The summarized counts can be reset using the statement `FLUSH CLIENT_ERRORS_SUMMARY`  $\hookrightarrow$  . The summary is local to each TiDB server and is only retained in memory. Summaries will be lost if the TiDB server restarts.

```
USE INFORMATION_SCHEMA;
DESC CLIENT_ERRORS_SUMMARY_BY_HOST;
```

The output is as follows:

```

+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+
HOST	varchar(255)	NO		NULL	
ERROR_NUMBER	bigint(64)	NO		NULL	
ERROR_MESSAGE	varchar(1024)	NO		NULL	
ERROR_COUNT	bigint(64)	NO		NULL	
WARNING_COUNT	bigint(64)	NO		NULL	
FIRST_SEEN	timestamp	YES		NULL	
LAST_SEEN	timestamp	YES		NULL	
+-----+
7 rows in set (0.00 sec)

```

Field description:

- **HOST**: The remote host of the client.
- **ERROR\_NUMBER**: The MySQL-compatible error number that was returned.
- **ERROR\_MESSAGE**: The error message which matches the error number (in prepared statement form).
- **ERROR\_COUNT**: The number of times this error was returned to the client host.
- **WARNING\_COUNT**: The number of times this warning was returned to the client host.
- **FIRST\_SEEN**: The first time this error (or warning) was seen from the client host.
- **LAST\_SEEN**: The most recent time this error (or warning) was seen from the client host.

The following example shows a warning being generated when the client connects to a local TiDB server. The summary is reset after executing `FLUSH CLIENT_ERRORS_SUMMARY`:

```

SELECT 0/0;
SELECT * FROM CLIENT_ERRORS_SUMMARY_BY_HOST;
FLUSH CLIENT_ERRORS_SUMMARY;
SELECT * FROM CLIENT_ERRORS_SUMMARY_BY_HOST;

```

The output is as follows:

```

+-----+
| 0/0 |
+-----+
| NULL |
+-----+
1 row in set, 1 warning (0.00 sec)

+---
 ↪ -----+
 ↪

```

```

```

#### 14.11.18.2.4 CLIENT\_ERRORS\_SUMMARY\_BY\_USER

The table `CLIENT_ERRORS_SUMMARY_BY_USER` provides a summary of SQL errors and warnings that have been returned to clients that connect to a TiDB server. These include:

- Malformed SQL statements.
- Division by zero errors.
- The attempt to insert out-of-range or duplicate key values.
- Permission errors.
- A table that does not exist.

Client errors are returned to the client via the MySQL server protocol, where applications are expected to take appropriate action. The `INFORMATION_SCHEMA.CLIENT_ERRORS_SUMMARY_BY_USER` table provides an useful method to inspect errors in the scenario where applications are not correctly handling (or logging) errors returned by the TiDB server.

Because `CLIENT_ERRORS_SUMMARY_BY_USER` summarizes the errors on a per-user basis, it can be useful to diagnose scenarios where one user server is generating more errors than other servers. Possible scenarios include:

- Permission errors.
- Missing tables, or relational objects.
- Incorrect SQL syntax, or incompatibilities between the application and the version of TiDB.

The summarized counts can be reset with the statement `FLUSH CLIENT_ERRORS_SUMMARY` . The summary is local to each TiDB server and is only retained in memory. Summaries will be lost if the TiDB server restarts.

```
USE INFORMATION_SCHEMA;
DESC CLIENT_ERRORS_SUMMARY_BY_USER;
```

The output is as follows:

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
USER	varchar(64)	NO		NULL	
ERROR_NUMBER	bigint(64)	NO		NULL	
ERROR_MESSAGE	varchar(1024)	NO		NULL	
ERROR_COUNT	bigint(64)	NO		NULL	
WARNING_COUNT	bigint(64)	NO		NULL	
FIRST_SEEN	timestamp	YES		NULL	
LAST_SEEN	timestamp	YES		NULL	
+-----+-----+-----+-----+-----+-----+
7 rows in set (0.00 sec)
```

Field description:

- **USER:** The authenticated user.
- **ERROR\_NUMBER:** The MySQL-compatible error number that was returned.
- **ERROR\_MESSAGE:** The error message which matches the error number (in prepared statement form).
- **ERROR\_COUNT:** The number of times this error was returned to the user.
- **WARNING\_COUNT:** The number of times this warning was returned to the user.
- **FIRST\_SEEN:** The first time this error (or warning) was sent to the user.
- **LAST\_SEEN:** The most recent time this error (or warning) was sent to the user.

The following example shows a warning being generated when the client connects to a local TiDB server. The summary is reset after executing `FLUSH CLIENT_ERRORS_SUMMARY:`

```
SELECT 0/0;
SELECT * FROM CLIENT_ERRORS_SUMMARY_BY_USER;
FLUSH CLIENT_ERRORS_SUMMARY;
SELECT * FROM CLIENT_ERRORS_SUMMARY_BY_USER;
```

The output is as follows:

```
+-----+
| 0/0 |
+-----+
| NULL |
+-----+
1 row in set, 1 warning (0.00 sec)
```

```

+---
 ↪ -----+-----+-----+-----+-----+

+---
 ↪ -----+-----+-----+-----+
 ↪
1 row in set (0.00 sec)

Query OK, 0 rows affected (0.00 sec)

Empty set (0.00 sec)

```

#### 14.11.18.2.5 CLIENT\_ERRORS\_SUMMARY\_GLOBAL

The table `CLIENT_ERRORS_SUMMARY_GLOBAL` provides a global summary of all SQL errors and warnings that have been returned to clients that connect to a TiDB server. These include:

- Malformed SQL statements.
- Division by zero errors.
- The attempt to insert out-of-range of duplicate key values.
- Permission errors.
- A table does not exist.

Client errors are returned to the client via the MySQL server protocol, where applications are expected to take appropriate action. The `INFORMATION_SCHEMA.CLIENT_ERRORS_SUMMARY_GLOBAL` table provides a high-level overview, and is useful in the scenario where applications are not correctly handling (or logging) errors returned by the TiDB server.

The summarized counts can be reset with the statement `FLUSH CLIENT_ERRORS_SUMMARY`. The summary is local to each TiDB server and is only retained in memory. Summaries will be lost if the TiDB server restarts.

```

USE INFORMATION_SCHEMA;
DESC CLIENT_ERRORS_SUMMARY_GLOBAL;

```

The output is as follows:

```

+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+
ERROR_NUMBER	bigint(64)	NO		NULL	
ERROR_MESSAGE	varchar(1024)	NO		NULL	
ERROR_COUNT	bigint(64)	NO		NULL	
WARNING_COUNT	bigint(64)	NO		NULL	
FIRST_SEEN	timestamp	YES		NULL	
LAST_SEEN	timestamp	YES		NULL	
+-----+-----+
6 rows in set (0.00 sec)

```

Field description:

- **ERROR\_NUMBER**: The MySQL-compatible error number that was returned.
- **ERROR\_MESSAGE**: The error message which matches the error number (in prepared statement form).
- **ERROR\_COUNT**: The number of times this error was returned.
- **WARNING\_COUNT**: The number of times this warning was returned.
- **FIRST\_SEEN**: The first time this error (or warning) was sent.
- **LAST\_SEEN**: The most recent time this error (or warning) was sent.

The following example shows a warning being generated when connecting to a local TiDB server. The summary is reset after executing `FLUSH CLIENT_ERRORS_SUMMARY`:

```

SELECT 0/0;
SELECT * FROM CLIENT_ERRORS_SUMMARY_GLOBAL;
FLUSH CLIENT_ERRORS_SUMMARY;
SELECT * FROM CLIENT_ERRORS_SUMMARY_GLOBAL;

```

The output is as follows:

```

+-----+
| 0/0 |
+-----+
| NULL |
+-----+
1 row in set, 1 warning (0.00 sec)

+---
↪ -----+-----+-----+-----+
↪
| ERROR_NUMBER | ERROR_MESSAGE | ERROR_COUNT | WARNING_COUNT | FIRST_SEEN |
↪ LAST_SEEN |

```

```

+--
↪ -----+-----+-----+-----+-----+-----+
↪
| 1365 | Division by 0 | 0 | 1 | 2021-03-18 13:10:51
↪ | 2021-03-18 13:10:51 |
+--
↪ -----+-----+-----+-----+
↪
1 row in set (0.00 sec)

Query OK, 0 rows affected (0.00 sec)

Empty set (0.00 sec)

```

#### 14.11.18.2.6 CHARACTER\_SETS

The CHARACTER\_SETS table provides information about **character sets**. Currently, TiDB only supports some of the character sets.

```

USE INFORMATION_SCHEMA;
DESC CHARACTER_SETS;

```

The output is as follows:

```

+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
CHARACTER_SET_NAME	varchar(32)	YES		NULL	
DEFAULT_COLLATE_NAME	varchar(32)	YES		NULL	
DESCRIPTION	varchar(60)	YES		NULL	
MAXLEN	bigint(3)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
4 rows in set (0.00 sec)

```

View the CHARACTER\_SETS table:

```

SELECT * FROM `CHARACTER_SETS`;

```

The output is as follows:

```

+--
↪ -----+-----+-----+-----+-----+
↪
| CHARACTER_SET_NAME | DEFAULT_COLLATE_NAME | DESCRIPTION |
↪ MAXLEN |

```

```

+---+
|< |
|< |
| ascii | ascii_bin | US ASCII |
|< 1 |
| binary | binary | binary |
|< 1 |
| gbk | gbk_chinese_ci | Chinese Internal Code Specification
|< 2 |
| latin1 | latin1_bin | Latin1 |
|< 1 |
| utf8 | utf8_bin | UTF-8 Unicode |
|< 3 |
| utf8mb4 | utf8mb4_bin | UTF-8 Unicode |
|< 4 |
+---+
|< |
|< |
6 rows in set (0.00 sec)

```

The description of columns in the `CHARACTER_SETS` table is as follows:

- `CHARACTER_SET_NAME`: The name of the character set.
- `DEFAULT_COLLATE_NAME`: The default collation name of the character set.
- `DESCRIPTION`: The description of the character set.
- `MAXLEN`: The maximum length required to store a character in this character set.

#### 14.11.18.2.7 CLUSTER\_CONFIG

You can use the `CLUSTER_CONFIG` cluster configuration table to get the current configuration of all server components in the cluster. This simplifies the usage over earlier releases of TiDB, where obtaining similar information would require accessing the HTTP API endpoints of each instance.

```

USE information_schema;
DESC cluster_config;

```

```

+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+
TYPE	varchar(64)	YES		NULL	
INSTANCE	varchar(64)	YES		NULL	
KEY	varchar(256)	YES		NULL	
VALUE	varchar(128)	YES		NULL	
+-----+-----+-----+-----+-----+

```

Field description:

- **TYPE:** The instance type. The optional values are `tidb`, `pd`, and `tikv`.
- **INSTANCE:** The service address of the instance.
- **KEY:** The configuration item name.
- **VALUE:** The configuration item value.

The following example shows how to query the coprocessor configuration on the TiKV instance using the `CLUSTER_CONFIG` table:

```
SELECT * FROM cluster_config WHERE type='tikv' AND `key` LIKE 'coprocessor%'
↪ ;
```

```
+-----+-----+-----+-----+
| TYPE | INSTANCE | KEY | VALUE |
+-----+-----+-----+-----+
tikv	127.0.0.1:20165	coprocessor.batch-split-limit	10
tikv	127.0.0.1:20165	coprocessor.region-max-keys	1440000
tikv	127.0.0.1:20165	coprocessor.region-max-size	144MiB
tikv	127.0.0.1:20165	coprocessor.region-split-keys	960000
tikv	127.0.0.1:20165	coprocessor.region-split-size	96MiB
tikv	127.0.0.1:20165	coprocessor.split-region-on-table	false
+-----+-----+-----+-----+
6 rows in set (0.00 sec)
```

#### 14.11.18.2.8 CLUSTER\_HARDWARE

The `CLUSTER_HARDWARE` hardware system table provides the hardware information of the server where each instance of the cluster is located.

```
USE information_schema;
DESC cluster hardware;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
TYPE	varchar(64)	YES		NULL	
INSTANCE	varchar(64)	YES		NULL	
DEVICE_TYPE	varchar(64)	YES		NULL	
DEVICE_NAME	varchar(64)	YES		NULL	
NAME	varchar(256)	YES		NULL	
VALUE	varchar(128)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
6 rows in set (0.00 sec)
```

Field description:

- **TYPE:** Corresponds to the **TYPE** field in the `information_schema.cluster_info` table. The optional values are `tidb`, `pd`, and `tikv`.
- **INSTANCE:** Corresponds to the **INSTANCE** field in the `information_schema.cluster_info` cluster information table.
- **DEVICE\_TYPE:** Hardware type. Currently, you can query the `cpu`, `memory`, `disk`, and `net` types.
- **DEVICE\_NAME:** Hardware name. The value of **DEVICE\_NAME** varies with **DEVICE\_TYPE**.
  - `cpu`: The hardware name is `cpu`.
  - `memory`: The hardware name is `memory`.
  - `disk`: The disk name.
  - `net`: The network card name.
- **NAME:** The different information names of the hardware. For example, `cpu` has two information names: `cpu-logical-cores` and `cpu-physical-cores`, which respectively mean logical core numbers and physical core numbers.
- **VALUE:** The value of the corresponding hardware information, such as the disk volume and CPU core numbers.

The following example shows how to query the CPU information using the `CLUSTER_HARDWARE` table:

```
SELECT * FROM clusterHardware WHERE device_type='cpu' AND device_name='cpu
↳ ' AND name LIKE '%cores';
```

```
+--
↳ -----+-----+-----+-----+-----+-----+
↳
| TYPE | INSTANCE | DEVICE_TYPE | DEVICE_NAME | NAME | VALUE |
+--
↳ -----+-----+-----+-----+-----+-----+
↳
tidb	0.0.0.0:4000	cpu	cpu	cpu-logical-cores	16
tidb	0.0.0.0:4000	cpu	cpu	cpu-physical-cores	8
pd	127.0.0.1:2379	cpu	cpu	cpu-logical-cores	16
pd	127.0.0.1:2379	cpu	cpu	cpu-physical-cores	8
tikv	127.0.0.1:20165	cpu	cpu	cpu-logical-cores	16
tikv	127.0.0.1:20165	cpu	cpu	cpu-physical-cores	8
+--
↳ -----+-----+-----+-----+-----+-----+
↳
6 rows in set (0.03 sec)
```

### 14.11.18.2.9 CLUSTER\_INFO

The `CLUSTER_INFO` cluster topology table provides the current topology information of the cluster, the version information of each instance, the Git Hash corresponding to the instance version, the starting time of each instance, and the running time of each instance.

```
USE information_schema;
desc cluster_info;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
TYPE	varchar(64)	YES		NULL	
INSTANCE	varchar(64)	YES		NULL	
STATUS_ADDRESS	varchar(64)	YES		NULL	
VERSION	varchar(64)	YES		NULL	
GIT_HASH	varchar(64)	YES		NULL	
START_TIME	varchar(32)	YES		NULL	
UPTIME	varchar(32)	YES		NULL	
SERVER_ID	bigint(21)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
8 rows in set (0.01 sec)
```

Field description:

- `TYPE`: The instance type. The optional values are `tidb`, `pd`, and `tikv`.
- `INSTANCE`: The instance address, which is a string in the format of `IP:PORT`.
- `STATUS_ADDRESS`: The service address of HTTP API. Some commands in `tikv-ctl`, `pd-ctl`, or `tidb-ctl` might use this API and this address. You can also get more cluster information via this address. Refer to [TiDB HTTP API document](#) for details.
- `VERSION`: The semantic version number of the corresponding instance. To be compatible with the MySQL version number, the TiDB version is displayed in the format of `mysql-version-tidb-version`.
- `GIT_HASH`: The Git Commit Hash when compiling the instance version, which is used to identify whether two instances are of the absolutely consistent version.
- `START_TIME`: The starting time of the corresponding instance.
- `UPTIME`: The uptime of the corresponding instance.
- `SERVER_ID`: The server ID of the corresponding instance.

```
SELECT * FROM cluster_info;
```

```
+--
|
|
+--
```

```

| TYPE | INSTANCE | STATUS_ADDRESS | VERSION | GIT_HASH
|-----+-----+-----+-----+-----+
| | | | |
| | | | |
+---+

+---+			
3 rows in set (0.00 sec)

```

#### 14.11.18.2.10 CLUSTER\_LOAD

The `CLUSTER_LOAD` cluster load table provides the current load information of the server where each instance of the TiDB cluster is located.

```

USE information_schema;
DESC cluster_load;

```

```

+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
TYPE	varchar(64)	YES		NULL	
INSTANCE	varchar(64)	YES		NULL	
DEVICE_TYPE	varchar(64)	YES		NULL	
DEVICE_NAME	varchar(64)	YES		NULL	
NAME	varchar(256)	YES		NULL	
VALUE	varchar(128)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
6 rows in set (0.00 sec)

```

Field description:

- `TYPE`: Corresponds to the `TYPE` field in the `information_schema.cluster_info` table. The optional values are `tidb`, `pd`, and `tikv`.

- **INSTANCE:** Corresponds to the `INSTANCE` field in the `information_schema.cluster_info` cluster information table.
- **DEVICE\_TYPE:** Hardware type. Currently, you can query the `cpu`, `memory`, `disk`, and `net` types.
- **DEVICE\_NAME:** Hardware name. The value of `DEVICE_NAME` varies with `DEVICE_TYPE`.
  - `cpu`: The hardware name is `cpu`.
  - `disk`: The disk name.
  - `net`: The network card name.
  - `memory`: The hardware name is `memory`.
- **NAME:** Different load types. For example, `cpu` has three load types: `load1`, `load5`, and `load15`, which respectively mean the average load of `cpu` within 1 minute, 5 minutes, and 15 minutes.
- **VALUE:** The value of the hardware load. For example, `1min`, `5min`, and `15min` respectively mean the average load of the hardware within 1 minute, 5 minutes, and 15 minutes.

The following example shows how to query the current load information of `cpu` using the `CLUSTER_LOAD` table:

```
SELECT * FROM cluster_load WHERE device_type='cpu' AND device_name='cpu';
```

```
+-----+-----+-----+-----+-----+
| TYPE | INSTANCE | DEVICE_TYPE | DEVICE_NAME | NAME | VALUE |
+-----+-----+-----+-----+-----+
tidb	0.0.0.0:4000	cpu	cpu	load1	0.13
tidb	0.0.0.0:4000	cpu	cpu	load5	0.25
tidb	0.0.0.0:4000	cpu	cpu	load15	0.31
pd	127.0.0.1:2379	cpu	cpu	load1	0.13
pd	127.0.0.1:2379	cpu	cpu	load5	0.25
pd	127.0.0.1:2379	cpu	cpu	load15	0.31
tikv	127.0.0.1:20165	cpu	cpu	load1	0.13
tikv	127.0.0.1:20165	cpu	cpu	load5	0.25
tikv	127.0.0.1:20165	cpu	cpu	load15	0.31
+-----+-----+-----+-----+-----+
9 rows in set (1.50 sec)
```

#### 14.11.18.2.11 CLUSTER\_LOG

You can query cluster logs on the `CLUSTER_LOG` cluster log table. By pushing down query conditions to each instance, the impact of the query on cluster performance is less than that of the `grep` command.

To get the logs of the TiDB cluster before v4.0, you need to log in to each instance to summarize logs. This cluster log table in 4.0 provides the global and time-ordered log

search result, which makes it easier to track full-link events. For example, by searching logs according to the `region id`, you can query all logs in the life cycle of this Region. Similarly, by searching the full link log through the slow log's `txn id`, you can query the flow and the number of keys scanned by this transaction at each instance.

```
USE information_schema;
DESC cluster_log;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
TIME	varchar(32)	YES		NULL	
TYPE	varchar(64)	YES		NULL	
INSTANCE	varchar(64)	YES		NULL	
LEVEL	varchar(8)	YES		NULL	
MESSAGE	var_string(1024)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
5 rows in set (0.00 sec)
```

Field description:

- **TIME**: The time to print the log.
- **TYPE**: The instance type. The optional values are `tidb`, `pd`, and `tikv`.
- **INSTANCE**: The service address of the instance.
- **LEVEL**: The log level.
- **MESSAGE**: The log content.

#### Note:

- All fields of the cluster log table are pushed down to the corresponding instance for execution. To reduce the overhead of using the cluster log table, you must specify the keywords used for the search, the time range, and as many conditions as possible. For example, `select * from cluster_log where message like '%ddl ↵ %' and time > '2020-05-18 20:40:00' and time < '2020-05-18 ↵ 21:40:00' and type='tidb'`.
- The `message` field supports the `like` and `regexp` regular expressions, and the corresponding pattern is encoded as `regexp`. Specifying multiple `message` conditions is equivalent to the pipeline form of the `grep` command. For example, executing the `select * from cluster_log ↵ where message like 'coprocessor%' and message regexp ↵ '.*slow.*' and time > '2020-05-18 20:40:00' and time ↵ < '2020-05-18 21:40:00'` statement is equivalent to executing

```
grep 'coprocessor' xxx.log | grep -E '.*slow.*' on all cluster instances.
```

The following example shows how to query the execution process of a DDL statement using the CLUSTER\_LOG table:

```
SELECT time,instance,left(message,150) FROM cluster_log WHERE message LIKE
↳ '%ddl%job%ID.80%' AND type='tidb' AND time > '2020-05-18 20:40:00'
↳ AND time < '2020-05-18 21:40:00'
```

```
+--
↳ -----+-----+
↳
| time | instance | left(message,150)
↳
↳ |

↳ [ver=70] ["take time"]=50.809848ms] [job="ID:80, Type: |
| 2020/05/18 21:37:55.382 | 127.0.0.1:4000 | [ddl_worker.go:359] ["[ddl]
↳ finish DDL job"] [worker="worker 1, tp general"] [job="ID:80, Type:
↳ create table, State:synced, SchemaState:public, SchemaI |
| 2020/05/18 21:37:55.786 | 127.0.0.1:4002 | [ddl.go:509] ["[ddl] DDL job is
↳ finished"] [jobID=80]
↳
↳ |
+-----+-----+
↳
```

The query results above show the process of executing a DDL statement:

1. The request with a DDL JOB ID of 80 is sent to the 127.0.0.1:4002 TiDB instance.

2. The 127.0.0.1:4000 TiDB instance processes this DDL request, which indicates that the 127.0.0.1:4000 instance is the DDL owner at that time.
3. The request with a DDL JOB ID of 80 has been processed.

#### 14.11.18.2.12 CLUSTER\_SYSTEMINFO

You can use the `CLUSTER_SYSTEMINFO` kernel parameter table to query the kernel configuration information of the server where all instances of the cluster are located. Currently, you can query the information of the `sysctl` system.

```
USE information_schema;
DESC cluster_systeminfo;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
TYPE	varchar(64)	YES		NULL	
INSTANCE	varchar(64)	YES		NULL	
SYSTEM_TYPE	varchar(64)	YES		NULL	
SYSTEM_NAME	varchar(64)	YES		NULL	
NAME	varchar(256)	YES		NULL	
VALUE	varchar(128)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
6 rows in set (0.00 sec)
```

Field description:

- **TYPE**: Corresponds to the `TYPE` field in the `information_schema.cluster_info` table. The optional values are `tidb`, `pd`, and `tikv`.
- **INSTANCE**: Corresponds to the `INSTANCE` field in the `information_schema.cluster_info` cluster information table.
- **SYSTEM\_TYPE**: The system type. Currently, you can query the `system` system type.
- **SYSTEM\_NAME**: The system name. Currently, you can query the `sysctl` system name.
- **NAME**: The configuration name corresponding to `sysctl`.
- **VALUE**: The value of the configuration item corresponding to `sysctl`.

The following example shows how to query the kernel version of all servers in the cluster using the `CLUSTER_SYSTEMINFO` system information table.

```
SELECT * FROM cluster_systeminfo WHERE name LIKE '%kernel.osrelease%'
```

```
+---+
↪ -----+-----+-----+-----+-----+-----+
↪
| TYPE | INSTANCE | SYSTEM_TYPE | SYSTEM_NAME | NAME | VALUE
↪
|-----+-----+-----+-----+-----+-----+
|
```

```
+--
 ↪ -----+-----+-----+-----+-----+
 ↪
| tidb | 172.16.5.40:4008 | system | sysctl | kernel.osrelease |
 ↪ 3.10.0-862.14.4.el7.x86_64 |
| pd | 172.16.5.40:20379 | system | sysctl | kernel.osrelease |
 ↪ 3.10.0-862.14.4.el7.x86_64 |
| tikv | 172.16.5.40:21150 | system | sysctl | kernel.osrelease |
 ↪ 3.10.0-862.14.4.el7.x86_64 |
+--
 ↪ -----+-----+-----+-----+-----+
 ↪
```

### 14.11.18.2.13 COLLATIONS

The COLLATIONS table provides a list of collations that correspond to character sets in the CHARACTER\_SETS table. Currently, this table is included only for compatibility with MySQL.

```
USE information_schema;
DESC collations;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
COLLATION_NAME	varchar(32)	YES		NULL	
CHARACTER_SET_NAME	varchar(32)	YES		NULL	
ID	bigint(11)	YES		NULL	
IS_DEFAULT	varchar(3)	YES		NULL	
IS_COMPILED	varchar(3)	YES		NULL	
SORTLEN	bigint(3)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
6 rows in set (0.00 sec)
```

```
SELECT * FROM collations WHERE character_set_name='utf8mb4';
```

```
+--
 ↪ -----+-----+-----+-----+-----+
 ↪
| COLLATION_NAME | CHARACTER_SET_NAME | ID | IS_DEFAULT | IS_COMPILED |
 ↪ SORTLEN |
+--
 ↪ -----+-----+-----+-----+-----+
 ↪
```

```

| utf8mb4_bin | utf8mb4 | 46 | Yes | Yes | 1
 ↳ |
| utf8mb4_general_ci | utf8mb4 | 45 | | Yes | 1
 ↳ |
| utf8mb4_unicode_ci | utf8mb4 | 224 | | Yes | 1
 ↳ |
+---+
 ↳ -----+-----+-----+-----+
 ↳
3 rows in set (0.001 sec)

```

The description of columns in the COLLATIONS table is as follows:

- COLLATION\_NAME: The name of the collation.
- CHARACTER\_SET\_NAME: The name of the character set which the collation belongs to.
- ID: The ID of the collation.
- IS\_DEFAULT: Whether this collation is the default collation of the character set it belongs to.
- IS\_COMPILED: Whether the character set is compiled into the server.
- SORTLEN: The minimum length of memory allocated when the collation sorts characters.

#### 14.11.18.2.14 COLLATION\_CHARACTER\_SET\_APPLICABILITY

The COLLATION\_CHARACTER\_SET\_APPLICABILITY table maps collations to the applicable character set name. Similar to the COLLATIONS table, it is included only for compatibility with MySQL.

```

USE INFORMATION_SCHEMA;
DESC COLLATION_CHARACTER_SET_APPLICABILITY;

```

The output is as follows:

```

+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
| COLLATION_NAME | varchar(32) | NO | | NULL | |
| CHARACTER_SET_NAME | varchar(32) | NO | | NULL | |
+-----+-----+-----+-----+-----+-----+
2 rows in set (0.00 sec)

```

View the collation mapping for the utf8mb4 character set in the COLLATION\_CHARACTER\_SET\_APPLICABILITY table:

```

SELECT * FROM COLLATION_CHARACTER_SET_APPLICABILITY WHERE
 ↳ character_set_name='utf8mb4';

```

The output is as follows:

```

+-----+
| COLLATION_NAME | CHARACTER_SET_NAME |
+-----+
utf8mb4_bin	utf8mb4
utf8mb4_general_ci	utf8mb4
utf8mb4_unicode_ci	utf8mb4
+-----+
3 rows in set (0.00 sec)

```

The description of columns in the COLLATION\_CHARACTER\_SET\_APPLICABILITY table is as follows:

- COLLATION\_NAME: The name of the collation.
- CHARACTER\_SET\_NAME: The name of the character set which the collation belongs to.

#### 14.11.18.2.15 COLUMNS

The COLUMNS table provides detailed information about columns in tables.

```

USE INFORMATION_SCHEMA;
DESC COLUMNS;

```

The output is as follows:

```

+---
 ↪ -----+-----+-----+-----+-----+
 ↪
| Field | Type | Null | Key | Default | Extra |
+---
 ↪ -----+-----+-----+-----+-----+
 ↪
TABLE_CATALOG	varchar(512)	YES		NULL	
TABLE_SCHEMA	varchar(64)	YES		NULL	
TABLE_NAME	varchar(64)	YES		NULL	
COLUMN_NAME	varchar(64)	YES		NULL	
ORDINAL_POSITION	bigint(64)	YES		NULL	
COLUMN_DEFAULT	text	YES		NULL	
IS_NULLABLE	varchar(3)	YES		NULL	
DATA_TYPE	varchar(64)	YES		NULL	
CHARACTER_MAXIMUM_LENGTH	bigint(21)	YES		NULL	
CHARACTER_OCTET_LENGTH	bigint(21)	YES		NULL	
NUMERIC_PRECISION	bigint(21)	YES		NULL	
NUMERIC_SCALE	bigint(21)	YES		NULL	
DATETIME_PRECISION	bigint(21)	YES		NULL	

```

|                       |               |     |  |      |  |
|-----------------------|---------------|-----|--|------|--|
| CHARACTER_SET_NAME    | varchar(32)   | YES |  | NULL |  |
| COLLATION_NAME        | varchar(32)   | YES |  | NULL |  |
| COLUMN_TYPE           | text          | YES |  | NULL |  |
| COLUMN_KEY            | varchar(3)    | YES |  | NULL |  |
| EXTRA                 | varchar(30)   | YES |  | NULL |  |
| PRIVILEGES            | varchar(80)   | YES |  | NULL |  |
| COLUMN_COMMENT        | varchar(1024) | YES |  | NULL |  |
| GENERATION_EXPRESSION | text          | NO  |  | NULL |  |

+--  
↪ -----+-----+-----+-----+-----+-----+-----  
↪

21 rows in set (0.00 sec)

Create a table `test.t1` and query the information in the `COLUMNS` table:

```
CREATE TABLE test.t1 (a int);
SELECT * FROM COLUMNS WHERE table_schema='test' AND TABLE_NAME='t1'\G
```

输出结果如下:

```
***** 1. row *****
 TABLE_CATALOG: def
 TABLE_SCHEMA: test
 TABLE_NAME: t1
 COLUMN_NAME: a
 ORDINAL_POSITION: 1
 COLUMN_DEFAULT: NULL
 IS_NULLABLE: YES
 DATA_TYPE: int
CHARACTER_MAXIMUM_LENGTH: NULL
CHARACTER_OCTET_LENGTH: NULL
 NUMERIC_PRECISION: 11
 NUMERIC_SCALE: 0
 DATETIME_PRECISION: NULL
 CHARACTER_SET_NAME: NULL
 COLLATION_NAME: NULL
 COLUMN_TYPE: int(11)
 COLUMN_KEY:
 EXTRA:
 PRIVILEGES: select,insert,update,references
 COLUMN_COMMENT:
 GENERATION_EXPRESSION:
1 row in set (0.02 sec)
```

The description of columns in the `COLUMNS` table is as follows:

- **TABLE\_CATALOG**: The name of the catalog to which the table with the column belongs. The value is always `def`.
- **TABLE\_SCHEMA**: The name of the schema in which the table with the column is located.
- **TABLE\_NAME**: The name of the table with the column.
- **COLUMN\_NAME**: The name of the column.
- **ORDINAL\_POSITION**: The position of the column in the table.
- **COLUMN\_DEFAULT**: The default value of the column. If the explicit default value is `NULL`, or if the column definition does not include the `default` clause, this value is `NULL`.
- **IS\_NULLABLE**: Whether the column is nullable. If the column can store null values, this value is `YES`; otherwise, it is `NO`.
- **DATA\_TYPE**: The type of data in the column.
- **CHARACTER\_MAXIMUM\_LENGTH**: For string columns, the maximum length in characters.
- **CHARACTER\_OCTET\_LENGTH**: For string columns, the maximum length in bytes.
- **NUMERIC\_PRECISION**: The numeric precision of a number-type column.
- **NUMERIC\_SCALE**: The numeric scale of a number-type column.
- **DATETIME\_PRECISION**: For time-type columns, the fractional seconds precision.
- **CHARACTER\_SET\_NAME**: The name of the character set of a string column.
- **COLLATION\_NAME**: The name of the collation of a string column.
- **COLUMN\_TYPE**: The column type.
- **COLUMN\_KEY**: Whether this column is indexed. This field might have the following values:
  - Empty: This column is not indexed, or this column is indexed and is the second column in a multi-column non-unique index.
  - `PRI`: This column is the primary key or one of multiple primary keys.
  - `UNI`: This column is the first column of the unique index.
  - `MUL`: The column is the first column of a non-unique index, in which a given value is allowed to occur for multiple times.
- **EXTRA**: Any additional information of the given column.
- **PRIVILEGES**: The privilege that the current user has on this column. Currently, this value is fixed in TiDB, and is always `select,insert,update,references`.
- **COLUMN\_COMMENT**: Comments contained in the column definition.
- **GENERATION\_EXPRESSION**: For generated columns, this value displays the expression used to calculate the column value. For non-generated columns, the value is empty.

The corresponding `SHOW` statement is as follows:

```
SHOW COLUMNS FROM t1 FROM test;
```

The output is as follows:

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
| a | int(11) | YES | | NULL | |
+-----+-----+-----+-----+-----+-----+
```

```
1 row in set (0.00 sec)
```

#### 14.11.18.2.16 DATA\_LOCK\_WAITS

The `DATA_LOCK_WAITS` table shows the ongoing lock-wait information on all TiKV nodes in a cluster, including the lock-wait information of pessimistic transactions and the information of optimistic transactions being blocked.

```
USE information_schema;
DESC data_lock_waits;
```

```
+--
 ↪ -----+-----+-----+-----+-----+
 ↪
| Field | Type | Null | Key | Default | Extra |
+--
 ↪ -----+-----+-----+-----+-----+
 ↪
KEY	text	NO		NULL	
KEY_INFO	text	YES		NULL	
TRX_ID	bigint(21) unsigned	NO		NULL	
CURRENT_HOLDING_TRX_ID	bigint(21) unsigned	NO		NULL	
SQL_DIGEST	varchar(64)	YES		NULL	
SQL_DIGEST_TEXT	text	YES		NULL	
+--
 ↪ -----+-----+-----+-----+-----+
 ↪
```

The meaning of each column field in the `DATA_LOCK_WAITS` table is as follows:

- `KEY`: The key that is waiting for the lock and in the hexadecimal form.
- `KEY_INFO`: The detailed information of `KEY`. See the `KEY_INFO` section.
- `TRX_ID`: The ID of the transaction that is waiting for the lock. This ID is also the `start_ts` of the transaction.
- `CURRENT_HOLDING_TRX_ID`: The ID of the transaction that currently holds the lock. This ID is also the `start_ts` of the transaction.
- `SQL_DIGEST`: The digest of the SQL statement that is currently blocked in the lock-waiting transaction.
- `SQL_DIGEST_TEXT`: The normalized SQL statement (the SQL statement without arguments and formats) that is currently blocked in the lock-waiting transaction. It corresponds to `SQL_DIGEST`.

### Warning:

- Only the users with the [PROCESS](#) privilege can query this table.
- Currently, the `SQL_DIGEST` and `SQL_DIGEST_TEXT` fields are `null` (which means unavailable) for optimistic transactions. As a workaround, to find out the SQL statement that causes the blocking, you can join this table with `CLUSTER_TIDB_TRX` to get all the SQL statements of the optimistic transaction.
- The information in the `DATA_LOCK_WAITS` table is obtained in real time from all TiKV nodes during the query. Currently, even if a query has the `WHERE` condition, the information collection is still performed on all TiKV nodes. If your cluster is large and the load is high, querying this table might cause potential risk of performance jitter. Therefore, use it according to your actual situation.
- Information from different TiKV nodes is NOT guaranteed to be snapshots of the same time.
- The information (SQL digest) in the `SQL_DIGEST` column is the hash value calculated from the normalized SQL statement. The information in the `SQL_DIGEST_TEXT` column is internally queried from statements summary tables, so it is possible that the corresponding statement cannot be found internally. For the detailed description of SQL digests and the statements summary tables, see [Statement Summary Tables](#).

### KEY\_INFO

The `KEY_INFO` column shows the detailed information of the `KEY` column. The information is shown in the JSON format. The description of each field is as follows:

- `"db_id"`: The ID of the schema to which the key belongs.
- `"db_name"`: The name of the schema to which the key belongs.
- `"table_id"`: The ID of the table to which the key belongs.
- `"table_name"`: The name of the table to which the key belongs.
- `"partition_id"`: The ID of the partition where the key is located.
- `"partition_name"`: The name of the partition where the key is located.
- `"handle_type"`: The handle type of the row key (that is, the key that stores a row of data). The possible values are as follows:
  - `"int"`: The handle type is `int`, which means that the handle is the row ID.
  - `"common"`: The handle type is not `int64`. This type is shown in the non-`int` primary key when clustered index is enabled.
  - `"unknown"`: The handle type is currently not supported.
- `"handle_value"`: The handle value.

- "index\_id": The index ID to which the index key (the key that stores the index) belongs.
- "index\_name": The name of the index to which the index key belongs.
- "index\_values": The index value in the index key.

In the above fields, if the information of a field is not applicable or currently unavailable, the field is omitted in the query result. For example, the row key information does not contain `index_id`, `index_name`, and `index_values`; the index key does not contain `handle_type` and `handle_value`; non-partitioned tables do not display `partition_id` and `partition_name`  $\leftrightarrow$ ; the key information in the deleted table cannot obtain schema information such as `table_name`, `db_id`, `db_name`, and `index_name`, and it is unable to distinguish whether the table is a partitioned table.

### Note:

If a key comes from a table with partitioning enabled, and the information of the schema to which the key belongs cannot be queried due to some reasons (for example, the table to which the key belongs has been deleted) during the query, the ID of the partition to which the key belongs might be appear in the `table_id` field. This is because TiDB encodes the keys of different partitions in the same way as it encodes the keys of several independent tables. Therefore, when the schema information is missing, TiDB cannot confirm whether the key belongs to an unpartitioned table or to one partition of a table.

### Example

```
select * from information_schema.data_lock_waits\G
```

```
***** 1. row *****
 KEY: 7480000000000000355F728000000000000001
 KEY_INFO: {"db_id":1,"db_name":"test","table_id":53,"table_name
 ↪ ":"t","handle_type":"int","handle_value":"1"}
 TRX_ID: 426790594290122753
CURRENT_HOLDING_TRX_ID: 426790590082449409
 SQL_DIGEST: 38
 ↪ b03afa5debbdf0326a014dbe5012a62c51957f1982b3093e748460f8b00821
 ↪
 SQL_DIGEST_TEXT: update `t` set `v` = `v` + ? where `id` = ?
1 row in set (0.01 sec)
```

The above query result shows that the transaction of the ID 426790594290122753 is trying to obtain the pessimistic lock on the key "7480000000000000355F728000000000000001"

when executing a statement that has digest "38b03afa5debbdf0326a014dbe5012a62c51957f1982b3093e77" and is in the form of `update `t` set `v` = `v` + ? where `id` = ?`, but the lock on this key was held by the transaction of the ID 426790590082449409.

#### 14.11.18.2.17 DDL\_JOBS

The DDL\_JOBS table provides an INFORMATION\_SCHEMA interface to the `ADMIN SHOW DDL JOBS` command. It provides both the current status and a short history of DDL operations across the TiDB cluster.

```
USE information_schema;
DESC ddl_jobs;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
JOB_ID	bigint(21)	YES		NULL	
DB_NAME	varchar(64)	YES		NULL	
TABLE_NAME	varchar(64)	YES		NULL	
JOB_TYPE	varchar(64)	YES		NULL	
SCHEMA_STATE	varchar(64)	YES		NULL	
SCHEMA_ID	bigint(21)	YES		NULL	
TABLE_ID	bigint(21)	YES		NULL	
ROW_COUNT	bigint(21)	YES		NULL	
START_TIME	datetime	YES		NULL	
END_TIME	datetime	YES		NULL	
STATE	varchar(64)	YES		NULL	
QUERY	varchar(64)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
12 rows in set (0.00 sec)
```

```
SELECT * FROM ddl_jobs LIMIT 3\G
```

```
***** 1. row *****
 JOB_ID: 44
 DB_NAME: mysql
 TABLE_NAME: opt_rule_blacklist
 JOB_TYPE: create table
 SCHEMA_STATE: public
 SCHEMA_ID: 3
 TABLE_ID: 43
 ROW_COUNT: 0
 START_TIME: 2020-07-06 15:24:27
 END_TIME: 2020-07-06 15:24:27
 STATE: synced
```

```

 count bigint(64) UNSIGNED NOT NULL,
 index tbl(table_id, is_index, hist_id)
);
3 rows in set (0.01 sec)
```

#### 14.11.18.2.18 DEADLOCKS

The DEADLOCKS table shows the information of the several deadlock errors that have occurred recently on the current TiDB node.

```
USE INFORMATION_SCHEMA;
DESC deadlocks;
```

The output is as follows:

```
+--
 ↪ -----+-----+-----+-----+
 ↪
| Field | Type | Null | Key | Default | Extra |
+--
 ↪ -----+-----+-----+-----+
 ↪
DEADLOCK_ID	bigint(21)	NO		NULL	
OCCUR_TIME	timestamp(6)	YES		NULL	
RETRYABLE	tinyint(1)	NO		NULL	
TRY_LOCK_TRX_ID	bigint(21) unsigned	NO		NULL	
CURRENT_SQL_DIGEST	varchar(64)	YES		NULL	
CURRENT_SQL_DIGEST_TEXT	text	YES		NULL	
KEY	text	YES		NULL	
KEY_INFO	text	YES		NULL	
TRX_HOLDING_LOCK	bigint(21) unsigned	NO		NULL	
+--
 ↪ -----+-----+-----+-----+
 ↪
```

The DEADLOCKS table uses multiple rows to show the same deadlock event, and each row displays the information about one of the transactions involved in the deadlock event. If the TiDB node records multiple deadlock errors, each error is distinguished using the DEADLOCK\_ID column. The same DEADLOCK\_ID indicates the same deadlock event. Note that DEADLOCK\_ID **does not guarantee global uniqueness and will not be persisted**. It only shows the same deadlock event in the same result set.

The meaning of each column field in the DEADLOCKS table is as follows:

- **DEADLOCK\_ID**: The ID of the deadlock event. When multiple deadlock errors exist in the table, you can use this column to distinguish rows that belong to different deadlock errors.
- **OCCUR\_TIME**: The time when the deadlock error occurs.
- **RETRYABLE**: Whether the deadlock error can be retried. For the description of retryable deadlock errors, see the [Retryable deadlock errors](#) section.
- **TRY\_LOCK\_TRX\_ID**: The ID of the transaction that tries to acquire lock. This ID is also the `start_ts` of the transaction.
- **CURRENT\_SQL\_DIGEST**: The digest of the SQL statement currently being executed in the lock-acquiring transaction.

- `CURRENT_SQL_DIGEST_TEXT`: The normalized form of the SQL statement that is currently being executed in the lock-acquiring transaction.
- `KEY`: The blocked key that the transaction tries to lock. The value of this field is displayed in the form of hexadecimal string.
- `KEY_INFO`: The detailed information of `KEY`. See the [KEY\\_INFO](#) section.
- `TRX_HOLDING_LOCK`: The ID of the transaction that currently holds the lock on the key and causes blocking. This ID is also the `start_ts` of the transaction.

To adjust the maximum number of deadlock events that can be recorded in the `DEADLOCKS` table, adjust the `pessimistic-txn.deadlock-history-capacity` configuration in the TiDB configuration file. By default, the information of the recent 10 deadlock events is recorded in the table.

### Warning:

- Only users with the [PROCESS](#) privilege can query this table.
- The information (SQL digest) in the `CURRENT_SQL_DIGEST` column is the hash value calculated from the normalized SQL statement. The information in the `CURRENT_SQL_DIGEST_TEXT` column is internally queried from statements summary tables, so it is possible that the corresponding statement cannot be found internally. For the detailed description of SQL digests and the statements summary tables, see [Statement Summary Tables](#).

### KEY\_INFO

The `KEY_INFO` column shows the detailed information of the `KEY` column. The information is shown in the JSON format. The description of each field is as follows:

- `"db_id"`: The ID of the schema to which the key belongs.
- `"db_name"`: The name of the schema to which the key belongs.
- `"table_id"`: The ID of the table to which the key belongs.
- `"table_name"`: The name of the table to which the key belongs.
- `"partition_id"`: The ID of the partition where the key is located.
- `"partition_name"`: The name of the partition where the key is located.
- `"handle_type"`: The handle type of the row key (that is, the key that stores a row of data). The possible values are as follows:
  - `"int"`: The handle type is `int`, which means that the handle is the row ID.
  - `"common"`: The handle type is not `int64`. This type is shown in the non-`int` primary key when clustered index is enabled.
  - `"unknown"`: The handle type is currently not supported.

- "handle\_value": The handle value.
- "index\_id": The index ID to which the index key (the key that stores the index) belongs.
- "index\_name": The name of the index to which the index key belongs.
- "index\_values": The index value in the index key.

In the above fields, if the information of a field is not applicable or currently unavailable, the field is omitted in the query result. For example, the row key information does not contain `index_id`, `index_name`, and `index_values`; the index key does not contain `handle_type` and `handle_value`; non-partitioned tables do not display `partition_id` and `partition_name` ↪ ; the key information in the deleted table cannot obtain schema information such as `table_name`, `db_id`, `db_name`, and `index_name`, and it is unable to distinguish whether the table is a partitioned table.

#### Note:

If a key comes from a table with partitioning enabled, and the information of the schema to which the key belongs cannot be queried due to some reasons (for example, the table to which the key belongs has been deleted) during the query, the ID of the partition to which the key belongs might appear in the `table_id` field. This is because TiDB encodes the keys of different partitions in the same way as it encodes the keys of several independent tables. Therefore, when the schema information is missing, TiDB cannot confirm whether the key belongs to an unpartitioned table or to one partition of a table.

## Retryable deadlock errors

#### Note:

The `DEADLOCKS` table does not collect the information of retryable deadlock errors by default. If you want the table to collect the retryable deadlock error information, you can adjust the value of `pessimistic-txn.deadlock-history-collect-retryable` in the TiDB configuration file.

When transaction A is blocked by a lock already held by transaction B, and transaction B is directly or indirectly blocked by the lock held by the current transaction A, a deadlock error will occur. In this deadlock, there might be two cases:

- Case 1: Transaction B might be (directly or indirectly) blocked by a lock generated by a statement that has been executed after transaction A starts and before transaction A gets blocked.
- Case 2: Transaction B might also be blocked by the statement currently being executed in transaction A.

In case 1, TiDB will report a deadlock error to the client of transaction A and terminate the transaction.

In case 2, the statement currently being executed in transaction A will be automatically retried in TiDB. For example, suppose that transaction A executes the following statement:

```
UPDATE t SET v = v + 1 WHERE id = 1 OR id = 2;
```

Transaction B executes the following two statements successively.

```
UPDATE t SET v = 4 WHERE id = 2;
UPDATE t SET v = 2 WHERE id = 1;
```

Then if transaction A locks the two rows with `id = 1` and `id = 2`, and the two transactions run in the following sequence:

1. Transaction A locks the row with `id = 1`.
2. Transaction B executes the first statement and locks the row with `id = 2`.
3. Transaction B executes the second statement and tries to lock the row with `id = 1`, which is blocked by transaction A.
4. Transaction A tries to lock the row with `id = 2` and is blocked by transaction B, which forms a deadlock.

For this case, because the statement of transaction A that blocks other transactions is also the statement currently being executed, the pessimistic lock on the current statement can be resolved (so that transaction B can continue to run), and the current statement can be retried. TiDB uses the key hash internally to determine whether this is the case.

When a retryable deadlock occurs, the internal automatic retry will not cause a transaction error, so it is transparent to the client. However, if this situation occurs frequently, the performance might be affected. When this occurs, you can see `single statement ↪ deadlock, retry statement` in the TiDB log.

#### Example 1

Assume that the table definition and the initial data is as follows:

```
CREATE TABLE t (id int primary key, v int);
INSERT INTO t VALUES (1, 10), (2, 20);
```

Two transactions are executed in the following order:

| Transaction 1                     | Transaction 2                     | Description                            |
|-----------------------------------|-----------------------------------|----------------------------------------|
| UPDATE t SET v = 11 WHERE id = 1; | UPDATE t SET v = 21 WHERE id = 2; | Transaction 1 gets blocked             |
| UPDATE t SET v = 12 WHERE id = 2; | UPDATE t SET v = 22 WHERE id = 1; | Transaction 2 reports a deadlock error |

Next, transaction 2 reports a deadlock error. At this time, query the DEADLOCKS table:

```
SELECT * FROM INFORMATION_SCHEMA.DEADLOCKS;
```

The expected output is as follows:

```
+--
 ↪ -----+-----+-----+-----+
 ↪
 | DEADLOCK_ID | OCCUR_TIME | RETRYABLE | TRY_LOCK_TRX_ID |
 ↪ CURRENT_SQL_DIGEST |
 ↪ CURRENT_SQL_DIGEST_TEXT | KEY
 ↪ | KEY_INFO
 ↪ | TRX_HOLDING_LOCK |
+--
 ↪ -----+-----+-----+-----+
 ↪
 | 1 | 2021-08-05 11:09:03.230341 | 0 | 426812829645406216 |
 ↪ 22230766411edb40f27a68dadefc63c6c6970d5827f1e5e22fc97be2c4d8350d |
 ↪ update `t` set `v` = ? where `id` = ? ; | 7480000000000000355
 ↪ F7280000000000000002 | {"db_id":1,"db_name":"test","table_id":53,"
 ↪ table_name":"t","handle_type":"int","handle_value":"2"} |
 ↪ 426812829645406217 |
 | 1 | 2021-08-05 11:09:03.230341 | 0 | 426812829645406217 |
 ↪ 22230766411edb40f27a68dadefc63c6c6970d5827f1e5e22fc97be2c4d8350d |
 ↪ update `t` set `v` = ? where `id` = ? ; | 7480000000000000355
 ↪ F7280000000000000001 | {"db_id":1,"db_name":"test","table_id":53,"
 ↪ table_name":"t","handle_type":"int","handle_value":"1"} |
 ↪ 426812829645406216 |
+--
 ↪ -----+-----+-----+-----+
 ↪
```

Two rows of data are generated in the DEADLOCKS table. The DEADLOCK\_ID field of both rows is 1, which means that the information in both rows belongs to the same deadlock error. The first row shows that on the key of "7480000000000000355F72800000000000000002" ↪ , the transaction of the ID "426812829645406216" is blocked by the transaction of the ID

"426812829645406217". The second row shows that on the key of "7480000000000000355  
 ↪ F7280000000000000001", the transaction of the ID "426812829645406217" is blocked  
 by the transaction of the ID 426812829645406216, which constitutes mutual blocking and  
 forms a deadlock.

### Example 2

Assume that you query the DEADLOCKS table and get the following result:

```
+--
↪ -----+-----+-----+-----+
↪
| DEADLOCK_ID | OCCUR_TIME | RETRYABLE | TRY_LOCK_TRX_ID |
↪ CURRENT_SQL_DIGEST |
↪ CURRENT_SQL_DIGEST_TEXT | KEY
↪ | KEY_INFO
↪
↪ | TRX_HOLDING_LOCK |
+--
↪ -----+-----+-----+-----+
↪
| 1 | 2021-08-05 11:09:03.230341 | 0 | 426812829645406216 |
↪ 22230766411edb40f27a68dadefc63c6c6970d5827f1e5e22fc97be2c4d8350d |
↪ update `t` set `v` = ? where `id` = ? ; | 74800000000000000355
↪ F7280000000000000002 | {"db_id":1,"db_name":"test","table_id":53,"
↪ table_name":"t","handle_type":"int","handle_value":"2"} |
↪ 426812829645406217 |
| 1 | 2021-08-05 11:09:03.230341 | 0 | 426812829645406217 |
↪ 22230766411edb40f27a68dadefc63c6c6970d5827f1e5e22fc97be2c4d8350d |
↪ update `t` set `v` = ? where `id` = ? ; | 74800000000000000355
↪ F7280000000000000001 | {"db_id":1,"db_name":"test","table_id":53,"
↪ table_name":"t","handle_type":"int","handle_value":"1"} |
↪ 426812829645406216 |
| 2 | 2021-08-05 11:09:21.252154 | 0 | 426812832017809412 |
↪ 22230766411edb40f27a68dadefc63c6c6970d5827f1e5e22fc97be2c4d8350d |
↪ update `t` set `v` = ? where `id` = ? ; | 74800000000000000355
↪ F7280000000000000002 | {"db_id":1,"db_name":"test","table_id":53,"
↪ table_name":"t","handle_type":"int","handle_value":"2"} |
↪ 426812832017809413 |
| 2 | 2021-08-05 11:09:21.252154 | 0 | 426812832017809413 |
↪ 22230766411edb40f27a68dadefc63c6c6970d5827f1e5e22fc97be2c4d8350d |
↪ update `t` set `v` = ? where `id` = ? ; | 74800000000000000355
↪ F7280000000000000003 | {"db_id":1,"db_name":"test","table_id":53,"
↪ table_name":"t","handle_type":"int","handle_value":"3"} |
↪ 426812832017809414 |
| 2 | 2021-08-05 11:09:21.252154 | 0 | 426812832017809414 |
↪ 22230766411edb40f27a68dadefc63c6c6970d5827f1e5e22fc97be2c4d8350d |
```

```

↪ update `t` set `v` = ? where `id` = ? ; | 7480000000000000355
↪ F7280000000000000001 | {"db_id":1,"db_name":"test","table_id":53,"
↪ table_name":"t","handle_type":"int","handle_value":"1"} |
↪ 426812832017809412 |
+--
↪ -----+-----+-----+-----+
↪

```

The DEADLOCK\_ID column in the preceding query result shows that the first two rows together represent the information of a deadlock error, and the two transactions that wait for each other form the deadlock. The next three rows together represent the information of another deadlock error, and the three transactions that wait in a cycle form the deadlock.

### CLUSTER\_DEADLOCKS

The CLUSTER\_DEADLOCKS table returns information about the recent deadlock errors on each TiDB node in the entire cluster, which is the combined information of the DEADLOCKS table on each node. CLUSTER\_DEADLOCKS also includes an additional INSTANCE column to display the IP address and port of the node to distinguish between different TiDB nodes.

Note that, because DEADLOCK\_ID does not guarantee global uniqueness, in the query result of the CLUSTER\_DEADLOCKS table, you need to use the INSTANCE and DEADLOCK\_ID together to distinguish the information of different deadlock errors in the result set.

```

USE INFORMATION_SCHEMA;
DESC CLUSTER_DEADLOCKS;

```

The output is as follows:

```

+--
↪ -----+-----+-----+-----+
↪
| Field | Type | Null | Key | Default | Extra |
+--
↪ -----+-----+-----+-----+
↪
INSTANCE	varchar(64)	YES		NULL	
DEADLOCK_ID	bigint(21)	NO		NULL	
OCCUR_TIME	timestamp(6)	YES		NULL	
RETRYABLE	tinyint(1)	NO		NULL	
TRY_LOCK_TRX_ID	bigint(21) unsigned	NO		NULL	
CURRENT_SQL_DIGEST	varchar(64)	YES		NULL	
CURRENT_SQL_DIGEST_TEXT	text	YES		NULL	
KEY	text	YES		NULL	
KEY_INFO	text	YES		NULL	
TRX_HOLDING_LOCK	bigint(21) unsigned	NO		NULL	
+--
↪ -----+-----+-----+-----+

```

↩

### 14.11.18.2.19 ENGINES

The `ENGINES` table provides information about storage engines. For compatibility, TiDB will always describe InnoDB as the only supported engine. In addition, other column values in the `ENGINES` table are also fixed values.

```
USE information_schema;
DESC engines;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
ENGINE	varchar(64)	YES		NULL	
SUPPORT	varchar(8)	YES		NULL	
COMMENT	varchar(80)	YES		NULL	
TRANSACTIONS	varchar(3)	YES		NULL	
XA	varchar(3)	YES		NULL	
SAVEPOINTS	varchar(3)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
6 rows in set (0.00 sec)
```

```
SELECT * FROM engines;
```

```
+-----+-----+-----+-----+-----+-----+
| ENGINE | SUPPORT | COMMENT |
+-----+-----+-----+-----+-----+
| InnoDB | DEFAULT | Supports transactions, row-level locking, and foreign
 ↩ keys | YES | YES | YES |
+-----+-----+-----+-----+-----+
1 row in set (0.01 sec)
```

The description of columns in the `ENGINES` table is as follows:

- **ENGINES:** The name of the storage engine.
- **SUPPORT:** The level of support that the server has on the storage engine. In TiDB, the value is always `DEFAULT`.
- **COMMENT:** The brief comment on the storage engine.
- **TRANSACTIONS:** Whether the storage engine supports transactions.
- **XA:** Whether the storage engine supports XA transactions.
- **SAVEPOINTS:** Whether the storage engine supports `savepoints`.

### 14.11.18.2.20 INSPECTION\_RESULT

TiDB has some built-in diagnostic rules for detecting faults and hidden issues in the system.

The `INSPECTION_RESULT` diagnostic feature can help you quickly find problems and reduce your repetitive manual work. You can use the `select * from information_schema ↵ .inspection_result` statement to trigger the internal diagnostics.

The structure of the `information_schema.inspection_result` diagnostic result table `information_schema.inspection_result` is as follows:

```
USE information_schema;
DESC inspection_result;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
RULE	varchar(64)	YES		NULL	
ITEM	varchar(64)	YES		NULL	
TYPE	varchar(64)	YES		NULL	
INSTANCE	varchar(64)	YES		NULL	
STATUS_ADDRESS	varchar(64)	YES		NULL	
VALUE	varchar(64)	YES		NULL	
REFERENCE	varchar(64)	YES		NULL	
SEVERITY	varchar(64)	YES		NULL	
DETAILS	varchar(256)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
9 rows in set (0.00 sec)
```

Field description:

- **RULE:** The name of the diagnostic rule. Currently, the following rules are available:
  - **config:** Checks whether the configuration is consistent and proper. If the same configuration is inconsistent on different instances, a **warning** diagnostic result is generated.
  - **version:** The consistency check of version. If the same version is inconsistent on different instances, a **warning** diagnostic result is generated.
  - **node-load:** Checks the server load. If the current system load is too high, the corresponding **warning** diagnostic result is generated.
  - **critical-error:** Each module of the system defines critical errors. If a critical error exceeds the threshold within the corresponding time period, a warning diagnostic result is generated.
  - **threshold-check:** The diagnostic system checks the thresholds of key metrics. If a threshold is exceeded, the corresponding diagnostic information is generated.

- **ITEM:** Each rule diagnoses different items. This field indicates the specific diagnostic items corresponding to each rule.
- **TYPE:** The instance type of the diagnostics. The optional values are `tidb`, `pd`, and `tikv`.
- **INSTANCE:** The specific address of the diagnosed instance.
- **STATUS\_ADDRESS:** The HTTP API service address of the instance.
- **VALUE:** The value of a specific diagnostic item.
- **REFERENCE:** The reference value (threshold value) for this diagnostic item. If **VALUE** exceeds the threshold, the corresponding diagnostic information is generated.
- **SEVERITY:** The severity level. The optional values are `warning` and `critical`.
- **DETAILS:** Diagnostic details, which might also contain SQL statement(s) or document links for further diagnostics.

### Diagnostics example

Diagnose issues currently existing in the cluster.

```
SELECT * FROM information_schema.inspection_result\G
```

```
*****[1. row]*****
RULE | config
ITEM | log.slow-threshold
TYPE | tidb
INSTANCE | 172.16.5.40:4000
VALUE | 0
REFERENCE | not 0
SEVERITY | warning
DETAILS | slow-threshold = 0 will record every query to slow log, it may
 | ↪ affect performance
*****[2. row]*****
RULE | version
ITEM | git_hash
TYPE | tidb
INSTANCE |
VALUE | inconsistent
REFERENCE | consistent
SEVERITY | critical
DETAILS | the cluster has 2 different tidb version, execute the sql to see
 | ↪ more detail: select * from information_schema.cluster_info where type
 | ↪ ='tidb'
*****[3. row]*****
RULE | threshold-check
ITEM | storage-write-duration
TYPE | tikv
INSTANCE | 172.16.5.40:23151
VALUE | 130.417
```

```

REFERENCE | < 0.100
SEVERITY | warning
DETAILS | max duration of 172.16.5.40:23151 tikv storage-write-duration was
 ↳ too slow
*****[4. row]*****
RULE | threshold-check
ITEM | rocksdb-write-duration
TYPE | tikv
INSTANCE | 172.16.5.40:20151
VALUE | 108.105
REFERENCE | < 0.100
SEVERITY | warning
DETAILS | max duration of 172.16.5.40:20151 tikv rocksdb-write-duration was
 ↳ too slow

```

The following issues can be detected from the diagnostic result above:

- The first row indicates that TiDB’s `log.slow-threshold` value is configured to 0, which might affect performance.
- The second row indicates that two different TiDB versions exist in the cluster.
- The third and fourth rows indicate that the TiKV write delay is too long. The expected delay is no more than 0.1 second, while the actual delay is far longer than expected.

You can also diagnose issues existing within a specified range, such as from “2020-03-26 00:03:00” to “2020-03-26 00:08:00”. To specify the time range, use the SQL Hint of `/*+ time_range()*/`. See the following query example:

```

select /*+ time_range("2020-03-26 00:03:00", "2020-03-26 00:08:00") */ *
 ↳ from information_schema.inspection_result\G

```

```

*****[1. row]*****
RULE | critical-error
ITEM | server-down
TYPE | tidb
INSTANCE | 172.16.5.40:4009
VALUE |
REFERENCE |
SEVERITY | critical
DETAILS | tidb 172.16.5.40:4009 restarted at time '2020/03/26 00:05:45.670'
*****[2. row]*****
RULE | threshold-check
ITEM | get-token-duration
TYPE | tidb
INSTANCE | 172.16.5.40:10089
VALUE | 0.234

```

```
REFERENCE | < 0.001
SEVERITY | warning
DETAILS | max duration of 172.16.5.40:10089 tidb get-token-duration is too
 ↪ slow
```

The following issues can be detected from the diagnostic result above:

- The first row indicates that the 172.16.5.40:4009 TiDB instance is restarted at 2020/03/26 00:05:45.670.
- The second row indicates that the maximum `get-token-duration` time of the 172.16.5.40:10089 TiDB instance is 0.234s, but the expected time is less than 0.001s.

You can also specify conditions, for example, to query the critical level diagnostic results:

```
select * from information_schema.inspection_result where severity='critical
 ↪ ';
```

Query only the diagnostic result of the `critical-error` rule:

```
select * from information_schema.inspection_result where rule='critical-
 ↪ error';
```

## Diagnostic rules

The diagnostic module contains a series of rules. These rules compare the results with the thresholds after querying the existing monitoring tables and cluster information tables. If the results exceed the thresholds, the diagnostics of `warning` or `critical` is generated and the corresponding information is provided in the `details` column.

You can query the existing diagnostic rules by querying the `inspection_rules` system table:

```
select * from information_schema.inspection_rules where type='inspection';
```

```
+-----+-----+-----+
| NAME | TYPE | COMMENT |
+-----+-----+-----+
config	inspection	
version	inspection	
node-load	inspection	
critical-error	inspection	
threshold-check	inspection	
+-----+-----+-----+
```

config diagnostic rule

In the config diagnostic rule, the following two diagnostic rules are executed by querying the CLUSTER\_CONFIG system table:

- Check whether the configuration values of the same component are consistent. Not all configuration items has this consistency check. The allowlist of consistency check is as follows:

```
// The allowlist of the TiDB configuration consistency check
port
status.status-port
host
path
advertise-address
status.status-port
log.file.filename
log.slow-query-file
tmp-storage-path

// The allowlist of the PD configuration consistency check
advertise-client-urls
advertise-peer-urls
client-urls
data-dir
log-file
log.file.filename
metric.job
name
peer-urls

// The allowlist of the TiKV configuration consistency check
server.addr
server.advertise-addr
server.status-addr
log-file
raftstore.raftdb-path
storage.data-dir
storage.block-cache.capacity
```

- Check whether the values of the following configuration items are as expected.

| Component | Configuration item | Expected value |
|-----------|--------------------|----------------|
| TiDB      | log.slow-threshold | larger than 0  |
| TiKV      | raftstore.sync-log | true           |

### version diagnostic rule

The `version` diagnostic rule checks whether the version hash of the same component is consistent by querying the `CLUSTER_INFO` system table. See the following example:

```
SELECT * FROM information_schema.inspection_result WHERE rule='version'\G
```

```
*****[1. row]*****
RULE | version
ITEM | git_hash
TYPE | tidb
INSTANCE |
VALUE | inconsistent
REFERENCE | consistent
SEVERITY | critical
DETAILS | the cluster has 2 different tidb versions, execute the sql to see
 ↳ more detail: SELECT * FROM information_schema.cluster_info WHERE
 ↳ type='tidb'
```

### critical-error diagnostic rule

In `critical-error` diagnostic rule, the following two diagnostic rules are executed:

- Detect whether the cluster has the following errors by querying the related monitoring system tables in the metrics schema:

| Component | Error name   | Monitoring table | Error description                                        |
|-----------|--------------|------------------|----------------------------------------------------------|
| TiDB      | panic-count  | tidb_panic       | Panic count_total_count occurs in TiDB.                  |
| TiDB      | binlog-error | tidb_binlog      | Binlog_error_total_count occurs when TiDB writes binlog. |

| Component | Error name          | Monitoring table         | Description                                                                              |
|-----------|---------------------|--------------------------|------------------------------------------------------------------------------------------|
| TiKV      | critical-error      | tikv_critical_error      | The total error count of critical error of TiKV.                                         |
| TiKV      | scheduler-is-busy   | tikv_scheduler_is_busy   | The total count of TiKV scheduler is too busy, which makes TiKV temporarily unavailable. |
| TiKV      | coprocessor-is-busy | tikv_coprocessor_is_busy | The total count of TiKV Co-processor is too busy.                                        |
| TiKV      | channel-is-full     | tikv_channel_full        | The total count of “channel full” error occurs in TiKV.                                  |

| Component | Error name              | Monitoring table        | Expected value | Description                       |
|-----------|-------------------------|-------------------------|----------------|-----------------------------------|
| TiKV      | tikv_engine_write_stall | tikv_engine_write_stall | 0              | The “stall” error occurs in TiKV. |

- Check whether any component is restarted by querying the `metrics_schema.up` monitoring table and the `CLUSTER_LOG` system table.

#### threshold-check diagnostic rule

The `threshold-check` diagnostic rule checks whether the following metrics in the cluster exceed the threshold by querying the related monitoring system tables in the metrics schema:

| Component | Monitoring metric name | Monitoring table     | Expected value | Description                                     |
|-----------|------------------------|----------------------|----------------|-------------------------------------------------|
| TiDB      | tso-duration           | pd_tso_wait_duration | 50ms           | The duration of getting the TSO of transaction. |

---

| Component | Monitoring met-ric | Monitoring table | Expected value | Description                                                                                                                        |
|-----------|--------------------|------------------|----------------|------------------------------------------------------------------------------------------------------------------------------------|
| PD        | region-health      | pd_region_health | 100            | Detects the number of Regions that are in the process of scheduling in the cluster. The expected number is less than 100 in total. |

---

In addition, this rule also checks whether the CPU usage of the following threads in a TiKV instance is too high:

- scheduler-worker-cpu
- coprocessor-normal-cpu
- coprocessor-high-cpu
- coprocessor-low-cpu
- grpc-cpu
- raftstore-cpu
- apply-cpu

- storage-readpool-normal-cpu
- storage-readpool-high-cpu
- storage-readpool-low-cpu
- split-check-cpu

The built-in diagnostic rules are constantly being improved. If you have more diagnostic rules, welcome to create a PR or an issue in the [tidb repository](#).

#### 14.11.18.2.21 INSPECTION\_RULES

The INSPECTION\_RULES table provides information about which diagnostic tests are run in an inspection result. See [inspection result](#) for example usage.

```
USE information_schema;
DESC inspection_rules;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
NAME	varchar(64)	YES		NULL	
TYPE	varchar(64)	YES		NULL	
COMMENT	varchar(256)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
3 rows in set (0.00 sec)
```

```
SELECT * FROM inspection_rules;
```

```
+-----+-----+-----+
| NAME | TYPE | COMMENT |
+-----+-----+-----+
config	inspection	
version	inspection	
node-load	inspection	
critical-error	inspection	
threshold-check	inspection	
ddl	summary	
gc	summary	
pd	summary	
query-summary	summary	
raftstore	summary	
read-link	summary	
rocksdb	summary	
stats	summary	
wait-events	summary	
write-link	summary	
```

```
+-----+-----+-----+
15 rows in set (0.00 sec)
```

#### 14.11.18.2.22 INSPECTION\_SUMMARY

In some scenarios, you might need to pay attention only to the monitoring summary of specific links or modules. For example, the number of threads for Coprocessor in the thread pool is configured as 8. If the CPU usage of Coprocessor reaches 750%, you can determine that a risk exists and Coprocessor might become a bottleneck in advance. However, some monitoring metrics vary greatly due to different user workloads, so it is difficult to define specific thresholds. It is important to troubleshoot issues in this scenario, so TiDB provides the `inspection_summary` table for link summary.

The structure of the `information_schema.inspection_summary` inspection summary table is as follows:

```
USE information_schema;
DESC inspection_summary;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
RULE	varchar(64)	YES		NULL	
INSTANCE	varchar(64)	YES		NULL	
METRICS_NAME	varchar(64)	YES		NULL	
LABEL	varchar(64)	YES		NULL	
QUANTILE	double	YES		NULL	
AVG_VALUE	double(22,6)	YES		NULL	
MIN_VALUE	double(22,6)	YES		NULL	
MAX_VALUE	double(22,6)	YES		NULL	
COMMENT	varchar(256)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
9 rows in set (0.00 sec)
```

Field description:

- **RULE:** Summary rules. Because new rules are being added continuously, you can execute the `select * from inspection_rules where type='summary'` statement to query the latest rule list.
- **INSTANCE:** The monitored instance.
- **METRICS\_NAME:** The monitoring metrics name.
- **QUANTILE:** Takes effect on monitoring tables that contain `QUANTILE`. You can specify multiple percentiles by pushing down predicates. For example, you can execute `select * from inspection_summary where rule='ddl' and quantile in (0.80, 0.90, 0.99, 0.999)` to summarize the DDL-related monitoring

metrics and query the P80/P90/P99/P999 results. `AVG_VALUE`, `MIN_VALUE`, and `MAX_VALUE` respectively indicate the average value, minimum value, and maximum value of the aggregation.

- `COMMENT`: The comment about the corresponding monitoring metric.

### Note:

Because summarizing all results causes overhead, it is recommended to display the specific rule in the SQL predicate to reduce overhead. For example, executing `select * from inspection_summary where rule in ('read-link', 'ddl')` summarizes the read link and DDL-related monitoring metrics.

Usage example:

Both the diagnostic result table and the diagnostic monitoring summary table can specify the diagnostic time range using `hint`. `select /*+ time_range('2020-03-07 12:00:00', '2020-03-07 13:00:00')*/ from inspection_summary` is the monitoring summary for the 2020-03-07 12:00:00 to 2020-03-07 13:00:00 period. Like the monitoring summary table, you can use the `inspection_summary` table to quickly find the monitoring items with large differences by comparing the data of two different periods.

The following example compares the monitoring metrics of read links in two time periods:

- (2020-01-16 16:00:54.933, 2020-01-16 16:10:54.933)
- (2020-01-16 16:10:54.933, 2020-01-16 16:20:54.933)

```
SELECT
t1.avg_value / t2.avg_value AS ratio,
t1.*,
t2.*
FROM
(
 SELECT
 /*+ time_range("2020-01-16 16:00:54.933", "2020-01-16 16:10:54.933")
 ↪ */ *
 FROM information_schema.inspection_summary WHERE rule='read-link'
) t1
JOIN
(
 SELECT
 /*+ time_range("2020-01-16 16:10:54.933", "2020-01-16 16:20:54.933")
 ↪ */ *
```

```

FROM information_schema.inspection_summary WHERE rule='read-link'
) t2
ON t1.metrics_name = t2.metrics_name
and t1.instance = t2.instance
and t1.label = t2.label
ORDER BY
ratio DESC;

```

#### 14.11.18.2.23 KEY\_COLUMN\_USAGE

The KEY\_COLUMN\_USAGE table describes the key constraints of the columns, such as the primary key constraint.

```

USE information_schema;
DESC key_column_usage;

```

```

+-----+-----+-----+-----+-----+-----+
↪
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
↪
CONSTRAINT_CATALOG	varchar(512)	NO		NULL	
CONSTRAINT_SCHEMA	varchar(64)	NO		NULL	
CONSTRAINT_NAME	varchar(64)	NO		NULL	
TABLE_CATALOG	varchar(512)	NO		NULL	
TABLE_SCHEMA	varchar(64)	NO		NULL	
TABLE_NAME	varchar(64)	NO		NULL	
COLUMN_NAME	varchar(64)	NO		NULL	
ORDINAL_POSITION	bigint(10)	NO		NULL	
POSITION_IN_UNIQUE_CONSTRAINT	bigint(10)	YES		NULL	
REFERENCED_TABLE_SCHEMA	varchar(64)	YES		NULL	
REFERENCED_TABLE_NAME	varchar(64)	YES		NULL	
REFERENCED_COLUMN_NAME	varchar(64)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
↪
12 rows in set (0.00 sec)

```

```

SELECT * FROM key_column_usage WHERE table_schema='mysql' and table_name='
↪ user';

```

```

***** 1. row *****
CONSTRAINT_CATALOG: def
CONSTRAINT_SCHEMA: mysql
CONSTRAINT_NAME: PRIMARY
TABLE_CATALOG: def

```

```

 TABLE_SCHEMA: mysql
 TABLE_NAME: user
 COLUMN_NAME: Host
 ORDINAL_POSITION: 1
POSITION_IN_UNIQUE_CONSTRAINT: NULL
 REFERENCED_TABLE_SCHEMA: NULL
 REFERENCED_TABLE_NAME: NULL
 REFERENCED_COLUMN_NAME: NULL
***** 2. row *****
 CONSTRAINT_CATALOG: def
 CONSTRAINT_SCHEMA: mysql
 CONSTRAINT_NAME: PRIMARY
 TABLE_CATALOG: def
 TABLE_SCHEMA: mysql
 TABLE_NAME: user
 COLUMN_NAME: User
 ORDINAL_POSITION: 2
POSITION_IN_UNIQUE_CONSTRAINT: NULL
 REFERENCED_TABLE_SCHEMA: NULL
 REFERENCED_TABLE_NAME: NULL
 REFERENCED_COLUMN_NAME: NULL
2 rows in set (0.00 sec)

```

The description of columns in the KEY\_COLUMN\_USAGE table is as follows:

- **CONSTRAINT\_CATALOG:** The name of the catalog to which the constraint belongs. The value is always `def`.
- **CONSTRAINT\_SCHEMA:** The name of the schema to which the constraint belongs.
- **CONSTRAINT\_NAME:** The name of the constraint.
- **TABLE\_CATALOG:** The name of the catalog to which the table belongs. The value is always `def`.
- **TABLE\_SCHEMA:** The name of the schema to which the table belongs.
- **TABLE\_NAME:** The name of the table with constraints.
- **COLUMN\_NAME:** The name of the column with constraints.
- **ORDINAL\_POSITION:** The position of the column in the constraint, rather than in the table. The position number starts from 1.
- **POSITION\_IN\_UNIQUE\_CONSTRAINT:** The unique constraint and the primary key constraint are empty. For foreign key constraints, this column is the position of the referenced table's key.
- **REFERENCED\_TABLE\_SCHEMA:** The name of the schema referenced by the constraint. Currently in TiDB, the value of this column in all constraints is `nil`, except for the foreign key constraint.
- **REFERENCED\_TABLE\_NAME:** The name of the table referenced by the constraint. Currently in TiDB, the value of this column in all constraints is `nil`, except for the foreign key constraint.

- `REFERENCED_COLUMN_NAME`: The name of the column referenced by the constraint. Currently in TiDB, the value of this column in all constraints is `nil`, except for the foreign key constraint.

#### 14.11.18.2.24 MEMORY\_USAGE

The `MEMORY_USAGE` table describes the current memory usage of the current TiDB instance.

```
USE information_schema;
DESC memory_usage;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
MEMORY_TOTAL	bigint(21)	NO		NULL	
MEMORY_LIMIT	bigint(21)	NO		NULL	
MEMORY_CURRENT	bigint(21)	NO		NULL	
MEMORY_MAX_USED	bigint(21)	NO		NULL	
CURRENT_OPS	varchar(50)	YES		NULL	
SESSION_KILL_LAST	datetime	YES		NULL	
SESSION_KILL_TOTAL	bigint(21)	NO		NULL	
GC_LAST	datetime	YES		NULL	
GC_TOTAL	bigint(21)	NO		NULL	
DISK_USAGE	bigint(21)	NO		NULL	
QUERY_FORCE_DISK	bigint(21)	NO		NULL	
+-----+-----+-----+-----+-----+-----+
11 rows in set (0.000 sec)
```

```
SELECT * FROM information_schema.memory_usage;
```

```
+--
 ↪ -----+-----+-----+-----+-----+-----+
 ↪
| MEMORY_TOTAL | MEMORY_LIMIT | MEMORY_CURRENT | MEMORY_MAX_USED |
 ↪ CURRENT_OPS | SESSION_KILL_LAST | SESSION_KILL_TOTAL | GC_LAST |
 ↪ GC_TOTAL | DISK_USAGE | QUERY_FORCE_DISK |
+--
 ↪ -----+-----+-----+-----+-----+-----+
 ↪
| 33674170368 | 10737418240 | 5097644032 | 10826604544 | NULL |
 ↪ 2022-10-17 22:47:47 | 1 | 2022-10-17 22:47:47 | 20 |
 ↪ 0 | 0 |
+--
 ↪ -----+-----+-----+-----+-----+-----+
 ↪
```

```
2 rows in set (0.002 sec)
```

The columns in the `MEMORY_USAGE` table are described as follows:

- `MEMORY_TOTAL`: The total available memory of TiDB, in bytes.
- `MEMORY_LIMIT`: The memory usage limit of TiDB, in bytes. The value is the same as that of the system variable `tidb_server_memory_limit`.
- `MEMORY_CURRENT`: The current memory usage of TiDB, in bytes.
- `MEMORY_MAX_USED`: The maximum memory usage of TiDB from the time it is started to the current time, in bytes.
- `CURRENT_OPS`: “shrinking” | null. “shrinking” means that TiDB is performing operations that shrink memory usage.
- `SESSION_KILL_LAST`: The timestamp of the last time a session is terminated.
- `SESSION_KILL_TOTAL`: The number of times sessions are terminated, from the time TiDB is started to the current time.
- `GC_LAST`: The timestamp of the last time Golang GC is triggered by memory usage.
- `GC_TOTAL`: The number of times Golang GC is triggered by memory usage, from the time TiDB is started to the current time.
- `DISK_USAGE`: The disk usage for the current data spill operation, in bytes.
- `QUERY_FORCE_DISK`: The number of times data is spilled to disk, from the time TiDB is started to the current time.

#### 14.11.18.2.25 MEMORY\_USAGE\_OPS\_HISTORY

The `MEMORY_USAGE_OPS_HISTORY` table describes the history of memory-related operations and the execution basis of the current TiDB instance.

```
USE information_schema;
DESC memory_usage_ops_history;
```

| Field                       | Type                             | Null             | Key | Default           | Extra |
|-----------------------------|----------------------------------|------------------|-----|-------------------|-------|

↪ -----+
↪
2 rows in set (0.002 sec)

```

The columns in the MEMORY\_USAGE\_OPS\_HISTORY table are described as follows:

- **TIME**: The timestamp when the session is terminated.
- **OPS**: “SessionKill”
- **MEMORY\_LIMIT**: The memory usage limit of TiDB at the time of termination, in bytes. Its value is the same as that of the system variable `tidb_server_memory_limit` ↪ [\]\(/system-variables.md#tidb\\_server\\_memory\\_limit-new-in-v640\)](#).
- **MEMORY\_CURRENT**: The current memory usage of TiDB, in bytes.
- **PROCESSID**: The connection ID of the terminated session.
- **MEM**: The memory usage of the terminated session, in bytes.
- **DISK**: The disk usage of the terminated session, in bytes.
- **CLIENT**: The client connection address of the terminated session.
- **DB**: The name of the database connected to the terminated session.
- **USER**: The user name of the terminated session.
- **SQL\_DIGEST**: The digest of the SQL statement being executed in the terminated session.
- **SQL\_TEXT**: The SQL statement being executed in the terminated session.

#### 14.11.18.2.26 METRICS\_SUMMARY

The TiDB cluster has many monitoring metrics. To make it easy to detect abnormal monitoring metrics, TiDB 4.0 introduces the following two monitoring summary tables:

- `information_schema.metrics_summary`
- `information_schema.metrics_summary_by_label`

The two tables summarize all monitoring data for you to check each monitoring metric efficiently. Compared with `information_schema.metrics_summary`, the `information_schema.metrics_summary_by_label` table has an additional label column and performs differentiated statistics according to different labels.

```
USE information_schema;
DESC metrics_summary;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
METRICS_NAME	varchar(64)	YES		NULL	
QUANTILE	double	YES		NULL	
SUM_VALUE	double(22,6)	YES		NULL	
AVG_VALUE	double(22,6)	YES		NULL	
MIN_VALUE	double(22,6)	YES		NULL	
MAX_VALUE	double(22,6)	YES		NULL	
COMMENT	varchar(256)	YES		NULL	
+-----+-----+-----+-----+-----+
7 rows in set (0.00 sec)
```

Field description:

- **METRICS\_NAME**: The monitoring table name.
- **QUANTILE**: The percentile. You can specify **QUANTILE** using SQL statements. For example:
  - `select * from metrics_summary where quantile=0.99` specifies viewing the data of the 0.99 percentile.
  - `select * from metrics_summary where quantile in (0.80, 0.90, 0.99, ↵ 0.999)` specifies viewing the data of the 0.8, 0.90, 0.99, 0.999 percentiles at the same time.
- **SUM\_VALUE**, **AVG\_VALUE**, **MIN\_VALUE**, and **MAX\_VALUE** respectively mean the sum, the average value, the minimum value, and the maximum value.
- **COMMENT**: The comment for the corresponding monitoring table.

For example:

To query the three groups of monitoring items with the highest average time consumption in the TiDB cluster within the time range of '2020-03-08 13:23:00', '2020-03-08 13:↵ 33: 00', you can directly query the `information_schema.metrics_summary` table and use the `/* time_range()*/` hint to specify the time range. The SQL statement is as follows:

```
SELECT /* time_range('2020-03-08 13:23:00','2020-03-08 13:33:00') */ *
FROM information_schema.metrics_summary
WHERE metrics_name LIKE 'tidb%duration'
 AND avg_value > 0
 AND quantile = 0.99
ORDER BY avg_value DESC
LIMIT 3\G
```

```
*****[1. row]*****
METRICS_NAME | tidb_get_token_duration
QUANTILE | 0.99
SUM_VALUE | 8.972509
AVG_VALUE | 0.996945
MIN_VALUE | 0.996515
MAX_VALUE | 0.997458
COMMENT | The quantile of Duration (us) for getting token, it should be
 ↵ small until concurrency limit is reached(second)
*****[2. row]*****
METRICS_NAME | tidb_query_duration
QUANTILE | 0.99
SUM_VALUE | 0.269079
AVG_VALUE | 0.007272
MIN_VALUE | 0.000667
MAX_VALUE | 0.01554
COMMENT | The quantile of TiDB query durations(second)
*****[3. row]*****
METRICS_NAME | tidb_kv_request_duration
QUANTILE | 0.99
SUM_VALUE | 0.170232
AVG_VALUE | 0.004601
MIN_VALUE | 0.000975
MAX_VALUE | 0.013
COMMENT | The quantile of kv requests durations by store
```

Similarly, the following example queries the `metrics_summary_by_label` monitoring summary table:

```
SELECT /* time_range('2020-03-08 13:23:00','2020-03-08 13:33:00') */ *
FROM information_schema.metrics_summary_by_label
WHERE metrics_name LIKE 'tidb%duration'
```

```

AND avg_value > 0
AND quantile = 0.99
ORDER BY avg_value DESC
LIMIT 10\G

```

```

*****[1. row]*****
INSTANCE | 172.16.5.40:10089
METRICS_NAME | tidb_get_token_duration
LABEL |
QUANTILE | 0.99
SUM_VALUE | 8.972509
AVG_VALUE | 0.996945
MIN_VALUE | 0.996515
MAX_VALUE | 0.997458
COMMENT | The quantile of Duration (us) for getting token, it should be
 ↪ small until concurrency limit is reached(second)
*****[2. row]*****
INSTANCE | 172.16.5.40:10089
METRICS_NAME | tidb_query_duration
LABEL | Select
QUANTILE | 0.99
SUM_VALUE | 0.072083
AVG_VALUE | 0.008009
MIN_VALUE | 0.007905
MAX_VALUE | 0.008241
COMMENT | The quantile of TiDB query durations(second)
*****[3. row]*****
INSTANCE | 172.16.5.40:10089
METRICS_NAME | tidb_query_duration
LABEL | Rollback
QUANTILE | 0.99
SUM_VALUE | 0.072083
AVG_VALUE | 0.008009
MIN_VALUE | 0.007905
MAX_VALUE | 0.008241
COMMENT | The quantile of TiDB query durations(second)

```

The second and third rows of the query results above indicate that the **Select** and **Rollback** statements on `tidb_query_duration` have a long average execution time.

In addition to the example above, you can use the monitoring summary table to quickly find the module with the largest change from the monitoring data by comparing the full link monitoring items of the two time periods, and quickly locate the bottleneck. The following example compares all monitoring items in two periods (where `t1` is the baseline) and sorts these items according to the greatest difference:

- Period t1: ("2020-03-03 17:08:00", "2020-03-03 17:11:00")
- Period t2: ("2020-03-03 17:18:00", "2020-03-03 17:21:00")

The monitoring items of the two time periods are joined according to `METRICS_NAME` and sorted according to the difference value. `TIME_RANGE` is the hint that specifies the query time.

```
SELECT GREATEST(t1.avg_value,t2.avg_value)/LEAST(t1.avg_value,
 t2.avg_value) AS ratio,
 t1.metrics_name,
 t1.avg_value as t1_avg_value,
 t2.avg_value as t2_avg_value,
 t2.comment
FROM
 (SELECT /** time_range("2020-03-03 17:08:00", "2020-03-03 17:11:00")*/
 ↪ *
 FROM information_schema.metrics_summary) t1
JOIN
 (SELECT /** time_range("2020-03-03 17:18:00", "2020-03-03 17:21:00")*/
 ↪ *
 FROM information_schema.metrics_summary) t2
ON t1.metrics_name = t2.metrics_name
ORDER BY ratio DESC LIMIT 10;
```

```

+---
↳ -----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↳
```

From the query result above, you can get the following information:

- `tib_slow_query_cop_process_total_time` (the time consumption of cop process in TiDB slow queries) in the period t2 is 5,865 times higher than that in period t1.
- `tidb_distsql_partial_scan_key_total_num` (the number of keys to scan requested by TiDB's distsql) in period t2 is 3,648 times higher than that in period t1. During period t2, `tidb_slow_query_cop_wait_total_time` (the waiting time of Coprocessor requesting to queue up in the TiDB slow query) is 267 times higher than that in period t1.
- `tikv_cop_total_response_size` (the size of the TiKV Coprocessor request result) in period t2 is 192 times higher than that in period t1.
- `tikv_cop_scan_details` in period t2 (the scan requested by the TiKV Coprocessor) is 105 times higher than that in period t1.

From the result above, you can see that the Coprocessor requests in period t2 are much more than those in period t1. This causes TiKV Coprocessor to be overloaded, and the

`cop task` has to wait. It might be that some large queries appear in period t2 that bring more load.

In fact, during the entire time period from t1 to t2, the `go-ycsb` pressure test is running. Then 20 `tpch` queries are running during period t2. So it is the `tpch` queries that cause many Coprocessor requests.

#### 14.11.18.2.27 METRICS\_TABLES

The `METRICS_TABLES` table provides the PromQL (Prometheus Query Language) definition for each of the views in the `METRICS_SCHEMA` database.

```
USE INFORMATION_SCHEMA;
DESC METRICS_TABLES;
```

The output is as follows:

| Field      | Type                      | Null | Key | Default | Extra |
|------------|---------------------------|------|-----|---------|-------|
| TABLE_NAME | <code>varchar(64)</code>  | YES  |     | NULL    |       |
| PROMQL     | <code>varchar(64)</code>  | YES  |     | NULL    |       |
| LABELS     | <code>varchar(64)</code>  | YES  |     | NULL    |       |
| QUANTILE   | <code>double</code>       | YES  |     | NULL    |       |
| COMMENT    | <code>varchar(256)</code> | YES  |     | NULL    |       |

Field description:

- `TABLE_NAME`: Corresponds to the table name in `METRICS_SCHEMA`.
- `PROMQL`: The working principle of the monitoring table is to map SQL statements to PromQL and convert Prometheus results into SQL query results. This field is the expression template of PromQL. When you query the data of the monitoring table, the query conditions are used to rewrite the variables in this template to generate the final query expression.
- `LABELS`: The label for the monitoring item. Each label corresponds to a column in the monitoring table. If the SQL statement contains the filter of the corresponding column, the corresponding PromQL changes accordingly.
- `QUANTILE`: The percentile. For monitoring data of the histogram type, a default percentile is specified. If the value of this field is 0, it means that the monitoring item corresponding to the monitoring table is not a histogram.
- `COMMENT`: The comment about the monitoring table.

```
SELECT * FROM metrics_tables LIMIT 5\G
```

The output is as follows:

```

***** 1. row *****
TABLE_NAME: abnormal_stores
 PROMQL: sum(pd_cluster_status{ type=~"store_disconnected_count|
 ↪ store_unhealth_count|store_low_space_count|store_down_count|

```

#### 14.11.18.2.29 PLACEMENT\_POLICIES

The `PLACEMENT_POLICIES` table provides information on all placement policies. For details, refer to [Placement Rules in SQL](#).

```

USE information_schema;
DESC placement_policies;

```

```

+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
POLICY_ID	bigint(64)	NO		<null>	
CATALOG_NAME	varchar(512)	NO		<null>	
POLICY_NAME	varchar(64)	NO		<null>	
PRIMARY_REGION	varchar(1024)	YES		<null>	
REGIONS	varchar(1024)	YES		<null>	
CONSTRAINTS	varchar(1024)	YES		<null>	
LEADER_CONSTRAINTS	varchar(1024)	YES		<null>	
FOLLOWER_CONSTRAINTS	varchar(1024)	YES		<null>	
LEARNER_CONSTRAINTS	varchar(1024)	YES		<null>	
SCHEDULE	varchar(20)	YES		<null>	
FOLLOWERS	bigint(64)	YES		<null>	
LEARNERS	bigint(64)	YES		<null>	
+-----+-----+-----+-----+-----+-----+
12 rows in set (0.00 sec)

```

Examples

The `PLACEMENT_POLICIES` table only shows all placement policies. To view the canonical version of placement rules (including all placement policies and objects assigned placement policies), use the statement `SHOW PLACEMENT` instead:

```
CREATE TABLE t1 (a INT);
CREATE PLACEMENT POLICY p1 primary_region="us-east-1" regions="us-east-1";
CREATE TABLE t3 (a INT) PLACEMENT POLICY=p1;
SHOW PLACEMENT; -- Shows all information, including table t3.
SELECT * FROM information_schema.placement_policies; -- Only shows
↳ placement policies, excluding t3.
```

Query OK, 0 rows affected (0.09 sec)

Query OK, 0 rows affected (0.11 sec)

Query OK, 0 rows affected (0.08 sec)

### 14.11.18.2.30 PROCESSLIST

PROCESSLIST, just like SHOW PROCESSLIST, is used to view the requests that are being handled.

The PROCESSLIST table has additional columns not present in SHOW PROCESSLIST:

- A DIGEST column to show the digest of the SQL statement.
- A MEM column to show the memory used by the request that is being processed, in bytes.
- A DISK column to show the disk usage in bytes.
- A TxnStart column to show the start time of the transaction.
- A RESOURCE\_GROUP column to show the resource group name.

```
USE information_schema;
DESC processlist;
```

```
+--
 ↪ -----+-----+-----+-----+-----+-----+
 ↪
| Field | Type | Null | Key | Default | Extra |
+--
 ↪ -----+-----+-----+-----+-----+-----+
 ↪
ID	bigint(21) unsigned	NO		0	
USER	varchar(16)	NO			
HOST	varchar(64)	NO			
DB	varchar(64)	YES		NULL	
COMMAND	varchar(16)	NO			
TIME	int(7)	NO		0	
STATE	varchar(7)	YES		NULL	
INFO	longtext	YES		NULL	
DIGEST	varchar(64)	YES			
MEM	bigint(21) unsigned	YES		NULL	
DISK	bigint(21) unsigned	YES		NULL	
TxnStart	varchar(64)	NO			
RESOURCE_GROUP	varchar(32)	NO			
```

```
13 rows in set (0.00 sec)
```

```
SELECT * FROM processlist\G
```

```
***** 1. row *****
 ID: 2300033189772525975
 USER: root
 HOST: 127.0.0.1:51289
 DB: NULL
 COMMAND: Query
 TIME: 0
 STATE: autocommit
 INFO: SELECT * FROM processlist
 DIGEST:
 ↪ dbfaa16980ec628011029f0aaf0d160f4b040885240dfc567bf760d96d374f7e
 ↪
 MEM: 0
 DISK: 0
 TxnStart:
 RESOURCE_GROUP: rg1
1 row in set (0.00 sec)
```

Fields in the PROCESSLIST table are described as follows:

- ID: The ID of the user connection.
- USER: The name of the user who is executing PROCESS.
- HOST: The address that the user is connecting to.
- DB: The name of the currently connected default database.
- COMMAND: The command type that PROCESS is executing.
- TIME: The current execution duration of PROCESS, in seconds.
- STATE: The current connection state.
- INFO: The requested statement that is being processed.
- DIGEST: The digest of the SQL statement.
- MEM: The memory used by the request that is being processed, in bytes.
- DISK: The disk usage in bytes.
- TxnStart: The start time of the transaction.
- RESOURCE\_GROUP: The resource group name.

## CLUSTER\_PROCESSLIST

CLUSTER\_PROCESSLIST is the cluster system table corresponding to PROCESSLIST. It is used to query the PROCESSLIST information of all TiDB nodes in the cluster. The table schema of CLUSTER\_PROCESSLIST has one more column than PROCESSLIST, the INSTANCE column, which stores the address of the TiDB node this row of data is from.

```
SELECT * FROM information_schema.cluster_processlist;
```

```
+--
↪ -----+-----+-----+-----+-----+-----+-----+-----+
↪
| INSTANCE | ID | USER | HOST | DB | COMMAND | TIME | STATE | INFO
↪ | MEM | TxnStart

### 14.11.18.2.31 REFERENTIAL\_CONSTRAINTS

The `REFERENTIAL_CONSTRAINTS` table provides information about `FOREIGN KEY` relationships between tables.

```
USE INFORMATION_SCHEMA;
DESC REFERENTIAL_CONSTRAINTS;
```

The output is as follows:

```
+--
↪ -----+-----+-----+-----+-----+-----+-----+-----+
↪
| Field | Type | Null | Key | Default | Extra |
```

```
+--
 ↪ -----+-----+-----+-----+-----+
 ↪
CONSTRAINT_CATALOG	varchar(512)	NO		NULL	
CONSTRAINT_SCHEMA	varchar(64)	NO		NULL	
CONSTRAINT_NAME	varchar(64)	NO		NULL	
UNIQUE_CONSTRAINT_CATALOG	varchar(512)	NO		NULL	
UNIQUE_CONSTRAINT_SCHEMA	varchar(64)	NO		NULL	
UNIQUE_CONSTRAINT_NAME	varchar(64)	YES		NULL	
MATCH_OPTION	varchar(64)	NO		NULL	
UPDATE_RULE	varchar(64)	NO		NULL	
DELETE_RULE	varchar(64)	NO		NULL	
TABLE_NAME	varchar(64)	NO		NULL	
REFERENCED_TABLE_NAME	varchar(64)	NO		NULL	
+--
 ↪ -----+-----+-----+-----+-----+
 ↪
11 rows in set (0.00 sec)
```

```
CREATE TABLE test.parent (
 id INT NOT NULL AUTO_INCREMENT,
 PRIMARY KEY (id)
);

CREATE TABLE test.child (
 id INT NOT NULL AUTO_INCREMENT,
 name varchar(255) NOT NULL,
 parent_id INT DEFAULT NULL,
 PRIMARY KEY (id),
 CONSTRAINT fk_parent FOREIGN KEY (parent_id) REFERENCES parent (id) ON
 ↪ UPDATE CASCADE ON DELETE RESTRICT
);

SELECT * FROM REFERENTIAL_CONSTRAINTS\G
```

The output is as follows:

```
***** 1. row *****
CONSTRAINT_CATALOG: def
CONSTRAINT_SCHEMA: test
CONSTRAINT_NAME: fk_parent
UNIQUE_CONSTRAINT_CATALOG: def
UNIQUE_CONSTRAINT_SCHEMA: test
UNIQUE_CONSTRAINT_NAME: PRIMARY
MATCH_OPTION: NONE
```

```

UPDATE_RULE: CASCADE
DELETE_RULE: RESTRICT
TABLE_NAME: child
REFERENCED_TABLE_NAME: parent
1 row in set (0.00 sec)

```

### 14.11.18.2.32 RESOURCE\_GROUPS

#### Warning:

This feature is experimental and its form and usage might change in subsequent versions.

The RESOURCE\_GROUPS table shows the information about all resource groups. For more information, see [Use Resource Control to Achieve Resource Isolation](#).

```

USE information_schema;
DESC resource_groups;

```

```

+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+
NAME	varchar(32)	NO		NULL	
RU_PER_SEC	bigint(21)	YES		NULL	
BURSTABLE	varchar(3)	YES		NULL	
+-----+-----+-----+-----+-----+
3 rows in set (0.00 sec)

```

#### Examples

```

mysql> CREATE RESOURCE GROUP rg1 RU_PER_SEC=1000; -- Create the resource
 ↪ group rg1
Query OK, 0 rows affected (0.34 sec)
mysql> SHOW CREATE RESOURCE GROUP rg1; -- Display the definition of the rg1
 ↪ resource group
+-----+-----+-----+-----+-----+
| Resource_Group | Create Resource Group |
+-----+-----+-----+-----+
| rg1 | CREATE RESOURCE GROUP `rg1` RU_PER_SEC=1000 |
+-----+-----+-----+-----+
1 row in set (0.00 sec)
mysql> SELECT * FROM information_schema.resource_groups WHERE NAME = 'rg1';

```

```

+-----+-----+-----+
| NAME | RU_PER_SEC | BURSTABLE |
+-----+-----+-----+
| rg1 | 1000 | NO |
+-----+-----+-----+
1 row in set (0.00 sec)

```

The descriptions of the columns in the RESOURCE\_GROUPS table are as follows:

- **NAME:** the name of the resource group.
- **RU\_PER\_SEC:** the backfilling speed of the resource group. The unit is RU/second, in which RU means **Request Unit**.
- **BURSTABLE:** whether to allow the resource group to overuse the available system resources.

### 14.11.18.2.33 SCHEMATA

The SCHEMATA table provides information about databases. The table data is equivalent to the result of the SHOW DATABASES statement.

```

USE information_schema;
desc SCHEMATA;

```

```

+-----+-----+-----+-----+-----+-----+
↪
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
↪
CATALOG_NAME	varchar(512)	YES		NULL	
SCHEMA_NAME	varchar(64)	YES		NULL	
DEFAULT_CHARACTER_SET_NAME	varchar(64)	YES		NULL	
DEFAULT_COLLATION_NAME	varchar(32)	YES		NULL	
SQL_PATH	varchar(512)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
↪
5 rows in set (0.00 sec)

```

```

SELECT * FROM SCHEMATA;

```

```

+-----+-----+-----+-----+-----+-----+
↪
| CATALOG_NAME | SCHEMA_NAME | DEFAULT_CHARACTER_SET_NAME |
↪ DEFAULT_COLLATION_NAME | SQL_PATH |
+-----+-----+-----+-----+-----+-----+
↪

```

```

| def | INFORMATION_SCHEMA | utf8mb4 | utf8mb4_bin
| ↪ | NULL | |
| def | METRICS_SCHEMA | utf8mb4 | utf8mb4_bin
| ↪ | NULL | |
| def | mysql | utf8mb4 | utf8mb4_bin
| ↪ | NULL | |
| def | PERFORMANCE_SCHEMA | utf8mb4 | utf8mb4_bin
| ↪ | NULL | |
| def | test | utf8mb4 | utf8mb4_bin
| ↪ | NULL | |
+-----+-----+-----+-----+
| ↪
5 rows in set (0.00 sec)

```

Fields in the SCHEMATA table are described as follows:

- **CATALOG\_NAME**: The catalog to which the database belongs.
- **SCHEMA\_NAME**: The database name.
- **DEFAULT\_CHARACTER\_SET\_NAME**: The default character set of the database.
- **DEFAULT\_COLLATION\_NAME**: The default collation of the database.
- **SQL\_PATH**: The value of this item is always NULL.

#### 14.11.18.2.34 SEQUENCES

The SEQUENCES table provides information about sequences. The **sequences feature** is modeled on a similar feature in MariaDB.

```

USE INFORMATION_SCHEMA;
DESC SEQUENCES;

```

The output is as follows:

```

+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
TABLE_CATALOG	varchar(512)	NO		NULL	
SEQUENCE_SCHEMA	varchar(64)	NO		NULL	
SEQUENCE_NAME	varchar(64)	NO		NULL	
CACHE	tinyint(0)	NO		NULL	
CACHE_VALUE	bigint(21)	YES		NULL	
CYCLE	tinyint(0)	NO		NULL	
INCREMENT	bigint(21)	NO		NULL	
MAX_VALUE	bigint(21)	YES		NULL	
MIN_VALUE	bigint(21)	YES		NULL	
START	bigint(21)	YES		NULL	
COMMENT	varchar(64)	YES		NULL	

```

```
+-----+
11 rows in set (0.00 sec)
```

Create a sequence `test.seq` and query the next value of the sequence:

```
CREATE SEQUENCE test.seq;
SELECT nextval(test.seq);
SELECT * FROM sequences\G
```

The output is as follows:

```
+-----+
| nextval(test.seq) |
+-----+
| 1 |
+-----+
1 row in set (0.01 sec)
```

View all sequences:

```
SELECT * FROM SEQUENCES\G
```

The output is as follows:

```
***** 1. row *****
TABLE_CATALOG: def
SEQUENCE_SCHEMA: test
SEQUENCE_NAME: seq
 CACHE: 1
 CACHE_VALUE: 1000
 CYCLE: 0
 INCREMENT: 1
 MAX_VALUE: 9223372036854775806
 MIN_VALUE: 1
 START: 1
 COMMENT:
1 row in set (0.00 sec)
```

#### 14.11.18.235 SESSION\_VARIABLES

The `SESSION_VARIABLES` table provides information about session variables. The table data is similar to the result of the `SHOW SESSION VARIABLES` statement.

```
USE INFORMATION_SCHEMA;
DESC SESSION_VARIABLES;
```

The output is as follows:

```

+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
| VARIABLE_NAME | varchar(64) | YES | | NULL | |
| VARIABLE_VALUE | varchar(1024) | YES | | NULL | |
+-----+-----+-----+-----+-----+-----+
2 rows in set (0.00 sec)

```

Query the first 10 rows of the SESSION\_VARIABLES table:

```
SELECT * FROM SESSION_VARIABLES ORDER BY variable_name LIMIT 10;
```

The output is as follows:

```

+-----+-----+
| VARIABLE_NAME | VARIABLE_VALUE |
+-----+-----+
allow_auto_random_explicit_insert	OFF
auto_increment_increment	1
auto_increment_offset	1
autocommit	ON
automatic_sp_privileges	1
avoid_temporal_upgrade	OFF
back_log	80
basedir	/usr/local/mysql
big_tables	OFF
bind_address	*
+-----+-----+
10 rows in set (0.00 sec)

```

The description of columns in the SESSION\_VARIABLES table is as follows:

- VARIABLE\_NAME: The name of the session-level variable in the database.
- VARIABLE\_VALUE: The value of the session-level variable in the database.

#### 14.11.18.2.36 SLOW\_QUERY

The SLOW\_QUERY table provides the slow query information of the current node, which is the parsing result of the TiDB slow log file. The column names in the table are corresponding to the field names in the slow log.

For how to use this table to identify problematic statements and improve query performance, see [Slow Query Log Document](#).

```
USE INFORMATION_SCHEMA;
DESC SLOW_QUERY;
```

The output is as follows:

| ↪<br>Field                  | Type                | Null | Key | Default |
|-----------------------------|---------------------|------|-----|---------|
| ↪ Extra                     |                     |      |     |         |
| ↪<br>Time                   | timestamp(6)        | NO   | PRI | NULL    |
| ↪                           |                     |      |     |         |
| ↪ Txn_start_ts              | bigint(20) unsigned | YES  |     | NULL    |
| ↪                           |                     |      |     |         |

### CLUSTER\_SLOW\_QUERY table

The `CLUSTER_SLOW_QUERY` table provides the slow query information of all nodes in the cluster, which is the parsing result of the TiDB slow log files. You can use the `CLUSTER_SLOW_QUERY` table the way you do with `SLOW_QUERY`. The table schema of the `CLUSTER_SLOW_QUERY` table differs from that of the `SLOW_QUERY` table in that an `INSTANCE` column is added to `CLUSTER_SLOW_QUERY`. The `INSTANCE` column represents the TiDB node address of the row information on the slow query.

For how to use this table to identify problematic statements and improve query performance, see [Slow Query Log Document](#).

```
DESC CLUSTER_SLOW_QUERY;
```

The output is as follows:

```

+---
 ↪ -----+-----+-----+-----+-----+
 ↪
| Field | Type | Null | Key | Default |
 ↪ Extra |

```

```

| ↪                        |               |     |  |      |

```

| IsWriteCacheTable | tinyint(1) | YES | | NULL |
 ↳ |
| Plan_from_cache | tinyint(1) | YES | | NULL |
 ↳ |
| Plan_from_binding | tinyint(1) | YES | | NULL |
 ↳ |
| Has_more_results | tinyint(1) | YES | | NULL |
 ↳ |
| Plan | longtext | YES | | NULL |
 ↳ |
| Plan_digest | varchar(128) | YES | | NULL |
 ↳ |
| Binary_plan | longtext | YES | | NULL |
 ↳ |
| Prev_stmt | longtext | YES | | NULL |
 ↳ |
| Query | longtext | YES | | NULL |
 ↳ |
+--
 ↳ -----+-----+-----+-----+-----+
 ↳
75 rows in set (0.001 sec)

```

When the cluster system table is queried, TiDB does not obtain data from all nodes, but pushes down the related calculation to other nodes. The execution plan is as follows:

```
DESC SELECT COUNT(*) FROM CLUSTER_SLOW_QUERY WHERE user = 'u1';
```

The output is as follows:

```

+--
 ↳ -----+-----+-----+-----+-----+
 ↳
| id | estRows | task | access object |
 ↳ operator info | | | |
+--
 ↳ -----+-----+-----+-----+-----+
 ↳
| StreamAgg_7 | 1.00 | root | |
 ↳ funcs:count(1)->Column#75 | | | |
| -TableReader_13 | 10.00 | root | | data:
 ↳ Selection_12 | | | |
| -Selection_12 | 10.00 | cop[tidb] | | eq(
 ↳ INFORMATION_SCHEMA.cluster_slow_query.user, "u1") |
| -TableFullScan_11 | 10000.00 | cop[tidb] | table:CLUSTER_SLOW_QUERY |
 ↳ keep order:false, stats:pseudo |

```

```
+--
 ↳ -----+-----+-----+-----+-----+
 ↳
4 rows in set (0.00 sec)
```

In the preceding execution plan, the `user = u1` condition is pushed down to other (cop) TiDB nodes, and the aggregate operator is also pushed down (the `StreamAgg` operator in the graph).

Currently, because statistics of the system tables are not collected, sometimes some aggregation operators cannot be pushed down, which results in slow execution. In this case, you can manually specify the SQL HINT to push down the aggregation operators. For example:

```
SELECT /*+ AGG_TO_COP() */ COUNT(*) FROM CLUSTER_SLOW_QUERY GROUP BY user;
```

#### 14.11.18.2.37 STATISTICS

The `STATISTICS` table provides information about table indexes.

```
USE information_schema;
DESC statistics;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
TABLE_CATALOG	varchar(512)	YES		NULL	
TABLE_SCHEMA	varchar(64)	YES		NULL	
TABLE_NAME	varchar(64)	YES		NULL

+-----+-----+-----+-----+-----+-----+
18 rows in set (0.00 sec)
```

Fields in the `STATISTICS` table are described as follows:

- `TABLE_CATALOG`: The name of the catalog to which the table containing the index belongs. This value is always `def`.
- `TABLE_SCHEMA`: The name of the database to which the table containing the index belongs.
- `TABLE_NAME`: The name of the table containing the index.
- `NON_UNIQUE`: If the index must not contain duplicate values, the value is 0; if duplicate values are allowed in the index, the value is 1.
- `INDEX_SCHEMA`: The name of the database to which the index belongs.
- `INDEX_NAME`: The name of the index. If the index is the primary key, then the value is always `PRIMARY`.
- `SEQ_IN_INDEX`: The column number in the index, starting from 1.
- `COLUMN_NAME`: The column name. See the description of the `Expression` column.
- `COLLATION`: The sorting method of the columns in the index. The value can be `A` (ascending order), `D` (descending order) or `NULL` (unsorted).
- `CARDINALITY`: TiDB does not use this field. The field value is always 0.
- `SUB_PART`: The prefix of the index. If only part of the prefix of the column is indexed, the value is the number of indexed characters; if the entire column is indexed, the value is `NULL`.
- `PACKED`: TiDB does not use this field. This value is always `NULL`.
- `NULLABLE`: If the column might contain a `NULL` value, the value is `YES`; if not, the value is `' '`.
- `INDEX_TYPE`: The type of the index.
- `COMMENT`: Other information related to the index.
- `INDEX_COMMENT`: Any comment with comment attribute provided for the index when creating the index.
- `IS_VISIBLE`: Whether the optimizer can use this index.
- `Expression` For the index key of the non-expression part, this value is `NULL`; for the index key of the expression part, this value is the expression itself. Refer to [Expression Index](#).

The following statements are equivalent:

```
SELECT * FROM INFORMATION_SCHEMA.STATISTICS
WHERE table_name = 'tbl_name'
AND table_schema = 'db_name'

SHOW INDEX
FROM tbl_name
FROM db_name
```

#### 14.11.18.2.38 TABLES

The `TABLES` table provides information about tables in databases:

```
USE information_schema;
DESC tables;
```

```
+--
 ↪ -----+-----+-----+-----+-----+
 ↪
| Field | Type | Null | Key | Default | Extra |

 ↪ -----+-----+-----+-----+-----+
 ↪
23 rows in set (0.00 sec)
```

```
SELECT * FROM tables WHERE table_schema='mysql' AND table_name='user'\G
```

```
***** 1. row *****
TABLE_CATALOG: def
TABLE_SCHEMA: mysql
TABLE_NAME: user
```

```
TABLE_TYPE: BASE TABLE
ENGINE: InnoDB
VERSION: 10
ROW_FORMAT: Compact
TABLE_ROWS: 0
AVG_ROW_LENGTH: 0
DATA_LENGTH: 0
MAX_DATA_LENGTH: 0
INDEX_LENGTH: 0
DATA_FREE: 0
AUTO_INCREMENT: NULL
CREATE_TIME: 2020-07-05 09:25:51
UPDATE_TIME: NULL
CHECK_TIME: NULL
TABLE_COLLATION: utf8mb4_bin
CHECKSUM: NULL
CREATE_OPTIONS:
TABLE_COMMENT:
TIDB_TABLE_ID: 5
TIDB_ROW_ID_SHARDING_INFO: NULL
1 row in set (0.00 sec)
```

The following statements are equivalent:

```
SELECT table_name FROM INFORMATION_SCHEMA.TABLES
WHERE table_schema = 'db_name'
[AND table_name LIKE 'wild']

SHOW TABLES
FROM db_name
[LIKE 'wild']
```

The description of columns in the TABLES table is as follows:

- **TABLE\_CATALOG:** The name of the catalog which the table belongs to. The value is always `def`.
- **TABLE\_SCHEMA:** The name of the schema which the table belongs to.
- **TABLE\_NAME:** The name of the table.
- **TABLE\_TYPE:** The type of the table.
- **ENGINE:** The type of the storage engine. The value is currently `InnoDB`.
- **VERSION:** Version. The value is 10 by default.
- **ROW\_FORMAT:** The row format. The value is currently `Compact`.
- **TABLE\_ROWS:** The number of rows in the table in statistics.
- **AVG\_ROW\_LENGTH:** The average row length of the table.  $AVG\_ROW\_LENGTH = DATA\_LENGTH / TABLE\_ROWS$ .

- **DATA\_LENGTH**: Data length.  $DATA\_LENGTH = TABLE\_ROWS * \text{the sum of storage lengths of the columns in the tuple}$ . The replicas of TiKV are not taken into account.
- **MAX\_DATA\_LENGTH**: The maximum data length. The value is currently 0, which means the data length has no upper limit.
- **INDEX\_LENGTH**: The index length.  $INDEX\_LENGTH = TABLE\_ROWS * \text{the sum of lengths of the columns in the index tuple}$ . The replicas of TiKV are not taken into account.
- **DATA\_FREE**: Data fragment. The value is currently 0.
- **AUTO\_INCREMENT**: The current step of the auto-increment primary key.
- **CREATE\_TIME**: The time at which the table is created.
- **UPDATE\_TIME**: The time at which the table is updated.
- **CHECK\_TIME**: The time at which the table is checked.
- **TABLE\_COLLATION**: The collation of strings in the table.
- **CHECKSUM**: Checksum.
- **CREATE\_OPTIONS**: Creates options.
- **TABLE\_COMMENT**: The comments and notes of the table.

Most of the information in the table is the same as MySQL. Only two columns are newly defined by TiDB:

- **TIDB\_TABLE\_ID**: to indicate the internal ID of a table. This ID is unique in a TiDB cluster.
- **TIDB\_ROW\_ID\_SHARDING\_INFO**: to indicate the sharding type of a table. The possible values are as follows:
  - "NOT\_SHARDED": the table is not sharded.
  - "NOT\_SHARDED(PK\_IS\_HANDLE)": the table that defines an integer Primary Key as its row id is not sharded.
  - "PK\_AUTO\_RANDOM\_BITS={bit\_number}": the table that defines an integer Primary Key as its row id is sharded because the Primary Key is assigned with AUTO\_RANDOM attribute.
  - "SHARD\_BITS={bit\_number}": the table is sharded using SHARD\_ROW\_ID\_BITS={bit\_number}.
  - NULL: the table is a system table or view, and thus cannot be sharded.

#### 14.11.18.2.39 TABLE\_CONSTRAINTS

The TABLE\_CONSTRAINTS table describes which tables have constraints.

```
USE information_schema;
DESC table_constraints;
```

| Field              | Type         | Null | Key | Default | Extra |
|--------------------|--------------|------|-----|---------|-------|
| CONSTRAINT_CATALOG | varchar(512) | YES  |     | NULL    |       |
| CONSTRAINT_SCHEMA  | varchar(64)  | YES  |     | NULL    |       |

```

CONSTRAINT_NAME	varchar(64)	YES		NULL	
TABLE_SCHEMA	varchar(64)	YES		NULL	
TABLE_NAME	varchar(64)	YES		NULL	
CONSTRAINT_TYPE	varchar(64)	YES		NULL	
+-----+-----+-----+-----+-----+
6 rows in set (0.00 sec)

```

```
SELECT * FROM table_constraints WHERE constraint_type='UNIQUE';
```

```

+---
 ↪ -----+-----+-----+-----+
 ↪
| CONSTRAINT_CATALOG | CONSTRAINT_SCHEMA | CONSTRAINT_NAME | TABLE_SCHEMA
 ↪ | TABLE_NAME | CONSTRAINT_TYPE |
+---
 ↪ -----+-----+-----+-----+
 ↪
| def | mysql | name | mysql
 ↪ | help_topic | UNIQUE |
| def | mysql | tbl | mysql
 ↪ | stats_meta | UNIQUE |
| def | mysql | tbl | mysql
 ↪ | stats_histograms | UNIQUE |
| def | mysql | tbl | mysql
 ↪ | stats_buckets | UNIQUE |
| def | mysql | delete_range_index | mysql
 ↪ | gc_delete_range | UNIQUE |
| def | mysql | delete_range_done_index | mysql
 ↪ | gc_delete_range_done | UNIQUE |
| def | PERFORMANCE_SCHEMA | SCHEMA_NAME |
 ↪ PERFORMANCE_SCHEMA | events_statements_summary_by_digest | UNIQUE |
+---
 ↪ -----+-----+-----+-----+
 ↪
7 rows in set (0.01 sec)

```

Fields in the TABLE\_CONSTRAINTS table are described as follows:

- **CONSTRAINT\_CATALOG:** The name of the catalog to which the constraint belongs. This value is always def.
- **CONSTRAINT\_SCHEMA:** The name of the database to which the constraint belongs.
- **CONSTRAINT\_NAME:** The name of the constraint.
- **TABLE\_NAME:** The name of the table.

- **CONSTRAINT\_TYPE**: The type of the constraint. The value can be **UNIQUE**, **PRIMARY** ↔ **KEY** or **FOREIGN KEY**. The **UNIQUE** and **PRIMARY KEY** information is similar to the execution result of the **SHOW INDEX** statement.

#### 14.11.18.2.40 TABLE\_STORAGE\_STATS

The **TABLE\_STORAGE\_STATS** table provides information about table sizes as stored by the storage engine (TiKV).

```
USE INFORMATION_SCHEMA;
DESC TABLE_STORAGE_STATS;
```

The output is as follows:

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
TABLE_SCHEMA	varchar(64)	YES		NULL	
TABLE_NAME	varchar(64)	YES		NULL	
TABLE_ID	bigint(21)	YES		NULL	
PEER_COUNT	bigint(21)	YES		NULL	
REGION_COUNT	bigint(21)	YES		NULL	
EMPTY_REGION_COUNT	bigint(21)	YES		NULL	
TABLE_SIZE	bigint(64)	YES		NULL	
TABLE_KEYS	bigint(64)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
8 rows in set (0.00 sec)
```

```
CREATE TABLE test.t1 (id INT);
INSERT INTO test.t1 VALUES (1);
SELECT * FROM TABLE_STORAGE_STATS WHERE table_schema = 'test' AND
↪ table_name = 't1'\G
```

The output is as follows:

```
***** 1. row *****
TABLE_SCHEMA: test
TABLE_NAME: t1
TABLE_ID: 56
PEER_COUNT: 1
REGION_COUNT: 1
EMPTY_REGION_COUNT: 1
TABLE_SIZE: 1
TABLE_KEYS: 0
1 row in set (0.00 sec)
```

Fields in the **TABLE\_STORAGE\_STATS** table are described as follows:

- **TABLE\_SCHEMA**: The name of the schema to which the table belongs.
- **TABLE\_NAME**: The name of the table.
- **TABLE\_ID**: The ID of the table.
- **PEER\_COUNT**: The number of replicas of the table.
- **REGION\_COUNT**: The number of Regions.
- **EMPTY\_REGION\_COUNT**: The number of Regions that do not contain data in this table.
- **TABLE\_SIZE**: The total size of the table, in the unit of MiB.
- **TABLE\_KEYS**: The total number of records in the table.

#### 14.11.18.2.41 TIDB\_HOT\_REGIONS

The `TIDB_HOT_REGIONS` table provides information about the current hot Regions. For information about history hot Regions, see `[TIDB_HOT_REGIONS_HISTORY] (# ↪ tidb_hot_regions_history)`.

```
USE information_schema;
DESC tidb_hot_regions;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
TABLE_ID	bigint(21)	YES		NULL	
INDEX_ID	bigint(21)	YES		NULL	
DB_NAME	varchar(64)	YES		NULL	
TABLE_NAME	varchar(64)	YES		NULL	
INDEX_NAME	varchar(64)	YES		NULL	
REGION_ID	bigint(21)	YES		NULL	
TYPE	varchar(64)	YES		NULL	
MAX_HOT_DEGREE	bigint(21)	YES		NULL	
REGION_COUNT	bigint(21)	YES		NULL	
FLOW_BYTES	bigint(21)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
10 rows in set (0.00 sec)
```

The description of columns in the `TIDB_HOT_REGIONS` table is as follows:

- **TABLE\_ID**: The ID of the table in which the hot Region is located.
- **INDEX\_ID**: The ID of the index in which the hot Region is located.
- **DB\_NAME**: The database name of the object in which the hot Region is located.
- **TABLE\_NAME**: The name of the table in which the hot Region is located.
- **INDEX\_NAME**: The name of the index in which the hot Region is located.
- **REGION\_ID**: The ID of the hot Region.
- **TYPE**: The type of the hot Region.
- **MAX\_HOT\_DEGREE**: The maximum hot degree of the Region.
- **REGION\_COUNT**: The number of hot Regions in the instance.
- **FLOW\_BYTES**: The number of bytes written and read in the Region.

#### 14.11.18.2.42 TIDB\_HOT\_REGIONS\_HISTORY

The `TIDB_HOT_REGIONS_HISTORY` table provides information about history hot Regions that are periodically recorded locally by PD.

You can specify the record interval by configuring `hot-regions-write-interval`. The default value is 10 minutes. You can specify the period for reserving history information about hot Regions by configuring `hot-regions-reserved-days`. The default value is 7 days. See [PD configuration file description](#) for details.

```
USE information_schema;
DESC tidb_hot_regions_history;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
UPDATE_TIME	timestamp(6)	YES		NULL	
DB_NAME	varchar(64)	YES		NULL	
TABLE_NAME	varchar(64)	YES		NULL	
TABLE_ID	bigint(21)	YES		NULL	
INDEX_NAME	varchar(64)	YES		NULL	
INDEX_ID	bigint(21)	YES		NULL	
REGION_ID	bigint(21)	YES		NULL	
STORE_ID	bigint(21)	YES		NULL	
PEER_ID	bigint(21)	YES		NULL	
IS_LEARNER	tinyint(1)	NO		0	
IS_LEADER	tinyint(1)	NO		0	
TYPE	varchar(64)	YES		NULL	
HOT_DEGREE	bigint(21)	YES		NULL	
FLOW_BYTES	double	YES		NULL	
KEY_RATE	double	YES		NULL	
QUERY_RATE	double	YES		NULL	
+-----+-----+-----+-----+-----+-----+
16 rows in set (0.00 sec)
```

The fields in the `TIDB_HOT_REGIONS_HISTORY` table are described as follows:

- `UPDATE_TIME`: The update time of the hot Region.
- `DB_NAME`: The database name of the object in which the hot Region is located.
- `TABLE_ID`: The ID of the table in which the hot Region is located.
- `TABLE_NAME`: The name of the table in which the hot Region is located.
- `INDEX_NAME`: The name of the index in which the hot Region is located.
- `INDEX_ID`: The ID of the index in which the hot Region is located.
- `REGION_ID`: The ID of the hot Region.
- `STORE_ID`: The ID of the store in which the hot Region is located.
- `PEER_ID`: The ID of the Peer corresponding to the hot Region.

- IS\_LEARNER: Whether the PEER is the LEARNER.
- IS\_LEADER: Whether the PEER is the LEADER.
- TYPE: The type of the hot Region.
- HOT\_DEGREE: The hot degree of the hot Region.
- FLOW\_BYTES: The number of bytes written and read in the Region.
- KEY\_RATE: The number of keys written and read in the Region.
- QUERY\_RATE: The number of queries written and read in the Region.

#### Note:

UPDATE\_TIME, REGION\_ID, STORE\_ID, PEER\_ID, IS\_LEARNER, IS\_LEADER and TYPE fields are pushed down to the PD servers for execution. To reduce the overhead of using the table, you must specify the time range for the search, and specify as many conditions as possible. For example,

```
select * from tidb_hot_regions_history where store_id = 11
↪ and update_time > '2020-05-18 20:40:00' and update_time <
↪ '2020-05-18 21:40:00' and type='write'.
```

#### Common user scenarios

- Query hot Regions within a specific period of time. Replace `update_time` with your actual time.

```
SELECT * FROM INFORMATION_SCHEMA.TIDB_HOT_REGIONS_HISTORY WHERE
↪ update_time >'2021-08-18 21:40:00' and update_time <'2021-09-19
↪ 00:00:00';
```

#### Note:

UPDATE\_TIME also supports Unix timestamps. For example, `update_time >TIMESTAMP('2021-08-18 21:40:00')` or `update_time > FROM_UNIXTIME(1629294000.000)`.

- Query hot Regions in a table within a specific period of time. Replace `update_time` and `table_name` with your actual values.

```
SELECT * FROM INFORMATION_SCHEMA.TIDB_HOT_REGIONS_HISTORY WHERE
↪ update_time >'2021-08-18 21:40:00' and update_time <'2021-09-19
↪ 00:00:00' and TABLE_NAME = 'table_name';
```

- Query the distribution of hot Regions within a specific period of time. Replace `update_time` and `table_name` with your actual values.

```
SELECT count(region_id) cnt, store_id FROM INFORMATION_SCHEMA.
 ↪ TIDB_HOT_REGIONS_HISTORY WHERE update_time >'2021-08-18 21:40:00
 ↪ ' and update_time <'2021-09-19 00:00:00' and table_name = '
 ↪ table_name' GROUP BY STORE_ID ORDER BY cnt DESC;
```

- Query the distribution of hot Leader Regions within a specific period of time. Replace `update_time` and `table_name` with your actual values.

```
SELECT count(region_id) cnt, store_id FROM INFORMATION_SCHEMA.
 ↪ TIDB_HOT_REGIONS_HISTORY WHERE update_time >'2021-08-18 21:40:00
 ↪ ' and update_time <'2021-09-19 00:00:00' and table_name = '
 ↪ table_name' and is_leader=1 GROUP BY STORE_ID ORDER BY cnt DESC;
```

- Query the distribution of hot Index Regions within a specific period of time. Replace `update_time` and `table_name` with your actual values.

```
SELECT count(region_id) cnt, index_name, store_id FROM
 ↪ INFORMATION_SCHEMA.TIDB_HOT_REGIONS_HISTORY WHERE update_time >'
 ↪ 2021-08-18 21:40:00' and update_time <'2021-09-19 00:00:00' and
 ↪ table_name = 'table_name' group by index_name, store_id order by
 ↪ index_name,cnt desc;
```

- Query the distribution of hot Index Leader Regions within a specific period of time. Replace `update_time` and `table_name` with your actual values.

```
SELECT count(region_id) cnt, index_name, store_id FROM
 ↪ INFORMATION_SCHEMA.TIDB_HOT_REGIONS_HISTORY WHERE update_time >'
 ↪ 2021-08-18 21:40:00' and update_time <'2022-09-19 00:00:00' and
 ↪ table_name = 'table_name' and is_leader=1 group by index_name,
 ↪ store_id order by index_name,cnt desc;
```

#### 14.11.18.2.43 TIDB\_INDEXES

The `TIDB_INDEXES` table provides the `INDEX` information of all tables.

```
USE information_schema;
DESC tidb_indexes;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
| TABLE_SCHEMA | varchar(64) | YES | | NULL | |
| TABLE_NAME | varchar(64) | YES | | NULL | |
```

```

NON_UNIQUE	bigint(21)	YES		NULL	
KEY_NAME	varchar(64)	YES		NULL	
SEQ_IN_INDEX	bigint(21)	YES		NULL	
COLUMN_NAME	varchar(64)	YES		NULL	
SUB_PART	bigint(21)	YES		NULL	
INDEX_COMMENT	varchar(2048)	YES		NULL	
Expression	varchar(64)	YES		NULL	
INDEX_ID	bigint(21)	YES		NULL	
IS_VISIBLE	varchar(64)	YES		NULL	
CLUSTERED	varchar(64)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
12 rows in set (0.00 sec)

```

INDEX\_ID is the unique ID that TiDB allocates for each index. It can be used to do a join operation with INDEX\_ID obtained from another table or API.

For example, you can obtain TABLE\_ID and INDEX\_ID that are involved in some slow query in the **SLOW\_QUERY** table and then obtain the specific index information using the following SQL statements:

```

SELECT
 tidb_indexes.*
FROM
 tidb_indexes,
 tables
WHERE
 tidb_indexes.table_schema = tables.table_schema
AND tidb_indexes.table_name = tidb_indexes.table_name
AND tables.tidb_table_id = ?
AND index_id = ?

```

Fields in the TIDB\_INDEXES table are described as follows:

- TABLE\_SCHEMA: The name of the schema to which the index belongs.
- TABLE\_NAME: The name of the table to which the index belongs.
- NON\_UNIQUE: If the index is unique, the value is 0; otherwise, the value is 1.
- KEY\_NAME: The index name. If the index is the primary key, the name is PRIMARY.
- SEQ\_IN\_INDEX: The sequential number of columns in the index, which starts from 1.
- COLUMN\_NAME: The name of the column where the index is located.
- SUB\_PART: The prefix length of the index. If the the column is partly indexed, the SUB\_PART value is the count of the indexed characters; otherwise, the value is NULL.
- INDEX\_COMMENT: The comment of the index, which is made when the index is created.
- INDEX\_ID: The index ID.
- IS\_VISIBLE: Whether the index is visible.
- CLUSTERED: Whether it is a **clustered index**.

#### 14.11.18.2.44 TIDB\_SERVERS\_INFO

The TIDB\_SERVERS\_INFO table provides information about TiDB servers in the TiDB Cluster (namely, tidb-server processes).

```
USE INFORMATION_SCHEMA;
DESC tidb_servers_info;
```

The output is as follows:

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
DDL_ID	varchar(64)	YES		NULL	
IP	varchar(64)	YES		NULL

| ↪   | -----             |  |      |     |      |
| ↪   | -----             |  |      |     |      |

The meaning of each column field in the `TIDB_TRX` table is as follows:

- **ID**: The transaction ID, which is the `start_ts` (start timestamp) of the transaction.
- **START\_TIME**: The start time of the transaction, which is the physical time corresponding to the `start_ts` of the transaction.
- **CURRENT\_SQL\_DIGEST**: The digest of the SQL statement currently being executed in the transaction.
- **CURRENT\_SQL\_DIGEST\_TEXT**: The normalized form of the SQL statement currently being executed by the transaction, that is, the SQL statement without arguments and format. It corresponds to `CURRENT_SQL_DIGEST`.
- **STATE**: The current state of the transaction. The possible values include:
  - **Idle**: The transaction is in an idle state, that is, it is waiting for the user to input a query.
  - **Running**: The transaction is executing a query.
  - **LockWaiting**: The transaction is waiting for the pessimistic lock to be acquired. Note that the transaction enters this state at the beginning of the pessimistic locking operation, no matter whether it is blocked by other transactions or not.
  - **Committing**: The transaction is in the process of commit.
  - **RollingBack**: The transaction is being rolled back.
- **WAITING\_START\_TIME**: When the value of `STATE` is `LockWaiting`, this column shows the start time of the waiting.
- **MEM\_BUFFER\_KEYS**: The number of keys written into the memory buffer by the current transaction.
- **MEM\_BUFFER\_BYTES**: The total number of key-value bytes written into the memory buffer by the current transaction.
- **SESSION\_ID**: The ID of the session to which this transaction belongs.
- **USER**: The name of the user who performs the transaction.
- **DB**: The current default database name of the session in which the transaction is executed.
- **ALL\_SQL\_DIGESTS**: The digest list of statements that have been executed by the transaction. The list is shown as a string array in JSON format. Each transaction records at most the first 50 statements. Using the `TIDB_DECODE_SQL_DIGESTS` function, you can convert the information in this column into a list of corresponding normalized SQL statements.

- `RELATED_TABLE_IDS`: The IDs of the tables, views, and other objects that the transaction accesses.

### Note:

- Only users with the `PROCESS` privilege can obtain the complete information in this table. Users without the `PROCESS` privilege can only query information of the transactions performed by the current user.
- The information (SQL digest) in the `CURRENT_SQL_DIGEST` and `ALL_SQL_DIGESTS` columns is the hash value calculated from the normalized SQL statement. The information in the `CURRENT_SQL_DIGEST_TEXT` column and the result returned from the `TIDB_DECODE_SQL_DIGESTS` function are internally queried from the statements summary tables, so it is possible that the corresponding statement cannot be found internally. For the detailed description of SQL digests and the statements summary tables, see [Statement Summary Tables](#).
- The `TIDB_DECODE_SQL_DIGESTS` function call has a high overhead. If the function is called to query historical SQL statements for a large number of transactions, the query might take a long time. If the cluster is large with many concurrent transactions, avoid directly using this function on the `ALL_SQL_DIGEST` column while querying the full table of `TIDB_TRX`. This means to avoid an SQL statement like `SELECT *, ↵ tidb_decode_sql_digests(all_sql_digests)FROM TIDB_TRX`.
- Currently the `TIDB_TRX` table does not support showing information of TiDB internal transactions.

### Example

View the `TIDB_TRX` table:

```
SELECT * FROM INFORMATION_SCHEMA.TIDB_TRX\G
```

The output is as follows:

```
***** 1. row *****
 ID: 426789913200689153
 START_TIME: 2021-08-04 10:51:54.883000
 CURRENT_SQL_DIGEST: NULL
 CURRENT_SQL_DIGEST_TEXT: NULL
 STATE: Idle
 WAITING_START_TIME: NULL
 MEM_BUFFER_KEYS: 1
 MEM_BUFFER_BYTES: 29
```

```

SESSION_ID: 7
 USER: root
 DB: test
ALL_SQL_DIGESTS: ["
 ↪ e6f07d43b5c21db0fbb9a31feac2dc599787763393dd5acbfad80e247eb02ad5
 ↪ ", "04

 ↪ "]
2 rows in set (0.01 sec)

```

From the query result of this example, you can see that: the current node has two on-going transactions. One transaction is in the idle state (STATE is Idle and CURRENT\_SQL\_DIGEST is NULL), and this transaction has executed 3 statements (there are three records in the ALL\_SQL\_DIGESTS list, which are the digests of the three SQL statements that have been executed). Another transaction is executing a statement and waiting for the lock (STATE is LockWaiting and WAITING\_START\_TIME shows the start time of the waiting lock). The transaction has executed 2 statements, and the statement currently being executed is in the form of "update `t` set `v` = `v` + ? where `id` = ?".

```

SELECT id, all_sql_digests, tidb_decode_sql_digests(all_sql_digests) AS
 ↪ all_sqls FROM INFORMATION_SCHEMA.TIDB_TRX\G

```

The output is as follows:

```

***** 1. row *****
 id: 426789913200689153

```

```

all_sql_digests: ["
 ↪ e6f07d43b5c21db0fbb9a31feac2dc599787763393dd5acbfad80e247eb02ad5", "04

 all_sqls: ["begin", "update `t` set `v` = `v` + ? where `id` = ?"]

```

This query calls the `TIDB_DECODE_SQL_DIGESTS` function on the `ALL_SQL_DIGESTS` column of the `TIDB_TRX` table, and converts the SQL digest array into an array of normalized SQL statement through the system internal query. This helps you visually obtain the information of the statements that have been historically executed by the transaction. However, note that the preceding query scans the entire table of `TIDB_TRX` and calls the `TIDB_DECODE_SQL_DIGESTS` function for each row. Calling the `TIDB_DECODE_SQL_DIGESTS` function has a high overhead. Therefore, if many concurrent transactions exist in the cluster, try to avoid this type of query.

### CLUSTER\_TIDB\_TRX

The `TIDB_TRX` table only provides information about the transactions that are being executed on a single TiDB node. If you want to view the information of the transactions that are being executed on all TiDB nodes in the entire cluster, you need to query the `CLUSTER_TIDB_TRX` table. Compared with the query result of the `TIDB_TRX` table, the query result of the `CLUSTER_TIDB_TRX` table includes an extra `INSTANCE` field. The `INSTANCE` field displays the IP address and port of each node in the cluster, which is used to distinguish the TiDB nodes where the transactions are located.

```

USE INFORMATION_SCHEMA;
DESC CLUSTER_TIDB_TRX;

```

The output is as follows:

```

+---
 ↪ -----+
 ↪
| Field | Type | Null | Key |
 ↪ | | | |
 ↪ Default | Extra |
+---

+---+
14 rows in set (0.00 sec)

```

#### 14.11.18.2.46 TIFLASH\_REPLICA

The TIFLASH\_REPLICA table provides information about TiFlash replicas available.

```
USE INFORMATION_SCHEMA;
DESC TIFLASH_REPLICA;
```

The output is as follows:

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
TABLE_SCHEMA	varchar(64)	YES		NULL	
TABLE_NAME	varchar(64)	YES		NULL	
TABLE_ID	bigint(21)	YES		NULL	
REPLICA_COUNT	bigint(64)	YES		NULL	
LOCATION_LABELS	varchar(64)	YES		NULL	
AVAILABLE	tinyint(1)	YES		NULL	
PROGRESS	double	YES		NULL	
+-----+-----+-----+-----+-----+-----+
7 rows in set (0.01 sec)
```

Fields in the TIFLASH\_REPLICA table are described as follows:

- **TABLE\_SCHEMA**: the name of the database to which the table belongs.
- **TABLE\_NAME**: the name of the table.
- **TABLE\_ID**: the internal ID of the table, which is unique within a TiDB cluster.
- **REPLICA\_COUNT**: the number of TiFlash replicas.
- **LOCATION\_LABELS**: the LocationLabelList that is set when a TiFlash replica is created.
- **AVAILABLE**: indicates whether the TiFlash replica of the table is available. When the value is 1 (available), the TiDB optimizer can intelligently choose to push down queries to TiKV or TiFlash based on query cost. When the value is 0 (unavailable), TiDB will not push down queries to TiFlash. Once the value of this field becomes 1 (available), it will not change anymore.
- **PROGRESS**: the replication progress of TiFlash replicas, with the accuracy to two decimal places and at the minute level. The scope of this field is [0, 1]. When the **AVAILABLE** field is 1 and **PROGRESS** is less than 1, the TiFlash replica is far behind TiKV, and the queries pushed down to TiFlash will probably fail due to timeout of waiting for data replication.

#### 14.11.18.2.47 TIFLASH\_SEGMENTS

**Warning:**

Do not use this table in production environments, as the fields of the table are unstable, and subject to change in new releases of TiDB, without prior notice.

The `TIFLASH_SEGMENTS` table provides statistical information about data tables in TiFlash.

```
USE information_schema;
DESC tiflash_segments;
```

```

```

Fields in the TIFLASH\_SEGMENTS table are described as follows:

- **DATABASE:** Database name in TiFlash. The segment belongs to a table in this database.
- **TABLE:** Table name in TiFlash. The segment belongs to this table.
- **TIDB\_DATABASE:** Database name in TiDB. The segment belongs to a table in this database.
- **TIDB\_TABLE:** Table name in TiDB. The segment belongs to this table.
- **TABLE\_ID:** The internal ID of the table to which the segment belongs. This ID is unique within a TiDB cluster.
- **IS\_TOMBSTONE:** Indicates whether the table the segment belongs to can be recycled. 1 indicates that the table can be recycled. 0 indicates that the table is in a normal state.
- **SEGMENT\_ID:** Segment ID, which is unique within a table.
- **RANGE:** The range of data that the segment contains.
- **EPOCH:** The updated version of the segment. The version number of each segment increases monotonically.
- **ROWS:** The total number of rows in the segment.
- **SIZE:** The total size of the segment data (in bytes).
- **DELTA\_RATE:** The ratio of the total number of rows in the Delta layer to that in the segment.
- **DELTA\_MEMTABLE\_ROWS:** The total number of cached rows in the Delta layer.
- **DELTA\_MEMTABLE\_SIZE:** The total size of the data cached in the Delta layer (in bytes).
- **DELTA\_MEMTABLE\_COLUMN\_FILES:** The number of Column Files cached in the Delta layer.
- **DELTA\_MEMTABLE\_DELETE\_RANGES:** The number of Delete Ranges cached in the Delta layer.
- **DELTA\_PERSISTED\_PAGE\_ID:** The ID of the data stored on a disk in the Delta layer.
- **DELTA\_PERSISTED\_ROWS:** The total number of rows of persisted data in the Delta layer.
- **DELTA\_PERSISTED\_SIZE:** The total size of the persisted data in the Delta layer (in bytes).
- **DELTA\_PERSISTED\_COLUMN\_FILES:** The number of persisted Column Files in the Delta layer.
- **DELTA\_PERSISTED\_DELETE\_RANGES:** The number of persisted Delete Ranges in the Delta layer.

- `DELTA_CACHE_SIZE`: The size of the cache in the Delta layer (in bytes).
- `DELTA_INDEX_SIZE`: The size of the indexes in the Delta layer (in bytes).
- `STABLE_PAGE_ID`: The disk storage ID of the data in the Stable layer.
- `STABLE_ROWS`: The total number of rows in the Stable layer.
- `STABLE_SIZE`: The total size of the data in the Stable layer (in bytes).
- `STABLE_DMFILES`: The number of DMFiles in the Stable layer.
- `STABLE_DMFILES_ID_0`: The disk storage ID of the first DMFile in the Stable layer.
- `STABLE_DMFILES_ROWS`: The total number of rows in the DMFile in the Stable layer.
- `STABLE_DMFILES_SIZE`: The total size of the data in the DMFile in the Stable layer (in bytes).
- `STABLE_DMFILES_SIZE_ON_DISK`: The disk space occupied by the DMFile in the Stable layer (in bytes).
- `STABLE_DMFILES_PACKS`: The number of Packs in the DMFile in the Stable layer.
- `TIFLASH_INSTANCE`: The address of the TiFlash instance.

```

Fields in the TIFLASH\_TABLES table are described as follows:

- **DATABASE:** The name of the database that the table belongs to in TiFlash.
- **TABLE:** The name of the table in TiFlash.
- **TIDB\_DATABASE:** The name of the database that the table belongs to in TiDB.
- **TIDB\_TABLE:** The name of the table in TiDB.
- **TABLE\_ID:** The internal ID of the table, which is unique within a TiDB cluster.
- **IS\_TOMBSTONE:** Indicates whether the table can be recycled. 1 indicates that the table can be recycled, and 0 indicates that the table is in a normal state.
- **SEGMENT\_COUNT:** The number of segments in the table. A segment is a data management unit in TiFlash.
- **TOTAL\_ROWS:** The total number of rows in the table.
- **TOTAL\_SIZE:** The total size of the table (in bytes).
- **TOTAL\_DELETE\_RANGES:** The total number of Delete Ranges in the table.
- **DELTA\_RATE\_ROWS:** The ratio of the total rows of the table in the Delta layer to the total rows of that table.
- **DELTA\_RATE\_SEGMENTS:** The proportion of segments that contain a non-empty Delta layer in the table.
- **DELTA\_PLACED\_RATE:** The proportion of rows that have completed index construction of the table in the Delta layer.
- **DELTA\_CACHE\_SIZE:** The size of the cache of the table in the Delta layer (in bytes).
- **DELTA\_CACHE\_RATE:** The proportion of cache data of the table in the Delta layer.
- **DELTA\_CACHE\_WASTED\_RATE:** The proportion of invalid cache data of the table in the Delta layer.
- **DELTA\_INDEX\_SIZE:** The size of the memory occupied by indexes in the Delta layer (in bytes).
- **AVG\_SEGMENT\_ROWS:** The average number of rows in all segments of the table.
- **AVG\_SEGMENT\_SIZE:** The average size of all segments of the table (in bytes).

- **DELTA\_COUNT**: The number of segments that contain a non-empty Delta layer in the table.
- **TOTAL\_DELTA\_ROWS**: The total number of rows in the Delta layer.
- **TOTAL\_DELTA\_SIZE**: The total size of the data in the Delta layer (in bytes).
- **AVG\_DELTA\_ROWS**: The average number of rows of data in all Delta layers.
- **AVG\_DELTA\_SIZE**: The average size of data in all Delta layers (in bytes).
- **AVG\_DELTA\_DELETE\_RANGES**: The average number of Delete Range operations in all Delta layers.
- **STABLE\_COUNT**: The number of segments that contain a non-empty Stable layer in the table.
- **TOTAL\_STABLE\_ROWS**: The total number of rows in all Stable layers.
- **TOTAL\_STABLE\_SIZE**: The total size of the data in all Stable layers (in bytes).
- **TOTAL\_STABLE\_SIZE\_ON\_DISK**: The disk space occupied by the data in all Stable layers (in bytes).
- **AVG\_STABLE\_ROWS**: The average number of rows of data in all Stable layers.
- **AVG\_STABLE\_SIZE**: The average size of data in all Stable layers (in bytes).
- **TOTAL\_PACK\_COUNT\_IN\_DELTA**: The total number of Column Files in all Delta layers.
- **MAX\_PACK\_COUNT\_IN\_DELTA**: The maximum number of Column Files in a single Delta layer.
- **AVG\_PACK\_COUNT\_IN\_DELTA**: The average number of Column Files in all Delta layers.
- **AVG\_PACK\_ROWS\_IN\_DELTA**: The average number of rows in all Column Files in all Delta layers.
- **AVG\_PACK\_SIZE\_IN\_DELTA**: The average size of data in all Column Files in all Delta layers (in bytes).
- **TOTAL\_PACK\_COUNT\_IN\_STABLE**: The total number of Packs in all Stable layers.
- **AVG\_PACK\_COUNT\_IN\_STABLE**: The average number of Packs in all Stable layers.
- **AVG\_PACK\_ROWS\_IN\_STABLE**: The average number of rows in all Packs in all Stable layers.
- **AVG\_PACK\_SIZE\_IN\_STABLE**: The average size of data in all Packs in the Stable layer (in bytes).
- **STORAGE\_STABLE\_NUM\_SNAPSHOTS**: The number of snapshots in the Stable layer.
- **STORAGE\_STABLE\_OLDEST\_SNAPSHOT\_LIFETIME**: The duration of the earliest snapshot in the Stable layer (in seconds).
- **STORAGE\_STABLE\_OLDEST\_SNAPSHOT\_THREAD\_ID**: The thread ID of the earliest snapshot in the Stable layer.
- **STORAGE\_STABLE\_OLDEST\_SNAPSHOT\_TRACING\_ID**: The tracing ID of the earliest snapshot in the Stable layer.
- **STORAGE\_DELTA\_NUM\_SNAPSHOTS**: The number of snapshots in the Delta layer.
- **STORAGE\_DELTA\_OLDEST\_SNAPSHOT\_LIFETIME**: The duration of the earliest snapshot in the Delta layer (in seconds).
- **STORAGE\_DELTA\_OLDEST\_SNAPSHOT\_THREAD\_ID**: The thread ID of the earliest snapshot in the Delta layer.
- **STORAGE\_DELTA\_OLDEST\_SNAPSHOT\_TRACING\_ID**: The tracing ID of the earliest snapshot in the Delta layer.
- **STORAGE\_META\_NUM\_SNAPSHOTS**: The number of snapshots in the meta information.

- `STORAGE_META_OLDEST_SNAPSHOT_LIFETIME`: The duration of the earliest snapshot in the meta information (in seconds).
- `STORAGE_META_OLDEST_SNAPSHOT_THREAD_ID`: The thread ID of the earliest snapshot in the meta information.
- `STORAGE_META_OLDEST_SNAPSHOT_TRACING_ID`: The tracing ID of the earliest snapshot in the meta information.
- `BACKGROUND_TASKS_LENGTH`: The length of the task queue in the background.
- `TIFLASH_INSTANCE`: The address of the TiFlash instance.

#### 14.11.18.2.49 TIKV\_REGION\_PEERS

The `TIKV_REGION_PEERS` table shows detailed information of a single Region node in TiKV, such as whether it is a learner or leader.

```
USE INFORMATION_SCHEMA;
DESC TIKV_REGION_PEERS;
```

The output is as follows:

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
REGION_ID	bigint(21)	YES		NULL	
PEER_ID	bigint(21)	YES		NULL	
STORE_ID	bigint(21)	YES		NULL	
IS_LEARNER	tinyint(1)	NO		0	
IS_LEADER	tinyint(1)	NO		0	
STATUS	varchar(10)	YES		0	
DOWN_SECONDS	bigint(21)	YES		0	
+-----+-----+-----+-----+-----+-----+
7 rows in set (0.01 sec)
```

For example, you can query the specific TiKV addresses for the top 3 Regions with the maximum value of `WRITTEN_BYTES` using the following SQL statement:

```
SELECT
 address,
 tikv.address,
 region.region_id
FROM
 TIKV_STORE_STATUS tikv,
 TIKV_REGION_PEERS peer,
 (SELECT * FROM tikv_region_status ORDER BY written_bytes DESC LIMIT 3)
 ↪ region
WHERE
 region.region_id = peer.region_id
AND peer.is_leader = 1
```

```
AND peer.store_id = tikv.store_id;
```

Fields in the TIKV\_REGION\_PEERS table are described as follows:

- REGION\_ID: The Region ID.
- PEER\_ID: The ID of the Region peer.
- STORE\_ID: The ID of the TiKV store where the Region is located.
- IS\_LEARNER: Whether the peer is learner.
- IS\_LEADER: Whether the peer is leader.
- STATUS: The statuses of a peer:
  - PENDING: Temporarily unavailable.
  - DOWN: Offline and converted. This peer no longer provides service.
  - NORMAL: Running normally.
- DOWN\_SECONDS: The duration of being offline, in seconds.

#### 14.11.18.250 TIKV\_REGION\_STATUS

The TIKV\_REGION\_STATUS table shows some basic information of TiKV Regions via PD's API, like the Region ID, starting and ending key-values, and read and write traffic.

```
USE information_schema;
DESC tikv_region_status;
```

```
+--
 ↳ -----+-----+-----+-----+-----+-----+
 ↳
| Field | Type | Null | Key | Default | Extra |
+--
 ↳ -----+-----+-----+-----+-----+-----+
 ↳
REGION_ID	bigint(21)	YES		NULL	
START_KEY	text	YES		NULL	
END_KEY	text	YES		NULL	
TABLE_ID	bigint(21)	YES		NULL	
DB_NAME	varchar(64)	YES		NULL	
TABLE_NAME	varchar(64)	YES		NULL	
IS_INDEX	tinyint(1)	NO		0	
INDEX_ID	bigint(21)	YES		NULL	
INDEX_NAME	varchar(64)	YES		NULL	
EPOCH_CONF_VER	bigint(21)	YES		NULL	
EPOCH_VERSION	bigint(21)	YES		NULL	
WRITTEN_BYTES	bigint(21)	YES		NULL	
READ_BYTES	bigint(21)	YES		NULL	
APPROXIMATE_SIZE	bigint(21)	YES		NULL	
```

```

APPROXIMATE_KEYS	bigint(21)	YES		NULL	
REPLICATIONSTATUS_STATE	varchar(64)	YES		NULL	
REPLICATIONSTATUS_STATEID	bigint(21)	YES		NULL	
+---+
↵ -----+-----+-----+-----+-----+
↵
17 rows in set (0.00 sec)

```

The descriptions of the columns in the `TIKV_REGION_STATUS` table are as follows:

- `REGION_ID`: The ID of the Region.
- `START_KEY`: The value of the start key of the Region.
- `END_KEY`: The value of the end key of the Region.
- `TABLE_ID`: The ID of the table to which the Region belongs.
- `DB_NAME`: The name of the database to which `TABLE_ID` belongs.
- `TABLE_NAME`: The name of the table to which the Region belongs.
- `IS_INDEX`: Whether the Region data is an index. 0 means that it is not an index, while 1 means that it is an index. If the current Region contains both table data and index data, there will be multiple rows of records, and `IS_INDEX` is 0 and 1 respectively.
- `INDEX_ID`: The ID of the index to which the Region belongs. If `IS_INDEX` is 0, the value of this column is `NULL`.
- `INDEX_NAME`: The name of the index to which the Region belongs. If `IS_INDEX` is 0, the value of this column is `NULL`.
- `EPOCH_CONF_VER`: The version number of the Region configuration. The version number increases when a peer is added or removed.
- `EPOCH_VERSION`: The current version number of the Region. The version number increases when the Region is split or merged.
- `WRITTEN_BYTES`: The amount of data (bytes) written to the Region.
- `READ_BYTES`: The amount of data (bytes) that has been read from the Region.
- `APPROXIMATE_SIZE`: The approximate data size (MB) of the Region.
- `APPROXIMATE_KEYS`: The approximate number of keys in the Region.
- `REPLICATIONSTATUS_STATE`: The current replication status of the Region. The status might be `UNKNOWN`, `SIMPLE_MAJORITY`, or `INTEGRITY_OVER_LABEL`.
- `REPLICATIONSTATUS_STATEID`: The identifier corresponding to `REPLICATIONSTATUS_STATE`.

Also, you can implement the `top confver`, `top read` and `top write` operations in `pdctl` via the `ORDER BY X LIMIT Y` operation on the `EPOCH_CONF_VER`, `WRITTEN_BYTES` and `READ_BYTES` columns.

You can query the top 3 Regions with the most write data using the following SQL statement:

```
SELECT * FROM tikv_region_status ORDER BY written_bytes DESC LIMIT 3;
```

### 14.11.18.2.51 TIKV\_STORE\_STATUS

The `TIKV_STORE_STATUS` table shows some basic information of TiKV nodes via PD's API, like the ID allocated in the cluster, address and port, and status, capacity, and the number of Region leaders of the current node.

```
USE INFORMATION_SCHEMA;
DESC TIKV_STORE_STATUS;
```

The output is as follows:

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
STORE_ID	bigint(21)	YES		NULL	
ADDRESS	varchar(64)	YES		NULL	
STORE_STATE	bigint(21)	YES		NULL	
STORE_STATE_NAME	varchar(64)	YES		NULL	
LABEL	json	YES		NULL	
VERSION	varchar(64)	YES		NULL	
CAPACITY	varchar(64)	YES		NULL	
AVAILABLE	varchar(64)	YES		NULL	
LEADER_COUNT	bigint(21)	YES		NULL	
LEADER_WEIGHT	double	YES		NULL	
LEADER_SCORE	double	YES		NULL	
LEADER_SIZE	bigint(21)	YES		NULL	
REGION_COUNT	bigint(21)	YES		NULL	
REGION_WEIGHT	double	YES		NULL	
REGION_SCORE	double	YES		NULL	
REGION_SIZE	bigint(21)	YES		NULL	
START_TS	datetime	YES		NULL	
LAST_HEARTBEAT_TS	datetime	YES		NULL	
UPTIME	varchar(64)	YES		NULL	
+-----+-----+-----+-----+-----+-----+
19 rows in set (0.00 sec)
```

The descriptions of the columns in the `TIKV_STORE_STATUS` table are as follows:

- `STORE_ID`: The ID of the Store.
- `ADDRESS`: The address of the Store.
- `STORE_STATE`: The identifier of the Store state, which corresponds to `STORE_STATE_NAME`  $\leftrightarrow$  .
- `STORE_STATE_NAME`: The name of the Store state. The name is `Up`, `Offline`, or `Tombstone`.
- `LABEL`: The label set for the Store.
- `VERSION`: The version number of the Store.

- **CAPACITY**: The storage capacity of the Store.
- **AVAILABLE**: The remaining storage space of the Store.
- **LEADER\_COUNT**: The number of leaders on the Store.
- **LEADER\_WEIGHT**: The leader weight of the Store.
- **LEADER\_SCORE**: The leader score of the Store.
- **LEADER\_SIZE**: The approximate total data size (MB) of all leaders on the Store.
- **REGION\_COUNT**: The number of Regions on the Store.
- **REGION\_WEIGHT**: The Region weight of the Store.
- **REGION\_SCORE**: The Region score of the Store.
- **REGION\_SIZE**: The approximate total data size (MB) of all Regions on the Store.
- **START\_TS**: The timestamp when the Store is started.
- **LAST\_HEARTBEAT\_TS**: The timestamp of the last heartbeat sent by the Store.
- **UPTIME**: The total time since the Store starts.

#### 14.11.18.2.52 USER\_ATTRIBUTES

The `USER_PRIVILEGES` table provides information about user comments and user attributes. This information comes from the `mysql.user` system table.

```
USE information_schema;
DESC user_attributes;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
USER	varchar(32)	NO		NULL	
HOST	varchar(255)	NO		NULL	
ATTRIBUTE	longtext	YES		NULL	
+-----+-----+-----+-----+-----+
3 rows in set (0.00 sec)
```

Fields in the `USER_ATTRIBUTES` table are described as follows:

- **USER**: The user name.
- **HOST**: The host from which the user can connect to TiDB. If the value of this field is `%`, it means that the user can connect to TiDB from any host.
- **ATTRIBUTE**: The comment and attribute of the user, which are set by the `CREATE USER` or `ALTER USER` statement.

The following is an example:

```
CREATE USER testuser1 COMMENT 'This user is created only for test';
CREATE USER testuser2 ATTRIBUTE '{"email": "user@pingcap.com"}';
SELECT * FROM information_schema.user_attributes;
```

```

+-----+-----+-----+-----+
| USER | HOST | ATTRIBUTE |
+-----+-----+-----+-----+
root	%	NULL
testuser1	%	{"comment": "This user is created only for test"}
testuser2	%	{"email": "user@pingcap.com"}
+-----+-----+-----+-----+
3 rows in set (0.00 sec)

```

### 14.11.18.2.53 USER\_PRIVILEGES

The USER\_PRIVILEGES table provides information about global privileges. This information comes from the mysql.user system table:

```

USE INFORMATION_SCHEMA;
DESC USER_PRIVILEGES;

```

The output is as follows:

```

+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
GRANTEE	varchar(81)	YES		NULL	
TABLE_CATALOG	varchar(512)	YES		NULL	
PRIVILEGE_TYPE	varchar(64)	YES		NULL

Fields in the USER\_PRIVILEGES table are described as follows:

- **GRANTEE:** The name of the granted user, which is in the format of 'user\_name'@'↔ host\_name'.
- **TABLE\_CATALOG:** The name of the catalog to which the table belongs. This value is always def.
- **PRIVILEGE\_TYPE:** The privilege type to be granted. Only one privilege type is shown in each row.
- **IS\_GRANTABLE:** If you have the GRANT OPTION privilege, the value is YES; otherwise, the value is NO.

#### 14.11.18.2.54 VARIABLES\_INFO

The VARIABLES\_INFO table provides information about the default value, current value, and scope of system variables in the current TiDB instance or TiDB cluster.

