of the components fail to start, try to restart the failed individual component(s).

#### 13.10.2.9 Conclusion

In this tutorial, we've set up TiDB Binlog to replicate from a TiDB cluster to a downstream MariaDB server, using a cluster with a single Pump and a single Drainer. As we've seen, TiDB Binlog is a comprehensive platform for capturing and processing changes to a TiDB cluster.

In a more robust development, testing, or production deployment, you'd have multiple TiDB servers for high availability and scaling purposes, and you'd use multiple Pump instances to ensure that application traffic to TiDB server instances is unaffected by problems in the Pump cluster. You may also use additional Drainer instances to push updates to different downstream platforms or to implement incremental backups.

### 13.10.3 TiDB Binlog Cluster Deployment

This document describes how to deploy TiDB Binlog using a Binary package.

#### 13.10.3.1 Hardware requirements

Pump and Drainer are deployed and operate on 64-bit universal hardware server platforms with Intel x86-64 architecture.

In environments of development, testing and production, the requirements on server hardware are as follows:

| Service | The Number of Servers | CPU | Disk | Memory |
|---|---|---|---|---|
| Pump | 3 | 8 core+ | SSD, 200 GB+ | 16G |
| Drainer | 1 | 8 core+ | SAS, 100 GB+ (If binlogs are output as local files, the disk size depends on how long these files are retained.) | 16G |

#### 13.10.3.2 Deploy TiDB Binlog using TiUP

It is recommended to deploy TiDB Binlog using TiUP. To do that, when deploying TiDB using TiUP, you need to add the node information of `drainer` and `pump` of TiDB Binlog in TiDB Binlog Deployment Topology. For detailed deployment information, refer to Deploy a TiDB Cluster Using TiUP.

#### 13.10.3.3 Deploy TiDB Binlog using a binary package

##### 13.10.3.3.1 Download the official binary package

The binary package of TiDB Binlog is included in the TiDB Toolkit. To download the TiDB Toolkit, see Download TiDB Tools.

##### 13.10.3.3.2 The usage example

Assuming that you have three PD nodes, one TiDB node, two Pump nodes, and one Drainer node, the information of each node is as follows:

| Node | IP |
|---|---|
| TiDB | 192.168.0.10 |
| PD1 | 192.168.0.16 |
| PD2 | 192.168.0.15 |
| PD3 | 192.168.0.14 |

| Node | IP |
|---|---|
| Pump | 192.168.0.11 |
| Pump | 192.168.0.12 |
| Drainer | 192.168.0.13 |

The following part shows how to use Pump and Drainer based on the nodes above.

1. Deploy Pump using the binary.

    - To view the command line parameters of Pump, execute `./pump -help`:

```
Usage of Pump:
-L string
    the output information level of logs: debug, info, warn, error,
        ↪  fatal ("info" by default)
-V
    the print version information
-addr string
    the RPC address through which Pump provides the service (-addr=
        ↪ "192.168.0.11:8250")
-advertise-addr string
    the RPC address through which Pump provides the external
        ↪ service (-advertise-addr="192.168.0.11:8250")
-config string
    the path of the configuration file. If you specify the
        ↪ configuration file, Pump reads the configuration in the
        ↪ configuration file first. If the corresponding
        ↪ configuration also exits in the command line parameters,
        ↪ Pump uses the configuration of the command line
        ↪ parameters to cover that of the configuration file.
-data-dir string
    the path where the Pump data is stored
-gc int
    the number of days to retain the data in Pump ("7" by default)
-heartbeat-interval int
    the interval of the heartbeats Pump sends to PD (in seconds)
-log-file string
    the file path of logs
-log-rotate string
    the switch frequency of logs (hour/day)
-metrics-addr string
    the Prometheus Pushgateway address. If not set, it is forbidden
        ↪  to report the monitoring metrics.
-metrics-interval int
```

```
   the report frequency of the monitoring metrics ("15" by default
      ↪ , in seconds)
-node-id string
   the unique ID of a Pump node. If you do not specify this ID,
      ↪ the system automatically generates an ID based on the
      ↪ host name and listening port.
-pd-urls string
   the address of the PD cluster nodes (-pd-urls="http
      ↪ ://192.168.0.16:2379,http://192.168.0.15:2379,http
      ↪ ://192.168.0.14:2379")
-fake-binlog-interval int
   the frequency at which a Pump node generates fake binlog ("3"
      ↪ by default, in seconds)
```

- Taking deploying Pump on "192.168.0.11" as an example, the Pump configuration file is as follows:

```
# Pump Configuration

# the bound address of Pump
addr = "192.168.0.11:8250"

# the address through which Pump provides the service
advertise-addr = "192.168.0.11:8250"

# the number of days to retain the data in Pump ("7" by default)
gc = 7

# the directory where the Pump data is stored
data-dir = "data.pump"

# the interval of the heartbeats Pump sends to PD (in seconds)
heartbeat-interval = 2

# the address of the PD cluster nodes (each separated by a comma
   ↪ with no whitespace)
pd-urls = "http://192.168.0.16:2379,http://192.168.0.15:2379,http
   ↪ ://192.168.0.14:2379"

# [security]
# This section is generally commented out if no special security
   ↪ settings are required.
# The file path containing a list of trusted SSL CAs connected to
   ↪ the cluster.
# ssl-ca = "/path/to/ca.pem"
```

```
# The path to the X509 certificate in PEM format that is connected
    ↪ to the cluster.
# ssl-cert = "/path/to/drainer.pem"
# The path to the X509 key in PEM format that is connected to the
    ↪ cluster.
# ssl-key = "/path/to/drainer-key.pem"

# [storage]
# Set to true (by default) to guarantee reliability by ensuring
    ↪ binlog data is flushed to the disk
# sync-log = true

# When the available disk capacity is less than the set value, Pump
    ↪  stops writing data.
# 42 MB -> 42000000, 42 mib -> 44040192
# default: 10 gib
# stop-write-at-available-space = "10 gib"
# The LSM DB settings embedded in Pump. Unless you know this part
    ↪ well, it is usually commented out.
# [storage.kv]
# block-cache-capacity = 8388608
# block-restart-interval = 16
# block-size = 4096
# compaction-L0-trigger = 8
# compaction-table-size = 67108864
# compaction-total-size = 536870912
# compaction-total-size-multiplier = 8.0
# write-buffer = 67108864
# write-L0-pause-trigger = 24
# write-L0-slowdown-trigger = 17
```

- The example of starting Pump:

```
./pump -config pump.toml
```

  If the command line parameters is the same with the configuration file parameters, the values of command line parameters are used.

2. Deploy Drainer using binary.

   - To view the command line parameters of Drainer, execute `./drainer -help`:

```
Usage of Drainer:
-L string
    the output information level of logs: debug, info, warn, error,
        ↪  fatal ("info" by default)
```

```
-V
    the print version information
-addr string
    the address through which Drainer provides the service (-addr="
        ↪ 192.168.0.13:8249")
-c int
    the number of the concurrency of the downstream for replication
        ↪ . The bigger the value, the better throughput performance
        ↪  of the concurrency ("1" by default).
-cache-binlog-count int
    the limit on the number of binlog items in the cache ("8" by
        ↪ default)
    If a large single binlog item in the upstream causes OOM in
        ↪ Drainer, try to lower the value of this parameter to
        ↪ reduce memory usage.
-config string
    the directory of the configuration file. Drainer reads the
        ↪ configuration file first.
    If the corresponding configuration exists in the command line
        ↪ parameters, Drainer uses the configuration of the command
        ↪  line parameters to cover that of the configuration file.
-data-dir string
    the directory where the Drainer data is stored ("data.drainer"
        ↪ by default)
-dest-db-type string
    the downstream service type of Drainer
    The value can be "mysql", "tidb", "kafka", and "file". ("mysql"
        ↪  by default)
-detect-interval int
    the interval of checking the online Pump in PD ("10" by default
        ↪ , in seconds)
-disable-detect
    whether to disable the conflict monitoring
-disable-dispatch
    whether to disable the SQL feature of splitting a single binlog
        ↪  file. If it is set to "true", each binlog file is
        ↪ restored to a single transaction for replication based on
        ↪  the order of binlogs.
    It is set to "False", when the downstream is MySQL.
-ignore-schemas string
    the db filter list ("INFORMATION_SCHEMA,PERFORMANCE_SCHEMA,
        ↪ mysql,test" by default)
    It does not support the Rename DDL operation on tables of `
        ↪ ignore schemas`.
-initial-commit-ts
```

```
   If Drainer does not have the related breakpoint information,
      ↪ you can configure the related breakpoint information
      ↪ using this parameter. ("-1" by default)
   If the value of this parameter is `-1`, Drainer automatically
      ↪ obtains the latest timestamp from PD.
-log-file string
   the path of the log file
-log-rotate string
   the switch frequency of log files, hour/day
-metrics-addr string
   the Prometheus Pushgateway address
   It it is not set, the monitoring metrics are not reported.
-metrics-interval int
   the report frequency of the monitoring metrics ("15" by default
      ↪ , in seconds)
-node-id string
   the unique ID of a Drainer node. If you do not specify this ID,
      ↪  the system automatically generates an ID based on the
      ↪ host name and listening port.
-pd-urls string
   the address of the PD cluster nodes (-pd-urls="http
      ↪ ://192.168.0.16:2379,http://192.168.0.15:2379,http
      ↪ ://192.168.0.14:2379")
-safe-mode
   Whether to enable safe mode so that data can be written into
      ↪ the downstream MySQL/TiDB repeatedly.
   This mode replaces the `INSERT` statement with the `REPLACE`
      ↪ statement and splits the `UPDATE` statement into `DELETE`
      ↪  plus `REPLACE`.
-txn-batch int
   the number of SQL statements of a transaction which are output
      ↪ to the downstream database ("1" by default)
```

- Taking deploying Drainer on "192.168.0.13" as an example, the Drainer configuration file is as follows:

```
# Drainer Configuration.

# the address through which Drainer provides the service
   ↪ ("192.168.0.13:8249")
addr = "192.168.0.13:8249"

# the address through which Drainer provides the external service
advertise-addr = "192.168.0.13:8249"
```

```
# the interval of checking the online Pump in PD ("10" by default,
    ↪ in seconds)
detect-interval = 10

# the directory where the Drainer data is stored "data.drainer" by
    ↪ default)
data-dir = "data.drainer"

# the address of the PD cluster nodes (each separated by a comma
    ↪ with no whitespace)
pd-urls = "http://192.168.0.16:2379,http://192.168.0.15:2379,http
    ↪ ://192.168.0.14:2379"

# the directory of the log file
log-file = "drainer.log"

# Drainer compresses the data when it gets the binlog from Pump.
    ↪ The value can be "gzip". If it is not configured, it will
    ↪ not be compressed
# compressor = "gzip"

# [security]
# This section is generally commented out if no special security
    ↪ settings are required.
# The file path containing a list of trusted SSL CAs connected to
    ↪ the cluster.
# ssl-ca = "/path/to/ca.pem"
# The path to the X509 certificate in PEM format that is connected
    ↪ to the cluster.
# ssl-cert = "/path/to/pump.pem"
# The path to the X509 key in PEM format that is connected to the
    ↪ cluster.
# ssl-key = "/path/to/pump-key.pem"

# Syncer Configuration
[syncer]
# If the item is set, the sql-mode will be used to parse the DDL
    ↪ statement.
# If the downstream database is MySQL or TiDB, then the downstream
    ↪ sql-mode
# is also set to this value.
# sql-mode = "STRICT_TRANS_TABLES,NO_ENGINE_SUBSTITUTION"

# the number of SQL statements of a transaction that are output to
    ↪ the downstream database ("20" by default)
```

```
txn-batch = 20

# the number of the concurrency of the downstream for replication.
   ↪ The bigger the value,
# the better throughput performance of the concurrency ("16" by
   ↪ default)
worker-count = 16

# whether to disable the SQL feature of splitting a single binlog
   ↪ file. If it is set to "true",
# each binlog file is restored to a single transaction for
   ↪ replication based on the order of binlogs.
# If the downstream service is MySQL, set it to "False".
disable-dispatch = false

# In safe mode, data can be written into the downstream MySQL/TiDB
   ↪ repeatedly.
# This mode replaces the `INSERT` statement with the `REPLACE`
   ↪ statement and replaces the `UPDATE` statement with `DELETE`
   ↪ plus `REPLACE` statements.
safe-mode = false

# the downstream service type of Drainer ("mysql" by default)
# Valid value: "mysql", "tidb", "file", and "kafka".
db-type = "mysql"

# If `commit ts` of the transaction is in the list, the transaction
   ↪  is filtered and not replicated to the downstream.
ignore-txn-commit-ts = []

# the db filter list ("INFORMATION_SCHEMA,PERFORMANCE_SCHEMA,mysql,
   ↪ test" by default)
# Does not support the Rename DDL operation on tables of `ignore
   ↪ schemas`.
ignore-schemas = "INFORMATION_SCHEMA,PERFORMANCE_SCHEMA,mysql"

# `replicate-do-db` has priority over `replicate-do-table`. When
   ↪ they have the same `db` name,
# regular expressions are supported for configuration.
# The regular expression should start with "~".

   ↪ request. If it is left blank or a value smaller than 0 is
   ↪ configured, the default value 1024 is used.
# kafka-max-messages = 1024
# The maximum size of a broker request (unit: byte). The default
   ↪ value is 1 GiB and the maximum value is 2 GiB.
# kafka-max-message-size = 1073741824

# the topic name of the Kafka cluster that saves the binlog data.
   ↪ The default value is <cluster-id>_obinlog.
# To run multiple Drainers to replicate data to the same Kafka
   ↪ cluster, you need to set different `topic-name`s for each
   ↪ Drainer.
# topic-name = ""
```

- Starting Drainer:

**Note:**
If the downstream is MySQL/TiDB, to guarantee the data integrity, you need to obtain the `initial-commit-ts` value and make a full backup of the data and restore the data before the initial start of Drainer.

When Drainer is started for the first time, use the `initial-commit-ts` parameter.

```
./drainer -config drainer.toml -initial-commit-ts {initial-commit-
    ↪ ts}
```

If the command line parameter and the configuration file parameter are the same, the parameter value in the command line is used.

3. Starting TiDB server:

- After starting Pump and Drainer, start TiDB server with binlog enabled by adding this section to your config file for TiDB server:

```
[binlog]
enable=true
```

- TiDB server will obtain the addresses of registered Pumps from PD and will stream data to all of them. If there are no registered Pump instances, TiDB server will refuse to start or will block starting until a Pump instance comes online.

**Note:**

- When TiDB is running, you need to guarantee that at least one Pump is running normally.
- To enable the TiDB Binlog service in TiDB server, use the `-enable-binlog` startup parameter in TiDB, or add enable=true to the binlog section of the TiDB server configuration file.
- Make sure that the TiDB Binlog service is enabled in all TiDB instances in a same cluster, otherwise upstream and downstream data inconsistency might occur during data replication. If you want to temporarily run a TiDB instance where the TiDB Binlog service is not enabled, set `run_ddl=false` in the TiDB configuration file.
- Drainer does not support the `rename` DDL operation on the table of `ignore schemas` (the schemas in the filter list).

- If you want to start Drainer in an existing TiDB cluster, generally you need to make a full backup of the cluster data, obtain **snapshot timestamp**, import the data to the target database, and then start Drainer to replicate the incremental data from the corresponding **snapshot timestamp**.
- When the downstream database is TiDB or MySQL, ensure that the `sql_mode` in the upstream and downstream databases are consistent. In other words, the `sql_mode` should be the same when each SQL statement is executed in the upstream and replicated to the downstream. You can execute the `select @@sql_mode;` statement in the upstream and downstream respectively to compare `sql_mode`.
- When a DDL statement is supported in the upstream but incompatible with the downstream, Drainer fails to replicate data. An example is to replicate the `CREATE TABLE t1(a INT)ROW_FORMAT=FIXED;` statement when the downstream database MySQL uses the InnoDB engine. In this case, you can configure skipping transactions in Drainer, and manually execute compatible statements in the downstream database.

### 13.10.4 TiDB Binlog Cluster Operations

This document introduces the following TiDB Binlog cluster operations:

- The state of a Pump and Drainer nodes
- Starting or exiting a Pump or Drainer process
- Managing the TiDB Binlog cluster by using the binlogctl tool or by directly performing SQL operations in TiDB

#### 13.10.4.1 Pump or Drainer state

Pump or Drainer state description:

- `online`: running normally
- `pausing`: in the pausing process
- `paused`: has been stopped
- `closing`: in the offline process
- `offline`: has been offline

**Note:**

The state information of a Pump or Drainer node is maintained by the service itself and is regularly updated to the Placement Driver (PD).

#### 13.10.4.2 Starting and exiting a Pump or Drainer process

##### 13.10.4.2.1 Pump

- Starting: When started, the Pump node notifies all Drainer nodes in the `online` state. If the notification is successful, the Pump node sets its state to `online`. Otherwise, the Pump node reports an error, sets its state to `paused` and exits the process.
- Exiting: The Pump node enters the `paused` or `offline` state before the process is exited normally; if the process is exited abnormally (caused by the `kill -9` command, process panic, crash), the node is still in the `online` state.
    - Pause: You can pause a Pump process by using the `kill` command (not `kill -9` ↪ ), pressing Ctrl+C or using the `pause-pump` command in the binlogctl tool. After receiving the pause instruction, the Pump node sets its state to `pausing`, stops receiving binlog write requests and stops providing binlog data to Drainer nodes. After all threads are safely exited, the Pump node updates its state to `paused` and exits the process.
    - Offline: You can close a Pump process only by using the `offline-pump` command in the binlogctl tool. After receiving the offline instruction, the Pump node sets its state to `closing` and stops receiving the binlog write requests. The Pump node continues providing binlog to Drainer nodes until all binlog data is consumed by Drainer nodes. Then, the Pump node sets its state to `offline` and exits the process.

##### 13.10.4.2.2 Drainer

- Starting: When started, the Drainer node sets its state to `online` and tries to pull binlogs from all Pump nodes which are not in the `offline` state. If it fails to get the binlogs, it keeps trying.
- Exiting: The Drainer node enters the `paused` or `offline` state before the process is exited normally; if the process is exited abnormally (caused by `kill -9`, process panic, crash), the Drainer node is still in the `online` state.
    - Pause: You can pause a Drainer process by using the `kill` command (not `kill` ↪ `-9`), pressing Ctrl+C or using the `pause-drainer` command in the binlogctl tool. After receiving the pause instruction, the Drainer node sets its state to `pausing` and stops pulling binlogs from Pump nodes. After all threads are safely exited, the Drainer node sets its state to `paused` and exits the process.
    - Offline: You can close a Drainer process only by using the `offline-drainer` command in the binlogctl tool. After receiving the offline instruction, the Drainer node sets its state to `closing` and stops pulling binlogs from Pump nodes. After all threads are safely exited, the Drainer node updates its state to `offline` and exits the process.

For how to pause, close, check, and modify the state of Drainer, see the binlogctl guide.

#### 13.10.4.3 Use `binlogctl` to manage Pump/Drainer

`binlogctl` is an operations tool for TiDB Binlog with the following features:

- Checking the state of Pump or Drainer
- Pausing or closing Pump or Drainer
- Handling the abnormal state of Pump or Drainer

For detailed usage of `binlogctl`, refer to binlogctl overview.

#### 13.10.4.4 Use SQL statements to manage Pump or Drainer

To view or modify binlog related states, execute corresponding SQL statements in TiDB.

- Check whether binlog is enabled:

```
show variables like "log_bin";
```

```
+---------------+-------+
| Variable_name | Value |
+---------------+-------+
| log_bin       | 0     |
+---------------+-------+
```

When the Value is `0`, binlog is enabled. When the Value is `1`, binlog is disabled.

- Check the status of all the Pump or Drainer nodes:

```
show pump status;
```

```
+--------|----------------|--------|--------------------|--------------------|
   ↪
| NodeID |   Address    | State |  Max_Commit_Ts  |    Update_Time     |
+--------|----------------|--------|--------------------|--------------------|

```

- Modify the state of a Pump or Drainer node in abnormal situations

```
change pump to node_state ='paused' for node_id 'pump1';
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
change drainer to node_state ='paused' for node_id 'drainer1';
```

```
Query OK, 0 rows affected (0.01 sec)
```

Executing the above SQL statements works the same as the `update-pump` or `update ↪ -drainer` commands in binlogctl. Use the above SQL statements **only** when the Pump or Drainer node is in abnormal situations.

**Note:**

- Checking whether binlog is enabled and the running status of Pump or Drainer is supported in TiDB v2.1.7 and later versions.
- Modifying the status of Pump or Drainer is supported in TiDB v3.0.0-rc.1 and later versions. This feature only supports modifying the status of Pump or Drainer nodes stored in PD. To pause or close the node, use the `binlogctl` tool.

### 13.10.5 TiDB Binlog Configuration File

This document introduces the configuration items of TiDB Binlog.

#### 13.10.5.1 Pump

This section introduces the configuration items of Pump. For the example of a complete Pump configuration file, see Pump Configuration.

##### 13.10.5.1.1 addr

- Specifies the listening address of HTTP API in the format of `host:port`.
- Default value: `127.0.0.1:8250`

##### 13.10.5.1.2 advertise-addr

- Specifies the externally accessible HTTP API address. This address is registered in PD in the format of `host:port`.
- Default value: `127.0.0.1:8250`

##### 13.10.5.1.3 socket

- The Unix socket address that HTTP API listens to.
- Default value: “”

##### 13.10.5.1.4 pd-urls

- Specifies the comma-separated list of PD URLs. If multiple addresses are specified, when the PD client fails to connect to one address, it automatically tries to connect to another address.
- Default value: `http://127.0.0.1:2379`

##### 13.10.5.1.5 data-dir

- Specifies the directory where binlogs and their indexes are stored locally.
- Default value: `data.pump`

##### 13.10.5.1.6 heartbeat-interval

- Specifies the heartbeat interval (in seconds) at which the latest status is reported to PD.
- Default value: `2`

##### 13.10.5.1.7 gen-binlog-interval

- Specifies the interval (in seconds) at which data is written into fake binlog.
- Default value: `3`

#### 13.10.5.1.8 gc

- Specifies the number of days (integer) that binlogs can be stored locally. Binlogs stored longer than the specified number of days are automatically deleted.
- Default value: `7`

#### 13.10.5.1.9 log-file

- Specifies the path where log files are stored. If the parameter is set to an empty value, log files are not stored.
- Default value: ""

#### 13.10.5.1.10 log-level

- Specifies the log level.
- Default value: `info`

#### 13.10.5.1.11 node-id

- Specifies the Pump node ID. With this ID, this Pump process can be identified in the cluster.
- Default value: `hostname:port number`. For example, `node-1:8250`.

#### 13.10.5.1.12 security

This section introduces configuration items related to security.

ssl-ca

- Specifies the file path of the trusted SSL certificate list or CA list. For example, `/path/to/ca.pem`.
- Default value: ""

ssl-cert

- Specifies the path of the X509 certificate file encoded in the Privacy Enhanced Mail (PEM) format. For example, `/path/to/pump.pem`.
- Default value: ""

ssl-key

- Specifies the path of the X509 key file encoded in the PEM format. For example, `/path/to/pump-key.pem`.
- Default value: ""

#### 13.10.5.1.13 storage

This section introduces configuration items related to storage.

sync-log

- Specifies whether to use `fsync` after each **batch** write to binlog to ensure data safety.
- Default value: `true`

kv_chan_cap

- Specifies the number of write requests that the buffer can store before Pump receives these requests.
- Default value: `1048576` (that is, 2 to the power of 20)

slow_write_threshold

- The threshold (in seconds). If it takes longer to write a single binlog file than this specified threshold, the write is considered slow write and `"take a long time to write binlog"` is output in the log.
- Default value: `1`

stop-write-at-available-space

- Binlog write requests is no longer accepted when the available storage space is below this specified value. You can use the format such as `900 MB`, `5 GB`, and `12 GiB` to specify the storage space. If there is more than one Pump node in the cluster, when a Pump node refuses a write request because of the insufficient space, TiDB will automatically write binlogs to other Pump nodes.
- Default value: `10 GiB`

kv

Currently the storage of Pump is implemented based on GoLevelDB. Under `storage` there is also a `kv` subgroup that is used to adjust the GoLevel configuration. The supported configuration items are shown as below:

- block-cache-capacity
- block-restart-interval
- block-size
- compaction-L0-trigger
- compaction-table-size
- compaction-total-size
- compaction-total-size-multiplier
- write-buffer
- write-L0-pause-trigger
- write-L0-slowdown-trigger

For the detailed description of the above items, see GoLevelDB Document.

#### 13.10.5.2 Drainer

This section introduces the configuration items of Drainer. For the example of a complete Drainer configuration file, see Drainer Configuration

##### 13.10.5.2.1 addr

- Specifies the listening address of HTTP API in the format of `host:port`.
- Default value: `127.0.0.1:8249`

##### 13.10.5.2.2 advertise-addr

- Specifies the externally accessible HTTP API address. This address is registered in PD in the format of `host:port`.
- Default value: `127.0.0.1:8249`

##### 13.10.5.2.3 log-file

- Specifies the path where log files are stored. If the parameter is set to an empty value, log files are not stored.
- Default value: “”

##### 13.10.5.2.4 log-level

- Specifies the log level.
- Default value: `info`

##### 13.10.5.2.5 node-id

- Specifies the Drainer node ID. With this ID, this Drainer process can be identified in the cluster.
- Default value: `hostname:port number`. For example, `node-1:8249`.

##### 13.10.5.2.6 data-dir

- Specifies the directory used to store files that need to be saved during Drainer operation.
- Default value: `data.drainer`

##### 13.10.5.2.7 detect-interval

- Specifies the interval (in seconds) at which PD updates the Pump information.
- Default value: `5`

#### 13.10.5.2.8 pd-urls

- The comma-separated list of PD URLs. If multiple addresses are specified, the PD client will automatically attempt to connect to another address if an error occurs when connecting to one address.
- Default value: `http://127.0.0.1:2379`

#### 13.10.5.2.9 initial-commit-ts

- Specifies from which commit timestamp of the transaction the replication process starts. This configuration is applicable only to the Drainer node that is in the replication process for the first time. If a checkpoint already exists in the downstream, the replication will be performed according to the time recorded in the checkpoint.
- commit ts (commit timestamp) is a specific point in time for transaction commits in TiDB. It is a globally unique and increasing timestamp from PD as the unique ID of the current transaction. You can get the `initial-commit-ts` configuration in the following typical ways:
    - If BR is used, you can get `initial-commit-ts` from the backup TS recorded in the metadata backed up by BR (backupmeta).
    - If Dumpling is used, you can get `initial-commit-ts` from the Pos recorded in the metadata backed up by Dumpling (metadata),
    - If PD Control is used, `initial-commit-ts` is in the output of the `tso` command.
- Default value: `-1`. Drainer will get a new timestamp from PD as the starting time, which means that the replication process starts from the current time.

#### 13.10.5.2.10 synced-check-time

- You can access the `/status` path through the HTTP API to query the status of Drainer replication. `synced-check-time` specifies how many minutes from the last successful replication is considered as `synced`, that is, the replication is complete.
- Default value: `5`

#### 13.10.5.2.11 compressor

- Specifies the compression algorithm used for data transfer between Pump and Drainer. Currently only the `gzip` algorithm is supported.
- Default value: "", which means no compression.

#### 13.10.5.2.12 security

This section introduces configuration items related to security.

ssl-ca

- Specifies the file path of the trusted SSL certificate list or CA list. For example, `/path/to/ca.pem`.
- Default value: “”

ssl-cert

- Specifies the path of the X509 certificate file encoded in the PEM format. For example, `/path/to/drainer.pem`.
- Default value: “”

ssl-key

- Specifies the path of the X509 key file encoded in the PEM format. For example, `/path/to/pump-key.pem`.
- Default value: “”

#### 13.10.5.2.13 syncer

The `syncer` section includes configuration items related to the downstream.

db-type

Currently, the following downstream types are supported:

- `mysql`
- `tidb`
- `kafka`
- `file`

Default value: `mysql`

sql-mode

- Specifies the SQL mode when the downstream is the `mysql` or `tidb` type. If there is more than one mode, use commas to separate them.
- Default value: “”

ignore-txn-commit-ts

- Specifies the commit timestamp at which the binlog is ignored, such as `[416815754209656834, 421349811963822081]`.
- Default value: `[]`

ignore-schemas

- Specifies the database to be ignored during replication. If there is more than one database to be ignored, use commas to separate them. If all changes in a binlog file are filtered, the whole binlog file is ignored.
- Default value: `INFORMATION_SCHEMA,PERFORMANCE_SCHEMA,mysql`

ignore-table

Ignores the specified table changes during replication. You can specify multiple tables to be ignored in the `toml` file. For example:

```
[[syncer.ignore-table]]
db-name = "test"
tbl-name = "log"

[[syncer.ignore-table]]
db-name = "test"
tbl-name = "audit"
```

If all changes in a binlog file are filtered, the whole binlog file is ignored.

Default value: `[]`

replicate-do-db

- Specifies the database to be replicated. For example, `[db1, db2]`.
- Default value: `[]`

replicate-do-table

Specifies the table to be replicated. For example:

```
[[syncer.replicate-do-table]]
db-name ="test"
tbl-name = "log"

[[syncer.replicate-do-table]]
db-name ="test"
tbl-name = "~^a.*"
```

Default value: `[]`

txn-batch

- When the downstream is the `mysql` or `tidb` type, DML operations are executed in different batches. This parameter specifies how many DML operations can be included in each transaction.
- Default value: `20`

worker-count

- When the downstream is the `mysql` or `tidb` type, DML operations are executed concurrently. This parameter specifies the concurrency numbers of DML operations.
- Default value: `16`

disable-dispatch

- Disables the concurrency and forcibly set `worker-count` to `1`.
- Default value: `false`

safe-mode

If the safe mode is enabled, Drainer modifies the replication updates in the following way:

- `Insert` is modified to `Replace Into`
- `Update` is modified to `Delete` plus `Replace Into`

Default value: `false`

load-schema-snapshot

- Specifies how Drainer loads table information.
- When you set it to `false`, Drainer replays all DDL operations from history to derive the table schema for each table at a specific schema version. This approach requires processing all DDL changes from the initial state to the target schema version, which might involve significant data processing and replaying.
- When you set it to `true`, Drainer directly reads the table information at the checkpoint TS. Becasue it directly reads the table information at a specific point in time, this method is usually more efficient. However, it is subject to the GC mechanism, because GC might delete older data versions. If the checkpoint TS is too old, the corresponding table information might have been deleted by GC, making it impossible to read directly.
- When configuring Drainer, choose whether to read the table information at the checkpoint TS based on actual needs. If data integrity and consistency are priorities and handling a large number of DDL changes is acceptable, it is recommended to set it to `false`. If efficiency and performance are more important, and the checkpoint TS is guaranteed to be after the GC safe point, it is recommended to set it to `true`.
- Default value: `false`

#### 13.10.5.2.14 syncer.to

The `syncer.to` section introduces different types of downstream configuration items according to configuration types.

mysql/tidb

The following configuration items are related to connection to downstream databases:

- `host`: If this item is not set, TiDB Binlog tries to check the `MYSQL_HOST` environment variable which is `localhost` by default.
- `port`: If this item is not set, TiDB Binlog tries to check the `MYSQL_PORT` environment variable which is `3306` by default.
- `user`: If this item is not set, TiDB Binlog tries to check the `MYSQL_USER` environment variable which is `root` by default.
- `password`: If this item is not set, TiDB Binlog tries to check the `MYSQL_PSWD` environment variable which is `""` by default.
- `read-timeout`: Specifies the I/O read timeout of the downstream database connection. The default value is `1m`. If Drainer keeps failing on some DDLs that take a long time, you can set this configuration to a larger value.

file

- `dir`: Specifies the directory where binlog files are stored. If this item is not set, `data-dir` is used.

kafka

When the downstream is Kafka, the valid configuration items are as follows:

- `zookeeper-addrs`
- `kafka-addrs`
- `kafka-version`
- `kafka-max-messages`
- `kafka-max-message-size`
- `topic-name`

#### 13.10.5.2.15 syncer.to.checkpoint

- `type`: Specifies in what way the replication progress is saved. Currently, the available options are `mysql`, `tidb`, and `file`.

  This configuration item is the same as the downstream type by default. For example, when the downstream is `file`, the checkpoint progress is saved in the local file `<data-dir>/savepoint`; when the downstream is `mysql`, the progress is saved in the downstream database. If you need to explicitly specify using `mysql` or `tidb` to store the progress, make the following configuration:

- `schema`: `"tidb_binlog"` by default.

> **Note:**
> When deploying multiple Drainer nodes in the same TiDB cluster, you need to specify a different checkpoint schema for each node. Otherwise, the replication progress of two instances will overwrite each other.

- `host`
- `user`
- `password`
- `port`

#### 13.10.5.3 TiDB Binlog Configuration File

This document introduces the configuration items of TiDB Binlog.

##### 13.10.5.3.1 Pump

This section introduces the configuration items of Pump. For the example of a complete Pump configuration file, see Pump Configuration.

addr

- Specifies the listening address of HTTP API in the format of `host:port`.
- Default value: `127.0.0.1:8250`

advertise-addr

- Specifies the externally accessible HTTP API address. This address is registered in PD in the format of `host:port`.
- Default value: `127.0.0.1:8250`

socket

- The Unix socket address that HTTP API listens to.
- Default value: “”

pd-urls

- Specifies the comma-separated list of PD URLs. If multiple addresses are specified, when the PD client fails to connect to one address, it automatically tries to connect to another address.
- Default value: `http://127.0.0.1:2379`

data-dir

- Specifies the directory where binlogs and their indexes are stored locally.
- Default value: `data.pump`

heartbeat-interval

- Specifies the heartbeat interval (in seconds) at which the latest status is reported to PD.
- Default value: `2`

gen-binlog-interval

- Specifies the interval (in seconds) at which data is written into fake binlog.
- Default value: `3`

gc

- Specifies the number of days (integer) that binlogs can be stored locally. Binlogs stored longer than the specified number of days are automatically deleted.
- Default value: `7`

log-file

- Specifies the path where log files are stored. If the parameter is set to an empty value, log files are not stored.
- Default value: “”

log-level

- Specifies the log level.
- Default value: `info`

node-id

- Specifies the Pump node ID. With this ID, this Pump process can be identified in the cluster.

- Default value: `hostname:port number`. For example, `node-1:8250`.

security

This section introduces configuration items related to security.

ssl-ca

- Specifies the file path of the trusted SSL certificate list or CA list. For example, `/path/to/ca.pem`.
- Default value: ""

ssl-cert

- Specifies the path of the X509 certificate file encoded in the Privacy Enhanced Mail (PEM) format. For example, `/path/to/pump.pem`.
- Default value: ""

ssl-key

- Specifies the path of the X509 key file encoded in the PEM format. For example, `/path/to/pump-key.pem`.
- Default value: ""

storage

This section introduces configuration items related to storage.

sync-log

- Specifies whether to use `fsync` after each **batch** write to binlog to ensure data safety.
- Default value: `true`

kv_chan_cap

- Specifies the number of write requests that the buffer can store before Pump receives these requests.
- Default value: `1048576` (that is, 2 to the power of 20)

slow_write_threshold

- The threshold (in seconds). If it takes longer to write a single binlog file than this specified threshold, the write is considered slow write and `"take a long time to write binlog"` is output in the log.

- Default value: `1`

stop-write-at-available-space

- Binlog write requests is no longer accepted when the available storage space is below this specified value. You can use the format such as `900 MB`, `5 GB`, and `12 GiB` to specify the storage space. If there is more than one Pump node in the cluster, when a Pump node refuses a write request because of the insufficient space, TiDB will automatically write binlogs to other Pump nodes.
- Default value: `10 GiB`

kv

Currently the storage of Pump is implemented based on GoLevelDB. Under `storage` there is also a `kv` subgroup that is used to adjust the GoLevel configuration. The supported configuration items are shown as below:

- block-cache-capacity
- block-restart-interval
- block-size
- compaction-L0-trigger
- compaction-table-size
- compaction-total-size
- compaction-total-size-multiplier
- write-buffer
- write-L0-pause-trigger
- write-L0-slowdown-trigger

For the detailed description of the above items, see GoLevelDB Document.

#### 13.10.5.3.2 Drainer

This section introduces the configuration items of Drainer. For the example of a complete Drainer configuration file, see Drainer Configuration

addr

- Specifies the listening address of HTTP API in the format of `host:port`.
- Default value: `127.0.0.1:8249`

advertise-addr

- Specifies the externally accessible HTTP API address. This address is registered in PD in the format of `host:port`.

- Default value: `127.0.0.1:8249`

log-file

- Specifies the path where log files are stored. If the parameter is set to an empty value, log files are not stored.
- Default value: “”

log-level

- Specifies the log level.
- Default value: `info`

node-id

- Specifies the Drainer node ID. With this ID, this Drainer process can be identified in the cluster.
- Default value: `hostname:port number`. For example, `node-1:8249`.

data-dir

- Specifies the directory used to store files that need to be saved during Drainer operation.
- Default value: `data.drainer`

detect-interval

- Specifies the interval (in seconds) at which PD updates the Pump information.
- Default value: `5`

pd-urls

- The comma-separated list of PD URLs. If multiple addresses are specified, the PD client will automatically attempt to connect to another address if an error occurs when connecting to one address.
- Default value: `http://127.0.0.1:2379`

initial-commit-ts

- Specifies from which commit timestamp of the transaction the replication process starts. This configuration is applicable only to the Drainer node that is in the replication process for the first time. If a checkpoint already exists in the downstream, the replication will be performed according to the time recorded in the checkpoint.

- commit ts (commit timestamp) is a specific point in time for transaction commits in TiDB. It is a globally unique and increasing timestamp from PD as the unique ID of the current transaction. You can get the `initial-commit-ts` configuration in the following typical ways:
    - If BR is used, you can get `initial-commit-ts` from the backup TS recorded in the metadata backed up by BR (backupmeta).
    - If Dumpling is used, you can get `initial-commit-ts` from the Pos recorded in the metadata backed up by Dumpling (metadata),
    - If PD Control is used, `initial-commit-ts` is in the output of the `tso` command.
- Default value: `-1`. Drainer will get a new timestamp from PD as the starting time, which means that the replication process starts from the current time.

synced-check-time

- You can access the `/status` path through the HTTP API to query the status of Drainer replication. `synced-check-time` specifies how many minutes from the last successful replication is considered as `synced`, that is, the replication is complete.
- Default value: `5`

compressor

- Specifies the compression algorithm used for data transfer between Pump and Drainer. Currently only the `gzip` algorithm is supported.
- Default value: "", which means no compression.

security

This section introduces configuration items related to security.

ssl-ca

- Specifies the file path of the trusted SSL certificate list or CA list. For example, `/path/to/ca.pem`.
- Default value: ""

ssl-cert

- Specifies the path of the X509 certificate file encoded in the PEM format. For example, `/path/to/drainer.pem`.
- Default value: ""

ssl-key

- Specifies the path of the X509 key file encoded in the PEM format. For example, `/path/to/pump-key.pem`.
- Default value: “”

syncer

The `syncer` section includes configuration items related to the downstream.

db-type

Currently, the following downstream types are supported:

- `mysql`
- `tidb`
- `kafka`
- `file`

Default value: `mysql`

sql-mode

- Specifies the SQL mode when the downstream is the `mysql` or `tidb` type. If there is more than one mode, use commas to separate them.
- Default value: “”

ignore-txn-commit-ts

- Specifies the commit timestamp at which the binlog is ignored, such as `[416815754209656834, 421349811963822081]`.
- Default value: `[]`

ignore-schemas

- Specifies the database to be ignored during replication. If there is more than one database to be ignored, use commas to separate them. If all changes in a binlog file are filtered, the whole binlog file is ignored.
- Default value: `INFORMATION_SCHEMA,PERFORMANCE_SCHEMA,mysql`

ignore-table

Ignores the specified table changes during replication. You can specify multiple tables to be ignored in the `toml` file. For example:

```
[[syncer.ignore-table]]
db-name = "test"
tbl-name = "log"

[[syncer.ignore-table]]
db-name = "test"
tbl-name = "audit"
```

If all changes in a binlog file are filtered, the whole binlog file is ignored.

Default value: `[]`

replicate-do-db

- Specifies the database to be replicated. For example, `[db1, db2]`.
- Default value: `[]`

replicate-do-table

Specifies the table to be replicated. For example:

```
[[syncer.replicate-do-table]]
db-name ="test"
tbl-name = "log"

[[syncer.replicate-do-table]]
db-name ="test"
tbl-name = "~^a.*"
```

Default value: `[]`

txn-batch

- When the downstream is the `mysql` or `tidb` type, DML operations are executed in different batches. This parameter specifies how many DML operations can be included in each transaction.
- Default value: `20`

worker-count

- When the downstream is the `mysql` or `tidb` type, DML operations are executed concurrently. This parameter specifies the concurrency numbers of DML operations.
- Default value: `16`

disable-dispatch

- Disables the concurrency and forcibly set `worker-count` to `1`.
- Default value: `false`

safe-mode

If the safe mode is enabled, Drainer modifies the replication updates in the following way:

- `Insert` is modified to `Replace Into`
- `Update` is modified to `Delete` plus `Replace Into`

Default value: `false`

load-schema-snapshot

- Specifies how Drainer loads table information.
- When you set it to `false`, Drainer replays all DDL operations from history to derive the table schema for each table at a specific schema version. This approach requires processing all DDL changes from the initial state to the target schema version, which might involve significant data processing and replaying.
- When you set it to `true`, Drainer directly reads the table information at the checkpoint TS. Becasue it directly reads the table information at a specific point in time, this method is usually more efficient. However, it is subject to the GC mechanism, because GC might delete older data versions. If the checkpoint TS is too old, the corresponding table information might have been deleted by GC, making it impossible to read directly.
- When configuring Drainer, choose whether to read the table information at the checkpoint TS based on actual needs. If data integrity and consistency are priorities and handling a large number of DDL changes is acceptable, it is recommended to set it to `false`. If efficiency and performance are more important, and the checkpoint TS is guaranteed to be after the GC safe point, it is recommended to set it to `true`.
- Default value: `false`

syncer.to

The `syncer.to` section introduces different types of downstream configuration items according to configuration types.

mysql/tidb

The following configuration items are related to connection to downstream databases:

- `host`: If this item is not set, TiDB Binlog tries to check the `MYSQL_HOST` environment variable which is `localhost` by default.
- `port`: If this item is not set, TiDB Binlog tries to check the `MYSQL_PORT` environment variable which is `3306` by default.
- `user`: If this item is not set, TiDB Binlog tries to check the `MYSQL_USER` environment variable which is `root` by default.

- `password`: If this item is not set, TiDB Binlog tries to check the `MYSQL_PSWD` environment variable which is `""` by default.
- `read-timeout`: Specifies the I/O read timeout of the downstream database connection. The default value is `1m`. If Drainer keeps failing on some DDLs that take a long time, you can set this configuration to a larger value.

file

- `dir`: Specifies the directory where binlog files are stored. If this item is not set, `data-dir` is used.

kafka

When the downstream is Kafka, the valid configuration items are as follows:

- `zookeeper-addrs`
- `kafka-addrs`
- `kafka-version`
- `kafka-max-messages`
- `kafka-max-message-size`
- `topic-name`

syncer.to.checkpoint

- `type`: Specifies in what way the replication progress is saved. Currently, the available options are `mysql`, `tidb`, and `file`.

  This configuration item is the same as the downstream type by default. For example, when the downstream is `file`, the checkpoint progress is saved in the local file `<data-dir>/savepoint`; when the downstream is `mysql`, the progress is saved in the downstream database. If you need to explicitly specify using `mysql` or `tidb` to store the progress, make the following configuration:

- `schema`: `"tidb_binlog"` by default.

> **Note:**
> When deploying multiple Drainer nodes in the same TiDB cluster, you need to specify a different checkpoint schema for each node. Otherwise, the replication progress of two instances will overwrite each other.

- `host`
- `user`
- `password`
- `port`

### 13.10.6 Upgrade TiDB Binlog

This document introduces how to upgrade TiDB Binlog that is deployed manually to the latest cluster version. There is also a section on how to upgrade TiDB Binlog from an earlier incompatible version (Kafka/Local version) to the latest version.

#### 13.10.6.1 Upgrade TiDB Binlog deployed manually

Follow the steps in this section if you deploy TiDB Binlog manually.

##### 13.10.6.1.1 Upgrade Pump

First, upgrade each Pump instance in the cluster one by one. This ensures that there are always Pump instances in the cluster that can receive binlogs from TiDB. The steps are as below:

1. Replace the original file with the new version of `pump`.
2. Restart the Pump process.

##### 13.10.6.1.2 Upgrade Drainer

Second, upgrade the Drainer component:

1. Replace the original file with the new version of `drainer`.
2. Restart the Drainer process.

#### 13.10.6.2 Upgrade TiDB Binlog from Kafka/Local version to the cluster version

The new TiDB versions (v2.0.8-binlog, v2.1.0-rc.5 or later) are not compatible with the Kafka version or Local version of TiDB Binlog. If TiDB is upgraded to one of the new versions, it is required to use the cluster version of TiDB Binlog. If the Kafka or local version of TiDB Binlog is used before upgrading, you need to upgrade your TiDB Binlog to the cluster version.

The corresponding relationship between TiDB Binlog versions and TiDB versions is shown in the following table:

| TiDB Binlog version | TiDB version | Note |
|---|---|---|
| Local | TiDB 1.0 or earlier | |
| Kafka | TiDB 1.0 ~ TiDB 2.1 RC5 | TiDB 1.0 supports both the local and Kafka versions of TiDB Binlog. |
| Cluster | TiDB v2.0.8-binlog, TiDB 2.1 RC5 or later | TiDB v2.0.8-binlog is a special 2.0 version supporting the cluster version of TiDB Binlog. |

#### 13.10.6.2.1 Upgrade process

> **Note:**
>
> If importing the full data is acceptable, you can abandon the old version and deploy TiDB Binlog following TiDB Binlog Cluster Deployment.

If you want to resume replication from the original checkpoint, perform the following steps to upgrade TiDB Binlog:

1. Deploy the new version of Pump.
2. Stop the TiDB cluster service.
3. Upgrade TiDB and the configuration, and write the binlog data to the new Pump cluster.
4. Reconnect the TiDB cluster to the service.
5. Make sure that the old version of Drainer has replicated the data in the old version of Pump to the downstream completely;

   Query the `status` interface of Drainer, command as below:

   ```
   curl 'http://172.16.10.49:8249/status'
   ```

   ```
   {"PumpPos":{"172.16.10.49:8250":{"offset":32686}},"Synced": true ,"
       ↪ DepositWindow":{"Upper":398907800202772481,"Lower
       ↪ ":398907799455662081}}
   ```

   If the return value of `Synced` is True, it means Drainer has replicated the data in the old version of Pump to the downstream completely.
6. Start the new version of Drainer.
7. Close the Pump and Drainer of the old versions and the dependent Kafka and ZooKeeper.

### 13.10.7 TiDB Binlog Monitoring

After you have deployed TiDB Binlog successfully, you can go to the Grafana Web (default address: http://grafana_ip:3000, default account: admin, password: admin) to check the state of Pump and Drainer.

#### 13.10.7.1 Monitoring metrics

TiDB Binlog consists of two components: Pump and Drainer. This section shows the monitoring metrics of Pump and Drainer.

##### 13.10.7.1.1 Pump monitoring metrics

To understand the Pump monitoring metrics, check the following table:

| Pump monitoring metrics | Description |
|---|---|
| Storage Size | Records the total disk space (capacity) and the available disk space (available) |

| Pump monitoring metrics | Description |
| --- | --- |
| Metadata | Records the biggest TSO (`gc_tso` ↪ ) of the binlog that each Pump node can delete, and the biggest commit TSO (`max_commit_tso` ↪ ) of the saved binlog |

| Pump monitoring metrics | Description |
| --- | --- |
| Write Binlog QPS by Instance | Shows QPS of writing binlog requests received by each Pump node |
| Write Binlog Latency | Records the latency time of each Pump node writing binlog |

| Pump monitoring metrics | Description |
| --- | --- |
| Storage Write Binlog Size | Shows the size of the binlog data written by Pump |
| Storage Write Binlog Latency | Records the latency time of the Pump storage module writing binlog |

| Pump monitoring metrics | Description |
| --- | --- |
| Pump Storage Error By Type | Records the number of errors encountered by Pump, counted based on the type of error |
| Query TiKV | The number of times that Pump queries the transaction status through TiKV |

#### 13.10.7.1.2 Drainer monitoring metrics

To understand the Drainer monitoring metrics, check the following table:

| Drainer monitoring metrics | Description |
| --- | --- |

| Drainer monitoring metrics | Description |
| --- | --- |
| Checkpoint TSO | Shows the biggest TSO time of the binlog that Drainer has already replicated into the downstream. You can get the lag by using the current time to subtract the bin- |

| Drainer monitoring metrics | Description |
| --- | --- |
| Pump Handle TSO | Records the biggest TSO time among the binlog files that Drainer obtains from each Pump node |
| Pull Binlog QPS by Pump NodeID | Shows the QPS when Drainer obtains binlog from each Pump node |

| Drainer monitoring metrics | Description |
| --- | --- |
| 95% Binlog Reach Duration By Pump | Records the delay from the time when binlog is written into Pump to the time when the binlog is obtained by Drainer |

| Drainer monitoring metrics | Description |
| --- | --- |
| Error By Type | Shows the number of errors encountered by Drainer, counted based on the type of error |
| SQL Query Time | Records the time it takes Drainer to execute the SQL statement in the downstream |

| Drainer monitoring metrics | Description |
| --- | --- |
| DrainerEvent | Shows the number of various types of events, including “ddl”, “insert”, “delete”, “update”, “flush”, and “savepoint” |

| Drainer monitoring metrics | Description |
| --- | --- |
| Execute Time | Records the time it takes to write binlog into the downstream syncing module |
| 95% Binlog Size | Shows the size of the binlog data that Drainer obtains from each Pump node |

| Drainer monitoring metrics | Description |
|---|---|
| DDL Job Count | Records the number of DDL statements handled by Drainer |
| Queue Size | Records the work queue size in Drainer |

#### 13.10.7.2 Alert rules

This section gives the alert rules for TiDB Binlog. According to the severity level, TiDB Binlog alert rules are divided into three categories (from high to low): emergency-level, critical-level and warning-level.

##### 13.10.7.2.1 Emergency-level alerts

Emergency-level alerts are often caused by a service or node failure. Manual intervention is required immediately.

`binlog_pump_storage_error_count`

- Alert rule:

  `changes(binlog_pump_storage_error_count[1m])> 0`

- Description:

  Pump fails to write the binlog data to the local storage.

- Solution:

  Check whether an error exists in the `pump_storage_error` monitoring and check the Pump log to find the causes.

#### 13.10.7.2.2 Critical-level alerts

For the critical-level alerts, a close watch on the abnormal metrics is required.

`binlog_drainer_checkpoint_high_delay`

- Alert rule:

  `(time()- binlog_drainer_checkpoint_tso / 1000)> 3600`

- Description:

  The delay of Drainer replication exceeds one hour.

- Solution:

  - Check whether it is too slow to obtain the data from Pump:

    You can check `handle tso` of Pump to get the time for the latest message of each Pump. Check whether a high latency exists for Pump and make sure the corresponding Pump is running normally.
  - Check whether it is too slow to replicate data in the downstream based on Drainer `event` and Drainer `execute latency`:
    - If Drainer `execute time` is too large, check the network bandwidth and latency between the machine with Drainer deployed and the machine with the target database deployed, and the state of the target database.
    - If Drainer `execute time` is not too large and Drainer `event` is too small, add `work count` and `batch` and retry.
  - If the two solutions above cannot work, get support from PingCAP or the community.

#### 13.10.7.2.3 Warning-level alerts

Warning-level alerts are a reminder for an issue or error.

`binlog_pump_write_binlog_rpc_duration_seconds_bucket`

- Alert rule:

  ```
  histogram_quantile(0.9, rate(binlog_pump_rpc_duration_seconds_bucket{
  ↪ method="WriteBinlog"}[5m]))> 1
  ```

- Description:

  It takes too much time for Pump to handle the TiDB request of writing binlog.

- Solution:
    - Verify the disk performance pressure and check the disk performance monitoring via `node exported`.
    - If both `disk latency` and `util` are low, get support from PingCAP or the community.

`binlog_pump_storage_write_binlog_duration_time_bucket`

- Alert rule:

```
histogram_quantile(0.9, rate(binlog_pump_storage_write_binlog_duration_time_bucket
↪ {type="batch"}[5m]))> 1
```

- Description:

  The time it takes for Pump to write the local binlog to the local disk.

- Solution:

  Check the state of the local disk of Pump and fix the problem.

`binlog_pump_storage_available_size_less_than_20G`

- Alert rule:

```
binlog_pump_storage_storage_size_bytes{type="available"} < 20 * 1024 *
↪ 1024 * 1024
```

- Description:

  The available disk space of Pump is less than 20 GB.

- Solution:

  Check whether Pump `gc_tso` is normal. If not, adjust the GC time configuration of Pump or get the corresponding Pump offline.

`binlog_drainer_checkpoint_tso_no_change_for_1m`

- Alert rule:

```
changes(binlog_drainer_checkpoint_tso[1m])< 1
```

- Description:

  Drainer `checkpoint` has not been updated for one minute.

- Solution:

  Check whether all the Pumps that are not offline are running normally.

`binlog_drainer_execute_duration_time_more_than_10s`

- Alert rule:

  ```
  histogram_quantile(0.9, rate(binlog_drainer_execute_duration_time_bucket
  ↪ [1m]))> 10
  ```

- Description:

  The transaction time it takes Drainer to replicate data to TiDB. If it is too large, the Drainer replication of data is affected.

- Solution:

  - Check the TiDB cluster state.
  - Check the Drainer log or monitor. If a DDL operation causes this problem, you can ignore it.

### 13.10.8 Reparo User Guide

Reparo is a TiDB Binlog tool, used to recover the incremental data. To back up the incremental data, you can use Drainer of TiDB Binlog to output the binlog data in the protobuf format to files. To restore the incremental data, you can use Reparo to parse the binlog data in the files and apply the binlog in TiDB/MySQL.

The Reparo installation package (`reparo`) is included in the TiDB Toolkit. To download the TiDB Toolkit, see Download TiDB Tools.

#### 13.10.8.1 Reparo usage

##### 13.10.8.1.1 Description of command line parameters

```
Usage of Reparo:
-L string
    The level of the output information of logs
    Value: "debug"/"info"/"warn"/"error"/"fatal" ("info" by default)
-V Prints the version.
-c int
    The number of concurrencies in the downstream for the replication
       ↪ process (`16` by default). A higher value indicates a better
       ↪ throughput for the replication.
-config string
    The path of the configuration file
    If the configuration file is specified, Reparo reads the configuration
       ↪ data in this file.
```

```
   If the configuration data also exists in the command line parameters,
      ↪ Reparo uses the configuration data in the command line parameters
      ↪ to cover that in the configuration file.
-data-dir string
   The storage directory for the binlog file in the protobuf format that
      ↪ Drainer outputs ("data.drainer" by default)
-dest-type string
   The downstream service type
   Value: "print"/"mysql" ("print" by default)
   If it is set to "print", the data is parsed and printed to standard
      ↪ output while the SQL statement is not executed.
   If it is set to "mysql", you need to configure the "host", "port", "user
      ↪ " and "password" information in the configuration file.
-log-file string
   The path of the log file
-log-rotate string
   The switch frequency of log files
   Value: "hour"/"day"
-start-datetime string
   Specifies the time point for starting recovery.
   Format: "2006-01-02 15:04:05"
   If it is not set, the recovery process starts from the earliest binlog
      ↪ file.
-stop-datetime string
   Specifies the time point of finishing the recovery process.
   Format: "2006-01-02 15:04:05"
   If it is not set, the recovery process ends up with the last binlog file
      ↪ .
-safe-mode bool
   Specifies whether to enable safe mode. When enabled, it supports
      ↪ repeated replication.
-txn-batch int
   The number of SQL statements in a transaction that is output to the
      ↪ downstream database (`20` by default).
```

#### 13.10.8.1.2 Description of the configuration file

```
### The storage directory for the binlog file in the protobuf format that
   ↪ Drainer outputs
data-dir = "./data.drainer"

### The level of the output information of logs
### Value: "debug"/"info"/"warn"/"error"/"fatal" ("info" by default)
log-level = "info"
```

```
### Uses `start-datetime` and `stop-datetime` to specify the time range in
    ↪ which
### the binlog files are to be recovered.
### Format: "2006-01-02 15:04:05"
### start-datetime = ""
### stop-datetime = ""

### Correspond to `start-datetime` and `stop-datetime` respectively.
### They are used to specify the time range in which the binlog files are to
    ↪  be recovered.
### If `start-datetime` and `stop-datetime` are set, there is no need to set
    ↪  `start-tso` and `stop-tso`.
### When you perform a full recovery or resume an incremental recovery, set
    ↪ start-tso to tso + 1 or stop-tso + 1, respectively.
### start-tso = 0
### stop-tso = 0

### The downstream service type
### Value: "print"/"mysql" ("print" by default)
### If it is set to "print", the data is parsed and printed to standard
    ↪ output
### while the SQL statement is not executed.
### If it is set to "mysql", you need to configure `host`, `port`, `user`
    ↪ and `password` in [dest-db].
dest-type = "mysql"

### The number of SQL statements in a transaction that is output to the
    ↪ downstream database (`20` by default).
txn-batch = 20

### The number of concurrencies in the downstream for the replication
    ↪ process (`16` by default). A higher value indicates a better
    ↪ throughput for the replication.
worker-count = 16

### Safe-mode configuration
### Value: "true"/"false" ("false" by default)
### If it is set to "true", Reparo splits the `UPDATE` statement into a `
    ↪ DELETE` statement plus a `REPLACE` statement.
safe-mode = false

### `replicate-do-db` and `replicate-do-table` specify the database and
    ↪ table to be recovered.
### `replicate-do-db` has priority over `replicate-do-table`.
```

```
### You can use a regular expression for configuration. The regular
    ↪ expression should start with "~".
### The configuration method for `replicate-do-db` and `replicate-do-table`
    ↪ is
### the same with that for `replicate-do-db` and `replicate-do-table` of
    ↪ Drainer.
### replicate-do-db = ["~^b.*","s1"]
### [[replicate-do-table]]
### db-name ="test"
### tbl-name = "log"
### [[replicate-do-table]]
### db-name ="test"
### tbl-name = "~^a.*"

### If `dest-type` is set to `mysql`, `dest-db` needs to be configured.
[dest-db]
host = "127.0.0.1"
port = 3309
user = "root"
password = ""
```

#### 13.10.8.1.3 Start example

```
./reparo -config reparo.toml
```

**Note:**

- `data-dir` specifies the directory for the binlog file that Drainer outputs.
- Both `start-datatime` and `start-tso` are used to specify the time point for starting recovery, but they are different in the time format. If they are not set, the recovery process starts from the earliest binlog file by default.
- Both `stop-datetime` and `stop-tso` are used to specify the time point for finishing recovery, but they are different in the time format. If they are not set, the recovery process ends up with the last binlog file by default.
- `dest-type` specifies the destination type. Its value can be "mysql" and "print."
    - When it is set to `mysql`, the data can be recovered to MySQL or TiDB that uses or is compatible with the MySQL protocol. In this

case, you need to specify the database information in `[dest-db]` of the configuration information.
    - When it is set to `print`, only the binlog information is printed. It is generally used for debugging and checking the binlog information. In this case, there is no need to specify `[dest-db]`.
- `replicate-do-db` specifies the database for recovery. If it is not set, all the databases are to be recovered.
- `replicate-do-table` specifies the table for recovery. If it is not set, all the tables are to be recovered.

### 13.10.9 binlogctl

Binlog Control (`binlogctl` for short) is a command line tool for TiDB Binlog. You can use `binlogctl` to manage TiDB Binlog clusters.

You can use `binlogctl` to:

- Check the state of Pump or Drainer
- Pause or close Pump or Drainer
- Handle the abnormal state of Pump or Drainer

The following are its usage scenarios:

- An error occurs during data replication or you need to check the running state of Pump or Drainer.
- You need to pause or close Pump or Drainer when maintaining the cluster.
- A Pump or Drainer process exits abnormally, while the node state is not updated or is unexpected. This affects the data replication task.

#### 13.10.9.1 Download `binlogctl`

`binlogctl` is included in the TiDB Toolkit. To download the TiDB Toolkit, see Download TiDB Tools.

#### 13.10.9.2 Descriptions

Command line parameters:

```
Usage of binlogctl:
  -V   prints version and exit
  -cmd string
```

```
      operator: "generate_meta", "pumps", "drainers", "update-pump", "
         ↪ update-drainer", "pause-pump", "pause-drainer", "offline-pump
         ↪ ", "offline-drainer", "encrypt" (default "pumps")
-data-dir string
      meta directory path (default "binlog_position")
-node-id string
      id of node, used to update some nodes with operations update-pump,
         ↪ update-drainer, pause-pump, pause-drainer, offline-pump and
         ↪ offline-drainer
-pd-urls string
      a comma separated list of PD endpoints (default "http
         ↪ ://127.0.0.1:2379")
-show-offline-nodes
      include offline nodes when querying pumps/drainers
-ssl-ca string
      Path of file that contains list of trusted SSL CAs for connection
         ↪ with cluster components.
-ssl-cert string
      Path of file that contains X509 certificate in PEM format for
         ↪ connection with cluster components.
-ssl-key string
      Path of file that contains X509 key in PEM format for connection with
         ↪  cluster components.
-state string
      set node's state, can be set to online, pausing, paused, closing or
         ↪ offline.
-text string
      text to be encrypted when using encrypt command
-time-zone Asia/Shanghai
      set time zone if you want to save time info in savepoint file; for
         ↪ example, Asia/Shanghai for CST time, `Local` for local time
```

Command examples:

- Check the state of all the Pump or Drainer nodes.

  Set `cmd` to `pumps` or `drainers`. For example:

```
bin/binlogctl -pd-urls=http://127.0.0.1:2379 -cmd pumps
```

```
[2019/04/28 09:29:59.016 +00:00] [INFO] [nodes.go:48] ["query node"] [
   ↪ type=pump] [node="{NodeID: 1.1.1.1:8250, Addr: pump:8250, State:
   ↪ online, MaxCommitTS: 408012403141509121, UpdateTime: 2019-04-28
   ↪ 09:29:57 +0000 UTC}"]
```

```
bin/binlogctl -pd-urls=http://127.0.0.1:2379 -cmd drainers
```

```
[2019/04/28 09:29:59.016 +00:00] [INFO] [nodes.go:48] ["query node"] [
    ↪ type=drainer] [node="{NodeID: 1.1.1.1:8249, Addr: 1.1.1.1:8249,
    ↪ State: online, MaxCommitTS: 408012403141509121, UpdateTime:
    ↪ 2019-04-28 09:29:57 +0000 UTC}"]
```

- Pause or close Pump or Drainer.

  You can use the following commands to pause or close services:

| Command | Description | Example |
|---|---|---|
| pause-pump | Pause Pump | `bin/binlogctl -pd-urls=http://127.0.0.1:2379 -cmd pause-pump -node-id ip-127-0-0-1:8250` |
| pause-drainer | Pause Drainer | `bin/binlogctl -pd-urls=http://127.0.0.1:2379 -cmd pause-drainer -node-id ip-127-0-0-1:8249` |
| offline-pump | Close Pump | `bin/binlogctl -pd-urls=http://127.0.0.1:2379 -cmd offline-pump -node-id ip-127-0-0-1:8250` |
| offline-drainer | Close Drainer | `bin/binlogctl -pd-urls=http://127.0.0.1:2379 -cmd offline-drainer -node-id ip-127-0-0-1:8249` |

  `binlogctl` sends the HTTP request to the Pump or Drainer node. After receiving the request, the node executes the exiting procedures accordingly.

- Modify the state of a Pump or Drainer node in abnormal states.

  When a Pump or Drainer node runs normally or when it is paused or closed in the normal process, it is in the normal state. In abnormal states, the Pump or Drainer node cannot correctly maintain its state. This affects data replication tasks. In this case, use `binlogctl` to repair the state information.

  To update the state of a Pump or Drainer node, set `cmd` to `update-pump` or `update-drainer`. The state can be `paused` or `offline`. For example:

```
bin/binlogctl -pd-urls=http://127.0.0.1:2379 -cmd update-pump -node-id
    ↪ ip-127-0-0-1:8250 -state paused
```

> **Note:**
> When a Pump or Drainer node runs normally, it regularly updates its state to PD. The above command directly modifies the Pump or Drainer state saved in PD; therefore, do not use the command when the Pump or Drainer node runs normally. For more information, refer to TiDB Binlog FAQ.

### 13.10.10 Binlog Consumer Client User Guide

Binlog Consumer Client is used to consume TiDB secondary binlog data from Kafka and output the data in a specific format. Currently, Drainer supports multiple kinds of down streaming, including MySQL, TiDB, file and Kafka. But sometimes users have customized requirements for outputting data to other formats, for example, Elasticsearch and Hive, so this feature is introduced.

#### 13.10.10.1 Configure Drainer

Modify the configuration file of Drainer and set it to output the data to Kafka:

```
[syncer]
db-type = "kafka"

[syncer.to]
### the Kafka address
kafka-addrs = "127.0.0.1:9092"
### the Kafka version
kafka-version = "2.4.0"
```

#### 13.10.10.2 Customized development

##### 13.10.10.2.1 Data format

Firstly, you need to obtain the format information of the data which is output to Kafka by Drainer:

```
// `Column` stores the column data in the corresponding variable based on
   ↪ the data type.
message Column {
  // Indicates whether the data is null
  optional bool is_null = 1 [ default = false ];
  // Stores `int` data
  optional int64 int64_value = 2;
  // Stores `uint`, `enum`, and `set` data
  optional uint64 uint64_value = 3;
  // Stores `float` and `double` data
  optional double double_value = 4;
  // Stores `bit`, `blob`, `binary` and `json` data
  optional bytes bytes_value = 5;
  // Stores `date`, `time`, `decimal`, `text`, `char` data
  optional string string_value = 6;
}
```

```
// `ColumnInfo` stores the column information, including the column name,
    ↪ type, and whether it is the primary key.
message ColumnInfo {
  optional string name = 1 [ (gogoproto.nullable) = false ];
  // the lower case column field type in MySQL
  // https://dev.mysql.com/doc/refman/8.0/en/data-types.html
  // for the `numeric` type: int bigint smallint tinyint float double
      ↪ decimal bit
  // for the `string` type: text longtext mediumtext char tinytext varchar
  // blob longblob mediumblob binary tinyblob varbinary
  // enum set
  // for the `json` type: json
  optional string mysql_type = 2 [ (gogoproto.nullable) = false ];
  optional bool is_primary_key = 3 [ (gogoproto.nullable) = false ];
}

// `Row` stores the actual data of a row.
message Row { repeated Column columns = 1; }

// `MutationType` indicates the DML type.
enum MutationType {
  Insert = 0;
  Update = 1;
  Delete = 2;
}

// `Table` contains mutations in a table.
message Table {
  optional string schema_name = 1;
  optional string table_name = 2;
  repeated ColumnInfo column_info = 3;
  repeated TableMutation mutations = 4;
}

// `TableMutation` stores mutations of a row.
message TableMutation {
  required MutationType type = 1;
  // data after modification
  required Row row = 2;
  // data before modification. It only takes effect for `Update MutationType
      ↪ `.
  optional Row change_row = 3;
}

// `DMLData` stores all the mutations caused by DML in a transaction.
```

```
message DMLData {
  // `tables` contains all the table changes in the transaction.
  repeated Table tables = 1;
}

// `DDLData` stores the DDL information.
message DDLData {
  // the database used currently
  optional string schema_name = 1;
  // the relates table
  optional string table_name = 2;
  // `ddl_query` is the original DDL statement query.
  optional bytes ddl_query = 3;
}

// `BinlogType` indicates the binlog type, including DML and DDL.
enum BinlogType {
  DML = 0; // Has `dml_data`
  DDL = 1; // Has `ddl_query`
}

// `Binlog` stores all the changes in a transaction. Kafka stores the
   ↪ serialized result of the structure data.
message Binlog {
  optional BinlogType type = 1 [ (gogoproto.nullable) = false ];
  optional int64 commit_ts = 2 [ (gogoproto.nullable) = false ];
  optional DMLData dml_data = 3;
  optional DDLData ddl_data = 4;
}
```

For the definition of the data format, see `secondary_binlog.proto`

#### 13.10.10.2.2 Driver

The TiDB-Tools project provides Driver, which is used to read the binlog data in Kafka. It has the following features:

- Read the Kafka data.
- Locate the binlog stored in Kafka based on `commit ts`.

You need to configure the following information when using Driver:

- `KafkaAddr`: the address of the Kafka cluster
- `CommitTS`: from which `commit ts` to start reading the binlog

- `Offset`: from which Kafka `offset` to start reading data. If `CommitTS` is set, you needn't configure this parameter.
- `ClusterID`: the cluster ID of the TiDB cluster
- `Topic`: the topic name of Kafka. If Topic is empty, use the default name in Drainer `<ClusterID>_obinlog`.

You can use Driver by quoting the Driver code in package and refer to the example code provided by Driver to learn how to use Driver and parse the binlog data.

Currently, two examples are provided:

- Using Driver to replicate data to MySQL. This example shows how to convert a binlog to SQL
- Using Driver to print data

**Note:**

- The example code only shows how to use Driver. If you want to use Driver in the production environment, you need to optimize the code.
- Currently, only the Golang version of Driver and example code are available. If you want to use other languages, you need to generate the code file in the corresponding language based on the binlog proto file and develop an application to read the binlog data in Kafka, parse the data, and output the data to the downstream. You are also welcome to optimize the example code and submit the example code of other languages to TiDB-Tools.

### 13.10.11 TiDB Binlog Relay Log

When replicating binlogs, Drainer splits transactions from the upstream and replicates the split transactions concurrently to the downstream.

In extreme cases where the upstream clusters are not available and Drainer exits abnormally, the downstream clusters (MySQL or TiDB) might be in the intermediate states with inconsistent data. In such cases, Drainer can use the relay log to ensure that the downstream clusters are in a consistent state.

#### 13.10.11.1 Consistent state during Drainer replication

The downstream clusters reaching a consistent state means the data of the downstream clusters are the same as the snapshot of the upstream which sets `tidb_snapshot = ts`.

The checkpoint consistency means Drainer checkpoint saves the consistent state of replication in `consistent`. When Drainer runs, `consistent` is `false`. After Drainer exits normally, `consistent` is set to `true`.

You can query the downstream checkpoint table as follows:

```
select * from tidb_binlog.checkpoint;
```

```
+--------------------+-----------------------------------------------------------------------+
   ↪
| clusterID          | checkPoint
   ↪                                                  |
+--------------------+-----------------------------------------------------------------------+
   ↪
| 6791641053252586769 | {"consistent":false,"commitTS":414529105591271429,"
   ↪ ts-map":{}} |
+--------------------+-----------------------------------------------------------------------+
   ↪
```

#### 13.10.11.2 Implementation principles

After Drainer enables the relay log, it first writes the binlog events to the disks and then replicates the events to the downstream clusters.

If the upstream clusters are not available, Drainer can restore the downstream clusters to a consistent state by reading the relay log.

> **Note:**
>
> If the relay log data is lost at the same time, this method does not work, but its incidence is very low. In addition, you can use the Network File System to ensure data safety of the relay log.

##### 13.10.11.2.1 Trigger scenarios where Drainer consumes binlogs from the relay log

When Drainer is started, if it fails to connect to the Placement Driver (PD) of the upstream clusters, and it detects that `consistent = false` in the checkpoint, Drainer will try to read the relay log, and restore the downstream clusters to a consistent state. After that, the Drainer process sets the checkpoint `consistent` to `true` and then exits.

##### 13.10.11.2.2 GC mechanism of relay log

Before data is replicated to the downstream, Drainer writes data to the relay log file. If the size of a relay log file reaches 10 MB (by default) and the binlog data of the current transaction is completely written, Drainer starts to write data to the next relay log file. After Drainer successfully replicates data to the downstream, it automatically cleans up the relay log files whose data has been replicated. The relay log into which data is currently being written will not be cleaned up.

#### 13.10.11.3 Configuration

To enable the relay log, add the following configuration in Drainer:

```
[syncer.relay]
### It saves the directory of the relay log. The relay log is not enabled if
    ↪ the value is empty.
### The configuration only comes to effect if the downstream is TiDB or
    ↪ MySQL.
log-dir = "/dir/to/save/log"
### The size limit of a single relay log file (unit: byte).
### When the size of a relay log file reaches this limit, data is written to
    ↪ the next relay log file.
max-file-size = 10485760
```

### 13.10.12 Bidirectional Replication between TiDB Clusters

> **Warning:**
>
> Currently, bidirectional replication is still an experimental feature. It is **NOT** recommended to use it in the production environment.

This document describes the bidirectional replication between two TiDB clusters, how the replication works, how to enable it, and how to replicate DDL operations.

#### 13.10.12.1 User scenario

If you want two TiDB clusters to exchange data changes with each other, TiDB Binlog allows you to do that. For example, you want cluster A and cluster B to replicate data with each other.

**Note:**

The data written to these two clusters must be conflict-free, that is, in the two clusters, the same primary key or the rows with the unique index of the tables must not be modified.

The user scenario is shown as below:

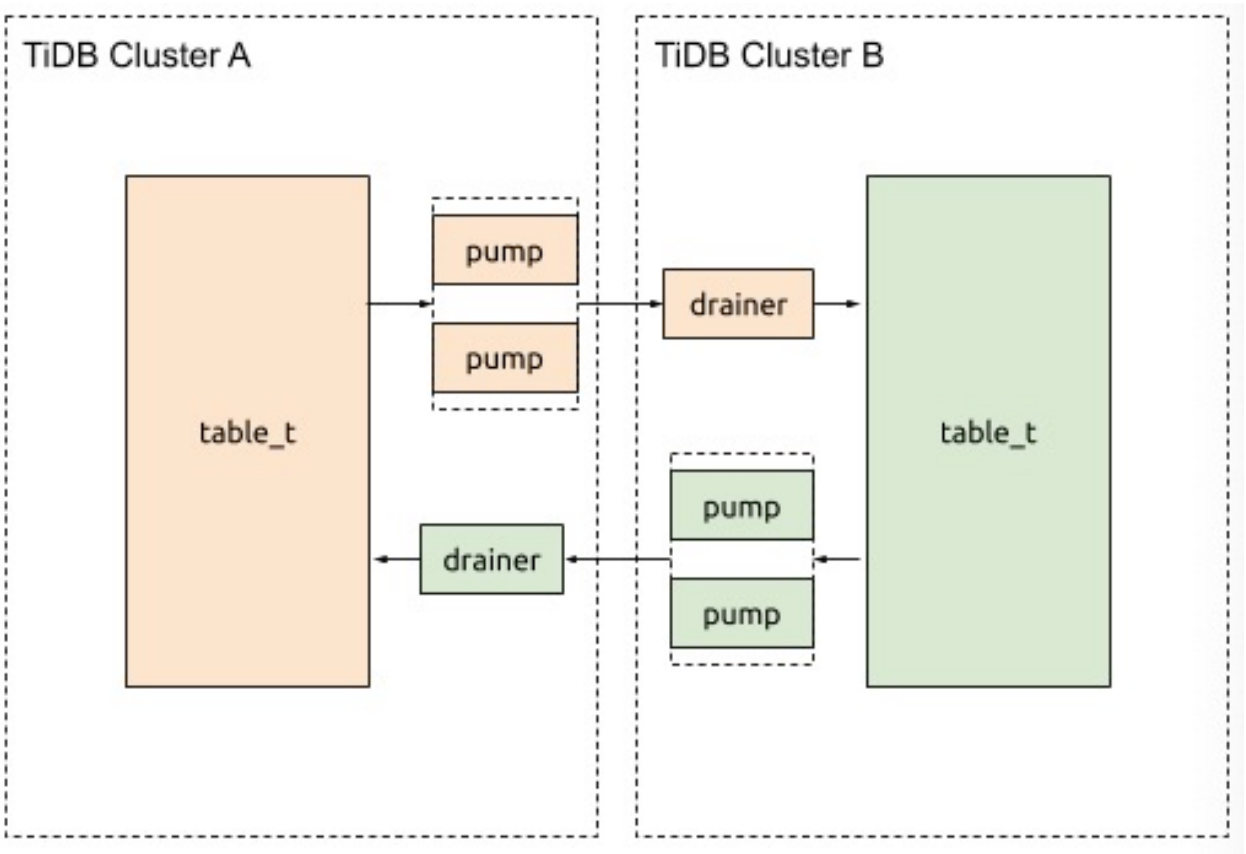

Figure 348: Architect

#### 13.10.12.2 Implementation details

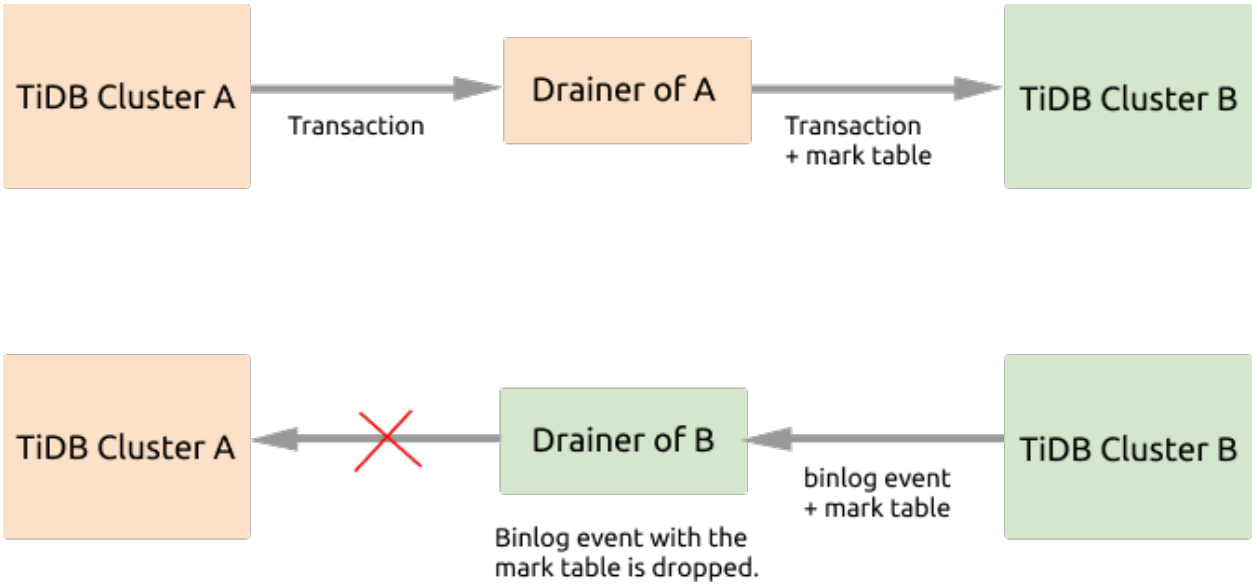

Figure 349: Mark Table

If the bidirectional replication is enabled between cluster A and cluster B, the data written to cluster A will be replicated to cluster B, and then these data changes will be replicated back to cluster A, which causes an infinite loop of replication. From the figure above, you can see that during the data replication, Drainer marks the binlog events, and filters out the marked events to avoid such a replication loop.

The detailed implementation is described as follows:

1. Start the TiDB Binlog replication program for each of the two clusters.
2. When the transaction to be replicated passes through the Drainer of cluster A, this Drainer adds the `_drainer_repl_mark` table to the transaction, writes this DML event update to the mark table, and replicate this transaction to cluster B.
3. Cluster B returns binlog events with the `_drainer_repl_mark` mark table to cluster A. The Drainer of cluster B identifies the mark table with the DML event when parsing the binlog event, and gives up replicating this binlog event to cluster A.

The replication process from cluster B to cluster A is the same as above. The two clusters can be upstream and downstream of each other.

**Note:**

- When updating the `_drainer_repl_mark` mark table, data changes are required to generate binlogs.

- DDL operations are not transactional, so you need to use the one-way replication method to replicate DDL operations. See Replicate DDL operations for details.

Drainer can use a unique ID for each connection to downstream to avoid conflicts. `channel_id` is used to indicate a channel for bidirectional replication. The two clusters should have the same `channel_id` configuration (with the same value).

If you add or delete columns in the upstream, there might be extra or missing columns of the data to be replicated to the downstream. Drainer allows this situation by ignoring the extra columns or by inserting default values to the missing columns.

#### 13.10.12.3 Mark table

The `_drainer_repl_mark` mark table has the following structure:

```
CREATE TABLE `_drainer_repl_mark` (
  `id` bigint(20) NOT NULL,
  `channel_id` bigint(20) NOT NULL DEFAULT '0',
  `val` bigint(20) DEFAULT '0',
  `channel_info` varchar(64) DEFAULT NULL,
  PRIMARY KEY (`id`,`channel_id`)
);
```

Drainer uses the following SQL statement to update `_drainer_repl_mark`, which ensures data change and the generation of binlog:

```
update drainer_repl_mark set val = val + 1 where id = ? && channel_id = ?;
```

#### 13.10.12.4 Replicate DDL operations

Because Drainer cannot add the mark table to DDL operations, you can only use the one-way replication method to replicate DDL operations.

For example, if DDL replication is enabled from cluster A to cluster B, then the replication is disabled from cluster B to cluster A. This means that all DDL operations are performed on cluster A.

**Note:**

DDL operations cannot be executed on two clusters at the same time. When a DDL operation is executed, if any DML operation is being executed at the same time or any DML binlog is being replicated, the upstream and downstream table structures of the DML replication might be inconsistent.

#### 13.10.12.5 Configure and enable bidirectional replication

For bidirectional replication between cluster A and cluster B, assume that all DDL operations are executed on cluster A. On the replication path from cluster A to cluster B, add the following configuration to Drainer:

```
[syncer]
loopback-control = true
channel-id = 1 # Configures the same ID for both clusters to be replicated.
sync-ddl = true # Enables it if you need to perform DDL replication.

[syncer.to]
### 1 means SyncFullColumn and 2 means SyncPartialColumn.
### If set to SyncPartialColumn, Drainer allows the downstream table
### structure to have more or fewer columns than the data to be replicated
### And remove the STRICT_TRANS_TABLES of the SQL mode to allow fewer
   ↪ columns, and insert zero values to the downstream.
sync-mode = 2

### Ignores the checkpoint table.
[[syncer.ignore-table]]
db-name = "tidb_binlog"
tbl-name = "checkpoint"
```

On the replication path from cluster B to cluster A, add the following configuration to Drainer:

```
[syncer]
loopback-control = true
channel-id = 1 # Configures the same ID for both clusters to be replicated.
sync-ddl = false # Disables it if you do not need to perform DDL replication
   ↪ .

[syncer.to]
### 1 means SyncFullColumn and 2 means SyncPartialColumn.
### If set to SyncPartialColumn, Drainer allows the downstream table
### structure to have more or fewer columns than the data to be replicated
### And remove the STRICT_TRANS_TABLES of the SQL mode to allow fewer
   ↪ columns, and insert zero values to the downstream.
sync-mode = 2

### Ignores the checkpoint table.
[[syncer.ignore-table]]
db-name = "tidb_binlog"
tbl-name = "checkpoint"
```

### 13.10.13 TiDB Binlog Glossary

This document lists the terms used in the logs, monitoring, configurations, and documentation of TiDB Binlog.

#### 13.10.13.1 Binlog

In TiDB Binlog, binlogs refer to the binary log data from TiDB. They also refer to the binary log data that Drainer writes to Kafka or files. The former and the latter are in different formats. In addition, binlogs in TiDB and binlogs in MySQL are also in different formats.

#### 13.10.13.2 Binlog event

The DML binlogs from TiDB have three types of event: `INSERT`, `UPDATE`, and `DELETE`. In the monitoring dashboard of Drainer, you can see the number of different events that correspond to the replication data.

#### 13.10.13.3 Checkpoint

A checkpoint indicates the position from which a replication task is paused and resumed, or is stopped and restarted. It records the commit-ts that Drainer replicates to the downstream. When restarted, Drainer reads the checkpoint and starts replicating data from the corresponding commit-ts.

#### 13.10.13.4 Safe mode

Safe mode refers to the mode that supports the idempotent import of DML when a primary key or unique index exists in the table schema in the incremental replication task.

In this mode, the `INSERT` statement is re-written as `REPLACE`, and the `UPDATE` statement is re-written as `DELETE` and `REPLACE`. Then the re-written statement is executed to the downstream. Safe mode is automatically enabled within 5 minutes after Drainer is started. You can manually enable the mode by modifying the `safe-mode` parameter in the configuration file, but this configuration is valid only when the downstream is MySQL or TiDB.

### 13.10.14 Troubleshoot

#### 13.10.14.1 TiDB Binlog Troubleshooting

This document describes how to troubleshoot TiDB Binlog to find the problem.

If you encounter errors while running TiDB Binlog, take the following steps to troubleshoot:

1. Check whether each monitoring metric is normal or not. Refer to TiDB Binlog Monitoring for details.

2. Use the binlogctl tool to check whether the state of each Pump or Drainer node is normal or not.

3. Check whether `ERROR` or `WARN` exists in the Pump log or Drainer log.

After finding out the problem by the above steps, refer to FAQ and TiDB Binlog Error Handling for the solution. If you fail to find the solution or the solution provided does not help, submit an issue for help.

#### 13.10.14.2 TiDB Binlog Error Handling

This document introduces common errors that you might encounter and solutions to these errors when you use TiDB Binlog.

##### 13.10.14.2.1 `kafka server: Message was too large, server rejected it to avoid allocation error` is returned when Drainer replicates data to Kafka

Cause: Executing a large transaction in TiDB generates binlog data of a large size, which might exceed Kafka's limit on the message size.

Solution: Adjust the configuration parameters of Kafka as shown below:

```
message.max.bytes=1073741824
replica.fetch.max.bytes=1073741824
fetch.message.max.bytes=1073741824
```

##### 13.10.14.2.2 Pump returns `no space left on device` error

Cause: The local disk space is insufficient for Pump to write binlog data normally.

Solution: Clean up the disk space and then restart Pump.

##### 13.10.14.2.3 `fail to notify all living drainer` is returned when Pump is started

Cause: When Pump is started, it notifies all Drainer nodes that are in the `online` state. If it fails to notify Drainer, this error log is printed.

Solution: Use the binlogctl tool to check whether each Drainer node is normal or not. This is to ensure that all Drainer nodes that are in the `online` state are working normally. If the state of a Drainer node is not consistent with its actual working status, use the binlogctl tool to change its state and then restart Pump.

##### 13.10.14.2.4 Data loss occurs during the TiDB Binlog replication

You need to confirm that TiDB Binlog is enabled on all TiDB instances and runs normally. If the cluster version is later than v3.0, use the `curl {TiDB_IP}:{STATUS_PORT}/info/all` command to confirm the TiDB Binlog status on all TiDB instances.

#### 13.10.14.2.5 When the upstream transaction is large, Pump reports an error `rpc error: code = ResourceExhausted desc = trying to send message larger than max (2191430008 vs. 2147483647)`

This error occurs because the gRPC message sent by TiDB to Pump exceeds the size limit. You can adjust the maximum size of a gRPC message that Pump allows by specifying `max-message-size` when starting Pump.

#### 13.10.14.2.6 Is there any cleaning mechanism for the incremental data of the file format output by Drainer? Will the data be deleted?

- In Drainer v3.0.x, there is no cleaning mechanism for incremental data of the file format.
- In the v4.0.x version, there is a time-based data cleaning mechanism. For details, refer to Drainer's `retention-time` configuration item.

### 13.10.15 TiDB Binlog FAQs

This document collects the frequently asked questions (FAQs) about TiDB Binlog.

#### 13.10.15.1 What is the impact of enabling TiDB Binlog on the performance of TiDB?

- There is no impact on the query.
- There is a slight performance impact on `INSERT`, `DELETE` and `UPDATE` transactions. In latency, a p-binlog is written concurrently in the TiKV prewrite stage before the transactions are committed. Generally, writing binlog is faster than TiKV prewrite, so it does not increase latency. You can check the response time of writing binlog in Pump's monitoring panel.

#### 13.10.15.2 How high is the replication latency of TiDB Binlog?

The latency of TiDB Binlog replication is measured in seconds, which is generally about 3 seconds during off-peak hours.

#### 13.10.15.3 What privileges does Drainer need to replicate data to the downstream MySQL or TiDB cluster?

To replicate data to the downstream MySQL or TiDB cluster, Drainer must have the following privileges:

- Insert
- Update

- Delete
- Create
- Drop
- Alter
- Execute
- Index
- Select
- Create View

#### 13.10.15.4 What can I do if the Pump disk is almost full?

1. Check whether Pump's GC works well:

    - Check whether the **gc_tso** time in Pump's monitoring panel is identical with that of the configuration file.

2. If GC works well, perform the following steps to reduce the amount of space required for a single Pump:

    - Modify the **GC** parameter of Pump to reduce the number of days to retain data.
    - Add pump instances.

#### 13.10.15.5 What can I do if Drainer replication is interrupted?

Execute the following command to check whether the status of Pump is normal and whether all the Pump instances that are not in the `offline` state are running.

```
binlogctl -cmd pumps
```

Then, check whether the Drainer monitor or log outputs corresponding errors. If so, resolve them accordingly.

#### 13.10.15.6 What can I do if Drainer is slow to replicate data to the downstream MySQL or TiDB cluster?

Check the following monitoring items:

- For the **Drainer Event** monitoring metric, check the speed of Drainer replicating `INSERT`, `UPDATE` and `DELETE` transactions to the downstream per second.
- For the **SQL Query Time** monitoring metric, check the time Drainer takes to execute SQL statements in the downstream.

Possible causes and solutions for slow replication:

- If the replicated database contains a table without a primary key or unique index, add a primary key to the table.
- If the latency between Drainer and the downstream is high, increase the value of the `worker-count` parameter of Drainer. For cross-datacenter replication, it is recommended to deploy Drainer in the downstream.
- If the load in the downstream is not high, increase the value of the `worker-count` parameter of Drainer.

#### 13.10.15.7 What can I do if a Pump instance crashes?

If a Pump instance crashes, Drainer cannot replicate data to the downstream because it cannot obtain the data of this instance. If this Pump instance can recover to the normal state, Drainer resumes replication; if not, perform the following steps:

1. Use binlogctl to change the state of this Pump instance to `offline` to discard the data of this Pump instance.
2. Because Drainer cannot obtain the data of this pump instance, the data in the downstream and upstream is inconsistent. In this situation, perform full and incremental backups again. The steps are as follows:
    1. Stop the Drainer.
    2. Perform a full backup in the upstream.
    3. Clear the data in the downstream including the `tidb_binlog.checkpoint` table.
    4. Restore the full backup to the downstream.
    5. Deploy Drainer and use `initialCommitTs` (set `initialCommitTs` as the snapshot timestamp of the full backup) as the start point of initial replication.

#### 13.10.15.8 What is checkpoint?

Checkpoint records the `commit-ts` that Drainer replicates to the downstream. When Drainer restarts, it reads the checkpoint and then replicates data to the downstream starting from the corresponding `commit-ts`. The `["write save point"] [ts =411222863322546177]` Drainer log means saving the checkpoint with the corresponding timestamp.

Checkpoint is saved in different ways for different types of downstream platforms:

- For MySQL/TiDB, it is saved in the `tidb_binlog.checkpoint` table.
- For Kafka/file, it is saved in the file of the corresponding configuration directory.

The data of kafka/file contains `commit-ts`, so if the checkpoint is lost, you can check the latest `commit-ts` of the downstream data by consuming the latest data in the downstream .

Drainer reads the checkpoint when it starts. If Drainer cannot read the checkpoint, it uses the configured `initialCommitTs` as the start point of the initial replication.

#### 13.10.15.9 How to redeploy Drainer on the new machine when Drainer fails and the data in the downstream remains?

If the data in the downstream is not affected, you can redeploy Drainer on the new machine as long as the data can be replicated from the corresponding checkpoint.

- If the checkpoint is not lost, perform the following steps:
    1. Deploy and start a new Drainer (Drainer can read checkpoint and resumes replication).
    2. Use binlogctl to change the state of the old Drainer to `offline`.
- If the checkpoint is lost, perform the following steps:
    1. To deploy a new Drainer, obtain the `commit-ts` of the old Drainer as the `initialCommitTs` of the new Drainer.
    2. Use binlogctl to change the state of the old Drainer to `offline`.

#### 13.10.15.10 How to restore the data of a cluster using a full backup and a binlog backup file?

1. Clean up the cluster and restore a full backup.
2. To restore the latest data of the backup file, use Reparo to set `start-tso` = {snapshot timestamp of the full backup + 1} and `end-ts` = 0 (or you can specify a point in time).

#### 13.10.15.11 How to redeploy Drainer when enabling `ignore-error` in Primary-Secondary replication triggers a critical error?

If a critical error is triggered when TiDB fails to write binlog after enabling `ignore-error`, TiDB stops writing binlog and binlog data loss occurs. To resume replication, perform the following steps:

1. Stop the Drainer instance.
2. Restart the `tidb-server` instance that triggers critical error and resume writing binlog (TiDB does not write binlog to Pump after critical error is triggered).
3. Perform a full backup in the upstream.
4. Clear the data in the downstream including the `tidb_binlog.checkpoint` table.
5. Restore the full backup to the downstream.
6. Deploy Drainer and use `initialCommitTs` (set `initialCommitTs` as the snapshot timestamp of the full backup) as the start point of initial replication.

#### 13.10.15.12 When can I pause or close a Pump or Drainer node?

Refer to TiDB Binlog Cluster Operations to learn the description of the Pump or Drainer state and how to start and exit the process.

Pause a Pump or Drainer node when you need to temporarily stop the service. For example:

- Version upgrade

Use the new binary to restart the service after the process is stopped.

- Server maintenance

When the server needs a downtime maintenance, exit the process and restart the service after the maintenance is finished.

Close a Pump or Drainer node when you no longer need the service. For example:

- Pump scale-in

If you do not need too many Pump services, close some of them.

- Cancelling replication tasks

If you no longer need to replicate data to a downstream database, close the corresponding Drainer node.

- Service migration

If you need to migrate the service to another server, close the service and re-deploy it on the new server.

#### 13.10.15.13 How can I pause a Pump or Drainer process?

- Directly kill the process.

> **Note:**
> Do not use the `kill -9` command. Otherwise, the Pump or Drainer node cannot process signals.

- If the Pump or Drainer node runs in the foreground, pause it by pressing Ctrl+C.
- Use the `pause-pump` or `pause-drainer` command in binlogctl.

#### 13.10.15.14 Can I use the `update-pump` or `update-drainer` command in binlogctl to pause the Pump or Drainer service?

No. The `update-pump` or `update-drainer` command directly modifies the state information saved in PD without notifying Pump or Drainer to perform the corresponding operation. Misusing the two commands can interrupt data replication and might even cause data loss.

#### 13.10.15.15 Can I use the `update-pump` or `update-drainer` command in binlogctl to close the Pump or Drainer service?

No. The `update-pump` or `update-drainer` command directly modifies the state information saved in PD without notifying Pump or Drainer to perform the corresponding operation. Misusing the two commands interrupts data replication and might even cause data inconsistency. For example:

- When a Pump node runs normally or is in the `paused` state, if you use the `update-pump` command to set the Pump state to `offline`, the Drainer node stops pulling the binlog data from the `offline` Pump. In this situation, the newest binlog cannot be replicated to the Drainer node, causing data inconsistency between upstream and downstream.
- When a Drainer node runs normally, if you use the `update-drainer` command to set the Drainer state to `offline`, the newly started Pump node only notifies Drainer nodes in the `online` state. In this situation, the `offline` Drainer fails to pull the binlog data from the Pump node in time, causing data inconsistency between upstream and downstream.

#### 13.10.15.16 When can I use the `update-pump` command in binlogctl to set the Pump state to `paused`?

In some abnormal situations, Pump fails to correctly maintain its state. Then, use the `update-pump` command to modify the state.

For example, when a Pump process is exited abnormally (caused by directly exiting the process when a panic occurs or mistakenly using the `kill -9` command to kill the process), the Pump state information saved in PD is still `online`. In this situation, if you do not need to restart Pump to recover the service at the moment, use the `update-pump` command to update the Pump state to `paused`. Then, interruptions can be avoided when TiDB writes binlogs and Drainer pulls binlogs.

#### 13.10.15.17 When can I use the `update-drainer` command in binlogctl to set the Drainer state to `paused`?

In some abnormal situations, the Drainer node fails to correctly maintain its state, which has influenced the replication task. Then, use the `update-drainer` command to modify the state.

For example, when a Drainer process is exited abnormally (caused by directly exiting the process when a panic occurs or mistakenly using the `kill -9` command to kill the process), the Drainer state information saved in PD is still `online`. When a Pump node is started, it fails to notify the exited Drainer node (the `notify drainer ...` error), which cause the Pump node failure. In this situation, use the `update-drainer` command to update the Drainer state to `paused` and restart the Pump node.

#### 13.10.15.18 How can I close a Pump or Drainer node?

Currently, you can only use the `offline-pump` or `offline-drainer` command in binlogctl to close a Pump or Drainer node.

#### 13.10.15.19 When can I use the `update-pump` command in binlogctl to set the Pump state to `offline`?

You can use the `update-pump` command to set the Pump state to `offline` in the following situations:

- When a Pump process is exited abnormally and the service cannot be recovered, the replication task is interrupted. If you want to recover the replication and accept some losses of binlog data, use the `update-pump` command to set the Pump state to `offline` ↪ . Then, the Drainer node stops pulling binlog from the Pump node and continues replicating data.
- Some stale Pump nodes are left over from historical tasks. Their processes have been exited and their services are no longer needed. Then, use the `update-pump` command to set their state to `offline`.

For other situations, use the `offline-pump` command to close the Pump service, which is the regular process.

> **Warning:**
>
> Do not use the `update-pump` command unless you can tolerate binlog data loss and data inconsistency between upstream and downstream, or you no longer need the binlog data stored in the Pump node.

#### 13.10.15.20 Can I use the `update-pump` command in binlogctl to set the Pump state to `offline` if I want to close a Pump node that is exited and set to `paused`?

When a Pump process is exited and the node is in the `paused` state, not all the binlog data in the node is consumed in its downstream Drainer node. Therefore, doing so might risk data inconsistency between upstream and downstream. In this situation, restart the Pump and use the `offline-pump` command to close the Pump node.

#### 13.10.15.21 When can I use the `update-drainer` command in binlogctl to set the Drainer state to `offline`?

Some stale Drainer nodes are left over from historical tasks. Their processes have been exited and their services are no longer needed. Then, use the `update-drainer` command to set their state to `offline`.

#### 13.10.15.22 Can I use SQL operations such as `change pump` and `change drainer` to pause or close the Pump or Drainer service?

No. For more details on these SQL operations, refer to Use SQL statements to manage Pump or Drainer.

These SQL operations directly modifies the state information saved in PD and are functionally equivalent to the `update-pump` and `update-drainer` commands in binlogctl. To pause or close the Pump or Drainer service, use the binlogctl tool.

#### 13.10.15.23 What can I do when some DDL statements supported by the upstream database cause error when executed in the downstream database?

To solve the problem, follow these steps:

1. Check `drainer.log`. Search `exec failed` for the last failed DDL operation before the Drainer process is exited.
2. Change the DDL version to the one compatible to the downstream. Perform this step manually in the downstream database.
3. Check `drainer.log`. Search for the failed DDL operation and find the `commit-ts` of this operation. For example:

```
[2020/05/21 09:51:58.019 +08:00] [INFO] [syncer.go:398] ["add ddl item
    ↪ to syncer, you can add this commit ts to `ignore-txn-commit-ts`
    ↪ to skip this ddl if needed"] [sql="ALTER TABLE `test` ADD INDEX
    ↪ (`index1`)"] ["commit ts"=416815754209656834].
```

4. Modify the `drainer.toml` configuration file. Add the `commit-ts` in the `ignore-txn-commit-ts` item and restart the Drainer node.

#### 13.10.15.24 TiDB fails to write to binlog and gets stuck, and `listener stopped, waiting for manual stop` appears in the log

In TiDB v3.0.12 and earlier versions, the binlog write failure causes TiDB to report the fatal error. TiDB does not automatically exit but only stops the service, which seems like getting stuck. You can see the `listener stopped, waiting for manual stop` error in the log.

You need to determine the specific causes of the binlog write failure. If the failure occurs because binlog is slowly written into the downstream, you can consider scaling out Pump or increasing the timeout time for writing binlog.

Since v3.0.13, the error-reporting logic is optimized. The binlog write failure causes transaction execution to fail and TiDB Binlog will return an error but will not get TiDB stuck.

#### 13.10.15.25 TiDB writes duplicate binlogs to Pump

This issue does not affect the downstream and replication logic.

When the binlog write fails or becomes timeout, TiDB retries writing binlog to the next available Pump node until the write succeeds. Therefore, if the binlog write to a Pump node is slow and causes TiDB timeout (default 15s), then TiDB determines that the write fails and tries to write to the next Pump node. If binlog is actually successfully written to the timeout-causing Pump node, the same binlog is written to multiple Pump nodes. When Drainer processes the binlog, it automatically de-duplicates binlogs with the same TSO, so this duplicate write does not affect the downstream and replication logic.

#### 13.10.15.26 Reparo is interrupted during the full and incremental restore process. Can I use the last TSO in the log to resume replication?

Yes. Reparo does not automatically enable the safe-mode when you start it. You need to perform the following steps manually:

1. After Reparo is interrupted, record the last TSO in the log as `checkpoint-tso`.
2. Modify the Reparo configuration file, set the configuration item `start-tso` to `checkpoint-tso + 1`, set `stop-tso` to `checkpoint-tso + 80,000,000,000` (approximately five minutes after the `checkpoint-tso`), and set `safe-mode` to `true`. Start Reparo, and Reparo replicates data to `stop-tso` and then stops automatically.
3. After Reparo stops automatically, set `start-tso` to `checkpoint tso + 80,000,000,001` ↪ , set `stop-tso` to `0`, and set `safe-mode` to `false`. Start Reparo to resume replication.

## 13.11 PingCAP Clinic Diagnostic Service

### 13.11.1 PingCAP Clinic Overview

PingCAP Clinic Diagnostic Service (PingCAP Clinic) is a diagnostic service provided by PingCAP for TiDB clusters that are deployed using either TiUP or TiDB Operator. This service helps to troubleshoot cluster problems remotely and provides a quick check of cluster status locally. With PingCAP Clinic, you can ensure the stable operation of your TiDB cluster for its full life-cycle, predict potential problems, reduce the probability of problems, troubleshoot cluster problems quickly, and fix cluster problems.

PingCAP Clinic provides the following two components to diagnose cluster problems:

- Diag client:

  Diag client (Diag) is an open-source diagnostic tool deployed on the cluster side. Diag is used to collect cluster diagnostic data, upload diagnostic data to the Clinic Server, and perform a quick health check locally on your cluster. For a full list of diagnostic data that can be collected by Diag, see PingCAP Clinic Diagnostic Data.

> **Note:**
> Diag supports TiDB v4.0 and later versions, but **does not support** collecting data from clusters deployed using TiDB Ansible.

- Clinic Server:

  Clinic Server is a cloud service deployed in the cloud. By providing diagnostic services in the SaaS model, the Clinic Server can not only receive uploaded diagnostic data but also work as an online diagnostic environment to store data, view data, and provide cluster diagnostic reports. Clinic Server provides two independent services depending on the storage location:

  - Clinic Server for international users: Data is stored in AWS in US.
  - Clinic Server for users in the Chinese mainland: Data is stored in AWS in China (Beijing) regions.

#### 13.11.1.1 User scenarios

- Troubleshoot cluster problems remotely

  When your cluster has some problems that cannot be fixed quickly, you can get support from PingCAP or the community. When contacting technical support for remote assistance, you need to save various diagnostic data from the cluster and forward the data to the support staff. In this case, you can use Diag to collect diagnostic data with one click. Diag helps you to collect complete diagnostic data quickly, which can avoid

complex manual data collection operations. After collecting data, you can upload the data to the Clinic Server for PingCAP technical support staff to troubleshoot cluster problems. The Clinic Server provides secure storage for uploaded diagnostic data and supports the online diagnosis, which greatly improves the troubleshooting efficiency.

- Quickly check cluster status

  Even if your cluster is running stably for now, it is necessary to periodically check the cluster to detect potential stability risks. You can identify potential health risks of a cluster using the local and server-side quick check feature provided by PingCAP Clinic.

#### 13.11.1.2 Implementation principles

This section introduces the implementation principles about how Diag collects diagnostic data from a cluster.

First, Diag gets cluster topology information from the deployment tool TiUP (tiup-cluster) or TiDB Operator (tidb-operator). Then, Diag collects different types of diagnostic data through various data collection methods as follows:

- Transfer server files through SCP

  For clusters deployed using TiUP, Diag can collect log files and configuration files directly from the nodes of the target component through the Secure copy protocol (SCP).

- Collect data by running commands remotely through SSH

  For clusters deployed using TiUP, Diag can connect to the target component system through SSH (Secure Shell) and run commands (such as Insight) to obtain system information, including kernel logs, kernel parameters, and basic information of the system and hardware.

- Collect data through HTTP call

  - By calling the HTTP interface of TiDB components, Diag can get the real-time configuration sampling information and the real-time performance sampling information of TiDB, TiKV, PD, and other components.
  - By calling the HTTP interface of Prometheus, Diag can get alert information and monitoring metrics data.

- Query database parameters through SQL statements

  Using SQL statements, Diag can query system variables and other information of TiDB. To use this method, you need to **additionally provide** the username and password to access TiDB when collecting data.

#### 13.11.1.3 The limitations of Clinic Server

**Note:**

- Clinic Server is free from July 15, 2022 to April 15, 2025. You will be notified through email before April 15, 2025 if the service starts charging fee afterwards.
- If you want to adjust the usage limitations, get support from PingCAP.

| Service Type | Limitation |
|---|---|
| Number of clusters | 10/organization |
| Storage capacity | 50 GB/cluster |
| Storage duration | 180 days |
| Data size | 3 GB/package |
| Saving duration of the data rebuild environment | 3 days |

#### 13.11.1.4 Next step

- Use PingCAP Clinic in a self-hosted environment
  - Quick Start with PingCAP Clinic
  - Troubleshoot Clusters using PingCAP Clinic
  - PingCAP Clinic Diagnostic Data
- Use PingCAP Clinic on Kubernetes
  - Troubleshoot TiDB Cluster using PingCAP Clinic
  - PingCAP Clinic Diagnostic Data

### 13.11.2 Quick Start Guide for PingCAP Clinic

This document describes how to use PingCAP Clinic diagnosis service (PingCAP Clinic) to collect, upload, and view cluster diagnosis data quickly.

PingCAP Clinic consists of two components: Diag client (shorten as Diag) and Clinic Server cloud service (shorten as Clinic Server). For details of these two components, refer to PingCAP Clinic Overview.

#### 13.11.2.1 User scenarios

- To accurately identify and quickly resolve problems in your cluster when seeking help remotely from PingCAP technical support, you can collect diagnostic data with Diag, upload the collected data to the Clinic Server, and provide the data access link to the technical support.
- When the cluster is running properly and you need to check the status of the cluster, you can use Diag to collect diagnostic data, upload the data to Clinic Server, and view the results of Health Report.

> **Note:**
>
> - The following methods to collect and upload data are **only** applicable to clusters deployed using TiUP. For clusters deployed using TiDB Operator on Kubernetes, see PingCAP Clinic for TiDB Operator environments.
> - The diagnostic data collected by PingCAP Clinic is **only** used for troubleshooting cluster problems.

#### 13.11.2.2 Prerequisites

Before using PingCAP Clinic, you need to install Diag and prepare an environment for uploading data.

1. On your control machine with TiUP installed, run the following command to install Diag:

```
tiup install diag
```

2. Log in to Clinic Server.

   Go to the Clinic Server for international users and select **Sign in with TiDB Account** to enter the TiDB Cloud login page. If you do not have a TiDB Cloud account, create one on that page.

> **Note:**
>
> A TiDB Cloud account is only used for logging in to Clinic Server in SSO mode and is not mandatory for accessing the TiDB Cloud service.

   Go to the Clinic Server for users in the Chinese mainland and select **Sign in with AskTUG** to enter the AskTUG community login page. If you do not have an AskTUG account, create one on that page

3. Create an organization on the Clinic Server. Organization is a collection of TiDB clusters. You can upload diagnostic data on the created organization.

4. Get an access token to upload data. When uploading collected data through Diag, you need a token for user authentication to ensure the data is isolated securely. If you already get a token from the Clinic Server, you can reuse the token.

   To get a token, click the icon in the lower-right corner of the Cluster page, select **Get Access Token For Diag Tool**, and click + in the pop-up window. Make sure that you have copied and saved the token that is displayed.

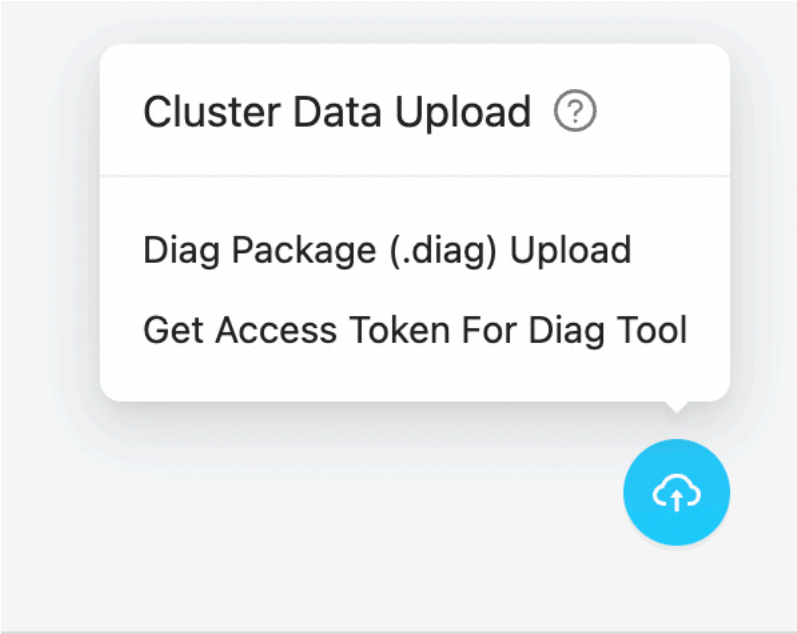

Figure 350: An example of a token

**Note:**

- For data security, TiDB only displays the token information when it is created. If you lost the information, you can delete the old token and create a new one.
- A token is only used for uploading data.

5. Set the token and `region` in Diag.

   - Run the following command to set the `clinic.token`:

     ```
     tiup diag config clinic.token ${token-value}
     ```

   - Run the following command to set the `clinic.region`:

`region` determines the encryption certificate used for packing data and the target service when uploading the data. For example:

> **Note:**
>
> - Diag v0.9.0 and later versions support setting `region`.
> - For versions earlier than Diag v0.9.0, data is uploaded to Clinic Server in the Chinese region by default. To set `region` in these versions, run the `tiup update diag` command to upgrade Diag to the latest version and then set `region` in Diag.

When using Clinic Server for international users, set `region` to `US` using the following command:

```
tiup diag config clinic.region US
```

When using Clinic Server for users in the Chinese mainland, set `region` to `CN` using the following command:

```
tiup diag config clinic.region CN
```

6. (Optional) Enable log redaction.

   When TiDB provides detailed log information, it might print sensitive information (for example, user data) in the log. If you want to avoid leaking sensitive information in the local log and Clinic Server, you can enable log redaction in the TiDB side. For more information, see log redaction.

#### 13.11.2.3 Steps

1. Run Diag to collect diagnostic data.

   For example, to collect the diagnostic data from 4 hours ago to 2 hours ago based on the current time, run the following command:

   ```
   tiup diag collect ${cluster-name} -f="-4h" -t="-2h"
   ```

   After you run the command, Diag does not start collecting data immediately. Instead, Diag provides the estimated data size and the target data storage path in the output for you to confirm whether to continue. To confirm that you want to start collecting data, enter `Y`.

   After the collection is complete, Diag provides the folder path where the collected data is located.

2. Upload the collected data to Clinic Server.

> **Note:**
> The size of data (the compressed file with collected data) to be uploaded should be **no larger than** 3 GB. Otherwise, the data upload fails.

- If the network where your cluster is located can access the internet, you can directly upload the folder with collected data using the following command:

```
tiup diag upload ${filepath}
```

  After the upload is completed, the `Download URL` is displayed in the output.

> **Note:**
> When uploading data using this method, you need to use Diag v0.9.0 or a later version. You can get the Diag version when you run it. If the Diag version is earlier than 0.9.0, you can use the `tiup update diag` command to upgrade Diag to the latest version.

- If the network where your cluster is located cannot access the internet, you need to pack the collected data and upload the package. For details, see Method 2. Pack and upload data.

3. After the upload is complete, get the data access link from `Download URL` in the command output.

   By default, the diagnostic data includes the cluster name, cluster topology information, log content in the collected diagnostic data, and Grafana Dashboard information reorganized based on the metrics in the collected data.

   You can use the data to troubleshoot cluster problems by yourself, or you can provide the data access link to PingCAP technical support staff to facilitate the remote troubleshooting.

4. View the results of Health Report

   After data is uploaded, Clinic Server processes the data automatically in the background. The Health Report is generated in approximately 5 to 15 minutes. You can view the report by opening the diagnostic data link and click the “Health Report”.

#### 13.11.2.4 What’s next

- PingCAP Clinic Overview
- Troubleshoot Clusters Using PingCAP Clinic
- PingCAP Clinic Diagnostic Data

### 13.11.3 Troubleshoot Clusters Using PingCAP Clinic

For TiDB clusters and DM clusters deployed using TiUP, you can use PingCAP Clinic Diagnostic Service (PingCAP Clinic) to troubleshoot cluster problems remotely and perform a quick check on cluster status locally using Diag client (Diag) and Clinic Server.

**Note:**

- This document **only** applies to clusters deployed using TiUP in a self-hosted environment. For clusters deployed using TiDB Operator on Kubernetes, see PingCAP Clinic for TiDB Operator environments.
- PingCAP Clinic **does not support** collecting data from clusters deployed using TiDB Ansible.

#### 13.11.3.1 User scenarios

- Troubleshoot cluster problems remotely
  - When your cluster has some problems, if you need to get support from PingCAP, you can perform the following operations to facilitate the remote troubleshooting: collect diagnostic data with Diag, upload the collected data to the Clinic Server, and provide the data access link to the technical support staff.
  - When your cluster has some problems, if you cannot analyze the problems immediately, you can use Diag to collect and save the data for later analysis.
- Perform a quick check on the cluster status locally

  Even if your cluster is running stably for now, it is necessary to periodically check the cluster to detect potential stability risks. You can identify potential health risks of a cluster using the local quick check feature provided by PingCAP Clinic. The local check only checks configuration. To check more items, such as metrics and logs, it is recommended to upload the diagnostic data to the Clinic Server and use the Health Report feature.

#### 13.11.3.2 Prerequisites

Before using PingCAP Clinic, you need to install Diag (a component to collect data provided by PingCAP Clinic) and prepare the environment to upload data.

1. Install Diag.

- If you have installed TiUP on your control machine, run the following command to install Diag:

```
```bash
tiup install diag
```
```

    - If you have installed Diag, you can use the following command to upgrade Diag to the latest version:

```
tiup update diag
```

> **Note:**
>
> - For clusters without an internet connection, you need to deploy Diag offline. For details, refer to Deploy TiUP offline: Method 2.
> - Diag is **only** provided in the TiDB Server offline mirror package of v5.4.0 or later.

2. Get and set an access token (token) to upload data.

   When uploading collected data through Diag, you need a token for user authentication. If you already set a token Diag, you can reuse the token and skip this step.

   To get a token, perform the following steps:

   - Log in to the Clinic Server.

     Clinic Server for international users: Data is stored in AWS in US.

     Clinic Server for users in the Chinese mainland: Data is stored in AWS in China (Beijing) regions.
   - Click the icon in the lower-right corner of the Cluster page, select **Get Access Token For Diag Tool**, and click + in the pop-up window. Make sure that you have copied and saved the token that is displayed.

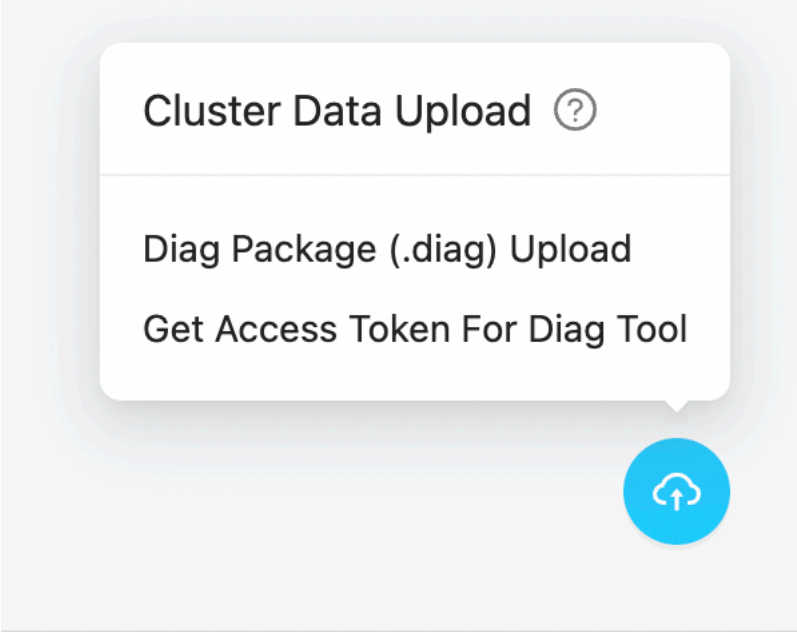

Figure 351: Get the Token

**Note:**

- When accessing Clinic Server for the first time, before getting a token, you need to prepare the environment by referring to Quick Start with PingCAP Clinic.
- For data security, TiDB only displays the token upon the token creation. If you have lost the token, delete the old token and create a new one.
- A token is only used for uploading data.

- Then, set the token in Diag. For example:

```
tiup diag config clinic.token ${token-value}
```

3. Set the `region` in Diag.

   `region` determines the encryption certificate used for packing data and the target service when uploading the data. For example:

**Note:**

- Diag v0.9.0 and later versions support setting `region`.
- For versions earlier than Diag v0.9.0, data is uploaded to Clinic Server in the Chinese region by default. To set `region` in these

versions, run the `tiup update diag` command to upgrade Diag to the latest version and then set `region` in Diag.

When using Clinic Server for international users, set `region` to `US` using the following command:

```
tiup diag config clinic.region US
```

When using Clinic Server for users in the Chinese mainland, set `region` to `CN` using the following command:

```
tiup diag config clinic.region CN
```

4. (Optional) Enable log redaction.

   When TiDB provides detailed log information, it might print sensitive information (for example, user data) in the log. If you want to avoid leaking sensitive information in the local log and Clinic Server, you can enable log redaction in the TiDB side. For more information, see log redaction.

#### 13.11.3.3 Troubleshoot cluster problems remotely

You can use Diag to quickly collect diagnostic data from TiDB clusters and DM clusters, including monitoring data and configuration information.

##### 13.11.3.3.1 Step 1. Check the data to be collected

For a full list of data that can be collected by Diag, see PingCAP Clinic Diagnostic Data.

To improve the efficiency of the later diagnosis, you are recommended to collect full diagnostic data including monitoring data and configuration information. For details, see Collect data from clusters.

##### 13.11.3.3.2 Step 2. Collect data

With Diag, you can collect data from the TiDB clusters and the DM clusters deployed using TiUP.

1. Run the data collection command of Diag.

   For example, to collect the diagnostic data from 4 hours ago to 2 hours ago based on the current time, run the following command:

```
tiup diag collect ${cluster-name} -f="-4h" -t="-2h"
```

```
tiup diag collectdm ${dm-cluster-name} -f="-4h" -t="-2h"
```

Descriptions of the parameters for data collection:

- `-f/--from`: specifies the start time of the data collection. If you do not specify this parameter, the default start time is 2 hours before the current time. To modify the time zone, use the `-f="12:30 +0800"` syntax. If you do not specify the time zone information in this parameter, such as `+0800`, the time zone is UTC by default.
- `-t/--to`: specifies the end time of the data collection. If you do not specify this parameter, the default end time is the current moment. To modify the time zone, use the `-f="12:30 +0800"` syntax. If you do not specify the time zone information in this parameter, such as `+0800`, the time zone is UTC by default.

Parameter usage tips:

In addition to specifying the data collection time, you can use Diag to specify more parameters. To get all parameters, run the `tiup diag collect -h` or `tiup diag collectdm -h` command.

**Note:**

- Diag does not collect system variables data (db_vars) by default. To collect this data, you need to additionally provide a username and password that can access the database. Note that the reading access to system variables should be enabled in this database.
- Diag does not collect performance data (`perf`) and debug data (`debug`) by default.
- To collect full diagnostic data including system variables, use the command `tiup diag collect <cluster-name> --include="system,monitor,log,config,db_vars,perf,debug"`.

- `-l`: the bandwidth limit for transferring files, the unit is Kbit/s, and the default value is `100000` (the `-l` parameter of scp).
- `-N/--node`: only collects data from a specified node. The format is `ip:port`.
- `--include`: only collects specific types of data. The optional values are `system`, `monitor`, `log`, `config`, and `db_vars`. To include two or more types, you can use `,` as a separator between the types.
- `--exclude`: does not collect specific types of data. The optional values are `system`, `monitor`, `log`, `config`, and `db_vars`. To exclude two or more types, you can use `,` as a separator between the types.

After you run the command, Diag does not start collecting data immediately. Instead, Diag provides the estimated data size and the target data storage path in the output for you to confirm whether to continue. For example:

```
Estimated size of data to collect:
Host              Size      Target
----              ----      ------
172.16.7.129:9090 43.57 MB 1775 metrics, compressed
172.16.7.87       0 B       /tidb-deploy/tidb-4000/log/tidb_stderr.log
... ...
172.16.7.179      325 B     /tidb-deploy/tikv-20160/conf/tikv.toml
Total             2.01 GB   (inaccurate)
These data will be stored in /home/user/diag-fNTnz5MGhr6
Do you want to continue? [y/N]: (default=N)
```

2. Enter `Y` to confirm that you want to start collecting data.

   Collecting data takes a certain amount of time. The time varies according to the volume of data to be collected. For example, in a test environment, collecting 1 GB of data takes about 10 minutes.

   After the collection is complete, Diag provides the folder path where the collected data is located. For example:

```
Collected data are stored in /home/user/diag-fNTnz5MGhr6
```

#### 13.11.3.3.3 Step 3. View data locally (optional)

The collected data is stored in separate subdirectories based on its data source. These subdirectories are named after machine names and port numbers. The storage locations of the configuration, logs, and other files of each node are the same as their relative storage paths in the real server of your TiDB cluster:

- Basic information of the system and hardware: in `insight.json`
- Contents in the system `/etc/security/limits.conf`: in `limits.conf`
- List of kernel parameters: in `sysctl.conf`
- Kernel logs: in `dmesg.log`
- Network connection during data collection: in `ss.txt`
- Configuration data: in the `config.json` directory of each node
- Meta-information for the cluster itself: in `meta.yaml` (this file is located at the top level of the directory that stores collected data)
- Monitoring data: in the `/monitor` file directory. The monitoring data is compressed by default and cannot be viewed directly. To directly view the JSON files with monitoring data, disable compression with the `--compress-metrics=false` parameter when collecting data.

#### 13.11.3.3.4 Step 4. Upload data

To provide cluster diagnostic data to PingCAP technical support staff, you need to upload the data to the Clinic Server first, and then send the obtained data access link to the staff. The Clinic Server is a cloud service that stores and shares diagnostic data securely.

Depending on the network connection of the cluster, you can choose one of the following methods to upload data:

- Methods 1: if the network where the cluster is located can access the internet, you can directly upload data using the upload command.
- Methods 2: if the network where the cluster is located cannot access the internet, you need to pack the data and then upload it.

> **Note:**
>
> If you did not set a token or `region` in Diag before uploading data, Diag reports the upload failure and reminds you to set a token or `region`. To set a token, see the second step in Prerequisites.

Method 1. Upload directly

If the network where the cluster is located can access the internet, you can directly upload the folder with collected data obtained in Step 2: Collect data using the following command:

```
tiup diag upload
```

After the upload is completed, the `Download URL` is displayed in the output. You can open the link of `Download URL` to see the uploaded data or send the link to the PingCAP technical support staff you contacted before.

Method 2. Pack and upload data

If the network where your cluster is located cannot access the internet, you need to pack the data on your intranet and upload the data package to the Clinic Server using a device with internet access. The detailed operations are as follows:

1. Pack the collected data obtained in Step 2. Collect data by running the following command:

   ```
   tiup diag package ${filepath}
   ```

   During packaging, Diag encrypts and compresses the data at the same time. In the test environment, 800 MB of data was compressed to 57 MB. The following is an example output:

```
Starting component `diag`: /root/.tiup/components/diag/v0.7.0/diag
    ↪ package diag-fNTnz5MGhr6
packaged data set saved to /home/user/diag-fNTnz5MGhr6.diag
```

After the packaging is complete, the data is packaged to the `.diag` format. The `.diag` file can only be decrypted and viewed after being uploaded to the Clinic Server. If you want to directly forward the collected data instead of uploading it to the Clinic Server, you can compress the data by your own method and forward it.

2. From a machine with internet access, upload the compressed data package:

```
tiup diag upload ${filepath}
```

The following is an example output:

```
[root@Copy-of-VM-EE-CentOS76-v1 user]# tiup diag upload /home/user/
    ↪ diag-fNTnz5MGhr6
Starting component `diag`: /root/.tiup/components/diag/v0.7.0/diag
    ↪ upload /home/user/diag-fNTnz5MGhr6
>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>><<<<<<<<<
Completed!
Download URL: "https://clinic.pingcap.com.cn/portal/#/orgs/4/clusters/
    ↪ XXXX"
```

3. After the upload is complete, you can open the link of `Download URL` to see the uploaded data or send the link to the PingCAP technical support staff you contacted before.

#### 13.11.3.4 Perform a quick check on the cluster status locally

You can have a quick check on the cluster status locally using Diag. Even if your cluster is running stably for now, it is necessary to periodically check the cluster to detect potential stability risks. You can identify potential health risks of a cluster using the local quick check feature provided by PingCAP Clinic. The local check only checks configuration. To check more items, such as metrics and logs, it is recommended to upload the diagnostic data to the Clinic Server and use the Health Report feature.

1. Collect configuration data:

```
tiup diag collect ${cluster-name} --include="config"
```

The data of configuration files are relatively small. After the collection, the collected data is stored in the current path by default. In the test environment, for a cluster with 18 nodes, the data size of configuration files is less than 10 KB.

2. Diagnose configuration data:

```
tiup diag check ${subdir-in-output-data}
```

`${subdir-in-output-data}` in the above command is the path that stores the collected data, and this path has the `meta.yaml` file.

3. View the diagnostic result:

   The diagnostic result is returned on the command line. For example:

```
Starting component `diag`: /root/.tiup/components/diag/v0.7.0/diag
    ↪ check diag-fNTnz5MGhr6

# Diagnostic result
lili 2022-01-24T09:33:57+08:00

## 1. Cluster basic information
- Cluster ID: 7047403704292855808
- Cluster Name: lili
- Cluster Version: v5.3.0

## 2. Sampling information
- Sample ID: fNTnz5MGhr6
- Sampling Date: 2022-01-24T09:33:57+08:00
- Sample Content:: [system monitor log config]

## 3. Diagnostic result, including potential configuration problems
In this inspection, 22 rules were executed.

The results of **1** rules were abnormal and needed to be further
    ↪ discussed with support team.

The following is the details of the abnormalities.

### Diagnostic result summary
The configuration rules are all derived from PingCAP' s OnCall Service.

If the results of the configuration rules are found to be abnormal,
    ↪ they may cause the cluster to fail.

There were **1** abnormal results.

#### Path to save the diagnostic result file

Rule Name: tidb-max-days
- RuleID: 100
- Variation: TidbConfig.log.file.max-days
```

```

  TidbConfig_172.16.7.179:4000 TidbConfig.log.file.max-days:0 warning

Result report and record are saved at diag-fNTnz5MGhr6/report
    ↪ -220125153215
```

In the last section of the diagnostic result (under `#### Path to save the diagnostic result file` in the above example output), for each configuration potential risk found, Diag provides a corresponding knowledge base link with detailed configuration suggestions. In the example above, the relevant link is `https://s.tidb.io/msmo6awg`.

#### 13.11.3.5 FAQ

1. If the data upload fails, can I re-upload it?

   Yes. Data upload supports breakpoint upload. If the upload fails, you can upload it again directly.

2. After uploading data, I cannot open the returned data access link. What should I do?

   Log in to Clinic Server first. If you still cannot open the link after login success, check whether you have access to data. If not, contact the data owner for permission. After getting the permission, log in to Clinic Server and open the link again.

3. How long will the uploaded data be kept on the Clinic Server?

   The longest time is 180 days. You can delete the data you uploaded on the Clinic Server page at any time.

### 13.11.4 PingCAP Clinic Diagnostic Data

This document provides the types of diagnostic data that can be collected by PingCAP Clinic Diagnostic Service (PingCAP Clinic) from the TiDB and DM clusters deployed using TiUP. Also, the document lists the parameters for data collection corresponding to each data type. When running a command to collect data using Diag client (Diag), you can add the required parameters to the command according to the types of the data to be collected.

The diagnostic data collected by PingCAP Clinic is **only** used for troubleshooting cluster problems.

A diagnostic service deployed in the cloud, Clinic Server provides two independent services depending on the data storage location:

- Clinic Server for international users: If you upload the collected data to Clinic Server for international users, the data will be stored in the Amazon S3 service deployed by PingCAP in AWS US regions. PingCAP uses strict data access policies and only authorized technical support can access the data.
- Clinic Server for users in the Chinese mainland: If you upload the collected data to Clinic Server for users in the Chinese mainland, the data will be stored in the Amazon S3 service deployed by PingCAP in China (Beijing) regions. PingCAP uses strict data access policies and only authorized technical support can access the data.

#### 13.11.4.1 TiDB clusters

This section lists the types of diagnostic data that can be collected by Diag from the TiDB clusters deployed using TiUP.

##### 13.11.4.1.1 TiDB cluster information

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
|---|---|---|
| Basic information of the cluster, including the cluster ID | `cluster.json` | The data is collected per run by default. |
| Detailed information of the cluster | `meta.yaml` | The data is collected per run by default. |

##### 13.11.4.1.2 TiDB diagnostic data

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
|---|---|---|
| Log | `tidb.log` | `--include=log` |
| Error log | `tidb_stderr.log` | `--include=log` |

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
|---|---|---|
| Slow log | `tidb_slow_query.log` | `--include=log` |
| Configuration file | `tidb.toml` | `--include=config` |
| Real-time configuration | `config.json` | `--include=config` |

#### 13.11.4.1.3 TiKV diagnostic data

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
|---|---|---|
| Log | `tikv.log` | `--include=log` |
| Error log | `tikv_stderr.log` | `--include=log` |
| Configuration file | `tikv.toml` | `--include=config` |
| Real-time configuration | `config.json` | `--include=config` |

#### 13.11.4.1.4 PD diagnostic data

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
|---|---|---|
| Log | `pd.log` | `--include=log` |
| Error log | `pd_stderr.log` | `--include=log` |
| Configuration file | `pd.toml` | `--include=config` |
| Real-time configuration | `config.json` | `--include=config` |

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
|---|---|---|
| Outputs of the command `tiup ↪ ctl ↪ :v< ↪ CLUSTER_VERSION ↪ > ↪ pd ↪ -u ↪ http ↪ :// ↪ ${ ↪ pd ↪ IP ↪ }:$ ↪ { ↪ PORT ↪ } ↪ store ↪` | `store. ↪ json ↪` | `-- ↪ include ↪ = ↪ config ↪` |

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
| --- | --- | --- |
| Outputs of the command `tiup ctl :v< CLUSTER_VERSION > pd -u http :// ${ pd IP }:$ { PORT } config placement - rules show` | `placement--include=config.json` | |

#### 13.11.4.1.5 TiFlash diagnostic data

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
|---|---|---|
| Log | `tiflash` `↪ .` `↪ log` | `--` `↪ include` `↪ =log` |
| Error log | `tiflash_stderr` `↪ .` `↪ log` | `--` `↪ include` `↪ =log` |
| Configuration file | `tiflash` `↪ -` `↪ learner` `↪ .` `↪ toml` `↪ ,` `tiflash` `↪ -` `↪ preprocessed` `↪ .` `↪ toml` `↪ ,` `tiflash` `↪ .` `↪ toml` `↪` | `--` `↪ include` `↪ =` `↪ config` `↪` |
| Real-time configuration | `config` `↪ .` `↪ json` `↪` | `--` `↪ include` `↪ =` `↪ config` `↪` |

#### 13.11.4.1.6 TiCDC diagnostic data

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
|---|---|---|
| Log | `ticdc.log` | `--include=log` |
| Error log | `ticdc_stderr.log` | `--include=log` |
| Configuration file | `ticdc.toml` | `--include=config` |
| Debug data | `info.txt`, `status.txt`, `changefeeds.txt`, `captures.txt`, `processors.txt` | `--include=debug` (Diagnostics does not collect this data type by default) |

#### 13.11.4.1.7 Prometheus monitoring data

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
|---|---|---|
| All metrics data | `{metric_name}.json` | `--include=monitor` |
| All alerts data | `alerts.json` | `--include=monitor` |

#### 13.11.4.1.8 TiDB system variables

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
|---|---|---|
| TiDB system variables | `mysql.tidb` ↪ `.` ↪ `csv` | `--include=db_vars` (Diag does not collect this data type by default; if you need to collect this data type, database credential is required) |
| | `global_variables` ↪ `.` ↪ `csv` | `--include=db_vars` (Diag does not collect this data type by default) |

#### 13.11.4.1.9 System information of the cluster node

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
|---|---|---|
| Kernel log | `dmesg.log` | `--include=system` |
| Basic information of the system and hardware | `insight.json` | `--include=system` |
| Contents in the `/etc/security/limits.conf` | `limits.conf` | `--include=system` |
| List of kernel parameters | `sysctl.conf` | `--include=system` |
| Socket system information, which is the output of the `ss` command | `ss.txt` | `--include=system` |

#### 13.11.4.2 DM clusters

This section lists the types of diagnostic data that can be collected by Diag from the DM clusters deployed using TiUP.

##### 13.11.4.2.1 DM cluster information

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
|---|---|---|
| Basic information of the cluster, including the cluster ID | `cluster.json` | The data is collected per run by default. |
| Detailed information of the cluster | `meta.yaml` | The data is collected per run by default. |

##### 13.11.4.2.2 dm-master diagnostic data

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
|---|---|---|
| Log | `m-master.log` | `--include=log` |
| Error log | `dm-master_stderr.log` | `--include=log` |
| Configuration file | `dm-master.toml` | `--include=config` |

##### 13.11.4.2.3 dm-worker diagnostic data

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
|---|---|---|
| Log | `dm-worker.log` | `--include=log` |
| Error log | `dm-worker_stderr.log` | `--include=log` |
| Configuration file | `dm-work.toml` | `--include=config` |

#### 13.11.4.2.4 Prometheus monitoring data

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
|---|---|---|
| All metrics data | `{metric_name}.json` | `--include=monitor` |
| All alerts data | `alerts.json` | `--include=monitor` |

#### 13.11.4.2.5 System information of the cluster node

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
|---|---|---|
| Kernel log | `dmesg.log` | `--include=system` |
| Basic information of the system and hardware | `insight.json` | `--include=system` |
| Contents in the `/etc/security/limits.conf` system | `limits.conf` | `--include=system` |
| List of kernel parameters | `sysctl.conf` | `--include=system` |

| Data type | Exported file | Parameter for data collection by PingCAP Clinic |
|---|---|---|
| Socket system information, which is the output of the `ss` command | `ss.txt` | `--include=system` |

## 13.12 TiSpark

### 13.12.1 TiSpark User Guide

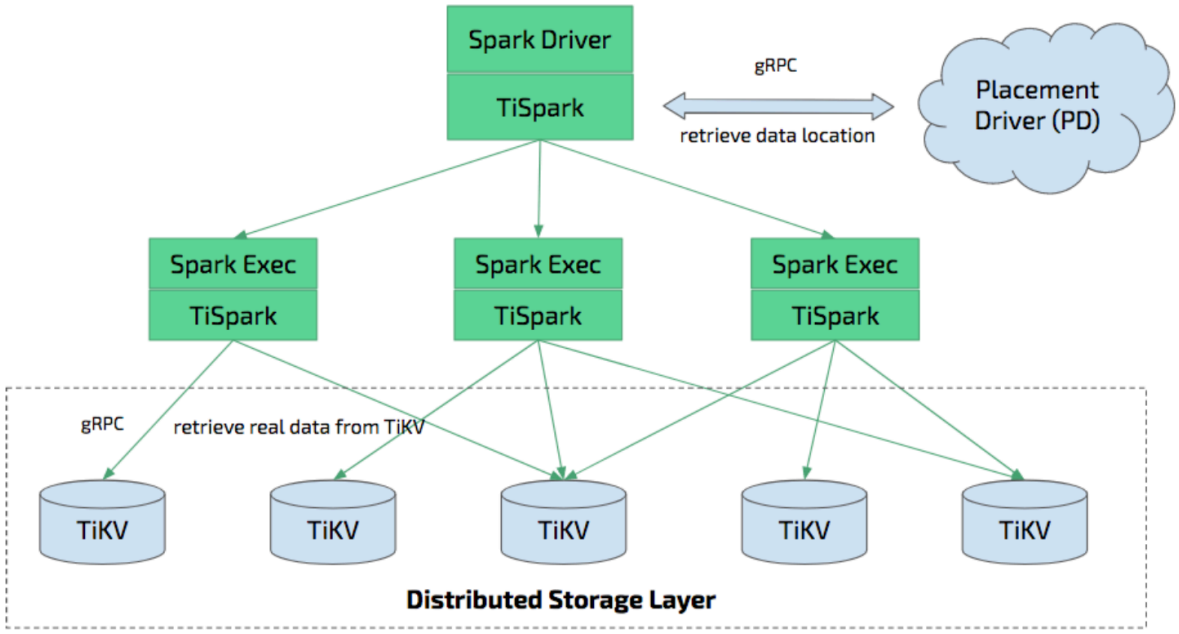

Figure 352: TiSpark architecture

#### 13.12.1.1 TiSpark vs TiFlash

TiSpark is a thin layer built for running Apache Spark on top of TiDB/TiKV to answer the complex OLAP queries. It takes advantages of both the Spark platform and the distributed TiKV cluster and seamlessly glues to TiDB, the distributed OLTP database, to provide a Hybrid Transactional/Analytical Processing (HTAP) solution to serve as a one-stop solution for both online transactions and analysis.

TiFlash is another tool that enables HTAP. Both TiFlash and TiSpark allow the use of multiple hosts to execute OLAP queries on OLTP data. TiFlash stores data in a columnar format, which allows more efficient analytical queries. TiFlash and TiSpark can be used together.

#### 13.12.1.2 What is TiSpark

TiSpark depends on the TiKV cluster and the PD cluster. You also need to set up a Spark cluster. This document provides a brief introduction to how to setup and use TiSpark. It requires some basic knowledge of Apache Spark. For more information, see Apache Spark website.

Deeply integrating with Spark Catalyst Engine, TiSpark provides precise control on computing. This allows Spark to read data from TiKV efficiently. TiSpark also supports index seek, which enables high-speed point query. TiSpark accelerates data queries by pushing computing to TiKV so as to reduce the volume of data to be processed by Spark SQL. Meanwhile, TiSpark can use TiDB built-in statistics to select the best query plan.

With TiSpark and TiDB, you can run both transaction and analysis tasks on the same platform without building and maintaining ETLs. This simplifies the system architecture and reduces the cost of maintenance.

You can use tools of the Spark ecosystem for data processing on TiDB:

- TiSpark: Data analysis and ETLs
- TiKV: Data retrieval
- Scheduling system: Report generation

Also, TiSpark supports distributed writes to TiKV. Compared with writes to TiDB by using Spark and JDBC, distributed writes to TiKV can implement transactions (either all data are written successfully or all writes fail), and the writes are faster.

> **Warning:**
>
> Because TiSpark accesses TiKV directly, the access control mechanisms used by TiDB Server are not applicable to TiSpark. Since TiSpark v2.5.0, TiSpark supports user authentication and authorization, for more information, see Security.

#### 13.12.1.3 Requirements

- TiSpark supports Spark >= 2.3.
- TiSpark requires JDK 1.8 and Scala 2.11/2.12.
- TiSpark runs in any Spark mode such as `YARN`, `Mesos`, and `Standalone`.

#### 13.12.1.4 Recommended deployment configurations of Spark

> **Warning:**
>
> Deploying TiSpark using TiUP as described in this doc has been deprecated.

Since TiSpark is a TiDB connector of Spark, to use it, a running Spark cluster is required.

This document provides basic advice on deploying Spark. Please turn to the Spark official website for detailed hardware recommendations.

For independent deployment of Spark cluster:

- It is recommended to allocate 32 GB memory for Spark. Reserve at least 25% of the memory for the operating system and the buffer cache.
- It is recommended to provision at least 8 to 16 cores per machine for Spark. First, you must assign all the CPU cores to Spark.

The following is an example based on the `spark-env.sh` configuration:

```
SPARK_EXECUTOR_MEMORY = 32g
SPARK_WORKER_MEMORY = 32g
SPARK_WORKER_CORES = 8
```

#### 13.12.1.5 Get TiSpark

TiSpark is a third-party jar package for Spark that provides the ability to read and write TiKV.

##### 13.12.1.5.1 Get mysql-connector-j

The `mysql-connector-java` dependency is no longer provided because of the limit of the GPL license.

The following versions of TiSpark's jar will no longer include `mysql-connector-java`.

- TiSpark > 3.0.1

- TiSpark > 2.5.1 for TiSpark 2.5.x
- TiSpark > 2.4.3 for TiSpark 2.4.x

However, TiSpark needs `mysql-connector-java` for writing and authentication. In such cases, you need to import `mysql-connector-java` manually using either of the following methods:

- Put `mysql-connector-java` into spark jars file.
- Import `mysql-connector-java` when you submit a spark job. See the following example:

```
spark-submit --jars tispark-assembly-3.0_2.12-3.1.0-SNAPSHOT.jar,mysql-
    ↪ connector-java-8.0.29.jar
```

#### 13.12.1.5.2 Choose TiSpark version

You can choose TiSpark version according to your TiDB and Spark version.

| TiSpark version | TiDB, TiKV, PD version | Spark version | Scala version |
|---|---|---|---|
| 2.4.x-scala_2.11 | 5.x, 4.x | 2.3.x, 2.4.x | 2.11 |
| 2.4.x-scala_2.12 | 5.x, 4.x | 2.4.x | 2.12 |
| 2.5.x | 5.x, 4.x | 3.0.x, 3.1.x | 2.12 |
| 3.0.x | 5.x, 4.x | 3.0.x, 3.1.x, 3.2.x | 2.12 |
| 3.1.x | 6.x, 5.x, 4.x | 3.0.x, 3.1.x, 3.2.x, 3.3.x | 2.12 |
| 3.2.x | 6.x, 5.x, 4.x | 3.0.x, 3.1.x, 3.2.x, 3.3.x | 2.12 |

TiSpark 2.4.4, 2.5.2, 3.0.2, 3.1.1, and 3.2.3 are the latest stable versions and are highly recommended.

> **Note:**
>
> TiSpark does not guarantee compatibility with TiDB v7.0.0 and later versions.

#### 13.12.1.5.3 Get TiSpark jar

You can get the TiSpark jar using one of the following methods:

- Get from maven central and search for `pingcap`

- Get from TiSpark releases
- Build from source with the steps below

> **Note:**
>
> Currently, java8 is the only choice to build TiSpark, run mvn -version to check.

```
git clone https://github.com/pingcap/tispark.git
```

Run the following command under the TiSpark root directory.

```
// add -Dmaven.test.skip=true to skip the tests
mvn clean install -Dmaven.test.skip=true
// or you can add properties to specify spark version
mvn clean install -Dmaven.test.skip=true -Pspark3.2.1
```

#### 13.12.1.5.4 TiSpark jar's artifact ID

The Artifact ID of TiSpark varies with TiSpark versions.

| TiSpark version | Artifact ID |
|---|---|
| 2.4.x-${scala_version}, 2.5.0 | tispark-assembly |
| 2.5.1 | tispark-assembly-${spark_version} |
| 3.0.x, 3.1.x, 3.2.x | tispark-assembly-${spark_version}-${scala_version} |

### 13.12.1.6 Getting started

This document describes how to use TiSpark in spark-shell.

#### 13.12.1.6.1 Start spark-shell

To use TiSpark in spark-shell:

Add the following configuration in `spark-defaults.conf`:

```
spark.sql.extensions org.apache.spark.sql.TiExtensions
spark.tispark.pd.addresses ${your_pd_adress}
spark.sql.catalog.tidb_catalog org.apache.spark.sql.catalyst.catalog.
    ↪ TiCatalog
spark.sql.catalog.tidb_catalog.pd.addresses ${your_pd_adress}
```

Start spark-shell with the `--jars` option.

```
spark-shell --jars tispark-assembly-{version}.jar
```

#### 13.12.1.6.2 Get TiSpark version

You can get TiSpark version information by running the following command in spark-shell:

```
spark.sql("select ti_version()").collect
```

#### 13.12.1.6.3 Read data using TiSpark

You can use Spark SQL to read data from TiKV.

```
spark.sql("use tidb_catalog")
spark.sql("select count(*) from ${database}.${table}").show
```

#### 13.12.1.6.4 Write data using TiSpark

You can use the Spark DataSource API to write data to TiKV, for which ACID is guaranteed.

```
val tidbOptions: Map[String, String] = Map(
  "tidb.addr" -> "127.0.0.1",
  "tidb.password" -> "",
  "tidb.port" -> "4000",
  "tidb.user" -> "root"
)

val customerDF = spark.sql("select * from customer limit 100000")

customerDF.write
.format("tidb")
.option("database", "tpch_test")
.option("table", "cust_test_select")
.options(tidbOptions)
.mode("append")
.save()
```

See Data Source API User Guide for more details.

Starting from TiSpark 3.1, you can write data to TiKV using Spark SQL. For more information, see insert SQL.

#### 13.12.1.6.5 Write data using JDBC DataSource

You can also use Spark JDBC to write to TiDB without the use of TiSpark.

This is beyond the scope of TiSpark. This document only provides an example here. For detailed information, see JDBC To Other Databases.

```
import org.apache.spark.sql.execution.datasources.jdbc.JDBCOptions

val customer = spark.sql("select * from customer limit 100000")
// you might need to repartition the source to make it balanced across
   ↪ nodes
// and increase concurrency
val df = customer.repartition(32)
df.write
.mode(saveMode = "append")
.format("jdbc")
.option("driver", "com.mysql.jdbc.Driver")
 // replace the host and port with yours and be sure to use rewrite batch
.option("url", "jdbc:mysql://127.0.0.1:4000/test?rewriteBatchedStatements=
   ↪ true")
.option("useSSL", "false")
// as tested, setting to `150` is a good practice
.option(JDBCOptions.JDBC_BATCH_INSERT_SIZE, 150)
.option("dbtable", s"cust_test_select") // database name and table name
   ↪ here
.option("isolationLevel", "NONE") // set isolationLevel to NONE
.option("user", "root") // TiDB user here
.save()
```

Set `isolationLevel` to `NONE` to avoid large single transactions which might lead to TiDB OOM and also avoid the `ISOLATION LEVEL does not support` error (TiDB currently only supports `REPEATABLE-READ`).

#### 13.12.1.6.6 Delete data using TiSpark

You can use Spark SQL to delete data from TiKV.

```
spark.sql("use tidb_catalog")
spark.sql("delete from ${database}.${table} where xxx")
```

See delete feature for more details.

#### 13.12.1.6.7 Work with other data sources

You can use multiple catalogs to read data from different data sources as follows:

```
// Read from Hive
spark.sql("select * from spark_catalog.default.t").show

// Join Hive tables and TiDB tables
spark.sql("select t1.id,t2.id from spark_catalog.default.t t1 left join
   ↪ tidb_catalog.test.t t2").show
```

#### 13.12.1.7 TiSpark configurations

The configurations in the following table can be put together with `spark-defaults.conf` or passed in the same way as other Spark configuration properties.

| Key | Default value | Description |
|---|---|---|
| `spark.tispark.pd.addresses` | `127.0.0.1:2379` | The addresses of PD clusters, which are split by commas. |
| `spark.tispark.grpc.framesize` | `2147483647` | Maximum frame size of gRPC response in bytes (default to 2G). |
| `spark.tispark.grpc.timeout_in_sec` | `10` | The gRPC timeout time in seconds. |
| `spark.tispark.plan.allow_agg_pushdown` | `true` | Whether aggregations are allowed to push down to TiKV (in case of busy TiKV nodes). |

| Key | Default value | Description |
|---|---|---|
| spark.tispark.index.enable | true | Whether index is enabled in planning (which might cause heavy pressure on TiKV). |
| spark.tispark.index.scan_batch_size | 20000 | The number of row keys in a batch for the concurrent index scan. |
| spark.tispark.index.scan_concurrency | 5 | The maximum number of threads for index scan that retrieves row keys (shared among tasks inside each JVM). |
| spark.tispark.table.scan_concurrency | 512 | The maximum number of threads for table scan (shared among tasks inside each JVM). |
| spark.tispark.request.command.priority | Low | The value options are `Low`, `Normal`, `High`. This setting impacts the resources allocated in TiKV. `Low` is recommended because the OLTP workload is not disturbed. |

| Key | Default value | Description |
|---|---|---|
| spark.tispark.coprocessor.codec_format | chblock | Obtain the default codec format for coprocessor. Available options are `default`, `chblock` and `chunk`. |
| spark.tispark.coprocessor.streaming | false | Whether to use streaming for response fetching (experimental). |
| spark.tispark.plan.unsupported_pushdown_exprs | | A comma-separated list of expressions. In case you have a very old version of TiKV, you might disable the push down of some expressions if they are not supported. |
| spark.tispark.plan.downgrade.index_threshold | 10000000 | If the range of index scan on one Region exceeds this limit in the original request, downgrade this Region's request to table scan rather than the planned index scan. By default, the downgrade is disabled. |
| spark.tispark.show_rowid | false | Whether to show row ID if the ID exists. |
| spark.tispark.db_prefix | | The string that indicates the extra prefix for all databases in TiDB. This string distinguishes the databases in TiDB from the Hive databases with the same name. |

| Key | Default value | Description |
|---|---|---|
| spark.tispark.request.isolation.level | SI | Whether to resolve locks for the underlying TiDB clusters. When you use the "RC", you get the latest version of the record smaller than your tso and ignore the locks. When you use "SI", you resolve the locks and get the records depending on whether the resolved lock is committed or aborted. |
| spark.tispark.coprocessor.chunk_batch_size | 1024 | Rows fetched from coprocessor. |
| spark.tispark.isolation_read_engines | tikv,tiflash | List of readable engines of TiSpark, comma separated. Storage engines not listed will not be read. |
| spark.tispark.stale_read | optional | The stale read timestamp(ms). See here for more details. |
| spark.tispark.tikv.tls_enable | false | Whether to enable TiSpark TLS. |
| spark.tispark.tikv.trust_cert_collection | | The trusted certificate for TiKV Client, used for verifying the remote PD's certificate, for example, `/home/tispark/config/root.pem` The file should contain an X.509 certificate collection. |

| Key | Default value | Description |
|---|---|---|
| spark.tispark.tikv.key_cert_chain | | An X.509 certificate chain file for TiKV Client, for example, /home/tispark/config/client.pem. |
| spark.tispark.tikv.key_file | | A PKCS#8 private key file for TiKV Client, for example, /home/tispark/client_pkcs8.key. |
| spark.tispark.tikv.jks_enable | false | Whether to use the JAVA key store instead of the X.509 certificate. |
| spark.tispark.tikv.jks_trust_path | | A JKS format certificate for TiKV Client, generated by keytool, for example, /home/tispark/config/tikv-truststore. |
| spark.tispark.tikv.jks_trust_password | | The password of spark.tispark.tikv.jks_trust_path. |
| spark.tispark.tikv.jks_key_path | | A JKS format key for TiKV Client, generated by keytool, for example, /home/tispark/config/tikv-clientstore. |

| Key | Default value | Description |
|---|---|---|
| spark.tispark.tikv.jks_key_password | | The password of spark.tispark.tikv.jks_key_path. |
| spark.tispark.jdbc.tls_enable | false | Whether to enable TLS when using the JDBC connector. |
| spark.tispark.jdbc.server_cert_store | | The trusted certificate for JDBC. It is a Java keystore (JKS) format certificate generated by keytool, for example, /home/tispark/config/jdbc-truststore. The default value is "", which means TiSpark does not verify the TiDB server. |
| spark.tispark.jdbc.server_cert_password | | The password of spark.tispark.jdbc.server_cert_store. |
| spark.tispark.jdbc.client_cert_store | | A PKCS#12 certificate for JDBC. It is a JKS format certificate generated by keytool, for example, /home/tispark/config/jdbc-clientstore. Default is "", which means TiDB server doesn't verify TiSpark. |
| spark.tispark.jdbc.client_cert_password | | The password of spark.tispark.jdbc.client_cert_store. |

| Key | Default value | Description |
|---|---|---|
| spark.tispark.tikv.tls_reload_interval | 10s | The interval for checking if there is any reloading certificates. The default value is 10s (10 seconds). |
| spark.tispark.tikv.conn_recycle_time | 60s | The interval for cleaning expired connections with TiKV. It takes effect only when certificate reloading is enabled. The default value is 60s (60 seconds). |
| spark.tispark.host_mapping | | The route map used to configure the mapping between public IP addresses and intranet IP addresses. When the TiDB cluster is running on the intranet, you can map a set of intranet IP addresses to public IP addresses for an outside Spark cluster to access. The format is {Intranet IP1}:{Public IP1};{Intranet IP2}:{Public IP2}, for example, 192.168.0.2:8.8.8.8;192.168.0.3:9.9.9.9. |
| spark.tispark.new_collation_enabled | | When new collation is enabled on TiDB, this configuration can be set to true. If new collation is not enabled on TiDB, this configuration can be set to false. If this item is not configured, TiSpark configures new_collation_enabled automatically based on the TiDB version. The configuration rule is as follows: If the TiDB version is greater than or equal to v6.0.0, it is true; otherwise, it is false. |

#### 13.12.1.7.1 TLS configurations

TiSpark TLS has two parts: TiKV Client TLS and JDBC connector TLS. To enable TLS in TiSpark, you need to configure both. `spark.tispark.tikv.xxx` is used for TiKV Client to create a TLS connection with PD and TiKV server. `spark.tispark.jdbc.xxx` is used for JDBC to connect with TiDB server in TLS connection.

When TiSpark TLS is enabled, you must configure either the X.509 certificate with `tikv.trust_cert_collection`, `tikv.key_cert_chain` and `tikv.key_file` configurations, or the JKS certificate with `tikv.jks_enable`, `tikv.jks_trust_path` and `tikv.jks_key_path`. `jdbc.server_cert_store` and `jdbc.client_cert_store` are optional.

TiSpark only supports TLSv1.2 and TLSv1.3.

- The following is an example of opening TLS configuration with the X.509 certificate in TiKV Client.

```
spark.tispark.tikv.tls_enable                                    true
spark.tispark.tikv.trust_cert_collection                         /home/tispark/root.
   ↪ pem
spark.tispark.tikv.key_cert_chain                                /home/tispark/client
   ↪ .pem
spark.tispark.tikv.key_file                                      /home/tispark/client
   ↪ .key
```

- The following is an example of enabling TLS with JKS configurations in TiKV Client.

```
spark.tispark.tikv.tls_enable                                    true
spark.tispark.tikv.jks_enable                                    true
spark.tispark.tikv.jks_key_path                                  /home/tispark/config
   ↪ /tikv-truststore
spark.tispark.tikv.jks_key_password
   ↪ tikv_trustore_password
spark.tispark.tikv.jks_trust_path                                /home/tispark/config
   ↪ /tikv-clientstore
spark.tispark.tikv.jks_trust_password
   ↪ tikv_clientstore_password
```

When both JKS and X.509 certificates are configured, JKS would have a higher priority. That means TLS builder will use JKS certificate first. Therefore, do not set `spark.tispark ↪ .tikv.jks_enable=true` when you just want to use a common PEM certificate.

- The following is an example of enabling TLS in JDBC connector.

```
spark.tispark.jdbc.tls_enable                                    true
spark.tispark.jdbc.server_cert_store                             /home/tispark/jdbc-
   ↪ truststore
spark.tispark.jdbc.server_cert_password
   ↪ jdbc_truststore_password
spark.tispark.jdbc.client_cert_store                             /home/tispark/jdbc-
   ↪ clientstore
spark.tispark.jdbc.client_cert_password
   ↪ jdbc_clientstore_password
```

- For details about how to open TiDB TLS, see Enable TLS between TiDB Clients and Servers.
- For details about how to generate a JAVA key store, see Connecting Securely Using SSL.

#### 13.12.1.7.2 Log4j configuration

When you start `spark-shell` or `spark-sql` and run query, you might see the following warnings:

```
Failed to get database ****, returning NoSuchObjectException
Failed to get database ****, returning NoSuchObjectException
```

where `****` is the database name.

The warnings are benign and occurs because Spark cannot find `****` in its own catalog. You can just ignore these warnings.

To mute them, append the following text to `${SPARK_HOME}/conf/log4j.properties`.

```
### tispark disable "WARN ObjectStore:568 - Failed to get database"
log4j.logger.org.apache.hadoop.hive.metastore.ObjectStore=ERROR
```

#### 13.12.1.7.3 Time zone configuration

Set time zone by using the `-Duser.timezone` system property (for example, `-Duser.timezone=GMT-7`), which affects the `Timestamp` type.

Do not use `spark.sql.session.timeZone`.

### 13.12.1.8 Features

The major features of TiSpark are as follows:

| Feature support | TiSpark 2.4.x | TiSpark 2.5.x | TiSpark 3.0.x | TiSpark 3.1.x |
|---|---|---|---|---|
| SQL select without tidb_catalog | | | | |
| SQL select with tidb_catalog | | | | |
| DataFrame append | | | | |
| DataFrame reads | | | | |
| SQL show databases | | | | |
| SQL show tables | | | | |
| SQL auth | | | | |
| SQL delete | | | | |
| SQL insert | | | | |
| TLS | | | | |
| DataFrame auth | | | | |

#### 13.12.1.8.1 Support for expression index

TiDB v5.0 supports expression index.

TiSpark currently supports retrieving data from tables with `expression index`, but the `expression index` will not be used by the planner of TiSpark.

#### 13.12.1.8.2 Work with TiFlash

TiSpark can read data from TiFlash via the configuration `spark.tispark.isolation_read_engines` ↪ .

#### 13.12.1.8.3 Support for partitioned tables

**Read partitioned tables from TiDB**

TiSpark can read the range and hash partitioned tables from TiDB.

Currently, TiSpark does not support a MySQL/TiDB partition table syntax `select col_name from table_name partition(partition_name)` ↪ . However, you can still use the `where` condition to filter the partitions.

TiSpark decides whether to apply partition pruning according to the partition type and the partition expression associated with the table.

TiSpark applies partition pruning on range partitioning only when the partition expression is one of the following:

- column expression
- `YEAR($argument)` where the argument is a column and its type is datetime or string literal that can be parsed as datetime.

If partition pruning is not applicable, TiSpark's reading is equivalent to doing a table scan over all partitions.

**Write into partitioned tables**

Currently, TiSpark only supports writing data into the range and hash partitioned tables under the following conditions:

- The partition expression is a column expression.
- The partition expression is `YEAR($argument)` where the argument is a column and its type is datetime or string literal that can be parsed as datetime.

There are two ways to write into partitioned tables:

- Use datasource API to write into partition table which supports replace and append semantics.
- Use delete statement with Spark SQL.

> **Note:**
>
> Currently, TiSpark only supports writing into partitioned tables with utf8mb4_bin collation enabled.

#### 13.12.1.8.4 Security

If you are using TiSpark v2.5.0 or a later version, you can authenticate and authorize TiSpark users by using TiDB.

The authentication and authorization feature is disabled by default. To enable it, add the following configurations to the Spark configuration file `spark-defaults.conf`.

```
// Enable authentication and authorization
spark.sql.auth.enable true

// Configure TiDB information
spark.sql.tidb.addr $your_tidb_server_address
spark.sql.tidb.port $your_tidb_server_port
spark.sql.tidb.user $your_tidb_server_user
spark.sql.tidb.password $your_tidb_server_password
```

For more information, see Authorization and authentication through TiDB server.

#### 13.12.1.8.5 Other features

- Push down
- Delete with TiSpark
- Stale read
- TiSpark with multiple catalogs
- TiSpark TLS
- TiSpark plan

### 13.12.1.9 Statistics information

TiSpark uses the statistic information for:

- Determining which index to use in your query plan with the minimum estimated cost.
- Small table broadcasting, which enables efficient broadcast join.

To allow TiSpark to access statistic information, make sure that relevant tables have been analyzed.

See Introduction to Statistics for more details about how to analyze tables.

Since TiSpark 2.0, statistics information is automatically loaded by default.

### 13.12.1.10 FAQ

See TiSpark FAQ.

## 13.13 sync-diff-inspector

### 13.13.1 sync-diff-inspector User Guide

sync-diff-inspector is a tool used to compare data stored in the databases with the MySQL protocol. For example, it can compare the data in MySQL with that in TiDB, the data in MySQL with that in MySQL, or the data in TiDB with that in TiDB. In addition, you can also use this tool to repair data in the scenario where a small amount of data is inconsistent.

This guide introduces the key features of sync-diff-inspector and describes how to configure and use this tool. To download sync-diff-inspector, use one of the following methods:

- Binary package. The sync-diff-inspector binary package is included in the TiDB Toolkit. To download the TiDB Toolkit, see Download TiDB Tools.
- Docker image. Execute the following command to download:

```
docker pull pingcap/tidb-enterprise-tools:nightly
```

#### 13.13.1.1 Key features

- Compare the table schema and data
- Generate the SQL statements used to repair data if the data inconsistency exists
- Support data check for tables with different schema or table names
- Support data check in the sharding scenario
- Support data check for TiDB upstream-downstream clusters
- Support data check in the DM replication scenario

#### 13.13.1.2 Restrictions of sync-diff-inspector

- Online check is not supported for data migration between MySQL and TiDB. Ensure that no data is written into the upstream-downstream checklist, and that data in a certain range is not changed. You can check data in this range by setting `range`.
- In TiDB and MySQL, `FLOAT`, `DOUBLE` and other floating-point types are implemented differently. `FLOAT` and `DOUBLE` respectively take 6 and 15 significant digits for calculating checksum. If you do not want to use this feature, set `ignore-columns` to skip checking these columns.
- Support checking tables that do not contain the primary key or the unique index. However, if data is inconsistent, the generated SQL statements might not be able to repair the data correctly.

#### 13.13.1.3 Database privileges for sync-diff-inspector

To access table schemas and query data, sync-diff-inspector requires specific database privileges. Grant the following privileges on both the upstream and downstream databases:

- `SELECT`: required to compare data.
- `RELOAD`: required to view table schemas.

> **Note**:
>
> - **DO NOT** grant the `SHOW DATABASES` privilege on all databases (`*.*` ↪ ). Otherwise, sync-diff-inspector will attempt to access inaccessible databases, which causes errors.
> - For MySQL data sources, ensure that the `skip_show_database` system variable is set to `OFF`. If this variable is set to `ON`, the check might fail.

#### 13.13.1.4 Configuration file description

The configuration of sync-diff-inspector consists of the following parts:

- `Global config`: General configurations, such as number of threads to check, whether to export SQL statement to fix inconsistent tables, and whether to campare the data.
- `Databases config`: Configures the instances of the upstream and downstream databases.
- `Routes`: Rules for upstream multiple schema names to match downstream single schema names **(optional)**.
- `Task config`: Configures the tables for checking. If some tables have a certain mapping relationship between the upstream and downstream databases or have some special requirements, you must configure these tables.
- `Table config`: Special configurations for specific tables, such as specified ranges and columns to be ignored **(optional)**.

Below is the description of a complete configuration file:

- Note: configurations with `s` after their name can have multiple values, so you need to use square brackets `[]` to contain the configuration values.

```
### Diff Configuration.

########################### Global config ###########################
```

```
### The number of goroutines created to check data. The number of
    ↪ connections between sync-diff-inspector and upstream/downstream
    ↪ databases is slightly greater than this value.
check-thread-count = 4

### If enabled, SQL statements is exported to fix inconsistent tables.
export-fix-sql = true

### Only compares the table structure instead of the data.
check-struct-only = false

########################### Datasource config ###########################
[data-sources]
[data-sources.mysql1] # mysql1 is the only custom ID for the database
    ↪ instance. It is used for the following `task.source-instances/task.
    ↪ target-instance` configuration.
    host = "127.0.0.1"
    port = 3306
    user = "root"
    password = "" # The password for connecting to the upstream database. It
        ↪  can be plain text or Base64-encoded.

    # (optional) Use mapping rules to match multiple upstream sharded tables
        ↪ . Rule1 and rule2 are configured in the following Routes section.
    route-rules = ["rule1", "rule2"]

[data-sources.tidb0]
    host = "127.0.0.1"
    port = 4000
    user = "root"
    password = "" # The password for connecting to the downstream database.
        ↪ It can be plain text or Base64-encoded.

    # (optional) Use TLS to connect TiDB.
    # security.ca-path = ".../ca.crt"
    # security.cert-path = ".../cert.crt"
    # security.key-path = ".../key.crt"

    # (optional) Use the snapshot feature. If enabled, historical data is
        ↪ used for comparison.
    # snapshot = "386902609362944000"
    # When "snapshot" is set to "auto", the last syncpoints generated by
        ↪ TiCDC in the upstream and downstream are used for comparison. For
        ↪ details, see <https://github.com/pingcap/tidb-tools/issues/663>.
    # snapshot = "auto"
```

```
############################## Routes ##############################
### To compare the data of a large number of tables with different schema
    ↪ names or table names, or check the data of multiple upstream sharded
    ↪ tables and downstream table family, use the table-rule to configure
    ↪ the mapping relationship. You can configure the mapping rule only for
    ↪  the schema or table. Also, you can configure the mapping rules for
    ↪ both the schema and the table.
[routes]
[routes.rule1] # rule1 is the only custom ID for the configuration. It is
    ↪ used for the above `data-sources.route-rules` configuration.
schema-pattern = "test_*"  # Matches the schema name of the data source.
    ↪ Supports the wildcards "*" and "?"
table-pattern = "t_*"      # Matches the table name of the data source.
    ↪ Supports the wildcards "*" and "?"
target-schema = "test"     # The name of the schema in the target database
target-table = "t"         # The name of the target table
[routes.rule2]
schema-pattern = "test2_*"  # Matches the schema name of the data source.
    ↪ Supports the wildcards "*" and "?"
table-pattern = "t2_*"      # Matches the table name of the data source.
    ↪ Supports the wildcards "*" and "?"
target-schema = "test2"     # The name of the schema in the target database
target-table = "t2"         # The name of the target table

########################### task config ##########################
### Configures the tables of the target database that need to be compared.
[task]
    # output-dir saves the following information:
    # 1 sql: The SQL file to fix tables that is generated after error is
        ↪ detected. One chunk corresponds to one SQL file.
    # 2 log: sync-diff.log
    # 3 summary: summary.txt
    # 4 checkpoint: a dir
    output-dir = "./output"
    # The upstream database. The value is the unique ID declared by data-
        ↪ sources.
    source-instances = ["mysql1"]
    # The downstream database. The value is the unique ID declared by data-
        ↪ sources.
    target-instance = "tidb0"
    # The tables of downstream databases to be compared. Each table needs to
        ↪  contain the schema name and the table name, separated by '.'
    # Use "?" to match any character and "*" to match characters of any
        ↪ length.
```

```
    # For detailed match rules, refer to golang regexp pkg: https://github.
       ↪ com/google/re2/wiki/Syntax.
    target-check-tables = ["schema*.table*", "!c.*", "test2.t2"]
    # (optional) Extra configurations for some tables, Config1 is defined in
       ↪  the following table config example.
    target-configs = ["config1"]

############################ Table config ############################
### Special configurations for specific tables. The tables to be configured
    ↪ must be in `task.target-check-tables`.
[table-configs.config1] # config1 is the only custom ID for this
    ↪ configuration. It is used for the above `task.target-configs`
    ↪ configuration.
### The name of the target table, you can use regular expressions to match
    ↪ multiple tables, but one table is not allowed to be matched by
    ↪ multiple special configurations at the same time.
target-tables = ["schema*.test*", "test2.t2"]
### (optional) Specifies the range of the data to be checked
### It needs to comply with the syntax of the WHERE clause in SQL.
range = "age > 10 AND age < 20"
### (optional) Specifies the column used to divide data into chunks. If you
    ↪ do not configure it,
### sync-diff-inspector chooses an appropriate column (primary key, unique
    ↪ key, or a field with index).
index-fields = ["col1","col2"]
### (optional) Ignores checking some columns such as some types (json, bit,
    ↪ blob, etc.)
### that sync-diff-inspector does not currently support.
### The floating-point data type behaves differently in TiDB and MySQL. You
    ↪ can use
### `ignore-columns` to skip checking these columns.
ignore-columns = ["",""]
### (optional) Specifies the size of the chunk for dividing the table. If
    ↪ not specified, this configuration can be deleted or be set as 0.
chunk-size = 0
### (optional) Specifies the "collation" for the table. If not specified,
    ↪ this configuration can be deleted or be set as an empty string.
collation = ""
```

#### 13.13.1.5 Run sync-diff-inspector

Run the following command:

```
./sync_diff_inspector --config=./config.toml
```

This command outputs a check report `summary.txt` in the `output-dir` of `config.toml` and the log `sync_diff.log`. In the `output-dir`, a folder named by the hash value of the `config. toml` file is also generated. This folder includes the checkpoint node information of breakpoints and the SQL file generated when the data is inconsistent.

#### 13.13.1.5.1 Progress information

sync-diff-inspector sends progress information to `stdout` when running. Progress information includes the comparison results of table structures, comparison results of table data and the progress bar.

> **Note:**
>
> To ensure the display effect, keep the display window width above 80 characters.

```
A total of 2 tables need to be compared

Comparing the table structure of ``sbtest`.`sbtest96`` ... equivalent
Comparing the table structure of ``sbtest`.`sbtest99`` ... equivalent
Comparing the table data of ``sbtest`.`sbtest96`` ... failure
Comparing the table data of ``sbtest`.`sbtest99`` ...
--------------------------------------------------------------------------------
   ↪
Progress [============================================================>--] 98%
   ↪  193/200
```

```
A total of 2 tables need to be compared

Comparing the table structure of ``sbtest`.`sbtest96`` ... equivalent
Comparing the table structure of ``sbtest`.`sbtest99`` ... equivalent
Comparing the table data of ``sbtest`.`sbtest96`` ... failure
Comparing the table data of ``sbtest`.`sbtest99`` ... failure
--------------------------------------------------------------------------------
   ↪
Progress [============================================================>]
   ↪ 100% 0/0
The data of `sbtest`.`sbtest99` is not equal
The data of `sbtest`.`sbtest96` is not equal

The rest of tables are all equal.
The patch file has been generated in
```

```
       'output/fix-on-tidb2/'
You can view the comparision details through 'output/sync_diff.log'
```

#### 13.13.1.5.2 Output file

The directory structure of the output file is as follows:

```
output/
|-- checkpoint # Saves the breakpoint information
| |-- bbfec8cc8d1f58a5800e63aa73e5 # Config hash. The placeholder file which
   ↪  identifies the configuration file corresponding to the output
   ↪ directory (output/)
  |-- DO_NOT_EDIT_THIS_DIR
   -- sync_diff_checkpoints.pb # The breakpoint information
|
|-- fix-on-target # Saves SQL files to fix data inconsistency
| |-- xxx.sql
| |-- xxx.sql
|  -- xxx.sql
|
|-- summary.txt # Saves the summary of the check results
 -- sync_diff.log # Saves the output log informatiion when sync-diff-
   ↪ inspector is running
```

#### 13.13.1.5.3 Log

The log of sync-diff-inspector is saved in `${output}/sync_diff.log`, among which `${output}` is the value of `output-dir` in the `config.toml` file.

#### 13.13.1.5.4 Progress

The running sync-diff-inspector periodically (every 10 seconds) prints the progress in checkpoint, which is located at `${output}/checkpoint/sync_diff_checkpoints.pb`, among which `${output}` is the value of `output-dir` in the `config.toml` file.

#### 13.13.1.5.5 Result

After the check is finished, sync-diff-inspector outputs a report. It is located at `${output}/summary.txt`, and `${output}` is the value of `output-dir` in the `config.toml` file.

```
+--------------------+--------------------+---------------+---------+-----------+
   ↪
|       TABLE        | STRUCTURE EQUALITY | DATA DIFF ROWS | UPCOUNT |
   ↪ DOWNCOUNT |
```

```
+--------------------+------------------+---------------+---------+-----------+
    ↪
| `sbtest`.`sbtest99` | true           | +97/-97       |  999999 |   999999 |
| `sbtest`.`sbtest96` | true           | +0/-101       |  999999 |  1000100 |
+--------------------+------------------+---------------+---------+-----------+
    ↪
Time Cost: 16.75370462s
Average Speed: 113.277149MB/s
```

- TABLE: The corresponding database and table names
- STRUCTURE EQUALITY: Checks whether the table structure is the same
- DATA DIFF ROWS: `rowAdd` / `rowDelete`. Indicates the number of rows that need to be added/deleted to fix the table
- `UPCOUNT`: The number of rows in this table in the upstream data source
- `DOWNCOUNT`: The number of rows in this table in the downstream data source

#### 13.13.1.5.6 SQL statements to fix inconsistent data

If different rows exist during the data checking process, the SQL statements will be generated to fix them. If the data inconsistency exists in a chunk, a SQL file named by `chunk.Index` will be generated. The SQL file is located at `${output}/fix-on-${instance` ↪ `}`, and `${instance}` is the value of `task.target-instance` in the `config.toml` file.

A SQL file contains the tale to which the chunk belong and the range information. For the SQL files, you should consider the following three situations:

- If the rows in the downstream database are missing, REPLACE statements will be applied
- If the rows in the downstream database are redundant, DELETE statements will be applied
- If some data of the rows in the downstream database is inconsistent, REPLACE statements will be applied and inconsistent columns will be marked with annotation in the SQL file

```
-- table: sbtest.sbtest99
-- range in sequence: (3690708) < (id) <= (3720581)
/*
  DIFF COLUMNS   `K`                  `C`                                  `PAD`

    ↪
  source data   2501808   'hello'                          'world'
```

```
    ↪
  target data   5003616   '0709824117-9809973320-4456050422'
     ↪ '1714066100-7057807621-1425865505'

    ↪
*/
REPLACE INTO `sbtest`.`sbtest99`(`id`,`k`,`c`,`pad`) VALUES
    ↪ (3700000,2501808,'hello','world');
```

#### 13.13.1.6 Note

- sync-diff-inspector consumes a certain amount of server resources when checking data. Avoid using sync-diff-inspector to check data during peak business hours.
- Before comparing the data in MySQL with that in TiDB, check the character set and `collation` configuration of the tables. This is especially important when the primary key or unique key of a table is the `varchar` type. If collation rules differ between upstream and downstream databases, sorting issues might occur, leading to inaccurate verification results. For example, MySQL's default collation is case-insensitive, while TiDB's default collation is case-sensitive. This inconsistency might cause identical delete and insert records in the repair SQL. To avoid this issue, use the `index-fields` configuration to specify index columns that are not affected by case sensitivity. If you configure `collation` in the sync-diff-inspector configuration file and explicitly use the same collation for both upstream and downstream during chunk-based comparison, note that the order of index fields depends on the table's collation configuration. If the collations differ, one side might be unable to use the index. Additionally, if the character sets differ between upstream and downstream (for example, MySQL uses UTF-8 while TiDB uses UTF-8MB4), it is not possible to unify the collation configuration.
- If the primary key differs between upstream and downstream tables, sync-diff-inspector does not use the original primary key column to divide chunks. For example, when sharded tables in MySQL are merged into TiDB using a composite primary key that includes the original primary key and a shard key. In this case, configure the original primary key column using `index-fields` and set `check-data-only` to `true`.
- sync-diff-inspector divides data into chunks first according to TiDB statistics and you need to guarantee the accuracy of the statistics. You can manually run the `analyze table {table_name}` command when the TiDB server's *workload is light*.
- Pay special attention to `table-rules`. If you configure `schema-pattern="test1"`, `table-pattern = "t_1"`, `target-schema="test2"` and `target-table = "t_2"`, the `test1.t_1` schema in the source database and the `test2.t_2` schema in the target database are compared. Sharding is enabled by default in sync-diff-inspector, so if the source database has a `test2.t_2` table, the `test1.t_1` table and `test2.t_2` table in the source database serving as sharding are compared with the `test2.t_2` table in the target database.

- The generated SQL file is only used as a reference for repairing data, and you need to confirm it before executing these SQL statements to repair data.

### 13.13.2 Data Check for Tables with Different Schema or Table Names

When using replication tools such as TiDB Data Migration, you can set `route-rules` to replicate data to a specified table in the downstream. sync-diff-inspector enables you to verify tables with different schema names or table names by setting `rules`.

The following is a simple configuration example. To learn the complete configuration, refer to Sync-diff-inspector User Guide.

```
########################### Datasource config ###########################
[data-sources.mysql1]
    host = "127.0.0.1"
    port = 3306
    user = "root"
    password = ""
    route-rules = ["rule1"]

[data-sources.tidb0]
    host = "127.0.0.1"
    port = 4000
    user = "root"
    password = ""
############################## Routes ###############################
[routes.rule1]
schema-pattern = "test_1"  # Matches the schema name of the data source.
    ↪ Supports the wildcards "*" and "?"
table-pattern = "t_1"      # Matches the table name of the data source.
    ↪ Supports the wildcards "*" and "?"
target-schema = "test_2"   # The name of the schema in the target database
target-table = "t_2"       # The name of the target table
```

This configuration can be used to check `test_2.t_2` in the downstream and `test_1.t_1` in the `mysql1` instance.

To check a large number of tables with different schema names or table names, you can simplify the configuration by setting the mapping relationship by using `rules`. You can configure the mapping relationship of either schema or table, or of both. For example, all the tables in the upstream `test_1` database are replicated to the downstream `test_2` database, which can be checked through the following configuration:

```
########################### Datasource config ###########################
[data-sources.mysql1]
    host = "127.0.0.1"
    port = 3306
```

```
    user = "root"
    password = ""
    route-rules = ["rule1"]

[data-sources.tidb0]
    host = "127.0.0.1"
    port = 4000
    user = "root"
    password = ""
############################## Routes ############################
[routes.rule1]
schema-pattern = "test_1"  # Matches the schema name of the data source.
    ↪ Supports the wildcards "*" and "?"
table-pattern = "*"        # Matches the table name of the data source.
    ↪ Supports the wildcards "*" and "?"
target-schema = "test_2"   # The name of the schema in the target database
target-table = "t_2"       # The name of the target table
```

#### 13.13.2.1 Note

If `test_2.t_2` exists in the upstream database, the downstream database also compares this table.

### 13.13.3 Data Check in the Sharding Scenario

sync-diff-inspector supports data check in the sharding scenario. Assume that you use the TiDB Data Migration tool to replicate data from multiple MySQL instances into TiDB, you can use sync-diff-inspector to check upstream and downstream data.

For scenarios where the number of upstream sharded tables is small and the naming rules of sharded tables do not have a pattern as shown below, you can use `Datasource config` to configure `table-0`, set corresponding `rules` and configure the tables that have the mapping relationship between the upstream and downstream databases. This configuration method requires setting all sharded tables.

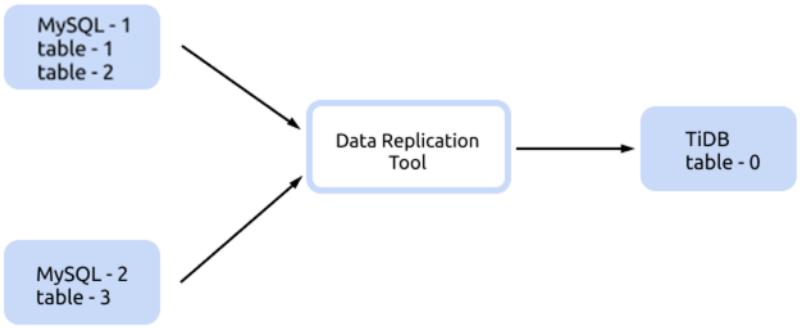

Figure 353: shard-table-replica-1

Below is a complete example of the sync-diff-inspector configuration.

```
### Diff Configuration.

############################# Global config #############################

### The number of goroutines created to check data. The number of
    ↪ connections between upstream and downstream databases are slightly
    ↪ greater than this value
check-thread-count = 4

### If enabled, SQL statements is exported to fix inconsistent tables
export-fix-sql = true

### Only compares the table structure instead of the data
check-struct-only = false

############################# Datasource config #############################
[data-sources.mysql1]
    host = "127.0.0.1"
    port = 3306
    user = "root"
    password = ""

    route-rules = ["rule1"]

[data-sources.mysql2]
    host = "127.0.0.1"
    port = 3306
    user = "root"
    password = ""
```

```
    route-rules = ["rule2"]

[data-sources.tidb0]
    host = "127.0.0.1"
    port = 4000
    user = "root"
    password = ""

############################## Routes ##############################
[routes.rule1]
schema-pattern = "test"    # Matches the schema name of the data source.
    ↪ Supports the wildcards "*" and "?"
table-pattern = "table-[1-2]" # Matches the table name of the data source.
    ↪ Supports the wildcards "*" and "?"
target-schema = "test"     # The name of the schema in the target database
target-table = "table-0"   # The name of the target table

[routes.rule2]
schema-pattern = "test"  # Matches the schema name of the data source.
    ↪ Supports the wildcards "*" and "?"
table-pattern = "table-3" # Matches the table name of the data source.
    ↪ Supports the wildcards "*" and "?"
target-schema = "test"   # The name of the schema in the target database
target-table = "table-0" # The name of the target table

########################### Task config ###########################
[task]
    output-dir = "./output"

    source-instances = ["mysql1", "mysql2"]

    target-instance = "tidb0"

    # The tables of downstream databases to be compared. Each table needs to
        ↪  contain the schema name and the table name, separated by '.'
    target-check-tables = ["test.table-0"]
```

You can use `table-rules` for configuration when there are a large number of upstream sharded tables and the naming rules of all sharded tables have a pattern, as shown below:

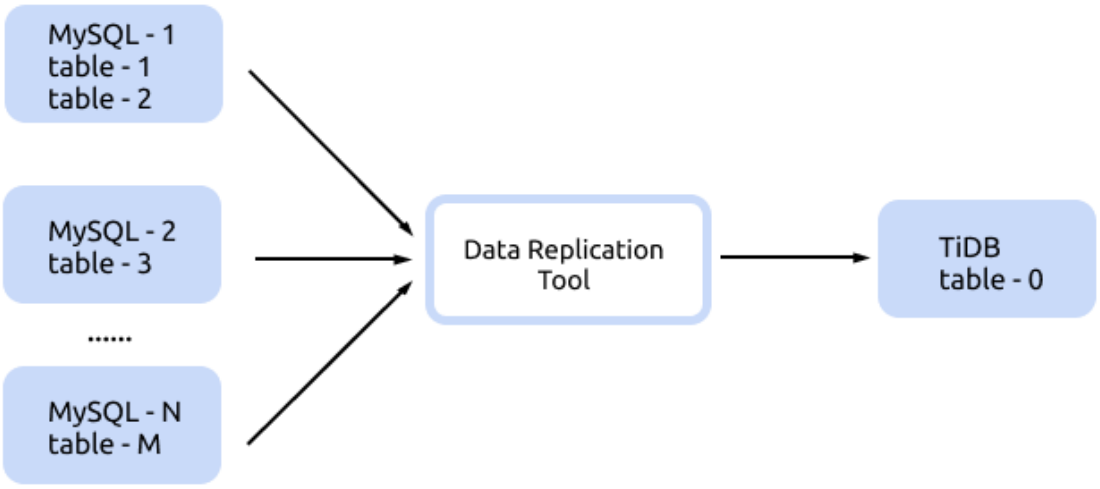

Figure 354: shard-table-replica-2

Below is a complete example of the sync-diff-inspector configuration.

```
### Diff Configuration.
############################ Global config ############################

### The number of goroutines created to check data. The number of
    ↪ connections between upstream and downstream databases are slightly
    ↪ greater than this value.
check-thread-count = 4

### If enabled, SQL statements is exported to fix inconsistent tables.
export-fix-sql = true

### Only compares the table structure instead of the data.
check-struct-only = false

############################ Datasource config ############################
[data-sources.mysql1]
    host = "127.0.0.1"
    port = 3306
    user = "root"
    password = ""

[data-sources.mysql2]
    host = "127.0.0.1"
    port = 3306
    user = "root"
```

```
    password = ""

[data-sources.tidb0]
    host = "127.0.0.1"
    port = 4000
    user = "root"
    password = ""

############################## Routes ############################
[routes.rule1]
schema-pattern = "test"   # Matches the schema name of the data source.
    ↪ Supports the wildcards "*" and "?"
table-pattern = "table-*" # Matches the table name of the data source.
    ↪ Supports the wildcards "*" and "?"
target-schema = "test"    # The name of the schema in the target database
target-table = "table-0"  # The name of the target table

########################### Task config ##########################
[task]
    output-dir = "./output"
    source-instances = ["mysql1", "mysql2"]

    target-instance = "tidb0"

    # The tables of downstream databases to be compared. Each table needs to
       ↪  contain the schema name and the table name, separated by '.'
    target-check-tables = ["test.table-0"]
```

#### 13.13.3.1 Note

If `test.table-0` exists in the upstream database, the downstream database also compares this table.

### 13.13.4 Data Check in the DM Replication Scenario

When using replication tools such as TiDB Data Migration, you need to check the data consistency before and after the replication process. You can set a specific `task-name` configuration from `DM-master` to perform a data check.

The following is a simple configuration example. To learn the complete configuration, refer to Sync-diff-inspector User Guide.

```
### Diff Configuration.

########################### Global config ##########################
```

```
### The number of goroutines created to check data. The number of
    ↪ connections between upstream and downstream databases are slightly
    ↪ greater than this value.
check-thread-count = 4

### If enabled, SQL statements is exported to fix inconsistent tables.
export-fix-sql = true

### Only compares the table structure instead of the data.
check-struct-only = false

### The IP address of dm-master and the format is "http://127.0.0.1:8261".
dm-addr = "http://127.0.0.1:8261"

### Specifies the `task-name` of DM.
dm-task = "test"

########################### Task config ###########################
[task]
    output-dir = "./output"

    # The tables of downstream databases to be compared. Each table needs to
        ↪  contain the schema name and the table name, separated by '.'
    target-check-tables = ["hb_test.*"]
```

This example is configured in dm-task = “test”, which checks all the tables of hb_test schema under the “test” task. It automatically gets the regular matching of the schemas between upstream and downstream databases to verify the data consistency after DM replication.

# 14 Reference

## 14.1 Cluster Architecture

### 14.1.1 TiDB Architecture

Compared with the traditional standalone databases, TiDB has the following advantages:

- Has a distributed architecture with flexible and elastic scalability.
- Fully compatible with the MySQL 5.7 protocol, common features and syntax of MySQL. To migrate your applications to TiDB, you do not need to change a single line of code in many cases.

- Supports high availability with automatic failover when a minority of replicas fail; transparent to applications.
- Supports ACID transactions, suitable for scenarios requiring strong consistency such as bank transfer.

- Provides a rich series of data migration tools for migrating, replicating, or backing up data.

As a distributed database, TiDB is designed to consist of multiple components. These components communicate with each other and form a complete TiDB system. The architecture is as follows:

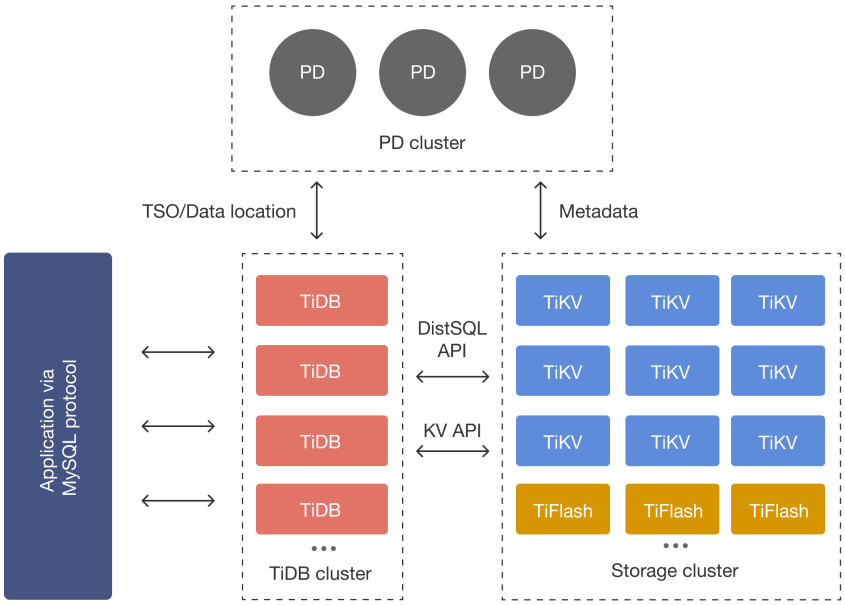

Figure 355: TiDB Architecture

#### 14.1.1.1 TiDB server

The TiDB server is a stateless SQL layer that exposes the connection endpoint of the MySQL protocol to the outside. The TiDB server receives SQL requests, performs SQL parsing and optimization, and ultimately generates a distributed execution plan. It is horizontally scalable and provides the unified interface to the outside through the load balancing components such as Linux Virtual Server (LVS), HAProxy, or F5. It does not store data and is only for computing and SQL analyzing, transmitting actual data read request to TiKV nodes (or TiFlash nodes).

#### 14.1.1.2 Placement Driver (PD) server

The PD server is the metadata managing component of the entire cluster. It stores metadata of real-time data distribution of every single TiKV node and the topology structure of the entire TiDB cluster, provides the TiDB Dashboard management UI, and allocates transaction IDs to distributed transactions. The PD server is "the brain" of the entire TiDB cluster because it not only stores metadata of the cluster, but also sends data scheduling command to specific TiKV nodes according to the data distribution state reported by TiKV nodes in real time. In addition, the PD server consists of three nodes at least and has high availability. It is recommended to deploy an odd number of PD nodes.

#### 14.1.1.3 Storage servers

##### 14.1.1.3.1 TiKV server

The TiKV server is responsible for storing data. TiKV is a distributed transactional key-value storage engine.

Region is the basic unit to store data. Each Region stores the data for a particular Key Range which is a left-closed and right-open interval from StartKey to EndKey.

Multiple Regions exist in each TiKV node. TiKV APIs provide native support to distributed transactions at the key-value pair level and supports the Snapshot Isolation level isolation by default. This is the core of how TiDB supports distributed transactions at the SQL level. After processing SQL statements, the TiDB server converts the SQL execution plan to an actual call to the TiKV API. Therefore, data is stored in TiKV. All the data in TiKV is automatically maintained in multiple replicas (three replicas by default), so TiKV has native high availability and supports automatic failover.

##### 14.1.1.3.2 TiFlash server

The TiFlash server is a special type of storage server. Unlike ordinary TiKV nodes, TiFlash stores data by column, mainly designed to accelerate analytical processing.

### 14.1.2 TiDB Storage

This document introduces some design ideas and key concepts of TiKV.

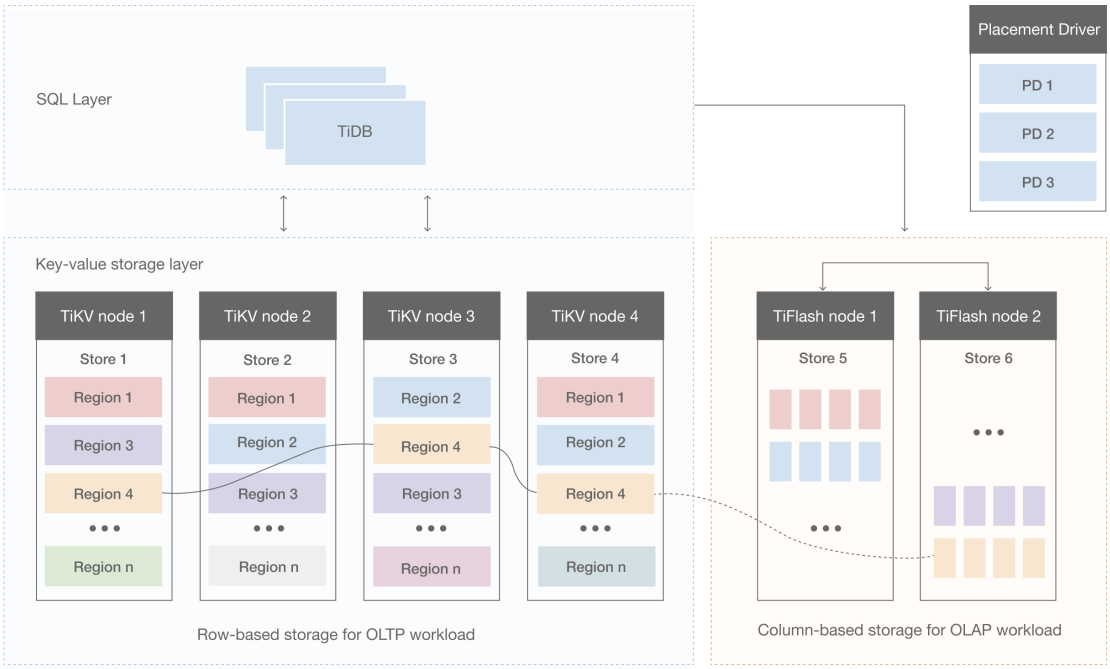

Figure 356: storage-architecture

#### 14.1.2.1 Key-Value pairs

The first thing to decide for a data storage system is the data storage model, that is, in what form the data is saved. TiKV's choice is the Key-Value model and provides an ordered traversal method. There are two key points for TiKV data storage model:

- This is a huge Map (similar to `std::Map` in C++) , which stores Key-Value pairs.
- The Key-Value pair in the Map is ordered according to Keys' binary order, which means you can Seek the position of a particular Key and then call the Next method to get the Key-Value pairs larger than this Key in incremental order.

Note that the KV storage model for TiKV described in this document has nothing to do with tables of SQL. This document does not discuss any concepts related to SQL and only focuses on how to implement a high-performance, high-reliability, distributed Key-Value storage such as TiKV.

#### 14.1.2.2 Local storage (RocksDB)

For any persistent storage engine, data is eventually saved on disk, and TiKV is no exception. TiKV does not write data directly on the disk, but stores data in RocksDB, which is responsible for the data storage. The reason is that it costs a lot to develop a

standalone storage engine, especially a high-performance standalone engine that requires careful optimization.

RocksDB is an excellent standalone storage engine open-sourced by Facebook. This engine can meet various requirements of TiKV for a single engine. Here, you can simply consider RocksDB as a single persistent Key-Value Map.