```

USE information_schema;
DESC variables_info;

```

```

+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
VARIABLE_NAME	varchar(64)	NO		NULL	
VARIABLE_SCOPE	varchar(64)	NO		NULL	
DEFAULT_VALUE	varchar(64)	NO		NULL	
CURRENT_VALUE	varchar(64)	NO		NULL	
MIN_VALUE	bigint(64)	YES		NULL	
MAX_VALUE	bigint(64) unsigned	YES		NULL	
POSSIBLE_VALUES	varchar(256)	YES		NULL	
IS_NOOP	varchar(64)	NO		NULL	
+-----+-----+-----+-----+-----+-----+
8 rows in set (0.00 sec)

```

```
SELECT * FROM variables_info ORDER BY variable_name LIMIT 3;
```

```

+--
 ↪ -----+-----+-----+-----+-----+-----+
 ↪
| VARIABLE_NAME | VARIABLE_SCOPE | DEFAULT_VALUE |
 ↪ CURRENT_VALUE | MIN_VALUE | MAX_VALUE | POSSIBLE_VALUES | IS_NOOP |
+--
 ↪ -----+-----+-----+-----+-----+-----+
 ↪
| allow_auto_random_explicit_insert | SESSION,GLOBAL | OFF | OFF |
 ↪ NULL | NULL | NULL | NO |
| auto_increment_increment | SESSION,GLOBAL | 1 | 1 |
 ↪ 1 | 65535 | NULL | NO |
| auto_increment_offset | SESSION,GLOBAL | 1 | 1 |
 ↪ 1 | 65535 | NULL | NO |
+--
 ↪ -----+-----+-----+-----+-----+-----+
 ↪
3 rows in set (0.01 sec)

```

Fields in the VARIABLES\_INFO table are described as follows:

- VARIABLE\_NAME: the name of the system variable.
- VARIABLE\_SCOPE: the scope of the system variable. SESSION means that the system variable is only valid in the current session. INSTANCE means that the system variable is valid in the TiDB instance. GLOBAL means that the system variable is valid in the TiDB cluster.
- DEFAULT\_VALUE: the default value of the system variable.

- **CURRENT\_VALUE**: the current value of the system variable. If the scope includes **SESSION**  $\leftrightarrow$  , **CURRENT\_VALUE** is the value in the current session.
- **MIN\_VALUE**: the minimum value allowed for the system variable. If the system variable is not numeric, **MIN\_VALUE** is **NULL**.
- **MAX\_VALUE**: the maximum value allowed for the system variable. If the system variable is not numeric, **MAX\_VALUE** is **NULL**.
- **POSSIBLE\_VALUES**: the possible values of the system variable. If the system variable is not an enum type, **POSSIBLE\_VALUES** is **NULL**.
- **IS\_NOOP**: whether the system variable is a noop system variable.

#### 14.11.18.2.55 VIEWS

The **VIEWS** table provides information about SQL views.

```
USE INFORMATION_SCHEMA;
DESC VIEWS;
```

The output is as follows:

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
TABLE_CATALOG	varchar(512)	NO		NULL	
TABLE_SCHEMA	varchar(64)	NO		NULL	
TABLE_NAME	varchar(64)	NO		NULL	
VIEW_DEFINITION	longtext	NO		NULL	
CHECK_OPTION	varchar(8)	NO		NULL	
IS_UPDATABLE	varchar(3)	NO		NULL	
DEFINER	varchar(77)	NO		NULL	
SECURITY_TYPE	varchar(7)	NO		NULL	
CHARACTER_SET_CLIENT	varchar(32)	NO		NULL	
COLLATION_CONNECTION	varchar(32)	NO		NULL	
+-----+-----+-----+-----+-----+-----+
10 rows in set (0.00 sec)
```

Create a view and query the **VIEWS** table:

```
CREATE VIEW test.v1 AS SELECT 1;
SELECT * FROM VIEWS\G
```

The output is as follows:

```
***** 1. row *****
TABLE_CATALOG: def
TABLE_SCHEMA: test
TABLE_NAME: v1
VIEW_DEFINITION: SELECT 1
```

```

CHECK_OPTION: CASCADED
IS_UPDATABLE: NO
DEFINER: root@127.0.0.1
SECURITY_TYPE: DEFINER
CHARACTER_SET_CLIENT: utf8mb4
COLLATION_CONNECTION: utf8mb4_0900_ai_ci
1 row in set (0.00 sec)

```

Fields in the VIEWS table are described as follows:

- **TABLE\_CATALOG**: The name of the catalog to which the view belongs. This value is always def.
- **TABLE\_SCHEMA**: The name of the schema to which the view belongs.
- **TABLE\_NAME**: The view name.
- **VIEW\_DEFINITION**: The definition of view, which is made by the SELECT statement when the view is created.
- **CHECK\_OPTION**: The CHECK\_OPTION value. The value options are NONE, CASCADE, and LOCAL.
- **IS\_UPDATABLE**: Whether UPDATE/INSERT/DELETE is applicable to the view. In TiDB, the value is always NO.
- **DEFINER**: The name of the user who creates the view, which is in the format of ' ↪ user\_name'@'host\_name'.
- **SECURITY\_TYPE**: The value of SQL SECURITY. The value options are DEFINER and INVOKER.
- **CHARACTER\_SET\_CLIENT**: The value of the character\_set\_client session variable when the view is created.
- **COLLATION\_CONNECTION**: The value of the collation\_connection session variable when the view is created.

### 14.11.18.3 Metrics Schema

The METRICS\_SCHEMA is a set of views on top of TiDB metrics that are stored in Prometheus. The source of the PromQL (Prometheus Query Language) for each of the tables is available in [INFORMATION\\_SCHEMA.METRICS\\_TABLES](#).

```

USE metrics_schema;
SELECT * FROM uptime;
SELECT * FROM information_schema.metrics_tables WHERE table_name='uptime'\G

```

```

The METRICS\_SCHEMA is used as a data source for monitoring-related summary tables such as ([metrics\\_summary](#), [metrics\\_summary\\_by\\_label](#) and [inspection\\_summary](#)).

### 14.11.18.3.1 Additional Examples

Taking the `tidb_query_duration` monitoring table in `metrics_schema` as an example, this section illustrates how to use this monitoring table and how it works. The working principles of other monitoring tables are similar to `tidb_query_duration`.

Query the information related to the `tidb_query_duration` table on `information_schema`  
`↪ .metrics_tables:`

```

SELECT * FROM information_schema.metrics_tables WHERE table_name='
↪ tidb_query_duration';

```

```

+---
↪ -----+
↪
| TABLE_NAME | PROMQL
↪
↪ | LABELS | QUANTILE | COMMENT |

```

```
+--
↪ -----+
↪
| tidb_query_duration | histogram_quantile($QUANTILE, sum(rate(
↪ tidb_server_handle_query_duration_seconds_bucket{$LABEL_CONDITIONS}[
↪ $RANGE_DURATION])) by (le,sql_type,instance)) | instance,sql_type |
↪ 0.9 | The quantile of TiDB query durations(second) |
+--
↪ -----+
↪
```

Field description:

- **TABLE\_NAME:** Corresponds to the table name in `metrics_schema`. In this example, the table name is `tidb_query_duration`.
- **PROMQL:** The working principle of the monitoring table is to first map SQL statements to PromQL, then to request data from Prometheus, and to convert Prometheus results into SQL query results. This field is the expression template of PromQL. When you query the data of the monitoring table, the query conditions are used to rewrite the variables in this template to generate the final query expression.
- **LABELS:** The label for the monitoring item. `tidb_query_duration` has two labels: `instance` and `sql_type`.
- **QUANTILE:** The percentile. For monitoring data of the histogram type, a default percentile is specified. If the value of this field is 0, it means that the monitoring item corresponding to the monitoring table is not a histogram.
- **COMMENT:** Explanations for the monitoring table. You can see that the `tidb_query_duration` table is used to query the percentile time of the TiDB query execution, such as the query time of P999/P99/P90. The unit is second.

To query the schema of the `tidb_query_duration` table, execute the following statement:

```
SHOW CREATE TABLE metrics_schema.tidb_query_duration;
```

```
+--
↪ -----+
↪
| Table | Create Table
↪
↪ |
+--
↪ -----+
↪
| tidb_query_duration | CREATE TABLE `tidb_query_duration` (
↪
```

```

| | `time` datetime unsigned DEFAULT CURRENT_TIMESTAMP,
| ↪ | |
| | `instance` varchar(512) DEFAULT NULL,
| ↪ | |
| | `sql_type` varchar(512) DEFAULT NULL,
| ↪ | |
| | `quantile` double unsigned DEFAULT '0.9',
| ↪ | |
| | `value` double unsigned DEFAULT NULL
| ↪ | |
| |) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=
| ↪ | utf8mb4_bin COMMENT='The quantile of TiDB query durations(second)' |
+---
| ↪ | -----+-----+-----+-----+-----+
| ↪ |

```

- **time**: The time of the monitoring item.
- **instance** and **sql\_type**: The labels of the `tidb_query_duration` monitoring item. **instance** means the monitoring address. **sql\_type** means the type of the executed SQL statement.
- **quantile**: The percentile. The monitoring item of the histogram type has this column, which indicates the percentile time of the query. For example, `quantile = 0.9` means to query the time of P90.
- **value**: The value of the monitoring item.

The following statement queries the P99 time within the range of [2020-03-25 23:40:00 ↪ , 2020-03-25 23:42:00].

```

SELECT * FROM metrics_schema.tidb_query_duration WHERE value is not null
| ↪ | AND time>='2020-03-25 23:40:00' AND time <= '2020-03-25 23:42:00' AND
| ↪ | quantile=0.99;

```

```

+---
| ↪ | -----+-----+-----+-----+-----+
| ↪ |
| time | instance | sql_type | quantile | value |
+---
| ↪ | -----+-----+-----+-----+-----+
| ↪ |
| 2020-03-25 23:40:00 | 172.16.5.40:10089 | Insert | 0.99 | 0.509929485256
| ↪ |
| 2020-03-25 23:41:00 | 172.16.5.40:10089 | Insert | 0.99 | 0.494690793986
| ↪ |
| 2020-03-25 23:42:00 | 172.16.5.40:10089 | Insert | 0.99 | 0.493460506934
| ↪ |

```

```

| 2020-03-25 23:40:00 | 172.16.5.40:10089 | Select | 0.99 | 0.152058493415
 ↳ |
| 2020-03-25 23:41:00 | 172.16.5.40:10089 | Select | 0.99 | 0.152193879678
 ↳ |
| 2020-03-25 23:42:00 | 172.16.5.40:10089 | Select | 0.99 | 0.140498483232
 ↳ |
2020-03-25 23:40:00	172.16.5.40:10089	internal	0.99	0.47104
2020-03-25 23:41:00	172.16.5.40:10089	internal	0.99	0.11776
2020-03-25 23:42:00	172.16.5.40:10089	internal	0.99	0.11776
+--
 ↳ -----+-----+-----+-----+
 ↳

```

The first row of the query result above means that at the time of 2020-03-25 23:40:00, on the TiDB instance 172.16.5.40:10089, the P99 execution time of the `Insert` type statement is 0.509929485256 seconds. The meanings of other rows are similar. Other values of the `sql_type` column are described as follows:

- **Select**: The `select` type statement is executed.
- **internal**: The internal SQL statement of TiDB, which is used to update the statistical information and get the global variables.

To view the execution plan of the statement above, execute the following statement:

```

DESC SELECT * FROM metrics_schema.tidb_query_duration WHERE value is not
 ↳ null AND time>='2020-03-25 23:40:00' AND time <= '2020-03-25 23:42:00
 ↳ ' AND quantile=0.99;

```

```

+--
 ↳ -----+-----+-----+-----+
 ↳
| id | estRows | task | access object | operator info
 ↳
 ↳ |
+--
 ↳ -----+-----+-----+-----+
 ↳
| Selection_5 | 8000.00 | root | | not(isnull(Column
 ↳ #5))
 ↳
 ↳ |
| -MemTableScan_6 | 10000.00 | root | table:tidb_query_duration | PromQL:
 ↳ histogram_quantile(0.99, sum(rate(
 ↳ tidb_server_handle_query_duration_seconds_bucket{}[60s])) by (le,
 ↳ sql_type,instance)), start_time:2020-03-25 23:40:00, end_time
 ↳ :2020-03-25 23:42:00, step:1m0s |

```

From the result above, you can see that `PromQL`, `start_time`, `end_time`, and `step` are in the execution plan. During the execution process, TiDB calls the `query_range` HTTP API of Prometheus to query the monitoring data.

You might find that in the range of `[2020-03-25 23:40:00, 2020-03-25 23:42:00]`, each label only has three time values. In the execution plan, the value of `step` is 1 minute, which means that the interval of these values is 1 minute. `step` is determined by the following two session variables:

- `tidb_metric_query_step`: The query resolution step width. To get the `query_range` data from Prometheus, you need to specify `start_time`, `end_time`, and `step`. `step` uses the value of this variable.
- `tidb_metric_query_range_duration`: When the monitoring data is queried, the value of the `$ RANGE_DURATION` field in `PROMQL` is replaced with the value of this variable. The default value is 60 seconds.

To view the values of monitoring items with different granularities, you can modify the two session variables above before querying the monitoring table. For example:

1. Modify the values of the two session variables and set the time granularity to 30 seconds.

**Note:**

The minimum granularity supported by Prometheus is 30 seconds.

```
set @@tidb_metric_query_step=30;
set @@tidb_metric_query_range_duration=30;
```

2. Query the `tidb_query_duration` monitoring item as follows. From the result, you can see that within the 3-minute time range, each label has 6 time values, and the interval between each value is 30 seconds.

```
select * from metrics_schema.tidb_query_duration where value is not
 ↪ null and time>='2020-03-25 23:40:00' and time <= '2020-03-25
 ↪ 23:42:00' and quantile=0.99;
```

| time                 | instance          | sql_type | quantile | value    |

## 14.11.19 Metadata Lock

This document introduces the metadata lock in TiDB.

### 14.11.19.1 Concept

TiDB uses the online asynchronous schema change algorithm to support changing metadata objects. When a transaction is executed, it obtains the corresponding metadata snapshot at the transaction start. If the metadata is changed during a transaction, to ensure data consistency, TiDB returns an **Information schema is changed** error and the transaction fails to commit.

To solve the problem, TiDB v6.3.0 introduces metadata lock into the online DDL algorithm. To avoid most DML errors, TiDB coordinates the priority of DMLs and DDLs during table metadata change and makes executing DDLs wait for the DMLs with old metadata to commit.

### 14.11.19.2 Scenarios

The metadata lock in TiDB applies to all DDL statements, such as:

- **ADD INDEX**

- `ADD COLUMN`
- `DROP COLUMN`
- `DROP INDEX`
- `DROP PARTITION`
- `TRUNCATE TABLE`
- `EXCHANGE PARTITION`
- `CHANGE COLUMN`
- `MODIFY COLUMN`

Enabling metadata lock might have some performance impact on the execution of the DDL task in TiDB. To reduce the impact, the following lists some scenarios that do not require metadata lock:

- `SELECT` queries with auto-commit enabled
- Stale Read is enabled
- Access temporary tables

#### 14.11.19.3 Usage

Starting from v6.5.0, TiDB enables metadata lock by default. When you upgrade your existing cluster from v6.4.0 or earlier to v6.5.0 or later, TiDB automatically enables metadata lock. To disable metadata lock, you can set the system variable `tidb_enable_metadata_lock` to `OFF`.

#### 14.11.19.4 Impact

- For DMLs, metadata lock does not block its execution, nor causes any deadlock.
- When metadata lock is enabled, the information of a metadata object in a transaction is determined on the first access and does not change after that.
- For DDLs, when changing metadata state, DDLs might be blocked by old transactions. The following is an example:

| Session 1                                                          | Session 2                                          |
|--------------------------------------------------------------------|----------------------------------------------------|
| <pre>CREATE TABLE t (a INT); INSERT INTO t VALUES(1); BEGIN;</pre> | <pre>ALTER ↪ TABLE t ↪ ADD ↪ COLUMN ↪ b INT;</pre> |

| Session 1                                                                                                            | Session 2                                                                 |
|----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| <pre>SELECT * FROM t; (Uses the current metadata version of table t. Returns (a=1, b=NULL) and locks table t.)</pre> | <pre>ALTER ↪ TABLE t ↪ ADD ↪ COLUMN ↪ c INT; (blocked by Session 1)</pre> |

At the repeatable read isolation level, from the transaction start to the timepoint of determining the metadata of a table, if a DDL that requires data changes is performed, such as adding an index, or changing column types, the DDL returns an error as follows:

| Session 1                                                                       | Session 2                                             |
|---------------------------------------------------------------------------------|-------------------------------------------------------|
| <pre>CREATE TABLE t (a INT); INSERT INTO t VALUES(1); BEGIN;</pre>              |                                                       |
| <pre>SELECT * FROM t; (index idx is not available) COMMIT; BEGIN;</pre>         | <pre>ALTER TABLE t ADD INDEX idx(a);</pre>            |
| <pre>SELECT * FROM t; (returns Error 8028: Information schema is changed)</pre> | <pre>ALTER TABLE t MODIFY COLUMN a VARCHAR(10);</pre> |

#### 14.11.19.5 Observability

TiDB v6.3.0 introduces the `mysql.tidb_md1_view` view to help you obtain the information of the current blocked DDL.

#### Note:

To select the `mysql.tidb_md1_view` view, the [PROCESS privilege](#) is required.

The following takes adding an index for table `t` as an example. Assume that there is a DDL statement `ALTER TABLE t ADD INDEX idx(a)`:

```
SELECT * FROM mysql.tidb_md1_view\G
***** 1. row *****
 JOB_ID: 141
 DB_NAME: test
TABLE_NAME: t
 QUERY: ALTER TABLE t ADD INDEX idx(a)
SESSION ID: 2199023255957
 TxnStart: 08-30 16:35:41.313(435643624013955072)
SQL_DIGESTS: ["begin","select * from `t`"]
1 row in set (0.02 sec)
```

From the preceding output, you can see that the transaction whose `SESSION ID` is 2199023255957 blocks the `ADD INDEX` DDL. `SQL_DIGEST` shows the SQL statements executed by this transaction, which is `["begin","select * from `t`"]`. To make the blocked DDL continue to execute, you can use the following global `KILL` statement to kill the 2199023255957 transaction:

```
mysql> KILL 2199023255957;
Query OK, 0 rows affected (0.00 sec)
```

After killing the transaction, you can select the `mysql.tidb_md1_view` view again. At this time, the preceding transaction is not shown in the output, which means the DDL is not blocked.

```
SELECT * FROM mysql.tidb_md1_view\G
Empty set (0.01 sec)
```

## 14.11.19.6 Principles

### 14.11.19.6.1 Description of the issue

DDL operations in TiDB are the online DDL mode. When a DDL statement is being executed, the metadata version of the defined object to be modified might go through multiple minor version changes. The online asynchronous metadata change algorithm only establishes that two adjacent minor versions are compatible, that is, operations between two versions do not break data consistency of the object that DDL changes.

When adding an index to a table, the state of the DDL statement changes as follows: None -> Delete Only, Delete Only -> Write Only, Write Only -> Write Reorg, Write Reorg -> Public.

The following commit process of transactions violates the preceding constraint:

| Transaction | Version used by transaction | Latest version in the cluster | Version difference |
|-------------|-----------------------------|-------------------------------|--------------------|
| txn1        | None                        | None                          | 0                  |
| txn2        | DeleteOnly                  | DeleteOnly                    | 0                  |
| txn3        | WriteOnly                   | WriteOnly                     | 0                  |
| txn4        | None                        | WriteOnly                     | 2                  |
| txn5        | WriteReorg                  | WriteReorg                    | 0                  |
| txn6        | WriteOnly                   | WriteReorg                    | 1                  |
| txn7        | Public                      | Public                        | 0                  |

In the preceding table, the metadata version used when `txn4` is committed is two versions different from the latest version in the cluster. This might cause data inconsistency.

#### 14.11.19.6.2 Implementation details

Metadata lock can ensure that the metadata versions used by all transactions in a TiDB cluster differ by one version at most. To achieve this goal, TiDB implements the following two rules:

- When executing a DML, TiDB records metadata objects accessed by the DML in the transaction context, such as tables, views, and corresponding metadata versions. These records are cleaned up when the transaction is committed.
- When a DDL statement changes state, the latest version of metadata is pushed to all TiDB nodes. If the difference between the metadata version used by all transactions related to this state change on a TiDB node and the current metadata version is less than two, the TiDB node is considered to acquire the metadata lock of the metadata object. The next state change can only be executed after all TiDB nodes in the cluster have obtained the metadata lock of the metadata object.

## 14.12 UI

### 14.12.1 TiDB Dashboard

#### 14.12.1.1 TiDB Dashboard Introduction

TiDB Dashboard is a Web UI for monitoring, diagnosing, and managing the TiDB cluster, which is available since v4.0. It is built into the PD component and does not require an independent deployment.

**Note:**

TiDB v6.5.0 (and later) and TiDB Operator v1.4.0 (and later) support deploying TiDB Dashboard as an independent Pod on Kubernetes. For details, see [Deploy TiDB Dashboard independently in TiDB Operator](#).

Figure 484: TiDB Dashboard interface

TiDB Dashboard is open-sourced on [GitHub](#).

This document introduces the main features of TiDB Dashboard. You can click links in the following sections to learn more details.

#### 14.12.1.1.1 Show the overall running status of the TiDB cluster

You can use TiDB Dashboard to learn the TiDB cluster's queries per second (QPS), execution time, the types of SQL statements that consume the most resources, and other overview information.

See [TiDB Dashboard Overview](#) for details.

#### 14.12.1.1.2 Show the running status of components and hosts

You can use TiDB Dashboard to view the running status of TiDB, TiKV, PD, TiFlash components in the entire cluster and the running status of the host on which these components are located.

See [TiDB Dashboard Cluster Information Page](#) for details.

#### **14.12.1.1.3 Show distribution and trends of read and write traffic**

The Key Visualizer feature of TiDB Dashboard visually shows the change of read and write traffic over time in the entire cluster in the form of heatmap. You can use this feature to timely discover changes of application modes or locate hotspot issues with uneven performance.

See [Key Visualizer Page](#) for details.

#### **14.12.1.1.4 Show a list of execution information of all SQL statements**

The execution information of all SQL statements is listed on the SQL Statements page. You can use this page to learn the execution time and total executions at all stages, which helps you analyze and locate the SQL queries that consume the most resources and improve the overall cluster performance.

See [SQL Statements Page of TiDB Dashboard](#) for details.

#### **14.12.1.1.5 Learn the detailed execution information of slow queries**

The Slow Queries page of TiDB Dashboard shows a list of all SQL statements that take a long time to execute, including the SQL texts and execution information. This page helps you locate the cause of slow queries or performance jitter.

See [Slow Queries Page](#) for details.

#### **14.12.1.1.6 Diagnose common cluster problems and generate reports**

The diagnostic feature of TiDB Dashboard automatically determines whether some common risks (such as inconsistent configurations) or problems exist in the cluster, generates reports, and gives operation suggestions, or compares the status of each cluster metric in different time ranges for you to analyze possible problems.

See [TiDB Dashboard Cluster Diagnostics Page](#) for details.

#### **14.12.1.1.7 Query logs of all components**

On the Search Logs page of TiDB Dashboard, you can quickly search logs of all running instances in the cluster by keywords, time range, and other conditions, package these logs, and download them to your local machine.

See [Search Logs Page](#) for details.

#### 14.12.1.1.8 Collect profiling data for each instance

This is an advanced debugging feature that lets you profile each instance online and analyze various internal operations an instance performed during the profiling data collection period and the proportion of the operation execution time in this period without third-party tools.

See [Profile Instances Page](#) for details.

#### 14.12.1.2 Maintain

##### 14.12.1.2.1 Deploy TiDB Dashboard

The TiDB Dashboard UI is built into the PD component for v4.0 or higher versions, and no additional deployment is required. Simply deploy a standard TiDB cluster, and TiDB Dashboard will be there.

#### Note:

TiDB v6.5.0 (and later) and TiDB Operator v1.4.0 (and later) support deploying TiDB Dashboard as an independent Pod on Kubernetes. For details, see [Deploy TiDB Dashboard independently in TiDB Operator](#).

See the following documents to learn how to deploy a standard TiDB cluster:

- [Quick Start Guide for the TiDB Database Platform](#)
- [Deploy TiDB in Production Environment](#)
- [Kubernetes environment deployment](#)

#### Note:

You cannot deploy TiDB Dashboard in a TiDB cluster earlier than v4.0.

#### Deployment with multiple PD instances

When multiple PD instances are deployed in the cluster, only one of these instances serves the TiDB Dashboard.

When PD instances are running for the first time, they automatically negotiate with each other to choose one instance to serve the TiDB Dashboard. TiDB Dashboard will not run on other PD instances. The TiDB Dashboard service will always be provided by the chosen

PD instance no matter PD instances are restarted or new PD instances are joined. However, there will be a re-negotiation when the PD instance that serves TiDB Dashboard is removed from the cluster (scaled-in). The negotiation process does not need user intervention.

When you access a PD instance that does not serve TiDB Dashboard, the browser will be redirected automatically to guide you to access the PD instance that serves the TiDB Dashboard, so that you can access the service normally. This process is illustrated in the image below.

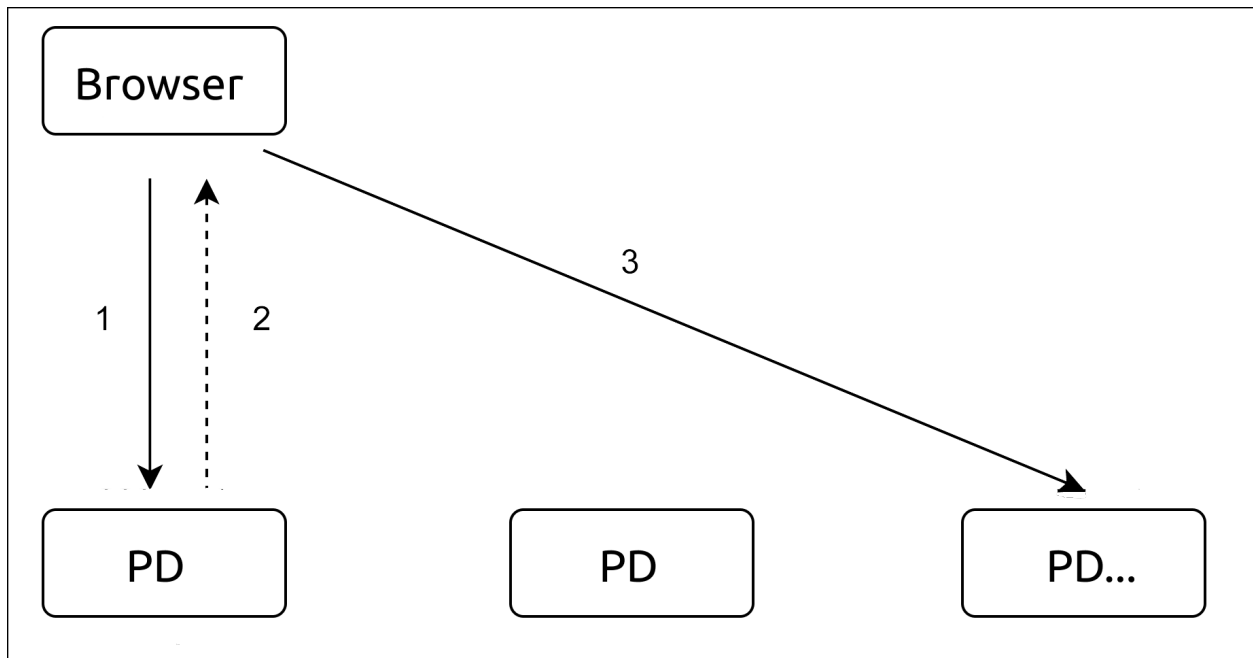

Figure 485: Process Schematic

**Note:**

The PD instance that serves TiDB Dashboard might not be a PD leader.

Check the PD instance that actually serves TiDB Dashboard

For a running cluster deployed using TiUP, you can use the `tiup cluster display` command to see which PD instance serves TiDB Dashboard. Replace `CLUSTER_NAME` with the cluster name.

```
tiup cluster display CLUSTER_NAME --dashboard
```

A sample output is as follows:

```
http://192.168.0.123:2379/dashboard/
```

**Note:**

This feature is available only in the later version of the `tiup cluster` deployment tool (v1.0.3 or later).

Upgrade TiUP Cluster

```
tiup update --self
tiup update cluster --force
```

Switch to another PD instance to serve TiDB Dashboard

For a running cluster deployed using TiUP, you can use the `tiup ctl:v<CLUSTER_VERSION>` `> pd` command to change the PD instance that serves TiDB Dashboard, or re-specify a PD instance to serve TiDB Dashboard when it is disabled:

```
tiup ctl:v<CLUSTER_VERSION> pd -u http://127.0.0.1:2379 config set
 ↪ dashboard-address http://9.9.9.9:2379
```

In the command above:

- Replace `127.0.0.1:2379` with the IP and port of any PD instance.
- Replace `9.9.9.9:2379` with the IP and port of the new PD instance that you desire to run the TiDB Dashboard service.

You can use the `tiup cluster display` command to see whether the modification is taking effect (replace `CLUSTER_NAME` with the cluster name):

```
tiup cluster display CLUSTER_NAME --dashboard
```

**Warning:**

If you change the instance to run TiDB Dashboard, the local data stored in the previous TiDB Dashboard instance will be lost, including the Key Visualize history and search history.

## Disable TiDB Dashboard

For a running cluster deployed using TiUP, use the `tiup ctl:v<CLUSTER_VERSION> pd` command to disable TiDB Dashboard on all PD instances (replace `127.0.0.1:2379` with the IP and port of any PD instance):

```
tiup ctl:v<CLUSTER_VERSION> pd -u http://127.0.0.1:2379 config set
 ↪ dashboard-address none
```

After disabling TiDB Dashboard, checking which PD instance provides the TiDB Dashboard service will fail:

```
Error: TiDB Dashboard is disabled
```

Visiting the TiDB Dashboard address of any PD instance via the browser will also fail:

```
Dashboard is not started.
```

## Re-enable TiDB Dashboard

For a running cluster deployed using TiUP, use the `tiup ctl:v<CLUSTER_VERSION> pd` ↪ command to request PD to renegotiate an instance to run TiDB Dashboard (replace `127.0.0.1:2379` with the IP and port of any PD instance):

```
tiup ctl:v<CLUSTER_VERSION> pd -u http://127.0.0.1:2379 config set
 ↪ dashboard-address auto
```

After executing the command above, you can use the `tiup cluster display` command to view the TiDB Dashboard instance address automatically negotiated by PD (replace `CLUSTER_NAME` with the cluster name):

```
tiup cluster display CLUSTER_NAME --dashboard
```

You can also re-enable TiDB Dashboard by manually specifying the PD instance that serves TiDB Dashboard. See [Switch to another PD instance to serve TiDB Dashboard](#).

### Warning:

If the newly enabled TiDB Dashboard instance is different with the previous instance that served the TiDB Dashboard, the local data stored in the previous TiDB Dashboard instance will be lost, including Key Visualize history and search history.

## What's next

- To learn how to access and log into the TiDB Dashboard UI, see [Access TiDB Dashboard](#).

- To learn how to enhance the security of TiDB Dashboard, such as configuring a firewall, see [Secure TiDB Dashboard](#).

#### 14.12.1.2.2 Use TiDB Dashboard behind a Reverse Proxy

You can use a reverse proxy to safely expose the TiDB Dashboard service from the internal network to the external.

Procedures

Step 1: Get the actual TiDB Dashboard address

When multiple PD instances are deployed in the cluster, only one of the PD instances actually runs TiDB Dashboard. Therefore, you need to ensure that the upstream of the reverse proxy points to the correct address. For details of this mechanism, see [Deployment with multiple PD instances](#).

When you use the TiUP tool for deployment, execute the following command to get the actual TiDB Dashboard address (replace `CLUSTER_NAME` with your cluster name):

```
tiup cluster display CLUSTER_NAME --dashboard
```

The output is the actual TiDB Dashboard address. A sample is as follows:

```
http://192.168.0.123:2379/dashboard/
```

#### Note:

This feature is available only in the later version of the `tiup cluster` deployment tool (v1.0.3 or later).

Upgrade TiUP Cluster

```
tiup update --self
tiup update cluster --force
```

Step 2: Configure the reverse proxy

Use HAProxy

When you use [HAProxy](#) as the reverse proxy, take the following steps:

1. Use reverse proxy for TiDB Dashboard on the 8033 port (for example). In the HAProxy configuration file, add the following configuration:

```
frontend tidb_dashboard_front
 bind *:8033
 use_backend tidb_dashboard_back if { path /dashboard } or { path_beg
 ↪ /dashboard/ }

backend tidb_dashboard_back
 mode http
 server tidb_dashboard 192.168.0.123:2379
```

Replace 192.168.0.123:2379 with IP and port of the actual address of the TiDB Dashboard obtained in [Step 1](#).

**Warning:**

You must retain the `if` part in the `use_backend` directive to ensure that services **only in this path** are behind reverse proxy; otherwise, security risks might be introduced. See [Secure TiDB Dashboard](#).

2. Restart HAProxy for the configuration to take effect.
3. Test whether the reverse proxy is effective: access the `/dashboard/` address on the 8033 port of the machine where HAProxy is located (such as `http://example.com ↪ :8033/dashboard/`) to access TiDB Dashboard.

Use NGINX

When you use [NGINX](#) as the reverse proxy, take the following steps:

1. Use reverse proxy for TiDB Dashboard on the 8033 port (for example). In the NGINX configuration file, add the following configuration:

```
server {
 listen 8033;
 location /dashboard/ {
 proxy_pass http://192.168.0.123:2379/dashboard/;
 }
}
```

Replace `http://192.168.0.123:2379/dashboard/` with the actual address of the TiDB Dashboard obtained in [Step 1](#).

**Warning:**

You must keep the `/dashboard/` path in the `proxy_pass` directive to ensure that only the services under this path are reverse proxied. Otherwise, security risks will be introduced. See [Secure TiDB Dashboard](#).

2. Reload NGINX for the configuration to take effect.

```
sudo nginx -s reload
```

3. Test whether the reverse proxy is effective: access the `/dashboard/` address on the 8033 port of the machine where NGINX is located (such as `http://example.com` ↪ `:8033/dashboard/`) to access TiDB Dashboard.

### Customize path prefix

TiDB Dashboard provides services by default in the `/dashboard/` path, such as `http://example.com:8033/dashboard/`, which is the case even for reverse proxies. To configure the reverse proxy to provide the TiDB Dashboard service with a non-default path, such as `http://example.com:8033/foo/` or `http://example.com:8033/`, take the following steps.

Step 1: Modify PD configuration to specify the path prefix of TiDB Dashboard service

Modify the `public-path-prefix` configuration item in the `[dashboard]` category of the PD configuration to specify the path prefix of the TiDB Dashboard service. After this item is modified, restart the PD instance for the modification to take effect.

For example, if the cluster is deployed using TiUP and you want the service to run on `http://example.com:8033/foo/`, you can specify the following configuration:

```
server_configs:
 pd:
 dashboard.public-path-prefix: /foo
```

Modify configuration when deploying a new cluster using TiUP

If you are deploying a new cluster, you can add the configuration above to the `topology` ↪ `.yaml` TiUP topology file and deploy the cluster. For specific instruction, see [TiUP deployment document](#).

Modify configuration of a deployed cluster using TiUP

For a deployed cluster:

1. Open the configuration file of the cluster in the edit mode (replace `CLUSTER_NAME` with the cluster name).

```
tiup cluster edit-config CLUSTER_NAME
```

2. Modify or add configuration items under the `pd` configuration of `server_configs`. If no `server_configs` exists, add it at the top level:

```
monitored:
 ...
server_configs:
 tidb: ...
```

```
tikv: ...
pd:
 dashboard.public-path-prefix: /foo
...
```

The configuration file after the modification is similar to the following file:

```
server_configs:
 pd:
 dashboard.public-path-prefix: /foo
 global:
 user: tidb
 ...
```

Or

```
monitored:
 ...
server_configs:
 tidb: ...
 tikv: ...
 pd:
 dashboard.public-path-prefix: /foo
```

3. Perform a rolling restart to all PD instances for the modified configuration to take effect (replace `CLUSTER_NAME` with your cluster name):

```
shell tiup cluster reload CLUSTER_NAME -R pd
```

See [Common TiUP Operations - Modify the configuration](#) for details.

If you want that the TiDB Dashboard service is run in the root path (such as `http://example.com:8033/`), use the following configuration:

```
server_configs:
 pd:
 dashboard.public-path-prefix: /
```

### Warning:

After the modified and customized path prefix takes effect, you cannot directly access TiDB Dashboard. You can only access TiDB Dashboard through a reverse proxy that matches the path prefix.

Step 2: Modify the reverse proxy configuration

Use HAProxy

Taking `http://example.com:8033/foo/` as an example, the corresponding HAProxy configuration is as follows:

```
frontend tidb_dashboard_front
 bind *:8033
 use_backend tidb_dashboard_back if { path /foo } or { path_beg /foo/ }

backend tidb_dashboard_back
 mode http
 http-request set-path %[path,regsub(~/foo/?,/dashboard/)]
 server tidb_dashboard 192.168.0.123:2379
```

Replace `192.168.0.123:2379` with IP and port of the actual address of the TiDB Dashboard obtained in [Step 1](#).

#### Warning:

You must retain the `if` part in the `use_backend` directive to ensure that services **only in this path** are behind reverse proxy; otherwise, security risks might be introduced. See [Secure TiDB Dashboard](#).

If you want that the TiDB Dashboard service is run in the root path (such as `http://example.com:8033/`), use the following configuration:

```
frontend tidb_dashboard_front
 bind *:8033
 use_backend tidb_dashboard_back
backend tidb_dashboard_back
 mode http
 http-request set-path /dashboard%[path]
 server tidb_dashboard 192.168.0.123:2379
```

Modify the configuration and restart HAProxy for the modified configuration to take effect.

Use NGINX

Taking `http://example.com:8033/foo/` as an example, the corresponding NGINX configuration is as follows:

```
server {
 listen 8033;
```

```
location /foo/ {
 proxy_pass http://192.168.0.123:2379/dashboard/;
}
}
```

Replace `http://192.168.0.123:2379/dashboard/` with the actual address of the TiDB Dashboard obtained in [Step 1](#).

### Warning:

You must retain the `/dashboard/` path in the `proxy_pass` directive to ensure that services **only in this path** are behind reverse proxy; otherwise, security risks might be introduced. See [Secure TiDB Dashboard](#).

If you want that the TiDB Dashboard service is run in the root path (such as `http://example.com:8033/`), use the following configuration:

```
server {
 listen 8033;
 location / {
 proxy_pass http://192.168.0.123:2379/dashboard/;
 }
}
```

Modify the configuration and restart NGINX for the modified configuration to take effect.

```
sudo nginx -s reload
```

What's next

To learn how to enhance the security of TiDB Dashboard, such as configuring a firewall, see [Secure TiDB Dashboard](#).

### 14.12.1.2.3 TiDB Dashboard User Management

TiDB Dashboard uses the same user privilege system and sign-in authentication as TiDB. You can control and manage TiDB SQL users to limit their access to TiDB Dashboard. This document describes the least privileges required for TiDB SQL users to access TiDB Dashboard and exemplifies how to create a least-privileged SQL user and how to authorize via RBAC.

For details about how to control and manage TiDB SQL users, see [TiDB User Account Management](#).

Required privileges

- To access TiDB Dashboard when **Security Enhanced Mode (SEM)** is not enabled on the connected TiDB server, the SQL user should have **all** the following privileges:
  - PROCESS
  - SHOW DATABASES
  - CONFIG
  - DASHBOARD\_CLIENT
- To access TiDB Dashboard when **Security Enhanced Mode (SEM)** is enabled on the connected TiDB server, the SQL user should have **all** the following privileges:
  - PROCESS
  - SHOW DATABASES
  - CONFIG
  - DASHBOARD\_CLIENT
  - RESTRICTED\_TABLES\_ADMIN
  - RESTRICTED\_STATUS\_ADMIN
  - RESTRICTED\_VARIABLES\_ADMIN
- To modify the configurations on the interface after signing in to TiDB Dashboard, the SQL user must also have the following privilege:
  - SYSTEM\_VARIABLES\_ADMIN
- To use the **Fast Bind Executions Plan** feature on the interface after signing in to TiDB Dashboard, the SQL user must also have the following privileges:
  - SYSTEM\_VARIABLES\_ADMIN
  - SUPER

**Note:**

Users with high privileges such as **ALL PRIVILEGES** or **SUPER** can sign in to TiDB Dashboard as well. Therefore, to comply with the least privilege principle, it is highly recommended that you create users with the required privileges only to prevent unintended operations. See **Privilege Management** for more information on these privileges.

If an SQL user does not meet the preceding privilege requirements, the user fails to sign in to TiDB Dashboard, as shown below.

# SQL User Sign In

\* Username

Password

Sign in failed: The user does not have sufficient privileges to access TiDB Dashboard. [Help](#)

Sign In

Figure 486: insufficient-privileges

Example: Create a least-privileged SQL user to access TiDB Dashboard

- When **Security Enhanced Mode (SEM)** is not enabled on the connected TiDB server, to create an SQL user `dashboardAdmin` that can sign in to TiDB Dashboard, execute the following SQL statements:

```
CREATE USER 'dashboardAdmin'@'%' IDENTIFIED BY '<YOUR_PASSWORD>';
```

```

GRANT PROCESS, CONFIG ON *.* TO 'dashboardAdmin'@'%';
GRANT SHOW DATABASES ON *.* TO 'dashboardAdmin'@'%';
GRANT DASHBOARD_CLIENT ON *.* TO 'dashboardAdmin'@'%';

-- To modify the configuration items on the interface after signing
 ↳ in to TiDB Dashboard, the user-defined SQL user must be granted
 ↳ with the following privilege.
GRANT SYSTEM_VARIABLES_ADMIN ON *.* TO 'dashboardAdmin'@'%';

-- To use the Fast Bind Executions Plan feature (https://docs.pingcap.com/tidb/v6.6/dashboard-statement-details#fast-plan-binding)
 ↳ on the interface after signing in to TiDB Dashboard, the user-
 ↳ defined SQL user must be granted with the following privileges.
GRANT SYSTEM_VARIABLES_ADMIN ON *.* TO 'dashboardAdmin'@'%';
GRANT SUPER ON *.* TO 'dashboardAdmin'@'%';

```

- When **Security Enhanced Mode (SEM)** is enabled on the connected TiDB server, disable SEM first and execute the following SQL statements to create an SQL user dashboardAdmin that can sign in to TiDB Dashboard. After creating the user, enable SEM again:

```

CREATE USER 'dashboardAdmin'@%' IDENTIFIED BY '<YOUR_PASSWORD>';
GRANT PROCESS, CONFIG ON *.* TO 'dashboardAdmin'@'%';
GRANT SHOW DATABASES ON *.* TO 'dashboardAdmin'@'%';
GRANT DASHBOARD_CLIENT ON *.* TO 'dashboardAdmin'@'%';
GRANT RESTRICTED_STATUS_ADMIN ON *.* TO 'dashboardAdmin'@'%';
GRANT RESTRICTED_TABLES_ADMIN ON *.* TO 'dashboardAdmin'@'%';
GRANT RESTRICTED_VARIABLES_ADMIN ON *.* TO 'dashboardAdmin'@'%';

-- To modify the configuration items on the interface after signing
 ↳ in to TiDB Dashboard, the user-defined SQL user must be granted
 ↳ with the following privilege.
GRANT SYSTEM_VARIABLES_ADMIN ON *.* TO 'dashboardAdmin'@'%';

-- To use the Fast Bind Executions Plan feature (https://docs.pingcap.com/tidb/v6.6/dashboard-statement-details#fast-plan-binding)
 ↳ on the interface after signing in to TiDB Dashboard, the user-
 ↳ defined SQL user must be granted with the following privileges.
GRANT SYSTEM_VARIABLES_ADMIN ON *.* TO 'dashboardAdmin'@'%';
GRANT SUPER ON *.* TO 'dashboardAdmin'@'%';

```

Example: Authorize SQL user to access TiDB Dashboard via RBAC

The following example demonstrates how to create a role and a user to access TiDB Dashboard through the **role-based access control (RBAC)** mechanism.

1. Create a `dashboard_access` role that meets all privilege requirements of TiDB Dashboard:

```
CREATE ROLE 'dashboard_access';
GRANT PROCESS, CONFIG ON *.* TO 'dashboard_access'@'%';
GRANT SHOW DATABASES ON *.* TO 'dashboard_access'@'%';
GRANT DASHBOARD_CLIENT ON *.* TO 'dashboard_access'@'%';
GRANT SYSTEM_VARIABLES_ADMIN ON *.* TO 'dashboard_access'@'%';
GRANT SUPER ON *.* TO 'dashboardAdmin'@'%';
```

2. Grant the `dashboard_access` role to other users and set `dashboard_access` as the default role:

```
CREATE USER 'dashboardAdmin'@'%' IDENTIFIED BY '<YOUR_PASSWORD>';
GRANT 'dashboard_access' TO 'dashboardAdmin'@'%';
-- You need to set dashboard_access as the default role to the user
SET DEFAULT ROLE dashboard_access to 'dashboardAdmin'@'%';
```

After the above steps, you can use the `dashboardAdmin` user to sign in to TiDB Dashboard.

Sign in to TiDB Dashboard

After creating an SQL user that meets the privilege requirements of TiDB Dashboard, you can use this user to [Sign in](#) to TiDB Dashboard.

#### 14.12.1.2.4 Secure TiDB Dashboard

Although you need to sign into TiDB Dashboard before accessing it, TiDB Dashboard is designed to be accessed by trusted user entities by default. When you want to provide TiDB Dashboard to external network users or untrusted users for access, take the following measures to avoid security vulnerabilities.

Enhance security of TiDB users

Set a strong password for the TiDB root user

The account system of TiDB Dashboard is consistent with that of TiDB SQL users. By default, TiDB's `root` user has no password, so accessing TiDB Dashboard does not require password authentication, which will give the malicious visitor high privileges, including executing privileged SQL statements.

It is recommended that you set a strong password for the TiDB `root` user. See [TiDB User Account Management](#) for details. Alternatively, you can disable the TiDB `root` user.

Create a least-privileged user for TiDB Dashboard

The account system of TiDB Dashboard is consistent with that of TiDB SQL. Users accessing TiDB Dashboard are authenticated and authorized based on TiDB SQL user's privileges. Therefore, TiDB Dashboard requires limited privileges, or merely the read-only

privilege. You can configure users to access TiDB Dashboard based on the principle of least privilege, thus avoiding access of high-privileged users.

It is recommended that you create a least-privileged SQL user to access and sign in to TiDB Dashboard. This avoids access of high-privileged users and improves security. See [TiDB Dashboard User Management](#) for details.

Use a firewall to block untrusted access

**Note:**

TiDB v6.5.0 (and later) and TiDB Operator v1.4.0 (and later) support deploying TiDB Dashboard as an independent Pod on Kubernetes. Using TiDB Operator, you can access the IP address of this Pod to start TiDB Dashboard. This port does not communicate with other privileged interfaces of PD and no extra firewall is required if provided externally. For details, see [Deploy TiDB Dashboard independently in TiDB Operator](#).

TiDB Dashboard provides services through the PD client port, which defaults to <http://IP:2379/dashboard/>. Although TiDB Dashboard requires identity authentication, other privileged interfaces (such as <http://IP:2379/pd/api/v1/members>) in PD carried on the PD client port do not require identity authentication and can perform privileged operations. Therefore, exposing the PD client port directly to the external network is extremely risky.

It is recommended that you take the following measures:

- Use a firewall to prohibit a component from accessing **any** client port of the PD component via the external network or untrusted network.

**Note:**

TiDB, TiKV, and other components need to communicate with the PD component through the PD client port, so do not block access to the internal network between components. Otherwise, the cluster will become unavailable.

- See [Use TiDB Dashboard behind a Reverse Proxy](#) to learn how to configure the reverse proxy to safely provide the TiDB Dashboard service on another port to the external network.

How to open access to TiDB Dashboard port when deploying multiple PD instances

**Warning:**

This section describes an unsafe access solution, which is for the test environment only. **DO NOT** use this solution in the production environment.

In the test environment, you might need to configure the firewall to open the TiDB Dashboard port for external access.

When multiple PD instances are deployed, only one of the PD instances actually runs TiDB Dashboard, and browser redirection occurs when you access other PD instances. Therefore, you need to ensure that the firewall is configured with the correct IP address. For details of this mechanism, see [Deployment with multiple PD instances](#).

When using the TiUP deployment tool, you can view the address of the PD instance that actually runs TiDB Dashboard by running the following command (replace `CLUSTER_NAME` with the cluster name):

```
tiup cluster display CLUSTER_NAME --dashboard
```

The output is the actual TiDB Dashboard address.

**Note:**

This feature is available only in the later version of the `tiup cluster` deployment tool (v1.0.3 or later).

Upgrade TiUP Cluster

```
tiup update --self
tiup update cluster --force
```

The following is a sample output:

```
http://192.168.0.123:2379/dashboard/
```

In this example, the firewall needs to be configured with inbound access for the 2379 port of the 192.168.0.123 open IP, and the TiDB Dashboard is accessed via <http://192.168.0.123:2379/dashboard/>.

Reverse proxy only for TiDB Dashboard

As mentioned in [Use a firewall to block untrusted access](#), the services provided under the PD client port include not only TiDB Dashboard (located at <http://IP:2379/dashboard/>),

but also other privileged interfaces in PD (such as <http://IP:2379/pd/api/v1/members>). Therefore, when using a reverse proxy to provide TiDB Dashboard to the external network, ensure that the services **ONLY** with the `/dashboard` prefix are provided (**NOT** all services under the port) to avoid that the external network can access the privileged interface in PD through the reverse proxy.

It is recommended that you see [Use TiDB Dashboard behind a Reverse Proxy](#) to learn a safe and recommended reverse proxy configuration.

Enable TLS for reverse proxy

To further enhance the security of the transport layer, you can enable TLS for reverse proxy, and even introduce mTLS to authenticate user certificates.

See [Configuring HTTPS servers](#) and [HAProxy SSL Termination](#) for more details.

Other recommended safety measures

- [Enable TLS Authentication and Encrypt the Stored Data](#)
- [Enable TLS Between TiDB Clients and Servers](#)

### 14.12.1.3 Access TiDB Dashboard

To access TiDB Dashboard, visit <http://127.0.0.1:2379/dashboard> via your browser. Replace `127.0.0.1:2379` with the actual PD instance address and port.

#### Note:

TiDB v6.5.0 (and later) and TiDB Operator v1.4.0 (and later) support deploying TiDB Dashboard as an independent Pod on Kubernetes. Using TiDB Operator, you can access the IP address of this Pod to start TiDB Dashboard. For details, see [Deploy TiDB Dashboard independently in TiDB Operator](#).

#### 14.12.1.3.1 Access TiDB Dashboard when multiple PD instances are deployed

When multiple multiple PD instances are deployed in your cluster and you can directly access **every** PD instance and port, you can simply replace `127.0.0.1:2379` in the <http://127.0.0.1:2379/dashboard/> address with **any** PD instance address and port.

#### Note:

If a firewall or reverse proxy is configured and you cannot directly access every PD instance, you might not be able to access TiDB Dashboard. Usually, this

is because the firewall or reverse proxy is not correctly configured. See [Use TiDB Dashboard behind Reverse Proxy](#) and [Secure TiDB Dashboard](#) to learn how to correctly configure the firewall or reverse proxy when multiple PD instances are deployed.

#### 14.12.1.3.2 Browser compatibility

You can use TiDB Dashboard in the following common desktop browsers of a relatively newer version:

- Chrome  $\geq 77$
- Firefox  $\geq 68$
- Edge  $\geq 17$

#### **Note:**

If you use the browsers above of earlier versions or other browsers to access TiDB Dashboard, some functions might not work properly.

#### 14.12.1.3.3 Sign in

After accessing TiDB Dashboard, you will be directed to the user login interface, as shown in the image below.

- You can sign in to TiDB Dashboard using the TiDB `root` account.
- If you have created a [User-defined SQL User](#), you can sign in using this account and the corresponding password.

## SQL User Sign In

\* Username

Password

 Switch Language ▾

Figure 487: Login interface

If one of the following situations exists, the login might fail:

- TiDB root user does not exist.
- PD is not started or cannot be accessed.
- TiDB is not started or cannot be accessed.
- Wrong root password.

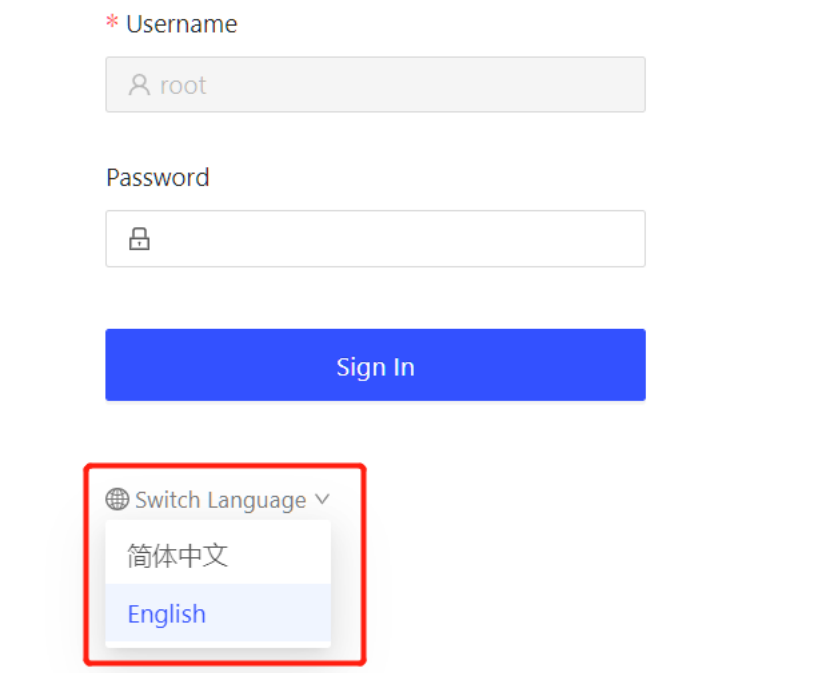

Once you have signed in, the session remains valid within the next 24 hours. To learn how to sign out, refer to the [Logout](#) section.

#### 14.12.1.3.4 Switch language

The following languages are supported in TiDB Dashboard:

- English
- Chinese (simplified)

In the **SQL User Sign In** page, you can click the **Switch Language** drop-down list to switch the interface language.

The screenshot shows the sign-in form for the TiDB Dashboard. It includes a username field with the text 'root', a password field with a lock icon, and a blue 'Sign In' button. Below the sign-in fields, there is a 'Switch Language' dropdown menu. The dropdown menu is open, showing two options: '简体中文' (Simplified Chinese) and 'English'. The 'English' option is highlighted in blue. The entire dropdown menu is enclosed in a red rectangular box.

Figure 488: Switch language

#### 14.12.1.3.5 Logout

Once you have logged in, click the login user name in the left navigation bar to switch to the user page. Click the **Logout** button on the user page to log out the current user. After logging out, you need to re-enter your username and password.

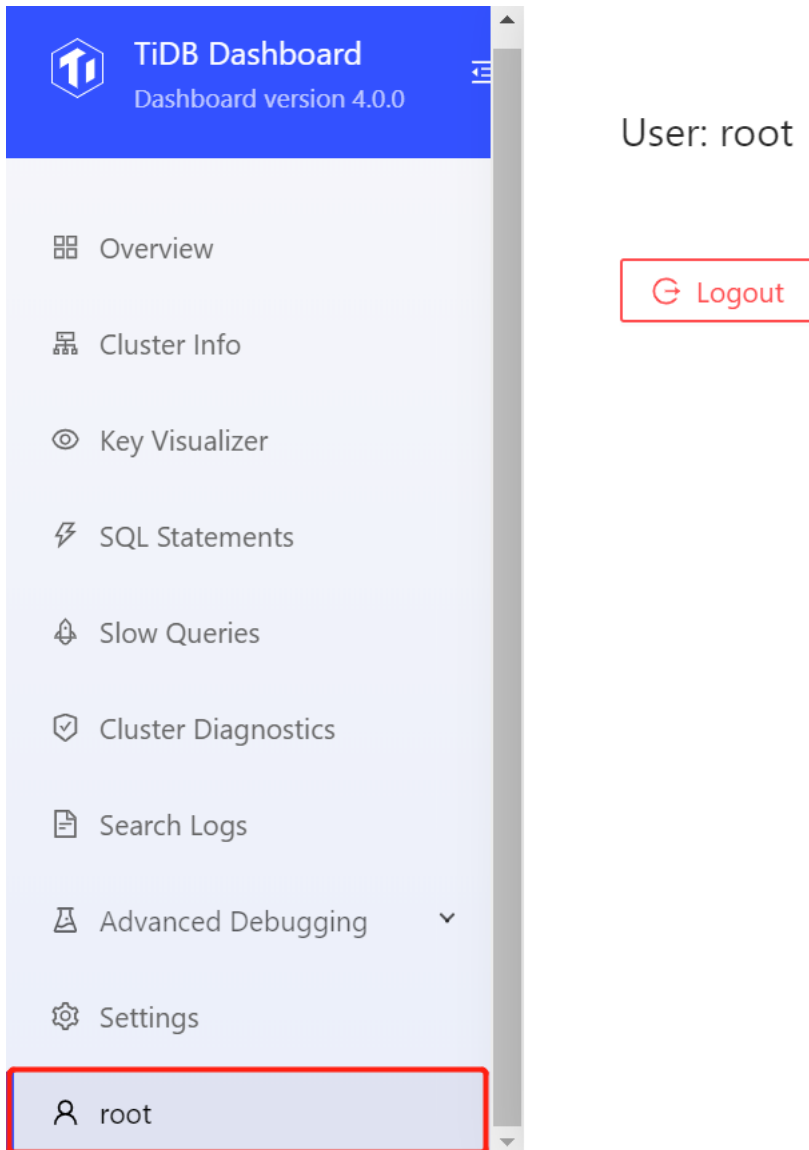

Figure 489: Logout

#### 14.12.1.4 Overview Page

This page shows the overview of the entire TiDB cluster, including the following information:

- Queries per second (QPS) of the entire cluster.
- The query latency of the entire cluster.
- The SQL statements that have accumulated the longest execution time over the recent period.
- The slow queries whose execution time over the recent period exceeds the threshold.
- The node count and status of each instance.
- Monitor and alert messages.

#### 14.12.1.4.1 Access the page

After logging into TiDB Dashboard, the overview page is entered by default, or you can click **Overview** on the left navigation menu to enter this page:

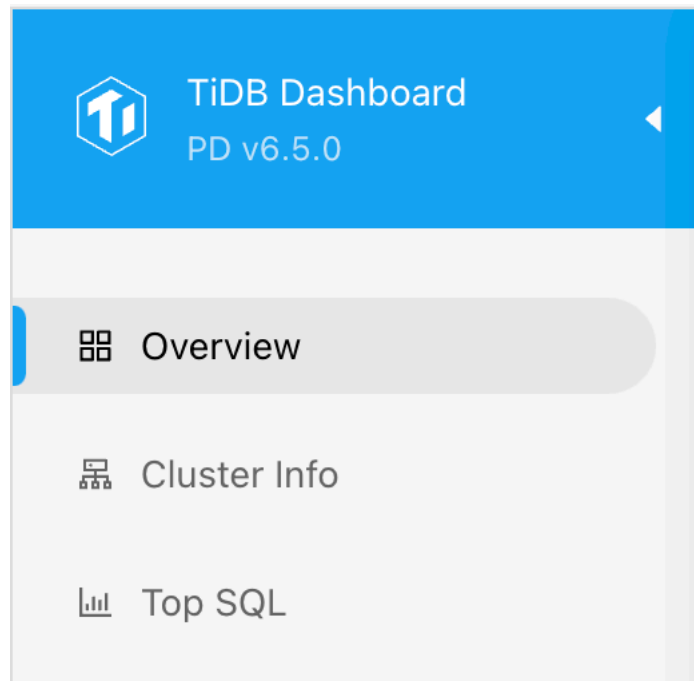

Figure 490: Enter overview page

#### 14.12.1.4.2 QPS

This area shows the number of successful and failed queries per second for the entire cluster over the recent hour:

Figure 491: QPS

**Note:**

This feature is available only in the cluster where the Prometheus monitoring component is deployed. If Prometheus is not deployed, an error will be displayed.

#### 14.12.1.4.3 Latency

This area shows the latency of 99.9%, 99%, and 90% of queries in the entire cluster over the recent one hour:

Figure 492: Latency

**Note:**

This feature is available only on the cluster where the Prometheus monitoring component is deployed. If Prometheus is not deployed, an error will be displayed.

#### 14.12.1.4.4 Top SQL statements

This area shows the ten types of SQL statements that have accumulated the longest execution time in the entire cluster over the recent period. SQL statements with different query parameters but of the same structure are classified into the same SQL type and displayed in the same row:

## Top SQL Statements > Today at 10:00 AM ~ Today at 10:30 AM

| SQL Template ⓘ                                      | Total Latency ⓘ ↓                                                                          | Mean Latency ⓘ                                                                              | Database ⓘ         |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|--------------------|
| <code>SELECT count (k) FROM sbtest1 WHERE...</code> | 9.8 s     | 3.5 ms   | test               |

| <code>INSERT INTO sbtest1 (k, c, pad) VAL...</code> | 22.7 ms   | 22.7 ms  | test               |

Figure 493: Top SQL

The information shown in this area is consistent with the more detailed [SQL Statements Page](#). You can click the **Top SQL Statements** heading to view the complete list. For details of the columns in this table, see [SQL Statements Page](#).

### Note:

This feature is available only on the cluster where SQL Statements feature is enabled.

#### 14.12.1.4.5 Recent slow queries

By default, this area shows the latest 10 slow queries in the entire cluster over the recent 30 minutes:

[Recent Slow Queries >](#) Today at 3:49 PM ~ Today at 4:19 PM

| SQL ⓘ                                                 | Finish Time ⓘ ↓  | Latency ⓘ                                                                                    | Max Memory ⓘ                                                                            |
|-------------------------------------------------------|------------------|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------|
| <code>ANALYZE TABLE `tpcc`.`bmsql_oorder`;</code>     | Today at 4:18 PM | 1.1 s     | 0 B  |
| <code>ANALYZE TABLE `tpcc`.`bmsql_new_order`;</code>  | Today at 4:17 PM | 406.5 ms  | 0 B  |
| <code>ANALYZE TABLE `tpcc`.`bmsql_customer`;</code>   | Today at 4:17 PM | 3.4 s     | 0 B  |
| <code>ANALYZE TABLE `tpcc`.`bmsql_new_order`;</code>  | Today at 4:15 PM | 394.5 ms  | 0 B  |
| <code>ANALYZE TABLE `tpcc`.`bmsql_stock`;</code>      | Today at 4:15 PM | 3.5 s     | 0 B  |
| <code>ANALYZE TABLE `tpcc`.`bmsql_new_order`;</code>  | Today at 4:13 PM | 414.6 ms  | 0 B  |
| <code>ANALYZE TABLE `tpcc`.`bmsql_customer`;</code>   | Today at 4:09 PM | 2.6 s     | 0 B  |
| <code>ANALYZE TABLE `tpcc`.`bmsql_order_line`;</code> | Today at 4:08 PM | 1.6 s     | 0 B  |
| <code>ANALYZE TABLE `tpcc`.`bmsql_new_order`;</code>  | Today at 4:07 PM | 406.9 ms  | 0 B  |
| <code>ANALYZE TABLE `tpcc`.`bmsql_oorder`;</code>     | Today at 4:07 PM | 971.0 ms  | 0 B  |

Figure 494: Recent slow queries

By default, the SQL query that is executed longer than 300 milliseconds is counted as a slow query and displayed on the table. You can change this threshold by modifying the `tidb_slow_log_threshold` variable or the `slow-threshold` TiDB parameter.

The content displayed in this area is consistent with the more detailed [Slow Queries Page](#). You can click the **Recent Slow Queries** title to view the complete list. For details of the columns in this table, see this [Slow Queries Page](#).

**Note:**

This feature is available only in the cluster with slow query logs enabled. By default, slow query logs are enabled in the cluster deployed using TiUP.

#### 14.12.1.4.6 Instances

This area summarizes the total number of instances and abnormal instances of TiDB, TiKV, PD, and TiFlash in the entire cluster:

# Instances >

TiDB: 1 Up / 0 Down

TiKV: 0 Up / 1 Down

PD: 1 Up / 0 Down

Figure 495: Instances

The statuses in the preceding image are described as follows:

- Up: The instance is running properly (including the offline storage instance).
- Down: The instance is running abnormally, such as network disconnection and process crash.

Click the **Instance** title to enter the [Cluster Info Page](#) that shows the detailed running status of each instance.

#### 14.12.1.4.7 Monitor and alert

This area provides links for you to view detailed monitor and alert:

## Monitor & Alert

[View Metrics >](#)

[View 1 Alerts >](#)

[Run Diagnostics >](#)

Figure 496: Monitor and alert

- **View Metrics:** Click this link to jump to the Grafana dashboard where you can view detailed monitoring information of the cluster. For details of each monitoring metric in the Grafana dashboard, see [monitoring metrics](#).
- **View Alerts:** Click this link to jump to the AlertManager page where you can view detailed alert information of the cluster. If alerts exist in the cluster, the number of alerts is directly shown in the link text.
- **Run Diagnostics:** Click this link to jump to the more detailed [cluster diagnostics page](#).

### Note:

The **View Metrics** link is available only in the cluster where the Grafana node is deployed. The **View Alerts** link is available only in the cluster where the AlertManager node is deployed.

### 14.12.1.5 TiDB Dashboard Cluster Information Page

On the cluster information page, you can view the running status of TiDB, TiKV, PD, TiFlash components in the entire cluster and the running status of the host on which these components are located.

#### 14.12.1.5.1 Access the page

You can use one of the following two methods to access the cluster information page:

- After logging into TiDB Dashboard, click **Cluster Info** on the left navigation menu:

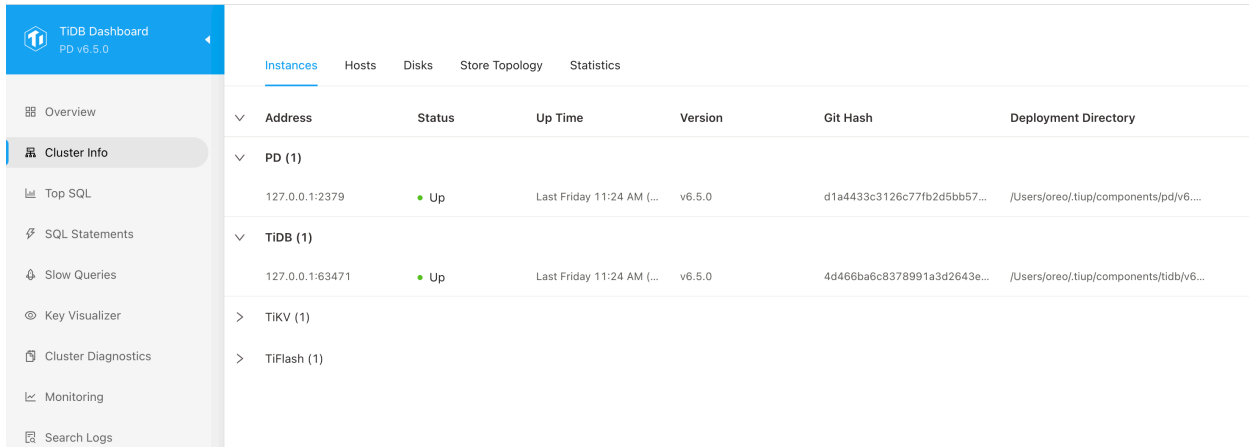

Figure 497: Access cluster information page

- Visit [http://127.0.0.1:2379/dashboard/#/cluster\\_info/instance](http://127.0.0.1:2379/dashboard/#/cluster_info/instance) in your browser. Replace 127.0.0.1:2379 with the actual PD instance address and port.

#### 14.12.1.5.2 Instance list

Click **Instances** to view the list of instances:

| Address         | Status | Up Time                    | Version | Git Hash                    | Deployment Directory                   |
|-----------------|--------|----------------------------|---------|-----------------------------|----------------------------------------|
| 127.0.0.1:2379  | Up     | Last Friday 11:24 AM (...) | v6.5.0  | d1a4433c3126c77fb2d5bb57... | /Users/oreo/tiup/components/pd/v6...   |
| 127.0.0.1:63471 | Up     | Last Friday 11:24 AM (...) | v6.5.0  | 4d466ba6c8378991a3d2643e... | /Users/oreo/tiup/components/tidb/v6... |

Figure 498: Instance list

This instance list shows the overview information of all instances of TiDB, TiKV, PD, and TiFlash components in the cluster.

The list includes the following information:

- Address: The instance address.
- Status: The running status of the instance.
- Up Time: The start time of the instance.
- Version: The instance version number.
- Git Hash: The Git Hash value corresponding to the instance binary file.
- Deployment directory: The directory in which the instance binary file is located.

### Instance status

An instance can run in one of the following statuses:

- Up: The instance is running normally.
- Down or Unreachable: The instance is not running or a network problem exists on the corresponding host.
- Tombstone: The data on the instance has been completely migrated out and the scaling-in is complete. This status exists only on TiKV or TiFlash instances.
- Leaving: The data on the instance is being migrated out and the scaling-in is in process. This status exists only on TiKV or TiFlash instances.
- Unknown: The running state of the instance is unknown.

### Note:

- Leaving in TiDB Dashboard, **Offline** returned by PD API, and **Pending Offline** in TiUP indicate the same status.
- Some columns in the table can be displayed only when the instance is up.

Instance status derives from the PD scheduling information. For more details, see [Information collection](#).

### 14.12.1.5.3 Host list

Click **Hosts** to view the list of hosts:

| Host Address | CPU           | CPU Arch | CPU Usage                       | Memory   | Memory Usage                    | Instances                       |
|--------------|---------------|----------|---------------------------------|----------|---------------------------------|---------------------------------|
| 127.0.0.1    | 10 (10 vCore) | arm64    | <div style="width: 20%;"></div> | 32.0 GIB | <div style="width: 10%;"></div> | 1 PD, 1 TiDB, 1 TiKV, 1 TiFlash |

Figure 499: Host list

This host list shows the running status of hosts that correspond to all instances of TiDB, TiKV, PD, and TiFlash components in the cluster.

The list includes the following information:

- **Host Address:** The Host IP address.
- **CPU:** The number of logical cores of the host CPU.
- **CPU Usage:** The user-mode and kernel-mode CPU usage in the current 1 second.
- **Memory:** The total physical memory size of the host.
- **Memory Usage:** The current memory usage of the host.

#### Note:

The host list information is provided by each instance process, so when all instances on the host are down, the host information is not displayed.

#### 14.12.1.5.4 Disk list

Click **Disks** to view the list of disks:

| Host Address | Mount Directory           | File System | Disk Capacity | Disk Usage                      | Instances            |
|--------------|---------------------------|-------------|---------------|---------------------------------|----------------------|
| 127.0.0.1    | /                         | APFS        | 926.4 GiB     | <div style="width: 10%;"></div> | 1 PD, 1 TiDB, 1 TiKV |
| 127.0.0.1    | /System/Volumes/SCPreboot | APFS        | 500.0 MiB     | <div style="width: 1%;"></div>  | 1 TiFlash            |

Figure 500: Disk list

This disk list shows the status of disks on which the TiDB, TiKV, PD, and TiFlash instances run.

The list includes the following information:

- **Host Address:** The Host IP address.
- **Mount Directory:** The mount path of this disk on the host on which the instance is running.
- **File System:** The file system type of this disk on the host on which the instance is running.
- **Disk Capacity:** The total space of the disk on the host on which the instance is running.
- **Disk Usage:** The space usage of the disk on the host on which the instance is running.
- **Instance:** The instance running on this host.

#### 14.12.1.6 TiDB Dashboard Top SQL Page

With Top SQL, you can monitor and visually explore the CPU overhead of each SQL statement in your database in real-time, which helps you optimize and resolve database performance issues. Top SQL continuously collects and stores CPU load data summarized by SQL statements at any seconds from all TiDB and TiKV instances. The collected data can be stored for up to 30 days. Top SQL presents you with visual charts and tables to quickly pinpoint which SQL statements are contributing the high CPU load of a TiDB or TiKV instance over a certain period of time.

Top SQL provides the following features:

- Visualize the top 5 types of SQL statements with the highest CPU overhead through charts and tables.
- Display detailed execution information such as queries per second, average latency, and query plan.
- Collect all SQL statements that are executed, including those that are still running.
- Allow viewing data of a specific TiDB and TiKV instance.

#### 14.12.1.6.1 Recommended scenarios

Top SQL is suitable for analyzing performance issues. The following are some typical Top SQL scenarios:

- You discovered that an individual TiKV instance in the cluster has a very high CPU usage through the Grafana charts. You want to know which SQL statements cause the CPU hotspots so that you can optimize them and better leverage all of your distributed resources.
- You discovered that the cluster has a very high CPU usage overall and queries are slow. You want to quickly figure out which SQL statements are currently consuming the most CPU resources so that you can optimize them.
- The CPU usage of the cluster has drastically changed and you want to know the major cause.
- Analyze the most resource-intensive SQL statements in the cluster and optimize them to reduce hardware costs.

Top SQL cannot be used to pinpoint non-performance issues, such as incorrect data or abnormal crashes.

The Top SQL feature is still in an early stage and is being continuously enhanced. Here are some scenarios that are **not supported** at the moment:

- Analyzing the overhead of SQL statements outside of Top 5 (for example, when multiple business workloads are mixed).
- Analyzing the overhead of Top N SQL statements by various dimensions such as users and databases.
- Analyzing database performance issues that are not caused by high CPU load, such as transaction lock conflicts.

#### 14.12.1.6.2 Access the page

You can access the Top SQL page using either of the following methods:

- After logging into TiDB Dashboard, click **Top SQL** on the left navigation bar.

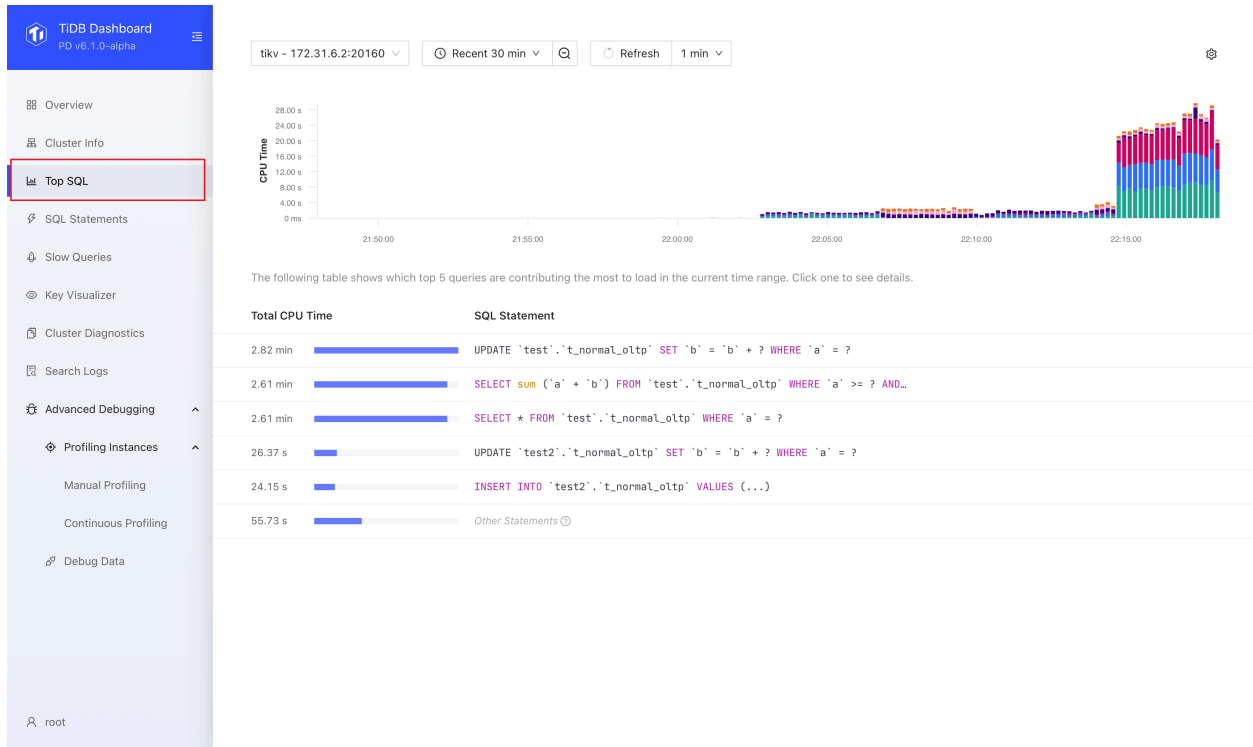

Figure 501: Top SQL

- Visit <http://127.0.0.1:2379/dashboard/#/topsql> in your browser. Replace 127.0.0.1:2379 ↩ with the actual PD instance address and port.

### 14.12.1.6.3 Enable Top SQL

#### Note:

To use Top SQL, your cluster should be deployed or upgraded with a recent version of TiUP (v1.9.0 or above) or TiDB Operator (v1.3.0 or above). If your cluster was upgraded using an earlier version of TiUP or TiDB Operator, see [FAQ](#) for instructions.

Top SQL is not enabled by default as it has a slight impact on cluster performance (within 3% on average) when enabled. You can enable Top SQL by the following steps:

1. Visit the [Top SQL page](#).
2. Click **Open Settings**. On the right side of the **Settings** area, switch on **Enable Feature**.

### 3. Click **Save**.

After enabling the feature, wait up to 1 minute for Top SQL to load the data. Then you can see the CPU load details.

In addition to the UI, you can also enable the Top SQL feature by setting the TiDB system variable `tidb_enable_top_sql`:

```
SET GLOBAL tidb_enable_top_sql = 1;
```

#### 14.12.1.6.4 Use Top SQL

The following are the common steps to use Top SQL.

1. Visit the [Top SQL page](#).
2. Select a particular TiDB or TiKV instance that you want to observe the load.

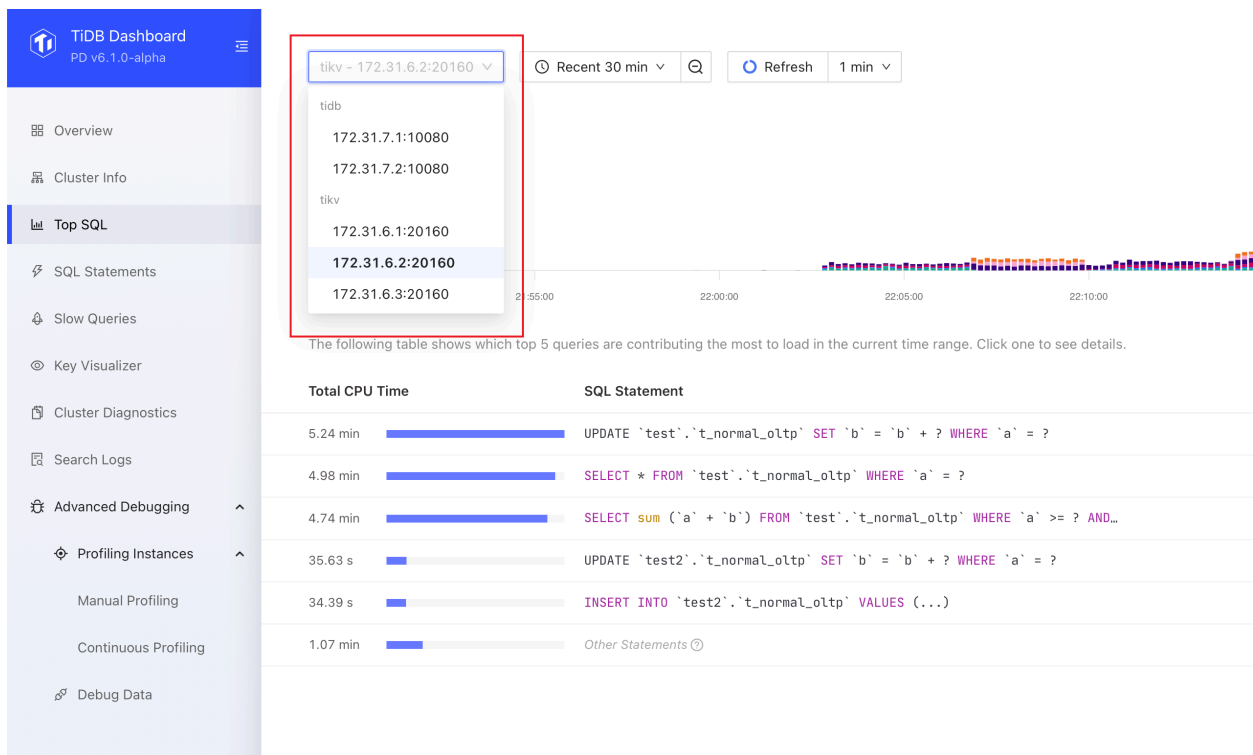

Figure 502: Select Instance

If you are unsure of which TiDB or TiKV instance to observe, you can select an arbitrary instance. Also, when the cluster CPU load is extremely unbalanced, you can first use Grafana charts to determine the specific instance you want to observe.

3. Observe the charts and tables presented by Top SQL.

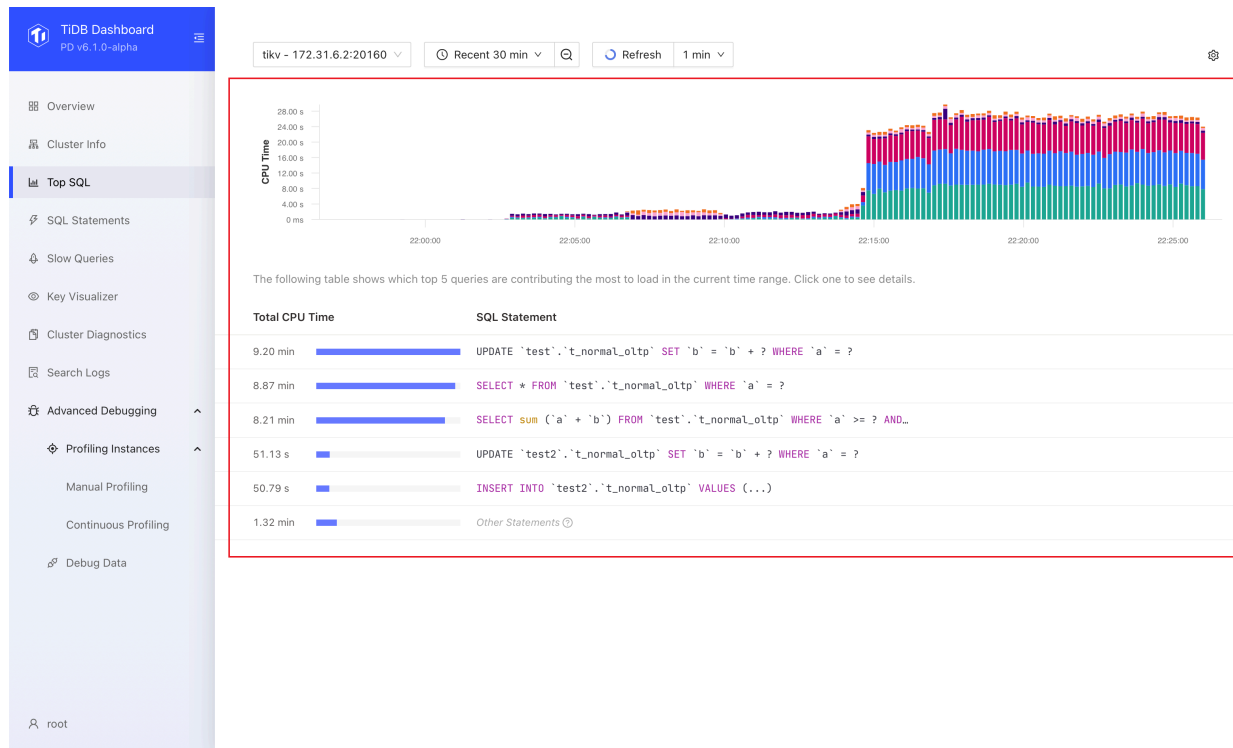

Figure 503: Chart and Table

The size of the bars in the bar chart represents the size of CPU resources consumed by the SQL statement at that moment. Different colors distinguish different types of SQL statements. In most cases, you only need to focus on the SQL statements that have a higher CPU resource overhead in the corresponding time range in the chart.

4. Click a SQL statement in the table to show more information. You can see detailed execution metrics of different plans of that statement, such as Call/sec (average queries per second) and Scan Indexes/sec (average number of index rows scanned per second).

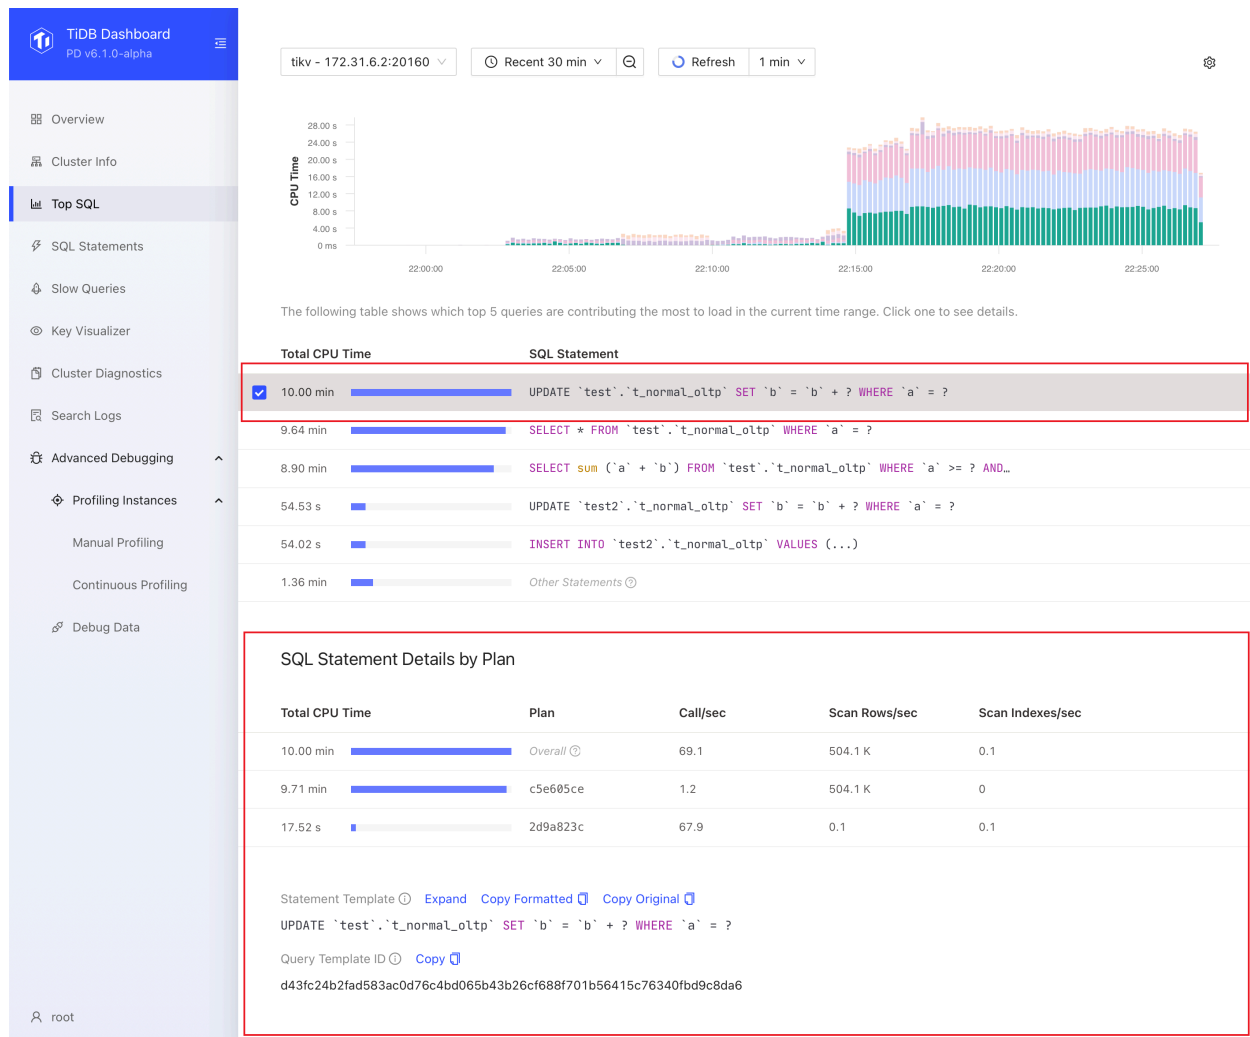

Figure 504: Details

5. Based on these initial clues, you can further explore the [SQL Statement](#) or [Slow Queries](#) page to find the root cause of high CPU consumption or large data scans of the SQL statement.

Additionally, you can configure Top SQL as follows:

- You can adjust the time range in the time picker or select a time range in the chart to get a more precise and detailed look at the problem. A smaller time range can provide more detailed data, with precision of up to 1 second.

Figure 505: Change time range

- If the chart is out of date, you can click the **Refresh** button or select Auto Refresh options from the **Refresh** drop-down list.

Figure 506: Refresh

#### 14.12.1.6.5 Disable Top SQL

You can disable this feature by following these steps:

1. Visit [Top SQL page](#).
2. Click the gear icon in the upper right corner to open the settings screen and switch off **Enable Feature**.
3. Click **Save**.
4. In the popped-up dialog box, click **Disable**.

In addition to the UI, you can also disable the Top SQL feature by setting the TiDB system variable `tidb_enable_top_sql`:

```
SET GLOBAL tidb_enable_top_sql = 0;
```

#### 14.12.1.6.6 Frequently asked questions

**1. Top SQL cannot be enabled and the UI displays “required component NgMonitoring is not started”.**

See [TiDB Dashboard FAQ](#).

**2. Will performance be affected after enabling Top SQL?**

This feature has a slight impact on cluster performance. According to our benchmark, the average performance impact is usually less than 3% when the feature is enabled.

**3. What is the status of this feature?**

It is now a generally available (GA) feature and can be used in production environments.

**4. What is the meaning of “Other Statements”?**

“Other Statement” counts the total CPU overhead of all non-Top 5 statements. With this information, you can learn the CPU overhead contributed by the Top 5 statements compared with the overall.

**5. What is the relationship between the CPU overhead displayed by Top SQL and the actual CPU usage of the process?**

Their correlation is strong but they are not exactly the same thing. For example, the cost of writing multiple replicas is not counted in the TiKV CPU overhead displayed by Top SQL. In general, SQL statements with higher CPU usage result in higher CPU overhead displayed in Top SQL.

**6. What is the meaning of the Y-axis of the Top SQL chart?**

It represents the size of CPU resources consumed. The more resources consumed by a SQL statement, the higher the value is. In most cases, you do not need to care about the meaning or unit of the specific value.

**7. Does Top SQL collect running (unfinished) SQL statements?**

Yes. The bars displayed in the Top SQL chart at each moment indicate the CPU overhead of all running SQL statements at that moment.

### 14.12.1.7 Key Visualizer Page

The Key Visualizer page of TiDB Dashboard is used to analyze the usage of TiDB and troubleshoot traffic hotspots. This page visually shows the traffic of the TiDB cluster over a period of time.

#### 14.12.1.7.1 Access Key Visualizer page

You can use one of the following two methods to access the Key Visualizer page:

- After logging into TiDB Dashboard, click **Key Visualizer** on the left navigation menu:

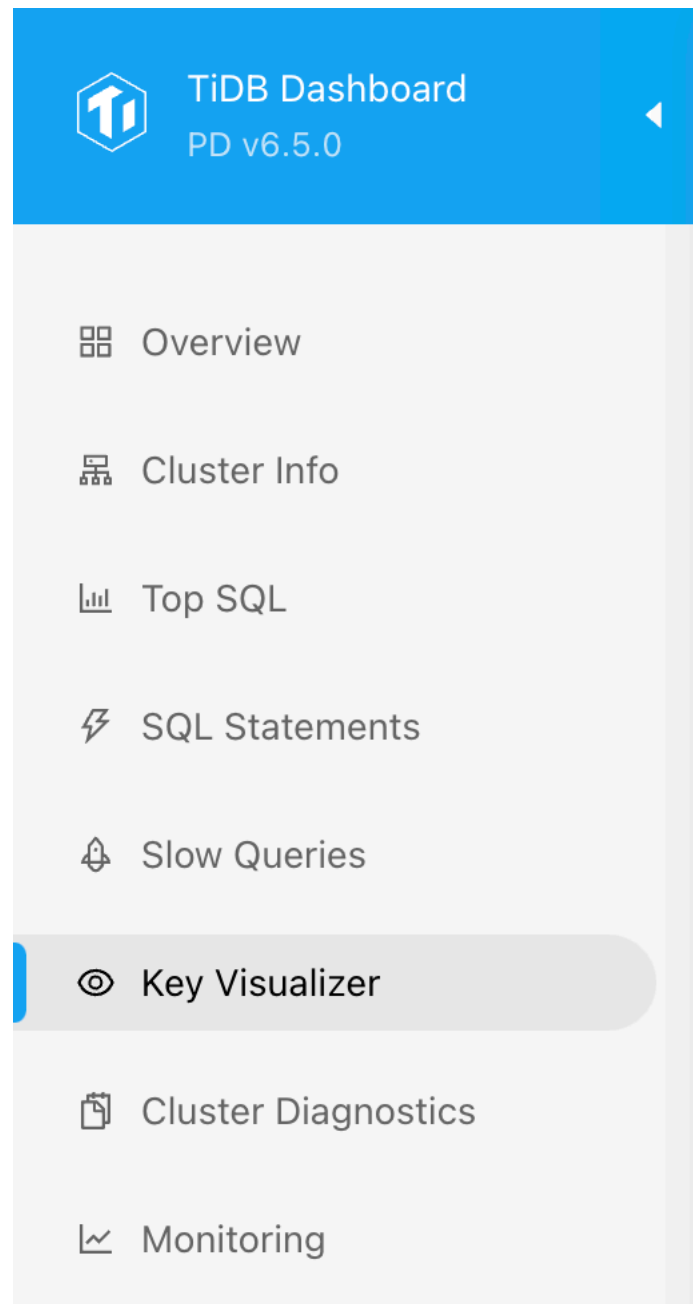

Figure 507: Access Key Visualizer

- Visit <http://127.0.0.1:2379/dashboard/#/keyviz> in your browser. Replace `127.0.0.1:2379` ↪ with the actual PD instance address and port.

#### 14.12.1.7.2 Interface demonstration

The following image is a demonstration of the Key Visualizer page:

Figure 508: Key Visualizer page

From the preceding interface, you can see the following objects:

- A large heatmap that shows changes of the overall traffic over time.
- The detailed information of a certain coordinate point.
- Information of tables, and indexes (on the left side of the heatmap).

#### 14.12.1.7.3 Basic concepts

This section introduces the basic concepts that relate to Key Visualizer.

##### Region

In a TiDB cluster, the stored data is distributed among TiKV instances. Logically, TiKV is a huge and orderly key-value map. The whole key-value space is divided into many segments and each segment consists of a series of adjacent keys. Such segment is called a **Region**.

For detailed introduction of Region, refer to [TiDB Internal \(I\) - Data Storage](#).

##### Hotspot

When you use the TiDB database, the hotspot issue is typical, where high traffic is concentrated on a small range of data. Because consecutive data ranges are often processed on the same TiKV instance, the TiKV instance on which the hotspot occurs becomes the performance bottleneck of the whole application. The hotspot issue often occurs in the following scenarios:

- Write adjacent data into a table with the `AUTO_INCREMENT` primary key, which causes a hotspot issue on this table.
- Write adjacent time data into the time index of a table, which causes a hotspot issue on the table index.

For more details about hotspot, refer to [Highly Concurrent Write Best Practices](#)

### Heatmap

The heatmap is the core part of Key Visualizer, which shows the change of a metric over time. The X-axis of the heatmap indicates the time. The Y-axis of the heatmap indicates the consecutive Regions based on key ranges that cover all schemas and tables of the TiDB cluster.

Colder colors in the heatmap indicate lower read and write traffic of Regions in that period of time. Hotter (brighter) colors indicate higher traffic.

### Region compression

A TiDB cluster might have up to hundreds of thousands of Regions. It is difficult to display so many Regions on screen. Therefore, on each heatmap, these Regions are compressed into 1,500 consecutive ranges, each range called a Bucket. In the heatmap, because hotter instances need more attention, Key Visualizer tends to compress a large number of Regions with lower traffic into one Bucket, and displays the Region with higher traffic also in one Bucket.

#### 14.12.1.7.4 Use Key Visualizer

This section introduces how to use Key Visualizer.

### Settings

To use the Key Visualizer page for the first time, you need to manually enable this feature on the **Settings** page. Follow the page guide and click **Open Settings** to open the settings page:

## Feature Not Enabled

Key Visualizer feature is not enabled so that visual reports cannot be viewed. You can modify settings to enable the feature and wait for new data being collected.

[Open Settings](#)

Figure 509: Feature disabled

After this feature is enabled, you can open the settings page by clicking the **Settings** icon in the upper right corner:

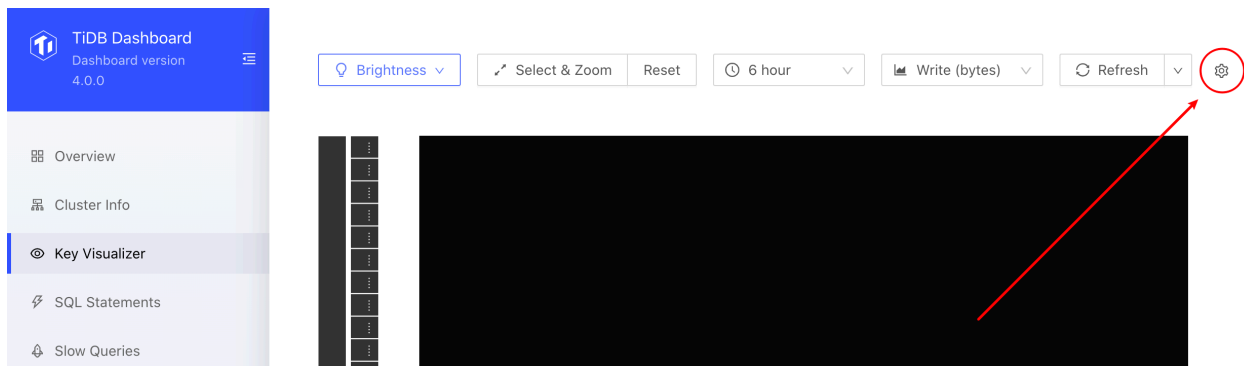

Figure 510: Settings icon

The settings page is shown as follows:

Figure 511: Settings page

Set whether to start data collection through the switch, and click **Save** to take effect. After enabling the feature, you can see that the toolbar is available:

Figure 512: Toolbar

After this feature is enabled, data collection is going on at the backend. You can see the heatmap shortly.

Observe a certain period of time or Region range

When you open Key Visualizer, the heatmap of the entire database over the recent six hours is displayed by default. In this heatmap, the closer to the right side (current time), the shorter the time interval corresponding to each column of Buckets. If you want to observe a specific time period or a specific Region range, you can zoom in to get more details. The specific instructions are as follows:

1. Scroll up or down in the heatmap.
2. Click and drag one of the following buttons to select the range.

- Click the **Select & Zoom** button. Then click and drag this button to select the area to zoom in.

Figure 513: Selection box

- Click the **Reset** button to reset the Region range to the entire database.
- Click the **time selection box** (at the position of 6 hour on the preceding interface) and select the observation time period again.

Figure 514: Select time

**Note:**

If you follow step 2 in the instruction above, the heatmap is redrawn, which might be very different from the original heatmap. This difference is normal because if you observe in more detail, the granularity of the Region compression has changed, or the basis of **hot** in a specific range has changed.

**Adjust brightness**

The heatmap uses colors of different brightnesses to indicate the Bucket traffic. Colder colors in the heatmap indicate lower read and write traffic of the Region in that period of time. Hotter (brighter) colors indicate higher traffic. If the color is too cold or too hot, it is difficult to observe in details. In this situation, you can click the **Brightness** button and then use the slider to adjust the brightness of the page.

**Note:**

When Key Visualizer displays the heatmap of an area, it defines the basis of being cold and hot according to the traffic of this area. When the traffic in the entire area is relatively even, even if the overall traffic is low in value, you might still see a large bright-colored area. Remember to include the value into your analysis.

Select metrics

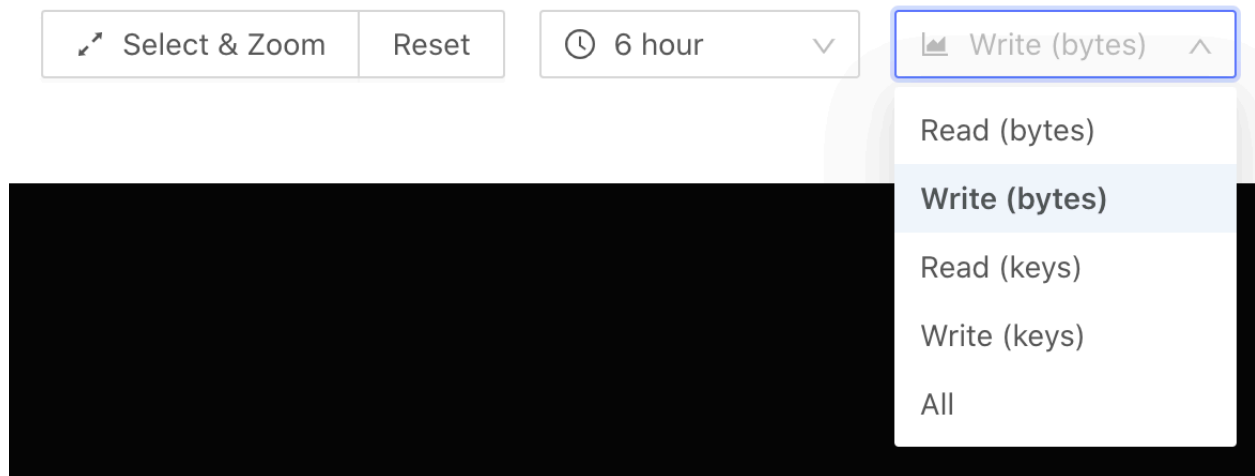

Figure 515: Select metrics

You can view a metric you are interested in by selecting this metric in the **metrics selection box** (at the **Write (bytes)** position in the interface above):

- **Read (bytes)**: Read traffic.
- **Write (bytes)**: Write traffic.
- **Read (keys)**: The number of read rows.
- **Write (keys)**: The number of written rows.
- **All**: The sum of read and write traffic.

Refresh and automatic refresh

To regain a heatmap based on the current time, click the **Refresh** button. If you need to observe the traffic distribution of the database in real time, click the down arrow on the right side of the **Refresh** button and select a fixed time interval for the heatmap to automatically refresh at this interval.

**Note:**

If you adjust the time range or Region range, the automatic refresh is disabled.

See Bucket details

You can hover your mouse over the Bucket you are interested in to view the detailed information of this Region range. The image below is an example of this information:

Figure 516: Bucket details

If you want to copy this information, click a Bucket. Then, the page with relevant details is temporarily pinned. Click on the information, and you have copied it to the clipboard.

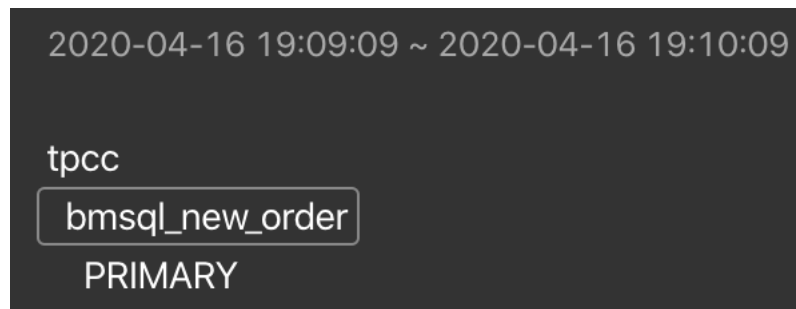

Figure 517: Copy Bucket details

#### 14.12.1.7.5 Common heatmap types

This section shows and interprets four common types of heatmap in Key Visualizer.

Evenly distributed workload

Figure 518: Balanced

In the heatmap above, bright and dark colors are a fine-grained mix. This indicates that reads or writes are evenly distributed over time and among key ranges. The workload is evenly distributed to all nodes, which is ideal for a distributed database.

Periodically reads and writes

Figure 519: Periodically

In the heatmap above, there is an alternating brightness and darkness along the X-axis (time) but the brightness is relatively even along the Y-axis (Region). This indicates that the reads and writes change periodically, which might occur in scenarios of periodically scheduled tasks. For example, the big data platform periodically extracts data from TiDB every day. In this kind of scenarios, pay attention to whether the resources are sufficient during peak usage.

Concentrated reads or writes

Figure 520: Concentrated

In the heatmap above, you can see several bright lines. Along the Y-axis, the fringes around the bright lines are dark, which indicates that the Regions corresponding to bright lines have high read and write traffic. You can observe whether the traffic distribution is expected by your application. For example, when all services are associated with the user table, the overall traffic of the user table can be high, so it is reasonable to show bright lines in the heatmap.

In addition, the height of the bright lines (the thickness along the Y-axis) is important. Because TiKV has its own Region-based hotspot balancing mechanism, the more Regions involved in the hotspot, the better it is for balancing traffic across all TiKV instances. The thicker and more bright lines indicate that hotspots are more scattered, and TiKV is better used. The thinner and fewer bright lines indicate that hotspots are more concentrated, and the hotspot issue is more obvious in TiKV, which might require manual intervention.

Sequential reads or writes

Figure 521: Sequential

In the heatmap above, you can see a bright line. This means that the data reads or writes are sequential. Typical scenarios of sequential data reads or writes are importing data or scanning tables and indexes. For example, you continuously write data to tables with auto-increment IDs.

Regions in the bright areas are the hotspots of read and write traffic, which often become the performance bottleneck of the entire cluster. In this situation, you might need to readjust the primary key for the application. By doing this, you scatter Regions much as possible to spread the pressure across multiple Regions. You can also schedule application tasks during the low-peak period.

**Note:**

In this section, only the common types of heatmap are shown. Key Visualizer actually displays the heatmap of all schemas and tables in the entire cluster, so you might see different types of heatmap in different areas, or mixed results of multiple heatmap types. Use the heatmap based on the actual situation.

### 14.12.1.7.6 Address hotspot issues

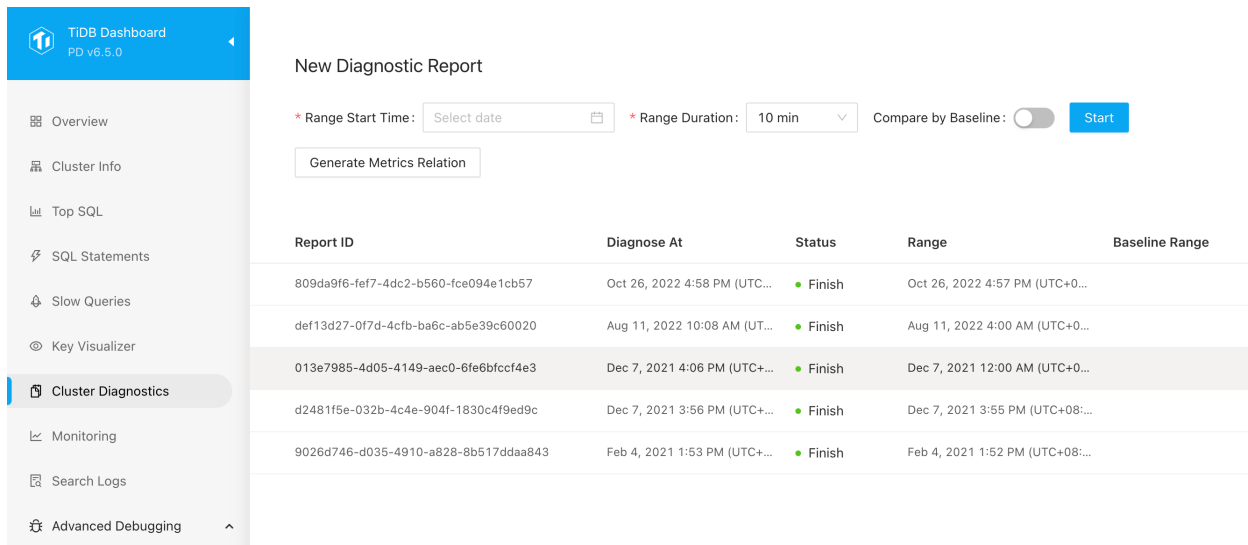

TiDB has some built-in features to mitigate the common hotspot issue. Refer to [Highly Concurrent Write Best Practices](#) for details.

### 14.12.1.8 TiDB Dashboard Metrics Relation Graph

TiDB Dashboard metrics relation graph is a feature introduced in v4.0.7. This feature presents a relation graph of the monitoring data of each internal process's duration in a TiDB cluster. The aim is to help you quickly understand the duration of each process and their relations.

#### 14.12.1.8.1 Access graph

Log into TiDB Dashboard, click **Cluster Diagnostics** on the left navigation menu, and you can see the page of generating the metrics relation graph.

| Report ID                            | Diagnose At                    | Status   | Range                           | Baseline Range |
|--------------------------------------|--------------------------------|----------|---------------------------------|----------------|
| 809da9f6-fef7-4dc2-b560-fce094e1cb57 | Oct 26, 2022 4:58 PM (UTC+...) | ● Finish | Oct 26, 2022 4:57 PM (UTC+0...  |                |
| def13d27-0f7d-4cfb-ba6c-ab5e39c60020 | Aug 11, 2022 10:08 AM (UT...   | ● Finish | Aug 11, 2022 4:00 AM (UTC+0...  |                |

| 9026d746-d035-4910-a828-8b517ddaa843 | Feb 4, 2021 1:53 PM (UTC+...   | ● Finish | Feb 4, 2021 1:52 PM (UTC+08:... |                |

Figure 522: Metrics relation graph homepage

After setting **Range Start Time** and **Range Duration**, click **Generate Metrics Relation** and you will enter the page of metrics relation graph.

#### 14.12.1.8.2 Understand graph

The following image is an example of the metrics relation graph. This graph illustrates the proportion of each monitoring metric's duration to the total query duration in a TiDB cluster within 5 minutes after 2020-07-29 16:36:00. The graph also illustrates the relations of each monitoring metric.

Figure 523: Metrics relation graph example

For example, the node meaning of the `tidb_execute` monitoring metric is as follows:

- The total duration of the `tidb_execute` monitoring metric is 19306.46 seconds, which accounts for 89.4% of the total query duration.
- The duration of the `tidb_execute` node itself is 9070.18 seconds, which accounts for 42% of the total query duration.
- Hover your mouse over the box area, and you can see the detailed information of the metric, including the total duration, the average duration, and the average P99 (99th percentile) duration.

Figure 524: `tidb_execute` node example

#### Node information

Each box area represents a monitoring metric and provides the following information:

- The name of the monitoring metric
- The total duration of the monitoring metric
- The proportion of the metric's total duration to the total query duration

*The total duration of the metric node = the duration of the metric node itself + the duration of its child nodes.* Therefore, the metric graph of some nodes displays the proportion of the node itself's duration to the total duration, such as the graph of `tidb_execute`.

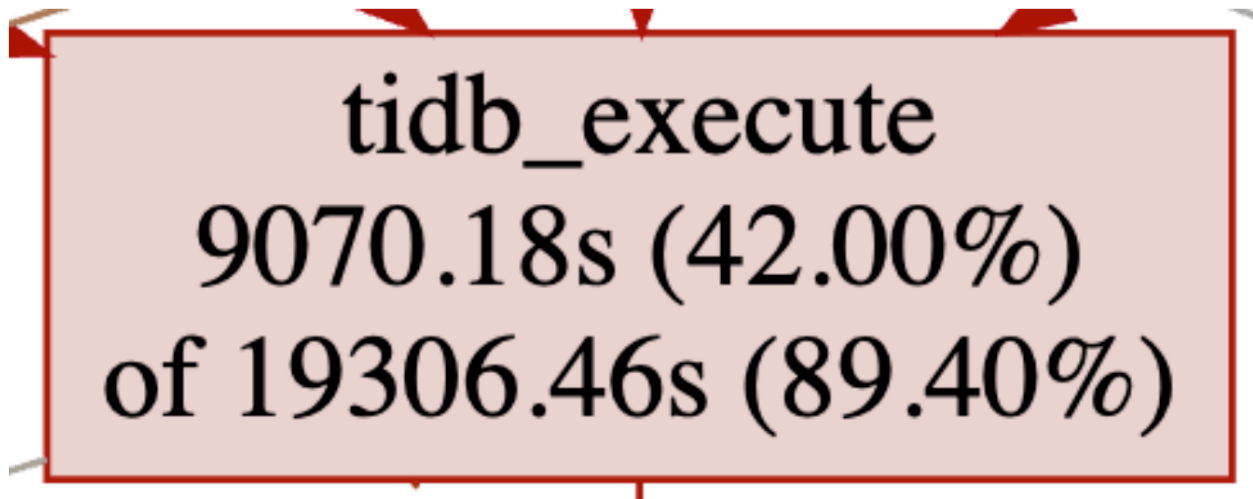

Figure 525: tidb\_execute node example1

- `tidb_execute` is the name of the monitoring metric, which represents the execution duration of a SQL query in the TiDB execution engine.
- 19306.46s represents that total duration of the `tidb_execute` metric is 19306.46 seconds. 89.40% represents that 19306.46 seconds account for 89.40% of the total time consumed for all SQL queries (including user SQL queries and TiDB's internal SQL queries). The total query duration is the total duration of `tidb_query`.
- 9070.18s represents that the total execution duration of the `tidb_execute` node itself is 9070.18 seconds, and the rest is the time consumed by its child nodes. 42.00% represents that 9070.18 seconds account for 42.00% of the total query duration of all queries.

Hover your mouse over the box area and you can see more details of the `tidb_execute` metric node:

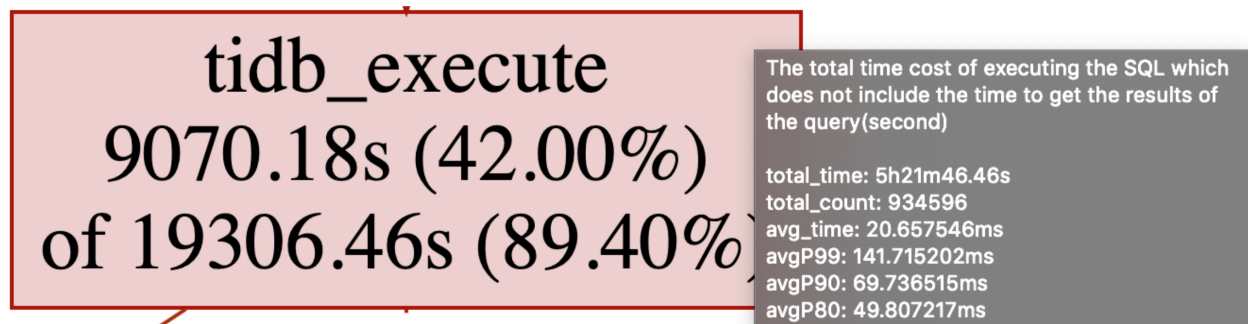

Figure 526: tidb\_execute node example2

The text information displayed in the image above is the description of the metric node, including the total duration, the total times, the average duration, and the average duration

P99, P90, and P80.

The parent-child relations between nodes

Taking the `tidb_execute` metric node as an example, this section introduces a metric's child nodes.

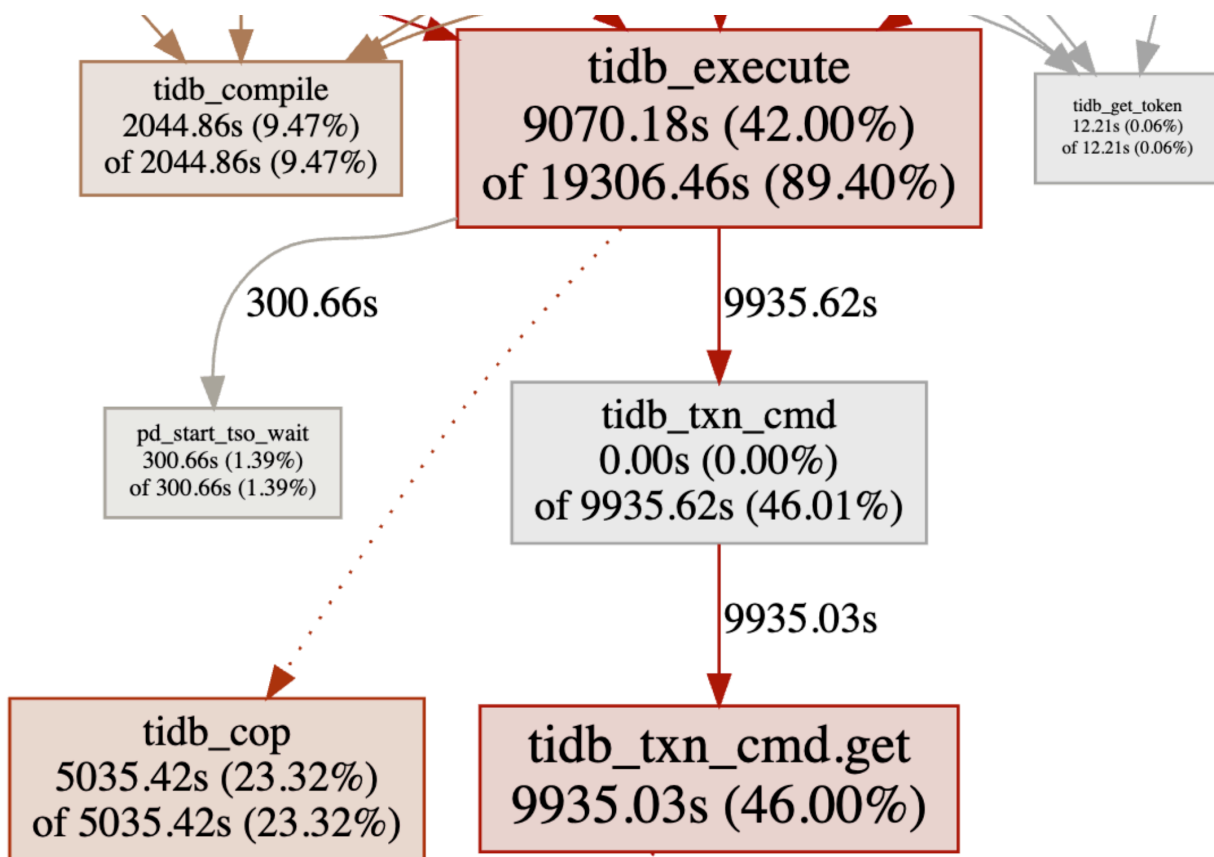

Figure 527: `tidb_execute` node relation example1

From the graph above, you can see the two child nodes of `tidb_execute`:

- `pd_start_tso_wait`: The total duration of waiting for the transaction's `start_tso`, which is 300.66 seconds.
- `tidb_txn_cmd`: The total duration of TiDB executing the relevant transaction commands, which is 9935.62 seconds.

In addition, `tidb_execute` also has a dotted arrow pointing to the `tidb_cop` box area, which indicates as follows:

`tidb_execute` includes the duration of the `tidb_cop` metric, but `cop` requests might be executed concurrently. For example, the `execute` duration of performing `join` queries on two tables is 60 seconds, during which table scan requests are concurrently executed on

the joined two tables. If the execution durations of `cop` requests are respectively 40 seconds and 30 seconds, the total duration of `cop` requests are 70 seconds. However, the `execute` duration is only 60 seconds. Therefore, if the duration of a parent node does not completely include the duration of a child node, the dotted arrow is used to point to the child node.

**Note:**

When a node have a dotted arrow pointing to its child node, the duration of this node itself is inaccurate. For example, in the `tidb_execute` node, the duration of the node itself is 9070.18 seconds ( $9070.18 = 19306.46 - \hookrightarrow 300.66 - 9935.62$ ). In this equation, the duration of the `tidb_cop` child node is not calculated into the duration of `tidb_execute`'s child nodes. But in fact, this is not true. 9070.18 seconds, the duration of `tidb_execute` itself, includes a part of the `tidb_cop` duration, and the duration of this part cannot be determined.

`tidb_kv_request` and its parent nodes

Figure 528: `tidb_execute` node relation example2

`tidb_cop` and `tidb_txn_cmd.get`, the parent nodes of `tidb_kv_request`, both have dotted arrows pointing to `tidb_kv_request`, which indicates as follows:

- The duration of `tidb_cop` includes a part of `tidb_kv_request`'s duration.
- The duration of `tidb_txn_cmd.get` also includes a part of `tidb_kv_request`'s duration.

However, it is hard to determine how much duration of `tidb_kv_request` is included in `tidb_cop`.

- `tidb_kv_request.Get`: The duration of TiDB sending the `Get` type key-value requests.
- `tidb_kv_request.Cop`: The duration of TiDB sending the `Cop` type key-value requests.

`tidb_kv_request` does not include `tidb_kv_request.Get` and `tidb_kv_request.Cop` nodes as its child nodes, but consists of the latter two nodes. The name prefix of the child node is the name of the parent node plus `.xxx`, which means that the child node is the sub-class of the parent node. You can understand this case in the following way:

The total duration of TiDB sending key-value requests is 14745.07 seconds, during which the key-value requests for the `Get` and `Cop` types respectively consume 9798.02 seconds and 4946.46 seconds.

### 14.12.1.9 SQL Statements Analysis

#### 14.12.1.9.1 SQL Statements Page of TiDB Dashboard

The SQL statements page shows the execution status of all SQL statements in the cluster. This page is often used to analyze the SQL statement whose total or single execution time is long.

On this page, SQL queries with a consistent structure (even if the query parameters are inconsistent) are classified as the same SQL statement. For example, both `SELECT * FROM employee WHERE id IN (1, 2, 3)` and `select * from EMPLOYEE where ID in (4, 5)` are classified as the same `select * from employee where id in (...)` SQL statement.

Access the page

You can use one of the following two methods to access the SQL statement summary page:

- After logging into TiDB Dashboard, click **SQL Statements** on the left navigation menu:

Figure 529: Access SQL statement summary page

- Visit <http://127.0.0.1:2379/dashboard/#/statement> in your browser. Replace 127.0.0.1:2379 with the actual PD instance address and port.

All the data shown on the SQL statement summary page are from the TiDB statement summary tables. For more details about the tables, see [TiDB Statement Summary Tables](#).

#### Note:

In the **Mean Latency** column of the SQL statement summary page, the blue bar indicates the average execution time. If there is a yellow line on the blue bar for an SQL statement, the left and right sides of the yellow line respectively represent the minimum and maximum execution time of the SQL statement during the recent data collection cycle.

#### Change Filters

On the top of the SQL statement summary page, you can modify the time range of SQL executions to be displayed. You can also filter the list by database in which SQL statements are executed, or by SQL types. The following image shows all SQL executions over the recent data collection cycle (recent 30 minutes by default).

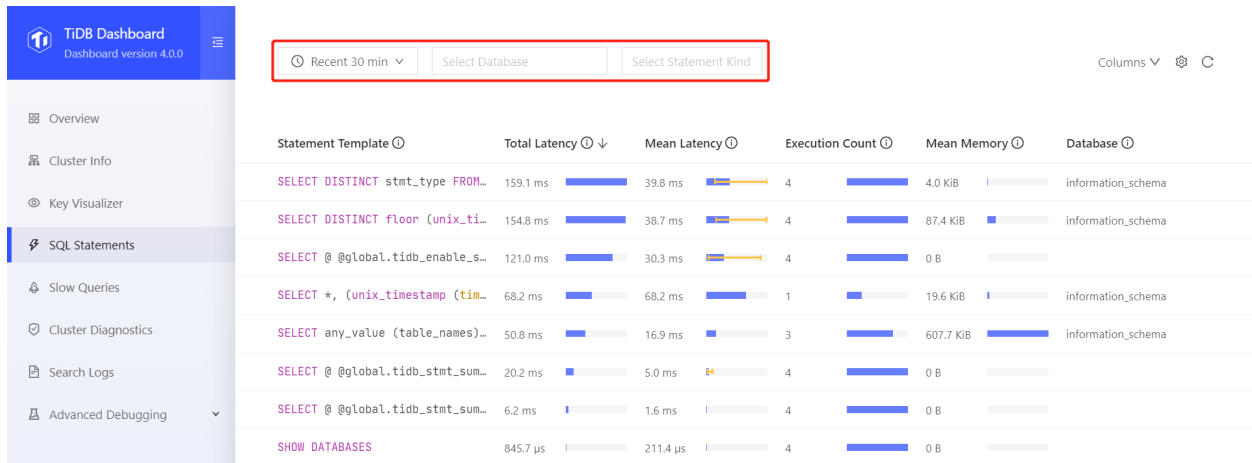

Figure 530: Modify filters

### Display More Columns

Click **Columns** on the page and you can choose to see more columns. You can move your mouse to the (i) icon at the right side of a column name to view the description of this column:

Figure 531: Choose columns

### Sort by Column

By default, the list is sorted by **Total Latency** from high to low. Click on different column headings to modify the sorting basis or switch the sorting order:

Figure 532: Modify list sorting

### Change Settings

On the list page, click the **Settings** button on the top right to change the settings of the SQL statements feature:

Figure 533: Settings entry

After clicking the **Settings** button, you can see the following setting dialog box:

## Settings

Enable

Collect interval

30 min

Data retain duration

1 day

Save

Cancel

Figure 534: Settings

On the setting page, you can disable or enable the SQL statements feature. When the SQL statements feature is enabled, you can modify the following settings:

- **Collect interval:** The length of period for each SQL statement analysis, which is 30 minutes by default. The SQL statements feature summarizes and counts all SQL statements within a period of time. If the period is too long, the granularity of the summary is coarse, which is not good for locating problems; if the period is too short, the granularity of the statistics is fine, which is good for locating problems, but this will result in more records and more memory usage within the same data retention duration. Therefore, you need to adjust this value based on the actual situation, and properly lower this value when locating problems.
- **Data retain duration:** The retention duration of summary information, which is 1 day by default. Data retained longer than this duration will be deleted from system tables.

See [Configurations of Statement Summary Tables](#) for details.

#### Note:

- Because the statement system table is only stored in memory, after the SQL Statements feature is disabled, the data in the system table will be cleared.
- The values of `Collect interval` and `retain duration` affect the memory usage, so it is recommended to adjust these values according to the actual situation. The value of `retain duration` should not be set too large.

#### 14.12.1.9.2 Statement Execution Details of TiDB Dashboard

Click any item in the list to enter the detail page of the SQL statement to view more detailed information. This information includes the following parts:

- The overview of SQL statements, which includes the SQL template, the SQL template ID, the current time range of displayed SQL executions, the number of execution plans, the database in which the SQL statement is executed, and the fast plan binding feature (area 1 in the following figure).
- The execution plan list: If a SQL statement has multiple execution plans, this list is displayed. Besides text information of execution plans, TiDB v6.2.0 introduces visual execution plans, through which you can learn each operator of a statement and detailed information more intuitively. You can select different execution plans, and the details of the selected plans are displayed below the list (area 2 in the following figure).

- Execution detail of plans, which displays the detailed information of the selected execution plans. See [Execution plan in details](#) (area 3 in the following figure).

Figure 535: Details

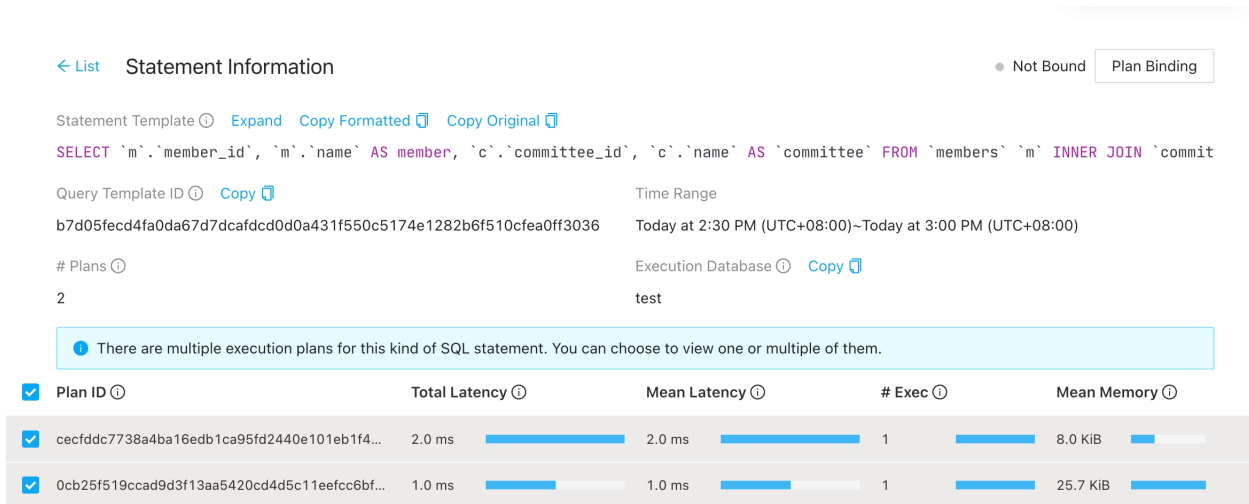

## Fast plan binding

Starting from v6.6.0, TiDB introduces the fast plan binding feature. You can quickly bind a SQL statement to a specific execution plan in TiDB Dashboard.

### Usage

#### Bind an execution plan

1. Click **Plan Binding**. The **Plan Binding** dialog box is displayed.

← List Statement Information ● Not Bound **Plan Binding**

Statement Template [Expand](#) [Copy Formatted](#) [Copy Original](#)