#### 14.1.2.3 Raft protocol

What's more, the implementation of TiKV faces a more difficult thing: to secure data safety in case a single machine fails.

A simple way is to replicate data to multiple machines, so that even if one machine fails, the replicas on other machines are still available. In other words, you need a data replication scheme that is reliable, efficient, and able to handle the situation of a failed replica. All of these are made possible by the Raft algorithm.

Raft is a consensus algorithm. This document only briefly introduces Raft. For more details, you can see In Search of an Understandable Consensus Algorithm. The Raft has several important features:

- Leader election
- Membership changes (such as adding replicas, deleting replicas, and transferring leaders)
- Log replication

TiKV use Raft to perform data replication. Each data change will be recorded as a Raft log. Through Raft log replication, data is safely and reliably replicated to multiple nodes of the Raft group. However, according to Raft protocol, successful writes only need that data is replicated to the majority of nodes.

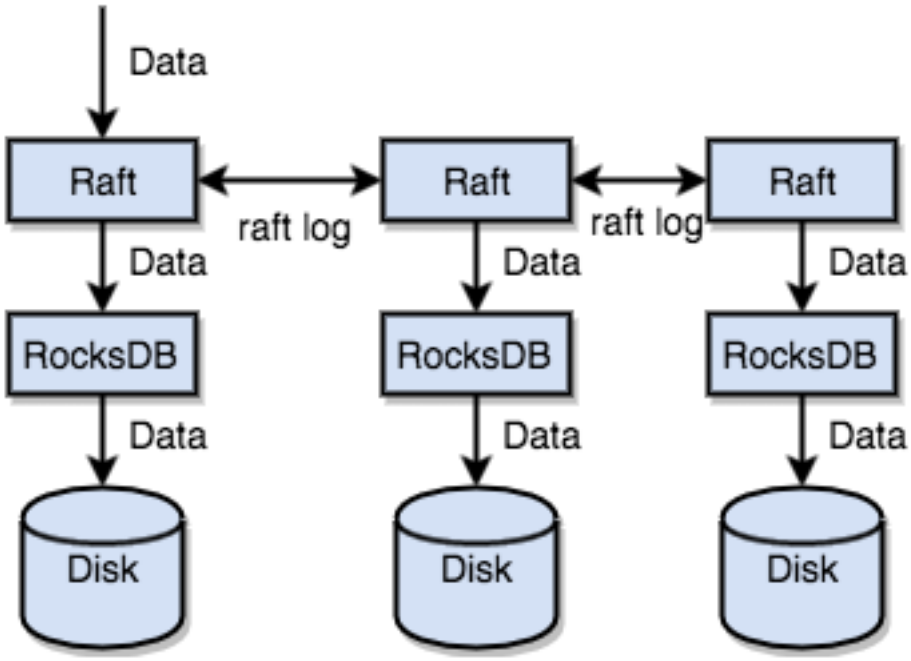

Figure 357: Raft in TiDB

In summary, TiKV can quickly store data on disk via the standalone machine RocksDB, and replicate data to multiple machines via Raft in case of machine failure. Data is written through the interface of Raft instead of to RocksDB. With the implementation of Raft, TiKV becomes a distributed Key-Value storage. Even with a few machine failures, TiKV can automatically complete replicas by virtue of the native Raft protocol, which does not impact the application.

#### 14.1.2.4 Region

To make it easy to understand, let's assume that all data only has one replica. As mentioned earlier, TiKV can be regarded as a large, orderly KV Map, so data is distributed across multiple machines in order to achieve horizontal scalability. For a KV system, there are two typical solutions to distributing data across multiple machines:

- Hash: Create Hash by Key and select the corresponding storage node according to the Hash value.
- Range: Divide ranges by Key, where a segment of serial Key is stored on a node.

TiKV chooses the second solution that divides the whole Key-Value space into a series of consecutive Key segments. Each segment is called a Region. Each Region can be described by `[StartKey, EndKey)`, a left-closed and right-open interval. The default size limit for each Region is 96 MiB and the size can be configured.

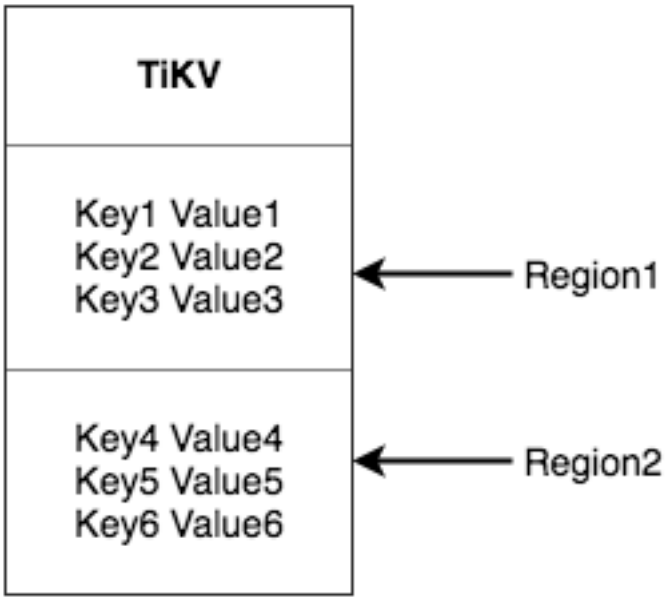

Figure 358: Region in TiDB

Note that the Region here has nothing to do with the table in SQL. In this document, forget about SQL and focus on KV for now. After dividing data into Regions, TiKV will perform two important tasks:

- Distributing data to all nodes in the cluster and use Region as the basic unit. Try its best to ensure that the number of Regions on each node is roughly similar.
- Performing Raft replication and membership management in Region.

These two tasks are very important and will be introduced one by one.

- First, data is divided into many Regions according to Key, and the data for each Region is stored on only one node (ignoring multiple replicas). The TiDB system has a PD component that is responsible for spreading Regions as evenly as possible across all nodes in the cluster. In this way, on one hand, the storage capacity is scaled horizontally (Regions on the other nodes are automatically scheduled to the newly added node); on the other hand, load balancing is achieved (the situation where one node has a lot of data while the others have little will not occur).

  At the same time, in order to ensure that the upper client can access the needed data, there is a component (PD) in the system to record the distribution of Regions on the node, that is, the exact Region of a Key and the node of that Region placed through any Key.

- For the second task, TiKV replicates data in Regions, which means that data in one Region will have multiple replicas with the name "Replica". Multiple Replicas of a

Region are stored on different nodes to form a Raft Group, which is kept consistent through the Raft algorithm.

One of the Replicas serves as the Leader of the Group and other as the Follower. By default, all reads and writes are processed through the Leader, where reads are done and write are replicated to followers. The following diagram shows the whole picture about Region and Raft group.

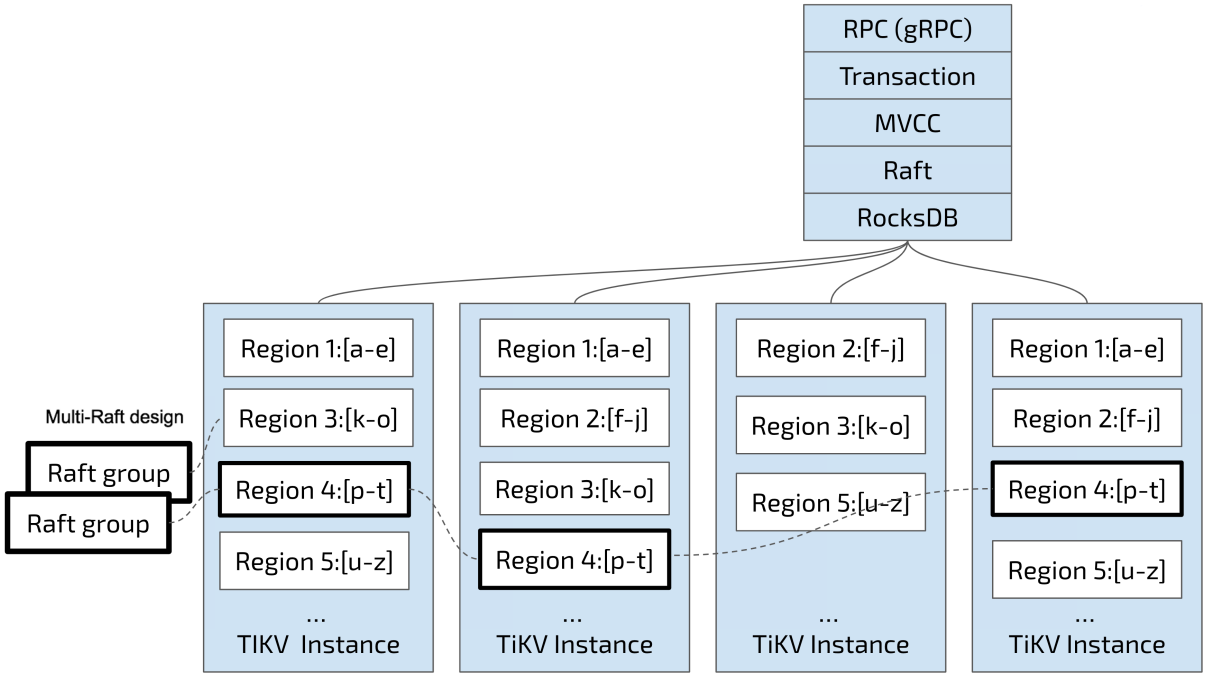

Figure 359: TiDB Storage

As we distribute and replicate data in Regions, we have a distributed Key-Value system that, to some extent, has the capability of disaster recovery. You no longer need to worry about the capacity, or disk failure and data loss.

#### 14.1.2.5 MVCC

Many databases implement multi-version concurrency control (MVCC), and TiKV is no exception. Imagine the situation where two clients modify the value of a Key at the same time. Without MVCC, the data needs to be locked. In a distributed scenario, it might cause performance and deadlock problems. TiKV's MVCC implementation is achieved by appending a version number to Key. In short, without MVCC, TiKV's data layout can be seen as:

```
Key1 -> Value
Key2 -> Value
```

```
......
KeyN -> Value
```

With MVCC, the key array of TiKV is like this:

```
Key1_Version3 -> Value
Key1_Version2 -> Value
Key1_Version1 -> Value
......
Key2_Version4 -> Value
Key2_Version3 -> Value
Key2_Version2 -> Value
Key2_Version1 -> Value
......
KeyN_Version2 -> Value
KeyN_Version1 -> Value
......
```

Note that for multiple versions of the same Key, versions with larger numbers are placed first (see the Key-Value section where Keys are arranged in order), so that when you obtain Value through Key + Version, the Key of MVCC can be constructed with Key and Version, which is `Key_Version`. Then you can directly locate the first position greater than or equal to this `Key_Version` through RocksDB's `SeekPrefix(Key_Version)` API.

#### 14.1.2.6 Distributed ACID transaction

Transaction of TiKV adopts the model used by Google in BigTable: Percolator. TiKV's implementation is inspired by this paper, with a lot of optimizations. See transaction overview for details.

### 14.1.3 TiDB Computing

Based on the distributed storage provided by TiKV, TiDB builds the computing engine that combines great capability of transactional processing with that of data analysis. This document starts by introducing a data mapping algorithm that maps data from TiDB database tables to (Key, Value) key-value pairs in TiKV, then introduces how TiDB manages metadata, and finally illustrates the architecture of the TiDB SQL layer.

For the storage solution on which the computing layer is dependent, this document only introduces the row-based storage structure of TiKV. For OLAP services, TiDB introduces a column-based storage solution TiFlash as a TiKV extension.

#### 14.1.3.1 Mapping table data to Key-Value

This section describes the scheme for mapping data to (Key, Value) key-value pairs in TiDB. Data to be mapped here includes the following two types:

- Data of each row in the table, hereinafter referred to as table data.
- Data of all indexes in the table, hereinafter referred to as index data.

#### 14.1.3.1.1 Mapping of table data to Key-Value

In a relational database, a table might have many columns. To map the data of each column in a row to a (Key, Value) key-value pair, you need to consider how to construct the Key. First of all, in OLTP scenarios, there are many operations such as adding, deleting, changing, and searching for data on a single or multiple rows, which needs the database to read a row of data quickly. Therefore, each key should have a unique ID (either explicit or implicit) to make it quick to locate. Then, many OLAP queries require a full table scan. If you can encode the keys of all rows in a table into a range, the whole table can be efficiently scanned by range queries.

Based on the considerations above, the mapping of table data to Key-Value in TiDB is designed as follows:

- To ensure that data from the same table is kept together for easy searching, TiDB assigns a table ID to each table represented by `TableID`. Table ID is an integer that is unique throughout the cluster.
- TiDB assigns a row ID, represented by `RowID`, to each row of data in the table. The row ID is also an integer, unique within the table. For row ID, TiDB has made a small optimization: if a table has an integer type primary key, TiDB uses the value of this primary key as the row ID.

Each row of data is encoded as a (Key, Value) key-value pair according to the following rule:

```
Key:   tablePrefix{TableID}_recordPrefixSep{RowID}
Value: [col1, col2, col3, col4]
```

`tablePrefix` and `recordPrefixSep` are both special string constants used to distinguish other data in Key space. The exact values of the string constants are introduced in Summary of mapping relationships.

#### 14.1.3.1.2 Mapping of indexed data to Key-Value

TiDB supports both primary keys and secondary indexes (both unique and non-unique indexes). Similar to the table data mapping scheme, TiDB assigns an index ID to each index of the table represented by `IndexID`.

For primary keys and unique indexes, it is needed to quickly locate the corresponding `RowID` based on the key-value pair, so such a key-value pair is encoded as follows.

```
Key:   tablePrefix{tableID}_indexPrefixSep{indexID}_indexedColumnsValue
Value: RowID
```

For ordinary secondary indexes that do not need to satisfy the uniqueness constraint, a single key might correspond to multiple rows. It needs to query corresponding `RowID` according to the range of keys. Therefore, the key-value pair must be encoded according to the following rule:

```
Key:  tablePrefix{TableID}_indexPrefixSep{IndexID}_indexedColumnsValue_{
    ↪ RowID}
Value: null
```

#### 14.1.3.1.3 Summary of mapping relationships

`tablePrefix`, `recordPrefixSep`, and `indexPrefixSep` in all of the above encoding rules are string constants that are used to distinguish a KV from other data in the Key space, which are defined as follows:

```
tablePrefix   = []byte{'t'}
recordPrefixSep = []byte{'r'}
indexPrefixSep = []byte{'i'}
```

Also note that in the above encoding schemes, no matter table data or index data key encoding scheme, all rows in a table have the same key prefix, and all data of an index also has the same prefix. Data with the same prefixes are thus arranged together in TiKV's key space. Therefore, by carefully designing the encoding scheme of the suffix part to ensure that the pre-encoding and post-encoding comparisons remain the same, the table data or index data can be stored in TiKV in an ordered manner. Using this encoding scheme, all row data in a table is arranged orderly by `RowID` in the TiKV's key space, and the data of a particular index is also arranged sequentially in the key space according to the specific value of the index data (`indexedColumnsValue`).

#### 14.1.3.1.4 Example of Key-Value mapping relationship

This section shows a simple example for you to understand the Key-Value mapping relationship of TiDB. Suppose the following table exists in TiDB.

```
CREATE TABLE User (
    ID int,
    Name varchar(20),
    Role varchar(20),
    Age int,
    PRIMARY KEY (ID),
    KEY idxAge (Age)
);
```

Suppose there are 3 rows of data in the table.

```
1, "TiDB", "SQL Layer", 10
2, "TiKV", "KV Engine", 20
```

```
3, "PD", "Manager", 30
```

Each row of data is mapped to a (Key, Value) key-value pair, and the table has an `int` type primary key, so the value of `RowID` is the value of this primary key. Suppose the table's `TableID` is `10`, and then its table data stored on TiKV is:

```
t10_r1 --> ["TiDB", "SQL Layer", 10]
t10_r2 --> ["TiKV", "KV Engine", 20]
t10_r3 --> ["PD", " Manager", 30]
```

In addition to the primary key, the table has a non-unique ordinary secondary index, `idxAge`. Suppose the `IndexID` is `1`, and then its index data stored on TiKV is:

```
t10_i1_10_1 --> null
t10_i1_20_2 --> null
t10_i1_30_3 --> null
```

The above example shows the mapping rule from a relational model to a Key-Value model in TiDB, and the consideration behind this mapping scheme.

#### 14.1.3.2 Metadata management

Each database and table in TiDB has metadata that indicates its definition and various attributes. This information also needs to be persisted, and TiDB stores this information in TiKV as well.

Each database or table is assigned a unique ID. As the unique identifier, when table data is encoded to Key-Value, this ID is encoded in the Key with the `m_` prefix. This constructs a key-value pair with the serialized metadata stored in it.

In addition, TiDB also uses a dedicated (Key, Value) key-value pair to store the latest version number of structure information of all tables. This key-value pair is global, and its version number is increased by `1` each time the state of the DDL operation changes. TiDB stores this key-value pair persistently in the PD server with the key of `/tidb/ddl` ↪ `/global_schema_version`, and Value is the version number value of the `int64` type. Meanwhile, because TiDB applies schema changes online, it keeps a background thread that constantly checks whether the version number of the table structure information stored in the PD server changes. This thread also ensures that the changes of version can be obtained within a certain period of time.

#### 14.1.3.3 SQL layer overview

TiDB's SQL layer, TiDB Server, translates SQL statements into Key-Value operations, forwards the operations to TiKV, the distributed Key-Value storage layer, assembles the results returned by TiKV, and finally returns the query results to the client.

The nodes at this layer are stateless. These nodes themselves do not store data and are completely equivalent.

#### 14.1.3.3.1 SQL computing

The simplest solution to SQL computing is the mapping of table data to Key-Value as described in the previous section, which maps SQL queries to KV queries, acquires the corresponding data through the KV interface, and performs various computations.

For example, to execute the `select count(*)from user where name = "TiDB"` SQL statement, TiDB needs to read all data in the table, then checks whether the `name` field is `TiDB`, and if so, returns this row. The process is as follows:

1. Construct the Key Range: all `RowID` in a table are in `[0, MaxInt64)` range. According to the row data `Key` encoding rule, using `0` and `MaxInt64` can construct a `[StartKey , EndKey)` range that is left-closed and right-open.
2. Scan Key Range: read the data in TiKV according to the key range constructed above.
3. Filter data: for each row of data read, calculate the `name = "TiDB"` expression. If the result is `true`, return to this row. If not, skip this row.
4. Calculate `Count(*)`: for each row that meets the requirements, add up to the result of `Count(*)`.

**The entire process is illustrated as follows:**

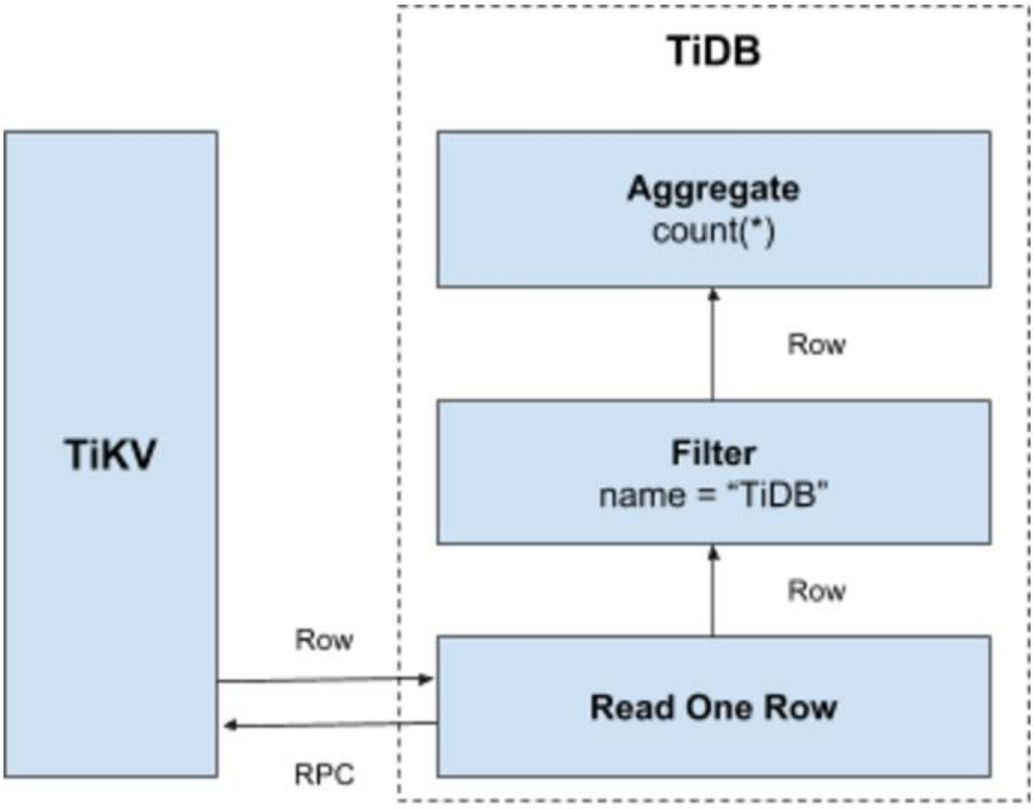

Figure 360: naive sql flow

This solution is intuitive and feasible, but has some obvious problems in a distributed database scenario:

- As the data is being scanned, each row is read from TiKV via a KV operation with at least one RPC overhead, which can be very high if there is a large amount of data to be scanned.
- It is not applicable to all rows. Data that does not meet the conditions does not need to be read.
- From the returned result of this query, only the number of rows that match the requirements is needed, not the value of those rows.

#### 14.1.3.3.2 Distributed SQL operations

To solve the problems above, the computation should be as close to the storage node as possible to avoid a large number of RPC callings. First of all, the SQL predicate condition `name = "TiDB"` should be pushed down to the storage node for computation, so that only valid rows are returned, which avoids meaningless network transfers. Then, the aggregation function `Count(*)` can also be pushed down to the storage nodes for pre-aggregation, and each node only has to return a result of `Count(*)`. The SQL layer will sum up the `Count(*)` results returned by each node.

The following image shows how data returns layer by layer:

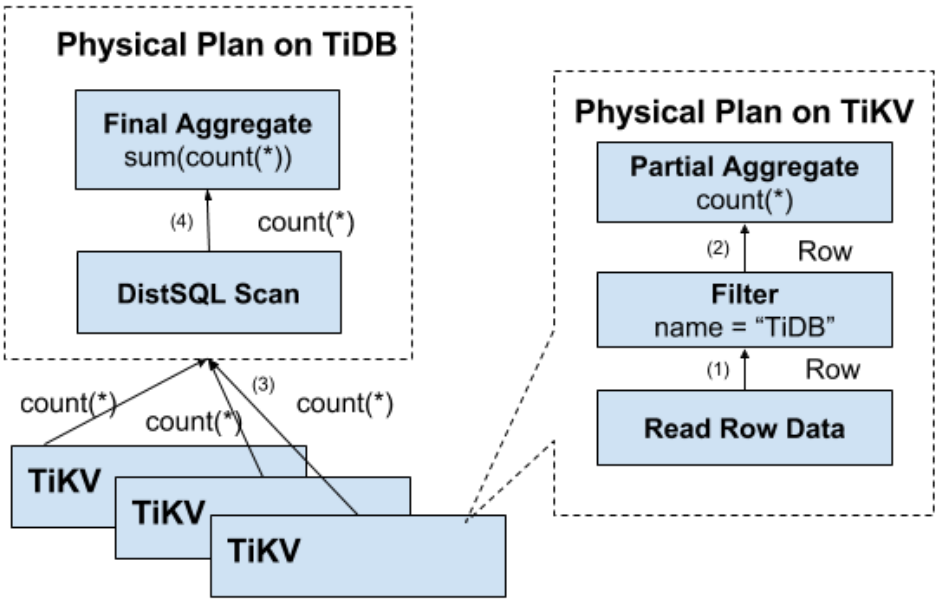

Figure 361: dist sql flow

#### 14.1.3.3.3 Architecture of SQL layer

The previous sections introduce some functions of the SQL layer and I hope you have a basic understanding of how SQL statements are handled. In fact, TiDB's SQL layer is much more complicated, with many modules and layers. The following diagram lists the important modules and calling relationships:

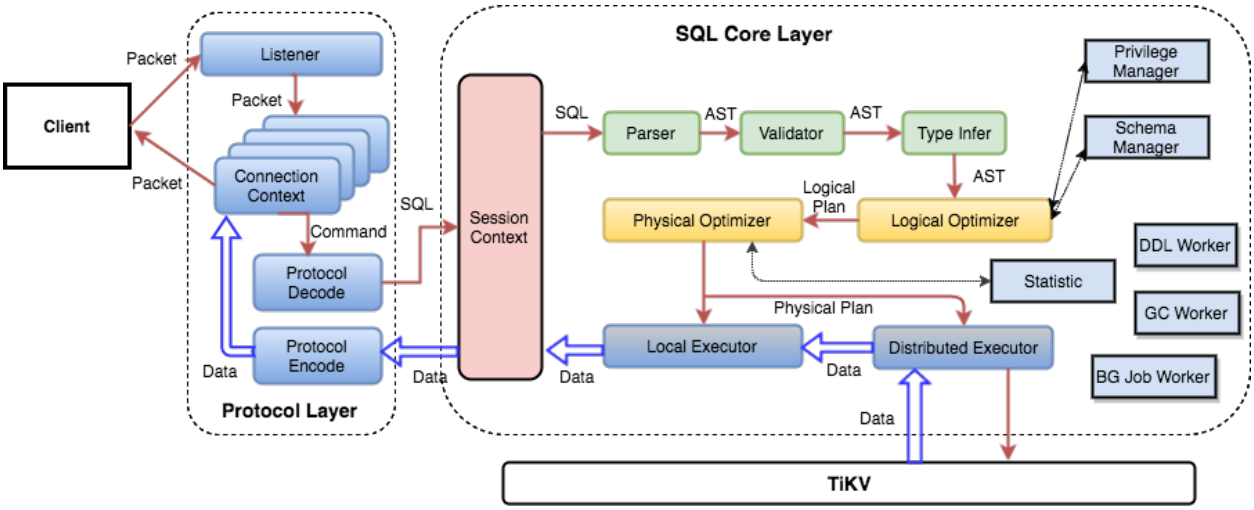

Figure 362: tidb sql layer

The user's SQL request is sent to TiDB Server either directly or via `Load Balancer`. TiDB Server will parse `MySQL Protocol Packet`, get the content of requests, parse the SQL request syntactically and semantically, develop and optimize query plans, execute a query plan, get and process the data. All data is stored in the TiKV cluster, so in this process, TiDB Server needs to interact with TiKV and get the data. Finally, TiDB Server needs to return the query results to the user.

### 14.1.4 TiDB Scheduling

The Placement Driver (PD) works as the manager in a TiDB cluster, and it also schedules Regions in the cluster. This article introduces the design and core concepts of the PD scheduling component.

#### 14.1.4.1 Scheduling situations

TiKV is the distributed key-value storage engine used by TiDB. In TiKV, data is organized as Regions, which are replicated on several stores. In all replicas, a leader is responsible for reading and writing, and followers are responsible for replicating Raft logs from the leader.

Now consider about the following situations:

- To utilize storage space in a high-efficient way, multiple Replicas of the same Region need to be properly distributed on different nodes according to the Region size;
- For multiple data center topologies, one data center failure only causes one replica to fail for all Regions;
- When a new TiKV store is added, data can be rebalanced to it;
- When a TiKV store fails, PD needs to consider:

    - Recovery time of the failed store.
        - If it's short (for example, the service is restarted), whether scheduling is necessary or not.
        - If it's long (for example, disk fault and data is lost), how to do scheduling.
    - Replicas of all Regions.
        - If the number of replicas is not enough for some Regions, PD needs to complete them.
        - If the number of replicas is more than expected (for example, the failed store re-joins into the cluster after recovery), PD needs to delete them.
- Read/Write operations are performed on leaders, which cannot be distributed only on a few individual stores;
- Not all Regions are hot, so loads of all TiKV stores need to be balanced;
- When Regions are in balancing, data transferring utilizes much network/disk traffic and CPU time, which can influence online services.

These situations can occur at the same time, which makes it harder to resolve. Also, the whole system is changing dynamically, so a scheduler is needed to collect all information about the cluster, and then adjust the cluster. So, PD is introduced into the TiDB cluster.

#### 14.1.4.2 Scheduling requirements

The above situations can be classified into two types:

1. A distributed and highly available storage system must meet the following requirements:

    - The right number of replicas.
    - Replicas need to be distributed on different machines according to different topologies.
    - The cluster can perform automatic disaster recovery from TiKV peers' failure.

2. A good distributed system needs to have the following optimizations:

    - All Region leaders are distributed evenly on stores;
    - Storage capacity of all TiKV peers are balanced;
    - Hot spots are balanced;
    - Speed of load balancing for the Regions needs to be limited to ensure that online services are stable;
    - Maintainers are able to take peers online/offline manually.

After the first type of requirements is satisfied, the system will be failure tolerable. After the second type of requirements is satisfied, resources will be utilized more efficiently and the system will have better scalability.

To achieve the goals, PD needs to collect information firstly, such as state of peers, information about Raft groups and the statistics of accessing the peers. Then we need to specify some strategies for PD, so that PD can make scheduling plans from these information and strategies. Finally, PD distributes some operators to TiKV peers to complete scheduling plans.

#### 14.1.4.3 Basic scheduling operators

All scheduling plans contain three basic operators:

- Add a new replica
- Remove a replica
- Transfer a Region leader between replicas in a Raft group

They are implemented by the Raft commands `AddReplica`, `RemoveReplica`, and `TransferLeader`.

#### 14.1.4.4 Information collection

Scheduling is based on information collection. In short, the PD scheduling component needs to know the states of all TiKV peers and all Regions. TiKV peers report the following information to PD:

- State information reported by each TiKV peer:

  Each TiKV peer sends heartbeats to PD periodically. PD not only checks whether the store is alive, but also collects `StoreState` in the heartbeat message. `StoreState` includes:

  - Total disk space
  - Available disk space
  - The number of Regions
  - Data read/write speed
  - The number of snapshots that are sent/received (The data might be replicated between replicas through snapshots)
  - Whether the store is overloaded
  - Labels (See Perception of Topology)

  You can use PD control to check the status of a TiKV store, which can be Up, Disconnect, Offline, Down, or Tombstone. The following is a description of all statuses and their relationship.

  - **Up**: The TiKV store is in service.
  - **Disconnect**: Heartbeat messages between the PD and the TiKV store are lost for more than 20 seconds. If the lost period exceeds the time specified by `max-store-down-time`, the status "Disconnect" changes to "Down".

- **Down**: Heartbeat messages between the PD and the TiKV store are lost for a time longer than `max-store-down-time` (30 minutes by default). In this status, the TiKV store starts replenishing replicas of each Region on the surviving store.
- **Offline**: A TiKV store is manually taken offline through PD Control. This is only an intermediate status for the store to go offline. The store in this status moves all its Regions to other "Up" stores that meet the relocation conditions. When `leader_count` and `region_count` (obtained through PD Control) both show `0`, the store status changes to "Tombstone" from "Offline". In the "Offline" status, **do not** disable the store service or the physical server where the store is located. During the process that the store goes offline, if the cluster does not have target stores to relocate the Regions (for example, inadequate stores to hold replicas in the cluster), the store is always in the "Offline" status.
- **Tombstone**: The TiKV store is completely offline. You can use the `remove-tombstone` interface to safely clean up TiKV in this status. Starting from v6.5.0, if not manually handled, PD will automatically delete the Tombstone records stored internally one month after the node is converted to Tombstone.

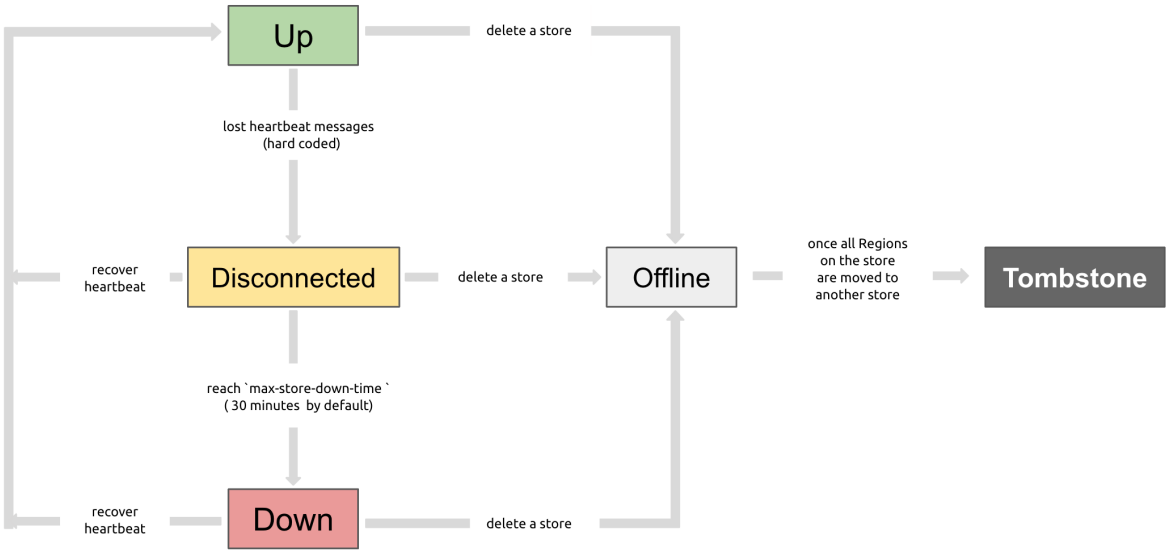

Figure 363: TiKV store status relationship

- Information reported by Region leaders:

  Each Region leader sends heartbeats to PD periodically to report `RegionState`, including:

  - Position of the leader itself

- Positions of other replicas
- The number of offline replicas
- data read/write speed

PD collects cluster information by the two types of heartbeats and then makes decision based on it.

Besides, PD can get more information from an expanded interface to make a more precise decision. For example, if a store's heartbeats are broken, PD can't know whether the peer steps down temporarily or forever. It just waits a while (by default 30min) and then treats the store as offline if there are still no heartbeats received. Then PD balances all regions on the store to other stores.

But sometimes stores are manually set offline by a maintainer, so the maintainer can tell PD this by the PD control interface. Then PD can balance all regions immediately.

#### 14.1.4.5 Scheduling strategies

After collecting the information, PD needs some strategies to make scheduling plans.

**Strategy 1: The number of replicas of a Region needs to be correct**

PD can know that the replica count of a Region is incorrect from the Region leader's heartbeat. If it happens, PD can adjust the replica count by adding/removing replica(s). The reason for incorrect replica count can be:

- Store failure, so some Region's replica count is less than expected;
- Store recovery after failure, so some Region's replica count could be more than expected;
- `max-replicas` is changed.

**Strategy 2: Replicas of a Region need to be at different positions**

Note that here "position" is different from "machine". Generally PD can only ensure that replicas of a Region are not at a same peer to avoid that the peer's failure causes more than one replicas to become lost. However in production, you might have the following requirements:

- Multiple TiKV peers are on one machine;
- TiKV peers are on multiple racks, and the system is expected to be available even if a rack fails;
- TiKV peers are in multiple data centers, and the system is expected to be available even if a data center fails;

The key to these requirements is that peers can have the same "position", which is the smallest unit for failure toleration. Replicas of a Region must not be in one unit. So, we can

configure labels for the TiKV peers, and set location-labels on PD to specify which labels are used for marking positions.

**Strategy 3: Replicas need to be balanced between stores**

The size limit of a Region replica is fixed, so keeping the replicas balanced between stores is helpful for data size balance.

**Strategy 4: Leaders need to be balanced between stores**

Read and write operations are performed on leaders according to the Raft protocol, so that PD needs to distribute leaders into the whole cluster instead of several peers.

**Strategy 5: Hot spots need to be balanced between stores**

PD can detect hot spots from store heartbeats and Region heartbeats, so that PD can distribute hot spots.

**Strategy 6: Storage size needs to be balanced between stores**

When started up, a TiKV store reports `capacity` of storage, which indicates the store's space limit. PD will consider this when scheduling.

**Strategy 7: Adjust scheduling speed to stabilize online services**

Scheduling utilizes CPU, memory, network and I/O traffic. Too much resource utilization will influence online services. Therefore, PD needs to limit the number of the concurrent scheduling tasks. By default this strategy is conservative, while it can be changed if quicker scheduling is required.

#### 14.1.4.6 Scheduling implementation

PD collects cluster information from store heartbeats and Region heartbeats, and then makes scheduling plans from the information and strategies. Scheduling plans are a sequence of basic operators. Every time PD receives a Region heartbeat from a Region leader, it checks whether there is a pending operator on the Region or not. If PD needs to dispatch a new operator to a Region, it puts the operator into heartbeat responses, and monitors the operator by checking follow-up Region heartbeats.

Note that here "operators" are only suggestions to the Region leader, which can be skipped by Regions. Leader of Regions can decide whether to skip a scheduling operator or not based on its current status.

### 14.1.5 TimeStamp Oracle (TSO) in TiDB

In TiDB, the Placement Driver (PD) plays a pivotal role in allocating timestamps to various components within a cluster. These timestamps are instrumental in the assignment of temporal markers to transactions and data, a mechanism crucial for enabling the Percolator model within TiDB. The Percolator model is used to support Multi-Version Concurrency Control (MVCC) and transaction management.

The following example shows how to get the current TSO in TiDB:

```
BEGIN; SET @ts := @@tidb_current_ts; ROLLBACK;
Query OK, 0 rows affected (0.0007 sec)
Query OK, 0 rows affected (0.0002 sec)
Query OK, 0 rows affected (0.0001 sec)

SELECT @ts;
+--------------------+
| @ts                |
+--------------------+
| 443852055297916932 |
+--------------------+
1 row in set (0.00 sec)
```

Note that this is done in a transaction with `BEGIN; ...; ROLLBACK` because TSO timestamps are assigned per transaction.

The TSO timestamp you get from the preceding example is a decimal number. You can use the SQL function `TIDB_PARSE_TSO()` to parse the timestamp:

```
SELECT TIDB_PARSE_TSO(443852055297916932);
+-----------------------------------+
| TIDB_PARSE_TSO(443852055297916932) |
+-----------------------------------+
| 2023-08-27 20:33:41.687000     |
+-----------------------------------+
1 row in set (0.00 sec)
```

The following example shows what a TSO timestamp looks like in binary:

```
0000011000101000111000010001011110111000110111000000000000000100 ← This is
    ↪ 443852055297916932 in binary
00000110001010001110000100010111101110001101 ← The first 46
    ↪ bits are the physical timestamp
                                              0000000000000000100 ← The last 18
                                                 ↪ bits are the logical
                                                 ↪ timestamp
```

There are two parts in a TSO timestamp:

- The physical timestamp: a UNIX timestamp in milliseconds since 1 January 1970.
- The logical timestamp: an incrementing counter, used in scenarios requiring multiple timestamps within the same millisecond, or in cases where certain events might trigger a reversal of the clock's progression. In such cases, the physical timestamp remains unchanged while the logical timestamp steadily advances. This mechanism ensures the integrity of the TSO timestamp, which always moves forward and never regresses.

With this knowledge, you can inspect the TSO timestamp a bit more in SQL:

```
SELECT @ts, UNIX_TIMESTAMP(NOW(6)), (@ts >> 18)/1000, FROM_UNIXTIME((@ts >>
   ↪ 18)/1000), NOW(6), @ts & 0x3FFFF\G
*************************** 1. row ***************************
                          @ts: 443852055297916932
        UNIX_TIMESTAMP(NOW(6)): 1693161835.502954
             (@ts >> 18)/1000: 1693161221.6870
FROM_UNIXTIME((@ts >> 18)/1000): 2023-08-27 20:33:41.6870
                      NOW(6): 2023-08-27 20:43:55.502954
                 @ts & 0x3FFFF: 4
1 row in set (0.00 sec)
```

The `>> 18` operation signifies a bitwise right shift by 18 bits, which is used to extract the physical timestamp. Because the physical timestamp is expressed in milliseconds, deviating from the more common UNIX timestamp format measured in seconds, you need to divide it by 1000 to convert it into a format compatible with `FROM_UNIXTIME()`. This process aligns with the functionality of `TIDB_PARSE_TSO()`.

You can also extract the logical timestamp `0000000000000000100` in binary, which is equivalent to `4` in decimal.

You can also parse the timestamp via the CLI tool as follows:

```
$ tiup ctl:v7.1.0 pd tso 443852055297916932
```

```
system: 2023-08-27 20:33:41.687 +0200 CEST
logic:  4
```

Here you can see the physical timestamp in the line that starts with `system:` and the logical timestamp in the line that starts with `logic:`.

## 14.2 Storage Engine - TiKV

### 14.2.1 TiKV Overview

TiKV is a distributed and transactional key-value database, which provides transactional APIs with ACID compliance. With the implementation of the Raft consensus algorithm and consensus state stored in RocksDB, TiKV guarantees data consistency between multiple replicas and high availability. As the storage layer of the TiDB distributed database, TiKV provides the read and write service, and persist the written data from applications. It also stores the statistics data of the TiDB cluster.

#### 14.2.1.1 Architecture overview

TiKV implements the multi-raft-group replica mechanism based on the design of Google Spanner. A Region is a basic unit of the key-value data movement and refers to a data

range in a Store. Each Region is replicated to multiple nodes. These multiple replicas form a Raft group. A replica of a Region is called a Peer. Typically there are 3 peers in a Region. One of them is the leader, which provides the read and write services. The PD component balances all the Regions automatically to guarantee that the read and write throughput is balanced among all the nodes in the TiKV cluster. With PD and carefully designed Raft groups, TiKV excels in horizontal scalability and can easily scale to store more than 100 TBs of data.

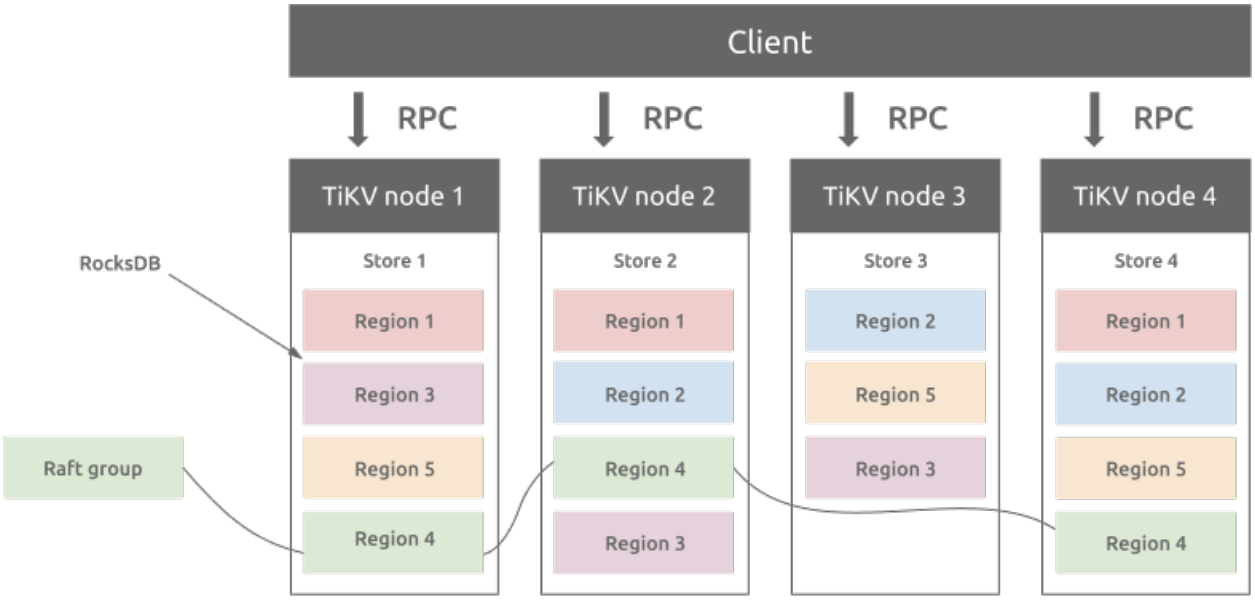

Figure 364: TiKV Architecture

#### 14.2.1.1.1 Region and RocksDB

There is a RocksDB database within each Store and it stores data into the local disk. All the Region data are stored in the same RocksDB instance in each Store. All the logs used for the Raft consensus algorithm is stored in another RocksDB instance in each Store. This is because the performance of sequential I/O is better than random I/O. With different RocksDB instances storing raft logs and Region data, TiKV combines all the data write operations of raft logs and TiKV Regions into one I/O operation to improve the performance.

#### 14.2.1.1.2 Region and Raft Consensus Algorithm

Data consistency between replicas of a Region is guaranteed by the Raft Consensus Algorithm. Only the leader of the Region can provide the writing service, and only when the data is written to the majority of replicas of a Region, the write operation succeeds.

TiKV tries to keep an appropriate size for each Region in the cluster. The Region size is currently 96 MiB by default. This mechanism helps the PD component to balance Regions among nodes in a TiKV cluster. When the size of a Region exceeds a threshold (144 MiB by default), TiKV splits it into two or more Regions. When the size of a Region is smaller

than the threshold (20 MiB by default), TiKV merges the two smaller adjacent Regions into one Region.

When PD moves a replica from one TiKV node to another, it firstly adds a Learner replica on the target node, after the data in the Learner replica is nearly the same as that in the Leader replica, PD changes it to a Follower replica and removes the Follower replica on the source node.

Moving Leader replica from one node to another has a similar mechanism. The difference is that after the Learner replica becomes the Follower replica, there is a "Leader Transfer" operation in which the Follower replica actively proposes an election to elect itself as the Leader. Finally, the new Leader removes the old Leader replica in the source node.

#### 14.2.1.2 Distributed Transaction

TiKV supports distributed transactions. Users (or TiDB) can write multiple key-value pairs without worrying about whether they belong to the same Region. TiKV uses two-phase commit to achieve ACID constraints. See TiDB Optimistic Transaction Model for details.

#### 14.2.1.3 TiKV Coprocessor

TiDB pushes some data computation logic to TiKV Coprocessor. TiKV Coprocessor processes the computation for each Region. Each request sent to TiKV Coprocessor only involves the data of one Region.

### 14.2.2 RocksDB Overview

RocksDB is an LSM-tree storage engine that provides key-value store and read-write functions. It is developed by Facebook and based on LevelDB. Key-value pairs written by the user are firstly inserted into Write Ahead Log (WAL) and then written to the SkipList in memory (a data structure called MemTable). LSM-tree engines convert the random modification (insertion) to sequential writes to the WAL file, so they provide better write throughput than B-tree engines.

Once the data in memory reaches a certain size, RocksDB flushes the content into a Sorted String Table (SST) file in the disk. SST files are organized in multiple levels (the default is up to 6 levels). When the total size of a level reaches the threshold, RocksDB chooses part of the SST files and merges them into the next level. Each subsequent level is 10 times larger than the previous one, so 90% of the data is stored in the last layer.

RocksDB allows users to create multiple Column Families (CFs). CFs have their own SkipList and SST files, and they share the same WAL file. In this way, different CFs can have different settings according to the application characteristics. It does not increase the number of writes to WAL at the same time.

#### 14.2.2.1 TiKV architecture

The architecture of TiKV is illustrated as follows:

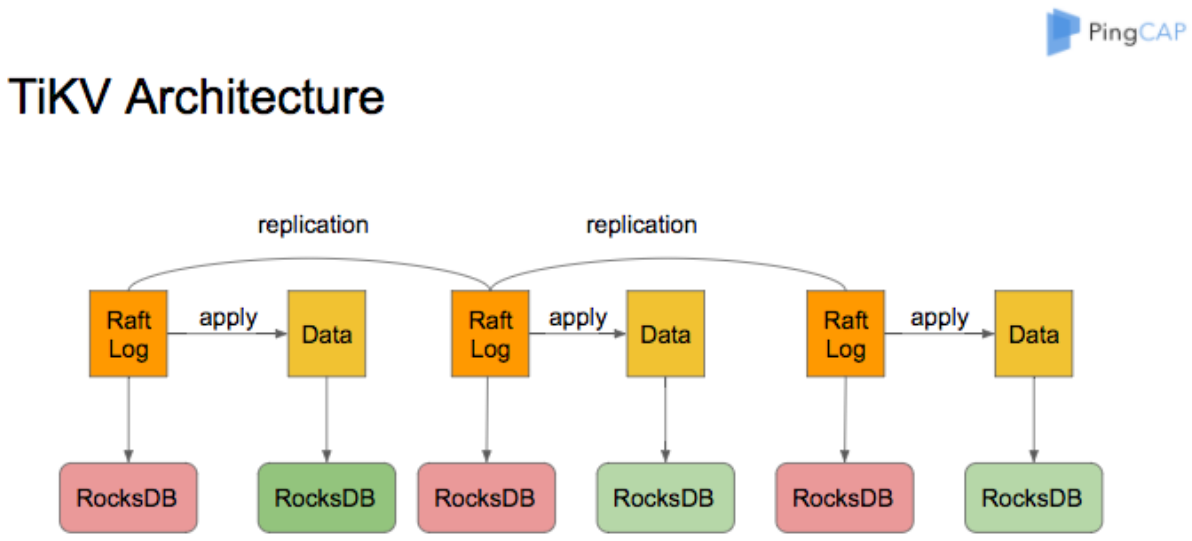

Figure 365: TiKV RocksDB

As the storage engine of TiKV, RocksDB is used to store Raft logs and user data. All data in a TiKV node shares two RocksDB instances. One is for Raft log (often called raftdb), and the other is for user data and MVCC metadata (often called kvdb). There are four CFs in kvdb: raft, lock, default, and write:

- raft CF: Store metadata of each Region. It occupies only a very small amount of space, and users do not need to care.
- lock CF: Store the pessimistic lock of pessimistic transactions and the Prewrite lock for distributed transactions. After the transaction is committed, the corresponding data in lock CF is deleted quickly. Therefore, the size of data in lock CF is usually very small (less than 1 GB). If the data in lock CF increases a lot, it means that a large number of transactions are waiting to be committed, and that the system meets a bug or failure.
- write CF: Store the user's real written data and MVCC metadata (the start timestamp and commit timestamp of the transaction to which the data belongs). When the user writes a row of data, it is stored in the write CF if the data length is less than or equal to 255 bytes. Otherwise, it is stored in the default CF. In TiDB, the secondary index only occupies the space of write CF, since the value stored in the non-unique index is empty and the value stored in the unique index is the primary key index.
- default CF: Store data longer than 255 bytes.

#### 14.2.2.2 RocksDB memory usage

To improve the reading performance and reduce the reading operations to the disk, RocksDB divides the files stored on the disk into blocks based on a certain size (the default

is 64 KB). When reading a block, it first checks if the data already exists in BlockCache in memory. If true, it can read the data directly from memory without accessing the disk.

BlockCache discards the least recently used data according to the LRU algorithm. By default, TiKV devotes 45% of the system memory to BlockCache. Users can also modify the `storage.block-cache.capacity` configuration to an appropriate value by themselves. However, it is not recommended to exceed 60% of the total system memory.

The data written to RocksDB is written to MemTable firstly. When the size of a MemTable exceeds 128 MB, it switches to a new MemTable. There are 2 RocksDB instances in TiKV, a total of 4 CFs. The size limit of a single MemTable for each CF is 128 MB. A maximum of 5 MemTables can exist at the same time; otherwise, the foreground writes is blocked. The memory occupied by this part is at most 2.5 GB (4 x 5 x 128 MB). It is not recommended to change this limit since it costs less memory.

#### 14.2.2.3 RocksDB space usage

- Multi-version: As RocksDB is a key-value storage engine with LSM-tree structure, the data in MemTable is flushed to L0 first. Because the file is arranged in the order of which they are generated, there might be overlap between the ranges of SSTs at the L0. As a result, the same key might have multiple versions in L0. When a file is merged from L0 to L1, it is cut into multiple files in a certain size (the default is 8 MB). The key range of each file on the same level does not overlap with each other, so there is only one version for each key on L1 and subsequent levels.
- Space amplification: The total size of files on each level is x (the default is 10) times that of the previous level, so 90% of the data is stored in the last level. It also means that the space amplification of RocksDB does not exceed 1.11 (L0 has fewer data and can be ignored).
- Space amplification of TiKV: TiKV has it's own MVCC strategy. When a user writes a key, the real data written to RocksDB is key + commit_ts, that is to say, the update and deletion also write a new key to RocksDB. TiKV deletes the old version of the data (through the Delete interface of RocksDB) at intervals, so it can be considered that the actual space of the data stored by the user on TiKV is enlarged to 1.11 plus the data written in the last 10 minutes (assuming that TiKV cleans up the old data promptly).

#### 14.2.2.4 RocksDB background threads and compaction

In RocksDB, operations such as converting the MemTable into SST files and merging SST files at various levels are performed in the background thread pool. The default size of the background thread pool is 8. When the number of CPUs in the machine is less than or equal to 8, the default size of the background thread pool is the number of CPUs minus one.

Generally speaking, users do not need to change this configuration. If the user deploys multiple TiKV instances on a machine, or the machine has a relatively high read load and a low write load, you can adjust the `rocksdb/max-background-jobs` to 3 or 4 as appropriate.

#### 14.2.2.5 WriteStall

The L0 of RocksDB is different from other levels. The SSTs of L0 are arranged in the order of generation. The key ranges between the SSTs can overlap. Therefore, each SST in L0 must be queried in turn when a query is performed. In order not to affect query performance, WriteStall is triggered to block writing when there are too many files in L0.

When encountering a sudden sharp increase in write delay, you can first check the **WriteStall Reason** metric on the Grafana RocksDB KV panel. If it is a WriteStall caused by too many L0 files, you can adjust the following configurations to 64.

```
rocksdb.defaultcf.level0-slowdown-writes-trigger
rocksdb.writecf.level0-slowdown-writes-trigger
rocksdb.lockcf.level0-slowdown-writes-trigger
rocksdb.defaultcf.level0-stop-writes-trigger
rocksdb.writecf.level0-stop-writes-trigger
rocksdb.lockcf.level0-stop-writes-trigger
```

### 14.2.3 Titan Overview

Titan is a high-performance RocksDB plugin for key-value separation. Titan can reduce write amplification in RocksDB when large values are used.

When the value size in Key-Value pairs is large (larger than 1 KB or 512 B), Titan performs better than RocksDB in write, update, and point read scenarios. However, Titan gets a higher write performance by sacrificing storage space and range query performance. As the price of SSDs continues to decrease, this trade-off will be more and more meaningful.

#### 14.2.3.1 Key features

- Reduce write amplification by separating values from the log-structured merge-tree (LSM-tree) and storing them independently.
- Seamlessly upgrade RocksDB instances to Titan. The upgrade does not require human intervention and does not impact online services.
- Achieve 100% compatibility with all RocksDB features used by the current TiKV.

#### 14.2.3.2 Usage scenarios

Titan is suitable for the scenarios where a huge volume of data is written to the TiKV foreground:

- RocksDB triggers a large amount of compactions, which consumes a lot of I/O bandwidth or CPU resources. This causes poor read and write performance of the foreground.
- The RocksDB compaction lags much behind (due to the I/O bandwidth limit or CPU bottleneck) and frequently causes write stalls.

- RocksDB triggers a large amount of compactions, which causes a lot of I/O writes and affects the life of the SSD disk.

#### 14.2.3.3 Prerequisites

The prerequisites for enabling Titan are as follows:

- The average size of values is large, or the size of all large values accounts for much of the total value size. Currently, the size of a value greater than 1 KB is considered as a large value. In some situations, this number (1 KB) can be 512 B. Note that a single value written to TiKV cannot exceed 8 MB due to the limitation of the TiKV Raft layer. You can adjust the `raft-entry-max-size` configuration value to relax the limit.
- No range query will be performed or you do not need a high performance of range query. Because the data stored in Titan is not well-ordered, its performance of range query is poorer than that of RocksDB, especially for the query of a large range. According PingCAP's internal test, Titan's range query performance is 40% to a few times lower than that of RocksDB.
- Sufficient disk space (consider reserving a space twice of the RocksDB disk consumption with the same data volume). This is because Titan reduces write amplification at the cost of disk space. In addition, Titan compresses values one by one, and its compression rate is lower than that of RocksDB. RocksDB compresses blocks one by one. Therefore, Titan consumes more storage space than RocksDB, which is expected and normal. In some situations, Titan's storage consumption can be twice that of RocksDB.

If you want to improve the performance of Titan, see the blog post Titan: A RocksDB Plugin to Reduce Write Amplification.

#### 14.2.3.4 Architecture and implementation

The following figure shows the architecture of Titan:

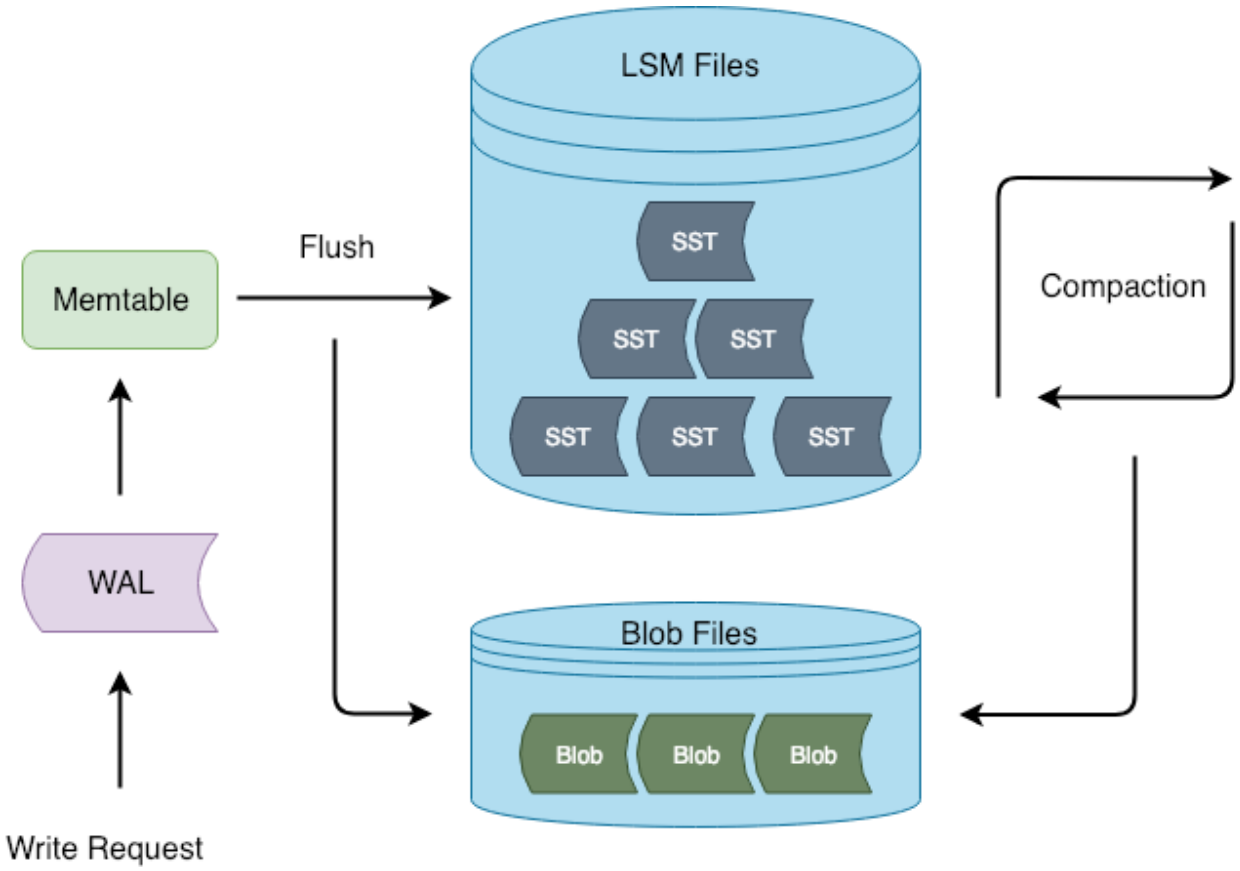

Figure 366: Titan Architecture

During flush and compaction operations, Titan separates values from the LSM-tree. The advantage of this approach is that the write process is consistent with RocksDB, which reduces the chance of invasive changes to RocksDB.

#### 14.2.3.4.1 BlobFile

When Titan separates the value file from the LSM-tree, it stores the value file in the BlobFile. The following figure shows the BlobFile format:

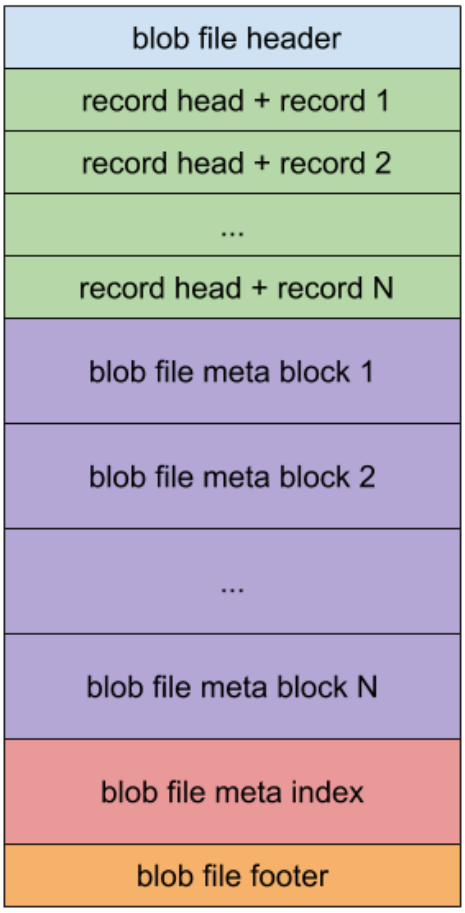

Figure 367: BlobFile Format

A blob file mainly consists of blob records, meta blocks, a meta index block, and a footer. Each block record stores a Key-Value pair. The meta blocks are used for scalability, and store properties related to the blob file. The meta index block is used for meta block searching.

**Note:**

- The Key-Value pairs in the blob file are stored in order, so that when the Iterator is implemented, the sequential reading performance can be improved via prefetching.
- Each blob record keeps a copy of the user key corresponding to the value. This way, when Titan performs Garbage Collection (GC), it can query the user key and identify whether the corresponding value is outdated. However, this process introduces some write amplification.

- BlobFile supports compression at the blob record level. Titan supports multiple compression algorithms, such as Snappy, LZ4, and Zstd. Currently, the default compression algorithm Titan uses is LZ4.

#### 14.2.3.4.2 TitanTableBuilder

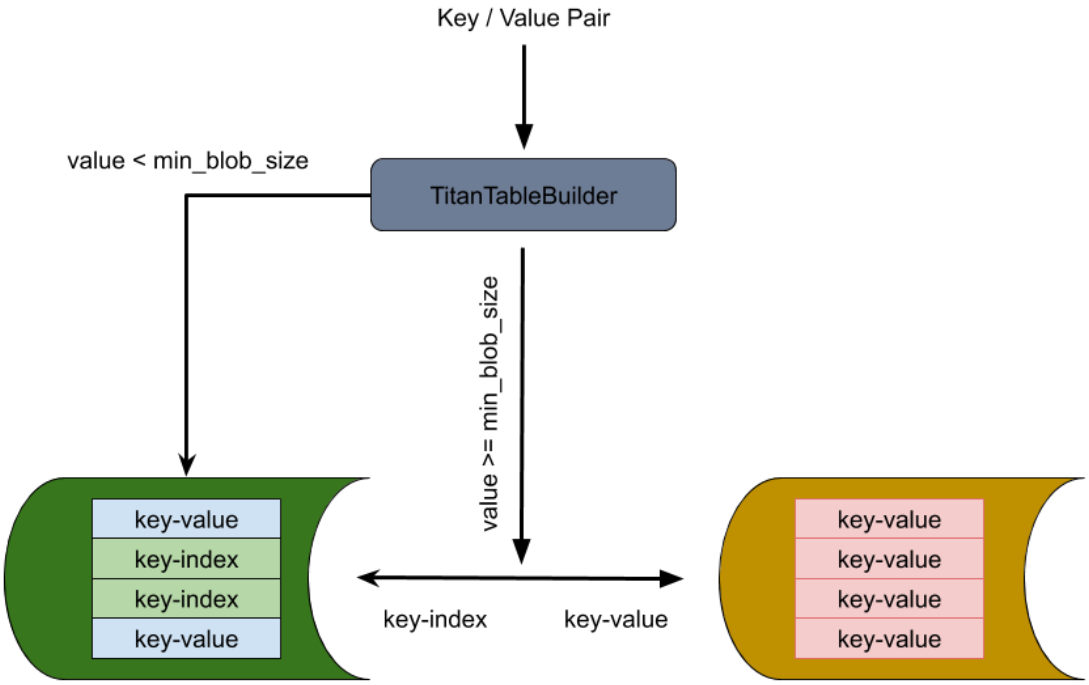

Figure 368: TitanTableBuilder

TitanTableBuilder is the key to achieving Key-Value separation. TitanTableBuilder determines the Key-Pair value size, and based on that, decides whether to separate the value from the Key-Value pair and store it in the blob file.

- If the value size is greater than or equal to `min_blob_size`, TitanTableBuilder separates the value and stores it in the blob file. TitanTableBuilder also generates an index and writes it into the SST.
- If the value size is smaller than `min_blob_size`, TitanTableBuilder writes the value directly into the SST.

Titan can also be downgraded to RocksDB in the process above. When RocksDB is performing compactions, the separated value can be written back to the newly generated SST files.

#### 14.2.3.5 Garbage Collection

Titan uses Garbage Collection (GC) to reclaim space. As the keys are being reclaimed in the LSM-tree compaction, some values stored in blob files are not deleted at the same time. Therefore, Titan needs to perform GC periodically to delete outdated values. Titan provides the following two types of GC:

- Blob files are periodically integrated and rewritten to delete outdated values. This is the regular way of performing GC.
- Blob files are rewritten while the LSM-tree compaction is performed at the same time. This is the feature of Level Merge.

##### 14.2.3.5.1 Regular GC

Titan uses the TablePropertiesCollector and EventListener components of RocksDB to collect the information for GC.

TablePropertiesCollector

RocksDB supports using BlobFileSizeCollector, a custom table property collector, to collect properties from the SST which are written into corresponding SST files. The collected properties are named BlobFileSizeProperties. The following figure shows the BlobFileSizeCollector workflow and data formats:

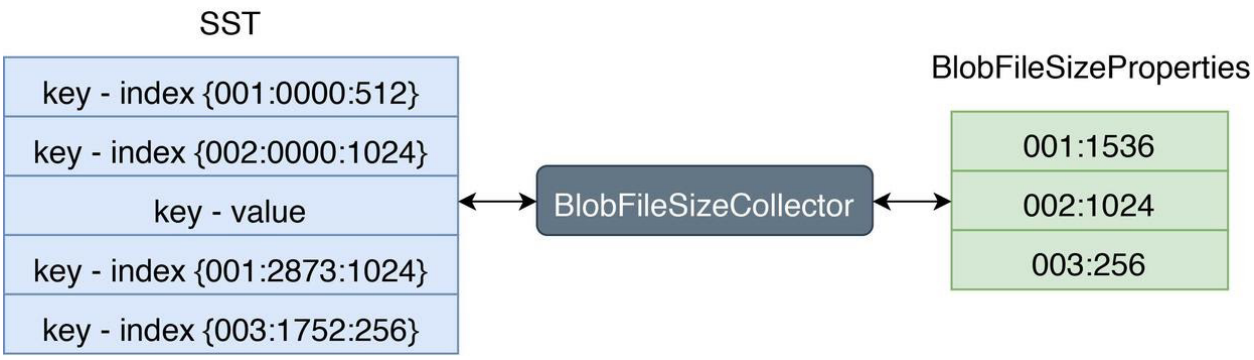

Figure 369: BlobFileSizeProperties

On the left is the SST index format. The first column is the blob file ID; the second column is the offset for the blob record in the blob file; the third column is the blob record size.

On the right is the BlobFileSizeProperties format. Each line represents a blob file and how much data is saved in this blob file. The first column is the blob file ID; the second column is the size of the data.

EventListener

RocksDB uses compaction to discard old data and reclaim space. After each compaction, some blob files in Titan might contain partly or entirely outdated data. Therefore, you can

trigger GC by listening to compaction events. During compaction, you can collect and compare the input/output blob file size properties of SST to determine which blob files require GC. The following figure shows the general process:

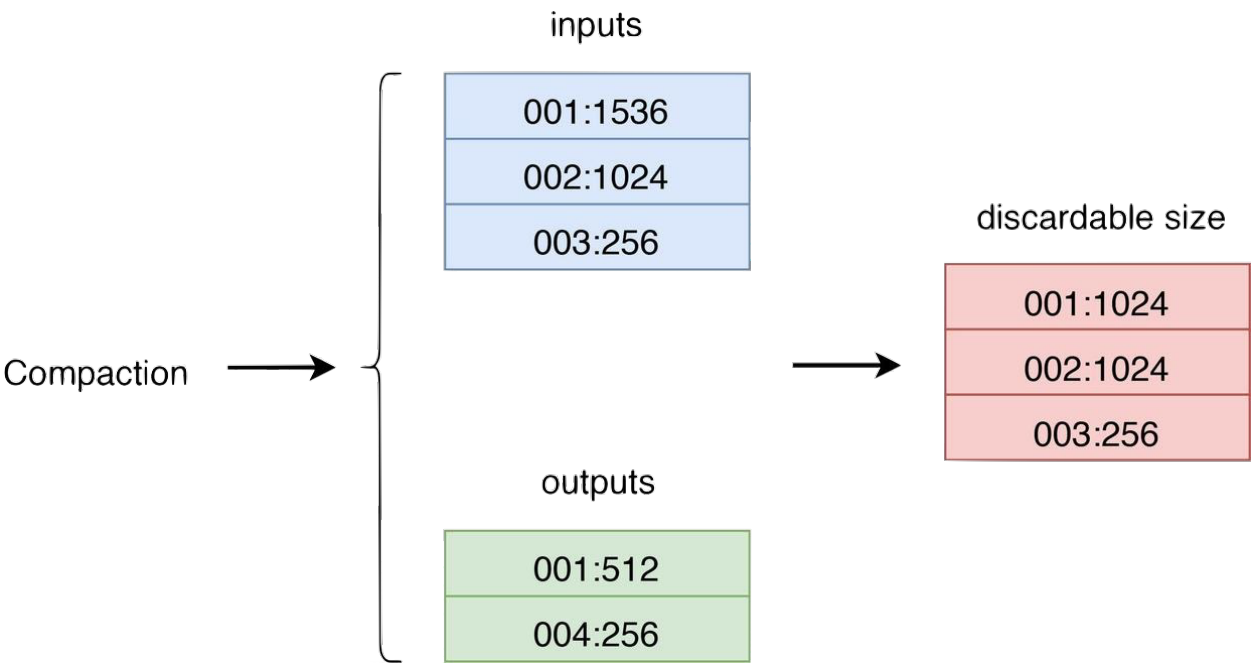

Figure 370: EventListener

- *inputs* stands for the blob file size properties for all SSTs that participate in the compaction.
- *outputs* stands for the blob file size properties for all SSTs generated in the compaction.
- *discardable size* is the size of the file to be discarded for each blob file, calculated based on inputs and outputs. The first column is the blob file ID. The second column is the size of the file to be discarded.

For each valid blob file, Titan maintains a discardable size variable in memory. After each compaction, this variable is accumulated for the corresponding blob file. Each time when GC starts, it picks the blob file with the greatest discardable size as the candidate file for GC. To reduce write amplification, a certain level of space amplification is allowed, which means GC can be started on a blob file only when the discardable file has reached a specific proportion in size.

For the selected blob file, Titan checks whether the blob index of the key corresponding to each value exists or has been updated to determine whether this value is outdated. If the value is not outdated, Titan merges and sorts the value into a new blob file, and writes the updated blob index into SST using WriteCallback or MergeOperator. Then, Titan records the latest sequence number of RocksDB and does not delete the old blob file until the sequence of the oldest snapshot exceeds the recorded sequence number. The reason is

that after the blob index is written back to SST, the old blob index is still accessible via the previous snapshot. Therefore, we need to ensure that no snapshot will access the old blob index before GC can safely deletes the corresponding blob file.

#### 14.2.3.5.2 Level Merge

Level Merge is a newly introduced algorithm in Titan. According to the implementation principle of Level Merge, Titan merges and rewrites blob file that corresponds to the SST file, and generates new blob file while compactions are performed in LSM-tree. The following figure shows the general process:

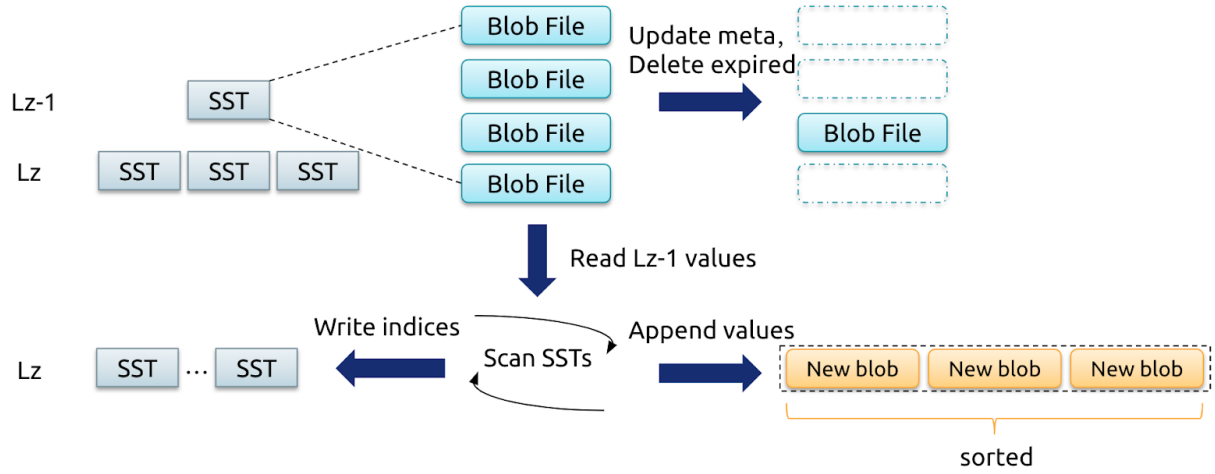

Figure 371: LevelMerge General Process

When compactions are performed on the SSTs of level z-1 and level z, Titan reads and writes Key-Value pairs in order. Then it writes the values of the selected blob files into new blob files in order, and updates the blob indexes of keys when new SSTs are generated. For the keys deleted in compactions, the corresponding values will not be written to the new blob file, which works similar to GC.

Compared with the regular way of GC, the Level Merge approach completes the blob GC while compactions are performed in LSM-tree. In this way, Titan no longer needs to check the status of blob index in LSM-tree or to write the new blob index into LSM-tree. This reduces the impact of GC on the foreground operations. As the blob file is repeatedly rewritten, fewer files overlap with each other, which makes the whole system in better order and improves the performance of scan.

However, layering blob files similar to tiering compaction brings write amplification. Because 99% of the data in LSM-tree is stored at the lowest two levels, Titan performs the Level Merge operation on the blob files corresponding to the data that is compacted only to the lowest two levels of LSM-tree.

Range Merge

Range Merge is an optimized approach of GC based on Level Merge. However, the bottom level of LSM-tree might be in poorer order in the following situations:

- When `level_compaction_dynamic_level_bytes` is enabled, data volume at each level of LSM-tree dynamically increases, and the sorted runs at the bottom level keep increasing.
- A specific range of data is frequently compacted, and this causes a lot of sorted runs in that range.

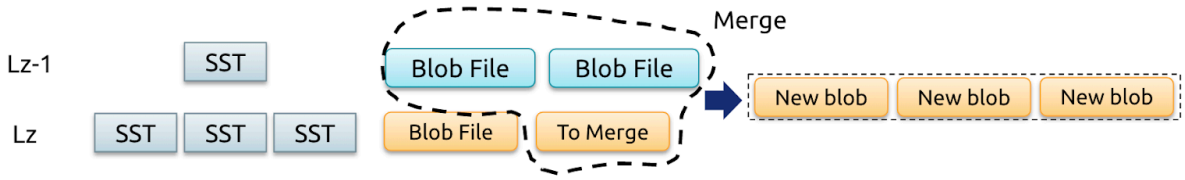

Figure 372: RangeMerge

Therefore, the Range Merge operation is needed to keep the number of sorted runs within a certain level. At the time of OnCompactionComplete, Titan counts the number of sorted runs in a range. If the number is large, Titan marks the corresponding blob file as ToMerge and rewrites it in the next compaction.

### 14.2.4 Titan Configuration

This document introduces how to enable and disable Titan using the corresponding configuration items, as well as the relevant parameters and the Level Merge feature.

#### 14.2.4.1 Enable Titan

Titan is compatible with RocksDB, so you can directly enable Titan on the existing TiKV instances that use RocksDB. You can use one of the following two methods to enable Titan:

- Method 1: If you have deployed the cluster using TiUP, you can execute the `tiup cluster edit-config ${cluster-name}` command and edit the TiKV configuration file as the following example shows:

```
tikv:
  rocksdb.titan.enabled: true
```

Reload the configuration and TiKV will be rolling restarted dynamically:

```
tiup cluster reload ${cluster-name} -R tikv
```

For the detailed command, see Modify the configuration using TiUP.

- Method 2: Directly edit the TiKV configuration file to enable Titan (**NOT** recommended for the production environment).

```
[rocksdb.titan]
enabled = true
```

After Titan is enabled, the existing data stored in RocksDB is not immediately moved to the Titan engine. As new data is written to the TiKV foreground and RocksDB performs compaction, the values are progressively separated from keys and written to Titan. You can view the **TiKV Details** -> **Titan kv** -> **blob file size** panel to confirm the size of the data stored in Titan.

If you want to speed up the writing process, compact data of the whole TiKV cluster manually using tikv-ctl. For details, see manual compaction.

> **Note:**
>
> When Titan is disabled, RocksDB cannot read data that has been migrated to Titan. If Titan is incorrectly disabled on a TiKV instance with Titan already enabled (mistakenly set `rocksdb.titan.enabled` to `false`), TiKV will fail to start, and the `You have disabled titan when its data directory is not empty` error appears in the TiKV log. To correctly disabled Titan, see Disable Titan.

#### 14.2.4.2 Parameters

To adjust Titan-related parameters using TiUP, refer to Modify the configuration.

- Titan GC thread count.

  From the **TiKV Details** -> **Thread CPU** -> **RocksDB CPU** panel, if you observe that the Titan GC threads are at full capacity for a long time, consider increasing the size of the Titan GC thread pool.

```
[rocksdb.titan]
max-background-gc = 1
```

- Value size threshold.

  When the size of the value written to the foreground is smaller than the threshold, this value is stored in RocksDB; otherwise, this value is stored in the blob file of Titan. Based on the distribution of value sizes, if you increase the threshold, more values are stored in RocksDB and TiKV performs better in reading small values. If you decrease the threshold, more values go to Titan, which further reduces RocksDB compactions.

```
[rocksdb.defaultcf.titan]
min-blob-size = "1KB"
```

- The algorithm used for compressing values in Titan, which takes value as the unit.

```
[rocksdb.defaultcf.titan]
blob-file-compression = "lz4"
```

- The size of value caches in Titan.

  Larger cache size means higher read performance of Titan. However, too large a cache size causes Out of Memory (OOM). It is recommended to set the value of `storage ↪ .block-cache.capacity` to the store size minus the blob file size and set `blob- ↪ cache-size` to `memory size * 50% - block cache size` according to the monitoring metrics when the database is running stably. This maximizes the blob cache size when the block cache is large enough for the whole RocksDB engine.

```
[rocksdb.defaultcf.titan]
blob-cache-size = 0
```

- When the ratio of discardable data (the corresponding key has been updated or deleted) in a blob file exceeds the following threshold, Titan GC is triggered.

```
discardable-ratio = 0.5
```

  When Titan writes the useful data of this blob file to another file, you can use the `discardable-ratio` value to estimate the upper limits of write amplification and space amplification (assuming the compression is disabled).

  Upper limit of write amplification = 1 / discardable_ratio

  Upper limit of space amplification = 1 / (1 - discardable_ratio)

  From the two equations above, you can see that decreasing the value of `discardable_ratio ↪` can reduce space amplification but causes GC to be more frequent in Titan. Increasing the value reduces Titan GC, the corresponding I/O bandwidth, and CPU consumption but increases disk usage.

- The following option limits the I/O rate of RocksDB compaction. During peak traffic, limiting RocksDB compaction, its I/O bandwidth, and its CPU consumption reduces its impact on the write and read performance of the foreground.

When Titan is enabled, this option limits the summed I/O rates of RocksDB compaction and Titan GC. If you find that the I/O and/or CPU consumption of RocksDB compaction and Titan GC is too large, set this option to a suitable value according the disk I/O bandwidth and the actual write traffic.

```
[rocksdb]
rate-bytes-per-sec = 0
```

#### 14.2.4.3 Disable Titan

To disable Titan, you can configure the `rocksdb.defaultcf.titan.blob-run-mode` option. The optional values for `blob-run-mode` are as follows:

- When the option is set to `normal`, Titan performs read and write operations normally.
- When the option is set to `read-only`, all newly written values are written into RocksDB, regardless of the value size.
- When the option is set to `fallback`, all newly written values are written into RocksDB, regardless of the value size. Also, all compacted values stored in the Titan blob file are automatically moved back to RocksDB.

To disable Titan for all existing and future data, you can take the following steps. Note that you can skip Step 2 because it greatly affects online traffic performance. In fact even without Step 2, the data compaction consumes extra I/O and CPU resources when it moves data from Titan to RocksDB, and performance will degrade (sometimes as much as 50%) when TiKV I/O or CPU resources are limited.

> **Warning:**
>
> When disabling Titan for TiDB versions earlier than v8.5.0, it is not recommended to modify the TiKV configuration item `rocksdb.titan.enabled` to `false`, as this might cause TiKV to crash. Following Step 1 is sufficient to disable Titan.

1. Update the configuration of the TiKV nodes you wish to disable Titan for. You can update configuration in two methods:

    - Execute `tiup cluster edit-config`, edit the configuration file, and execute `tiup cluster reload -R tikv`.
    - Manually update the configuration file and restart TiKV.

```
[rocksdb.defaultcf.titan]
blob-run-mode = "fallback"
discardable-ratio = 1.0
```

2. Perform a full compaction using tikv-ctl. This process will consume large amount of I/O and CPU resources.

```
tikv-ctl --pd <PD_ADDR> compact-cluster --bottommost force
```

3. After the compaction is finished, you should wait for the **Blob file count** metrics under **TiKV-Details/Titan - kv** to decrease to `0`.

#### 14.2.4.4 Level Merge (experimental)

In TiKV 4.0, Level Merge, a new algorithm, is introduced to improve the performance of range query and to reduce the impact of Titan GC on the foreground write operations. You can enable Level Merge using the following option:

```
[rocksdb.defaultcf.titan]
level-merge = true
```

Enabling Level Merge has the following benefits:

- Greatly improve the performance of Titan range query.
- Reduce the impact of Titan GC on the foreground write operations and improve write performance.
- Reduce space amplification of Titan and the disk usage (compared to the disk usage with the default configuration).

Accordingly, the write amplification with Level Merge enabled is slightly higher than that of Titan but is still lower than that of the native RocksDB.

## 14.3 Storage Engine - TiFlash

### 14.3.1 TiFlash Overview

TiFlash is the key component that makes TiDB essentially an Hybrid Transactional/-Analytical Processing (HTAP) database. As a columnar storage extension of TiKV, TiFlash provides both good isolation level and strong consistency guarantee.

In TiFlash, the columnar replicas are asynchronously replicated according to the Raft Learner consensus algorithm. When these replicas are read, the Snapshot Isolation level of consistency is achieved by validating Raft index and multi-version concurrency control (MVCC).

#### 14.3.1.1 Architecture

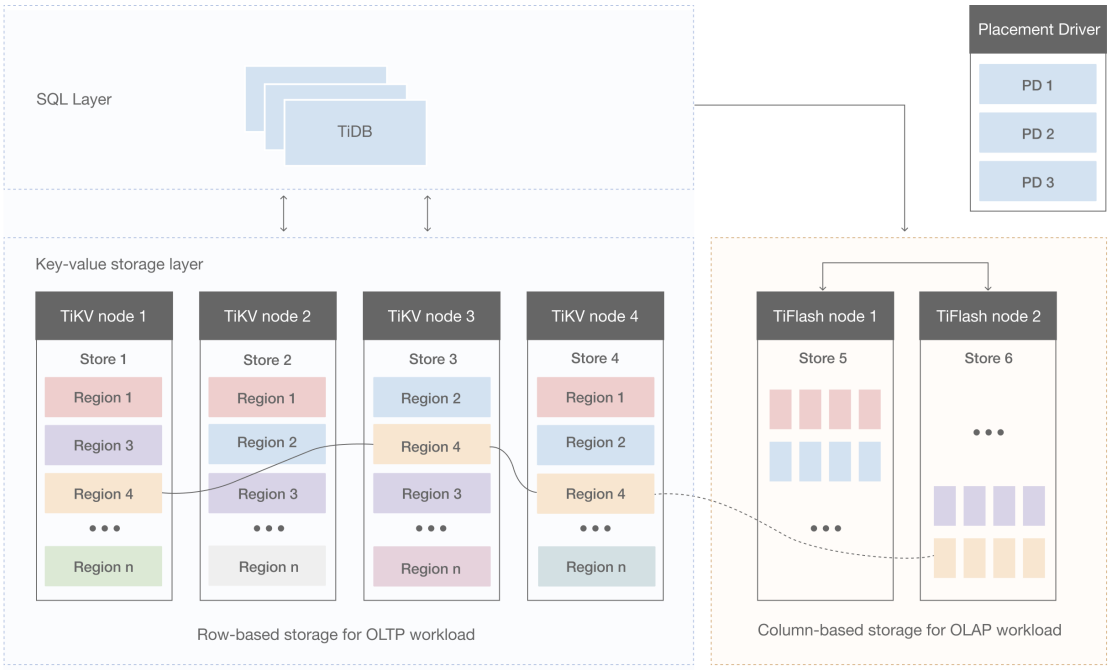

Figure 373: TiFlash Architecture

The above figure is the architecture of TiDB in its HTAP form, including TiFlash nodes.

TiFlash provides the columnar storage, with a layer of coprocessors efficiently implemented by ClickHouse. Similar to TiKV, TiFlash also has a Multi-Raft system, which supports replicating and distributing data in the unit of Region (see Data Storage for details).

TiFlash conducts real-time replication of data in the TiKV nodes at a low cost that does not block writes in TiKV. Meanwhile, it provides the same read consistency as in TiKV and ensures that the latest data is read. The Region replica in TiFlash is logically identical to those in TiKV, and is split and merged along with the Leader replica in TiKV at the same time.

To deploy TiFlash under the Linux AMD64 architecture, the CPU must support the AVX2 instruction set. Ensure that `cat /proc/cpuinfo | grep avx2` has output. To deploy TiFlash under the Linux ARM64 architecture, the CPU must support the ARMv8 instruction set architecture. Ensure that `cat /proc/cpuinfo | grep 'crc32' | grep 'asimd'` has output. By using the instruction set extensions, TiFlash's vectorization engine can deliver better performance.

TiFlash is compatible with both TiDB and TiSpark, which enables you to freely choose between these two computing engines.

It is recommended that you deploy TiFlash in different nodes from TiKV to ensure workload isolation. It is also acceptable to deploy TiFlash and TiKV in the same node if no business isolation is required.

Currently, data cannot be written directly into TiFlash. You need to write data in TiKV and then replicate it to TiFlash, because it connects to the TiDB cluster as a Learner role. TiFlash supports data replication in the unit of table, but no data is replicated by default after deployment. To replicate data of a specified table, see Create TiFlash replicas for tables.

TiFlash has three components: the columnar storage module, `tiflash proxy`, and `pd buddy`. `tiflash proxy` is responsible for the communication using the Multi-Raft consensus algorithm. `pd buddy` works with PD to replicate data from TiKV to TiFlash in the unit of table.

When TiDB receives the DDL command to create replicas in TiFlash, the `pd buddy` component acquires the information of the table to be replicated via the status port of TiDB, and sends the information to PD. Then PD performs the corresponding data scheduling according to the information provided by `pd buddy`.

#### 14.3.1.2 Key features

TiFlash has the following key features:

- Asynchronous replication
- Consistency
- Intelligent choice
- Computing acceleration

##### 14.3.1.2.1 Asynchronous replication

The replica in TiFlash is asynchronously replicated as a special role, Raft Learner. This means when the TiFlash node is down or high network latency occurs, applications in TiKV can still proceed normally.

This replication mechanism inherits two advantages of TiKV: automatic load balancing and high availability.

- TiFlash does not rely on additional replication channels, but directly receives data from TiKV in a many-to-many manner.
- As long as the data is not lost in TiKV, you can restore the replica in TiFlash at any time.

##### 14.3.1.2.2 Consistency

TiFlash provides the same Snapshot Isolation level of consistency as TiKV, and ensures that the latest data is read, which means that you can read the data previously written in TiKV. Such consistency is achieved by validating the data replication progress.

Every time TiFlash receives a read request, the Region replica sends a progress validation request (a lightweight RPC request) to the Leader replica. TiFlash performs the read operation only after the current replication progress includes the data covered by the timestamp of the read request.

#### 14.3.1.2.3 Intelligent choice

TiDB can automatically choose to use TiFlash (column-wise) or TiKV (row-wise), or use both of them in one query to ensure the best performance.

This selection mechanism is similar to that of TiDB which chooses different indexes to execute query. TiDB optimizer makes the appropriate choice based on statistics of the read cost.

#### 14.3.1.2.4 Computing acceleration

TiFlash accelerates the computing of TiDB in two ways:

- The columnar storage engine is more efficient in performing read operation.
- TiFlash shares part of the computing workload of TiDB.

TiFlash shares the computing workload in the same way as the TiKV Coprocessor does: TiDB pushes down the computing that can be completed in the storage layer. Whether the computing can be pushed down depends on the support of TiFlash. For details, see Supported pushdown calculations.

### 14.3.1.3 Use TiFlash

After TiFlash is deployed, data replication does not automatically begin. You need to manually specify the tables to be replicated.

You can either use TiDB to read TiFlash replicas for medium-scale analytical processing, or use TiSpark to read TiFlash replicas for large-scale analytical processing, which is based on your own needs. See the following sections for details:

- Create TiFlash Replicas
- Use TiDB to Read TiFlash Replicas
- Use TiSpark to Read TiFlash Replicas
- Use MPP Mode

To experience the whole process from importing data to querying in a TPC-H dataset, refer to Quick Start Guide for TiDB HTAP.

### 14.3.2 Create TiFlash Replicas

This document introduces how to create TiFlash replicas for tables and for databases, and set available zones for replica scheduling.

#### 14.3.2.1 Create TiFlash replicas for tables

After TiFlash is connected to the TiKV cluster, data replication by default does not begin. You can send a DDL statement to TiDB through a MySQL client to create a TiFlash replica for a specific table:

```
ALTER TABLE table_name SET TIFLASH REPLICA count;
```

The parameter of the above command is described as follows:

- `count` indicates the number of replicas. When the value is `0`, the replica is deleted.

If you execute multiple DDL statements on the same table, only the last statement is ensured to take effect. In the following example, two DDL statements are executed on the table `tpch50`, but only the second statement (to delete the replica) takes effect.

Create two replicas for the table:

```
ALTER TABLE `tpch50`.`lineitem` SET TIFLASH REPLICA 2;
```

Delete the replica:

```
ALTER TABLE `tpch50`.`lineitem` SET TIFLASH REPLICA 0;
```

**Notes:**

- If the table `t` is replicated to TiFlash through the above DDL statements, the table created using the following statement will also be automatically replicated to TiFlash:

```
CREATE TABLE table_name like t;
```

- For versions earlier than v4.0.6, if you create the TiFlash replica before using TiDB Lightning to import the data, the data import will fail. You must import data to the table before creating the TiFlash replica for the table.
- If TiDB and TiDB Lightning are both v4.0.6 or later, no matter a table has TiFlash replica(s) or not, you can import data to that table using TiDB Lightning. Note that this might slow the TiDB Lightning procedure, which depends on the NIC bandwidth on the lightning host, the CPU and disk load of the TiFlash node, and the number of TiFlash replicas.
- It is recommended that you do not replicate more than 1,000 tables because this lowers the PD scheduling performance. This limit will be removed in later versions.
- In v5.1 and later versions, setting the replicas for the system tables is no longer supported. Before upgrading the cluster, you need to clear the replicas of the relevant system tables. Otherwise, you cannot modify the replica settings of the system tables after you upgrade the cluster to a later version.

#### 14.3.2.1.1 Check replication progress

You can check the status of the TiFlash replicas of a specific table using the following statement. The table is specified using the `WHERE` clause. If you remove the `WHERE` clause, you will check the replica status of all tables.

```
SELECT * FROM information_schema.tiflash_replica WHERE TABLE_SCHEMA = '<
    ↪ db_name>' and TABLE_NAME = '<table_name>';
```

In the result of above statement:

- `AVAILABLE` indicates whether the TiFlash replicas of this table are available or not. `1` means available and `0` means unavailable. Once the replicas become available, this status does not change. If you use DDL statements to modify the number of replicas, the replication status will be recalculated.
- `PROGRESS` means the progress of the replication. The value is between `0.0` and `1.0`. `1` means at least one replica is replicated.

### 14.3.2.2 Create TiFlash replicas for databases

Similar to creating TiFlash replicas for tables, you can send a DDL statement to TiDB through a MySQL client to create a TiFlash replica for all tables in a specific database:

```
ALTER DATABASE db_name SET TIFLASH REPLICA count;
```

In this statement, `count` indicates the number of replicas. When you set it to `0`, replicas are deleted.

Examples:

- Create two replicas for all tables in the database `tpch50`:

```
ALTER DATABASE `tpch50` SET TIFLASH REPLICA 2;
```

- Delete TiFlash replicas created for the database `tpch50`:

```
ALTER DATABASE `tpch50` SET TIFLASH REPLICA 0;
```

**Note:**

- This statement actually performs a series of DDL operations, which are resource-intensive. If the statement is interrupted during the execution, executed operations are not rolled back and unexecuted operations do not continue.
- After executing the statement, do not set the number of TiFlash replicas or perform DDL operations on this database until **all tables in this database are replicated**. Otherwise, unexpected results might occur, which include:
  - If you set the number of TiFlash replicas to 2 and then change the number to 1 before all tables in the database are replicated, the final number of TiFlash replicas of all the tables is not necessarily 1 or 2.
  - After executing the statement, if you create tables in this database before the completion of the statement execution, TiFlash replicas **might or might not** be created for these new tables.
  - After executing the statement, if you add indexes for tables in the database before the completion of the statement execution, the statement might hang and resume only after the indexes are added.
- If you create tables in this database **after** the completion of the statement execution, TiFlash replicas are not created automatically for these new tables.
- This statement skips system tables, views, temporary tables, and tables with character sets not supported by TiFlash.

#### 14.3.2.2.1 Check replication progress

Similar to creating TiFlash replicas for tables, successful execution of the DDL statement does not mean the completion of replication. You can execute the following SQL statement to check the progress of replication on target tables:

```
SELECT * FROM information_schema.tiflash_replica WHERE TABLE_SCHEMA = '<
    ↪ db_name>';
```

To check tables without TiFlash replicas in the database, you can execute the following SQL statement:

```
SELECT TABLE_NAME FROM information_schema.tables where TABLE_SCHEMA = "<
    ↪ db_name>" and TABLE_NAME not in (SELECT TABLE_NAME FROM
    ↪ information_schema.tiflash_replica where TABLE_SCHEMA = "<db_name>");
```

#### 14.3.2.3 Speed up TiFlash replication

Before TiFlash replicas are added, each TiKV instance performs a full table scan and sends the scanned data to TiFlash as a "snapshot" to create replicas. By default, TiFlash replicas are added slowly with fewer resources usage in order to minimize the impact on the online service. If there are spare CPU and disk IO resources in your TiKV and TiFlash nodes, you can accelerate TiFlash replication by performing the following steps.

1. Temporarily increase the snapshot write speed limit for each TiKV and TiFlash instance by using the Dynamic Config SQL statement:

```
sql   -- The default value for both configurations are 100MiB, i.e. the
↪ maximum disk bandwidth used for writing snapshots is no more than 100MiB
↪ /s. SET CONFIG tikv `server.snap-max-write-bytes-per-sec` = '300MiB';
↪ SET CONFIG tiflash `raftstore-proxy.server.snap-max-write-bytes-per-sec`
↪  = '300MiB';
```

After executing these SQL statements, the configuration changes take effect immediately without restarting the cluster. However, since the replication speed is still restricted by the PD limit globally, you cannot observe the acceleration for now.

2. Use PD Control to progressively ease the new replica speed limit.

   The default new replica speed limit is 30, which means, approximately 30 Regions add TiFlash replicas every minute. Executing the following command will adjust the limit to 60 for all TiFlash instances, which doubles the original speed:

   ```
   tiup ctl:v<CLUSTER_VERSION> pd -u http://<PD_ADDRESS>:2379 store limit
       ↪ all engine tiflash 60 add-peer
   ```

In the preceding command, you need to replace `v<CLUSTER_VERSION>` with the actual cluster version, such as `v6.5.12` and `<PD_ADDRESS>:2379` with the address of any PD node. For example:

```
tiup ctl:v6.1.1 pd -u http://192.168.1.4:2379 store limit
    ↪ all engine tiflash 60 add-peer
```

Within a few minutes, you will observe a significant increase in CPU and disk IO resource usage of the TiFlash nodes, and TiFlash should create replicas faster. At the same time, the TiKV nodes' CPU and disk IO resource usage increases as well.

If the TiKV and TiFlash nodes still have spare resources at this point and the latency of your online service does not increase significantly, you can further ease the limit, for example, triple the original speed:

```
tiup ctl:v<CLUSTER_VERSION> pd -u http://<PD_ADDRESS>:2379 store limit
    ↪ all engine tiflash 90 add-peer
```

3. After the TiFlash replication is complete, revert to the default configuration to reduce the impact on online services.

Execute the following PD Control command to restore the default new replica speed limit:

```
shell   tiup ctl:v<CLUSTER_VERSION> pd -u http://<PD_ADDRESS>:2379 store
↪  limit all engine tiflash 30 add-peer
```

Execute the following SQL statements to restore the default snapshot write speed limit:

```
sql   SET CONFIG tikv `server.snap-max-write-bytes-per-sec` = '100MiB';
↪ SET CONFIG tiflash `raftstore-proxy.server.snap-max-write-bytes-per-sec`
↪  = '100MiB';
```

#### 14.3.2.4 Set available zones

When configuring replicas, if you need to distribute TiFlash replicas to multiple data centers for disaster recovery, you can configure available zones by following the steps below:

1. Specify labels for TiFlash nodes in the cluster configuration file.

```
tiflash_servers:
  - host: 172.16.5.81
      logger.level: "info"
    learner_config:
      server.labels:
```

```
      zone: "z1"
  - host: 172.16.5.82
    config:
      logger.level: "info"
    learner_config:
      server.labels:
        zone: "z1"
  - host: 172.16.5.85
    config:
      logger.level: "info"
    learner_config:
      server.labels:
        zone: "z2"
```

Note that the `flash.proxy.labels` configuration in earlier versions cannot handle special characters in the available zone name correctly. It is recommended to use the `server.labels` in `learner_config` to configure the name of an available zone.

2. After starting a cluster, specify the labels when creating replicas.

```
ALTER TABLE table_name SET TIFLASH REPLICA count LOCATION LABELS
    ↪ location_labels;
```

For example:

```
ALTER TABLE t SET TIFLASH REPLICA 2 LOCATION LABELS "zone";
```

3. PD schedules the replicas based on the labels. In this example, PD respectively schedules two replicas of the table `t` to two available zones. You can use pd-ctl to view the scheduling.

```
> tiup ctl:v<CLUSTER_VERSION> pd -u http://<PD_ADDRESS>:2379 store

    ...
    "address": "172.16.5.82:23913",
    "labels": [
      { "key": "engine", "value": "tiflash"},
      { "key": "zone", "value": "z1" }
    ],
    "region_count": 4,

    ...
    "address": "172.16.5.81:23913",
    "labels": [
      { "key": "engine", "value": "tiflash"},
      { "key": "zone", "value": "z1" }
```

```
    ],
    "region_count": 5,
    ...

    "address": "172.16.5.85:23913",
    "labels": [
      { "key": "engine", "value": "tiflash"},
      { "key": "zone", "value": "z2" }
    ],
    "region_count": 9,
    ...
```

For more information about scheduling replicas by using labels, see Schedule Replicas by Topology Labels, Multiple Data Centers in One City Deployment, and Three Data Centers in Two Cities Deployment.

### 14.3.3 Use TiDB to Read TiFlash Replicas

This document introduces how to use TiDB to read TiFlash replicas.

TiDB provides three ways to read TiFlash replicas. If you have added a TiFlash replica without any engine configuration, the CBO (cost-based optimization) mode is used by default.

#### 14.3.3.1 Smart selection

For tables with TiFlash replicas, the TiDB optimizer automatically determines whether to use TiFlash replicas based on the cost estimation. You can use the `desc` or `explain analyze` statement to check whether or not a TiFlash replica is selected. For example:

```
desc select count(*) from test.t;
```

```
+-------------------------+---------+--------------+--------------+-------------------
    ↪
| id                      | estRows | task         | access object | operator
    ↪ info            |
+-------------------------+---------+--------------+--------------+-------------------
    ↪

```

`cop[tiflash]` means that the task will be sent to TiFlash for processing. If you have not selected a TiFlash replica, you can try to update the statistics using the `analyze table` statement, and then check the result using the `explain analyze` statement.

Note that if a table has only a single TiFlash replica and the related node cannot provide service, queries in the CBO mode will repeatedly retry. In this situation, you need to specify the engine or use the manual hint to read data from the TiKV replica.

#### 14.3.3.2 Engine isolation

Engine isolation is to specify that all queries use a replica of the specified engine by configuring the corresponding variable. The optional engines are "tikv", "tidb" (indicates the internal memory table area of TiDB, which stores some TiDB system tables and cannot be actively used by users), and "tiflash".

You can specify the engines at the following two configuration levels:

- TiDB instance-level, namely, INSTANCE level. Add the following configuration item in the TiDB configuration file:

```
[isolation-read]
engines = ["tikv", "tidb", "tiflash"]
```

**The INSTANCE-level default configuration is `["tikv", "tidb", "tiflash"]` ↪ .**

- SESSION level. Use the following statement to configure:

```
set @@session.tidb_isolation_read_engines = "engine list separated by
    ↪ commas";
```

or

```
set SESSION tidb_isolation_read_engines = "engine list separated by
    ↪ commas";
```

The default configuration of the SESSION level inherits from the configuration of the TiDB INSTANCE level.

The final engine configuration is the session-level configuration, that is, the session-level configuration overrides the instance-level configuration. For example, if you have configured "tikv" in the INSTANCE level and "tiflash" in the SESSION level, then the TiFlash replicas are read. If the final engine configuration is "tikv" and "tiflash", then the TiKV and TiFlash replicas are both read, and the optimizer automatically selects a better engine to execute.

**Note:**

Because TiDB Dashboard and other components need to read some system tables stored in the TiDB memory table area, it is recommended to always add the "tidb" engine to the instance-level engine configuration.

If the queried table does not have a replica of the specified engine (for example, the engine is configured as "tiflash" but the table does not have a TiFlash replica), the query returns an error.

#### 14.3.3.3 Manual hint

Manual hint can force TiDB to use specified replicas for specific table(s) on the premise of satisfying engine isolation. Here is an example of using the manual hint:

```
select /*+ read_from_storage(tiflash[table_name]) */ ... from table_name;
```

If you set an alias to a table in a query statement, you must use the alias in the statement that includes a hint for the hint to take effect. For example:

```
select /*+ read_from_storage(tiflash[alias_a,alias_b]) */ ... from
    ↪ table_name_1 as alias_a, table_name_2 as alias_b where alias_a.
    ↪ column_1 = alias_b.column_2;
```

In the above statements, `tiflash[]` prompts the optimizer to read the TiFlash replicas. You can also use `tikv[]` to prompt the optimizer to read the TiKV replicas as needed. For hint syntax details, refer to READ_FROM_STORAGE.

If the table specified by a hint does not have a replica of the specified engine, the hint is ignored and a warning is reported. In addition, a hint only takes effect on the premise of engine isolation. If the engine specified in a hint is not in the engine isolation list, the hint is also ignored and a warning is reported.

**Note:**

The MySQL client of 5.7.7 or earlier versions clears optimizer hints by default. To use the hint syntax in these early versions, start the client with the `--comments` option, for example, `mysql -h 127.0.0.1 -P 4000 -uroot --comments`.

#### 14.3.3.4 The relationship of smart selection, engine isolation, and manual hint

In the above three ways of reading TiFlash replicas, engine isolation specifies the overall range of available replicas of engines; within this range, manual hint provides statement-level and table-level engine selection that is more fine-grained; finally, CBO makes the decision and selects a replica of an engine based on cost estimation within the specified engine list.

**Note:**

- Before v4.0.3, the behavior of reading from TiFlash replica in a non-read-only SQL statement (for example, `INSERT INTO ... SELECT`, `SELECT ... FOR UPDATE`, `UPDATE ...`, `DELETE ...`) is undefined.
- For versions from v4.0.3 to v6.2.0, internally TiDB ignores the TiFlash replica for a non-read-only SQL statement to guarantee the data correctness. That is, for smart selection, TiDB automatically selects the non-TiFlash replica; for engine isolation that specifies TiFlash replica **only**, TiDB reports an error; and for manual hint, TiDB ignores the hint.
- For versions from v6.3.0 to v6.5.x, if the TiFlash replica is enabled, you can use the `tidb_enable_tiflash_read_for_write_stmt` variable to control whether TiDB uses the TiFlash replica for a non-read-only SQL statement.

### 14.3.4 Use TiSpark to Read TiFlash Replicas

This document introduces how to use TiSpark to read TiFlash replicas.

Currently, you can use TiSpark to read TiFlash replicas in a method similar to the engine isolation in TiDB. This method is to configure the `spark.tispark.isolation_read_engines` parameter. The parameter value defaults to `tikv,tiflash`, which means that TiDB reads data from TiFlash or from TiKV according to CBO's selection. If you set the parameter value to `tiflash`, it means that TiDB forcibly reads data from TiFlash.

> **Note:**
>
> When this parameter is set to `tiflash`, only the TiFlash replicas of all tables involved in the query are read and these tables must have TiFlash replicas; for tables that do not have TiFlash replicas, an error is reported. When this parameter is set to `tikv`, only the TiKV replica is read.

You can configure this parameter in one of the following ways:

- Add the following item in the `spark-defaults.conf` file:

```
spark.tispark.isolation_read_engines tiflash
```

- Add `--conf spark.tispark.isolation_read_engines=tiflash` in the initialization command when initializing Spark shell or Thrift server.
- Set `spark.conf.set("spark.tispark.isolation_read_engines", "tiflash")` in Spark shell in a real-time manner.
- Set `set spark.tispark.isolation_read_engines=tiflash` in Thrift server after the server is connected via beeline.

### 14.3.5 Use TiFlash MPP Mode

This document introduces the MPP mode of TiFlash and how to use it.

TiFlash supports using the MPP mode to execute queries, which introduces cross-node data exchange (data shuffle process) into the computation. TiDB automatically determines whether to select the MPP mode using the optimizer's cost estimation. You can change the selection strategy by modifying the values of `tidb_allow_mpp` and `tidb_enforce_mpp`.

#### 14.3.5.1 Control whether to select the MPP mode

The `tidb_allow_mpp` variable controls whether TiDB can select the MPP mode to execute queries. The `tidb_enforce_mpp` variable controls whether the optimizer's cost estimation is ignored and the MPP mode of TiFlash is forcibly used to execute queries.

The results corresponding to all values of these two variables are as follows:

| | tidb_allow_mpp=off | tidb_allow_mpp=on (by default) |
|---|---|---|
| tidb_enforce_mpp=off (by default) | The MPP mode is not used. | The optimizer selects the MPP mode based on cost estimation. (by default) |
| tidb_enforce_mpp=on | The MPP mode is not used. | TiDB ignores the cost estimation and selects the MPP mode. |

For example, if you do not want to use the MPP mode, you can execute the following statements:

```
set @@session.tidb_allow_mpp=0;
```

If you want TiDB's cost-based optimizer to automatically decide whether to use the MPP mode (by default), you can execute the following statements:

```
set @@session.tidb_allow_mpp=1;
set @@session.tidb_enforce_mpp=0;
```

If you want TiDB to ignore the optimizer's cost estimation and to forcibly select the MPP mode, you can execute the following statements:

```
set @@session.tidb_allow_mpp=1;
set @@session.tidb_enforce_mpp=1;
```

The initial value of the `tidb_enforce_mpp` session variable is equal to the `enforce-mpp` configuration value of this tidb-server instance (which is `false` by default). If multiple tidb-server instances in a TiDB cluster only perform analytical queries and you want to make sure that the MPP mode is used on these instances, you can change their `enforce-mpp` configuration values to `true`.

> **Note:**
>
> When `tidb_enforce_mpp=1` takes effect, the TiDB optimizer will ignore the cost estimation to choose the MPP mode. However, if other factors block the MPP mode, TiDB will not select the MPP mode. These factors include the absence of TiFlash replica, unfinished replication of TiFlash replicas, and

statements containing operators or functions that are not supported by the MPP mode.

If TiDB optimizer cannot select the MPP mode due to reasons other than cost estimation, when you use the `EXPLAIN` statement to check out the execution plan, a warning is returned to explain the reason. For example:

```
set @@session.tidb_enforce_mpp=1;
create table t(a int);
explain select count(*) from t;
show warnings;
```

```
+---------+------+-----------------------------------------------------------------
   ↪
| Level   | Code | Message
   ↪
   ↪ |
+---------+------+-----------------------------------------------------------------
   ↪
| Warning | 1105 | MPP mode may be blocked because there aren't
   ↪  tiflash replicas of table `t`. |
+---------+------+-----------------------------------------------------------------
   ↪
```

#### 14.3.5.2 Algorithm support for the MPP mode

The MPP mode supports these physical algorithms: Broadcast Hash Join, Shuffled Hash Join, Shuffled Hash Aggregation, Union All, TopN, and Limit. The optimizer automatically determines which algorithm to be used in a query. To check the specific query execution plan, you can execute the `EXPLAIN` statement. If the result of the `EXPLAIN` statement shows ExchangeSender and ExchangeReceiver operators, it indicates that the MPP mode has taken effect.

The following statement takes the table structure in the TPC-H test set as an example:

```
explain select count(*) from customer c join nation n on c.c_nationkey=n.
   ↪ n_nationkey;
+--
   ↪ ----------------------------------------+-----------+--------------+-----------
   ↪
| id                                  | estRows   | task         | access
   ↪ object | operator info
   ↪                                                        |
+--
```

```
    ↪ ----------------------------------------+-----------+--------------+-----------
    ↪
| HashAgg_23                            | 1.00      | root         |
    ↪              | funcs:count(Column#16)->Column#15
    ↪                                    |
|  ─TableReader_25                      | 1.00      | root         |
    ↪              | data:ExchangeSender_24
    ↪                                                 |
|    ─ExchangeSender_24                 | 1.00      | mpp[tiflash] |
    ↪              | ExchangeType: PassThrough
    ↪                                                |
|      ─HashAgg_12                      | 1.00      | mpp[tiflash] |
    ↪              | funcs:count(1)->Column#16
    ↪                                               |
|        ─HashJoin_17                   | 3000000.00 | mpp[tiflash] |
    ↪           | inner join, equal:[eq(tpch.nation.n_nationkey, tpch.
    ↪ customer.c_nationkey)] |
|          ─ExchangeReceiver_21(Build) | 25.00     | mpp[tiflash] |
    ↪              |
    ↪                                                                    |
|            ─ExchangeSender_20         | 25.00     | mpp[tiflash] |
    ↪              | ExchangeType: Broadcast
    ↪                                                  |
|              ─TableFullScan_18        | 25.00     | mpp[tiflash] | table:n
    ↪    | keep order:false
    ↪ |
|          ─TableFullScan_22(Probe)     | 3000000.00 | mpp[tiflash] | table:c
    ↪   | keep order:false                                                  |
+--
    ↪ ----------------------------------------+-----------+--------------+-----------
    ↪
9 rows in set (0.00 sec)
```

In the example execution plan, the `ExchangeReceiver` and `ExchangeSender` operators are included. The execution plan indicates that after the `nation` table is read, the `ExchangeSender` operator broadcasts the table to each node, the `HashJoin` and `HashAgg` operations are performed on the `nation` table and the `customer` table, and then the results are returned to TiDB.

TiFlash provides the following two global/session variables to control whether to use Broadcast Hash Join:

- `tidb_broadcast_join_threshold_size`: The unit of the value is bytes. If the table size (in the unit of bytes) is less than the value of the variable, the Broadcast Hash Join algorithm is used. Otherwise, the Shuffled Hash Join algorithm is used.

- `tidb_broadcast_join_threshold_count`: The unit of the value is rows. If the objects of the join operation belong to a subquery, the optimizer cannot estimate the size of the subquery result set, so the size is determined by the number of rows in the result set. If the estimated number of rows in the subquery is less than the value of this variable, the Broadcast Hash Join algorithm is used. Otherwise, the Shuffled Hash Join algorithm is used.

#### 14.3.5.3 Access partitioned tables in the MPP mode

To access partitioned tables in the MPP mode, you need to enable dynamic pruning mode first.

Example:

```
mysql> DROP TABLE if exists test.employees;
Query OK, 0 rows affected, 1 warning (0.00 sec)

mysql> CREATE TABLE test.employees
(id int(11) NOT NULL,
 fname varchar(30) DEFAULT NULL,
 lname varchar(30) DEFAULT NULL,
 hired date NOT NULL DEFAULT '1970-01-01',
 separated date DEFAULT '9999-12-31',
 job_code int DEFAULT NULL,
 store_id int NOT NULL) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=
    ↪ utf8mb4_bin
PARTITION BY RANGE (store_id)
(PARTITION p0 VALUES LESS THAN (6),
 PARTITION p1 VALUES LESS THAN (11),
 PARTITION p2 VALUES LESS THAN (16),
 PARTITION p3 VALUES LESS THAN (MAXVALUE));
Query OK, 0 rows affected (0.10 sec)

mysql> ALTER table test.employees SET tiflash replica 1;
Query OK, 0 rows affected (0.09 sec)

mysql> SET tidb_partition_prune_mode=static;
Query OK, 0 rows affected (0.00 sec)

mysql> explain SELECT count(*) FROM test.employees;
+--
   ↪ ---------------------------------+----------+------------------+---------------
   ↪
| id                              | estRows | task           | access object
   ↪             | operator info                 |
+--
```

```
    ↪ ------------------------------+---------+-----------------+---------------
    ↪
| HashAgg_18                    | 1.00    | root            |
    ↪                             | funcs:count(Column#10)->Column#9 |
|  ─PartitionUnion_20           | 4.00    | root            |
    ↪                             |                                  |
|    ─StreamAgg_35              | 1.00    | root            |
    ↪                             | funcs:count(Column#12)->Column#10 |
|      ─TableReader_36          | 1.00    | root            |
    ↪                             | data:StreamAgg_26                |
|        ─StreamAgg_26          | 1.00    | batchCop[tiflash] |
    ↪                           | funcs:count(1)->Column#12        |
|          ─TableFullScan_34    | 10000.00 | batchCop[tiflash] | table:

```

#### 14.3.5.4 Known issues of MPP

In the current version, TiFlash uses the `start_ts` of a query as the unique key of the query. In most cases, the `start_ts` of each query can uniquely identify a query, but in the following cases, different queries have the same `start_ts`:

- All queries in the same transaction have the same `start_ts`.
- When you use `tidb_snapshot` to read data at a specific historical time point, the same time point is manually specified.
- When Stale Read is enabled, the same time point is manually specified.

When `start_ts` cannot uniquely represent the MPP query, if TiFlash detects that different queries have the same `start_ts` at a given time, TiFlash might report an error. Typical error cases are as follows:

- When multiple queries with the same `start_ts` are sent to TiFlash at the same time, you might encounter the `task has been registered` error.

- When multiple simple queries with `LIMIT` are executed continuously in the same transaction, once the `LIMIT` condition is met, TiDB sends a cancel request to TiFlash to cancel the query. This request also uses `start_ts` to identify the query to be canceled. If there are other queries with the same `start_ts` in TiFlash, these queries might be canceled by mistake. An example of this issue can be found in #43426.

This issue is fixed in TiDB v6.6.0. It is recommended to use the latest LTS version.

### 14.3.6 FastScan

> **Warning:**
>
> This feature is experimental and its form and usage may change in subsequent versions.

This document describes how to use FastScan to speed up queries in Online Analytical Processing (OLAP) scenarios.

By default, TiFlash guarantees the precision of query results and data consistency. With the feature FastScan, TiFlash provides more efficient query performance, but does not guarantee the accuracy of query results and data consistency.

Some OLAP scenarios allow for some tolerance to the accuracy of the query results. In these cases, if you need higher query performance, you can enable the FastScan feature at the session or global level. You can choose whether to enable the FastScan feature by configuring the variable `tiflash_fastscan`.

#### 14.3.6.1 Enable and disable FastScan

By default, the variable is `tiflash_fastscan=OFF` at the session level and global level, that is, the FastScan feature is not enabled. You can view the variable information by using the following statement.

```
show variables like 'tiflash_fastscan';

+------------------+-------+
| Variable_name  | Value |
+------------------+-------+
| tiflash_fastscan | OFF |
+------------------+-------+
```

```
show global variables like 'tiflash_fastscan';

+------------------+-------+
| Variable_name  | Value |
+------------------+-------+
| tiflash_fastscan | OFF |
+------------------+-------+
```

You can configure the variable `tiflash_fastscan` at the session level and global level. If you need to enable FastScan in the current session, you can do so with the following statement:

```
set session tiflash_fastscan=ON;
```

You can also set `tiflash_fastscan` at the global level. The new setting will take effect in new sessions, but will not take effect in the current and previous sessions. Besides, in new sessions, `tiflash_fastscan` of the session level and global level will both take the new value.

```
set global tiflash_fastscan=ON;
```

You can disable FastScan using the following statement.

```
set session tiflash_fastscan=OFF;
set global tiflash_fastscan=OFF;
```

#### 14.3.6.2 Mechanism of FastScan

Data in the storage layer of TiFlash is stored in two layers: Delta layer and Stable layer.

By default, FastScan is not enabled, and the TableScan operator processes data in the following steps:

1. Read data: create separate data streams in the Delta layer and Stable layer to read the respective data.
2. Sort Merge: merge the data streams created in step 1. Then return the data after sorting in (handle, version) order.
3. Range Filter: according to the data range, filter the data generated in step 2, and then return the data.
4. MVCC + Column Filter: filter the data generated in step 3 through MVCC and filter out unneeded columns, and then return the data.

FastScan gains faster query speed by sacrificing some data consistency. Step 2 and the MVCC part in step 4 in the normal scan process are omitted in FastScan, thus improving query performance.

### 14.3.7 Push-down Calculations Supported by TiFlash

This document introduces the push-down calculations supported by TiFlash.

#### 14.3.7.1 Push-down operators

TiFlash supports the push-down of the following operators:

- TableScan: Reads data from tables.
- Selection: Filters data.
- HashAgg: Performs data aggregation based on the Hash Aggregation algorithm.
- StreamAgg: Performs data aggregation based on the Stream Aggregation algorithm. SteamAgg only supports the aggregation without the `GROUP BY` condition.
- TopN: Performs the TopN calculation.
- Limit: Performs the limit calculation.
- Project: Performs the projection calculation.
- HashJoin: Performs the join calculation using the Hash Join algorithm, but with the following conditions:
    - The operator can be pushed down only in the MPP mode.
    - Supported joins are Inner Join, Left Join, Semi Join, Anti Semi Join, Left Semi Join, and Anti Left Semi Join.
    - The preceding joins support both Equi Join and Non-Equi Join (Cartesian Join). When calculating Cartesian Join, the Broadcast algorithm, instead of the Shuffle Hash Join algorithm, is used.
- Window functions: Currently, TiFlash supports `ROW_NUMBER()`, `RANK()`, `DENSE_RANK()`, `LEAD()`, and `LAG()`.

In TiDB, operators are organized in a tree structure. For an operator to be pushed down to TiFlash, all of the following prerequisites must be met:

- All of its child operators can be pushed down to TiFlash.
- If an operator contains expressions (most of the operators contain expressions), all expressions of the operator can be pushed down to TiFlash.

#### 14.3.7.2 Push-down expressions

TiFlash supports the following push-down expressions:

| Expression Type | Operations |
|---|---|
| Numeric functions and operators | +, -, /, *, %, >=, <=, =, !=, <, >, ROUND(), ABS(), FLOOR(int), CEIL(int), CEILING(int), SQRT(), LOG(), LOG2(), LOG10(), LN(), EXP(), POW(), SIGN(), RADIANS(), DEGREES(), CONV(), CRC32(), GREATEST(int/real), LEAST(int/real) |
| Logical functions and operators | AND, OR, NOT, CASE WHEN, IF(), IFNULL(), ISNULL(), IN, LIKE, COALESCE, IS |
| Bitwise operations | & (bitand), \| (bitor), ~ (bitneg), ^ (bitxor) |
| String functions | SUBSTR(), CHAR_LENGTH(), REPLACE(), CONCAT(), CONCAT_WS(), LEFT(), RIGHT(), ASCII(), LENGTH(), TRIM(), LTRIM(), RTRIM(), POSITION(), FORMAT(), LOWER(), UCASE(), UPPER(), SUBSTRING_INDEX(), LPAD(), RPAD(), STRCMP() |
| Regular expression functions and operators | REGEXP, REGEXP_LIKE(), REGEXP_INSTR(), REGEXP_SUBSTR(), RLIKE |
| Date functions | DATE_FORMAT(), TIMESTAMPDIFF(), FROM_UNIXTIME(), UNIX_TIMESTAMP(int), UNIX_TIMESTAMP(decimal), STR_TO_DATE(date), STR_TO_DATE(datetime), DATEDIFF(), YEAR(), MONTH(), DAY(), EXTRACT(datetime), DATE(), HOUR(), MICROSECOND(), MINUTE(), SECOND(), SYSDATE(), DATE_ADD/ADDDATE(datetime, int), DATE_ADD/ADDDATE(string, int/real), DATE_SUB/SUBDATE(datetime, int), DATE_SUB/SUBDATE(string, int/real), QUARTER(), DAYNAME(), DAYOFMONTH(), DAYOFWEEK(), DAYOFYEAR(), LAST_DAY(), MONTHNAME(), TO_SECONDS(), TO_DAYS(), FROM_DAYS(), WEEKOFYEAR() |
| JSON function | JSON_LENGTH(), ->, ->>, JSON_EXTRACT() |

| Expression Type | Operations |
|---|---|
| Conversion functions | `CAST(int AS DOUBLE)`, `CAST(int AS DECIMAL)`, `CAST(int AS STRING)`, `CAST(int AS TIME)`, `CAST(double AS INT)`, `CAST(double AS DECIMAL)`, `CAST(double AS STRING)`, `CAST(double AS TIME)`, `CAST(string AS INT)`, `CAST(string AS DOUBLE)`, `CAST(string AS DECIMAL)`, `CAST(string AS TIME)`, `CAST(decimal AS INT)`, `CAST(decimal AS STRING)`, `CAST(decimal AS TIME)`, `CAST(time AS INT)`, `CAST(time AS DECIMAL)`, `CAST(time AS STRING)`, `CAST(time AS REAL)` |
| Aggregate functions | `MIN()`, `MAX()`, `SUM()`, `COUNT()`, `AVG()`, `APPROX_COUNT_DISTINCT()`, `GROUP_CONCAT()` |
| Miscellaneous functions | `INET_NTOA()`, `INET_ATON()`, `INET6_NTOA()`, `INET6_ATON()` |

#### 14.3.7.3 Restrictions

- Expressions that contain the Bit, Set, and Geometry types cannot be pushed down to TiFlash.
- The `DATE_ADD()`, `DATE_SUB()`, `ADDDATE()`, and `SUBDATE()` functions support the following interval types only. If other interval types are used, TiFlash reports errors.
    - DAY
    - WEEK
    - MONTH
    - YEAR
    - HOUR
    - MINUTE
    - SECOND
- Window functions with the `ROWS` or `RANGE` type of frame cannot be pushed down to TiFlash.

If a query encounters unsupported push-down calculations, TiDB needs to complete the remaining calculations, which might greatly affect the TiFlash acceleration effect. The currently unsupported operators and expressions might be supported in future versions.

Functions like `MAX()` are supported for push-down when used as aggregate functions, but not as window functions.

#### 14.3.7.4 Examples

This section provides some examples of pushing down operators and expressions to TiFlash.

##### 14.3.7.4.1 Example 1: Push operators down to TiFlash

```
CREATE TABLE t(id INT PRIMARY KEY, a INT);
ALTER TABLE t SET TIFLASH REPLICA 1;

EXPLAIN SELECT * FROM t LIMIT 3;

+--
    ↪ ---------------------------+---------+-------------+---------------+----------
    ↪
| id                          | estRows | task      | access object | operator
    ↪ info            |
+--
    ↪ ---------------------------+---------+-------------+---------------+----------
    ↪
| Limit_9                     | 3.00    | root        |               | offset:0,
    ↪ count:3          |
|  ─TableReader_17            | 3.00    | root        |               | data:
    ↪ ExchangeSender_16     |
|    ─ExchangeSender_16       | 3.00    | mpp[tiflash] |              |
    ↪ ExchangeType: PassThrough  |
|      ─Limit_15              | 3.00    | mpp[tiflash] |              | offset:0,
    ↪ count:3          |
|        ─TableFullScan_14    | 3.00    | mpp[tiflash] | table:t      | keep order
    ↪ :false, stats:pseudo |
+--
    ↪ ---------------------------+---------+-------------+---------------+----------
    ↪
5 rows in set (0.18 sec)
```

In the preceding example, the operator `Limit` is pushed down to TiFlash for filtering data, which helps reduce the amount of data to be transferred over the network and reduce the network overhead. This is indicated by the `mpp[tiflash]` value of the `task` column on the row of the `Limit_15` operator.

#### 14.3.7.4.2 Example 2: Push expressions down to TiFlash

```
CREATE TABLE t(id INT PRIMARY KEY, a INT);
ALTER TABLE t SET TIFLASH REPLICA 1;
INSERT INTO t(id,a) VALUES (1,2),(2,4),(11,2),(12,4),(13,4),(14,7);

EXPLAIN SELECT MAX(id + a) FROM t GROUP BY a;

+--
   ↪ ----------------------------------+---------+-------------+---------------+----
   ↪
| id                                | estRows | task      | access object |
   ↪ operator info                                                  |
+--
   ↪ ----------------------------------+---------+-------------+---------------+----
   ↪
| TableReader_45                    | 4.80    | root        |               | data:
   ↪ ExchangeSender_44                                                |
|  ─ExchangeSender_44               | 4.80    | mpp[tiflash] |              |
   ↪ ExchangeType: PassThrough                                          |
|    ─Projection_39                 | 4.80    | mpp[tiflash] |              |
   ↪ Column#3                                                           |
|      ─HashAgg_37                  | 4.80    | mpp[tiflash] |              |
   ↪ group by:Column#9, funcs:max(Column#8)->Column#3                   |
|        ─Projection_46             | 6.00    | mpp[tiflash] |              | plus
   ↪ (test.t.id, test.t.a)->Column#8, test.t.a                          |
|          ─ExchangeReceiver_23     | 6.00    | mpp[tiflash] |              |
   ↪                                                                    |
|            ─ExchangeSender_22     | 6.00    | mpp[tiflash] |              |
   ↪ ExchangeType: HashPartition, Hash Cols: [name: test.t.a, collate:
   ↪ binary] |
|              ─TableFullScan_21    | 6.00    | mpp[tiflash] | table:t     | keep
   ↪  order:false, stats:pseudo                                         |
+--
   ↪ ----------------------------------+---------+-------------+---------------+----
   ↪
8 rows in set (0.18 sec)
```

In the preceding example, the expression `id + a` is pushed down to TiFlash for calculation in advance. This helps reduce the amount of data to be transferred over the network, thus reducing the network transmission overhead and improving the overall calculation performance. This is indicated by the `mpp[tiflash]` value in the `task` column of the row where the `operator` column has the `plus(test.t.id, test.t.a)` value.

#### 14.3.7.4.3 Example 3: Restrictions for pushdown

```
CREATE TABLE t(id INT PRIMARY KEY, a INT);
ALTER TABLE t SET TIFLASH REPLICA 1;
INSERT INTO t(id,a) VALUES (1,2),(2,4),(11,2),(12,4),(13,4),(14,7);

EXPLAIN SELECT id FROM t WHERE TIME(now()+ a) < '12:00:00';

+--
   ↪ ---------------------------+---------+-------------+---------------+----------
   ↪
| id                          | estRows | task        | access object | operator
   ↪ info
   ↪                                                                              |
+--
   ↪ ---------------------------+---------+-------------+---------------+----------
   ↪
| Projection_4                | 4.80    | root        |               | test.t.id
   ↪
   ↪ |
|  ─Selection_6               | 4.80    | root        |               | lt(cast(
   ↪ time(cast(plus(20230110083056, test.t.a), var_string(20))),
   ↪ var_string(10)), "12:00:00") |
|    ─TableReader_11          | 6.00    | root        |               | data:
   ↪ ExchangeSender_10
   ↪                                                                                 |
|      ─ExchangeSender_10     | 6.00    | mpp[tiflash] |              |
   ↪ ExchangeType: PassThrough
   ↪                                                                   |
|        ─TableFullScan_9     | 6.00    | mpp[tiflash] | table:t      | keep order:
   ↪ false, stats:pseudo
   ↪                                                                 |
+--
   ↪ ---------------------------+---------+-------------+---------------+----------
   ↪
5 rows in set, 3 warnings (0.20 sec)
```

The preceding example only performs `TableFullScan` on TiFlash. Other functions are calculated and filtered on `root` and are not pushed down to TiFlash.

You can identify the operators and expressions that cannot be pushed down to TiFlash by running the following command:

```
SHOW WARNINGS;

+--
   ↪ -------+------+-----------------------------------------------------------------
```

```
    ↪
| Level   | Code | Message
    ↪
    ↪ |
+--
    ↪ -------+------+-------------------------------------------------------------
    ↪
| Warning | 1105 | Scalar function 'time'(signature: Time, return type:
    ↪ time) is not supported to push down to storage layer now.  |
| Warning | 1105 | Scalar function 'cast'(signature: CastDurationAsString,
    ↪ return type: var_string(10)) is not supported to push down to tiflash
    ↪  now. |
| Warning | 1105 | Scalar function 'cast'(signature: CastDurationAsString,
    ↪ return type: var_string(10)) is not supported to push down to tiflash
    ↪  now. |
+--
    ↪ -------+------+-------------------------------------------------------------
    ↪
3 rows in set (0.18 sec)
```

The expressions in the preceding example cannot be completely pushed down to TiFlash, because the functions `Time` and `Cast` cannot be pushed down to TiFlash.

#### 14.3.7.4.4 Example 4: Window functions

```
CREATE TABLE t(id INT PRIMARY KEY, c1 VARCHAR(100));
ALTER TABLE t SET TIFLASH REPLICA 1;
INSERT INTO t VALUES(1,"foo"),(2,"bar"),(3,"bar foo"),(10,"foo"),(20,"bar")
    ↪ ,(30,"bar foo");

EXPLAIN SELECT id, ROW_NUMBER() OVER (PARTITION BY id > 10) FROM t;
+--
    ↪ ------------------------------+---------+-------------+---------------+-----
    ↪
| id                            | estRows | task        | access object |
    ↪ operator info
    ↪
    ↪ |
+--
    ↪ ------------------------------+---------+-------------+---------------+-----
    ↪
| TableReader_30                | 10000.00 | root       |               |
    ↪ MppVersion: 1, data:ExchangeSender_29
    ↪                                                                  |
```

```
|  ─ExchangeSender_29          | 10000.00 | mpp[tiflash] |          |
   ↪ ExchangeType: PassThrough
   ↪
   ↪ |
|    ─Projection_7             | 10000.00 | mpp[tiflash] |          | test.
   ↪ t.id, Column#5, stream_count: 4
   ↪                                                                 |
|      ─Window_28              | 10000.00 | mpp[tiflash] |          |
   ↪ row_number()->Column#5 over(partition by Column#4 rows between
   ↪ current row and current row), stream_count: 4 |
|        ─Sort_14              | 10000.00 | mpp[tiflash] |          |
   ↪ Column#4, stream_count: 4
   ↪
   ↪ |
|          ─ExchangeReceiver_13 | 10000.00 | mpp[tiflash] |          |
   ↪ stream_count: 4
   ↪
   ↪ |
|            ─ExchangeSender_12 | 10000.00 | mpp[tiflash] |          |
   ↪ ExchangeType: HashPartition, Compression: FAST, Hash Cols: [name:
   ↪ Column#4, collate: binary], stream_count: 4 |
|              ─Projection_10   | 10000.00 | mpp[tiflash] |          | test.
   ↪ t.id, gt(test.t.id, 10)->Column#4
   ↪                                                               |
|                ─TableFullScan_11 | 10000.00 | mpp[tiflash] | table:t | keep
   ↪  order:false, stats:pseudo
   ↪                                                                |
+--
   ↪ ---------------------------------+----------+--------------+---------------+-----
   ↪
9 rows in set (0.0073 sec)
```

In this output, you can see that the `Window` operation has a value of `mpp[tiflash]` in the `task` column, indicating that the `ROW_NUMBER()OVER (PARTITION BY id > 10)` operation can be pushed down to TiFlash.

```
CREATE TABLE t(id INT PRIMARY KEY, c1 VARCHAR(100));
ALTER TABLE t SET TIFLASH REPLICA 1;
INSERT INTO t VALUES(1,"foo"),(2,"bar"),(3,"bar foo"),(10,"foo"),(20,"bar")
   ↪ ,(30,"bar foo");

EXPLAIN SELECT id, MAX(id) OVER (PARTITION BY id > 10) FROM t;
+--
   ↪ ---------------------------+----------+----------+--------------+------------
   ↪
```

```
| id                        | estRows | task     | access object | operator
    ↪ info                                       |
+--
    ↪ -------------------------+---------+----------+---------------+------------
    ↪
| Projection_6              | 10000.00 | root    |               | test.t1.id,
    ↪ Column#5                                   |
|  ─Shuffle_14              | 10000.00 | root    |               | execution

    ↪
7 rows in set (0.0010 sec)
```

In this output, you can see that the `Window` operation has a value of `root` in the `task` ↪ column, indicating that the `MAX(id)OVER (PARTITION BY id > 10)` operation cannot be pushed down to TiFlash. This is because `MAX()` is only supported for push-down as an aggregate function and not as a window function.

### 14.3.8 TiFlash Query Result Materialization

> **Warning:**
>
> This is an experimental feature, which might be changed or removed without prior notice. The syntax and implementation might be modified before GA. If you encounter any problems, you can report an issue on GitHub.

This document introduces how to save the TiFlash query result to a specified TiDB table in an `INSERT INTO SELECT` transaction.

Starting from v6.5.0, TiDB supports saving TiFlash query results in a table, that is, TiFlash query result materialization. During the execution of the `INSERT INTO SELECT`

statement, if TiDB pushes down the SELECT subquery to TiFlash, the TiFlash query result can be saved to a TiDB table specified in the INSERT INTO clause. For TiDB versions earlier than v6.5.0, the TiFlash query results are read-only, so if you want to save TiFlash query results, you have to obtain them from the application level, and then save them in a separate transaction or process.

**Note:**

- By default (tidb_allow_mpp = ON), the TiDB optimizer intelligently chooses to push down queries to TiKV or TiFlash based on the query cost. To enforce that the queries are pushed down to TiFlash, you can set the system variable tidb_enforce_mpp to ON.
- During the experimental phase, this feature is disabled by default. To enable this feature, you can set the system variable tidb_enable_tiflash_read_for_write_stmt to ON.

The syntax of INSERT INTO SELECT is as follows.

```
INSERT [LOW_PRIORITY | HIGH_PRIORITY] [IGNORE]
    [INTO] tbl_name
    [PARTITION (partition_name [, partition_name] ...)]
    [(col_name [, col_name] ...)]
    SELECT ...
    [ON DUPLICATE KEY UPDATE assignment_list]value:
    {expr | DEFAULT}

assignment:
    col_name = valueassignment_list:
    assignment [, assignment] ...
```

For example, you can save the query result from table t1 in the SELECT clause to table t2 using the following INSERT INTO SELECT statement:

```
INSERT INTO t2 (name, country)
SELECT app_name, country FROM t1;
```

#### 14.3.8.1 Typical and recommended usage scenarios

- Efficient BI solutions

  For many BI applications, the analysis query requests are very heavy. For example, when a lot of users access and refresh a report at the same time, a BI application needs

to handle a lot of concurrent query requests. To deal with this situation effectively, you can use `INSERT INTO SELECT` to save the query results of the report in a TiDB table. Then, the end users can query data directly from the result table when the report is refreshed, which avoids multiple repeated computations and analyses. Similarly, by saving historical analysis results, you can further reduce the computation volume for long-time historical data analysis. For example, if you have a report `A` that is used to analyze daily sales profit, you can save the results of report `A` to a result table `T` using `INSERT INTO SELECT`. Then, when you need to generate a report `B` to analyze the sales profit of the past month, you can directly use the daily analysis results in table `T`. This way not only greatly reduces the computation volume but also improves the query response speed and reduces the system load.

- Serving online applications with TiFlash

  The number of concurrent requests supported by TiFlash depends on the volume of data and complexity of the queries, but it typically does not exceed 100 QPS. You can use `INSERT INTO SELECT` to save TiFlash query results, and then use the query result table to support highly concurrent online requests. The data in the result table can be updated in the background at a low frequency (for example, at an interval of 0.5 second), which is well below the TiFlash concurrency limit, while still maintaining a high level of data freshness.

#### 14.3.8.2 Execution process

- During the execution of the `INSERT INTO SELECT` statement, TiFlash first returns the query results of the `SELECT` clause to a TiDB server in the cluster, and then writes the results to the target table, which can have a TiFlash replica.
- The execution of the `INSERT INTO SELECT` statement guarantees ACID properties.

#### 14.3.8.3 Restrictions

- The TiDB memory limit on the `INSERT INTO SELECT` statement can be adjusted using the system variable `tidb_mem_quota_query`. Starting from v6.5.0, it is not recommended to use `txn-total-size-limit` to control transaction memory size.

  For more information, see TiDB memory control.

- TiDB has no hard limit on the concurrency of the `INSERT INTO SELECT` statement, but it is recommended to consider the following practices:

  - When a "write transaction" is large, such as close to 1 GiB, it is recommended to control concurrency to no more than 10.
  - When a "write transaction" is small, such as less than 100 MiB, it is recommended to control concurrency to no more than 30.
  - Determine the concurrency based on testing results and specific circumstances.

#### 14.3.8.4 Example

Data definition:

```
CREATE TABLE detail_data (
    ts DATETIME,              -- Fee generation time
    customer_id VARCHAR(20), -- Customer ID
    detail_fee DECIMAL(20,2)); -- Amount of fee

CREATE TABLE daily_data (
    rec_date DATE,            -- Date when data is collected
    customer_id VARCHAR(20), -- Customer ID
    daily_fee DECIMAL(20,2)); -- Amount of fee for per day

ALTER TABLE detail_data SET TIFLASH REPLICA 1;
ALTER TABLE daily_data SET TIFLASH REPLICA 1;

-- ... (detail_data table continues updating)
INSERT INTO detail_data(ts,customer_id,detail_fee) VALUES
('2023-1-1 12:2:3', 'cus001', 200.86),
('2023-1-2 12:2:3', 'cus002', 100.86),
('2023-1-3 12:2:3', 'cus002', 2200.86),
('2023-1-4 12:2:3', 'cus003', 2020.86),
('2023-1-5 12:2:3', 'cus003', 1200.86),
('2023-1-6 12:2:3', 'cus002', 20.86);
```

Save daily analysis results:

```
SET @@tidb_enable_tiflash_read_for_write_stmt=ON;

INSERT INTO daily_data (rec_date, customer_id, daily_fee)
SELECT DATE(ts), customer_id, sum(detail_fee) FROM detail_data WHERE DATE(
    ↪ ts) = CURRENT_DATE() GROUP BY DATE(ts), customer_id;
```

Analyze monthly data based on daily analysis data:

```
SELECT MONTH(rec_date), customer_id, sum(daily_fee) FROM daily_data GROUP
    ↪ BY MONTH(rec_date), customer_id;
```

The preceding example materializes the daily analysis results and saves them to the daily result table, based on which the monthly data analysis is accelerated, thus improving data analysis efficiency.

### 14.3.9 TiFlash Data validation

This document introduces the data validation mechanism and tools for TiFlash.

Data corruptions are usually caused by serious hardware failures. In such cases, even if you attempt to manually recover data, your data become less reliable.

To ensure data integrity, by default, TiFlash performs basic data validation on data files, using the `City128` algorithm. In the event of any data validation failure, TiFlash immediately reports an error and exits, avoiding secondary disasters caused by inconsistent data. At this time, you need to manually intervene and replicate the data again before you can restore the TiFlash node.

Starting from v5.4.0, TiFlash introduces more advanced data validation features. TiFlash uses the `XXH3` algorithm by default and allows you to customize the validation frame and algorithm.

#### 14.3.9.1 Validation mechanism

The validation mechanism builds upon the DeltaTree File (DTFile). DTFile is the storage file that persists TiFlash data. DTFile has three formats:

| Version | State | Validation mechanism | Notes |
| --- | --- | --- | --- |
| V1 | Deprecated | Hashes are embedded in data files. | |
| V2 | Default for versions < v6.0.0 | Hashes are embedded in data files. | Compared to V1, V2 adds statistics of column data. |

| Version | State | Validation mechanism | Notes |
|---|---|---|---|
| V3 | Default for versions >= v6.0.0 | V3 contains metadata and token data checksum, and supports multiple hash algorithms. | New in v5.4.0. |

DTFile is stored in the `stable` folder in the data file directory. All formats currently enabled are in folder format, which means the data is stored in multiple files under a folder with a name like `dmf_<file id>`.

#### 14.3.9.1.1 Use data validation

TiFlash supports both automatic and manual data validation:

- Automatic data validation:
  - v6.0.0 and later versions use the V3 validation mechanism by default.
  - Versions earlier than v6.0.0 use the V2 validation mechanism by default.
  - To manually switch the validation mechanism, refer to TiFlash configuration file. However, the default configuration is verified by tests and therefore recommended.
- Manual data validation. Refer to `DTTool inspect`.

**Warning:**

After you enable the V3 validation mechanism, the newly generated DTFile cannot be directly read by TiFlash earlier than v5.4.0. Since v5.4.0, TiFlash supports both V2 and V3 and does not actively upgrade or downgrade versions. If you need to upgrade or downgrade versions for existing files, you need to manually switch versions.

#### 14.3.9.1.2 Validation tool

In addition to automatic data validation performed when TiFlash reads data, a tool for manually checking data integrity is introduced in v5.4.0. For details, refer to DTTool.

### 14.3.10 TiFlash MinTSO Scheduler

The TiFlash MinTSO scheduler is a distributed scheduler for MPP (Massively Parallel Processing) tasks in TiFlash. This document describes the implementation principles of the TiFlash MinTSO scheduler.

#### 14.3.10.1 Background

When processing an MPP query, TiDB splits the query into one or more MPP tasks and sends these MPP tasks to the corresponding TiFlash nodes for compilation and execution. TiFlash needs to use several threads to execute each MPP task, with the specific number of threads depending on the complexity of the MPP task and the concurrency parameters set in TiFlash.

In high concurrency scenarios, TiFlash nodes receive multiple MPP tasks simultaneously. If the execution of MPP tasks is not controlled, the number of threads that TiFlash needs to request from the system will increase linearly along with the increasing number of MPP tasks. Too many threads can affect the execution efficiency of TiFlash, and because the operating system itself supports a limited number of threads, TiFlash will encounter errors when it requests more threads than the operating system can provide.

To improve TiFlash's processing capability in high concurrency scenarios, an MPP task scheduler needs to be introduced into TiFlash.

#### 14.3.10.2 Implementation principles

As mentioned in the background, the initial purpose of introducing the TiFlash task scheduler is to control the number of threads used during MPP query execution. A simple scheduling strategy is to specify the maximum number of threads TiFlash can request. For each MPP task, the scheduler decides whether the MPP task can be scheduled based on the

current number of threads used by the system and the expected number of threads the MPP task will use:

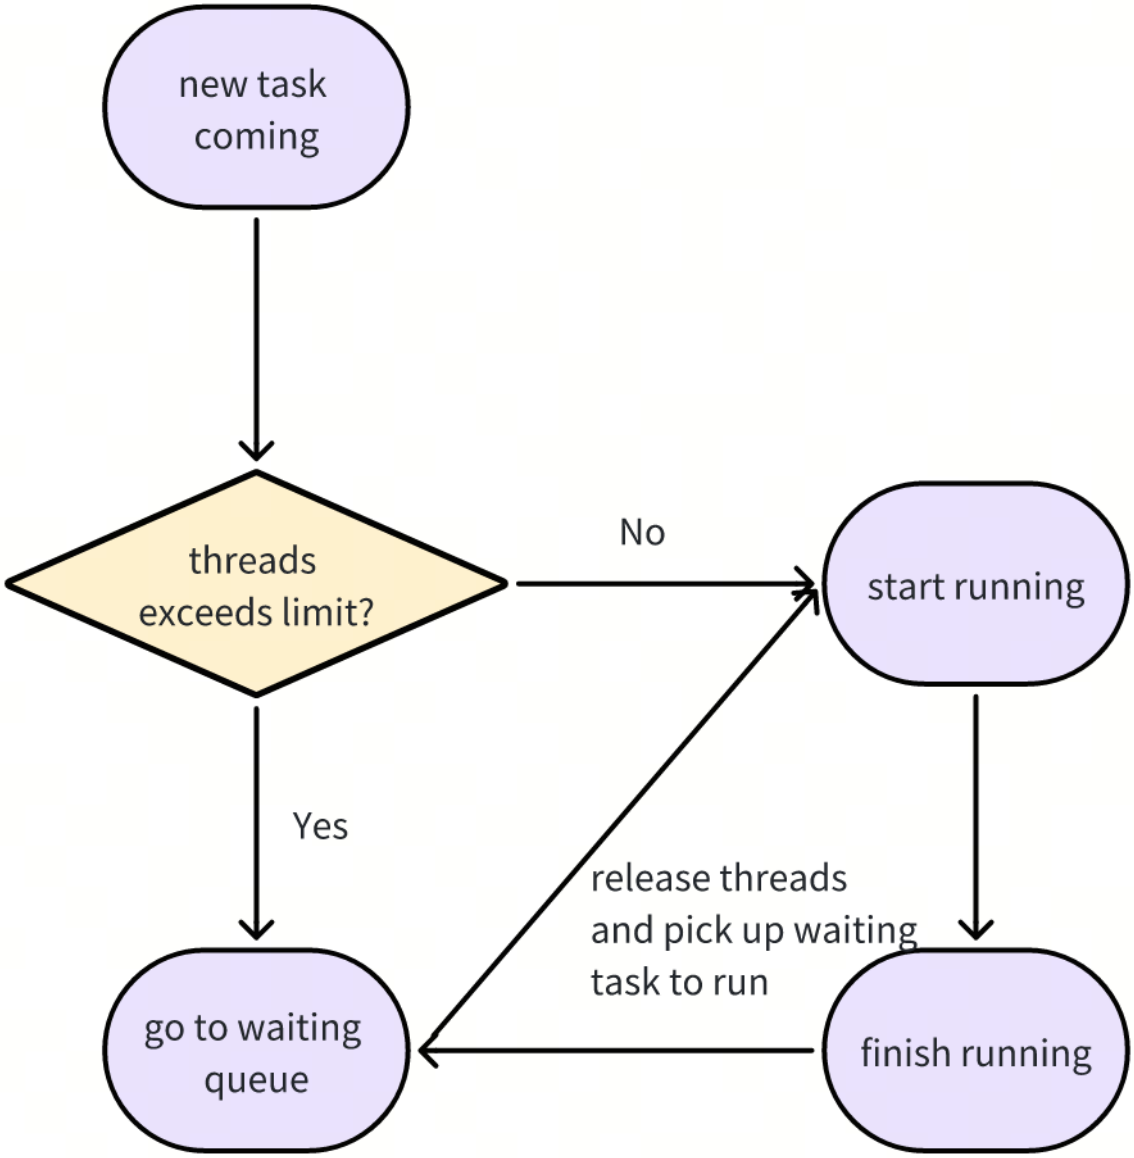

Figure 374: TiFlash MinTSO Scheduler v1

Although the preceding scheduling strategy can effectively control the number of system threads, an MPP task is not the smallest independent execution unit, and dependencies exist between different MPP tasks:

```
EXPLAIN SELECT count(*) FROM t0 a JOIN t0 b ON a.id = b.id;
```

```
+-------------------------------------------+----------+--------------+---------------+
   ↪
| id                                        | estRows | task         | access
   ↪ object | operator info                                          |

|            ─Selection_24(Probe)           | 9990.00 | mpp[tiflash] |
   ↪              | not(isnull(test.t0.id))                            |
|              ─TableFullScan_23            | 10000.00 | mpp[tiflash] | table:b
   ↪   | pushed down filter:empty, keep order:false, stats:pseudo |
+-------------------------------------------+----------+--------------+---------------+
   ↪
```

For example, the preceding query generates two MPP tasks on each TiFlash node, where the MPP task containing the `ExchangeSender_45` executor depends on the MPP task containing the `ExchangeSender_21` executor. In high concurrency scenarios, if the scheduler schedules the MPP task containing `ExchangeSender_45` for each query, the system will enter a deadlock state.

To avoid deadlock, TiFlash introduces the following two levels of thread limits:

- thread_soft_limit: used to limit the number of threads used by the system. For specific MPP tasks, this limit can be broken to avoid deadlock.
- thread_hard_limit: used to protect the system. Once the number of threads used by the system exceeds the hard limit, TiFlash will report an error to avoid deadlock.

The soft limit and hard limit work together to avoid deadlock as follows: the soft limit restricts the total number of threads used by all queries, enabling full use of resources while avoiding thread resource exhaustion; the hard limit ensures that in any situation, at least one query in the system can break the soft limit and continue to acquire thread resources and run, thus avoiding deadlock. As long as the number of threads does not exceed the hard limit, there will always be one query in the system where all its MPP tasks can be executed normally, thus preventing deadlock.

The goal of the MinTSO scheduler is to control the number of system threads while ensuring that there is always one and only one special query in the system, where all its MPP tasks can be scheduled. The MinTSO scheduler is a fully distributed scheduler, with each TiFlash node scheduling MPP tasks based only on its own information. Therefore, all MinTSO schedulers on TiFlash nodes need to identify the same "special" query. In TiDB, each query carries a read timestamp (`start_ts`), and the MinTSO scheduler defines the "special" query as the query with the smallest `start_ts` on the current TiFlash node. Based on the principle that the global minimum is also the local minimum, the "special" query selected by all TiFlash nodes must be the same, called the MinTSO query.

The scheduling process of the MinTSO Scheduler is as follows:

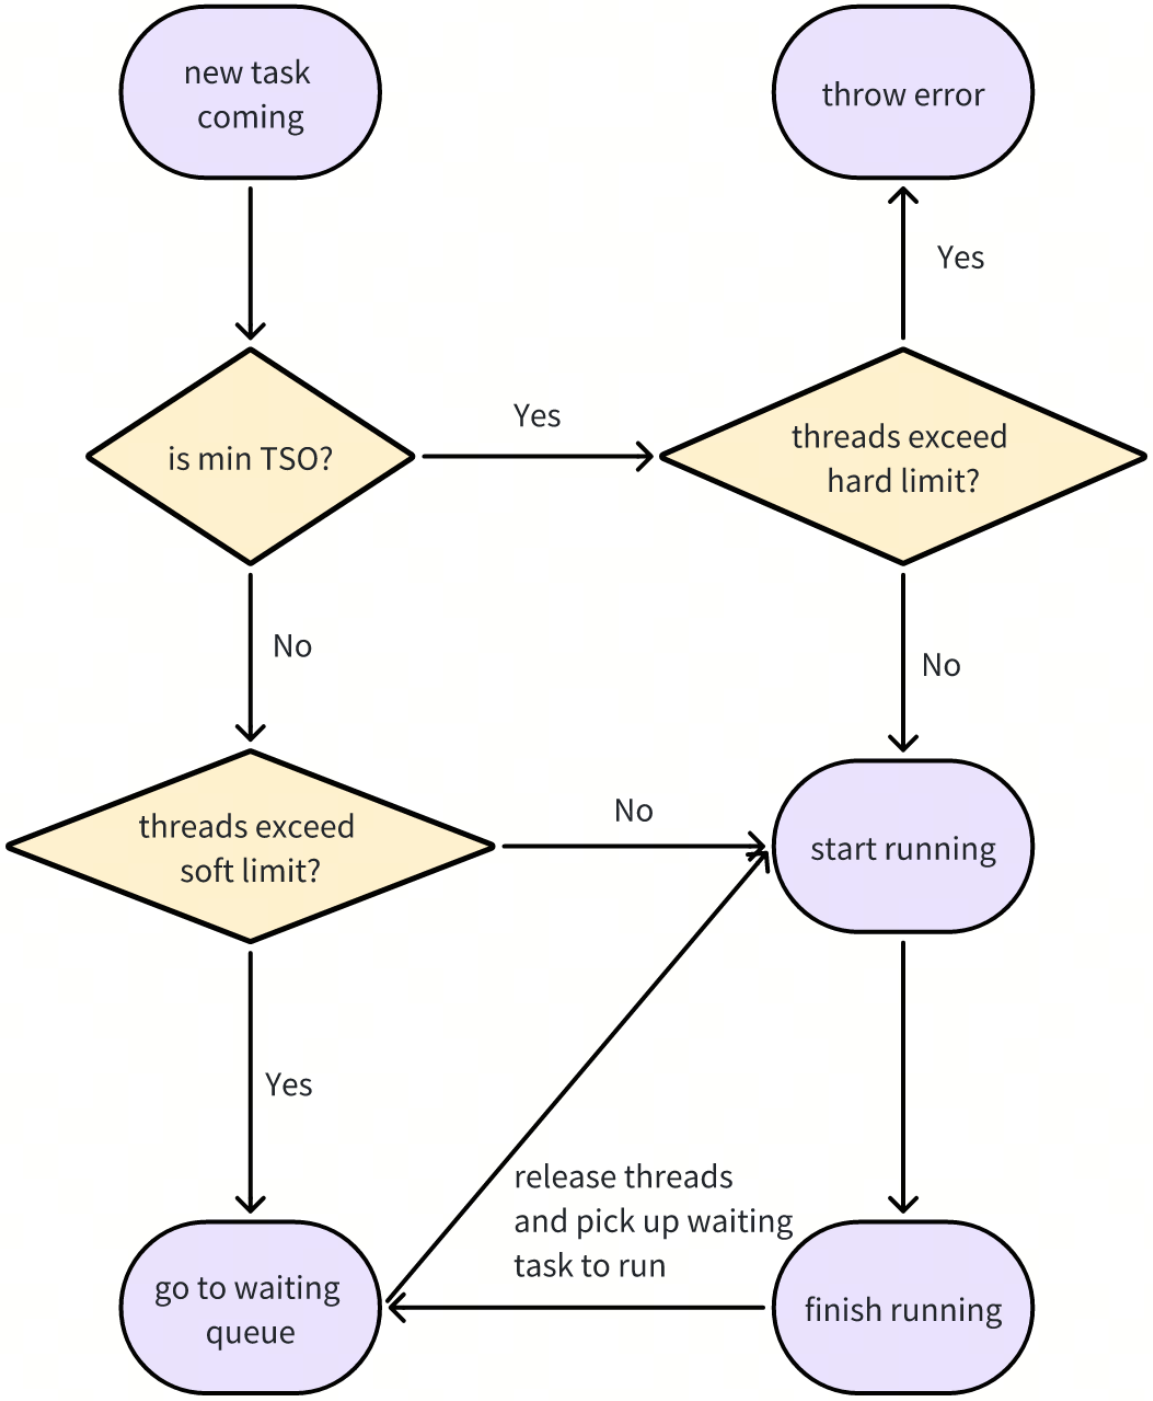

Figure 375: TiFlash MinTSO Scheduler v2

By introducing soft limit and hard limit, the MinTSO scheduler effectively avoids system deadlock while controlling the number of system threads. In high concurrency scenar-

ios, however, most queries might only have part of their MPP tasks scheduled. Queries with only part of MPP tasks scheduled cannot execute normally, leading to low system execution efficiency. To avoid this situation, TiFlash introduces a query-level limit for the MinTSO scheduler, called active_set_soft_limit. This limit allows only MPP tasks of up to active_set_soft_limit queries to participate in scheduling; MPP tasks of other queries do not participate in scheduling, and only after the current queries finish can new queries participate in scheduling. This limit is only a soft limit because for the MinTSO query, all its MPP tasks can be scheduled directly as long as the number of system threads does not exceed the hard limit.

- Configure TiFlash: learn how to configure the MinTSO scheduler.

### 14.3.11 TiFlash Compatibility Notes

TiFlash is incompatible with TiDB in the following situations:

- In the TiFlash computation layer:
  - Checking overflowed numerical values is not supported. For example, adding two maximum values of the `BIGINT` type `9223372036854775807 + 9223372036854775807`. The expected behavior of this calculation in TiDB is to return the `ERROR 1690 (22003): BIGINT value is out of range` error. However, if this calculation is performed in TiFlash, an overflow value of `-2` is returned without any error.
  - The window function is not supported.
  - Reading data from TiKV is not supported.
  - Currently, the `sum` function in TiFlash does not support the string-type argument. But TiDB cannot identify whether any string-type argument has been passed into the `sum` function during the compiling. Therefore, when you execute statements similar to `select sum(string_col)from t`, TiFlash returns the `[FLASH:Coprocessor:Unimplemented] CastStringAsReal is not supported .` error. To avoid such an error in this case, you need to modify this SQL statement to `select sum(cast(string_col as double))from t`.
  - Currently, TiFlash's decimal division calculation is incompatible with that of TiDB. For example, when dividing decimal, TiFlash performs the calculation always using the type inferred from the compiling. However, TiDB performs this calculation using a type that is more precise than that inferred from the compiling. Therefore, some SQL statements involving the decimal division return different execution results when executed in TiDB + TiKV and in TiDB + TiFlash. For example:

```
mysql> create table t (a decimal(3,0), b decimal(10, 0));
Query OK, 0 rows affected (0.07 sec)
mysql> insert into t values (43, 1044774912);
Query OK, 1 row affected (0.03 sec)
mysql> alter table t set tiflash replica 1;
Query OK, 0 rows affected (0.07 sec)
mysql> set session tidb_isolation_read_engines='tikv';
Query OK, 0 rows affected (0.00 sec)
mysql> select a/b, a/b + 0.0000000000001 from t where a/b;
+--------+-----------------------+
| a/b    | a/b + 0.0000000000001 |
+--------+-----------------------+
| 0.0000 |     0.0000000410001 |
+--------+-----------------------+
1 row in set (0.00 sec)
mysql> set session tidb_isolation_read_engines='tiflash';
Query OK, 0 rows affected (0.00 sec)
mysql> select a/b, a/b + 0.0000000000001 from t where a/b;
Empty set (0.01 sec)
```

In the example above, `a/b`'s inferred type from the compiling is `Decimal(7,4)` both in TiDB and in TiFlash. Constrained by `Decimal(7,4)`, `a/b`'s returned type should be `0.0000`. In TiDB, `a/b`'s runtime precision is higher than `Decimal(7,4)`, so the original table data is not filtered by the `where a/b` condition. However, in TiFlash, the calculation of `a/b` uses `Decimal(7,4)` as the result type, so the original table data is filtered by the `where a/b` condition.

## 14.4 System Variables

TiDB system variables behave similar to MySQL, in that settings apply on a `SESSION` or `GLOBAL` scope:

- Changes on a `SESSION` scope will only affect the current session.
- Changes on a `GLOBAL` scope apply immediately. If this variable is also`SESSION` scoped, all sessions (including your session) will continue to use their current session value.
- Changes are made using the SET statement:

```
## These two identical statements change a session variable
SET tidb_distsql_scan_concurrency = 10;
SET SESSION tidb_distsql_scan_concurrency = 10;

## These two identical statements change a global variable
SET @@global.tidb_distsql_scan_concurrency = 10;
SET GLOBAL tidb_distsql_scan_concurrency = 10;
```

**Note:**

Several `GLOBAL` variables persist to the TiDB cluster. Some variables in this document have a `Persists to cluster` setting, which can be configured to `Yes` or `No`.

- For variables with the `Persists to cluster: Yes` setting, when a global variable is changed, a notification is sent to all TiDB servers to refresh their system variable cache. When you add additional TiDB servers or restart existing TiDB servers, the persisted configuration value is automatically used.
- For variables with the `Persists to cluster: No` setting, changes only apply to the local TiDB instance that you are connected to. To retain any values set, you need to specify the variables in your `tidb.toml` configuration file.

Additionally, TiDB presents several MySQL variables as both readable and settable. This is required for compatibility, because it is common for both applications and connectors to read MySQL variables. For example, JDBC connectors both read and set query cache settings, despite not relying on the behavior.

**Note:**

Larger values do not always yield better performance. It is also important to consider the number of concurrent connections that are executing statements, because most settings apply to each connection.

Consider the unit of a variable when you determine safe values:

- For threads, safe values are typically up to the number of CPU cores.
- For bytes, safe values are typically less than the amount of system memory.
- For time, pay attention that the unit might be seconds or milliseconds.

Variables using the same unit might compete for the same set of resources.

### 14.4.1 Variable Reference

#### 14.4.1.1 allow_auto_random_explicit_insert New in v4.0.3

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- Determines whether to allow explicitly specifying the values of the column with the `AUTO_RANDOM` attribute in the `INSERT` statement.

#### 14.4.1.2 auto_increment_increment

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `1`
- Range: `[1, 65535]`
- Controls the step size of `AUTO_INCREMENT` values to be allocated to a column, and allocation rules for `AUTO_RANDOM` IDs. It is often used in combination with `auto_increment_offset`.

#### 14.4.1.3 auto_increment_offset

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `1`
- Range: `[1, 65535]`
- Controls the initial offset of `AUTO_INCREMENT` values to be allocated to a column, and allocation rules for `AUTO_RANDOM` IDs. This setting is often used in combination with `auto_increment_increment`. For example:

```
mysql> CREATE TABLE t1 (a int not null primary key auto_increment);
Query OK, 0 rows affected (0.10 sec)

mysql> set auto_increment_offset=1;
Query OK, 0 rows affected (0.00 sec)

mysql> set auto_increment_increment=3;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (),(),(),();
Query OK, 4 rows affected (0.04 sec)
Records: 4 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
```

```
+----+
| a  |
+----+
|  1 |
|  4 |
|  7 |
| 10 |
+----+
4 rows in set (0.00 sec)
```

#### 14.4.1.4 autocommit

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- Controls whether statements should automatically commit when not in an explicit transaction. See Transaction Overview for more information.

#### 14.4.1.5 block_encryption_mode

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `aes-128-ecb`
- Value options: `aes-128-ecb`, `aes-192-ecb`, `aes-256-ecb`, `aes-128-cbc`, `aes-192-cbc`, `aes-256-cbc`, `aes-128-ofb`, `aes-192-ofb`, `aes-256-ofb`, `aes-128-cfb`, `aes-192-cfb`, `aes-256-cfb`
- This variable sets the encryption mode for the built-in functions `AES_ENCRYPT()` and `AES_DECRYPT()`.

#### 14.4.1.6 character_set_client

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `utf8mb4`
- The character set for data sent from the client. See Character Set and Collation for details on the use of character sets and collations in TiDB. It is recommended to use `SET NAMES` to change the character set when needed.

#### 14.4.1.7 character_set_connection

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `utf8mb4`
- The character set for string literals that do not have a specified character set.

#### 14.4.1.8 character_set_database

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `utf8mb4`
- This variable indicates the character set of the default database in use. **It is NOT recommended to set this variable**. When a new default database is selected, the server changes the variable value.

#### 14.4.1.9 character_set_results

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `utf8mb4`
- The character set that is used when data is sent to the client.

#### 14.4.1.10 character_set_server

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `utf8mb4`
- The default character set for the server.

#### 14.4.1.11 collation_connection

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `utf8mb4_bin`
- This variable indicates the collation used in the current connection. It is consistent with the MySQL variable `collation_connection`.

#### 14.4.1.12 collation_database

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `utf8mb4_bin`
- This variable indicates the default collation of the database in use. **It is NOT recommended to set this variable**. When a new database is selected, TiDB changes this variable value.

#### 14.4.1.13 collation_server

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `utf8mb4_bin`
- The default collation used when the database is created.

#### 14.4.1.14 cte_max_recursion_depth

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `1000`
- Range: `[0, 4294967295]`
- Controls the maximum recursion depth in Common Table Expressions.

#### 14.4.1.15 datadir

- Scope: NONE
- Default value: it depends on the component and the deployment method.
    - `/tmp/tidb`: when you set `"unistore"` for `--store` or if you don't set `--store`.
    - `${pd-ip}:${pd-port}`: when you use TiKV, which is the default storage engine for TiUP and TiDB Operator for Kubernetes deployments.
- This variable indicates the location where data is stored. This location can be a local path `/tmp/tidb`, or point to a PD server if the data is stored on TiKV. A value in the format of `${pd-ip}:${pd-port}` indicates the PD server that TiDB connects to on startup.

#### 14.4.1.16 ddl_slow_threshold

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Integer
- Default value: `300`
- Range: `[0, 2147483647]`
- Unit: Milliseconds
- Log DDL operations whose execution time exceeds the threshold value.

#### 14.4.1.17 default_authentication_plugin

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `mysql_native_password`
- Possible values: `mysql_native_password`, `caching_sha2_password`, `tidb_sm3_password` ↪ , and `tidb_auth_token`
- This variable sets the authentication method that the server advertises when the server-client connection is being established.
- To authenticate using the `tidb_sm3_password` method, you can connect to TiDB using TiDB-JDBC.

For more possible values of this variable, see Authentication plugin status.

#### 14.4.1.18 default_password_lifetime New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `0`
- Range: `[0, 65535]`
- Sets the global policy for automatic password expiration. The default value `0` indicates that the password never expires. If this system variable is set to a positive integer `N`, it means that the password lifetime is `N` days, and you must change your password within `N` days.

#### 14.4.1.19 default_week_format

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes

- Type: Integer
- Default value: `0`
- Range: `[0, 7]`
- Sets the week format used by the `WEEK()` function.

#### 14.4.1.20 disconnect_on_expired_password New in v6.5.0

- Scope: GLOBAL
- Type: Boolean
- Default value: `ON`
- This variable is read-only. It indicates whether TiDB disconnects the client connection when the password is expired. If the variable is set to `ON`, the client connection is disconnected when the password is expired. If the variable is set to `OFF`, the client connection is restricted to the "sandbox mode" and the user can only execute the password reset operation.

- If you need to change the behavior of the client connection for the expired password, modify the `security.disconnect-on-expired-password` configuration item in the configuration file.

#### 14.4.1.21 error_count

- Scope: SESSION
- Type: Integer
- Default value: `0`
- A read-only variable that indicates the number of errors that resulted from the last statement that generated messages.

#### 14.4.1.22 foreign_key_checks

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- For compatibility, TiDB returns foreign key checks as `OFF`.

#### 14.4.1.23 group_concat_max_len

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `1024`
- Range: `[4, 18446744073709551615]`
- The maximum buffer size for items in the `GROUP_CONCAT()` function.

#### 14.4.1.24 have_openssl

- Scope: NONE
- Type: Boolean
- Default value: `DISABLED`
- A read-only variable for MySQL compatibility. Set to `YES` by the server when the server has TLS enabled.

#### 14.4.1.25 have_ssl

- Scope: NONE
- Type: Boolean
- Default value: `DISABLED`
- A read-only variable for MySQL compatibility. Set to `YES` by the server when the server has TLS enabled.

#### 14.4.1.26 hostname

- Scope: NONE
- Default value: (system hostname)
- The hostname of the TiDB server as a read-only variable.

#### 14.4.1.27 identity New in v5.3.0

This variable is an alias for `last_insert_id`.

#### 14.4.1.28 init_connect

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: “”
- The `init_connect` feature permits a SQL statement to be automatically executed when you first connect to a TiDB server. If you have the `CONNECTION_ADMIN` or `SUPER` privileges, this `init_connect` statement will not be executed. If the `init_connect` statement results in an error, your user connection will be terminated.

#### 14.4.1.29 innodb_lock_wait_timeout

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `50`
- Range: `[1, 3600]`
- Unit: Seconds
- The lock wait timeout for pessimistic transactions (default).

#### 14.4.1.30 interactive_timeout

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `28800`
- Range: `[1, 31536000]`
- Unit: Seconds
- This variable represents the idle timeout of the interactive user session. Interactive user session refers to the session established by calling `mysql_real_connect()` API using the `CLIENT_INTERACTIVE` option (for example, MySQL Shell and MySQL Client). This variable is fully compatible with MySQL.

#### 14.4.1.31 last_insert_id

- Scope: SESSION
- Type: Integer
- Default value: `0`
- Range: `[0, 9223372036854775807]`
- This variable returns the last `AUTO_INCREMENT` or `AUTO_RANDOM` value generated by an insert statement.
- The value of `last_insert_id` is the same as the value returned by the function `LAST_INSERT_ID()`.

#### 14.4.1.32 last_plan_from_binding New in v4.0

- Scope: SESSION
- Type: Boolean
- Default value: `OFF`
- This variable is used to show whether the execution plan used in the previous statement was influenced by a plan binding

#### 14.4.1.33 last_plan_from_cache New in v4.0

- Scope: SESSION
- Type: Boolean
- Default value: `OFF`
- This variable is used to show whether the execution plan used in the previous `execute` statement is taken directly from the plan cache.

#### 14.4.1.34 last_sql_use_alloc New in v6.4.0

- Scope: SESSION
- Default value: `OFF`
- This variable is read-only. It is used to show whether the previous statement uses a cached chunk object (chunk allocation).

#### 14.4.1.35 license

- Scope: NONE
- Default value: `Apache License 2.0`
- This variable indicates the license of your TiDB server installation.

#### 14.4.1.36 log_bin

- Scope: NONE
- Type: Boolean
- Default value: `OFF`
- This variable indicates whether TiDB Binlog is used.

#### 14.4.1.37 max_allowed_packet New in v6.1.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `67108864`
- Range: `[1024, 1073741824]`
- The value should be an integer multiple of 1024. If the value is not divisible by 1024, a warning will be prompted and the value will be rounded down. For example, when the value is set to 1025, the actual value in TiDB is 1024.
- The maximum packet size allowed by the server and the client in one transmission of packets.
- In the `SESSION` scope, this variable is read-only.
- This variable is compatible with MySQL.

#### 14.4.1.38 password_history New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `0`
- Range: `[0, 4294967295]`

- This variable is used to establish a password reuse policy that allows TiDB to limit password reuse based on the number of password changes. The default value `0` means disabling the password reuse policy based on the number of password changes. When this variable is set to a positive integer `N`, the reuse of the last `N` passwords is not allowed.

#### 14.4.1.39 password_reuse_interval New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `0`
- Range: `[0, 4294967295]`
- This variable is used to establish a password reuse policy that allows TiDB to limit password reuse based on time elapsed. The default value `0` means disabling the password reuse policy based on time elapsed. When this variable is set to a positive integer `N`, the reuse of any password used in the last `N` days is not allowed.

#### 14.4.1.40 max_connections

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Integer
- Default value: `0`
- Range: `[0, 100000]`
- The maximum number of concurrent connections permitted for a single TiDB instance. This variable can be used for resources control.
- The default value `0` means no limit. When the value of this variable is larger than `0` ↪ , and the number of connections reaches the value, the TiDB server rejects new connections from clients.

#### 14.4.1.41 max_execution_time

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `0`
- Range: `[0, 2147483647]`
- Unit: Milliseconds
- The maximum execution time of a statement. The default value is unlimited (zero).

> **Note:**
>
> Before v6.4.0, the `max_execution_time` system variable takes effect on all types of statements. Starting from v6.4.0, this variable only controls the maximum execution time of read-only statements. The precision of the timeout value is roughly 100ms. This means the statement might not be terminated in exact milliseconds as you specify.

For a SQL statement with the `MAX_EXECUTION_TIME` hint, the maximum execution time of this statement is limited by the hint instead of this variable. The hint can also be used with SQL bindings as described in the SQL FAQ.

#### 14.4.1.42 max_prepared_stmt_count

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `-1`
- Range: `[-1, 1048576]`
- Specifies the maximum number of `PREPARE` statements in the current TiDB instance.
- The value of `-1` means no limit on the maximum number of `PREPARE` statements in the current TiDB instance.
- If you set the variable to a value that exceeds the upper limit `1048576`, `1048576` is used instead:

```
mysql> SET GLOBAL max_prepared_stmt_count = 1048577;
Query OK, 0 rows affected, 1 warning (0.01 sec)

mysql> SHOW WARNINGS;
+--
    ↪ -------+------+-----------------------------------------------------------+
    ↪
| Level   | Code | Message                                                   |
+--
    ↪ -------+------+-----------------------------------------------------------+
    ↪
| Warning | 1292 | Truncated incorrect max_prepared_stmt_count value: '
    ↪ 1048577' |
+--
    ↪ -------+------+-----------------------------------------------------------+
    ↪
```

```
1 row in set (0.00 sec)

mysql> SHOW GLOBAL VARIABLES LIKE 'max_prepared_stmt_count';
+-------------------------+---------+
| Variable_name           | Value   |
+-------------------------+---------+
| max_prepared_stmt_count | 1048576 |
+-------------------------+---------+
1 row in set (0.00 sec)
```

#### 14.4.1.43 plugin_dir

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Default value: “”
- Indicates the directory to load plugins as specified by a command-line flag.

#### 14.4.1.44 plugin_load

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Default value: “”
- Indicates the plugins to load when TiDB is started. These plugins are specified by a command-line flag and separated by commas.

#### 14.4.1.45 port

- Scope: NONE
- Type: Integer
- Default value: `4000`
- Range: `[0, 65535]`
- The port that the `tidb-server` is listening on when speaking the MySQL protocol.

#### 14.4.1.46 rand_seed1

- Scope: SESSION
- Type: Integer
- Default value: `0`
- Range: `[0, 2147483647]`
- This variable is used to seed the random value generator used in the `RAND()` SQL function.
- The behavior of this variable is MySQL compatible.

#### 14.4.1.47 rand_seed2

- Scope: SESSION
- Type: Integer
- Default value: `0`
- Range: `[0, 2147483647]`
- This variable is used to seed the random value generator used in the `RAND()` SQL function.
- The behavior of this variable is MySQL compatible.

#### 14.4.1.48 require_secure_transport New in v6.1.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`

- This variable ensures that all connections to TiDB are either on a local socket, or using TLS. See Enable TLS between TiDB Clients and Servers for additional details.

- Setting this variable to `ON` requires you to connect to TiDB from a session that has TLS enabled. This helps prevent lock-out scenarios when TLS is not configured correctly.
- This setting was previously a `tidb.toml` option (`security.require-secure-transport`), but changed to a system variable starting from TiDB v6.1.0.
- For v6.5.6 or later 6.5 versions, when Security Enhanced Mode (SEM) is enabled, setting this variable to `ON` is prohibited to avoid potential connectivity issues for users.

#### 14.4.1.49 skip_name_resolve New in v5.2.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable controls whether the `tidb-server` instance resolves hostnames as a part of the connection handshake.
- When the DNS is unreliable, you can enable this option to improve network performance.

> **Note:**
>
> When `skip_name_resolve=ON`, users with a hostname in their identity will no longer be able to log into the server. For example:

```
CREATE USER 'appuser'@'apphost' IDENTIFIED BY 'app-password';
```

In this example, it is recommended to replace `apphost` with an IP address or the wildcard (`%`).

#### 14.4.1.50 socket

- Scope: NONE
- Default value: “”
- The local unix socket file that the `tidb-server` is listening on when speaking the MySQL protocol.

#### 14.4.1.51 sql_log_bin

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- Indicates whether to write changes to TiDB Binlog or not.

**Note:**

It is not recommended to set `sql_log_bin` as a global variable because the future versions of TiDB might only allow setting this as a session variable.

#### 14.4.1.52 sql_mode

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,`
  `↪ NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,NO_ENGINE_SUBSTITUTI`
  `↪`
- This variable controls a number of MySQL compatibility behaviors. See SQL Mode for more information.

#### 14.4.1.53 sql_require_primary_key New in v6.3.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable controls whether to enforce the requirement that a table has a primary key. After this variable is enabled, attempting to create or alter a table without a primary key will produce an error.
- This feature is based on the similarly named `sql_require_primary_key` in MySQL 8.0.
- It is strongly recommended to enable this variable when using TiCDC. This is because replicating changes to a MySQL sink requires that tables have a primary key.

#### 14.4.1.54 sql_select_limit New in v4.0.2

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `18446744073709551615`
- Range: `[0, 18446744073709551615]`
- Unit: Rows
- The maximum number of rows returned by the `SELECT` statements.

#### 14.4.1.55 ssl_ca

- Scope: NONE
- Default value: “”
- The location of the certificate authority file (if there is one). The value of this variable is defined by the TiDB configuration item `ssl-ca`.

#### 14.4.1.56 ssl_cert

- Scope: NONE
- Default value: “”
- The location of the certificate file (if there is a file) that is used for SSL/TLS connections. The value of this variable is defined by the TiDB configuration item `ssl-cert`.

#### 14.4.1.57 ssl_key

- Scope: NONE
- Default value: “”
- The location of the private key file (if there is one) that is used for SSL/TLS connections. The value of this variable is defined by TiDB configuration item `ssl-key`.

#### 14.4.1.58 system_time_zone

- Scope: NONE
- Default value: (system dependent)
- This variable shows the system time zone from when TiDB was first bootstrapped. See also `time_zone`.

#### 14.4.1.59 tidb_adaptive_closest_read_threshold New in v6.3.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `4096`
- Range: `[0, 9223372036854775807]`
- Unit: Bytes
- This variable is used to control the threshold at which the TiDB server prefers to send read requests to a replica in the same availability zone as the TiDB server when `tidb_replica_read` is set to `closest-adaptive`. If the estimated result is higher than or equal to this threshold, TiDB prefers to send read requests to a replica in the same availability zone. Otherwise, TiDB sends read requests to the leader replica.

#### 14.4.1.60 tidb_allow_batch_cop New in v4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `1`
- Range: `[0, 2]`
- This variable is used to control how TiDB sends a coprocessor request to TiFlash. It has the following values:
  - `0`: Never send requests in batches
  - `1`: Aggregation and join requests are sent in batches
  - `2`: All coprocessor requests are sent in batches

#### 14.4.1.61 tidb_allow_fallback_to_tikv New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: “”
- This variable is used to specify a list of storage engines that might fall back to TiKV. If the execution of a SQL statement fails due to a failure of the specified storage engine in the list, TiDB retries executing this SQL statement with TiKV. This variable can be set to “” or “tiflash”. When this variable is set to “tiflash”, if TiFlash returns a timeout error (error code: ErrTiFlashServerTimeout), TiDB retries executing this SQL statement with TiKV.

#### 14.4.1.62 tidb_allow_function_for_expression_index New in v5.2.0

- Scope: NONE
- Default value: `json_array`, `json_array_append`, `json_array_insert`, `json_contains` ↪ , `json_contains_path`, `json_depth`, `json_extract`, `json_insert`, `json_keys` ↪ , `json_length`, `json_merge_patch`, `json_merge_preserve`, `json_object`, `json_pretty`, `json_quote`, `json_remove`, `json_replace`, `json_search`, `json_set`, `json_storage_size`, `json_type`, `json_unquote`, `json_valid`, `lower`, `md5`, `reverse`, `tidb_shard`, `upper`, `vitess_hash`
- This variable is used to show the functions that are allowed to be used for creating expression indexes.

#### 14.4.1.63 tidb_allow_mpp New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- Controls whether to use the MPP mode of TiFlash to execute queries. The value options are as follows:
  - `0` or `OFF`, which means that the MPP mode will not be used.
  - `1` or `ON`, which means that the optimizer determines whether to use the MPP mode based on the cost estimation (by default).

MPP is a distributed computing framework provided by the TiFlash engine, which allows data exchange between nodes and provides high-performance, high-throughput SQL algorithms. For details about the selection of the MPP mode, refer to Control whether to select the MPP mode.

#### 14.4.1.64 tidb_allow_remove_auto_inc New in v2.1.18 and v3.0.4

- Scope: SESSION
- Type: Boolean
- Default value: `OFF`
- This variable is used to set whether the `AUTO_INCREMENT` property of a column is allowed to be removed by executing `ALTER TABLE MODIFY` or `ALTER TABLE CHANGE` statements. It is not allowed by default.

#### 14.4.1.65 tidb_analyze_partition_concurrency

> **Warning:**
>
> The feature controlled by this variable is not fully functional in the current TiDB version. Do not change the default value.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `1`
- This variable specifies the concurrency of reading and writing statistics for a partitioned table when TiDB analyzes the partitioned table.

#### 14.4.1.66 tidb_analyze_version New in v5.1.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `2`
- Range: `[1, 2]`
- Controls how TiDB collects statistics.
    - For TiDB Self-Hosted, the default value of this variable changes from `1` to `2` starting from v5.3.0.
    - For TiDB Cloud, the default value of this variable changes from `1` to `2` starting from v6.5.0.
    - If your cluster is upgraded from an earlier version, the default value of `tidb_analyze_version` does not change after the upgrade.
- For detailed introduction about this variable, see Introduction to Statistics.

#### 14.4.1.67 tidb_auto_analyze_end_time

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Time
- Default value: `23:59 +0000`
- This variable is used to restrict the time window that the automatic update of statistics is permitted. For example, to only allow automatic statistics updates between 1 AM and 3 AM in UTC time, set `tidb_auto_analyze_start_time='01:00 +0000'` and `tidb_auto_analyze_end_time='03:00 +0000'`.

#### 14.4.1.68 tidb_auto_analyze_partition_batch_size New in v6.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `1`
- Range: `[1, 1024]`
- This variable specifies the number of partitions that TiDB automatically analyzes when analyzing a partitioned table (which means automatically collecting statistics on a partitioned table).
- If the value of this variable is smaller than the number of partitions, TiDB automatically analyzes all partitions of the partitioned table in multiple batches. If the value of this variable is greater than or equal to the number of partitions, TiDB analyzes all partitions of the partitioned table at the same time.
- If the number of partitions of a partitioned table is far greater than this variable value and the auto-analyze takes a long time, you can increase the value of this variable to reduce the time consumption.

#### 14.4.1.69 tidb_auto_analyze_ratio

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Float
- Default value: `0.5`
- Range: `[0, 18446744073709551615]`
- This variable is used to set the threshold when TiDB automatically executes `ANALYZE TABLE` in a background thread to update table statistics. For example, a value of 0.5 means that auto-analyze is triggered when greater than 50% of the rows in a table have been modified. Auto-analyze can be restricted to only execute during certain hours of the day by specifying `tidb_auto_analyze_start_time` and `tidb_auto_analyze_end_time`.

> **Note:**
>
> This feature requires the system variable `tidb_enable_auto_analyze` set to `ON`.

#### 14.4.1.70 tidb_auto_analyze_start_time

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Time
- Default value: `00:00 +0000`
- This variable is used to restrict the time window that the automatic update of statistics is permitted. For example, to only allow automatic statistics updates between 1 AM and 3 AM in UTC time, set `tidb_auto_analyze_start_time='01:00 +0000'` and `tidb_auto_analyze_end_time='03:00 +0000'`.

#### 14.4.1.71 tidb_auto_build_stats_concurrency New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `1`
- Range: `[1, 256]`
- This variable is used to set the concurrency of executing the automatic update of statistics.

#### 14.4.1.72 tidb_backoff_lock_fast

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `10`
- Range: `[1, 2147483647]`
- This variable is used to set the `backoff` time when the read request meets a lock.

#### 14.4.1.73 tidb_backoff_weight

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes

- Type: Integer
- Default value: `2`
- Range: `[0, 2147483647]`
- This variable is used to increase the weight of the maximum time of TiDB `backoff`, that is, the maximum retry time for sending a retry request when an internal network or other component (TiKV, PD) failure is encountered. This variable can be used to adjust the maximum retry time and the minimum value is 1.

  For example, the base timeout for TiDB to take TSO from PD is 15 seconds. When `tidb_backoff_weight = 2`, the maximum timeout for taking TSO is: *base time * 2 = 30 seconds*.

  In the case of a poor network environment, appropriately increasing the value of this variable can effectively alleviate error reporting to the application end caused by timeout. If the application end wants to receive the error information more quickly, minimize the value of this variable.

#### 14.4.1.74 tidb_batch_commit

> **Warning:**
>
> It is **NOT** recommended to enable this variable.

- Scope: SESSION
- Type: Boolean
- Default value: `OFF`
- The variable is used to control whether to enable the deprecated batch-commit feature. When this variable is enabled, a transaction might be split into multiple transactions by grouping a few statements and committed non-atomically, which is not recommended.

#### 14.4.1.75 tidb_batch_delete

> **Warning:**
>
> This variable is associated with the deprecated batch-dml feature, which might cause data corruption. Therefore, it is not recommended to enable this variable for batch-dml. Instead, use non-transactional DML.

- Scope: SESSION
- Type: Boolean
- Default value: `OFF`
- This variable is used to control whether to enable the batch-delete feature, which is a part of the deprecated batch-dml feature. When this variable is enabled, `DELETE` statements might be split into multiple transactions and committed non-atomically. To make it work, you also need to enable `tidb_enable_batch_dml` and set a positive value for `tidb_dml_batch_size`, which is not recommended.

#### 14.4.1.76 tidb_batch_insert

> **Warning:**
>
> This variable is associated with the deprecated batch-dml feature, which might cause data corruption. Therefore, it is not recommended to enable this variable for batch-dml. Instead, use non-transactional DML.

- Scope: SESSION
- Type: Boolean
- Default value: `OFF`
- This variable is used to control whether to enable the batch-insert feature, which is a part of the deprecated batch-dml feature. When this variable is enabled, `INSERT` statements might be split into multiple transactions and committed non-atomically. To make it work, you also need to enable `tidb_enable_batch_dml` and set a positive value for `tidb_dml_batch_size`, which is not recommended.

#### 14.4.1.77 tidb_batch_pending_tiflash_count New in v6.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `4000`
- Range: `[0, 4294967295]`
- Specifies the maximum number of permitted unavailable tables when you use `ALTER DATABASE SET TIFLASH REPLICA` to add TiFlash replicas. If the number of unavailable tables exceeds this limit, the operation will be stopped or setting TiFlash replicas for the remaining tables will be very slow.

#### 14.4.1.78 tidb_broadcast_join_threshold_count New in v5.0

- Scope: SESSION | GLOBAL

- Persists to cluster: Yes
- Type: Integer
- Default value: `10240`
- Range: `[0, 9223372036854775807]`
- Unit: Rows
- If the objects of the join operation belong to a subquery, the optimizer cannot estimate the size of the subquery result set. In this situation, the size is determined by the number of rows in the result set. If the estimated number of rows in the subquery is less than the value of this variable, the Broadcast Hash Join algorithm is used. Otherwise, the Shuffled Hash Join algorithm is used.

#### 14.4.1.79 tidb_broadcast_join_threshold_size New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `104857600` (100 MiB)
- Range: `[0, 9223372036854775807]`
- Unit: Bytes
- If the table size is less than the value of the variable, the Broadcast Hash Join algorithm is used. Otherwise, the Shuffled Hash Join algorithm is used.

#### 14.4.1.80 tidb_build_stats_concurrency

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `4`
- Range: `[1, 256]`
- Unit: Threads
- This variable is used to set the concurrency of executing the `ANALYZE` statement.
- When the variable is set to a larger value, the execution performance of other queries is affected.

#### 14.4.1.81 tidb_capture_plan_baselines New in v4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to control whether to enable the baseline capturing feature. This feature depends on the statement summary, so you need to enable the statement summary before you use baseline capturing.

- After this feature is enabled, the historical SQL statements in the statement summary are traversed periodically, and bindings are automatically created for SQL statements that appear at least twice.

#### 14.4.1.82 tidb_cdc_write_source New in v6.5.0

- Scope: SESSION
- Persists to cluster: No
- Type: Integer
- Default value: `0`
- Range: `[0, 15]`
- When this variable is set to a value other than 0, data written in this session is considered to be written by TiCDC. This variable can only be modified by TiCDC. Do not manually modify this variable in any case.

#### 14.4.1.83 tidb_check_mb4_value_in_utf8

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Boolean
- Default value: `ON`
- This variable is used to enforce that the `utf8` character set only stores values from the Basic Multilingual Plane (BMP). To store characters outside the BMP, it is recommended to use the `utf8mb4` character set.
- You might need to disable this option when upgrading your cluster from an earlier version of TiDB where the `utf8` checking was more relaxed. For details, see FAQs After Upgrade.

#### 14.4.1.84 tidb_checksum_table_concurrency

- Scope: SESSION
- Type: Integer
- Default value: `4`
- Range: `[1, 256]`
- Unit: Threads
- This variable is used to set the scan index concurrency of executing the `ADMIN CHECKSUM TABLE` statement.
- When the variable is set to a larger value, the execution performance of other queries is affected.

#### 14.4.1.85 tidb_committer_concurrency New in v6.1.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `128`
- Range: `[1, 10000]`
- The number of goroutines for requests related to executing commit in the commit phase of the single transaction.
- If the transaction to commit is too large, the waiting time for the flow control queue when the transaction is committed might be too long. In this situation, you can increase the configuration value to speed up the commit.
- This setting was previously a `tidb.toml` option (`performance.committer-concurrency`), but changed to a system variable starting from TiDB v6.1.0.

#### 14.4.1.86 tidb_config

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Default value: ""
- This variable is read-only. It is used to obtain the configuration information of the current TiDB server.

#### 14.4.1.87 tidb_constraint_check_in_place

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable only applies to optimistic transactions. For pessimistic transactions, use `tidb_constraint_check_in_place_pessimistic` instead.
- When this variable is set to `OFF`, checking for duplicate values in unique indexes is deferred until the transaction commits. This helps improve performance but might be an unexpected behavior for some applications. See Constraints for details.
    - When setting `tidb_constraint_check_in_place` to `OFF` and using optimistic transactions:

```
tidb> create table t (i int key);
tidb> insert into t values (1);
tidb> begin optimistic;
tidb> insert into t values (1);
Query OK, 1 row affected
tidb> commit; -- Check only when a transaction is committed.
ERROR 1062 : Duplicate entry '1' for key 't.PRIMARY'
```

- When setting `tidb_constraint_check_in_place` to `ON` and using optimistic transactions:

```
tidb> set @@tidb_constraint_check_in_place=ON;
tidb> begin optimistic;
tidb> insert into t values (1);
ERROR 1062 : Duplicate entry '1' for key 't.PRIMARY'
```

#### 14.4.1.88 tidb_constraint_check_in_place_pessimistic New in v6.3.0

- Scope: SESSION
- Type: Boolean

- Default value: By default, the pessimistic-txn.constraint-check-in-place-pessimistic configuration item is `true` so the default value of this variable is `ON`. When pessimistic-txn.constraint-check-in-place-pessimistic is set to `false`, the default value of this variable is `OFF`.

- This variable only applies to pessimistic transactions. For optimistic transactions, use tidb_constraint_check_in_place instead.
- When this variable is set to `OFF`, TiDB defers the unique constraint check of a unique index (to the next time when executing a statement that requires a lock to the index or to the time when committing the transaction). This helps improve performance but might be an unexpected behavior for some applications. See Constraints for details.
- Disabling this variable might cause TiDB to return a `LazyUniquenessCheckFailure` error in pessimistic transactions. When this error occurs, TiDB rolls back the current transaction.
- When this variable is disabled, you cannot use `SAVEPOINT` in pessimistic transactions.
- When this variable is disabled, committing a pessimistic transaction might return a `Write conflict` or `Duplicate entry` error. When such an error occurs, TiDB rolls back the current transaction.

- When setting `tidb_constraint_check_in_place_pessimistic` to `OFF` and using pessimistic transactions:

```
set @@tidb_constraint_check_in_place_pessimistic=OFF;
create table t (i int key);
insert into t values (1);
begin pessimistic;
insert into t values (1);
```

```
Query OK, 1 row affected
```

```
tidb> commit; -- Check only when a transaction is committed.
```

```
ERROR 1062 : Duplicate entry '1' for key 't.PRIMARY'
```

- When setting `tidb_constraint_check_in_place_pessimistic` to `ON` and using pessimistic transactions:

```
set @@tidb_constraint_check_in_place_pessimistic=ON;
begin pessimistic;
insert into t values (1);
```

```
ERROR 1062 : Duplicate entry '1' for key 't.PRIMARY'
```

#### 14.4.1.89 tidb_cost_model_version New in v6.2.0

**Note:**

- Since TiDB v6.5.0, the newly created cluster uses Cost Model Version 2 by default. If you upgrade from a TiDB version earlier than v6.5.0 to v6.5.0 or later, the `tidb_cost_model_version` value does not change.
- Switching the version of the cost model might cause changes to query plans.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `2`
- Value options:
  - `1`: enables the Cost Model Version 1, which is used by default in TiDB v6.4.0 and earlier versions.

    - 2: enables the Cost Model Version 2, which is generally available in TiDB v6.5.0 and is more accurate than the version 1 in internal tests.
- The version of cost model affects the plan decision of optimizer. For more details, see Cost Model.

#### 14.4.1.90 tidb_current_ts

- Scope: SESSION
- Type: Integer
- Default value: `0`
- Range: `[0, 9223372036854775807]`
- This variable is read-only. It is used to obtain the timestamp of the current transaction.

#### 14.4.1.91 tidb_ddl_disk_quota New in v6.3.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `107374182400` (100 GiB)
- Range: `[107374182400, 1125899906842624]` ([100 GiB, 1 PiB])
- Unit: Bytes
- This variable only takes effect when `tidb_ddl_enable_fast_reorg` is enabled. It sets the usage limit of local storage during backfilling when creating an index.

#### 14.4.1.92 tidb_ddl_enable_fast_reorg New in v6.3.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls whether to enable the acceleration of `ADD INDEX` and `CREATE INDEX` to improve the speed of backfilling for index creation. Setting this variable value to `ON` can bring performance improvement for index creation on tables with a large amount of data.
- To verify whether a completed `ADD INDEX` operation is accelerated, you can execute the `ADMIN SHOW DDL JOBS` statement to see whether `ingest` is displayed in the `JOB_TYPE` column.

**Warning:**

Currently, this feature is not fully compatible with adding a unique index. When adding a unique index, it is recommended to disable the index acceleration feature (set `tidb_ddl_enable_fast_reorg` to `OFF`).

When PITR (Point-in-time recovery) is disabled, the speed of adding indexes is expected to be about 10 times that in v6.1.0. However, there is no performance improvement when both PITR and index acceleration are enabled. To optimize performance, it is recommended that you disable PITR, add indexes in a quick way, then enable PITR and perform a full backup. Otherwise, the following behaviors might occur:

- When PITR starts working first, the index adding job automatically falls back to the legacy mode by default, even if the configuration is set to `ON`. The index is added slowly.
- When the index adding job starts first, it prevents the log backup job of PITR from starting by throwing an error, which does not affect the index adding job in progress. After the index adding job is completed, you need to restart the log backup job and perform a full backup manually.
- When a log backup job of PITR and an index adding job start at the same time, no error is prompted because the two jobs are unable to detect each other. PITR does not back up the newly added index. After the index adding job is completed, you still need to restart the log backup job and perform a full backup manually.

**Note:**

- Index acceleration requires a `temp-dir` that is writable and has enough free space. If the `temp-dir` is unusable, TiDB falls back to non-accelerated index building. It is recommended to put the `temp-dir` on a SSD disk.
- Before you upgrade TiDB to v6.5.0 or later, it is recommended that you check whether the `temp-dir` path of TiDB is correctly mounted to an SSD disk. Make sure that the operating system user that runs TiDB has the read and write permissions for this directory. Otherwise, The DDL operations might experience unpredictable issues. This path is a TiDB configuration item, which takes effect after TiDB is restarted. Therefore, setting this configuration item before upgrading can avoid another restart.

#### 14.4.1.93 tidb_ddl_error_count_limit

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `512`
- Range: `[0, 9223372036854775807]`
- This variable is used to set the number of retries when the DDL operation fails. When the number of retries exceeds the parameter value, the wrong DDL operation is canceled.

#### 14.4.1.94 tidb_ddl_flashback_concurrency New in v6.3.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `64`
- Range: `[1, 256]`
- This variable controls the concurrency of `FLASHBACK CLUSTER`.

#### 14.4.1.95 tidb_ddl_reorg_batch_size

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `256`
- Range: `[32, 10240]`
- Unit: Rows
- This variable is used to set the batch size during the `re-organize` phase of the DDL operation. For example, when TiDB executes the `ADD INDEX` operation, the index data needs to backfilled by `tidb_ddl_reorg_worker_cnt` (the number) concurrent workers. Each worker backfills the index data in batches.
    - If many updating operations such as `UPDATE` and `REPLACE` exist during the `ADD INDEX` operation, a larger batch size indicates a larger probability of transaction conflicts. In this case, you need to adjust the batch size to a smaller value. The minimum value is 32.
    - If the transaction conflict does not exist, you can set the batch size to a large value (consider the worker count. See Interaction Test on Online Workloads and `ADD INDEX` Operations for reference). This can increase the speed of the backfilling data, but the write pressure on TiKV also becomes higher.

#### 14.4.1.96 tidb_ddl_reorg_priority

- Scope: SESSION
- Type: Enumeration
- Default value: `PRIORITY_LOW`
- Value options: `PRIORITY_LOW`, `PRIORITY_NORMAL`, `PRIORITY_HIGH`
- This variable is used to set the priority of executing the `ADD INDEX` operation in the `re-organize` phase.
- You can set the value of this variable to `PRIORITY_LOW`, `PRIORITY_NORMAL` or `PRIORITY_HIGH`.

#### 14.4.1.97 tidb_ddl_reorg_max_write_speed New in v6.5.12

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: String
- Default value: `0`
- Range: `[0, 1PiB]`
- This variable limits the write bandwidth for each TiKV node and only takes effect when index creation acceleration is enabled (controlled by the `tidb_ddl_enable_fast_reorg` ↪ variable). When the data size in your cluster is quite large (such as billions of rows), limiting the write bandwidth for index creation can effectively reduce the impact on application workloads.
- The default value `0` means no write bandwidth limit.
- You can specify the value of this variable either with a unit or without a unit.
    - When you specify the value without a unit, the default unit is bytes per second. For example, `67108864` represents `64MiB` per second.
    - When you specify the value with a unit, supported units include KiB, MiB, GiB, and TiB. For example, `'1GiB'` represents 1 GiB per second, and `'256MiB'` represents 256 MiB per second.

#### 14.4.1.98 tidb_ddl_reorg_worker_cnt

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `4`
- Range: `[1, 256]`
- Unit: Threads
- This variable is used to set the concurrency of the DDL operation in the `re-organize` phase.

#### 14.4.1.99 tidb_default_string_match_selectivity New in v6.2.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Default value: `0.8`
- Range: `[0, 1]`
- This variable is used to set the default selectivity of `like`, `rlike`, and `regexp` functions in the filter condition when estimating the number of rows. This variable also controls whether to enable TopN to help estimate these functions.
- TiDB tries to estimate `like` in the filter condition using statistics. But when `like` matches a complex string, or when using `rlike` or `regexp`, TiDB often fails to fully use statistics, and the default value `0.8` is set as the selectivity rate instead, resulting in inaccurate estimation.
- This variable is used to change the preceding behavior. If the variable is set to a value other than `0`, the selectivity rate is the specified variable value instead of `0.8`.
- If the variable is set to `0`, TiDB tries to evaluate using TopN in statistics to improve the accuracy and consider the NULL number in statistics when estimating the preceding three functions. The prerequisite is that statistics are collected when `tidb_analyze_version` is set to `2`. Such evaluation might slightly affect the performance.
- If the variable is set to a value other than the `0.8`, TiDB adjusts the estimation for `not like`, `not rlike`, and `not regexp` accordingly.

#### 14.4.1.100 tidb_disable_txn_auto_retry

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable is used to set whether to disable the automatic retry of explicit optimistic transactions. The default value of `ON` means that transactions will not automatically retry in TiDB and `COMMIT` statements might return errors that need to be handled in the application layer.

  Setting the value to `OFF` means that TiDB will automatically retry transactions, resulting in fewer errors from `COMMIT` statements. Be careful when making this change, because it might result in lost updates.

  This variable does not affect automatically committed implicit transactions and internally executed transactions in TiDB. The maximum retry count of these transactions is determined by the value of `tidb_retry_limit`.

For more details, see limits of retry.

This variable only applies to optimistic transactions, not to pessimistic transactions. The number of retries for pessimistic transactions is controlled by `max_retry_count`.

#### 14.4.1.101 tidb_distsql_scan_concurrency

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `15`
- Range: `[1, 256]`
- Unit: Threads
- This variable is used to set the concurrency of the `scan` operation.
- Use a bigger value in OLAP scenarios, and a smaller value in OLTP scenarios.
- For OLAP scenarios, the maximum value should not exceed the number of CPU cores of all the TiKV nodes.
- If a table has a lot of partitions, you can reduce the variable value appropriately (determined by the size of the data to be scanned and the frequency of the scan) to avoid TiKV becoming out of memory (OOM).
- For a simple query with only a `LIMIT` clause, if the `LIMIT` value is less than 100000, the scan operation pushed down to TiKV treats the value of this variable as `1` to enhance execution efficiency.
- For the `SELECT MAX/MIN(col)FROM ...` query, if the `col` column has an index sorted in the same order required by the `MAX(col)` or `MIN(col)` function, TiDB will rewrite the query to `SELECT col FROM ... LIMIT 1` for processing, and the value of this variable will also be processed as `1`. For example, for `SELECT MIN(col)FROM ...`, if the `col` column has an ascending index, TiDB can quickly obtain the `MIN(col)` value by rewriting the query to `SELECT col FROM ... LIMIT 1` and directly reading the first row of the index.

#### 14.4.1.102 tidb_dml_batch_size

> **Warning:**
>
> This variable is associated with the deprecated batch-dml feature, which might cause data corruption. Therefore, it is not recommended to enable this variable for batch-dml. Instead, use non-transactional DML.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer

- Default value: `0`
- Range: `[0, 2147483647]`
- Unit: Rows
- When this value is greater than `0`, TiDB will batch commit statements such as `INSERT` or `LOAD DATA` into smaller transactions. This reduces memory usage and helps ensure that the `txn-total-size-limit` is not reached by bulk modifications.
- Only the value `0` provides ACID compliance. Setting this to any other value will break the atomicity and isolation guarantees of TiDB.
- To make this variable work, you also need to enable `tidb_enable_batch_dml` and at least one of `tidb_batch_insert` and `tidb_batch_delete`.

#### 14.4.1.103 tidb_enable_1pc New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable is used to specify whether to enable the one-phase commit feature for transactions that only affect one Region. Compared with the often-used two-phase commit, one-phase commit can greatly reduce the latency of transaction commit and increase the throughput.

> **Note:**
>
> - The default value of `ON` only applies to new clusters. if your cluster was upgraded from an earlier version of TiDB, the value `OFF` will be used instead.
> - If you have enabled TiDB Binlog, enabling this variable cannot improve the performance. To improve the performance, it is recommended to use TiCDC instead.
> - Enabling this parameter only means that one-phase commit becomes an optional mode of transaction commit. In fact, the most suitable mode of transaction commit is determined by TiDB.

#### 14.4.1.104 tidb_enable_amend_pessimistic_txn New in v4.0.7

> **Warning:**

> Starting from v6.5.0, this variable is deprecated, and TiDB uses the Metadata Lock feature by default to avoid the `Information schema is changed` error. Note that this variable is planned to be removed in v6.6.0.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to control whether to enable the `AMEND TRANSACTION` feature. If you enable the `AMEND TRANSACTION` feature in a pessimistic transaction, when concurrent DDL operations and SCHEMA VERSION changes exist on tables associated with this transaction, TiDB attempts to amend the transaction. TiDB corrects the transaction commit to make the commit consistent with the latest valid SCHEMA VERSION so that the transaction can be successfully committed without getting the `Information schema is changed` error. This feature is effective on the following concurrent DDL operations:
  - `ADD COLUMN` or `DROP COLUMN` operations.
  - `MODIFY COLUMN` or `CHANGE COLUMN` operations which increase the length of a field.
  - `ADD INDEX` or `DROP INDEX` operations in which the index column is created before the transaction is opened.

> **Note:**
>
> Currently, this feature is incompatible with TiDB Binlog in some scenarios and might cause semantic changes on a transaction. For more usage precautions of this feature, refer to Incompatibility issues about transaction semantic and Incompatibility issues about TiDB Binlog.

#### 14.4.1.105 tidb_enable_analyze_snapshot New in v6.2.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`

- This variable controls whether to read historical data or the latest data when performing `ANALYZE`. If this variable is set to `ON`, `ANALYZE` reads the historical data available at the time of `ANALYZE`. If this variable is set to `OFF`, `ANALYZE` reads the latest data.
- Before v5.2, `ANALYZE` reads the latest data. From v5.2 to v6.1, `ANALYZE` reads the historical data available at the time of `ANALYZE`.

> **Warning:**
>
> If `ANALYZE` reads the historical data available at the time of `ANALYZE`, the long duration of `AUTO ANALYZE` might cause the `GC life time is shorter than transaction duration` error because the historical data is garbage-collected.

#### 14.4.1.106 tidb_enable_async_commit New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls whether to enable the async commit feature for the second phase of the two-phase transaction commit to perform asynchronously in the background. Enabling this feature can reduce the latency of transaction commit.

> **Note:**
>
> - The default value of `ON` only applies to new clusters. if your cluster was upgraded from an earlier version of TiDB, the value `OFF` will be used instead.
> - If you have enabled TiDB Binlog, enabling this variable cannot improve the performance. To improve the performance, it is recommended to use TiCDC instead.
> - Enabling this parameter only means that Async Commit becomes an optional mode of transaction commit. In fact, the most suitable mode of transaction commit is determined by TiDB.

#### 14.4.1.107 tidb_enable_auto_analyze New in v6.1.0

- Scope: GLOBAL

- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- Determines whether TiDB automatically updates table statistics as a background operation.
- This setting was previously a `tidb.toml` option (`performance.run-auto-analyze`), but changed to a system variable starting from TiDB v6.1.0.

#### 14.4.1.108 tidb_enable_auto_increment_in_generated

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to determine whether to include the `AUTO_INCREMENT` columns when creating a generated column or an expression index.

#### 14.4.1.109 tidb_enable_batch_dml

> **Warning:**
>
> This variable is associated with the deprecated batch-dml feature, which might cause data corruption. Therefore, it is not recommended to enable this variable for batch-dml. Instead, use non-transactional DML.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable controls whether to enable the deprecated batch-dml feature. When it is enabled, certain statements might be split into multiple transactions, which is non-atomic and should be used with care. When using batch-dml, you must ensure that there are no concurrent operations on the data you are operating on. To make it work, you must also specify a positive value for `tidb_batch_dml_size` and enable at least one of `tidb_batch_insert` and `tidb_batch_delete`.

#### 14.4.1.110 tidb_enable_cascades_planner

> **Warning:**
>
> Currently, cascades planner is an experimental feature. It is not recommended that you use it in production environments.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to control whether to enable the cascades planner.

#### 14.4.1.111 tidb_enable_chunk_rpc New in v4.0

- Scope: SESSION
- Type: Boolean
- Default value: `ON`
- This variable is used to control whether to enable the `Chunk` data encoding format in Coprocessor.

#### 14.4.1.112 tidb_enable_clustered_index New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `ON`
- Possible values: `OFF`, `ON`, `INT_ONLY`
- This variable is used to control whether to create the primary key as a clustered index by default. "By default" here means that the statement does not explicitly specify the keyword `CLUSTERED/NONCLUSTERED`. Supported values are `OFF`, `ON`, and `INT_ONLY`:
  - `OFF` indicates that primary keys are created as non-clustered indexes by default.
  - `ON` indicates that primary keys are created as clustered indexes by default.
  - `INT_ONLY` indicates that the behavior is controlled by the configuration item `alter-primary-key`. If `alter-primary-key` is set to `true`, all primary keys are created as non-clustered indexes by default. If it is set to `false`, only the primary keys which consist of an integer column are created as clustered indexes.

#### 14.4.1.113 tidb_enable_ddl New in v6.3.0

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.

- Default value: `ON`
- Possible values: `OFF`, `ON`
- This variable controls whether the corresponding TiDB instance can become a DDL owner or not. If there is only one TiDB instance in the current TiDB cluster, you cannot prevent it from becoming a DDL owner, which means you cannot set it to `OFF`.

#### 14.4.1.114 tidb_enable_collect_execution_info

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Boolean
- Default value: `ON`
- This variable controls whether to record the execution information of each operator in the slow query log.

#### 14.4.1.115 tidb_enable_column_tracking New in v5.4.0

> **Warning:**
>
> Currently, collecting statistics on `PREDICATE COLUMNS` is an experimental feature. It is not recommended that you use it in production environments.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable controls whether to enable TiDB to collect `PREDICATE COLUMNS`. After enabling the collection, if you disable it, the information of previously collected `PREDICATE COLUMNS` is cleared. For details, see Collect statistics on some columns.

#### 14.4.1.116 tidb_enable_concurrent_ddl New in v6.2.0

> **Warning:**
>
> **DO NOT modify this variable**. The risk of disabling this variable is unknown and might corrupt the metadata of the cluster.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls whether to allow TiDB to use concurrent DDL statements. When concurrent DDL statements are used, the DDL execution flow is changed, and DDL statements are not easily blocked by other DDL statements. In addition, multiple indexes can be added at the same time.

#### 14.4.1.117 tidb_enable_enhanced_security

- Scope: NONE
- Type: Boolean

- Default value: `OFF`
- This variable indicates whether the TiDB server you are connected to has the Security Enhanced Mode (SEM) enabled. To change its value, you need to modify the value of `enable-sem` in your TiDB server configuration file and restart the TiDB server.

- SEM is inspired by the design of systems such as Security-Enhanced Linux. It reduces the abilities of users with the MySQL `SUPER` privilege and instead requires `RESTRICTED` fine-grained privileges to be granted as a replacement. These fine-grained privileges include:
    - `RESTRICTED_TABLES_ADMIN`: The ability to write data to system tables in the `mysql` schema and to see sensitive columns on `information_schema` tables.
    - `RESTRICTED_STATUS_ADMIN`: The ability to see sensitive variables in the command `SHOW STATUS`.
    - `RESTRICTED_VARIABLES_ADMIN`: The ability to see and set sensitive variables in `SHOW [GLOBAL] VARIABLES` and `SET`.
    - `RESTRICTED_USER_ADMIN`: The ability to prevent other users from making changes or dropping a user account.

#### 14.4.1.118 tidb_enable_exchange_partition

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls whether to enable the `exchange partitions with tables` feature. The default value is `ON`, that is, `exchange partitions with tables` is enabled by default.
- This variable is deprecated since v6.3.0. Its value will be fixed to the default value `ON`, that is, `exchange partitions with tables` is enabled by default.

#### 14.4.1.119 tidb_enable_extended_stats

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable indicates whether TiDB can collect the extended statistic to guide the optimizer. See Introduction to Extended Statistics for more information.

#### 14.4.1.120 tidb_enable_external_ts_read New in v6.4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- If this variable is set to `ON`, TiDB reads data with the timestamp specified by `tidb_external_ts`.

#### 14.4.1.121 tidb_external_ts New in v6.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `0`
- If `tidb_enable_external_ts_read` is set to `ON`, TiDB reads data with the timestamp specified by this variable.

#### 14.4.1.122 tidb_enable_fast_analyze

> **Warning:**
>
> Currently, `Fast Analyze` is an experimental feature. It is not recommended that you use it in production environments.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to set whether to enable the statistics `Fast Analyze` feature.

- If the statistics `Fast Analyze` feature is enabled, TiDB randomly samples about 10,000 rows of data as statistics. When the data is distributed unevenly or the data size is small, the statistics accuracy is low. This might lead to a non-optimal execution plan, for example, selecting a wrong index. If the execution time of the regular `Analyze` statement is acceptable, it is recommended to disable the `Fast Analyze` feature.

#### 14.4.1.123 tidb_enable_foreign_key New in v6.3.0

> **Warning:**
>
> The feature controlled by this variable is not fully functional in the current TiDB version. Do not change the default value.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable controls whether to enable the `FOREIGN KEY` feature.

#### 14.4.1.124 tidb_enable_gc_aware_memory_track

> **Warning:**
>
> This variable is an internal variable for debugging in TiDB. It might be removed in a future release. **Do not** set this variable.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable controls whether to enable GC-Aware memory track.

#### 14.4.1.125 tidb_enable_general_plan_cache New in v6.3.0

> **Warning:**
>
> The feature controlled by this variable is not fully functional in the current TiDB version. Do not change the default value.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable controls whether to enable the General Plan Cache feature.

#### 14.4.1.126 tidb_enable_gogc_tuner New in v6.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls whether to enable GOGC Tuner.

#### 14.4.1.127 tidb_enable_historical_stats

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used for an unreleased feature. **Do not change the variable value**.

#### 14.4.1.128 tidb_enable_index_merge New in v4.0

> **Note:**
>
> - After upgrading a TiDB cluster from versions earlier than v4.0.0 to v5.4.0 or later, this variable is disabled by default to prevent performance regression due to changes of execution plans.
> - After upgrading a TiDB cluster from v4.0.0 or later to v5.4.0 or later, this variable remains the setting before the upgrade.
> - Since v5.4.0, for a newly deployed TiDB cluster, this variable is enabled by default.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable is used to control whether to enable the index merge feature.

#### 14.4.1.129 tidb_enable_index_merge_join

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- Specifies whether to enable the `IndexMergeJoin` operator.
- This variable is used only for the internal operation of TiDB. It is **NOT recommended** to adjust it. Otherwise, data correctness might be affected.

#### 14.4.1.130 tidb_enable_legacy_instance_scope New in v6.0.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable permits `INSTANCE` scoped variables to be set using the `SET SESSION` as well as `SET GLOBAL` syntax.
- This option is enabled by default for compatibility with earlier versions of TiDB.

#### 14.4.1.131 tidb_enable_list_partition New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable is used to set whether to enable the `LIST (COLUMNS)TABLE PARTITION` feature.

#### 14.4.1.132 tidb_enable_local_txn

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used for an unreleased feature. **Do not change the variable value**.

#### 14.4.1.133 tidb_enable_metadata_lock New in v6.3.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean

- Default value: `ON`
- This variable is used to set whether to enable the Metadata lock feature. Note that when setting this variable, you need to make sure that there are no running DDL statements in the cluster. Otherwise, the data might be incorrect or inconsistent.

#### 14.4.1.134 tidb_enable_mutation_checker New in v6.0.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable is used to control whether to enable TiDB mutation checker, which is a tool used to check consistency between data and indexes during the execution of DML statements. If the checker returns an error for a statement, TiDB rolls back the execution of the statement. Enabling this variable causes a slight increase in CPU usage. For more information, see Troubleshoot Inconsistency Between Data and Indexes.
- For new clusters of v6.0.0 or later versions, the default value is `ON`. For existing clusters that upgrade from versions earlier than v6.0.0, the default value is `OFF`.

#### 14.4.1.135 tidb_enable_new_cost_interface New in v6.2.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- TiDB v6.2.0 refactors the implementation of previous cost model. This variable controls whether to enable the refactored Cost Model implementation.
- This variable is enabled by default because the refactored Cost Model uses the same cost formula as before, which does not change the plan decision.
- If your cluster is upgraded from v6.1 to v6.2, this variable remains `OFF`, and it is recommended to enable it manually. If your cluster is upgraded from a version earlier than v6.1, this variable sets to `ON` by default.

#### 14.4.1.136 tidb_enable_new_only_full_group_by_check New in v6.1.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable controls the behavior when TiDB performs the `ONLY_FULL_GROUP_BY` ↪ check. For detailed information about `ONLY_FULL_GROUP_BY`, see the MySQL documentation. In v6.1.0, TiDB handles this check more strictly and correctly.
- To avoid potential compatibility issues caused by version upgrades, the default value of this variable is `OFF` in v6.1.0.

#### 14.4.1.137 tidb_enable_noop_functions New in v4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `OFF`
- Possible values: `OFF`, `ON`, `WARN`
- By default, TiDB returns an error when you attempt to use the syntax for functionality that is not yet implemented. When the variable value is set to `ON`, TiDB silently ignores such cases of unavailable functionality, which is helpful if you cannot make changes to the SQL code.
- Enabling `noop` functions controls the following behaviors:
  - `LOCK IN SHARE MODE` syntax
  - `SQL_CALC_FOUND_ROWS` syntax
  - `START TRANSACTION READ ONLY` and `SET TRANSACTION READ ONLY` syntax
  - The `tx_read_only`, `transaction_read_only`, `offline_mode`, `super_read_only` ↪ , `read_only` and `sql_auto_is_null` system variables
  - `GROUP BY <expr> ASC|DESC` syntax

> **Warning:**
>
> Only the default value of `OFF` can be considered safe. Setting `tidb_enable_noop_functions=1` might lead to unexpected behaviors in your application, because it permits TiDB to ignore certain syntax without providing an error. For example, the syntax `START TRANSACTION READ ONLY` is permitted, but the transaction remains in read-write mode.

#### 14.4.1.138 tidb_enable_noop_variables New in v6.2.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `ON`
- If you set the variable value to `OFF`, TiDB behaves as follows:
  - When you use `SET` to set a `noop` variable, TiDB returns the `"setting * ↪ variable_name* has no effect in TiDB"` warning.
  - The result of `SHOW [SESSION | GLOBAL] VARIABLES` does not include `noop` variables.
  - When you use `SELECT` to read a `noop` variable, TiDB returns the `"variable * ↪ variable_name* has no effect in TiDB"` warning.
- To check whether a TiDB instance has set and read the `noop` variable, you can use the `SELECT * FROM INFORMATION_SCHEMA.CLIENT_ERRORS_SUMMARY_GLOBAL;` statement.

#### 14.4.1.139 tidb_enable_null_aware_anti_join New in v6.3.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `OFF`
- Type: Boolean
- This variable controls whether TiDB applies Null Aware Hash Join when ANTI JOIN is generated by subqueries led by special set operators `NOT IN` and `!= ALL`.

#### 14.4.1.140 tidb_enable_outer_join_reorder New in v6.1.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- Since v6.1.0, the Join Reorder algorithm of TiDB supports Outer Join. This variable controls whether TiDB enables the Join Reorder's support for Outer Join.
- If your cluster is upgraded from an earlier version of TiDB, note the following:
  - If the TiDB version before the upgrade is earlier than v6.1.0, the default value of this variable after the upgrade is `ON`.
  - If the TiDB version before the upgrade is v6.1.0 or later, the default value of the variable after the upgrade follows the value before the upgrade.

#### 14.4.1.141 tidb_enable_inl_join_inner_multi_pattern New in v6.5.2

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable controls whether Index Join is supported when the inner table has `Selection` or `Projection` operators on it. The default value `OFF` means that Index Join is not supported in this scenario.

#### 14.4.1.142 tidb_enable_ordered_result_mode

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- Specifies whether to sort the final output result automatically.
- For example, with this variable enabled, TiDB processes `SELECT a, MAX(b)FROM t GROUP BY a` as `SELECT a, MAX(b)FROM t GROUP BY a ORDER BY a, MAX(b)`.

#### 14.4.1.143 tidb_enable_paging New in v5.4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls whether to use the method of paging to send coprocessor requests. For TiDB versions in [v5.4.0, v6.2.0), this variable only takes effect on the `IndexLookup` operator; for v6.2.0 and later, this variable takes effect globally. Starting from v6.4.0, the default value of this variable is changed from `OFF` to `ON`.
- User scenarios:
  - In all OLTP scenarios, it is recommended to use the method of paging.
  - For read queries that use `IndexLookup` and `Limit` and that `Limit` cannot be pushed down to `IndexScan`, there might be high latency for the read queries and high usage for TiKV `Unified read pool CPU`. In such cases, because the `Limit` operator only requires a small set of data, if you set `tidb_enable_paging` to `ON`, TiDB processes less data, which reduces query latency and resource consumption.
  - In scenarios such as data export using Dumpling and full table scan, enabling paging can effectively reduce the memory consumption of TiDB processes.

> **Note:**
>
> In OLAP scenarios where TiKV is used as the storage engine instead of TiFlash, enabling paging might cause performance regression in some cases. If the regression occurs, consider using this variable to disable paging, or using the `tidb_min_paging_size` and `tidb_max_paging_size` variables to adjust the range of rows for paging size.

#### 14.4.1.144 tidb_enable_parallel_apply New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable controls whether to enable concurrency for the `Apply` operator. The number of concurrencies is controlled by the `tidb_executor_concurrency` variable. The `Apply` operator processes correlated subqueries and has no concurrency by default, so the execution speed is slow. Setting this variable value to `1` can increase concurrency and speed up execution. Currently, concurrency for `Apply` is disabled by default.

#### 14.4.1.145 tidb_enable_pipelined_window_function

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variables specifies whether to use the pipeline execution algorithm for window functions.

#### 14.4.1.146 tidb_enable_plan_replayer_capture

> Warning:
>
> This variable controls a feature that is not fully functional in the current TiDB version. Do not change the default value.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`

#### 14.4.1.147 tidb_enable_prepared_plan_cache New in v6.1.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- Determines whether to enable Prepared Plan Cache. When it is enabled, the execution plans of `Prepare` and `Execute` are cached so that the subsequent executions skip optimizing the execution plans, which brings performance improvement.
- This setting was previously a `tidb.toml` option (`prepared-plan-cache.enabled`), but changed to a system variable starting from TiDB v6.1.0.

#### 14.4.1.148 tidb_enable_prepared_plan_cache_memory_monitor New in v6.4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `ON`
- This variable controls whether to count the memory consumed by the execution plans cached in the Prepared Plan Cache. For details, see Memory management of Prepared Plan Cache.

#### 14.4.1.149 tidb_enable_pseudo_for_outdated_stats New in v5.3.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable controls the behavior of the optimizer on using statistics of a table when the statistics are outdated.

- The optimizer determines whether the statistics of a table is outdated in this way: since the last time `ANALYZE` is executed on a table to get the statistics, if 80% of the table rows are modified (the modified row count divided by the total row count), the optimizer determines that the statistics of this table is outdated. You can change this ratio using the `pseudo-estimate-ratio` configuration.

- By default (with the variable value `OFF`), when the statistics of a table is outdated, the optimizer still keeps using the statistics of the table. If you set the variable value to `ON`, the optimizer determines that the statistics of the table is no longer reliable except for the total row count. Then, the optimizer uses the pseudo statistics.
- If the data on a table is frequently modified without executing `ANALYZE` on this table in time, to keep the execution plan stable, it is recommended to set the variable value to `OFF`.

#### 14.4.1.150 tidb_enable_rate_limit_action

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable controls whether to enable the dynamic memory control feature for the operator that reads data. By default, this operator enables the maximum number of threads that `tidb_distsql_scan_concurrency` allows to read data. When the memory usage of a single SQL statement exceeds `tidb_mem_quota_query` each time, the operator that reads data stops one thread.

- When the operator that reads data has only one thread left and the memory usage of a single SQL statement constantly exceeds `tidb_mem_quota_query`, this SQL statement triggers other memory control behaviors, such as spilling data to disk.
- This variable controls memory usage effectively when an SQL statement only reads data. If computing operations (such as join or aggregation operations) are required, memory usage might not be under the control of `tidb_mem_quota_query`, which increases the risk of OOM.

#### 14.4.1.151 tidb_enable_reuse_chunk New in v6.4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `ON`
- Value options: `OFF`, `ON`
- This variable controls whether TiDB enables chunk objects cache. If the value is `ON`, TiDB prefers to use the cached chunk object and only requests from the system if the requested object is not in the cache. If the value is `OFF`, TiDB requests chunk objects from the system directly.

#### 14.4.1.152 tidb_enable_slow_log

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Boolean
- Default value: `ON`
- This variable is used to control whether to enable the slow log feature.

#### 14.4.1.153 tidb_enable_tmp_storage_on_oom

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `ON`
- Value options: `OFF`, `ON`
- Controls whether to enable the temporary storage for some operators when a single SQL statement exceeds the memory quota specified by the system variable `tidb_mem_quota_query`.
- Before v6.3.0, you can enable or disable this feature by using the TiDB configuration item `oom-use-tmp-storage`. After upgrading the cluster to v6.3.0 or a later version, the TiDB cluster will initialize this variable using the value of `oom-use-tmp-storage` automatically. After that, changing the value of `oom-use-tmp-storage` **does not** take effect anymore.

#### 14.4.1.154 tidb_enable_stmt_summary New in v3.0.4

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable is used to control whether to enable the statement summary feature. If enabled, SQL execution information like time consumption is recorded to the `information_schema.STATEMENTS_SUMMARY` system table to identify and troubleshoot SQL performance issues.

#### 14.4.1.155 tidb_enable_strict_double_type_check New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable is used to control if tables can be created with invalid definitions of type `DOUBLE`. This setting is intended to provide an upgrade path from earlier versions of TiDB, which were less strict in validating types.
- The default value of `ON` is compatible with MySQL.

For example, the type `DOUBLE(10)` is now considered invalid because the precision of floating point types is not guaranteed. After changing `tidb_enable_strict_double_type_check` ↪ to `OFF`, the table is created:

```
mysql> CREATE TABLE t1 (id int, c double(10));
ERROR 1149 (42000): You have an error in your SQL syntax; check the manual
    ↪ that corresponds to your MySQL server version for the right syntax to
    ↪  use

mysql> SET tidb_enable_strict_double_type_check = 'OFF';
Query OK, 0 rows affected (0.00 sec)

mysql> CREATE TABLE t1 (id int, c double(10));
Query OK, 0 rows affected (0.09 sec)
```

> **Note:**
>
> This setting only applies to the type `DOUBLE` since MySQL permits precision for `FLOAT` types. This behavior is deprecated starting with MySQL 8.0.17, and it is not recommended to specify precision for either `FLOAT` or `DOUBLE` types.

#### 14.4.1.156 tidb_enable_table_partition

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `ON`
- Possible values: `OFF`, `ON`, `AUTO`
- This variable is used to set whether to enable the `TABLE PARTITION` feature:

- `ON` indicates enabling Range partitioning, Hash partitioning, and Range column partitioning with one single column.
- `AUTO` functions the same way as `ON` does.
- `OFF` indicates disabling the `TABLE PARTITION` feature. In this case, the syntax that creates a partition table can be executed, but the table created is not a partitioned one.

#### 14.4.1.157 tidb_enable_telemetry New in v4.0.2

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON` for v6.5.0; `OFF` for v6.5.1 and later v6.5.x versions

- This variable is used to dynamically control whether the telemetry collection in TiDB is enabled. If the TiDB `enable-telemetry` configuration item is set to `false` on all TiDB instances, the telemetry collection is always disabled and this system variable will not take effect. See Telemetry for details.

#### 14.4.1.158 tidb_enable_tiflash_read_for_write_stmt New in v6.3.0

> **Warning:**
>
> The feature controlled by this variable is experimental in the current TiDB version. It is not recommended that you use it for production environments.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable controls whether read operations in SQL statements containing `INSERT`, `DELETE`, and `UPDATE` can be pushed down to TiFlash. For example:
  - `SELECT` queries in `INSERT INTO SELECT` statements (typical usage scenario: TiFlash query result materialization)
  - `WHERE` condition filtering in `UPDATE` and `DELETE` statements

#### 14.4.1.159 tidb_enable_top_sql New in v5.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`

- This variable is used to control whether to enable the Top SQL feature.

#### 14.4.1.160 tidb_enable_tso_follower_proxy New in v5.3.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to enable the TSO Follower Proxy feature. When the value is `OFF`, TiDB only gets TSO from the PD leader. After this feature is enabled, TiDB gets TSO by evenly sending requests to all PD nodes and forwarding TSO requests through PD followers. This helps reduce the CPU pressure of PD leader.
- Scenarios for enabling TSO Follower Proxy:
  - Due to the high pressure of TSO requests, the CPU of the PD leader reaches a bottleneck, which causes high latency of TSO RPC requests.
  - The TiDB cluster has many TiDB instances, and increasing the value of `tidb_tso_client_batch_max_wait_time` cannot alleviate the high latency issue of TSO RPC requests.

> **Note:**
>
> Suppose that the TSO RPC latency increases for reasons other than a CPU usage bottleneck of the PD leader (such as network issues). In this case, enabling the TSO Follower Proxy might increase the execution latency in TiDB and affect the QPS performance of the cluster.

#### 14.4.1.161 tidb_enable_unsafe_substitute New in v6.3.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable controls whether to replace expressions with generated columns in an unsafe way. The default value is `OFF`, which means that unsafe replacement is disabled by default. For more details, see Generated Columns.

#### 14.4.1.162 tidb_enable_vectorized_expression New in v4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable is used to control whether to enable vectorized execution.

#### 14.4.1.163 tidb_enable_window_function

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable is used to control whether to enable the support for window functions. Note that window functions may use reserved keywords. This might cause SQL statements that could be executed normally cannot be parsed after upgrading TiDB. In this case, you can set `tidb_enable_window_function` to `OFF`.

#### 14.4.1.164 tidb_enforce_mpp New in v5.1

- Scope: SESSION
- Type: Boolean
- Default value: `OFF`

- To change this default value, modify the `performance.enforce-mpp` configuration value.

- Controls whether to ignore the optimizer's cost estimation and to forcibly use TiFlash's MPP mode for query execution. The value options are as follows:
  - `0` or `OFF`, which means that the MPP mode is not forcibly used (by default).
  - `1` or `ON`, which means that the cost estimation is ignored and the MPP mode is forcibly used. Note that this setting only takes effect when `tidb_allow_mpp=true`.

MPP is a distributed computing framework provided by the TiFlash engine, which allows data exchange between nodes and provides high-performance, high-throughput SQL algorithms. For details about the selection of the MPP mode, refer to Control whether to select the MPP mode.

#### 14.4.1.165 tidb_evolve_plan_baselines New in v4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to control whether to enable the baseline evolution feature. For detailed introduction or usage , see Baseline Evolution.
- To reduce the impact of baseline evolution on the cluster, use the following configurations:
    - Set `tidb_evolve_plan_task_max_time` to limit the maximum execution time of each execution plan. The default value is 600s.
    - Set `tidb_evolve_plan_task_start_time` and `tidb_evolve_plan_task_end_time` ↪ to limit the time window. The default values are respectively `00:00 +0000` and `23:59 +0000`.

#### 14.4.1.166 tidb_evolve_plan_task_end_time New in v4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Time
- Default value: `23:59 +0000`
- This variable is used to set the end time of baseline evolution in a day.

#### 14.4.1.167 tidb_evolve_plan_task_max_time New in v4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `600`
- Range: `[-1, 9223372036854775807]`
- Unit: Seconds
- This variable is used to limit the maximum execution time of each execution plan in the baseline evolution feature.

#### 14.4.1.168 tidb_evolve_plan_task_start_time New in v4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Time
- Default value: `00:00 +0000`
- This variable is used to set the start time of baseline evolution in a day.

#### 14.4.1.169 tidb_executor_concurrency New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `5`
- Range: `[1, 256]`
- Unit: Threads

This variable is used to set the concurrency of the following SQL operators (to one value):

- `index lookup`
- `index lookup join`
- `hash join`
- `hash aggregation` (the `partial` and `final` phases)
- `window`
- `projection`

`tidb_executor_concurrency` incorporates the following existing system variables as a whole for easier management:

- `tidb_index_lookup_concurrency`
- `tidb_index_lookup_join_concurrency`
- `tidb_hash_join_concurrency`
- `tidb_hashagg_partial_concurrency`
- `tidb_hashagg_final_concurrency`
- `tidb_projection_concurrency`
- `tidb_window_concurrency`

Since v5.0, you can still separately modify the system variables listed above (with a deprecation warning returned) and your modification only affects the corresponding single operators. After that, if you use `tidb_executor_concurrency` to modify the operator concurrency, the separately modified operators will not be affected. If you want to use `tidb_executor_concurrency` to modify the concurrency of all operators, you can set the values of all variables listed above to `-1`.

For a system upgraded to v5.0 from an earlier version, if you have not modified any value of the variables listed above (which means that the `tidb_hash_join_concurrency` value is `5` and the values of the rest are `4`), the operator concurrency previously managed by these variables will automatically be managed by `tidb_executor_concurrency`. If you have modified any of these variables, the concurrency of the corresponding operators will still be controlled by the modified variables.

#### 14.4.1.170 tidb_expensive_query_time_threshold

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Integer
- Default value: `60`
- Range: `[10, 2147483647]`
- Unit: Seconds
- This variable is used to set the threshold value that determines whether to print expensive query logs. The difference between expensive query logs and slow query logs is:
    - Slow logs are printed after the statement is executed.
    - Expensive query logs print the statements that are being executed, with execution time exceeding the threshold value, and their related information.

#### 14.4.1.171 tidb_force_priority

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Enumeration
- Default value: `NO_PRIORITY`
- Possible values: `NO_PRIORITY`, `LOW_PRIORITY`, `HIGH_PRIORITY`, `DELAYED`
- This variable is used to change the default priority for statements executed on a TiDB server. A use case is to ensure that a particular user that is performing OLAP queries receives lower priority than users performing OLTP queries.
- The default value `NO_PRIORITY` means that the priority for statements is not forced to change.

#### 14.4.1.172 tidb_gc_concurrency New in v5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `-1`
- Range: `[1, 256]`
- Unit: Threads
- Specifies the number of threads in the Resolve Locks step of GC. A value of `-1` means that TiDB will automatically decide the number of garbage collection threads to use.

#### 14.4.1.173 tidb_gc_enable New in v5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- Enables garbage collection for TiKV. Disabling garbage collection will reduce system performance, as old versions of rows will no longer be purged.

#### 14.4.1.174 tidb_gc_life_time New in v5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Duration
- Default value: `10m0s`
- Range: `[10m0s, 8760h0m0s]`
- The time limit during which data is retained for each GC, in the format of Go Duration. When a GC happens, the current time minus this value is the safe point.

**Note:**

- In scenarios of frequent updates, a large value (days or even months) for `tidb_gc_life_time` may cause potential issues, such as:
  - Larger storage use
  - A large amount of history data may affect performance to a certain degree, especially for range queries such as `select count(*)from t`
- If there is any transaction that has been running longer than `tidb_gc_life_time`, during GC, the data since `start_ts` is retained for this transaction to continue execution. For example, if `tidb_gc_life_time` is configured to 10 minutes, among all transactions being executed, the transaction that starts earliest has been running for 15 minutes, GC will retain data of the recent 15 minutes.

#### 14.4.1.175 tidb_gc_max_wait_time New in v6.1.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `86400`

- Range: `[600, 31536000]`
- Unit: Seconds
- This variable is used to set the maximum time that active transactions block the GC safe point. During each time of GC, the safe point does not exceed the start time of the ongoing transactions by default. If the runtime of active transactions does not exceed this variable value, the GC safe point will be blocked until the runtime exceeds this value.

#### 14.4.1.176 tidb_gc_run_interval New in v5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Duration
- Default value: `10m0s`
- Range: `[10m0s, 8760h0m0s]`
- Specifies the GC interval, in the format of Go Duration, for example, `"1h30m"`, and `"15m"`

#### 14.4.1.177 tidb_gc_scan_lock_mode New in v5.0

> **Warning:**
>
> Currently, Green GC is an experimental feature. It is not recommended that you use it in production environments.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `LEGACY`
- Possible values: `PHYSICAL`, `LEGACY`
  - `LEGACY`: Uses the old way of scanning, that is, disable Green GC.
  - `PHYSICAL`: Uses the physical scanning method, that is, enable Green GC.

- This variable specifies the way of scanning locks in the Resolve Locks step of GC. When the variable value is set to `LEGACY`, TiDB scans locks by Regions. When the value `PHYSICAL` is used, it enables each TiKV node to bypass the Raft layer and directly scan data, which can effectively mitigate the impact of GC wakening up all Regions when the Hibernate Region feature is enabled, thus improving the execution speed in the Resolve Locks step.

#### 14.4.1.178 tidb_general_log

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Boolean
- Default value: `OFF`

- This variable is used to set whether to record all SQL statements in the log. This feature is disabled by default. If maintenance personnel needs to trace all SQL statements when locating issues, they can enable this feature.

- To see all records of this feature in the log, you need to set the TiDB configuration item `log.level` to `"info"` or `"debug"` and then query the `"GENERAL_LOG"` string. The following information is recorded:

    - `conn`: The ID of the current session.
    - `user`: The current session user.
    - `schemaVersion`: The current schema version.
    - `txnStartTS`: The timestamp at which the current transaction starts.
    - `forUpdateTS`: In the pessimistic transactional mode, `forUpdateTS` is the current timestamp of the SQL statement. When a write conflict occurs in the pessimistic transaction, TiDB retries the SQL statement currently being executed and updates this timestamp. You can configure the number of retries via `max-retry-count`. In the optimistic transactional model, `forUpdateTS` is equivalent to `txnStartTS`.
    - `isReadConsistency`: Indicates whether the current transactional isolation level is Read Committed (RC).
    - `current_db`: The name of the current database.
    - `txn_mode`: The transactional mode. Value options are `OPTIMISTIC` and `PESSIMISTIC`.
    - `sql`: The SQL statement corresponding to the current query.

#### 14.4.1.179 tidb_general_plan_cache_size New in v6.3.0

> **Warning:**
>
> The feature controlled by this variable is not fully functional in the current TiDB version. Do not change the default value.

- Scope: SESSION | GLOBAL

- Persists to cluster: Yes
- Type: Integer
- Default value: `100`
- Range: `[1, 100000]`
- This variable controls the maximum number of execution plans that can be cached by General Plan Cache.

#### 14.4.1.180 tidb_generate_binary_plan New in v6.2.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls whether to generate binary-encoded execution plans in slow logs and statement summaries.
- When this variable is set to `ON`, you can view visual execution plans in TiDB Dashboard. Note that TiDB Dashboard only provides visual display for execution plans generated after this variable is enabled.
- You can execute the `SELECT tidb_decode_binary_plan('xxx...')` statement to parse the specific plan from a binary plan.

#### 14.4.1.181 tidb_gogc_tuner_threshold New in v6.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `0.6`
- Range: `[0, 0.9)`
- This variable specifies the maximum memory threshold for tuning GOGC. When the memory exceeds this threshold, GOGC Tuner stops working.

#### 14.4.1.182 tidb_guarantee_linearizability New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls the way commit TS is calculated for async commit. By default (with the `ON` value), the two-phase commit requests a new TS from the PD server and uses the TS to calculate the final commit TS. In this situation, linearizability is guaranteed for all the concurrent transactions.
- If you set this variable to `OFF`, the process of fetching TS from the PD server is skipped, with the cost that only causal consistency is guaranteed but not linearizability. For more details, see the blog post Async Commit, the Accelerator for Transaction Commit in TiDB 5.0.

- For scenarios that require only causal consistency, you can set this variable to `OFF` to improve performance.

#### 14.4.1.183 tidb_hash_exchange_with_new_collation

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls whether the MPP hash partition exchange operator is generated in a cluster with new collation enabled. `true` means to generate the operator, and `false` means not to generate it.
- This variable is used for the internal operation of TiDB. It is **NOT recommended** to set this variable.

#### 14.4.1.184 tidb_hash_join_concurrency

> **Warning:**
>
> Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `-1`
- Range: `[1, 256]`
- Unit: Threads
- This variable is used to set the concurrency of the `hash join` algorithm.
- A value of `-1` means that the value of `tidb_executor_concurrency` will be used instead.

#### 14.4.1.185 tidb_hashagg_final_concurrency

> **Warning:**
>
> Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `-1`
- Range: `[1, 256]`
- Unit: Threads
- This variable is used to set the concurrency of executing the concurrent `hash aggregation` algorithm in the `final` phase.
- When the parameter of the aggregate function is not distinct, `HashAgg` is run concurrently and respectively in two phases - the `partial` phase and the `final` phase.
- A value of `-1` means that the value of `tidb_executor_concurrency` will be used instead.

#### 14.4.1.186 tidb_hashagg_partial_concurrency

> **Warning:**
>
> Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `-1`
- Range: `[1, 256]`
- Unit: Threads
- This variable is used to set the concurrency of executing the concurrent `hash aggregation` algorithm in the `partial` phase.
- When the parameter of the aggregate function is not distinct, `HashAgg` is run concurrently and respectively in two phases - the `partial` phase and the `final` phase.
- A value of `-1` means that the value of `tidb_executor_concurrency` will be used instead.

#### 14.4.1.187 tidb_ignore_prepared_cache_close_stmt New in v6.0.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to set whether to ignore the commands for closing prepared statement cache.

- When this variable is set to `ON`, the `COM_STMT_CLOSE` command of the Binary protocol and the `DEALLOCATE PREPARE` statement of the text protocol are ignored. For details, see Ignore the `COM_STMT_CLOSE` command and the `DEALLOCATE PREPARE` statement.

#### 14.4.1.188 tidb_index_join_batch_size

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `25000`
- Range: `[1, 2147483647]`
- Unit: Rows
- This variable is used to set the batch size of the `index lookup join` operation.
- Use a bigger value in OLAP scenarios, and a smaller value in OLTP scenarios.

#### 14.4.1.189 tidb_index_lookup_concurrency

> **Warning:**
>
> Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `-1`
- Range: `[1, 256]`
- Unit: Threads
- This variable is used to set the concurrency of the `index lookup` operation.
- Use a bigger value in OLAP scenarios, and a smaller value in OLTP scenarios.
- A value of `-1` means that the value of `tidb_executor_concurrency` will be used instead.

#### 14.4.1.190 tidb_index_lookup_join_concurrency

> **Warning:**
>
> Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `-1`
- Range: `[1, 256]`
- Unit: Threads
- This variable is used to set the concurrency of the `index lookup join` algorithm.
- A value of `-1` means that the value of `tidb_executor_concurrency` will be used instead.

#### 14.4.1.191 tidb_index_merge_intersection_concurrency New in v6.5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `-1`
- Range: `[1, 256]`
- This variable sets the maximum concurrency for the intersection operations that index merge performs. It is effective only when TiDB accesses partitioned tables in the dynamic pruning mode. The actual concurrency is the smaller value of `tidb_index_merge_intersection_concurrency` and the number of partitions of the partitioned table.
- The default value `-1` means that the value of `tidb_executor_concurrency` is used.

#### 14.4.1.192 tidb_index_lookup_size

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `20000`
- Range: `[1, 2147483647]`
- Unit: Rows
- This variable is used to set the batch size of the `index lookup` operation.
- Use a bigger value in OLAP scenarios, and a smaller value in OLTP scenarios.

#### 14.4.1.193 tidb_index_serial_scan_concurrency

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `1`
- Range: `[1, 256]`
- Unit: Threads
- This variable is used to set the concurrency of the `serial scan` operation.
- Use a bigger value in OLAP scenarios, and a smaller value in OLTP scenarios.

#### 14.4.1.194 tidb_init_chunk_size

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `32`
- Range: `[1, 32]`
- Unit: Rows
- This variable is used to set the number of rows for the initial chunk during the execution process. The number of rows for a chunk directly affects the amount of memory required for a single query. You can roughly estimate the memory needed for a single chunk by considering the total width of all columns in the query and the number of rows for the chunk. Combining this with the concurrency of the executor, you can make a rough estimation of the total memory required for a single query. It is recommended that the total memory for a single chunk does not exceed 16 MiB.

#### 14.4.1.195 tidb_isolation_read_engines New in v4.0

- Scope: SESSION
- Default value: `tikv,tiflash,tidb`
- This variable is used to set the storage engine list that TiDB can use when reading data.

#### 14.4.1.196 tidb_last_ddl_info New in v6.0.0

- Scope: SESSION
- Default value: “”
- Type: String
- This is a read-only variable. It is internally used in TiDB to get the information of the last DDL operation within the current session.
    - “query”: The last DDL query string.
    - “seq_num”: The sequence number for each DDL operation. It is used to identify the order of DDL operations.

#### 14.4.1.197 tidb_last_query_info New in v4.0.14

- Scope: SESSION
- Default value: “”
- This is a read-only variable. It is internally used in TiDB to query the transaction information of the last DML statement. The information includes:
    - `txn_scope`: The scope of the transaction, which can be `global` or `local`.
    - `start_ts`: The start timestamp of the transaction.

- `for_update_ts`: The `for_update_ts` of the previously executed DML statement. This is an internal term of TiDB used for tests. Usually, you can ignore this information.
- `error`: The error message, if any.

#### 14.4.1.198 tidb_last_txn_info New in v4.0.9

- Scope: SESSION
- Type: String
- This variable is used to get the last transaction information within the current session. It is a read-only variable. The transaction information includes:
  - The transaction scope.
  - The start and commit TS.
  - The transaction commit mode, which might be a two-phase, one-phase, or async commit.
  - The information of transaction fallback from async commit or one-phase commit to two-phase commit.
  - The error encountered.

#### 14.4.1.199 tidb_last_plan_replayer_token New in v6.3.0

- Scope: SESSION
- Type: String
- This variable is read-only and is used to obtain the result of the last `PLAN REPLAYER DUMP` execution in the current session.

#### 14.4.1.200 tidb_log_file_max_days New in v5.3.0

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Integer
- Default value: `0`
- Range: `[0, 2147483647]`

- This variable is used to set the maximum days that the log is retained on the current TiDB instance. Its value defaults to the value of the `max-days` configuration in the configuration file. Changing the variable value only affects the current TiDB instance. After TiDB is restarted, the variable value is reset and the configuration value is not affected.

#### 14.4.1.201 tidb_low_resolution_tso

- Scope: SESSION
- Type: Boolean
- Default value: `OFF`
- This variable is used to set whether to enable the low precision TSO feature. After this feature is enabled, new transactions use a timestamp updated every 2 seconds to read data.
- The main applicable scenario is to reduce the overhead of acquiring TSO for small read-only transactions when reading old data is acceptable.

#### 14.4.1.202 tidb_max_auto_analyze_time New in v6.1.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `43200`
- Range: `[0, 2147483647]`
- Unit: Seconds
- This variable is used to specify the maximum execution time of automatic `ANALYZE` tasks. When the execution time of an automatic `ANALYZE` task exceeds the specified time, the task will be terminated. When the value of this variable is `0`, there is no limit to the maximum execution time of automatic `ANALYZE` tasks.

#### 14.4.1.203 tidb_max_chunk_size

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `1024`
- Range: `[32, 2147483647]`
- Unit: Rows
- This variable is used to set the maximum number of rows in a chunk during the execution process. Setting to too large of a value may cause cache locality issues. The recommended value for this variable is no larger than 65536. The number of rows for a chunk directly affects the amount of memory required for a single query. You can roughly estimate the memory needed for a single chunk by considering the total width of all columns in the query and the number of rows for the chunk. Combining this with the concurrency of the executor, you can make a rough estimation of the total memory required for a single query. It is recommended that the total memory for a single chunk does not exceed 16 MiB. When the query involves a large amount of data and a single chunk is insufficient to handle all the data, TiDB processes it multiple times, doubling the chunk size with each processing iteration, starting from `tidb_init_chunk_size` until the chunk size reaches the value of `tidb_max_chunk_size`.

#### 14.4.1.204 tidb_max_delta_schema_count New in v2.1.18 and v3.0.5

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `1024`
- Range: `[100, 16384]`
- This variable is used to set the maximum number of schema versions (the table IDs modified for corresponding versions) allowed to be cached. The value range is 100 ~ 16384.

#### 14.4.1.205 tidb_max_paging_size New in v6.3.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `50000`
- Range: `[1, 9223372036854775807]`
- Unit: Rows
- This variable is used to set the maximum number of rows during the coprocessor paging request process. Setting it to too small a value increases the RPC count between TiDB and TiKV, while setting it to too large a value results in excessive memory usage in some cases, such as loading data and full table scan. The default value of this variable brings better performance in OLTP scenarios than in OLAP scenarios. If the application only uses TiKV as the storage engine, consider increasing the value of this variable when executing OLAP workload queries, which might bring you better performance.

#### 14.4.1.206 tidb_max_tiflash_threads New in v6.1.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `-1`
- Range: `[-1, 256]`
- Unit: Threads
- This variable is used to set the maximum concurrency for TiFlash to execute a request. The default value is `-1`, indicating that this system variable is invalid and the maximum concurrency depends on the setting of the TiFlash configuration `profiles.default.max_threads`. When the value is `0`, the maximum number of threads is automatically configured by TiFlash.

#### 14.4.1.207 tidb_mem_oom_action New in v6.1.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `CANCEL`
- Possible values: `CANCEL`, `LOG`

- Specifies what operation TiDB performs when a single SQL statement exceeds the memory quota specified by `tidb_mem_quota_query` and cannot be spilled over to disk. See TiDB Memory Control for details.

- The default value is `CANCEL`, but in TiDB v4.0.2 and earlier versions, the default value is `LOG`.
- This setting was previously a `tidb.toml` option (`oom-action`), but changed to a system variable starting from TiDB v6.1.0.

#### 14.4.1.208 tidb_mem_quota_analyze New in v6.1.0

> **Warning:**
>
> Currently, the `ANALYZE` memory quota is an experimental feature, and the memory statistics might be inaccurate in production environments.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `-1`
- Range: `[-1, 9223372036854775807]`
- Unit: Bytes
- This variable controls the maximum memory usage of TiDB updating statistics. Such a memory usage occurs when you manually execute `ANALYZE TABLE` and when TiDB automatically analyzes tasks in the background. When the total memory usage exceeds this threshold, user-executed `ANALYZE` will exit, and an error message is reported that reminds you to try a lower sampling rate or retry later. If the automatic task in the TiDB background exits because the memory threshold is exceeded, and the sampling rate used is higher than the default value, TiDB will retry the update using the default sampling rate. When this variable value is negative or zero, TiDB does not limit the memory usage of both the manual and automatic update tasks.

**Note:**

`auto_analyze` will be triggered in a TiDB cluster only when `run-auto-analyze` is enabled in the TiDB startup configuration file.

#### 14.4.1.209 tidb_mem_quota_apply_cache New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `33554432` (32 MiB)
- Range: `[0, 9223372036854775807]`
- Unit: Bytes
- This variable is used to set the memory usage threshold of the local cache in the `Apply` operator.
- The local cache in the `Apply` operator is used to speed up the computation of the `Apply` operator. You can set the variable to `0` to disable the `Apply` cache feature.

#### 14.4.1.210 tidb_mem_quota_binding_cache New in v6.0.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `67108864`
- Range: `[0, 2147483647]`
- Unit: Bytes
- This variable is used to set the threshold of the memory used for caching bindings.
- If a system creates or captures excessive bindings, resulting in overuse of memory space, TiDB returns a warning in the log. In this case, the cache cannot hold all available bindings or determine which bindings to store. For this reason, some queries might miss their bindings. To address this problem, you can increase the value of this variable, which increases the memory used for caching bindings. After modifying this parameter, you need to run `admin reload bindings` to reload bindings and validate the modification.

#### 14.4.1.211 tidb_mem_quota_query

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer

- Default value: `1073741824` (1 GiB)
- Range: `[-1, 9223372036854775807]`
- Unit: Bytes

- For versions earlier than TiDB v6.1.0, this is a session scope variable and uses the value of `mem-quota-query` from `tidb.toml` as an initial value. Starting from v6.1.0, `tidb_mem_quota_query` is a `SESSION | GLOBAL` scope variable.
- For versions earlier than TiDB v6.5.0, this variable is used to set the threshold value of memory quota for **a query**. If the memory quota of a query during execution exceeds the threshold value, TiDB performs the operation defined by `tidb_mem_oom_action`.
- For TiDB v6.5.0 and later versions, this variable is used to set the threshold value of memory quota for **a session**. If the memory quota of a session during execution exceeds the threshold value, TiDB performs the operation defined by `tidb_mem_oom_action` ↪ . Note that starting from TiDB v6.5.0, the memory usage of a session contains the memory consumed by the transactions in the session. For the control behavior of transaction memory usage in TiDB v6.5.0 and later versions, see `txn-total-size-` ↪ `limit`.
- When you set the variable value to `0` or `-1`, the memory threshold is positive infinity. When you set a value smaller than 128, the value will be defaulted to `128`.

#### 14.4.1.212 tidb_memory_debug_mode_alarm_ratio

- Scope: SESSION
- Type: Float
- Default value: `0`
- This variable represents the memory statistics error value allowed in the TiDB memory debug mode.
- This variable is used for the internal testing of TiDB. It is **NOT recommended** to set this variable.

#### 14.4.1.213 tidb_memory_debug_mode_min_heap_inuse

- Scope: SESSION
- Type: Integer
- Default value: `0`
- This variable is used for the internal testing of TiDB. It is **NOT recommended** to set this variable. Enabling this variable will affect the performance of TiDB.
- After configuring this parameter, TiDB will enter the memory debug mode to analyze the accuracy of memory tracking. TiDB will frequently trigger GC during the execution of subsequent SQL statements, and compare the actual memory usage and memory statistics. If the current memory usage is greater than `tidb_memory_debug_mode_min_heap_inuse` and the memory statistics error exceeds `tidb_memory_debug_mode_alarm_ratio`, TiDB will output the relevant memory information to the log and file.

#### 14.4.1.214 tidb_memory_usage_alarm_ratio

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Float
- Default value: `0.7`
- Range: `[0.0, 1.0]`

- This variable sets the memory usage ratio that triggers the tidb-server memory alarm. By default, TiDB prints an alarm log when TiDB memory usage exceeds 70% of its total memory and any of the alarm conditions is met.
- When this variable is configured to `0` or `1`, it means the memory threshold alarm feature is disabled.
- When this variable is configured to a value greater than `0` and less than `1`, it means that the memory threshold alarm feature is enabled.
    - If the value of the system variable `tidb_server_memory_limit` is `0`, the memory alarm threshold is `tidb_memory-usage-alarm-ratio * system memory size`.
    - If the value of the system variable `tidb_server_memory_limit` is set to greater than 0, the memory alarm threshold is `tidb_memory-usage-alarm-ratio * tidb_server_memory_limit`.

#### 14.4.1.215 tidb_memory_usage_alarm_keep_record_num New in v6.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `5`
- Range: `[1, 10000]`
- When the tidb-server memory usage exceeds the memory alarm threshold and triggers an alarm, TiDB only retains the status files generated during the recent 5 alarms by default. You can adjust this number with this variable.

#### 14.4.1.216 tidb_merge_join_concurrency

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Range: `[1, 256]`
- Default value: `1`
- This variable sets the concurrency of the `MergeJoin` operator when a query is executed.
- It is **NOT recommended** to set this variable. Modifying the value of this variable might cause data correctness issues.

#### 14.4.1.217 tidb_merge_partition_stats_concurrency

> **Warning:**
>
> The feature controlled by this variable is not fully functional in the current TiDB version. Do not change the default value.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `1`
- This variable specifies the concurrency of merging statistics for a partitioned table when TiDB analyzes the partitioned table.

#### 14.4.1.218 tidb_metric_query_range_duration New in v4.0

- Scope: SESSION
- Type: Integer
- Default value: `60`
- Range: `[10, 216000]`
- Unit: Seconds
- This variable is used to set the range duration of the Prometheus statement generated when querying `METRICS_SCHEMA`.

#### 14.4.1.219 tidb_metric_query_step New in v4.0

- Scope: SESSION
- Type: Integer
- Default value: `60`
- Range: `[10, 216000]`
- Unit: Seconds
- This variable is used to set the step of the Prometheus statement generated when querying `METRICS_SCHEMA`.

#### 14.4.1.220 tidb_min_paging_size New in v6.2.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `128`
- Range: `[1, 9223372036854775807]`

- Unit: Rows
- This variable is used to set the minimum number of rows during the coprocessor paging request process. Setting it to a too small value increases the RPC request count between TiDB and TiKV, while setting it to a too large value might cause a performance decrease when executing queries using IndexLookup with Limit. The default value of this variable brings better performance in OLTP scenarios than in OLAP scenarios. If the application only uses TiKV as the storage engine, consider increasing the value of this variable when executing OLAP workload queries, which might bring you better performance.

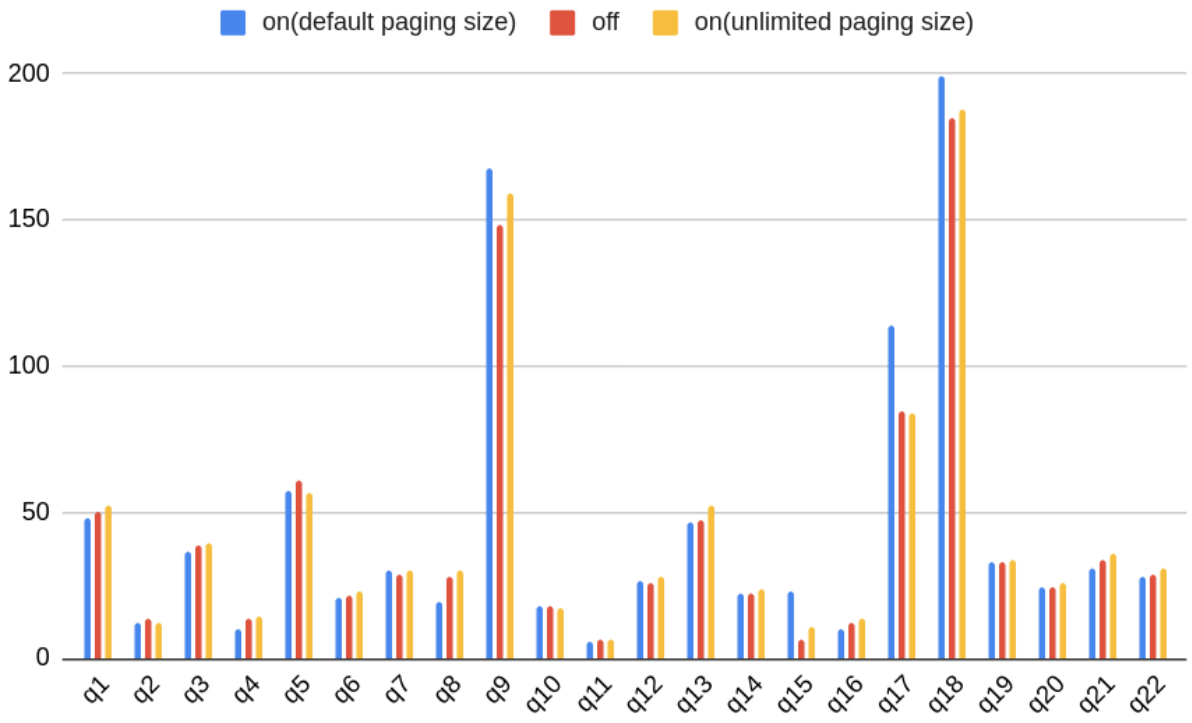

Figure 376: Paging size impact on TPCH

As shown in this diagram, when `tidb_enable_paging` is enabled, the performance of TPCH is affected by the settings of `tidb_min_paging_size` and `tidb_max_paging_size`. The vertical axis is the execution time, and it is the smaller the better.

#### 14.4.1.221 tidb_mpp_store_fail_ttl

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Duration

- Default value: `60s`
- The newly started TiFlash node does not provide services. To prevent queries from failing, TiDB limits the tidb-server sending queries to the newly started TiFlash node. This variable indicates the time range in which the newly started TiFlash node is not sent requests.

#### 14.4.1.222 tidb_multi_statement_mode New in v4.0.11

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `OFF`
- Possible values: `OFF`, `ON`, `WARN`
- This variable controls whether to allow multiple queries to be executed in the same `COM_QUERY` call.
- To reduce the impact of SQL injection attacks, TiDB now prevents multiple queries from being executed in the same `COM_QUERY` call by default. This variable is intended to be used as part of an upgrade path from earlier versions of TiDB. The following behaviors apply:

| Client setting | `tidb_multi_statement_mode` value | Multiple statements permitted? |
|---|---|---|
| Multiple Statements = ON | OFF | Yes |
| Multiple Statements = ON | ON | Yes |
| Multiple Statements = ON | WARN | Yes |
| Multiple Statements = OFF | OFF | No |
| Multiple Statements = OFF | ON | Yes |
| Multiple Statements = OFF | WARN | Yes (+warning returned) |

**Note:**

Only the default value of `OFF` can be considered safe. Setting `tidb_multi_statement_mode=ON` might be required if your application was specifically designed for an earlier version of TiDB. If your application requires multiple statement support, it is recommended to use the setting provided by your client library instead of the `tidb_multi_statement_mode` option. For example:

- go-sql-driver (`multiStatements`)
- Connector/J (`allowMultiQueries`)
- PHP mysqli (`mysqli_multi_query`)

#### 14.4.1.223 tidb_nontransactional_ignore_error New in v6.1.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable specifies whether to return an error immediately when the error occurs in a non-transactional DML statement.
- When the value is set to `OFF`, the non-transactional DML statement stops immediately at the first error and returns the error. All the following batches are canceled.
- When the value is set to `ON` and an error occurs in a batch, the following batches will continue to be executed until all batches are executed. All errors occurred during the execution process are returned together in the result.

#### 14.4.1.224 tidb_opt_agg_push_down

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to set whether the optimizer executes the optimization operation of pushing down the aggregate function to the position before Join, Projection, and UnionAll.
- When the aggregate operation is slow in query, you can set the variable value to ON.

#### 14.4.1.225 tidb_opt_broadcast_cartesian_join

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `1`
- Range: `[0, 2]`
- Indicates whether to allow the Broadcast Cartesian Join.
- `0` means that the Broadcast Cartesian Join is not allowed. `1` means that it is allowed based on `tidb_broadcast_join_threshold_count`. `2` means that it is always allowed even if the table size exceeds the threshold.
- This variable is internally used in TiDB, and it is **NOT** recommended to modify its value.

#### 14.4.1.226 tidb_opt_concurrency_factor

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes

- Type: Float
- Range: `[0, 18446744073709551615]`
- Default value: `3.0`
- Indicates the CPU cost of starting a Golang goroutine in TiDB. This variable is internally used in the Cost Model, and it is **NOT** recommended to modify its value.

#### 14.4.1.227 tidb_opt_copcpu_factor

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Range: `[0, 18446744073709551615]`
- Default value: `3.0`
- Indicates the CPU cost for TiKV Coprocessor to process one row. This variable is internally used in the Cost Model, and it is **NOT** recommended to modify its value.

#### 14.4.1.228 tidb_opt_correlation_exp_factor

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `1`
- Range: `[0, 2147483647]`
- When the method that estimates the number of rows based on column order correlation is not available, the heuristic estimation method is used. This variable is used to control the behavior of the heuristic method.
  - When the value is 0, the heuristic method is not used.
  - When the value is greater than 0:
    - A larger value indicates that an index scan will probably be used in the heuristic method.
    - A smaller value indicates that a table scan will probably be used in the heuristic method.

#### 14.4.1.229 tidb_opt_correlation_threshold

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Default value: `0.9`
- Range: `[0, 1]`
- This variable is used to set the threshold value that determines whether to enable estimating the row count by using column order correlation. If the order correlation between the current column and the `handle` column exceeds the threshold value, this method is enabled.

#### 14.4.1.230 tidb_opt_cpu_factor

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Range: `[0, 2147483647]`
- Default value: `3.0`
- Indicates the CPU cost for TiDB to process one row. This variable is internally used in the Cost Model, and it is **NOT** recommended to modify its value.

#### 14.4.1.231 tidb_opt_desc_factor

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Range: `[0, 18446744073709551615]`
- Default value: `3.0`
- Indicates the cost for TiKV to scan one row from the disk in descending order. This variable is internally used in the Cost Model, and it is **NOT** recommended to modify its value.

#### 14.4.1.232 tidb_opt_disk_factor

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Range: `[0, 18446744073709551615]`
- Default value: `1.5`
- Indicates the I/O cost for TiDB to read or write one byte of data from or to the temporary disk. This variable is internally used in the Cost Model, and it is **NOT** recommended to modify its value.

#### 14.4.1.233 tidb_opt_distinct_agg_push_down

- Scope: SESSION
- Type: Boolean
- Default value: `OFF`
- This variable is used to set whether the optimizer executes the optimization operation of pushing down the aggregate function with `distinct` (such as `select count(distinct a)from t`) to Coprocessor.
- When the aggregate function with the `distinct` operation is slow in the query, you can set the variable value to `1`.

In the following example, before `tidb_opt_distinct_agg_push_down` is enabled, TiDB needs to read all data from TiKV and execute `distinct` on the TiDB side. After `tidb_opt_distinct_agg_push_down` is enabled, `distinct a` is pushed down to Coprocessor, and a `group by` column `test.t.a` is added to `HashAgg_5`.

```
mysql> desc select count(distinct a) from test.t;
+--
   ↪ ----------------------+----------+-----------+---------------+----------------
   ↪
| id                    | estRows | task     | access object | operator info
   ↪                      |
+--
   ↪ ----------------------+----------+-----------+---------------+----------------

4 rows in set (0.00 sec)
```

#### 14.4.1.234 tidb_opt_enable_correlation_adjustment

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable is used to control whether the optimizer estimates the number of rows based on column order correlation

#### 14.4.1.235 tidb_opt_enable_hash_join New in v6.5.6

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable is used to control whether the optimizer selects hash joins for tables. The value is `ON` by default. If it is set to `OFF`, the optimizer avoids selecting hash joins when generating execution plans, unless no other join algorithm is available.
- If both the system variable `tidb_opt_enable_hash_join` and the `HASH_JOIN` hint are configured, the `HASH_JOIN` hint takes precedence. Even if `tidb_opt_enable_hash_join` ↪ is set to `OFF`, when you specify a `HASH_JOIN` hint in a query, the TiDB optimizer still enforces a hash join plan.

#### 14.4.1.236 tidb_opt_fix_control New in v6.5.3

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: String
- Default value: `""`
- This variable is used to control some internal behaviors of the optimizer.
- The optimizer's behavior might vary depending on user scenarios or SQL statements. This variable provides a more fine-grained control over the optimizer and helps to prevent performance regression after upgrading caused by behavior changes in the optimizer.
- For a more detailed introduction, see Optimizer Fix Controls.

#### 14.4.1.237 tidb_opt_force_inline_cte New in v6.3.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to control whether common table expressions (CTEs) in the entire session are inlined or not. The default value is `OFF`, which means that inlining CTE is not enforced by default. However, you can still inline CTE by specifying the `MERGE()` hint. If the variable is set to `ON`, all CTEs (except recursive CTE) in this session are forced to be inlined.

#### 14.4.1.238 tidb_opt_insubq_to_join_and_agg

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable is used to set whether to enable the optimization rule that converts a subquery to join and aggregation.
- For example, after you enable this optimization rule, the subquery is converted as follows:

```
select * from t where t.a in (select aa from t1);
```

The subquery is converted to join as follows:

```
select t.* from t, (select aa from t1 group by aa) tmp_t where t.a =
    ↪ tmp_t.aa;
```

If `t1` is limited to be `unique` and `not null` in the `aa` column. You can use the following statement, without aggregation.

```
select t.* from t, t1 where t.a=t1.aa;
```

#### 14.4.1.239 tidb_opt_join_reorder_threshold

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `0`

- Range: `[0, 2147483647]`
- This variable is used to control the selection of the TiDB Join Reorder algorithm. When the number of nodes participating in Join Reorder is greater than this threshold, TiDB selects the greedy algorithm, and when it is less than this threshold, TiDB selects the dynamic programming algorithm.
- Currently, for OLTP queries, it is recommended to keep the default value. For OLAP queries, it is recommended to set the variable value to 10~15 to get better connection orders in OLAP scenarios.

#### 14.4.1.240 tidb_opt_limit_push_down_threshold

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `100`
- Range: `[0, 2147483647]`
- This variable is used to set the threshold that determines whether to push the Limit or TopN operator down to TiKV.
- If the value of the Limit or TopN operator is smaller than or equal to this threshold, these operators are forcibly pushed down to TiKV. This variable resolves the issue that the Limit or TopN operator cannot be pushed down to TiKV partly due to wrong estimation.

#### 14.4.1.241 tidb_opt_memory_factor

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Range: `[0, 2147483647]`
- Default value: `0.001`
- Indicates the memory cost for TiDB to store one row. This variable is internally used in the Cost Model, and it is **NOT** recommended to modify its value.

#### 14.4.1.242 tidb_opt_mpp_outer_join_fixed_build_side New in v5.1.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- When the variable value is `ON`, the left join operator always uses inner table as the build side and the right join operator always uses outer table as the build side. If you set the value to `OFF`, the outer join operator can use either side of the tables as the build side.

#### 14.4.1.243 tidb_opt_network_factor

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Range: `[0, 2147483647]`
- Default value: `1.0`
- Indicates the net cost of transferring 1 byte of data through the network. This variable is internally used in the Cost Model, and it is **NOT** recommended to modify its value.

#### 14.4.1.244 tidb_opt_prefer_range_scan New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- After you set the value of this variable to `ON`, the optimizer always prefers range scans over full table scans.
- In the following example, before you enable `tidb_opt_prefer_range_scan`, the TiDB optimizer performs a full table scan. After you enable `tidb_opt_prefer_range_scan`, the optimizer selects an index range scan.

```
explain select * from t where age=5;
+--
   ↪ ----------------------+-----------+----------+--------------+--------------
   ↪
| id                    | estRows   | task     | access object | operator info
   ↪  |

```

#### 14.4.1.245 tidb_opt_prefix_index_single_scan New in v6.4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `ON`
- This variable controls whether the TiDB optimizer pushes down some filter conditions to the prefix index to avoid unnecessary table lookup and to improve query performance.
- When this variable value is set to `ON`, some filter conditions are pushed down to the prefix index. Suppose that the `col` column is the index prefix column in a table. The `col is null` or `col is not null` condition in the query is handled as a filter condition on the index instead of a filter condition for the table lookup, so that unnecessary table lookup is avoided.

Usage example of tidb_opt_prefix_index_single_scan

Create a table with a prefix index:

```
CREATE TABLE t (a INT, b VARCHAR(10), c INT, INDEX idx_a_b(a, b(5)));
```

Disable `tidb_opt_prefix_index_single_scan`:

```
SET tidb_opt_prefix_index_single_scan = 'OFF';
```

For the following query, the execution plan uses the prefix index `idx_a_b` but requires a table lookup (the `IndexLookUp` operator appears).

```
EXPLAIN FORMAT='brief' SELECT COUNT(1) FROM t WHERE a = 1 AND b IS NOT NULL
    ↪ ;
+--
    ↪ ---------------------------+---------+----------+-------------------------
    ↪
| id                          | estRows | task    | access object             |
    ↪  operator info                                  |
+--
    ↪ ---------------------------+---------+----------+-------------------------
    ↪
| HashAgg                     | 1.00    | root     |                           |
    ↪  funcs:count(Column#8)->Column#5                |
|  ─IndexLookUp               | 1.00    | root     |
    ↪ |                                               |
|    ─IndexRangeScan(Build)   | 99.90   | cop[tikv] | table:t, index:idx_a_b(a
    ↪ , b) | range:[1 -inf,1 +inf], keep order:false, stats:pseudo |
|    ─HashAgg(Probe)          | 1.00    | cop[tikv] |
    ↪ | funcs:count(1)->Column#8                      |
|      ─Selection             | 99.90   | cop[tikv] |
    ↪ | not(isnull(test.t.b))                         |
|        ─TableRowIDScan      | 99.90   | cop[tikv] | table:t
    ↪ | keep order:false, stats:pseudo                |
+--
    ↪ ---------------------------+---------+----------+-------------------------
    ↪
6 rows in set (0.00 sec)
```

Enable `tidb_opt_prefix_index_single_scan`:

```
SET tidb_opt_prefix_index_single_scan = 'ON';
```

After enabling this variable, for the following query, the execution plan uses the prefix index `idx_a_b` but does not require a table lookup.

```
EXPLAIN FORMAT='brief' SELECT COUNT(1) FROM t WHERE a = 1 AND b IS NOT NULL
    ↪ ;
+--
    ↪ ----------------------+---------+----------+---------------------------+--
    ↪
| id                     | estRows | task    | access object             |

```

#### 14.4.1.246 tidb_opt_projection_push_down New in v6.1.0

- Scope: SESSION
- Type: Boolean
- Default value: `OFF`
- Specifies whether to allow the optimizer to push `Projection` down to the TiKV or TiFlash coprocessor.

#### 14.4.1.247 tidb_opt_range_max_size New in v6.4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `67108864` (64 MiB)
- Scope: `[0, 9223372036854775807]`
- Unit: Bytes
- This variable is used to set the upper limit of memory usage for the optimizer to build scan ranges. When the variable value is `0`, there is no memory limit for building scan ranges. If building exact scan ranges consumes memory that exceeds the limit, the optimizer uses more relaxed scan ranges (such as `[[NULL,+inf]]`). If the execution plan does not use exact scan ranges, you can increase the value of this variable to let the optimizer build exact scan ranges.

The usage example of this variable is as follows:

tidb_opt_range_max_size usage examples

View the default value of this variable. From the result, you can see that the optimizer uses up to 64 MiB of memory to build scan ranges.

```
SELECT @@tidb_opt_range_max_size;
```

```
+----------------------------+
| @@tidb_opt_range_max_size |
+----------------------------+
| 67108864                   |
+----------------------------+
1 row in set (0.01 sec)
```

```
EXPLAIN SELECT * FROM t use index (idx) WHERE a IN (10,20,30) AND b IN
    ↪ (40,50,60);
```

In the 64 MiB memory upper limit, the optimizer builds the following exact scan ranges `[10 40,10 40]`, `[10 50,10 50]`, `[10 60,10 60]`, `[20 40,20 40]`, `[20 50,20 50]`, `[20 60,20 60]`, `[30 40,30 40]`, `[30 50,30 50]`, `[30 60,30 60]`, as shown in the following execution plan result.

```
+--
    ↪ ----------------------------+---------+----------+-------------------------+-
    ↪
| id                          | estRows | task    | access object         |
    ↪ operator info
    ↪
    ↪ |
+--
    ↪ ----------------------------+---------+----------+-------------------------+-
    ↪
| IndexLookUp_7               | 0.90    | root     |                         |
    ↪
    ↪ |
|  ─IndexRangeScan_5(Build)  | 0.90    | cop[tikv] | table:t, index:idx(a, b)
    ↪  | range:[10 40,10 40], [10 50,10 50], [10 60,10 60], [20 40,20 40],
    ↪ [20 50,20 50], [20 60,20 60], [30 40,30 40], [30 50,30 50], [30 60,30
    ↪  60], keep order:false, stats:pseudo |
|  ─TableRowIDScan_6(Probe)  | 0.90    | cop[tikv] | table:t               |
    ↪ keep order:false, stats:pseudo
    ↪
    ↪ |
+--
    ↪ ----------------------------+---------+----------+-------------------------+-
    ↪
3 rows in set (0.00 sec)
```

Now set the upper limit of memory usage for the optimizer to build scan ranges to 1500 bytes.

```
SET @@tidb_opt_range_max_size = 1500;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
EXPLAIN SELECT * FROM t USE INDEX (idx) WHERE a IN (10,20,30) AND b IN
    ↪ (40,50,60);
```

In the 1500-byte memory limit, the optimizer builds more relaxed scan ranges `[10,10]`, `[20,20]`, `[30,30]`, and uses a warning to inform the user that the memory usage required to build exact scan ranges exceeds the limit of `tidb_opt_range_max_size`.

```
+--
    ↪ ----------------------------+---------+----------+-----------------------+-
    ↪
| id                          | estRows | task     | access object         |

    ↪                                                        |
|  ─Selection_7(Build)        | 0.09    | cop[tikv] |                      | in
    ↪ (test.t.b, 40, 50, 60)                                 |
|    ─IndexRangeScan_5        | 30.00   | cop[tikv] | table:t, index:idx(a, b)
    ↪  | range:[10,10], [20,20], [30,30], keep order:false, stats:pseudo |
|  ─TableRowIDScan_6(Probe)   | 0.09    | cop[tikv] | table:t               |
    ↪ keep order:false, stats:pseudo                         |
+--
    ↪ ----------------------------+---------+----------+-----------------------+-
    ↪
4 rows in set, 1 warning (0.00 sec)
```

```
SHOW WARNINGS;
```

```
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
| Level   | Code | Message
    ↪
    ↪ |
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
| Warning | 1105 | Memory capacity of 1500 bytes for '
    ↪ tidb_opt_range_max_size' exceeded when building ranges. Less accurate
    ↪  ranges such as full range are chosen |
```

```
+--
    ↪ -------+------+-------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

Then set the upper limit of memory usage to 100 bytes:

```
set @@tidb_opt_range_max_size = 100;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
EXPLAIN SELECT * FROM t USE INDEX (idx) WHERE a IN (10,20,30) AND b IN
    ↪ (40,50,60);
```

In the 100-byte memory limit, the optimizer chooses `IndexFullScan`, and uses a warning to inform the user that the memory required to build exact scan ranges exceeds the limit of `tidb_opt_range_max_size`.

#### 14.4.1.248 tidb_opt_scan_factor

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Range: `[0, 2147483647]`
- Default value: `1.5`
- Indicates the cost for TiKV to scan one row of data from the disk in ascending order. This variable is internally used in the Cost Model, and it is **NOT** recommended to modify its value.

#### 14.4.1.249 tidb_opt_seek_factor

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Range: `[0, 2147483647]`
- Default value: `20`
- Indicates the start-up cost for TiDB to request data from TiKV. This variable is internally used in the Cost Model, and it is **NOT** recommended to modify its value.

#### 14.4.1.250 tidb_opt_skew_distinct_agg New in v6.2.0

> **Note:**
>
> The query performance optimization by enabling this variable is effective **only for TiFlash**.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable sets whether the optimizer rewrites the aggregate functions with `DISTINCT` to the two-level aggregate functions, such as rewriting `SELECT b, COUNT(DISTINCT a)FROM t GROUP BY b` to `SELECT b, COUNT(a)FROM (SELECT b, a FROM t GROUP BY b, a)t GROUP BY b`. When the aggregation column has serious skew and the `DISTINCT` column has many different values, this rewriting can avoid the data skew in the query execution and improve the query performance.

#### 14.4.1.251 tidb_opt_three_stage_distinct_agg New in v6.3.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable specifies whether to rewrite a `COUNT(DISTINCT)` aggregation into a three-stage aggregation in MPP mode.
- This variable currently applies to an aggregation that only contains one `COUNT(DISTINCT)`.

#### 14.4.1.252 tidb_opt_tiflash_concurrency_factor

- Scope: SESSION | GLOBAL
- Persists to cluster: YES
- Type: Float
- Range: `[0, 2147483647]`
- Default value: `24.0`
- Indicates the concurrency number of TiFlash computation. This variable is internally used in the Cost Model, and it is NOT recommended to modify its value.

#### 14.4.1.253 tidb_opt_write_row_id

- Scope: SESSION
- Type: Boolean
- Default value: `OFF`
- This variable is used to control whether to allow `INSERT`, `REPLACE`, and `UPDATE` statements to operate on the `_tidb_rowid` column. This variable can be used only when you import data using TiDB tools.

#### 14.4.1.254 tidb_optimizer_selectivity_level

- Scope: SESSION
- Type: Integer
- Default value: `0`
- Range: `[0, 2147483647]`
- This variable controls the iteration of the optimizer's estimation logic. After changing the value of this variable, the estimation logic of the optimizer will change greatly. Currently, `0` is the only valid value. It is not recommended to set it to other values.

#### 14.4.1.255 tidb_partition_prune_mode New in v5.1

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `dynamic`
- Possible values: `static`, `dynamic`, `static-only`, `dynamic-only`
- Specifies whether to use `dynamic` or `static` mode for partitioned tables. Note that dynamic partitioning is effective only after full table-level statistics, or GlobalStats, are collected. Before GlobalStats are collected, TiDB will use the `static` mode instead. For detailed information about GlobalStats, see Collect statistics of partitioned tables in dynamic pruning mode. For details about the dynamic pruning mode, see Dynamic Pruning Mode for Partitioned Tables.

#### 14.4.1.256 tidb_persist_analyze_options New in v5.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls whether to enable the ANALYZE configuration persistence feature.

#### 14.4.1.257 tidb_placement_mode New in v6.0.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `STRICT`
- Possible values: `STRICT`, `IGNORE`

- This variable controls whether DDL statements ignore the placement rules specified in SQL. When the variable value is `IGNORE`, all placement rule options are ignored.

- It is intended to be used by logical dump/restore tools to ensure that tables can always be created even if invalid placement rules are assigned. This is similar to how mysqldump writes `SET FOREIGN_KEY_CHECKS=0;` to the start of every dump file.

#### 14.4.1.258 tidb_pprof_sql_cpu New in v4.0

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Integer
- Default value: `0`
- Range: `[0, 1]`
- This variable is used to control whether to mark the corresponding SQL statement in the profile output to identify and troubleshoot performance issues.

#### 14.4.1.259 tidb_prepared_plan_cache_memory_guard_ratio New in v6.1.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Float
- Default value: `0.1`
- Range: `[0, 1]`
- The threshold at which the prepared plan cache triggers a memory protection mechanism. For details, see Memory management of Prepared Plan Cache.
- This setting was previously a `tidb.toml` option (`prepared-plan-cache.memory-guard-ratio`), but changed to a system variable starting from TiDB v6.1.0.

#### 14.4.1.260 tidb_prepared_plan_cache_size New in v6.1.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `100`
- Range: `[1, 100000]`
- The maximum number of plans that can be cached in a session. For details, see Memory management of Prepared Plan Cache.
- This setting was previously a `tidb.toml` option (`prepared-plan-cache.capacity`), but changed to a system variable starting from TiDB v6.1.0.

#### 14.4.1.261 tidb_projection_concurrency

**Warning:**

Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `-1`
- Range: `[-1, 256]`
- Unit: Threads
- This variable is used to set the concurrency of the `Projection` operator.
- A value of `-1` means that the value of `tidb_executor_concurrency` will be used instead.

#### 14.4.1.262 tidb_query_log_max_len

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `4096` (4 KiB)
- Range: `[0, 1073741824]`
- Unit: Bytes
- The maximum length of the SQL statement output. When the output length of a statement is larger than the `tidb_query_log_max_len` value, the statement is truncated to output.
- This setting was previously also available as a `tidb.toml` option (`log.query-log-max-len`), but is only a system variable starting from TiDB v6.1.0.

#### 14.4.1.263 tidb_rc_read_check_ts New in v6.0.0

**Warning:**

- This feature is incompatible with `replica-read`. Do not enable `tidb_rc_read_check_ts` and `replica-read` at the same time.
- If your client uses a cursor, it is not recommended to enable `tidb_rc_read_check_ts` in case that the previous batch of returned data has already been used by the client and the statement eventually fails.

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Boolean
- Default value: `OFF`
- This variable is used to optimize the timestamp acquisition, which is suitable for scenarios with read-committed isolation level where read-write conflicts are rare. Enabling this variable can avoid the latency and cost of getting the global timestamp, and can optimize the transaction-level read latency.
- If read-write conflicts are severe, enabling this feature will increase the cost and latency of getting the global timestamp, and might cause performance regression. For details, see Read Committed isolation level.

#### 14.4.1.264 tidb_rc_write_check_ts New in v6.3.0

> **Warning:**
>
> This feature is currently incompatible with `replica-read`. After this variable is enabled, all requests sent by the client cannot use `replica-read`. Therefore, do not enable `tidb_rc_write_check_ts` and `replica-read` at the same time.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to optimize the acquisition of timestamps and is suitable for scenarios with few point-write conflicts in `READ-COMMITTED` isolation level of pessimistic transactions. Enabling this variable can avoid the latency and overhead brought by obtaining the global timestamps during the execution of point-write statements. Currently, this variable is applicable to three types of point-write statements: `UPDATE`, `DELETE`, and `SELECT ..... FOR UPDATE`. A point-write statement refers to a write statement that uses the primary key or unique key as a filter condition and the final execution operator contains `POINT-GET`.
- If the point-write conflicts are severe, enabling this variable will increase extra overhead and latency, resulting in performance regression. For details, see Read Committed isolation level.

#### 14.4.1.265 tidb_read_consistency New in v5.4.0

- Scope: SESSION

- Type: String
- Default value: `strict`
- This variable is used to control the read consistency for an auto-commit read statement.
- If the variable value is set to `weak`, the locks encountered by the read statement are skipped directly and the read execution might be faster, which is the weak consistency read mode. However, the transaction semantics (such as atomicity) and distributed consistency (such as linearizability) are not guaranteed.
- For user scenarios where the auto-commit read needs to return fast and weak consistency read results are acceptable, you can use the weak consistency read mode.

#### 14.4.1.266 tidb_read_staleness New in v5.4.0

- Scope: SESSION
- Type: Integer
- Default value: `0`
- Range: `[-2147483648, 0]`
- This variable is used to set the time range of historical data that TiDB can read in the current session. After setting the value, TiDB selects a timestamp as new as possible from the range allowed by this variable, and all subsequent read operations are performed against this timestamp. For example, if the value of this variable is set to `-5`, on the condition that TiKV has the corresponding historical version's data, TiDB selects a timestamp as new as possible within a 5-second time range.

#### 14.4.1.267 tidb_record_plan_in_slow_log

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Boolean
- Default value: `ON`
- This variable is used to control whether to include the execution plan of slow queries in the slow log.

#### 14.4.1.268 tidb_redact_log

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable controls whether to hide user information in the SQL statement being recorded into the TiDB log and slow log.
- When you set the variable to `1`, user information is hidden. For example, if the executed SQL statement is `insert into t values (1,2)`, the statement is recorded as `insert into t values (?,?)` in the log.

#### 14.4.1.269 tidb_regard_null_as_point New in v5.4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls whether the optimizer can use a query condition including null equivalence as a prefix condition for index access.
- This variable is enabled by default. When it is enabled, the optimizer can reduce the volume of index data to be accessed, which accelerates query execution. For example, if a query involves multiple-column indexes `index(a, b)` and the query condition contains `a<=>null and b=1`, the optimizer can use both `a<=>null` and `b=1` in the query condition for index access. If the variable is disabled, because `a<=>null and b =1` includes the null equivalence condition, the optimizer does not use `b=1` for index access.

#### 14.4.1.270 tidb_remove_orderby_in_subquery New in v6.1.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- Specifies whether to remove `ORDER BY` clause in a subquery.

#### 14.4.1.271 tidb_replica_read New in v4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `leader`
- Possible values: `leader`, `follower`, `leader-and-follower`, `closest-replicas`, `closest-adaptive`
- This variable is used to control where TiDB reads data.
- For more details about usage and implementation, see Follower read.

#### 14.4.1.272 tidb_restricted_read_only New in v5.2.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- `tidb_restricted_read_only` and `tidb_super_read_only` behave similarly. In most cases, you should use `tidb_super_read_only` only.

- Users with the `SUPER` or `SYSTEM_VARIABLES_ADMIN` privilege can modify this variable. However, if the Security Enhanced Mode is enabled, the additional `RESTRICTED_VARIABLES_ADMIN` privilege is required to read or modify this variable.
- `tidb_restricted_read_only` affects `tidb_super_read_only` in the following cases:
    - Setting `tidb_restricted_read_only` to `ON` will update `tidb_super_read_only` to `ON`.
    - Setting `tidb_restricted_read_only` to `OFF` leaves `tidb_super_read_only` unchanged.
    - If `tidb_restricted_read_only` is `ON`, `tidb_super_read_only` cannot be set to `OFF`.
- For DBaaS providers of TiDB, if a TiDB cluster is a downstream database of another database, to make the TiDB cluster read-only, you might need to use `tidb_restricted_read_only` with Security Enhanced Mode enabled, which prevents your customers from using `tidb_super_read_only` to make the cluster writable. To achieve this, you need to enable Security Enhanced Mode, use an admin user with the `SYSTEM_VARIABLES_ADMIN` and `RESTRICTED_VARIABLES_ADMIN` privileges to control `tidb_restricted_read_only`, and let your database users use the root user with the `SUPER` privilege to control `tidb_super_read_only` only.
- This variable controls the read-only status of the entire cluster. When the variable is `ON`, all TiDB servers in the entire cluster are in the read-only mode. In this case, TiDB only executes the statements that do not modify data, such as `SELECT`, `USE`, and `SHOW`. For other statements such as `INSERT` and `UPDATE`, TiDB rejects executing those statements in the read-only mode.
- Enabling the read-only mode using this variable only ensures that the entire cluster finally enters the read-only status. If you have changed the value of this variable in a TiDB cluster but the change has not yet propagated to other TiDB servers, the un-updated TiDB servers are still **not** in the read-only mode.
- TiDB checks the read-only flag before SQL statements are executed. Since v6.2.0, the flag is also checked before SQL statements are committed. This helps prevent the case where long-running auto commit statements might modify data after the server has been placed in read-only mode.
- When this variable is enabled, TiDB handles the uncommitted transactions in the following ways:
    - For uncommitted read-only transactions, you can commit the transactions normally.
    - For uncommitted transactions that are not read-only, SQL statements that perform write operations in these transactions are rejected.
    - For uncommitted read-only transactions with modified data, the commit of these transactions is rejected.
- After the read-only mode is enabled, all users (including the users with the `SUPER` privilege) cannot execute the SQL statements that might write data unless the user is explicitly granted the `RESTRICTED_REPLICA_WRITER_ADMIN` privilege.

#### 14.4.1.273 tidb_retry_limit

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `10`
- Range: `[-1, 9223372036854775807]`
- This variable is used to set the maximum number of the retries for optimistic transactions. When a transaction encounters retryable errors (such as transaction conflicts, very slow transaction commit, or table schema changes), this transaction is re-executed according to this variable. Note that setting `tidb_retry_limit` to `0` disables the automatic retry. This variable only applies to optimistic transactions, not to pessimistic transactions.

#### 14.4.1.274 tidb_row_format_version

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `2`
- Range: `[1, 2]`
- Controls the format version of the newly saved data in the table. In TiDB v4.0, the new storage row format version `2` is used by default to save new data.
- If you upgrade from a TiDB version earlier than v4.0.0 to v4.0.0 or later versions, the format version is not changed, and TiDB continues to use the old format of version `1` to write data to the table, which means that **only newly created clusters use the new data format by default**.
- Note that modifying this variable does not affect the old data that has been saved, but applies the corresponding version format only to the newly written data after modifying this variable.

#### 14.4.1.275 tidb_scatter_region

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- By default, Regions are split for a new table when it is being created in TiDB. After this variable is enabled, the newly split Regions are scattered immediately during the execution of the `CREATE TABLE` statement. This applies to the scenario where data need to be written in batches right after the tables are created in batches, because the newly split Regions can be scattered in TiKV beforehand and do not have to wait to be scheduled by PD. To ensure the continuous stability of writing data in batches,

the `CREATE TABLE` statement returns success only after the Regions are successfully scattered. This makes the statement's execution time multiple times longer than that when you disable this variable.
- Note that if `SHARD_ROW_ID_BITS` and `PRE_SPLIT_REGIONS` have been set when a table is created, the specified number of Regions are evenly split after the table creation.

#### 14.4.1.276 tidb_server_memory_limit New in v6.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `80%`
- Range:
  - You can set the value in the percentage format, which means the percentage of the memory usage relative to the total memory. The value range is `[1%, 99%]`.
  - You can also set the value in memory size. The value range is `0` and `[536870912, 9223372036854775807]` in bytes. The memory format with the units "KB|MB|GB|TB" is supported. `0` means no memory limit.
  - If this variable is set to a memory size that is less than 512 MB but not `0`, TiDB uses 512 MB as the actual size.
- This variable specifies the memory limit for a TiDB instance. When the memory usage of TiDB reaches the limit, TiDB cancels the currently running SQL statement with the highest memory usage. After the SQL statement is successfully canceled, TiDB tries to call Golang GC to immediately reclaim memory to relieve memory stress as soon as possible.
- Only the SQL statements with more memory usage than the `tidb_server_memory_limit_sess_min_limit` are selected as the SQL statements to be canceled first.
- Currently, TiDB cancels only one SQL statement at a time. After TiDB completely cancels a SQL statement and recovers resources, if the memory usage is still greater than the limit set by this variable, TiDB starts the next cancel operation.

#### 14.4.1.277 tidb_server_memory_limit_gc_trigger New in v6.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `70%`
- Range: `[50%, 99%]`
- The threshold at which TiDB tries to trigger GC. When the memory usage of TiDB reaches the value of `tidb_server_memory_limit` * the value of `tidb_server_memory_limit_gc_trigger`, TiDB will actively trigger a Golang GC operation. Only one GC operation will be triggered in one minute.

#### 14.4.1.278 tidb_server_memory_limit_sess_min_size New in v6.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `134217728` (which is 128 MB)
- Range: `[128, 9223372036854775807]`, in bytes. The memory format with the units "KB|MB|GB|TB" is also supported.
- After you enable the memory limit, TiDB will terminate the SQL statement with the highest memory usage on the current instance. This variable specifies the minimum memory usage of the SQL statement to be terminated. If the memory usage of a TiDB instance that exceeds the limit is caused by too many sessions with low memory usage, you can properly lower the value of this variable to allow more sessions to be canceled.

#### 14.4.1.279 tidb_shard_allocate_step New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `9223372036854775807`
- Range: `[1, 9223372036854775807]`
- This variable controls the maximum number of continuous IDs to be allocated for the `AUTO_RANDOM` or `SHARD_ROW_ID_BITS` attribute. Generally, `AUTO_RANDOM` IDs or the `SHARD_ROW_ID_BITS` annotated row IDs are incremental and continuous in one transaction. You can use this variable to solve the hotspot issue in large transaction scenarios.

#### 14.4.1.280 tidb_simplified_metrics

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- When this variable is enabled, TiDB does not collect or record the metrics that are not used in the Grafana panels.

#### 14.4.1.281 tidb_skip_ascii_check New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to set whether to skip ASCII validation.
- Validating ASCII characters affects the performance. When you are sure that the input characters are valid ASCII characters, you can set the variable value to `ON`.

#### 14.4.1.282 tidb_skip_isolation_level_check

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- After this switch is enabled, if an isolation level unsupported by TiDB is assigned to `tx_isolation`, no error is reported. This helps improve compatibility with applications that set (but do not depend on) a different isolation level.

```
tidb> set tx_isolation='serializable';
ERROR 8048 (HY000): The isolation level 'serializable' is not supported.
    ↪ Set tidb_skip_isolation_level_check=1 to skip this error
tidb> set tidb_skip_isolation_level_check=1;
Query OK, 0 rows affected (0.00 sec)

tidb> set tx_isolation='serializable';
Query OK, 0 rows affected, 1 warning (0.00 sec)
```

#### 14.4.1.283 tidb_skip_utf8_check

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to set whether to skip UTF-8 validation.
- Validating UTF-8 characters affects the performance. When you are sure that the input characters are valid UTF-8 characters, you can set the variable value to `ON`.

> **Note:**
>
> If the character check is skipped, TiDB might fail to detect illegal UTF-8 characters written by the application, cause decoding errors when `ANALYZE` is executed, and introduce other unknown encoding issues. If your application cannot guarantee the validity of the written string, it is not recommended to skip the character check.

#### 14.4.1.284 tidb_slow_log_threshold

- Scope: GLOBAL

- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Integer
- Default value: `300`
- Range: `[-1, 9223372036854775807]`
- Unit: Milliseconds
- This variable outputs the threshold value of the time consumed by the slow log, and is set to 300 milliseconds by default. When the time consumed by a query is larger than this value, this query is considered as a slow query and its log is output to the slow query log. Note that when the output level of `log.level` is `"debug"`, all queries are recorded in the slow query log, regardless of the setting of this variable.

#### 14.4.1.285 tidb_slow_query_file

- Scope: SESSION
- Default value: ""
- When `INFORMATION_SCHEMA.SLOW_QUERY` is queried, only the slow query log name set by `slow-query-file` in the configuration file is parsed. The default slow query log name is "tidb-slow.log". To parse other logs, set the `tidb_slow_query_file` session variable to a specific file path, and then query `INFORMATION_SCHEMA.SLOW_QUERY` to parse the slow query log based on the set file path.

For details, see Identify Slow Queries.

#### 14.4.1.286 tidb_snapshot

- Scope: SESSION
- Default value: ""
- This variable is used to set the time point at which the data is read by the session. For example, when you set the variable to "2017-11-11 20:20:20" or a TSO number like "400036290571534337", the current session reads the data of this moment.

#### 14.4.1.287 tidb_source_id New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `1`
- Range: `[1, 15]`

- This variable is used to configure the different cluster IDs in a bi-directional replication cluster.

#### 14.4.1.288 tidb_stats_cache_mem_quota New in v6.1.0

> **Warning:**
>
> This variable is an experimental feature. It is not recommended to use it in production environments.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `0`
- Range: `[0, 1099511627776]`
- This variable sets the memory quota for the TiDB statistics cache.

#### 14.4.1.289 tidb_stats_load_pseudo_timeout New in v5.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls how TiDB behaves when the waiting time of SQL optimization reaches the timeout to synchronously load complete column statistics. The default value `ON` means that the SQL optimization gets back to using pseudo statistics after the timeout. If this variable to `OFF`, SQL execution fails after the timeout.

#### 14.4.1.290 tidb_stats_load_sync_wait New in v5.4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `100`
- Range: `[0, 2147483647]`
- Unit: Milliseconds
- This variable controls whether to enable the synchronously loading statistics feature. The value `0` means that the feature is disabled. To enable the feature, you can set this variable to a timeout (in milliseconds) that SQL optimization can wait for at most to synchronously load complete column statistics. For details, see Load statistics.

#### 14.4.1.291 tidb_stmt_summary_history_size New in v4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `24`
- Range: `[0, 255]`
- This variable is used to set the history capacity of statement summary tables.

#### 14.4.1.292 tidb_stmt_summary_internal_query New in v4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to control whether to include the SQL information of TiDB in statement summary tables.

#### 14.4.1.293 tidb_stmt_summary_max_sql_length New in v4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `4096`
- Range: `[0, 2147483647]`
- This variable is used to control the length of the SQL string in statement summary tables.

#### 14.4.1.294 tidb_stmt_summary_max_stmt_count New in v4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `3000`
- Range: `[1, 32767]`
- This variable is used to set the maximum number of statements that statement summary tables store in memory.

#### 14.4.1.295 tidb_stmt_summary_refresh_interval New in v4.0

- Scope: GLOBAL
- Persists to cluster: Yes

- Type: Integer
- Default value: `1800`
- Range: `[1, 2147483647]`
- Unit: Seconds
- This variable is used to set the refresh time of statement summary tables.

#### 14.4.1.296 tidb_store_batch_size

> **Warning:**
>
> Currently, `tidb_store_batch_size` is not stable yet. This variable might be removed in a future release. It is not recommended that you use it in production environments. It is not recommended to change the default value.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `0`
- Range: `[0, 25000]`
- This variable is used to control the batch size of the Coprocessor Tasks of the `IndexLookUp` operator. `0` means to disable batch. When the number of tasks is relatively large and slow queries occur, you can increase this variable to optimize the query.

#### 14.4.1.297 tidb_store_limit New in v3.0.4 and v4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `0`
- Range: `[0, 9223372036854775807]`
- This variable is used to limit the maximum number of requests TiDB can send to TiKV at the same time. 0 means no limit.

#### 14.4.1.298 tidb_streamagg_concurrency

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `1`

- This variable sets the concurrency of the `StreamAgg` operator when queries are executed.
- It is **NOT recommended** to set this variable. Modifying the variable value might cause data correctness issues.

#### 14.4.1.299 tidb_super_read_only New in v5.3.1

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- `tidb_super_read_only` aims to be implemented as a replacement of the MySQL variable `super_read_only`. However, because TiDB is a distributed database, `tidb_super_read_only` does not make the database read-only immediately after execution, but eventually.
- Users with the `SUPER` or `SYSTEM_VARIABLES_ADMIN` privilege can modify this variable.
- This variable controls the read-only status of the entire cluster. When the variable is `ON`, all TiDB servers in the entire cluster are in the read-only mode. In this case, TiDB only executes the statements that do not modify data, such as `SELECT`, `USE`, and `SHOW`. For other statements such as `INSERT` and `UPDATE`, TiDB rejects executing those statements in the read-only mode.
- Enabling the read-only mode using this variable only ensures that the entire cluster finally enters the read-only status. If you have changed the value of this variable in a TiDB cluster but the change has not yet propagated to other TiDB servers, the un-updated TiDB servers are still **not** in the read-only mode.
- TiDB checks the read-only flag before SQL statements are executed. Since v6.2.0, the flag is also checked before SQL statements are committed. This helps prevent the case where long-running auto commit statements might modify data after the server has been placed in read-only mode.
- When this variable is enabled, TiDB handles the uncommitted transactions in the following ways:
    - For uncommitted read-only transactions, you can commit the transactions normally.
    - For uncommitted transactions that are not read-only, SQL statements that perform write operations in these transactions are rejected.
    - For uncommitted read-only transactions with modified data, the commit of these transactions is rejected.
- After the read-only mode is enabled, all users (including the users with the `SUPER` privilege) cannot execute the SQL statements that might write data unless the user is explicitly granted the `RESTRICTED_REPLICA_WRITER_ADMIN` privilege.
- When the `tidb_restricted_read_only` system variable is set to `ON`, `tidb_super_read_only` ↪ is affected by `tidb_restricted_read_only` in some cases. For detailed impact, see the description of `tidb_restricted_read_only`.

#### 14.4.1.300 tidb_sysdate_is_now New in v6.0.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to control whether the `SYSDATE` function can be replaced by the `NOW` function. This configuration item has the same effect as the MySQL option `sysdate-is-now`.

#### 14.4.1.301 tidb_sysproc_scan_concurrency New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `1`
- Range: `[1, 256]`
- This variable is used to set the concurrency of scan operations performed when TiDB executes internal SQL statements (such as an automatic update of statistics).

#### 14.4.1.302 tidb_table_cache_lease New in v6.0.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `3`
- Range: `[1, 10]`
- Unit: Seconds
- This variable is used to control the lease time of cached tables with a default value of `3`. The value of this variable affects the modification to cached tables. After a modification is made to cached tables, the longest waiting time might be `tidb_table_cache_lease` seconds. If the table is read-only or can accept a high write latency, you can increase the value of this variable to increase the valid time for caching tables and to reduce the frequency of lease renewal.

#### 14.4.1.303 tidb_tmp_table_max_size New in v5.3.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `67108864`
- Range: `[1048576, 137438953472]`
- Unit: Bytes
- This variable is used to set the maximum size of a single temporary table. Any temporary table with a size larger than this variable value causes error.

#### 14.4.1.304 tidb_top_sql_max_meta_count New in v6.0.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `5000`
- Range: `[1, 10000]`

- This variable is used to control the maximum number of SQL statement types collected by Top SQL per minute.

#### 14.4.1.305 tidb_top_sql_max_time_series_count New in v6.0.0

> **Note:**
>
> Currently, the Top SQL page in TiDB Dashboard only displays the top 5 types of SQL queries that contribute the most to the load, which is irrelevant with the configuration of `tidb_top_sql_max_time_series_count`.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `100`
- Range: `[1, 5000]`

- This variable is used to control how many SQL statements that contribute the most to the load (that is, top N) can be recorded by Top SQL per minute.

#### 14.4.1.306 tidb_track_aggregate_memory_usage

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls whether TiDB tracks the memory usage of aggregate functions.

> **Warning:**
>
> If you disable this variable, TiDB might not accurately track the memory usage and cannot control the memory usage of the corresponding SQL statements.

#### 14.4.1.307 tidb_tso_client_batch_max_wait_time New in v5.3.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Float
- Default value: `0`
- Range: `[0, 10]`
- Unit: Milliseconds
- This variable is used to set the maximum waiting time for a batch operation when TiDB requests TSO from PD. The default value is `0`, which means no extra waiting time.
- When obtaining TSO requests from PD each time, PD Client, used by TiDB, collects as many TSO requests received at the same time as possible. Then, PD Client merges the collected requests in batch into one RPC request and sends the request to PD. This helps reduce the pressure on PD.
- After setting this variable to a value greater than `0`, TiDB waits for the maximum duration of this value before the end of each batch merge. This is to collect more TSO requests and improve the effect of batch operations.
- Scenarios for increasing the value of this variable:
  - Due to the high pressure of TSO requests, the CPU of the PD leader reaches a bottleneck, which causes high latency of TSO RPC requests.
  - There are not many TiDB instances in the cluster, but every TiDB instance is in high concurrency.
- It is recommended to set this variable to a value as small as possible.

> **Note:**
>
> Suppose that the TSO RPC latency increases for reasons other than a CPU usage bottleneck of the PD leader (such as network issues). In this case, increasing the value of `tidb_tso_client_batch_max_wait_time` might increase the execution latency in TiDB and affect the QPS performance of the cluster.

#### 14.4.1.308 tidb_ttl_delete_rate_limit New in v6.5.0

> **Warning:**
>
> TTL is an experimental feature. This system variable might be changed or removed in future releases.

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `0`
- Range: `[0, 9223372036854775807]`
- This variable is used to limit the rate of `DELETE` statements in TTL jobs on each TiDB node. The value represents the maximum number of `DELETE` statements allowed per second in a single node in a TTL job. When this variable is set to `0`, no limit is applied.

#### 14.4.1.309 tidb_ttl_delete_batch_size New in v6.5.0

> **Warning:**
>
> TTL is an experimental feature. This system variable might be changed or removed in future releases.

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `100`
- Range: `[1, 10240]`
- This variable is used to set the maximum number of rows that can be deleted in a single `DELETE` transaction in a TTL job.

#### 14.4.1.310 tidb_ttl_delete_worker_count New in v6.5.0

> **Warning:**
>
> TTL is an experimental feature. This system variable might be changed or removed in future releases.

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `4`
- Range: `[1, 256]`
- This variable is used to set the maximum concurrency of TTL jobs on each TiDB node.

#### 14.4.1.311 tidb_ttl_job_enable New in v6.5.0

> **Warning:**
>
> TTL is an experimental feature. This system variable might be changed or removed in future releases.

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `ON`
- Type: Boolean
- This variable is used to control whether TTL jobs are enabled. If it is set to `OFF`, all tables with TTL attributes automatically stop cleaning up expired data.

#### 14.4.1.312 tidb_ttl_scan_batch_size New in v6.5.0

> **Warning:**
>
> TTL is an experimental feature. This system variable might be changed or removed in future releases.

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `500`
- Range: `[1, 10240]`
- This variable is used to set the `LIMIT` value of each `SELECT` statement used to scan expired data in a TTL job.

#### 14.4.1.313 tidb_ttl_scan_worker_count New in v6.5.0

> **Warning:**
>
> TTL is an experimental feature. This system variable might be changed or removed in future releases.

- Scope: GLOBAL
- Persists to cluster: Yes

- Default value: `4`
- Range: `[1, 256]`
- This variable is used to set the maximum concurrency of TTL scan jobs on each TiDB node.

#### 14.4.1.314 tidb_ttl_job_run_interval New in v6.5.0

> **Warning:**
>
> TTL is an experimental feature. This system variable might be changed or removed in future releases.

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `1h0m0s`
- Range: `[10m0s, 8760h0m0s]`
- This variable is used to control the scheduling interval of TTL jobs in the background. For example, if the current value is set to `1h0m0s`, each table with TTL attributes cleans up expired data once every hour.

#### 14.4.1.315 tidb_ttl_job_schedule_window_start_time New in v6.5.0

> **Warning:**
>
> TTL is an experimental feature. This system variable might be changed or removed in future releases.

- Scope: GLOBAL
- Type: Time
- Persists to cluster: Yes
- Default value: `00:00 +0000`
- This variable is used to control the start time of the scheduling window of TTL jobs in the background. When you modify the value of this variable, be cautious that a small window might cause the cleanup of expired data to fail.

#### 14.4.1.316 tidb_ttl_job_schedule_window_end_time New in v6.5.0

> **Warning:**
>
> TTL is an experimental feature. This system variable might be changed or removed in future releases.

- Scope: GLOBAL
- Type: Time
- Persists to cluster: Yes
- Default value: `23:59 +0000`
- This variable is used to control the end time of the scheduling window of TTL jobs in the background. When you modify the value of this variable, be cautious that a small window might cause the cleanup of expired data to fail.

#### 14.4.1.317 tidb_txn_assertion_level New in v6.0.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `FAST`
- Possible values: `OFF`, `FAST`, `STRICT`
- This variable is used to control the assertion level. Assertion is a consistency check between data and indexes, which checks whether a key being written exists in the transaction commit process. For more information, see Troubleshoot Inconsistency Between Data and Indexes.
    - `OFF`: Disable this check.
    - `FAST`: Enable most of the check items, with almost no impact on performance.
    - `STRICT`: Enable all check items, with a minor impact on pessimistic transaction performance when the system workload is high.
- For new clusters of v6.0.0 or later versions, the default value is `FAST`. For existing clusters that upgrade from versions earlier than v6.0.0, the default value is `OFF`.

#### 14.4.1.318 tidb_txn_commit_batch_size New in v6.2.0

- Scope: GLOBAL
- Persists to cluster: Yes

- Type: Integer
- Default value: `16384`
- Range: `[1, 1073741824]`
- Unit: Bytes

- This variable is used to control the batch size of transaction commit requests that TiDB sends to TiKV. If most of the transactions in the application workload have a large number of write operations, adjusting this variable to a larger value can improve the performance of batch processing. However, if this variable is set to too large a value and exceeds the limit of TiKV's `raft-entry-max-size`, the commits might fail.

#### 14.4.1.319 tidb_txn_mode

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `pessimistic`
- Possible values: `pessimistic`, `optimistic`
- This variable is used to set the transaction mode. TiDB 3.0 supports the pessimistic transactions. Since TiDB 3.0.8, the pessimistic transaction mode is enabled by default.
- If you upgrade TiDB from v3.0.7 or earlier versions to v3.0.8 or later versions, the default transaction mode does not change. **Only the newly created clusters use the pessimistic transaction mode by default**.
- If this variable is set to "optimistic" or "", TiDB uses the optimistic transaction mode.

#### 14.4.1.320 tidb_use_plan_baselines New in v4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable is used to control whether to enable the execution plan binding feature. It is enabled by default, and can be disabled by assigning the `OFF` value. For the use of the execution plan binding, see Execution Plan Binding.

#### 14.4.1.321 tidb_wait_split_region_finish

- Scope: SESSION
- Type: Boolean
- Default value: `ON`
- It usually takes a long time to scatter Regions, which is determined by PD scheduling and TiKV loads. This variable is used to set whether to return the result to the client after all Regions are scattered completely when the `SPLIT REGION` statement is being executed:

  - `ON` requires that the `SPLIT REGIONS` statement waits until all Regions are scattered.
  - `OFF` permits the `SPLIT REGIONS` statement to return before finishing scattering all Regions.
- Note that when scattering Regions, the write and read performances for the Region that is being scattered might be affected. In batch-write or data importing scenarios, it is recommended to import data after Regions scattering is finished.

#### 14.4.1.322 tidb_wait_split_region_timeout

- Scope: SESSION
- Type: Integer
- Default value: `300`
- Range: `[1, 2147483647]`
- Unit: Seconds
- This variable is used to set the timeout for executing the `SPLIT REGION` statement. If a statement is not executed completely within the specified time value, a timeout error is returned.

#### 14.4.1.323 tidb_window_concurrency New in v4.0

> **Warning:**
>
> Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `-1`
- Range: `[1, 256]`
- Unit: Threads
- This variable is used to set the concurrency degree of the window operator.
- A value of `-1` means that the value of `tidb_executor_concurrency` will be used instead.

#### 14.4.1.324 tiflash_fastscan New in v6.3.0

- Scope: SESSION | GLOBAL
- Default value: `OFF`

- Type: Boolean
- If FastScan is enabled (set to `ON`), TiFlash provides more efficient query performance, but does not guarantee the accuracy of the query results or data consistency.

#### 14.4.1.325 tiflash_fine_grained_shuffle_batch_size New in v6.2.0

- Scope: SESSION | GLOBAL
- Default value: `8192`
- Range: `[1, 18446744073709551615]`
- When Fine Grained Shuffle is enabled, the window function pushed down to TiFlash can be executed in parallel. This variable controls the batch size of the data sent by the sender.
- Impact on performance: set a reasonable size according to your business requirements. Improper setting affects the performance. If the value is set too small, for example `1`, it causes one network transfer per Block. If the value is set too large, for example, the total number of rows of the table, it causes the receiving end to spend most of the time waiting for data, and the piplelined computation cannot work. To set a proper value, you can observe the distribution of the number of rows received by the TiFlash receiver. If most threads receive only a few rows, for example a few hundred, you can increase this value to reduce the network overhead.

#### 14.4.1.326 tiflash_fine_grained_shuffle_stream_count New in v6.2.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `0`
- Range: `[-1, 1024]`
- When the window function is pushed down to TiFlash for execution, you can use this variable to control the concurrency level of the window function execution. The possible values are as follows:
  - -1: the Fine Grained Shuffle feature is disabled. The window function pushed down to TiFlash is executed in a single thread.
  - 0: the Fine Grained Shuffle feature is enabled. If `tidb_max_tiflash_threads` is set to a valid value (greater than 0), then `tiflash_fine_grained_shuffle_stream_count` ↪ is set to the value of `tidb_max_tiflash_threads`. Otherwise, it is set to 8. The actual concurrency level of the window function on TiFlash is: min(`tiflash_fine_grained_shuffle_stream_count`, the number of physical threads on TiFlash nodes).

    - Integer greater than 0: the Fine Grained Shuffle feature is enabled. The window function pushed down to TiFlash is executed in multiple threads. The concurrency level is: min(`tiflash_fine_grained_shuffle_stream_count`, the number of physical threads on TiFlash nodes).

- Theoretically, the performance of the window function increases linearly with this value. However, if the value exceeds the actual number of physical threads, it instead leads to performance degradation.

#### 14.4.1.327 time_zone

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `SYSTEM`
- This variable returns the current time zone. Values can be specified as either an offset such as '-8:00' or a named zone 'America/Los_Angeles'.
- The value `SYSTEM` means that the time zone should be the same as the system host, which is available via the `system_time_zone` variable.

#### 14.4.1.328 timestamp

- Scope: SESSION
- Type: Float
- Default value: `0`
- Range: `[0, 2147483647]`
- A non-empty value of this variable indicates the UNIX epoch that is used as the timestamp for `CURRENT_TIMESTAMP()`, `NOW()`, and other functions. This variable might be used in data restore or replication.

#### 14.4.1.329 transaction_isolation

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `REPEATABLE-READ`
- Possible values: `READ-UNCOMMITTED`, `READ-COMMITTED`, `REPEATABLE-READ`, `SERIALIZABLE`
  ↪
- This variable sets the transaction isolation. TiDB advertises `REPEATABLE-READ` for compatibility with MySQL, but the actual isolation level is Snapshot Isolation. See transaction isolation levels for further details.

#### 14.4.1.330 tx_isolation

This variable is an alias for `transaction_isolation`.

#### 14.4.1.331 tx_isolation_one_shot

> **Note:**
>
> This variable is internally used in TiDB. You are not expected to use it.

Internally, the TiDB parser transforms the `SET TRANSACTION ISOLATION LEVEL [READ COMMITTED| REPEATABLE READ | ...]` statements to `SET @@SESSION.TX_ISOLATION_ONE_SHOT = [READ COMMITTED| REPEATABLE READ | ...]`.

#### 14.4.1.332 tx_read_ts

- Scope: SESSION
- Default value: ""
- In the Stale Read scenarios, this session variable is used to help record the Stable Read timestamp value.
- This variable is used for the internal operation of TiDB. It is **NOT recommended** to set this variable.

#### 14.4.1.333 txn_scope

- Scope: SESSION
- Default value: `global`
- Value options: `global` and `local`
- This variable is used to set whether the current session transaction is a global transaction or a local transaction.
- This variable is used for the internal operation of TiDB. It is **NOT recommended** to set this variable.

#### 14.4.1.334 validate_password.check_user_name New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `ON`
- Type: Boolean
- This variable is a check item in the password complexity check. It checks whether the password matches the username. This variable takes effect only when `validate_password.enable` is enabled.
- When this variable is effective and set to `ON`, if you set a password, TiDB compares the password with the username (excluding the hostname). If the password matches the username, the password is rejected.
- This variable is independent of `validate_password.policy` and not affected by the password complexity check level.

#### 14.4.1.335 validate_password.dictionary New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `""`
- Type: String
- This variable is a check item in the password complexity check. It checks whether the password matches the dictionary. This variable takes effect only when `validate_password.enable` is enabled and `validate_password.policy` is set to `2` (STRONG).
- This variable is a string not longer than 1024 characters. It contains a list of words that cannot exist in the password. Each word is separated by semicolon (`;`).
- This variable is set to an empty string by default, which means no dictionary check is performed. To perform the dictionary check, you need to include the words to be matched in the string. If this variable is configured, when you set a password, TiDB compares each substring (length in 4 to 100 characters) of the password with the words in the dictionary. If any substring of the password matches a word in the dictionary, the password is rejected. The comparison is case-insensitive.

#### 14.4.1.336 validate_password.enable New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `OFF`
- Type: Boolean
- This variable controls whether to perform password complexity check. If this variable is set to `ON`, TiDB performs the password complexity check when you set a password.

#### 14.4.1.337 validate_password.length New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `8`
- Range: `[0, 2147483647]`
- This variable is a check item in the password complexity check. It checks whether the password length is sufficient. By default, the minimum password length is `8`. This variable takes effect only when `validate_password.enable` is enabled.
- The value of this variable must not be smaller than the expression: `validate_password` ↪ `.number_count + validate_password.special_char_count + (2 * validate_password` ↪ `.mixed_case_count)`.
- If you change the value of `validate_password.number_count`, `validate_password` ↪ `.special_char_count`, or `validate_password.mixed_case_count` such that the expression value is larger than `validate_password.length`, the value of `validate_password.length` is automatically changed to match the expression value.

#### 14.4.1.338 validate_password.mixed_case_count New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `1`
- Range: `[0, 2147483647]`
- This variable is a check item in the password complexity check. It checks whether the password contains sufficient uppercase and lowercase letters. This variable takes effect only when `validate_password.enable` is enabled and `validate_password.policy` is set to `1` (MEDIUM) or larger.
- Neither the number of uppercase letters nor the number of lowercase letters in the password can be fewer than the value of `validate_password.mixed_case_count`. For example, when the variable is set to `1`, the password must contain at least one uppercase letter and one lowercase letter.

#### 14.4.1.339 validate_password.number_count New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `1`
- Range: `[0, 2147483647]`
- This variable is a check item in the password complexity check. It checks whether the password contains sufficient numbers. This variable takes effect only when `validate_password.enable` is enabled and `validate_password.policy` is set to `1` (MEDIUM) or larger.

#### 14.4.1.340 validate_password.policy New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `1`
- Value options: `0`, `1`, `2`
- This variable controls the policy for the password complexity check. This variable takes effect only when `validate_password.enable` is enabled. The value of this variable determines whether other `validate-password` variables take effect in the password complexity check, except for `validate_password.check_user_name`.
- This value of this variable can be `0`, `1`, or `2` (corresponds to LOW, MEDIUM, or STRONG). Different policy levels have different checks:
    - 0 or LOW: password length.

- 1 or MEDIUM: password length, uppercase and lowercase letters, numbers, and special characters.
- 2 or STRONG: password length, uppercase and lowercase letters, numbers, special characters, and dictionary match.

#### 14.4.1.341 validate_password.special_char_count New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `1`
- Range: `[0, 2147483647]`
- This variable is a check item in the password complexity check. It checks whether the password contains sufficient special characters. This variable takes effect only when `validate_password.enable` is enabled and `validate_password.policy` is set to `1` (MEDIUM) or larger.

#### 14.4.1.342 version

- Scope: NONE
- Default value: `5.7.25-TiDB-`(tidb version)
- This variable returns the MySQL version, followed by the TiDB version. For example '5.7.25-TiDB-v4.0.0-beta.2-716-g25e003253'.

#### 14.4.1.343 version_comment

- Scope: NONE
- Default value: (string)
- This variable returns additional details about the TiDB version. For example, 'TiDB Server (Apache License 2.0) Community Edition, MySQL 5.7 compatible'.

#### 14.4.1.344 version_compile_machine

- Scope: NONE
- Default value: (string)
- This variable returns the name of the CPU architecture on which TiDB is running.

#### 14.4.1.345 version_compile_os

- Scope: NONE
- Default value: (string)
- This variable returns the name of the OS on which TiDB is running.

#### 14.4.1.346 wait_timeout

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `28800`
- Range: `[0, 31536000]`
- Unit: Seconds
- This variable controls the idle timeout of user sessions. A zero-value means unlimited.

#### 14.4.1.347 warning_count

- Scope: SESSION
- Default value: `0`
- This read-only variable indicates the number of warnings that occurred in the statement that was previously executed.

#### 14.4.1.348 windowing_use_high_precision

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls whether to use the high precision mode when computing the window functions.

## 14.5 Configuration File Parameters

### 14.5.1 TiDB Configuration File

The TiDB configuration file supports more options than command-line parameters. You can download the default configuration file `config.toml.example` and rename it to `config.toml`. This document describes only the options that are not involved in command line options.

> **Tip:**
>
> If you need to adjust the value of a configuration item, refer to Modify the configuration.

#### 14.5.1.0.1 `split-table`

- Determines whether to create a separate Region for each table.
- Default value: `true`
- It is recommended to set it to `false` if you need to create a large number of tables (for example, more than 100 thousand tables).

#### 14.5.1.0.2 `tidb-max-reuse-chunk` New in v6.4.0

- Controls the maximum cached chunk objects of chunk allocation. Setting this configuration item to too large a value might increase the risk of OOM.
- Default value: `64`
- Minimum value: `0`
- Maximum value: `2147483647`

#### 14.5.1.0.3 `tidb-max-reuse-column` New in v6.4.0

- Controls the maximum cached column objects of chunk allocation. Setting this configuration item to too large a value might increase the risk of OOM.
- Default value: `256`
- Minimum value: `0`
- Maximum value: `2147483647`

#### 14.5.1.0.4 `token-limit`

- The number of sessions that can execute requests concurrently.
- Type: Integer
- Default value: `1000`
- Minimum value: `1`
- Maximum Value (64-bit platforms): `18446744073709551615`
- Maximum Value (32-bit platforms): `4294967295`

#### 14.5.1.0.5 `temp-dir` New in v6.3.0

- File system location used by TiDB to store temporary data. If a feature requires local storage in TiDB nodes, TiDB stores the corresponding temporary data in this location.
- When creating an index, if `tidb_ddl_enable_fast_reorg` is enabled, data that needs to be backfilled for a newly created index will be at first stored in the TiDB local temporary directory, and then imported into TiKV in batches, thus accelerating the index creation.
- Default value: `"/tmp/tidb"`

**Note:**

If the directory does not exist, TiDB will automatically create it upon startup. If the directory creation fails or TiDB does not have the read and write permissions on that directory, `Fast Online DDL` might experience unpredictable issues.

#### 14.5.1.0.6 `oom-use-tmp-storage`

**Warning:**

Since v6.3.0, this configuration item is deprecated and superseded by the system variable `tidb_enable_tmp_storage_on_oom`. When the TiDB cluster is upgraded to v6.3.0 or a later version, it will automatically initialize the variable with the value of `oom-use-tmp-storage`. After that, changing the value of `oom-use-tmp-storage` **does not** take effect anymore.

- Controls whether to enable the temporary storage for some operators when a single SQL statement exceeds the memory quota specified by the system variable `tidb_mem_quota_query`.
- Default value: `true`

#### 14.5.1.0.7 `tmp-storage-path`

- Specifies the temporary storage path for some operators when a single SQL statement exceeds the memory quota specified by the system variable `tidb_mem_quota_query`.
- Default value: `<temporary directory of OS>/<OS user ID>_tidb/MC4wLjAuMDo0MDAwLzAuMC4wL`
  ↪ `=/tmp-storage`. `MC4wLjAuMDo0MDAwLzAuMC4wLjA6MTAwODA=` is the `Base64` encoding result of `<host>:<port>/<statusHost>:<statusPort>`.
- This configuration takes effect only when the system variable `tidb_enable_tmp_storage_on_oom`
  ↪ is `ON`.

#### 14.5.1.0.8 `tmp-storage-quota`

- Specifies the quota for the storage in `tmp-storage-path`. The unit is byte.
- When a single SQL statement uses a temporary disk and the total volume of the temporary disk of the TiDB server exceeds this configuration value, the current SQL operation is cancelled and the `Out of Global Storage Quota!` error is returned.

- When the value of this configuration is smaller than `0`, the above check and limit do not apply.
- Default value: `-1`
- When the remaining available storage in `tmp-storage-path` is lower than the value defined by `tmp-storage-quota`, the TiDB server reports an error when it is started, and exits.

#### 14.5.1.0.9 `lease`

- The timeout of the DDL lease.
- Default value: `45s`
- Unit: second

#### 14.5.1.0.10 `compatible-kill-query`

- Determines whether to set the `KILL` statement to be MySQL compatible.
- Default value: `false`
- `compatible-kill-query` takes effect only when `enable-global-kill` is set to `false`.
- When `enable-global-kill` is `false`, `compatible-kill-query` controls whether you need to append the `TIDB` keyword when killing a query.
    - When `compatible-kill-query` is `false`, the behavior of `KILL xxx` in TiDB is different from that in MySQL. To kill a query in TiDB, you need to append the `TIDB` keyword, such as `KILL TIDB xxx`.
    - When `compatible-kill-query` is `true`, to kill a query in TiDB, there is no need to append the `TIDB` keyword. It is **STRONGLY NOT RECOMMENDED** to set `compatible-kill-query` to `true` in your configuration file UNLESS you are certain that clients will be always connected to the same TiDB instance. This is because pressing Control+C in the default MySQL client opens a new connection in which `KILL` is executed. If there is a proxy between the client and the TiDB cluster, the new connection might be routed to a different TiDB instance, which possibly kills a different session by mistake.
- When `enable-global-kill` is `true`, `KILL xxx` and `KILL TIDB xxx` have the same effect, but using Control+C to kill a query is not supported.
- For more information about the `KILL` statement, see KILL [TIDB].

#### 14.5.1.0.11 `check-mb4-value-in-utf8`

- Determines whether to enable the `utf8mb4` character check. When this feature is enabled, if the character set is `utf8` and the `mb4` characters are inserted in `utf8`, an error is returned.
- Default value: `false`

- Since v6.1.0, whether to enable the `utf8mb4` character check is determined by the TiDB configuration item `instance.tidb_check_mb4_value_in_utf8` or the system variable `tidb_check_mb4_value_in_utf8`. `check-mb4-value-in-utf8` still takes effect. But if both `check-mb4-value-in-utf8` and `instance.tidb_check_mb4_value_in_utf8` are set, the latter takes effect.

#### 14.5.1.0.12 `treat-old-version-utf8-as-utf8mb4`

- Determines whether to treat the `utf8` character set in old tables as `utf8mb4`.
- Default value: `true`

#### 14.5.1.0.13 `alter-primary-key` (Deprecated)

- Determines whether to add or remove the primary key constraint to or from a column.
- Default value: `false`
- With this default setting, adding or removing the primary key constraint is not supported. You can enable this feature by setting `alter-primary-key` to `true`. However, if a table already exists before the switch is on, and the data type of its primary key column is an integer, dropping the primary key from the column is not possible even if you set this configuration item to `true`.

> **Note:**
>
> This configuration item has been deprecated, and currently takes effect only when the value of `@tidb_enable_clustered_index` is `INT_ONLY`. If you need to add or remove the primary key, use the `NONCLUSTERED` keyword instead when creating the table. For more details about the primary key of the `CLUSTERED` type, refer to clustered index.

#### 14.5.1.0.14 `server-version`

- Modifies the version string returned by TiDB in the following situations:
  - When the built-in `VERSION()` function is used.
  - When TiDB establishes the initial connection to the client and returns the initial handshake packet with version string of the server. For details, see MySQL Initial Handshake Packet.
- Default value: ""
- By default, the format of the TiDB version string is `5.7.${mysql_latest_minor_version}-TiDB-${tidb_version}`.

**Note:**

TiDB nodes use the value of `server-version` to verify the current TiDB version. Therefore, to avoid unexpected behaviors, before upgrading the TiDB cluster, you need to set the value of `server-version` to empty or the real version of the current TiDB cluster.

#### 14.5.1.0.15 `repair-mode`

- Determines whether to enable the untrusted repair mode. When the `repair-mode` is set to `true`, bad tables in the `repair-table-list` cannot be loaded.
- Default value: `false`
- The `repair` syntax is not supported by default. This means that all tables are loaded when TiDB is started.

#### 14.5.1.0.16 `repair-table-list`

- `repair-table-list` is only valid when `repair-mode` is set to `true`. `repair-table-list` is a list of bad tables that need to be repaired in an instance. An example of the list is: [“db.table1”,“db.table2”…].
- Default value: []
- The list is empty by default. This means that there are no bad tables that need to be repaired.

#### 14.5.1.0.17 `new_collations_enabled_on_first_bootstrap`

- Enables or disables the new collation support.
- Default value: `true`
- Note: This configuration takes effect only for the TiDB cluster that is first initialized. After the initialization, you cannot use this configuration item to enable or disable the new collation support.

#### 14.5.1.0.18 `max-server-connections`

- The maximum number of concurrent client connections allowed in TiDB. It is used to control resources.
- Default value: `0`
- By default, TiDB does not set limit on the number of concurrent client connections. When the value of this configuration item is greater than `0` and the number of actual client connections reaches this value, the TiDB server rejects new client connections.

- Since v6.2.0, the TiDB configuration item `instance.max_connections` or the system variable `max_connections` is used to set the maximum number of concurrent client connections allowed in TiDB. `max-server-connections` still takes effect. But if `max-server-connections` and `instance.max_connections` are set at the same time, the latter takes effect.

#### 14.5.1.0.19 `max-index-length`

- Sets the maximum allowable length of the newly created index.
- Default value: `3072`
- Unit: byte
- Currently, the valid value range is `[3072, 3072*4]`. MySQL and TiDB (version < v3.0.11) do not have this configuration item, but both limit the length of the newly created index. This limit in MySQL is `3072`. In TiDB (version =< 3.0.7), this limit is `3072*4`. In TiDB (3.0.7 < version < 3.0.11), this limit is `3072`. This configuration is added to be compatible with MySQL and earlier versions of TiDB.

#### 14.5.1.0.20 `table-column-count-limit` New in v5.0

- Sets the limit on the number of columns in a single table.
- Default value: `1017`
- Currently, the valid value range is `[1017, 4096]`.

#### 14.5.1.0.21 `index-limit` New in v5.0

- Sets the limit on the number of indexes in a single table.
- Default value: `64`
- Currently, the valid value range is `[64, 512]`.

#### 14.5.1.0.22 `enable-telemetry` New in v4.0.2

- Enables or disables the telemetry collection in TiDB.
- Default value: `true` for v6.5.0; `false` for v6.5.1 and later v6.5.x versions
- When this configuration is set to `true` on a TiDB instance and the `tidb_enable_telemetry` system variable is set to `ON`, the telemetry collection in this TiDB instance is enabled.
- When this configuration is set to `false` on all TiDB instances, the telemetry collection in TiDB is disabled and the `tidb_enable_telemetry` system variable does not take effect. See Telemetry for details.

#### 14.5.1.0.23 `enable-tcp4-only` New in v5.0

- Enables or disables listening on TCP4 only.
- Default value: `false`
- Enabling this option is useful when TiDB is used with LVS for load balancing because the real client IP from the TCP header can be correctly parsed by the "tcp4" protocol.

#### 14.5.1.0.24 `enable-enum-length-limit` New in v5.0

- Determines whether to limit the maximum length of a single `ENUM` element and a single `SET` element.
- Default value: `true`
- When this configuration value is `true`, the maximum length of a single `ENUM` element and a single `SET` element is 255 characters, which is compatible with MySQL 8.0. When this configuration value is `false`, there is no limit on the length of a single element, which is compatible with TiDB (earlier than v5.0).

#### 14.5.1.0.25 `graceful-wait-before-shutdown` New in v5.0

- Specifies the number of seconds that TiDB waits when you shut down the server, which allows the clients to disconnect.
- Default value: `0`
- When TiDB is waiting for shutdown (in the grace period), the HTTP status will indicate a failure, which allows the load balancers to reroute traffic.

#### 14.5.1.0.26 `enable-global-kill` New in v6.1.0

- Controls whether to enable the Global Kill (terminating queries or connections across instances) feature.
- Default value: `true`
- When the value is `true`, both `KILL` and `KILL TIDB` statements can terminate queries or connections across instances so you do not need to worry about erroneously terminating queries or connections. When you use a client to connect to any TiDB instance and execute the `KILL` or `KILL TIDB` statement, the statement will be forwarded to the target TiDB instance. If there is a proxy between the client and the TiDB cluster, the `KILL` and `KILL TIDB` statements will also be forwarded to the target TiDB instance for execution. Currently, using the MySQL command line ctrl+c to terminate a query or connection in TiDB is not supported when `enable-global-kill` is `true`. For more information on the `KILL` statement, see KILL.

#### 14.5.1.0.27 `initialize-sql-file` New in v6.5.1

- Specifies the SQL script to be executed when the TiDB cluster is started for the first time.
- Default value: `""`
- All SQL statements in this script are executed with the highest privilege without any privilege check. If the specified SQL script fails to execute, the TiDB cluster might fail to start.
- This configuration item is used to perform such operations as modifying the value of a system variable, creating a user, or granting privileges.

#### 14.5.1.0.28 `enable-forwarding` New in v5.0.0

- Controls whether the PD client and TiKV client in TiDB forward requests to the leader via the followers in the case of possible network isolation.
- Default value: `false`
- If the environment might have isolated network, enabling this parameter can reduce the window of service unavailability.
- If you cannot accurately determine whether isolation, network interruption, or downtime has occurred, using this mechanism has the risk of misjudgment and causes reduced availability and performance. If network failure has never occurred, it is not recommended to enable this parameter.

#### 14.5.1.0.29 `enable-table-lock` New in v4.0.0

> **Warning:**
>
> The table lock is an experimental feature. It is not recommended that you use it in the production environment.

- Controls whether to enable the table lock feature.
- Default value: `false`
- The table lock is used to coordinate concurrent access to the same table among multiple sessions. Currently, the `READ`, `WRITE`, and `WRITE LOCAL` lock types are supported. When the configuration item is set to `false`, executing the `LOCK TABLES` or `UNLOCK TABLES` statement does not take effect and returns the "LOCK/UNLOCK TABLES is not supported" warning. For more information, see `LOCK TABLES` and `UNLOCK TABLES`.

#### 14.5.1.0.30 `labels`

- Specify server labels. For example, `{ zone = "us-west-1", dc = "dc1", rack = "rack1", host = "tidb1" }`.
- Default value: `{}`

> **Note:**
>
> - In TiDB, the `zone` label is specially used to specify the zone where a server is located. If `zone` is set to a non-null value, the corresponding value is automatically used by features such as `txn-score` and `Follower read`.
> - The `group` label has a special use in TiDB Operator. For clusters deployed using TiDB Operator, it is **NOT** recommended that you specify the `group` label manually.

### 14.5.1.1 Log

Configuration items related to log.

#### 14.5.1.1.1 `level`

- Specifies the log output level.
- Value options: `debug`, `info`, `warn`, `error`, and `fatal`.
- Default value: `info`

#### 14.5.1.1.2 `format`

- Specifies the log output format.
- Value options: `json` and `text`.
- Default value: `text`

#### 14.5.1.1.3 `enable-timestamp`

- Determines whether to enable timestamp output in the log.
- Default value: `null`
- If you set the value to `false`, the log does not output timestamp.

**Note:**

- To be backward compatible, the initial `disable-timestamp` configuration item remains valid. But if the value of `disable-timestamp` semantically conflicts with the value of `enable-timestamp` (for example, if both `enable-timestamp` and `disable-timestamp` are set to `true`), TiDB ignores the value for `disable-timestamp`.
- Currently, TiDB use `disable-timestamp` to determine whether to output timestamps in the log. In this situation, the value of `enable-timestamp` is `null`.
- In later versions, the `disable-timestamp` configuration will be removed. Discard `disable-timestamp` and use `enable-timestamp` which is semantically easier to understand.

#### 14.5.1.1.4 `enable-slow-log`

- Determines whether to enable the slow query log.
- Default value: `true`
- To enable the slow query log, set `enable-slow-log` to `true`. Otherwise, set it to `false`.
- Since v6.1.0, whether to enable slow query log is determined by the TiDB configuration item `instance.tidb_enable_slow_log` or the system variable `tidb_enable_slow_log`. `enable-slow-log` still takes effect. But if `enable-slow-log` and `instance.tidb_enable_slow_log` are set at the same time, the latter takes effect.

#### 14.5.1.1.5 `slow-query-file`

- The file name of the slow query log.
- Default value: `tidb-slow.log`
- The format of the slow log is updated in TiDB v2.1.8, so the slow log is output to the slow log file separately. In versions before v2.1.8, this variable is set to "" by default.
- After you set it, the slow query log is output to this file separately.

#### 14.5.1.1.6 `slow-threshold`

- Outputs the threshold value of consumed time in the slow log.
- Default value: `300`
- Unit: Milliseconds

- When the time consumed by a query is larger than this value, this query is considered as a slow query and its log is output to the slow query log. Note that when the output level of `log.level` is `"debug"`, all queries are recorded in the slow query log, regardless of the setting of this parameter.
- Since v6.1.0, the threshold value of consumed time in the slow log is specified by the TiDB configuration item `instance.tidb_slow_log_threshold` or the system variable `tidb_slow_log_threshold`. `slow-threshold` still takes effect. But if `slow-threshold` and `instance.tidb_slow_log_threshold` are set at the same time, the latter takes effect.

#### 14.5.1.1.7 `record-plan-in-slow-log`

- Determines whether to record execution plans in the slow log.
- Default value: `1`
- Since v6.1.0, whether to record execution plans in the slow log is determined by the TiDB configuration item `instance.tidb_record_plan_in_slow_log` or the system variable `tidb_record_plan_in_slow_log`. `record-plan-in-slow-log` still takes effect. But if `record-plan-in-slow-log` and `instance.tidb_record_plan_in_slow_log` are set at the same time, the latter takes effect.

#### 14.5.1.1.8 `expensive-threshold`

> **Warning:**
>
> Starting from v5.4.0, the `expensive-threshold` configuration item is deprecated and replaced by the system variable `tidb_expensive_query_time_threshold`.

- Outputs the threshold value of the number of rows for the `expensive` operation.
- Default value: `10000`
- When the number of query rows (including the intermediate results based on statistics) is larger than this value, it is an `expensive` operation and outputs log with the `[EXPENSIVE_QUERY]` prefix.

### 14.5.1.2 log.file

Configuration items related to log files.

`filename`

- The file name of the general log file.

- Default value: “”
- If you set it, the log is output to this file.

`max-size`

- The size limit of the log file.
- Default value: 300
- Unit: MB
- The maximum value is 4096.

`max-days`

- The maximum number of days that the log is retained.
- Default value: `0`
- The log is retained by default. If you set the value, the expired log is cleaned up after `max-days`.

`max-backups`

- The maximum number of retained logs.
- Default value: `0`
- All the log files are retained by default. If you set it to `7`, seven log files are retained at maximum.

#### 14.5.1.3 Security

Configuration items related to security.

##### 14.5.1.3.1 `enable-sem`

- Enables the Security Enhanced Mode (SEM).
- Default value: `false`
- The status of SEM is available via the system variable `tidb_enable_enhanced_security` ↪ .

##### 14.5.1.3.2 `ssl-ca`

- The file path of the trusted CA certificate in the PEM format.
- Default value: “”
- If you set this option and `--ssl-cert`, `--ssl-key` at the same time, TiDB authenticates the client certificate based on the list of trusted CAs specified by this option when the client presents the certificate. If the authentication fails, the connection is terminated.
- If you set this option but the client does not present the certificate, the secure connection continues without client certificate authentication.

#### 14.5.1.3.3 `ssl-cert`

- The file path of the SSL certificate in the PEM format.
- Default value: “”
- If you set this option and `--ssl-key` at the same time, TiDB allows (but not forces) the client to securely connect to TiDB using TLS.
- If the specified certificate or private key is invalid, TiDB starts as usual but cannot receive secure connection.

#### 14.5.1.3.4 `ssl-key`

- The file path of the SSL certificate key in the PEM format, that is, the private key of the certificate specified by `--ssl-cert`.
- Default value: “”
- Currently, TiDB does not support loading the private keys protected by passwords.

#### 14.5.1.3.5 `cluster-ssl-ca`

- The CA root certificate used to connect TiKV or PD with TLS.
- Default value: “”

#### 14.5.1.3.6 `cluster-ssl-cert`

- The path of the SSL certificate file used to connect TiKV or PD with TLS.
- Default value: “”

#### 14.5.1.3.7 `cluster-ssl-key`

- The path of the SSL private key file used to connect TiKV or PD with TLS.
- Default value: “”

#### 14.5.1.3.8 `cluster-verify-cn`

- A list of acceptable X.509 Common Names in certificates presented by clients. Requests are permitted only when the presented Common Name is an exact match with one of the entries in the list.
- Default value: [], which means that the client certificate CN check is disabled.

#### 14.5.1.3.9 `spilled-file-encryption-method`

- Determines the encryption method used for saving the spilled files to disk.
- Default value: `"plaintext"`, which disables encryption.
- Optional values: `"plaintext"` and `"aes128-ctr"`

#### 14.5.1.3.10 `auto-tls`

- Determines whether to automatically generate the TLS certificates on startup.
- Default value: `false`

#### 14.5.1.3.11 `tls-version`

- Set the minimum TLS version for MySQL Protocol connections.
- Default value: “”, which allows TLSv1.1 or higher.
- Optional values: `"TLSv1.0"`, `"TLSv1.1"`, `"TLSv1.2"` and `"TLSv1.3"`

#### 14.5.1.3.12 `auth-token-jwks` New in v6.4.0

- Set the local file path of the JSON Web Key Sets (JWKS) for the `tidb_auth_token` authentication method.
- Default value: `""`

#### 14.5.1.3.13 `auth-token-refresh-interval` New in v6.4.0

- Set the JWKS refresh interval for the `tidb_auth_token` authentication method.
- Default value: `1h`

#### 14.5.1.3.14 `disconnect-on-expired-password` New in v6.5.0

- Determines whether TiDB disconnects the client connection when the password is expired.
- Default value: `true`
- Optional values: `true`, `false`
- If you set it to `true`, the client connection is disconnected when the password is expired. If you set it to `false`, the client connection is restricted to the “sandbox mode” and the user can only execute the password reset operation.

#### 14.5.1.3.15 `session-token-signing-cert` New in v6.4.0

- The certificate file path, which is used by TiProxy for session migration.
- Default value: “”
- Empty value will cause TiProxy session migration to fail. To enable session migration, all TiDB nodes must set this to the same certificate and key. This means that you should store the same certificate and key on every TiDB node.

#### 14.5.1.3.16 `session-token-signing-key` New in v6.4.0

- The key file path used by TiProxy for session migration.
- Default value: ""
- Refer to the descriptions of `session-token-signing-cert`.

### 14.5.1.4 Performance

Configuration items related to performance.

#### 14.5.1.4.1 `max-procs`

- The number of CPUs used by TiDB.
- Default value: `0`
- The default `0` indicates using all the CPUs on the machine. You can also set it to n, and then TiDB uses n CPUs.

#### 14.5.1.4.2 `server-memory-quota` New in v4.0.9

> **Warning:**
>
> Since v6.5.0, the `server-memory-quota` configuration item is deprecated and replaced by the system variable `tidb_server_memory_limit`.

- The memory usage limit of tidb-server instances.
- Default value: `0` (in bytes), which means no memory limit.

#### 14.5.1.4.3 `max-txn-ttl`

- The longest time that a single transaction can hold locks. If this time is exceeded, the locks of a transaction might be cleared by other transactions so that this transaction cannot be successfully committed.
- Default value: `3600000`
- Unit: Millisecond
- The transaction that holds locks longer than this time can only be committed or rolled back. The commit might not be successful.

#### 14.5.1.4.4 `stmt-count-limit`

- The maximum number of statements allowed in a single TiDB transaction.
- Default value: `5000`
- If a transaction does not roll back or commit after the number of statements exceeds `stmt-count-limit`, TiDB returns the `statement count 5001 exceeds the transaction limitation, autocommit = false` error. This configuration takes effect **only** in the retryable optimistic transaction. If you use the pessimistic transaction or have disabled the transaction retry, the number of statements in a transaction is not limited by this configuration.

#### 14.5.1.4.5 `txn-entry-size-limit` New in v4.0.10 and v5.0.0

- The size limit of a single row of data in TiDB.
- Default value: `6291456` (in bytes)
- The size limit of a single key-value record in a transaction. If the size limit is exceeded, TiDB returns the `entry too large` error. The maximum value of this configuration item does not exceed `125829120` (120 MB).
- Note that TiKV has a similar limit. If the data size of a single write request exceeds `raft-entry-max-size`, which is 8 MB by default, TiKV refuses to process this request. When a table has a row of large size, you need to modify both configurations at the same time.
- The default value of `max_allowed_packet` (the maximum size of a packet for the MySQL protocol) is 67108864 (64 MiB). If a row is larger than `max_allowed_packet`, the row gets truncated.
- The default value of `txn-total-size-limit` (the size limit of a single transaction in TiDB) is 100 MiB. If you increase the `txn-entry-size-limit` value to be over 100 MiB, you need to increase the `txn-total-size-limit` value accordingly.

#### 14.5.1.4.6 `txn-total-size-limit`

- The size limit of a single transaction in TiDB.
- Default value: `104857600` (in bytes)
- In a single transaction, the total size of key-value records cannot exceed this value. The maximum value of this parameter is `1099511627776` (1 TB). Note that if you have used the binlog to serve the downstream consumer Kafka (such as the `arbiter` cluster), the value of this parameter must be no more than `1073741824` (1 GB). This is because 1 GB is the upper limit of a single message size that Kafka can process. Otherwise, an error is returned if this limit is exceeded.
- In TiDB v6.5.0 and later versions, this configuration is no longer recommended. The memory size of a transaction will be accumulated into the memory usage of the session, and the `tidb_mem_quota_query` variable will take effect when the session memory threshold is exceeded. To be compatible with previous versions, this configuration works as follows when you upgrade from an earlier version to TiDB v6.5.0 or later:

- If this configuration is not set or is set to the default value (`104857600`), after an upgrade, the memory size of a transaction will be accumulated into the memory usage of the session, and the `tidb_mem_quota_query` variable will take effect.
- If this configuration is not defaulted (`104857600`), it still takes effect and its behavior on controling the size of a single transaction remains unchanged before and after the upgrade. This means that the memory size of the transaction is not controlled by the `tidb_mem_quota_query` variable.

#### 14.5.1.4.7 `tcp-keep-alive`

- Determines whether to enable `keepalive` in the TCP layer.
- Default value: `true`

#### 14.5.1.4.8 `tcp-no-delay`

- Determines whether to enable TCP_NODELAY at the TCP layer. After it is enabled, TiDB disables the Nagle algorithm in the TCP/IP protocol and allows sending small data packets to reduce network latency. This is suitable for latency-sensitive applications with a small transmission volume of data.
- Default value: `true`

#### 14.5.1.4.9 `cross-join`

- Default value: `true`
- TiDB supports executing the `JOIN` statement without any condition (the `WHERE` field) of both sides tables by default; if you set the value to `false`, the server refuses to execute when such a `JOIN` statement appears.

#### 14.5.1.4.10 `stats-lease`

- The time interval of reloading statistics, updating the number of table rows, checking whether it is needed to perform the automatic analysis, using feedback to update statistics and loading statistics of columns.
- Default value: `3s`
    - At intervals of `stats-lease` time, TiDB checks the statistics for updates and updates them to the memory if updates exist.
    - At intervals of `20 * stats-lease` time, TiDB updates the total number of rows generated by DML and the number of modified rows to the system table.
    - At intervals of `stats-lease`, TiDB checks for tables and indexes that need to be automatically analyzed.
    - At intervals of `stats-lease`, TiDB checks for column statistics that need to be loaded to the memory.

    - At intervals of `200 * stats-lease`, TiDB writes the feedback cached in the memory to the system table.
    - At intervals of `5 * stats-lease`, TiDB reads the feedback in the system table, and updates the statistics cached in the memory.

- When `stats-lease` is set to 0s, TiDB periodically reads the feedback in the system table, and updates the statistics cached in the memory every three seconds. But TiDB no longer automatically modifies the following statistics-related system tables:

    - `mysql.stats_meta`: TiDB no longer automatically records the number of table rows that are modified by the transaction and updates it to this system table.
    - `mysql.stats_histograms`/`mysql.stats_buckets` and `mysql.stats_top_n`: TiDB no longer automatically analyzes and proactively updates statistics.
    - `mysql.stats_feedback`: TiDB no longer updates the statistics of the tables and indexes according to a part of statistics returned by the queried data.

#### 14.5.1.4.11 `pseudo-estimate-ratio`

- The ratio of (number of modified rows)/(total number of rows) in a table. If the value is exceeded, the system assumes that the statistics have expired and the pseudo statistics will be used.
- Default value: `0.8`
- The minimum value is `0` and the maximum value is `1`.

#### 14.5.1.4.12 `force-priority`

- Sets the priority for all statements.
- Default value: `NO_PRIORITY`
- Value options: The default value `NO_PRIORITY` means that the priority for statements is not forced to change. Other options are `LOW_PRIORITY`, `DELAYED`, and `HIGH_PRIORITY` in ascending order.
- Since v6.1.0, the priority for all statements is determined by the TiDB configuration item `instance.tidb_force_priority` or the system variable `tidb_force_priority` ↪ . `force-priority` still takes effect. But if `force-priority` and `instance.` ↪ `tidb_force_priority` are set at the same time, the latter takes effect.

#### 14.5.1.4.13 `distinct-agg-push-down`

- Determines whether the optimizer executes the operation that pushes down the aggregation function with `Distinct` (such as `select count(distinct a)from t`) to Coprocessors.
- Default: `false`
- This variable is the initial value of the system variable `tidb_opt_distinct_agg_push_down` ↪ .

#### 14.5.1.4.14 `enforce-mpp`

- Determines whether to ignore the optimizer's cost estimation and to forcibly use TiFlash's MPP mode for query execution.
- Default value: `false`
- This configuration item controls the initial value of `tidb_enforce_mpp`. For example, when this configuration item is set to `true`, the default value of `tidb_enforce_mpp` is `ON`.

#### 14.5.1.4.15 `enable-stats-cache-mem-quota` New in v6.1.0

> **Warning:**
>
> This variable is an experimental feature. It is not recommended to use it in production environments.

- Controls whether to enable the memory quota for the statistics cache.
- Default value: `false`

#### 14.5.1.4.16 `stats-load-concurrency` New in v5.4.0

> **Warning:**
>
> Currently, synchronously loading statistics is an experimental feature. It is not recommended that you use it in production environments.

- The maximum number of columns that the TiDB synchronously loading statistics feature can process concurrently.
- Default value: `5`
- Currently, the valid value range is `[1, 128]`.

#### 14.5.1.4.17 `stats-load-queue-size` New in v5.4.0

> **Warning:**
>
> Currently, synchronously loading statistics is an experimental feature. It is not recommended that you use it in production environments.

- The maximum number of column requests that the TiDB synchronously loading statistics feature can cache.
- Default value: `1000`
- Currently, the valid value range is `[1, 100000]`.

#### 14.5.1.4.18 `force-init-stats` New in v6.5.7

- Controls whether to wait for statistics initialization to finish before providing services during TiDB startup.
- Default value: false
- When the value of `force-init-stats` is `true`, TiDB needs to wait until statistics initialization is finished before providing services upon startup. If there are a large number of tables and partitions, setting `force-init-stats` to `true` might prolong the time it takes for TiDB to start providing services.
- When the value of `force-init-stats` is `false`, TiDB can still provide services before statistics initialization is finished, but the optimizer uses pseudo statistics to make decisions, which might result in suboptimal execution plans.

### 14.5.1.5 opentracing

Configuration items related to opentracing.

#### 14.5.1.5.1 `enable`

- Enables opentracing to trace the call overhead of some TiDB components. Note that enabling opentracing causes some performance loss.
- Default value: `false`

#### 14.5.1.5.2 `rpc-metrics`

- Enables RPC metrics.
- Default value: `false`

### 14.5.1.6 opentracing.sampler

Configuration items related to opentracing.sampler.

#### 14.5.1.6.1 `type`

- Specifies the type of the opentracing sampler. The string value is case-insensitive.
- Default value: `"const"`
- Value options: `"const"`, `"probabilistic"`, `"ratelimiting"`, `"remote"`

#### 14.5.1.6.2 `param`

- The parameter of the opentracing sampler.
  - For the `const` type, the value can be `0` or `1`, which indicates whether to enable the `const` sampler.
  - For the `probabilistic` type, the parameter specifies the sampling probability, which can be a float number between `0` and `1`.
  - For the `ratelimiting` type, the parameter specifies the number of spans sampled per second.
  - For the `remote` type, the parameter specifies the sampling probability, which can be a float number between `0` and `1`.
- Default value: `1.0`

#### 14.5.1.6.3 `sampling-server-url`

- The HTTP URL of the jaeger-agent sampling server.
- Default value: `""`

#### 14.5.1.6.4 `max-operations`

- The maximum number of operations that the sampler can trace. If an operation is not traced, the default probabilistic sampler is used.
- Default value: `0`

#### 14.5.1.6.5 `sampling-refresh-interval`

- Controls the frequency of polling the jaeger-agent sampling policy.
- Default value: `0`

### 14.5.1.7 opentracing.reporter

Configuration items related to opentracing.reporter.

#### 14.5.1.7.1 `queue-size`

- The queue size with which the reporter records spans in memory.
- Default value: `0`

#### 14.5.1.7.2 `buffer-flush-interval`

- The interval at which the reporter flushes the spans in memory to the storage.
- Default value: `0`

#### 14.5.1.7.3 `log-spans`

- Determines whether to print the log for all submitted spans.
- Default value: `false`

#### 14.5.1.7.4 `local-agent-host-port`

- The address at which the reporter sends spans to the jaeger-agent.
- Default value: `""`

### 14.5.1.8 tikv-client

#### 14.5.1.8.1 `grpc-connection-count`

- The maximum number of connections established with each TiKV.
- Default value: `4`

#### 14.5.1.8.2 `grpc-keepalive-time`

- The `keepalive` time interval of the RPC connection between TiDB and TiKV nodes. If there is no network packet within the specified time interval, the gRPC client executes `ping` command to TiKV to see if it is alive.
- Default: `10`
- Unit: second

#### 14.5.1.8.3 `grpc-keepalive-timeout`

- The timeout of the RPC `keepalive` check between TiDB and TiKV nodes.
- Default value: `3`
- Unit: second

#### 14.5.1.8.4 `grpc-compression-type`

- Specifies the compression type used for data transfer from TiDB nodes to TiKV nodes. The default value is `"none"`, which means no compression. To enable the gzip compression, set this value to `"gzip"`.
- Default value: `"none"`
- Value options: `"none"`, `"gzip"`

**Note:**

The compression algorithm for response messages returned from TiKV nodes to TiDB nodes is controlled by the TiKV configuration item `grpc-compression-type`.

#### 14.5.1.8.5 `commit-timeout`

- The maximum timeout when executing a transaction commit.
- Default value: `41s`
- It is required to set this value larger than twice of the Raft election timeout.

#### 14.5.1.8.6 `max-batch-size`

- The maximum number of RPC packets sent in batch. If the value is not `0`, the `BatchCommands` API is used to send requests to TiKV, and the RPC latency can be reduced in the case of high concurrency. It is recommended that you do not modify this value.
- Default value: `128`

#### 14.5.1.8.7 `max-batch-wait-time`

- Waits for `max-batch-wait-time` to encapsulate the data packets into a large packet in batch and send it to the TiKV node. It is valid only when the value of `tikv-client.max-batch-size` is greater than `0`. It is recommended not to modify this value.
- Default value: `0`
- Unit: nanoseconds

#### 14.5.1.8.8 `batch-wait-size`

- The maximum number of packets sent to TiKV in batch. It is recommended not to modify this value.
- Default value: `8`
- If the value is `0`, this feature is disabled.

#### 14.5.1.8.9 `overload-threshold`

- The threshold of the TiKV load. If the TiKV load exceeds this threshold, more `batch` packets are collected to relieve the pressure of TiKV. It is valid only when the value of `tikv-client.max-batch-size` is greater than `0`. It is recommended not to modify this value.
- Default value: `200`

### 14.5.1.9 tikv-client.copr-cache New in v4.0.0

This section introduces configuration items related to the Coprocessor Cache feature.

#### 14.5.1.9.1 `capacity-mb`

- The total size of the cached data. When the cache space is full, old cache entries are evicted. When the value is `0.0`, the Coprocessor Cache feature is disabled.
- Default value: `1000.0`
- Unit: MB
- Type: Float

### 14.5.1.10 txn-local-latches

Configuration related to the transaction latch. It is recommended to enable it when many local transaction conflicts occur.

#### 14.5.1.10.1 `enabled`

- Determines whether to enable the memory lock of transactions.
- Default value: `false`

#### 14.5.1.10.2 `capacity`

- The number of slots corresponding to Hash, which automatically adjusts upward to an exponential multiple of 2. Each slot occupies 32 Bytes of memory. If set too small, it might result in slower running speed and poor performance in the scenario where data writing covers a relatively large range (such as importing data).
- Default value: `2048000`

### 14.5.1.11 binlog

Configurations related to TiDB Binlog.

#### 14.5.1.11.1 `enable`

- Enables or disables binlog.
- Default value: `false`

#### 14.5.1.11.2 `write-timeout`

- The timeout of writing binlog into Pump. It is not recommended to modify this value.
- Default: `15s`
- unit: second

#### 14.5.1.11.3 `ignore-error`

- Determines whether to ignore errors occurred in the process of writing binlog into Pump. It is not recommended to modify this value.
- Default value: `false`
- When the value is set to `true` and an error occurs, TiDB stops writing binlog and add `1` to the count of the `tidb_server_critical_error_total` monitoring item. When the value is set to `false`, the binlog writing fails and the entire TiDB service is stopped.

#### 14.5.1.11.4 `binlog-socket`

- The network address to which binlog is exported.
- Default value: “”

#### 14.5.1.11.5 `strategy`

- The strategy of Pump selection when binlog is exported. Currently, only the `hash` and `range` methods are supported.
- Default value: `range`

### 14.5.1.12 status

Configuration related to the status of TiDB service.

#### 14.5.1.12.1 `report-status`

- Enables or disables the HTTP API service.
- Default value: `true`

#### 14.5.1.12.2 record-db-qps

- Determines whether to transmit the database-related QPS metrics to Prometheus.
- Default value: `false`

### 14.5.1.13 pessimistic-txn

For pessimistic transaction usage, refer to TiDB Pessimistic Transaction Mode.

#### 14.5.1.13.1 max-retry-count

- The maximum number of retries of each statement in pessimistic transactions. If the number of retries exceeds this limit, an error occurs.
- Default value: `256`

#### 14.5.1.13.2 deadlock-history-capacity

- The maximum number of deadlock events that can be recorded in the `INFORMATION_SCHEMA.DEADLOCKS` table of a single TiDB server. If this table is in full volume and an additional deadlock event occurs, the earliest record in the table will be removed to make place for the newest error.
- Default value: `10`
- Minimum value: `0`
- Maximum value: `10000`

#### 14.5.1.13.3 deadlock-history-collect-retryable

- Controls whether the `INFORMATION_SCHEMA.DEADLOCKS` table collects the information of retryable deadlock errors. For the description of retryable deadlock errors, see Retryable deadlock errors.
- Default value: `false`

#### 14.5.1.13.4 pessimistic-auto-commit New in v6.0.0

- Determines the transaction mode that the auto-commit transaction uses when the pessimistic transaction mode is globally enabled (`tidb_txn_mode='pessimistic'`). By default, even if the pessimistic transaction mode is globally enabled, the auto-commit transaction still uses the optimistic transaction mode. After enabling `pessimistic-auto-commit` (set to `true`), the auto-commit transaction also uses pessimistic mode, which is consistent with the other explicitly committed pessimistic transactions.
- For scenarios with conflicts, after enabling this configuration, TiDB includes auto-commit transactions into the global lock-waiting management, which avoids deadlocks and mitigates the latency spike brought by deadlock-causing conflicts.

- For scenarios with no conflicts, if there are many auto-commit transactions (the specific number is determined by the real scenarios. For example, the number of auto-commit transactions accounts for more than half of the total number of applications), and a single transaction operates a large data volume, enabling this configuration causes performance regression. For example, the auto-commit `INSERT INTO SELECT` statement.
- Default value: `false`

#### 14.5.1.13.5 constraint-check-in-place-pessimistic New in v6.4.0

- Controls the default value of the system variable `tidb_constraint_check_in_place_pessimistic` ↪ .
- Default value: `true`

### 14.5.1.14 isolation-read

Configuration items related to read isolation.

#### 14.5.1.14.1 `engines`

- Controls from which engine TiDB allows to read data.
- Default value: ["tikv", "tiflash", "tidb"], indicating that the engine is automatically selected by the optimizer.
- Value options: Any combinations of "tikv", "tiflash", and "tidb", for example, ["tikv", "tidb"] or ["tiflash", "tidb"]

### 14.5.1.15 instance

#### 14.5.1.15.1 `tidb_enable_collect_execution_info`

- This configuration controls whether to record the execution information of each operator in the slow query log.
- Default value: `true`
- Before v6.1.0, this configuration is set by `enable-collect-execution-info`.

#### 14.5.1.15.2 `tidb_enable_slow_log`

- This configuration is used to control whether to enable the slow log feature.
- Default value: `true`
- Value options: `true` or `false`
- Before v6.1.0, this configuration is set by `enable-slow-log`.

#### 14.5.1.15.3 `tidb_slow_log_threshold`

- Outputs the threshold value of the time consumed by the slow log.
- Default value: `300`
- Range: `[-1, 9223372036854775807]`
- Unit: Milliseconds
- When the time consumed by a query is larger than this value, this query is considered as a slow query and its log is output to the slow query log. Note that when the output level of `log.level` is `"debug"`, all queries are recorded in the slow query log, regardless of the setting of this parameter.
- Before v6.1.0, this configuration is set by `slow-threshold`.

#### 14.5.1.15.4 `tidb_expensive_query_time_threshold`

- This configuration is used to set the threshold value that determines whether to print expensive query logs. The difference between expensive query logs and slow query logs is:
  - Slow logs are printed after the statement is executed.
  - Expensive query logs print the statements that are being executed, with execution time exceeding the threshold value, and their related information.
- Default value: `60`
- Range: `[10, 2147483647]`
- Unit: Seconds
- Before v5.4.0, this configuration is set by `expensive-threshold`.

#### 14.5.1.15.5 `tidb_record_plan_in_slow_log`

- This configuration is used to control whether to include the execution plan of slow queries in the slow log.
- Default value: `1`
- Value options: `1` (enabled, default) or `0` (disabled).
- The value of this configuration will initialize the value of system variable `tidb_record_plan_in_slow`
  ↪
- Before v6.1.0, this configuration is set by `record-plan-in-slow-log`.

#### 14.5.1.15.6 `tidb_force_priority`

- This configuration is used to change the default priority for statements executed on a TiDB server.
- Default value: `NO_PRIORITY`
- The default value `NO_PRIORITY` means that the priority for statements is not forced to change. Other options are `LOW_PRIORITY`, `DELAYED`, and `HIGH_PRIORITY` in ascending order.
- Before v6.1.0, this configuration is set by `force-priority`.

#### 14.5.1.15.7 `max_connections`

- The maximum number of connections permitted for a single TiDB instance. It can be used for resources control.
- Default value: `0`
- Range: `[0, 100000]`
- The default value `0` means no limit. When the value of this variable is larger than `0`, and the number of connections reaches the value, the TiDB server will reject new connections from clients.
- The value of this configuration will initialize the value of system variable `max_connections` ↪
- Before v6.2.0, this configuration is set by `max-server-connections`.

#### 14.5.1.15.8 `tidb_enable_ddl`

- This configuration controls whether the corresponding TiDB instance can become a DDL owner or not.
- Default value: `true`
- Possible values: `OFF`, `ON`
- The value of this configuration will initialize the value of the system variable `tidb_enable_ddl`
- Before v6.3.0, this configuration is set by `run-ddl`.

### 14.5.1.16 proxy-protocol

Configuration items related to the PROXY protocol.

#### 14.5.1.16.1 `networks`

- The list of proxy server's IP addresses allowed to connect to TiDB using the PROXY protocol
- Default value: ""
- In general cases, when you access TiDB behind a reverse proxy, TiDB takes the IP address of the reverse proxy server as the IP address of the client. By enabling the PROXY protocol, reverse proxies that support this protocol, such as HAProxy, can pass the real client IP address to TiDB.
- After configuring this parameter, TiDB allows the configured source IP address to connect to TiDB using the PROXY protocol; if a protocol other than PROXY is used, this connection will be denied. If this parameter is left empty, no IP address can connect to TiDB using the PROXY protocol. The value can be an IP address (192.168.1.50) or CIDR (192.168.1.0/24) with `,` as the separator. `*` means any IP addresses.

> **Warning:**
>
> Use `*` with caution because it might introduce security risks by allowing a client of any IP address to report its IP address. In addition, using `*` might also cause the internal component that directly connects to TiDB (such as TiDB Dashboard) to be unavailable.

#### 14.5.1.16.2 `fallbackable` New in v6.5.1

- Controls whether to enable the PROXY protocol fallback mode. If this configuration item is set to `true`, TiDB can accept clients that belong to `proxy-protocol.networks` ↪ to connect to TiDB without using the PROXY protocol specification or without sending the PROXY protocol header. By default, TiDB only accepts client connections that belong to `proxy-protocol.networks` and send a PROXY protocol header.
- Default value: `false`

### 14.5.1.17 experimental

The `experimental` section, introduced in v3.1.0, describes the configurations related to the experimental features of TiDB.

#### 14.5.1.17.1 `allow-expression-index` New in v4.0.0

- Controls whether an expression index can be created. Since TiDB v5.2.0, if the function in an expression is safe, you can create an expression index directly based on this function without enabling this configuration. If you want to create an expression index based on other functions, you can enable this configuration, but correctness issues might exist. By querying the `tidb_allow_function_for_expression_index` variable, you can get the functions that are safe to be directly used for creating an expression.
- Default value: `false`

## 14.5.2 TiKV Configuration File

The TiKV configuration file supports more options than command-line parameters. You can find the default configuration file in etc/config-template.toml and rename it to `config` ↪ `.toml`.

This document only describes the parameters that are not included in command-line parameters. For more details, see command-line parameter.

**Tip:**

If you need to adjust the value of a configuration item, refer to Modify the configuration.

#### 14.5.2.1 Global configuration

##### 14.5.2.1.1 `abort-on-panic`

- Sets whether to call `abort()` to exit the process when TiKV panics. This option affects whether TiKV allows the system to generate core dump files.
    - If the value of this configuration item is `false`, when TiKV panics, it calls `exit()` to exit the process.
    - If the value of this configuration item is `true`, when TiKV panics, TiKV calls `abort()` to exit the process. At this time, TiKV allows the system to generate core dump files when exiting. To generate the core dump file, you also need to perform the system configuration related to core dump (for example, setting the size limit of the core dump file via `ulimit -c` command, and configure the core dump path. Different operating systems have different related configurations). To avoid the core dump files occupying too much disk space and causing insufficient TiKV disk space, it is recommended to set the core dump generation path to a disk partition different to that of TiKV data.
- Default value: `false`

##### 14.5.2.1.2 `slow-log-file`

- The file that stores slow logs
- If this configuration item is not set, but `log.file.filename` is set, slow logs are output to the log file specified by `log.file.filename`.
- If neither `slow-log-file` nor `log.file.filename` are set, all logs are output to "stderr" by default.
- If both configuration items are set, ordinary logs are output to the log file specified by `log.file.filename`, and slow logs are output to the log file set by `slow-log-file`.
- Default value: `""`

##### 14.5.2.1.3 `slow-log-threshold`

- The threshold for outputing slow logs. If the processing time is longer than this threshold, slow logs are output.
- Default value: `"1s"`

#### 14.5.2.1.4 `memory-usage-limit`

- The limit on memory usage of the TiKV instance. When the memory usage of TiKV almost reaches this threshold, internal cache will be evicted to release memory.
- In most cases, the TiKV instance is set to use 75% of the total available system memory, so you do not need to explicitly specify this configuration item. The rest 25% of the memory is reserved for the OS page cache. See `storage.block-cache.capacity` for details.
- When deploying multiple TiKV nodes on a single physical machine, you still do not need to set this configuration item. In this case, the TiKV instance uses `5/3 * block-cache.capacity` of memory.
- The default value for different system memory capacity is as follows:
  - system=8G block-cache=3.6G memory-usage-limit=6G page-cache=2G
  - system=16G block-cache=7.2G memory-usage-limit=12G page-cache=4G
  - system=32G block-cache=14.4G memory-usage-limit=24G page-cache=8G

### 14.5.2.2 log New in v5.4.0

- Configuration items related to the log.
- From v5.4.0, to make the log configuration items of TiKV and TiDB consistent, TiKV deprecates the former configuration item `log-rotation-timespan` and changes `log-level`, `log-format`, `log-file`, `log-rotation-size` to the following ones. If you only set the old configuration items, and their values are set to non-default values, the old items remain compatible with the new items. If both old and new configuration items are set, the new items take effect.

#### 14.5.2.2.1 `level` New in v5.4.0

- The log level
- Optional values: `"debug"`, `"info"`, `"warn"`, `"error"`, `"fatal"`
- Default value: `"info"`

#### 14.5.2.2.2 `format` New in v5.4.0

- The log format
- Optional values: `"json"`, `"text"`
- Default value: `"text"`

#### 14.5.2.2.3 `enable-timestamp` New in v5.4.0

- Determines whether to enable or disable the timestamp in the log
- Optional values: `true`, `false`
- Default value: `true`

### 14.5.2.3 log.file New in v5.4.0

- Configuration items related to the log file.

#### 14.5.2.3.1 `filename` New in v5.4.0

- The log file. If this configuration item is not set, logs are output to "stderr" by default. If this configuration item is set, logs are output to the corresponding file.
- Default value: `""`

#### 14.5.2.3.2 `max-size` New in v5.4.0

- The maximum size of a single log file. When the file size is larger than the value set by this configuration item, the system automatically splits the single file into multiple files.
- Default value: `300`
- Maximum value: `4096`
- Unit: MiB

#### 14.5.2.3.3 `max-days` New in v5.4.0

- The maximum number of days that TiKV keeps log files.
    - If the configuration item is not set, or the value of it is set to the default value `0`, TiKV does not clean log files.
    - If the parameter is set to a value other than `0`, TiKV cleans up the expired log files after `max-days`.
- Default value: `0`

#### 14.5.2.3.4 `max-backups` New in v5.4.0

- The maximum number of log files that TiKV keeps.
    - If the configuration item is not set, or the value of it is set to the default value `0`, TiKV keeps all log files.
    - If the configuration item is set to a value other than `0`, TiKV keeps at most the number of old log files specified by `max-backups`. For example, if the value is set to `7`, TiKV keeps up to 7 old log files.
- Default value: `0`

#### 14.5.2.4 server

- Configuration items related to the server.

##### 14.5.2.4.1 addr

- The listening IP address and the listening port
- Default value: "127.0.0.1:20160"

##### 14.5.2.4.2 advertise-addr

- Advertise the listening address for client communication
- If this configuration item is not set, the value of addr is used.
- Default value: ""

##### 14.5.2.4.3 status-addr

- The configuration item reports TiKV status directly through the HTTP address

> **Warning:**
> If this value is exposed to the public, the status information of the TiKV server might be leaked.

- To disable the status address, set the value to "".
- Default value: "127.0.0.1:20180"

##### 14.5.2.4.4 status-thread-pool-size

- The number of worker threads for the HTTP API service
- Default value: 1
- Minimum value: 1

##### 14.5.2.4.5 grpc-compression-type

- The compression algorithm for gRPC messages. It affects gRPC messages between TiKV nodes. Starting from v6.5.11, it also affects gRPC response messages sent from TiKV to TiDB.
- Optional values: "none", "deflate", "gzip"

> **Note:**
> TiDB does not support `"deflate"`. Therefore, if you want to compress gRPC response messages sent from TiKV to TiDB, set this configuration item to `"gzip"`.

- Default value: `"none"`

#### 14.5.2.4.6 grpc-concurrency

- The number of gRPC worker threads. When you modify the size of the gRPC thread pool, refer to Performance tuning for TiKV thread pools.
- Default value: `5`
- Minimum value: `1`

#### 14.5.2.4.7 grpc-concurrent-stream

- The maximum number of concurrent requests allowed in a gRPC stream
- Default value: `1024`
- Minimum value: `1`

#### 14.5.2.4.8 grpc-memory-pool-quota

- Limits the memory size that can be used by gRPC
- Default value: No limit
- Limit the memory in case OOM is observed. Note that limit the usage can lead to potential stall

#### 14.5.2.4.9 grpc-raft-conn-num

- The maximum number of connections between TiKV nodes for Raft communication
- Default value: `1`
- Minimum value: `1`

#### 14.5.2.4.10 max-grpc-send-msg-len

- Sets the maximum length of a gRPC message that can be sent
- Default value: `10485760`
- Unit: Bytes
- Maximum value: `2147483647`

#### 14.5.2.4.11 `grpc-stream-initial-window-size`

- The window size of the gRPC stream
- Default value: `2MB`
- Unit: KB|MB|GB
- Minimum value: `"1KB"`

#### 14.5.2.4.12 `grpc-keepalive-time`

- The time interval at which that gRPC sends `keepalive` Ping messages
- Default value: `"10s"`
- Minimum value: `"1s"`

#### 14.5.2.4.13 `grpc-keepalive-timeout`

- Disables the timeout for gRPC streams
- Default value: `"3s"`
- Minimum value: `"1s"`

#### 14.5.2.4.14 `concurrent-send-snap-limit`

- The maximum number of snapshots sent at the same time
- Default value: `32`
- Minimum value: `1`

#### 14.5.2.4.15 `concurrent-recv-snap-limit`

- The maximum number of snapshots received at the same time
- Default value: `32`
- Minimum value: `1`

#### 14.5.2.4.16 `end-point-recursion-limit`

- The maximum number of recursive levels allowed when TiKV decodes the Coprocessor DAG expression
- Default value: `1000`
- Minimum value: `1`

#### 14.5.2.4.17 `end-point-request-max-handle-duration`

- The longest duration allowed for a TiDB's push down request to TiKV for processing tasks
- Default value: `"60s"`
- Minimum value: `"1s"`

#### 14.5.2.4.18 `snap-max-write-bytes-per-sec`

- The maximum allowable disk bandwidth when processing snapshots
- Default value: `"100MB"`
- Unit: KB|MB|GB
- Minimum value: `"1KB"`

#### 14.5.2.4.19 `enable-request-batch`

- Determines whether to process requests in batches
- Default value: `true`

#### 14.5.2.4.20 `labels`

- Specifies server attributes, such as `{ zone = "us-west-1", disk = "ssd" }`.
- Default value: `{}`

#### 14.5.2.4.21 `background-thread-count`

- The working thread count of the background pool, including endpoint threads, BR threads, split-check threads, Region threads, and other threads of delay-insensitive tasks.
- Default value: when the number of CPU cores is less than 16, the default value is `2`; otherwise, the default value is `3`.

#### 14.5.2.4.22 `end-point-slow-log-threshold`

- The time threshold for a TiDB's push-down request to output slow log. If the processing time is longer than this threshold, the slow logs are output.
- Default value: `"1s"`
- Minimum value: `0`

#### 14.5.2.4.23 `raft-client-queue-size`

- Specifies the queue size of the Raft messages in TiKV. If too many messages not sent in time result in a full buffer, or messages discarded, you can specify a greater value to improve system stability.
- Default value: `8192`

#### 14.5.2.4.24 `simplify-metrics` New in v6.2.0

- Specifies whether to simplify the returned monitoring metrics. After you set the value to `true`, TiKV reduces the amount of data returned for each request by filtering out some metrics.
- Default value: `false`

#### 14.5.2.4.25 `forward-max-connections-per-address` New in v5.0.0

- Sets the size of the connection pool for service and forwarding requests to the server. Setting it to too small a value affects the request latency and load balancing.
- Default value: `4`

### 14.5.2.5 readpool.unified

Configuration items related to the single thread pool serving read requests. This thread pool supersedes the original storage thread pool and coprocessor thread pool since the 4.0 version.

#### 14.5.2.5.1 `min-thread-count`

- The minimal working thread count of the unified read pool
- Default value: `1`

#### 14.5.2.5.2 `max-thread-count`

- The maximum working thread count of the unified read pool or the UnifyReadPool thread pool. When you modify the size of this thread pool, refer to Performance tuning for TiKV thread pools.
- Value range: `[min-thread-count, MAX(4, CPU quota * 10)]`. `MAX(4, CPU quota * 10)` takes the greater value out of `4` and the `CPU quota * 10`.
- Default value: MAX(4, CPU * 0.8)

> **Note:**
>
> Increasing the thread count will lead to more context switches, which might cause a performance decrease. It is not recommended to modify the value of this configuration item.

#### 14.5.2.5.3 `stack-size`

- The stack size of the threads in the unified thread pool
- Type: Integer + Unit
- Default value: `"10MB"`
- Unit: KB|MB|GB
- Minimum value: `"2MB"`
- Maximum value: The number of Kbytes output in the result of the `ulimit -sH` command executed in the system.

#### 14.5.2.5.4 `max-tasks-per-worker`

- The maximum number of tasks allowed for a single thread in the unified read pool. `Server Is Busy` is returned when the value is exceeded.
- Default value: `2000`
- Minimum value: `2`

#### 14.5.2.5.5 `auto-adjust-pool-size` New in v6.3.0

- Controls whether to automatically adjust the thread pool size. When it is enabled, the read performance of TiKV is optimized by automatically adjusting the UnifyReadPool thread pool size based on the current CPU usage. The possible range of the thread pool is `[max-thread-count, MAX(4, CPU)]`. The maximum value is the same as the one of `max-thread-count`.
- Default value: `false`

### 14.5.2.6 readpool.storage

Configuration items related to storage thread pool.

#### 14.5.2.6.1 `use-unified-pool`

- Determines whether to use the unified thread pool (configured in `readpool.unified`) for storage requests. If the value of this parameter is `false`, a separate thread pool is used, which is configured through the rest parameters in this section (`readpool.storage`).
- Default value: If this section (`readpool.storage`) has no other configurations, the default value is `true`. Otherwise, for the backward compatibility, the default value is `false`. Change the configuration in `readpool.unified` as needed before enabling this option.

#### 14.5.2.6.2 high-concurrency

- The allowable number of concurrent threads that handle high-priority `read` requests
- When `8 cpu num 16`, the default value is `cpu_num * 0.5`; when `cpu num` is smaller than `8`, the default value is `4`; when `cpu num` is greater than `16`, the default value is `8`.
- Minimum value: `1`

#### 14.5.2.6.3 normal-concurrency

- The allowable number of concurrent threads that handle normal-priority `read` requests
- When `8 cpu num 16`, the default value is `cpu_num * 0.5`; when `cpu num` is smaller than `8`, the default value is `4`; when `cpu num` is greater than `16`, the default value is `8`.
- Minimum value: `1`

#### 14.5.2.6.4 low-concurrency

- The allowable number of concurrent threads that handle low-priority `read` requests
- When `8 cpu num 16`, the default value is `cpu_num * 0.5`; when `cpu num` is smaller than `8`, the default value is `4`; when `cpu num` is greater than `16`, the default value is `8`.
- Minimum value: `1`

#### 14.5.2.6.5 max-tasks-per-worker-high

- The maximum number of tasks allowed for a single thread in a high-priority thread pool. `Server Is Busy` is returned when the value is exceeded.
- Default value: `2000`
- Minimum value: `2`

#### 14.5.2.6.6 max-tasks-per-worker-normal

- The maximum number of tasks allowed for a single thread in a normal-priority thread pool. `Server Is Busy` is returned when the value is exceeded.
- Default value: `2000`
- Minimum value: `2`

#### 14.5.2.6.7 max-tasks-per-worker-low

- The maximum number of tasks allowed for a single thread in a low-priority thread pool. `Server Is Busy` is returned when the value is exceeded.
- Default value: `2000`
- Minimum value: `2`

#### 14.5.2.6.8 `stack-size`

- The stack size of threads in the Storage read thread pool
- Type: Integer + Unit
- Default value: `"10MB"`
- Unit: KB|MB|GB
- Minimum value: `"2MB"`
- Maximum value: The number of Kbytes output in the result of the `ulimit -sH` command executed in the system.

### 14.5.2.7 `readpool.coprocessor`

Configuration items related to the Coprocessor thread pool.

#### 14.5.2.7.1 `use-unified-pool`

- Determines whether to use the unified thread pool (configured in `readpool.unified` ↪ ) for coprocessor requests. If the value of this parameter is `false`, a separate thread pool is used, which is configured through the rest parameters in this section (`readpool.coprocessor`).
- Default value: If none of the parameters in this section (`readpool.coprocessor`) are set, the default value is `true`. Otherwise, the default value is `false` for the backward compatibility. Adjust the configuration items in `readpool.unified` before enabling this parameter.

#### 14.5.2.7.2 `high-concurrency`

- The allowable number of concurrent threads that handle high-priority Coprocessor requests, such as checkpoints
- Default value: `CPU * 0.8`
- Minimum value: `1`

#### 14.5.2.7.3 `normal-concurrency`

- The allowable number of concurrent threads that handle normal-priority Coprocessor requests
- Default value: `CPU * 0.8`
- Minimum value: `1`

#### 14.5.2.7.4 `low-concurrency`

- The allowable number of concurrent threads that handle low-priority Coprocessor requests, such as table scan
- Default value: `CPU * 0.8`
- Minimum value: `1`

#### 14.5.2.7.5 `max-tasks-per-worker-high`

- The number of tasks allowed for a single thread in a high-priority thread pool. When this number is exceeded, `Server Is Busy` is returned.
- Default value: `2000`
- Minimum value: `2`

#### 14.5.2.7.6 `max-tasks-per-worker-normal`

- The number of tasks allowed for a single thread in a normal-priority thread pool. When this number is exceeded, `Server Is Busy` is returned.
- Default value: `2000`
- Minimum value: `2`

#### 14.5.2.7.7 `max-tasks-per-worker-low`

- The number of tasks allowed for a single thread in a low-priority thread pool. When this number is exceeded, `Server Is Busy` is returned.
- Default value: `2000`
- Minimum value: `2`

#### 14.5.2.7.8 `stack-size`

- The stack size of the thread in the Coprocessor thread pool
- Type: Integer + Unit
- Default value: `"10MB"`
- Unit: KB|MB|GB
- Minimum value: `"2MB"`
- Maximum value: The number of Kbytes output in the result of the `ulimit -sH` command executed in the system.

### 14.5.2.8 storage

Configuration items related to storage.

#### 14.5.2.8.1 `data-dir`

- The storage path of the RocksDB directory
- Default value: `"./"`

#### 14.5.2.8.2 `scheduler-concurrency`

- A built-in memory lock mechanism to prevent simultaneous operations on a key. Each key has a hash in a different slot.
- Default value: `524288`
- Minimum value: `1`

#### 14.5.2.8.3 `scheduler-worker-pool-size`

- The number of threads in the Scheduler thread pool. Scheduler threads are mainly used for checking transaction consistency before data writing. If the number of CPU cores is greater than or equal to `16`, the default value is `8`; otherwise, the default value is `4`. When you modify the size of the Scheduler thread pool, refer to Performance tuning for TiKV thread pools.
- Default value: `4`
- Value range: `[1, MAX(4, CPU)]`. In `MAX(4, CPU)`, `CPU` means the number of your CPU cores. `MAX(4, CPU)` takes the greater value out of `4` and the `CPU`.

#### 14.5.2.8.4 `scheduler-pending-write-threshold`

- The maximum size of the write queue. A `Server Is Busy` error is returned for a new write to TiKV when this value is exceeded.
- Default value: `"100MB"`
- Unit: MB|GB

#### 14.5.2.8.5 `enable-async-apply-prewrite`

- Determines whether Async Commit transactions respond to the TiKV client before applying prewrite requests. After enabling this configuration item, latency can be easily reduced when the apply duration is high, or the delay jitter can be reduced when the apply duration is not stable.
- Default value: `false`

#### 14.5.2.8.6 `reserve-space`

- When TiKV is started, some space is reserved on the disk as disk protection. When the remaining disk space is less than the reserved space, TiKV restricts some write operations. The reserved space is divided into two parts: 80% of the reserved space is used as the extra disk space required for operations when the disk space is insufficient, and the other 20% is used to store the temporary file. In the process of reclaiming space, if the storage is exhausted by using too much extra disk space, this temporary file serves as the last protection for restoring services.

- The name of the temporary file is `space_placeholder_file`, located in the `storage.data-dir` directory. When TiKV goes offline because its disk space ran out, if you restart TiKV, the temporary file is automatically deleted and TiKV tries to reclaim the space.
- When the remaining space is insufficient, TiKV does not create the temporary file. The effectiveness of the protection is related to the size of the reserved space. The size of the reserved space is the larger value between 5% of the disk capacity and this configuration value. When the value of this configuration item is `"0MB"`, TiKV disables this disk protection feature.
- Default value: `"5GB"`
- Unit: MB|GB

#### 14.5.2.8.7 `enable-ttl`

**Warning:**

- Set `enable-ttl` to `true` or `false` **ONLY WHEN** deploying a new TiKV cluster. **DO NOT** modify the value of this configuration item in an existing TiKV cluster. TiKV clusters with different `enable-ttl` values use different data formats. Therefore, if you modify the value of this item in an existing TiKV cluster, the cluster will store data in different formats, which causes the "can't enable TTL on a non-ttl" error when you restart the TiKV cluster.
- Use `enable-ttl` **ONLY IN** a TiKV cluster. **DO NOT** use this configuration item in a cluster that has TiDB nodes (which means setting `enable-ttl` to `true` in such clusters) unless `storage.api-version = 2` is configured. Otherwise, critical issues such as data corruption and the upgrade failure of TiDB clusters will occur.

- TTL is short for "Time to live". If this item is enabled, TiKV automatically deletes data that reaches its TTL. To set the value of TTL, you need to specify it in the requests when writing data via the client. If the TTL is not specified, it means that TiKV does not automatically delete the corresponding data.
- Default value: `false`

#### 14.5.2.8.8 `ttl-check-poll-interval`

- The interval of checking data to reclaim physical spaces. If data reaches its TTL, TiKV forcibly reclaims its physical space during the check.
- Default value: `"12h"`
- Minimum value: `"0s"`

#### 14.5.2.8.9 `background-error-recovery-window` New in v6.1.0

- The maximum allowable time for TiKV to recover after RocksDB detects a recoverable background error. If some background SST files are damaged, RocksDB will report to PD via heartbeat after locating the Peer to which the damaged SST files belong. PD then performs scheduling operations to remove this Peer. Finally, the damaged SST files are deleted directly, and the TiKV background will work as normal again.
- The damaged SST files still exist before the recovery finishes. During such a period, RocksDB can continue writing data, but an error will be reported when the damaged part of the data is read.
- If the recovery fails to finish within this time window, TiKV will panic.
- Default value: 1h

#### 14.5.2.8.10 `api-version` New in v6.1.0

- The storage format and interface version used by TiKV when TiKV serves as the RawKV store.
- Value options:
  - `1`: Uses API V1, does not encode the data passed from the client, and stores data as it is. In versions earlier than v6.1.0, TiKV uses API V1 by default.
  - `2`: Uses API V2:
    - The data is stored in the Multi-Version Concurrency Control (MVCC) format, where the timestamp is obtained from PD (which is TSO) by tikv-server.
    - Data is scoped according to different usage and API V2 supports co-existence of TiDB, Transactional KV, and RawKV applications in a single cluster.
    - When API V2 is used, you are expected to set `storage.enable-ttl = true` at the same time. Because API V2 supports the TTL feature, you must turn on `enable-ttl` explicitly. Otherwise, it will be in conflict because `storage.enable-ttl` defaults to `false`.
    - When API V2 is enabled, you need to deploy at least one tidb-server instance to reclaim obsolete data. This tidb-server instance can provide read and write services at the same time. To ensure high availability, you can deploy multiple tidb-server instances.
    - Client support is required for API V2. For details, see the corresponding instruction of the client for the API V2.
    - Since v6.2.0, Change Data Capture (CDC) for RawKV is supported. Refer to RawKV CDC.
- Default value: `1`

**Warning:**

- API V1 and API V2 are different from each other in the storage format. You can enable or disable API V2 directly **only** when TiKV contains only TiDB data. In other scenarios, you need to deploy a new cluster, and migrate data using RawKV Backup & Restore.
- After API V2 is enabled, you **cannot** downgrade the TiKV cluster to a version earlier than v6.1.0. Otherwise, data corruption might occur.

#### 14.5.2.9 storage.block-cache

Configuration items related to the sharing of block cache among multiple RocksDB Column Families (CF). When these configuration items are enabled, block cache separately configured for each column family is disabled.

##### 14.5.2.9.1 `shared`

- Enables or disables the sharing of block cache.
- Default value: `true`

##### 14.5.2.9.2 `capacity`

- The size of the shared block cache.
- Default value: 45% of the size of total system memory
- Unit: KB|MB|GB

#### 14.5.2.10 storage.flow-control

Configuration items related to the flow control mechanism in TiKV. This mechanism replaces the write stall mechanism in RocksDB and controls flow at the scheduler layer, which avoids secondary disasters caused by the stuck Raftstore or Apply threads.

##### 14.5.2.10.1 `enable`

- Determines whether to enable the flow control mechanism. After it is enabled, TiKV automatically disables the write stall mechanism of KvDB and the write stall mechanism of RaftDB (excluding memtable).
- Default value: `true`

#### 14.5.2.10.2 `memtables-threshold`

- When the number of kvDB memtables reaches this threshold, the flow control mechanism starts to work. When `enable` is set to `true`, this configuration item overrides `rocksdb.(defaultcf|writecf|lockcf).max-write-buffer-number`.
- Default value: `5`

#### 14.5.2.10.3 `l0-files-threshold`

- When the number of kvDB L0 files reaches this threshold, the flow control mechanism starts to work. When `enable` is set to `true`, this configuration item overrides `rocksdb.(defaultcf|writecf|lockcf).level0-slowdown-writes-trigger`.
- Default value: `20`

#### 14.5.2.10.4 `soft-pending-compaction-bytes-limit`

- When the pending compaction bytes in KvDB reach this threshold, the flow control mechanism starts to reject some write requests and reports the `ServerIsBusy` error. When `enable` is set to `true`, this configuration item overrides `rocksdb.(defaultcf|writecf|lockcf).soft-pending-compaction-bytes-limit`.
- Default value: `"192GB"`

#### 14.5.2.10.5 `hard-pending-compaction-bytes-limit`

- When the pending compaction bytes in KvDB reach this threshold, the flow control mechanism rejects all write requests and reports the `ServerIsBusy` error. When `enable` is set to `true`, this configuration item overrides `rocksdb.(defaultcf|writecf|lockcf).hard-pending-compaction-bytes-limit`.
- Default value: `"1024GB"`

### 14.5.2.11 storage.io-rate-limit

Configuration items related to the I/O rate limiter.

#### 14.5.2.11.1 `max-bytes-per-sec`

- Limits the maximum I/O bytes that a server can write to or read from the disk (determined by the `mode` configuration item below) in one second. When this limit is reached, TiKV prefers throttling background operations over foreground ones. The value of this configuration item should be set to the disk's optimal I/O bandwidth, for example, the maximum I/O bandwidth specified by your cloud disk vendor. When this configuration value is set to zero, disk I/O operations are not limited.
- Default value: `"0MB"`

#### 14.5.2.11.2 `mode`

- Determines which types of I/O operations are counted and restrained below the `max-bytes-per-sec` threshold. Currently, only the write-only mode is supported.
- Value options: `"read-only"`, `"write-only"`, and `"all-io"`
- Default value: `"write-only"`

### 14.5.2.12 pd

#### 14.5.2.12.1 `enable-forwarding` New in v5.0.0

- Controls whether the PD client in TiKV forwards requests to the leader via the followers in the case of possible network isolation.
- Default value: `false`
- If the environment might have isolated network, enabling this parameter can reduce the window of service unavailability.
- If you cannot accurately determine whether isolation, network interruption, or downtime has occurred, using this mechanism has the risk of misjudgment and causes reduced availability and performance. If network failure has never occurred, it is not recommended to enable this parameter.

#### 14.5.2.12.2 `endpoints`

- The endpoints of PD. When multiple endpoints are specified, you need to separate them using commas.
- Default value: `["127.0.0.1:2379"]`

#### 14.5.2.12.3 `retry-interval`

- The interval for retrying to initialize the PD connection
- Default value: `"300ms"`

#### 14.5.2.12.4 `retry-log-every`

- Specified the frequency at which the PD client skips reporting errors when the client observes errors. For example, when the value is `5`, after the PD client observes errors, the client skips reporting errors every 4 times and reports errors every 5th time.
- To disable this feature, set the value to `1`.
- Default value: `10`

#### 14.5.2.12.5 `retry-max-count`

- The maximum number of times to retry to initialize PD connection
- To disable the retry, set its value to `0`. To release the limit on the number of retries, set the value to `-1`.
- Default value: `-1`

### 14.5.2.13 raftstore

Configuration items related to Raftstore.

#### 14.5.2.13.1 `prevote`

- Enables or disables `prevote`. Enabling this feature helps reduce jitter on the system after recovery from network partition.
- Default value: `true`

#### 14.5.2.13.2 `capacity`

- The storage capacity, which is the maximum size allowed to store data. If `capacity` is left unspecified, the capacity of the current disk prevails. To deploy multiple TiKV instances on the same physical disk, add this parameter to the TiKV configuration. For details, see Key parameters of the hybrid deployment.
- Default value: `0`
- Unit: KB|MB|GB

#### 14.5.2.13.3 `raftdb-path`

- The path to the Raft library, which is `storage.data-dir/raft` by default
- Default value: `""`

#### 14.5.2.13.4 `raft-base-tick-interval`

> **Note:**
>
> This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The time interval at which the Raft state machine ticks
- Default value: `"1s"`
- Minimum value: greater than `0`

#### 14.5.2.13.5 `raft-heartbeat-ticks`

> **Note:**
>
> This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The number of passed ticks when the heartbeat is sent. This means that a heartbeat is sent at the time interval of `raft-base-tick-interval` * `raft-heartbeat-ticks`.
- Default value: `2`
- Minimum value: greater than `0`

#### 14.5.2.13.6 `raft-election-timeout-ticks`

> **Note:**
>
> This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The number of passed ticks when Raft election is initiated. This means that if Raft group is missing the leader, a leader election is initiated approximately after the time interval of `raft-base-tick-interval` * `raft-election-timeout-ticks`.
- Default value: `10`
- Minimum value: `raft-heartbeat-ticks`

#### 14.5.2.13.7 `raft-min-election-timeout-ticks`

> **Note:**
>
> This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The minimum number of ticks during which the Raft election is initiated. If the number is `0`, the value of `raft-election-timeout-ticks` is used. The value of this parameter must be greater than or equal to `raft-election-timeout-ticks`.
- Default value: `0`
- Minimum value: `0`

#### 14.5.2.13.8 `raft-max-election-timeout-ticks`

> **Note:**
>
> This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The maximum number of ticks during which the Raft election is initiated. If the number is `0`, the value of `raft-election-timeout-ticks` * `2` is used.
- Default value: `0`
- Minimum value: `0`

#### 14.5.2.13.9 `raft-max-size-per-msg`

- The soft limit on the size of a single message packet
- Default value: `"1MB"`
- Minimum value: greater than `0`
- Maximum value: `3GB`
- Unit: KB|MB|GB

#### 14.5.2.13.10 `raft-max-inflight-msgs`

- The number of Raft logs to be confirmed. If this number is exceeded, the Raft state machine slows down log sending.
- Default value: `256`
- Minimum value: greater than `0`
- Maximum value: `16384`

#### 14.5.2.13.11 `raft-entry-max-size`

- The hard limit on the maximum size of a single log
- Default value: `"8MB"`
- Minimum value: `0`
- Unit: MB|GB

#### 14.5.2.13.12 `raft-log-compact-sync-interval` New in v5.3

- The time interval to compact unnecessary Raft logs
- Default value: `"2s"`
- Minimum value: `"0s"`

#### 14.5.2.13.13 `raft-log-gc-tick-interval`

- The time interval at which the polling task of deleting Raft logs is scheduled. `0` means that this feature is disabled.
- Default value: `"3s"`
- Minimum value: `"0s"`

#### 14.5.2.13.14 `raft-log-gc-threshold`

- The soft limit on the maximum allowable count of residual Raft logs
- Default value: `50`
- Minimum value: `1`

#### 14.5.2.13.15 `raft-log-gc-count-limit`

- The hard limit on the allowable number of residual Raft logs
- Default value: the log number that can be accommodated in the 3/4 Region size (calculated as 1MB for each log)
- Minimum value: `0`

#### 14.5.2.13.16 `raft-log-gc-size-limit`

- The hard limit on the allowable size of residual Raft logs
- Default value: 3/4 of the Region size
- Minimum value: greater than `0`

#### 14.5.2.13.17 `raft-log-reserve-max-ticks` New in v5.3

- After the number of ticks set by this configuration item passes, even if the number of residual Raft logs does not reach the value set by `raft-log-gc-threshold`, TiKV still performs garbage collection (GC) to these logs.
- Default value: `6`
- Minimum value: greater than `0`

#### 14.5.2.13.18 `raft-engine-purge-interval`

- The interval for purging old TiKV log files to recycle disk space as soon as possible. Raft engine is a replaceable component, so the purging process is needed for some implementations.
- Default value: `"10s"`

#### 14.5.2.13.19 `raft-entry-cache-life-time`

- The maximum remaining time allowed for the log cache in memory
- Default value: `"30s"`
- Minimum value: `0`

#### 14.5.2.13.20 `hibernate-regions`

- Enables or disables Hibernate Region. When this option is enabled, a Region idle for a long time is automatically set as hibernated. This reduces the extra overhead caused by heartbeat messages between the Raft leader and the followers for idle Regions. You can use `peer-stale-state-check-interval` to modify the heartbeat interval between the leader and the followers of hibernated Regions.
- Default value: `true` in v5.0.2 and later versions; `false` in versions before v5.0.2

#### 14.5.2.13.21 `split-region-check-tick-interval`

- Specifies the interval at which to check whether the Region split is needed. `0` means that this feature is disabled.
- Default value: `"10s"`
- Minimum value: `0`

#### 14.5.2.13.22 `region-split-check-diff`

- The maximum value by which the Region data is allowed to exceed before Region split
- Default value: 1/16 of the Region size.
- Minimum value: `0`

#### 14.5.2.13.23 `region-compact-check-interval`

- The time interval at which to check whether it is necessary to manually trigger RocksDB compaction. `0` means that this feature is disabled.
- Default value: `"5m"`
- Minimum value: `0`

#### 14.5.2.13.24 `region-compact-check-step`

- The number of Regions checked at one time for each round of manual compaction
- Default value: `100`
- Minimum value: `0`

#### 14.5.2.13.25 `region-compact-min-tombstones`

- The number of tombstones required to trigger RocksDB compaction
- Default value: `10000`
- Minimum value: `0`

#### 14.5.2.13.26 `region-compact-tombstones-percent`

- The proportion of tombstone required to trigger RocksDB compaction
- Default value: `30`
- Minimum value: `1`
- Maximum value: `100`

#### 14.5.2.13.27 `report-region-buckets-tick-interval` New in v6.1.0

> **Warning:**
>
> `report-region-buckets-tick-interval` is an experimental feature introduced in TiDB v6.1.0. It is not recommended that you use it in production environments.

- The interval at which TiKV reports bucket information to PD when `enable-region-bucket` is true.
- Default value: `10s`

#### 14.5.2.13.28 `pd-heartbeat-tick-interval`

- The time interval at which a Region's heartbeat to PD is triggered. `0` means that this feature is disabled.
- Default value: `"1m"`
- Minimum value: `0`

#### 14.5.2.13.29 `pd-store-heartbeat-tick-interval`

- The time interval at which a store's heartbeat to PD is triggered. `0` means that this feature is disabled.
- Default value: `"10s"`
- Minimum value: `0`

#### 14.5.2.13.30 `snap-mgr-gc-tick-interval`

- The time interval at which the recycle of expired snapshot files is triggered. `0` means that this feature is disabled.
- Default value: `"1m"`
- Minimum value: `0`

#### 14.5.2.13.31 `snap-gc-timeout`

- The longest time for which a snapshot file is saved
- Default value: `"4h"`
- Minimum value: `0`

#### 14.5.2.13.32 `snap-generator-pool-size` New in v5.4.0

- Configures the size of the `snap-generator` thread pool.
- To make Regions generate snapshot faster in TiKV in recovery scenarios, you need to increase the count of the `snap-generator` threads of the corresponding worker. You can use this configuration item to increase the size of the `snap-generator` thread pool.
- Default value: `2`
- Minimum value: `1`

#### 14.5.2.13.33 `lock-cf-compact-interval`

- The time interval at which TiKV triggers a manual compaction for the Lock Column Family
- Default value: `"10m"`
- Minimum value: `0`

#### 14.5.2.13.34 `lock-cf-compact-bytes-threshold`

- The size out of which TiKV triggers a manual compaction for the Lock Column Family
- Default value: `"256MB"`
- Minimum value: `0`
- Unit: MB

#### 14.5.2.13.35 `notify-capacity`

- The longest length of the Region message queue.
- Default value: `40960`
- Minimum value: `0`

#### 14.5.2.13.36 `messages-per-tick`

- The maximum number of messages processed per batch
- Default value: `4096`
- Minimum value: `0`

#### 14.5.2.13.37 `max-peer-down-duration`

- The longest inactive duration allowed for a peer. A peer with timeout is marked as `down`, and PD tries to delete it later.
- Default value: `"10m"`
- Minimum value: When Hibernate Region is enabled, the minimum value is `peer-stale-state-check-interval * 2`; when Hibernate Region is disabled, the minimum value is `0`.

#### 14.5.2.13.38 `max-leader-missing-duration`

- The longest duration allowed for a peer to be in the state where a Raft group is missing the leader. If this value is exceeded, the peer verifies with PD whether the peer has been deleted.
- Default value: `"2h"`
- Minimum value: greater than `abnormal-leader-missing-duration`

#### 14.5.2.13.39 `abnormal-leader-missing-duration`

- The longest duration allowed for a peer to be in the state where a Raft group is missing the leader. If this value is exceeded, the peer is seen as abnormal and marked in metrics and logs.
- Default value: `"10m"`
- Minimum value: greater than `peer-stale-state-check-interval`

#### 14.5.2.13.40 `peer-stale-state-check-interval`

- The time interval to trigger the check for whether a peer is in the state where a Raft group is missing the leader.
- Default value: `"5m"`
- Minimum value: greater than `2 * election-timeout`

#### 14.5.2.13.41 `leader-transfer-max-log-lag`

- The maximum number of missing logs allowed for the transferee during a Raft leader transfer
- Default value: `128`
- Minimum value: `10`

#### 14.5.2.13.42 `max-snapshot-file-raw-size` New in v6.1.0

- When the size of a snapshot file exceeds this configuration value, this file will be split into multiple files.
- Default value: `100MiB`
- Minimum value: `100MiB`

#### 14.5.2.13.43 `snap-apply-batch-size`

- The memory cache size required when the imported snapshot file is written into the disk
- Default value: `"10MB"`
- Minimum value: `0`
- Unit: MB

#### 14.5.2.13.44 `consistency-check-interval`

> **Warning:**
>
> It is **NOT** recommended to enable the consistency check in production environments, because it affects cluster performance and is incompatible with the garbage collection in TiDB.

- The time interval at which the consistency check is triggered. `0` means that this feature is disabled.
- Default value: `"0s"`
- Minimum value: `0`

#### 14.5.2.13.45 `raft-store-max-leader-lease`

- The longest trusted period of a Raft leader
- Default value: `"9s"`
- Minimum value: `0`

#### 14.5.2.13.46 `right-derive-when-split`

- Specifies the start key of the new Region when a Region is split. When this configuration item is set to `true`, the start key is the maximum split key. When this configuration item is set to `false`, the start key is the original Region's start key.
- Default value: `true`

#### 14.5.2.13.47 `merge-max-log-gap`

- The maximum number of missing logs allowed when `merge` is performed
- Default value: `10`
- Minimum value: greater than `raft-log-gc-count-limit`

#### 14.5.2.13.48 `merge-check-tick-interval`

- The time interval at which TiKV checks whether a Region needs merge
- Default value: `"2s"`
- Minimum value: greater than `0`

#### 14.5.2.13.49 `use-delete-range`

- Determines whether to delete data from the `rocksdb delete_range` interface
- Default value: `false`

#### 14.5.2.13.50 `cleanup-import-sst-interval`

- The time interval at which the expired SST file is checked. `0` means that this feature is disabled.
- Default value: `"10m"`
- Minimum value: `0`

#### 14.5.2.13.51 `local-read-batch-size`

- The maximum number of read requests processed in one batch
- Default value: `1024`
- Minimum value: greater than `0`

#### 14.5.2.13.52 `apply-yield-write-size` New in v6.4.0

- The maximum number of bytes that the Apply thread can write for one FSM (Finite-state Machine) in one round of poll. This is a soft limit.
- Default value: `"32KiB"`
- Minimum value: greater than `0`
- Unit: KiB|MiB|GiB

#### 14.5.2.13.53 apply-max-batch-size

- Raft state machines process data write requests in batches by the BatchSystem. This configuration item specifies the maximum number of Raft state machines that can process the requests in one batch.
- Default value: 256
- Minimum value: greater than 0
- Maximum value: 10240

#### 14.5.2.13.54 apply-pool-size

- The allowable number of threads in the pool that flushes data to the disk, which is the size of the Apply thread pool. When you modify the size of this thread pool, refer to Performance tuning for TiKV thread pools.
- Default value: 2
- Value ranges: [1, CPU * 10]. CPU means the number of your CPU cores.

#### 14.5.2.13.55 store-max-batch-size

- Raft state machines process requests for flushing logs into the disk in batches by the BatchSystem. This configuration item specifies the maximum number of Raft state machines that can process the requests in one batch.
- If hibernate-regions is enabled, the default value is 256. If hibernate-regions is disabled, the default value is 1024.
- Minimum value: greater than 0
- Maximum value: 10240

#### 14.5.2.13.56 store-pool-size

- The allowable number of threads in the pool that processes Raft, which is the size of the Raftstore thread pool. When you modify the size of this thread pool, refer to Performance tuning for TiKV thread pools.
- Default value: 2
- Value ranges: [1, CPU * 10]. CPU means the number of your CPU cores.

#### 14.5.2.13.57 store-io-pool-size New in v5.3.0

- The allowable number of threads that process Raft I/O tasks, which is the size of the StoreWriter thread pool. When you modify the size of this thread pool, refer to Performance tuning for TiKV thread pools.
- Default value: 0
- Minimum value: 0

#### 14.5.2.13.58 `future-poll-size`

- The allowable number of threads that drive `future`
- Default value: `1`
- Minimum value: greater than `0`

#### 14.5.2.13.59 `cmd-batch`

- Controls whether to enable batch processing of the requests. When it is enabled, the write performance is significantly improved.
- Default value: `true`

#### 14.5.2.13.60 `inspect-interval`

- At a certain interval, TiKV inspects the latency of the Raftstore component. This parameter specifies the interval of the inspection. If the latency exceeds this value, this inspection is marked as timeout.
- Judges whether the TiKV node is slow based on the ratio of timeout inspection.
- Default value: `"500ms"`
- Minimum value: `"1ms"`

#### 14.5.2.13.61 `raft-write-size-limit` New in v5.3.0

- Determines the threshold at which Raft data is written into the disk. If the data size is larger than the value of this configuration item, the data is written to the disk. When the value of `store-io-pool-size` is `0`, this configuration item does not take effect.
- Default value: `1MB`
- Minimum value: `0`

#### 14.5.2.13.62 `report-min-resolved-ts-interval` New in v6.0.0

- Determines the interval at which the minimum resolved timestamp is reported to the PD leader. If this value is set to `0`, it means that the reporting is disabled.
- Default value: Before v6.3.0, the default value is `"0s"`. Starting from v6.3.0, the default value is `"1s"`, which is the smallest positive value.
- Minimum value: `0`
- Unit: second

### 14.5.2.14 coprocessor

Configuration items related to Coprocessor.

#### 14.5.2.14.1 `split-region-on-table`

- Determines whether to split Region by table. It is recommended for you to use the feature only in TiDB mode.
- Default value: `false`

#### 14.5.2.14.2 `batch-split-limit`

- The threshold of Region split in batches. Increasing this value speeds up Region split.
- Default value: `10`
- Minimum value: `1`

#### 14.5.2.14.3 `region-max-size`

- The maximum size of a Region. When the value is exceeded, the Region splits into many.
- Default value: `region-split-size / 2 * 3`
- Unit: KiB|MiB|GiB

#### 14.5.2.14.4 `region-split-size`

- The size of the newly split Region. This value is an estimate.
- Default value: `"96MiB"`
- Unit: KiB|MiB|GiB

#### 14.5.2.14.5 `region-max-keys`

- The maximum allowable number of keys in a Region. When this value is exceeded, the Region splits into many.
- Default value: `region-split-keys / 2 * 3`

#### 14.5.2.14.6 `region-split-keys`

- The number of keys in the newly split Region. This value is an estimate.
- Default value: `960000`

#### 14.5.2.14.7 `consistency-check-method`

- Specifies the method of data consistency check
- For the consistency check of MVCC data, set the value to `"mvcc"`. For the consistency check of raw data, set the value to `"raw"`.
- Default value: `"mvcc"`

#### 14.5.2.15 coprocessor-v2

##### 14.5.2.15.1 `coprocessor-plugin-directory`

- The path of the directory where compiled coprocessor plugins are located. Plugins in this directory are automatically loaded by TiKV.
- If this configuration item is not set, the coprocessor plugin is disabled.
- Default value: `"./coprocessors"`

##### 14.5.2.15.2 `enable-region-bucket` New in v6.1.0

- Determines whether to divide a Region into smaller ranges called buckets. The bucket is used as the unit of the concurrent query to improve the scan concurrency. For more about the design of the bucket, refer to Dynamic size Region.
- Default value: false

> **Warning:**
>
> - `enable-region-bucket` is an experimental feature introduced in TiDB v6.1.0. It is not recommended that you use it in production environments.
> - This configuration makes sense only when `region-split-size` is twice of `region-bucket-size` or above; otherwise, no bucket is actually generated.
> - Adjusting `region-split-size` to a larger value might have the risk of performance regression and slow scheduling.

##### 14.5.2.15.3 `region-bucket-size` New in v6.1.0

- The size of a bucket when `enable-region-bucket` is true.
- Default value: `96MiB`

> **Warning:**
>
> `region-bucket-size` is an experimental feature introduced in TiDB v6.1.0. It is not recommended that you use it in production environments.

#### 14.5.2.16 rocksdb

Configuration items related to RocksDB

##### 14.5.2.16.1 `max-background-jobs`

- The number of background threads in RocksDB. When you modify the size of the RocksDB thread pool, refer to Performance tuning for TiKV thread pools.
- Default value:
  - When the number of CPU cores is 10, the default value is `9`.
  - When the number of CPU cores is 8, the default value is `7`.
  - When the number of CPU cores is `N`, the default value is `max(2, min(N - 1, 9))`.
- Minimum value: `2`

##### 14.5.2.16.2 `max-background-flushes`

- The maximum number of concurrent background memtable flush jobs
- Default value:
  - When the number of CPU cores is 10, the default value is `3`.
  - When the number of CPU cores is 8, the default value is `2`.
  - When the number of CPU cores is `N`, the default value is `[(max-background-jobs + 3)/ 4]`.
- Minimum value: `1`

##### 14.5.2.16.3 `max-sub-compactions`

- The number of sub-compaction operations performed concurrently in RocksDB
- Default value: `3`
- Minimum value: `1`

##### 14.5.2.16.4 `max-open-files`

- The total number of files that RocksDB can open
- Default value: `40960`
- Minimum value: `-1`

##### 14.5.2.16.5 `max-manifest-file-size`

- The maximum size of a RocksDB Manifest file
- Default value: `"128MB"`
- Minimum value: `0`
- Unit: B|KB|MB|GB

#### 14.5.2.16.6 `create-if-missing`

- Determines whether to automatically create a DB switch
- Default value: `true`

#### 14.5.2.16.7 `wal-recovery-mode`

- WAL recovery mode
- Optional values:
  - `"tolerate-corrupted-tail-records"`: tolerates and discards the records that have incomplete trailing data on all logs
  - `"absolute-consistency"`: abandons recovery when corrupted logs are found
  - `"point-in-time"`: recovers logs sequentially until the first corrupted log is encountered
  - `"skip-any-corrupted-records"`: post-disaster recovery. The data is recovered as much as possible, and corrupted records are skipped.
- Default value: `"point-in-time"`

#### 14.5.2.16.8 `wal-dir`

- The directory in which WAL files are stored. If not specified, the WAL files will be stored in the same directory as the data.
- Default value: `""`

#### 14.5.2.16.9 `wal-ttl-seconds`

- The living time of the archived WAL files. When the value is exceeded, the system deletes these files.
- Default value: `0`
- Minimum value: `0`
- unit: second

#### 14.5.2.16.10 `wal-size-limit`

- The size limit of the archived WAL files. When the value is exceeded, the system deletes these files.
- Default value: `0`
- Minimum value: `0`
- Unit: B|KB|MB|GB

#### 14.5.2.16.11 `max-total-wal-size`

- The maximum RocksDB WAL size in total, which is the size of `*.log` files in the `data-dir`.
- Default value: `"4GB"`

#### 14.5.2.16.12 `enable-statistics`

- Determines whether to enable the statistics of RocksDB
- Default value: `true`

#### 14.5.2.16.13 `stats-dump-period`

- The interval at which statistics are output to the log.
- Default value: `10m`

#### 14.5.2.16.14 `compaction-readahead-size`

- Enables the readahead feature during RocksDB compaction and specifies the size of readahead data. If you are using mechanical disks, it is recommended to set the value to 2MB at least.
- Default value: `0`
- Minimum value: `0`
- Unit: B|KB|MB|GB

#### 14.5.2.16.15 `writable-file-max-buffer-size`

- The maximum buffer size used in WritableFileWrite
- Default value: `"1MB"`
- Minimum value: `0`
- Unit: B|KB|MB|GB

#### 14.5.2.16.16 `use-direct-io-for-flush-and-compaction`

- Determines whether to use `O_DIRECT` for both reads and writes in the background flush and compactions. The performance impact of this option: enabling `O_DIRECT` bypasses and prevents contamination of the OS buffer cache, but the subsequent file reads require re-reading the contents to the buffer cache.
- Default value: `false`

#### 14.5.2.16.17 `rate-bytes-per-sec`

- The maximum rate permitted by RocksDB's compaction rate limiter
- Default value: `10GB`
- Minimum value: `0`
- Unit: B|KB|MB|GB

#### 14.5.2.16.18 `rate-limiter-refill-period`

- Controls how often I/O tokens are refilled. A smaller value reduces I/O bursts but causes more CPU overhead.
- Default value: `"100ms"`

#### 14.5.2.16.19 `rate-limiter-mode`

- RocksDB's compaction rate limiter mode
- Optional values: `"read-only"`, `"write-only"`, `"all-io"`
- Default value: `"write-only"`

#### 14.5.2.16.20 `rate-limiter-auto-tuned` New in v5.0

- Determines whether to automatically optimize the configuration of the RocksDB's compaction rate limiter based on recent workload. When this configuration is enabled, compaction pending bytes will be slightly higher than usual.
- Default value: `true`

#### 14.5.2.16.21 `enable-pipelined-write`

- Controls whether to enable Pipelined Write. When this configuration is enabled, the previous Pipelined Write is used. When this configuration is disabled, the new Pipelined Commit mechanism is used.
- Default value: `false`

#### 14.5.2.16.22 `bytes-per-sync`

- The rate at which OS incrementally synchronizes files to disk while these files are being written asynchronously
- Default value: `"1MB"`
- Minimum value: `0`
- Unit: B|KB|MB|GB

#### 14.5.2.16.23 wal-bytes-per-sync

- The rate at which OS incrementally synchronizes WAL files to disk while the WAL files are being written
- Default value: "512KB"
- Minimum value: 0
- Unit: B|KB|MB|GB

#### 14.5.2.16.24 info-log-max-size

> **Warning:**
>
> Starting from v5.4.0, RocksDB logs are managed by the logging module of TiKV. Therefore, this configuration item is deprecated, and its function is replaced by the configuration item log.file.max-size.

- The maximum size of Info log
- Default value: "1GB"
- Minimum value: 0
- Unit: B|KB|MB|GB

#### 14.5.2.16.25 info-log-roll-time

> **Warning:**
>
> Starting from v5.4.0, RocksDB logs are managed by the logging module of TiKV. Therefore, this configuration item is deprecated. TiKV no longer supports automatic log splitting based on time. Instead, you can use the configuration item log.file.max-size to set the threshold for automatic log splitting based on file size.

- The time interval at which Info logs are truncated. If the value is 0s, logs are not truncated.
- Default value: "0s"

#### 14.5.2.16.26 info-log-keep-log-file-num

**Warning:**

Starting from v5.4.0, RocksDB logs are managed by the logging module of TiKV. Therefore, this configuration item is deprecated, and its function is replaced by the configuration item `log.file.max-backups`.

- The maximum number of kept log files
- Default value: `10`
- Minimum value: `0`

#### 14.5.2.16.27 `info-log-dir`

- The directory in which logs are stored
- Default value: `""`

#### 14.5.2.16.28 `info-log-level`

**Warning:**

Starting from v5.4.0, RocksDB logs are managed by the logging module of TiKV. Therefore, this configuration item is deprecated, and its function is replaced by the configuration item `log.level`.

- Log levels of RocksDB
- Default value: `"info"`

#### 14.5.2.16.29 `track-and-verify-wals-in-manifest` New in v6.5.9

- Controls whether to record information about Write Ahead Log (WAL) files in the RocksDB MANIFEST file and whether to verify the integrity of WAL files during startup. For more information, see RocksDB Track WAL in MANIFEST.
- Default value: `false`
- Value options:
  - `true`: records information about WAL files in the MANIFEST file and verifies the integrity of WAL files during startup.
  - `false`: does not record information about WAL files in the MANIFEST file and does not verify the integrity of WAL files during startup.

#### 14.5.2.17 rocksdb.titan

Configuration items related to Titan.

##### 14.5.2.17.1 `enabled`

> **Warning**
>
> When disabling Titan for TiDB versions earlier than v8.5.0, it is not recommended to modify this configuration item to `false`, as this might cause TiKV to crash. To disable Titan, refer to the steps in Disable Titan.

- Enables or disables Titan
- Default value: `false`

##### 14.5.2.17.2 `dirname`

- The directory in which the Titan Blob file is stored
- Default value: `"titandb"`

##### 14.5.2.17.3 `disable-gc`

- Determines whether to disable Garbage Collection (GC) that Titan performs to Blob files
- Default value: `false`

##### 14.5.2.17.4 `max-background-gc`

- The maximum number of GC threads in Titan
- Default value: `4`
- Minimum value: `1`

#### 14.5.2.18 rocksdb.defaultcf | rocksdb.writecf | rocksdb.lockcf

Configuration items related to `rocksdb.defaultcf`, `rocksdb.writecf`, and `rocksdb.lockcf`.

#### 14.5.2.18.1 `block-size`

- The default size of a RocksDB block
- Default value for `defaultcf` and `writecf`: `"64KB"`
- Default value for `lockcf`: `"16KB"`
- Minimum value: `"1KB"`
- Unit: KB|MB|GB

#### 14.5.2.18.2 `block-cache-size`

- The cache size of a RocksDB block
- Default value for `defaultcf`: `Total machine memory * 25%`
- Default value for `writecf`: `Total machine memory * 15%`
- Default value for `lockcf`: `Total machine memory * 2%`
- Minimum value: `0`
- Unit: KB|MB|GB

#### 14.5.2.18.3 `disable-block-cache`

- Enables or disables block cache
- Default value: `false`

#### 14.5.2.18.4 `cache-index-and-filter-blocks`

- Enables or disables caching index and filter
- Default value: `true`

#### 14.5.2.18.5 `pin-l0-filter-and-index-blocks`

- Determines whether to pin the index and filter blocks of the level 0 SST files in memory.
- Default value: `true`

#### 14.5.2.18.6 `use-bloom-filter`

- Enables or disables bloom filter
- Default value: `true`

#### 14.5.2.18.7 `optimize-filters-for-hits`

- Determines whether to optimize the hit ratio of filters
- Default value for `defaultcf`: `true`
- Default value for `writecf` and `lockcf`: `false`

#### 14.5.2.18.8 `whole-key-filtering`

- Determines whether to put the entire key to bloom filter
- Default value for `defaultcf` and `lockcf`: `true`
- Default value for `writecf`: `false`

#### 14.5.2.18.9 `bloom-filter-bits-per-key`

- The length that bloom filter reserves for each key
- Default value: `10`
- Unit: byte

#### 14.5.2.18.10 `block-based-bloom-filter`

- Determines whether each block creates a bloom filter
- Default value: `false`

#### 14.5.2.18.11 `read-amp-bytes-per-bit`

- Enables or disables statistics of read amplification.
- Optional values: `0` (disabled), > `0` (enabled).
- Default value: `0`
- Minimum value: `0`

#### 14.5.2.18.12 `compression-per-level`

- The default compression algorithm for each level
- Default value for `defaultcf`: [“no”, “no”, “lz4”, “lz4”, “lz4”, “zstd”, “zstd”]
- Default value for `writecf`: [“no”, “no”, “lz4”, “lz4”, “lz4”, “zstd”, “zstd”]
- Default value for `lockcf`: [“no”, “no”, “no”, “no”, “no”, “no”, “no”]

#### 14.5.2.18.13 `bottommost-level-compression`

- Sets the compression algorithm of the bottommost layer. This configuration item overrides the `compression-per-level` setting.
- Ever since data is written to LSM-tree, RocksDB does not directly adopt the last compression algorithm specified in the `compression-per-level` array for the bottommost layer. `bottommost-level-compression` enables the bottommost layer to use the compression algorithm of the best compression effect from the beginning.
- If you do not want to set the compression algorithm for the bottommost layer, set the value of this configuration item to `disable`.
- Default value: `"zstd"`

#### 14.5.2.18.14 write-buffer-size

- Memtable size
- Default value for defaultcf and writecf: "128MB"
- Default value for lockcf: "32MB"
- Minimum value: 0
- Unit: KB|MB|GB

#### 14.5.2.18.15 max-write-buffer-number

- The maximum number of memtables. When storage.flow-control.enable is set to true, storage.flow-control.memtables-threshold overrides this configuration item.
- Default value: 5
- Minimum value: 0

#### 14.5.2.18.16 min-write-buffer-number-to-merge

- The minimum number of memtables required to trigger flush
- Default value: 1
- Minimum value: 0

#### 14.5.2.18.17 max-bytes-for-level-base

- The maximum number of bytes at base level (level-1). Generally, it is set to 4 times the size of a memtable. When the level-1 data size reaches the limit value of max-bytes-for-level-base, the SST files of level-1 and their overlapping SST files of level-2 will be compacted.
- Default value for defaultcf and writecf: "512MB"
- Default value for lockcf: "128MB"
- Minimum value: 0
- Unit: KB|MB|GB
- It is recommended that the value of max-bytes-for-level-base is set approximately equal to the data volume in L0 to reduce unnecessary compaction. For example, if the compression method is "no:no:lz4:lz4:lz4:lz4:lz4", the value of max-bytes-for-level-base should be write-buffer-size * 4, because there is no compression of L0 and L1 and the trigger condition of compaction for L0 is that the number of the SST files reaches 4 (the default value). When L0 and L1 both adopt compaction, you need to analyze RocksDB logs to understand the size of an SST file compressed from a memtable. For example, if the file size is 32 MB, it is recommended to set the value of max-bytes-for-level-base to 128 MB (32 MB * 4).

#### 14.5.2.18.18 target-file-size-base

- The size of the target file at base level. This value is overridden by `compaction-guard -max-output-file-size` when the `enable-compaction-guard` value is `true`.
- Default value: `"8MB"`
- Minimum value: `0`
- Unit: KB|MB|GB

#### 14.5.2.18.19 level0-file-num-compaction-trigger

- The maximum number of files at L0 that trigger compaction
- Default value for `defaultcf` and `writecf`: `4`
- Default value for `lockcf`: `1`
- Minimum value: `0`

#### 14.5.2.18.20 level0-slowdown-writes-trigger

- The maximum number of files at L0 that trigger write stall. When `storage.flow -control.enable` is set to `true`, `storage.flow-control.l0-files-threshold` overrides this configuration item.
- Default value: `20`
- Minimum value: `0`

#### 14.5.2.18.21 level0-stop-writes-trigger

- The maximum number of files at L0 required to completely block write
- Default value: `36`
- Minimum value: `0`

#### 14.5.2.18.22 max-compaction-bytes

- The maximum number of bytes written into disk per compaction
- Default value: `"2GB"`
- Minimum value: `0`
- Unit: KB|MB|GB

#### 14.5.2.18.23 compaction-pri

- The priority type of compaction
- Optional values:

- `"by-compensated-size"`: compact files in order of file size and large files are compacted with higher priority.
- `"oldest-largest-seq-first"`: prioritize compaction on files with the oldest update time. Use this value **only** when updating hot keys in small ranges.
- `"oldest-smallest-seq-first"`: prioritize compaction on files with ranges that are not compacted to the next level for a long time. If you randomly update hot keys across the key space, this value can slightly reduce write amplification.
- `"min-overlapping-ratio"`: prioritize compaction on files with a high overlap ratio. When a file is small in different levels (the result of `the file size in the next level ÷ the file size in this level` is small), TiKV compacts this file first. In many cases, this value can effectively reduce write amplification.

- Default value for `defaultcf` and `writecf`: `"min-overlapping-ratio"`
- Default value for `lockcf`: `"by-compensated-size"`

#### 14.5.2.18.24 `dynamic-level-bytes`

- Determines whether to optimize dynamic level bytes
- Default value: `true`

#### 14.5.2.18.25 `num-levels`

- The maximum number of levels in a RocksDB file
- Default value: `7`

#### 14.5.2.18.26 `max-bytes-for-level-multiplier`

- The default amplification multiple for each layer
- Default value: `10`

#### 14.5.2.18.27 `compaction-style`

- Compaction method
- Optional values: `"level"`, `"universal"`, `"fifo"`
- Default value: `"level"`

#### 14.5.2.18.28 `disable-auto-compactions`

- Determines whether to disable auto compaction.
- Default value: `false`

#### 14.5.2.18.29 `soft-pending-compaction-bytes-limit`

- The soft limit on the pending compaction bytes. When `storage.flow-control.enable` is set to `true`, `storage.flow-control.soft-pending-compaction-bytes-limit` overrides this configuration item.
- Default value: `"192GB"`
- Unit: KB|MB|GB

#### 14.5.2.18.30 `hard-pending-compaction-bytes-limit`

- The hard limit on the pending compaction bytes. When `storage.flow-control.enable` is set to `true`, `storage.flow-control.hard-pending-compaction-bytes-limit` overrides this configuration item.
- Default value: `"256GB"`
- Unit: KB|MB|GB

#### 14.5.2.18.31 `enable-compaction-guard`

- Enables or disables the compaction guard, which is an optimization to split SST files at TiKV Region boundaries. This optimization can help reduce compaction I/O and allows TiKV to use larger SST file size (thus less SST files overall) and at the time efficiently clean up stale data when migrating Regions.
- Default value for `defaultcf` and `writecf`: `true`
- Default value for `lockcf`: `false`

#### 14.5.2.18.32 `compaction-guard-min-output-file-size`

- The minimum SST file size when the compaction guard is enabled. This configuration prevents SST files from being too small when the compaction guard is enabled.
- Default value: `"8MB"`
- Unit: KB|MB|GB

#### 14.5.2.18.33 `compaction-guard-max-output-file-size`

- The maximum SST file size when the compaction guard is enabled. The configuration prevents SST files from being too large when the compaction guard is enabled. This configuration overrides `target-file-size-base` for the same column family.
- Default value: `"128MB"`
- Unit: KB|MB|GB

#### 14.5.2.18.34 `format-version` New in v6.2.0

- The format version of SST files. This configuration item only affects newly written tables. For existing tables, the version information is read from the footer.
- Optional values:
  - `0`: Can be read by all TiKV versions. The default checksum type is CRC32 and this version does not support changing the checksum type.
  - `1`: Can be read by all TiKV versions. Supports non-default checksum types like xxHash. RocksDB only writes data when the checksum type is not CRC32. (version `0` is automatically upgraded)
  - `2`: Can be read by all TiKV versions. Changes the encoding of compressed blocks using LZ4, BZip2 and Zlib compression.
  - `3`: Can be read by TiKV v2.1 and later versions. Changes the encoding of the keys in index blocks.
  - `4`: Can be read by TiKV v3.0 and later versions. Changes the encoding of the values in index blocks.
  - `5`: Can be read by TiKV v6.1 and later versions. Full and partitioned filters use a faster and more accurate Bloom filter implementation with a different schema.
- Default value: `2`

#### 14.5.2.18.35 `ttl` New in v6.5.4

- SST files with updates older than the TTL will be automatically selected for compaction. These SST files will go through the compaction in a cascading way so that they can be compacted to the bottommost level or file.
- Default value: `"0s"`, meaning that no SST file is selected by default.
- Unit: s(second)|h(hour)|d(day)

#### 14.5.2.18.36 `periodic-compaction-seconds` New in v6.5.4

- The time interval for periodic compaction. SST files with updates older than this value will be selected for compaction and rewritten to the same level where these SST files originally reside.
- Default value: `"0s"`, meaning that periodic compaction is disabled by default.
- Unit: s(second)|h(hour)|d(day)

### 14.5.2.19 rocksdb.defaultcf.titan

Configuration items related to `rocksdb.defaultcf.titan`.

#### 14.5.2.19.1 `min-blob-size`

- The smallest value stored in a Blob file. Values smaller than the specified size are stored in the LSM-Tree.
- Default value: `"1KB"`
- Minimum value: `0`
- Unit: KB|MB|GB

#### 14.5.2.19.2 `blob-file-compression`

- The compression algorithm used in a Blob file
- Optional values: `"no"`, `"snappy"`, `"zlib"`, `"bzip2"`, `"lz4"`, `"lz4hc"`, `"zstd"`
- Default value: `"lz4"`

#### 14.5.2.19.3 `blob-cache-size`

- The cache size of a Blob file
- Default value: `"0GB"`
- Minimum value: `0`
- Unit: KB|MB|GB

#### 14.5.2.19.4 `min-gc-batch-size`

- The minimum total size of Blob files required to perform GC for one time
- Default value: `"16MB"`
- Minimum value: `0`
- Unit: KB|MB|GB

#### 14.5.2.19.5 `max-gc-batch-size`

- The maximum total size of Blob files allowed to perform GC for one time
- Default value: `"64MB"`
- Minimum value: `0`
- Unit: KB|MB|GB

#### 14.5.2.19.6 `discardable-ratio`

- The ratio at which GC is triggered for Blob files. The Blob file can be selected for GC only if the proportion of the invalid values in a Blob file exceeds this ratio.
- Default value: `0.5`
- Minimum value: `0`
- Maximum value: `1`

#### 14.5.2.19.7 `sample-ratio`

- The ratio of (data read from a Blob file/the entire Blob file) when sampling the file during GC
- Default value: `0.1`
- Minimum value: `0`
- Maximum value: `1`

#### 14.5.2.19.8 `merge-small-file-threshold`

- When the size of a Blob file is smaller than this value, the Blob file might still be selected for GC. In this situation, `discardable-ratio` is ignored.
- Default value: `"8MB"`
- Minimum value: `0`
- Unit: KB|MB|GB

#### 14.5.2.19.9 `blob-run-mode`

- Specifies the running mode of Titan.
- Optional values:
  - `normal`: Writes data to the blob file when the value size exceeds `min-blob-size`.
  - `read_only`: Refuses to write new data to the blob file, but still reads the original data from the blob file.
  - `fallback`: Writes data in the blob file back to LSM.
- Default value: `normal`

#### 14.5.2.19.10 `level-merge`

- Determines whether to optimize the read performance. When `level-merge` is enabled, there is more write amplification.
- Default value: `false`

### 14.5.2.20 raftdb

Configuration items related to `raftdb`

#### 14.5.2.20.1 `max-background-jobs`

- The number of background threads in RocksDB. When you modify the size of the RocksDB thread pool, refer to Performance tuning for TiKV thread pools.
- Default value: `4`
- Minimum value: `2`

#### 14.5.2.20.2 `max-sub-compactions`

- The number of concurrent sub-compaction operations performed in RocksDB
- Default value: `2`
- Minimum value: `1`

#### 14.5.2.20.3 `max-open-files`

- The total number of files that RocksDB can open
- Default value: `40960`
- Minimum value: `-1`

#### 14.5.2.20.4 `max-manifest-file-size`

- The maximum size of a RocksDB Manifest file
- Default value: `"20MB"`
- Minimum value: `0`
- Unit: B|KB|MB|GB

#### 14.5.2.20.5 `create-if-missing`

- If the value is `true`, the database will be created if it is missing
- Default value: `true`

#### 14.5.2.20.6 `enable-statistics`

- Determines whether to enable the statistics of Raft RocksDB
- Default value: `true`

#### 14.5.2.20.7 `stats-dump-period`

- The interval at which statistics are output to the log
- Default value: `10m`

#### 14.5.2.20.8 `wal-dir`

- The directory in which Raft RocksDB WAL files are stored, which is the absolute directory path for WAL. **Do not** set this configuration item to the same value as `rocksdb.wal-dir`.
- If this configuration item is not set, the log files are stored in the same directory as data.
- If there are two disks on the machine, storing RocksDB data and WAL logs on different disks can improve performance.
- Default value: `""`

#### 14.5.2.20.9 `wal-ttl-seconds`

- Specifies how long the archived WAL files are retained. When the value is exceeded, the system deletes these files.
- Default value: `0`
- Minimum value: `0`
- Unit: second

#### 14.5.2.20.10 `wal-size-limit`

- The size limit of the archived WAL files. When the value is exceeded, the system deletes these files.
- Default value: `0`
- Minimum value: `0`
- Unit: B|KB|MB|GB

#### 14.5.2.20.11 `max-total-wal-size`

- The maximum RocksDB WAL size in total
- Default value: `"4GB"`

#### 14.5.2.20.12 `compaction-readahead-size`

- Controls whether to enable the readahead feature during RocksDB compaction and specify the size of readahead data.
- If you use mechanical disks, it is recommended to set the value to `2MB` at least.
- Default value: `0`
- Minimum value: `0`
- Unit: B|KB|MB|GB

#### 14.5.2.20.13 `writable-file-max-buffer-size`

- The maximum buffer size used in WritableFileWrite
- Default value: `"1MB"`
- Minimum value: `0`
- Unit: B|KB|MB|GB

#### 14.5.2.20.14 `use-direct-io-for-flush-and-compaction`

- Determines whether to use `O_DIRECT` for both reads and writes in the background flush and compactions. The performance impact of this option: enabling `O_DIRECT` bypasses and prevents contamination of the OS buffer cache, but the subsequent file reads require re-reading the contents to the buffer cache.
- Default value: `false`

#### 14.5.2.20.15 `enable-pipelined-write`

- Controls whether to enable Pipelined Write. When this configuration is enabled, the previous Pipelined Write is used. When this configuration is disabled, the new Pipelined Commit mechanism is used.
- Default value: `true`

#### 14.5.2.20.16 `allow-concurrent-memtable-write`

- Controls whether to enable concurrent memtable write.
- Default value: `true`

#### 14.5.2.20.17 `bytes-per-sync`

- The rate at which OS incrementally synchronizes files to disk while these files are being written asynchronously
- Default value: `"1MB"`
- Minimum value: `0`
- Unit: B|KB|MB|GB

#### 14.5.2.20.18 `wal-bytes-per-sync`

- The rate at which OS incrementally synchronizes WAL files to disk when the WAL files are being written
- Default value: `"512KB"`
- Minimum value: `0`
- Unit: B|KB|MB|GB

#### 14.5.2.20.19 `info-log-max-size`

> **Warning:**
>
> Starting from v5.4.0, RocksDB logs are managed by the logging module of TiKV. Therefore, this configuration item is deprecated, and its function is replaced by the configuration item `log.file.max-size`.

- The maximum size of Info logs
- Default value: `"1GB"`
- Minimum value: `0`
- Unit: B|KB|MB|GB

#### 14.5.2.20.20 `info-log-roll-time`

> **Warning:**
>
> Starting from v5.4.0, RocksDB logs are managed by the logging module of TiKV. Therefore, this configuration item is deprecated. TiKV no longer supports automatic log splitting based on time. Instead, you can use the configuration item `log.file.max-size` to set the threshold for automatic log splitting based on file size.

- The interval at which Info logs are truncated. If the value is `0s`, logs are not truncated.
- Default value: `"0s"` (which means logs are not truncated)

#### 14.5.2.20.21 `info-log-keep-log-file-num`

> **Warning:**
>
> Starting from v5.4.0, RocksDB logs are managed by the logging module of TiKV. Therefore, this configuration item is deprecated, and its function is replaced by the configuration item `log.file.max-backups`.

- The maximum number of Info log files kept in RaftDB
- Default value: `10`
- Minimum value: `0`

#### 14.5.2.20.22 `info-log-dir`

- The directory in which Info logs are stored
- Default value: `""`

#### 14.5.2.20.23 `info-log-level`

> **Warning:**
>
> Starting from v5.4.0, RocksDB logs are managed by the logging module of TiKV. Therefore, this configuration item is deprecated, and its function is replaced by the configuration item `log.level`.

- Log levels of RaftDB
- Default value: `"info"`

#### 14.5.2.21 raft-engine

Configuration items related to Raft Engine.

> **Note:**
>
> - When you enable Raft Engine for the first time, TiKV transfers its data from RocksDB to Raft Engine. Therefore, you need to wait extra tens of seconds for TiKV to start.
> - The data format of Raft Engine in TiDB v5.4.0 is not compatible with earlier TiDB versions. Therefore, if you need to downgrade a TiDB cluster from v5.4.0 to an earlier version, **before** downgrading, disable Raft Engine by setting `enable` to `false` and restart TiKV for the configuration to take effect.

##### 14.5.2.21.1 `enable`

- Determines whether to use Raft Engine to store Raft logs. When it is enabled, configurations of `raftdb` are ignored.
- Default value: `true`

##### 14.5.2.21.2 `dir`

- The directory at which raft log files are stored. If the directory does not exist, it will be created when TiKV is started.
- If this configuration item is not set, `{data-dir}/raft-engine` is used.
- If there are multiple disks on your machine, it is recommended to store the data of Raft Engine on a different disk to improve TiKV performance.
- Default value: `""`

##### 14.5.2.21.3 `batch-compression-threshold`

- Specifies the threshold size of a log batch. A log batch larger than this configuration is compressed. If you set this configuration item to `0`, compression is disabled.
- Default value: `"8KB"`

#### 14.5.2.21.4 `bytes-per-sync`

> **Warning:**
>
> Starting from v6.5.0, Raft Engine writes logs to disk directly without buffering. Therefore, this configuration item is deprecated and no longer functional.

- Specifies the maximum accumulative size of buffered writes. When this configuration value is exceeded, buffered writes are flushed to the disk.
- If you set this configuration item to `0`, incremental sync is disabled.
- Before v6.5.0, the default value is `"4MiB"`.

#### 14.5.2.21.5 `target-file-size`

- Specifies the maximum size of log files. When a log file is larger than this value, it is rotated.
- Default value: `"128MB"`

#### 14.5.2.21.6 `purge-threshold`

- Specifies the threshold size of the main log queue. When this configuration value is exceeded, the main log queue is purged.
- This configuration can be used to adjust the disk space usage of Raft Engine.
- Default value: `"10GB"`

#### 14.5.2.21.7 `recovery-mode`

- Determines how to deal with file corruption during recovery.
- Value options: `"absolute-consistency"`, `"tolerate-tail-corruption"`, `"tolerate-any-corruption"`
- Default value: `"tolerate-tail-corruption"`

#### 14.5.2.21.8 `recovery-read-block-size`

- The minimum I/O size for reading log files during recovery.
- Default value: `"16KB"`
- Minimum value: `"512B"`

#### 14.5.2.21.9 `recovery-threads`

- The number of threads used to scan and recover log files.
- Default value: `4`
- Minimum value: `1`

#### 14.5.2.21.10 `memory-limit`

- Specifies the limit on the memory usage of Raft Engine.
- When this configuration value is not set, 15% of the available system memory is used.
- Default value: `Total machine memory * 15%`

#### 14.5.2.21.11 `format-version` New in v6.3.0

> **Note:**
>
> After `format-version` is set to `2`, if you need to downgrade a TiKV cluster from v6.3.0 to an earlier version, take the following steps **before** the downgrade:
>
> 1. Disable Raft Engine by setting `enable` to `false` and restart TiKV to make the configuration take effect.
> 2. Set `format-version` to `1`.
> 3. Enable Raft Engine by setting `enable` to `true` and restart TiKV to make the configuration take effect.

- Specifies the version of log files in Raft Engine.
- Value Options:
  - `1`: Default log file version for TiKV earlier than v6.3.0. Can be read by TiKV >= v6.1.0.
  - `2`: Supports log recycling. Can be read by TiKV >= v6.3.0.
- Default value: `2`

#### 14.5.2.21.12 `enable-log-recycle` New in v6.3.0

> **Note:**
>
> This configuration item is only available when `format-version` >= 2.

- Determines whether to recycle stale log files in Raft Engine. When it is enabled, logically purged log files will be reserved for recycling. This reduces the long tail latency on write workloads.
- Default value: `false`

#### 14.5.2.22 security

Configuration items related to security.

##### 14.5.2.22.1 `ca-path`

- The path of the CA file
- Default value: `""`

##### 14.5.2.22.2 `cert-path`

- The path of the Privacy Enhanced Mail (PEM) file that contains the X.509 certificate
- Default value: `""`

##### 14.5.2.22.3 `key-path`

- The path of the PEM file that contains the X.509 key
- Default value: `""`

##### 14.5.2.22.4 `cert-allowed-cn`

- A list of acceptable X.509 Common Names in certificates presented by clients. Requests are permitted only when the presented Common Name is an exact match with one of the entries in the list.
- Default value: `[]`. This means that the client certificate CN check is disabled by default.

##### 14.5.2.22.5 `redact-info-log` New in v4.0.8

- This configuration item enables or disables log redaction. If the configuration value is set to `true`, all user data in the log will be replaced by `?`.
- Default value: `false`

#### 14.5.2.23 security.encryption

Configuration items related to encryption at rest (TDE).

#### 14.5.2.23.1 `data-encryption-method`

- The encryption method for data files
- Value options: "plaintext", "aes128-ctr", "aes192-ctr", "aes256-ctr", and "sm4-ctr" (supported since v6.3.0)
- A value other than "plaintext" means that encryption is enabled, in which case the master key must be specified.
- Default value: `"plaintext"`

#### 14.5.2.23.2 `data-key-rotation-period`

- Specifies how often TiKV rotates the data encryption key.
- Default value: `7d`

#### 14.5.2.23.3 `enable-file-dictionary-log`

- Enables the optimization to reduce I/O and mutex contention when TiKV manages the encryption metadata.
- To avoid possible compatibility issues when this configuration parameter is enabled (by default), see Encryption at Rest - Compatibility between TiKV versions for details.
- Default value: `true`

#### 14.5.2.23.4 `master-key`

- Specifies the master key if encryption is enabled. To learn how to configure a master key, see Encryption at Rest - Configure encryption.

#### 14.5.2.23.5 `previous-master-key`

- Specifies the old master key when rotating the new master key. The configuration format is the same as that of `master-key`. To learn how to configure a master key, see Encryption at Rest - Configure encryption.

### 14.5.2.24 import

Configuration items related to TiDB Lightning import and BR restore.

#### 14.5.2.24.1 `num-threads`

- The number of threads to process RPC requests
- Default value: `8`
- Minimum value: `1`

#### 14.5.2.24.2 `stream-channel-window`

- The window size of Stream channel. When the channel is full, the stream is blocked.
- Default value: `128`

#### 14.5.2.24.3 `memory-use-ratio` New in v6.5.0

- Starting from v6.5.0, PITR supports directly accessing backup log files in memory and restoring data. This configuration item specifies the ratio of memory available for PITR to the total memory of TiKV.
- Value range: [0.0, 0.5]
- Default value: `0.3`, which means that 30% of the system memory is available for PITR. When the value is `0.0`, PITR is performed through downloading log files to a local directory.

> **Note:**
>
> In versions earlier than v6.5.0, point-in-time recovery (PITR) only supports restoring data by downloading backup files to a local directory.

### 14.5.2.25 gc

#### 14.5.2.25.1 `batch-keys`

- The number of keys to be garbage-collected in one batch
- Default value: `512`

#### 14.5.2.25.2 `max-write-bytes-per-sec`

- The maximum bytes that GC worker can write to RocksDB in one second.
- If the value is set to `0`, there is no limit.
- Default value: `"0"`

#### 14.5.2.25.3 `enable-compaction-filter` New in v5.0

- Controls whether to enable the GC in Compaction Filter feature
- Default value: `true`

#### 14.5.2.25.4 `ratio-threshold`

- The garbage ratio threshold to trigger GC.
- Default value: `1.1`

#### 14.5.2.25.5 `num-threads` New in v6.5.8

- The number of GC threads when `enable-compaction-filter` is `false`.
- Default value: `1`

### 14.5.2.26 backup

Configuration items related to BR backup.

#### 14.5.2.26.1 `num-threads`

- The number of worker threads to process backup
- Default value: `MIN(CPU * 0.5, 8)`
- Value range: `[1, CPU]`
- Minimum value: `1`

#### 14.5.2.26.2 `batch-size`

- The number of data ranges to back up in one batch
- Default value: `8`

#### 14.5.2.26.3 `sst-max-size`

- The threshold of the backup SST file size. If the size of a backup file in a TiKV Region exceeds this threshold, the file is backed up to several files with the TiKV Region split into multiple Region ranges. Each of the files in the split Regions is the same size as `sst-max-size` (or slightly larger).
- For example, when the size of a backup file in the Region of `[a,e)` is larger than `sst-max-size`, the file is backed up to several files with regions `[a,b)`, `[b,c)`, `[c,d)` and `[d,e)`, and the size of `[a,b)`, `[b,c)`, `[c,d)` is the same as that of `sst-max-size` (or slightly larger).
- Default value: `"144MB"`

#### 14.5.2.26.4 `enable-auto-tune` New in v5.4.0

- Controls whether to limit the resources used by backup tasks to reduce the impact on the cluster when the cluster resource utilization is high. For more information, refer to BR Auto-Tune.
- Default value: `true`

#### 14.5.2.26.5 `s3-multi-part-size` New in v5.3.2

> **Note:**
>
> This configuration is introduced to address backup failures caused by S3 rate limiting. This problem has been fixed by refining the backup data storage structure. Therefore, this configuration is deprecated from v6.1.1 and is no longer recommended.

- The part size used when you perform multipart upload to S3 during backup. You can adjust the value of this configuration to control the number of requests sent to S3.
- If data is backed up to S3 and the backup file is larger than the value of this configuration item, multipart upload is automatically enabled. Based on the compression ratio, the backup file generated by a 96-MiB Region is approximately 10 MiB to 30 MiB.
- Default value: 5MiB

### 14.5.2.27 backup.hadoop

#### 14.5.2.27.1 `home`

- Specifies the location of the HDFS shell command and allows TiKV to find the shell command. This configuration item has the same effect as the environment variable `$HADOOP_HOME`.
- Default value: `""`

#### 14.5.2.27.2 `linux-user`

- Specifies the Linux user with which TiKV runs HDFS shell commands.
- If this configuration item is not set, TiKV uses the current linux user.
- Default value: `""`

### 14.5.2.28 log-backup

Configuration items related to log backup.

#### 14.5.2.28.1 `enable` New in v6.2.0

- Determines whether to enable log backup.
- Default value: `true`

#### 14.5.2.28.2 `file-size-limit` New in v6.2.0

- The size limit on backup log data to be stored.
- Default value: 256MiB
- Note: Generally, the value of `file-size-limit` is greater than the backup file size displayed in external storage. This is because the backup files are compressed before being uploaded to external storage.

#### 14.5.2.28.3 `initial-scan-pending-memory-quota` New in v6.2.0

- The quota of cache used for storing incremental scan data during log backup.
- Default value: `min(Total machine memory * 10%, 512 MB)`

#### 14.5.2.28.4 `initial-scan-rate-limit` New in v6.2.0

- The rate limit on throughput in an incremental data scan during log backup, which means the maximum amount of data that can be read from the disk per second. Note that if you only specify a number (for example, `60`), the unit is Byte instead of KiB.
- Default value: 60MiB

#### 14.5.2.28.5 `max-flush-interval` New in v6.2.0

- The maximum interval for writing backup data to external storage in log backup.
- Default value: 3min

#### 14.5.2.28.6 `num-threads` New in v6.2.0

- The number of threads used in log backup.
- Default value: CPU * 0.5
- Value range: [2, 12]

#### 14.5.2.28.7 `temp-path` New in v6.2.0

- The temporary path to which log files are written before being flushed to external storage.
- Default value: `${deploy-dir}/data/log-backup-temp`

### 14.5.2.29 cdc

Configuration items related to TiCDC.

#### 14.5.2.29.1 `min-ts-interval`

- The interval at which Resolved TS is calculated and forwarded.
- Default value: `"1s"`.

> **Note:**
>
> In v6.5.0, the default value of `min-ts-interval` is changed from `"1s"` to `"200ms"` to reduce CDC latency. Starting from v6.5.1, this default value is changed back to `"1s"` to reduce network traffic.

#### 14.5.2.29.2 `old-value-cache-memory-quota`

- The upper limit of memory usage by TiCDC old values.
- Default value: `512MB`

#### 14.5.2.29.3 `sink-memory-quota`

- The upper limit of memory usage by TiCDC data change events.
- Default value: `512MB`

#### 14.5.2.29.4 `incremental-scan-speed-limit`

- The maximum speed at which historical data is incrementally scanned.
- Default value: `"128MB"`, which means 128 MB per second.

#### 14.5.2.29.5 `incremental-scan-threads`

- The number of threads for the task of incrementally scanning historical data.
- Default value: `4`, which means 4 threads.

#### 14.5.2.29.6 `incremental-scan-concurrency`

- The maximum number of concurrent executions for the tasks of incrementally scanning historical data.
- Default value: `6`, which means 6 tasks can be concurrent executed at most.
- Note: The value of `incremental-scan-concurrency` must be greater than or equal to that of `incremental-scan-threads`; otherwise, TiKV will report an error at startup.

#### 14.5.2.30 resolved-ts

Configuration items related to maintaining the Resolved TS to serve Stale Read requests.

##### 14.5.2.30.1 `enable`

- Determines whether to maintain the Resolved TS for all Regions.
- Default value: `true`

##### 14.5.2.30.2 `advance-ts-interval`

- The interval at which Resolved TS is calculated and forwarded.
- Default value:
  - For TiDB v6.5.0, the default value is `"1s"`.
  - For TiDB v6.5.1 and later v6.5.x versions, the default value is `"20s"`.

##### 14.5.2.30.3 `scan-lock-pool-size`

- The number of threads that TiKV uses to scan the MVCC (multi-version concurrency control) lock data when initializing the Resolved TS.
- Default value: `2`, which means 2 threads.

#### 14.5.2.31 pessimistic-txn

For pessimistic transaction usage, refer to TiDB Pessimistic Transaction Mode.

##### 14.5.2.31.1 `wait-for-lock-timeout`

- The longest time that a pessimistic transaction in TiKV waits for other transactions to release the lock. If the time is out, an error is returned to TiDB, and TiDB retries to add a lock. The lock wait timeout is set by `innodb_lock_wait_timeout`.
- Default value: `"1s"`
- Minimum value: `"1ms"`

##### 14.5.2.31.2 `wake-up-delay-duration`

- When pessimistic transactions release the lock, among all the transactions waiting for lock, only the transaction with the smallest `start_ts` is woken up. Other transactions will be woken up after `wake-up-delay-duration`.
- Default value: `"20ms"`

#### 14.5.2.31.3 `pipelined`

- This configuration item enables the pipelined process of adding the pessimistic lock. With this feature enabled, after detecting that data can be locked, TiKV immediately notifies TiDB to execute the subsequent requests and write the pessimistic lock asynchronously, which reduces most of the latency and significantly improves the performance of pessimistic transactions. But there is a still low probability that the asynchronous write of the pessimistic lock fails, which might cause the failure of pessimistic transaction commits.
- Default value: `true`

#### 14.5.2.31.4 `in-memory` New in v6.0.0

- Enables the in-memory pessimistic lock feature. With this feature enabled, pessimistic transactions try to store their locks in memory, instead of writing the locks to disk or replicating the locks to other replicas. This improves the performance of pessimistic transactions. However, there is a still low probability that the pessimistic lock gets lost and causes the pessimistic transaction commits to fail.
- Default value: `true`
- Note that `in-memory` takes effect only when the value of `pipelined` is `true`.

### 14.5.2.32 quota

Configuration items related to Quota Limiter.

#### 14.5.2.32.1 `max-delay-duration` New in v6.0.0

- The maximum time that a single read or write request is forced to wait before it is processed in the foreground.
- Default value: `500ms`
- Recommended setting: It is recommended to use the default value in most cases. If out of memory (OOM) or violent performance jitter occurs in the instance, you can set the value to 1S to make the request waiting time shorter than 1 second.

#### 14.5.2.32.2 Foreground Quota Limiter

Configuration items related to foreground Quota Limiter.

Suppose that your machine on which TiKV is deployed has limited resources, for example, with only 4v CPU and 16 G memory. In this situation, the foreground of TiKV might process too many read and write requests so that the CPU resources used by the background are occupied to help process such requests, which affects the performance stability of TiKV. To avoid this situation, you can use the foreground quota-related configuration items to limit the CPU resources to be used by the foreground. When a request triggers Quota Limiter, the

request is forced to wait for a while for TiKV to free up CPU resources. The exact waiting time depends on the number of requests, and the maximum waiting time is no longer than the value of `max-delay-duration`.

`foreground-cpu-time` New in v6.0.0

- The soft limit on the CPU resources used by TiKV foreground to process read and write requests.
- Default value: `0` (which means no limit)
- Unit: millicpu (for example, `1500` means that the foreground requests consume 1.5v CPU)
- Recommended setting: For the instance with more than 4 cores, use the default value `0`. For the instance with 4 cores, setting the value to the range of `1000` and `1500` can make a balance. For the instance with 2 cores, keep the value smaller than `1200`.

`foreground-write-bandwidth` New in v6.0.0

- The soft limit on the bandwidth with which transactions write data.
- Default value: `0KB` (which means no limit)
- Recommended setting: Use the default value `0` in most cases unless the `foreground-cpu-time` setting is not enough to limit the write bandwidth. For such an exception, it is recommended to set the value smaller than `50MB` in the instance with 4 or less cores.

`foreground-read-bandwidth` New in v6.0.0

- The soft limit on the bandwidth with which transactions and the Coprocessor read data.
- Default value: `0KB` (which means no limit)
- Recommended setting: Use the default value `0` in most cases unless the `foreground-cpu-time` setting is not enough to limit the read bandwidth. For such an exception, it is recommended to set the value smaller than `20MB` in the instance with 4 or less cores.

#### 14.5.2.32.3 Background Quota Limiter

Configuration items related to background Quota Limiter.

Suppose that your machine on which TiKV is deployed has limited resources, for example, with only 4v CPU and 16 G memory. In this situation, the background of TiKV might process too many calculations and read and write requests, so that the CPU resources used by the foreground are occupied to help process such requests, which affects the performance stability of TiKV. To avoid this situation, you can use the background quota-related configuration items to limit the CPU resources to be used by the background. When a request triggers Quota Limiter, the request is forced to wait for a while for TiKV to free up CPU resources. The exact waiting time depends on the number of requests, and the maximum waiting time is no longer than the value of `max-delay-duration`.

**Warning:**

- Background Quota Limiter is an experimental feature introduced in TiDB v6.2.0, and it is **NOT** recommended to use it in the production environment.
- This feature is only suitable for environments with limited resources to ensure that TiKV can run stably in those environments. If you enable this feature in an environment with rich resources, performance degradation might occur when the amount of requests reaches a peak.

`background-cpu-time` New in v6.2.0

- The soft limit on the CPU resources used by TiKV background to process read and write requests.
- Default value: `0` (which means no limit)
- Unit: millicpu (for example, `1500` means that the background requests consume 1.5v CPU)

`background-write-bandwidth` New in v6.2.0

- The soft limit on the bandwidth with which background transactions write data.
- Default value: `0KB` (which means no limit)

`background-read-bandwidth` New in v6.2.0

- The soft limit on the bandwidth with which background transactions and the Coprocessor read data.
- Default value: `0KB` (which means no limit)

`enable-auto-tune` New in v6.2.0

- Determines whether to enable the auto-tuning of quota. If this configuration item is enabled, TiKV dynamically adjusts the quota for the background requests based on the load of TiKV instances.
- Default value: `false` (which means that the auto-tuning is disabled)

#### 14.5.2.33 causal-ts New in v6.1.0

Configuration items related to getting the timestamp when TiKV API V2 is enabled (`storage.api-version = 2`).

To reduce write latency, TiKV periodically fetches and caches a batch of timestamps locally. Cached timestamps help avoid frequent access to PD and allow short-term TSO service failure.

#### 14.5.2.33.1 `alloc-ahead-buffer` New in v6.4.0

- The pre-allocated TSO cache size (in duration).
- Indicates that TiKV pre-allocates the TSO cache based on the duration specified by this configuration item. TiKV estimates the TSO usage based on the previous period, and requests and caches TSOs satisfying `alloc-ahead-buffer` locally.
- This configuration item is often used to increase the tolerance of PD failures when TiKV API V2 is enabled (`storage.api-version = 2`).
- Increasing the value of this configuration item might result in more TSO consumption and memory overhead of TiKV. To obtain enough TSOs, it is recommended to decrease the `tso-update-physical-interval` configuration item of PD.
- According to the test, when `alloc-ahead-buffer` is in its default value, and the PD leader fails and switches to another node, the write request will experience a short-term increase in latency and a decrease in QPS (about 15%).
- To avoid the impact on the business, you can configure `tso-update-physical-interval = "1ms"` in PD and the following configuration items in TiKV:
  - `causal-ts.alloc-ahead-buffer = "6s"`
  - `causal-ts.renew-batch-max-size = 65536`
  - `causal-ts.renew-batch-min-size = 2048`
- Default value: `3s`

#### 14.5.2.33.2 `renew-interval`

- The interval at which the locally cached timestamps are updated.
- At an interval of `renew-interval`, TiKV starts a batch of timestamp refresh and adjusts the number of cached timestamps according to the timestamp consumption in the previous period and the setting of `alloc-ahead-buffer`. If you set this parameter to too large a value, the latest TiKV workload changes are not reflected in time. If you set this parameter to too small a value, the load of PD increases. If the write traffic is strongly fluctuating, if timestamps are frequently exhausted, and if write latency increases, you can set this parameter to a smaller value. At the same time, you should also consider the load of PD.
- Default value: `"100ms"`

#### 14.5.2.33.3 `renew-batch-min-size`

- The minimum number of TSOs in a timestamp request.
- TiKV adjusts the number of cached timestamps according to the timestamp consumption in the previous period. If only a few TSOs are required, TiKV reduces the TSOs requested until the number reaches `renew-batch-min-size`. If large bursty write traffic often occurs in your application, you can set this parameter to a larger value as appropriate. Note that this parameter is the cache size for a single tikv-server. If you set the parameter to too large a value and the cluster contains many tikv-servers, the TSO consumption will be too fast.

- In the **TiKV-RAW > Causal timestamp** panel in Grafana, **TSO batch size** is the number of locally cached timestamps that has been dynamically adjusted according to the application workload. You can refer to this metric to adjust `renew-batch-min-size`.
- Default value: `100`

#### 14.5.2.33.4 `renew-batch-max-size` New in v6.4.0

- The maximum number of TSOs in a timestamp request.
- In a default TSO physical time update interval (`50ms`), PD provides at most 262144 TSOs. When requested TSOs exceed this number, PD provides no more TSOs. This configuration item is used to avoid exhausting TSOs and the reverse impact of TSO exhaustion on other businesses. If you increase the value of this configuration item to improve high availability, you need to decrease the value of `tso-update-physical-interval` at the same time to get enough TSOs.
- Default value: `8192`

### 14.5.3 Configure TiFlash

This document introduces the configuration parameters related to the deployment and use of TiFlash.

#### 14.5.3.1 PD scheduling parameters

You can adjust the PD scheduling parameters using pd-ctl. Note that you can use `tiup ctl:v<CLUSTER_VERSION> pd` to replace `pd-ctl -u <pd_ip:pd_port>` when using tiup to deploy and manage your cluster.

- `replica-schedule-limit`: determines the rate at which the replica-related operator is generated. The parameter affects operations such as making nodes offline and add replicas.

> **Note:**
>
> The value of this parameter should be less than that of `region-schedule-limit`. Otherwise, the normal Region scheduling among TiKV nodes is affected.

- `store-balance-rate`: limits the rate at which Regions of each TiKV/TiFlash store are scheduled. Note that this parameter takes effect only when the stores have newly joined the cluster. If you want to change the setting for existing stores, use the following command.

> **Note:**
>
> Since v4.0.2, the `store-balance-rate` parameter has been deprecated and changes have been made to the `store limit` command. See store-limit for details.