```
SELECT `m`.`member_id`, `m`.`name` AS `member`, `c`.`committee_id`, `c`.`name` AS `committee` FROM `members` `m` INNER JOIN `commit
```

Query Template ID [Copy](#) Time Range  
 b7d05fecdd4fa0da67d7dcafdcd0d0a431f550c5174e1282b6f510cfea0ff3036 Today at 2:30 PM (UTC+08:00)~Today at 3:00 PM (UTC+08:00)

# Plans [Copy](#) Execution Database [Copy](#)

Figure 539: Fast plan binding - bound - entry

2. Click **Drop**.

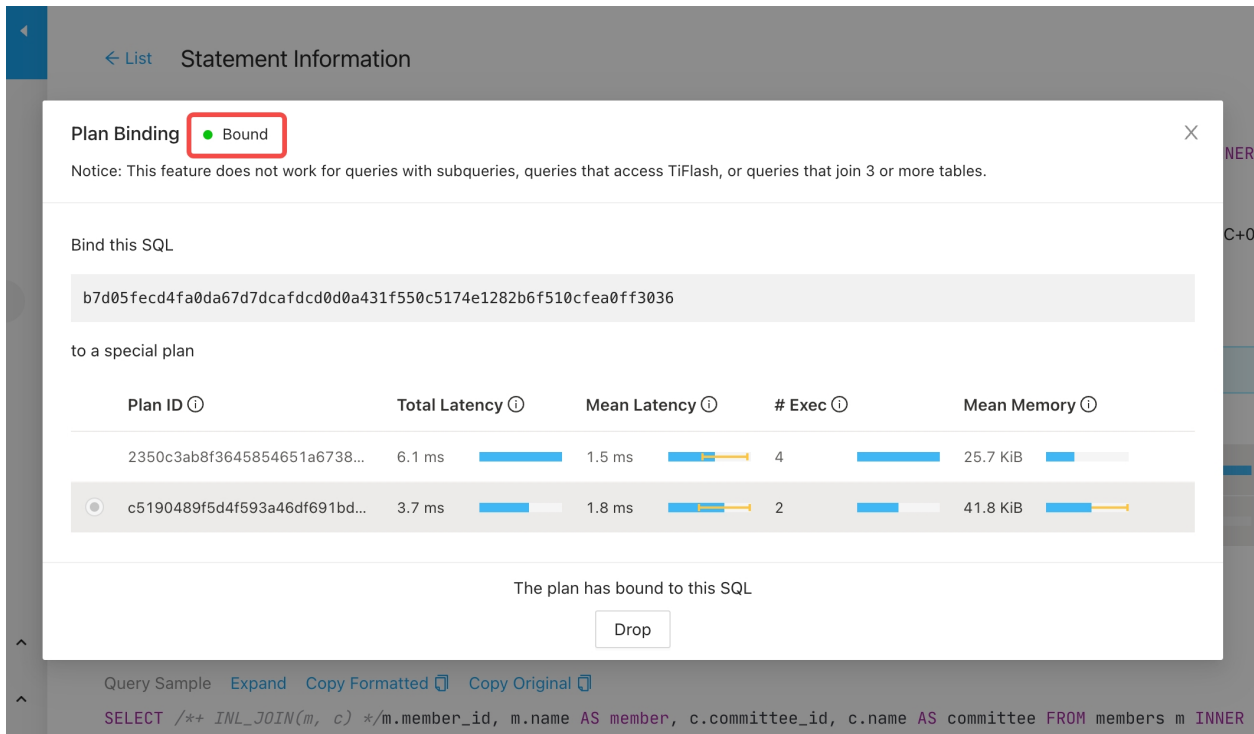

Figure 540: Fast plan binding - popup - bound

3. After the binding is dropped, you can see the **Not bound** label.

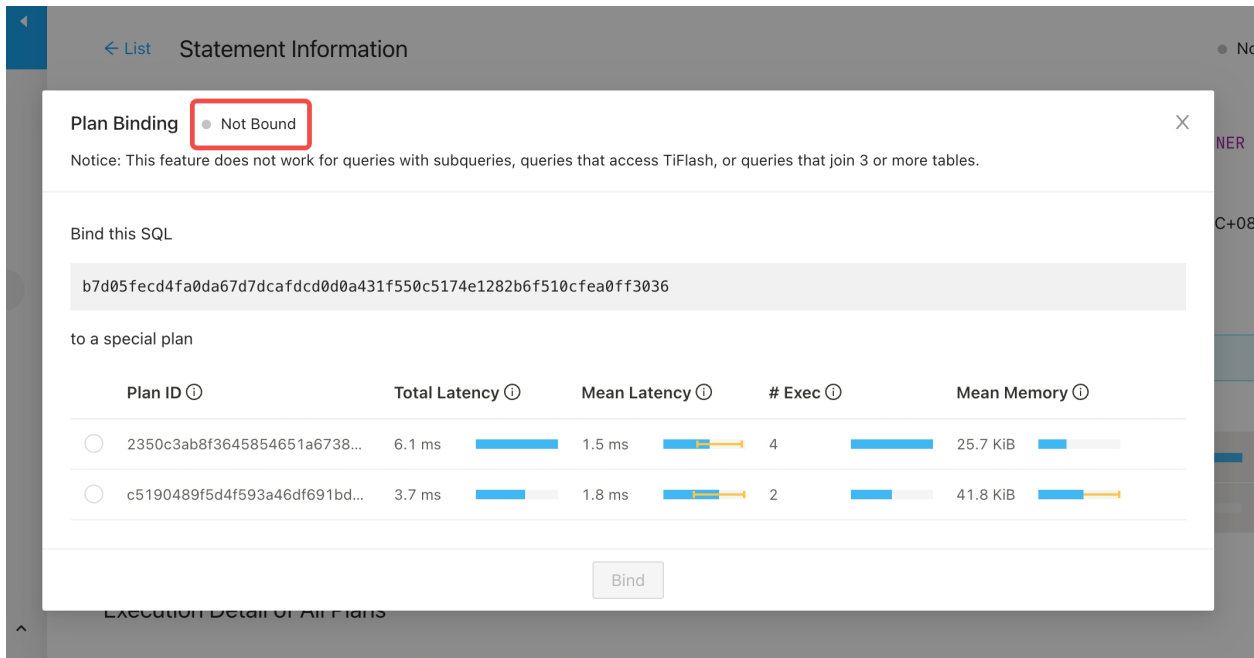

Figure 541: Fast plan binding - popup

## Limitation

Currently, the fast plan binding feature does not support the following types of SQL statements:

- Statements that are not **SELECT**, **DELETE**, **UPDATE**, **INSERT**, or **REPLACE**
- Queries with subqueries
- Queries that access TiFlash
- Queries that join three or more tables

To use this feature, you must have the **SUPER** privilege. If you encounter permission issues while using it, refer to [TiDB Dashboard User Management](#) to add the necessary privileges.

## Execution details of plans

The execution detail of plans includes the following information:

- **SQL sample**: The text of a certain SQL statement that is actually executed corresponding to the plan. Any SQL statement that has been executed within the time range might be used as a SQL sample.
- **Execution plan**: Complete information about execution plans, displayed in graph and text. For details of the execution plan, see [Understand the Query Execution Plan](#). If multiple execution plans are selected, only (any) one of them is displayed.
- For basic information, execution time, Coprocessor read, transaction, and slow query of the SQL statement, you can click the corresponding tab titles to switch among different information.

## Execution Detail of All Plans

| Total Errors                                                                                                                                                     | 0                |                                            |
| Total Warnings                                                                                                                                                   | 0                |                                            |
| Mean Memory                                                                                                                                                      | 111.9 KiB        | Memory usage of single SQL                 |
| Max Memory                                                                                                                                                       | 236.3 KiB        | Maximum memory usage of single SQL         |

Figure 543: Basic information

### Time Tab

Click the **Time** tab, and you can see how long each stage of the execution plan lasts.

#### Note:

Because some operations might be performed in parallel within a single SQL statement, the cumulative duration of each stage might exceed the actual execution time of the SQL statement.

Basic **Time** Coprocessor Read Transaction Slow Query

| Name                  | Time          | Description                                    |
|-----------------------|---------------|------------------------------------------------|
| Parse                 | 69.7 $\mu$ s  | Time consumed when parsing the SQL statement   |
| Compile               | 331.4 $\mu$ s | Time consumed when optimizing the SQL state... |
| Coprocessor Wait      | 0 ns          |                                                |
| Coprocessor Execution | 400.0 $\mu$ s |                                                |
| Backoff Retry         | 0 ns          |                                                |
| Get Commit Ts         | 0 ns          |                                                |
| Local Latch Wait      | 0 ns          |                                                |
| Resolve Lock          | 0 ns          |                                                |
| Prewrite              | 0 ns          |                                                |
| Commit                | 0 ns          |                                                |
| Commit Backoff Retry  | 0 ns          |                                                |
| Query                 | 9.3 ms        |                                                |

Figure 544: Execution time

### Coprocessor Read Tab

Click the **Coprocessor Read** tab, and you can see information related to Coprocessor read.

Basic   Time   **Coprocessor Read**   Transaction   Slow Query

| Name                          | Value  | Description                                        |
|-------------------------------|--------|----------------------------------------------------|
| Total Coprocessor Tasks       | 6      |                                                    |
| Mean Visible Versions per SQL | 6.0 K  |                                                    |
| Max Visible Versions per SQL  | 10.0 K |                                                    |
| Mean Meet Versions per SQL    | 6.0 K  | Meet versions contains overwritten or deleted v... |
| Max Meet Versions per SQL     | 10.0 K |                                                    |

Figure 545: Coprocessor read

### Transaction Tab

Click the **Transaction** tab, and you can see information related to execution plans and transactions, such as the average number of written keys or the maximum number of written keys.

Basic   Time   Coprocessor Read   **Transaction**   Slow Query

| Name                     | Value | Description |
|--------------------------|-------|-------------|
| Mean Affected Rows       | 0     |             |
| Total Backoff Count      | 0     |             |
| Mean Written Keys        | 0     |             |
| Max Written Keys         | 0     |             |
| Mean Written Data Size   | 0 B   |             |
| Max Written Data Size    | 0 B   |             |
| Mean Prewrite Regions    | 0     |             |
| Max Prewrite Regions     | 0     |             |
| Mean Transaction Retries | 0     |             |
| Max Transaction Retries  | 0     |             |

Figure 546: Transaction

### Slow Query Tab

If an execution plan is executed too slowly, you can see its associated slow query records under the **Slow Query** tab.

Basic   Time   Coprocessor Read   Transaction   **Slow Query**

| SQL ⓘ            | Finish Time ⓘ ↓  | Latency ⓘ                                                                                     | Max Memory ⓘ                                                                              |
|------------------|------------------|-----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|
| ANALYZE TABLE t; | Today at 1:19 PM | 336.5 ms  | 0 B  |

Figure 547: Slow Query

The information displayed in this area has the same structure with the slow query page. See [TiDB Dashboard Slow Query Page](#) for details.

### 14.12.1.10 Slow Queries Page of TiDB Dashboard

On the Slow Queries page of TiDB Dashboard, you can search and view all slow queries in the cluster.

By default, SQL queries with an execution time of more than 300 milliseconds are considered as slow queries. These queries are recorded in the [slow query logs](#) and can be searched via TiDB Dashboard. You can adjust the threshold of slow queries through the `tidb_slow_log_threshold` session variable or the `slow-threshold` TiDB parameter.

#### Note:

If the slow query log is disabled, this feature will be unavailable. The slow query log is enabled by default, and you can enable or disable it through the system variable `tidb_enable_slow_log`.

#### 14.12.1.10.1 Access the page

You can use one of the following two methods to access the slow query page:

- After logging into TiDB Dashboard, click **Slow Queries** on the left navigation menu:

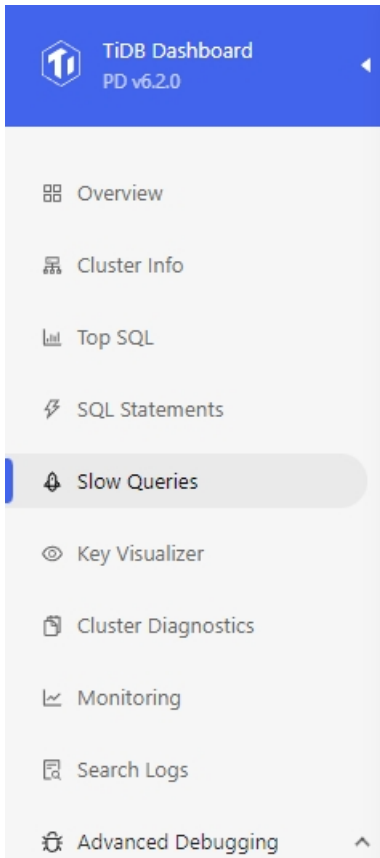

Figure 548: Access slow query page

- Visit [http://127.0.0.1:2379/dashboard/#/slow\\_query](http://127.0.0.1:2379/dashboard/#/slow_query) in your browser. Replace 127.0.0.1:2379 with the actual PD address and port.

All data displayed on the slow query page comes from TiDB slow query system tables and slow query logs. See [slow query logs](#) for details.

#### Change filters

You can filter slow queries based on the time range, the related database, SQL keywords, SQL types, the number of slow queries to be displayed. In the image below, 100 slow queries over the recent 30 minutes are displayed by default.

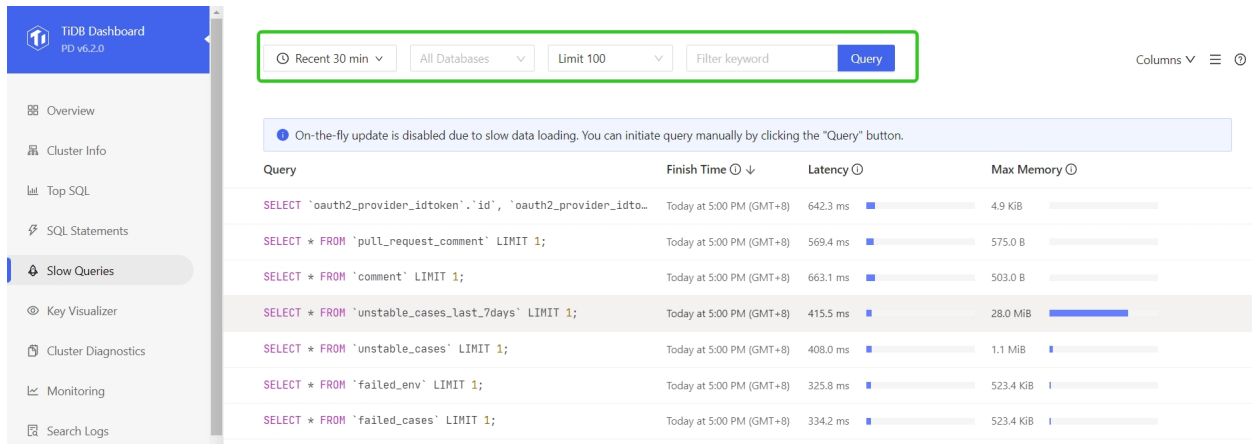

Figure 549: Modify list filters

### Display more columns

Click **Columns** on the page and you can choose to see more columns. You can move your mouse to the (i) icon at the right side of a column name to view the description of this column:

Figure 550: Show more columns

### Sort by column

By default, the list is sorted by **Finish Time** in the descending order. Click column headings to sort by the column or switch the sorting order:

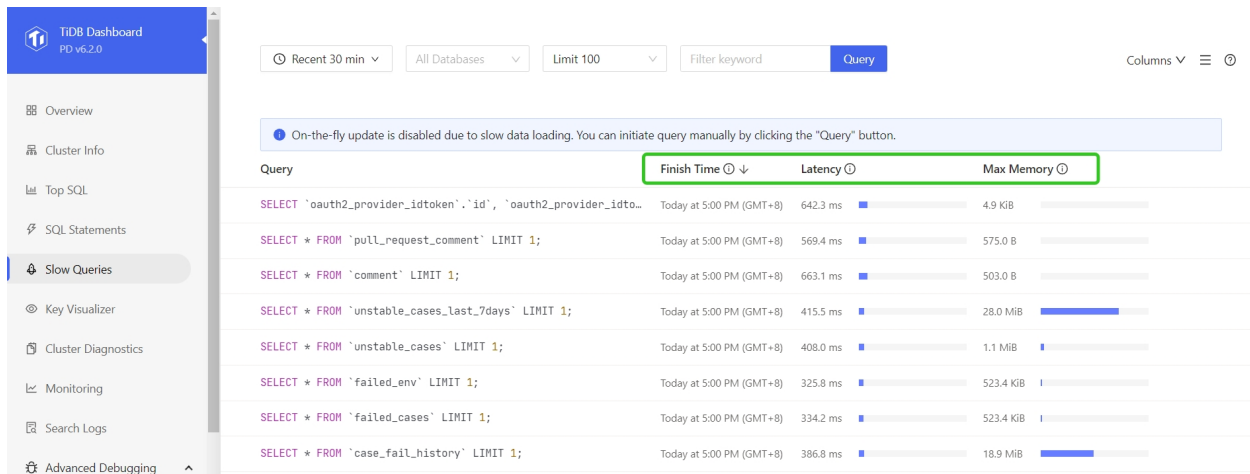

Figure 551: Modify sorting basis

### 14.12.1.10.2 View execution details

Click any item in the list to display detailed execution information of the slow query, including:

- Query: The text of the SQL statement (area 1 in the following figure)
- Plan: The execution plan of the slow query (area 2 in the following figure)
- Other sorted SQL execution information (area 3 in the following figure)

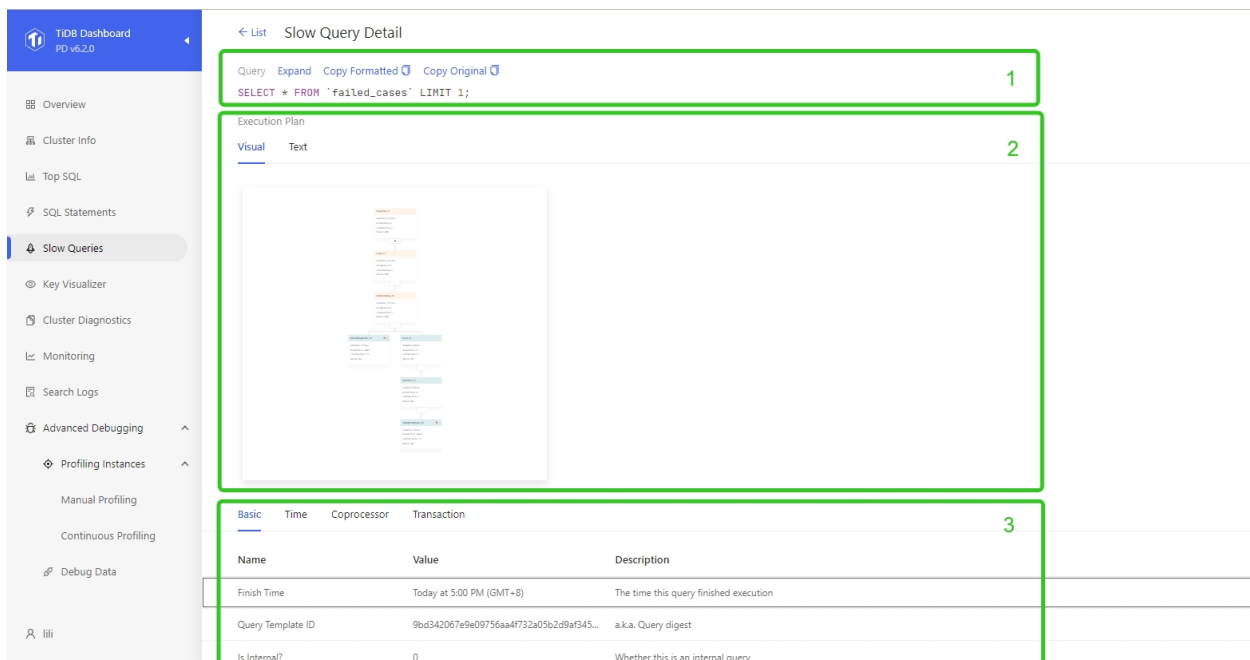

Figure 552: View execution details

## SQL

Click the **Expand** button to view the detailed information of an item. Click the **Copy** button to copy the detailed information to the clipboard.

### Execution plans

On TiDB Dashboard, you can view execution plans in two ways: Graph and text. Visual execution plans allow you to learn each operator of a statement and detailed information more intuitively. See [Understand the Query Execution Plan](#) to learn how to read a execution plan.

### Visual execution plans

The following figure shows a visual execution plan.

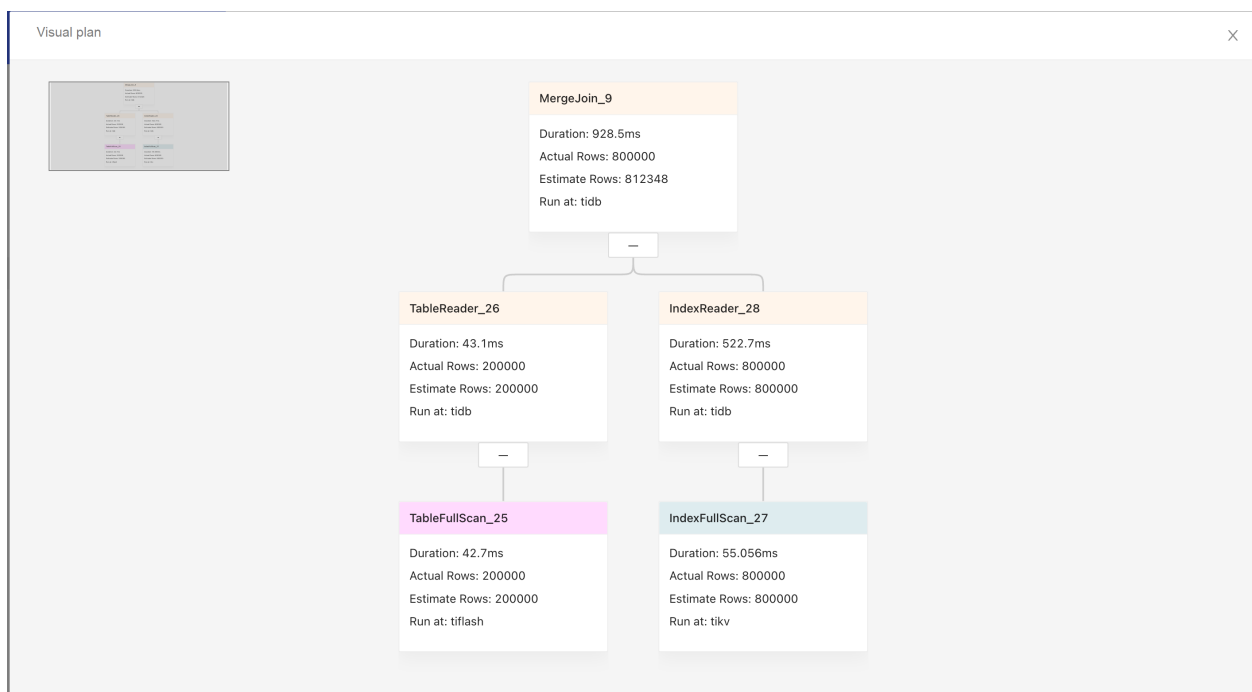

Figure 553: Visual execution plan

- The graph shows the execution from left to right, and from top to bottom.
- Upper nodes are parent operators and lower nodes are child operators.
- The color of the title bar indicates the component where the operator is executed: yellow stands for TiDB, blue stands for TiKV, and pink stands for TiFlash.
- The title bar shows the operator name and the text shown below is the basic information of the operator.

Click the node area, and the detailed operator information is displayed on the right sidebar.

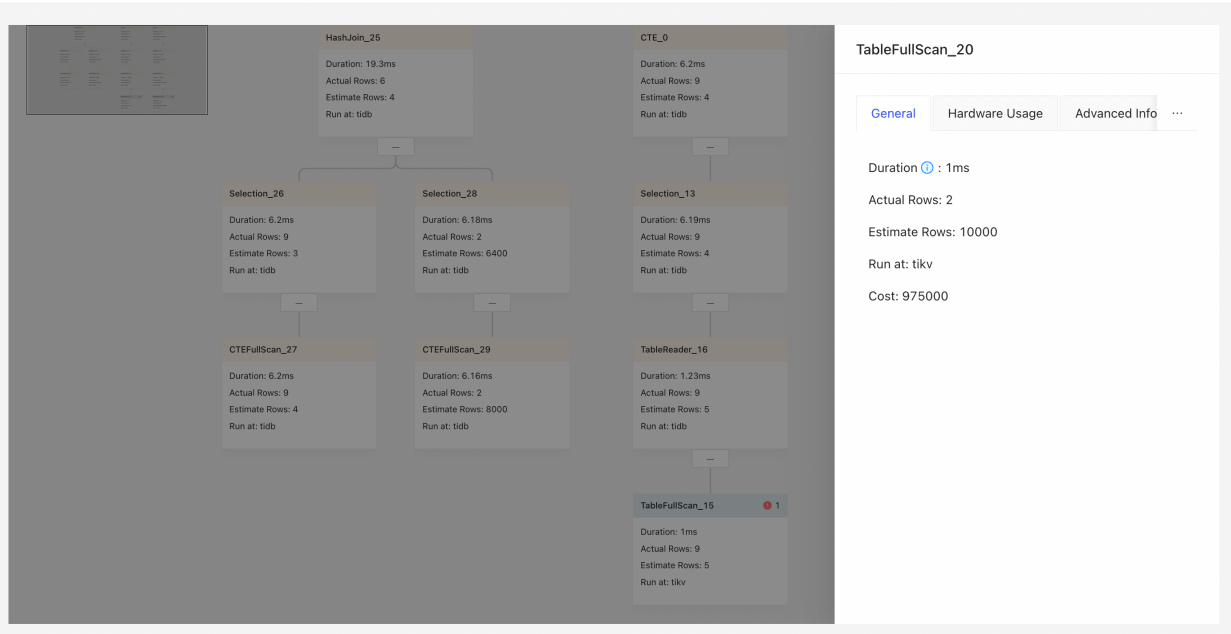

Figure 554: Visual execution plan - sidebar

## SQL execution details

Click the corresponding tab titles to switch information of SQL executions.

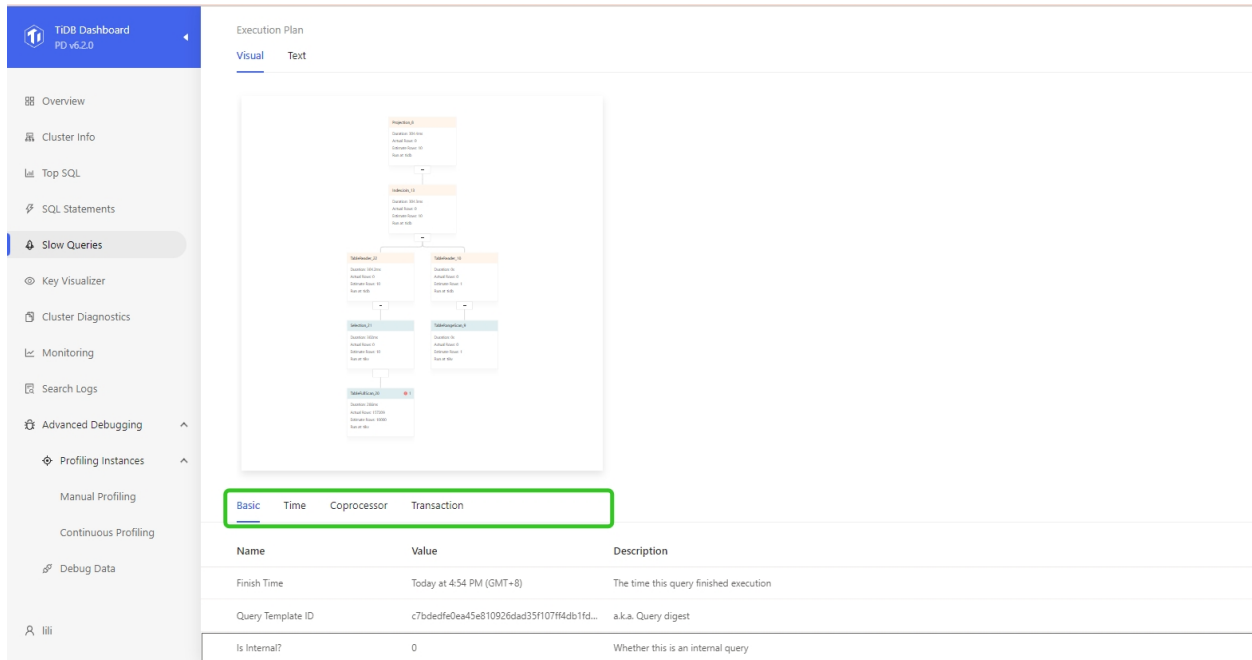

Figure 555: Show different execution information

## 14.12.1.11 Cluster Diagnostics

### 14.12.1.11.1 TiDB Dashboard Cluster Diagnostics Page

The cluster diagnostics feature in TiDB Dashboard diagnoses the problems that might exist in a cluster within a specified time range, and summarizes the diagnostic results and the cluster-related load monitoring information into a diagnostic report. This diagnostic report is in the form of a web page. You can browse the page offline and circulate this page link after saving the page from a browser.

#### Note:

The cluster diagnostics feature depends on Prometheus deployed in the cluster. For details about how to deploy this monitoring component, see the [TiUP deployment document](#). If no monitoring component is deployed in the cluster, the generated diagnostic report will indicate a failure.

Access the page

You can use one of the following methods to access the cluster diagnostics page:

- After logging into TiDB Dashboard, click **Cluster Diagnostics** on the left navigation menu:

Figure 556: Access Cluster Diagnostics page

- Visit <http://127.0.0.1:2379/dashboard/#/diagnose> in your browser. Replace 127.0.0.1:2379 with the actual PD address and port number.

## Generate diagnostic report

To diagnose a cluster within a specified time range and check the cluster load, you can take the following steps to generate a diagnostic report:

1. Set the **Range Start Time**, such as 2022-05-21 14:40:00.
2. Set the **Range Duration**, such as 10 min.
3. Click **Start**.

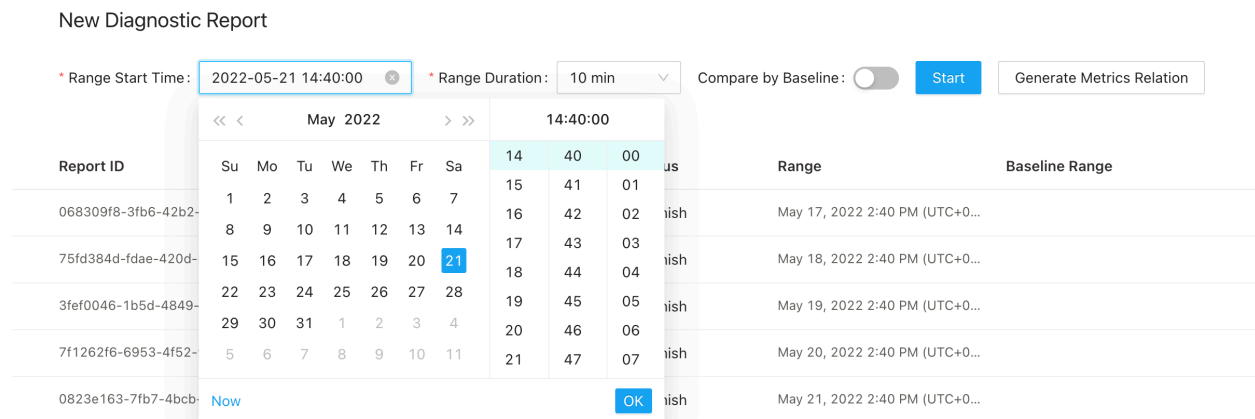

Figure 557: Generate diagnostic report

### Note:

It is recommended that the **Range Duration** of the report is between 1 minute and 60 minutes. This **Range Duration** cannot exceed 60 minutes.

The preceding steps generate a diagnostic report for the time range from 2022-05-21 14:40:00 to 2022-05-21 14:50:00. After clicking **Start**, you can see the interface below. **Progress** is the progress bar of the diagnostic report. After the report is generated, click **View Full Report**.

[← New Diagnostic Report](#)   Diagnostic Status [View Full Report](#)

Figure 558: Report progress

### Generate comparison report

If a system exception occurs at a certain point, for example, QPS jitter or higher latency, a diagnostic report can be generated. Particularly, this report compares the system in the abnormal time range with the system in the normal time range. For example:

- Abnormal time range: 2022-05-21 14:40:00-2022-05-21 14:45:00. Within this time range, the system is abnormal.
- Normal time range: 2022-05-21 14:30:00 - 2022-05-21 14:35:00. Within this time range, the system is normal.

You can take the following steps to generate a comparison report for the preceding two time ranges:

1. Set the **Range Start Time**, which is the start time of the range in which the system becomes abnormal, such as 2022-05-21 14:40:00.
2. Set the **Range Duration**. Generally, this duration is the duration of system anomalies, such as 5 minutes.
3. Enable **Compare by Baseline**.
4. Set the **Baseline Range Start Time**, which is the start time of the range (to be compared with) in which the system is normal, such as 2022-05-21 14:30:00.
5. Click **Start**.

Figure 559: Generate comparison report

Then wait for the report to be generated and click **View Full Report**.

In addition, the historical diagnostic report is displayed in the list on the main page of the diagnostic report. You can click to view these historical reports directly.

#### 14.12.1.11.2 TiDB Dashboard Diagnostic Report

This document introduces the content of the diagnostic report and viewing tips. To access the cluster diagnostic page and generate reports, see [TiDB Dashboard Cluster Diagnostics Page](#).

#### View report

The diagnostic report consists of the following parts:

- Basic information: Includes the time range of the diagnostic report, hardware information of the cluster, the version information of cluster topology.
- Diagnostic information: Shows the results of automatic diagnostics.
- Load information: Includes CPU, memory and other load information of the server, TiDB, PD, or TiKV.
- Overview information: Includes the consumed time and error information of each TiDB, PD, or TiKV module.
- TiDB/PD/TiKV monitoring information: Includes monitoring information of each component.
- Configuration information: Includes configuration information of each component.

An example of the diagnostic report is as follows:

| Total Time Consume                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                 |            |            |             |         |          |          |          |

Figure 560: Sample report

In the image above, **Total Time Consume** in the top blue box is the report name. The information in the red box below explains the content of this report and the meaning of each field in the report.

In this report, some small buttons are described as follows:

- **i** icon: You can move your mouse to the **i** icon to see the explanatory note of the row.
- **expand**: Click **expand** to see details about this monitoring metric. For example, the detailed information of `tidb_get_token` in the image above includes the monitoring information of each TiDB instance’s latency.
- **collapse**: Contrary to **expand**, the button is used to fold detailed monitoring information.

All monitoring metrics basically correspond to those on the TiDB Grafana monitoring dashboard. After a module is found to be abnormal, you can view more monitoring information on the TiDB Grafana.

In addition, the `TOTAL_TIME` and `TOTAL_COUNT` metrics in this report are monitoring data read from Prometheus, so calculation inaccuracy might exists in their statistics.

Each part of this report is introduced as follows.

Basic information

Diagnostics Time Range

The time range for generating the diagnostics report includes the start time and end time.

Report Time Range

| START_TIME          | END_TIME            |
|---------------------|---------------------|
| 2020-05-21 06:40:00 | 2020-05-21 06:50:00 |

Figure 561: Report time range

Cluster Hardware Info

Cluster Hardware Info includes information such as CPU, memory, and disk of each server in the cluster.

Cluster Hardware

| HOST      | INSTANCE  | CPU_CORES | MEMORY (GB) | DISK (GB)                     | UPTIME (DAY)       |
|-----------|-----------|-----------|-------------|-------------------------------|--------------------|
| 10.0.1.14 | tiflash*1 | 20/40     | 125.64      | nvme01: 498.638               | 2.9132028513567314 |
| 10.0.1.11 | pd*1      | 20/40     | 125.64      | sda1: 965.834                 | 2.921851028772416  |
| 10.0.1.12 | tikv*1    | 20/40     | 125.64      | nvme0n1: 122.78 sda1: 965.834 | 2.9197623066052247 |
| 10.0.1.13 | tidb*1    | 20/40     | 125.64      | sda1: 498.638                 | 2.917983893669314  |

Figure 562: Cluster hardware report

The fields in the table above are described as follows:

- **HOST:** The IP address of the server.
- **INSTANCE:** The number of instances deployed on the server. For example, `pd * 1` means that this server has 1 PD instance deployed; `tidb * 2 pd * 1` means that this server has 2 TiDB instances and 1 PD instance deployed.
- **CPU\_CORES:** Indicates the number of CPU cores (physical cores or logical cores) of the server.
- **MEMORY:** Indicates the memory size of the server. The unit is GB.
- **DISK:** Indicates the server disk size. The unit is GB.
- **UPTIME:** The uptime of the server. The unit is day.

### Cluster Topology Info

The `Cluster Info` table shows the cluster topology information. The information in this table are from TiDB `information_schema.cluster_info` system table.

Cluster Info

| TYPE    | INSTANCE        | STATUS_ADDRESS  | VERSION                    | GIT_HASH                                 | START_TIME           | UPTIME              |

Figure 563: Cluster info

The fields in the table above are described as follows:

- **TYPE:** The node type.
- **INSTANCE:** The instance address(es), which is a string in the `IP:PORT` format.
- **STATUS\_ADDRESS:** The HTTP API service address.

- **VERSION:** The semantic version number of the corresponding node.
- **GIT\_HASH:** Git Commit Hash when compiling the node version, which is used to identify whether the two nodes are absolutely the consistent version.
- **START\_TIME:** The start time of the corresponding node.
- **UPTIME:** The uptime of the corresponding node.

## Diagnostic information

TiDB has built-in automatic diagnostic results. For the description of each field, see [information\\_schema.inspection-result](#) system table.

## Load Info

### Node Load Info

The **Node Load Info** table shows the load information of the server node, including the average value (AVG), maximum value (MAX), minimum value (MIN) of the following metrics of the server within the time range:

- CPU usage (the maximum value is 100%)
- Memory usage
- Disk I/O usage
- Disk write latency
- Disk read latency
- Disk read bytes per second
- Disk write bytes per second
- The number of bytes received by the node network per minute
- The number of bytes sent from the node network per minute
- The number of TCP connections in use by the node
- The number of all TCP connections of the node

Node Load Info

| METRIC_NAME                                     | instance | AVG        | MAX       | MIN      |

Figure 564: Server Load Info report

## Instance CPU Usage

The **Instance CPU Usage** table shows the average value (AVG), maximum value (MAX), and minimum value (MIN) of the CPU usage of each TiDB/PD/TiKV process. The maximum CPU usage of the process is  $100\% * \text{the number of CPU logical cores}$ .

| INSTANCE          | JOB  | AVG   | MAX   | MIN   |
|-------------------|------|-------|-------|-------|
| 172.16.5.40:10089 | tidb | 1891% | 1906% | 1878% |
| 172.16.5.40:22151 | tikv | 517%  | 571%  | 459%  |
| 172.16.5.40:20151 | tikv | 498%  | 562%  | 444%  |
| 172.16.5.40:23151 | tikv | 352%  | 399%  | 311%  |
| 172.16.5.40:24799 | pd   | 39%   | 45%   | 36%   |

Figure 565: Instance CPU Usage report

### Instance Memory Usage

The **Instance Memory Usage** table shows the average value (AVG), maximum value (MAX), and minimum value (MIN) of memory bytes occupied by each TiDB/PD/TiKV process.

| INSTANCE          | JOB  | AVG        | MAX        | MIN        |
|-------------------|------|------------|------------|------------|
| 172.16.5.40:20151 | tikv | 9.562 GB   | 9.605 GB   | 9.523 GB   |
| 172.16.5.40:23151 | tikv | 9.528 GB   | 9.574 GB   | 9.496 GB   |
| 172.16.5.40:22151 | tikv | 9.433 GB   | 9.498 GB   | 9.345 GB   |
| 172.16.5.40:10089 | tidb | 904.500 MB | 911.660 MB | 894.336 MB |
| 172.16.5.40:24799 | pd   | 61.089 MB  | 61.270 MB  | 60.980 MB  |

Figure 566: Instance memory usage report

### TiKV Thread CPU Usage

The **TiKV Thread CPU Usage** table shows the average value (AVG), maximum value (MAX) and minimum value (MIN) of CPU usage of each module thread in TiKV. The maximum CPU usage of the process is  $100\% * \text{the thread count of the corresponding configuration}$ .

### TiKV Thread CPU Usage

| METRIC_NAME                                                       | INSTANCE       | AVG    | MAX   | MIN    | CONFIG_KEY                         | CURRENT_CONFIG_VALUE |

Figure 567: TiKV Thread CPU Usage report

In the table above,

- **CONFIG\_KEY**: The relevant thread configuration of the corresponding module.
- **CURRENT\_CONFIG\_VALUE**: The current value of the configuration when the report is generated.

#### Note:

**CURRENT\_CONFIG\_VALUE** is the value when the report is generated, not the value within the time range of this report. Currently, some configuration values of historical time cannot be obtained.

### TiDB/PD Goroutines Count

The **TiDB/PD Goroutines Count** table shows the average value (AVG), maximum value (MAX), and minimum value (MIN) of the number of TiDB or PD goroutines. If the number of goroutines exceeds 2,000, the concurrency of the process is too high, which affects the overall request latency.

| INSTANCE          | JOB  | AVG     | MAX  | MIN  |
|-------------------|------|---------|------|------|
| 172.16.5.40:10089 | tidb | 1434.33 | 1473 | 1394 |
| 172.16.5.40:24799 | pd   | 157     | 157  | 157  |

Figure 568: TiDB/PD goroutines count report

## Overview information

### Time Consumed by Each Component

The **Time Consumed by Each Component** table shows the monitored consumed time and the time ratio of TiDB, PD, TiKV modules in the cluster. The default time unit is seconds. You can use this table to quickly locate which modules consume more time.

| METRIC_NAME                                              | LABEL | TIME_RATIO  | TOTAL_TIME | TOTAL_COUNT | P999    | P99      | P90      | P80      |
|----------------------------------------------------------|-------|-------------|------------|-------------|---------|----------|----------|----------|
| tidb_query <a href="#">expand</a>                        |       | 1           | 23223.86   | 459625      | 63.54   | 45.55    | 0.1      | 0.06     |

Figure 569: Time Consume report

The fields in columns of the table above are described as follows:

- **METRIC\_NAME**: The name of the monitoring metric.
- **Label**: The label information for the monitoring metric. Click **expand** to view more detailed monitoring information of each label for a metric.
- **TIME\_RATIO**: The ratio of the total time consumed by this monitoring metric to the total time of the monitoring row where **TIME\_RATIO** is 1. For example, the total

consumed time by `kv_request` is 1.65 (namely,  $38325.58/23223.86$ ) times that of `tidb_query`. Because KV requests are executed concurrently, the total time of all KV requests might exceed the total query (`tidb_query`) execution time.

- `TOTAL_TIME`: The total time consumed by this monitoring metric.
- `TOTAL_COUNT`: The total number of times this monitoring metric is executed.
- `P999`: The maximum P999 time of this monitoring metric.
- `P99`: The maximum P99 time of this monitoring metric.
- `P90`: The maximum P90 time of this monitoring metric.
- `P80`: The maximum P80 time of this monitoring metric.

The following image shows the relationship of time consumption of the related modules in the monitoring metrics above.

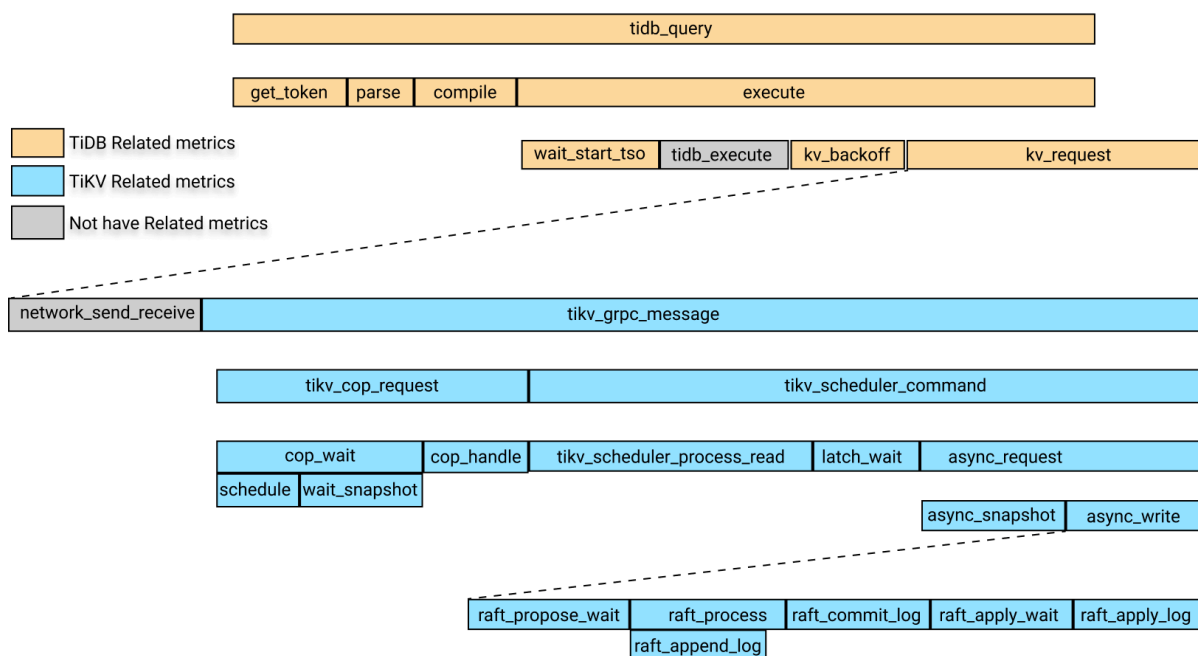

Figure 570: Time-consumption relationship of each module

In the image above, yellow boxes are the TiDB-related monitoring metrics. Blue boxes are TiKV-related monitoring metrics, and gray boxes temporarily do not correspond to specific monitoring metrics.

In the image above, the time consumption of `tidb_query` includes the following four parts:

- `get_token`
- `parse`
- `compile`

- `execute`

The `execute` time includes the following parts:

- `wait_start_tso`
- The execution time at the TiDB layer, which is currently not monitored
- KV request time
- `KV_backoff` time, which is the time for backoff after the KV request fails

Among the parts above, the KV request time includes the following parts:

- The time consumed by the network sending and receiving of requests. Currently, there is no monitoring metric for this item. You can subtract the time of `tikv_grpc_message` from the KV request time to roughly estimate this item.
- `tikv_grpc_message` time consumption.

Among the parts above, `tikv_grpc_message` time consumption includes the following parts:

- Coprocessor request time consumption, which refers to processing the COP type requests. This time consumption includes the following parts:
  - `tikv_cop_wait`: The time consumed by request queue.
  - `Coprocessor handle`: The time consumed to process Coprocessor requests.
- `tikv_scheduler_command` time consumption, which includes the following parts:
  - `tikv_scheduler_processing_read`: The time consumed to process read requests.
  - The time consumed to get snapshot in `tikv_storage_async_request` (snapshot is the label for this monitoring metric).
  - Time consumed to process write requests. This time consumption includes the following parts:
    - \* `tikv_scheduler_latch_wait`: The time consumed to wait for latch.
    - \* The time consumption of writes in `tikv_storage_async_request` (write is the label for this monitoring metric).

Among the above metrics, The time consumption of writes in `tikv_storage_async_request` ↪ refers to the time consumption of writing Raft KVs, including the following parts:

- `tikv_raft_propose_wait`
- `tikv_raft_process`, which mainly includes `tikv_raft_append_log`
- `tikv_raft_commit_log`
- `tikv_raft_apply_wait`

- `tikv_raft_apply_log`

You can use `TOTAL_TIME`, the P999 time, and the P99 time to determine which modules consume longer time according to the relationship between the time consumptions described above, and then look at the related monitoring metrics.

#### Note:

Because the Raft KVs writes might be processed in one batch, using `TOTAL_TIME` to measure the time consumed by each module is inapplicable to monitoring metrics related to Raft KV writes, specifically, `tikv_raft_process`, `tikv_raft_append_log`, `tikv_raft_commit_log`, `tikv_raft_apply_wait`, and `tikv_raft_apply_log`. In this situation, it is more reasonable to compare the time consumption of each module with the time of P999 and P99.

The reason is that if there are 10 asynchronous write requests, Raft KVs internally pack 10 requests into a batch execution, and the execution time is 1 second. Therefore, the execution time of each request is 1 second, and the total time of 10 requests is 10 seconds, but the total time for Raft KV processing is 1 second. If you use `TOTAL_TIME` to measure the consumed time, you might not understand where the remaining 9 seconds are spent. You can also see the difference between the monitoring metric of Raft KV and other previous monitoring metrics from the total number of requests (`TOTAL_COUNT`  $\leftrightarrow$  ).

#### Errors Occurred in Each Component

The `Errors Occurred in Each Component` table shows the total number of errors in TiDB and TiKV, such as the failure to write binlog, `tikv server is busy`, `TiKV channel`  $\leftrightarrow$  `full`, `tikv write stall`. You can see the row comments for the specific meaning of each error.

| METRIC_NAME                                         | LABEL | TOTAL_COUNT |

Figure 571: Errors Occurred in Each Component report

### Specific TiDB/PD/TiKV monitoring information

This part includes more specific monitoring information of TiDB, PD, or TiKV.

### TiDB-related monitoring information

#### Time Consumed by TiDB Component

This table shows the time consumed by each TiDB module and the ratio of each time consumption, which is similar to the `time consume` table in the overview, but the label information of this table are more detailed.

#### TiDB Server Connections

This table shows the number of client connections for each TiDB instance.

#### TiDB Transaction

This table shows transaction-related monitoring metrics.

| METRIC_NAME                             | LABEL | TOTAL_VALUE | TOTAL_COUNT | P999       | P99      | P90      | P80      |

Figure 572: Transaction report

- **TOTAL\_VALUE**: The sum of all values (SUM) during the report time range.
- **TOTAL\_COUNT**: The total number of occurrences of this monitoring metric.
- **P999**: The maximum P999 value of this monitoring metric.
- **P99**: The maximum P99 value of this monitoring metric.
- **P90**: The maximum P90 value of this monitoring metric.
- **P80**: The maximum P80 value of this monitoring metric.

Example:

In the table above, within the report time range, `tidb_txn_kv_write_size`: a total of about 181,296 transactions of KV writes, and the total KV write size is 266.772 MB, of which the maximum P999, P99, P90, P80 values for a single transaction of KV writes are 116.913 KB, 1.996 KB, 1.905 KB, and 1.805 KB.

DDL Owner

| MIN_TIME            | DDL OWNER       |
|---------------------|-----------------|
| 2020-05-21 14:40:00 | 10.0.1.13:10080 |

Figure 573: TiDB DDL Owner Report

The table above shows that from 2020-05-21 14:40:00, the cluster's DDL OWNER is at the 10.0.1.13:10080 node. If the owner changes, multiple rows of data exist in the table above, where the `Min_Time` column indicates the minimum time of the corresponding known owner.

#### Note:

If the owner information is empty, it does not mean that no owner exists in this period of time. Because in this situation, the DDL owner is determined based on the monitoring information of `ddl_worker`, it might be that `ddl_worker` ↔ has not done any DDL job in this period of time, causing the owner information to be empty.

Other monitoring tables in TiDB are as follows:

- **Statistics Info**: Shows related monitoring metrics of TiDB statistical information.
- **Top 10 Slow Query**: Shows the Top 10 slow query information in the report time range.
- **Top 10 Slow Query Group By Digest**: Shows the Top 10 slow query information in the report time range, which is aggregated according to the SQL fingerprint.

- **Slow Query With Diff Plan:** The SQL statement whose execution plan changes within the report time range.

#### PD related monitoring information

The tables related to the monitoring information of PD modules are as follows:

- **Time Consumed by PD Component:** The time consumed by the monitoring metrics of related modules in PD.
- **Balance Leader/Region:** The monitoring information of `balance-region` and `balance leader` occurred in the cluster within the report time range, such as the number of leaders that are scheduled out from `tikv_node_1` or the number of leaders that are scheduled in.
- **Cluster Status:** The cluster status information, including total number of TiKV nodes, total cluster storage capacity, the number of Regions, and the number of offline TiKV nodes.
- **Store Status:** Record the status information of each TiKV node, including Region score, leader score, and the number of Regions/leaders.
- **EtcD Status:** etcd related information in PD.

#### TiKV related monitoring information

The tables related to the monitoring information of TiKV modules are as follows:

- **Time Consumed by TiKV Component:** The time consumed by related modules in TiKV.
- **Time Consumed by RocksDB:** The time consumed by RocksDB in TiKV.
- **TiKV Error:** The error information related to each module in TiKV.
- **TiKV Engine Size:** The size of stored data of column families on each node in TiKV.
- **Coprocessor Info:** Monitoring information related to the Coprocessor module in TiKV.
- **Raft Info:** Monitoring information of the Raft module in TiKV.
- **Snapshot Info:** Snapshot related monitoring information in TiKV.
- **GC Info:** Garbage Collection (GC) related monitoring information in TiKV.
- **Cache Hit:** The hit rate information of each cache of RocksDB in TiKV.

#### Configuration information

In the configuration information, the configuration values of some modules are shown within the report time range. But the historical values of some other configurations of these modules cannot be obtained, so the shown values of these configurations are the current (when the report is generated) values .

Within the report time range, the following tables include items whose values are configured at the start time of the report time range:

- **Scheduler Initial Config:** The initial value of PD scheduling-related configuration at the report's start time.
- **TiDB GC Initial Config:** The initial value of TiDB GC related-configuration at the report's start time
- **TiKV RocksDB Initial Config:** The initial value of TiKV RocksDB-related configuration at the report's start time
- **TiKV RaftStore Initial Config:** The initial value of TiKV RaftStore-related configuration at the report's start time

Within the report time range, if some configurations have been modified, the following tables include records of some configurations that have been modified:

- Scheduler Config Change History
- TiDB GC Config Change History
- TiKV RocksDB Config Change History
- TiKV RaftStore Config Change History

Example:

| APPROXIMATE_CHANGE_TIME   | CONFIG_ITEM           | VALUE |
|---------------------------|-----------------------|-------|
| 2020-05-22T20:00:00+08:00 | leader-schedule-limit | 4     |
| 2020-05-22T20:07:00+08:00 | leader-schedule-limit | 8     |

Figure 574: Scheduler Config Change History report

The table above shows that the `leader-schedule-limit` configuration parameter has been modified within the report time range:

- 2020-05-22T20:00:00+08:00: At the start time of the report, the configuration value of `leader-schedule-limit` is 4, which does not mean that the configuration has been modified, but that at the start time in the report time range, its configuration value is 4.
- 2020-05-22T20:07:00+08:00: The `leader-schedule-limit` configuration value is 8  $\leftrightarrow$  , which indicates that the value of this configuration has been modified around 2020-05-22T20:07:00+08:00.

The following tables show the current configuration of TiDB, PD, and TiKV at the time when the report is generated:

- TiDB's Current Config
- PD's Current Config
- TiKV's Current Config

## Comparison report

You can generate a comparison report for two time ranges. The report content is the same as the report for a single time range, except that a comparison column is added to show the difference between the two time ranges. The following sections introduce some unique tables in the comparison report and how to view the comparison report.

First, the **Compare Report Time Range** report in the basic information shows the two time ranges for comparison:

Compare Report Time Range

| T1.START_TIME       | T1.END_TIME         | T2.START_TIME       | T2.END_TIME         |
|---------------------|---------------------|---------------------|---------------------|
| 2020-05-21 06:30:00 | 2020-05-21 06:35:00 | 2020-05-21 06:40:00 | 2020-05-21 06:45:00 |

Figure 575: Compare Report Time Range report

In the table above, **t1** is the normal time range, or the reference time range. **t2** is the abnormal time range.

Tables related to slow queries are shown as follows:

- **Slow Queries In Time Range t2**: Shows slow queries that only appear in **t2** but not during **t1**.
- **Top 10 slow query in time range t1**: The Top 10 slow queries during **t1**.
- **Top 10 slow query in time range t2**: The Top 10 slow queries during **t2**.

## DIFF\_RATIO introduction

This section introduces **DIFF\_RATIO** using the **Instance CPU Usage** table as an example.

Instance CPU Usage

| INSTANCE          | JOB  | t1.AVG | t1.MAX | t1.MIN | t2.AVG | t2.MAX | t2.MIN | AVG_DIFF_RATIO | MAX_DIFF_RATIO | MIN_DIFF_RATIO |
|-------------------|------|--------|--------|--------|--------|--------|--------|----------------|----------------|----------------|
| 172.16.5.40:10089 | tidb | 410%   | 410%   | 410%   | 1240%  | 1240%  | 1240%  | 2.02           | 2.02           | 2.02           |
| 172.16.5.40:20151 | tikv | 221%   | 221%   | 221%   | 617%   | 617%   | 617%   | 1.79           | 1.79           | 1.79           |
| 172.16.5.40:20379 | pd   | 82%    | 82%    | 82%    | 78%    | 78%    | 78%    | -0.05          | -0.05          | -0.05          |

Figure 576: Compare Instance CPU Usage report

- **t1.AVG**, **t1.MAX**, **t1.Min** are the average value, maximum value, and minimum value of CPU usage in the **t1**.
- **t2.AVG**, **t2.MAX**, and **t2.Min** are the average value, maximum value, and minimum value of CPU usage during **t2**.
- **AVG\_DIFF\_RATIO** is **DIFF\_RATIO** of the average values during **t1** and **t2**.
- **MAX\_DIFF\_RATIO** is **DIFF\_RATIO** of the maximum values during **t1** and **t2**.
- **MIN\_DIFF\_RATIO** is **DIFF\_RATIO** of the minimum values during **t1** and **t2**.

**DIFF\_RATIO**: Indicates the difference value between the two time ranges. It has the following values:

- If the monitoring metric has a value only within **t2** and has no value within **t1**, the value of **DIFF\_RATIO** is 1.
- If the monitoring metric has a value only within **t1**, and has no value within **t2** time range, the value of **DIFF\_RATIO** is -1.
- If the value of **t2** is greater than that of **t1**, then  $\text{DIFF\_RATIO} = (\text{t2.value} / \text{t1.value}) - 1$
- If the value of **t2** is smaller than that of **t1**, then  $\text{DIFF\_RATIO} = 1 - (\text{t1.value} / \text{t2.value})$

For example, in the table above, the average CPU usage of the **tidb** node in **t2** is 2.02 times higher than that in **t1**, which is  $2.02 = 1240/410 - 1$ .

#### Maximum Different Item table

The **Maximum Different Item** table compares the monitoring metrics of two time ranges, and sorts them according to the difference of the monitoring metrics. Using this table, you can quickly find out which monitoring metric has the biggest difference in the two time ranges. See the following example:

## Maximum Different Item

The maximum different metrics between two time ranges.

| TABLE                                               | METRIC_NAME                      | LABEL                                   | MAX_DIFF | t1.VALUE   | t2.VALUE     | VALUE_TYPE  |
|-----------------------------------------------------|----------------------------------|-----------------------------------------|----------|------------|--------------|-------------|
| TiKV, coprocessor_info <a href="#">Expand</a>       | TiKV Coprocessor scan            | 172.16.5.40:20151,select,get,lock       | 28916.85 | 61.33      | 1773532      | TOTAL_VALUE |

Figure 577: Maximum Different Item table

- **Table:** Indicates this monitoring metric comes from which table in the comparison report. For example, TiKV, coprocessor\_info indicates the coprocessor\_info table in the TiKV component.
- **METRIC\_NAME:** The monitoring metric name. Click [expand](#) to view the comparison of different labels of metrics.
- **LABEL:** The label corresponding to the monitoring metric. For example, the monitoring metric of TiKV Coprocessor scan has 2 labels, namely instance, req, tag, sql\_type ↔ , which are the TiKV address, request type, operation type and operation column family.
- **MAX\_DIFF:** Difference value, which is the DIFF\_RATIO calculation of t1.VALUE and

t2.VALUE.

From the table above, you can see the t2 time range has much more Coprocessor requests than the t1 time range, and the SQL parsing time of TiDB in t2 is much longer.

### 14.12.1.11.3 Locate Problems Using Diagnostic Report of TiDB Dashboard

This document introduces how to locate problems using diagnostic report of TiDB Dashboard.

#### Comparison diagnostics

This section demonstrates how to use the comparison diagnostic feature to diagnose QPS jitter or latency increase caused by large queries or writes.

#### Example 1

Figure 578: QPS example

The result of a `go-ycsb` pressure test is shown in the image above. You can see that at 2020-03-10 13:24:30, QPS suddenly began to decrease. After 3 minutes, QPS began to return to normal. You can use diagnostic report of TiDB Dashboard to find out the cause.

Generate a report that compares the system in the following two time ranges:

T1: 2020-03-10 13:21:00 to 2020-03-10 13:23:00. In this range, the system is normal, which is called a reference range.

T2: 2020-03-10 13:24:30 to 2020-03-10 13:27:30. In this range, QPS began to decrease.

Because the impact range of jitter is 3 minutes, the two time ranges above are both 3 minutes. Because some monitored average values are used for comparison during diagnostics, too long a range will cause the difference of average values to be insignificant, and then the problem cannot be accurately located.

After the report is generated, you can view this report on the **Compare Diagnose** page.

## Compare Diagnose

Automatically diagnose the cluster problem by compare with the refer time.

| RULE      | DETAIL                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Figure 579: Comparison diagnostics

The diagnostic results above show that big queries might exist during the diagnostic time. Each **DETAIL** in the report above is described as follows:

- **tidb\_qps**: QPS decreased by 0.93 times.
- **tidb\_query\_duration**: P999 query latency increased by 1.54 times.
- **tidb\_cop\_duration**: The processing latency of P999 coprocessor requests increased by 2.48 times.
- **tidb\_kv\_write\_num**: The number written KVs in the P999 TiDB transaction increased by 7.61 times.
- **tikv\_cop\_scan\_keys\_total\_nun**: The number of keys/values scanned by the TiKV Coprocessor has greatly improved on 3 TiKV instances.
- In **pd\_operator\_step\_finish\_total\_count**, the number of transferred leaders increases by 2.45 times, which means that the scheduling in the abnormal time range is higher than that in the normal time range.
- The report indicates that there might be slow queries and indicates that you can use SQL statements to query slow queries. The execution result of the SQL statements are as follows:

```
SELECT * FROM (SELECT count(*), min(time), sum(query_time) AS
↪ sum_query_time, sum(Process_time) AS sum_process_time, sum(Wait_time)
↪ AS sum_wait_time, sum(Commit_time), sum(Request_count), sum(
↪ process_keys), sum(Write_keys), max(Cop_proc_max), min(query), min(
↪ prev_stmt), digest FROM information_schema.CLUSTER_SLOW_QUERY WHERE
↪ time >= '2020-03-10 13:24:30' AND time < '2020-03-10 13:27:30' AND
↪ Is_internal = false GROUP BY digest) AS t1 WHERE t1.digest NOT IN (
↪ SELECT digest FROM information_schema.CLUSTER_SLOW_QUERY WHERE time
```

```

↪ >= '2020-03-10 13:21:00' AND time < '2020-03-10 13:24:00' GROUP BY
↪ digest) ORDER BY t1.sum_query_time DESC limit 10\G
***** [1. row] *****
count(*) | 196
min(time) | 2020-03-10 13:24:30.204326
sum_query_time | 46.878509117
sum_process_time | 265.924
sum_wait_time | 8.308
sum(Commit_time) | 0.926820886
sum(Request_count) | 6035
sum(process_keys) | 201453000
sum(Write_keys) | 274500
max(Cop_proc_max) | 0.263
min(query) | delete from test.tcs2 limit 5000;
min(prev_stmt) |
digest | 24
↪ bd6d8a9b238086c9b8c3d240ad4ef32f79ce94cf5a468c0b8fe1eb5f8d03df

```

From the result above, you can see that from 13:24:30, there is a large write of batch deletion, which has been executed 196 times in total, each time deleting 5,000 rows of data, in a total duration of 46.8 seconds.

### Example 2

If a large query has not been executed, the query is not recorded in the slow log. In this situation, this large query can still be diagnosed. See the following example:

Figure 580: QPS results

The result of another `go-ycsb` pressure test is shown in the image above. You can see that at 2020-03-08 01:46:30, QPS suddenly began to drop and did not recover.

Generate a report that compares the system in the following two time ranges:

T1: 2020-03-08 01:36:00 to 2020-03-08 01:41:00. In this range, the system is normal, which is called a reference range.

T2: 2020-03-08 01:46:30 to 2020-03-08 01:51:30. In this range, QPS began to decrease.

After the report is generated, you can view this report on the **Compare Diagnose** page.

Compare Diagnose

Automatically diagnose the cluster problem by compare with the refer time.

 ↳ join t_wide as t2 where t1.c0>t2.c1 and t1.c2>0"]
```

The query result above shows that on this 172.16.5.40:4009 TiDB instance, at 2020/03/08 01:47:35.846 there is an expensive query that has been executed for 60

seconds, but the execution has not yet been finished. This query is a join of Cartesian products.

Locate problems using comparison diagnostic report

Because the diagnostics might be wrong, using a comparison report might help DBAs locate problems more quickly. See the following example.

Figure 582: QPS results

The result of a `go-ycsb` pressure test is shown in the image above. You can see that at 2020-05-22 22:14:00, QPS suddenly began to decrease. After 3 minutes, QPS began to return to normal. You can use the comparison diagnostic report of TiDB Dashboard to find out the cause.

Generate a report that compares the system in the following two time ranges:

T1: 2020-05-22 22:11:00 to 2020-05-22 22:14:00. In this range, the system is normal, which is called a reference range.

T2: 2020-05-22 22:14:00 2020-05-22 22:17:00. In this range, QPS began to decrease.

After generating the comparison report, check the **Max diff item** report. This report compares the monitoring items of the two time ranges above and sorts them according to the difference of the monitoring items. The result of this table is as follows:

### Maximum Different Item

The maximum different metrics between two time ranges.

| TABLE                                               | METRIC_NAME                      | LABEL                             | MAX_DIFF  | t1.VALUE | t2.VALUE    | VALUE_TYPE  |

Figure 583: Comparison results

From the result above, you can see that the Coprocessor requests in T2 are much more than those in T1. It might be that some large queries appear in T2 that bring more load.

In fact, during the entire time range from T1 to T2, the `go-ycsb` pressure test is running. Then 20 `tpch` queries are running during T2. So it is the `tpch` queries that cause many Coprocessor requests.

If such a large query whose execution time exceeds the threshold of slow log is recorded in the slow log. You can check the `Slow Queries In Time Range t2` report to see whether there is any slow query. However, some queries in T1 might become slow queries in T2, because in T2, other loads cause their executions to slow down.

#### 14.12.1.12 TiDB Dashboard Monitoring Page

On the monitoring page, you can view the Performance Overview dashboard, a performance analysis and tuning tool introduced in TiDB v6.1.0. With the Performance Overview dashboard, you can analyze performance efficiently, and confirm whether the bottleneck of user response time is in the database. If the bottleneck is in the database, you can identify the bottleneck inside the database, with database time overview, workload profile and SQL latency breakdown. For details, see [Performance Analysis and Tuning](#).

##### 14.12.1.12.1 Access the page

Log in to TiDB dashboard and click **Monitoring** from the left navigation bar. The Performance Overview dashboard is displayed.

Figure 584: Monitoring page

If the TiDB cluster is deployed using TiUP, you can also view the Performance Overview dashboard on Grafana. In this deployment mode, the monitoring system (Prometheus & Grafana) is deployed at the same time. For more information, see [TiDB Monitoring Framework Overview](#).

Figure 585: performance overview

### 14.12.1.12.2 Key Metrics on Performance Overview

The Performance Overview dashboard orchestrates the metrics of TiDB, PD, and TiKV, and presents each of them in the following sections:

- Overview: Database time and SQL execution time summary. By checking different colors in the overview, you can quickly identify the database workload profile and the performance bottleneck.
- Load profile: Key metrics and resource usage, including database QPS, connection information, the MySQL command types the application interacts with TiDB, database internal TSO and KV request OPS, and resource usage of the TiKV and TiDB.
- Top-down latency breakdown: Query latency versus connection idle time ratio, query latency breakdown, TSO/KV request latency during execution, breakdown of write latency within TiKV.

The following sections illustrate the metrics on the Performance Overview dashboard.

#### Database Time by SQL Type

- database time: Total database time per second
- sql\_type: Database time consumed by each type of SQL statements per second

#### Database Time by SQL Phase

- database time: Total database time per second
- get token/parse/compile/execute: Database time consumed in four SQL processing phases

The SQL execution phase is in green and other phases are in red on general. If non-green areas are large, it means much database time is consumed in other phases than the execution phase and further cause analysis is required.

#### SQL Execute Time Overview

- execute time: Database time consumed during SQL execution per second
- tso\_wait: Concurrent TSO waiting time per second during SQL execution
- kv request type: Time waiting for each KV request type per second during SQL execution. The total KV request wait time might exceed SQL execution time, because KV requests are concurrent.

Green metrics stand for common KV write requests (such as prewrite and commit), blue metrics stand for common read requests, and metrics in other colors stand for unexpected situations which you need to pay attention to. For example, pessimistic lock KV requests are marked red and TSO waiting is marked dark brown.

If non-blue or non-green areas are large, it means there is a bottleneck during SQL execution. For example:

- If serious lock conflicts occur, the red area will take a large proportion.
- If excessive time is consumed in waiting TSO, the dark brown area will take a large proportion.

## QPS

Number of SQL statements executed per second in all TiDB instances, collected by type: such as `SELECT`, `INSERT`, and `UPDATE`

## CPS By Type

Number of commands processed by all TiDB instances per second based on type

## Queries Using Plan Cache OPS

Number of queries using plan cache per second in all TiDB instances

## KV/TSO Request OPS

- kv request total: Total number of KV requests per second in all TiDB instances
- kv request by type: Number of KV requests per second in all TiDB instances based on such types as `Get`, `Prewrite`, and `Commit`.
- tso - cmd: Number of `tso cmd` requests per second in all TiDB instances
- tso - request: Number of `tso request` requests per second in all TiDB instances

Generally, dividing `tso - cmd` by `tso - request` yields the average batch size of requests per second.

## Connection Count

- total: Number of connections to all TiDB instances
- active connections: Number of active connections to all TiDB instances
- Number of connections to each TiDB instance

## TiDB CPU

- avg: Average CPU utilization across all TiDB instances
- delta: Maximum CPU utilization of all TiDB instances minus minimum CPU utilization of all TiDB instances
- max: Maximum CPU utilization across all TiDB instances

## TiKV CPU/IO MBps

- CPU-Avg: Average CPU utilization of all TiKV instances
- CPU-Delta: Maximum CPU utilization of all TiKV instances minus minimum CPU utilization of all TiKV instances
- CPU-MAX: Maximum CPU utilization among all TiKV instances

- IO-Avg: Average MBps of all TiKV instances
- IO-Delt: Maximum MBps of all TiKV instances minus minimum MBps of all TiKV instances
- IO-MAX: Maximum MBps of all TiKV instances

## Duration

- Duration: Execution time
  - The duration from receiving a request from the client to TiDB till TiDB executing the request and returning the result to the client. In general, client requests are sent in the form of SQL statements; however, this duration can include the execution time of commands such as `COM_PING`, `COM_SLEEP`, `COM_STMT_FETCH`, and `COM_SEND_LONG_DATA`.
  - TiDB supports Multi-Query, which means the client can send multiple SQL statements at one time, such as `select 1; select 1; select 1;`. In this case, the total execution time of this query includes the execution time of all SQL statements.
- avg: Average time to execute all requests
- 99: P99 duration to execute all requests
- avg by type: Average time to execute all requests in all TiDB instances, collected by type: `SELECT`, `INSERT`, and `UPDATE`

## Connection Idle Duration

Connection Idle Duration indicates the duration of a connection being idle.

- avg-in-txn: Average connection idle duration when the connection is within a transaction
- avg-not-in-txn: Average connection idle duration when the connection is not within a transaction
- 99-in-txn: P99 connection idle duration when the connection is within a transaction
- 99-not-in-txn: P99 connection idle duration when the connection is not within a transaction

## Parse Duration, Compile Duration, and Execute Duration

- Parse Duration: Time consumed in parsing SQL statements
- Compile Duration: Time consumed in compiling the parsed SQL AST to execution plans
- Execution Duration: Time consumed in executing execution plans of SQL statements

All these three metrics include the average duration and the 99th percentile duration in all TiDB instances.

#### Avg TiDB KV Request Duration

Average time consumed in executing KV requests in all TiDB instances based on the type, including `Get`, `Prewrite`, and `Commit`.

#### Avg TiKV GRPC Duration

Average time consumed in executing gRPC requests in all TiKV instances based on the type, including `kv_get`, `kv_prewrite`, and `kv_commit`.

#### PD TSO Wait/RPC Duration

- `wait - avg`: Average time in waiting for PD to return TSO in all TiDB instances
- `rpc - avg`: Average time from sending TSO requests to PD to receiving TSO in all TiDB instances
- `wait - 99`: P99 time in waiting for PD to return TSO in all TiDB instances
- `rpc - 99`: P99 time from sending TSO requests to PD to receiving TSO in all TiDB instances

#### Storage Async Write Duration, Store Duration, and Apply Duration

- `Storage Async Write Duration`: Time consumed in asynchronous write
- `Store Duration`: Time consumed in store loop during asynchronously write
- `Apply Duration`: Time consumed in apply loop during asynchronously write

All these three metrics include the average duration and P99 duration in all TiKV instances.

Average storage async write duration = Average store duration + Average apply duration

#### Append Log Duration, Commit Log Duration, and Apply Log Duration

- `Append Log Duration`: Time consumed by Raft to append logs
- `Commit Log Duration`: Time consumed by Raft to commit logs
- `Apply Log Duration`: Time consumed by Raft to apply logs

All these three metrics include the average duration and P99 duration in all TiKV instances.

### 14.12.1.13 TiDB Dashboard Log Search Page

On the log search page of TiDB Dashboard, you can search logs of all nodes, preview the search result and download logs.

### 14.12.1.13.1 Access the page

After logging into TiDB Dashboard, you can click **Search Logs** to enter this log search homepage.

Figure 586: Log Search Page

This page provides the following search parameters:

- **Time range:** Specifies the time range of logs to search. The default value is the recent 30 minutes.
- **Log level:** Specifies the minimum log level. All logs above this log level are searched. The default value is the **INFO**.
- **Keywords:** The parameter is optional and its value can be any legal string. Multiple keywords are separated by a space. Regular expressions are supported (case-insensitive).
- **Components:** Selects the cluster components to search, which are multi-select and non-empty. By default, all components are selected.

After clicking the **Search** button, you enter the detail page of the search results.

### 14.12.1.13.2 Page of search result

Figure 587: Search result

This page consists of the following three areas:

- Parameter options (area 1 in the image above): These options are the same as the parameter options on the search homepage. You can re-select the parameters in the boxes and start a new search.
- Progress (area 2 in the image above): The current search progress is shown on the right side of this page, including the log search status and statistics of each node.
- Search results (area 3 in the image above):
  - Time: The time at which the log is generated. The time zone is the same as the time zone of the front-end user.
  - Level: log level.
  - Component: Shows the component name and its address.
  - Log: The body part of each log record, excluding the log time and log level. Logs that are too long are automatically truncated. Click a row to expand the full content. The full log can show up to 512 characters.

**Note:**

At most 500 search results can be previewed on this page. You can get the complete search results by downloading them.

## Search progress

In the search progress area, a search on a node is called a search task. A search task might have the following statuses:

- **Running:** After starting the search, all tasks enter the **Running** status.
- **Success:** After the task is completed, it automatically enters the **Success** status. At this time, the logs have been cached in the local disk where the Dashboard backend is located, and can be provided to the frontend to download.
- **Failed:** When you cancel the search task, or the task exits with an error, the task enters the **Failed** status. When the task fails, the local temporary files are automatically cleaned.

The search progress area has the following three control buttons:

- **Download Selected:** Click this button to download logs of the selected components (only the completed ones can be selected), and you will get a tar file. Unzip this tar file to get one or more zip files (each component corresponds to a zip file). Unzip the zip file(s) to get the log text file.
- **Cancel:** Click this button to cancel all running tasks. You can click this button only when there are running tasks.
- **Retry:** Click this button to retry all failed tasks. You can click this button only when there are failed tasks and no running tasks.

### 14.12.1.13.3 Search history list

Click the **View search history** link on the log search homepage to enter page of search history list:

## 14.12.1.14 Instance Profiling

### 14.12.1.14.1 TiDB Dashboard Instance Profiling - Manual Profiling

#### Note:

This feature is designed for database experts. For non-expert users, it is recommended to use this feature under the guidance of PingCAP technical supports.

Manual Profiling allows users to collect current performance data **on demand** for each TiDB, TiKV, PD and TiFlash instances with a single click. The collected performance data can be visualized as FlameGraph or DAG.

With these performance data, experts can analyze current resource consumption details like instance's CPU and memory, to help pinpoint sophisticated ongoing performance problems, such as high CPU overhead, high memory usage, and process stalls.

After initiates the profiling, TiDB Dashboard collects current performance data for a period of time (30 seconds by default). Therefore this feature can only be used to analyze ongoing problems that the cluster is facing now and has no significant effect on historical problems. If you want to collect and analyze performance data **at any time**, see [Continuous Profiling](#).

Supported performance data

The following performance data are currently supported:

- CPU: The CPU overhead of each internal function on TiDB, TiKV, PD and TiFlash instances

The CPU overhead of TiKV and TiFlash instances is currently not supported in ARM architecture.

- Heap: The memory consumption of each internal function on TiDB and PD instances
- Mutex: The mutex contention states on TiDB and PD instances
- Goroutine: The running state and call stack of all goroutines on TiDB and PD instances

Access the page

You can access the instance profiling page using either of the following methods:

- After logging into TiDB Dashboard, click **Advanced Debugging** > **Profiling Instances** > **Manual Profiling** on the left navigation bar.

Figure 591: Access instance profiling page

- Visit [http://127.0.0.1:2379/dashboard/#/instance\\_profiling](http://127.0.0.1:2379/dashboard/#/instance_profiling) in your browser. Replace 127.0.0.1:2379 with the actual PD instance address and port.

Start Profiling

In the instance profiling page, choose at least one target instance and click **Start Profiling** to start the instance profiling.

\* Select instances:  \* Select Profiling Type:  \* Duration:

| Instances                       | Profiling Types | Duration (sec)                      |
|---------------------------------|-----------------|-------------------------------------|
| 0 TiKV, 1 TiDB, 0 PD, 0 TiFlash | CPU             | 5 PM (GMT+8) 30                     |
| 0 TiKV, 1 TiDB, 0 PD, 0 TiFlash | CPU             | 5 PM (GMT+8) 10                     |
| 0 TiKV, 1 TiDB, 0 PD, 0 TiFlash | Heap            | 5 PM (GMT+8) 10                     |
| 0 TiKV, 1 TiDB, 0 PD, 0 TiFlash | CPU             | Finished Monday 11:05 PM (GMT+8) 30 |

Filter

- Profiling Type
- CPU
- Heap
- Goroutine
- Mutex

Figure 592: Start instance profiling

You can modify the profiling duration before starting the profiling. This duration is determined by the time needed for the profiling, which is 30 seconds by default. The 30-second duration takes 30 seconds to complete.

Manual Profiling cannot be initiated on clusters that have **Continuous Profiling** enabled. To view the performance data at the current moment, click on the most recent profiling result in the **Continuous Profiling** page.

View profiling status

After a profiling is started, you can view the profiling status and progress in real time.

#### 14.12.1.14.2 TiDB Dashboard Instance Profiling - Continuous Profiling

##### Note:

This feature is designed for database experts. For non-expert users, it is recommended to use this feature under the guidance of PingCAP technical supports.

Continuous Profiling allows collecting performance data **continuously** from each TiDB, TiKV and PD instance. The collected performance data can be visualized as FlameGraph or DAG.

With these performance data, experts can analyze resource consumption details like instance's CPU and memory, to help pinpoint sophisticated performance problems at any time, such as high CPU overhead, high memory usage, process stalls, and so on. Even for problems cannot be reproduced, experts can dig deep into the problem by viewing the historical performance data collected at that moment. In this way, MTTR can be reduced effectively.

Compare with Manual Profiling

Continuous Profiling is an enhanced feature of **Manual Profiling**. They can be both used to collect and analyze different kinds of performance data for each instance. Differences between them are as follows:

- Manual Profiling only collects performance data for a short period of time (for example, 30 seconds) at the moment you initiate the profiling, while Continuous Profiling collects data continuously when it is enabled.
- Manual Profiling can only be used to analyze current occurring problems, while Continuous Profiling can be used to analyze both the current and historical problems.
- Manual Profiling allows to collect specific performance data for specific instances, while Continuous Profiling collects all performance data for all instances.
- Continuous Profiling stores more performance data, therefore it takes up more disk space.

Supported performance data

All performance data in **Manual Profiling** is collected.

- CPU: The CPU overhead of each internal function on TiDB, TiKV, TiFlash, and PD instances
- Heap: The memory consumption of each internal function on TiDB and PD instances
- Mutex: The mutex contention states on TiDB and PD instances
- Goroutine: The running state and call stack of all goroutines on TiDB and PD instances

Access the page

You can access the Continuous Profiling page using either of the following methods:

- After logging into TiDB Dashboard, click **Advanced Debugging > Profiling Instances > Continuous Profiling** on the left navigation bar.

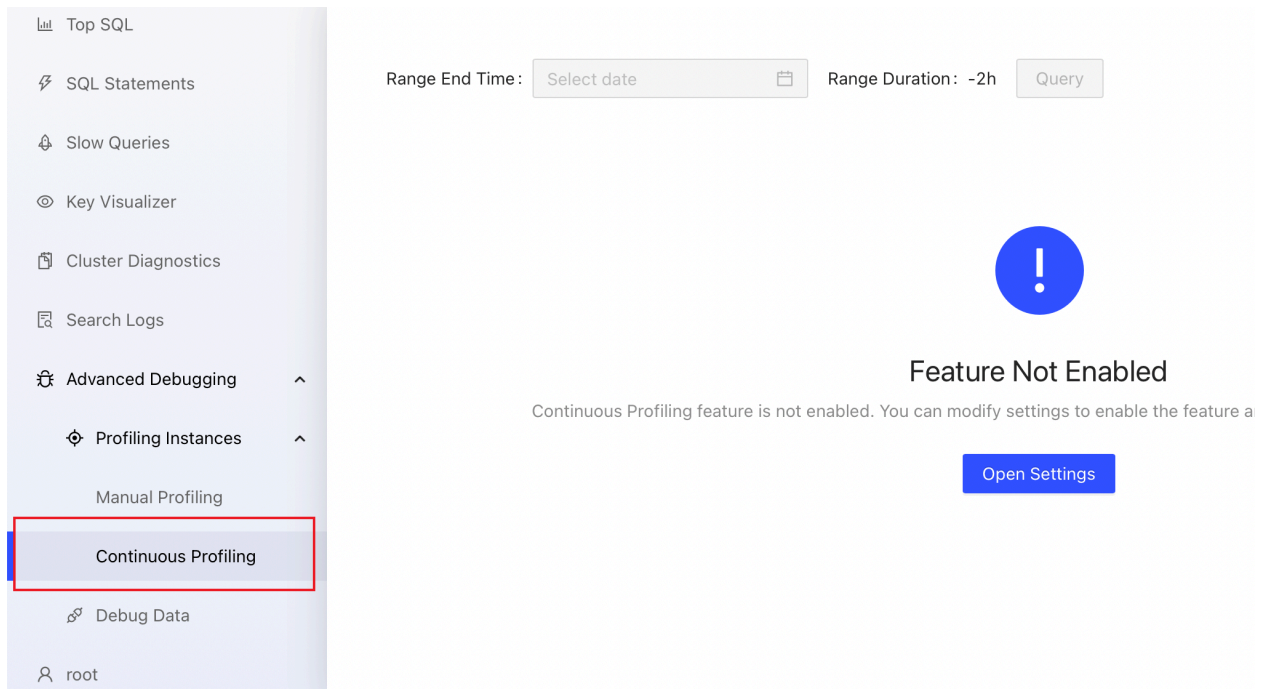

Figure 597: Access page

- Visit [http://127.0.0.1:2379/dashboard/#/continuous\\_profiling](http://127.0.0.1:2379/dashboard/#/continuous_profiling) in your browser. Replace 127.0.0.1:2379 with the actual PD instance address and port.

### Enable Continuous Profiling

#### Note:

To use Continuous Profiling, your cluster should be deployed or upgraded with a recent version of TiUP (v1.9.0 or above) or TiDB Operator (v1.3.0 or above). If your cluster was upgraded using an earlier version of TiUP or TiDB Operator, see [FAQ](#) for instructions.

After enabling Continuous Profiling, you can have performance data continuously collected in the background without keeping the web pages always active. Data collected can be kept for a certain period of time and expired data is automatically cleared.

To enable this feature:

1. Visit the [Continuous Profiling page](#).
2. Click **Open Settings**. In the **Settings** area on the right, switch **Enable Feature** on, and modify the default value of **Retention Duration** if necessary.

3. Click **Save**.

Figure 598: Enable feature

View current performance data

Manual Profiling cannot be initiated on clusters that have Continuous Profiling enabled. To view the performance data at the current moment, just click on the most recent profiling result.

View historical performance data

On the list page, you can see all performance data collected since the enabling of this feature.

Figure 601: View profiling result

### Disable Continuous Profiling

1. Visit the [Continuous Profiling](#) page.
2. Click the gear icon in the upper right corner to open the settings page. Switch **Enable Feature** off.
3. Click **Save**.
4. In the popped-up dialog box, click **Disable**.

The screenshot shows the 'Settings' panel on the right side of the interface. The 'Enable Feature' toggle switch is turned off and highlighted with a red box. Below the toggle, there is a 'Save' button also highlighted with a red box. In the center, a dialog box titled 'Disable Continuous Profiling Feature' is displayed, asking for confirmation to disable the feature. The 'Disable' button in the dialog box is highlighted with a red box.

Figure 602: Disable feature

Frequently asked questions

**1. Continuous Profiling cannot be enabled and the UI displays “required component NgMonitoring is not started”.**

See [TiDB Dashboard FAQ](#).

**2. Will performance be affected after enabling Continuous Profiling?**

According to our benchmark, the average performance impact is less than 1% when the feature is enabled.

**3. What is the status of this feature?**

It is now a generally available (GA) feature and can be used in production environments.

#### 14.12.1.15 Session Management and Configuration

##### 14.12.1.15.1 Share TiDB Dashboard Sessions

You can share the current session of the TiDB Dashboard to other users so that they can access and operate the TiDB Dashboard without entering the user password.

Steps for the inviter

1. Sign into TiDB Dashboard.
2. Click the username in the left sidebar to access the configuration page.
3. Click **Share Current Session**.

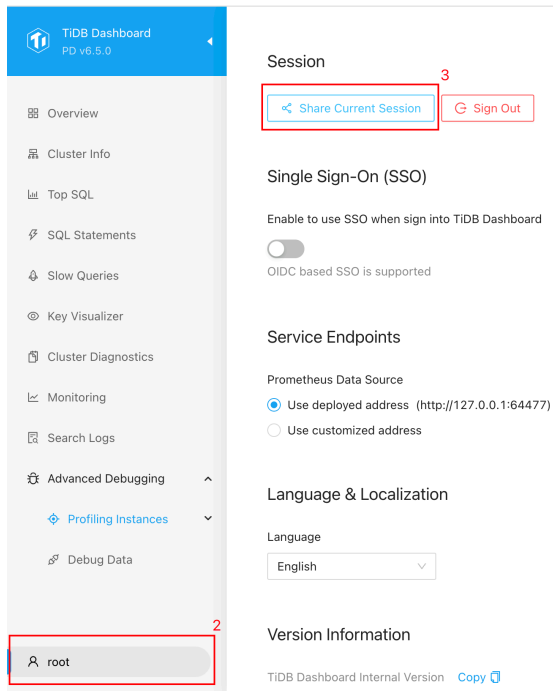

Figure 603: Sample Step

**Note:**

For security reasons, the shared session cannot be shared again.

4. Adjust sharing settings in the popup dialog:

- **Expire in:** How long the shared session will be effective. Signing out of the current session does not affect the effective time of the shared session.
- **Share as read-only privilege:** The shared session only permits read operations but not write operations (such as modifying configurations).

5. Click **Generate Authorization Code**.

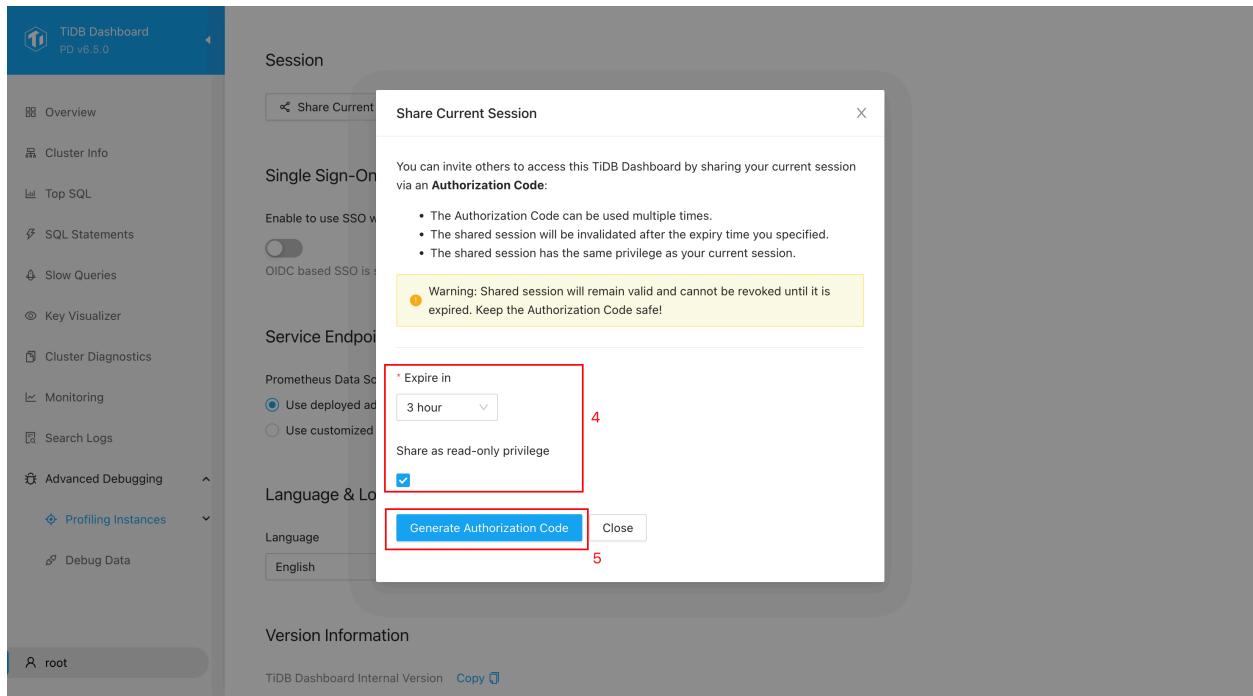

Figure 604: Sample Step

6. Provide the generated **Authorization Code** to the user to whom you want to share the session.

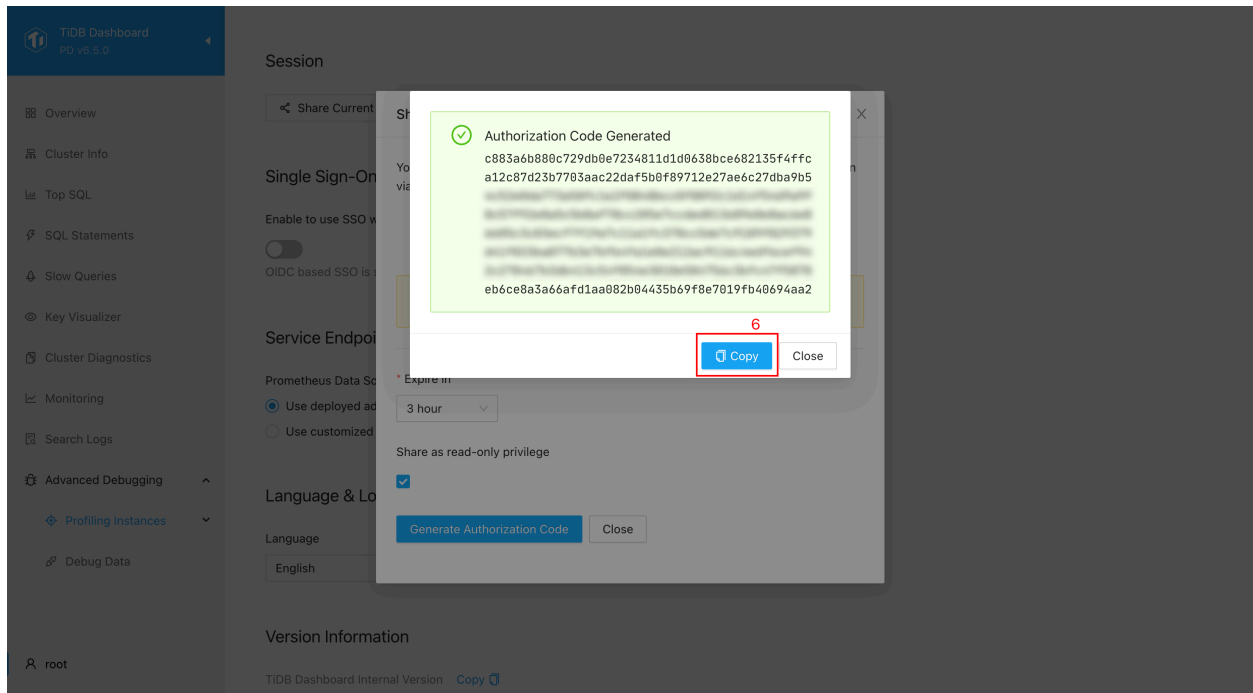

Figure 605: Sample Step

**Warning:**

Keep your authorization code secure and do not send it to anyone who is untrusted. Otherwise, they will be able to access and operate TiDB Dashboard without your authorization.

Steps for the invitee

1. On the sign-in page of TiDB Dashboard, click **Use Alternative Authentication**.

 TiDB Dashboard

### SQL User Sign In

Authorization Code **2**

I was invited by others with an authorization code

Switch Language ▾

Figure 607: Sample Step

3. Enter the authorization code you have received from the inviter.
4. Click **Sign In**.

Figure 608: Sample Step

#### 14.12.1.15.2 Configure SSO for TiDB Dashboard

TiDB Dashboard supports [OIDC](#)-based Single Sign-On (SSO). After enabling the SSO feature of TiDB Dashboard, the configured SSO service is used for your sign-in authentication and then you can access TiDB Dashboard without entering the SQL user password.

Configure OIDC SSO

Enable SSO

1. Sign into TiDB Dashboard.
2. Click the username in the left sidebar to access the configuration page.
3. In the **Single Sign-On** section, select **Enable to use SSO when sign into TiDB Dashboard**.
4. Fill the **OIDC Client ID** and the **OIDC Discovery URL** fields in the form.

Generally, you can obtain the two fields from the SSO service provider:

- OIDC Client ID is also called OIDC Token Issuer.
- OIDC Discovery URL is also called OIDC Token Audience.

5. Click **Authorize Impersonation** and input the SQL password.

TiDB Dashboard will store this SQL password and use it to impersonate a normal SQL sign-in after an SSO sign-in is finished.

Figure 609: Sample Step

### Note:

The password you have entered will be encrypted and stored. The SSO sign-in will fail after the password of the SQL user is changed. In this case, you can re-enter the password to bring SSO back.

6. Click **Authorize and Save**.

Figure 610: Sample Step

7. Click **Update** (Update) to save the configuration.

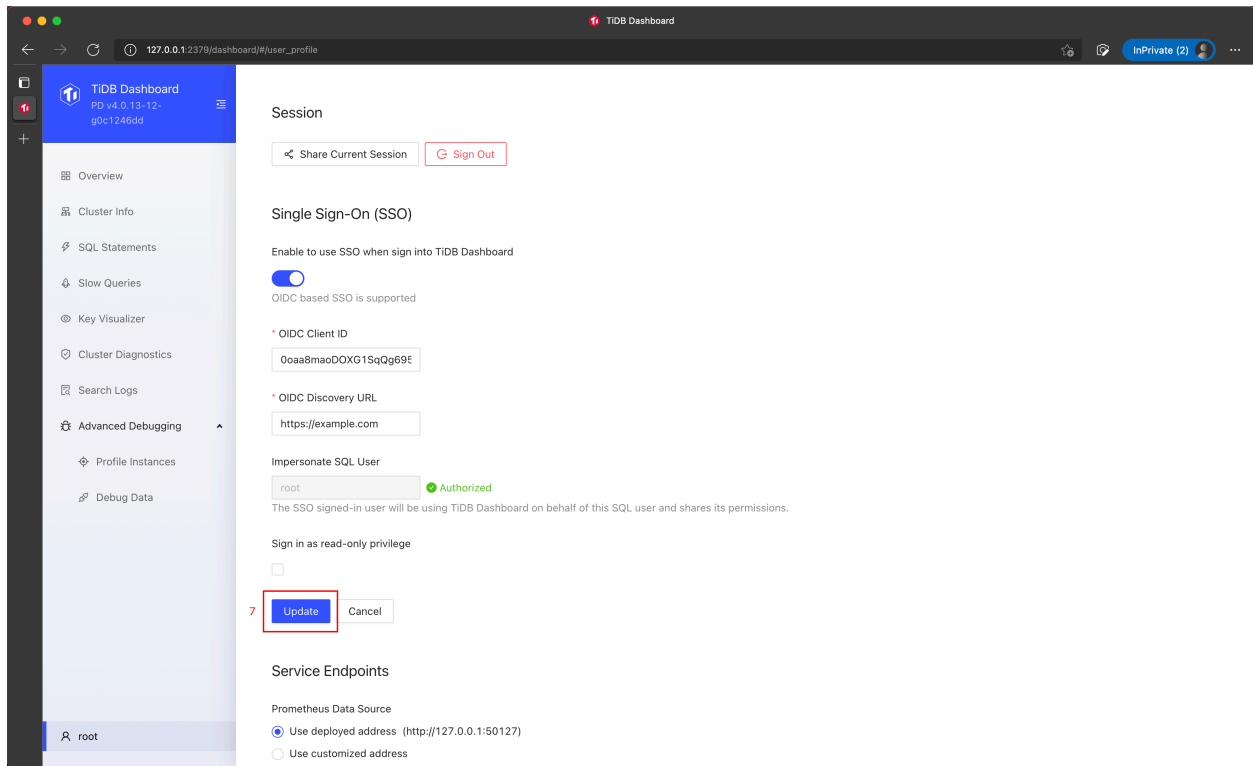

Figure 611: Sample Step

Now SSO sign-in has been enabled for TiDB Dashboard.

### Note:

For security reasons, some SSO services require additional configuration for the SSO service, such as the trusted sign-in and sign-out URIs. Refer to the documentation of the SSO service for further information.

### Disable SSO

You can disable the SSO, which will completely erase the stored SQL password:

1. Sign into TiDB Dashboard.
2. Click the username in the left sidebar to access the configuration page.
3. In the **Single Sign-On** section, deselect **Enable to use SSO when sign into TiDB Dashboard**.
4. Click **Update** (Update) to save the configuration.

Figure 612: Sample Step

Re-enter the password after a password change

The SSO sign-in will fail once the password of the SQL user is changed. In this case, you can bring back the SSO sign-in by re-entering the SQL password:

1. Sign into TiDB Dashboard.
2. Click the username in the left sidebar to access the configuration page.
3. In the **Single Sign-On** section, Click **Authorize Impersonation** and input the updated SQL password.

Figure 613: Sample Step

#### 4. Click **Authorize and Save**.

#### Sign in via SSO

Once SSO is configured for TiDB Dashboard, you can sign in via SSO by taking following steps:

#### 1. In the sign-in page of TiDB Dashboard, click **Sign in via Company Account**.

Figure 614: Sample Step

2. Sign into the system with SSO service configured.
3. You are redirected back to TiDB Dashboard to finish the sign-in.

#### Example 1: Use Okta for TiDB Dashboard SSO sign-in

[Okta](#) is an OIDC SSO identity service, which is compatible with the SSO feature of TiDB Dashboard. The steps below demonstrate how to configure Okta and TiDB Dashboard so that Okta can be used as the TiDB Dashboard SSO provider.

##### Step 1: Configure Okta

First, create an Okta Application Integration to integrate SSO.

1. Access the Okta administration site.
2. Navigate from the left sidebar **Applications** > **Applications**.
3. Click **Create App Integration**.

Figure 615: Sample Step

4. In the popped up dialog, choose **OIDC - OpenID Connect** in **Sign-in method**.
5. Choose **Single-Page Application** in **Application Type**.
6. Click the **Next** button.

Figure 616: Sample Step

7. Fill **Sign-in redirect URIs** as follows:

```
http://DASHBOARD_IP:PORT/dashboard/?sso_callback=1
```

Substitute `DASHBOARD_IP:PORT` with the actual domain (or IP address) and port that you use to access the TiDB Dashboard in the browser.

8. Fill **Sign-out redirect URIs** as follows:

```
http://DASHBOARD_IP:PORT/dashboard/
```

Similarly, substitute `DASHBOARD_IP:PORT` with the actual domain (or IP address) and port.

Figure 617: Sample Step

9. Configure what type of users in your organization is allowed for SSO sign-in in the **Assignments** field, and then click **Save** to save the configuration.

Figure 618: Sample Step

Step 2: Obtain OIDC information and fill in TiDB Dashboard

1. In the Application Integration just created in Okta, click **Sign On**.

Figure 619: Sample Step 1

2. Copy values of the **Issuer** and **Audience** fields from the **OpenID Connect ID Token** section.

Figure 620: Sample Step 2

- Open the TiDB Dashboard configuration page, fill **OIDC Client ID** with **Issuer** obtained from the last step and fill **OIDC Discovery URL** with **Audience**. Then finish the authorization and save the configuration. For example:

Figure 621: Sample Step 3

Now TiDB Dashboard has been configured to use Okta SSO for sign-in.

Example 2: Use Auth0 for TiDB Dashboard SSO sign-in

Similar to Okta, [Auth0](#) also provides OIDC SSO identity service. The following steps describe how to configure Auth0 and TiDB Dashboard so that Auth0 can be used as the TiDB Dashboard SSO provider.

Step 1: Configure Auth0

1. Access the Auth0 administration site.
2. Navigate on the left sidebar **Applications > Applications**.
3. Click **Create App Integration**.

## Create application

Name \*

TiDB Dashboard

You can change the application name later in the application settings.

Choose an application type

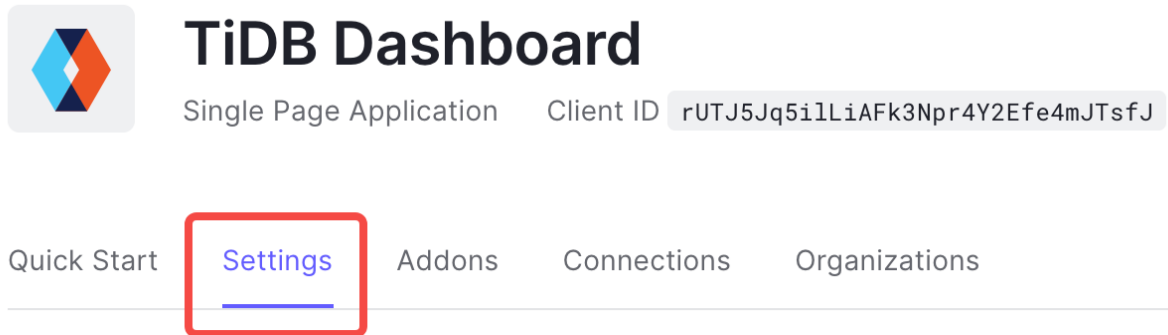

|                                                                                                                                                                                                                      |                                                                                                                                                                                                                   |                                                                                                                                                                                                                       |                                                                                                                                                                                                                       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  <p><b>Native</b></p> <p>Mobile, desktop, CLI and smart device apps running natively.</p> <p>e.g.: iOS, Electron, Apple TV apps</p> |  <p><b>Single Page Web Applications</b></p> <p>A JavaScript front-end app that uses an API.</p> <p>e.g.: Angular, React, Vue</p> |  <p><b>Regular Web Applications</b></p> <p>Traditional web app using redirects.</p> <p>e.g.: Node.js Express, ASP.NET, Java, PHP</p> |  <p><b>Machine to Machine Applications</b></p> <p>CLIs, daemons or services running on your backend.</p> <p>e.g.: Shell script</p> |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

Figure 622: Create Application

In the popped-up dialog, fill **Name**, for example, "TiDB Dashboard".  
↪ Choose **Single Page Web Applications** in **Choose an application type**. Click **Create**.

4. Click **Settings**.

← Back to Applications

The screenshot shows the PingCAP dashboard interface. At the top left, there is a back arrow and the text "Back to Applications". Below this is the application icon for TiDB Dashboard, which is a blue and orange diamond shape. To the right of the icon is the text "TiDB Dashboard" in a large, bold font. Below the title, it says "Single Page Application" and "Client ID" followed by a long alphanumeric string: "rUTJ5Jq5i1LiAFk3Npr4Y2Efe4mJTsfJ". Below the application information, there is a horizontal navigation bar with five tabs: "Quick Start", "Settings", "Addons", "Connections", and "Organizations". The "Settings" tab is highlighted with a red rectangular box and a blue underline.

Figure 623: Settings

5. Fill **Allowed Callback URLs** as follows:

```
http://DASHBOARD_IP:PORT/dashboard/?sso_callback=1
```

Replace `DASHBOARD_IP:PORT` with the actual domain (or IP address) and port that you use to access the TiDB Dashboard in your browser.

6. Fill **Allowed Logout URLs** as follows:

```
http://DASHBOARD_IP:PORT/dashboard/
```

Similarly, replace `DASHBOARD_IP:PORT` with the actual domain (or IP address) and port.

## Allowed Callback URLs

```
http://localhost:3001/dashboard/?sso_callback=1,
http://127.0.0.1:2379/dashboard/?sso_callback
```

After the user authenticates we will only call back to any of these URLs. You can specify multiple valid URLs by comma-separating them (typically to handle different environments like QA or testing). Make sure to specify the protocol ( `https://` ) otherwise the callback may fail in some cases. With the exception of custom URI schemes for native clients, all callbacks should use protocol `https://` . You can use [Organization URL](#) parameters in these URLs.

## Allowed Logout URLs

```
http://localhost:3001/dashboard/
http://127.0.0.1:2379/dashboard/
```

A set of URLs that are valid to redirect to after logout from Auth0. After a user logs out from Auth0 you can redirect them with the `returnTo` query parameter. The URL that you use in `returnTo` must be listed here. You can specify multiple valid URLs by comma-separating them. You can use the star symbol as a wildcard for subdomains ( `*.google.com` ). Query strings and hash information are not taken into account when validating these URLs. Read more about this at <https://auth0.com/docs/login/logout>

Figure 624: Settings

7. Keep the default values for other settings and click **Save Changes**.

Step 2: Obtain OIDC information and fill in TiDB Dashboard

1. Fill **OIDC Client ID** of TiDB Dashboard with **Client ID** in **Basic Information** under the **Settings** tab of Auth0.
2. Fill **OIDC Discovery URL** with the **Domain** field value prefixed with `https://` ↪ and suffixed with `/`, for example, `https://example.us.auth0.com/`. Complete authorization and save the configuration.

Figure 625: Settings

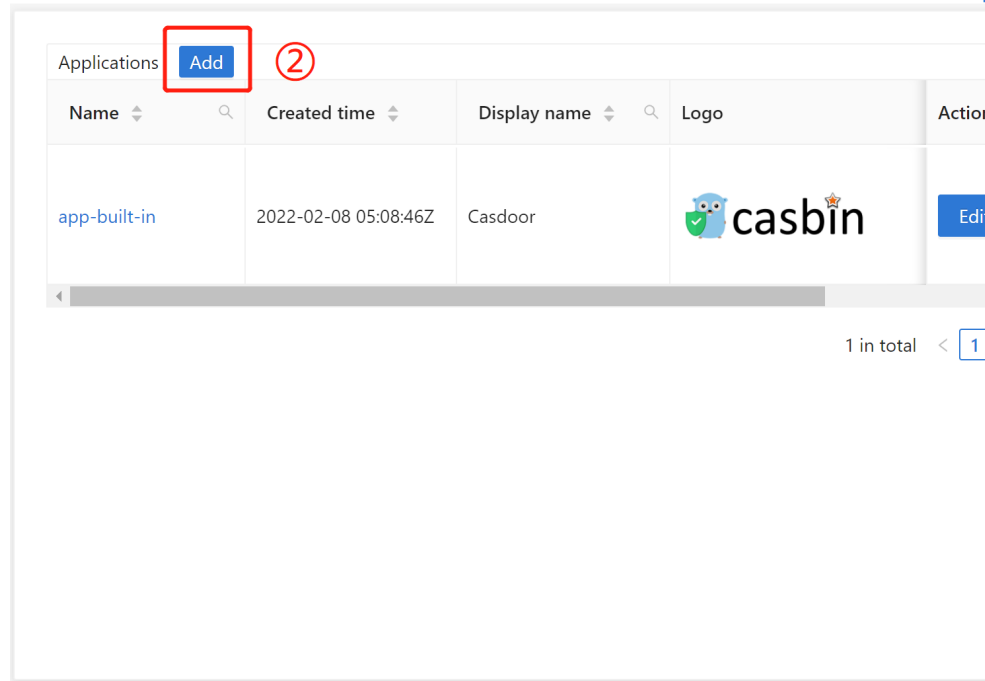

Now TiDB Dashboard has been configured to use Auth0 SSO for sign-in.

### Example 3: Use Casdoor for TiDB Dashboard SSO sign-in

[Casdoor](#) is an open-source SSO platform that can be deployed in your own hosts. It is compatible with the SSO feature of TiDB Dashboard. The following steps describe how to configure Casdoor and TiDB Dashboard so that Casdoor can be used as the TiDB Dashboard SSO provider.

#### Step 1: Configure Casdoor

1. Deploy and access the Casdoor administration site.
2. Navigate from the top sidebar **Applications**.

Made with ❤️ by Casdoor

3. Click **Applications - Add**.
4. Fill **Name** and **Display name**, for example, **TiDB Dashboard**.
5. Add **Redirect URLs** as follows:

```
http://DASHBOARD_IP:PORT/dashboard/?sso_callback=1
```

Replace `DASHBOARD_IP:PORT` with the actual domain (or IP address) and port that you use to access the TiDB Dashboard in your browser.

Redirect URLs [?](#):

| Redirect URL                                                                                                  |
|---------------------------------------------------------------------------------------------------------------|
| <a href="http://127.0.0.1:2379/dashboard/?sso_callback=1">http://127.0.0.1:2379/dashboard/?sso_callback=1</a> |

Figure 626: Settings

6. Keep the default values for other settings and click **Save & Exit**.
7. Save the **Client ID** seen on the page.

Step 2: Obtain OIDC information and fill in TiDB Dashboard

1. Fill **OIDC Client ID** of TiDB dashboard with **Client ID** saved in the previous step.
2. Fill **OIDC Discovery URL** with the **Domain** field value prefixed with **https://** and suffixed with **/**, for example, **https://casdoor.example.com/**. Complete authorization and save the configuration.

Figure 627: Settings

Now TiDB Dashboard has been configured to use Casdoor SSO for sign-in.

### 14.12.1.16 TiDB Dashboard FAQs

This document summarizes the frequently asked questions (FAQs) and answers about TiDB Dashboard. If a problem cannot be located or persists after you perform as instructed, [get support](#) from PingCAP or the community.

#### 14.12.1.16.1 Access-related FAQ

When the firewall or reverse proxy is configured, I am redirected to an internal address other than TiDB Dashboard

When multiple Placement Driver (PD) instances are deployed in a cluster, only one of the PD instances actually runs the TiDB Dashboard service. If you access other PD instances instead of this one, your browser redirects you to another address. If the firewall

or reverse proxy is not properly configured for accessing TiDB Dashboard, when you visit the Dashboard, you might be redirected to an internal address that is protected by the firewall or reverse proxy.

- See [TiDB Dashboard Multi-PD Instance Deployment](#) to learn the working principle of TiDB Dashboard with multiple PD instances.
- See [Use TiDB Dashboard through a Reverse Proxy](#) to learn how to correctly configure a reverse proxy.
- See [Secure TiDB Dashboard](#) to learn how to correctly configure the firewall.

When TiDB Dashboard is deployed with dual network interface cards (NICs), TiDB Dashboard cannot be accessed using another NIC

For security reasons, TiDB Dashboard on PD only monitors the IP addresses specified during deployment (that is, it only listens on one NIC), not on 0.0.0.0. Therefore, when multiple NICs are installed on the host, you cannot access TiDB Dashboard using another NIC.

If you have deployed TiDB using the `tiup cluster` or `tiup playground` command, currently this problem cannot be solved. It is recommended that you use a reverse proxy to safely expose TiDB Dashboard to another NIC. For details, see [Use TiDB Dashboard behind a Reverse Proxy](#).

#### 14.12.1.16.2 UI-related FAQ

A `prometheus_not_found` error is shown in **QPS** and **Latency** sections on the Overview page

The **QPS** and **Latency** sections on the **Overview** page require a cluster with Prometheus deployed. Otherwise, the error is shown. You can solve this problem by deploying a Prometheus instance in the cluster.

If you still encounter this problem when the Prometheus instance has been deployed, the possible reason is that your deployment tool is out of date (TiUP or TiDB Operator), and your tool does not automatically report metrics addresses, which makes TiDB Dashboard unable to query metrics. You can upgrade your deployment tool to the latest version and try again.

If your deployment tool is TiUP, take the following steps to solve this problem. For other deployment tools, refer to the corresponding documents of those tools.

1. Upgrade TiUP and TiUP Cluster:

```
tiup update --self
tiup update cluster --force
```

2. After the upgrade, when a new cluster is deployed with Prometheus instances, the metrics can be displayed normally.

3. After the upgrade, for an existing cluster, you can restart this cluster to report the metrics addresses. Replace `CLUSTER_NAME` with the actual cluster name:

```
tiup cluster start CLUSTER_NAME
```

Even if the cluster has been started, still execute this command. This command does not affect the normal application in the cluster, but refreshes and reports the metrics addresses, so that the monitoring metrics can be displayed normally in TiDB Dashboard.

An `invalid connection` error is shown on the **Slow Queries** page

The possible reason is that you have enabled the Prepared Plan Cache feature of TiDB. As an experimental feature, when enabled, Prepared Plan Cache might not function properly in specific TiDB versions, which could cause this problem in TiDB Dashboard (and other applications). You can disable Prepared Plan Cache by setting the system variable `tidb_enable_prepared_plan_cache = OFF`.

A `required component NgMonitoring is not started` error is shown

NgMonitoring is an advanced monitoring component built in TiDB clusters of v5.4.0 and later versions to support TiDB Dashboard features such as **Continuous Profiling** and **Top SQL**. NgMonitoring is automatically deployed when you deploy or upgrade a cluster with a newer version of TiUP. For clusters deployed using TiDB Operator, you can deploy NgMonitoring manually by referring to [Enable Continuous Profiling](#).

If the web page shows `required component NgMonitoring is not started`, you can troubleshoot the deployment issue as follows:

Clusters Deployed using TiUP

Step 1. Check versions

1. Check the TiUP cluster version. NgMonitoring is deployed only when TiUP is v1.9.0 or later.

```
tiup cluster --version
```

The command output shows the TiUP version. For example:

```
tiup version 1.9.0 tiup
Go Version: go1.17.2
Git Ref: v1.9.0
```

2. If the TiUP cluster version is earlier than v1.9.0, upgrade TiUP and TiUP cluster to the latest version:

```
tiup update --all
```

Step 2. Add the `ng_port` configuration item on the control machine by using TiUP. Then reload Prometheus.

1. Open the cluster configuration file in editing mode:

```
tiup cluster edit-config ${cluster-name}
```

2. Under `monitoring_servers`, add the `ng_port:12020` parameter:

```
monitoring_servers:
- host: 172.16.6.6
 ng_port: 12020
```

3. Reload Prometheus:

```
tiup cluster reload ${cluster-name} --role prometheus
```

If the error message is still prompted after performing steps above, [get support](#) from PingCAP or the community.

Clusters Deployed using TiDB Operator

Deploy the NgMonitoring component by following instructions in the [Enable Continuous Profiling](#) section in TiDB Operator documentation.

Clusters Started using TiUP Playground

When starting the cluster, TiUP Playground ( $\geq$  v1.8.0) automatically starts the NgMonitoring component. To update TiUP Playground to the latest version, run the following command:

```
tiup update --self
tiup update playground
```

An `unknown field` error is shown on the **Slow Queries** page

If the `unknown field` error appears on the **Slow Queries** page after the cluster upgrade, the error is related to a compatibility issue caused by the difference between TiDB Dashboard server fields (which might be updated) and user preferences fields (which are in the browser cache). This issue has been fixed. If your cluster is earlier than v5.0.3 or v4.0.14, perform the following steps to clear your browser cache:

1. Open TiDB Dashboard page.
2. Open Developer Tools. Different browsers have different ways of opening Developer Tools. After clicking the **Menu Bar**:
  - Firefox: **Menu** > **Web Developer** > **Toggle Tools**, or **Tools** > **Web Developer** > **Toggle Tools**.
  - Chrome: **More tools** > **Developer tools**.

- Safari: **Develop** > **Show Web Inspector**. If you can't see the **Develop** menu, go to **Safari** > **Preferences** > **Advanced**, and check the **Show Develop** menu in menu bar checkbox.

In the following example, Chrome is used.

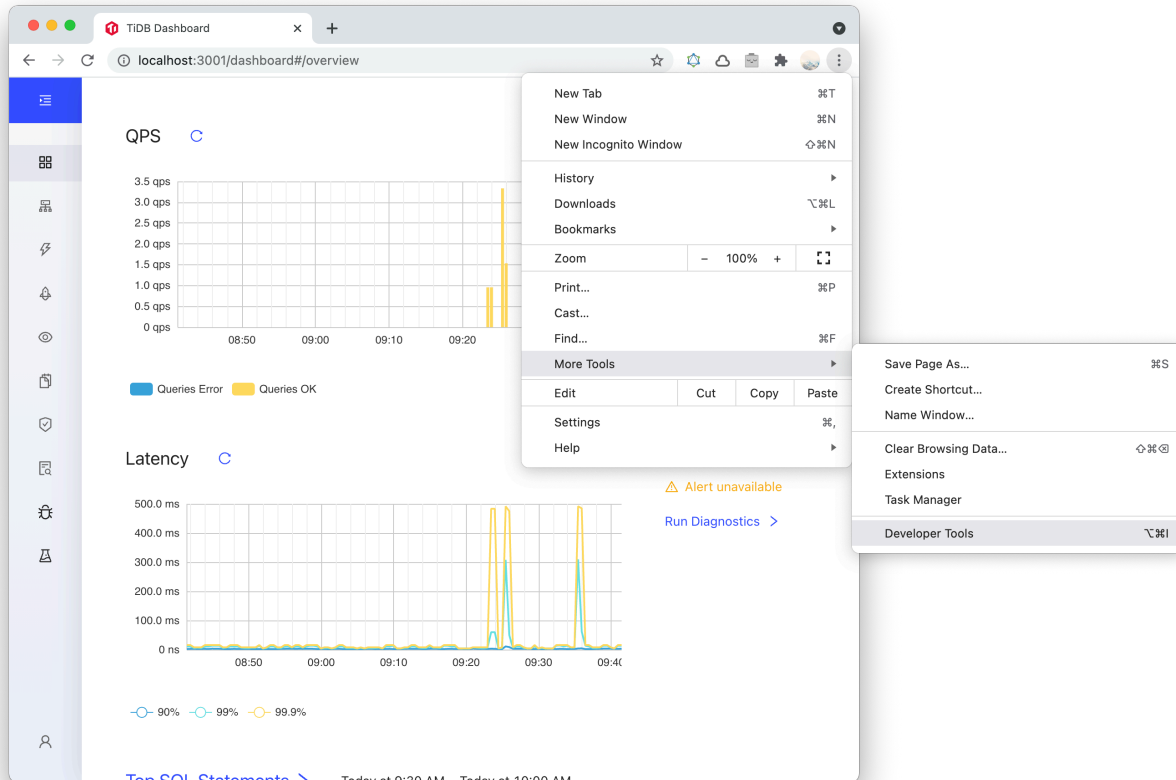

Figure 628: Opening DevTools from Chrome's main menu

3. Select the **Application** panel, expand the **Local Storage** menu and select the **TiDB Dashboard** page domain. Click the **Clear All** button.

Figure 629: Clear the Local Storage

## 14.13 Telemetry

When the telemetry is enabled, TiDB, TiUP and TiDB Dashboard collect usage information and share the information with PingCAP to help understand how to improve the product. For example, this usage information helps prioritize new features.

### Note:

- Starting from February 20, 2023, the telemetry feature is disabled by default in new versions of TiDB and TiDB Dashboard, including v6.6.0, and usage information is not collected and shared with PingCAP. Before upgrading to these versions, if the cluster uses the default telemetry configuration, the telemetry feature is disabled after the upgrade. See [TiDB Release Timeline](#) for the specific version.
- Starting from v1.11.3, the telemetry feature is disabled by default in newly deployed TiUP, and usage information is not collected. If you upgrade from a TiUP version earlier than v1.11.3 to v1.11.3 or a later

version, the telemetry feature keeps the same status as before the upgrade.

### 14.13.1 What is shared?

The following sections describe the shared usage information in detail for each component. The usage details that get shared might change over time. These changes (if any) will be announced in [release notes](#).

#### Note:

In **ALL** cases, user data stored in the TiDB cluster will **NOT** be shared. You can also refer to [PingCAP Privacy Policy](#).

#### 14.13.1.1 TiDB

When the telemetry collection feature is enabled in TiDB, the TiDB cluster collects usage details on a 6-hour basis. These usage details include but are not limited to:

- A randomly generated telemetry ID.
- Deployment characteristics, such as the size of hardware (CPU, memory, disk), TiDB components versions, OS name.
- The status of query requests in the system, such as the number of query requests and the duration.
- Component usage, for example, whether the Async Commit feature is in use or not.
- Pseudonymized IP address of the TiDB telemetry data sender.

To view the full content of the usage information shared to PingCAP, execute the following SQL statement:

```
ADMIN SHOW TELEMETRY;
```

#### 14.13.1.2 TiDB Dashboard

When the telemetry collection feature is enabled for TiDB Dashboard, usage details of the TiDB Dashboard web UI will be shared, including (but not limited to):

- A randomly generated telemetry ID.

- User operation information, such as the name of the TiDB Dashboard web page accessed by the user.
- Browser and OS information, such as browser name, OS name, and screen resolution.

To view the full content of the usage information shared to PingCAP, use the [Network Activity Inspector of Chrome DevTools](#) or the [Network Monitor of Firefox Developer Tools](#).

### 14.13.1.3 TiUP

When the telemetry collection feature is enabled in TiUP, usage details of TiUP will be shared, including (but not limited to):

- A randomly generated telemetry ID.
- Execution status of TiUP commands, such as whether the execution is successful and the execution duration.
- Deployment characteristics, such as the size of hardware, TiDB components versions, and deployment configuration names that have been modified.

To view the full content of the usage information shared to PingCAP, set the `TIUP_CLUSTER_DEBUG=enable` environment variable when executing the TiUP command. For example:

```
TIUP_CLUSTER_DEBUG=enable tiup cluster list
```

### 14.13.1.4 TiSpark

#### Note:

Starting from v3.3, the telemetry collection is disabled by default in TiSpark, and usage information is not collected and shared with PingCAP.

When the telemetry collection feature is enabled for TiSpark, the Spark module will share the usage details of TiSpark, including (but not limited to):

- A randomly generated telemetry ID.
- Some configuration information of TiSpark, such as the read engine and whether streaming read is enabled.
- Cluster deployment information, such as the machine hardware information, OS information, and component version number of the node where TiSpark is located.

You can view TiSpark usage information that is collected in Spark logs. You can set the Spark log level to INFO or lower, for example:

```
cat {spark.log} | grep Telemetry report | tail -n 1
```

## 14.13.2 Disable telemetry

### 14.13.2.1 Disable TiDB telemetry at deployment

When the telemetry is enabled in existing TiDB clusters, you can configure `enable-telemetry = false` on each TiDB instance to disable the TiDB telemetry collection on that instance, which does not take effect until you restart the cluster.

Detailed steps to disable telemetry in different deployment tools are listed below.

Binary deployment

Create a configuration file `tidb_config.toml` with the following content:

```
enable-telemetry = false
```

Specify the `--config=tidb_config.toml` command-line parameter when starting TiDB for the configuration file above to take effect.

See [TiDB Configuration Options](#) and [TiDB Configuration File](#) for details.

Deployment using TiUP Playground

Create a configuration file `tidb_config.toml` with the following content:

```
enable-telemetry = false
```

When starting TiUP Playground, specify the `--db.config tidb_config.toml` command-line parameter for the configuration file above to take effect. For example:

```
tiup playground --db.config tidb_config.toml
```

See [Quickly Deploy a Local TiDB Cluster](#) for details.

Deployment using TiUP Cluster

Modify the deployment topology file `topology.yaml` to add the following content:

```
server_configs:
 tidb:
 enable-telemetry: false
```

Deployment on Kubernetes via TiDB Operator

Configure `spec.tidb.config.enable-telemetry: false` in `tidb-cluster.yaml` or `TidbCluster` Custom Resource.

See [Deploy TiDB Operator on Kubernetes](#) for details.

#### Note:

This configuration item requires TiDB Operator v1.1.3 or later to take effect.

### 14.13.2.2 Disable TiDB telemetry for deployed TiDB clusters

In existing TiDB clusters, you can also modify the system variable `tidb_enable_telemetry` ↔ to dynamically disable the TiDB telemetry collection:

```
SET GLOBAL tidb_enable_telemetry = 0;
```

#### Note:

When you disable telemetry, the configuration file has a higher priority over system variable. That is, after telemetry collection is disabled by the configuration file, the value of the system variable will be ignored.

### 14.13.2.3 Disable TiDB Dashboard telemetry

Configure `dashboard.enable-telemetry = false` to disable the TiDB Dashboard telemetry collection on all PD instances. You need to restart the running clusters for the configuration to take effect.

Detailed steps to disable telemetry for different deployment tools are listed below.

Binary deployment

Create a configuration file `pd_config.toml` with the following content:

```
[dashboard]
enable-telemetry = false
```

Specify the `--config=pd_config.toml` command-line parameter when starting PD to take effect.

See [PD Configuration Flags](#) and [PD Configuration File](#) for details.

Deployment using TiUP Playground

Create a configuration file `pd_config.toml` with the following content:

```
[dashboard]
enable-telemetry = false
```

When starting TiUP Playground, specify the `--pd.config pd_config.toml` command-line parameter to take effect, for example:

```
tiup playground --pd.config pd_config.toml
```

See [Quickly Deploy a Local TiDB Cluster](#) for details.

Deployment using TiUP Cluster

Modify the deployment topology file `topology.yaml` to add the following content:

```
server_configs:
 pd:
 dashboard.enable-telemetry: false
```

Deployment on Kubernetes via TiDB Operator

Configure `spec.pd.config.dashboard.enable-telemetry: false` in `tidb-cluster`.  
↪ `yaml` or `TidbCluster Custom Resource`.

See [Deploy TiDB Operator on Kubernetes](#) for details.

**Note:**

This configuration item requires TiDB Operator v1.1.3 or later to take effect.

#### 14.13.2.4 Disable TiUP telemetry

To disable the TiUP telemetry collection, execute the following command:

```
tiup telemetry disable
```

#### 14.13.3 Check telemetry status

For TiDB telemetry, execute the following SQL statement to check the telemetry status:

```
ADMIN SHOW TELEMETRY;
```

If the `DATA_PREVIEW` column in the execution result is empty, TiDB telemetry is disabled. If not, TiDB telemetry is enabled. You can also check when the usage information was shared previously according to the `LAST_STATUS` column and whether the sharing was successful or not.

For TiUP telemetry, execute the following command to check the telemetry status:

```
tiup telemetry status
```

#### 14.13.4 Compliance

To meet compliance requirements in different countries or regions, the usage information is sent to servers located in different countries according to the IP address of the sender machine:

- For IP addresses from the Chinese mainland, usage information is sent to and stored on cloud servers in the Chinese mainland.

- For IP addresses from outside of the Chinese mainland, usage information is sent to and stored on cloud servers in the US.

See [PingCAP Privacy Policy](#) for details.

## 14.14 Error Codes and Troubleshooting

This document describes the problems encountered during the use of TiDB and provides the solutions.

### 14.14.1 Error codes

TiDB is compatible with the error codes in MySQL, and in most cases returns the same error code as MySQL. For a list of error codes for MySQL, see [MySQL 5.7 Error Message Reference](#). In addition, TiDB has the following unique error codes:

#### Note:

Some error codes stand for internal errors. Normally, TiDB handles the error rather than return it to the user, so some error codes are not listed here.

If you encounter an error code that is not listed here, [get support](#) from PingCAP or the community.

- Error Number: 8001

The memory used by the request exceeds the threshold limit for the TiDB memory usage.

Increase the memory limit for a single SQL statement by configuring the system variable `tidb_mem_quota_query`.

- Error Number: 8002

To guarantee consistency, a transaction with the `SELECT FOR UPDATE` statement cannot be retried when it encounters a commit conflict. TiDB rolls back the transaction and returns this error.

The application can safely retry the whole transaction.

- Error Number: 8003

If the data in a row is not consistent with the index when executing the `ADMIN CHECK ↔ TABLE` command, TiDB returns this error. This error is commonly seen when you check the data corruption in the table.

You can [get support](#) from PingCAP or the community.

- Error Number: 8004  
A single transaction is too large.  
See [the error message transaction too large](#) for the cause and solution.
- Error Number: 8005  
The complete error message: `ERROR 8005 (HY000): Write Conflict, txnStartTS ↪ is stale`  
Transactions in TiDB encounter write conflicts. Check your application logic and retry the write operation.
- Error Number: 8018  
When you reload a plugin, if the plugin has not been loaded before, this error is returned.  
You can execute an initial load of the plugin.
- Error Number: 8019  
The version of the plugin that is being reloaded is different from the previous version. Therefore, the plugin cannot be reloaded, and this error is returned.  
You can reload the plugin by ensuring that the plugin version is the same as the previous one.
- Error Number: 8020  
When the table is locked, if you perform a write operation on the table, this error is returned.  
Unlock the table and retry the write operation.
- Error Number: 8021  
When the key to be read from TiKV does not exist, this error is returned. This error is used internally, and the external result is an empty read.
- Error Number: 8022  
The transaction commit fails and has been rolled back.  
The application can safely retry the whole transaction.
- Error Number: 8023  
If you set an empty value when writing the transaction cache, this error is returned. This error is used and dealt with internally, and is not returned to the application.
- Error Number: 8024  
Invalid transactions. If TiDB finds that no transaction ID (Start Timestamp) is obtained for the transaction that is being executed, which means this transaction is invalid, this error is returned.

Usually this error does not occur. If you encounter this error, [get support](#) from PingCAP or the community.

- Error Number: 8025

The single Key-Value pair being written is too large. The largest single Key-Value pair supported in TiDB is 6 MB by default.

If a pair exceeds this limit, you need to properly adjust the `txn-entry-size-limit` configuration value to relax the limit.

- Error Number: 8026

The interface function being used has not been implemented. This error is only used internally, and is not returned to the application.

- Error Number: 8027

The table schema version is outdated. TiDB applies schema changes online. When the table schema version of the TiDB server is earlier than that of the entire system, this error is returned if you execute a SQL statement.

When this error occurs, check the network between the TiDB server and the PD Leader.

- Error Number: 8028

Since v6.3.0, TiDB introduces the `Metadata lock` feature. When the metadata lock is disabled and a transaction is executed, the transaction cannot recognize the table schema changes. Therefore, when the transaction is committed, TiDB checks the table schema related to the transaction. If the related table schema has been changed during the execution, the transaction commit fails with this error. At this time, the application can safely retry the whole transaction.

When the metadata lock is enabled not in the Read Committed isolation level, if a lossy column type change occurs on a table (for example, changing from `INT` to `CHAR` is lossy, and changing from `TINYINT` to `INT` is not lossy because overwriting data is not required) from a transaction start to access the table for the first time, then the query fails while the transaction will not roll back automatically. You can continue to execute other statements and decide whether to roll back or commit the transaction.

- Error Number: 8029

This error occurs when numeric conversion within the database encounters an error. This error is only used internally and is converted to a specific type of error for external applications.

- Error Number: 8030

After an unsigned positive integer is converted to a signed integer, it exceeds the maximum value and displays as a negative integer. This error mostly occurs in the alert message.

- Error Number: 8031  
When being converted to an unsigned integer, a negative integer is converted to a positive integer. This error mostly occurs in the alert message.
- Error Number: 8032  
Invalid `year` format is used. `year` only accepts 1, 2 or 4 digits.
- Error Number: 8033  
Invalid `year` value is used. The valid range of `year` is (1901, 2155).
- Error Number: 8037  
Invalid `mode` format is used in the `week` function. `mode` must be 1 digit within [0, 7].
- Error Number: 8038  
The field fails to obtain the default value. This error is usually used internally, and is converted to a specific type of error for external applications.
- Error Number: 8040  
Unsupported operations are performed. For example, you perform a table locking operation on a view or a sequence.
- Error Number: 8047  
The value of the system variable is not supported. This error usually occurs in the alarm information when the user sets a variable value that is not supported in the database.
- Error Number: 8048  
An unsupported database isolation level is set.  
If you cannot modify the codes because you are using a third-party tool or framework, consider using `tidb_skip_isolation_level_check` to bypass this check.  

```
set @@tidb_skip_isolation_level_check = 1;
```
- Error Number: 8050  
An unsupported privilege type is set.  
See [Privileges required for TiDB operations](#) for the solution.
- Error Number: 8051  
Unknown data type is encountered when TiDB parses the Exec argument list sent by the client.  
If you encounter this error, check the client. If the client is normal, [get support](#) from PingCAP or the community.

- Error Number: 8052  
The serial number of the data packet from the client is incorrect.  
If you encounter this error, check the client. If the client is normal, [get support](#) from PingCAP or the community.
- Error Number: 8055  
The current snapshot is too old. The data may have been garbage collected. You can increase the value of `tidb_gc_life_time` to avoid this problem. TiDB automatically reserves data for long-running transactions. Usually this error does not occur.  
See [garbage collection overview](#) and [garbage collection configuration](#).
- Error Number: 8059  
The auto-random ID is exhausted and cannot be allocated. There is no way to recover from such errors currently. It is recommended to use bigint when using the auto random feature to obtain the maximum number of assignment. And try to avoid manually assigning values to the auto random column.  
See [auto random](#) for reference.
- Error Number: 8060  
Invalid auto-incrementing offset. Check the values of `auto_increment_increment` and `auto_increment_offset`.
- Error Number: 8061  
Unsupported SQL Hint.  
See [Optimizer Hints](#) to check and modify the SQL Hint.
- Error Number: 8062  
An invalid token is used in SQL Hint. It conflicts with reserved words in SQL Hint.  
See [Optimizer Hints](#) to check and modify the SQL Hint.
- Error Number: 8063  
The limited memory usage set in SQL Hint exceeds the upper limit of the system. The setting in SQL Hint is ignored.  
See [Optimizer Hints](#) to check and modify the SQL Hint.
- Error Number: 8064  
It fails to parse SQL Hint.  
See [Optimizer Hints](#) to check and modify the SQL Hint.
- Error Number: 8065  
An invalid integer is used in SQL Hint.  
See [Optimizer Hints](#) to check and modify the SQL Hint.

- Error Number: 8066  
The second parameter in the `JSON_OBJECTAGG` function is invalid.
- Error Number: 8101  
The format of plugin ID is incorrect.  
The correct format is `[name]-[version]`, and no `-` is allowed in `name` and `version`.
- Error Number: 8102  
Unable to read the plugin definition information.  
Check the configuration related to the plugin.
- Error Number: 8103  
The plugin name is incorrect.  
Check the configuration of the plugin.
- Error Number: 8104  
The plugin version does not match.  
Check the configuration of the plugin.
- Error Number: 8105  
The plugin is repeatedly loaded.
- Error Number: 8106  
The plugin defines a system variable whose name does not begin with the plugin name.  
Contact the developer of the plugin to modify, or [get support](#) from PingCAP or the community.
- Error Number: 8107  
The loaded plugin does not specify a version, or the specified version is too low.  
Check the configuration of the plugin.
- Error Number: 8108  
Unsupported execution plan type. This error is an internal error.  
If you encounter this error, [get support](#) from PingCAP or the community.
- Error Number: 8109  
The specified index cannot be found when the index is analyzed.
- Error Number: 8110  
The Cartesian product operation cannot be executed.  
Set `cross-join` in the configuration to `true`.

- Error Number: 8111  
When executing the `EXECUTE` statement, the corresponding `Prepare` statement cannot be found.
- Error Number: 8112  
The number of parameters in the `EXECUTE` statement is not consistent with the `Prepare` statement.
- Error Number: 8113  
The table schema related in the `EXECUTE` statement has changed after the `Prepare` statement is executed.
- Error Number: 8115  
It is not supported to prepare multiple lines of statements.
- Error Number: 8116  
It is not supported to prepare DDL statements.
- Error Number: 8120  
The `start tso` of transactions cannot be obtained.  
Check the state/monitor/log of the PD server and the network between the TiDB server and the PD server.
- Error Number: 8121  
Privilege check fails.  
Check the privilege configuration of the database.
- Error Number: 8122  
No corresponding table name is found, given the specified wild cards.
- Error Number: 8123  
An SQL query with aggregate functions returns non-aggregated columns, which violates the `only_full_group_by` mode.  
Modify the SQL statement or disable the `only_full_group_by` mode.
- Error Number: 8129  
TiDB does not yet support JSON objects with the key length  $\geq 65536$ .
- Error Number: 8130  
The complete error message: `ERROR 8130 (HY000): client has multi-statement ↪ capability disabled`

This error might occur after you upgrade from an earlier version of TiDB. To reduce the impact of SQL injection attacks, TiDB now prevents multiple queries from being executed in the same `COM_QUERY` call by default.

The system variable `tidb_multi_statement_mode` can be used to control this behavior.

- Error Number: 8138

The transaction attempts to write an incorrect row value. For more information, see [Troubleshoot Inconsistency Between Data and Indexes](#).

- Error Number: 8139

The transaction attempts to write a row whose handle is inconsistent with that in the index. For more information, see [Troubleshoot Inconsistency Between Data and Indexes](#).

- Error Number: 8140

The transaction attempts to write a row whose data is inconsistent with the index data. For more information, see [Troubleshoot Inconsistency Between Data and Indexes](#).

- Error Number: 8141

When a transaction is being committed, the existence assertion of a key fails. For more information, see [Troubleshoot Inconsistency Between Data and Indexes](#).

- Error Number: 8143

During the execution of a non-transactional DML statement, if a batch fails, the statement is stopped. For more information, see [Non-transactional DML statements](#).

- Error Number: 8147

When `tidb_constraint_check_in_place_pessimistic` is set to `OFF`, to ensure the correctness of transactions, any errors in the SQL statement execution might cause TiDB to return this 8147 error and abort the current transaction. For specific causes of the error, refer to the error message. For more information, see [Constraints](#).

- Error Number: 8200

The DDL syntax is not yet supported.

See [compatibility of MySQL DDL](#) for reference.

- Error Number: 8214

The DDL operation is terminated by the `admin cancel` operation.

- Error Number: 8215

`ADMIN REPAIR TABLE` fails.

If you encounter this error, [get support](#) from PingCAP or the community.

- Error Number: 8216  
The usage of automatic random columns is incorrect.  
See [auto random](#) to modify.
- Error Number: 8223  
This error occurs when detecting that the data is not consistent with the index.  
If you encounter this error, [get support](#) from PingCAP or the community.
- Error Number: 8224  
The DDL job cannot be found.  
Check whether the job id specified by the `restore` operation exists.
- Error Number: 8225  
The DDL operation is completed and cannot be canceled.
- Error Number: 8226  
The DDL operation is almost completed and cannot be canceled.
- Error Number: 8227  
Unsupported options are used when creating Sequence.  
See [Sequence documentation](#) to find the list of the supported options.
- Error Number: 8228  
Unsupported types are specified when using `setval` on Sequence.  
See [Sequence documentation](#) to find the example of the function.
- Error Number: 8229  
The transaction exceeds the survival time.  
Commit or roll back the current transaction, and start a new transaction.
- Error Number: 8230  
TiDB currently does not support using Sequence as the default value on newly added columns, and reports this error if you use it.
- Error Number: 8248  
The resource group already exists. This error is returned when a resource group is repeatedly created.
- Error Number: 8249  
The resource group does not exist. This error is returned when you modify or bind a resource group that does not exist. See [Create a resource group](#).

- Error Number: 8250

The complete error message is as follows:

```
ERROR 8250 (HY000): Resource control feature is disabled. Run "SET
↔ GLOBAL tidb_enable_resource_control='on'" to enable the feature
```

This error is returned when you try to use the resource control feature but it is not enabled. You can turn on the global variable `tidb_enable_resource_control` to enable resource control.

- Error Number: 8251

The **Resource Control** component is initialized upon TiDB startup. The associated configuration is fetched from the **Resource Manager** on the server side of **Resource** ↔ **Control**. This error is returned if there is an error during this process.

- Error Number: 8252

The complete error message is as follows:

```
ERROR 8252 (HY000): Exceeded resource group quota limitation
```

This error is returned when the attempted consumption exceeds the resource group limit. This error is usually caused by a single transaction that is too large or too many concurrent transactions. You need to adjust the transaction size or reduce the number of concurrent clients.

- Error Number: 9001

The complete error message: **ERROR 9001 (HY000): PD Server Timeout**

The PD request timed out.

Check the status, monitoring data and log of the PD server, and the network between the TiDB server and the PD server.

- Error Number: 9002

The complete error message: **ERROR 9002 (HY000): TiKV Server Timeout**

The TiKV request timed out.

Check the status, monitoring data and log of the TiKV server, and the network between the TiDB server and the TiKV server.

- Error Number: 9003

The complete error message: **ERROR 9003 (HY000): TiKV Server is Busy**

The TiKV server is busy and this usually occurs when the workload is too high.

Check the status, monitoring data, and log of the TiKV server.

- Error Number: 9004

The complete error message: **ERROR 9004 (HY000): Resolve Lock Timeout**

A lock resolving timeout. This error occurs when a large number of transactional conflicts exist in the database.

Check the application code to see whether lock contention exists in the database.

- Error Number: 9005

The complete error message: `ERROR 9005 (HY000): Region is unavailable`

The accessed Region or a certain Raft Group is not available, with possible reasons such as insufficient replicas. This error usually occurs when the TiKV server is busy or the TiKV node is down.

Check the status, monitoring data and log of the TiKV server.

- Error Number: 9006

The complete error message: `ERROR 9006 (HY000): GC life time is shorter  
↪ than transaction duration`

The interval of GC Life Time is too short. The data that should have been read by long transactions might be deleted. You can adjust `tidb_gc_life_time` using the following command:

```
SET GLOBAL tidb_gc_life_time = '30m';
```

**Note:**

“30m” means only cleaning up the data generated 30 minutes ago, which might consume some extra storage space.

- Error Number: 9500

A single transaction is too large.

See [the error message transaction too large](#) for the solution.

- Error Number: 9007

The error message starts with `ERROR 9007 (HY000): Write conflict`.

If the error message contains `reason=LazyUniquenessCheck`, it means that the transaction is pessimistic, `@@tidb_constraint_check_in_place_pessimistic=OFF` is set, and a write conflict occurs on a unique index for the application. In this case, successful execution of the pessimistic transaction is not guaranteed. You can retry the transaction from the application, or set the variable to `ON` to avoid the error.

- Error Number: 9008

Too many requests are sent to TiKV at the same time. The number exceeds limit.

Increase `tidb_store_limit` or set it to 0 to remove the limit on the traffic of requests.

- Error Number: 9010  
TiKV cannot process this raft log.  
Check the state/monitor/log of the TiKV server.
- Error Number: 9012  
The TiFlash request timed out.  
Check the state/monitor/log of the TiFlash server and the network between the TiDB server and TiFlash server.
- Error Number: 9013  
The TiFlash server is busy and this usually occurs when the workload is too high.  
Check the state/monitor/log of the TiFlash server.

#### 14.14.1.1 MySQL native error messages

- Error Number: 2013 (HY000)  
The complete error message: `ERROR 2013 (HY000): Lost connection to MySQL ↪ server during query`  
You can handle this error as follows:
  - Check whether panic is in the log.
  - Check whether OOM exists in dmesg using `dmesg -T | grep -i oom`.
  - A long time of no access might also lead to this error. It is usually caused by TCP timeout. If TCP is not used for a long time, the operating system kills it.
- Error Number: 1105 (HY000)  
The complete error message: `ERROR 1105 (HY000): other error: unknown error ↪ Wire Error(InvalidEnumValue(4004))`  
This error usually occurs when the version of TiDB does not match with that of TiKV. To avoid version mismatch, upgrade all components when you upgrade the version.
- Error Number: 1148 (42000)  
The complete error message: `ERROR 1148 (42000): the used command is not ↪ allowed with this TiDB version`  
When you execute the `LOAD DATA LOCAL` statement but the MySQL client does not allow executing this statement (the value of the `local_infile` option is 0), this error occurs.  
The solution is to use the `--local-infile=1` option when you start the MySQL client. For example, run the command `mysql --local-infile=1 -u root -h 127.0.0.1 ↪ -P 4000`. The default value of `local-infile` varies in different versions of the MySQL client. Therefore, you need to configure it in specific MySQL clients.

- Error Number: 9001 (HY000)

The complete error message: `ERROR 9001 (HY000): PD server timeout start`  
↔ `timestamp may fall behind safe point`

This error occurs when TiDB fails to access PD. A worker in the TiDB background continuously queries the safepoint from PD and reports this error if it fails to query within 100s. Generally, it is because the disk on PD is slow and busy or the network failed between TiDB and PD. For the details of common errors, see [Error Number and Fault Diagnosis](#).

- TiDB log error message: EOF error

When the client or proxy disconnects from TiDB, TiDB does not immediately notice the disconnection. Instead, TiDB notices the disconnection only when it begins to return data to the connection. At this time, the log prints an EOF error.

## 14.14.2 Troubleshooting

See the [troubleshooting](#) and [FAQ](#) documents.

## 14.15 Table Filter

The TiDB migration tools operate on all the databases by default, but oftentimes only a subset is needed. For example, you only want to work with the schemas in the form of `foo*` and `bar*` and nothing else.

Since TiDB 4.0, all TiDB migration tools share a common filter syntax to define subsets. This document describes how to use the table filter feature.

### 14.15.1 Usage

#### 14.15.1.1 CLI

Table filters can be applied to the tools using multiple `-f` or `--filter` command line parameters. Each filter is in the form of `db.table`, where each part can be a wildcard (further explained in the [next section](#)). The following lists the example usage.

- **BR:**

```
./br backup full -f 'foo*.*' -f 'bar*.*' -s 'local:///tmp/backup'
```

```
./br restore full -f 'foo*.*' -f 'bar*.*' -s 'local:///tmp/backup'
```

- **Dumpling:**

```
./dumpling -f 'foo*.*' -f 'bar*.*' -P 3306 -o /tmp/data/
```

- **TiDB Lightning:**

```
./tidb-lightning -f 'foo*.*' -f 'bar*.*' -d /tmp/data/ --backend tidb
```

### 14.15.1.2 TOML configuration files

Table filters in TOML files are specified as [array of strings](#). The following lists the example usage.

- **TiDB Lightning:**

```
[mydumper]
filter = ['foo*.*', 'bar*.*']
```

- **TiCDC:**

```
[filter]
rules = ['foo*.*', 'bar*.*']

[[sink.dispatchers]]
matcher = ['db1.*', 'db2.*', 'db3.*']
dispatcher = 'ts'
```

## 14.15.2 Syntax

### 14.15.2.1 Plain table names

Each table filter rule consists of a “schema pattern” and a “table pattern”, separated by a dot (.). Tables whose fully-qualified name matches the rules are accepted.

```
db1.tb11
db2.tb12
db3.tb13
```

A plain name must only consist of valid [identifier characters](#), such as:

- digits (0 to 9)
- letters (a to z, A to Z)
- \$
- -
- non ASCII characters (U+0080 to U+10FFFF)

All other ASCII characters are reserved. Some punctuations have special meanings, as described in the next section.

### 14.15.2.2 Wildcards

Each part of the name can be a wildcard symbol described in [fnmatch\(3\)](#):

- `*` — matches zero or more characters
- `?` — matches one character
- `[a-z]` — matches one character between “a” and “z” inclusively
- `[!a-z]` — matches one character except “a” to “z”.

```
db[0-9].tbl[0-9a-f][0-9a-f]
data.*
.backup_
```

“Character” here means a Unicode code point, such as:

- U+00E9 (é) is 1 character.
- U+0065 U+0301 (é) are 2 characters.
- U+1F926 U+1F3FF U+200D U+2640 U+FE0F ( ) are 5 characters.

### 14.15.2.3 File import

To import a file as the filter rule, include an `@` at the beginning of the rule to specify the file name. The table filter parser treats each line of the imported file as additional filter rules.

For example, if a file `config/filter.txt` has the following content:

```
employees.*
*.WorkOrder
```

the following two invocations are equivalent:

```
./dumpling -f '@config/filter.txt'
./dumpling -f 'employees.*' -f '*.WorkOrder'
```

A filter file cannot further import another file.

### 14.15.2.4 Comments and blank lines

Inside a filter file, leading and trailing white-spaces of every line are trimmed. Furthermore, blank lines (empty strings) are ignored.

A leading `#` marks a comment and is ignored. `#` not at start of line is considered syntax error.

```
this line is a comment
db.table # but this part is not comment and may cause error
```

#### 14.15.2.5 Exclusion

An `!` at the beginning of the rule means the pattern after it is used to exclude tables from being processed. This effectively turns the filter into a block list.

```
 .
#^ note: must add the *.* to include all tables first
!*.Password
!employees.salaries
```

#### 14.15.2.6 Escape character

To turn a special character into an identifier character, precede it with a backslash `\`.

```
db\.with\.dots.*
```

For simplicity and future compatibility, the following sequences are prohibited:

- `\` at the end of the line after trimming whitespaces (use `[ ]` to match a literal whitespace at the end).
- `\` followed by any ASCII alphanumeric character (`[0-9a-zA-Z]`). In particular, C-like escape sequences like `\0`, `\r`, `\n` and `\t` currently are meaningless.

#### 14.15.2.7 Quoted identifier

Besides `\`, special characters can also be suppressed by quoting using `"` or ```.

```
"db.with.dots"."tbl\1"
`db.with.dots`.`tbl\2`
```

The quotation mark can be included within an identifier by doubling itself.

```
"foo""bar"`.`foo``bar`
equivalent to:
foo\"bar.foo\"bar
```

Quoted identifiers cannot span multiple lines.

It is invalid to partially quote an identifier:

```
"this is "invalid*.*
```

#### 14.15.2.8 Regular expression

In case very complex rules are needed, each pattern can be written as a regular expression delimited with `/`:

```
/^db\d{2,}$/.\/^tbl\d{2,}$/
```

These regular expressions use the [Go dialect](#). The pattern is matched if the identifier contains a substring matching the regular expression. For instance, `/b/` matches `db01`.

**Note:**

Every `/` in the regular expression must be escaped as `\/`, including inside `[...]`. You cannot place an unescaped `/` between `\Q...E`.

### 14.15.3 Multiple rules

When a table name matches none of the rules in the filter list, the default behavior is to ignore such unmatched tables.

To build a block list, an explicit `*.*` must be used as the first rule, otherwise all tables will be excluded.

```
every table will be filtered out
./dumping -f '!*.Password'

only the "Password" table is filtered out, the rest are included.
./dumping -f '*.*' -f '!*.Password'
```

In a filter list, if a table name matches multiple patterns, the last match decides the outcome. For instance:

```
rule 1
employees.*
rule 2
!*.dep*
rule 3
*.departments
```

The filtered outcome is as follows:

| Table name            | Rule 1 | Rule 2 | Rule 3 | Outcome          |
|-----------------------|--------|--------|--------|------------------|
| irrelevant.table      |        |        |        | Default (reject) |
| employees.employees   |        |        |        | Rule 1 (accept)  |
| employees.dept_emp    |        |        |        | Rule 2 (reject)  |
| employees.departments |        |        |        | Rule 3 (accept)  |
| else.departments      |        |        |        | Rule 3 (accept)  |

**Note:**

In TiDB tools, the system schemas are always excluded in the default configuration. The system schemas are:

- INFORMATION\_SCHEMA
- PERFORMANCE\_SCHEMA
- METRICS\_SCHEMA
- INSPECTION\_SCHEMA
- mysql
- sys

## 14.16 Schedule Replicas by Topology Labels

**Note:**

TiDB v5.3.0 introduces [Placement Rules in SQL](#). This offers a more convenient way to configure the placement of tables and partitions. Placement Rules in SQL might replace placement configuration with PD in future releases.

To improve the high availability and disaster recovery capability of TiDB clusters, it is recommended that TiKV nodes are physically scattered as much as possible. For example, TiKV nodes can be distributed on different racks or even in different data centers. According to the topology information of TiKV, the PD scheduler automatically performs scheduling at the background to isolate each replica of a Region as much as possible, which maximizes the capability of disaster recovery.

To make this mechanism effective, you need to properly configure TiKV and PD so that the topology information of the cluster, especially the TiKV location information, is reported to PD during deployment. Before you begin, see [Deploy TiDB Using TiUP](#) first.

### 14.16.1 Configure labels based on the cluster topology

#### 14.16.1.1 Configure labels for TiKV and TiFlash

You can use the command-line flag or set the TiKV or TiFlash configuration file to bind some attributes in the form of key-value pairs. These attributes are called `labels`. After

TiKV and TiFlash are started, they report their `labels` to PD so users can identify the location of TiKV and TiFlash nodes.

Assume that the topology has four layers: `zone > data center (dc) > rack > host`, and you can use these labels (`zone`, `dc`, `rack`, `host`) to set location of the TiKV and TiFlash. To set labels for TiKV and TiFlash, you can use one of the following methods:

- Use the command-line flag to start a TiKV instance:

```
shell tikv-server --labels zone=<zone>,dc=<dc>,rack=<rack>,host=<host>
```

- Configure in the TiKV configuration file:

```
[server]
[server.labels]
zone = "<zone>"
dc = "<dc>"
rack = "<rack>"
host = "<host>"
```

To set labels for TiFlash, you can use the `tiflash-learner.toml` file, which is the configuration file of `tiflash-proxy`:

```
toml [server] [server.labels] zone = "<zone>" dc = "<dc>" rack = "<rack
↪ >" host = "<host>"
```

#### 14.16.1.2 (Optional) Configure labels for TiDB

When **Follower read** is enabled, if you want TiDB to prefer to read data from the same region, you need to configure `labels` for TiDB nodes.

You can set `labels` for TiDB using the configuration file:

```
[labels]
zone = "<zone>"
dc = "<dc>"
rack = "<rack>"
host = "<host>"
```

#### Note:

Currently, TiDB depends on the `zone` label to match and select replicas that are in the same region. To use this feature, you need to include `zone` when **configuring location-labels for PD**, and configure `zone` when configuring `labels` for TiDB, TiKV, and TiFlash. For more details, see **Configure labels for TiKV and TiFlash**.

### 14.16.1.3 Configure `location-labels` for PD

According to the description above, the label can be any key-value pair used to describe TiKV attributes. But PD cannot identify the location-related labels and the layer relationship of these labels. Therefore, you need to make the following configuration for PD to understand the TiKV node topology.

Defined as an array of strings, `location-labels` is the configuration for PD. Each item of this configuration corresponds to the key of TiKV `labels`. Besides, the sequence of each key represents the layer relationship of different labels (the isolation levels decrease from left to right).

You can customize the value of `location-labels`, such as `zone`, `rack`, or `host`, because the configuration does not have default values. Also, this configuration has **no** restriction in the number of label levels (not mandatory for 3 levels) as long as they match with TiKV server labels.

#### Note:

- To make configurations take effect, you must configure `location-labels` for PD and `labels` for TiKV at the same time. Otherwise, PD does not perform scheduling according to the topology.
- If you use Placement Rules in SQL, you only need to configure `labels` for TiKV. Currently, Placement Rules in SQL is incompatible with the `location-labels` configuration of PD and ignores this configuration. It is not recommended to use `location-labels` and Placement Rules in SQL at the same time; otherwise, unexpected results might occur.

To configure `location-labels`, choose one of the following methods according to your cluster situation:

- If the PD cluster is not initialized, configure `location-labels` in the PD configuration file:

```
[replication]
location-labels = ["zone", "rack", "host"]
```

- If the PD cluster is already initialized, use the `pd-ctl` tool to make online changes:

```
pd-ctl config set location-labels zone,rack,host
```

#### 14.16.1.4 Configure isolation-level for PD

If `location-labels` has been configured, you can further enhance the topological isolation requirements on TiKV clusters by configuring `isolation-level` in the PD configuration file.

Assume that you have made a three-layer cluster topology by configuring `location-labels` according to the instructions above: `zone -> rack -> host`, you can configure the `isolation-level` to `zone` as follows:

```
[replication]
isolation-level = "zone"
```

If the PD cluster is already initialized, you need to use the `pd-ctl` tool to make online changes:

```
pd-ctl config set isolation-level zone
```

The `location-level` configuration is an array of strings, which needs to correspond to a key of `location-labels`. This parameter limits the minimum and mandatory isolation level requirements on TiKV topology clusters.

#### Note:

`isolation-level` is empty by default, which means there is no mandatory restriction on the isolation level. To set it, you need to configure `location-labels` for PD and ensure that the value of `isolation-level` is one of `location-labels` names.

#### 14.16.1.5 Configure a cluster using TiUP (recommended)

When using TiUP to deploy a cluster, you can configure the TiKV location in the [initialization configuration file](#). TiUP will generate the corresponding configuration files for TiKV, PD, and TiFlash during deployment.

In the following example, a two-layer topology of `zone/host` is defined. The TiKV nodes of the cluster are distributed among three zones, `z1`, `z2`, and `z3`, with each zone having four hosts, `h1`, `h2`, `h3`, and `h4`. In `z1`, four TiKV instances are deployed on two hosts, `tikv-1` and `tikv-2` on `h1`, and `tikv-3` and `tikv-4` on `h2`. Two TiFlash instances are deployed on the other two hosts, `tiflash-1` on `h3` and `tiflash-2` on `h4`. In `z2` and `z3`, two TiKV instances are deployed on two hosts, and two TiFlash instances are deployed on the other two hosts. In the following example, `tikv-n` represents the IP address of the `n`th TiKV node, and `tiflash-n` represents the IP address of the `n`th TiFlash node.

```
server_configs:
 pd:
```

```
 replication.location-labels: ["zone", "host"]

tikv_servers:
z1
- host: tikv-1
 config:
 server.labels:
 zone: z1
 host: h1
- host: tikv-2
 config:
 server.labels:
 zone: z1
 host: h1
- host: tikv-3
 config:
 server.labels:
 zone: z1
 host: h2
- host: tikv-4
 config:
 server.labels:
 zone: z1
 host: h2
z2
- host: tikv-5
 config:
 server.labels:
 zone: z2
 host: h1
- host: tikv-6
 config:
 server.labels:
 zone: z2
 host: h2
z3
- host: tikv-7
 config:
 server.labels:
 zone: z3
 host: h1
- host: tikv-8
 config:
 server.labels:
 zone: z3
```

```
 host: h2s
tiflash_servers:
z1
- host: tiflash-1
 learner_config:
 server.labels:
 zone: z1
 host: h3
- host: tiflash-2
 learner_config:
 server.labels:
 zone: z1
 host: h4
z2
- host: tiflash-3
 learner_config:
 server.labels:
 zone: z2
 host: h3
- host: tiflash-4
 learner_config:
 server.labels:
 zone: z2
 host: h4
z3
- host: tiflash-5
 learner_config:
 server.labels:
 zone: z3
 host: h3
- host: tiflash-6
 learner_config:
 server.labels:
 zone: z3
 host: h4
```

For details, see [Geo-distributed Deployment topology](#).

**Note:**

If you have not configured `replication.location-labels` in the configuration file, when you deploy a cluster using this topology file, an error might occur. It is recommended that you confirm `replication.location-labels` is configured in the configuration file before deploying a cluster.

### 14.16.2 PD schedules based on topology label

PD schedules replicas according to the label layer to make sure that different replicas of the same data are scattered as much as possible.

Take the topology in the previous section as an example.

Assume that the number of cluster replicas is 3 (`max-replicas=3`). Because there are 3 zones in total, PD ensures that the 3 replicas of each Region are respectively placed in z1, z2, and z3. In this way, the TiDB cluster is still available when one data center fails.

Then, assume that the number of cluster replicas is 5 (`max-replicas=5`). Because there are only 3 zones in total, PD cannot guarantee the isolation of each replica at the zone level. In this situation, the PD scheduler will ensure replica isolation at the host level. In other words, multiple replicas of a Region might be distributed in the same zone but not on the same host.

In the case of the 5-replica configuration, if z3 fails or is isolated as a whole, and cannot be recovered after a period of time (controlled by `max-store-down-time`), PD will make up the 5 replicas through scheduling. At this time, only 4 hosts are available. This means that host-level isolation cannot be guaranteed and that multiple replicas might be scheduled to the same host. But if the `isolation-level` value is set to `zone` instead of being left empty, this specifies the minimum physical isolation requirements for Region replicas. That is to say, PD will ensure that replicas of the same Region are scattered among different zones. PD will not perform corresponding scheduling even if following this isolation restriction does not meet the requirement of `max-replicas` for multiple replicas.

For example, a TiKV cluster is distributed across three data zones z1, z2, and z3. Each Region has three replicas as required, and PD distributes the three replicas of the same Region to these three data zones respectively. If a power outage occurs in z1 and cannot be recovered after a period of time (controlled by `max-store-down-time` and 30 minutes by default), PD determines that the Region replicas on z1 are no longer available. However, because `isolation-level` is set to `zone`, PD needs to strictly guarantee that different replicas of the same Region will not be scheduled on the same data zone. Because both z2 and z3 already have replicas, PD will not perform any scheduling under the minimum isolation level restriction of `isolation-level`, even if there are only two replicas at this moment.

Similarly, when `isolation-level` is set to `rack`, the minimum isolation level applies to different racks in the same data center. With this configuration, the isolation at the zone layer is guaranteed first if possible. When the isolation at the zone level cannot be guaranteed, PD tries to avoid scheduling different replicas to the same rack in the same zone. The scheduling works similarly when `isolation-level` is set to `host` where PD first guarantees the isolation level of rack, and then the level of host.

In summary, PD maximizes the disaster recovery of the cluster according to the current topology. Therefore, if you want to achieve a certain level of disaster recovery, deploy more machines on different sites according to the topology than the number of `max-replicas`. TiDB also provides mandatory configuration items such as `isolation-level` for you to more flexibly control the topological isolation level of data according to different scenarios.

## 15 FAQs

### 15.1 TiDB FAQ Summary

This document summarizes frequently asked questions (FAQs) about TiDB.

## 15.2 TiDB Architecture FAQs

This document lists the Most Frequently Asked Questions about TiDB.

### 15.2.1 TiDB introduction and architecture

#### 15.2.1.1 What is TiDB?

**TiDB** is an open-source distributed SQL database that supports Hybrid Transactional and Analytical Processing (HTAP) workloads. It is MySQL compatible and features horizontal scalability, strong consistency, and high availability. The goal of TiDB is to provide users with a one-stop database solution that covers OLTP (Online Transactional Processing), OLAP (Online Analytical Processing), and HTAP services. TiDB is suitable for various use cases that require high availability and strong consistency with large-scale data.

#### 15.2.1.2 What is TiDB's architecture?

The TiDB cluster has three components: the TiDB server, the PD (Placement Driver) server, and the TiKV server. For more details, see [TiDB architecture](#), [TiDB storage](#), [TiDB computing](#), and [TiDB scheduling](#).

#### 15.2.1.3 Is TiDB based on MySQL?

No. TiDB supports MySQL syntax and protocol, but it is a new open source database that is developed and maintained by PingCAP, Inc.

#### 15.2.1.4 What is the respective responsibility of TiDB, TiKV and PD (Placement Driver)?

- TiDB works as the SQL computing layer, mainly responsible for parsing SQL, specifying query plan, and generating executor.
- TiKV works as a distributed Key-Value storage engine, used to store the real data. In short, TiKV is the storage engine of TiDB.
- PD works as the cluster manager of TiDB, which manages TiKV metadata, allocates timestamps, and makes decisions for data placement and load balancing.

#### 15.2.1.5 Is it easy to use TiDB?

Yes, it is. When all the required services are started, you can use TiDB as easily as a MySQL server. You can replace MySQL with TiDB to power your applications without changing a single line of code in most cases. You can also manage TiDB using the popular MySQL management tools.

#### 15.2.1.6 How is TiDB compatible with MySQL?

Currently, TiDB supports the majority of MySQL 5.7 syntax, but does not support triggers, stored procedures, and user-defined functions. For more details, see [Compatibility with MySQL](#).

#### 15.2.1.7 Does TiDB support distributed transactions?

Yes. TiDB distributes transactions across your cluster, whether it is a few nodes in a single location or many [nodes across multiple data centers](#).

Inspired by Google's Percolator, the transaction model in TiDB is mainly a two-phase commit protocol with some practical optimizations. This model relies on a timestamp allocator to assign the monotone increasing timestamp for each transaction, so conflicts can be detected. [PD](#) works as the timestamp allocator in a TiDB cluster.

#### 15.2.1.8 What programming language can I use to work with TiDB?

Any language supported by MySQL client or driver.

#### 15.2.1.9 Can I use other Key-Value storage engines with TiDB?

Yes. In addition to TiKV, TiDB supports standalone storage engines such as UniStore and MockTiKV. Note that in later TiDB releases, MockTiKV might NO LONGER be supported.

To check all TiDB-supported storage engines, use the following command:

```
./bin/tidb-server -h
```

The output is as follows:

```
Usage of ./bin/tidb-server:
-L string
 log level: info, debug, warn, error, fatal (default "info")
-P string
 tidb server port (default "4000")
-V print version information and exit (default false)
.....
-store string
 registered store name, [tikv, mocktikv, unistore] (default "unistore
 ↪ ")
.....
```

#### 15.2.1.10 In addition to the TiDB documentation, are there any other ways to acquire TiDB knowledge?

- [TiDB documentation](#): the most important and timely way to get TiDB related knowledge.
- [TiDB blogs](#): learn technical articles, product insights, and case studies.
- [PingCAP Education](#): take online courses and certification programs.

#### 15.2.1.11 What is the length limit for the TiDB user name?

32 characters at most.

#### 15.2.1.12 What are the limits on the number of columns and row size in TiDB?

- The maximum number of columns in TiDB defaults to 1017. You can adjust the number up to 4096.
- The maximum size of a single row defaults to 6 MB. You can increase the number up to 120 MB.

For more information, see [TiDB Limitations](#).

#### 15.2.1.13 Does TiDB support XA?

No. The JDBC driver of TiDB is MySQL Connector/J. When using Atomikos, set the data source to `type="com.mysql.jdbc.jdbc2.optional.MysqlXADataSource"`. TiDB does not support the connection with MySQL JDBC XADataSource. MySQL JDBC XADataSource only works for MySQL (for example, using DML to modify the redo log).

After you configure the two data sources of Atomikos, set the JDBC drives to XA. When Atomikos operates TM and RM (DB), Atomikos sends the command including XA to the JDBC layer. Taking MySQL for an example, when XA is enabled in the JDBC layer, JDBC will send a series of XA logic operations to InnoDB, including using DML to change the redo log. This is the operation of the two-phase commit. The current TiDB version does not support the upper application layer JTA/XA and does not parse XA operations sent by Atomikos.

As a standalone database, MySQL can only implement across-database transactions using XA; while TiDB supports distributed transactions using Google Percolator transaction model and its performance stability is higher than XA, so TiDB does not support JTA/XA and there is no need for TiDB to support XA.

#### 15.2.1.14 How could TiDB support high concurrent INSERT or UPDATE operations to the columnar storage engine (TiFlash) without hurting performance?

- [TiFlash](#) introduces a special structure named DeltaTree to process the modification of the columnar engine.

- TiFlash acts as the learner role in a Raft group, so it does not vote for the log commit or writes. This means that DML operations do not have to wait for the acknowledgment of TiFlash, which is why TiFlash does not slow down the OLTP performance. In addition, TiFlash and TiKV work in separate instances, so they do not affect each other.

#### 15.2.1.15 Is TiFlash eventually consistent?

Yes. TiFlash maintains strong data consistency by default.

### 15.2.2 TiDB techniques

#### 15.2.2.1 TiKV for data storage

See [TiDB Internal \(I\) - Data Storage](#).

#### 15.2.2.2 TiDB for data computing

See [TiDB Internal \(II\) - Computing](#).

#### 15.2.2.3 PD for scheduling

See [TiDB Internal \(III\) - Scheduling](#).

## 15.3 SQL FAQs

This document summarizes the FAQs related to SQL operations in TiDB.

### 15.3.1 Does TiDB support the secondary key?

Yes. You can have the **NOT NULL constraint** on a non-primary key column with a unique **secondary index**. In this case, the column works as a secondary key.

### 15.3.2 How does TiDB perform when executing DDL operations on a large table?

DDL operations of TiDB on large tables are usually not an issue. TiDB supports online DDL operations, and these DDL operations do not block DML operations.

For some DDL operations such as adding columns, deleting columns or dropping indexes, TiDB can perform these operations quickly.

For some heavy DDL operations such as adding indexes, TiDB needs to backfill data, which takes a longer time (depending on the size of the table) and consumes additional resources. The impact on online traffic is tunable. TiDB can do the backfill with multiple threads, and the resource consumed can be set by the following system variables:

- `tidb_ddl_reorg_worker_cnt`
- `tidb_ddl_reorg_priority`
- `tidb_ddl_error_count_limit`
- `tidb_ddl_reorg_batch_size`

### 15.3.3 How to choose the right query plan? Do I need to use hints? Or can I use hints?

TiDB includes a cost-based optimizer. In most cases, the optimizer chooses the optimal query plan for you. If the optimizer does not work well, you can still use [optimizer hints](#) to intervene with the optimizer.

In addition, you can also use the [SQL binding](#) to fix the query plan for a particular SQL statement.

### 15.3.4 How to prevent the execution of a particular SQL statement?

You can create [SQL bindings](#) with the `MAX_EXECUTION_TIME` hint to limit the execution time of a particular statement to a small value (for example, 1ms). In this way, the statement is terminated automatically by the threshold.

For example, to prevent the execution of `SELECT * FROM t1, t2 WHERE t1.id = t2.id`, you can use the following SQL binding to limit the execution time of the statement to 1ms:

```
CREATE GLOBAL BINDING for
 SELECT * FROM t1, t2 WHERE t1.id = t2.id
USING
 SELECT /*+ MAX_EXECUTION_TIME(1) */ * FROM t1, t2 WHERE t1.id = t2.id;
```

#### Note:

The precision of `MAX_EXECUTION_TIME` is roughly 100ms. Before TiDB terminates the SQL statement, the tasks in TiKV might be started. To reduce the TiKV resource consumption in such case, it is recommended to set `tidb_enable_paging` to ON.

Dropping this SQL binding will remove the limit.

```
DROP GLOBAL BINDING for
 SELECT * FROM t1, t2 WHERE t1.id = t2.id;
```

### 15.3.5 What are the MySQL variables that TiDB is compatible with?

See [System Variables](#).

### 15.3.6 The order of results is different from MySQL when ORDER BY is omitted

It is not a bug. The default order of records depends on various situations without any guarantee of consistency.

The order of results in MySQL might appear stable because queries are executed in a single thread. However, it is common that query plans can change when upgrading to new versions. It is recommended to use ORDER BY whenever an order of results is desired.

The reference can be found in [ISO/IEC 9075:1992, Database Language SQL- July 30, 1992](#), which states as follows:

If an <order by clause> is not specified, then the table specified by the <cursor specification> is T and the ordering of rows in T is implementation-dependent.

In the following two queries, both results are considered legal:

```
> select * from t;
+-----+-----+
| a | b |
+-----+-----+
| 1 | 1 |
| 2 | 2 |
+-----+-----+
2 rows in set (0.00 sec)
```

```
> select * from t; -- the order of results is not guaranteed
+-----+-----+
| a | b |
+-----+-----+
| 2 | 2 |
| 1 | 1 |
+-----+-----+
2 rows in set (0.00 sec)
```

If the list of columns used in the ORDER BY is non-unique, the statement is also considered non-deterministic. In the following example, the column a has duplicate values. Thus, only ORDER BY a, b is guaranteed deterministic:

```
> select * from t order by a;
+-----+-----+
| a | b |
+-----+-----+
| 1 | 1 |
| 2 | 1 |
| 2 | 2 |
+-----+-----+
3 rows in set (0.00 sec)
```

In the following statement, the order of column a is guaranteed, but the order of b is not guaranteed.

```
> select * from t order by a;
+-----+-----+
| a | b |
+-----+-----+
| 1 | 1 |
| 2 | 2 |
| 2 | 1 |
+-----+-----+
3 rows in set (0.00 sec)
```

In TiDB, you can also use the system variable `tidb_enable_ordered_result_mode` to sort the final output result automatically.

### 15.3.7 Does TiDB support **SELECT FOR UPDATE**?

Yes. When using pessimistic locking (the default since TiDB v3.0.8) the **SELECT FOR UPDATE** execution behaves similar to MySQL.

When using optimistic locking, **SELECT FOR UPDATE** does not lock data when the transaction is started, but checks conflicts when the transaction is committed. If the check reveals conflicts, the committing transaction rolls back.

For details, see [description of the \*\*SELECT\*\* syntax elements](#).

### 15.3.8 Can the codec of TiDB guarantee that the UTF-8 string is memcomparable? Is there any coding suggestion if our key needs to support UTF-8?

TiDB uses the UTF-8 character set by default and currently only supports UTF-8. The string of TiDB uses the memcomparable format.

### 15.3.9 What is the maximum number of statements in a transaction?

The maximum number of statements in a transaction is 5000 by default.

In the optimistic transaction mode, When transaction retry is enabled, the default upper limit is 5000. You can adjust the limit by using the `stmt-count-limit` parameter.

### 15.3.10 Why does the auto-increment ID of the later inserted data is smaller than that of the earlier inserted data in TiDB?

The auto-increment ID feature in TiDB is only guaranteed to be automatically incremental and unique but is not guaranteed to be allocated sequentially. Currently, TiDB is allocating IDs in batches. If data is inserted into multiple TiDB servers simultaneously, the allocated IDs are not sequential. When multiple threads concurrently insert data to multiple `tidb-server` instances, the auto-increment ID of the later inserted data might be smaller. TiDB allows specifying `AUTO_INCREMENT` for the integer field, but allows only one `AUTO_INCREMENT` field in a single table. For details, see [Auto-increment ID](#) and [the AUTO\\_INCREMENT attribute](#).

### 15.3.11 How do I modify the `sql_mode` in TiDB?

TiDB supports modifying the `sql_mode` system variables on a `SESSION` or `GLOBAL` basis.

- Changes to `GLOBAL` scoped variables propagate to the rest servers of the cluster and persist across restarts. This means that you do not need to change the `sql_mode` value on each TiDB server.
- Changes to `SESSION` scoped variables only affect the current client session. After restarting a server, the changes are lost.

### 15.3.12 Error: `java.sql.BatchUpdateException:statement count 5001 exceeds the transaction limitation while using Sqoop to write data into TiDB in batches`

In Sqoop, `--batch` means committing 100 statements in each batch, but by default each statement contains 100 SQL statements. So,  $100 * 100 = 10000$  SQL statements, which exceeds 5000, the maximum number of statements allowed in a single TiDB transaction.

Two solutions:

- Add the `-Dsqoop.export.records.per.statement=10` option as follows:

```
sqoop export \
-Dsqoop.export.records.per.statement=10 \
--connect jdbc:mysql://mysql.example.com/sqoop \

```

```
--username sqoop ${user} \
--password ${passwd} \
--table ${tab_name} \
--export-dir ${dir} \
--batch
```

- You can also increase the limited number of statements in a single TiDB transaction, but this will consume more memory. For details, see [Limitations on SQL statements](#).

### 15.3.13 Does TiDB have a function like the Flashback Query in Oracle? Does it support DDL?

Yes, it does. And it supports DDL as well. For details, see [Read Historical Data Using the AS OF TIMESTAMP Clause](#).

### 15.3.14 Does TiDB release space immediately after deleting data?

None of the DELETE, TRUNCATE and DROP operations release data immediately. For the TRUNCATE and DROP operations, after the TiDB GC (Garbage Collection) time (10 minutes by default), the data is deleted and the space is released. For the DELETE operations, the data is deleted but the space is not immediately released until the compaction is performed.

### 15.3.15 Why does the query speed get slow after data is deleted?

Deleting a large amount of data leaves a lot of useless keys, affecting the query efficiency. To solve the problem, you can use the [Region Merge](#) feature. For details, see the [deleting data section in TiDB Best Practices](#).

### 15.3.16 What should I do if it is slow to reclaim storage space after deleting data?

Because TiDB uses multi-version concurrency control (MVCC), when the old data is overwritten with new data, the old data is not replaced but retained along with the new data. Timestamps are used to identify the data version. Deleting data does not immediately reclaim space. Garbage collection is delayed so that concurrent transactions are able to see earlier versions of rows. This can be configured via the [tidb\\_gc\\_life\\_time](#) (default: 10m0s) system variable.

### 15.3.17 Does SHOW PROCESSLIST display the system process ID?

The display content of TiDB SHOW PROCESSLIST is almost the same as that of MySQL SHOW PROCESSLIST. TiDB SHOW PROCESSLIST does not display the system process ID. The ID that it displays is the current session ID. The differences between TiDB SHOW  $\leftrightarrow$  PROCESSLIST and MySQL SHOW PROCESSLIST are as follows:

- As TiDB is a distributed database, the `tidb-server` instance is a stateless engine for parsing and executing the SQL statements (for details, see [TiDB architecture](#)). `SHOW`  $\hookrightarrow$  `PROCESSLIST` displays the session list executed in the `tidb-server` instance that the user logs in to from the MySQL client, not the list of all the sessions running in the cluster. But MySQL is a standalone database and its `SHOW PROCESSLIST` displays all the SQL statements executed in MySQL.
- The `State` column in TiDB is not continually updated during query execution. Because TiDB supports parallel query, each statement might be in multiple *states* at once, and so it is difficult to simplify to a single value.

### 15.3.18 How to control or change the execution priority of SQL commits?

TiDB supports changing the priority on a [global](#) or individual statement basis. Priority has the following meaning:

- `HIGH_PRIORITY`: this statement has a high priority, that is, TiDB gives priority to this statement and executes it first.
- `LOW_PRIORITY`: this statement has a low priority, that is, TiDB reduces the priority of this statement during the execution period.
- `DELAYED`: this statement has normal priority and is the same as the `NO_PRIORITY` setting for `tidb_force_priority`.

You can combine the above two parameters with the DML of TiDB to use them. For example:

1. Adjust the priority by writing SQL statements in the database:

```
SELECT HIGH_PRIORITY | LOW_PRIORITY | DELAYED COUNT(*) FROM table_name
 \hookrightarrow ;
INSERT HIGH_PRIORITY | LOW_PRIORITY | DELAYED INTO table_name
 \hookrightarrow insert_values;
DELETE HIGH_PRIORITY | LOW_PRIORITY | DELAYED FROM table_name;
UPDATE HIGH_PRIORITY | LOW_PRIORITY | DELAYED table_reference SET
 \hookrightarrow assignment_list WHERE where_condition;
REPLACE HIGH_PRIORITY | LOW_PRIORITY | DELAYED INTO table_name;
```

2. The full table scan statement automatically adjusts itself to a low priority. `ANALYZE` has a low priority by default.

### 15.3.19 What's the trigger strategy for `auto analyze` in TiDB?

Trigger strategy: `auto analyze` is automatically triggered when the number of rows in a new table reaches 1000 and this table has no write operation within one minute.

When the ratio (the number of modified rows / the current total number of rows) is larger than `tidb_auto_analyze_ratio`, the `analyze` statement is automatically triggered. The default value of `tidb_auto_analyze_ratio` is 0.5, indicating that this feature is enabled by default. To ensure safety, its minimum value is 0.3 when the feature is enabled, and it must be smaller than `pseudo-estimate-ratio` whose default value is 0.8, otherwise pseudo statistics will be used for a period of time. It is recommended to set `tidb_auto_analyze_ratio` to 0.5.

To disable `auto analyze`, use the system variable `tidb_enable_auto_analyze`.

### 15.3.20 Can I use optimizer hints to override the optimizer behavior?

TiDB supports multiple ways to override the default query optimizer behavior, including [hints](#) and [SQL Plan Management](#). The basic usage is similar to MySQL, with several TiDB specific extensions:

```
SELECT column_name FROM table_name USE INDEX (index_name) WHERE
 ↪ where_condition;
```

### 15.3.21 DDL Execution

This section lists issues related to DDL statement execution. For detailed explanations on the DDL execution principles, see [Execution Principles and Best Practices of DDL Statements](#).

#### 15.3.21.1 How long does it take to perform various DDL operations?

Assume that DDL operations are not blocked, each TiDB server can update the schema version normally, and the DDL Owner node is running normally. In this case, the estimated time for various DDL operations is as follows:

| DDL Operation Type                                                                                                                                                                                                                                                                                | Estimated Time                                                          |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| Reorg DDL, such as ADD INDEX, MODIFY<br>↪ COLUMN (Reorg type data changes)                                                                                                                                                                                                                        | Depends on the amount of data, system load, and DDL parameter settings. |
| General DDL (DDL types other than Reorg), such as CREATE<br>↪ DATABASE<br>↪ ,<br>CREATE<br>↪ TABLE,<br>DROP<br>↪ DATABASE<br>↪ ,<br>DROP TABLE,<br>TRUNCATE<br>↪ TABLE,<br>ALTER<br>↪ TABLE<br>↪ ADD,<br>ALTER<br>↪ TABLE<br>↪ DROP,<br>MODIFY<br>↪ COLUMN (only changes metadata),<br>DROP INDEX | About 1 second                                                          |

**Note:**

The above is estimated time for the operations. The actual time might be different.

### 15.3.21.2 Possible reasons why DDL execution is slow

- In a user session, if there is a non-auto-commit DML statement before a DDL statement, and if the commit operation of the non-auto-commit DML statement is slow, it will cause the DDL statement to execute slowly. That is, TiDB commits the uncommitted DML statement before executing the DDL statement.
- When multiple DDL statements are executed together, the execution of the later DDL statements might be slower because they might need to wait in queue. Queuing scenarios include:
  - The same type of DDL statements need to be queued. For example, both `CREATE TABLE` and `CREATE DATABASE` are general DDL statements, so when both operations are executed at the same time, they need to be queued. Starting from TiDB v6.2.0, parallel DDL statements are supported, but to avoid DDL execution using too many TiDB computing resources, there is also a concurrency limit. Queuing occurs when DDL exceeds the concurrency limit.
  - The DDL operations performed on the same table have a dependency relationship between them. The later DDL statement needs to wait for the previous DDL operation to complete.
- After the cluster is started normally, the execution time of the first DDL operation might be relatively long because the DDL module is electing the DDL Owner.
- TiDB is terminated, which causes TiDB to not able to communicate with PD normally (including power-off situations). Or TiDB is terminated by the `kill -9` command, which causes TiDB to not timely clear the registration data from PD.
- A communication problem occurs between a certain TiDB node in the cluster and PD or TiKV, which makes TiDB not able to obtain the latest version information in time.

### 15.3.21.3 What triggers the Information schema is changed error?

When executing SQL statements, TiDB determines the schema version of an object based on the isolation level and processes the SQL statement accordingly. TiDB also supports online asynchronous DDL changes. When you execute DML statements, there might be DDL statements being executed at the same time, and you need to ensure that each SQL statement is executed on the same schema. Therefore, when executing DML, if a DDL operation is ongoing, TiDB might report an `Information schema is changed` error.

Starting from v6.4.0, TiDB has implemented a **metadata lock mechanism**, which allows the coordinated execution of DML statements and DDL schema changes, and avoids most **Information schema is changed** errors.

Now, there are still a few causes for this error reporting:

- Cause 1: Some tables involved in the DML operation are the same tables involved in the ongoing DDL operation. To check the ongoing DDL operations, use the `ADMIN ↔ SHOW DDL` statement.
- Cause 2: The DML operation goes on for a long time. During this period, many DDL statements have been executed, which causes more than 1024 **schema** version changes. You can modify this default value by modifying the `tidb_max_delta_schema_count` variable.
- Cause 3: The TiDB server that accepts the DML request is not able to load **schema** ↔ **information** for a long time (possibly caused by the connection failure between TiDB and PD or TiKV). During this period, many DDL statements have been executed, which causes more than 100 **schema** version changes.
- Cause 4: After TiDB restarts and before the first DDL operation is executed, the DML operation is executed and then encounters the first DDL operation (which means before the first DDL operation is executed, the transaction corresponding to the DML is started. And after the first **schema** version of the DDL is changed, the transaction corresponding to the DML is committed), this DML operation reports this error.

In the preceding causes, only Cause 1 is related to tables. Cause 1 and Cause 2 do not impact the application, as the related DML operations retry after failure. For cause 3, you need to check the network between TiDB and TiKV/PD.

#### Note:

- Currently, TiDB does not cache all the **schema** version changes.
- For each DDL operation, the number of **schema** version changes is the same with the number of corresponding **schema state** version changes.
- Different DDL operations cause different number of **schema** version changes. For example, the `CREATE TABLE` statement causes one **schema** version change while the `ADD COLUMN` statement causes four.

#### 15.3.21.4 What are the causes of the “Information schema is out of date” error?

Before TiDB v6.5.0, when executing a DML statement, if TiDB fails to load the latest schema within a DDL lease (45s by default), the **Information schema is out of date** error might occur. Possible causes are:

- The TiDB instance that executed this DML was killed, and the transaction execution corresponding to this DML statement took longer than a DDL lease. When the transaction was committed, the error occurred.
- TiDB failed to connect to PD or TiKV while executing this DML statement. As a result, TiDB failed to load schema within a DDL lease or disconnected from PD due to the keepalive setting.

#### 15.3.21.5 Error is reported when executing DDL statements under high concurrency?

When you execute DDL statements (such as creating tables in batches) under high concurrency, a very few of these statements might fail because of key conflicts during the concurrent execution.

It is recommended to keep the number of concurrent DDL statements under 20. Otherwise, you need to retry the failed statements from the client.

#### 15.3.21.6 Why is DDL execution blocked?

Before TiDB v6.2.0, TiDB allocates DDL statements to two first-in-first-out queues based on the type of DDL statements. More specifically, Reorg DDLs go to the Reorg queue and General DDLs go to the general queue. Because of the first-in-first-out limitation and the need for serial execution of DDL statements on the same table, multiple DDL statements might be blocked during execution.

For example, consider the following DDL statements:

- DDL 1: `CREATE INDEX idx on t(a int);`
- DDL 2: `ALTER TABLE t ADD COLUMN b int;`
- DDL 3: `CREATE TABLE t1(a int);`

Due to the limitation of the first-in-first-out queue, DDL 3 must wait for DDL 2 to execute. Also, because DDL statements on the same table need to be executed in serial, DDL 2 must wait for DDL 1 to execute. Therefore, DDL 3 needs to wait for DDL 1 to be executed first, even if they operate on different tables.

Starting from TiDB v6.2.0, the TiDB DDL module uses a concurrent framework. In the concurrent framework, there is no longer the limitation of the first-in-first-out queue. Instead, TiDB picks up the DDL task that can be executed from all DDL tasks. Additionally, the number of Reorg workers has been expanded, approximately to CPU/4 per node. This allows TiDB to build indexes for multiple tables simultaneously in the concurrent framework.

Whether your cluster is a new cluster or an upgraded cluster from an earlier version, TiDB automatically uses the concurrent framework in TiDB v6.2 and later versions. You do not need to make manual adjustments.

### 15.3.21.7 Identify the cause of stuck DDL execution

1. Eliminate other reasons that make the DDL statement execution slow.
  2. Use one of the following methods to identify the DDL Owner node:
    - Use `curl http://{TiDBIP}:10080/info/all` to obtain the owner of the current cluster.
    - View the owner during a specific time period from the monitoring dashboard **DDL > DDL META OPM**.
- 
- If the owner does not exist, try manually triggering owner election with: `curl -X ↪ POST http://{TiDBIP}:10080/ddl/owner/resign`.
  - If the owner exists, export the Goroutine stack and check for the possible stuck location.

### 15.3.22 SQL optimization

#### 15.3.22.1 TiDB execution plan description

See [Understand the Query Execution Plan](#).

#### 15.3.22.2 Statistics collection

See [Introduction to Statistics](#).

#### 15.3.22.3 How to optimize `select count(1)`?

The `count(1)` statement counts the total number of rows in a table. Improving the degree of concurrency can significantly improve the speed. To modify the concurrency, refer to the [tidb\\_distsql\\_scan\\_concurrency document](#). But it also depends on the CPU and I/O resources. TiDB accesses TiKV in every query. When the amount of data is small, all MySQL is in memory, and TiDB needs to conduct a network access.

Recommendations:

- Improve the hardware configuration. See [Software and Hardware Requirements](#).
- Improve the concurrency. The default value is 10. You can improve it to 50 and have a try. But usually the improvement is 2-4 times of the default value.
- Test the `count` in the case of large amount of data.
- Optimize the TiKV configuration. See [Tune TiKV Thread Performance](#) and [Tune TiKV Memory Performance](#).
- Enable the [Coprocessor Cache](#).

### 15.3.22.4 How to view the progress of the current DDL job?

You can use `ADMIN SHOW DDL` to view the progress of the current DDL job. The operation is as follows:

```
ADMIN SHOW DDL;
```

```
***** 1. row *****
SCHEMA_VER: 140
 OWNER: 1a1c4174-0fcd-4ba0-add9-12d08c4077dc
RUNNING_JOBS: ID:121, Type:add index, State:running, SchemaState:write
 ↪ reorganization, SchemaID:1, TableID:118, RowCount:77312, ArgLen:0,
 ↪ start time: 2018-12-05 16:26:10.652 +0800 CST, Err:<nil>, ErrCount:0,
 ↪ SnapshotVersion:404749908941733890
 SELF_ID: 1a1c4174-0fcd-4ba0-add9-12d08c4077dc
```

From the above results, you can get that the `ADD INDEX` operation is currently being processed. You can also get from the `RowCount` field of the `RUNNING_JOBS` column that now the `ADD INDEX` operation has added 77312 rows of indexes.

### 15.3.22.5 How to view the DDL job?

- `ADMIN SHOW DDL`: to view the running DDL job
- `ADMIN SHOW DDL JOBS`: to view all the results in the current DDL job queue (including tasks that are running and waiting to run) and the last ten results in the completed DDL job queue
- `ADMIN SHOW DDL JOBS QUERIES 'job_id' [, 'job_id'] ...`: to view the original SQL statement of the DDL task corresponding to the `job_id`; the `job_id` only searches the running DDL job and the last ten results in the DDL history job queue.

### 15.3.22.6 Does TiDB support CBO (Cost-Based Optimization)? If yes, to what extent?

Yes. TiDB uses the cost-based optimizer. The cost model and statistics are constantly optimized. TiDB also supports join algorithms like hash join and sort-merge join.

### 15.3.22.7 How to determine whether I need to execute `analyze` on a table?

View the `Healthy` field using `SHOW STATS_HEALTHY` and generally you need to execute `ANALYZE` on a table when the field value is smaller than 60.

### 15.3.22.8 What is the ID rule when a query plan is presented as a tree? What is the execution order for this tree?

No rule exists for these IDs but the IDs are unique. When IDs are generated, a counter works and adds one when one plan is generated. The execution order has nothing to do with

the ID. The whole query plan is a tree and the execution process starts from the root node and the data is returned to the upper level continuously. For details about the query plan, see [Understanding the TiDB Query Execution Plan](#).

### 15.3.22.9 In the TiDB query plan, cop tasks are in the same root. Are they executed concurrently?

Currently the computing tasks of TiDB belong to two different types of tasks: `cop task` and `root task`.

`cop task` is the computing task which is pushed down to the KV end for distributed execution; `root task` is the computing task for single point execution on the TiDB end.

Generally the input data of `root task` comes from `cop task`; when `root task` processes data, `cop task` of TiKV can processes data at the same time and waits for the pull of `root task` of TiDB. Therefore, `cop tasks` can be considered as executed concurrently with `root task`; but their data has an upstream and downstream relationship. During the execution process, they are executed concurrently during some time. For example, the first `cop task` is processing the data in [100, 200] and the second `cop task` is processing the data in [1, 100]. For details, see [Understanding the TiDB Query Plan](#).

## 15.3.23 Database optimization

### 15.3.23.1 Edit TiDB options

See [The TiDB Command Options](#).

### 15.3.23.2 How to avoid hotspot issues and achieve load balancing? Is hot partition or range an issue in TiDB?

To learn the scenarios that cause hotspots, refer to [common hotspots](#). The following TiDB features are designed to help you solve hotspot issues:

- The `SHARD_ROW_ID_BITS` attribute. After setting this attribute, row IDs are scattered and written into multiple Regions, which can alleviate the write hotspot issue.
- The `AUTO_RANDOM` attribute, which helps resolve hotspots brought by auto-increment primary keys.
- [Coprocessor Cache](#), for read hotspots on small tables.
- [Load Base Split](#), for hotspots caused by unbalanced access between Regions, such as full table scans for small tables.
- [Cached tables](#), for frequently accessed but rarely updated small hotspot tables.

If you have a performance issue caused by hotspot, refer to [Troubleshoot Hotspot Issues](#) to get it resolved.

### 15.3.23.3 Tune TiKV performance

See [Tune TiKV Thread Performance](#) and [Tune TiKV Memory Performance](#).

## 15.4 TiDB Deployment FAQs

This document summarizes the FAQs related to TiDB deployment.

### 15.4.1 Software and hardware requirements

#### 15.4.1.1 What operating systems does TiDB support?

For the TiDB-supported operating systems, see [Software and Hardware Recommendations](#).

#### 15.4.1.2 What is the recommended hardware configuration for a TiDB cluster in the development, test, or production environment?

You can deploy and run TiDB on the 64-bit generic hardware server platform in the Intel x86-64 architecture or on the hardware server platform in the ARM architecture. For the requirements and recommendations about server hardware configuration for development, test, and production environments, see [Software and Hardware Recommendations - Server recommendations](#).

#### 15.4.1.3 What's the purposes of 2 network cards of 10 gigabit?

As a distributed cluster, TiDB has a high demand on time, especially for PD, because PD needs to distribute unique timestamps. If the time in the PD servers is not consistent, it takes longer waiting time when switching the PD server. The bond of two network cards guarantees the stability of data transmission, and 10 gigabit guarantees the transmission speed. Gigabit network cards are prone to meet bottlenecks, therefore it is strongly recommended to use 10 gigabit network cards.

#### 15.4.1.4 Is it feasible if we don't use RAID for SSD?

If the resources are adequate, it is recommended to use RAID 10 for SSD. If the resources are inadequate, it is acceptable not to use RAID for SSD.

#### 15.4.1.5 What's the recommended configuration of TiDB components?

- TiDB has a high requirement on CPU and memory. If you need to enable TiDB Binlog, the local disk space should be increased based on the service volume estimation and the time requirement for the GC operation. But the SSD disk is not a must.
- PD stores the cluster metadata and has frequent Read and Write requests. It demands a high I/O disk. A disk of low performance will affect the performance of the whole cluster. It is recommended to use SSD disks. In addition, a larger number of Regions has a higher requirement on CPU and memory.
- TiKV has a high requirement on CPU, memory and disk. It is required to use SSD.

For details, see [Software and Hardware Recommendations](#).

## 15.4.2 Installation and deployment

For the production environment, it is recommended to use [TiUP](#) to deploy your TiDB cluster. See [Deploy a TiDB Cluster Using TiUP](#).

### 15.4.2.1 Why the modified toml configuration for TiKV/PD does not take effect?

You need to set the `--config` parameter in TiKV/PD to make the `toml` configuration effective. TiKV/PD does not read the configuration by default. Currently, this issue only occurs when deploying using Binary. For TiKV, edit the configuration and restart the service. For PD, the configuration file is only read when PD is started for the first time, after which you can modify the configuration using `pd-ctl`. For details, see [PD Control User Guide](#).

### 15.4.2.2 Should I deploy the TiDB monitoring framework (Prometheus + Grafana) on a standalone machine or on multiple machines? What is the recommended CPU and memory?

The monitoring machine is recommended to use standalone deployment. It is recommended to use an 8 core CPU with 16 GB+ memory and a 500 GB+ hard disk.

### 15.4.2.3 Why the monitor cannot display all metrics?

Check the time difference between the machine time of the monitor and the time within the cluster. If it is large, you can correct the time and the monitor will display all the metrics.

### 15.4.2.4 What is the function of supervise/svc/svstat service?

- supervise: the daemon process, to manage the processes
- svc: to start and stop the service
- svstat: to check the process status

### 15.4.2.5 Description of inventory.ini variables

| Variable                  | Description                   |
|---------------------------|-------------------------------|
| <code>cluster_name</code> | name of a cluster, adjustable |
| <code>tidb_version</code> | version of TiDB               |

| Variable                         | Description                                                                                                                                   |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <code>deployment_method</code>   | method of deployment, binary by default, Docker optional                                                                                      |
| <code>process_supervision</code> | supervision way of processes, systemd by default, supervise optional                                                                          |
| <code>timezone</code>            | time-zone of the managed node, adjustable, Asia/Shanghai<br>↳ Shanghai<br>↳ by default, used with the <code>set_timezone</code><br>↳ variable |

---

| Variable | Description |
|----------|-------------|
|----------|-------------|

---

|                           |        |
|---------------------------|--------|
| <code>set_timezone</code> | enable |
|---------------------------|--------|

↳ the time-zone of the managed node, True by default; False means closing

|                          |        |
|--------------------------|--------|
| <code>enable_curl</code> | enable |
|--------------------------|--------|

↳ not supported

|                               |        |
|-------------------------------|--------|
| <code>enable_firewalld</code> | enable |
|-------------------------------|--------|

↳ enable the firewall, closed by default

|                          |        |
|--------------------------|--------|
| <code>enable_ntpd</code> | enable |
|--------------------------|--------|

↳ monitor the NTP service of the managed node, True by default; do not close it

| <u>Variable</u>                | <u>Description</u>                                                          |
|--------------------------------|-----------------------------------------------------------------------------|
| <code>machine_benchmark</code> |                                                                             |
| ↪                              | monitor the disk IOPS of the managed node, True by default; do not close it |
| <code>set_hostname</code>      |                                                                             |
| ↪                              | the host-name of the managed node based on the IP, False by default         |

| <u>Variable</u>              | <u>Description</u>                                                                                                                    |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| <code>enable_binlog</code>   | to deploy Pump and enable the binlog, False by default, dependent on the Kafka cluster; see the <code>zookeeper_addrs</code> variable |
| <code>zookeeper_addrs</code> | ZooKeeper address of the binlog Kafka cluster                                                                                         |

| <u>Variable</u>                    | <u>Description</u>                                                                                                                                               |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>enable_slow_query_log</code> | record the slow query log of TiDB into a single file: ({{ de-<br>ploy_dir<br>}}/log/tidb_slow_query.log).<br>False by default,<br>to record it into the TiDB log |

| Variable                         | Description                                                                                                                                                                  |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>deploy_without_tidb</code> | Key-Value mode, deploy only PD, TiKV and the monitoring service, not TiDB; set the IP of the <code>tidb_servers</code> host group to null in the <code>inventory</code> file |

#### 15.4.2.6 How to separately record the slow query log in TiDB? How to locate the slow query SQL statement?

1. The slow query definition for TiDB is in the TiDB configuration file. The `slow-  
↔ threshold: 300` parameter is used to configure the threshold value of the slow query (unit: millisecond).
2. If a slow query occurs, you can locate the `tidb-server` instance where the slow query is and the slow query time point using Grafana and find the SQL statement information recorded in the log on the corresponding node.
3. In addition to the log, you can also view the slow query using the `ADMIN SHOW SLOW` command. For details, see [ADMIN SHOW SLOW command](#).

#### 15.4.2.7 How to add the label configuration if label of TiKV was not configured when I deployed the TiDB cluster for the first time?

The configuration of TiDB `label` is related to the cluster deployment architecture. It is important and is the basis for PD to execute global management and scheduling. If you did not configure `label` when deploying the cluster previously, you should adjust the deployment structure by manually adding the `location-labels` information using the PD management tool `pd-ctl`, for example, `config set location-labels "zone,rack,host"` (you should configure it based on the practical `label` level name).

For the usage of `pd-ctl`, see [PD Control User Guide](#).

#### 15.4.2.8 Why does the `dd` command for the disk test use the `oflag=direct` option?

The Direct mode wraps the Write request into the I/O command and sends this command to the disk to bypass the file system cache and directly test the real I/O Read/Write performance of the disk.

#### 15.4.2.9 How to use the `fio` command to test the disk performance of the TiKV instance?

- Random Read test:

```
./fio -ioengine=psync -bs=32k -fdatasync=1 -thread -rw=randread -size
↳ =10G -filename=fio_randread_test.txt -name='fio randread test' -
↳ iodepth=4 -runtime=60 -numjobs=4 -group_reporting --output-format
↳ =json --output=fio_randread_result.json
```

- The mix test of sequential Write and random Read:

```
./fio -ioengine=psync -bs=32k -fdatasync=1 -thread -rw=randrw -
↳ percentage_random=100,0 -size=10G -filename=
↳ fio_randread_write_test.txt -name='fio mixed randread and
↳ sequential write test' -iodepth=4 -runtime=60 -numjobs=4 -
↳ group_reporting --output-format=json --output=
↳ fio_randread_write_test.json
```

### 15.4.3 What public cloud vendors are currently supported by TiDB?

TiDB supports deployment on [Google GKE](#), [AWS EKS](#), and [Alibaba Cloud ACK](#).

In addition, TiDB is currently available on JD Cloud and UCloud.

## 15.5 Migration FAQs

This document summarizes the frequently asked questions (FAQs) related to TiDB data migration.

For the frequently asked questions about migration-related tools, click the corresponding links in the list below:

- [Backup & Restore FAQs](#)
- [TiDB Binlog FAQ](#)
- [TiDB Lightning FAQs](#)
- [TiDB Data Migration \(DM\) FAQs](#)
- [TiCDC FAQs](#)

## 15.5.1 Full data export and import

### 15.5.1.1 How to migrate an application running on MySQL to TiDB?

Because TiDB supports most MySQL syntax, generally you can migrate your applications to TiDB without changing a single line of code in most cases.

### 15.5.1.2 Data import and export is slow, and many retries and EOF errors appear in the log of each component without other errors

If no other logical errors occur, retries and EOF errors might be caused by network issues. It is recommended to first use tools to check the network connectivity. In the following example, [iperf](#) is used for troubleshooting:

- Execute the following command on the server-side node where the retries and EOF errors occur:

```
iperf3 -s
```

- Execute the following command on the client-side node where the retries and EOF errors occur:

```
iperf3 -c <server-IP>
```

The following example is the output of a client node with a good network connection:

```
$ iperf3 -c 192.168.196.58
Connecting to host 192.168.196.58, port 5201
[5] local 192.168.196.150 port 55397 connected to 192.168.196.58 port 5201
[ID] Interval Transfer Bitrate
[5] 0.00-1.00 sec 18.0 MBytes 150 Mb/s
[5] 1.00-2.00 sec 20.8 MBytes 175 Mb/s
[5] 2.00-3.00 sec 18.2 MBytes 153 Mb/s
[5] 3.00-4.00 sec 22.5 MBytes 188 Mb/s
[5] 4.00-5.00 sec 22.4 MBytes 188 Mb/s
[5] 5.00-6.00 sec 22.8 MBytes 191 Mb/s
```

```
[5] 6.00-7.00 sec 20.8 MBytes 174 Mbits/sec
[5] 7.00-8.00 sec 20.1 MBytes 168 Mbits/sec
[5] 8.00-9.00 sec 20.8 MBytes 175 Mbits/sec
[5] 9.00-10.00 sec 21.8 MBytes 183 Mbits/sec

[ID] Interval Transfer Bitrate
[5] 0.00-10.00 sec 208 MBytes 175 Mbits/sec sender
[5] 0.00-10.00 sec 208 MBytes 174 Mbits/sec receiver

iperf Done.
```

If the output shows low network bandwidth and high bandwidth fluctuations, a large number of retries and EOF errors might appear in each component log. In this case, you need to consult your network service provider to improve the network quality.

If the output of each metric looks good, try to update each component. If the problem persists after the updating, [get support](#) from PingCAP or the community.

### 15.5.1.3 If I accidentally import the MySQL user table into TiDB, or forget the password and cannot log in, how to deal with it?

Restart the TiDB service, add the `-skip-grant-table=true` parameter in the configuration file. Log into the cluster without password and recreate the user, or recreate the `mysql.user` table. For the specific table schema, search the official documentation.

### 15.5.1.4 How to export the data in TiDB?

You can use the following methods to export the data in TiDB:

- Export data using `mysqldump` and the `WHERE` clause.
- Use the MySQL client to export the results of `select` to a file.

### 15.5.1.5 How to migrate from DB2 or Oracle to TiDB?

To migrate all the data or migrate incrementally from DB2 or Oracle to TiDB, see the following solution:

- Use the official migration tool of Oracle, such as OGG, Gateway, CDC (Change Data Capture).
- Develop a program for importing and exporting data.
- Export Spool as text file, and import data using Load infile.
- Use a third-party data migration tool.

Currently, it is recommended to use OGG.

### 15.5.1.6 Error: java.sql.BatchUpdateException:statement count 5001 exceeds the transaction limitation while using Sqoop to write data into TiDB in batches

In Sqoop, `--batch` means committing 100 statements in each batch, but by default each statement contains 100 SQL statements. So,  $100 * 100 = 10000$  SQL statements, which exceeds 5000, the maximum number of statements allowed in a single TiDB transaction.

Two solutions:

- Add the `-Dsqoop.export.records.per.statement=10` option as follows:

```
sqoop export \
 -Dsqoop.export.records.per.statement=10 \
 --connect jdbc:mysql://mysql.example.com/sqoop \
 --username sqoop ${user} \
 --password ${passwd} \
 --table ${tab_name} \
 --export-dir ${dir} \
 --batch
```

- You can also increase the limited number of statements in a single TiDB transaction, but this will consume more memory.

### 15.5.1.7 Why does Dumping return The local disk space is insufficient error or cause the upstream database to run out of memory when exporting a table?

This issue might have the following causes:

- The database's primary keys are not evenly distributed (for example, when you enable [SHARD\\_ROW\\_ID\\_BITS](#)).
- The upstream database is TiDB and the exported table is a partitioned table.

For the above cases, Dumping splits excessively large data chunk for the export and sends queries with excessively large results. To address the issue, you can get the latest version of Dumping.

### 15.5.1.8 Does TiDB have a function like the Flashback Query in Oracle? Does it support DDL?

Yes, it does. And it supports DDL as well. For details, see [how TiDB reads data from history versions](#).

## 15.5.2 Migrate the data online

### 15.5.2.1 Is there a current solution to replicating data from TiDB to other databases like HBase and Elasticsearch?

No. Currently, the data replication depends on the application itself.

## 15.5.3 Migrate the traffic

### 15.5.3.1 How to migrate the traffic quickly?

It is recommended to migrate application data from MySQL to TiDB using [TiDB Data Migration](#) tool. You can migrate the read and write traffic in batches by editing the network configuration as needed. Deploy a stable network LB (such as HAproxy, LVS, F5, and DNS) on the upper layer, in order to implement seamless migration by directly editing the network configuration.

### 15.5.3.2 Is there a limit for the total write and read capacity in TiDB?

The total read capacity has no limit. You can increase the read capacity by adding more TiDB servers. Generally the write capacity has no limit as well. You can increase the write capacity by adding more TiKV nodes.

### 15.5.3.3 The error message `transaction too large` is displayed

Due to the limitation of the underlying storage engine, each key-value entry (one row) in TiDB should be no more than 6MB. You can adjust the `txn-entry-size-limit` configuration value up to 120MB.

Distributed transactions need two-phase commit and the bottom layer performs the Raft replication. If a transaction is very large, the commit process would be quite slow and the write conflict is more likely to occur. Moreover, the rollback of a failed transaction leads to an unnecessary performance penalty. To avoid these problems, we limit the total size of key-value entries to no more than 100MB in a transaction by default. If you need larger transactions, modify the value of `txn-total-size-limit` in the TiDB configuration file. The maximum value of this configuration item is up to 10G. The actual limitation is also affected by the physical memory of the machine.

There are [similar limits](#) on Google Cloud Spanner.

### 15.5.3.4 How to import data in batches?

When you import data, insert in batches and keep the number of rows within 10,000 for each batch.

#### 15.5.3.5 Does TiDB release space immediately after deleting data?

None of the `DELETE`, `TRUNCATE` and `DROP` operations release data immediately. For the `TRUNCATE` and `DROP` operations, after the TiDB GC (Garbage Collection) time (10 minutes by default), the data is deleted and the space is released. For the `DELETE` operation, the data is deleted but the space is not released according to TiDB GC. When subsequent data is written into RocksDB and executes `COMPACT`, the space is reused.

#### 15.5.3.6 Can I execute DDL operations on the target table when loading data?

No. None of the DDL operations can be executed on the target table when you load data, otherwise the data fails to be loaded.

#### 15.5.3.7 Does TiDB support the `replace into` syntax?

Yes.

#### 15.5.3.8 Why does the query speed getting slow after deleting data?

Deleting a large amount of data leaves a lot of useless keys, affecting the query efficiency. Currently the Region Merge feature is in development, which is expected to solve this problem. For details, see the [deleting data section in TiDB Best Practices](#).

#### 15.5.3.9 What is the most efficient way of deleting data?

When deleting a large amount of data, it is recommended to use `Delete from t where`  
`↪ xx limit 5000;`. It deletes through the loop and uses `Affected Rows == 0` as a condition to end the loop, so as not to exceed the limit of transaction size. With the prerequisite of meeting business filtering logic, it is recommended to add a strong filter index column or directly use the primary key to select the range, such as `id >= 5000*n+m` and `id < 5000*(`  
`↪ n+1)+m`.

If the amount of data that needs to be deleted at a time is very large, this loop method will get slower and slower because each deletion traverses backward. After deleting the previous data, lots of deleted flags remain for a short period (then all will be processed by Garbage Collection) and influence the following `Delete` statement. If possible, it is recommended to refine the `Where` condition. See [details in TiDB Best Practices](#).

#### 15.5.3.10 How to improve the data loading speed in TiDB?

- The [TiDB Lightning](#) tool is developed for distributed data import. It should be noted that the data import process does not perform a complete transaction process for performance reasons. Therefore, the ACID constraint of the data being imported during the import process cannot be guaranteed. The ACID constraint of the imported data can only be guaranteed after the entire import process ends. Therefore, the

applicable scenarios mainly include importing new data (such as a new table or a new index) or the full backup and restoring (truncate the original table and then import data).

- Data loading in TiDB is related to the status of disks and the whole cluster. When loading data, pay attention to metrics like the disk usage rate of the host, TiClient Error, Backoff, Thread CPU and so on. You can analyze the bottlenecks using these metrics.

## 15.6 Upgrade and After Upgrade FAQs

This document introduces some FAQs and their solutions when or after you upgrade TiDB.

### 15.6.1 Upgrade FAQs

This section lists some FAQs and their solutions when you upgrade TiDB.

#### 15.6.1.1 What are the effects of rolling updates?

When you apply rolling updates to the TiDB services, the running application is affected to varying degrees. Therefore, it is not recommended that you perform a rolling update during business peak hours. You need to configure the minimum cluster topology (TiDB \* 2, PD \* 3, TiKV \* 3). If the Pump or Drainer service is involved in the cluster, it is recommended to stop Drainer before rolling updates. When you upgrade TiDB, Pump is also upgraded.

#### 15.6.1.2 Can I upgrade the TiDB cluster during the DDL execution?

**DO NOT** upgrade a TiDB cluster when a DDL statement is being executed in the cluster (usually for the time-consuming DDL statements such as `ADD INDEX` and the column type changes).

Before the upgrade, it is recommended to use the `ADMIN SHOW DDL` command to check whether the TiDB cluster has an ongoing DDL job. If the cluster has a DDL job, to upgrade the cluster, wait until the DDL execution is finished or use the `ADMIN CANCEL DDL` command to cancel the DDL job before you upgrade the cluster.

In addition, during the cluster upgrade, **DO NOT** execute any DDL statement. Otherwise, the issue of undefined behavior might occur.

#### 15.6.1.3 How to upgrade TiDB using the binary?

It is not recommended to upgrade TiDB using the binary. Instead, it is recommended to [upgrade TiDB using TiUP](#) or [upgrade a TiDB cluster on Kubernetes](#), which ensures both version consistency and compatibility.

## 15.6.2 After upgrade FAQs

This section lists some FAQs and their solutions after you upgrade TiDB.

### 15.6.2.1 The character set (charset) errors when executing DDL operations

In v2.1.0 and earlier versions (including all versions of v2.0), the character set of TiDB is UTF-8 by default. But starting from v2.1.1, the default character set has been changed into UTF8MB4.

If you explicitly specify the charset of a newly created table as UTF-8 in v2.1.0 or earlier versions, then you might fail to execute DDL operations after upgrading TiDB to v2.1.1.

To avoid this issue, you need to pay attention to:

- Before v2.1.3, TiDB does not support modifying the charset of the column. Therefore, when you execute DDL operations, you need to make sure that the charset of the new column is consistent with that of the original column.
- Before v2.1.3, even if the charset of the column is different from that of the table, `show create table` does not show the charset of the column. But as shown in the following example, you can view it by obtaining the metadata of the table through the HTTP API.

#### 15.6.2.1.1 unsupported modify column charset utf8mb4 not match origin utf8

- Before upgrading, the following operations are executed in v2.1.0 and earlier versions.

```
create table t(a varchar(10)) charset=utf8;
```

```
Query OK, 0 rows affected
Time: 0.106s
```

```
show create table t;
```

```
+-----+-----+-----+-----+
| Table | Create Table |
+-----+-----+-----+-----+
t	CREATE TABLE `t` (
	`a` varchar(10) DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8 COLLATE=utf8_bin
+-----+-----+-----+-----+
1 row in set
Time: 0.006s
```

- After upgrading, the following error is reported in v2.1.1 and v2.1.2 but there is no such error in v2.1.3 and the later versions.

```
alter table t change column a a varchar(20);
```

```
ERROR 1105 (HY000): unsupported modify column charset utf8mb4 not match
↪ origin utf8
```

Solution:

You can explicitly specify the column charset as the same with the original charset.

```
alter table t change column a a varchar(22) character set utf8;
```

- According to Point #1, if you do not specify the column charset, UTF8MB4 is used by default, so you need to specify the column charset to make it consistent with the original one.
- According to Point #2, you can obtain the metadata of the table through the HTTP API, and find the column charset by searching the column name and the keyword “Charset”.

```
curl "http://$IP:10080/schema/test/t" | python -m json.tool
```

A python tool is used here to format JSON, which is not required and only for the convenience to add the comments.

```
{
 "ShardRowIDBits": 0,
 "auto_inc_id": 0,
 "charset": "utf8", # The charset of the table.
 "collate": "",
 "cols": [# The relevant information about the columns.
 {
 ...
 "id": 1,
 "name": {
 "L": "a",
 "O": "a" # The column name.
 },
 "offset": 0,
 "origin_default": null,
 "state": 5,
 "type": {
 "Charset": "utf8", # The charset of column a.
 "Collate": "utf8_bin",
```

```

 "Decimal": 0,
 "Elems": null,
 "Flag": 0,
 "Flen": 10,
 "Tp": 15
 }
}
],
...
}

```

### 15.6.2.1.2 unsupported modify charset from utf8mb4 to utf8

- Before upgrading, the following operations are executed in v2.1.1 and v2.1.2.

```
create table t(a varchar(10)) charset=utf8;
```

```
Query OK, 0 rows affected
Time: 0.109s
```

```
show create table t;
```

```

+-----+-----+-----+
| Table | Create Table |
+-----+-----+-----+
t	CREATE TABLE `t` (
	`a` varchar(10) DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8 COLLATE=utf8_bin
+-----+-----+-----+

```

In the above example, `show create table` only shows the charset of the table, but the charset of the column is actually UTF8MB4, which can be confirmed by obtaining the schema through the HTTP API. However, when a new table is created, the charset of the column should stay consistent with that of the table. This bug has been fixed in v2.1.3.

- After upgrading, the following operations are executed in v2.1.3 and the later versions.

```
show create table t;
```

```

+-----+-----+-----+-----+
↪
| Table | Create Table |
+-----+-----+-----+-----+
↪

```

```

t | CREATE TABLE `t` (
 | `a` varchar(10) CHARSET utf8mb4 COLLATE utf8mb4_bin DEFAULT
 | NULL |
 |) ENGINE=InnoDB DEFAULT CHARSET=utf8 COLLATE=utf8_bin |
+-----+-----+-----+-----+-----+-----+-----+-----+
↪
1 row in set
Time: 0.007s

```

```
alter table t change column a a varchar(20);
```

```
ERROR 1105 (HY000): unsupported modify charset from utf8mb4 to utf8
```

Solution:

- Starting from v2.1.3, TiDB supports modifying the charsets of the column and the table, so it is recommended to modify the table charset into UTF8MB4.

```
alter table t convert to character set utf8mb4;
```

- You can also specify the column charset as done in Issue #1, making it stay consistent with the original column charset (UTF8MB4).

```
alter table t change column a a varchar(20) character set utf8mb4;
```

### 15.6.2.1.3 ERROR 1366 (HY000): incorrect utf8 value f09f8c80(□) for column a

In TiDB v2.1.1 and earlier versions, if the charset is UTF-8, there is no UTF-8 Unicode encoding check on the inserted 4-byte data. But in v2.1.2 and the later versions, this check is added.

- Before upgrading, the following operations are executed in v2.1.1 and earlier versions.

```
create table t(a varchar(100) charset utf8);
```

```
Query OK, 0 rows affected
```

```
insert t values (unhex('f09f8c80'));
```

```
Query OK, 1 row affected
```

- After upgrading, the following error is reported in v2.1.2 and the later versions.

```
insert t values (unhex('f09f8c80'));
```

```
ERROR 1366 (HY000): incorrect utf8 value f09f8c80() for column a
```

Solution:

- In v2.1.2: this version does not support modifying the column charset, so you have to skip the UTF-8 check.

```
set @@session.tidb_skip_utf8_check=1;
```

```
Query OK, 0 rows affected
```

```
insert t values (unhex('f09f8c80'));
```

```
Query OK, 1 row affected
```

- In v2.1.3 and the later versions: it is recommended to modify the column charset into UTF8MB4. Or you can set `tidb_skip_utf8_check` to skip the UTF-8 check. But if you skip the check, you might fail to replicate data from TiDB to MySQL because MySQL executes the check.

```
alter table t change column a a varchar(100) character set utf8mb4;
```

```
Query OK, 0 rows affected
```

```
insert t values (unhex('f09f8c80'));
```

```
Query OK, 1 row affected
```

Specifically, you can use the variable `tidb_skip_utf8_check` to skip the legal UTF-8 and UTF8MB4 check on the data. But if you skip the check, you might fail to replicate the data from TiDB to MySQL because MySQL executes the check.

If you only want to skip the UTF-8 check, you can set `tidb_check_mb4_value_in_utf8`  $\leftrightarrow$  `.`. This variable is added to the `config.toml` file in v2.1.3, and you can modify `check-mb4-value-in-utf8` in the configuration file and then restart the cluster to enable it.

Starting from v2.1.5, you can set `tidb_check_mb4_value_in_utf8` through the HTTP API and the session variable:

– HTTP API ( the HTTP API can be enabled only on a single server )

\* To enable HTTP API:

```
curl -X POST -d "check_mb4_value_in_utf8=1" http://{TiDBIP
↪ }:10080/settings
```

\* To disable HTTP API:

```
curl -X POST -d "check_mb4_value_in_utf8=0" http://{TiDBIP
↪ }:10080/settings
```

– Session variable

\* To enable session variable:

```
set @@session.tidb_check_mb4_value_in_utf8 = 1;
```

\* To disable session variable:

```
set @@session.tidb_check_mb4_value_in_utf8 = 0;
```

## 15.7 TiDB Monitoring FAQs

This document summarizes the FAQs related to TiDB monitoring.

- For details of Prometheus monitoring framework, see [Overview of the Monitoring Framework](#).
- For details of key metrics of monitoring, see [Key Metrics](#).

### 15.7.1 Is there a better way of monitoring the key metrics?

The monitoring system of TiDB consists of Prometheus and Grafana. From the dashboard in Grafana, you can monitor various running metrics of TiDB which include the monitoring metrics of system resources, of client connection and SQL operation, of internal communication and Region scheduling. With these metrics, the database administrator can better understand the system running status, running bottlenecks and so on. In the practice of monitoring these metrics, we list the key metrics of each TiDB component. Generally you only need to pay attention to these common metrics. For details, see [official documentation](#).

### 15.7.2 The Prometheus monitoring data is deleted every 15 days by default. Could I set it to two months or delete the monitoring data manually?

Yes. Find the startup script on the machine where Prometheus is started, edit the startup parameter and restart Prometheus.

```
--storage.tsdb.retention="60d"
```

### 15.7.3 Region Health monitor

In TiDB 2.0, Region health is monitored in the PD metric monitoring page, in which the **Region Health** monitoring item shows the statistics of all the Region replica status. **miss** means shortage of replicas and **extra** means the extra replica exists. In addition, **Region Health** also shows the isolation level by **label**. **level-1** means the Region replicas are isolated physically in the first **label** level. All the Regions are in **level-0** when **location label** is not configured.

### 15.7.4 What is the meaning of **selectsimplefull** in Statement Count monitor?

It means full table scan but the table might be a small system table.

### 15.7.5 What is the difference between QPS and Statement OPS in the monitor?

The **QPS** statistics is about all the SQL statements, including **use database**, **load data**, **begin**, **commit**, **set**, **show**, **insert** and **select**.

The **Statement OPS** statistics is only about applications related SQL statements, including **select**, **update** and **insert**, therefore the **Statement OPS** statistics matches the applications better.

## 15.8 TiDB Cluster Management FAQs

This document summarizes the FAQs related to TiDB cluster management.

### 15.8.1 Daily management

This section describes common problems you might encounter during daily cluster management, their causes, and solutions.

#### 15.8.1.1 How to log into TiDB?

You can log into TiDB like logging into MySQL. For example:

```
mysql -h 127.0.0.1 -uroot -P4000
```

#### 15.8.1.2 How to modify the system variables in TiDB?

Similar to MySQL, TiDB includes static and solid parameters. You can directly modify static parameters using **SET GLOBAL xxx = n**, but the new value of a parameter is only effective within the life cycle in this instance.

### 15.8.1.3 Where and what are the data directories in TiDB (TiKV)?

TiKV data is located in the `--data-dir`, which include four directories of backup, db, raft, and snap, used to store backup, data, Raft data, and mirror data respectively.

### 15.8.1.4 What are the system tables in TiDB?

Similar to MySQL, TiDB includes system tables as well, used to store the information required by the server when it runs. See [TiDB system table](#).

### 15.8.1.5 Where are the TiDB/PD/TiKV logs?

By default, TiDB/PD/TiKV outputs standard error in the logs. If a log file is specified by `--log-file` during the startup, the log is output to the specified file and executes rotation daily.

### 15.8.1.6 How to safely stop TiDB?

- If a load balancer is running (recommended): Stop the load balancer and execute the SQL statement `SHUTDOWN`. Then TiDB waits for a period as specified by `graceful-↔ wait-before-shutdown` until all sessions are terminated. Then TiDB stops running.
- If no load balancer is running: Execute the `SHUTDOWN` statement. Then TiDB components are gracefully stopped.

### 15.8.1.7 Can `kill` be executed in TiDB?

- Kill DML statements:

First use `information_schema.cluster_processlist` to find TiDB instance address and session ID, and then run the kill command.

TiDB v6.1.0 introduces the Global Kill feature (controlled by the `enable-global-↔ kill` configuration, which is enabled by default). If Global Kill is enabled, just execute `kill session_id`.

If the TiDB version is earlier than v6.1.0, or the Global Kill feature is not enabled, `kill session_id` does not take effect by default. To terminate a DML statement, you should connect the client directly to the TiDB instance that is executing the DML statement and then execute the `kill tidb session_id` statement. If the client connects to another TiDB instance or there is a proxy between the client and the TiDB cluster, the `kill tidb session_id` statement might be routed to another TiDB instance, which might incorrectly terminate another session. For details, see [KILL](#).

- Kill DDL statements: First use `admin show ddl jobs` to find the ID of the DDL job you need to terminate, and then run `admin cancel ddl jobs 'job_id' [, 'job_id ↔ ']` .... For more details, see the [ADMIN statement](#).

#### 15.8.1.8 Does TiDB support session timeout?

TiDB currently supports two timeouts, `wait_timeout` and `interactive_timeout`.

#### 15.8.1.9 What is the TiDB version management strategy?

For details about TiDB version management, see [TiDB versioning](#).

#### 15.8.1.10 How about the operating cost of deploying and maintaining a TiDB cluster?

TiDB provides a few features and [tools](#), with which you can manage the clusters easily at a low cost:

- For maintenance operations, [TiUP](#) works as the package manager, which simplifies the deployment, scaling, upgrade, and other maintenance tasks.
- For monitoring, the [TiDB monitoring framework](#) uses [Prometheus](#) to store the monitoring and performance metrics, and uses [Grafana](#) to visualize these metrics. Dozens of built-in panels are available with hundreds of metrics.
- For troubleshooting, the [TiDB Troubleshooting Map](#) summarizes common issues of the TiDB server and other components. You can use this map to diagnose and resolve issues when you encounter related problems.

#### 15.8.1.11 What's the difference between various TiDB master versions?

The TiDB community is highly active. The engineers have been keeping optimizing features and fixing bugs. Therefore, the TiDB version is updated quite fast. If you want to keep informed of the latest version, see [TiDB Release Timeline](#).

It is recommended to deploy TiDB [using TiUP](#) or [using TiDB Operator](#). TiDB has a unified management of the version number. You can view the version number using one of the following methods:

- `select tidb_version()`
- `tidb-server -V`

#### 15.8.1.12 Is there a graphical deployment tool for TiDB?

Currently no.

#### 15.8.1.13 How to scale out a TiDB cluster?

You can scale out your TiDB cluster without interrupting the online services.

- If your cluster is deployed using [TiUP](#), refer to [Scale a TiDB Cluster Using TiUP](#).
- If your cluster is deployed using [TiDB Operator](#) on Kubernetes, refer to [Manually Scale TiDB on Kubernetes](#).

#### 15.8.1.14 How to scale TiDB horizontally?

As your business grows, your database might face the following three bottlenecks:

- Lack of storage resources which means that the disk space is not enough.
- Lack of computing resources such as high CPU occupancy.
- Not enough write and read capacity.

You can scale TiDB as your business grows.

- If the disk space is not enough, you can increase the capacity simply by adding more TiKV nodes. When the new node is started, PD will migrate the data from other nodes to the new node automatically.
- If the computing resources are not enough, check the CPU consumption situation first before adding more TiDB nodes or TiKV nodes. When a TiDB node is added, you can configure it in the Load Balancer.
- If the capacity is not enough, you can add both TiDB nodes and TiKV nodes.

#### 15.8.1.15 If Percolator uses distributed locks and the crash client keeps the lock, will the lock not be released?

For more details, see [Percolator and TiDB Transaction Algorithm](#) in Chinese.

#### 15.8.1.16 Why does TiDB use gRPC instead of Thrift? Is it because Google uses it?

Not really. We need some good features of gRPC, such as flow control, encryption and streaming.

#### 15.8.1.17 What does the 92 indicate in `like(bindo.customers.name, jason%, 92)`?

The 92 indicates the escape character, which is ASCII 92 by default.

#### 15.8.1.18 Why does the data length shown by `information_schema.tables.data_length` differ from the store size on the TiKV monitoring panel?

Two reasons:

- The two results are calculated in different ways. `information_schema.tables.data_length` ⇔ `data_length` is an estimated value by calculating the averaged length of each row, while the store size on the TiKV monitoring panel sums up the length of the data files (the SST files of RocksDB) in a single TiKV instance.

- `information_schema.tables.data_length` is a logical value, while the store size is a physical value. The redundant data generated by multiple versions of the transaction is not included in the logical value, while the redundant data is compressed by TiKV in the physical value.

#### 15.8.1.19 Why does the transaction not use the Async Commit or the one-phase commit feature?

In the following situations, even you have enabled the [Async Commit](#) feature and the [one-phase commit](#) feature using the system variables, TiDB will not use these features:

- If you have enabled TiDB Binlog, restricted by the implementation of TiDB Binlog, TiDB does not use the Async Commit or one-phase commit feature.
- TiDB uses the Async Commit or one-phase commit features only when no more than 256 key-value pairs are written in the transaction and the total size of keys is no more than 4 KB. This is because, for transactions with a large amount of data to write, using Async Commit cannot greatly improve the performance.

### 15.8.2 PD management

This section describes common problems you may encounter during PD management, their causes, and solutions.

#### 15.8.2.1 The TiKV cluster is not bootstrapped message is displayed when I access PD

Most of the APIs of PD are available only when the TiKV cluster is initialized. This message is displayed if PD is accessed when PD is started while TiKV is not started when a new cluster is deployed. If this message is displayed, start the TiKV cluster. When TiKV is initialized, PD is accessible.

#### 15.8.2.2 The etcd cluster ID mismatch message is displayed when starting PD

This is because the `--initial-cluster` in the PD startup parameter contains a member that doesn't belong to this cluster. To solve this problem, check the corresponding cluster of each member, remove the wrong member, and then restart PD.

#### 15.8.2.3 What's the maximum tolerance for time synchronization error of PD?

PD can tolerate any synchronization error, but a larger error value means a larger gap between the timestamp allocated by the PD and the physical time, which will affect functions such as read of historical versions.

#### 15.8.2.4 How does the client connection find PD?

The client connection can only access the cluster through TiDB. TiDB connects PD and TiKV. PD and TiKV are transparent to the client. When TiDB connects to any PD, the PD tells TiDB who is the current leader. If this PD is not the leader, TiDB reconnects to the leader PD.

#### 15.8.2.5 What is the relationship between each status (Up, Disconnect, Offline, Down, Tombstone) of a TiKV store?

For the relationship between each status, refer to [Relationship between each status of a TiKV store](#).

You can use PD Control to check the status information of a TiKV store.

#### 15.8.2.6 What is the difference between the `leader-schedule-limit` and `region-schedule-limit` scheduling parameters in PD?

- The `leader-schedule-limit` scheduling parameter is used to balance the Leader number of different TiKV servers, affecting the load of query processing.
- The `region-schedule-limit` scheduling parameter is used to balance the replica number of different TiKV servers, affecting the data amount of different nodes.

#### 15.8.2.7 Is the number of replicas in each region configurable? If yes, how to configure it?

Yes. Currently, you can only update the global number of replicas. When started for the first time, PD reads the configuration file (`conf/pd.yml`) and uses the `max-replicas` configuration in it. If you want to update the number later, use the `pd-ctl` configuration command `config set max-replicas $num` and view the enabled configuration using `config show ↵ all`. The updating does not affect the applications and is configured in the background.

Make sure that the total number of TiKV instances is always greater than or equal to the number of replicas you set. For example, 3 replicas need 3 TiKV instances at least. Additional storage requirements need to be estimated before increasing the number of replicas. For more information about `pd-ctl`, see [PD Control User Guide](#).

#### 15.8.2.8 How to check the health status of the whole cluster when lacking command line cluster management tools?

You can determine the general status of the cluster using the `pd-ctl` tool. For detailed cluster status, you need to use the monitor to determine.

#### 15.8.2.9 How to delete the monitoring data of a cluster node that is offline?

The offline node usually indicates the TiKV node. You can determine whether the offline process is finished by the `pd-ctl` or the monitor. After the node is offline, perform the following steps:

1. Manually stop the relevant services on the offline node.
2. Delete the `node_exporter` data of the corresponding node from the Prometheus configuration file.

### 15.8.3 TiDB server management

This section describes common problems you may encounter during TiDB server management, their causes, and solutions.

#### 15.8.3.1 How to set the lease parameter in TiDB?

The lease parameter (`--lease=60`) is set from the command line when starting a TiDB server. The value of the lease parameter impacts the Database Schema Changes (DDL) speed of the current session. In the testing environments, you can set the value to 1s for to speed up the testing cycle. But in the production environments, it is recommended to set the value to minutes (for example, 60) to ensure the DDL safety.

#### 15.8.3.2 What is the processing time of a DDL operation?

The processing time is different for different scenarios. Generally, you can consider the following three scenarios:

1. The `Add Index` operation with a relatively small number of rows in the corresponding data table: about 3s
2. The `Add Index` operation with a relatively large number of rows in the corresponding data table: the processing time depends on the specific number of rows and the QPS at that time (the `Add Index` operation has a lower priority than ordinary SQL operations)
3. Other DDL operations: about 1s

If the TiDB server instance that receives the DDL request is the same TiDB server instance that the DDL owner is in, the first and third scenarios above may cost only dozens to hundreds of milliseconds.

#### 15.8.3.3 Why it is very slow to run DDL statements sometimes?

Possible reasons:

- If you run multiple DDL statements together, the last few DDL statements might run slowly. This is because the DDL statements are executed serially in the TiDB cluster.
- After you start the cluster successfully, the first DDL operation may take a longer time to run, usually around 30s. This is because the TiDB cluster is electing the leader that processes DDL statements.

- The processing time of DDL statements in the first ten minutes after starting TiDB would be much longer than the normal case if you meet the following conditions: 1) TiDB cannot communicate with PD as usual when you are stopping TiDB (including the case of power failure); 2) TiDB fails to clean up the registration data from PD in time because TiDB is stopped by the `kill -9` command. If you run DDL statements during this period, for the state change of each DDL, you need to wait for  $2 * \text{lease}$  (lease = 45s).
- If a communication issue occurs between a TiDB server and a PD server in the cluster, the TiDB server cannot get or update the version information from the PD server in time. In this case, you need to wait for  $2 * \text{lease}$  for the state processing of each DDL.

#### 15.8.3.4 Can I use S3 as the backend storage engine in TiDB?

No. Currently, TiDB only supports the distributed storage engine and the Goleveldb/RocksDB/BoltDB engine.

#### 15.8.3.5 Can the `Information_schema` support more real information?

As part of MySQL compatibility, TiDB supports a number of `INFORMATION_SCHEMA`  $\hookrightarrow$  tables. Many of these tables also have a corresponding `SHOW` command. For more information, see [Information Schema](#).

#### 15.8.3.6 What's the explanation of the TiDB Backoff type scenario?

In the communication process between the TiDB server and the TiKV server, the `Server`  $\hookrightarrow$  `is busy` or `backoff.maxsleep 20000ms` log message is displayed when processing a large volume of data. This is because the system is busy while the TiKV server processes data. At this time, usually you can view that the TiKV host resources usage rate is high. If this occurs, you can increase the server capacity according to the resources usage.

#### 15.8.3.7 What is the main reason of TiDB TiClient type?

The TiClient Region Error indicator describes the error types and metrics that appear when the TiDB server as a client accesses the TiKV server through the KV interface to perform data operations. The error types include `not_leader` and `stale_epoch`. These errors occur when the TiDB server manipulates the Region leader data according to its own cache information, the Region leader has migrated, or the current TiKV Region information and the routing information of the TiDB cache are inconsistent. Generally, in this case, the TiDB server will automatically retrieve the latest routing data from PD and redo the previous operation.

#### 15.8.3.8 What's the maximum number of concurrent connections that TiDB supports?

By default, there is no limit on the maximum number of connections per TiDB server. If needed, you can limit the maximum number of connections by setting `instance`. ↪ `max_connections` in the `config.toml` file, or changing the value of the system variable `max_connections`. If too large concurrency leads to an increase of response time, it is recommended to increase the capacity by adding TiDB nodes.

### 15.8.3.9 How to view the creation time of a table?

The `create_time` of tables in the `information_schema` is the creation time.

### 15.8.3.10 What is the meaning of `EXPENSIVE_QUERY` in the TiDB log?

When TiDB is executing a SQL statement, the query will be `EXPENSIVE_QUERY` if each operator is estimated to process over 10,000 rows. You can modify the `tidb-server` configuration parameter to adjust the threshold and then restart the `tidb-server`.

### 15.8.3.11 How do I estimate the size of a table in TiDB?

To estimate the size of a table in TiDB, you can use the following query statement.

```
SELECT
 db_name,
 table_name,
 ROUND(SUM(total_size / cnt), 2) Approximate_Size,
 ROUND(
 SUM(
 total_size / cnt / (
 SELECT
 ROUND(AVG(value), 2)
 FROM
 METRICS_SCHEMA.store_size_amplification
 WHERE
 value > 0
)
),
 2
) Disk_Size
FROM
 (
 SELECT
 db_name,
 table_name,
 region_id,
 SUM(Approximate_Size) total_size,
 COUNT(*) cnt
 FROM
```

```
information_schema.TIKV_REGION_STATUS
WHERE
 db_name = @dbname
 AND table_name IN (@table_name)
GROUP BY
 db_name,
 table_name,
 region_id
) tabinfo
GROUP BY
 db_name,
 table_name;
```

When using the above statement, you need to fill in and replace the following fields in the statement as appropriate.

- `@dbname`: the name of the database.
- `@table_name`: the name of the target table.

In addition, in the above statement:

- `store_size_amplification` indicates the average of the cluster compression ratio. In addition to using `SELECT * FROM METRICS_SCHEMA.store_size_amplification;` to query this information, you can also check the **Size amplification** metric for each node on the **Grafana Monitoring PD - statistics balance** panel. The average of the cluster compression ratio is the average of the Size amplification for all nodes.
- `Approximate_Size` indicates the size of the table in a replica before compression. Note that this is an approximate value, not an accurate one.
- `Disk_Size` indicates the size of the table after compression. This is an approximate value and can be calculated according to `Approximate_Size` and `store_size_amplification`.

## 15.8.4 TiKV server management

This section describes common problems you might encounter during TiKV server management, their causes, and solutions.

### 15.8.4.1 How to specify the location of data for compliance or multi-tenant applications?

You can use [Placement Rules](#) to specify the location of data for compliance or multi-tenant applications.

Placement Rules in SQL is designed to control the attributes of any continuous data range, such as the number of replicas, the Raft role, the placement location, and the key ranges in which the rules take effect.

#### 15.8.4.2 What is the recommended number of replicas in the TiKV cluster? Is it better to keep the minimum number for high availability?

3 replicas for each Region is sufficient for a testing environment. However, you should never operate a TiKV cluster with under 3 nodes in a production scenario. Depending on infrastructure, workload, and resiliency needs, you may wish to increase this number. It is worth noting that the higher the copy, the lower the performance, but the higher the security.

#### 15.8.4.3 The cluster ID mismatch message is displayed when starting TiKV

This is because the cluster ID stored in local TiKV is different from the cluster ID specified by PD. When a new PD cluster is deployed, PD generates random cluster IDs. TiKV gets the cluster ID from PD and stores the cluster ID locally when it is initialized. The next time when TiKV is started, it checks the local cluster ID with the cluster ID in PD. If the cluster IDs don't match, the `cluster ID mismatch` message is displayed and TiKV exits.

If you previously deploy a PD cluster, but then you remove the PD data and deploy a new PD cluster, this error occurs because TiKV uses the old data to connect to the new PD cluster.

#### 15.8.4.4 The duplicated store address message is displayed when starting TiKV

This is because the address in the startup parameter has been registered in the PD cluster by other TiKVs. Common conditions that cause this error: There is no data folder in the path specified by TiKV `--data-dir` (no update `-data-dir` after deleting or moving), restart the TiKV with the previous parameters. Please try [store delete](#) function of `pd-ctl`, delete the previous store, and then restart TiKV.

#### 15.8.4.5 TiKV primary node and secondary node use the same compression algorithm, why the results are different?

Currently, some files of TiKV primary node have a higher compression rate, which depends on the underlying data distribution and RocksDB implementation. It is normal that the data size fluctuates occasionally. The underlying storage engine adjusts data as needed.

#### 15.8.4.6 What are the features of TiKV block cache?

TiKV implements the Column Family (CF) feature of RocksDB. By default, the KV data is eventually stored in the 3 CFs (default, write and lock) within RocksDB.

- The default CF stores real data and the corresponding parameter is in `[rocksdb.defaultcf]`.
- The write CF stores the data version information (MVCC) and index-related data, and the corresponding parameter is in `[rocksdb.writecf]`.
- The lock CF stores the lock information and the system uses the default parameter.

- The Raft RocksDB instance stores Raft logs. The default CF mainly stores Raft logs and the corresponding parameter is in `[raftdb.defaultcf]`.
- All CFs have a shared block-cache to cache data blocks and improve RocksDB read speed. The size of block-cache is controlled by the `block-cache-size` parameter. A larger value of the parameter means more hot data can be cached and is more favorable to read operation. At the same time, it consumes more system memory.
- Each CF has an individual write-buffer and the size is controlled by the `write-buffer`  $\leftrightarrow$  `-size` parameter.

#### 15.8.4.7 Why is the TiKV channel full?

- The Raftstore thread is too slow or blocked by I/O. You can view the CPU usage status of Raftstore.
- TiKV is too busy (such as CPU and disk I/O) and cannot manage to handle it.

#### 15.8.4.8 Why does TiKV frequently switch Region leader?

- Network problem results in the communication stuck among nodes. You can check Report failures monitoring.
- The node of the original main Leader is stuck, resulting in failure to reach out to the Follower in time.
- Raftstore thread stuck.

#### 15.8.4.9 If a node is down, will the service be affected? If yes, how long?

TiKV uses Raft to replicate data among multiple replicas (by default 3 replicas for each Region). If one replica goes wrong, the other replicas can guarantee data safety. Based on the Raft protocol, if a single leader fails as the node goes down, a follower in another node is soon elected as the Region leader after a maximum of  $2 * \text{lease time}$  (lease time is 10 seconds).

#### 15.8.4.10 What are the TiKV scenarios that take up high I/O, memory, CPU, and exceed the parameter configuration?

Writing or reading a large volume of data in TiKV takes up high I/O, memory and CPU. Executing very complex queries costs a lot of memory and CPU resources, such as the scenario that generates large intermediate result sets.

#### 15.8.4.11 Does TiKV support SAS/SATA disks or mixed deployment of SSD/SAS disks?

No. For OLTP scenarios, TiDB requires high I/O disks for data access and operation. As a distributed database with strong consistency, TiDB has some write amplification such as replica replication and bottom layer storage compaction. Therefore, it is recommended to use NVMe SSD as the storage disks in TiDB best practices. Mixed deployment of TiKV and PD is not supported.

#### 15.8.4.12 Is the Range of the Key data table divided before data access?

No. It differs from the table splitting rules of MySQL. In TiKV, the table Range is dynamically split based on the size of Region.

#### 15.8.4.13 How does Region split?

Region is not divided in advance, but it follows a Region split mechanism. When the Region size exceeds the value of the `region-max-size` or `region-max-keys` parameters, split is triggered. After the split, the information is reported to PD.

#### 15.8.4.14 Does TiKV have the `innodb_flush_log_trx_commit` parameter like MySQL, to guarantee the security of data?

Yes. Currently, the standalone storage engine uses two RocksDB instances. One instance is used to store the raft-log. When the `sync-log` parameter in TiKV is set to true, each commit is mandatorily flushed to the raft-log. If a crash occurs, you can restore the KV data using the raft-log.

#### 15.8.4.15 What is the recommended server configuration for WAL storage, such as SSD, RAID level, cache strategy of RAID card, NUMA configuration, file system, I/O scheduling strategy of the operating system?

WAL belongs to ordered writing, and currently, we do not apply a unique configuration to it. Recommended configuration is as follows:

- SSD
- RAID 10 preferred
- Cache strategy of RAID card and I/O scheduling strategy of the operating system: currently no specific best practices; you can use the default configuration in Linux 7 or later
- NUMA: no specific suggestion; for memory allocation strategy, you can use `interleave`  
↪ = `all`
- File system: `ext4`

#### 15.8.4.16 How is the write performance in the most strict data available mode (`sync-log = true`)?

Generally, enabling `sync-log` reduces about 30% of the performance. For write performance when `sync-log` is set to false, see [Performance test result for TiDB using Sysbench](#).

#### 15.8.4.17 Can Raft + multiple replicas in the TiKV architecture achieve absolute data safety? Is it necessary to apply the most strict mode (`sync-log = true`) to a standalone storage?

Data is redundantly replicated between TiKV nodes using the [Raft Consensus Algorithm](#) to ensure recoverability should a node failure occur. Only when the data has been written

into more than 50% of the replicas will the application return ACK (two out of three nodes). However, theoretically, two nodes might crash. Therefore, except for scenarios with less strict requirement on data safety but extreme requirement on performance, it is strongly recommended that you enable the `sync-log` mode.

As an alternative to using `sync-log`, you may also consider having five replicas instead of three in your Raft group. This would allow for the failure of two replicas, while still providing data safety.

For a standalone TiKV node, it is still recommended to enable the `sync-log` mode. Otherwise, the last write might be lost in case of a node failure.

#### **15.8.4.18 Since TiKV uses the Raft protocol, multiple network roundtrips occur during data writing. What is the actual write delay?**

Theoretically, TiDB has a write delay of 4 more network roundtrips than standalone databases.

#### **15.8.4.19 Does TiDB have an InnoDB memcached plugin like MySQL which can directly use the KV interface and does not need the independent cache?**

TiKV supports calling the interface separately. Theoretically, you can take an instance as the cache. Because TiDB is a distributed relational database, we do not support TiKV separately.

#### **15.8.4.20 What is the Coprocessor component used for?**

- Reduce the data transmission between TiDB and TiKV
- Make full use of the distributed computing resources of TiKV to execute computing pushdown.

#### **15.8.4.21 The error message IO error: No space left on device While appending to file is displayed**

This is because the disk space is not enough. You need to add nodes or enlarge the disk space.

#### **15.8.4.22 Why does the OOM (Out of Memory) error occur frequently in TiKV?**

The memory usage of TiKV mainly comes from the block-cache of RocksDB, which is 40% of the system memory size by default. When the OOM error occurs frequently in TiKV, you should check whether the value of `block-cache-size` is set too high. In addition, when multiple TiKV instances are deployed on a single machine, you need to explicitly configure the parameter to prevent multiple instances from using too much system memory that results in the OOM error.

#### 15.8.4.23 Can both TiDB data and RawKV data be stored in the same TiKV cluster?

No. TiDB (or data created from the transactional API) relies on a specific key format. It is not compatible with data created from RawKV API (or data from other RawKV-based services).

### 15.8.5 TiDB testing

This section describes common problems you might encounter during TiDB testing, their causes, and solutions.

#### 15.8.5.1 What is the performance test result for TiDB using Sysbench?

At the beginning, many users tend to do a benchmark test or a comparison test between TiDB and MySQL. We have also done a similar official test and find the test result is consistent at large, although the test data has some bias. Because the architecture of TiDB differs greatly from MySQL, it is hard to find a benchmark point. The suggestions are as follows:

- Do not spend too much time on the benchmark test. Pay more attention to the difference of scenarios using TiDB.
- See [Performance test result for TiDB using Sysbench](#).

#### 15.8.5.2 What's the relationship between the TiDB cluster capacity (QPS) and the number of nodes? How does TiDB compare to MySQL?

- Within 10 nodes, the relationship between TiDB write capacity (Insert TPS) and the number of nodes is roughly 40% linear increase. Because MySQL uses single-node write, its write capacity cannot be scaled.
- In MySQL, the read capacity can be increased by adding secondary database, but the write capacity cannot be increased except using sharding, which has many problems.
- In TiDB, both the read and write capacity can be easily increased by adding more nodes.

#### 15.8.5.3 The performance test of MySQL and TiDB by our DBA shows that the performance of a standalone TiDB is not as good as MySQL

TiDB is designed for scenarios where sharding is used because the capacity of a MySQL standalone is limited, and where strong consistency and complete distributed transactions are required. One of the advantages of TiDB is pushing down computing to the storage nodes to execute concurrent computing.

TiDB is not suitable for tables of small size (such as below ten million level), because its strength in concurrency cannot be shown with a small size of data and limited Regions.

A typical example is the counter table, in which records of a few lines are updated high frequently. In TiDB, these lines become several Key-Value pairs in the storage engine, and then settle into a Region located on a single node. The overhead of background replication to guarantee strong consistency and operations from TiDB to TiKV leads to a poorer performance than a MySQL standalone.

## 15.8.6 Backup and restoration

This section describes common problems you may encounter during backup and restoration, their causes, and solutions.

### 15.8.6.1 How to back up data in TiDB?

Currently, for the backup of a large volume of data (more than 1 TB), the preferred method is using [Backup & Restore \(BR\)](#). Otherwise, the recommended tool is [Dumpling](#). Although the official MySQL tool `mysqldump` is also supported in TiDB to back up and restore data, its performance is no better than BR and it needs much more time to back up and restore large volumes of data.

For more FAQs about BR, see [BR FAQs](#).

### 15.8.6.2 How is the speed of backup and restore?

When [BR](#) is used to perform backup and restore tasks, the backup is processed at about 40 MB/s per TiKV instance, and restore is processed at about 100 MB/s per TiKV instance.

## 15.9 High Availability FAQs

This document summarizes the FAQs related to high availability of TiDB.

### 15.9.1 How is TiDB strongly consistent?

Data is redundantly replicated between TiKV nodes using the [Raft consensus algorithm](#) to ensure recoverability when a node failure occurs.

At the bottom layer, TiKV uses a model of replication log + State Machine to replicate data. For the write requests, the data is written to a Leader and the Leader then replicates the command to its Followers in the form of log. When the majority of nodes in the cluster receive this log, this log is committed and can be applied into the State Machine.

### 15.9.2 What's the recommended solution for the deployment of three geo-distributed data centers?

The architecture of TiDB guarantees that it fully supports geo-distribution and multi-activeness. Your data and applications are always-on. All the outages are transparent to

your applications and your data can recover automatically. The operation depends on the network latency and stability. It is recommended to keep the latency within 5ms. Currently, TiDB already has similar use cases. For details, see [Three Data Centers in Two Cities Deployment](#).

## 15.10 High Reliability FAQs

This document summarizes the FAQs related to high reliability of TiDB.

### 15.10.1 Does TiDB support data encryption?

Yes. To encrypt data in the network traffic, you can [enable TLS between TiDB clients and servers](#). To encrypt data in the storage engine, you can enable [transparent data encryption \(TDE\)](#).

### 15.10.2 Does TiDB support modifying the MySQL version string of the server to a specific one that is required by the security vulnerability scanning tool?

- Since v3.0.8, TiDB supports modifying the version string of the server by modifying [server-version](#) in the configuration file.
- Since v4.0, if you deploy TiDB using TiUP, you can also specify the proper version string by executing `tiup cluster edit-config <cluster-name>` to edit the following section:

```
server_configs:
 tidb:
 server-version: 'YOUR_VERSION_STRING'
```

Then, use the `tiup cluster reload <cluster-name> -R tidb` command to make the preceding modification effective to avoid the failure of security vulnerability scan.

### 15.10.3 What authentication protocols does TiDB support? What's the process?

Like MySQL, TiDB supports the SASL protocol for user login authentication and password processing.

When the client connects to TiDB, the challenge-response authentication mode starts. The process is as follows:

1. The client connects to the server.
2. The server sends a random string challenge to the client.
3. The client sends the username and response to the server.
4. The server verifies the response.

#### 15.10.4 How to modify the user password and privilege?

To modify the user password in TiDB, it is recommended to use `ALTER USER` (for example, `ALTER USER 'test'@'localhost' IDENTIFIED BY 'mypass';`), not `UPDATE mysql.user` which might lead to the condition that the password in other nodes is not refreshed timely.

It is recommended to use the official standard statements when modifying the user password and privilege. For details, see [TiDB user account management](#).

### 15.11 Backup & Restore FAQs

This document lists the frequently asked questions (FAQs) and the solutions of TiDB Backup & Restore (BR).

#### 15.11.1 What should I do to quickly recover data after mistakenly deleting or updating data?

TiDB v6.4.0 introduces the flashback feature. You can use this feature to quickly recover data within the GC time to a specified point in time. Therefore, if misoperations occur, you can use this feature to recover data. For details, see [Flashback Cluster](#) and [Flashback Database](#).

#### 15.11.2 In TiDB v5.4.0 and later versions, when backup tasks are performed on the cluster under a heavy workload, why does the speed of backup tasks become slow?

Starting from TiDB v5.4.0, BR introduces the auto-tune feature for backup tasks. For clusters in v5.4.0 or later versions, this feature is enabled by default. When the cluster workload is heavy, the feature limits the resources used by backup tasks to reduce the impact on the online cluster. For more information, refer to [Backup Auto-Tune](#).

TiKV supports [dynamically configuring](#) the auto-tune feature. You can enable or disable the feature by the following methods without restarting your cluster:

- Disable auto-tune: Set the TiKV configuration item `backup.enable-auto-tune` to `false`.
- Enable auto-tune: Set `backup.enable-auto-tune` to `true`. For clusters upgraded from v5.3.x to v5.4.0 or later versions, the auto-tune feature is disabled by default. You need to manually enable it.

To use `tikv-ctl` to enable or disable auto-tune, refer to [Use auto-tune](#).

In addition, auto-tune reduces the default number of threads used by backup tasks. For details, see `backup.num-threads`([/tikv-configuration-file.md#num-threads-1](#)). Therefore,

on the Grafana Dashboard, the speed, CPU usage, and I/O resource utilization used by backup tasks are lower than those of versions earlier than v5.4.0. Before v5.4.0, the default value of `backup.num-threads` was  $\text{CPU} * 0.75$ , that is, the number of threads used by backup tasks makes up 75% of the logical CPU cores. The maximum value of it was 32  $\hookrightarrow$  . Starting from v5.4.0, the default value of this configuration item is  $\text{CPU} * 0.5$ , and its maximum value is 8.

When you perform backup tasks on an offline cluster, to speed up the backup, you can modify the value of `backup.num-threads` to a larger number using `tikv-ctl`.

### 15.11.3 PITR issues

#### 15.11.3.1 What is the difference between PITR and cluster flashback?

From the perspective of use cases, PITR is usually used to restore the data of a cluster to a specified point in time when the cluster is completely out of service or the data is corrupted and cannot be recovered using other solutions. To use PITR, you need a new cluster for data recovery. The cluster flashback feature is specifically designed for the data error scenarios caused by user mis-operations or other factors, which allows you to restore the data of a cluster in-place to the latest timestamp before the data errors occur.

In most cases, flashback is a better recovery solution than PITR for data errors caused by human mistakes, as it has a much shorter RPO (close to zero) and RTO. However, when a cluster is completely unavailable, because flashback cannot run at this time, PITR is the only solution to recover the cluster in this case. Therefore, PITR is always a must-have solution when you develop database disaster recovery strategies, even though it has a longer RPO (up to 5 minutes) and RTO than flashback.

#### 15.11.3.2 When the upstream database imports data using TiDB Lightning in the physical import mode, the log backup feature becomes unavailable. Why?

Currently, the log backup feature is not fully adapted to TiDB Lightning. Therefore, data imported in the physical mode of TiDB Lightning cannot be backed up into log data.

In upstream clusters where you create log backup tasks, avoid using the TiDB Lightning physical mode to import data. Instead, you can use TiDB Lightning logical mode. If you do need to use the physical mode, perform a snapshot backup after the import is complete, so that PITR can be restored to the time point after the snapshot backup.

#### 15.11.3.3 Why is the acceleration of adding indexes feature incompatible with PITR?

Issue: [#38045](#)

Currently, the **acceleration of adding indexes** feature is not compatible with PITR. When using index acceleration, you need to ensure that there are no PITR log backup tasks running in the background. Otherwise, unexpected behaviors might occur, including:

- If you start a log backup task first, and then add an index. The adding index process is not accelerated even if index acceleration is enabled. But the index is added in a slow way.
- If you start an index acceleration task first, and then start a log backup task. The log backup task returns an error. But the index acceleration is not affected.
- If you start a log backup task and an index acceleration task at the same time, the two tasks might not be aware of each other. This might result in PITR failing to back up the newly added index.

#### 15.11.3.4 The cluster has recovered from the network partition failure, but the checkpoint of the log backup task progress still does not resume. Why?

Issue: [#13126](#)

After a network partition failure in the cluster, the backup task cannot continue backing up logs. After a certain retry time, the task will be set to `ERROR` state. At this point, the backup task has stopped.

To resolve this issue, you need to manually execute the `br log resume` command to resume the log backup task.

#### 15.11.3.5 What should I do if the error `execute over region id` is returned when I perform PITR?

Issue: [#37207](#)

This issue usually occurs when you enable log backup during a full data import and afterward perform a PITR to restore data at a time point during the data import.

Specifically, there is a probability that this issue occurs if there are a large number of hotspot writes for a long time (such as 24 hours) and if the OPS of each TiKV node is larger than 50k/s (you can view the metrics in Grafana: **TiKV-Details** -> **Backup Log** -> **Handle Event Rate**).

It is recommended that you perform a snapshot backup after the data import and perform PITR based on this snapshot backup.

#### 15.11.4 After restoring a downstream cluster using the `br restore point` command, data cannot be accessed from TiFlash. What should I do?

Currently, PITR does not support writing data directly to TiFlash during the restore phase. Instead, `br` command-line tool executes the `ALTER TABLE table_name SET TIFLASH ↪ REPLICAS ***` DDL to replicate the data. Therefore, TiFlash replicas are not available immediately after PITR completes data restore. Instead, you need to wait for a certain period of time for the data to be replicated from TiKV nodes. To check the replication progress, check the `progress` information in the `INFORMATION_SCHEMA.tiflash_replica` table.

#### 15.11.4.1 What should I do if the status of a log backup task becomes ERROR?

During a log backup task, the task status becomes **ERROR** if it fails and cannot be recovered after retrying. The following is an example:

```
br log status --pd x.x.x.x:2379

Total 1 Tasks.
> #1 <
 name: task1
 status: ERROR
 start: 2022-07-25 13:49:02.868 +0000
 end: 2090-11-18 14:07:45.624 +0000
 storage: s3://tmp/br-log-backup0ef49055-5198-4be3-beab-
 ↪ d382a2189efb/Log
 speed(est.): 0.00 ops/s
 checkpoint[global]: 2022-07-25 14:46:50.118 +0000; gap=11h31m29s
 error[store=1]: KV:LogBackup:RaftReq
error-happen-at[store=1]: 2022-07-25 14:54:44.467 +0000; gap=11h23m35s
error-message[store=1]: retry time exceeds: and error failed to get
 ↪ initial snapshot: failed to get the snapshot (region_id = 94812):
 ↪ Error during requesting raftstore: message: "read index not ready,
 ↪ reason can not read index due to merge, region 94812"
 ↪ read_index_not_ready { reason: "can not read index due to merge"
 ↪ region_id: 94812 }: failed to get initial snapshot: failed to get
 ↪ the snapshot (region_id = 94812): Error during requesting raftstore:
 ↪ message: "read index not ready, reason can not read index due to
 ↪ merge, region 94812" read_index_not_ready { reason: "can not read
 ↪ index due to merge" region_id: 94812 }: failed to get initial
 ↪ snapshot: failed to get the snapshot (region_id = 94812): Error
 ↪ during requesting raftstore: message: "read index not ready, reason
 ↪ can not read index due to merge, region 94812" read_index_not_ready
 ↪ { reason: "can not read index due to merge" region_id: 94812 }
```

To address this problem, check the error message for the cause and perform as instructed. After the problem is addressed, run the following command to resume the task:

```
br log resume --task-name=task1 --pd x.x.x.x:2379
```

After the backup task is resumed, you can check the status using `br log status`. The backup task continues when the task status becomes **NORMAL**.

```
Total 1 Tasks.
> #1 <
 name: task1
 status: NORMAL
 start: 2022-07-25 13:49:02.868 +0000
```

```
end: 2090-11-18 14:07:45.624 +0000
storage: s3://tmp/br-log-backup0ef49055-5198-4be3-beab-
↳ d382a2189efb/Log
speed(est.): 15509.75 ops/s
checkpoint[global]: 2022-07-25 14:46:50.118 +0000; gap=6m28s
```

### Note:

This feature backs up multiple versions of data. When a long backup task fails and the status becomes `ERROR`, the checkpoint data of this task is set as a `safe point`, and the data of the `safe point` will not be garbage collected within 24 hours. Therefore, the backup task continues from the last checkpoint after resuming the error. If the task fails for more than 24 hours and the last checkpoint data has been garbage collected, an error will be reported when you resume the task. In this case, you can only run the `br log stop` command to stop the task first and then start a new backup task.

#### 15.11.4.2 What should I do if the error message `ErrBackupGCSafepointExceeded` is returned when using the `br log resume` command to resume a suspended task?

```
Error: failed to check gc safePoint, checkpoint ts 433177834291200000: GC
↳ safepoint 433193092308795392 exceed TS 433177834291200000: [BR:Backup
↳ :ErrBackupGCSafepointExceeded]backup GC safepoint exceeded
```

After you pause a log backup task, to prevent the MVCC data from being garbage collected, the pausing task program sets the current checkpoint as the service safepoint automatically. This ensures that the MVCC data generated within 24 hours can remain. If the MVCC data of the backup checkpoint has been generated for more than 24 hours, the data of the checkpoint will be garbage collected, and the backup task is unable to resume.

To address this problem, delete the current task using `br log stop`, and then create a log backup task using `br log start`. At the same time, you can perform a full backup for subsequent PITR.

#### 15.11.5 Feature compatibility issues

##### 15.11.5.1 Why does data restored using `br` command-line tool cannot be replicated to the upstream cluster of TiCDC or Drainer?

- **The data restored using BR cannot be replicated to the downstream.** This is because BR directly imports SST files but the downstream cluster currently cannot obtain these files from the upstream.

- Before v4.0.3, DDL jobs generated during the restore might cause unexpected DDL executions in TiCDC/Drainer. Therefore, if you need to perform restore on the upstream cluster of TiCDC/Drainer, add all tables restored using br command-line tool to the TiCDC/Drainer block list.

You can use `filter.rules` to configure the block list for TiCDC and use `syncer.ignore` ↪ `-table` to configure the block list for Drainer.

### 15.11.5.2 Why is `new_collations_enabled_on_first_bootstrap` mismatch reported during restore?

Since TiDB v6.0.0, the default value of `new_collations_enabled_on_first_bootstrap` has changed from `false` to `true`. BR backs up the `new_collations_enabled_on_first_bootstrap` ↪ configuration of the upstream cluster and then checks whether the value of this configuration is consistent between the upstream and downstream clusters. If the value is consistent, BR safely restores the data backed up in the upstream cluster to the downstream cluster. If the value is inconsistent, BR does not perform the data restore and reports an error.

Suppose that you have backed up the data in a TiDB cluster of an earlier version of v6.0.0, and you want to restore this data to a TiDB cluster of v6.0.0 or later versions. In this situation, you need to manually check whether the value of `new_collations_enabled_on_first_bootstrap` is consistent between the upstream and downstream clusters:

- If the value is consistent, you can add `--check-requirements=false` to the restore command to skip this configuration check.
- If the value is inconsistent, and you forcibly perform the restore, BR reports a data validation error.

### 15.11.5.3 Why does an error occur when I restore placement rules to a cluster?

Before v6.0.0, BR does not support `placement rules`. Starting from v6.0.0, BR supports placement rules and introduces a command-line option `--with-tidb-placement-mode` ↪ `=strict/ignore` to control the backup and restore mode of placement rules. With the default value `strict`, BR imports and validates placement rules, but ignores all placement rules when the value is `ignore`.

## 15.11.6 Data restore issues

### 15.11.6.1 What should I do to handle the `Io(0s...)` error?

Almost all of these problems are system call errors that occur when TiKV writes data to the disk, for example, `Io(0s {code: 13, kind: PermissionDenied...})` or `Io(0s {code: 2, kind: NotFound...})`.

To address such problems, first check the mounting method and the file system of the backup directory, and try to back up data to another folder or another hard disk.

For example, you might encounter the `Code: 22(invalid argument)` error when backing up data to the network disk built by `samba`.

#### 15.11.6.2 What should I do to handle the `rpc error: code = Unavailable desc = ... error occurred in restore?`

This error might occur when the capacity of the cluster to restore is insufficient. You can further confirm the cause by checking the monitoring metrics of this cluster or the TiKV log.

To handle this issue, you can try to scale out the cluster resources, reduce the concurrency during restore, and enable the `RATE_LIMIT` option.

#### 15.11.6.3 What should I do if the restore fails with the error message `the entry too large, the max entry size is 6291456, the size of data is 7690800?`

You can try to reduce the number of tables to be created in a batch by setting `--ddl-batch-size` to 128 or a smaller value.

When using BR to restore the backup data with the value of `--ddl-batch-size` greater than 1, TiDB writes a DDL job of table creation to the DDL jobs queue that is maintained by TiKV. At this time, the total size of all tables schema sent by TiDB at one time should not exceed 6 MB, because the maximum value of job messages is 6 MB by default (it is **not recommended** to modify this value. For details, see `txn-entry-size-limit` and `raft-entry-max-size`). Therefore, if you set `--ddl-batch-size` to an excessively large value, the schema size of the tables sent by TiDB in a batch at one time exceeds the specified value, which causes BR to report the `entry too large, the max entry size is 6291456, the size of data is 7690800` error.

#### 15.11.6.4 Where are the backed up files stored when I use local storage?

##### Note:

If no Network File System (NFS) is mounted to a BR or TiKV node, or if you use external storage that supports Amazon S3, GCS, or Azure Blob Storage protocols, the data backed up by BR is generated at each TiKV node. **Note that this is not the recommended way to deploy BR**, because the backup data are scattered in the local file system of each node. Collecting the backup data might result in data redundancy and operation and maintenance problems. Meanwhile, if you restore data directly before collecting the backup data, you will encounter the `SST file not found` error.

When you use local storage, `backupmeta` is generated on the node where BR is running, and backup files are generated on the Leader nodes of each Region.

#### 15.11.6.5 What should I do if the error message `could not read local://...:download sst failed` is returned during data restore?

When you restore data, each node must have access to **all** backup files (SST files). By default, if `local` storage is used, you cannot restore data because the backup files are scattered among different nodes. Therefore, you have to copy the backup file of each TiKV node to the other TiKV nodes. **It is recommended that you store backup data to Amazon S3, Google Cloud Storage (GCS), Azure Blob Storage, or NFS.**

#### 15.11.6.6 What should I do to handle the `Permission denied` or `No such file or directory` error, even if I have tried to run `br` using `root` in vain?

You need to confirm whether TiKV has access to the backup directory. To back up data, confirm whether TiKV has the write permission. To restore data, confirm whether it has the read permission.

During the backup operation, if the storage medium is the local disk or a network file system (NFS), make sure that the user to start `br` and the user to start TiKV are consistent (if `br` and TiKV are on different machines, the users' UIDs must be consistent). Otherwise, the `Permission denied` issue might occur.

Running `br` as the `root` user might fail due to the disk permission, because the backup files (SST files) are saved by TiKV.

#### Note:

You might encounter the same problem during data restore. When the SST files are read for the first time, the read permission is verified. The execution duration of DDL suggests that there might be a long interval between checking the permission and running `br`. You might receive the error message `Permission denied` after waiting for a long time.

Therefore, it is recommended to check the permission before data restore according to the following steps:

1. Run the Linux command for process query:

```
ps aux | grep tikv-server
```

The output is as follows:

```
tidb_ouo 9235 10.9 3.8 2019248 622776 ? Ssl 08:28 1:12 bin/tikv-
↳ server --addr 0.0.0.0:20162 --advertise-addr 172.16.6.118:20162
↳ --status-addr 0.0.0.0:20188 --advertise-status-addr
↳ 172.16.6.118:20188 --pd 172.16.6.118:2379 --data-dir /home/user1/
↳ tidb-data/tikv-20162 --config conf/tikv.toml --log-file /home/
↳ user1/tidb-deploy/tikv-20162/log/tikv.log
tidb_ouo 9236 9.8 3.8 2048940 631136 ? Ssl 08:28 1:05 bin/tikv-
↳ server --addr 0.0.0.0:20161 --advertise-addr 172.16.6.118:20161
↳ --status-addr 0.0.0.0:20189 --advertise-status-addr
↳ 172.16.6.118:20189 --pd 172.16.6.118:2379 --data-dir /home/user1/
↳ tidb-data/tikv-20161 --config conf/tikv.toml --log-file /home/
↳ user1/tidb-deploy/tikv-20161/log/tikv.log
```

Or you can run the following command:

```
ps aux | grep tikv-server | awk '{print $1}'
```

The output is as follows:

```
tidb_ouo
tidb_ouo
```

2. Query the startup information of the cluster using the tiup command:

```
tiup cluster list
```

The output is as follows:

```
[root@Copy-of-VM-EE-CentOS76-v1 br]# tiup cluster list
Starting component `cluster`: /root/.tiup/components/cluster/v1.5.2/
↳ tiup-cluster list
Name User Version Path
↳

↳
tidb_cluster tidb_ouo v5.0.2 /root/.tiup/storage/cluster/clusters/
↳ tidb_cluster /root/.tiup/storage/cluster/clusters/tidb_cluster/
↳ ssh/id_rsa
```

3. Check the permission for the backup directory. For example, backup is for backup data storage:

```
ls -al backup
```

The output is as follows:

```
[root@Copy-of-VM-EE-CentOS76-v1 user1]# ls -al backup
total 0
drwxr-xr-x 2 root root 6 Jun 28 17:48 .
drwxr-xr-x 11 root root 310 Jul 4 10:35 ..
```

From the output of step 2, you can find that the `tikv-server` instance is started by the user `tidb_ouo`. But the user `tidb_ouo` does not have the write permission for `backup`. Therefore, the backup fails.

### 15.11.6.7 Why are tables in the `mysql` schema not restored?

Starting from BR v5.1.0, when you perform a full backup, BR backs up the **tables in the `mysql` schema**. Before BR v6.2.0, under default configuration, BR only restores user data, but does not restore tables in the **`mysql` schema**.

To restore a table created by the user in the `mysql` schema (not system tables), you can explicitly include the table using **table filters**. The following example shows how to restore the `mysql.usertable` table when BR performs a normal restore.

```
br restore full -f ' *.* ' -f '!mysql.*' -f 'mysql.usertable' -s
↪ $external_storage_url --with-sys-table
```

In the preceding command,

- `-f ' *.* '` is used to override the default rules
- `-f '!mysql.*'` instructs BR not to restore tables in `mysql` unless otherwise stated.
- `-f 'mysql.usertable'` indicates that `mysql.usertable` should be restored.

If you only need to restore `mysql.usertable`, run the following command:

```
br restore full -f 'mysql.usertable' -s $external_storage_url --with-sys-
↪ table
```

Note that even if you configures **table filter**, **BR does not restore the following system tables**:

- Statistics tables (`mysql.stat_*`)
- System variable tables (`mysql.tidb`, `mysql.global_variables`)
- [Other system tables](#)

## 15.11.7 Other things you may want to know about backup and restore

### 15.11.7.1 What is the size of the backup data? Are there replicas of the backup?

During data backup, backup files are generated on the Leader nodes of each Region. The size of the backup is equal to the data size, with no redundant replicas. Therefore, the total data size is approximately the total number of TiKV data divided by the number of replicas.

However, if you want to restore data from local storage, the number of replicas is equal to that of the TiKV nodes, because each TiKV must have access to all backup files.

### 15.11.7.2 Why is the disk usage shown on the monitoring node inconsistent after backup or restore using BR?

This inconsistency is caused by the fact that the data compression rate used in backup is different from the default rate used in restore. If the checksum succeeds, you can ignore this issue.

### 15.11.7.3 After BR restores the backup data, do I need to execute the ANALYZE statement on the table to update the statistics of TiDB on the tables and indexes?

BR does not back up statistics (except in v4.0.9). Therefore, after restoring the backup data, you need to manually execute `ANALYZE TABLE` or wait for TiDB to automatically execute `ANALYZE`.

In v4.0.9, BR backs up statistics by default, which consumes too much memory. To ensure that the backup process goes well, the backup for statistics is disabled by default starting from v4.0.10.

If you do not execute `ANALYZE` on the table, TiDB will fail to select the optimal execution plan due to inaccurate statistics. If query performance is not a key concern, you can ignore `ANALYZE`.

### 15.11.7.4 Can I start multiple restore tasks at the same time to restore the data of a single cluster?

**It is strongly not recommended** to start multiple restore tasks at the same time to restore the data of a single cluster for the following reasons:

- When BR restores data, it modifies some global configurations of PD. Therefore, if you start multiple restore tasks for data restore at the same time, these configurations might be mistakenly overwritten and cause abnormal cluster status.
- BR consumes a lot of cluster resources to restore data, so in fact, running restore tasks in parallel improves the restore speed only to a limited extent.
- There has been no test for running multiple restore tasks in parallel for data restore, so it is not guaranteed to succeed.

### 15.11.7.5 Does BR back up the SHARD\_ROW\_ID\_BITS and PRE\_SPLIT\_REGIONS information of a table? Does the restored table have multiple Regions?

Yes. BR backs up the `SHARD_ROW_ID_BITS` and `PRE_SPLIT_REGIONS` information of a table. The data of the restored table is also split into multiple Regions.

## 16 Release Notes

### 16.1 TiDB Release Notes

#### 16.1.1 6.6

- [6.6.0-DMR](#): 2023-02-20

#### 16.1.2 6.5

- [6.5.3](#): 2023-06-14

## 16.2 TiDB Release Timeline

This document shows all the released TiDB versions in reverse chronological order.

| Version   | Release Date |
|-----------|--------------|
| 6.5.3     | 2023-06-14   |
| 6.5.2     | 2023-04-21   |
| 6.1.6     | 2023-04-12   |
| 6.5.1     | 2023-03-10   |
| 6.1.5     | 2023-02-28   |
| 6.6.0-DMR | 2023-02-20   |
| 6.1.4     | 2023-02-08   |
| 6.5.0     | 2022-12-29   |
| 5.1.5     | 2022-12-28   |
| 6.1.3     | 2022-12-05   |
| 5.3.4     | 2022-11-24   |
| 6.4.0-DMR | 2022-11-17   |
| 6.1.2     | 2022-10-24   |
| 5.4.3     | 2022-10-13   |
| 6.3.0-DMR | 2022-09-30   |
| 5.3.3     | 2022-09-14   |
| 6.1.1     | 2022-09-01   |
| 6.2.0-DMR | 2022-08-23   |
| 5.4.2     | 2022-07-08   |
| 5.3.2     | 2022-06-29   |
| 6.1.0     | 2022-06-13   |
| 5.4.1     | 2022-05-13   |
| 5.2.4     | 2022-04-26   |
| 6.0.0-DMR | 2022-04-07   |
| 5.3.1     | 2022-03-03   |
| 5.1.4     | 2022-02-22   |
| 5.4.0     | 2022-02-15   |
| 5.0.6     | 2021-12-31   |
| 4.0.16    | 2021-12-17   |
| 5.1.3     | 2021-12-03   |
| 5.0.5     | 2021-12-03   |
| 5.2.3     | 2021-12-03   |
| 5.3.0     | 2021-11-30   |
| 5.2.2     | 2021-10-29   |
| 5.1.2     | 2021-09-27   |
| 5.0.4     | 2021-09-27   |
| 4.0.15    | 2021-09-27   |
| 5.2.1     | 2021-09-09   |
| 5.2.0     | 2021-08-27   |
| 5.1.1     | 2021-07-30   |

| Version      | Release Date |
|--------------|--------------|
| 4.0.14       | 2021-07-27   |
| 5.0.3        | 2021-07-02   |

## 16.3 TiDB Versioning

It is recommended to always upgrade to the latest patch release of your release series.

TiDB offers two release series:

- Long-Term Support Releases
- Development Milestone Releases (introduced in TiDB v6.0.0)

To learn about the support policy for major releases of TiDB, see [TiDB Release Support Policy](#).

### 16.3.1 Release versioning

TiDB versioning has the form of  $X.Y.Z$ .  $X.Y$  represents a release series.

- Since TiDB 1.0,  $X$  increments every year. Each  $X$  release introduces new features and improvements.
- $Y$  increments from 0. Each  $Y$  release introduces new features and improvements.
- In the first release of a release series,  $Z$  is set to 0 by default. For patch releases,  $Z$  increments from 1.

For the versioning system of TiDB v5.0.0 and earlier versions, refer to [Historical versioning](#).

### 16.3.2 Long-Term Support releases

Long-Term Support (LTS) versions are released approximately every six months and introduce new features, improvements, bug fixes and security vulnerability fixes.

LTS releases are versioned as  $X.Y.Z$ .  $Z$  defaults to 0.

Example versions:

- 6.1.0
- 5.4.0

During the lifecycle of LTS, patch releases are made available on demand. Patch releases contain bug fixes and security vulnerability fixes, and do not introduce new features.

Patch releases are versioned as  $X.Y.Z$ .  $X.Y$  is consistent with the corresponding LTS versioning. The patch number  $Z$  increments from 1.

Example version:

- 6.1.1

v5.1.0, v5.2.0, v5.3.0, v5.4.0 were released only two months after their preceding releases, but all four releases are LTS and provide patch releases.

### 16.3.3 Development Milestone Releases

Development Milestone Releases (DMR) are released approximately every two months that do not contain LTS. DMR versions introduce new features, improvements and bug fixes. TiDB does not provide patch releases based on DMR, and any related bugs are fixed in the subsequent release series.

DMRs are versioned as  $X.Y.Z$ .  $Z$  defaults to 0. A `-DMR` suffix is appended to the version number.

Example version:

- 6.0.0-DMR

### 16.3.4 Versioning of TiDB ecosystem tools

Some TiDB tools are released together with the TiDB server and use the same version numbering system, such as TiDB Lightning. Some TiDB tools are released separately from the TiDB server and use their own version numbering system, such as TiUP and TiDB Operator.

### 16.3.5 Historical versioning (deprecated)

#### 16.3.5.1 General Availability releases

General Availability (GA) releases are stable versions of the current release series of TiDB. GA versions are released after Release Candidate (RC) versions. GA can be used in production environments.

Example versions:

- 1.0
- 2.1 GA
- 5.0 GA

#### 16.3.5.2 Release Candidate releases

Release Candidate (RC) releases introduce new features and improvements. RC versions are significantly more stable than Beta versions. RC can be used for early testing, but are not suitable for production.

Example versions:

- RC1
- 2.0-RC1
- 3.0.0-rc.1

#### 16.3.5.3 Beta releases

Beta releases introduces new features and improvements. Beta versions are greatly improved over Alpha versions and have eliminated critical bugs, but still contain some bugs. Beta releases are available for users to test the latest features.

Example versions:

- 1.1 Beta
- 2.1 Beta
- 4.0.0-beta.1

### 16.3.5.4 Alpha releases

Alpha releases are internal releases for testing and introduce new features and improvements. Alpha releases are the initial versions of the current release series. Alpha releases might have some bugs and are available for users to test the latest features.

Example version:

- 1.1 Alpha

## 16.4 TiDB Installation Packages

Before [deploying TiUP offline](#), you need to download the binary packages of TiDB at the [official download page](#).

TiDB binary packages are available in amd64 and arm64 architectures. In either architecture, TiDB provides two binary packages: `TiDB-community-server` and `TiDB-community-  
↪ toolkit`.

The `TiDB-community-server` package contains the following contents.

| Content                                                      | Change history |
|--------------------------------------------------------------|----------------|
| <code>tidb-{version}-linux-{arch}.tar.gz</code>              |                |
| <code>tikv-{version}-linux-{arch}.tar.gz</code>              |                |
| <code>tiflash-{version}-linux-{arch}.tar.gz</code>           |                |
| <code>pd-{version}-linux-{arch}.tar.gz</code>                |                |
| <code>ctl-{version}-linux-{arch}.tar.gz</code>               |                |
| <code>grafana-{version}-linux-{arch}.tar.gz</code>           |                |
| <code>alertmanager-{version}-linux-{arch}.tar.gz</code>      |                |
| <code>blackbox_exporter-{version}-linux-{arch}.tar.gz</code> |                |
| <code>prometheus-{version}-linux-{arch}.tar.gz</code>        |                |
| <code>node_exporter-{version}-linux-{arch}.tar.gz</code>     |                |
| <code>tiup-linux-{arch}.tar.gz</code>                        |                |
| <code>tiup-{version}-linux-{arch}.tar.gz</code>              |                |
| <code>local_install.sh</code>                                |                |
| <code>cluster-{version}-linux-{arch}.tar.gz</code>           |                |
| <code>insight-{version}-linux-{arch}.tar.gz</code>           |                |
| <code>diag-{version}-linux-{arch}.tar.gz</code>              | New in v6.0.0  |
| <code>influxdb-{version}-linux-{arch}.tar.gz</code>          |                |
| <code>playground-{version}-linux-{arch}.tar.gz</code>        |                |

#### Note:

`{version}` depends on the version of the component or server you are in-

stalling. `{arch}` depends on the architecture of the system, which can be `amd64` or `arm64`.

The `TiDB-community-toolkit` package contains the following contents.

| Content                                                      | Change history |
|--------------------------------------------------------------|----------------|
| <code>tikv-importer-{version}-linux-{arch}.tar.gz</code>     |                |
| <code>pd-recover-{version}-linux-{arch}.tar.gz</code>        |                |
| <code>etcdctl</code>                                         | New in v6.0.0  |
| <code>tiup-linux-{arch}.tar.gz</code>                        |                |
| <code>tiup-{version}-linux-{arch}.tar.gz</code>              |                |
| <code>tidb-lightning-{version}-linux-{arch}.tar.gz</code>    |                |
| <code>tidb-lightning-ctl</code>                              |                |
| <code>dumpling-{version}-linux-{arch}.tar.gz</code>          |                |
| <code>cdc-{version}-linux-{arch}.tar.gz</code>               |                |
| <code>dm-{version}-linux-{arch}.tar.gz</code>                |                |
| <code>dm-worker-{version}-linux-{arch}.tar.gz</code>         |                |
| <code>dm-master-{version}-linux-{arch}.tar.gz</code>         |                |
| <code>dmctl-{version}-linux-{arch}.tar.gz</code>             |                |
| <code>br-{version}-linux-{arch}.tar.gz</code>                |                |
| <code>spark-{version}-any-any.tar.gz</code>                  |                |
| <code>tispark-{version}-any-any.tar.gz</code>                |                |
| <code>package-{version}-linux-{arch}.tar.gz</code>           |                |
| <code>bench-{version}-linux-{arch}.tar.gz</code>             |                |
| <code>errdoc-{version}-linux-{arch}.tar.gz</code>            |                |
| <code>dba-{version}-linux-{arch}.tar.gz</code>               |                |
| <code>PCC-{version}-linux-{arch}.tar.gz</code>               |                |
| <code>pump-{version}-linux-{arch}.tar.gz</code>              |                |
| <code>drainer-{version}-linux-{arch}.tar.gz</code>           |                |
| <code>binlogctl</code>                                       | New in v6.0.0  |
| <code>sync_diff_inspector</code>                             |                |
| <code>reparo</code>                                          |                |
| <code>arbiter</code>                                         |                |
| <code>mydumper</code>                                        | New in v6.0.0  |
| <code>server-{version}-linux-{arch}.tar.gz</code>            | New in v6.2.0  |
| <code>grafana-{version}-linux-{arch}.tar.gz</code>           | New in v6.2.0  |
| <code>alertmanager-{version}-linux-{arch}.tar.gz</code>      | New in v6.2.0  |
| <code>prometheus-{version}-linux-{arch}.tar.gz</code>        | New in v6.2.0  |
| <code>blackbox_exporter-{version}-linux-{arch}.tar.gz</code> | New in v6.2.0  |
| <code>node_exporter-{version}-linux-{arch}.tar.gz</code>     | New in v6.2.0  |

**Note:**

{version} depends on the version of the tool you are installing. {arch} depends on the architecture of the system, which can be amd64 or arm64.

## 16.5 v6.6

### 16.5.1 TiDB 6.6.0 Release Notes

Release date: February 20, 2023

TiDB version: 6.6.0-DMR

Quick access: [Quick start](#) | [Installation package](#)

In v6.6.0-DMR, the key new features and improvements are as follows:

| Category | Feature                                                                                                                               | Description                                                                                                                                                                                                                                               |
|----------|---------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          |                                                                                                                                       | Scalability and Performance                                                                                                                                                                                                                               |
|          | TiKV supports <a href="https://docs.pingcap.com/tidb/v6.6/partitioned-raft-kv">Partitioned Raft KV storage engine</a> (experimental)  | TiKV introduces the Partitioned Raft KV storage engine, and each Region uses an independent RocksDB instance, which can easily expand the storage capacity of the cluster from TB to PB and provide more stable write latency and stronger scalability.   |
|          | TiKV supports <a href="https://docs.pingcap.com/tidb/v6.6/system-variables#tidb_store_batch_size">batch aggregating data requests</a> | This enhancement significantly reduces total RPCs in TiKV batch-get operations. In situations where data is highly dispersed and the gRPC thread pool has insufficient resources, batching coprocessor requests can improve performance by more than 50%. |

```
<td>TiFlash supports <a href="https://docs.pingcap.com/tidb/v6.6/stale-read"
 ↳ target="_blank">Stale Read and <a href="https://docs.pingcap.com
 ↳ /tidb/v6.6/explain-mpp#mpp-version-and-exchange-data-compression"
 ↳ target="_blank">compression exchange</td>
<td>TiFlash supports the stale read feature, which can improve query
 ↳ performance in scenarios where real-time requirements are not
 ↳ restricted. TiFlash supports data compression to improve the
 ↳ efficiency of parallel data exchange, and the overall TPC-H
 ↳ performance improves by 10%, which can save more than 50% of the
 ↳ network usage.</td>
```

```
<td rowspan="2">Reliability and availability
</td>
<td><a href="https://docs.pingcap.com/tidb/v6.6/tidb-resource-control"
 ↳ target="_blank">Resource control (experimental)</td>
<td>Support resource management based on resource groups, which maps
 ↳ database users to the corresponding resource groups and sets quotas
 ↳ for each resource group based on actual needs.</td>
```

```
<td><a href="https://docs.pingcap.com/tidb/v6.6/sql-plan-management#create-a
 ↳ -binding-according-to-a-historical-execution-plan" target="_blank">
 ↳ Historical SQL binding</td>
<td>Support binding historical execution plans and quickly binding execution
 ↳ plans on TiDB Dashboard.</td>
```

```
<td rowspan="2">SQL functionalities
</td>
<td><a href="https://docs.pingcap.com/tidb/v6.6/foreign-key" target="_blank"
 ↳ ">Foreign key</td>
<td>Support MySQL-compatible foreign key constraints to maintain data
 ↳ consistency and improve data quality.</td>
```

```
<td><a href="https://docs.pingcap.com/tidb/v6.6/sql-statement-create-index/#
 ↳ multi-valued-index" target="_blank">Multi-valued index (
 ↳ experimental)</td>
<td>Introduce MySQL-compatible multi-valued indexes and enhance the JSON
 ↳ type to improve TiDB's compatibility with MySQL 8.0.</td>
```

```
<td>DB operations and observability
</td>
<td><a href="https://docs.pingcap.com/tidb/v6.6/dm-precheck#check-items-for-
 ↳ physical-import" target="_blank">DM supports physical import (
 ↳ experimental)</td>
<td>TiDB Data Migration (DM) integrates TiDB Lightning's physical import
 ↳ mode to improve the performance of full data migration, with
 ↳ performance being up to 10 times faster.</td>
```

### 16.5.1.1 Feature details

#### 16.5.1.1.1 Scalability

- Support Partitioned Raft KV storage engine (experimental) [#11515](#) [#12842](#) [@busyjay](#) [@tonyxuqqi](#) [@tabokie](#) [@bufferflies](#) [@5kbpers](#) [@SpadeA-Tang](#) [@nolouch](#)

Before TiDB v6.6.0, TiKV's Raft-based storage engine used a single RocksDB instance to store the data of all 'Regions' of the TiKV instance. To support larger clusters more stably, starting from TiDB v6.6.0, a new TiKV storage engine is introduced, which uses multiple RocksDB instances to store TiKV Region data, and the data of each Region is independently stored in a separate RocksDB instance. The new engine can better control the number and level of files in the RocksDB instance, achieve physical isolation of data operations between Regions, and support stably managing more data. You can see it as TiKV managing multiple RocksDB instances through partitioning, which is why the feature is named Partitioned-Raft-KV. The main advantage of this feature is better write performance, faster scaling, and larger volume of data supported with the same hardware. It can also support larger cluster scales.

Currently, this feature is experimental and not recommended for use in production environments.

For more information, see [documentation](#).

- Support the distributed parallel execution framework for DDL operations (experimental) [#37125](#) [@zimulala](#)

In previous versions, only one TiDB instance in the entire TiDB cluster was allowed to handle schema change tasks as a DDL owner. To further improve DDL concurrency for large table's DDL operations, TiDB v6.6.0 introduces the distributed parallel execution framework for DDL, through which all TiDB instances in the cluster can concurrently execute the `StateWriteReorganization` phase of the same task to speed up DDL execution. This feature is controlled by the system variable `tidb_ddl_distribute_reorg` and is currently only supported for `Add Index` operations.

#### 16.5.1.1.2 Performance

- Support a stable wake-up model for pessimistic lock queues [#13298](#) [@MyonKeminta](#)

If an application encounters frequent single-point pessimistic lock conflicts, the existing wake-up mechanism cannot guarantee the time for transactions to acquire locks, which causes high long-tail latency and even lock acquisition timeout. Starting from v6.6.0, you can enable a stable wake-up model for pessimistic locks by setting the value of the system variable `tidb_pessimistic_txn_aggressive_locking` to `ON`. In this wake-up model, the wake-up sequence of a queue can be strictly controlled to avoid the waste of resources caused by invalid wake-ups. In scenarios with serious lock conflicts, the stable wake-up model can reduce long-tail latency and the P99 response time.

Tests indicate this reduces tail latency 40-60%.

For more information, see [documentation](#).

- Batch aggregate data requests [#39361](#) @cfzjywxk @you06

When TiDB sends a data request to TiKV, TiDB compiles the request into different sub-tasks according to the Region where the data is located, and each sub-task only processes the request of a single Region. When the data to be accessed is highly dispersed, even if the size of the data is not large, many sub-tasks will be generated, which in turn will generate many RPC requests and consume extra time. Starting from v6.6.0, TiDB supports partially merging data requests that are sent to the same TiKV instance, which reduces the number of sub-tasks and the overhead of RPC requests. In the case of high data dispersion and insufficient gRPC thread pool resources, batching requests can improve performance by more than 50%.

This feature is enabled by default. You can set the batch size of requests using the system variable `tidb_store_batch_size`.

- Remove the limit on LIMIT clauses [#40219](#) @fzzf678

Starting from v6.6.0, TiDB plan cache supports caching execution plans with a variable as the LIMIT parameter, such as `LIMIT ?` or `LIMIT 10, ?`. This feature allows more SQL statements to benefit from plan cache, thus improving execution efficiency. Currently, for security considerations, TiDB can only cache execution plans with ? not greater than 10000.

For more information, see [documentation](#).

- TiFlash supports data exchange with compression [#6620](#) @solotzg

To cooperate with multiple nodes for computing, the TiFlash engine needs to exchange data among different nodes. When the size of the data to be exchanged is very large, the performance of data exchange might affect the overall computing efficiency. In v6.6.0, the TiFlash engine introduces a compression mechanism to compress the data that needs to be exchanged when necessary, and then to perform the exchange, thereby improving the efficiency of data exchange.

For more information, see [documentation](#).

- TiFlash supports the Stale Read feature [#4483](#) @hehechen

The Stale Read feature has been generally available (GA) since v5.1.1, which allows you to read historical data at a specific timestamp or within a specified time range. Stale read can reduce read latency and improve query performance by reading data from local TiKV replicas directly. Before v6.6.0, TiFlash does not support Stale Read. Even if a table has TiFlash replicas, Stale Read can only read its TiKV replicas.

Starting from v6.6.0, TiFlash supports the Stale Read feature. When you query the historical data of a table using the `AS OF TIMESTAMP` syntax or the `tidb_read_staleness` system variable, if the table has a TiFlash replica, the optimizer now can choose to read the corresponding data from the TiFlash replica, thus further improving query performance.

For more information, see [\[documentation\]](#) ([#usage-scenarios-of-stale-read](#)).

- Support pushing down the `regexp_replace` string function to TiFlash [#6115](#) [@xzhangxian1008](#)

### 16.5.1.1.3 Reliability

- Support resource control based on resource groups (experimental) [#38825](#) [@nolouch](#) [@BornChanger](#) [@glorv](#) [@tiancaiamao](#) [@Connor1996](#) [@JmPotato](#) [@hnes](#) [@CabinfeverB](#) [@HuSharp](#)

Now you can create resource groups for a TiDB cluster, bind different database users to corresponding resource groups, and set quotas for each resource group according to actual needs. When the cluster resources are limited, all resources used by sessions in the same resource group will be limited to the quota. In this way, even if a resource group is over-consumed, the sessions in other resource groups are not affected. TiDB provides a built-in view of the actual usage of resources on Grafana dashboards, assisting you to allocate resources more rationally.

The introduction of the resource control feature is a milestone for TiDB. It can divide a distributed database cluster into multiple logical units. Even if an individual unit overuses resources, it does not crowd out the resources needed by other units.

With this feature, you can:

- Combine multiple small and medium-sized applications from different systems into a single TiDB cluster. When the workload of an application grows larger, it does not affect the normal operation of other applications. When the system workload is low, busy applications can still be allocated the required system resources even if they exceed the set read and write quotas, so as to achieve the maximum utilization of resources.
- Choose to combine all test environments into a single TiDB cluster, or group the batch tasks that consume more resources into a single resource group. It can improve hardware utilization and reduce operating costs while ensuring that critical applications can always get the necessary resources.

In addition, the rational use of the resource control feature can reduce the number of clusters, ease the difficulty of operation and maintenance, and save management costs.

In v6.6, you need to enable both TiDB's global variable `tidb_enable_resource_control`  $\leftrightarrow$  and the TiKV configuration item `resource-control.enabled` to enable resource control. Currently, the supported quota method is based on “[Request Unit \(RU\)](#)”. RU is TiDB's unified abstraction unit for system resources such as CPU and IO.

For more information, see [documentation](#).

- Binding historical execution plans is GA [#39199](#) @fzzf678

In v6.5.0, TiDB extends the binding targets in the `CREATE [GLOBAL | SESSION]` `↔` `BINDING` statements and supports creating bindings according to historical execution plans. In v6.6.0, this feature is GA. The selection of execution plans is not limited to the current TiDB node. Any historical execution plan generated by any TiDB node can be selected as the target of `SQL binding`, which further improves the feature usability.

For more information, see [documentation](#).

- Add several optimizer hints [#39964](#) @Reminiscent

TiDB adds several optimizer hints in v6.6.0 to control the execution plan selection of `LIMIT` operations.

- `ORDER_INDEX()`: tells the optimizer to use the specified index, to keep the order of the index when reading data, and generates plans similar to `Limit + IndexScan` `↔` `(keep order: true)`.
- `NO_ORDER_INDEX()`: tells the optimizer to use the specified index, not to keep the order of the index when reading data, and generates plans similar to `TopN + IndexScan(keep order: false)`.

Continuously introducing optimizer hints provides users with more intervention methods, helps solve SQL performance issues, and improves the stability of overall performance.

- Support dynamically managing the resource usage of DDL operations (experimental) [#38025](#) @hawkingrei

TiDB v6.6.0 introduces resource management for DDL operations to reduce the impact of DDL changes on online applications by automatically controlling the CPU usage of these operations. This feature is effective only after the `DDL distributed parallel execution framework` is enabled.

#### 16.5.1.1.4 Availability

- Support configuring `SURVIVAL_PREFERENCE` for `placement rules in SQL` [#38605](#) @nolouch

`SURVIVAL_PREFERENCES` provides data survival preference settings to increase the disaster survivability of data. By specifying `SURVIVAL_PREFERENCE`, you can control the following:

- For TiDB clusters deployed across cloud regions, when a cloud region fails, the specified databases or tables can survive in another cloud region.
- For TiDB clusters deployed in a single cloud region, when an availability zone fails, the specified databases or tables can survive in another availability zone.

For more information, see [documentation](#).

- Support rolling back DDL operations via the `FLASHBACK CLUSTER TO TIMESTAMP` statement [#14088](#) [@Defined2014](#) [@JmPotato](#)

The `FLASHBACK CLUSTER TO TIMESTAMP` statement supports restoring the entire cluster to a specified point in time within the Garbage Collection (GC) lifetime. In TiDB v6.6.0, this feature adds support for rolling back DDL operations. This can be used to quickly undo a DML or DDL misoperation on a cluster, roll back a cluster within minutes, and roll back a cluster multiple times on the timeline to determine when specific data changes occurred.

For more information, see [documentation](#).

#### 16.5.1.1.5 SQL

- Support MySQL-compatible foreign key constraints [#18209](#) [[@crazycs520](#)](<https://github.com/crazy>)

TiDB v6.6.0 introduces the foreign key constraints feature, which is compatible with MySQL. This feature supports referencing within a table or between tables, constraints validation, and cascade operations. This feature helps to migrate applications to TiDB, maintain data consistency, improve data quality, and facilitate data modeling.

For more information, see [documentation](#).

- Support the MySQL-compatible multi-valued index (experimental) [#39592](#) [@xiongjiwei](#) [@qw4990](#)

TiDB introduces the MySQL-compatible multi-valued index in v6.6.0. Filtering the values of an array in a JSON column is a common operation, but normal indexes cannot help speed up such an operation. Creating a multi-valued index on an array can greatly improve filtering performance. If an array in the JSON column has a multi-valued index, you can use the multi-value index to filter the retrieval conditions with `MEMBER OF()`, `JSON_CONTAINS()`, `JSON_OVERLAPS()` functions, thereby reducing much I/O consumption and improving operation speed.

Introducing multi-valued indexes further enhances TiDB's support for the JSON data type and also improves TiDB's compatibility with MySQL 8.0.

For more information, see [documentation](#).

#### 16.5.1.1.6 DB operations

- Support configuring read-only storage nodes for resource-consuming tasks [@v01dstar](#)

In production environments, some read-only operations might consume a large number of resources regularly and affect the performance of the entire cluster, such as backups and large-scale data reading and analysis. TiDB v6.6.0 supports configuring read-only storage nodes for resource-consuming read-only tasks to reduce the impact on

the online application. Currently, TiDB, TiSpark, and BR support reading data from read-only storage nodes. You can configure read-only storage nodes according to [steps](#) and specify where data is read through the system variable `tidb_replica_read`, the TiSpark configuration item `spark.tispark.replica_read`, or the br command line argument `--replica-read-label`, to ensure the stability of cluster performance.

For more information, see [documentation](#).

- Support dynamically modifying `store-io-pool-size` [#13964](#) @LykxSassinator

The TiKV configuration item `raftstore.store-io-pool-size` specifies the allowable number of threads that process Raft I/O tasks, which can be adjusted when tuning TiKV performance. Before v6.6.0, this configuration item cannot be modified dynamically. Starting from v6.6.0, you can modify this configuration without restarting the server, which means more flexible performance tuning.

For more information, see [documentation](#).

- Support specifying the SQL script executed upon TiDB cluster initialization [#35624](#) @morgo

When you start a TiDB cluster for the first time, you can specify the SQL script to be executed by configuring the command line parameter `--initialize-sql-file`. You can use this feature when you need to perform such operations as modifying the value of a system variable, creating a user, or granting privileges.

For more information, see [documentation](#).

- TiDB Data Migration (DM) integrates with TiDB Lightning's physical import mode for up to a 10x performance boost for full migration (experimental) @lance6716

In v6.6.0, DM full migration capability integrates with physical import mode of TiDB Lightning, which enables DM to improve the performance of full data migration by up to 10 times, greatly reducing the migration time in large data volume scenarios.

Before v6.6.0, for large data volume scenarios, you were required to configure physical import tasks in TiDB Lightning separately for fast full data migration, and then use DM for incremental data migration, which was a complex configuration. Starting from v6.6.0, you can migrate large data volumes without the need to configure TiDB Lightning tasks; one DM task can accomplish the migration.

For more information, see [documentation](#).

- TiDB Lightning adds a new configuration parameter `"header-schema-match"` to address the issue of mismatched column names between the source file and the target table @dsdashun

In v6.6.0, TiDB Lightning adds a new profile parameter `"header-schema-match"`. The default value is `true`, which means the first row of the source CSV file is treated as the column name, and consistent with that in the target table. If the field name in the CSV table header does not match the column name of the target table, you can

set this configuration to **false**. TiDB Lightning will ignore the error and continue to import the data in the order of the columns in the target table.

For more information, see [documentation](#).

- TiDB Lightning supports enabling compressed transfers when sending key-value pairs to TiKV [#41163](#) (experimental) [@gozssky](#)

Starting from v6.6.0, TiDB Lightning supports compressing locally encoded and sorted key-value pairs for network transfer when sending them to TiKV, thus reducing the amount of data transferred over the network and lowering the network bandwidth overhead. In the earlier TiDB versions before this feature is supported, TiDB Lightning requires relatively high network bandwidth and incurs high traffic charges in case of large data volumes.

This feature is disabled by default. To enable it, you can set the `compress-kv-pairs` configuration item of TiDB Lightning to "gzip" or "gz".

For more information, see [documentation](#).

- The TiKV-CDC tool is now GA and supports subscribing to data changes of RawKV [#48](#) [@zeminzhou](#) [@haojinming](#) [@pingyu](#)

TiKV-CDC is a CDC (Change Data Capture) tool for TiKV clusters. TiKV and PD can constitute a KV database when used without TiDB, which is called RawKV. TiKV-CDC supports subscribing to data changes of RawKV and replicating them to a downstream TiKV cluster in real time, thus enabling cross-cluster replication of RawKV.

For more information, see [documentation](#).

- TiCDC supports scaling out a single table on Kafka changefeeds and distributing the changefeed to multiple TiCDC nodes (experimental) [#7720](#) [@overvenus](#)

Before v6.6.0, when a table in the upstream accepts a large amount of writes, the replication capability of this table cannot be scaled out, resulting in an increase in the replication latency. Starting from TiCDC v6.6.0, the changefeed of an upstream table can be distributed to multiple TiCDC nodes in a Kafka sink, which means the replication capability of a single table is scaled out.

For more information, see [documentation](#).

- **GORM** adds TiDB integration tests. Now TiDB is the default database supported by GORM. [#6014](#) [@Icemap](#)
  - In v1.4.6, [GORM MySQL driver](#) adapts to the `AUTO_RANDOM` attribute of TiDB [#104](#)
  - In v1.4.6, [GORM MySQL driver](#) fixes the issue that when connecting to TiDB, the `Unique` attribute of the `Unique` field cannot be modified during `AutoMigrate` [#105](#)
  - [GORM documentation](#) mentions TiDB as the default database [#638](#)

For more information, see [GORM documentation](#).

### 16.5.1.1.7 Observability

- Support quickly creating SQL binding on TiDB Dashboard [#781](#) @YiniXu9506

TiDB v6.6.0 supports creating SQL binding from statement history, which allows you to quickly bind a SQL statement to a specific plan on TiDB Dashboard.

By providing a user-friendly interface, this feature simplifies the process of binding plans in TiDB, reduces the operation complexity, and improves the efficiency and user experience of the plan binding process.

For more information, see [documentation](#).

- Add warning for caching execution plans @qw4990

When an execution plan cannot be cached, TiDB indicates the reason in warning to make diagnostics easier. For example:

```
mysql> PREPARE st FROM 'SELECT * FROM t WHERE a<?';
Query OK, 0 rows affected (0.00 sec)

mysql> SET @a='1';
Query OK, 0 rows affected (0.00 sec)

mysql> EXECUTE st USING @a;
Empty set, 1 warning (0.01 sec)

mysql> SHOW WARNINGS;
+-----+-----+-----+-----+
| Level | Code | Message |
+-----+-----+-----+-----+
| Warning | 1105 | skip plan-cache: '1' may be converted to INT |
+-----+-----+-----+-----+
```

In the preceding example, the optimizer converts a non-INT type to an INT type, and the execution plan might change with the change of the parameter, so TiDB does not cache the plan.

For more information, see [documentation](#).

- Add a Warnings field to the slow query log [#39893](#) @time-and-fate

TiDB v6.6.0 adds a **Warnings** field to the slow query log to help diagnose performance issues. This field records warnings generated during the execution of a slow query. You can also view the warnings on the slow query page of TiDB Dashboard.

For more information, see [documentation](#).

- Automatically capture the generation of SQL execution plans [#38779](#) @Yisaer

In the process of troubleshooting execution plan issues, **PLAN REPLAYER** can help preserve the scene and improve the efficiency of diagnosis. However, in some scenarios,

the generation of some execution plans cannot be reproduced freely, which makes the diagnosis work more difficult.

To address such issues, in TiDB v6.6.0, `PLAN REPLAYER` extends the capability of automatic capture. With the `PLAN REPLAYER CAPTURE` command, you can register the target SQL statement in advance and also specify the target execution plan at the same time. When TiDB detects the SQL statement or the execution plan that matches the registered target, it automatically generates and packages the `PLAN REPLAYER` information. When the execution plan is unstable, this feature can improve diagnostic efficiency.

To use this feature, set the value of `tidb_enable_plan_replayer_capture` to `ON`.

For more information, see [documentation](#).

- Support persisting statements summary (experimental) [#40812](#) @mornyx

Before v6.6.0, statements summary data is kept in memory and would be lost upon a TiDB server restart. Starting from v6.6.0, TiDB supports enabling statements summary persistence, which allows historical data to be written to disks on a regular basis. In the meantime, the result of queries on system tables will derive from disks, instead of memory. After TiDB restarts, all historical data remains available.

For more information, see [documentation](#).

#### 16.5.1.1.8 Security

- TiFlash supports automatic rotations of TLS certificates [#5503](#) @ywqzzy

In v6.6.0, TiDB supports automatic rotations of TiFlash TLS certificates. For a TiDB cluster with encrypted data transmission between components enabled, when a TLS certificate of TiFlash expires and needs to be reissued with a new one, the new TiFlash TLS certificate can be automatically loaded without restarting the TiDB cluster. In addition, the rotation of a TLS certificate between components within a TiDB cluster does not affect the use of the TiDB cluster, which ensures high availability of the cluster.

For more information, see [documentation](#).

- TiDB Lightning supports accessing Amazon S3 data via AWS IAM role keys and session tokens [#4075](#) @okJiang

Before v6.6.0, TiDB Lightning only supports accessing S3 data via AWS IAM **user's access keys** (each access key consists of an access key ID and a secret access key) so you cannot use a temporary session token to access S3 data. Starting from v6.6.0, TiDB Lightning supports accessing S3 data via AWS IAM **role's access keys + session tokens** as well to improve the data security.

For more information, see [documentation](#).

#### 16.5.1.1.9 Telemetry

- Starting from February 20, 2023, the **telemetry feature** is disabled by default in new versions of TiDB and TiDB Dashboard (including v6.6.0). If you upgrade from a previous version that uses the default telemetry configuration, the telemetry feature is disabled after the upgrade. For the specific versions, see [TiDB Release Timeline](#).
- Starting from v1.11.3, the telemetry feature is disabled by default in newly deployed TiUP. If you upgrade from a previous version of TiUP to v1.11.3 or a later version, the telemetry feature keeps the same status as before the upgrade.

#### 16.5.1.2 Compatibility changes

##### Note:

This section provides compatibility changes you need to know when you upgrade from v6.5.0 to the current version (v6.6.0). If you are upgrading from v6.4.0 or earlier versions to the current version, you might also need to check the compatibility changes introduced in intermediate versions.

##### 16.5.1.2.1 MySQL compatibility

- Support MySQL-compatible foreign key constraints [#18209](#) [@crazycs520](#)  
For more information, see the [SQL](#) section in this document and [documentation](#).
- Support the MySQL-compatible multi-valued index (experimental) [#39592](#) [@xiongjiwei](#) [@qw4990](#)  
For more information, see the [SQL](#) section in this document and [documentation](#).

##### 16.5.1.2.2 System variables

Variable name	Change type	Description
tidb_enable_tkql	Deleted	Starting from v6.5.0, this variable is deprecated. Starting from v6.6.0, this variable and the AMEND <code>⇨ TRANSACTION</code> feature are deleted. TiDB will use <b>meta lock</b> to avoid the Information <code>⇨</code> <code>⇨ schema</code> <code>⇨ is</code> <code>⇨</code> <code>⇨ changed</code> <code>⇨</code> error.
tidb_enable_pessimistic_txn	Deleted	Starting from v6.5.0, this variable is deprecated. Starting from v6.6.0, this variable and the AMEND <code>⇨ TRANSACTION</code> feature are deleted. TiDB will use <b>meta lock</b> to avoid the Information <code>⇨</code> <code>⇨ schema</code> <code>⇨ is</code> <code>⇨</code> <code>⇨ changed</code> <code>⇨</code> error.

Variable name	Change type	Description
<code>tidb_enable_concurrent_ddl</code> ↔		This variable controls whether to allow TiDB to use concurrent DDL statements. When this variable is disabled, TiDB uses the old DDL execution framework, which provides limited support for concurrent DDL execution. Starting from v6.6.0, this variable is

Variable name	Change type	Description
<code>tidb_ttl_job_run_interval</code> ↔	Deleted	This variable is used to control the scheduling interval of TTL jobs in the background. Starting from v6.6.0, this variable is deleted, because TiDB provides the <code>TTL_JOB_INTERVAL</code> ↔ attribute for every table to control the TTL runtime, which is more flexible than <code>tidb_ttl_job_run_interval</code>

---

Variable name	Change type	Description
<code>foreign_key_checks</code> ↔	Modified	This variable controls whether to enable the foreign key constraint check. The default value changes from OFF to ON, which means enabling the foreign key check by default.

---

Variable name	Change type	Description
<code>tidb_enable_foreign_key</code> ↔	Modified	This variable controls whether to enable the foreign key feature. The default value changes from OFF to ON, which means enabling foreign key by default.

Variable name	Change type	Description
<code>tidb_enable_general_plan_cache</code> ↔	Modified	This variable controls whether to enable General Plan Cache. Starting from v6.6.0, this variable is renamed to <code>tidb_enable_non_prepared_plan_cache</code> . ↔ .

---

Variable name	Change type	Description
<code>tidb_enable_historical_stats</code> ↔	Modified	This variable controls whether to enable historical statistics. The default value changes from OFF to ON, which means that historical statistics are enabled by default.

---

Variable name	Change type	Description
<code>tidb_enable_telemetry</code> ↔	Modified	The default value changes from ON to OFF, which means that telemetry is disabled by default in TiDB.

Variable name	Change type	Description
<code>tidb_general_plan_cache_size</code> ↔	Modified	This variable controls the maximum number of execution plans that can be cached by General Plan Cache. Starting from v6.6.0, this variable is renamed to <code>tidb_non_prepared_plan_cache_size</code> ↔ .

---

Variable name	Change type	Description
<code>tidb_replica_learner</code>	Modified	A new value option <code>learner</code> $\hookrightarrow$ is added for this variable to specify the learner replicas with which TiDB reads data from read-only nodes.

Variable name	Change type	Description
<code>tidb_replica_read_prefer_leader</code>	Modified	<p>A new value option <code>prefer_leader</code> is added for this variable to improve the overall read availability of TiDB clusters. When this option is set, TiDB prefers to read from the leader replica. When the performance of the leader replica significantly decreases, TiDB automatically</p>

Variable name	Change type	Description
<code>tidb_store_<del>modified</del>size</code> ↔	Modified	This variable controls the batch size of the Coprocessor Tasks of the IndexLookUp operator. 0 means to disable batch. Starting from v6.6.0, the default value is changed from 0 to 4, which means 4 Coprocessor tasks will be batched into one task for each batch of requests.

Variable name	Change type	Description
<code>mpp_exchange_operator_compression_mode</code> ↔	Newly added	This variable specifies the data compression mode of the MPP Exchange operator. It takes effect when TiDB selects the MPP execution plan with the version number 1. The default value <code>UNSPECIFIED</code> ↔ means that TiDB automatically selects the <code>FAST</code> compression

Variable name	Change type	Description
<code>mpp_version</code> ↔	Newly added	This variable specifies the version of the MPP execution plan. After a version is specified, TiDB selects the specified version of the MPP execution plan. The default value <code>UNSPECIFIED</code> ↔ means that TiDB automatically selects the latest version 1.

Variable name	Change type	Description
<code>tidb_ddl_newly_added_reorg</code> ↔	Newly added	This variable controls whether to enable distributed execution of the DDL reorg phase to accelerate this phase. The default value <b>OFF</b> means not to enable distributed execution of the DDL reorg phase by default. Currently, this variable takes effect only for

Variable name	Change type	Description
<code>tidb_enable_new_logical_stats_for_capture</code>	Newly added	This variable controls whether the information captured by <code>PLAN REPLAYER</code> includes historical statistics by default. The default value <code>OFF</code> means that historical statistics are not included by default.

Variable name	Change type	Description
<code>tidb_enable_prepared_plan_cache</code>	Newly added	This variable controls whether Prepared Plan Cache caches execution plans that contain COUNT after Limit. The default value is ON, which means Prepared Plan Cache supports caching such execution plans. Note that Prepared Plan Cache does not support

Variable name	Change type	Description
<code>tidb_enable_replayer_capture</code>	Newly added	<p>This variable controls whether to enable the <b>PLAN REPLAYER</b> feature. The default value <b>OFF</b> means to disable the <b>PLAN REPLAYER</b> feature.</p>

Variable name	Change type	Description
<code>tidb_enable_resource_control</code> ↔	Newly added	This variable controls whether to enable the resource control feature. The default value is <code>OFF</code> . When this variable is set to <code>ON</code> , the TiDB cluster supports resource isolation of applications based on resource groups.

---

Variable name	Change type	Description
<code>tidb_history_stats_duration</code> ↔	Newly added	This variable controls how long the historical statistics are retained in storage. The default value is 7 days.

---

Variable name	Change type	Description
<code>tidb_index_join_selectivity</code>	Newly added	This variable controls whether to add some penalty cost to the selection of index join. The default value 0 means that this feature is disabled by default.

Variable name	Change type	Description
<code>tidb_pessimistic_locking</code>	Newly added	This variable controls whether to use enhanced pessimistic locking wake-up model for pessimistic transactions. The default value <b>OFF</b> means not to use such a wake-up model for pessimistic transactions by default.

Variable name	Change type	Description
<code>tidb_stmt_summary_enable_persistent</code> ↔	Newly added	This variable is read-only. It controls whether to enable <code>state-ments summary persistence</code> . The value of this variable is the same as that of the configuration item <code>tidb_stmt_summary_enable_persistent</code> . ↔ .

Variable name	Change type	Description
<code>tidb_stmt_summary_filename</code> ↔	Newly added	This variable is read-only. It specifies the file to which persistent data is written when <code>state-ments-summary-persistence</code> is enabled. The value of this variable is the same as that of the configuration item <code>tidb_stmt_summary_filename</code> ↔ .

Variable name	Change type	Description
<code>tidb_stmt_summary_file_max_backups</code> ↔	Newly added	This variable is read-only. It specifies the maximum number of data files that can be persisted when <code>state-ments summary persistence</code> is enabled. The value of this variable is the same as that of the configuration item <code>tidb_stmt_summary_file_max_backups</code> ↔ .

Variable name	Change type	Description
<code>tidb_stmt_summary_file_max_days</code> ↔	Newly added	This variable is read-only. It specifies the maximum number of days to keep persistent data files when <code>state-ments summary persistence</code> is enabled. The value of this variable is the same as that of the configuration item <code>tidb_stmt_summary_file_max_days</code> ↔ .

Variable name	Change type	Description
<code>tidb_stmt_summary_file_max_size</code> ↔	Newly added	This variable is read-only. It specifies the maximum size of a persistent data file when <code>state-ments-summary-persistence</code> is enabled. The value of this variable is the same as that of the configuration item <code>tidb_stmt_summary_file_max_size</code> ↔ .

### 16.5.1.2.3 Configuration file parameters

Configuration			
Configuration file	Parameter	Change type	Description
TiKV	<b>rocksdb</b> ↳ . ↳ <b>enable</b> ↳ - ↳ <b>statistics</b> ↳	Deleted	This configuration item specifies whether to enable RocksDB statistics. Starting from v6.6.0, this item is deleted. RocksDB statistics are enabled for all clusters by default to help diagnostics. For details, see <a href="#">#13942</a> .

Configuration			
Configuration file	parameter	Change type	Description
TiKV	<code>raftdb.</code>	Deleted	This configuration item specifies whether to enable Raft RocksDB statistics. Starting from v6.6.0, this item is deleted. Raft RocksDB statistics are enabled for all clusters by default to help diagnostics. For details, see <a href="#">#13942</a> .
	↳ <code>enable</code>		
	↳ <code>-</code>		
	↳ <code>statistics</code>		
	↳		

Configuration			
Configuration file	parameter	Change type	Description
TiKV	<b>storage</b> ↳ . ↳ <b>block</b> ↳ - ↳ <b>cache</b> ↳ . ↳ <b>shared</b> ↳	Deleted	Starting from v6.6.0, this configuration item is deleted, and the block cache is enabled by default and cannot be disabled. For details, see <a href="#">#12936</a> .

Configuration file	Configuration parameter	Configuration Change type	Description
DM	on- ↔ <b>duplicate</b> ↔	Deleted	This configuration item controls the methods to resolve conflicts during the full import phase. In v6.6.0, new configuration items on- ↔ <b>duplicate</b> ↔ - ↔ <b>logical</b> ↔ <b>and</b> on- ↔ <b>duplicate</b> ↔ - ↔ <b>physical</b> ↔ <b>are</b> introduced to replace on- ↔ <b>duplicate</b> ↔ .

Configuration			
Configuration file	parameter	Change type	Description
TiDB	<code>enable-telemetry</code>	Modified	Starting from v6.6.0, the default value changes from <code>true</code> to <code>false</code> , which means that telemetry is disabled by default in TiDB.
TiKV	<code>rocksdb.defaultcf.block-size</code> and <code>rocksdb.writecf.block-size</code>	Modified	The default values change from 64K to 32K.

Configuration file	Configuration parameter	Change type	Description
TiKV	<code>rocksdb</code>	Deprecated	Starting from v6.6.0, these configuration items are deprecated. For details, see <a href="#">#12936</a> .

Configuration			
Configuration file	parameter	Change type	Description
PD	<del>enable</del> ↔ <b>telemetry</b> ↔	Modified	Starting from v6.6.0, the default value changes from <b>true</b> to <b>false</b> , which means that telemetry is disabled by default in TiDB Dashboard.

Configuration			
Configuration file	parameter	Change type	Description
DM	<code>import- ↔ mode</code>	Modified	<p>The possible values of this configuration item are changed from "sql" and "loader" ↔ " to " ↔ logical" ↔ " and " ↔ physical" ↔ ".".</p> <p>The default value is " ↔ logical" ↔ ", which means using TiDB Lightning's logical import mode to import data.</p>

Configuration			
Configuration file	Parameter	Change type	Description
TiFlash	<code>profile</code> ↳ <code>.</code> ↳ <code>default</code> ↳ <code>.</code> ↳ <code>max_memory_usage_limit_for_queries</code> ↳	Modified	Specifies the memory usage limit for the generated intermediate data in all queries. Starting from v6.6.0, the default value changes from 0 to 0.8, which means the limit is 80% of the total memory.

Configuration file	Configuration parameter	Change type	Description
TiCDC	<b>consistent</b> ↳ <b>.</b> ↳ <b>storage</b> ↳	Modified	This configuration item specifies the path under which redo log backup is stored. Two more value options are added for <b>scheme</b> , <b>GCS</b> , and <b>Azure</b> .

Configuration			
Configuration file	parameter	Change type	Description
TiDB	<code>initialize</code> ↳ <code>-sql</code> ↳ <code>-</code> ↳ <code>file</code>	Newly added	This configuration item specifies the SQL script to be executed when the TiDB cluster is started for the first time. The default value is empty.

Configuration			
Configuration file	parameter	Change type	Description
TiDB	<code>tidb_stmt_summary_enabled</code> ↔	Newly added	This configuration item controls whether to enable statements summary persistence. The default value is <code>false</code> , which means this feature is not enabled by default.

Configuration			
Configuration file	Parameter	Change type	Description
TiDB	<code>tidb_stmt_summary_file_max_backups</code> ↔	Newly added	When statements summary persistence is enabled, this configuration specifies the maximum number of data files that can be persisted. 0 means no limit on the number of files.

Configuration file	Configuration		Description
	parameter	Change type	
TiDB	<code>tidb_stmt_summary_file</code> ↔	Newly added	When <code>max_days</code> statements summary persistence is enabled, this configuration specifies the maximum number of days to keep persistent data files.
TiDB	<code>tidb_stmt_summary_file</code> ↔	Newly added	When <code>max_size</code> statements summary persistence is enabled, this configuration specifies the maximum size of a persistent data file (in MiB).

Configuration			
Configuration file	parameter	Change type	Description
TiDB	<code>tidb_stmt_summary_file</code> ↔	Newly added	When statements summary persistence is enabled, this configuration specifies the file to which persistent data is written.

Configuration			
Configuration file	parameter	Change type	Description
TiKV	<b>resource</b> ↔ - ↔ <b>control</b> ↔ . ↔ <b>enabled</b> ↔	Newly added	Whether to enable scheduling for user foreground read/write requests according to the Request Unit (RU) of the corresponding resource groups. The default value is <b>false</b> , which means to disable scheduling according to the RU of the corresponding resource groups.

Configuration			
Configuration file	Parameter	Change type	Description
TiKV	<b>storage</b> ↪ <b>.</b> ↪ <b>engine</b> ↪	Newly added	This configuration item specifies the type of the storage engine. Value options are "raft- ↪ kv" and " ↪ partitioned ↪ - ↪ raft ↪ -kv". This configuration item can only be specified when creating a cluster and cannot be modified once being specified.

Configuration			
Configuration file	parameter	Change type	Description
TiKV	<b>rocksdb</b>	Newly added	This configuration item specifies the flush strategy used when the memory usage of memtable reaches the threshold.
	↪ <b>.</b>		
	↪ <b>write</b>		
	↪ <b>-</b>		
	↪ <b>buffer</b>		
	↪ <b>-</b>		
	↪ <b>flush</b>		
	↪ <b>-</b>		
	↪ <b>oldest</b>		
	↪ <b>-</b>		
	↪ <b>first</b>		
	↪		

Configuration file	Configuration parameter	Change type	Description
TiKV	<b>rocksdb</b> ↪ <b>.</b> ↪ <b>write</b> ↪ <b>-</b> ↪ <b>buffer</b> ↪ <b>-</b> ↪ <b>limit</b> ↪	Newly added	This configuration item specifies the limit on total memory used by memtable ↪ of all RocksDB instances in a single TiKV. The default value is 25% of the total machine memory.
PD	<b>pd-</b> ↪ <b>server</b> ↪ <b>.</b> ↪ <b>enable</b> ↪ <b>-</b> ↪ <b>gogc</b> ↪ <b>-</b> ↪ <b>tuner</b> ↪	Newly added	This configuration item controls whether to enable the GOGC tuner, which is disabled by default.

Configuration file	Configuration parameter	Change type	Description
PD	pd- ↪ server ↪ .gc- ↪ tuner ↪ - ↪ threshold ↪	Newly added	This configuration item specifies the maximum memory threshold ratio for tuning GOGC. The default value is 0.6.
PD	pd- ↪ server ↪ . ↪ server ↪ - ↪ memory ↪ - ↪ limit ↪ -gc- ↪ trigger ↪	Newly added	This configuration item specifies the threshold ratio at which PD tries to trigger GC. The default value is 0.7.

Configuration file	Configuration parameter	Change type	Description
PD	<p><code>pd-</code></p> <ul style="list-style-type: none"> <li>↳ <code>server</code></li> <li>↳ <code>.</code></li> <li>↳ <code>server</code></li> <li>↳ <code>-</code></li> <li>↳ <code>memory</code></li> <li>↳ <code>-</code></li> <li>↳ <code>limit</code></li> <li>↳</li> </ul>	Newly added	<p>This configuration item specifies the memory limit ratio for a PD instance. The value 0 means no memory limit.</p>

Configuration file	Configuration parameter	Change type	Description
TiCDC	<p><b>scheduler</b></p> <p>↳ <b>.</b></p> <p>↳ <b>region</b></p> <p>↳ <b>-per</b></p> <p>↳ <b>-</b></p> <p>↳ <b>span</b></p>	Newly added	<p>This configuration item controls whether to split a table into multiple replication ranges based on the number of Regions, and these ranges can be replicated by multiple TiCDC nodes. The default value is 50000.</p>

Configuration file	Configuration		Description
	parameter	Change type	
TiDB	<b>compress</b>	Newly added	This configuration item controls whether to enable compression when sending KV pairs to TiKV in the physical import mode. The default value is empty, meaning that the compression is not enabled.
Lightning	↔ <b>-kv-</b>		
	↔ <b>pairs</b>		
	↔		

Configuration			
Configuration file	parameter	Change type	Description
DM	<b>checksum</b> ↔ - ↔ <b>physical</b> ↔	Newly added	This configuration item controls whether DM performs ADMIN ↔ CHECKSUM ↔ ↔ TABLE ↔ < ↔ <b>table</b> ↔ > for each table to verify data integrity after the import. The default value is " ↔ <b>required</b> ↔ ", which performs admin check-sum after the import. If check-sum fails, DM pauses the task and you need to manually handle

Configuration			
Configuration file	parameter	Change type	Description
DM	disk- ↪ quota ↪ - ↪ physical ↪	Newly added	This configuration item sets the disk quota. It corresponds to the disk- ↪ quota ↪ configuration of TiDB Lightning.

Configuration			
Configuration file	parameter	Change type	Description
DM	<code>on-</code> <code>↔ duplicated</code> <code>↔ -</code> <code>↔ logical</code> <code>↔</code>	Newly added	<p>This configuration item controls how DM resolves conflicting data in the logical import mode. The default value is "</p> <p><code>↔ replace</code></p> <p><code>↔ "</code>, which means using the new data to replace the existing data.</p>

Configuration			
Configuration file	parameter	Change type	Description
DM	<del>on-</del> ↔ duplicated ↔ - ↔ physical ↔	Newly added	<p>This configuration item controls how DM resolves conflicting data in the physical import mode. The default value is "none", which means not resolving conflicting data. "none" has the best performance, but might lead to inconsistent data in the downstream database.</p>

Configuration			
Configuration file	parameter	Change type	Description
DM	<b>sorting</b> ↳ <b>-dir</b> ↳ <b>-</b> ↳ <b>physical</b> ↳	Newly added	This configuration item specifies the directory used for local KV sorting in the physical import mode. The default value is the same as the <b>dir</b> configuration.

Configuration			
Configuration file	parameter	Change type	Description
sync-diff-inspector	<b>skip-</b> ↔ <b>non-</b> ↔ <b>existing</b> ↔ <b>-</b> ↔ <b>table</b> ↔	Newly added	This configuration item controls whether to skip checking up-stream and down-stream data consistency when tables in the down-stream do not exist in the up-stream.

Configuration file	Configuration parameter	Change type	Description
TiSpark	<code>spark.tispark.replica_read</code>	Newly added	This configuration item controls the type of replicas to be read. The value options are leader, follower, and learner.
TiSpark	<code>spark.tispark.replica_read_label</code>	Newly added	This configuration item is used to set labels for the target TiKV node.

#### 16.5.1.2.4 Others

- Support dynamically modifying `store-io-pool-size`. This facilitates more flexible TiKV performance tuning.
- Remove the limit on LIMIT clauses, thus improving the execution performance.
- Starting from v6.6.0, BR does not support restoring data to clusters earlier than v6.1.0.
- Starting from v6.6.0, TiDB no longer supports modifying column types on partitioned tables because of potential correctness issues.

#### 16.5.1.3 Improvements

- TiDB

- Improve the scheduling mechanism of TTL background cleaning tasks to allow the cleaning task of a single table to be split into several sub-tasks and scheduled to run on multiple TiDB nodes simultaneously [#40361](#) @YangKeao
- Optimize the column name display of the result returned by running multi-statements after setting a non-default delimiter [#39662](#) @mjonss
- Optimize the execution efficiency of statements after warning messages are generated [#39702](#) @tiancaiaimao
- Support distributed data backfill for ADD INDEX (experimental) [#37119](#) @zimulala
- Support using CURDATE() as the default value of a column [#38356](#) @CbcWestwolf
- `partial order prop push down` now supports the LIST-type partitioned tables [#40273](#) @winoros
- Add error messages for conflicts between optimizer hints and execution plan bindings [#40910](#) @Reminiscent
- Optimize the plan cache strategy to avoid non-optimal plans when using plan cache in some scenarios [#40312](#) [#40218](#) [#40280](#) [#41136](#) [#40686](#) @qw4990
- Clear expired region cache regularly to avoid memory leak and performance degradation [#40461](#) @sticnarf
- MODIFY COLUMN is not supported on partitioned tables [#39915](#) @wjhuang2016
- Disable renaming of columns that partition tables depend on [#40150](#) @mjonss
- Refine the error message reported when a column that a partitioned table depends on is deleted [#38739](#) @jiyfhust
- Add a mechanism that FLASHBACK CLUSTER retries when it fails to check the min-resolved-ts [#39836](#) @Defined2014

- TiKV

- Optimize the default values of some parameters in partitioned-raft-kv mode: the default value of the TiKV configuration item `storage.block-cache.capacity` is adjusted from 45% to 30%, and the default value of `region-split-size` is adjusted from 96MiB adjusted to 10GiB. When using raft-kv mode and `enable-region-bucket` is true, `region-split-size` is adjusted to 1 GiB by default. [#12842](#) @tonyxuqqi
- Support priority scheduling in Raftstore asynchronous writes [#13730](#) @Connor1996
- Support starting TiKV on a CPU with less than 1 core [#13586](#) [#13752](#) [#14017](#) @andreid-db
- Optimize the new detection mechanism of Raftstore slow score and add `evict-slow-trend-scheduler` [#14131](#) @innerr
- Force the block cache of RocksDB to be shared and no longer support setting the block cache separately according to CF [#12936](#) @busyjay

- PD

- Support managing the global memory threshold to alleviate the OOM problem (experimental) [#5827](#) @hnes

- Add the GC Tuner to alleviate the GC pressure (experimental) [#5827](#) @hnes
  - Add the `evict-slow-trend-scheduler` scheduler to detect and schedule abnormal nodes [#5808](#) @innerr
  - Add the keyspace manager to manage keyspace [#5293](#) @AmoebaProtozoa
- TiFlash
    - Support an independent MVCC bitmap filter that decouples the MVCC filtering operations in the TiFlash data scanning process, which provides the foundation for future optimization of the data scanning process [#6296](#) @JinheLin
    - Reduce the memory usage of TiFlash by up to 30% when there is no query [#6589](#) @hongyunyan
- Tools
    - Backup & Restore (BR)
      - \* Optimize the concurrency of downloading log backup files on the TiKV side to improve the performance of PITR recovery in regular scenarios [#14206](#) @YuJuncen
    - TiCDC
      - \* Support batch UPDATE DML statements to improve TiCDC replication performance [#8084](#) @amyangfei
      - \* Implement MQ sink and MySQL sink in the asynchronous mode to improve the sink throughput [#5928](#) @hicqu @hi-rustin
    - TiDB Data Migration (DM)
      - \* Optimize DM alert rules and content [#7376](#) @D3Hunter  
Previously, alerts similar to “DM\_XXX\_process\_exits\_with\_error” were raised whenever a related error occurred. But some alerts are caused by idle database connections, which can be recovered after reconnecting. To reduce these kinds of alerts, DM divides errors into two types: automatically recoverable errors and unrecoverable errors:
        - For an error that is automatically recoverable, DM reports the alert only if the error occurs more than 3 times within 2 minutes.
        - For an error that is not automatically recoverable, DM maintains the original behavior and reports the alert immediately.
      - \* Optimize relay performance by adding the async/batch relay writer [#4287](#) @GMHDBJD
    - TiDB Lightning
      - \* Physical Import Mode supports keyspace [#40531](#) @iosmanthus
      - \* Support setting the maximum number of conflicts by `lightning.max-error` [#40743](#) @dsdashun
      - \* Support importing CSV data files with BOM headers [#40744](#) @dsdashun

- \* Optimize the processing logic when encountering TiKV flow-limiting errors and try other available regions instead [#40205](#) @lance6716
- \* Disable checking the table foreign keys during import [#40027](#) @gozssky
- Dumping
  - \* Support exporting settings for foreign keys [#39913](#) @lichunzhu
- sync-diff-inspector
  - \* Add a new parameter `skip-non-existing-table` to control whether to skip checking upstream and downstream data consistency when tables in the downstream do not exist in the upstream [#692](#) @lichunzhu @liumengya94

#### 16.5.1.4 Bug fixes

- TiDB
  - Fix the issue that a statistics collection task fails due to an incorrect `datetime` value [#39336](#) @xuyifangreeneyes
  - Fix the issue that `stats_meta` is not created following table creation [#38189](#) @xuyifangreeneyes
  - Fix frequent write conflicts in transactions when performing DDL data backfill [#24427](#) @mjonss
  - Fix the issue that sometimes an index cannot be created for an empty table using ingest mode [#39641](#) @tangenta
  - Fix the issue that `wait_ts` in the slow query log is the same for different SQL statements within the same transaction [#39713](#) @TonsnakeLin
  - Fix the issue that the `Assertion Failed` error is reported when adding a column during the process of deleting a row record [#39570](#) @wjhuang2016
  - Fix the issue that the `not a DDL owner` error is reported when modifying a column type [#39643](#) @zimulala
  - Fix the issue that no error is reported when inserting a row after exhaustion of the auto-increment values of the `AUTO_INCREMENT` column [#38950](#) @Dousir9
  - Fix the issue that the `Unknown column` error is reported when creating an expression index [#39784](#) @Defined2014
  - Fix the issue that data cannot be inserted into a renamed table when the generated expression includes the name of this table [#39826](#) @Defined2014
  - Fix the issue that the `INSERT ignore` statement cannot fill in default values when the column is write-only [#40192](#) @YangKeao
  - Fix the issue that resources are not released when disabling the resource management module [#40546](#) @zimulala
  - Fix the issue that TTL tasks cannot trigger statistics updates in time [#40109](#) @YangKeao
  - Fix the issue that unexpected data is read because TiDB improperly handles NULL values when constructing key ranges [#40158](#) @tiancaiaobao

- Fix the issue that illegal values are written to a table when the `MODIFY COLUMN` statement also changes the default value of a column [#40164](#) @wjuhuang2016
- Fix the issue that the adding index operation is inefficient due to invalid Region cache when there are many Regions in a table [#38436](#) @tangenta
- Fix data race occurred in allocating auto-increment IDs [#40584](#) @Dousir9
- Fix the issue that the implementation of the not operator in JSON is incompatible with the implementation in MySQL [#40683](#) @YangKeao
- Fix the issue that concurrent view might cause DDL operations to be blocked [#40352](#) @zeminzhou
- Fix data inconsistency caused by concurrently executing DDL statements to modify columns of partitioned tables [#40620](#) @mjonss @mjonss
- Fix the issue that “Malformed packet” is reported when using  `caching_sha2_password`  ↪ for authentication without specifying a password [#40831](#) @dveeden
- Fix the issue that a TTL task fails if the primary key of the table contains an ENUM column [#40456](#) @lcwangchao
- Fix the issue that some DDL operations blocked by MDL cannot be queried in `mysql.tidb_md1_view` [#40838](#) @YangKeao
- Fix the issue that data race might occur during DDL ingestion [#40970](#) @tangenta
- Fix the issue that TTL tasks might delete some data incorrectly after the time zone changes [#41043](#) @lcwangchao
- Fix the issue that JSON\_OBJECT might report an error in some cases [#39806](#) @YangKeao
- Fix the issue that TiDB might deadlock during initialization [#40408](#) @Defined2014
- Fix the issue that the value of system variables might be incorrectly modified in some cases due to memory reuse [#40979](#) @lcwangchao
- Fix the issue that data might be inconsistent with the index when a unique index is created in the ingest mode [#40464](#) @tangenta
- Fix the issue that some truncate operations cannot be blocked by MDL when truncating the same table concurrently [#40484](#) @wjuhuang2016
- Fix the issue that the `SHOW PRIVILEGES` statement returns an incomplete privilege list [#40591](#) @CbcWestwolf
- Fix the issue that TiDB panics when adding a unique index [#40592](#) @tangenta
- Fix the issue that executing the `ADMIN RECOVER` statement might cause the index data to be corrupted [#40430](#) @xiongjiwei
- Fix the issue that a query might fail when the queried table contains a `CAST` expression in the expression index [#40130](#) @xiongjiwei
- Fix the issue that a unique index might still produce duplicate data in some cases [#40217](#) @tangenta
- Fix the PD OOM issue when there is a large number of Regions but the table ID cannot be pushed down when querying some virtual tables using `Prepare` or `Execute` [#39605](#) @djshow832
- Fix the issue that data race might occur when an index is added [#40879](#) @tangenta
- Fix the `can't find proper physical plan` issue caused by virtual columns

- [#41014](#) @AilinKid
  - Fix the issue that TiDB cannot restart after global bindings are created for partition tables in dynamic trimming mode [#40368](#) @Yisaer
  - Fix the issue that `auto analyze` causes graceful shutdown to take a long time [#40038](#) @xuyifanggreeneyes
  - Fix the panic of the TiDB server when the IndexMerge operator triggers memory limiting behaviors [#41036](#) @guo-shaoge
  - Fix the issue that the `SELECT * FROM table_name LIMIT 1` query on partitioned tables is slow [#40741](#) @soltzg
- TiKV
  - Fix an error that occurs when casting the `const Enum` type to other types [#14156](#) @wshwsh12
  - Fix the issue that Resolved TS causes higher network traffic [#14092](#) @overvenus
  - Fix the data inconsistency issue caused by network failure between TiDB and TiKV during the execution of a DML after a failed pessimistic DML [#14038](#) @MyonKeminta
- PD
  - Fix the issue that the Region Scatter task generates redundant replicas unexpectedly [#5909](#) @HundunDM
  - Fix the issue that the Online Unsafe Recovery feature would get stuck and time out in `auto-detect` mode [#5753](#) @Connor1996
  - Fix the issue that the execution `replace-down-peer` slows down under certain conditions [#5788](#) @HundunDM
  - Fix the PD OOM issue that occurs when the calls of `ReportMinResolvedTS` are too frequent [#5965](#) @HundunDM
- TiFlash
  - Fix the issue that querying TiFlash-related system tables might get stuck [#6745](#) @lidezhu
  - Fix the issue that semi-joins use excessive memory when calculating Cartesian products [#6730](#) @gengliqi
  - Fix the issue that the result of the division operation on the DECIMAL data type is not rounded [#6393](#) @LittleFall
  - Fix the issue that `start_ts` cannot uniquely identify an MPP query in TiFlash queries, which might cause an MPP query to be incorrectly canceled [#43426](#) @hehechen
- Tools
  - Backup & Restore (BR)

- \* Fix the issue that when restoring log backup, hot Regions cause the restore to fail [#37207](#) @Leavrth
  - \* Fix the issue that restoring data to a cluster on which the log backup is running causes the log backup file to be unrecoverable [#40797](#) @Leavrth
  - \* Fix the issue that the PITR feature does not support CA-bundles [#38775](#) @YuJuncen
  - \* Fix the panic issue caused by duplicate temporary tables during recovery [#40797](#) @joccau
  - \* Fix the issue that PITR does not support configuration changes for PD clusters [#14165](#) @YuJuncen
  - \* Fix the issue that the connection failure between PD and tidb-server causes PITR backup progress not to advance [#41082](#) @YuJuncen
  - \* Fix the issue that TiKV cannot listen to PITR tasks due to the connection failure between PD and TiKV [#14159](#) @YuJuncen
  - \* Fix the issue that the frequency of `resolve lock` is too high when there is no PITR backup task in the TiDB cluster [#40759](#) @joccau
  - \* Fix the issue that when a PITR backup task is deleted, the residual backup data causes data inconsistency in new tasks [#40403](#) @joccau
- TiCDC
- \* Fix the issue that `transaction_atomicity` and `protocol` cannot be updated via the configuration file [#7935](#) @CharlesCheung96
  - \* Fix the issue that precheck is not performed on the storage path of redo log [#6335](#) @CharlesCheung96
  - \* Fix the issue of insufficient duration that redo log can tolerate for S3 storage failure [#8089](#) @CharlesCheung96
  - \* Fix the issue that changefeed might get stuck in special scenarios such as when scaling in or scaling out TiKV or TiCDC nodes [#8174](#) @hicqu
  - \* Fix the issue of too high traffic among TiKV nodes [#14092](#) @overvenus
  - \* Fix the performance issues of TiCDC in terms of CPU usage, memory control, and throughput when the pull-based sink is enabled [#8142](#) [#8157](#) [#8001](#) [#5928](#) @hicqu @hi-rustin
- TiDB Data Migration (DM)
- \* Fix the issue that the `binlog-schema delete` command fails to execute [#7373](#) @liumengya94
  - \* Fix the issue that the checkpoint does not advance when the last binlog is a skipped DDL [#8175](#) @D3Hunter
  - \* Fix a bug that when the expression filters of both “update” and “non-update” types are specified in one table, all UPDATE statements are skipped [#7831](#) @lance6716
  - \* Fix a bug that when only one of `update-old-value-expr` or `update-new-value-expr` is set for a table, the filter rule does not take effect or DM panics [#7774](#) @lance6716
- TiDB Lightning

- \* Fix the issue that TiDB Lightning timeout hangs due to TiDB restart in some scenarios [#33714](#) @lichunzhu
- \* Fix the issue that TiDB Lightning might incorrectly skip conflict resolution when all but the last TiDB Lightning instance encounters a local duplicate record during a parallel import [#40923](#) @lichunzhu
- \* Fix the issue that precheck cannot accurately detect the presence of a running TiCDC in the target cluster [#41040](#) @lance6716
- \* Fix the issue that TiDB Lightning panics in the split-region phase [#40934](#) @lance6716
- \* Fix the issue that the conflict resolution logic (`duplicate-resolution`) might lead to inconsistent checksums [#40657](#) @gozssky
- \* Fix a possible OOM problem when there is an unclosed delimiter in the data file [#40400](#) @buchitoudegou
- \* Fix the issue that the file offset in the error report exceeds the file size [#40034](#) @buchitoudegou
- \* Fix an issue with the new version of PDClient that might cause parallel import to fail [#40493](#) @AmoebaProtozoa
- \* Fix the issue that TiDB Lightning prechecks cannot find dirty data left by previously failed imports [#39477](#) @dsdashun

#### 16.5.1.5 Contributors

We would like to thank the following contributors from the TiDB community:

## 16.6 v6.5

### 16.6.1 TiDB 6.5.3 Release Notes

Release date: June 14, 2023

TiDB version: 6.5.3

Quick access: [Quick start](#) | [Production deployment](#) | [Installation packages](#)

### 16.6.1.1 Improvements

- TiDB
  - Improve the performance of TRUNCATE on partitioned tables with Placement Rules [#43070](#) @Lloyd-Pottiger
  - Avoid invalid Stale Read retries after resolving locks [#43659](#) @you06
  - Reduce latency by using leader read when Stale Read encounters the DataIsNotReady error [#765](#) @Tema
  - Add Stale Read OPS and Stale Read MBps metrics to track hit rate and traffic when using Stale Read [#43325](#) @you06
- TiKV
  - Reduce traffic by using gzip to compress check\_leader requests [#14839](#) @cfzjywxk
- PD
  - Use a separate gRPC connection for PD leader election to prevent the impact of other requests [#6403](#) @rleungx
- Tools
  - TiCDC
    - \* Optimize the way TiCDC handles DDLs so that DDLs do not block the use of other unrelated DML Events, and reduce memory usage [#8106](#) @asddongmen
    - \* Optimize the Decoder interface and add a new method AddKeyValue [#8861](#) @3AceShowHand
    - \* Optimize the directory structure when DDL events occur in the scenario of replicating data to object storage [#8890](#) @CharlesCheung96
    - \* Support replicating data to the Kafka-on-Pulsar downstream [#8892](#) @hi-rustin
    - \* Support using the OAuth protocol for validation when replicating data to Kafka [#8865](#) @hi-rustin
    - \* Optimize the way TiCDC handles the UPDATE statement during data replication using the Avro or CSV protocol, by splitting UPDATE into DELETE and INSERT statements, so that you can get the old value from the DELETE statement [#9086](#) @3AceShowHand
    - \* Add a configuration item insecure-skip-verify to control whether to set the authentication algorithm in the scenario of enabling TLS [#8867](#) @hi-rustin
    - \* Optimize DDL replication operations to mitigate the impact of DDL operations on downstream latency [#8686](#) @hi-rustin

- \* Optimize the method of setting GC TLS for the upstream when the TiCDC replication task fails [#8403](#) [@charleszheng44](#)
- TiDB Binlog
  - \* Optimize the method of retrieving table information to reduce the initialization time and memory usage of Drainer [#1137](#) [@lichunzhu](#)

### 16.6.1.2 Bug fixes

- TiDB
  - Fix the issue that the `min`, `max` query result is incorrect [#43805](#) [@wshwsh12](#)
  - Fix the issue of incorrect execution plans when pushing down window functions to TiFlash [#43922](#) [@gengliqi](#)
  - Fix the issue that the query with CTE causes TiDB to hang [#43749](#) [#36896](#) [@guo-shaoge](#)
  - Fix the issue that the SQL statement reports the `runtime error: index out of range` error when using the `AES_DECRYPT` expression [#43063](#) [@lcwangchao](#)
  - Fix the issue that the `SHOW PROCESSLIST` statement cannot display the `TxnStart` of the transaction of the statement with a long subquery time [#40851](#) [@crazycs520](#)
  - Fix the issue that PD isolation might block the running DDL [#44014](#) [#43755](#) [#44267](#) [@wjhuang2016](#)
  - Fix the TiDB panic issue that occurs when querying union views and temporary tables with `UNION` [#42563](#) [@lcwangchao](#)
  - Fix the behavior issue of Placement Rules in partitioned tables, so that the Placement Rules in deleted partitions can be correctly set and recycled [#44116](#) [@lcwangchao](#)
  - Fix the issue that truncating a partition of a partitioned table might cause the Placement Rule of the partition to become invalid [#44031](#) [@lcwangchao](#)
  - Fix the issue that TiCDC might lose some row changes during table renaming [#43338](#) [@tangenta](#)
  - Fix the issue that the DDL job history is lost after importing a table using BR [#43725](#) [@tangenta](#)
  - Fix the issue that `JSON_OBJECT` might report an error in some cases [#39806](#) [@YangKeao](#)
  - Fix the issue that the cluster cannot query some system views in IPv6 environment [#43286](#) [@Defined2014](#)
  - Fix the issue that when the PD member address changes, allocating ID for the `AUTO_INCREMENT` column will be blocked for a long time [#42643](#) [@tiancaiamao](#)
  - Fix the issue that TiDB sends duplicate requests to PD during placement rules recycling, causing numerous `full config reset` entries in the PD log [#33069](#) [@tiancaiamao](#)
  - Fix the issue that the `SHOW PRIVILEGES` statement returns an incomplete privilege list [#40591](#) [@CbcWestwolf](#)

- Fix the issue that `ADMIN SHOW DDL JOBS LIMIT` returns incorrect results [#42298](#) [@CbcWestwolf](#)
  - Fix the issue that the `tidb_auth_token` user fails to be created when the password complexity check is enabled [#44098](#) [@CbcWestwolf](#)
  - Fix the issue of not finding the partition during inner join in dynamic pruning mode [#43686](#) [@mjonss](#)
  - Fix the issue that the `Data Truncated` warning occurs when executing `MODIFY ↪ COLUMN` on a partitioned table [#41118](#) [@mjonss](#)
  - Fix the issue of displaying the incorrect TiDB address in IPv6 environment [#43260](#) [@nexustar](#)
  - Fix the issue that CTE results are incorrect when pushing down predicates [#43645](#) [@winoros](#)
  - Fix the issue that incorrect results might be returned when using a common table expression (CTE) in statements with non-correlated subqueries [#44051](#) [@winoros](#)
  - Fix the issue that Join Reorder might cause incorrect outer join results [#44314](#) [@AilinKid](#)
  - Fix the issue that in some extreme cases, when the first statement of a pessimistic transaction is retried, resolving locks on this transaction might affect transaction correctness [#42937](#) [@MyonKeminta](#)
  - Fix the issue that in some rare cases, residual pessimistic locks of pessimistic transactions might affect data correctness when GC resolves locks [#43243](#) [@MyonKeminta](#)
  - Fix the issue that the scan detail information during the execution of `batch cop` might be inaccurate [#41582](#) [@you06](#)
  - Fix the issue that TiDB cannot read data updates when Stale Read and `PREPARE` statements are used at the same time [#43044](#) [@you06](#)
  - Fix the issue that an `assertion failed` error might be mistakenly reported when executing the `LOAD DATA` statement [#43849](#) [@you06](#)
  - Fix the issue that the coprocessor cannot fall back to the leader when a `region ↪ data not ready` error occurs during the use of Stale Read [#43365](#) [@you06](#)
- TiKV
    - Fix the issue of file handle leakage in Continuous Profiling [#14224](#) [@tabokie](#)
    - Fix the issue that PD crash might cause PITR to fail to proceed [#14184](#) [@YuJuncen](#)
    - Fix the issue that encryption key ID conflict might cause the deletion of the old keys [#14585](#) [@tabokie](#)
    - Fix the issue that autocommit and point get replica read might break linearizability [#14715](#) [@cfzjywxk](#)
    - Fix the performance degradation issue caused by accumulated lock records when a cluster is upgraded from a previous version to v6.5 or later versions [#14780](#) [@MyonKeminta](#)
    - Fix the issue that TiDB Lightning might cause SST file leakage [#14745](#) [@YuJuncen](#)

- Fix the potential conflict between the encryption key and raft log file deletion that might cause TiKV to fail to start [#14761](#) @Connor1996
- TiFlash
  - Fix the performance degradation issue of the partition TableScan operator during Region transfer [#7519](#) @Lloyd-Pottiger
  - Fix the issue that a TiFlash query might report an error if the GENERATED type field is present along with the TIMESTAMP or TIME type [#7468](#) @Lloyd-Pottiger
  - Fix the issue that large update transactions might cause TiFlash to repeatedly report errors and restart [#7316](#) @JaySon-Huang
  - Fix the issue that the error “Truncate error cast decimal as decimal” occurs when reading data from TiFlash with the INSERT SELECT statement [#7348](#) @windtalker
  - Fix the issue that queries might consume more memory than needed when the data on the Join build side is very large and contains many small string type columns [#7416](#) @yibin87
- Tools
  - Backup & Restore (BR)
    - \* Fix the issue that the error message “resolve lock timeout” of BR is misleading when a backup fails, which hides the actual error information [#43236](#) @YuJuncen
  - TiCDC
    - \* Fix an OOM issue that might occur when there are as many as 50,000 tables [#7872](#) @sdojyy
    - \* Fix the issue that TiCDC gets stuck when an OOM occurs in upstream TiDB [#8561](#) @overvenus
    - \* Fix the issue that TiCDC gets stuck when PD fails such as network isolation or PD Owner node reboot [#8808](#) [#8812](#) [#8877](#) @asddongmen
    - \* Fix the issue of TiCDC time zone setting [#8798](#) @hi-rustin
    - \* Fix the issue that checkpoint lag increases when one of the upstream TiKV nodes crashes [#8858](#) @hicqu
    - \* Fix the issue that when replicating data to downstream MySQL, a replication error occurs after the FLASHBACK CLUSTER TO TIMESTAMP statement is executed in the upstream TiDB [#8040](#) @asddongmen
    - \* Fix the issue that when replicating data to object storage, the EXCHANGE ↔ PARTITION operation in the upstream cannot be properly replicated to the downstream [#8914](#) @CharlesCheung96
    - \* Fix the OOM issue caused by excessive memory usage of the sorter component in some special scenarios [#8974](#) @hicqu
    - \* Fix the issue that when the downstream is Kafka, TiCDC queries the downstream metadata too frequently and causes excessive workload in the downstream [#8957](#) [#8959](#) @hi-rustin

- \* Fix the issue that when a replication error occurs due to an oversized Kafka message, the message body is recorded in the log [#9031](#) [@darraes](#)
- \* Fix the TiCDC node panic that occurs when the downstream Kafka sinks are rolling restarted [#9023](#) [@asddongmen](#)
- \* Fix the issue that when replicating data to storage services, the JSON file corresponding to downstream DDL statements does not record the default values of table fields [#9066](#) [@CharlesCheung96](#)
- TiDB Lightning
  - \* Fix the issue that OOM might occur when importing a wide table [#43728](#) [@D3Hunter](#)
  - \* Fix the issue of `write to tikv with no leader` returned when importing a large amount of data [#43055](#) [@lance6716](#)
  - \* Fix a possible OOM problem when there is an unclosed delimiter in the data file [#40400](#) [@buchitoudegou](#)
  - \* Add a retry mechanism when encountering an `unknown` RPC error during data import [#43291](#) [@D3Hunter](#)
- TiDB Binlog
  - \* Fix the issue that TiDB Binlog reports an error when encountering a `CANCELED` DDL statement [#1228](#) [@okJiang](#)

## 16.6.2 TiDB 6.5.2 Release Notes

Release date: April 21, 2023

TiDB version: 6.5.2

Quick access: [Quick start](#) | [Production deployment](#) | [Installation packages](#)

### 16.6.2.1 Compatibility changes

- TiCDC fixes the issue of incorrect encoding of `FLOAT` data in Avro [#8490](#) [@3AceShowHand](#)

When upgrading the TiCDC cluster to v6.5.2 or a later v6.5.x version, if a table replicated using Avro contains the `FLOAT` data type, you need to manually adjust the compatibility policy of Confluent Schema Registry to `None` before upgrading so that the changefeed can successfully update the schema. Otherwise, after upgrading, the changefeed will be unable to update the schema and enter an error state.