```
- Execute the `pd-ctl -u <pd_ip:pd_port> store limit <store_id> <value>`
    ↪ command to set the scheduling rate of a specified store. (To get `
    ↪ store_id`, you can execute the `pd-ctl -u <pd_ip:pd_port> store`
    ↪ command.
- If you do not set the scheduling rate for Regions of a specified store,
    ↪ this store inherits the setting of `store-balance-rate`.
- You can execute the `pd-ctl -u <pd_ip:pd_port> store limit` command to
    ↪ view the current setting value of `store-balance-rate`.
```

- `replication.location-labels`: indicates the topological relationship of TiKV instances. The order of the keys indicates the layering relationship of different labels. If TiFlash is enabled, you need to use `pd-ctl config placement-rules` to set the default value. For details, see geo-distributed-deployment-topology.

#### 14.5.3.2 TiFlash configuration parameters

This section introduces the configuration parameters of TiFlash.

> **Tip:**
>
> If you need to adjust the value of a configuration item, refer to Modify the configuration.

##### 14.5.3.2.1 Configure the `tiflash.toml` file

```
#### The listening host for supporting services such as TPC/HTTP. It is
    ↪ recommended to configure it as "0.0.0.0", which means to listen on
    ↪ all IP addresses of this machine.
listen_host = "0.0.0.0"
#### The TiFlash TCP service port.
tcp_port = 9000
#### The TiFlash HTTP service port.
http_port = 8123
```

```
#### The cache size limit of the metadata of a data block. Generally, you do
    ↪  not need to change this value.
mark_cache_size = 5368709120
#### The cache size limit of the min-max index of a data block. Generally,
    ↪ you do not need to change this value.
minmax_index_cache_size = 5368709120
#### The cache size limit of the DeltaIndex. The default value is 0, which
    ↪ means no limit.
delta_index_cache_size = 0

#### The storage path of TiFlash data. If there are multiple directories,
    ↪ separate each directory with a comma.
#### path and path_realtime_mode are deprecated since v4.0.9. Use the
    ↪ configurations
#### in the [storage] section to get better performance in the multi-disk
    ↪ deployment scenarios
#### Since TiDB v5.2.0, if you need to use the storage.io_rate_limit
    ↪ configuration, you need to set the storage path of TiFlash data to
    ↪ storage.main.dir at the same time.
#### When the [storage] configurations exist, both path and
    ↪ path_realtime_mode configurations are ignored.
### path = "/tidb-data/tiflash-9000"
#### or
### path = "/ssd0/tidb-data/tiflash,/ssd1/tidb-data/tiflash,/ssd2/tidb-data/
    ↪ tiflash"
#### The default value is false. If you set it to true and multiple
    ↪ directories
#### are set in the path, the latest data is stored in the first directory
    ↪ and older
#### data is stored in the rest directories.
### path_realtime_mode = false

#### The path in which the TiFlash temporary files are stored. By default it
    ↪  is the first directory in path
#### or in storage.latest.dir appended with "/tmp".
### tmp_path = "/tidb-data/tiflash-9000/tmp"

#### Storage paths settings take effect starting from v4.0.9
[storage]

    ## DTFile format
    ## * format_version = 2, the default format for versions < v6.0.0.
    ## * format_version = 3, the default format for v6.0.0 and v6.1.x, which
       ↪  provides more data validation features.
    ## * format_version = 4, the default format for v6.2.0 and later
```

```
    ↪ versions, which reduces write amplification and background task
    ↪ resource consumption
# format_version = 4

[storage.main]
## The list of directories to store the main data. More than 90% of the
    ↪ total data is stored in
## the directory list.
dir = [ "/tidb-data/tiflash-9000" ]
## or
# dir = [ "/ssd0/tidb-data/tiflash", "/ssd1/tidb-data/tiflash" ]

## The maximum storage capacity of each directory in storage.main.dir.
## If it is not set, or is set to multiple 0, the actual disk (the disk
    ↪ where the directory is located) capacity is used.
## Note that human-readable numbers such as "10GB" are not supported yet
    ↪ .
## Numbers are specified in bytes.
## The size of the capacity list should be the same with the dir size.
## For example:
# capacity = [ 10737418240, 10737418240 ]

[storage.latest]
## The list of directories to store the latest data. About 10% of the
    ↪ total data is stored in
## the directory list. The directories (or directory) listed here
    ↪ require higher IOPS
## metrics than those in storage.main.dir.
## If it is not set (by default), the values of storage.main.dir are
    ↪ used.
# dir = [ ]
## The maximum storage capacity of each directory in storage.latest.dir.
## If it is not set, or is set to multiple 0, the actual disk (the disk
    ↪ where the directory is located) capacity is used.
# capacity = [ 10737418240, 10737418240 ]

## [storage.io_rate_limit] settings are new in v5.2.0.
[storage.io_rate_limit]
## This configuration item determines whether to limit the I/O traffic,
    ↪ which is disabled by default. This traffic limit in TiFlash is
    ↪ suitable for cloud storage that has the disk bandwidth of a small
    ↪ and specific size.
## The total I/O bandwidth for disk reads and writes. The unit is bytes
    ↪ and the default value is 0, which means the I/O traffic is not
    ↪ limited by default.
```

```
    # max_bytes_per_sec = 0
    ## max_read_bytes_per_sec and max_write_bytes_per_sec have similar
       ↪ meanings to max_bytes_per_sec. max_read_bytes_per_sec means the
       ↪ total I/O bandwidth for disk reads, and max_write_bytes_per_sec
       ↪ means the total I/O bandwidth for disk writes.
    ## These configuration items limit I/O bandwidth for disk reads and
       ↪ writes separately. You can use them for cloud storage that
       ↪ calculates the limit of I/O bandwidth for disk reads and writes
       ↪ separately, such as the Persistent Disk provided by Google Cloud
       ↪ Platform.
    ## When the value of max_bytes_per_sec is not 0, max_bytes_per_sec is
       ↪ prioritized.
    # max_read_bytes_per_sec = 0
    # max_write_bytes_per_sec = 0

    ## The following parameters control the bandwidth weights assigned to
       ↪ different I/O traffic types. Generally, you do not need to adjust
       ↪ these parameters.
    ## TiFlash internally divides I/O requests into four types: foreground
       ↪ writes, background writes, foreground reads, background reads.
    ## When the I/O traffic limit is initialized, TiFlash assigns the
       ↪ bandwidth according to the following weight ratio.
    ## The following default configurations indicate that each type of
       ↪ traffic gets a weight of 25% (25 / (25 + 25 + 25 + 25) = 25%).
    ## If the weight is configured to 0, the corresponding I/O traffic is
       ↪ not limited.
    # foreground_write_weight = 25
    # background_write_weight = 25
    # foreground_read_weight = 25
    # background_read_weight = 25
    ## TiFlash supports automatically tuning the traffic limit for different
       ↪  I/O types according to the current I/O load. Sometimes, the tuned
       ↪  bandwidth might exceed the weight ratio set above.
    ## auto_tune_sec indicates the interval of automatic tuning. The unit is
       ↪  seconds. If the value of auto_tune_sec is 0, the automatic tuning
       ↪  is disabled.
    # auto_tune_sec = 5

[flash]
    ## The listening address of TiFlash coprocessor services.
    service_addr = "0.0.0.0:3930"

#### Multiple TiFlash nodes elect a master to add or delete placement rules
    ↪ to PD,
#### and the configurations in flash.flash_cluster control this process.
```

```
[flash.flash_cluster]
    refresh_interval = Master regularly refreshes the valid period.
    update_rule_interval = Master regularly gets the status of TiFlash
        ↪ replicas and interacts with PD.
    master_ttl = The valid period of the elected master.
    cluster_manager_path = The absolute path of the pd buddy directory.
    log = The pd buddy log path.

[flash.proxy]
    ## The listening address of proxy. If it is left empty, 127.0.0.1:20170
        ↪ is used by default.
    addr = "127.0.0.1:20170"
    ## The external access address of addr. If it is left empty, "addr" is
        ↪ used by default.
    ## Should guarantee that other nodes can access through `advertise-addr`
        ↪  when you deploy the cluster on multiple nodes.
    advertise-addr = ""
    ## The listening address from which the proxy pulls metrics or status
        ↪ information. If it is left empty, 127.0.0.1:20292 is used by
        ↪ default.
    status-addr = "127.0.0.1:20292"
    ## The external access address of status-addr. If it is left empty, the
        ↪ value of "status-addr" is used by default.
    ## Should guarantee that other nodes can access through `advertise-
        ↪ status-addr` when you deploy the cluster on multiple nodes.
    advertise-status-addr = ""
    ## The data storage path of proxy.
    data-dir = "/tidb-data/tiflash-9000/flash"
    ## The configuration file path of proxy.
    config = "/tidb-deploy/tiflash-9000/conf/tiflash-learner.toml"
    ## The log path of proxy.
    log-file = "/tidb-deploy/tiflash-9000/log/tiflash_tikv.log"
    ## The log level of proxy (available options: "trace", "debug", "info",
        ↪ "warn", "error"). The default value is "info"
    # log-level = "info"

[logger]
    ## log level (available options: "trace", "debug", "info", "warn", "
        ↪ error"). Starting from v6.5.7, the default value changes from "
        ↪ debug" to "info".
    level = "info"
    log = "/tidb-deploy/tiflash-9000/log/tiflash.log"
    errorlog = "/tidb-deploy/tiflash-9000/log/tiflash_error.log"
    ## Size of a single log file. The default value is "100M".
    size = "100M"
```

```
    ## Maximum number of log files to save. The default value is 10.
    count = 10

[raft]
    ## PD service address. Multiple addresses are separated with commas.
    pd_addr = "10.0.1.11:2379,10.0.1.12:2379,10.0.1.13:2379"

[status]
    ## The port through which Prometheus pulls metrics information. The
       ↪ default value is 8234.
    metrics_port = 8234

[profiles]

[profiles.default]
    ## The default value is false. This parameter determines whether the
       ↪ segment
    ## of DeltaTree Storage Engine uses logical split.
    ## Using the logical split can reduce the write amplification.
    ## However, these are at the cost of disk space waste.
    ## It is strongly recommended to keep the default value `false` and
    ## not to change it to `true` in v6.2.0 and later versions. For details,
    ## see known issue [#5576](https://github.com/pingcap/tiflash/issues
       ↪ /5576).
    # dt_enable_logical_split = false

    ## The memory usage limit for the generated intermediate data when a
       ↪ single
    ## coprocessor query is executed. The default value is 0, which means no
       ↪  limit.
    max_memory_usage = 0

    ## The memory usage limit for the generated intermediate data when all
       ↪ queries
    ## are executed. The default value is 0 (in bytes), which means no limit
       ↪ .
    max_memory_usage_for_all_queries = 0

    ## New in v5.0. This item specifies the maximum number of cop requests
       ↪ that TiFlash Coprocessor executes at the same time. If the number
       ↪ of requests exceeds the specified value, the exceeded requests
       ↪ will queue. If the configuration value is set to 0 or not set, the
       ↪  default value is used, which is twice the number of physical
       ↪ cores.
    cop_pool_size = 0
```

```
## New in v5.0. This item specifies the maximum number of cop requests
    ↪ that TiFlash Coprocessor handles at the same time, including the
    ↪ requests being executed and the requests waiting in the queue. If
    ↪ the number of requests exceeds the specified value, the error "
    ↪ TiFlash Server is Busy" is returned. -1 indicates no limit; 0
    ↪ indicates using the default value, which is 10 * cop_pool_size.
cop_pool_handle_limit = 0

## New in v5.0. This item specifies the maximum time that a cop request
    ↪ can queue in TiFlash. If a cop request waits in the queue for a
    ↪ time longer than the value specified by this configuration, the
    ↪ error "TiFlash Server is Busy" is returned. A value less than or
    ↪ equal to 0 indicates no limit.
cop_pool_max_queued_seconds = 15

## New in v5.0. This item specifies the maximum number of batch requests
    ↪  that TiFlash Coprocessor executes at the same time. If the number
    ↪  of requests exceeds the specified value, the exceeded requests
    ↪ will queue. If the configuration value is set to 0 or not set, the
    ↪  default value is used, which is twice the number of physical
    ↪ cores.
batch_cop_pool_size = 0
## New in v6.1.0. This item specifies the number of requests that
    ↪ TiFlash can concurrently process when it receives ALTER TABLE ...
    ↪ COMPACT from TiDB.
## If the value is set to 0, the default value 1 prevails.
manual_compact_pool_size = 1
## New in v5.4.0. This item enables or disables the elastic thread pool
    ↪ feature, which significantly improves CPU utilization in high
    ↪ concurrency scenarios of TiFlash. The default value is true.
enable_elastic_threadpool = true
## Compression algorithm of the TiFlash storage engine. The value can be
    ↪  LZ4, zstd, or LZ4HC, and is case-insensitive. By default, LZ4 is
    ↪ used.
dt_compression_method = "LZ4"
## Compression level of the TiFlash storage engine. The default value is
    ↪  1.
## It is recommended that you set this value to 1 if
    ↪ dt_compression_method is LZ4.
## It is recommended that you set this value to -1 (smaller compression
    ↪ rate, but better read performance) or 1 if dt_compression_method
    ↪ is zstd.
## It is recommended that you set this value to 9 if
    ↪ dt_compression_method is LZ4HC.
```

```
    dt_compression_level = 1

    ## New in v6.2.0. This item specifies the minimum ratio of valid data in
        ↪  a PageStorage data file. When the ratio of valid data in a
        ↪ PageStorage data file is less than the value of this configuration
        ↪ , GC is triggered to compact data in the file. The default value
        ↪ is 0.5.
    dt_page_gc_threshold = 0.5

    ## New in v6.0.0. This item is used for the MinTSO scheduler. It
        ↪ specifies the maximum number of threads that one resource group
        ↪ can use. The default value is 5000. For details about the MinTSO
        ↪ scheduler, see https://docs.pingcap.com/tidb/v6.5/tiflash-mintso-
        ↪ scheduler.
    task_scheduler_thread_soft_limit = 5000

    ## New in v6.0.0. This item is used for the MinTSO scheduler. It
        ↪ specifies the maximum number of threads in the global scope. The
        ↪ default value is 10000. For details about the MinTSO scheduler,
        ↪ see https://docs.pingcap.com/tidb/v6.5/tiflash-mintso-scheduler.
    task_scheduler_thread_hard_limit = 10000

    ## New in v6.4.0. This item is used for the MinTSO scheduler. It
        ↪ specifies the maximum number of queries that can run
        ↪ simultaneously in a TiFlash instance. The default value is 0,
        ↪ which means twice the number of vCPUs. For details about the
        ↪ MinTSO scheduler, see https://docs.pingcap.com/tidb/v6.5/tiflash-
        ↪ mintso-scheduler.
    task_scheduler_active_set_soft_limit = 0

#### Security settings take effect starting from v4.0.5.
[security]
    ## New in v5.0. This configuration item enables or disables log
        ↪ redaction. If the configuration value
    ## is set to true, all user data in the log will be replaced by ?.
    ## Note that you also need to set security.redact-info-log for tiflash-
        ↪ learner's logging in tiflash-learner.toml.
    # redact_info_log = false

    ## Path of the file that contains a list of trusted SSL CAs. If set, the
        ↪  following settings
    ## cert_path and key_path are also needed.
    # ca_path = "/path/to/ca.pem"
    ## Path of the file that contains X509 certificate in PEM format.
    # cert_path = "/path/to/tiflash-server.pem"
```

```
    ## Path of the file that contains X509 key in PEM format.
    # key_path = "/path/to/tiflash-server-key.pem"
```

#### 14.5.3.2.2 Configure the `tiflash-learner.toml` file

```
[server]
    engine-addr = The external access address of the TiFlash coprocessor
        ↪ service.
[raftstore]
    ## The allowable number of threads in the pool that flushes Raft data to
        ↪  storage.
    apply-pool-size = 4

    ## The allowable number of threads that process Raft, which is the size
        ↪ of the Raftstore thread pool.
    store-pool-size = 4

    ## The number of threads that handle snapshots.
    ## The default number is 2.
    ## If you set it to 0, the multi-thread optimization is disabled.
    snap-handle-pool-size = 2

[security]
    ## New in v5.0. This configuration item enables or disables log
        ↪ redaction.
    ## If the configuration value is set to true,
    ## all user data in the log will be replaced by ?. The default value is
        ↪ false.
    redact-info-log = false

[security.encryption]
    ## The encryption method for data files.
    ## Value options: "aes128-ctr", "aes192-ctr", "aes256-ctr", "sm4-ctr" (
        ↪ supported since v6.4.0), and "plaintext".
    ## Default value: `"plaintext"`, which means encryption is disabled by
        ↪ default. A value other than "plaintext" means that encryption is
        ↪ enabled, in which case the master key must be specified.
    data-encryption-method = "aes128-ctr"
    ## Specifies how often the data encryption key is rotated. Default value
        ↪ : `7d`.
    data-key-rotation-period = "168h" # 7 days

[security.encryption.master-key]
    ## Specifies the master key if encryption is enabled. To learn how to
```

```
      ↪ configure a master key, see Configure encryption: https://docs.
      ↪ pingcap.com/tidb/dev/encryption-at-rest#configure-encryption .

[security.encryption.previous-master-key]
   ## Specifies the old master key when rotating the new master key. The
      ↪ configuration format is the same as that of `master-key`. To learn
      ↪  how to configure a master key, see Configure encryption: https://
      ↪ docs.pingcap.com/tidb/dev/encryption-at-rest#configure-encryption
      ↪ .
```

In addition to the items above, other parameters are the same as those of TiKV. Note that the `label` whose key is `engine` is reserved and cannot be configured manually.

#### 14.5.3.2.3 Schedule replicas by topology labels

See Set available zones.

#### 14.5.3.2.4 Multi-disk deployment

TiFlash supports multi-disk deployment. If there are multiple disks in your TiFlash node, you can make full use of those disks by configuring the parameters described in the following sections. For TiFlash's configuration template to be used for TiUP, see The complex template for the TiFlash topology.

Multi-disk deployment with TiDB version earlier than v4.0.9

For TiDB clusters earlier than v4.0.9, TiFlash only supports storing the main data of the storage engine on multiple disks. You can set up a TiFlash node on multiple disks by specifying the `path` (`data_dir` in TiUP) and `path_realtime_mode` configuration.

If there are multiple data storage directories in `path`, separate each with a comma. For example, `/nvme_ssd_a/data/tiflash,/sata_ssd_b/data/tiflash,/sata_ssd_c/data/tiflash`. If there are multiple disks in your environment, it is recommended that each directory corresponds to one disk and you put disks with the best performance at the front to maximize the performance of all disks.

If there are multiple disks with similar I/O metrics on your TiFlash node, you can leave the `path_realtime_mode` parameter to the default value (or you can explicitly set it to `false`). It means that data will be evenly distributed among all storage directories. However, the latest data is written only to the first directory, so the corresponding disk is busier than other disks.

If there are multiple disks with different I/O metrics on your TiFlash node, it is recommended to set `path_realtime_mode` to `true` and put disks with the best I/O metrics at the front of `path`. It means that the first directory only stores the latest data, and the older data are evenly distributed among the other directories. Note that in this case, the capacity of the first directory should be planned as 10% of the total capacity of all directories.

Multi-disk deployment with TiDB v4.0.9 or later

For TiDB clusters with v4.0.9 or later versions, TiFlash supports storing the main data and the latest data of the storage engine on multiple disks. If you want to deploy a TiFlash node on multiple disks, it is recommended to specify your storage directories in the `[storage ↪ ]` section to make full use of your node. Note that the configurations earlier than v4.0.9 (`path` and `path_realtime_mode`) are still supported.

If there are multiple disks with similar I/O metrics on your TiFlash node, it is recommended to specify corresponding directories in the `storage.main.dir` list and leave `storage ↪ .latest.dir` empty. TiFlash will distribute I/O pressure and data among all directories.

If there are multiple disks with different I/O metrics on your TiFlash node, it is recommended to specify directories with higher metrics in the `storage.latest.dir` list, and specify directories with lower metrics in the `storage.main.dir` list. For example, for one NVMe-SSD and two SATA-SSDs, you can set `storage.latest.dir` to `["/nvme_ssd_a/data/ ↪ tiflash"]` and `storage.main.dir` to `["/sata_ssd_b/data/tiflash", "/sata_ssd_c ↪ /data/tiflash"]`. TiFlash will distribute I/O pressure and data among these two directories list respectively. Note that in this case, the capacity of `storage.latest.dir` should be planned as 10% of the total planned capacity.

> **Warning:**
>
> The `[storage]` configuration is supported in TiUP since v1.2.5. If your TiDB cluster version is v4.0.9 or later, make sure that your TiUP version is v1.2.5 or later. Otherwise, the data directories defined in `[storage]` will not be managed by TiUP.

### 14.5.4 PD Configuration File

The PD configuration file supports more options than command-line parameters. You can find the default configuration file here.

This document only describes parameters that are not included in command-line parameters. Check here for the command line parameters.

> **Tip:**
>
> If you need to adjust the value of a configuration item, refer to Modify the configuration.

#### 14.5.4.0.1 `name`

- The unique name of a PD node
- Default value: `"pd"`
- To start multiply PD nodes, use a unique name for each node.

#### 14.5.4.0.2 `data-dir`

- The directory in which PD stores data
- Default value: `default.${name}"`

#### 14.5.4.0.3 `client-urls`

- The list of client URLs to be listened to by PD
- Default value: `"http://127.0.0.1:2379"`
- When you deploy a cluster, you must specify the IP address of the current host as `client-urls` (for example, `"http://192.168.100.113:2379"`). If the cluster runs on Docker, specify the IP address of Docker as `"http://0.0.0.0:2379"`.

#### 14.5.4.0.4 `advertise-client-urls`

- The list of advertise URLs for the client to access PD
- Default value: `"${client-urls}"`
- In some situations such as in the Docker or NAT network environment, if a client cannot access PD through the default client URLs listened to by PD, you must manually set the advertise client URLs.
- For example, the internal IP address of Docker is `172.17.0.1`, while the IP address of the host is `192.168.100.113` and the port mapping is set to `-p 2380:2380`. In this case, you can set `advertise-client-urls` to `"http://192.168.100.113:2380"`. The client can find this service through `"http://192.168.100.113:2380"`.

#### 14.5.4.0.5 `peer-urls`

- The list of peer URLs to be listened to by a PD node
- Default value: `"http://127.0.0.1:2380"`
- When you deploy a cluster, you must specify `peer-urls` as the IP address of the current host, such as `"http://192.168.100.113:2380"`. If the cluster runs on Docker, specify the IP address of Docker as `"http://0.0.0.0:2380"`.

#### 14.5.4.0.6 `advertise-peer-urls`

- The list of advertise URLs for other PD nodes (peers) to access a PD node
- Default: `"${peer-urls}"`

- In some situations such as in the Docker or NAT network environment, if the other nodes (peers) cannot access the PD node through the default peer URLs listened to by this PD node, you must manually set the advertise peer URLs.
- For example, the internal IP address of Docker is `172.17.0.1`, while the IP address of the host is `192.168.100.113` and the port mapping is set to `-p 2380:2380`. In this case, you can set `advertise-peer-urls` to `"http://192.168.100.113:2380"`. The other PD nodes can find this service through `"http://192.168.100.113:2380"`.

#### 14.5.4.0.7 `initial-cluster`

- The initial cluster configuration for bootstrapping
- Default value: `"{name}=http://{advertise-peer-url}"`
- For example, if `name` is "pd", and `advertise-peer-urls` is `"http://192.168.100.113:2380"` ↪ , the `initial-cluster` is `"pd=http://192.168.100.113:2380"`.
- If you need to start three PD servers, the `initial-cluster` might be:

```
pd1=http://192.168.100.113:2380, pd2=http://192.168.100.114:2380, pd3
    ↪ =192.168.100.115:2380
```

#### 14.5.4.0.8 `initial-cluster-state`

- The initial state of the cluster
- Default value: `"new"`

#### 14.5.4.0.9 `initial-cluster-token`

- Identifies different clusters during the bootstrap phase
- Default value: `"pd-cluster"`
- If multiple clusters that have nodes with same configurations are deployed successively, you must specify different tokens to isolate different cluster nodes.

#### 14.5.4.0.10 `lease`

- The timeout of the PD Leader Key lease. After the timeout, the system re-elects a Leader.
- Default value: `3`
- Unit: second

#### 14.5.4.0.11 `quota-backend-bytes`

- The storage size of the meta-information database, which is 8GiB by default
- Default value: `8589934592`

#### 14.5.4.0.12 `auto-compaction-mod`

- The automatic compaction modes of the meta-information database
- Available options: `periodic` (by cycle) and `revision` (by version number).
- Default value: `periodic`

#### 14.5.4.0.13 `auto-compaction-retention`

- The time interval for automatic compaction of the meta-information database when `auto-compaction-retention` is `periodic`. When the compaction mode is set to `revision`, this parameter indicates the version number for the automatic compaction.
- Default value: 1h

#### 14.5.4.0.14 `force-new-cluster`

- Determines whether to force PD to start as a new cluster and modify the number of Raft members to `1`
- Default value: `false`

#### 14.5.4.0.15 `tso-update-physical-interval`

- The interval at which PD updates the physical time of TSO.
- In a default update interval of TSO physical time, PD provides at most 262144 TSOs. To get more TSOs, you can reduce the value of this configuration item. The minimum value is `1ms`.
- Decreasing this configuration item might increase the CPU usage of PD. According to the test, compared with the interval of `50ms`, the CPU usage of PD will increase by about 10% when the interval is `1ms`.
- Default value: `50ms`
- Minimum value: `1ms`

### 14.5.4.1 pd-server

Configuration items related to pd-server

#### 14.5.4.1.1 `flow-round-by-digit` New in TiDB 5.1

- Default value: 3
- PD rounds the lowest digits of the flow number, which reduces the update of statistics caused by the changes of the Region flow information. This configuration item is used to specify the number of lowest digits to round for the Region flow information. For example, the flow `100512` will be rounded to `101000` because the default value is `3`. This configuration replaces `trace-region-flow`.

**Note:**

If you have upgraded your cluster from a TiDB 4.0 version to the current version, the behavior of `flow-round-by-digit` after the upgrading and the behavior of `trace-region-flow` before the upgrading are consistent by default. This means that if the value of `trace-region-flow` is false before the upgrading, the value of `flow-round-by-digit` after the upgrading is 127; if the value of `trace-region-flow` is `true` before the upgrading, the value of `flow-round-by-digit` after the upgrading is `3`.

#### 14.5.4.1.2 `min-resolved-ts-persistence-interval` New in v6.0.0

- Determines the interval at which the minimum resolved timestamp is persistent to the PD. If this value is set to `0`, it means that the persistence is disabled.
- Default value: Before v6.3.0, the default value is `"0s"`. Starting from v6.3.0, the default value is `"1s"`, which is the smallest positive value.
- Minimum value: `0`
- Unit: second

**Note:**

For clusters upgraded from v6.0.0~v6.2.0, the default value of `min-resolved-ts-persistence-interval` does not change after the upgrade, which means that it will remain `"0s"`. To enable this feature, you need to manually change the value of this configuration item.

### 14.5.4.2 security

Configuration items related to security

#### 14.5.4.2.1 `cacert-path`

- The path of the CA file
- Default value: “”

#### 14.5.4.2.2 `cert-path`

- The path of the Privacy Enhanced Mail (PEM) file that contains the X509 certificate
- Default value: “”

#### 14.5.4.2.3 `key-path`

- The path of the PEM file that contains the X509 key
- Default value: “”

#### 14.5.4.2.4 `redact-info-log` New in v5.0

- Controls whether to enable log redaction in the PD log
- When you set the configuration value to `true`, user data is redacted in the PD log.
- Default value: `false`

### 14.5.4.3 `log`

Configuration items related to log

#### 14.5.4.3.1 `level`

- Specifies the level of the output log
- Optional value: `"debug"`, `"info"`, `"warn"`, `"error"`, `"fatal"`
- Default value: `"info"`

#### 14.5.4.3.2 `format`

- The log format
- Optional value: `"text"`, `"json"`
- Default value: `"text"`

#### 14.5.4.3.3 `disable-timestamp`

- Whether to disable the automatically generated timestamp in the log
- Default value: `false`

### 14.5.4.4 `log.file`

Configuration items related to the log file

#### 14.5.4.4.1 `max-size`

- The maximum size of a single log file. When this value is exceeded, the system automatically splits the log into several files.
- Default value: `300`
- Unit: MiB
- Minimum value: `1`

#### 14.5.4.4.2 `max-days`

- The maximum number of days in which a log is kept
- If the configuration item is not set, or the value of it is set to the default value 0, PD does not clean log files.
- Default value: `0`

#### 14.5.4.4.3 `max-backups`

- The maximum number of log files to keep
- If the configuration item is not set, or the value of it is set to the default value 0, PD keeps all log files.
- Default value: `0`

### 14.5.4.5 `metric`

Configuration items related to monitoring

#### 14.5.4.5.1 `interval`

- The interval at which monitoring metric data is pushed to Prometheus
- Default value: `15s`

### 14.5.4.6 `schedule`

Configuration items related to scheduling

> **Note:**
>
> To modify these PD configuration items related to `schedule`, choose one of the following methods based on your cluster status:
>
> - For clusters to be newly deployed, you can modify the PD configuration file directly.
> - For existing clusters, use the command-line tool PD Control to make changes instead. Direct modifications to these PD configuration items related to `schedule` in the configuration file do not take effect on existing clusters.

#### 14.5.4.6.1 `max-merge-region-size`

- Controls the size limit of `Region Merge`. When the Region size is greater than the specified value, PD does not merge the Region with the adjacent Regions.
- Default value: `20`
- Unit: MiB

#### 14.5.4.6.2 `max-merge-region-keys`

- Specifies the upper limit of the `Region Merge` key. When the Region key is greater than the specified value, the PD does not merge the Region with its adjacent Regions.
- Default value: `200000`

#### 14.5.4.6.3 `patrol-region-interval`

- Controls the running frequency at which `replicaChecker` checks the health state of a Region. The smaller this value is, the faster `replicaChecker` runs. Normally, you do not need to adjust this parameter.
- Default value: `10ms`

#### 14.5.4.6.4 `split-merge-interval`

- Controls the time interval between the `split` and `merge` operations on the same Region. That means a newly split Region will not be merged for a while.
- Default value: `1h`

#### 14.5.4.6.5 `max-snapshot-count`

- Controls the maximum number of snapshots that a single store receives or sends at the same time. PD schedulers depend on this configuration to prevent the resources used for normal traffic from being preempted.
- Default value value: `64`

#### 14.5.4.6.6 `max-pending-peer-count`

- Controls the maximum number of pending peers in a single store. PD schedulers depend on this configuration to prevent too many Regions with outdated logs from being generated on some nodes.
- Default value: `64`

#### 14.5.4.6.7 `max-store-down-time`

- The downtime after which PD judges that the disconnected store cannot be recovered. When PD fails to receive the heartbeat from a store after the specified period of time, it adds replicas at other nodes.
- Default value: `30m`

#### 14.5.4.6.8 `max-store-preparing-time` New in v6.1.0

- Controls the maximum waiting time for the store to go online. During the online stage of a store, PD can query the online progress of the store. When the specified time is exceeded, PD assumes that the store has been online and cannot query the online progress of the store again. But this does not prevent Regions from transferring to the new online store. In most scenarios, you do not need to adjust this parameter.
- Default value: `48h`

#### 14.5.4.6.9 `leader-schedule-limit`

- The number of Leader scheduling tasks performed at the same time
- Default value: `4`

#### 14.5.4.6.10 `region-schedule-limit`

- The number of Region scheduling tasks performed at the same time
- Default value: `2048`

#### 14.5.4.6.11 `enable-diagnostic` New in v6.3.0

- Controls whether to enable the diagnostic feature. When it is enabled, PD records the state during scheduling to help diagnose. If enabled, it might slightly affect the scheduling speed and consume more memory when there are many stores.
- Default value: false

#### 14.5.4.6.12 `hot-region-schedule-limit`

- Controls the hot Region scheduling tasks that are running at the same time. It is independent of the Region scheduling.
- Default value: `4`

#### 14.5.4.6.13 `hot-region-cache-hits-threshold`

- The threshold used to set the number of minutes required to identify a hot Region. PD can participate in the hotspot scheduling only after the Region is in the hotspot state for more than this number of minutes.
- Default value: `3`

#### 14.5.4.6.14 `replica-schedule-limit`

- The number of Replica scheduling tasks performed at the same time
- Default value: `64`

#### 14.5.4.6.15 `merge-schedule-limit`

- The number of the `Region Merge` scheduling tasks performed at the same time. Set this parameter to `0` to disable `Region Merge`.
- Default value: `8`

#### 14.5.4.6.16 `high-space-ratio`

- The threshold ratio below which the capacity of the store is sufficient. If the space occupancy ratio of the store is smaller than this threshold value, PD ignores the remaining space of the store when performing scheduling, and balances load mainly based on the Region size. This configuration takes effect only when `region-score-formula-version` is set to `v1`.
- Default value: `0.7`
- Minimum value: greater than `0`
- Maximum value: less than `1`

#### 14.5.4.6.17 `low-space-ratio`

- The threshold ratio above which the capacity of the store is insufficient. If the space occupancy ratio of a store exceeds this threshold value, PD avoids migrating data to this store as much as possible. Meanwhile, to avoid the disk space of the corresponding store being exhausted, PD performs scheduling mainly based on the remaining space of the store.
- Default value: `0.8`
- Minimum value: greater than `0`
- Maximum value: less than `1`

#### 14.5.4.6.18 `tolerant-size-ratio`

- Controls the `balance` buffer size
- Default value: `0` (automatically adjusts the buffer size)
- Minimum value: `0`

#### 14.5.4.6.19 `enable-cross-table-merge`

- Determines whether to enable the merging of cross-table Regions
- Default value: `true`

#### 14.5.4.6.20 `region-score-formula-version` New in v5.0

- Controls the version of the Region score formula
- Default value: `v2`
- Optional values: `v1` and `v2`. Compared to v1, the changes in v2 are smoother, and the scheduling jitter caused by space reclaim is improved.

> **Note:**
>
> If you have upgraded your cluster from a TiDB 4.0 version to the current version, the new formula version is automatically disabled by default to ensure consistent PD behavior before and after the upgrading. If you want to change the formula version, you need to manually switch through the `pd-ctl` setting. For details, refer to PD Control.

#### 14.5.4.6.21 `enable-joint-consensus` New in v5.0

- Controls whether to use Joint Consensus for replica scheduling. If this configuration is disabled, PD schedules one replica at a time.
- Default value: `true`

#### 14.5.4.6.22 `hot-regions-write-interval` New in v5.4.0

- The time interval at which PD stores hot Region information.
- Default value: `10m`

> **Note:**
>
> The information about hot Regions is updated every three minutes. If the interval is set to less than three minutes, updates during the interval might be meaningless.

#### 14.5.4.6.23 `hot-regions-reserved-days` New in v5.4.0

- Specifies how many days the hot Region information is retained.
- Default value: `7`

### 14.5.4.7 `replication`

Configuration items related to replicas

#### 14.5.4.7.1 `max-replicas`

- The number of replicas, that is, the sum of the number of leaders and followers. The default value `3` means 1 leader and 2 followers. When this configuration is modified dynamically, PD will schedule Regions in the background so that the number of replicas matches this configuration.
- Default value: `3`

#### 14.5.4.7.2 `location-labels`

- The topology information of a TiKV cluster
- Default value: `[]`
- Cluster topology configuration

#### 14.5.4.7.3 `isolation-level`

- The minimum topological isolation level of a TiKV cluster
- Default value: `""`
- Cluster topology configuration

#### 14.5.4.7.4 `strictly-match-label`

- Enables the strict check for whether the TiKV label matches PD's `location-labels`.
- Default value: `false`

#### 14.5.4.7.5 `enable-placement-rules`

- Enables `placement-rules`.
- Default value: `true`
- See Placement Rules.

### 14.5.4.8 `label-property` (deprecated)

Configuration items related to labels, which only support the `reject-leader` type.

> **Note:**
>
> Starting from v5.2, the configuration items related to labels are deprecated. It is recommended to use Placement Rules to configure the replica policy.

#### 14.5.4.8.1 `key` (deprecated)

- The label key for the store that rejected the Leader
- Default value: `""`

#### 14.5.4.8.2 `value` (deprecated)

- The label value for the store that rejected the Leader
- Default value: `""`

### 14.5.4.9 `dashboard`

Configuration items related to the TiDB Dashboard built in PD.

#### 14.5.4.9.1 `tidb-cacert-path`

- The path of the root CA certificate file. You can configure this path when you connect to TiDB's SQL services using TLS.
- Default value: `""`

#### 14.5.4.9.2 `tidb-cert-path`

- The path of the SSL certificate file. You can configure this path when you connect to TiDB's SQL services using TLS.
- Default value: `""`

#### 14.5.4.9.3 `tidb-key-path`

- The path of the SSL private key file. You can configure this path when you connect to TiDB's SQL services using TLS.
- Default value: `""`

#### 14.5.4.9.4 `public-path-prefix`

- When TiDB Dashboard is accessed behind a reverse proxy, this item sets the public URL path prefix for all web resources.
- Default value: `/dashboard`
- Do **not** modify this configuration item when TiDB Dashboard is accessed not behind a reverse proxy; otherwise, access issues might occur. See Use TiDB Dashboard behind a Reverse Proxy for details.

#### 14.5.4.9.5 `enable-telemetry`

- Determines whether to enable the telemetry collection feature in TiDB Dashboard.
- Default value: `true` for v6.5.0; `false` for v6.5.1 and later v6.5.x versions
- See Telemetry for details.

### 14.5.4.10 `replication-mode`

Configuration items related to the replication mode of all Regions. See Enable the DR Auto-Sync mode for details.

## 14.6 CLI

### 14.6.1 TiKV Control User Guide

TiKV Control (`tikv-ctl`) is a command line tool of TiKV, used to manage the cluster. Its installation directory is as follows:

- If the cluster is deployed using TiUP, `tikv-ctl` directory is in the in `~/.tiup/components/ctl/{VERSION}/` directory.

#### 14.6.1.1 Use TiKV Control in TiUP

> **Note:**
>
> It is recommended that the version of the Control tool you use is consistent with the version of the cluster.

`tikv-ctl` is also integrated in the `tiup` command. Execute the following command to call the `tikv-ctl` tool:

```
tiup ctl:v<CLUSTER_VERSION> tikv
```

```
Starting component `ctl`: /home/tidb/.tiup/components/ctl/v4.0.8/ctl tikv
TiKV Control (tikv-ctl)
Release Version: 4.0.8
Edition:         Community
Git Commit Hash: 83091173e960e5a0f5f417e921a0801d2f6635ae
Git Commit Branch: heads/refs/tags/v4.0.8
UTC Build Time:  2020-10-30 08:40:33
Rust Version:    rustc 1.42.0-nightly (0de96d37f 2019-12-19)
Enable Features: jemalloc mem-profiling portable sse protobuf-codec
Profile:         dist_release

A tool for interacting with TiKV deployments.
USAGE:
    TiKV Control (tikv-ctl) [FLAGS] [OPTIONS] [SUBCOMMAND]
FLAGS:
    -h, --help                 Prints help information
        --skip-paranoid-checks Skip paranoid checks when open rocksdb
    -V, --version              Prints version information
OPTIONS:
        --ca-path <ca-path>          Set the CA certificate path
        --cert-path <cert-path>      Set the certificate path
        --config <config>            TiKV config path, by default it's <
            ↪ deploy-dir>/conf/tikv.toml
        --data-dir <data-dir>        TiKV data directory path, check <deploy-
            ↪ dir>/scripts/run.sh to get it
        --decode <decode>            Decode a key in escaped format
        --encode <encode>            Encode a key in escaped format
        --to-hex <escaped-to-hex>    Convert an escaped key to hex key
        --to-escaped <hex-to-escaped> Convert a hex key to escaped key
        --host <host>                Set the remote host
        --key-path <key-path>        Set the private key path
        --log-level <log-level>      Set the log level [default: warn]
        --pd <pd>                    Set the address of pd
SUBCOMMANDS:
    bad-regions        Get all regions with corrupt raft
    cluster            Print the cluster id
    compact            Compact a column family in a specified range
    compact-cluster    Compact the whole cluster in a specified range in one
        ↪  or more column families
    consistency-check  Force a consistency-check for a specified region
```

```
decrypt-file       Decrypt an encrypted file
diff               Calculate difference of region keys from different
    ↪ dbs
dump-snap-meta     Dump snapshot meta file
encryption-meta    Dump encryption metadata
fail               Inject failures to TiKV and recovery
help               Prints this message or the help of the given
    ↪ subcommand(s)
metrics            Print the metrics
modify-tikv-config Modify tikv config, eg. tikv-ctl --host ip:port
    ↪ modify-tikv-config -n
                   rocksdb.defaultcf.disable-auto-compactions -v true
mvcc               Print the mvcc value
print              Print the raw value
raft               Print a raft log entry
raw-scan           Print all raw keys in the range
recover-mvcc       Recover mvcc data on one node by deleting corrupted
    ↪ keys
recreate-region    Recreate a region with given metadata, but alloc new
    ↪ id for it
region-properties  Show region properties
scan               Print the range db range
size               Print region size
split-region       Split the region
store              Print the store id
tombstone          Set some regions on the node to tombstone by manual
unsafe-recover     Unsafely recover the cluster when the majority
    ↪ replicas are failed
```

You can add corresponding parameters and subcommands after `tiup ctl:v<
↪ CLUSTER_VERSION> tikv`.

#### 14.6.1.2 General options

`tikv-ctl` provides two operation modes:

- Remote mode: use the `--host` option to accept the service address of TiKV as the argument

  For this mode, if SSL is enabled in TiKV, `tikv-ctl` also needs to specify the related certificate file. For example:

  ```
  tikv-ctl --ca-path ca.pem --cert-path client.pem --key-path client-key.
      ↪ pem --host 127.0.0.1:20160 <subcommands>
  ```

  However, sometimes `tikv-ctl` communicates with PD instead of TiKV. In this case, you need to use the `--pd` option instead of `--host`. Here is an example:

```
tikv-ctl --pd 127.0.0.1:2379 compact-cluster
```

```
store:"127.0.0.1:20160" compact db:KV cf:default range:([], []) success
    ↪ !
```

- Local mode:
  - Use the `--data-dir` option to specify the local TiKV data directory path.
  - Use the `--config` option to specify the local TiKV configuration file path.

In this mode, you need to stop the running TiKV instance.

Unless otherwise noted, all commands support both the remote mode and the local mode.

Additionally, `tikv-ctl` has two simple commands `--to-hex` and `--to-escaped`, which are used to make simple changes to the form of the key.

Generally, use the `escaped` form of the key. For example:

```
tikv-ctl --to-escaped 0xaaff
\252\377
tikv-ctl --to-hex "\252\377"
AAFF
```

> **Note:**
>
> When you specify the `escaped` form of the key in a command line, it is required to enclose it in double quotes. Otherwise, bash eats the backslash and a wrong result is returned.

#### 14.6.1.3 Subcommands, some options and flags

This section describes the subcommands that `tikv-ctl` supports in detail. Some subcommands support a lot of options. For all details, run `tikv-ctl --help <subcommand>`.

##### 14.6.1.3.1 View information of the Raft state machine

Use the `raft` subcommand to view the status of the Raft state machine at a specific moment. The status information includes two parts: three structs (**RegionLocalState**, **RaftLocalState**, and **RegionApplyState**) and the corresponding Entries of a certain piece of log.

Use the `region` and `log` subcommands to obtain the above information respectively. The two subcommands both support the remote mode and the local mode at the same time.

For the `region` subcommand:

- To specify the Regions to be viewed, use the `-r` option. Multiple Regions are separated by `,`. You can also use the `--all-regions` option to view all Regions. Note that `-r` and `--all-regions` cannot be used at the same time.
- To limit the number of Regions to be printed, use the `--limit` option (default: `16`).
- To query which Regions are included in a certain key range, use the `--start` and `--end` options (default: no range limit, in Hex format).

For example, to print the Region with the ID `1239`, use the following command:

```
tikv-ctl --host 127.0.0.1:20160 raft region -r 1239
```

The output is as follows:

```
"region id": 1239
"region state": {
    id: 1239,
    start_key: 7480000000000000FF4E5F728000000000FF1443770000000000FA,
    end_key: 7480000000000000FF4E5F728000000000FF21C4420000000000FA,
    region_epoch: {conf_ver: 1 version: 43},
    peers: [ {id: 1240 store_id: 1 role: Voter} ]
}
"raft state": {
    hard_state {term: 8 vote: 5 commit: 7}
    last_index: 8)
}
"apply state": {
    applied_index: 8 commit_index: 8 commit_term: 8
    truncated_state {index: 5 term: 5}
}
```

To query which Regions are included in a certain key range, use the following command:

- If the key range is in a Region range, the Region information is output.
- If the key range is the same as a Region range, for example, when the given key range is the same as the Region `1239`, because the Region range is a left-closed and right-open interval, and Region `1009` takes the `end_key` of Region `1239` as the `start_key`, the Region `1009` information is also output.

```
tikv-ctl --host 127.0.0.1:20160 raft region --start 7480000000000000
    ↪ FF4E5F728000000000FF1443770000000000FA --end 7480000000000000
    ↪ FF4E5F728000000000FF21C4420000000000FA
```

The output is as follows:

```
"region state": {
    id: 1009
    start_key: 7480000000000000FF4E5F728000000000FF21C4420000000000FA,
    end_key: 7480000000000000FF5000000000000000F8,
    ...
}
"region state": {
    id: 1239
    start_key: 7480000000000000FF4E5F728000000000FF06C6D60000000000FA,
    end_key: 7480000000000000FF4E5F728000000000FF1443770000000000FA,
    ...
}
```

#### 14.6.1.3.2 View the Region size

Use the `size` command to view the Region size:

```
tikv-ctl --data-dir /path/to/tikv size -r 2
```

The output is as follows:

```
region id: 2
cf default region size: 799.703 MB
cf write region size: 41.250 MB
cf lock region size: 27616
```

#### 14.6.1.3.3 Scan to view MVCC of a specific range

The `--from` and `--to` options of the `scan` command accept two escaped forms of raw key, and use the `--show-cf` flag to specify the column families that you need to view.

```
tikv-ctl --data-dir /path/to/tikv scan --from 'zm' --limit 2 --show-cf lock,
    ↪ default,write
```

```
key: zmBootstr\377a\377pKey
    ↪ \000\000\377\000\000\373\000\000\000\000\000\377\000\000s
    ↪ \000\000\000\000\000\372
        write cf value: start_ts: 399650102814441473 commit_ts:
            ↪ 399650102814441475 short_value: "20"
key: zmDB:29\000\000\377\000\374\000\000\000\000\000\000\377\000H
    ↪ \000\000\000\000\000\000\371
        write cf value: start_ts: 399650105239273474 commit_ts:
            ↪ 399650105239273475 short_value:
            ↪ "\000\000\000\000\000\000\000\002"
```

```
        write cf value: start_ts: 399650105199951882 commit_ts:
           ↪ 399650105213059076 short_value:
           ↪ "\000\000\000\000\000\000\000\001"
```

#### 14.6.1.3.4 View MVCC of a given key

Similar to the `scan` command, the `mvcc` command can be used to view MVCC of a given key.

```
tikv-ctl --data-dir /path/to/tikv mvcc -k "zmDB
   ↪ :29\000\000\377\000\374\000\000\000\000\000\000\377\000H
   ↪ \000\000\000\000\000\000\371" --show-cf=lock,write,default
```

```
key: zmDB:29\000\000\377\000\374\000\000\000\000\000\000\377\000H
   ↪ \000\000\000\000\000\000\371
        write cf value: start_ts: 399650105239273474 commit_ts:
           ↪ 399650105239273475 short_value:
           ↪ "\000\000\000\000\000\000\000\002"
        write cf value: start_ts: 399650105199951882 commit_ts:
           ↪ 399650105213059076 short_value:
           ↪ "\000\000\000\000\000\000\000\001"
```

In this command, the key is also the escaped form of raw key.

#### 14.6.1.3.5 Scan raw keys

The `raw-scan` command scans directly from the RocksDB. Note that to scan data keys you need to add a `'z'` prefix to keys.

Use `--from` and `--to` options to specify the range to scan (unbounded by default). Use `--limit` to limit at most how many keys to print out (30 by default). Use `--cf` to specify which cf to scan (can be `default`, `write` or `lock`).

```
tikv-ctl --data-dir /var/lib/tikv raw-scan --from 'zt' --limit 2 --cf
   ↪ default
```

```
key: "zt\200\000\000\000\000\000\000\377\005_r
   ↪ \200\000\000\000\000\377\000\000\001\000\000\000\000\000\372\372b2
   ↪ ,^\033\377\364", value: "\010\002\002\002%\010\004\002\010root
   ↪ \010\006\002\000\010\010\t\002\010\n\t\002\010\014\t\002\010\016\t
   ↪ \002\010\020\t\002\010\022\t\002\010\024\t\002\010\026\t\002\010\030\
   ↪ t\002\010\032\t\002\010\034\t\002\010\036\t\002\010 \t\002\010\"\t
   ↪ \002\010s\t\002\010&\t\002\010(\t\002\010*\t\002\010,\t\002\010.\t
   ↪ \002\0100\t\002\0102\t\002\0104\t\002"
```

```
key: "zt\200\000\000\000\000\000\000\377\025_r
    ↪ \200\000\000\000\000\377\000\000\023\000\000\000\000\000\372\372b2
    ↪ ,^\033\377\364", value: "\010\002\002&slow_query_log_file\010\004\002
    ↪ P/usr/local/mysql/data/localhost-slow.log"

Total scanned keys: 2
```

#### 14.6.1.3.6 Print a specific key value

To print the value of a key, use the `print` command.

#### 14.6.1.3.7 Print some properties about Region

In order to record Region state details, TiKV writes some statistics into the SST files of Regions. To view these properties, run `tikv-ctl` with the `region-properties` sub-command:

```
tikv-ctl --host localhost:20160 region-properties -r 2
```

```
num_files: 0
num_entries: 0
num_deletes: 0
mvcc.min_ts: 18446744073709551615
mvcc.max_ts: 0
mvcc.num_rows: 0
mvcc.num_puts: 0
mvcc.num_versions: 0
mvcc.max_row_versions: 0
middle_key_by_approximate_size:
```

The properties can be used to check whether the Region is healthy or not. If not, you can use them to fix the Region. For example, splitting the Region manually by `middle_key_approximate_size`.

#### 14.6.1.3.8 Compact data of each TiKV manually

Use the `compact` command to manually compact data of each TiKV.

- Use the `--from` and `--to` options to specify the compaction range in the form of escaped raw key. If not set, the whole range will be compacted.
- Use the `--region` option to compact the range of a specific region. If set, `--from` and `--to` will be ignored.
- Use the `-c` option to specify the column family name. The default value is `default`. The optional values are `default`, `lock`, and `write`.

- Use the `-d` option to specify the RocksDB that performs compaction. The default value is `kv`. The optional values are `kv` and `raft`.
- Use the `--threads` option allows you to specify the concurrency for the TiKV compaction and its default value is `8`. Generally, a higher concurrency comes with a faster compaction speed, which might yet affect the service. You need to choose an appropriate concurrency count based on your scenario.
- Use the `--bottommost` option to include or exclude the bottommost files when TiKV performs compaction. The value options are `default`, `skip`, and `force`. The default value is `default`.
    - `default` means that the bottommost files are included only when the Compaction Filter feature is enabled.
    - `skip` means that the bottommost files are excluded when TiKV performs compaction.
    - `force` means that the bottommost files are always included when TiKV performs compaction.
- To compact data in the local mode, use the following command:

```
tikv-ctl --data-dir /path/to/tikv compact -d kv
```

- To compact data in the remote mode, use the following command:

```
tikv-ctl --host ip:port compact -d kv
```

#### 14.6.1.3.9 Compact data of the whole TiKV cluster manually

Use the `compact-cluster` command to manually compact data of the whole TiKV cluster. The flags of this command have the same meanings and usage as those of the `compact` command. The only difference is as follows:

- For the `compact-cluster` command, use `--pd` to specify the address of the PD, so that `tikv-ctl` can locate all TiKV nodes in the cluster as the compact target.
- For the `compact` command, use `--data-dir` or `--host` to specify a single TiKV as the compact target.

#### 14.6.1.3.10 Set a Region to tombstone

The `tombstone` command is usually used in circumstances where the sync-log is not enabled, and some data written in the Raft state machine is lost caused by power down.

In a TiKV instance, you can use this command to set the status of some Regions to tombstone. Then when you restart the instance, those Regions are skipped to avoid the restart failure caused by damaged Raft state machines of those Regions. Those Regions

need to have enough healthy replicas in other TiKV instances to be able to continue the reads and writes through the Raft mechanism.

In general cases, you can remove the corresponding Peer of this Region using the `remove -peer` command:

```
pd-ctl operator add remove-peer <region_id> <store_id>
```

Then use the `tikv-ctl` tool to set a Region to tombstone on the corresponding TiKV instance to skip the health check for this Region at startup:

```
tikv-ctl --data-dir /path/to/tikv tombstone -p 127.0.0.1:2379 -r <region_id>
```

```
success!
```

However, in some cases, you cannot easily remove this Peer of this Region from PD, so you can specify the `--force` option in `tikv-ctl` to forcibly set the Peer to tombstone:

```
tikv-ctl --data-dir /path/to/tikv tombstone -p 127.0.0.1:2379 -r <region_id
    ↪ >,<region_id> --force
```

```
success!
```

**Note:**

- The `tombstone` command only supports the local mode.
- The argument of the `-p` option specifies the PD endpoints without the `http` prefix. Specifying the PD endpoints is to query whether PD can safely switch to Tombstone.

#### 14.6.1.3.11 Send a `consistency-check` request to TiKV

Use the `consistency-check` command to execute a consistency check among replicas in the corresponding Raft of a specific Region. If the check fails, TiKV itself panics. If the TiKV instance specified by `--host` is not the Region leader, an error is reported.

```
tikv-ctl --host 127.0.0.1:20160 consistency-check -r 2
success!
tikv-ctl --host 127.0.0.1:20161 consistency-check -r 2
DebugClient::check_region_consistency: RpcFailure(RpcStatus { status:
    ↪ Unknown, details: Some("StringError(\"Leader is on store 1\")") })
```

**Note:**

- It is **NOT** recommended to use the `consistency-check` command, because it is incompatible with the garbage collection in TiDB and might mistakenly report an error.
- This command only supports the remote mode.
- Even if this command returns `success!`, you need to check whether TiKV panics. This is because this command is only a proposal that requests a consistency check for the leader, and you cannot know from the client whether the whole check process is successful or not.

#### 14.6.1.3.12 Dump snapshot meta

This sub-command is used to parse a snapshot meta file at given path and print the result.

#### 14.6.1.3.13 Print the Regions where the Raft state machine corrupts

To avoid checking the Regions while TiKV is started, you can use the `tombstone` command to set the Regions where the Raft state machine reports an error to Tombstone. Before running this command, use the `bad-regions` command to find out the Regions with errors, so as to combine multiple tools for automated processing.

```
tikv-ctl --data-dir /path/to/tikv bad-regions
```

```
all regions are healthy
```

If the command is successfully executed, it prints the above information. If the command fails, it prints the list of bad Regions. Currently, the errors that can be detected include the mismatches between `last index`, `commit index` and `apply index`, and the loss of Raft log. Other conditions like the damage of snapshot files still need further support.

#### 14.6.1.3.14 View Region properties

- To view in local the properties of Region 2 on the TiKV instance that is deployed in `/path/to/tikv`:

  ```
  tikv-ctl --data-dir /path/to/tikv/data region-properties -r 2
  ```

- To view online the properties of Region 2 on the TiKV instance that is running on `127.0.0.1:20160`:

  ```
  tikv-ctl --host 127.0.0.1:20160 region-properties -r 2
  ```

#### 14.6.1.3.15 Modify the TiKV configuration dynamically

You can use the `modify-tikv-config` command to dynamically modify the configuration arguments. Currently, the TiKV configuration items that can be dynamically modified and the detailed modification are consistent with modifying configuration using SQL statements. For details, see Modify TiKV configuration dynamically.

- `-n` is used to specify the full name of the configuration item. For the list of configuration items that can be modified dynamically, see Modify TiKV configuration dynamically.
- `-v` is used to specify the configuration value.

Set the size of `shared block cache`:

```
tikv-ctl --host ip:port modify-tikv-config -n storage.block-cache.capacity -
    ↪ v 10GB
```

```
success
```

When `shared block cache` is disabled, set `block cache size` for the `write` CF:

```
tikv-ctl --host ip:port modify-tikv-config -n rocksdb.writecf.block-cache-
    ↪ size -v 256MB
```

```
success
```

```
tikv-ctl --host ip:port modify-tikv-config -n raftdb.defaultcf.disable-auto-
    ↪ compactions -v true
```

```
success
```

```
tikv-ctl --host ip:port modify-tikv-config -n raftstore.sync-log -v false
```

```
success
```

When the compaction rate limit causes accumulated compaction pending bytes, disable the `rate-limiter-auto-tuned` mode or set a higher limit for the compaction flow:

```
tikv-ctl --host ip:port modify-tikv-config -n rocksdb.rate-limiter-auto-
    ↪ tuned -v false
```

```
success
```

```
tikv-ctl --host ip:port modify-tikv-config -n rocksdb.rate-bytes-per-sec -v
    ↪ "1GB"
```

```
success
```

#### 14.6.1.3.16 Force Regions to recover services from failure of multiple replicas (deprecated)

> **Warning:**
>
> It is not recommended to use this feature. Instead, you can use Online Unsafe Recovery in `pd-ctl` which provides one-stop automatic recovery capabilities. Extra operations such as stopping services are not needed. For detailed introduction, see Online Unsafe Recovery.

You can use the `unsafe-recover remove-fail-stores` command to remove the failed machines from the peer list of Regions. Before running this command, you need to stop the service of the target TiKV store to release file locks.

The `-s` option accepts multiple `store_id` separated by comma and uses the `-r` flag to specify involved Regions. If you need to perform this operation on all Regions in a specific store, you can simply specify `--all-regions`.

> **Warning:**
>
> - If any misoperation is performed, it might be hard to recover the cluster. Be aware of the potential risks and avoid using this feature in a production environment.
> - If the `--all-regions` option is used, you are expected to run this command on all the remaining stores connected to the cluster. You need to ensure that these healthy stores stop providing services before recovering the damaged stores. Otherwise, the inconsistent peer lists in Region replicas will cause errors when you run `split-region` or `remove-peer`. This further causes inconsistency between other metadata, and finally, the Regions will become unavailable.
> - Once you have run `remove-fail-stores`, you cannot restart the removed nodes or add these nodes to the cluster. Otherwise, the metadata will be inconsistent, and finally, the Regions will be unavailable.

```
tikv-ctl --data-dir /path/to/tikv unsafe-recover remove-fail-stores -s 3 -r
    ↪ 1001,1002
```

```
success!
```

```
tikv-ctl --data-dir /path/to/tikv unsafe-recover remove-fail-stores -s 4,5
    ↪ --all-regions
```

Then, after you restart TiKV, the Regions can continue providing services with the remaining healthy replicas. This command is commonly used when multiple TiKV stores are damaged or deleted.

**Note:**

- You are expected to run this command for all stores where the specified Regions' peers are located.
- This command only supports the local mode. It prints `success!` when successfully run.

#### 14.6.1.3.17 Recover from MVCC data corruption

Use the `recover-mvcc` command in circumstances where TiKV cannot run normally caused by MVCC data corruption. It cross-checks 3 CFs ("default", "write", "lock") to recover from various kinds of inconsistency.

- Use the `-r` option to specify involved Regions by `region_id`.
- Use the `-p` option to specify PD endpoints.

```
tikv-ctl --data-dir /path/to/tikv recover-mvcc -r 1001,1002 -p
    ↪ 127.0.0.1:2379
success!
```

**Note:**

- This command only supports the local mode. It prints `success!` when successfully run.
- The argument of the `-p` option specifies the PD endpoints without the `http` prefix. Specifying the PD endpoints is to query whether the specified `region_id` is validated or not.
- You need to run this command for all stores where specified Regions' peers are located.

#### 14.6.1.3.18 Flashback

TiDB v6.4.0 introduces the `FLASHBACK CLUSTER` syntax. You can use it to restore a cluster to a specific point in time. To facilitate usage without TiDB, starting from v6.5.3, tikv-ctl provides the `flashback` command. This command supports flashback operations at the TiKV level.

**Note:**

- The `flashback` command writes the old data of a specific point in time with the latest timestamp, and will not delete the current data. So before using this feature, you need to ensure that there is enough storage space for both the old data and the current data.
- This command only supports local mode.

Prerequisites

Before running the `flashback` command, you need to stop PD scheduling using the `pd-ctl config set halt-scheduling true` command.

Usage

```
tikv-ctl --pd <pd_address:port> flashback -v <target_timestamp>
```

Use the `--pd` option to specify the access address of the PD. Use the `-v` option to specify the target timestamp for the flashback.

By default, this command will flashback the entire cluster. If you need to flashback specified Regions or a key range, you can use the following options:

- Use the `-r` option to specify the Regions. Multiple Regions are separated by commas (`,`).
- Use `--start` and `--end` to specify all Regions within a key range (default: no range limit, in Hex format).

When the command runs successfully, it will print `flashback all stores success!`. You can also view the execution progress via the Raft admin > Peer in Flashback State metrics.

Examples

- To flashback the entire cluster data to the timestamp `430315739761082369`:

```
tikv-ctl --pd 127.0.0.1:2379 flashback -v 430315739761082369
```

- To flashback the data of Regions with IDs `100` and `102` to the timestamp `430315739761082369`, use the following command:

```
tikv-ctl --pd 127.0.0.1:2379 flashback -v 430315739761082369 -r 100,102
```

- To flashback the data within a key range to the timestamp `430315739761082369`, use the following command:

```
tikv-ctl --pd 127.0.0.1:2379 flashback -v 430315739761082369 --start
    ↪ 7480000000000000FF0800000000000000F8 --end 7480000000000000
    ↪ FF0C0000000000000000F8
```

#### 14.6.1.3.19 Ldb Command

The `ldb` command line tool offers multiple data access and database administration commands. Some examples are listed below. For more information, refer to the help message displayed when running `tikv-ctl ldb` or check the documents from RocksDB.

Examples of data access sequence:

To dump an existing RocksDB in HEX:

```
tikv-ctl ldb --hex --db=/tmp/db dump
```

To dump the manifest of an existing RocksDB:

```
tikv-ctl ldb --hex manifest_dump --path=/tmp/db/MANIFEST-000001
```

You can specify the column family that your query is against using the `--column_family =<string>` command line.

`--try_load_options` loads the database options file to open the database. It is recommended to always keep this option on when the database is running. If you open the database with default options, the LSM-tree might be messed up, which cannot be recovered automatically.

#### 14.6.1.3.20 Dump encryption metadata

Use the `encryption-meta` subcommand to dump encryption metadata. The subcommand can dump two types of metadata: encryption info for data files, and the list of data encryption keys used.

To dump encryption info for data files, use the `encryption-meta dump-file` subcommand. You need to create a TiKV config file to specify `data-dir` for the TiKV deployment:

```
### conf.toml
[storage]
data-dir = "/path/to/tikv/data"
```

The `--path` option can be used to specify an absolute or relative path to the data file of interest. The command might give empty output if the data file is not encrypted. If `--path` is not provided, encryption info for all data files will be printed.

```
tikv-ctl --config=./conf.toml encryption-meta dump-file --path=/path/to/tikv
    ↪ /data/db/CURRENT
```

```
/path/to/tikv/data/db/CURRENT: key_id: 9291156302549018620 iv:
    ↪ E3C2FDBF63FC03BFC28F265D7E78283F method: Aes128Ctr
```

To dump data encryption keys, use the `encryption-meta dump-key` subcommand. In additional to `data-dir`, you also need to specify the current master key used in the config file. For how to config master key, refer to Encryption-At-Rest. Also with this command, the `security.encryption.previous-master-key` config will be ignored, and the master key rotation will not be triggered.

```
### conf.toml
[storage]
data-dir = "/path/to/tikv/data"

[security.encryption.master-key]
type = "kms"
key-id = "0987dcba-09fe-87dc-65ba-ab0987654321"
region = "us-west-2"
```

Note if the master key is a AWS KMS key, `tikv-ctl` needs to have access to the KMS key. Access to a AWS KMS key can be granted to `tikv-ctl` via environment variable, AWS default config file, or IAM role, whichever is suitable. Refer to AWS document for usage.

The `--ids` option can be used to specified a list of comma-separated data encryption key ids to print. If `--ids` is not provided, all data encryption keys will be printed, along with current key id, which is the id of the latest active data encryption key.

When using the command, you will see a prompt warning that the action will expose sensitive information. Type "I consent" to continue.

```
tikv-ctl --config=./conf.toml encryption-meta dump-key
```

```
This action will expose encryption key(s) as plaintext. Do not output the
    ↪ result in file on disk.
Type "I consent" to continue, anything else to exit: I consent
current key id: 9291156302549018620
9291156302549018620: key: 8B6B6B8F83D36BE2467ED55D72AE808B method: Aes128Ctr
    ↪  creation_time: 1592938357
```

```
tikv-ctl --config=./conf.toml encryption-meta dump-key --ids
    ↪ =9291156302549018620
```

```
This action will expose encryption key(s) as plaintext. Do not output the
    ↪ result in file on disk.
Type "I consent" to continue, anything else to exit: I consent
9291156302549018620: key: 8B6B6B8F83D36BE2467ED55D72AE808B method: Aes128Ctr
    ↪  creation_time: 1592938357
```

> **Note:**
>
> The command will expose data encryption keys as plaintext. In production, DO NOT redirect the output to a file. Even deleting the output file afterward may not cleanly wipe out the content from disk.

#### 14.6.1.3.21 Print information related to damaged SST files

Damaged SST files in TiKV might cause TiKV processes to panic. Before TiDB v6.1.0, these files cause TiKV to panic immediately. Since TiDB v6.1.0, TiKV processes panic 1 hour after SST files are damaged.

To clean up the damaged SST files, you can run the `bad-ssts` command in TiKV Control to show the needed information. The following is an example command and output.

> **Note:**
>
> Before running this command, stop the running TiKV instance.

```
tikv-ctl --data-dir </path/to/tikv> bad-ssts --pd <endpoint>
```

```
--------------------------------------------------------
corruption info:
data/tikv-21107/db/000014.sst: Corruption: Bad table magic number: expected
    ↪ 9863518390377041911, found 759105309091689679 in data/tikv-21107/db
    ↪ /000014.sst

sst meta:
14:552997[1 .. 5520]['0101' seq:1, type:1 .. '7
    ↪ A7480000000000000FF0F5F728000000000FF0002160000000000FAFA13AB33020BFFFA
    ↪ ' seq:2032, type:1] at level 0 for Column family "default" (ID 0)
it isn't easy to handle local data, start key:0101
```

```
overlap region:
RegionInfo { region: id: 4 end_key: 7480000000000000FF0500000000000000F8
    ↪ region_epoch { conf_ver: 1 version: 2 } peers { id: 5 store_id: 1 },
    ↪ leader: Some(id: 5 store_id: 1) }

refer operations:
tikv-ctl ldb --db=/path/to/tikv/db unsafe_remove_sst_file 000014
tikv-ctl --data-dir=/path/to/tikv tombstone -r 4 --pd <endpoint>
------------------------------------------------------------
corruption analysis has completed
```

From the output above, you can see that the information of the damaged SST file is printed first and then the meta-information is printed.

- In the `sst meta` part, `14` means the SST file number; `552997` means the file size, followed by the smallest and largest sequence numbers and other meta-information.
- The `overlap region` part shows the information of the Region involved. This information is obtained through the PD server.
- The `suggested operations` part provides you suggestion to clean up the damaged SST file. You can take the suggestion to clean up files and restart the TiKV instance.

#### 14.6.1.3.22 Get the state of a Region's `RegionReadProgress`

Starting from v6.5.4, TiKV introduces the `get-region-read-progress` subcommand to get up-to-date details of the resolver and `RegionReadProgress`. You need to specify a Region ID and a TiKV, which can be obtained from Grafana (`Min Resolved TS Region` and `Min Safe TS Region`) or `DataIsNotReady` logs.

- `--log` (optional): If specified, TiKV logs the smallest `start_ts` of locks in the Region's resolver in this TiKV at `INFO` level. This option helps you identify locks that might block resolved-ts in advance.
- `--min-start-ts` (optional): If specified, TiKV filters out locks with smaller `start_ts` than this value in logs. You can use this to specify a transaction of interest for logging. It defaults to `0`, which means no filter.

The following is an example:

```
./tikv-ctl --host 127.0.0.1:20160 get-region-read-progress -r 14 --log --min
    ↪ -start-ts 0
```

The output is as follows:

```
Region read progress:
    exist: true,
    safe_ts: 0,
```

```
    applied_index: 92,
    pending front item (oldest) ts: 0,
    pending front item (oldest) applied index: 0,
    pending back item (latest) ts: 0,
    pending back item (latest) applied index: 0,
    paused: false,
Resolver:
    exist: true,
    resolved_ts: 0,
    tracked index: 92,
    number of locks: 0,
    number of transactions: 0,
    stopped: false,
```

The subcommand is useful in diagnosing issues related to Stale Read and safe-ts. For details, see Understanding Stale Read and safe-ts in TiKV.

### 14.6.2 PD Control User Guide

As a command line tool of PD, PD Control obtains the state information of the cluster and tunes the cluster.

#### 14.6.2.1 Install PD Control

> **Note:**
>
> It is recommended that the version of the Control tool you use is consistent with the version of the cluster.

##### 14.6.2.1.1 Use TiUP command

To use PD Control, execute the `tiup ctl:v<CLUSTER_VERSION> pd -u http://<pd_ip>:<pd_port> [-i]` command.

##### 14.6.2.1.2 Download the installation package

To obtain `pd-ctl` of the latest version, download the TiDB server installation package. `pd-ctl` is included in the `ctl-{version}-linux-{arch}.tar.gz` package.

| Installation package | OS | Architecture | SHA256 checksum |
|---|---|---|---|
| https://download.pingcap.org/tidb-community-server-{version}-linux-amd64.tar.gz (pd-ctl) | Linux | amd64 | https://download.pingcap.org/tidb-community-server-{version}-linux-amd64.tar.gz.sha256 |
| https://download.pingcap.org/tidb-community-server-{version}-linux-arm64.tar.gz (pd-ctl) | Linux | arm64 | https://download.pingcap.org/tidb-community-server-{version}-linux-arm64.tar.gz.sha256 |

**Note:**

`{version}` in the link indicates the version number of TiDB. For example, the download link for `v6.5.12` in the `amd64` architecture is `https://download.pingcap.org/tidb-community-server-v6.5.12-linux-amd64.tar.gz`.

#### 14.6.2.1.3 Compile from source code

1. Go 1.19 or later is required because the Go modules are used.
2. In the root directory of the PD project, use the `make` or `make pd-ctl` command to compile and generate `bin/pd-ctl`.

### 14.6.2.2 Usage

Single-command mode:

```
tiup ctl:v<CLUSTER_VERSION> pd store -u http://127.0.0.1:2379
```

Interactive mode:

```
tiup ctl:v<CLUSTER_VERSION> pd -i -u http://127.0.0.1:2379
```

Use environment variables:

```
export PD_ADDR=http://127.0.0.1:2379
tiup ctl:v<CLUSTER_VERSION> pd
```

Use TLS to encrypt:

```
tiup ctl:v<CLUSTER_VERSION> pd -u https://127.0.0.1:2379 --cacert="path/to/ca" --cert="path/to/cert" --key="path/to/key"
```

#### 14.6.2.3 Command line flags

##### 14.6.2.3.1 `--cacert`

- Specifies the path to the certificate file of the trusted CA in PEM format
- Default: “”

##### 14.6.2.3.2 `--cert`

- Specifies the path to the certificate of SSL in PEM format
- Default: “”

##### 14.6.2.3.3 `--detach` / `-d`

- Uses the single command line mode (not entering readline)
- Default: true

##### 14.6.2.3.4 `--help` / `-h`

- Outputs the help information
- Default: false

##### 14.6.2.3.5 `--interact` / `-i`

- Uses the interactive mode (entering readline)
- Default: false

##### 14.6.2.3.6 `--key`

- Specifies the path to the certificate key file of SSL in PEM format, which is the private key of the certificate specified by `--cert`
- Default: “”

##### 14.6.2.3.7 `--pd` / `-u`

- Specifies the PD address
- Default address: `http://127.0.0.1:2379`
- Environment variable: `PD_ADDR`

#### 14.6.2.3.8 `--version` / `-V`

- Prints the version information and exit
- Default: false

### 14.6.2.4 Command

#### 14.6.2.4.1 `cluster`

Use this command to view the basic information of the cluster.

Usage:

```
>> cluster                                  // To show the cluster information
{
  "id": 6493707687106161130,
  "max_peer_count": 3
}
```

#### 14.6.2.4.2 `config [show | set <option> <value> | placement-rules]`

Use this command to view or modify the configuration information.

Usage:

```
>> config show                              // Display the config information
   ↪ of the scheduling
{
  "replication": {
    "enable-placement-rules": "true",
    "isolation-level": "",
    "location-labels": "",
    "max-replicas": 3,
    "strictly-match-label": "false"
  },
  "schedule": {
    "enable-cross-table-merge": "true",
    "high-space-ratio": 0.7,
    "hot-region-cache-hits-threshold": 3,
    "hot-region-schedule-limit": 4,
    "leader-schedule-limit": 4,
    "leader-schedule-policy": "count",
    "low-space-ratio": 0.8,
    "max-merge-region-keys": 200000,
    "max-merge-region-size": 20,
    "max-pending-peer-count": 64,
```

```
    "max-snapshot-count": 64,
    "max-store-down-time": "30m0s",
    "merge-schedule-limit": 8,
    "patrol-region-interval": "10ms",
    "region-schedule-limit": 2048,
    "region-score-formula-version": "v2",
    "replica-schedule-limit": 64,
    "scheduler-max-waiting-operator": 5,
    "split-merge-interval": "1h0m0s",
    "tolerant-size-ratio": 0
  }
}
>> config show all                          // Display all config information
>> config show replication                  // Display the config information
   ↪ of replication
{
  "max-replicas": 3,
  "location-labels": "",
  "isolation-level": "",
  "strictly-match-label": "false",
  "enable-placement-rules": "true"
}

>> config show cluster-version              // Display the current version of
   ↪ the cluster, which is the current minimum version of TiKV nodes in
   ↪ the cluster and does not correspond to the binary version.
"5.2.2"
```

- `max-snapshot-count` controls the maximum number of snapshots that a single store receives or sends out at the same time. The scheduler is restricted by this configuration to avoid taking up normal application resources. When you need to improve the speed of adding replicas or balancing, increase this value.

```
config set max-snapshot-count 64 // Set the maximum number of snapshots
   ↪  to 64
```

- `max-pending-peer-count` controls the maximum number of pending peers in a single store. The scheduler is restricted by this configuration to avoid producing a large number of Regions without the latest log in some nodes. When you need to improve the speed of adding replicas or balancing, increase this value. Setting it to 0 indicates no limit.

```
config set max-pending-peer-count 64 // Set the maximum number of
   ↪ pending peers to 64
```

- `max-merge-region-size` controls the upper limit on the size of Region Merge (the unit is MiB). When `regionSize` exceeds the specified value, PD does not merge it with the adjacent Region. Setting it to 0 indicates disabling Region Merge.

```
config set max-merge-region-size 16 // Set the upper limit on the size
    ↪ of Region Merge to 16 MiB
```

- `max-merge-region-keys` controls the upper limit on the key count of Region Merge. When `regionKeyCount` exceeds the specified value, PD does not merge it with the adjacent Region.

```
config set max-merge-region-keys 50000 // Set the the upper limit on
    ↪ keyCount to 50000
```

- `split-merge-interval` controls the interval between the `split` and `merge` operations on a same Region. This means the newly split Region won't be merged within a period of time.

```
config set split-merge-interval 24h // Set the interval between `split`
    ↪  and `merge` to one day
```

- `enable-one-way-merge` controls whether PD only allows a Region to merge with the next Region. When you set it to `false`, PD allows a Region to merge with the adjacent two Regions.

```
config set enable-one-way-merge true // Enables one-way merging.
```

- `enable-cross-table-merge` is used to enable the merging of cross-table Regions. When you set it to `false`, PD does not merge the Regions from different tables. This option only works when key type is "table".

```
config set enable-cross-table-merge true // Enable cross table merge.
```

- `key-type` specifies the key encoding type used for the cluster. The supported options are ["table", "raw", "txn"], and the default value is "table".

    - If no TiDB instance exists in the cluster, `key-type` will be "raw" or "txn", and PD is allowed to merge Regions across tables regardless of the `enable-cross-table-merge` setting.
    - If any TiDB instance exists in the cluster, `key-type` should be "table". Whether PD can merge Regions across tables is determined by `enable-cross-table-merge`. If `key-type` is "raw", placement rules do not work.

```
config set key-type raw // Enable cross table merge.
```

- `region-score-formula-version` controls the version of the Region score formula. The value options are `v1` and `v2`. The version 2 of the formula helps to reduce redundant balance Region scheduling in some scenarios, such as taking TiKV nodes online or offline.

```
config set region-score-formula-version v2
```

- `patrol-region-interval` controls the execution frequency that `replicaChecker` checks the health status of Regions. A shorter interval indicates a higher execution frequency. Generally, you do not need to adjust it.

```
config set patrol-region-interval 10ms // Set the execution frequency
    ↪ of replicaChecker to 10ms
```

- `max-store-down-time` controls the time that PD decides the disconnected store cannot be restored if exceeded. If PD does not receive heartbeats from a store within the specified period of time, PD adds replicas in other nodes.

```
config set max-store-down-time 30m // Set the time within which PD
    ↪ receives no heartbeats and after which PD starts to add replicas
    ↪ to 30 minutes
```

- `max-store-preparing-time` controls the maximum waiting time for the store to go online. During the online stage of a store, PD can query the online progress of the store. When the specified time is exceeded, PD assumes that the store has been online and cannot query the online progress of the store again. But this does not prevent Regions from transferring to the new online store. In most scenarios, you do not need to adjust this parameter.

  The following command specifies that the maximum waiting time for the store to go online is 4 hours.

```
config set max-store-preparing-time 4h
```

- `leader-schedule-limit` controls the number of tasks scheduling the leader at the same time. This value affects the speed of leader balance. A larger value means a higher speed and setting the value to 0 closes the scheduling. Usually the leader scheduling has a small load, and you can increase the value in need.

```
config set leader-schedule-limit 4    // 4 tasks of leader scheduling
    ↪ at the same time at most
```

- `region-schedule-limit` controls the number of tasks of scheduling Regions at the same time. This value avoids too many Region balance operators being created. The default value is `2048` which is enough for all sizes of clusters, and setting the value to `0` closes the scheduling. Usually, the Region scheduling speed is limited by `store-limit`, but it is recommended that you do not customize this value unless you know exactly what you are doing.

```
config set region-schedule-limit 2    // 2 tasks of Region scheduling
    ↪ at the same time at most
```

- `replica-schedule-limit` controls the number of tasks scheduling the replica at the same time. This value affects the scheduling speed when the node is down or removed. A larger value means a higher speed and setting the value to 0 closes the scheduling. Usually the replica scheduling has a large load, so do not set a too large value. Note that this configuration item is usually kept at the default value. If you want to change the value, you need to try a few values to see which one works best according to the real situation.

```
config set replica-schedule-limit 4   // 4 tasks of replica scheduling
    ↪ at the same time at most
```

- `merge-schedule-limit` controls the number of Region Merge scheduling tasks. Setting the value to 0 closes Region Merge. Usually the Merge scheduling has a large load, so do not set a too large value. Note that this configuration item is usually kept at the default value. If you want to change the value, you need to try a few values to see which one works best according to the real situation.

```
config set merge-schedule-limit 16  // 16 tasks of Merge scheduling at
    ↪ the same time at most
```

- `hot-region-schedule-limit` controls the hot Region scheduling tasks that are running at the same time. Setting its value to `0` means disabling the scheduling. It is not recommended to set a too large value. Otherwise, it might affect the system performance. Note that this configuration item is usually kept at the default value. If you want to change the value, you need to try a few values to see which one works best according to the real situation.

```
config set hot-region-schedule-limit 4 // 4 tasks of hot Region
    ↪ scheduling at the same time at most
```

- `hot-region-cache-hits-threshold` is used to set the number of minutes required to identify a hot Region. PD can participate in the hotspot scheduling only after the Region is in the hotspot state for more than this number of minutes.

- `tolerant-size-ratio` controls the size of the balance buffer area. When the score difference between the leader or Region of the two stores is less than specified multiple times of the Region size, it is considered in balance by PD.

```
config set tolerant-size-ratio 20   // Set the size of the buffer area
    ↪ to about 20 times of the average Region Size
```

- `low-space-ratio` controls the threshold value that is considered as insufficient store space. When the ratio of the space occupied by the node exceeds the specified value, PD tries to avoid migrating data to the corresponding node as much as possible. At the same time, PD mainly schedules the remaining space to avoid using up the disk space of the corresponding node.

```
config set low-space-ratio 0.9        // Set the threshold value of
    ↪ insufficient space to 0.9
```

- `high-space-ratio` controls the threshold value that is considered as sufficient store space. This configuration takes effect only when `region-score-formula-version` is set to `v1`. When the ratio of the space occupied by the node is less than the specified value, PD ignores the remaining space and mainly schedules the actual data volume.

```
config set high-space-ratio 0.5       // Set the threshold value of
    ↪ sufficient space to 0.5
```

- `cluster-version` is the version of the cluster, which is used to enable or disable some features and to deal with the compatibility issues. By default, it is the minimum version of all normally running TiKV nodes in the cluster. You can set it manually only when you need to roll it back to an earlier version.

```
config set cluster-version 1.0.8        // Set the version of the
    ↪ cluster to 1.0.8
```

- `replication-mode` controls the replication mode of Regions in the dual data center scenario. See Enable the DR Auto-Sync mode for details.

- `leader-schedule-policy` is used to select the scheduling strategy for the leader. You can schedule the leader according to `size` or `count`.

- `scheduler-max-waiting-operator` is used to control the number of waiting operators in each scheduler.

- `enable-remove-down-replica` is used to enable the feature of automatically deleting DownReplica. When you set it to `false`, PD does not automatically clean up the downtime replicas.

- `enable-replace-offline-replica` is used to enable the feature of migrating OfflineReplica. When you set it to `false`, PD does not migrate the offline replicas.

- `enable-make-up-replica` is used to enable the feature of making up replicas. When you set it to `false`, PD does not add replicas for Regions without sufficient replicas.

- `enable-remove-extra-replica` is used to enable the feature of removing extra replicas. When you set it to `false`, PD does not remove extra replicas for Regions with redundant replicas.

- `enable-location-replacement` is used to enable the isolation level checking. When you set it to `false`, PD does not increase the isolation level of a Region replica through scheduling.
- `enable-debug-metrics` is used to enable the metrics for debugging. When you set it to `true`, PD enables some metrics such as `balance-tolerant-size`.
- `enable-placement-rules` is used to enable placement rules, which is enabled by default in v5.0 and later versions.
- `store-limit-mode` is used to control the mode of limiting the store speed. The optional modes are `auto` and `manual`. In `auto` mode, the stores are automatically balanced according to the load (experimental).
- `halt-scheduling` is used to halt scheduling. When you set it to `true`, PD will halt scheduling and ignore other scheduling configurations. Introduced in v6.5.3.
- PD rounds the lowest digits of the flow number, which reduces the update of statistics caused by the changes of the Region flow information. This configuration item is used to specify the number of lowest digits to round for the Region flow information. For example, the flow `100512` will be rounded to `101000` because the default value is `3`. This configuration replaces `trace-region-flow`.
- For example, set the value of `flow-round-by-digit` to 4:

```
config set flow-round-by-digit 4
```

`config placement-rules [disable | enable | load | save | show | rule-group]`

For the usage of `config placement-rules [disable | enable | load | save | show | rule-group]`, see Configure placement rules.

#### 14.6.2.4.3 health

Use this command to view the health information of the cluster.

Usage:

```
>> health                              // Display the health information
[
  {
    "name": "pd",
    "member_id": 13195394291058371180,
    "client_urls": [
      "http://127.0.0.1:2379"
      ......
    ],
    "health": true
```

```
  }
  ......
]
```

#### 14.6.2.4.4 hot [read | write | store| history <start_time> <end_time> [<key> <value>]]

Use this command to view the hot spot information of the cluster.

Usage:

```
>> hot read                                // Display hot spot for the read
   ↪ operation
>> hot write                               // Display hot spot for the write
   ↪ operation
>> hot store                               // Display hot spot for all the read
   ↪ and write operations
>> hot history 1629294000000 1631980800000 // Display history hot spot for
   ↪ the specified period (milliseconds). 1629294000000 is the start time
   ↪ and 1631980800000 is the end time.
{
  "history_hot_region": [
    {
      "update_time": 1630864801948,
      "region_id": 103,
      "peer_id": 1369002,
      "store_id": 3,
      "is_leader": true,
      "is_learner": false,
      "hot_region_type": "read",
      "hot_degree": 152,
      "flow_bytes": 0,
      "key_rate": 0,
      "query_rate": 305,
      "start_key": "7480000000000000FF5300000000000000F8",
      "end_key": "7480000000000000FF5600000000000000F8"
    },
    ...
  ]
}
>> hot history 1629294000000 1631980800000 hot_region_type read region_id
   ↪ 1,2,3 store_id 1,2,3 peer_id 1,2,3 is_leader true is_learner true //
   ↪ Display history hotspot for the specified period with more conditions
{
  "history_hot_region": [
    {
```

```
      "update_time": 1630864801948,
      "region_id": 103,
      "peer_id": 1369002,
      "store_id": 3,
      "is_leader": true,
      "is_learner": false,
      "hot_region_type": "read",
      "hot_degree": 152,
      "flow_bytes": 0,
      "key_rate": 0,
      "query_rate": 305,
      "start_key": "7480000000000000FF5300000000000000F8",
      "end_key": "7480000000000000FF5600000000000000F8"
    },
    ...
  ]
}
```

#### 14.6.2.4.5 label [store <name> <value>]

Use this command to view the label information of the cluster.

Usage:

```
>> label                              // Display all labels
>> label store zone cn                // Display all stores including the "zone
   ↪ ":"cn" label
```

#### 14.6.2.4.6 member [delete | leader_priority | leader [show | resign | transfer <member_name>]]

Use this command to view the PD members, remove a specified member, or configure the priority of leader.

Usage:

```
>> member                             // Display the information of all members
{
  "header": {......},
  "members": [......],
  "leader": {......},
  "etcd_leader": {......},
}
>> member delete name pd2             // Delete "pd2"
Success!
>> member delete id 1319539429105371180 // Delete a node using id
```

```
Success!
>> member leader show              // Display the leader information
{
  "name": "pd",
  "member_id": 13155432540099656863,
  "peer_urls": [......],
  "client_urls": [......]
}
>> member leader resign // Move leader away from the current member
......
>> member leader transfer pd3 // Migrate leader to a specified member
......
```

#### 14.6.2.4.7 operator [check | show | add | remove]

Use this command to view and control the scheduling operation.

Usage:

```
>> operator show                                    // Display all operators
>> operator show admin                              // Display all admin
   ↪ operators
>> operator show leader                             // Display all leader
   ↪ operators
>> operator show region                             // Display all Region
   ↪ operators
>> operator add add-peer 1 2                        // Add a replica of Region
   ↪ 1 on store 2
>> operator add add-learner 1 2                     // Add a learner replica of
   ↪  Region 1 on store 2
>> operator add remove-peer 1 2                     // Remove a replica of
   ↪ Region 1 on store 2
>> operator add transfer-leader 1 2                 // Schedule the leader of
   ↪ Region 1 to store 2
>> operator add transfer-region 1 2 3 4             // Schedule Region 1 to
   ↪ stores 2,3,4
>> operator add transfer-peer 1 2 3                 // Schedule the replica of
   ↪ Region 1 on store 2 to store 3
>> operator add merge-region 1 2                    // Merge Region 1 with
   ↪ Region 2
>> operator add split-region 1 --policy=approximate // Split Region 1 into
   ↪ two Regions in halves, based on approximately estimated value
>> operator add split-region 1 --policy=scan        // Split Region 1 into two
   ↪ Regions in halves, based on accurate scan value
>> operator remove 1                                // Remove the scheduling
   ↪ operation of Region 1
```

```
>> operator check 1                                    // Check the status of the
   ↪ operators related to Region 1
```

The splitting of Regions starts from the position as close as possible to the middle. You can locate this position using two strategies, namely "scan" and "approximate". The difference between them is that the former determines the middle key by scanning the Region, and the latter obtains the approximate position by checking the statistics recorded in the SST file. Generally, the former is more accurate, while the latter consumes less I/O and can be completed faster.

#### 14.6.2.4.8 `ping`

Use this command to view the time that `ping` PD takes.

Usage:

```
>> ping
time: 43.12698ms
```

#### 14.6.2.4.9 `region <region_id> [--jq="<query string>"]`

Use this command to view the Region information. For a jq formatted output, see jq-formatted-json-output-usage.

Usage:

```
>> region                              //  Display the information of all
   ↪ Regions
{
  "count": 1,
  "regions": [......]
}

>> region 2                            // Display the information of the Region
   ↪ with the ID of 2
{
  "id": 2,
  "start_key": "7480000000000000FF1D00000000000000F8",
  "end_key": "7480000000000000FF1F00000000000000F8",
  "epoch": {
    "conf_ver": 1,
    "version": 15
  },
  "peers": [
    {
      "id": 40,
      "store_id": 3
```

```
    }
  ],
  "leader": {
    "id": 40,
    "store_id": 3
  },
  "written_bytes": 0,
  "read_bytes": 0,
  "written_keys": 0,
  "read_keys": 0,
  "approximate_size": 1,
  "approximate_keys": 0
}
```

#### 14.6.2.4.10 region key [--format=raw|encode|hex] <key>

Use this command to query the Region that a specific key resides in. It supports the raw, encoding, and hex formats. And you need to use single quotes around the key when it is in the encoding format.

Hex format usage (default):

```
>> region key 7480000000000000FF1300000000000000F8
{
  "region": {
    "id": 2,
    ......
  }
}
```

Raw format usage:

```
>> region key --format=raw abc
{
  "region": {
    "id": 2,
    ......
  }
}
```

Encoding format usage:

```
>> region key --format=encode 't\200\000\000\000\000\000\000\377\035_r
   ↪ \200\000\000\000\000\377\017U\320\000\000\000\000\000\000\372'
{
  "region": {
    "id": 2,
```

```
    ......
  }
}
```

#### 14.6.2.4.11 `region scan`

Use this command to get all Regions.

Usage:

```
>> region scan
{
  "count": 20,
  "regions": [......],
}
```

#### 14.6.2.4.12 `region sibling <region_id>`

Use this command to check the adjacent Regions of a specific Region.

Usage:

```
>> region sibling 2
{
  "count": 2,
  "regions": [......],
}
```

#### 14.6.2.4.13 `region keys [--format=raw|encode|hex] <start_key> <end_key> <limit>`

Use this command to query all Regions in a given range `[startkey, endkey)`. Ranges without `endKey`s are supported.

The `limit` parameter limits the number of keys. The default value of `limit` is `16`, and the value of `-1` means unlimited keys.

Usage:

```
>> region keys --format=raw a    // Display all Regions that start from the
   ↪  key a with a default limit count of 16
{
  "count": 16,
  "regions": [......],
}

>> region keys --format=raw a z // Display all Regions in the range [a, z)
   ↪ with a default limit count of 16
```

```
{
  "count": 16,
  "regions": [......],
}

>> region keys --format=raw a z -1 // Display all Regions in the range [a,
   ↪ z) without a limit count
{
  "count": ...,
  "regions": [......],
}

>> region keys --format=raw a "" 20 // Display all Regions that start from
   ↪ the key a with a limit count of 20
{
  "count": 20,
  "regions": [......],
}
```

#### 14.6.2.4.14 region store <store_id>

Use this command to list all Regions of a specific store.

Usage:

```
>> region store 2
{
  "count": 10,
  "regions": [......],
}
```

#### 14.6.2.4.15 region topread [limit]

Use this command to list Regions with top read flow. The default value of the limit is 16.

Usage:

```
>> region topread
{
  "count": 16,
  "regions": [......],
}
```

#### 14.6.2.4.16 region topwrite [limit]

Use this command to list Regions with top write flow. The default value of the limit is 16.

Usage:

```
>> region topwrite
{
  "count": 16,
  "regions": [......],
}
```

#### 14.6.2.4.17 region topconfver [limit]

Use this command to list Regions with top conf version. The default value of the limit is 16.

Usage:

```
>> region topconfver
{
  "count": 16,
  "regions": [......],
}
```

#### 14.6.2.4.18 region topversion [limit]

Use this command to list Regions with top version. The default value of the limit is 16.

Usage:

```
>> region topversion
{
  "count": 16,
  "regions": [......],
}
```

#### 14.6.2.4.19 region topsize [limit]

Use this command to list Regions with top approximate size. The default value of the limit is 16.

Usage:

```
>> region topsize
{
  "count": 16,
  "regions": [......],
```

```
}
```

#### 14.6.2.4.20 region check [miss-peer | extra-peer | down-peer | pending-peer | offline-peer | empty-region | hist-size | hist-keys] [--jq="<query string>"]

Use this command to check the Regions in abnormal conditions. For a jq formatted output, see jq formatted JSON output usage.

Description of various types:

- miss-peer: the Region without enough replicas
- extra-peer: the Region with extra replicas
- down-peer: the Region in which some replicas are Down
- pending-peer: the Region in which some replicas are Pending

Usage:

```
>> region check miss-peer
{
  "count": 2,
  "regions": [......],
}
```

#### 14.6.2.4.21 scheduler [show | add | remove | pause | resume | config | describe]

Use this command to view and control the scheduling policy.

Usage:

```
>> scheduler show                                    // Display all created
   ↪ schedulers
>> scheduler add grant-leader-scheduler 1           // Schedule all the
   ↪ leaders of the Regions on store 1 to store 1
>> scheduler add evict-leader-scheduler 1           // Move all the Region
   ↪ leaders on store 1 out
>> scheduler config evict-leader-scheduler          // Display the stores in
   ↪  which the scheduler is located since v4.0.0
>> scheduler config evict-leader-scheduler add-store 2 // Add leader
   ↪ eviction scheduling for store 2
>> scheduler config evict-leader-scheduler delete-store 2 // Remove leader
   ↪ eviction scheduling for store 2
>> scheduler add evict-slow-store-scheduler         // When there is one and
   ↪  only one slow store, evict all Region leaders of that store
```

```
>> scheduler remove grant-leader-scheduler-1        // Remove the
   ↪ corresponding scheduler, and `-1` corresponds to the store ID
>> scheduler pause balance-region-scheduler 10      // Pause the balance-
   ↪ region scheduler for 10 seconds
>> scheduler pause all 10                           // Pause all schedulers
   ↪ for 10 seconds
>> scheduler resume balance-region-scheduler        // Continue to run the
   ↪ balance-region scheduler
>> scheduler resume all                             // Continue to run all
   ↪ schedulers
>> scheduler config balance-hot-region-scheduler    // Display the
   ↪ configuration of the balance-hot-region scheduler
>> scheduler describe balance-region-scheduler      // Display the running
   ↪ state and related diagnostic information of the balance-region
   ↪ scheduler
```

#### 14.6.2.4.22 `scheduler describe balance-region-scheduler`

Use this command to view the running state and related diagnostic information of the `balance-region-scheduler`.

Since TiDB v6.3.0, PD provides the running state and brief diagnostic information for `balance-region-scheduler` and `balance-leader-scheduler`. Other schedulers and checkers are not supported yet. To enable this feature, you can modify the `enable-diagnostic` configuration item using `pd-ctl`.

The state of the scheduler can be one of the following:

- `disabled`: the scheduler is unavailable or removed.
- `paused`: the scheduler is paused.
- `scheduling`: the scheduler is generating scheduling operators.
- `pending`: the scheduler cannot generate scheduling operators. For a scheduler in the `pending` state, brief diagnostic information is returned. The brief information describes the state of stores and explains why these stores cannot be selected for scheduling.
- `normal`: there is no need to generate scheduling operators.

#### 14.6.2.4.23 `scheduler config balance-leader-scheduler`

Use this command to view and control the `balance-leader-scheduler` policy.

Since TiDB v6.0.0, PD introduces the `Batch` parameter for `balance-leader-scheduler` to control the speed at which the balance-leader processes tasks. To use this parameter, you can modify the `balance-leader batch` configuration item using pd-ctl.

Before v6.0.0, PD does not have this configuration item, which means `balance-leader batch=1`. In v6.0.0 or later versions, the default value of `balance-leader batch` is `4`. To set this configuration item to a value greater than `4`, you need to set a greater value for

`scheduler-max-waiting-operator` (whose default value is 5) at the same time. You can get the expected acceleration effect only after modifying both configuration items.

```
scheduler config balance-leader-scheduler set batch 3 // Set the size of
    ↪ the operator that the balance-leader scheduler can execute in a batch
    ↪  to 3
```

`scheduler config balance-hot-region-scheduler`

Use this command to view and control the `balance-hot-region-scheduler` policy.

Usage:

```
>> scheduler config balance-hot-region-scheduler // Display all
    ↪ configuration of the balance-hot-region scheduler
{
  "min-hot-byte-rate": 100,
  "min-hot-key-rate": 10,
  "min-hot-query-rate": 10,
  "max-zombie-rounds": 3,
  "max-peer-number": 1000,
  "byte-rate-rank-step-ratio": 0.05,
  "key-rate-rank-step-ratio": 0.05,
  "query-rate-rank-step-ratio": 0.05,
  "count-rank-step-ratio": 0.01,
  "great-dec-ratio": 0.95,
  "minor-dec-ratio": 0.99,
  "src-tolerance-ratio": 1.05,
  "dst-tolerance-ratio": 1.05,
  "read-priorities": [
    "query",
    "byte"
  ],
  "write-leader-priorities": [
    "key",
    "byte"
  ],
  "write-peer-priorities": [
    "byte",
    "key"
  ],
  "strict-picking-store": "true",
  "enable-for-tiflash": "true",
  "rank-formula-version": "v2"
}
```

- `min-hot-byte-rate` means the smallest number of bytes to be counted, which is usually 100.

```
scheduler config balance-hot-region-scheduler set min-hot-byte-rate 100
```

- `min-hot-key-rate` means the smallest number of keys to be counted, which is usually 10.

```
scheduler config balance-hot-region-scheduler set min-hot-key-rate 10
```

- `min-hot-query-rate` means the smallest number of queries to be counted, which is usually 10.

```
scheduler config balance-hot-region-scheduler set min-hot-query-rate 10
```

- `max-zombie-rounds` means the maximum number of heartbeats with which an operator can be considered as the pending influence. If you set it to a larger value, more operators might be included in the pending influence. Usually, you do not need to adjust its value. Pending influence refers to the operator influence that is generated during scheduling but still has an effect.

```
scheduler config balance-hot-region-scheduler set max-zombie-rounds 3
```

- `max-peer-number` means the maximum number of peers to be solved, which prevents the scheduler from being too slow.

```
scheduler config balance-hot-region-scheduler set max-peer-number 1000
```

- `byte-rate-rank-step-ratio`, `key-rate-rank-step-ratio`, `query-rate-rank-step-ratio`, and `count-rank-step-ratio` respectively mean the step ranks of byte, key, query, and count. The rank-step-ratio decides the step when the rank is calculated. `great-dec-ratio` and `minor-dec-ratio` are used to determine the `dec` rank. Usually, you do not need to modify these items.

```
scheduler config balance-hot-region-scheduler set byte-rate-rank-step-
    ↪ ratio 0.05
```

- `src-tolerance-ratio` and `dst-tolerance-ratio` are configuration items for the expectation scheduler. The smaller the `tolerance-ratio`, the easier it is for scheduling. When redundant scheduling occurs, you can appropriately increase this value.

```
scheduler config balance-hot-region-scheduler set src-tolerance-ratio
    ↪ 1.1
```

- `read-priorities`, `write-leader-priorities`, and `write-peer-priorities` control which dimension the scheduler prioritizes for hot Region scheduling. Two dimensions are supported for configuration.

- `read-priorities` and `write-leader-priorities` control which dimensions the scheduler prioritizes for scheduling hot Regions of the read and write-leader types. The dimension options are `query`, `byte`, and `key`.
- `write-peer-priorities` controls which dimensions the scheduler prioritizes for scheduling hot Regions of the write-peer type. The dimension options are `byte` and `key`.

> **Note:**
>
> If a cluster component is earlier than v5.2, the configuration of `query` dimension does not take effect. If some components are upgraded to v5.2 or later, the `byte` and `key` dimensions still by default have the priority for hot Region scheduling. After all components of the cluster are upgraded to v5.2 or later, such a configuration still takes effect for compatibility. You can view the real-time configuration using the `pd-ctl` command. Usually, you do not need to modify these configurations.

```
scheduler config balance-hot-region-scheduler set read-priorities query
    ↪ ,byte
```

- `strict-picking-store` controls the search space of hot Region scheduling. Usually, it is enabled. This configuration item only affects the behavior when `rank-formula` ↪ `-version` is `v1`. When it is enabled, hot Region scheduling ensures hot Region balance on the two configured dimensions. When it is disabled, hot Region scheduling only ensures the balance on the dimension with the first priority, which might reduce balance on other dimensions. Usually, you do not need to modify this configuration.

```
scheduler config balance-hot-region-scheduler set strict-picking-store
    ↪ true
```

- `rank-formula-version` controls which scheduler algorithm version is used in hot Region scheduling. Value options are `v1` and `v2`. The default value is `v2`.

    - The `v1` algorithm is the scheduler strategy used in TiDB v6.3.0 and earlier versions. This algorithm mainly focuses on reducing load difference between stores and avoids introducing side effects in the other dimension.
    - The `v2` algorithm is an experimental scheduler strategy introduced in TiDB v6.3.0 and is in General Availability (GA) in TiDB v6.4.0. This algorithm mainly focuses on improving the rate of the equitability between stores and factors in few side effects. Compared with the `v1` algorithm with `strict-picking-store` being `true` ↪ , the `v2` algorithm pays more attention to the priority equalization of the first dimension. Compared with the `v1` algorithm with `strict-picking-store` being `false`, the `v2` algorithm considers the balance of the second dimension.

- The v1 algorithm with strict-picking-store being true is conservative and scheduling can only be generated when there is a store with a high load in both dimensions. In certain scenarios, it might be impossible to continue balancing due to dimensional conflicts. To achieve better balancing in the first dimension, it is necessary to set the strict-picking-store to false. The v2 algorithm can achieve better balancing in both dimensions and reduce invalid scheduling.

```
bash  scheduler config balance-hot-region-scheduler set rank-formula-
↪ version v2
```

- enable-for-tiflash controls whether hot Region scheduling takes effect for TiFlash instances. Usually, it is enabled. When it is disabled, the hot Region scheduling between TiFlash instances is not performed.

```
scheduler config balance-hot-region-scheduler set enable-for-tiflash
    ↪ true
```

#### 14.6.2.4.24 scheduler config evict-leader-scheduler

Use this command to view and manage the configuration of the evict-leader-
↪ scheduler.

- When an evict-leader-scheduler already exists, use the add-store subcommand to add leader eviction scheduling for the specified store:

```
scheduler config evict-leader-scheduler add-store 2 // Add leader
    ↪ eviction scheduling for store 2
```

- When an evict-leader-scheduler already exists, use the delete-store subcommand to remove leader eviction scheduling for the specified store:

```
scheduler config evict-leader-scheduler delete-store 2 // Remove leader
    ↪  eviction scheduling for store 2
```

If all store configurations of an evict-leader-scheduler are removed, the scheduler itself is automatically removed.

#### 14.6.2.4.25 service-gc-safepoint

Use this command to query the current GC safepoint and service GC safepoint. The output is as follows:

```
{
  "service_gc_safe_points": [
    {
      "service_id": "gc_worker",
```

```
      "expired_at": 9223372036854775807,
      "safe_point": 439923410637160448
    }
  ],
  "gc_safe_point": 0
}
```

#### 14.6.2.4.26 store [delete | cancel-delete | label | weight | remove-tombstone | limit ] <store_id> [--jq="<query string>"]

For a jq formatted output, see jq-formatted-json-output-usage.

Get a store

To display the information of all stores, run the following command:

```
store
```

```
{
  "count": 3,
  "stores": [...]
}
```

To get the store with id of 1, run the following command:

```
store 1
```

```
......
```

Delete a store

To delete the store with id of 1, run the following command:

```
store delete 1
```

To cancel deleting `Offline` state stores which are deleted using `store delete`, run the `store cancel-delete` command. After canceling, the store changes from `Offline` to `Up`. Note that the `store cancel-delete` command cannot change a `Tombstone` state store to the `Up` state.

To cancel deleting the store with id of 1, run the following command:

```
store cancel-delete 1
```

To delete all stores in `Tombstone` state, run the following command:

```
store remove-tombstone
```

**Note:**

If the PD leader changes during store deletion, you need to modify the store limit manually using the `store limit` command.

Manage store labels

To manage the labels of a store, run the `store label` command.

- To set a label with the key being `"zone"` and value being `"cn"` to the store with id of 1, run the following command:

```
store label 1 zone=cn
```

- To update the label of a store, for example, changing the value of the key `"zone"` from `"cn"` to `"us"` for the store with id of 1, run the following command:

```
store label 1 zone=us
```

- To rewrite all labels of a store with id of 1, use the `--rewrite` option. Note that this option overwrites all existing labels:

```
store label 1 region=us-est-1 disk=ssd --rewrite
```

- To delete the `"disk"` label for the store with id of 1, use the `--delete` option:

```
store label 1 disk --delete
```

**Note:**

- The label of a store is updated by merging the label in TiKV and that in PD. Specifically, after you modify a store label in the TiKV configuration file and restart the cluster, PD merges its own store label with the TiKV store label, updates the label, and persists the merged result.
- To manage labels of a store using TiUP, you can run the `store label <id> --force` command to empty the labels stored in PD before restarting the cluster.

Configure store weight

To set the leader weight to 5 and Region weight to 10 for the store with id of 1, run the following command:

```
store weight 1 5 10
```

Configure store scheduling speed

You can set the scheduling speed of stores by using `store limit`. For more details about the principles and usage of `store limit`, see store limit.

```
>> store limit                    // Show the speed limit of adding-peer
   ↪ operations and the limit of removing-peer operations per minute in
   ↪ all stores
>> store limit add-peer           // Show the speed limit of adding-peer
   ↪ operations per minute in all stores
>> store limit remove-peer        // Show the limit of removing-peer
   ↪ operations per minute in all stores
>> store limit all 5              // Set the limit of adding-peer
   ↪ operations to 5 and the limit of removing-peer operations to 5 per
   ↪ minute for all stores
>> store limit 1 5                // Set the limit of adding-peer
   ↪ operations to 5 and the limit of removing-peer operations to 5 per
   ↪ minute for store 1
>> store limit all 5 add-peer     // Set the limit of adding-peer
   ↪ operations to 5 per minute for all stores
>> store limit 1 5 add-peer       // Set the limit of adding-peer
   ↪ operations to 5 per minute for store 1
>> store limit 1 5 remove-peer    // Set the limit of removing-peer
   ↪ operations to 5 per minute for store 1
>> store limit all 5 remove-peer  // Set the limit of removing-peer
   ↪ operations to 5 per minute for all stores
```

**Note:**

You can use `pd-ctl` to check the state (`Up`, `Disconnect`, `Offline`, `Down`, or `Tombstone`) of a TiKV store. For the relationship between each state, refer to Relationship between each state of a TiKV store.

#### 14.6.2.4.27 `log [fatal | error | warn | info | debug]`

Use this command to set the log level of the PD leader.

Usage:

```
log warn
```

#### 14.6.2.4.28 `tso`

Use this command to parse the physical and logical time of TSO.

Usage:

```
>> tso 395181938313123110    // Parse TSO
system: 2017-10-09 05:50:59 +0800 CST
logic: 120102
```

#### 14.6.2.4.29 `unsafe remove-failed-stores [store-ids | show]`

**Warning:**

- This feature is a lossy recovery, so TiKV cannot guarantee data integrity and data indexes integrity after using the feature.
- It is recommended to perform the feature-related operations with the support from the TiDB team. If any misoperation is performed, it might be hard to recover the cluster.

Use this command to perform lossy recovery operations when permanently damaged replicas cause data to be unavailable. See the following example. The details are described in Online Unsafe Recovery

Execute Online Unsafe Recovery to remove permanently damaged stores:

```
unsafe remove-failed-stores 101,102,103
```

```
Success!
```

Show the current or historical state of Online Unsafe Recovery:

```
unsafe remove-failed-stores show
```

```
[
  "Collecting cluster info from all alive stores, 10/12.",
  "Stores that have reports to PD: 1, 2, 3, ...",
  "Stores that have not reported to PD: 11, 12",
]
```

### 14.6.2.5 Jq formatted JSON output usage

#### 14.6.2.5.1 Simplify the output of `store`

```
>> store --jq=".stores[].store | { id, address, state_name}"
{"id":1,"address":"127.0.0.1:20161","state_name":"Up"}
{"id":30,"address":"127.0.0.1:20162","state_name":"Up"}
...
```

#### 14.6.2.5.2 Query the remaining space of the node

```
>> store --jq=".stores[] | {id: .store.id, available: .status.available}"
{"id":1,"available":"10 GiB"}
{"id":30,"available":"10 GiB"}
...
```

#### 14.6.2.5.3 Query all nodes whose status is not `Up`

```
store --jq='.stores[].store | select(.state_name!="Up") | { id, address,
    ↪ state_name}'
```

```
{"id":1,"address":"127.0.0.1:20161""state_name":"Offline"}
{"id":5,"address":"127.0.0.1:20162""state_name":"Offline"}
...
```

#### 14.6.2.5.4 Query all TiFlash nodes

```
store --jq='.stores[].store | select(.labels | length>0 and contains([{"key
    ↪ ":"engine","value":"tiflash"}])) | { id, address, state_name}'
```

```
{"id":1,"address":"127.0.0.1:20161""state_name":"Up"}
{"id":5,"address":"127.0.0.1:20162""state_name":"Up"}
...
```

#### 14.6.2.5.5 Query the distribution status of the Region replicas

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id]}"
{"id":2,"peer_stores":[1,30,31]}
{"id":4,"peer_stores":[1,31,34]}
...
```

#### 14.6.2.5.6 Filter Regions according to the number of replicas

For example, to filter out all Regions whose number of replicas is not 3:

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id] |
   ↪ select(length != 3)}"
{"id":12,"peer_stores":[30,32]}
{"id":2,"peer_stores":[1,30,31,32]}
```

#### 14.6.2.5.7 Filter Regions according to the store ID of replicas

For example, to filter out all Regions that have a replica on store30:

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id] |
   ↪ select(any(.==30))}"
{"id":6,"peer_stores":[1,30,31]}
{"id":22,"peer_stores":[1,30,32]}
...
```

You can also find out all Regions that have a replica on store30 or store31 in the same way:

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id] |
   ↪ select(any(.==(30,31)))}"
{"id":16,"peer_stores":[1,30,34]}
{"id":28,"peer_stores":[1,30,32]}
{"id":12,"peer_stores":[30,32]}
...
```

#### 14.6.2.5.8 Look for relevant Regions when restoring data

For example, when [store1, store30, store31] is unavailable at its downtime, you can find all Regions whose Down replicas are more than normal replicas:

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id] |
   ↪ select(length as $total | map(if .==(1,30,31) then . else empty end)
   ↪ | length>=$total-length) }"
{"id":2,"peer_stores":[1,30,31,32]}
{"id":12,"peer_stores":[30,32]}
{"id":14,"peer_stores":[1,30,32]}
...
```

Or when [store1, store30, store31] fails to start, you can find Regions where the data can be manually removed safely on store1. In this way, you can filter out all Regions that have a replica on store1 but don't have other DownPeers:

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id] |
   ↪ select(length>1 and any(.==1) and all(.!=(30,31)))}"
{"id":24,"peer_stores":[1,32,33]}
```

When [store30, store31] is down, find out all Regions that can be safely processed by creating the `remove-peer` Operator, that is, Regions with one and only DownPeer:

```
>> region --jq=".regions[] | {id: .id, remove_peer: [.peers[].store_id] |
   ↪ select(length>1) | map(if .==(30,31) then . else empty end) | select(
   ↪ length==1)}"
{"id":12,"remove_peer":[30]}
{"id":4,"remove_peer":[31]}
{"id":22,"remove_peer":[30]}
...
```

### 14.6.3 TiDB Control User Guide

TiDB Control is a command-line tool of TiDB, usually used to obtain the status information of TiDB for debugging. This document introduces the features of TiDB Control and how to use these features.

> **Note:**
>
> TiDB Control is specifically designed for debugging purposes and might not be fully compatible with future capabilities introduced in TiDB. It's not recommended to include this tool in applications or utilities development to get information.

#### 14.6.3.1 Get TiDB Control

You can get TiDB Control by installing it using TiUP or by compiling it from source code.

> **Note:**
>
> It is recommended that the version of the Control tool you use is consistent with the version of the cluster.

#### 14.6.3.1.1 Install TiDB Control using TiUP

After installing TiUP, you can use `tiup ctl:v<CLUSTER_VERSION> tidb` command to get and execute TiDB Control.

#### 14.6.3.1.2 Compile from source code

- Compilation environment requirement: Go 1.19 or later
- Compilation procedures: Go to the root directory of the TiDB Control project, use the `make` command to compile, and generate `tidb-ctl`.
- Compilation documentation: you can find the help files in the `doc` directory; if the help files are lost or you want to update them, use the `make doc` command to generate the help files.

### 14.6.3.2 Usage introduction

This section describes how to use commands, subcommands, options, and flags in `tidb-ctl`.

- command: characters without `-` or `--`
- subcommand: characters without `-` or `--` that follow a command
- option: characters with `-` or `--`
- flag: characters exactly following a command/subcommand or option, passing value to the command/subcommand or option

Usage example: `tidb-ctl schema in mysql -n db`

- `schema`: the command
- `in`: the subcommand of `schema`
- `mysql`: the flag of `in`
- `-n`: the option
- `db`: the flag of `-n`

Currently, TiDB Control has the following subcommands:

- `tidb-ctl base64decode`: used for `BASE64` decoding
- `tidb-ctl decoder`: used for `KEY` decoding
- `tidb-ctl etcd`: used for operating etcd
- `tidb-ctl log`: used to format the log file to expand the single-line stack information
- `tidb-ctl mvcc`: used to get the MVCC information
- `tidb-ctl region`: used to get the Region information
- `tidb-ctl schema`: used to get the schema information
- `tidb-ctl table`: used to get the table information

#### 14.6.3.2.1 Get help

Use `tidb-ctl -h/--help` to get usage information.

TiDB Control consists of multiple layers of commands. You can use `-h/--help` after each command/subcommand to get its respective usage information.

The following example shows how to obtain the schema information:

Use `tidb-ctl schema -h` to get usage details. The `schema` command itself has two subcommands: `in` and `tid`.

- `in` is used to obtain the table schema of all tables in the database through the database name.
- `tid` is used to obtain the table schema by using the unique `table_id` in the whole database.

#### 14.6.3.2.2 Global options

`tidb-ctl` has the following connection-related global options:

- `--host`: TiDB Service address (default 127.0.0.1)
- `--port`: TiDB status port (default 10080)
- `--pdhost`: PD Service address (default 127.0.0.1)
- `--pdport`: PD Service port (default 2379)
- `--ca`: The CA file path used for the TLS connection
- `--ssl-key`: The key file path used for the TLS connection
- `--ssl-cert`: The certificate file path used for the TLS connection

`--pdhost` and `--pdport` are mainly used in the `etcd` subcommand. For example, `tidb-ctl etcd ddlinfo`. If you do not specify the address and the port, the following default value is used:

- The default service address of TiDB and PD: `127.0.0.1`. The service address must be an IP address.
- The default service port of TiDB: `10080`.
- The default service port of PD: `2379`.

#### 14.6.3.2.3 The `schema` command

The `in` subcommand

`in` is used to obtain the table schema of all tables in the database through the database name.

```
tidb-ctl schema in <database name>
```

For example, running `tidb-ctl schema in mysql` returns the following result:

```
[
    {
        "id": 13,
        "name": {
            "O": "columns_priv",
            "L": "columns_priv"
        },
             ...
        "update_timestamp": 399494726837600268,
        "ShardRowIDBits": 0,
        "Partition": null
    }
]
```

The result is displayed in the JSON format. (The above output is truncated.)

- If you want to specify the table name, use `tidb-ctl schema in <database> -n <table name>` to filter.

  For example, `tidb-ctl schema in mysql -n db` returns the table schema of the `db` table in the `mysql` database:

  ```
  {
      "id": 9,
      "name": {
          "O": "db",
          "L": "db"
      },
      ...
      "Partition": null
  }
  ```

  (The above output is also truncated.)

  If you do not want to use the default TiDB service address and port, use the `--host` and `--port` options to configure. For example, `tidb-ctl --host 172.16.55.88 --port 8898 schema in mysql -n db`.

The `tid` subcommand

`tid` is used to obtain the table schema by using the unique `table_id` in the whole database. You can use the `in` subcommand to get all table IDs of certain schema and use the `tid` subcommand to get the detailed table information.

For example, the table ID of `mysql.stat_meta` is `21`. You can use `tidb-ctl schema tid -i 21` to obtain the detail of `mysql.stat_meta`.

```
{
 "id": 21,
 "name": {
  "O": "stats_meta",
  "L": "stats_meta"
 },
 "charset": "utf8mb4",
 "collate": "utf8mb4_bin",
  ...
}
```

Like the `in` subcommand, if you do not want to use the default TiDB service address and status port, use the `--host` and `--port` options to specify the host and port.

The `base64decode` command

`base64decode` is used to decode `base64` data.

```
tidb-ctl base64decode [base64_data]
tidb-ctl base64decode [db_name.table_name] [base64_data]
tidb-ctl base64decode [table_id] [base64_data]
```

1. Execute the following SQL statement to prepare the environment:

```
use test;
create table t (a int, b varchar(20),c datetime default
    ↪ current_timestamp , d timestamp default current_timestamp,
    ↪ unique index(a));
insert into t (a,b,c) values(1,"哈哈 hello",NULL);
alter table t add column e varchar(20);
```

2. Obtian MVCC data using the HTTP API interface:

```
$ curl "http://$IP:10080/mvcc/index/test/t/a/1?a=1"
{
 "info": {
  "writes": [
   {
    "start_ts": 407306449994645510,
    "commit_ts": 407306449994645513,
    "short_value": "AAAAAAAAAAE=" # The unique index a stores the
        ↪ handle id of the corresponding row.
   }
  ]
 }
}%
```

```
$ curl "http://$IP:10080/mvcc/key/test/t/1"
{
 "info": {
  "writes": [
   {
    "start_ts": 407306588892692486,
    "commit_ts": 407306588892692489,
    "short_value": "CAIIAggEAhjlk4jlk4ggaGVsbG8IBgAICAmAgIDwjYuu0Rk=" #
       ↪  Row data that handle id is 1.
   }
  ]
 }
}%
```

3. Decode `handle id (uint64)using `base64decode``.

```
$ tidb-ctl base64decode AAAAAAAAAAE=
hex: 0000000000000001
uint64: 1
```

4. Decode row data using `base64decode`.

```
$ ./tidb-ctl base64decode test.t
   ↪ CAIIAggEAhjlk4jlk4ggaGVsbG8IBgAICAmAgIDwjYuu0Rk=
a:     1
b:     哈哈 hello
c is NULL
d:     2019-03-28 05:35:30
e not found in data

# if the table id of test.t is 60, you can also use below command to do
   ↪  the same thing.
$ ./tidb-ctl base64decode 60
   ↪ CAIIAggEAhjlk4jlk4ggaGVsbG8IBgAICAmAgIDwjYuu0Rk=
a:     1
b:     哈哈 hello
c is NULL
d:     2019-03-28 05:35:30
e not found in data
```

#### 14.6.3.2.4 The `decoder` command

- The following example shows how to decode the row key, similar to decoding the index key.

```
$ ./tidb-ctl decoder "t\x00\x00\x00\x00\x00\x00\x00\x1c_r\x00\x00\x00\
    ↪ x00\x00\x00\x00\xfa"
format: table_row
table_id: -9223372036854775780  table_id: -9223372036854775780
row_id: -9223372036854775558    row_id: -9223372036854775558
```

- The following example shows how to decode `value`.

```
$ ./tidb-ctl decoder AhZoZWxsbyB3b3JsZAiAEA==
format: index_value
type: bigint, value: 1024   index_value[0]: {type: bytes, value: hello
    ↪ world}
index_value[1]: {type: bigint, value: 1024}
```

#### 14.6.3.2.5 The `etcd` command

- `tidb-ctl etcd ddlinfo` is used to obtain DDL information.
- `tidb-ctl etcd putkey KEY VALUE` is used to add KEY VALUE to etcd (All the KEYs are added to the `/tidb/ddl/all_schema_versions/` directory).

```
tidb-ctl etcd putkey "foo" "bar"
```

  In fact, a key-value pair is added to the etcd whose KEY is `/tidb/ddl/
  ↪ all_schema_versions/foo` and VALUE is `bar`.

- `tidb-ctl etcd delkey` deletes the KEY in etcd. Only those KEYs with the `/tidb/
  ↪ ddl/fg/owner/` or `/tidb/ddl/all_schema_versions/` prefix can be deleted.

```
tidb-ctl etcd delkey "/tidb/ddl/fg/owner/foo"
tidb-ctl etcd delkey "/tidb/ddl/all_schema_versions/bar"
```

#### 14.6.3.2.6 The `log` command

The stack information for the TiDB error log is in one line format. You could use `tidb-ctl log` to change its format to multiple lines.

#### 14.6.3.2.7 The `keyrange` command

The `keyrange` subcommand is used to query the global or table-related key range information, which is output in the hexadecimal form.

- Execute the `tidb-ctl keyrange` command to check the global key range information:

```
tidb-ctl keyrange
```

```
global ranges:
  meta: (6d, 6e)
  table: (74, 75)
```

- Add the `--encode` option to display encoded keys (in the same format as in TiKV and PD):

```
tidb-ctl keyrange --encode
```

```
global ranges:
  meta: (6d00000000000000f8, 6e00000000000000f8)
  table: (7400000000000000f8, 7500000000000000f8)
```

- Execute the `tidb-ctl keyrange --database={db} --table={tbl}` command to check the global and table-related key range information:

```
tidb-ctl keyrange --database test --table ttt
```

```
global ranges:
  meta: (6d, 6e)
  table: (74, 75)
table ttt ranges: (NOTE: key range might be changed after DDL)
  table: (748000000000002f, 748000000000000030)
  table indexes: (748000000000002f5f69, 748000000000002f5f72)
    index c2: (748000000000002f5f698000000000000001,
       ↪ 748000000000002f5f698000000000000002)
    index c3: (748000000000002f5f698000000000000002,
       ↪ 748000000000002f5f698000000000000003)
    index c4: (748000000000002f5f698000000000000003,
       ↪ 748000000000002f5f698000000000000004)
  table rows: (748000000000002f5f72, 748000000000000030)
```

### 14.6.4 PD Recover User Guide

PD Recover is a disaster recovery tool of PD, used to recover the PD cluster which cannot start or provide services normally.

#### 14.6.4.1 Compile from source code

- Go 1.19 or later is required because the Go modules are used.
- In the root directory of the PD project, use the `make pd-recover` command to compile and generate `bin/pd-recover`.

> **Note:**
>
> Generally, you do not need to compile source code because the PD Control tool already exists in the released binary or Docker. However, developer users can refer to the instructions above for compiling source code.

#### 14.6.4.2 Download TiDB Toolkit

The PD Recover installation package is included in the TiDB Toolkit. To download the TiDB Toolkit, see Download TiDB Tools.

The following sections introduce two methods to recover a PD cluster: recover from a surviving PD node and rebuild a PD cluster entirely.

#### 14.6.4.3 Method 1: Recover a PD cluster using a surviving PD node

When a majority of PD nodes in a cluster experience an unrecoverable error, the cluster becomes unable to provide services. If there are any surviving PD nodes, you can recover the service by selecting a surviving PD node and forcibly modifying the members of the Raft Group. The steps are as follows:

##### 14.6.4.3.1 Step 1: Stop all nodes

To prevent data corruption or other unrecoverable errors caused by interactions with PD parameters during the recovery process, stop the TiDB, TiKV, and TiFlash processes in the cluster.

##### 14.6.4.3.2 Step 2: Start the surviving PD node

Start the surviving PD node using the `--force-new-cluster` startup parameter. The following is an example:

```
./bin/pd-server --force-new-cluster --name=pd-127.0.0.10-2379 --client-urls=
    ↪ http://0.0.0.0:2379 --advertise-client-urls=http://127.0.0.1:2379 --
    ↪ peer-urls=http://0.0.0.0:2380 --advertise-peer-urls=http
    ↪ ://127.0.0.1:2380 --config=conf/pd.toml
```

##### 14.6.4.3.3 Step 3: Repair metadata using `pd-recover`

Since this method relies on a minority PD node to recover the service, the node might contain outdated data. If the `alloc_id` and `tso` data roll back, the cluster data might be corrupted or unavailable. To prevent this, you need to use `pd-recover` to modify the metadata to ensure that the node can provide correct allocation IDs and TSO services. The following is an example:

```
./bin/pd-recover --from-old-member --endpoints=http://127.0.0.1:2379 #
    ↪ Specify the corresponding PD address
```

> **Note:**
>
> In this step, the `alloc_id` in the storage automatically increases by a safe value of `100000000`. As a result, the subsequent cluster will allocate larger IDs.
>
> Additionally, `pd-recover` does not modify the TSO. Therefore, before performing this step, make sure that the local time is later than the time when the failure occurs, and verify that the NTP clock synchronization service is enabled between the PD components before the failure. If it is not enabled, you need to adjust the local clock to a future time to prevent the TSO from rolling back.

#### 14.6.4.3.4 Step 4: Restart the PD node

Once you see the prompt message `recovery is successful`, restart the PD node.

#### 14.6.4.3.5 Step 5: Scale out PD and start the cluster

Scale out the PD cluster using the deployment tool and start the other components in the cluster. At this point, the PD service is available.

### 14.6.4.4 Method 2: Entirely rebuild a PD cluster

This method is applicable to scenarios in which all PD data is lost, but the data of other components, such as TiDB, TiKV, and TiFlash, still exists.

#### 14.6.4.4.1 Step 1: Get cluster ID

The cluster ID can be obtained from the log of PD, TiKV, or TiDB. To get the cluster ID, you can view the log directly on the server.

Get cluster ID from PD log (recommended)

To get the cluster ID from the PD log, run the following command:

```
cat {{/path/to}}/pd.log | grep "init cluster id"
```

```
[2019/10/14 10:35:38.880 +00:00] [INFO] [server.go:212] ["init cluster id"]
    ↪ [cluster-id=6747551640615446306]
...
```

Get cluster ID from TiDB log

To get the cluster ID from the TiDB log, run the following command:

```
cat {{/path/to}}/tidb.log | grep "init cluster id"
```

```
2019/10/14 19:23:04.688 client.go:161: [info] [pd] init cluster id
    ↪ 6747551640615446306
...
```

Get cluster ID from TiKV log

To get the cluster ID from the TiKV log, run the following command:

```
cat {{/path/to}}/tikv.log | grep "connect to PD cluster"
```

```
[2019/10/14 07:06:35.278 +00:00] [INFO] [tikv-server.rs:464] ["connect to PD
    ↪  cluster 6747551640615446306"]
...
```

#### 14.6.4.4.2 Step 2: Get allocated ID

The allocated ID value you specify must be larger than the currently largest allocated ID value. To get allocated ID, you can either get it from the monitor, or view the log directly on the server.

Get allocated ID from the monitor (recommended)

To get allocated ID from the monitor, you need to make sure that the metrics you are viewing are the metrics of **the last PD leader**, and you can get the largest allocated ID from the **Current ID allocation** panel in PD dashboard.

Get allocated ID from PD log

To get the allocated ID from the PD log, you need to make sure that the log you are viewing is the log of **the last PD leader**, and you can get the maximum allocated ID by running the following command:

```
cat {{/path/to}}/pd*.log | grep "idAllocator allocates a new id" | awk -F
    ↪ '=' '{print $2}' | awk -F']' '{print $1}' | sort -r -n | head -n 1
```

```
4000
...
```

Or you can simply run the above command in all PD servers to find the largest one.

#### 14.6.4.4.3 Step 3: Deploy a new PD cluster

Before deploying a new PD cluster, you need to stop the the existing PD cluster and then delete the previous data directory or specify a new data directory using `--data-dir`.

##### 14.6.4.4.4 Step 4: Use pd-recover

You only need to run `pd-recover` on one PD node.

```
./pd-recover -endpoints http://10.0.1.13:2379 -cluster-id
   ↪ 6747551640615446306 -alloc-id 10000
```

##### 14.6.4.4.5 Step 5: Restart the whole cluster

When you see the prompted information that the recovery is successful, restart the whole cluster.

#### 14.6.4.5 FAQ

##### 14.6.4.5.1 Multiple cluster IDs are found when getting the cluster ID

When a PD cluster is created, a new cluster ID is generated. You can determine the cluster ID of the old cluster by viewing the log.

##### 14.6.4.5.2 The error `dial tcp 10.0.1.13:2379: connect: connection refused` is returned when executing `pd-recover`

The PD service is required when you execute `pd-recover`. Deploy and start the PD cluster before you use PD Recover.

## 14.7 Command Line Flags

### 14.7.1 Configuration Options

When you start the TiDB cluster, you can use command-line options or environment variables to configure it. This document introduces TiDB's command options. The default TiDB ports are `4000` for client requests and `10080` for status report.

#### 14.7.1.1 `--advertise-address`

- The IP address through which to log into the TiDB server
- Default: `""`
- This address must be accessible by the rest of the TiDB cluster and the user.

#### 14.7.1.2 `--config`

- The configuration file
- Default: `""`

- If you have specified the configuration file, TiDB reads the configuration file. If the corresponding configuration also exists in the command line options, TiDB uses the configuration in the command line options to overwrite that in the configuration file. For detailed configuration information, see TiDB Configuration File Description.

#### 14.7.1.3 `--config-check`

- Checks the validity of the configuration file and exits
- Default: `false`

#### 14.7.1.4 `--config-strict`

- Enforces the validity of the configuration file
- Default: `false`

#### 14.7.1.5 `--cors`

- Specifies the `Access-Control-Allow-Origin` value for Cross-Origin Request Sharing (CORS) request of the TiDB HTTP status service
- Default: `""`

#### 14.7.1.6 `--enable-binlog`

- Enables or disables TiDB binlog generation
- Default: `false`

#### 14.7.1.7 `--host`

- The host address that the TiDB server monitors
- Default: `"0.0.0.0"`
- The TiDB server monitors this address.
- The `"0.0.0.0"` address monitors all network cards by default. If you have multiple network cards, specify the network card that provides service, such as `192.168.100.113`.

#### 14.7.1.8 `--initialize-insecure`

- Bootstraps tidb-server in insecure mode
- Default: `true`

#### 14.7.1.9 `--initialize-secure`

- Bootstraps tidb-server in secure mode
- Default: `false`

#### 14.7.1.10 `--initialize-sql-file`

- The SQL script to be executed when the TiDB cluster is started for the first time. For details, see configuration item `initialize-sql-file`
- Default: `""`

#### 14.7.1.11 `-L`

- The log level
- Default: `"info"`
- Optional values: `"debug"`, `"info"`, `"warn"`, `"error"`, `"fatal"`

#### 14.7.1.12 `--lease`

- The duration of the schema lease. It is **dangerous** to change the value unless you know what you do.
- Default: `45s`

#### 14.7.1.13 `--log-file`

- The log file
- Default: `""`
- If this option is not set, logs are output to "stderr". If this option is set, logs are output to the corresponding file.

#### 14.7.1.14 `--log-slow-query`

- The directory for the slow query log
- Default: `""`
- If this option is not set, logs are output to the file specified by `--log-file` by default.

#### 14.7.1.15 `--metrics-addr`

- The Prometheus Pushgateway address
- Default: `""`
- Leaving it empty stops the Prometheus client from pushing.
- The format is `--metrics-addr=192.168.100.115:9091`.

#### 14.7.1.16 `--metrics-interval`

- The Prometheus client push interval in seconds
- Default: `15s`
- Setting the value to 0 stops the Prometheus client from pushing.

#### 14.7.1.17 `-P`

- The monitoring port of TiDB services
- Default: `"4000"`
- The TiDB server accepts MySQL client requests from this port.

#### 14.7.1.18 `--path`

- The path to the data directory for local storage engine like "unistore"
- For `--store = tikv`, you must specify the path; for `--store = unistore`, the default value is used if you do not specify the path.
- For the distributed storage engine like TiKV, `--path` specifies the actual PD address. Assuming that you deploy the PD server on 192.168.100.113:2379, 192.168.100.114:2379 and 192.168.100.115:2379, the value of `--path` is "192.168.100.113:2379, 192.168.100.114:2379, 192.168.100.115:2379".
- Default: `"/tmp/tidb"`
- You can use `tidb-server --store=unistore --path=""` to enable a pure in-memory TiDB.

#### 14.7.1.19 `--proxy-protocol-fallbackable`

- Controls whether to enable PROXY protocol fallback mode. When this parameter is set to `true`, TiDB accepts client connections that belong to `--proxy-protocol-networks` without using the PROXY protocol specification or without sending a PROXY protocol header. By default, TiDB only accepts client connections that belong to `--proxy-protocol-networks` and send a PROXY protocol header.
- Default value: `false`

#### 14.7.1.20 `--proxy-protocol-networks`

- The list of proxy server's IP addresses allowed to connect to TiDB using the PROXY protocol.
- Default: `""`
- In general cases, when you access TiDB behind a reverse proxy, TiDB takes the IP address of the reverse proxy server as the IP address of the client. By enabling the PROXY protocol, reverse proxies that support this protocol such as HAProxy can pass the real client IP address to TiDB.

- After configuring this flag, TiDB allows the configured source IP address to connect to TiDB using the PROXY protocol; if a protocol other than PROXY is used, this connection will be denied; other addresses are allowed to connect to TiDB without the PROXY protocol. If this flag is left empty, no IP address can connect to TiDB using the PROXY protocol. The value can be the IP address (192.168.1.50) or CIDR (192.168.1.0/24) with `,` as the separator. `*` means any IP addresses.

> **Warning:**
>
> Use `*` with caution because it might introduce security risks by allowing a client of any IP address to report its IP address. In addition, using `*` might also cause the internal component that directly connects to TiDB (such as TiDB Dashboard) to be unavailable unless `--proxy-protocol-fallbackable` is set to `true`.

> **Note:**
>
> To use an AWS Network Load Balancer (NLB) with the PROXY protocol enabled, you need to configure the `target group` property of NLB. Specifically, set `proxy_protocol_v2.client_to_server.header_place` to `on_first_ack`. At the same time, you need to submit a ticket to AWS Support. Note that after the PROXY protocol is enabled, the client will fail to obtain handshake packets from the server and the packets are blocked until the client times out. This is because NLB sends proxy packets only after the client sends data. However, before the client sends any data packets, data packets sent by the server are dropped in the internal network.

#### 14.7.1.21 `--proxy-protocol-header-timeout`

- Timeout for the PROXY protocol header read
- Default: `5` (seconds)

> **Warning:**
>
> Since v6.3.0, this parameter is deprecated. It is no longer used because the PROXY protocol header will be read upon the first time network data is read. Deprecating this parameter avoids affecting the timeout set when network data is read for the first time.

**Note:**

Do not set the value to `0`. Use the default value except for special situations.

#### 14.7.1.22 `--report-status`

- Enables (`true`) or disables (`false`) the status report and pprof tool
- Default: `true`
- When set to `true`, this parameter enables metrics and pprof. When set to `false`, this parameter disables metrics and pprof.

#### 14.7.1.23 `--run-ddl`

- To see whether the `tidb-server` runs DDL statements, and set when the number of `tidb-server` is over two in the cluster
- Default: `true`
- The value can be (true) or (false). (true) indicates the `tidb-server` runs DDL itself. (false) indicates the `tidb-server` does not run DDL itself.

#### 14.7.1.24 `--socket string`

- The TiDB services use the unix socket file for external connections.
- Default: `""`
- Use `/tmp/tidb.sock` to open the unix socket file.

#### 14.7.1.25 `--status`

- The status report port for TiDB server
- Default: `"10080"`
- This port is used to get server internal data. The data includes Prometheus metrics and pprof.
- Prometheus metrics can be accessed by `"http://host:status_port/metrics"`.
- pprof data can be accessed by `"http://host:status_port/debug/pprof"`.

#### 14.7.1.26 `--status-host`

- The `HOST` used to monitor the status of TiDB service
- Default: `0.0.0.0`

#### 14.7.1.27 `--store`

- Specifies the storage engine used by TiDB in the bottom layer
- Default: `"unistore"`
- You can choose "unistore" or "tikv". ("unistore" is the local storage engine; "tikv" is a distributed storage engine)

#### 14.7.1.28 `--temp-dir`

- The temporary directory of TiDB
- Default: `"/tmp/tidb"`

#### 14.7.1.29 `--token-limit`

- The number of sessions allowed to run concurrently in TiDB. It is used for traffic control.
- Default: `1000`
- If the number of the concurrent sessions is larger than `token-limit`, the request is blocked and waiting for the operations which have been finished to release tokens.

#### 14.7.1.30 `-V`

- Outputs the version of TiDB
- Default: `""`

#### 14.7.1.31 `--plugin-dir`

- The storage directory for plugins.
- Default: `"/data/deploy/plugin"`

#### 14.7.1.32 `--plugin-load`

- The names of the plugins to be loaded, each separated by a comma.
- Default: `""`

#### 14.7.1.33 `--affinity-cpus`

- Sets the CPU affinity of TiDB servers, which is separated by commas. For example, "1,2,3".
- Default: `""`

#### 14.7.1.34 `--repair-mode`

- Determines whether to enable the repair mode, which is only used in the data repair scenario.
- Default: `false`

#### 14.7.1.35 `--repair-list`

- The names of the tables to be repaired in the repair mode.
- Default: `""`

### 14.7.2 TiKV Configuration Flags

TiKV supports some readable unit conversions for command line parameters.

- File size (based on byte): KB, MB, GB, TB, PB (or lowercase)
- Time (based on ms): ms, s, m, h

#### 14.7.2.1 `-A, --addr`

- The address that the TiKV server monitors
- Default: `"127.0.0.1:20160"`
- To deploy a cluster, you must use `--addr` to specify the IP address of the current host, such as `"192.168.100.113:20160"`. If the cluster is run on Docker, specify the IP address of Docker as `"0.0.0.0:20160"`.

#### 14.7.2.2 `--advertise-addr`

- The server advertise address for client traffic from outside
- Default: `${addr}`
- If the client cannot connect to TiKV through the `--addr` address because of Docker or NAT network, you must manually set the `--advertise-addr` address.
- For example, the internal IP address of Docker is 172.17.0.1, while the IP address of the host is 192.168.100.113 and the port mapping is set to `-p 20160:20160`. In this case, you can set `--advertise-addr` to "192.168.100.113:20160". The client can find this service through 192.168.100.113:20160.

#### 14.7.2.3 `--status-addr`

- The port through which the TiKV service status is listened
- Default: `"20180"`
- The Prometheus can access this status information via `http://host:status_port/` ↪ `metrics`.
- The Profile can access this status information via `http://host:status_port/debug` ↪ `/pprof/profile`.

#### 14.7.2.4 `--advertise-status-addr`

- The address through which TiKV accesses service status from outside.
- Default: The value of `--status-addr` is used.
- If the client cannot connect to TiKV through the `--status-addr` address because of Docker or NAT network, you must manually set the `--advertise-status-addr` address.
- For example, the internal IP address of Docker is `172.17.0.1`, while the IP address of the host is `192.168.100.113` and the port mapping is set to `-p 20180:20180`. In this case, set `--advertise-status-addr="192.168.100.113:20180"`. The client can find this service through `192.168.100.113:20180`.

#### 14.7.2.5 `-C, --config`

- The config file
- Default: `""`
- If you set the configuration using the command line, the same setting in the config file will be overwritten.

#### 14.7.2.6 `--capacity`

- The store capacity
- Default: `0` (unlimited)
- PD uses this flag to determine how to balance the TiKV servers. (Tip: you can use 10GB instead of 1073741824)

#### 14.7.2.7 `--config-info <FORMAT>`

- When this flag is used, available configuration values are listed according to `FORMAT` and then exit.
- Value option for `FORMAT`: `json`. Currently, only JSON format is supported.
- Only the configuration name (Name), default value (DefaultValue) and current value (ValueInFile) are listed in the output JSON. If the `-C` or `--config` is specified, the current value and the default value of configuration items in the file are listed together, and other items without `-C` or `--config` specified only have default values. The following is an example:

```
{
"Component": "TiKV Server",
"Version": "6.2.0",
"Parameters": [
    {
```

```
    "Name": "log-level",
    "DefaultValue": "info",
    "ValueInFile": "warn"
    },
    {
    "Name": "log-file",
    "DefaultValue": ""
    },
    ...
]
}
```

#### 14.7.2.8 `--data-dir`

- The path to the data directory
- Default: `"/tmp/tikv/store"`

#### 14.7.2.9 `-L`

- The log level
- Default: `"info"`
- Optional values: `"debug"`, `"info"`, `"warn"`, `"error"`, `"fatal"`

#### 14.7.2.10 `--log-file`

- The log file
- Default: `""`
- If this flag is not set, logs will be written to "stderr". If this flag is set, logs are output to the corresponding file.

#### 14.7.2.11 `--pd`

- The address list of PD servers
- Default: `""`
- To make TiKV work, you must use the value of `--pd` to connect the TiKV server to the PD server. Separate multiple PD addresses using comma, for example "192.168.100.113:2379, 192.168.100.114:2379, 192.168.100.115:2379".

### 14.7.3 TiFlash Command-Line Flags

This document introduces the command-line flags that you can use when you launch TiFlash.

#### 14.7.3.1 `server --config-file`

- Specifies the path of the TiFlash configuration file
- Default: “”
- You must specify the configuration file. For detailed configuration items, refer to TiFlash configuration parameters.

#### 14.7.3.2 `dttool migrate`

- Migrates the file format of DTFile (for testing or downgrading). Data is migrated in the unit of a single DTFile. If you want to migrate the whole table, you need to locate all the paths similar to `<data dir>/t_<table id>/stable/dmf_<file id>` and migrate them one by one. You can use scripts to automate the migration.

- User scenarios:

    - If you need to downgrade TiFlash from a version >= v5.4.0 that has enabled data validation to a version < v5.4.0, you can use this tool to downgrade the data format of the DTFile.
    - If you upgrade TiFlash to a version >= v5.4.0, and if you hope to enable data validation for existing data, you can use this tool to upgrade the data format of the DTFile.
    - Test the space usage and read speed of the DTFile in different configurations.

- Parameters:

    - `--imitative`: When you do not use the encryption feature of the DTFile, you can use this flag to avoid using the configuration file and connecting to PD.
    - `--version`: The version of DTFile. The value options are `1` and `2` (default). `1` is the old version, and `2` is the version corresponding to the new checksum.
    - `--algorithm`: The hash algorithm used for data validation. The value options are `xxh3` (default), `city128`, `crc32`, `crc64`, and `none`. This parameter is effective only when `version` is `2`.
    - `--frame`: The size of the validation frame. The default value is `1048576`. This parameter is effective only when `version` is `2`.
    - `--compression`: The target compression algorithm. The value options are `LZ4` (default), `LZ4HC`, `zstd`, and `none`.
    - `--level`: The target compression level. If not specified, the recommended compression level is used by default according to the compression algorithm. If `compression` is set to `LZ4` or `zstd`, the default level is 1. If `compression` is set to `LZ4HC`, the default level is 9.
    - `--config-file`: The configuration file of `dttool migrate` is the same as the configuration file of `server`. For more information, see `--imitative`.
    - `--file-id`: The ID of the DTFile. For example, the ID of the DTFile `dmf_123` is `123`.

- `--workdir`: The parent directory of `dmf_xxx`.
- `--dry`: The dry run mode. Only the migration process is output.
- `--nokeep`: Does not keep the original data. When this option is not enabled, `dmf_xxx.old` files are created.

**Warning:**

TiFlash can read DTFile that uses custom compression algorithms and compression levels. However, only the `lz4` algorithm with the default compression level is officially supported. Custom compression parameters have not been thoroughly tested and are only experimental.

**Note:**

For security reasons, DTTool attempts to add a lock to the working directory in the migration mode. Therefore, in the same directory, only one DTTool can perform the migration task at the same time. If you forcibly stop DTTool where the lock is not released, then when you try to rerun DTTool later, it might refuse to perform the migration task.

If you encounter this situation, and if you are aware that removing the LOCK file does not cause any data corruption, you can manually delete the LOCK file in the working directory to release the lock.

#### 14.7.3.3 `dttool bench`

- Provides a basic I/O speed test for the DTFile.
- Parameters:
  - `--version`: The version of DTFile. See `--version` in `dttool migrate`.
  - `--algorithm`: The hash algorithm used for data validation. See `--algorithm` in `dttool migrate`.
  - `--frame`: The size of the validation frame. See `--frame` in `dttool migrate`.
  - `--column`: The columns of the table to be tested. The default value is `100`.
  - `--size`: The rows of the table to be tested. The default value is `1000`.
  - `--field`: The field length limit of the table to be tested. The default value is `1024`.
  - `--random`: The random seed. If you do not specify this parameter, the random seed is drawn from the system entropy pool.

- `--encryption`: Enables the encryption feature.
- `--repeat`: The number of times to repeat the test. The default value is `5`.
- `--workdir`: The temporary data directory, which points to a path in the file system to be tested. The default value is `/tmp/test`.

#### 14.7.3.4 `dttool inspect`

- Checks the integrity of the DTFile. Data validation is performed in the unit of a single DTFile. If you want to validate the whole table, you need to locate all the paths similar to `<data dir>/t_<table id>/stable/dmf_<file id>` and validate them one by one. You can use scripts to automate the validation.
- User scenarios:
  - After you perform a format upgrade or downgrade, you can validate the data integrity of the DTFile.
  - After you migrate the DTFile to a new environment, you can validate the data integrity of the DTFile.
- Parameters:
  - `--config-file`: The configuration file of `dttool bench`. See `--config-file` in `dttool migrate`.
  - `--check`: Performs hash validation.
  - `--file-id`: The ID of the DTFile. See `--file-id` in `dttool migrate`.
  - `--imitative`: Imitates the database context. See `--imitative` in `dttool migrate`.
  - `--workdir`: The data directory. See `--workdir` in `dttool migrate`.

### 14.7.4 PD Configuration Flags

PD is configurable using command-line flags and environment variables.

#### 14.7.4.1 `--advertise-client-urls`

- The list of advertise URLs for the client to access PD
- Default: `"${client-urls}"`
- In some situations such as in the Docker or NAT network environment, if a client cannot access PD through the default client URLs listened to by PD, you must manually set the advertise client URLs.
- For example, the internal IP address of Docker is `172.17.0.1`, while the IP address of the host is `192.168.100.113` and the port mapping is set to `-p 2379:2379`. In this case, you can set `--advertise-client-urls` to `"http://192.168.100.113:2379"`. The client can find this service through `"http://192.168.100.113:2379"`.

#### 14.7.4.2 `--advertise-peer-urls`

- The list of advertise URLs for other PD nodes (peers) to access a PD node
- Default: `"${peer-urls}"`
- In some situations such as in the Docker or NAT network environment, if the other nodes (peers) cannot access the PD node through the default peer URLs listened to by this PD node, you must manually set the advertise peer URLs.
- For example, the internal IP address of Docker is `172.17.0.1`, while the IP address of the host is `192.168.100.113` and the port mapping is set to `-p 2380:2380`. In this case, you can set `--advertise-peer-urls` to `"http://192.168.100.113:2380"`. The other PD nodes can find this service through `"http://192.168.100.113:2380"`.

#### 14.7.4.3 `--client-urls`

- The list of client URLs to be listened to by PD
- Default: `"http://127.0.0.1:2379"`
- When you deploy a cluster, you must specify the IP address of the current host as `--client-urls` (for example, `"http://192.168.100.113:2379"`). If the cluster runs on Docker, specify the IP address of Docker as `"http://0.0.0.0:2379"`.

#### 14.7.4.4 `--peer-urls`

- The list of peer URLs to be listened to by a PD node
- Default: `"http://127.0.0.1:2380"`
- When you deploy a cluster, you must specify `--peer-urls` as the IP address of the current host, such as `"http://192.168.100.113:2380"`. If the cluster runs on Docker, specify the IP address of Docker as `"http://0.0.0.0:2380"`.

#### 14.7.4.5 `--config`

- The configuration file
- Default: `""`
- If you set the configuration using the command line, the same setting in the configuration file will be overwritten.

#### 14.7.4.6 `--data-dir`

- The path to the data directory
- Default: `"default.${name}"`

#### 14.7.4.7 `--initial-cluster`

- The initial cluster configuration for bootstrapping
- Default: `"{name}=http://{advertise-peer-url}"`
- For example, if `name` is "pd", and `advertise-peer-urls` is `"http://192.168.100.113:2380"` ↪ , the `initial-cluster` is `"pd=http://192.168.100.113:2380"`.
- If you need to start three PD servers, the `initial-cluster` might be:

```
pd1=http://192.168.100.113:2380, pd2=http://192.168.100.114:2380, pd3
    ↪ =192.168.100.115:2380
```

#### 14.7.4.8 `--join`

- Join the cluster dynamically
- Default: `""`
- If you want to join an existing cluster, you can use `--join="${advertise-client-` ↪ `urls}"`, the `advertise-client-url` is any existing PD's, multiply advertise client urls are separated by comma.

#### 14.7.4.9 `-L`

- The log level
- Default: `"info"`
- Optional values: `"debug"`, `"info"`, `"warn"`, `"error"`, `"fatal"`

#### 14.7.4.10 `--log-file`

- The log file
- Default: `""`
- If this flag is not set, logs will be written to "stderr". If this flag is set, logs are output to the corresponding file.

#### 14.7.4.11 `--log-rotate`

- To enable or disable log rotation
- Default: `true`
- When the value is true, follow the `[log.file]` in PD configuration files.

#### 14.7.4.12 `--name`

- The human-readable unique name for this PD member
- Default: `"pd-${hostname}"`
- If you want to start multiply PDs, you must use different name for each one.

#### 14.7.4.13 `--cacert`

- The file path of CA, used to enable TLS
- Default: `""`

#### 14.7.4.14 `--cert`

- The path of the PEM file including the X509 certificate, used to enable TLS
- Default: `""`

#### 14.7.4.15 `--key`

- The path of the PEM file including the X509 key, used to enable TLS
- Default: `""`

#### 14.7.4.16 `--metrics-addr`

- The address of Prometheus Pushgateway, which does not push data to Prometheus by default.
- Default: `""`

## 14.8 Key Monitoring Metrics

### 14.8.1 Key Metrics

If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus & Grafana) is deployed at the same time. For more information, see TiDB Monitoring Framework Overview.

The Grafana dashboard is divided into a series of sub dashboards which include Overview, PD, TiDB, TiKV, Node_exporter, Disk Performance, and Performance_overview. A lot of metrics are there to help you diagnose.

For routine operations, you can get an overview of the component (PD, TiDB, TiKV) status and the entire cluster from the Overview dashboard, where the key metrics are displayed. This document provides a detailed description of these key metrics.

#### 14.8.1.1 Key metrics description

To understand the key metrics displayed on the Overview dashboard, check the following table:

| Service | Panel Name | Description | Normal Range |
|---|---|---|---|
| Services Port Status | Services Up | The online nodes number of each service. | |
| PD | PD role | The role of the current PD. | |
| PD | Storage capacity | The total storage capacity of the TiDB cluster. | |
| PD | Current storage size | The occupied storage capacity of the TiDB cluster, including the space occupied by TiKV replicas. | |
| PD | Normal stores | The number of nodes in the normal state. | |
| PD | Abnormal stores | The number of nodes in the abnormal state. | 0 |
| PD | Number of Regions | The total number of Regions in the current cluster. Note that the number of Regions has nothing to do with the number of replicas. | |
| PD | 99% completed_cmds_duration_seconds | The 99th percentile duration to complete a pd-server request. | less than 5ms |
| PD | Handle_requests_duration_seconds | The network duration of a PD request. | |
| PD | Region health | The state of each Region. | Generally, the number of pending peers is less than 100, and that of the missing peers cannot always be greater than 0. |
| PD | Hot write Region's leader distribution | The total number of leaders who are the write hotspots on each TiKV instance. | |
| PD | Hot read Region's leader distribution | The total number of leaders who are the read hotspots on each TiKV instance. | |
| PD | Region heartbeat report | The count of heartbeats reported to PD per instance. | |
| PD | 99% Region heartbeat latency | The heartbeat latency per TiKV instance (P99). | |

| Service | Panel Name | Description | Normal Range |
|---|---|---|---|
| TiDB | Statement OPS | The number of different types of SQL statements executed per second, which is counted according to `SELECT`, `INSERT`, `UPDATE`, and other types of statements. | |
| TiDB | Duration | The execution time.1. The duration between the time that the client's network request is sent to TiDB and the time that the request is returned to the client after TiDB has executed the request. In general, client requests are sent in the form of SQL statements; however, this duration can include the execution time of commands such as `COM_PING`, `COM_SLEEP`, `COM_STMT_FETCH`, and `COM_SEND_LONG_DATA`.2. Because TiDB supports Multi-Query, TiDB supports sending multiple SQL statements at one time, such as `select 1; select 1; select 1;`. In this case, the total execution time of this query includes the execution time of all SQL statements. | |
| TiDB | CPS By Instance | CPS By Instance: the command statistics on each TiDB instance, which is classified according to the success or failure of command execution results. | |
| TiDB | Failed Query OPM | The statistics of error types (such as syntax errors and primary key conflicts) based on the errors occurred when executing SQL statements per second on each TiDB instance. The module in which the error occurs and the error code are included. | |
| TiDB | Connection Count | The connection number of each TiDB instance. | |

| Service | Panel Name | Description | Normal Range |
|---|---|---|---|
| TiDB | Memory Usage | The memory usage statistics of each TiDB instance, which is divided into the memory occupied by processes and the memory applied by Golang on the heap. | |
| TiDB | Transaction OPS | The number of transactions executed per second. | |
| TiDB | Transaction Duration | The execution time of a transaction | |
| TiDB | KV Cmd OPS | The number of executed KV commands. | |
| TiDB | KV Cmd Duration 99 | The execution time of the KV command. | |
| TiDB | PD TSO OPS | The number of TSO that TiDB obtains from PD per second. | |
| TiDB | PD TSO Wait Duration | The duration that TiDB waits for PD to return TSO. | |
| TiDB | TiClient Region Error OPS | The number of Region related errors returned by TiKV. | |
| TiDB | Lock Resolve OPS | The number of TiDB operations that resolve locks. When TiDB's read or write request encounters a lock, it tries to resolve the lock. | |
| TiDB | KV Backoff OPS | The number of errors returned by TiKV. | |
| TiKV | leader | The number of leaders on each TiKV node. | |
| TiKV | region | The number of Regions on each TiKV node. | |
| TiKV | CPU | The CPU usage ratio on each TiKV node. | |
| TiKV | Memory | The memory usage on each TiKV node. | |
| TiKV | store size | The size of storage space used by each TiKV instance. | |
| TiKV | cf size | The size of each column family (CF for short). | |
| TiKV | channel full | The number of "channel full" errors on each TiKV instance. | 0 |
| TiKV | server report failures | The number of error messages reported by each TiKV instance. | 0 |

| Service | Panel Name | Description | Normal Range |
|---|---|---|---|
| TiKV | scheduler pending commands | The number of pending commands on each TiKV instance. | |
| TiKV | coprocessor executor count | The number of coprocessor operations received by TiKV per second. Each type of coprocessor is counted separately. | |
| TiKV | coprocessor request duration | The time consumed to process read requests of coprocessor. | |
| TiKV | raft store CPU | The CPU usage ratio of the raftstore thread | The default number of threads is 2 (configured by `raftstore.store-pool-size`). A value of over 80% for a single thread indicates that the CPU usage ratio is very high. |
| TiKV | Coprocessor CPU | The CPU usage ratio of the coprocessor thread. | |
| System Info | Vcores | The number of CPU cores. | |
| System Info | Memory | The total memory. | |
| System Info | CPU Usage | The CPU usage ratio, 100% at a maximum. | |
| System Info | Load [1m] | The overload within 1 minute. | |
| System Info | Memory Available | The size of the available memory. | |
| System Info | Network Traffic | The statistics of the network traffic. | |
| System Info | TCP Retrans | The frequency of the TOC retransmission. | |
| System Info | IO Util | The disk usage ratio, 100% at a maximum; generally you need to consider adding a new node when the usage ratio is up to 80% ~ 90%. | |

#### 14.8.1.2 Interface of the Overview dashboard

Figure 377: overview

### 14.8.2 Key Metrics on Performance Overview

If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus & Grafana) is deployed at the same time. For more information, see TiDB Monitoring Framework Overview.

The Grafana dashboard is divided into a series of sub dashboards which include PD, TiDB, TiKV, Node_exporter, Overview, and Performance Overview. A lot of metrics are there to help you diagnose.

The Performance Overview dashboard orchestrates the metrics of TiDB, PD, and TiKV, and presents each of them in the following sections:

- Overview: Database time and SQL execution time summary. By checking different colors in the overview, you can quickly identify the database workload profile and the

performance bottleneck.

- Load profile: Key metrics and resource usage, including database QPS, connection information, the MySQL command types the application interacts with TiDB, database internal TSO and KV request OPS, and resource usage of the TiKV and TiDB.
- Top-down latency breakdown: Query latency versus connection idle time ratio, query latency breakdown, TSO/KV request latency during execution, breakdown of write latency within TiKV.

With the Performance Overview Dashboard, you can analyze performance efficiently, and confirm whether the bottleneck of user response time is in the database. If the bottleneck is in the database, you can identify the bottleneck inside the database, with database time overview, workload profile and SQL latency breakdown. For details, see Performance Analysis and Tuning.

The following sections illustrate the metrics on the Performance Overview dashboard.

#### 14.8.2.1 Performance Overview

##### 14.8.2.1.1 Database Time by SQL Type

- database time: Total database time per second
- sql_type: Database time consumed by each type of SQL statements per second

##### 14.8.2.1.2 Database Time by SQL Phase

- database time: Total database time per second
- get token/parse/compile/execute: Database time consumed in four SQL processing phases

The SQL execution phase is in green and other phases are in red on general. If non-green areas are large, it means much database time is consumed in other phases than the execution phase and further cause analysis is required.

##### 14.8.2.1.3 SQL Execute Time Overview

- execute time: Database time consumed during SQL execution per second
- tso_wait: Concurrent TSO waiting time per second during SQL execution
- kv request type: Time waiting for each KV request type per second during SQL execution. The total KV request wait time might exceed SQL execution time, because KV requests are concurrent.
- tiflash_mpp: Time of processing TiFlash requests per second during SQL execution.

Green metrics stand for common KV write requests (such as prewrite and commit), blue metrics stand for common read requests, purple metrics stand for TiFlash MPP requests, and metrics in other colors stand for unexpected situations which you need to pay attention to. For example, pessimistic lock KV requests are marked red and TSO waiting is marked dark brown.

If non-blue or non-green areas are large, it means there is a bottleneck during SQL execution. For example:

- If serious lock conflicts occur, the red area will take a large proportion.
- If excessive time is consumed in waiting TSO, the dark brown area will take a large proportion.

#### 14.8.2.1.4 QPS

Number of SQL statements executed per second in all TiDB instances, collected by type: such as `SELECT`, `INSERT`, and `UPDATE`

#### 14.8.2.1.5 CPS By Type

Number of commands processed by all TiDB instances per second based on type

#### 14.8.2.1.6 Queries Using Plan Cache OPS

- avg-hit: The number of queries using the execution plan cache per second for all TiDB instances
- avg-miss: The number of queries not using the execution plan cache per second for all TiDB instances

`avg-hit + avg-miss` is equal to `StmtExecute`, which is the number of all queries executed per second.

#### 14.8.2.1.7 KV/TSO Request OPS

- kv request total: Total number of KV requests per second in all TiDB instances
- kv request by type: Number of KV requests per second in all TiDB instances based on such types as `Get`, `Prewrite`, and `Commit`.
- tso - cmd: Number of `tso cmd` requests per second in all TiDB instances
- tso - request: Number of `tso request` requests per second in all TiDB instances

Generally, dividing `tso - cmd` by `tso - request` yields the average batch size of requests per second.

#### 14.8.2.1.8 KV Request Time By Source

- kv request total time: Total time of processing KV and TiFlash requests per second in all TiDB instances
- Each KV request and the corresponding request source form a stacked bar chart, in which `external` identifies normal business requests and `internal` identifies internal activity requests (such as DDL and auto analyze requests)

#### 14.8.2.1.9 TiDB CPU

- avg: Average CPU utilization across all TiDB instances
- delta: Maximum CPU utilization of all TiDB instances minus minimum CPU utilization of all TiDB instances
- max: Maximum CPU utilization across all TiDB instances

#### 14.8.2.1.10 TiKV CPU/IO MBps

- CPU-Avg: Average CPU utilization of all TiKV instances
- CPU-Delta: Maximum CPU utilization of all TiKV instances minus minimum CPU utilization of all TiKV instances
- CPU-MAX: Maximum CPU utilization among all TiKV instances
- IO-Avg: Average MBps of all TiKV instances
- IO-Delt: Maximum MBps of all TiKV instances minus minimum MBps of all TiKV instances
- IO-MAX: Maximum MBps of all TiKV instances

#### 14.8.2.1.11 Duration

- Duration: Execution time
    - The duration from receiving a request from the client to TiDB till TiDB executing the request and returning the result to the client. In general, client requests are sent in the form of SQL statements; however, this duration can include the execution time of commands such as `COM_PING`, `COM_SLEEP`, `COM_STMT_FETCH`, and `COM_SEND_LONG_DATA`.
    - TiDB supports Multi-Query, which means the client can send multiple SQL statements at one time, such as `select 1; select 1; select 1;`. In this case, the total execution time of this query includes the execution time of all SQL statements.
- avg: Average time to execute all requests
- 99: P99 duration to execute all requests
- avg by type: Average time to execute all requests in all TiDB instances, collected by type: `SELECT`, `INSERT`, and `UPDATE`

#### 14.8.2.1.12 Connection Idle Duration

Connection Idle Duration indicates the duration of a connection being idle.

- avg-in-txn: Average connection idle duration when the connection is within a transaction
- avg-not-in-txn: Average connection idle duration when the connection is not within a transaction
- 99-in-txn: P99 connection idle duration when the connection is within a transaction

#### 14.8.2.1.13 Connection Count

- total: Number of connections to all TiDB instances
- active connections: Number of active connections to all TiDB instances
- tidb-{node-number}-peer: Number of connections to each TiDB instance
- disconnection/s: Number of disconnections in a TiDB cluster
- 99-not-in-txn: P99 connection idle duration when the connection is not within a transaction

#### 14.8.2.1.14 Parse Duration, Compile Duration, and Execute Duration

- Parse Duration: Time consumed in parsing SQL statements
- Compile Duration: Time consumed in compiling the parsed SQL AST to execution plans
- Execution Duration: Time consumed in executing execution plans of SQL statements

All these three metrics include the average duration and the 99th percentile duration in all TiDB instances.

#### 14.8.2.1.15 Avg TiDB KV Request Duration

Average time consumed in executing KV requests in all TiDB instances based on the type, including `Get`, `Prewrite`, and `Commit`.

#### 14.8.2.1.16 Avg TiKV GRPC Duration

Average time consumed in executing gRPC requests in all TiKV instances based on the type, including `kv_get`, `kv_prewrite`, and `kv_commit`.

#### 14.8.2.1.17 PD TSO Wait/RPC Duration

- wait - avg: Average time in waiting for PD to return TSO in all TiDB instances
- rpc - avg: Average time from sending TSO requests to PD to receiving TSO in all TiDB instances
- wait - 99: P99 time in waiting for PD to return TSO in all TiDB instances
- rpc - 99: P99 time from sending TSO requests to PD to receiving TSO in all TiDB instances

#### 14.8.2.1.18 Storage Async Write Duration, Store Duration, and Apply Duration

- Storage Async Write Duration: Time consumed in asynchronous write
- Store Duration: Time consumed in store loop during asynchronously write
- Apply Duration: Time consumed in apply loop during asynchronously write

All these three metrics include the average duration and P99 duration in all TiKV instances.

Average storage async write duration = Average store duration + Average apply duration

#### 14.8.2.1.19 Append Log Duration, Commit Log Duration, and Apply Log Duration

- Append Log Duration: Time consumed by Raft to append logs
- Commit Log Duration: Time consumed by Raft to commit logs
- Apply Log Duration: Time consumed by Raft to apply logs

All these three metrics include the average duration and P99 duration in all TiKV instances.

#### 14.8.2.1.20 Interface of the Performance Overview panels

Figure 378: performance overview

#### 14.8.2.2 TiFlash

- CPU: The CPU utilization per TiFlash instance.
- Memory: The memory usage per TiFlash instance.
- IO utilization: The IO utilization per TiFlash instance.
- MPP Query count: The number of TiFlash MPP queries per second per TiFlash instance.
- Request QPS: The number of coprocessor requests received by all TiFlash instances.
    - `batch`: Number of batch requests.
    - `batch_cop`: Number of coprocessor requests in the batch requests.
    - `cop`: Number of coprocessor requests that are sent directly via the coprocessor interface.
    - `cop_dag`: Number of dag requests in all coprocessor requests.
    - `super_batch`: Number of requests that enable the Super Batch feature.
- Executor QPS: The number of each type of dag executors in the requests received by all TiFlash instances. `table_scan` is the table scan executor. `selection` is the selection executor. `aggregation` is the aggregation executor. `top_n` is the `TopN` executor. `limit` is the limit executor.
- Request Duration Overview: Provides a stacked chart of total processing time per second for all request types in all TiFlash instances.
- Request Duration: The total processing duration for each MPP and coprocessor request type in all TiFlash instances. It is from the time that the coprocessor request is received to the time that the response of the request is completed, which includes the average latency and p99 latency.
- Request Handle Duration: The actual processing duration for each MPP and coprocessor request type in all TiFlash instances. It is from the start of executing the coprocessor request to the completion of the execution, which includes the average latency and p99 latency.
- Raft Wait Index Duration: The time used by `wait_index` for all TiFlash instances, namely the time used to wait until Region index >= `read_index` after the `read_index` request is received.
- Raft Batch Read Index Duration: The time used by `read_index` for all TiFlash instances. Most time is used for interaction with the Region leader and retry.
- Write Throughput By Instance: The throughput of write by instance. It includes the throughput by applying the Raft write commands and Raft snapshots.
- Write flow: The traffic of disk writes by all TiFlash instances.
- Read flow: The traffic of disk reads by all TiFlash instances.

#### 14.8.2.3 CDC

- CPU usage: The CPU usage per TiCDC node.
- Memory usage: The memory usage per TiCDC node.
- Goroutine count: The number of goroutines per TiCDC node.
- Changefeed checkpoint lag: The progress lag of data replication (the unit is second) between the upstream and the downstream.
- Changefeed resolved ts lag: The progress lag of data replication (the unit is second) between the upstream and TiCDC nodes.
- The status of changefeeds:
    - 0: Normal
    - 1: Error
    - 2: Failed
    - 3: Stopped
    - 4: Finished
    - -1: Unknown
- Puller output events/s: The number of rows that the Puller module of TiCDC nodes sends to the Sorter module per second.
- Sorter output events/s: The number of rows that the Sorter module of TiCDC nodes sends to the Mounter module per second.
- Mounter output events/s: The number of rows that the Mounter module of TiCDC nodes sends to the Sink module per second.
- Table sink output events/s: The number of rows that the Table Sorter module of the TiCDC nodes sends to the Sink module per second.
- SinkV2 - Sink flush rows/s: The number of rows that the Sink module in the TiCDC node sends to the downstream per second.
- Transaction Sink Full Flush Duration: The average latency and p999 latency of writing downstream transactions by the MySQL Sink of TiCDC nodes.
- MQ Worker Send Message Duration Percentile: The latency of sending messages by MQ worker when the downstream is Kafka.
- Kafka Outgoing Bytes: The traffic of writing downstream transactions in MQ Workload.

### 14.8.3 TiDB Monitoring Metrics

If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus & Grafana) is deployed at the same time. For the monitoring architecture, see TiDB Monitoring Framework Overview.

The Grafana dashboard is divided into a series of sub dashboards which include Overview, PD, TiDB, TiKV, Node_exporter, Disk Performance, and Performance_overview. The TiDB dashboard consists of the TiDB panel and the TiDB Summary panel. The differences between the two panels are different in the following aspects:

- TiDB panel: provides as comprehensive information as possible for troubleshooting cluster anomalies.
- TiDB Summary Panel: extracts parts of the TiDB panel information with which users are most concerned, with some modifications. It provides data (such as QPS, TPS, response delay) that users care about in the daily database operations, which serves as the monitoring information to be displayed or reported.

This document describes some key monitoring metrics displayed on the TiDB dashboard.

#### 14.8.3.1 Key metrics description

To understand the key metrics displayed on the TiDB dashboard, check the following sections:

##### 14.8.3.1.1 Query Summary

- Duration: execution time
    - The duration between the time that the client's network request is sent to TiDB and the time that the request is returned to the client after TiDB has executed it. In general, client requests are sent in the form of SQL statements, but can also include the execution time of commands such as `COM_PING`, `COM_SLEEP`, `COM_STMT_FETCH`, and `COM_SEND_LONG_DATA`
    - Because TiDB supports Multi-Query, it supports sending multiple SQL statements at one time, such as `select 1; select 1; select 1;`. In this case, the total execution time of this query includes the execution time of all SQL statements
- Command Per Second: the number of commands processed by TiDB per second, which is classified according to the success or failure of command execution results
- QPS: the number of SQL statements executed per second on all TiDB instances, which is counted according to `SELECT`, `INSERT`, `UPDATE`, and other types of statements
- CPS By Instance: the command statistics on each TiDB instance, which is classified according to the success or failure of command execution results

- Failed Query OPM: the statistics of error types (such as syntax errors and primary key conflicts) according to the errors occurred when executing SQL statements per minute on each TiDB instance. It contains the module in which the error occurs and the error code
- Slow query: the statistics of the processing time of slow queries (the time cost of the entire slow query, the time cost of Coprocessor, and the waiting time for Coprocessor scheduling). Slow queries are classified into internal and general SQL statements
- Connection Idle Duration: the duration of idle connections
- 999/99/95/80 Duration: the statistics of the execution time for different types of SQL statements (different percentiles)

#### 14.8.3.1.2 Query Detail

- Duration 80/95/99/999 By Instance: the statistics of the execution time for SQL statements on each TiDB instance (different percentiles)
- Failed Query OPM Detail: the statistics of error types (such as syntax errors and primary key conflicts) according to the errors occurred when executing SQL statements per minute on each TiDB instance
- Internal SQL OPS: the internal SQL statements executed per second in the entire TiDB cluster. The internal SQL statements are internally executed and are generally triggered by user SQL statements or internally scheduled tasks.

#### 14.8.3.1.3 Server

- Uptime: the runtime of each TiDB instance
- Memory Usage: the memory usage statistics of each TiDB instance, which is divided into the memory occupied by processes and the memory applied by Golang on the heap
- CPU Usage: the statistics of CPU usage of each TiDB instance
- Connection Count: the number of clients connected to each TiDB instance
- Open FD Count: the statistics of opened file descriptors of each TiDB instance
- Disconnection Count: the number of clients disconnected to each TiDB instance
- Events OPM: the statistics of key events, such as “start”, “close”, “graceful-shutdown”,“kill”, and “hang”
- Goroutine Count: the number of Goroutines on each TiDB instance
- Prepare Statement Count: the number of `Prepare` statements that are executed on each TiDB instance and the total count of them
- Keep Alive OPM: the number of times that the metrics are refreshed every minute on each TiDB instance. It usually needs no attention.
- Panic And Critical Error: the number of panics and critical errors occurred in TiDB
- Time Jump Back OPS: the number of times that the operating system rewinds every second on each TiDB instance
- Get Token Duration: the time cost of getting Token on each connection
- Skip Binlog Count: the number of binlog write failures in TiDB
- Client Data Traffic: data traffic statistics of TiDB and the client

#### 14.8.3.1.4 Transaction

- Transaction OPS: the number of transactions executed per second
- Duration: the execution duration of a transaction
- Transaction Statement Num: the number of SQL statements in a transaction
- Transaction Retry Num: the number of times that a transaction retries
- Session Retry Error OPS: the number of errors encountered during the transaction retry per second. This metric includes two error types: retry failure and exceeding the maximum number of retries
- Commit Token Wait Duration: the wait duration in the flow control queue during the transaction commit. If the wait duration is long, it means that the transaction to commit is too large and the flow is controlled. If the system still has resources available, you can speed up the commit process by increasing the system variable `tidb_committer_concurrency`.
- KV Transaction OPS: the number of transactions executed per second within each TiDB instance
    - A user transaction might trigger multiple transaction executions in TiDB, including reading internal metadata and atomic retries of the user transaction
    - TiDB's internally scheduled tasks also operate on the database through transactions, which are also included in this panel
- KV Transaction Duration: the time spent on executing transactions within each TiDB
- Transaction Regions Num: the number of Regions operated in the transaction
- Transaction Write KV Num Rate and Sum: the rate at which KVs are written and the sum of these written KVs in the transaction
- Transaction Write KV Num: the number of KVs operated in the transaction
- Statement Lock Keys: the number of locks for a single statement
- Send HeartBeat Duration: the duration for the transaction to send heartbeats
- Transaction Write Size Bytes Rate and sum: the rate at which bytes are written and the sum of these written bytes in the transaction
- Transaction Write Size Bytes: the size of the data written in the transaction
- Acquire Pessimistic Locks Duration: the time consumed by adding locks
- TTL Lifetime Reach Counter: the number of transactions that reach the upper limit of TTL. The default value of the TTL upper limit is 1 hour. It means that 1 hour has passed since the first lock of a pessimistic transaction or the first prewrite of an optimistic transaction. The default value of the upper limit of TTL is 1 hour. The upper limit of TTL life can be changed by modifying `max-txn-TTL` in the TiDB configuration file
- Load Safepoint OPS: the number of times that `Safepoint` is loaded. `Safepoint` is to ensure that the data before `Safepoint` is not read when the transaction reads data, thus ensuring data safety. The data before `Safepoint` might be cleaned up by the GC
- Pessimistic Statement Retry OPS: the number of retry attempts for pessimistic statements. When the statement tries to add lock, it might encounter a write conflict. At this time, the statement will acquire a new snapshot and add lock again

- Transaction Types Per Seconds: the number of transactions committed per second using the two-phase commit (2PC), async commit, and one-phase commit (1PC) mechanisms, including both success and failure transactions

#### 14.8.3.1.5 Executor

- Parse Duration: the statistics of the parsing time of SQL statements
- Compile Duration: the statistics of the time of compiling the parsed SQL AST to the execution plan
- Execution Duration: the statistics of the execution time for SQL statements
- Expensive Executor OPS: the statistics of the operators that consume many system resources per second, including `Merge Join`, `Hash Join`, `Index Look Up Join`, `Hash Agg`, `Stream Agg`, `Sort`, and `TopN`
- Queries Using Plan Cache OPS: the statistics of queries using the Plan Cache per second
- Plan Cache Miss OPS: the statistics of the number of times that the Plan Cache is missed per second
- Plan Cache Memory Usage: the total memory consumed by the execution plan cached in each TiDB instance
- Plan Cache Plan Num: the total number of execution plans cached in each TiDB instance

#### 14.8.3.1.6 Distsql

- Distsql Duration: the processing time of Distsql statements
- Distsql QPS: the statistics of Distsql statements
- Distsql Partial QPS: the number of Partial results every second
- Scan Keys Num: the number of keys that each query scans
- Scan Keys Partial Num: the number of keys that each Partial result scans
- Partial Num: the number of Partial results for each SQL statement

#### 14.8.3.1.7 KV Errors

- KV Backoff Duration: the total duration that a KV retry request lasts. TiDB might encounter an error when sending a request to TiKV. TiDB has a retry mechanism for every request to TiKV. This `KV Backoff Duration` item records the total time of a request retry.
- TiClient Region Error OPS: the number of Region related error messages returned by TiKV
- KV Backoff OPS: the number of error messages returned by TiKV
- Lock Resolve OPS: the number of TiDB operations to resolve locks. When TiDB's read or write request encounters a lock, it tries to resolve the lock
- Other Errors OPS: the number of other types of errors, including clearing locks and updating `SafePoint`

#### 14.8.3.1.8 KV Request

The following metrics relate to requests sent to TiKV. Retry requests are counted multiple times.

- KV Request OPS: the execution times of a KV request, displayed according to TiKV
- KV Request Duration 99 by store: the execution time of a KV request, displayed according to TiKV
- KV Request Duration 99 by type: the execution time of a KV request, displayed according to the request type
- Stale Read Hit/Miss Ops
    - **hit**: the number of requests per second that successfully execute a stale read
    - **miss**: the number of requests per second that attempt a stale read but fail
- Stale Read Req Ops:
    - **cross-zone**: the number of requests per second that attempt a stale read in a remote zone
    - **local**: the number of requests per second that attempt a stale read in the local zone
- Stale Read Req Traffic:
    - **cross-zone-in**: the incoming traffic of responses to requests that attempt a stale read in a remote zone
    - **cross-zone-out**: the outgoing traffic of requests that attempt a stale read in a remote zone
    - **local-in**: the incoming traffic of responses to requests that attempt a stale read in the local zone
    - **local-out**: the outgoing traffic of requests that attempt a stale read in the local zone

#### 14.8.3.1.9 PD Client

- PD Client CMD OPS: the statistics of commands executed by PD Client per second
- PD Client CMD Duration: the time it takes for PD Client to execute commands
- PD Client CMD Fail OPS: the statistics of failed commands executed by PD Client per second
- PD TSO OPS: the number of TSO that TiDB obtains from PD per second
- PD TSO Wait Duration: the time that TiDB waits for PD to return TSO
- PD TSO RPC duration: the duration from the time that TiDB sends request to PD (to get TSO) to the time that TiDB receives TSO
- Start TSO Wait Duration: the duration from the time that TiDB sends request to PD (to get `start TSO`) to the time that TiDB receives `start TSO`

#### 14.8.3.1.10 Schema Load

- Load Schema Duration: the time it takes TiDB to obtain the schema from TiKV
- Load Schema OPS: the statistics of the schemas that TiDB obtains from TiKV per second
- Schema Lease Error OPM: the Schema Lease errors include two types: `change` and `outdate`. `change` means that the schema has changed, and `outdate` means that the schema cannot be updated, which is a more serious error and triggers an alert.
- Load Privilege OPS: the statistics of the number of privilege information obtained by TiDB from TiKV per second

#### 14.8.3.1.11 DDL

- DDL Duration 95: 95% quantile of DDL statement processing time
- Batch Add Index Duration 100: statistics of the maximum time spent by each Batch on creating an index
- DDL Waiting Jobs Count: the number of DDL tasks that are waiting
- DDL META OPM: the number of times that a DDL obtains META every minute
- DDL Worker Duration 99: 99% quantile of the execution time of each DDL worker
- Deploy Syncer Duration: the time consumed by Schema Version Syncer initialization, restart, and clearing up operations
- Owner Handle Syncer Duration: the time that it takes the DDL Owner to update, obtain, and check the Schema Version
- Update Self Version Duration: the time consumed by updating the version information of Schema Version Syncer
- DDL OPM: the number of DDL executions per second
- DDL backfill progress in percentage: the progress of backfilling DDL tasks

#### 14.8.3.1.12 Statistics

- Auto Analyze Duration 95: the time consumed by automatic `ANALYZE`
- Auto Analyze QPS: the statistics of automatic `ANALYZE`
- Stats Inaccuracy Rate: the information of the statistics inaccuracy rate
- Pseudo Estimation OPS: the number of the SQL statements optimized using pseudo statistics
- Dump Feedback OPS: the number of stored statistical feedbacks
- Store Query Feedback QPS: the number of operations per second to store the feedback information of the union query, which is performed in TiDB memory
- Significant Feedback: the number of significant feedback pieces that update the statistics information
- Update Stats OPS: the number of operations of updating statistics with feedback
- Fast Analyze Status 100: the status for quickly collecting statistical information

#### 14.8.3.1.13 Owner

- New ETCD Session Duration 95: the time it takes to create a new etcd session. TiDB connects to etcd in PD through etcd client to save/read some metadata information. This records the time spent creating the session
- Owner Watcher OPS: the number of Goroutine operations per second of DDL owner watch PD's etcd metadata

#### 14.8.3.1.14 Meta

- AutoID QPS: AutoID related statistics, including three operations (global ID allocation, a single table AutoID allocation, a single table AutoID Rebase)
- AutoID Duration: the time consumed by AutoID related operations
- Region Cache Error OPS: the number of errors encountered per second by the cached Region information in TiDB
- Meta Operations Duration 99: the latency of Meta operations

#### 14.8.3.1.15 GC

- Worker Action OPM: the number of GC related operations, including `run_job`, `resolve_lock`, and `delete_range`
- Duration 99: the time consumed by GC related operations
- Config: the configuration of GC data life time and GC running interval
- GC Failure OPM: the number of failed GC related operations
- Delete Range Failure OPM: the number of times the `Delete Range` has failed
- Too Many Locks Error OPM: the number of the error that GC clears up too many locks
- Action Result OPM: the number of results of GC-related operations
- Delete Range Task Status: the task status of `Delete Range`, including completion and failure
- Push Task Duration 95: the time spent pushing GC subtasks to GC workers

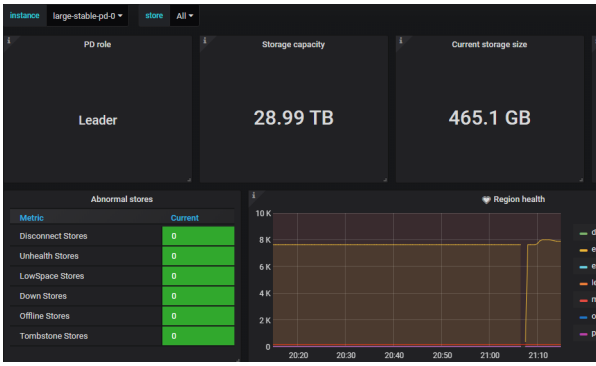
#### 14.8.3.1.16 Batch Client

- Pending Request Count by TiKV: the number of Batch messages that are pending processing
- Batch Client Unavailable Duration 95: the unavailable time of the Batch client
- No Available Connection Counter: the number of times the Batch client cannot find an available link

#### 14.8.3.1.17 TTL

- TTL QPS By Type: the QPS information of different types of statements generated by TTL jobs.
- TTL Processed Rows Per Second: the number of expired rows processed by TTL jobs per second.
- TTL Scan/Delete Query Duration: the execution time of TTL scan/delete statements.
- TTL Scan/Delete Worker Time By Phase: the time consumed by different phases of TTL internal worker threads.
- TTL Job Count By Status: the number of TTL jobs currently being executed.

### 14.8.4 Key Monitoring Metrics of PD



If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus & Grafana) is deployed at the same time. For more information, see Overview of the Monitoring Framework.

The Grafana dashboard is divided into a series of sub dashboards which include Overview, PD, TiDB, TiKV, Node_exporter, Disk Performance, and Performance_overview. A lot of metrics are there to help you diagnose.

You can get an overview of the component PD status from the PD dashboard, where the key metrics are displayed. This document provides a detailed description of these key metrics.

The following is the description of PD Dashboard metrics items:

- PD role: The role of the current PD instance
- Storage capacity: The total storage capacity for this TiDB cluster
- Current storage size: The storage size that is currently used by the TiDB cluster
- Current storage usage: The current storage usage rate
- Normal stores: The count of healthy storage instances
- Number of Regions: The total count of cluster Regions
- Abnormal stores: The count of unhealthy stores. The normal value is `0`. If the number is bigger than `0`, it means at least one instance is abnormal.
- Region health: The health status of Regions indicated via the count of unusual Regions including pending peers, down peers, extra peers, offline peers, missing peers, learner peers and incorrect namespaces. Generally, the number of pending peers should be less than `100`. The missing peers should not be persistently greater than `0`. If many empty Regions exist, enable Region Merge in time.

- Current peer count: The current count of all cluster peers

#### 14.8.4.1 Key metrics description

#### 14.8.4.2 Cluster

- PD scheduler config: The list of PD scheduler configurations
- Cluster ID: The unique identifier of the cluster
- Current TSO: The physical part of current allocated TSO
- Current ID allocation: The maximum allocatable ID for new store/peer
- Region label isolation level: The number of Regions in different label levels
- Label distribution: The distribution status of the labels in the cluster
- Store Limit: The flow control limitation of scheduling on the Store

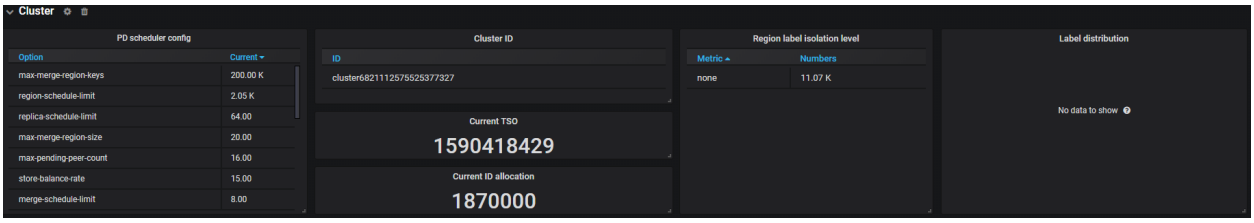


Figure 379: PD Dashboard - Cluster metrics

#### 14.8.4.3 Operator

- Schedule operator create: The number of newly created operators per type
- Schedule operator check: The number of checked operator per type. It mainly checks whether the current step is finished; if yes, it returns the next step to be executed
- Schedule operator finish: The number of finished operators per type
- Schedule operator timeout: The number of timeout operators per type
- Schedule operator replaced or canceled: The number of replaced or canceled operators per type
- Schedule operators count by state: The number of operators per state

- Operator finish duration: The maximum duration of finished operators
- Operator step duration: The maximum duration of finished operator steps

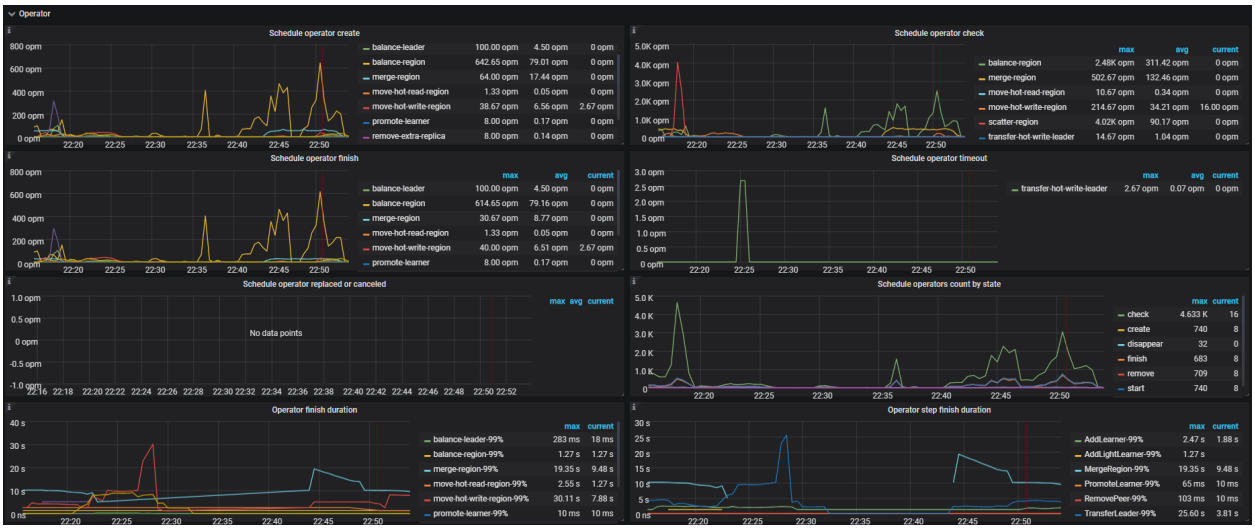

Figure 380: PD Dashboard - Operator metrics

#### 14.8.4.4 Statistics - Balance

- Store capacity: The capacity size per TiKV instance
- Store available: The available capacity size per TiKV instance
- Store used: The used capacity size per TiKV instance
- Size amplification: The size amplification ratio per TiKV instance, which is equal to (Store Region size)/(Store used capacity size)
- Size available ratio: The size availability ratio per TiKV instance, which is equal to (Store available capacity size)/(Store capacity size)
- Store leader score: The leader score per TiKV instance
- Store Region score: The Region score per TiKV instance
- Store leader size: The total leader size per TiKV instance
- Store Region size: The total Region size per TiKV instance
- Store leader count: The leader count per TiKV instance
- Store Region count: The Region count per TiKV instance

Figure 381: PD Dashboard - Balance metrics

#### 14.8.4.5 Statistics - hot write

- Hot Region's leader distribution: The total number of leader Regions that have become write hotspots on each TiKV instance
- Total written bytes on hot leader Regions: The total written bytes by leader Regions that have become write hotspots on each TiKV instance
- Hot write Region's peer distribution: The total number of peer Regions that have become write hotspots on each TiKV instance
- Total written bytes on hot peer Regions: The written bytes of all peer Regions that have become write hotspots on each TiKV instance
- Store Write rate bytes: The total written bytes on each TiKV instance
- Store Write rate keys: The total written keys on each TiKV instance
- Hot cache write entry number: The number of peers on each TiKV instance that are in the write hotspot statistics module
- Selector events: The event count of Selector in the hotspot scheduling module
- Direction of hotspot move leader: The direction of leader movement in the hotspot scheduling. The positive number means scheduling into the instance. The negtive number means scheduling out of the instance

- Direction of hotspot move peer: The direction of peer movement in the hotspot scheduling. The positive number means scheduling into the instance. The negative number means scheduling out of the instance

Figure 382: PD Dashboard - Hot write metrics

#### 14.8.4.6 Statistics - hot read

- Hot Region's peer distribution: The total number of peer Regions that have become read hotspots on each TiKV instance
- Total read bytes on hot peer Regions: The total read bytes of peers that have become read hotspots on each TiKV instance
- Store read rate bytes: The total read bytes of each TiKV instance
- Store read rate keys: The total read keys of each TiKV instance
- Hot cache read entry number: The number of peers that are in the read hotspot statistics module on each TiKV instance

Figure 383: PD Dashboard - Hot read metrics

#### 14.8.4.7 Scheduler

- Scheduler is running: The current running schedulers
- Balance leader movement: The leader movement details among TiKV instances
- Balance Region movement: The Region movement details among TiKV instances
- Balance leader event: The count of balance leader events
- Balance Region event: The count of balance Region events
- Balance leader scheduler: The inner status of balance leader scheduler
- Balance Region scheduler: The inner status of balance Region scheduler
- Replica checker: The replica checker's status
- Rule checker: The rule checker's status
- Region merge checker: The merge checker's status
- Filter target: The number of attempts that the store is selected as the scheduling target but failed to pass the filter
- Filter source: The number of attempts that the store is selected as the scheduling source but failed to pass the filter
- Balance Direction: The number of times that the Store is selected as the target or source of scheduling

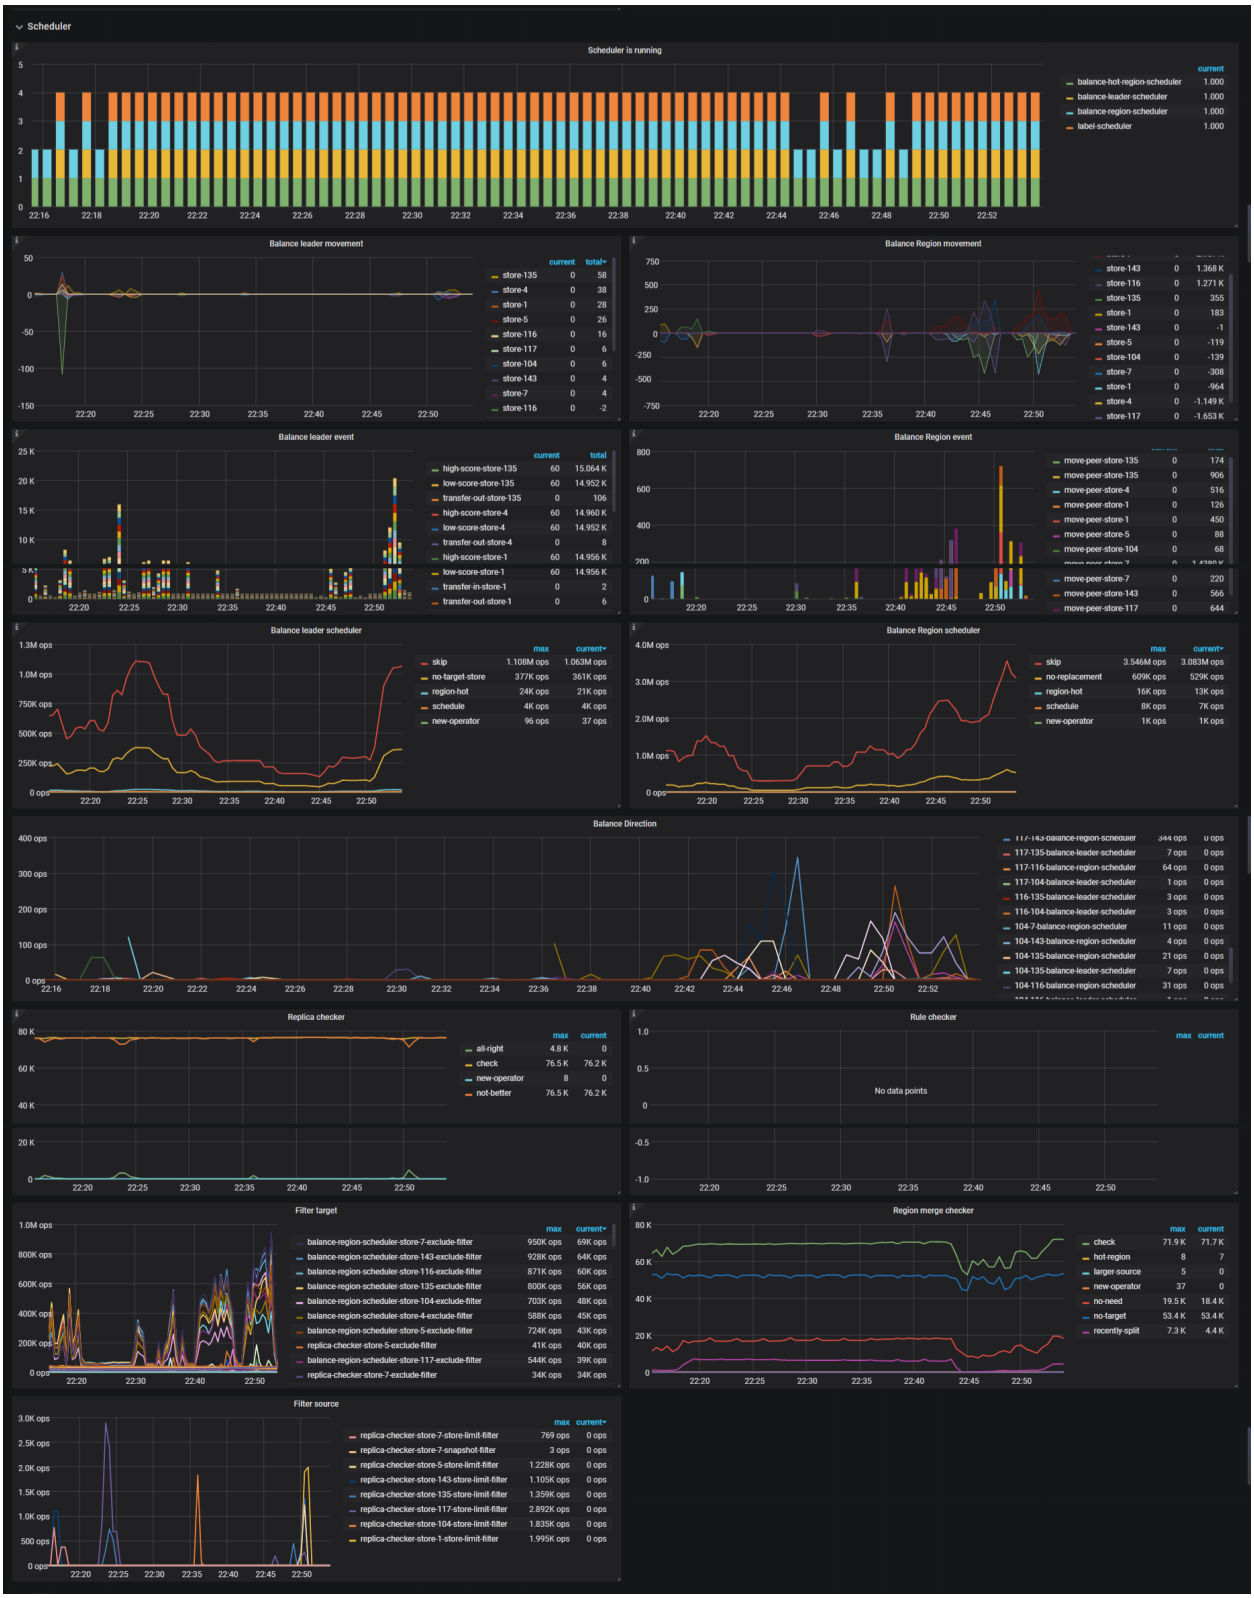

Figure 384: PD Dashboard - Scheduler metrics

#### 14.8.4.8 gRPC

- Completed commands rate: The rate per command type at which gRPC commands are completed
- 99% Completed commands duration: The rate per command type at which gRPC commands are completed (P99)

Figure 385: PD Dashboard - gRPC metrics

#### 14.8.4.9 etcd

- Handle transactions count: The rate at which etcd handles transactions
- 99% Handle transactions duration: The transaction handling rate (P99)
- 99% WAL fsync duration: The time consumed for writing WAL into the persistent storage. It is less than `1s` (P99)
- 99% Peer round trip time seconds: The network latency for etcd (P99) | The value is less than `1s`
- etcd disk WAL fsync rate: The rate of writing WAL into the persistent storage
- Raft term: The current term of Raft
- Raft committed index: The last committed index of Raft
- Raft applied index: The last applied index of Raft

Figure 386: PD Dashboard - etcd metrics

#### 14.8.4.10 TiDB

- PD Server TSO handle time and Client recv time: The duration between PD receiving the TSO request and the PD client getting the TSO response
- Handle requests count: The count of TiDB requests
- Handle requests duration: The time consumed for handling TiDB requests. It should be less than `100ms` (P99)

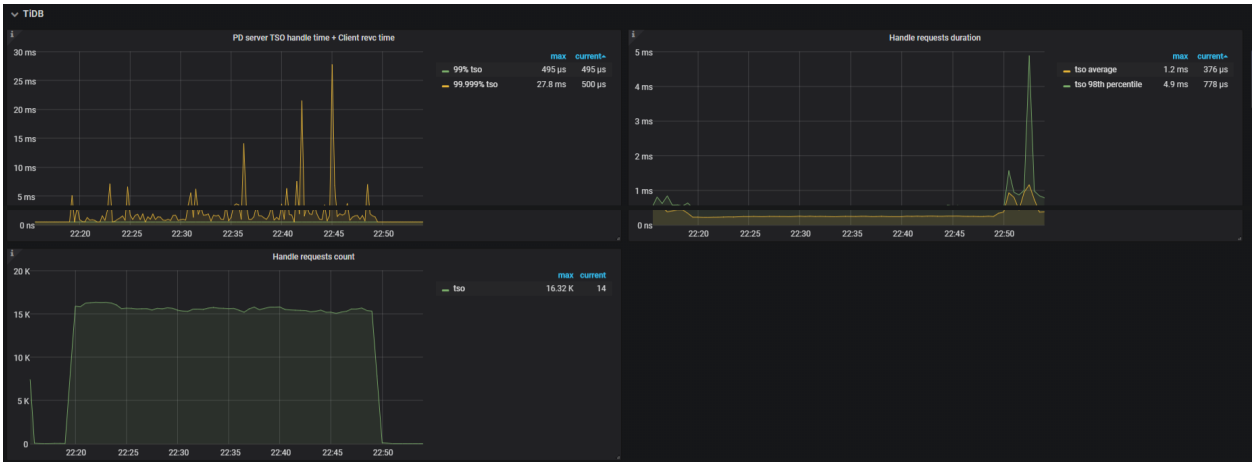

Figure 387: PD Dashboard - TiDB metrics

#### 14.8.4.11 Heartbeat

- Heartbeat region event QPS: The QPS of handling heartbeat messages, including updating the cache and persisting data
- Region heartbeat report: The count of heartbeats reported to PD per instance
- Region heartbeat report error: The count of heartbeats with the `error` status
- Region heartbeat report active: The count of heartbeats with the `ok` status
- Region schedule push: The count of corresponding schedule commands sent from PD per TiKV instance
- 99% Region heartbeat latency: The heartbeat latency per TiKV instance (P99)

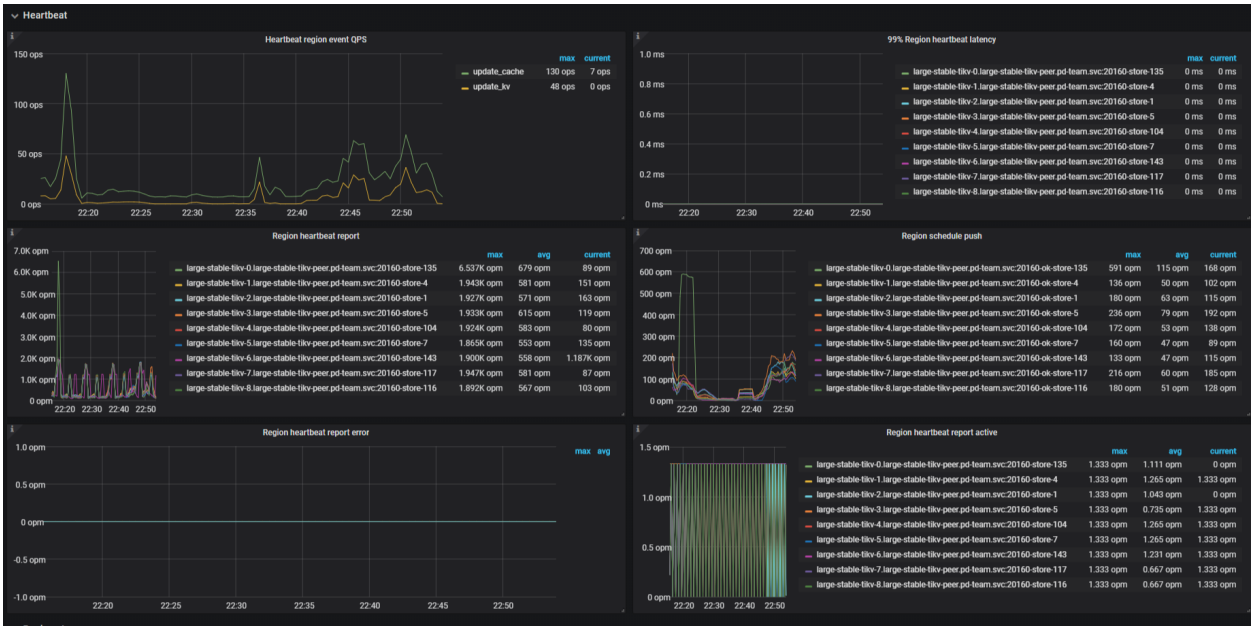

Figure 388: PD Dashboard - Heartbeat metrics

#### 14.8.4.12 Region storage

- Syncer Index: The maximum index in the Region change history recorded by the leader
- history last index: The last index where the Region change history is synchronized successfully with the follower

Figure 389: PD Dashboard - Region storage

### 14.8.5 Key Monitoring Metrics of TiKV

If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus/-Grafana) is deployed at the same time. For more information, see Overview of the Monitoring Framework.

The Grafana dashboard is divided into a series of sub dashboards which include Overview, PD, TiDB, TiKV, Node_exporter, and Performance_overview. A lot of metrics are there to help you diagnose.

#### 14.8.5.1 TiKV-Details dashboard

You can get an overview of the component TiKV status from the **TiKV-Details** dashboard, where the key metrics are displayed. According to the Performance Map, you can check whether the status of the cluster is as expected.

This section provides a detailed description of these key metrics on the **TiKV-Details** dashboard.

##### 14.8.5.1.1 Cluster

- Store size: The storage size per TiKV instance
- Available size: The available capacity per TiKV instance
- Capacity size: The capacity size per TiKV instance
- CPU: The CPU utilization per TiKV instance
- Memory: The memory usage per TiKV instance
- IO utilization: The I/O utilization per TiKV instance
- MBps: The total bytes of read and write in each TiKV instance
- QPS: The QPS per command in each TiKV instance
- Errps: The rate of gRPC message failures
- leader: The number of leaders per TiKV instance
- Region: The number of Regions per TiKV instance
- Uptime: The runtime of TiKV since last restart

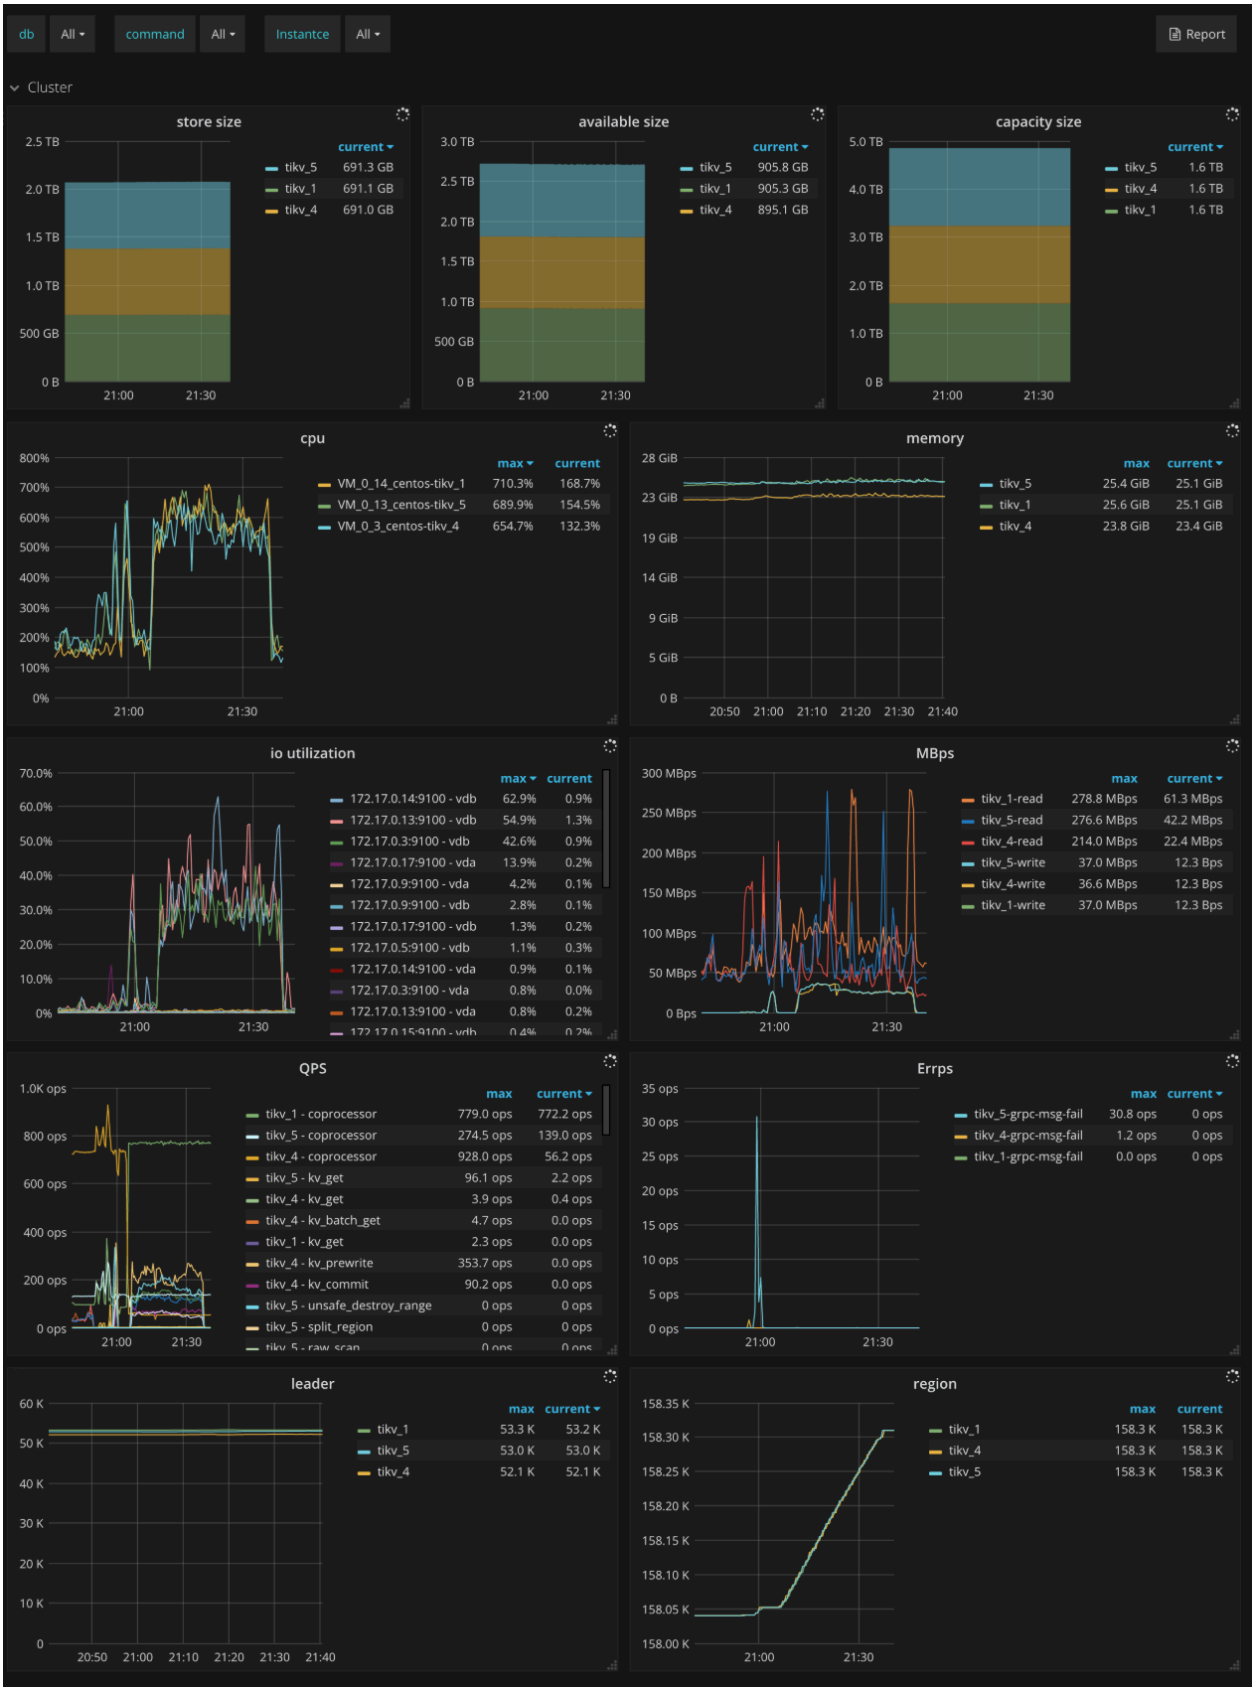

Figure 390: TiKV Dashboard - Cluster metrics

#### 14.8.5.1.2 Errors

- Critical error: The number of critical errors
- Server is busy: Indicates occurrences of events that make the TiKV instance unavailable temporarily, such as Write Stall, and Channel Full. It should be `0` in normal case.
- Server report failures: The number of error messages reported by server. It should be `0` in normal case.
- Raftstore error: The number of Raftstore errors per type on each TiKV instance
- Scheduler error: The number of scheduler errors per type on each TiKV instance
- Coprocessor error: The number of coprocessor errors per type on each TiKV instance
- gRPC message error: The number of gRPC message errors per type on each TiKV instance
- Leader drop: The count of dropped leaders per TiKV instance
- Leader missing: The count of missing leaders per TiKV instance
- Log Replication Reject: The number of logappend messages rejected due to insufficient memory on each TiKV instance

Figure 391: TiKV Dashboard - Errors metrics

#### 14.8.5.1.3 Server

- CF size: The size of each column family
- Store size: The storage size per TiKV instance
- Channel full: The number of Channel Full errors per TiKV instance. It should be `0` in normal case.
- Active written leaders: The number of leaders being written on each TiKV instance

- Approximate Region size: The approximate Region size
- Approximate Region size Histogram: The histogram of each approximate Region size
- Region average written keys: The average number of written keys to Regions per TiKV instance
- Region average written bytes: The average written bytes to Regions per TiKV instance

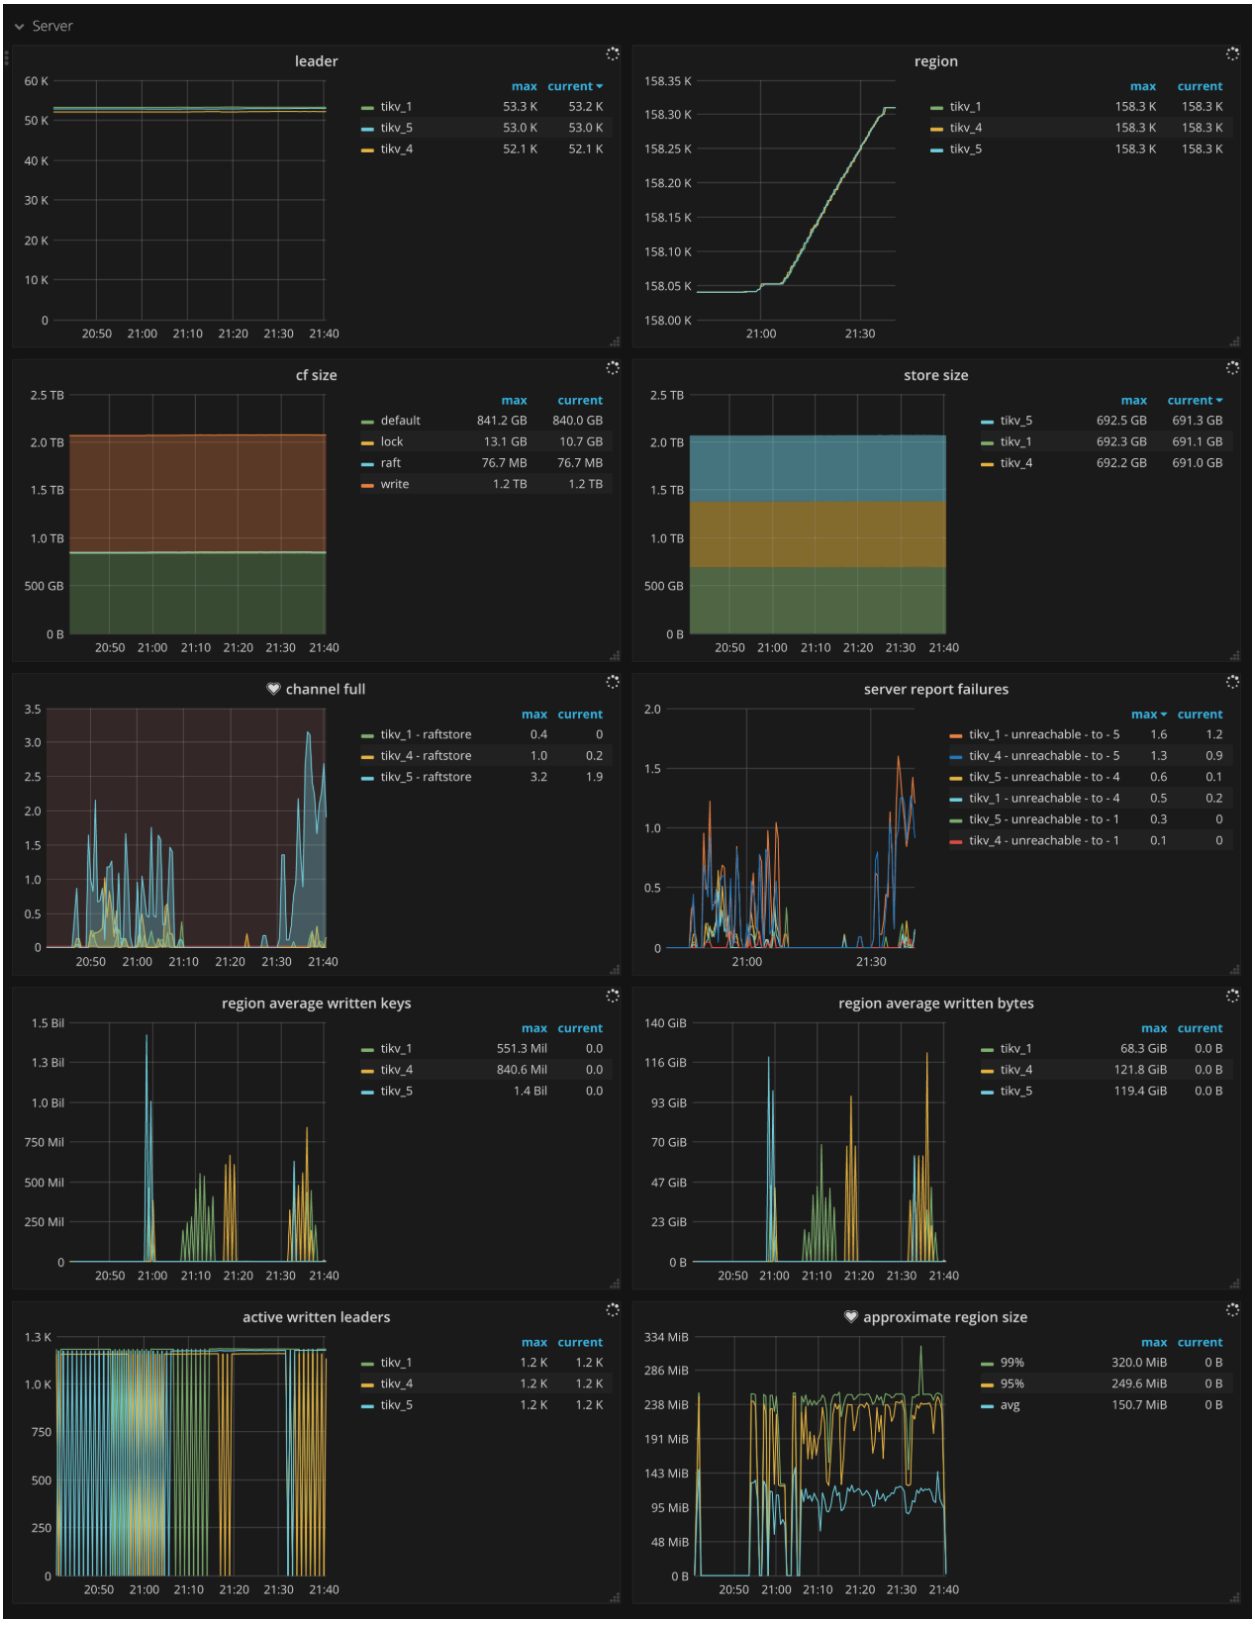

Figure 392: TiKV Dashboard - Server metrics

#### 14.8.5.1.4 gRPC

- gRPC message count: The rate of gRPC messages per type
- gRPC message failed: The rate of failed gRPC messages
- 99% gRPC message duration: The gRPC message duration per message type (P99)
- Average gRPC message duration: The average execution time of gRPC messages
- gRPC batch size: The batch size of gRPC messages between TiDB and TiKV
- Raft message batch size: The batch size of Raft messages between TiKV instances

#### 14.8.5.1.5 Thread CPU

- Raft store CPU: The CPU utilization of the `raftstore` thread. The CPU utilization should be less than 80% * `raftstore.store-pool-size` in normal case.
- Async apply CPU: The CPU utilization of the `async apply` thread. The CPU utilization should be less than 90% * `raftstore.apply-pool-size` in normal cases.
- Store writer CPU: The CPU utilization of the async IO thread. The CPU utilization should be less than 90% * `raftstore.store-io-pool-size` in normal cases.
- gRPC poll CPU: The CPU utilization of the `gRPC` thread. The CPU utilization should be less than 80% * `server.grpc-concurrency` in normal cases.
- Scheduler worker CPU: The CPU utilization of the `scheduler worker` thread. The CPU utilization should be less than 90% * `storage.scheduler-worker-pool-size` in normal cases.
- Storage ReadPool CPU: The CPU utilization of the `storage read pool` thread
- Unified read pool CPU: The CPU utilization of the `unified read pool` thread
- RocksDB CPU: The CPU utilization of the RocksDB thread
- Coprocessor CPU: The CPU utilization of the `coprocessor` thread
- GC worker CPU: The CPU utilization of the `GC worker` thread
- BackGround worker CPU: The CPU utilization of the `background worker` thread
- Import CPU: The CPU utilization of the `import` thread
- Backup Worker CPU: The CPU utilization of the `backup` thread
- CDC Worker CPU: The CPU utilization of the `CDC worker` thread
- CDC endpoint CPU: The CPU utilization of the `CDC endpoint` thread
- Raftlog fetch worker CPU: The CPU utilization of the async raft log fetcher worker
- TSO Worker CPU: The CPU utilization of the `TSO worker` thread

#### 14.8.5.1.6 PD

- PD requests: The rate at which TiKV sends to PD
- PD request duration (average): The average duration of processing requests that TiKV sends to PD
- PD heartbeats: The rate at which heartbeat messages are sent from TiKV to PD
- PD validate peers: The rate at which messages are sent from TiKV to PD to validate TiKV peers

#### 14.8.5.1.7 Raft IO

- Apply log duration: The time consumed for Raft to apply logs
- Apply log duration per server: The time consumed for Raft to apply logs per TiKV instance
- Append log duration: The time consumed for Raft to append logs
- Append log duration per server: The time consumed for Raft to append logs per TiKV instance
- Commit log duration: The time consumed by Raft to commit logs
- Commit log duration per server: The time consumed by Raft to commit logs per TiKV instance

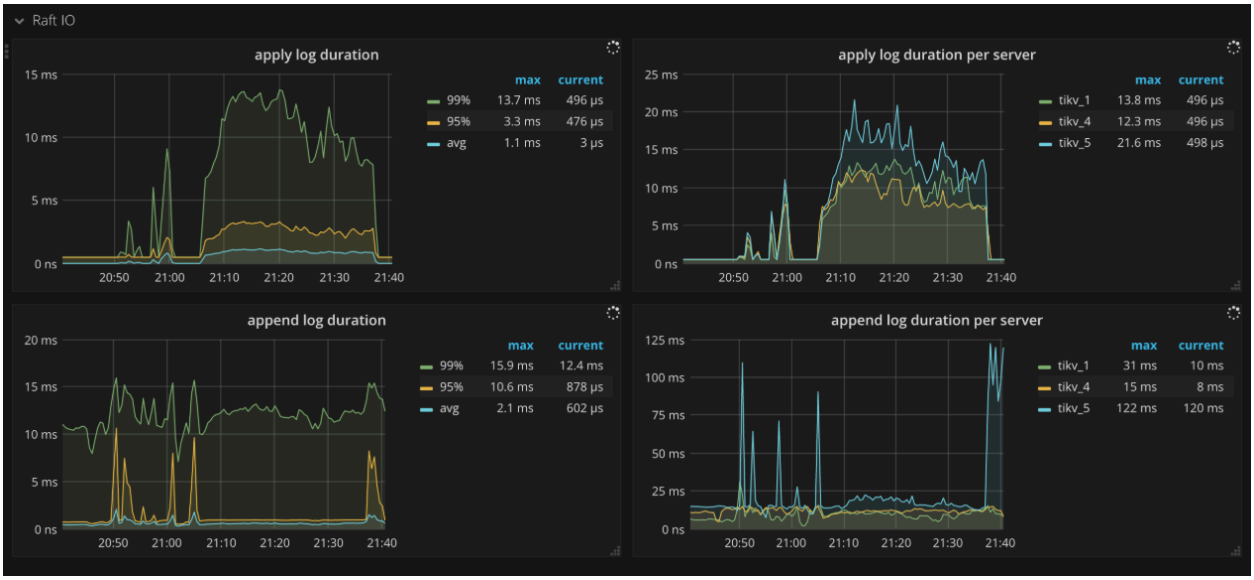

Figure 393: TiKV Dashboard - Raft IO metrics

#### 14.8.5.1.8 Raft process

- Ready handled: The number of handled ready operations per type per second
  - count: The number of handled ready operations per second
  - has_ready_region: The number of Regions that have ready per second
  - pending_region: The operations per second of the Regions being checked for whether it has ready. This metric is deprecated since v3.0.0
  - message: The number of messages that the ready operations per second contain
  - append: The number of Raft log entries that the ready operations per second contain
  - commit: The number of committed Raft log entries that the ready operations per second contain

  - snapshot: The number of snapshots that the ready operations per second contains

- 0.99 Duration of Raft store events: The time consumed by Raftstore events (P99)
- Process ready duration: The time consumed for processes to be ready in Raft
- Process ready duration per server: The time consumed for peer processes to be ready in Raft per TiKV instance. It should be less than 2 seconds (P99.99).
- Max Duration of Raft store events: The time consumed by the slowest Raftstore event.
- Replica read lock checking duration: The time consumed for checking locks when processing Replica Read.
- Peer msg length distribution: The number of messages processed by each Region in each TiKV instance at a time. The more messages, the busier the peer is.

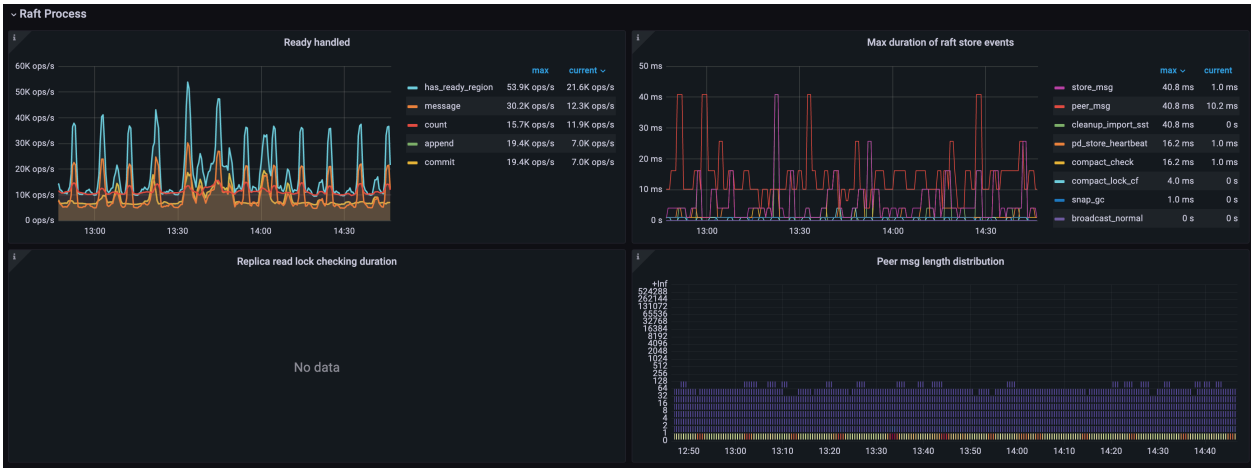

Figure 394: TiKV Dashboard - Raft process metrics

#### 14.8.5.1.9 Raft message

- Sent messages per server: The number of Raft messages sent by each TiKV instance per second
- Flush messages per server: The number of Raft messages flushed by the Raft client in each TiKV instance per second
- Receive messages per server: The number of Raft messages received by each TiKV instance per second
- Messages: The number of Raft messages sent per type per second
- Vote: The number of Vote messages sent in Raft per second
- Raft dropped messages: The number of dropped Raft messages per type per second

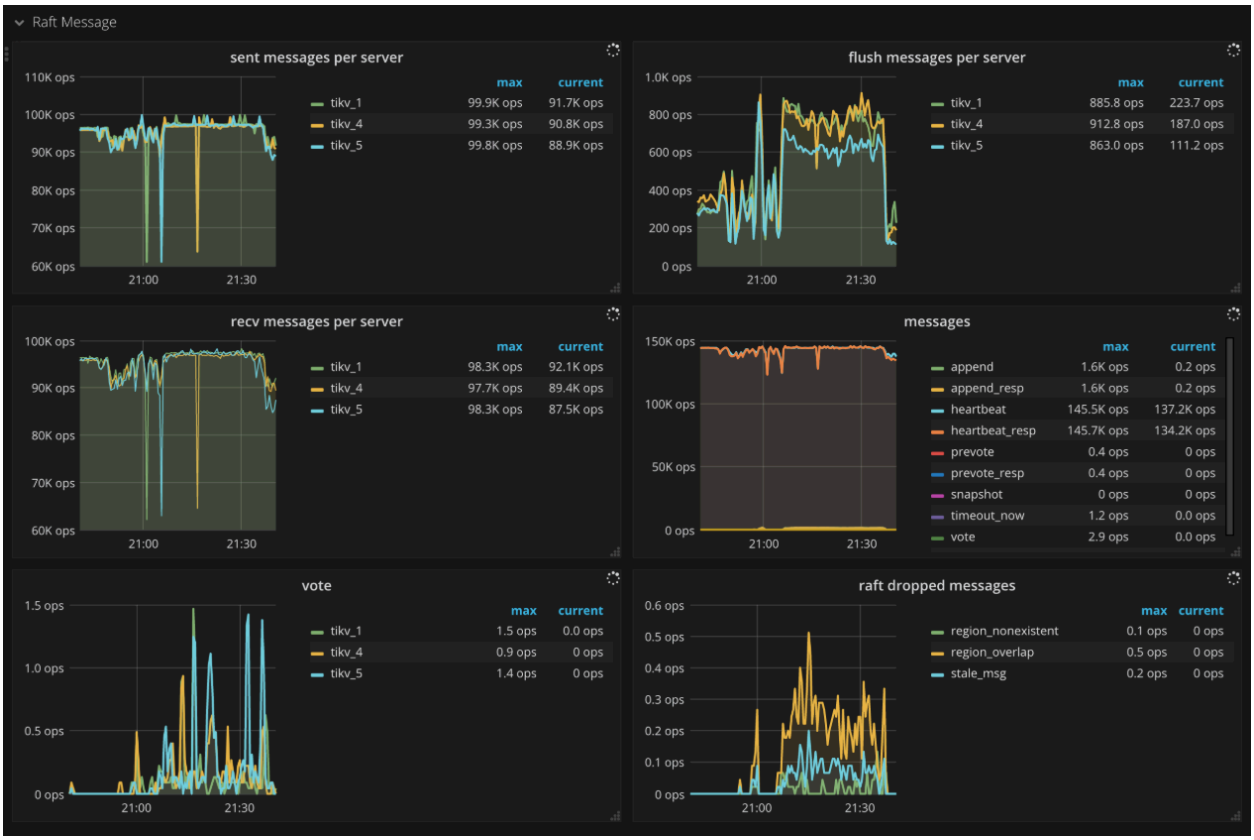

Figure 395: TiKV Dashboard - Raft message metrics

#### 14.8.5.1.10 Raft propose

- Raft apply proposals per ready: The histogram of the number of proposals that each ready operation contains in a batch while applying proposal.
- Raft read/write proposals: The number of proposals per type per second
- Raft read proposals per server: The number of read proposals made by each TiKV instance per second
- Raft write proposals per server: The number of write proposals made by each TiKV instance per second
- Propose wait duration: The histogram of waiting time of each proposal
- Propose wait duration per server: The histogram of waiting time of each proposal per TiKV instance
- Apply wait duration: The histogram of apply time of each proposal
- Apply wait duration per server: The histogram of apply time of each proposal per TiKV instance
- Raft log speed: The average rate at which peers propose logs

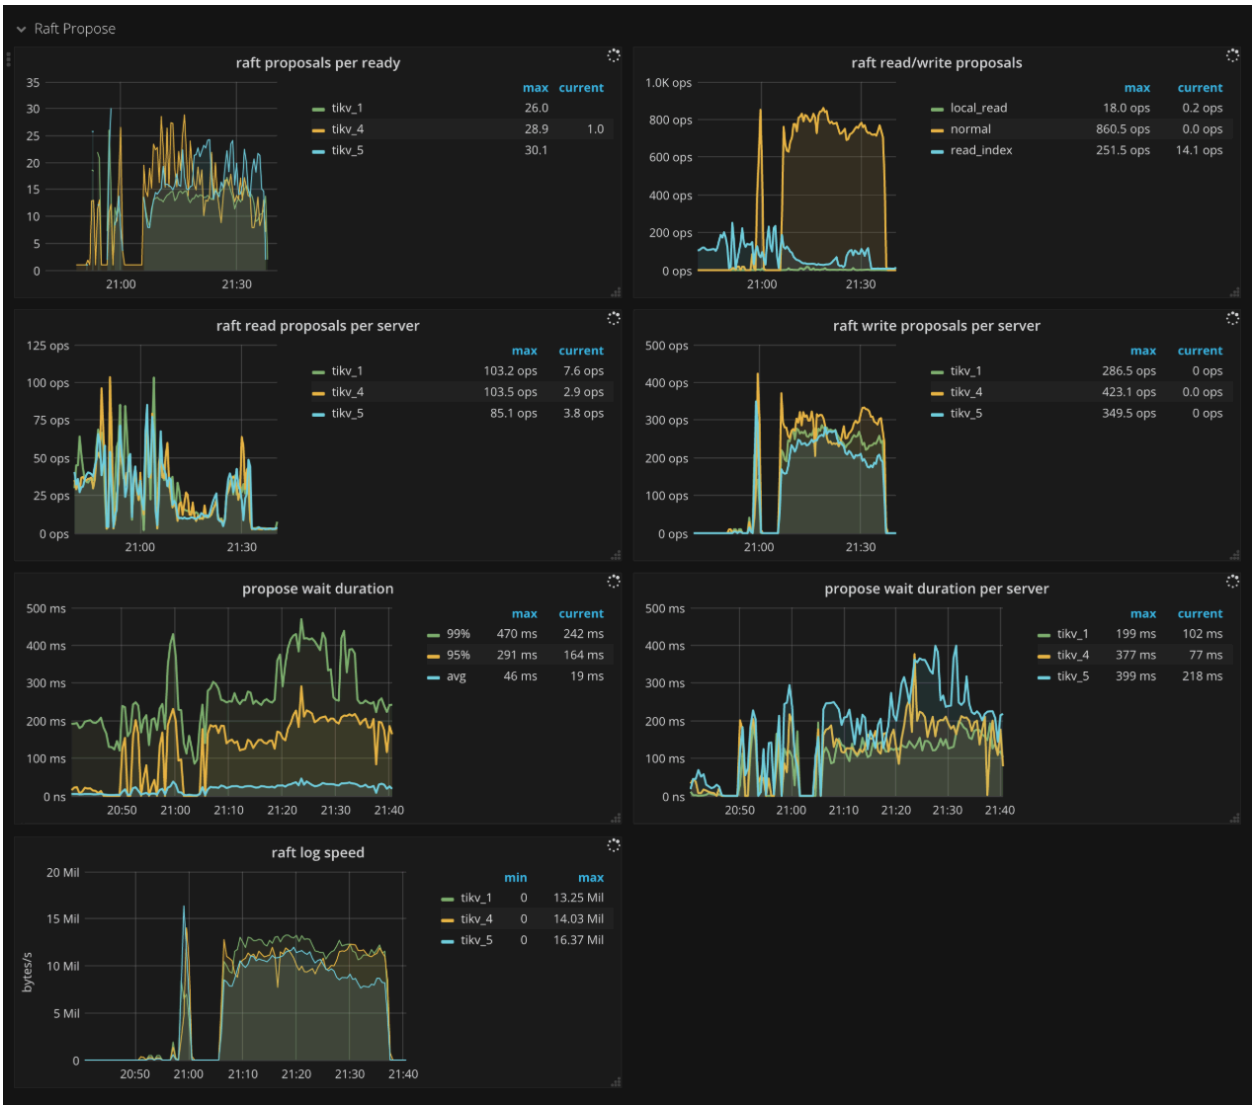

Figure 396: TiKV Dashboard - Raft propose metrics

#### 14.8.5.1.11 Raft admin

- Admin proposals: The number of admin proposals per second
- Admin apply: The number of processed apply commands per second
- Check split: The number of Raftstore split check commands per second
- 99.99% Check split duration: The time consumed when running split check commands (P99.99)
- Peer in Flashback State: The number of peers in flashback state

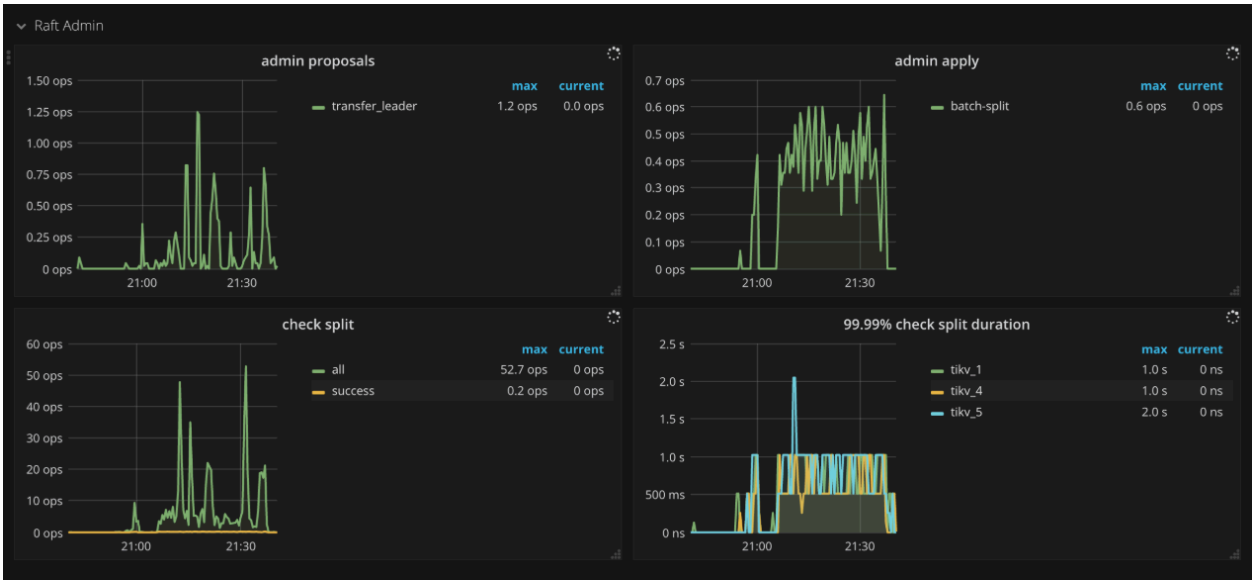

Figure 397: TiKV Dashboard - Raft admin metrics

#### 14.8.5.1.12 Local reader

- Local reader requests: The number of total requests and the number of rejections from the local read thread

Figure 398: TiKV Dashboard - Local reader metrics

#### 14.8.5.1.13 Unified Read Pool

- Time used by level: The time consumed for each level in the unified read pool. Level 0 means small queries.
- Level 0 chance: The proportion of level 0 tasks in unified read pool
- Running tasks: The number of tasks running concurrently in the unified read pool

#### 14.8.5.1.14 Storage

- Storage command total: The number of received command by type per second
- Storage async request error: The number of engine asynchronous request errors per second
- Storage async snapshot duration: The time consumed by processing asynchronous snapshot requests. It should be less than `1s` in `.99`.
- Storage async write duration: The time consumed by processing asynchronous write requests. It should be less than `1s` in `.99`.

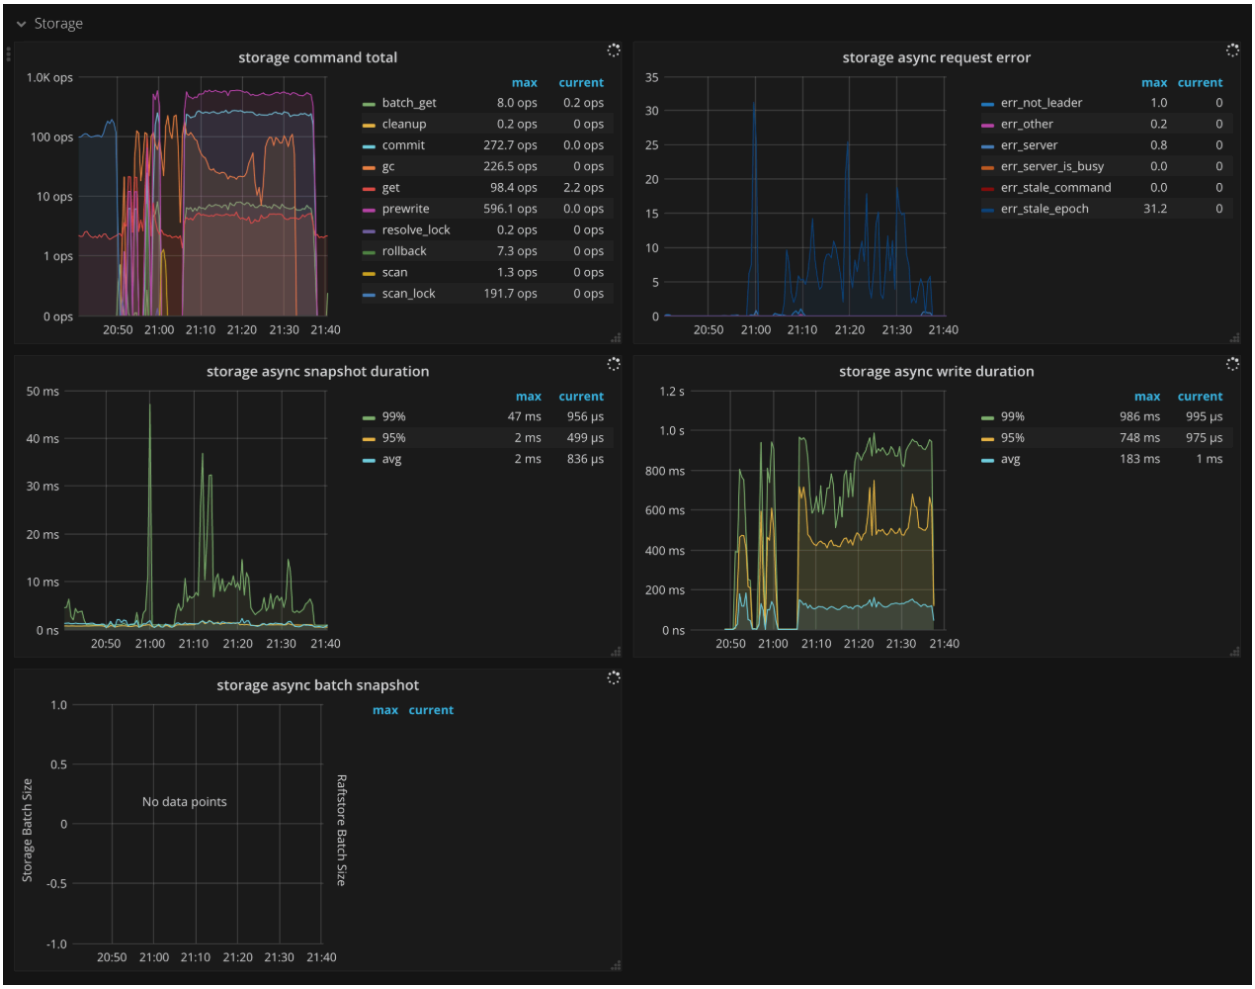

Figure 399: TiKV Dashboard - Storage metrics

#### 14.8.5.1.15 Flow Control

- Scheduler flow: The scheduler traffic on each TiKV instance in real time.
- Scheduler discard ratio: The rejection ratio of scheduler requests on each TiKV instance. If this ratio is greater than 0, it indicates that flow control exists. When `Compaction pending bytes` exceeds its threshold, TiKV will linearly increase the `Scheduler discard ratio` based on the exceeded portion. The client will retry the rejected requests automatically.
- Throttle duration: The blocked duration for the execution of the scheduler requests when flow control is triggered due to too many L0 files. If this metric has values, it indicates that flow control exists.
- Scheduler throttled CF: The CF that triggers RocksDB throttling when the flow control threshold is reached.
- Flow controller actions: The actions that trigger RocksDB throttling when the flow control threshold is reached.

- Flush/L0 flow: The traffic of flush and L0 compaction for different CFs of RocksDB on each TiKV instance.
- Flow control factors: The factors related to triggering RocksDB throttling.
- Compaction pending bytes: The size of the RocksDB data awaiting compaction in real time on each TiKV instance.
- Txn command throttled duration: The blocked duration for commands related to transactions due to throttling. Under normal circumstances, this metric is 0.
- Non-txn command throttled duration: The blocked duration for other commands due to throttling. Under normal circumstances, this metric is 0.

Figure 400: TiKV Dashboard - Flow Control metrics

#### 14.8.5.1.16 Scheduler

- Scheduler stage total: The number of commands at each stage per second. There should not be a lot of errors in a short time.
- Scheduler writing bytes: The total written bytes by commands processed on each TiKV instance
- Scheduler priority commands: The count of different priority commands per second

- Scheduler pending commands: The count of pending commands per TiKV instance per second

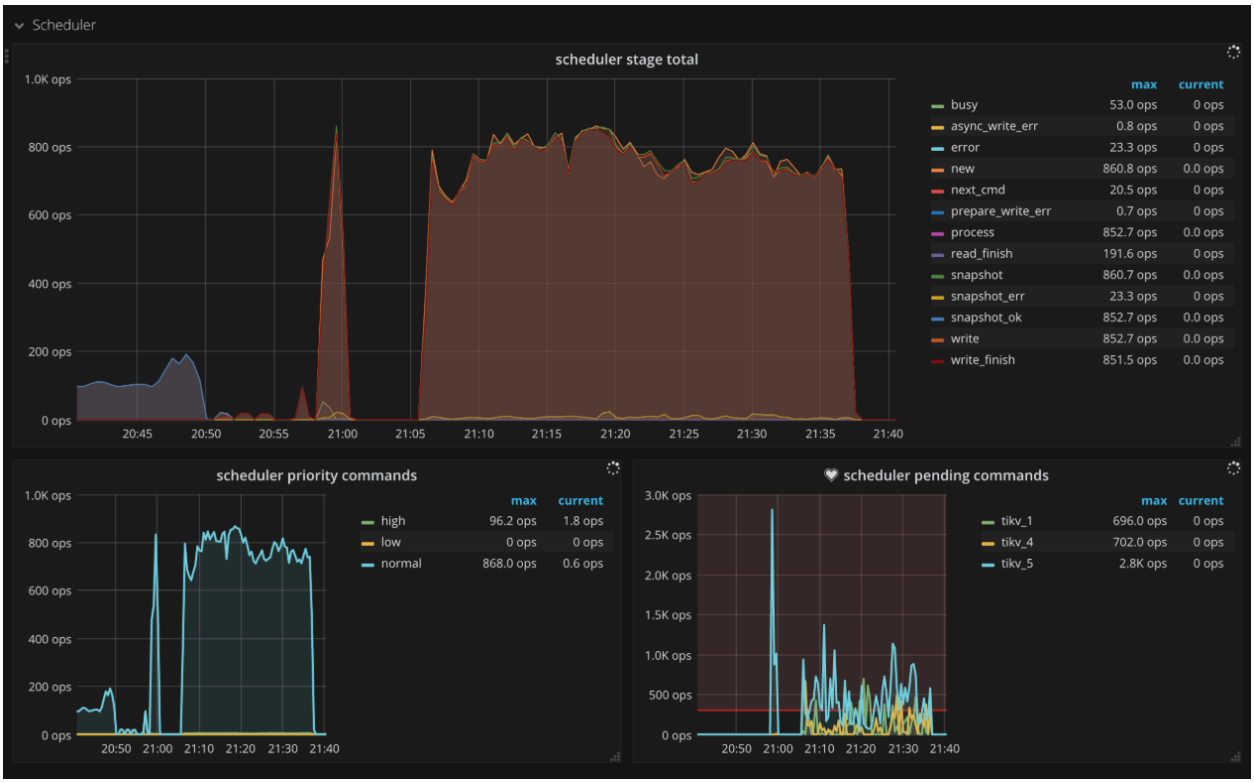

Figure 401: TiKV Dashboard - Scheduler metrics

#### 14.8.5.1.17 Scheduler - commit

- Scheduler stage total: The number of commands at each stage per second when executing the commit command. There should not be a lot of errors in a short time.
- Scheduler command duration: The time consumed when executing the commit command. It should be less than `1s`.
- Scheduler latch wait duration: The waiting time caused by latch when executing the commit command. It should be less than `1s`.
- Scheduler keys read: The count of keys read by a commit command
- Scheduler keys written: The count of keys written by a commit command
- Scheduler scan details: The keys scan details of each CF when executing the commit command.
- Scheduler scan details lock: The keys scan details of lock CF when executing the commit command
- Scheduler scan details write: The keys scan details of write CF when executing the commit command

- Scheduler scan details [default]: The keys scan details of default CF when executing the commit command

Figure 402: TiKV Dashboard - Scheduler commit metrics

#### 14.8.5.1.18 Scheduler - pessimistic_rollback

- Scheduler stage total: The number of commands at each stage per second when executing the `pessimistic_rollback` command. There should not be a lot of errors in a short time.

- Scheduler command duration: The time consumed when executing the `pessimistic_rollback` ↪ command. It should be less than `1s`.
- Scheduler latch wait duration: The waiting time caused by latch when executing the `pessimistic_rollback` command. It should be less than `1s`.
- Scheduler keys read: The count of keys read by a `pessimistic_rollback` command
- Scheduler keys written: The count of keys written by a `pessimistic_rollback` command
- Scheduler scan details: The keys scan details of each CF when executing the `pessimistic_rollback` command.
- Scheduler scan details lock: The keys scan details of lock CF when executing the `pessimistic_rollback` command
- Scheduler scan details write: The keys scan details of write CF when executing the `pessimistic_rollback` command
- Scheduler scan details [default]: The keys scan details of default CF when executing the `pessimistic_rollback` command

#### 14.8.5.1.19 Scheduler - prewrite

- Scheduler stage total: The number of commands at each stage per second when executing the prewrite command. There should not be a lot of errors in a short time.
- Scheduler command duration: The time consumed when executing the prewrite command. It should be less than `1s`.
- Scheduler latch wait duration: The waiting time caused by latch when executing the prewrite command. It should be less than `1s`.
- Scheduler keys read: The count of keys read by a prewrite command
- Scheduler keys written: The count of keys written by a prewrite command
- Scheduler scan details: The keys scan details of each CF when executing the prewrite command.
- Scheduler scan details lock: The keys scan details of lock CF when executing the prewrite command
- Scheduler scan details write: The keys scan details of write CF when executing the prewrite command
- Scheduler scan details [default]: The keys scan details of default CF when executing the prewrite command

#### 14.8.5.1.20 Scheduler - rollback

- Scheduler stage total: The number of commands at each stage per second when executing the rollback command. There should not be a lot of errors in a short time.
- Scheduler command duration: The time consumed when executing the rollback command. It should be less than `1s`.
- Scheduler latch wait duration: The waiting time caused by latch when executing the rollback command. It should be less than `1s`.
- Scheduler keys read: The count of keys read by a rollback command

- Scheduler keys written: The count of keys written by a rollback command
- Scheduler scan details: The keys scan details of each CF when executing the rollback command.
- Scheduler scan details lock: The keys scan details of lock CF when executing the rollback command
- Scheduler scan details write: The keys scan details of write CF when executing the rollback command
- Scheduler scan details [default]: The keys scan details of default CF when executing the rollback command

#### 14.8.5.1.21 GC

- GC tasks: The count of GC tasks processed by gc_worker
- GC tasks Duration: The time consumed when executing GC tasks
- TiDB GC seconds: The GC duration
- TiDB GC worker actions: The count of TiDB GC worker actions
- ResolveLocks Progress: The progress of the first phase of GC (Resolve Locks)
- TiKV Auto GC Progress: The progress of the second phase of GC
- GC speed: The number of keys deleted by GC per second
- TiKV Auto GC SafePoint: The value of TiKV GC safe point. The safe point is the current GC timestamp
- GC lifetime: The lifetime of TiDB GC
- GC interval: The interval of TiDB GC
- GC in Compaction Filter: The count of filtered versions in the compaction filter of write CF.

#### 14.8.5.1.22 Snapshot

- Rate snapshot message: The rate at which Raft snapshot messages are sent
- 99% Handle snapshot duration: The time consumed to handle snapshots (P99)
- Snapshot state count: The number of snapshots per state
- 99.99% Snapshot size: The snapshot size (P99.99)
- 99.99% Snapshot KV count: The number of KV within a snapshot (P99.99)

#### 14.8.5.1.23 Task

- Worker handled tasks: The number of tasks handled by worker per second
- Worker pending tasks: Current number of pending and running tasks of worker per second. It should be less than `1000` in normal case.
- FuturePool handled tasks: The number of tasks handled by future pool per second
- FuturePool pending tasks: Current number of pending and running tasks of future pool per second

#### 14.8.5.1.24 Coprocessor Overview

- Request duration: The total duration from the time of receiving the coprocessor request to the time of finishing processing the request
- Total Requests: The number of requests by type per second
- Handle duration: The histogram of time spent actually processing coprocessor requests per minute
- Total Request Errors: The number of request errors of Coprocessor per second. There should not be a lot of errors in a short time.
- Total KV Cursor Operations: The total number of the KV cursor operations by type per second, such as `select`, `index`, `analyze_table`, `analyze_index`, `checksum_table` ↪ , and `checksum_index`.
- KV Cursor Operations: The histogram of KV cursor operations by type per second
- Total RocksDB Perf Statistics: The statistics of RocksDB performance
- Total Response Size: The total size of coprocessor response

#### 14.8.5.1.25 Coprocessor Detail

- Handle duration: The histogram of time spent actually processing coprocessor requests per minute
- 95% Handle duration by store: The time consumed to handle coprocessor requests per TiKV instance per second (P95)
- Wait duration: The time consumed when coprocessor requests are waiting to be handled. It should be less than `10s` (P99.99).
- 95% Wait duration by store: The time consumed when coprocessor requests are waiting to be handled per TiKV instance per second (P95)
- Total DAG Requests: The total number of DAG requests per second
- Total DAG Executors: The total number of DAG executors per second
- Total Ops Details (Table Scan): The number of RocksDB internal operations per second when executing select scan in coprocessor
- Total Ops Details (Index Scan): The number of RocksDB internal operations per second when executing index scan in coprocessor
- Total Ops Details by CF (Table Scan): The number of RocksDB internal operations for each CF per second when executing select scan in coprocessor
- Total Ops Details by CF (Index Scan): The number of RocksDB internal operations for each CF per second when executing index scan in coprocessor

#### 14.8.5.1.26 Threads

- Threads state: The state of TiKV threads
- Threads IO: The I/O traffic of each TiKV thread
- Thread Voluntary Context Switches: The number of TiKV threads voluntary context switches
- Thread Nonvoluntary Context Switches: The number of TiKV threads nonvoluntary context switches

#### 14.8.5.1.27 RocksDB - kv/raft

- Get operations: The count of get operations per second
- Get duration: The time consumed when executing get operations
- Seek operations: The count of seek operations per second
- Seek duration: The time consumed when executing seek operations
- Write operations: The count of write operations per second
- Write duration: The time consumed when executing write operations
- WAL sync operations: The count of WAL sync operations per second
- Write WAL duration: The time consumed for writing WAL
- WAL sync duration: The time consumed when executing WAL sync operations
- Compaction operations: The count of compaction and flush operations per second
- Compaction duration: The time consumed when executing the compaction and flush operations
- SST read duration: The time consumed when reading SST files
- Write stall duration: Write stall duration. It should be `0` in normal case.
- Memtable size: The memtable size of each column family
- Memtable hit: The hit rate of memtable
- Block cache size: The block cache size. Broken down by column family if shared block cache is disabled.
- Block cache hit: The hit rate of block cache
- Block cache flow: The flow rate of block cache operations per type
- Block cache operations: The count of block cache operations per type
- Keys flow: The flow rate of operations on keys per type
- Total keys: The count of keys in each column family
- Read flow: The flow rate of read operations per type
- Bytes / Read: The bytes per read operation
- Write flow: The flow rate of write operations per type
- Bytes / Write: The bytes per write operation
- Compaction flow: The flow rate of compaction operations per type
- Compaction pending bytes: The pending bytes to be compacted
- Read amplification: The read amplification per TiKV instance
- Compression ratio: The compression ratio of each level
- Number of snapshots: The number of snapshots per TiKV instance
- Oldest snapshots duration: The time that the oldest unreleased snapshot survivals
- Number files at each level: The number of SST files for different column families in each level
- Ingest SST duration seconds: The time consumed to ingest SST files
- Stall conditions changed of each CF: Stall conditions changed of each column family

#### 14.8.5.1.28 Raft Engine

- Operations
    - write: the number of write operations by Raft Engine per second

    - read_entry: the number of raft log read operations by Raft Engine per second
    - read_message: the number of raft metadata read operations by Raft Engine per second
- Write duration: the duration of write operations by Raft Engine. This duration is close to the sum of the latency of disk IOs involved in writing these data.
- Flow
    - write: the write traffic of Raft Engine
    - rewrite append: the traffic of rewriting append logs
    - rewrite rewrite: the traffic of rewriting rewrite logs
- Write Duration Breakdown (99%)
    - wal: the latency of writing Raft Engine WAL
    - wait: the waiting time before writing
    - apply: the time consumed for applying data to memory
- Bytes/Written: the bytes written by Raft Engine every time
- WAL Duration Breakdown (P99%): the time consumed for each stage of writing Raft Engine WAL
- File Count
    - append: the number of files used for appending data by Raft Engine
    - rewrite: the number of files used for rewriting data by Raft Engine (rewrite is similar to RocksDB compaction)
- Entry Count
    - rewrite: the number of entries rewritten by Raft Engine
    - append: the number of entries appended by Raft Engine

#### 14.8.5.1.29 Titan - All

- Blob file count: The number of Titan blob files
- Blob file size: The total size of Titan blob file
- Live blob size: The total size of valid blob record
- Blob cache hit: The hit rate of Titan block cache
- Iter touched blob file count: The number of blob file involved in a single iterator
- Blob file discardable ratio distribution: The ratio distribution of blob record failure of blob files
- Blob key size: The size of Titan blob keys
- Blob value size: The size of Titan blob values
- Blob get operations: The count of get operations in Titan blob
- Blob get duration: The time consumed when executing get operations in Titan blob
- Blob iter operations: The time consumed when executing iter operations in Titan blob
- Blob seek duration: The time consumed when executing seek operations in Titan blob
- Blob next duration: The time consumed when executing next operations in Titan blob

- Blob prev duration: The time consumed when executing prev operations in Titan blob
- Blob keys flow: The flow rate of operations on Titan blob keys
- Blob bytes flow: The flow rate of bytes on Titan blob keys
- Blob file read duration: The time consumed when reading Titan blob file
- Blob file write duration: The time consumed when writing Titan blob file
- Blob file sync operations: The count of blob file sync operations
- Blob file sync duration: The time consumed when synchronizing blob file
- Blob GC action: The count of Titan GC actions
- Blob GC duration: The Titan GC duration
- Blob GC keys flow: The flow rate of keys read and written by Titan GC
- Blob GC bytes flow: The flow rate of bytes read and written by Titan GC
- Blob GC input file size: The size of Titan GC input file
- Blob GC output file size: The size of Titan GC output file
- Blob GC file count: The count of blob files involved in Titan GC

#### 14.8.5.1.30 Pessimistic Locking

- Lock Manager Thread CPU: The CPU utilization of the lock manager thread
- Lock Manager Handled tasks: The number of tasks handled by lock manager
- Waiter lifetime duration: The waiting time of the transaction for the lock to be released
- Wait table: The status information of wait table, including the number of locks and the number of transactions waiting for the lock
- Deadlock detect duration: The time consumed for detecting deadlock
- Detect error: The number of errors encountered when detecting deadlock, including the number of deadlocks
- Deadlock detector leader: The information of the node where the deadlock detector leader is located
- Total pessimistic locks memory size: The memory size occupied by the in-memory pessimistic locks
- In-memory pessimistic locking result: The result of only saving pessimistic locks to memory. `full` means the number of times that the pessimistic lock is not saved to memory because the memory limit is exceeded.

#### 14.8.5.1.31 Resolved-TS

- Resolved-TS worker CPU: The CPU utilization of the resolved-ts worker threads
- Advance-TS worker CPU: The CPU utilization of the advance-ts worker threads
- Scan lock worker CPU: The CPU utilization of the scan lock worker threads
- Max gap of resolved-ts: The maximum time difference between the resolved-ts of all active Regions in this TiKV and the current time
- Max gap of safe-ts: The maximum time difference between the safe-ts of all active Regions in this TiKV and the current time
- Min Resolved TS Region: The ID of the Region whose resolved-ts is the minimal
- Min Safe TS Region: The ID of the Region whose safe-ts is the minimal

- Check Leader Duration: The distribution of time spent on processing leader requests. The duration is from sending requests to receiving responses in leader
- Max gap of resolved-ts in Region leaders: The maximum time difference between the resolved-ts of all active Regions in this TiKV and the current time, only for Region leaders
- Min Leader Resolved TS Region: The ID of the Region whose resolved-ts is the minimal, only for Region leaders
- Lock heap size: The size of the heap that tracks locks in the resolved-ts module

#### 14.8.5.1.32 Memory

- Allocator Stats: The statistics of the memory allocator

#### 14.8.5.1.33 Backup

- Backup CPU: The CPU utilization of the backup thread
- Range Size: The histogram of backup range size
- Backup Duration: The time consumed for backup
- Backup Flow: The total bytes of backup
- Disk Throughput: The disk throughput per instance
- Backup Range Duration: The time consumed for backing up a range
- Backup Errors: The number of errors encountered during a backup

#### 14.8.5.1.34 Encryption

- Encryption data keys: The total number of encrypted data keys
- Encrypted files: The number of encrypted files
- Encryption initialized: Shows whether encryption is enabled. `1` means enabled.
- Encryption meta files size: The size of the encryption meta file
- Encrypt/decrypt data nanos: The histogram of duration on encrypting/decrypting data each time
- Read/write encryption meta duration: The time consumed for reading/writing encryption meta files

#### 14.8.5.1.35 Log Backup

- Handle Event Rate: The speed of handling write events
- Initial Scan Generate Event Throughput: Incremental scanning speed when generating a new listener stream
- Abnormal Checkpoint TS Lag: The lag of the current checkpoint TS to the present time for each task
- Memory Of Events: An estimated amount of memory occupied by temporary data generated by incremental scanning

- Observed Region Count: The number of Regions currently listened to
- Errors: The number and type of retryable and non-fatal errors
- Fatal Errors: The number and type of fatal errors. Usually, fatal errors cause the task to be paused.
- Checkpoint TS of Tasks: Checkpoint TS for each task
- Flush Duration: The heat map of how long it takes for moving cached data to external storage
- Initial Scanning Duration: The heat map of how long it takes for incremental scanning when creating a new listening stream
- Convert Raft Event Duration: The heat map of how long it takes to transform a Raft log entry into backup data after creating a listening stream
- Command Batch Size: The batch size (within a single Raft group) of the listening Raft command
- Save to Temp File Duration: The heat map of how long it takes to temporarily store a batch of backup data (spanning several tasks) into the temporary file area
- Write to Temp File Duration: The heat map of how long it takes to temporarily store a batch of backup data (from a particular task) into the temporary file area
- System Write Call Duration: The heat map of how long it takes to write a batch of backup data (from a Region) to a temporary file
- Internal Message Type: The type of messages received by the actor responsible for the log backup within TiKV
- Internal Message Handling Duration (P90|P99): The speed of consuming and processing each type of messages
- Initial Scan RocksDB Throughput: The read traffic generated by RocksDB internal logging during incremental scanning
- Initial Scan RocksDB Operation: The number of individual operations logged internally by RocksDB during incremental scanning
- Initial Scanning Trigger Reason: The reason for triggering incremental scanning
- Region Checkpoint Key Putting: The number of checkpoint operations logged to the PD

> **Note:**
>
> The following monitoring metrics all use TiDB nodes as their data source, but they have some impact on the log backup process. Therefore, they are placed in the **TiKV Details** dashboard for ease of reference. TiKV actively pushes progress most of the time, but it is normal for some of the following monitoring metrics to occasionally not have sampled data.

- Request Checkpoint Batch Size: The request batch size when the log backup coordinator requests checkpoint information for each TiKV
- Tick Duration [P99|P90]: The time taken by the tick inside the coordinator

- Region Checkpoint Failure Reason: The reason why a Region checkpoint cannot advance within the coordinator
- Request Result: The record of the coordinator's success or failure in advancing the Region checkpoint
- Get Region Operation Count: The number of times the coordinator requests Region information from the PD
- Try Advance Trigger Time: The time taken for the coordinator to attempt to advance the checkpoint

#### 14.8.5.1.36 Backup & Import

- Import CPU Utilization: The CPU utilization aggregated by SST importer.
- Import Thread Count: The number of threads used by SST importer.
- Import Errors: The number of errors encountered during SST import.
- Import RPC Duration: The time spent on various RPC calls in SST importer.
- Import RPC Ops: The total number of RPC calls in SST importer.
- Import RPC Count: The number of RPC calls being processed by SST importer.
- Import Write/Download RPC Duration: The RPC time for write or download operations in SST importer.
- Import Wait Duration: The time spent waiting in queue for download task execution.
- Import Read SST Duration: The time spent reading an SST file from external storage and downloading it to TiKV.
- Import Rewrite SST Duration: The time spent rewriting the SST file based on rewrite rules.
- Import Ingest RPC Duration: The time spent handling ingest RPC requests on TiKV.
- Import Ingest SST Duration: The time spent ingesting the SST file into RocksDB.
- Import Ingest SST Bytes: The number of bytes ingested.
- Import Download SST Throughput: The SST download throughput in bytes per second.
- cloud request: The number of requests to cloud providers.

#### 14.8.5.1.37 Point In Time Restore

- CPU Usage: The CPU utilization by point-in-time recovery (PITR).
- P99 RPC Duration: The 99th percentile of RPC request duration.
- Import RPC Ops: The total number of RPC calls in SST importer.
- Import RPC Count: The number of RPC calls being processed by SST importer.
- Cache Events: The number of events in the file cache during SST import.
- Overall RPC Duration: The time spent on RPC calls.
- Read File into Memory Duration: The time spent downloading files from external storage and loading them into memory.
- Queuing Time: The time spent waiting to be scheduled on a thread.
- Apply Request Throughput: The rate of applying requests in bytes.
- Downloaded File Size: The size of downloaded file in bytes.

- Apply Batch Size: The number of bytes for applying to Raft store in one batch.
- Blocked by Concurrency Time: The time spent waiting for execution due to concurrency constraints.
- Apply Request Speed: The speed of applying request to Raft store.
- Cached File in Memory: The files cached by the applying requests of SST importer.
- Engine Requests Unfinished: The number of pending requests to Raft store.
- Apply Time: The time spent writing data to Raft store.
- Raft Store Memory Usage: The memory usage for Raft store.

#### 14.8.5.1.38 Explanation of Common Parameters

gRPC Message Type

1. Transactional API:

    - kv_get: The command of getting the latest version of data specified by `ts`
    - kv_scan: The command of scanning a range of data
    - kv_prewrite: The command of prewriting the data to be committed at first phase of 2PC
    - kv_pessimistic_lock: The command of adding a pessimistic lock to the key to prevent other transaction from modifying this key
    - kv_pessimistic_rollback: The command of deleting the pessimistic lock on the key
    - kv_txn_heart_beat: The command of updating `lock_ttl` for pessimistic transactions or large transactions to prevent them from rolling back
    - kv_check_txn_status: The command of checking the status of the transaction
    - kv_commit: The command of committing the data written by the prewrite command
    - kv_cleanup: The command of rolling back a transaction, which is deprecated in v4.0
    - kv_batch_get: The command of getting the value of batch key at once, similar to `kv_get`
    - kv_batch_rollback: The command of batch rollback of multiple prewrite transactions
    - kv_scan_lock: The command of scanning all locks with a version number before `max_version` to clean up expired transactions
    - kv_resolve_lock: The command of committing or rollback the transaction lock, according to the transaction status.
    - kv_gc: The command of GC
    - kv_delete_range: The command of deleting a range of data from TiKV

2. Raw API:

    - raw_get: The command of getting the value of key
    - raw_batch_get: The command of getting the value of batch keys

- raw_scan: The command of scanning a range of data
- raw_batch_scan: The command of scanning multiple consecutive data range
- raw_put: The command of writing a key/value pair
- raw_batch_put: The command of writing a batch of key/value pairs
- raw_delete: The command of deleting a key/value pair
- raw_batch_delete: The command of a batch of key/value pairs
- raw_delete_range: The command of deleting a range of data

#### 14.8.5.2 TiKV-FastTune dashboard

If performance issues of TiKV occur, such as QPS jitter, latency jitter, and latency increasing trend, you can check the **TiKV-FastTune** dashboard. This dashboard contains a set of panels that help you with diagnostics, especially when the write workload in your cluster is medium or large.

When write-related performance issues occur, you can first check the TiDB-related dashboards. If the issues are at the storage side, open the **TiKV-FastTune** page, browse and check every panel on it.

In the **TiKV-FastTune** dashboard, you can see a title that suggests a possible cause of the performance issues. To check whether the suggested cause is true, check the graph on the page.

The left-Y-axis of the graph represents the write-RPC QPS of the storage side, and a set of graphs on the right-Y-axis are drawn upside down. If the shape of the left graph matches that of the right graphs, the suggested cause is true.

For detailed metrics and descriptions, see the dashboard user manual.

### 14.8.6 Monitor the TiFlash Cluster

This document describes the monitoring items of TiFlash.

If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus & Grafana) is deployed at the same time. For more information, see Overview of the Monitoring Framework.

The Grafana dashboard is divided into a series of sub dashboards which include Overview, PD, TiDB, TiKV, and Node_exporter. A lot of metrics are there to help you diagnose.

TiFlash has three dashboard panels: **TiFlash-Summary**, **TiFlash-Proxy-Summary**, and **TiFlash-Proxy-Details**. The metrics on these panels indicate the current status of TiFlash. The **TiFlash-Proxy-Summary** and **TiFlash-Proxy-Details** panels mainly show the information of the Raft layer and the metrics are detailed in Key Monitoring Metrics of TiKV.

> **Note:**
>
> It is recommended that you use TiDB v4.0.5 or later versions for improved monitor on TiFlash.

The following sections introduce the default monitoring information of **TiFlash-Summary**.

#### 14.8.6.1 Server

- Store size: The storage size used by each TiFlash instance.
- Available size: The storage size available for each TiFlash instance.
- Capacity size: The storage capacity for each TiFlash instance.
- Uptime: The runtime of TiFlash since last restart.
- Memory: The memory usage per TiFlash instance.
- CPU Usage: The CPU utilization per TiFlash instance.
- FSync OPS: The number of fsync operations per TiFlash instance per second.
- File Open OPS: The number of `open` operations per TiFlash instance per second.
- Opened File Count: The number of file descriptors currently opened by each TiFlash instance.

> **Note:**
>
> Store size, FSync OPS, File Open OPS, and Opened File Count currently only cover the monitoring information of the TiFlash storage layer and do not cover that in TiFlash-Proxy.

#### 14.8.6.2 Coprocessor

- Request QPS: The number of coprocessor requests received by all TiFlash instances. `batch` is the number of batch requests. `batch_cop` is the number of coprocessor requests in the batch requests. `cop` is the number of coprocessor requests that are sent directly via the coprocessor interface. `cop_dag` is the number of dag requests in all coprocessor requests. `super_batch` is the number of requests to enable the Super Batch feature.
- Executor QPS: The number of each type of dag executors in the requests received by all TiFlash instances. `table_scan` is the table scan executor. `selection` is the selection executor. `aggregation` is the aggregation executor. `top_n` is the `TopN` executor. `limit` is the limit executor.

- Request Duration: The total duration of all TiFlash instances processing coprocessor requests. The total duration is from the time that the coprocessor request is received to the time that the response to the request is completed.
- Error QPS: The number of errors of all TiFlash instances processing coprocessor requests. `meet_lock` means that the read data is locked. `region_not_found` means that the Region does not exist. `epoch_not_match` means the read Region epoch is inconsistent with the local epoch. `kv_client_error` means that the communication with TiKV returns an error. `internal_error` is the internal system error of TiFlash. `other` is other types of errors.
- Request Handle Duration: The duration of all TiFlash instances processing coprocessor requests. The processing time is from starting to execute the coprocessor request to completing the execution.
- Response Bytes/Seconds: The total bytes of the response from all TiFlash instances.
- Cop task memory usage: The total memory usage of all TiFlash instances processing coprocessor requests.
- Handling Request Number: The total number of all TiFlash instances processing coprocessor requests. The classification of the requests is the same as that of Request QPS.
- Threads of RPC: The real-time number of RPC threads used in each TiFlash instance.
- Max Threads of RPC: The maximum number of RPC threads recently used in each TiFlash instance.
- Threads: The real-time number of threads used in each TiFlash instance.
- Max Threads: The maximum number of threads recently used in each TiFlash instance.

#### 14.8.6.3 Task Scheduler

- Min TSO: The minimum TSO among all queries running on each TiFlash instance. This value ensures that queries with the minimum TSO can be scheduled to run. When no queries are running, this value is the maximum unsigned 64-bit integer.
- Estimated Thread Usage and Limit: The estimated amount of threads used by all queries running on each TiFlash instance, and the soft and hard limits on the amount.
- Active and Waiting Queries Count: The amount of running queries and that of waiting queries on each TiFlash instance.
- Active and Waiting Tasks Count: The amount of running tasks and that of waiting tasks on each TiFlash instance.
- Hard Limit Exceeded Count: Times that the estimated amount of threads used by queries running on each TiFlash instance exceeds the hard limit.
- Task Waiting Duration: The duration from task initialization to task scheduling on each TiFlash instance.

#### 14.8.6.4 DDL

- Schema Version: The version of the schema currently cached in each TiFlash instance.

- Schema Apply OPM: The number of TiDB `schema diff` synchronized in `apply` operations by all TiFlash instances per minute. This item includes the count of three types of `apply`: `diff apply`, `full apply`, and `failed apply`. `diff apply` is the normal process of a single apply. If `diff apply` fails, `failed apply` increases by `1`, and TiFlash rolls back to `full apply` and pulls the latest schema information to update the schema version of TiFlash.
- Schema Internal DDL OPM: The number of specific DDL operations executed per minute in all TiFlash instances.
- Schema Apply Duration: The time used for a single `apply schema` operation in all TiFlash instances.

#### 14.8.6.5 Storage

- Write Command OPS: The number of write requests received per second by the storage layer of all TiFlash instances.
- Write Amplification: Write amplification of each TiFlash instance (the actual bytes of disk writes divided by the written bytes of logical data). `total` is the write amplification since this start, and `5min` is the write amplification in the last 5 minutes.
- Read Tasks OPS: The number of read tasks in the storage layer per second for each TiFlash instance.
- Rough Set Filter Rate: The proportion of the number of packets read by each TiFlash instance in the last minute that are filtered by the rough set index of the storage layer.
- Internal Tasks OPS: The number of times that all TiFlash instances perform internal data sorting tasks per second.
- Internal Tasks Duration: The time consumed by all TiFlash instances for internal data sorting tasks.
- Page GC Tasks OPM: The number of times that all TiFlash instances perform Delta data sorting tasks per minute.
- Page GC Tasks Duration: The distribution of time consumed by all TiFlash instances to perform Delta data sorting tasks.
- Disk Write OPS: The number of disk writes per second by all TiFlash instances.
- Disk Read OPS: The number of disk reads per second by all TiFlash instances.
- Write flow: The traffic of disk writes by all TiFlash instances.
- Read flow: The traffic of disk reads by all TiFlash instances.

> **Note:**
>
> These metrics only cover the monitoring information of the TiFlash storage layer and do not cover that in TiFlash-Proxy.

#### 14.8.6.6 Storage Write Stall

- Write & Delta Management Throughput: The throughput of write and data compaction for all instances.
    - `throughput_write` means the throughput of data synchronization through Raft.
    - `throughput_delta-management` means the throughput of data compaction.
    - `total_write` means the total bytes written since the last start.
    - `total_delta-management` means the total bytes of data compacted since the last start.
- Write Stall Duration: The stall duration of write and removing Region data (deleting ranges) by instance.
- Write Throughput By Instance: The throughput of write by instance. It includes the throughput by applying the Raft write commands and Raft snapshots.
- Write Command OPS By Instance: The total count of different kinds of commands received by instance.
    - `write block` means the data logs synchronized through Raft.
    - `delete_range` means that some Regions are removed from or moved to this instance.
    - `ingest` means some Region snapshots are applied to this instance.

#### 14.8.6.7 Raft

- Read Index OPS: The number of times that each TiFlash instance triggers the `read_index` request per second, which equals to the number of Regions triggered.
- Read Index Duration: The time used by `read_index` for all TiFlash instances. Most time is used for interaction with the Region leader and retry.
- Wait Index Duration: The time used by `wait_index` for all TiFlash instances, namely the time used to wait until local index >= read_index after the `read_index` request is received.

### 14.8.7 Key Monitoring Metrics of TiCDC

If you use TiUP to deploy the TiDB cluster, you can see a sub-dashboard for TiCDC in the monitoring system which is deployed at the same time. You can get an overview of TiCDC's current status from the TiCDC dashboard, where the key metrics are displayed. This document provides a detailed description of these key metrics.

The metric description in this document is based on the following replication task example, which replicates data to MySQL using the default configuration.

```
cdc cli changefeed create --server=http://10.0.10.25:8300 --sink-uri="mysql
    ↪ ://root:1234560127.0.0.1:3306/" --changefeed-id="simple-replication-
    ↪ task"
```

The TiCDC dashboard contains four monitoring panels. See the following screenshot:

Figure 403: TiCDC Dashboard - Overview

The description of each panel is as follows:

- **Server**: The summary information of TiKV nodes and TiCDC nodes in the TiDB cluster
- **Changefeed**: The detailed information of TiCDC replication tasks
- **Events**: The detail information about the data flow within the TiCDC cluster
- **TiKV**: TiKV information related to TiCDC

#### 14.8.7.1 Server

The following is an example of the **Server** panel:

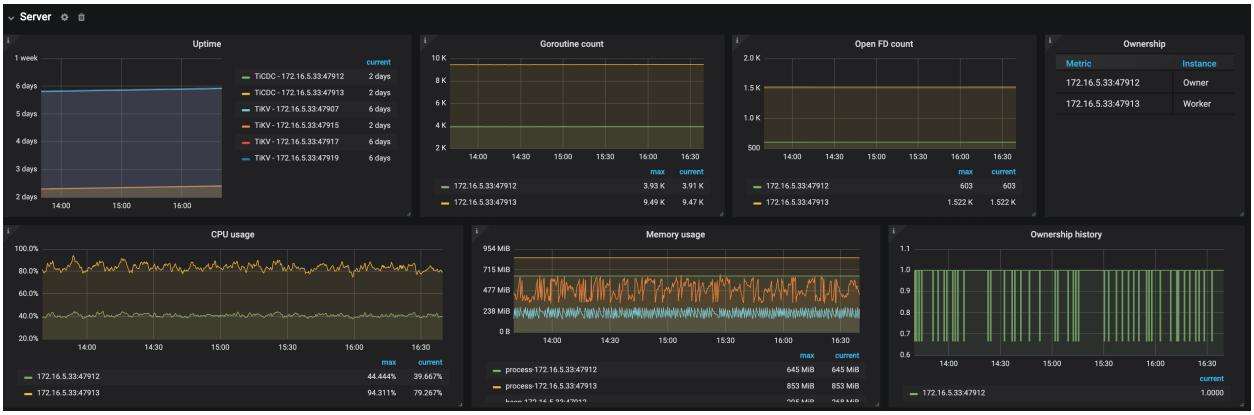

Figure 404: TiCDC Dashboard - Server metrics

The description of each metric in the **Server** panel is as follows:

- Uptime: The time for which TiKV nodes and TiCDC nodes have been running
- Goroutine count: The number of goroutines of a TiCDC node
- Open FD count: The number of file handles opened by TiCDC nodes
- Ownership: The current status of nodes in the TiCDC cluster
- Ownership history: The ownership history of the TiCDC cluster
- CPU usage: The CPU usage of TiCDC nodes
- Memory usage: The memory usage of TiCDC nodes

#### 14.8.7.2 Changefeed

The following is an example of the **Changefeed** panel:

Figure 405: TiCDC Dashboard - Changefeed metrics 1

- Changefeed table count: The number of tables that each TiCDC node needs to replicate in the replication task
- Processor resolved ts: The timestamps that have been resolved in the TiCDC cluster
- Table resolved ts: The replication progress of each table in the replication task
- Changefeed checkpoint: The progress of replicating data to the downstream. Normally, the green bars are connected to the yellow line
- PD etcd requests/s: The number of requests that a TiCDC node sends to PD per second
- Exit error count/m: The number of errors that interrupt the replication task per minute
- Changefeed checkpoint lag: The progress lag of data replication (the unit is second) between the upstream and the downstream
- Processor resolved ts lag: The progress lag of data replication (the unit is second) between the upstream and TiCDC nodes

Figure 406: TiCDC Dashboard - Changefeed metrics 2

- Sink write duration: The histogram of the time spent by TiCDC writing a transaction change to the downstream
- Sink write duration percentile: The time (P95, P99, and P999) spent by TiCDC writing a transaction change to the downstream within one second
- Flush sink duration: The histogram of the time spent by TiCDC asynchronously flushing data to the downstream
- Flush sink duration percentile: The time (P95, P99, and P999) spent by TiCDC asynchronously flushing data to the downstream within one second

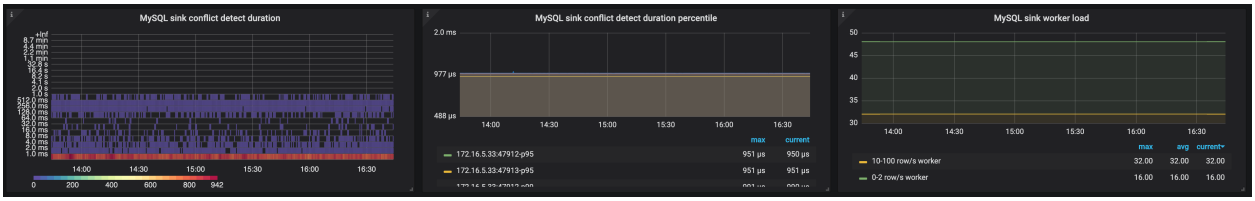

Figure 407: TiCDC Dashboard - Changefeed metrics 3

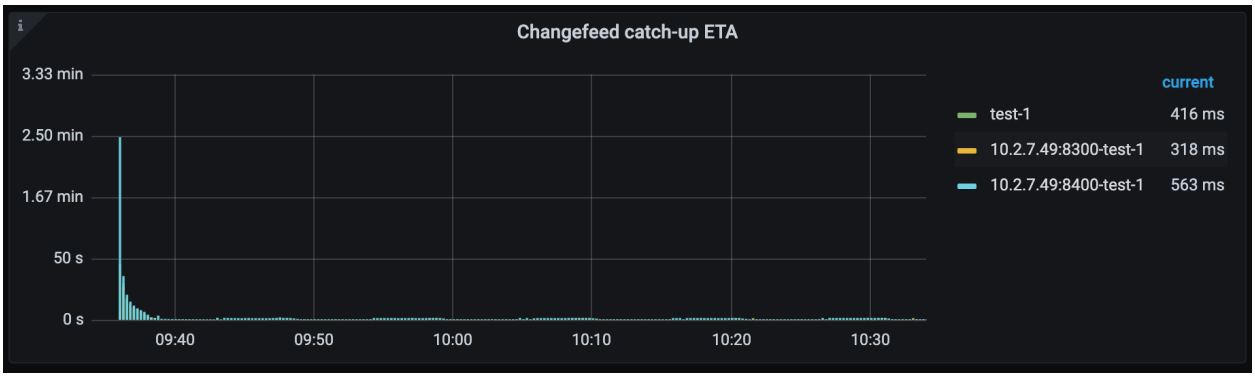
- MySQL sink conflict detect duration: The histogram of the time spent on detecting MySQL sink conflicts
- MySQL sink conflict detect duration percentile: The time (P95, P99, and P999) spent on detecting MySQL sink conflicts within one second
- MySQL sink worker load: The workload of MySQL sink workers of TiCDC nodes



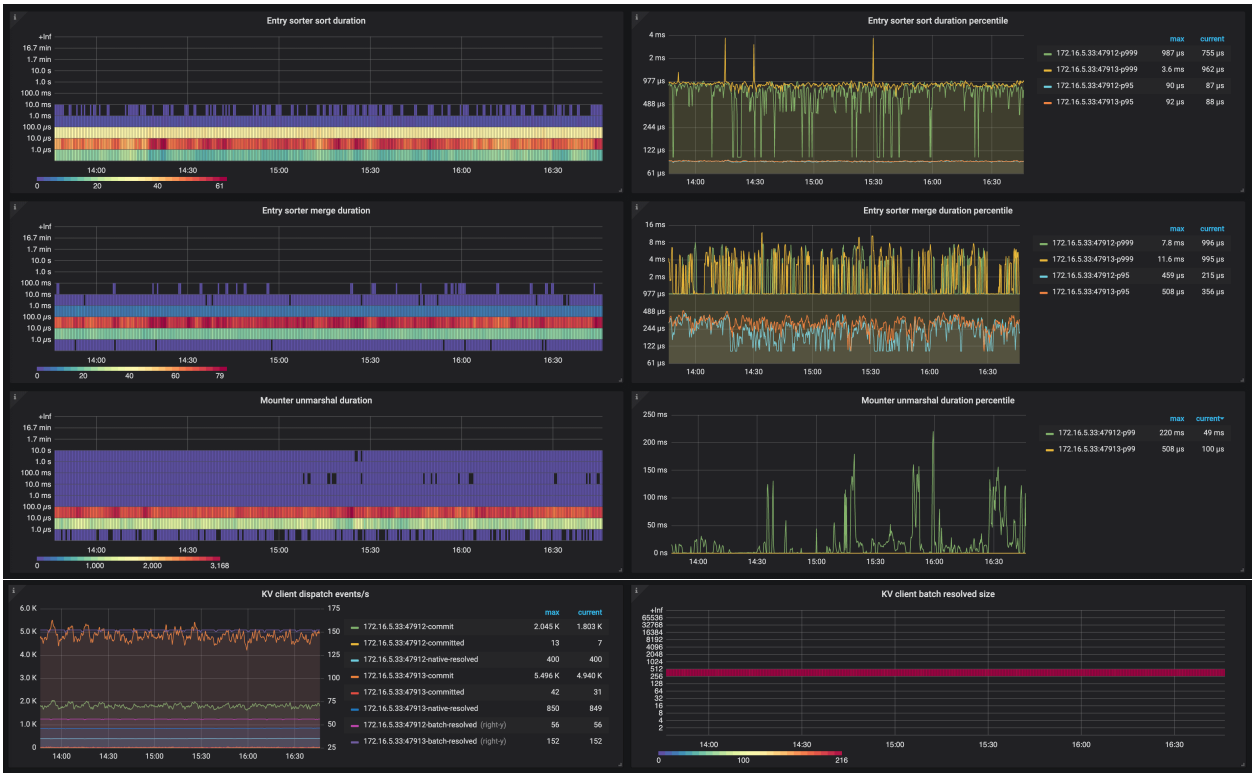


Figure 408: TiCDC Dashboard - Changefeed metrics 4

- Changefeed catch-up ETA: The estimated time needed for the replication task to catch up with the upstream cluster data. When the upstream write speed is faster than the TiCDC replication speed, the metric might be extremely large. Because TiCDC replication speed is subject to many factors, this metric is for reference only and might not be the actual replication time.

#### 14.8.7.3 Events

The following is an example of the **Events** panel:

The description of each metric in the **Events** panel is as follows:

- Eventfeed count: The number of Eventfeed RPC requests of TiCDC nodes
- Event size percentile: The event size (P95, P99, and P999) which TiCDC receives from TiKV within one second
- Eventfeed error/m: The number of errors reported by Eventfeed RPC requests of TiCDC nodes per minute
- KV client receive events/s: The number of events that the KV client module of TiCDC nodes receives from TiKV per second
- Puller receive events/s: The number of events that the Puller module of TiCDC nodes receives from the KV client per second
- Puller output events/s: The number of events that the Puller module of TiCDC nodes sends to the Sorter module per second
- Sink flush rows/s: The number of events that TiCDC nodes write to the downstream per second
- Puller buffer size: The number of events that TiCDC nodes cache in the Puller module
- Entry sorter buffer size: The number of events that TiCDC nodes cache in the Sorter module
- Processor/Mounter buffer size: The number of events that TiCDC nodes cache in the Processor module and the Mounter module
- Sink row buffer size: The number of events that TiCDC nodes cache in the Sink module
- Entry sorter sort duration: The histogram of the time spent by TiCDC nodes sorting events
- Entry sorter sort duration percentile: The time (P95, P99, and P999) spent by TiCDC

sorting events within one second

- Entry sorter merge duration: The histogram of the time spent by TiCDC nodes merging sorted events
- Entry sorter merge duration percentile: The time (P95, P99, and P999) spent by TiCDC merging sorted events within one second
- Mounter unmarshal duration: The histogram of the time spent by TiCDC nodes unmarshaling events
- Mounter unmarshal duration percentile: The time (P95, P99, and P999) spent by TiCDC unmarshaling events within one second
- KV client dispatch events/s: The number of events that the KV client module dispatches among the TiCDC nodes
- KV client batch resolved size: The batch size of resolved timestamp messages that TiKV sends to TiCDC

#### 14.8.7.4 TiKV

The following is an example of the **TiKV** panel:

The description of each metric in the **TiKV** panel is as follows:

- CDC endpoint CPU: The CPU usage of the CDC endpoint threads on TiKV nodes
- CDC worker CPU: The CPU usage of the CDC worker threads on TiKV nodes
- Min resolved ts: The minimum resolved timestamp on TiKV nodes
- Min resolved region: The Region ID of the minimum resolved timestamp on TiKV nodes
- Resolved ts lag duration percentile: The lag between the minimum resolved timestamp on TiKV nodes and the current time
- Initial scan duration: The histogram of the time spent on incremental scan when TiKV nodes connect to TiCDC nodes
- Initial scan duration percentile: The time (P95, P99, and P999) spent on the incremental scan of TiKV nodes within one second
- Memory without block cache: The memory usage of TiKV nodes excluding the RocksDB block cache
- CDC pending bytes in memory: The memory usage of CDC module on TiKV nodes
- Captured region count: The number of event-capturing Regions on TiKV nodes

## 14.9 Privileges

### 14.9.1 Security Compatibility with MySQL

TiDB supports security features similar to MySQL 5.7, and also supports some security features of MySQL 8.0. The security features of TiDB are different from MySQL in implementation.

#### 14.9.1.1 Unsupported security features

- Column level permissions.
- These permission attributes: `max_questions`, `max_updated`, and `max_user_connections` ↪ .
- Password verification policy, which requires you to verify the current password when you change it.
- Dual password policy.
- Random password generation.
- Multi-factor authentication.

#### 14.9.1.2 Differences with MySQL

##### 14.9.1.2.1 Password expiration policy

The password expiration policies of TiDB and MySQL have the following differences:

- MySQL supports password expiration policy in v5.7 and v8.0.
- TiDB supports password expiration policy starting from v6.5.0.

The expiration mechanism of TiDB is different from MySQL in the following aspects:

- In MySQL v5.7 and v8.0, the configuration of the client and the server combined together determines whether to enable "sandbox mode" for the client connection.
- In TiDB, the `security.disconnect-on-expired-password` configuration item alone determines whether to enable "sandbox mode" for the client connection.

#### 14.9.1.2.2 Password complexity policy

The password complexity policies of TiDB and MySQL have the following differences:

- MySQL v5.7 implements the password complexity policy by using the `validate_password` ↪ plugin.
- MySQL v8.0 re-implements the password complexity policy by using the `validate_password` ↪ component.
- TiDB introduces a built-in password complexity management feature starting from v6.5.0.

The feature implementation has the following differences:

- Enable the feature:
    - In MySQL v5.7, the feature is implemented by using the `validate_password` plugin. You can enable the feature by installing the plugin.
    - In MySQL v8.0, the feature is implemented by using the `validate_password` component. You can enable the feature by installing the component.
    - For TiDB, this feature is built-in. You can enable the feature using the system variable `validate_password.enable`.
- Dictionary check:
    - In MySQL v5.7, you can specify a file path using the `validate_password_dictionary_file` ↪ variable. The file contains a list of words that are not allowed to exist in passwords.
    - In MySQL v8.0, you can specify a file path using the `validate_password.` ↪ `dictionary_file` variable. The file contains a list of words that are not allowed to exist in passwords.
    - In TiDB, you can specify a string using the `validate_password.dictionary` system variable. The string contains a list of words that are not allowed to exist in passwords.

#### 14.9.1.2.3 Password failure tracking

The password failure tracking policies of TiDB and MySQL have the following differences:

- MySQL v5.7 does not support password failure tracking.
- MySQL v8.0 supports password failure tracking.
- TiDB supports password failure tracking starting from v6.5.0.

Because the number of failed attempts and lock status of accounts need to be globally consistent, and as a distributed database, TiDB cannot record the number of failed attempts and lock status in the server memory like MySQL, so the implementation mechanisms are different between TiDB and MySQL.

- For users that are not locked automatically, the count of failed attempts is reset in the following scenarios:
    - MySQL 8.0:
        - When the server is restarted, the count of failed attempts for all accounts is reset.
        - When `FLUSH PRIVILEGES` is executed, the count of failed attempts for all accounts is reset.
        - When you run `ALTER USER ... ACCOUNT UNLOCK` to unlock an account, the count is reset.
        - When an account logs in successfully, the count is reset.
    - TiDB:
        - When you run `ALTER USER ... ACCOUNT UNLOCK` to unlock an account, the count is reset.
        - When an account logs in successfully, the count is reset.
- For users that are locked automatically, the count of failed attempts is reset in the following scenarios:
    - MySQL 8.0:
        - When the server is restarted, the temporary locking for all accounts is reset.
        - When `FLUSH PRIVILEGES` is executed, the temporary locking for all accounts is reset.
        - If the lock time of an account ends, the temporary locking for the account is reset on the next login attempt.
        - When you run `ALTER USER ... ACCOUNT UNLOCK` to unlock an account, the temporary locking for the account is reset.
    - TiDB:
        - If the lock time of an account ends, the temporary locking for the account is reset on the next login attempt.
        - When you run `ALTER USER ... ACCOUNT UNLOCK` to unlock an account, the temporary locking for the account is reset.

#### 14.9.1.2.4 Password reuse policy

The password reuse policies of TiDB and MySQL have the following differences:

- MySQL v5.7 does not support password reuse management.
- MySQL v8.0 supports password reuse management.
- TiDB supports password reuse management starting from v6.5.0.

The implementation mechanisms are consistent between TiDB and MySQL. Both use the `mysql.password_history` system table to implement the password reuse management feature. However, when deleting a user that does not exist in the `mysql.user` system table, TiDB and MySQL have different behaviors:

- Scenario: A user (`user01`) is not created in a normal way; instead, it is created by using the `INSERT INTO mysql.password_history VALUES (...)` statement to append a record of `user01` to the `mysql.password_history` system table. In such cases, because the record of `user01` does not exist in the `mysql.user` system table, when you run `DROP USER` on `user01`, TiDB and MySQL have different behaviors.
  - MySQL: When you run `DROP USER user01`, MySQL tries to find `user01` in `mysql.user` and `mysql.password_history`. If either system table contains `user01`, the `DROP USER` statement is executed successfully and no error is reported.
  - TiDB: When you run `DROP USER user01`, TiDB tries to find `user01` only in `mysql.user`. If no related record is found, the `DROP USER` statement fails and an error is reported. If you want to execute the statement successfully and delete the `user01` record from `mysql.password_history`, use `DROP USER IF EXISTS user01` instead.

### 14.9.1.3 Authentication plugin status

TiDB supports multiple authentication methods. These methods can be specified on a per user basis using `CREATE USER` and `ALTER USER`. These methods are compatible with the authentication methods of MySQL with the same names.

You can use one of the following supported authentication methods in the table. To specify a default method that the server advertises when the client-server connection is being established, set the `default_authentication_plugin` variable. `tidb_sm3_password` is the SM3 authentication method only supported in TiDB. Therefore, to authenticate using this method, you must connect to TiDB using TiDB-JDBC. `tidb_auth_token` is a JSON Web Token (JWT)-based authentication method used in TiDB Cloud, and you can also configure it for use in TiDB Self-Hosted.

The support for TLS authentication is configured differently. For detailed information, see Enable TLS between TiDB Clients and Servers.

| Authentication Method | Supported |
|---|---|
| `mysql_native_password` | Yes |
| `sha256_password` | No |
| `caching_sha2_password` | Yes, since 5.2.0 |
| `auth_socket` | Yes, since 5.3.0 |
| `tidb_sm3_password` | Yes, since 6.3.0 |
| `tidb_auth_token` | Yes, since 6.4.0 |
| TLS Certificates | Yes |
| LDAP | No |
| PAM | No |
| ed25519 (MariaDB) | No |
| GSSAPI (MariaDB) | No |
| FIDO | No |

#### 14.9.1.3.1 `tidb_auth_token`

`tidb_auth_token` is a passwordless authentication method based on JSON Web Token (JWT). In v6.4.0, `tidb_auth_token` is only used for user authentication in TiDB Cloud. Starting from v6.5.0, you can also configure `tidb_auth_token` as a user authentication method for TiDB Self-Hosted. Different from password-based authentication methods such as `mysql_native_passsword` and `caching_sha2_password`, when you create users using `tidb_auth_token`, there is no need to set or store custom passwords. To log into TiDB, users only need to use a signed token instead of a password, which simplifies the authentication process and improves security.

JWT

JWT consists of three parts: Header, Payload, and Signature. After being encoded using base64, they are concatenated into a string separated by dots (`.`) for transmission between the client and server.

The Header describes the metadata of the JWT, including 3 parameters:

- `alg`: the algorithm for signature, which is `RS256` by default.
- `typ`: the type of token, which is `JWT`.
- `kid`: the key ID for generating token signature.

Here is an example for Header:

```
{
  "alg": "RS256",
  "kid": "the-key-id-0",
  "typ": "JWT"
}
```

Payload is the main part of JWT, which stores the user information. Each field in the Payload is called a claim. The claims required for TiDB user authentication are as follows:

- `iss`: if `TOKEN_ISSUER` is not specified or set to empty when `CREATE USER`, this claim is not required; otherwise, `iss` should use the same value as `TOKEN_ISSUER`.
- `sub`: this claim is required to be the same as the username to be authenticated.
- `iat`: it means `issued at`, the timestamp when the token is issued. In TiDB, this value must not be later than the authentication time or earlier than 15 minutes before authentication.
- `exp`: the timestamp when the token expires. If it is earlier than the time of authentication, the authentication fails.
- `email`: the email can be specified when creating a user by `ATTRIBUTE '{"email": ↪ "xxxx@pingcap.com"}`. If no email is specified when a user is created, this claim must be set as an empty string; otherwise, this claim must be the same as the specified value when the user is created.

Here is an example for Payload:

```
{
  "email": "user@pingcap.com",
  "exp": 1703305494,
  "iat": 1703304594,
  "iss": "issuer-abc",
  "sub": "user@pingcap.com"
}
```

Signature is used to sign the Header and Payload data.

**Warning:**

- The encoding of the Header and Payload in base64 is reversible. Do **Not** attach any sensitive information to them.
- The `tidb_auth_token` authentication method requires clients to support the `mysql_clear_password` plugin to send the token to TiDB in plain text. Therefore, you need to enale TLS between clients and servers before using `tidb_auth_token`.

Usage

To configure and use `tidb_auth_token` as the authentication method for TiDB Self-Hosted users, take the following steps:

1. Configure `auth-token-jwks` and `auth-token-refresh-interval` in the TiDB configuration file.

   For example, you can get an example JWKS using the following command:

```
wget https://raw.githubusercontent.com/CbcWestwolf/generate_jwt/master/
    ↪ JWKS.json
```

Then, configure the path of the example JWKS in `config.toml`:

```
[security]
auth-token-jwks = "JWKS.json"
```

2. Start `tidb-server` and periodically update and save the JWKS to the path specified by `auth-token-jwks`.

3. Create a user with `tidb_auth_token`, and specify `iss` and `email` as needed using `REQUIRE TOKEN_ISSUER` and `ATTRIBUTE '{"email": "xxxx@pingcap.com"}`.

   For example, create a user `user@pingcap.com` with `tidb_auth_token`:

```
CREATE USER 'user@pingcap.com' IDENTIFIED WITH 'tidb_auth_token'
    ↪ REQUIRE TOKEN_ISSUER 'issuer-abc' ATTRIBUTE '{"email": "
    ↪ user@pingcap.com"}';
```

4. Generate and sign a token for authentication, and authenticate using the `mysql_clear_text` ↪ plugin of the MySQL client.

   Install the JWT generation tool via `go install github.com/cbcwestwolf/` ↪ `generate_jwt` (this tool is only used for testing `tidb_auth_token`). For example:

```
generate_jwt --kid "the-key-id-0" --sub "user@pingcap.com" --email "
    ↪ user@pingcap.com" --iss "issuer-abc"
```

   It prints the public key and token as follows:

```
-----BEGIN PUBLIC KEY-----
MIIBCgKCAQEAq8G5n9XBidxmBMVJKLOBsmdOHrCqGf17y9+VUXingwDUZxRp2Xbu
LZLbJtLgcln1lC0L9BsogrWf7+pDhAzWovO6Ai4Aybu00tJ2u0g4j1aLiDdsy0gy
vSb5FBoL08jFIH7t/JzMt4JpF487AjzvITwZZcnsrB9a9sdn2E5B/aZmpDGi2+Is
f5osnlw0zvveTwiMo9ba416VIzjntAVEvqMFHK7vyHqXbfqUPAyhjLO+iee99Tg5
AlGfjo1s6FjeML4xX7sAMGEy8FVBWNfpRU7ryTWoSn2adzyA/FVmtBvJNQBCMrrA
hXDTMJ5FNi8zHhvzyBKHU0kBTS1UNUbP9wIDAQAB
-----END PUBLIC KEY-----

eyJhbGciOiJSUzI1NiIsImtpZCI6InRoZS1rZXktaWQtMCIsInR5cCI6IkpXVCJ9.
    ↪ eyJlbWFpbCI6InVzZXJAcGluZ2NhcC5jb20iLCJleHAiOjE3MDMzMDU0OTQsImlhdCI6MTcwMzMwN
    ↪ .T4QPh2hTB5on5xCuvtWiZiDTuuKvckggNHtNaovm1F4RvwUv15GyOqj9yMstE-
    ↪ wSoV5eLEcPC2HgE6eN1C6yH_f4CU-A6n3dm9F1w-
    ↪ oLbjts7aYCl8OHycVYnq609fNnb8JLsQAmd1Zn9C0JW899-WSOQtvjLqVSPe9prH-
    ↪ cWaBVDQXzUJKxwywQzk9v-Z1Njt9H3Rn9vvwwJEEPI16VnaNK38I7YG-1
    ↪ LN4fAG9jZ6Zwvz7vb_s4TW7xccFf3dIhWTEwOQ5jDPCeYkwraRXU8NC6DPF_duSrYJc7d7Nu9Z2cr
    ↪ -E4i1Rt_IiRTuIIzzKlcQGg7jd9AGEfGe_SowsA-w
```

Copy the preceding token in the last line for login:

```
mycli -h 127.0.0.1 -P 4000 -u 'user@pingcap.com' -p '<the-token-
    ↪ generated>'
```

Ensure that the MySQL client here supports the `mysql_clear_password` plugin. mycli supports and enables this plugin by default. If you are using the mysql command-line client, you need to use the `--enable-cleartext-plugin` option to enable this plugin:

```
mysql -h 127.0.0.1 -P 4000 -u 'user@pingcap.com' -p'<the-token-
    ↪ generated>' --enable-cleartext-plugin
```

If an incorrect `--sub` is specified when the token is generated (such as `--sub "
↪ wronguser@pingcap.com"`), the authentication using this token would fail.

You can encode and decode a token using the debugger provided by jwt.io. >>>>>>> de815dc10d (Add description for `tidb_auth_token` authentication (#15979))

### 14.9.2 Privilege Management

TiDB supports MySQL 5.7's privilege management system, including the syntax and privilege types. The following features from MySQL 8.0 are also supported:

- SQL Roles, starting with TiDB 3.0.
- Dynamic privileges, starting with TiDB 5.1.

This document introduces privilege-related TiDB operations, privileges required for TiDB operations and implementation of the privilege system.

#### 14.9.2.1 Privilege-related operations

##### 14.9.2.1.1 Grant privileges

The `GRANT` statement grants privileges to the user accounts.

For example, use the following statement to grant the `xxx` user the privilege to read the `test` database.

```
GRANT SELECT ON test.* TO 'xxx'@'%';
```

Use the following statement to grant the `xxx` user all privileges on all databases:

```
GRANT ALL PRIVILEGES ON *.* TO 'xxx'@'%';
```

By default, `GRANT` statements will return an error if the user specified does not exist. This behavior depends on if the SQL Mode `NO_AUTO_CREATE_USER` is specified:

```
mysql> SET sql_mode=DEFAULT;
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT @@sql_mode;
+--
    ↪ ------------------------------------------------------------------------
    ↪
| @@sql_mode
    ↪
    ↪ |
+--
    ↪ ------------------------------------------------------------------------
    ↪
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_ZERO_DATE,
    ↪ ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,NO_ENGINE_SUBSTITUTION
    ↪  |
+--
    ↪ ------------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)

mysql> SELECT * FROM mysql.user WHERE user='idontexist';
Empty set (0.00 sec)

mysql> GRANT ALL PRIVILEGES ON test.* TO 'idontexist';
ERROR 1105 (HY000): You are not allowed to create a user with GRANT

mysql> SELECT user,host,authentication_string FROM mysql.user WHERE user='
    ↪ idontexist';
Empty set (0.00 sec)
```

In the following example, the user `idontexist` is automatically created with an empty password because the SQL Mode `NO_AUTO_CREATE_USER` was not set. This is **not recommended** since it presents a security risk: miss-spelling a username will result in a new user created with an empty password:

```
mysql> SET @@sql_mode='ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,
    ↪ NO_ZERO_IN_DATE,NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,
    ↪ NO_ENGINE_SUBSTITUTION';
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT @@sql_mode;
+--
```

```
    ↪ ------------------------------------------------------------------------------
    ↪
| @@sql_mode
    ↪
    ↪ |
+--
    ↪ ------------------------------------------------------------------------------
    ↪
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_ZERO_DATE,
    ↪ ERROR_FOR_DIVISION_BY_ZERO,NO_ENGINE_SUBSTITUTION |
+--
    ↪ ------------------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)

mysql> SELECT * FROM mysql.user WHERE user='idontexist';
Empty set (0.00 sec)

mysql> GRANT ALL PRIVILEGES ON test.* TO 'idontexist';
Query OK, 1 row affected (0.05 sec)

mysql> SELECT user,host,authentication_string FROM mysql.user WHERE user='
    ↪ idontexist';
+-----------+------+-----------------------+
| user      | host | authentication_string |
+-----------+------+-----------------------+
| idontexist | %  |                       |
+-----------+------+-----------------------+
1 row in set (0.01 sec)
```

You can use fuzzy matching in `GRANT` to grant privileges to databases.

```
mysql> GRANT ALL PRIVILEGES ON `te%`.* TO genius;
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT user,host,db FROM mysql.db WHERE user='genius';
+--------/------/-----+
| user   | host | db |
+--------/------/-----+
| genius | %  | te% |
+--------/------/-----+
1 row in set (0.00 sec)
```

In this example, because of the `%` in `te%`, all the databases starting with `te` are granted the privilege.

#### 14.9.2.1.2 Revoke privileges

The REVOKE statement enables system administrators to revoke privileges from the user accounts.

The REVOKE statement corresponds with the REVOKE statement:

```
REVOKE ALL PRIVILEGES ON `test`.* FROM 'genius'@'localhost';
```

> **Note:**
>
> To revoke privileges, you need the exact match. If the matching result cannot be found, an error will be displayed:

```
mysql> REVOKE ALL PRIVILEGES ON `te%`.* FROM 'genius'@'%';
ERROR 1141 (42000): There is no such grant defined for user 'genius' on
    ↪ host '%'
```

About fuzzy matching, escape, string and identifier:

```
mysql> GRANT ALL PRIVILEGES ON `te\%`.* TO 'genius'@'localhost';
Query OK, 0 rows affected (0.00 sec)
```

This example uses exact match to find the database named te%. Note that the % uses the \ escape character so that % is not considered as a wildcard.

A string is enclosed in single quotation marks(”), while an identifier is enclosed in backticks (“). See the differences below:

```
mysql> GRANT ALL PRIVILEGES ON 'test'.* TO 'genius'@'localhost';
ERROR 1064 (42000): You have an error in your SQL syntax; check the
manual that corresponds to your MySQL server version for the right
syntax to use near ''test'.* to 'genius'@'localhost'' at line 1

mysql> GRANT ALL PRIVILEGES ON `test`.* TO 'genius'@'localhost';
Query OK, 0 rows affected (0.00 sec)
```

If you want to use special keywords as table names, enclose them in backticks (“). For example:

```
mysql> CREATE TABLE `select` (id int);
Query OK, 0 rows affected (0.27 sec)
```

#### 14.9.2.1.3 Check privileges granted to users

You can use the `SHOW GRANTS` statement to see what privileges are granted to a user. For example:

```
SHOW GRANTS; -- show grants for the current user

+-------------------------------------------------------------+
| Grants for User                                             |
+-------------------------------------------------------------+
| GRANT ALL PRIVILEGES ON *.* TO 'root'@'%' WITH GRANT OPTION |
+-------------------------------------------------------------+
SHOW GRANTS FOR 'root'@'%'; -- show grants for a specific user
```

For example, create a user `rw_user@192.168.%` and grant the user with write privilege on the `test.write_table` table and global read privilege.

```
CREATE USER `rw_user`@`192.168.%`;
GRANT SELECT ON *.* TO `rw_user`@`192.168.%`;
GRANT INSERT, UPDATE ON `test`.`write_table` TO `rw_user`@`192.168.%`;
```

Show granted privileges of the `rw_user@192.168.%` user:

```
SHOW GRANTS FOR `rw_user`@`192.168.%`;

+-----------------------------------------------------------------+
| Grants for rw_user@192.168.%                                    |
+-----------------------------------------------------------------+
| GRANT Select ON *.* TO 'rw_user'@'192.168.%'                    |
| GRANT Insert,Update ON test.write_table TO 'rw_user'@'192.168.%' |
+-----------------------------------------------------------------+
```

#### 14.9.2.1.4 Dynamic privileges

Since v5.1, TiDB features support dynamic privileges, a feature borrowed from MySQL 8.0. Dynamic privileges are intended to replace the `SUPER` privilege by implementing more fine-grained access to certain operations. For example, using dynamic privileges, system administrators can create a user account that can only perform `BACKUP` and `RESTORE` operations.

Dynamic privileges include:

- `BACKUP_ADMIN`
- `RESTORE_ADMIN`
- `SYSTEM_USER`
- `SYSTEM_VARIABLES_ADMIN`
- `ROLE_ADMIN`

- CONNECTION_ADMIN
- PLACEMENT_ADMIN allows privilege owners to create, modify, and remove placement policies.
- DASHBOARD_CLIENT allows privilege owners to log in to TiDB Dashboard.
- RESTRICTED_TABLES_ADMIN allows privilege owners to view system tables when SEM is enabled.
- RESTRICTED_STATUS_ADMIN allows privilege owners to view all status variables in SHOW [GLOBAL|SESSION] STATUS when SEM is enabled.
- RESTRICTED_VARIABLES_ADMIN allows privilege owners to view all system variables when SEM is enabled.
- RESTRICTED_USER_ADMIN prohibits privilege owners to have their access revoked by SUPER users when SEM is enabled.
- RESTRICTED_CONNECTION_ADMIN allows privilege owners to kill connections of RESTRICTED_USER_ADMIN users. This privilege affects KILL and KILL TIDB statements.
- RESTRICTED_REPLICA_WRITER_ADMIN allows privilege owners to perform write or update operations without being affected when the read-only mode is enabled in the TiDB cluster. For details, see tidb_restricted_read_only.

To see the full set of dynamic privileges, execute the SHOW PRIVILEGES statement. Because plugins are permitted to add new privileges, the list of privileges that are assignable might differ based on your TiDB installation.

#### 14.9.2.2 SUPER privilege

- The SUPER privilege allows the user to perform almost any operation. By default, only the root user is granted with this privilege. Be careful when granting this privilege to other users.
- The SUPER privilege is considered deprecated in MySQL 8.0 and can be replaced by dynamic privileges to provide more fine-grained access control.

#### 14.9.2.3 Privileges required for TiDB operations

You can check privileges of TiDB users in the INFORMATION_SCHEMA.USER_PRIVILEGES table. For example:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.USER_PRIVILEGES WHERE grantee = "'
    ↪ root'@'%'";
+------------+---------------+------------------------+--------------+
| GRANTEE    | TABLE_CATALOG | PRIVILEGE_TYPE         | IS_GRANTABLE |
+------------+---------------+------------------------+--------------+
| 'root'@'%' | def           | Select                 | YES          |
| 'root'@'%' | def           | Insert                 | YES          |
| 'root'@'%' | def           | Update                 | YES          |
| 'root'@'%' | def           | Delete                 | YES          |
```

```
| 'root'@'%' | def        | Create                | YES        |
| 'root'@'%' | def        | Drop                  | YES        |
| 'root'@'%' | def        | Process               | YES        |
| 'root'@'%' | def        | References            | YES        |
| 'root'@'%' | def        | Alter                 | YES        |
| 'root'@'%' | def        | Show Databases        | YES        |
| 'root'@'%' | def        | Super                 | YES        |
| 'root'@'%' | def        | Execute               | YES        |
| 'root'@'%' | def        | Index                 | YES        |
| 'root'@'%' | def        | Create User           | YES        |
| 'root'@'%' | def        | Create Tablespace     | YES        |
| 'root'@'%' | def        | Trigger               | YES        |
| 'root'@'%' | def        | Create View           | YES        |
| 'root'@'%' | def        | Show View             | YES        |
| 'root'@'%' | def        | Create Role           | YES        |
| 'root'@'%' | def        | Drop Role             | YES        |
| 'root'@'%' | def        | CREATE TEMPORARY TABLES | YES      |
| 'root'@'%' | def        | LOCK TABLES           | YES        |
| 'root'@'%' | def        | CREATE ROUTINE        | YES        |
| 'root'@'%' | def        | ALTER ROUTINE         | YES        |
| 'root'@'%' | def        | EVENT                 | YES        |
| 'root'@'%' | def        | SHUTDOWN              | YES        |
| 'root'@'%' | def        | RELOAD                | YES        |
| 'root'@'%' | def        | FILE                  | YES        |
| 'root'@'%' | def        | CONFIG                | YES        |
| 'root'@'%' | def        | REPLICATION CLIENT    | YES        |
| 'root'@'%' | def        | REPLICATION SLAVE     | YES        |
+------------+---------------+-------------------------+--------------+
31 rows in set (0.00 sec)
```

#### 14.9.2.3.1 ALTER

- For all `ALTER` statements, users must have the `ALTER` privilege for the corresponding table.
- For statements except `ALTER...DROP` and `ALTER...RENAME TO`, users must have the `INSERT` and `CREATE` privileges for the corresponding table.
- For the `ALTER...DROP` statement, users must have the `DROP` privilege for the corresponding table.
- For the `ALTER...RENAME TO` statement, users must have the `DROP` privilege for the table before renaming, and the `CREATE` and `INSERT` privileges for the table after renaming.

**Note:**

In MySQL 5.7 documentation, users need `INSERT` and `CREATE` privileges to perform the `ALTER` operation on a table. But in reality for MySQL 5.7.25, only the `ALTER` privilege is required in this case. Currently, the `ALTER` privilege in TiDB is consistent with the actual behavior in MySQL.

#### 14.9.2.3.2 BACKUP

Requires the `SUPER` or `BACKUP_ADMIN` privilege.

#### 14.9.2.3.3 CREATE DATABASE

Requires the `CREATE` privilege for the database.

#### 14.9.2.3.4 CREATE INDEX

Requires the `INDEX` privilege for the table.

#### 14.9.2.3.5 CREATE TABLE

Requires the `CREATE` privilege for the table.

To execute the `CREATE TABLE...LIKE...` statement, the `SELECT` privilege for the table is required.

#### 14.9.2.3.6 CREATE VIEW

Requires the `CREATE VIEW` privilege.

**Note:**

If the current user is not the user that creates the View, both the `CREATE VIEW` and `SUPER` privileges are required.

#### 14.9.2.3.7 DROP DATABASE

Requires the `DROP` privilege for the table.

#### 14.9.2.3.8 DROP INDEX

Requires the `INDEX` privilege for the table.

#### 14.9.2.3.9 DROP TABLES

Requires the `DROP` privilege for the table.

#### 14.9.2.3.10 LOAD DATA

Requires the `INSERT` privilege for the table. When you use `REPLACE INTO`, the `DELETE` privilege is also required.

#### 14.9.2.3.11 TRUNCATE TABLE

Requires the `DROP` privilege for the table.

#### 14.9.2.3.12 RENAME TABLE

Requires the `ALTER` and `DROP` privileges for the table before renaming and the `CREATE` and `INSERT` privileges for the table after renaming.

#### 14.9.2.3.13 ANALYZE TABLE

Requires the `INSERT` and `SELECT` privileges for the table.

#### 14.9.2.3.14 SHOW

`SHOW CREATE TABLE` requires any single privilege to the table.

`SHOW CREATE VIEW` requires the `SHOW VIEW` privilege.

`SHOW GRANTS` requires the `SELECT` privilege to the `mysql` database. If the target user is current user, `SHOW GRANTS` does not require any privilege.

`SHOW PROCESSLIST` requires `SUPER` to show connections belonging to other users.

#### 14.9.2.3.15 CREATE ROLE/USER

`CREATE ROLE` requires the `CREATE ROLE` privilege.

`CREATE USER` requires the `CREATE USER` privilege.

#### 14.9.2.3.16 DROP ROLE/USER

`DROP ROLE` requires the `DROP ROLE` privilege.

`DROP USER` requires the `CREATE USER` privilege.

#### 14.9.2.3.17 ALTER USER

Requires the `CREATE USER` privilege.

#### 14.9.2.3.18 GRANT

Requires the `GRANT` privilege with the privileges granted by `GRANT`.

Requires additional `CREATE USER` privilege to create a user implicitly.

`GRANT ROLE` requires `SUPER` or `ROLE_ADMIN` privilege.

#### 14.9.2.3.19 REVOKE

Requires the `GRANT` privilege and those privileges targeted by the `REVOKE` statement.

`REVOKE ROLE` requires `SUPER` or `ROLE_ADMIN` privilege.