- To fix the potential issue of data loss during replication of partitioned tables to storage services, the default value of the TiCDC `sink.enable-partition-separator` configuration item is changed from `false` to `true`. This means that partitions in a table are stored in separate directories by default. It is recommended that you keep the value as `true` to avoid the data loss issue. [#8724](#) [@CharlesCheung96](#)

### 16.6.2.2 Improvements

- TiDB
  - Support caching the execution plan for `BatchPointGet` in Prepared Plan Cache [#42125](#) @qw4990
  - Support more SQL formats for Index Join [#40505](#) @Yisaer
  - Change the log level of some Index Merge readers from "info" to "debug" [#41949](#) @yibin87
  - Optimize the `distsql_concurrency` setting for Range partitioned tables with Limit to reduce query latency [#41480](#) @you06
- TiFlash
  - Reduce CPU consumption of task scheduling during TiFlash reads [#6495](#) @JinheLin
  - Improve performance of data import from BR and TiDB Lightning to TiFlash with default configurations [#7272](#) @breezewish
- Tools
  - TiCDC
    - \* Release TiCDC Open API v2.0 [#8743](#) @sdojyy
    - \* Introduce `gomemlimit` to prevent TiCDC from OOM issues [#8675](#) @amyangfei
    - \* Use the multi-statement approach to optimize the replication performance in scenarios involving batch execution of `UPDATE` statements [#8057](#) @amyangfei
    - \* Support splitting transactions in the redo applier to improve its throughput and reduce RTO in disaster recovery scenarios [#8318](#) @CharlesCheung96
    - \* Support applying DDL events in redo logs [#8361](#) @CharlesCheung96
  - TiDB Lightning
    - \* Support importing CSV data files with BOM headers [#40744](#) @dsdashun

### 16.6.2.3 Bug fixes

- TiDB
  - Fix the issue that after a new column is added in the cache table, the value is NULL instead of the default value of the column [#42928](#) @lqs
  - Fix the issue of DDL retry caused by write conflict when executing `TRUNCATE` `↔` `TABLE` for partitioned tables with many partitions and TiFlash replicas [#42940](#) @mjonss
  - Fix the issue of missing table names in the `ADMIN SHOW DDL JOBS` result when a `DROP TABLE` operation is being executed [#42268](#) @tiancaiaobao

- Fix the issue that TiDB server cannot start due to an error in reading the cgroup information with the error message “can’t read file memory.stat from cgroup v1: open /sys/memory.stat no such file or directory” [#42659](#) @hawkingrei
  - Fix frequent write conflicts in transactions when performing DDL data backfill [#24427](#) @mjonss
  - Fix the issue that TiDB panic occurs due to inconsistent InfoSchema being obtained when generating the execution plan [#41622](#) [@tiancaia-mao](https://github.com/tiancaia-mao)
  - Fix the issue that when modifying the floating-point type using DDL to keep the length unchanged and reduce the decimal places, the old data still remains the same [#41281](#) [@zimulala](https://github.com/zimulala)
  - Fix the issue that after executing `PointUpdate` within a transaction, TiDB returns incorrect results for the `SELECT` statement [#28011](#) @zyguan
  - Fix the issue that, when using Cursor Fetch and running other statements among Execute, Fetch, and Close, the Fetch and Close commands might return incorrect results or cause TiDB to panic [#40094](#) [@YangKeao](https://github.com/YangKeao)
  - Fix the issue that `INSERT IGNORE` and `REPLACE` statements do not lock keys that do not modify values [#42121](#) @zyguan
  - Fix the issue that TiFlash reports an error for generated columns during execution [#40663](#) @guo-shaoge
  - Fix the issue that TiDB might produce incorrect results when different partitioned tables appear in a single SQL statement [#42135](#) @mjonss
  - Fix the issue that full index scans might cause errors when prepared plan cache is enabled [#42150](#) @fzzf678
  - Fix the issue that IndexMerge might produce incorrect results when prepare plan cache is enabled [#41828](#) @qw4990
  - Fix the issue that the configuration of `max_prepared_stmt_count` does not take effect [#39735](#) @xuyifangreeneyes
  - Fix the issue that IndexMerge might produce incorrect results when prepare plan cache is enabled [#41828](#) @qw4990 @XuHuaiyu
  - Fix the issue that Index Join might cause panic in dynamic trimming mode of partition tables [#40596](#) @tiancaia-mao
- TiKV
    - Fix the issue that TiKV does not correctly parse the `:` character when processing the cgroup path [#14538](#) @SpadeA-Tang
  - PD
    - Fix the issue that PD might unexpectedly add multiple Learners to a Region [#5786](#) @HunDunDM
    - Fix the issue that switching placement rule might cause uneven distribution of leaders [#6195](#) @bufferflies
  - TiFlash

- Fix the issue that TiFlash cannot recognize generated columns [#6801](#) @guo-shaoge
  - Fix the issue that Decimal division does not round up the last digit in certain cases [#7022](#) @LittleFall
  - Fix the issue that Decimal cast rounds up incorrectly in certain cases [#6994](#) @windtalker
  - Fix the issue that TopN/Sort operators produce incorrect results after enabling the new collation [#6807](#) @xzhangxian1008
  - Fix the issue of TiFlash process failures due to TiCDC incompatibility [#7212](#) @hongyunyan
- Tools
    - Backup & Restore (BR)
      - \* Fix the issue that the frequency of `resolve lock` is too high when there is no PITR backup task in the TiDB cluster [#40759](#) @joccau
      - \* Fix the issue of insufficient wait time for splitting Region retry during the PITR recovery process [#42001](#) @joccau
    - TiCDC
      - \* Fix the issue that the partition separator does not work when TiCDC replicates data to object storage [#8581](#) @CharlesCheung96 @hi-rustin
      - \* Fix the issue that table scheduling might cause data loss when TiCDC replicates data to object storage [#8256](#) @zhaoxinyu
      - \* Fix the issue that the replication gets stuck due to non-reentrant DDL statements [#8662](#) @hicqu
      - \* Fix the issue that TiCDC scaling might cause data loss when TiCDC replicates data to object storage [#8666](#) @CharlesCheung96
      - \* Fix the issue that the memory usage of `db sorter` is not controlled by `cgroup` ↪ `memory limit` [#8588](#) @amyangfei
      - \* Fix the issue that data loss might occur in special cases during the apply of Redo log [#8591](#) @CharlesCheung96
      - \* Fix the issue that the memory usage of `db sorter` is not controlled by `cgroup` ↪ `memory limit` [#8588](#) @amyangfei
      - \* Fix the issue that the disorder of `UPDATE` and `INSERT` statements during data replication might cause the `Duplicate entry` error [#8597](#) @sdojjy
      - \* Fix the abnormal exit issue of the TiCDC service caused by network isolation between PD and TiCDC [#8562](#) @overvenus
      - \* Fix the issue that graceful upgrade for TiCDC clusters fails on Kubernetes [#8484](#) @overvenus
      - \* Fix the issue that the TiCDC server panics when all downstream Kafka servers are unavailable [#8523](#) @3AceShowHand
      - \* Fix the issue that restarting the changefeed might cause data loss or that the checkpoint cannot advance [#8242](#) @overvenus

### 16.6.3 TiDB 6.5.1 Release Notes

Release date: March 10, 2023

TiDB version: 6.5.1

Quick access: [Quick start](#) | [Production deployment](#) | [Installation packages](#)

#### 16.6.3.1 Compatibility changes

- Starting from February 20, 2023, the **telemetry feature** is disabled by default in new versions of TiDB and TiDB Dashboard, including v6.5.1, and usage information is not collected and shared with PingCAP. Before upgrading to these versions, if the cluster uses the default telemetry configuration, the telemetry feature is disabled after the upgrade. See [TiDB Release Timeline](#) for specific versions.
  - The default value of the **tidb\_enable\_telemetry** system variable is changed from **ON** to **OFF**.
  - The default value of the TiDB **enable-telemetry** configuration item is changed from **true** to **false**.
  - The default value of the PD **enable-telemetry** configuration item is changed from **true** to **false**.
- Starting from v1.11.3, the telemetry feature is disabled by default in newly deployed TiUP, and usage information is not collected. If you upgrade from a TiUP version earlier than v1.11.3 to v1.11.3 or a later version, the telemetry feature keeps the same status as before the upgrade.
- No longer support modifying column types on partitioned tables because of potential correctness issues. [#40620](#) @mjonss
- The default value of the TiKV **advance-ts-interval** configuration item is changed from **1s** to **20s**. You can modify this configuration item to reduce the latency and improve the timeliness of the Stale Read data. See [Reduce Stale Read latency](#) for details.

#### 16.6.3.2 Improvements

- TiDB
  - Starting from v6.5.1, the TiDB cluster deployed by TiDB Operator v1.4.3 or higher supports IPv6 addresses. This means that TiDB can support a larger address space and bring you better security and network performance.
    - \* Full support for IPv6 addressing: TiDB supports using IPv6 addresses for all network connections, including client connections, internal communication between nodes, and communication with external systems.

- \* Dual-stack support: If you are not ready to fully switch to IPv6 yet, TiDB also supports dual-stack networks. This means that you can use both IPv4 and IPv6 addresses in the same TiDB cluster and choose a network deployment mode that prioritizes IPv6 by configuration.

For more information on IPv6 deployment, see [TiDB on Kubernetes documentation](#).

- Support specifying the SQL script executed upon TiDB cluster initialization [#35624](#) @morgo  
TiDB v6.5.1 adds a new configuration item `initialize-sql-file`. When you start a TiDB cluster for the first time, you can specify the SQL script to be executed by configuring the command line parameter `--initialize-sql-file`. You can use this feature when you need to perform such operations as modifying the value of a system variable, creating a user, or granting privileges. For more information, see [documentation](#).
  - Clear expired region cache regularly to avoid memory leak and performance degradation [#40461](#) @sticnarf
  - Add a new configuration item `--proxy-protocol-fallbackable` to control whether to enable PROXY protocol fallback mode. When this parameter is set to `true`, TiDB accepts PROXY client connections and client connections without any PROXY protocol header [#41409](#) @blacktear23
  - Improve the accuracy of Memory Tracker [#40900](#) [#40500](#) @wshwsh12
  - When the plan cache fails to take effect, the system returns the reason as a warning [#40210](#) @qw4990
  - Improve the optimizer strategy for out-of-range estimation [#39008](#) @time-and-fate
- TiKV
    - Support starting TiKV on a CPU with less than 1 core [#13586](#) [#13752](#) [#14017](#) @and Reid-db
    - Increase the thread limit of the Unified Read Pool (`readpool.unified.max-  
↔ thread-count`) to 10 times the CPU quota, to better handle high-concurrency queries [#13690](#) @v01dstar
    - Change the the default value of `resolved-ts.advance-ts-interval` from "1s" to "20s", to reduce cross-region traffic [#14100](#) @overvenus
  - TiFlash
    - Accelerate TiFlash startup greatly when the data volume is large [#6395](#) @hehechen
  - Tools

- Backup & Restore (BR)
  - \* Optimize the concurrency of downloading log backup files on the TiKV side to improve the performance of PITR in regular scenarios [#14206](#) @YuJuncen
- TiCDC
  - \* Enable pull-based sink to optimize system throughput [#8232](#) @hi-rustin
  - \* Support storing redo logs to GCS-compatible or Azure-compatible object storage [#7987](#) @CharlesCheung96
  - \* Implement MQ sink and MySQL sink in the asynchronous mode to improve the sink throughput [#5928](#) @amyangfei @CharlesCheung96

### 16.6.3.3 Bug fixes

- TiDB

- Fix the issue that the `pessimistic-auto-commit` configuration item does not take effect for point-get queries [#39928](#) @zyguan
- Fix the issue that the `INSERT` or `REPLACE` statements might panic in long session connections [#40351](#) @winoros
- Fix the issue that `auto analyze` causes graceful shutdown to take a long time [#40038](#) @xuyifangreeneyes
- Fix the issue that data race might occur during DDL ingestion [#40970](#) @tangenta
- Fix the issue that data race might occur when an index is added [#40879](#) @tangenta
- Fix the issue that the adding index operation is inefficient due to invalid Region cache when there are many Regions in a table [#38436](#) @tangenta
- Fix the issue that TiDB might deadlock during initialization [#40408](#) @Defined2014
- Fix the issue that unexpected data is read because TiDB improperly handles NULL values when constructing key ranges [#40158](#) @tiancaiamao
- Fix the issue that the value of system variables might be incorrectly modified in some cases due to memory reuse [#40979](#) @lcwangchao
- Fix the issue that a TTL task fails if the primary key of the table contains an `ENUM` column [#40456](#) @lcwangchao
- Fix the issue that TiDB panics when adding a unique index [#40592](#) @tangenta
- Fix the issue that some truncate operations cannot be blocked by MDL when truncating the same table concurrently [#40484](#) @wjhuang2016
- Fix the issue that TiDB cannot restart after global bindings are created for partition tables in dynamic trimming mode [#40368](#) @Yisaer
- Fix the issue that reading data using the “cursor read” method might return an error because of GC [#39447](#) @zyguan
- Fix the issue that the `EXECUTE` information is null in the result of `SHOW ↪ PROCESSLIST` [#41156](#) @YangKeao
- Fix the issue that when `globalMemoryControl` is killing a query, the `KILL` operation might not end [#41057](#) @wshwsh12

- Fix the issue that TiDB might panic after `indexMerge` encounters an error [#41047](#) [#40877](#) @guo-shaoge @windtalker
- Fix the issue that the `ANALYZE` statement might be terminated by `KILL` [#41825](#) @XuHuaiyu
- Fix the issue that goroutine leak might occur in `indexMerge` [#41545](#) [#41605](#) @guo-shaoge
- Fix the issue of potential wrong results when comparing unsigned `TINYINT`  $\leftrightarrow$  `/SMALLINT/INT` values with `DECIMAL/FLOAT/DOUBLE` values smaller than 0 [#41736](#) @LittleFall
- Fix the issue that enabling `tidb_enable_reuse_chunk` might lead to memory leak [#40987](#) @guo-shaoge
- Fix the issue that data race in time zone might cause data-index inconsistency [#40710](#) @wjhuang2016
- Fix the issue that the scan detail information during the execution of `batch cop` might be inaccurate [#41582](#) @you06
- Fix the issue that the upper concurrency of `cop` is not limited [#41134](#) @you06
- Fix the issue that the `statement context` in `cursor read` is mistakenly cached [#39998](#) @zyguan
- Periodically clean up stale Region cache to avoid memory leak and performance degradation [#40355](#) @sticnarf
- Fix the issue that using plan cache on queries that contain `year <cmp> const` might get a wrong result [#41626](#) @qw4990
- Fix the issue of large estimation errors when querying with a large range and a large amount of data modification [#39593](#) @time-and-fate
- Fix the issue that some conditions cannot be pushed down through Join operators when using Plan Cache [#40093](#) [#38205](#) @qw4990
- Fix the issue that `IndexMerge` plans might generate incorrect ranges on the `SET` type columns [#41273](#) [#41293](#) @time-and-fate
- Fix the issue that Plan Cache might cache FullScan plans when processing `int_col <cmp> decimal` conditions [#40679](#) [#41032](#) @qw4990
- Fix the issue that Plan Cache might cache FullScan plans when processing `int_col in (decimal...)` conditions [#40224](#) @qw4990
- Fix the issue that the `ignore_plan_cache` hint might not work for `INSERT` statements [#40079](#) [#39717](#) @qw4990
- Fix the issue that Auto Analyze might hinder TiDB from exiting [#40038](#) @xuyifangreeneyes
- Fix the issue that incorrect access intervals might be constructed on Unsigned Primary Keys in partitioned tables [#40309](#) @winoros
- Fix the issue that Plan Cache might cache Shuffle operators and return incorrect results [#38335](#) @qw4990
- Fix the issue that creating Global Binding on partitioned tables might cause TiDB to fail to start [#40368](#) @Yisaer
- Fix the issue that query plan operators might be missing in slow logs [#41458](#) @time-and-fate
- Fix the issue that incorrect results might be returned when TopN operators

- with virtual columns are mistakenly pushing down to TiKV or TiFlash [#41355](#) [@Dousir9](#)
- Fix the issue of inconsistent data when adding indexes [#40698](#) [#40730](#) [#41459](#) [#40464](#) [#40217](#) [@tangenta](#)
  - Fix the issue of getting the `Pessimistic lock not found` error when adding indexes [#41515](#) [@tangenta](#)
  - Fix the issue of misreported duplicate key errors when adding unique indexes [#41630](#) [@tangenta](#)
  - Fix the issue of performance degradation when using paging in TiDB [#40741](#) [@solotzg](#)
- TiKV
    - Fix the issue that Resolved TS causes higher network traffic [#14092](#) [@overvenus](#)
    - Fix the data inconsistency issue caused by network failure between TiDB and TiKV during the execution of a DML after a failed pessimistic DML [#14038](#) [@MyonKeminta](#)
    - Fix an error that occurs when casting the `const Enum` type to other types [#14156](#) [@wshwsh12](#)
    - Fix the issue that the paging in a cop task is inaccurate [#14254](#) [@you06](#)
    - Fix the issue that the `scan_detail` field is inaccurate in `batch_cop` mode [#14109](#) [@you06](#)
    - Fix a potential error in the Raft Engine that might cause TiKV to detect Raft data corruption and fail to restart [#14338](#) [@tonyxuqqi](#)
  - PD
    - Fix the issue that the execution `replace-down-peer` slows down under certain conditions [#5788](#) [@HundunDM](#)
    - Fix the issue that PD might unexpectedly add multiple Learners to a Region [#5786](#) [@HunDunDM](#)
    - Fix the issue that the Region Scatter task generates redundant replicas unexpectedly [#5909](#) [@HundunDM](#)
    - Fix the PD OOM issue that occurs when the calls of `ReportMinResolvedTS` are too frequent [#5965](#) [@HundunDM](#)
    - Fix the issue that the Region Scatter might cause uneven distribution of leader [#6017](#) [@HunDunDM](#)
  - TiFlash
    - Fix the issue that semi-joins use excessive memory when calculating Cartesian products [#6730](#) [@gengliqi](#)
    - Fix the issue that TiFlash log search is too slow [#6829](#) [@hehechen](#)
    - Fix the issue that TiFlash cannot start because files are mistakenly deleted after repeated restarts [#6486](#) [@JaySon-Huang](#)

- Fix the issue that TiFlash might report an error when performing a query after adding a new column [#6726](#) @JaySon-Huang
- Fix the issue that TiFlash does not support IPv6 configuration [#6734](#) @ywqzzy
- Tools
  - Backup & Restore (BR)
    - \* Fix the issue that the connection failure between PD and tidb-server causes PITR backup progress not to advance [#41082](#) @YuJuncen
    - \* Fix the issue that TiKV cannot listen to PITR tasks due to the connection failure between PD and TiKV [#14159](#) @YuJuncen
    - \* Fix the issue that PITR does not support configuration changes for PD clusters [#14165](#) @YuJuncen
    - \* Fix the issue that the PITR feature does not support CA-bundles [#38775](#) @3pointer
    - \* Fix the issue that when a PITR backup task is deleted, the residual backup data causes data inconsistency in new tasks [#40403](#) @joccau
    - \* Fix the issue that causes panic when BR parses the `backupmeta` file [#40878](#) @MoCuishle28
    - \* Fix the issue that restore is interrupted due to failure in getting the Region size [#36053](#) @YuJuncen
    - \* Fix the issue that the frequency of `resolve lock` is too high when there is no PITR backup task in the TiDB cluster [#40759](#) @joccau
    - \* Fix the issue that restoring data to a cluster on which the log backup is running causes the log backup file unable to be restored [#40797](#) @Leavrth
    - \* Fix the panic issue that occurs when attempting to resume backup from a checkpoint after a full backup failure [#40704](#) @Leavrth
    - \* Fix the issue that PITR errors are overwritten [#40576](#)@Leavrth
    - \* Fix the issue that checkpoints do not advance in PITR backup tasks when the advance owner and gc owner are different [#41806](#) @joccau
  - TiCDC
    - \* Fix the issue that changefeed might get stuck in special scenarios such as when scaling in or scaling out TiKV or TiCDC nodes [#8174](#) @hicqu
    - \* Fix the issue that precheck is not performed on the storage path of redo log [#6335](#) @CharlesCheung96
    - \* Fix the issue of insufficient duration that redo log can tolerate for S3 storage failure [#8089](#) @CharlesCheung96
    - \* Fix the issue that `transaction_atomicity` and `protocol` cannot be updated via the configuration file [#7935](#) @CharlesCheung96
    - \* Fix the issue that the checkpoint cannot advance when TiCDC replicates an excessively large number of tables [#8004](#) @overvenus
    - \* Fix the issue that applying redo log might cause OOM when the replication lag is excessively high [#8085](#) @CharlesCheung96

- \* Fix the issue that the performance degrades when redo log is enabled to write meta [#8074](#) [@CharlesCheung96](#)
  - \* Fix a bug that the context deadline is exceeded when TiCDC replicates data without splitting large transactions [#7982](#) [@hi-rustin](#)
  - \* Fix the issue that pausing a changefeed when PD is abnormal results in incorrect status [#8330](#) [@sdojjy](#)
  - \* Fix the data inconsistency that occurs when replicating data to a TiDB or MySQL sink and when CHARACTER SET is specified on the column that has the non-null unique index without a primary key [#8420](#) [@asddongmen](#)
  - \* Fix the panic issue in table scheduling and blackhole sink [#8024](#) [#8142](#) [@hicqu](#)
- TiDB Data Migration (DM)
- \* Fix the issue that the `binlog-schema delete` command fails to execute [#7373](#) [@liumengya94](#)
  - \* Fix the issue that the checkpoint does not advance when the last binlog is a skipped DDL [#8175](#) [@D3Hunter](#)
  - \* Fix a bug that when the expression filters of both “update” and “non-update” types are specified in one table, all UPDATE statements are skipped [#7831](#) [@lance6716](#)
- TiDB Lightning
- \* Fix the issue that TiDB Lightning prechecks cannot find dirty data left by previously failed imports [#39477](#) [@dsdashun](#)
  - \* Fix the issue that TiDB Lightning panics in the split-region phase [#40934](#) [@lance6716](#)
  - \* Fix the issue that the conflict resolution logic (`duplicate-resolution`) might lead to inconsistent checksums [#40657](#) [@gozssky](#)
  - \* Fix the issue that TiDB Lightning might incorrectly skip conflict resolution when all but the last TiDB Lightning instance encounters a local duplicate record during a parallel import [#40923](#) [@lichunzhu](#)
  - \* Fix the issue that when importing data in Local Backend mode, the target columns do not automatically generate data if the compound primary key of the imported target table has an `auto_random` column and no value for the column is specified in the source data [#41454](#) [@D3Hunter](#)

## 16.6.4 TiDB 6.5.0 Release Notes

Release date: December 29, 2022

TiDB version: 6.5.0

Quick access: [Quick start](#) | [Production deployment](#) | [Installation packages](#)

TiDB 6.5.0 is a Long-Term Support Release (LTS).

Compared with the previous LTS 6.1.0, 6.5.0 not only includes new features, improvements, and bug fixes released in [6.2.0-DMR](#), [6.3.0-DMR](#), [6.4.0-DMR](#), but also introduces the

following key features and improvements:

- The **index acceleration** feature becomes generally available (GA), which improves the performance of adding indexes by about 10 times compared with v6.1.0.
- The TiDB global memory control becomes GA, and you can control the memory consumption threshold via `tidb_server_memory_limit`.
- The high-performance and globally monotonic **AUTO\_INCREMENT** column attribute becomes GA, which is compatible with MySQL.
- **FLASHBACK CLUSTER TO TIMESTAMP** is now compatible with TiCDC and PITR and becomes GA.
- Enhance TiDB optimizer by making the more accurate **Cost Model version 2** generally available and supporting expressions connected by AND for **INDEX MERGE**.
- Support pushing down the `JSON_EXTRACT()` function to TiFlash.
- Support **password management** policies that meet password compliance auditing requirements.
- TiDB Lightning and Dumpling support **importing** and **exporting** compressed SQL and CSV files.
- TiDB Data Migration (DM) **continuous data validation** becomes GA.
- TiDB Backup & Restore supports snapshot checkpoint backup, improves the recovery performance of **PITR** by 50%, and reduces the RPO in common scenarios to as short as 5 minutes.
- Improve the TiCDC throughput of **replicating data to Kafka** from 4000 rows/s to 35000 rows/s, and reduce the replication latency to 2s.
- Provide row-level **Time to live (TTL)** to manage data lifecycle (experimental).
- TiCDC supports **replicating changed logs to object storage** such as Amazon S3, Azure Blob Storage, and NFS (experimental).

#### 16.6.4.1 New features

##### 16.6.4.1.1 SQL

- The performance of TiDB adding indexes is improved by about 10 times (GA) [#35983](#) [@benjamin2037](#) [@tangent](#)  
TiDB v6.3.0 introduces the **Add index acceleration** as an experimental feature to improve the speed of backfilling when creating an index. In v6.5.0, this feature becomes GA and is enabled by default, and the performance on large tables is expected to be about 10 times faster than that in v6.1.0. The acceleration feature is suitable for scenarios where a single SQL statement adds an index serially. When multiple SQL statements add indexes in parallel, only one of the SQL statements will be accelerated.
- Provide lightweight metadata lock to improve the DML success rate during DDL change (GA) [#37275](#) [@wjhuang2016](#)

TiDB v6.3.0 introduces **Metadata lock** as an experimental feature. To avoid the **Information schema is changed** error caused by DML statements, TiDB coordinates the priority of DMLs and DDLs during table metadata change, and makes the ongoing DDLs wait for the DMLs with old metadata to commit. In v6.5.0, this feature becomes GA and is enabled by default. It is suitable for various types of DDLs change scenarios. When you upgrade your existing cluster from versions earlier than v6.5.0 to v6.5.0 or later, TiDB automatically enables metadata lock. To disable this feature, you can set the system variable `tidb_enable_metadata_lock` to `OFF`.

For more information, see [documentation](#).

- Support restoring a cluster to a specific point in time by using `FLASHBACK CLUSTER ↔ TO TIMESTAMP` (GA) [#37197](#) [#13303](#) [@Defined2014](#) [@bb7133](#) [@JmPotato](#) [@Connor1996](#) [@HuSharp](#) [@CalvinNeo](#)

Since v6.4.0, TiDB has introduced the `FLASHBACK CLUSTER TO TIMESTAMP` statement as an experimental feature. You can use this statement to restore a cluster to a specific point in time within the Garbage Collection (GC) life time. In v6.5.0, this feature is now compatible with TiCDC and PITR and becomes GA. This feature helps you to easily undo DML misoperations, restore the original cluster in minutes, and roll back data at different time points to determine the exact time when data changes.

For more information, see [documentation](#).

- Fully support non-transactional DML statements including `INSERT`, `REPLACE`, `UPDATE`, and `DELETE` [#33485](#) [@ekexium](#)

In the scenarios of large data processing, a single SQL statement with a large transaction might have a negative impact on the cluster stability and performance. A non-transactional DML statement is a DML statement split into multiple SQL statements for internal execution. The split statements compromise transaction atomicity and isolation but greatly improve the cluster stability. TiDB has supported non-transactional `DELETE` statements since v6.1.0, and non-transactional `INSERT`, `REPLACE`, and `UPDATE` statements since v6.5.0.

For more information, see [Non-Transactional DML statements](#) and [BATCH syntax](#).

- Support time to live (TTL) (experimental) [#39262](#) [@lcwangchao](#)

TTL provides row-level data lifetime management. In TiDB, a table with the TTL attribute automatically checks data lifetime and deletes expired data at the row level. TTL is designed to help you clean up unnecessary data periodically and in a timely manner without affecting the online read and write workloads.

For more information, see [documentation](#).

- Support saving TiFlash query results using the `INSERT INTO SELECT` statement (experimental) [#37515](#) [@gengliqi](#)

Starting from v6.5.0, TiDB supports pushing down the `SELECT` clause (analytical query) of the `INSERT INTO SELECT` statement to TiFlash. In this way, you can easily

save the TiFlash query result to a TiDB table specified by `INSERT INTO` for further analysis, which takes effect as result caching (that is, result materialization). For example:

```
INSERT INTO t2 SELECT Mod(x,y) FROM t1;
```

During the experimental phase, this feature is disabled by default. To enable it, you can set the `tidb_enable_tiflash_read_for_write_stmt` system variable to `ON`. There are no special restrictions on the result table specified by `INSERT INTO` for this feature, and you are free to add or not add a TiFlash replica to that result table. Typical usage scenarios of this feature include:

- Run complex analytical queries using TiFlash
- Reuse TiFlash query results or deal with highly concurrent online requests
- Need a relatively small result set compared with the input data size, preferably smaller than 100 MiB.

For more information, see [documentation](#).

- Support binding history execution plans (experimental) [#39199](#) @fzzf678

For a SQL statement, due to various factors during execution, the optimizer might occasionally choose a new execution plan instead of its previous optimal execution plan, and the SQL performance is impacted. In this case, if the optimal execution plan has not been cleared yet, it still exists in the SQL execution history.

In v6.5.0, TiDB supports binding historical execution plans by extending the binding object in the `CREATE [GLOBAL | SESSION] BINDING` statement. When the execution plan of a SQL statement changes, you can bind the original execution plan by specifying `plan_digest` in the `CREATE [GLOBAL | SESSION] BINDING` statement to quickly recover SQL performance, as long as the original execution plan is still in the SQL execution history memory table (for example, `statements_summary`). This feature can simplify the process of handling execution plan change issues and improve your maintenance efficiency.

For more information, see [documentation](#).

#### 16.6.4.1.2 Security

- Support the password complexity policy [#38928](#) @CbcWestwolf

After this policy is enabled, when you set a password, TiDB checks the password length, whether uppercase and lowercase letters, numbers, and special characters in the password are sufficient, whether the password matches the dictionary, and whether the password matches the username. This ensures that you set a secure password.

TiDB provides the SQL function `VALIDATE_PASSWORD_STRENGTH()` to validate the password strength.

For more information, see [documentation](#).

- Support the password expiration policy [#38936](#) @CbcWestwolf  
TiDB supports configuring the password expiration policy, including manual expiration, global-level automatic expiration, and account-level automatic expiration. After this policy is enabled, you must change your passwords periodically. This reduces the risk of password leakage due to long-term use and improves password security.  
For more information, see [documentation](#).
- Support the password reuse policy [#38937](#) @keeplearning20221  
TiDB supports configuring the password reuse policy, including global-level password reuse policy and account-level password reuse policy. After this policy is enabled, you cannot use the passwords that you have used within a specified period or the most recent several passwords that you have used. This reduces the risk of password leakage due to repeated use of passwords and improves password security.  
For more information, see [documentation](#).
- Support failed-login tracking and temporary account locking policy [#38938](#) @lastincisor  
After this policy is enabled, if you log in to TiDB with incorrect passwords multiple times consecutively, the account is temporarily locked. After the lock time ends, the account is automatically unlocked.  
For more information, see [documentation](#).

#### 16.6.4.1.3 Observability

- TiDB Dashboard can be deployed on Kubernetes as an independent Pod [#1447](#) @SabaPing  
TiDB v6.5.0 (and later) and TiDB Operator v1.4.0 (and later) support deploying TiDB Dashboard as an independent Pod on Kubernetes. Using TiDB Operator, you can access the IP address of this Pod to start TiDB Dashboard.  
Independently deploying TiDB Dashboard provides the following benefits:
  - The compute work of TiDB Dashboard does not pose pressure on PD nodes. This ensures more stable cluster operation.
  - The user can still access TiDB Dashboard for diagnosis even if the PD node is unavailable.
  - Accessing TiDB Dashboard on the internet does not involve the privileged interfaces of PD. Therefore, the security risk of the cluster is reduced.

For more information, see [documentation](#).

- Performance Overview dashboard adds TiFlash and CDC (Change Data Capture) panels [#39230](#) @dbsid

Since v6.1.0, TiDB has introduced the Performance Overview dashboard in Grafana, which provides a system-level entry for overall performance diagnosis of TiDB, TiKV, and PD. In v6.5.0, the Performance Overview dashboard adds TiFlash and CDC panels. With these panels, starting from v6.5.0, you can use the Performance Overview dashboard to analyze the performance of all components in a TiDB cluster.

The TiFlash and CDC panels reorganize the TiFlash and TiCDC monitoring information, which can help you greatly improve the efficiency of analyzing and troubleshooting TiFlash and TiCDC performance issues.

- On the [TiFlash panels](#), you can easily view the request types, latency analysis, and resource usage overview of your TiFlash cluster.
- On the [CDC panels](#), you can easily view the health, replication latency, data flow, and downstream write latency of your TiCDC cluster.

For more information, see [documentation](#).

#### 16.6.4.1.4 Performance

- [INDEX MERGE](#) supports expressions connected by AND [#39333](#) @guo-shaoge @time-and-fate @hailanwhu

Before v6.5.0, TiDB only supported using index merge for the filter conditions connected by OR. Starting from v6.5.0, TiDB has supported using index merge for filter conditions connected by AND in the WHERE clause. In this way, the index merge of TiDB can now cover more general combinations of query filter conditions and is no longer limited to union (OR) relationship. The current v6.5.0 version only supports index merge under OR conditions as automatically selected by the optimizer. To enable index merge for AND conditions, you need to use the [USE\\_INDEX\\_MERGE](#) hint.

For more details about index merge, see [v5.4.0 Release Notes](#) and [Explain Index Merge](#).

- Support pushing down the following JSON functions to TiFlash [#39458](#) @yibin87
  - ->
  - ->>
  - `JSON_EXTRACT()`

The JSON format provides a flexible way for application data modeling. Therefore, more and more applications are using the JSON format for data exchange and data storage. By pushing down JSON functions to TiFlash, you can improve the efficiency of analyzing data in the JSON type and use TiDB for more real-time analytics scenarios.

- Support pushing down the following string functions to TiFlash [#6115](#) @xzhangxian1008

- `regexp_like`
- `regexp_instr`
- `regexp_substr`

- Support the global optimizer hint to interfere with the execution plan generation in [Views #37887 @Reminiscent](#)

In some view access scenarios, you need to use optimizer hints to interfere with the execution plan of a query in the view to achieve the optimal performance. Starting from v6.5.0, TiDB supports adding global hints to query blocks in views, making the hints defined in the query effective in the view. This feature provides a way to inject hints into complex SQL statements that contain nested views, enhances the execution plan control, and stabilizes the performance of complex statements. To use global hints, you need to [name the query blocks](#) and [specify hint references](#).

For more information, see [documentation](#).

- Support pushing down sorting operations of [partitioned tables](#) to TiKV [#26166 @winoros](#)

Although the [partitioned table](#) feature has been GA since v6.1.0, TiDB is continually improving its performance. In v6.5.0, TiDB supports pushing down sorting operations such as `ORDER BY` and `LIMIT` to TiKV for computation and filtering, which reduces network I/O overhead and improves SQL performance when you use partitioned tables.

- Optimizer introduces a more accurate Cost Model Version 2 (GA) [#35240 @qw4990](#)

TiDB v6.2.0 introduces the [Cost Model Version 2](#) as an experimental feature. This model uses a more accurate cost estimation method to help the optimizer choose the optimal execution plan. Especially when TiFlash is deployed, Cost Model Version 2 automatically helps choose the appropriate storage engine and avoids much manual intervention. After real-scene testing for a period of time, this model becomes GA in v6.5.0. Starting from v6.5.0, newly created clusters use Cost Model Version 2 by default. For clusters upgrade to v6.5.0, because Cost Model Version 2 might cause changes to query plans, you can set the `tidb_cost_model_version = 2` variable to use the new cost model after sufficient performance testing.

Cost Model Version 2 becomes a generally available feature that significantly improves the overall capability of the TiDB optimizer and helps TiDB evolve towards a more powerful HTAP database.

For more information, see [documentation](#).

- TiFlash optimizes the operations of getting the number of table rows [#37165 @elsa0520](#)

In the scenarios of data analysis, It is a common operation to get the actual number of rows of a table through `COUNT(*)` without filter conditions. In v6.5.0, TiFlash optimizes the rewriting of `COUNT(*)` and automatically selects the not-null columns with the shortest column definition to count the number of rows, which can effectively reduce the number of I/O operations in TiFlash and improve the execution efficiency of getting row counts.

#### 16.6.4.1.5 Stability

- The global memory control feature is now GA [#37816](#) @wshwsh12

Since v6.4.0, TiDB has introduced global memory control as an experimental feature. In v6.5.0, it becomes GA and can track the main memory consumption. When the global memory consumption reaches the threshold defined by `tidb_server_memory_limit`, TiDB tries to limit the memory usage by GC or canceling SQL operations, to ensure stability.

Note that the memory consumed by the transaction in a session (the maximum value was previously set by the configuration item `txn-total-size-limit`) is now tracked by the memory management module: when the memory consumption of a single session reaches the threshold defined by the system variable `tidb_mem_quota_query`, the behavior defined by the system variable `tidb_mem_oom_action` will be triggered (the default is CANCEL, that is, canceling operations). To ensure forward compatibility, when `txn-total-size-limit` is configured as a non-default value, TiDB will still ensure that transactions can use the memory set by `txn-total-size-limit`.

If you are using TiDB v6.5.0 or later, it is recommended to remove `txn-total-size-limit`  $\leftrightarrow$  `limit` and not to set a separate limit on the memory usage of transactions. Instead, use the system variables `tidb_mem_quota_query` and `tidb_server_memory_limit` to manage global memory, which can improve the efficiency of memory usage.

For more information, see [documentation](#).

#### 16.6.4.1.6 Ease of use

- Refine the execution information of the TiFlash `TableFullScan` operator in the `EXPLAIN ANALYZE` output [#5926](#) @hongyunyan

The `EXPLAIN ANALYZE` statement is used to print execution plans and runtime statistics. In v6.5.0, TiFlash has refined the execution information of the `TableFullScan` operator by adding the DMFile-related execution information. Now the TiFlash data scan status information is presented more intuitively, which helps you analyze TiFlash performance more easily.

For more information, see [documentation](#).

- Support the output of execution plans in the JSON format [#39261](#) @fzzf678

In v6.5.0, TiDB extends the output format of execution plans. By specifying `FORMAT  $\leftrightarrow$  = "tidb_json"` in the `EXPLAIN` statement, you can output SQL execution plans in the JSON format. With this capability, SQL debugging tools and diagnostic tools can read execution plans more conveniently and accurately, thus improving the ease of use of SQL diagnosis and tuning.

For more information, see [documentation](#).

#### 16.6.4.1.7 MySQL compatibility

- Support a high-performance and globally monotonic `AUTO_INCREMENT` column attribute (GA) [#38442](#) @[tiancaiaobao](#)

Since v6.4.0, TiDB has introduced the `AUTO_INCREMENT` MySQL compatibility mode as an experimental feature. This mode introduces a centralized auto-increment ID allocating service that ensures IDs monotonically increase on all TiDB instances. This feature makes it easier to sort query results by auto-increment IDs. In v6.5.0, this feature becomes GA. The insert TPS of a table using this feature is expected to exceed 20,000, and this feature supports elastic scaling to improve the write throughput of a single table and entire clusters. To use the MySQL compatibility mode, you need to set `AUTO_ID_CACHE` to 1 when creating a table. The following is an example:

```
CREATE TABLE t(a int AUTO_INCREMENT key) AUTO_ID_CACHE 1;
```

For more information, see [documentation](#).

#### 16.6.4.1.8 Data migration

- Support exporting and importing SQL and CSV files in gzip, snappy, and zstd compression formats [#38514](#) @[lichunzhu](#)

Dumpling supports exporting data to compressed SQL and CSV files in these compression formats: gzip, snappy, and zstd. TiDB Lightning also supports importing compressed files in these formats.

Previously, you had to provide large storage space for exporting or importing data to store CSV and SQL files, resulting in high storage costs. With the release of this feature, you can greatly reduce your storage costs by compressing the data files.

For more information, see [documentation](#).

- Optimize binlog parsing capability [#924](#) @[gmhdbjd](#)

TiDB can filter out binlog events of the schemas and tables that are not in the migration task, thus improving the parsing efficiency and stability. This policy takes effect by default in v6.5.0. No additional configuration is required.

Previously, even if only a few tables were migrated, the entire binlog file upstream had to be parsed. The binlog events of the tables in the binlog file that did not need to be migrated still had to be parsed, which was not efficient. Meanwhile, if these binlog events do not support parsing, the task will fail. By only parsing the binlog events of the tables in the migration task, the binlog parsing efficiency can be greatly improved and the task stability can be enhanced.

- Disk quota in TiDB Lightning is GA [#446](#) @[buchitoudegou](#)

You can configure disk quota for TiDB Lightning. When there is not enough disk quota, TiDB Lightning stops reading source data and writing temporary files. Instead,

it writes the sorted key-values to TiKV first, and then continues the import process after TiDB Lightning deletes the local temporary files.

Previously, when TiDB Lightning imported data using physical mode, it would create a large number of temporary files on the local disk for encoding, sorting, and splitting the raw data. When your local disk ran out of space, TiDB Lightning would exit with an error due to failing to write to the file. With this feature, TiDB Lightning tasks can avoid overwriting the local disk.

For more information, see [documentation](#).

- Continuous data validation in DM is GA [#4426](#) [@D3Hunter](#)

In the process of migrating incremental data from upstream to downstream databases, there is a small probability that data flow might cause errors or data loss. In scenarios where strong data consistency is required, such as credit and securities businesses, you can perform a full volume checksum on the data after migration to ensure data consistency. However, in some incremental replication scenarios, upstream and downstream writes are continuous and uninterrupted because the upstream and downstream data is constantly changing, making it difficult to perform consistency checks on all data.

Previously, you needed to interrupt the business to validate the full data, which would affect your business. Now, with this feature, you can perform incremental data validation without interrupting the business.

For more information, see [documentation](#).

#### 16.6.4.1.9 TiDB data share subscription

- TiCDC supports replicating changed logs to storage sinks (experimental) [#6797](#) [@zhaoxinyu](#)

TiCDC supports replicating changed logs to Amazon S3, Azure Blob Storage, NFS, and other S3-compatible storage services. Cloud storage is reasonably priced and easy to use. If you are not using Kafka, you can use storage sinks. TiCDC saves the changed logs to a file and then sends it to the storage system. From the storage system, the consumer program reads the newly generated changed log files periodically.

The storage sink supports changed logs in the canal-json and CSV formats. For more information, see [documentation](#).

- TiCDC supports bidirectional replication between two clusters [#38587](#) [@xiongjiwei](#) [@asddongmen](#)

TiCDC supports bidirectional replication between two TiDB clusters. If you need to build geo-distributed and multiple active data centers for your application, you can use this feature as a solution. By configuring the `bdr-mode = true` parameter for the TiCDC changefeeds from one TiDB cluster to another TiDB cluster, you can achieve bidirectional data replication between the two TiDB clusters.

For more information, see [documentation](#).

- TiCDC supports updating TLS online [#7908](#) @CharlesCheung96

To keep security of the database system, you need to set an expiration policy for the certificate used by the system. After the expiration period, the system needs a new certificate. TiCDC v6.5.0 supports online updates of TLS certificates. Without interrupting the replication tasks, TiCDC can automatically detect and update the certificate, without the need for manual intervention.

- TiCDC performance improves significantly [#7540](#) [#7478](#) [#7532](#) @sdojyy [@3AceShowHand](<https://github.com/3AceShowHand>)

In a test scenario of the TiDB cluster, the performance of TiCDC has improved significantly. Specifically, in the scenario of replicating data to Kafka, the maximum row changes that a single TiCDC can process reaches 30K rows/s, and the replication latency is reduced to 10s. Even during TiKV and TiCDC rolling upgrade, the replication latency is less than 30s.

In a disaster recovery (DR) scenario, if TiCDC redo log and Syncpoint are enabled, the TiCDC throughput of [replicating data to Kafka](#) can be improved from 4000 rows/s to 35000 rows/s, and the replication latency can be limited to 2s.

#### 16.6.4.1.10 Backup and restore

- TiDB Backup & Restore supports snapshot checkpoint backup [#38647](#) @Leavrth

TiDB snapshot backup supports resuming backup from a checkpoint. When Backup & Restore (BR) encounters a recoverable error, it retries backup. However, BR exits if the retry fails for several times. The checkpoint backup feature allows for longer recoverable failures to be retried, for example, a network failure of tens of minutes.

Note that if you do not recover the system from a failure within one hour after BR exits, the snapshot data to be backed up might be recycled by the GC mechanism, causing the backup to fail. For more information, see [documentation](#).

- PITR performance improved remarkably [@joccau](<https://github.com/joccau>)

In the log restore stage, the restore speed of one TiKV can reach 9 MiB/s, which is 50% faster than before. The restore speed is scalable and the RTO in DR scenarios is reduced greatly. The RPO in DR scenarios can be as short as 5 minutes. In normal cluster operation and maintenance (OM), for example, a rolling upgrade is performed or only one TiKV is down, the RPO can be 5 minutes.

- TiKV-BR GA: Supports backing up and restoring RawKV [#67](#) @pingyu @haojinming

TiKV-BR is a backup and restore tool used in TiKV clusters. TiKV and PD can constitute a KV database when used without TiDB, which is called RawKV. TiKV-BR supports data backup and restore for products that use RawKV. TiKV-BR can also upgrade the [api-version](#) from API V1 to API V2 for TiKV cluster.

For more information, see [documentation](#).

## 16.6.4.2 Compatibility changes

### 16.6.4.2.1 System variables

Variable name	Change type	Description
<code>tidb_enable_prepared_essimistic_txn</code> ↔	Deprecate	Starting from v6.5.0, this variable is deprecated, and TiDB uses the <a href="#">Meta-data Lock</a> feature by default to avoid the <a href="#">Information</a> ↔ ↔ <code>schema</code> ↔ <code>is</code> ↔ ↔ <code>changed</code> ↔ error.

---

Variable name	Change type	Description
<code>tidb_enable_modified_join_reorder</code> ↔	Modified	Changes the default value from OFF to ON after further tests, meaning that the support of Outer Join for the <b>Join Re-order</b> algorithm is enabled by default.

---

Variable name	Change type	Description
<code>tidb_cost_model_version</code> ↔	Modified	Changes the default value from 1 to 2 after further tests, meaning that Cost Model Version 2 is used for index selection and operator selection by default.

Variable name	Change type	Description
<code>tidb_enable_gc_aware_memory_track</code> ↔	Modified	Changes the default value from ON to OFF. Because the GC-aware memory track is found inaccurate in tests and causes too large analyzed memory size tracked, the memory track is disabled. In addition, in Golang 1.19, the memory tracked by the GC-aware

---

Variable name	Change type	Description
<code>tidb_enable_metadata_lock</code> ↔	Modified	Changes the default value from OFF to ON after further tests, meaning that the meta-data lock feature is enabled by default.

Variable name	Change type	Description
<code>tidb_enable_tiflash_read_for_write_stmt</code> ↔	Modified	Takes effect starting from v6.5.0. It controls whether read operations in SQL statements containing INSERT ↔ , DELETE ↔ , and UPDATE can be pushed down to TiFlash. The default value is OFF.

Variable name	Change type	Description
<code>tidb_ddl_enable_fast_reorg</code> ↔	Modified	Changes the default value from OFF to ON after further tests, meaning that the acceleration of ADD ↔ INDEX ↔ and CREATE ↔ ↔ INDEX ↔ is enabled by default.

Variable name	Change type	Description
<code>tidb_mem_query</code> ↔	Modified	For versions earlier than TiDB v6.5.0, this variable is used to set the threshold value of memory quota for a query. For TiDB v6.5.0 and later versions, to control the memory of DML statements more accurately, this variable is used to set the threshold value

Variable name	Change type	Description
<code>tidb_replica_modified</code>	Modified	Starting from v6.5.0, to optimize load balancing across TiDB nodes, when this variable is set to <code>closest</code> <code>↔ -</code> <code>↔ adaptive</code> <code>↔</code> and the estimated result of a read request is greater than or equal to <code>tidb_adaptive_closest_read_threshold</code> <code>↔</code> , the number of TiDB nodes whose <code>closest</code> <code>↔ -</code> <code>↔ adaptive</code> <code>↔</code> configuration

---

Variable name	Change type	Description
<code>tidb_server_memory_limit</code> ↔	Modified	Changes the default value from 0 to 80%. As the TiDB global memory control becomes GA, this default value change enables the memory control by default and sets the memory limit for a TiDB instance to 80% of the total memory by default.

---

Variable name	Change type	Description
<code>default_password_lifetime</code> ↔	Newly added	Sets the global policy for automatic password expiration to require users to change passwords periodically. The default value 0 indicates that passwords never expire.

---

Variable name	Change type	Description
<code>disconnect</code>	Newly applied password	Indicates whether TiDB disconnects the client connection when the password is expired. This variable is read-only.

---

Variable name	Change type	Description
<code>password_history</code>	Newly added	This variable is used to establish a password reuse policy that allows TiDB to limit password reuse based on the number of password changes. The default value 0 means disabling the password reuse policy based on the number of password changes.

---

Variable name	Change type	Description
<code>password_reuse_interval</code> ↔	Newly added	This variable is used to establish a password reuse policy that allows TiDB to limit password reuse based on time elapsed. The default value 0 means disabling the password reuse policy based on time elapsed.

---

Variable name	Change type	Description
<code>tidb_auto_newly_added_concurrency</code> ↔	Newly added	This variable is used to set the concurrency of executing the automatic update of statistics. The default value is 1.

---

Variable name	Change type	Description
<code>tidb_cdc_w_newly_added</code> ↔	Newly added	When this variable is set to a value other than 0, data written in this session is considered to be written by TiCDC. This variable can only be modified by TiCDC. Do not manually modify this variable in any case.

Variable name	Change type	Description
<code>tidb_index_newly_added_intersection_concurrency</code> ↔	Newly added	Sets the maximum concurrency for the intersection operations that index merge performs. It is effective only when TiDB accesses partitioned tables in the dynamic pruning mode.

---

Variable name	Change type	Description
<code>tidb_source_id</code> ↔	Newly added	This variable is used to configure the different cluster IDs in a <b>bi-directional replication</b> cluster.

Variable name	Change type	Description
<code>tidb_sysvar_newly_added_concurrency</code> ↔	Newly added	This variable is used to set the concurrency of scan operations performed when TiDB executes internal SQL statements (such as an automatic update of statistics). The default value is 1.

---

Variable name	Change type	Description
<code>tidb_ttl_delete_batch_size</code>	Newly added	This variable is used to set the maximum number of rows that can be deleted in a single DELETE transaction in a TTL job.

---

Variable name	Change type	Description
<code>tidb_ttl_delete_limit</code>	Newly added	This variable is used to limit the maximum number of DELETE statements allowed per second in a single node in a TTL job. When this variable is set to 0, no limit is applied.

Variable name	Change type	Description
<code>tidb_ttl_delete_worker_count</code> ↔	Newly added	This variable is used to set the maximum concurrency of TTL jobs on each TiDB node.
<code>tidb_ttl_job_enable</code> ↔	Newly added	This variable is used to control whether to enable TTL jobs. If it is set to <code>OFF</code> , all tables with TTL attributes automatically stop cleaning up expired data.

Variable name	Change type	Description
<code>tidb_ttl_job_run_interval</code> ↔	Dynamic	This variable is used to control the scheduling interval of the TTL job in the background. For example, if the current value is set to <code>1h0m0s</code> ↔ , each table with TTL attributes will clean up expired data once every hour.

---

Variable name	Change type	Description
<code>tidb_ttl_job_enable</code>	Newly added	This variable is used to control the start time of the scheduling window of the TTL job in the background. When you modify the value of this variable, be cautious that a small window might cause the cleanup of expired data to fail.

---

Variable name	Change type	Description
<code>tidb_ttl_job_enable</code>	Newly added	This variable is used to control the end time of the scheduling window of the TTL job in the background. When you modify the value of this variable, be cautious that a small window might cause the cleanup of expired data to fail.

Variable name	Change type	Description
<code>tidb_ttl_scan_batch_size</code> ↔	Newly added	This variable is used to set the LIMIT value of each SELECT statement used to scan expired data in a TTL job.
<code>tidb_ttl_scan_concurrency</code> ↔	Newly added	This variable is used to set the maximum concurrency of TTL scan jobs on each TiDB node.

Variable name	Change type	Description
<code>validate_password</code>	Newly added	A check item in the password complexity check. It checks whether the password matches the user-name. This variable takes effect only when <code>validate_password</code>
<code>check_user_name</code>		<code>check_user_name</code>
		<code>enable</code>
		<code>is enabled</code> . The default value is ON.

---

Variable name	Change type	Description
<code>validate_password</code>	Newly added	A check item in the password complexity check. It checks whether the password matches any word in the dictionary. This variable takes effect only when <code>validate_password</code>
<code>→ .</code>		<code>→ .</code>
<code>→ dictionary</code>		<code>→ enable</code>
<code>→</code>		<code>→ is enabled and</code>
		<code>validate_password</code>
		<code>→ .</code>
		<code>→ policy</code>
		<code>→ is set to</code>
		2
		(STRONG). The default value is "".

Variable name	Change type	Description
<code>validate_password</code>	Newly added	This variable controls whether to perform password complexity check. If this variable is set to ON, TiDB performs the password complexity check when you set a password. The default value is OFF.
↔ <code>.</code>		
↔ <code>enable</code>		
↔		

Variable name	Change type	Description
<code>validate_password</code>	Newly added	A check item in the password complexity check. It checks whether the password length is sufficient. By default, the minimum password length is 8. This variable takes effect only when <code>validate_password</code>
<code>↔ .</code>		
<code>↔ length</code>		
<code>↔</code>		
		<code>↔ .</code>
		<code>↔ enable</code>
		<code>↔ is</code>
		enabled.

Variable name	Change type	Description
<code>validate_password</code>	Newly added	A check item in the password complexity check. It checks whether the password contains sufficient upper-case and lower-case letters. This variable takes effect only when <code>validate_password</code>
<code>mixed_case_count</code>		<code>validate_password</code> is enabled and <code>validate_password</code>
		<code>policy</code> is set to 1 (MEDIUM) or

Variable name	Change type	Description
<code>validate_password</code>	Newly added	A check item in the password complexity check. It checks whether the password contains sufficient numbers. This variable takes effect only when <code>validate_password</code>
<code>.</code>		<code>.</code>
<code>number_count</code>		<code>enable</code>
		is enabled and <code>validate_password</code>
		<code>.</code>
		<code>policy</code>
		is set to 1 (MEDIUM) or larger. The default value

Variable name	Change type	Description
<code>validate_password</code>	Newly added	This variable controls the policy for the password complexity check. The value can be 0, 1, or 2 (corresponds to LOW, MEDIUM, or STRONG). This variable takes effect only when <code>validate_password</code>
↔ <code>.</code>		↔ <code>.</code>
↔ <code>policy</code>		↔ <code>enable</code>
↔		↔ <code>is</code>
		enabled. The default value is 1.

Variable name	Change type	Description
<code>validate_password</code>	Newly added	A check item in the password complexity check. It checks whether the password contains sufficient special characters. This variable takes effect only when <code>validate_password</code>
<code>validate_password</code>		<code>validate_password</code>
<code>validate_password</code>		<code>enable</code>
<code>validate_password</code>		<code>is enabled and</code>
<code>validate_password</code>		<code>validate_password</code>
<code>validate_password</code>		<code>validate_password</code>
<code>validate_password</code>		<code>policy</code>
<code>validate_password</code>		<code>is set to</code>
<code>validate_password</code>		<code>1 (MEDIUM)</code>
<code>validate_password</code>		<code>or larger. The default</code>

#### 16.6.4.2.2 Configuration file parameters

Configuration file	parameter	Change type	Description
TiDB	<del>server-</del> ↪ <code>memory</code> ↪ <code>-</code> ↪ <code>quota</code> ↪	Deprecated	Starting from v6.5.0, this configuration item is deprecated. Instead, use the system variable <code>tidb_server_memory_limit</code> ↪ to manage memory globally.

Configuration file	Configuration parameter	Change type	Description
TiDB	<b>disconnect</b> ↪ <del>-on-</del> ↪ <b>expired</b> ↪ <del>-</del> ↪ <b>password</b> ↪	Newly added	Determines whether TiDB disconnects the client connection when the password is expired. The default value is <b>true</b> , which means the client connection is disconnected when the password is expired.
TiKV	<b>raw-min</b> ↪ <del>-ts-</del> ↪ <b>outlier</b> ↪ <del>-</del> ↪ <b>threshold</b> ↪	Deleted	This configuration item was deprecated in v6.4.0 and deleted in v6.5.0.

Configuration			
Configuration file	parameter	Change type	Description
TiKV	<code>cdc.min-interval</code> ↔ <code>-ts-</code> ↔ <code>interval</code> ↔	Modified	To reduce CDC latency, the default value is changed from 1s to 200ms.
TiKV	<code>memory-use-ratio</code> ↔ <code>use-ratio</code> ↔	Newly added	Indicates the ratio of available memory to total system memory in PITR log recovery.

Configuration			
Configuration file	parameter	Change type	Description
TiCDC	<code>sink.terminated</code> ↔ <code>terminated</code> ↔	Newly added	Indicates the row terminator, which is used for separating two data change events. The value is empty by default, which means <code>\r\n</code> is used.

Configuration			
Configuration file	parameter	Change type	Description
TiCDC	<b>sink.</b> ↳ <b>date</b> ↳ <b>-</b> ↳ <b>separator</b> ↳	Newly added	Indicates the date separator type of the file directory. Value options are <b>none</b> , <b>year</b> , <b>month</b> , and <b>day</b> . <b>none</b> is the default value and means that the date is not separated.

Configuration			
Configuration file	parameter	Change type	Description
TiCDC	<b>sink.</b>	Newly added	Specifies whether to use partitions as the separation string. The default value is <b>false</b> , which means that partitions in a table are not stored in separate directories.
	↳ <b>enable</b>		
	↳ <b>-</b>		
	↳ <b>partition</b>		
	↳ <b>-</b>		
	↳ <b>separator</b>		
	↳		
TiCDC	<b>sink.</b>	Newly added	Indicates the delimiter between fields. The value must be an ASCII character and defaults to <b>,</b> .
	↳ <b>csv.</b>		
	↳ <b>delimiter</b>		
	↳		

Configuration file	Configuration parameter	Change type	Description
TiCDC	<code>sink.</code> ↳ <code>csv.</code> ↳ <code>quote</code> ↳	Newly added	The quotation that surrounds the fields. The default value is ". When the value is empty, no quotation is used.
TiCDC	<code>sink.</code> ↳ <code>csv.</code> ↳ <code>null</code>	Newly added	Specifies the character displayed when the CSV column is null. The default value is \N.
TiCDC	<code>sink.</code> ↳ <code>csv.</code> ↳ <code>include</code> ↳ <code>-</code> ↳ <code>commit</code> ↳ <code>-ts</code>	Newly added	Specifies whether to include commits in CSV rows. The default value is <code>false</code> .

### 16.6.4.2.3 Others

- Starting from v6.5.0, the `mysql.user` table adds two new columns: `Password_reuse_history` ↪ and `Password_reuse_time`.
- Starting from v6.5.0, the [index acceleration](#) feature is enabled by default. This feature is not fully compatible with [altering multiple columns or indexes in a single ALTER TABLE statement](#). When adding a unique index with the index acceleration, you need to avoid altering other columns or indexes in the same statement. This feature is incompatible with [PITR \(Point-in-time recovery\)](#) either. When using the index acceleration feature, you need to make sure that no PITR backup task is running in the background; otherwise, unexpected results might occur. For more information, see [documentation](#).

### 16.6.4.3 Deprecated feature

Starting from v6.5.0, the `AMEND TRANSACTION` mechanism introduced in v4.0.7 is deprecated and replaced by [Metadata Lock](#).

### 16.6.4.4 Improvements

- TiDB
  - For BIT and CHAR columns, make the result of `INFORMATION_SCHEMA.COLUMNS` consistent with MySQL [#25472](#) @[hawkingrei](#)
  - Optimize the TiDB probing mechanism for TiFlash nodes in the TiFlash MPP mode to mitigate the performance impact when nodes are abnormal [#39686](#) @[hackersean](#)
- TiKV
  - Stop writing to Raft Engine when there is insufficient space to avoid exhausting disk space [#13642](#) @[jiayang-zheng](#)
  - Support pushing down the `json_valid` function to TiKV [#13571](#) @[lizhenhuan](#)
  - Support backing up multiple ranges of data in a single backup request [#13701](#) @[Leavrth](#)
  - Support backing up data to the Asia Pacific region (ap-southeast-3) of AWS by updating the rusoto library [#13751](#) @[3pointer](#)
  - Reduce pessimistic transaction conflicts [#13298](#) @[MyonKeminta](#)
  - Improve recovery performance by caching external storage objects [#13798](#) @[YuJuncen](#)
  - Run the CheckLeader in a dedicated thread to reduce TiCDC replication latency [#13774](#) @[overvenus](#)
  - Support pull model for Checkpoints [#13824](#) @[YuJuncen](#)
  - Avoid spinning issues on the sender side by updating crossbeam-channel [#13815](#) @[sticnarf](#)

- Support batch Coprocessor tasks processing in TiKV [#13849](#) [@cfzjywxk](#)
- Reduce waiting time on failure recovery by notifying TiKV to wake up Regions [#13648](#) [@LykxSassinator](#)
- Reduce the requested size of memory usage by code optimization [#13827](#) [@BusyJay](#)
- Introduce the Raft extension to improve code extensibility [#13827](#) [@BusyJay](#)
- Support using tikv-ctl to query which Regions are included in a certain key range [#13760](#) [[@HuSharp](#)](<https://github.com/HuSharp>)
- Improve read and write performance for rows that are not updated but locked continuously [#13694](#) [[@sticnarf](#)](<https://github.com/sticnarf>)
- PD
  - Optimize the granularity of locks to reduce lock contention and improve the handling capability of heartbeats under high concurrency [#5586](#) [@rleungx](#)
  - Optimize scheduler performance for large-scale clusters and accelerate the production of scheduling policies [#5473](#) [@bufferflies](#)
  - Improve the speed of loading Regions [#5606](#) [@rleungx](#)
  - Reduce unnecessary overhead by optimized handling of Region heartbeats [#5648](#) [@rleungx](#)
  - Add the feature of automatically garbage collecting tombstone stores [#5348](#) [@nolouch](#)
- TiFlash
  - Improve write performance in scenarios where there is no batch processing on the SQL side [#6404](#) [@lidezhu](#)
  - Add more details for TableFullScan in the `explain analyze` output [#5926](#) [@hongyunyan](#)
- Tools
  - TiDB Dashboard
    - \* Add three new fields to the slow query page: “Is Prepared?”, “Is Plan from Cache?”, “Is Plan from Binding?” [#1451](#) [@shhdgit](#)
  - Backup & Restore (BR)
    - \* Optimize BR memory usage during the process of cleaning backup log data [#38869](#) [@Leavrth](#)
    - \* Fix the restoration failure issue caused by PD leader switch during the restoration process [#36910](#) [@MoCuishle28](#)
    - \* Improve TLS compatibility by using the OpenSSL protocol in log backup [#13867](#) [@YuJuncen](#)
  - TiCDC

- \* Improve the performance of Kafka protocol encoder [#7540](#) [#7532](#) [#7543](#)  
[@3AceShowHand](#) [@sdojyy](#)
- TiDB Data Migration (DM)
  - \* Improve the data replication performance for DM by not parsing the data of tables in the block list [#7622](#) [@GMHDBJD](#)
  - \* Improve the write efficiency of DM relay by using asynchronous write and batch write [#7580](#) [@GMHDBJD](#)
  - \* Optimize the error messages in DM precheck [#7621](#) [@buchitoudegou](#)
  - \* Improve the compatibility of SHOW SLAVE HOSTS for old MySQL versions [#5017](#) [@lyzx2001](#)

#### 16.6.4.5 Bug fixes

- TiDB
  - Fix the issue of memory chunk misuse for the chunk reuse feature that occurs in some cases [#38917](#) [@keeplearning20221](#)
  - Fix the issue that the internal sessions of `tidb_constraint_check_in_place_pessimistic`  $\leftrightarrow$  might be affected by the global setting [#38766](#) [@ekexium](#)
  - Fix the issue that the `AUTO_INCREMENT` column cannot work with the `CHECK` constraint [#38894](#) [@YangKeao](#)
  - Fix the issue that using `INSERT IGNORE INTO` to insert data of the `STRING` type into an auto-increment column of the `SMALLINT` type will cause an error [#38483](#) [@hawkingrei](#)
  - Fix the issue that the null pointer error occurs in the operation of renaming the partition column of a partitioned table [#38932](#) [@mjonss](#)
  - Fix the issue that modifying the partition column of a partitioned table causes DDL to hang [#38530](#) [@mjonss](#)
  - Fix the issue that the `ADMIN SHOW JOB` operation panics after upgrading from v4.0.16 to v6.4.0 [#38980](#) [@tangenta](#)
  - Fix the issue that the `tidb_decode_key` function fails to correctly parse the encoding of partitioned tables [#39304](#) [@Defined2014](#)
  - Fix the issue that gRPC error logs are not redirected to the correct log file during log rotation [#38941](#) [@xhebox](#)
  - Fix the issue that TiDB generates an unexpected execution plan for the `BEGIN;`  $\leftrightarrow$  `SELECT... FOR UPDATE;` point query when TiKV is not configured as a read engine [#39344](#) [@Yisaer](#)
  - Fix the issue that mistakenly pushing down `StreamAgg` to TiFlash causes wrong results [#39266](#) [@fixdb](#)
- TiKV
  - Fix an error in Raft Engine ctl [#11119](#) [@tabokie](#)

- Fix the `Get raft db is not allowed` error when executing the `compact raft` command in `tikv-ctl` [#13515](#) @guoxiangCN
- Fix the issue that log backup does not work when TLS is enabled [#13867](#) @YuJuncen
- Fix the support issue of the Geometry field type [#13651](#) @dveeden
- Fix the issue that `_` in the LIKE operator cannot match non-ASCII characters when new collation is not enabled [#13769](#) @YangKeao
- Fix the issue that `tikv-ctl` is terminated unexpectedly when executing the `reset`  $\rightarrow$  `-to-version` command [#13829](#) @tabokie
- PD
  - Fix the issue that the `balance-hot-region-scheduler` configuration is not persisted if not modified [#5701](#) @HunDunDM
  - Fix the issue that `rank-formula-version` does not retain the pre-upgrade configuration during the upgrade process [#5698](#) @HunDunDM
- TiFlash
  - Fix the issue that column files in the delta layer cannot be compacted after restarting TiFlash [#6159](#) @lidezhu
  - Fix the issue that TiFlash File Open OPS is too high [#6345](#) @JaySon-Huang
- Tools
  - Backup & Restore (BR)
    - \* Fix the issue that when BR deletes log backup data, it mistakenly deletes data that should not be deleted [#38939](#) @Leavrth
    - \* Fix the issue that restore tasks fail when using old framework for collations in databases or tables [#39150](#) @MoCuishle28
    - \* Fix the issue that backup fails because Alibaba Cloud and Huawei Cloud are not fully compatible with Amazon S3 storage [#39545](#) @3pointer
  - TiCDC
    - \* Fix the issue that TiCDC gets stuck when the PD leader crashes [#7470](#) @zeminzhou
    - \* Fix data loss occurred in the scenario of executing DDL statements first and then pausing and resuming the changefeed [#7682](#) @asddongmen
    - \* Fix the issue that TiCDC mistakenly reports an error when there is a later version of TiFlash [#7744](#) @overvenus
    - \* Fix the issue that the sink component gets stuck if the downstream network is unavailable [#7706](#) @hicqu
    - \* Fix the issue that data is lost when a user quickly deletes a replication task and then creates another one with the same task name [#7657](#) @overvenus
  - TiDB Data Migration (DM)

- \* Fix the issue that a `task-mode:all` task cannot be started when the upstream database enables the GTID mode but does not have any data [#7037](#) [@liumengya94](#)
  - \* Fix the issue that data is replicated for multiple times when a new DM worker is scheduled before the existing worker exits [#7658](#) [@GMHDBJD](#)
  - \* Fix the issue that DM precheck is not passed when the upstream database uses regular expressions to grant privileges [#7645](#) [@lance6716](#)
- TiDB Lightning
- \* Fix the memory leakage issue when TiDB Lightning imports a huge source data file [#39331](#) [@dsdashun](#)
  - \* Fix the issue that TiDB Lightning cannot detect conflicts correctly when importing data in parallel [#39476](#) [@dsdashun](#)

## 16.7 v6.4

### 16.7.1 TiDB 6.4.0 Release Notes

Release date: November 17, 2022

TiDB version: 6.4.0-DMR

Quick access: [Quick start](#) | [Installation packages](#)

In v6.4.0-DMR, the key new features and improvements are as follows:

- Support restoring a cluster to a specific point in time by using `FLASHBACK CLUSTER`  $\leftrightarrow$  `TO TIMESTAMP` (experimental).
- Support `tracking the global memory usage` of TiDB instances (experimental).
- Be compatible with `the Linear Hash partitioning syntax`.
- Support a high-performance and globally monotonic `AUTO_INCREMENT` (experimental).
- Support range selection of array data in `the JSON type`.

- Accelerate fault recovery in extreme situations such as disk failures and stuck I/O.
- Add the [dynamic planning algorithm](#) to determine table join order.
- Introduce a [new optimizer hint NO\\_DECORRELATE](#) to control whether to perform decorrelation for correlated subqueries.
- The [cluster diagnostics](#) feature becomes GA.
- TiFlash supports the SM4 algorithm for [encryption at rest](#).
- Support using a SQL statement to [compact TiFlash replicas of specified partitions in a table immediately](#).
- Support [backing up a TiDB cluster using EBS volume snapshots](#).
- DM supports [writing upstream data source information to the extended columns of the downstream merged table](#).

### 16.7.1.1 New features

#### 16.7.1.1.1 SQL

- Support using a SQL statement to compact TiFlash replicas of specified partitions in a table immediately [#5315](#) [@hehechen](#)

Since v6.2.0, TiDB has supported the feature of [compacting physical data immediately](#) on a full-table replica of TiFlash. You can choose the right time to manually execute SQL statements to immediately compact the physical data in TiFlash, which helps to reduce storage space and improve query performance. In v6.4.0, we refine the granularity of TiFlash replica data to be compacted and support compacting TiFlash replicas of specified partitions in a table immediately.

By executing the SQL statement `ALTER TABLE table_name COMPACT [PARTITION ↪ PartitionNameList] [engine_type REPLICA]`, you can immediately compact TiFlash replicas of specified partitions in a table.

For more information, see [User document](#).

- Support restoring a cluster to a specific point in time by using `FLASHBACK CLUSTER TO ↪ TIMESTAMP` (experimental) [#37197](#) [#13303](#) [@Defined2014](#) [@bb7133](#) [@JmPotato](#) [@Connor1996](#) [@HuSharp](#) [@CalvinNeo](#)

You can use the `FLASHBACK CLUSTER TO TIMESTAMP` syntax to restore a cluster to a specific point in time quickly within the Garbage Collection (GC) lifetime. This feature helps you to easily and quickly undo DML misoperations. For example, you can use this syntax to restore the original cluster in minutes after mistakenly executing `DELETE` without a `WHERE` clause. This feature does not rely on database backups and supports rolling back data at different time points to determine the exact time when data changes. Note that `FLASHBACK CLUSTER TO TIMESTAMP` cannot replace database backups.

Before executing `FLASHBACK CLUSTER TO TIMESTAMP`, you need to pause PITR and replication tasks running on such tools as TiCDC and restart them after the `FLASHBACK` is completed. Otherwise, replication tasks might fail.

For more information, see [User document](#).

- Support restoring a deleted database by using `FLASHBACK DATABASE` [#20463](#) [@erwadba](#)  
By using `FLASHBACK DATABASE`, you can restore a database and its data deleted by `DROP` within the garbage collection (GC) life time. This feature does not depend on any external tools. You can quickly restore data and metadata using SQL statements.  
For more information, see [User document](#).

#### 16.7.1.1.2 Security

- TiFlash supports the SM4 algorithm for encryption at rest [#5953](#) [@lidezhu](#)  
Add the SM4 algorithm for TiFlash encryption at rest. When you configure encryption at rest, you can enable the SM4 encryption capacity by setting the value of the `data-encryption-method` configuration to `sm4-ctr` in the `tiflash-learner.toml` configuration file.  
For more information, see [User document](#).

#### 16.7.1.1.3 Observability

- Cluster diagnostics becomes GA [#1438](#) [@Hawkson-jee](#)  
The [cluster diagnostics](#) feature in TiDB Dashboard diagnoses the problems that might exist in a cluster within a specified time range, and summarizes the diagnostic results and the cluster-related load monitoring information into a [diagnostic report](#). This diagnostic report is in the form of a web page. You can browse the page offline and circulate this page link after saving the page from a browser.  
With the diagnostic reports, you can quickly understand the basic health information of the cluster, including the load, component status, time consumption, and configurations. If the cluster has some common problems, you can locate the causes in the result of the built-in automatic diagnosis in the [diagnostic information](#) section.

#### 16.7.1.1.4 Performance

- Introduce the concurrency adaptive mechanism for coprocessor tasks [#37724](#) [@you06](#)  
As the number of coprocessor tasks increases, based on TiKV's processing speed, TiDB automatically increases concurrency (adjust the value of `tidb_distsql_scan_concurrency`  $\leftrightarrow$  ) to reduce the coprocessor task queue and thus reduce latency.
- Add the dynamic planning algorithm to determine table join order [#37825](#) [@winoros](#)  
In earlier versions, TiDB uses the greedy algorithm to determine the join order of tables. In v6.4.0, the TiDB optimizer introduces the [dynamic planning algorithm](#). The dynamic planning algorithm can enumerate more possible join orders than the

greedy algorithm, so it increases the possibility to find a better execution plan and improves SQL execution efficiency in some scenarios.

Because the dynamic programming algorithm consumes more time, the selection of the TiDB Join Reorder algorithms is controlled by the `tidb_opt_join_reorder_threshold`  $\leftrightarrow$  variable. If the number of nodes participating in Join Reorder is greater than this threshold, TiDB uses the greedy algorithm. Otherwise, TiDB uses the dynamic programming algorithm.

For more information, see [User document](#).

- The prefix index supports filtering null values. [#21145](#) [@xuyifangreeneyes](#)

This feature is an optimization for the prefix index. When a column in a table has a prefix index, the `IS NULL` or `IS NOT NULL` condition of the column in the SQL statement can be directly filtered by the prefix, which avoids table lookup in this case and improves the performance of the SQL execution.

For more information, see [User document](#).

- Enhance the TiDB chunk reuse mechanism [#38606](#) [@keeplearning20221](#)

In earlier versions, TiDB only reuses chunks in the `writetchunk` function. TiDB v6.4.0 extends the chunk reuse mechanism to operators in Executor. By reusing chunks, TiDB does not need to frequently request memory release and SQL queries are executed more efficiently in some scenarios. You can use the system variable `tidb_enable_reuse_chunk` to control whether to reuse chunk objects, which is enabled by default.

For more information, see [User document](#).

- Introduce a new optimizer hint `NO_DECORRELATE` to control whether to perform decorrelation for correlated subqueries [#37789](#) [@time-and-fate](#)

By default, TiDB always tries to rewrite correlated subqueries to perform decorrelation, which usually improves execution efficiency. However, in some scenarios, decorrelation reduces the execution efficiency. In v6.4.0, TiDB introduces the optimizer hint `NO_DECORRELATE` to tell the optimizer not to perform decorrelation for specified query blocks to improve query performance in some scenarios.

For more information, see [User document](#).

- Improve the performance of statistics collection on partitioned tables [#37977](#) [@Yisaer](#)

In v6.4.0, TiDB optimizes the strategy of collecting statistics on partitioned tables. You can use the system variable `tidb_auto_analyze_partition_batch_size` to set the concurrency of collecting statistics on partitioned tables in parallel to speed up the collection and shorten the analysis time.

#### 16.7.1.1.5 Stability

- Accelerate fault recovery in extreme situations such as disk failures and stuck I/O [#13648](#) @LykxSassinator

For enterprise users, database availability is one of the most important metrics. While in complex hardware environments, how to quickly detect and recover from failures has always been one of the challenges of database availability. In v6.4.0, TiDB fully optimizes the state detection mechanism of TiKV nodes. Even in extreme situations such as disk failures and stuck I/O, TiDB can still report node state quickly and use the active wake-up mechanism to launch Leader election in advance, which accelerates cluster self-healing. Through this optimization, TiDB can shorten the cluster recovery time by about 50% in the case of disk failures.

- Global control on TiDB memory usage [#37816](#) @wshwsh12

In v6.4.0, TiDB introduces global control of memory usage as an experimental feature that tracks the global memory usage of TiDB instances. You can use the system variable `tidb_server_memory_limit` to set the upper limit for the global memory usage. When the memory usage reaches the threshold, TiDB tries to reclaim and release more free memory. When the memory usage exceeds the threshold, TiDB identifies and cancels the SQL operation that has the highest memory usage to avoid system issues caused by excessive memory usage.

When the memory consumption of TiDB instances has potential risks, TiDB will collect diagnostic information in advance and write it to the specified directory to facilitate the issue diagnosis. At the same time, TiDB provides system table views `INFORMATION_SCHEMA.MEMORY_USAGE` and `INFORMATION_SCHEMA.MEMORY_USAGE_OPS_HISTORY` that show the memory usage and operation history to help you better understand the memory usage.

Global memory control is a milestone in TiDB memory management. It introduces a global view for instances and adopts systematic management for memory, which can greatly enhance database stability and service availability in more key scenarios.

For more information, see [User document](#).

- Control the memory usage of the range-building optimizer [#37176](#) @xuyifangreeneyes

In v6.4.0, the system variable `tidb_opt_range_max_size` is introduced to limit the maximum memory usage of the optimizer that builds ranges. When the memory usage exceeds the limit, the optimizer will build more coarse-grained ranges instead of more exact ranges to reduce memory consumption. If a SQL statement has many IN conditions, this optimization can significantly reduce the memory usage of compiling and ensure system stability.

For more information, see [User document](#).

- Support synchronously loading statistics (GA) [#37434](#) @chrysan

TiDB v6.4.0 enables the synchronously loading statistics feature by default. This feature allows TiDB to synchronously load large-sized statistics (such as histograms,

TopN, and Count-Min Sketch statistics) into memory when you execute SQL statements, which improves the completeness of statistics for SQL optimization.

For more information, see [User document](#).

- Reduce the impact of batch write requests on the response time of lightweight transactional writes [#13313](#) [@glorv](#)

The business logic of some systems requires periodic batch DML tasks, but processing these batch write tasks increases the latency of online transactions. In v6.3.0, TiKV optimizes the scheduling of read requests in hybrid workload scenarios, so you can enable the `readpool.unified.auto-adjust-pool-size` configuration item to have TiKV automatically adjust the size of the UnifyReadPool thread pool for all read requests. In v6.4.0, TiKV can dynamically identify and prioritize write requests as well, and control the maximum bytes that the Apply thread can write for one FSM (Finite-state Machine) in one round of poll, thus reducing the impact of batch write requests on the response time of transactional writes.

#### 16.7.1.1.6 Ease of use

- TiKV API V2 becomes generally available (GA) [#11745](#) [@pingyu](#)

Before v6.1.0, TiKV only provides basic Key Value read and write capability because it only stores the raw data passed in by the client. In addition, due to different coding methods and unscoped data ranges, TiDB, Transactional KV, and RawKV cannot be used at the same time in the same TiKV cluster; instead, multiple clusters are needed in this case, thus increasing machine and deployment costs.

TiKV API V2 provides a new RawKV storage format and access interface, which delivers the following benefits:

- Store data in MVCC with the change timestamp of the data recorded, based on which Change Data Capture (CDC) is implemented. This feature is experimental and is detailed in [TiKV-CDC](#).
- Data is scoped according to different usage and API V2 supports co-existence of TiDB, Transactional KV, and RawKV applications in a single cluster.
- Reserve the Key Space field to support features such as multi-tenancy.

To enable TiKV API V2, set `api-version = 2` in the `[storage]` section of the TiKV configuration file.

For more information, see [User document](#).

- Improve the accuracy of TiFlash data replication progress [#4902](#) [@hehechen](#)

In TiDB, the `PROGRESS` field of the `INFORMATION_SCHEMA.TIFLASH_REPLICA` table is used to indicate the progress of data replication from the corresponding tables in TiKV to the TiFlash replicas. In earlier TiDB versions, the `PROCESS` field only provides the

progress of data replication during the creation of the TiFlash replicas. After a TiFlash replica is created, if new data is imported to a corresponding table in TiKV, this field will not be updated to show the replication progress from TiKV to TiFlash for the new data.

In v6.4.0, TiDB improves the update mechanism of data replication progress for TiFlash replicas. After a TiFlash replica is created, if new data is imported to a corresponding table in TiKV, the `PROGRESS` value in the `INFORMATION_SCHEMA.TIFLASH_REPLICA` table will be updated to show the actual replication progress from TiKV to TiFlash for the new data. With this improvement, you can easily view the actual progress of TiFlash data replication.

For more information, see [User document](#).

#### 16.7.1.1.7 MySQL compatibility

- Be compatible with the Linear Hash partitioning syntax [#38450 @mjonn](#)

In the earlier version, TiDB has supported the Hash, Range, and List partitioning. Starting from v6.4.0, TiDB can also be compatible with the syntax of [MySQL Linear Hash partitioning](#).

In TiDB, you can execute the existing DDL statements of your MySQL Linear Hash partitions directly, and TiDB will create the corresponding Hash partition tables (note that there is no Linear Hash partition inside TiDB). You can also execute the existing DML statements of your MySQL Linear Hash partitions directly, and TiDB will return the query result of the corresponding TiDB Hash partitions normally. This feature ensures the TiDB syntax compatibility with MySQL Linear Hash partitions and facilitates seamless migration from MySQL-based applications to TiDB.

If the number of partitions is a power of 2, the rows in a TiDB Hash partitioned table are distributed the same as that in the MySQL Linear Hash partitioned table. Otherwise, the distribution of these rows in TiDB is different from MySQL.

For more information, see [User document](#).

- Support a high-performance and globally monotonic `AUTO_INCREMENT` (experimental) [#38442 @tiancaimao](#)

TiDB v6.4.0 introduces the `AUTO_INCREMENT` MySQL compatibility mode. This mode introduces a centralized auto-increment ID allocating service that ensures IDs monotonically increase on all TiDB instances. This feature makes it easier to sort query results by auto-increment IDs. To use the MySQL compatibility mode, you need to set `AUTO_ID_CACHE` to 1 when creating a table. The following is an example:

```
CREATE TABLE t (a INT AUTO_INCREMENT PRIMARY KEY) AUTO_ID_CACHE = 1;
```

For more information, see [User document](#).

- Support range selection of array data in the JSON type [#13644](#) @YangKeao

Starting from v6.4.0, you can use the MySQL-compatible [range selection syntax](#) in TiDB.

- With the keyword `to`, you can specify the start and end positions of array elements and select elements of a continuous range in an array. With `0`, you can specify the position of the first element in an array. For example, using `$$[0 to 2]`, you can select the first three elements of an array.
- With the keyword `last`, you can specify the position of the last element in an array, which allows you to set the position from right to left. For example, using `$$[last-2 to last]`, you can select the last three elements of an array.

This feature simplifies the process of writing SQL statements, further improves the JSON type compatibility, and reduces the difficulty of migrating MySQL applications to TiDB.

- Support adding additional descriptions for database users [#38172](#) @CbcWestwolf

In TiDB v6.4, you can use the `CREATE USER` or `ALTER USER` to add additional descriptions for database users. TiDB provides two description formats. You can add a text comment using `COMMENT` and add a set of structured attributes in JSON format using `ATTRIBUTE`.

In addition, TiDB v6.4.0 adds the `USER_ATTRIBUTES` table, where you can view the information of user comments and user attributes.

```
CREATE USER 'newuser1'@'%' COMMENT 'This user is created only for test'
↳ ;
CREATE USER 'newuser2'@'%' ATTRIBUTE '{"email": "user@pingcap.com"}';
SELECT * FROM INFORMATION_SCHEMA.USER_ATTRIBUTES;
```

```
+--
↳ -----+-----+-----+
↳
| USER | HOST | ATTRIBUTE |
+--
↳ -----+-----+-----+
↳
| newuser1 | % | {"comment": "This user is created only for test"} |
| newuser1 | % | {"email": "user@pingcap.com"} |
+--
↳ -----+-----+-----+
↳
2 rows in set (0.00 sec)
```

This feature improves TiDB compatibility with MySQL syntax and makes it easier to integrate TiDB into tools or platforms in the MySQL ecosystem.

#### 16.7.1.1.8 Backup and restore

- Support backing up a TiDB cluster using EBS volume snapshots [#33849](#) @fengou1  
If your TiDB cluster is deployed on EKS and uses AWS EBS volumes, and you have the following requirements when backing up TiDB cluster data, you can use TiDB Operator to back up the data by volume snapshots and metadata to AWS S3:
  - Minimize the impact of backup, for example, to keep the impact on QPS and transaction latency less than 5%, and to occupy no cluster CPU and memory.
  - Back up and restore data in a short time. For example, finish backup within 1 hour and restore data in 2 hours.

For more information, see [User document](#).

#### 16.7.1.1.9 Data migration

- DM supports writing upstream data source information to the extended columns of the downstream merged table [#37797](#) @lichunzhu

When merging sharded schemas and tables from upstream to TiDB, you can manually add several fields (extended columns) in the target table and specify their values when configuring the DM task. For example, if you specify the names of the upstream sharded schema and table for the extended columns, the data written to the downstream by DM will include the schema name and table name. When the downstream data looks unusual, you can use this feature to quickly locate the data source information in the target table, such as the schema name and table name.

For more information, see [Extract table, schema, and source information and write into the merged table](#).

- DM optimizes the pre-check mechanism by changing some mandatory check items to optional ones [#7333](#) @lichunzhu

To run a data migration task smoothly, DM triggers a [precheck](#) automatically at the start of the task and returns the check results. DM starts the migration only after the precheck is passed.

In v6.4.0, DM changes the following three check items from mandatory to optional, which improves the pass rate of the pre-check:

- Check whether the upstream tables use character sets that are incompatible with TiDB.
- Check whether the upstream tables have primary key constraints or unique key constraints
- Check whether the database ID `server_id` for the upstream database has been specified in the primary-secondary configuration.

- DM supports configuring binlog position and GTID as optional parameters for incremental migration tasks [#7393](#) @GMHDBJD

Since v6.4.0, you can perform incremental migration directly without specifying the binlog position or GTID. DM automatically obtains the binlog files generated after the task starts from upstream and migrates these incremental data to the downstream. This relieves users from laborious understanding and complicated configuration.

For more information, see [DM Advanced Task Configuration File](#).

- DM adds more status indicators for migration tasks [#7343](#) @okJiang

In v6.4.0, DM adds more performance and progress indicators for migration tasks, which helps you understand the migration performance and progress more intuitively and provides you with a reference for troubleshooting.

- Add status indicators (in bytes/s) showing data importing and exporting performance.
- Rename the performance indicator for writing data to the downstream database from TPS to RPS (in rows/s).
- Add progress indicators showing the data export progress of DM full migration tasks.

For more information about these indicators, see [Query Task Status in TiDB Data Migration](#).

#### 16.7.1.1.10 TiDB data share subscription

- TiCDC supports replicating data to Kafka of the 3.2.0 version [#7191](#) @3AceShowHand  
From v6.4.0, TiCDC supports [replicating data to Kafka](#) of the 3.2.0 version and earlier.

### 16.7.1.2 Compatibility changes

#### 16.7.1.2.1 System variables

Variable name	Change type	Description
<code>tidb_constraint_check_in_place_pessimistic</code>	Modified	Removes the GLOBAL scope and allows you to modify the default value using the <code>pessimistic</code> <ul style="list-style-type: none"> <li>↳ -</li> <li>↳ <code>txn</code></li> <li>↳ <code>.</code></li> <li>↳ <code>constraint</code></li> <li>↳ -</li> <li>↳ <code>check</code></li> <li>↳ <code>-in</code></li> <li>↳ -</li> <li>↳ <code>place</code></li> <li>↳ -</li> <li>↳ <code>pessimistic</code></li> <li>↳</li> </ul> configuration item. This variable controls when TiDB checks the unique constraints in pessimistic trans-

Variable name	Change type	Description
<code>tidb_ddl_flashback_concurrency</code> ↔	Modified	<p>Takes effect starting from v6.4.0 and controls the concurrency of <b>FLASHBACK</b> ↔ <b>CLUSTER</b> ↔ <b>TO</b> ↔ ↔ <b>TIMESTAMP</b> ↔ .</p> <p>The default value is 64.</p>

---

Variable name	Change type	Description
<code>tidb_enable_modified_index</code> ↔	Modified	Changes the default value from <code>INT_ONLY</code> ↔ to <code>ON</code> , meaning that primary keys are created as clustered indexes by default.

Variable name	Change type	Description
<code>tidb_enable_paging</code> ↔	Modified	Changes the default value from OFF to ON, meaning that the method of paging to send coprocessor requests is used by default.
<code>tidb_enable_prepared_plan_cache</code> ↔	Modified	Adds the SESSION scope. This variable controls whether to enable Prepared Plan Cache.

---

Variable name	Change type	Description
<code>tidb_memory_usage_alarm_ratio</code> ↔	Modified	Changes the default value from 0.8 to 0.7. This variable controls the memory usage ratio that triggers the tidb-server memory alarm.

---

Variable name	Change type	Description
<code>tidb_opt_agg_push_down</code> ↔	Modified	Adds the GLOBAL scope. This variable controls whether the optimizer executes the optimization operation of pushing down the aggregate function to the position before Join, Projection, and Union-All.

---

Variable name	Change type	Description
<code>tidb_prepared_statement_cache_size</code> ↔	Modified	Adds the SESSION scope. This variable controls the maximum number of plans that can be cached in a session.

---

Variable name	Change type	Description
<code>tidb_stats_modified_sync_wait</code> ↔	Modified	Changes the default value from 0 to 100, meaning that the SQL execution can wait for at most 100 milliseconds by default to synchronously load complete column statistics.

---

Variable name	Change type	Description
<code>tidb_stats_modified_pseudo_timeout</code> ↔	Modified	Changes the default value from OFF to ON, meaning that the SQL optimization gets back to using pseudo statistics after reaching the timeout of synchronously loading complete column statistics.

---

Variable name	Change type	Description
<code>last_sql_used</code>	Newly added ↔	Shows whether the previous statement uses a cached chunk object (chunk allocation). This variable is read-only and the default value is OFF.

---

Variable name	Change type	Description
<code>tidb_auto_analyze_partition_batch_size</code>	Newly added ↔	Specifies the number of partitions that TiDB can automatically analyzes at a time when analyzing a partitioned table (which means automatically collecting statistics on a partitioned table). The default value is 1.

Variable name	Change type	Description
<code>tidb_enable_newer_ts_read</code> ↔	Newly added	Controls whether TiDB reads data with the times-tamp specified by <code>tidb_external_ts</code> ↔ . The default value is OFF.
<code>tidb_enable_gogc_tuner</code> ↔	Newly added	Controls whether to enable GOGC Tuner. The default value is ON.

Variable name	Change type	Description
<code>tidb_enable_newly_added_chunk</code> ↔	Newly added	Controls whether TiDB enables chunk objects cache. The default value is ON, meaning that TiDB prefers to use the cached chunk object and only requests from the system if the requested object is not in the cache. If the value is OFF, TiDB requests chunk objects from the system directly.

---

Variable name	Change type	Description
<code>tidb_enable_prepared_plan_cache_memory_controls</code> ↔	Newly added	Controls whether to count the memory consumed by the execution plans cached in the Prepared Plan Cache. The default value is ON.

---

Variable name	Change type	Description
<code>tidb_external_ts_read</code> ↔	Newly added	The default value is 0. If <code>tidb_enable_external_ts_read</code> ↔ is set to ON, TiDB reads data with the timestamp specified by this variable.

---

Variable name	Change type	Description
<code>tidb_gogc_newly_added</code> ↔	Newly added	Specifies the maximum memory threshold for tuning GOGC. When the memory exceeds this threshold, GOGC Tuner stops working. The default value is 0.6.

Variable name	Change type	Description
<code>tidb_memory_usage_alarm_keep_record_num</code>	Newly added	When the tidb-server memory usage exceeds the memory alarm threshold and triggers an alarm, TiDB only retains the status files generated during the recent 5 alarms by default. You can adjust this number with this variable.

---

Variable name	Change type	Description
<code>tidb_opt_push_down_index_single_scan</code> ↔	Newly added	Controls whether the TiDB optimizer pushes down some filter conditions to the prefix index to avoid unnecessary table lookup and to improve query performance. The default value is ON.

---

Variable name	Change type	Description
<code>tidb_opt_newly_scan_size</code>	Dynamic	Specifies the upper limit of memory usage for the optimizer to construct a scan range. The default value is 67108864 (64 MiB).

---

Variable name	Change type	Description
<code>tidb_server_memory_limit</code> ↔	Newly added	Controls the upper limit of memory usage for the optimizer to build scan ranges (experimental). The default value is 0, meaning that there is no memory limit.

---

Variable name	Change type	Description
<code>tidb_server_newly_added_limit_gc_trigger</code> ↔	Newly added	Controls the threshold at which TiDB tries to trigger GC (experimental). The default value is 70%.

Variable name	Change type	Description
<code>tidb_server_memory_limit_sess_min_size</code>	Newly added	After you enable the memory limit, TiDB will terminate the SQL statement with the highest memory usage on the current instance. This variable specifies the minimum memory usage of the SQL statement to be terminated. The default value is 134217728

Variable name	Change type	Description
---------------	-------------	-------------

### 16.7.1.2.2 Configuration file parameters

Configuration			
Configuration file	parameter	Change type	Description
TiDB	<code>tidb_memory_usage_alarm_ratio</code> ↔	Deleted	This configuration item is no longer effective.
TiDB	<code>memory-usage-alarm-ratio</code> ↔ ↔ - ↔ <code>alarm-ratio</code> ↔ - ↔ <code>ratio</code> ↔	Deleted	Replaced by the system variable <code>tidb_memory_usage_alarm_ratio</code> . If this configuration item has been configured in a TiDB version earlier than v6.4.0, it will not take effect after the upgrade.

Configuration file	Configuration parameter	Configuration Change type	Description
TiDB	<code>tidb_pessimistic_txn</code>	Newly added	Controls the default value of the system variable <code>tidb_constraint_check_in_place_pessimistic</code> . The default value is <code>true</code> .
	↪ <code>-txn</code>		
	↪ <code>.</code>		
	↪ <code>constraint</code>

TiFlash	<code>data-</code> ↳ <code>encryption</code> ↳ <code>-</code> ↳ <code>method</code> ↳	Modified	<p>Introduces a new value option <code>sm4-ctr</code>. When this configuration item is set to <code>sm4-ctr</code>, data is encrypted using SM4 before being stored.</p>

Configuration file	Configuration parameter	Change type	Description
DM	<code>routes.</code> ↳ <code>route</code> ↳ <code>-</code> ↳ <code>rule</code> ↳ <code>-1.</code> ↳ <code>extract</code> ↳ <code>-</code> ↳ <code>table</code> ↳	Newly added	Optional. Used in the sharding scenario for extracting the source information of sharded tables. The extracted information will be written to the merged table in the downstream to identify the data source. If this parameter is configured, you need to manually create a merged table in the downstream in advance.

Configuration file	Configuration parameter	Change type	Description
DM	<code>routes.</code> ↳ <code>route</code> ↳ <code>-</code> ↳ <code>rule</code> ↳ <code>-1.</code> ↳ <code>extract</code> ↳ <code>-</code> ↳ <code>schema</code> ↳	Newly added	Optional. Used in the sharding scenario for extracting the source information of sharded schemas. The extracted information will be written to the merged table in the downstream to identify the data source. If this parameter is configured, you need to manually create a merged table in the downstream in advance.

Configuration file	Configuration parameter	Change type	Description
DM	<code>routes.</code> ↳ <code>route</code> ↳ <code>-</code> ↳ <code>rule</code> ↳ <code>-1.</code> ↳ <code>extract</code> ↳ <code>-</code> ↳ <code>source</code> ↳	Newly added	Optional. Used in the sharding scenario for extracting the source instance information. The extracted information will be written to the merged table in the downstream to identify the data source. If this parameter is configured, you need to manually create a merged table in the downstream in advance.

Configuration file	Configuration parameter	Change type	Description
TiCDC	<code>transaction</code>	Modified	Changes the default value from <code>table</code> to <code>none</code> . This change helps reduce replication latency and OOM risks. In addition, TiCDC now only splits a few transactions (the size of a single transaction exceeds 1024 rows), instead of all transactions.

### 16.7.1.2.3 Others

- Starting from v6.4.0, the `mysql.user` table adds two new columns: `User_attributes` and `Token_issuer`. If you [restore system tables in the mysql schema](#) from backup data

of earlier TiDB versions to TiDB v6.4.0, BR will report the `column count mismatch`  $\leftrightarrow$  error for the `mysql.user` table. If you do not restore system tables in the `mysql` schema, this error will not be reported.

- For files whose names match the [format of Dumping exported files](#) but end with uncompressed formats (such as `test-schema-create.sql.origin` and `test.table`  $\leftrightarrow$  `-schema.sql.origin`), the way how TiDB Lightning handles them is changed. Before v6.4.0, if the files to be imported include such files, TiDB Lightning skips importing such files. Starting from v6.4.0, TiDB Lightning assumes that such files use unsupported compression formats, so the import task will fail.
- Starting with v6.4.0, only the changefeed with the `SYSTEM_VARIABLES_ADMIN` or `SUPER` privilege can use the TiCDC Syncpoint feature.

### 16.7.1.3 Improvements

- TiDB
  - Allow modifying the noop variable `lc_messages` [#38231](#) [@djshow832](#)
  - Support the `AUTO_RANDOM` column as the first column of the clustered composite index [#38572](#) [@tangenta](#)
  - Use pessimistic transactions in internal transaction retry to avoid retry failure and reduce time consumption [#38136](#) [@jackysp](#)
- TiKV
  - Add a new configuration item `apply-yield-write-size` to control the maximum number of bytes that the Apply thread can write for one Finite-state Machine in one round of poll, and relieve Raftstore congestion when the Apply thread writes a large volume of data [#13313](#) [@glorv](#)
  - Warm up the entry cache before migrating the leader of Region to avoid QPS jitter during the leader transfer process [#13060](#) [@cosven](#)
  - Support pushing down the `json_constains` operator to Coprocessor [#13592](#) [@lizhenhuan](#)
  - Add the asynchronous function for `CausalTsProvider` to improve the flush performance in some scenarios [#13428](#) [@zeminzhou](#)
- PD
  - The v2 algorithm of the hot Region scheduler becomes GA. In some scenarios, the v2 algorithm can achieve better balancing in both configured dimensions and reduce invalid scheduling [#5021](#) [@HundunDM](#)
  - Optimize the timeout mechanism of operator step to avoid premature timeout [#5596](#) [@bufferflies](#)
  - Improve the performance of the scheduler in large clusters [#5473](#) [@bufferflies](#)
  - Support using external timestamp which is not provided by PD [#5637](#) [@lhy1024](#)

- TiFlash
  - Refactor the TiFlash MPP error handling logic to further improve the stability of MPP [#5095](#) @windtalker
  - Optimize the sorting of the TiFlash computation process, and optimize the key handling for Join and Aggregation [#5294](#) @solotzg
  - Optimize the memory usage for decoding and remove redundant transfer columns to improve Join performance [#6157](#) @yibin87
- Tools
  - TiDB Dashboard
    - \* Support displaying TiFlash metrics on the Monitoring page and optimize the presentation of metrics on that page [#1440](#) @YiniXu9506
    - \* Show the number of rows for results in the Slow Query list and SQL Statement list [#1443](#) @baurine
    - \* Optimize the Dashboard to not report the Alertmanager errors when Alertmanager does not exist [#1444](#) @baurine
  - Backup & Restore (BR)
    - \* Improve the mechanism for loading the metadata. The metadata is loaded into memory only when necessary, which significantly reduces the memory usage during PITR [#38404](#) @YuJuncen
  - TiCDC
    - \* Support replicating the exchange partition DDL statements [#639](#) @asddongmen
    - \* Improve non-batch sending performance for the MQ sink module [#7353](#) @hirustin
    - \* Improve performance of TiCDC puller when a table has a large number of Regions [#7078](#) [#7281](#) @sdojyy
    - \* Support reading historical data in the downstream TiDB by using the `tidb_enable_external_ts_read` variable when Syncpoint is enabled [#7419](#) @asddongmen
    - \* Enable transaction split and disable safeMode by default to improve the replication stability [#7505](#) @asddongmen
  - TiDB Data Migration (DM)
    - \* Remove the useless `operate-source update` command from dmctl [#7246](#) @buchitoudegou
    - \* Fix the issue that DM full import fails if the upstream database uses DDL statements that are incompatible with TiDB. You can create the schema of target tables in TiDB manually in advance using DDL statements supported by TiDB to ensure successful import [#37984](#) @lance6716
  - TiDB Lightning
    - \* Optimize the file scanning logic to accelerate the scan of schema files [#38598](#) @dsdashun

#### 16.7.1.4 Bug fixes

- TiDB
  - Fix the potential issue of index inconsistency that occurs after you create a new index [#38165](#) @tangenta
  - Fix a permission issue of the INFORMATION\_SCHEMA.TIKV\_REGION\_STATUS table [#38407](#) @CbcWestwolf
  - Fix the issue that the grantor field is missing in the mysql.tables\_priv table [#38293](#) @CbcWestwolf
  - Fix the issue that the join result of common table expressions might be wrong [#38170](#) @wjhuang2016
  - Fix the issue that the union result of common table expressions might be wrong [#37928](#) @YangKeao
  - Fix the issue that the information in the **transaction region num** monitoring panel is incorrect [#38139](#) @jackysp
  - Fix the issue that the system variable `tidb_constraint_check_in_place_pessimistic`  $\leftrightarrow$  might affect internal transactions. The variable scope is modified to SESSION. [#38766](#) @ekexium
  - Fix the issue that conditions in a query are mistakenly pushed down to projections [#35623](#) @Reminiscent
  - Fix the issue that the wrong isNullRejected check results for AND and OR cause wrong query results [#38304](#) @Yisaer
  - Fix the issue that ORDER BY in GROUP\_CONCAT is not considered when the outer join is eliminated, which causes wrong query results [#18216](#) @winoros
  - Fix the issue of the wrong query result that occurs when the mistakenly pushed-down conditions are discarded by Join Reorder [#38736](#) @winoros
- TiKV
  - Fix the issue that TiDB fails to start on Gitpod when there are multiple cgroup and mountinfo records [#13660](#) @tabokie
  - Fix the wrong expression of a TiKV metric tikv\_gc\_compaction\_filtered [#13537](#) @Defined2014
  - Fix the performance issue caused by the abnormal delete\_files\_in\_range [#13534](#) @tabokie
  - Fix abnormal Region competition caused by expired lease during snapshot acquisition [#13553](#) @SpadeA-Tang
  - Fix errors occurred when FLASHBACK fails in the first batch [#13672](#) [#13704](#) [#13723](#) @HuSharp
- PD
  - Fix inaccurate Stream timeout and accelerate leader switchover [#5207](#) @CabinfeverB

- TiFlash
  - Fix the OOM issue due to oversized WAL files that occurs when PageStorage GC does not clear the Page deletion marker properly [#6163](#) [@JaySon-Huang](#)
- Tools
  - TiDB Dashboard
    - \* Fix the TiDB OOM issue when querying execution plans of certain complex SQL statements [#1386](#) [@baurine](#)
    - \* Fix the issue that the Top SQL switch might not take effect when NgMonitoring loses the connection to the PD nodes [#164](#) [@zhongzc](#)
  - Backup & Restore (BR)
    - \* Fix the restoration failure issue caused by PD leader switch during the restoration process [#36910](#) [@MoCuishle28](#)
    - \* Fix the issue that the log backup task cannot be paused [#38250](#) [@joccau](#)
    - \* Fix the issue that when BR deletes log backup data, it mistakenly deletes data that should not be deleted [#38939](#) [@Leavrth](#)
    - \* Fix the issue that BR fails to delete data when deleting the log backup data stored in Azure Blob Storage or Google Cloud Storage for the first time [#38229](#) [@Leavrth](#)
  - TiCDC
    - \* Fix the issue that `sasl-password` in the `changefeed` query result is not masked [#7182](#) [@dveeden](#)
    - \* Fix the issue that TiCDC might become unavailable when too many operations in an etcd transaction are committed [#7131](#) [@asddongmen](#)
    - \* Fix the issue that redo logs might be deleted incorrectly [#6413](#) [@asddongmen](#)
    - \* Fix performance regression when replicating wide tables in Kafka Sink V2 [#7344](#) [@hi-rustin](#)
    - \* Fix the issue that checkpoint ts might be advanced incorrectly [#7274](#) [@hi-rustin](#)
    - \* Fix the issue that too many logs are printed due to improper log level of the mounter module [#7235](#) [@hi-rustin](#)
    - \* Fix the issue that a TiCDC cluster might have two owners [#4051](#) [@asddongmen](#)
  - TiDB Data Migration (DM)
    - \* Fix the issue that DM WebUI generates the wrong `allow-list` parameter [#7096](#) [@zoubingwu](#)
    - \* Fix the issue that a DM-worker has a certain probability of triggering data race when it starts or stops [#6401](#) [@liumengya94](#)
    - \* Fix the issue that when DM replicates an UPDATE or DELETE statement but the corresponding row data does not exist, DM silently ignores the event [#6383](#) [@GMHDBJD](#)

- \* Fix the issue that the `secondsBehindMaster` field is not displayed after you run the `query-status` command [#7189](#) @GMHDBJD
- \* Fix the issue that updating the checkpoint may trigger a large transaction [#5010](#) @lance6716
- \* Fix the issue that in full task mode, when a task enters the sync stage and fails immediately, DM may lose upstream table schema information [#7159](#) @lance6716
- \* Fix the issue that deadlock may be triggered when the consistency check is enabled [#7241](#) @buchitoudegou
- \* Fix the issue that task precheck requires the `SELECT` privilege for the `INFORMATION_SCHEMA` table [#7317](#) @lance6716
- \* Fix the issue that an empty TLS configuration causes an error [#7384](#) @liumengya94
- TiDB Lightning
  - \* Fix the import performance degradation when importing the Apache Parquet files to the target tables that contain the string type columns in the binary encoding format [#38351](#) @dsdashun
- TiDB Dumping
  - \* Fix the issue that Dumping might time out when exporting a lot of tables [#36549](#) @lance6716
  - \* Fix lock errors reported when consistency lock is enabled but the upstream has no target table [#38683](#) @lance6716

## 16.8 v6.3

### 16.8.1 TiDB 6.3.0 Release Notes

Release date: September 30, 2022

TiDB version: 6.3.0-DMR

Quick access: [Quick start](#) | [Installation packages](#)

In v6.3.0-DMR, the key new features and improvements are as follows:

- TiKV supports encryption at rest using the SM4 algorithm.
- TiDB supports authentication using the SM3 algorithm.
- The `CREATE USER` and `ALTER USER` statements support the `ACCOUNT LOCK/UNLOCK` option.
- JSON data type and functions become generally available (GA).
- TiDB supports null-aware anti join.
- TiDB provides execution time metrics at a finer granularity.
- A new syntactic sugar is added to simplify Range partition definitions.
- Range `COLUMNS` partitioning supports defining multiple columns.
- The performance of adding indexes is tripled.
- Reduce the impact of resource-consuming queries on the response time of lightweight queries by more than 50%.

#### 16.8.1.1 New features

##### 16.8.1.1.1 SQL

- Add a new syntactic sugar (Range `INTERVAL` partitioning) to simplify Range partition definitions (experimental) [#35683](#) [@mjonss](#)  
TiDB provides **INTERVAL partitioning** as a new way of defining Range partitions. You do not need to enumerate all partitions, which drastically reduces the length of Range partitioning DDL statements. The syntax is equivalent to that of the original Range partitioning.
- Range `COLUMNS` partitioning supports defining multiple columns [#36636](#) [@mjonss](#)  
TiDB supports **PARTITION BY RANGE COLUMNS (column\_list)**. `column_list` is no longer limited to a single column. The basic feature is the same as MySQL.
- **EXCHANGE PARTITION** becomes GA [#35996](#) [@ymkzpx](#)
- Support pushdown of two more **window functions** to TiFlash [#5579](#) [@SeaRise](#)
  - `LEAD()`
  - `LAG()`

- Provide lightweight metadata lock to improve the DML success rate during DDL change (experimental) [#37275](#) @wjuhuang2016

TiDB uses the online asynchronous schema change algorithm to support changing metadata objects. When a transaction is executed, it obtains the corresponding metadata snapshot at the transaction start. If the metadata is changed during a transaction, to ensure data consistency, TiDB returns an `Information schema is changed` error and the transaction fails to commit. To solve the problem, TiDB v6.3.0 introduces `metadata lock` into the online DDL algorithm. To avoid DML errors whenever possible, TiDB coordinates the priority of DMLs and DDLs during table metadata change, and makes executing DDLs wait for the DMLs with old metadata to commit.

- Improve the performance of adding indexes and reduce its impact on DML transactions (experimental) [#35983](#) @benjamin2037

To improve the speed of backfilling when creating an index, TiDB v6.3.0 accelerates the `ADD INDEX` and `CREATE INDEX` DDL operations when the `tidb_ddl_enable_fast_reorg`  $\rightarrow$  system variable is enabled. When the feature is enabled, the performance of adding indexes is about tripled.

#### 16.8.1.1.2 Security

- TiKV supports the SM4 algorithm for encryption at rest [#13041](#) @jiayang-zheng

Add the `SM4 algorithm` for TiKV encryption at rest. When you configure encryption at rest, you can enable the SM4 encryption capacity by setting the value of the `data-encryption-method` configuration to `sm4-ctr`.

- TiDB supports authentication with the SM3 algorithm [#36192](#) @CbcWestwolf

TiDB adds an authentication plugin `tidb_sm3_password` based on the SM3 algorithm. When this plugin is enabled, the user password is encrypted and validated using the SM3 algorithm.

- TiDB JDBC supports authentication with the SM3 algorithm [#25](#) @lastincisor

Authenticating the user password needs client-side support. Now because `JDBC supports the SM3 algorithm`, you can connect to TiDB using SM3 authentication via TiDB-JDBC.

#### 16.8.1.1.3 Observability

- TiDB provides fine-grained metrics of SQL query execution time [#34106](#) @cfzjywxk

TiDB v6.3.0 provides fine-grained data metrics for `detailed observation of execution time`. Through the complete and segmented metrics, you can clearly understand the main time consumption of SQL queries, and then quickly find key problems and save time in troubleshooting.

- Enhanced output for slow logs and TRACE statements [#34106](#) @cfzjywxk  
TiDB v6.3.0 enhances the output of slow logs and TRACE. You can observe the **full-link duration** of SQL queries from TiDB parsing to KV RocksDB writing to disk, which further enhances the diagnostic capabilities.
- TiDB Dashboard provides deadlock history information [#34106](#) @cfzjywxk  
From v6.3.0, TiDB Dashboard provides deadlock history. If you check the slow log in TiDB Dashboard and find the lock waiting time of some SQL statements to be excessively long, you can check the deadlock history to locate the root cause, which makes your diagnosis easier.

#### 16.8.1.1.4 Performance

- TiFlash changes the way of using FastScan (experimental) [#5252](#) @hongyunyan  
In v6.2.0, TiFlash introduces the FastScan feature, which brings expected performance improvements but lacks flexibility in use. Therefore, in v6.3.0, TiFlash changes **the way of using FastScan**: the ALTER TABLE ... SET TIFLASH MODE ... syntax to enable or disable FastScan is deprecated. Instead, you can use the system variable **tiflash\_fastscan** to easily control whether to enable FastScan.  
When you upgrade from v6.2.0 to v6.3.0, all FastScan settings in v6.2.0 will become invalid, but will not affect the normal reading of data. You need to set the variable **tiflash\_fastscan**. When you upgrade from v6.2.0 or an earlier version to v6.3.0, the FastScan feature is not enabled by default for all sessions to keep data consistency.
- TiFlash optimizes data scanning performance in scenarios of multiple concurrency tasks [#5376](#) @JinheLin  
TiFlash reduces duplicate reads of the same data by combining read operations of the same data. It optimizes the resource overhead and **improves the performance of data scanning in the case of concurrent tasks**. For multiple concurrent tasks, it avoids the situation where each task needs to read the same data separately, and avoids the possibility of multiple reads of the same data at the same time.  
This feature is experimental in v6.2.0, and becomes GA in v6.3.0.
- TiFlash improves performance of data replication [#5237](#) @breezewish  
TiFlash uses the Raft protocol for data replication from TiKV. Prior to v6.3.0, it often took a long time to replicate large amounts of replica data. TiDB v6.3.0 optimizes the TiFlash data replication mechanism and significantly improves the replication speed. When you use BR to recover data, use TiDB Lightning to import data, or add new TiFlash replicas, the TiFlash replicas can be replicated more quickly. You can query with TiFlash in a more timely manner. In addition, TiFlash replicas will also reach a secure and balanced state faster when you scale up, scale down, or modify the number of TiFlash replicas.

- TiFlash supports three-stage aggregation of individual `COUNT(DISTINCT)` [#37202](#) [@fixdb](#)  
TiFlash supports rewriting queries containing only one `COUNT(DISTINCT)` into a **three-stage aggregation**. This improves concurrency and performance.
- TiKV supports log recycling [#214](#) [@LykxSassinator](#)  
TiKV supports **recycling log files** in Raft Engine. This reduces the long tail latency in network disks during Raft log appending and improves performance under write workloads.
- TiDB supports null-aware anti join [#37525](#) [@Arenatlx](#)  
TiDB v6.3.0 introduces a new join type **Null-aware anti join (NAAJ)**. NAAJ can be aware of whether the collection is empty or NULL when processing collection operations. This optimizes the execution efficiency of operations such as `IN` and `= ANY` and improves SQL performance.
- Add optimizer hints to control the build end of Hash Join [#35439](#) [@Reminiscent](#)  
In v6.3.0, the TiDB optimizer introduces 2 hints, `HASH_JOIN_BUILD()` and `HASH_JOIN_PROBE()`, to specify the Hash Join, its probe end, and its build end. When the optimizer fails to select the optimal execution plan, you can use these hints to intervene with the plan.
- Support session-level common table expressions (CTE) inline [#36514](#) [@elsa0520](#)  
TiDB v6.2.0 introduced the `MERGE` hint in optimizers to allow CTE inline, so that the consumers of a CTE query result can execute it in parallel in TiFlash. In v6.3.0, a session variable `tidb_opt_force_inline_cte` is introduced to allow CTE inline in sessions. This can greatly improve the ease of use.

#### 16.8.1.1.5 Transactions

- Support deferring checks of unique constraints in pessimistic transactions [#36579](#) [@ekexium](#)  
You can use the `tidb_constraint_check_in_place_pessimistic` system variable to control when TiDB checks **unique constraints** in pessimistic transactions. This variable is disabled by default. When the variable is enabled (set to `ON`), TiDB will defer locking operations and unique constraint checks in pessimistic transactions until necessary, thus improving the performance of bulk DML operations.
- Optimize the way of fetching TSO in the Read-Committed isolation level [#36812](#) [@TonsnakeLin](#)  
In the Read-Committed isolation level, the system variable `tidb_rc_write_check_ts` is introduced to control how TSO is fetched. In the case of Plan Cache hit, TiDB improves the execution efficiency of batch DML statements by reducing the frequency of fetching TSO, and reduces the execution time of running tasks in batch.

### 16.8.1.1.6 Stability

- Reduce the impact of resource-consuming queries on the response time of lightweight queries [#13313](#) @glorv

When resource-consuming queries and lightweight queries are executed at the same time, the response time of lightweight queries is affected. In this case, to ensure the quality of transactional services, lightweight queries are expected to be processed by TiDB first. In v6.3.0, TiKV optimizes the scheduling mechanism of read requests, so that the execution time of resource-consuming queries in each round can meet expectations. This drastically reduces the impact of resource-consuming queries on the response time of lightweight queries and reduces P99 latency by more than 50% for mixed workload scenarios.

- Modify the default policy of loading statistics when statistics become outdated [#27601](#) @xuyifanggreeneyes

In v5.3.0, TiDB introduced the system variable `tidb_enable_pseudo_for_outdated_stats`  $\leftrightarrow$  to control how the optimizer behaves when the statistics become outdated. The default value is `ON`, which means keeping the behavior of the old version: When the statistics on objects that are involved in a SQL statement are outdated, the optimizer considers that statistics (other than the total number of rows on the table) are no longer reliable and uses pseudo statistics instead. After tests and analyses of actual user scenarios, the default value of `tidb_enable_pseudo_for_outdated_stats` is changed to `OFF` since v6.3.0. Even if the statistics become outdated, the optimizer will still use the statistics on the table, which makes the execution plan more stable.

- Disabling Titan becomes GA @tabokie

You can `disable Titan` for online TiKV nodes.

- Use `static` partition pruning when GlobalStats are not ready [#37535](#) @Yisaer

When `dynamic pruning` is enabled, the optimizer selects execution plans based on `GlobalStats`. Before GlobalStats are fully collected, using pseudo statistics might cause performance regression. In v6.3.0, this issue is addressed by maintaining the `static` mode if you enable dynamic pruning before GlobalStats are collected. TiDB remains in the `static` mode until GlobalStats are collected. This ensures performance stability when you change the partition pruning settings.

### 16.8.1.1.7 Ease of use

- Address the conflict between SQL-based data Placement Rules and TiFlash replicas [#37171](#) @lcwangchao

TiDB v6.0.0 provides SQL-based data Placement Rules. But this feature conflicts with TiFlash replicas due to implementation issues. TiDB v6.3.0 optimizes the implementation mechanisms, and `resolves the conflict between SQL-based data Placement Rules and TiFlash`.

#### 16.8.1.1.8 MySQL compatibility

- Improve MySQL 8.0 compatibility by adding support for four regular expression functions: `REGEXP_INSTR()`, `REGEXP_LIKE()`, `REGEXP_REPLACE()`, and `REGEXP_SUBSTR()` [#23881](#) @windtalker

For more details about the compatibility with MySQL, see [Regular expression compatibility with MySQL](#).

- The `CREATE USER` and `ALTER USER` statements support the `ACCOUNT LOCK/UNLOCK` option [#37051](#) @CbcWestwolf

When you create a user using the `CREATE USER` statement, you can specify whether the created user is locked using the `ACCOUNT LOCK/UNLOCK` option. A locked user cannot log in to the database.

You can modify the lock state of an existing user using the `ACCOUNT LOCK/UNLOCK` option in the `ALTER USER` statement.

- JSON data type and JSON functions become GA [#36993](#) @xiongjiwei

JSON is a popular data format adopted by a large number of programs. TiDB has introduced the [JSON support](#) as an experimental feature since an earlier version, compatible with MySQL's JSON data type and some JSON functions.

In TiDB v6.3.0, the JSON data type and functions become GA, which enriches TiDB's data types, supports using JSON functions in [expression indexes](#) and [generated-columns](#), and further improves TiDB's compatibility with MySQL.

#### 16.8.1.1.9 Backup and restore

- PITR supports [GCS and Azure Blob Storage](#) as backup storages @joccau

If your TiDB cluster is deployed on GCP or Azure, you can use the PITR feature after upgrading your cluster to v6.3.0.

- BR supports AWS S3 Object Lock [#13442](#) @3pointer

You can protect backup data on AWS from being tampered with or deleted by enabling [S3 Object Lock](#).

#### 16.8.1.1.10 Data migration

- TiDB Lightning supports [importing Parquet files exported by Apache Hive into TiDB](#) [#37536](#) @buchitoudegou

- DM adds a new configuration item `safe-mode-duration` [#6224](#) @okJiang

This configuration item is added to the [task configuration file](#). You can adjust the automatic safe mode duration after DM exits abnormally. The default value is 60 seconds. If `safe-mode-duration` is set to "0s", an error is reported when DM tries to enter safe mode after an abnormal restart.

#### 16.8.1.1.11 TiDB data share subscription

- TiCDC supports a deployment topology that can replicate data from multiple geo-distributed data sources [#5301](#) [@sdojyy](#)

To support replicating data from a single TiDB cluster to multiple geo-distributed data systems, starting from v6.3.0, **you can deploy TiCDC in multiple IDCs** to replicate data for each IDC. This feature helps deliver the capability of geo-distributed data replication and deployment topology.

- TiCDC supports keeping the snapshots consistent between the upstream and the downstream (sync point) [#6977](#) [@asddongmen](#)

In the scenarios of data replication for disaster recovery, TiCDC supports **periodically maintaining a downstream data snapshot** so that the downstream snapshot is consistent with the upstream snapshot. With this feature, TiCDC can better support the scenarios where reads and writes are separate, and help you lower the cost.

- TiCDC supports graceful upgrade [#4757](#) [@overvenus](#) [@3AceShowHand](#)

When TiCDC is deployed using **TiUP** ( $\geq v1.11.0$ ) or **TiDB Operator** ( $\geq v1.3.8$ ), you can gracefully upgrade the TiCDC cluster. During the upgrade, data replication latency is kept as low as 30 seconds. This improves stability, empowering TiCDC to better support latency-sensitive applications.

#### 16.8.1.2 Compatibility changes

##### 16.8.1.2.1 System variables

Variable name	Change type	Description
<code>default_authentication_plugin</code>	Modified	Adds
↔		a new option <code>tidb_sm3_password</code>
↔		.
		When this variable is set to <code>tidb_sm3_password</code>
↔		, SM3 is used as the encryption algorithm.

Variable name	Change type	Description
<code>sql_re</code>	Newly Controls	<code>key</code>
<code>↪</code>	added	whether to enforce the requirement that a table has a primary key. After this variable is enabled, attempting to create or alter a table without a primary key will produce an er-

Variable name	Change type	Description
<code>tidb_newly_controls</code>	Added	Added the <code>tidb_newly_controls</code> variable.
<code>tidb_apply_control_read_threshold</code>	Added	Added the <code>tidb_apply_control_read_threshold</code> variable. This variable controls the TiDB server's preference to send read requests to the replica in the same region as the TiDB server when <code>tidb_replica_read</code> is set to <code>closest</code> .
		→ -
		→ adaptive
		→ .

Variable name	Change type	Description
<code>tidb_newly_controls</code>		
<code>tidb_check_in_place_pessimistic</code>		
↔	added	when TiDB checks unique constraints in pessimistic transactions.

Variable name	Change type	Description
<code>tidb_ddl_enable_fast_reorg</code>	Added	Effect only when <code>tidb_ddl_enable_fast_reorg</code> is enabled. It sets the usage limit of local storage during backfilling when creating an index.

Variable name	Change type	Description
<code>tidb_new_collation_reorg</code>	added	whether to enable the acceleration of ADD INDEX and CREATE INDEX DDL operations to improve the speed of back-filling when creating an index.

Variable name	Change type	Description
<code>tidb_new_flashback_concurrency</code>	Newly Added	<p>↪ added the concurrency of flashback</p> <p>↪ cluster</p> <p>↪ .</p> <p>The feature controlled by this variable is not fully functional in TiDB v6.3.0. Do not change the default value.</p>

Variable name	Change type	Description
<code>tidb_enable_exchange_partition</code>	Deprecated	Controls whether to enable the exchange partitions with tables feature. The default value is ON, that is, exchange partitions with tables is enabled by default.

Variable name	Change type	Description
<code>tidb_enable_foreign_key</code>	Newly Controls	<p>added whether to enable the FOREIGN KEY feature. The feature controlled by this variable is not fully functional in TiDB v6.3.0. Do not change the default value.</p>

Variable name	Change type	Description
tidb_enable_general_plan_cache	Added	whether to enable the General Plan Cache feature. The feature controlled by this variable is not fully functional in TiDB v6.3.0. Do not change the default value.

---

Variable name	Change type	Description
<code>tidb_enable_newly_specified_meta_lock</code>	↔	added whether to enable the Meta-data lock feature.

Variable name	Change type	Description
<code>tidb_enable_newly_controls_aware_anti_join</code>	↪ added	whether TiDB applies Null-Aware Hash Join when Anti Join is generated by sub-queries led by special set operators NOT ↪ ↪ IN ↪ and != ↪ ALL ↪ .

---

Variable name	Change type	Description
---------------	-------------	-------------

---

<code>tidb_enable_optimizations_for_outdated_stats</code>		
-----------------------------------------------------------	--	--

↪ the behavior of the optimizer on using statistics of a table when the statistics are outdated. The default value changes from ON to OFF, which means the optimizer still keeps using the statistics of the

Variable name	Change type	Description
<code>tidb_enable_dynamic_memory_control</code>	Modify	whether to enable the dynamic memory control feature for the operator that reads data. When this variable is set to ON, the memory usage might not be under the control of <code>tidb_mem_quota_query</code> .
		There-

Variable name	Change type	Description
<code>tidb_enable_control_read_for_write_stmt</code>	Newly Control	added whether read requests in SQL write statements are pushed down to TiFlash. The feature controlled by this variable is not fully functional in TiDB v6.3.0. Do not change the default value.

Variable name	Change type	Description
<code>tidb_enable_newly_generated_columns_substitute</code>	Added	whether to replace expressions with generated columns in an unsafe way.

Variable name	Change type	Description
<code>tidb_general_plan_cache_size</code>	Added	<p>↪ added the maximum number of execution plans that can be cached by General Plan Cache. The feature controlled by this variable is not fully functional in TiDB v6.3.0. Do not change the default value.</p>

Variable name	Change type	Description
<code>tidb_newly_read_replayer_token</code>	added	only used to obtain the result of the last PLAN execution in the current session.
		↪
		↪ REPLAYER
		↪
		↪ DUMP
		↪

Variable name	Change type	Description
<code>tidb_newly_added_rows_size</code>	Newly added	This variable is used to set the minimum number of rows during the coprocessor paging request process.

Variable name	Change type	Description
<code>tidb_newly_controls_cte</code>	↔	added whether common table expressions (CTEs) in the entire session are in-lined or not. The default value is <b>OFF</b> , which means that in-lining CTE is not enforced by default.

Variable name	Change type	Description
<code>tidb_on_newly_specified_distinct_agg</code>	Added	Whether to rewrite a COUNT (DISTINCT) aggregation into a three-stage aggregation in MPP mode. The default value is ON.

Variable name	Change type	Description
<code>tidb_enable_dynamic_pruning</code>	Modified	Specifies whether to enable dynamic pruning. Since v6.3.0, the default value changes to <code>dynamic</code> .

Variable name	Change type	Description
---------------	-------------	-------------

<code>tidb_read_consistency</code>	Added	
------------------------------------	-------	--

`tidb_read_consistency`  
 → for optimizing the times-tamp acquisition, which is suitable for scenarios with read-committed isolation level where read-write conflicts are rare. This feature is oriented to specific service workloads

---

Variable name	Change type	Description
---------------	-------------	-------------

---

<code>tidb_newly_used_check_ts</code>	Newly Used	
---------------------------------------	------------	--

↪ added for optimizing the acquisition of timestamps and is suitable for scenarios with few point-write conflicts in RC isolation level of pessimistic transactions. Enabling this variable can avoid the

Variable name	Change type	Description
<code>tiflash</code>	Newly Controls	added whether to enable FastScan. If FastScan is enabled (set to ON), TiFlash provides more efficient query performance, but does not guarantee the accuracy of the query results or data consistency.

Variable	Change
name	type Description

#### 16.8.1.2.2 Configuration file parameters

---

Configuration file	Change type	Description
--------------------	-------------	-------------

---

Configuration file	Change type	Description
--------------------	-------------	-------------

---

TiDB **temp** Newly Specifies

↪ - added the

↪ **dir** file

↪ sys-tem lo-cation used by TiDB to store temporary data. If a feature requires local storage in TiDB nodes, TiDB stores the corresponding temporary data in this location.

---

Configuration file	Change Configuration	Description

### 16.8.1.2.3 Others

- Log backup supports GCS and Azure Blob Storage as backup storage.
- Log backup is now compatible with the `exchange partition` DDL.
- The SQL statement `ALTER TABLE ...SET TiFLASH MODE ...` previously used for enabling `fastscan` is deprecated, and replaced by the system variable `tiflash_fastscan`. When you upgrade from v6.2.0 to v6.3.0, all FastScan settings in v6.2.0 will become invalid, but will not affect the normal reading of data. In this case, you need to configure the variable `tiflash_fastscan` to enable or disable FastScan. When you upgrade from an earlier version to v6.3.0, the FastScan feature is not enabled by default for all sessions to keep data consistent.
- To deploy TiFlash under the Linux AMD64 architecture, the CPU must support the AVX2 instruction set. Ensure that `cat /proc/cpuinfo | grep avx2` has output. To deploy TiFlash under the Linux ARM64 architecture, the CPU must support the ARMv8 instruction set architecture. Ensure that `cat /proc/cpuinfo | grep ↔ 'crc32' | grep 'asimd'` has output. By using the instruction set extensions, TiFlash's vectorization engine can deliver better performance.

- The minimum version of HAProxy that works with TiDB is now v1.5. HAProxy versions between v1.5 and v2.1 now require the `post-41` configuration option to be set in `mysql-check`. It is recommended to use HAProxy v2.2 or newer.

### 16.8.1.3 Removed feature

Since v6.3.0, TiCDC no longer supports configuring Pulsar sink. `kop` provided by StreamNative can be used as an alternative.

### 16.8.1.4 Improvements

- TiDB
  - TiDB is now case-insensitive to the target table name when checking the table existence [#34610](#) @tiancaiaobao
  - Improve MySQL compatibility by adding a parsing check when setting the value of `init_connect` [#35324](#) @CbcWestwolf
  - Improve the log warning generated for new connections [#34964](#) @xiongjiwei
  - Optimize the HTTP API for querying DDL history jobs, and add support for the `start_job_id` parameter [#35838](#) @tiancaiaobao
  - Report errors when the JSON path has wrong syntax [#22525](#) [#34959](#) @xiongjiwei
  - Improve the performance of Join operations by fixing a false sharing issue [#37641](#) @gengliqi
  - Support exporting the execution plan information of multiple SQL statements at a time using `PLAN REPLAYER`, which makes troubleshooting more efficient [#37798](#) @Yisaer
- TiKV
  - Support configuring the `unreachable_backoff` item to avoid Raftstore broadcasting too many messages after one peer becomes unreachable [#13054](#) @5kbpers
  - Improve the fault tolerance of TSO service [#12794](#) @pingyu
  - Support dynamically modifying the number of sub-compaction operations performed concurrently in RocksDB (`rocksdb.max-sub-compactions`) [#13145](#) @ethercflow
  - Optimize the performance of merging empty Regions [#12421](#) @tabokie
  - Support more regular expression functions [#13483](#) @gengliqi
  - Support automatically adjusting the thread pool size based on the CPU usage [#13313](#) @glorv
- PD
  - Improve the query of the TiKV IO MBps metric in TiDB Dashboard [#5366](#) @YiniXu9506

- Modify the URL in TiDB Dashboard from `metrics` to `monitoring` #5366 @YiniXu9506
- TiFlash
  - Support pushing down the `elt` function to TiFlash #5104 @Willendless
  - Support pushing down the `leftShift` function to TiFlash #5099 @AnnieoftheStars
  - Support pushing down the `castTimeAsDuration` function to TiFlash #5306 @AntiTopQuark
  - Support pushing down the `HexIntArg/HexStrArg` function to TiFlash #5107 @YangKeao
  - Refactor TiFlash’s interpreter, and support the new interpreter Planner #4739 @SeaRise
  - Improve the accuracy of memory tracker in TiFlash #5609 @bestwoody
  - Improve the performance of string columns with the `UTF8_BIN/ASCII_BIN/↔ LATIN1_BIN/UTF8MB4_BIN` collations #5294 @solotzg
  - Calculate the I/O throughput in background in ReadLimiter #5401, #5091 @Lloyd-Pottiger
- Tools
  - Backup & Restore (BR)
    - \* PITR can merge small files generated in log backup, which greatly reduces the number of backup files #13232 @Leavrth
    - \* PITR supports automatically configuring the number of TiFlash replicas based on the upstream cluster configuration after the restoration #37208 @YuJuncen
  - TiCDC
    - \* Improve TiCDC’s compatibility with the concurrent DDL framework introduced in the upstream TiDB #6506 @lance6716
    - \* Support logging `start ts` of DML statements when MySQL sink gets an error #6460 @overvenus
    - \* Enhance the `api/v1/health` API to return a more accurate health state of a TiCDC cluster #4757 @overvenus
    - \* Implement MQ sink and MySQL sink in the asynchronous mode to improve the sink throughput #5928 @hicqu @hi-rustin
    - \* Delete the deprecated pulsar sink #7087 @hi-rustin
    - \* Improve replication performance by discarding DDL statements that are irrelevant to a changefeed #6447 @asddongmen
  - TiDB Data Migration (DM)
    - \* Improve compatibility with MySQL 8.0 as data source #6448 @lance6716
    - \* Optimize DDL by executing DDL asynchronously when encounter “invalid connection” #4689 @lyzx2001

- TiDB Lightning
  - \* Add query parameters for S3 external storage URL to support accessing the S3 data in another account by assuming a given role [#36891](#) @dsdashun

### 16.8.1.5 Bug fixes

- TiDB
  - Fix the issue that the privilege check is skipped for PREPARE statements [#35784](#) @lcwangchao
  - Fix the issue that the system variable `tidb_enable_noop_variable` can be set to WARN [#36647](#) @lcwangchao
  - Fix the issue that when an expression index is defined, the `ORDINAL_POSITION` column of the `INFORMATION_SCHEMA.COLUMNS` table might be incorrect [#31200](#) @bb7133
  - Fix the issue that TiDB does not report an error when the timestamp is larger than `MAXINT32` [#31585](#) @bb7133
  - Fix the issue that TiDB server cannot be started when the enterprise plugin is used [#37319](#) @xhebox
  - Fix the incorrect output of `SHOW CREATE PLACEMENT POLICY` [#37526](#) @xhebox
  - Fix the unexpected `EXCHANGE PARTITION` behaviors with temporary tables [#37201](#) @lcwangchao
  - Fix the issue that querying `INFORMATION_SCHEMA.TIKV_REGION_STATUS` returns an incorrect result @zimulala
  - Fix the issue that the `EXPLAIN` query on views does not check privileges [#34326](#) @hawkingrei
  - Fix the issue that JSON `null` cannot be updated to `NULL` [#37852](#) @YangKeao
  - Fix the issue that `row_count` of DDL jobs is inaccurate [#25968](#) @Defined2014
  - Fix the issue that `FLASHBACK TABLE` does not work properly [#37386](#) @tiancaiamao
  - Fix the issue of failing to handle prepared statement flags in the typical MySQL protocol [#36731](#) @dveeden
  - Fix the issue of incorrect TiDB status that might appear on startup in some extreme cases [#36791](#) @xhebox
  - Fix the issue that `INFORMATION_SCHEMA.VARIABLES_INFO` does not comply with security enhanced mode (SEM) [#37586](#) @CbcWestwolf
  - Fix the issue that casting string to string goes wrong in queries with `UNION` [#31678](#) @cbwestwolf
  - Fix the wrong result that occurs when enabling dynamic mode in partitioned tables for TiFlash [#37254](#) @wshwsh12
  - Fix the issue that the cast and comparison between binary strings and JSON in TiDB are incompatible with MySQL [#31918](#) [#25053](#) @YangKeao
  - Fix the issue that `JSON_OBJECTAGG` and `JSON_ARRAYAGG` in TiDB are not compatible with MySQL on binary values [#25053](#) @YangKeao

- Fix the issue that the comparison between JSON opaque values causes panic [#37315](#) @YangKeao
  - Fix the issue that the single precision float cannot be used in JSON aggregation functions [#37287](#) @YangKeao
  - Fix the issue that the UNION operator might return unexpected empty result [#36903](#) @tiancaiamao
  - Fix the issue that the result of the `castRealAsTime` expression is inconsistent with MySQL [#37462](#) @mengxin9014
  - Fix the issue that pessimistic DML operations lock non-unique index keys [#36235](#) @ekexium
  - Fix the issue that `auto-commit` change affects transaction commit behaviours [#36581](#) @cfzjywxk
  - Fix the issue that the EXPLAIN ANALYZE statement with DML executors might return result before the transaction commit finishes [#37373](#) @cfzjywxk
  - Fix the issue that the UPDATE statements incorrectly eliminate the projection in some cases, which causes the `Can't find column` error [#37568](#) @AilinKid
  - Fix the issue that the Join Reorder operation will mistakenly push down its Outer Join condition [#37238](#) @AilinKid
  - Fix the issue that the IN and NOT IN subqueries in some patterns report the `Can't find column` error [#37032](#) @AilinKid
  - Fix the issue that `Can't find column` is reported if an UPDATE statement contains common table expressions (CTE) [#35758](#) @AilinKid
  - Fix incorrect PromQL [#35856](#) @Defined2014
- TiKV
    - Fix the issue that PD does not reconnect to TiKV after the Region heartbeat is interrupted [#12934](#) @bufferflies
    - Fix the issue that Regions might be overlapped if Raftstore is busy [#13160](#) @5kbpers
    - Fix the issue that the PD client might cause deadlocks [#13191](#) @bufferflies [#12933](#) @BurtonQin
    - Fix the issue that TiKV might panic when encryption is disabled [#13081](#) @jiayang-zheng
    - Fix the wrong expression of Unified Read Pool CPU in Dashboard [#13086](#) @glorv
    - Fix the issue that the TiKV service is unavailable for several minutes when a TiKV instance is in an isolated network environment [#12966](#) @cosven
    - Fix the issue that TiKV mistakenly reports a `PessimisticLockNotFound` error [#13425](#) @sticnarf
    - Fix the issue that PITR might cause data loss in some situations [#13281](#) @YuJuncen
    - Fix the issue that causes checkpoint not advanced when there are some long pessimistic transactions [#13304](#) @YuJuncen

- Fix the issue that TiKV does not distinguish the datetime type (DATETIME, DATE, TIMESTAMP and TIME) and STRING type in JSON [#13417](#) @YangKeao
- Fix incompatibility with MySQL of comparison between JSON bool and other JSON value [#13386](#) [#37481](#) @YangKeao
- PD
  - Fix PD panics caused by the issue that gRPC handles errors inappropriately when `enable-forwarding` is enabled [#5373](#) @bufferflies
  - Fix the issue that unhealthy Region might cause PD panic [#5491](#) @nolouch
  - Fix the issue that the TiFlash learner replica might not be created [#5401](#) @HunDunDM
- TiFlash
  - Fix the issue that a window function might cause TiFlash to crash when the query is canceled [#5814](#) @SeaRise
  - Fix the issue that wrong data input for `CAST(value AS DATETIME)` causing high TiFlash sys CPU [#5097](#) @xzhangxian1008
  - Fix the issue that the result of `CAST(Real/Decimal AS time)` is inconsistent with MySQL [#3779](#) @mengxin9014
  - Fix the issue that some obsolete data in storage cannot be deleted [#5570](#) @JaySon-Huang
  - Fix the issue that page GC might block creating tables [#5697](#) @JaySon-Huang
  - Fix the panic that occurs after creating the primary index with a column containing the NULL value [#5859](#) @JaySon-Huang
- Tools
  - Backup & Restore (BR)
    - \* Fix the issue that might cause the information of the checkpoint being stale [#36423](#) @YuJuncen
    - \* Fix the issue that the regions are not balanced because the concurrency is set too large during the restoration [#37549](#) @3pointer
    - \* Fix the issue that might cause log backup checkpoint TS stuck when TiCDC exists in the cluster [#37822](#) @YuJuncen
    - \* Fix the issue that might lead to backup and restoration failure if special characters exist in the authorization key of external storage [#37469](#) [@MoCuishle28](https://github.com/MoCuishle28)
  - TiCDC
    - \* Fix the issue that TiCDC returns an inaccurate error for a wrong PD address with a `grpc` service [#6458](#) @crelax
    - \* Fix the issue that the `cdc cause cli changefeed list` command does not return failed changefeeds [#6334](#) @asddongmen

- \* Fix the issue that TiCDC is unavailable when changefeed initialization fails [#6859](#) @asddongmen
- TiDB Binlog
  - \* Fix the issue that Drainer cannot send requests correctly to Pump when compressor is set to gzip [#1152](#) @lichunzhu
- TiDB Data Migration (DM)
  - \* Fix the issue that DM reports the Specified key was too long error [#5315](#) @lance6716
  - \* Fix goroutine leak when relay meets an error [#6193](#) @lance6716
  - \* Fix the issue that when `collation_compatible` is set to "strict", DM might generate SQL with duplicated collations [#6832](#) @lance6716
  - \* Reduce the appearance of the warning message “found error when get time-zone from binlog status\_vars” in DM-worker log [#6628](#) @lyzx2001
  - \* Fix the issue that latin1 data might be corrupted during replication [#7028](#) @lance6716
- TiDB Lightning
  - \* Fix the issue that TiDB Lightning does not support columns starting with slash, number, or non-ascii characters in Parquet files [#36980](#) @D3Hunter

### 16.8.1.6 Contributors

We would like to thank the following contributors from the TiDB community:

## 16.9 v6.2

### 16.9.1 TiDB 6.2.0 Release Notes

Release date: August 23, 2022

TiDB version: 6.2.0-DMR

#### Note:

The TiDB 6.2.0-DMR documentation has been [archived](#). PingCAP encourages you to use [the latest LTS version](#) of the TiDB database.

In v6.2.0-DMR, the key new features and improvements are as follows:

- TiDB Dashboard supports [visual execution plans](#), allowing more intuitive display of execution plans.
- Add a [Monitoring page](#) in TiDB Dashboard to make the performance analysis and tuning more efficient.
- The [Lock View](#) of TiDB feature supports showing the waiting information of optimistic transactions, facilitating quick locating of lock conflicts.
- TiFlash supports [a newer version of storage format](#), enhancing stability and performance.
- The [Fine Grained Shuffle feature](#) allows parallel execution of window functions in multiple threads.
- A new concurrent DDL framework: Less DDL statements blocked and higher execution efficiency.
- TiKV supports [automatically tuning the CPU usage](#), thus ensuring stable and efficient database operations.
- [Point-in-time recovery \(PITR\)](#) is introduced to restore a snapshot of a TiDB cluster to a new cluster from any given time point in the past.
- TiDB Lightning supports [pausing the scheduling on the table level](#) in the physical import mode, instead of on the cluster level.
- BR supports [restoring user and privilege data](#), making backup and restore smoother.
- TiCDC unlocks more data replication scenarios by supporting [filtering specific types of DDL events](#).
- The [SAVEPOINT mechanism](#) is supported, with which you can flexibly control the roll-back points within a transaction.
- TiDB supports [adding, dropping, and modifying multiple columns or indexes with only one ALTER TABLE statement](#).
- [Cross-cluster RawKV replication](#) is now supported.

#### 16.9.1.1 New features

### 16.9.1.1.1 SQL

- The physical data compaction feature is GA

The TiFlash backend automatically compacts physical data based on specific conditions to reduce the backlog of useless data and optimize the data storage structure.

There is often a certain amount of useless data in TiFlash tables before data compaction is automatically triggered. This feature lets you choose the right timing and manually execute SQL statements to immediately compact the physical data in TiFlash, thus reducing storage space usage and improving query performance. This feature is experimental in TiDB v6.1, and now is in General Availability (GA) in TiDB v6.2.0.

[User document #4145](#) @breezewish

### 16.9.1.1.2 Observability

- Split TiDB Dashboard from PD

TiDB Dashboard is moved from PD to the monitoring node. This reduces the impact of TiDB Dashboard on PD and makes PD more stable.

[@Hawkson-jee](#)

- TiDB Dashboard adds a Monitoring page

The new Monitoring page shows key indicators required for performance tuning, based on which you can analyze and tune performance with reference to [Performance tuning by database time](#).

Specifically, you can analyze user response time and database time from a global and top-down perspective, to confirm whether the bottleneck in user response time is caused by database issues. If the bottleneck is in the database, you can use the database time overview and SQL latency breakdowns to identify the bottleneck and tune performance.

[User document #1381](#) @YiniXu9506

- TiDB Dashboard supports visual execution plans

TiDB Dashboard provides visual execution plans and basic diagnosis service through the SQL Statements and Monitoring pages. This feature offers a fresh new perspective for you to identify each step of a query plan. Therefore, you can learn all traces of query execution plans more intuitively.

This feature is particularly useful when you are trying to learn the execution of complex and large queries. Meanwhile, for each query execution plan, TiDB Dashboard automatically analyzes the execution details, spots potential problems, and provides optimization suggestions to reduce the time required for executing specific query plans.

[User document #1224](#) @time-and-fate

- Lock View supports showing the waiting information of optimistic transactions

Too many lock conflicts might cause serious performance problems, and detecting the lock conflicts is a necessary way to troubleshoot such problems. Before v6.2.0, TiDB supported viewing the lock conflict relationships using the `INFORMATION_SCHEMA`  $\leftrightarrow$  `.DATA_LOCK_WAITS` system view, but it does not show the waiting information of optimistic transactions. TiDB v6.2.0 extends the `DATA_LOCK_WAITS` view and lists the optimistic transactions blocked by pessimistic locks in the view. This feature helps users detect lock conflicts quickly, and provides a basis for improving the application, thus reducing the frequency of lock conflicts and improving the overall performance.

[User document #34609](#) @longfangsong

### 16.9.1.1.3 Performance

- Improve the `LEADING` optimizer hint to support outer join ordering

In v6.1.0, the optimizer hint `LEADING` was introduced to modify the join order of tables. But this hint was not applicable to queries that contain outer joins. For more information, see [LEADING document](#). In v6.2.0, TiDB lifts this restriction. In a query that contains outer join, now you can use this hint to specify the join order of tables to get better SQL execution performance and to avoid the sudden change of execution plans.

[User document #29932](#) @Reminiscent

- Add a new optimizer `SEMI_JOIN_REWRITE` to improve the performance of `EXISTS` queries

In some scenarios, queries with `EXISTS` cannot have the optimal execution plan and might be executed for too long. In v6.2.0, the optimizer adds rewriting rules for such scenarios, and you can use `SEMI_JOIN_REWRITE` in queries to forcibly make the optimizer rewrite the query and get better query performance.

[User document #35323](#) @winoros

- Add a new optimizer hint `MERGE` to improve the performance of analytical queries

Common table expression (CTE) is an effective way to simplify the query logic. It is widely used to write complex queries. Before v6.2.0, CTE cannot be automatically expanded in TiFlash environments, which, to some extent, limits the execution efficiency of MPP. In v6.2.0, a MySQL-compatible optimizer hint `MERGE` is introduced. With this hint, the optimizer now allows CTE inlines to be expanded, so that the consumers of the CTE query results can concurrently execute the query in TiFlash, which improves the performance of some analytical queries.

[User document #36122](#) @dayicklp

- Optimize the performance of aggregation operations in some analytical scenarios

When you use TiFlash to perform aggregation operations on a column in an OLAP scenario, if serious data skew exists due to uneven distribution of the aggregated column, and if the aggregated column has many different values, the execution efficiency of `COUNT(DISTINCT)` queries on the column is low. In v6.2.0, new rewriting rules are introduced to improve the performance of `COUNT(DISTINCT)` queries on a single column.

[User document #36169](#) @fixdb

- TiDB supports concurrent DDL operations

TiDB v6.2.0 introduces a new concurrent DDL framework, which enables DDL statements to be concurrently executed on different table objects and fixes the issue that DDL operations are blocked by DDL operations on other tables. In addition, TiDB supports concurrent DDL execution when adding an index on multiple tables or changing a column type. This improves the efficiency of DDL execution.

[#32031](#) @wjhuang2016

- Optimizer enhances the estimation of string matching

In the string matching scenario, if the optimizer cannot accurately estimate the number of rows, it affects the generation of the optimal execution plan. For example, the condition is `like '%xyz'` or using a regular expression `regex ()`. To improve the estimation accuracy in such scenarios, TiDB v6.2.0 enhances the estimation method. The new method combines the TopN information of statistics and system variables to improve the accuracy and makes it possible to modify the match selectivity manually, thus improving the SQL performance.

[User document #36209](#) @time-and-fate

- Window functions pushed down to TiFlash can be executed in multiple threads

After the Fine Grained Shuffle feature is enabled, window functions can be executed in multiple threads, instead of in a single thread. This feature reduces the query response time significantly without changing user behavior. You can control the granularity of the shuffle by adjusting the value of the variables.

[User document #4631](#) @guo-shaoge

- TiFlash supports a newer version of storage format

The new storage format relieves high CPU usage caused by GC in high-concurrency and heavy workload scenarios. This significantly reduces IO traffic of background tasks, thereby boosting stability under high concurrencies and heavy workloads. At the same time, space amplification and disk waste can be significantly reduced.

In TiDB v6.2.0, data is stored in the new storage format by default. Note that if TiFlash is upgraded from earlier versions to v6.2.0, you cannot perform in-place downgrade on TiFlash, because earlier TiFlash versions cannot recognize the new storage format.

For more information about upgrading TiFlash, see [TiFlash v6.2.0 Upgrade Guide](#).

[User document #3594](#) @JaySon-Huang @lidezhu @jiaqizho

- TiFlash optimizes data scanning performance in multiple concurrency scenarios (experimental)

TiFlash reduces duplicate reads of the same data by merging read operations of the same data, and optimizes the resource overhead in the case of multiple concurrent tasks to improve data scanning performance. It avoids the situation where the same data has to be read separately in each task, or even the same data may be read multiple times at the same time, if the same data is involved in multiple concurrent tasks.

[User document #5376](#) @JinheLin

- TiFlash adds FastScan for data scanning to increase read and write speed by sacrificing data consistency (experimental)

TiDB introduces FastScan in v6.2.0. It supports skipping consistency checks to increase the speed significantly. FastScan is suitable for scenarios that do not require high accuracy and consistency of data such as offline analysis tasks. Previously, to ensure data consistency, TiFlash needed to perform data consistency checks during the data scanning process to find the required data from multiple different versions.

When you upgrade from an earlier version to TiDB v6.2.0, FastScan is not enabled by default for all tables, which ensures data consistency. You can enable FastScan for each table independently. If the table is set to FastScan in TiDB v6.2.0, it will be disabled when you downgrade to a lower version, but this does not affect the normal data read. In this case, it is equivalent to strong consistency read.

[User document #5252](#) @hongyunyan

#### 16.9.1.1.4 Stability

- TiKV supports automatically tuning the CPU usage (experimental)

Databases usually have background processes to perform internal operations. Statistical information can be collected to help identify performance problems, generate better execution plans, and improve the stability and performance of the database. However, how to more efficiently collect information, and how to balance the resource overhead of background operations and foreground operations without affecting the daily use have always been one of the headaches in the database industry.

Starting from v6.2.0, TiDB supports setting the CPU usage rate of background requests using the TiKV configuration file, thereby limiting the CPU usage ratio of background operations such as automatically collecting statistics in TiKV, and avoiding the resource preemption of user operations by background operations in extreme cases. This ensures that the operations of the database are stable and efficient.

At the same time, TiDB also supports automatically adjusting CPU usage. Then, TiKV will adaptively adjust the CPU resources occupied by background requests according to the CPU usage of the instance. This feature is disabled by default.

[User document #12503](#) @BornChanger

#### 16.9.1.1.5 Ease of use

- TiKV supports listing detailed configuration information using command-line flags

The TiKV configuration file can be used to manage TiKV instances. However, for instances that run for a long time and are managed by different users, it is difficult to know which configuration item has been modified and what the default value is. This might cause confusion when you upgrade the cluster or migrate data. Since TiDB v6.2.0, `tikv-server` supports a new command-line flag `--config-info` that lists default and current values of all TiKV configuration items, helps users to quickly verify the startup parameters of the TiKV process, and improves usability.

[User document #12492](#) @glorv

#### 16.9.1.1.6 MySQL compatibility

- TiDB supports modifying multiple columns or indexes in a single `ALTER TABLE` statement

Before v6.2.0, TiDB only supports single DDL changes, which leads to incompatible DDL operations when migrating heterogeneous databases, and it takes extra effort to modify a complex DDL statement into multiple TiDB-supported simple DDL statements. In addition, some users rely on the ORM framework to create assembly in SQL, thus causing SQL incompatibility. Since v6.2.0, TiDB supports modifying multiple schema objects in a single SQL statement, which is convenient for users to implement SQL and improves usability.

[User document #14766](#) @tangenta

- Support setting savepoints in transactions

A transaction is a logical collection of a series of consecutive operations with which the database guarantees ACID properties. In some complex application scenarios, you might need to manage many operations in a transaction, and sometimes you might need to roll back some operations in the transaction. “Savepoint” is a nameable mechanism for the internal implementation of transactions. With this mechanism, you can flexibly control the rollback points within a transaction, thereby managing the more complex transactions and having more freedom in designing diverse applications.

[User document #6840](#) @crazyys520

#### 16.9.1.1.7 Data migration

- BR supports restoring user and privilege data

BR supports restoring user and privilege data when it performs a normal restoration. You do not need any additional restoration plan to restore user and privilege data. To enable this feature, specify the `--with-sys-table` parameter when you use BR to restore data.

[User document #35395](#) @D3Hunter

- Support point-in-time recovery (PITR) based on backup and restoration of log and snapshot

PITR is implemented based on the backup and restoration of log and snapshot. It allows you to restore the snapshots of a cluster at any point in history to a new cluster. This feature satisfies the following needs:

- Reduce the RPO in disaster recovery to less than 20 minutes.
- Handle the cases of incorrect writes from applications by, for example, rolling back data to before the error event.
- Perform history data auditing to meet the requirements of laws and regulations.

This feature has usage limitations. For details, refer to the user document.

[User document #29501](#) @joccau

- DM supports continuous data validation (experimental)

Continuous data validation is used to continuously compare the upstream binlog with the data written into the downstream during data migration. The validator identifies data exceptions, such as inconsistent data and missing records.

This feature solves the issues of lagging validation and excessive resource consumption in common full data validation schemes.

[User document #4426](#) @D3Hunter @buchitoudegou

- Automatically identify the region of Amazon S3 buckets

Data migration tasks can automatically identify the region of Amazon S3 buckets. You do not need to explicitly pass the region parameter.

[#34275](#) @WangLe1321

- Support configuring disk quota for TiDB Lightning (experimental)

When TiDB Lightning imports data in the physical import mode (`backend='local'`), `sorted-kv-dir` must have enough space to store the source data. Insufficient disk space might cause the import task to fail. Now you can use the new `disk_quota` configuration to limit the total amount of disk space used by TiDB Lightning, so that the import task can be completed normally even when `sorted-kv-dir` does not have enough storage space.

[User document #446](#) @buchitoudegou

- TiDB Lightning supports importing data to production clusters in the physical import mode

Previously, the physical import mode of TiDB Lightning (`backend='local'`) had a significant impact on the target cluster. For example, during the migration, PD global scheduling is paused. Therefore, the previous physical import mode is only suitable for initial data import.

TiDB Lightning improves the existing physical import mode. By allowing pausing the scheduling of tables, the impact of import is reduced from cluster level to table level. That is, you can read and write tables that are not being imported.

This feature does not need manual configuration. If your TiDB cluster is v6.1.0 or later versions and TiDB Lightning is v6.2.0 or later versions, the new physical import mode takes effect automatically.

[User document #35148 @gozssky](#)

- Refactor the [user documentation of TiDB Lightning](#) to make its structure more reasonable and clear. The terms for “backend” is also modified to lower the understanding barrier for new users:
  - Replace “local backend” with “physical import mode”.
  - Replace “tidb backend” with “logical import mode”.

#### 16.9.1.1.8 TiDB data share subscription

- Support cross-cluster RawKV replication (experimental)

Support subscribing to the data change of RawKV and replicating the data change to a downstream TiKV cluster in real-time using a new component TiKV-CDC, which makes the cross-cluster replication possible.

[User document #11965 @pingyu](#)

- Support filtering DDL and DML events

In some special occasions, you might want to set filter rules for incremental data change logs. For example, filtering high risk DDL events such as DROP TABLE. Starting from v6.2.0, TiCDC supports filtering DDL events of specified types and filtering DML events based on SQL expressions. This makes TiCDC applicable to more data replication scenarios.

[User document #6160 @asddongmen](#)

### 16.9.1.2 Compatibility changes

#### 16.9.1.2.1 System variables

---

Variable name	Change type	Description
<code>tidb_enable_cost_interface</code>	Newly added variable	This controls whether to enable the refactored Cost Model implementation.

Variable name	Change type	Description
<code>tidb_cost_model_version</code>	Newly added	TiDB v6.2.0 introduces the Cost Model Version 2, which uses a cost model to choose an index and operator during physical optimization. This variable is used to select the cost model version. TiDB v6.2.0 introduces the Cost Model Version 2, which

Variable name	Change type	Description
tidb_enable_newly_added_variables_controls	Whether to allow TiDB to use concurrent DDL statements.	DO NOT modify this variable. The risk of disabling this variable is unknown and might corrupt the meta-data of the cluster.

---

Variable name	Change type	Description
<code>tiflash_newly_pushed_shuffle_stream_count</code>	Newly added	This variable controls the concurrency level of the window function execution. When the window function is pushed down to TiFlash for execution.

Variable name	Change type	Description
<code>tiflash_newly_added</code>	Newly added	When <code>shuffle_batch_size</code> is enabled, the window function pushed down to TiFlash can be executed in parallel. This variable controls the batch size of the data sent by the sender. The sender will send data once the

---------------	-------------	-------------

---

tidb_newly_this_match_selectivity	Newly This	
-----------------------------------	------------	--

added variable is used to set the default selectivity of like  $\rightarrow$ , rlike  $\rightarrow$ , and regexp  $\rightarrow$  functions in the filter condition when estimating the number of rows. This variable also controls whether

Variable name	Change type	Description
tidb_enable_analyze_snapshot	Newly added variable controls whether to read historical data or the latest data when performing ANALYZE	This variable controls whether to read historical data or the latest data when performing ANALYZE

Variable name	Change type	Description
<code>tidb_generate_binary_plan_summary</code>	Newly added variable controls whether to generate binary-encoded execution plans in slow logs and statement summaries.	

Variable name	Change type	Description
tidb_newly_added_variables_sets	newly added	This distinct_aggregate function with DISTINCT to the two-level aggregate functions, such as rewriting SELECT b, COUNT (DISTINCT a) FROM t GROUP

Variable name	Change type	Description
<code>tidb_enable_new_variables</code>	Newly added	This variable controls whether to show noop <code>↪</code> variables in the result of <code>SHOW</code> <code>↪</code> <code>[</code> <code>↪ GLOBAL</code> <code>↪ ]</code> <code>↪</code> <code>VARIABLES</code> <code>↪ .</code>

Variable name	Change type	Description
<code>tidb_new_page_size</code>	Added	This variable is used to set the maximum number of rows during the coprocessor paging request process.

Variable name	Change type	Description
<code>tidb_txn_newly_added</code>	<code>boolean</code>	This variable is used to control the batch size of transaction commit requests that TiDB sends to TiKV.

Variable name	Change type	Description
tidb_enable_multi_schema_index	Boolean	This variable is used to control whether multiple columns or indexes can be altered in one ALTER TABLE statement.

Variable name	Change type	Description
<code>tidb_enable_join_reorder</code>	Modification	<p>variable controls whether the Join Reorder algorithm of TiDB supports Outer Join. In v6.1.0, the default value is ON, which means the Join Reorder's support for Outer Join is enabled by default. From v6.2.0, the</p>

### 16.9.1.2.2 Configuration file parameters

Configuration file	Change type	Description
--------------------	-------------	-------------

TiDB feedback-probability	Deleted	This configuration is no longer effective and is not recommended.
---------------------------	---------	-------------------------------------------------------------------

TiDB query-feedback-limit	Deleted	This configuration is no longer effective and is not recommended.
---------------------------	---------	-------------------------------------------------------------------

---

Configuration file	Change Configuration	Description
TiKV	server-newly-added-metrics	This configuration specifies whether to simplify the returned monitoring metrics.

Configuration file	Change Configuration	Description
TiKV	<code>quota-cpu-time</code>	Newly added configuration specifies the soft limit on the CPU resources used by TiKV background process read and write requests.

Configuration file	Change type	Description
TiKV quota	Newly added	This configuration specifies the soft limit on the bandwidth with which background transactions write data (not effective currently).

Configuration file	Change Configuration	Description
TiKV	quota Newly added	This configuration specifies the soft limit on the bandwidth with which background transactions and the Co-processor read data (not effective currently).

---

Configuration file	Change Configuration	Description
--------------------	----------------------	-------------

---

TiKV	quota Newly auto-tune	This configuration specifies whether to enable the auto-tuning of quota. If this configuration item is enabled, TiKV dynamically adjusts the quota for the background requests based on the
------	-----------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Configuration file	Change Configuration	Description
TiKV rocksdb-pipelined-commit	Deleted	This configuration is no longer effective.
TiKV gc-merge-rewrite	Deleted	This configuration is no longer effective.
TiKV log-backup	Newly added	This configuration controls whether to enable log backup on TiKV.

Configuration file	Change Configuration	Description
TiKV	log-backup-size-limit	Newly added configuration specifies the size limit on log backup data. Once this limit is reached, data is automatically flushed to external storage.

Configuration file	Change Configuration	Description
TiKV	log-backup-scan-pending-memory-quota	Newly added configuration specifies the quota of cache used for storing incremental scan data.

Configuration file	Change Configuration	Description
TiKV	log-backup-flush-interval	Newly added configuration specifies the maximum interval for writing backup data to external storage in log backup.

Configuration file	Change Configuration	Description
TiKV	log-backup-scan-rate-limit	Newly added configuration specifies the rate limit on throughput in incremental data scan in log backup.

Configuration file	Change Configuration	Description
TiKV	<b>log-backup-threads</b> Newly added	This configuration specifies the number of threads used in log backup.

---

Configuration file	Change Configuration	Description
--------------------	----------------------	-------------

---

TiKV	<code>log-backup-path</code>	Newly added configuration specifies temporary path to which log files are written before being flushed to external storage.
------	------------------------------	-----------------------------------------------------------------------------------------------------------------------------

TiKV	<code>[rocksdb]cf.format-version</code>	Default format-version-new-in-v620)
------	-----------------------------------------	-------------------------------------

Configuration file	Change Configuration	Description
PD	replica-mode.dr-auto-sync-timeout	Deleted. This configuration does not take effect and is deleted.
PD	replica-mode.dr-auto-sync-timeout	Deleted. This configuration does not take effect and is deleted.

Configuration file	Change type	Description
TiFlash storage	Modified	The default value of <code>format_version</code> changes to 4, the default format for v6.2.0 and later versions, which reduces write amplification and background task resource consumption.

Configuration file	Change type	Description
TiFlash profile	Newly added	This configuration controls whether to use the thread pool to handle read requests from the storage engine. The default value is <code>false</code> ↪ .

Configuration file	Change type	Description
TiFlash profile	Newly added	This configuration specifies the minimum ratio of valid data in a PageStorage data file.

Configuration file	Change type	Description
TiCDC	Newly added	This configuration is added to the cdc cli changefeed resume sub-command.
	overwritten	fig-uration is added to the cdc cli changefeed resume sub-command.
TiCDC	Newly added	This configuration is added to the cdc cli changefeed resume sub-command.
	no-confirm	fig-uration is added to the cdc cli changefeed resume sub-command.

Configuration file	Change type	Description
DM	<b>mode</b> Newly added	This configuration parameter is a validator parameter. Optional values are <b>full</b> $\leftrightarrow$ , <b>fast</b> $\leftrightarrow$ , and <b>none</b> $\leftrightarrow$ . The default value is <b>none</b> $\leftrightarrow$ , which does not validate the data.

---

Configuration file	Change Configuration	Description
DM	<b>worker count</b>	Newly added configuration is a validator parameter and specifies the number of validation workers in the background. The default value is 4.

Configuration file	Change Configuration	Description
--------------------	----------------------	-------------

DM	row-error-delay	<p>Newly added configuration parameter. If a row is not validated within the specified time, it will be marked as an error row. The default value is 30m, which means 30 minutes.</p>
----	-----------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Configuration file	Change Configuration	Description
TiDB Lightning	<code>tikv-write-bwlimit</code>	Newly added configuration item. This configuration item determines the write bandwidth when TiDB Lightning writes data to each TiKV Store. The default value is 0, indicating the bandwidth is not limited.

Configuration file	Change type	Description
TiDB <code>tikv-lightning quota</code>	Newly added	This configuration item limits the storage space used by TiDB Lightning.

### 16.9.1.2.3 Others

- TiFlash `format_version` cannot be downgraded from 4 to 3. For details, see [TiFlash v6.2.0 Upgrade Guide](#).
- In v6.2.0 and later versions, it is strongly recommended to keep the default value `false` of `dt_enable_logical_split` and not to change it to `true`. For details, see known issue [#5576](#).
- If the backup cluster has a TiFlash replica, after you perform PITR, the restoration cluster does not contain the data in the TiFlash replica. To restore data from the TiFlash replica, you need to manually configure TiFlash replicas. Executing the `exchange partition` DDL statement might result in a failure of PITR. If the upstream database uses TiDB Lightning's physical import mode to import data, the data cannot be backed up in log backup. It is recommended to perform a full backup after the data import. For other compatibility issues of PITR, see [PITR limitations](#).
- Since TiDB v6.2.0, you can restore table in `mysql` schema by specifying the parameter `--with-sys-table=true` when restoring data.
- When you execute the `ALTER TABLE` statement to add, drop, or modify multiple columns or indexes, TiDB checks table consistency by comparing the table before and after statement execution, regardless of the change in the same DDL statement. The execution order of the DDLs is not fully compatible with MySQL in some scenarios.
- If the TiDB component is v6.2.0 or later, the TiKV component should not be earlier than v6.2.0.
- TiKV adds a configuration item `split.region-cpu-overload-threshold-ratio` that supports [dynamic configuration](#).

- Slow query logs, `information_schema.statements_summary`, and `information_schema`  $\leftrightarrow$  `.slow_query` can export `binary_plan`, or execution plans encoded in the binary format.
- Two columns are added to the `SHOW TABLE ... REGIONS` statement: `SCHEDULING_CONSTRAINTS`  $\leftrightarrow$  and `SCHEDULING_STATE`, which respectively indicate Region scheduling constraints in Placement in SQL and the current scheduling state.
- Since TiDB v6.2.0, you can capture data changes of RawKV via [TiKV-CDC](#).
- When `ROLLBACK TO SAVEPOINT` is used to roll back a transaction to a specified savepoint, MySQL releases the locks held only after the specified savepoint, while in TiDB pessimistic transaction, TiDB does not immediately release the locks held after the specified savepoint. Instead, TiDB releases all locks when the transaction is committed or rolled back.
- Since TiDB v6.2.0, the `SELECT tidb_version()` statement also returns Store type (tikv or unistore).
- TiDB no longer has hidden system variables.
- TiDB v6.2.0 introduces two new system tables:
  - `INFORMATION_SCHEMA.VARIABLES_INFO`: used for viewing information about TiDB system variables.
  - `PERFORMANCE_SCHEMA.SESSION_VARIABLES`: used for viewing information about TiDB session-level system variables.

### 16.9.1.3 Removed feature

Since TiDB v6.2.0, backing up and restoring RawKV using BR is deprecated.

### 16.9.1.4 Improvements

- TiDB
  - Support the `SHOW COUNT(*)WARNINGS` and `SHOW COUNT(*)ERRORS` statements [#25068](#) @likzn
  - Add validation check for some system variables [#35048](#) @morgo
  - Optimize the error messages for some type conversions [#32447](#) @fanrenhoo
  - The `KILL` command now supports DDL operations [#24144](#) @morgo
  - Make the output of `SHOW TABLES/DATABASES LIKE ...` more MySQL-compatible. The column names in the output contain the `LIKE` value [#35116](#) @likzn
  - Improve the performance of JSON-related functions [#35859](#) @wjhuang2016
  - Improve the verification speed of password login using SHA-2 [#35998](#) @virusdefender
  - Simplify some log outputs [#36011](#) @dveeden

- Optimize the Coprocessor communication protocol. This can greatly reduce the memory consumption of the TiDB processes when reading data, and further alleviate the OOM issue in the scenario of scanning tables and exporting data by Dumping. The system variable `tidb_enable_paging` is introduced to control whether to enable this communication protocol (with the scope of SESSION or GLOBAL). This protocol is disabled by default. To enable it, set the variable value to `true` [#35633](#) [@tiancaiama](#) [@wshwsh12](#)
- Optimize the accuracy of memory tracking for some operators (HashJoin, HashAgg, Update, Delete) ([#35634](#), [#35631](#), [#35635](#) [@wshwsh12](#)) ([#34096](#) [@ekexium](#))
- The system table `INFORMATION_SCHEMA.DATA_LOCK_WAIT` supports recording the locking information of optimistic transactions [#34609](#) [@longfangson](#)
- Add some monitoring metrics for transactions [#34456](#) [@longfangsong](#)
- TiKV
  - Support compressing the metrics response using gzip to reduce the HTTP body size [#12355](#) [@glorv](#)
  - Improve the readability of the TiKV panel in Grafana Dashboard [#12007](#) [@kevin-xianliu](#)
  - Optimize the commit pipeline performance of the Apply operator [#12898](#) [@ethercflow](#)
  - Support dynamically modifying the number of sub-compaction operations performed concurrently in RocksDB (`rocksdb.max-sub-compactions`) [#13145](#) [@ethercflow](#)
- PD
  - Support the statistical dimension of CPU usage of a Region and enhance the usage scenarios of Load Base Split [#12063](#) [@Jmpotato](#)
- TiFlash
  - Refine error handling of the TiFlash MPP engine, thereby enhancing stability [#5095](#) [@windtalker](#) [@yibin87](#)
  - Optimize the comparison and sorting of UTF8\_BIN and UTF8MB4\_BIN collations [#5294](#) [@solotzg](#)
- Tools
  - Backup & Restore (BR)
    - \* Adjust the backup data directory structure to fix backup failure caused by S3 rate limiting in large cluster backup [#30087](#) [@MoCuishle28](#)
  - TiCDC

- \* Reduce performance overhead caused by runtime context switching in multi-Region scenarios [#5610](#) [@hicqu](#)
- \* Optimize redo log performance, and fix meta and data inconsistency problems ([#6011](#) [@CharlesCheung96](#)) ([#5924](#) [@zhaoxinyu](#)) ([#6277](#) [@hicqu](#))
- TiDB Lightning
  - \* Add more retryable errors, including EOF, Read index not ready, and Coprocessor timeout [#36674](#), [#36566](#) [@D3Hunter](#)
- TiUP
  - \* When a new cluster is deployed using TiUP, node-exporter will use the 1.3.1 version, and blackbox-exporter will use the 0.21.1 version, which ensures successful deployment in different systems and environments

### 16.9.1.5 Bug fixes

- TiDB
  - Fix the issue that a partition is incorrectly pruned if a partition key is used in the query condition and the collate is different from the one in the query partition table [#32749](#) [@mjonss](#)
  - Fix the issue that SET ROLE cannot match the granted role if there are capital letters in the host [#33061](#) [@morgo](#)
  - Fix the issue that columns with auto\_increment cannot be dropped [#34891](#) [@Defined2014](#)
  - Fix the issue that SHOW CONFIG shows some configuration items that have been removed [#34867](#) [@morgo](#)
  - Fix the issue that SHOW DATABASES LIKE ... is case-sensitive [#34766](#) [@elijah1](#)
  - Fix the issue that SHOW TABLE STATUS LIKE ... is case-sensitive [#7518](#) [@likzn](#)
  - Fix the issue that max-index-length still reports an error in non-strict mode [#34931](#) [@elijah1](#)
  - Fix the issue that ALTER COLUMN ... DROP DEFAULT does not work [#35018](#) [@Defined2014](#)
  - Fix the issue that when you create a table, the default value and the type of a column are not consistent and are not automatically corrected [#34881](#) [@Lloyd-Pottiger](#)
  - Fix the issue that data in the mysql.columns\_priv table is not deleted synchronously after you run DROP USER [#35059](#) [@lcwangchao](#)
  - Fix the issue of DDL jam by disallowing creating tables within the schemas of some systems [#35205](#) [@tangenta](#)
  - Fix the issue that querying partitioned tables might report “index-out-of-range” and “non used index” errors in some cases [#35181](#) [@mjonss](#)
  - Fix the issue that INTERVAL expr unit + expr might report an error [#30253](#) [@mjonss](#)

- Fix a bug that a temporary table cannot be found after being created in a transaction [#35644](#) [@djshow832](#)
  - Fix the panic issue that occurs when setting collation to the ENUM column [#31637](#) [@wjhuang2016](#)
  - Fix the issue that when one PD node goes down, the query of `information_schema`  $\leftrightarrow$  `.TIKV_REGION_STATUS` fails due to not retrying other PD nodes [#35708](#) [@tangenta](#)
  - Fix the issue that `SHOW CREATE TABLE ...` cannot correctly display set or ENUM columns after `SET character_set_results = GBK` [#31338](#) [@tangenta](#)
  - Fix the incorrect scope of the system variables `tidb_log_file_max_days` and `tidb_config` [#35190](#) [@morgo](#)
  - Fix the issue that the output of `SHOW CREATE TABLE` is not compatible with MySQL for the ENUM or SET column [#36317](#) [@Defined2014](#)
  - Fix the issue that when creating a table, the behavior of a LONG BYTE column is not compatible with MySQL [#36239](#) [@Defined2014](#)
  - Fix the issue that `auto_increment = x` does not take effect on temporary tables [#36224](#) [@djshow832](#)
  - Fix the wrong default value when modifying columns concurrently [#35846](#) [@wjhuang2016](#)
  - Avoid sending requests to unhealthy TiKV nodes to improve availability [#34906](#) [@sticnarf](#)
  - Fix the issue that the column list does not work in the LOAD DATA statement [#35198](#) [@SpadeA-Tang](#)
  - Fix the issue that in some scenarios the pessimistic lock is incorrectly added to the non-unique secondary index [#36235](#) [@ekexium](#)
- TiKV
    - Avoid reporting `WriteConflict` errors in pessimistic transactions [#11612](#) [@sticnarf](#)
    - Fix the possible duplicate commit records in pessimistic transactions when async commit is enabled [#12615](#) [@sticnarf](#)
    - Fix the issue that TiKV panics when modifying the `storage.api-version` from 1 to 2 [#12600](#) [@pingyu](#)
    - Fix the issue of inconsistent Region size configuration between TiKV and PD [#12518](#) [@5kbpers](#)
    - Fix the issue that TiKV keeps reconnecting PD clients [#12506](#), [#12827](#) [@Connor1996](#)
    - Fix the issue that TiKV panics when performing type conversion for an empty string [#12673](#) [@wshwsh12](#)
    - Fix the issue of time parsing error that occurs when the DATETIME values contain a fraction and Z [#12739](#) [@gengliqi](#)
    - Fix the issue that the perf context written by the Apply operator to TiKV RocksDB is coarse-grained [#11044](#) [@LykxSassinator](#)

- Fix the issue that TiKV fails to start when the configuration of `backup/import/cdc` is invalid [#12771](#) @3pointer
  - Fix the panic issue that might occur when a peer is being split and destroyed at the same time [#12825](#) @BusyJay
  - Fix the panic issue that might occur when the source peer catches up logs by snapshot in the Region merge process [#12663](#) @BusyJay
  - Fix the panic issue caused by analyzing statistics when `max_sample_size` is set to 0 [#11192](#) @LykxSassinator
  - Fix the issue that encryption keys are not cleaned up when Raft Engine is enabled [#12890](#) @tabokie
  - Fix the issue that the `get_valid_int_prefix` function is incompatible with TiDB. For example, the `FLOAT` type was incorrectly converted to `INT` [#13045](#) @guo-shaoge
  - Fix the issue that the Commit Log Duration of a new Region is too high, which causes QPS to drop [#13077](#) @Connor1996
  - Fix the issue that PD does not reconnect to TiKV after the Region heartbeat is interrupted [#12934](#) @bufferflies
- Tools
    - Backup & Restore (BR)
      - \* Fix the issue that BR does not reset the rate limit after finishing a rate-limited backup task [#31722](#) @MoCuishle28

## 16.10 v6.1

### 16.10.1 TiDB 6.1.6 Release Notes

Release date: April 12, 2023

TiDB version: 6.1.6

Quick access: [Quick start](#) | [Production deployment](#) | [Installation packages](#)

#### 16.10.1.1 Compatibility changes

- TiCDC fixes the issue of incorrect encoding of FLOAT data in Avro [#8490](#) [@3AceShowHand](#)

When upgrading the TiCDC cluster to v6.1.6 or a later v6.1.x version, if a table replicated using Avro contains the FLOAT data type, you need to manually adjust the compatibility policy of Confluent Schema Registry to `None` before upgrading so that the changefeed can successfully update the schema. Otherwise, after upgrading, the changefeed will be unable to update the schema and enter an error state.

#### 16.10.1.2 Improvements

- TiDB
  - Supports caching the execution plan for `BatchPointGet` in Prepared Plan Cache [#42125](#) [@qw4990](#)
  - Support more SQL formats for Index Join [#40505](#) [@Yisaer](#)
- TiKV
  - Support starting TiKV on a CPU with less than 1 core [#13586](#) [#13752](#) [#14017](#) [@and Reid-db](#) [@and Reid-db](#)

#### 16.10.1.3 Bug fixes

- TiDB
  - Fix the issue that the `ignore_plan_cache` hint might not work for INSERT statements [#40079](#) [#39717](#) [@qw4990](#)

- Fix the issue that TiDB might panic after `indexMerge` encounters an error [#41047](#) [#40877](#) @guo-shaoge @windtalker
- Fix the issue that incorrect results might be returned when TopN operators with virtual columns are mistakenly pushing down to TiKV or TiFlash [#41355](#) @Dousir9
- Fix the PD OOM issue when there is a large number of Regions but the table ID cannot be pushed down when querying some virtual tables using `Prepare` or `Execute` [#39605](#) @djshow832
- Fix the issue that Plan Cache might cache FullScan plans when processing `int_col in (decimal...)` conditions [#40224](#) @qw4990
- Fix the issue that IndexMerge plans might generate incorrect ranges on the SET type columns [#41273](#) [#41293](#) @time-and-fate
- Fix the issue of potential wrong results when comparing unsigned TINYINT  $\leftrightarrow$  /SMALLINT/INT values with DECIMAL/FLOAT/DOUBLE values smaller than 0 [#41736](#) @LittleFall
- Fix the issue that the TiDB server might run out of memory when the `INFORMATION_SCHEMA.CLUSTER_SLOW_QUERY` table is queried. This issue can be triggered when you check slow queries on the Grafana dashboard [#33893](#) @crazycs520
- Fix the issue that range partitions allow multiple MAXVALUE partitions [#36329](#) @u5surf
- Fix the issue that Plan Cache might cache Shuffle operators and return incorrect results [#38335](#) @qw4990
- Fix the issue that data race in time zone might cause data-index inconsistency [#40710](#) @wjhuang2016
- Fix the issue that goroutine leak might occur in `indexMerge` [#41545](#) [#41605](#) @guo-shaoge @guo-shaoge
- Fix the issue that, when using Cursor Fetch and running other statements among `Execute`, `Fetch`, and `Close`, the `Fetch` and `Close` commands might return incorrect results or cause TiDB to panic [#40094](#) [@YangKeao](https://github.com/YangKeao)
- Fix the issue that when modifying the floating-point type using DDL to keep the length unchanged and reduce the decimal places, the old data still remains the same [#41281](#) [@zimulala](https://github.com/zimulala)
- Fix the issue that joining the `information_schema.columns` table causes TiDB to panic [#32459](#) [@tangenta](https://github.com/tangenta)
- Fix the issue that TiDB panic occurs due to inconsistent InfoSchema being obtained when generating the execution plan [#41622](#) [@tiancaia-mao](https://github.com/tiancaia-mao)
- Fix the issue that TiFlash reports an error for generated columns during execution [#40663](#) @guo-shaoge
- Fix the issue that TiDB might produce incorrect results when different partitioned tables appear in a single SQL statement [#42135](#) @mjonss
- Fix the issue that Plan Cache might cache Shuffle operators and return incorrect results [#38335](#) @qw4990 @fzzf678
- Fix the issue that using Index Merge to read a table containing the SET type

- column might lead to incorrect results [#41293](#) @time-and-fate
- Fix the issue that full index scans might cause errors when prepared plan cache is enabled [#42150](#) @fzzf678
- Fix the issue that SQL statements using `PointGet` to read a table during the execution of a DDL statement might throw a panic [#41622](#) @tiancaiamao
- Fix the issue that after executing `PointUpdate` within a transaction, TiDB returns incorrect results for the `SELECT` statement [#28011](#) @zyguan
- Clear expired region cache regularly to avoid memory leak and performance degradation [#40461](#) @sticnarf @zyguan
- Fix the issue that `INSERT IGNORE` and `REPLACE` statements do not lock keys that do not modify values [#42121](#) @zyguan
- TiKV
  - Fix an error that occurs when casting the `const Enum` type to other types [#14156](#) @wshwsh12
  - Fix the issue of CPU quota limitation [13084](#) @BornChanger
  - Fix the issue of incorrect snapshot last index [12618](#) @LintianShi
- PD
  - Fix the issue that the Region Scatter might cause uneven distribution of leader [#6017](#) @HunDunDM
  - Fix the issue that the timeout mechanism of Online Unsafe Recovery does not work [#6107](#) @v01dstar
- TiFlash
  - Fix the issue that semi-joins use excessive memory when calculating Cartesian products [#6730](#) @gengliqi
  - Fix the issue that TiFlash log search is too slow [#6829](#) @hehechen
  - Fix the issue that TopN/Sort operators produce incorrect results after enabling the new collation [#6807](#) @xzhangxian1008
  - Fix the issue that Decimal cast rounds up incorrectly in certain cases [#6994](#) @windtalker
  - Fix the issue that TiFlash cannot recognize generated columns [#6801](#) @guo-shaoge
  - Fix the issue that Decimal division does not round up the last digit in certain cases [#7022](#) @LittleFall
- Tools
  - TiCDC
    - \* Fix the issue that the disorder of `UPDATE` and `INSERT` statements during data replication might cause the `Duplicate entry` error [#8597](#) @sdojyy

- \* Fix the abnormal exit issue of the TiCDC service caused by network isolation between PD and TiCDC [#8562](#) @overvenus
  - \* Fix the data inconsistency that occurs when replicating data to a TiDB or MySQL sink and when CHARACTER SET is specified on the column that has the non-null unique index without a primary key [#8420](#) @zhaoxinyu
  - \* Fix the issue that the memory usage of db sorter is not controlled by cgroup ↔ memory limit [#8588](#) @amyangfei
  - \* Optimize the error message of cdc cli for invalid input [#7903](#) @CharlesCheung96
  - \* Fix the issue of insufficient duration that redo log can tolerate for S3 storage failure [#8089](#) @CharlesCheung96
  - \* Fix the issue that pausing a changefeed when PD is abnormal results in incorrect status [#8330](#) @sdojjy
- TiDB Lightning
- \* Fix the issue that the conflict resolution logic (duplicate-resolution) might lead to inconsistent checksums [#40657](#) @gozssky
  - \* Fix the issue that TiDB Lightning panics in the split-region phase [#40934](#) @lance6716
  - \* Fix the issue that when importing data in Local Backend mode, the target columns do not automatically generate data if the compound primary key of the imported target table has an auto\_random column and no value for the column is specified in the source data [#41454](#) @D3Hunter
  - \* Fix the issue that TiDB Lightning might incorrectly skip conflict resolution when all but the last TiDB Lightning instance encounters a local duplicate record during a parallel import [#40923](#) @lichunzhu

## 16.10.2 TiDB 6.1.5 Release Notes

Release date: February 28, 2023

TiDB version: 6.1.5

Quick access: [Quick start](#) | [Production deployment](#) | [Installation packages](#)

### 16.10.2.1 Compatibility changes

- Starting from February 20, 2023, the **telemetry feature** is disabled by default in new versions of TiDB and TiDB Dashboard, including v6.1.5, and usage information is not collected and shared with PingCAP. Before upgrading to these versions, if the cluster uses the default telemetry configuration, the telemetry feature is disabled after the upgrade. See [TiDB Release Timeline](#) for a specific version.
  - The default value of the **tidb\_enable\_telemetry** system variable is changed from ON to OFF.
  - The default value of the TiDB **enable-telemetry** configuration item is changed from true to false.

- The default value of the PD `enable-telemetry` configuration item is changed from `true` to `false`.
- Starting from v1.11.3, the telemetry feature is disabled by default in newly deployed TiUP, and usage information is not collected. If you upgrade from a TiUP version earlier than v1.11.3 to v1.11.3 or a later version, the telemetry feature keeps the same status as before the upgrade.

### 16.10.2.2 Improvements

- TiDB
  - Support the `AUTO_RANDOM` column as the first column of the clustered composite index [#38572](#) @tangenta

### 16.10.2.3 Bug fixes

- TiDB
  - Fix the issue that data race might cause TiDB to restart [#27725](#) @XuHuaiyu
  - Fix the issue that the `UPDATE` statement might not read the latest data when the Read Committed isolation level is used [#41581](#) @cfzjywxk
- PD
  - Fix the PD OOM issue that occurs when the calls of `ReportMinResolvedTS` are too frequent [#5965](#) @HundunDM
- Tools
  - TiCDC
    - \* Fix the issue that applying redo log might cause OOM when the replication lag is excessively high [#8085](#) @CharlesCheung96
    - \* Fix the issue that the performance degrades when redo log is enabled to write meta [#8074](#) @CharlesCheung96
  - TiDB Data Migration (DM)
    - \* Fix the issue that the `binlog-schema delete` command fails to execute [#7373](#) @liumengya94
    - \* Fix the issue that the checkpoint does not advance when the last binlog is a skipped DDL [#8175](#) @D3Hunter

### 16.10.3 TiDB 6.1.4 Release Notes

Release date: February 8, 2023

TiDB version: 6.1.4

Quick access: [Quick start](#) | [Production deployment](#) | [Installation packages](#)

#### 16.10.3.1 Compatibility changes

- TiDB
  - No longer support modifying column types on partitioned tables because of potential correctness issues [#40620](#) [@mjonss](#)

#### 16.10.3.2 Improvements

- TiFlash
  - Reduce the IOPS by up to 95% and the write amplification by up to 65% for TiFlash instances under high update throughput workloads [#6460](#) [@flowbehappy](#)
- Tools
  - TiCDC
    - \* Add the DML batch operation mode to improve the throughput when SQL statements are generated in batches [#7653](#) [@asddongmen](#)
    - \* Support storing redo logs to GCS- or Azure-compatible object storage [#7987](#) [@CharlesCheung96](#)
  - TiDB Lightning
    - \* Change the severity of the precheck items `clusterResourceCheckItem` and `emptyRegionCheckItem` from `Critical` to `Warning` [#37654](#) [@niubell](#)

#### 16.10.3.3 Bug fixes

- TiDB
  - Fix the issue that when you create a table, the default value and the type of a column are not consistent and are not automatically corrected [#34881](#) [@Lloyd-Pottiger](#) [@mjonss](#)
  - Fix the data race issue in the `LazyTxn.LockKeys` function [#40355](#) [@HuSharp](#)
  - Fix the issue that the `INSERT` or `REPLACE` statements might panic in long session connections [#40351](#) [@fanrenhoo](#)

- Fix the issue that reading data using the “cursor read” method might return an error because of GC [#39447](#) @zyguan
  - Fix the issue that the `pessimistic-auto-commit` configuration item does not take effect for point-get queries [#39928](#) @zyguan
  - Fix the issue that querying the `INFORMATION_SCHEMA.TIKV_REGION_STATUS` table returns an incorrect result [#37436](#) @zimulala
  - Fix the issue that the `IN` and `NOT IN` subqueries in some patterns report the `Can't find column` error [#37032](#) @AilinKid @lance6716
- PD
    - Fix the issue that PD might unexpectedly add multiple Learners to a Region [#5786](#) @HunDunDM
- TiKV
    - Fix the issue that TiDB fails to start on Gitpod when there are multiple `cgroup` and `mountinfo` records [#13660](#) @tabokie
    - Fix the issue that `tikv-ctl` is terminated unexpectedly when executing the `reset`  $\leftrightarrow$  `-to-version` command [#13829](#) @tabokie
    - Fix the issue that TiKV mistakenly reports a `PessimisticLockNotFound` error [#13425](#) @sticnarf
    - Fix the issue that TiKV might panic when the size of one single write exceeds 2 GiB [#13848](#) @YuJuncen
    - Fix the data inconsistency issue caused by network failure between TiDB and TiKV during the execution of a DML after a failed pessimistic DML [#14038](#) @MyonKeminta
    - Fix the issue that `_` in the `LIKE` operator cannot match non-ASCII characters when new collation is not enabled [#13769](#) @YangKeao @tonyxuqqi
- TiFlash
    - Fix the issue that TiFlash global locks are blocked for a long time occasionally [#6418](#) @SeaRise
    - Fix the issue that high throughput writes cause OOM [#6407](#) @JaySon-Huang
- Tools
    - Backup & Restore (BR)
      - \* Fix the issue that restore is interrupted due to failure in getting the Region size [#36053](#) @YuJuncen
      - \* Fix the issue that causes panic when BR debugs the `backupmeta` file [#40878](#) @MoCuishle28
    - TiCDC

- \* Fix the issue that the checkpoint cannot advance when TiCDC replicates an excessively large number of tables [#8004](#) @asddongmen
  - \* Fix the issue that `transaction_atomicity` and `protocol` cannot be updated via the configuration file [#7935](#) @CharlesCheung96
  - \* Fix the issue that TiCDC mistakenly reports an error when the version of TiFlash is later than that of TiCDC [#7744](#) @overvenus
  - \* Fix the issue that OOM occurs when TiCDC replicates large transactions [#7913](#) @overvenus
  - \* Fix a bug that the context deadline is exceeded when TiCDC replicates data without splitting large transactions [#7982](#) @hi-rustin
  - \* Fix the issue that `sasl-password` in the `changefeed` query result is not masked [#7182](#) @dveeden
  - \* Fix the issue that data is lost when a user quickly deletes a replication task and then creates another one with the same task name [#7657](#) @overvenus
- TiDB Data Migration (DM)
- \* Fix a bug that DM might raise an error during precheck when the downstream database name in `SHOW GRANTS` contains a wildcard (“\*“) [#7645](#) @lance6716
  - \* Fix the issue that DM prints too many logs caused by “COMMIT” in binlog query events [#7525](#) @liumengya94
  - \* Fix the issue that the DM task fails to start when only `ssl-ca` is configured for SSL [#7941](#) @liumengya94
  - \* Fix a bug that when the expression filters of both “update” and “non-update” types are specified in one table, all `UPDATE` statements are skipped [#7831](#) @lance6716
  - \* Fix a bug that when only one of `update-old-value-expr` or `update-new-value-expr` is set for a table, the filter rule does not take effect or DM panics [#7774](#) @lance6716
- TiDB Lightning
- \* Fix the memory leakage issue when TiDB Lightning imports a huge source data file [#39331](#) @dsdashun
  - \* Fix the issue that TiDB Lightning prechecks cannot find dirty data left by previously failed imports [#39477](#) @dsdashun

#### 16.10.4 TiDB 6.1.3 Release Notes

Release date: December 5, 2022

TiDB version: 6.1.3

Quick access: [Quick start](#) | [Production deployment](#) | [Installation packages](#)

##### 16.10.4.1 Compatibility changes

- Tools

- TiCDC
  - \* Change the default value of `transaction-atomicity` from `table` to `none`, which helps reduce replication latency and reduce OOM risks, and ensures that only a few transactions (the size of a single transaction exceeds 1024 rows) are split, instead of all transactions [#7505](#) [#5231](#) [@asddongmen](#)

#### 16.10.4.2 Improvements

- PD
  - Optimize the granularity of locks to reduce lock contention and improve the capability of processing heartbeat in high concurrency [#5586](#) [@rleungx](#)
- Tools
  - TiCDC
    - \* Enable transaction split and disable the safe mode of a changefeed in TiCDC by default to improve performance [#7505](#) [@asddongmen](#)
    - \* Improve the performance of Kafka protocol encoder [#7540](#), [#7532](#), [#7543](#) [@sdojyy](#) [@3AceShowHand](#)
- Others
  - Upgrade the Go compiler version of TiDB from `go1.18` to `go1.19`, which improves the TiDB stability. Specifically, a Go environment variable `GOMEMLIMIT` is introduced to keep the memory usage of TiDB below a certain threshold. This helps mitigate most OOM issues. For more information, see [Mitigate OOM issues by configuring the GOMEMLIMIT](#).

#### 16.10.4.3 Bug fixes

- TiDB
  - Fix the issue that the `grantor` field is missing in the `mysql.tables_priv` table [#38293](#) [@CbcWestwolf](#)
  - Fix the issue of the wrong query result that occurs when the mistakenly pushed-down conditions are discarded by Join Reorder [#38736](#) [@winoros](#)
  - Fix the issue that the lock acquired by `get_lock()` cannot hold for more than 10 minutes [#38706](#) [@tangenta](#)
  - Fix the issue that the auto-increment column cannot be used with check constraint [#38894](#) [@YangKeao](#)
  - Fix the issue that the gPRC log is output to a wrong file [#38941](#) [@xhebox](#)
  - Fix the issue that the TiFlash sync status of a table is not deleted from etcd when the table is truncated or dropped [#37168](#) [@CalvinNeo](#)

- Fix the issue that data files can be accessed unrestrainedly via data source name injection (CVE-2022-3023) [#38541](#) @lance6716
- Fix the issue that the function `str_to_date` returns wrong result in the `NO_ZERO_DATE` SQL mode [#39146](#) @mengxin9014
- Fix the issue that statistics collection tasks in the background might panic [#35421](#) @lilinghai
- Fix the issue that in some scenarios the pessimistic lock is incorrectly added to the non-unique secondary index [#36235](#) @ekexium
- PD
  - Fix inaccurate Stream timeout and accelerate leader switchover [#5207](#) @CabinfeverB
- TiKV
  - Fix abnormal Region competition caused by expired lease during snapshot acquisition [#13553](#) @SpadeA-Tang
- TiFlash
  - Fix the issue that logical operators return wrong results when the argument type is `UInt8` [#6127](#) @xzhangxian1008
  - Fix the issue that wrong data input for `CAST(value AS DATETIME)` causing high TiFlash sys CPU [#5097](#) @xzhangxian1008
  - Fix the issue that heavy write pressure might generate too many column files in the delta layer [#6361](#) @lidezhu
  - Fix the issue that column files in the delta layer cannot be compacted after restarting TiFlash [#6159](#) @lidezhu
- Tools
  - Backup & Restore (BR)
    - \* Fix the issue that restore tasks fail when using old framework for collations in databases or tables [#39150](#) @MoCuishle28
  - TiCDC
    - \* Fix data loss occurred in the scenario of executing DDL statements first and then pausing and resuming the changefeed [#7682](#) @asddongmen
    - \* Fix the issue that the sink component gets stuck if the downstream network is unavailable [#7706](#) @hicqu
  - TiDB Data Migration (DM)
    - \* Fix the issue that when `collation_compatible` is set to "strict", DM might generate SQL with duplicated collations [#6832](#) @lance6716

- \* Fix the issue that DM tasks might stop with an `Unknown placement policy` error [#7493](#) @lance6716
- \* Fix the issue that relay logs might be pulled from upstream again in some cases [#7525](#) @liumengya94
- \* Fix the issue that data is replicated for multiple times when a new DM worker is scheduled before the existing worker exits [#7658](#) @GMHDBJD

### 16.10.5 TiDB 6.1.2 Release Notes

Release date: October 24, 2022

TiDB version: 6.1.2

Quick access: [Quick start](#) | [Production deployment](#) | [Installation packages](#)

#### 16.10.5.1 Improvements

- TiDB
  - Allow setting placement rules and TiFlash replicas at the same time in one table [#37171](#) @lcwangchao
- TiKV
  - Support configuring the `unreachable_backoff` item to avoid Raftstore broadcasting too many messages after one peer becomes unreachable [#13054](#) @5kbpers
  - Support configuring the RocksDB write stall settings to a value smaller than the flow control threshold [#13467](#) @tabokie
- Tools
  - TiDB Lightning
    - \* Add retryable errors during checksum to improve robustness [#37690](#) @D3Hunter
  - TiCDC
    - \* Enhance the performance of the region worker by handling resolved TS in a batch [#7078](#) @sdojyy

#### 16.10.5.2 Bug fixes

- TiDB
  - Fix the issue that database-level privileges are incorrectly cleaned up [#38363](#) @dveeden

- Fix the incorrect output of `SHOW CREATE PLACEMENT POLICY` [#37526](#) @xhebox
- Fix the issue that when one PD node goes down, the query of `information_schema` `↔` `.TIKV_REGION_STATUS` fails due to not retrying other PD nodes [#35708](#) @tangenta
- Fix the issue that the `UNION` operator might return unexpected empty result [#36903](#) @tiancaiamao
- Fix the wrong result that occurs when enabling dynamic mode in partitioned tables for TiFlash [#37254](#) @wshwsh12
- Fix the issue that the Region cache is not cleaned up in time when the Region is merged [#37141](#) @sticnarf
- Fix the issue that the KV client sends unnecessary ping messages [#36861](#) @jackysp
- Fix the issue that the `EXPLAIN ANALYZE` statement with DML executors might return result before the transaction commit finishes [#37373](#) @cfzjywxk
- Fix the issue that `GROUP CONCAT` with `ORDER BY` might fail when the `ORDER BY` clause contains a correlated subquery [#18216](#) @winoros
- Fix the issue that `Can't find column` is reported if an `UPDATE` statement contains common table expressions (CTE) [#35758](#) @AilinKid
- Fix the issue that the `EXECUTE` might throw an unexpected error in specific scenarios [#37187](#) @Reminiscent
- TiKV
  - Fix the issue that the snapshot data might be incomplete caused by batch snapshot across Regions [#13553](#) @SpadeA-Tang
  - Fix the issue of QPS drop when flow control is enabled and `level0_slowdown_trigger` `↔` is set explicitly [#11424](#) @Connor1996
  - Fix the issue that causes permission denied error when TiKV gets an error from the web identity provider and fails back to the default provider [#13122](#) @3pointer
  - Fix the issue that the TiKV service is unavailable for several minutes when a TiKV instance is in an isolated network environment [#12966](#) @cosven
- PD
  - Fix the issue that the statistics of the Region tree might be inaccurate [#5318](#) @rleungx
  - Fix the issue that the TiFlash learner replica might not be created [#5401](#) @HunDunDM
  - Fix the issue that PD cannot correctly handle dashboard proxy requests [#5321](#) @HunDunDM
  - Fix the issue that unhealthy Region might cause PD panic [#5491](#) @nolouch
- TiFlash
  - Fix the issue that I/O Limiter might incorrectly throttle the I/O throughput of query requests after bulk writes, which reduces the query performance [#5801](#) @JinheLin

- Fix the issue that a window function might cause TiFlash to crash when the query is canceled [#5814](#) @SeaRise
- Fix the panic that occurs after creating the primary index with a column containing the NULL value [#5859](#) @JaySon-Huang
- Tools
  - TiDB Lightning
    - \* Fix panic of TiDB Lightning caused by invalid metric counters [#37338](#) @D3Hunter
  - TiDB Data Migration (DM)
    - \* Fix the issue that upstream table structure information is lost when DM tasks enter the sync unit and are interrupted [#7159](#) @lance6716
    - \* Fix large transaction errors by splitting SQL statements when saving checkpoints [#5010](#) @lance6716
    - \* Fix the issue that DM precheck requires the SELECT privilege on INFORMATION\_SCHEMA [#7317](#) @lance6716
    - \* Fix the issue that DM-worker triggers a deadlock error after running DM tasks with fast/full validators [#7241](#) @buchitoudougou
    - \* Fix the issue that DM reports the Specified key was too long error [#5315](#) @lance6716
    - \* Fix the issue that latin1 data might be corrupted during replication [#7028](#) @lance6716
  - TiCDC
    - \* Fix the issue that the cdc server might panic if it receives an HTTP request before the cdc server fully starts [#6838](#) @asddongmen
    - \* Fix the log flooding issue during upgrade [#7235](#) @hi-rustin
    - \* Fix the issue that changefeed's redo log files might be deleted by mistake [#6413](#) @hi-rustin
    - \* Fix the issue that TiCDC might become unavailable when too many operations in an etcd transaction are committed [#7131](#) @hi-rustin
    - \* Fix the issue that data inconsistency might occur when non-reentrant DDL statements in redo logs are executed twice [#6927](#) @hicqu
  - Backup & Restore (BR)
    - \* Fix the issue that the regions are not balanced because the concurrency is set too large during the restoration [#37549](#) @3pointer
    - \* Fix the issue that might lead to backup and restoration failure if special characters exist in the authorization key of external storage [#37469](#) @MoCuishle28

### 16.10.6 TiDB 6.1.1 Release Notes

Release date: September 1, 2022

TiDB version: 6.1.1

Quick access: [Quick start](#) | [Production deployment](#) | [Installation packages](#)

### 16.10.6.1 Compatibility changes

- TiDB
  - Make the `SHOW DATABASES LIKE ...` statement case-insensitive [#34766](#) @elijah1
  - Change the default value of `tidb_enable_outer_join_reorder` from 1 to 0, which disables Join Reorder's support for Outer Join by default.
- Diagnosis
  - Disable the Continuous Profiling feature by default, which avoids the possible TiFlash crash issue that occurs when this feature is enabled. For details, see [#5687](#) @mornyx

### 16.10.6.2 Other changes

- Add the following contents in the `TiDB-community-toolkit` binary package. For details, see [TiDB Installation Packages](#).
  - `server-{version}-linux-amd64.tar.gz`
  - `grafana-{version}-linux-amd64.tar.gz`
  - `alertmanager-{version}-linux-amd64.tar.gz`
  - `prometheus-{version}-linux-amd64.tar.gz`
  - `blackbox_exporter-{version}-linux-amd64.tar.gz`
  - `node_exporter-{version}-linux-amd64.tar.gz`
- Introduce multi-level support for different quality standards on the combination of operating systems and CPU architectures. See [OS and platform requirements](#).

### 16.10.6.3 Improvements

- TiDB
  - Add a new optimizer `SEMI_JOIN_REWRITE` to improve the performance of `EXISTS` queries [#35323](#) @winoros
- TiKV
  - Support compressing the metrics response using gzip to reduce the HTTP body size [#12355](#) @winoros

- Support reducing the amount of data returned for each request by filtering out some metrics using the `server.simplify-metrics` configuration item [#12355](#) [@glorv](#)
- Support dynamically modifying the number of sub-compaction operations performed concurrently in RocksDB (`rocksdb.max-sub-compactions`) [#13145](#) [@ethercflow](#)
- PD
  - Improve the scheduling speed of Balance Region in specific stages [#4990](#) [@bufferflies](#)
- Tools
  - TiDB Lightning
    - \* Add a retry mechanism on errors such as `stale command` to improve import success rate [#36877](#) [@D3Hunter](#)
  - TiDB Data Migration (DM)
    - \* Users can manually set the amount of concurrency for lightning loader [#5505](#) [@buchitoudegou](#)
  - TiCDC
    - \* Add a sink uri parameter `transaction-atomicity` to support splitting the large transaction in a changefeed. This can greatly reduce the latency and memory consumption of large transactions [#5231](#) [@CharlesCheung96](#)
    - \* Reduce performance overhead caused by runtime context switching in multi-Region scenarios [#5610](#) [@hicqu](#)
    - \* Enhance the MySQL sink to turn off the safe mode automatically [#5611](#) [@overvenus](#)

#### 16.10.6.4 Bug fixes

- TiDB
  - Fix the issue that `INL_HASH_JOIN` might hang when used with `LIMIT` [#35638](#) [@guo-shaoge](#)
  - Fix the issue that TiDB might panic when executing the `UPDATE` statement [#32311](#) [@Yisaer](#)
  - Fix a bug that TiDB might send coprocessor requests when executing the `SHOW ↵ COLUMNS` statement [#36496](#) [@tangenta](#)
  - Fix a bug that TiDB might return the invalid memory address or nil ↵ `pointer dereference` error when executing the `SHOW WARNINGS` statement [#31569](#) [@zyguan](#)

- Fix a bug that in the static partition prune mode, SQL statements with an aggregate condition might return wrong result when the table is empty [#35295](#) @tiancaiamao
  - Fix the issue that the Join Reorder operation will mistakenly push down its Outer Join condition [#37238](#) @winoros
  - Fix the issue that CTE-schema hash code is cloned mistakenly, which causes the `Can't find column ... in schema ...` error when CTE is referenced more than once [#35404](#) @AilinKid
  - Fix the issue that the wrong join reorder in some right outer join scenarios causes wrong query result [#36912](#) @winoros
  - Fix the issue of incorrectly inferred null flag of the TiFlash `firstrow` aggregate function in the `EqualAll` case [#34584](#) @fixdb
  - Fix the issue that Plan Cache does not work when a binding is created with the `IGNORE_PLAN_CACHE` hint [#34596](#) @fzzf678
  - Fix the issue that an `EXCHANGE` operator is missing between the hash-partition window and the single-partition window [#35990](#) @LittleFall
  - Fix the issue that partitioned tables cannot fully use indexes to scan data in some cases [#33966](#) @mjonss
  - Fix the issue of wrong query result when a wrong default value is set for partial aggregation after the aggregation is pushed down [#35295](#) @tiancaiamao
  - Fix the issue that querying partitioned tables might get the `index-out-of-range` error in some cases [#35181](#) @mjonss
  - Fix the issue that a partition is incorrectly pruned if a partition key is used in the query condition and the collate is different from the one in the query partition table [#32749](#) @mjonss
  - Fix the issue that when TiDB Binlog is enabled, executing the `ALTER SEQUENCE`  $\leftrightarrow$  statement might cause a wrong metadata version and cause Drainer to exit [#36276](#) @AilinKid
  - Fix the issue of incorrect TiDB status that might appear on startup in some extreme cases [#36791](#) @xhebox
  - Fix the potential `UnknownPlanID` issue that occurs when querying the execution plans for partitioned tables in TiDB Dashboard [#35153](#) @time-and-fate
  - Fix the issue that the column list does not work in the `LOAD DATA` statement [#35198](#) @SpadeA-Tang
  - Fix the issue of the `data and columnID count not match` error that occurs when inserting duplicated values with TiDB Binlog enabled [#33608](#) @zyguan
  - Remove the limitation of `tidb_gc_life_time` [#35392](#) @TonsnakeLin
  - Fix the `LOAD DATA` statement dead loop when an empty filed terminator is used [#33298](#) @zyguan
  - Avoid sending requests to unhealthy TiKV nodes to improve availability [#34906](#) @sticnarf
- TiKV
    - Fix a bug that Regions might be overlapped if Raftstore is busy [#13160](#) @5kbpers

- Fix the issue that PD does not reconnect to TiKV after the Region heartbeat is interrupted [#12934](#) @bufferflies
  - Fix the issue that TiKV panics when performing type conversion for an empty string [#12673](#) @wshwsh12
  - Fix the issue of inconsistent Region size configuration between TiKV and PD [#12518](#) @5kbpers
  - Fix the issue that encryption keys are not cleaned up when Raft Engine is enabled [#12890](#) @tabokie
  - Fix the panic issue that might occur when a peer is being split and destroyed at the same time [#12825](#) @BusyJay
  - Fix the panic issue that might occur when the source peer catches up logs by snapshot in the Region merge process [#12663](#) @BusyJay
  - Fix the issue of frequent PD client reconnection that occurs when the PD client meets an error [#12345](#) @Connor1996
  - Fix potential panic when parallel recovery is enabled for Raft Engine [#13123](#) @tabokie
  - Fix the issue that the Commit Log Duration of a new Region is too high, which causes QPS to drop [#13077](#) @Connor1996
  - Fix rare panics when Raft Engine is enabled [#12698](#) @tabokie
  - Avoid redundant log warnings when proc filesystem (procf) cannot be found [#13116](#) @tabokie
  - Fix the wrong expression of Unified Read Pool CPU in dashboard [#13086](#) @glorv
  - Fix the issue that when a Region is large, the default `region-split-check-diff` might be larger than the bucket size [#12598](#) @tonyxuqqi
  - Fix the issue that TiKV might panic when Apply Snapshot is aborted and Raft Engine is enabled [#12470](#) @tabokie
  - Fix the issue that the PD client might cause deadlocks [#13191](#) @bufferflies [#12933](#) @BurtonQin
- PD
    - Fix the issue that the online progress is inaccurate when label configurations of cluster nodes are invalid [#5234](#) @rleungx
    - Fix PD panics caused by the issue that gRPC handles errors inappropriately when `enable-forwarding` is enabled [#5373](#) @bufferflies
    - Fix the issue that `/regions/replicated` might return a wrong status [#5095](#) @rleungx
  - TiFlash
    - Fix the issue that TiFlash crashes after dropping a column of a table with clustered indexes in some situations [#5154](#) @hongyunyan
    - Fix the issue that the `format` function might return a `Data truncated` error [#4891](#) @xzhangxian1008

- Fix the issue that some obsolete data might persist in storage and cannot be deleted [#5659](#) @lidezhu
  - Fix unnecessary CPU usage in some edge cases [#5409](#) @breezewish
  - Fix a bug that TiFlash cannot work in a cluster using IPv6 [#5247](#) @solotzg
  - Fix a bug that TiFlash might crash due to an error in parallel aggregation [#5356](#) @gengliqi
  - Fix a bug that thread resources might leak in case of MinTSOScheduler query errors [#5556](#) @windtalker
- Tools
    - TiDB Lightning
      - \* Fix the issue that TiDB Lightning fails to connect to TiDB when TiDB uses an IPv6 host [#35880](#) @D3Hunter

      - \* Fix the wrong maximum compatible version number [#6039](#) @hi-rustin
      - \* Fix a bug that may cause the cdc server to panic when it receives an HTTP request before it fully starts [#5639](#) @asddongmen
      - \* Fix the ddl sink panic issue when the changefeed sync-point is enabled [#4934](#) @asddongmen
      - \* Fix the issue that a changefeed is stuck in some scenarios when sync-point is enabled [#6827](#) @hicqu

- \* Fix a bug that changefeed API does not work properly after the cdc server restarts [#5837](#) [@asddongmen](#)
- \* Fix the data race issue in the black hole sink [#6206](#) [@asddongmen](#)
- \* Fix the TiCDC panic issue when you set `enable-old-value = false` [#6198](#) [@hi-rustin](#)
- \* Fix the data consistency issue when the redo log feature is enabled [#6189](#) [#6368](#) [#6277](#) [#6456](#) [#6695](#) [#6764](#) [#6859](#) [@asddongmen](#)
- \* Fix poor redo log performance by writing redo events asynchronously [#6011](#) [@CharlesCheung96](#)
- \* Fix the issue that the MySQL sink cannot connect to IPv6 addresses [#6135](#) [@hi-rustin](#)
- Backup & Restore (BR)
  - \* Fix a bug that BR reports `ErrRestoreTableIDMismatch` in RawKV mode [#35279](#) [@3pointer](#)
  - \* Adjust the backup data directory structure to fix backup failure caused by S3 rate limiting in large cluster backup [#30087](#) [@MoCuishle28](#)
  - \* Fix incorrect backup time in the summary log [#35553](#) [@ixuh12](#)
- Dumping
  - \* Fix the issue that GetDSN does not support IPv6 [#36112](#) [@D3Hunter](#)
- TiDB Binlog
  - \* Fix a bug that Drainer cannot send requests correctly to Pump when `compressor` is set to `gzip` [#1152](#) [@lichunzhu](#)

### 16.10.7 TiDB 6.1.0 Release Notes

Release date: June 13, 2022

TiDB version: 6.1.0

Quick access: [Quick start](#) | [Production deployment](#) | [Installation packages](#)

In 6.1.0, the key new features or improvements are as follows:

- List partitioning and list COLUMNS partitioning become GA, compatible with MySQL 5.7
- TiFlash partitioned table (dynamic pruning) becomes GA
- Support user-level lock management, compatible with MySQL
- Support non-transactional DML statements (only support DELETE)
- TiFlash supports on-demand data compaction
- MPP introduces the window function framework
- TiCDC supports replicating changelogs to Kafka via Avro
- TiCDC supports splitting large transactions during replication, which significantly reduces replication latency caused by large transactions
- The optimistic mode for merging and migrating sharded tables becomes GA

## 16.10.7.1 New Features

### 16.10.7.1.1 SQL

- List partitioning and list COLUMNS partitioning become GA. Both are compatible with MySQL 5.7.

User documents: [List partitioning](#), [List COLUMNS partitioning](#)

- TiFlash supports initiating a compact command. (experimental)

TiFlash v6.1.0 introduces the `ALTER TABLE ... COMPACT` statement, which provides a manual way to compact physical data based on the existing background compaction mechanism. With this statement, you can update data in earlier formats and improve read/write performance any time as appropriate. It is recommended that you execute this statement to compact data after upgrading your cluster to v6.1.0. This statement is an extension of the standard SQL syntax and therefore is compatible with MySQL clients. For scenarios other than TiFlash upgrade, usually there is no need to use this statement.

[User document](#), [#4145](#)

- TiFlash implements the window function framework and supports the following window functions:

- `RANK()`
- `DENSE_RANK()`
- `ROW_NUMBER()`

[User document](#), [#33072](#)

### 16.10.7.1.2 Observability

- Continuous Profiling supports the ARM architecture and TiFlash.

[User document](#)

- Grafana adds a Performance Overview dashboard to provide a system-level entry for overall performance diagnosis.

As a new dashboard in the TiDB visualized monitoring component Grafana, Performance Overview provides a system-level entry for overall performance diagnosis. According to the top-down performance analysis methodology, the Performance Overview dashboard reorganizes TiDB performance metrics based on database time breakdown and displays these metrics in different colors. By checking these colors, you can identify performance bottlenecks of the entire system at the first glance, which significantly reduces performance diagnosis time and simplifies performance analysis and diagnosis.

[User document](#)

### 16.10.7.1.3 Performance

- Support customized Region size (experimental)

Setting Regions to a larger size can effectively reduce the number of Regions, make Regions easier to manage, and improve the cluster performance and stability. This feature introduces the concept of bucket, which is a smaller range within a Region. Using buckets as the query unit can optimize concurrent query performance when Regions are set to a larger size. Using buckets as the query unit can also dynamically adjust the sizes of hot Regions to ensure the scheduling efficiency and load balance. This feature is currently experimental. It is not recommended to use it in production environments.

[User document](#), [#11515](#)

- Use Raft Engine as the default log storage engine

Since v6.1.0, TiDB uses Raft Engine as the default storage engine for logs. Compared with RocksDB, Raft Engine can reduce TiKV I/O write traffic by up to 40% and CPU usage by 10%, while improving foreground throughput by about 5% and reducing tail latency by 20% under certain loads.

[User document](#), [#95](#)

- Support the join order hint syntax

- The **LEADING** hint reminds the optimizer to use the specified order as the prefix of join operations. A good prefix of join can quickly reduce the amount of data at the early phase of join and improve the query performance.
- The **STRAIGHT\_JOIN** hint reminds the optimizer to join tables in an order that is consistent with the order of tables in the **FROM** clause.

This provides a method for you to fix the order of table joins. A proper use of the hints can effectively enhance the SQL performance and cluster stability.

User document: [LEADING](#), [STRAIGHT\\_JOIN](#), [#29932](#)

- TiFlash supports four more functions:

- **FROM\_DAYS**
- **TO\_DAYS**
- **TO\_SECONDS**
- **WEEKOFYEAR**

[User document](#), [#4679](#), [#4678](#), [#4677](#)

- TiFlash supports partitioned tables in dynamic pruning mode.

To enhance performance in OLAP scenarios, dynamic pruning mode is supported for partitioned tables. If your TiDB is upgraded from versions earlier than v6.0.0, it is

recommended that you manually update statistics of existing partitioned tables, so as to maximize the performance (not required for new installations or new partitions created after upgrade to v6.1.0).

User documents: [Access partitioned tables in the MPP mode](#), [Dynamic pruning mode](#), [#3873](#)

#### 16.10.7.1.4 Stability

- Automatic recovery from SST corruption

When RocksDB detects a damaged SST file in the background, TiKV will try to schedule the affected Peer and recover its data using other replicas. You can set the maximum allowable time for the recovery using the `background-error-recovery-window` parameter. If the recovery operation is not completed within the time window, TiKV will panic. This feature automatically detects and recovers recoverable damaged storage, thus improving the cluster stability.

[User document](#), [#10578](#)

- Support non-transactional DML statement

In the scenarios of large data processing, a single SQL statement with a large transaction might have a negative impact on the cluster stability and performance. Since v6.1.0, TiDB supports providing a syntax in which a `DELETE` statement is split into multiple statements for batch processing. The split statements compromise transactional atomicity and isolation but greatly improve the cluster stability. For detailed syntax, see [BATCH](#).

[User document](#)

- TiDB supports configuring the maximum GC wait time

The transaction of TiDB adopts the Multi-Version Concurrency Control (MVCC) mechanism. When the newly written data overwrites the old data, the old data is not replaced, and both versions of data are stored. The old data is cleaned up by the Garbage Collection (GC) task periodically, which helps reclaim storage space to improve the performance and stability of the cluster. GC is triggered every 10 minutes by default. To ensure that long-running transactions can access the corresponding historical data, when there are transactions in execution, the GC task is delayed. To ensure that the GC task is not delayed indefinitely, TiDB introduces the system variable `tidb_gc_max_wait_time` to control the maximum delay time of the GC task. If the maximum delay time is exceeded, the GC will be forcibly executed. The default value of the variable is 24 hours. This feature enables you to control the relationship between the GC waiting time and the long-running transaction, which improves the stability of the cluster.

[User document](#)

- TiDB supports configuring the maximum execution time for automatic statistics collection tasks

Databases can effectively understand the distribution of data by collecting statistics, which helps generate reasonable execution plans and improve the efficiency of SQL execution. TiDB regularly collects statistics on frequently changed data objects in the background. However, collecting statistics takes up cluster resources and might affect the stable operation of the business during business peaks.

Starting from v6.1.0, TiDB introduces `tidb_max_auto_analyze_time` to control the maximum execution time for background statistics collection, which is 12 hours by default. When the application does not encounter a resource bottleneck, it is recommended not to modify this variable so that TiDB can timely collect statistics.

[User document](#)

#### 16.10.7.1.5 Ease of use

- Support a one-stop online data recovery when multiple replicas are lost

Before TiDB v6.1.0, when multiple Region replicas are lost because of machine failure, users have to stop all TiKV servers and use TiKV Control to recover TiKV one by one. Since TiDB v6.1.0, the recovery process is fully automated, does not require to stop TiKV, and does not affect other applications online. The recovery process can be triggered using PD Control and provides a more user-friendly summary information.

[User document](#), [#10483](#)

- Support viewing history statistics collection tasks

You can use the `SHOW ANALYZE STATUS` statement to show cluster-level statistics collection tasks. Before TiDB v6.1.0, the `SHOW ANALYZE STATUS` statement shows instance-level tasks only, and history task records are cleared after a TiDB restart. Therefore, you cannot view history statistics collection time and details. Starting from TiDB v6.1.0, history records of statistics collection tasks are persisted and can be queried after a cluster restart, which provides a reference for troubleshooting query performance issues caused by statistics anomalies.

[User document](#)

- Support modifying TiDB, TiKV, and TiFlash configurations dynamically

In earlier TiDB versions, after modifying a configuration item, you must restart the cluster to make the modification effective. This might interrupt online services. To address this issue, TiDB v6.1.0 introduces the dynamic configuration feature, which allows you to validate a parameter change without restarting the cluster. The specific optimizations are as follows:

- \* Transform some TiDB configuration items to system variables, so that they
  - ↳ can be modified dynamically and persisted. Note that the original
  - ↳ configuration items are deprecated after transformation. For a
  - ↳ detailed list of the transformed configuration items, see [[Configuration file parameters](#)](#configuration-file-parameters).
- \* Support configuring some TiKV parameters online. For a detailed list of
  - ↳ the parameters, see [[Others](#)](#others).
- \* Transform the TiFlash configuration item `max_threads`` to a system
  - ↳ variable `tidb_max_tiflash_threads``, so that the configuration can be
  - ↳ modified dynamically and persisted. Note that the original
  - ↳ configuration item remains after transformation.

For v6.1.0 clusters upgraded (including online and offline upgrades) from earlier versions, note that:

- \* If the configuration items specified in the configuration file before the
  - ↳ upgrade already exist, TiDB will automatically update the values of
  - ↳ the configured items to those of the corresponding system variables
  - ↳ during the upgrade process. In this way, after the upgrade, the
  - ↳ system behavior is not affected by parameter optimization.
- \* The automatic update mentioned above occurs only once during the upgrade.
  - ↳ After the upgrade, the deprecated configuration items are no longer
  - ↳ effective.

This feature allows you to modify parameters dynamically, and validate and persist them, instead of restarting the system and interrupting services. This makes your daily maintenance easier.

### User document

- Support killing queries or connections globally

You can control the Global Kill feature using the `enable-global-kill` configuration (enabled by default).

Before TiDB v6.1.0, when an operation consumes a lot of resources and causes cluster stability issues, you have to connect to the target TiDB instance and then run the `KILL TIDB ${id};` command to terminate the target connection and operation. In the case of many TiDB instances, this method is not easy to use and prone to wrong operations. Starting from v6.1.0, the `enable-global-kill` configuration is introduced and enabled by default. You can run the kill command in any TiDB instance to terminate a specified connection and operation, without worrying about incorrectly terminating other queries or sessions by mistake when there is a proxy between the client and TiDB. Currently, TiDB does not support using Ctrl+C to terminate queries or sessions.

[User document](#), [#8854](#)

- TiKV API V2 (experimental)

Before v6.1.0, when TiKV is used as Raw Key Value storage, TiKV only provides basic Key Value read and write capability because it only stores the raw data passed in by the client.

TiKV API V2 provides a new Raw Key Value storage format and access interface, including:

- The data is stored in MVCC and the change timestamp of the data is recorded. This feature will lay the foundation for implementing Change Data Capture and incremental backup and restore.
- Data is scoped according to different usage and supports co-existence of a single TiDB cluster, Transactional KV, RawKV applications.

Due to significant changes in the underlying storage format, after enabling API V2, you cannot roll back a TiKV cluster to a version earlier than v6.1.0. Downgrading TiKV might result in data corruption.

```
[User document](#api-version-new-in-v610), [#11745](https://github.com/tikv/tikv/issues/11745)
```

#### 16.10.7.1.6 MySQL compatibility

- Support compatibility with user-level lock management with MySQL

User-level locks are a user-named lock management system provided by MySQL through built-in functions. The locking functions can provide lock blocking, waiting, and other lock management capabilities. User-level locks are also widely used in ORM frameworks, such as Rails, Elixir, and Ecto. Since v6.1.0, TiDB has supported MySQL-compatible user-level lock management, and supports `GET_LOCK`, `RELEASE_LOCK`, and `RELEASE_ALL_LOCKS` functions.

[User document](#), [#14994](#)

#### 16.10.7.1.7 Data migration

- The optimistic mode for merging and migrating sharded tables becomes GA

DM adds a large number of scenario tests for tasks that merge and migrate data from sharded tables in the optimistic mode, which covers 90% of the daily use scenarios. Compared with the pessimistic mode, the optimistic mode is simpler and more efficient to use. It is recommended to use the optimistic mode preferably after you are familiar with the usage notes.

[User document](#)

- DM WebUI supports starting a task according to the specified parameters

When starting a migration task, you can specify a start time and a safe mode duration. This is especially useful when you create an incremental migration task with lots of sources, eliminating the need to specify the binlog start position specifically for each source.

[User document, #5442](#)

#### 16.10.7.1.8 TiDB data share subscription

- TiDB supports data sharing with various third-party data ecosystems
  - TiCDC supports sending TiDB incremental data to Kafka in the Avro format, allowing data sharing with third-parties, such as KSQL and Snowflake via Confluent.

[User document, #5338](#)

- TiCDC supports dispatching incremental data from TiDB to different Kafka topics by table, which, combined with the Canal-json format, allows sharing data directly with Flink.

[User document, #4423](#)

- TiCDC supports SASL GSSAPI authentication types and adds SASL authentication examples using Kafka.

[User document, #4423](#)

- TiCDC supports replicating `charset=GBK` tables.

[User document, #4806](#)

### 16.10.7.2 Compatibility changes

#### 16.10.7.2.1 System variables

Variable name	Change type	Description
<code>tidb_enable_tight_partition</code>	Modify	The default value is changed from OFF to ON.
<code>tidb_enable_query</code>	Modify	This variable adds the GLOBAL scope, and the variable value persists to the cluster.

Variable name	Change type	Description
<code>tidb_query_max_len</code>	Modified	<p>The variable scope is changed from INSTANCE to GLOBAL. The variable value persists to the cluster, and the value range is changed to [0, 1073741824].</p>

Variable name	Change type	Description
<code>require_new_transport</code>	Newly added	This setting was previously a <code>tidb</code> option (security) but changed to a system variable starting from TiDB v6.1.0.

Variable name	Change type	Description
<code>tidb_newly_added</code>	Newly added	This concurrency setting was previously a <code>tidb</code> option (performance), but changed to a system variable starting from TiDB v6.1.0.

Variable name	Change type	Description
<code>tidb_enable_analyze</code>	Newly Added	This setting was previously a <code>tidb</code> option (run <code>show variables like 'tidb_%%';</code> to see the list of options), but changed to a system variable starting from TiDB v6.1.0.

Variable name	Change type	Description
<code>tidb_enable_this_only_full_group_by_check</code>	Newly added	This variable controls the behavior when TiDB performs the ONLY_FULL_GROUP_BY check.

Variable name	Change type	Description
<code>tidb_enable_new_join_reorder</code>	Newly Added	<p>↪ added v6.1.0, the Join Re-order algorithm of TiDB supports Outer Join. This variable controls the support behavior, and the default value is ON.</p>

Variable name	Change type	Description
<code>tidb_enable_prepared_plan_cache</code>	Newly Added	This setting was previously a <code>tidb</code> option (prepared plan cache enabled), but changed to a system variable starting from TiDB v6.1.0.

Variable name	Change type	Description
<code>tidb_gc_</code>	Newly Added	This time
↪	added	variable used to set the maximum time of GC safe point blocked by uncommitted transactions.

Variable name	Change type	Description
<code>tidb_newly_analyze_time</code>	Added	variable is used to specify the maximum execution time of auto-analyze.
<code>tidb_newly_flash_threads</code>	Added	variable is used to set the maximum concurrency for TiFlash to execute a request.

Variable name	Change type	Description
<code>tidb_newly_initialized</code>	added	<p>↪ setting was previously a <code>tidb</code> ↪ . ↪ <code>toml</code> ↪ option (oom ↪ - ↪ <code>action</code> ↪ ), but changed to a system variable starting from TiDB v6.1.0.</p>

Variable name	Change type	Description
<code>tidb_newly_analyze</code>	added	variable controls the maximum memory usage when TiDB updates statistics, including manually executed <b>ANALYZE</b> <code>TABLE</code> by users and automatic analyze tasks in the TiDB background.

Variable name	Change type	Description
<code>tidb_new_transaction_ignore_error</code>	Newly added	This variable specifies whether to return error immediately when an error occurs in a non-transactional DML statement.

Variable name	Change type	Description
<code>tidb_plan_cache_memory_guard_ratio</code>	Newly added	This setting was previously a <code>tidb</code> <code>→ .</code> <code>→ toml</code> <code>→</code> option (prepared <code>→ -</code> <code>→ plan</code> <code>→ -</code> <code>→ cache</code> <code>→ .</code> <code>→ memory</code> <code>→ -</code> <code>→ guard</code> <code>→ -</code> <code>→ ratio</code> <code>→</code> ), but changed to a system variable starting from TiDB v6.1.0.

Variable name	Change type	Description
<code>tidb_plan_cache_size</code>	Newly added	This setting was previously a <code>tidb</code> <code>→ .</code> <code>→ toml</code> <code>→</code> option (prepared <code>→ -</code> <code>→ plan</code> <code>→ -</code> <code>→ cache</code> <code>→ .</code> <code>→ capacity</code> <code>→</code> ), but changed to a system variable starting from TiDB v6.1.0.

---

Variable name	Change type	Description
<code>tidb_stats_mem_quota</code>	Newly added	This sets the memory quota for the TiDB statistics cache.

---

#### 16.10.7.2.2 Configuration file parameters

Configuration file	Change type	Description
TiDB committer	Deleted	Replaced by <code>concurrency</code> system variable <code>tidb_committer_concurrency</code> .
	↔ -	
	↔ <code>concurrency</code>	
	↔	This configuration item is no longer valid, if you want to modify the value, you need to modify the corresponding system variable.

### 16.10.7.2.3 Others

- Enable Prepared Plan Cache by default

Prepared Plan Cache is enabled by default in new clusters to cache the execution plans for `Prepare` / `Execute` requests. In the subsequent execution, query plan optimization can be skipped and thus leads to a performance boost. Upgraded clusters inherit the configuration from the configuration file. New clusters use the new default values, which means Prepared Plan Cache is enabled by default and each session can cache 100 plans at most (`capacity=100`). For the memory consumption of this feature, see [memory management of Prepared Plan Cache](#).

- Prior to TiDB v6.1.0, `SHOW ANALYZE STATUS` shows instance-level tasks and the task records are cleared after TiDB restarts. Since TiDB v6.1.0, `SHOW ANALYZE STATUS` ↔ shows cluster-level tasks, and the task records persist after the restart. When `tidb_analyze_version = 2`, the `Job_info` column adds the `analyze` option information.
- Damaged SST files in TiKV might cause the TiKV process to panic. Before TiDB v6.1.0, damaged SST files caused TiKV to panic immediately. Since TiDB v6.1.0, the TiKV process will panic 1 hour after SST files are damaged.
- The following TiKV configuration items support [modifying values dynamically](#):
  - `raftstore.raft-entry-max-size`
  - `quota.foreground-cpu-time`

- `quota.foreground-write-bandwidth`
  - `quota.foreground-read-bandwidth`
  - `quota.max-delay-duration`
  - `server.grpc-memory-pool-quota`
  - `server.max-grpc-send-msg-len`
  - `server.raft-msg-max-batch-size`
- In v6.1.0, some configuration file parameters are converted to system variables. For v6.1.0 clusters upgraded (including online and offline upgrades ) from earlier versions, note that:
    - If the configuration items specified in the configuration file before the upgrade already exist, TiDB will automatically update the values of the configured items to those of the corresponding system variables during the upgrade process. In this way, after the upgrade, the system behavior does not change thanks to parameter optimization.
    - The automatic update mentioned above occurs only once during the upgrade. After the upgrade, the deprecated configuration items are no longer effective.
  - The Dashboard page is removed from DM WebUI.
  - When `dispatchers.topic` and `dispatchers.partition` are enabled, TiCDC cannot be downgraded to versions earlier than v6.1.0.
  - TiCDC Changefeed using the Avro protocol cannot be downgraded to versions earlier than v6.1.0.

### 16.10.7.3 Improvements

- TiDB
  - Improve the performance of the `UnionScanRead` operator [#32433](#)
  - Improve the display of task types in the output of `EXPLAIN` (add the MPP task type) [#33332](#)
  - Support using `rand()` as the default value of a column [#10377](#)
  - Support using `uuid()` as the default value of a column [#33870](#)
  - Support modifying the character set of columns from `latin1` to `utf8/utf8mb4` [#34008](#)
- TiKV
  - Improve the old value hit rate of CDC when using in-memory pessimistic lock [#12279](#)
  - Improve the health check to detect unavailable Raftstore, so that the TiKV client can update Region Cache in time [#12398](#)
  - Support setting memory limit on Raft Engine [#12255](#)

- TiKV automatically detects and deletes the damaged SST files to improve the product availability [#10578](#)
- CDC supports RawKV [#11965](#)
- Support splitting a large snapshot file into multiple files [#11595](#)
- Move the snapshot garbage collection from Raftstore to background thread to prevent snapshot GC from blocking Raftstore message loops [#11966](#)
- Support dynamic setting of the the maximum message length (`max-grpc-send`  $\leftrightarrow$  `-msg-len`) and the maximum batch size of gPRC messages (`raft-msg-max-`  $\leftrightarrow$  `batch-size`) [#12334](#)
- Support executing online unsafe recovery plan through Raft [#10483](#)
- PD
  - Support time-to-live (TTL) for region labels [#4694](#)
  - Support Region Buckets [#4668](#)
  - Disable compiling swagger server by default [#4932](#)
- TiFlash
  - Optimize memory calculation for an aggregate operator so that a more efficient algorithm is used in the merge phase [#4451](#)
- Tools
  - Backup & Restore (BR)
    - \* Support backing up and restoring empty databases [#33866](#)
  - TiDB Lightning
    - \* Optimize Scatter Region to batch mode to improve the stability of the Scatter Region process [#33618](#)
  - TiCDC
    - \* TiCDC supports splitting large transactions during replication, which significantly reduces replication latency caused by large transactions [#5280](#)

#### 16.10.7.4 Bug fixes

- TiDB
  - Fix the issue of possible panic that might occur when the `in` function processes the `bit` type data [#33070](#)
  - Fix the issue of wrong query result because the `UnionScan` operator cannot maintain the order [#33175](#)
  - Fix the issue that the Merge Join operator gets wrong results in certain cases [#33042](#)

- Fix the issue that the `index join` result might be wrong in the dynamic pruning mode [#33231](#)
  - Fix the issue that data might not be garbage-collected when some partitions of a partitioned table is dropped [#33620](#)
  - Fix the issue that some DDL statements might be stuck for a period after the PD node of a cluster is replaced [#33908](#)
  - Fix the issue that the TiDB server might run out of memory when the `INFORMATION_SCHEMA.CLUSTER_SLOW_QUERY` table is queried. This issue can be triggered when you check slow queries on the Grafana dashboard [#33893](#)
  - Fix the issue that the system variable `max_allowed_packet` does not take effect [#31422](#)
  - Fix the issue of memory leak in the TopSQL module [#34525](#) [#34502](#)
  - Fix the issue that the Plan Cache might be wrong on the PointGet plan [#32371](#)
  - Fix the issue that query result might be wrong when Plan Cache is started in the RC isolation level [#34447](#)
- TiKV
    - Fix the issue that the Raft log lag is increasing when a TiKV instance is taken offline [#12161](#)
    - Fix the issue that TiKV panics and destroys peers unexpectedly because the target Region to be merged is invalid [#12232](#)
    - Fix the issue that TiKV reports the `failed to load latest options` error when upgrading from v5.3.1 or v5.4.0 to v6.0.0 or later versions [#12269](#)
    - Fix the issue of OOM caused by appending Raft logs when the memory resource is insufficient [#11379](#)
    - Fix the issue of TiKV panic caused by the race between destroying peers and batch splitting Regions [#12368](#)
    - Fix the issue of TiKV memory usage spike in a short time after `stats_monitor` falls into a dead loop [#12416](#)
    - Fix the issue that TiKV reports the `invalid store ID 0` error when using Follower Read [#12478](#)
- PD
    - Fix the wrong status code of `not leader` [#4797](#)
    - Fix a bug of TSO fallback in some corner cases [#4884](#)
    - Fix the issue that a removed tombstone store appears again after the PD leader transfer [#4941](#)
    - Fix the issue that scheduling cannot start immediately after the PD leader transfer [#4769](#)
- TiDB Dashboard
    - Fix a bug that Top SQL cannot collect the CPU overhead of the SQL statements that were running before the Top SQL feature is enabled [#33859](#)

- TiFlash
  - Fix potential data inconsistency after a lot of INSERT and DELETE operations [#4956](#)
- Tools
  - TiCDC
    - \* Fix excessive memory usage by optimizing the way DDL schemas are buffered [#1386](#)
    - \* Fix data loss that occurs in special incremental scanning scenarios [#5468](#)
  - TiDB Data Migration (DM)
    - \* Fix the `start-time` time zone issue and change DM behavior from using the downstream time zone to using the upstream time zone [#5271](#)
    - \* Fix the issue that DM occupies more disk space after the task automatically resumes [#3734](#) [#5344](#)
    - \* Fix the problem that checkpoint flush may cause the data of failed rows to be skipped [#5279](#)
    - \* Fix the issue that in some cases manually executing the filtered DDL in the downstream might cause task resumption failure [#5272](#)
    - \* Fix an issue that the uppercase table cannot be replicated when `case-sensitive: true` is not set [#5255](#)
    - \* Fix the DM worker panic issue that occurs when the primary key is not first in the index returned by the `SHOW CREATE TABLE` statement [#5159](#)
    - \* Fix the issue that CPU usage may increase and a large amount of log is printed when GTID is enabled or when the task is automatically resumed [#5063](#)
    - \* Fix the offline option and other usage issues in DM WebUI [#4993](#)
    - \* Fix the issue that incremental tasks fail to start when GTID is empty in the upstream [#3731](#)
    - \* Fix the issue that empty configurations may cause dm-master to panic [#3732](#)
  - TiDB Lightning
    - \* Fix the issue that the precheck does not check local disk resources and cluster availability [#34213](#)
    - \* Fix the issue of incorrect routing for schemas [#33381](#)
    - \* Fix the issue that the PD configuration is not restored correctly when TiDB Lightning panics [#31733](#)
    - \* Fix the issue of Local-backend import failure caused by out-of-bounds data in the `auto_increment` column [#29737](#)
    - \* Fix the issue of local backend import failure when the `auto_random` or `auto_increment` column is null [#34208](#)

## 16.11 v6.0

### 16.11.1 TiDB 6.0.0 Release Notes

Release date: April 7, 2022

TiDB version: 6.0.0-DMR

#### Note:

The TiDB 6.0.0-DMR documentation has been [archived](#). PingCAP encourages you to use [the latest LTS version](#) of the TiDB database.

In 6.0.0-DMR, the key new features or improvements are as follows:

- Support placement rules in SQL to provide more flexible management for data placement.
- Add a consistency check between data and indexes at the kernel level, which improves system stability and robustness, with only very low resource overhead.
- Provide Top SQL, a self-serving database performance monitoring and diagnosis feature for non-experts.
- Support Continuous Profiling that collects cluster performance data all the time, reducing MTTR for technical experts.
- Cache hotspot small tables in memory, which greatly improves the access performance, improves the throughput and reduces access latency.
- Optimize in-memory pessimistic locking. Under the performance bottleneck caused by pessimistic locks, memory optimization for pessimistic locks can effectively reduce latency by 10% and increase QPS by 10%.
- Enhance prepared statements to share execution plans, which lessens CPU resource consumption and improves SQL execution efficiency.
- Improve the computing performance of the MPP engine by supporting pushing down more expressions and the general availability (GA) of the elastic thread pool.
- Add DM WebUI to facilitate managing a large number of migration tasks.
- Improve the stability and efficiency of TiCDC when replicating data in large clusters. TiCDC now supports replicating 100,000 tables simultaneously.
- Accelerate leader balancing after restarting TiKV nodes, which improves the speed of business recovery after a restart.
- Support canceling the automatic update of statistics, which reduces resource contention and limits the impact on SQL performance.
- Provide PingCAP Clinic, an automatic diagnosis service for TiDB clusters (Technical Preview version).
- Provide TiDB Enterprise Manager, an enterprise-level database management platform.

Also, as a core component of TiDB's HTAP solution, TiFlash™ is officially open source in this release. For details, see [TiFlash repository](#).

### 16.11.1.1 Release strategy changes

Starting from TiDB v6.0.0, TiDB provides two types of releases:

- Long-Term Support Releases

Long-Term Support (LTS) releases are released approximately every six months. An LTS release introduces new features and improvements, and accepts patch releases within its release lifecycle. For example, v6.1.0 will be an LTS release.

- Development Milestone Releases

Development Milestone Releases (DMR) are released approximately every two months. A DMR introduces new features and improvements, but does not accept patch releases. It is not recommended for users to use DMR in production environments. For example, v6.0.0-DMR is a DMR.

TiDB v6.0.0 is a DMR, and its version is 6.0.0-DMR.

### 16.11.1.2 New features

#### 16.11.1.2.1 SQL

- SQL-based placement rules for data

TiDB is a distributed database with excellent scalability. Usually, data is deployed across multiple servers or even multiple data centers. Therefore, data scheduling management is one of the most important basic capabilities of TiDB. In most cases, users do not need to care about how to schedule and manage data. However, with the increasing application complexity, deployment changes caused by isolation and access latency have become new challenges for TiDB. Since v6.0.0, TiDB officially provides data scheduling and management capabilities based on SQL interfaces. It supports flexible scheduling and management in dimensions such as replica counts, role types, and placement locations for any data. TiDB also supports more flexible management for data placement in multi-service shared clusters and cross-AZ deployments.

[User document](#)

- Support building TiFlash replicas by databases. To add TiFlash replicas for all tables in a database, you only need to use a single SQL statement, which greatly saves operation and maintenance costs.

[User document](#)

### 16.11.1.2.2 Transaction

- Add a check for data index consistency at the kernel level

Add a check for data index consistency when a transaction is executed, which improves system stability and robustness, with only very low resource overhead. You can control the check behavior using the `tidb_enable_mutation_checker` and `tidb_txn_assertion_level` variables. With the default configuration, the QPS drop is controlled within 2% in most scenarios. For the error description of the consistency check, see [user document](#).

### 16.11.1.2.3 Observability

- Top SQL: Performance diagnosis for non-experts

Top SQL is a self-serving database performance monitoring and diagnosis feature in TiDB Dashboard, for DBAs and App developers, which is now generally available in TiDB v6.0.

Unlike existing diagnostic features for experts, Top SQL is designed for non-experts: you do not need to traverse thousands of monitoring charts to find correlations or understand TiDB internal mechanisms such as Raft Snapshot, RocksDB, MVCC, and TSO. To use Top SQL for analyzing database load quickly and improving App performance, only basic database knowledge (such as index, lock conflict, and execution plans) is needed.

Top SQL is not enabled by default. When enabled, Top SQL provides you with the real-time CPU load of each TiKV or TiDB node. Therefore, you can spot SQL statements consuming high CPU loads at first glimpse, and quickly analyze the issues such as database hotspots and sudden load increases. For example, you can use Top SQL to pinpoint and diagnose an unusual query that consumes 90% CPU of a single TiKV node.

[User documentation](#)

- Support Continuous Profiling

TiDB Dashboard introduces the Continuous Profiling feature, which is now generally available in TiDB v6.0. Continuous profiling is not enabled by default. When enabled, the performance data of individual TiDB, TiKV, and PD instances will be collected all the time, with negligible overhead. With history performance data, technical experts can backtrack and pinpoint the root causes of issues like high memory consumption, even when the issues are difficult to reproduce. In this way, the mean time to recovery (MTTR) can be reduced.

[User document](#)

#### 16.11.1.2.4 Performance

- Cache hotspot small tables

For user applications in scenarios where hotspot small tables are accessed, TiDB supports explicitly caching the hotspot tables in memory, which greatly improves the access performance, improves the throughput, and reduces access latency. This solution can effectively avoid introducing a third-party cache middleware, reduce the complexity of the architecture, and cut the cost of operation and maintenance. The solution is suitable for scenarios where small tables are frequently accessed but rarely updated, such as the configuration tables or exchange rate tables.

[User document, #25293](#)

- In-memory pessimistic locking

Since TiDB v6.0.0, in-memory pessimistic locking is enabled by default. After enabling this feature, pessimistic transaction locks are managed in memory. This avoids persisting pessimistic locks and the Raft replication of the lock information, and greatly reduces the overhead of managing pessimistic transaction locks. Under the performance bottleneck caused by pessimistic locks, memory optimization for pessimistic locks can effectively reduce latency by 10% and increase QPS by 10%.

[User document, #11452](#)

- Optimization to get TSO at the Read Committed isolation level

To reduce query latency, when read-write conflicts are rare, TiDB adds the `tidb_rc_read_check_ts` system variable at the [Read Committed isolation level](#) to get less unnecessary TSO. This variable is disabled by default. When the variable is enabled, this optimization avoids getting duplicated TSO to reduce latency in scenarios where there is no read-write conflict. However, in scenarios with frequent read-write conflicts, enabling this variable might cause a performance regression.

[User document, #33159](#)

- Enhance prepared statements to share execution plans

Reusing SQL execution plans can effectively reduce the time for parsing SQL statements, lessen CPU resource consumption, and improve SQL execution efficiency. One of the important methods of SQL tuning is to reuse SQL execution plans effectively. TiDB has supported sharing execution plans with prepared statements. However, when the prepared statements are closed, TiDB automatically clears the corresponding plan cache. After that, TiDB might unnecessarily parse the repeated SQL statements, affecting the execution efficiency. Since v6.0.0, TiDB supports controlling whether to ignore the `COM_STMT_CLOSE` command through the `tidb_ignore_prepared_cache_close_stmt` parameter (disabled by default). When the parameter is enabled, TiDB ignores the command of closing prepared statements and keeps the execution plan in the cache, improving the reuse rate of the execution plan.

[User document, #31056](#)

- Improve query pushdown

With its native architecture of separating computing from storage, TiDB supports filtering out invalid data by pushing down operators, which greatly reduces the data transmission between TiDB and TiKV and thereby improves the query efficiency. In v6.0.0, TiDB supports pushing down more expressions and the BIT data type to TiKV, improving the query efficiency when computing the expressions and data type.

[User document](#), [#30738](#)

- Optimization of hotspot index

Writing monotonically increasing data in batches to the secondary index causes an index hotspot and affects the overall write throughput. Since v6.0.0, TiDB supports scattering the index hotspot using the `tidb_shard` function to improve the write performance. Currently, `tidb_shard` only takes effect on the unique secondary index. This application-friendly solution does not require modifying the original query conditions. You can use this solution in the scenarios of high write throughput, point queries, and batch point queries. Note that using the data that has been scattered by range queries in the application might cause a performance regression. Therefore, do not use this function in such cases without verification.

[User document](#), [#31040](#)

- Support dynamic pruning mode for partitioned tables in TiFlash MPP engine (experimental)

In this mode, TiDB can read and compute the data on partitioned tables using the MPP engine of TiFlash, which greatly improves the query performance of partitioned tables.

[User document](#)

- Improve the computing performance of the MPP engine

- Support pushing down more functions and operators to the MPP engine

- \* Logical functions: IS, IS NOT

- \* String functions: REGEXP(), NOT REGEXP()

- \* Mathematical functions: GREATEST(int/real), LEAST(int/real)

- \* Date functions: DAYNAME(), DAYOFMONTH(), DAYOFWEEK(), DAYOFYEAR(), LAST\_DAY(), MONTHNAME()

- \* Operators: Anti Left Outer Semi Join, Left Outer Semi Join

[User document](#)

- The elastic thread pool (enabled by default) becomes GA. This feature aims to improve CPU utilization.

[User document](#)

### 16.11.1.2.5 Stability

- Enhance baseline capturing of execution plans

Enhance the usability of baseline capturing of execution plans by adding a blacklist with such dimensions as table name, frequency, and user name. Introduce a new algorithm to optimize memory management for caching bindings. After baseline capturing is enabled, the system automatically creates bindings for most OLTP queries. Execution plans of bound statements are fixed, avoiding performance problems due to any change in the execution plans. Baseline capturing is applicable to scenarios such as major version upgrades and cluster migration, and helps reduce performance problems caused by regression of execution plans.

[User document](#), [#32466](#)

- Support TiKV quota limiter (experimental)

If your machine deployed with TiKV has limited resources and the foreground is burdened by an excessively large amount of requests, background CPU resources are occupied by the foreground, causing TiKV performance unstable. In TiDB v6.0.0, you can use the quota-related configuration items to limit the resources used by the foreground, including CPU and read/write bandwidth. This greatly improves stability of clusters under long-term heavy workloads.

[User document](#), [#12131](#)

- Support the zstd compression algorithm in TiFlash

TiFlash introduces two parameters, `profiles.default.dt_compression_method` and `profiles.default.dt_compression_level`, which allow users to select the optimal compression algorithm based on performance and capacity balance.

[User document](#)

- Enable all I/O checks (Checksum) by default

This feature was introduced in v5.4.0 as experimental. It enhances data accuracy and security without imposing an obvious impact on users' businesses.

Warning: Newer version of data format cannot be downgraded in place to versions earlier than v5.4.0. During such a downgrade, you need to delete TiFlash replicas and replicate data after the downgrade. Alternatively, you can perform a downgrade by referring to [dttool migrate](#).

[User document](#)

- Improve thread utilization

TiFlash introduces asynchronous gRPC and Min-TSO scheduling mechanisms. Such mechanisms ensure more efficient use of threads and avoid system crashes caused by excessive threads.

[User document](#)

### 16.11.1.2.6 Data migration

#### TiDB Data Migration (DM)

- Add WebUI (experimental)

With the WebUI, you can easily manage a large number of migration tasks. On the WebUI, you can:

- View migration tasks on Dashboard
- Manage migration tasks
- Configure upstream settings
- Query replication status
- View master and worker information

WebUI is still experimental and is still under development. Therefore, it is recommended only for trial. A known issue is that problems might occur if you use WebUI and `dmctl` to operate the same task. This issue will be resolved in later versions.

[User document](#)

- Add an error handling mechanism

More commands are introduced to address problems that interrupt a migration task. For example:

- In case of a schema error, you can update the schema file by using the `--from-↔ source/--from-target` parameter of the `binlog-schema update` command, instead of editing the schema file separately.
- You can specify a binlog position to inject, replace, skip, or revert a DDL statement.

[User document](#)

- Support full data storage to Amazon S3

When DM performs all or full data migration tasks, sufficient hard disk space is required for storing full data from upstream. Compared with EBS, Amazon S3 has nearly infinite storage at lower costs. Now, DM supports configuring Amazon S3 as the dump directory. That means you can use S3 to store full data when you perform all or full data migration tasks.

[User document](#)

- Support starting a migration task from specified time

A new parameter `--start-time` is added to migration tasks. You can define time in the format of `'2021-10-21 00:01:00'` or `'2021-10-21T00:01:00'`.

This feature is particularly useful in scenarios where you migrate and merge incremental data from shard mysql instances. Specifically, you do not need to set a binlog start

point for each source in an incremental migration task. Instead, you can create an incremental migration task quickly by using the `--start-time` parameter in `safe-mode`.

[User document](#)

## TiDB Lightning

- Support configuring the maximum number of tolerable errors

Added a configuration item `lightning.max-error`. The default value is 0. When the value is greater than 0, the `max-error` feature is enabled. If an error occurs in a row during encoding, a record containing this row is added to `lightning_task_info.type_error_v1` in the target TiDB and this row is ignored. When rows with errors exceed the threshold, TiDB Lightning exits immediately.

Matching the `lightning.max-error` configuration, the `lightning.task-info-schema-name` configuration item records the name of the database that reports a data saving error.

This feature does not cover all types of errors, for example, syntax errors are not applicable.

[User document](#)

### 16.11.1.2.7 TiDB data share subscription

- Support replicating 100,000 tables simultaneously

By optimizing the data processing flow, TiCDC reduces the resource consumption of processing incremental data for each table, which greatly improves the replication stability and efficiency when replicating data in large clusters. The result of an internal test shows that TiCDC can stably support replicating 100,000 tables simultaneously.

### 16.11.1.2.8 Deployment and maintenance

- Enable new collation rules by default

Since v4.0, TiDB has supported new collation rules that behave the same way as MySQL in the case-insensitive, accent-insensitive, and padding rules. The new collation rules are controlled by the `new_collations_enabled_on_first_bootstrap` parameter, which was disabled by default. Since v6.0, TiDB enables the new collation rules by default. Note that this configuration takes effect only upon TiDB cluster initialization.

[User documentation](#)

- Accelerate leader balancing after restarting TiKV nodes

After a restart of TiKV nodes, the unevenly scattered leaders must be redistributed for load balance. In large-scale clusters, leader balancing time is positively correlated with the number of Regions. For example, the leader balancing of 100K Regions can take 20-30 minutes, which is prone to performance issues and stability risks due to uneven load. TiDB v6.0.0 provides a parameter to control the balancing concurrency and enlarges the default value to 4 times of the original, which greatly shortens the leader rebalancing time and accelerates the business recovery after a restart of the TiKV nodes.

[User documentation](#), [#4610](#)

- Support canceling the automatic update of statistics

Statistics are one of the most important basic data that affect SQL performance. To ensure the completeness and timeliness of statistics, TiDB automatically updates object statistics periodically in the background. However, automatic statistics updates may result in resource contention, affecting SQL performance. To address this issue, you can manually cancel the automatic update of statistics since v6.0.

[User documentation](#)

- PingCAP Clinic diagnostic service (Technical Preview version)

PingCAP Clinic is a diagnostic service for TiDB clusters. This service helps troubleshoot cluster issues remotely and provides a quick check of cluster status locally. With PingCAP Clinic, you can ensure the stable operation of your TiDB cluster during its full life cycle, predict potential issues, reduce the probability of issues, and quickly troubleshoot cluster issues.

When contacting PingCAP technical support for remote assistance to troubleshoot cluster issues, you can use the PingCAP Clinic service to collect and upload diagnostic data, thereby improving the troubleshooting efficiency.

[User documentation](#)

- An enterprise-level database management platform, TiDB Enterprise Manager

TiDB Enterprise Manager (TiEM) is an enterprise-level database management platform based on the TiDB database, which aims to help users manage TiDB clusters in self-hosted or public cloud environments.

TiEM not only provides full lifecycle visual management for TiDB clusters, but also provides one-stop services: parameter management, version upgrades, cluster clone, active-standby cluster switching, data import and export, data replication, and data backup and restore services. TiEM can improve the efficiency of DevOps on TiDB and reduce the DevOps cost for enterprises.

Currently, TiEM is provided in the [TiDB Enterprise](#) edition only. To get TiEM, contact us via the [TiDB Enterprise](#) page.

- Support customizing configurations of the monitoring components

When you deploy a TiDB cluster using TiUP, TiUP automatically deploys monitoring components such as Prometheus, Grafana, and Alertmanager, and automatically adds new nodes into the monitoring scope after scale-out. You can customize the configurations of the monitoring components by adding configuration items to the `topology.yaml` file.

[User document](#)

### 16.11.1.3 Compatibility changes

**Note:**

When upgrading from an earlier TiDB version to v6.0.0, if you want to know the compatibility change notes of all intermediate versions, you can check the [Release Notes](#) of the corresponding version.

#### 16.11.1.3.1 System variables

VariableChange		
name	type	Description
placement_delete_controls	boolean	whether the DDL statement validates the placement rules specified by <a href="#">Placement Rules in SQL</a> . Replaced by <code>tidb_placement_mode</code>
tidb_enable_placement	boolean	whether to enable <a href="#">placement rules in SQL</a> .

## VariableChange

name	type	Description
------	------	-------------

<code>tidb_enable_newly_controls_checker</code>	boolean	
-------------------------------------------------	---------	--

↪ added whether to enable the mutation checker. The default value is ON. For existing clusters that upgrade from versions earlier than v6.0.0, the mutation checker is disabled by default.

---

VariableChange

name	type	Description
------	------	-------------

<code>tidb_ignore_cache_close_stmt</code>	bool	Whether to ignore the command that closes Prepared Statement. The default value is OFF.
-------------------------------------------	------	-----------------------------------------------------------------------------------------

↪ added whether to ignore the command that closes Prepared Statement. The default value is OFF.

<code>tidb_memory_binding_cache</code>	int	Memory usage threshold for the cache holding binding.
----------------------------------------	-----	-------------------------------------------------------

↪ added the memory usage threshold for the cache holding binding.

↪ .

The default value is 67108864 (64 MiB).

Variable	Change	Description
<code>tidb_placement_rules</code>	Newly added	whether DDL statements ignore the placement rules specified by <a href="#">Placement Rules in SQL</a> . The default value is <code>strict</code> $\leftrightarrow$ , which means that DDL statements do not ignore placement rules.

| `tidb_rc_read_check_ts` | Newly added |

Optimizes read statement latency within a transaction. If read/write conflicts are more severe, turning this variable on will add additional overhead and latency, causing regressions in performance. The default value is `off`.

This variable is not yet compatible with `replica-read`. If a read request has `tidb_rc_read_check_ts` on, it might not be able to use `replica-read`. Do not turn on both variables at the same time.

| | `tidb_sysdate_is_now` | Newly added | Controls whether the `SYSDATE` function can be replaced by the `NOW` function. This configuration item has the same effect as the MySQL option `sysdate-is-now`. The default value is `OFF`. | | `tidb_table_cache_lease` | Newly added | Controls the lease time of `table cache`, in seconds. The default value is `3`  $\hookrightarrow$  . | | `tidb_top_sql_max_meta_count` | Newly added | Controls the maximum number of SQL statement types collected by `Top SQL` per minute. The default value is `5000`. | | `tidb_top_sql_max_time_series_count` | Newly added | Controls how many SQL statements that contribute the most to the load (that is, top N) can be recorded by `Top SQL` per minute. The default value is `100`. | | `tidb_txn_assertion_level` | Newly added | Controls the assertion level. The assertion is a consistency check between data and indexes, which checks whether a key being written exists in the transaction commit process. By default, the check enables most of the check items, with almost no impact on performance. For existing clusters that upgrade from versions earlier than v6.0.0, the check is disabled by default. |

Configuration file	Configuration	Change	Description
TiDB	<code>new_collation</code>	Modified	<p><code>controlled_on_first_bootstrap</code></p> <p>↔</p> <p>whether to enable support for the new collation. Since v6.0, the default value is changed from <code>false</code> ↔ to <code>true</code>. This configuration item only takes effect when the cluster is initialized for the first time. After the first</p>

Configuration file	Configuration	Change type	Description
TiKV	<code>backup</code>	Modified	The value range is modified to [1, CPU].
	↪ <code>.</code>		value
	↪ <code>num</code>		range
	↪ <code>-</code>		is
	↪ <code>threads</code>		modified
	↪		to
			[1,
			↪ CPU
			↪ ].
TiKV	<code>raftstore</code>	Modified	The maximum value is changed to 10240.
	↪ <code>.</code>		maxi-
	↪ <code>apply</code>		mum
	↪ <code>-</code>		value
	↪ <code>max</code>		is
	↪ <code>-</code>		changed
	↪ <code>batch</code>		to
	↪ <code>-</code>		10240
	↪ <code>size</code>		↪ .
	↪		

| TiKV | `raftstore.raft-max-size-per-msg` | Modified |

The minimum value is changed from 0 to larger than 0.

The maximum value is set to 3GB.

The unit is changed from MB to KB|MB|GB.

|| TiKV | `raftstore.store-max-batch-size` | Modified | The maximum value is set to 10240. || TiKV | `readpool.unified.max-thread-count` | Modified | The adjustable range is changed to [min-thread-count, MAX(4, CPU)]. || TiKV | `rocksdb.enable-↪ pipelined-write` | Modified | The default value is changed from true to false. When this configuration is enabled, the previous Pipelined Write is used. When this configuration is disabled, the new Pipelined Commit mechanism is used. || TiKV | `rocksdb.max-↪ background-flushes` | Modified |

When the number of CPU cores is 10, the default value is 3.

When the number of CPU cores is 8, the default value is 2.

|| TiKV | `rocksdb.max-background-jobs` | Modified |

When the number of CPU cores is 10, the default value is 9.

When the number of CPU cores is 8, the default value is 7.

|| TiFlash | `profiles.default.dt_enable_logical_split` | Modified | Determines whether the segment of DeltaTree Storage Engine uses logical split. The default value is changed from `true` to `false`. || TiFlash | `profiles.default.enable_elastic_threadpool` ↔ | Modified | Controls whether to enable the elastic thread pool. The default value is changed from `false` to `true`. || TiFlash | `storage.format_version` | Modified | Controls the data validation feature of TiFlash. The default value is changed from 2 to 3. When `format_version` is set to 3, consistency check is performed on the read operations for all TiFlash data to avoid incorrect read due to hardware failure. Note that the new format version cannot be downgraded in place to versions earlier than v5.4. || TiDB | `pessimistic` ↔ `-txn.pessimistic-auto-commit` | Newly added | Determines the transaction mode that the auto-commit transaction uses when the pessimistic transaction mode is globally enabled (`tidb_txn_mode='pessimistic'`). || TiKV | `pessimistic-txn.in-memory` | Newly added | Controls whether to enable the in-memory pessimistic lock. With this feature enabled, pessimistic transactions store pessimistic locks in TiKV memory as much as possible, instead of writing pessimistic locks to disks or replicating to other replicas. This improves the performance of pessimistic transactions; however, there is a low probability that a pessimistic lock will be lost, which might cause the pessimistic transaction to fail to commit. The default value is `true`. || TiKV | `quota` | Newly added | Add configuration items related to Quota Limiter, which limit the resources occupied by frontend requests. Quota Limiter is an experimental feature and is disabled by default. New quota-related configuration items are `foreground-cpu-time`, `foreground-write-bandwidth`, `foreground-read-bandwidth` ↔ , and `max-delay-duration`. || TiFlash | `profiles.default.dt_compression_method` | Newly added | Specifies the compression algorithm for TiFlash. The optional values are LZ4, `zstd` and LZ4HC, all case insensitive. The default value is LZ4. || TiFlash | `profiles` ↔ `.default.dt_compression_level` | Newly added | Specifies the compression level of TiFlash. The default value is 1. || DM | `loaders.<name>.import-mode` | Newly added | The import mode during the full import phase. Since v6.0, DM uses TiDB Lightning's TiDB-backend mode to import data during the full import phase; the previous Loader component is no longer used. This is an internal replacement and has no obvious impact on daily operations. The default value is set to `sql`, which means using `tidb-backend` mode. In some rare cases, `tidb-backend` might not be fully compatible. You can fall back to Loader mode by configuring this parameter to `loader`. || DM | `loaders.<name>.on-duplicate` | Newly added | Specifies the methods to resolve conflicts during the full import phase. The default value is `replace`, which means using the new data to replace the existing data. || TiCDC | `dial-timeout` | Newly added | The timeout in establishing a connection with the downstream Kafka. The default value is 10s. || TiCDC | `read-timeout` | Newly added | The timeout in getting a response returned by the downstream Kafka. The default value is 10s. || TiCDC | `write-timeout` | Newly added | The timeout in sending a request to the downstream Kafka. The default value is 10s. |

### 16.11.1.3.3 Others

- The data placement policy has the following compatibility changes:

- Binding is not supported. The direct placement option is removed from the syntax.
  - The `CREATE PLACEMENT POLICY` and `ALTER PLACEMENT POLICY` statements no longer support the `VOTERS` and `VOTER_CONSTRAINTS` placement options.
  - TiDB migration tools (TiDB Binlog, TiCDC, and BR) are now compatible with placement rules. The placement option is moved to a special comment in TiDB Binlog.
  - The `information_schema.placement_rules` system table is renamed to `information_schema.placement_policies`. This table now only displays information about placement policies.
  - The `placement_checks` system variable is replaced by `tidb_placement_mode`.
  - It is prohibited to add partitions with placement rules to tables that have TiFlash replicas.
  - Remove the `TIDB_DIRECT_PLACEMENT` column from the `INFORMATION_SCHEMA` table.
- The `status` value of SQL plan management (SPM) binding is modified:
    - Remove `using`.
    - Add `enabled` (available) to replace `using`.
    - Add `disabled` (unavailable).
  - DM modifies the OpenAPI interface
    - Because of internal mechanism changes, the interface related to task management cannot be compatible with the previous experimental version. You need to refer to the new [DM OpenAPI documentation](#) for adaptation.
  - DM changes the methods to resolve conflicts during the full import phase
    - A `loader.<name>.on-duplicate` parameter is added. The default value is `replace`, which means using the new data to replace the existing data. If you want to keep the previous behavior, you can set the value to `error`. This parameter only controls the behavior during the full import phase.
  - To use DM, you should use the corresponding version of `dmctl`
    - Due to internal mechanism changes, after upgrading DM to v6.0.0, you should also upgrade `dmctl` to v6.0.0.
  - In v5.4 (v5.4 only), TiDB allows incorrect values for some noop system variables. Since v6.0.0, TiDB disallows setting incorrect values for system variables. [#31538](#)

#### 16.11.1.4 Improvements

- TiDB
  - Clear the placement rule settings of a table automatically after restoring the table using the `FLASHBACK` or `RECOVER` statement [#31668](#)

- Add a performance overview dashboard to show core performance metrics on typical critical paths, making metrics analysis on TiDB easier [#31676](#)
- Support using the REPLACE keyword in the LOAD DATA LOCAL INFILE statement [#24515](#)
- Support partition pruning for the built-in IN expression in Range partition tables [#26739](#)
- Improve query efficiency by eliminating potentially redundant Exchange operations in MPP aggregation queries [#31762](#)
- Improve compatibility with MySQL by allowing duplicate partition names in the TRUNCATE PARTITION and DROP PARTITION statements [#31681](#)
- Support showing the CREATE\_TIME information in the results of the ADMIN SHOW  $\leftrightarrow$  DDL JOBS statement [#23494](#)
- Support a new built-in function CHARSET() [#3931](#)
- Support filtering a baseline capturing blocklist by usernames [#32558](#)
- Support using wildcards in a baseline capturing blocklist [#32714](#)
- Optimize the results of the ADMIN SHOW DDL JOBS and SHOW TABLE STATUS statements by displaying the time according to the current time\_zone [#26642](#)
- Support pushing down the DAYNAME() and MONTHNAME() functions to TiFlash [#32594](#)
- Support pushing down the REGEXP function to TiFlash [#32637](#)
- Support pushing down the DAYOFMONTH() and LAST\_DAY() functions to TiFlash [#33012](#)
- Support pushing down the DAYOFWEEK() and DAYOFYEAR() functions to TiFlash [#33130](#)
- Support pushing down the IS\_TRUE, IS\_FALSE, and IS\_TRUE\_WITH\_NULL functions to TiFlash [#33047](#)
- Support pushing down the GREATEST and LEAST functions to TiFlash [#32787](#)
- Support tracking the execution of the UnionScan operator [#32631](#)
- Support using the PointGet plan for queries that read the \_tidb\_rowid column [#31543](#)
- Support showing the original partition name in the output of the EXPLAIN statement without converting the name to lowercase [#32719](#)
- Enable partition pruning for RANGE COLUMNS partitionings on IN conditions and string type columns [#32626](#)
- Return an error message when a system variable is set to NULL [#32850](#)
- Remove Broadcast Join from the non-MPP mode [#31465](#)
- Support executing MPP plans on partitioned tables in dynamic pruning mode [#32347](#)
- Support pushing down predicates for common table expressions (CTEs) [#28163](#)
- Simplify the configurations of Statement Summary and Capture Plan  $\leftrightarrow$  Baselines to be available on a global basis only [#30557](#)
- Update gopsutil to v3.21.12 to address alarms reported when building binary on macOS 12 [#31607](#)

- TiKV

- Improve the sampling accuracy of the Raftstore for batches with many key ranges [#12327](#)
  - Add the correct “Content-Type” for `debug/pprof/profile` to make the Profile more easily identified [#11521](#)
  - Renew the lease time of the leader infinitely when the Raftstore has heartbeats or handles read requests, which helps reduce latency jitter [#11579](#)
  - Choose the store with the least cost when switching the leader, which helps improve performance stability [#10602](#)
  - Fetch Raft logs asynchronously to reduce the performance jitter caused by blocking the Raftstore [#11320](#)
  - Support the `QUARTER` function in vector calculation [#5751](#)
  - Support pushing down the `BIT` data type to TiKV [#30738](#)
  - Support pushing down the `MOD` function and the `SYSDATE` function to TiKV [#11916](#)
  - Reduce the TiCDC recovery time by reducing the number of the Regions that require the Resolve Locks step [#11993](#)
  - Support dynamically modifying `raftstore.raft-max-inflight-msgs` [#11865](#)
  - Support `EXTRA_PHYSICAL_TABLE_ID_COL_ID` to enable dynamic pruning mode [#11888](#)
  - Support calculation in buckets [#11759](#)
  - Encode the keys of RawKV API V2 as `user-key + memcomparable-padding + timestamp` [#11965](#)
  - Encode the values of RawKV API V2 as `user-value + ttl + ValueMeta` and encode `delete` in `ValueMeta` [#11965](#)
  - Support dynamically modifying `raftstore.raft-max-size-per-msg` [#12017](#)
  - Support monitoring multi-k8s in Grafana [#12014](#)
  - Transfer the leadership to CDC observer to reduce latency jitter [#12111](#)
  - Support dynamically modifying `raftstore.apply_max_batch_size` and `raftstore.store_max_batch_size` [#11982](#)
  - RawKV V2 returns the latest version upon receiving the `raw_get` or `raw_scan` request [#11965](#)
  - Support the `RCCheckTS` consistency reads [#12097](#)
  - Support dynamically modifying `storage.scheduler-worker-pool-size`(the thread count of the Scheduler pool) [#12067](#)
  - Control the use of CPU and bandwidth by using the global foreground flow controller to improve the performance stability of TiKV [#11855](#)
  - Support dynamically modifying `readpool.unified.max-thread-count` (the thread count of the UnifyReadPool) [#11781](#)
  - Use the TiKV internal pipeline to replace the RocksDB pipeline and deprecate the `rocksdb.enable-multibatch-write` parameter [#12059](#)
- PD
    - Support automatically selecting the fastest object for transfer when evicting the leader, which helps speed up the eviction process [#4229](#)

- Forbid deleting a voter from a 2-replica Raft group in case the Region becomes unavailable [#4564](#)
- Speed up the scheduling of the balance leader [#4652](#)
- TiFlash
  - Forbid the logical splitting of TiFlash files (by adjusting the default value of `profiles.default.dt_enable_logical_split` to `false`. See [user document](#) for details) and improve the space usage efficiency of the TiFlash columnar storage so that the space occupation of a table synchronized to TiFlash is similar to the space occupation of the table in TiKV
  - Optimize the cluster management and replica replication mechanism for TiFlash by integrating the previous cluster management module into TiDB, which accelerates replica creation for small tables [#29924](#)
- Tools
  - Backup & Restore (BR)
    - \* Improve the speed of restoring the backup data. In the simulation test when BR restores 16 TB data to a TiKV cluster with 15 nodes (each node has 16 CPU cores), the throughput reaches 2.66 GiB/s. [#27036](#)
    - \* Support importing and exporting placement rules. Add a `--with-tidb-⟷ placement-mode` parameter to control whether to ignore the placement rules when importing data. [#32290](#)
  - TiCDC
    - \* Add a `Lag analyze` panel in Grafana [#4891](#)
    - \* Support placement rules [#4846](#)
    - \* Synchronize HTTP API handling [#1710](#)
    - \* Add the exponential backoff mechanism for restarting a changefeed [#3329](#)
    - \* Set the default isolation level of MySQL sink to `read-committed` to reduce deadlocks in MySQL [#3589](#)
    - \* Validate changefeed parameters upon creation and refine error messages [#1716](#) [#1718](#) [#1719](#) [#4472](#)
    - \* Expose configuration parameters of the Kafka producer to make them configurable in TiCDC [#4385](#)
  - TiDB Data Migration (DM)
    - \* Support starting a task when upstream table schemas are inconsistent and in optimistic mode [#3629](#) [#3708](#) [#3786](#)
    - \* Support creating a task in the `stopped` state [#4484](#)
    - \* Support Syncer using the working directory of the DM-worker rather than `/⟷ tmp` to write internal files, and cleaning the directory after the task is stopped [#4107](#)
    - \* Precheck has improved. Some important checks are no longer skipped. [#3608](#)

- TiDB Lightning
  - \* Add more retryable error types [#31376](#)
  - \* Support the base64 format password string [#31194](#)
  - \* Standardize error codes and error outputs [#32239](#)

#### 16.11.1.5 Bug fixes

- TiDB
  - Fix a bug that TiDB fails to create tables with placement rules when `SCHEDULE`  $\leftrightarrow$  `majority_in_primary`, and `PrimaryRegion` and `Regions` are of the same value [#31271](#)
  - Fix the `invalid transaction` error when executing a query using index lookup join [#30468](#)
  - Fix a bug that `show grants` returns incorrect results when two or more privileges are granted [#30855](#)
  - Fix a bug that `INSERT INTO t1 SET timestamp_col = DEFAULT` would set the timestamp to the zero timestamp for the field defaulted to `CURRENT_TIMESTAMP` [#29926](#)
  - Fix errors reported in reading the results by avoiding encoding the maximum value and minimum non-null value of the string type [#31721](#)
  - Fix load data panic if the data is broken at an escape character [#31589](#)
  - Fix the issue that the `greatest` or `least` function with collation gets a wrong result [#31789](#)
  - Fix a bug that the `date_add` and `date_sub` functions might return incorrect data types [#31809](#)
  - Fix possible panic when inserting data to virtually generated columns using an insert statement [#31735](#)
  - Fix a bug that no error is reported when duplicate columns are present in the created list partition [#31784](#)
  - Fix wrong results returned when `select for update union select` uses incorrect snapshots [#31530](#)
  - Fix the potential issue that `Regions` might be unevenly distributed after a restore operation is finished [#31034](#)
  - Fix a bug that `COERCIBILITY` is wrong for the `json` type [#31541](#)
  - Fix wrong collation of the `json` type when this type is processed using builtin-func [#31320](#)
  - Fix a bug that PD rules are not deleted when the count of TiFlash replicas is set to 0 [#32190](#)
  - Fix the issue that `alter column set default` wrongly updates the table schema [#31074](#)
  - Fix the issue that `date_format` in TiDB handles `'\n'` in a MySQL-incompatible way [#32232](#)

- Fix a bug that errors may occur when updating partitioned tables using `join` [#31629](#)
- Fix wrong range calculation results for `Nulleq` function on Enum values [#32428](#)
- Fix possible panic in `upper()` and `lower()` functions [#32488](#)
- Fix time zone problems encountered when changing the other type columns to timestamp type columns [#29585](#)
- Fix TiDB OOM when exporting data using `ChunkRPC` [#31981](#) [#30880](#)
- Fix a bug that sub `SELECT LIMIT` does not work as expected in dynamic partition pruning mode [#32516](#)
- Fix wrong or inconsistent format of bit default value in the `INFORMATION_SCHEMA` `.COLUMNS` table [#32655](#)
- Fix a bug that partition table pruning might not work for listing partition tables after server restart [#32416](#)
- Fix a bug that `add column` might use a wrong default timestamp after `SET` `timestamp` is executed [#31968](#)
- Fix a bug that connecting to a TiDB passwordless account from MySQL 5.5 or 5.6 client may fail [#32334](#)
- Fix wrong results when reading partitioned tables in dynamic mode in transactions [#29851](#)
- Fix a bug that TiDB may dispatch duplicate tasks to TiFlash [#32814](#)
- Fix wrong results returned when the input of the `timdiff` function contains a millisecond [#31680](#)
- Fix wrong results when explicitly reading partitions and using the `IndexJoin` plan [#32007](#)
- Fix a bug that renaming a column fails when changing its column type concurrently [#31075](#)
- Fix a bug that the formula for calculating net cost for TiFlash plans is not aligned with TiKV plans [#30103](#)
- Fix a bug that `KILL TIDB` cannot take effect immediately on idle connections [#24031](#)
- Fix possible wrong results when querying a table with generated columns [#33038](#)
- Fix wrong results of deleting data of multiple tables using `left join` [#31321](#)
- Fix a bug that the `SUBTIME` function returns a wrong result in case of overflow [#31868](#)
- Fix a bug that the `selection` operator cannot be pushed down when an aggregation query contains the `having` condition [#33166](#)
- Fix a bug that CTE might be blocked when a query reports errors [#31302](#)
- Fix a bug that excessive length of varbinary or varchar columns when creating tables in non-strict mode might result in errors [#30328](#)
- Fix the wrong number of followers in `information_schema.placement_policies` when no follower is specified [#31702](#)
- Fix the issue that TiDB allows to specify column prefix length as 0 when an index is created [#31972](#)
- Fix the issue that TiDB allows partition names ending with spaces [#31535](#)
- Correct the error message of the `RENAME TABLE` statement [#29893](#)

- TiKV
  - Fix the panic issue caused by deleting snapshot files when the peer status is `Applying` [#11746](#)
  - Fix the issue of QPS drop when flow control is enabled and `level0_slowdown_trigger`  $\leftrightarrow$  is set explicitly [#11424](#)
  - Fix the issue that destroying a peer might cause high latency [#10210](#)
  - Fix a bug that TiKV cannot delete a range of data (which means the internal command `unsafe_destroy_range` is executed) when the GC worker is busy [#11903](#)
  - Fix a bug that TiKV panics when the data in `StoreMeta` is accidentally deleted in some corner cases [#11852](#)
  - Fix a bug that TiKV panics when performing profiling on an ARM platform [#10658](#)
  - Fix a bug that TiKV might panic if it has been running for 2 years or more [#11940](#)
  - Fix the compilation issue on the ARM64 architecture caused by missing SSE instruction set [#12034](#)
  - Fix the issue that deleting an uninitialized replica might cause an old replica to be recreated [#10533](#)
  - Fix a bug that stale messages cause TiKV to panic [#12023](#)
  - Fix the issue that undefined behavior (UB) might occur in `TsSet` conversions [#12070](#)
  - Fix a bug that replica reads might violate the linearizability [#12109](#)
  - Fix the potential panic issue that occurs when TiKV performs profiling on Ubuntu 18.04 [#9765](#)
  - Fix the issue that `tikv-ctl` returns an incorrect result due to its wrong string match [#12329](#)
  - Fix the issue of intermittent packet loss and out of memory (OOM) caused by the overflow of memory metrics [#12160](#)
  - Fix the potential issue of mistakenly reporting TiKV panics when exiting TiKV [#12231](#)
- PD
  - Fix the issue that PD generates the operator with meaningless steps of Joint Consensus [#4362](#)
  - Fix a bug that the TSO revoking process might get stuck when closing the PD client [#4549](#)
  - Fix the issue that the Region scatterer scheduling lost some peers [#4565](#)
  - Fix the issue that `Duration` fields of `dr-autosync` cannot be dynamically configured [#4651](#)
- TiFlash
  - Fix the TiFlash panic issue that occurs when the memory limit is enabled [#3902](#)

- Fix the issue that expired data is recycled slowly [#4146](#)
  - Fix the potential issue of TiFlash panic when `Snapshot` is applied simultaneously with multiple DDL operations [#4072](#)
  - Fix the potential query error after adding columns under heavy read workload [#3967](#)
  - Fix the issue that the `SQRT` function with a negative argument returns NaN instead of Null [#3598](#)
  - Fix the issue that casting `INT` to `DECIMAL` might cause overflow [#3920](#)
  - Fix the issue that the result of `IN` is incorrect in multi-value expressions [#4016](#)
  - Fix the issue that the date format identifies `'\n'` as an invalid separator [#4036](#)
  - Fix the issue that the learner-read process takes too much time under high concurrency scenarios [#3555](#)
  - Fix the wrong result that occurs when casting `DATETIME` to `DECIMAL` [#4151](#)
  - Fix the issue of memory leak that occurs when a query is canceled [#4098](#)
  - Fix a bug that enabling the elastic thread pool might cause a memory leak [#4098](#)
  - Fix a bug that canceled MPP queries might cause tasks to hang forever when the local tunnel is enabled [#4229](#)
  - Fix a bug that the failure of the HashJoin build side might cause MPP queries to hang forever [#4195](#)
  - Fix a bug that MPP tasks might leak threads forever [#4238](#)
- Tools
    - Backup & Restore (BR)
      - \* Fix a bug that BR gets stuck when the restore operation meets some unrecoverable errors [#33200](#)
      - \* Fix a bug that causes the restore operation to fail when the encryption information is lost during backup retry [#32423](#)
    - TiCDC
      - \* Fix a bug that MySQL sink generates duplicated `replace` SQL statements when `batch-replace-enable` is disabled [#4501](#)
      - \* Fix a bug that a TiCDC node exits abnormally when a PD leader is killed [#4248](#)
      - \* Fix the error `Unknown system variable 'transaction_isolation'` for some MySQL versions [#4504](#)
      - \* Fix the TiCDC panic issue that might occur when Canal-JSON incorrectly handles `string` [#4635](#)
      - \* Fix a bug that sequence is incorrectly replicated in some cases [#4563](#)
      - \* Fix the TiCDC panic issue that might occur because Canal-JSON does not support nil [#4736](#)
      - \* Fix the wrong data mapping for avro codec of type `Enum/Set` and `TinyText`  $\leftrightarrow$  `/MediumText/Text/LongText` [#4454](#)
      - \* Fix a bug that Avro converts a `NOT NULL` column to a nullable field [#4818](#)
      - \* Fix an issue that TiCDC cannot exit [#4699](#)

- TiDB Data Migration (DM)
  - \* Fix the issue that syncer metrics are updated only when querying the status [#4281](#)
  - \* Fix the issue that execution errors of the update statement in safemode may cause the DM-worker panic [#4317](#)
  - \* Fix a bug that long varchars report an error `Column length too big` [#4637](#)
  - \* Fix the conflict issue caused by multiple DM-workers writing data from the same upstream [#3737](#)
  - \* Fix the issue that hundreds of “checkpoint has no change, skip sync flush checkpoint” print in the log and the replication is very slow [#4619](#)
  - \* Fix the DML loss issue when merging shards and replicating incremental data from upstream in the pessimistic mode [#5002](#)
- TiDB Lightning
  - \* Fix a bug that TiDB Lightning may not delete the metadata schema when some import tasks do not contain source files [#28144](#)
  - \* Fix the panic that occurs when the table names in the source file and in the target cluster are different [#31771](#)
  - \* Fix the checksum error “GC life time is shorter than transaction duration” [#32733](#)
  - \* Fix the issue that TiDB Lightning gets stuck when it fails to check empty tables [#31797](#)
- Dumpling
  - \* Fix the issue that the displayed progress is not accurate when running `dumpling --sql $query` [#30532](#)
  - \* Fix the issue that Amazon S3 cannot correctly calculate the size of compressed data [#30534](#)
- TiDB Binlog
  - \* Fix the issue that TiDB Binlog might be skipped when large upstream write transactions are replicated to Kafka [#1136](#)

## 16.12 v5.4

### 16.12.1 TiDB 5.4.3 Release Notes

Release date: October 13, 2022

TiDB version: 5.4.3

#### 16.12.1.1 Improvements

- TiKV

- Support configuring the RocksDB write stall settings to a value smaller than the flow control threshold [#13467](#)
- Support configuring the `unreachable_backoff` item to avoid Raftstore broadcasting too many messages after one peer becomes unreachable [#13054](#)

- Tools

- TiDB Lightning
  - \* Optimize Scatter Region to batch mode to improve the stability of the Scatter Region process [#33618](#)
- TiCDC
  - \* Reduce performance overhead caused by runtime context switching in multi-Region scenarios [#5610](#)

### 16.12.1.2 Bug fixes

- TiDB

- Fix the incorrect output of `SHOW CREATE PLACEMENT POLICY` [#37526](#)
- Fix the issue that some DDL statements might be stuck for a period after the PD node of a cluster is replaced [#33908](#)
- Fix the issue that `KILL TIDB` cannot take effect immediately on idle connections [#24031](#)
- Fix the issue that incorrect results are returned in the `DATA_TYPE` and `COLUMN_TYPE` columns when querying the `INFORMATION_SCHEMA.COLUMNS` system table [#36496](#)
- Fix the issue that when TiDB Binlog is enabled, executing the `ALTER SEQUENCE`  $\leftrightarrow$  statement might cause a wrong metadata version and cause Drainer to exit [#36276](#)
- Fix the issue that the `UNION` operator might return unexpected empty result [#36903](#)
- Fix the wrong result that occurs when enabling dynamic mode in partitioned tables for TiFlash [#37254](#)
- Fix the issue that `INL_HASH_JOIN` might hang when used with `LIMIT` [#35638](#)
- Fix the issue that TiDB might return the `invalid memory address or nil`  $\leftrightarrow$  `pointer dereference` error when executing the `SHOW WARNINGS` statement [#31569](#)
- Fix the `invalid transaction` error that occurs when performing Stale Read in the RC isolation level [#30872](#)
- Fix the issue that the `EXPLAIN ANALYZE` statement with DML executors might return result before the transaction commit finishes [#37373](#)
- Fix the issue of the `data and columnID count not match` error that occurs when inserting duplicated values with TiDB Binlog enabled [#33608](#)

- Fix the issue that in the static partition prune mode, SQL statements with an aggregate condition might return wrong result when the table is empty [#35295](#)
  - Fix the issue that TiDB might panic when executing the UPDATE statement [#32311](#)
  - Fix the issue of wrong query result because the UnionScan operator cannot maintain the order [#33175](#)
  - Fix the issue that the UPDATE statements incorrectly eliminate the projection in some cases, which causes the `Can't find column` error [#37568](#)
  - Fix the issue that partitioned tables cannot fully use indexes to scan data in some cases [#33966](#)
  - Fix the issue that the EXECUTE might throw an unexpected error in specific scenarios [#37187](#)
  - Fix the issue that TiDB might return wrong results when using a BIT type index with prepared plan cache enabled [#33067](#)
- TiKV
    - Fix the issue of continuous SQL execution errors in the cluster after the PD leader is switched or PD is restarted [#12934](#)
      - \* Cause: This issue is caused by a TiKV bug that TiKV does not retry sending heartbeat information to PD client after heartbeat requests fail, until TiKV reconnects to PD client. As a result, the Region information on the failed TiKV node becomes outdated, and TiDB cannot get the latest Region information, which causes SQL execution errors.
      - \* Affected versions: v5.3.2 and v5.4.2. This issue has been fixed in v5.3.3 and v5.4.3. If you are using v5.4.2, you can upgrade your cluster to v5.4.3.
      - \* Workaround: In addition to upgrade, you can also restart the TiKV nodes that cannot send Region heartbeat to PD, until there is no Region heartbeat to send.
    - Fix the issue that causes permission denied error when TiKV gets an error from the web identity provider and fails back to the default provider [#13122](#)
    - Fix the issue that the PD client might cause deadlocks [#13191](#)
    - Fix the issue that Regions might be overlapped if Raftstore is busy [#13160](#)
  - PD
    - Fix the issue that PD cannot correctly handle dashboard proxy requests [#5321](#)
    - Fix the issue that a removed tombstone store appears again after the PD leader transfer [#4941](#)
    - Fix the issue that the TiFlash learner replica might not be created [#5401](#)
  - TiFlash
    - Fix the issue that the `format` function might return a `Data truncated` error [#4891](#)

- Fix the issue that TiFlash might crash due to an error in parallel aggregation [#5356](#)
- Fix the panic that occurs after creating the primary index with a column containing the NULL value [#5859](#)
- Tools
  - TiDB Lightning
    - \* Fix the issue that an auto-increment column of the BIGINT type might be out of range [#27397](#)
    - \* Fix the issue that de-duplication might cause TiDB Lightning to panic in extreme cases [#34163](#)
    - \* Fix the issue that TiDB Lightning does not support columns starting with slash, number, or non-ascii characters in Parquet files [#36980](#)
    - \* Fix the issue that TiDB Lightning fails to connect to TiDB when TiDB uses an IPv6 host [#35880](#)
  - TiDB Data Migration (DM)
    - \* Fix the issue that DM Worker might get stuck when getting DB Conn [#3733](#)
    - \* Fix the issue that DM reports the Specified key was too long error [#5315](#)
    - \* Fix the issue that latin1 data might be corrupted during replication [#7028](#)
    - \* Fix the issue that DM fails to start when TiDB uses an IPv6 host [#6249](#)
    - \* Fix the issue of possible data race in `query-status` [#4811](#)
    - \* Fix goroutine leak when relay meets an error [#6193](#)
  - TiCDC
    - \* Fix the TiCDC panic issue when you set `enable-old-value = false` [#6198](#)
  - Backup & Restore (BR)
    - \* Fix the issue that might lead to backup and restoration failure if special characters exist in the authorization key of external storage [#37469](#)
    - \* Fix the issue that the regions are not balanced because the concurrency is set too large during the restoration [#37549](#)
  - Dumping
    - \* Fix the issue that GetDSN does not support IPv6 [#36112](#)

### 16.12.2 TiDB 5.4.2 Release Notes

Release Date: July 8, 2022

TiDB version: 5.4.2

**Warning:**

It is not recommended to use v5.4.2, because this version has a known bug. For details, see [#12934](#). This bug has been fixed in v5.4.3. It is recommended to use [v5.4.3](#).

### 16.12.2.1 Improvements

- TiDB
  - Avoid sending requests to unhealthy TiKV nodes to improve availability [#34906](#)
- TiKV
  - Reload TLS certificate automatically for each update to improve availability [#12546](#)
  - Improve the health check to detect unavailable Raftstore, so that the TiKV client can update Region Cache in time [#12398](#)
  - Transfer the leadership to CDC observer to reduce latency jitter [#12111](#)
- PD
  - Disable compiling swagger server by default [#4932](#)
- Tools
  - TiDB Lightning
    - \* Optimize Scatter Region to batch mode to improve the stability of the Scatter Region process [#33618](#)

### 16.12.2.2 Bug Fixes

- TiDB
  - Fix the issue of wrong TableDual plans cached in binary protocol [#34690](#) [#34678](#)
  - Fix the issue of incorrectly inferred null flag of the TiFlash `firstrow` aggregate function in the EqualAll case [#34584](#)
  - Fix the issue that the planner generates wrong 2-phase aggregate plan for TiFlash [#34682](#)
  - Fix the planner wrong behaviors that occur when `tidb_opt_agg_push_down` and `tidb_enforce_mpp` are enabled [#34465](#)

- Fix the wrong memory-usage value used when Plan Cache is evicted [#34613](#)
  - Fix the issue that the column list does not work in the LOAD DATA statement [#35198](#)
  - Avoid reporting WriteConflict errors in pessimistic transactions [#11612](#)
  - Fix the issue that the prewrite requests are not idempotency when Region errors and network issues occur [#34875](#)
  - Fix the issue that the async commit transactions being rolled back might not meet atomicity [#33641](#)
  - Previously, when a network connectivity issue occurred, TiDB did not always correctly free the resources held by the disconnected session. This issue has been fixed so that open transactions can be rolled back and other associated resources can be released. [#34722](#)
  - Fix the issue that the references invalid table error might be incorrectly reported when TiDB queries views with CTE [#33965](#)
  - Fix the panic issue caused by the fatal error: concurrent map read and ↪ map write error [#35340](#)
- TiKV
    - Fix the panic issue caused by analyzing statistics when max\_sample\_size is set to 0 [#11192](#)
    - Fix the potential issue of mistakenly reporting TiKV panics when exiting TiKV [#12231](#)
    - Fix the panic issue that might occur when the source peer catches up logs by snapshot in the Region merge process [#12663](#)
    - Fix the panic issue that might occur when a peer is being split and destroyed at the same time [#12825](#)
    - Fix the issue of frequent PD client reconnection that occurs when the PD client meets an error [#12345](#)
    - Fix the issue of time parsing error that occurs when the DATETIME values contain a fraction and Z [#12739](#)
    - Fix the issue that TiKV panics when performing type conversion for an empty string [#12673](#)
    - Fix the possible duplicate commit records in pessimistic transactions when async commit is enabled [#12615](#)
    - Fix the issue that TiKV reports the invalid store ID 0 error when using Follower Read [#12478](#)
    - Fix the issue of TiKV panic caused by the race between destroying peers and batch splitting Regions [#12368](#)
    - Fix the issue that tikv-ctl returns an incorrect result due to its wrong string match [#12329](#)
    - Fix the issue of failing to start TiKV on AUFS [#12543](#)
  - PD
    - Fix the wrong status code of not leader [#4797](#)

- Fix the PD panic that occurs when a hot region has no leader [#5005](#)
- Fix the issue that scheduling cannot start immediately after the PD leader transfer [#4769](#)
- Fix a bug of TSO fallback in some corner cases [#4884](#)
- TiFlash
  - Fix the issue that TiFlash crashes after dropping a column of a table with clustered indexes in some situations [#5154](#)
  - Fix potential data inconsistency after a lot of INSERT and DELETE operations [#4956](#)
  - Fix wrong decimal comparison results in corner cases [#4512](#)
- Tools
  - Backup & Restore (BR)
    - \* Fix a bug that BR reports `ErrRestoreTableIDMismatch` in RawKV mode [#35279](#)
    - \* Fix a bug that BR does not retry when an error occurs in saving files [#34865](#)
    - \* Fix a panic issue when BR is running [#34956](#)
    - \* Fix the issue that BR cannot handle S3 internal errors [#34350](#)
    - \* Fix a bug that BR gets stuck when the restore operation meets some unrecoverable errors [#33200](#)
  - TiCDC
    - \* Fix data loss that occurs in special incremental scanning scenarios [#5468](#)
    - \* Fix a bug that the redo log manager flushes logs before writing logs [#5486](#)
    - \* Fix a bug that the resolved ts moves too fast when some tables are not maintained by the redo writer [#5486](#)
    - \* Fix the issue that file name conflicts may cause data loss [#5486](#)
    - \* Fix replication interruption that occurs when Region leader is missing and the retry exceeds the limit [#5230](#)
    - \* Fix the bug that MySQL Sink may save a wrong checkpointTs [#5107](#)
    - \* Fix a bug that may cause goroutine leak in the HTTP server [#5303](#)
    - \* Fix the issue that changes in meta Region can lead to latency increase [#4756](#) [#4762](#)
  - TiDB Data Migration (DM)
    - \* Fix the issue that DM occupies more disk space after a task automatically resumes [#5344](#)
    - \* Fix the issue that the uppercase table cannot be replicated when `case-sensitive: true` is not set [#5255](#)

### 16.12.3 TiDB 5.4.1 Release Notes

Release Date: May 13, 2022

TiDB version: 5.4.1

### 16.12.3.1 Compatibility changes

TiDB v5.4.1 does not introduce any compatibility changes in product design. But note that bug fixes in this release might result in compatibility changes, too. For more information, see [Bug Fixes](#).

### 16.12.3.2 Improvements

- TiDB
  - Support using the PointGet plan for queries that read the `_tidb_rowid` column [#31543](#)
  - Add more logs and metrics for the `Apply` operator to show whether it is parallel [#33887](#)
  - Improve the TopN pruning logic for Analyze Version 2 used for collecting statistics [#34256](#)
  - Support displaying multiple Kubernetes clusters in the Grafana dashboard [#32593](#)
- TiKV
  - Support displaying multiple Kubernetes clusters in the Grafana dashboard [#12104](#)
- PD
  - Support displaying multiple Kubernetes clusters in the Grafana dashboard [#4673](#)
- TiFlash
  - Support displaying multiple Kubernetes clusters in the Grafana dashboard [#4129](#)
- Tools
  - TiCDC
    - \* Support multiple Kubernetes clusters in Grafana dashboards [#4665](#)
    - \* Expose configuration parameters of the Kafka producer to make them configurable in TiCDC [#4385](#)
  - TiDB Data Migration (DM)
    - \* Support Syncer using the working directory of the DM-worker rather than `/tmp` to write internal files, and cleaning the directory after the task is stopped [#4107](#)

### 16.12.3.3 Bug Fixes

- TiDB
  - Fix the issue that `date_format` in TiDB handles `'\n'` in a MySQL-incompatible way [#32232](#)
  - Fix the issue that TiDB writes wrong data due to the wrong encoding of the `ENUM` or `SET` column [#32302](#)
  - Fix the issue that the Merge Join operator gets wrong results in certain cases [#33042](#)
  - Fix the issue that TiDB gets a wrong result when a correlated subquery returns a constant [#32089](#)
  - Fix the issue that TiDB gets the wrong result when using TiFlash to scan tables with empty range although TiFlash does not support reading tables with empty range yet [#33083](#)
  - Fix the issue that the `MAX` or `MIN` function on the `ENUM` or `SET` column returns a wrong result when the new collation is enabled in TiDB [#31638](#)
  - Fix a bug that CTE might be blocked when a query reports errors [#31302](#)
  - Fix wrong range calculation results for Nulleq function on Enum values [#32428](#)
  - Fix TiDB OOM when exporting data using ChunkRPC [#31981](#) [#30880](#)
  - Fix a bug that `tidb_super_read_only` is not automatically enabled when `tidb_restricted_read_only` is enabled [#31745](#)
  - Fix the issue that the `greatest` or `least` function with collation gets a wrong result [#31789](#)
  - Fix load data panic if the data is broken at an escape character [#31589](#)
  - Fix the `invalid transaction` error when executing a query using index lookup join [#30468](#)
  - Fix wrong results of deleting data of multiple tables using `left join` [#31321](#)
  - Fix a bug that TiDB may dispatch duplicate tasks to TiFlash [#32814](#)
  - Fix the issue that granting the `all` privilege might fail in clusters that are upgraded from v4.0 [#33588](#)
  - Fix the session panic that occurs when executing the prepared statement after table schema change with the MySQL binary protocol [#33509](#)
  - Fix the issue that executing SQL statements that have the `compress()` expression with `tidb_enable_vectorized_expression` enabled will fail [#33397](#)
  - Fix the issue of high CPU usage by the `reArrangeFallback` function [#30353](#)
  - Fix the issue that the table attributes are not indexed when a new partition is added and the issue that the table range information is not updated when the partition changes [#33929](#)
  - Fix a bug that the `TopN` statistical information of a table during the initialization is not correctly sorted [#34216](#)
  - Fix the error that occurs when reading from the `INFORMATION_SCHEMA.ATTRIBUTES` table by skipping the unidentifiable table attributes [#33665](#)
  - Fix a bug that even if `@@tidb_enable_parallel_apply` is set, the `Apply` operator is not paralleled when an `order` property exists [#34237](#)

- Fix a bug that '0000-00-00 00:00:00' can be inserted into a `datetime` column when `sql_mode` is set to `NO_ZERO_DATE` [#34099](#)
- Fix the issue that the TiDB server might run out of memory when the `INFORMATION_SCHEMA.CLUSTER_SLOW_QUERY` table is queried. This issue can be triggered when you check slow queries on the Grafana dashboard [#33893](#)
- Fix a bug that in the `NOWAIT` statement, a transaction being executed does not return immediately when encountering a lock [#32754](#)
- Fix a bug that causes a failure when creating a table with the `GBK` charset and `gbk_bin` collation [#31308](#)
- Fix a bug that when `enable-new-charset` is on, creating a `GBK` charset table with collation fails with the “Unknown character set” error [#31297](#)

- TiKV

- Fix the issue that TiKV panics and destroys peers unexpectedly because the target Region to be merged is invalid [#12232](#)
- Fix a bug that stale messages cause TiKV to panic [#12023](#)
- Fix the issue of intermittent packet loss and out of memory (OOM) caused by the overflow of memory metrics [#12160](#)
- Fix the potential panic issue that occurs when TiKV performs profiling on Ubuntu 18.04 [#9765](#)
- Fix a bug that replica reads might violate the linearizability [#12109](#)
- Fix the TiKV panic issue that occurs when the target peer is replaced with the peer that is destroyed without being initialized when merging a Region [#12048](#)
- Fix a bug that TiKV might panic if it has been running for 2 years or more [#11940](#)
- Reduce the TiCDC recovery time by reducing the number of the Regions that require the Resolve Locks step [#11993](#)
- Fix the panic issue caused by deleting snapshot files when the peer status is `Applying` [#11746](#)
- Fix the issue that destroying a peer might cause high latency [#10210](#)
- Fix the panic issue caused by invalid assertion in resource metering [#12234](#)
- Fix the issue that slow score calculation is inaccurate in some corner cases [#12254](#)
- Fix the OOM issue caused by the `resolved_ts` module and add more metrics [#12159](#)
- Fix the issue that successfully committed optimistic transactions may report the `Write Conflict` error when the network is poor [#34066](#)
- Fix the TiKV panic issue that occurs when replica read is enabled on a poor network [#12046](#)

- PD

- Fix the issue that `Duration` fields of `dr-autosync` cannot be dynamically configured [#4651](#)

- Fix the issue that when there exists a Store with large capacity (2T for example), fully allocated small Stores cannot be detected, which results in no balance operator being generated [#4805](#)
- Fix the issue that the label distribution has residual labels in the metrics [#4825](#)
- TiFlash
  - Fix the panic issue that occurs when TLS is enabled [#4196](#)
  - Fix possible metadata corruption caused by Region merge on a lagging Region peer [#4437](#)
  - Fix the issue that a query containing JOIN might be hung if an error occurs [#4195](#)
  - Fix a bug that MPP tasks might leak threads forever [#4238](#)
  - Fix the overflow that occurs when casting FLOAT to DECIMAL [#3998](#)
  - Fix the issue that expired data is recycled slowly [#4146](#)
  - Fix a bug that canceled MPP queries might cause tasks to hang forever when the local tunnel is enabled [#4229](#)
  - Fix the issue of memory leak that occurs when a query is canceled [#4098](#)
  - Fix the wrong result that occurs when casting DATETIME to DECIMAL [#4151](#)
  - Fix the potential issue of TiFlash panic when Snapshot is applied simultaneously with multiple DDL operations [#4072](#)
  - Fix the bug that invalid storage directory configurations lead to unexpected behaviors [#4093](#)
  - Fix the bug that some exceptions are not handled properly [#4101](#)
  - Fix the issue that casting INT to DECIMAL might cause overflow [#3920](#)
  - Fix the issue that the result of IN is incorrect in multi-value expressions [#4016](#)
  - Fix the issue that the date format identifies '\n' as an invalid separator [#4036](#)
  - Fix the potential query error after adding columns under heavy read workload [#3967](#)
  - Fix the panic issue that occurs when the memory limit is enabled [#3902](#)
  - Fix potential data corruption in DTFiles [#4778](#)
  - Fix potential errors when querying on a table with many delete operations [#4747](#)
  - Fix a bug that TiFlash reports many “Keepalive watchdog fired” errors randomly [#4192](#)
  - Fix a bug that data not matching any region range remains on a TiFlash node [#4414](#)
  - Fix a bug that empty segments cannot be merged after GC [#4511](#)
- Tools
  - Backup & Restore (BR)
    - \* Fix a bug that causes the restore operation to fail when the encryption information is lost during backup retry [#32423](#)
    - \* Fix the issue that BR fails to back up RawKV [#32607](#)
    - \* Fix duplicate primary keys when inserting a record into a table after incremental restoration [#33596](#)

- \* Fix a bug that BR incremental restore returns errors mistakenly due to DDL jobs with empty query [#33322](#)
  - \* Fix the potential issue that Regions might be unevenly distributed after a restore operation is finished [#31034](#)
  - \* Fix the issue that BR does not retry enough times when Regions are not consistent during restoration [#33419](#)
  - \* Fix the issue that BR might panic occasionally when merging small files is enabled [#33801](#)
  - \* Fix the issue that schedulers do not resume after BR or TiDB Lightning exits abnormally [#33546](#)
- TiCDC
- \* Fix incorrect metrics caused by owner changes [#4774](#)
  - \* Fix the TiCDC panic issue that might occur because Canal-JSON does not support nil [#4736](#)
  - \* Fix a stability problem in workerpool used by Unified Sorter [#4447](#)
  - \* Fix a bug that sequence is incorrectly replicated in some cases [#4563](#)
  - \* Fix the TiCDC panic issue that might occur when Canal-JSON incorrectly handles `string` [#4635](#)
  - \* Fix a bug that a TiCDC node exits abnormally when a PD leader is killed [#4248](#)
  - \* Fix a bug that MySQL sink generates duplicated `replace` SQL statements when `batch-replace-enable` is disabled [#4501](#)
  - \* Fix the DML construct error caused by the `rename tables` DDL [#5059](#)
  - \* Fix the issue that in rare cases replication can be stuck if the owner is changed and the new scheduler is enabled (disabled by default) [#4963](#)
  - \* Fix the issue that the error `ErrProcessorDuplicateOperations` is reported when the new scheduler is enabled (disabled by default) [#4769](#)
  - \* Fix the issue that TiCDC fails to start when the first PD set in `--pd` is not available after TLS is enabled [#4777](#)
  - \* Fix the issue that the checkpoint metrics are missing when tables are being scheduled [#4714](#)
- TiDB Lightning
- \* Fix the checksum error “GC life time is shorter than transaction duration” [#32733](#)
  - \* Fix the issue that TiDB Lightning gets stuck when it fails to check empty tables [#31797](#)
  - \* Fix a bug that TiDB Lightning may not delete the metadata schema when some import tasks do not contain source files [#28144](#)
  - \* Fix the issue that the precheck does not check local disk resources and cluster availability [#34213](#)
- TiDB Data Migration (DM)
- \* Fix the issue that hundreds of “checkpoint has no change, skip sync flush checkpoint” print in the log and the replication is very slow [#4619](#)

- \* Fix a bug that long varchars report an error `Column length too big` [#4637](#)
- \* Fix the issue that execution errors of the update statement in safemode may cause the DM-worker panic [#4317](#)
- \* Fix the issue that in some cases manually executing the filtered DDL in the downstream might cause task resumption failure [#5272](#)
- \* Fix a bug that no data is returned for the `query-status` command when binlog is not enabled in the upstream [#5121](#)
- \* Fix the DM worker panic issue that occurs when the primary key is not first in the index returned by the `SHOW CREATE TABLE` statement [#5159](#)
- \* Fix the issue that CPU usage may increase and a large amount of log is printed when GTID is enabled or when the task is automatically resumed [#5063](#)

#### 16.12.4 TiDB 5.4 Release Notes

Release date: February 15, 2022

TiDB version: 5.4.0

In v5.4, the key new features or improvements are as follows:

- Support the GBK character set
- Support using Index Merge to access data, which merges the filtering results of indexes on multiple columns
- Support reading stale data using a session variable
- Support persisting the configuration for collecting statistics
- Support using Raft Engine as the log storage engine of TiKV (experimental)
- Optimize the impact of backup on the cluster
- Support using Azure Blob storage as the backup storage
- Continuously improve the stability and performance of TiFlash and the MPP engine
- Add a switch in TiDB Lightning to determine whether to allow importing to an existing table with data
- Optimize the Continuous Profiling feature (experimental)
- TiSpark supports user identification and authentication

##### 16.12.4.1 Compatibility changes

###### **Note:**

When upgrading from an earlier TiDB version to v5.4.0, if you want to know the compatibility change notes of all intermediate versions, you can check the [Release Notes](#) of the corresponding version.

#### 16.12.4.1.1 System variables

Variable name	Change type	Description
<code>tidb_enable_newly_added_index</code>		Controls whether to allow TiDB to collect PREDICATE $\hookrightarrow$ COLUMNS. The default value is OFF.

Variable name	Change type	Description
<code>tidb_enable_paging</code> ↔	Newly added	Controls whether to use the method of paging to send coprocessor requests in <code>IndexLookUp</code> operator. The default value is <code>OFF</code> . For read queries that use <code>IndexLookup</code> and <code>Limit</code> and that <code>Limit</code> cannot be pushed down to <code>IndexScan</code> , there might be high latency for the read queries and high CPU usage for TiKV's unified ↔ <code>read</code> ↔ <code>pool</code> . In such cases, because the <code>Limit</code> operator only requires a small set of data, if you set <code>tidb_enable_paging</code> ↔ to <code>ON</code> , TiDB processes less data, which reduces query

Variable name	Change type	Description
<code>tidb_enable_top_sql</code> ↔	Newly added	Controls whether to enable the Top SQL feature. The default value is <code>OFF</code> .
<code>tidb_persist_analyze_options</code> ↔	Newly added	Controls whether to enable the <code>ANALYZE configuration persistence</code> feature. The default value is <code>ON</code> .
<code>tidb_read_stats</code> ↔	Newly added	Controls the range of historical data that can be read in the current session. The default value is <code>0</code> .
<code>tidb_regard_null_in_index</code> ↔	Newly added	Controls whether the optimizer can use a query condition including null equivalence as a prefix condition for index access.

Variable name	Change type	Description
<code>tidb_stats_load_synced</code> ↔	Newly added	Controls whether to enable the synchronously loading statistics feature. The default value 0 means that the feature is disabled and that the statistics is asynchronously loaded. When the feature is enabled, this variable controls the maximum time that SQL optimization can wait for synchronously loading statistics before timeout.

Variable name	Change type	Description
<code>tidb_stats_load_newly_added_indexes</code>	Newly added	Controls when synchronously loading statistics reaches timeout, whether SQL fails (OFF) or falls back to using pseudo statistics (ON). The default value is OFF.
<code>tidb_backoff_modified</code>	Modified	The default value is changed from 100 to 10.

| `tidb_enable_index_merge` | Modified | The default value is changed from OFF to ON.

If you upgrade a TiDB cluster from versions earlier than v4.0.0 to v5.4.0 or later, this variable is OFF by default.

If you upgrade a TiDB cluster from v4.0.0 or later to v5.4.0 or later, this variable remains the same as before the upgrade.

For the newly created TiDB clusters of v5.4.0 and later, this variable is ON by default.

|| `tidb_store_limit` | Modified | Before v5.4.0, this variable can be configured at instance level and globally. Starting from v5.4.0, this variable only supports global configuration. |

### 16.12.4.1.2 Configuration file parameters

Configuration file	Configuration	Change type	Description
TiDB	<b>stats-load</b> ↪ - ↪ <b>concurrency</b> ↪	Newly added	Controls the maximum number of columns that the TiDB synchronously loading statistics feature can process concurrently. The default value is 5.
TiDB	<b>stats-load</b> ↪ <b>-queue-</b> ↪ <b>size</b>	Newly added	Controls the maximum number of column requests that the TiDB synchronously loading statistics feature can cache. The default value is 1000.
TiKV	<b>snap-</b> ↪ <b>generator</b> ↪ <b>-pool-</b> ↪ <b>size</b>	Newly added	The size of the <b>snap-</b> ↪ <b>generator</b> ↪ thread pool. The default value is 2.

---

Configuration file	Configuration	Change type	Description
TiKV	log.file. ↪ max- ↪ size, log.file. ↪ max- ↪ days, log.file. ↪ max- ↪ backups	Newly added	For details, see <a href="#">TiKV Configuration File - log.file.</a>

Configuration file	Configuration	Change type	Description
TiKV	<code>raft- ↪ engine</code>	Newly added	Includes <code>enable</code> , <code>dir</code> , <code>batch- ↪ compression</code> , <code>↪ -</code> , <code>↪ threshold</code> , <code>↪ ,</code> , <code>bytes-per- ↪ sync</code> , <code>target- ↪ file- ↪ size</code> , <code>purge- ↪ threshold</code> , <code>↪ ,</code> , <code>recovery- ↪ mode</code> , <code>recovery- ↪ read- ↪ block- ↪ size</code> , <code>recovery- ↪ read- ↪ block- ↪ size</code> , and <code>recovery- ↪ threads</code> . For details, see <a href="#">TiKV Configuration File - raft- ↪ engine</a> .

Configuration file	Configuration	Change type	Description
TiKV	<b>backup.</b> ↔ <b>enable-</b> ↔ <b>auto-</b> ↔ <b>tune</b>	Newly added	In v5.3.0, the default value is <b>false</b> . Since v5.4.0, the default value is changed to <b>true</b> . This parameter controls whether to limit the resources used by backup tasks to reduce the impact on the cluster when the cluster resource utilization is high. In the default configuration, the speed of backup tasks might slow down.

Configuration file	Configuration	Change type	Description
TiKV	<code>log-level</code> , <code>log-format</code> , <code>log-file</code> , <code>log-</code> ↳ <code>rotation</code> ↳ <code>-size</code>	Modified	<p>The names of TiKV log parameters are replaced with the names that are consistent with TiDB log parameters, which are <code>log.level</code>, <code>log.format</code>, <code>log.file</code>.</p> <p>↳ <code>filename</code>  ↳ <code>,</code> and <code>log.enable</code>  ↳ <code>-</code>  ↳ <code>timestamp</code>  ↳ <code>.</code> If you only set the old parameters, and their values are set to non-default values, the old parameters remain compatible with the new parameters. If both old and new parameters are set, the new parameters take effect. For details, see <a href="#">TiKV Configuration File - 1</a></p>

Configuration file	Configuration	Change type	Description
TiKV	<code>log-</code> ↪ <code>rotation</code> ↪ <code>-</code> ↪ <code>timespan</code> ↪	Deleted	<p>The timespan between log rotations. After this timespan passes, a log file is rotated, which means a timestamp is appended to the file name of the current log file, and a new log file is created.</p>
TiKV	<code>allow-</code> ↪ <code>remove-</code> ↪ <code>leader</code>	Deleted	<p>Determines whether to allow deleting the main switch.</p>
TiKV	<code>raft-msg-</code> ↪ <code>flush-</code> ↪ <code>interval</code> ↪	Deleted	<p>Determines the interval at which Raft messages are sent in batches. The Raft messages are sent in batches at every interval specified by this configuration item.</p>

Configuration file	Configuration	Change type	Description
PD	<code>log.level</code>	Modified	The default value is changed from “INFO” to “info”, guaranteed to be case-insensitive.
TiFlash	<code>profile.</code> <code>↪ default</code> <code>↪ .</code> <code>↪ enable_elastic_threadpool</code> <code>↪</code>	Newly added	Determines whether to enable or disable the elastic thread pool function. Enabling this configuration item can significantly improve TiFlash CPU utilization in high concurrency scenarios. The default value is <code>false</code> .