#### 14.9.2.3.20 SET GLOBAL

Requires `SUPER` or `SYSTEM_VARIABLES_ADMIN` privilege to set global variables.

#### 14.9.2.3.21 ADMIN

Requires `SUPER` privilege.

#### 14.9.2.3.22 SET DEFAULT ROLE

Requires `SUPER` privilege.

#### 14.9.2.3.23 KILL

Requires `SUPER` or `CONNECTION_ADMIN` privilege to kill other user sessions.

### 14.9.2.4 Implementation of the privilege system

#### 14.9.2.4.1 Privilege table

The following system tables are special because all the privilege-related data is stored in them:

- `mysql.user` (user account, global privilege)
- `mysql.db` (database-level privilege)
- `mysql.tables_priv` (table-level privilege)
- `mysql.columns_priv` (column-level privilege; not currently supported)

These tables contain the effective range and privilege information of the data. For example, in the `mysql.user` table:

```
mysql> SELECT User,Host,Select_priv,Insert_priv FROM mysql.user LIMIT 1;
+------/------/-------------/-------------+
| User | Host | Select_priv | Insert_priv |
+------/------/-------------/-------------+
| root | %  | Y           | Y           |
+------/------/-------------/-------------+
1 row in set (0.00 sec)
```

In this record, `Host` and `User` determine that the connection request sent by the `root` user from any host (`%`) can be accepted. `Select_priv` and `Insert_priv` mean that the user has global `Select` and `Insert` privilege. The effective range in the `mysql.user` table is global.

`Host` and `User` in `mysql.db` determine which databases users can access. The effective range is the database.

> **Note:**
>
> It is recommended to only update the privilege tables via the supplied syntax such as `GRANT`, `CREATE USER` and `DROP USER`. Making direct edits to the underlying privilege tables will not automatically update the privilege cache, leading to unpredictable behavior until `FLUSH PRIVILEGES` is executed.

#### 14.9.2.4.2 Connection verification

When the client sends a connection request, TiDB server will verify the login operation. TiDB server first checks the `mysql.user` table. If a record of `User` and `Host` matches the connection request, TiDB server then verifies the `authentication_string`.

User identity is based on two pieces of information: `Host`, the host that initiates the connection, and `User`, the user name. If the user name is not empty, the exact match of user named is a must.

`User`+`Host` may match several rows in `user` table. To deal with this scenario, the rows in the `user` table are sorted. The table rows will be checked one by one when the client connects; the first matched row will be used to verify. When sorting, Host is ranked before User.

#### 14.9.2.4.3 Request verification

When the connection is successful, the request verification process checks whether the operation has the privilege.

For database-related requests (`INSERT`, `UPDATE`), the request verification process first checks the user's global privileges in the `mysql.user` table. If the privilege is granted, you can access directly. If not, check the `mysql.db` table.

The `user` table has global privileges regardless of the default database. For example, the `DELETE` privilege in `user` can apply to any row, table, or database.

In the `db` table, an empty user is to match the anonymous user name. Wildcards are not allowed in the `User` column. The value for the `Host` and `Db` columns can use `%` and `_`, which can use pattern matching.

Data in the `user` and `db` tables is also sorted when loaded into memory.

The use of `%` in `tables_priv` and `columns_priv` is similar, but column value in `Db`, `Table_name` and `Column_name` cannot contain `%`. The sorting is also similar when loaded.

#### 14.9.2.4.4 Time of effect

When TiDB starts, some privilege-check tables are loaded into memory, and then the cached data is used to verify the privileges. Executing privilege management statements such as `GRANT`, `REVOKE`, `CREATE USER`, `DROP USER` will take effect immediately.

Manually editing tables such as `mysql.user` with statements such as `INSERT`, `DELETE`, `UPDATE` will not take effect immediately. This behavior is compatible with MySQL, and privilege cache can be updated with the following statement:

```
FLUSH PRIVILEGES;
```

### 14.9.3 TiDB User Account Management

This document describes how to manage a TiDB user account.

#### 14.9.3.1 User names and passwords

TiDB stores the user accounts in the table of the `mysql.user` system database. Each account is identified by a user name and the client host. Each account may have a password.

You can connect to the TiDB server using the MySQL client, and use the specified account and password to login. For each user name, make sure that it contains no more than 32 characters.

```
mysql --port 4000 --user xxx --password
```

Or use the abbreviation of command line parameters:

```
mysql -P 4000 -u xxx -p
```

#### 14.9.3.2 Add user accounts

You can create TiDB accounts in two ways:

- By using the standard account-management SQL statements intended for creating accounts and establishing their privileges, such as `CREATE USER` and `GRANT`.
- By manipulating the privilege tables directly with statements such as `INSERT`, `UPDATE`, or `DELETE`. It is not recommended to use this method to create accounts, because it might lead to incomplete updates.

You can also create accounts by using third party GUI tools.

```
CREATE USER [IF NOT EXISTS] user [IDENTIFIED BY 'auth_string'];
```

After you assign the password, TiDB encrypts and stores the `auth_string` in the `mysql.user` table.

```
CREATE USER 'test'@'127.0.0.1' IDENTIFIED BY 'xxx';
```

The name of a TiDB account consists of a user name and a hostname. The syntax of the account name is 'user_name'@'host_name'.

- `user_name` is case sensitive.
- `host_name` is a hostname or IP address, which supports the wild card `%` or `_`. For example, the hostname `'%'` matches all hosts, and the hostname `'192.168.1.%'` matches all hosts in the subnet.

The host supports fuzzy matching:

```
CREATE USER 'test'@'192.168.10.%';
```

The `test` user is allowed to log in from any hosts on the `192.168.10` subnet.

If the host is not specified, the user is allowed to log in from any IP. If no password is specified, the default is empty password:

```
CREATE USER 'test';
```

Equivalent to:

```
CREATE USER 'test'@'%' IDENTIFIED BY '';
```

If the specified user does not exist, the behavior of automatically creating users depends on `sql_mode`. If the `sql_mode` includes `NO_AUTO_CREATE_USER`, the `GRANT` statement will not create users with an error returned.

For example, assume that the `sql_mode` does not include `NO_AUTO_CREATE_USER`, and you use the following `CREATE USER` and `GRANT` statements to create four accounts:

```
CREATE USER 'finley'@'localhost' IDENTIFIED BY 'some_pass';
```

```
GRANT ALL PRIVILEGES ON *.* TO 'finley'@'localhost' WITH GRANT OPTION;
```

```
CREATE USER 'finley'@'%' IDENTIFIED BY 'some_pass';
```

```
GRANT ALL PRIVILEGES ON *.* TO 'finley'@'%' WITH GRANT OPTION;
```

```
CREATE USER 'admin'@'localhost' IDENTIFIED BY 'admin_pass';
```

```
GRANT RELOAD,PROCESS ON *.* TO 'admin'@'localhost';
```

```
CREATE USER 'dummy'@'localhost';
```

To see the privileges granted for an account, use the `SHOW GRANTS` statement:

```
SHOW GRANTS FOR 'admin'@'localhost';
```

```
+-------------------------------------------------------+
| Grants for admin@localhost                            |
+-------------------------------------------------------+
| GRANT RELOAD, PROCESS ON *.* TO 'admin'@'localhost' |
+-------------------------------------------------------+
```

#### 14.9.3.3 Remove user accounts

To remove a user account, use the `DROP USER` statement:

```
DROP USER 'test'@'localhost';
```

This operation clears the user's records in the `mysql.user` table and the related records in the privilege table.

#### 14.9.3.4 Reserved user accounts

TiDB creates the `'root'@'%'` default account during the database initialization.

#### 14.9.3.5 Set account resource limits

Currently, TiDB does not support setting account resource limits.

#### 14.9.3.6 Assign account passwords

TiDB stores passwords in the `mysql.user` system database. Operations that assign or update passwords are permitted only to users with the `CREATE USER` privilege, or, alternatively, privileges for the `mysql` database (`INSERT` privilege to create new accounts, `UPDATE` privilege to update existing accounts).

- To assign a password when you create a new account, use `CREATE USER` and include an `IDENTIFIED BY` clause:

```
CREATE USER 'test'@'localhost' IDENTIFIED BY 'mypass';
```

- To assign or change a password for an existing account, use `SET PASSWORD FOR` or `ALTER USER`:

```
SET PASSWORD FOR 'root'@'%' = 'xxx';
```

Or:

```
ALTER USER 'test'@'localhost' IDENTIFIED BY 'mypass';
```

#### 14.9.3.7 Forget the root password

1. Modify the configuration file:
    1. Log in to the machine where one of the tidb-server instances is located.
    2. Enter the `conf` directory under the TiDB node deployment directory, and find the `tidb.toml` configuration file.
    3. Add the configuration item `skip-grant-table` in the `security` section of the configuration file. If there is no `security` section, add the following two lines to the end of the tidb.toml configuration file:

```
[security]
skip-grant-table = true
```

2. Stop the tidb-server process:
    1. View the tidb-server process:

```
ps aux | grep tidb-server
```

    2. Find the process ID (PID) corresponding to tidb-server and use the `kill` command to stop the process:

```
kill -9 <pid>
```

3. Start TiDB using the modified configuration:

> **Note:**
>
> If you set `skip-grant-table` before starting the TiDB process, a check on the operating system user will be initiated. Only the `root` user of the operating system can start the TiDB process.

1. Enter the `scripts` directory under the TiDB node deployment directory.
2. Switch to the `root` account of the operating system.
3. Run the `run_tidb.sh` script in the directory in the foreground.
4. Log in as `root` in a new terminal window and change the password.

```
mysql -h 127.0.0.1 -P 4000 -u root
```

4. Stop running the `run_tidb.sh` script, remove the content added in the TiDB configuration file in step 1, and wait for tidb-server to start automatically.

#### 14.9.3.8 `FLUSH PRIVILEGES`

Information related to users and privileges is stored in the TiKV server, and TiDB caches this information inside the process. Generally, modification of the related information through `CREATE USER`, `GRANT`, and other statements takes effect quickly within the entire cluster. If the operation is affected by some factors such as temporarily unavailable network, the modification will take effect in about 15 minutes because TiDB will periodically reload the cache information.

If you modified the privilege tables directly, run the following command to apply changes immediately:

```
FLUSH PRIVILEGES;
```

For details, see Privilege Management.

### 14.9.4 TiDB Password Management

To protect the security of user passwords, TiDB supports the following password management policies starting from v6.5.0:

- Password complexity policy: require users to set strong passwords to prevent empty and weak passwords.
- Password expiration policy: require users to change their passwords periodically.
- Password reuse policy: prevent users from reusing old passwords.
- Failed-login tracking and temporary account locking policy: temporarily lock a user account to prevent the same user from trying to log in after multiple login failures caused by wrong passwords.

#### 14.9.4.1 TiDB authentication credential storage

To ensure the authenticity of user identity, TiDB uses passwords as credentials to authenticate users when they log in to the TiDB server.

The *password* described in this document refers to the internal credentials generated, stored, and verified by TiDB. TiDB stores user passwords in the `mysql.user` system table.

The following authentication plugins are related to TiDB password management:

- `mysql_native_password`
- `caching_sha2_password`
- `tidb_sm3_password`

For more information about TiDB authentication plugins, see Authentication plugin status.

#### 14.9.4.2 Password complexity policy

Password complexity check is disabled by default in TiDB. By configuring system variables related to password complexity, you can enable the password complexity check and make sure the user passwords comply with the password complexity policy.

The password complexity policy has the following features:

- For SQL statements that set user passwords in plaintext (including `CREATE USER`, `ALTER USER`, and `SET PASSWORD`), TiDB checks the passwords against the password complexity policy. If a password does not meet the requirements, the password is rejected.
- You can use the SQL function `VALIDATE_PASSWORD_STRENGTH()` to validate the password strength.

> **Note:**
>
> - For the `CREATE USER` statement, even if you can lock the account upon creation, you must set an acceptable password. Otherwise, when the account is unlocked, this account can log in to TiDB using a password that does not comply with the password complexity policy.
> - The modification to the password complexity policy does not affect the passwords that already exist and only affects the newly set passwords.

You can view all system variables related to the password complexity policy by executing the following SQL statement:

```
mysql> SHOW VARIABLES LIKE 'validate_password.%';

+--------------------------------------+--------+
| Variable_name                        | Value  |
+--------------------------------------+--------+
| validate_password.check_user_name    | ON     |
| validate_password.dictionary         |        |
| validate_password.enable             | OFF    |
| validate_password.length             | 8      |
| validate_password.mixed_case_count   | 1      |
| validate_password.number_count       | 1      |
| validate_password.policy             | MEDIUM |
| validate_password.special_char_count | 1      |
+--------------------------------------+--------+
8 rows in set (0.00 sec)
```

For a detailed description of each system variable, see System Variables.

#### 14.9.4.2.1 Configure password complexity policy

This section shows examples of configuring system variables related to the password complexity policy.

Enable the password complexity check:

```
SET GLOBAL validate_password.enable = ON;
```

Do not allow users to use a password that is the same as the user name:

```
SET GLOBAL validate_password.check_user_name = ON;
```

Set the password complexity level to `LOW`:

```
SET GLOBAL validate_password.policy = LOW;
```

Set the minimum password length to `10`:

```
SET GLOBAL validate_password.length = 10;
```

Require a password to contain at least two numbers, one uppercase letter, one lowercase letter, and one special character:

```
SET GLOBAL validate_password.number_count = 2;
SET GLOBAL validate_password.mixed_case_count = 1;
SET GLOBAL validate_password.special_char_count = 1;
```

Enable the dictionary check that prevents a password from containing words like `mysql` or `abcd`:

```
SET GLOBAL validate_password.dictionary = 'mysql;abcd';
```

**Note:**

- The value of `validate_password.dictionary` is a string, no longer than 1024 characters. It contains a list of words that must not exist in the password. Each word is separated by semicolon (;).
- The dictionary check is case-insensitive.

#### 14.9.4.2.2 Password complexity check examples

When the system variable `validate_password.enable` is set to `ON`, TiDB enables the password complexity check. The following are examples of the check results:

TiDB checks the user's plaintext password against the default password complexity policy. If the set password does not meet the policy, the password is rejected.

```
mysql> ALTER USER 'test'@'localhost' IDENTIFIED BY 'abc';
ERROR 1819 (HY000): Require Password Length: 8
```

TiDB does not check the hashed password against the password complexity policy.

```
mysql> ALTER USER 'test'@'localhost' IDENTIFIED WITH mysql_native_password
    ↪ AS '*0D3CED9BEC10A777AEC23CCC353A8C08A633045E';
Query OK, 0 rows affected (0.01 sec)
```

When creating an account initially locked, you must also set a password that matches the password complexity policy, or the creation will fail.

```
mysql> CREATE USER 'user02'@'localhost' ACCOUNT LOCK;
ERROR 1819 (HY000): Require Password Length: 8
```

#### 14.9.4.2.3 Password strength validation function

To check the password strength, you can use the `VALIDATE_PASSWORD_STRENGTH()` function. This function accepts a password argument and returns an integer from 0 (weak) to 100 (strong).

**Note:**

> This function evaluates the password strength based on the current password complexity policy. If the password complexity policy is changed, the same password might get different evaluation results.

The following example shows how to use the `VALIDATE_PASSWORD_STRENGTH()` function:

```
mysql> SELECT VALIDATE_PASSWORD_STRENGTH('weak');
+----------------------------------+
| VALIDATE_PASSWORD_STRENGTH('weak') |
+----------------------------------+
|                               25 |
+----------------------------------+
1 row in set (0.01 sec)

mysql> SELECT VALIDATE_PASSWORD_STRENGTH('lessweak$_@123');
+-------------------------------------------+
| VALIDATE_PASSWORD_STRENGTH('lessweak$_@123') |
+-------------------------------------------+
|                                        50 |
+-------------------------------------------+
1 row in set (0.01 sec)

mysql> SELECT VALIDATE_PASSWORD_STRENGTH('NOTweak$_@123!');
+-------------------------------------------+
| VALIDATE_PASSWORD_STRENGTH('NOTweak$_@123!') |
+-------------------------------------------+
|                                       100 |

```

#### 14.9.4.3 Password expiration policy

TiDB supports configuring a password expiration policy so that users must change their passwords periodically to improve password security. You can manually make account passwords expire or establish a policy for automatic password expiration.

The automatic password expiration policy can be set at the global level and at the account level. As a database administrator, you can establish an automatic password expiration policy at the global level, and also use an account-level policy to override the global policy.

The privileges for setting the password expiration policy are as follows:

- Database administrator with `SUPER` or `CREATE USER` privileges can manually make passwords expire.

- Database administrator with `SUPER` or `CREATE USER` privileges can set the account-level password expiration policy.
- Database administrator with `SUPER` or `SYSTEM_VARIABLES_ADMINR` privileges can set the global-level password expiration policy.

#### 14.9.4.3.1 Manual expiration

To manually make an account password expire, use the `CREATE USER` or `ALTER USER` statements.

```
ALTER USER 'test'@'localhost' PASSWORD EXPIRE;
```

When the account password is set to expire by a database administrator, you must change the password before you can log in to TiDB. The manual expiration cannot be revoked.

For roles created using the `CREATE ROLE` statement, since the role does not require a password, the password field for the role is empty. In such case, TiDB sets the `password_expired` attribute to `'Y'`, which means that the role's password is manually expired. The purpose of this design is to prevent the role from being unlocked and logged into TiDB with an empty password. When the role is unlocked by the `ALTER USER ... ACCOUNT UNLOCK` statement, you can log in with this account even though the password is empty. Therefore, TiDB makes the password manually expired using the `password_expired` attribute so that the user must set a valid password for the account.

```
mysql> CREATE ROLE testrole;
Query OK, 0 rows affected (0.01 sec)

mysql> SELECT user,password_expired,Account_locked FROM mysql.user WHERE
    ↪ user = 'testrole';
+----------+------------------+----------------+
| user     | password_expired | Account_locked |
+----------+------------------+----------------+
| testrole | Y                | Y              |
+----------+------------------+----------------+
1 row in set (0.02 sec)
```

#### 14.9.4.3.2 Automatic expiration

Automatic password expiration is based on the **password age** and the **password lifetime**.

- Password age: the time interval from the last password change date to the current date. The time of the last password change is recorded in the `mysql.user` system table.
- Password lifetime: the number of days the password can be used to log in to TiDB.

If a password is used for a longer period than it is allowed to live, the server automatically treats the password as expired.

TiDB supports automatic password expiration at the global level and at the account level.

- The global level

  You can set the system variable `default_password_lifetime` to control the password lifetime. The default value `0` indicates that the password never expires. If this system variable is set to a positive integer `N`, it means that the password lifetime is `N` days, and you must change your password every `N` days.

  The global automatic password expiration policy applies to all accounts that do not have an account-level override.

  The following example establishes a global automatic password expiration policy with a password lifetime of 180 days:

```
SET GLOBAL default_password_lifetime = 180;
```

- The account level

  To establish an automatic password expiration policy for an individual account, use the `PASSWORD EXPIRE` option in the `CREATE USER` or `ALTER USER` statement.

  The following examples require that the user password is changed every 90 days:

```
CREATE USER 'test'@'localhost' PASSWORD EXPIRE INTERVAL 90 DAY;
ALTER USER 'test'@'localhost' PASSWORD EXPIRE INTERVAL 90 DAY;
```

  The following examples disable the automatic password expiration policy for an individual account:

```
CREATE USER 'test'@'localhost' PASSWORD EXPIRE NEVER;
ALTER USER 'test'@'localhost' PASSWORD EXPIRE NEVER;
```

  Remove the account-level automatic password expiration policy for a specified account so that it follows the global automatic password expiration policy:

```
CREATE USER 'test'@'localhost' PASSWORD EXPIRE DEFAULT;
ALTER USER 'test'@'localhost' PASSWORD EXPIRE DEFAULT;
```

#### 14.9.4.4.3.3 Password expiration check mechanism

When a client connects to the TiDB server, the server checks whether the password is expired in the following order:

1. The server checks whether the password has been set as expired manually.
2. If the password is not manually expired, the server checks whether the password age is longer than its configured lifetime. If so, the server treats the password as expired.

#### 14.9.4.3.4 Handle an expired password

You can control the behavior of the TiDB server for password expiration. When a password is expired, the server either disconnects the client or restricts the client to the "sandbox mode". In a "sandbox mode", the TiDB server allows connections from the expired account. However, in such connections, the user is only allowed to reset the password.

The TiDB server can control whether to restrict the user with an expired password in the "sandbox mode". To control the behavior of the TiDB server when a password is expired, configure the `security.disconnect-on-expired-password` parameter in the TiDB configuration file:

```
[security]
disconnect-on-expired-password = true
```

- If `disconnect-on-expired-password` is set to `true` (default), the server disconnects the client when the password is expired.
- If `disconnect-on-expired-password` is set to `false`, the server enables the "sandbox mode" and allows the user to connect to the server. However, the user can only reset the password. After the password is reset, the user can execute SQL statements normally.

When `disconnect-on-expired-password` is enabled, if an account password is expired, TiDB rejects the connection from the account. In such cases, you can modify the password in the following ways:

- If the password for a normal account is expired, the administrator can change the password for the account by using SQL statements.
- If the password for an administrator account is expired, another administrator can change the password for the account by using SQL statements.
- If the password for an administrator account is expired and no other administrator is available to help change the password, you can use the `skip-grant-table` mechanism to change the password for the account. For details, see Forgot password process.

### 14.9.4.4 Password reuse policy

TiDB can limit the reuse of previous passwords. The password reuse policy can be based on the number of password changes or time elapsed, or both.

The password reuse policy can be set at the global level and at the account level. You can establish a password reuse policy at the global level, and also use an account-level policy to override the global policy.

TiDB records the password history for an account and limits the selection of a new password from the history:

- If a password reuse policy is based on the number of password changes, a new password must not be the same as any of the specified number of most recent passwords. For

example, if the minimum number of password changes is set to 3, the new password cannot be the same as any of the previous 3 passwords.

- If a password reuse policy is based on time elapsed, a new password must not be the same as any of the passwords used within the specified number of days. For example, if the password reuse interval is set to 60, the new password cannot be the same as any of the passwords used within the last 60 days.

> **Note:**
>
> Empty passwords are not recorded in the password history and can be reused at any time.

#### 14.9.4.4.1 Global-level password reuse policy

To establish a global password reuse policy, use the `password_history` and `password_reuse_interval` system variables.

For example, to establish a global password reuse policy that prohibits the reuse of the last 6 passwords and passwords used within the last 365 days:

```
SET GLOBAL password_history = 6;
SET GLOBAL password_reuse_interval = 365;
```

The global password reuse policy applies to all accounts that do not have an account-level override.

#### 14.9.4.4.2 Account-level password reuse policy

To establish an account-level password reuse policy, use the `PASSWORD HISTORY` and `PASSWORD REUSE INTERVAL` options in the `CREATE USER` or `ALTER USER` statement.

For example:

To prohibit the reuse of the last 5 passwords:

```
CREATE USER 'test'@'localhost' PASSWORD HISTORY 5;
ALTER USER 'test'@'localhost' PASSWORD HISTORY 5;
```

To prohibit the reuse of passwords used within the last 365 days:

```
CREATE USER 'test'@'localhost' PASSWORD REUSE INTERVAL 365 DAY;
ALTER USER 'test'@'localhost' PASSWORD REUSE INTERVAL 365 DAY;
```

To combine the two types of reuse policies, use both `PASSWORD HISTORY` and `PASSWORD REUSE INTERVAL`:

```
CREATE USER 'test'@'localhost'
  PASSWORD HISTORY 5
  PASSWORD REUSE INTERVAL 365 DAY;
ALTER USER 'test'@'localhost'
  PASSWORD HISTORY 5
  PASSWORD REUSE INTERVAL 365 DAY;
```

To remove the account-level password reuse policy for a specified account so that it follows the global password reuse policy:

```
CREATE USER 'test'@'localhost'
  PASSWORD HISTORY DEFAULT
  PASSWORD REUSE INTERVAL DEFAULT;
ALTER USER 'test'@'localhost'
  PASSWORD HISTORY DEFAULT
  PASSWORD REUSE INTERVAL DEFAULT;
```

**Note:**

- If you set the password reuse policy multiple times, the last set value takes effect.
- The default value of the `PASSWORD HISTORY` and `PASSWORD REUSE INTERVAL` options is 0, which means that the reuse policy is disabled.
- When you modify a username, TiDB migrates the corresponding password history in the `mysql.password_history` system table from the original username to the new username.

#### 14.9.4.5 Failed-login tracking and temporary account locking policy

TiDB can track the number of failed login attempts for an account. To prevent the password from being cracked by brute force, TiDB can lock the account after a specified number of failed login attempts.

**Note:**

- TiDB only supports failed-login tracking and temporary account locking at the account level, but not at the global level.

- Failed-login means that the client fails to provide the correct password during the connection attempt, and does not include connection failures due to unknown users or network issues.
- When you enable the failed-login tracking and temporary account locking for an account, the account is subject to additional checks when the account attempts to log in. This affects the performance of the login operation, especially in high-concurrency login scenarios.

#### 14.9.4.5.1 Configure the login failure tracking policy

You can configure the number of failed login attempts and the lock time for each account by using the `FAILED_LOGIN_ATTEMPTS` and `PASSWORD_LOCK_TIME` options in the `CREATE USER` or `ALTER USER` statement. The available value options are as follows:

- `FAILED_LOGIN_ATTEMPTS`: N. The account is temporarily locked after `N` consecutive login failures. The value of N ranges from 0 to 32767.
- `PASSWORD_LOCK_TIME`: N | UNBOUNDED.
  - N means that the account will be temporarily locked for `N` days after consecutive failed login attempts. The value of N ranges from 0 to 32767.
  - `UNBOUNDED` means that the lock time is unlimited and the account must be manually unlocked. The value of N ranges from 0 to 32767.

**Note:**

- You can configure only `FAILED_LOGIN_ATTEMPTS` or `PASSWORD_LOCK_TIME` in a single SQL statement. In this case, the account locking does not take effect.
- The account locking takes effect only when both `FAILED_LOGIN_ATTEMPTS` and `PASSWORD_LOCK_TIME` are not 0.

You can configure the account locking policy as follows:

Create a user and configure the account locking policy. When the password is entered incorrectly for 3 consecutive times, the account will be temporarily locked for 3 days:

```
CREATE USER 'test1'@'localhost' IDENTIFIED BY 'password'
    ↪ FAILED_LOGIN_ATTEMPTS 3 PASSWORD_LOCK_TIME 3;
```

Modify the account locking policy for an existing user. When the password is entered incorrectly for 4 consecutive times, the account will be locked indefinitely until it is manually unlocked:

```
ALTER USER 'test2'@'localhost' FAILED_LOGIN_ATTEMPTS 4 PASSWORD_LOCK_TIME
    ↪ UNBOUNDED;
```

Disable the account locking policy for an existing user:

```
ALTER USER 'test3'@'localhost' FAILED_LOGIN_ATTEMPTS 0 PASSWORD_LOCK_TIME
    ↪ 0;
```

#### 14.9.4.5.2 Unlock the locked account

In the following scenarios, the count of consecutive password errors can be reset:

- When you execute the `ALTER USER ... ACCOUNT UNLOCK` statement.
- When you log in successfully.

In the following scenarios, the locked account can be unlocked:

- When the lock time ends, the automatic lock flag of the account will be reset at the next login attempt.
- When you execute the `ALTER USER ... ACCOUNT UNLOCK` statement.

> **Note:**
>
> When an account is locked due to consecutive login failures, modifying the account locking policy has the following effects:
>
> - When you modify `FAILED_LOGIN_ATTEMPTS`, the lock status of the account does not change. The modified `FAILED_LOGIN_ATTEMPTS` takes effect after the account is unlocked and attempts to log in again.
> - When you modify `PASSWORD_LOCK_TIME`, the lock status of the account does not change. The modified `PASSWORD_LOCK_TIME` takes effect when the account attempts to log in again. At that time, TiDB checks whether the new lock time has reached. If yes, TiDB will unlock the user.

### 14.9.5 Role-Based Access Control

The implementation of TiDB's role-based access control (RBAC) system is similar to that of MySQL 8.0. TiDB is compatible with most RBAC syntax of MySQL.

This document introduces TiDB RBAC-related operations and implementation.

#### 14.9.5.1 RBAC operations

A role is a collection of a series of privileges. You can do the following operations:

- Create a role.
- Delete a role.
- Grant a privilege to a role.
- Grant a role to another user. That user can obtain the privileges involved in the role, after enabling the role.

##### 14.9.5.1.1 Create a role

For example, you can use the following statement to create the roles `app_developer`, `app_read`, and `app_write`:

```
CREATE ROLE 'app_developer', 'app_read', 'app_write';
```

For the role naming format and rule, see TiDB User Account Management.

Roles are stored in the `mysql.user` table and the host name part of the role name (if omitted) defaults to `'%'`. The name of the role you are trying to create must be unique; otherwise, an error is reported.

To create a role, you need the `CREATE ROLE` or `CREATE USER` privilege.

##### 14.9.5.1.2 Grant a privilege to a role

The operation of granting a privilege to a role is the same with that of granting a privilege to a user. For details, see TiDB Privilege Management.

For example, you can use the following statement to grant the `app_read` role the privilege to read the `app_db` database:

```
GRANT SELECT ON app_db.* TO 'app_read'@'%';
```

You can use the following statement to grant the `app_write` role the privilege to write data to the `app_db` database:

```
GRANT INSERT, UPDATE, DELETE ON app_db.* TO 'app_write'@'%';
```

You can use the following statement to grant the `app_developer` role all privileges on the `app_db` database:

```
GRANT ALL ON app_db.* TO 'app_developer';
```

#### 14.9.5.1.3 Grant a role to a user

Assume that a user `dev1` has the developer role with all the privileges on `app_db`; two users `read_user1` and `read_user2` have the read-only privilege on `app_db`; and a user `rw_user1` has read and write privileges on `app_db`.

Use `CREATE USER` to create the users:

```
CREATE USER 'dev1'@'localhost' IDENTIFIED BY 'dev1pass';
CREATE USER 'read_user1'@'localhost' IDENTIFIED BY 'read_user1pass';
CREATE USER 'read_user2'@'localhost' IDENTIFIED BY 'read_user2pass';
CREATE USER 'rw_user1'@'localhost' IDENTIFIED BY 'rw_user1pass';
```

Then use `GRANT` to grant roles to users

```
GRANT 'app_developer' TO 'dev1'@'localhost';
GRANT 'app_read' TO 'read_user1'@'localhost', 'read_user2'@'localhost';
GRANT 'app_read', 'app_write' TO 'rw_user1'@'localhost';
```

To grant a role to another user or revoke a role, you need the `SUPER` privilege.

Granting a role to a user does not mean enabling the role immediately. Enabling a role is another operation.

The following operations might form a "relation loop:"

```
CREATE USER 'u1', 'u2';
CREATE ROLE 'r1', 'r2';

GRANT 'u1' TO 'u1';
GRANT 'r1' TO 'r1';

GRANT 'r2' TO 'u2';
GRANT 'u2' TO 'r2';
```

TiDB supports this multi-level authorization relationship. You can use it to implement privilege inheritance.

#### 14.9.5.1.4 Check a role's privileges

You can use the `SHOW GRANTS` statement to check what privileges have been granted to the user.

To check privilege-related information of another user, you need the `SELECT` privilege on the `mysql` database.

```
SHOW GRANTS FOR 'dev1'@'localhost';
```

```
+-----------------------------------------------+
| Grants for dev1@localhost                     |
+-----------------------------------------------+
| GRANT USAGE ON *.* TO `dev1`@`localhost`      |
| GRANT `app_developer`@`%` TO `dev1`@`localhost` |
+-----------------------------------------------+
```

You can use the `USING` option in `SHOW GRANTS` to check a role's privileges:

```
SHOW GRANTS FOR 'dev1'@'localhost' USING 'app_developer';
```

```
+-----------------------------------------------------------+
| Grants for dev1@localhost                                 |
+-----------------------------------------------------------+
| GRANT USAGE ON *.* TO `dev1`@`localhost`                  |
| GRANT ALL PRIVILEGES ON `app_db`.* TO `dev1`@`localhost`  |
| GRANT `app_developer`@`%` TO `dev1`@`localhost`           |
+-----------------------------------------------------------+
```

```
SHOW GRANTS FOR 'rw_user1'@'localhost' USING 'app_read', 'app_write';
```

```
+-------------------------------------------------------------------------------------+
   ↪
| Grants for rw_user1@localhost                                                       |
+-------------------------------------------------------------------------------------+
   ↪
| GRANT USAGE ON *.* TO `rw_user1`@`localhost`                                        |
| GRANT SELECT, INSERT, UPDATE, DELETE ON `app_db`.* TO `rw_user1`@`
   ↪ localhost` |
| GRANT `app_read`@`%`,`app_write`@`%` TO `rw_user1`@`localhost`                     |
+-------------------------------------------------------------------------------------+
   ↪
```

```
SHOW GRANTS FOR 'read_user1'@'localhost' USING 'app_read';
```

```
+-------------------------------------------------------+
| Grants for read_user1@localhost                       |
+-------------------------------------------------------+
| GRANT USAGE ON *.* TO `read_user1`@`localhost`        |
| GRANT SELECT ON `app_db`.* TO `read_user1`@`localhost` |
| GRANT `app_read`@`%` TO `read_user1`@`localhost`      |
+-------------------------------------------------------+
```

You can use `SHOW GRANTS` or `SHOW GRANTS FOR CURRENT_USER()` to check the current user's privileges. `SHOW GRANTS` and `SHOW GRANTS FOR CURRENT_USER()` are different in the following aspects:

- `SHOW GRANTS` shows the privilege of the enabled role for the current user.
- `SHOW GRANTS FOR CURRENT_USER()` does not show the enabled role's privilege.

#### 14.9.5.1.5 Set the default role

After a role is granted to a user, it does not take effect immediately. Only after the user enables this role, he can use the privilege the role owns.

You can set default roles for a user. When the user logs in, the default roles are automatically enabled.

```
SET DEFAULT ROLE
    {NONE | ALL | role [, role ] ...}
    TO user [, user ]
```

For example, you can use the following statement to set default roles of `rw_user1@localhost` to `app_read` and `app_write`:

```
SET DEFAULT ROLE app_read, app_write TO 'rw_user1'@'localhost';
```

You can use the following statement to set default roles of `dev1@localhost` to all roles:

```
SET DEFAULT ROLE ALL TO 'dev1'@'localhost';
```

You can use the following statement to disable all default roles of `dev1@localhost`:

```
SET DEFAULT ROLE NONE TO 'dev1'@'localhost';
```

> **Note:**
>
> You need to grant the role to the user before you set the default role to this role.

#### 14.9.5.1.6 Enable a role in the current session

You can enable some role(s) in the current session.

```
SET ROLE {
    DEFAULT
  | NONE
  | ALL
```

```
  | ALL EXCEPT role [, role ] ...
  | role [, role ] ...
}
```

For example, after `rw_user1` logs in, you can use the following statement to enable roles `app_read` and `app_write` that are valid only in the current session:

```
SET ROLE 'app_read', 'app_write';
```

You can use the following statement to enable the default role of the current user:

```
SET ROLE DEFAULT
```

You can use the following statement to enable all roles granted to the current user:

```
SET ROLE ALL
```

You can use the following statement to disable all roles:

```
SET ROLE NONE
```

You can use the following statement to enable roles except `app_read`:

```
SET ROLE ALL EXCEPT 'app_read'
```

> **Note:**
>
> If you use `SET ROLE` to enable a role, this role is valid only in the current session.

#### 14.9.5.1.7 Check the current enabled role

The current user can use the `CURRENT_ROLE()` function to check which role has been enabled by the current user.

For example, you can grant default roles to `rw_user1'@'localhost`:

```
SET DEFAULT ROLE ALL TO 'rw_user1'@'localhost';
```

After `rw_user1@localhost` logs in, you can execute the following statement:

```
SELECT CURRENT_ROLE();
```

```
+--------------------------------+
| CURRENT_ROLE()                 |
+--------------------------------+
| `app_read`@`%`,`app_write`@`%` |
+--------------------------------+
```

```
SET ROLE 'app_read'; SELECT CURRENT_ROLE();
```

```
+----------------+
| CURRENT_ROLE() |
+----------------+
| `app_read`@`%` |
+----------------+
```

#### 14.9.5.1.8 Revoke a role

You can use the following statement to revoke the `app_read` role granted to the users `read_user1@localhost` and `read_user2@localhost`:

```
REVOKE 'app_read' FROM 'read_user1'@'localhost', 'read_user2'@'localhost';
```

You can use the following statement to revoke the roles `app_read` and `app_write` granted to the `rw_user1@localhost` user:

```
REVOKE 'app_read', 'app_write' FROM 'rw_user1'@'localhost';
```

The operation of revoking a role from a user is atomic. If you fail to revoke a role, this operation rolls back.

#### 14.9.5.1.9 Revoke a privilege

The `REVOKE` statement is reverse to `GRANT`. You can use `REVOKE` to revoke the privileges of `app_write`.

```
REVOKE INSERT, UPDATE, DELETE ON app_db.* FROM 'app_write';
```

For details, see TiDB Privilege Management.

#### 14.9.5.1.10 Delete a role

You can use the following statement to delete roles `app_read` and `app_write`:

```
DROP ROLE 'app_read', 'app_write';
```

This operation deletes the role records of `app_read` and `app_write` in the `mysql.user` table and related records in the authorization table, and terminates the authorization related to the two roles.

To delete a role, you need the `DROP ROLE` or `DROP USER` privilege.

#### 14.9.5.1.11 Authorization table

In addition to four system privilege tables, the RBAC system introduces two new system privilege tables:

- `mysql.role_edges`: records the authorization relationship of the role and user.
- `mysql.default_roles`: records default roles of each user.

`mysql.role_edges`

`mysql.role_edges` contains the following data:

```
SELECT * FROM mysql.role_edges;
```

```
+-----------+-----------+---------+---------+-------------------+
| FROM_HOST | FROM_USER | TO_HOST | TO_USER | WITH_ADMIN_OPTION |
+-----------+-----------+---------+---------+-------------------+
| %         | r_1       | %       | u_1     | N                 |
+-----------+-----------+---------+---------+-------------------+
1 row in set (0.00 sec)
```

- `FROM_HOST` and `FROM_USER` indicate the role's host name and user name respectively.
- `TO_HOST` and `TO_USER` indicate the host name and user name of the user to which a role is granted.

`mysql.default_roles`

`mysql.default_roles` shows which roles have been enabled by default for each user.

```
SELECT * FROM mysql.default_roles;
```

```
+------+------+-------------------+-------------------+
| HOST | USER | DEFAULT_ROLE_HOST | DEFAULT_ROLE_USER |
+------+------+-------------------+-------------------+
| %    | u_1  | %                 | r_1               |
| %    | u_1  | %                 | r_2               |
+------+------+-------------------+-------------------+
2 rows in set (0.00 sec)
```

- `HOST` and `USER` indicate the user's host name and user name respectively.
- `DEFAULT_ROLE_HOST` and `DEFAULT_ROLE_USER` indicate the host name and user name of the default role respectively.

#### 14.9.5.1.12 References

Because RBAC, user management, and privilege management are closely related, you can refer to operation details in the following resources:

- TiDB Privilege Management
- TiDB User Account Management

### 14.9.6 Certificate-Based Authentication for Login

TiDB supports a certificate-based authentication method for users to log into TiDB. With this method, TiDB issues certificates to different users, uses encrypted connections to transfer data, and verifies certificates when users log in. This approach is more secure than the traditional password-based authentication method commonly used by MySQL users and is thus adopted by an increasing number of users.

To use certificate-based authentication, you might need to perform the following operations:

- Create security keys and certificates
- Configure certificates for TiDB and the client
- Configure the user certificate information to be verified when the user logs in
- Update and replace certificates

The rest of the document introduces in detail how to perform these operations.

#### 14.9.6.1 Create security keys and certificates

It is recommended that you use OpenSSL to create keys and certificates. The certificate generation process is similar to the process described in Enable TLS Between TiDB Clients and Servers. The following paragraphs demonstrate how to configure more attribute fields that need to be verified in the certificate.

##### 14.9.6.1.1 Generate CA key and certificate

1. Execute the following command to generate the CA key:

```
sudo openssl genrsa 2048 > ca-key.pem
```

The output of the above command:

```
Generating RSA private key, 2048 bit long modulus (2 primes)
.....................+++++
.............................................+++++
e is 65537 (0x010001)
```

2. Execute the following command to generate the certificate corresponding to the CA key:

```
sudo openssl req -new -x509 -nodes -days 365000 -key ca-key.pem -out ca
    ↪ -cert.pem
```

3. Enter detailed certificate information. For example:

```
Country Name (2 letter code) [AU]:US
State or Province Name (full name) [Some-State]:California
Locality Name (e.g. city) []:San Francisco
Organization Name (e.g. company) [Internet Widgits Pty Ltd]:PingCAP Inc
    ↪ .
Organizational Unit Name (e.g. section) []:TiDB
Common Name (e.g. server FQDN or YOUR name) []:TiDB admin
Email Address []:s@pingcap.com
```

> **Note:**
> In the above certificate details, texts after : are the entered information.

#### 14.9.6.1.2 Generate server key and certificate

1. Execute the following command to generate the server key:

```
sudo openssl req -newkey rsa:2048 -days 365000 -nodes -keyout server-
    ↪ key.pem -out server-req.pem
```

2. Enter detailed certificate information. For example:

```
Country Name (2 letter code) [AU]:US
State or Province Name (full name) [Some-State]:California
Locality Name (e.g. city) []:San Francisco
Organization Name (e.g. company) [Internet Widgits Pty Ltd]:PingCAP Inc
    ↪ .
Organizational Unit Name (e.g. section) []:TiKV
Common Name (e.g. server FQDN or YOUR name) []:TiKV Test Server
Email Address []:k@pingcap.com

Please enter the following 'extra' attributes
to be sent with your certificate request
A challenge password []:
An optional company name []:
```

3. Execute the following command to generate the RSA key of the server:

```
sudo openssl rsa -in server-key.pem -out server-key.pem
```

The output of the above command:

```
writing RSA key
```

4. Use the CA certificate signature to generate the signed server certificate:

```
sudo openssl x509 -req -in server-req.pem -days 365000 -CA ca-cert.pem
    ↪ -CAkey ca-key.pem -set_serial 01 -out server-cert.pem
```

The output of the above command (for example):

```
Signature ok
subject=C = US, ST = California, L = San Francisco, O = PingCAP Inc.,
    ↪ OU = TiKV, CN = TiKV Test Server, emailAddress = k@pingcap.com
Getting CA Private Key
```

> **Note:**
> When you log in, TiDB checks whether the information in the `subject` section of the above output is consistent or not.

#### 14.9.6.1.3 Generate client key and certificate

After generating the server key and certificate, you need to generate the key and certificate for the client. It is often necessary to generate different keys and certificates for different users.

1. Execute the following command to generate the client key:

```
sudo openssl req -newkey rsa:2048 -days 365000 -nodes -keyout client-
    ↪ key.pem -out client-req.pem
```

2. Enter detailed certificate information. For example:

```
Country Name (2 letter code) [AU]:US
State or Province Name (full name) [Some-State]:California
Locality Name (e.g. city) []:San Francisco
Organization Name (e.g. company) [Internet Widgits Pty Ltd]:PingCAP Inc
    ↪ .
Organizational Unit Name (e.g. section) []:TiDB
Common Name (e.g. server FQDN or YOUR name) []:tpch-user1
Email Address []:zz@pingcap.com
```

```
Please enter the following 'extra' attributes
to be sent with your certificate request
A challenge password []:
An optional company name []:
```

3. Execute the following command to generate the RSA key of the client:

```
sudo openssl rsa -in client-key.pem -out client-key.pem
```

The output of the above command:

```
writing RSA key
```

4. Use the CA certificate signature to generate the client certificate:

```
sudo openssl x509 -req -in client-req.pem -days 365000 -CA ca-cert.pem
    ↪ -CAkey ca-key.pem -set_serial 01 -out client-cert.pem
```

The output of the above command (for example):

```
Signature ok
subject=C = US, ST = California, L = San Francisco, O = PingCAP Inc.,
    ↪ OU = TiDB, CN = tpch-user1, emailAddress = zz@pingcap.com
Getting CA Private Key
```

> **Note:**
> The information of the `subject` section in the above output is used for certificate configuration for login verification in the `require` section.

#### 14.9.6.1.4 Verify certificate

Execute the following command to verify certificate:

```
openssl verify -CAfile ca-cert.pem server-cert.pem client-cert.pem
```

If the certificate is verified, you will see the following result:

```
server-cert.pem: OK
client-cert.pem: OK
```

### 14.9.6.2 Configure TiDB and the client to use certificates

After generating the certificates, you need to configure the TiDB server and the client to use the corresponding server certificate or client certificate.

#### 14.9.6.2.1 Configure TiDB to use server certificate

Modify the `[security]` section in the TiDB configuration file. This step specifies the directory in which the CA certificate, the server key, and the server certificate are stored. You can replace `path/to/server-cert.pem`, `path/to/server-key.pem`, `path/to/ca-cert.pem` with your own directory.

```
[security]
ssl-cert ="path/to/server-cert.pem"
ssl-key ="path/to/server-key.pem"
ssl-ca="path/to/ca-cert.pem"
```

Start TiDB and check logs. If the following information is displayed in the log, the configuration is successful:

```
[INFO] [server.go:264] ["secure connection is enabled"] ["client
    ↪ verification enabled"=true]
```

#### 14.9.6.2.2 Configure the client to use client certificate

Configure the client so that the client uses the client key and certificate for login.

Taking the MySQL client as an example, you can use the newly created client certificate, client key and CA by specifying `ssl-cert`, `ssl-key`, and `ssl-ca`:

```
mysql -utest -h0.0.0.0 -P4000 --ssl-cert /path/to/client-cert.new.pem --ssl-
    ↪ key /path/to/client-key.new.pem --ssl-ca /path/to/ca-cert.pem
```

> **Note:**
>
> `/path/to/client-cert.new.pem`, `/path/to/client-key.new.pem`, and `/
> ↪ path/to/ca-cert.pem` are the directory of the CA certificate, client key, and client certificate. You can replace them with your own directory.

### 14.9.6.3 Configure the user certificate information for login verification

First, connect TiDB using the client to configure the login verification. Then, you can get and configure the user certificate information to be verified.

#### 14.9.6.3.1 Get user certificate information

The user certificate information can be specified by `require subject`, `require issuer`, `require san`, and `require cipher`, which are used to check the X509 certificate attributes.

- `require subject`: Specifies the `subject` information of the client certificate when you log in. With this option specified, you do not need to configure `require ssl` or x509. The information to be specified is consistent with the entered `subject` information in Generate client keys and certificates.

  To get this option, execute the following command:

```
openssl x509 -noout -subject -in client-cert.pem | sed 's/.\{8\}//' |
    ↪ sed 's/, /\//g' | sed 's/ = /=/g' | sed 's/^/\//'
```

- `require issuer`: Specifies the `subject` information of the CA certificate that issues the user certificate. The information to be specified is consistent with the entered `subject` information in Generate CA key and certificate.

  To get this option, execute the following command:

```
openssl x509 -noout -subject -in ca-cert.pem | sed 's/.\{8\}//' | sed '
    ↪ s/, /\//g' | sed 's/ = /=/g' | sed 's/^/\//'
```

- `require san`: Specifies the `Subject Alternative Name` information of the CA certificate that issues the user certificate. The information to be specified is consistent with the `alt_names` of the `openssl.cnf` configuration file used to generate the client certificate.

  - Execute the following command to get the information of the `require san` item in the generated certificate:

```
openssl x509 -noout -extensions subjectAltName -in client.crt
```

  - `require san` currently supports the following `Subject Alternative Name` check items:

    - URI
    - IP
    - DNS

  - Multiple check items can be configured after they are connected by commas. For example, configure `require san` as follows for the `u1` user:

```
create user 'u1'@'%' require san 'DNS:d1,URI:spiffe://example.org/
    ↪ myservice1,URI:spiffe://example.org/myservice2';
```

    The above configuration only allows the `u1` user to log in to TiDB using the certificate with the URI item `spiffe://example.org/myservice1` or `spiffe://example.org/myservice2` and the DNS item `d1`.

- `require cipher`: Checks the cipher method supported by the client. Use the following statement to check the list of supported cipher methods:

```
SHOW SESSION STATUS LIKE 'Ssl_cipher_list';
```

#### 14.9.6.3.2 Configure user certificate information

After getting the user certificate information (`require subject`, `require issuer`, `require san`, `require cipher`), configure these information to be verified when creating a user, granting privileges, or altering a user. Replace `<replaceable>` with the corresponding information in the following statements.

You can configure one option or multiple options using the space or `and` as the separator.

- Configure user certificate when creating a user (`create user`):

```
create user 'u1'@'%' require issuer '<replaceable>' subject '<
    ↪ replaceable>' san '<replaceable>' cipher '<replaceable>';
```

- Configure user certificate when granting privileges:

```
grant all on *.* to 'u1'@'%' require issuer '<replaceable>' subject '<
    ↪ replaceable>' san '<replaceable>' cipher '<replaceable>';
```

- Configure user certificate when altering a user:

```
alter user 'u1'@'%' require issuer '<replaceable>' subject '<
    ↪ replaceable>' san '<replaceable>' cipher '<replaceable>';
```

After the above configuration, the following items will be verified when you log in:

- SSL is used; the CA that issues the client certificate is consistent with the CA configured in the server.
- The `issuer` information of the client certificate matches the information specified in `require issuer`.
- The `subject` information of the client certificate matches the information specified in `require cipher`.
- The `Subject Alternative Name` information of the client certificate matches the information specified in `require san`.

You can log into TiDB only after all the above items are verified. Otherwise, the `ERROR 1045 (28000): Access denied` error is returned. You can use the following command to check the TLS version, the cipher algorithm and whether the current connection uses the certificate for the login.

Connect the MySQL client and execute the following statement:

```
\s
```

The output:

```
--------------
mysql Ver 15.1 Distrib 10.4.10-MariaDB, for Linux (x86_64) using readline
    ↪ 5.1

Connection id:    1
Current database: test
Current user:     root@127.0.0.1
SSL:              Cipher in use is TLS_AES_256_GCM_SHA384
```

Then execute the following statement:

```
show variables like '%ssl%';
```

The output:

```
+---------------+---------------------------------+
| Variable_name | Value                           |
+---------------+---------------------------------+
| ssl_cert      | /path/to/server-cert.pem        |
| ssl_ca        | /path/to/ca-cert.pem            |
| have_ssl      | YES                             |
| have_openssl  | YES                             |
| ssl_key       | /path/to/server-key.pem         |
+---------------+---------------------------------+
6 rows in set (0.067 sec)
```

#### 14.9.6.4 Update and replace certificate

The key and certificate are updated regularly. The following sections introduce how to update the key and certificate.

The CA certificate is the basis for mutual verification between the client and server. To replace the CA certificate, generate a combined certificate that supports the authentication for both old and new certificates. On the client and server, first replace the CA certificate, then replace the client/server key and certificate.

##### 14.9.6.4.1 Update CA key and certificate

1. Back up the old CA key and certificate (suppose that `ca-key.pem` is stolen):

   ```
   mv ca-key.pem ca-key.old.pem && \
   mv ca-cert.pem ca-cert.old.pem
   ```

2. Generate the new CA key:

```
sudo openssl genrsa 2048 > ca-key.pem
```

3. Generate the new CA certificate using the newly generated CA key:

```
sudo openssl req -new -x509 -nodes -days 365000 -key ca-key.pem -out ca
    ↪ -cert.new.pem
```

> **Note:**
> Generating the new CA certificate is to replace the keys and certificates on the client and server, and to ensure that online users are not affected. Therefore, the appended information in the above command must be consistent with the `require issuer` information.

4. Generate the combined CA certificate:

```
cat ca-cert.new.pem ca-cert.old.pem > ca-cert.pem
```

After the above operations, restart the TiDB server with the newly created combined CA certificate. Then the server accepts both the new and old CA certificates.

Also replace the old CA certificate with the combined certificate so that the client accepts both the old and new CA certificates.

#### 14.9.6.4.2 Update client key and certificate

> **Note:**
> Perform the following steps **only after** you have replaced the old CA certificate on the client and server with the combined CA certificate.

1. Generate the new RSA key of the client:

```
sudo openssl req -newkey rsa:2048 -days 365000 -nodes -keyout client-
    ↪ key.new.pem -out client-req.new.pem && \
sudo openssl rsa -in client-key.new.pem -out client-key.new.pem
```

> **Note:**
>
> The above command is to replace the client key and certificate, and to ensure that the online users are not affected. Therefore, the appended information in the above command must be consistent with the `require subject` information.

2. Use the combined certificate and the new CA key to generate the new client certificate:

```
sudo openssl x509 -req -in client-req.new.pem -days 365000 -CA ca-cert.
    ↪ pem -CAkey ca-key.pem -set_serial 01 -out client-cert.new.pem
```

3. Make the client (for example, MySQL) connect TiDB with the new client key and certificate:

```
mysql -utest -h0.0.0.0 -P4000 --ssl-cert /path/to/client-cert.new.pem
    ↪ --ssl-key /path/to/client-key.new.pem --ssl-ca /path/to/ca-cert.
    ↪ pem
```

> **Note:**
>
> `/path/to/client-cert.new.pem`, `/path/to/client-key.new.pem`, and `/path/to/ca-cert.pem` specify the directory of the CA certificate, client key, and client certificate. You can replace them with your own directory.

#### 14.9.6.4.3 Update the server key and certificate

1. Generate the new RSA key of the server:

```
sudo openssl req -newkey rsa:2048 -days 365000 -nodes -keyout server-
    ↪ key.new.pem -out server-req.new.pem && \
sudo openssl rsa -in server-key.new.pem -out server-key.new.pem
```

2. Use the combined CA certificate and the new CA key to generate the new server certificate:

```
sudo openssl x509 -req -in server-req.new.pem -days 365000 -CA ca-cert.
    ↪ pem -CAkey ca-key.pem -set_serial 01 -out server-cert.new.pem
```

3. Configure the TiDB server to use the new server key and certificate. See Configure TiDB server for details.

## 14.10 SQL

### 14.10.1 SQL Language Structure and Syntax

#### 14.10.1.1 Attributes

##### 14.10.1.1.1 AUTO_INCREMENT

This document introduces the `AUTO_INCREMENT` column attribute, including its concept, implementation principles, auto-increment related features, and restrictions.

> **Note:**
>
> The `AUTO_INCREMENT` attribute might cause hotspot in production environments. See Troubleshoot HotSpot Issues for details. It is recommended to use `AUTO_RANDOM` instead.

Concept

`AUTO_INCREMENT` is a column attribute that is used to automatically fill in default column values. When the `INSERT` statement does not specify values for the `AUTO_INCREMENT` column, the system automatically assigns values to this column.

For performance reasons, `AUTO_INCREMENT` numbers are allocated in a batch of values (30 thousand by default) to each TiDB server. This means that while `AUTO_INCREMENT` numbers are guaranteed to be unique, values assigned to an `INSERT` statement will only be monotonic on a per TiDB server basis.

> **Note:**
>
> If you want the `AUTO_INCREMENT` numbers to be monotonic on all TiDB servers and your TiDB version is v6.5.0 or later, it is recommended to enable the MySQL compatibility mode.

The following is a basic example of `AUTO_INCREMENT`:

```
CREATE TABLE t(id int PRIMARY KEY AUTO_INCREMENT, c int);
```

```
INSERT INTO t(c) VALUES (1);
INSERT INTO t(c) VALUES (2);
INSERT INTO t(c) VALUES (3), (4), (5);
```

```
mysql> SELECT * FROM t;
+----+---+
| id | c |
+----+---+
| 1  | 1 |
| 2  | 2 |
| 3  | 3 |
| 4  | 4 |
| 5  | 5 |
+----+---+
5 rows in set (0.01 sec)
```

In addition, `AUTO_INCREMENT` also supports the `INSERT` statements that explicitly specify column values. In such cases, TiDB stores the explicitly specified values:

```
INSERT INTO t(id, c) VALUES (6, 6);
```

```
mysql> SELECT * FROM t;
+----+---+
| id | c |
+----+---+
| 1  | 1 |
| 2  | 2 |
| 3  | 3 |
| 4  | 4 |
| 5  | 5 |
| 6  | 6 |
+----+---+
6 rows in set (0.01 sec)
```

The usage above is the same as that of `AUTO_INCREMENT` in MySQL. However, in terms of the specific value that is implicitly assigned, TiDB differs from MySQL significantly.

Implementation principles

TiDB implements the `AUTO_INCREMENT` implicit assignment in the following way:

For each auto-increment column, a globally visible key-value pair is used to record the maximum ID that has been assigned. In a distributed environment, communication between nodes has some overhead. Therefore, to avoid the issue of write amplification, each TiDB node applies for a batch of consecutive IDs as caches when assigning IDs, and then applies for the next batch of IDs after the first batch is assigned. Therefore, TiDB nodes do not apply to the storage node for IDs when assigning IDs each time. For example:

```
CREATE TABLE t(id int UNIQUE KEY AUTO_INCREMENT, c int);
```

Assume two TiDB instances, `A` and `B`, in the cluster. If you execute an `INSERT` statement on the `t` table on `A` and `B` respectively:

```
INSERT INTO t (c) VALUES (1)
```

Instance `A` might cache the auto-increment IDs of `[1,30000]`, and instance `B` might cache the auto-increment IDs of `[30001,60000]`. In `INSERT` statements to be executed, these cached IDs of each instance will be assigned to the `AUTO_INCREMENT` column as the default values.

Basic Features

Uniqueness

> **Warning:**
>
> When the cluster has multiple TiDB instances, if the table schema contains the auto-increment IDs, it is recommended not to use explicit insert and implicit assignment at the same time, which means using the default values of the auto-increment column and the custom values. Otherwise, it might break the uniqueness of implicitly assigned values.

In the example above, perform the following operations in order:

1. The client inserts a statement `INSERT INTO t VALUES (2, 1)` to instance `B`, which sets `id` to `2`. The statement is successfully executed.
2. The client sends a statement `INSERT INTO t (c)(1)` to instance `A`. This statement does not specify the value of `id`, so the ID is assigned by `A`. At present, because `A` caches the IDs of `[1, 30000]`, it might assign `2` as the value of the auto-increment ID, and increases the local counter by `1`. At this time, the data whose ID is `2` already exists in the database, so the `Duplicated Error` error is returned.

Monotonicity

TiDB guarantees that `AUTO_INCREMENT` values are monotonic (always increasing) on a per-server basis. Consider the following example where consecutive `AUTO_INCREMENT` values of 1-3 are generated:

```
CREATE TABLE t (a int PRIMARY KEY AUTO_INCREMENT, b timestamp NOT NULL
    ↪ DEFAULT NOW());
INSERT INTO t (a) VALUES (NULL), (NULL), (NULL);
SELECT * FROM t;
```

```
Query OK, 0 rows affected (0.11 sec)

Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0

+---+---------------------+
| a | b                   |
+---+---------------------+
| 1 | 2020-09-09 20:38:22 |
| 2 | 2020-09-09 20:38:22 |
| 3 | 2020-09-09 20:38:22 |
+---+---------------------+
3 rows in set (0.00 sec)
```

Monotonicity is not the same guarantee as consecutive. Consider the following example:

```
CREATE TABLE t (id INT NOT NULL PRIMARY KEY auto_increment, a VARCHAR(10),
    ↪ cnt INT NOT NULL DEFAULT 1, UNIQUE KEY (a));
INSERT INTO t (a) VALUES ('A'), ('B');
SELECT * FROM t;
INSERT INTO t (a) VALUES ('A'), ('C') ON DUPLICATE KEY UPDATE cnt = cnt +
    ↪ 1;
SELECT * FROM t;
```

```
Query OK, 0 rows affected (0.00 sec)

Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0

+----+------+-----+
| id | a    | cnt |
+----+------+-----+
|  1 | A    |   1 |
|  2 | B    |   1 |
+----+------+-----+
2 rows in set (0.00 sec)

Query OK, 3 rows affected (0.00 sec)
Records: 2 Duplicates: 1 Warnings: 0

+----+------+-----+
| id | a    | cnt |
+----+------+-----+
|  1 | A    |   2 |
|  2 | B    |   1 |
```

```
| 4 | C    |   1 |
+----+------+-----+
3 rows in set (0.00 sec)
```

In this example, the `AUTO_INCREMENT` value of `3` is allocated for the `INSERT` of the key `A` in `INSERT INTO t (a)VALUES ('A'), ('C')ON DUPLICATE KEY UPDATE cnt = cnt + 1;` but never used because this `INSERT` statement contains a duplicate key `A`. This leads to a gap where the sequence is non-consecutive. This behavior is considered legal, even though it differs from MySQL. MySQL will also have gaps in the sequence in other scenarios such as transactions being aborted and rolled back.

AUTO_ID_CACHE

The `AUTO_INCREMENT` sequence might appear to *jump* dramatically if an `INSERT` operation is performed against a different TiDB server. This is caused by the fact that each server has its own cache of `AUTO_INCREMENT` values:

```
CREATE TABLE t (a int PRIMARY KEY AUTO_INCREMENT, b timestamp NOT NULL
    ↪ DEFAULT NOW());
INSERT INTO t (a) VALUES (NULL), (NULL), (NULL);
INSERT INTO t (a) VALUES (NULL);
SELECT * FROM t;
```

```
Query OK, 1 row affected (0.03 sec)

+---------+---------------------+
| a       | b                   |
+---------+---------------------+
|       1 | 2020-09-09 20:38:22 |
|       2 | 2020-09-09 20:38:22 |
|       3 | 2020-09-09 20:38:22 |
| 2000001 | 2020-09-09 20:43:43 |
+---------+---------------------+
4 rows in set (0.00 sec)
```

A new `INSERT` operation against the initial TiDB server generates the `AUTO_INCREMENT` value of `4`. This is because the initial TiDB server still has space left in the `AUTO_INCREMENT` cache for allocation. In this case, the sequence of values cannot be considered globally monotonic, because the value of `4` is inserted after the value of `2000001`:

```
mysql> INSERT INTO t (a) VALUES (NULL);
Query OK, 1 row affected (0.01 sec)

mysql> SELECT * FROM t ORDER BY b;
+---------+---------------------+
| a       | b                   |
+---------+---------------------+
```

```
|       1 | 2020-09-09 20:38:22 |
|       2 | 2020-09-09 20:38:22 |
|       3 | 2020-09-09 20:38:22 |
| 2000001 | 2020-09-09 20:43:43 |
|       4 | 2020-09-09 20:44:43 |
+---------+---------------------+
5 rows in set (0.00 sec)
```

The `AUTO_INCREMENT` cache does not persist across TiDB server restarts. The following `INSERT` statement is performed after the initial TiDB server is restarted:

```
mysql> INSERT INTO t (a) VALUES (NULL);
Query OK, 1 row affected (0.01 sec)

mysql> SELECT * FROM t ORDER BY b;
+---------+---------------------+
| a       | b                   |
+---------+---------------------+
|       1 | 2020-09-09 20:38:22 |
|       2 | 2020-09-09 20:38:22 |
|       3 | 2020-09-09 20:38:22 |
| 2000001 | 2020-09-09 20:43:43 |
|       4 | 2020-09-09 20:44:43 |
| 2030001 | 2020-09-09 20:54:11 |
+---------+---------------------+
6 rows in set (0.00 sec)
```

A high rate of TiDB server restarts might contribute to the exhaustion of `AUTO_INCREMENT` values. In the above example, the initial TiDB server still has values `[5-30000]` free in its cache. These values are lost, and will not be reallocated.

It is not recommended to rely on`AUTO_INCREMENT` values being continuous. Consider the following example, where a TiDB server has a cache of values `[2000001-2030000]`. By manually inserting the value `2029998`, you can see the behavior as a new cache range is retrieved:

```
mysql> INSERT INTO t (a) VALUES (2029998);
Query OK, 1 row affected (0.01 sec)

mysql> INSERT INTO t (a) VALUES (NULL);
Query OK, 1 row affected (0.01 sec)

mysql> INSERT INTO t (a) VALUES (NULL);
Query OK, 1 row affected (0.00 sec)

mysql> INSERT INTO t (a) VALUES (NULL);
```

```
Query OK, 1 row affected (0.02 sec)

mysql> INSERT INTO t (a) VALUES (NULL);
Query OK, 1 row affected (0.01 sec)

mysql> SELECT * FROM t ORDER BY b;
+---------+---------------------+
| a       | b                   |
+---------+---------------------+
|       1 | 2020-09-09 20:38:22 |
|       2 | 2020-09-09 20:38:22 |
|       3 | 2020-09-09 20:38:22 |
| 2000001 | 2020-09-09 20:43:43 |
|       4 | 2020-09-09 20:44:43 |
| 2030001 | 2020-09-09 20:54:11 |
| 2029998 | 2020-09-09 21:08:11 |
| 2029999 | 2020-09-09 21:08:11 |
| 2030000 | 2020-09-09 21:08:11 |
| 2060001 | 2020-09-09 21:08:11 |
| 2060002 | 2020-09-09 21:08:11 |
+---------+---------------------+
11 rows in set (0.00 sec)
```

After the value 2030000 is inserted, the next value is 2060001. This jump in sequence is due to another TiDB server obtaining the intermediate cache range of [2030001-2060000] ↪ . When multiple TiDB servers are deployed, there will be gaps in the AUTO_INCREMENT sequence because cache requests are interleaved.

Cache size control

In earlier versions of TiDB, the cache size of the auto-increment ID was transparent to users. Starting from v3.0.14, v3.1.2, and v4.0.rc-2, TiDB has introduced the AUTO_ID_CACHE table option to allow users to set the cache size for allocating the auto-increment ID.

```
CREATE TABLE t(a int AUTO_INCREMENT key) AUTO_ID_CACHE 100;
Query OK, 0 rows affected (0.02 sec)

INSERT INTO t values();
Query OK, 1 row affected (0.00 sec)

SELECT * FROM t;
+---+
| a |
+---+
| 1 |
+---+
1 row in set (0.01 sec)
```

```
SHOW CREATE TABLE t;
+--
    ↪ -----+-------------------------------------------------------------------------
    ↪
| Table | Create Table
    ↪
    ↪ |
+--
    ↪ -----+-------------------------------------------------------------------------
    ↪
| t     | CREATE TABLE `t` (
  `a` int(11) NOT NULL AUTO_INCREMENT,
  PRIMARY KEY (`a`) /*T![clustered_index] CLUSTERED */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin AUTO_INCREMENT
    ↪ =101 /*T![auto_id_cache] AUTO_ID_CACHE=100 */ |
+--
    ↪ -----+-------------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

At this time, if you restart TiDB, the auto-increment ID cache will be lost, and new insert operations will allocate IDs starting from a higher value beyond the previously cached range.

```
INSERT INTO t VALUES();
Query OK, 1 row affected (0.00 sec)

SELECT * FROM t;
+-----+
| a   |
+-----+
|   1 |
| 101 |
+-----+
2 rows in set (0.01 sec)
```

The newly allocated value is `101`. This shows that the size of cache for allocating auto-increment IDs is `100`.

In addition, when the length of consecutive IDs in a batch `INSERT` statement exceeds the length of `AUTO_ID_CACHE`, TiDB increases the cache size accordingly to ensure that the statement can insert data properly.

Clear the auto-increment ID cache

In some scenarios, you might need to clear the auto-increment ID cache to ensure data

consistency. For example:

- In the scenario of incremental replication using Data Migration (DM), once the replication is complete, data writing to the downstream TiDB switches from DM to your application's write operations. Meanwhile, the ID writing mode of the auto-increment column usually switches from explicit insertion to implicit allocation.

- When your application involves both explicit ID insertion and implicit ID allocation, you need to clear the auto-increment ID cache to avoid conflicts between future implicitly allocated IDs and previously explicitly inserted IDs, which could result in primary key conflict errors. For more information, see Uniqueness.

To clear the auto-increment ID cache on all TiDB nodes in the cluster, you can execute the `ALTER TABLE` statement with `AUTO_INCREMENT = 0`. For example:

```
CREATE TABLE t(a int AUTO_INCREMENT key) AUTO_ID_CACHE 100;
Query OK, 0 rows affected (0.02 sec)

INSERT INTO t VALUES();
Query OK, 1 row affected (0.02 sec)

INSERT INTO t VALUES(50);
Query OK, 1 row affected (0.00 sec)

SELECT * FROM t;
+----+
| a  |
+----+
|  1 |
| 50 |
+----+
2 rows in set (0.01 sec)
```

```
ALTER TABLE t AUTO_INCREMENT = 0;
Query OK, 0 rows affected, 1 warning (0.07 sec)

SHOW WARNINGS;
+--
    ↪ -------+------+-----------------------------------------------------------------
    ↪
| Level   | Code | Message
    ↪                                                                 |
+--
    ↪ -------+------+-----------------------------------------------------------------
    ↪
```

```
| Warning | 1105 | Can't reset AUTO_INCREMENT to 0 without FORCE option,
    ↪ using 101 instead |
+---------+------+-----------------------------------------------------------------
    ↪
1 row in set (0.01 sec)

INSERT INTO t VALUES();
Query OK, 1 row affected (0.02 sec)

SELECT * FROM t;
+-----+
| a   |
+-----+
|   1 |
|  50 |
| 101 |
+-----+
3 rows in set (0.01 sec)
```

Auto-increment step size and offset

Starting from v3.0.9 and v4.0.0-rc.1, similar to the behavior of MySQL, the value implicitly assigned to the auto-increment column is controlled by the `@@auto_increment_increment` and `@@auto_increment_offset` session variables.

The value (ID) implicitly assigned to auto-increment columns satisfies the following equation:

```
(ID - auto_increment_offset)% auto_increment_increment == 0
```

MySQL compatibility mode

TiDB v6.4.0 introduces a centralized auto-increment ID allocating service. In each request, an auto-increment ID is allocated from this service instead of caching data in TiDB instances.

Currently, the centralized allocating service is in the TiDB process and works like DDL Owner. One TiDB instance allocates IDs as the primary node and other TiDB instances work as secondary nodes. To ensure high availability, when the primary instance fails, TiDB starts automatic failover.

To use the MySQL compatibility mode, you can set `AUTO_ID_CACHE` to `1` when creating a table:

```
CREATE TABLE t(a int AUTO_INCREMENT key) AUTO_ID_CACHE 1;
```

**Note:**

In TiDB, setting `AUTO_ID_CACHE` to `1` means that TiDB no longer caches IDs. But the implementation varies with TiDB versions:

- Before TiDB v6.4.0, since allocating ID requires a TiKV transaction to persist the `AUTO_INCREMENT` value for each request, setting `AUTO_ID_CACHE` to `1` causes performance degradation.
- Since TiDB v6.4.0, the modification of the `AUTO_INCREMENT` value is faster because it is only an in-memory operation in the TiDB process as the centralized allocating service is introduced.
- Setting `AUTO_ID_CACHE` to `0` means that TiDB uses the default cache size `30000`.

After you enable the MySQL compatibility mode, the allocated IDs are **unique** and **monotonically increasing**, and the behavior is almost the same as MySQL. Even if you access across TiDB instances, the IDs will keep monotonic. Only when the primary instance of the centralized service crashes, there might be a few IDs that are not continuous. This is because the secondary instance discards some IDs that are supposed to have been allocated by the primary instance during the failover to ensure ID uniqueness.

Restrictions

Currently, `AUTO_INCREMENT` has the following restrictions when used in TiDB:

- It must be defined on the first column of the primary key or the first column of an index.
- It must be defined on the column of `INTEGER`, `FLOAT`, or `DOUBLE` type.
- It cannot be specified on the same column with the `DEFAULT` column value.
- `ALTER TABLE` cannot be used to add the `AUTO_INCREMENT` attribute.
- `ALTER TABLE` can be used to remove the `AUTO_INCREMENT` attribute. However, starting from v2.1.18 and v3.0.4, TiDB uses the session variable `@@tidb_allow_remove_auto_inc` ↪ to control whether `ALTER TABLE MODIFY` or `ALTER TABLE CHANGE` can be used to remove the `AUTO_INCREMENT` attribute of a column. By default, you cannot use `ALTER TABLE MODIFY` or `ALTER TABLE CHANGE` to remove the `AUTO_INCREMENT` attribute.
- `ALTER TABLE` requires the `FORCE` option to set the `AUTO_INCREMENT` value to a smaller value.
- Setting the `AUTO_INCREMENT` to a value smaller than `MAX(<auto_increment_column>)` leads to duplicate keys because pre-existing values are not skipped.

#### 14.10.1.1.2 AUTO_RANDOM New in v3.1.0

User scenario

Since the value of AUTO_RANDOM is random and unique, AUTO_RANDOM is often used in place of AUTO_INCREMENT to avoid write hotspot in a single storage node caused by TiDB assigning consecutive IDs. If the current AUTO_INCREMENT column is a primary key and the type is BIGINT, you can execute the ALTER TABLE t MODIFY COLUMN id BIGINT AUTO_RANDOM(5) ; statement to switch from AUTO_INCREMENT to AUTO_RANDOM.

For more information about how to handle highly concurrent write-heavy workloads in TiDB, see Highly concurrent write best practices.

Basic concepts

AUTO_RANDOM is a column attribute that is used to automatically assign values to a BIGINT column. Values assigned automatically are **random** and **unique**.

To create a table with an AUTO_RANDOM column, you can use the following statements. The AUTO_RANDOM column must be included in a primary key, and the AUTO_RANDOM column is the first column in the primary key.

```
CREATE TABLE t (a BIGINT AUTO_RANDOM, b VARCHAR(255), PRIMARY KEY (a));
CREATE TABLE t (a BIGINT PRIMARY KEY AUTO_RANDOM, b VARCHAR(255));
CREATE TABLE t (a BIGINT AUTO_RANDOM(6), b VARCHAR(255), PRIMARY KEY (a));
CREATE TABLE t (a BIGINT AUTO_RANDOM(5, 54), b VARCHAR(255), PRIMARY KEY (a
    ↪ ));
CREATE TABLE t (a BIGINT AUTO_RANDOM(5, 54), b VARCHAR(255), PRIMARY KEY (a
    ↪ , b));
```

You can wrap the keyword AUTO_RANDOM in an executable comment. For more details, refer to TiDB specific comment syntax.

```
CREATE TABLE t (a bigint /*T![auto_rand] AUTO_RANDOM */, b VARCHAR(255),
    ↪ PRIMARY KEY (a));
CREATE TABLE t (a bigint PRIMARY KEY /*T![auto_rand] AUTO_RANDOM */, b
    ↪ VARCHAR(255));
CREATE TABLE t (a BIGINT /*T![auto_rand] AUTO_RANDOM(6) */, b VARCHAR(255),
    ↪  PRIMARY KEY (a));
CREATE TABLE t (a BIGINT /*T![auto_rand] AUTO_RANDOM(5, 54) */, b VARCHAR
    ↪ (255), PRIMARY KEY (a));
```

When you execute an INSERT statement:

- If you explicitly specify the value of the AUTO_RANDOM column, it is inserted into the table as is.
- If you do not explicitly specify the value of the AUTO_RANDOM column, TiDB generates a random value and inserts it into the table.

```
tidb> CREATE TABLE t (a BIGINT PRIMARY KEY AUTO_RANDOM, b VARCHAR(255)) /*T
    ↪ ! PRE_SPLIT_REGIONS=2 */ ;
Query OK, 0 rows affected, 1 warning (0.01 sec)
```

```
tidb> INSERT INTO t(a, b) VALUES (1, 'string');
Query OK, 1 row affected (0.00 sec)

tidb> SELECT * FROM t;
+---+--------+
| a | b      |
+---+--------+
| 1 | string |
+---+--------+
1 row in set (0.01 sec)

tidb> INSERT INTO t(b) VALUES ('string2');
Query OK, 1 row affected (0.00 sec)

tidb> INSERT INTO t(b) VALUES ('string3');

    ↪
4 rows in set (0.00 sec)
```

The `AUTO_RANDOM(S, R)` column value automatically assigned by TiDB has a total of 64 bits:

- `S` is the number of shard bits. The value ranges from `1` to `15`. The default value is `5`.
- `R` is the total length of the automatic allocation range. The value ranges from `32` to `64`. The default value is `64`.

The structure of an `AUTO_RANDOM` value with a signed bit is as follows:

| Signed bit | Reserved bits | Shard bits | Auto-increment bits |
|---|---|---|---|
| 1 bit | `64-R` bits | `S` bits | `R-1-S` bits |

The structure of an `AUTO_RANDOM` value without a signed bit is as follows:

| Reserved bits | Shard bits | Auto-increment bits |
|---|---|---|
| `64-R` bits | `S` bits | `R-S` bits |

- Whether a value has a signed bit depends on whether the corresponding column has the `UNSIGNED` attribute.
- The length of the sign bit is determined by the existence of an `UNSIGNED` attribute. If there is an `UNSIGNED` attribute, the length is `0`. Otherwise, the length is `1`.
- The length of the reserved bits is `64-R`. The reserved bits are always `0`.
- The content of the shard bits is obtained by calculating the hash value of the starting time of the current transaction. To use a different length of shard bits (such as 10), you can specify `AUTO_RANDOM(10)` when creating the table.
- The value of the auto-increment bits is stored in the storage engine and allocated sequentially. Each time a new value is allocated, the value is incremented by 1. The auto-increment bits ensure that the values of `AUTO_RANDOM` are unique globally. When the auto-increment bits are exhausted, an error `Failed to read auto-increment value from storage engine` is reported when the value is allocated again.
- Value range: the maximum number of bits for the final generated value = shard bits + auto-increment bits. The range of a signed column is `[-(2^(R-1))+1, (2^(R-1))-1]`, and the range of an unsigned column is `[0, (2^R)-1]`.
- You can use `AUTO_RANDOM` with `PRE_SPLIT_REGIONS`. When a table is created successfully, `PRE_SPLIT_REGIONS` pre-splits data in the table into the number of Regions as specified by `2^(PRE_SPLIT_REGIONS)`.

**Note:**

Selection of shard bits (`S`):

- Since there is a total of 64 available bits, the shard bits length affects the auto-increment bits length. That is, as the shard bits length increases, the length of auto-increment bits decreases, and vice versa. Therefore, you need to balance the randomness of allocated values and available space.
- The best practice is to set the shard bits as `log(2, x)`, in which `x` is the current number of storage engines. For example, if there are 16 TiKV nodes in a TiDB cluster, you can set the shard bits as `log(2, 16)`, that is `4`. After all regions are evenly scheduled to each TiKV node, the load

of bulk writes can be uniformly distributed to different TiKV nodes to maximize resource utilization.

Selection of range (`R`):

- Typically, the `R` parameter needs to be set when the numeric type of the application cannot represent a full 64-bit integer.
- For example, the range of JSON number is `[-(2^53)+1, (2^53)-1]`. TiDB can easily assign an integer beyond this range to a column defined as `AUTO_RANDOM(5)`, causing unexpected behaviors when the application reads the column. In such cases, you can replace `AUTO_RANDOM(5)` with `AUTO_RANDOM(5, 54)` for signed columns, and replace `AUTO_RANDOM(5)` with `AUTO_RANDOM(5, 53)` for unsigned columns, ensuring that TiDB does not assign integers greater than `9007199254740991` (2^53-1) to the column.

Values allocated implicitly to the `AUTO_RANDOM` column affect `last_insert_id()`. To get the ID that TiDB last implicitly allocates, you can use the `SELECT last_insert_id ()` statement.

To view the shard bits number of the table with an `AUTO_RANDOM` column, you can execute the `SHOW CREATE TABLE` statement. You can also see the value of the `PK_AUTO_RANDOM_BITS=x` mode in the `TIDB_ROW_ID_SHARDING_INFO` column in the `information_schema.tables` system table. `x` is the number of shard bits.

After creating a table with an `AUTO_RANDOM` column, you can use `SHOW WARNINGS` to view the maximum implicit allocation times:

```
CREATE TABLE t (a BIGINT AUTO_RANDOM, b VARCHAR(255), PRIMARY KEY (a));
SHOW WARNINGS;
```

The output is as follows:

```
+-------+------+-----------------------------------------------------------+
| Level | Code | Message                                                   |
+-------+------+-----------------------------------------------------------+
| Note | 1105 | Available implicit allocation times: 288230376151711743 |
+-------+------+-----------------------------------------------------------+
1 row in set (0.00 sec)
```

Implicit allocation rules of IDs

TiDB implicitly allocates values to `AUTO_RANDOM` columns similarly to `AUTO_INCREMENT` columns. They are also controlled by the session-level system variables `auto_increment_increment` and `auto_increment_offset`. The auto-increment bits (ID) of implicitly allocated val-

ues conform to the equation `(ID - auto_increment_offset)% auto_increment_increment == 0`.

Restrictions

Pay attention to the following restrictions when you use `AUTO_RANDOM`:

- To insert values explicitly, you need to set the value of the `@@allow_auto_random_explicit_insert` system variable to `1` (`0` by default). It is **not** recommended that you explicitly specify a value for the column with the `AUTO_RANDOM` attribute when you insert data. Otherwise, the numeral values that can be automatically allocated for this table might be used up in advance.
- Specify this attribute for the primary key column **ONLY** as the `BIGINT` type. Otherwise, an error occurs. In addition, when the attribute of the primary key is `NONCLUSTERED`, `AUTO_RANDOM` is not supported even on the integer primary key. For more details about the primary key of the `CLUSTERED` type, refer to clustered index.
- You cannot use `ALTER TABLE` to modify the `AUTO_RANDOM` attribute, including adding or removing this attribute.
- You cannot use `ALTER TABLE` to change from `AUTO_INCREMENT` to `AUTO_RANDOM` if the maximum value is close to the maximum value of the column type.
- You cannot change the column type of the primary key column that is specified with `AUTO_RANDOM` attribute.
- You cannot specify `AUTO_RANDOM` and `AUTO_INCREMENT` for the same column at the same time.
- You cannot specify `AUTO_RANDOM` and `DEFAULT` (the default value of a column) for the same column at the same time.
- When`AUTO_RANDOM` is used on a column, it is difficult to change the column attribute back to `AUTO_INCREMENT` because the auto-generated values might be very large.

#### 14.10.1.1.3 SHARD_ROW_ID_BITS

This document introduces the `SHARD_ROW_ID_BITS` table attribute, which is used to set the number of bits of the shards after the implicit `_tidb_rowid` is sharded.

Concept

For the tables with a non-clustered primary key or no primary key, TiDB uses an implicit auto-increment row ID. When a large number of `INSERT` operations are performed, the data is written into a single Region, causing a write hot spot.

To mitigate the hot spot issue, you can configure `SHARD_ROW_ID_BITS`. The row IDs are scattered and the data are written into multiple different Regions.

- `SHARD_ROW_ID_BITS = 4` indicates 16 shards
- `SHARD_ROW_ID_BITS = 6` indicates 64 shards
- `SHARD_ROW_ID_BITS = 0` indicates the default 1 shard

For details on the usage, see the Troubleshoot Hotspot Issues guide.

Examples

```
CREATE TABLE t (
    id INT PRIMARY KEY NONCLUSTERED
) SHARD_ROW_ID_BITS = 4;
```

```
ALTER TABLE t SHARD_ROW_ID_BITS = 4;
```

#### 14.10.1.2 Literal Values

TiDB literal values include character literals, numeric literals, time and date literals, hexadecimal, binary literals, and NULL literals. This document introduces each of these literal values.

This document describes String literals, Numeric literals, NULL values, Hexadecimal literals, Date and time literals, Boolean literals, and Bit-value literals.

##### 14.10.1.2.1 String literals

A string is a sequence of bytes or characters, enclosed within either single quote `'` or double quote `"` characters. For example:

```
'example string'
"example string"
```

Quoted strings placed next to each other are concatenated to a single string. The following lines are equivalent:

```
'a string'
'a' ' ' 'string'
"a" ' ' "string"
```

If the `ANSI_QUOTES` SQL MODE is enabled, string literals can be quoted only within single quotation marks because a string quoted within double quotation marks is interpreted as an identifier.

The string is divided into the following two types:

- Binary string: It consists of a sequence of bytes, whose charset and collation are both `binary`, and uses **byte** as the unit when compared with each other.
- Non-binary string: It consists of a sequence of characters and has various charsets and collations other than `binary`. When compared with each other, non-binary strings use **characters** as the unit. A character might contain multiple bytes, depending on the charset.

A string literal may have an optional `character set introducer` and `COLLATE clause`, to designate it as a string that uses a specific character set and collation.

```
[_charset_name]'string' [COLLATE collation_name]
```

For example:

```
SELECT _latin1'string';
SELECT _binary'string';
SELECT _utf8'string' COLLATE utf8_bin;
```

You can use N'literal' (or n'literal') to create a string in the national character set. The following statements are equivalent:

```
SELECT N'some text';
SELECT n'some text';
SELECT _utf8'some text';
```

To represent some special characters in a string, you can use escape characters to escape:

| Escape Characters | Meaning |
|---|---|
| \0 | An ASCII NUL (X'00') character |
| \' | A single quote ' character |
| \" | A double quote " character |
| \b | A backspace character |
| \n | A line break (newline) character |
| \r | A carriage return character |
| \t | A tab character |
| \z | ASCII 26 (Ctrl + Z) |
| \\ | A backslash \ character |
| \% | A % character |
| _ | A _ character |

If you want to represent " in the string surrounded by ', or ' in the string surrounded by ", you do not need to use escape characters.

For more information, see String Literals in MySQL.

#### 14.10.1.2.2 Numeric literals

Numeric literals include integer and DECIMAL literals and floating-point literals.

Integer may include . as a decimal separator. Numbers may be preceded by - or + to indicate a negative or positive value respectively.

Exact-value numeric literals can be represented as `1, .2, 3.4, -5, -6.78, +9.10`.

Numeric literals can also be represented in scientific notation, such as `1.2E3, 1.2E-3, -1.2E3, -1.2E-3`.

For more information, see Numeric Literals in MySQL.

#### 14.10.1.2.3 Date and time literals

Date and time literal values can be represented in several formats, such as quoted strings or as numbers. When TiDB expects a date, it interprets any of `'2017-08-24'`, `'20170824'` and `20170824` as a date.

TiDB supports the following date formats:

- `'YYYY-MM-DD'` or `'YY-MM-DD'`: The `-` delimiter here is not strict. It can be any punctuation. For example, `'2017-08-24'`, `'2017&08&24'`, `'2012@12^31'` are all valid date formats. The only special punctuation is '.', which is is treated as a decimal point to separate the integer and fractional parts. Date and time can be separated by `T` or a white space. For example, `2017-8-24 10:42:00` and `2017-8-24T10:42:00` represents the same date and time.
- `'YYYYMMDDHHMMSS'` or `'YYMMDDHHMMSS'`: For example, `'20170824104520'` and `'170824104520'` are regarded as `'2017-08-24 10:45:20'`. However, if you provide a value out of range, such as `'170824304520'`, it is not treated as a valid date. Note that incorrect formats such as `YYYYMMDD HHMMSS`, `YYYYMMDD HH:MM:DD`, or `YYYY-MM-DD HHMMSS` will fail to insert.
- `YYYYMMDDHHMMSS` or `YYMMDDHHMMSS`: Note that these formats have no single or double quotes, but a number. For example, `20170824104520` is interpreted as `'2017-08-24 10:45:20'`.

DATETIME or TIMESTAMP values can be followed by a fractional part, used to represent microseconds precision (6 digits). The fractional part should always be separated from the rest of the time by a decimal point `.`.

The year value containing only two digits is ambiguous. It is recommended to use the four-digit year format. TiDB interprets the two-digit year value according to the following rules:

- If the year value is in the range of `70-99`, it is converted to `1970-1999`.
- If the year value is in the range of `00-69`, it is converted to `2000-2069`.

For month or day values less than 10, `'2017-8-4'` is the same as `'2017-08-04'`. The same is true for Time. For example, `'2017-08-24 1:2:3'` is the same as `'2017-08-24 01:02:03'`.

When the date or time value is required, TiDB selects the specified format according to the length of the value:

- 6 digits: `YYMMDD`.

- 12 digits: `YYMMDDHHMMSS`.
- 8 digits: `YYYYMMDD`.
- 14 digits: `YYYYMMDDHHMMSS`.

TiDB supports the following formats for time values:

- `'D HH:MM:SS'`, or `'HH:MM:SS'`, `'HH:MM'`, `'D HH:MM'`, `'D HH'`, `'SS'`: `D` means days and the valid value range is `0-34`.
- A number in `HHMMSS` format: For example, `231010` is interpreted as `'23:10:10'`.
- A number in any of `SS`, `MMSS`, and `HHMMSS`formats can be regarded as time.

The decimal point of the Time type is also `.`, with a precision of up to 6 digits after the decimal point.

See MySQL date and time literals for more details.

#### 14.10.1.2.4 Boolean Literals

The constants `TRUE` and `FALSE` are equal to 1 and 0 respectively, which are not case sensitive.

```
SELECT TRUE, true, tRuE, FALSE, FaLsE, false;
```

```
+------+------+------+-------+-------+-------+
| TRUE | true | tRuE | FALSE | FaLsE | false |
+------+------+------+-------+-------+-------+
|    1 |    1 |    1 |     0 |     0 |     0 |
+------+------+------+-------+-------+-------+
1 row in set (0.00 sec)
```

#### 14.10.1.2.5 Hexadecimal literals

Hexadecimal literal values are written using `X'val'` or `0xval` notation, where `val` contains hexadecimal digits. A leading `0x` is case sensitive and cannot be written as `0X`.

Legal hexadecimal literals:

```
X'ac12'
X'12AC'
x'ac12'
x'12AC'
0xac12
0x12AC
```

Illegal hexadecimal literals:

```
X'1z' (z is not a hexadecimal legal digit)
0X12AC (0X must be written as 0x)
```

Hexadecimal literals written using `X'val'` notation must contain an even number of digits. If the length of `val` is an odd number (for example, `X'A'` or `X'11A'`), to avoid the syntax error, pad the value with a leading zero:

```
mysql> select X'aff';
ERROR 1105 (HY000): line 0 column 13 near ""hex literal: invalid
    ↪ hexadecimal format, must even numbers, but 3 (total length 13)
mysql> select X'0aff';
+---------+
| X'0aff' |
+---------+
| 0x0aff |
+---------+
1 row in set (0.00 sec)
```

By default, a hexadecimal literal is a binary string.

To convert a string or a number to a string in hexadecimal format, use the `HEX()` function:

```
mysql> SELECT HEX('TiDB');
+-------------+
| HEX('TiDB') |
+-------------+
| 54694442  |
+-------------+
1 row in set (0.01 sec)

mysql> SELECT X'54694442';
+-------------+
| X'54694442' |
+-------------+
| TiDB      |
+-------------+
1 row in set (0.00 sec)
```

#### 14.10.1.2.6 Bit-value literals

Bit-value literals are written using `b'val'` or `0bval` notation. The `val` is a binary value written using zeros and ones. A leading `0b` is case sensitive and cannot be written as `0B`.

Legal bit-value literals:

```
b'01'
```

```
B'01'
0b01
```

Illegal bit-value literals:

```
b'2' (2 is not a binary digit; it must be 0 or 1)
0B01 (0B must be written as 0b)
```

By default, a bit-value literal is a binary string.

Bit values are returned as binary values, which may not display well in the MySQL client. To convert a bit value to printable form, you can use a conversion function such as `BIN()` or `HEX()`.

```
CREATE TABLE t (b BIT(8));
INSERT INTO t SET b = b'00010011';
INSERT INTO t SET b = b'1110';
INSERT INTO t SET b = b'100101';

mysql> SELECT b+0, BIN(b), HEX(b) FROM t;
+------+--------+--------+
| b+0 | BIN(b) | HEX(b) |
+------+--------+--------+
|   19 | 10011 | 13    |
|   14 | 1110  | E     |
|   37 | 100101 | 25   |
+------+--------+--------+
3 rows in set (0.00 sec)
```

#### 14.10.1.2.7 NULL Values

`NULL` means the data is empty, which is case-insensitive, and is synonymous with `\N` (case-sensitive).

> **Note:**
>
> `NULL` is not the same as `0`, nor the empty string `''`.

### 14.10.1.3 Schema Object Names

This document introduces schema object names in TiDB SQL statements.

Schema object names are used to name all schema objects in TiDB, including database, table, index, column, and alias. You can quote these objects using identifiers in SQL statements.

You can use backticks to enclose the identifier. For example, `SELECT * FROM t` can also be written as `SELECT * FROM `t``. But if the identifier includes one or more special characters or is a reserved keyword, it must be enclosed in backticks to quote the schema object it represents.

```
SELECT * FROM `table` WHERE `table`.id = 20;
```

If you set `ANSI_QUOTES` in SQL MODE, TiDB will recognize the string enclosed in double quotation marks `"` as an identifier.

```
CREATE TABLE "test" (a varchar(10));
```

```
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual
    ↪ that corresponds to your TiDB version for the right syntax to use
    ↪ line 1 column 19 near ""test" (a varchar(10))"
```

```
SET SESSION sql_mode='ANSI_QUOTES';
```

```
Query OK, 0 rows affected (0.000 sec)
```

```
CREATE TABLE "test" (a varchar(10));
```

```
Query OK, 0 rows affected (0.012 sec)
```

If you want to use the backtick character in the quoted identifier, repeat the backtick twice. For example, to create a table a‘b:

```
CREATE TABLE `a``b` (a int);
```

In a `SELECT` statement, you can use an identifier or a string to specify an alias:

```
SELECT 1 AS `identifier`, 2 AS 'string';
```

```
+------------+--------+
| identifier | string |
+------------+--------+
|          1 |      2 |
+------------+--------+
1 row in set (0.00 sec)
```

For more information, see MySQL Schema Object Names.

#### 14.10.1.3.1 Identifier qualifiers

Object names can be unqualified or qualified. For example, the following statement creates a table without a qualified name:

```
CREATE TABLE t (i int);
```

If you have not used the `USE` statement or the connection parameter to configure the database, the `ERROR 1046 (3D000): No database selected` error is displayed. At this time, you can specify the database qualified name:

```
CREATE TABLE test.t (i int);
```

White spaces can exist around `.` . `table_name.col_name` and `table_name . col_name` are equivalent.

To quote this identifier, use:

```
`table_name`.`col_name`
```

Instead of:

```
`table_name.col_name`
```

For more information, see MySQL Identifier Qualifiers.

#### 14.10.1.4 Keywords

This article introduces the keywords in TiDB, the differences between reserved words and non-reserved words and summarizes all keywords for the query.

Keywords are words that have special meanings in SQL statements, such as `SELECT`, `UPDATE`, and `DELETE`. Some of them can be used as identifiers directly, which are called **non-reserved keywords**. Some of them require special treatment before being used as identifiers, which are called **reserved keywords**. However, there are special non-reserved keywords that might still require special treatment. It is recommended that you treat them as reserved keywords.

To use the reserved keywords as identifiers, you must enclose them in backticks `:

```
CREATE TABLE select (a INT);
```

```
ERROR 1105 (HY000): line 0 column 19 near " (a INT)" (total length 27)
```

```
CREATE TABLE `select` (a INT);
```

```
Query OK, 0 rows affected (0.09 sec)
```

The non-reserved keywords do not require backticks, such as `BEGIN` and `END`, which can be successfully used as identifiers in the following statement:

```
CREATE TABLE `select` (BEGIN int, END int);
```

```
Query OK, 0 rows affected (0.09 sec)
```

In the special case, the reserved keywords do not need backticks if they are used with the . delimiter:

```
CREATE TABLE test.select (BEGIN int, END int);
```

```
Query OK, 0 rows affected (0.08 sec)
```

#### 14.10.1.4.1 Keyword list

The following list shows the keywords in TiDB. Reserved keywords are marked with (R). Reserved keywords for Window Functions are marked with (R-Window). Special non-reserved keywords that need to be escaped with backticks ` are marked with (S).

A

- ACCOUNT
- ACTION
- ADD (R)
- ADMIN
- ADVISE
- AFTER
- AGAINST
- AGO
- ALGORITHM
- ALL (R)
- ALTER (R)
- ALWAYS
- ANALYZE (R)
- AND (R)
- ANY
- AS (R)
- ASC (R)
- ASCII
- ATTRIBUTE
- ATTRIBUTES
- AUTO_ID_CACHE
- AUTO_INCREMENT
- AUTO_RANDOM
- AUTO_RANDOM_BASE
- AVG
- AVG_ROW_LENGTH

B

- BACKEND
- BACKUP
- BACKUPS
- BATCH
- BEGIN
- BERNOULLI
- BETWEEN (R)
- BIGINT (R)
- BINARY (R)
- BINDING
- BINDINGS
- BINDING_CACHE
- BINLOG
- BIT
- BLOB (R)
- BLOCK
- BOOL
- BOOLEAN
- BOTH (R)
- BTREE

#### 14.10.1.5 User-Defined Variables

This document describes the concept of user-defined variables in TiDB and the methods to set and read the user-defined variables.

> **Warning:**
>
> User-defined variables are still an experimental feature. It is **NOT** recommended that you use them in the production environment.

The format of the user-defined variables is `@var_name`. The characters that compose `var_name` can be any characters that can compose an identifier, including the numbers `0-9` ↪ , the letters `a-zA-Z`, the underscore `_`, the dollar sign `$`, and the UTF-8 characters. In addition, it also includes the English period `.`. The user-defined variables are case-insensitive.

The user-defined variables are session-specific, which means a user variable defined by one client connection cannot be seen or used by other client connections.

#### 14.10.1.5.1 Set the user-defined variables

You can use the `SET` statement to set a user-defined variable, and the syntax is `SET` ↪ `@var_name = expr [, @var_name = expr] ...;`. For example:

```
SET @favorite_db = 'TiDB';
```

```
SET @a = 'a', @b = 'b', @c = 'c';
```

For the assignment operator, you can also use `:=`. For example:

```
SET @favorite_db := 'TiDB';
```

The content to the right of the assignment operator can be any valid expression. For example:

```
SET @c = @a + @b;
```

```
set @c = b'1000001' + b'1000001';
```

#### 14.10.1.5.2 Read the user-defined variables

To read a user-defined variable, you can use the `SELECT` statement to query:

```
SELECT @a1, @a2, @a3
```

```
+------+------+------+
| @a1  | @a2  | @a3  |
+------+------+------+
|    1 |    2 |    4 |
+------+------+------+
```

You can also assign values in the SELECT statement:

```
SELECT @a1, @a2, @a3, @a4 := @a1+@a2+@a3;
```

```
+------+------+------+--------------------+
| @a1 | @a2 | @a3 | @a4 := @a1+@a2+@a3 |
+------+------+------+--------------------+
|    1 |    2 |    4 |                  7 |
+------+------+------+--------------------+
```

Before the variable @a4 is modified or the connection is closed, its value is always 7.

If a hexadecimal literal or binary literal is used when setting the user-defined variable, TiDB will treat it as a binary string. If you want to set it to a number, you can manually add the CAST conversion, or use the numeric operator in the expression:

```
SET @v1 = b'1000001';
SET @v2 = b'1000001'+0;
SET @v3 = CAST(b'1000001' AS UNSIGNED);
```

```
SELECT @v1, @v2, @v3;
```

```
+------+------+------+
| @v1 | @v2 | @v3 |
+------+------+------+
| A    | 65   | 65   |
+------+------+------+
```

If you refer to a user-defined variable that has not been initialized, it has a value of NULL and a type of string.

```
SELECT @not_exist;
```

```
+------------+
| @not_exist |
+------------+
| NULL       |
+------------+
```

In addition to using the SELECT statement to read the user-defined variables, another common usage is the PREPARE statement. For example:

```
SET @s = 'SELECT SQRT(POW(?,2) + POW(?,2)) AS hypotenuse';
PREPARE stmt FROM @s;
SET @a = 6;
SET @b = 8;
EXECUTE stmt USING @a, @b;
```

```
+------------+
| hypotenuse |
+------------+
|         10 |
+------------+
```

The contents of the user-defined variables are not recognized as identifiers in the SQL statements. For example:

```
SELECT * from t;
```

```
+---+
| a |
+---+
| 1 |
+---+
```

```
SET @col = "`a`";
SELECT @col FROM t;
```

```
+------+
| @col |
+------+
| `a` |
+------+
```

#### 14.10.1.5.3 MySQL compatibility

Except for `SELECT ... INTO <variable>`, the syntax supported in MySQL and TiDB is identical.

For more information, see User-Defined Variables in MySQL.

### 14.10.1.6 Expression Syntax

An expression is a combination of one or more values, operators, or functions. In TiDB, expressions are mainly used in various clauses of the `SELECT` statement, including Group by clause, Where clause, Having clause, Join condition and window function. In addition, some DDL statements also use expressions, such as the setting of the default values, columns, and partition rules when creating tables.

The expressions can be divided into the following types:

- Identifier. For reference, see Schema object names.

- Predicates, numeric values, strings, date expressions. The Literal values of these types are also expressions.
- Function calls and window functions. For reference, see Functions and operators overview and Window functions
- ParamMarker (?), system variables, user variables and CASE expressions.

The following rules are the expression syntax, which is based on the parser.y rules of TiDB parser. For the navigable version of the following syntax diagram, refer to TiDB SQL Syntax Diagram.

```
Expression ::=
    ( singleAtIdentifier assignmentEq | 'NOT' | Expression ( logOr | 'XOR' |
       ↪  logAnd ) ) Expression
|   'MATCH' '(' ColumnNameList ')' 'AGAINST' '(' BitExpr
    ↪ FulltextSearchModifierOpt ')'
|   PredicateExpr ( IsOrNotOp 'NULL' | CompareOp ( ( singleAtIdentifier
    ↪ assignmentEq )? PredicateExpr | AnyOrAll SubSelect ) )* ( IsOrNotOp (
    ↪  trueKwd | falseKwd | 'UNKNOWN' ) )?

PredicateExpr ::=
    BitExpr ( BetweenOrNotOp BitExpr 'AND' BitExpr )* ( InOrNotOp ( '('
       ↪ ExpressionList ')' | SubSelect ) | LikeOrNotOp SimpleExpr
       ↪ LikeEscapeOpt | RegexpOrNotOp SimpleExpr )?

BitExpr ::=
    BitExpr ( ( '|' | '&' | '<<' | '>>' | '*' | '/' | '%' | 'DIV' | 'MOD' |
       ↪ '^' ) BitExpr | ( '+' | '-' ) ( BitExpr | "INTERVAL" Expression
       ↪ TimeUnit ) )
|   SimpleExpr

SimpleExpr ::=
    SimpleIdent ( ( '->' | '->>' ) stringLit )?
|   FunctionCallKeyword
|   FunctionCallNonKeyword
|   FunctionCallGeneric
|   SimpleExpr ( 'COLLATE' CollationName | pipes SimpleExpr )
|   WindowFuncCall
|   Literal
|   paramMarker
|   Variable
|   SumExpr
|   ( '!' | '~' | '-' | '+' | 'NOT' | 'BINARY' ) SimpleExpr
|   'EXISTS'? SubSelect
```

```
|   ( ( '(' ( ExpressionList ',' )? | 'ROW' '(' ExpressionList ',' )
    ↪ Expression | builtinCast '(' Expression 'AS' CastType | ( 'DEFAULT' |
    ↪  'VALUES' ) '(' SimpleIdent | 'CONVERT' '(' Expression ( ',' CastType
    ↪  | 'USING' CharsetName ) ) ')'
|   'CASE' ExpressionOpt WhenClause+ ElseOpt 'END'
```

#### 14.10.1.7 Comment Syntax

This document describes the comment syntax supported by TiDB.

TiDB supports three comment styles:

- Use `#` to comment a line:

```
SELECT 1+1;   # comments
```

```
+------+
| 1+1  |
+------+
|    2 |
+------+
1 row in set (0.00 sec)
```

- Use `--` to comment a line:

```
SELECT 1+1;   -- comments
```

```
+------+
| 1+1  |
+------+
|    2 |
+------+
1 row in set (0.00 sec)
```

And this style requires at least one whitespace after `--`:

```
SELECT 1+1--1;
```

```
+--------+
| 1+1--1 |
+--------+
|      3 |
+--------+
1 row in set (0.01 sec)
```

- Use `/* */` to comment a block or multiple lines:

```
SELECT 1 /* this is an in-line comment */ + 1;
```

```
+--------+
| 1  + 1 |
+--------+
|      2 |
+--------+
1 row in set (0.01 sec)
```

```
SELECT 1+
/*
/*> this is a
/*> multiple-line comment
/*> */
    1;
```

```
+--------------------+
| 1+
       1 |
+--------------------+
|                2 |
+--------------------+
1 row in set (0.001 sec)
```

#### 14.10.1.7.1 MySQL-compatible comment syntax

The same as MySQL, TiDB supports a variant of C comment style:

```
/*! Specific code */
```

or

```
/*!50110 Specific code */
```

In this style, TiDB runs the statements in the comment.

For example:

```
SELECT /*! STRAIGHT_JOIN */ col1 FROM table1,table2 WHERE ...
```

In TiDB, you can also use another version:

```
SELECT STRAIGHT_JOIN col1 FROM table1,table2 WHERE ...
```

If the server version number is specified in the comment, for example, `/*!50110 KEY_BLOCK_SIZE=1024 */`, in MySQL it means that the contents in this comment are processed only when the MySQL version is or higher than 5.1.10. But in TiDB, the MySQL version number does not work and all contents in the comment are processed.

#### 14.10.1.7.2 TiDB specific comment syntax

TiDB has its own comment syntax (that is, TiDB specific comment syntax), which can be divided into the following two types:

- `/*T! Specific code */`: This syntax can only be parsed and executed by TiDB, and be ignored in other databases.
- `/*T![feature_id] Specific code */`: This syntax is used to ensure compatibility between different versions of TiDB. TiDB can parse the SQL fragment in this comment only if it implements the corresponding feature of `feature_id` in the current version. For example, as the `AUTO_RANDOM` feature is introduced in v3.1.1, this version of TiDB can parse `/*T![auto_rand] auto_random */` into `auto_random`. Because the `AUTO_RANDOM` feature is not implemented in v3.0.0, the SQL statement fragment above is ignored. **Do not leave any space inside the `/*T![` characters**.

#### 14.10.1.7.3 Optimizer comment syntax

Another type of comment is specially treated as an optimizer hint:

```
SELECT /*+ hint */ FROM ...;
```

For details about the optimizer hints that TiDB supports, see Optimizer hints.

> **Note:**
>
> In MySQL client, the TiDB-specific comment syntax is treated as comments and cleared by default. In MySQL client before 5.7.7, hints are also seen as comments and are cleared by default. It is recommended to use the `--comments` option when you start the client. For example, `mysql -h 127.0.0.1 -P 4000 -uroot --comments`.

For more information, see Comment Syntax.

### 14.10.2 SQL Statements

#### 14.10.2.1 ADD COLUMN

The `ALTER TABLE.. ADD COLUMN` statement adds a column to an existing table. This operation is online in TiDB, which means that neither reads or writes to the table are blocked by adding a column.

#### 14.10.2.1.1 Synopsis

```
AlterTableStmt
        ::= 'ALTER' 'IGNORE'? 'TABLE' TableName AddColumnSpec ( ','
           ↪ AddColumnSpec )*

TableName ::=
    Identifier ('.' Identifier)?

AddColumnSpec
        ::= 'ADD' 'COLUMN' 'IF NOT EXISTS'? ColumnName ColumnType
           ↪ ColumnOption+ ( 'FIRST' | 'AFTER' ColumnName )?

ColumnType
        ::= NumericType
          | StringType
          | DateAndTimeType
          | 'SERIAL'

ColumnOption
        ::= 'NOT'? 'NULL'
          | 'AUTO_INCREMENT'
          | 'PRIMARY'? 'KEY' ( 'CLUSTERED' | 'NONCLUSTERED' )?
          | 'UNIQUE' 'KEY'?
          | 'DEFAULT' ( NowSymOptionFraction | SignedLiteral |
             ↪ NextValueForSequence )
          | 'SERIAL' 'DEFAULT' 'VALUE'
          | 'ON' 'UPDATE' NowSymOptionFraction
          | 'COMMENT' stringLit
          | ( 'CONSTRAINT' Identifier? )? 'CHECK' '(' Expression ')' ( 'NOT
             ↪ '? ( 'ENFORCED' | 'NULL' ) )?
          | 'GENERATED' 'ALWAYS' 'AS' '(' Expression ')' ( 'VIRTUAL' | '
             ↪ STORED' )?
          | 'REFERENCES' TableName ( '(' IndexPartSpecificationList ')' )?
             ↪ Match? OnDeleteUpdateOpt
          | 'COLLATE' CollationName
          | 'COLUMN_FORMAT' ColumnFormat
          | 'STORAGE' StorageMedia
          | 'AUTO_RANDOM' ( '(' LengthNum ')' )?
```

#### 14.10.2.1.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT);
Query OK, 0 rows affected (0.11 sec)
```

```
mysql> INSERT INTO t1 VALUES (NULL);
Query OK, 1 row affected (0.02 sec)

mysql> SELECT * FROM t1;
+----+
| id |
+----+
|  1 |
+----+
1 row in set (0.00 sec)

mysql> ALTER TABLE t1 ADD COLUMN c1 INT NOT NULL;
Query OK, 0 rows affected (0.28 sec)

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  0 |
+----+----+
1 row in set (0.00 sec)

mysql> ALTER TABLE t1 ADD c2 INT NOT NULL AFTER c1;
Query OK, 0 rows affected (0.28 sec)

mysql> SELECT * FROM t1;
+----+----+----+
| id | c1 | c2 |
+----+----+----+
|  1 |  0 |  0 |
+----+----+----+
1 row in set (0.00 sec)
```

#### 14.10.2.1.3 MySQL compatibility

- Adding a new column and setting it to the `PRIMARY KEY` is not supported.
- Adding a new column and setting it to `AUTO_INCREMENT` is not supported.
- There are limitations on adding generated columns, refer to: generated column limitations.

#### 14.10.2.1.4 See also

- ADD INDEX
- CREATE TABLE

#### 14.10.2.2 ADD INDEX

The `ALTER TABLE.. ADD INDEX` statement adds an index to an existing table. This operation is online in TiDB, which means that neither reads or writes to the table are blocked by adding an index.

> **Warning:**
>
> - **DO NOT** upgrade a TiDB cluster when a DDL statement is being executed in the cluster (usually for the time-consuming DDL statements such as `ADD INDEX` and the column type changes).
> - Before the upgrade, it is recommended to use the `ADMIN SHOW DDL` command to check whether the TiDB cluster has an ongoing DDL job. If the cluster has a DDL job, to upgrade the cluster, wait until the DDL execution is finished or use the `ADMIN CANCEL DDL` command to cancel the DDL job before you upgrade the cluster.
> - In addition, during the cluster upgrade, **DO NOT** execute any DDL statement. Otherwise, the issue of undefined behavior might occur.

##### 14.10.2.2.1 Synopsis

```
AlterTableStmt
        ::= 'ALTER' 'IGNORE'? 'TABLE' TableName AddIndexSpec ( ','
           ↪ AddIndexSpec )*

AddIndexSpec
        ::= 'ADD' ( ( 'PRIMARY' 'KEY' | ( 'KEY' | 'INDEX' ) 'IF NOT EXISTS'?
           ↪  | 'UNIQUE' ( 'KEY' | 'INDEX' )? ) ( ( Identifier? 'USING' |
           ↪ Identifier 'TYPE' ) IndexType )? | 'FULLTEXT' ( 'KEY' | '
           ↪ INDEX' )? IndexName ) '(' IndexPartSpecification ( ','
           ↪ IndexPartSpecification )* ')' IndexOption*

IndexPartSpecification
        ::= ( ColumnName ( '(' LengthNum ')' )? | '(' Expression ')' ) ( '
           ↪ ASC' | 'DESC' )

IndexOption
        ::= 'KEY_BLOCK_SIZE' '='? LengthNum
          | IndexType
          | 'WITH' 'PARSER' Identifier
          | 'COMMENT' stringLit
          | 'VISIBLE'
```

```
          | 'INVISIBLE'

IndexType
        ::= 'BTREE'
          | 'HASH'
          | 'RTREE'
```

#### 14.10.2.2.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
+--
    ↪ ----------------------+----------+-----------+---------------+----------------
    ↪
| id                    | estRows | task      | access object | operator info
    ↪            |
+--
    ↪ ----------------------+----------+-----------+---------------+----------------
    ↪
| TableReader_7         | 10.00   | root      |               | data:Selection_6
    ↪           |
| └─Selection_6         | 10.00   | cop[tikv] |               | eq(test.t1.c1,
    ↪ 3)          |
|   └─TableFullScan_5   | 10000.00 | cop[tikv] | table:t1 | keep order:false
    ↪ , stats:pseudo |
+--
    ↪ ----------------------+----------+-----------+---------------+----------------
    ↪
3 rows in set (0.00 sec)

mysql> ALTER TABLE t1 ADD INDEX (c1);
Query OK, 0 rows affected (0.30 sec)

mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
+--
    ↪ ---------------------+---------+-----------+-----------------------+----------
    ↪
```

```
| id                  | estRows | task    | access object       | operator

+--
    ↪ --------------------+---------+-----------+----------------------+----------
    ↪
2 rows in set (0.00 sec)
```

#### 14.10.2.2.3 MySQL compatibility

- `FULLTEXT`, `HASH` and `SPATIAL` indexes are not supported.
- Descending indexes are not supported (similar to MySQL 5.7).
- Adding the primary key of the `CLUSTERED` type to a table is not supported. For more details about the primary key of the `CLUSTERED` type, refer to clustered index.

#### 14.10.2.2.4 See also

- Index Selection
- Wrong Index Solution
- CREATE INDEX
- DROP INDEX
- RENAME INDEX
- ALTER INDEX
- ADD COLUMN
- CREATE TABLE
- EXPLAIN

### 14.10.2.3 ADMIN

This statement is a TiDB extension syntax, used to view the status of TiDB and check the data of tables in TiDB. This document introduces the following `ADMIN` related statements:

- `ADMIN RELOAD`
- `ADMIN PLUGINS`
- `ADMIN ... BINDINGS`
- `ADMIN REPAIR`
- `ADMIN SHOW SLOW`

#### 14.10.2.3.1 DDL related statement

| Statement | Description |
| --- | --- |
| ADMIN CANCEL DDL JOBS | Cancels a currently running DDL jobs. |
| ADMIN CHECKSUM TABLE | Calculates the CRC64 of all rows + indexes of a table. |
| [ADMIN CHECK [TABLE\|INDEX]](#admin-check-[table index]) | |
| [ADMIN SHOW DDL [JOBS\|QUERIES]](#admin-show-ddl-[jobs job-queries]) | |
| ADMIN SHOW TELEMETRY | Shows information that will be reported back to PingCAP as part of the telemetry feature. |

#### 14.10.2.3.2 `ADMIN RELOAD` statement

```
ADMIN RELOAD expr_pushdown_blacklist;
```

The above statement is used to reload the blocklist pushed down by the expression.

```
ADMIN RELOAD opt_rule_blacklist;
```

The above statement is used to reload the blocklist of logic optimization rules.

#### 14.10.2.3.3 `ADMIN PLUGINS` related statement

```
ADMIN PLUGINS ENABLE plugin_name [, plugin_name] ...;
```

The above statement is used to enable the `plugin_name` plugin.

```
ADMIN PLUGINS DISABLE plugin_name [, plugin_name] ...;
```

The above statement is used to disable the `plugin_name` plugin.

#### 14.10.2.3.4 `ADMIN BINDINGS` related statement

```
ADMIN FLUSH BINDINGS;
```

The above statement is used to persist SQL Plan binding information.

```
ADMIN CAPTURE BINDINGS;
```

The above statement can generate the binding of SQL Plan from the `SELECT` statement that occurs more than once.

```
ADMIN EVOLVE BINDINGS;
```

After the automatic binding feature is enabled, the evolution of SQL Plan binding information is triggered every `bind-info-leave` (the default value is `3s`). The above statement is used to proactively trigger this evolution.

```
ADMIN RELOAD BINDINGS;
```

The above statement is used to reload SQL Plan binding information.

#### 14.10.2.3.5 `ADMIN REPAIR` statement

To overwrite the metadata of the stored table in an untrusted way in extreme cases, use `ADMIN REPAIR TABLE`:

```
ADMIN REPAIR TABLE tbl_name CREATE TABLE STATEMENT;
```

Here "untrusted" means that you need to manually ensure that the metadata of the original table can be covered by the `CREATE TABLE STATEMENT` operation. To use this `REPAIR` statement, enable the `repair-mode` configuration item, and make sure that the tables to be repaired are listed in the `repair-table-list`.

#### 14.10.2.3.6 `ADMIN SHOW SLOW` statement

```
ADMIN SHOW SLOW RECENT N;
```

```
ADMIN SHOW SLOW TOP [INTERNAL | ALL] N;
```

For details, refer to admin show slow statement

#### 14.10.2.3.7 Synopsis

```
AdminStmt ::=
    'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
       ↪ 'QUERIES' NumList )? | TableName 'NEXT_ROW_ID' | 'SLOW'
       ↪ AdminShowSlow ) | 'CHECK' ( 'TABLE' TableNameList | 'INDEX'
       ↪ TableName Identifier ( HandleRange ( ',' HandleRange )* )? ) | '
       ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ( 'INDEX'
       ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList ) | 'CHECKSUM'
       ↪  'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
       ↪ ( 'EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS' )
       ↪ | 'PLUGINS' ( 'ENABLE' | 'DISABLE' ) PluginNameList | 'REPAIR' '
       ↪ TABLE' TableName CreateTableStmt | ( 'FLUSH' | 'CAPTURE' | 'EVOLVE
       ↪ ' ) 'BINDINGS' )
```

#### 14.10.2.3.8 Examples

Run the following command to view the last 10 completed DDL jobs in the currently running DDL job queue. When `NUM` is not specified, only the last 10 completed DDL jobs is presented by default.

```
ADMIN SHOW DDL JOBS;
```

```
+--------+---------+-----------+---------------------+----------------+-----------+----
   ↪
| JOB_ID | DB_NAME | TABLE_NAME | JOB_TYPE      | SCHEMA_STATE | SCHEMA_ID |
   ↪  TABLE_ID | ROW_COUNT | START_TIME                | END_TIME
   ↪                        | STATE       |
+--------+---------+-----------+---------------------+----------------+-----------+----
   ↪
| 45    | test   | t1        | add index    | write reorganization | 32    |
   ↪ 37      | 0         | 2019-01-10 12:38:36.501 +0800 CST |
   ↪                             | running     |
| 44    | test   | t1        | add index    | none                 | 32       |
   ↪ 37      | 0         | 2019-01-10 12:36:55.18 +0800 CST | 2019-01-10
   ↪ 12:36:55.852 +0800 CST | rollback done |

```

- `JOB_ID`: each DDL operation corresponds to one DDL job. `JOB_ID` is globally unique.
- `DB_NAME`: the name of the database on which the DDL operations are performed.
- `TABLE_NAME`: the name of the table on which the DDL operations are performed.
- `JOB_TYPE`: the type of the DDL operations.
- `SCHEMA_STATE`: the current state of the schema. If the `JOB_TYPE` is `add index`, it is the state of the index; if the `JOB_TYPE` is `add column`, it is the state of the column; if the `JOB_TYPE` is `create table`, it is the state of the table. The common states include:
    - `none`: it indicates not existing. When the `drop` or `create` operation fails and rolls back, it usually becomes the `none` state.
    - `delete only`, `write only`, `delete reorganization`, `write reorganization`: these four states are intermediate states. These states are not visible in common operations, because the conversion from the intermediate states is so quick. You can see the `write reorganization` state only in `add index` operations, which means that the index data is being added.
    - `public`: it indicates existing and usable. When operations like `create table` and `add index/column` are finished, it usually becomes the `public` state, which means that the created table/column/index can be normally read and written now.
- `SCHEMA_ID`: the ID of the database on which the DDL operations are performed.
- `TABLE_ID`: the ID of the table on which the DDL operations are performed.
- `ROW_COUNT`: the number of the data rows that have been added when running the `add index` operation.
- `START_TIME`: the start time of the DDL operations.
- `END_TIME`: the end time of the DDL operations.
- `STATE`: the state of the DDL operations. The common states include:
    - `none`: it indicates that the operation task has been put in the DDL job queue but has not been performed yet, because it is waiting for the previous tasks to complete. Another reason might be that it becomes the `none` state after running

the drop operation, but it will soon be updated to the `synced` state, which means that all TiDB instances have been synced to this state.

- `running`: it indicates that the operation is being performed.
- `synced`: it indicates that the operation has been performed successfully and all TiDB instances have been synced to this state.
- `rollback done`: it indicates that the operation has failed and has finished rolling back.
- `rollingback`: it indicates that the operation has failed and is rolling back.
- `cancelling`: it indicates that the operation is being cancelled. This state only occurs when you cancel DDL jobs using the `ADMIN CANCEL DDL JOBS` command.

#### 14.10.2.3.9 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.10.2.4 ADMIN CANCEL DDL

The `ADMIN CANCEL DDL` statement allows you to cancel a running DDL job. The `job_id` can be found by running `ADMIN SHOW DDL JOBS`.

The `ADMIN CANCEL DDL` statement also allows you to cancel a DDL job that is committed but not yet completed executing. After the cancellation, the SQL statement that executes the DDL job returns the `ERROR 8214 (HY000): Cancelled DDL job` error. If you cancel a DDL job that has already been completed, you will see the `DDL Job:90 not found` error in the `RESULT` column, which indicates that the job has been removed from the DDL waiting queue.

#### 14.10.2.4.1 Synopsis

```
AdminStmt ::=
    'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
       ↪ 'QUERIES' NumList )? | TableName 'NEXT_ROW_ID' | 'SLOW'
       ↪ AdminShowSlow ) | 'CHECK' ( 'TABLE' TableNameList | 'INDEX'
       ↪ TableName Identifier ( HandleRange ( ',' HandleRange )* )? ) | '
       ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ( 'INDEX'
       ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList ) | 'CHECKSUM'
       ↪  'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
       ↪ ( 'EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS' )
       ↪ | 'PLUGINS' ( 'ENABLE' | 'DISABLE' ) PluginNameList | 'REPAIR' '
       ↪ TABLE' TableName CreateTableStmt | ( 'FLUSH' | 'CAPTURE' | 'EVOLVE
       ↪ ' ) 'BINDINGS' )

NumList ::=
    Int64Num ( ',' Int64Num )*
```

#### 14.10.2.4.2 Examples

To cancel the currently running DDL jobs and return whether the corresponding jobs are successfully cancelled, use `ADMIN CANCEL DDL JOBS`:

```
ADMIN CANCEL DDL JOBS job_id [, job_id] ...;
```

If the operation fails to cancel the jobs, specific reasons are displayed.

**Note:**

- Before v6.2.0, only this operation can cancel DDL jobs, and all other operations and environment changes (such as machine restart and cluster restart) cannot cancel these jobs. Starting from v6.2.0, `KILL` statements can also be used to cancel ongoing DDL jobs by killing them.
- This operation can cancel multiple DDL jobs at the same time. You can get the ID of DDL jobs using the `ADMIN SHOW DDL JOBS` statement.
- If the jobs you want to cancel are finished, the cancellation operation fails.

#### 14.10.2.4.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.10.2.4.4 See also

- `ADMIN SHOW DDL [JOBS|JOB QUERIES]`

### 14.10.2.5 ADMIN CHECKSUM TABLE

The `ADMIN CHECKSUM TABLE` statement calculates a CRC64 checksum for the data and indexes of a table. This statement is used by programs such as TiDB Lightning to ensure that import operations have completed successfully.

#### 14.10.2.5.1 Synopsis

```
AdminStmt ::=
    'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
       ↪ 'QUERIES' NumList )? | TableName 'NEXT_ROW_ID' | 'SLOW'
       ↪ AdminShowSlow ) | 'CHECK' ( 'TABLE' TableNameList | 'INDEX'
       ↪ TableName Identifier ( HandleRange ( ',' HandleRange )* )? ) | '
       ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ( 'INDEX'
       ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList ) | 'CHECKSUM'
```

```
        ↪  'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
        ↪ ( 'EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS' )
        ↪ | 'PLUGINS' ( 'ENABLE' | 'DISABLE' ) PluginNameList | 'REPAIR' '
        ↪ TABLE' TableName CreateTableStmt | ( 'FLUSH' | 'CAPTURE' | 'EVOLVE
        ↪ ' ) 'BINDINGS' )

TableNameList ::=
    TableName ( ',' TableName )*
```

#### 14.10.2.5.2 Examples

Create table `t1`:

```
CREATE TABLE t1(id INT PRIMARY KEY);
```

Insert some data into `t1`:

```
INSERT INTO t1 VALUES (1),(2),(3);
```

Calculate the checksum for `t1`:

```
ADMIN CHECKSUM TABLE t1;
```

The output is as follows:

```
+---------+------------+---------------------+-----------+-------------+
| Db_name | Table_name | Checksum_crc64_xor | Total_kvs | Total_bytes |
+---------+------------+---------------------+-----------+-------------+
| test    | t1         | 10909174369497628533 |     3 |         75 |
+---------+------------+---------------------+-----------+-------------+
1 row in set (0.00 sec)
```

#### 14.10.2.5.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.10.2.6 ADMIN CHECK [TABLE|INDEX]

The `ADMIN CHECK [TABLE|INDEX]` statement checks for data consistency of tables and indexes.

It does not support the following:

- Checking the PRIMARY KEY index if a clustered primary key is used.

If `ADMIN CHECK [TABLE|INDEX]` finds any issues, you can resolve them by dropping and recreating the index. If the issue is not resolved, you can report an issue on GitHub.

#### 14.10.2.6.1 Principles

The `ADMIN CHECK TABLE` statement takes the following steps to check the table:

1. For each index, it checks if the number of records in the index is the same as that in the table.
2. For each index, it loops over the values in each row and compares the values with that in the table.

If you use the `ADMIN CHECK INDEX` statement, it only checks the specified index.

#### 14.10.2.6.2 Synopsis

```
AdminStmt ::=
    'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
       ↪ 'QUERIES' NumList )? | TableName 'NEXT_ROW_ID' | 'SLOW'
       ↪ AdminShowSlow ) | 'CHECK' ( 'TABLE' TableNameList | 'INDEX'
       ↪ TableName Identifier ( HandleRange ( ',' HandleRange )* )? ) | '
       ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ( 'INDEX'
       ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList ) | 'CHECKSUM'
       ↪  'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
       ↪ ( 'EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS' )
       ↪ | 'PLUGINS' ( 'ENABLE' | 'DISABLE' ) PluginNameList | 'REPAIR' '
       ↪ TABLE' TableName CreateTableStmt | ( 'FLUSH' | 'CAPTURE' | 'EVOLVE
       ↪ ' ) 'BINDINGS' )

TableNameList ::=
    TableName ( ',' TableName )*
```

#### 14.10.2.6.3 Examples

To check the consistency of all the data and corresponding indexes in the `tbl_name` table, use `ADMIN CHECK TABLE`:

```
ADMIN CHECK TABLE tbl_name [, tbl_name] ...;
```

If the consistency check is passed, an empty result is returned. Otherwise, an error message is returned indicating that the data is inconsistent.

```
ADMIN CHECK INDEX tbl_name idx_name;
```

The above statement is used to check the consistency of the column data and index data corresponding to the `idx_name` index in the `tbl_name` table. If the consistency check is passed, an empty result is returned; otherwise, an error message is returned indicating that the data is inconsistent.

```
ADMIN CHECK INDEX tbl_name idx_name (lower_val, upper_val) [, (lower_val,
    ↪ upper_val)] ...;
```

The above statement is used to check the consistency of the column data and index data corresponding to the `idx_name` index in the `tbl_name` table, with the data range (to be checked) specified. If the consistency check is passed, an empty result is returned. Otherwise, an error message is returned indicating that the data is inconsistent.

#### 14.10.2.6.4 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.10.2.6.5 See also

- ADMIN REPAIR

### 14.10.2.7 ADMIN CLEANUP INDEX

The `ADMIN CLEANUP INDEX` statement is used to delete redundant indexes from a table when the table has inconsistent data and index. Note that this syntax does not support foreign key constraints yet.

#### 14.10.2.7.1 Synopsis

```
AdminCleanupStmt ::=
    'ADMIN' 'CLEANUP' ( 'INDEX' TableName IndexName | 'TABLE' 'LOCK'
        ↪ TableNameList )

TableNameList ::=
    TableName ( ',' TableName )*
```

#### 14.10.2.7.2 Examples

Assume that the `tbl` table in a database has inconsistent data and index due to some reasons (for example, some row data is lost in the cluster in a disaster recovery scenario):

```
SELECT * FROM tbl;
ERROR 1105 (HY000): inconsistent index idx handle count 3 isn't equal to
    ↪ value count 2

ADMIN CHECK INDEX tbl idx ;
ERROR 1105 (HY000): handle &kv.CommonHandle{encoded:[]uint8{0x1, 0x0, 0x0, 0
    ↪ x0, 0x0, 0x0, 0x0, 0x0, 0xf8}, colEndOffsets:[]uint16{0xa}},
    ↪ index:types.Datum{k:0x5, decimal:0x0, length:0x0, i:0, collation:"
    ↪ utf8mb4_bin", b:[]uint8{0x0}, x:interface {}(nil)} != record:<nil>
```

It can be seen from the error message of the `SELECT` query that, the `tbl` table contains two rows of data and three rows of index data, which means inconsistent row and index data. At the same time, at least one index is in dangling state. In this case, you can use the `ADMIN CLEANUP INDEX` statement to delete the dangling index:

```
ADMIN CLEANUP INDEX tbl idx;
```

The execution result is as follows:

```
ADMIN CLEANUP INDEX tbl idx;
+---------------+
| REMOVED_COUNT |
+---------------+
|             1 |
+---------------+
```

You can execute the `ADMIN CHECK INDEX` statement again to check the consistency of data and index, and verify whether the data has been restored to a normal state:

```
ADMIN CHECK INDEX tbl idx;
Query OK, 0 rows affected (0.01 sec)
```

**Note:**

When the data and index are inconsistent due to the loss of replicas:

- There might be a loss of both row data and index data. To restore the consistency, use the `ADMIN CLEANUP INDEX` and `ADMIN RECOVER INDEX` statements together.
- The `ADMIN CLEANUP INDEX` statement is always executed in a single thread. When the table data is large, it is recommended to recover the index data by rebuilding the index.
- When you execute the `ADMIN CLEANUP INDEX` statement, the corresponding table or index is not locked and TiDB allows other sessions to modify the table records at the same time. However, in this case, `ADMIN CLEANUP INDEX` might not be able to handle all table records correctly. Therefore, when you execute `ADMIN CLEANUP INDEX`, avoid modifying the table data at the same time.
- If you use the enterprise edition of TiDB, you can submit a request to contact the support engineer for help.

The `ADMIN CLEANUP INDEX` statement is not atomic: if the statement is interrupted during execution, it is recommended to execute it again until it succeeds.

#### 14.10.2.7.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.10.2.7.4 See also

- ADMIN CHECK TABLE/INDEX
- ADMIN RECOVER INDEX

### 14.10.2.8 ADMIN RECOVER INDEX

When the row data and index data are inconsistent, you can use the `ADMIN RECOVER INDEX` statement to recover the consistency based on the redundant indexes. Note that this syntax does not support foreign key constraints yet.

#### 14.10.2.8.1 Synopsis

```
AdminCleanupStmt ::=
    'ADMIN' 'RECOVER' 'INDEX' TableName IndexName
```

#### 14.10.2.8.2 Examples

Assume that the `tbl` table in a database has inconsistent row data and index due to some reasons (for example, some row data is lost in the cluster in a disaster recovery scenario):

```
SELECT * FROM tbl;
ERROR 1105 (HY000): inconsistent index idx handle count 2 isn't equal to
    ↪ value count 3

ADMIN CHECK INDEX tbl idx ;
ERROR 1105 (HY000): handle &kv.CommonHandle{encoded:[]uint8{0x1, 0x0, 0x0, 0
    ↪ x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0xf8}, colEndOffsets:[]uint16{0xa}},
    ↪ index:types.Datum{k:0x5, decimal:0x0, length:0x0, i:0, collation:"
    ↪ utf8mb4_bin", b:[]uint8{0x0}, x:interface {}(nil)} != record:<nil>
```

It can be seen from the error message of the `SELECT` query that, the `tbl` table contains three rows of data and two rows of index data, which means inconsistent row data and index data. At the same time, at least one row of data has no corresponding index. In this case, you can use the `ADMIN RECOVER INDEX` statement to supplement the missing index:

```
ADMIN RECOVER INDEX tbl idx;
```

The execution result is as follows:

```
ADMIN RECOVER INDEX tbl idx;
+-------------+------------+
| ADDED_COUNT | SCAN_COUNT |
+-------------+------------+
|           1 |          3 |
+-------------+------------+
1 row in set (0.00 sec)
```

You can execute the `ADMIN CHECK INDEX` statement again to check the consistency of data and index, and verify whether the data has been restored to normal state:

```
ADMIN CHECK INDEX tbl idx;
Query OK, 0 rows affected (0.01 sec)
```

**Note:**

When the data and index are inconsistent due to the loss of replicas:

- There might be a loss of both row data and index data. To address the issue, use the `ADMIN CLEANUP INDEX` and `ADMIN RECOVER INDEX` statements together to recover the consistency of row data and index data.
- The `ADMIN RECOVER INDEX` statement is always executed in a single thread. When the table data is large, it is recommended to recover the index data by rebuilding the index.
- When you execute the `ADMIN RECOVER INDEX` statement, the corresponding table or index is not locked and TiDB allows other sessions to modify the table records at the same time. However, in this case, `ADMIN RECOVER INDEX` might not be able to handle all table records correctly. Therefore, when you execute `ADMIN RECOVER INDEX`, avoid modifying the table data at the same time.
- If you use the enterprise edition of TiDB, you can submit a request to contact the support engineer for help.

The `ADMIN RECOVER INDEX` statement is not atomic: if the statement is interrupted during execution, it is recommended to execute it again until it succeeds.

#### 14.10.2.8.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.10.2.8.4 See also

- ADMIN CHECK TABLE/INDEX
- ADMIN CLEANUP INDEX

### 14.10.2.9 ADMIN SHOW DDL [JOBS|JOB QUERIES]

The `ADMIN SHOW DDL [JOBS|JOB QUERIES]` statement shows information about running and recently completed DDL jobs.

#### 14.10.2.9.1 Synopsis

```
AdminStmt ::=
    'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
       ↪ 'QUERIES' NumList | 'JOB' 'QUERIES' 'LIMIT' m 'OFFSET' n )? |
       ↪ TableName 'NEXT_ROW_ID' | 'SLOW' AdminShowSlow ) | 'CHECK' ( '
       ↪ TABLE' TableNameList | 'INDEX' TableName Identifier ( HandleRange
       ↪ ( ',' HandleRange )* )? ) | 'RECOVER' 'INDEX' TableName Identifier
       ↪  | 'CLEANUP' ( 'INDEX' TableName Identifier | 'TABLE' 'LOCK'
       ↪ TableNameList ) | 'CHECKSUM' 'TABLE' TableNameList | 'CANCEL' 'DDL
       ↪ ' 'JOBS' NumList | 'RELOAD' ( 'EXPR_PUSHDOWN_BLACKLIST' | '
       ↪ OPT_RULE_BLACKLIST' | 'BINDINGS' ) | 'PLUGINS' ( 'ENABLE' | '
       ↪ DISABLE' ) PluginNameList | 'REPAIR' 'TABLE' TableName
       ↪ CreateTableStmt | ( 'FLUSH' | 'CAPTURE' | 'EVOLVE' ) 'BINDINGS' )

NumList ::=
    Int64Num ( ',' Int64Num )*

WhereClauseOptional ::=
    WhereClause?
```

#### 14.10.2.9.2 Examples

`ADMIN SHOW DDL`

To view the status of the currently running DDL jobs, use `ADMIN SHOW DDL`. The output includes the current schema version, the DDL ID and address of the owner, the running DDL jobs and SQL statements, and the DDL ID of the current TiDB instance.

```
ADMIN SHOW DDL;
```

```
mysql> ADMIN SHOW DDL;
+--
    ↪ ----------+--------------------------------------+--------------+-------------
    ↪
```

```
| SCHEMA_VER | OWNER_ID                             | OWNER_ADDRESS | RUNNING_JOBS

    ↪ ----------+--------------------------------------+--------------+------------
    ↪
1 row in set (0.00 sec)
```

### ADMIN SHOW DDL JOBS

The `ADMIN SHOW DDL JOBS` statement is used to view all the results in the current DDL job queue, including running and queuing tasks, as well as the latest ten results in the completed DDL job queue. The returned result fields are described as follows:

- `JOB_ID`: each DDL operation corresponds to a DDL job. `JOB_ID` is globally unique.
- `DB_NAME`: the name of the database where the DDL operation is performed.
- `TABLE_NAME`: the name of the table where the DDL operation is performed.
- `JOB_TYPE`: the type of DDL operation. Common job types include the following:
    - `ingest`: Ingestion with accelerated index backfilling as configured by `tidb_ddl_enable_fast_reorg`.
    - `txn`: Basic transactional backfill.
    - `txn-merge`: Transactional backfill with a temporary index that gets merged with the original index when the backfill is finished.
- `SCHEMA_STATE`: the current state of the schema object that the DDL operates on. If `JOB_TYPE` is `ADD INDEX`, it is the state of the index; if `JOB_TYPE` is `ADD COLUMN`, it is the state of the column; if `JOB_TYPE` is `CREATE TABLE`, it is the state of the table. Common states include the following:
    - `none`: indicates that it does not exist. Generally, after the `DROP` operation or after the `CREATE` operation fails and rolls back, it will become the `none` state.
    - `delete only`, `write only`, `delete reorganization`, `write reorganization`: these four states are intermediate states. For their specific meanings, see How the Online DDL Asynchronous Change Works in TiDB. As the intermediate state conversion is fast, these states are generally not visible during operation. Only when performing `ADD INDEX` operation can the `write reorganization` state be seen, indicating that index data is being added.
    - `public`: indicates that it exists and is available to users. Generally, after `CREATE TABLE` and `ADD INDEX` (or `ADD COLUMN`) operations are completed, it will become the `public` state, indicating that the newly created table, column, and index can be read and written normally.

- `SCHEMA_ID`: the ID of the database where the DDL operation is performed.
- `TABLE_ID`: the ID of the table where the DDL operation is performed.
- `ROW_COUNT`: when performing the `ADD INDEX` operation, it is the number of data rows that have been added.
- `START_TIME`: the start time of the DDL operation.
- `STATE`: the state of the DDL operation. Common states include the following:
    - `queueing`: indicates that the operation job has entered the DDL job queue but has not been executed because it is still waiting for an earlier DDL job to complete. Another reason might be that after executing the `DROP` operation, it will become the `none` state, but it will soon be updated to the `synced` state, indicating that all TiDB instances have been synchronized to that state.
    - `running`: indicates that the operation is being executed.
    - `synced`: indicates that the operation has been executed successfully and all TiDB instances have been synchronized to this state.
    - `rollback done`: indicates that the operation has failed and the rollback has been completed.
    - `rollingback`: indicates that the operation has failed and is rolling back.
    - `cancelling`: indicates that the operation is being canceled. This state only appears when you use the `ADMIN CANCEL DDL JOBS` command to cancel the DDL job.

The following example shows the results of `ADMIN SHOW DDL JOBS`:

```
ADMIN SHOW DDL JOBS;
```

```
mysql> ADMIN SHOW DDL JOBS;

+--
   ↪ ------+--------+--------------------+-------------+--------------------+----
   ↪
12 rows in set (0.00 sec)
```

From the output above:

- Job 59 is currently in progress (`STATE` of `running`). The schema state is currently in `write reorganization`, but will switch to `public` once the task is completed to note that the change can be observed publicly by user sessions. The `end_time` column is also `NULL` indicating that the completion time for the job is currently not known.
- Job 60 is an `add index` job, which is currently queued waiting for job 59 to complete. When job 59 completes, the `STATE` of job 60 will switch to `running`.
- For destructive changes such as dropping an index or dropping a table, the `SCHEMA_STATE` will change to `none` when the job is complete. For additive changes, the `SCHEMA_STATE` will change to `public`.

To limit the number of rows shown, specify a number and a where condition:

```
ADMIN SHOW DDL JOBS [NUM] [WHERE where_condition];
```

- `NUM`: to view the last `NUM` results in the completed DDL job queue. If not specified, `NUM` is by default 10.
- `WHERE`: to add filter conditions.

`ADMIN SHOW DDL JOB QUERIES`

To view the original SQL statements of the DDL job corresponding to `job_id`, use `ADMIN SHOW DDL JOB QUERIES`:

```
ADMIN SHOW DDL JOBS;
ADMIN SHOW DDL JOB QUERIES 51;
```

```
mysql> ADMIN SHOW DDL JOB QUERIES 51;
+-----------------------------------------------------------+
| QUERY                                                     |
+-----------------------------------------------------------+
| CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY auto_increment) |
+-----------------------------------------------------------+
1 row in set (0.02 sec)
```

You can only search the running DDL job corresponding to `job_id` within the last ten results in the DDL history job queue.

`ADMIN SHOW DDL JOB QUERIES LIMIT m OFFSET n`

To view the original SQL statements of the DDL job within a specified range `[n+1, n+m]` corresponding to `job_id`, use `ADMIN SHOW DDL JOB QUERIES LIMIT m OFFSET n`:

```
sql ADMIN SHOW DDL JOB QUERIES LIMIT m; # Retrieve first m rows ADMIN
↪ SHOW DDL JOB QUERIES LIMIT n, m; # Retrieve rows [n+1, n+m] ADMIN SHOW
↪ DDL JOB QUERIES LIMIT m OFFSET n; # Retrieve rows [n+1, n+m]
```

where `n` and `m` are integers greater or equal to 0.

```
sql ADMIN SHOW DDL JOB QUERIES LIMIT 3; # Retrieve first 3 rows +--------+----------
↪  | JOB_ID | QUERY                                  |  +--------+----------------------
↪  | 59 | ALTER TABLE t1 ADD INDEX index2 (col2)          |  |    60 |
↪ ALTER TABLE t2 ADD INDEX index1 (col1)               |  |    58 | CREATE
↪ TABLE t2 (id INT NOT NULL PRIMARY KEY auto_increment)| +--------+--------------------
↪  3 rows in set (0.00 sec)

sql ADMIN SHOW DDL JOB QUERIES LIMIT 6, 2; # Retrieve rows 7-8 +--------+-----------
↪  | JOB_ID | QUERY                                          |  +--------+------------
↪  | 52 | ALTER TABLE t1 ADD INDEX index1 (col1)                  |  |
↪     51 | CREATE TABLE IF NOT EXISTS t1 (id INT NOT NULL PRIMARY KEY
↪ auto_increment)| +--------+-------------------------------------------------------
↪  3 rows in set (0.00 sec)
```

```
   sql  ADMIN SHOW DDL JOB QUERIES LIMIT 3 OFFSET 4; # Retrieve rows 5-7
↪ +--------+----------------------------------------+ | JOB_ID | QUERY
↪                 |  +--------+----------------------------------------+
↪ | 54 | DROP TABLE IF EXISTS t3        |  |    53 | ALTER TABLE t1 DROP
↪  INDEX index1  |  |    52 | ALTER TABLE t1 ADD INDEX index1 (col1)|
↪ +--------+----------------------------------------+ 3 rows in set (0.00
↪ sec)
```

You can search the running DDL job corresponding to `job_id` within an arbitrarily specified range of results in the DDL history job queue. This syntax does not have the limitation of the last ten results of `ADMIN SHOW DDL JOB QUERIES`.

#### 14.10.2.9.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.10.2.9.4 See also

- ADMIN CANCEL DDL

### 14.10.2.10 ADMIN SHOW TELEMETRY

The `ADMIN SHOW TELEMETRY` statement shows the information that will be reported back to PingCAP as part of the telemetry feature.

#### 14.10.2.10.1 Synopsis

```
AdminStmt ::=
    'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
       ↪ 'QUERIES' NumList )? | TableName 'NEXT_ROW_ID' | 'SLOW'
       ↪ AdminShowSlow | 'TELEMETRY' ) | 'CHECK' ( 'TABLE' TableNameList |
       ↪ 'INDEX' TableName Identifier ( HandleRange ( ',' HandleRange )* )?
       ↪  ) | 'RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ( 'INDEX'
       ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList ) | 'CHECKSUM'
       ↪  'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
       ↪ ( 'EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS' )
       ↪ | 'PLUGINS' ( 'ENABLE' | 'DISABLE' ) PluginNameList | 'REPAIR' '
       ↪ TABLE' TableName CreateTableStmt | ( 'FLUSH' | 'CAPTURE' | 'EVOLVE
       ↪ ' ) 'BINDINGS' )
```

#### 14.10.2.10.2 Examples

```
ADMIN SHOW TELEMETRY\G
```

```

#### 14.10.2.10.3 MySQL compatibility

The `ADMIN` statement is a TiDB extension to MySQL syntax.

#### 14.10.2.10.4 See also

- Telemetry

- tidb_enable_telemetry System Variable

#### 14.10.2.11 ALTER DATABASE

`ALTER DATABASE` is used to specify or modify the default character set and collation of the current database. `ALTER SCHEMA` has the same effect as `ALTER DATABASE`.

##### 14.10.2.11.1 Synopsis

```
AlterDatabaseStmt ::=
    'ALTER' 'DATABASE' DBName? DatabaseOptionList

DatabaseOption ::=
    DefaultKwdOpt ( CharsetKw '='? CharsetName | 'COLLATE' '='?
        ↪ CollationName | 'ENCRYPTION' '='? EncryptionOpt )
```

##### 14.10.2.11.2 Examples

Modify the test database schema to use the utf8mb4 character set:

```
ALTER DATABASE test DEFAULT CHARACTER SET = utf8mb4;
```

```
Query OK, 0 rows affected (0.00 sec)
```

Currently, TiDB only supports some character sets and collations. See Character Set and Collation Support for details.

##### 14.10.2.11.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

##### 14.10.2.11.4 See also

- CREATE DATABASE
- SHOW DATABASES

#### 14.10.2.12 ALTER INDEX

The `ALTER INDEX` statement is used to modify the visibility of the index to `Visible` or `Invisible`. Invisible indexes are maintained by DML statements, but will not be used by the query optimizer. This is useful in scenarios where you want to double-check before removing an index permanently.

#### 14.10.2.12.1 Synopsis

```
AlterTableStmt
        ::= 'ALTER' 'IGNORE'? 'TABLE' TableName AlterIndexSpec ( ','
           ↪ AlterIndexSpec )*

AlterIndexSpec
        ::= 'ALTER' 'INDEX' Identifier ( 'VISIBLE' | 'INVISIBLE' )
```

#### 14.10.2.12.2 Examples

You can modify the visibility of an index using the `ALTER TABLE ... ALTER INDEX ...` statement.

```
CREATE TABLE t1 (c1 INT, UNIQUE(c1));
ALTER TABLE t1 ALTER INDEX c1 INVISIBLE;
```

```
Query OK, 0 rows affected (0.02 sec)
```

```
SHOW CREATE TABLE t1;
```

```
+--
   ↪ -----+-----------------------------------------------------------------
   ↪
| Table | Create Table
                                |
+--
   ↪ -----+-----------------------------------------------------------------
   ↪
| t1    | CREATE TABLE `t1` (
  `c1` int(11) DEFAULT NULL,
  UNIQUE KEY `c1` (`c1`) /*!80000 INVISIBLE */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin |
+--
   ↪ -----+-----------------------------------------------------------------
   ↪
1 row in set (0.00 sec)
```

The optimizer cannot use the **invisible index** of `c1`.

```
EXPLAIN SELECT c1 FROM t1 ORDER BY c1;
```

```
+--
   ↪ ----------------------+----------+-----------+--------------+----------
   ↪
```

```
| id                    | estRows | task     | access object | operator info
   ↪             |
+--
   ↪ ----------------------+---------+----------+---------------+----------------
   ↪
| Sort_4                | 10000.00 | root    |               | test.t1.c1:asc
   ↪              |
|  ─TableReader_8       | 10000.00 | root    |               | data:
   ↪ TableFullScan_7        |
|    ─TableFullScan_7   | 10000.00 | cop[tikv] | table:t1 | keep order:false
   ↪ , stats:pseudo |
+--
   ↪ ----------------------+---------+----------+---------------+----------------
   ↪
3 rows in set (0.00 sec)
```

By comparison, c2 is a **visible index** and can be used by the optimizer.

```
EXPLAIN SELECT c2 FROM t1 ORDER BY c2;
```

```
+--
   ↪ ----------------------+---------+----------+-----------------------+--------
   ↪
| id                    | estRows | task     | access object         | operator
   ↪ info              |
+--
   ↪ ----------------------+---------+----------+-----------------------+--------
   ↪
| IndexReader_13        | 10000.00 | root    |                       | index:
   ↪ IndexFullScan_12    |
|  ─IndexFullScan_12    | 10000.00 | cop[tikv] | table:t1, index:c2(c2) |
   ↪ keep order:true, stats:pseudo |
+--
   ↪ ----------------------+---------+----------+-----------------------+--------
   ↪
2 rows in set (0.00 sec)
```

Even if you use the USE INDEX SQL hint to forcibly use indexes, the optimizer still cannot use invisible indexes; otherwise, an error is returned.

```
SELECT * FROM t1 USE INDEX(c1);
```

```
ERROR 1176 (42000): Key 'c1' doesn't exist in table 't1'
```

> **Note:**
>
> "Invisible" here means invisible only to the optimizer. You can still modify or delete invisible indexes.

```
ALTER TABLE t1 DROP INDEX c1;
```

```
Query OK, 0 rows affected (0.02 sec)
```

#### 14.10.2.12.3 MySQL compatibility

- Invisible indexes in TiDB are modeled on the equivalent feature from MySQL 8.0.
- Similiar to MySQL, TiDB does not permit `PRIMARY KEY` indexes to be made invisible.
- MySQL provides an optimizer switch `use_invisible_indexes=on` to make all invisible indexes *visible* again. This functionality is not available in TiDB.

#### 14.10.2.12.4 See also

- CREATE TABLE
- CREATE INDEX
- ADD INDEX
- DROP INDEX
- RENAME INDEX

### 14.10.2.13 ALTER INSTANCE

The `ALTER INSTANCE` statement is used to make changes to a single TiDB instance. Currently, TiDB only supports the `RELOAD TLS` clause.

#### 14.10.2.13.1 RELOAD TLS

You can execute the `ALTER INSTANCE RELOAD TLS` statement to reload the certificate (`ssl-cert`), the key (`ssl-key`), and the CA (`ssl-ca`) from the original configuration path.

The newly loaded certificate, key, and CA take effect on the connection that is established after the statement is successfully executed. The connection established before this statement execution is not affected.

When an error occurs during reloading, by default, this error message is returned and the previous key and certificate continue to be used. However, if you have added the optional `NO ROLLBACK ON ERROR`, when an error occurs during reloading, the error is not returned, and the subsequent requests are handled with the TLS security connection disabled.

#### 14.10.2.13.2 Syntax diagram

**AlterInstanceStmt:**

```
AlterInstanceStmt ::=
    'ALTER' 'INSTANCE' InstanceOption

InstanceOption ::=
    'RELOAD' 'TLS' ('NO' 'ROLLBACK' 'ON' 'ERROR')?
```

#### 14.10.2.13.3 Example

```
ALTER INSTANCE RELOAD TLS;
```

#### 14.10.2.13.4 MySQL compatibility

The `ALTER INSTANCE RELOAD TLS` statement only supports reloading from the original configuration path. It does not support dynamically modifying the loading path or dynamically enabling the TLS encrypted connection feature when TiDB is started. This feature is disabled by default when you restart TiDB.

#### 14.10.2.13.5 See also

Enable TLS Between TiDB Clients and Servers.

### 14.10.2.14 ALTER PLACEMENT POLICY

`ALTER PLACEMENT POLICY` is used to modify existing placement policies that have previously been created. All the tables and partitions which use the placement policy will automatically be updated.

`ALTER PLACEMENT POLICY` *replaces* the previous policy with the new definition. It does not *merge* the old policy with the new one. In the following example, `FOLLOWERS=4` is lost when the `ALTER PLACEMENT POLICY` is executed:

```
CREATE PLACEMENT POLICY p1 FOLLOWERS=4;
ALTER PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us-
    ↪ west-1";
```

#### 14.10.2.14.1 Synopsis

```
AlterPolicyStmt ::=
    "ALTER" "PLACEMENT" "POLICY" IfExists PolicyName PlacementOptionList

PolicyName ::=
    Identifier
```

```
PlacementOptionList ::=
    PlacementOption
|   PlacementOptionList PlacementOption
|   PlacementOptionList ',' PlacementOption

PlacementOption ::=
    CommonPlacementOption
|   SugarPlacementOption
|   AdvancedPlacementOption

CommonPlacementOption ::=
    "FOLLOWERS" EqOpt LengthNum

SugarPlacementOption ::=
    "PRIMARY_REGION" EqOpt stringLit
|   "REGIONS" EqOpt stringLit
|   "SCHEDULE" EqOpt stringLit

AdvancedPlacementOption ::=
    "LEARNERS" EqOpt LengthNum
|   "CONSTRAINTS" EqOpt stringLit
|   "LEADER_CONSTRAINTS" EqOpt stringLit
|   "FOLLOWER_CONSTRAINTS" EqOpt stringLit
|   "LEARNER_CONSTRAINTS" EqOpt stringLit
```

#### 14.10.2.14.2 Examples

> **Note:**
>
> To know which regions are available in your cluster, see SHOW PLACEMENT LABELS.
>
> If you do not see any available regions, your TiKV installation might not have labels set correctly.

```
CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us
    -west-1";
CREATE TABLE t1 (i INT) PLACEMENT POLICY=p1; -- Assign policy p1 to table
    t1
ALTER PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us-
    west-1,us-west-2" FOLLOWERS=4; -- The rules of t1 will be updated
```

```
    ↪ automatically.
SHOW CREATE PLACEMENT POLICY p1\G;
```

```
Query OK, 0 rows affected (0.08 sec)

Query OK, 0 rows affected (0.10 sec)

***************************[ 1. row ]***************************
Policy      | p1
Create Policy | CREATE PLACEMENT POLICY `p1` PRIMARY_REGION="us-east-1"
    ↪ REGIONS="us-east-1,us-west-1,us-west-2" FOLLOWERS=4
1 row in set (0.00 sec)
```

#### 14.10.2.14.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.10.2.14.4 See also

- Placement Rules in SQL
- SHOW PLACEMENT
- CREATE PLACEMENT POLICY
- DROP PLACEMENT POLICY

### 14.10.2.15 ALTER TABLE

This statement modifies an existing table to conform to a new table structure. The statement `ALTER TABLE` can be used to:

- `ADD`, `DROP`, or `RENAME` indexes
- `ADD`, `DROP`, `MODIFY` or `CHANGE` columns
- `COMPACT` table data

#### 14.10.2.15.1 Synopsis

```
AlterTableStmt ::=
    'ALTER' IgnoreOptional 'TABLE' TableName (
        AlterTableSpecListOpt AlterTablePartitionOpt |
        'ANALYZE' 'PARTITION' PartitionNameList ( 'INDEX' IndexNameList )?
            ↪ AnalyzeOptionListOpt |
        'COMPACT' ( 'PARTITION' PartitionNameList )? 'TIFLASH' 'REPLICA'
    )

TableName ::=
```

```
    Identifier ('.' Identifier)?

AlterTableSpec ::=
    TableOptionList
|   'SET' 'TIFLASH' 'REPLICA' LengthNum LocationLabelList
|   'CONVERT' 'TO' CharsetKw ( CharsetName | 'DEFAULT' ) OptCollate
|   'ADD' ( ColumnKeywordOpt IfNotExists ( ColumnDef ColumnPosition | '('
    ↪ TableElementList ')' ) | Constraint | 'PARTITION' IfNotExists
    ↪ NoWriteToBinLogAliasOpt ( PartitionDefinitionListOpt | 'PARTITIONS'
    ↪ NUM ) )
|   ( ( 'CHECK' | 'TRUNCATE' ) 'PARTITION' | ( 'OPTIMIZE' | 'REPAIR' | '
    ↪ REBUILD' ) 'PARTITION' NoWriteToBinLogAliasOpt )
    ↪ AllOrPartitionNameList
|   'COALESCE' 'PARTITION' NoWriteToBinLogAliasOpt NUM
|   'DROP' ( ColumnKeywordOpt IfExists ColumnName RestrictOrCascadeOpt | '
    ↪ PRIMARY' 'KEY' | 'PARTITION' IfExists PartitionNameList | (
    ↪ KeyOrIndex IfExists | 'CHECK' ) Identifier | 'FOREIGN' 'KEY' IfExists
    ↪  Symbol )
|   'EXCHANGE' 'PARTITION' Identifier 'WITH' 'TABLE' TableName
    ↪ WithValidationOpt

    ↪ TABLESPACE'
|   'REORGANIZE' 'PARTITION' NoWriteToBinLogAliasOpt
    ↪ ReorganizePartitionRuleOpt
|   'ORDER' 'BY' AlterOrderItem ( ',' AlterOrderItem )*
|   ( 'DISABLE' | 'ENABLE' ) 'KEYS'
|   ( 'MODIFY' ColumnKeywordOpt IfExists | 'CHANGE' ColumnKeywordOpt
    ↪ IfExists ColumnName ) ColumnDef ColumnPosition
|   'ALTER' ( ColumnKeywordOpt ColumnName ( 'SET' 'DEFAULT' ( SignedLiteral
    ↪ | '(' Expression ')' ) | 'DROP' 'DEFAULT' ) | 'CHECK' Identifier
    ↪ EnforcedOrNot | 'INDEX' Identifier IndexInvisible )
|   'RENAME' ( ( 'COLUMN' | KeyOrIndex ) Identifier 'TO' Identifier | ( 'TO'
    ↪  | '='? | 'AS' ) TableName )
|   LockClause
|   AlgorithmClause
|   'FORCE'
|   ( 'WITH' | 'WITHOUT' ) 'VALIDATION'
|   'SECONDARY_LOAD'
|   'SECONDARY_UNLOAD'
|   ( 'AUTO_INCREMENT' | 'AUTO_ID_CACHE' | 'AUTO_RANDOM_BASE' | '
    ↪ SHARD_ROW_ID_BITS' ) EqOpt LengthNum
|   ( 'CACHE' | 'NOCACHE' )
|   (
        'TTL' EqOpt TimeColumnName '+' 'INTERVAL' Expression TimeUnit (
            ↪ TTLEnable EqOpt ( 'ON' | 'OFF' ))?
```

```
        | 'REMOVE' 'TTL'
        | TTLEnable EqOpt ( 'ON' | 'OFF' )
    )
|   PlacementPolicyOption

PlacementPolicyOption ::=
    "PLACEMENT" "POLICY" EqOpt PolicyName
|   "PLACEMENT" "POLICY" (EqOpt | "SET") "DEFAULT"
```

#### 14.10.2.15.2 Examples

Create a table with some initial data:

```
CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT NOT
    ↪ NULL);
INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
```

```
Query OK, 0 rows affected (0.11 sec)

Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0
```

The following query requires a full table scan because the column c1 is not indexed:

```
EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
```

```
+--
    ↪ ----------------------+----------+-----------+---------------+----------------
    ↪
| id                    | estRows | task      | access object | operator info
    ↪            |
+--
    ↪ ----------------------+----------+-----------+---------------+----------------
    ↪
| TableReader_7         | 10.00   | root      |               | data:Selection_6
    ↪           |
| └─Selection_6         | 10.00   | cop[tikv] |               | eq(test.t1.c1,
    ↪ 3)          |
|   └─TableFullScan_5   | 10000.00 | cop[tikv] | table:t1 | keep order:false
    ↪ , stats:pseudo |
+--
    ↪ ----------------------+----------+-----------+---------------+----------------
    ↪
3 rows in set (0.00 sec)
```

The statement `ALTER TABLE .. ADD INDEX` can be used to add an index on the table t1. `EXPLAIN` confirms that the original query now uses an index range scan, which is more efficient:

```
ALTER TABLE t1 ADD INDEX (c1);
EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
```

```
Query OK, 0 rows affected (0.30 sec)

+--
    ↪ ---------------------+---------+----------+-----------------------+----------
    ↪
| id                    | estRows | task     | access object         | operator
    ↪ info                              |
+--
    ↪ ---------------------+---------+----------+-----------------------+----------
    ↪
| IndexReader_6         | 10.00   | root     |                       | index:
    ↪ IndexRangeScan_5                  |
|  ─IndexRangeScan_5    | 10.00   | cop[tikv] | table:t1, index:c1(c1) | range
    ↪ :[3,3], keep order:false, stats:pseudo |
+--
    ↪ ---------------------+---------+----------+-----------------------+----------
    ↪
2 rows in set (0.00 sec)
```

TiDB supports the ability to assert that DDL changes will use a particular `ALTER` algorithm. This is only an assertion, and does not change the actual algorithm which will be used to modify the table. It can be useful if you only want to permit instant DDL changes during the peak hours of your cluster:

```
ALTER TABLE t1 DROP INDEX c1, ALGORITHM=INSTANT;
```

```
Query OK, 0 rows affected (0.24 sec)
```

Using the `ALGORITHM=INSTANT` assertion on an operation that requires the `INPLACE` algorithm results in a statement error:

```
ALTER TABLE t1 ADD INDEX (c1), ALGORITHM=INSTANT;
```

```
ERROR 1846 (0A000): ALGORITHM=INSTANT is not supported. Reason: Cannot
    ↪ alter table by INSTANT. Try ALGORITHM=INPLACE.
```

However, using the `ALGORITHM=COPY` assertion for an `INPLACE` operation generates a warning instead of an error. This is because TiDB interprets the assertion as *this algorithm or better*. This behavior difference is useful for MySQL compatibility because the algorithm TiDB uses might differ from MySQL:

```
ALTER TABLE t1 ADD INDEX (c1), ALGORITHM=COPY;
SHOW WARNINGS;
```

```
Query OK, 0 rows affected, 1 warning (0.25 sec)

+--
   ↪ -----+------+-----------------------------------------------------------------
   ↪

1 row in set (0.00 sec)
```

#### 14.10.2.15.3 MySQL compatibility

The following major restrictions apply to `ALTER TABLE` in TiDB:

- When altering multiple schema objects in a single `ALTER TABLE` statement:
    - Modifying the same object in multiple changes is not supported.
    - TiDB validates statements according to the table schema **before execution**. For example, an error returns when `ALTER TABLE ADD INDEX i(b), DROP INDEX i;` is executed because the index `i` does not exist in the table.
    - For an `ALTER TABLE` statement, the order of execution in TiDB is one change after another from left to right, which is incompatible with MySQL in some cases.
- Changes of the Reorg-Data types on primary key columns are not supported.
- Changes of column types on partitioned tables are not supported.
- Changes of column types on generated columns are not supported.
- Changes of some data types (for example, some TIME, Bit, Set, Enum, and JSON types) are not supported due to the compatibility issues of the `CAST` function's behavior between TiDB and MySQL.
- Spatial data types are not supported.

- `ALTER TABLE t CACHE | NOCACHE` is a TiDB extension to MySQL syntax. For details, see Cached Tables.

For further restrictions, see MySQL Compatibility.

### 14.10.2.16 ALTER TABLE ... COMPACT

To enhance read performance and reduce disk usage, TiDB automatically schedules data compaction on storage nodes in the background. During the compaction, storage nodes rewrite physical data, including cleaning up deleted rows and merging multiple versions of data caused by updates. The `ALTER TABLE ... COMPACT` statement allows you to initiate compaction for a specific table immediately, without waiting until compaction is triggered in the background.

The execution of this statement does not block existing SQL statements or affect any TiDB features, such as transactions, DDL, and GC. Data that can be selected via SQL statements will not be changed either. Executing this statement consumes some IO and CPU resources. Be careful to choose an appropriate timing for execution, such as when resources are available, to avoid negative impact on the business.

The compaction statement will be finished and returned when all replicas of a table are compacted. During the execution process, you can safely interrupt the compaction by executing the `KILL` statement. Interrupting a compaction does not break data consistency or lead to data loss, nor does it affect subsequent manual or background compactions.

This data compaction statement is currently supported only for TiFlash replicas, not for TiKV replicas.

#### 14.10.2.16.1 Synopsis

```
AlterTableCompactStmt ::=
    'ALTER' 'TABLE' TableName 'COMPACT' ( 'PARTITION' PartitionNameList )? (
      ↪ 'TIFLASH' 'REPLICA' )?
```

Since v6.2.0, the `TIFLASH REPLICA` part of the syntax can be omitted. When omitted, the semantic of the statement remains unchanged, and takes effect only for TiFlash.

#### 14.10.2.16.2 Examples

Compact TiFlash replicas in a table

The following takes an `employees` table as an example, which has 4 partitions with 2 TiFlash replicas:

```
CREATE TABLE employees (
    id INT NOT NULL,
    hired DATE NOT NULL DEFAULT '1970-01-01',
    store_id INT
)
PARTITION BY LIST (store_id) (
    PARTITION pNorth VALUES IN (1, 2, 3, 4, 5),
    PARTITION pEast VALUES IN (6, 7, 8, 9, 10),
    PARTITION pWest VALUES IN (11, 12, 13, 14, 15),
    PARTITION pCentral VALUES IN (16, 17, 18, 19, 20)
);
ALTER TABLE employees SET TIFLASH REPLICA 2;
```

You can execute the following statement to immediately initiate the compaction for the 2 TiFlash replicas for all partitions in the `employees` table:

```
ALTER TABLE employees COMPACT TIFLASH REPLICA;
```

Compact TiFlash replicas of specified partitions in a table

The following takes an `employees` table as an example, which has 4 partitions with 2 TiFlash replicas:

```
CREATE TABLE employees (
    id INT NOT NULL,
    hired DATE NOT NULL DEFAULT '1970-01-01',
    store_id INT
)
PARTITION BY LIST (store_id) (
    PARTITION pNorth VALUES IN (1, 2, 3, 4, 5),
    PARTITION pEast VALUES IN (6, 7, 8, 9, 10),
    PARTITION pWest VALUES IN (11, 12, 13, 14, 15),
    PARTITION pCentral VALUES IN (16, 17, 18, 19, 20)
);

ALTER TABLE employees SET TIFLASH REPLICA 2;
```

You can execute the following statement to immediately initiate the compaction for the 2 TiFlash replicas of the `pNorth` and `pEast` partitions in the `employees` table:

```
ALTER TABLE employees COMPACT PARTITION pNorth, pEast TIFLASH REPLICA;
```

#### 14.10.2.16.3 Concurrency

The `ALTER TABLE ... COMPACT` statement compacts all replicas in a table simultaneously.

To avoid a significant impact on online business, each TiFlash instance only compacts data in one table at a time by default (except for the compaction triggered in the background). This means that if you execute the `ALTER TABLE ... COMPACT` statement on multiple tables at the same time, their executions will be queued on the same TiFlash instance, rather than being executed simultaneously.

To obtain greater table-level concurrency with higher resource usage, you can modify the TiFlash configuration `manual_compact_pool_size`. For example, when `manual_compact_pool_size` is set to 2, compaction for 2 tables can be processed simultaneously.

#### 14.10.2.16.4 Observe data compaction progress

You can observe the progress of data compaction or determine whether to initiate compaction for a table by checking the `TOTAL_DELTA_ROWS` column in the `INFORMATION_SCHEMA` ↪ `.TIFLASH_TABLES` table. The larger the value of `TOTAL_DELTA_ROWS`, the more data that can be compacted. If `TOTAL_DELTA_ROWS` is `0`, all data in the table is in the best state and does not need to be compacted.

Example: Check the compaction state of a non-partitioned table

```
USE test;

CREATE TABLE foo(id INT);

ALTER TABLE foo SET TIFLASH REPLICA 1;

SELECT TOTAL_DELTA_ROWS, TOTAL_STABLE_ROWS FROM INFORMATION_SCHEMA.
    ↪ TIFLASH_TABLES
    WHERE IS_TOMBSTONE = 0 AND
    `TIDB_DATABASE` = "test" AND `TIDB_TABLE` = "foo";
+------------------+------------------+
| TOTAL_DELTA_ROWS | TOTAL_STABLE_ROWS |
+------------------+------------------+
|                0 |                0 |
+------------------+------------------+

INSERT INTO foo VALUES (1), (3), (7);
```

```
SELECT TOTAL_DELTA_ROWS, TOTAL_STABLE_ROWS FROM INFORMATION_SCHEMA.
    ↪ TIFLASH_TABLES
    WHERE IS_TOMBSTONE = 0 AND
    `TIDB_DATABASE` = "test" AND `TIDB_TABLE` = "foo";
+------------------+------------------+
| TOTAL_DELTA_ROWS | TOTAL_STABLE_ROWS |
+------------------+------------------+
|                3 |                0 |
+------------------+------------------+
-- Newly written data can be compacted

ALTER TABLE foo COMPACT TIFLASH REPLICA;

SELECT TOTAL_DELTA_ROWS, TOTAL_STABLE_ROWS FROM INFORMATION_SCHEMA.
    ↪ TIFLASH_TABLES
    WHERE IS_TOMBSTONE = 0 AND
    `TIDB_DATABASE` = "test" AND `TIDB_TABLE` = "foo";
+------------------+------------------+
| TOTAL_DELTA_ROWS | TOTAL_STABLE_ROWS |
+------------------+------------------+
|                0 |                3 |
+------------------+------------------+
-- All data is in the best state and no compaction is needed
```

Example: Check the compaction state of a partitioned table

```
USE test;

CREATE TABLE employees
    (id INT NOT NULL, store_id INT)
    PARTITION BY LIST (store_id) (
        PARTITION pNorth VALUES IN (1, 2, 3, 4, 5),
        PARTITION pEast VALUES IN (6, 7, 8, 9, 10),
        PARTITION pWest VALUES IN (11, 12, 13, 14, 15),
        PARTITION pCentral VALUES IN (16, 17, 18, 19, 20)
    );

ALTER TABLE employees SET TIFLASH REPLICA 1;

INSERT INTO employees VALUES (1, 1), (6, 6), (10, 10);

SELECT PARTITION_NAME, TOTAL_DELTA_ROWS, TOTAL_STABLE_ROWS
    FROM INFORMATION_SCHEMA.TIFLASH_TABLES t, INFORMATION_SCHEMA.PARTITIONS
        ↪ p
```

```
    WHERE t.IS_TOMBSTONE = 0 AND t.TABLE_ID = p.TIDB_PARTITION_ID AND
    p.TABLE_SCHEMA = "test" AND p.TABLE_NAME = "employees";
+----------------+------------------+-------------------+
| PARTITION_NAME | TOTAL_DELTA_ROWS | TOTAL_STABLE_ROWS |
+----------------+------------------+-------------------+
| pNorth         |                1 |                 0 |
| pEast          |                2 |                 0 |
| pWest          |                0 |                 0 |
| pCentral       |                0 |                 0 |
+----------------+------------------+-------------------+
-- Some partitions can be compacted

ALTER TABLE employees COMPACT TIFLASH REPLICA;

SELECT PARTITION_NAME, TOTAL_DELTA_ROWS, TOTAL_STABLE_ROWS
    FROM INFORMATION_SCHEMA.TIFLASH_TABLES t, INFORMATION_SCHEMA.PARTITIONS
        ↪ p
    WHERE t.IS_TOMBSTONE = 0 AND t.TABLE_ID = p.TIDB_PARTITION_ID AND
    p.TABLE_SCHEMA = "test" AND p.TABLE_NAME = "employees";
+----------------+------------------+-------------------+
| PARTITION_NAME | TOTAL_DELTA_ROWS | TOTAL_STABLE_ROWS |
+----------------+------------------+-------------------+
| pNorth         |                0 |                 1 |
| pEast          |                0 |                 2 |
| pWest          |                0 |                 0 |
| pCentral       |                0 |                 0 |
+----------------+------------------+-------------------+
-- Data in all partitions is in the best state and no compaction is needed
```

**Note:**

- If data is updated during compaction, `TOTAL_DELTA_ROWS` might still be a non-zero value after compaction is done. This is normal and indicates that these updates have not been compacted. To compact these updates, execute the `ALTER TABLE ... COMPACT` statement again.
- `TOTAL_DELTA_ROWS` indicates the data version, not the number of rows. For example, if you insert a row and then delete it, `TOTAL_DELTA_ROWS` will increase by 2.

#### 14.10.2.16.5 Compatibility

MySQL compatibility

The `ALTER TABLE ... COMPACT` syntax is TiDB specific, which is an extension to the standard SQL syntax. Although there is no equivalent MySQL syntax, you can still execute this statement by using MySQL clients or various database drivers that comply with the MySQL protocol.

TiDB Binlog and TiCDC compatibility

The `ALTER TABLE ... COMPACT` statement does not result in logical data changes and are therefore not replicated to downstream by TiDB Binlog or TiCDC.

#### 14.10.2.16.6 See also

- ALTER TABLE
- KILL TIDB

### 14.10.2.17 ALTER USER

This statement changes an existing user inside the TiDB privilege system. In the MySQL privilege system, a user is the combination of a username and the host from which they are connecting from. Thus, it is possible to create a user `'newuser2'@'192.168.1.1'` who is only able to connect from the IP address `192.168.1.1`. It is also possible to have two users have the same user-portion, and different permissions as they login from different hosts.

#### 14.10.2.17.1 Synopsis

```
AlterUserStmt ::=
    'ALTER' 'USER' IfExists (UserSpecList RequireClauseOpt ConnectionOptions
       ↪  PasswordOption LockOption AttributeOption | 'USER' '(' ')' '
       ↪ IDENTIFIED' 'BY' AuthString)

UserSpecList ::=
    UserSpec ( ',' UserSpec )*

UserSpec ::=
    Username AuthOption

    ( 'REQUIRE' 'NONE' | 'REQUIRE' 'SSL' | 'REQUIRE' 'X509' | 'REQUIRE'
       ↪ RequireList )?

RequireList ::=
    ( "ISSUER" stringLit | "SUBJECT" stringLit | "CIPHER" stringLit | "SAN"
       ↪ stringLit | "TOKEN_ISSUER" stringLit )*
```

```
Username ::=
    StringName ('@' StringName | singleAtIdentifier)? | 'CURRENT_USER'
       ↪ OptionalBraces

AuthOption ::=
    ( 'IDENTIFIED' ( 'BY' ( AuthString | 'PASSWORD' HashString ) | 'WITH'
       ↪ StringName ( 'BY' AuthString | 'AS' HashString )? ) )?

PasswordOption ::= ( 'PASSWORD' 'EXPIRE' ( 'DEFAULT' | 'NEVER' | 'INTERVAL'
    ↪ N 'DAY' )? | 'PASSWORD' 'HISTORY' ( 'DEFAULT' | N ) | 'PASSWORD' '
    ↪ REUSE' 'INTERVAL' ( 'DEFAULT' | N 'DAY' ) | 'FAILED_LOGIN_ATTEMPTS' N
    ↪  | 'PASSWORD_LOCK_TIME' ( N | 'UNBOUNDED' ) )*

LockOption ::= ( 'ACCOUNT' 'LOCK' | 'ACCOUNT' 'UNLOCK' )?

AttributeOption ::= ( 'COMMENT' CommentString | 'ATTRIBUTE' AttributeString
    ↪ )?
```

#### 14.10.2.17.2 Examples

```
mysql> CREATE USER 'newuser' IDENTIFIED BY 'newuserpassword';
Query OK, 1 row affected (0.01 sec)

mysql> SHOW CREATE USER 'newuser';
+--
    ↪ ------------------------------------------------------------------------
    ↪
| CREATE USER for newuser@%
    ↪
    ↪ |
+--
    ↪ ------------------------------------------------------------------------
    ↪
| CREATE USER 'newuser'@'%' IDENTIFIED WITH 'mysql_native_password' AS '
    ↪ *5806E04BBEE79E1899964C6A04D68BCA69B1A879' REQUIRE NONE PASSWORD
    ↪ EXPIRE DEFAULT ACCOUNT UNLOCK |
+--
    ↪ ------------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)

mysql> ALTER USER 'newuser' IDENTIFIED BY 'newnewpassword';
Query OK, 0 rows affected (0.02 sec)
```

```
mysql> SHOW CREATE USER 'newuser';
+--
    ↪ ------------------------------------------------------------------------------
    ↪
| CREATE USER for newuser@%
    ↪
    ↪ |
+--
    ↪ ------------------------------------------------------------------------------
    ↪
| CREATE USER 'newuser'@'%' IDENTIFIED WITH 'mysql_native_password' AS '*
    ↪ FB8A1EA1353E8775CA836233E367FBDFCB37BE73' REQUIRE NONE PASSWORD
    ↪ EXPIRE DEFAULT ACCOUNT UNLOCK |
+--
    ↪ ------------------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

```
ALTER USER 'newuser' ACCOUNT LOCK;
```

```
Query OK, 0 rows affected (0.02 sec)
```

Modify the attributes of `newuser`:

```
ALTER USER 'newuser' ATTRIBUTE '{"newAttr": "value", "deprecatedAttr": null
    ↪ }';
SELECT * FROM information_schema.user_attributes;
```

```
+----------+------+-------------------------+
| USER     | HOST | ATTRIBUTE               |
+----------+------+-------------------------+
| newuser  | %    | {"newAttr": "value"}  |
+----------+------+-------------------------+
1 rows in set (0.00 sec)
```

Modify the comment of `newuser` using `ALTER USER ... COMMENT`:

```
ALTER USER 'newuser' COMMENT 'Here is the comment';
SELECT * FROM information_schema.user_attributes;
```

```
+--
    ↪ ---------+------+-------------------------------------------------------------+
    ↪
| USER     | HOST | ATTRIBUTE                                                   |
```

```
+--
    ↪ ---------+------+-------------------------------------------------------+
    ↪
| newuser  | %    | {"comment": "Here is the comment", "newAttr": "value"} |
+--
    ↪ ---------+------+-------------------------------------------------------+
    ↪
1 rows in set (0.00 sec)
```

Remove the comment of `newuser` using `ALTER USER ... ATTRIBUTE`:

```
ALTER USER 'newuser' ATTRIBUTE '{"comment": null}';
SELECT * FROM information_schema.user_attributes;
```

```
+-----------+------+--------------------------+
| USER      | HOST | ATTRIBUTE                |
+-----------+------+--------------------------+
| newuser  | %    | {"newAttr": "value"}   |
+-----------+------+--------------------------+
1 rows in set (0.00 sec)
```

Change the automatic password expiration policy for `newuser` to never expire via `ALTER USER ... PASSWORD EXPIRE NEVER`:

```
ALTER USER 'newuser' PASSWORD EXPIRE NEVER;
```

```
Query OK, 0 rows affected (0.02 sec)
```

Modify the password reuse policy for `newuser` to disallow the reuse of any password used within the last 90 days using `ALTER USER ... PASSWORD REUSE INTERVAL ... DAY`:

```
ALTER USER 'newuser' PASSWORD REUSE INTERVAL 90 DAY;
```

```
Query OK, 0 rows affected (0.02 sec)
```

#### 14.10.2.18 ANALYZE

This statement updates the statistics that TiDB builds on tables and indexes. It is recommended to run `ANALYZE` after performing a large batch update or import of records, or when you notice that query execution plans are sub-optimal.

TiDB will also automatically update its statistics over time as it discovers that they are inconsistent with its own estimates.

Currently, TiDB collects statistical information in two ways: full collection (implemented using the `ANALYZE TABLE` statement) and incremental collection (implemented using the `ANALYZE INCREMENTAL TABLE` statement). For detailed usage of these two statements, refer to introduction to statistics

##### 14.10.2.18.1 Synopsis

```
AnalyzeTableStmt ::=
    'ANALYZE' ( 'TABLE' ( TableNameList ( 'ALL COLUMNS' | 'PREDICATE COLUMNS
       ↪ ' ) | TableName ( 'INDEX' IndexNameList? | AnalyzeColumnOption | '
       ↪ PARTITION' PartitionNameList ( 'INDEX' IndexNameList? |
       ↪ AnalyzeColumnOption )? )? ) | 'INCREMENTAL' 'TABLE' TableName ( '
       ↪ PARTITION' PartitionNameList )? 'INDEX' IndexNameList? )
       ↪ AnalyzeOptionListOpt

AnalyzeOptionListOpt ::=
( WITH AnalyzeOptionList )?

AnalyzeOptionList ::=
AnalyzeOption ( ',' AnalyzeOption )*

AnalyzeOption ::=
( NUM ( 'BUCKETS' | 'TOPN' | ( 'CMSKETCH' ( 'DEPTH' | 'WIDTH' ) ) | 'SAMPLES
   ↪ ' ) ) | ( FLOATNUM 'SAMPLERATE' )

AnalyzeColumnOption ::=
( 'ALL COLUMNS' | 'PREDICATE COLUMNS' | 'COLUMNS' ColumnNameList )

TableNameList ::=
    TableName (',' TableName)*

TableName ::=
    Identifier ( '.' Identifier )?

ColumnNameList ::=
    Identifier ( ',' Identifier )*

IndexNameList ::=
```

```
    Identifier ( ',' Identifier )*

PartitionNameList ::=
    Identifier ( ',' Identifier )*
```

#### 14.10.2.18.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> ALTER TABLE t1 ADD INDEX (c1);
Query OK, 0 rows affected (0.30 sec)

mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
+--

    ↪ IndexRangeScan_5    |
|  ─IndexRangeScan_5    | 1.00    | cop[tikv] | table:t1, index:c1(c1) | range
    ↪ :[3,3], keep order:false |
+--
    ↪ --------------------+---------+-----------+-----------------------+----------
    ↪
2 rows in set (0.00 sec)
```

#### 14.10.2.18.3 MySQL compatibility

TiDB differs from MySQL in **both** the statistics it collects and how it makes use of statistics during query execution. While this statement is syntactically similar to MySQL, the following differences apply:

1. TiDB might not include very recently committed changes when running `ANALYZE TABLE`. After a batch-update of rows, you might need to `sleep(1)` before executing `ANALYZE TABLE` in order for the statistics update to reflect these changes. #16570.
2. `ANALYZE TABLE` takes significantly longer to execute in TiDB than MySQL. This performance difference can be partially mitigated by enabling fast analyze with `SET GLOBAL tidb_enable_fast_analyze=1`. Fast analyze makes use of sampling, leading to less accurate statistics. Its usage is still considered experimental.

MySQL does not support the `ANALYZE INCREMENTAL TABLE` statement. TiDB supports incremental collection of statistics. For detailed usage, refer to incremental collection.

The BACKUP statement uses the same engine as the BR tool does, except that the backup process is driven by TiDB itself rather than a separate BR tool. All benefits and warnings of BR also apply in this statement.

Executing BACKUP requires either the BACKUP_ADMIN or SUPER privilege. Additionally, both the TiDB node executing the backup and all TiKV nodes in the cluster must have read or write permission to the destination. Local storage (storage paths starting with local://) is not permitted when Security Enhanced Mode is enabled.

The BACKUP statement is blocked until the entire backup task is finished, failed, or canceled. A long-lasting connection should be prepared for executing BACKUP. The task can be canceled using the KILL TIDB QUERY statement.

Only one BACKUP and RESTORE task can be executed at a time. If a BACKUP or RESTORE statement is already being executed on the same TiDB server, the new BACKUP execution will wait until all previous tasks are finished.

BACKUP can only be used with "tikv" storage engine. Using BACKUP with the "unistore" engine will fail.

#### 14.10.2.19.1 Synopsis

```
BackupStmt ::=
    "BACKUP" BRIETables "TO" stringLit BackupOption*

BRIETables ::=
    "DATABASE" ( '*' | DBName (',' DBName)* )
|   "TABLE" TableNameList

BackupOption ::=
    "RATE_LIMIT" '='? LengthNum "MB" '/' "SECOND"
|   "CONCURRENCY" '='? LengthNum
|   "CHECKSUM" '='? Boolean
|   "SEND_CREDENTIALS_TO_TIKV" '='? Boolean
|   "LAST_BACKUP" '='? BackupTSO
|   "SNAPSHOT" '='? ( BackupTSO | LengthNum TimestampUnit "AGO" )

Boolean ::=
    NUM | "TRUE" | "FALSE"

BackupTSO ::=
    LengthNum | stringLit
```

#### 14.10.2.19.2 Examples

Back up databases

```
BACKUP DATABASE `test` TO 'local:///mnt/backup/2020/04/';
```

```
+--
   ↪ ---------------------------+----------+---------------+--------------------
   ↪
| Destination                | Size     | BackupTS      | Queue Time         |
   ↪ Execution Time    |
+--
   ↪ ---------------------------+----------+---------------+--------------------
   ↪
| local:///mnt/backup/2020/04/ | 248665063 | 416099531454472 | 2020-04-12
   ↪ 23:09:48 | 2020-04-12 23:09:48 |
+--
   ↪ ---------------------------+----------+---------------+--------------------
   ↪
1 row in set (58.453 sec)
```

In the example above, the `test` database is backed up into the local filesystem. The data is saved as SST files in the `/mnt/backup/2020/04/` directories distributed among all TiDB and TiKV nodes.

The first row of the result above is described as follows:

| Column | Description |
|---|---|
| `Destination` ↪ | The destination URL |
| `Size` | The total size of the backup archive, in bytes |
| `BackupTS` | The TSO of the snapshot when the backup is created (useful for incremental backup) |

| Column | Description |
|---|---|
| `Queue Time` | The timestamp (in current time zone) when the `BACKUP` task is queued. |
| `Execution Time` | The timestamp (in current time zone) when the `BACKUP` task starts to run. |

Back up tables

```
BACKUP TABLE `test`.`sbtest01` TO 'local:///mnt/backup/sbtest01/';
```

```
BACKUP TABLE sbtest02, sbtest03, sbtest04 TO 'local:///mnt/backup/sbtest/';
```

Back up the entire cluster

```
BACKUP DATABASE * TO 'local:///mnt/backup/full/';
```

Note that the system tables (`mysql.*`, `INFORMATION_SCHEMA.*`, `PERFORMANCE_SCHEMA.*`, …) will not be included into the backup.

External storages

BR supports backing up data to S3 or GCS:

```
BACKUP DATABASE `test` TO 's3://example-bucket-2020/backup-05/?access-key={YOUR_ACCESS_KEY}&secret-access-key={YOUR_SECRET_KEY}';
```

The URL syntax is further explained in external storage URL.

When running on cloud environment where credentials should not be distributed, set the `SEND_CREDENTIALS_TO_TIKV` option to `FALSE`:

```
BACKUP DATABASE `test` TO 's3://example-bucket-2020/backup-05/'
    SEND_CREDENTIALS_TO_TIKV = FALSE;
```

Performance fine-tuning

Use `RATE_LIMIT` to limit the average upload speed per TiKV node to reduce network bandwidth.

By default, every TiKV node would run 4 backup threads. This value can be adjusted with the `CONCURRENCY` option.

Before backup is completed, `BACKUP` would perform a checksum against the data on the cluster to verify correctness. This step can be disabled with the `CHECKSUM` option if you are confident that this is unnecessary.

```
BACKUP DATABASE `test` TO 's3://example-bucket-2020/backup-06/'
    RATE_LIMIT = 120 MB/SECOND
    CONCURRENCY = 8
    CHECKSUM = FALSE;
```

Snapshot

Specify a timestamp, TSO or relative time to backup historical data.

```
-- relative time
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist01'
    SNAPSHOT = 36 HOUR AGO;

-- timestamp (in current time zone)
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist02'
    SNAPSHOT = '2020-04-01 12:00:00';

-- timestamp oracle
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist03'
    SNAPSHOT = 415685305958400;
```

The supported units for relative time are:

- MICROSECOND
- SECOND
- MINUTE
- HOUR
- DAY
- WEEK

Note that, following SQL standard, the units are always singular.

Incremental backup

Supply the `LAST_BACKUP` option to only backup the changes between the last backup to the current snapshot.

```
-- timestamp (in current time zone)
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist02'
```

```
    LAST_BACKUP = '2020-04-01 12:00:00';

-- timestamp oracle
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist03'
    LAST_BACKUP = 415685305958400;
```

#### 14.10.2.19.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

- RESTORE
- SHOW BACKUPS

### 14.10.2.20 BATCH

The `BATCH` syntax splits a DML statement into multiple statements in TiDB for execution. This means that there are **no guarantees** of transactional atomicity and isolation. Therefore, it is a "non-transactional" statement.

Currently, `INSERT`, `REPLACE`, `UPDATE`, and `DELETE` are supported in `BATCH`.

Based on a column, the `BATCH` syntax divides a DML statement into multiple ranges of scope for execution. In each range, a single SQL statement is executed.

For details about the usage and restrictions, see Non-transactional DML statements.

When you use multi-table join in a `BATCH` statement, you need to specify the full path of the column to avoid ambiguity:

```
BATCH ON test.t2.id LIMIT 1 INSERT INTO t SELECT t2.id, t2.v, t3.v FROM t2
    ↪ JOIN t3 ON t2.k = t3.k;
```

The preceding statement specifies the column to be split as `test.t2.id`, which is unambiguous. If you use the `id` as follows, an error is reported:

```
BATCH ON id LIMIT 1 INSERT INTO t SELECT t2.id, t2.v, t3.v FROM t2 JOIN t3
    ↪ ON t2.k = t3.k;

Non-transactional DML, shard column must be fully specified
```

#### 14.10.2.20.1 Synopsis

```
NonTransactionalDMLStmt ::=
    'BATCH' ( 'ON' ColumnName )? 'LIMIT' NUM DryRunOptions? ShardableStmt
```

```
DryRunOptions ::=
    'DRY' 'RUN' 'QUERY'?

ShardableStmt ::=
    DeleteFromStmt
|   UpdateStmt
|   InsertIntoStmt
|   ReplaceIntoStmt
```

#### 14.10.2.20.2 MySQL compatibility

The `BATCH` syntax is TiDB-specific and not compatible with MySQL.

#### 14.10.2.20.3 See also

- Non-transactional DML statements

### 14.10.2.21 BEGIN

This statement starts a new transaction inside of TiDB. It is similar to the statements `START TRANSACTION` and `SET autocommit=0`.

In the absence of a `BEGIN` statement, every statement will by default autocommit in its own transaction. This behavior ensures MySQL compatibility.

#### 14.10.2.21.1 Synopsis

```
BeginTransactionStmt ::=
    'BEGIN' ( 'PESSIMISTIC' | 'OPTIMISTIC' )?
|   'START' 'TRANSACTION' ( 'READ' ( 'WRITE' | 'ONLY' ( 'WITH' 'TIMESTAMP' '
    ↪ BOUND' TimestampBound )? ) | 'WITH' 'CONSISTENT' 'SNAPSHOT' )?
```

#### 14.10.2.21.2 Examples

```
mysql> CREATE TABLE t1 (a int NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.12 sec)

mysql> BEGIN;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.00 sec)

mysql> COMMIT;
Query OK, 0 rows affected (0.01 sec)
```

#### 14.10.2.21.3 MySQL compatibility

TiDB supports the syntax extension of `BEGIN PESSIMISTIC` or `BEGIN OPTIMISTIC`. This enables you to override the default transactional model for your transaction.

#### 14.10.2.21.4 See also

- COMMIT
- ROLLBACK
- START TRANSACTION
- TiDB optimistic transaction model
- TiDB pessimistic transaction mode

### 14.10.2.22 CHANGE COLUMN

The `ALTER TABLE.. CHANGE COLUMN` statement changes a column on an existing table. The change can include both renaming the column, and changing the data type to a compatible type.

Since v5.1.0, TiDB has supported changing the Reorg data type, including but not limited to:

- Changing `VARCHAR` to `BIGINT`
- Modifying the `DECIMAL` precision
- Compressing the length of `VARCHAR(10)` to `VARCHAR(5)`

#### 14.10.2.22.1 Synopsis

```
AlterTableStmt
        ::= 'ALTER' 'IGNORE'? 'TABLE' TableName ChangeColumnSpec ( ','
           ↪ ChangeColumnSpec )*

ChangeColumnSpec
        ::= 'CHANGE' ColumnKeywordOpt 'IF EXISTS' ColumnName ColumnName
           ↪ ColumnType ColumnOption* ( 'FIRST' | 'AFTER' ColumnName )?

ColumnType
        ::= NumericType
          | StringType
          | DateAndTimeType
          | 'SERIAL'

ColumnOption
        ::= 'NOT'? 'NULL'
          | 'AUTO_INCREMENT'
          | 'PRIMARY'? 'KEY' ( 'CLUSTERED' | 'NONCLUSTERED' )?
```

```
          | 'UNIQUE' 'KEY'?
          | 'DEFAULT' ( NowSymOptionFraction | SignedLiteral |
             ↪ NextValueForSequence )
          | 'SERIAL' 'DEFAULT' 'VALUE'
          | 'ON' 'UPDATE' NowSymOptionFraction
          | 'COMMENT' stringLit
          | ( 'CONSTRAINT' Identifier? )? 'CHECK' '(' Expression ')' ( 'NOT
             ↪ '? ( 'ENFORCED' | 'NULL' ) )?
          | 'GENERATED' 'ALWAYS' 'AS' '(' Expression ')' ( 'VIRTUAL' | '
             ↪ STORED' )?
          | 'REFERENCES' TableName ( '(' IndexPartSpecificationList ')' )?
             ↪ Match? OnDeleteUpdateOpt
          | 'COLLATE' CollationName
          | 'COLUMN_FORMAT' ColumnFormat
          | 'STORAGE' StorageMedia
          | 'AUTO_RANDOM' ( '(' LengthNum ')' )?

ColumnName ::=
    Identifier ( '.' Identifier ( '.' Identifier )? )?
```

#### 14.10.2.22.2 Examples

```
CREATE TABLE t1 (id int not null primary key AUTO_INCREMENT, col1 INT);
```

```
Query OK, 0 rows affected (0.11 sec)
```

```
INSERT INTO t1 (col1) VALUES (1),(2),(3),(4),(5);
```

```
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0
```

```
ALTER TABLE t1 CHANGE col1 col2 INT;
```

```
Query OK, 0 rows affected (0.09 sec)
```

```
ALTER TABLE t1 CHANGE col2 col3 BIGINT, ALGORITHM=INSTANT;
```

```
Query OK, 0 rows affected (0.08 sec)
```

```
ALTER TABLE t1 CHANGE col3 col4 BIGINT, CHANGE id id2 INT NOT NULL;
```

```
ERROR 1105 (HY000): can't run multi schema change
```

```
CREATE TABLE t (a int primary key);
ALTER TABLE t CHANGE COLUMN a a VARCHAR(10);
```

```
ERROR 8200 (HY000): Unsupported modify column: column has primary key flag
```

```
CREATE TABLE t (c1 INT, c2 INT, c3 INT) partition by range columns(c1) (
    ↪ partition p0 values less than (10), partition p1 values less than (
    ↪ maxvalue));
ALTER TABLE t CHANGE COLUMN c1 c1 DATETIME;
```

```
ERROR 8200 (HY000): Unsupported modify column: table is partition table
```

```
CREATE TABLE t (a INT, b INT as (a+1));
ALTER TABLE t CHANGE COLUMN b b VARCHAR(10);
```

```
ERROR 8200 (HY000): Unsupported modify column: column is generated
```

```
CREATE TABLE t (a DECIMAL(13, 7));
ALTER TABLE t CHANGE COLUMN a a DATETIME;
```

```
ERROR 8200 (HY000): Unsupported modify column: change from original type
    ↪ decimal(13,7) to datetime is currently unsupported yet
```

#### 14.10.2.22.3 MySQL compatibility

- Changes of Reorg-Data types on primary key columns are not supported.
- Changes of column types on partitioned tables are not supported.
- Changes of column types on generated columns are not supported.
- Changes from some data types (for example, TIME, BIT, SET, ENUM, and JSON types) to some other types are not supported due to the compatibility issues of the `CAST` function's behavior between TiDB and MySQL.

#### 14.10.2.22.4 See also

- CREATE TABLE
- SHOW CREATE TABLE
- ADD COLUMN
- DROP COLUMN
- MODIFY COLUMN

#### 14.10.2.23 COMMIT

This statement commits a transaction inside of the TIDB server.