Configuration file	Configuration	Change type	Description
TiFlash	<code>storage.</code> ↪ <code>format_version</code> ↪	Newly added	Specifies the version of DTFile. The default value is 2, under which hashes are embedded in the data file. You can also set the value to 3. When it is 3, the data file contains metadata and token data checksum, and supports multiple hash algorithms.
TiFlash	<code>logger.</code> ↪ <code>count</code>	Modified	The default value is changed to 10.
TiFlash	<code>status.</code> ↪ <code>metrics_port</code> ↪	Modified	The default value is changed to 8234.
TiFlash	<code>raftstore.</code> ↪ <code>apply-</code> ↪ <code>pool-</code> ↪ <code>size</code>	Newly added	The allowable number of threads in the pool that flushes Raft data to storage. The default value is 4.

Configuration file	Configuration	Change type	Description
TiFlash	<code>raftstore.</code> ↔ <code>store-</code> ↔ <code>pool-</code> ↔ <code>size</code>	Newly added	The allowable number of threads that process Raft, which is the size of the Raftstore thread pool. The default value is 4.
TiDB Data Migration (DM)	<code>collation_compatible</code> ↔	Newly added	The mode to sync the default collation in CREATE SQL statements. The value options are “loose” (by default) and “strict”.
TiCDC	<code>max-</code> ↔ <code>message</code> ↔ <code>-bytes</code>	Modified	Change the default value of <code>max-</code> ↔ <code>message</code> ↔ <code>-bytes</code> in Kafka sink to 104857601 (10MB)

Configuration file	Configuration	Change type	Description
TiCDC	<code>partition- ↪ num</code>	Modified	Change the default value of <code>partition- ↪ num</code> in Kafka Sink from 4 to 3. It makes TiCDC send messages to Kafka partitions more evenly.
TiDB Lightning	<code>meta- ↪ schema- ↪ name</code>	Modified	Specifies the schema name for the metadata in the target TiDB. From v5.4.0, this schema is created only if you have enabled <code>parallel import</code> (the corresponding parameter is <code>tikv- ↪ importer ↪ . ↪ incremental ↪ -import ↪ = true ↪ )</code> ).

Configuration file	Configuration	Change type	Description
TiDB Lightning	<code>task-info- ↔ schema- ↔ name</code>	Newly added	Specifies the name of the database where duplicated data is stored when TiDB Lightning detects conflicts. By default, the value is “lightning_task_info”. Specify this parameter only if you have enabled the “duplicate-resolution” feature.
TiDB Lightning	<code>incremental ↔ -import</code>	Newly added	Determines whether to allow importing data to tables where data already exists. The default value is <code>false</code> .

### 16.12.4.1.3 Others

- An interface is added between TiDB and PD. When you use the `information_schema` ↔ `.TIDB_HOT_REGIONS_HISTORY` system table, TiDB needs to use PD in the corresponding version.
- TiDB Server, PD Server, and TiKV Server start using a unified naming method for the log-related parameters to manage log names, output formats, and the rules for rotation and expiration. For details, see [TiKV configuration file - log](#).

- Since v5.4.0, if you create a SQL binding for an execution plan that has been cached via Plan Cache, the binding invalidates the plan already cached for the corresponding query. The new binding does not affect execution plans cached before v5.4.0.
- In v5.3 and earlier versions, [TiDB Data Migration \(DM\)](#) documentation is independent of TiDB documentation. Since v5.4, DM documentation is integrated into TiDB documentation with the same version. You can directly read [DM documentation](#) without accessing the DM documentation site.
- Remove the experimental feature of Point-in-time recovery (PITR) along with cdclog. Since v5.4.0, cdclog-based PITR and cdclog are no longer supported.
- Make the behavior of setting system variables to the “DEFAULT” more MySQL-compatible [#29680](#)
- Set the system variable `lc_time_names` to read-only [#30084](#)
- Set the scope of `tidb_store_limit` from INSTANCE or GLOBAL to GLOBAL [#30756](#)
- Forbid converting the integer type column to the time type column when the column contains zero [#25728](#)
- Fix the issue that no error is reported for the `Inf` or `NAN` value when inserting floating-point values [#30148](#)
- Fix the issue that the `REPLACE` statement incorrectly changes other rows when the auto ID is out of range [#30301](#)

#### 16.12.4.2 New features

##### 16.12.4.2.1 SQL

- **TiDB supports the GBK character set since v5.4.0**

Before v5.4.0, TiDB supports `ascii`, `binary`, `latin1`, `utf8`, and `utf8mb4` character sets.

To better support Chinese users, TiDB supports the GBK character set since v5.4.0. After enabling the `new_collations_enabled_on_first_bootstrap` option in the TiDB configuration file when initializing a TiDB cluster for the first time, the TiDB GBK character set supports both `gbk_bin` and `gbk_chinese_ci` collations.

When using the GBK character set, you need to pay attention to the compatibility restrictions. For details, see [Character Set and Collation - GBK](#).

##### 16.12.4.2.2 Security

- **TiSpark supports user authentication and authorization**

Since TiSpark 2.5.0, TiSpark supports both database user authentication and read/write authorization at a database or table level. After enabling this feature, you can prevent the business from running unauthorized batch tasks such as draws to obtain data, which improves the stability and data security of online clusters.

This feature is disabled by default. When it is enabled, if a user operating through TiSpark does not have the needed permissions, the user gets an exception from TiSpark.

[User document](#)

- **TiUP supports generating an initial password for the root user**

An `--init` parameter is introduced to the command for starting a cluster. With this parameter, in a TiDB cluster deployed using TiUP, TiUP generates an initial strong password for the database root user. This avoids security risks in using a root user with an empty password and ensures the security of databases.

[User document](#)

### 16.12.4.2.3 Performance

- **Continue improving the stability and performance of the columnar storage engine TiFlash and the computing engine MPP**

- Support pushing down more functions to the MPP engine:

- \* String functions: `LPAD()`, `RPAD()`, `STRCMP()`

- \* Date functions: `ADDDATE(string, real)`, `DATE_ADD(string, real)`, `DATE_SUB(string, real)`, `SUBDATE(string, real)`, `QUARTER()`

- Introduce the elastic thread pool feature to improve resource utilization (experimental)

- Improve the efficiency of converting data from row-based storage format to column-based storage format when replicating data from TiKV, which brings 50% improvement in the overall performance of data replication

- Improve TiFlash performance and stability by tuning the default values of some configuration items. In an HTAP hybrid load, the performance of simple queries on a single table improves up to 20%.

User documents: [Supported push-down calculations](#), [Configure the tiflash.toml file](#)

- **Read historical data within a specified time range through a session variable**

TiDB is a multi-replica distributed database based on the Raft consensus algorithm. In face of high-concurrency and high-throughput application scenarios, TiDB can scale out its read performance through follower replicas, separating read and write requests.

For different application scenarios, TiDB provides two modes of follower read: strongly consistent read and weakly consistent history read. The strongly consistent read mode is suitable for application scenarios that require real-time data. However, in this mode, because of the data replication latency between leaders and followers and the reduced throughput, the read request might have high latency, especially for geo-distributed deployments.

For the application scenarios that have less strict requirements on real-time data, the history read mode is recommended. This mode can reduce latency and improve throughput. TiDB currently supports reading historical data by the following methods: Use SQL statements to read data from a time point in the past, or start a read-only transaction based on a time point in the past. Both methods support reading the historical data of a specific point in time or within a specified time range. For details, refer to [Read Historical Data Using the AS OF TIMESTAMP Clause](#).

Since v5.4.0, TiDB improves the usability of the history read mode by supporting reading historical data within a specified time range through a session variable. This mode serves low-latency, high-throughput read requests in quasi-real-time scenarios. You can set the variable as follows:

```
set @@tidb_replica_read=leader_and_follower
set @@tidb_read_staleness="-5"
```

By this setting, TiDB can select the nearest leader or follower node and read the latest historical data within 5 seconds.

[User document](#)

- **GA for Index Merge**

Index Merge is introduced in TiDB v4.0 as an experimental feature for SQL optimization. This method greatly accelerates condition filtering when a query requires scanning of multiple columns of data. Take the following query as an example. In the `WHERE` statement, if the filtering conditions connected by `OR` have their respective indexes on columns `key1` and `key2`, the Index Merge feature filters the respective indexes at the same time, merges the query results, and returns the merged result.

```
SELECT * FROM table WHERE key1 <= 100 OR key2 = 200;
```

Before TiDB v4.0, a query on a table supports using only one index for filtering at one time. If you want to query multiple columns of data, you can enable Index Merge to get the exact query result in a short time by using the indexes in individual columns. Index Merge avoids unnecessary full table scans and does not require establishing a large number of composite indexes.

In v5.4.0, Index Merge becomes GA. However, you still need to pay attention to the following restrictions:

- Index Merge supports only disjunctive normal form ( $X_1 \ X_2 \ \dots X_n$ ). That is, this feature only works when filtering conditions in a `WHERE` clause are connected by `OR`.
- For newly deployed TiDB clusters of v5.4.0 or later, this feature is enabled by default. For v5.4.0 or later TiDB clusters upgraded from earlier versions, this feature inherits the setting before the upgrade and you can change the setting as required (for TiDB clusters earlier than v4.0, this feature does not exist and is disabled by default).

### User document

- **Support Raft Engine (experimental)**

Support using [Raft Engine](#) as the log storage engine in TiKV. Compared with RocksDB, Raft Engine can reduce TiKV I/O write traffic by up to 40% and CPU usage by 10%, while improving foreground throughput by about 5% and reducing tail latency by 20% under certain loads. In addition, Raft Engine improves the efficiency of log recycling and fixes the issue of log accumulation in extreme conditions.

Raft Engine is still an experimental feature and is disabled by default. Note that the data format of Raft Engine in v5.4.0 is not compatible with previous versions. Before upgrading the cluster, you need to make sure that Raft Engine on all TiKV nodes is disabled. It is recommended to use Raft Engine only in v5.4.0 or a later version.

### User document

- **Support collecting statistics on PREDICATE COLUMNS (experimental)**

In most cases, when executing SQL statements, the optimizer only uses statistics of some columns (such as columns in the WHERE, JOIN, ORDER BY, and GROUP BY statements). These used columns are called PREDICATE COLUMNS.

Since v5.4.0, you can set the value of the `tidb_enable_column_tracking` system variable to ON to enable TiDB to collect PREDICATE COLUMNS.

After the setting, TiDB writes the PREDICATE COLUMNS information to the `mysql.column_stats_usage` system table every  $100 * \text{stats-lease}$ . When the query pattern of your business is stable, you can use the `ANALYZE TABLE TableName PREDICATE COLUMNS` syntax to collect statistics on the PREDICATE COLUMNS columns only, which can greatly reduce the overhead of collecting statistics.

### User document

- **Support synchronously loading statistics (experimental)**

Since v5.4.0, TiDB introduces the synchronously loading statistics feature. This feature is disabled by default. After enabling the feature, TiDB can synchronously load large-sized statistics (such as histograms, TopN, and Count-Min Sketch statistics) into memory when you execute SQL statements, which improves the completeness of statistics for SQL optimization.

### User document

#### 16.12.4.2.4 Stability

- **Support persisting ANALYZE configurations**

Statistics are one type of the basic information that the optimizer refers to when generating execution plans. The accuracy of the statistics directly affects whether the generated execution plans are reasonable. To ensure the accuracy of the statistics,

sometimes it is necessary to set different collection configurations for different tables, partitions, and indexes.

Since v5.4.0, TiDB supports persisting some `ANALYZE` configurations. With this feature, the existing configurations can be easily reused for future statistics collection.

The `ANALYZE` configuration persistence feature is enabled by default (the system variable `tidb_analyze_version` is 2 and `tidb_persist_analyze_options` is `ON` by default). You can use this feature to record the persistence configurations specified in the `ANALYZE` statement when executing the statement manually. Once recorded, the next time TiDB automatically updates statistics or you manually collect statistics without specifying these configurations, TiDB will collect statistics according to the recorded configurations.

[User document](#)

#### 16.12.4.2.5 High availability and disaster recovery

- **Reduce the impact of backup tasks on the cluster**

Backup & Restore (BR) introduces the auto-tune feature (enabled by default). This feature can reduce the impact of backup tasks on the cluster by monitoring the cluster resource usage and adjusting the number of threads used by the backup tasks. In some cases, if you increase the cluster hardware resource for backup and enable the auto-tune feature, it can limit the impact of backup tasks on the cluster to 10% or less.

[User document](#)

- **Support Azure Blob Storage as a target storage for backup**

Backup & Restore (BR) supports Azure Blob Storage as a remote backup storage. If you deploy TiDB in Azure Cloud, now you can back up the cluster data to the Azure Blob Storage service.

[\[User document\]](#) (#backup-storages)

#### 16.12.4.2.6 Data migration

- **TiDB Lightning introduces a new feature to determine whether to allow importing data to tables with data**

TiDB Lightning introduces a configuration `itemincremental-import`. It determines whether to allow importing data to tables with data. The default value is `false`. When using the parallel import mode, you must set the configuration to `true`.

[User document](#)

- **TiDB Lightning introduces the schema name that stores the meta information for parallel import**

TiDB Lightning introduces the `meta-schema-name` configuration item. In parallel import mode, this parameter specifies the schema name that stores the meta information for each TiDB Lightning instance in the target cluster. By default, the value is “`lightning_metadata`”. The value set for this parameter must be the same for each TiDB Lightning instance that participates in the same parallel import; otherwise, the correctness of the imported data cannot be ensured.

[User document](#)

- **TiDB Lightning introduces duplicate resolution**

In Local-backend mode, TiDB Lightning outputs duplicated data before the data import is completed, and then removes that duplicated data from the database. You can resolve the duplicated data after the import is completed and select suitable data to insert according to application rules. It is recommended to clean upstream data sources based on duplicated data to avoid data inconsistency caused by duplicated data encountered in the subsequent incremental data migration phase.

[User document](#)

- **Optimize the usage of relay log in TiDB Data Migration (DM)**

- Recover the `enable-relay` switch in the `source` configuration.
- Support dynamically enabling and disabling relay log using the `start-relay` and `stop-relay` commands.
- Bind the status of relay log to `source`. `source` keeps its original status of being enabled or disabled after it is migrated to any DM-worker.
- Move the storage path of relay log to the DM-worker configuration file.

[User document](#)

- **Optimize the processing of `collation` in DM**

Add the `collation_compatible` configuration item. The value options are `loose` (default) and `strict`:

- If your application does not have strict requirements on collation, and the collation of query results can be different between the upstream and downstream, you can use the default `loose` mode to avoid reporting errors.
- If your application has strict requirements on collation, and the collation must be consistent between the upstream and downstream, you can use the `strict` mode. However, if the downstream does not support the upstream’s default collation, the data replication might report errors.

## User document

- **Optimize transfer source in DM to support running replication tasks smoothly**

When the DM-worker nodes have an unbalanced load, the `transfer source` command can be used to manually transfer the configuration of a `source` to another load. After the optimization, the `transfer source` command simplifies the manual operation. You can smoothly transfer the source instead of pausing all related tasks, because DM completes other operations internally.

- **DM OpenAPI becomes generally available (GA)**

DM supports daily management via API, including adding data sources and managing tasks. In v5.4.0, DM OpenAPI becomes GA.

## User document

### 16.12.4.2.7 Diagnostic efficiency

- **Top SQL (experimental feature)**

A new experimental feature, Top SQL (disabled by default), is introduced to help you easily find source-consuming queries.

## User document

### 16.12.4.2.8 TiDB data share subscription

- **Optimize the impact of TiCDC on clusters**

Significantly reduces the impact on the performance of TiDB clusters when you use TiCDC. In the test environment, the performance impact of TiCDC on TiDB can be reduced to less than 5%.

### 16.12.4.2.9 Deployment and maintenance

- **Enhance Continuous Profiling (experimental)**

- More components supported: Besides TiDB, PD, and TiKV, TiDB v5.4.0 also supports CPU profiling of TiFlash.
- More forms of profiling display: Supports showing CPU profiling and Goroutine results on flame charts.
- More deployment environments supported: Continuous Profiling can also be used for clusters deployed using TiDB Operator.

Continuous Profiling is disabled by default and can be enabled on TiDB Dashboard.

Continuous Profiling is applicable to clusters deployed or upgraded using  
↳ TiUP of v1.9.0 or later or TiDB Operator of v1.3.0 or later.

[User document](#tidb-dashboard-instance-profiling---continuous-profiling)

### 16.12.4.3 Improvements

- TiDB
  - Support the `ADMIN {SESSION | INSTANCE | GLOBAL} PLAN_CACHE` syntax to clear the cached query plan [#30370](#)
- TiKV
  - Coprocessor supports paging API to process requests in a stream-like way [#11448](#)
  - Support `read-through-lock` so that read operations do not need to wait for secondary locks to be resolved [#11402](#)
  - Add a disk protection mechanism to avoid panic caused by disk space drainage [#10537](#)
  - Support archiving and rotating logs [#11651](#)
  - Reduce the system call by the Raft client and increase CPU efficiency [#11309](#)
  - Coprocessor supports pushing down substring to TiKV [#11495](#)
  - Improve the scan performance by skip reading locks in the Read Committed isolation level [#11485](#)
  - Reduce the default thread pool size used by backup operations and limit the use of thread pool when the stress is high [#11000](#)
  - Support dynamically adjusting the sizes of the Apply thread pool and the Store thread pool [#11159](#)
  - Support configuring the size of the `snap-generator` thread pool [#11247](#)
  - Optimize the issue of global lock race that occurs when there are many files with frequent reads and writes [#250](#)
- PD
  - Record the historic hotspot information by default [#25281](#)
  - Add signature for the HTTP component to identify the request source [#4490](#)
  - Update TiDB Dashboard to v2021.12.31 [#4257](#)
- TiFlash
  - Optimize the communication of local operators
  - Increase the non-temporary thread count of gRPC to avoid the frequent creation or destruction of threads

- Tools
  - Backup & Restore (BR)
    - \* Add a validity check for the key when BR performs encrypted backup [#29794](#)
  - TiCDC
    - \* Reduce the count of “EventFeed retry rate limited” logs [#4006](#)
    - \* Reduce the replication latency when replicating many tables [#3900](#)
    - \* Reduce the time for the KV client to recover when a TiKV store is down [#3191](#)
  - TiDB Data Migration (DM)
    - \* Lower the usage rate of CPU when the relay is enabled [#2214](#)
  - TiDB Lightning
    - \* Use optimistic transactions by default to write data to improve performance in TiDB-backend mode [#30953](#)
  - Dumpling
    - \* Improve compatibility when Dumpling checks the database version [#29500](#)
    - \* Add the default collation when dumping CREATE DATABASE and CREATE ↪ TABLE [#3420](#)

#### 16.12.4.4 Bug fixes

- TiDB
  - Fix the issue of the `tidb_analyze_version` value change that occurs when upgrading the cluster from v4.x to v5.x [#25422](#)
  - Fix the issue of the wrong result that occurs when using different collations in a subquery [#30748](#)
  - Fix the issue that the result of `concat(ifnull(time(3))` in TiDB is different from that in MySQL [#29498](#)
  - Fix the issue of potential data index inconsistency in optimistic transaction mode [#30410](#)
  - Fix the issue that the query execution plan of IndexMerge is wrong when an expression cannot be pushed down to TiKV [#30200](#)
  - Fix the issue that concurrent column type change causes inconsistency between the schema and the data [#31048](#)
  - Fix the issue that the IndexMerge query result is wrong when there is a subquery [#30913](#)
  - Fix the panic issue that occurs when the FetchSize is set too large in the client [#30896](#)
  - Fix the issue that LEFT JOIN might be mistakenly converted to INNER JOIN [#20510](#)

- Fix the issue that panic might occur when the `CASE-WHEN` expression and collation are used together [#30245](#)
  - Fix the issue of wrong query result that occurs when the `IN` value contains a binary constant [#31261](#)
  - Fix the issue of wrong query result that occurs when CTE has a subquery [#31255](#)
  - Fix the issue that executing the `INSERT ... SELECT ... ON DUPLICATE KEY ↪ UPDATE` statement gets panic [#28078](#)
  - Fix the issue that `INDEX HASH JOIN` returns the `send on closed channel` error [#31129](#)
- TiKV
    - Fix the issue that the MVCC deletion records are not cleared by GC [#11217](#)
    - Fix the issue that retrying prewrite requests in the pessimistic transaction mode might cause the risk of data inconsistency in rare cases [#11187](#)
    - Fix the issue that GC scan causes memory overflow [#11410](#)
    - Fix the issue that RocksDB flush or compaction causes panic when the disk capacity is full [#11224](#)
- PD
    - Fix the issue that Region statistics are not affected by `flow-round-by-digit` [#4295](#)
    - Fix the issue that the scheduling operator cannot fail fast because the target store is down [#3353](#)
    - Fix the issue that Regions on offline stores cannot be merged [#4119](#)
    - Fix the issue that the cold hotspot data cannot be deleted from the hotspot statistics [#4390](#)
- TiFlash
    - Fix the issue that TiFlash might panic when an MPP query is stopped
    - Fix the issue that queries with the `where <string>` clause return wrong results
    - Fix the potential issue of data inconsistency that might occur when setting the column type of an integer primary key to a larger range
    - Fix the issue that when an input time is earlier than 1970-01-01 00:00:01 UTC, the behavior of `unix_timestamp` is inconsistent with that of TiDB or MySQL
    - Fix the issue that TiFlash might return the `EstablishMPPConnection` error after it is restarted
    - Fix the issue that the `CastStringAsDecimal` behavior is inconsistent in TiFlash and in TiDB/TiKV
    - Fix the issue that the `DB::Exception: Encode type of coprocessor ↪ response is not CHBlock` error is returned in the query result
    - Fix the issue that the `castStringAsReal` behavior is inconsistent in TiFlash and in TiDB/TiKV

- Fix the issue that the returned result of the `date_add_string_xxx` function in TiFlash is inconsistent with that in MySQL
- Tools
  - Backup & Restore (BR)
    - \* Fix the potential issue that Region distribution might be uneven after a restore operation is finished [#30425](#)
    - \* Fix the issue that `'/'` cannot be specified in endpoint when `minio` is used as the backup storage [#30104](#)
    - \* Fix the issue that system tables cannot be restored because concurrently backing up system tables makes the table name fail to update [#29710](#)
  - TiCDC
    - \* Fix the issue that replication cannot be performed when `min.insync.replicas` is smaller than `replication-factor` [#3994](#)
    - \* Fix the issue that the `cached region` monitoring metric is negative [#4300](#)
    - \* Fix the issue that `mq sink write row` does not have monitoring data [#3431](#)
    - \* Fix the compatibility issue of `sql mode` [#3810](#)
    - \* Fix the potential panic issue that occurs when a replication task is removed [#3128](#)
    - \* Fix the issue of panic and data inconsistency that occurs when outputting the default column value [#3929](#)
    - \* Fix the issue that default values cannot be replicated [#3793](#)
    - \* Fix the potential issue that the deadlock causes a replication task to get stuck [#4055](#)
    - \* Fix the issue that no log is output when the disk is fully written [#3362](#)
    - \* Fix the issue that special comments in DDL statements cause the replication task to stop [#3755](#)
    - \* Fix the issue that the service cannot be started because of a timezone issue in the RHEL release [#3584](#)
    - \* Fix the issue of potential data loss caused by inaccurate checkpoint [#3545](#)
    - \* Fix the OOM issue in the container environment [#1798](#)
    - \* Fix the issue of replication stop caused by the incorrect configuration of `config.Metadata.Timeout` [#3352](#)
  - TiDB Data Migration (DM)
    - \* Fix the issue that the `CREATE VIEW` statement interrupts data replication [#4173](#)
    - \* Fix the issue the schema needs to be reset after a DDL statement is skipped [#4177](#)
    - \* Fix the issue that the table checkpoint is not updated in time after a DDL statement is skipped [#4184](#)
    - \* Fix a compatibility issue of the TiDB version with the Parser version [#4298](#)
    - \* Fix the issue that syncer metrics are updated only when querying the status [#4281](#)

- TiDB Lightning
  - \* Fix the issue of wrong import result that occurs when TiDB Lightning does not have the privilege to access the `mysql.tidb` table [#31088](#)
  - \* Fix the issue that some checks are skipped when TiDB Lightning is restarted [#30772](#)
  - \* Fix the issue that TiDB Lightning fails to report the error when the S3 path does not exist [#30674](#)
- TiDB Binlog
  - \* Fix the issue that Drainer fails because it is incompatible with the `CREATE ↪ PLACEMENT POLICY` statement [#1118](#)

## 16.13 v5.3

### 16.13.1 TiDB 5.3.4 Release Notes

Release date: November 24, 2022

TiDB version: 5.3.4

#### 16.13.1.1 Improvements

- TiKV
  - Reload TLS certificate automatically for each update to improve availability [#12546](#)

#### 16.13.1.2 Bug fixes

- TiDB
  - Fix the issue that the Region cache is not cleaned up in time when the Region is merged [#37141](#)
  - Fix the issue that TiDB writes wrong data due to the wrong encoding of the `ENUM` or `SET` column [#32302](#)
  - Fix the issue that database-level privileges are incorrectly cleaned up [#38363](#)
  - Fix the issue that the `grantor` field is missing in the `mysql.tables_priv` table [#38293](#)
  - Fix the issue that `KILL TIDB` cannot take effect immediately on idle connections [#24031](#)
  - Fix the issue that the return type of `date_add` and `date_sub` is different between TiDB and MySQL [#36394](#), [#27573](#)
  - Fix the incorrect `INSERT_METHOD` value when Parser restores table options [#38368](#)

- Fix the issue that authentication fails when a MySQL client of v5.1 or earlier connects to the TiDB server [#29725](#)
- Fix wrong results of GREATEST and LEAST when passing in unsigned BIGINT arguments [#30101](#)
- Fix the issue that the result of `concat(ifnull(time(3)))` in TiDB is different from that in MySQL [#29498](#)
- Fix the issue that the `avg()` function returns `ERROR 1105 (HY000): other ↪ error for mpp stream: Could not convert to the target type - - ↪ value is out of range.` when queried from TiFlash [#29952](#)
- Fix the issue that `ERROR 1105 (HY000): close of nil channel` is returned when using `HashJoinExec` [#30289](#)
- Fix the issue that TiKV and TiFlash return different results when querying logical operations [#37258](#)
- Fix the issue that the `EXPLAIN ANALYZE` statement with DML executors might return result before the transaction commit finishes [#37373](#)
- Fix the issue that Region cache is not cleared properly after merging many Regions [#37174](#)
- Fix the issue that the `EXECUTE` statement might throw an unexpected error in specific scenarios [#37187](#)
- Fix the issue that `GROUP CONCAT` with `ORDER BY` might fail when the `ORDER BY` clause contains a correlated subquery [#18216](#)
- Fix wrong results returned when length and width are incorrectly set for Decimal and Real when using plan cache [#29565](#)
- PD
  - Fix the issue that PD cannot correctly handle dashboard proxy requests [#5321](#)
  - Fix the issue that the TiFlash learner replica might not be created in specific scenarios [#5401](#)
  - Fix inaccurate Stream timeout and accelerate leader switchover [#5207](#)
- TiFlash
  - Fix the issue that logical operators return wrong results when the argument type is `UInt8` [#6127](#)
  - Fix the issue that TiFlash bootstrap fails when `0.0` is used as the default value for integers, for example, ``i` int(11)NOT NULL DEFAULT '0.0'` [#3157](#)
- Tools
  - Dumpling
    - \* Fix the issue that Dumpling cannot dump data when the `--compress` option and the S3 output directory are set simultaneously [#30534](#)
  - TiCDC
    - \* Fix the issue that changefeed state is incorrect because a MySQL-related error is not reported to the owner in time [#6698](#)

### 16.13.2 TiDB 5.3.3 Release Note

Release date: September 14, 2022

TiDB version: 5.3.3

#### 16.13.2.1 Bug fix

- TiKV
  - Fix the issue of continuous SQL execution errors in the cluster after the PD leader is switched or PD is restarted.
    - \* Cause: This issue is caused by a TiKV bug that TiKV does not retry sending heartbeat information to PD client after heartbeat requests fail, until TiKV reconnects to PD client. As a result, the Region information on the failed TiKV node becomes outdated, and TiDB cannot get the latest Region information, which causes SQL execution errors.
    - \* Affected versions: v5.3.2 and v5.4.2. This issue has been fixed in v5.3.3. If you are using v5.3.2, you can upgrade your cluster to v5.3.3.
    - \* Workaround: In addition to upgrade, you can also restart the TiKV nodes that cannot send Region heartbeat to PD, until there is no Region heartbeat to send.

For bug details, see [#12934](#).

### 16.13.3 TiDB 5.3.2 Release Notes

Release Date: June 29, 2022

TiDB version: 5.3.2

#### Warning:

It is not recommended to use v5.3.2, because this version has a known bug. For details, see [#12934](#). This bug has been fixed in v5.3.3. It is recommended to use [v5.3.3](#).

#### 16.13.3.1 Compatibility Changes

- TiDB
  - Fix the issue that the REPLACE statement incorrectly changes other rows when the auto ID is out of range [#29483](#)

- PD
  - Disable compiling swagger server by default [#4932](#)

### 16.13.3.2 Improvements

- TiKV
  - Reduce the system call by the Raft client and increase CPU efficiency [#11309](#)
  - Improve the health check to detect unavailable Raftstore, so that the TiKV client can update Region Cache in time [#12398](#)
  - Transfer the leadership to CDC observer to reduce latency jitter [#12111](#)
  - Add more metrics for the garbage collection module of Raft logs to locate performance problems in the module [#11374](#)
- Tools
  - TiDB Data Migration (DM)
    - \* Support Syncer using the working directory of the DM-worker rather than /  
↔ tmp to write internal files, and cleaning the directory after the task is stopped [#4107](#)
  - TiDB Lightning
    - \* Optimize Scatter Region to batch mode to improve the stability of the Scatter Region process [#33618](#)

### 16.13.3.3 Bug Fixes

- TiDB
  - Fix the issue that Amazon S3 cannot correctly calculate the size of compressed data [#30534](#)
  - Fix the issue of potential data index inconsistency in optimistic transaction mode [#30410](#)
  - Fix the issue that a SQL operation is canceled when its JSON type column joins its CHAR type column [#29401](#)
  - Previously, when a network connectivity issue occurred, TiDB did not always correctly free the resources held by the disconnected session. This issue has been fixed so that open transactions can be rolled back and other associated resources can be released. [#34722](#)
  - Fix the issue of the `data and columnID count not match` error that occurs when inserting duplicated values with TiDB Binlog enabled [#33608](#)
  - Fix the issue that query result might be wrong when Plan Cache is started in the RC isolation level [#34447](#)

- Fix the session panic that occurs when executing the prepared statement after table schema change with the MySQL binary protocol [#33509](#)
  - Fix the issue that the table attributes are not indexed when a new partition is added and the issue that the table range information is not updated when the partition changes [#33929](#)
  - Fix the issue that the TiDB server might run out of memory when the `INFORMATION_SCHEMA.CLUSTER_SLOW_QUERY` table is queried. This issue can be triggered when you check slow queries on the Grafana dashboard [#33893](#)
  - Fix the issue that some DDL statements might be stuck for a period after the PD node of a cluster is replaced [#33908](#)
  - Fix the issue that granting the `all` privilege might fail in clusters that are upgraded from v4.0 [#33588](#)
  - Fix wrong results of deleting data of multiple tables using `left join` [#31321](#)
  - Fix a bug that TiDB may dispatch duplicate tasks to TiFlash [#32814](#)
  - Fix the issue that the background HTTP service of TiDB might not exit successfully and makes the cluster in an abnormal state [#30571](#)
  - Fix the panic issue caused by the `fatal error: concurrent map read and ↪ map write` error [#35340](#)
- TiKV
    - Fix the issue of frequent PD client reconnection that occurs when the PD client meets an error [#12345](#)
    - Fix the issue of time parsing error that occurs when the `DATETIME` values contain a fraction and `Z` [#12739](#)
    - Fix the issue that TiKV panics when performing type conversion for an empty string [#12673](#)
    - Fix the possible duplicate commit records in pessimistic transactions when async commit is enabled [#12615](#)
    - Fix the bug that TiKV reports the `invalid store ID 0` error when using Follower Read [#12478](#)
    - Fix the issue of TiKV panic caused by the race between destroying peers and batch splitting Regions [#12368](#)
    - Fix the issue that successfully committed optimistic transactions may report the `Write Conflict` error when the network is poor [#34066](#)
    - Fix the issue that TiKV panics and destroys peers unexpectedly when the target Region to be merged is invalid [#12232](#)
    - Fix a bug that stale messages cause TiKV to panic [#12023](#)
    - Fix the issue of intermittent packet loss and out of memory (OOM) caused by the overflow of memory metrics [#12160](#)
    - Fix the potential panic issue that occurs when TiKV performs profiling on Ubuntu 18.04 [#9765](#)
    - Fix the issue that `tikv-ctl` returns an incorrect result due to its wrong string match [#12329](#)
    - Fix a bug that replica reads might violate the linearizability [#12109](#)

- Fix the TiKV panic issue that occurs when the target peer is replaced with the peer that is destroyed without being initialized when merging a Region [#12048](#)
- Fix a bug that TiKV might panic if it has been running for 2 years or more [#11940](#)
- PD
  - Fix the PD panic that occurs when a hot region has no leader [#5005](#)
  - Fix the issue that scheduling cannot start immediately after the PD leader transfer [#4769](#)
  - Fix the issue that a removed tombstone store appears again after the PD leader transfer [#4941](#)
  - Fix a bug of TSO fallback in some corner cases [#4884](#)
  - Fix the issue that when there exists a Store with large capacity (2T for example), fully allocated small Stores cannot be detected, which results in no balance operator being generated [#4805](#)
  - Fix the issue that schedulers do not work when `SchedulerMaxWaitingOperator` is set to 1 [#4946](#)
  - Fix the issue that the label distribution has residual labels in the metrics [#4825](#)
- TiFlash
  - Fix the bug that invalid storage directory configurations lead to unexpected behaviors [#4093](#)
  - Fix `TiFlash_schema_error` reported when NOT NULL columns are added [#4596](#)
  - Fix repeated crashes caused by the `commit state jump backward` errors [#2576](#)
  - Fix potential data inconsistency after a lot of INSERT and DELETE operations [#4956](#)
  - Fix a bug that canceled MPP queries might cause tasks to hang forever when the local tunnel is enabled [#4229](#)
  - Fix false reports of inconsistent TiFlash versions when TiFlash uses remote read [#3713](#)
  - Fix a bug that an MPP query might fail due to random gRPC keepalive timeout [#4662](#)
  - Fix a bug that an MPP query might hang forever if there are retries in the exchange receiver [#3444](#)
  - Fix the wrong result that occurs when casting DATETIME to DECIMAL [#4151](#)
  - Fix the overflow that occurs when casting FLOAT to DECIMAL [#3998](#)
  - Fix the potential `index out of bounds` error if calling `json_length` with empty string [#2705](#)
  - Fix wrong decimal comparison results in corner cases [#4512](#)
  - Fix bug that MPP query may hang forever if query failed in join build stage [#4195](#)
  - Fix possible wrong results when a query contains the `where <string>` clause [#3447](#)

- Fix the issue that the `CastStringAsReal` behavior is inconsistent in TiFlash and in TiDB or TiKV [#3475](#)
  - Fix incorrect `microsecond` when casting string to datetime [#3556](#)
  - Fix potential errors when querying on a table with many delete operations [#4747](#)
  - Fix a bug that TiFlash reports many “Keepalive watchdog fired” errors randomly [#4192](#)
  - Fix a bug that data not matching any region range remains on a TiFlash node [#4414](#)
  - Fix a bug that MPP tasks might leak threads forever [#4238](#)
  - Fix a bug that empty segments cannot be merged after GC [#4511](#)
  - Fix the panic issue that occurs when TLS is enabled [#4196](#)
  - Fix the issue that expired data is recycled slowly [#4146](#)
  - Fix the bug that invalid storage directory configurations lead to unexpected behaviors [#4093](#)
  - Fix the bug that some exceptions are not handled properly [#4101](#)
  - Fix the potential query error after adding columns under heavy read workload [#3967](#)
  - Fix the bug that the `STR_TO_DATE()` function incorrectly handles leading zeros when parsing microseconds [#3557](#)
  - Fix the issue that TiFlash might return the `EstablishMPPConnection` error after it is restarted [#3615](#)
- Tools
    - Backup & Restore (BR)
      - \* Fix duplicate primary keys when inserting a record into a table after incremental restoration [#33596](#)
      - \* Fix the issue that schedulers do not resume after BR or TiDB Lightning exits abnormally [#33546](#)
      - \* Fix a bug that BR incremental restore returns errors mistakenly due to DDL jobs with empty query [#33322](#)
      - \* Fix the issue that BR does not retry enough times when Regions are not consistent during restoration [#33419](#)
      - \* Fix a bug that BR gets stuck when the restore operation meets some unrecoverable errors [#33200](#)
      - \* Fix the issue that BR fails to back up RawKV [#32607](#)
      - \* Fix the issue that BR cannot handle S3 internal errors [#34350](#)
    - TiCDC
      - \* Fix incorrect metrics caused by owner changes [#4774](#)
      - \* Fix the bug that the redo log manager flushes logs before writing logs [#5486](#)
      - \* Fix the bug that the resolved ts moves too fast when some tables are not maintained by the redo writer [#5486](#)
      - \* Add the UUID suffix to the redo log file name to fix the issue that file name conflicts may cause data loss [#5486](#)

- \* Fix the bug that MySQL Sink may save a wrong checkpointTs [#5107](#)
- \* Fix the issue that TiCDC clusters may panic after upgrade [#5266](#)
- \* Fix the issue that changefeed gets stuck when tables are repeatedly scheduled in the same node [#4464](#)
- \* Fix the issue that TiCDC fails to start when the first PD set in `--pd` is not available after TLS is enabled [#4777](#)
- \* Fix a bug that querying status through open API may be blocked when the PD node is abnormal [#4778](#)
- \* Fix a stability problem in workerpool used by Unified Sorter [#4447](#)
- \* Fix a bug that sequence is incorrectly replicated in some cases [#4563](#)
- TiDB Data Migration (DM)
  - \* Fix the issue that DM occupies more disk space after the task automatically resumes [#3734](#) [#5344](#)
  - \* Fix an issue that the uppercase table cannot be replicated when `case-sensitive: true` is not set [#5255](#)
  - \* Fix the issue that in some cases manually executing the filtered DDL in the downstream might cause task resumption failure [#5272](#)
  - \* Fix the DM worker panic issue that occurs when the primary key is not first in the index returned by the `SHOW CREATE TABLE` statement [#5159](#)
  - \* Fix the issue that CPU usage may increase and a large amount of log is printed when GTID is enabled or when the task is automatically resumed [#5063](#)
  - \* Fix the issue that the relay log may be disabled after the DM-master reboots [#4803](#)
- TiDB Lightning
  - \* Fix the issue of Local-backend import failure caused by out-of-bounds data in the `auto_increment` column [#27937](#)
  - \* Fix the issue that the precheck does not check local disk resources and cluster availability [#34213](#)
  - \* Fix the checksum error “GC life time is shorter than transaction duration” [#32733](#)

#### 16.13.4 TiDB 5.3.1 Release Notes

Release Date: March 3, 2022

TiDB version: 5.3.1

##### 16.13.4.1 Compatibility changes

- Tools

- TiDB Lightning

- \* Change the default value of `regionMaxKeyCount` from `1_440_000` to `1_280_000`, to avoid too many empty Regions after data import [#30018](#)

### 16.13.4.2 Improvements

- TiDB
  - Optimize the mapping logic of user login mode to make the logging more MySQL-compatible [#30450](#)
- TiKV
  - Reduce the TiCDC recovery time by reducing the number of the Regions that require the Resolve Locks step [#11993](#)
  - Speed up the Garbage Collection (GC) process by increasing the write batch size when performing GC to Raft logs [#11404](#)
  - Update the proc filesystem (procf) to v0.12.0 [#11702](#)
- PD
  - Optimize the content format of the DR\_STATE file [#4341](#)
- Tools
  - TiCDC
    - \* Expose configuration parameters of the Kafka producer to make them configurable in TiCDC [#4385](#)
    - \* Add a pre-cleanup process upon TiCDC startup if S3 is used as backend storage [#3878](#)
    - \* The TiCDC client works when no certificate name is specified [#3627](#)
    - \* Manage sink checkpoints per table to avoid unexpected advance of checkpoint timestamps [#3545](#)
    - \* Add the exponential backoff mechanism for restarting a changefeed. [#3329](#)
    - \* Change the default value of Kafka Sink `partition-num` to 3 so that TiCDC distributes messages across Kafka partitions more evenly [#3337](#)
    - \* Reduce the count of “EventFeed retry rate limited” logs [#4006](#)
    - \* Set the default value of `max-message-bytes` to 10M [#4041](#)
    - \* Add more Prometheus and Grafana monitoring metrics and alerts, including `no owner alert`, `mounter row`, `table sink total row`, and `buffer sink` ↪ `total row` [#4054](#) [#1606](#)
    - \* Reduce the time for the KV client to recover when a TiKV store is down [#3191](#)
  - TiDB Lightning
    - \* Refine the output message of the precheck to make it more user-friendly when the local disk space check fails [#30395](#)

### 16.13.4.3 Bug fixes

- TiDB
  - Fix the issue that `date_format` in TiDB handles `'\n'` in a MySQL-incompatible way [#32232](#)
  - Fix the issue that `alter column set default` wrongly updates the table schema [#31074](#)
  - Fix a bug that `tidb_super_read_only` is not automatically enabled when `tidb_restricted_read_only` is enabled [#31745](#)
  - Fix the issue that the `greatest` or `least` function with collation gets a wrong result [#31789](#)
  - Fix the MPP task list empty error when executing a query [#31636](#)
  - Fix wrong results of index join caused by an innerWorker panic [#31494](#)
  - Fix wrong query results after changing the column type from `FLOAT` to `DOUBLE` [#31372](#)
  - Fix the `invalid transaction` error when executing a query using index lookup join [#30468](#)
  - Fix wrong query results due to the optimization of `Order By` [#30271](#)
  - Fix the issue that the configurations of `MaxDays` and `MaxBackups` do not take effect on the slow log [#25716](#)
  - Fix the issue that executing the `INSERT ... SELECT ... ON DUPLICATE KEY ↪ UPDATE` statement gets panic [#28078](#)
- TiKV
  - Fix the panic issue caused by deleting snapshot files when the peer status is `Applying` [#11746](#)
  - Fix the issue of QPS drop when flow control is enabled and `level0_slowdown_trigger ↪` is set explicitly [#11424](#)
  - Fix the panic issue that occurs when the cgroup controller is not mounted [#11569](#)
  - Fix the issue that the latency of Resolved TS increases after TiKV stops operating [#11351](#)
  - Fix a bug that TiKV cannot delete a range of data (`unsafe_destroy_range` cannot be executed) when the GC worker is busy [#11903](#)
  - Fix the issue that destroying a peer might cause high latency [#10210](#)
  - Fix a bug that the `any_value` function returns a wrong result when regions are empty [#11735](#)
  - Fix the issue that deleting an uninitialized replica might cause an old replica to be recreated [#10533](#)
  - Fix the metadata corruption issue when `Prepare Merge` is triggered after a new election is finished but the isolated peer is not informed [#11526](#)
  - Fix the deadlock issue that happens occasionally when coroutines run too fast [#11549](#)
  - Fix the issue that a down TiKV node causes the resolved timestamp to lag [#11351](#)

- Fix the issue that batch messages are too large in Raft client implementation [#9714](#)
- Fix a panic issue that occurs when Region merge, ConfChange, and Snapshot happen at the same time in extreme conditions [#11475](#)
- Fix the issue that TiKV cannot detect the memory lock when TiKV performs a reverse table scan [#11440](#)
- Fix the issue that RocksDB flush or compaction causes panic when the disk capacity is full [#11224](#)
- Fix a bug that tikv-ctl cannot return the correct Region-related information [#11393](#)
- Fix the issue that the average latency of the by-instance gRPC requests is inaccurate in TiKV metrics [#11299](#)
- PD
  - Fix a bug that the scheduling process has the unnecessary JointConsensus steps in certain cases [#4362](#)
  - Fix a bug that the scheduling cannot be executed when demoting a voter directly [#4444](#)
  - Fix a data race issue that occurs when updating the configuration of the replication mode of replicas [#4325](#)
  - Fix a bug that the Read lock is not released in certain cases [#4354](#)
  - Fix the issue that the cold hotspot data cannot be deleted from the hotspot statistics [#4390](#)
- TiFlash
  - Fix the issue that `cast(arg as decimal(x,y))` returns a wrong result when the input argument `arg` overflows the range of `decimal(x,y)`
  - Fix the TiFlash crash issue that occurs when `max_memory_usage` and `max_memory_usage_for_all_queries` are enabled
  - Fix the issue that `cast(string as real)` returns a wrong result
  - Fix the issue that `cast(string as decimal)` returns a wrong result
  - Fix potential data inconsistency after altering a primary key column to a larger int data type
  - Fix the bug that when `in` has multiple arguments in the statements like `select ↪ (arg0, arg1) in (x,y), in` returns a wrong result
  - Fix the issue that TiFlash might panic when an MPP query is stopped
  - Fix the issue that `str_to_date` returns a wrong result when the input argument has leading zeros
  - Fix the issue that the query returns a wrong result when the filter is in the `where ↪ <string> format`
  - Fix the issue that `cast(string as datetime)` returns a wrong result when the input argument `string` is in the `%Y-%m-%d\n%H:%i:%s` format
- Tools

- Backup & Restore (BR)
  - \* Fix the potential issue that Regions might be unevenly distributed after a restore operation is finished [#31034](#)
- TiCDC
  - \* Fix a bug that long varchars report an error `Column length too big` [#4637](#)
  - \* Fix a bug that a TiCDC node exits abnormally when a PD leader is killed [#4248](#)
  - \* Fix the issue that execution errors of the update statement in safemode may cause the DM-worker panic [#4317](#)
  - \* Fix the issue that cached region metric of the TiKV client may be negative [#4300](#)
  - \* Fix the bug that HTTP API panics when the required processor information does not exist [#3840](#)
  - \* Fix a bug that redo logs are not cleaned up when removing a paused change-feed [#4740](#)
  - \* Fix OOM in container environments [#1798](#)
  - \* Fix a bug that stopping a loading task results in unexpected transfer of the task [#3771](#)
  - \* Fix the issue that wrong progress is returned for the `query-status` command on loader [#3252](#)
  - \* Fix the issue that HTTP API fails to work if there are TiCDC nodes of different versions in a cluster [#3483](#)
  - \* Fix the issue that TiCDC exits abnormally when the S3 storage is configured with TiCDC Redo Log [#3523](#)
  - \* Fix the issue that default values cannot be replicated [#3793](#)
  - \* Fix a bug that MySQL sink generates duplicated `replace` SQL statements if `batch-replace-enable` is disabled [#4501](#)
  - \* Fix the issue that syncer metrics are updated only when querying the status [#4281](#)
  - \* Fix the issue that `mq sink write row` does not have monitoring data [#3431](#)
  - \* Fix the issue that replication cannot be performed when `min.insync`.  
↪ `replicas` is smaller than `replication-factor` [#3994](#)
  - \* Fix the issue that `mq sink write row` does not have monitoring data [#3431](#)
  - \* Fix the potential panic issue that occurs when a replication task is removed [#3128](#)
  - \* Fix the potential issue that the deadlock causes a replication task to get stuck [#4055](#)
  - \* Fix the TiCDC panic issue that occurs when manually cleaning the task status in etcd [#2980](#)
  - \* Fix the issue that special comments in DDL statements cause the replication task to stop [#3755](#)
  - \* Fix the issue of replication stop caused by the incorrect configuration of `config.Metadata.Timeout` [#3352](#)
  - \* Fix the issue that the service cannot be started because of a timezone issue

- in some RHEL releases [#3584](#)
  - \* Fix the issue that `stopped` changefeeds resume automatically after a cluster upgrade [#3473](#)
  - \* Fix the issue that default values cannot be replicated [#3793](#)
  - \* Fix the issue of overly frequent warnings caused by MySQL sink deadlock [#2706](#)
  - \* Fix the bug that the `enable-old-value` configuration item is not automatically set to `true` on Canal and Maxwell protocols [#3676](#)
  - \* Fix the issue that Avro sink does not support parsing JSON type columns [#3624](#)
  - \* Fix the negative value error in the changefeed checkpoint lag [#3010](#)
- TiDB Data Migration (DM)
- \* Fix a bug that the relay status in the DM-master is wrong after restarting the DM-master and DM-worker in a particular order [#3478](#)
  - \* Fix a bug that the DM-worker fails to boot up after a restart [#3344](#)
  - \* Fix a bug that a DM task fails if running a PARTITION DDL takes too long time [#3854](#)
  - \* Fix a bug that DM may report `invalid sequence` when upstream is MySQL 8.0 [#3847](#)
  - \* Fix a bug of data loss when DM does finer grained retry [#3487](#)
  - \* Fix the issue that the `CREATE VIEW` statement interrupts data replication [#4173](#)
  - \* Fix the issue the schema needs to be reset after a DDL statement is skipped [#4177](#)
- TiDB Lightning
- \* Fix the bug that TiDB Lightning may not delete the metadata schema when some import tasks do not contain source files [#28144](#)
  - \* Fix the bug that TiDB Lightning returns an error if the storage URL prefix is `gs://xxx`, instead of `gcs://xxx` [#32742](#)
  - \* Fix the issue that setting `-log-file=""` does not print any log to stdout [#29876](#)
  - \* Fix the issue that TiDB Lightning does not report errors when the S3 storage path does not exist [#30709](#)

### 16.13.5 TiDB 5.3 Release Notes

Release date: November 30, 2021

TiDB version: 5.3.0

In v5.3, the key new features or improvements are as follows:

- Introduce temporary tables to simplify your application logic and improve performance
- Support setting attributes for tables and partitions

- Support creating users with the least privileges on TiDB Dashboard to enhance system security
- Optimize the timestamp processing flow in TiDB to improve the overall performance
- Enhance the performance of TiDB Data Migration (DM) so that data is migrated from MySQL to TiDB with lower latency
- Support parallel import using multiple TiDB Lightning instances to improve the efficiency of full data migration
- Support saving and restoring the on-site information of a cluster with a single SQL statement, which helps improve the efficiency of troubleshooting issues relating to execution plans
- Support the continuous profiling experimental feature to improve the observability of database performance
- Continue optimizing the storage and computing engines to improve the system performance and stability
- Reduce the write latency of TiKV by separating I/O operations from Raftstore thread pool (disabled by default)

### 16.13.5.1 Compatibility changes

**Note:**

When upgrading from an earlier TiDB version to v5.3.0, if you want to know the compatibility change notes of all intermediate versions, you can check the [Release Notes](#) of the corresponding version.

#### 16.13.5.1.1 System variables

Variable name	Change type	Description
<code>tidb_enable_noop_functions</code>	Modified	Temporary tables are now supported by TiDB so <code>CREATE TEMPORARY TABLE</code> and <code>DROP TEMPORARY TABLE</code> no longer require enabling <code>tidb_enable_noop_functions</code> .

Variable name	Change type	Description
<code>tidb_enable_pseudo-estimate-ratio</code>	Newly added	Controls the behavior of the optimizer when the statistics on a table expire. The default value is ON. When the number of modified rows in the table is greater than 80% of the total rows (This ratio can be adjusted by the configuration <code>pseudo-estimate-ratio</code> ), the optimizer considers that the statistics other than the total number of rows are no longer reliable and use pseudo statistics instead. When you set the value as OFF, even if the statistics expire, the optimizer still uses them.

Variable name	Change type	Description
<code>tidb_enable_tso_follower_proxy</code> ↔	Newly added	Determines whether to enable or disable the TSO Follower Proxy feature. The default value is OFF, which means the TSO Follower Proxy feature is disabled. At this time, TiDB only gets TSO from PD leader. When this feature is enabled, TiDB evenly sends the requests to all PD nodes when acquiring TSO. The PD follower then forwards the TSO requests to reduce the CPU pressure of PD leader.

Variable name	Change type	Description
<code>tidb_tso_client_batch_wait_time</code> ↔	Newly added	Set the maximum waiting time for a batch saving operation when TiDB requests TSO from PD. The default value is 0, which means no additional waiting.
<code>tidb_tmp_table_size</code> ↔	Newly added	Limits the maximum size of a single temporary table. If the temporary table exceeds this size, an error will occur.

### 16.13.5.1.2 Configuration file parameters

Configuration file	Configuration item	Change type	Description
TiDB	<code>prepared-plan-cache.capacity</code> ↔	Modified	Controls the number of cached statements. The default value is changed from 100 to 1000.

Configuration file	Configuration item	Change type	Description
TiKV	<b>storage.</b> ↔ <b>reserve</b> ↔ <b>-space</b>	Modified	Controls space reserved for disk protection when TiKV is started. Starting from v5.3.0, 80% of the reserved space is used as the extra disk space required for operations and maintenance when the disk space is insufficient, and the other 20% is used to store temporary files.
TiKV	<b>memory-</b> ↔ <b>usage-</b> ↔ <b>limit</b>	Modified	This configuration item is new in TiDB v5.3.0 and its value is calculated based on <code>storage.block-cache.capacity</code> .

Configuration file	Configuration item	Change type	Description
TiKV	<code>raftstore.</code> ↳ <code>store-</code> ↳ <code>io-pool</code> ↳ <code>-size</code>	Newly added	The allowable number of threads that process Raft I/O tasks, which is the size of the StoreWriter thread pool. When you modify the size of this thread pool, refer to <a href="#">Performance tuning for TiKV thread pools</a> .

Configuration file	Configuration item	Change type	Description
TiKV	<b>raftstore.</b> ↪ <b>raft-</b> ↪ <b>write-</b> ↪ <b>size-</b> ↪ <b>limit</b>	Newly added	Determines the threshold at which Raft data is written into the disk. If the data size is larger than the value of this configuration item, the data is written to the disk. When the value of <b>raftstore.</b> ↪ <b>store-</b> ↪ <b>io-pool</b> ↪ <b>-size</b> is 0, this configuration item does not take effect.

Configuration file	Configuration item	Change type	Description
TiKV	raftstore. ↔ raft- ↔ msg- ↔ flush- ↔ interval ↔	Newly added	Determines the interval at which Raft messages are sent in batches. The Raft messages in batches are sent at every interval specified by this configuration item. When the value of raftstore. ↔ store- ↔ io-pool ↔ -size is 0, this configuration item does not take effect.
TiKV	raftstore. ↔ raft- ↔ reject- ↔ transfer ↔ -leader ↔ - ↔ duration ↔	Deleted	Determines the smallest duration that a Leader is transferred to a newly added node.

Configuration file	Configuration item	Change type	Description
PD	<code>log.file.</code> ↔ <code>max-</code> ↔ <code>days</code>	Modified	Controls the maximum number of days that logs are retained for. The default value is changed from 1 to 0.
PD	<code>log.file.</code> ↔ <code>max-</code> ↔ <code>backups</code>	Modified	Controls the maximum number of logs that are retained for. The default value is changed from 7 to 0.

Configuration file	Configuration item	Change type	Description
PD	<code>patrol-</code> ↔ <code>region-</code> ↔ <code>interval</code> ↔	Modified	Controls the running frequency at which replicaChecker checks the health state of a Region. The smaller this value is, the faster replicaChecker runs. Normally, you do not need to adjust this parameter. The default value is changed from 100ms to 10ms.

---

Configuration file	Configuration item	Change type	Description
PD	<b>max-</b> ↔ <b>snapshot</b> ↔ <b>-count</b>	Modified	Controls the maximum number of snapshots that a single store receives or sends at the same time. PD schedulers depend on this configuration to prevent the resources used for normal traffic from being preempted. The default value is changed from 3 to 64.

Configuration file	Configuration item	Change type	Description
PD	<b>max-</b> ↔ <b>pending</b> ↔ <b>-peer-</b> ↔ <b>count</b>	Modified	Controls the maximum number of pending peers in a single store. PD schedulers depend on this configuration to prevent too many Regions with outdated logs from being generated on some nodes. The default value is changed from 16 to 64.
TiDB Lightning	<b>meta-</b> ↔ <b>schema-</b> ↔ <b>name</b>	Newly added	The schema name where the meta information for each TiDB Lightning instance is stored in the target cluster. The default value is “lightning_metadata”.

### 16.13.5.1.3 Others

- Temporary tables:
  - If you have created local temporary tables in a TiDB cluster earlier than v5.3.0, these tables are actually ordinary tables, and handled as ordinary tables after the cluster is upgraded to v5.3.0 or a later version. If you have created global temporary tables in a TiDB cluster of v5.3.0 or a later version, when the cluster is downgraded to a version earlier than v5.3.0, these tables are handled as ordinary tables and cause a data error.
  - Since v5.3.0, TiCDC and BR support [global temporary tables](#). If you use TiCDC and BR of a version earlier than v5.3.0 to replicate global temporary tables to the downstream, a table definition error occurs.
  - The following clusters are expected to be v5.3.0 or later; otherwise, data error is reported when you create a global temporary table:
    - \* the cluster to be imported using TiDB migration tools
    - \* the cluster restored using TiDB migration tools
    - \* the downstream cluster in a replication task using TiDB migration tools
  - For the compatibility information of temporary tables, refer to [Compatibility with MySQL temporary tables](#) and [Compatibility restrictions with other TiDB features](#).
- For releases earlier than v5.3.0, TiDB reports an error when a system variable is set to an illegal value. For v5.3.0 and later releases, TiDB returns success with a warning such as “|Warning | 1292 | Truncated incorrect xxx: ‘xx’” when a system variable is set to an illegal value.
- Fix the issue that the `SHOW VIEW` permission is not required to execute `SHOW CREATE VIEW`. Now you are expected to have the `SHOW VIEW` permission to execute the `SHOW CREATE VIEW` statement.
- The system variable `sql_auto_is_null` is added to the noop functions. When `tidb_enable_noop_functions = 0/OFF`, modifying this variable value causes an error.
- The `GRANT ALL ON performance_schema.*` syntax is no longer permitted. If you execute this statement in TiDB, an error occurs.
- Fix the issue that auto-analyze is unexpectedly triggered outside the specified time period when new indexes are added before v5.3.0. In v5.3.0, after you set the time period through the `tidb_auto_analyze_start_time` and `tidb_auto_analyze_end_time` variables, auto-analyze is triggered only during this time period.
- The default storage directory for plugins is changed from `""` to `/data/deploy/plugin`.
- The DM code is migrated to [the folder “dm” in TiCDC code repository](#). Now DM follows TiDB in version numbers. Next to v2.0.x, the new DM version is v5.3.0, and you can upgrade from v2.0.x to v5.3.0 without any risk.

- The default deployed version of Prometheus is upgraded from v2.8.1 to [v2.27.1](#), which is released in May 2021. This version provides more features and fixes a security issue. Compared with Prometheus v2.8.1, alert time representation in v2.27.1 is changed from Unix timestamp to UTC. For details, refer to [Prometheus commit](#) for more details.

## 16.13.5.2 New features

### 16.13.5.2.1 SQL

- **Use SQL interface to set placement rules for data (experimental feature)**

Support the `[CREATE | ALTER] PLACEMENT POLICY` syntax that provides a SQL interface to set placement rules for data. Using this feature, you can specify tables and partitions to be scheduled to specific regions, data centers, racks, hosts, or replica count rules. This meets your application demands for lower cost and higher flexibility. The typical user scenarios are as follows:

- Merge multiple databases of different applications to reduce the cost on database maintenance, and achieve application resource isolation through the rule configuration
- Increase replica count for important data to improve the application availability and data reliability
- Store new data into SSDs and store old data into HDDs to lower the cost on data archiving and storage
- Schedule the leaders of hotspot data to high-performance TiKV instances
- Separate cold data to lower-cost storage mediums to improve cost efficiency

[User document](#), [#18030](#)

- **Temporary tables**

Support the `CREATE [GLOBAL] TEMPORARY TABLE` statement to create temporary tables. Using this feature, you can easily manage the temporary data generated in the calculation process of an application. Temporary data is stored in memory and you can use the `tidb_tmp_table_max_size` variable to limit the size of a temporary table. TiDB supports the following types of temporary tables:

- Global temporary tables
  - \* Visible to all sessions in the cluster, and table schemas are persistent.
  - \* Provides transaction-level data isolation. The temporary data is effective only in the transaction. After the transaction finishes, the data is automatically dropped.
- Local temporary tables
  - \* Visible only to the current session, and tables schemas are not persistent.

- \* Supports duplicated table names. You do not need to design complicated naming rules for your application.
- \* Provides session-level data isolation, which enables you to design a simpler application logic. After the transaction finishes, the temporary tables are dropped.

[User document, #24169](#)

- **Support the FOR UPDATE OF TABLES syntax**

For a SQL statement that joins multiple tables, TiDB supports acquiring pessimistic locks on the rows correlated to the tables that are included in `OF TABLES`.

[User document, #28689](#)

- **Table attributes**

Support the `ALTER TABLE [PARTITION] ATTRIBUTES` statement that allows you to set attributes for a table or partition. Currently, TiDB only supports setting the `merge_option` attribute. By adding this attribute, you can explicitly control the Region merge behavior.

User scenarios: When you perform the `SPLIT TABLE` operation, if no data is inserted after a certain period of time (controlled by the PD parameter `split-merge-interval`  $\leftrightarrow$  ), the empty Regions are automatically merged by default. In this case, you can set the table attribute to `merge_option=deny` to avoid the automatic merging of Regions.

[User document, #3839](#)

#### 16.13.5.2.2 Security

- **Support creating users with the least privileges on TiDB Dashboard**

The account system of TiDB Dashboard is consistent with that of TiDB SQL. Users accessing TiDB Dashboard are authenticated and authorized based on TiDB SQL users' privileges. Therefore, TiDB Dashboard requires limited privileges, or merely the read-only privilege. You can configure users to access TiDB Dashboard based on the principle of least privilege, thus avoiding access of high-privileged users.

It is recommended that you create a least-privileged SQL user to access and sign in with TiDB Dashboard. This avoids access of high-privileged users and improves security.

[User document](#)

#### 16.13.5.2.3 Performance

- **Optimize the timestamp processing flow of PD**

TiDB optimizes its timestamp processing flow and reduces the timestamp processing load of PD by enabling PD Follower Proxy and modifying the batch waiting time required when the PD client requests TSO in batches. This helps improve the overall scalability of the system.

- Support enabling or disabling PD Follower Proxy through the system variable `tidb_enable_tso_follower_proxy`. Suppose that the TSO requests load of PD is too high. In this case, enabling PD follower proxy can batch forward the TSO requests collected during the request cycle on followers to the leader nodes. This solution can effectively reduce the number of direct interactions between clients and leaders, reduce the pressure of the load on leaders, and improve the overall performance of TiDB.

**Note:**

When the number of clients is small and the PD leader CPU load is not full, it is NOT recommended to enable PD Follower Proxy.

- Support using the system variable `tidb_tso_client_batch_max_wait_time` to set the maximum waiting time needed for the PD client to batch request TSO. The unit of this time is milliseconds. In case that PD has a high TSO requests load, you can reduce the load and improve the throughput by increasing the waiting time to get a larger batch size.

**Note:**

When the TSO request load is not high, it is NOT recommended to modify this variable value.

[User document](#), [#3149](#)

#### 16.13.5.2.4 Stability

- **Support Online Unsafe Recovery after some stores are permanently damaged (experimental feature)**

Support the `pdctl unsafe remove-failed-stores` command that performs online data unsafe recovery. Suppose that the majority of data replicas encounter issues like permanent damage (such as disk damage), and these issues cause the data ranges in an application to be unreadable or unwritable. In this case, you can use the Online Unsafe Recovery feature implemented in PD to recover the data, so that the data is readable or writable again.

It is recommended to perform the feature-related operations with the support of the TiDB team.

[User document](#), [#10483](#)

#### 16.13.5.2.5 Data migration

- **DM replication performance enhanced**

Supports the following features to ensure lower-latency data replication from MySQL to TiDB:

- Compact multiple updates on a single row into one statement
- Merge batch updates of multiple rows into one statement

- **Add DM OpenAPI to better maintain DM clusters (experimental feature)**

DM provides the OpenAPI feature for querying and operating the DM cluster. It is similar to the feature of [dmctl tools](#).

Currently, DM OpenAPI is an experimental feature and disabled by default. It is not recommended to use it in a production environment.

[User document](#)

- **TiDB Lightning Parallel Import**

TiDB Lightning provides parallel import capability to extend the original feature. It allows you to deploy multiple Lightning instances at the same time to import single tables or multiple tables to downstream TiDB in parallel. Without changing the way customers use it, it greatly improves the data migration ability, allowing you to migrate data in a more real-time way to further process, integrate and analyze them. It improves the efficiency of enterprise data management.

In our test, using 10 TiDB Lightning instances, a total of 20 TiB MySQL data can be imported to TiDB within 8 hours. The performance of multiple table import is also improved. A single TiDB Lightning instance can support importing at 250 GiB/h, and the overall migration is 8 times faster than the original performance.

[User document](#)

- **TiDB Lightning Prechecks**

TiDB Lightning provides the ability to check the configuration before running a migration task. It is enabled by default. This feature automatically performs some routine checks for disk space and execution configuration. The main purpose is to ensure that the whole subsequent import process goes smoothly.

[User document](#)

- **TiDB Lightning supports importing files of GBK character set**

You can specify the character set of the source data file. TiDB Lightning will convert the source file from the specified character set to UTF-8 encoding during the import process.

[User document](#)

- **Sync-diff-inspector improvement**

- Improve the comparison speed from 375 MB/s to 700 MB/s
- Reduce the memory consumption of TiDB nodes by nearly half during comparison
- Optimize the user interface and display the progress bar during comparison

[User document](#)

#### 16.13.5.2.6 Diagnostic efficiency

- **Save and restore the on-site information of a cluster**

When you locate and troubleshoot the issues of a TiDB cluster, you often need to provide information on the system and the query plan. To help you get the information and troubleshoot cluster issues in a more convenient and efficient way, the `PLAN`  $\rightarrow$  `REPLAYER` command is introduced in TiDB v5.3.0. This command enables you to easily save and restore the on-site information of a cluster, improves the efficiency of troubleshooting, and helps you more easily archive the issues for management.

The features of `PLAN REPLAYER` are as follows:

- Exports the information of a TiDB cluster at an on-site troubleshooting to a ZIP-formatted file for storage.
- Imports into a cluster the ZIP-formatted file exported from another TiDB cluster. This file contains the information of the latter TiDB cluster at an on-site troubleshooting.

[User document](#), [#26325](#)

#### 16.13.5.2.7 TiDB data share subscription

- **TiCDC Eventually Consistent Replication**

TiCDC provides the eventually consistent replication capability in disaster scenarios. When a disaster occurs in the primary TiDB cluster and the service cannot be resumed in a short period of time, TiCDC needs to provide the ability to ensure the consistency of data in the secondary cluster. Meanwhile, TiCDC needs to allow the business to quickly switch the traffic to the secondary cluster to avoid the database being unavailable for a long time and affecting the business.

This feature supports TiCDC to replicate incremental data from a TiDB cluster to the secondary relational database TiDB/Aurora/MySQL/MariaDB. In case the primary cluster crashes, TiCDC can recover the secondary cluster to a certain snapshot in the primary cluster within 5 minutes, given the condition that before disaster the replication status of TiCDC is normal and replication lag is small. It allows data loss of less than 30 minutes, that is,  $RTO \leq 5min$ , and  $RPO \leq 30min$ .

[User document](#)

- **TiCDC supports the HTTP protocol OpenAPI for managing TiCDC tasks**  
Since TiDB v5.3.0, TiCDC OpenAPI becomes a General Availability (GA) feature. You can query and operate TiCDC clusters using OpenAPI in the production environment.

#### 16.13.5.2.8 Deployment and maintenance

- **Continuous Profiling (experimental feature)**

TiDB Dashboard supports the Continuous Profiling feature, which stores instance performance analysis results automatically in real time when TiDB clusters are running. You can check the performance analysis result in a flame graph, which is more observable and shortens troubleshooting time.

This feature is disabled by default and needs to be enabled on the **Continuous Profile** page of TiDB Dashboard.

This feature is only available for clusters upgraded or installed using TiUP v1.7.0 or above.

[User document](#)

#### 16.13.5.3 Telemetry

TiDB adds the information to the telemetry report about whether or not the TEMPORARY TABLE feature is used. This does not include table names or table data.

To learn more about telemetry and how to disable this behavior, refer to [Telemetry](#).

#### 16.13.5.4 Removed feature

Starting from TiCDC v5.3.0, the cyclic replication feature between TiDB clusters (an experimental feature in v5.0.0) has been removed. If you have already used this feature to replicate data before upgrading TiCDC, the related data is not affected after the upgrade.

#### 16.13.5.5 Improvements

- TiDB
  - Show the affected SQL statements in the debug log when the coprocessor encounters a lock, which is helpful in diagnosing problems [#27718](#)
  - Support showing the size of the backup and restore data when backing up and restoring data in the SQL logical layer [#27247](#)
  - Improve the default collection logic of ANALYZE when `tidb_analyze_version` is 2, which accelerates collection and reduces resource overhead
  - Introduce the `ANALYZE TABLE table_name COLUMNS col_1, col_2, ... , ↪ col_n` syntax. The syntax allows collecting statistics only on a portion of the columns in wide tables, which improves the speed of statistics collection

- TiKV
  - Enhance disk space protection to improve storage stability  
To solve the issue that TiKV might panic in case of a disk fully-written error, TiKV introduces a two-level threshold defense mechanism to protect the disk remaining space from being exhausted by excess traffic. Additionally, the mechanism provides the ability to reclaim space when the threshold is triggered. When the remaining space threshold is triggered, some write operations will fail and TiKV will return a disk full error as well as a list of disk full nodes. In this case, to recover the space and restore the service, you can execute `Drop/Truncate`  $\leftrightarrow$  `Table` or scale out the nodes.
  - Simplify the algorithm of L0 flow control [#10879](#)
  - Improve the error log report in the raft client module [#10944](#)
  - Improve logging threads to avoid them becoming a performance bottleneck [#10841](#)
  - Add more statistics types of write queries [#10507](#)
  - Reduce the write latency by separating I/O operations from Raftstore thread pool (disabled by default). For more information about tuning, see [Tune TiKV Thread Pool Performance](#) [#10540](#)
- PD
  - Add more types of write queries to QPS dimensions in the hotspot scheduler [#3869](#)
  - Support dynamically adjusting the retry limit of the Balance Region scheduler to improve the performance of the scheduler [#3744](#)
  - Update TiDB Dashboard to v2021.10.08.1 [#4070](#)
  - Support that the evict leader scheduler can schedule Regions with unhealthy peers [#4093](#)
  - Speed up the exit process of schedulers [#4146](#)
- TiFlash
  - Improve the execution efficiency of the TableScan operator greatly
  - Improve the execution efficiency of the Exchange operator
  - Reduce write amplification and memory usage during GC of the storage engine (experimental feature)
  - Improve the stability and availability of TiFlash when TiFlash restarts, which reduces possible query failures following the restart
  - Support pushing down multiple new String and Time functions to the MPP engine
    - \* String functions: `LIKE` pattern, `FORMAT()`, `LOWER()`, `LTRIM()`, `RTRIM()`, `SUBSTRING_INDEX()`, `TRIM()`, `UCASE()`, `UPPER()`

- \* Mathematical functions: ROUND (decimal, int)
- \* Date and time functions: HOUR(), MICROSECOND(), MINUTE(), SECOND(), SYSDATE()
- \* Type conversion function: CAST(time, real)
- \* Aggregation functions: GROUP\_CONCAT(), SUM(enum)
- Support 512-bit SIMD
- Enhance the cleanup algorithm for outdated data to reduce disk usage and read files more efficiently
- Fix the issue that dashboard does not display memory or CPU information in some non-Linux systems
- Unify the naming style of TiFlash log files (keep the naming style consistent with that of TiKV) and support dynamic modification of logger.count and logger.size
- Improve the data validation capability of column-based files (checksums, experimental feature)
- Tools
  - TiCDC
    - \* Reduce the default value of the Kafka sink configuration item `MaxMessageBytes` ↪ from 64 MB to 1 MB to fix the issue that large messages are rejected by the Kafka Broker [#3104](#)
    - \* Reduce memory usage in the replication pipeline [#2553](#)[#3037](#) [#2726](#)
    - \* Optimize monitoring items and alert rules to improve observability of synchronous links, memory GC, and stock data scanning processes [#2735](#) [#1606](#) [#3000](#) [#2985](#) [#2156](#)
    - \* When the sync task status is normal, no more historical error messages are displayed to avoid misleading users [#2242](#)

### 16.13.5.6 Bug Fixes

- TiDB
  - Fix an error that occurs during execution caused by the wrong execution plan. The wrong execution plan is caused by the shallow copy of schema columns when pushing down the aggregation operators on partitioned tables [#27797](#) [#26554](#)
  - Fix the issue that `plan cache` cannot detect changes of unsigned flags [#28254](#)
  - Fix the wrong partition pruning when the partition function is out of range [#28233](#)
  - Fix the issue that planner might cache invalid plans for `join` in some cases [#28087](#)
  - Fix wrong `IndexLookUpJoin` when hash column type is `enum` [#27893](#)
  - Fix a batch client bug that recycling idle connection might block sending requests in some rare cases [#27688](#)

- Fix the TiDB Lightning panic issue when it fails to perform checksum on a target cluster [#27686](#)
- Fix wrong results of the `date_add` and `date_sub` functions in some cases [#27232](#)
- Fix wrong results of the `hour` function in vectorized expression [#28643](#)
- Fix the authenticating issue when connecting to MySQL 5.1 or an older client version [#27855](#)
- Fix the issue that auto analyze might be triggered out of the specified time when a new index is added [#28698](#)
- Fix a bug that setting any session variable invalidates `tidb_snapshot` [#28683](#)
- Fix a bug that BR is not working for clusters with many missing-peer Regions [#27534](#)
- Fix the unexpected error like `tidb_cast to Int32 is not supported` when the unsupported `cast` is pushed down to TiFlash [#23907](#)
- Fix the issue that `DECIMAL overflow` is missing in the `%s value is out of ↪ range in '%s'` error message [#27964](#)
- Fix a bug that the availability detection of MPP node does not work in some corner cases [#3118](#)
- Fix the `DATA RACE` issue when assigning MPP task ID [#27952](#)
- Fix the `INDEX OUT OF RANGE` error for a MPP query after deleting an empty dual table [#28250](#)
- Fix the issue of false positive error log `invalid cop task execution summaries ↪ length` for MPP queries [#1791](#)
- Fix the issue of error log `cannot found column in Schema column` for MPP queries [#28149](#)
- Fix the issue that TiDB might panic when TiFlash is shutting down [#28096](#)
- Remove the support for insecure 3DES (Triple Data Encryption Algorithm) based TLS cipher suites [#27859](#)
- Fix the issue that Lightning connects to offline TiKV nodes during pre-check and causes import failures [#27826](#)
- Fix the issue that pre-check cost too much time when importing many files to tables [#27605](#)
- Fix the issue that rewriting expressions makes `between` infer wrong collation [#27146](#)
- Fix the issue that `group_concat` function did not consider the collation [#27429](#)
- Fix the result wrong that occurs when the argument of the `extract` function is a negative duration [#27236](#)
- Fix the issue that creating partition fails if `NO_UNSIGNED_SUBTRACTION` is set [#26765](#)
- Avoid expressions with side effects in column pruning and aggregation pushdown [#27106](#)
- Remove useless gRPC logs [#24190](#)
- Limit the valid decimal length to fix precision-related issues [#3091](#)
- Fix the issue of a wrong way to check for overflow in `plus` expression [#26977](#)
- Fix the issue of `data too long` error when dumping statistics from the table with new collation data [#27024](#)

- Fix the issue that the retried transactions' statements are not included in TIDB\_TRX [#28670](#)
  - Fix the wrong default value of the `plugin_dir` configuration [#28084](#)
  - Fix the issue that the `CONVERT_TZ` function returns NULL when it is given a named timezone and a UTC offset [#8311](#)
  - Fix the issue that `CREATE SCHEMA` does not use the character set specified by `character_set_server` and `collation_server` for new schemas if none are provided as part of the statement [#27214](#)
- TiKV
    - Fix the issue of unavailable TiKV caused by Raftstore deadlock when migrating Regions. The workaround is to disable the scheduling and restart the unavailable TiKV [#10909](#)
    - Fix the issue that CDC adds scan retries frequently due to the Congest error [#11082](#)
    - Fix the issue that the Raft connection is broken when the channel is full [#11047](#)
    - Fix the issue that batch messages are too large in Raft client implementation [#9714](#)
    - Fix the issue that some coroutines leak in `resolved_ts` [#10965](#)
    - Fix a panic issue that occurs to the coprocessor when the size of response exceeds 4 GiB [#9012](#)
    - Fix the issue that snapshot Garbage Collection (GC) misses GC snapshot files when snapshot files cannot be garbage collected [#10813](#)
    - Fix a panic issue caused by timeout when processing Coprocessor requests [#10852](#)
    - Fix a memory leak caused by monitoring data of statistics threads [#11195](#)
    - Fix a panic issue caused by getting the cgroup information from some platforms [#10980](#)
    - Fix the issue of poor scan performance because MVCC Deletion versions are not dropped by compaction filter GC [#11248](#)
  - PD
    - Fix the issue that PD incorrectly delete the peers with data and in pending status because the number of peers exceeds the number of configured peers [#4045](#)
    - Fix the issue that PD does not fix down peers in time [#4077](#)
    - Fix the issue that the scatter range scheduler cannot schedule empty Regions [#4118](#)
    - Fix the issue that the key manager cost too much CPU [#4071](#)
    - Fix the data race issue that might occur when setting configurations of hot Region scheduler [#4159](#)
    - Fix slow leader election caused by stucked Region syncer [#3936](#)
  - TiFlash
    - Fix the issue of inaccurate TiFlash Store Size statistics

- Fix the issue that TiFlash fails to start up on some platforms due to the absence of library `ns1`
  - Block the infinite wait of `wait index` when writing pressure is heavy (a default timeout of 5 minutes is added), which prevents TiFlash from waiting too long for data replication to provide services
  - Fix the slow and no result issues of the log search when the log volume is large
  - Fix the issue that only the most recent logs can be searched when searching old historical logs
  - Fix the possible wrong result when a new collation is enabled
  - Fix the possible parsing errors when an SQL statement contains extremely long nested expressions
  - Fix the possible `Block schema mismatch` error of the Exchange operator
  - Fix the possible `Can't compare` error when comparing Decimal types
  - Fix the 3rd arguments of function `substringUTF8` must be constants error of the `left/substring` function
- Tools
    - TiCDC
      - \* Fix the issue that TiCDC replication task might terminate when the upstream TiDB instance unexpectedly exits [#3061](#)
      - \* Fix the issue that TiCDC process might panic when TiKV sends duplicate requests to the same Region [#2386](#)
      - \* Fix unnecessary CPU consumption when verifying downstream TiDB/MySQL availability [#3073](#)
      - \* Fix the issue that the volume of Kafka messages generated by TiCDC is not constrained by `max-message-size` [#2962](#)
      - \* Fix the issue that TiCDC sync task might pause when an error occurs during writing a Kafka message [#2978](#)
      - \* Fix the issue that some partitioned tables without valid indexes might be ignored when `force-replicate` is enabled [#2834](#)
      - \* Fix the issue that scanning stock data might fail due to TiKV performing GC when scanning stock data takes too long [#2470](#)
      - \* Fix a possible panic issue when encoding some types of columns into Open Protocol format [#2758](#)
      - \* Fix a possible panic issue when encoding some types of columns into Avro format [#2648](#)
    - TiDB Binlog
      - \* Fix the issue that when most tables are filtered out, checkpoint cannot be updated under some special load [#1075](#)

## 16.14 v5.2

### 16.14.1 TiDB 5.2.4 Release Notes

Release Date: April 26, 2022

TiDB version: 5.2.4

#### 16.14.1.1 Compatibility change(s)

- TiDB
  - Change the default value of the system variable `tidb_analyze_version` from 2 to 1 [#31748](#)
- TiKV
  - Add `raft-log-compact-sync-interval` to control the time interval ("2s" by default) to compact unnecessary Raft logs [#11404](#)
  - Change the default value of `raft-log-gc-tick-interval` from "10s" to "3s" [#11404](#)
  - When `storage.flow-control.enable` is set to `true`, the value of `storage.flow-control.hard-pending-compaction-bytes-limit` overwrites that of `rocksdb.(defaultcf|writecf|lockcf).hard-pending-compaction-bytes-limit` [#11424](#)
- Tools
  - TiDB Lightning
    - \* Change the default value of `regionMaxKeyCount` from 1\_440\_000 to 1\_280\_000, to avoid too many empty Regions after data import [#30018](#)

#### 16.14.1.2 Improvements

- TiKV
  - Transfer the leadership to CDC observer to reduce latency jitter [#12111](#)
  - Reduce the TiCDC recovery time by reducing the number of the Regions that require the Resolve Locks step [#11993](#)
  - Update the proc filesystem (procf) to v0.12.0 [#11702](#)
  - Speed up the Garbage Collection (GC) process by increasing the write batch size when performing GC to Raft logs [#11404](#)
  - Increase the speed of inserting SST files by moving the verification process to the `Import` thread pool from the `Apply` thread pool [#11239](#)

- Tools
  - TiCDC
    - \* Change the default value of Kafka Sink `partition-num` to 3 so that TiCDC distributes messages across Kafka partitions more evenly [#3337](#)
    - \* Reduce the time for the KV client to recover when a TiKV store is down [#3191](#)
    - \* Add a `Lag analyze` panel in Grafana [#4891](#)
    - \* Expose configuration parameters of the Kafka producer to make them configurable in TiCDC [#4385](#)
    - \* Add the exponential backoff mechanism for restarting a changefeed [#3329](#)
    - \* Reduce the count of “EventFeed retry rate limited” logs [#4006](#)
    - \* Set the default value of `max-message-bytes` to 10M [#4041](#)
    - \* Add more Prometheus and Grafana monitoring metrics and alerts, including `no owner alert`, `mounter row`, `table sink total row`, and `buffer sink`  
↪ `total row` [#4054](#) [#1606](#)
    - \* Support multiple Kubernetes clusters in Grafana dashboards [#4665](#)
    - \* Add catch-up ETA (Estimated Time of Arrival) to the `changefeed`  
↪ `checkpoint` monitoring metric [#5232](#)

### 16.14.1.3 Bug fixes

- TiDB
  - Fix wrong range calculation results for Nulleq function on Enum values [#32428](#)
  - Fix the issue that INDEX HASH JOIN returns the `send on closed channel` error [#31129](#)
  - Fix the issue that concurrent column type change causes inconsistency between the schema and the data [#31048](#)
  - Fix the issue of potential data index inconsistency in optimistic transaction mode [#30410](#)
  - Fix the issue that a SQL operation is canceled when its JSON type column joins its CHAR type column [#29401](#)
  - Fix the issue that window functions might return different results when using a transaction or not [#29947](#)
  - Fix the issue that the Column '`col_name`' in field list is ambiguous error is reported unexpectedly when a SQL statement contains natural join [#25041](#)
  - Fix the issue that the length information is wrong when casting Decimal to String [#29417](#)
  - Fix the issue that the GREATEST function returns inconsistent results due to different values of `tidb_enable_vectorized_expression` (set to on or off) [#29434](#)
  - Fix wrong results of deleting data of multiple tables using `left join` [#31321](#)
  - Fix a bug that TiDB may dispatch duplicate tasks to TiFlash [#32814](#)
  - Fix the MPP task list empty error when executing a query [#31636](#)

- Fix wrong results of index join caused by an innerWorker panic [#31494](#)
- Fix the issue that executing the `INSERT ... SELECT ... ON DUPLICATE KEY ↪ UPDATE` statement gets panic [#28078](#)
- Fix wrong query results due to the optimization of `Order By` [#30271](#)
- Fix the wrong result that might occur when performing `JOIN` on `ENUM` type columns [#27831](#)
- Fix the panic when using the `CASE WHEN` function on the `ENUM` data type [#29357](#)
- Fix wrong results of the `microsecond` function in vectorized expressions [#29244](#)
- Fix the issue that the window function causes TiDB to panic instead of reporting an error [#30326](#)
- Fix the issue that the Merge Join operator gets wrong results in certain cases [#33042](#)
- Fix the issue that TiDB gets a wrong result when a correlated subquery returns a constant [#32089](#)
- Fix the issue that TiDB writes wrong data due to the wrong encoding of the `ENUM` or `SET` column [#32302](#)
- Fix the issue that the `MAX` or `MIN` function on the `ENUM` or `SET` column returns a wrong result when the new collation is enabled in TiDB [#31638](#)
- Fix the issue that the `IndexHashJoin` operator does not exit successfully [#31062](#)
- Fix the issue that TiDB might read wrong data when a table has a virtual column [#30965](#)
- Fix the issue that the setting of the log level does not take effect on the slow query log [#30309](#)
- Fix the issue that partitioned tables cannot fully use indexes to scan data in some cases [#33966](#)
- Fix the issue that the background HTTP service of TiDB might not exit successfully and makes the cluster in an abnormal state [#30571](#)
- Fix the issue that TiDB might unexpectedly output many logs of failed authentication [#29709](#)
- Fix the issue that the system variable `max_allowed_packet` does not take effect [#31422](#)
- Fix the issue that the `REPLACE` statement incorrectly changes other rows when the auto ID is out of range [#29483](#)
- Fix the issue that the slow query log cannot output log normally and might consume too much memory [#32656](#)
- Fix the issue that the result of `NATURAL JOIN` might include unexpected columns [#24981](#)
- Fix the issue that using `ORDER BY` and `LIMIT` together in one statement might output wrong results if a prefix-column index is used to query data [#29711](#)
- Fix the issue that the `DOUBLE` type auto-increment column might be changed when the optimistic transaction retries [#29892](#)
- Fix the issue that the `STR_TO_DATE` function cannot handle the preceding zero of the microsecond part correctly [#30078](#)
- Fix the issue that TiDB gets the wrong result when using TiFlash to scan tables with empty range although TiFlash does not support reading tables with empty

range yet [#33083](#)

- TiKV

- Fix a bug that stale messages cause TiKV to panic [#12023](#)
- Fix the issue of intermittent packet loss and out of memory (OOM) caused by the overflow of memory metrics [#12160](#)
- Fix the potential panic issue that occurs when TiKV performs profiling on Ubuntu 18.04 [#9765](#)
- Fix the issue that tikv-ctl returns an incorrect result due to its wrong string match [#12329](#)
- Fix a bug that replica reads might violate the linearizability [#12109](#)
- Fix a bug that TiKV might panic if it has been running for 2 years or more [#11940](#)
- Fix the issue of QPS drop when flow control is enabled and `level0_slowdown_trigger`  $\leftrightarrow$  is set explicitly [#11424](#)
- Fix the panic issue that occurs when the cgroup controller is not mounted [#11569](#)
- Fix possible metadata corruption caused by Region merge on a lagging Region peer [#11526](#)
- Fix the issue that the latency of Resolved TS increases after TiKV stops operating [#11351](#)
- Fix a panic issue that occurs when Region merge, ConfChange, and Snapshot happen at the same time in extreme conditions [#11475](#)
- Fix a bug that tikv-ctl cannot return the correct Region-related information [#11393](#)
- Fix the issue of negative sign when the decimal divide result is zero [#29586](#)
- Fix the issue that retrying prewrite requests in the pessimistic transaction mode might cause the risk of data inconsistency in rare cases [#11187](#)
- Fix a memory leak caused by monitoring data of statistics threads [#11195](#)
- Fix the issue that the average latency of the by-instance gRPC requests is inaccurate in TiKV metrics [#11299](#)
- Fix the panic issue caused by deleting snapshot files when the peer status is **Applying** [#11746](#)
- Fix a bug that TiKV cannot delete a range of data (which means the internal command `unsafe_destroy_range` is executed) when the GC worker is busy [#11903](#)
- Fix the issue that deleting an uninitialized replica might cause an old replica to be recreated [#10533](#)
- Fix the issue that TiKV cannot detect the memory lock when TiKV performs a reverse table scan [#11440](#)
- Fix the deadlock issue that happens occasionally when coroutines run too fast [#11549](#)
- Fix the issue that destroying a peer might cause high latency [#10210](#)
- Fix the issue that TiKV panics and destroys peers unexpectedly because the target Region to be merged is invalid [#12232](#)

- Fix the TiKV panic issue that occurs when the target peer is replaced with the peer that is destroyed without being initialized when merging a Region [#12048](#)
- Fix the TiKV panic issue that occurs when applying snapshot is aborted [#11618](#)
- Fix a bug that TiKV cannot correctly calculate the number of snapshots being sent when the operator execution fails [#11341](#)
- PD
  - Fix the issue that the Region scatterer scheduling lost some peers [#4565](#)
  - Fix the issue that the cold hotspot data cannot be deleted from the hotspot statistics [#4390](#)
- TiFlash
  - Fix a bug that MPP tasks might leak threads forever [#4238](#)
  - Fix the issue that the result of IN is incorrect in multi-value expressions [#4016](#)
  - Fix the issue that the date format identifies '\n' as an invalid separator [#4036](#)
  - Fix the potential query error after adding columns under heavy read workload [#3967](#)
  - Fix the bug that invalid storage directory configurations lead to unexpected behaviors [#4093](#)
  - Fix the bug that some exceptions are not handled properly [#4101](#)
  - Fix the bug that the STR\_TO\_DATE() function incorrectly handles leading zeros when parsing microseconds [#3557](#)
  - Fix the issue that casting INT to DECIMAL might cause overflow [#3920](#)
  - Fix the wrong result that occurs when casting DATETIME to DECIMAL [#4151](#)
  - Fix the overflow that occurs when casting FLOAT to DECIMAL [#3998](#)
  - Fix the issue that the CastStringAsReal behavior is inconsistent in TiFlash and in TiDB or TiKV [#3475](#)
  - Fix the issue that the CastStringAsDecimal behavior is inconsistent in TiFlash and in TiDB or TiKV [#3619](#)
  - Fix the issue that TiFlash might return the EstablishMPPConnection error after it is restarted [#3615](#)
  - Fix the issue that obsolete data cannot be reclaimed after setting the number of TiFlash replicas to 0 [#3659](#)
  - Fix potential data inconsistency when widening the primary key column with the primary key being handle [#3569](#)
  - Fix possible parsing errors when an SQL statement contains extremely long nested expressions [#3354](#)
  - Fix possible wrong results when a query contains the where <string> clause [#3447](#)
  - Fix possible wrong results when new\_collations\_enabled\_on\_first\_bootstrap ↪ is enabled [#3388](#), [#3391](#)
  - Fix the panic issue that occurs when TLS is enabled [#4196](#)
  - Fix the panic issue that occurs when the memory limit is enabled [#3902](#)

- Fix the issue that TiFlash crashes occasionally when an MPP query is stopped [#3401](#)
  - Fix the unexpected error of `Unexpected type of column: Nullable(Nothing)` [#3351](#)
  - Fix possible metadata corruption caused by Region merge on a lagging Region peer [#4437](#)
  - Fix the issue that a query containing JOIN might be hung if an error occurs [#4195](#)
  - Fix possible wrong results returned for MPP queries due to incorrect execution plans [#3389](#)
- Tools
    - Backup & Restore (BR)
      - \* Fix the issue that BR fails to back up RawKV [#32607](#)
    - TiCDC
      - \* Fix the issue that default values cannot be replicated [#3793](#)
      - \* Fix a bug that sequence is incorrectly replicated in some cases [#4563](#)
      - \* Fix a bug that a TiCDC node exits abnormally when a PD leader is killed [#4248](#)
      - \* Fix a bug that MySQL sink generates duplicated `replace` SQL statements when `batch-replace-enable` is disabled [#4501](#)
      - \* Fix the issue of panic and data inconsistency that occurs when outputting the default column value [#3929](#)
      - \* Fix the issue that `mq sink write row` does not have monitoring data [#3431](#)
      - \* Fix the issue that replication cannot be performed when `min.insync.replicas` is smaller than `replication-factor` [#3994](#)
      - \* Fix the potential panic issue that occurs when a replication task is removed [#3128](#)
      - \* Fix the bug that HTTP API panics when the required processor information does not exist [#3840](#)
      - \* Fix the issue of potential data loss caused by inaccurate checkpoint [#3545](#)
      - \* Fix the potential issue that the deadlock causes a replication task to get stuck [#4055](#)
      - \* Fix the TiCDC panic issue that occurs when manually cleaning the task status in etcd [#2980](#)
      - \* Fix the issue that special comments in DDL statements cause the replication task to stop [#3755](#)
      - \* Fix the issue of replication stop caused by the incorrect configuration of `config.Metadata.Timeout` [#3352](#)
      - \* Fix the issue that the service cannot be started because of a timezone issue in the RHEL release [#3584](#)
      - \* Fix the issue that `stopped` changefeeds resume automatically after a cluster upgrade [#3473](#)

- \* Fix the issue of overly frequent warnings caused by MySQL sink deadlock [#2706](#)
  - \* Fix the bug that the `enable-old-value` configuration item is not automatically set to `true` on Canal and Maxwell protocols [#3676](#)
  - \* Fix the issue that Avro sink does not support parsing JSON type columns [#3624](#)
  - \* Fix the negative value error in the changefeed checkpoint lag [#3010](#)
  - \* Fix the OOM issue in the container environment [#1798](#)
  - \* Fix the memory leak issue after processing DDLs [#3174](#)
  - \* Fix the issue that changefeed gets stuck when tables are repeatedly scheduled in the same node [#4464](#)
  - \* Fix a bug that querying status through open API may be blocked when the PD node is abnormal [#4778](#)
  - \* Fix incorrect metrics caused by owner changes [#4774](#)
  - \* Fix a stability problem in workerpool used by Unified Sorter [#4447](#)
  - \* Fix the issue that the `cached region` monitoring metric is negative [#4300](#)
- TiDB Lightning
- \* Fix the issue of wrong import result that occurs when TiDB Lightning does not have the privilege to access the `mysql.tidb` table [#31088](#)
  - \* Fix the checksum error “GC life time is shorter than transaction duration” [#32733](#)
  - \* Fix a bug that TiDB Lightning may not delete the metadata schema when some import tasks do not contain source files [#28144](#)
  - \* Fix the issue that TiDB Lightning does not report errors when the S3 storage path does not exist [#28031](#) [#30709](#)
  - \* Fix an error that occurs when iterating more than 1000 keys on GCS [#30377](#)

## 16.14.2 TiDB 5.2.3 Release Note

Release date: December 3, 2021

TiDB version: 5.2.3

### 16.14.2.1 Bug fix

- TiKV
  - Fix the issue that the `GcKeys` task does not work when it is called by multiple keys. Caused by this issue, compaction filter GC might not drop the MVCC deletion information. [#11217](#)

## 16.14.3 TiDB 5.2.2 Release Notes

Release Date: October 29, 2021

TiDB version: 5.2.2

### 16.14.3.1 Improvements

- TiDB
  - Show the affected SQL statements in the debug log when the coprocessor encounters a lock, which is helpful in diagnosing problems [#27718](#)
  - Support showing the size of the backup and restore data when backing up and restoring data in the SQL logical layer [#27247](#)
- TiKV
  - Simplify the algorithm of L0 flow control [#10879](#)
  - Improve the error log report in the raft client module [#10983](#)
  - Improve logging threads to avoid them becoming a performance bottleneck [#10841](#)
  - Add more statistics types of write queries [#10507](#)
- PD
  - Add more types of write queries to QPS dimensions in the hotspot scheduler [#3869](#)
  - Support dynamically adjusting the retry limit of the balance region scheduler to improve the performance of the scheduler [#3744](#)
  - Update TiDB Dashboard to v2021.10.08.1 [#4070](#)
  - Support that the evict leader scheduler can schedule regions with unhealthy peers [#4093](#)
  - Speed up the exit process of schedulers [#4146](#)
- Tools
  - TiCDC
    - \* Reduce the default value of the Kafka sink configuration item `MaxMessageBytes`  $\hookrightarrow$  from 64 MB to 1 MB to fix the issue that large messages are rejected by the Kafka Broker [#3104](#)
    - \* Reduce memory usage in the replication pipeline [#2553](#)[#3037](#) [#2726](#)
    - \* Optimize monitoring items and alert rules to improve observability of synchronous links, memory GC, and stock data scanning processes [#2735](#) [#1606](#) [#3000](#) [#2985](#) [#2156](#)
    - \* When the sync task status is normal, no more historical error messages are displayed to avoid misleading users [#2242](#)

### 16.14.3.2 Bug Fixes

- TiDB
  - Fix the issue that plan-cache cannot detect changes of unsigned flags [#28254](#)
  - Fix the wrong partition pruning when the partition function is out of range [#28233](#)
  - Fix the issue that planner might cache invalid plans for `join` in some cases [#28087](#)
  - Fix wrong index hash join when hash column type is enum [#27893](#)
  - Fix a batch client bug that recycling idle connection might block sending requests in some rare cases [#27688](#)
  - Fix the TiDB Lightning panic issue when it fails to perform checksum on a target cluster [#27686](#)
  - Fix wrong results of the `date_add` and `date_sub` functions in some cases [#27232](#)
  - Fix wrong results of the `hour` function in vectorized expression [#28643](#)
  - Fix the authenticating issue when connecting to MySQL 5.1 or an older client version [#27855](#)
  - Fix the issue that auto analyze might be triggered out of the specified time when a new index is added [#28698](#)
  - Fix a bug that setting any session variable invalidates `tidb_snapshot` [#28683](#)
  - Fix a bug that BR is not working for clusters with many missing-peer regions [#27534](#)
  - Fix the unexpected error like `tidb_cast to Int32 is not supported` when the unsupported `cast` is pushed down to TiFlash [#23907](#)
  - Fix the issue that `DECIMAL overflow` is missing in the `%s value is out of ↪ range in '%s'` error message [#27964](#)
  - Fix a bug that the availability detection of MPP node does not work in some corner cases [#3118](#)
  - Fix the `DATA RACE` issue when assigning MPP task ID [#27952](#)
  - Fix the `INDEX OUT OF RANGE` error for a MPP query after deleting an empty dual table. [#28250](#)
  - Fix the issue of false positive error log `invalid cop task execution summaries ↪ length` for MPP queries [#1791](#)
  - Fix the issue of error log `cannot found column in Schema column` for MPP queries [#28149](#)
  - Fix the issue that TiDB might panic when TiFlash is shutting down [#28096](#)
  - Remove the support for insecure 3DES (Triple Data Encryption Algorithm) based TLS cipher suites [#27859](#)
  - Fix the issue that Lightning connects to offline TiKV nodes during pre-check and causes import failures [#27826](#)
  - Fix the issue that pre-check cost too much time when importing many files to tables [#27605](#)
  - Fix the issue that rewriting expressions makes `between` infer wrong collation [#27146](#)
  - Fix the issue that `group_concat` function did not consider the collation [#27429](#)

- Fix the result wrong that occurs when the argument of the `extract` function is a negative duration [#27236](#)
- Fix the issue that creating partition fails if `NO_UNSIGNED_SUBTRACTION` is set [#26765](#)
- Avoid expressions with side effects in column pruning and aggregation pushdown [#27106](#)
- Remove useless gRPC logs [#24190](#)
- Limit the valid decimal length to fix precision-related issues [#3091](#)
- Fix the issue of a wrong way to check for overflow in `plus` expression [#26977](#)
- Fix the issue of `data too long` error when dumping statistics from the table with `new collation` data [#27024](#)
- Fix the issue that the retried transactions' statements are not included in `TIDB_TRX` [#28670](#)
- TiKV
  - Fix the issue that CDC adds scan retries frequently due to the Congest error [#11082](#)
  - Fix the issue that the raft connection is broken when the channel is full [#11047](#)
  - Fix the issue that batch messages are too large in Raft client implementation [#9714](#)
  - Fix the issue that some coroutines leak in `resolved_ts` [#10965](#)
  - Fix a panic issue that occurs to the coprocessor when the size of response exceeds 4 GiB [#9012](#)
  - Fix the issue that snapshot Garbage Collection (GC) misses GC snapshot files when snapshot files cannot be garbage collected [#10813](#)
  - Fix a panic issue caused by timeout when processing Coprocessor requests [#10852](#)
- PD
  - Fix the issue that PD incorrectly delete the peers with data and in pending status because the number of peers exceeds the number of configured peers [#4045](#)
  - Fix the issue that PD does not fix down peers in time [#4077](#)
  - Fix the issue that the scatter range scheduler cannot schedule empty regions [#4118](#)
  - Fix the issue that the key manager cost too much CPU [#4071](#)
  - Fix the data race issue that might occur when setting configurations of hot region scheduler [#4159](#)
  - Fix slow leader election caused by stuck region syncer [#3936](#)
- TiFlash
  - Fix the issue that TiFlash fails to start up on some platforms due to the absence of library `ns1`
- Tools

- TiCDC
  - \* Fix the issue that TiCDC replication task might terminate when the upstream TiDB instance unexpectedly exits [#3061](#)
  - \* Fix the issue that TiCDC process might panic when TiKV sends duplicate requests to the same Region [#2386](#)
  - \* Fix unnecessary CPU consumption when verifying downstream TiDB/MySQL availability [#3073](#)
  - \* Fix the issue that the volume of Kafka messages generated by TiCDC is not constrained by `max-message-size` [#2962](#)
  - \* Fix the issue that TiCDC sync task might pause when an error occurs during writing a Kafka message [#2978](#)
  - \* Fix the issue that some partitioned tables without valid indexes might be ignored when `force-replicate` is enabled [#2834](#)
  - \* Fix the issue that scanning stock data might fail due to TiKV performing GC when scanning stock data takes too long [#2470](#)
  - \* Fix a possible panic issue when encoding some types of columns into Open Protocol format [#2758](#)
  - \* Fix a possible panic issue when encoding some types of columns into Avro format [#2648](#)
- TiDB Binlog
  - \* Fix the issue that when most tables are filtered out, checkpoint cannot be updated under some special load [#1075](#)

#### 16.14.4 TiDB 5.2.1 Release Notes

Release date: September 9, 2021

TiDB version: 5.2.1

##### 16.14.4.1 Bug fixes

- TiDB
  - Fix an error that occurs during execution caused by the wrong execution plan. The wrong execution plan is caused by the shallow copy of schema columns when pushing down the aggregation operators on partitioned tables. [#27797](#) [#26554](#)
- TiKV
  - Fix the issue of unavailable TiKV caused by Raftstore deadlock when migrating Regions. The workaround is to disable the scheduling and restart the unavailable TiKV. [#10909](#)

## 16.14.5 TiDB 5.2 Release Notes

Release date: August 27, 2021

TiDB version: 5.2.0

### **Warning:**

Some known issues are found in this version, and these issues are fixed in new versions. It is recommended that you use the latest 5.2.x version.

In v5.2, the key new features and improvements are as follows:

- Support using several functions in expression indexes to greatly improve query performance
- Improve the accuracy of optimizer cardinality estimation to help to select optimal execution plans
- Announce the general availability (GA) for the Lock View feature to observe transaction locking events and troubleshoot deadlock problems
- Add the TiFlash I/O traffic limit feature to improve the stability of read and write for TiFlash
- TiKV introduces a new flow control mechanism to replace the previous RocksDB write stall mechanism to improve the stability of TiKV flow control
- Simplify the operation and maintenance of Data Migration (DM) to reduce the management cost.
- TiCDC supports HTTP protocol OpenAPI to manage TiCDC tasks. It provides a more user-friendly operation method for both Kubernetes and self-hosted environments. (Experimental feature)

### 16.14.5.1 Compatibility changes

#### **Note:**

When upgrading from an earlier TiDB version to v5.2, if you want to know the compatibility change notes of all intermediate versions, you can check the [Release Note](#) for the corresponding version.

#### 16.14.5.1.1 System variables

Variable name	Change type	Description
<code>default_authentication_plugin</code> ↔	Newly added	Sets the authentication method that the server advertises. The default value is <code>mysql_native_password</code> . ↔ .
<code>tidb_enable_analyze_index_statistics</code> ↔	Newly added	Determines whether to include the <code>AUTO_INCREMENT</code> columns when creating a generated column or an expression index. The default value is <code>OFF</code> .
<code>tidb_opt_enable_correlation_statistics</code> ↔	Newly added	Controls whether the optimizer estimates the number of rows based on column order correlation. The default value is <code>ON</code> .

Variable name	Change type	Description
<code>tidb_opt_limit_topn</code> ↔	Newly added	Sets the threshold that determines whether to push the Limit or TopN operator down to TiKV. The default value is 100.
<code>tidb_stmt_summary_max_stmts_in_memory</code> ↔	Modified	Sets the maximum number of statements that the statement summary tables store in memory. The default value is changed from 200 to 3000.
<code>tidb_enable_streaming</code> ↔	Deprecated	The system variable <code>enable-streaming</code> is deprecated and it is not recommended to use it any more.

#### 16.14.5.1.2 Configuration file parameters

Configuration file	Configuration item	Change type	Description
TiDB configuration file	<p><b>pessimistic</b></p> <p>↔ <b>-txn.</b></p> <p>↔ <b>deadlock</b></p> <p>↔ <b>-</b></p> <p>↔ <b>history</b></p> <p>↔ <b>-</b></p> <p>↔ <b>collect</b></p> <p>↔ <b>-</b></p> <p>↔ <b>retryable</b></p> <p>↔</p>	Newly added	<p>Controls whether the <b>INFORMATION_SCHEMA</b></p> <p>↔ <b>.</b></p> <p>↔ <b>DEADLOCKS</b></p> <p>↔ table collects retryable deadlock error messages or not.</p>
TiDB configuration file	<p><b>security.</b></p> <p>↔ <b>auto-</b></p> <p>↔ <b>tls</b></p>	Newly added	<p>Determines whether to automatically generate the TLS certificates on startup. The default value is <b>false</b>.</p>
TiDB configuration file	<p><b>stmt-</b></p> <p>↔ <b>summary</b></p> <p>↔ <b>.max-</b></p> <p>↔ <b>stmt-</b></p> <p>↔ <b>count</b></p>	Modified	<p>Indicates the maximum number of SQL categories allowed to be saved in the statement summary tables. The default value is changed from 200 to 3000.</p>

Configuration file	Configuration item	Change type	Description
TiDB configuration file	<b>experimental</b> ↔ <b>.allow-</b> ↔ <b>expression</b> ↔ <b>-index</b>	Deprecated	The <b>allow-</b> ↔ <b>expression</b> ↔ <b>-index</b> configuration in the TiDB configuration file is deprecated.
TiKV configuration file	<b>raftstore.</b> ↔ <b>cmd-</b> ↔ <b>batch</b>	Newly added	Controls whether to enable batch processing of the requests. When it is enabled, the write performance is significantly improved. The default value is <b>true</b> .

Configuration file	Configuration item	Change type	Description
TiKV configuration file	<b>raftstore.</b> ↔ <b>inspect</b> ↔ <b>-</b> ↔ <b>interval</b> ↔	Newly added	<p>At a certain interval, TiKV inspects the latency of the Raftstore component. This configuration item specifies the interval of the inspection. If the latency exceeds this value, this inspection is marked as timeout. The default value is 500ms.</p>
TiKV configuration file	<b>raftstore.</b> ↔ <b>max-</b> ↔ <b>peer-</b> ↔ <b>down-</b> ↔ <b>duration</b> ↔	Modified	<p>Indicates the longest inactive duration allowed for a peer. A peer with timeout is marked as <b>down</b>, and PD tries to delete it later. The default value is changed from 5m to 10m.</p>

Configuration file	Configuration item	Change type	Description
TiKV configuration file	<b>server.</b> ↔ <b>raft-</b> ↔ <b>client-</b> ↔ <b>queue-</b> ↔ <b>size</b>	Newly added	Specifies the queue size of the Raft messages in TiKV. The default value is 8192.
TiKV configuration file	<b>storage.</b> ↔ <b>flow-</b> ↔ <b>control</b> ↔ <b>.enable</b>	Newly added	Determines whether to enable the flow control mechanism. The default value is <b>true</b> .
TiKV configuration file	<b>storage.</b> ↔ <b>flow-</b> ↔ <b>control</b> ↔ <b>.</b> ↔ <b>memtables</b> ↔ <b>-</b> ↔ <b>threshold</b> ↔	Newly added	When the number of kvDB memtables reaches this threshold, the flow control mechanism starts to work. The default value is 5.
TiKV configuration file	<b>storage.</b> ↔ <b>flow-</b> ↔ <b>control</b> ↔ <b>.l0-</b> ↔ <b>files-</b> ↔ <b>threshold</b> ↔	Newly added	When the number of kvDB L0 files reaches this threshold, the flow control mechanism starts to work. The default value is 9.

Configuration file	Configuration item	Change type	Description
TiKV configuration file	<b>storage.</b> ↪ <b>flow-</b> ↪ <b>control</b> ↪ <b>.soft-</b> ↪ <b>pending</b> ↪ <b>-</b> ↪ <b>compaction</b> ↪ <b>-bytes-</b> ↪ <b>limit</b>	Newly added	When the pending compaction bytes in KvDB reach this threshold, the flow control mechanism starts to reject some write requests and reports the <code>ServerIsBusy</code> error. The default value is “192GB”.
TiKV configuration file	<b>storage.</b> ↪ <b>flow-</b> ↪ <b>control</b> ↪ <b>.hard-</b> ↪ <b>pending</b> ↪ <b>-</b> ↪ <b>compaction</b> ↪ <b>-bytes-</b> ↪ <b>limit</b>	Newly added	When the pending compaction bytes in KvDB reach this threshold, the flow control mechanism rejects all write requests and reports the <code>ServerIsBusy</code> error. The default value is “1024GB”.

### 16.14.5.1.3 Others

- Before the upgrade, check whether the value of the `tidb_evolve_plan_baselines` system variable is `ON`. If the value is `ON`, set it to `OFF`; otherwise, the upgrade will fail.
- For TiDB clusters upgraded from v4.0 to v5.2, the default value of `tidb_multi_statement_mode`  $\hookrightarrow$  changes from `WARN` to `OFF`.
- Before the upgrade, check the value of the TiDB configuration `feedback-probability`  $\hookrightarrow$  . If the value is not 0, the “panic in the recoverable goroutine” error will occur after the upgrade, but this error does not affect the upgrade.
- TiDB is now compatible with MySQL 5.7’s noop variable `innodb_default_row_format`  $\hookrightarrow$  . Setting this variable has no effect. [#23541](#)
- Starting from TiDB 5.2, to improve system security, it is recommended (but not mandatory) to encrypt the transport layer for connections from clients. TiDB provides the Auto TLS feature to automatically configure and enable encryption in TiDB. To use the Auto TLS feature, before the TiDB upgrade, set `security.auto-tls` in the TiDB configuration file to `true`.
- Support the `caching_sha2_password` authentication method to make migration from MySQL 8.0 easier and to improve security.

## 16.14.5.2 New features

### 16.14.5.2.1 SQL

- **Support using several functions in expression indexes**

The expression index is a type of special index that can be created on an expression. After an expression index is created, TiDB supports expression-based queries, which greatly improves query performance.

[User document](#), [#25150](#)

- **Support the `translate` function in Oracle**

The `translate` function replaces all occurrences of characters by other characters in a string. In TiDB, this function does not treat empty strings as `NULL` as Oracle does.

[User document](#)

- **Support spilling HashAgg**

Support spilling HashAgg into disk. When a SQL statement that includes an HashAgg operator causes out of memory (OOM), you can try to set the concurrency of this operator to 1 to trigger disk spill, which alleviates memory stress.

[User document](#), [#25882](#)

- **Improve the accuracy of optimizer cardinality estimation**

- Improve the accuracy of TiDB’s estimation of TopN/Limit. For example, for pagination queries on a large table that contain the `order by col limit x` condition, TiDB can more easily select the right index and reduce query response time.

- Improve the accuracy of out-of-range estimation. For example, even if the statistics for a day have not been updated, TiDB can accurately select the corresponding index for a query that contains `where date=Now()`.
- Introduce the `tidb_opt_limit_push_down_threshold` variable to control the optimizer's behavior of pushing down Limit/TopN, which resolves the issue that Limit/TopN cannot be pushed down in some situations due to wrong estimation.

[User document](#), #26085

- **Improve index selection of the optimizer**

Add pruning rules for index selection. Before using the statistics for comparison, TiDB uses these rules to narrow down the scope of possible indexes to be selected, which reduces the possibility of selecting non-optimal indexes.

[User document](#)

#### 16.14.5.2.2 Transaction

- **General availability (GA) for Lock View**

The Lock View feature provides more information about lock conflicts and lock waits of pessimistic locks, which helps DBAs to observe transaction locking events and troubleshoot deadlock problems.

In v5.2, the following enhancements are made to Lock View:

- In addition to the SQL digest column in the Lock View-related tables, add a column to these tables that shows the corresponding normalized SQL text. You do not have to manually query the statement corresponding to a SQL digest.
- Add the `TIDB_DECODE_SQL_DIGESTS` function to query the normalized SQL statements (a form without formats and arguments) corresponding to a set of SQL digests in the cluster. This simplifies the operation of querying the statements that have been historically executed by a transaction.
- Add a column in the `DATA_LOCK_WAITS` and `DEADLOCKS` system tables to show the table name, row ID, index value, and other key information interpreted from a key. This simplifies the operations such as locating the table to which a key belongs and interpreting the key information.
- Support collecting the information of retryable deadlock errors in the `DEADLOCKS` table, which makes it easier to troubleshoot issues caused by such errors. The error collection is disabled by default and can be enabled using the `pessimistic ↔ -txn.deadlock-history-collect-retryable` configuration.
- Support distinguishing query-executing transactions from idle transactions on the `TIDB_TRX` system table. The `Normal` state is now divided into `Running` and `Idle` states.

User documents:

- View the pessimistic lock-waiting events that are occurring on all TiKV
  - ↪ nodes in the cluster: [`DATA_LOCK_WAITS``](#data\_lock\_waits)
- View the deadlock errors recently occurred on a TiDB node: [`DEADLOCKS``](#deadlocks)
  - ↪ deadlocks)
- View the executing transaction on a TiDB node: [`TIDB_TRX``](#tidb\_trx)

- Optimize the user scenarios of adding indexes on tables with the `AUTO_RANDOM` or `SHARD_ROW_ID_BITS` attribute.

### 16.14.5.2.3 Stability

- **Add TiFlash I/O traffic limit**

This new feature is suitable for cloud storage with disk bandwidth of a small and specific size. It is disabled by default.

TiFlash I/O Rate Limiter provides a new mechanism to avoid excessive race for I/O resources between read and write tasks. It balances the responses to read and write tasks, and limits the rate automatically according to read/write workload.

[User document](#)

- **Improve stability of TiKV flow control**

TiKV introduces a new flow control mechanism to replace the previous RocksDB write stall mechanism. Compared with the write stall mechanism, this new mechanism reduces the impact on the stability of foreground write.

In specific, when the stress of RocksDB compaction accumulates, flow control is performed at the TiKV scheduler layer instead of the RocksDB layer, to avoid the following issues:

- Raftstore is stuck, which is caused by RocksDB write stall.
- Raft election times out, and the node leader is transferred as a result.

This new mechanism improves the flow control algorithm to mitigate QPS decrease when the write traffic is high.

[User document](#), [#10137](#)

- **Detect and recover automatically from impact caused by a single slow TiKV node in a cluster**

TiKV introduces the slow node detection mechanism. This mechanism calculates a score by inspecting the rate of TiKV Raftstore, and then reports the score to PD through store heartbeats. Meanwhile, it adds the `evict-slow-store-scheduler` scheduler on PD to automatically evict the leader on a single slow TiKV node. In this way, the impact on the whole cluster is mitigated. At the same time, more alert items about slow nodes are introduced to help you quickly pinpoint and solve problems.

[User document](#), [#10539](#)

#### 16.14.5.2.4 Data Migration

- **Simplify operations of Data Migration (DM)**

DM v2.0.6 can automatically identify the change event (failover or plan change) of the data source using VIP, and can automatically connect to a new data source instance, to reduce data replication latency and simplify operation procedures.

- TiDB Lightning supports customized line terminators in the CSV data, and is compatible with the MySQL LOAD DATA CSV data formats. You can then use TiDB Lightning directly in your data flow architecture.

[#1297](#)

#### 16.14.5.2.5 TiDB data share subscription

TiCDC supports using the HTTP protocol (OpenAPI) to manage TiCDC tasks, which is a more user-friendly operation method for both Kubernetes and self-hosted environments. (Experimental feature)

[#2411](#)

#### 16.14.5.2.6 Deployment and operations

Support running the `tiup playground` command on Mac computers with Apple M1 chips.

### 16.14.5.3 Feature Enhancements

- Tools

- TiCDC

- \* Add the binary MQ format designed for TiDB. It is more compact than the open protocols based on JSON [#1621](#)
- \* Remove support for file sorter [#2114](#)
- \* Support log rotation configurations [#2182](#)

- TiDB Lightning

- \* Support customized line terminators (except `\r` and `\n`) [#1297](#)
- \* Support expression index and the index that depends on virtual generated columns [#1407](#)

- Dumping

- \* Support backing up MySQL compatible databases but does not support `START TRANSACTION ... WITH CONSISTENT SNAPSHOT` or `SHOW CREATE ↪ TABLE` [#311](#)

#### 16.14.5.4 Improvements

- TiDB
  - Support pushing down the built-in function `json_unquote()` to TiKV [#24415](#)
  - Support removing the `union` branch from the dual table [#25614](#)
  - Optimize the aggregate operator’s cost factor [#25241](#)
  - Allow the MPP outer join to choose the build table based on the table row count [#25142](#)
  - Support balancing the MPP query workload among different TiFlash nodes based on Regions [#24724](#)
  - Support invalidating stale Regions in the cache after the MPP query is executed [#24432](#)
  - Improve the MySQL compatibility of the built-in function `str_to_date` for the format specifiers `%b/%M/%r/%T` [#25767](#)
  - Fix the issue that inconsistent binding caches might be created in multiple TiDB after recreating different bindings for the same query [#26015](#)
  - Fix the issue that the existing bindings cannot be loaded into cache after upgrade [#23295](#)
  - Support ordering the result of `SHOW BINDINGS` by `(original_sql, update_time)` [#26139](#)
  - Improve the logic of query optimization when bindings exist, and reduce optimization times of a query [#26141](#)
  - Support completing the garbage collection automatically for the bindings in the “deleted” status [#26206](#)
  - Support showing whether a binding is used for query optimization in the result of `EXPLAIN VERBOSE` [#26930](#)
  - Add a new status variation `last_plan_binding_update_time` to view the timestamp corresponding to the binding cache in the current TiDB instance [#26340](#)
  - Support reporting an error when starting binding evolution or running `admin ↪ evolve bindings` to ban the baseline evolution (currently disabled in the TiDB Self-Hosted version because it is an experimental feature) affecting other features [#26333](#)
- PD
  - Add more QPS dimensions for hot Region scheduling, and support adjusting the priority of the scheduling [#3869](#)
  - Support hot Region balance scheduling for the write hotspot of TiFlash [#3900](#)
- TiFlash
  - Add operators: `MOD` / `%`, `LIKE`
  - Add string functions: `ASCII()`, `COALESCE()`, `LENGTH()`, `POSITION()`, `TRIM()`
  - Add mathematical functions: `CONV()`, `CRC32()`, `DEGREES()`, `EXP()`, `LN()`, `LOG()`, `LOG10()`, `LOG2()`, `POW()`, `RADIANS()`, `ROUND(decimal)`, `SIN()`, `MOD()`

- Add date functions: `ADDDATE(string, real)`, `DATE_ADD(string, real)`, `DATE ↷ ()`
  - Add other functions: `INET_NTOA()`, `INET_ATON()`, `INET6_ATON`, `INET6_NTOA()`
  - Support Shuffled Hash Join calculation and Shuffled Hash Aggregation calculation in the MPP mode when a new collation is enabled
  - Optimize basic code to improve MPP performance
  - Support casting the `STRING` type to the `DOUBLE` type
  - Optimize the non-joined data in right outer join using multiple threads
  - Support automatically invalidating stale Regions in MPP queries
- Tools
    - TiCDC
      - \* Add the concurrency limit to the incremental scan of kv client [#1899](#)
      - \* TiCDC can always pull the old value internally [#2271](#)
      - \* TiCDC can fail and exit fast when unrecoverable DML errors occur [#1928](#)
      - \* `resolve lock` cannot be run immediately after a Region is initialized [#2235](#)
      - \* Optimize workerpool to reduce the number of goroutines under high concurrency [#2201](#)
    - Dumping
      - \* Support always splitting TiDB v3.x tables through `tidb_rowid` to save TiDB memory [#301](#)
      - \* Reduce access of Dumping to the `information_schema` to improve stability [#305](#)

#### 16.14.5.5 Bug Fixes

- TiDB
  - Fix the issue that an incorrect result is returned when using merge join on the `SET` type column [#25669](#)
  - Fix the data corruption issue in the `IN` expression's arguments [#25591](#)
  - Avoid the sessions of GC being affected by global variables [#24976](#)
  - Fix the panic issue that occurs when using `limit` in the window function queries [#25344](#)
  - Fix the wrong value returned when querying a partitioned table using `Limit` [#24636](#)
  - Fix the issue that `IFNULL` does not correctly take effect on the `ENUM` or `SET` type column [#24944](#)
  - Fix the wrong results caused by changing the `count` in the join subqueries to `first_row` [#24865](#)
  - Fix the query hang issue that occurs when `ParallelApply` is used under the `TopN` operator [#24930](#)

- Fix the issue that more results than expected are returned when executing SQL statements using multi-column prefix indexes [#24356](#)
- Fix the issue that the `<=>` operator cannot correctly take effect [#24477](#)
- Fix the data race issue of the parallel Apply operator [#23280](#)
- Fix the issue that the `index out of range` error is reported when sorting the IndexMerge results of the PartitionUnion operator [#23919](#)
- Fix the issue that setting the `tidb_snapshot` variable to an unexpectedly large value might damage the transaction isolation [#25680](#)
- Fix the issue that the ODBC-styled constant (for example, `{d '2020-01-01'}`) cannot be used as the expression [#25531](#)
- Fix the issue that `SELECT DISTINCT` converted to `Batch Get` causes incorrect results [#25320](#)
- Fix the issue that backing off queries from TiFlash to TiKV cannot be triggered [#23665](#) [#24421](#)
- Fix the `index-out-of-range` error that occurs when checking `only_full_group_by`  $\leftrightarrow$  [#23839](#))
- Fix the issue that the result of index join in correlated subqueries is wrong [#25799](#)
- TiKV
  - Fix the wrong `tikv_raftstore_hibernated_peer_state` metric [#10330](#)
  - Fix the wrong arguments type of the `json_unquote()` function in the coprocessor [#10176](#)
  - Skip clearing callback during graceful shutdown to avoid breaking ACID in some cases [#10353](#) [#10307](#)
  - Fix a bug that the read index is shared for replica reads on a Leader [#10347](#)
  - Fix the wrong function that casts `DOUBLE` to `DOUBLE` [#25200](#)
- PD
  - Fix the issue that the expected scheduling cannot be generated due to scheduling conflicts among multiple schedulers [#3807](#) [#3778](#)
- TiFlash
  - Fix the issue that TiFlash keeps restarting because of the split failure
  - Fix the potential issue that TiFlash cannot delete the delta data
  - Fix a bug that TiFlash adds wrong padding for non-binary characters in the `CAST` function
  - Fix the issue of incorrect results when handling aggregation queries with complex `GROUP BY` columns
  - Fix the TiFlash panic issue that occurs under heavy write pressure
  - Fix the panic that occurs when the right join key is not nullable and the left join key is nullable
  - Fix the potential issue that the `read-index` requests take a long time
  - Fix the panic issue that occurs when the read load is heavy

- Fix the panic issue that might occur when the `Date_Format` function is called with the `STRING` type argument and `NULL` values
- Tools
  - TiCDC
    - \* Fix a bug that TiCDC owner exits abnormally when refreshing the checkpoint [#1902](#)
    - \* Fix a bug that changefeed fails immediately after its successful creation [#2113](#)
    - \* Fix a bug that changefeed fails due to the invalid format of rules filter [#1625](#)
    - \* Fix the potential DDL loss issue when the TiCDC owner panics [#1260](#)
    - \* Fix the CLI compatibility issue with 4.0.x clusters on the default sort-engine option [#2373](#)
    - \* Fix a bug that changefeed might be reset unexpectedly when TiCDC gets the `ErrSchemaStorageTableMiss` error [#2422](#)
    - \* Fix a bug that changefeed cannot be removed when TiCDC gets the `ErrGCTTLExceeded` error [#2391](#)
    - \* Fix a bug that TiCDC fails to synchronize large tables to cdclog [#1259](#) [#2424](#)
    - \* Fix a bug that multiple processors might write data to the same table when TiCDC is rescheduling the table [#2230](#)
  - Backup & Restore (BR)
    - \* Fix a bug that BR skips restoring all system tables during the restore [#1197](#) [#1201](#)
    - \* Fix a bug that BR misses DDL operations when restoring cdclog [#870](#)
  - TiDB Lightning
    - \* Fix a bug that TiDB Lightning fails to parse the `DECIMAL` data type in Parquet file [#1272](#)
    - \* Fix a bug that TiDB Lightning reports the “Error 9007: Write conflict” error when restoring table schemas [#1290](#)
    - \* Fix a bug that TiDB Lightning fails to import data due to the overflow of int handle [#1291](#)
    - \* Fix a bug that TiDB Lightning might get a checksum mismatching error due to data loss in the local backend mode [#1403](#)
    - \* Fix the Lightning incompatibility issue with clustered index when TiDB Lightning is restoring table schemas [#1362](#)
  - Dumpling
    - \* Fix a bug that the data export fails because the Dumpling GC safepoint is set too late [#290](#)
    - \* Fix the Dumpling getting stuck issue when exporting table names from the upstream database in certain MySQL versions [#322](#)

## 16.15 v5.1

### 16.15.1 TiDB 5.1.5 Release Notes

Release date: December 28, 2022

TiDB version: 5.1.5

Quick access: [Quick start](#) | [Production deployment](#) | [Installation packages](#)

#### 16.15.1.1 Compatibility changes

- PD
  - Disable compiling swagger server by default [#4932](#)

#### 16.15.1.2 Bug fixes

- TiDB
  - Fix the issue that the window function causes TiDB to panic instead of reporting an error [#30326](#)
  - Fix the wrong result that occurs when enabling dynamic mode in partitioned tables for TiFlash [#37254](#)
  - Fix wrong results of `GREATEST` and `LEAST` when passing in unsigned `BIGINT` arguments [#30101](#)
  - Fix wrong results of deleting data of multiple tables using `left join` [#31321](#)
  - Fix the issue that the result of `concat(ifnull(time(3)))` in TiDB is different from that in MySQL [#29498](#)
  - Fix the issue that the SQL statements that contain `cast(integer as char)`  $\leftrightarrow$  `union string` return wrong results [#29513](#)
  - Fix the issue that `INL_HASH_JOIN` might hang when used with `LIMIT` [#35638](#)
  - Fix the wrong `ANY_VALUE` result that occurs when a Region returns empty data [#30923](#)
  - Fix wrong results of index join caused by an innerWorker panic [#31494](#)
  - Fix the issue that a SQL operation is canceled when its `JSON` type column joins its `CHAR` type column [#29401](#)
  - Fix the issue that the background HTTP service of TiDB might not exit successfully and makes the cluster in an abnormal state [#30571](#)
  - Fix the issue that concurrent column type change causes inconsistency between the schema and the data [#31048](#)
  - Fix the issue that `KILL TIDB` cannot take effect immediately on idle connections [#24031](#)
  - Fix the bug that setting any session variable will make `tidb_snapshot` fail to work [#35515](#)

- Fix the issue that the Region cache is not cleaned up in time when the Region is merged [#37141](#)
  - Fix the panic issue caused by the connection array race in the KV client [#33773](#)
  - Fix the issue that when TiDB Binlog is enabled, executing the ALTER SEQUENCE ↪ statement might cause a wrong metadata version and cause Drainer to exit [#36276](#)
  - Fix the bug that TiDB may panic when querying statement summary tables [#35340](#)
  - Fix the issue that TiDB gets the wrong result when using TiFlash to scan tables with empty range although TiFlash does not support reading tables with empty range yet [#33083](#)
  - Fix the issue that the avg() function returns ERROR 1105 (HY000): other ↪ error for mpp stream: Could not convert to the target type - - ↪ value is out of range. when queried from TiFlash [#29952](#)
  - Fix the issue that ERROR 1105 (HY000): close of nil channel is returned when using HashJoinExec [#30289](#)
  - Fix the issue that TiKV and TiFlash return different results when querying logical operations [#37258](#)
  - Fix the issue that the EXECUTE statement might throw an unexpected error in specific scenarios [#37187](#)
  - Fix the planner wrong behaviors that occur when tidb\_opt\_agg\_push\_down and tidb\_enforce\_mpp are enabled [#34465](#)
  - Fix a bug that TiDB might send coprocessor requests when executing the SHOW ↪ COLUMNS statement [#36496](#)
  - Add warnings for lock tables and unlock tables when the enable-table- ↪ lock flag is not enabled [#28967](#)
  - Fix the issue that range partitions allow multiple MAXVALUE partitions [#36329](#)
- TiKV
    - Fix the issue of time parsing error that occurs when the DATETIME values contain a fraction and Z [#12739](#)
    - Fix a bug that replica reads might violate the linearizability [#12109](#)
    - Fix a bug that Regions might be overlapped if Raftstore is busy [#13160](#)
    - Fix the TiKV panic issue that occurs when applying snapshot is aborted [#11618](#)
    - Fix a bug that TiKV might panic if it has been running for 2 years or more [#11940](#)
    - Fix the panic issue that might occur when the source peer catches up logs by snapshot in the Region merge process [#12663](#)
    - Fix the issue that TiKV panics when performing type conversion for an empty string [#12673](#)
    - Fix a bug that stale messages cause TiKV to panic [#12023](#)
    - Fix the panic issue that might occur when a peer is being split and destroyed at the same time [#12825](#)

- Fix the TiKV panic issue that occurs when the target peer is replaced with the peer that is destroyed without being initialized when merging a Region [#12048](#)
  - Fix the issue that TiKV reports the `invalid store ID 0` error when using `Follower Read` [#12478](#)
  - Fix the possible duplicate commit records in pessimistic transactions when `async commit` is enabled [#12615](#)
  - Support configuring the `unreachable_backoff` item to avoid Raftstore broadcasting too many messages after one peer becomes unreachable [#13054](#)
  - Fix the issue that successfully committed optimistic transactions may report the `Write Conflict` error when the network is poor [#34066](#)
  - Fix the wrong expression of `Unified Read Pool CPU` in dashboard [#13086](#)
- PD
    - Fix the issue that a removed tombstone store appears again after the PD leader transfer [#4941](#)
    - Fix the issue that scheduling cannot start immediately after the PD leader transfer [#4769](#)
    - Fix the wrong status code of `not leader` [#4797](#)
    - Fix the issue that PD cannot correctly handle dashboard proxy requests [#5321](#)
    - Fix a bug of TSO fallback in some corner cases [#4884](#)
    - Fix the issue that the TiFlash learner replica might not be created in specific scenarios [#5401](#)
    - Fix the issue that the label distribution has residual labels in the metrics [#4825](#)
    - Fix the issue that when there exists a Store with large capacity (2T for example), fully allocated small Stores cannot be detected, which results in no balance operator being generated [#4805](#)
    - Fix the issue that schedulers do not work when `SchedulerMaxWaitingOperator` is set to 1 [#4946](#)
  - TiFlash
    - Fix incorrect `microsecond` when casting string to datetime [#3556](#)
    - Fix the panic issue that occurs when TLS is enabled [#4196](#)
    - Fix a bug that TiFlash might crash due to an error in parallel aggregation [#5356](#)
    - Fix the issue that a query containing `JOIN` might be hung if an error occurs [#4195](#)
    - Fix the issue that the function `OR` returns wrong results [#5849](#)
    - Fix the bug that invalid storage directory configurations lead to unexpected behaviors [#4093](#)
    - Fix potential data inconsistency after a lot of `INSERT` and `DELETE` operations [#4956](#)
    - Fix a bug that data not matching any region range remains on a TiFlash node [#4414](#)
    - Fix the potential query error after adding columns under heavy read workload [#3967](#)

- Fix repeated crashes caused by the `commit state jump backward` errors [#2576](#)
  - Fix potential errors when querying on a table with many delete operations [#4747](#)
  - Fix the issue that the date format identifies `'` as an invalid separator [#4036](#)
  - Fix the wrong result that occurs when casting `DATETIME` to `DECIMAL` [#4151](#)
  - Fix the bug that some exceptions are not handled properly [#4101](#)
  - Fix the issue that `Prepare Merge` might damage the metadata of the raft store and cause TiFlash to restart [#3435](#)
  - Fix a bug that an MPP query might fail due to random gRPC keepalive timeout [#4662](#)
  - Fix the issue that the result of `IN` is incorrect in multi-value expressions [#4016](#)
  - Fix a bug that MPP tasks might leak threads forever [#4238](#)
  - Fix the issue that expired data is recycled slowly [#4146](#)
  - Fix the overflow that occurs when casting `FLOAT` to `DECIMAL` [#3998](#)
  - Fix the issue that logical operators return wrong results when the argument type is `UInt8` [#6127](#)
  - Fix the potential `index out of bounds` error if calling `json_length` with empty string [#2705](#)
  - Fix wrong decimal comparison results in corner cases [#4512](#)
  - Fix `TiFlash_schema_error` reported when `NOT NULL` columns are added [#4596](#)
  - Fix the issue that TiFlash bootstrap fails when `0.0` is used as the default value for integers, for example, ``i` int(11)NOT NULL DEFAULT '0.0'` [#3157](#)
- Tools
    - TiDB Binlog
      - \* Fix the issue that Drainer cannot send requests to Pump correctly when `compressor` is set to `zip` [#1152](#)
    - Backup & Restore (BR)
      - \* Fix the issue that system tables cannot be restored because concurrently backing up system tables makes the table name fail to update [#29710](#)
    - TiCDC
      - \* Fix data loss that occurs in special incremental scanning scenarios [#5468](#)
      - \* Fix the issue that there are no sorter metrics [#5690](#)
      - \* Fix excessive memory usage by optimizing the way DDL schemas are buffered [#1386](#)

### 16.15.2 TiDB 5.1.4 Release Notes

Release Date: February 22, 2022

TiDB version: 5.1.4

### 16.15.2.1 Compatibility changes

- TiDB
  - Change the default value of the system variable `tidb_analyze_version` from 2 to 1 [#31748](#)
  - Since v5.1.4, if TiKV is configured with `storage.enable-ttl = true`, the requests from TiDB are rejected, because the TTL feature of TiKV only supports the `RawKV mode` [#27303](#)
- Tools
  - TiCDC
    - \* Set the default value of `max-message-bytes` to 10M [#4041](#)

### 16.15.2.2 Improvements

- TiDB
  - Support partition pruning for the built-in `IN` expression in Range partition tables [#26739](#)
  - Improve the accuracy of tracking memory usage when `IndexJoin` is executed [#28650](#)
- TiKV
  - Update the proc filesystem (`prodfs`) to v0.12.0 [#11702](#)
  - Improve the error log report in the Raft client [#11959](#)
  - Increase the speed of inserting SST files by moving the verification process to the `Import` thread pool from the `Apply` thread pool [#11239](#)
- PD
  - Speed up the exit process of schedulers [#4146](#)
- TiFlash
  - Support pushing down `ADDDATE()` and `DATE_ADD()` to TiFlash
  - Support pushing down `INET6_ATON()` and `INET6_NTOA()` to TiFlash
  - Support pushing down `INET_ATON()` and `INET_NTOA()` to TiFlash
  - Increase the max supported depth of an expression or a plan tree in a DAG request from 100 to 200
- Tools

- TiCDC
  - \* Add the exponential backoff mechanism for restarting a changefeed. [#3329](#)
  - \* Reduce the replication latency when replicating many tables [#3900](#)
  - \* Add metrics for observing the remaining time of incremental scan [#2985](#)
  - \* Reduce the count of “EventFeed retry rate limited” logs [#4006](#)
  - \* Add more Prometheus and Grafana monitoring metrics and alerts, including `no owner alert`, `mounter row`, `table sink total row`, and `buffer sink`  
↪ `total row` [#4054](#) [#1606](#)
  - \* Optimize rate limiting control on TiKV reloads to reduce gPRC congestion during changefeed initialization [#3110](#)
  - \* Reduce the time for the KV client to recover when a TiKV store is down [#3191](#)

### 16.15.2.3 Bug fixes

- TiDB
  - Fix a memory leak bug that occurs when the system variable `tidb_analyze_version`  
↪ is set to 2 [#32499](#)
  - Fix the issue that the `MaxDays` and `MaxBackups` configurations do not take effect for the slow log [#25716](#)
  - Fix the issue that executing the `INSERT ... SELECT ... ON DUPLICATE KEY`  
↪ `UPDATE` statement gets panic [#28078](#)
  - Fix the wrong result that might occur when performing JOIN on ENUM type columns [#27831](#)
  - Fix the issue that INDEX HASH JOIN returns the `send on closed channel` error [#31129](#)
  - Fix the issue that using the `BatchCommands` API might block sending TiDB requests to TiKV in some rare cases [#32500](#)
  - Fix the issue of potential data index inconsistency in optimistic transaction mode [#30410](#)
  - Fix the issue that window functions might return different results when using a transaction or not [#29947](#)
  - Fix the issue that the length information is wrong when casting `Decimal` to `String` [#29417](#)
  - Fix the issue that the `GREATEST` function returns incorrect result that occurs when setting the `tidb_enable_vectorized_expression` vectorized expression to off [#29434](#)
  - Fix the issue that the optimizer might cache invalid plans for join in some cases [#28087](#)
  - Fix wrong results of the `microsecond` and `hour` functions in vectorized expressions [#29244](#) [#28643](#)
  - Fix the TiDB panic when executing the `ALTER TABLE... ADD INDEX` statement in some cases [#27687](#)

- Fix a bug that the availability detection of MPP node does not work in some corner cases [#3118](#)
- Fix the DATA RACE issue when assigning MPP task ID [#27952](#)
- Fix the INDEX OUT OF RANGE error for a MPP query after deleting an empty dual table [#28250](#)
- Fix the issue of false positive error log `invalid cop task execution summaries`  $\leftrightarrow$  `length` for MPP queries [#1791](#)
- Fix the issue that SET GLOBAL `tidb_skip_isolation_level_check=1` doesn't affect new session settings [#27897](#)
- Fix the `index out of range` issue that occurs when `tiup bench` runs for a long time [#26832](#)

- TiKV

- Fix a bug that TiKV cannot delete a range of data (`unsafe_destroy_range` cannot be executed) when the GC worker is busy [#11903](#)
- Fix the issue that destroying a peer might cause high latency [#10210](#)
- Fix a bug that the `any_value` function returns a wrong result when regions are empty [#11735](#)
- Fix the issue that deleting an uninitialized replica might cause an old replica to be recreated [#10533](#)
- Fix the metadata corruption issue when Prepare Merge is triggered after a new election is finished but the isolated peer is not informed [#11526](#)
- Fix the deadlock issue that happens occasionally when coroutines run too fast [#11549](#)
- Fix the potential deadlock and memory leak issues when profiling flame graphs [#11108](#)
- Fix the rare data inconsistency issue when retrying a prewrite request in pessimistic transactions [#11187](#)
- Fix a bug that the configuration `resource-metering.enabled` does not work [#11235](#)
- Fix the issue that some coroutines leak in `resolved_ts` [#10965](#)
- Fix the issue of reporting false “GC can not work” alert under low write flow [#9910](#)
- Fix a bug that `tikv-ctl` cannot return the correct Region-related information [#11393](#)
- Fix the issue that a down TiKV node causes the resolved timestamp to lag [#11351](#)
- Fix a panic issue that occurs when Region merge, ConfChange, and Snapshot happen at the same time in extreme conditions [#11475](#)
- Fix the issue that TiKV cannot detect the memory lock when TiKV performs a reverse table scan [#11440](#)
- Fix the issue of negative sign when the decimal divide result is zero [#29586](#)
- Fix a memory leak caused by the monitoring data of statistics threads [#11195](#)
- Fix the issue of TiCDC panic that occurs when the downstream database is missing [#11123](#)

- Fix the issue that TiCDC adds scan retries frequently due to the Congest error [#11082](#)
- Fix the issue that batch messages are too large in Raft client implementation [#9714](#)
- Collapse some uncommon storage-related metrics in Grafana dashboard [#11681](#)
- PD
  - Fix a bug that the schedule generated by the region scatterer might decrease the number of peers [#4565](#)
  - Fix the issue that Region statistics are not affected by `flow-round-by-digit` [#4295](#)
  - Fix slow leader election caused by stucked region syncer [#3936](#)
  - Support that the evict leader scheduler can schedule regions with unhealthy peers [#4093](#)
  - Fix the issue that the cold hotspot data cannot be deleted from the hotspot statistics [#4390](#)
  - Fix a panic issue that occurs after the TiKV node is removed [#4344](#)
  - Fix the issue that the scheduling operator cannot fail fast because the target store is down [#3353](#)
- TiFlash
  - Fix the issue that the `str_to_date()` function incorrectly handles leading zeros when parsing microseconds
  - Fix the TiFlash crash problem when the memory limit is enabled
  - Fix the issue that when an input time is earlier than 1970-01-01 00:00:01 UTC, the behavior of `unix_timestamp` is inconsistent with that of TiDB or MySQL
  - Fix the potential data inconsistency caused by widening the primary key column when the primary key is handle
  - Fix the overflow bug and the issue of reporting `Can't compare` error when comparing data in the `DECIMAL` data type
  - Fix the unexpected error of 3rd arguments of function `substringUTF8` must `↔ be constants`.
  - Fix the issue that TiFlash fails to start on platforms without the `ns1` library
  - Fix the overflow bug when casting data to the `DECIMAL` data type
  - Fix the issue that the `castStringAsReal` behavior is inconsistent in TiFlash and in TiDB/TiKV
  - Fix the issue that TiFlash might return the `EstablishMPPConnection` error after it is restarted
  - Fix the issue that obsolete data cannot be reclaimed after setting the number of TiFlash replicas to 0
  - Fix the issue that the `CastStringAsDecimal` behavior is inconsistent in TiFlash and in TiDB/TiKV
  - Fix the issue that queries with the `where <string>` clause return wrong results

- Fix the issue that TiFlash might panic when an MPP query is stopped
- Fix the unexpected error of `Unexpected type of column: Nullable(Nothing)`
- Tools
  - TiCDC
    - \* Fix a bug that MySQL sink generates duplicated `replace` SQL statements if `batch-replace-enable` is disabled [#4501](#)
    - \* Fix the issue that the `cached region` monitoring metric is negative [#4300](#)
    - \* Fix the issue that replication cannot be performed when `min.insync.replicas` is smaller than `replication-factor` [#3994](#)
    - \* Fix the potential panic issue that occurs when a replication task is removed [#3128](#)
    - \* Fix the issue of potential data loss caused by inaccurate checkpoint [#3545](#)
    - \* Fix the potential issue that the deadlock causes a replication task to get stuck [#4055](#)
    - \* Fix the issue that special comments in DDL statements cause the replication task to stop [#3755](#)
    - \* Fix a bug that EtcdWorker might hang the owner and processor [#3750](#)
    - \* Fix the issue that `stopped` changefeeds resume automatically after a cluster upgrade [#3473](#)
    - \* Fix the issue that default values cannot be replicated [#3793](#)
    - \* Fix data inconsistency caused by TiCDC default value padding exceptions [#3918](#) [#3929](#)
    - \* Fix a bug that an owner gets stuck when a PD leader shuts down and transfers to a new node [#3615](#)
    - \* Fix the TiCDC panic issue that occurs when manually cleaning the task status in etcd [#2980](#)
    - \* Fix the issue that the service cannot be started because of a timezone issue in the RHEL release [#3584](#)
    - \* Fix the issue of overly frequent warnings caused by MySQL sink deadlock [#2706](#)
    - \* Fix the bug that the `enable-old-value` configuration item is not automatically set to `true` on Canal and Maxwell protocols [#3676](#)
    - \* Fix the issue that Avro sink does not support parsing JSON type columns [#3624](#)
    - \* Fix the negative value error in the changefeed checkpoint lag [#3010](#)
    - \* Fix the OOM issue in the container environment [#1798](#)
    - \* Fix the TiCDC replication interruption issue when multiple TiKVs crash or during a forced restart [#3288](#)
    - \* Fix the memory leak issue after processing DDLs [#3174](#)
    - \* Fix the issue that changefeed does not fail fast enough when the `ErrGCT-TLExceeded` error occurs [#3111](#)
    - \* Fix the issue that TiCDC replication task might terminate when the upstream TiDB instance unexpectedly exits [#3061](#)

- \* Fix the issue that TiCDC process might panic when TiKV sends duplicate requests to the same Region [#2386](#)
- \* Fix the issue that Kafka may send excessively large messages by setting the default value of `max-message-bytes` to 10M [#3081](#)
- \* Fix the issue that TiCDC sync task might pause when an error occurs during writing a Kafka message [#2978](#)
- Backup & Restore (BR)
  - \* Fix the potential issue that Regions might be unevenly distributed after a restore operation is finished [#30425](#) [#31034](#)
- TiDB Binlog
  - \* Fix the issue that DBaaS importing CSV fails with `InvalidRange` if CSV file size is about 256MB and `strict-format` is `true` [#27763](#)
- TiDB Lightning
  - \* Fix the issue that TiDB Lightning does not report errors when the S3 storage path does not exist [#28031](#) [#30709](#)

### 16.15.3 TiDB 5.1.3 Release Note

Release date: December 3, 2021

TiDB version: 5.1.3

#### 16.15.3.1 Bug fix

- TiKV
  - Fix the issue that the `GcKeys` task does not work when it is called by multiple keys. Caused by this issue, compaction filter GC might not drop the MVCC deletion information. [#11217](#)

### 16.15.4 TiDB 5.1.2 Release Notes

Release Date: September 27, 2021

TiDB version: 5.1.2

#### 16.15.4.1 Compatibility changes

- TiDB
  - The following bug fixes change execution results, which might cause upgrade incompatibilities:

- \* Fix the issue that `greatest(datetime)union null` returns empty string [#26532](#)
- \* Fix the issue that the `having` clause might not work correctly [#26496](#)
- \* Fix the wrong execution results that occur when the collations around the `between` expression are different [#27146](#)
- \* Fix the wrong execution results that occur when the column in the `group_concat` function has a non-bin collation [#27429](#)
- \* Fix an issue that using a `count(distinct)` expression on multiple columns returns wrong result when the new collation is enabled [#27091](#)
- \* Fix the result wrong that occurs when the argument of the `extract` function is a negative duration [#27236](#)
- \* Fix the issue that inserting an invalid date does not report an error when the `SQL_MODE` is `'STRICT_TRANS_TABLES'` [#26762](#)
- \* Fix the issue that using an invalid default date does not report an error when the `SQL_MODE` is `'NO_ZERO_IN_DATE'` [#26766](#)

- Tools

- TiCDC

- \* Set the compatible version from 5.1.0-alpha to 5.2.0-alpha [#2659](#)

#### 16.15.4.2 Improvements

- TiDB

- Trigger auto-analyze by histogram row count and increase the accuracy of this trigger action [#24237](#)

- TiKV

- Support dynamically modifying TiCDC configurations [#10645](#)
  - Reduce the size of Resolved TS message to save network bandwidth [#2448](#)
  - Limit the counts of peer stats in the heartbeat message reported by a single store [#10621](#)

- PD

- Allow empty Regions to be scheduled and use a separate tolerance configuration in scatter range scheduler [#4117](#)
  - Improve the performance of synchronizing Region information between PDs [#3933](#)
  - Support dynamically adjusting the retry limit of a store based on the generated operator [#3744](#)

- TiFlash

- Support the `DATE()` function
- Add Grafana panels for write throughput per instance
- Optimize the performance of the `leader-read` process
- Accelerate the process of canceling MPP tasks
- Tools
  - TiCDC
    - \* Optimize memory management when the Unified Sorter is using memory to sort data [#2553](#)
    - \* Optimize workerpool for fewer goroutines when concurrency is high [#2211](#)
    - \* Reduce goroutine usage when a table's Region transfer away from a TiKV node [#2284](#)
    - \* Add a global gRPC connection pool and share gRPC connections among KV clients [#2534](#)
    - \* Prohibit operating TiCDC clusters across major and minor versions [#2599](#)
  - Dumping
    - \* Support backing up MySQL-compatible databases that do not support `START TRANSACTION ... WITH CONSISTENT SNAPSHOT` and `SHOW CREATE`  
↔ `TABLE` [#309](#)

#### 16.15.4.3 Bug fixes

- TiDB
  - Fix the potential wrong results of index hash join when the hash column is the `ENUM` type [#27893](#)
  - Fix a batch client bug that recycle idle connection might block sending requests in some rare cases [#27678](#)
  - Fix the issue that the overflow check of the `FLOAT64` type is different with that of MySQL [#23897](#)
  - Fix the issue that TiDB returns an `unknow` error while it should return the `pd`  
↔ `is timeout` error [#26147](#)
  - Fix the wrong character set and collation for the `case when` expression [#26662](#)
  - Fix the potential `can not found column in Schema column` error for MPP queries [#28148](#)
  - Fix a bug that TiDB might panic when TiFlash is shutting down [#28096](#)
  - Fix the issue of wrong range caused by using `enum like 'x%'` [#27130](#)
  - Fix the Common Table Expression (CTE) dead lock issue when used with `IndexLookupJoin` [#27410](#)
  - Fix a bug that retryable deadlocks are incorrectly recorded into the `INFORMATION_SCHEMA`  
↔ `.DEADLOCKS` table [#27400](#)
  - Fix the issue that the `TABLESAMPLE` query result from partitioned tables is not sorted as expected [#27349](#)

- Remove the unused `/debug/sub-optimal-plan` HTTP API [#27265](#)
  - Fix a bug that the query might return wrong results when the hash partitioned table deals with unsigned data [#26569](#)
  - Fix a bug that creating partition fails if `NO_UNSIGNED_SUBTRACTION` is set [#26765](#)
  - Fix the issue that the `distinct` flag is missing when `Apply` is converted to `Join` [#26958](#)
  - Set a block duration for the newly recovered TiFlash node to avoid blocking queries during this time [#26897](#)
  - Fix a bug that might occur when the CTE is referenced more than once [#26212](#)
  - Fix a CTE bug when `MergeJoin` is used [#25474](#)
  - Fix a bug that the `SELECT FOR UPDATE` statement does not correctly lock the data when a normal table joins a partitioned table [#26251](#)
  - Fix the issue that the `SELECT FOR UPDATE` statement returns an error when a normal table joins a partitioned table [#26250](#)
  - Fix the issue that `PointGet` does not use the lite version of resolving lock [#26562](#)
- TiKV
    - Fix a panic issue that occurs after TiKV is upgraded from v3.x to later versions [#10902](#)
    - Fix the potential disk full issue caused by corrupted snapshot files [#10813](#)
    - Make the slow log of TiKV coprocessor only consider the time spent on processing requests [#10841](#)
    - Drop log instead of blocking threads when the slogger thread is overloaded and the queue is filled up [#10841](#)
    - Fix a panic issue that occurs when processing Coprocessor requests times out [#10852](#)
    - Fix the TiKV panic issue that occurs when upgrading from a pre-5.0 version with Titan enabled [#10842](#)
    - Fix the issue that TiKV of a newer version cannot be rolled back to v5.0.x [#10842](#)
    - Fix the issue that TiKV might delete files before ingesting data to RocksDB [#10438](#)
    - Fix the parsing failure caused by the left pessimistic locks [#26404](#)
  - PD
    - Fix the issue that PD does not fix the down peers in time [#4077](#)
    - Fix the issue that the replica count of the default placement rules stays constant after `replication.max-replicas` is updated [#3886](#)
    - Fix a bug that PD might panic when scaling out TiKV [#3868](#)
    - Fix a bug that the hot Region scheduler cannot work when the cluster has the evict leader scheduler [#3697](#)
  - TiFlash

- Fix the issue of unexpected results when TiFlash fails to establish MPP connections
  - Fix the potential issue of data inconsistency that occurs when TiFlash is deployed on multiple disks
  - Fix a bug that MPP queries get wrong results when TiFlash server is under high load
  - Fix a potential bug that MPP queries hang forever
  - Fix the panic issue when operating store initialization and DDL simultaneously
  - Fix a bug of incorrect results that occurs when queries contain filters like `CONSTANT`  $\leftrightarrow$  `,` `<`, `<=`, `>`, `>=`, or `COLUMN`
  - Fix the potential panic issue when `Snapshot` is applied simultaneously with multiple DDL operations
  - Fix the issue that the store size in metrics is inaccurate under heavy writing
  - Fix the potential issue that TiFlash cannot garbage-collect the delta data after running for a long time
  - Fix the issue of wrong results when the new collation is enabled
  - Fix the potential panic issue that occurs when resolving locks
  - Fix a potential bug that metrics display wrong values
- Tools
    - Backup & Restore (BR)
      - \* Fix the issue that the average speed is not accurate during data backup and restore [#1405](#)
    - Dumpling
      - \* Fix the issue that Dumpling is pending when `show table status` returns incorrect results in some MySQL versions (8.0.3 and 8.0.23) [#322](#)
      - \* Fix the CLI compatibility issue with 4.0.x clusters on the default `sort- $\leftrightarrow$  engine` option [#2373](#)
    - TiCDC
      - \* Fix a bug that the JSON encoding might cause panic when processing a string type value that is `string` or `[]byte` [#2758](#)
      - \* Reduce gRPC window size to avoid OOM [#2673](#)
      - \* Fix a gRPC `keepalive` error under high memory pressure [#2202](#)
      - \* Fix a bug that an unsigned `tinyint` causes TiCDC to panic [#2648](#)
      - \* Fix an empty value issue in TiCDC Open Protocol. An empty value is no longer output when there is no change in one transaction. [#2612](#)
      - \* Fix a bug in DDL handling during manual restarts [#2603](#)
      - \* Fix the issue that `EtcWorker`'s snapshot isolation might be wrongly violated when managing the metadata [#2559](#)
      - \* Fix a bug that multiple processors might write data to the same table when TiCDC is rescheduling the table [#2230](#)
      - \* Fix a bug that changefeed might be reset unexpectedly when TiCDC gets the `ErrSchemaStorageTableMiss` error [#2422](#)

- \* Fix a bug that changefeed cannot be removed when TiCDC gets the `ErrGCTTLExceeded` error [#2391](#)
- \* Fix a bug that TiCDC fails to synchronize large tables to cdclog [#1259](#) [#2424](#)

### 16.15.5 TiDB 5.1.1 Release Notes

Release Date: July 30, 2021

TiDB version: 5.1.1

#### 16.15.5.1 Compatibility changes

- TiDB
  - For TiDB clusters upgrade from v4.0 to v5.1, the default value of `tidb_multi_statement_mode`  $\leftrightarrow$  is `OFF`. It is recommended to use the multi-statement feature of your client library instead. See [the documentation on `tidb\_multi\_statement\_mode`](#) for details. [#25751](#)
  - Change the default value of the `tidb_stmt_summary_max_stmt_count` variable from 200 to 3000 [#25874](#)
  - Require the `SUPER` privilege to access the `table_storage_stats` table [#26352](#)
  - Require the `SELECT` privilege on `mysql.user` to access the `information_schema.user_privileges` table to show other user's privileges [#26311](#)
  - Require the `CONFIG` privilege to access the `information_schema.cluster_hardware`  $\leftrightarrow$  table [#26297](#)
  - Require the `PROCESS` privilege to access the `information_schema.cluster_info` table [#26297](#)
  - Require the `PROCESS` privilege to access the `information_schema.cluster_load` table [#26297](#)
  - Require the `PROCESS` privilege to access the `information_schema.cluster_systeminfo`  $\leftrightarrow$  table [#26297](#)
  - Require the `PROCESS` privilege to access the `information_schema.cluster_log` table [#26297](#)
  - Require the `CONFIG` privilege to access the `information_schema.cluster_config`  $\leftrightarrow$  table [#26150](#)

#### 16.15.5.2 Feature enhancements

- TiDB Dashboard
  - Support OIDC SSO. By setting the OIDC-compatible SSO services (such as Okta and Auth0), users can log into TiDB Dashboard without entering the SQL password. [#3883](#)
- TiFlash
  - Support the `HAVING()` function in DAG requests

### 16.15.5.3 Improvements

- TiDB
  - Announce the general availability (GA) of the Stale Read feature
  - Avoid allocation for `paramMarker` to speed up data insertion [#26076](#)
  - Support the stable result mode to make the query results more stable [#25995](#)
  - Support pushing down the built-in function `json_unquote()` to TiKV [#26265](#)
  - Support retrying MPP queries [#26480](#)
  - Change the `LOCK` record into the `PUT` record for the index keys using `point get` or `batch point get` for `UPDATE` reads [#26225](#)
  - Forbid creating views from stale queries [#26200](#)
  - Thoroughly push down the `COUNT(DISTINCT)` aggregation function in the MPP mode [#26194](#)
  - Check the availability of TiFlash before launching MPP queries [#26192](#)
  - Do not allow setting the read timestamp to a future time [#25763](#)
  - Print log warnings when aggregation functions cannot be pushed down in `EXPLAIN` statements [#25737](#)
  - Add the `statements_summary_evicted` table to record the evicted count information of a cluster [#25587](#)
  - Improve the MySQL compatibility of the built-in function `str_to_date` for the format specifiers `%b/%M/%r/%T` [#25768](#)
- TiKV
  - Make the prewrite requests as idempotent as possible to reduce the chance of undetermined errors [#10586](#)
  - Prevent the risk of stack overflow when handling many expired commands [#10502](#)
  - Avoid excessive commit request retrying by not using the Stale Read request's `start_ts` to update `max_ts` [#10451](#)
  - Handle read ready and write ready separately to reduce read latency [#10592](#)
  - Reduce the impact on data import speed when the I/O rate limiting is enabled [#10390](#)
  - Improve the load balance between Raft gRPC connections [#10495](#)
- Tools
  - TiCDC
    - \* Remove `file sorter` [#2327](#)
    - \* Improve the error message returned when a PD endpoint misses the certificate [#1973](#)
  - TiDB Lightning
    - \* Add a retry mechanism for restoring schemas [#1294](#)
  - Dumpling

- \* Always split tables using `_tidb_rowid` when the upstream is a TiDB v3.x cluster, which helps reduce TiDB's memory usage [#295](#)
- \* Reduce the frequency of accessing the database metadata to improve Dumpling's performance and stability [#315](#)

#### 16.15.5.4 Bug fixes

- TiDB
  - Fix the data loss issue that might occur when changing the column type with `tidb_enable_amend_pessimistic_txn=on` [#26203](#)
  - Fix the issue that the behavior of the `last_day` function is incompatible in the SQL mode [#26001](#)
  - Fix the panic issue that might occur when LIMIT is on top of window functions [#25344](#)
  - Fix the issue that committing pessimistic transactions might cause write conflict [#25964](#)
  - Fix the issue that the result of index join in correlated subqueries is wrong [#25799](#)
  - Fix a bug that the successfully committed optimistic transactions might report commit errors [#10468](#)
  - Fix the issue that an incorrect result is returned when using merge join on the SET type column [#25669](#)
  - Fix a bug that the index keys in a pessimistic transaction might be repeatedly committed [#26359](#)
  - Fix the risk of integer overflow when the optimizer is locating partitions [#26227](#)
  - Fix the issue that invalid values might be written when casting DATE to timestamp [#26292](#)
  - Fix the issue that the Coprocessor Cache metrics are not displayed on Grafana [#26338](#)
  - Fix the issue of annoying logs caused by telemetry [#25760](#) [#25785](#)
  - Fix a bug on the query range of prefix index [#26029](#)
  - Fix the issue that concurrently truncating the same partition hangs DDL executions [#26229](#)
  - Fix the issue of duplicate ENUM items [#25955](#)
  - Fix a bug that the CTE iterator is not correctly closed [#26112](#)
  - Fix the issue that the LOAD DATA statement might abnormally import non-utf8 data [#25979](#)
  - Fix the panic issue that might occur when using the window function on the unsigned integer columns [#25956](#)
  - Fix the issue that TiDB might panic when resolving async commit locks [#25778](#)
  - Fix the issue that Stale Read is not fully compatible with the PREPARE statements [#25800](#)
  - Fix the issue that the ODBC-styled constant (for example, `{d '2020-01-01'}`) cannot be used as the expression [#25531](#)

- Fix an error that occurs when running TiDB alone [#25555](#)
- TiKV
  - Fix the issue that the duration calculation might panic on certain platforms [#10569](#)
  - Fix the issue that Load Base Split mistakenly uses the unencoded keys of `batch_get_command` [#10542](#)
  - Fix the issue that changing the `resolved-ts.advance-ts-interval` configuration dynamically cannot take effect immediately [#10426](#)
  - Fix the issue of follower metadata corruption in rare cases with more than 4 replicas [#10225](#)
  - Fix the panic issue that occurs when building a snapshot twice if encryption is enabled [#9786](#) [#10407](#)
  - Fix the wrong `tikv_raftstore_hibernated_peer_state` metric [#10330](#)
  - Fix the wrong arguments type of the `json_unquote()` function in the coprocessor [#10176](#)
  - Fix a bug that the index keys in a pessimistic transaction might be repeatedly committed [#10468](#)
  - Fix the issue that the `ReadIndex` request returns stale result right after the leader is transferred [#9351](#)
- PD
  - Fix the issue the expected scheduling cannot be generated when the conflict occurs due to multiple schedulers running at the same time [#3807](#) [#3778](#)
  - Fix the issue that the scheduler might appear again even if the scheduler is already deleted [#2572](#)
- TiFlash
  - Fix the potential panic issue that occurs when running table scan tasks
  - Fix a bug that TiFlash raises the error about `duplicated region` when handling DAQ requests
  - Fix the panic issue that occurs when the read load is heavy
  - Fix the potential panic issue that occurs when executing the `DateFormat` function
  - Fix the potential memory leak issue that occurs when executing MPP tasks
  - Fix the issue of unexpected results when executing the aggregation functions `COUNT` or `COUNT DISTINCT`
  - Fix a potential bug that TiFlash cannot restore data when deployed on multiple disks
  - Fix the issue that TiDB Dashboard cannot display the disk information of TiFlash correctly
  - Fix the potential panic issue that occurs when deconstructing `SharedQueryBlockInputStream`  
↔
  - Fix the potential panic issue that occurs when deconstructing `MPPTask`

- Fix the potential issue of data inconsistency after synchronizing data via snapshot
- Tools
  - TiCDC
    - \* Fix the support for the new collation feature [#2301](#)
    - \* Fix the issue that an unsynchronized access to a shared map at runtime might cause panic [#2300](#)
    - \* Fix the potential DDL loss issue that occurs when the owner crashes while executing the DDL statement [#2290](#)
    - \* Fix the issue of trying to resolve locks in TiDB prematurely [#2188](#)
    - \* Fix a bug that might cause data loss if a TiCDC node is killed immediately after a table migration [#2033](#)
    - \* Fix the handling logic of `changefeed update` on `--sort-dir` and `--start-  
→ ts` [#1921](#)
  - Backup & Restore (BR)
    - \* Fix the issue that the size of the data to restore is incorrectly calculated [#1270](#)
    - \* Fix the issue of missed DDL events that occurs when restoring from `cdclog` [#870](#)
  - TiDB Lightning
    - \* Fix the issue that TiDB fails to parse the `DECIMAL` type data in Parquet files [#1275](#)
    - \* Fix the issue of integer overflow when calculating key intervals [#1291](#) [#1290](#)

### 16.15.6 TiDB 5.1 Release Notes

Release date: June 24, 2021

TiDB version: 5.1.0

In v5.1, the key new features or improvements are as follows:

- Support the Common Table Expression (CTE) feature of MySQL 8.0 to improve the readability and execution efficiency of SQL statements.
- Support changing column types online to improve code development flexibility.
- Introduce a new statistics type to improve query stability, which is enabled as an experimental feature by default.
- Support the dynamic privilege feature of MySQL 8.0 to implement more fine-grained control over certain operations.
- Support directly reading data from the local replica using the Stale Read feature to reduce read latency and improve query performance (Experimental).
- Add the Lock View feature to facilitate database administrators (DBAs) to observe transaction locking events and troubleshoot deadlock problems (Experimental).
- Add TiKV write rate limiter for background tasks to ensure that the latency of read and write requests is stable.