In the absence of a `BEGIN` or `START TRANSACTION` statement, the default behavior of TiDB is that every statement will be its own transaction and autocommit. This behavior ensures MySQL compatibility.

##### 14.10.2.23.1 Synopsis

```
CommitStmt ::=
    'COMMIT' CompletionTypeWithinTransaction?

CompletionTypeWithinTransaction ::=
    'AND' ( 'CHAIN' ( 'NO' 'RELEASE' )? | 'NO' 'CHAIN' ( 'NO'? 'RELEASE' )?
       ↪ )
|   'NO'? 'RELEASE'
```

##### 14.10.2.23.2 Examples

```
mysql> CREATE TABLE t1 (a int NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.12 sec)

mysql> START TRANSACTION;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.00 sec)

mysql> COMMIT;
Query OK, 0 rows affected (0.01 sec)
```

##### 14.10.2.23.3 MySQL compatibility

- Currently, TiDB use Metadata Locking (MDL) to prevent DDL statements from modifying tables used by transactions by default. The behavior of metadata lock is different between TiDB and MySQL. For more details, see Metadata Lock.
- By default, TiDB 3.0.8 and later versions use Pessimistic Locking. When using Optimistic Locking, it is important to consider that a `COMMIT` statement might fail because rows have been modified by another transaction.
- When Optimistic Locking is enabled, `UNIQUE` and `PRIMARY KEY` constraint checks are deferred until statement commit. This results in additional situations where a a `COMMIT` statement might fail. This behavior can be changed by setting `tidb_constraint_check_in_place=ON`.

- TiDB parses but ignores the syntax `ROLLBACK AND [NO] RELEASE`. This functionality is used in MySQL to disconnect the client session immediately after committing the transaction. In TiDB, it is recommended to instead use the `mysql_close()` functionality of your client driver.
- TiDB parses but ignores the syntax `ROLLBACK AND [NO] CHAIN`. This functionality is used in MySQL to immediately start a new transaction with the same isolation level while the current transaction is being committed. In TiDB, it is recommended to instead start a new transaction.

### 14.10.2.24 CHANGE DRAINER

The `CHANGE DRAINER` statement modifies the status information for Drainer in the cluster.

> **Tip:**
>
> Drainer's state is automatically reported to PD while running. Only when Drainer is under abnormal circumstances and its state is inconsistent with the state information stored in PD, you can use the `CHANGE DRAINER` statement to modify the state information stored in PD.

#### 14.10.2.24.1 Examples

```
SHOW DRAINER STATUS;
```

```
+--
   ↪ --------/----------------/--------/--------------------/--------------------/
   ↪
|  NodeID |     Address    | State |   Max_Commit_Ts   |    Update_Time     |
+--
   ↪ --------/----------------/--------/--------------------/--------------------/
   ↪
| drainer1 | 127.0.0.3:8249 | Online | 408553768673342532 | 2019-04-30
   ↪ 00:00:03 |
```

```
+--
    ↪ --------/----------------/--------/--------------------/--------------------/
    ↪
| drainer2 | 127.0.0.4:8249 | Online | 408553768673345531 | 2019-05-01
    ↪ 00:00:04 |
+--
    ↪ --------/----------------/--------/--------------------/--------------------/
    ↪
2 rows in set (0.00 sec)
```

It can be seen that drainer1's state has not been updated for more than a day, the Drainer is in an abnormal state, but the `State` remains `Online`. After using `CHANGE DRAINER`, the Drainer's `State` is changed to 'paused':

```
CHANGE DRAINER TO NODE_STATE ='paused' FOR NODE_ID 'drainer1';
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
SHOW DRAINER STATUS;
```

```
+--
    ↪ --------/----------------/--------/--------------------/--------------------/
    ↪
|  NodeID |     Address    | State |   Max_Commit_Ts   |    Update_Time     |
+--
    ↪ --------/----------------/--------/--------------------/--------------------/
    ↪
| drainer1 | 127.0.0.3:8249 | Paused | 408553768673342532 | 2019-04-30
    ↪ 00:00:03 |
+--
    ↪ --------/----------------/--------/--------------------/--------------------/
    ↪
| drainer2 | 127.0.0.4:8249 | Online | 408553768673345531 | 2019-05-01
    ↪ 00:00:04 |
+--
    ↪ --------/----------------/--------/--------------------/--------------------/
    ↪
2 rows in set (0.00 sec)
```

#### 14.10.2.24.2 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.10.2.24.3 See also

- SHOW PUMP STATUS
- SHOW DRAINER STATUS
- CHANGE PUMP STATUS

### 14.10.2.25 CHANGE PUMP

The `CHANGE PUMP` statement modifies the status information for Pump in the cluster.

> **Tip:**
>
> Pump's state is automatically reported to PD while running. Only when Pump is under abnormal circumstances and its state is inconsistent with the state information stored in PD, you can use the `CHANGE PUMP` statement to modify the state information stored in PD.

#### 14.10.2.25.1 Examples

```
SHOW PUMP STATUS;
```

```
+--
    ↪ ------/---------------/--------/--------------------/--------------------/
    ↪
| NodeID |   Address   | State |   Max_Commit_Ts  |    Update_Time     |
+--
    ↪ ------/---------------/--------/--------------------/--------------------/
    ↪
| pump1 | 127.0.0.1:8250 | Online | 408553768673342237 | 2019-04-30 00:00:01
    ↪  |
+--
    ↪ ------/---------------/--------/--------------------/--------------------/
    ↪
| pump2 | 127.0.0.2:8250 | Online | 408553768673342335 | 2019-05-01 00:00:02
    ↪  |
+--
    ↪ ------/---------------/--------/--------------------/--------------------/
    ↪
2 rows in set (0.00 sec)
```

It can be seen that pump1's state has not been updated for more than a day, the Pump is in an abnormal state, but the `State` remains `Online`. After using `CHANGE PUMP`, the Pump's `State` is changed to 'paused' :

```
CHANGE PUMP TO NODE_STATE ='paused' FOR NODE_ID 'pump1';
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
SHOW PUMP STATUS;
```

```
+--
    ↪ ------/----------------/--------/--------------------/--------------------/
    ↪
| NodeID |    Address    | State |   Max_Commit_Ts   |    Update_Time     |
+--
    ↪ ------/----------------/--------/--------------------/--------------------/
    ↪
| pump1 | 127.0.0.1:8250 | Paused | 408553768673342237 | 2019-04-30 00:00:01
    ↪  |
+--
    ↪ ------/----------------/--------/--------------------/--------------------/
    ↪
| pump2 | 127.0.0.2:8250 | Online | 408553768673342335 | 2019-05-01 00:00:02
    ↪  |
+--
    ↪ ------/----------------/--------/--------------------/--------------------/
    ↪
2 rows in set (0.00 sec)
```

#### 14.10.2.25.2 MySQL compatibility

- SHOW PUMP STATUS
- SHOW DRAINER STATUS
- CHANGE DRAINER STATUS

### 14.10.2.26 CREATE [GLOBAL|SESSION] BINDING

This statement creates a new execution plan binding in TiDB. Binding can be used to inject a hint into a statement without requiring changes to the underlying query.

A `BINDING` can be on either a `GLOBAL` or `SESSION` basis. The default is `SESSION`.

The bound SQL statement is parameterized and stored in the system table. When a SQL query is processed, as long as the parameterized SQL statement and a bound one in

the system table are consistent and the system variable `tidb_use_plan_baselines` is set to `ON` (default), the corresponding optimizer hint is available. If multiple execution plans are available, the optimizer chooses to bind the plan with the least cost. For more information, see Create a binding.

#### 14.10.2.26.1 Synopsis

```
CreateBindingStmt ::=
    'CREATE' GlobalScope 'BINDING' ( 'FOR' BindableStmt 'USING' BindableStmt
       ↪ )
|   ( 'FROM' 'HISTORY' 'USING' 'PLAN' 'DIGEST' PlanDigest )

GlobalScope ::=
    ( 'GLOBAL' | 'SESSION' )?

BindableStmt ::=
    ( SelectStmt | UpdateStmt | InsertIntoStmt | ReplaceIntoStmt |
       ↪ DeleteStmt )
```

---

#### 14.10.2.26.2 Examples

You can create a binding according to a SQL statement or a historical execution plan.

The following example shows how to create a binding according to a SQL statement.

```
mysql> CREATE TABLE t1 (
     id INT NOT NULL PRIMARY KEY auto_increment,
     b INT NOT NULL,
     pad VARBINARY(255),
     INDEX(b)
    );
Query OK, 0 rows affected (0.07 sec)

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM dual;
Query OK, 1 row affected (0.01 sec)
Records: 1 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 1 row affected (0.00 sec)
Records: 1 Duplicates: 0 Warnings: 0
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 8 rows affected (0.00 sec)
Records: 8 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 1000 rows affected (0.04 sec)
Records: 1000 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 100000 rows affected (1.74 sec)
Records: 100000 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 100000 rows affected (2.15 sec)
Records: 100000 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 100000 rows affected (2.64 sec)
Records: 100000 Duplicates: 0 Warnings: 0

mysql> SELECT SLEEP(1);
+----------+
| SLEEP(1) |
+----------+
|        0 |
+----------+
1 row in set (1.00 sec)

mysql> ANALYZE TABLE t1;
Query OK, 0 rows affected (1.33 sec)

mysql> EXPLAIN ANALYZE SELECT * FROM t1 WHERE b = 123;

#### 14.10.2.26.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.10.2.26.4 See also

- DROP [GLOBAL|SESSION] BINDING
- SHOW [GLOBAL|SESSION] BINDINGS
- ANALYZE TABLE
- Optimizer Hints
- SQL Plan Management

#### 14.10.2.27 CREATE DATABASE

This statement creates a new database in TiDB. The MySQL terminology for 'database' most closely maps to a schema in the SQL standard.

##### 14.10.2.27.1 Synopsis

```
CreateDatabaseStmt ::=
    'CREATE' 'DATABASE' IfNotExists DBName DatabaseOptionListOpt

IfNotExists ::=
    ( 'IF' 'NOT' 'EXISTS' )?

DBName ::=
    Identifier

DatabaseOptionListOpt ::=
    DatabaseOptionList?

DatabaseOptionList ::=
    DatabaseOption ( ','? DatabaseOption )*

DatabaseOption ::=
    DefaultKwdOpt ( CharsetKw '='? CharsetName | 'COLLATE' '='?
        ↪ CollationName | 'ENCRYPTION' '='? EncryptionOpt )
|   DefaultKwdOpt PlacementPolicyOption

PlacementPolicyOption ::=
    "PLACEMENT" "POLICY" EqOpt PolicyName
|   "PLACEMENT" "POLICY" (EqOpt | "SET") "DEFAULT"
```

##### 14.10.2.27.2 Syntax

The `CREATE DATABASE` statement is used to create a database, and to specify the default properties of the database, such as the default character set and collation. `CREATE SCHEMA` is a synonym for `CREATE DATABASE`.

```
CREATE {DATABASE | SCHEMA} [IF NOT EXISTS] db_name
    [create_specification] ...

create_specification:
    [DEFAULT] CHARACTER SET [=] charset_name
  | [DEFAULT] COLLATE [=] collation_name
```

If you create an existing database and does not specify `IF NOT EXISTS`, an error is displayed.

The `create_specification` option is used to specify the specific `CHARACTER SET` and `COLLATE` in the database. Currently, TiDB only supports some of the character sets and collations. For details, see Character Set and Collation Support.

#### 14.10.2.27.3 Examples

```
mysql> CREATE DATABASE mynewdatabase;
Query OK, 0 rows affected (0.09 sec)

mysql> USE mynewdatabase;
Database changed
mysql> CREATE TABLE t1 (a int);
Query OK, 0 rows affected (0.11 sec)

mysql> SHOW TABLES;
+------------------------+
| Tables_in_mynewdatabase |
+------------------------+
| t1                     |
+------------------------+
1 row in set (0.00 sec)
```

#### 14.10.2.27.4 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.27.5 See also

- USE
- ALTER DATABASE
- DROP DATABASE
- SHOW DATABASES

### 14.10.2.28 CREATE INDEX

This statement adds a new index to an existing table. It is an alternative syntax to `ALTER TABLE .. ADD INDEX`, and included for MySQL compatibility.

#### 14.10.2.28.1 Synopsis

```
CreateIndexStmt ::=
    'CREATE' IndexKeyTypeOpt 'INDEX' IfNotExists Identifier IndexTypeOpt 'ON
       ↪ ' TableName '(' IndexPartSpecificationList ')' IndexOptionList
       ↪ IndexLockAndAlgorithmOpt
```

```
IndexKeyTypeOpt ::=
    ( 'UNIQUE' | 'SPATIAL' | 'FULLTEXT' )?

IfNotExists ::=
    ( 'IF' 'NOT' 'EXISTS' )?

IndexTypeOpt ::=
    IndexType?

IndexPartSpecificationList ::=
    IndexPartSpecification ( ',' IndexPartSpecification )*

IndexOptionList ::=
    IndexOption*

IndexLockAndAlgorithmOpt ::=
    ( LockClause AlgorithmClause? | AlgorithmClause LockClause? )?

IndexType ::=
    ( 'USING' | 'TYPE' ) IndexTypeName

IndexPartSpecification ::=
    ( ColumnName OptFieldLen | '(' Expression ')' ) Order

IndexOption ::=
    'KEY_BLOCK_SIZE' '='? LengthNum
|   IndexType
|   'WITH' 'PARSER' Identifier
|   'COMMENT' stringLit
|   IndexInvisible

IndexTypeName ::=
    'BTREE'
|   'HASH'
|   'RTREE'

ColumnName ::=
    Identifier ( '.' Identifier ( '.' Identifier )? )?

OptFieldLen ::=
    FieldLen?

IndexNameList ::=
    ( Identifier | 'PRIMARY' )? ( ',' ( Identifier | 'PRIMARY' ) )*
```

```
KeyOrIndex ::=
    'Key' | 'Index'
```

#### 14.10.2.28.2 Examples

mysql> CREATE UNIQUE INDEX c1 ON t1 (c1);
Query OK, 0 rows affected (0.31 sec)
```

#### 14.10.2.28.3 Expression index

In some scenarios, the filtering condition of a query is based on a certain expression. In these scenarios, the query performance is relatively poor because ordinary indexes cannot take effect, the query can only be executed by scanning the entire table. The expression index is a type of special index that can be created on an expression. Once an expression index is created, TiDB can use the index for the expression-based query, which significantly improves the query performance.

For example, if you want to create an index based on `lower(col1)`, execute the following SQL statement:

```
CREATE INDEX idx1 ON t1 ((lower(col1)));
```

Or you can execute the following equivalent statement:

```
ALTER TABLE t1 ADD INDEX idx1((lower(col1)));
```

You can also specify the expression index when you create the table:

```
CREATE TABLE t1(col1 char(10), col2 char(10), index((lower(col1))));
```

> **Note:**
>
> The expression in an expression index must be surrounded by `(` and `)`. Otherwise, a syntax error is reported.

You can drop an expression index in the same way as dropping an ordinary index:

```
DROP INDEX idx1 ON t1;
```

Expression index involves various kinds of expressions. To ensure correctness, only some fully tested functions are allowed for creating an expression index. This means that only these functions are allowed in expressions in a production environment. You can get these functions by querying the `tidb_allow_function_for_expression_index` variable. Currently, the allowed functions are as follows:

```
json_array, json_array_append, json_array_insert, json_contains,
    ↪ json_contains_path, json_depth, json_extract, json_insert, json_keys,
    ↪  json_length, json_merge_patch, json_merge_preserve, json_object,
    ↪ json_pretty, json_quote, json_remove, json_replace, json_search,
    ↪ json_set, json_storage_size, json_type, json_unquote, json_valid,
    ↪ lower, md5, reverse, tidb_shard, upper, vitess_hash
```

For the functions that are not included in the above list, those functions are not fully tested and not recommended for a production environment, which can be seen as experimental. Other expressions such as operators, `cast`, and `case when` are also seen as experimental and not recommended for production.

If you still want to use those expressions, you can make the following configuration in the TiDB configuration file:

```
allow-expression-index = true
```

**Note:**

An expression index cannot be created on a primary key.

The expression in an expression index cannot contain the following content:

- Volatile functions, such as `rand()` and `now()`.
- System variables and user variables.
- Subqueries.
- `AUTO_INCREMENT` column. You can remove this restriction by setting the value of `tidb_enable_auto_increment_in_generated` (system variable) to `true`.
- Window functions.
- ROW functions, such as `create table t (j json, key k (((j,j)))` ↪ `);`.
- Aggregate functions.

An expression index implicitly takes up a name (for example, `_V$_{` ↪ `index_name}_{index_offset}`). If you try to create a new expression

index with the name that a column has already had, an error occurs. In addition, if you add a new column with the same name, an error also occurs.

Make sure that the number of function parameters in the expression of an expression index is correct.

When the expression of an index contains a string-related function, affected by the returned type and the length, creating the expression index might fail. In this situation, you can use the `cast()` function to explicitly specify the returned type and the length. For example, to create an expression index based on the `repeat(a, 3)` expression, you need to modify this expression to `cast(repeat(a, 3)as char(20))`.

When the expression in a query statement matches the expression in an expression index, the optimizer can choose the expression index for the query. In some cases, the optimizer might not choose an expression index depending on statistics. In this situation, you can force the optimizer to select an expression index by using optimizer hints.

In the following examples, suppose that you create the expression index `idx` on the expression `lower(col1)`:

If the results of the query statement are the same expressions, the expression index applies. Take the following statement as an example:

```
SELECT lower(col1) FROM t;
```

If the same expression is included in the filtering conditions, the expression index applies. Take the following statements as an example:

```
SELECT * FROM t WHERE lower(col1) = "a";
SELECT * FROM t WHERE lower(col1) > "a";
SELECT * FROM t WHERE lower(col1) BETWEEN "a" AND "b";
SELECT * FROM t WHERE lower(col1) in ("a", "b");
SELECT * FROM t WHERE lower(col1) > "a" AND lower(col1) < "b";
SELECT * FROM t WHERE lower(col1) > "b" OR lower(col1) < "a";
```

When the queries are sorted by the same expression, the expression index applies. Take the following statement as an example:

```
SELECT * FROM t ORDER BY lower(col1);
```

If the same expression is included in the aggregate (`GROUP BY`) functions, the expression index applies. Take the following statements as an example:

```
SELECT max(lower(col1)) FROM t;
SELECT min(col1) FROM t GROUP BY lower(col1);
```

To see the expression corresponding to the expression index, execute `show index` ↪ , or check the system tables `information_schema.tidb_indexes` and the table `information_schema.STATISTICS`. The `Expression` column in the output indicates the corresponded expression. For the non-expression indexes, the column shows `NULL`.

The cost of maintaining an expression index is higher than that of maintaining other indexes, because the value of the expression needs to be calculated whenever a row is inserted or updated. The value of the expression is already stored in the index, so this value does not require recalculation when the optimizer selects the expression index.

Therefore, when the query performance outweighs the insert and update performance, you can consider indexing the expressions.

Expression indexes have the same syntax and limitations as in MySQL. They are implemented by creating indexes on generated virtual columns that are invisible, so the supported expressions inherit all limitations of virtual generated columns.

#### 14.10.2.28.4 Invisible index

Invisible indexes are indexes that are ignored by the query optimizer:

```
CREATE TABLE t1 (c1 INT, c2 INT, UNIQUE(c2));
CREATE UNIQUE INDEX c1 ON t1 (c1) INVISIBLE;
```

For details, see ALTER INDEX.

#### 14.10.2.28.5 Associated system variables

The system variables associated with the `CREATE INDEX` statement are `tidb_ddl_enable_fast_reorg` ↪ , `tidb_ddl_reorg_worker_cnt`, `tidb_ddl_reorg_batch_size`, `tidb_enable_auto_increment_in_ge` ↪ , and `tidb_ddl_reorg_priority`. Refer to system variables for details.

#### 14.10.2.28.6 MySQL compatibility

- TiDB supports parsing the `FULLTEXT` and `SPATIAL` syntax but does not support using the `FULLTEXT`, `HASH`, and `SPATIAL` indexes.
- Descending indexes are not supported (similar to MySQL 5.7).
- Adding the primary key of the `CLUSTERED` type to a table is not supported. For more details about the primary key of the `CLUSTERED` type, refer to clustered index.
- Expression indexes are incompatible with views. When a query is executed using a view, the expression index cannot be used at the same time.
- Expression indexes have compatibility issues with bindings. When the expression of an expression index has a constant, the binding created for the corresponding query expands its scope. For example, suppose that the expression in the expression index is `a+1`, and the corresponding query condition is `a+1 > 2`. In this case, the created binding is `a+? > ?`, which means that the query with the condition such as `a+2 > 2` is also forced to use the expression index and results in a poor execution plan. In

addition, this also affects the baseline capturing and baseline evolution in SQL Plan Management (SPM).

### 14.10.2.29 CREATE PLACEMENT POLICY

`CREATE PLACEMENT POLICY` is used to create a named placement policy that can later be assigned to tables, partitions, or database schemas.

#### 14.10.2.29.1 Synopsis

```
CreatePolicyStmt ::=
    "CREATE" "PLACEMENT" "POLICY" IfNotExists PolicyName PlacementOptionList

PolicyName ::=
    Identifier

PlacementOptionList ::=
    PlacementOption
|   PlacementOptionList PlacementOption
|   PlacementOptionList ',' PlacementOption

PlacementOption ::=
    CommonPlacementOption
|   SugarPlacementOption
|   AdvancedPlacementOption

CommonPlacementOption ::=
    "FOLLOWERS" EqOpt LengthNum

SugarPlacementOption ::=
    "PRIMARY_REGION" EqOpt stringLit
|   "REGIONS" EqOpt stringLit
|   "SCHEDULE" EqOpt stringLit
```

```
AdvancedPlacementOption ::=
    "LEARNERS" EqOpt LengthNum
|   "CONSTRAINTS" EqOpt stringLit
|   "LEADER_CONSTRAINTS" EqOpt stringLit
|   "FOLLOWER_CONSTRAINTS" EqOpt stringLit
|   "LEARNER_CONSTRAINTS" EqOpt stringLit
```

#### 14.10.2.29.2 Examples

> **Note:**
>
> To know which regions are available in your cluster, see SHOW PLACEMENT LABELS.
>
> If you do not see any available regions, your TiKV installation might not have labels set correctly.

```
CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us
    -west-1" FOLLOWERS=4;
CREATE TABLE t1 (a INT) PLACEMENT POLICY=p1;
SHOW CREATE PLACEMENT POLICY p1;
```

```
Query OK, 0 rows affected (0.08 sec)

Query OK, 0 rows affected (0.10 sec)

+--------+-------------------------------------------------------------------------
    
| Policy | Create Policy
    
    |
+--------+-------------------------------------------------------------------------
    
| p1     | CREATE PLACEMENT POLICY `p1` PRIMARY_REGION="us-east-1" REGIONS="
    us-east-1,us-west-1" FOLLOWERS=4 |
+--------+-------------------------------------------------------------------------
    
1 row in set (0.00 sec)
```

#### 14.10.2.29.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

- DROP PLACEMENT POLICY

### 14.10.2.30 CREATE ROLE

This statement creates a new role, which can be assigned to users as part of role-based access control.

#### 14.10.2.30.1 Synopsis

```
CreateRoleStmt ::=
    'CREATE' 'ROLE' IfNotExists RoleSpec (',' RoleSpec)*

IfNotExists ::=
    ('IF' 'NOT' 'EXISTS')?

RoleSpec ::=
    Rolename
```

#### 14.10.2.30.2 Examples

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Create a new role `analyticsteam` and a new user `jennifer`:

```
CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Note that by default `jennifer` needs to execute `SET ROLE analyticsteam` in order to be able to use the privileges associated with the `analyticsteam` role:

```
SHOW GRANTS;
+-------------------------------------------+
| Grants for User                           |
+-------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'      |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-------------------------------------------+
2 rows in set (0.00 sec)

SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

SHOW GRANTS;
+-------------------------------------------+
| Grants for User                           |
+-------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'      |
| GRANT SELECT ON test.* TO 'jennifer'@'%'  |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

The statement `SET DEFAULT ROLE` can be used to associate the role `analyticsteam` to `jennifer`:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
```

```
Query OK, 0 rows affected (0.02 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

After this, the user `jennifer` has the privileges associated with the role `analyticsteam` and `jennifer` does not have to execute the statement `SET ROLE`:

```
SHOW GRANTS;
+-------------------------------------------+
| Grants for User                           |
+-------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'      |
| GRANT SELECT ON test.* TO 'jennifer'@'%'  |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

#### 14.10.2.30.3 MySQL compatibility

This statement is understood to be fully compatible with roles, which are a feature of MySQL 8.0. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.30.4 See also

- DROP ROLE
- GRANT <role>
- REVOKE <role>
- SET ROLE
- SET DEFAULT ROLE

- Role-Based Access Control

### 14.10.2.31 CREATE SEQUENCE

The `CREATE SEQUENCE` statement creates sequence objects in TiDB. The sequence is a database object that is on a par with the table and the `View` object. The sequence is used to generate serialized IDs in a customized way.

#### 14.10.2.31.1 Synopsis

```
CreateSequenceStmt ::=
    'CREATE' 'SEQUENCE' IfNotExists TableName CreateSequenceOptionListOpt
       ↪ CreateTableOptionListOpt

IfNotExists ::=
    ('IF' 'NOT' 'EXISTS')?

TableName ::=
    Identifier ('.' Identifier)?

CreateSequenceOptionListOpt ::=
    SequenceOption*

SequenceOptionList ::=
    SequenceOption

SequenceOption ::=
    ( 'INCREMENT' ( '='? | 'BY' ) | 'START' ( '='? | 'WITH' ) | ( 'MINVALUE'
       ↪  | 'MAXVALUE' | 'CACHE' ) '='? ) SignedNum
|   'NOMINVALUE'
|   'NO' ( 'MINVALUE' | 'MAXVALUE' | 'CACHE' | 'CYCLE' )
|   'NOMAXVALUE'
|   'NOCACHE'
|   'CYCLE'
|   'NOCYCLE'
```

#### 14.10.2.31.2 Syntax

```
CREATE [TEMPORARY] SEQUENCE [IF NOT EXISTS] sequence_name
    [ INCREMENT [ BY | = ] increment ]
    [ MINVALUE [=] minvalue | NO MINVALUE | NOMINVALUE ]
    [ MAXVALUE [=] maxvalue | NO MAXVALUE | NOMAXVALUE ]
    [ START [ WITH | = ] start ]
    [ CACHE [=] cache | NOCACHE | NO CACHE]
    [ CYCLE | NOCYCLE | NO CYCLE]
    [table_options]
```

#### 14.10.2.31.3 Parameters

| Parameters | Default value | Description |
| --- | --- | --- |
| `TEMPORARY` ↪ | `false` | TiDB currently does not support the `TEMPORARY` ↪ option and provides only syntax compatibility for it. |

| Parameters | Default value | Description |
| --- | --- | --- |
| `INCREMENT` | `1` | Specifies the increment of a sequence. Its positive or negative values can control the growth direction of the sequence. |

| Parameters | Default value | Description |
| --- | --- | --- |
| `MINVALUE` or `-9223372036854775807` | 1 | Specifies the minimum value of a sequence. When `INCREMENT` > `0`, the default value is `1`. When `INCREMENT` < `0`, the default value is `-9223372036854775807` . |

| Parameters | Default value | Description |
| --- | --- | --- |
| `MAXVALUE` | `9223372036854775806` or `-1` | Specifies the maximum value of a sequence. When `INCREMENT` > `0`, the default value is `9223372036854775806`. When `INCREMENT` < `0`, the default value is `-1`. |

| Parameters | Default value | Description |
| --- | --- | --- |
| `START` | `MINVALUE` or `MAXVALUE` | Specifies the initial value of a sequence. When `INCREMENT` > `0`, the default value is `MINVALUE`. When `INCREMENT` < `0`, the default value is `MAXVALUE`. |
| `CACHE` | `1000` | Specifies the local cache size of a sequence in TiDB. |

| Parameters | Default value | Description |
| --- | --- | --- |
| `CYCLE` ↪ | `NO` ↪ | `CYCLE` Specifies whether a sequence restarts from the minimum value (or maximum for the descending sequence). When `INCREMENT` ↪ > 0, the default value is `MINVALUE` ↪ . When `INCREMENT` ↪ < 0, the default value is `MAXVALUE` ↪ . |

| Parameters | Default value | Description |
|---|---|---|

#### 14.10.2.31.4 `SEQUENCE` function

You can control a sequence through the following expression functions:

- `NEXTVAL` or `NEXT VALUE FOR`

  Essentially, both are the `nextval()` function that gets the next valid value of a sequence object. The parameter of the `nextval()` function is the `identifier` of the sequence.

- `LASTVAL`

  This function gets the last used value of this session. If the value does not exist, `NULL` is used. The parameter of this function is the `identifier` of the sequence.

- `SETVAL`

  This function sets the progression of the current value for a sequence. The first parameter of this function is the `identifier` of the sequence; the second parameter is `num`.

> **Note:**
>
> In the implementation of a sequence in TiDB, the `SETVAL` function cannot change the initial progression or cycle progression of this sequence. This function only returns the next valid value based on this progression.

#### 14.10.2.31.5 Examples

- Create a sequence object with the default parameter:

```
CREATE SEQUENCE seq;
```

```
Query OK, 0 rows affected (0.06 sec)
```

- Use the `nextval()` function to get the next value of the sequence object:

```
SELECT nextval(seq);
```

```
+--------------+
| nextval(seq) |
+--------------+
|            1 |
+--------------+
1 row in set (0.02 sec)
```

- Use the `lastval()` function to get the value generated by the last call to a sequence object in this session:

```
SELECT lastval(seq);
```

```
+--------------+
| lastval(seq) |
+--------------+
|            1 |
+--------------+
1 row in set (0.02 sec)
```

- Use the `setval()` function to set the current value (or the current position) of the sequence object:

```
SELECT setval(seq, 10);
```

```
+-----------------+
| setval(seq, 10) |
+-----------------+
|              10 |
+-----------------+
1 row in set (0.01 sec)
```

- You can also use the `next value for` syntax to get the next value of the sequence:

```
SELECT next value for seq;
```

```
+--------------------+
| next value for seq |
+--------------------+
|                 11 |
+--------------------+
1 row in set (0.00 sec)
```

- Create a sequence object with default custom parameters:

```
CREATE SEQUENCE seq2 start 3 increment 2 minvalue 1 maxvalue 10 cache
    ↪ 3;
```

```
Query OK, 0 rows affected (0.01 sec)
```

- When the sequence object has not been used in this session, the `lastval()` function returns a `NULL` value.

```
SELECT lastval(seq2);
```

```
+---------------+
| lastval(seq2) |
+---------------+
|          NULL |
+---------------+
1 row in set (0.01 sec)
```

- The first valid value of the `nextval()` function for the sequence object is the value of `START` parameter.

```
SELECT nextval(seq2);
```

```
+---------------+
| nextval(seq2) |
+---------------+
|             3 |
+---------------+
1 row in set (0.00 sec)
```

- Although the `setval()` function can change the current value of the sequence object, it cannot change the arithmetic progression rule for the next value.

```
SELECT setval(seq2, 6);
```

```
+-----------------+
| setval(seq2, 6) |
+-----------------+
|               6 |
+-----------------+
1 row in set (0.00 sec)
```

- When you use `nextval()` to get the next value, the next value will follow the arithmetic progression rule defined by the sequence.

```
SELECT next value for seq2;
```

```
+--------------------+
| next value for seq2 |
+--------------------+
|                  7 |
+--------------------+
1 row in set (0.00 sec)
```

- You can use the next value of the sequence as the default value for the column, as in the following example.

```
CREATE table t(a int default next value for seq2);
```

```
Query OK, 0 rows affected (0.02 sec)
```

- In the following example, the value is not specified, so the default value of `seq2` is used.

```
INSERT into t values();
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SELECT * from t;
```

```
+------+
| a    |
+------+
|    9 |
+------+
1 row in set (0.00 sec)
```

- In the following example, the value is not specified, so the default value of `seq2` is used. But the next value of `seq2` is not within the range defined in the above example (`CREATE SEQUENCE seq2 start 3 increment 2 minvalue 1 maxvalue 10 cache 3;`), so an error is returned.

```
INSERT into t values();
```

```
ERROR 4135 (HY000): Sequence 'test.seq2' has run out
```

#### 14.10.2.31.6 MySQL compatibility

This statement is a TiDB extension. The implementation is modeled on sequences available in MariaDB.

Except for the `SETVAL` function, all other functions have the same *progressions* as MariaDB. Here "progression" means that the numbers in a sequence follow a certain arithmetic

progression rule defined by the sequence. Although you can use `SETVAL` to set the current value of a sequence, the subsequent values of the sequence still follow the original progression rule.

For example:

```
1, 3, 5, ...          // The sequence starts from 1 and increments by 2.
select setval(seq, 6) // Sets the current value of a sequence to 6.
7, 9, 11, ...         // Subsequent values still follow the progression rule.
```

In the `CYCLE` mode, the initial value of a sequence in the first round is the value of the `START` parameter, and the initial value in the subsequent rounds is the value of `MinValue` (`INCREMENT` $> 0$) or `MaxValue` (`INCREMENT` $< 0$).

#### 14.10.2.31.7 See also

- DROP SEQUENCE
- SHOW CREATE SEQUENCE

### 14.10.2.32 CREATE TABLE LIKE

This statement copies the definition of an existing table, without copying any data.

#### 14.10.2.32.1 Synopsis

```
CreateTableLikeStmt ::=
    'CREATE' OptTemporary 'TABLE' IfNotExists TableName
       ↪ LikeTableWithOrWithoutParen OnCommitOpt

OptTemporary ::=
    ( 'TEMPORARY' | ('GLOBAL' 'TEMPORARY') )?

LikeTableWithOrWithoutParen ::=
    'LIKE' TableName
|   '(' 'LIKE' TableName ')'

OnCommitOpt ::=
    ('ON' 'COMMIT' 'DELETE' 'ROWS')?
```

#### 14.10.2.32.2 Examples

```
mysql> CREATE TABLE t1 (a INT NOT NULL);
Query OK, 0 rows affected (0.13 sec)

mysql> INSERT INTO t1 VALUES (1),(2),(3),(4),(5);
```

```
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+---+
| a |
+---+
| 1 |
| 2 |
| 3 |
| 4 |
| 5 |
+---+
5 rows in set (0.00 sec)

mysql> CREATE TABLE t2 LIKE t1;
Query OK, 0 rows affected (0.10 sec)

mysql> SELECT * FROM t2;
Empty set (0.00 sec)
```

#### 14.10.2.32.3 Pre-split region

If the table to be copied is defined with the `PRE_SPLIT_REGIONS` attribute, the table created using the `CREATE TABLE LIKE` statement inherits this attribute, and the Region on the new table will be split. For details of `PRE_SPLIT_REGIONS`, see `CREATE TABLE` Statement.

#### 14.10.2.32.4 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.32.5 See also

- CREATE TABLE
- SHOW CREATE TABLE

### 14.10.2.33 CREATE TABLE

This statement creates a new table in the currently selected database. It behaves similarly to the `CREATE TABLE` statement in MySQL.

#### 14.10.2.33.1 Synopsis

```
CreateTableStmt ::=
    'CREATE' OptTemporary 'TABLE' IfNotExists TableName (
       ↪ TableElementListOpt CreateTableOptionListOpt PartitionOpt
       ↪ DuplicateOpt AsOpt CreateTableSelectOpt |
       ↪ LikeTableWithOrWithoutParen ) OnCommitOpt

OptTemporary ::=
    ( 'TEMPORARY' | ('GLOBAL' 'TEMPORARY') )?

IfNotExists ::=
    ('IF' 'NOT' 'EXISTS')?

TableName ::=
    Identifier ('.' Identifier)?

TableElementListOpt ::=
    ( '(' TableElementList ')' )?

TableElementList ::=
    TableElement ( ',' TableElement )*

TableElement ::=
    ColumnDef
|   Constraint

ColumnDef ::=
    ColumnName ( Type | 'SERIAL' ) ColumnOptionListOpt

ColumnOptionListOpt ::=
    ColumnOption*

ColumnOptionList ::=
    ColumnOption*

ColumnOption ::=
    'NOT'? 'NULL'
|   'AUTO_INCREMENT'
|   PrimaryOpt 'KEY'
|   'UNIQUE' 'KEY'?
|   'DEFAULT' DefaultValueExpr
|   'SERIAL' 'DEFAULT' 'VALUE'
|   'ON' 'UPDATE' NowSymOptionFraction
|   'COMMENT' stringLit
```

    ↪ EnforcedOrNotOrNotNullOpt
|   GeneratedAlways 'AS' '(' Expression ')' VirtualOrStored
|   ReferDef
|   'COLLATE' CollationName
|   'COLUMN_FORMAT' ColumnFormat
|   'STORAGE' StorageMedia
|   'AUTO_RANDOM' OptFieldLen

CreateTableOptionListOpt ::=
    TableOptionList?

PartitionOpt ::=
    ( 'PARTITION' 'BY' PartitionMethod PartitionNumOpt SubPartitionOpt
       ↪ PartitionDefinitionListOpt )?

DuplicateOpt ::=
    ( 'IGNORE' | 'REPLACE' )?

TableOptionList ::=
    TableOption ( ','? TableOption )*

TableOption ::=
    PartDefOption
|   DefaultKwdOpt ( CharsetKw EqOpt CharsetName | 'COLLATE' EqOpt
    ↪ CollationName )
|   ( 'AUTO_INCREMENT' | 'AUTO_ID_CACHE' | 'AUTO_RANDOM_BASE' | '
    ↪ AVG_ROW_LENGTH' | 'CHECKSUM' | 'TABLE_CHECKSUM' | 'KEY_BLOCK_SIZE' |
    ↪ 'DELAY_KEY_WRITE' | 'SHARD_ROW_ID_BITS' | 'PRE_SPLIT_REGIONS' ) EqOpt
    ↪  LengthNum
|   ( 'CONNECTION' | 'PASSWORD' | 'COMPRESSION' ) EqOpt stringLit
|   RowFormat
|   ( 'STATS_PERSISTENT' | 'PACK_KEYS' ) EqOpt StatsPersistentVal
|   ( 'STATS_AUTO_RECALC' | 'STATS_SAMPLE_PAGES' ) EqOpt ( LengthNum | '
    ↪ DEFAULT' )
|   'STORAGE' ( 'MEMORY' | 'DISK' )
|   'SECONDARY_ENGINE' EqOpt ( 'NULL' | StringName )
|   'UNION' EqOpt '(' TableNameListOpt ')'
|   'ENCRYPTION' EqOpt EncryptionOpt
| 'TTL' EqOpt TimeColumnName '+' 'INTERVAL' Expression TimeUnit (TTLEnable
    ↪ EqOpt ( 'ON' | 'OFF' ))?
|   PlacementPolicyOption

OnCommitOpt ::=
    ('ON' 'COMMIT' 'DELETE' 'ROWS')?
```

```
PlacementPolicyOption ::=
    "PLACEMENT" "POLICY" EqOpt PolicyName
|   "PLACEMENT" "POLICY" (EqOpt | "SET") "DEFAULT"
```

The following *table_options* are supported. Other options such as `AVG_ROW_LENGTH` ↪ , `CHECKSUM`, `COMPRESSION`, `CONNECTION`, `DELAY_KEY_WRITE`, `ENGINE`, `KEY_BLOCK_SIZE`, `MAX_ROWS`, `MIN_ROWS`, `ROW_FORMAT` and `STATS_PERSISTENT` are parsed but ignored.

| Options | Description | Example |
|---|---|---|
| `AUTO_INCREMENT` ↪ | The initial value of the increment field | `AUTO_INCREMENT` ↪ = 5 |
| `SHARD_ROW_ID_BITS` ↪ | To set the number of bits for the implicit `_tidb_rowid` ↪ shards | `SHARD_ROW_ID_BITS` ↪ = 4 |
| `PRE_SPLIT_REGIONS` ↪ | To pre-split 2^( ↪ `PRE_SPLIT_REGIONS` ↪ ) Regions when creating a table | `PRE_SPLIT_REGIONS` ↪ = 4 |
| `AUTO_ID_CACHE` ↪ | To set the auto ID cache size in a TiDB instance. By default, TiDB automatically changes this size according to allocation speed of auto ID | `AUTO_ID_CACHE` ↪ = 200 |

| Options | Description | Example |
| --- | --- | --- |
| AUTO_RANDOM_BASE | To set the initial incremental part value of auto_random. This option can be considered as a part of the internal interface. Users can ignore this parameter | AUTO_RANDOM_BASE = 0 |
| CHARACTER SET | To specify the character set for the table | CHARACTER SET = 'utf8mb4' |
| COMMENT | The comment information | COMMENT = 'comment info' |

**Note:**

The `split-table` configuration option is enabled by default. When it is enabled, a separate Region is created for each newly created table. For details, see TiDB configuration file.

#### 14.10.2.33.2 Examples

Creating a simple table and inserting one row:

```
CREATE TABLE t1 (a int);
DESC t1;
SHOW CREATE TABLE t1\G
INSERT INTO t1 (a) VALUES (1);
SELECT * FROM t1;
```

```
mysql> drop table if exists t1;
Query OK, 0 rows affected (0.23 sec)

mysql> CREATE TABLE t1 (a int);
Query OK, 0 rows affected (0.09 sec)

mysql> DESC t1;
+-------+---------+------+-----+---------+-------+
| Field | Type    | Null | Key | Default | Extra |
+-------+---------+------+-----+---------+-------+
| a     | int(11) | YES  |     | NULL    |       |
+-------+---------+------+-----+---------+-------+
1 row in set (0.00 sec)

mysql> SHOW CREATE TABLE t1\G
*************************** 1. row ***************************
       Table: t1
Create Table: CREATE TABLE `t1` (
  `a` int(11) DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
1 row in set (0.00 sec)

mysql> INSERT INTO t1 (a) VALUES (1);
Query OK, 1 row affected (0.03 sec)

mysql> SELECT * FROM t1;
+------+
| a    |
+------+
|    1 |
+------+
1 row in set (0.00 sec)
```

Dropping a table if it exists, and conditionally creating a table if it does not exist:

```
DROP TABLE IF EXISTS t1;
CREATE TABLE IF NOT EXISTS t1 (
 id BIGINT NOT NULL PRIMARY KEY auto_increment,
 b VARCHAR(200) NOT NULL
);
DESC t1;
```

```
mysql> DROP TABLE IF EXISTS t1;
Query OK, 0 rows affected (0.22 sec)
```

```
mysql> CREATE TABLE IF NOT EXISTS t1 (
        id BIGINT NOT NULL PRIMARY KEY auto_increment,
        b VARCHAR(200) NOT NULL
       );
Query OK, 0 rows affected (0.08 sec)

mysql> DESC t1;
+-------+--------------+------+------+---------+----------------+
| Field | Type         | Null | Key  | Default | Extra          |
+-------+--------------+------+------+---------+----------------+
| id    | bigint(20)   | NO   | PRI  | NULL    | auto_increment |
| b     | varchar(200) | NO   |      | NULL    |                |
+-------+--------------+------+------+---------+----------------+
2 rows in set (0.00 sec)
```

#### 14.10.2.33.3 MySQL compatibility

- All of the data types except spatial types are supported.
- `FULLTEXT`, `HASH` and `SPATIAL` indexes are not supported.

- For compatibility, the `index_col_name` attribute supports the length option with a maximum length limit of 3072 bytes by default. The length limit can be changed through the `max-index-length` configuration option. For details, see TiDB configuration file.

- The `[ASC | DESC]` in `index_col_name` is currently parsed but ignored (MySQL 5.7 compatible behavior).
- The `COMMENT` attribute does not support the `WITH PARSER` option.
- TiDB supports 1017 columns in a single table by default and 4096 columns at most. The corresponding number limit in InnoDB is 1017 columns, and the hard limit in MySQL is 4096 columns. For details, see TiDB Limitations.
- TiDB supports `HASH`, `RANGE`, and `LIST` partitioning types. For an unsupported partition type, TiDB returns `Warning: Unsupported partition type %s, treat as normal table`, where `%s` is the specific unsupported partition type.
- `CHECK` constraints are parsed but ignored (MySQL 5.7 compatible behavior). For details, see Constraints.
- `FOREIGN KEY` constraints are parsed and stored, but not enforced by DML statements. For details, see Constraints.

#### 14.10.2.33.4 See also

- Data Types
- DROP TABLE
- CREATE TABLE LIKE
- SHOW CREATE TABLE

#### 14.10.2.34 CREATE USER

This statement creates a new user, specified with a password. In the MySQL privilege system, a user is the combination of a username and the host from which they are connecting from. Thus, it is possible to create a user `'newuser2'@'192.168.1.1'` who is only able to connect from the IP address `192.168.1.1`. It is also possible to have two users have the same user-portion, and different permissions as they login from different hosts.

##### 14.10.2.34.1 Synopsis

```
CreateUserStmt ::=
    'CREATE' 'USER' IfNotExists UserSpecList RequireClauseOpt
       ↪ ConnectionOptions PasswordOption LockOption AttributeOption

IfNotExists ::=
    ('IF' 'NOT' 'EXISTS')?

UserSpecList ::=
    UserSpec ( ',' UserSpec )*

RequireClauseOpt ::=
    ( 'REQUIRE' 'NONE' | 'REQUIRE' 'SSL' | 'REQUIRE' 'X509' | 'REQUIRE'
       ↪ RequireList )?

RequireList ::=
    ( "ISSUER" stringLit | "SUBJECT" stringLit | "CIPHER" stringLit | "SAN"
       ↪ stringLit | "TOKEN_ISSUER" stringLit )*

UserSpec ::=
    Username AuthOption

AuthOption ::=
    ( 'IDENTIFIED' ( 'BY' ( AuthString | 'PASSWORD' HashString ) | 'WITH'
       ↪ StringName ( 'BY' AuthString | 'AS' HashString )? ) )?

StringName ::=
    stringLit
|   Identifier

PasswordOption ::= ( 'PASSWORD' 'EXPIRE' ( 'DEFAULT' | 'NEVER' | 'INTERVAL'
    ↪ N 'DAY' )? | 'PASSWORD' 'HISTORY' ( 'DEFAULT' | N ) | 'PASSWORD' '
    ↪ REUSE' 'INTERVAL' ( 'DEFAULT' | N 'DAY' ) | 'FAILED_LOGIN_ATTEMPTS' N
    ↪  | 'PASSWORD_LOCK_TIME' ( N | 'UNBOUNDED' ) )*

LockOption ::= ( 'ACCOUNT' 'LOCK' | 'ACCOUNT' 'UNLOCK' )?
```

```
AttributeOption ::= ( 'COMMENT' CommentString | 'ATTRIBUTE' AttributeString
    ↪ )?
```

#### 14.10.2.34.2 Examples

Create a user with the `newuserpassword` password.

```
mysql> CREATE USER 'newuser' IDENTIFIED BY 'newuserpassword';
Query OK, 1 row affected (0.04 sec)
```

Create a user who can only log in to `192.168.1.1`.

```
mysql> CREATE USER 'newuser2'@'192.168.1.1' IDENTIFIED BY 'newuserpassword'
    ↪ ;
Query OK, 1 row affected (0.02 sec)
```

Create a user who is enforced to log in using TLS connection.

```
CREATE USER 'newuser3'@'%' IDENTIFIED BY 'newuserpassword' REQUIRE SSL;
Query OK, 1 row affected (0.02 sec)
```

Create a user who is required to use X.509 certificate at login.

```
CREATE USER 'newuser4'@'%' IDENTIFIED BY 'newuserpassword' REQUIRE ISSUER '
    ↪ /C=US/ST=California/L=San Francisco/O=PingCAP';
Query OK, 1 row affected (0.02 sec)
```

Create a user who is locked upon creation.

```
CREATE USER 'newuser5'@'%' ACCOUNT LOCK;
```

```
Query OK, 1 row affected (0.02 sec)
```

Create a user with a comment.

```
CREATE USER 'newuser6'@'%' COMMENT 'This user is created only for test';
SELECT * FROM information_schema.user_attributes;
```

```
+-----------+------+-----------------------------------------------------+
| USER      | HOST | ATTRIBUTE                                           |
+-----------+------+-----------------------------------------------------+
| newuser6 | %    | {"comment": "This user is created only for test"} |
+-----------+------+-----------------------------------------------------+
1 rows in set (0.00 sec)
```

Create a user with an `email` attribute.

```
CREATE USER 'newuser7'@'%' ATTRIBUTE '{"email": "user@pingcap.com"}';
SELECT * FROM information_schema.user_attributes;
```

```
+----------+------+-----------------------------------------------------+
| USER     | HOST | ATTRIBUTE                                           |
+----------+------+-----------------------------------------------------+
| newuser7 | %    | {"email": "user@pingcap.com"}                       |
+----------+------+-----------------------------------------------------+
1 rows in set (0.00 sec)
```

Create a user who is not allowed to reuse the last 5 passwords:

```
CREATE USER 'newuser8'@'%' PASSWORD HISTORY 5;
```

```
Query OK, 1 row affected (0.02 sec)
```

Create a user whose password is manually expired:

```
CREATE USER 'newuser9'@'%' PASSWORD EXPIRE;
```

```
Query OK, 1 row affected (0.02 sec)
```

#### 14.10.2.34.3 MySQL compatibility

The following `CREATE USER` options are not yet supported by TiDB, and will be parsed but ignored:

- TiDB does not support `WITH MAX_QUERIES_PER_HOUR`, `WITH MAX_UPDATES_PER_HOUR`, and `WITH MAX_USER_CONNECTIONS` options.
- TiDB does not support the `DEFAULT ROLE` option.

#### 14.10.2.34.4 See also

- Security Compatibility with MySQL
- Privilege Management

- DROP USER
- SHOW CREATE USER
- ALTER USER

### 14.10.2.35 CREATE VIEW

The `CREATE VIEW` statement saves a `SELECT` statement as a queryable object, similar to a table. Views in TiDB are non-materialized. This means that as a view is queried, TiDB will internally rewrite the query to combine the view definition with the SQL query.

#### 14.10.2.35.1 Synopsis

```
CreateViewStmt ::=
    'CREATE' OrReplace ViewAlgorithm ViewDefiner ViewSQLSecurity 'VIEW'
       ↪ ViewName ViewFieldList 'AS' CreateViewSelectOpt ViewCheckOption

OrReplace ::=
    ( 'OR' 'REPLACE' )?

ViewAlgorithm ::=
    ( 'ALGORITHM' '=' ( 'UNDEFINED' | 'MERGE' | 'TEMPTABLE' ) )?

ViewDefiner ::=
    ( 'DEFINER' '=' Username )?

ViewSQLSecurity ::=
    ( 'SQL' 'SECURITY' ( 'DEFINER' | 'INVOKER' ) )?

ViewName ::= TableName

ViewFieldList ::=
    ( '(' Identifier ( ',' Identifier )* ')' )?

ViewCheckOption ::=
    ( 'WITH' ( 'CASCADED' | 'LOCAL' ) 'CHECK' 'OPTION' )?
```

#### 14.10.2.35.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> CREATE VIEW v1 AS SELECT * FROM t1 WHERE c1 > 2;
Query OK, 0 rows affected (0.11 sec)

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
```

```
|  3 |  3 |
|  4 |  4 |
|  5 |  5 |
+----+----+
5 rows in set (0.00 sec)

mysql> SELECT * FROM v1;
+----+----+
| id | c1 |
+----+----+
|  3 |  3 |
|  4 |  4 |
|  5 |  5 |
+----+----+
3 rows in set (0.00 sec)

mysql> INSERT INTO t1 (c1) VALUES (6);
Query OK, 1 row affected (0.01 sec)

mysql> SELECT * FROM v1;
+----+----+
| id | c1 |
+----+----+
|  3 |  3 |
|  4 |  4 |
|  5 |  5 |
|  6 |  6 |
+----+----+
4 rows in set (0.00 sec)

mysql> INSERT INTO v1 (c1) VALUES (7);
ERROR 1105 (HY000): insert into view v1 is not supported now.
```

#### 14.10.2.35.3 MySQL compatibility

- Currently, any view in TiDB cannot be inserted or updated (that is, `INSERT VIEW` and `UPDATE VIEW` are not supported). `WITH CHECK OPTION` is only syntactically compatible but does not take effect.
- Currently, the view in TiDB does not support `ALTER VIEW`, but you can use `CREATE OR REPLACE` instead.
- Currently, the `ALGORITHM` field is only syntactically compatible in TiDB but does not take effect. TiDB currently only supports the MERGE algorithm.

#### 14.10.2.35.4 See also

- DROP VIEW
- CREATE TABLE
- SHOW CREATE TABLE
- DROP TABLE

#### 14.10.2.36 DEALLOCATE

The `DEALLOCATE` statement provides an SQL interface to server-side prepared statements.

##### 14.10.2.36.1 Synopsis

```
DeallocateStmt ::=
    DeallocateSym 'PREPARE' Identifier

DeallocateSym ::=
    'DEALLOCATE'
|   'DROP'

Identifier ::=
    identifier
|   UnReservedKeyword
|   NotKeywordToken
|   TiDBKeyword
```

##### 14.10.2.36.2 Examples

```
mysql> PREPARE mystmt FROM 'SELECT ? as num FROM DUAL';
Query OK, 0 rows affected (0.00 sec)

mysql> SET @number = 5;
Query OK, 0 rows affected (0.00 sec)

mysql> EXECUTE mystmt USING @number;
+------+
| num |
+------+
| 5   |
+------+
1 row in set (0.00 sec)

mysql> DEALLOCATE PREPARE mystmt;
Query OK, 0 rows affected (0.00 sec)
```

#### 14.10.2.36.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.36.4 See also

- PREPARE
- EXECUTE

### 14.10.2.37 DELETE

The DELETE statement removes rows from a specified table.

#### 14.10.2.37.1 Synopsis

```
DeleteFromStmt ::=
    'DELETE' TableOptimizerHints PriorityOpt QuickOptional IgnoreOptional (
       ↪ 'FROM' ( TableName TableAsNameOpt IndexHintListOpt
       ↪ WhereClauseOptional OrderByOptional LimitClause |
       ↪ TableAliasRefList 'USING' TableRefs WhereClauseOptional ) |
       ↪ TableAliasRefList 'FROM' TableRefs WhereClauseOptional )
```

#### 14.10.2.37.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 |  3 |
|  4 |  4 |
|  5 |  5 |
+----+----+
5 rows in set (0.00 sec)
```

```
mysql> DELETE FROM t1 WHERE id = 4;
Query OK, 1 row affected (0.02 sec)

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 |  3 |
|  5 |  5 |
+----+----+
4 rows in set (0.00 sec)
```

#### 14.10.2.37.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.37.4 See also

- INSERT
- SELECT
- UPDATE
- REPLACE

### 14.10.2.38 DESC

This statement is an alias to `EXPLAIN`. It is included for compatibility with MySQL.

### 14.10.2.39 DESCRIBE

This statement is an alias to `EXPLAIN`. It is included for compatibility with MySQL.

### 14.10.2.40 DO

`DO` executes the expressions but does not return any results. In most cases, `DO` is equivalent to `SELECT expr, ...` that does not return a result.

> **Note:**
>
> `DO` only executes expressions. It cannot be used in all cases where `SELECT` can be used. For example, `DO id FROM t1` is invalid because it references a table.

In MySQL, a common use case is to execute stored procedure or trigger. Since TiDB does not provide stored procedure or trigger, this function has a limited use.

#### 14.10.2.40.1 Synopsis

```
DoStmt  ::= 'DO' ExpressionList

ExpressionList ::=
    Expression ( ',' Expression )*

Expression ::=
    ( singleAtIdentifier assignmentEq | 'NOT' | Expression ( logOr | 'XOR' |
       ↪  logAnd ) ) Expression
|   'MATCH' '(' ColumnNameList ')' 'AGAINST' '(' BitExpr
    ↪ FulltextSearchModifierOpt ')'
|   PredicateExpr ( IsOrNotOp 'NULL' | CompareOp ( ( singleAtIdentifier
    ↪ assignmentEq )? PredicateExpr | AnyOrAll SubSelect ) )* ( IsOrNotOp (
    ↪  trueKwd | falseKwd | 'UNKNOWN' ) )?
```

#### 14.10.2.40.2 Examples

This SELECT statement pauses, but also produces a result set.

```
mysql> SELECT SLEEP(5);
+----------+
| SLEEP(5) |
+----------+
|        0 |
+----------+
1 row in set (5.00 sec)
```

DO, on the other hand, pauses without producing a result set.

```
mysql> DO SLEEP(5);
Query OK, 0 rows affected (5.00 sec)

mysql> DO SLEEP(1), SLEEP(1.5);
Query OK, 0 rows affected (2.50 sec)
```

#### 14.10.2.40.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.40.4 See also

- SELECT

### 14.10.2.41 DROP [GLOBAL|SESSION] BINDING

This statement removes a binding from a specific SQL statement. Bindings can be used to inject a hint into a statement without requiring changes to the underlying query.

A `BINDING` can be on either a `GLOBAL` or `SESSION` basis. The default is `SESSION`.

#### 14.10.2.41.1 Synopsis

```
DropBindingStmt ::=
    'DROP' GlobalScope 'BINDING' 'FOR' ( BindableStmt ( 'USING' BindableStmt
       ↪ )? )
|   ('SQL' 'DIGEST' SqlDigest)

GlobalScope ::=
    ( 'GLOBAL' | 'SESSION' )?

BindableStmt ::=
    ( SelectStmt | UpdateStmt | InsertIntoStmt | ReplaceIntoStmt |
       ↪ DeleteStmt )
```

#### 14.10.2.41.2 Examples

You can remove a binding according to a SQL statement or `sql_digest`.

The following example shows how to remove a binding according to a SQL statement.

```
mysql> CREATE TABLE t1 (
        id INT NOT NULL PRIMARY KEY auto_increment,
        b INT NOT NULL,
        pad VARBINARY(255),
        INDEX(b)
       );
Query OK, 0 rows affected (0.07 sec)

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
   ↪ FROM dual;
Query OK, 1 row affected (0.01 sec)
Records: 1 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
   ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
```

```
Query OK, 1 row affected (0.00 sec)
Records: 1 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 8 rows affected (0.00 sec)
Records: 8 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 1000 rows affected (0.04 sec)
Records: 1000 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 100000 rows affected (1.74 sec)
Records: 100000 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 100000 rows affected (2.15 sec)
Records: 100000 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 100000 rows affected (2.64 sec)
Records: 100000 Duplicates: 0 Warnings: 0

mysql> SELECT SLEEP(1);
+----------+

- SQL Plan Management

### 14.10.2.42 DROP COLUMN

This statement drops a column from a specified table. `DROP COLUMN` is online in TiDB, which means that it does not block read or write operations.

#### 14.10.2.42.1 Synopsis

```
AlterTableStmt
        ::= 'ALTER' 'IGNORE'? 'TABLE' TableName DropColumnSpec ( ','
           ↪ DropColumnSpec )*

DropColumnSpec
        ::= 'DROP' 'COLUMN'? 'IF EXISTS'? ColumnName ( 'RESTRICT' | 'CASCADE
           ↪ ' )?

ColumnName
        ::= Identifier ( '.' Identifier ( '.' Identifier )? )?
```

#### 14.10.2.42.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, col1
   ↪ INT NOT NULL, col2 INT NOT NULL);
Query OK, 0 rows affected (0.12 sec)

mysql> INSERT INTO t1 (col1,col2) VALUES (1,1),(2,2),(3,3),(4,4),(5,5);
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+----+------+------+
| id | col1 | col2 |
+----+------+------+
|  1 |    1 |    1 |
|  2 |    2 |    2 |
|  3 |    3 |    3 |
|  4 |    4 |    4 |
|  5 |    5 |    5 |
+----+------+------+
5 rows in set (0.01 sec)

mysql> ALTER TABLE t1 DROP COLUMN col1, DROP COLUMN col2;
ERROR 1105 (HY000): can't run multi schema change
mysql> SELECT * FROM t1;
+----+------+------+
| id | col1 | col2 |
+----+------+------+
|  1 |    1 |    1 |
|  2 |    2 |    2 |
|  3 |    3 |    3 |
|  4 |    4 |    4 |
|  5 |    5 |    5 |
```

```
+----+------+------+
5 rows in set (0.00 sec)

mysql> ALTER TABLE t1 DROP COLUMN col1;
Query OK, 0 rows affected (0.27 sec)

mysql> SELECT * FROM t1;
+----+------+
| id | col2 |
+----+------+
|  1 |    1 |
|  2 |    2 |
|  3 |    3 |
|  4 |    4 |
|  5 |    5 |
+----+------+
5 rows in set (0.00 sec)
```

#### 14.10.2.42.3 MySQL compatibility

- Dropping primary key columns or columns covered by the composite index is not supported.

#### 14.10.2.42.4 See also

- ADD COLUMN
- SHOW CREATE TABLE
- CREATE TABLE

### 14.10.2.43 DROP DATABASE

The `DROP DATABASE` statement permanently removes a specified database schema, and all of the tables and views that were created inside. User privileges that are associated with the dropped database remain unaffected.

#### 14.10.2.43.1 Synopsis

```
DropDatabaseStmt ::=
    'DROP' 'DATABASE' IfExists DBName

IfExists ::= ( 'IF' 'EXISTS' )?
```

#### 14.10.2.43.2 Examples

```
mysql> SHOW DATABASES;
+--------------------+
| Database           |
+--------------------+
| INFORMATION_SCHEMA |
| PERFORMANCE_SCHEMA |
| mysql              |
| test               |
+--------------------+
4 rows in set (0.00 sec)

mysql> DROP DATABASE test;
Query OK, 0 rows affected (0.25 sec)

mysql> SHOW DATABASES;
+--------------------+
| Database           |
+--------------------+
| INFORMATION_SCHEMA |
| PERFORMANCE_SCHEMA |
| mysql              |
+--------------------+
3 rows in set (0.00 sec)
```

#### 14.10.2.43.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.43.4 See also

- CREATE DATABASE
- ALTER DATABASE

### 14.10.2.44 DROP INDEX

This statement removes an index from a specified table, marking space as free in TiKV.

#### 14.10.2.44.1 Synopsis

```
DropIndexStmt ::=
    "DROP" "INDEX" IfExists Identifier "ON" TableName
        ↪ IndexLockAndAlgorithmOpt
```

```
IfExists ::=
    ( 'IF' 'EXISTS' )?

IndexLockAndAlgorithmOpt ::=
    ( LockClause AlgorithmClause? | AlgorithmClause LockClause? )?
```

#### 14.10.2.44.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.10 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
+--
    ↪ ----------------------+----------+-----------+---------------+----------------
    ↪
| id                    | estRows | task      | access object | operator info
    ↪            |
+--
    ↪ ----------------------+----------+-----------+---------------+----------------
    ↪
| TableReader_7         | 10.00   | root      |               | data:Selection_6
    ↪           |
| └─Selection_6         | 10.00   | cop[tikv] |               | eq(test.t1.c1,
    ↪ 3)          |
|   └─TableFullScan_5   | 10000.00 | cop[tikv] | table:t1 | keep order:false
    ↪ , stats:pseudo |
+--
    ↪ ----------------------+----------+-----------+---------------+----------------
    ↪
3 rows in set (0.00 sec)

mysql> CREATE INDEX c1 ON t1 (c1);
Query OK, 0 rows affected (0.30 sec)

mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
+--
    ↪ ----------------------+---------+-----------+-----------------------+----------
    ↪
```

```
| id                  | estRows | task    | access object       | operator
    ↪ info                          |
+--
    ↪ --------------------+---------+-----------+----------------------+----------
    ↪
| IndexReader_6       | 0.01    | root      |                      | index:
    ↪ IndexRangeScan_5                |
|  └─IndexRangeScan_5   | 0.01    | cop[tikv] | table:t1, index:c1(c1) | range
    ↪ :[3,3], keep order:false, stats:pseudo |
+--
    ↪ --------------------+---------+-----------+----------------------+----------
    ↪
2 rows in set (0.00 sec)

mysql> DROP INDEX c1 ON t1;
Query OK, 0 rows affected (0.30 sec)
```

#### 14.10.2.44.3 MySQL compatibility

- Dropping the primary key of the `CLUSTERED` type is not supported. For more details about the primary key of the `CLUSTERED` type, refer to clustered index.

#### 14.10.2.44.4 See also

- SHOW INDEX
- CREATE INDEX
- ADD INDEX
- RENAME INDEX
- ALTER INDEX

### 14.10.2.45 DROP PLACEMENT POLICY

`DROP PLACEMENT POLICY` is used to drop a previously created placement policy.

#### 14.10.2.45.1 Synopsis

```
DropPolicyStmt ::=
    "DROP" "PLACEMENT" "POLICY" IfExists PolicyName

PolicyName ::=
    Identifier
```

#### 14.10.2.45.2 Examples

Placement policies can only be dropped when they are not referenced by any tables or partitions.

```
CREATE PLACEMENT POLICY p1 FOLLOWERS=4;
CREATE TABLE t1 (a INT PRIMARY KEY) PLACEMENT POLICY=p1;
DROP PLACEMENT POLICY p1; -- This statement fails because the placement
    ↪ policy p1 is referenced.

-- Finds which tables and partitions reference the placement policy.
SELECT table_schema, table_name FROM information_schema.tables WHERE
    ↪ tidb_placement_policy_name='p1';
SELECT table_schema, table_name FROM information_schema.partitions WHERE
    ↪ tidb_placement_policy_name='p1';

ALTER TABLE t1 PLACEMENT POLICY=default; -- Removes the placement policy
    ↪ from t1.
DROP PLACEMENT POLICY p1; -- Succeeds.
```

```
Query OK, 0 rows affected (0.10 sec)

Query OK, 0 rows affected (0.11 sec)

ERROR 8241 (HY000): Placement policy 'p1' is still in use

+--------------+------------+
| table_schema | table_name |
+--------------+------------+
| test         | t1         |
+--------------+------------+
1 row in set (0.00 sec)

Empty set (0.01 sec)

Query OK, 0 rows affected (0.08 sec)

Query OK, 0 rows affected (0.21 sec)
```

#### 14.10.2.45.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.10.2.45.4 See also

- Placement Rules in SQL
- SHOW PLACEMENT
- CREATE PLACEMENT POLICY
- ALTER PLACEMENT POLICY

#### 14.10.2.46 DROP ROLE

This statement removes a role, that was previously created with `CREATE ROLE`.

##### 14.10.2.46.1 Synopsis

```
DropRoleStmt ::=
    'DROP' 'ROLE' ( 'IF' 'EXISTS' )? RolenameList

RolenameList ::=
    Rolename ( ',' Rolename )*
```

##### 14.10.2.46.2 Examples

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Create a new role `analyticsteam` and a new user `jennifer`:

```
CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Note that by default `jennifer` needs to execute `SET ROLE analyticsteam` in order to be able to use the privileges associated with the `analyticsteam` role:

```
SHOW GRANTS;
+-------------------------------------------+
| Grants for User                           |
```

```
+-----------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'  |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----------------------------------------------+
2 rows in set (0.00 sec)

SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

SHOW GRANTS;
+-----------------------------------------------+
| Grants for User                               |
+-----------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'  |
| GRANT SELECT ON test.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

The statement `SET DEFAULT ROLE` can be used to associate the role `analyticsteam` to `jennifer`:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
Query OK, 0 rows affected (0.02 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

After this, the user `jennifer` has the privileges associated with the role `analyticsteam` and `jennifer` does not have to execute the statement `SET ROLE`:

```
SHOW GRANTS;
```

```
+-------------------------------------------+
| Grants for User                           |
+-------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'      |
| GRANT SELECT ON test.* TO 'jennifer'@'%'  |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Drop the role for the `analyticsteam`:

```
DROP ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)
```

`jennifer` no longer has the default role of `analyticsteam` associated, nor can set the role to `analyticsteam`.

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Show the privileges of `jennifer`:

```
SHOW GRANTS;
+-----------------------------------+
| Grants for User                   |
+-----------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
+-----------------------------------+
1 row in set (0.00 sec)

SET ROLE analyticsteam;
ERROR 3530 (HY000): `analyticsteam`@`%` is is not granted to jennifer@%
```

#### 14.10.2.46.3 MySQL compatibility

This statement is understood to be fully compatible with roles, which are a feature of MySQL 8.0. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.46.4 See also

- CREATE ROLE
- GRANT <role>
- REVOKE <role>
- SET ROLE
- SET DEFAULT ROLE

- Role-Based Access Control

### 14.10.2.47 DROP SEQUENCE

The `DROP SEQUENCE` statement drops the sequence object in TiDB.

#### 14.10.2.47.1 Synopsis

```
DropSequenceStmt ::=
    'DROP' 'SEQUENCE' IfExists TableNameList

IfExists ::= ( 'IF' 'EXISTS' )?

TableNameList ::=
    TableName ( ',' TableName )*

TableName ::=
    Identifier ('.' Identifier)?
```

#### 14.10.2.47.2 Examples

```
DROP SEQUENCE seq;
```

```
Query OK, 0 rows affected (0.10 sec)
```

```
DROP SEQUENCE seq, seq2;
```

```
Query OK, 0 rows affected (0.03 sec)
```

#### 14.10.2.47.3 MySQL compatibility

This statement is a TiDB extension. The implementation is modeled on sequences available in MariaDB.

#### 14.10.2.47.4 See also

- CREATE SEQUENCE
- SHOW CREATE SEQUENCE

### 14.10.2.48 DROP STATS

The `DROP STATS` statement is used to delete the statistics of the selected table from the selected database.

#### 14.10.2.48.1 Synopsis

```
DropStatsStmt ::=
    'DROP' 'STATS' TableNameList

TableNameList ::=
    TableName ( ',' TableName )*

TableName ::=
    Identifier ('.' Identifier)?
```

#### 14.10.2.48.2 Examples

```
CREATE TABLE t(a INT);
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
SHOW STATS_META WHERE db_name='test' and table_name='t';
```

```
+--
    ↪ -------+------------+----------------+---------------------+--------------+-----
    ↪
| Db_name | Table_name | Partition_name | Update_time | Modify_count |
    ↪ Row_count |
+--
    ↪ -------+------------+----------------+---------------------+--------------+-----
    ↪
| test    | t          |                | 2020-05-25 20:34:33 |            0 |
    ↪         0 |
```

```
+--
    ↪ -------+-----------+---------------+--------------------+-------------+-----
    ↪
1 row in set (0.00 sec)
```

```
DROP STATS t;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
SHOW STATS_META WHERE db_name='test' and table_name='t';
```

```
Empty set (0.00 sec)
```

#### 14.10.2.48.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.10.2.48.4 See also

- Introduction to Statistics

### 14.10.2.49 DROP TABLE

This statement drops a table from the currently selected database. An error is returned if the table does not exist, unless the `IF EXISTS` modifier is used.

#### 14.10.2.49.1 Synopsis

```
DropTableStmt ::=
    'DROP' OptTemporary TableOrTables IfExists TableNameList
       ↪ RestrictOrCascadeOpt

OptTemporary ::=
    ( 'TEMPORARY' | ('GLOBAL' 'TEMPORARY') )?

TableOrTables ::=
    'TABLE'
|   'TABLES'

TableNameList ::=
    TableName ( ',' TableName )*
```

#### 14.10.2.49.2 Drop temporary tables

You can use the following syntax to drop ordinary tables and temporary tables:

- Use `DROP TEMPORARY TABLE` to drop local temporary tables.
- Use `DROP GLOBAL TEMPORARY TABLE` to drop global temporary tables.
- Use `DROP TABLE` to drop ordinary tables or temporary tables.

#### 14.10.2.49.3 Examples

```
mysql> CREATE TABLE t1 (a INT);
Query OK, 0 rows affected (0.11 sec)

mysql> DROP TABLE t1;
Query OK, 0 rows affected (0.22 sec)

mysql> DROP TABLE table_not_exists;
ERROR 1051 (42S02): Unknown table 'test.table_not_exists'

mysql> DROP TABLE IF EXISTS table_not_exists;
Query OK, 0 rows affected, 1 warning (0.01 sec)

mysql> SHOW WARNINGS;
+-------+------+----------------------------------------+
| Level | Code | Message                                |
+-------+------+----------------------------------------+
| Note | 1051 | Unknown table 'test.table_not_exists' |
+-------+------+----------------------------------------+
1 row in set (0.01 sec)

mysql> CREATE VIEW v1 AS SELECT 1;
Query OK, 0 rows affected (0.10 sec)

mysql> DROP TABLE v1;
Query OK, 0 rows affected (0.23 sec)
```

#### 14.10.2.49.4 MySQL compatibility

Currently, `RESTRICT` and `CASCADE` are only supported syntactically.

#### 14.10.2.49.5 See also

- CREATE TABLE
- SHOW CREATE TABLE
- SHOW TABLES

#### 14.10.2.50 DROP USER

This statement removes a user from the TiDB system database. The optional keyword `IF EXISTS` can be used to silence an error if the user does not exist. This statement requires the `CREATE USER` privilege.

##### 14.10.2.50.1 Synopsis

```
DropUserStmt ::=
    'DROP' 'USER' ( 'IF' 'EXISTS' )? UsernameList

Username ::=
    StringName ('@' StringName | singleAtIdentifier)? | 'CURRENT_USER'
        ↪ OptionalBraces
```

##### 14.10.2.50.2 Examples

```
mysql> DROP USER idontexist;
ERROR 1396 (HY000): Operation DROP USER failed for idontexist@%

mysql> DROP USER IF EXISTS 'idontexist';
Query OK, 0 rows affected (0.01 sec)

mysql> CREATE USER 'newuser' IDENTIFIED BY 'mypassword';
Query OK, 1 row affected (0.02 sec)

mysql> GRANT ALL ON test.* TO 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-------------------------------------------------+
| Grants for newuser@%                            |
+-------------------------------------------------+
| GRANT USAGE ON *.* TO 'newuser'@'%'             |
| GRANT ALL PRIVILEGES ON test.* TO 'newuser'@'%' |
+-------------------------------------------------+
2 rows in set (0.00 sec)

mysql> REVOKE ALL ON test.* FROM 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+----------------------------------+
| Grants for newuser@%             |
+----------------------------------+
```

```
| GRANT USAGE ON *.* TO 'newuser'@'%' |
+-------------------------------------+
1 row in set (0.00 sec)

mysql> DROP USER 'newuser';
Query OK, 0 rows affected (0.14 sec)

mysql> SHOW GRANTS FOR 'newuser';
ERROR 1141 (42000): There is no such grant defined for user 'newuser' on
    ↪ host '%'
```

#### 14.10.2.50.3 MySQL compatibility

- Dropping a user that does not exist with `IF EXISTS` will not create a warning in TiDB. Issue #10196.

#### 14.10.2.50.4 See also

- CREATE USER
- ALTER USER
- SHOW CREATE USER

- Privilege Management

### 14.10.2.51 DROP VIEW

This statement drops an view object from the currently selected database. It does not effect any base tables that a view references.

#### 14.10.2.51.1 Synopsis

```
DropViewStmt ::=
    'DROP' 'VIEW' ( 'IF' 'EXISTS' )? TableNameList RestrictOrCascadeOpt

TableNameList ::=
    TableName ( ',' TableName )*

TableName ::=
    Identifier ('.' Identifier)?
```

#### 14.10.2.51.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> CREATE VIEW v1 AS SELECT * FROM t1 WHERE c1 > 2;
Query OK, 0 rows affected (0.11 sec)

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 |  3 |
|  4 |  4 |
|  5 |  5 |
+----+----+
5 rows in set (0.00 sec)

mysql> SELECT * FROM v1;
+----+----+
| id | c1 |
+----+----+
|  3 |  3 |
|  4 |  4 |
|  5 |  5 |
+----+----+
3 rows in set (0.00 sec)

mysql> DROP VIEW v1;
Query OK, 0 rows affected (0.23 sec)

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 |  3 |
```

```
|  4 |  4 |
|  5 |  5 |
+----+----+
5 rows in set (0.00 sec)
```

#### 14.10.2.51.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.51.4 See also

- CREATE VIEW
- DROP TABLE

### 14.10.2.52 EXECUTE

The `EXECUTE` statement provides an SQL interface to server-side prepared statements.

#### 14.10.2.52.1 Synopsis

```
ExecuteStmt ::=
    'EXECUTE' Identifier ( 'USING' UserVariable ( ',' UserVariable )* )?
```

#### 14.10.2.52.2 Examples

```
mysql> PREPARE mystmt FROM 'SELECT ? as num FROM DUAL';
Query OK, 0 rows affected (0.00 sec)

mysql> SET @number = 5;
Query OK, 0 rows affected (0.00 sec)

mysql> EXECUTE mystmt USING @number;
+------+
| num |
+------+
| 5   |
+------+
1 row in set (0.00 sec)

mysql> DEALLOCATE PREPARE mystmt;
Query OK, 0 rows affected (0.00 sec)
```

#### 14.10.2.52.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.52.4 See also

- PREPARE
- DEALLOCATE

### 14.10.2.53 EXPLAIN ANALYZE

The `EXPLAIN ANALYZE` statement works similar to `EXPLAIN`, with the major difference being that it will actually execute the statement. This allows you to compare the estimates used as part of query planning to actual values encountered during execution. If the estimates differ significantly from the actual values, you should consider running `ANALYZE TABLE` on the affected tables.

> **Note:**
>
> When you use `EXPLAIN ANALYZE` to execute DML statements, modification to data is normally executed. Currently, the execution plan for DML statements **cannot** be shown yet.

#### 14.10.2.53.1 Synopsis

```
ExplainSym ::=
    'EXPLAIN'
|   'DESCRIBE'
|    'DESC'

ExplainStmt ::=
    ExplainSym ( TableName ColumnName? | 'ANALYZE'? ExplainableStmt | 'FOR'
       ↪ 'CONNECTION' NUM | 'FORMAT' '=' ( stringLit | ExplainFormatType )
       ↪ ( 'FOR' 'CONNECTION' NUM | ExplainableStmt ) )

ExplainableStmt ::=
    SelectStmt
|   DeleteFromStmt
|   UpdateStmt
|   InsertIntoStmt

#### 14.10.2.53.2 EXPLAIN ANALYZE output format

Different from `EXPLAIN`, `EXPLAIN ANALYZE` executes the corresponding SQL statement, records its runtime information, and returns the information together with the execution plan. Therefore, you can regard `EXPLAIN ANALYZE` as an extension of the `EXPLAIN` statement. Compared to `EXPLAIN` (for debugging query exeuction), the return results of `EXPLAIN ANALYZE` also include columns of information such as `actRows`, `execution info`, `memory`, and `disk`. The details of these columns are shown as follows:

| attribute name | description |
|---|---|
| actRows | Number of rows output by the operator. |
| execution info | Execution information of the operator. `time` represents the total `wall time` from entering the operator to leaving the operator, including the total execution time of all sub-operators. If the operator is called many times by the parent operator (in loops), then the time refers to the accumulated time. `loops` is the number of times the current operator is called by the parent operator. |
| memory | Memory space occupied by the operator. |
| disk | Disk space occupied by the operator. |

#### 14.10.2.53.3 Examples

```
CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT NOT
    ↪ NULL);
```

```
Query OK, 0 rows affected (0.12 sec)
```

```
INSERT INTO t1 (c1) VALUES (1), (2), (3);
```

```
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0
```

```
EXPLAIN ANALYZE SELECT * FROM t1 WHERE id = 1;
```

```
+--
    ↪ ----------+---------+---------+------+--------------+-----------------------
    ↪
```

```
| id          | estRows | actRows | task | access object | execution info
    ↪                                    | operator info | memory | disk |
+--
    ↪ ----------+---------+---------+------+---------------+----------------------
    ↪
| Point_Get_1 | 1.00 | 1       | root | table:t1    | time:757.205µs, loops:2,

2 rows in set (0.00 sec)
```

#### 14.10.2.53.4 Execution information of operators

In addition to the basic `time` and `loop` execution information, `execution info` also contains operator-specific execution information, which mainly includes the time consumed

for the operator to send RPC requests and the duration of other steps.

Point_Get

The execution information from a `Point_Get` operator will typically contain the following information:

- `Get:{num_rpc:1, total_time:697.051µs}`: The number of the `Get` RPC requests (`num_rpc`) sent to TiKV and the total duration (`total_time`) of all RPC requests.
- `ResolveLock:{num_rpc:1, total_time:12.117495ms}`: If TiDB encounters a lock when reading data, it has to resolve the lock first, which generally occurs in the scenario of read-write conflict. This information indicates the duration of resolving locks.
- `regionMiss_backoff:{num:11, total_time:2010 ms},tikvRPC_backoff:{num :11, total_time:10691 ms}`: When an RPC request fails, TiDB will wait the backoff time before retrying the request. Backoff statistics include the type of backoff (such as `regionMiss` and `tikvRPC`), the total waiting time (`total_time`), and the total number of backoffs (`num`).

Batch_Point_Get

The execution information of the `Batch_Point_Get` operator is similar to that of the `Point_Get` operator, but `Batch_Point_Get` generally sends `BatchGet` RPC requests to TiKV to read data.

`BatchGet:{num_rpc:2, total_time:83.13µs}`: The number of RPC requests (`num_rpc`) of the `BatchGet` type sent to TiKV and the total time consumed (`total_time`) for all RPC requests.

TableReader

The execution information of a `TableReader` operator is typically as follows:

```
cop_task: {num: 6, max: 1.07587ms, min: 844.312µs, avg: 919.601µs, p95:
    ↪ 1.07587ms, max_proc_keys: 16, p95_proc_keys: 16, tot_proc: 1ms,
    ↪ tot_wait: 1ms, rpc_num: 6, rpc_time: 5.313996 ms,
    ↪ copr_cache_hit_ratio: 0.00}
```

- `cop_task`: Contains the execution information of `cop` tasks. For example:
  - `num`: The number of cop tasks.
  - `max`, `min`, `avg`, `p95`: The maximum, minimum, average, and P95 values of the execution time consumed for executing cop tasks.
  - `max_proc_keys` and `p95_proc_keys`: The maximum and P95 key-values scanned by TiKV in all cop tasks. If the difference between the maximum value and the P95 value is large, the data distribution might be imbalanced.
  - `rpc_num`, `rpc_time`: The total number and total time consumed for `Cop` RPC requests sent to TiKV.
  - `copr_cache_hit_ratio`: The hit rate of Coprocessor Cache for `cop` task requests.

- `backoff`: Contains different types of backoff and the total waiting time of backoff.

Insert

The execution information of an `Insert` operator is typically as follows:

```
prepare:109.616µs, check_insert:{total_time:1.431678ms, mem_insert_time
    ↪ :667.878µs, prefetch:763.8µs, rpc:{BatchGet:{num_rpc:1, total_time
    ↪ :699.166µs},Get:{num_rpc:1, total_time:378.276µs }}}
```

- `prepare`: The time consumed for preparing to write, including expression, default value and auto-increment value calculations.
- `check_insert`: This information generally appears in `insert ignore` and `insert ↪ on duplicate` statements, including conflict checking and the time consumed for writing data to TiDB transaction cache. Note that this time consumption does not include the time consumed for transaction commit. It contains the following information:
    - `total_time`: The total time spent on the `check_insert` step.
    - `mem_insert_time`: The time consumed for writing data to the TiDB transaction cache.
    - `prefetch`: The duration of retrieving the data that needs to be checked for conflicts from TiKV. This step sends a `Batch_Get` RPC request to TiKV to retrieve data.
    - `rpc`: The total time consumed for sending RPC requests to TiKV, which generally includes two types of RPC time, `BatchGet` and `Get`, among which:
        - `BatchGet` RPC request is sent in the `prefetch` step.
        - `Get` RPC request is sent when the `insert on duplicate` statement executes `duplicate update`.
- `backoff`: Contains different types of backoff and the total waiting time of backoff.

IndexJoin

The `IndexJoin` operator has 1 outer worker and N inner workers for concurrent execution. The join result preserves the order of the outer table. The detailed execution process is as follows:

1. The outer worker reads N outer rows, then wraps it into a task, and sends it to the result channel and the inner worker channel.
2. The inner worker receives the task, build key ranges from the task, and fetches inner rows according to the key ranges. It then builds the inner row hash table.
3. The main `IndexJoin` thread receives the task from the result channel and waits for the inner worker to finish handling the task.
4. The main `IndexJoin` thread joins each outer row by looking up to the inner rows' hash table.

The `IndexJoin` operator contains the following execution information:

```
inner:{total:4.297515932s, concurrency:5, task:17, construct:97.96291ms,
    ↪ fetch:4.164310088s, build:35.219574ms}, probe:53.574945ms
```

- `Inner`: The execution information of inner worker:
  - `total`: The total time consumed by the inner worker.
  - `concurrency`: The number of concurrent inner workers.
  - `task`: The total number of tasks processed by the inner worker.
  - `construct`: The preparation time before the inner worker reads the inner table rows corresponding to the task.
  - `fetch`: The total time consumed for it takes for the inner worker to read inner table rows.
  - `Build`: The total time consumed for it takes for the inner worker to construct the hash table of the corresponding inner table rows.
- `probe`: The total time consumed by the main `IndexJoin` thread to perform join operations with the hash table of the outer table rows and the inner table rows.

IndexHashJoin

The execution process of the `IndexHashJoin` operator is similar to that of the `IndexJoin` operator. `IndexHashJoin` operator also has 1 outer worker and N inner workers to execute in parallel, but the output order is not guaranteed to be consistent with that of the outer table. The detailed execution process is as follows:

1. The outer worker reads N outer rows, builds a task, and sends it to the inner worker channel.
2. The inner worker receives the tasks from the inner worker channel and performs the following three operations in order for every task:

a. Build a hash table from the outer rows
b. Build key ranges from outer rows and fetches inner rows
c. Probe the hash table and sends the join result to the result channel. Note: step a and step b are running concurrently.

3. The main thread of `IndexHashJoin` receives the join results from the result channel.

The `IndexHashJoin` operator contains the following execution information:

```
inner:{total:4.429220003s, concurrency:5, task:17, construct:96.207725ms,
    ↪ fetch:4.239324006s, build:24.567801ms, join:93.607362ms}
```

- `Inner`: the execution information of inner worker:

- `total`: the total time consumed by the inner worker.
- `concurrency`: the number of inner workers.
- `task`: The total number of tasks processed by the inner worker.
- `construct`: The preparation time before the inner worker reads the inner table rows.
- `fetch`: The total time consumed for inner worker to read inner table rows.
- `Build`: The total time consumed for inner worker to construct the hash table of the outer table rows.
- `join`: The total time consumed for inner worker to do join with the inner table rows and the hash table of outer table rows.

HashJoin

The `HashJoin` operator has an inner worker, an outer worker, and N join workers. The detailed execution process is as follows:

1. The inner worker reads inner table rows and constructs a hash table.
2. The outer worker reads the outer table rows, then wraps it into a task and sends it to the join worker.
3. The join worker waits for the hash table construction in step 1 to finish.
4. The join worker uses the outer table rows and hash table in the task to perform join operations, and then sends the join result to the result channel.
5. The main thread of `HashJoin` receives the join result from the result channel.

The `HashJoin` operator contains the following execution information:

```
build_hash_table:{total:146.071334ms, fetch:110.338509ms, build:35.732825ms
    ↪ }, probe:{concurrency:5, total:857.162518ms, max:171.48271ms, probe
    ↪ :125.341665ms, fetch:731.820853ms}
```

- `build_hash_table`: Reads the data of the inner table and constructs the execution information of the hash table:
    - `total`: The total time consumption.
    - `fetch`: The total time spent reading inner table data.
    - `build`: The total time spent constructing a hash table.
- `probe`: The execution information of join workers:
    - `concurrency`: The number of join workers.
    - `total`: The total time consumed by all join workers.
    - `max`: The longest time for a single join worker to execute.
    - `probe`: The total time consumed for joining with outer table rows and the hash table.
    - `fetch`: The total time that the join worker waits to read the outer table rows data.

TableFullScan (TiFlash)

The `TableFullScan` operator executed on a TiFlash node contains the following execution information:

```
tiflash_scan: {
  dtfile: {
    total_scanned_packs: 2,
    total_skipped_packs: 1,
    total_scanned_rows: 16000,
    total_skipped_rows: 8192,
    total_rough_set_index_load_time: 2ms,
    total_read_time: 20ms
  },
  total_create_snapshot_time: 1ms
}
```

- `dtfile`: the DTFile (DeltaTree File) related information during the table scan, which reflects the data scan status of the TiFlash Stable layer.
    - `total_scanned_packs`: the total number of packs that have been scanned in the DTFile. A pack is the minimum unit that can be read in the TiFlash DTFile. By default, every 8192 rows constitute a pack.
    - `total_skipped_packs`: the total number of packs that have been skipped by the scan in the DTFile. When a `WHERE` clause hits rough set indexes or matches the range filtering of a primary key, the irrelevant packs are skipped.
    - `total_scanned_rows`: the total number of rows that have been scanned in the DTFile. If there are multiple versions of updates or deletions because of MVCC, each version is counted independently.
    - `total_skipped_rows`: the total number of rows that are skipped by the scan in the DTFile.
    - `total_rs_index_load_time`: the total time used to read DTFile rough set indexes.
    - `total_read_time`: the total time used to read DTFile data.
- `total_create_snapshot_time`: the total time used to create snapshots during the table scan.

lock_keys execution information

When a DML statement is executed in a pessimistic transaction, the execution information of the operator might also include the execution information of `lock_keys`. For example:

```
lock_keys: {time:94.096168ms, region:6, keys:8, lock_rpc:274.503214ms,
    ↪ rpc_count:6}
```

- `time`: The total duration of executing the `lock_keys` operation.
- `region`: The number of Regions involved in executing the `lock_keys` operation.
- `keys`: The number of `Keys` that need `Lock`.
- `lock_rpc`: The total time spent sending an RPC request of the `Lock` type to TiKV. Because multiple RPC requests can be sent in parallel, the total RPC time consumption might be greater than the total time consumption of the `lock_keys` operation.
- `rpc_count`: The total number of RPC requests of the `Lock` type sent to TiKV.

commit_txn execution information

When a write-type DML statement is executed in a transaction with `autocommit=1`, the execution information of the write operator will also include the duration information of the transaction commit. For example:

```
commit_txn: {prewrite:48.564544ms, wait_prewrite_binlog:47.821579,
    ↪ get_commit_ts:4.277455ms, commit:50.431774ms, region_num:7,
    ↪ write_keys:16, write_byte:536}
```

- `prewrite`: The time consumed for the `prewrite` phase of the 2PC commit of the transaction.
- `wait_prewrite_binlog`:: The time consumed for waiting to write the prewrite Binlog.
- `get_commit_ts`: The time consumed for getting the transaction commit timestamp.
- `commit`: The time consumed for the `commit` phase during the 2PC commit of the transaction.
- `write_keys`: The total `keys` written in the transaction.
- `write_byte`: The total bytes of `key-value` written in the transaction, and the unit is byte.

Other common execution information

The Coprocessor operators usually contain two parts of execution time information: `cop_task` and `tikv_task`. `cop_task` is the time recorded by TiDB, and it is from the moment that the request is sent to the server to the moment that the response is received. `tikv_task` is the time recorded by TiKV Coprocessor itself. If there is much difference between the two, it might indicate that the time spent waiting for the response is too long, or the time spent on gRPC or network is too long.

#### 14.10.2.53.5 MySQL compatibility

`EXPLAIN ANALYZE` is a feature of MySQL 8.0, but both the output format and the potential execution plans in TiDB differ substantially from MySQL.

#### 14.10.2.53.6 See also

- Understanding the Query Execution Plan

- EXPLAIN
- ANALYZE TABLE
- TRACE

#### 14.10.2.54 EXPLAIN

The EXPLAIN statement shows the execution plan for a query without executing it. It is complimented by EXPLAIN ANALYZE which will execute the query. If the output of EXPLAIN does not match the expected result, consider executing ANALYZE TABLE on each table in the query.

The statements DESC and DESCRIBE are aliases of this statement. The alternative usage of EXPLAIN <tableName> is documented under SHOW [FULL] COLUMNS FROM.

TiDB supports the EXPLAIN [options] FOR CONNECTION connection_id statement. However, this statement is different from the EXPLAIN FOR statement in MySQL. For more details, see EXPLAIN FOR CONNECTION.

##### 14.10.2.54.1 Synopsis

```
ExplainSym ::=
    'EXPLAIN'
|   'DESCRIBE'
|   'DESC'

ExplainStmt ::=
    ExplainSym ( TableName ColumnName? | 'ANALYZE'? ExplainableStmt | 'FOR'
        ↪ 'CONNECTION' NUM | 'FORMAT' '=' ( stringLit | ExplainFormatType )
        ↪ ( 'FOR' 'CONNECTION' NUM | ExplainableStmt ) )

ExplainableStmt ::=
    SelectStmt
|   DeleteFromStmt
|   UpdateStmt
|   InsertIntoStmt
|   ReplaceIntoStmt
|   UnionStmt
```

##### 14.10.2.54.2 EXPLAIN output format

> **Note:**
>
> When you use the MySQL client to connect to TiDB, to read the output result in a clearer way without line wrapping, you can use the pager less -S command. Then, after the EXPLAIN result is output, you can press

the right arrow → button on your keyboard to horizontally scroll through the output.

**Note:**

In the returned execution plan, for all probe-side child nodes of `IndexJoin` ↪ and `Apply` operators, the meaning of `estRows` since v6.4.0 is different from that before v6.4.0. You can find details in TiDB Query Execution Plan Overview.

Currently, `EXPLAIN` in TiDB outputs 5 columns: `id`, `estRows`, `task`, `access object`, `operator info`. Each operator in the execution plan is described by these attributes, with each row in the `EXPLAIN` output describing an operator. The description of each attribute is as follows:

| Attribute name | Description |
|---|---|
| id | The operator ID is the unique identifier of the operator in the entire execution plan. In TiDB 2.1, the ID is formatted to display the tree structure of the operator. Data flows from the child node to the parent node. One and only one parent node for each operator. |
| estRows | The number of rows that the operator is expected to output. This number is estimated according to the statistics and the operator's logic. `estRows` is called `count` in the earlier versions of TiDB 4.0. |
| task | The type of task the operator belongs to. Currently, the execution plans are divided into two tasks: **root** task, which is executed on tidb-server, and **cop** task, which is performed in parallel on TiKV or TiFlash. The topology of the execution plan at the task level is that a root task followed by many cop tasks. The root task uses the output of cop tasks as input. The cop tasks refer to tasks that TiDB pushes down to TiKV or TiFlash. Each cop task is distributed in the TiKV cluster or the TiFlash cluster, and is executed by multiple processes. |
| access object | Data item information accessed by the operator. The information includes `table`, `partition`, and `index` (if any). Only operators that directly access the data have such information. |
| operator info | Other information about the operator. `operator info` of each operator is different. You can refer to the following examples. |

#### 14.10.2.54.3 Examples

```
EXPLAIN SELECT 1;

    ↪
4 rows in set (0.01 sec)
```

To specify the format of the `EXPLAIN` output, you can use the `FORMAT = xxx` syntax. Currently, TiDB supports the following formats:

| FORMAT | Description |
|---|---|
| Not specified | If the format is not specified, `EXPLAIN` ↪ uses the default format `row`. |

| FORMAT | Description |
| --- | --- |
| `row` | The `EXPLAIN` statement outputs results in a tabular format. See Understand the Query Execution Plan for more information. |

| FORMAT | Description |
| --- | --- |
| `brief` | The operator IDs in the output of the `EXPLAIN` statement are simplified, compared with those when `FORMAT` is left unspecified. |

| FORMAT | Description |
| --- | --- |
| `dot` | The `EXPLAIN` statement outputs DOT execution plans, which can be used to generate PNG files through a `dot` program (in the `graphviz` package). |

| FORMAT | Description |
| --- | --- |
| `tidb_json` | The `EXPLAIN` statement outputs execution plans in JSON and stores the operator information in a JSON array. |

The following is an example when `FORMAT` is `"brief"` in `EXPLAIN`:

```
EXPLAIN FORMAT = "brief" DELETE FROM t1 WHERE c1 = 3;
```

```
+-----------------------+---------+----------+--------------+-------------------------------+
| id                    | estRows | task     | access object | operator info                 |
+-----------------------+---------+----------+--------------+-------------------------------+
| Delete                | N/A     | root     |              | N/A                           |
| └─TableReader         | 0.00    | root     |              | data:Selection                |
|   └─Selection         | 0.00    | cop[tikv] |              | eq(test.t1.c1, 3)             |
|     └─TableFullScan   | 3.00    | cop[tikv] | table:t1     | keep order:false, stats:pseudo |
+-----------------------+---------+----------+--------------+-------------------------------+
```

```
    ↪
4 rows in set (0.001 sec)
```

In addition to the MySQL standard result format, TiDB also supports DotGraph and you need to specify `FORMAT = "dot"` as in the following example:

```
CREATE TABLE t(a bigint, b bigint);
EXPLAIN format = "dot" SELECT A.a, B.b FROM t A JOIN t B ON A.a > B.b WHERE
    ↪  A.a < 10;
```

```
+--
    ↪ ------------------------------------------------------------------------------
    ↪
| dot contents
    ↪
    ↪ |
+--
    ↪ ------------------------------------------------------------------------------
    ↪
|
digraph Projection_8 {
subgraph cluster8{
node [style=filled, color=lightgrey]
color=black
label = "root"
"Projection_8" -> "HashJoin_9"
"HashJoin_9" -> "TableReader_13"
"HashJoin_9" -> "Selection_14"
"Selection_14" -> "TableReader_17"
}
subgraph cluster12{
node [style=filled, color=lightgrey]
color=black
label = "cop"
"Selection_12" -> "TableFullScan_11"
}
subgraph cluster16{
node [style=filled, color=lightgrey]
color=black
label = "cop"
"Selection_16" -> "TableFullScan_15"
}
"TableReader_13" -> "Selection_12"
"TableReader_17" -> "Selection_16"
}
```

```
 |
+--
    ↪ ----------------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

If your computer has a `dot` program, you can generate a PNG file using the following method:

```
dot xx.dot -T png -O

The xx.dot is the result returned by the above statement.
```

If your computer has no `dot` program, copy the result to this website to get a tree diagram:

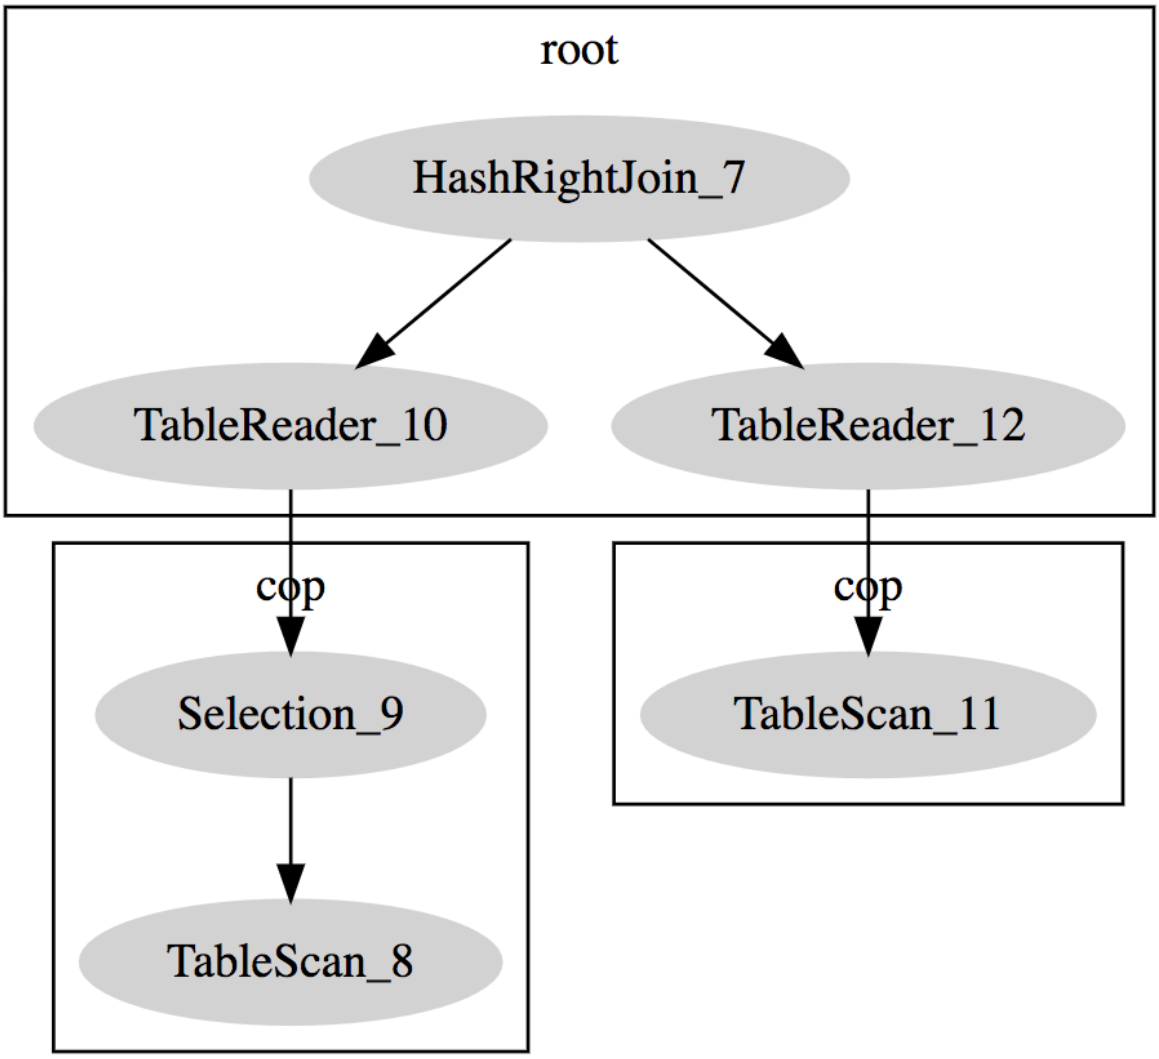

Figure 409: Explain Dot

To get the output in JSON, specify `FORMAT = "tidb_json"` in the `EXPLAIN` statement. The following is an example:

```
CREATE TABLE t(id int primary key, a int, b int, key(a));
EXPLAIN FORMAT = "tidb_json" SELECT id FROM t WHERE a = 1;
```

```
+-------------------------------------------------------------------------------------------
    ↪
| TiDB_JSON
    ↪
    ↪ |
```

```
+-------------------------------------------------------------------------------------------
    ↪
| [
    {
        "id": "Projection_4",
        "estRows": "10.00",
        "taskType": "root",
        "operatorInfo": "test.t.id",
        "subOperators": [
            {
                "id": "IndexReader_6",
                "estRows": "10.00",
                "taskType": "root",
                "operatorInfo": "index:IndexRangeScan_5",
                "subOperators": [
                    {
                        "id": "IndexRangeScan_5",
                        "estRows": "10.00",
                        "taskType": "cop[tikv]",
                        "accessObject": "table:t, index:a(a)",
                        "operatorInfo": "range:[1,1], keep order:false, stats:
                            ↪ pseudo"
                    }
                ]
            }
        ]
    }
]
 |
+-------------------------------------------------------------------------------------------
    ↪
1 row in set (0.01 sec)
```

In the output, `id`, `estRows`, `taskType`, `accessObject`, and `operatorInfo` have the same meaning as the columns in the default format. `subOperators` is an array that stores the sub-nodes. The fields and meanings of the sub-nodes are the same as the parent node. If a field is missing, it means that the field is empty.

#### 14.10.2.54.4 MySQL compatibility

- Both the format of `EXPLAIN` and the potential execution plans in TiDB differ substantially from MySQL.
- TiDB does not support the `FORMAT=JSON` or `FORMAT=TREE` options.
- `FORMAT=tidb_json` in TiDB is the JSON format output of the default `EXPLAIN` result. The format and fields are different from the `FORMAT=JSON` output in MySQL.

`EXPLAIN FOR CONNECTION`

`EXPLAIN FOR CONNECTION` is used to get the execution plan of the currently executed SQL query or the last executed SQL query in a connection. The output format is the same as that of `EXPLAIN`. However, the implementation of `EXPLAIN FOR CONNECTION` in TiDB is different from that in MySQL. Their differences (apart from the output format) are listed as follows:

- If the connection is sleeping, MySQL returns an empty result, while TiDB returns the last executed query plan.
- If you try to get the execution plan of the current session, MySQL returns an error, while TiDB returns the result normally.
- MySQL requires the login user to be the same as the connection being queried, or the login user has the **`PROCESS`** privilege; while TiDB requires the login user to be the same as the connection being queried, or the login user has the **`SUPER`** privilege.

### 14.10.2.55 FLASHBACK CLUSTER

TiDB v6.4.0 introduces the `FLASHBACK CLUSTER TO TIMESTAMP` syntax. You can use it to restore a cluster to a specific point in time. When specifying the timestamp, you can either set a datetime value or use a time function. The format of datetime is like '2016-10-08 16:45:26.999', with millisecond as the minimum time unit. But in most cases, specifying the timestamp with second as the time unit is sufficient, for example, '2016-10-08 16:45:26'.

Starting from v6.5.6, TiDB introduces the `FLASHBACK CLUSTER TO TSO` syntax. This syntax enables you to use TSO to specify a more precise recovery point in time, thereby enhancing flexibility in data recovery.

> **Warning:**
>
> When specifying a recovery point in time, make sure to check the validity of your target timestamp or TSO and avoid specifying a future time that exceeds the maximum TSO currently allocated by PD (see `Current TSO` on the Grafana PD panel). Otherwise, concurrent processing linear consistency and transaction isolation levels might be violated, leading to serious data correctness issues.

**Note:**

The working principle of `FLASHBACK CLUSTER TO [TIMESTAMP|TSO]` is to write the old data of a specific point in time with the latest timestamp, and will not delete the current data. So before using this feature, you need to ensure that there is enough storage space for the old data and the current data.

#### 14.10.2.55.1 Syntax

```
FLASHBACK CLUSTER TO TIMESTAMP '2022-09-21 16:02:50';
FLASHBACK CLUSTER TO TSO 445494839813079041;
```

Synopsis

```
FlashbackToTimestampStmt
        ::= 'FLASHBACK' 'CLUSTER' 'TO' 'TIMESTAMP' stringLit
          | 'FLASHBACK' 'CLUSTER' 'TO' 'TSO' LengthNum
```

#### 14.10.2.55.2 Notes

- The time specified in the `FLASHBACK` statement must be within the Garbage Collection (GC) lifetime. The system variable `tidb_gc_life_time` (default: `10m0s`) defines the retention time of earlier versions of rows. The current `safePoint` of where garbage collection has been performed up to can be obtained with the following query:

  ```
  SELECT * FROM mysql.tidb WHERE variable_name = 'tikv_gc_safe_point';
  ```

- Only a user with the `SUPER` privilege can execute the `FLASHBACK CLUSTER` SQL statement.
- From the time specified in the `FLASHBACK` statement to the time when the `FLASHBACK` is executed, there cannot be a DDL statement that changes the related table structure. If such a DDL exists, TiDB will reject it.
- Before executing `FLASHBACK CLUSTER`, TiDB disconnects all related connections and prohibits read and write operations on these tables until the `FLASHBACK` statement is completed.
- The `FLASHBACK CLUSTER` statement cannot be canceled after being executed. TiDB will keep retrying until it succeeds.

#### 14.10.2.55.3 Example

The following example shows how to flashback a cluster to a specific timestamp to restore newly inserted data:

```
mysql> CREATE TABLE t(a INT);
Query OK, 0 rows affected (0.09 sec)

mysql> SELECT * FROM t;
Empty set (0.01 sec)

mysql> SELECT now();
+---------------------+
| now()               |
+---------------------+
| 2022-09-28 17:24:16 |
+---------------------+
1 row in set (0.02 sec)

mysql> INSERT INTO t VALUES (1);
Query OK, 1 row affected (0.02 sec)

mysql> SELECT * FROM t;
+------+
| a    |
+------+
|    1 |
+------+
1 row in set (0.01 sec)

mysql> FLASHBACK CLUSTER TO TIMESTAMP '2022-09-28 17:24:16';
Query OK, 0 rows affected (0.20 sec)

mysql> SELECT * FROM t;
Empty set (0.00 sec)
```

The following example shows how to flashback a cluster to a specific TSO to precisely restore mistakenly deleted data:

```
mysql> INSERT INTO t VALUES (1);
Query OK, 1 row affected (0.02 sec)

mysql> SELECT * FROM t;
+------+
| a    |
+------+
|    1 |
```

```
+------+
1 row in set (0.01 sec)

mysql> BEGIN;
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT @@tidb_current_ts; -- Get the current TSO
+--------------------+
| @@tidb_current_ts |
+--------------------+
| 446113975683252225 |
+--------------------+
1 row in set (0.00 sec)

mysql> ROLLBACK;
Query OK, 0 rows affected (0.00 sec)

mysql> DELETE FROM t;
Query OK, 1 rows affected (0.00 sec)

mysql> FLASHBACK CLUSTER TO TSO 446113975683252225;
Query OK, 0 rows affected (0.20 sec)

mysql> SELECT * FROM t;
+------+
| a    |
+------+
|    1 |
+------+
1 row in set (0.01 sec)
```

If there is a DDL statement that changes the table structure from the time specified in the `FLASHBACK` statement to the time when the `FLASHBACK` is executed, the `FLASHBACK` statement fails:

```
mysql> SELECT now();
+---------------------+
| now()               |
+---------------------+
| 2022-10-09 16:40:51 |
+---------------------+
1 row in set (0.01 sec)
```

```
mysql> CREATE TABLE t(a int);
Query OK, 0 rows affected (0.12 sec)

mysql> FLASHBACK CLUSTER TO TIMESTAMP '2022-10-09 16:40:51';
ERROR 1105 (HY000): Detected schema change due to another DDL job during
    ↪ [2022-10-09 16:40:51 +0800 CST, now), can't do flashback
```

The `FLASHBACK` execution progress can be viewed via the Raft admin > Peer in Flashback State metrics and the log. The following log is an example:

```
[2022/10/09 17:25:59.316 +08:00] [INFO] [cluster.go:463] ["flashback cluster
    ↪  stats"] ["complete regions"=9] ["total regions"=10] []
```

#### 14.10.2.55.4 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.10.2.56 FLASHBACK DATABASE

TiDB v6.4.0 introduces the `FLASHBACK DATABASE` syntax. You can use `FLASHBACK ↪ DATABASE` to restore a database and its data that are deleted by the `DROP` statement within the Garbage Collection (GC) life time.

You can set the retention time of historical data by configuring the `tidb_gc_life_time` system variable. The default value is `10m0s`. You can query the current `safePoint`, that is, the time point GC has been performed up to, using the following SQL statement:

```
SELECT * FROM mysql.tidb WHERE variable_name = 'tikv_gc_safe_point';
```

As long as a database is deleted by `DROP` after the `tikv_gc_safe_point` time, you can use `FLASHBACK DATABASE` to restore the database.

#### 14.10.2.56.1 Syntax

```
FLASHBACK DATABASE DBName [TO newDBName]
```

Synopsis

```
FlashbackDatabaseStmt ::=
    'FLASHBACK' DatabaseSym DBName FlashbackToNewName
FlashbackToNewName ::=
    ( 'TO' Identifier )?
```

#### 14.10.2.56.2 Notes

- If the database is deleted before the `tikv_gc_safe_point` time, you cannot restore the data using the `FLASHBACK DATABASE` statement. The `FLASHBACK DATABASE` statement returns an error similar to `ERROR 1105 (HY000): Can't find dropped database '
↪ test' in GC safe point 2022-11-06 16:10:10 +0800 CST`.
- You cannot restore the same database multiple times using the `FLASHBACK DATABASE`
↪ statement. Because the database restored by `FLASHBACK DATABASE` has the same schema ID as the original database, restoring the same database multiple times leads to duplicate schema IDs. In TiDB, the database schema ID must be globally unique.
- When TiDB Binlog is enabled, note the following when you use `FLASHBACK DATABASE`:
  - The downstream secondary database must support `FLASHBACK DATABASE`.
  - The GC life time of the secondary database must be longer than that of the primary database. Otherwise, the latency between the upstream and the downstream might lead to data restoration failure in the downstream.
  - If TiDB Binlog replication encounters an error, you need to filter out the database in TiDB Binlog and then manually import full data for this database.

#### 14.10.2.56.3 Example

- Restore the `test` database that is deleted by `DROP`:

```
DROP DATABASE test;
```

```
FLASHBACK DATABASE test;
```

- Restore the `test` database that is deleted by `DROP` and rename it to `test1`:

```
DROP DATABASE test;
```

```
FLASHBACK DATABASE test TO test1;
```

#### 14.10.2.56.4 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.10.2.57 FLASHBACK TABLE

The `FLASHBACK TABLE` syntax is introduced since TiDB 4.0. You can use the `FLASHBACK
↪ TABLE` statement to restore the tables and data dropped by the `DROP` or `TRUNCATE` operation within the Garbage Collection (GC) lifetime.

The system variable `tidb_gc_life_time` (default: `10m0s`) defines the retention time of earlier versions of rows. The current `safePoint` of where garbage collection has been performed up to can be obtained with the following query:

```
SELECT * FROM mysql.tidb WHERE variable_name = 'tikv_gc_safe_point';
```

As long as the table is dropped by `DROP` or `TRUNCATE` statements after the `tikv_gc_safe_point` time, you can restore the table using the `FLASHBACK TABLE` statement.

#### 14.10.2.57.1 Syntax

```
FLASHBACK TABLE table_name [TO other_table_name]
```

#### 14.10.2.57.2 Synopsis

```
FlashbackTableStmt ::=
    'FLASHBACK' 'TABLE' TableName FlashbackToNewName

TableName ::=
    Identifier ( '.' Identifier )?

FlashbackToNewName ::=
    ( 'TO' Identifier )?
```

#### 14.10.2.57.3 Notes

If a table is dropped and the GC lifetime has passed, you can no longer use the `FLASHBACK TABLE` statement to recover the dropped data. Otherwise, an error like `Can't find dropped / truncated table 't' in GC safe point 2020-03-16 16:34:52 +0800 CST` will be returned.

Pay attention to the following conditions and requirements when you enable TiDB Binlog and use the `FLASHBACK TABLE` statement:

- The downstream secondary cluster must also support `FLASHBACK TABLE`.
- The GC lifetime of the secondary cluster must be longer than that of the primary cluster.
- The delay of replication between the upstream and downstream might also cause the failure to recover data to the downstream.
- If an error occurs when TiDB Binlog is replicating a table, you need to filter that table in TiDB Binlog and manually import all data of that table.

#### 14.10.2.57.4 Example

- Recover the table data dropped by the `DROP` operation:

```
DROP TABLE t;
```

```
FLASHBACK TABLE t;
```

- Recover the table data dropped by the `TRUNCATE` operation. Because the truncated table `t` still exists, you need to rename the table `t` to be recovered. Otherwise, an error will be returned because the table `t` already exists.

```
TRUNCATE TABLE t;
```

```
FLASHBACK TABLE t TO t1;
```

#### 14.10.2.57.5 Implementation principle

When deleting a table, TiDB only deletes the table metadata, and writes the table data (row data and index data) to be deleted to the `mysql.gc_delete_range` table. The GC Worker in the TiDB background periodically removes from the `mysql.gc_delete_range` table the keys that exceed the GC lifetime.

Therefore, to recover a table, you only need to recover the table metadata and delete the corresponding row record in the `mysql.gc_delete_range` table before the GC Worker deletes the table data. You can use a snapshot read of TiDB to recover the table metadata. For details of snapshot read, refer to Read Historical Data.

The following is the working process of `FLASHBACK TABLE t TO t1`:

1. TiDB searches the recent DDL history jobs and locates the first DDL operation of the `DROP TABLE` or the `truncate table` type on table `t`. If TiDB fails to locate one, an error is returned.
2. TiDB checks whether the starting time of the DDL job is before `tikv_gc_safe_point`. If it is before `tikv_gc_safe_point`, it means that the table dropped by the `DROP` or `TRUNCATE` operation has been cleaned up by the GC and an error is returned.
3. TiDB uses the starting time of the DDL job as the snapshot to read historical data and read table metadata.
4. TiDB deletes GC tasks related to table `t` in `mysql.gc_delete_range`.
5. TiDB changes `name` in the table's metadata to `t1`, and uses this metadata to create a new table. Note that only the table name is changed but not the table ID. The table ID is the same as that of the previously dropped table `t`.

From the above process, you can see that TiDB always operates on the metadata of the table, and the user data of the table has never been modified. The restored table `t1` has the same ID as the previously dropped table `t`, so `t1` can read the user data of `t`.

**Note:**

You cannot use `FLASHBACK` statements to restore the same deleted table multiple times, because the ID of the restored table is the same ID of the dropped table, and TiDB requires that all existing tables must have a globally unique table ID.

The `FLASHBACK TABLE` operation is done by TiDB obtaining the table metadata through snapshot read, and then going through the process of table creation similar to `CREATE TABLE`. Therefore, `FLASHBACK TABLE` is, in essence, a kind of DDL operation.

#### 14.10.2.57.6 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.10.2.58 FLUSH PRIVILEGES

This statement triggers TiDB to reload the in-memory copy of privileges from the privilege tables. You should execute `FLUSH PRIVILEGES` after making manual edits to tables such as `mysql.user`. Executing this statement is not required after using privilege statements such as `GRANT` or `REVOKE`. Executing this statement requires the `RELOAD` privilege.

#### 14.10.2.58.1 Synopsis

```
FlushStmt ::=
    'FLUSH' NoWriteToBinLogAliasOpt FlushOption

NoWriteToBinLogAliasOpt ::=
    ( 'NO_WRITE_TO_BINLOG' | 'LOCAL' )?

FlushOption ::=
    'PRIVILEGES'
|   'STATUS'
|    'TIDB' 'PLUGINS' PluginNameList
|    'HOSTS'
|   LogTypeOpt 'LOGS'
|   TableOrTables TableNameListOpt WithReadLockOpt
```

#### 14.10.2.58.2 Examples

```
mysql> FLUSH PRIVILEGES;
Query OK, 0 rows affected (0.01 sec)
```

#### 14.10.2.58.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.58.4 See also

- SHOW GRANTS
- Privilege Management

### 14.10.2.59 FLUSH STATUS

This statement is included for compatibility with MySQL. It has no effect on TiDB, which uses Prometheus and Grafana for centralized metrics collection instead of `SHOW STATUS`.

#### 14.10.2.59.1 Synopsis

```
FlushStmt ::=
    'FLUSH' NoWriteToBinLogAliasOpt FlushOption

NoWriteToBinLogAliasOpt ::=
    ( 'NO_WRITE_TO_BINLOG' | 'LOCAL' )?

FlushOption ::=
    'PRIVILEGES'
|   'STATUS'
|    'TIDB' 'PLUGINS' PluginNameList
|    'HOSTS'
|   LogTypeOpt 'LOGS'
|   TableOrTables TableNameListOpt WithReadLockOpt
```

```

#### 14.10.2.59.3 MySQL compatibility

- This statement is included only for compatibility with MySQL.

#### 14.10.2.59.4 See also

- SHOW [GLOBAL|SESSION] STATUS

### 14.10.2.60 FLUSH TABLES

This statement is included for compatibility with MySQL. It has no effective usage in TiDB.

#### 14.10.2.60.1 Synopsis

```
FlushStmt ::=
    'FLUSH' NoWriteToBinLogAliasOpt FlushOption

NoWriteToBinLogAliasOpt ::=
    ( 'NO_WRITE_TO_BINLOG' | 'LOCAL' )?

FlushOption ::=
    'PRIVILEGES'
|   'STATUS'
|    'TIDB' 'PLUGINS' PluginNameList
|    'HOSTS'
|    LogTypeOpt 'LOGS'
|    TableOrTables TableNameListOpt WithReadLockOpt

LogTypeOpt ::=
    ( 'BINARY' | 'ENGINE' | 'ERROR' | 'GENERAL' | 'SLOW' )?

TableOrTables ::=
    'TABLE'
|   'TABLES'

TableNameListOpt ::=
    TableNameList?

WithReadLockOpt ::=
    ( 'WITH' 'READ' 'LOCK' )?
```

#### 14.10.2.60.2 Examples

```
mysql> FLUSH TABLES;
Query OK, 0 rows affected (0.00 sec)

mysql> FLUSH TABLES WITH READ LOCK;
ERROR 1105 (HY000): FLUSH TABLES WITH READ LOCK is not supported. Please
    ↪ use @@tidb_snapshot
```

#### 14.10.2.60.3 MySQL compatibility

- TiDB does not have a concept of table cache as in MySQL. Thus, `FLUSH TABLES` is parsed but ignored in TiDB for compatibility.
- The statement `FLUSH TABLES WITH READ LOCK` produces an error, as TiDB does not currently support locking tables. It is recommended to use Historical reads for this purpose instead.

#### 14.10.2.60.4 See also

- Read historical data

### 14.10.2.61 `GRANT <privileges>`

This statement allocates privileges to a pre-existing user in TiDB. The privilege system in TiDB follows MySQL, where credentials are assigned based on a database/table pattern. Executing this statement requires the `GRANT OPTION` privilege and all privileges you allocate.

#### 14.10.2.61.1 Synopsis

```
GrantStmt ::=
    'GRANT' PrivElemList 'ON' ObjectType PrivLevel 'TO' UserSpecList
       ↪ RequireClauseOpt WithGrantOptionOpt

PrivElemList ::=
    PrivElem ( ',' PrivElem )*

PrivElem ::=
    PrivType ( '(' ColumnNameList ')' )?

PrivType ::=
    'ALL' 'PRIVILEGES'?
|    'ALTER' 'ROUTINE'?
|   'CREATE' ( 'USER' | 'TEMPORARY' 'TABLES' | 'VIEW' | 'ROLE' | 'ROUTINE' )
    ↪ ?
|   'TRIGGER'
|   'DELETE'
|   'DROP' 'ROLE'?
|    'PROCESS'
|   'EXECUTE'
|   'INDEX'
|   'INSERT'
|   'SELECT'
|   'SUPER'
|   'SHOW' ( 'DATABASES' | 'VIEW' )
|   'UPDATE'
|    'GRANT' 'OPTION'
|    'REFERENCES'
|    'REPLICATION' ( 'SLAVE' | 'CLIENT' )
|    'USAGE'
|   'RELOAD'
|   'FILE'
|   'CONFIG'
```

```
|   'LOCK' 'TABLES'
|   'EVENT'
|   'SHUTDOWN'

ObjectType ::=
    'TABLE'?

PrivLevel ::=
    '*' ( '.' '*' )?
|    Identifier ( '.' ( '*' | Identifier ) )?

UserSpecList ::=
    UserSpec ( ',' UserSpec )*
```

#### 14.10.2.61.2 Examples

```
mysql> CREATE USER 'newuser' IDENTIFIED BY 'mypassword';
Query OK, 1 row affected (0.02 sec)

mysql> GRANT ALL ON test.* TO 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-------------------------------------------------+
| Grants for newuser@%                            |
+-------------------------------------------------+
| GRANT USAGE ON *.* TO 'newuser'@'%'             |
| GRANT ALL PRIVILEGES ON test.* TO 'newuser'@'%' |
+-------------------------------------------------+
2 rows in set (0.00 sec)
```

#### 14.10.2.61.3 MySQL compatibility

- Similar to MySQL, the `USAGE` privilege denotes the ability to log into a TiDB server.
- Column level privileges are not currently supported.
- Similar to MySQL, when the `NO_AUTO_CREATE_USER` sql mode is not present, the `GRANT` statement will automatically create a new user with an empty password when a user does not exist. Removing this sql-mode (it is enabled by default) presents a security risk.

#### 14.10.2.61.4 See also

- GRANT <role>

- REVOKE <privileges>
- SHOW GRANTS

- Privilege Management

#### 14.10.2.62 GRANT <role>

Assigns a previously created role to an existing user. The user can use then use the statement SET ROLE <rolename> to assume the privileges of the role, or SET ROLE ALL to assume all roles that have been assigned.

##### 14.10.2.62.1 Synopsis

```
GrantRoleStmt ::=
    'GRANT' RolenameList 'TO' UsernameList

RolenameList ::=
    Rolename ( ',' Rolename )*

UsernameList ::=
    Username ( ',' Username )*
```

##### 14.10.2.62.2 Examples

Connect to TiDB as the root user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Create a new role analyticsteam and a new user jennifer:

```
CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the jennifer user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Note that by default `jennifer` needs to execute `SET ROLE analyticsteam` in order to be able to use the privileges associated with the `analyticsteam` role:

```
SHOW GRANTS;
+-----------------------------------------------+
| Grants for User                               |
+-----------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'          |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----------------------------------------------+
2 rows in set (0.00 sec)

SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

SHOW GRANTS;
+-----------------------------------------------+
| Grants for User                               |
+-----------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'          |
| GRANT SELECT ON test.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

The statement `SET DEFAULT ROLE` can be used to associate the role `analyticsteam` to `jennifer`:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
Query OK, 0 rows affected (0.02 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

After this, the user `jennifer` has the privileges associated with the role `analyticsteam` and `jennifer` does not have to execute the statement `SET ROLE`:

```
SHOW GRANTS;
+-------------------------------------------+
| Grants for User                           |
+-------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'      |
| GRANT SELECT ON test.* TO 'jennifer'@'%'  |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

#### 14.10.2.62.3 MySQL compatibility

This statement is understood to be fully compatible with roles, which are a feature of MySQL 8.0. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.62.4 See also

- GRANT <privileges>
- CREATE ROLE
- DROP ROLE
- REVOKE <role>
- SET ROLE
- SET DEFAULT ROLE

- Role-Based Access Control

### 14.10.2.63 INSERT

This statement inserts new rows into a table.

#### 14.10.2.63.1 Synopsis

```
InsertIntoStmt ::=
    'INSERT' TableOptimizerHints PriorityOpt IgnoreOptional IntoOpt
       ↪ TableName PartitionNameListOpt InsertValues OnDuplicateKeyUpdate

TableOptimizerHints ::=
    hintComment?

PriorityOpt ::=
    ( 'LOW_PRIORITY' | 'HIGH_PRIORITY' | 'DELAYED' )?

IgnoreOptional ::=
    'IGNORE'?

IntoOpt ::= 'INTO'?

TableName ::=
    Identifier ( '.' Identifier )?

PartitionNameListOpt ::=
    ( 'PARTITION' '(' Identifier ( ',' Identifier )* ')' )?

InsertValues ::=
    '(' ( ColumnNameListOpt ')' ( ValueSym ValuesList | SelectStmt | '('
       ↪ SelectStmt ')' | UnionStmt ) | SelectStmt ')' )
|   ValueSym ValuesList
|   SelectStmt
|   UnionStmt
|   'SET' ColumnSetValue? ( ',' ColumnSetValue )*

OnDuplicateKeyUpdate ::=
    ( 'ON' 'DUPLICATE' 'KEY' 'UPDATE' AssignmentList )?
```

#### 14.10.2.63.2 Examples

```
mysql> CREATE TABLE t1 (a INT);
Query OK, 0 rows affected (0.11 sec)

mysql> CREATE TABLE t2 LIKE t1;
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.02 sec)
```

```
mysql> INSERT INTO t1 (a) VALUES (1);
Query OK, 1 row affected (0.01 sec)

mysql> INSERT INTO t2 SELECT * FROM t1;
Query OK, 2 rows affected (0.01 sec)
Records: 2 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+------+
| a    |
+------+
|    1 |
|    1 |
+------+
2 rows in set (0.00 sec)

mysql> SELECT * FROM t2;
+------+
| a    |
+------+
|    1 |
|    1 |
+------+
2 rows in set (0.00 sec)

mysql> INSERT INTO t2 VALUES (2),(3),(4);
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t2;
+------+
| a    |
+------+
|    1 |
|    1 |
|    2 |
|    3 |
|    4 |
+------+
5 rows in set (0.00 sec)
```

#### 14.10.2.63.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility

differences should be reported via an issue on GitHub.

- DELETE
- SELECT
- UPDATE
- REPLACE

### 14.10.2.64 KILL

The `KILL` statement is used to terminate a connection in any TiDB instance in the current TiDB cluster. Starting from TiDB v6.2.0, you can also use the `KILL` statement to terminate ongoing DDL jobs.

#### 14.10.2.64.1 Synopsis

```
KillStmt ::= 'KILL' 'TIDB'? ( 'CONNECTION' | 'QUERY' )? CONNECTION_ID
```

#### 14.10.2.64.2 Examples

The following example shows how to get all active queries in the current cluster and terminate any one of them.

```
SELECT ID, USER, INSTANCE, INFO FROM INFORMATION_SCHEMA.CLUSTER_PROCESSLIST
    ↪ ;
```

```
+--------------------+------+-----------------+-------------------------------------
    ↪
| ID                 | USER | INSTANCE        | INFO
    ↪                                                                              |
+--------------------+------+-----------------+-------------------------------------
    ↪
| 8306449708033769879 | root | 127.0.0.1:10082 | select sleep(30), 'foo'
    ↪                                                 |
| 5857102839209263511 | root | 127.0.0.1:10080 | select sleep(50)
    ↪                                                   |
| 5857102839209263513 | root | 127.0.0.1:10080 | SELECT ID, USER, INSTANCE,
    ↪ INFO FROM INFORMATION_SCHEMA.CLUSTER_PROCESSLIST |
+--------------------+------+-----------------+-------------------------------------
    ↪
```

```
KILL 5857102839209263511;
```

```
Query OK, 0 rows affected (0.00 sec)
```

#### 14.10.2.64.3 MySQL compatibility

- The `KILL` statement of MySQL can only terminate a connection in the currently connected MySQL instance, while the `KILL` statement of TiDB can terminate a connection in any TiDB instance in the entire cluster.
- Currently, using the MySQL command line ctrl+c to terminate a query or connection in TiDB is not supported.

#### 14.10.2.64.4 Behavior change descriptions

Starting from v6.1.0, TiDB supports the Global Kill feature, which is enabled by default and controlled by the `enable-global-kill` configuration.

When the Global Kill feature is enabled, both `KILL` and `KILL TIDB` statements can terminate queries or connections across instances so you do not need to worry about erroneously terminating queries or connections. When you use a client to connect to any TiDB instance and execute the `KILL` or `KILL TIDB` statement, the statement will be forwarded to the target TiDB instance. If there is a proxy between the client and the TiDB cluster, the `KILL` and `KILL TIDB` statements will also be forwarded to the target TiDB instance for execution.

If the Global Kill feature is not enabled or you are using a TiDB version earlier than v6.1.0, note the following:

- By default, `KILL` is not compatible with MySQL. This helps prevent against a case of a connection being terminated by a wrong TiDB server, because it is common to place multiple TiDB servers behind a load balancer. To terminate other connections on the currently connected TiDB instance, you need to add the `TIDB` suffix explicitly by executing the `KILL TIDB` statement.

- It is **STRONGLY NOT RECOMMENDED** to set `compatible-kill-query = true` in your configuration file UNLESS you are certain that clients will be always connected to the same TiDB instance. This is because pressing ctrl+c in the default MySQL client opens a new connection in which `KILL` is executed. If there is a proxy between the client and the TiDB cluster, the new connection might be routed to a different TiDB instance, which possibly kills a different session by mistake.

- The `KILL TIDB` statement is a TiDB extension. The feature of this statement is similar to the MySQL `KILL [CONNECTION|QUERY]` command and the MySQL command line ctrl+c. It is safe to use `KILL TIDB` on the same TiDB instance.

#### 14.10.2.64.5 See also

- SHOW [FULL] PROCESSLIST
- CLUSTER_PROCESSLIST

#### 14.10.2.65 LOAD DATA

The `LOAD DATA` statement batch loads data into a TiDB table.

##### 14.10.2.65.1 Synopsis

```
LoadDataStmt ::=
    'LOAD' 'DATA' LocalOpt 'INFILE' stringLit DuplicateOpt 'INTO' 'TABLE'
        ↪ TableName CharsetOpt Fields Lines IgnoreLines
        ↪ ColumnNameOrUserVarListOptWithBrackets LoadDataSetSpecOpt
```

##### 14.10.2.65.2 Parameters

`LocalOpt`

You can specify that the imported data file is located on the client or on the server by configuring the `LocalOpt` parameter. Currently, TiDB only supports data import from the client. Therefore, when importing data, set the value of `LocalOpt` to `Local`.

`Fields` and `Lines`

You can specify how to process the data format by configuring the `Fields` and `Lines` parameters.

- `FIELDS TERMINATED BY`: Specifies the separating character of each data.
- `FIELDS ENCLOSED BY`: Specifies the enclosing character of each data.
- `LINES TERMINATED BY`: Specifies the line terminator, if you want to end a line with a certain character.

Take the following data format as an example:

```
"bob","20","street 1"\r\n
"alice","33","street 1"\r\n
```

If you want to extract `bob`, 20, and `street 1`, specify the separating character as `','`, and the enclosing character as `'\"'`:

```
FIELDS TERMINATED BY ',' ENCLOSED BY '\"' LINES TERMINATED BY '\r\n'
```

If you do not specify the parameters above, the imported data is processed in the following way by default:

```
FIELDS TERMINATED BY '\t' ENCLOSED BY ''
LINES TERMINATED BY '\n'
```

`IGNORE number LINES`

You can ignore the first `number` lines of a file by configuring the `IGNORE number LINES` parameter. For example, if you configure `IGNORE 1 LINES`, the first line of a file is ignored.

#### 14.10.2.65.3 Examples

```
CREATE TABLE trips (
    trip_id bigint NOT NULL PRIMARY KEY AUTO_INCREMENT,
    duration integer not null,
    start_date datetime,
    end_date datetime,
    start_station_number integer,
    start_station varchar(255),
    end_station_number integer,
    end_station varchar(255),
    bike_number varchar(255),
    member_type varchar(255)
    );
```

```
Query OK, 0 rows affected (0.14 sec)
```

The following example imports data using `LOAD DATA`. Comma is specified as the separating character. The double quotation marks that enclose the data is ignored. The first line of the file is ignored.

If you see the error message `ERROR 1148 (42000): the used command is not allowed with this TiDB version`, refer to ERROR 1148 (42000): the used command is not allowed with this TiDB version.

```
LOAD DATA LOCAL INFILE '/mnt/evo970/data-sets/bikeshare-data/2017Q4-
    ↪ capitalbikeshare-tripdata.csv' INTO TABLE trips FIELDS TERMINATED BY
    ↪ ',' ENCLOSED BY '\"' LINES TERMINATED BY '\r\n' IGNORE 1 LINES (
    ↪ duration, start_date, end_date, start_station_number, start_station,
    ↪ end_station_number, end_station, bike_number, member_type);
```

```
Query OK, 815264 rows affected (39.63 sec)
Records: 815264 Deleted: 0 Skipped: 0 Warnings: 0
```

`LOAD DATA` also supports using hexadecimal ASCII character expressions or binary ASCII character expressions as the parameters for `FIELDS ENCLOSED BY` and `FIELDS TERMINATED BY`. See the following example:

```
LOAD DATA LOCAL INFILE '/mnt/evo970/data-sets/bikeshare-data/2017Q4-
    ↪ capitalbikeshare-tripdata.csv' INTO TABLE trips FIELDS TERMINATED BY
    ↪ x'2c' ENCLOSED BY b'100010' LINES TERMINATED BY '\r\n' IGNORE 1 LINES
    ↪  (duration, start_date, end_date, start_station_number, start_station
    ↪ , end_station_number, end_station, bike_number, member_type);
```

In the above example, `x'2c'` is the hexadecimal representation of the `,` character and `b'100010'` is the binary representation of the `"` character.

#### 14.10.2.65.4 MySQL compatibility

The syntax of the `LOAD DATA` statement is compatible with that of MySQL, except for character set options which are parsed but ignored. If you find any syntax compatibility difference, you can report it via an issue on GitHub.

**Note:**

- For versions earlier than TiDB v4.0.0, `LOAD DATA` committed every 20000 rows. By default, TiDB now commits all rows in one transaction. This can result in the error `ERROR 8004 (HY000)at line 1: Transaction is too large, size: 100000058` after upgrading from TiDB 4.0 or earlier versions. The recommended way to resolve this error is to increase the `txn-total-size-limit` value in your `tidb.toml` file. If you are unable to increase this limit, you can also restore the previous behavior by setting `tidb_dml_batch_size` to 20000.
- No matter how many rows are committed in a transaction, `LOAD DATA` is not rolled back by the `ROLLBACK` statement in an explicit transaction.
- The `LOAD DATA` statement is always executed in optimistic transaction mode, regardless of the TiDB transaction mode configuration.

### 14.10.2.66 LOAD STATS

The `LOAD STATS` statement is used to load the statistics into TiDB.

#### 14.10.2.66.1 Synopsis

```
LoadStatsStmt ::=
    'LOAD' 'STATS' stringLit
```

#### 14.10.2.66.2 Examples

You can access the address `http://${tidb-server-ip}:${tidb-server-status-port}/stats/dump/${db_name}/${table_name}` to download the TiDB instance's statistics.

You can also use `LOAD STATS ${stats_path}` to load the specific statistics file.

The `${stats_path}` can be an absolute path or a relative path. If you use a relative path, the corresponding file is found starting from the path where `tidb-server` is started. Here is an example:

```
LOAD STATS '/tmp/stats.json';
```

```
Query OK, 0 rows affected (0.00 sec)
```

#### 14.10.2.66.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.10.2.66.4 See also

- Statistics

### 14.10.2.67 LOCK STATS

`LOCK STATS` is used to lock the statistics of a table or tables.

> **Warning:**
>
> Locking statistics is an experimental feature for the current version. It is not recommended to use it in the production environment.

#### 14.10.2.67.1 Synopsis

```
LockStatsStmt ::=
    'LOCK' 'STATS' TableNameList

TableNameList ::=
    TableName (',' TableName)*

TableName ::=
    Identifier ( '.' Identifier )?
```

#### 14.10.2.67.2 Examples

Create table `t`, and insert data into it. When the statistics of table `t` are not locked, the `ANALYZE` statement can be successfully executed.

```
mysql> create table t(a int, b int);
Query OK, 0 rows affected (0.03 sec)

mysql> insert into t values (1,2), (3,4), (5,6), (7,8);
Query OK, 4 rows affected (0.00 sec)
Records: 4 Duplicates: 0 Warnings: 0

mysql> analyze table t;
Query OK, 0 rows affected, 1 warning (0.02 sec)

mysql> show warnings;
+--
   ↪ -----+------+-----------------------------------------------------------------+
   ↪
| Level | Code | Message                                                         |
+--
   ↪ -----+------+-----------------------------------------------------------------+
   ↪
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
   ↪ test.t |
+--
   ↪ -----+------+-----------------------------------------------------------------+
   ↪
1 row in set (0.00 sec)
```

Lock the statistics of table `t` and execute `ANALYZE`. From the output of `SHOW
↪ STATS_LOCKED`, you can see that the statistics of table `t` have been locked. The warning message shows that the `ANALYZE` statement has skipped table `t`.

```
mysql> lock stats t;
Query OK, 0 rows affected (0.00 sec)

mysql> show stats_locked;
+---------+------------+----------------+--------+
| Db_name | Table_name | Partition_name | Status |
+---------+------------+----------------+--------+
| test    | t          |                | locked |
+---------+------------+----------------+--------+
1 row in set (0.01 sec)

mysql> analyze table t;
Query OK, 0 rows affected, 2 warnings (0.00 sec)
```

```
mysql> show warnings;
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
| Level   | Code | Message                                                      |
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
| Note    | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
    ↪ test.t |
| Warning | 1105 | skip analyze locked table: t                                 |
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
2 rows in set (0.00 sec)
```

Unlock the statistics of table `t` and `ANALYZE` can be successfully executed again.

```
mysql> unlock stats t;
Query OK, 0 rows affected (0.01 sec)

mysql> analyze table t;
Query OK, 0 rows affected, 1 warning (0.03 sec)

mysql> show warnings;
+--
    ↪ -----+------+-----------------------------------------------------------+
    ↪
| Level | Code | Message                                                     |
+--
    ↪ -----+------+-----------------------------------------------------------+
    ↪
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
    ↪ test.t |
+--
    ↪ -----+------+-----------------------------------------------------------+
    ↪
1 row in set (0.00 sec)
```

#### 14.10.2.67.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

> **Warning:**
>
> `LOCK TABLES` and `UNLOCK TABLES` are experimental features for the current version. It is not recommended to use it in the production environment.

TiDB enables client sessions to acquire table locks for the purpose of cooperating with other sessions for access to tables, or to prevent other sessions from modifying tables. A session can acquire or release locks only for itself. One session cannot acquire locks for another session or release locks held by another session.

`LOCK TABLES` acquires table locks for the current client session. If you have the `LOCK TABLES` and `SELECT` privileges for each object to be locked, you can acquire table locks for common tables.

`UNLOCK TABLES` explicitly releases any table locks held by the current session. `LOCK TABLES` implicitly releases all table locks held by the current session before acquiring new locks.

A table lock protects against reads or writes by other sessions. A session that holds a `WRITE` lock can perform table-level operations such as `DROP TABLE` or `TRUNCATE TABLE`.

> **Warning:**
>
> To enable table locks, you need to set `enable-table-lock` to `true` in the configuration files of all TiDB instances.

##### 14.10.2.68.1 Synopsis

```
LockTablesDef
        ::= 'LOCK' ( 'TABLES' | 'TABLE' ) TableName LockType ( ',' TableName
           ↪  LockType)*

UnlockTablesDef
        ::= 'UNLOCK' 'TABLES'
```

```
LockType
        ::= 'READ' ('LOCAL')?
          | 'WRITE' ('LOCAL')?
```

#### 14.10.2.68.2 Acquire table locks

You can acquire table locks within the current session by using the `LOCK TABLES` statement. The following lock types are available:

`READ` lock:

- The session that holds this lock can read the table, but cannot write it.
- Multiple sessions can acquire a `READ` lock from the same table at the same time.
- Other sessions can read the table without explicitly acquiring a `READ` lock.

The `READ LOCAL` lock is only for syntax compatibility with MySQL and is not supported.

`WRITE` lock:

- The session that holds this lock can read and write the table.
- Only the session that holds this lock can access the table. No other sessions can access it until the lock is released.

`WRITE LOCAL` lock:

- The session that holds this lock can read and write the table.
- Only the session that holds this lock can access the table. Other sessions can read the table, but cannot write it.

If the lock that the `LOCK TABLES` statement needs is held by another session, the `LOCK TABLES` statement must wait, and an error is returned upon the execution of this statement, for example:

```
> LOCK TABLES t1 READ;
ERROR 8020 (HY000): Table 't1' was locked in WRITE by server: f4799bcb-cad7
    ↪ -4285-8a6d-23d3555173f1_session: 2199023255959
```

The preceding error message indicates that the session with ID `2199023255959` in TiDB `f4799bcb-cad7-4285-8a6d-23d3555173f1` already holds a `WRITE` lock on table `t1`. Therefore, the current session cannot acquire a `READ` lock on table `t1`.

You cannot acquire the same table lock multiple times in a single `LOCK TABLES` statement.

```
> LOCK TABLES t WRITE, t READ;
ERROR 1066 (42000): Not unique table/alias: 't'
```

#### 14.10.2.68.3 Release table locks

When the table locks held by a session are released, they are all released at the same time. A session can release its locks explicitly or implicitly.

- A session can release its locks explicitly with `UNLOCK TABLES`.
- If a session issues a `LOCK TABLES` statement to acquire a lock while already holding locks, its existing locks are released implicitly before the new locks are acquired.

If the connection for a client session terminates, whether normally or abnormally, TiDB implicitly releases all table locks held by the session. If the client reconnects, the locks are no longer in effect. For this reason, it is not recommended to enable auto-reconnection on the client. If you enable auto-reconnection, the client is not notified when reconnection occurs, and all table locks or current transactions are lost. By contrast, with auto-reconnection disabled, if the connection drops, an error occurs when the next statement is issued. The client can detect the error and take appropriate action such as reacquiring the locks or redoing the transaction.

#### 14.10.2.68.4 Table-locking restrictions and conditions

You can safely use `KILL` to terminate a session that holds a table lock.

You cannot acquire table locks on tables in the following databases:

- `INFORMATION_SCHEMA`
- `PERFORMANCE_SCHEMA`
- `METRICS_SCHEMA`
- `mysql`

#### 14.10.2.68.5 MySQL compatibility

Table lock acquisition

- In TiDB, if session A has already held a table lock, an error is returned if session B attempts to write to the table. In MySQL, the write request of session B is blocked until session A releases the table lock, and requests for locking the table from other sessions are blocked until the current session releases the `WRITE` lock.
- In TiDB, if the lock that the `LOCK TABLES` statement needs is held by another session, the `LOCK TABLES` statement must wait, and an error is returned upon the execution of this statement. In MySQL, this statement is blocked until the lock is acquired.
- In TiDB, the `LOCK TABLES` statement is effective in the whole cluster. In MySQL, this statement is effective only in the current MySQL server, and is not compatible with the NDB cluster.

Table lock release

When a transaction is explicitly started in a TiDB session (for example, with the `BEGIN` statement), TiDB does not implicitly release the table locks held by the session; but MySQL does.

#### 14.10.2.69 MODIFY COLUMN

The `ALTER TABLE.. MODIFY COLUMN` statement modifies a column on an existing table. The modification can include changing the data type and attributes. To rename at the same time, use the `CHANGE COLUMN` statement instead.

Since v5.1.0, TiDB has supported changes of data types for Reorg data, including but not limited to:

- Changing `VARCHAR` to `BIGINT`
- Modifying the `DECIMAL` precision
- Compressing the length of `VARCHAR(10)` to `VARCHAR(5)`

##### 14.10.2.69.1 Synopsis

```
AlterTableStmt
        ::= 'ALTER' 'IGNORE'? 'TABLE' TableName ModifyColumnSpec ( ','
           ↪ ModifyColumnSpec )*

ModifyColumnSpec
        ::= 'MODIFY' ColumnKeywordOpt 'IF EXISTS' ColumnName ColumnType
           ↪ ColumnOption* ( 'FIRST' | 'AFTER' ColumnName )?

ColumnType
        ::= NumericType
          | StringType
          | DateAndTimeType
          | 'SERIAL'

ColumnOption
        ::= 'NOT'? 'NULL'
          | 'AUTO_INCREMENT'
          | 'PRIMARY'? 'KEY' ( 'CLUSTERED' | 'NONCLUSTERED' )?
          | 'UNIQUE' 'KEY'?
          | 'DEFAULT' ( NowSymOptionFraction | SignedLiteral |
             ↪ NextValueForSequence )
          | 'SERIAL' 'DEFAULT' 'VALUE'
          | 'ON' 'UPDATE' NowSymOptionFraction
          | 'COMMENT' stringLit
          | ( 'CONSTRAINT' Identifier? )? 'CHECK' '(' Expression ')' ( 'NOT
             ↪ '? ( 'ENFORCED' | 'NULL' ) )?
          | 'GENERATED' 'ALWAYS' 'AS' '(' Expression ')' ( 'VIRTUAL' | '
             ↪ STORED' )?
          | 'REFERENCES' TableName ( '(' IndexPartSpecificationList ')' )?
             ↪ Match? OnDeleteUpdateOpt
          | 'COLLATE' CollationName
```

```
          | 'COLUMN_FORMAT' ColumnFormat
          | 'STORAGE' StorageMedia
          | 'AUTO_RANDOM' ( '(' LengthNum ')' )?

ColumnName ::=
    Identifier ( '.' Identifier ( '.' Identifier )? )?
```

#### 14.10.2.69.2 Examples

Meta-Only Change

```
CREATE TABLE t1 (id int not null primary key AUTO_INCREMENT, col1 INT);
```

```
Query OK, 0 rows affected (0.11 sec)
```

```
INSERT INTO t1 (col1) VALUES (1),(2),(3),(4),(5);
```

```
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0
```

```
ALTER TABLE t1 MODIFY col1 BIGINT;
```

```
Query OK, 0 rows affected (0.09 sec)
```

```
SHOW CREATE TABLE t1\G;
```

```
*************************** 1. row ***************************
       Table: t1
Create Table: CREATE TABLE `t1` (
  `id` int(11) NOT NULL AUTO_INCREMENT,
  `col1` bigint(20) DEFAULT NULL,
  PRIMARY KEY (`id`)
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin AUTO_INCREMENT
    ↪ =30001
1 row in set (0.00 sec)
```

Reorg-Data Change

```
CREATE TABLE t1 (id int not null primary key AUTO_INCREMENT, col1 INT);
```

```
Query OK, 0 rows affected (0.11 sec)
```

```
INSERT INTO t1 (col1) VALUES (12345),(67890);
```

```
Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0
```

```
ALTER TABLE t1 MODIFY col1 VARCHAR(5);
```

```
Query OK, 0 rows affected (2.52 sec)
```

```
SHOW CREATE TABLE t1\G;
```

```
*************************** 1. row ***************************
       Table: t1
CREATE TABLE `t1` (
  `id` int(11) NOT NULL AUTO_INCREMENT,
  `col1` varchar(5) DEFAULT NULL,
  PRIMARY KEY (`id`) /*T![clustered_index] CLUSTERED */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin AUTO_INCREMENT
    ↪ =30001
1 row in set (0.00 sec)
```

**Note:**

- TiDB returns an error when the changed data type conflicts with an existing data row. In the above example, TiDB returns the following error:

```
alter table t1 modify column col1 varchar(4); ERROR 1406
↪ (22001): Data Too Long, field len 4, data len 5
```

- Due to the compatibility with the Async Commit feature, the DDL statement waits for a period of time (about 2.5s) before starting to process into Reorg Data.

```
Query OK, 0 rows affected (2.52 sec)
```

#### 14.10.2.69.3 MySQL compatibility

- Does not support modifying the Reorg-Data types on the primary key columns but supports modifying the Meta-Only types. For example:

```
CREATE TABLE t (a int primary key);
ALTER TABLE t MODIFY COLUMN a VARCHAR(10);
ERROR 8200 (HY000): Unsupported modify column: column has primary key
    ↪ flag
```

```
CREATE TABLE t (a int primary key);
ALTER TABLE t MODIFY COLUMN a INT(10) UNSIGNED;
ERROR 8200 (HY000): Unsupported modify column: column has primary key
    ↪ flag
```

```
CREATE TABLE t (a int primary key);
ALTER TABLE t MODIFY COLUMN a bigint;
Query OK, 0 rows affected (0.01 sec)
```

- Does not support modifying the column types on generated columns. For example:

```
CREATE TABLE t (a INT, b INT as (a+1));
ALTER TABLE t MODIFY COLUMN b VARCHAR(10);
ERROR 8200 (HY000): Unsupported modify column: column is generated
```

- Does not support modifying the column types on the partitioned tables. For example:

```
CREATE TABLE t (c1 INT, c2 INT, c3 INT) partition by range columns(c1)
    ↪  ( partition p0 values less than (10), partition p1 values less
    ↪ than (maxvalue));
ALTER TABLE t MODIFY COLUMN c1 DATETIME;
ERROR 8200 (HY000): Unsupported modify column: table is partition
    ↪ table
```

- Does not support modifying from some data types (for example, some TIME types, BIT, SET, ENUM, JSON) to some other types due to some compatibility issues of the `cast` function's behavior between TiDB and MySQL.

```
CREATE TABLE t (a DECIMAL(13, 7));
ALTER TABLE t MODIFY COLUMN a DATETIME;
ERROR 8200 (HY000): Unsupported modify column: change from original
    ↪ type decimal(13,7) to datetime is currently unsupported yet
```

#### 14.10.2.69.4 See also

#### 14.10.2.70 PREPARE

The `PREPARE` statement provides an SQL interface to server-side prepared statements.

##### 14.10.2.70.1 Synopsis

```
PreparedStmt ::=
    'PREPARE' Identifier 'FROM' PrepareSQL

PrepareSQL ::=
    stringLit
|   UserVariable
```

##### 14.10.2.70.2 Examples

```
mysql> PREPARE mystmt FROM 'SELECT ? as num FROM DUAL';
Query OK, 0 rows affected (0.00 sec)

mysql> SET @number = 5;
Query OK, 0 rows affected (0.00 sec)

mysql> EXECUTE mystmt USING @number;
+------+
| num |
+------+
| 5   |
+------+
1 row in set (0.00 sec)

mysql> DEALLOCATE PREPARE mystmt;
Query OK, 0 rows affected (0.00 sec)
```

##### 14.10.2.70.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

##### 14.10.2.70.4 See also

- EXECUTE
- DEALLOCATE

#### 14.10.2.71 RECOVER TABLE

`RECOVER TABLE` is used to recover a deleted table and the data on it within the GC (Garbage Collection) life time after the `DROP TABLE` statement is executed.

#### 14.10.2.71.1 Syntax

```
RECOVER TABLE table_name;
```

```
RECOVER TABLE BY JOB JOB_ID;
```

#### 14.10.2.71.2 Synopsis

```
RecoverTableStmt ::=
    'RECOVER' 'TABLE' ( 'BY' 'JOB' Int64Num | TableName Int64Num? )

TableName ::=
    Identifier ( '.' Identifier )?

Int64Num ::= NUM

NUM ::= intLit
```

**Note:**

- If a table is deleted and the GC lifetime is out, the table cannot be recovered with `RECOVER TABLE`. Execution of `RECOVER TABLE` in this scenario returns an error like: `snapshot is older than GC safe point` ↪ `2019-07-10 13:45:57 +0800 CST`.
- If the TiDB version is 3.0.0 or later, it is not recommended for you to use `RECOVER TABLE` when TiDB Binlog is used.
- `RECOVER TABLE` is supported in the Binlog version 3.0.1, so you can use `RECOVER TABLE` in the following three situations:
  - Binlog version is 3.0.1 or later.
  - TiDB 3.0 is used both in the upstream cluster and the downstream cluster.
  - The GC life time of the secondary cluster must be longer than that of the primary cluster. However, as latency occurs during data replication between upstream and downstream databases, data recovery might fail in the downstream.

**Troubleshoot errors during TiDB Binlog replication**

When you use `RECOVER TABLE` in the upstream TiDB during TiDB Binlog replication, TiDB Binlog might be interrupted in the following three situations:

- The downstream database does not support the `RECOVER TABLE` statement. An error instance: `check the manual that corresponds to your MySQL server version for the right syntax to use near 'RECOVER TABLE table_name'`.
- The GC life time is not consistent between the upstream database and the downstream database. An error instance: `snapshot is older than GC safe point 2019-07-10 13:45:57 +0800 CST`.
- Latency occurs during replication between upstream and downstream databases. An error instance: `snapshot is older than GC safe point 2019-07-10 13:45:57 +0800 CST`.

For the above three situations, you can resume data replication from TiDB Binlog with a full import of the deleted table.

#### 14.10.2.71.3 Examples

- Recover the deleted table according to the table name.

```
DROP TABLE t;
```

```
RECOVER TABLE t;
```

This method searches the recent DDL job history and locates the first DDL operation of the `DROP TABLE` type, and then recovers the deleted table with the name identical to the one table name specified in the `RECOVER TABLE` statement.

- Recover the deleted table according to the table's `DDL JOB ID` used.

Suppose that you had deleted the table `t` and created another `t`, and again you deleted the newly created `t`. Then, if you want to recover the `t` deleted in the first place, you must use the method that specifies the `DDL JOB ID`.

```
DROP TABLE t;
```

```
ADMIN SHOW DDL JOBS 1;
```

The second statement above is used to search for the table's `DDL JOB ID` to delete `t`. In the following example, the ID is `53`.

```
+--------+---------+------------+------------+--------------+-----------+----------
    ↪
| JOB_ID | DB_NAME | TABLE_NAME | JOB_TYPE | SCHEMA_STATE | SCHEMA_ID |
    ↪  TABLE_ID | ROW_COUNT | START_TIME          | STATE |
+--------+---------+------------+------------+--------------+-----------+----------
    ↪
```

```
| 53    | test   |           | drop table | none      | 1         | 41
   ↪      | 0         | 2019-07-10 13:23:18.277 +0800 CST | synced |
+--------+--------+-----------+-----------+-------------+-----------+----------
   ↪
```

```
RECOVER TABLE BY JOB 53;
```

This method recovers the deleted table via the `DDL JOB ID`. If the corresponding DDL job is not of the `DROP TABLE` type, an error occurs.

#### 14.10.2.71.4 Implementation principle

When deleting a table, TiDB only deletes the table metadata, and writes the table data (row data and index data) to be deleted to the `mysql.gc_delete_range` table. The GC Worker in the TiDB background periodically removes from the `mysql.gc_delete_range` table the keys that exceed the GC life time.

Therefore, to recover a table, you only need to recover the table metadata and delete the corresponding row record in the `mysql.gc_delete_range` table before the GC Worker deletes the table data. You can use a snapshot read of TiDB to recover the table metadata. Refer to Read Historical Data for details.

Table recovery is done by TiDB obtaining the table metadata through snapshot read, and then going through the process of table creation similar to `CREATE TABLE`. Therefore, `RECOVER TABLE` itself is, in essence, a kind of DDL operation.

#### 14.10.2.71.5 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.10.2.72 RENAME USER

`RANAME USER` is used to rename an existing user.

#### 14.10.2.72.1 Synopsis

```
RenameUserStmt ::=
    'RENAME' 'USER' UserToUser ( ',' UserToUser )*
UserToUser ::=
    Username 'TO' Username
Username ::=
    StringName ('@' StringName | singleAtIdentifier)? | 'CURRENT_USER'
       ↪ OptionalBraces
```

#### 14.10.2.72.2 Examples

```
CREATE USER 'newuser' IDENTIFIED BY 'mypassword';
```

```
Query OK, 1 row affected (0.02 sec)
```

```
SHOW GRANTS FOR 'newuser';
```

```
+-------------------------------------+
| Grants for newuser@%                |
+-------------------------------------+
| GRANT USAGE ON *.* TO 'newuser'@'%' |
+-------------------------------------+
1 row in set (0.00 sec)
```

```
RENAME USER 'newuser' TO 'testuser';
```

```
Query OK, 0 rows affected (0.08 sec)
```

```
SHOW GRANTS FOR 'testuser';
```

```
+-------------------------------------+
| Grants for testuser@%               |
+-------------------------------------+
| GRANT USAGE ON *.* TO 'testuser'@'%' |
+-------------------------------------+
1 row in set (0.00 sec)
```

```
SHOW GRANTS FOR 'newuser';
```

```
ERROR 1141 (42000): There is no such grant defined for user 'newuser' on
    ↪ host '%'
```

#### 14.10.2.72.3 MySQL compatibility

`RENAME USER` is expected to be fully compatible with MySQL. If you find any compatibility difference, submit a GitHub issue.

#### 14.10.2.72.4 See also

- CREATE USER
- SHOW GRANTS
- DROP USER

#### 14.10.2.73 RENAME INDEX

The statement `ALTER TABLE .. RENAME INDEX` renames an existing index to a new name. This operation is instant in TiDB, and requires only a meta data change.

##### 14.10.2.73.1 Synopsis

```
AlterTableStmt
        ::= 'ALTER' 'IGNORE'? 'TABLE' TableName RenameIndexSpec ( ','
           ↪ RenameIndexSpec )*

RenameIndexSpec
        ::= 'RENAME' ( 'KEY' | 'INDEX' ) Identifier 'TO' Identifier
```

##### 14.10.2.73.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
   ↪ NOT NULL, INDEX col1 (c1));
Query OK, 0 rows affected (0.11 sec)

mysql> SHOW CREATE TABLE t1\G
*************************** 1. row ***************************
       Table: t1
Create Table: CREATE TABLE `t1` (
  `id` int(11) NOT NULL AUTO_INCREMENT,
  `c1` int(11) NOT NULL,
  PRIMARY KEY (`id`),
  KEY `col1` (`c1`)
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
1 row in set (0.00 sec)

mysql> ALTER TABLE t1 RENAME INDEX col1 TO c1;
Query OK, 0 rows affected (0.09 sec)

mysql> SHOW CREATE TABLE t1\G
*************************** 1. row ***************************
       Table: t1
Create Table: CREATE TABLE `t1` (
  `id` int(11) NOT NULL AUTO_INCREMENT,
  `c1` int(11) NOT NULL,
  PRIMARY KEY (`id`),
  KEY `c1` (`c1`)
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
1 row in set (0.00 sec)
```

#### 14.10.2.73.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.73.4 See also

- SHOW CREATE TABLE
- CREATE INDEX
- DROP INDEX
- SHOW INDEX
- ALTER INDEX

### 14.10.2.74 RENAME TABLE

This statement renames an existing table to a new name.

#### 14.10.2.74.1 Synopsis

```
RenameTableStmt ::=
    'RENAME' 'TABLE' TableToTable ( ',' TableToTable )*

TableToTable ::=
    TableName 'TO' TableName
```

#### 14.10.2.74.2 Examples

```
mysql> CREATE TABLE t1 (a int);
Query OK, 0 rows affected (0.12 sec)

mysql> SHOW TABLES;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)

mysql> RENAME TABLE t1 TO t2;
Query OK, 0 rows affected (0.08 sec)

mysql> SHOW TABLES;
+----------------+
| Tables_in_test |
+----------------+
```

```
| t2             |
+----------------+
1 row in set (0.00 sec)
```

#### 14.10.2.74.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.74.4 See also

- CREATE TABLE
- SHOW TABLES
- ALTER TABLE

### 14.10.2.75 REPLACE

The `REPLACE` statement is semantically a combined `DELETE`+`INSERT` statement. It can be used to simplify application code.

#### 14.10.2.75.1 Synopsis

```
ReplaceIntoStmt ::=
    'REPLACE' PriorityOpt IntoOpt TableName PartitionNameListOpt
       ↪ InsertValues

PriorityOpt ::=
    ( 'LOW_PRIORITY' | 'HIGH_PRIORITY' | 'DELAYED' )?

IntoOpt ::= 'INTO'?

TableName ::=
    Identifier ( '.' Identifier )?

PartitionNameListOpt ::=
    ( 'PARTITION' '(' Identifier ( ',' Identifier )* ')' )?

InsertValues ::=
    '(' ( ColumnNameListOpt ')' ( ValueSym ValuesList | SelectStmt | '('
       ↪ SelectStmt ')' | UnionStmt ) | SelectStmt ')' )
|   ValueSym ValuesList
|   SelectStmt
|   UnionStmt
|   'SET' ColumnSetValue? ( ',' ColumnSetValue )*
```

#### 14.10.2.75.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.12 sec)

mysql> INSERT INTO t1 (c1) VALUES (1), (2), (3);
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 |  3 |
+----+----+
3 rows in set (0.00 sec)

mysql> REPLACE INTO t1 (id, c1) VALUES(3, 99);
Query OK, 2 rows affected (0.01 sec)

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 | 99 |
+----+----+
3 rows in set (0.00 sec)
```

#### 14.10.2.75.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.75.4 See also

- DELETE
- INSERT
- SELECT
- UPDATE

#### 14.10.2.76 RESTORE

This statement performs a distributed restore from a backup archive previously produced by a BACKUP statement.

> **Warning:**
>
> This feature is experimental. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an issue on GitHub.

The RESTORE statement uses the same engine as the BR tool, except that the restore process is driven by TiDB itself rather than a separate BR tool. All benefits and caveats of BR also apply here. In particular, **RESTORE is currently not ACID-compliant**. Before running RESTORE, ensure that the following requirements are met:

- The cluster is "offline", and the current TiDB session is the only active SQL connection to access all tables being restored.
- When a full restore is being performed, the tables being restored should not already exist, because existing data might be overridden and causes inconsistency between the data and indices.
- When an incremental restore is being performed, the tables should be at the exact same state as the LAST_BACKUP timestamp when the backup is created.

Running RESTORE requires either the RESTORE_ADMIN or SUPER privilege. Additionally, both the TiDB node executing the restore and all TiKV nodes in the cluster must have read permission from the destination.

The RESTORE statement is blocking, and will finish only after the entire restore task is finished, failed, or canceled. A long-lasting connection should be prepared for running RESTORE. The task can be canceled using the KILL TIDB QUERY statement.

Only one BACKUP and RESTORE task can be executed at a time. If a BACKUP or RESTORE task is already running on the same TiDB server, the new RESTORE execution will wait until all previous tasks are done.

RESTORE can only be used with "tikv" storage engine. Using RESTORE with the "unistore" engine will fail.

##### 14.10.2.76.1 Synopsis

```
RestoreStmt ::=
    "RESTORE" BRIETables "FROM" stringLit RestoreOption*
```

```
BRIETables ::=
    "DATABASE" ( '*' | DBName (',' DBName)* )
|   "TABLE" TableNameList

RestoreOption ::=
    "RATE_LIMIT" '='? LengthNum "MB" '/' "SECOND"
|   "CONCURRENCY" '='? LengthNum
|   "CHECKSUM" '='? Boolean
|   "SEND_CREDENTIALS_TO_TIKV" '='? Boolean

Boolean ::=
    NUM | "TRUE" | "FALSE"
```

#### 14.10.2.76.2 Examples

Restore from backup archive

```
RESTORE DATABASE * FROM 'local:///mnt/backup/2020/04/';
```

```
+--
    ↪ ----------------------------+----------+---------+--------------------+------
    ↪
| Destination                | Size     | BackupTS | Queue Time         |
    ↪ Execution Time    |
+--
    ↪ ----------------------------+----------+---------+--------------------+------
    ↪
| local:///mnt/backup/2020/04/ | 248665063 | 0 | 2020-04-21 17:16:55 |
    ↪ 2020-04-21 17:16:55 |
+--
    ↪ ----------------------------+----------+---------+--------------------+------
    ↪
1 row in set (28.961 sec)
```

In the example above, all data is restored from a backup archive at the local filesystem. The data is read as SST files from the `/mnt/backup/2020/04/` directories distributed among all TiDB and TiKV nodes.

The first row of the result above is described as follows:

| Column | Description |
|---|---|
| `Destination` ↪ | The destination URL to read from |

| Column | Description |
|---|---|
| `Size` | The total size of the backup archive, in bytes |
| `BackupTS` | (not used) |
| `Queue ↪ Time` | The timestamp (in current time zone) when the `RESTORE` task was queued. |
| `Execution ↪ Time` | The timestamp (in current time zone) when the `RESTORE` task starts to run. |

Partial restore

You can specify which databases or tables to restore. If some databases or tables are missing from the backup archive, they will be ignored, and thus `RESTORE` would complete without doing anything.

```
RESTORE DATABASE `test` FROM 'local:///mnt/backup/2020/04/';
```

```
RESTORE TABLE `test`.`sbtest01`, `test`.`sbtest02` FROM 'local:///mnt/
    ↪ backup/2020/04/';
```

External storages

BR supports restoring data from S3 or GCS:

```
RESTORE DATABASE * FROM 's3://example-bucket-2020/backup-05/';
```

The URL syntax is further explained in external storage URL.

When running on cloud environment where credentials should not be distributed, set the `SEND_CREDENTIALS_TO_TIKV` option to `FALSE`:

```
RESTORE DATABASE * FROM 's3://example-bucket-2020/backup-05/'
    SEND_CREDENTIALS_TO_TIKV = FALSE;
```

Performance fine-tuning

Use `RATE_LIMIT` to limit the average download speed per TiKV node to reduce network bandwidth.

By default, TiDB node would run 128 restore threads. This value can be adjusted with the `CONCURRENCY` option.

Before restore is completed, `RESTORE` would perform a checksum against the data from the archive to verify correctness. This step can be disabled with the `CHECKSUM` option if you are confident that this is unnecessary.

```
RESTORE DATABASE * FROM 's3://example-bucket-2020/backup-06/'
    RATE_LIMIT = 120 MB/SECOND
    CONCURRENCY = 64
    CHECKSUM = FALSE;
```

Incremental restore

There is no special syntax to perform incremental restore. TiDB will recognize whether the backup archive is full or incremental and take appropriate action. You only need to apply each incremental restore in correct order.

For instance, if a backup task is created as follows:

```
BACKUP DATABASE `test` TO 's3://example-bucket/full-backup' SNAPSHOT =
    ↪ 413612900352000;
BACKUP DATABASE `test` TO 's3://example-bucket/inc-backup-1' SNAPSHOT =
    ↪ 414971854848000 LAST_BACKUP = 413612900352000;
BACKUP DATABASE `test` TO 's3://example-bucket/inc-backup-2' SNAPSHOT =
    ↪ 416353458585600 LAST_BACKUP = 414971854848000;
```

then the same order should be applied in the restore:

```
RESTORE DATABASE * FROM 's3://example-bucket/full-backup';
RESTORE DATABASE * FROM 's3://example-bucket/inc-backup-1';
RESTORE DATABASE * FROM 's3://example-bucket/inc-backup-2';
```

#### 14.10.2.76.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

|   'CONFIG'
|   'LOCK' 'TABLES'
|    'EVENT'
|   'SHUTDOWN'

ObjectType ::=
    'TABLE'?
```

```
PrivLevel ::=
    '*' ( '.' '*' )?
|    Identifier ( '.' ( '*' | Identifier ) )?

UserSpecList ::=
    UserSpec ( ',' UserSpec )*
```

#### 14.10.2.77.2 Examples

```
mysql> CREATE USER 'newuser' IDENTIFIED BY 'mypassword';
Query OK, 1 row affected (0.02 sec)

mysql> GRANT ALL ON test.* TO 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-------------------------------------------------+
| Grants for newuser@%                            |
+-------------------------------------------------+
| GRANT USAGE ON *.* TO 'newuser'@'%'             |
| GRANT ALL PRIVILEGES ON test.* TO 'newuser'@'%' |
+-------------------------------------------------+
2 rows in set (0.00 sec)

mysql> REVOKE ALL ON test.* FROM 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-----------------------------------+
| Grants for newuser@%              |
+-----------------------------------+
| GRANT USAGE ON *.* TO 'newuser'@'%' |
+-----------------------------------+
1 row in set (0.00 sec)

mysql> DROP USER 'newuser';
Query OK, 0 rows affected (0.14 sec)

mysql> SHOW GRANTS FOR 'newuser';
ERROR 1141 (42000): There is no such grant defined for user 'newuser' on
    ↪ host '%'
```

#### 14.10.2.77.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.77.4 See also

- GRANT <privileges>
- SHOW GRANTS

- Privilege Management

### 14.10.2.78 REVOKE <role>

This statement removes a previously assigned role from a specified user (or list of users).

#### 14.10.2.78.1 Synopsis

```
RevokeRoleStmt ::=
    'REVOKE' RolenameList 'FROM' UsernameList

RolenameList ::=
    Rolename ( ',' Rolename )*

UsernameList ::=
    Username ( ',' Username )*
```

#### 14.10.2.78.2 Examples

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Create a new role `analyticsteam` and a new user `jennifer`:

```
CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Note that by default `jennifer` needs to execute `SET ROLE analyticsteam` in order to be able to use the privileges associated with the `analyticsteam` role:

```
SHOW GRANTS;
+-------------------------------------------+
| Grants for User                           |
+-------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'      |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-------------------------------------------+
2 rows in set (0.00 sec)

SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

SHOW GRANTS;
+-------------------------------------------+
| Grants for User                           |
+-------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'      |
| GRANT SELECT ON test.* TO 'jennifer'@'%'  |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

The statement `SET DEFAULT ROLE` can be used to associate the role `analyticsteam` to `jennifer`:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
```

```
Query OK, 0 rows affected (0.02 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

After this, the user `jennifer` has the privileges associated with the role `analyticsteam` and `jennifer` does not have to execute the statement `SET ROLE`:

```
SHOW GRANTS;
+-------------------------------------------+
| Grants for User                           |
+-------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'      |
| GRANT SELECT ON test.* TO 'jennifer'@'%'  |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Revoke the role of analyticsteam from `jennifer`:

```
REVOKE analyticsteam FROM jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Show the privileges of `jennifer`:

```
SHOW GRANTS;
+-------------------------------------+
| Grants for User                     |
+-------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
+-------------------------------------+
1 row in set (0.00 sec)
```

#### 14.10.2.78.3 MySQL compatibility

This statement is understood to be fully compatible with roles, which are a feature of MySQL 8.0. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.78.4 See also

- CREATE ROLE
- DROP ROLE
- GRANT <role>
- SET ROLE
- SET DEFAULT ROLE

- Role-Based Access Control

### 14.10.2.79 ROLLBACK

This statement reverts all changes in the current transaction inside of TIDB. It is the opposite of a `COMMIT` statement.

#### 14.10.2.79.1 Synopsis

```
RollbackStmt ::=
    'ROLLBACK' CompletionTypeWithinTransaction?

CompletionTypeWithinTransaction ::=
    'AND' ( 'CHAIN' ( 'NO' 'RELEASE' )? | 'NO' 'CHAIN' ( 'NO'? 'RELEASE' )?
       ↪ )
|   'NO'? 'RELEASE'
```

#### 14.10.2.79.2 Examples

```
mysql> CREATE TABLE t1 (a INT NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.12 sec)

mysql> BEGIN;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.00 sec)

mysql> ROLLBACK;
Query OK, 0 rows affected (0.01 sec)

mysql> SELECT * FROM t1;
Empty set (0.01 sec)
```

#### 14.10.2.79.3 MySQL compatibility

- TiDB parses but ignores the syntax `ROLLBACK AND [NO] RELEASE`. This functionality is used in MySQL to disconnect the client session immediately after rolling back the transaction. In TiDB, it is recommended to instead use the `mysql_close()` functionality of your client driver.
- TiDB parses but ignores the syntax `ROLLBACK AND [NO] CHAIN`. This functionality is used in MySQL to immediately start a new transaction with the same isolation level while the current transaction is being rolled back. In TiDB, it is recommended to instead start a new transaction.

#### 14.10.2.79.4 See also

- SAVEPOINT
- COMMIT
- BEGIN
- START TRANSACTION

### 14.10.2.80 SAVEPOINT

`SAVEPOINT` is a feature introduced in TiDB v6.2.0. The syntax is as follows:

```
SAVEPOINT identifier
ROLLBACK TO [SAVEPOINT] identifier
RELEASE SAVEPOINT identifier
```

**Warning:**

- You cannot use `SAVEPOINT` with TiDB Binlog enabled.
- You cannot use `SAVEPOINT` in pessimistic transactions when `tidb_constraint_check_in_place_pessimistic` is disabled.

- `SAVEPOINT` is used to set a savepoint of a specified name in the current transaction. If a savepoint with the same name already exists, it will be deleted and a new savepoint with the same name will be set.
- `ROLLBACK TO SAVEPOINT` rolls back a transaction to the savepoint of a specified name and does not terminate the transaction. Data changes made to the table data after the savepoint will be reverted in the rollback, and all savepoints after the savepoint are deleted. In a pessimistic transaction, the locks held by the transaction are not rolled back. Instead, the locks will be released when the transaction ends.

If the savepoint specified in the `ROLLBACK TO SAVEPOINT` statement does not exist, the statement returns the following error:

```
ERROR 1305 (42000): SAVEPOINT identifier does not exist
```

- `RELEASE SAVEPOINT` statement removes the named savepoint and **all savepoints** after this savepoint from the current transaction, without committing or rolling back the current transaction. If the savepoint of the specified name does not exist, the following error is returned:

```
ERROR 1305 (42000): SAVEPOINT identifier does not exist
```

After the transaction is committed or rolled back, all savepoints in the transaction will be deleted.

#### 14.10.2.80.1 Examples

Create a table `t1`:

```
CREATE TABLE t1 (a INT NOT NULL PRIMARY KEY);
```

```
Query OK, 0 rows affected (0.12 sec)
```

Start the current transaction:

```
BEGIN;
```

```
Query OK, 0 rows affected (0.00 sec)
```

Insert data into the table and set a savepoint `sp1`:

```
INSERT INTO t1 VALUES (1);
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SAVEPOINT sp1;
```

```
Query OK, 0 rows affected (0.01 sec)
```

Insert data into the table again and set a savepoint `sp2`:

```
INSERT INTO t1 VALUES (2);
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SAVEPOINT sp2;
```

```
Query OK, 0 rows affected (0.01 sec)
```

Release the savepoint `sp2`:

```
RELEASE SAVEPOINT sp2;
```

```
Query OK, 0 rows affected (0.01 sec)
```

Roll back to the savepoint `sp1`:

```
ROLLBACK TO SAVEPOINT sp1;
```

```
Query OK, 0 rows affected (0.01 sec)
```

Commit the transaction and query the table. Only the data inserted before `sp1` is returned.

```
COMMIT;
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
SELECT * FROM t1;
```

```
+---+
| a |
+---+
| 1 |
+---+
1 row in set
```

#### 14.10.2.80.2 MySQL compatibility

When `ROLLBACK TO SAVEPOINT` is used to roll back a transaction to a specified savepoint, MySQL releases the locks held only after the specified savepoint, while in TiDB pessimistic transaction, TiDB does not immediately release the locks held after the specified savepoint. Instead, TiDB releases all locks when the transaction is committed or rolled back.

#### 14.10.2.81.2 Description of the syntax elements

| Syntax Element | Description |
|---|---|
| `TableOptimizerHints` | This is the hint to control the behavior of TiDB's optimizer. For more information, refer to Optimizer Hints. |
| `ALL`, `DISTINCT`, `DISTINCTROW` | The `ALL`, `DISTINCT`/`DISTINCTROW` modifiers specify whether duplicate rows should be returned. ALL (the default) specifies that all matching rows should be returned. |
| `HIGH_PRIORITY` | `HIGH_PRIORITY` gives the current statement higher priority than other statements. |
| `SQL_CALC_FOUND_ROWS` | TiDB does not support this feature, and will return an error unless `tidb_enable_noop_functions=1` is set. |
| `SQL_CACHE`, `SQL_NO_CACHE` | `SQL_CACHE` and `SQL_NO_CACHE` are used to control whether to cache the request results to the `BlockCache` of TiKV (RocksDB). For a one-time query on a large amount of data, such as the `count(*)` query, it is recommended to fill in `SQL_NO_CACHE` to avoid flushing the hot user data in `BlockCache`. |
| `STRAIGHT_JOIN` | `STRAIGHT_JOIN` forces the optimizer to do a union query in the order of the tables used in the `FROM` clause. When the optimizer chooses a join order that is not good, you can use this syntax to speed up the execution of the query. |

| Syntax Element | Description |
| --- | --- |
| `select_expr` | Each `select_expr` indicates a column to retrieve. including the column names and expressions. `\*` represents all the columns. |
| `FROM` ↪ `table_references` | The `FROM table_references` clause indicates the table (such as `select * from t;`), or tables (such as `select * from t1 join t2;`) or even 0 tables (such as `select 1+1 from dual;` which is equivalent to `select 1+1;`) from which to retrieve rows. |
| `WHERE` ↪ `where_condition` | The `WHERE` clause, if given, indicates the condition or conditions that rows must satisfy to be selected. The result contains only the data that meets the condition(s). |
| `GROUP BY` | The `GROUP BY` statement is used to group the result-set. |
| `HAVING` ↪ `where_condition` | The `HAVING` clause and the `WHERE` clause are both used to filter the results. The `HAVING` clause filters the results of `GROUP BY`, while the `WHERE` clause filter the results before aggregation. |
| `ORDER BY` | The `ORDER BY` clause is used to sort the data in ascending or descending order, based on columns, expressions or items in the `select_expr` list. |
| `LIMIT` | The `LIMIT` clause can be used to constrain the number of rows. `LIMIT` takes one or two numeric arguments. With one argument, the argument specifies the maximum number of rows to return, the first row to return is the first row of the table by default; with two arguments, the first argument specifies the offset of the first row to return, and the second specifies the maximum number of rows to return. TiDB also supports the `FETCH FIRST/NEXT n ROW/ROWS ONLY` syntax, which has the same effect as `LIMIT n`. You can omit `n` in this syntax and its effect is the same as `LIMIT 1`. |
| `Window` ↪ `window_definition` | This is the syntax for window function, which is usually used to do some analytical computation. For more information, refer to Window Function. |

| Syntax Element | Description |
| --- | --- |
| `FOR UPDATE` | The `SELECT FOR UPDATE` clause locks all the data in the result sets to detect concurrent updates from other transactions. Data that match the query conditions but do not exist in the result sets are not read-locked, such as the row data written by other transactions after the current transaction is started. TiDB uses the Optimistic Transaction Model. The transaction conflicts are not detected in the statement execution phase. Therefore, the current transaction does not block other transactions from executing `UPDATE`, `DELETE` or `SELECT FOR UPDATE` like other databases such as PostgreSQL. In the committing phase, the rows read by `SELECT FOR UPDATE` are committed in two phases, which means they can also join the conflict detection. If write conflicts occur, the commit fails for all transactions that include the `SELECT FOR UPDATE` clause. If no conflict is detected, the commit succeeds. And a new version is generated for the locked rows, so that write conflicts can be detected when other uncommitted transactions are being committed later. When using pessimistic transaction mode, the behavior is basically the same as other databases. Refer to Difference with MySQL InnoDB to see the details. TiDB supports the `NOWAIT` modifier for `FOR UPDATE`. See TiDB Pessimistic Transaction Mode for details. |
| `LOCK IN SHARE MODE` | To guarantee compatibility, TiDB parses these three modifiers, but will ignore them. |
| `TABLESAMPLE` | To get a sample of rows from the table. |

#### 14.10.2.81.3 Examples

SELECT

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
```

```
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 |  3 |
|  4 |  4 |
|  5 |  5 |
+----+----+
5 rows in set (0.00 sec)
```

```
mysql> SELECT AVG(s_quantity), COUNT(s_quantity) FROM stock TABLESAMPLE
    ↪ REGIONS();
+----------------+------------------+
| AVG(s_quantity) | COUNT(s_quantity) |
+----------------+------------------+
|        59.5000 |                4 |
+----------------+------------------+
1 row in set (0.00 sec)

mysql> SELECT AVG(s_quantity), COUNT(s_quantity) FROM stock;
+----------------+------------------+
| AVG(s_quantity) | COUNT(s_quantity) |
+----------------+------------------+
|        54.9729 |          1000000 |
+----------------+------------------+
1 row in set (0.52 sec)
```

The above example uses data generated with `tiup bench tpcc prepare`. The first query shows the use of `TABLESAMPLE`.

SELECT … INTO OUTFILE

The `SELECT ... INTO OUTFILE` statement is used to write the result of a query to a file.

**Note:**

- This statement is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.
- This statement does not support writing query results to any external storages such as Amazon S3 or GCS.

In the statement, you can specify the format of the output file by using the following clauses:

- `FIELDS TERMINATED BY`: specifies the field delimiter in the file. For example, you can specify it as `','` to output comma-separated values (CSV) or `'\t'` to output tab-separated values (TSV).
- `FIELDS ENCLOSED BY`: specifies the enclosing character that wraps around each field in the file.
- `LINES TERMINATED BY`: specifies the line terminator in the file, if you want to end a line with a certain character.

Assume that there is a table `t` with three columns as follows:

```
mysql> CREATE TABLE t (a INT, b VARCHAR(10), c DECIMAL(10,2));
Query OK, 0 rows affected (0.02 sec)

mysql> INSERT INTO t VALUES (1, 'a', 1.1), (2, 'b', 2.2), (3, 'c', 3.3);
Query OK, 3 rows affected (0.01 sec)
```

The following examples show how to use the `SELECT ... INTO OUTFILE` statement to write the query result to a file.

**Example 1:**

```
mysql> SELECT * FROM t INTO OUTFILE '/tmp/tmp_file1';
Query OK, 3 rows affected (0.00 sec)
```

In this example, you can find the query result in `/tmp/tmp_file1` as follows:

```
1       a       1.10
2       b       2.20
3       c       3.30
```

**Example 2:**

```
mysql> SELECT * FROM t INTO OUTFILE '/tmp/tmp_file2' FIELDS TERMINATED BY '
    ↪ ,' ENCLOSED BY '"';
Query OK, 3 rows affected (0.00 sec)
```

In this example, you can find the query result in `/tmp/tmp_file2` as follows:

```
"1","a","1.10"
"2","b","2.20"
"3","c","3.30"
```

**Example 3:**

```
mysql> SELECT * FROM t INTO OUTFILE '/tmp/tmp_file3'
    -> FIELDS TERMINATED BY ',' ENCLOSED BY '\'' LINES TERMINATED BY '<<<\n'
       ↪ ;
Query OK, 3 rows affected (0.00 sec)
```

In this example, you can find the query result in `/tmp/tmp_file3` as follows:

```
'1','a','1.10'<<<
'2','b','2.20'<<<
'3','c','3.30'<<<
```

#### 14.10.2.81.4 MySQL compatibility

- The syntax `SELECT ... INTO @variable` is not supported.
- The syntax `SELECT ... GROUP BY ... WITH ROLLUP` is not supported.
- The syntax `SELECT ... INTO DUMPFILE` is not supported.
- The syntax `SELECT .. GROUP BY expr` does not imply `GROUP BY expr ORDER BY expr` as it does in MySQL 5.7. TiDB instead matches the behavior of MySQL 8.0 and does not imply a default order.
- The syntax `SELECT ... TABLESAMPLE ...` is a TiDB extension designed for compatibility with other database systems and the ISO/IEC 9075-2 standard, but currently it is not supported by MySQL.

#### 14.10.2.81.5 See also

- INSERT
- DELETE
- UPDATE
- REPLACE

### 14.10.2.82 `SET DEFAULT ROLE`

This statement sets a specific role to be applied to a user by default. Thus, they will automatically have the permissions associated with a role without having to execute `SET ROLE <rolename>` or `SET ROLE ALL`.

#### 14.10.2.82.1 Synopsis

**SetDefaultRoleStmt:**

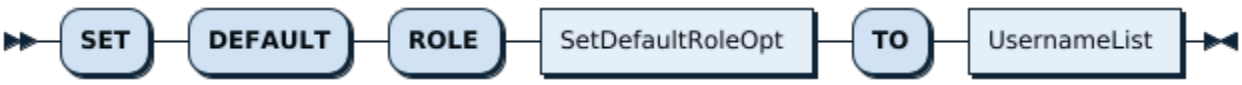

Figure 423: SetDefaultRoleStmt

**SetDefaultRoleOpt:**

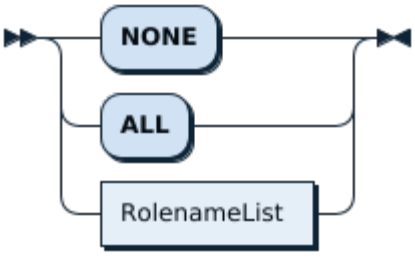

Figure 424: SetDefaultRoleOpt

**RolenameList:**

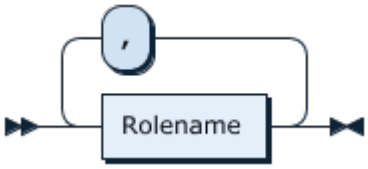

Figure 425: RolenameList

**UsernameList:**

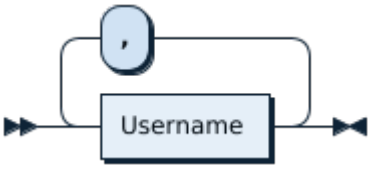

Figure 426: UsernameList

#### 14.10.2.82.2 Examples

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Create a new role `analyticsteam` and a new user `jennifer`:

```
CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Note that by default `jennifer` needs to execute `SET ROLE analyticsteam` in order to be able to use the privileges associated with the `analyticsteam` role:

```
SHOW GRANTS;
+-----------------------------------------------+
| Grants for User                               |
+-----------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'          |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%'   |
+-----------------------------------------------+
2 rows in set (0.00 sec)

SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

SHOW GRANTS;
+-----------------------------------------------+
| Grants for User                               |
+-----------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'          |
| GRANT Select ON test.* TO 'jennifer'@'%'      |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%'   |
+-----------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

The statement `SET DEFAULT ROLE` can be used to associate the role `analyticsteam` to `jennifer`:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
```

```
Query OK, 0 rows affected (0.02 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

After this, the user `jennifer` has the privileges associated with the role `analyticsteam` and `jennifer` does not have to execute the statement `SET ROLE`:

```
SHOW GRANTS;
+--------------------------------------------+
| Grants for User                            |
+--------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'       |
| GRANT Select ON test.* TO 'jennifer'@'%'   |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+--------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

`SET DEFAULT ROLE` will not automatically `GRANT` the associated role to the user. Attempting to `SET DEFAULT ROLE` for a role that `jennifer` does not have granted results in the following error:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
ERROR 3530 (HY000): `analyticsteam`@`%` is is not granted to jennifer@%
```

#### 14.10.2.82.3 MySQL compatibility

This statement is understood to be fully compatible with roles, which are a feature of MySQL 8.0. Any compatibility differences should be reported via an issue on GitHub.

- CREATE USER
- Privilege Management

### 14.10.2.85 SET ROLE

The `SET ROLE` statement is used to enable roles in the current session. After enabling roles, users can use the privileges of the role(s).

#### 14.10.2.85.1 Synopsis

**SetRoleStmt:**

Figure 435: SetRoleStmt

**SetRoleOpt:**

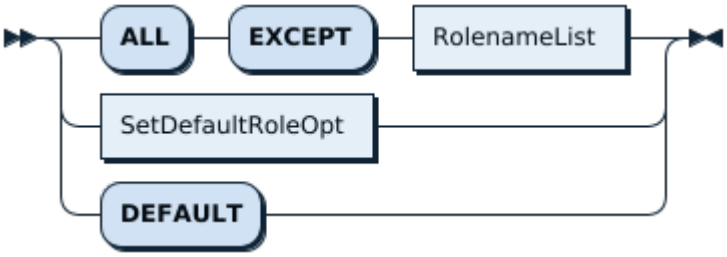

Figure 436: SetRoleOpt

**SetDefaultRoleOpt:**

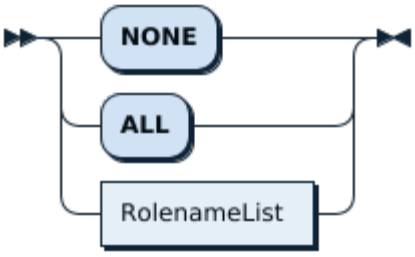

Figure 437: SetDefaultRoleOpt

#### 14.10.2.85.2 Examples

Create a user `'u1'@'%'` and three roles: `'r1'@'%'`, `'r2'@'%'` and `'r3'@'%'`. Grant these roles to `'u1'@'%'` and set `'r1'@'%'` as the default role of `'u1'@'%'`.

```
CREATE USER 'u1'@'%';
CREATE ROLE 'r1', 'r2', 'r3';
GRANT 'r1', 'r2', 'r3' TO 'u1'@'%';
SET DEFAULT ROLE 'r1' TO 'u1'@'%';
```

Log in as `'u1'@'%'` and execute the following `SET ROLE` statement to enable all roles.

```
SET ROLE ALL;
SELECT CURRENT_ROLE();
```

```
+----------------------------+
| CURRENT_ROLE()             |
+----------------------------+
| `r1`@`%`,`r2`@`%`,`r3`@`%` |
+----------------------------+
1 row in set (0.000 sec)
```

Execute the following `SET ROLE` statement to enable `'r2'` and `'r3'`.

```
SET ROLE 'r2', 'r3';
SELECT CURRENT_ROLE();
```

```
+-------------------+
| CURRENT_ROLE()    |
+-------------------+
| `r2`@`%`,`r3`@`%` |
+-------------------+
1 row in set (0.000 sec)
```

Execute the following `SET ROLE` statement to enable the default role(s).

```
SET ROLE DEFAULT;
SELECT CURRENT_ROLE();
```

```
+----------------+
| CURRENT_ROLE() |
+----------------+
| `r1`@`%`       |
+----------------+
1 row in set (0.000 sec)
```

Execute the following `SET ROLE` statement to cancel all enabled role(s).

```
SET ROLE NONE;
SELECT CURRENT_ROLE();
```

```
+----------------+
| CURRENT_ROLE() |
+----------------+
|                |
+----------------+
1 row in set (0.000 sec)
```

#### 14.10.2.85.3 MySQL compatibility

This statement is understood to be fully compatible with roles, which are a feature of MySQL 8.0. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.85.4 See also

- CREATE ROLE
- DROP ROLE
- `GRANT <role>`
- `REVOKE <role>`
- SET DEFAULT ROLE

- Role-Based Access Control

### 14.10.2.86 SET TRANSACTION

The `SET TRANSACTION` statement can be used to change the current isolation level on a `GLOBAL` or `SESSION` basis. This syntax is an alternative to `SET transaction_isolation='new-value'` and is included for compatibility with both MySQL, and the SQL standards.

#### 14.10.2.86.1 Synopsis

```
SetStmt ::=
    'SET' ( VariableAssignmentList |
    'PASSWORD' ('FOR' Username)? '=' PasswordOpt |
    ( 'GLOBAL'| 'SESSION' )? 'TRANSACTION' TransactionChars |
    'CONFIG' ( Identifier | stringLit) ConfigItemName EqOrAssignmentEq
       ↪ SetExpr )

TransactionChars ::=
    ( 'ISOLATION' 'LEVEL' IsolationLevel | 'READ' 'WRITE' | 'READ' 'ONLY'
       ↪ AsOfClause? )

IsolationLevel ::=
    ( 'REPEATABLE' 'READ' | 'READ' ( 'COMMITTED' | 'UNCOMMITTED' ) | '
       ↪ SERIALIZABLE' )

AsOfClause ::=
    ( 'AS' 'OF' 'TIMESTAMP' Expression)
```

#### 14.10.2.86.2 Examples

```
mysql> SHOW SESSION VARIABLES LIKE 'transaction_isolation';
+-----------------------+----------------+
| Variable_name         | Value          |
+-----------------------+----------------+
| transaction_isolation | REPEATABLE-READ |
+-----------------------+----------------+
1 row in set (0.00 sec)

mysql> SET SESSION TRANSACTION ISOLATION LEVEL READ COMMITTED;
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW SESSION VARIABLES LIKE 'transaction_isolation';
+-----------------------+----------------+
| Variable_name         | Value          |
+-----------------------+----------------+
| transaction_isolation | READ-COMMITTED |
+-----------------------+----------------+
1 row in set (0.01 sec)

mysql> SET SESSION transaction_isolation = 'REPEATABLE-READ';
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW SESSION VARIABLES LIKE 'transaction_isolation';
```

```
+----------------------+----------------+
| Variable_name        | Value          |
+----------------------+----------------+
| transaction_isolation | REPEATABLE-READ |
+----------------------+----------------+
1 row in set (0.00 sec)
```

#### 14.10.2.86.3 MySQL compatibility

- TiDB supports the ability to set a transaction as read-only in syntax only.
- The isolation levels `READ-UNCOMMITTED` and `SERIALIZABLE` are not supported.
- The `REPEATABLE-READ` isolation level is achieved through using the snapshot isolation technology, which is partly compatible with MySQL.
- In pessimistic transactions, TiDB supports two isolation levels compatible with MySQL: `REPEATABLE-READ` and `READ-COMMITTED`. For a detailed description, see Isolation Levels.

#### 14.10.2.86.4 See also

- `SET [GLOBAL|SESSION] <variable>`
- Isolation Levels

### 14.10.2.87 `SET [GLOBAL|SESSION] <variable>`

The statement `SET [GLOBAL|SESSION]` modifies one of TiDB's built in variables, of either `SESSION` or `GLOBAL` scope.

> **Note:**
>
> Similar to MySQL, changes to `GLOBAL` variables do not apply to either existing connections, or the local connection. Only new sessions reflect the changes to the value.

#### 14.10.2.87.1 Synopsis

**SetStmt:**

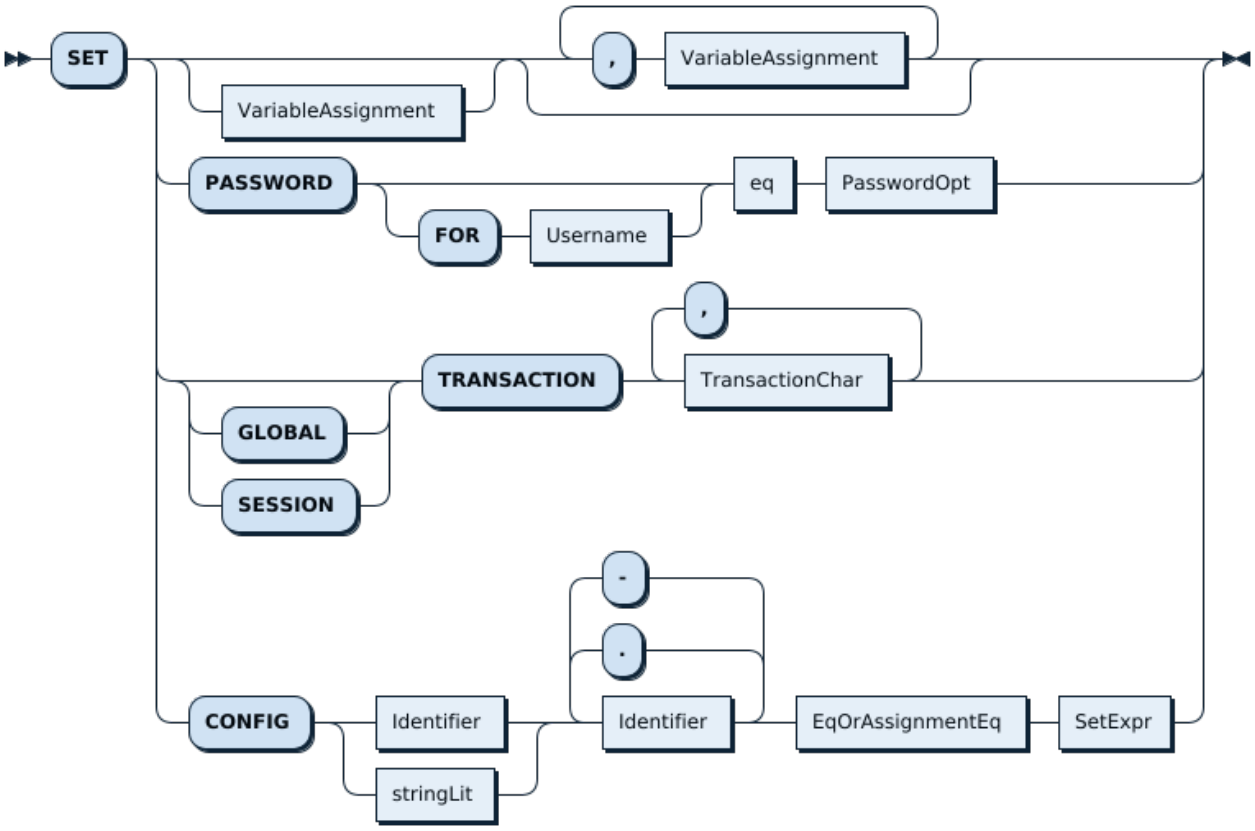

Figure 438: SetStmt

**VariableAssignment:**

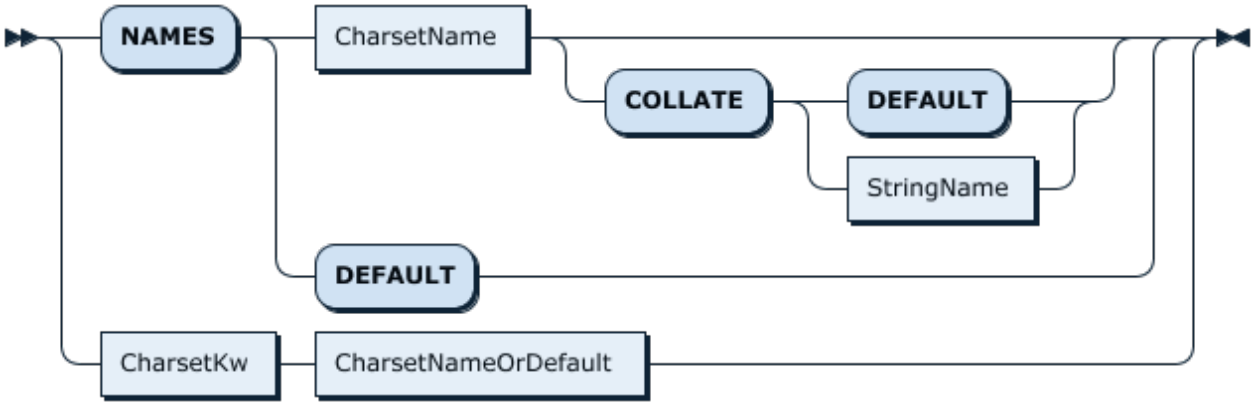

Figure 439: VariableAssignment

#### 14.10.2.87.2 Examples

Get the value of `sql_mode`.

```
mysql> SHOW GLOBAL VARIABLES LIKE 'sql_mode';
+--
    ↪ -------------+-----------------------------------------------------------
    ↪
| Variable_name | Value
    ↪
    ↪ |
+--
    ↪ -------------+-----------------------------------------------------------
    ↪
| sql_mode      | ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,
    ↪ NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,
    ↪ NO_ENGINE_SUBSTITUTION |
+--
    ↪ -------------+-----------------------------------------------------------
    ↪
1 row in set (0.00 sec)

mysql> SHOW SESSION VARIABLES LIKE 'sql_mode';
+--
    ↪ -------------+-----------------------------------------------------------
    ↪
| Variable_name | Value
    ↪
    ↪ |
+--
    ↪ -------------+-----------------------------------------------------------
    ↪
| sql_mode      | ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,
    ↪ NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,
    ↪ NO_ENGINE_SUBSTITUTION |
+--
    ↪ -------------+-----------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

Update the value of `sql_mode` globally. If you check the value of `SQL_mode` after the update, you can see that the value of `SESSION` level has not been updated:

```
mysql> SET GLOBAL sql_mode = 'STRICT_TRANS_TABLES,NO_AUTO_CREATE_USER';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GLOBAL VARIABLES LIKE 'sql_mode';
+---------------+-----------------------------------------+
| Variable_name | Value                                   |
```

```
+---------------+-----------------------------------------+
| sql_mode      | STRICT_TRANS_TABLES,NO_AUTO_CREATE_USER |
+---------------+-----------------------------------------+
1 row in set (0.00 sec)

mysql> SHOW SESSION VARIABLES LIKE 'sql_mode';
+--
    ↪ -------------+-----------------------------------------------------------------
    ↪
| Variable_name | Value
    ↪
    ↪ |
+--
    ↪ -------------+-----------------------------------------------------------------
    ↪
| sql_mode      | ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,
    ↪ NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,
    ↪ NO_ENGINE_SUBSTITUTION |
+--
    ↪ -------------+-----------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

Using `SET SESSION` takes effect immediately:

```
mysql> SET SESSION sql_mode = 'STRICT_TRANS_TABLES,NO_AUTO_CREATE_USER';
Query OK, 0 rows affected (0.01 sec)

mysql> SHOW SESSION VARIABLES LIKE 'sql_mode';
+---------------+-----------------------------------------+
| Variable_name | Value                                   |
+---------------+-----------------------------------------+
| sql_mode      | STRICT_TRANS_TABLES,NO_AUTO_CREATE_USER |
+---------------+-----------------------------------------+
1 row in set (0.00 sec)
```

#### 14.10.2.87.3 MySQL compatibility

The following behavior differences apply:

- Changes made with `SET GLOBAL` will be propagated to all TiDB instances in the cluster. This differs from MySQL, where changes do not propagate to replicas.
- TiDB presents several variables as both readable and settable. This is required for MySQL compatibility, because it is common for both applications and connectors to

read MySQL variables. For example: JDBC connectors both read and set query cache settings, despite not relying on the behavior.
- Changes made with `SET GLOBAL` will persist through TiDB server restarts. This means that `SET GLOBAL` in TiDB behaves more similar to `SET PERSIST` as available in MySQL 8.0 and above.

#### 14.10.2.87.4 See also

- SHOW [GLOBAL|SESSION] VARIABLES

### 14.10.2.88 SHOW ANALYZE STATUS

The `SHOW ANALYZE STATUS` statement shows the statistics collection tasks being executed by TiDB and a limited number of historical task records.

Starting from TiDB v6.1.0, the `SHOW ANALYZE STATUS` statement supports showing cluster-level tasks. Even after a TiDB restart, you can still view task records before the restart using this statement. Before TiDB v6.1.0, the `SHOW ANALYZE STATUS` statement can only show instance-level tasks, and task records are cleared after a TiDB restart.

Starting from TiDB v6.1.0, you can view the history tasks within the last 7 days through the system table `mysql.analyze_jobs`.

#### 14.10.2.88.1 Synopsis

```
ShowAnalyzeStatusStmt ::= 'SHOW' 'ANALYZE' 'STATUS' ShowLikeOrWhereOpt

ShowLikeOrWhereOpt ::= 'LIKE' SimpleExpr | 'WHERE' Expression
```

#### 14.10.2.88.2 Examples

```
mysql> create table t(x int, index idx(x)) partition by hash(x) partitions
    ↪ 2;
Query OK, 0 rows affected (0.69 sec)

mysql> set @@tidb_analyze_version = 1;
Query OK, 0 rows affected (0.00 sec)

mysql> analyze table t;
Query OK, 0 rows affected (0.20 sec)

mysql> show analyze status;
+--
    ↪ ------------+------------+----------------+-------------------+----------------+
    ↪
```

```
| Table_schema | Table_name | Partition_name | Job_info  | Processed_rows |

- ANALYZE_STATUS table

### 14.10.2.89 SHOW [BACKUPS|RESTORES]

These statements show a list of all queued, running and recently finished `BACKUP` and `RESTORE` tasks that were executed on a TiDB instance.

Both statements require `SUPER` privilege to run.

Use `SHOW BACKUPS` to query `BACKUP` tasks and use `SHOW RESTORES` to query `RESTORE` tasks.

Backups and restores that were started with the `br` commandline tool are not shown.

#### 14.10.2.89.1 Synopsis

```
ShowBRIEStmt ::=
    "SHOW" ("BACKUPS" | "RESTORES") ShowLikeOrWhere?

ShowLikeOrWhere ::=
    "LIKE" SimpleExpr
|   "WHERE" Expression
```

#### 14.10.2.89.2 Examples

In one connection, execute the following statement:

```
BACKUP DATABASE `test` TO 's3://example-bucket/backup-01';
```

Before the backup completes, run `SHOW BACKUPS` in a new connection:

```
SHOW BACKUPS;
```

```
+--
    ↪ ----------------------------+---------+----------+--------------------+------
    ↪
| Destination                  | State  | Progress | Queue_time      |
    ↪ Execution_time    | Finish_time | Connection | Message |
+--
    ↪ ----------------------------+---------+----------+--------------------+------
    ↪
| s3://example-bucket/backup-01/ | Backup | 98.38 | 2020-04-12 23:09:03 |
    ↪ 2020-04-12 23:09:25 | NULL |      4 | NULL   |
+--
    ↪ ----------------------------+---------+----------+--------------------+------
    ↪
1 row in set (0.00 sec)
```

The first row of the result above is described as follows:

| Column | Description |
|---|---|
| `Destination` ↪ | The destination URL (with all parameters stripped to avoid leaking secret keys) |

| Column | Description |
| --- | --- |
| `State` | State of the task |
| `Progress` | Estimated progress in the current state as a percentage |
| `Queue_time` | When the task was queued |
| `Execution_time` | When the task was started; the value is `0000-00-00 00:00:00` for queueing tasks |
| `Finish_time` | The timestamp when the task finished; the value is `0000-00-00 00:00:00` for queueing and running tasks |
| `Connection` | Connection ID running this task |
| `Message` | Message with details |

The possible states are:

| State | Description |
|---|---|
| Backup | Making a backup |
| Wait | Waiting for execution |
| Checksum | Running a checksum operation |

The connection ID can be used to cancel a backup/restore task via the `KILL TIDB QUERY` statement.

```
KILL TIDB QUERY 4;
```

```
Query OK, 0 rows affected (0.00 sec)
```

Filtering

Use the `LIKE` clause to filter out tasks by matching the destination URL against a wildcard expression.

```
SHOW BACKUPS LIKE 's3://%';
```

Use the `WHERE` clause to filter by columns.

```
SHOW BACKUPS WHERE `Progress` < 25.0;
```

#### 14.10.2.89.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.10.2.90 SHOW [GLOBAL|SESSION] BINDINGS

The `SHOW BINDINGS` statement is used to display information about created SQL bindings. A `BINDING` can be on either a `GLOBAL` or `SESSION` basis. The default is `SESSION`.

#### 14.10.2.90.1 Synopsis

**ShowStmt:**

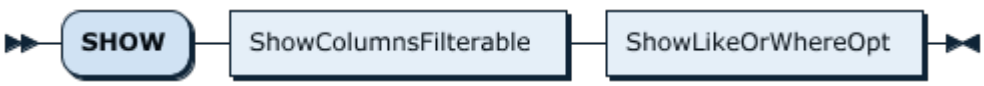

Figure 440: ShowStmt

**ShowTargetFilterable:**

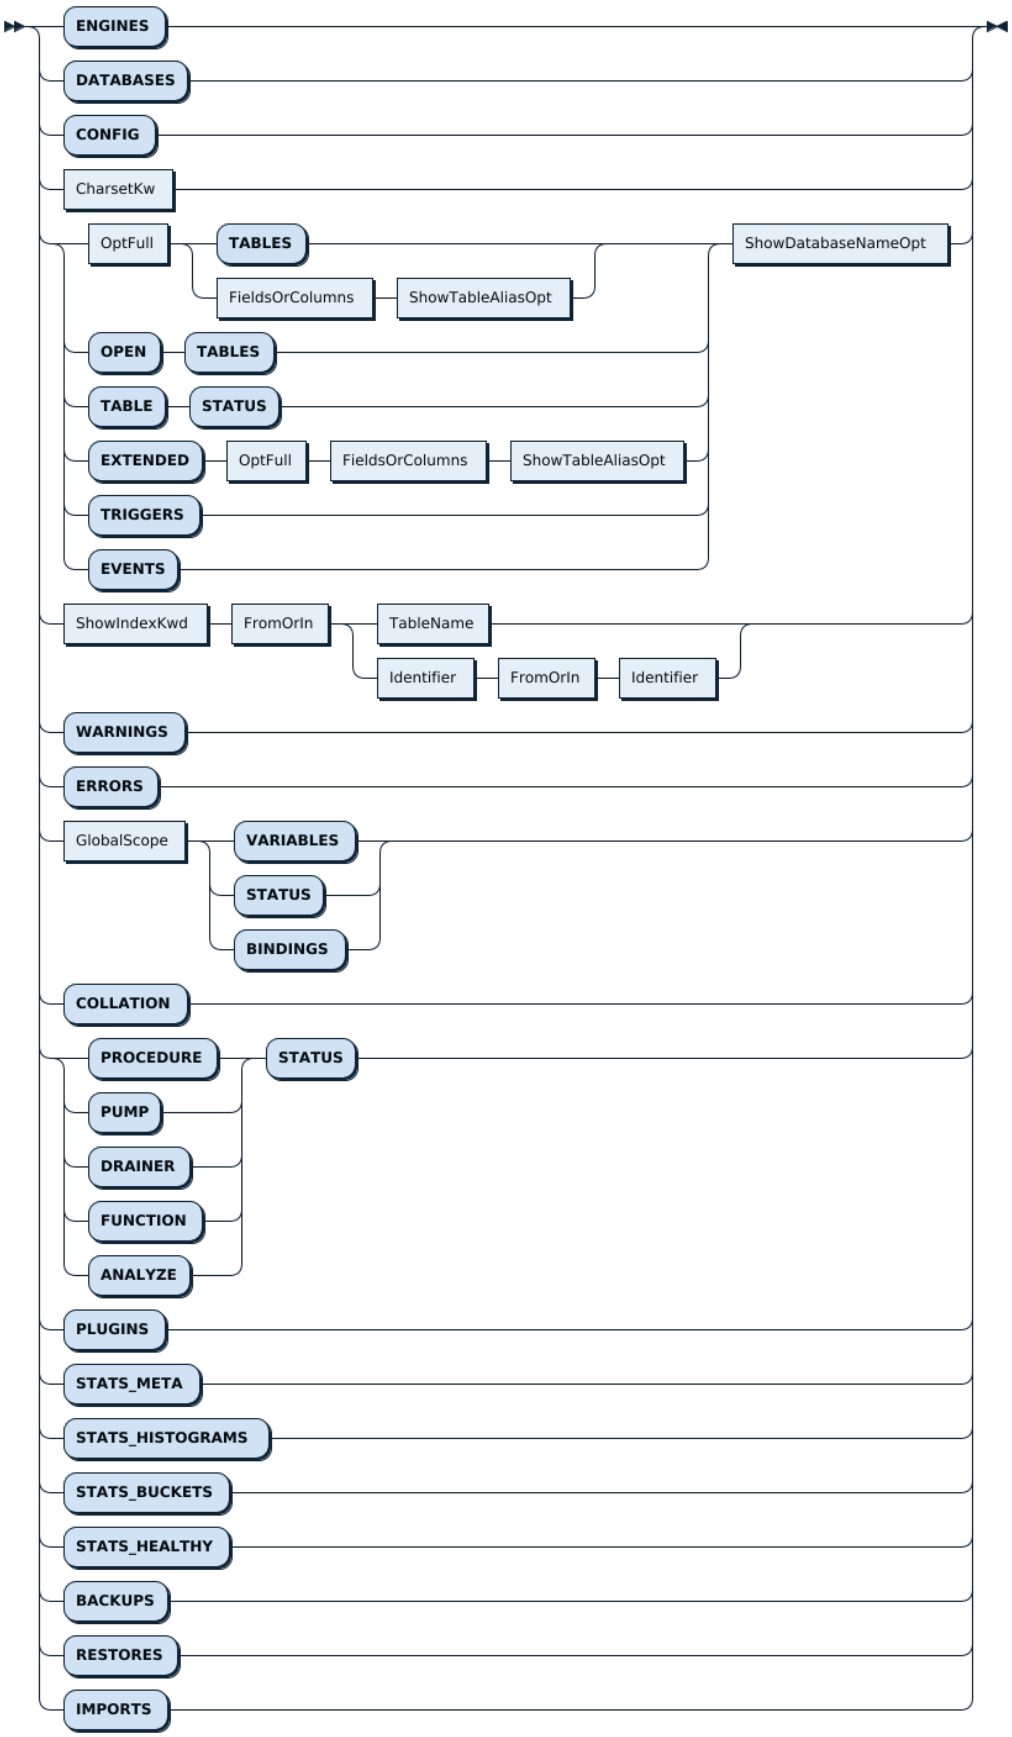

Figure 441: ShowTargetFilterable

**GlobalScope:**

Figure 442: GlobalScope

**ShowLikeOrWhereOpt**

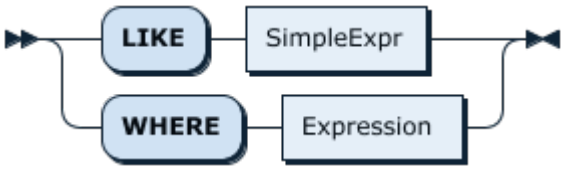

Figure 443: ShowLikeOrWhereOpt

#### 14.10.2.90.2 Syntax description

```
SHOW [GLOBAL | SESSION] BINDINGS [ShowLikeOrWhereOpt];
```

This statement outputs the execution plan bindings at the GLOBAL or SESSION level. The default scope is SESSION. Currently `SHOW BINDINGS` outputs eight columns, as shown below:

| Column Name | Description |
|---|---|
| original_sql | Original SQL statement after parameterization |
| bind_sql | Bound SQL statement with hints |
| default_db | Default database |
| status | Status including 'Using', 'Deleted', 'Invalid', 'Rejected', and 'Pending verification' |

| Column Name | Description |
|---|---|
| create_time | Created time |
| update_time | Updated time |
| charset | Character set |
| collation | Sorting rule |
| source | The way in which a binding is created, including `manual` (created by the `create [global] binding` SQL statement), `capture` (captured automatically by TiDB), and `evolve` (evolved automatically by TiDB) |

#### 14.10.2.90.3 Examples

```
mysql> CREATE TABLE t1 (
         id INT NOT NULL PRIMARY KEY auto_increment,
         b INT NOT NULL,
         pad VARBINARY(255),
         INDEX(b)
        );
Query OK, 0 rows affected (0.07 sec)

#### 14.10.2.91.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.10.2.92 SHOW CHARACTER SET

This statement provides a static list of available character sets in TiDB. The output does not reflect any attributes of the current connection or user.

#### 14.10.2.92.1 Synopsis

**ShowCharsetStmt:**

Figure 445: ShowCharsetStmt

**CharsetKw:**

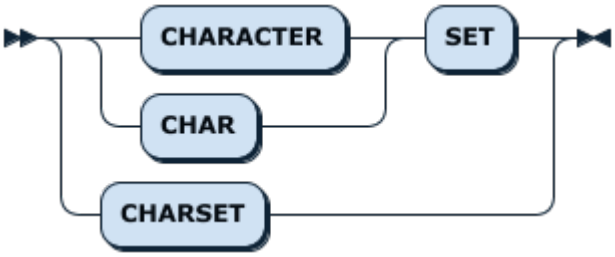

Figure 446: CharsetKw

#### 14.10.2.92.2 Examples

```
SHOW CHARACTER SET;
```

```
+---------+---------------------------------+-------------------+--------+
    ↪
| Charset | Description                     | Default collation | Maxlen |
+---------+---------------------------------+-------------------+--------+
    ↪
```

```
| ascii  | US ASCII                          | ascii_bin       |      1 |
| binary | binary                            | binary          |      1 |
| gbk    | Chinese Internal Code Specification | gbk_chinese_ci | 2 |
| latin1 | Latin1                            | latin1_bin      |      1 |
| utf8   | UTF-8 Unicode                     | utf8_bin        |      3 |
| utf8mb4 | UTF-8 Unicode                    | utf8mb4_bin     |      4 |
+---------+-----------------------------------+-----------------+--------+
   ↪
6 rows in set (0.00 sec)
```

#### 14.10.2.92.3 MySQL compatibility

The usage of this statement is understood to be fully compatible with MySQL. However, charsets in TiDB may have different default collations compared with MySQL. For details, refer to Compatibility with MySQL. Any other compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.92.4 See also

- SHOW COLLATION
- Character Set and Collation

### 14.10.2.93 SHOW COLLATION

This statement provides a static list of collations, and is included to provide compatibility with MySQL client libraries.

> **Note:**
>
> Results of `SHOW COLLATION` vary when the "new collation framework" is enabled. For new collation framework details, refer to Character Set and Collation.

#### 14.10.2.93.1 Synopsis

**ShowCollationStmt:**

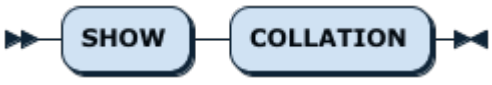

Figure 447: ShowCollationStmt

#### 14.10.2.93.2 Examples

When new collation framework is disabled, only binary collations are displayed.

```
mysql> SHOW COLLATION;
+-------------+---------+------+---------+----------+---------+
| Collation | Charset | Id | Default | Compiled | Sortlen |
+-------------+---------+------+---------+----------+---------+
| utf8mb4_bin | utf8mb4 | 46 | Yes  | Yes     |      1 |
| latin1_bin | latin1 |  47 | Yes    | Yes     |      1 |
| binary     | binary |   63 | Yes    | Yes     |      1 |
| ascii_bin | ascii  |   65 | Yes    | Yes     |      1 |
| utf8_bin   | utf8   |   83 | Yes    | Yes     |      1 |
+-------------+---------+------+---------+----------+---------+
5 rows in set (0.02 sec)
```

When new collation framework is enabled, `utf8_general_ci` and `utf8mb4_general_ci` are additionally supported.

```
mysql> SHOW COLLATION;
+--------------------+---------+------+---------+----------+---------+
| Collation        | Charset | Id | Default | Compiled | Sortlen |
+--------------------+---------+------+---------+----------+---------+
| ascii_bin        | ascii  |   65 | Yes    | Yes     |      1 |
| binary           | binary |   63 | Yes    | Yes     |      1 |
| gbk_bin          | gbk    |   87 |        | Yes     |      1 |
| gbk_chinese_ci   | gbk    |   28 | Yes    | Yes     |      1 |
| latin1_bin       | latin1 |   47 | Yes    | Yes     |      1 |
| utf8_bin         | utf8   |   83 | Yes    | Yes     |      1 |
| utf8_general_ci  | utf8   |   33 |        | Yes     |      1 |
| utf8_unicode_ci  | utf8   |  192 |        | Yes     |      1 |
| utf8mb4_bin      | utf8mb4 | 46 | Yes    | Yes     |      1 |
| utf8mb4_general_ci | utf8mb4 | 45 |     | Yes     |      1 |
| utf8mb4_unicode_ci | utf8mb4 | 224 |    | Yes     |      1 |
+--------------------+---------+------+---------+----------+---------+
11 rows in set (0.001 sec)
```

#### 14.10.2.93.3 MySQL compatibility

The usage of this statement is understood to be fully compatible with MySQL. However, charsets in TiDB may have different default collations compared with MySQL. For details, refer to Compatibility with MySQL. Any other compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.93.4 See also

- SHOW CHARACTER SET
- Character Set and Collation

#### 14.10.2.94 SHOW [FULL] COLUMNS FROM

The statement `SHOW [FULL] COLUMNS FROM <table_name>` describes the columns of a table or view in a useful tabular format. The optional keyword `FULL` displays the privileges the current user has to that column, and the `comment` from the table definition.

The statements `SHOW [FULL] FIELDS FROM <table_name>`, `DESC <table_name>`, `DESCRIBE <table_name>`, and `EXPLAIN <table_name>` are aliases of this statement.

> **Note:**
>
> `DESC TABLE <table_name>`, `DESCRIBE TABLE <table_name>`, and `EXPLAIN TABLE <table_name>` are not equivalent to the above statements. They are aliases of `DESC SELECT * FROM <table_name>`.

   ↪
38 rows in set (0.00 sec)
```

#### 14.10.2.94.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.94.4 See also

- SHOW CREATE TABLE

### 14.10.2.95 SHOW CONFIG

The `SHOW CONFIG` statement is used to show the current configuration of various components of TiDB. Note that the configuration and system variables act on different dimensions and should not be mixed up. If you want to obtain the system variable information, use the SHOW VARIABLES syntax.

#### 14.10.2.95.1 Synopsis

**ShowStmt:**

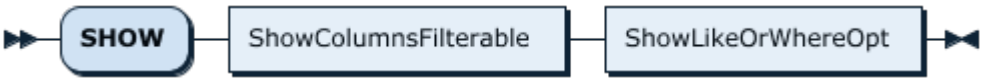

Figure 458: ShowStmt

**ShowTargetFilterable:**

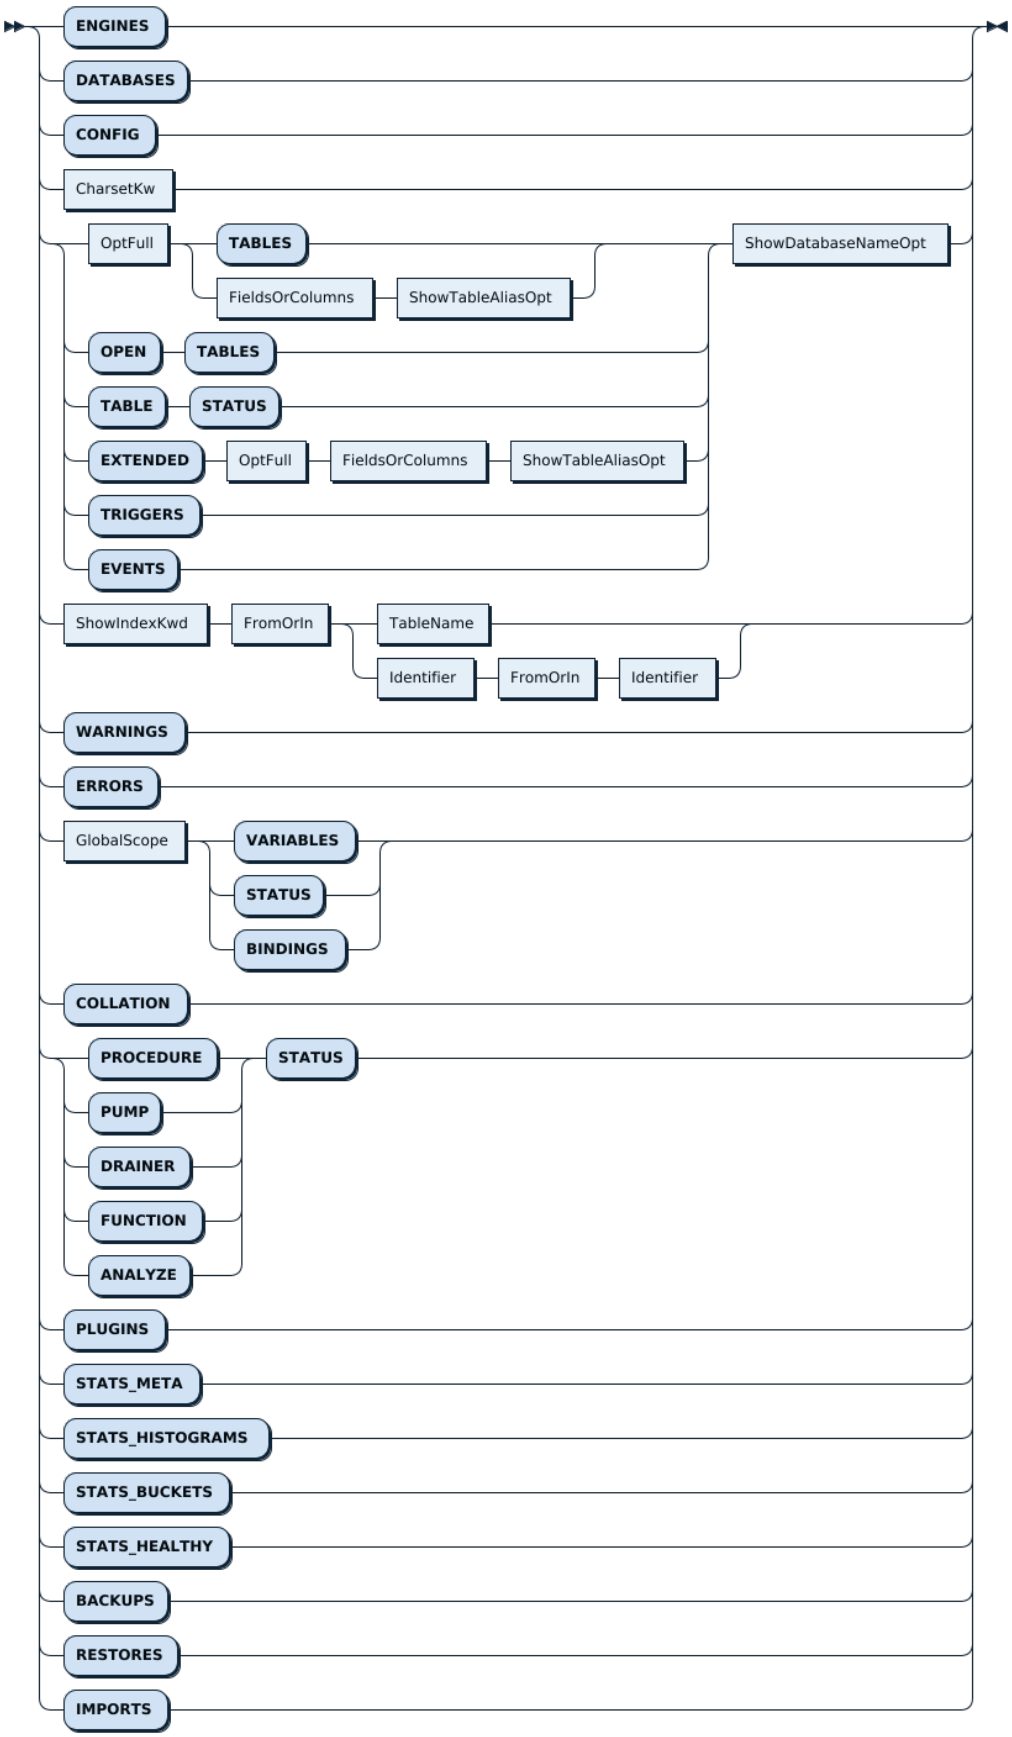

Figure 459: ShowTargetFilterable

#### 14.10.2.95.2 Examples

Show all configurations:

```
SHOW CONFIG;
```

```
+------+----------------+-----------------------------------------------------+-------------
    ↪
| Type | Instance     | Name                                                | Value
    ↪                                                          |
+------+----------------+-----------------------------------------------------+-------------
    ↪
| tidb | 127.0.0.1:4000 | advertise-address                                   | 127.0.0.1
    ↪                                                        |
| tidb | 127.0.0.1:4000 | binlog.binlog-socket                                |
    ↪                                                         |
| tidb | 127.0.0.1:4000 | binlog.enable                                       | false
    ↪                                                          |
...
120 rows in set (0.01 sec)
```

Show the configuration where the `type` is `tidb`:

```
SHOW CONFIG WHERE type = 'tidb' AND name = 'advertise-address';
```

```
+------+----------------+------------------+-----------+
| Type | Instance     | Name             | Value     |
+------+----------------+------------------+-----------+
| tidb | 127.0.0.1:4000 | advertise-address | 127.0.0.1 |
+------+----------------+------------------+-----------+
1 row in set (0.05 sec)
```

You can also use the `LIKE` clause to show the configuration where the `type` is `tidb`:

```
SHOW CONFIG LIKE 'tidb';
```

```
+------+----------------+-----------------------------------------------------+-------------
    ↪
| Type | Instance     | Name                                                | Value
    ↪                                                          |
+------+----------------+-----------------------------------------------------+-------------
    ↪
| tidb | 127.0.0.1:4000 | advertise-address                                   | 127.0.0.1
    ↪                                                        |
| tidb | 127.0.0.1:4000 | binlog.binlog-socket                                |
    ↪                                                         |
```

```
| tidb | 127.0.0.1:4000 | binlog.enable                                  | false
    ↪                                                                |
...
40 rows in set (0.01 sec)
```

#### 14.10.2.95.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.10.2.95.4 See also

- SHOW VARIABLES

### 14.10.2.96 SHOW CREATE DATABASE

`SHOW CREATE DATABASE` is used to show the exact SQL statement for re-creating an existing database. `SHOW CREATE SCHEMA` is a synonym for it.

#### 14.10.2.96.1 Synopsis

**ShowCreateDatabaseStmt:**

```
ShowCreateDatabaseStmt ::=
    "SHOW" "CREATE" "DATABASE" | "SCHEMA" ("IF" "NOT" "EXISTS")? DBName
```

#### 14.10.2.96.2 Examples

```
CREATE DATABASE test;
```

```
Query OK, 0 rows affected (0.12 sec)
```

```
SHOW CREATE DATABASE test;
```

```
+--
    ↪ --------+-----------------------------------------------------------------+
    ↪
| Database | Create Database                                                  |
+--
    ↪ --------+-----------------------------------------------------------------+
    ↪
| test     | CREATE DATABASE `test` /*!40100 DEFAULT CHARACTER SET utf8mb4
    ↪ */ |
+--
    ↪ --------+-----------------------------------------------------------------+
    ↪
```

```
1 row in set (0.00 sec)
```

```
SHOW CREATE SCHEMA IF NOT EXISTS test;
```

```
+--
    ↪ --------+-----------------------------------------------------------------------
    ↪
| Database | Create Database
    ↪                                                                          |
+--
    ↪ --------+-----------------------------------------------------------------------
    ↪
| test     | CREATE DATABASE /*!32312 IF NOT EXISTS*/ `test` /*!40100
    ↪ DEFAULT CHARACTER SET utf8mb4 */ |
+--
    ↪ --------+-----------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

#### 14.10.2.96.3 MySQL compatibility

`SHOW CREATE DATABASE` is expected to be fully compatible with MySQL. If you find any compatibility differences, submit a GitHub issue.

#### 14.10.2.96.4 See also

- CREATE TABLE
- DROP TABLE
- SHOW TABLES
- SHOW COLUMNS FROM

### 14.10.2.97 SHOW CREATE PLACEMENT POLICY

`SHOW CREATE PLACEMENT POLICY` is used to show the definition of a placement policy. This can be used to see the current definition of a placement policy and recreate it in another TiDB cluster.

#### 14.10.2.97.1 Synopsis

```
ShowCreatePlacementPolicyStmt ::=
    "SHOW" "CREATE" "PLACEMENT" "POLICY" PolicyName

PolicyName ::=
    Identifier
```

#### 14.10.2.97.2 Examples

```
CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us
    ↪ -west-1" FOLLOWERS=4;
CREATE TABLE t1 (a INT) PLACEMENT POLICY=p1;
SHOW CREATE PLACEMENT POLICY p1\G;
```

```
Query OK, 0 rows affected (0.08 sec)

Query OK, 0 rows affected (0.10 sec)

***************************[ 1. row ]***************************
Policy      | p1
Create Policy | CREATE PLACEMENT POLICY `p1` PRIMARY_REGION="us-east-1"
    ↪ REGIONS="us-east-1,us-west-1" FOLLOWERS=4
1 row in set (0.00 sec)
```

#### 14.10.2.97.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.10.2.97.4 See also

- Placement Rules in SQL
- SHOW PLACEMENT
- CREATE PLACEMENT POLICY
- ALTER PLACEMENT POLICY
- DROP PLACEMENT POLICY

### 14.10.2.98 SHOW CREATE SEQUENCE

The `SHOW CREATE SEQUENCE` shows the detailed information of a sequence, which is similar to `SHOW CREATE TABLE`.

#### 14.10.2.98.1 Synopsis

**ShowCreateSequenceStmt:**

Figure 460: ShowCreateSequenceStmt

**TableName:**

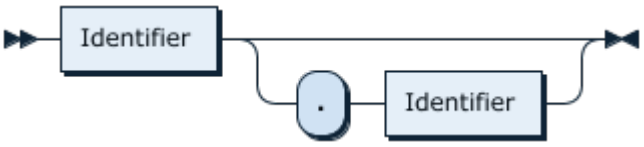

Figure 461: TableName

#### 14.10.2.98.2 Examples

```
CREATE SEQUENCE seq;
```

```
Query OK, 0 rows affected (0.03 sec)
```

```
SHOW CREATE SEQUENCE seq;
```

```
+-------+-------------------------------------------------------------------------------
   ↪
| Table | Create Table
   ↪
   ↪ |
+-------+-------------------------------------------------------------------------------
   ↪
| seq   | CREATE SEQUENCE `seq` start with 1 minvalue 1 maxvalue
   ↪ 9223372036854775806 increment by 1 cache 1000 nocycle ENGINE=InnoDB |
+-------+-------------------------------------------------------------------------------
   ↪
1 row in set (0.00 sec)
```

#### 14.10.2.98.3 MySQL compatibility

This statement is a TiDB extension. The implementation is modeled on sequences available in MariaDB.

#### 14.10.2.98.4 See also

- CREATE SEQUENCE
- DROP SEQUENCE

### 14.10.2.99 SHOW CREATE TABLE

This statement shows the exact statement to recreate an existing table using SQL.

#### 14.10.2.99.1 Synopsis

**ShowCreateTableStmt:**

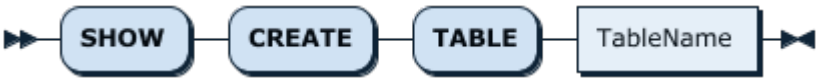

Figure 462: ShowCreateTableStmt

**TableName:**

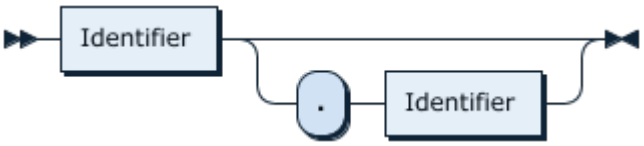

Figure 463: TableName

#### 14.10.2.99.2 Examples

```
mysql> CREATE TABLE t1 (a INT);
Query OK, 0 rows affected (0.12 sec)

mysql> SHOW CREATE TABLE t1;
+--
    ↪ -----+-------------------------------------------------------------------------
    ↪
| Table | Create Table
    ↪
    ↪ |
+--
    ↪ -----+-------------------------------------------------------------------------
    ↪
| t1    | CREATE TABLE `t1` (
  `a` int(11) DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin |
+--
    ↪ -----+-------------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

#### 14.10.2.99.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.99.4 See also

- CREATE TABLE
- DROP TABLE
- SHOW TABLES
- SHOW COLUMNS FROM

### 14.10.2.100 SHOW CREATE USER

This statement shows how to re-create a user using the `CREATE USER` syntax.

#### 14.10.2.100.1 Synopsis

**ShowCreateUserStmt:**

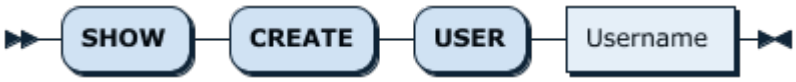

Figure 464: ShowCreateUserStmt

**Username:**

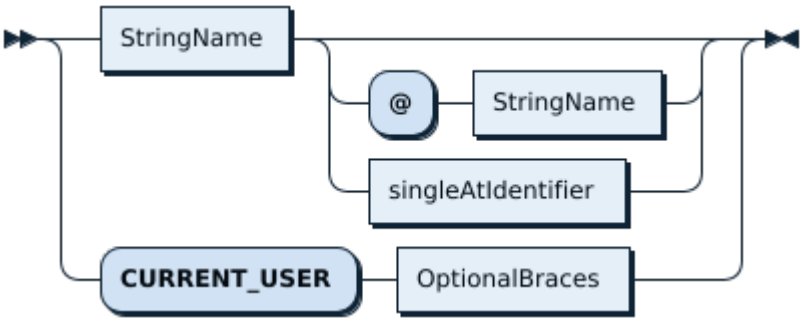

Figure 465: Username

#### 14.10.2.100.2 Examples

```
mysql> SHOW CREATE USER 'root';
+--
    ↪ ------------------------------------------------------------------------
    ↪
| CREATE USER for root@%
    ↪
    ↪ |
+--
    ↪ ------------------------------------------------------------------------
    ↪
```

```
| CREATE USER 'root'@'%' IDENTIFIED WITH 'mysql_native_password' AS ''
    ↪ REQUIRE NONE PASSWORD EXPIRE DEFAULT ACCOUNT UNLOCK |
+--
    ↪ ----------------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)

mysql> SHOW GRANTS FOR 'root';
+----------------------------------------+
| Grants for root@%                      |
+----------------------------------------+
| GRANT ALL PRIVILEGES ON *.* TO 'root'@'%' |
+----------------------------------------+
1 row in set (0.00 sec)
```

#### 14.10.2.100.3 MySQL compatibility

- The output of `SHOW CREATE USER` is designed to match MySQL, but several of the `CREATE` options are not yet supported by TiDB. Not yet supported options will be parsed but ignored. See [security compatibility] for more details.

#### 14.10.2.100.4 See also

- CREATE USER
- SHOW GRANTS
- DROP USER

### 14.10.2.101 SHOW DATABASES

This statement shows a list of databases that the current user has privileges to. Databases which the current user does not have access to will appear hidden from the list. The `information_schema` database always appears first in the list of databases.

`SHOW SCHEMAS` is an alias of this statement.

#### 14.10.2.101.1 Synopsis

**ShowDatabasesStmt:**

Figure 466: ShowDatabasesStmt

**ShowLikeOrWhereOpt:**

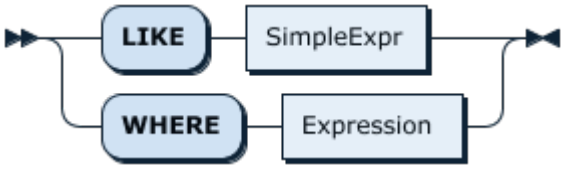

Figure 467: ShowLikeOrWhereOpt

#### 14.10.2.101.2 Examples

```
mysql> SHOW DATABASES;
+--------------------+
| Database           |
+--------------------+
| INFORMATION_SCHEMA |
| PERFORMANCE_SCHEMA |
| mysql              |
| test               |
+--------------------+
4 rows in set (0.00 sec)

mysql> CREATE DATABASE mynewdb;
Query OK, 0 rows affected (0.10 sec)

mysql> SHOW DATABASES;
+--------------------+
| Database           |
+--------------------+
| INFORMATION_SCHEMA |
| PERFORMANCE_SCHEMA |
| mynewdb            |
| mysql              |
| test               |
+--------------------+
5 rows in set (0.00 sec)
```

#### 14.10.2.101.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.101.4 See also

- SHOW SCHEMAS
- DROP DATABASE
- CREATE DATABASE

#### 14.10.2.102 SHOW DRAINER STATUS

The `SHOW DRAINER STATUS` statement displays the status information for all Drainer nodes in the cluster.

##### 14.10.2.102.1 Examples

```
SHOW DRAINER STATUS;
```

```
+--
    ↪ --------/----------------/--------/--------------------/--------------------/
    ↪
|  NodeID |     Address    | State |   Max_Commit_Ts   |    Update_Time     |
+--
    ↪ --------/----------------/--------/--------------------/--------------------/
    ↪
| drainer1 | 127.0.0.3:8249 | Online | 408553768673342532 | 2019-05-01
    ↪ 00:00:03 |
+--
    ↪ --------/----------------/--------/--------------------/--------------------/
    ↪
| drainer2 | 127.0.0.4:8249 | Online | 408553768673345531 | 2019-05-01
    ↪ 00:00:04 |
+--
    ↪ --------/----------------/--------/--------------------/--------------------/
    ↪
2 rows in set (0.00 sec)
```

##### 14.10.2.102.2 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

##### 14.10.2.102.3 See also

- SHOW PUMP STATUS
- CHANGE PUMP STATUS
- CHANGE DRAINER STATUS

#### 14.10.2.103 SHOW ENGINES

This statement is used to list all supported storage engines. The syntax is included only for compatibility with MySQL.

#### 14.10.2.103.1 Synopsis

**ShowEnginesStmt:**

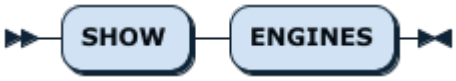

Figure 468: ShowEnginesStmt

```
SHOW ENGINES;
```

#### 14.10.2.103.2 Examples

```
mysql> SHOW ENGINES;
+--
    ↪ ------+---------+----------------------------------------------------------------+--
    ↪
| Engine | Support | Comment                                                        |
    ↪ Transactions | XA | Savepoints |
+--
    ↪ ------+---------+----------------------------------------------------------------+--
    ↪
| InnoDB | DEFAULT | Supports transactions, row-level locking, and foreign
    ↪ keys | YES | YES | YES    |
+--
    ↪ ------+---------+----------------------------------------------------------------+--
    ↪
1 row in set (0.00 sec)
```

#### 14.10.2.103.3 MySQL compatibility

- This statement will always only return InnoDB as the supported engine. Internally, TiDB will typically use TiKV as the storage engine.

### 14.10.2.104 SHOW ERRORS

This statement shows errors from previously executed statements. The error buffer is cleared as soon as a statement executes successfully. In which case, `SHOW ERRORS` will return an empty set.

The behavior of which statements generate errors vs. warnings is highly influenced by the current `sql_mode`.

#### 14.10.2.104.1 Synopsis

**ShowErrorsStmt:**

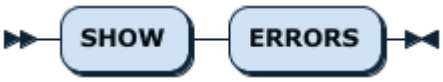

Figure 469: ShowErrorsStmt

#### 14.10.2.104.2 Examples

```
mysql> select invalid;
ERROR 1054 (42S22): Unknown column 'invalid' in 'field list'
mysql> create invalid;
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual
    ↪ that corresponds to your TiDB version for the right syntax to use
    ↪ line 1 column 14 near "invalid"
mysql> SHOW ERRORS;
+--
    ↪ -----+------+-----------------------------------------------------------------
    ↪
| Level | Code | Message
    ↪
    ↪ |
+--
    ↪ -----+------+-----------------------------------------------------------------
    ↪
| Error | 1054 | Unknown column 'invalid' in 'field list'
    ↪
    ↪ |

### 14.10.2.105 SHOW [FULL] FIELDS FROM

This statement is an alias to `SHOW [FULL] COLUMNS FROM`. It is included for compatibility with MySQL.

### 14.10.2.106 SHOW GRANTS

This statement shows a list of privileges associated with a user. As in MySQL, the `USAGE` privileges denotes the ability to login to TiDB.

#### 14.10.2.106.1 Synopsis

**ShowGrantsStmt:**

### 14.10.2.107 SHOW INDEX [FROM|IN]

This statement is an alias to `SHOW INDEXES [FROM|IN]`. It is included for compatibility with MySQL.

### 14.10.2.108 SHOW INDEXES [FROM|IN]

The statement `SHOW INDEXES [FROM|IN]` lists the indexes on a specified table. The statements `SHOW INDEX [FROM|IN]`, `SHOW KEYS [FROM|IN]` are aliases of this statement, and included for compatibility with MySQL.

    ↪  |    NULL | NULL | YES | BTREE     |         |               | YES
    | NULL       |
+--
    ↪ -----+------------+----------+-------------+------------+----------+--------
    ↪
2 rows in set (0.00 sec)

mysql> SHOW KEYS FROM t1;
+--
    ↪ -----+------------+----------+-------------+------------+----------+--------
    ↪
| Table | Non_unique | Key_name | Seq_in_index | Column_name | Collation |
    ↪ Cardinality | Sub_part | Packed | Null | Index_type | Comment |
    ↪ Index_comment | Visible | Expression |
+--
    ↪ -----+------------+----------+-------------+------------+----------+--------
    ↪
| t1    |          0 | PRIMARY |           1 | id         | A         |          0
    ↪  |    NULL | NULL |      | BTREE     |         |               | YES
    | NULL       |
| t1    |          1 | col1    |           1 | col1       | A         |          0
    ↪  |    NULL | NULL | YES | BTREE     |         |               | YES
    | NULL       |
+--
    ↪ -----+------------+----------+-------------+------------+----------+--------
    ↪
2 rows in set (0.00 sec)
```

#### 14.10.2.108.3 MySQL compatibility

The `Cardinality` column in MySQL shows the number of different values on the index. In TiDB, the `Cardinality` column always shows `0`.

#### 14.10.2.108.4 See also

- SHOW CREATE TABLE
- DROP INDEX
- CREATE INDEX

### 14.10.2.109 SHOW KEYS [FROM|IN]

This statement is an alias to SHOW INDEXES [FROM|IN]. It is included for compatibility with MySQL.

#### 14.10.2.110 SHOW MASTER STATUS

The SHOW MASTER STATUS statement displays the latest TSO in the cluster.

##### 14.10.2.110.1 Examples

```
SHOW MASTER STATUS;
```

```
+--
    ↪ ----------+--------------------+-------------+-----------------+-----------
    ↪
| File       | Position          | Binlog_Do_DB | Binlog_Ignore_DB |
    ↪ Executed_Gtid_Set |
+--
    ↪ ----------+--------------------+-------------+-----------------+-----------
    ↪
| tidb-binlog | 416916363252072450 |        |                 |
    ↪                  |
+--
    ↪ ----------+--------------------+-------------+-----------------+-----------
    ↪
1 row in set (0.00 sec)
```

##### 14.10.2.110.2 MySQL compatibility

The output of SHOW MASTER STATUS is designed to match MySQL. However, the execution results are different in that the MySQL result is the binlog location information and the TiDB result is the latest TSO information.

##### 14.10.2.110.3 See also

- SHOW PUMP STATUS
- SHOW DRAINER STATUS
- CHANGE PUMP STATUS
- CHANGE DRAINER STATUS

#### 14.10.2.111 SHOW PLACEMENT

SHOW PLACEMENT summarizes all placement options from placement policies, and presents them in canonical form.

The statement returns a result set in which the Scheduling_State field indicates the current progress that the Placement Driver (PD) has made in scheduling the placement:

- `PENDING`: The PD has not yet started scheduling the placement. This might indicate that that the placement rules are semantically correct, but cannot currently be satisfied by the cluster. For example, if `FOLLOWERS=4` but there are only 3 TiKV stores which are candidates for followers.
- `INPROGRESS`: The PD is currently scheduling the placement.
- `SCHEDULED`: The PD has successfully scheduled the placement.

#### 14.10.2.111.1 Synopsis

```
ShowStmt ::=
    "PLACEMENT"
```

#### 14.10.2.111.2 Examples

```
CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us
    ↪ -west-1" FOLLOWERS=4;
CREATE TABLE t1 (a INT) PLACEMENT POLICY=p1;
SHOW PLACEMENT;
```

```
Query OK, 0 rows affected (0.01 sec)

Query OK, 0 rows affected (0.00 sec)

- Placement Rules in SQL
- SHOW PLACEMENT FOR
- CREATE PLACEMENT POLICY

### 14.10.2.112 SHOW PLACEMENT FOR

`SHOW PLACEMENT FOR` summarizes all placement options, and presents them in the canonical form for a specific table, database schema, or partition.

The statement returns a result set in which the `Scheduling_State` field indicates the current progress that the Placement Driver (PD) has made in scheduling the placement:

- `PENDING`: The PD has not yet started scheduling the placement. This might indicate that that the placement rules are semantically correct, but cannot currently be satisfied by the cluster. For example, if `FOLLOWERS=4` but there are only 3 TiKV stores that are candidates for followers.
- `INPROGRESS`: The PD is currently scheduling the placement.
- `SCHEDULED`: The PD has successfully scheduled the placement.

#### 14.10.2.112.1 Synopsis

```
ShowStmt ::=
    "PLACEMENT" "FOR" ShowPlacementTarget

ShowPlacementTarget ::=
    DatabaseSym DBName

```

#### 14.10.2.115.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.115.4 See also

- SHOW GRANTS
- GRANT <privileges>

#### 14.10.2.116 SHOW [FULL] PROCESSLIST

This statement lists the current sessions connected to the same TiDB server. The `Info` column contains the query text, which will be truncated unless the optional keyword `FULL` is specified.

##### 14.10.2.116.1 Synopsis

**ShowProcesslistStmt:**

Figure 483: ShowProcesslistStmt

**OptFull:**

Figure 484: OptFull

##### 14.10.2.116.2 Examples

```
mysql> SHOW PROCESSLIST;
+--
   ↪ ----+------+-----------------+------+---------+------+-----------+-----------
   ↪
| Id   | User | Host            | db   | Command | Time | State   | Info
   ↪           |
+--
   ↪ ----+------+-----------------+------+---------+------+-----------+-----------
   ↪
|    5 | root | 127.0.0.1:45970 | test | Query | 0 | autocommit | SHOW
   ↪ PROCESSLIST |
+--
   ↪ ----+------+-----------------+------+---------+------+-----------+-----------
   ↪
1 rows in set (0.00 sec)
```

##### 14.10.2.116.3 MySQL compatibility

- The `State` column in TiDB is non-descriptive. Representing state as a single value is more complex in TiDB, since queries are executed in parallel and each goroutine will have a different state at any one time.

#### 14.10.2.116.4 See also

- KILL [TIDB]

### 14.10.2.117 SHOW PROFILES

The `SHOW PROFILES` statement currently only returns an empty result.

#### 14.10.2.117.1 Synopsis

**ShowStmt:**

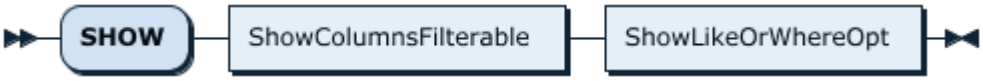

Figure 485: ShowStmt

#### 14.10.2.117.2 Examples

```
SHOW PROFILES;
```

```
Empty set (0.00 sec)
```

#### 14.10.2.117.3 MySQL compatibility

This statement is included only for compatibility with MySQL. Executing `SHOW PROFILES` always returns an empty result.

### 14.10.2.118 SHOW PUMP STATUS

The `SHOW PUMP STATUS` statement displays the status information for all Pump nodes in the cluster.

#### 14.10.2.118.1 Examples

```
SHOW PUMP STATUS;
```

```
+--
    ↪ ------/---------------/--------/-------------------/--------------------/
    ↪
| NodeID |   Address   | State |  Max_Commit_Ts  |    Update_Time     |
+--
    ↪ ------/---------------/--------/-------------------/--------------------/
    ↪
```

```
| pump1 | 127.0.0.1:8250 | Online | 408553768673342237 | 2019-05-01 00:00:01
    ↪  |
+--
    ↪ ------/---------------/--------/--------------------/--------------------/
    ↪
| pump2 | 127.0.0.2:8250 | Online | 408553768673342335 | 2019-05-01 00:00:02
    ↪  |
+--
    ↪ ------/---------------/--------/--------------------/--------------------/
    ↪
2 rows in set (0.00 sec)
```

#### 14.10.2.118.2 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.10.2.118.3 See also

- SHOW DRAINER STATUS
- CHANGE PUMP STATUS
- CHANGE DRAINER STATUS

### 14.10.2.119 SHOW SCHEMAS

This statement is an alias to `SHOW DATABASES`. It is included for compatibility with MySQL.

### 14.10.2.120 SHOW STATS_HEALTHY

The `SHOW STATS_HEALTHY` statement shows an estimation of how accurate statistics are believed to be. Tables with a low percentage health may generate sub-optimal query execution plans.

The health of a table can be improved by running the `ANALYZE` table command. `ANALYZE` runs automatically when the health drops below the `tidb_auto_analyze_ratio` threshold.

#### 14.10.2.120.1 Synopsis

**ShowStmt**

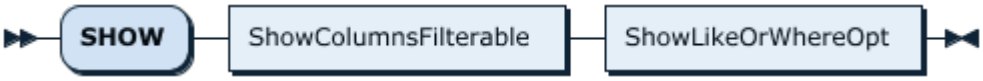

Figure 486: ShowStmt

**ShowTargetFiltertable**

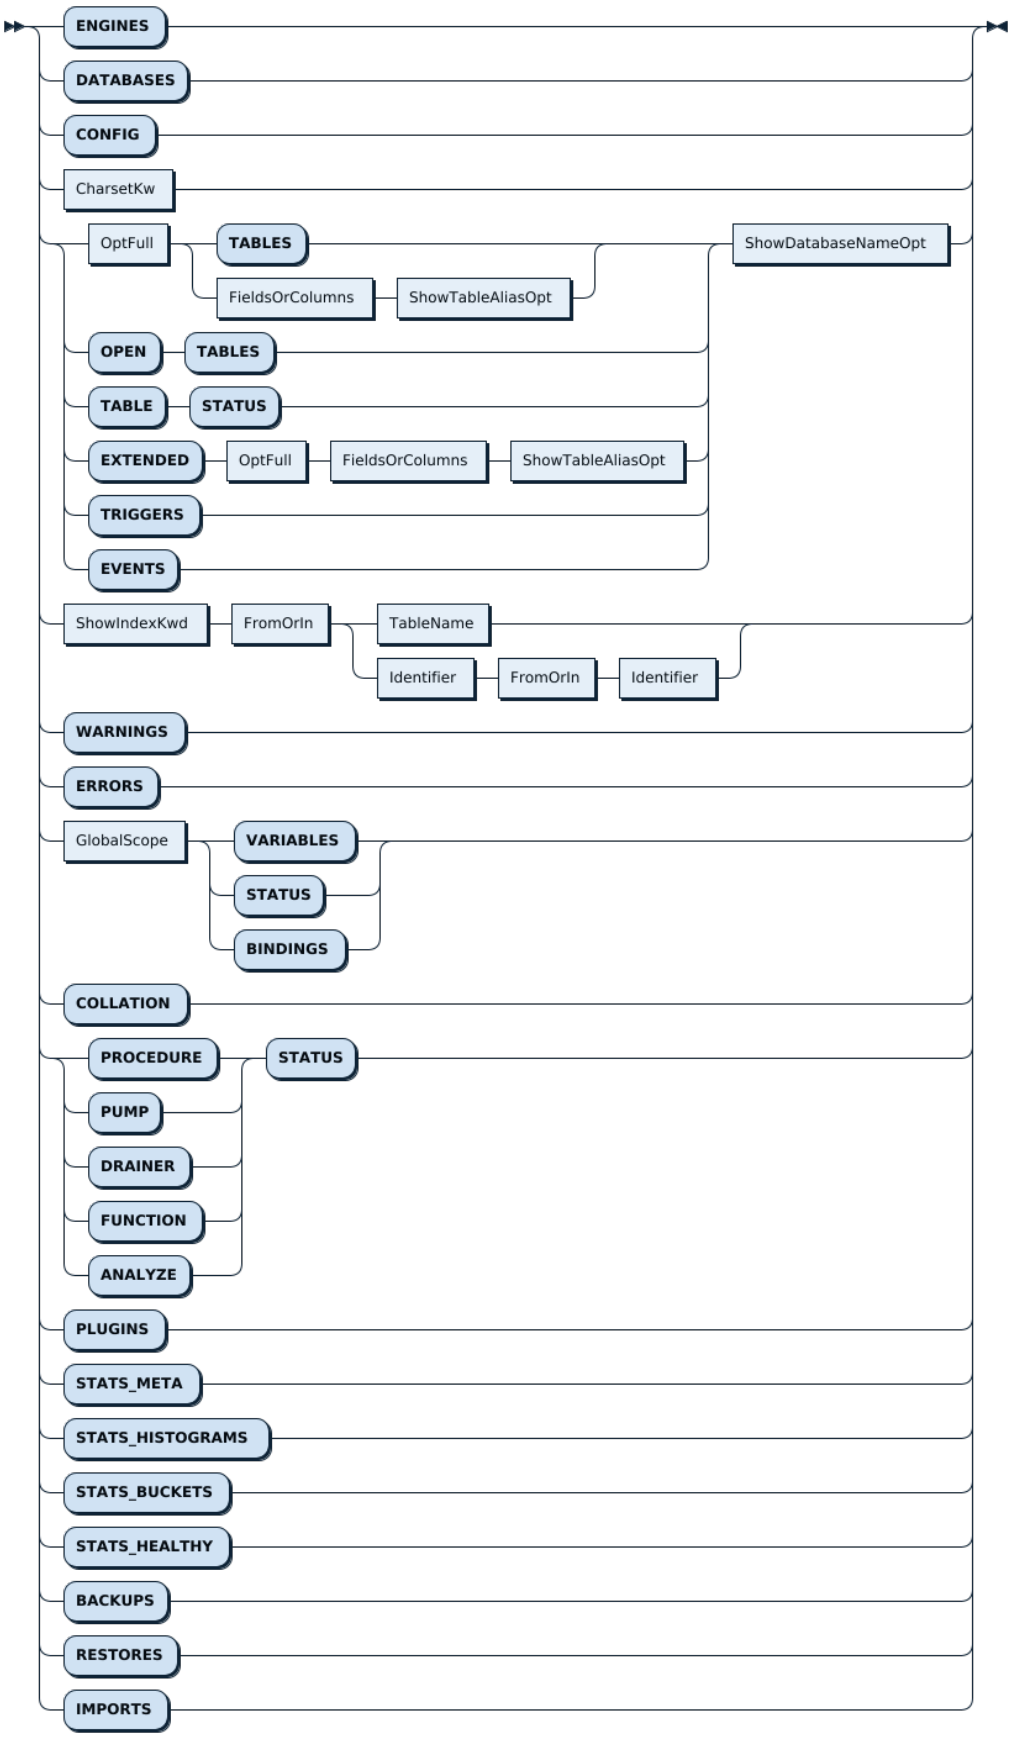

Figure 487: ShowTargetFilterable

**ShowLikeOrWhereOpt**

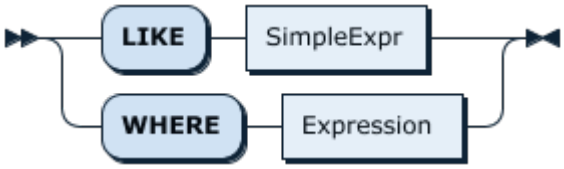

Figure 488: ShowLikeOrWhereOpt

#### 14.10.2.120.2 Examples

Load example data and run `ANALYZE`:

```
CREATE TABLE t1 (
 id INT NOT NULL PRIMARY KEY auto_increment,
 b INT NOT NULL,
 pad VARBINARY(255),
 INDEX(b)
);

INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM dual
    ↪ ;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
    ↪  JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
    ↪  JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
    ↪  JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
    ↪  JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
    ↪  JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
    ↪  JOIN t1 b JOIN t1 c LIMIT 100000;
SELECT SLEEP(1);
ANALYZE TABLE t1;
SHOW STATS_HEALTHY; # should be 100% healthy
```

```
...
mysql> SHOW STATS_HEALTHY;
+---------+------------+----------------+---------+
| Db_name | Table_name | Partition_name | Healthy |
+---------+------------+----------------+---------+
| test    | t1         |                |     100 |
+---------+------------+----------------+---------+
```

```
1 row in set (0.00 sec)
```

Perform a bulk update deleting approximately 30% of the records. Check the health of the statistics:

```
DELETE FROM t1 WHERE id BETWEEN 101010 AND 201010; # delete about 30% of
    ↪ records
SHOW STATS_HEALTHY;
```

```
mysql> SHOW STATS_HEALTHY;
+---------+------------+----------------+---------+
| Db_name | Table_name | Partition_name | Healthy |
+---------+------------+----------------+---------+
| test    | t1         |                |      50 |
+---------+------------+----------------+---------+
1 row in set (0.00 sec)
```

#### 14.10.2.120.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.10.2.122 SHOW STATS_LOCKED

`SHOW STATS_LOCKED` shows the tables whose statistics are locked.

> **Warning:**
>
> Locking statistics is an experimental feature for the current version. It is not recommended to use it in the production environment.

#### 14.10.2.122.1 Synopsis

```
ShowStatsLockedStmt ::= 'SHOW' 'STATS_LOCKED' ShowLikeOrWhereOpt

ShowLikeOrWhereOpt ::= 'LIKE' SimpleExpr | 'WHERE' Expression
```

#### 14.10.2.122.2 Examples

Create table `t`, and insert data into it. When the statistics of table `t` are not locked, the `ANALYZE` statement can be successfully executed.

```
mysql> create table t(a int, b int);
Query OK, 0 rows affected (0.03 sec)
```

```
mysql> insert into t values (1,2), (3,4), (5,6), (7,8);
Query OK, 4 rows affected (0.00 sec)
Records: 4 Duplicates: 0 Warnings: 0

mysql> analyze table t;
Query OK, 0 rows affected, 1 warning (0.02 sec)

mysql> show warnings;
+--
   ↪ -----+------+-----------------------------------------------------------------+
   ↪
| Level | Code | Message                                                         |
+--
   ↪ -----+------+-----------------------------------------------------------------+
   ↪
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
   ↪ test.t |
+--
   ↪ -----+------+-----------------------------------------------------------------+
   ↪
1 row in set (0.00 sec)
```

Lock the statistics of table `t` and execute `ANALYZE`. From the output of `SHOW STATS_LOCKED`, you can see that the statistics of table `t` have been locked. The warning message shows that the `ANALYZE` statement has skipped table `t`.

```
mysql> lock stats t;
Query OK, 0 rows affected (0.00 sec)

mysql> show stats_locked;
+---------+------------+----------------+--------+
| Db_name | Table_name | Partition_name | Status |
+---------+------------+----------------+--------+
| test    | t          |                | locked |
+---------+------------+----------------+--------+
1 row in set (0.01 sec)

mysql> analyze table t;
Query OK, 0 rows affected, 2 warnings (0.00 sec)

mysql> show warnings;
+--
   ↪ -------+------+-----------------------------------------------------------------
   ↪
| Level   | Code | Message                                                          |
```

```
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
| Note    | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
    ↪ test.t |
| Warning | 1105 | skip analyze locked table: t                                |
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
2 rows in set (0.00 sec)
```

Unlock the statistics of table `t` and `ANALYZE` can be successfully executed again.

```
mysql> unlock stats t;
Query OK, 0 rows affected (0.01 sec)

mysql> analyze table t;
Query OK, 0 rows affected, 1 warning (0.03 sec)

mysql> show warnings;
+--
    ↪ -----+------+-------------------------------------------------------------+
    ↪
| Level | Code | Message                                                       |
+--
    ↪ -----+------+-------------------------------------------------------------+
    ↪
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
    ↪ test.t |
+--
    ↪ -----+------+-------------------------------------------------------------+
    ↪
1 row in set (0.00 sec)
```

#### 14.10.2.122.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

- Statistics
- LOCK STATS
- UNLOCK STATS

#### 14.10.2.123 SHOW STATS_META

You can use `SHOW STATS_META` to view how many rows are in a table and how many rows are changed in that table. When using this statement, you can filter the needed information by the `ShowLikeOrWhere` clause.

Currently, the `SHOW STATS_META` statement outputs 6 columns:

| Column name | Description |
|---|---|
| db_name | Database name |
| table_name | Table name |
| partition_name | Partition name |
| update_time | Last updated time |
| modify_count | The number of rows modified |
| row_count | The total row count |

> **Note:**
>
> The `update_time` is updated when TiDB updates the `modify_count` and `row_count` fields according to DML statements. So `update_time` is not the last execution time of the `ANALYZE` statement.

##### 14.10.2.123.1 Synopsis

| ddl_schema_version | 141                                  |
| Ssl_verify_mode    | 0                                    |
| Ssl_version        |                                      |
| Ssl_cipher         |                                      |
+--------------------+--------------------------------------+
6 rows in set (0.01 sec)

mysql> show global status;
+--------------------+--------------------------------------+
| Variable_name      | Value                                |
+--------------------+--------------------------------------+
| Ssl_cipher         |                                      |
| Ssl_cipher_list    |                                      |
| Ssl_verify_mode    | 0                                    |
| Ssl_version        |                                      |
| server_id          | 93e2e07d-6bb4-4a1b-90b7-e035fae154fe |
| ddl_schema_version | 141                                  |
+--------------------+--------------------------------------+
6 rows in set (0.00 sec)
```

#### 14.10.2.124.3 MySQL compatibility

- This statement is included only for compatibility with MySQL.

#### 14.10.2.124.4 See also

- FLUSH STATUS

#### 14.10.2.125 SHOW TABLE NEXT_ROW_ID

`SHOW TABLE NEXT_ROW_ID` is used to show the details of some special columns of a table, including:

- `AUTO_INCREMENT` column automatically created by TiDB, namely, `_tidb_rowid` column.
- `AUTO_INCREMENT` column created by users.
- `AUTO_RANDOM` column created by users.
- `SEQUENCE` created by users.

##### 14.10.2.125.1 Synopsis

**ShowTableNextRowIDStmt:**

Figure 498: ShowTableNextRowIDStmt

**TableName:**

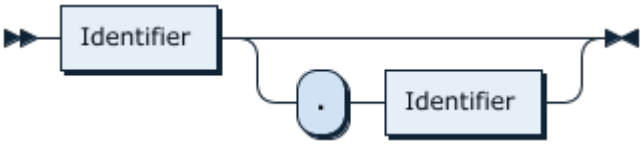

Figure 499: TableName

##### 14.10.2.125.2 Examples

For newly created tables, `NEXT_GLOBAL_ROW_ID` is `1` because no Row ID is allocated.

```
create table t(a int);
Query OK, 0 rows affected (0.06 sec)
```

```
show table t next_row_id;
+---------+------------+-------------+--------------------+
| DB_NAME | TABLE_NAME | COLUMN_NAME | NEXT_GLOBAL_ROW_ID |
+---------+------------+-------------+--------------------+
| test    | t          | _tidb_rowid |                  1 |
+---------+------------+-------------+--------------------+
1 row in set (0.00 sec)
```

Data have been written to the table. The TiDB server that inserts the data allocates and caches 30000 IDs at once. Thus, NEXT_GLOBAL_ROW_ID is 30001 now.

```
insert into t values (), (), ();
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0
```

```
show table t next_row_id;
+---------+------------+-------------+--------------------+
| DB_NAME | TABLE_NAME | COLUMN_NAME | NEXT_GLOBAL_ROW_ID |
+---------+------------+-------------+--------------------+
| test    | t          | _tidb_rowid |              30001 |
+---------+------------+-------------+--------------------+
1 row in set (0.00 sec)
```

#### 14.10.2.125.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.10.2.126 SHOW TABLE REGIONS

The `SHOW TABLE REGIONS` statement is used to show the Region information of a table in TiDB.

#### 14.10.2.126.1 Syntax

```
SHOW TABLE [table_name] REGIONS [WhereClauseOptional];
SHOW TABLE [table_name] INDEX [index_name] REGIONS [WhereClauseOptional];
```

#### 14.10.2.126.2 Synopsis

**ShowTableRegionStmt:**

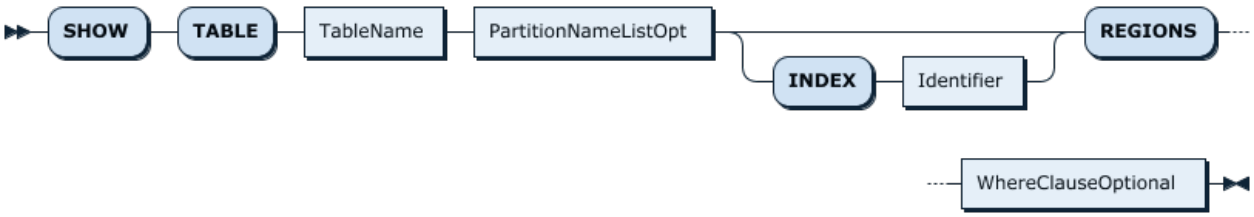

Figure 500: ShowTableRegionStmt

**TableName:**

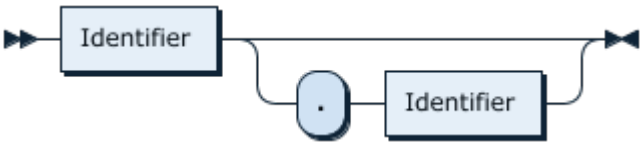

Figure 501: TableName

**PartitionNameListOpt:**

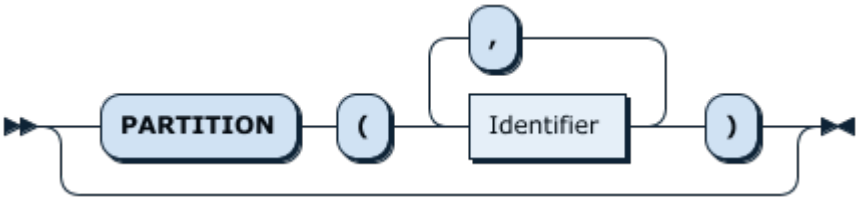

Figure 502: PartitionNameListOpt

**WhereClauseOptional:**

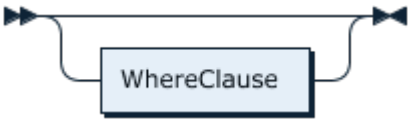

Figure 503: WhereClauseOptional

**WhereClause:**

Figure 504: WhereClause

Executing `SHOW TABLE REGIONS` returns the following columns:

- `REGION_ID`: The Region ID.
- `START_KEY`: The start key of the Region.
- `END_KEY`: The end key of the Region.
- `LEADER_ID`: The Leader ID of the Region.
- `LEADER_STORE_ID`: The ID of the store (TiKV) where the Region leader is located.
- `PEERS`: The IDs of all Region replicas.
- `SCATTERING`: Whether the Region is being scheduled. `1` means true.

- `WRITTEN_BYTES`: The estimated amount of data written into the Region within one heartbeat cycle. The unit is byte.
- `READ_BYTES`: The estimated amount of data read from the Region within one heartbeat cycle. The unit is byte.
- `APPROXIMATE_SIZE(MB)`: The estimated amount of data in the Region. The unit is megabytes (MB).
- `APPROXIMATE_KEYS`: The estimated number of Keys in the Region.

- `SCHEDULING_CONSTRAINTS`: The placement policy settings associated with the table or partition to which a Region belongs.

- `SCHEDULING_STATE`: The scheduling state of the Region which has a placement policy.

> **Note:**
>
> The values of `WRITTEN_BYTES`, `READ_BYTES`, `APPROXIMATE_SIZE(MB)`, `APPROXIMATE_KEYS` are not accurate data. They are estimated data from PD based on the heartbeat information that PD receives from the Region.

#### 14.10.2.126.3 Examples

Create an example table with enough data that fills a few Regions:

```
CREATE TABLE t1 (
 id INT NOT NULL PRIMARY KEY auto_increment,
 b INT NOT NULL,
 pad1 VARBINARY(1024),
 pad2 VARBINARY(1024),
 pad3 VARBINARY(1024)
);
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
    ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM dual;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
    ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
    ↪ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
    ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
    ↪ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
    ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
    ↪ LIMIT 10000;
```

```
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
    ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
    ↪ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
    ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
    ↪ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
    ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
    ↪ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
    ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
    ↪ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
    ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
    ↪ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
    ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
    ↪ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
    ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
    ↪ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
    ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
    ↪ LIMIT 10000;
SELECT SLEEP(5);
SHOW TABLE t1 REGIONS;
```

The output should show that the table is split into Regions. The `REGION_ID`, `START_KEY` and `END_KEY` may not match exactly:

```
...
mysql> SHOW TABLE t1 REGIONS;
+--
    ↪ ---------+-------------+-------------+----------+----------------+-------+--
    ↪
| REGION_ID | START_KEY | END_KEY    | LEADER_ID | LEADER_STORE_ID | PEERS |
    ↪  SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB) |
    ↪ APPROXIMATE_KEYS | SCHEDULING_CONSTRAINTS | SCHEDULING_STATE |
+--
    ↪ ---------+-------------+-------------+----------+----------------+-------+--
    ↪
|       94 | t_75_      | t_75_r_31717 |     95 |             1 | 95    |
    ↪         0 |           0 |         0 |                112 |
    ↪ 207465 |                     |                |
|       96 | t_75_r_31717 | t_75_r_63434 |   97 |             1 | 97    |
```

```
    ↪         0 |            0 |         0 |                 97 |
    ↪ 0 |                      |                |
|        2 | t_75_r_63434 |           |        3 |             1 | 3    |
    ↪         0 |    269323514 | 66346110 |               245 |
    ↪ 162020 |                      |                |
+--
    ↪ ---------+--------------+--------------+----------+-----------------+-------+--
    ↪
3 rows in set (0.00 sec)
```

In the output above, a `START_KEY` of `t_75_r_31717` and `END_KEY` of `t_75_r_63434` shows that data with a PRIMARY KEY between `31717` and `63434` is stored in this Region. The prefix `t_75_` indicates that this is the Region for a table (`t`) which has an internal table ID of `75`. An empty key value for `START_KEY` or `END_KEY` indicates negative infinity or positive infinity respectively.

TiDB automatically rebalances Regions as needed. For manual rebalancing, use the `SPLIT TABLE REGION` statement:

```
mysql> SPLIT TABLE t1 BETWEEN (31717) AND (63434) REGIONS 2;
+--------------------+----------------------+
| TOTAL_SPLIT_REGION | SCATTER_FINISH_RATIO |
+--------------------+----------------------+
|                  1 |                    1 |
+--------------------+----------------------+
1 row in set (42.34 sec)

mysql> SHOW TABLE t1 REGIONS;
+--
    ↪ ---------+--------------+--------------+----------+-----------------+-------+--
    ↪
| REGION_ID | START_KEY | END_KEY    | LEADER_ID | LEADER_STORE_ID | PEERS |
    ↪  SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB) |
    ↪ APPROXIMATE_KEYS | SCHEDULING_CONSTRAINTS | SCHEDULING_STATE |
+--
    ↪ ---------+--------------+--------------+----------+-----------------+-------+--
    ↪
|       94 | t_75_      | t_75_r_31717 |     95 |             1 | 95    |
    ↪         0 |            0 |         0 |                112 |
    ↪ 207465 |                      |                |
|       98 | t_75_r_31717 | t_75_r_47575 |   99 |             1 | 99    |
    ↪         0 |         1325 |         0 |                 53 |
    ↪ 12052 |                      |                |
|       96 | t_75_r_47575 | t_75_r_63434 |   97 |             1 | 97    |
    ↪         0 |         1526 |         0 |                 48 |
    ↪ 0 |                      |                |
```

```
|        2 | t_75_r_63434 |           |        3 |              1 | 3    |
    ↪         0 |           0 |   55752049 |               60 |
    ↪ 0 |                     |                |
+--
    ↪ ---------+-------------+-------------+----------+-----------------+-------+--
    ↪
4 rows in set (0.00 sec)
```

The above output shows that Region 96 was split, with a new Region 98 being created. The remaining Regions in the table were unaffected by the split operation. This is confirmed by the output statistics:

- `TOTAL_SPLIT_REGION` indicates the number of newly split Regions. In this example, the number is 1.
- `SCATTER_FINISH_RATIO` indicates the rate at which the newly split Regions are successfully scattered. `1.0` means that all Regions are scattered.

For a more detailed example:

```
mysql> show table t regions;
+--
    ↪ ---------+-------------+-------------+----------+-----------------+----------
    ↪
| REGION_ID | START_KEY | END_KEY    | LEADER_ID | LEADER_STORE_ID | PEERS
    ↪    | SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB) |
    ↪ APPROXIMATE_KEYS | SCHEDULING_CONSTRAINTS | SCHEDULING_STATE |
+--
    ↪ ---------+-------------+-------------+----------+-----------------+----------
    ↪
| 102      | t_43_r      | t_43_r_20000 | 118    | 7               | 105, 118,
    ↪ 119 | 0       | 0           | 0         | 1                 | 0
    ↪               |                      |                |
| 106      | t_43_r_20000 | t_43_r_40000 | 120  | 7               | 107, 108,
    ↪ 120 | 0       | 23          | 0         | 1                 | 0
    ↪               |                      |                |
| 110      | t_43_r_40000 | t_43_r_60000 | 112  | 9               | 112, 113,
    ↪ 121 | 0       | 0           | 0         | 1                 | 0
    ↪               |                      |                |
| 114      | t_43_r_60000 | t_43_r_80000 | 122  | 7               | 115, 122,
    ↪ 123 | 0       | 35          | 0         | 1                 | 0
    ↪               |                      |                |
| 3        | t_43_r_80000 |           | 93       | 8               | 5, 73, 93
    ↪   | 0         | 0           | 0         | 1                 | 0
    ↪               |                      |                |
```

```
| 98       | t_43_       | t_43_r      | 99       | 1              | 99, 100,
   ↪ 101 | 0        | 0           | 0         | 1                | 0
   ↪               |                    |               |
+--
   ↪ ---------+-------------+-------------+----------+----------------+----------
   ↪
6 rows in set
```

In the above example:

- Table t corresponds to six Regions. In these Regions, `102`, `106`, `110`, `114`, and `3` store the row data and `98` stores the index data.
- For `START_KEY` and `END_KEY` of Region `102`, `t_43` indicates the table prefix and ID. `_r` is the prefix of the record data in table t. `_i` is the prefix of the index data.
- In Region `102`, `START_KEY` and `END_KEY` mean that record data in the range of `[-inf, 20000)` is stored. In similar way, the ranges of data storage in Regions (`106`, `110`, `114`, `3`) can also be calculated.
- Region `98` stores the index data. The start key of table t's index data is `t_43_i`, which is in the range of Region `98`.

To check the Region that corresponds to table t in store 1, use the `WHERE` clause:

```
test> show table t regions where leader_store_id =1;
+--
   ↪ ---------+-----------+---------+-----------+----------------+---------------+---
   ↪
| REGION_ID | START_KEY | END_KEY | LEADER_ID | LEADER_STORE_ID | PEERS |
   ↪ SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB) |
   ↪ APPROXIMATE_KEYS | SCHEDULING_CONSTRAINTS | SCHEDULING_STATE |
+--
   ↪ ---------+-----------+---------+-----------+----------------+---------------+---
   ↪
| 98       | t_43_     | t_43_r | 99       | 1              | 99, 100, 101 | 0
   ↪       | 0           | 0         | 1                | 0              |
   ↪                     |                |
+--
   ↪ ---------+-----------+---------+-----------+----------------+---------------+---
   ↪
```

Use `SPLIT TABLE REGION` to split the index data into Regions. In the following example, the index data `name` of table t is split into two Regions in the range of `[a,z]`.

```
test> split table t index name between ("a") and ("z") regions 2;
+--------------------+----------------------+
| TOTAL_SPLIT_REGION | SCATTER_FINISH_RATIO |
```

```
+-------------------+---------------------+
| 2                 | 1.0                 |
+-------------------+---------------------+
1 row in set
```

Now table t corresponds to seven Regions. Five of them (102, 106, 110, 114, 3) store the record data of table t and another two (135, 98) store the index data name.

```
test> show table t regions;
+--
   ↪ ---------+----------------------------+----------------------------+---------
   ↪
| REGION_ID | START_KEY                | END_KEY                    | LEADER_ID |
   ↪  LEADER_STORE_ID | PEERS    | SCATTERING | WRITTEN_BYTES | READ_BYTES
   ↪ | APPROXIMATE_SIZE(MB) | APPROXIMATE_KEYS | SCHEDULING_CONSTRAINTS |
   ↪ SCHEDULING_STATE |
+--
   ↪ ---------+----------------------------+----------------------------+---------
   ↪
| 102      | t_43_r                   | t_43_r_20000               | 118      |
   ↪ 7              | 105, 118, 119 | 0       | 0           | 0         | 1
   ↪                  | 0              |                       |
   ↪                |
| 106      | t_43_r_20000             | t_43_r_40000               | 120      |
   ↪ 7              | 108, 120, 126 | 0       | 0           | 0         | 1
   ↪                  | 0              |                       |
   ↪                |
| 110      | t_43_r_40000             | t_43_r_60000               | 112      |
   ↪ 9              | 112, 113, 121 | 0       | 0           | 0         | 1
   ↪                  | 0              |                       |
   ↪                |
| 114      | t_43_r_60000             | t_43_r_80000               | 122      |
   ↪ 7              | 115, 122, 123 | 0       | 35          | 0         | 1
   ↪                  | 0              |                       |
   ↪                |
| 3        | t_43_r_80000             |                            | 93       |
   ↪ 8              | 73, 93, 128 | 0         | 0           | 0         | 1
   ↪                  | 0              |                       |
   ↪                |
| 135      | t_43_i_1_                | t_43_i_1_016d80000000000000 | 139  |
   ↪ 2              | 138, 139, 140 | 0       | 35          | 0         | 1
   ↪                  | 0              |                       |
   ↪                |
| 98       | t_43_i_1_016d80000000000000 | t_43_r                  | 99       |
   ↪ 1              | 99, 100, 101 | 0        | 0           | 0         | 1
```

```
    ↪                    | 0              |                          |
    ↪                   |
+--
    ↪ ---------+----------------------------+----------------------------+---------
    ↪
7 rows in set
```

#### 14.10.2.126.4 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.10.2.127.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.127.4 See also

- SHOW TABLES
- CREATE TABLE
- DROP TABLE
- SHOW CREATE TABLE

### 14.10.2.128 SHOW [FULL] TABLES

This statement shows a list of tables and views in the currently selected database. The optional keyword `FULL` indicates if a table is of type `BASE TABLE` or `VIEW`.

To show tables in a different database, use `SHOW TABLES IN DatabaseName`.

#### 14.10.2.128.1 Synopsis

**ShowTablesStmt:**

Figure 508: ShowTablesStmt

**OptFull:**

Figure 509: OptFull

**ShowDatabaseNameOpt:**

- SET [GLOBAL|SESSION]

### 14.10.2.130 SHOW WARNINGS

This statement shows a list of warnings that occurred for previously executed statements in the current client connection. As in MySQL, the `sql_mode` impacts which statements will cause errors vs. warnings considerably.

#### 14.10.2.130.1 Synopsis

**ShowWarningsStmt:**

Figure 515: ShowWarningsStmt

#### 14.10.2.130.2 Examples

```
mysql> CREATE TABLE t1 (a INT UNSIGNED);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 VALUES (0);
Query OK, 1 row affected (0.02 sec)

mysql> SELECT 1/a FROM t1;
+------+
| 1/a  |
+------+
| NULL |
+------+
1 row in set, 1 warning (0.00 sec)

mysql> SHOW WARNINGS;
+---------+------+---------------+
| Level   | Code | Message       |
+---------+------+---------------+
| Warning | 1365 | Division by 0 |
```

```
+---------+------+---------------+
1 row in set (0.00 sec)

mysql> INSERT INTO t1 VALUES (-1);
ERROR 1264 (22003): Out of range value for column 'a' at row 1
mysql> SELECT * FROM t1;
+------+
| a    |
+------+
|    0 |
+------+
1 row in set (0.00 sec)

mysql> SET sql_mode='';
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (-1);
Query OK, 1 row affected, 1 warning (0.01 sec)

mysql> SHOW WARNINGS;
+---------+------+--------------------------+
| Level   | Code | Message                  |
+---------+------+--------------------------+
| Warning | 1690 | constant -1 overflows int |

2 rows in set (0.00 sec)
```

#### 14.10.2.130.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.130.4 See also

- SHOW ERRORS

#### 14.10.2.131 SHUTDOWN

The `SHUTDOWN` statement is used to perform a shutdown operation in TiDB. Execution of the `SHUTDOWN` statement requires the user to have `SHUTDOWN privilege`.

##### 14.10.2.131.1 Synopsis

**Statement:**

Figure 516: Statement

##### 14.10.2.131.2 Examples

```
SHUTDOWN;
```

```
Query OK, 0 rows affected (0.00 sec)
```

##### 14.10.2.131.3 MySQL compatibility

> **Note:**
>
> Because TiDB is a distributed database, the shutdown operation in TiDB stops the client-connected TiDB instance, not the entire TiDB cluster.

The `SHUTDOWN` statement is partly compatible with MySQL. If you encounter any compatibility issues, you can report the issues on GitHub.

#### 14.10.2.132 Split Region

For each new table created in TiDB, one Region is segmented by default to store the data of this table. This default behavior is controlled by `split-table` in the TiDB configuration file. When the data in this Region exceeds the default Region size limit, the Region starts to split into two.

In the above case, because there is only one Region at the beginning, all write requests occur on the TiKV where the Region is located. If there are a large number of writes for the newly created table, hotspots are caused.

To solve the hotspot problem in the above scenario, TiDB introduces the pre-split function, which can pre-split multiple Regions for a certain table according to the specified parameters and scatter them to each TiKV node.

#### 14.10.2.132.1 Synopsis

**SplitRegionStmt:**

**Int64Num:**

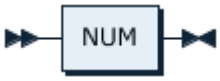

Figure 523: Int64Num

#### 14.10.2.132.2 Usage of Split Region

There are two types of Split Region syntax:

- The syntax of even split:

```
SPLIT TABLE table_name [INDEX index_name] BETWEEN (lower_value) AND (
    ↪ upper_value) REGIONS region_num
```

`BETWEEN lower_value AND upper_value REGIONS region_num` defines the upper boundary, the lower boundary, and the Region amount. Then the current region will be evenly spilt into the number of regions (as specified in `region_num`) between the upper and lower boundaries.

- The syntax of uneven split:

```
SPLIT TABLE table_name [INDEX index_name] BY (value_list) [, (
    ↪ value_list)] ...
```

`BY value_list⋯` specifies a series of points manually, based on which the current Region is spilt. It is suitable for scenarios with unevenly distributed data.

The following example shows the result of the `SPLIT` statement:

```
+--------------------+----------------------+
| TOTAL_SPLIT_REGION | SCATTER_FINISH_RATIO |
+--------------------+----------------------+
| 4                  | 1.0                  |
+--------------------+----------------------+
```

- `TOTAL_SPLIT_REGION`: the number of newly split Regions.
- `SCATTER_FINISH_RATIO`: the completion rate of scattering for newly split Regions. `1.0` means that all Regions are scattered. `0.5` means that only half of the Regions are scattered and the rest are being scattered.

**Note:**

The following two session variables might affect the behavior of the `SPLIT` statement:

- `tidb_wait_split_region_finish`: It might take a while to scatter the Regions. This duration depends on PD scheduling and TiKV loads. This variable is used to control when executing the `SPLIT REGION` statement whether to return the results to the client until all Regions are scattered. If its value is set to `1` (by default), TiDB returns the results only after the scattering is completed. If its value is set to `0`, TiDB returns the results regardless of the scattering status.
- `tidb_wait_split_region_timeout`: This variable is to set the execution timeout of the `SPLIT REGION` statement, in seconds. The default value is 300s. If the `split` operation is not completed within the duration, TiDB returns a timeout error.

Split Table Region

The key of row data in each table is encoded by `table_id` and `row_id`. The format is as follows:

```
t[table_id]_r[row_id]
```

For example, when `table_id` is 22 and `row_id` is 11:

```
t22_r11
```

Row data in the same table have the same `table_id`, but each row has its unique `row_id` that can be used for Region split.

Even Split

Because `row_id` is an integer, the value of the key to be split can be calculated according to the specified `lower_value`, `upper_value`, and `region_num`. TiDB first calculates the step value (`step = (upper_value - lower_value)/region_num`). Then split will be done evenly per each "step" between `lower_value` and `upper_value` to generate the number of Regions as specified by `region_num`.

For example, if you want 16 evenly split Regions split from key range`minInt64~maxInt64` for table t, you can use this statement:

```
SPLIT TABLE t BETWEEN (-9223372036854775808) AND (9223372036854775807)
    ↪ REGIONS 16;
```

This statement splits table t into 16 Regions between minInt64 and maxInt64. If the given primary key range is smaller than the specified one, for example, 0~1000000000, you can use 0 and 1000000000 take place of minInt64 and maxInt64 respectively to split Regions.

```
SPLIT TABLE t BETWEEN (0) AND (1000000000) REGIONS 16;
```

Uneven split

If the known data is unevenly distributed, and you want a Region to be split respectively in key ranges -inf ~ 10000, 10000 ~ 90000, and 90000 ~ +inf, you can achieve this by setting fixed points, as shown below:

```
SPLIT TABLE t BY (10000), (90000);
```

Split index Region

The key of the index data in the table is encoded by `table_id`, `index_id`, and the value of the index column. The format is as follows:

```
t[table_id]_i[index_id][index_value]
```

For example, when `table_id` is 22, `index_id` is 5, and `index_value` is abc:

```
t22_i5abc
```

The `table_id` and `index_id` of the same index data in one table is the same. To split index Regions, you need to split Regions based on `index_value`.

Even Spilt

The way to split index evenly works the same as splitting data evenly. However, calculating the value of step is more complicated, because `index_value` might not be an integer.

The values of `upper` and `lower` are encoded into a byte array firstly. After removing the longest common prefix of `lower` and `upper` byte array, the first 8 bytes of `lower` and `upper` are converted into the uint64 format. Then `step = (upper - lower)/num` is calculated. After that, the calculated step is encoded into a byte array, which is appended to the longest common prefix of the `lower` and `upper` byte array for index split. Here is an example:

If the column of the `idx` index is of the integer type, you can use the following SQL statement to split index data:

```
SPLIT TABLE t INDEX idx BETWEEN (-9223372036854775808) AND
    ↪ (9223372036854775807) REGIONS 16;
```

This statement splits the Region of index idx in table t into 16 Regions from `minInt64` to `maxInt64`.

If the column of index idx1 is of varchar type, and you want to split index data by prefix letters.

```
SPLIT TABLE t INDEX idx1 BETWEEN ("a") AND ("z") REGIONS 25;
```

This statement splits index idx1 into 25 Regions from a~z. The range of Region 1 is `[minIndexValue, b)`; the range of Region 2 is `[b, c)`; … the range of Region 25 is `[y, minIndexValue]`. For the `idx` index, data with the `a` prefix is written into Region 1, and data with the `b` prefix is written into Region 2.

In the split method above, both data with the `y` and `z` prefixes are written into Region 25, because the upper bound is not `z`, but `{` (the character next to `z` in ASCII). Therefore, a more accurate split method is as follows:

```
SPLIT TABLE t INDEX idx1 BETWEEN ("a") AND ("{") REGIONS 26;
```

This statement splits index idx1 of the table `t` into 26 Regions from a~`{`. The range of Region 1 is `[minIndexValue, b)`; the range of Region 2 is `[b, c)`; … the range of Region 25 is `[y, z)`, and the range of Region 26 is `[z, maxIndexValue)`.

If the column of index `idx2` is of time type like timestamp/datetime, and you want to split index Region by year:

```
SPLIT TABLE t INDEX idx2 BETWEEN ("2010-01-01 00:00:00") AND ("2020-01-01
    ↪ 00:00:00") REGIONS 10;
```

This statement splits the Region of index `idx2` in table `t` into 10 Regions from `2010-01-01 00:00:00` to `2020-01-01 00:00:00`. The range of Region 1 is `[minIndexValue , 2011-01-01 00:00:00)`; the range of Region 2 is `[2011-01-01 00:00:00, 2012-01-01 00:00:00)`.

If you want to split the index Region by day, see the following example:

```
SPLIT TABLE t INDEX idx2 BETWEEN ("2020-06-01 00:00:00") AND ("2020-07-01
    ↪ 00:00:00") REGIONS 30;
```

This statement splits the data of June 2020 of index `idex2` in table `t` into 30 Regions, each Region representing 1 day.

Region split methods for other types of index columns are similar.

For data Region split of joint indexes, the only difference is that you can specify multiple columns values.

For example, index `idx3 (a, b)` contains 2 columns, with column `a` of timestamp type and column `b` int. If you just want to do a time range split according to column `a`, you can use the SQL statement for splitting time index of a single column. In this case, do not specify the value of column `b` in `lower_value` and `upper_velue`.

```
SPLIT TABLE t INDEX idx3 BETWEEN ("2010-01-01 00:00:00") AND ("2020-01-01
    ↪ 00:00:00") REGIONS 10;
```

Within the same range of time, if you want to do one more split according to column b column. Just specify the value for column b when splitting.

```
SPLIT TABLE t INDEX idx3 BETWEEN ("2010-01-01 00:00:00", "a") AND ("
    ↪ 2010-01-01 00:00:00", "z") REGIONS 10;
```

This statement splits 10 Regions in the range of a~z according to the value of column b, with the same time prefix as column a. If the value specified for column a is different, the value of column b might not be used in this case.

If the primary key of the table is a non-clustered index, you need to use backticks ` to escape the `PRIMARY` keyword when splitting Regions. For example:

```
SPLIT TABLE t INDEX `PRIMARY` BETWEEN (-9223372036854775808) AND
    ↪ (9223372036854775807) REGIONS 16;
```

Uneven Split

Index data can also be split by specified index values.

For example, there is `idx4 (a,b)`, with column `a` of the varchar type and column `b` of the timestamp type.

```
SPLIT TABLE t1 INDEX idx4 BY ("a", "2000-01-01 00:00:01"), ("b", "
    ↪ 2019-04-17 14:26:19"), ("c", "");
```

This statement specifies 3 values to split 4 Regions. The range of each Region is as follows:

```
region1 [ minIndexValue           , ("a", "2000-01-01 00:00:01"))
region2 [("a", "2000-01-01 00:00:01") , ("b", "2019-04-17 14:26:19"))
region3 [("b", "2019-04-17 14:26:19") , ("c", "")           )
region4 [("c", "")                , maxIndexValue           )
```

Split Regions for partitioned tables

Splitting Regions for partitioned tables is the same as splitting Regions for ordinary tables. The only difference is that the same split operation is performed for every partition.

- The syntax of even split:

```
SPLIT [PARTITION] TABLE t [PARTITION] [(partition_name_list...)] [INDEX
    ↪  index_name] BETWEEN (lower_value) AND (upper_value) REGIONS
    ↪ region_num
```

- The syntax of uneven split:

```
SPLIT [PARTITION] TABLE table_name [PARTITION (partition_name_list...)]
    ↪  [INDEX index_name] BY (value_list) [, (value_list)] ...
```

Examples of Split Regions for partitioned tables

1. Create a partitioned table `t`. Suppose that you want to create a Hash table divided into two partitions. The example statement is as follows:

```
create table t (a int,b int,index idx(a)) partition by hash(a)
    ↪ partitions 2;
```

After creating the table `t`, a Region is split for each partition. Use the `SHOW TABLE ↪ REGIONS` syntax to view the Regions of this table:

```
show table t regions;
```

```
+--
    ↪ ---------+-----------+---------+-----------+-----------------+------------
    ↪
| REGION_ID | START_KEY | END_KEY | LEADER_ID | LEADER_STORE_ID | PEERS
    ↪   | SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB
    ↪ ) | APPROXIMATE_KEYS |
+--
    ↪ ---------+-----------+---------+-----------+-----------------+------------
    ↪
| 1978     | t_1400_  | t_1401_ | 1979    | 4             | 1979, 1980,
    ↪ 1981 | 0       | 0           | 0         | 1                   | 0
    ↪              |
| 6        | t_1401_  |         | 17      | 4             | 17, 18, 21
    ↪     | 0         | 223         | 0         | 1                   | 0
    ↪              |
+--
    ↪ ---------+-----------+---------+-----------+-----------------+------------
    ↪
```

2. Use the `SPLIT` syntax to split a Region for each partition. Suppose that you want to split the data in the `[0,10000]` range of each partition into four Regions. The example statement is as follows:

```
split partition table t between (0) and (10000) regions 4;
```

In the above statement, `0` and `10000` respectively represent the `row_id` of the upper and lower boundaries corresponding to the hotspot data you want to scatter.

> **Note:**
>
> This example only applies to scenarios where hotspot data is evenly distributed. If the hotspot data is unevenly distributed in a specified data range, refer to the syntax of uneven split in Split Regions for partitioned tables.

3. Use the `SHOW TABLE REGIONS` syntax to view the Regions of this table again. You can see that this table now has ten Regions, each partition with five Regions, four of which are the row data and one is the index data.

```
show table t regions;
```

```
+--

   ↪                  | 0               |
```

```
| 1994     | t_1401_r_2500 | t_1401_r_5000 | 1997 | 5            |
   ↪ 1996, 1997, 2021 | 0       | 129          | 0         | 1
   ↪                  | 0             |
| 2002     | t_1401_r_5000 | t_1401_r_7500 | 2003 | 4            |
   ↪ 2003, 2023, 2022 | 0       | 141          | 0         | 1
   ↪                  | 0             |
| 6        | t_1401_r_7500 |               | 17       | 4            | 17,
   ↪ 18, 21     | 0         | 601           | 0         | 1
   ↪                  | 0             |
| 1986     | t_1401_      | t_1401_r     | 1989     | 5            |
   ↪ 1989, 2018, 2019 | 0       | 123          | 0         | 1
   ↪                  | 0             |
+--
   ↪ ---------+---------------+---------------+----------+-------------------+---
   ↪
```

4. You can also split Regions for the index of each partition. For example, you can split the `[1000,10000]` range of the `idx` index into two Regions. The example statement is as follows:

```
split partition table t index idx between (1000) and (10000) regions
   ↪ 2;
```

Examples of Split Region for a single partition

You can specify the partition to be split.

1. Create a partitioned table. Suppose that you want to create a Range partitioned table split into three partitions. The example statement is as follows:

```
create table t ( a int, b int, index idx(b)) partition by range( a ) (
   partition p1 values less than (10000),
   partition p2 values less than (20000),
   partition p3 values less than (MAXVALUE) );
```

2. Suppose that you want to split the data in the `[0,10000]` range of the `p1` partition into two Regions. The example statement is as follows:

```
split partition table t partition (p1) between (0) and (10000) regions
   ↪  2;
```

3. Suppose that you want to split the data in the `[10000,20000]` range of the `p2` partition into two Regions. The example statement is as follows:

```
split partition table t partition (p2) between (10000) and (20000)
   ↪ regions 2;
```

4. You can use the `SHOW TABLE REGIONS` syntax to view the Regions of this table:

```
show table t regions;
```

```
+--
    ↪ ---------+----------------+----------------+----------+-----------------+-
    ↪
| REGION_ID | START_KEY   | END_KEY      | LEADER_ID | LEADER_STORE_ID |
    ↪  PEERS      | SCATTERING | WRITTEN_BYTES | READ_BYTES |
    ↪ APPROXIMATE_SIZE(MB) | APPROXIMATE_KEYS |
+--
    ↪ ---------+----------------+----------------+----------+-----------------+-
    ↪
| 2040     | t_1406_       | t_1406_r_5000 | 2045    | 3             |
    ↪ 2043, 2045, 2044 | 0       | 0            | 0         | 1
    ↪                  | 0              |
| 2032     | t_1406_r_5000 | t_1407_      | 2033     | 4             |
    ↪ 2033, 2034, 2035 | 0       | 0            | 0         | 1
    ↪                  | 0              |
| 2046     | t_1407_       | t_1407_r_15000 | 2048   | 2             |
    ↪ 2047, 2048, 2050 | 0       | 35           | 0         | 1
    ↪                  | 0              |
| 2036     | t_1407_r_15000 | t_1408_     | 2037     | 4             |
    ↪ 2037, 2038, 2039 | 0       | 0            | 0         | 1
    ↪                  | 0              |
| 6        | t_1408_       |              | 17       | 4             |
    ↪ 17, 18, 21     | 0         | 214          | 0         | 1
    ↪                  | 0              |
+--
    ↪ ---------+----------------+----------------+----------+-----------------+-
    ↪
```

5. Suppose that you want to split the `[0,20000]` range of the `idx` index of the `p1` and `p2` partitions into two Regions. The example statement is as follows:

```
split partition table t partition (p1,p2) index idx between (0) and
    ↪ (20000) regions 2;
```

#### 14.10.2.132.3 pre__split__regions

When creating a table with the `AUTO_RANDOM` or `SHARD_ROW_ID_BITS` attribute, you can also specify the `PRE_SPLIT_REGIONS` option if you want to evenly pre-split the table into Regions immediately after the table is created. The number of pre-split Regions for a table is `2^(PRE_SPLIT_REGIONS)`.

**Note:**

The value of `PRE_SPLIT_REGIONS` must be less than or equal to that of `SHARD_ROW_ID_BITS` or `AUTO_RANDOM`.

The `tidb_scatter_region` global variable affects the behavior of `PRE_SPLIT_REGIONS` ↪ . This variable controls whether to wait for Regions to be pre-split and scattered before returning results after the table creation. If there are intensive writes after creating the table, you need to set the value of this variable to `1`, then TiDB will not return the results to the client until all the Regions are split and scattered. Otherwise, TiDB writes the data before the scattering is completed, which will have a significant impact on write performance.

Examples of pre_split_regions

```
create table t (a int, b int,index idx1(a)) shard_row_id_bits = 4
    ↪ pre_split_regions=2;
```

After building the table, this statement splits `4 + 1` Regions for table t. `4 (2^2)` Regions are used to save table row data, and 1 Region is for saving the index data of `idx1`.

The ranges of the 4 table Regions are as follows:

```
region1:  [ -inf     ,  1<<61 )
region2:  [ 1<<61    ,  2<<61 )
region3:  [ 2<<61    ,  3<<61 )
region4:  [ 3<<61    ,  +inf  )
```

**Note:**

The Region split by the Split Region statement is controlled by the Region merge scheduler in PD. To avoid PD re-merging the newly split Region soon after, you need to use table attributes or dynamically modify configuration items related to the Region merge feature.

#### 14.10.2.132.4 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.10.2.132.5 See also

- SHOW TABLE REGIONS

- Session variables: tidb_scatter_region, tidb_wait_split_region_finish and tidb_wait_split_region_timeout.

#### 14.10.2.133 START TRANSACTION

This statement starts a new transaction inside of TiDB. It is similar to the statement BEGIN.

In the absence of a START TRANSACTION statement, every statement will by default autocommit in its own transaction. This behavior ensures MySQL compatibility.

##### 14.10.2.133.1 Synopsis

**BeginTransactionStmt:**

```
BeginTransactionStmt ::=
    'BEGIN' ( 'PESSIMISTIC' | 'OPTIMISTIC' )?
|   'START' 'TRANSACTION' ( 'READ' ( 'WRITE' | 'ONLY' ( ( 'WITH' 'TIMESTAMP'
    ↪  'BOUND' TimestampBound )? | AsOfClause ) ) | 'WITH' 'CONSISTENT' '
    ↪ SNAPSHOT' | 'WITH' 'CAUSAL' 'CONSISTENCY' 'ONLY' )?

AsOfClause ::=
    ( 'AS' 'OF' 'TIMESTAMP' Expression)
```

##### 14.10.2.133.2 Examples

```
mysql> CREATE TABLE t1 (a int NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.12 sec)

mysql> START TRANSACTION;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.00 sec)

mysql> COMMIT;
Query OK, 0 rows affected (0.01 sec)
```

##### 14.10.2.133.3 MySQL compatibility

- START TRANSACTION immediately starts a transaction inside TiDB. This differs from MySQL, where START TRANSACTION lazily creates a transaction. But START ↪ TRANSACTION in TiDB is equivalent to MySQL's START TRANSACTION WITH ↪ CONSISTENT SNAPSHOT.
- The statement START TRANSACTION READ ONLY is parsed for compatibility with MySQL, but still allows write operations.

#### 14.10.2.133.4 See also

- COMMIT
- ROLLBACK
- BEGIN
- START TRANSACTION WITH CAUSAL CONSISTENCY ONLY

### 14.10.2.134 TABLE

The `TABLE` statement can be used instead of `SELECT * FROM` when no aggregation or complex filtering is needed.

#### 14.10.2.134.1 Synopsis

```
TableStmt ::=
    "TABLE" Table ( "ORDER BY" Column )? ( "LIMIT" NUM )?
```

#### 14.10.2.134.2 Examples

Create table `t1`:

```
CREATE TABLE t1(id INT PRIMARY KEY);
```

Insert some data into `t1`:

```
INSERT INTO t1 VALUES (1),(2),(3);
```

View the data in table `t1`:

```
TABLE t1;
```

```
+----+
| id |
+----+
|  1 |
|  2 |
|  3 |
+----+
3 rows in set (0.01 sec)
```

Query `t1` and sort the result by the `id` field in descending order:

```
TABLE t1 ORDER BY id DESC;
```

```
+----+
| id |
+----+
|  3 |
|  2 |
|  1 |
+----+
3 rows in set (0.01 sec)
```

Query the first record in `t1`:

```
TABLE t1 LIMIT 1;
```

```
+----+
| id |
+----+
|  1 |
+----+
1 row in set (0.01 sec)
```

#### 14.10.2.134.3 MySQL compatibility

The `TABLE` statement was introduced in MySQL 8.0.19.

#### 14.10.2.134.4 See also

- SELECT
- `TABLE` statements in MySQL

### 14.10.2.135 TRACE

The `TRACE` statement provides detailed information about query execution. It is intended to be viewed through a Graphical interface exposed by the TiDB server's status port.

#### 14.10.2.135.1 Synopsis

**TraceStmt:**

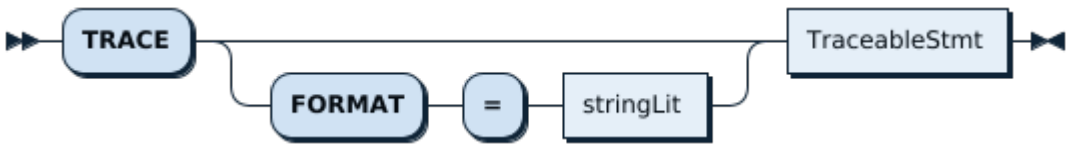

Figure 524: TraceStmt

**TraceableStmt:**

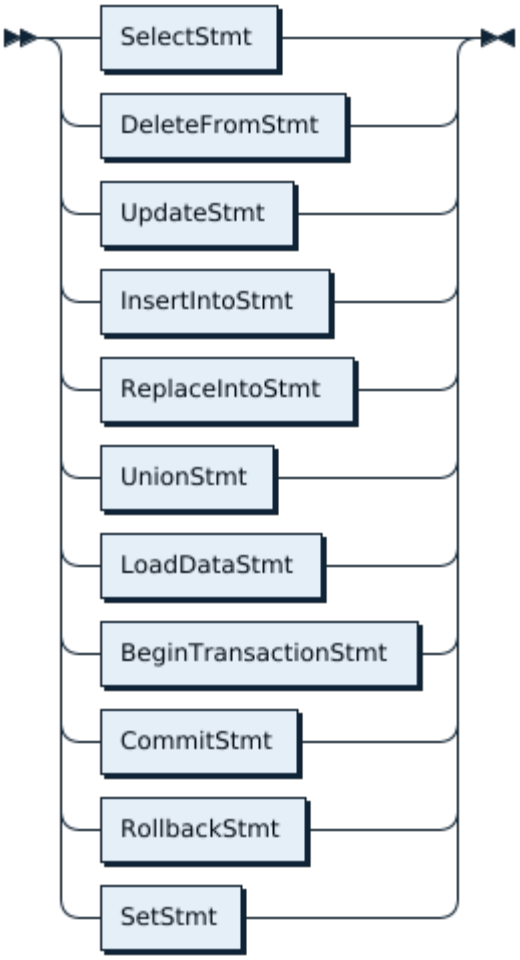

Figure 525: TraceableStmt

#### 14.10.2.135.2 Examples

```
trace format='row' select * from mysql.user;
```

```
+-----------------------------------------+-----------------+------------+

### 14.10.2.136 TRUNCATE

The `TRUNCATE` statement removes all data from the table in a non-transactional way. `TRUNCATE` can be thought of as semantically the same as `DROP TABLE` + `CREATE TABLE` with the previous definition.

Both `TRUNCATE TABLE tableName` and `TRUNCATE tableName` are valid syntax.

#### 14.10.2.136.1 Synopsis

**TruncateTableStmt:**

Figure 528: TruncateTableStmt

**OptTable:**

Figure 529: OptTable

**TableName:**

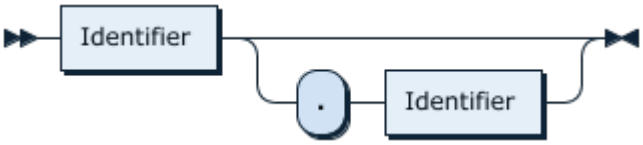

Figure 530: TableName

#### 14.10.2.136.2 Examples

```
mysql> CREATE TABLE t1 (a INT NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.01 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+---+
| a |
+---+
| 1 |
| 2 |
| 3 |
| 4 |
| 5 |
+---+
5 rows in set (0.00 sec)

mysql> TRUNCATE t1;
Query OK, 0 rows affected (0.11 sec)
```

```
mysql> SELECT * FROM t1;
Empty set (0.00 sec)

mysql> INSERT INTO t1 VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.01 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> TRUNCATE TABLE t1;
Query OK, 0 rows affected (0.11 sec)
```

#### 14.10.2.136.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

### 14.10.2.137 UNLOCK STATS

`UNLOCK STATS` is used to unlock the statistics of a table or tables.

> **Warning:**
>
> Locking statistics is an experimental feature for the current version. It is not recommended to use it in the production environment.

#### 14.10.2.137.1 Synopsis

```
UnlockStatsStmt ::=
    'UNLOCK' 'STATS' TableNameList

TableNameList ::=
    TableName (',' TableName)*

TableName ::=
    Identifier ( '.' Identifier )?
```

#### 14.10.2.137.2 Examples

Create table `t`, and insert data into it. When the statistics of table `t` are not locked, the `ANALYZE` statement can be successfully executed.

```
mysql> create table t(a int, b int);
Query OK, 0 rows affected (0.03 sec)

mysql> insert into t values (1,2), (3,4), (5,6), (7,8);
Query OK, 4 rows affected (0.00 sec)
Records: 4 Duplicates: 0 Warnings: 0

mysql> analyze table t;
Query OK, 0 rows affected, 1 warning (0.02 sec)

mysql> show warnings;
+--
   ↪ -----+------+-----------------------------------------------------------------+
   ↪
| Level | Code | Message                                                         |
+--
   ↪ -----+------+-----------------------------------------------------------------+
   ↪
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
   ↪ test.t |
+--
   ↪ -----+------+-----------------------------------------------------------------+
   ↪
1 row in set (0.00 sec)
```

Lock the statistics of table `t` and execute `ANALYZE`. From the output of `SHOW
↪ STATS_LOCKED`, you can see that the statistics of table `t` have been locked. The warning message shows that the `ANALYZE` statement has skipped table `t`.

```
mysql> lock stats t;
Query OK, 0 rows affected (0.00 sec)

mysql> show stats_locked;
+---------+------------+----------------+--------+
| Db_name | Table_name | Partition_name | Status |
+---------+------------+----------------+--------+
| test    | t          |                | locked |
+---------+------------+----------------+--------+
1 row in set (0.01 sec)

mysql> analyze table t;
Query OK, 0 rows affected, 2 warnings (0.00 sec)
```

```
mysql> show warnings;
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
| Level   | Code | Message                                                      |
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
| Note    | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
    ↪ test.t |
| Warning | 1105 | skip analyze locked table: t                                 |
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
2 rows in set (0.00 sec)
```

Unlock the statistics of table `t` and `ANALYZE` can be successfully executed again.

```
mysql> unlock stats t;
Query OK, 0 rows affected (0.01 sec)

mysql> analyze table t;
Query OK, 0 rows affected, 1 warning (0.03 sec)

mysql> show warnings;
+--
    ↪ -----+------+-----------------------------------------------------------+
    ↪
| Level | Code | Message                                                     |
+--
    ↪ -----+------+-----------------------------------------------------------+
    ↪
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
    ↪ test.t |
+--
    ↪ -----+------+-----------------------------------------------------------+
    ↪
1 row in set (0.00 sec)
```

#### 14.10.2.138.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1), (2), (3);
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 |  3 |
+----+----+
3 rows in set (0.00 sec)
```

```
mysql> UPDATE t1 SET c1=5 WHERE c1=3;
Query OK, 1 row affected (0.01 sec)
Rows matched: 1 Changed: 1 Warnings: 0

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 |  5 |
+----+----+
3 rows in set (0.00 sec)
```

#### 14.10.2.138.3 MySQL compatibility

TiDB always uses the original value of a column when evaluating expressions. For example:

```
CREATE TABLE t (a int, b int);
INSERT INTO t VALUES (1,2);
UPDATE t SET a = a+1,b=a;
```

In MySQL, the column `b` is updated to 2 because it is set to the value of `a`, and the value of `a` (which is 1) is updated to `a+1` (which is 2) in the same statement.

TiDB follows the more standard SQL behavior, and updates `b` to 1.

mysql> SHOW TABLES;
Empty set (0.00 sec)

mysql> CREATE TABLE t1 (a int);
Query OK, 0 rows affected (0.10 sec)

mysql> SHOW TABLES;
+------------------+
| Tables_in_newtest |
+------------------+
| t1               |
+------------------+
1 row in set (0.00 sec)
```

#### 14.10.2.139.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be reported via an issue on GitHub.

#### 14.10.2.139.4 See also

- CREATE DATABASE
- SHOW TABLES

### 14.10.2.140 WITH

A Common Table Expression (CTE) is a temporary result set that can be referred multiple times within a SQL statement to improve the statement's readability and execution efficiency. You can apply the `WITH` statement to use Common Table Expressions.

#### 14.10.2.140.1 Synopsis

**WithClause:**

```
WithClause ::=
       "WITH" WithList
|      "WITH" recursive WithList
```

**WithList:**

```
WithList ::=
       WithList ',' CommonTableExpr
|      CommonTableExpr
```

**CommonTableExpr:**

```
CommonTableExpr ::=
       Identifier IdentListWithParenOpt "AS" SubSelect
```

**IdentListWithParenOpt:**

```
IdentListWithParenOpt ::=
( '(' IdentList ')' )?
```

#### 14.10.2.140.2 Examples

Non-recursive CTE:

```
WITH CTE AS (SELECT 1, 2) SELECT * FROM cte t1, cte t2;
```

```
+---+---+---+---+
| 1 | 2 | 1 | 2 |
+---+---+---+---+
| 1 | 2 | 1 | 2 |
+---+---+---+---+
1 row in set (0.00 sec)
```

Recursive CTE:

```
WITH RECURSIVE cte(a) AS (SELECT 1 UNION SELECT a+1 FROM cte WHERE a < 5)
    ↪ SELECT * FROM cte;
```

```
+---+
| a |
+---+
| 1 |
| 2 |
| 3 |
| 4 |
| 5 |
+---+
5 rows in set (0.00 sec)
```

#### 14.10.2.140.3 MySQL compatibility

- In strict mode, when the data length recursively calculated exceeds the data length of the seed part, TiDB returns a warning while MySQL returns an error. In non-strict mode, the behavior of TiDB is consistent with that of MySQL.

- The data type for recursive CTE is determined by the seed part. The data type of the seed part is not completely consistent with MySQL in some cases (such as functions).
- In the case of multiple `UNION` / `UNION ALL` operators, MySQL does not allow `UNION` to be followed by `UNION ALL`, but TiDB does.
- If there is a problem with the definition of a CTE, TiDB will report an error, while MySQL will not if the CTE is not referred.

#### 14.10.2.140.4 See also

- SELECT
- INSERT
- DELETE
- UPDATE
- REPLACE

### 14.10.3 Data Types

#### 14.10.3.1 Data Types

TiDB supports all the data types in MySQL except the `SPATIAL` type. This includes all the numeric types, string types, date & time types, and the JSON type.

The definitions used for datatypes are specified as `T(M[, D])`. Where by:

- `T` indicates the specific data type.
- `M` indicates the maximum display width for integer types. For floating-point and fixed-point types, `M` is the total number of digits that can be stored (the precision). For string types, `M` is the maximum length. The maximum permissible value of M depends on the data type.
- `D` applies to floating-point and fixed-point types and indicates the number of digits following the decimal point (the scale).
- `fsp` applies to the `TIME`, `DATETIME`, and `TIMESTAMP` types and represents the fractional seconds precision. The `fsp` value, if given, must be in the range 0 to 6. A value of 0 signifies that there is no fractional part. If omitted, the default precision is 0.

#### 14.10.3.2 Default Values

The `DEFAULT` value clause in a data type specification indicates a default value for a column. The default value must be a constant and cannot be a function or an expression. But for the time type, you can specify the `NOW`, `CURRENT_TIMESTAMP`, `LOCALTIME`, and `LOCALTIMESTAMP` functions as the default for `TIMESTAMP` and `DATETIME` columns.

The `BLOB`, `TEXT`, and `JSON` columns **cannot** be assigned a default value.

If a column definition includes no explicit `DEFAULT` value, TiDB determines the default value as follows:

- If the column can take `NULL` as a value, the column is defined with an explicit `DEFAULT NULL` clause.
- If the column cannot take `NULL` as the value, TiDB defines the column with no explicit `DEFAULT` clause.

For data entry into a `NOT NULL` column that has no explicit `DEFAULT` clause, if an `INSERT` or `REPLACE` statement includes no value for the column, TiDB handles the column according to the SQL mode in effect at the time:

- If strict SQL mode is enabled, an error occurs for transactional tables, and the statement is rolled back. For nontransactional tables, an error occurs.
- If strict mode is not enabled, TiDB sets the column to the implicit default value for the column data type.

Implicit defaults are defined as follows:

- For numeric types, the default is 0. If declared with the `AUTO_INCREMENT` attribute, the default is the next value in the sequence.
- For date and time types other than `TIMESTAMP`, the default is the appropriate "zero" value for the type. For `TIMESTAMP`, the default value is the current date and time.
- For string types other than `ENUM`, the default value is the empty string. For `ENUM`, the default is the first enumeration value.

#### 14.10.3.3 Numeric Types

TiDB supports all the MySQL numeric types, including:

- Integer Types (Exact Value)
- Floating-Point Types (Approximate Value)
- Fixed-Point Types (Exact Value)

##### 14.10.3.3.1 Integer types

TiDB supports all the MySQL integer types, including `INTEGER/INT`, `TINYINT`, `SMALLINT`, `MEDIUMINT`, and `BIGINT`. For more information, see Integer Data Type Syntax in MySQL.

The following table summarizes field descriptions:

| Syntax Element | Description |
|---|---|
| M | the display width of the type. Optional. |
| UNSIGNED | UNSIGNED. If omitted, it is SIGNED. |

| Syntax Element | Description |
|---|---|
| ZEROFILL | If you specify ZEROFILL for a numeric column, TiDB automatically adds the UNSIGNED attribute to the column. |

The following table summarizes the required storage and range for integer types supported by TiDB:

| Data Type | Storage Required (bytes) | Minimum Value (signed/unsigned) | Maximum value (signed/unsigned) |
|---|---|---|---|
| `TINYINT` | 1 | -128 / 0 | 127 / 255 |
| `SMALLINT` | 2 | -32768 / 0 | 32767 / 65535 |
| `MEDIUMINT` | 3 | -8388608 / 0 | 8388607 / 16777215 |
| `INT` | 4 | -2147483648 / 0 | 2147483647 / 4294967295 |
| `BIGINT` | 8 | -9223372036854775808 / 0 | 9223372036854775807 / 18446744073709551615 |

`BIT` type

The BIT data type. A type of BIT(M) enables the storage of M-bit values. M can range from 1 to 64, with the default value of 1:

```
BIT[(M)]
```

`BOOLEAN` type

The `BOOLEAN` type and its alias `BOOL` are equivalent to `TINYINT(1)`. If the value is `0`, it is considered as `False`; otherwise, it is considered `True`. As in MySQL, `True` is `1` and `False` is `0`:

```
BOOLEAN
```

`TINYINT` type

The TINYINT data type stores signed values of range [-128, 127] and unsigned values of range [0, 255]:

```
TINYINT[(M)] [UNSIGNED] [ZEROFILL]
```

SMALLINT type

The SMALLINT data type stores signed values of range [-32768, 32767], and unsigned values of range [0, 65535]:

```
SMALLINT[(M)] [UNSIGNED] [ZEROFILL]
```

MEDIUMINT type

The MEDIUMINT data type stores signed values of range [-8388608, 8388607], and unsigned values of range [0, 16777215]:

```
MEDIUMINT[(M)] [UNSIGNED] [ZEROFILL]
```

INTEGER type

The INTEGER type and its alias INT stores signed values of range [-2147483648, 2147483647], and unsigned values of range [0, 4294967295]:

```
INT[(M)] [UNSIGNED] [ZEROFILL]
```

You can also use another form:

```
INTEGER[(M)] [UNSIGNED] [ZEROFILL]
```

BIGINT type

The BIGINT data type stores signed values of range [-9223372036854775808, 9223372036854775807], and unsigned values of range [0, 18446744073709551615]:

```
BIGINT[(M)] [UNSIGNED] [ZEROFILL]
```

#### 14.10.3.3.2 Floating-point types

TiDB supports all the MySQL floating-point types, including FLOAT, and DOUBLE. For more information, see Floating-Point Types (Approximate Value) - FLOAT, DOUBLE in MySQL.

The following table summarizes field descriptions:

| Syntax Element | Description |
|---|---|
| M | the total number of digits |
| D | the number of digits following the decimal point |

| Syntax Element | Description |
|---|---|
| UNSIGNED | UNSIGNED. If omitted, it is SIGNED. |
| ZEROFILL | If you specify ZEROFILL for a numeric column, TiDB automatically adds the UNSIGNED attribute to the column. |

The following table summarizes the required storage for floating-point types supported by TiDB:

| Data Type | Storage Required (bytes) |
|---|---|
| `FLOAT` | 4 |
| `FLOAT(p)` | If 0 <= p <= 24, it is 4; if 25 <= p <= 53, it is 8 |
| `DOUBLE` | 8 |

`FLOAT` type

The `FLOAT` type stores a single-precision floating-point number. Permissible values are -3.402823466E+38 to -1.175494351E-38, 0, and 1.175494351E-38 to 3.402823466E+38. These are the theoretical limits, based on the IEEE standard. The actual range might be slightly smaller depending on your hardware or operating system.

`FLOAT(p)` can be used to represent the required precision in bits. TiDB uses this value only to determine whether to use `FLOAT` or `DOUBLE` for the resulting data type. If p is from 0 to 24, the data type becomes FLOAT with no M or D values. If p is from 25 to 53, the data type becomes `DOUBLE` with no M or D values. The range of the resulting column is the same as for the single-precision `FLOAT` or double-precision `DOUBLE` data type.

```
FLOAT[(M,D)] [UNSIGNED] [ZEROFILL]
FLOAT(p) [UNSIGNED] [ZEROFILL]
```

**Note:**

As in MySQL, the `FLOAT` data type stores approximate values. For values such as currency, it is recommended to use the `DECIMAL` type instead.

In TiDB, the default precision of the `FLOAT` data type is 8 digits, but in MySQL, the default precision is 6 digits. For example, assuming that you insert `123456789` and `1.23456789` into columns of the `FLOAT` type in both TiDB and MySQL, when you query the corresponding values in MySQL,

you get `123457000` and `1.23457`, while in TiDB, you get `123456790` and `1.2345679`.

`DOUBLE` type

The `DOUBLE` type, and its alias `DOUBLE PRECISION` stores a double-precision floating-point number. Permissible values are -1.7976931348623157E+308 to -2.2250738585072014E-308, 0, and 2.2250738585072014E-308 to 1.7976931348623157E+308. These are the theoretical limits, based on the IEEE standard. The actual range might be slightly smaller depending on your hardware or operating system.

```
DOUBLE[(M,D)] [UNSIGNED] [ZEROFILL]
DOUBLE PRECISION [(M,D)] [UNSIGNED] [ZEROFILL], REAL[(M,D)] [UNSIGNED] [
    ↪ ZEROFILL]
```

**Warning:**

As in MySQL, the `DOUBLE` data type stores approximate values. For values such as currency, it is recommended to use the `DECIMAL` type instead.

**Note:**

When TiDB converts a double-precision floating-point number represented in scientific notation to the `CHAR` type, the result is displayed inconsistently with that in MySQL. See Cast functions and operators for details.

#### 14.10.3.3.3 Fixed-point types

TiDB supports all the MySQL floating-point types, including DECIMAL, and NUMERIC. For more information, Fixed-Point Types (Exact Value) - DECIMAL, NUMERIC in MySQL.

The meaning of the fields:

| Syntax Element | Description |
|---|---|
| M | the total number of decimal digits |
| D | the number of digits after the decimal point |

| Syntax Element | Description |
|---|---|
| UNSIGNED | UNSIGNED. If omitted, it is SIGNED. |
| ZEROFILL | If you specify ZEROFILL for a numeric column, TiDB automatically adds the UNSIGNED attribute to the column. |

`DECIMAL` type

`DECIMAL` and its alias `NUMERIC` store a packed "exact" fixed-point number. M is the total number of decimal digits (the precision), and D is the number of digits after the decimal point (the scale). The decimal point and (for negative numbers) the - sign are not counted in M. If D is 0, values have no decimal point or fractional part. The maximum number of digits (M) for DECIMAL is 65. The maximum number of supported decimals (D) is 30. If D is omitted, the default is 0. If M is omitted, the default is 10.

```
DECIMAL[(M[,D])] [UNSIGNED] [ZEROFILL]
NUMERIC[(M[,D])] [UNSIGNED] [ZEROFILL]
```

#### 14.10.3.4 Date and Time Types

TiDB supports all MySQL date and time data types to store temporal values: `DATE`, `TIME`, `DATETIME`, `TIMESTAMP`, and `YEAR`. For more information, see Date and Time Data Types in MySQL.

Each of these types has its range of valid values, and uses a zero value to indicate that it is an invalid value. In addition, the `TIMESTAMP` and `DATETIME` types can automatically generate new time values on modification.

When dealing with date and time value types, note:

- Although TiDB tries to interpret different formats, the date-portion must be in the format of year-month-day (for example, '1998-09-04'), rather than month-day-year or day-month-year.
- If the year-portion of a date is specified as 2 digits, TiDB converts it based on specific rules.
- If a numeric value is needed in the context, TiDB automatically converts the date or time value into a numeric type. For example:

```
mysql> SELECT NOW(), NOW()+0, NOW(3)+0;
+---------------------+---------------+--------------------+
| NOW()               | NOW()+0       | NOW(3)+0           |
```

```
+---------------------+---------------+--------------------+
| 2012-08-15 09:28:00 | 20120815092800 | 20120815092800.889 |
+---------------------+---------------+--------------------+
```

- TiDB might automatically convert invalid values or values beyond the supported range to a zero value of that type. This behavior is dependent on the SQL Mode set. For example:

```
mysql> show create table t1;
+--
    ↪ -----+-----------------------------------------------------------------
    ↪
| Table | Create Table
    ↪
    ↪ |
+--
    ↪ -----+-----------------------------------------------------------------
    ↪
| t1    | CREATE TABLE `t1` (
  `a` time DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin |
+--
    ↪ -----+-----------------------------------------------------------------
    ↪
1 row in set (0.00 sec)

mysql> select @@sql_mode;
+--
    ↪ -----------------------------------------------------------------------
    ↪
| @@sql_mode
    ↪
    ↪ |
+--
    ↪ -----------------------------------------------------------------------
    ↪
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_ZERO_DATE,
    ↪ ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,
    ↪ NO_ENGINE_SUBSTITUTION |
+--
    ↪ -----------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)

mysql> insert into t1 values ('2090-11-32:22:33:44');
```

```
ERROR 1292 (22007): Truncated incorrect time value: '
    ↪ 2090-11-32:22:33:44'
mysql> set @@sql_mode='';
    ↪
    ↪ Query OK, 0 rows affected (0.01 sec)

mysql> insert into t1 values ('2090-11-32:22:33:44');
Query OK, 1 row affected, 1 warning (0.01 sec)

mysql> select * from t1;
+----------+
| a        |
+----------+
| 00:00:00 |
+----------+
1 row in set (0.01 sec)
```

- Setting different SQL modes can change TiDB behaviors.
- If the SQL mode `NO_ZERO_DATE` is not enabled, TiDB allows month or day in the columns of `DATE` and `DATETIME` to be zero value, for example, '2009-00-00' or '2009-01-00'. If this date type is to be calculated in a function, for example, in `DATE_SUB()` or `DATE_ADD()`, the result can be incorrect.
- By default, TiDB enables the SQL mode `NO_ZERO_DATE`. This mode prevents storing zero values such as '0000-00-00'.

Different types of zero value are shown in the following table:

| Date Type | "Zero" Value |
|---|---|
| DATE | '0000-00-00' |
| TIME | '00:00:00' |
| DATETIME | '0000-00-00 00:00:00' |
| TIMESTAMP | '0000-00-00 00:00:00' |
| YEAR | 0000 |

Invalid `DATE`, `DATETIME`, `TIMESTAMP` values are automatically converted to the corresponding type of zero value ( '0000-00-00' or '0000-00-00 00:00:00' ) if the SQL mode permits such usage.

#### 14.10.3.4.1 Supported types

`DATE` type

`DATE` only contains date-portion and no time-portion, displayed in `YYYY-MM-DD` format. The supported range is '0000-01-01' to '9999-12-31':

```
DATE
```

`TIME` type

For the `TIME` type, the format is `HH:MM:SS[.fraction]` and valid values range from '-838:59:59.000000' to '838:59:59.000000'. `TIME` is used not only to indicate the time within a day but also to indicate the time interval between 2 events. An optional `fsp` value in the range from 0 to 6 may be given to specify fractional seconds precision. If omitted, the default precision is 0:

```
TIME[(fsp)]
```

> **Note:**
>
> Pay attention to the abbreviated form of `TIME`. For example, '11:12' means '11:12:00' instead of '00:11:12'. However, '1112' means '00:11:12'. These differences are caused by the presence or absence of the `:` character.

`DATETIME` type

`DATETIME` contains both date-portion and time-portion. Valid values range from '0000-01-01 00:00:00.000000' to '9999-12-31 23:59:59.999999'.

TiDB displays `DATETIME` values in `YYYY-MM-DD HH:MM:SS[.fraction]` format, but permits assignment of values to `DATETIME` columns using either strings or numbers. An optional fsp value in the range from 0 to 6 may be given to specify fractional seconds precision. If omitted, the default precision is 0:

```
DATETIME[(fsp)]
```

`TIMESTAMP` type

`TIMESTAMP` contains both date-portion and time-portion. Valid values range from '1970-01-01 00:00:01.000000' to '2038-01-19 03:14:07.999999' in UTC time. An optional fsp value in the range from 0 to 6 may be given to specify fractional seconds precision. If omitted, the default precision is 0.

In `TIMESTAMP`, zero is not permitted to appear in the month-portion or day-portion. The only exception is zero value itself '0000-00-00 00:00:00'.

```
TIMESTAMP[(fsp)]
```

Timezone Handling

When TIMESTAMP is to be stored, TiDB converts the TIMESTAMP value from the current time zone to UTC time zone. When TIMESTAMP is to be retrieved, TiDB converts the stored TIMESTAMP value from UTC time zone to the current time zone (Note: DATETIME is not handled in this way). The default time zone for each connection is the server's local time zone, which can be modified by the environment variable time_zone.

> **Warning:**
>
> As in MySQL, the TIMESTAMP data type suffers from the Year 2038 Problem. For storing values that may span beyond 2038, please consider using the DATETIME type instead.

YEAR type

The YEAR type is specified in the format 'YYYY'. Supported values range from 1901 to 2155, or the zero value of 0000:

```
YEAR[(4)]
```

YEAR follows the following format rules:

- Four-digit numeral ranges from 1901 to 2155
- Four-digit string ranges from '1901' to '2155'
- One-digit or two-digit numeral ranges from 1 to 99. Accordingly, 1-69 is converted to 2001-2069 and 70-99 is converted to 1970-1999
- One-digit or two-digit string ranges from '0' to '99'
- Value 0 is taken as 0000 whereas the string '0' or '00' is taken as 2000

Invalid YEAR value is automatically converted to 0000 (if users are not using the NO_ZERO_DATE SQL mode).

#### 14.10.3.4.2 Automatic initialization and update of TIMESTAMP and DATETIME

Columns with TIMESTAMP or DATETIME value type can be automatically initialized or updated to the current time.

For any column with TIMESTAMP or DATETIME value type in the table, you can set the default or auto-update value as current timestamp.

These properties can be set by setting DEFAULT CURRENT_TIMESTAMP and ON UPDATE ↪ CURRENT_TIMESTAMP when the column is being defined. DEFAULT can also be set as a specific value, such as DEFAULT 0 or DEFAULT '2000-01-01 00:00:00'.

```
CREATE TABLE t1 (
    ts TIMESTAMP DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP,
    dt DATETIME DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP
);
```

The default value for DATETIME is NULL unless it is specified as NOT NULL. For the latter situation, if no default value is set, the default value is be 0.

```
CREATE TABLE t1 (
    dt1 DATETIME ON UPDATE CURRENT_TIMESTAMP,   -- default NULL
    dt2 DATETIME NOT NULL ON UPDATE CURRENT_TIMESTAMP -- default 0
);
```

#### 14.10.3.4.3 Decimal part of time value

DATETIME and TIMESTAMP values can contain a fractional part of up to 6 digits which is accurate to microseconds. In any column of DATETIME or TIMESTAMP types, a fractional part is stored instead of being discarded. With a fractional part, the value is in the format of 'YYYY-MM-DD HH:MM:SS[.fraction]', and the fraction ranges from 000000 to 999999. A decimal point must be used to separate the fraction from the rest.

- Use type_name(fsp) to define a column that supports fractional precision, where type_name can be TIME, DATETIME or TIMESTAMP. For example,

```
CREATE TABLE t1 (t TIME(3), dt DATETIME(6));
```

fsp must range from 0 to 6.

0 means there is no fractional part. If fsp is omitted, the default is 0.

- When inserting TIME, DATETIME or TIMESTAMP which contain a fractional part, if the number of digit of the fraction is too few, or too many, rounding might be needed in the situation. For example:

```
mysql> CREATE TABLE fractest( c1 TIME(2), c2 DATETIME(2), c3 TIMESTAMP
    ↪ (2) );
Query OK, 0 rows affected (0.33 sec)

mysql> INSERT INTO fractest VALUES
    > ('17:51:04.777', '2014-09-08 17:51:04.777', '2014-09-08
        ↪ 17:51:04.777');
Query OK, 1 row affected (0.03 sec)

mysql> SELECT * FROM fractest;
```

```
+-------------/----------------------/----------------------+
| c1          | c2                   | c3                   |
+-------------/----------------------/----------------------+
| 17:51:04.78 | 2014-09-08 17:51:04.78 | 2014-09-08 17:51:04.78 |
+-------------/----------------------/----------------------+
1 row in set (0.00 sec)
```

#### 14.10.3.4.4 Conversions between date and time types

Sometimes we need to make conversions between date and time types. But some conversions might lead to information loss. For example, `DATE`, `DATETIME` and `TIMESTAMP` values all have their own respective ranges. `TIMESTAMP` should be no earlier than the year 1970 in UTC time or no later than UTC time '2038-01-19 03:14:07'. Based on this rule, '1968-01-01' is a valid date value of `DATE` or `DATETIME`, but becomes 0 when it is converted to `TIMESTAMP`.

The conversions of `DATE`:

- When `DATE` is converted to `DATETIME` or `TIMESTAMP`, a time-portion '00:00:00' is added, because DATE does not contain any time information
- When `DATE` is converted to `TIME`, the result is '00:00:00'

Conversions of `DATETIME` or `TIMESTAMP`:

- When `DATETIME` or `TIMESTAMP` is converted to `DATE`, the time and fractional part is discarded. For example, '1999-12-31 23:59:59.499' is converted to '1999-12-31'
- When `DATETIME` or `TIMESTAMP` is converted to TIME, the date-portion is discarded, because `TIME` does not contain any date information

When we convert `TIME` to other time and date formats, the date-portion is automatically specified as `CURRENT_DATE()`. The final converted result is a date that consists of `TIME` and `CURRENT_DATE()`. This is to say that if the value of TIME is beyond the range from '00:00:00' to '23:59:59', the converted date-portion does not indicate the current day.

When `TIME` is converted to `DATE`, the process is similar, and the time-portion is discarded.

Using the `CAST()` function can explicitly convert a value to a `DATE` type. For example:

```
date_col = CAST(datetime_col AS DATE)
```

Converting `TIME` and `DATETIME` to numeric format. For example:

```
mysql> SELECT CURTIME(), CURTIME()+0, CURTIME(3)+0;
+-----------/-------------/--------------+
| CURTIME() | CURTIME()+0 | CURTIME(3)+0 |
+-----------/-------------/--------------+
| 09:28:00 |      92800 |   92800.887 |
```

```
+----------/-------------/--------------+
mysql> SELECT NOW(), NOW()+0, NOW(3)+0;
+---------------------/----------------/--------------------+
| NOW()               | NOW()+0      | NOW(3)+0           |
+---------------------/----------------/--------------------+
| 2012-08-15 09:28:00 | 20120815092800 | 20120815092800.889 |
+---------------------/----------------/--------------------+
```

#### 14.10.3.4.5 Two-digit year-portion contained in the date

The two-digit year-portion contained in date does not explicitly indicate the actual year and is ambiguous.

For `DATETIME`, `DATE` and `TIMESTAMP` types, TiDB follows the following rules to eliminate ambiguity:

- Values between 01 and 69 is converted to a value between 2001 and 2069
- Values between 70 and 99 is converted to a value between 1970 and 1999

These rules also apply to the `YEAR` type, with one exception:

When numeral `00` is inserted to `YEAR(4)`, the result is 0000 rather than 2000.

If you want the result to be 2000, specify the value to be 2000.

The two-digit year-portion might not be properly calculated in some functions such `MIN()` and `MAX()`. For these functions, the four-digit format suites better.

### 14.10.3.5 String Types

TiDB supports all the MySQL string types, including `CHAR`, `VARCHAR`, `BINARY`, `VARBINARY` ↪ , `BLOB`, `TEXT`, `ENUM`, and `SET`. For more information, see String Types in MySQL.

#### 14.10.3.5.1 Supported types

`CHAR` type

`CHAR` is a fixed length string. M represents the column-length in characters (not bytes). The range of M is 0 to 255. Different from the `VARCHAR` type, when data is inserted into a `CHAR` column, the trailing spaces are truncated.

```
[NATIONAL] CHAR[(M)] [CHARACTER SET charset_name] [COLLATE collation_name]
```

`VARCHAR` type

`VARCHAR` is a string of variable-length. M represents the maximum column length in characters (not bytes). The maximum size of `VARCHAR` cannot exceed 65,535 bytes. The maximum row length and the character set being used determine the `VARCHAR` length.

The space occupied by a single character might differ for different character sets. The following table shows the bytes consumed by a single character, and the range of the `VARCHAR` column length in each character set:

| Character Set | Byte(s) per Character | Range of the Maximum `VARCHAR` Column Length |
|---|---|---|
| ascii | 1 | (0, 65535] |
| latin1 | 1 | (0, 65535] |
| binary | 1 | (0, 65535] |
| utf8 | 3 | (0, 21845] |
| utf8mb4 | 4 | (0, 16383] |

```
[NATIONAL] VARCHAR(M) [CHARACTER SET charset_name] [COLLATE collation_name]
```

`TEXT` type

`TEXT` is a string of variable-length. The maximum column length is 65,535 bytes. The optional M argument is in characters and is used to automatically select the fittest type of a `TEXT` column. For example `TEXT(60)` will yield a `TINYTEXT` data type that can hold up to 255 bytes, which fits a 60-character UTF-8 string that has up to 4 bytes per character (4×60=240). Using the M argument is not recommended.

```
TEXT[(M)] [CHARACTER SET charset_name] [COLLATE collation_name]
```

`TINYTEXT` type

The `TINYTEXT` type is similar to the TEXT type. The difference is that the maximum column length of `TINYTEXT` is 255.

```
TINYTEXT [CHARACTER SET charset_name] [COLLATE collation_name]
```

`MEDIUMTEXT` type

The `MEDIUMTEXT` type is similar to the TEXT type. The difference is that the maximum column length of `MEDIUMTEXT` is 16,777,215. But due to the limitation of `txn-entry-size-limit`, the maximum storage size of a single row in TiDB is 6 MiB by default and can be increased to 120 MiB by changing the configuration.

```
MEDIUMTEXT [CHARACTER SET charset_name] [COLLATE collation_name]
```

`LONGTEXT` type

The `LONGTEXT` type is similar to the TEXT type. The difference is that the maximum column length of `LONGTEXT` is 4,294,967,295. But due to the limitation of `txn-entry-size-limit`, the maximum storage size of a single row in TiDB is 6 MiB by default and can be increased to 120 MiB by changing the configuration.

```
LONGTEXT [CHARACTER SET charset_name] [COLLATE collation_name]
```

`BINARY` type

The `BINARY` type is similar to the `CHAR` type. The difference is that `BINARY` stores binary byte strings.

```
BINARY(M)
```

`VARBINARY` type

The `VARBINARY` type is similar to the `VARCHAR` type. The difference is that the `VARBINARY` stores binary byte strings.

```
VARBINARY(M)
```

`BLOB` type

`BLOB` is a large binary file. M represents the maximum column length in bytes, ranging from 0 to 65,535.

```
BLOB[(M)]
```

`TINYBLOB` type

The `TINYBLOB` type is similar to the `BLOB` type. The difference is that the maximum column length of `TINYBLOB` is 255.

```
TINYBLOB
```

`MEDIUMBLOB` type

The `MEDIUMBLOB` type is similar to the `BLOB` type. The difference is that the maximum column length of `MEDIUMBLOB` is 16,777,215. But due to the limitation of `txn-entry-size-limit`, the maximum storage size of a single row in TiDB is 6 MiB by default and can be increased to 120 MiB by changing the configuration.

```
MEDIUMBLOB
```

`LONGBLOB` type

The `LONGBLOB` type is similar to the `BLOB` type. The difference is that the maximum column length of `LONGBLOB` is 4,294,967,295. But due to the limitation of `txn-entry-size-limit`, the maximum storage size of a single row in TiDB is 6 MiB by default and can be increased to 120 MiB by changing the configuration.

```
LONGBLOB
```

`ENUM` type

An `ENUM` is a string object with a value chosen from a list of permitted values that are enumerated explicitly in the column specification when the table is created. The syntax is:

```
ENUM('value1','value2',...) [CHARACTER SET charset_name] [COLLATE
    ↪ collation_name]

#### For example:
ENUM('apple', 'orange', 'pear')
```

The value of the `ENUM` data type is stored as numbers. Each value is converted to a number according the definition order. In the previous example, each string is mapped to a number:

| Value | Number |
|---|---|
| NULL | NULL |
| ” | 0 |
| ‘apple’ | 1 |
| ‘orange’ | 2 |
| ‘pear’ | 3 |

For more information, see the ENUM type in MySQL.

`SET` type

A `SET` is a string object that can have zero or more values, each of which must be chosen from a list of permitted values specified when the table is created. The syntax is:

```
SET('value1','value2',...) [CHARACTER SET charset_name] [COLLATE
    ↪ collation_name]

#### For example:
SET('1', '2') NOT NULL
```

In the example, any of the following values can be valid:

```
''
'1'
'2'
'1,2'
```

In TiDB, the values of the `SET` type is internally converted to `Int64`. The existence of each element is represented using a binary: 0 or 1. For a column specified as `SET('a','b ↪ ','c','d')`, the members have the following decimal and binary values.

| Member | Decimal Value | Binary Value |
|---|---|---|
| ‘a’ | 1 | 0001 |
| ‘b’ | 2 | 0010 |
| ‘c’ | 4 | 0100 |

| Member | Decimal Value | Binary Value |
|---|---|---|
| 'd' | 8 | 1000 |

In this case, for an element of `('a', 'c')`, it is `0101` in binary.

For more information, see the SET type in MySQL.

#### 14.10.3.6 JSON Type

TiDB supports the `JSON` (JavaScript Object Notation) data type, which is useful for storing semi-structured data. The `JSON` data type provides the following advantages over storing `JSON`-format strings in a string column:

- Use the Binary format for serialization. The internal format permits quick read access to `JSON` document elements.
- Automatic validation of the JSON documents stored in `JSON` columns. Only valid documents can be stored.

`JSON` columns, like columns of other binary types, are not indexed directly, but you can index the fields in the `JSON` document in the form of generated column:

```
CREATE TABLE city (
    id INT PRIMARY KEY,
    detail JSON,
    population INT AS (JSON_EXTRACT(detail, '$.population')),
    index index_name (population)
    );
INSERT INTO city (id,detail) VALUES (1, '{"name": "Beijing", "population":
    ↪ 100}');
SELECT id FROM city WHERE population >= 100;
```

For more information, see JSON Functions and Generated Columns.

##### 14.10.3.6.1 Restrictions

- Currently, TiDB only supports pushing down limited `JSON` functions to TiFlash. For more information, see Push-down expressions.
- TiDB Backup & Restore (BR) changes how JSON column data is encoded in v6.3.0. Therefore, it is not recommended to use BR to restore data containing JSON columns to a TiDB cluster earlier than v6.3.0.
- Do not use any replication tool to replicate data containing non-standard `JSON` data types, such as `DATE`, `DATETIME`, and `TIME`.

#### 14.10.3.6.2 MySQL compatibility

- When you create JSON columns with data in the `BINARY` type, MySQL mislabels the data as the `STRING` type currently, while TiDB processes it as the `BINARY` type correctly.

```
CREATE TABLE test(a json);
INSERT INTO test SELECT json_objectagg('a', b'01010101');

-- In TiDB, executing the following SQL statement returns `0, 0`. In
   ↪ MySQL, executing the following SQL statement returns `0, 1`.
mysql> SELECT JSON_EXTRACT(JSON_OBJECT('a', b'01010101'), '$.a') = "
   ↪ base64:type15:VQ==" AS r1, JSON_EXTRACT(a, '$.a') = "base64:
   ↪ type15:VQ==" AS r2 FROM test;
+------+------+
| r1   | r2   |
+------+------+
|    0 |    0 |
+------+------+
1 row in set (0.01 sec)
```

  For more information, see issue #37443.

- When converting the data type from `ENUM` or `SET` to `JSON`, TiDB checks the correctness of data format. For example, executing the following SQL statements in TiDB will return an error.

```
CREATE TABLE t(e ENUM('a'));
INSERT INTO t VALUES ('a');
mysql> SELECT CAST(e AS JSON) FROM t;
ERROR 3140 (22032): Invalid JSON text: The document root must not be
   ↪ followed by other values.
```

  For more information, see issue #9999.

- In TiDB, you can use `ORDER BY` to sort JSON arrays or JSON objects.

  In MySQL, if you use `ORDER BY` to sort JSON arrays or JSON objects, MySQL returns a warning and the sorting result does not match the result of the comparison operation:

```
CREATE TABLE t(j JSON);
INSERT INTO t VALUES ('[1,2,3,4]');
INSERT INTO t VALUES ('[5]');

mysql> SELECT j FROM t WHERE j < JSON_ARRAY(5);
+--------------+
| j            |
+--------------+
```

```
| [1, 2, 3, 4] |
+--------------+
1 row in set (0.00 sec)

-- In TiDB, executing the following SQL statement returns the correct
   ↪  sorting result. In MySQL, executing the following SQL
   ↪ statement returns the "This version of MySQL doesn't yet
   ↪ support 'sorting of non-scalar JSON values'." warning and the
   ↪ sorting result is inconsistent with the comparison result of
   ↪ `<`.
mysql> SELECT j FROM t ORDER BY j;
+--------------+
| j            |
+--------------+
| [1, 2, 3, 4] |
| [5]          |
+--------------+
2 rows in set (0.00 sec)
```

For more information, see issue #37506.

- When you insert data to a JSON column, TiDB implicitly converts the value of the data to the `JSON` type.

```
CREATE TABLE t(col JSON);

-- In TiDB, the following INSERT statement is executed successfully.
   ↪ In MySQL, executing the following INSERT statement returns the
   ↪ "Invalid JSON text" error.
INSERT INTO t VALUES (3);
```

For more information about the `JSON` data type, see JSON functions and Generated Columns.

### 14.10.4 Functions and Operators

#### 14.10.4.1 Function and Operator Reference

The usage of the functions and operators in TiDB is similar to MySQL. See Functions and Operators in MySQL.

In SQL statements, expressions can be used on the `ORDER BY` and `HAVING` clauses of the `SELECT` statement, the `WHERE` clause of `SELECT`/`DELETE`/`UPDATE` statements, and `SET` statements.

You can write expressions using literals, column names, NULL, built-in functions, operators and so on. For expressions that TiDB supports pushing down to TiKV, see List of Expressions for Pushdown.

#### 14.10.4.2 Type Conversion in Expression Evaluation

TiDB behaves the same as MySQL: https://dev.mysql.com/doc/refman/5.7/en/type-conversion.html

#### 14.10.4.3 Operators

This document describes the operators precedence, comparison functions and operators, logical operators, and assignment operators.

- Operator precedence
- Comparison functions and operators
- Logical operators
- Assignment operators

| Name | Description |
|---|---|
| AND, && | Logical AND |
| = | Assign a value (as part of a `SET` statement, or as part of the `SET` clause in an `UPDATE` statement) |
| := | Assign a value |
| BETWEEN … AND … | Check whether a value is within a range of values |
| BINARY | Cast a string to a binary string |
| & | Bitwise AND |
| ~ | Bitwise inversion |
| \| | Bitwise OR |
| [^](https://dev.mysql.com/doc/refman/5.7/en/bit-functions.html#operator_bitwise-xor) | Bitwise XOR |
| CASE | Case operator |
| DIV | Integer division |
| / | Division operator |
| = | Equal operator |
| <=> | NULL-safe equal to operator |
| > | Greater than operator |
| >= | Greater than or equal operator |
| IS | Test a value against a boolean |
| IS NOT | Test a value against a boolean |
| IS NOT NULL | NOT NULL value test |
| IS NULL | NULL value test |
| -> | Return value from JSON column after evaluating path; equivalent to `JSON_EXTRACT()` |

| Name | Description |
|---|---|
| ->> | Return value from JSON column after evaluating path and unquoting the result; equivalent to `JSON_UNQUOTE(JSON_EXTRACT())` |
| << | Left shift |
| < | Less than operator |
| <= | Less than or equal operator |
| LIKE | Simple pattern matching |
| - | Minus operator |
| %, MOD | Modulo operator |
| NOT, ! | Negates value |
| NOT BETWEEN ... AND ... | Check whether a value is not within a range of values |
| !=, <> | Not equal operator |
| NOT LIKE | Negation of simple pattern matching |
| NOT REGEXP | Negation of REGEXP |
| \|\|, OR | Logical OR |
| + | Addition operator |
| REGEXP | Pattern matching using regular expressions |
| >> | Right shift |
| RLIKE | Synonym for REGEXP |
| * | Multiplication operator |
| - | Change the sign of the argument |
| XOR | Logical XOR |

#### 14.10.4.3.1 Unsupported operators

- SOUNDS LIKE

#### 14.10.4.3.2 Operator precedence

Operator precedences are shown in the following list, from highest precedence to the lowest. Operators that are shown together on a line have the same precedence.

```
INTERVAL
BINARY, COLLATE
!
- (unary minus), ~ (unary bit inversion)
^
*, /, DIV, %, MOD
-, +
<<, >>
&
```

```
|
= (comparison), <=>, >=, >, <=, <, <>, !=, IS, LIKE, REGEXP, IN
BETWEEN, CASE, WHEN, THEN, ELSE
NOT
AND, &&
XOR
OR, ||
= (assignment), :=
```

For details, see Operator Precedence.

#### 14.10.4.3.3 Comparison functions and operators

| Name | Description |
|---|---|
| BETWEEN ... AND ... | Check whether a value is within a range of values |
| COALESCE() | Return the first non-NULL argument |
| = | Equal operator |
| <=> | NULL-safe equal to operator |
| > | Greater than operator |
| >= | Greater than or equal operator |
| GREATEST() | Return the largest argument |
| IN() | Check whether a value is within a set of values |
| INTERVAL() | Return the index of the argument that is less than the first argument |
| IS | Test a value against a boolean |
| IS NOT | Test a value against a boolean |
| IS NOT NULL | NOT NULL value test |
| IS NULL | NULL value test |
| ISNULL() | Test whether the argument is NULL |
| LEAST() | Return the smallest argument |
| < | Less than operator |
| <= | Less than or equal operator |
| LIKE | Simple pattern matching |
| NOT BETWEEN ... AND ... | Check whether a value is not within a range of values |
| !=, <> | Not equal operator |
| NOT IN() | Check whether a value is not within a set of values |
| NOT LIKE | Negation of simple pattern matching |
| STRCMP() | Compare two strings |

For details, see Comparison Functions and Operators.

#### 14.10.4.3.4 Logical operators

| Name | Description |
|---|---|
| AND, && | Logical AND |
| NOT, ! | Negates value |
| \|\|, OR | Logical OR |
| XOR | Logical XOR |

For details, see MySQL Handling of GROUP BY.

#### 14.10.4.3.5 Assignment operators

| Name | Description |
|---|---|
| = | Assign a value (as part of a `SET` statement, or as part of the `SET` clause in an `UPDATE` statement) |
| := | Assign a value |

For details, see Detection of Functional Dependence.

### 14.10.4.4 Control Flow Functions

TiDB supports all of the control flow functions available in MySQL 5.7.

| Name | Description |
|---|---|
| `CASE` | Case operator |
| `IF()` | If/else construct |
| `IFNULL()` | Null if/else construct |
| `NULLIF()` | Return NULL if expr1 = expr2 |

### 14.10.4.5 String Functions

TiDB supports most of the string functions available in MySQL 5.7, some of the string functions available in MySQL 8.0, and some of the functions available in Oracle 21.

For comparisons between functions and syntax of Oracle and TiDB, see Comparisons between Functions and Syntax of Oracle and TiDB.

#### 14.10.4.5.1 Supported functions

| Name | Description |
|---|---|
| `ASCII()` | Return numeric value of left-most character |

| Name | Description |
|---|---|
| BIN() | Return a string containing binary representation of a number |
| BIT_LENGTH() | Return length of argument in bits |
| CHAR() | Return the character for each integer passed |
| CHAR_LENGTH() | Return number of characters in argument |
| CHARACTER_LENGTH() | Synonym for CHAR_LENGTH() |
| CONCAT() | Return concatenated string |
| CONCAT_WS() | Return concatenate with separator |
| ELT() | Return string at index number |
| EXPORT_SET() | Return a string such that for every bit set in the value bits, you get an on string and for every unset bit, you get an off string |
| FIELD() | Return the index (position) of the first argument in the subsequent arguments |
| FIND_IN_SET() | Return the index position of the first argument within the second argument |
| FORMAT() | Return a number formatted to specified number of decimal places |
| FROM_BASE64() | Decode to a base-64 string and return result |
| HEX() | Return a hexadecimal representation of a decimal or string value |
| INSERT() | Insert a substring at the specified position up to the specified number of characters |
| INSTR() | Return the index of the first occurrence of substring |
| LCASE() | Synonym for LOWER() |
| LEFT() | Return the leftmost number of characters as specified |
| LENGTH() | Return the length of a string in bytes |
| LIKE | Simple pattern matching |
| LOCATE() | Return the position of the first occurrence of substring |
| LOWER() | Return the argument in lowercase |
| LPAD() | Return the string argument, left-padded with the specified string |
| LTRIM() | Remove leading spaces |
| MAKE_SET() | Return a set of comma-separated strings that have the corresponding bit in bits set |
| MID() | Return a substring starting from the specified position |
| NOT LIKE | Negation of simple pattern matching |

| Name | Description |
|---|---|
| NOT REGEXP | Negation of REGEXP |
| OCT() | Return a string containing octal representation of a number |
| OCTET_LENGTH() | Synonym for LENGTH() |
| ORD() | Return character code for leftmost character of the argument |
| POSITION() | Synonym for LOCATE() |
| QUOTE() | Escape the argument for use in an SQL statement |
| REGEXP | Pattern matching using regular expressions |
| REGEXP_INSTR() | Return the starting index of the substring that matches the regular expression (Partly compatible with MySQL. For more details, see Regular expression compatibility with MySQL) |
| REGEXP_LIKE() | Whether the string matches the regular expression (Partly compatible with MySQL. For more details, see Regular expression compatibility with MySQL) |
| REGEXP_REPLACE() | Replace substrings that match the regular expression (Partly compatible with MySQL. For more details, see Regular expression compatibility with MySQL) |
| REGEXP_SUBSTR() | Return the substring that matches the regular expression (Partly compatible with MySQL. For more details, see Regular expression compatibility with MySQL) |
| REPEAT() | Repeat a string the specified number of times |
| REPLACE() | Replace occurrences of a specified string |
| REVERSE() | Reverse the characters in a string |
| RIGHT() | Return the specified rightmost number of characters |
| RLIKE | Synonym for REGEXP |
| RPAD() | Append string the specified number of times |
| RTRIM() | Remove trailing spaces |
| SPACE() | Return a string of the specified number of spaces |
| STRCMP() | Compare two strings |
| SUBSTR() | Return the substring as specified |

| Name | Description |
|---|---|
| SUBSTRING() | Return the substring as specified |
| SUBSTRING_INDEX() | Return a substring from a string before the specified number of occurrences of the delimiter |
| TO_BASE64() | Return the argument converted to a base-64 string |
| TRANSLATE() | Replace all occurrences of characters by other characters in a string. It does not treat empty strings as NULL as Oracle does. |
| TRIM() | Remove leading and trailing spaces |
| UCASE() | Synonym for UPPER() |
| UNHEX() | Return a string containing hex representation of a number |
| UPPER() | Convert to uppercase |
| WEIGHT_STRING() | Return the weight string for the input string |

#### 14.10.4.5.2 Unsupported functions

- LOAD_FILE()
- MATCH()
- SOUNDEX()

#### 14.10.4.5.3 Regular expression compatibility with MySQL

The following sections describe the regular expression compatibility with MySQL.

Syntax compatibility

MySQL implements regular expression using International Components for Unicode (ICU), and TiDB uses RE2. To learn the syntax differences between the two libraries, you can refer to the ICU documentation and RE2 Syntax.

`match_type` compatibility

The value options of `match_type` between TiDB and MySQL are:

- Value options in TiDB are `"c"`, `"i"`, `"m"`, and `"s"`, and value options in MySQL are `"c"`, `"i"`, `"m"`, `"n"`, and `"u"`.
- The `"s"` in TiDB corresponds to `"n"` in MySQL. When `"s"` is set in TiDB, the `.` character also matches line terminators (`\n`).

  For example, the `SELECT REGEXP_LIKE(a, b, "n")FROM t1` in MySQL is the same as the `SELECT REGEXP_LIKE(a, b, "s")FROM t1` in TiDB.

- TiDB does not support `"u"`, which means Unix-only line endings in MySQL.

Data type compatibility

The difference between TiDB and MySQL support for the binary string type:

- MySQL does not support binary strings in regular expression functions since 8.0.22. For more details, refer to MySQL documentation. But in practice, regular functions can work in MySQL when all parameters or return types are binary strings. Otherwise, an error will be reported.
- Currently, TiDB prohibits using binary strings and an error will be reported under any circumstances.

Other compatibility

The difference between TiDB and MySQL support in replacing empty strings:

The following takes `REGEXP_REPLACE("", "^$", "123")` as an example:

- MySQL does not replace the empty string and returns `""` as the result.
- TiDB replaces the empty string and returns `"123"` as the result.

#### 14.10.4.6 Numeric Functions and Operators

TiDB supports all of the numeric functions and operators available in MySQL 5.7.

##### 14.10.4.6.1 Arithmetic operators

| Name | Description |
|---|---|
| `+` | Addition operator |
| `-` | Minus operator |
| `*` | Multiplication operator |
| `/` | Division operator |
| `DIV` | Integer division |
| `lstinlineMOD!` | Modulo operator |
| `-` | Change the sign of the argument |

##### 14.10.4.6.2 Mathematical functions

| Name | Description |
|---|---|
| `POW()` | Return the argument raised to the specified power |
| `POWER()` | Return the argument raised to the specified power |
| `EXP()` | Raise to the power of |
| `SQRT()` | Return the square root of the argument |

| Name | Description |
|---|---|
| LN() | Return the natural logarithm of the argument |
| LOG() | Return the natural logarithm of the first argument |
| LOG2() | Return the base-2 logarithm of the argument |
| LOG10() | Return the base-10 logarithm of the argument |
| PI() | Return the value of pi |
| TAN() | Return the tangent of the argument |
| COT() | Return the cotangent |
| SIN() | Return the sine of the argument |
| COS() | Return the cosine |
| ATAN() | Return the arc tangent |
| ATAN2(), ATAN() | Return the arc tangent of the two arguments |
| ASIN() | Return the arc sine |
| ACOS() | Return the arc cosine |
| RADIANS() | Return argument converted to radians |
| DEGREES() | Convert radians to degrees |
| MOD() | Return the remainder |
| ABS() | Return the absolute value |
| CEIL() | Return the smallest integer value not less than the argument |
| CEILING() | Return the smallest integer value not less than the argument |
| FLOOR() | Return the largest integer value not greater than the argument |
| ROUND() | Round the argument |
| RAND() | Return a random floating-point value |
| SIGN() | Return the sign of the argument |
| CONV() | Convert numbers between different number bases |
| TRUNCATE() | Truncate to specified number of decimal places |
| CRC32() | Compute a cyclic redundancy check value |

#### 14.10.4.7 Date and Time Functions

TiDB supports all of the date and time functions available in MySQL 5.7.

**Note:**

- MySQL will often accept the incorrectly formatted date and time values. For example, `'2020-01-01\n\t01:01:01'` and `'2020-01_01\n\t01:01'` are treated as valid date and time values.
- TiDB makes the best effort to match MySQL's behavior, but it might not match in all instances. It is recommended to correctly format dates, because the intended behavior for incorrectly formatted values is not documented, and is often inconsistent.

**Date/Time functions:**

| Name | Description |
|---|---|
| ADDDATE() | Add time values (intervals) to a date value |
| ADDTIME() | Add time |
| CONVERT_TZ() | Convert from one time zone to another |
| CURDATE() | Return the current date |
| CURRENT_DATE(), CURRENT_DATE | Synonyms for CURDATE() |
| CURRENT_TIME(), CURRENT_TIME | Synonyms for CURTIME() |
| CURRENT_TIMESTAMP(), CURRENT_TIMESTAMP | Synonyms for NOW() |
| CURTIME() | Return the current time |
| DATE() | Extract the date part of a date or datetime expression |
| DATE_ADD() | Add time values (intervals) to a date value |
| DATE_FORMAT() | Format date as specified |
| DATE_SUB() | Subtract a time value (interval) from a date |
| DATEDIFF() | Subtract two dates |
| DAY() | Synonym for DAYOFMONTH() |
| DAYNAME() | Return the name of the weekday |
| DAYOFMONTH() | Return the day of the month (0-31) |
| DAYOFWEEK() | Return the weekday index of the argument |
| DAYOFYEAR() | Return the day of the year (1-366) |
| EXTRACT() | Extract part of a date |
| FROM_DAYS() | Convert a day number to a date |
| FROM_UNIXTIME() | Format Unix timestamp as a date |
| GET_FORMAT() | Return a date format string |
| HOUR() | Extract the hour |
| LAST_DAY | Return the last day of the month for the argument |
| LOCALTIME(), LOCALTIME | Synonym for NOW() |
| LOCALTIMESTAMP, LOCALTIMESTAMP() | Synonym for NOW() |
| MAKEDATE() | Create a date from the year and day of year |
| MAKETIME() | Create time from hour, minute, second |
| MICROSECOND() | Return the microseconds from argument |
| MINUTE() | Return the minute from the argument |
| MONTH() | Return the month from the date passed |
| MONTHNAME() | Return the name of the month |
| NOW() | Return the current date and time |
| PERIOD_ADD() | Add a period to a year-month |
| PERIOD_DIFF() | Return the number of months between periods |

| Name | Description |
|---|---|
| QUARTER() | Return the quarter from a date argument |
| SEC_TO_TIME() | Converts seconds to 'HH:MM:SS' format |
| SECOND() | Return the second (0-59) |
| STR_TO_DATE() | Convert a string to a date |
| SUBDATE() | Synonym for DATE_SUB() when invoked with three arguments |
| SUBTIME() | Subtract times |
| SYSDATE() | Return the time at which the function executes |
| TIME() | Extract the time portion of the expression passed |
| TIME_FORMAT() | Format as time |
| TIME_TO_SEC() | Return the argument converted to seconds |
| TIMEDIFF() | Subtract time |
| TIMESTAMP() | With a single argument, this function returns the date or datetime expression; with two arguments, the sum of the arguments |
| TIMESTAMPADD() | Add an interval to a datetime expression |
| TIMESTAMPDIFF() | Subtract an interval from a datetime expression |
| TO_DAYS() | Return the date argument converted to days |
| TO_SECONDS() | Return the date or datetime argument converted to seconds since Year 0 |
| UNIX_TIMESTAMP() | Return a Unix timestamp |
| UTC_DATE() | Return the current UTC date |
| UTC_TIME() | Return the current UTC time |
| UTC_TIMESTAMP() | Return the current UTC date and time |
| WEEK() | Return the week number |
| WEEKDAY() | Return the weekday index |
| WEEKOFYEAR() | Return the calendar week of the date (1-53) |
| YEAR() | Return the year |
| YEARWEEK() | Return the year and week |

For details, see Date and Time Functions.

#### 14.10.4.7.1 MySQL compatibility

The function `str_to_date()` is supported by TiDB, but is unable to parse all date and time values. In addition, the following date and time formatting options are **not implemented**:

| Format | Description |
|---|---|
| “%a” | Abbreviated weekday name (Sun..Sat) |
| “%D” | Day of the month with English suffix (0th, 1st, 2nd, 3rd) |
| “%U” | Week (00..53), where Sunday is the first day of the week; WEEK() mode 0 |
| “%u” | Week (00..53), where Monday is the first day of the week; WEEK() mode 1 |
| “%V” | Week (01..53), where Sunday is the first day of the week; WEEK() mode 2; used with %X |
| “%v” | Week (01..53), where Monday is the first day of the week; WEEK() mode 3; used with %x |
| “%W” | Weekday name (Sunday..Saturday) |
| “%w” | Day of the week (0=Sunday..6=Saturday) |
| “%X” | Year for the week where Sunday is the first day of the week, numeric, four digits. |
| “%x” | Year for the week, where Monday is the first day of the week, numeric, four digits. |

See issue #30082 for more details.

#### 14.10.4.7.2 Related system variables

The `default_week_format` variable affects the `WEEK()` function.

### 14.10.4.8 Bit Functions and Operators

TiDB supports all of the bit functions and operators available in MySQL 5.7.

**Bit functions and operators:**

| Name | Description |
|---|---|
| `BIT_COUNT ↪ ()` | Return the number of bits that are set as 1 |
| & | Bitwise AND |
| ~ | Bitwise inversion |
| \| | Bitwise OR |
| [^](https://dev.mysql.com/doc/refman/5.7/en/bit-functions.html#operator_bitwise-xor) | Bitwise XOR |
| << | Left shift |
| >> | Right shift |

### 14.10.4.9 Cast Functions and Operators

Cast functions and operators enable conversion of values from one data type to another. TiDB supports all of the cast functions and operators available in MySQL 5.7.

#### 14.10.4.9.1 List of cast functions and operators

| Name | Description |
|---|---|
| BINARY | Cast a string to a binary string |
| CAST() | Cast a value as a certain type |
| CONVERT() | Cast a value as a certain type |

**Note:**

TiDB and MySQL display inconsistent results for `SELECT CAST(MeN AS CHAR ↪ )` (or its equivalent form `SELECT CONVERT(MeM, CHAR)`), where `MeN` represents a double-precision floating-point number in scientific notation. MySQL displays the complete numeric value when `-15 <= N <= 14` and the scientific notation when `N < -15` or `N > 14`. However, TiDB always displays the complete numeric value. For example, MySQL displays the result of `SELECT ↪ CAST(3.1415e15 AS CHAR)` as `3.1415e15`, while TiDB displays the result as `3141500000000000`.

### 14.10.4.10 Encryption and Compression Functions

TiDB supports most of the encryption and compression functions available in MySQL 5.7.

#### 14.10.4.10.1 Supported functions

| Name | Description |
|---|---|
| MD5() | Calculate MD5 checksum |
| PASSWORD() | Calculate and return a password string |
| RANDOM_BYTES() | Return a random byte vector |
| SHA1(), SHA() | Calculate an SHA-1 160-bit checksum |
| SHA2() | Calculate an SHA-2 checksum |
| SM3() | Calculate an SM3 checksum (currently MySQL does not support this |
| AES_DECRYPT() | Decrypt using AES |
| AES_ENCRYPT() | Encrypt using AES |
| COMPRESS() | Return result as a binary string |
| UNCOMPRESS() | Uncompress a string compressed |
| UNCOMPRESSED_LENGTH() | Return the length of a string before compression |

| Name | Description |
|---|---|
| VALIDATE_PASSWORD_STRENGTH() | Validate the password strength |

#### 14.10.4.10.2 Related system variables

The `block_encryption_mode` variable sets the encryption mode that is used for `AES_ENCRYPT()` and `AES_DECRYPT()`.

#### 14.10.4.10.3 Unsupported functions

- `DES_DECRYPT()`, `DES_ENCRYPT()`, `OLD_PASSWORD()`, `ENCRYPT()`: these functions were deprecated in MySQL 5.7 and removed in 8.0.
- Functions only available in MySQL Enterprise Issue #2632.

### 14.10.4.11 Locking Functions

TiDB supports most of the user-level locking functions available in MySQL 5.7.

#### 14.10.4.11.1 Supported functions

| Name | Description |
|---|---|
| GET_LOCK(lockName, timeout) | Acquires an advisory lock. The `lockName` parameter must be NO longer than 64 characters. Waits maximum `timeout` seconds before timing out and returns a failure. |
| RELEASE_LOCK(lockName) | Releases a previously acquired lock. The `lockName` parameter must be NO longer than 64 characters. |
| RELEASE_ALL_LOCKS() | Releases all locks held by the current session. |

#### 14.10.4.11.2 MySQL compatibility

- The minimum timeout permitted by TiDB is 1 second, and the maximum timeout is 1 hour (3600 seconds). This differs from MySQL, where both 0 second and unlimited timeouts (`timeout=-1`) are permitted. TiDB will automatically convert out-of-range values to the nearest permitted value and convert `timeout=-1` to 3600 seconds.
- TiDB does not automatically detect deadlocks caused by user-level locks. Deadlocked sessions will timeout after a maximum of 1 hour, but can also be manually resolved by

using `KILL` on one of the affected sessions. You can also prevent deadlocks by always acquiring user-level locks in the same order.
- Locks take effect on all TiDB servers in the cluster. This differs from MySQL Cluster and Group Replication where locks are local to a single server.

#### 14.10.4.11.3 Unsupported functions

- `IS_FREE_LOCK()`
- `IS_USED_LOCK()`

### 14.10.4.12 Information Functions

TiDB supports most of the information functions available in MySQL 5.7.

#### 14.10.4.12.1 Supported functions

| Name | Description |
|---|---|
| `BENCHMARK()` | Execute an expression in a loop |
| `CONNECTION_ID()` | Return the connection ID (thread ID) for the connection |
| `CURRENT_USER()`, `CURRENT_USER` | Return the authenticated user name and host name |
| `DATABASE()` | Return the default (current) database name |
| `FOUND_ROWS()` | For a `SELECT` with a `LIMIT` clause, the number of the rows that are returned if there is no `LIMIT` clause |

| Name | Description |
| --- | --- |
| LAST_INSERT_ID () | Return the value of the AUTOINCREMENT column for the last INSERT |
| ROW_COUNT () | The number of rows affected |
| SCHEMA () | Synonym for DATABASE() |
| SESSION_USER () | Synonym for USER() |
| SYSTEM_USER () | Synonym for USER() |
| USER() | Return the user name and host name provided by the client |
| VERSION () | Return a string that indicates the MySQL server version |

#### 14.10.4.12.2 Unsupported functions

- CHARSET()
- COERCIBILITY()
- COLLATION()

### 14.10.4.13 JSON Functions

TiDB supports most of the JSON functions that shipped with the GA release of MySQL 5.7.

#### 14.10.4.13.1 Functions that create JSON values

| Function Name | Description |
| --- | --- |
| JSON_ARRAY([val[, val] ...]) | Evaluates a (possibly empty) list of values and returns a JSON array containing those values |
| JSON_OBJECT(key, val[, key, val] ...) | Evaluates a (possibly empty) list of key-value pairs and returns a JSON object containing those pairs |
| JSON_QUOTE(string) | Returns a string as a JSON value with quotes |

#### 14.10.4.13.2 Functions that search JSON values

| Function Name | Description |
| --- | --- |
| JSON_CONTAINS(target, candidate[, path]) | Indicates by returning 1 or 0 whether a given candidate JSON document is contained within a target JSON document |

| Function Name | Description |
| --- | --- |
| JSON_CONTAINS_PATH(json_doc, one_or_all, path[, path] ...) | Returns 0 or 1 to indicate whether a JSON document contains data at a given path or paths |
| JSON_EXTRACT(json_doc, path[, path] ...) | Returns data from a JSON document, selected from the parts of the document matched by the `path` arguments |
| -> | Returns the value from a JSON column after the evaluating path; an alias for `JSON_EXTRACT` ↪ `(doc,` ↪ `path_literal` ↪ `)` |

| Function Name | Description |
| --- | --- |
| ->> | Returns the value from a JSON column after the evaluating path and unquoting the result; an alias for `JSON_UNQUOTE ↪ ( ↪ JSON_EXTRACT ↪ (doc, ↪ path_literal ↪ ))` |
| JSON_KEYS(json_doc[, path]) | Returns the keys from the top-level value of a JSON object as a JSON array, or, if a path argument is given, the top-level keys from the selected path |
| JSON_SEARCH(json_doc, one_or_all, search_string) | Search a JSON document for one or all matches of a string |

#### 14.10.4.13.3 Functions that modify JSON values

| Function Name | Description |
|---|---|

| Function Name | Description |
|---|---|
| JSON_APPEND(json_doc, path, value) | An alias to `JSON_ARRAY_APPEND` ↪ |
| JSON_ARRAY_APPEND(json_doc, path, value) | Appends a value to the end of a JSON array at a specified path |
| JSON_ARRAY_INSERT(json_doc, path, val[, path, val] ...) | Inserts an array into the json document and returns the modified document |
| JSON_INSERT(json_doc, path, val[, path, val] ...) | Inserts data into a JSON document and returns the result |
| JSON_MERGE(json_doc, json_doc[, json_doc] ...) | A deprecated alias for `JSON_MERGE_PRESERVE` ↪ |
| JSON_MERGE_PATCH(json_doc, json_doc[, json_doc] ...) | Merge JSON documents |
| JSON_MERGE_PRESERVE(json_doc, json_doc[, json_doc] ...) | Merges two or more JSON documents and returns the merged result |

| Function Name | Description |
| --- | --- |
| JSON_REMOVE(json_doc, path[, path] …) | Removes data from a JSON document and returns the result |
| JSON_REPLACE(json_doc, path, val[, path, val] …) | Replaces existing values in a JSON document and returns the result |
| JSON_SET(json_doc, path, val[, path, val] …) | Inserts or updates data in a JSON document and returns the result |
| JSON_UNQUOTE(json_val) | Unquotes a JSON value and returns the result as a string |
| JSON_ARRAY_APPEND(json_doc, path, val[, path, val] …) | Appends values to the end of the indicated arrays within a JSON document and returns the result |
| JSON_ARRAY_INSERT(json_doc, path, val[, path, val] …) | Insert values into the specified location of a JSON document and returns the result |

#### 14.10.4.13.4 Functions that return JSON value attributes

| Function Name | Description |
|---|---|
| JSON_DEPTH(json_doc) | Returns the maximum depth of a JSON document |
| JSON_LENGTH(json_doc[, path]) | Returns the length of a JSON document, or, if a path argument is given, the length of the value within the path |
| JSON_TYPE(json_val) | Returns a string indicating the type of a JSON value |
| JSON_VALID(json_doc) | Checks if a json_doc is valid JSON. Useful for checking a column before converting it to the json type. |

#### 14.10.4.13.5 Utility Functions

| Function Name | Description |
|---|---|
| JSON_PRETTY(json_doc) | Pretty formatting of a JSON document |

| Function Name | Description |
| --- | --- |
| JSON_STORAGE_FREE(json_doc) | Returns how much storage space was freed in the binary representation of the JSON value after it was updated in place. As TiDB has different storage architecture from MySQL, this function always returns 0 for a valid JSON value, and it is implemented for compatibility with MySQL 8.0. |

| Function Name | Description |
| --- | --- |
| JSON_STORAGE_SIZE(json_doc) | Returns an approximate size of bytes required to store the json value. As the size does not account for TiKV using compression, the output of this function is not strictly compatible with MySQL. |

#### 14.10.4.13.6 Aggregate Functions

| Function Name | Description |
| --- | --- |
| JSON_ARRAYAGG(key) | Provides an aggregation of keys. |
| JSON_OBJECTAGG(key, value) | Provides an aggregation of values for a given key. |

### 14.10.4.14 Aggregate (GROUP BY) Functions

This document describes details about the supported aggregate functions in TiDB.

#### 14.10.4.14.1 Supported aggregate functions

This section describes the supported MySQL `GROUP BY` aggregate functions in TiDB.

| Name | Description |
|---|---|
| COUNT() | Return a count of the number of rows returned |
| COUNT(DISTINCT) | Return the count of a number of different values |
| SUM() | Return the sum |
| AVG() | Return the average value of the argument |
| MAX() | Return the maximum value |
| MIN() | Return the minimum value |
| GROUP_CONCAT() | Return a concatenated string |
| VARIANCE(), VAR_POP() | Return the population standard variance |
| STD(), STDDEV(), STDDEV_POP | Return the population standard deviation |
| VAR_SAMP() | Return the sample variance |
| STDDEV_SAMP() | Return the sample standard deviation |
| JSON_OBJECTAGG(key, value) | Return the result set as a single JSON object containing key-value pairs |

- Unless otherwise stated, group functions ignore `NULL` values.
- If you use a group function in a statement containing no `GROUP BY` clause, it is equivalent to grouping on all rows.

In addition, TiDB also provides the following aggregate functions:

- `APPROX_PERCENTILE(expr, constant_integer_expr)`

  This function returns the percentile of `expr`. The `constant_integer_expr` argument indicates the percentage value which is a constant integer in the range of `[1,100]`. A percentile Pk (`k` represents percentage) indicates that there are at least `k%` values in the data set that are less than or equal to Pk.

  This function only supports the numeric type and the date and time type as the returned type of `expr`. For other returned types, `APPROX_PERCENTILE` only returns `NULL`.

  The following example shows how to calculate the fiftieth percentile of a `INT` column:

```
drop table if exists t;
create table t(a int);
insert into t values(1), (2), (3);
```

```
select approx_percentile(a, 50) from t;
```

```
+--------------------------+
| approx_percentile(a, 50) |
+--------------------------+
|                        2 |
+--------------------------+
1 row in set (0.00 sec)
```

- `APPROX_COUNT_DISTINCT(expr, [expr...])`

  This function is similar to `COUNT(DISTINCT)` in counting the number of distinct values but returns an approximate result. It uses the `BJKST` algorithm, significantly reducing memory consumption when processing large datasets with a power-law distribution. Moreover, for low-cardinality data, this function provides high accuracy while maintaining efficient CPU utilization.

  The following example shows how to use this function:

```
DROP TABLE IF EXISTS t;
CREATE TABLE t(a INT, b INT, c INT);
INSERT INTO t VALUES(1, 1, 1), (2, 1, 1), (2, 2, 1), (3, 1, 1), (5, 1,
    ↪ 2), (5, 1, 2), (6, 1, 2), (7, 1, 2);
```

```
SELECT APPROX_COUNT_DISTINCT(a, b) FROM t GROUP BY c;
```

```
+-----------------------------+
| approx_count_distinct(a, b) |
+-----------------------------+
|                           3 |
|                           4 |
+-----------------------------+
2 rows in set (0.00 sec)
```

Except for the `GROUP_CONCAT()`, `APPROX_PERCENTILE()`, and `APPROX_COUNT_DISTINCT` functions, all the preceding functions can serve as Window functions.

#### 14.10.4.14.2 GROUP BY modifiers

TiDB does not currently support `GROUP BY` modifiers such as `WITH ROLLUP`. We plan to add support in the future. See TiDB #4250.

#### 14.10.4.14.3 SQL mode support

TiDB supports the SQL Mode `ONLY_FULL_GROUP_BY`, and when enabled TiDB will refuse queries with ambiguous non-aggregated columns. For example, this query is illegal with `ONLY_FULL_GROUP_BY` enabled because the non-aggregated column "b" in the `SELECT` list does not appear in the `GROUP BY` statement:

```
drop table if exists t;
create table t(a bigint, b bigint, c bigint);
insert into t values(1, 2, 3), (2, 2, 3), (3, 2, 3);

mysql> select a, b, sum(c) from t group by a;
+------+------+--------+
| a    | b    | sum(c) |
+------+------+--------+
|    1 |    2 |      3 |
|    2 |    2 |      3 |
|    3 |    2 |      3 |
+------+------+--------+
3 rows in set (0.01 sec)

mysql> set sql_mode = 'ONLY_FULL_GROUP_BY';
Query OK, 0 rows affected (0.00 sec)

mysql> select a, b, sum(c) from t group by a;
ERROR 1055 (42000): Expression #2 of SELECT list is not in GROUP BY clause
    ↪ and contains nonaggregated column 'b' which is not functionally
    ↪ dependent on columns in GROUP BY clause; this is incompatible with
    ↪ sql_mode=only_full_group_by
```

TiDB currently enables the `ONLY_FULL_GROUP_BY` mode by default.

Differences from MySQL

The current implementation of `ONLY_FULL_GROUP_BY` is less strict than that in MySQL 5.7. For example, suppose that we execute the following query, expecting the results to be ordered by "c":

```
drop table if exists t;
create table t(a bigint, b bigint, c bigint);
insert into t values(1, 2, 1), (1, 2, 2), (1, 3, 1), (1, 3, 2);
select distinct a, b from t order by c;
```

To order the result, duplicates must be eliminated first. But to do so, which row should we keep? This choice influences the retained value of "c", which in turn influences ordering and makes it arbitrary as well.

In MySQL, a query that has `DISTINCT` and `ORDER BY` is rejected as invalid if any `ORDER BY` expression does not satisfy at least one of these conditions:

- The expression is equal to one in the `SELECT` list
- All columns referenced by the expression and belonging to the query's selected tables are elements of the `SELECT` list

But in TiDB, the above query is legal, for more information see #4254.

Another TiDB extension to standard SQL permits references in the `HAVING` clause to aliased expressions in the `SELECT` list. For example, the following query returns "name" values that occur only once in table "orders":

```
select name, count(name) from orders
group by name
having count(name) = 1;
```

The TiDB extension permits the use of an alias in the `HAVING` clause for the aggregated column:

```
select name, count(name) as c from orders
group by name
having c = 1;
```

Standard SQL permits only column expressions in `GROUP BY` clauses, so a statement such as this is invalid because "FLOOR(value/100)" is a noncolumn expression:

```
select id, floor(value/100)
from tbl_name
group by id, floor(value/100);
```

TiDB extends standard SQL to permit noncolumn expressions in `GROUP BY` clauses and considers the preceding statement valid.

Standard SQL also does not permit aliases in `GROUP BY` clauses. TiDB extends standard SQL to permit aliases, so another way to write the query is as follows:

```
select id, floor(value/100) as val
from tbl_name
group by id, val;
```

#### 14.10.4.14.4 Related system variables

The `group_concat_max_len` variable sets the maximum number of items for the `GROUP_CONCAT()` function.

### 14.10.4.15 Window Functions

The usage of window functions in TiDB is similar to that in MySQL 8.0. For details, see MySQL Window Functions.

Because window functions reserve additional words in the parser, TiDB provides an option to disable window functions. If you receive errors parsing SQL statements after upgrading, try setting `tidb_enable_window_function=0`.

The window functions listed here can be pushed down to TiFlash.

Except for `GROUP_CONCAT()` and `APPROX_PERCENTILE()`, TiDB supports all `GROUP BY` aggregate functions. In addition, TiDB supports the following window functions:

| Function name | Feature description |
|---|---|
| `CUME_DIST()` | Returns the cumulative distribution of a value within a group of values. |
| `DENSE_RANK()` | Returns the rank of the current row within the partition, and the rank is without gaps. |
| `FIRST_VALUE()` | Returns the expression value of the first row in the current window. |
| `LAG()` | Returns the expression value from the row that precedes the current row by N rows within the partition. |
| `LAST_VALUE()` | Returns the expression value of the last row in the current window. |
| `LEAD()` | Returns the expression value from the row that follows the current row by N rows within the partition. |
| `NTH_VALUE()` | Returns the expression value from the N-th row of the current window. |
| `NTILE()` | Divides a partition into N buckets, assigns the bucket number to each row in the partition, and returns the bucket number of the current row within the partition. |
| `PERCENT_RANK()` | Returns the percentage of partition values that are less than the value in the current row. |
| `RANK()` | Returns the rank of the current row within the partition. The rank may be with gaps. |
| `ROW_NUMBER()` | Returns the number of the current row in the partition. |

#### 14.10.4.16 Miscellaneous Functions

TiDB supports most of the miscellaneous functions available in MySQL 5.7.

##### 14.10.4.16.1 Supported functions

| Name | Description |
|---|---|
| ANY_VALUE() | Suppress ONLY_FULL_GROUP_BY value rejection |
| BIN_TO_UUID() | Convert UUID from binary format to text format |
| DEFAULT() | Returns the default value for a table column |
| INET_ATON() | Return the numeric value of an IP address |
| INET_NTOA() | Return the IP address from a numeric value |
| INET6_ATON() | Return the numeric value of an IPv6 address |
| INET6_NTOA() | Return the IPv6 address from a numeric value |
| IS_IPV4() | Whether argument is an IPv4 address |
| IS_IPV4_COMPAT() | Whether argument is an IPv4-compatible address |
| IS_IPV4_MAPPED() | Whether argument is an IPv4-mapped address |
| IS_IPV6() | Whether argument is an IPv6 address |
| NAME_CONST() | Can be used to rename a column name |
| SLEEP() | Sleep for a number of seconds |
| UUID() | Return a Universal Unique Identifier (UUID) |
| UUID_TO_BIN() | Convert UUID from text format to binary format |
| VALUES() | Defines the values to be used during an INSERT |

#### 14.10.4.16.2 Unsupported functions

| Name | Description |
|---|---|
| UUID_SHORT () | Provides a UUID that is unique given certain assumptions not present in TiDB TiDB #4620 |
| MASTER_WAIT_POS () | Relates to MySQL replication |

### 14.10.4.17 Precision Math

The precision math support in TiDB is consistent with MySQL. For more information, see Precision Math in MySQL.

#### 14.10.4.17.1 Numeric types

The scope of precision math for exact-value operations includes the exact-value data types (integer and DECIMAL types) and exact-value numeric literals. Approximate-value data types and numeric literals are handled as floating-point numbers.

Exact-value numeric literals have an integer part or fractional part, or both. They may be signed. Examples: `1`, `.2`, `3.4`, `-5`, `-6.78`, `+9.10`.

Approximate-value numeric literals are represented in scientific notation (power-of-10) with a mantissa and exponent. Either or both parts may be signed. Examples: `1.2E3`, `1.2E-3`, `-1.2E3`, `-1.2E-3`.

Two numbers that look similar might be treated differently. For example, `2.34` is an exact-value (fixed-point) number, whereas `2.34E0` is an approximate-value (floating-point) number.

The DECIMAL data type is a fixed-point type and the calculations are exact. The FLOAT and DOUBLE data types are floating-point types and calculations are approximate.

#### 14.10.4.17.2 DECIMAL data type characteristics

This section discusses the following topics of the characteristics of the DECIMAL data type (and its synonyms):

- Maximum number of digits
- Storage format
- Storage requirements

The declaration syntax for a DECIMAL column is `DECIMAL(M,D)`. The ranges of values for the arguments are as follows:

- M is the maximum number of digits (the precision). 1<= M <= 65.
- D is the number of digits to the right of the decimal point (the scale). 1 <= D <= 30 and D must be no larger than M.

The maximum value of 65 for M means that calculations on DECIMAL values are accurate up to 65 digits. This limit of 65 digits of precision also applies to exact-value numeric literals.

Values for DECIMAL columns are stored using a binary format that packs 9 decimal digits into 4 bytes. The storage requirements for the integer and fractional parts of each value are determined separately. Each multiple of 9 digits requires 4 bytes, and any remaining digits left over require some fraction of 4 bytes. The storage required for remaining digits is given by the following table.

| Leftover Digits | Number of Bytes |
|---|---|
| 0 | 0 |
| 1–2 | 1 |
| 3–4 | 2 |
| 5–6 | 3 |
| 7–9 | 4 |

For example, a `DECIMAL(18,9)` column has 9 digits on each side of the decimal point, so the integer part and the fractional part each require 4 bytes. A `DECIMAL(20,6)` column has 14 integer digits and 6 fractional digits. The integer digits require 4 bytes for 9 of the digits and 3 bytes for the remaining 5 digits. The 6 fractional digits require 3 bytes.

DECIMAL columns do not store a leading `+` character or `-` character or leading `0` digits. If you insert `+0003.1` into a `DECIMAL(5,1)` column, it is stored as `3.1`. For negative numbers, a literal `-` character is not stored.

DECIMAL columns do not permit values larger than the range implied by the column definition. For example, a `DECIMAL(3,0)` column supports a range of `-999` to `999`. A `DECIMAL(M,D)` column permits at most `M - D` digits to the left of the decimal point.

For more information about the internal format of the DECIMAL values, see `mydecimal.go` in TiDB souce code.

#### 14.10.4.17.3 Expression handling

For expressions with precision math, TiDB uses the exact-value numbers as given whenever possible. For example, numbers in comparisons are used exactly as given without a change in value. In strict SQL mode, if you add an exact data type into a column, a number is inserted with its exact value if it is within the column range. When retrieved, the value is the same as what is inserted. If strict SQL mode is not enabled, truncation for INSERT is permitted in TiDB.

How to handle a numeric expression depends on the values of the expression:

- If the expression contains any approximate values, the result is approximate. TiDB evaluates the expression using floating-point arithmetic.
- If the expression contains no approximate values are present, which means only exact values are contained, and if any exact value contains a fractional part, the expression is evaluated using DECIMAL exact arithmetic and has a precision of 65 digits.
- Otherwise, the expression contains only integer values. The expression is exact. TiDB evaluates the expression using integer arithmetic and has a precision the same as BIGINT (64 bits).