### 16.15.6.1 Compatibility changes

**Note:**

When upgrading from an earlier TiDB version to v5.1, if you want to know the compatibility change notes of all intermediate versions, you can check the [Release Notes](#) for the corresponding version.

#### 16.15.6.1.1 System variables

Variable name	Change type	Description
<code>cte_max_recursion_depth</code>	Newly added	Controls the maximum recursion depth in Common Table Expressions.
<code>init_connect</code>	Newly added	Controls the initial connection to a TiDB server.
<code>tidb_analyze_statistics</code>	Newly added	Controls how TiDB collects statistics. The default value of this variable is 2. This is an experimental feature.

Variable name	Change type	Description
<code>tidb_enable_security_check</code>	Newly added	Indicates whether the TiDB server you are connected to has the Security Enhanced Mode (SEM) enabled. This variable setting cannot be changed without restarting the TiDB server.
<code>tidb_enforce_mpp</code>	Newly added	Controls whether to ignore the optimizer's cost estimation and to forcibly use the MPP mode for query execution. The data type of this variable is <code>BOOL</code> and the default value is <code>false</code> .

Variable name	Change type	Description
<code>tidb_partition_prune_mode</code> ↔	Newly added	Specifies whether to enable dynamic pruning mode for partitioned tables. This feature is experimental. The default value of this variable is <code>static</code> , which means the dynamic pruning mode for partitioned tables is disabled by default.

#### 16.15.6.1.2 Configuration file parameters

Configuration file	Configuration item	Change type	Description
TiDB configuration file	<b>security.</b> ↔ <b>enable-</b> ↔ <b>sem</b>	Newly added	Controls whether to enable the Security Enhanced Mode (SEM). The default value of this configuration item is <b>false</b> , which means the SEM is disabled.
TiDB configuration file	<b>performance</b> ↔ <b>.</b> ↔ <b>committer</b> ↔ <b>-</b> ↔ <b>concurrency</b> ↔	Modified	Controls the concurrency number for requests related to commit operations in the commit phase of a single transaction. The default value is changed from 16 to 128.

Configuration file	Configuration item	Change type	Description
TiDB configuration file	<b>performance</b> ↔ <b>.tcp-no</b> ↔ <b>-delay</b>	Newly added	Determines whether to enable TCP_NODELAY at the TCP layer. The default value is <b>true</b> , which means TCP_NODELAY is enabled.
TiDB configuration file	<b>performance</b> ↔ <b>.</b> ↔ <b>enforce</b> ↔ <b>-mpp</b>	Newly added	Controls whether TiDB ignores cost estimates of Optimizer at the instance level and enforces the MPP mode. The default value is <b>false</b> . This configuration item controls the initial value of the system variable <b>tidb_enforce_mpp</b> ↔ <b>.</b>

Configuration file	Configuration item	Change type	Description
TiDB configuration file	<b>pessimistic</b>	Newly added	Sets the maximum number of deadlock events that can be recorded in the <b>INFORMATION_SCHEMA</b> <b>DEADLOCKS</b> table of a single TiDB server. The default value is 10.
	↔ <b>-txn.</b>		
	↔ <b>deadlock</b>		
	↔ <b>-</b>		
	↔ <b>history</b>		
	↔ <b>-</b>		
	↔ <b>capacity</b>		
TiKV configuration file	<b>abort-on-</b>	Newly added	Sets whether the abort process allows the system to generate core dump files when TiKV panics. The default value is <b>false</b> , which means it is not allowed to generate core dump files.
	↔ <b>panic</b>		

Configuration file	Configuration item	Change type	Description
TiKV configuration file	<del>hibernate-</del> ↔ <b>regions</b>	Modified	The default value is changed from <b>false</b> to <b>true</b> . If a Region is idle for a long time, it is automatically set as hibernated.
TiKV configuration file	<del>old-value-</del> ↔ <del>cache-</del> ↔ <del>memory-</del> ↔ <del>quota</del>	Newly added	Sets the upper limit of memory usage by TiCDC old values. The default value is 512MB.
TiKV configuration file	<b>sink-</b> ↔ <del>memory-</del> ↔ <del>quota</del>	Newly added	Sets the upper limit of memory usage by TiCDC data change events. The default value is 512MB.

Configuration file	Configuration item	Change type	Description
TiKV configuration file	<b>incremental</b> ↔ <del>-scan-</del> ↔ <b>threads</b>	Newly added	Sets the number of threads for the task of incrementally scanning historical data. The default value is 4, which means there are four threads for the task.
TiKV configuration file	<b>incremental</b> ↔ <del>-scan-</del> ↔ <b>concurrency</b> ↔	Newly added	Sets the maximum number of concurrent executions for the tasks of incrementally scanning historical data. The default value is 6, which means that six tasks can be concurrently executed at most.

Configuration file	Configuration item	Change type	Description
TiKV configuration file	<del>soft-</del> ↔ <b>pending</b> ↔ <del>-</del> ↔ <b>compaction</b> ↔ <del>-bytes-</del> ↔ <b>limit</b>	Modified	The soft limit on the pending compaction bytes. The default value is changed from "64GB" to "192GB".
TiKV configuration file	<b>storage.io</b> ↔ <del>-rate-</del> ↔ <b>limit</b>	Newly added	Controls the I/O rate of TiKV writes. The default value of <b>storage.io</b> is "0MB". ↔ <b>io-rate</b> ↔ <del>-limit.</del> ↔ <del>max-</del> ↔ <del>bytes-</del> ↔ <del>per-sec</del>
TiKV configuration file	<del>resolved-</del> ↔ <b>ts.</b> ↔ <b>enable</b>	Newly added	Determines whether to maintain the <b>resolved-</b> ↔ <b>ts</b> for all Region leaders. The default value is <b>true</b> .
TiKV configuration file	<del>resolved-</del> ↔ <b>ts.</b> ↔ <b>advance</b> ↔ <del>-ts-</del> ↔ <b>interval</b> ↔	Newly added	The interval at which the <b>resolved-</b> ↔ <b>ts</b> is forwarded. The default value is "1s". You can change the value dynamically.

Configuration file	Configuration item	Change type	Description
TiKV configuration file	<del>resolved-</del> $\leftrightarrow$ <code>ts.scan</code> <del>-lock-</del> $\leftrightarrow$ <code>pool-</code> $\leftrightarrow$ <code>size</code>	Newly added	The number of threads that TiKV uses to scan the MVCC (multi-version concurrency control) lock data when initializing the <del>resolved-</del> $\leftrightarrow$ <code>ts</code> . The default value is 2.

### 16.15.6.1.3 Others

- Before the upgrade, check the value of the TiDB configuration `feedback-probability`  $\leftrightarrow$  `.`. If the value is not 0, the “panic in the recoverable goroutine” error will occur after the upgrade, but this error does not affect the upgrade.
- Upgrade the Go compiler version of TiDB from go1.13.7 to go1.16.4, which improves the TiDB performance. If you are a TiDB developer, upgrade your Go compiler version to ensure a smooth compilation.
- Avoid creating tables with clustered indexes in the cluster that uses TiDB Binlog during the TiDB rolling upgrade.
- Avoid executing statements like `alter table ... modify column` or `alter table  $\leftrightarrow$  ... change column` during the TiDB rolling upgrade.
- Since v5.1, setting the replica of system tables, when building TiFlash replicas for each table, is no longer supported. Before upgrading the cluster, you need to clear the relevant system table replicas; otherwise, the upgrade will fail.
- Deprecate the `--sort-dir` parameter in the `cdc cli changefeed` command of TiCDC. Instead, you can set `--sort-dir` in the `cdc server` command. [#1795](#)
- After upgrading to TiDB 5.1, if TiDB returns the “function READ ONLY has only noop implementation” error, you can let TiDB ignore this error by setting the value of `tidb_enable_noop_functions` to `ON`. This is because the `read_only` variable in MySQL does not yet take effect in TiDB (which is a ‘noop’ behavior in TiDB). Therefore, even if this variable is set in TiDB, you can still write data into the TiDB cluster.

### 16.15.6.2 New features

### 16.15.6.2.1 SQL

- Support the Common Table Expression (CTE) feature of MySQL 8.0.

This feature empowers TiDB with the capability of querying hierarchical data recursively or non-recursively and meets the needs of using tree queries to implement application logics in multiple sectors such as human resources, manufacturing, financial markets, and education.

In TiDB, you can apply the `WITH` statement to use Common Table Expressions. [User document, #17472](#)

- Support the dynamic privilege feature of MySQL 8.0.

Dynamic privileges are used to limit the `SUPER` privilege and provide TiDB with more flexible privilege configuration for more fine-grained access control. For example, you can use dynamic privileges to create a user account that can only perform `BACKUP` and `RESTORE` operations.

The supported dynamic privileges are as follows:

- `BACKUP_ADMIN`
- `RESTORE_ADMIN`
- `ROLE_ADMIN`
- `CONNECTION_ADMIN`
- `SYSTEM_VARIABLES_ADMIN`

You can also use plugins to add new privileges. To check out all supported privileges, execute the `SHOW PRIVILEGES` statement. [User document](#)

- Add a new configuration item for the Security Enhanced Mode (SEM), which divides the TiDB administrator privileges in a finer-grained way.

The Security Enhanced Mode is disabled by default. To enable it, see the [user document](#).

- Enhance the capability of changing column types online. Support changing the column type online using the `ALTER TABLE` statement, including but not limited to:

- Changing `VARCHAR` to `BIGINT`
- Modifying the `DECIMAL` precision
- Compressing the length of `VARCHAR(10)` to `VARCHAR(5)`

[User document](#)

- Introduce a new SQL syntax `AS OF TIMESTAMP` to perform Stale Read, a new experimental feature used to read historical data from a specified point in time or from a specified time range.

[User document, #21094](#)

The examples of `AS OF TIMESTAMP` are as follows:

```
SELECT * FROM t AS OF TIMESTAMP '2020-09-06 00:00:00';
START TRANSACTION READ ONLY AS OF TIMESTAMP '2020-09-06 00:00:00';
SET TRANSACTION READ ONLY as of timestamp '2020-09-06 00:00:00';
```

- Introduce a new statistics type `tidb_analyze_version = 2` (Experimental).  
`tidb_analyze_version` is set to 2 by default, which avoids the large errors that might occur in the large data volume caused by hash conflicts in Version 1 and maintains the estimation accuracy in most scenarios.

[User document](#)

#### 16.15.6.2.2 Transaction

- Support the Lock View feature (Experimental)

The Lock View feature provides more information about lock conflicts and lock waits of pessimistic locks, which helps DBAs to observe transaction locking conditions and troubleshoot deadlock problems. [#24199](#)

User document:

- View the pessimistic locks and other locks that currently occur on all TiKV nodes in the clusters: [DATA\\_LOCK\\_WAITS](#)
- View several deadlock errors that recently occurred on the TiDB nodes: [DEADLOCKS](#)
- View the transaction information executed currently on the TiDB nodes: [TIDB\\_TRX](#)

#### 16.15.6.2.3 Performance

- Stale read of data replicas (Experimental)

Read local replicas data directly to reduce read latency and improve the query performance

[User document](#), [#21094](#)

- Enable the Hibernate Region feature by default.

If a Region is in an inactive state for a long time, it is automatically set to a silent state, which reduces the system overhead of the heartbeat information between the Leader and the Follower.

[User document](#), [#10266](#)

#### 16.15.6.2.4 Stability

- Solve the replication stability issue of TiCDC
  - Improve TiCDC memory usage to avoid OOM in the following scenarios
  - If large amounts of data is accumulated during the replication interruption, exceeding 1TB, the re-replication causes OOM problems.
  - Large amounts of data writes cause OOM problems in TiCDC.
  - Reduce the possibility of TiCDC replication interruption in the following scenarios:
    - [project#11](#)
    - \* Replication interruption when the network is unstable
    - \* Replication interruption when some TiKV/PD/TiCDC nodes are down
- TiFlash storage memory control

Optimize the speed and memory usage of Region snapshot generation and reduce the possibility of OOM
- Add a write rate limiter for TiKV background tasks (TiKV Write Rate Limiter)

To ensure the duration stability of read and write requests, TiKV Write Rate Limiter smoothes the write traffic of TiKV background tasks such as GC and Compaction. The default value of TiKV background task write rate limiter is “0MB”. It is recommended to set this value to the optimal I/O bandwidth of the disk, such as the maximum I/O bandwidth specified by the cloud disk manufacturer.

[User document](#), [#9156](#)
- Solve scheduling stability issues when multiple scaling tasks are performed at the same time

#### 16.15.6.2.5 Telemetry

TiDB adds the running status of TiDB cluster requests in telemetry, including execution status and failure status.

To learn more about the information and how to disable this behavior, refer to [Telemetry](#).

#### 16.15.6.3 Improvements

- TiDB
  - Support the built-in function `VITNESS_HASH()` [#23915](#)
  - Support pushing down data of the enumerated type to TiKV to improve performance when using enumerated types in `WHERE` clauses [#23619](#)

- Support the `RENAME USER` syntax [#23648](#)
- Optimize the calculation of Window Function to solve TiDB OOM problems when paging data with `ROW_NUMBER()` [#23807](#)
- Optimize the calculation of `UNION ALL` to solve the TiDB OOM problems when using `UNION ALL` to join a large number of `SELECT` statements [#21441](#)
- Optimize the dynamic pruning mode of partitioned tables to improve performance and stability [#24150](#)
- Fix the `Region is Unavailable` issue that occurs in multiple scenarios [project#62](#)
- Fix multiple `Region is Unavailable` issues that might occur in frequent scheduling situations
- Fix `Region is Unavailable` issue that might occur in some high stress write situations
- Avoid frequently reading the `mysql.stats_histograms` table if the cached statistics is up-to-date to avoid high CPU usage [#24317](#)
- TiKV
  - Use `zstd` to compress Region snapshots, preventing large space differences between nodes in case of heavy scheduling or scaling [#10005](#)
  - Solve OOM issues in multiple cases [#10183](#)
    - \* Add memory usage tracking for each module
    - \* Solve the OOM issue caused by oversized Raft entries cache
    - \* Solve the OOM issue caused by stacked GC tasks
    - \* Solve the OOM issue caused by fetching too many Raft entries from the Raft log to memory at one time
  - Split Regions more evenly to mitigate the issue that the growth of Region size exceeds the splitting speed when there are hotspot writes [#9785](#)
- TiFlash
  - Support `Union All`, `TopN`, and `Limit` functions
  - Support the Cartesian product including left outer join and semi anti join in MPP mode
  - Optimize lock operations to avoid that running DDL statements and read operations are blocked by each other
  - Optimize cleanup of expired data by TiFlash
  - Support further filtering of query filters on `timestamp` columns at the TiFlash storage level
  - Improve the startup and scalability speed of TiFlash when a large number of tables are in a cluster
  - Improve TiFlash compatibility when running on unknown CPUs
- PD

- Avoid unexpected statistics after adding the `scatter region` scheduler [#3602](#)
- Solve multiple scheduling issues in the scaling process
  - \* Optimize the generation process of replica snapshots to solve slow scheduling issues during scaling [#3563](#) [#10059](#) [#10001](#)
  - \* Solve slow scheduling issues caused by heartbeat pressure due to traffic changes [#3693](#) [#3739](#) [#3728](#) [#3751](#)
  - \* Reduce the space discrepancies of large clusters due to scheduling, and optimize the scheduling formula to prevent the bursting issue (which is similar to heterogeneous space clusters) caused by large compression rate discrepancies [#3592](#) [#10005](#)
- Tools
  - Backup & Restore (BR)
    - \* Support backing up and restoring system tables in the `mysql` schema [#1143](#) [#1078](#)
    - \* Support the S3-compatible storage that is based on the virtual-host addressing mode [#10243](#)
    - \* Optimize the format of backupmeta to reduce memory usage [#1171](#)
  - TiCDC
    - \* Improve the descriptions of some log messages to be clearer and more useful for diagnosing problems [#1759](#)
    - \* Support the back pressure feature to allow the TiCDC scanning speed to sense the downstream processing capacity [#10151](#)
    - \* Reduce memory usage when TiCDC performs the initial scan [#10133](#)
    - \* Improve the cache hit rate for the TiCDC Old Value in pessimistic transactions [#10089](#)
  - Dumping
    - \* Improve the logic of exporting data from TiDB v4.0 to avoid TiDB becoming out of memory (OOM) [#273](#)
    - \* Fix the issue that no error is output when a backup operation fails [#280](#)
  - TiDB Lightning
    - \* Improve data importing speed. The optimization results show that the speed of importing TPC-C data is increased by 30%, and the speed of importing large tables (2TB+) with more indexes (5 indexes) is increased by more than 50%. [#753](#)
    - \* Add a pre-check on the data to be imported and also on the target cluster before importing, and report errors to reject the import process if it does not meet the import requirements [#999](#)
    - \* Optimize the timing of checkpoint updates on the Local backend to improve performance of restarting from breakpoints [#1080](#)

#### 16.15.6.4 Bug Fixes

- TiDB
  - Fix the issue that the execution result of project elimination might be wrong when the projection result is empty [#23887](#)
  - Fix the issue of wrong query results when a column contains NULL values in some cases [#23891](#)
  - Forbid generating MPP plans when the scan contains virtual columns [#23886](#)
  - Fix the wrong reuse of `PointGet` and `TableDual` in Plan Cache [#23187](#) [#23144](#) [#23304](#) [#23290](#)
  - Fix the error that occurs when the optimizer builds the `IndexMerge` plan for clustered indexes [#23906](#)
  - Fix the type inference of the BIT-type errors [#23832](#)
  - Fix the issue that some optimizer hints do not take effect when the `PointGet` operator exists [#23570](#)
  - Fix the issue that DDL operations might fail when rolling back due to an error [#23893](#)
  - Fix the issue that the index range of the binary literal constant is incorrectly built [#23672](#)
  - Fix the potential wrong results of the `IN` clause in some cases [#23889](#)
  - Fix the wrong results of some string functions [#23759](#)
  - Users now need both `INSERT` and `DELETE` privileges on a table to perform `REPLACE` operations [#23909](#)
  - Users now need both `INSERT` and `DELETE` privileges on a table to perform `REPLACE` operations [#24070](#)
  - Fix the wrong `TableDual` plans caused by incorrectly comparing binaries and bytes [#23846](#)
  - Fix the panic issue caused by using the prefix index and index join in some cases [#24547](#) [#24716](#) [#24717](#)
  - Fix the issue that the prepared plan cache of `point get` is incorrectly used by the `point get` statement in the transaction [#24741](#)
  - Fix the issue of writing the wrong prefix index value when the collation is `ascii_bin` or `latin1_bin` [#24569](#)
  - Fix the issue that the ongoing transaction might be interrupted by the GC worker [#24591](#)
  - Fix a bug that the point query might get wrong on the clustered index when `new-collation` is enabled but `new-row-format` is disabled [#24541](#)
  - Refactor the conversion of partition keys for shuffle hash join [#24490](#)
  - Fix the panic issue that occurs when building the plan for queries that contain the `HAVING` clause [#24045](#)
  - Fix the issue that the column pruning improvement causes the `Apply` and `Join` operators' results to go wrong [#23887](#)
  - Fix a bug that the primary lock fallen back from async commit cannot be resolved [#24384](#)

- Fix a GC issue of statistics that might cause duplicated fm-sketch records [#24357](#)
- Avoid unnecessary pessimistic rollback when the pessimistic locking receives the `ErrKeyExists` error [#23799](#)
- Fix the issue that numeric literals cannot be recognized when the `sql_mode` contains `ANSI_QUOTES` [#24429](#)
- Forbid statements such as `INSERT INTO table PARTITION (<partitions>)...  
↔ ON DUPLICATE KEY UPDATE` to read data from non-listed partitions [#24746](#)
- Fix the potential `index out of range` error when a SQL statement contains both `GROUP BY` and `UNION` [#24281](#)
- Fix the issue that the `CONCAT` function incorrectly handles the collation [#24296](#)
- Fix the issue that the `collation_server` global variable does not take effect in new sessions [#24156](#)
- TiKV
  - Fix the issue that the coprocessor fails to properly handle the signed or unsigned integer types in the `IN` expression [#9821](#)
  - Fix the issue of many empty Regions after batch ingesting SST files [#964](#)
  - Fix a bug that TiKV cannot start up after the file dictionary file is damaged [#9886](#)
  - Fix a TiCDC OOM issue caused by reading old values [#9996](#) [#9981](#)
  - Fix the issue of empty value in the secondary index for the clustered primary key column when collation is `latin1_bin` [#24548](#)
  - Add the `abort-on-panic` configuration, which allows TiKV to generate the core dump file when panic occurs. Users still need to correctly configure the environment to enable core dump [#10216](#)
  - Fix the performance regression issue of `point get` queries that occurs when TiKV is not busy [#10046](#)
- PD
  - Fix the issue that the PD Leader re-election is slow when there are many stores [#3697](#)
  - Fix the panic issue that occurs when removing the evict leader scheduler from a non-existent store [#3660](#)
  - Fix the issue that the statistics are not updated after offline peers are merged [#3611](#)
- TiFlash
  - Fix the issue of incorrect results when casting the time type to the integer type
  - Fix a bug that the `receiver` cannot find corresponding tasks within 10 seconds
  - Fix the issue that there might be invalid iterators in `cancelMPPQuery`
  - Fix a bug that the behavior of the `bitwise` operator is different from that of TiDB

- Fix the alert issue caused by overlapping ranges when using the `prefix key`
  - Fix the issue of incorrect results when casting the string type to the integer type
  - Fix the issue that consecutive and fast writes might make TiFlash out of memory
  - Fix the potential issue that the exception of null pointer might be raised during the table GC
  - Fix the TiFlash panic issue that occurs when writing data to dropped tables
  - Fix the issue that TiFlash might panic during BR restore
  - Fix the issue of incorrect results when cloning shared delta index concurrently
  - Fix the potential panic that occurs when the Compaction Filter feature is enabled
  - Fix the issue that TiFlash cannot resolve the lock fallen back from async commit
  - Fix the issue of incorrect results returned when the casted result of the `TIMEZONE` type contains the `TIMESTAMP` type
  - Fix the TiFlash panic issue that occurs during Segment Split
- Tools
    - TiDB Lightning
      - \* Fix the issue of TiDB Lightning panic that occurs when generating KV data [#1127](#)
      - \* Fix a bug that the batch split Region fails due to the total key size exceeding the raft entry limit during the data import [#969](#)
      - \* Fix the issue that when importing CSV files, if the last line of the file does not contain line break characters (`\r\n`), an error will be reported [#1133](#)
      - \* Fix the issue that if a table to be imported includes an auto-increment column of the double type, the `auto_increment` value becomes abnormal [#1178](#)
    - Backup & Restore (BR)
      - \* Fix the issue of backup interruption caused by the failure of a few TiKV nodes [#980](#)
    - TiCDC
      - \* Fix the concurrency issue in Unified Sorter and filter the unhelpful error messages [#1678](#)
      - \* Fix a bug that the creation of redundant directories might interrupt the replication with MinIO [#1463](#)
      - \* Set the default value of the `explicit_defaults_for_timestamp` session variable to ON to make the MySQL 5.7 downstream keep the same behavior with the upstream TiDB [#1585](#)
      - \* Fix the issue that the incorrect handling of `io.EOF` might cause replication interruption [#1633](#)
      - \* Correct the TiKV CDC endpoint CPU metric in the TiCDC dashboard [#1645](#)
      - \* Increase `defaultBufferChanSize` to avoid replication blocking in some cases [#1259](#)
      - \* Fix the issue that the time zone information is lost in the Avro output [#1712](#)
      - \* Support cleaning up stale temporary files in Unified Sorter and forbid sharing the `sort-dir` directory [#1742](#)

- \* Fix a deadlock bug in the KV client that occurs when many stale Regions exist [#1599](#)
- \* Fix the wrong help information in the `--cert-allowed-cn` flag [#1697](#)
- \* Revert the update for `explicit_defaults_for_timestamp` which requires the SUPER privilege when replicating data to MySQL [#1750](#)
- \* Support the sink flow control to reduce the risk of memory overflow [#1840](#)
- \* Fix a bug that the replication task might stop when moving a table [#1828](#)
- \* Fix the issue that the TiKV GC safe point is blocked due to the stagnation of TiCDC changefeed checkpoint [#1759](#)

## 16.16 v5.0

### 16.16.1 TiDB 5.0.6 Release Notes

Release date: December 31, 2021

TiDB version: 5.0.6

#### 16.16.1.1 Compatibility changes

- Tools
  - TiCDC
    - \* Change the output of the `cdc server` command error from stdout to stderr [#3133](#)
    - \* Set the default value of Kafka sink `max-message-bytes` to 10M [#3081](#)
    - \* Change the default value of Kafka Sink `partition-num` to 3 so that TiCDC distributes messages across Kafka partitions more evenly [#3337](#)

#### 16.16.1.2 Improvements

- TiDB
  - Show the affected SQL statements in the debug log when the coprocessor encounters a lock, which is helpful in diagnosing problems [#27718](#)
- TiKV
  - Increase the speed of inserting SST files by moving the verification process to the `Import` thread pool from the `Apply` thread pool [#11239](#)
  - Add more metrics for the garbage collection module of Raft logs to locate performance problems in the module [#11374](#)
  - Collapse some uncommon storage-related metrics in Grafana dashboard [#11681](#)

- PD
  - Speed up the exit process of schedulers [#4146](#)
  - Make the scheduling results of the `scatter-range-scheduler` scheduler more even by allowing the scheduler to schedule empty Regions and fix the configurations of the scheduler [#4497](#)
  - Support that the evict leader scheduler can schedule Regions with unhealthy peers [#4093](#)
- Tools
  - TiCDC
    - \* Optimize rate limiting control on TiKV reloads to reduce gPRC congestion during changefeed initialization [#3110](#)
    - \* Add a tick frequency limit to EtcdWorker to prevent frequent etcd writes from affecting PD services [#3112](#)
    - \* Add the default configuration for `config.Metadata.Timeout` in Kafka sink [#3352](#)
    - \* Set the default value of `max-message-bytes` to 10M, to reduce the probability that Kafka messages cannot be sent [#3081](#)
    - \* Add more Prometheus and Grafana monitoring metrics and alerts, including `no owner alert`, `mounter row`, `table sink total row`, and `buffer sink`  
↪ `total row` [#4054](#) [#1606](#)
  - Backup & Restore (BR)
    - \* Retry BR tasks when encountering the PD request error or the TiKV I/O timeout error [#27787](#)
    - \* Improve the robustness of restoring [#27421](#)
  - TiDB Lightning
    - \* Support importing data into tables that have expression index or the index that depends on virtual generated columns [#1404](#)

### 16.16.1.3 Bug fixes

- TiDB
  - Fix the issue that optimistic transaction conflicts might cause transactions to block each other [#11148](#)
  - Fix the issue of false positive error log `invalid cop task execution summaries`  
↪ `length` for MPP queries [#1791](#)
  - Fix the panic that might occur when DML and DDL statements are executed concurrently [#30940](#)
  - Fix the `privilege check fail` error when performing the `grant` and `revoke` operations to grant and revoke global level privileges [#29675](#)

- Fix the TiDB panic when executing the `ALTER TABLE... ADD INDEX` statement in some cases [#27687](#)
- Fix the issue that the `enforce-mpp` configuration does not take effect in v5.0.4 [#29252](#)
- Fix the panic when using the `CASE WHEN` function on the `ENUM` data type [#29357](#)
- Fix wrong results of the `microsecond` function in vectorized expressions [#29244](#)
- Fix the issue of incomplete log information from the `auto analyze` result [#29188](#)
- Fix wrong results of the `hour` function in vectorized expression [#28643](#)
- Fix the unexpected error like `tidb_cast to Int32 is not supported` when the unsupported `cast` is pushed down to TiFlash [#23907](#)
- Fix a bug that the availability detection of MPP node does not work in some corner cases [#3118](#)
- Fix the `DATA RACE` issue when assigning MPP task ID [#27952](#)
- Fix the `INDEX OUT OF RANGE` error for a MPP query after deleting an empty dual table [#28250](#)
- Fix the TiDB panic when inserting invalid date values concurrently [#25393](#)
- Fix the unexpected `can not found column in Schema column` error for queries in the MPP mode [#30980](#)
- Fix the issue that TiDB might panic when TiFlash is shutting down [#28096](#)
- Fix the unexpected `index out of range` error when the planner is doing join reorder [#24095](#)
- Fix wrong results of the control functions (such as `IF` and `CASE WHEN`) when using the `ENUM` type data as parameters of such functions [#23114](#)
- Fix the wrong result of `CONCAT(IFNULL(TIME(3)))` [#29498](#)
- Fix wrong results of `GREATEST` and `LEAST` when passing in unsigned `BIGINT` arguments [#30101](#)
- Fix the issue that a SQL operation is canceled when its `JSON` type column joins its `CHAR` type column [#29401](#)
- Fix the data inconsistency issue caused by incorrect usage of lazy existence check and untouched key optimization [#30410](#)
- Fix the issue that window functions might return different results when using a transaction or not [#29947](#)
- Fix the issue that the SQL statements that contain `cast(integer as char)`  $\leftrightarrow$  `union string` return wrong results [#29513](#)
- Fix the issue that the length information is wrong when casting `Decimal` to `String` [#29417](#)
- Fix the issue that the `Column 'col_name' in field list is ambiguous` error is reported unexpectedly when a SQL statement contains natural join [#25041](#)
- Fix the issue that the `GREATEST` function returns inconsistent results due to different values of `tidb_enable_vectorized_expression` (set to `on` or `off`) [#29434](#)
- Fix the issue that the planner might cache invalid plans for join in some cases [#28087](#)
- Fix the issue that the `index out of range [1] with length 1` error is reported when a SQL statement evaluates an aggregation result on the result of join in some cases [#1978](#)

- TiKV
  - Fix the issue that a down TiKV node causes the resolved timestamp to lag [#11351](#)
  - Fix the issue that batch messages are too large in Raft client implementation [#9714](#)
  - Fix a panic issue that occurs when Region merge, ConfChange, and Snapshot happen at the same time in extreme conditions [#11475](#)
  - Fix the issue that TiKV cannot detect the memory lock when TiKV perform a reverse table scan [#11440](#)
  - Fix the issue of negative sign when the decimal divide result is zero [#29586](#)
  - Fix the issue that the accumulation of GC tasks might cause TiKV to be OOM (out of memory) [#11410](#)
  - Fix the issue that the average latency of the by-instance gRPC requests is inaccurate in TiKV metrics [#11299](#)
  - Fix a memory leak caused by monitoring data of statistics threads [#11195](#)
  - Fix the issue of TiCDC panic that occurs when the downstream database is missing [#11123](#)
  - Fix the issue that TiCDC adds scan retries frequently due to the Congest error [#11082](#)
  - Fix the issue that the Raft connection is broken when the channel is full [#11047](#)
  - Fix the issue of TiKV panic that occurs when the files do not exist when TiDB Lightning imports data [#10438](#)
  - Fix the issue that TiDB cannot correctly identify whether the `Int64` types in `Max/Min` functions are a signed integer or not, which causes the wrong calculation result of `Max/Min` [#10158](#)
  - Fix the issue that the node of a TiKV replica is down after the node gets snapshots because TiKV cannot modify the metadata accurately [#10225](#)
  - Fix the leak issue of the backup thread pool [#10287](#)
  - Fix the issue of casting illegal strings into floating-point numbers [#23322](#)
- PD
  - Fix a panic issue that occurs after the TiKV node is removed [#4344](#)
  - Fix the issue that operator can get blocked due to down store [#3353](#)
  - Fix slow leader election caused by stucked Region syncer [#3936](#)
  - Fix the issue that the speed of removing peers is limited when repairing the down nodes [#4090](#)
  - Fix the issue that the hotspot cache cannot be cleared when the Region heartbeat is less than 60 seconds [#4390](#)
- TiFlash
  - Fix potential data inconsistency after altering a primary key column to a larger int data type
  - Fix the issue that TiFlash fails to start up on some platforms, such as ARM, due to the absence of the `libnsl.so` library

- Fix the issue that the `Store size` metric does not match the actual data size on a disk
  - Fix the issue that TiFlash crashes due to a `Cannot open file` error
  - Fix occasional crashes of TiFlash when an MPP query is killed
  - Fix the unexpected error `3rd arguments of function substringUTF8 must ↪ be constants`
  - Fix query failures caused by excessive OR conditions
  - Fix the bug that results of `where <string>` are wrong
  - Fix inconsistent behaviors of `CastStringAsDecimal` between TiFlash and TiDB/TiKV
  - Fix query failures caused by the error `different types: expected Nullable( ↪ Int64), got Int64`
  - Fix query failures caused by the error `Unexpected type of column: Nullable ↪ (Nothing)`
  - Fix query failures caused by overflow when comparing data in the DECIMAL data type
- Tools
    - TiCDC
      - \* Fix the issue that some partitioned tables without valid indexes might be ignored when `force-replicate` is enabled [#2834](#)
      - \* Fix the issue that `cdc cli` silently truncates user parameters when receiving unexpected parameters, causing the user input parameters to be lost [#2303](#)
      - \* Fix the issue that TiCDC sync task might pause when an error occurs during writing a Kafka message [#2978](#)
      - \* Fix a possible panic issue when encoding some types of columns into Open Protocol format [#2758](#)
      - \* Fix the issue that Kafka may send excessively large messages by setting the default value of `max-message-bytes` to 10M [#3081](#)
      - \* Fix the issue that TiCDC replication task might terminate when the upstream TiDB instance unexpectedly exits [#3061](#)
      - \* Fix the issue that TiCDC process might panic when TiKV sends duplicate requests to the same Region [#2386](#)
      - \* Fix the TiCDC replication interruption issue when multiple TiKVs crash or during a forced restart [#3288](#)
      - \* Fix the negative value error in the changefeed checkpoint lag [#3010](#)
      - \* Fix the issue of overly frequent warnings caused by MySQL sink deadlock [#2706](#)
      - \* Fix the issue that Avro sink does not support parsing JSON type columns [#3624](#)
      - \* Fix the bug that TiCDC reads the incorrect schema snapshot from TiKV when the TiKV owner restarts [#2603](#)
      - \* Fix the memory leak issue after processing DDLs [#3174](#)

- \* Fix the bug that the `enable-old-value` configuration item is not automatically set to `true` on Canal and Maxwell protocols [#3676](#)
- \* Fix the timezone error that occurs when the `cdc server` command runs on some Red Hat Enterprise Linux releases (such as 6.8 and 6.9) [#3584](#)
- \* Fix the issue of the inaccurate `txn_batch_size` monitoring metric for Kafka sink [#3431](#)
- \* Fix the issue that `tikv_cdc_min_resolved_ts_no_change_for_1m` keeps alerting when there is no changefeed [#11017](#)
- \* Fix the TiCDC panic issue that occurs when manually cleaning the task status in etcd [#2980](#)
- \* Fix the issue that changefeed does not fail fast enough when the `ErrGCT-TLExceeded` error occurs [#3111](#)
- \* Fix the issue that scanning stock data might fail due to TiKV performing GC when scanning stock data takes too long [#2470](#)
- \* Fix OOM in container environments [#1798](#)
- Backup & Restore (BR)
  - \* Fix a bug that the average speed is inaccurately calculated for backup and restore [#1405](#)
- Dumpling
  - \* Fix the bug that Dumpling becomes very slow when dumping tables with the composite primary key or unique key [#29386](#)

## 16.16.2 TiDB 5.0.5 Release Note

Release date: December 3, 2021

TiDB version: 5.0.5

### 16.16.2.1 Bug fix

- TiKV
  - Fix the issue that the `GcKeys` task does not work when it is called by multiple keys. Caused by this issue, compaction filter GC might not drop the MVCC deletion information. [#11217](#)

## 16.16.3 TiDB 5.0.4 Release Notes

Release Date: September 27, 2021

TiDB version: 5.0.4

### 16.16.3.1 Compatibility changes

- TiDB
  - Fix the issue that executing `SHOW VARIABLES` in a new session is slow. This fix reverts some changes made in [#19341](#) and might cause compatibility issues. [#24326](#)
  - Change the default value of the `tidb_stmt_summary_max_stmt_count` variable from 200 to 3000 [#25873](#)
  - The following bug fixes change execution results, which might cause upgrade incompatibilities:
    - \* Fix the issue that TiDB returns wrong result when the children of `UNION` contain the `NULL` value [#26559](#)
    - \* Fix the issue that `greatest(datetime)union null` returns empty string [#26532](#)
    - \* Fix the issue that the behavior of the `last_day` function is incompatible in SQL mode [#26000](#)
    - \* Fix the issue that the `having` clause might not work correctly [#26496](#)
    - \* Fix the wrong execution results that occur when the collations around the `between` expression are different [#27146](#)
    - \* Fix the wrong execution results that occur when the column in the `group_concat` function has a non-bin collation [#27429](#)
    - \* Fix an issue that using a `count(distinct)` expression on multiple columns returns wrong result when the new collation is enabled [#27091](#)
    - \* Fix the result wrong that occurs when the argument of the `extract` function is a negative duration [#27236](#)
    - \* Fix the issue that inserting an invalid date does not report an error when the `SQL_MODE` is `'STRICT_TRANS_TABLES'` [#26762](#)
    - \* Fix the issue that using an invalid default date does not report an error when the `SQL_MODE` is `'NO_ZERO_IN_DATE'` [#26766](#)
    - \* Fix a bug on the query range of prefix index [#26029](#)
    - \* Fix the issue that the `LOAD DATA` statement might abnormally import non-utf8 data [#25979](#)
    - \* Fix the issue that `insert ignore on duplicate update` might insert wrong data when the secondary index has the same column with the primary key [#25809](#)
    - \* Fix the issue that `insert ignore duplicate update` might insert wrong data when a partitioned table has a clustered index [#25846](#)
    - \* Fix the issue that the query result might be wrong when the key is the `ENUM` type in point get or batch point get [#24562](#)
    - \* Fix the wrong result that occurs when dividing a `BIT`-type value [#23479](#)
    - \* Fix the issue that the results of `prepared` statements and direct queries might be inconsistent [#22949](#)
    - \* Fix the issue that the query result might be wrong when a `YEAR` type is compared with a string or an integer type [#23262](#)

### 16.16.3.2 Feature enhancements

- TiDB
  - Support setting `tidb_enforce_mpp=1` to ignore the optimizer estimation and forcibly use the MPP mode [#26382](#)
- TiKV
  - Support changing TiCDC configurations dynamically [#10645](#)
- PD
  - Add OIDC-based SSO support for TiDB Dashboard [#3884](#)
- TiFlash
  - Support the `HAVING()` function in DAG requests
  - Support the `DATE()` function
  - Add Grafana panels for write throughput per instance

### 16.16.3.3 Improvements

- TiDB
  - Trigger auto-analyze based on the histogram row count [#24237](#)
  - Stop sending requests to a TiFlash node for a period if the node has failed and restarted before [#26757](#)
  - Increase the `split region` upper limit to make `split table` and `presplit` more stable [#26657](#)
  - Support retry for MPP queries [#26483](#)
  - Check the availability of TiFlash before launching MPP queries [#1807](#)
  - Support the stable result mode to make the query result more stable [#26084](#)
  - Support the MySQL system variable `init_connect` and its associated features [#18894](#)
  - Thoroughly push down the `COUNT(DISTINCT)` aggregation function in the MPP mode [#25861](#)
  - Print log warnings when the aggregation function cannot be pushed down in `EXPLAIN` statements [#25736](#)
  - Add error labels for `TiFlashQueryTotalCounter` in Grafana dashboard [#25327](#)
  - Support getting the MVCC data of a clustered index table through a secondary index by HTTP API [#24209](#)
  - Optimize the memory allocation of `prepared` statement in parser [#24371](#)
- TiKV

- Handle read ready and write ready separately to reduce read latency [#10475](#)
- Reduce the size of Resolved TS messages to save network bandwidth [#2448](#)
- Drop log instead of blocking threads when the slogger thread is overloaded and the queue is filled up [#10841](#)
- Make the slow log of TiKV coprocessor only consider the time spent on processing requests [#10841](#)
- Make prewrite as idempotent as possible to reduce the chance of undetermined errors [#10587](#)
- Avoid the false “GC can not work” alert under low write flow [#10662](#)
- Make the database to be restored always match the original cluster size during backup. [#10643](#)
- Ensure that the panic output is flushed to the log [#9955](#)
- PD
  - Improve the performance of synchronizing Region information between PDs [#3993](#)
- Tools
  - Dumpling
    - \* Support backing up MySQL-compatible databases that do not support the `START TRANSACTION ... WITH CONSISTENT SNAPSHOT` or the `SHOW CREATE`  $\leftrightarrow$  `TABLE` syntax [#309](#)
  - TiCDC
    - \* Optimize memory management when Unified Sorter is using memory to sort [#2553](#)
    - \* Prohibit operating TiCDC clusters across major or minor versions [#2598](#)
    - \* Reduce the goroutine usage when a table’s Regions are all transferred away from a TiKV node [#2284](#)
    - \* Remove `file sorter` [#2326](#)
    - \* Always pull the old values from TiKV and the output is adjusted according to `enable-old-value` [#2301](#)
    - \* Improve the error message returned when a PD endpoint misses the certificate [#1973](#)
    - \* Optimize workerpool for fewer goroutines when concurrency is high [#2211](#)
    - \* Add a global gRPC connection pool and share gRPC connections among KV clients [#2533](#)

#### 16.16.3.4 Bug Fixes

- TiDB

- Fix the issue that TiDB might panic when querying a partitioned table and the partition key has the IS NULL condition [#23802](#)
  - Fix the issue that the overflow check of the FLOAT64 type is different with that of MySQL [#23897](#)
  - Fix the wrong character set and collation for the case when expression [#26662](#)
  - Fix the issue that committing pessimistic transactions might cause write conflicts [#25964](#)
  - Fix a bug that the index keys in a pessimistic transaction might be repeatedly committed [#26359](#) [#10600](#)
  - Fix the issue that TiDB might panic when resolving the async commit locks [#25778](#)
  - Fix a bug that a column might not be found when using INDEX MERGE [#25045](#)
  - Fix a bug that ALTER USER REQUIRE SSL clears users' authentication\_string [#25225](#)
  - Fix a bug that the value of the tidb\_gc\_scan\_lock\_mode global variable on a new cluster shows “PHYSICAL” instead of the actual default mode “LEGACY” [#25100](#)
  - Fix the bug that the TIKV\_REGION\_PEERS system table does not show the correct DOWN status [#24879](#)
  - Fix the issue of memory leaks that occurs when HTTP API is used [#24649](#)
  - Fix the issue that views do not support DEFINER [#24414](#)
  - Fix the issue that tidb-server --help exits with the code 2 [#24046](#)
  - Fix the issue that setting the global variable dml\_batch\_size does not take effect [#24709](#)
  - Fix the issue that using read\_from\_storage and partitioned table at the same time causes an error [#20372](#)
  - Fix the issue that TiDB panics when executing the projection operator [#24264](#)
  - Fix the issue that statistics might cause queries to panic [#24061](#)
  - Fix the issue that using the approx\_percentile function on a BIT column might panic [#23662](#)
  - Fix the issue that the metrics on the **Coprocessor Cache** panel in Grafana are wrong [#26338](#)
  - Fix the issue that concurrently truncating the same partition causes DDL statements to stuck [#26229](#)
  - Fix the issue of wrong query results that occurs when the session variable is used as the GROUP BY item [#27106](#)
  - Fix the wrong implicit conversion between VARCHAR and timestamp when joining tables [#25902](#)
  - Fix the wrong results in associated subquery statements [#27233](#)
- TiKV
    - Fix the potential disk full issue caused by corrupted snapshot files [#10813](#)
    - Fix the TiKV panic issue that occurs when upgrading from a pre-5.0 version with Titan enabled [#10843](#)

- Fix the issue that TiKV of a newer version cannot be rolled back to v5.0.x [#10843](#)
  - Fix the TiKV panic issue that occurs when upgrading from a pre-5.0 version to a 5.0 version or later. If a cluster was upgraded from TiKV v3.x with Titan enabled before the upgrade, this cluster might encounter the issue. [#10774](#)
  - Fix the parsing failure caused by the left pessimistic locks [#26404](#)
  - Fix the panic that occurs when calculating duration on certain platforms [#10571](#)
  - Fix the issue that the keys of `batch_get_command` in Load Base Split are unencoded [#10542](#)
- PD
    - Fix the issue that PD does not fix the down peers in time [#4077](#)
    - Fix the issue that the replica count of the default placement rules stays constant after `replication.max-replicas` is updated [#3886](#)
    - Fix a bug that PD might panic when scaling out TiKV [#3868](#)
    - Fix the scheduling conflict issue that occurs when multiple schedulers are running at same time [#3807](#)
    - Fix the issue that the scheduler might appear again even if it has been deleted [#2572](#)
- TiFlash
    - Fix the potential panic issue that occurs when running table scan tasks
    - Fix the potential memory leak issue that occurs when executing MPP tasks
    - Fix a bug that TiFlash raises the `duplicated region` error when handling DAQ requests
    - Fix the issue of unexpected results when executing the aggregation functions `COUNT` or `COUNT DISTINCT`
    - Fix the potential panic issue that occurs when executing MPP tasks
    - Fix a potential bug that TiFlash cannot restore data when deployed on multiple disks
    - Fix the potential panic issue that occurs when deconstructing `SharedQueryBlockInputStream`  
↔
    - Fix the potential panic issue that occurs when deconstructing `MPPTask`
    - Fix the issue of unexpected results when TiFlash fails to establish MPP connections
    - Fix the potential panic issue that occurs when resolving locks
    - Fix the issue that the store size in metrics is inaccurate under heavy writing
    - Fix a bug of incorrect results that occurs when queries contain filters like `CONSTANT`  
↔, `<`, `<=`, `>`, `>=`, or `COLUMN`
    - Fix the potential issue that TiFlash cannot garbage-collect the delta data after running for a long time
    - Fix a potential bug that metrics display wrong values
    - Fix the potential issue of data inconsistency that occurs when TiFlash is deployed on multiple disks

- Tools
  - Dumping
    - \* Fix the issue that the execution of `show table status` is stuck in MySQL 8.0.3 or a later version [#322](#)
  - TiCDC
    - \* Fix the issue of process panic that occurs when encoding the data types such as `mysql.TypeString`, `mysql.TypeVarChar`, `mysql.TypeVarchar` into JSON [#2758](#)
    - \* Fix a data inconsistency issue that occurs because multiple processors might write data to the same table when this table is being re-scheduled [#2417](#)
    - \* Decrease the gRPC window size to avoid the OOM that occurs when TiCDC captures too many Regions [#2724](#)
    - \* Fix the error that the gRPC connection is frequently broken when the memory pressure is high [#2202](#)
    - \* Fix a bug that causes TiCDC to panic on the unsigned `TINYINT` type [#2648](#)
    - \* Fix the issue that TiCDC Open Protocol outputs an empty value when inserting a transaction and deleting data of the same row in the upstream [#2612](#)
    - \* Fix a bug that DDL handling fails when a changefeed starts at the finish TS of a schema change [#2603](#)
    - \* Fix the issue that irresponsive downstreams interrupt the replication task in old owner until the task times out [#2295](#)
    - \* Fix a bug in metadata management [#2558](#)
    - \* Fix the issue of data inconsistency that occurs after the TiCDC owner switch [#2230](#)
    - \* Fix the issue that outdated capture might appear in the output of the `capture ↔ list` command [#2388](#)
    - \* Fix the `ErrSchemaStorageTableMiss` error that occurs when the DDL Job duplication is encountered in the integrated test [#2422](#)
    - \* Fix the bug that a changefeed cannot be removed if the `ErrGCTTLExceeded` error occurs [#2391](#)
    - \* Fix a bug that replicating large tables to cdclog fails [#1259](#) [#2424](#)
    - \* Fix the CLI backward compatibility issue [#2373](#)
    - \* Fix the issue of insecure concurrent access to the map in `SinkManager` [#2299](#)
    - \* Fix the issue of potential DDL loss when the owner crashes when executing DDL statements [#1260](#)
    - \* Fix the issue that the lock is resolved immediately after a Region is initialized [#2188](#)
    - \* Fix the issue of extra partition dispatching that occurs when adding a new partitioned table [#2263](#)
    - \* Fix the issue that TiCDC keeps warning on removed changefeeds [#2156](#)

## 16.16.4 TiDB 5.0.3 Release Notes

Release date: July 2, 2021

TiDB version: 5.0.3

### 16.16.4.1 Compatibility Changes

- TiDB
  - After a v4.0 cluster is upgraded to v5.0 or a later version (dev or v5.1), the default value of the `tidb_multi_statement_mode` variable changes from `WARN` to `OFF`
  - TiDB is now compatible with MySQL 5.7's noop variable `innodb_default_row_format`  $\leftrightarrow$  `.`. Setting this variable will have no effect. [#23541](#)

### 16.16.4.2 Feature Enhancements

- Tools
  - TiCDC
    - \* Add an HTTP API to get the changefeed information and the health information of the node [#1955](#)
    - \* Add the SASL/SCRAM support for the kafka sink [#1942](#)
    - \* Make TiCDC support `--data-dir` at the server level [#2070](#)

### 16.16.4.3 Improvements

- TiDB
  - Support pushing down the `TopN` operator to TiFlash [#25162](#)
  - Support pushing down the built-in function `json_unquote()` to TiKV [#24415](#)
  - Support removing the union branch from the dual table [#25614](#)
  - Support pushing down the built-in function `replace()` to TiFlash [#25565](#)
  - Support pushing down the built-in functions `unix_timestamp()`, `concat()`, `year`  $\leftrightarrow$  `()`, `day()`, `datediff()`, `datesub()`, and `concat_ws()` to TiFlash [#25564](#)
  - Optimize the aggregate operator's cost factor [#25241](#)
  - Support pushing down the `Limit` operator to TiFlash [#25159](#)
  - Support pushing down the built-in function `str_to_date` to TiFlash [#25148](#)
  - Allow the MPP outer join to choose the build table based on the table row count [#25142](#)
  - Support pushing down the built-in functions `left()`, `right()`, and `abs()` to TiFlash [#25133](#)
  - Support pushing down the Broadcast Cartesian join to TiFlash [#25106](#)
  - Support pushing down the `Union All` operator to TiFlash [#25051](#)

- Support balancing the MPP query workload among different TiFlash nodes based on Regions [#24724](#)
- Support invalidating stale Regions in the cache after the MPP query is executed [#24432](#)
- Improve the MySQL compatibility of the built-in function `str_to_date` for the format specifiers `%b/%M/%r/%T` [#25767](#)
- TiKV
  - Limit the TiCDC sink’s memory consumption [#10305](#)
  - Add the memory-bounded upper limit for the TiCDC old value cache [#10313](#)
- PD
  - Update TiDB Dashboard to v2021.06.15.1 [#3798](#)
- TiFlash
  - Support casting the `STRING` type to the `DOUBLE` type
  - Support the `STR_TO_DATE()` function
  - Optimize the non-joined data in right outer join using multiple threads
  - Support the Cartesian join
  - Support the `LEFT()` and `RIGHT()` functions
  - Support automatically invalidating stale Regions in MPP queries
  - Support the `ABS()` function
- Tools
  - TiCDC
    - \* Refine gRPC’s reconnection logic and increase the KV client’s throughput [#1586](#) [#1501](#) [#1682](#) [#1393](#) [#1847](#) [#1905](#) [#1904](#)
    - \* Make the sorter I/O errors more user-friendly

#### 16.16.4.4 Bug Fixes

- TiDB
  - Fix the issue that an incorrect result is returned when using merge join on the `SET` type column [#25669](#)
  - Fix the data corruption issue in the `IN` expression’s arguments [#25591](#)
  - Avoid the sessions of GC being affected by global variables [#24976](#)
  - Fix the panic issue that occurs when using `limit` in the window function queries [#25344](#)
  - Fix the wrong value returned when querying a partitioned table using `Limit` [#24636](#)

- Fix the issue that IFNULL does not correctly take effect on the ENUM or SET type column [#24944](#)
  - Fix the wrong results caused by changing the count in the join subqueries to first\_row [#24865](#)
  - Fix the query hang issue that occurs when ParallelApply is used under the TopN operator [#24930](#)
  - Fix the issue that more results than expected are returned when executing SQL statements using multi-column prefix indexes [#24356](#)
  - Fix the issue that the <=> operator cannot correctly take effect [#24477](#)
  - Fix the data race issue of the parallel Apply operator [#23280](#)
  - Fix the issue that the index out of range error is reported when sorting the IndexMerge results of the PartitionUnion operator [#23919](#)
  - Fix the issue that setting the tidb\_snapshot variable to an unexpectedly large value might damage the transaction isolation [#25680](#)
  - Fix the issue that the ODBC-styled constant (for example, {d '2020-01-01'}) cannot be used as the expression [#25531](#)
  - Fix the issue that SELECT DISTINCT converted to Batch Get causes incorrect results [#25320](#)
  - Fix the issue that backing off queries from TiFlash to TiKV cannot be triggered [#23665](#) [#24421](#)
  - Fix the index-out-of-range error that occurs when checking only\_full\_group\_by  $\leftrightarrow$  [#23839](#))
  - Fix the issue that the result of index join in correlated subqueries is wrong [#25799](#)
- TiKV
    - Fix the wrong tikv\_raftstore\_hibernated\_peer\_state metric [#10330](#)
    - Fix the wrong arguments type of the json\_unquote() function in the coprocessor [#10176](#)
    - Skip clearing callback during graceful shutdown to avoid breaking ACID in some cases [#10353](#) [#10307](#)
    - Fix a bug that the read index is shared for replica reads on a Leader [#10347](#)
    - Fix the wrong function that casts DOUBLE to DOUBLE [#25200](#)
  - PD
    - Fix the data race issue that occurs when loading TTL configurations after the scheduler is started [#3771](#)
    - Fix a bug that the is\_learner field of the TIKV\_REGION\_PEERS table in TiDB is incorrect [#3372](#) [#24293](#)
    - Fix the issue that when all TiKV nodes in a zone are offline or down, PD does not schedule replicas to other zones [#3705](#)
    - Fix the issue that PD might get panic after the scatter Region scheduler is added [#3762](#)
  - TiFlash

- Fix the issue that TiFlash keeps restarting because of the split failure
- Fix the potential issue that TiFlash cannot delete the delta data
- Fix a bug that TiFlash adds wrong padding for non-binary characters in the `CAST` function
- Fix the issue of incorrect results when handling aggregation queries with complex `GROUP BY` columns
- Fix the TiFlash panic issue that occurs under heavy write pressure
- Fix the panic that occurs when the right join key is not nullable and the left join key is nullable
- Fix the potential issue that the `read-index` requests take a long time
- Fix the panic issue that occurs when the read load is heavy
- Fix the panic issue that might occur when the `Date_Format` function is called with the `STRING` type argument and `NULL` values
- Tools
  - TiCDC
    - \* Fix the issue that TiCDC owner exits when refreshing the checkpoint [#1902](#)
    - \* Fix a bug that some MySQL connection might leak after MySQL sink meets the error and pauses [#1946](#)
    - \* Fix the panic issue that occurs when TiCDC fails to read `/proc/meminfo` [#2024](#)
    - \* Reduce TiCDC's runtime memory consumption [#2012](#) [#1958](#)
    - \* Fix a bug that might cause TiCDC server panic due to the late calculation of resolved ts [#1576](#)
    - \* Fix the potential deadlock issue for the processor [#2142](#)
  - Backup & Restore (BR)
    - \* Fix a bug that all system tables are filtered during restore [#1197](#) [#1201](#)
    - \* Fix the issue that Backup & Restore reports the error of “file already exists” when TDE is enabled during the restore [#1179](#)
  - TiDB Lightning
    - \* Fix the TiDB Lightning panic issue for some special data [#1213](#)
    - \* Fix the EOF error reported when TiDB Lightning splits the imported large CSV files [#1133](#)
    - \* Fix a bug that an excessively large base value is generated when TiDB Lightning imports tables with the `auto_increment` column of the `FLOAT` or `DOUBLE` type [#1186](#)
    - \* Fix the issue that TiDB fails to parse the `DECIMAL` type data in Parquet files [#1277](#)

### 16.16.5 TiDB 5.0.2 Release Notes

Release date: June 10, 2021

TiDB version: 5.0.2

### 16.16.5.1 Compatibility Changes

- Tools
  - TiCDC
    - \* Deprecate `--sort-dir` in the `cdc cli changefeed` command. Instead, users can set `--sort-dir` in the `cdc server` command. [#1795](#)

### 16.16.5.2 New Features

- TiKV
  - Enable the Hibernate Region feature by default [#10266](#)

### 16.16.5.3 Improvements

- TiDB
  - Avoid frequently reading the `mysql.stats_histograms` table if the cached statistics is up-to-date to avoid high CPU usage [#24317](#)
- TiKV
  - BR now supports the S3-compatible storage using the virtual-host addressing mode [#10243](#)
  - Support the back pressure for TiCDC's scan speed [#10151](#)
  - Reduce the memory usage of TiCDC's initial scan [#10133](#)
  - Improve the cache hit ratio of the TiCDC's Old Value feature in the pessimistic transaction [#10089](#)
  - Split Regions more evenly to mitigate the issue that the growth of Region size exceeds the splitting speed when there are hotspot writes [#9785](#)
- TiFlash
  - Optimize the table lock to prevent DDL jobs and data reads from blocking each other
  - Support casting the `INTEGER` or `REAL` type to `REAL` type
- Tools
  - TiCDC
    - \* Add monitoring metrics for the table memory consumption [#1885](#)
    - \* Optimize the memory and CPU usages during the sorting stage [#1863](#)
    - \* Delete some useless log information that might cause user confusion [#1759](#)

- Backup & Restore (BR)
  - \* Clarify some ambiguous error messages [#1132](#)
  - \* Support checking the cluster version of a backup [#1091](#)
  - \* Support backing up and restoring system tables in the `mysql` schema [#1143](#) [#1078](#)
- Dumping
  - \* Fix the issue that no error is output when a backup operation fails [#280](#)

#### 16.16.5.4 Bug Fixes

- TiDB
  - Fix the panic issue caused by using the prefix index and index join in some cases [#24547](#) [#24716](#) [#24717](#)
  - Fix the issue that the prepared plan cache of `point get` is incorrectly used by the `point get` statement in the transaction [#24741](#)
  - Fix the issue of writing the wrong prefix index value when the collation is `ascii_bin` or `latin1_bin` [#24569](#)
  - Fix the issue that the ongoing transaction might be interrupted by the GC worker [#24591](#)
  - Fix a bug that the point query might get wrong on the clustered index when `new-collation` is enabled but `new-row-format` is disabled [#24541](#)
  - Refactor the conversion of partition keys for shuffle hash join [#24490](#)
  - Fix the panic issue that occurs when building the plan for queries that contain the `HAVING` clause [#24045](#)
  - Fix the issue that the column pruning improvement causes the `Apply` and `Join` operators' results to go wrong [#23887](#)
  - Fix a bug that the primary lock fallen back from async commit cannot be resolved [#24384](#)
  - Fix a GC issue of statistics that might cause duplicated fm-sketch records [#24357](#)
  - Avoid unnecessary pessimistic rollback when the pessimistic locking receives the `ErrKeyExists` error [#23799](#)
  - Fix the issue that numeric literals cannot be recognized when the `sql_mode` contains `ANSI_QUOTES` [#24429](#)
  - Forbid statements such as `INSERT INTO table PARTITION (<partitions>)...  
↪ ON DUPLICATE KEY UPDATE` to read data from non-listed partitions [#24746](#)
  - Fix the potential `index out of range` error when a SQL statement contains both `GROUP BY` and `UNION` [#24281](#)
  - Fix the issue that the `CONCAT` function incorrectly handles the collation [#24296](#)
  - Fix the issue that the `collation_server` global variable does not take effect in new sessions [#24156](#)
- TiKV

- Fix a TiCDC OOM issue caused by reading old values [#9996](#) [#9981](#)
- Fix the issue of empty value in the secondary index for the clustered primary key column when collation is `latin1_bin` [#24548](#)
- Add the `abort-on-panic` configuration, which allows TiKV to generate the core dump file when panic occurs. Users still need to correctly configure the environment to enable core dump [#10216](#)
- Fix the performance regression issue of `point get` queries that occurs when TiKV is not busy [#10046](#)
- PD
  - Fix the issue that the PD Leader re-election is slow when there are many stores [#3697](#)
  - Fix the panic issue that occurs when removing the evict leader scheduler from a non-existent store [#3660](#)
  - Fix the issue that the statistics are not updated after offline peers are merged [#3611](#)
- TiFlash
  - Fix the issue of incorrect results when cloning shared delta index concurrently
  - Fix the potential issue that TiFlash fails to restart with incomplete data
  - Fix the issue that old dm files are not removed automatically
  - Fix the potential panic that occurs when the Compaction Filter feature is enabled
  - Fix the potential issue that `ExchangeSender` sends duplicated data
  - Fix the issue that TiFlash cannot resolve the lock fallen back from async commit
  - Fix the issue of incorrect results returned when the casted result of the `TIMEZONE` type contains the `TIMESTAMP` type
  - Fix the TiFlash panic issue that occurs during Segment Split
  - Fix the issue that the execution information about the non-root MPP task is not accurate
- Tools
  - TiCDC
    - \* Fix the issue that the time zone information is lost in the Avro output [#1712](#)
    - \* Support cleaning up stale temporary files in Unified Sorter and forbid sharing the `sort-dir` directory [#1742](#)
    - \* Fix a deadlock bug in the KV client that occurs when many stale Regions exist [#1599](#)
    - \* Fix the wrong help information in the `--cert-allowed-cn` flag [#1697](#)
    - \* Revert the update for `explicit_defaults_for_timestamp` which requires the `SUPER` privilege when replicating data to MySQL [#1750](#)
    - \* Support the sink flow control to reduce the risk of memory overflow [#1840](#)
    - \* Fix a bug that the replication task might stop when moving a table [#1828](#)

- \* Fix the issue that the TiKV GC safe point is blocked due to the stagnation of TiCDC changefeed checkpoint [#1759](#)
- Backup & Restore (BR)
  - \* Fix the issue that the DELETE events are lost during the log restore [#1063](#)
  - \* Fix a bug that causes BR to send too many useless RPC requests to TiKV [#1037](#)
  - \* Fix the issue that no error is output when a backup operation fails [#1043](#)
- TiDB Lightning
  - \* Fix the issue of TiDB Lightning panic that occurs when generating KV data [#1127](#)
  - \* Fix the issue that TiDB Lightning in the TiDB-backend mode cannot load any data when the autocommit is disabled [#1104](#)
  - \* Fix a bug that the batch split Region fails due to the total key size exceeding the raft entry limit during the data import [#969](#)

### 16.16.6 TiDB 5.0.1 Release Notes

Release date: April 24, 2021

TiDB version: 5.0.1

#### 16.16.6.1 Compatibility change

- The default value of the `committer-concurrency` configuration item is changed from 16 to 128.

#### 16.16.6.2 Improvements

- TiDB
  - Support the built-in function `VITESS_HASH()` [#23915](#)
- TiKV
  - Use `zstd` to compress the Region snapshot [#10005](#)
- PD
  - Modify the Region score calculator to better satisfy isomorous stores [#3605](#)
  - Avoid unexpected statistics after adding the `scatter region` scheduler [#3602](#)
- Tools
  - Backup & Restore (BR)
    - \* Remove some misleading information from the summary log [#1009](#)

### 16.16.6.3 Bug Fixes

- TiDB
  - Fix the issue that the execution result of project elimination might be wrong when the projection result is empty [#24093](#)
  - Fix the issue of wrong query results when a column contains NULL values in some cases [#24063](#)
  - Forbid generating MPP plans when the scan contains virtual columns [#24058](#)
  - Fix the wrong reuse of `PointGet` and `TableDual` in Plan Cache [#24043](#)
  - Fix the error that occurs when the optimizer builds the `IndexMerge` plan for clustered indexes [#24042](#)
  - Fix the type inference of the BIT-type errors [#24027](#)
  - Fix the issue that some optimizer hints do not take effect when the `PointGet` operator exists [#23685](#)
  - Fix the issue that DDL operations might fail when rolling back due to an error [#24080](#)
  - Fix the issue that the index range of the binary literal constant is incorrectly built [#24041](#)
  - Fix the potential wrong results of the IN clause in some cases [#24023](#)
  - Fix the wrong results of some string functions [#23879](#)
  - Users now need both INSERT and DELETE privileges on a table to perform REPLACE operations [#23939](#)
  - Fix the performance regression when executing the point query [#24070](#)
  - Fix the wrong `TableDual` plans caused by incorrectly comparing binaries and bytes [#23918](#)
- TiKV
  - Fix the issue that the coprocessor fails to properly handle the signed or unsigned integer types in the IN expression [#10018](#)
  - Fix the issue of many empty Regions after batch ingesting SST files [#10015](#)
  - Fix the potential panic that occurs when the input of `cast_string_as_time` is invalid UTF-8 bytes [#9995](#)
  - Fix a bug that TiKV cannot start up after the file dictionary file is damaged [#9992](#)
- TiFlash
  - Fix the issue that the storage engine fails to remove the data of some ranges
  - Fix the issue of incorrect results when casting the time type to the integer type
  - Fix a bug that the `receiver` cannot find corresponding tasks within 10 seconds
  - Fix the issue that there might be invalid iterators in `cancelMPPQuery`
  - Fix a bug that the behavior of the `bitwise` operator is different from that of TiDB

- Fix the alert issue caused by overlapping ranges when using the `prefix key`
  - Fix the issue of incorrect results when casting the string type to the integer type
  - Fix the issue that consecutive and fast writes might make TiFlash out of memory
  - Fix the issue that duplicated column names will make TiFlash raise errors
  - Fix the issue that TiFlash fails to parse MPP plans
  - Fix the potential issue that the exception of null pointer might be raised during the table GC
  - Fix the TiFlash panic issue that occurs when writing data to dropped tables
  - Fix the issue that TiFlash might panic during BR restore
- Tools
    - TiDB Lightning
      - \* Fix the issue of the inaccurate table count in the progress log during the import [#1005](#)
    - Backup & Restore (BR)
      - \* Fix a bug that the actual backup speed exceeds the `--ratelimit` limit [#1026](#)
      - \* Fix the issue of backup interruption caused by the failure of a few TiKV nodes [#1019](#)
      - \* Fix the issue of the inaccurate table count in the progress log during TiDB Lightning's import [#1005](#)
    - TiCDC
      - \* Fix the concurrency issue in Unified Sorter and filter the unhelpful error messages [#1678](#)
      - \* Fix a bug that the creation of redundant directories might interrupt the replication with MinIO [#1672](#)
      - \* Set the default value of the `explicit_defaults_for_timestamp` session variable to `ON` to make the MySQL 5.7 downstream keep the same behavior with the upstream TiDB [#1659](#)
      - \* Fix the issue that the incorrect handling of `io.EOF` might cause replication interruption [#1648](#)
      - \* Correct the TiKV CDC endpoint CPU metric in the TiCDC dashboard [#1645](#)
      - \* Increase `defaultBufferChanSize` to avoid replication blocking in some cases [#1632](#)

### 16.16.7 What's New in TiDB 5.0

Release date: April 7, 2021

TiDB version: 5.0.0

In v5.0, PingCAP is dedicated to helping enterprises quickly build applications based on TiDB, freeing them from worries about database performance, performance jitter, security, high availability, disaster recovery, troubleshooting SQL performance, and so on.

In v5.0, the key new features or improvements are as follows:

- Introduce Massively Parallel Processing (MPP) architecture through TiFlash nodes, which shares the execution workloads of large join queries among TiFlash nodes. When the MPP mode is enabled, TiDB, based on cost, determines whether to use the MPP framework to perform the calculation. In the MPP mode, the join keys are redistributed through the **Exchange** operation while being calculated, which distributes the calculation pressure to each TiFlash node and speeds up the calculation. According to the benchmark, with the same cluster resource, TiDB 5.0 MPP shows 2 to 3 times of speedup over Greenplum 6.15.0 and Apache Spark 3.1.1, and some queries have 8 times better performance.
- Introduce the clustered index feature to improve database performance. For example, in the TPC-C tpmC test, the performance of TiDB, with clustered index enabled, improves by 39%.
- Enable the async commit feature to reduce the write latency. For example, in the 64-thread Sysbench test, the average latency of updating indexes, with async commit enabled, is reduced by 41.7%, from 12.04 ms to 7.01 ms.
- Reduce jitters. This is achieved by improving the optimizer stability and by limiting system tasks' usages of I/O, network, CPU, and memory resources. For example, in the 8-hour performance test, the standard deviation of TPC-C tpmC does not exceed 2%.
- Enhance system stability by improving scheduling and by keeping execution plans stable as much as possible.
- Introduces Raft Joint Consensus algorithm, which ensures the system availability during the Region membership change.
- Optimize **EXPLAIN** features and invisible index, which helps Database Administrators (DBAs) debug SQL statements more efficiently.
- Guarantee reliability for enterprise data. You can back up data from TiDB to Amazon S3 storage and Google Cloud GCS, or restore data from these cloud storage platforms.
- Improve performance of data import from or data export to Amazon S3 storage or TiDB/MySQL, which helps enterprises quickly build applications on the cloud. For example, in the TPC-C test, the performance of importing 1 TiB data improves by 40%, from 254 GiB/h to 366 GiB/h.

### 16.16.7.1 Compatibility changes

#### 16.16.7.1.1 System variables

- Add the `tidb_executor_concurrency` system variable to control the concurrency of multiple operators. The previous `tidb*_concurrency` settings (such as `tidb_projection_concurrency`) still take effect but with a warning when you use them.
- Add the `tidb_skip_ascii_check` system variable to specify whether to skip the ASCII validation check when the ASCII character set is written. This default value is `OFF`.

- Add the `tidb_enable_strict_double_type_check` system variable to determine whether the syntax like `double(N)` can be defined in the table schema. This default value is `OFF`.
- Change the default value of `tidb_dml_batch_size` from 20000 to 0. This means that batch DML statements are no longer used by default in `LOAD/INSERT INTO SELECT`  $\leftrightarrow$  `...`. Instead, large transactions are used to comply with the strict ACID semantics.

**Note:**

The scope of the variable is changed from session to global, and the default value is changed from 20000 to 0. If the application relies on the original default value, you need to use the `set global` statement to modify the variable to the original value after the upgrade.

- Control temporary tables' syntax compatibility using the `tidb_enable_noop_functions`  $\leftrightarrow$  system variable. When this variable value is `OFF`, the `CREATE TEMPORARY TABLE` syntax returns an error.
- Add the following system variables to directly control the garbage collection-related parameters:
  - `tidb_gc_concurrency`
  - `tidb_gc_enable`
  - `tidb_gc_life_time`
  - `tidb_gc_run_interval`
  - `tidb_gc_scan_lock_mode`
- Change the default value of `enable-joint-consensus` from `false` to `true`, which enables the Joint Consensus feature by default.
- Change the value of `tidb_enable_amend_pessimistic_txn` from 0 or 1 to `ON` or `OFF`.
- Change the default value of `tidb_enable_clustered_index` from `OFF` to `INT_ONLY` with the following new meanings:
  - `ON`: clustered index is enabled. Adding or deleting non-clustered indexes is supported.
  - `OFF`: clustered index is disabled. Adding or deleting non-clustered indexes is supported.
  - `INT_ONLY`: the default value. The behavior is consistent with that before v5.0. You can control whether to enable clustered index for the INT type together with `alter-primary-key = false`.

**Note:**

The `INT_ONLY` value of `tidb_enable_clustered_index` in 5.0 GA has the same meaning as the `OFF` value in 5.0 RC. After upgrading from a 5.0 RC cluster with the `OFF` setting to 5.0 GA, it will be displayed as `INT_ONLY`.

### 16.16.7.1.2 Configuration file parameters

- Add the `index-limit` configuration item for TiDB. Its value defaults to `64` and ranges between `[64,512]`. A MySQL table supports 64 indexes at most. If its value exceeds the default setting and more than 64 indexes are created for a table, when the table schema is re-imported into MySQL, an error will be reported.
- Add the `enable-enum-length-limit` configuration item for TiDB to be compatible and consistent with MySQL's ENUM/SET length (ENUM length < 255). The default value is `true`.
- Replace the `pessimistic-txn.enable` configuration item with the `tidb_txn_mode` environment variable.
- Replace the `performance.max-memory` configuration item with `performance.server`  
↔ `-memory-quota`
- Replace the `tikv-client.copr-cache.enable` configuration item with `tikv-client`  
↔ `.copr-cache.capacity-mb`. If the item's value is `0.0`, this feature is disabled. If the item's value is greater than `0.0`, this feature is enabled. Its default value is `1000.0`.
- Replace the `rocksdb.auto-tuned` configuration item with `rocksdb.rate-limiter-`  
↔ `auto-tuned`.
- Delete the `raftstore.sync-log` configuration item. By default, written data is forcibly spilled to the disk. Before v5.0, you can explicitly disable `raftstore.sync-`  
↔ `log`. Since v5.0, the configuration value is forcibly set to `true`.
- Change the default value of the `gc.enable-compaction-filter` configuration item from `false` to `true`.
- Change the default value of the `enable-cross-table-merge` configuration item from `false` to `true`.
- Change the default value of the `rate-limiter-auto-tuned` configuration item from `false` to `true`.

### 16.16.7.1.3 Others

- Before the upgrade, check the value of the TiDB configuration `feedback-probability`  
↔ `.`. If the value is not `0`, the “panic in the recoverable goroutine” error will occur after the upgrade, but this error does not affect the upgrade.
- Forbid conversion between `VARCHAR` type and `CHAR` type during the column type change to avoid data correctness issues.

## 16.16.7.2 New features

### 16.16.7.2.1 SQL

List partitioning (**Experimental**)

[User document](#)

With the list partitioning feature, you can effectively query and maintain tables with a large amount of data.

With this feature enabled, partitions and how data is distributed among partitions are defined according to the `PARTITION BY LIST(expr)PARTITION part_name VALUES IN (...)` expression. The partitioned tables' data set supports at most 1024 distinct integer values. You can define the values using the `PARTITION ... VALUES IN (...)` clause.

To enable list partitioning, set the session variable `tidb_enable_list_partition` to `ON`.

List COLUMNS partitioning (**Experimental**)

[User document](#)

List COLUMNS partitioning is a variant of list partitioning. You can use multiple columns as partition keys. Besides the integer data type, you can also use the columns in the string, DATE, and DATETIME data types as partition columns.

To enable List COLUMNS partitioning, set the session variable `tidb_enable_list_partition`  $\leftrightarrow$  to `ON`.

Invisible indexes

[User document, #9246](#)

When you tune performance or select optimal indexes, you can set an index to be `Visible`  $\leftrightarrow$  or `Invisible` by using SQL statements. This setting can avoid performing resource-consuming operations, such as `DROP INDEX` and `ADD INDEX`.

To modify the visibility of an index, use the `ALTER INDEX` statement. After the modification, the optimizer decides whether to add this index to the index list based on the index visibility.

`EXCEPT` and `INTERSECT` operators

[User document, #18031](#)

The `INTERSECT` operator is a set operator, which returns the intersection of the result sets of two or more queries. To some extent, it is an alternative to the `Inner Join` operator.

The `EXCEPT` operator is a set operator, which combines the result sets of two queries and returns elements that are in the first query result but not in the second.

### 16.16.7.2.2 Transaction

[#18005](#)

In the pessimistic transaction mode, if the tables involved in a transaction contain concurrent DDL operations or `SCHEMA VERSION` changes, the system automatically updates the transaction's `SCHEMA VERSION` to the latest to ensure the successful transaction commit, and to avoid that the client receives the `Information schema is changed` error when the transaction is interrupted by DDL operations or `SCHEMA VERSION` changes.

This feature is disabled by default. To enable the feature, modify the value of `tidb_enable_amend_pessimistic_txn` system variable. This feature is introduced in v4.0.7 and has the following issues fixed in v5.0:

- The compatibility issue that occurs when TiDB Binlog executes `Add Column` operations
- The data inconsistency issue that occurs when using the feature together with the unique index
- The data inconsistency issue that occurs when using the feature together with the added index

Currently, this feature still has the following incompatibility issues:

- Transaction's semantics might change when there are concurrent transactions
- Known compatibility issue that occurs when using the feature together with TiDB Binlog
- Incompatibility with `Change Column`

#### 16.16.7.2.3 Character set and collation

- Support the `utf8mb4_unicode_ci` and `utf8_unicode_ci` collations. [User document, #17596](#)
- Support the case-insensitive comparison sort for collations

#### 16.16.7.2.4 Security

[User document, #18566](#)

To meet security compliance requirements (such as *General Data Protection Regulation*, or GDPR), the system supports desensitizing information (such as ID and credit card number) in the output error messages and logs, which can avoid leaking sensitive information.

TiDB supports desensitizing the output log information. To enable this feature, use the following switches:

- The global variable `tidb_redact_log`. Its default value is `0`, which means that desensitization is disabled. To enable desensitization for `tidb-server` logs, set the variable value to `1`.
- The configuration item `security.redact-info-log`. Its default value is `false`, which means that desensitization is disabled. To enable desensitization for `tikv-server` logs, set the variable value to `true`.

- The configuration item `security.redact-info-log`. Its default value is `false`, which means that desensitization is disabled. To enable desensitization for pd-server logs, set the variable value to `true`.
- The configuration item `security.redact_info_log` for tiflash-server and `security.redact-info-log` for tiflash-learner. Their default values are both `false`, which means that desensitization is disabled. To enable desensitization for tiflash-server and tiflash-learner logs, set the values of both variables to `true`.

This feature is introduced in v5.0. To use the feature, enable the system variable and all configuration items above.

### 16.16.7.3 Performance optimization

#### 16.16.7.3.1 MPP architecture

##### User document

TiDB introduces the MPP architecture through TiFlash nodes. This architecture allows multiple TiFlash nodes to share the execution workload of large join queries.

When the MPP mode is on, TiDB determines whether to send a query to the MPP engine for computation based on the calculation cost. In the MPP mode, TiDB distributes the computation of table joins to each running TiFlash node by redistributing the join key during data calculation (**Exchange** operation), and thus accelerates the calculation. Furthermore, with the aggregation computing feature that TiFlash has already supported, TiDB can pushdown the computation of a query to the TiFlash MPP cluster. Then the distributed environment can help accelerate the entire execution process and dramatically increase the speed of analytic queries.

In the TPC-H 100 benchmark test, TiFlash MPP delivers significant processing speed over analytic engines of traditional analytic databases and SQL on Hadoop. With this architecture, you can perform large-scale analytic queries directly on the latest transaction data, with a higher performance than traditional offline analytic solutions. According to the benchmark, with the same cluster resource, TiDB 5.0 MPP shows 2 to 3 times of speedup over Greenplum 6.15.0 and Apache Spark 3.1.1, and some queries have 8 times better performance.

Currently, the main features that the MPP mode does not support are as follows (For details, refer to [Use TiFlash](#)):

- Table partitioning
- Window Function
- Collation
- Some built-in functions
- Reading data from TiKV
- OOM spill
- Union
- Full Outer Join

### 16.16.7.3.2 Clustered index

[User document, #4841](#)

When you are designing table structures or analyzing database behaviors, it is recommended to use the clustered index feature if you find that some columns with primary keys are often grouped and sorted, queries on these columns often return a certain range of data or a small amount of data with different values, and the corresponding data does not cause read or write hotspot issues.

Clustered indexes, also known as *index-organized tables* in some database management systems, is a storage structure associated with the data of a table. When creating a clustered index, you can specify one or more columns from the table as the keys for the index. TiDB stores these keys in a specific structure, which allows TiDB to quickly and efficiently find the rows associated with the keys, thus improves the performance of querying and writing data.

When the clustered index feature is enabled, the TiDB performance improves significantly (for example in the TPC-C tpmC test, the performance of TiDB, with clustered index enabled, improves by 39%) in the following cases:

- When data is inserted, the clustered index reduces one write of the index data from the network.
- When a query with an equivalent condition only involves the primary key, the clustered index reduces one read of index data from the network.
- When a query with a range condition only involves the primary key, the clustered index reduces multiple reads of index data from the network.
- When a query with an equivalent or range condition involves the primary key prefix, the clustered index reduces multiple reads of index data from the network.

Each table can either use a clustered or non-clustered index to sort and store data. The differences of these two storage structures are as follows:

- When creating a clustered index, you can specify one or more columns in the table as the key value of the index. A clustered index sorts and stores the data of a table according to the key value. Each table can have only one clustered index. If a table has a clustered index, it is called a clustered index table. Otherwise, it is called a non-clustered index table.
- When you create a non-clustered index, the data in the table is stored in an unordered structure. You do not need to explicitly specify the key value of the non-clustered index, because TiDB automatically assigns a unique ROWID to each row of data. During a query, the ROWID is used to locate the corresponding row. Because there are at least two network I/O operations when you query or insert data, the performance is degraded compared with clustered indexes.

When table data is modified, the database system automatically maintains clustered indexes and non-clustered indexes for you.

All primary keys are created as non-clustered indexes by default. You can create a primary key as a clustered index or non-clustered index in either of the following two ways:

- Specify the keyword `CLUSTERED` | `NONCLUSTERED` in the statement when creating a table, then the system creates the table in the specified way. The syntax is as follows:

```
CREATE TABLE `t` (`a` VARCHAR(255), `b` INT, PRIMARY KEY (`a`, `b`)
↳ CLUSTERED);
```

Or

```
CREATE TABLE `t` (`a` VARCHAR(255) PRIMARY KEY CLUSTERED, `b` INT);
```

You can execute the statement `SHOW INDEX FROM tbl-name` to query whether a table has a clustered index.

- Configure the system variable `tidb_enable_clustered_index` to control the clustered index feature. Supported values are `ON`, `OFF`, and `INT_ONLY`.
  - `ON`: Indicates that the clustered index feature is enabled for all types of primary keys. Adding and dropping non-clustered indexes are supported.
  - `OFF`: Indicates that the clustered index feature is disabled for all types of primary keys. Adding and dropping non-clustered indexes are supported.
  - `INT_ONLY`: The default value. If the variable is set to `INT_ONLY` and `alter-primary-key` is set to `false`, the primary keys which consist of single integer columns are created as clustered indexes by default. The behavior is consistent with that of TiDB v5.0 and earlier versions.

If a `CREATE TABLE` statement contains the keyword `CLUSTERED` | `NONCLUSTERED`, the statement overrides the configuration of the system variable and the configuration item.

You are recommended to use the clustered index feature by specifying the keyword `CLUSTERED` | `NONCLUSTERED` in statements. In this way, it is more flexible for TiDB to use all data types of clustered and non-clustered indexes in the system at the same time as required.

It is not recommended to use `tidb_enable_clustered_index = INT_ONLY`, because `INT_ONLY` is temporarily used to make this feature compatible and will be deprecated in the future.

Limitations for the clustered index are as follows:

- Mutual conversion between clustered indexes and non-clustered indexes is not supported.
- Dropping clustered indexes is not supported.
- Adding, dropping, and altering clustered indexes using `ALTER TABLE` statements are not supported.

- Reorganizing and re-creating a clustered index is not supported.
- Enabling or disabling indexes is not supported, which means the invisible index feature is not effective for clustered indexes.
- Creating a `UNIQUE KEY` as a clustered index is not supported.
- Using the clustered index feature together with TiDB Binlog is not supported. After TiDB Binlog is enabled, TiDB only supports creating a single integer primary key as a clustered index. TiDB Binlog does not replicate data changes of existing tables with clustered indexes to the downstream.
- Using the clustered index feature together with the attributes `SHARD_ROW_ID_BITS` and `PRE_SPLIT_REGIONS` is not supported.
- If the cluster is upgraded to a later version then rolls back, you need to downgrade newly-added tables by exporting table data before the rollback and importing the data after the rollback. Other tables are not affected.

### 16.16.7.3.3 Async Commit

[User document, #8316](#)

The client of the database will wait for the database system to complete the transaction commit in two phases (2PC) synchronously. The transaction returns the result to the client after the first phase commit is successful, and the system executes the second phase commit operation in the background asynchronously to reduce the transaction commit latency. If the transaction write involves only one Region, the second phase is omitted directly, and the transaction becomes a one-phase commit.

After the Async Commit feature is enabled, with the same hardware and configuration, when Sysbench is set to test the Update index with 64 threads, the average latency decreases by 41.7% from 12.04ms to 7.01ms.

When Async Commit feature is enabled, to reduce one network interaction latency and improve the performance of data writes, database application developers are recommended to consider reducing the consistency of transactions from linear consistency to **causal consistency**. The SQL statement to enable causal consistency is `START TRANSACTION WITH ↪ CAUSAL CONSISTENCY`.

After the causal consistency is enabled, with the same hardware and configuration, when Sysbench is set to test `oltp_write_only` with 64 threads, the average latency decreased by 5.6% from 11.86ms to 11.19ms.

After the consistency of transactions is reduced from the linear consistency to causal consistency, if there is no interdependence between multiple transactions in the application, the transactions do not have a globally consistent order.

**The Async Commit feature is enabled by default for newly created v5.0 clusters.**

This feature is disabled by default for clusters upgraded from earlier versions to v5.0. You can enable this feature by executing the `set global tidb_enable_async_commit = ON;` and `set global tidb_enable_1pc = ON;` statements.

The limitation for the Async Commit feature is as follows:

- Direct downgrade is not supported.

#### 16.16.7.3.4 Enable the Coprocessor cache feature by default

[User document](#), [#18028](#)

In 5.0 GA, the Coprocessor cache feature is enabled by default. After this feature is enabled, to reduce the latency of reading data, TiDB caches the calculation results of the operators pushed down to tikv-server in tidb-server.

To disable the Coprocessor cache feature, you can modify the `capacity-mb` configuration item of `tikv-client.copr-cache` to 0.0.

#### 16.16.7.3.5 Improve the execution performance of delete from table where id <? Limit ? statement

[#18028](#)

The p99 performance of the `delete from table where id <? limit ? statement` is improved by 4 times.

#### 16.16.7.3.6 Optimize load base split strategy to solve the performance problem that data cannot be split in some small table hotspot read scenarios

[#18005](#)

### 16.16.7.4 Improve stability

#### 16.16.7.4.1 Optimize the performance jitter issue caused by imperfect scheduling

[#18005](#)

The TiDB scheduling process occupies resources such as I/O, network, CPU, and memory. If TiDB does not control the scheduled tasks, QPS and delay might cause performance jitter due to resource preemption.

After the following optimizations, in the 8-hour performance test, the standard deviation of TPC-C tpmC does not exceed 2%.

Introduce new scheduling calculation formulas to reduce unnecessary scheduling and performance jitter

When the node capacity is always near the waterline set in the system, or when the `store-limit` is set too large, to balance the capacity load, the system frequently schedules Regions to other nodes or even schedules Regions back to their original nodes. Because

scheduling occupies resources, such as I/O, network, CPU, and memory, and causes performance jitter, this type of scheduling is not necessary.

To mitigate this issue, PD introduces a new set of default scheduling calculation formulas. You can switch back to the old formulas by configuring `region-score-formula-version`  $\leftrightarrow$  `v1`.

Enable the cross-table Region merge feature by default

#### User document

Before v5.0, TiDB disables the cross-table Region merge feature by default. Starting from v5.0, this feature is enabled by default to reduce the number of empty Regions and the overhead of network, memory, and CPU. You can disable this feature by modifying the `schedule.enable-cross-table-merge` configuration item.

Enable the system to automatically adjust the data compaction speed by default to balance the contention for I/O resources between background tasks and foreground reads and writes

#### User document

Before v5.0, to balance the contention for I/O resources between background tasks and foreground reads and writes, the feature that the system automatically adjusts the data compaction speed is disabled by default. Starting from v5.0, TiDB enables this feature by default and optimizes the algorithm so that the latency jitter is significantly reduced.

You can disable this feature by modifying the `rate-limiter-auto-tuned` configuration item.

Enable the GC Compaction Filter feature by default to reduce GC's consumption of CPU and I/O resources

#### User document, #18009

When TiDB performs garbage collection (GC) and data compaction, partitions occupy CPU and I/O resources. Overlapping data exists during the execution of these two tasks.

To reduce GC's consumption of CPU and I/O resources, the GC Compaction Filter feature combines these two tasks into one and executes them in the same task. This feature is enabled by default. You can disable it by configuring `gc.enable-compaction-filter`  $\leftrightarrow$  `false`.

TiFlash limits the compression and data sorting's use of I/O resources (**experimental feature**)

This feature alleviates the contention for I/O resources between background tasks and foreground reads and writes.

This feature is disabled by default. You can enable this feature by modifying the `bg_task_io_rate_limit` configuration item.

Improve the performance of checking scheduling constraints and the performance of fixing the unhealthy Regions in a large cluster

#### 16.16.7.4.2 Ensure that the execution plans are unchanged as much as possible to avoid performance jitter

[User document](#)

SQL Binding supports the `INSERT`、`REPLACE`、`UPDATE`、`DELETE` statements

When tuning performance or maintaining the database, if you find that the system performance is unstable due to unstable execution plans, you can select a manually optimized SQL statement according to your judgement or tested by `EXPLAIN ANALYZE`. You can bind the optimized SQL statement to the SQL statement to be executed in the application code to ensure stable performance.

When manually binding SQL statements using the `SQL BINDING` statement, you need to ensure that the optimized SQL statement has the same syntax as the original SQL statement.

You can view the manually or automatically bound execution plan information by running the `SHOW {GLOBAL | SESSION} BINDINGS` command. The output is the same as that of versions earlier than v5.0.

Automatically capture and bind execution plans

When upgrading TiDB, to avoid performance jitter, you can enable the baseline capturing feature to allow the system to automatically capture and bind the latest execution plan and store it in the system table. After TiDB is upgraded, you can export the bound execution plan by running the `SHOW GLOBAL BINDING` command and decide whether to delete these plans.

This feature is disabled by default. You can enable it by modifying the server or setting the `tidb_capture_plan_baselines` global system variable to `ON`. When this feature is enabled, the system fetches the SQL statements that appear at least twice from the Statement Summary every `bind-info-lease` (the default value is `3s`), and automatically captures and binds these SQL statements.

#### 16.16.7.4.3 Improve stability of TiFlash queries

Add a system variable `tidb_allow_fallback_to_tikv` to fall back queries to TiKV when TiFlash fails. The default value is `OFF`.

#### 16.16.7.4.4 Improve TiCDC stability and alleviate the OOM issue caused by replicating too much incremental data

[User document](#), [#1150](#)

In TiCDC v4.0.9 or earlier versions, replicating too much data change might cause OOM. In v5.0, the Unified Sorter feature is enabled by default to mitigate OOM issues caused by the following scenarios:

- The data replication task in TiCDC is paused for a long time, during which a large amount of incremental data is accumulated and needs to be replicated.

- The data replication task is started from an early timestamp, so it becomes necessary to replicate a large amount of incremental data.

Unified Sorter is integrated with the `memory/file` sort-engine options of earlier versions. You do not need to manually configure the change.

Limitations:

- You need to provide sufficient disk capacity according to the amount of your incremental data. It is recommended to use SSDs with free capacity greater than 128 GB.

### 16.16.7.5 High availability and disaster recovery

#### 16.16.7.5.1 Improve system availability during Region membership change

[User document](#), [#18079](#), [#7587](#), [#2860](#)

In the process of Region membership changes, “adding a member” and “deleting a member” are two operations performed in two steps. If a failure occurs when the membership change finishes, the Regions will become unavailable and an error of foreground application is returned.

The introduced Raft Joint Consensus algorithm can improve the system availability during Region membership change. “adding a member” and “deleting a member” operations during the membership change are combined into one operation and sent to all members. During the change process, Regions are in an intermediate state. If any modified member fails, the system is still available.

This feature is enabled by default. You can disable it by running the `pd-ctl config` ↪ `set enable-joint-consensus` command to set the `enable-joint-consensus` value to `false`.

#### 16.16.7.5.2 Optimize the memory management module to reduce system OOM risks

Track the memory usage of aggregate functions. This feature is enabled by default. When SQL statements with aggregate functions are executed, if the total memory usage of the current query exceeds the threshold set by `mem-quota-query`, the system automatically performs operations defined by `oom-action`.

#### 16.16.7.5.3 Improve the system availability during network partition

### 16.16.7.6 Data migration

#### 16.16.7.6.1 Migrate data from S3/Aurora to TiDB

TiDB data migration tools support using Amazon S3 (and other S3-compatible storage services) as the intermediate for data migration and initializing Aurora snapshot data directly into TiDB, providing more options for migrating data from Amazon S3/Aurora to TiDB.

To use this feature, refer to the following documents:

- [Export data to Amazon S3 cloud storage, #8](#)
- [Migrate from Amazon Aurora MySQL Using TiDB Lightning, #266](#)

#### 16.16.7.6.2 Optimize the data import performance of TiDB Cloud

TiDB Lightning optimizes its data import performance specifically for AWS T1.standard configurations (or equivalent) of TiDB Cloud. Test results show that TiDB Lightning improves its speed of importing 1TB of TPC-C data into TiDB by 40%, from 254 GiB/h to 366 GiB/h.

### 16.16.7.7 Data sharing and subscription

#### 16.16.7.7.1 Integrate TiDB to Kafka Connect (Confluent Platform) using TiCDC (experimental feature)

[User document, #660](#)

To support the business requirements of streaming TiDB data to other systems, this feature enables you to stream TiDB data to the systems such as Kafka, Hadoop, and Oracle.

The Kafka connectors protocol provided by the Confluent platform is widely used in the community, and it supports transferring data to either relational or non-relational databases in different protocols. By integrating TiCDC to Kafka Connect of the Confluent platform, TiDB extends the ability to stream TiDB data to other heterogeneous databases or systems.

#### 16.16.7.8 Diagnostics

[User document](#)

During the troubleshooting of SQL performance issues, detailed diagnostic information is needed to determine the causes of performance issues. Before TiDB 5.0, the information collected by the `EXPLAIN` statements was not detailed enough. The root causes of the issues can only be determined based on log information, monitoring information, or even on guess, which might be inefficient.

In TiDB v5.0, the following improvements are made to help you troubleshoot performance issues more efficiently:

- Support using the `EXPLAIN ANALYZE` statement to analyze all DML statements to show the actual performance plans and the execution information of each operator. [#18056](#)

- Support using the `EXPLAIN FOR CONNECTION` statement to check the real-time status of all the SQL statements being executed. For example, you can use the statement to check the execution duration of each operator and the number of processed rows. [#18233](#)
- Provide more details about the operator execution in the output of the `EXPLAIN`  $\leftrightarrow$  `ANALYZE` statement, including the number of RPC requests sent by operators, the duration of resolving lock conflicts, network latency, the scanned volume of deleted data in RocksDB, and the hit rate of RocksDB caches. [#18663](#)
- Support automatically recording the detailed execution information of SQL statements in the slow log. The execution information in the slow log is consistent with the output information of the `EXPLAIN ANALYZE` statement, which includes the time consumed by each operator, the number of processed rows, and the number of sent RPC requests. [#15009](#)

### 16.16.7.9 Deployment and maintenance

#### 16.16.7.9.1 Optimize the logic of cluster deployment operations, to help DBAs deploy a set of standard TiDB production cluster faster

##### User Document

In previous TiDB versions, DBAs using TiUP to deploy TiDB clusters find that the environment initialization is complicated, the checksum configuration is excessive, and the cluster topology file is difficult to edit. All of these issues lead to low deployment efficiency for DBAs. In TiDB v5.0, the TiDB deployment efficiency using TiUP is improved for DBAs through the following items:

- TiUP Cluster supports the `check topo.yaml` command to perform a more comprehensive one-click environment check and provide repair recommendations.
- TiUP Cluster supports the `check topo.yaml --apply` command to automatically repair environmental problems found during the environment check.
- TiUP Cluster supports the `template` command to get the cluster topology template file for DBAs to edit and support modifying the global node parameters.
- TiUP supports editing the `remote_config` parameter using the `edit-config` command to configure remote Prometheus.
- TiUP supports editing the `external_alertmanagers` parameter to configure different AlertManagers using the `edit-config` command.
- When editing the topology file using the `edit-config` subcommand in `tiup-cluster`, you can modify the data types of the configuration item values.

#### 16.16.7.9.2 Improve upgrade stability

Before TiUP v1.4.0, during the upgrade of a TiDB cluster using `tiup-cluster`, the SQL responses of the cluster jitter for a long period of time, and during PD online rolling upgrades, the QPS of the cluster jitter between 10s to 30s.

TiUP v1.4.0 adjusts the logic and makes the following optimizations:

- During the upgrade of PD nodes, TiUP automatically checks the status of the restarted PD node, and then rolls to upgrade the next PD node after confirming that the status is ready.
- TiUP identifies the PD role automatically, first upgrades the PD nodes of the follower role, and finally upgrades the PD Leader node.

### 16.16.7.9.3 Optimize the upgrade time

Before TiUP v1.4.0, when DBAs upgrade TiDB clusters using `tiup-cluster`, for clusters with a large number of nodes, the total upgrade time is long and cannot meet the upgrade time window requirement for certain users.

Starting from v1.4.0, TiUP optimizes the following items:

- Supports fast offline upgrades using the `tiup cluster upgrade --offline` subcommand.
- Speeds up the Region Leader relocation for users using rolling upgrades during upgrades by default, so that reduces the time of rolling TiKV upgrades.
- Checks the status of the Region monitor using the `check` subcommand before running a rolling upgrade. Ensure that the cluster is in a normal state before the upgrade, thus reducing the probability of upgrade failures.

### 16.16.7.9.4 Support the breakpoint feature

Before TiUP v1.4.0, when DBAs upgrade TiDB clusters using `tiup-cluster`, if the execution of a command is interrupted, all the upgrade operations have to be performed again from the beginning.

TiUP v1.4.0 supports retrying failed operations from breakpoints using the `tiup-cluster replay` subcommand, to avoid re-executing all operations after an upgrade interruption.

### 16.16.7.9.5 Enhance the functionalities of maintenance and operations

TiUP v1.4.0 further enhances the functionalities for operating and maintaining TiDB clusters.

- Supports the upgrade or patch operation on the downtime TiDB and DM clusters to adapt to more usage scenarios.
- Adds the `--version` parameter to the `display` subcommand of `tiup-cluster` to get the cluster version.
- When only Prometheus is included in the node being scaled out, the operation of updating the monitoring configuration is not performed, to avoid scale-out failure due to the absence of the Prometheus node.
- Adds user input to the error message when the results of the input TiUP commands are incorrect, so that you can locate the cause of the problem more quickly.

### 16.16.7.10 Telemetry

TiDB adds cluster usage metrics in telemetry, such as the number of data tables, the number of queries, and whether new features are enabled.

To learn more about details and how to disable this behavior, refer to [telemetry](#).

### 16.16.8 TiDB 5.0 RC Release Notes

Release date: January 12, 2021

TiDB version: 5.0.0-rc

TiDB v5.0.0-rc is the predecessor version of TiDB v5.0. In v5.0, PingCAP will be dedicated to helping enterprises quickly build applications based on TiDB, freeing them from worries about database performance, performance jitter, security, high availability, disaster recovery, troubleshooting SQL performance, and so on.

In v5.0, the key new features or improvements are as follows:

- **Clustered index.** When this feature is enabled, database performance is improved. For example, in the TPC-C tpmC test, TiDB's performance, with clustered index enabled, improves by 39%.
- **Async commit.** When this feature is enabled, the write latency is reduced. For example, in the Sysbench oltp-insert test, the write latency of TiDB, with async commit enabled, is reduced by 37.3%.
- **Reduced jitters.** This is achieved by improving the optimizer stability and by limiting system tasks' usages of I/O, network, CPU, and memory resources. For example, in the 72-hour performance test, the standard deviation of Sysbench TPS jitter is reduced from 11.09% to 3.36%.
- **Raft Joint Consensus algorithm,** which ensures the system availability during the Region membership change.
- **Optimized EXPLAIN features and invisible index,** which helps Database Administrators (DBAs) debug SQL statements more efficiently.
- **Guaranteed reliability for enterprise data.** You can back up data from TiDB to AWS S3 storage and Google Cloud GCS, or restore data from these cloud storage platforms.
- **Improved performance of data import from or data export to AWS S3 storage or TiDB/MySQL,** which helps enterprises quickly build applications on the cloud. For example, in the TPC-C test, the performance of importing 1 TiB data improves by 40%, from 254 GiB/h to 366 GiB/h.

#### 16.16.8.1 SQL

##### 16.16.8.1.1 Support clustered index (experimental)

When the clustered index feature is enabled, TiDB performance improves significantly (for example in the TPC-C tpmC test, TiDB's performance, with clustered index enabled, improves by 39%) in the following cases:

- When data is inserted, the clustered index reduces one write of the index data from the network.
- When a query with an equivalent condition only involves the primary key, the clustered index reduces one read of index data from the network.
- When a query with a range condition only involves the primary key, the clustered index reduces multiple reads of index data from the network.
- When a query with an equivalent or range condition involves the primary key prefix, the clustered index reduces multiple reads of index data from the network.

Clustered index defines the physical storage order of data in a table. The data in the table is sorted only according to the definition of the clustered index. Each table has only one clustered index.

Users can enable the clustered index feature by modifying the `tidb_enable_clustered_index` ↪ variable. When enabled, the feature takes effect only on newly created tables and applies to the primary key that has multiple columns or is non-integer types in a single column. If the primary key is an integer type in a single column, or if the table has no primary key, the data is sorted in the same way as before, without being affected by the clustered index.

For example, to check whether a table (`tbl_name`) has a clustered index, execute `select tidb_pk_type from information_schema.tables where table_name = '{` ↪ `tbl_name}'`.

- [User document](#)
- Related issue: [#4841](#)

#### 16.16.8.1.2 Support invisible indexes

When users tune performance or select optimal indexes, they can set an index to be `Visible` or `Invisible` by using SQL statements. This setting can avoid performing resource-consuming operations, such as `DROP INDEX` and `ADD INDEX`.

To modify the visibility of an index, use the `ALTER INDEX` statement. After the modification, the optimizer decides whether to add this index to the index list based on the index visibility.

- [User document](#)
- Related issue: [#9246](#)

#### 16.16.8.1.3 Support EXCEPT and INTERSECT operators

The `INTERSECT` operator is a set operator, which returns the intersection of the result sets of two or more queries. To some extent, it is an alternative to the `InnerJoin` operator.

The `EXCEPT` operator is a set operator, which combines the result sets of two queries and returns elements that are in the first query result but not in the second.

- [User document](#)
- Related issue: [#18031](#)

## 16.16.8.2 Transaction

### 16.16.8.2.1 Increase the success rate of executing pessimistic transactions

In the pessimistic transaction mode, if the tables involved in a transaction contain concurrent DDL operations or `SCHEMA VERSION` changes, the system automatically updates the transaction's `SCHEMA VERSION` to the latest to avoid the transaction being interrupted by DDL operations and to ensure the successful transaction commit. If the transaction is interrupted, the client receives the `Information schema is changed` error message.

- Related issue: [#18005](#)

## 16.16.8.3 Character set and collation

Support case-insensitive comparison sort for character sets.

- [User document](#)
- Related issue: [#17596](#)

## 16.16.8.4 Security

### 16.16.8.4.1 Support desensitizing error messages and log files

TiDB now supports desensitizing error messages and log files to avoid leaking sensitive information such as ID information and credit card number.

Users can enable the desensitization feature for different components:

- For the TiDB side, set the `tidb_redact_log=1` variable using SQL statements in `tidb-server`.
- For the TiKV side, set the `security.redact-info-log = true` configuration in `tikv-server`.
- For the PD side, set the `security.redact-info-log = true` configuration in `pd-server`. [#2852](#) [#3011](#)
- For the TiFlash side, set the `security.redact_info_log = true` configuration in `tiflash-server` and set `security.redact-info-log = true` in `tiflash-learner`.

[User document](#)

Related issue: [#18566](#)

## 16.16.8.5 Performance improvements

#### 16.16.8.5.1 Support async commit (experimental)

Enabling the async commit feature can significantly reduce the latency of transactions. For example, with this feature enabled, the latency of transactions in the Sysbench oltp-insert test is 37.3% lower than that when this feature is disabled.

Previously without the async commit feature, the statements being written were only returned to the client after the two-phase transaction commit finished. Now the async commit feature supports returning the result to the client after the first phase of the two-phase commit finishes. The second phase is then performed asynchronously in the background, thus reducing the latency of transaction commit.

However, when async commit is enabled, the external consistency of transactions can be guaranteed **only** when `tidb_guarantee_external_consistency = ON` is set. With async commit enabled, the performance might drop.

Users can enable this feature by setting the global variable `tidb_enable_async_commit` ↪ = ON.

- [User document](#)
- Related issue: [#8316](#)

#### 16.16.8.5.2 Improve the optimizer's stability in index selection (experimental)

The optimizer's ability to always select a relatively suitable index greatly determines whether the latency of queries is stable. We have improved and refactored the statistics module to ensure that, for the same SQL statements, the optimizer does not select a different index from multiple candidate indexes each time due to missing or inaccurate statistics. The main improvements to help the optimizer select a relatively suitable index are as follows:

- Add more information to the statistics module, such as the multi-column NDV, the multi-column order dependency, and the multi-column function dependency.
- Refactor the statistics module.
  - Delete TopN values from CMSKetch.
  - Refactor the search logic of TopN.
  - Delete the TopN information from the histogram and create an index of the histogram for easy maintenance of Bucket NDV.

Related issue: [#18065](#)

#### 16.16.8.5.3 Optimize performance jitter caused by imperfect scheduling or imperfect I/O flow control

The TiDB scheduling process occupies resources such as I/O, network, CPU, and memory. If TiDB does not control the scheduled tasks, QPS and delay might cause performance jitter due to resource preemption. After the following optimizations, in the 72-hour test, the standard deviation of Sysbench TPS jitter is reduced from 11.09% to 3.36%.

- Reduce the redundant scheduling issues caused by fluctuations of node capacity (always near the waterline) and caused by PD's `store-limit` configuration value set too large. This is achieved by introducing a new set of scheduling calculation formulas enabled via the `region-score-formula-version = v2` configuration item. [#3269](#)
- Enable the cross-Region merge feature by modifying `enable-cross-table-merge =`  $\rightarrow$  `true` to reduce the number of empty Regions. [#3129](#)
- Data compaction in the TiKV background occupies a lot of I/O resources. The system automatically adjusts the compaction rate to balance the contention for I/O resources between background tasks and foreground reads and writes. After enabling this feature via the `rate-limiter-auto-tuned` configuration item, the delay jitter is greatly reduced. [#18011](#)
- When TiKV performs garbage collection (GC) and data compaction, partitions occupy CPU and I/O resources. Overlapping data exists during the execution of these two tasks. To reduce I/O usage, the GC Compaction Filter feature combines these two tasks into one and executes them in the same task. This feature is still experimental and you can enable it via `gc.enable-compaction-filter = true`. [#18009](#)
- When TiFlash compresses or sorts data, it occupies a lot of I/O resources. The system alleviates contention for resources by limiting the compression and data sorting's use of I/O resources. This feature is still experimental and you can enable it via `bg_task_io_rate_limit`.

Related issue: [#18005](#)

#### 16.16.8.5.4 Improve the stability of TiFlash in Real-time BI / Data Warehousing scenarios

- Limit the memory usage of DeltaIndex to avoid system out of memory (OOM) caused by excessive memory usage in the scenarios of huge data volume.
- Limit the I/O write traffic used by the background data sorting task to reduce the impact on the foreground tasks.
- Add new thread pools to queue coprocessor tasks, which avoids system OOM caused by excessive memory usage when processing coprocessors in high concurrency.

#### 16.16.8.5.5 Other performance optimizations

- Improve the execution performance of `delete from table where id < ?` statement. Its P99 performance improves by four times. [#18028](#)
- TiFlash supports concurrently reading and writing data in multiple local disks to improve performance.

#### 16.16.8.6 High availability and disaster recovery

#### 16.16.8.6.1 Improve system availability during Region membership change (experimental)

In the process of Region membership changes, “adding a member” and “deleting a member” are two operations performed in two steps. If a failure occurs when the membership change finishes, the Regions will become unavailable and an error of foreground application is returned. The introduced Raft Joint Consensus algorithm can improve the system availability during Region membership change. “adding a member” and “deleting a member” operations during the membership change are combined into one operation and sent to all members. During the change process, Regions are in an intermediate state. If any modified member fails, the system is still available. Users can enable this feature by modifying the membership variable by executing `pd-ctl config set enable-joint-consensus`  
↪ `true`. [#7587](#) [#2860](#)

- [User document](#)
- Related issue: [#18079](#)

#### 16.16.8.6.2 Optimize the memory management module to reduce system OOM risks

- Reduce the memory consumption of caching statistics.
- Reduce the memory consumption of exporting data using the Dumping tool.
- Reduced the memory consumption by storing the encrypted intermediate results of data to the disk.

#### 16.16.8.7 Backup and restore

- The Backup & Restore tool (BR) supports backing up data to AWS S3 and Google Cloud GCS. ([User document](#))
- The Backup & Restore tool (BR) supports restoring data from AWS S3 and Google Cloud GCS to TiDB. ([User document](#))
- Related issue: [#89](#)

#### 16.16.8.8 Data import and export

- TiDB Lightning supports importing Aurora snapshot data from AWS S3 storage to TiDB. (Related issue: [#266](#))
- In the TPC-C test of importing 1 TiB of data into DBaaS T1.standard, the performance improves by 40%, from 254 GiB/h to 366 GiB/h.
- Dumping supports exporting data from TiDB/MySQL to AWS S3 storage (experimental) (Related issue: [#8](#), [User document](#))

#### 16.16.8.9 Diagnostics

#### 16.16.8.9.1 Optimized EXPLAIN features with more collected information help users troubleshoot performance issues

When users troubleshoot SQL performance issues, they need detailed diagnostic information to determine the causes of performance issues. In previous TiDB versions, the information collected by the EXPLAIN statements was not detailed enough. DBAs performed troubleshooting only based on log information, monitoring information, or even on guess, which might be inefficient. The following improvements are made in TiDB v5.0 to help users troubleshoot performance issues more efficiently:

- EXPLAIN ANALYZE supports analyzing all DML statements and shows the actual performance plans and the execution information of each operator. [#18056](#)
- Users can use EXPLAIN FOR CONNECTION to analyze the status information of the SQL statements that are being executed. This information includes the execution duration of each operator and the number of processed rows. [#18233](#)
- More information is available in the output of EXPLAIN ANALYZE, including the number of RPC requests sent by operators, the duration of resolving lock conflicts, network latency, the scanned volume of deleted data in RocksDB, and the hit rate of RocksDB caches. [#18663](#)
- The detailed execution information of SQL statements is recorded in the slow log, which is consistent with the output information of EXPLAIN ANALYZE. This information includes the time consumed by each operator, the number of processed rows, and the number of sent RPC requests. [#15009](#)

#### User document

#### 16.16.8.10 Deployment and maintenance

- Previously, when the configuration information of TiDB Ansible was imported to TiUP, TiUP put the user configuration in the `ansible-imported-configs` directory. When users later needed to edit the configuration using `tiup cluster edit-config`, the imported configuration was not displayed in the editor interface, which could be confusing for users. In TiDB v5.0, when TiDB Ansible configuration is imported, TiUP puts the configuration information both in `ansible-imported-configs` and in the editor interface. With this improvement, users can see the imported configuration when they are editing the cluster configuration.
- Enhanced `mirror` command that supports merging multiple mirrors into one, publishing components in the local mirror, and adding component owners in the local mirror. [#814](#)
  - For a large enterprise, especially for the financial industry, any change in the production environment is given careful consideration. It can be troublesome if each version requires users to use a CD for installation. In TiDB v5.0, the `merge`  $\leftrightarrow$  command of TiUP supports merging multiple installation packages into one, which makes the installation easier.

- In v4.0, users had to start `tiup-server` to publish the self-built mirror, which was not convenient enough. In v5.0, users can publish the self-built mirror simply by using `tiup mirror set` to set the current mirror to the local mirror.

## 16.17 v4.0

### 16.17.1 TiDB 4.0.16 Release Notes

Release date: December 17, 2021

TiDB version: 4.0.16

#### 16.17.1.1 Compatibility changes

- TiKV
  - Before v4.0.16, when TiDB converts an illegal UTF-8 string to a Real type, an error is reported directly. Starting from v4.0.16, TiDB processes the conversion according to the legal UTF-8 prefix in the string [#11466](#)
- Tools
  - TiCDC
    - \* Change the default value of Kafka Sink `max-message-bytes` to 1 MB to prevent TiCDC from sending too large messages to Kafka clusters [#2962](#)
    - \* Change the default value of Kafka Sink `partition-num` to 3 so that TiCDC distributes messages across Kafka partitions more evenly [#3337](#)

#### 16.17.1.2 Improvements

- TiDB
  - Upgrade the Grafana version from 7.5.7 to 7.5.11
- TiKV
  - Reduce disk space consumption by adopting the `zstd` algorithm to compress SST files when restoring data using Backup & Restore or importing data using Local-backend of TiDB Lightning [#11469](#)
- Tools
  - Backup & Restore (BR)
    - \* Improve the robustness of restoring [#27421](#)

- TiCDC
  - \* Add a tick frequency limit to EtcdWorker to prevent frequent etcd writes from affecting PD services [#3112](#)
  - \* Optimize rate limiting control on TiKV reloads to reduce gPRC congestion during changefeed initialization [#3110](#)

### 16.17.1.3 Bug fixes

- TiDB
  - Fix the query panic caused by overflow in the statistics module when converting a range to points for cost estimation [#23625](#)
  - Fix wrong results of the control functions (such as IF and CASE WHEN) when using the ENUM type data as parameters of such functions [#23114](#)
  - Fix the issue that the GREATEST function returns inconsistent results due to different values of `tidb_enable_vectorized_expression` (on or off) [#29434](#)
  - Fix the panic when applying index join on prefix indexes in some cases [#24547](#)
  - Fix the issue that planner might cache invalid plans for join in some cases [#28087](#)
  - Fix a bug that TiDB cannot insert null into a non-null column when `sql_mode` is empty [#11648](#)
  - Fix the wrong result type of the GREATEST and LEAST functions [#29019](#)
  - Fix the `privilege check fail` error when performing the `grant` and `revoke` operations to grant and revoke global level privileges [#29675](#)
  - Fix the panic when using the CASE WHEN function on the ENUM data type [#29357](#)
  - Fix wrong results of the `microsecond` function in vectorized expressions [#29244](#)
  - Fix wrong results of the `hour` function in vectorized expression [#28643](#)
  - Fix the issue that optimistic transaction conflicts might cause transactions to block each other [#11148](#)
  - Fix the issue of incomplete log information from the `auto analyze` result [#29188](#)
  - Fix the issue that using an invalid default date does not report an error when the `SQL_MODE` is `'NO_ZERO_IN_DATE'` [#26766](#)
  - Fix the issue that the Coprocessor Cache panel in Grafana does not display metrics. Now, Grafana displays the number of `hits/miss/evict` [#26338](#)
  - Fix the issue that concurrently truncating the same partition causes DDL statements to stuck [#26229](#)
  - Fix the issue that the length information is wrong when converting `Decimal` to `String` [#29417](#)
  - Fix the issue of an extra column in the query result when `NATURAL JOIN` is used to join multiple tables [#29481](#)
  - Fix the issue that `TopN` is wrongly pushed down to `indexPlan` when `IndexScan` uses a prefix index [#29711](#)
  - Fix the issue that retrying transactions with the auto-increment columns of `DOUBLE` type causes data corruption [#29892](#)
- TiKV

- Fix a panic issue that occurs when Region merge, ConfChange, and Snapshot happen at the same time in extreme conditions [#11475](#)
- Fix the issue of negative sign when the decimal divide result is zero [#29586](#)
- Fix the issue that the average latency of the by-instance gRPC requests is inaccurate in TiKV metrics [#11299](#)
- Fix the issue of TiCDC panic that occurs when the downstream database is missing [#11123](#)
- Fix the issue that the Raft connection is broken when the channel is full [#11047](#)
- Fix the issue that TiDB cannot correctly identify whether the `Int64` types in `Max/Min` functions are a signed integer or not, which causes the wrong calculation result of `Max/Min` [#10158](#)
- Fix the issue that CDC adds scan retries frequently due to the Congest error [#11082](#)
- PD
  - Fix a panic issue that occurs after the TiKV node is removed [#4344](#)
  - Fix slow leader election caused by stucked region syncer [#3936](#)
  - Support that the evict leader scheduler can schedule regions with unhealthy peers [#4093](#)
- TiFlash
  - Fix the issue that TiFlash fails to start up on some platforms due to the absence of library `ns1`
- Tools
  - TiDB Binlog
    - \* Fix the bug that Drainer exits when transporting a transaction greater than 1 GB [#28659](#)
  - TiCDC
    - \* Fix the negative value error in the changefeed checkpoint lag [#3010](#)
    - \* Fix OOM in container environments [#1798](#)
    - \* Fix the TiCDC replication interruption issue when multiple TiKVs crash or during a forced restart [#3288](#)
    - \* Fix the memory leak issue after processing DDLs [#3174](#)
    - \* Fix the issue that changefeed does not fail fast enough when the `ErrGCT-TLExceeded` error occurs [#3111](#)
    - \* Fix the issue that TiCDC replication task might terminate when the upstream TiDB instance unexpectedly exits [#3061](#)
    - \* Fix the issue that TiCDC process might panic when TiKV sends duplicate requests to the same Region [#2386](#)
    - \* Fix the issue that the volume of Kafka messages generated by TiCDC is not constrained by `max-message-size` [#2962](#)

- \* Fix the issue that `tikv_cdc_min_resolved_ts_no_change_for_1m` keeps alerting when there is no changefeed [#11017](#)
- \* Fix the issue that TiCDC sync task might pause when an error occurs during writing a Kafka message [#2978](#)
- \* Fix the issue that some partitioned tables without valid indexes might be ignored when `force-replicate` is enabled [#2834](#)
- \* Fix the memory leak issue when creating a new changefeed [#2389](#)
- \* Fix the issue that might cause inconsistent data due to Sink components advancing resolved ts early [#3503](#)
- \* Fix the issue that scanning stock data might fail due to TiKV performing GC when scanning stock data takes too long [#2470](#)
- \* Fix the issue that the changefeed update command does not recognize global command line parameters [#2803](#)

## 16.17.2 TiDB 4.0.15 Release Notes

Release Date: September 27, 2021

TiDB version: 4.0.15

### 16.17.2.1 Compatibility changes

- TiDB

- Fix the issue that executing `SHOW VARIABLES` in a new session is slow. This fix reverts some changes made in [#21045](#) and might cause compatibility issues. [#24326](#)
- The following bug fixes change execution results, which might cause upgrade incompatibilities:
  - \* Fix the issue that `greatest(datetime)union null` returns empty string [#26532](#)
  - \* Fix the issue that the `having` clause might not work correctly [#26496](#)
  - \* Fix the wrong execution results that occur when the collations around the `between` expression are different [#27146](#)
  - \* Fix the result wrong that occurs when the argument of the `extract` function is a negative duration [#27236](#)
  - \* Fix the wrong execution results that occur when the column in the `group_concat` function has a non-bin collation [#27429](#)
  - \* Fix the issue that column information is missed when converting the `Apply` operator to `Join` [#27233](#)
  - \* Fix the issue of unexpected behavior when casting the invalid string to `DATE` [#26762](#)
  - \* Fix a bug that the `count distinct` result on multiple columns is wrong when the new collation is enabled [#27091](#)

### 16.17.2.2 Feature enhancement

- TiKV
  - Support changing TiCDC configurations dynamically [#10645](#)

### 16.17.2.3 Improvements

- TiDB
  - Trigger auto-analyze based on the histogram row count [#24237](#)
- TiKV
  - Handle read ready and write ready separately to reduce read latency [#10475](#)
  - The slow log of TiKV coprocessor only considers the time spent on processing requests. [#10841](#)
  - Drop log instead of blocking threads when the slogger thread is overloaded and the queue is filled up [#10841](#)
  - Reduce the size of Resolved TS messages to save network bandwidth [#2448](#)
- PD
  - Improve the performance of synchronizing Region information between PDs [#3932](#)
- Tools
  - Backup & Restore (BR)
    - \* Split and scatter Regions concurrently to improve restore speed [#1363](#)
    - \* Retry BR tasks when encountering the PD request error or the TiKV I/O timeout error [#27787](#)
    - \* Reduce empty Regions when restoring many small tables to avoid affecting cluster operations after the restore [#1374](#)
    - \* Perform the `rebase auto id` operation while creating tables, which saves the separate `rebase auto id` DDL operation and speeds up restore [#1424](#)
  - Dumpling
    - \* Filter the skipped databases before getting the table information to improve the filtering efficiency of `SHOW TABLE STATUS` [#337](#)
    - \* Use `SHOW FULL TABLES` to get table information for tables to be exported, because `SHOW TABLE STATUS` cannot work properly in some MySQL versions [#322](#)

- \* Support backing up MySQL-compatible databases that do not support the `START TRANSACTION ... WITH CONSISTENT SNAPSHOT` or the `SHOW CREATE TABLE` syntax [#309](#)
- \* Refine the Dumping warning log to avoid the misleading information that a dump fails [#340](#)
- TiDB Lightning
  - \* Support importing data into tables that have expression index or the index that depends on virtual generated columns [#1404](#)
- TiCDC
  - \* Always pulls old values from TiKV internally to improve usability [#2397](#)
  - \* Reduce the goroutine usage when a table's Regions are all transferred away from a TiKV node [#2284](#)
  - \* Optimize workerpool for fewer goroutines when concurrency is high [#2211](#)
  - \* Execute DDL statements asynchronously to avoid affecting other changefeeds [#2295](#)
  - \* Add a global gRPC connection pool and share gRPC connections among KV clients [#2531](#)
  - \* Fail fast for unrecoverable DML errors [#1724](#)
  - \* Optimize memory management when the Unified Sorter is using memory to sort data [#2553](#)
  - \* Add Prometheus metrics for DDL executions [#2595](#) [#2669](#)
  - \* Prohibit operating TiCDC clusters across major or minor versions [#2601](#)
  - \* Remove `file sorter` [#2325](#)
  - \* Clean up changefeed metrics when a changefeed is removed, and clean up processor metrics when a processor exits [#2156](#)
  - \* Optimize the lock-resolving algorithm after a Region is initialized [#2188](#)

#### 16.17.2.4 Bug fixes

- TiDB
  - Fix a bug that collation is incorrectly set for binary literals when building ranges [#23672](#)
  - Fix the “index out of range” error that occurs when a query includes both `GROUP BY` and `UNION` [#26553](#)
  - Fix the issue that TiDB might fail to send requests if TiKV has tombstone stores [#23676](#) [#24648](#)
  - Remove the undocumented `/debug/sub-optimal-plan` HTTP API [#27264](#)
  - Fix the issue of wrong character set and collation for the `case when` expression [#26662](#)
- TiKV

- Fix the issue that BR reports the “file already exists” error when TDE is enabled during data restore [#1179](#)
- Fix the potential disk full issue caused by corrupted snapshot files [#10813](#)
- Fix the issue that TiKV deletes stale Regions too frequently [#10680](#)
- Fix the issue that TiKV frequently reconnects the PD client [#9690](#)
- Check stale file information from the encryption file dictionary [#9115](#)
- PD
  - Fix the issue that PD does not fix the down peers in time [#4077](#)
  - Fix a bug that PD might panic when scaling out TiKV [#3868](#)
- TiFlash
  - Fix the potential issue of data inconsistency that occurs when TiFlash is deployed on multiple disks
  - Fix a bug of incorrect results that occurs when queries contain filters like `CONSTANT` `↔` `,` `<`, `<=`, `>`, `>=`, or `COLUMN`
  - Fix the issue that the store size in metrics is inaccurate under heavy writing
  - Fix a potential bug that TiFlash cannot restore data when deployed on multiple disks
  - Fix the potential issue that TiFlash cannot garbage-collect the delta data after running for a long time
- Tools
  - Backup & Restore (BR)
    - \* Fix a bug that the average speed is inaccurately calculated for backup and restore [#1405](#)
  - TiCDC
    - \* Fix the `ErrSchemaStorageTableMiss` error that occurs when the DDL Job duplication is encountered in the integrated test [#2422](#)
    - \* Fix a bug that a changefeed cannot be removed if the `ErrGCTTLExceeded` error occurs [#2391](#)
    - \* Fix the issue that outdated capture might appear in the output of the `capture` `↔` `list` command [#2388](#)
    - \* Fix the deadlock issue in the TiCDC processor [#2017](#)
    - \* Fix a data inconsistency issue that occurs because multiple processors might write data to the same table when this table is being re-scheduled [#2230](#)
    - \* Fix a bug that the `EtcdWorker` snapshot isolation is violated in metadata management [#2557](#)
    - \* Fix the issue that the changefeed cannot be stopped due to the DDL sink error [#2552](#)
    - \* Fix the issue of TiCDC Open Protocol: TiCDC outputs an empty value when there is no change in a transaction [#2612](#)

- \* Fix a bug that causes TiCDC to panic on the unsigned TINYINT type [#2648](#)
- \* Decrease the gRPC window size to avoid the OOM that occurs when TiCDC captures too many Regions [#2202](#)
- \* Fix the OOM issue that occurs when TiCDC captures too many Regions [#2673](#)
- \* Fix the issue of process panic that occurs when encoding the data types such as `mysql.TypeString`, `mysql.TypeVarString`, `mysql.TypeVarchar` into JSON [#2758](#)
- \* Fix the a memory leak issue that might occur when creating a new changefeed [#2389](#)
- \* Fix a bug that DDL handling fails when a changefeed starts at the finish TS of a schema change [#2603](#)
- \* Fix the issue of potential DDL loss when the owner crashes when executing DDL statements [#1260](#)
- \* Fix the issue of insecure concurrent access to the map in `SinkManager` [#2298](#)

### 16.17.3 TiDB 4.0.14 Release Notes

Release date: July 27, 2021

TiDB version: 4.0.14

#### 16.17.3.1 Compatibility changes

- TiDB
  - Change the default value of `tidb_multi_statement_mode` from `WARN` to `OFF` in v4.0. It is recommended to use the multi-statement feature of your client library instead. See [the documentation on `tidb\_multi\_statement\_mode`](#) for details. [#25749](#)
  - Upgrade Grafana dashboard from v6.1.16 to v7.5.7 to solve two security vulnerabilities. See the [Grafana blog post](#) for details.
  - Change the default value of the `tidb_stmt_summary_max_stmt_count` variable from 200 to 3000 [#25872](#)
- TiKV
  - Change the default value of `merge-check-tick-interval` from 10 to 2 to speed up the Region merge process [#9676](#)

#### 16.17.3.2 Feature enhancements

- TiKV

- Add a metric `pending` to monitor the number of pending PD heartbeats, which helps locate the issue of slow PD threads [#10008](#)
- Support using the virtual-host addressing mode to make BR support the S3-compatible storage [#10242](#)
- TiDB Dashboard
  - Support OIDC SSO. By setting the OIDC-compatible SSO services (such as Okta and Auth0), users can log into TiDB Dashboard without entering the SQL password. [#960](#)
  - Add the **Debug API** UI, which is an alternative method to the command line to call several common TiDB and PD internal APIs for advanced debugging [#927](#)

### 16.17.3.3 Improvements

- TiDB
  - Change the LOCK record into the PUT record for the index keys using `point get` or `batch point get` for UPDATE reads [#26223](#)
  - Support the MySQL system variable `init_connect` and its associated features [#26031](#)
  - Support the stable result mode to make the query results more stable [#26003](#)
  - Support pushing down the built-in function `json_unquote()` to TiKV [#25721](#)
  - Make the SQL Plan Management (SPM) not affected by the character set [#23295](#)
- TiKV
  - Shutdown the status server first to make sure that the client can correctly check the shutdown status [#10504](#)
  - Always respond to stale peers to make sure that these peers are cleared quicker [#10400](#)
  - Limit the TiCDC sink's memory consumption [#10147](#)
  - When a Region is too large, use the even split to speed up the split process [#10275](#)
- PD
  - Reduce the conflicts among multiple schedulers that run at the same time [#3858](#) [#3854](#)
- TiDB Dashboard
  - Update TiDB Dashboard to v2021.07.17.1 [#3882](#)
  - Support sharing the current session as a read-only session to avoid further modification to it [#960](#)

- Tools

- Backup & Restore (BR)
  - \* Speed up restore by merging small backup files [#655](#)
- Dumping
  - \* Always split tables using `_tidb_rowid` when the upstream is a TiDB v3.x cluster, which helps reduce TiDB's memory usage [#306](#)
- TiCDC
  - \* Improve the error message returned when a PD endpoint misses the certificate [#1973](#)
  - \* Make the sorter I/O errors more user-friendly [#1976](#)
  - \* Add a concurrency limit on the Region incremental scan in the KV client to reduce the pressure of TiKV [#1926](#)
  - \* Add metrics for the table memory consumption [#1884](#)
  - \* Add `capture-session-ttl` to the TiCDC server configuration [#2169](#)

#### 16.17.3.4 Bug fixes

- TiDB
  - Fix the issue that the `SELECT` result is incompatible with MySQL when joining a subquery with a `WHERE` clause evaluated to `false` [#24865](#)
  - Fix the calculation error of the `ifnull` function that occurs when the argument is the `ENUM` or `SET` type [#24944](#)
  - Fix the wrong aggregate pruning in some cases [#25202](#)
  - Fix the incorrect result of the merge join operation that might occur when the column is the `SET` type [#25669](#)
  - Fix the issue that TiDB returns wrong results for cartesian join [#25591](#)
  - Fix the panic issue that occurs when `SELECT ... FOR UPDATE` works on a join operation and the join uses a partitioned table [#20028](#)
  - Fix the issue that the cached prepared plan is incorrectly used for point get [#24741](#)
  - Fix the issue that the `LOAD DATA` statement can abnormally import non-utf8 data [#25979](#)
  - Fix a potential memory leak issue that occurs when accessing the statistics via an HTTP API [#24650](#)
  - Fix a security issue that occurs when executing the `ALTER USER` statement [#25225](#)
  - Fix a bug that the `TIKV_REGION_PEERS` table cannot correctly handle the `DOWN` status [#24879](#)
  - Fix the issue that invalid strings are not truncated when parsing `DateTime` [#22231](#)
  - Fix the issue that the `select into outfile` statement might have no result when the column type is `YEAR` [#22159](#)
  - Fix the issue that the query result might be wrong when `NULL` is in the `UNION` subquery [#26532](#)

- Fix the issue that the projection operator in execution might cause panic in some cases [#26534](#)
- TiKV
  - Fix the issue that the duration calculation might panic on certain platforms [#related-issue](#)
  - Fix the wrong function that casts DOUBLE to DOUBLE [#25200](#)
  - Fix the issue that the panic log might be lost when using the async logger [#8998](#)
  - Fix the panic issue that occurs when building a snapshot twice if encryption is enabled [#9786](#) [#10407](#)
  - Fix the wrong arguments type of the `json_unquote()` function in the coprocessor [#10176](#)
  - Fix the issues of suspicious warnings during shutdown and the non-deterministic response from Raftstore [#10353](#) [#10307](#)
  - Fix the issue of backup threads leak [#10287](#)
  - Fix the issue that Region split might panic and corrupt the metadata if the split process is too slow and Region merge is on-going [#8456](#) [#8783](#)
  - Fix the issue that the Region heartbeats prevent TiKV from splitting large Regions in some situations [#10111](#)
  - Fix the wrong statistics caused by the format inconsistency of CM Sketch between TiKV and TiDB [#25638](#)
  - Fix the wrong statistics of the `apply wait duration` metric [#9893](#)
  - Fix the “Missing Blob” error after using `delete_files_in_range` in Titan [#10232](#)
- PD
  - Fix a bug that the scheduler might reappear after executing the delete operation [#2572](#)
  - Fix the data race issue that might occur when the scheduler is started before the temporary configuration is loaded [#3771](#)
  - Fix a PD panic issue that might occur during the Region scattering operation [#3761](#)
  - Fix the issue that the priority of some operators is not set correctly [#3703](#)
  - Fix a PD panic issue that might occur when deleting the `evict-leader` scheduler from a non-existent store [#3660](#)
  - Fix the issue that the PD Leader re-election is slow when there are many stores [#3697](#)
- TiDB Dashboard
  - Fix the issue that the **Profiling** UI cannot profile all TiDB instances [#944](#)
  - Fix the issue that the **Statements** UI does not display “Plan Count” [#939](#)
  - Fix the issue that the **Slow Query** UI might display the “unknown field” error after cluster upgrade [#902](#)

- TiFlash
  - Fix the potential panic issue that occurs when compiling DAG requests
  - Fix the panic issue that occurs when the read load is heavy
  - Fix the issue that TiFlash keeps restarting because of the split failure in column storage
  - Fix a potential bug that TiFlash cannot delete the delta data
  - Fix the incorrect results that occur when cloning the shared delta index concurrently
  - Fix a bug that TiFlash fails to restart in the case of incomplete data
  - Fix the issue that the old dm files cannot be removed automatically
  - Fix the panic issue that occurs when executing the `SUBSTRING` function with specific arguments
  - Fix the issue of incorrect results when casting the `INTEGER` type to the `TIME` type
  
- Tools
  - Backup & Restore (BR)
    - \* Fix the issue that the data restore from the `mysql` schema might fail [#1142](#)
  - TiDB Lightning
    - \* Fix the issue that TiDB Lightning fails to parse the `DECIMAL` type data in Parquet files [#1276](#)
    - \* Fix the EOF error reported when TiDB Lightning splits the imported large CSV files [#1133](#)
    - \* Fix a bug that an excessively large base value is generated when TiDB Lightning imports tables with the `auto_increment` column of the `FLOAT` or `DOUBLE` type [#1185](#)
    - \* Fix the issue of TiDB Lightning panic that occurs when generating KV data larger than 4 GB [#1128](#)
  - Dumpling
    - \* When using Dumpling to export data to the S3 storage, the `s3:ListBucket` ↪ permission is no longer required on the entire bucket. The permission is required only on the data source prefix. [#898](#)
  - TiCDC
    - \* Fix the issue of extra partition dispatching after adding new table partitions [#2205](#)
    - \* Fix the panic issue that occurs when TiCDC fails to read `/proc/meminfo` [#2023](#)
    - \* Reduce TiCDC's runtime memory consumption [#2011](#) [#1957](#)
    - \* Fix a bug that some MySQL connection might leak after MySQL sink meets the error and pauses [#1945](#)
    - \* Fix the issue that TiCDC changefeed cannot be created when start TS is less than current TS minus GC TTL [#1839](#)

- \* Reduce memory `malloc` in sort heap to avoid too much CPU overhead [#1853](#)
- \* Fix a bug that the replication task might stop when moving a table [#1827](#)

#### 16.17.4 TiDB 4.0.13 Release Notes

Release date: May 28, 2021

TiDB version: 4.0.13

##### 16.17.4.1 New Features

- TiDB
  - Support changing an `AUTO_INCREMENT` column to an `AUTO_RANDOM` one [#24608](#)
  - Add the `infoschema.client_errors_summary` tables to help users keep track of the errors that have been returned to clients [#23267](#)

##### 16.17.4.2 Improvements

- TiDB
  - Avoid frequently reading the `mysql.stats_histograms` table if the cached statistics is up-to-date to avoid high CPU usage [#24352](#)
- TiKV
  - Make the calculation process of `store used size` more precise [#9904](#)
  - Set more Regions in the `EpochNotMatch` message to reduce Region misses [#9731](#)
  - Speed up freeing the memory accumulated in the long-running cluster [#10035](#)
- PD
  - Optimize the metrics of TSO processing time to help users determine whether the TSO processing time at the PD side is too long [#3524](#)
  - Update the dashboard version to v2021.03.12.1 [#3469](#)
- TiFlash
  - Automatically clean archived data to free up disk space
- Tools
  - Backup & Restore (BR)
    - \* Support backing up user tables created in the `mysql` schema [#1077](#)
    - \* Update `checkVersion` to check the cluster data and the backup data [#1090](#)

- \* Tolerate a small number of TiKV node failures during backup [#1062](#)
- TiCDC
  - \* Implement the processor flow control to avoid memory overflow (OOM) [#1751](#)
  - \* Support cleaning up stale temporary files in Unified Sorter and prevent multiple `cdc server` instances from sharing the same `sort-dir` directory [#1741](#)
  - \* Add the HTTP handler for the failpoint [#1732](#)

### 16.17.4.3 Bug Fixes

- TiDB
  - Fix the panic issue that occurs when the `UPDATE` statement with a subquery updates the generated column [#24658](#)
  - Fix the issue that causes duplicate query results when using the multi-column index for data reads [#24634](#)
  - Fix the issue that causes wrong query result when using the `BIT` type constant as the divisor in the `DIV` expression [#24266](#)
  - Fix the issue that the `NO_ZERO_IN_DATE` SQL mode does not take effect for the default column value set in DDL statements [#24185](#)
  - Fix an issue which causes wrong query results when using `UNION` between a `BIT` type column and an `INTEGER` type column [#24026](#)
  - Fix the issue that the `TableDual` plans are mistakenly created when comparing the `BINARY` type and the `CHAR` type [#23917](#)
  - Fix the issue that the `insert ignore on duplicate` statement might unexpectedly delete table records [#23825](#)
  - Fix the issue that the Audit plugin causes TiDB panic [#23819](#)
  - Fix the issue that the `HashJoin` operator incorrectly processes the collation [#23812](#)
  - Fix the issue of disconnection that occurs when `batch_point_get` incorrectly handles abnormal values in the pessimistic transaction [#23778](#)
  - Fix the issue of inconsistent indexes that occurs when the `tidb_row_format_version`  $\leftrightarrow$  configuration value is set to 1 and the `enable_new_collation` value is set to `true` [#23772](#)
  - Fix a bug that occurs when comparing the `INTEGER` type column with the `STRING` constant value [#23705](#)
  - Fix the error that occurs when the `BIT` type column is passed into the `approx_percent` function [#23702](#)
  - Fix a bug that causes TiDB to mistakenly report the TiKV `server timeout` error when executing TiFlash batch requests [#23700](#)
  - Fix the issue that the `IndexJoin` operator returns wrong results on the prefix column index [#23691](#)
  - Fix the issue which causes wrong query results because the collation on the `BINARY` type column is not properly handled [#23598](#)

- Fix the issue of query panic that occurs when the UPDATE statement contains the join query with the HAVING clause [#23575](#)
- Fix the issue that causes TiFlash to return wrong results when using the NULL constant in the comparison expression [#23474](#)
- Fix the issue of wrong results when comparing the YEAR type column with the STRING constant [#23335](#)
- Fix the issue that `group_concat` panics when `session.group_concat_max_len` is set too small [#23257](#)
- Fix the issue of wrong query results that occurs when using the BETWEEN expression for the TIME type column [#23233](#)
- Fix the issue of privilege check in the DELETE statements [#23215](#)
- Fix the issue that no error is reported when inserting invalid strings to the DECIMAL type column [#23196](#)
- Fix the issue of parsing error occurred when inserting data to the DECIMAL type columns [#23152](#)
- Fix the issue that the USE\_INDEX\_MERGE hint does not take effect [#22924](#)
- Fix a bug that the query returns wrong results when using ENUM or SET columns in the WHERE clause as an filter [#22814](#)
- Fix a bug that the query returns wrong results when using the clustered index and the new collation at the same time [#21408](#)
- Fix the panic that occurs when executing ANALYZE with `enable_new_collation` enabled [#21299](#)
- Fix the issue that SQL views does not correctly handle the default roles associated with the SQL DEFINER [#24531](#)
- Fix the issue that cancelling DDL jobs gets stuck [#24445](#)
- Fix the issue that the concat function incorrectly handles the collation [#24300](#)
- Fix a bug that the query returns wrong results when the SELECT field has an IN subquery and the subquery's outer side contains NULL tuples [#24022](#)
- Fix a bug that TiFlash is chosen wrongly by the optimizer when TableScan is in descending order [#23974](#)
- Fix a bug that the `point_get` plan returns the column name that is inconsistent with that of MySQL [#23970](#)
- Fix the issue that executing the `show table status` statement on a database with a upper-cased name returns wrong results [#23958](#)
- Fix a bug that the users who do not have the INSERT and DELETE privileges on a table at the same time can perform the REPLACE operation [#23938](#)
- Fix the issue that the results of the `concat/make_set/insert` expressions are wrong because the collation is incorrectly handled [#23878](#)
- Fix the panic that occurs when executing a query on the table that has RANGE partitions [#23689](#)
- Fix the issue: In the cluster of an earlier version, if the `tidb_enable_table_partition`  $\leftrightarrow$  variable is set to `false`, the tables that contain partitions are handled as non-partitioned tables. Executing `batch point get` queries on this table, when the cluster is upgraded to a later version, causes connection panic. [#23682](#)
- Fix the issue that when TiDB is configured to listen on TCP and UNIX sock-

- ets, the remote hosts over the TCP connection are not correctly validated for connection [#23513](#)
  - Fix a bug that the non-default collation causes wrong query results [#22923](#)
  - Fix a bug that the **Coprocessor Cache** panel of Grafana does not work [#22617](#)
  - Fix the error that occurs when the optimizer accesses the statistic cache [#22565](#)
- TiKV
    - Fix a bug that TiKV cannot start if the `file_dict` file is not fully written into the disk that has been full [#9963](#)
    - Limit TiCDC's scan speed at 128MB/s by default [#9983](#)
    - Reduce the memory usage of TiCDC's initial scan [#10133](#)
    - Support the back pressure for TiCDC's scan speed [#10142](#)
    - Fix a potential OOM issue by avoiding unnecessary reads to get TiCDC old values [#10031](#)
    - Fix a TiCDC OOM issue caused by reading old values [#10197](#)
    - Add a timeout mechanism for S3 storages to avoid the client hanging without responses [#10132](#)
  - TiFlash
    - Fix the issue that number of `delta-merge-tasks` is not reported to Prometheus
    - Fix the TiFlash panic issue that occurs during `Segment Split`
    - Fix the issue that the `Region write Duration (write blocks)` panel in Grafana is shown in a wrong place
    - Fix the potential issue that the storage engine fails to remove data
    - Fix the issue of incorrect results when casting the `TIME` type to the `INTEGER` type
    - Fix a bug that the behavior of the `bitwise` operator is different from that of TiDB
    - Fix the issue of incorrect results when casting the `STRING` type to the `INTEGER` type
    - Fix the issue that consecutive and fast writes might make TiFlash out of memory
    - Fix the potential issue that the exception of null pointer might be raised during the table GC
    - Fix the TiFlash panic issue that occurs when writing data to dropped tables
    - Fix the TiFlash panic issue that occurs during BR restore
    - Fix a bug that the weights of some characters are wrong when using the general CI collation
    - Fix the potential issue that data will be lost in tombstoned tables
    - Fix the issue of incorrect results when comparing the string which contains zero bytes
    - Fix the issue that the logical function returns wrong results if the input column contains null constants
    - Fix the issue that the logical function only accepts the numeric type
    - Fix the issue of incorrect results that occurs when the timestamp value is 1970-01-01 and the timezone offset is negative

- Fix the issue that hash value of `Decimal256` is not stable
- Tools
  - TiCDC
    - \* Fix the deadlock issue caused by the flow control when the sorter's input channel has been blocked [#1779](#)
    - \* Fix the issue that the TiKV GC safe point is blocked due to the stagnation of TiCDC changefeed checkpoint [#1756](#)
    - \* Revert the update in `explicit_defaults_for_timestamp` which requires the `SUPER` privilege when replicating data to MySQL [#1749](#)
  - TiDB Lightning
    - \* Fix a bug that TiDB Lightning's TiDB-backend cannot load any data when `autocommit` is disabled

### 16.17.5 TiDB 4.0.12 Release Notes

Release date: April 2, 2021

TiDB version: 4.0.12

#### 16.17.5.1 New Features

- TiFlash
  - Add tools to check the status of `tiflash replica` for online rolling updates

#### 16.17.5.2 Improvements

- TiDB
  - Refine the output information of the `EXPLAIN` statement for the `batch cop` mode [#23164](#)
  - Add the warning information for expressions that cannot be pushed to the storage layer in the output of the `EXPLAIN` statement [#23020](#)
  - Migrate a part of the DDL package code from `Execute/ExecRestricted` to the safe API (2) [#22935](#)
  - Migrate a part of the DDL package code from `Execute/ExecRestricted` to the safe API (1) [#22929](#)
  - Add `optimization-time` and `wait-TS-time` into the slow log [#22918](#)
  - Support querying `partition_id` from the `infoschema.partitions` table [#22489](#)
  - Add `last_plan_from_binding` to help the users know whether a SQL statement's execution plan is matched with the hints in the binding [#21430](#)

- Scatter truncated tables without the `pre-split` option [#22872](#)
- Add three format specifiers for the `str_to_date` expression [#22812](#)
- Record the PREPARE execution failure as Failed Query OPM in the metrics monitor [#22672](#)
- Do not report errors for the PREPARE execution if `tidb_snapshot` is set [#22641](#)
- TiKV
  - Prevent a large number of reconnections in a short period of time [#9879](#)
  - Optimize the write operations and Batch Get in the scenarios of many tombstones [#9729](#)
  - Change the default value of `leader-transfer-max-log-lag` to 128 to increase the success rate of leader transfer [#9605](#)
- PD
  - Update the Region cache only when `pending-peers` or `down-peers` changes, which reduces the pressure of updating heartbeats [#3471](#)
  - Prevent the Regions in `split-cache` from becoming the target of merge [#3459](#)
- TiFlash
  - Optimize the configuration file and remove useless items
  - Reduce the size of TiFlash binary files
  - Use an adaptive aggressive GC strategy to reduce memory usage
- Tools
  - TiCDC
    - \* Add a double confirmation when users create or resume the changefeed with the `start-ts` or `checkpoint-ts` 1 day before the current timestamp [#1497](#)
    - \* Add Grafana panels for the Old Value feature [#1571](#)
  - Backup & Restore (BR)
    - \* Log the `HTTP_PROXY` and `HTTPS_PROXY` environmental variables [#827](#)
    - \* Improve the backup performance when there are many tables [#745](#)
    - \* Report errors if the service safe point check fails [#826](#)
    - \* Add the `cluster_version` and `br_version` information in `backupmeta` [#803](#)
    - \* Add retry for external storage errors to increase the success rate of backup [#851](#)
    - \* Reduce memory usage during backup [#886](#)
  - TiDB Lightning
    - \* Check the TiDB cluster version before running TiDB Lightning to avoid unexpected errors [#787](#)
    - \* Fail fast when TiDB Lightning meets the `cancel` error [#867](#)

- \* Add `tikv-importer.engine-mem-cache-size` and `tikv-importer.local-writer-mem-cache-size` configuration items to balance between memory usage and performance [#866](#)
- \* Run `batch split region` in parallel for TiDB Lightning's Local-backend to increase the import speed [#868](#)
- \* When using TiDB Lightning to import data from a S3 storage, TiDB Lightning no longer requires the `s3:ListBucket` permission [#919](#)
- \* When resuming from a checkpoint, TiDB Lightning keeps using the original engine [#924](#)

### 16.17.5.3 Bug Fixes

- TiDB

- Fix the issue that the `get` variable expression goes wrong when the session variable is hexadecimal literals [#23372](#)
- Fix the issue that wrong collation is used when creating the fast execution plan for the `Enum` or `Set` type [#23292](#)
- Fix the possible wrong result of the `nullif` expression when it is used with `is`  $\leftrightarrow$  `null` [#23279](#)
- Fix the issue that the auto-analysis is triggered outside its time range [#23219](#)
- Fix the issue that the `CAST` function might ignore errors for the `point get` plan [#23211](#)
- Fix a bug that prevents SPM from taking effect when `CurrentDB` is empty [#23209](#)
- Fix the issue of possible wrong table filters for the `IndexMerge` plan [#23165](#)
- Fix the issue of unexpected `NotNullFlag` in the returning types of the `NULL` constant [#23135](#)
- Fix a bug that collation might not be handled by the text type [#23092](#)
- Fix the issue that the range partition might incorrectly handle the `IN` expression [#23074](#)
- Fix the issue that after marking a TiKV store as tombstone, starting new TiKV stores with different `StoreIDs` with the same IP address and port keeps returning the `StoreNotMatch` error [#23071](#)
- Do not adjust the `INT` type when it is `NULL` and compared with `YEAR` [#22844](#)
- Fix the issue of lost connection when loading data on tables with the `auto_random` column [#22736](#)
- Fix the issue of DDL hangover when the DDL operation meets panic in the cancelling path [#23297](#)
- Fix the wrong key range of index scan when comparing the `YEAR` column with `NULL` [#23104](#)
- Fix the issue that a successfully created view is failed to use [#23083](#)

- TiKV

- Fix the issue that the `IN` expression does not properly handle unsigned/signed integers [#9850](#)
- Fix the issue that the ingest operation is not re-entrant [#9779](#)
- Fix the issue that the space is missed when converting JSON to string in TiKV coprocessor [#9666](#)
- PD
  - Fix a bug that the isolation level is wrong when the store lacks the label [#3474](#)
- TiFlash
  - Fix the issue of incorrect execution results when the default value of the `binary` type column contains leading or trailing zero bytes
  - Fix a bug that TiFlash fails to synchronize schema if the name of the database contains special characters
  - Fix the issue of incorrect results when handling the `IN` expression with decimal values
  - Fix a bug that the metric for the opened file count shown in Grafana is high
  - Fix a bug that TiFlash does not support the `Timestamp` literal
  - Fix the potential not responding issue while handling the `FROM_UNIXTIME` expression
  - Fix the issue of incorrect results when casting string as integer
  - Fix a bug that the `like` function might return wrong results
- Tools
  - TiCDC
    - \* Fix a disorder issue of the `resolved ts` event [#1464](#)
    - \* Fix a data loss issue caused by wrong table scheduling due to the network problem [#1508](#)
    - \* Fix a bug of untimely release of resources after a processor is stopped [#1547](#)
    - \* Fix a bug that the transaction counter is not correctly updated, which might cause database connection leak [#1524](#)
    - \* Fix the issue that multiple owners can co-exist when PD has jitter, which might lead to table missing [#1540](#)
  - Backup & Restore (BR)
    - \* Fix a bug that `WalkDir` for the s3 storage returns `nil` if the target path is bucket name [#733](#)
    - \* Fix a bug that the `status` port is not served with TLS [#839](#)
  - TiDB Lightning
    - \* Fix the error that TiKV Importer might ignore that the file has already existed [#848](#)

- \* Fix a bug that the TiDB Lightning might use the wrong timestamp and read the wrong data [#850](#)
- \* Fix a bug that TiDB Lightning's unexpected exit might cause damaged checkpoint file [#889](#)
- \* Fix the issue of possible data error that occurs because the `cancel` error is ignored [#874](#)

### 16.17.6 TiDB 4.0.11 Release Notes

Release date: February 26, 2021

TiDB version: 4.0.11

#### 16.17.6.1 New Features

- TiDB
  - Support the `utf8_unicode_ci` and `utf8mb4_unicode_ci` collations [#22558](#)
- TiKV
  - Support the `utf8mb4_unicode_ci` collation [#9577](#)
  - Support the `cast_year_as_time` collation [#9299](#)
- TiFlash
  - Add a Coprocessor thread pool to queue Coprocessor requests for execution, which avoids out of memory (OOM) in some cases, and add the `cop_pool_size` ↔ `batch_cop_pool_size` configuration items with the default values of `NumOfPhysicalCores * 2`

#### 16.17.6.2 Improvements

- TiDB
  - Reorder inner joins that are simplified from outer joins [#22402](#)
  - Support multiple clusters in Grafana dashboards [#22534](#)
  - Add a workaround for the issue of multiple statements [#22468](#)
  - Divide the metrics of slow query into `internal` and `general` [#22405](#)
  - Add interface for `utf8_unicode_ci` and `utf8mb4_unicode_ci` collations [#22099](#)
- TiKV
  - Add metrics of server information for DBaaS [#9591](#)
  - Support multiple clusters in Grafana dashboards [#9572](#)

- Report RocksDB metrics to TiDB [#9316](#)
- Record the suspension time for Coprocessor tasks [#9277](#)
- Add thresholds of key counts and key size for Load Base Split [#9354](#)
- Check whether the file exists before data import [#9544](#)
- Improve Fast Tune panels [#9180](#)
- PD
  - Support multiple clusters in Grafana dashboards [#3398](#)
- TiFlash
  - Optimize the performance of the `date_format` function
  - Optimize the memory consumption of handling ingest SST
  - Optimize the retrying logic in Batch Coprocessor to reduce the probability of Region error
- Tools
  - TiCDC
    - \* Add the version information in the `capture` metadata and add the CLI version of a `changefeed` in the `changefeed` metadata [#1342](#)
  - TiDB Lightning
    - \* Create tables in parallel to improve import performance [#502](#)
    - \* Skip splitting Regions to improve import performance if the engine's total size is smaller than the Region size [#524](#)
    - \* Add a import progress bar and optimize the accuracy of restore progress [#506](#)

### 16.17.6.3 Bug Fixes

- TiDB
  - Fix the issue of abnormal `unicode_ci` constant propagation [#22614](#)
  - Fix the issue that might cause wrong collation and coercibility [#22602](#)
  - Fix the issue that might cause wrong collation results [#22599](#)
  - Fix the issue of constant substitution for different collations [#22582](#)
  - Fix a bug that the `like` function might return wrong result when using collation [#22531](#)
  - Fix the issue of incorrect `duration` type inference in `least` and `greatest` functions [#22580](#)
  - Fix a bug that occurs when the `like` function handles a single character wildcard (`_`) followed by a multiple character wildcard (`%`) [#22575](#)
  - Fix the type inference error of the TiDB's built-in functions (`least` and `greatest`) [#22562](#)

- Fix a bug that makes the `like` function get the wrong result if the pattern string is a unicode string [#22529](#)
- Fix a bug that the point get query does not get the snapshot data when the `@tidb_snapshot` variable is set [#22527](#)
- Fix the potential panic that occurs when generating hints from joins [#22518](#)
- Fix the issue that strings are incorrectly converted to the BIT type [#22420](#)
- Fix the `index out of range` error that occurs when inserting values to the `tidb_rowid` column [#22359](#)
- Fix a bug that the cached plan is incorrectly used [#22353](#)
- Fix the runtime panic in the `WEIGHT_STRING` function when the length of the binary/char string is too large [#22332](#)
- Forbid using the generated column when the number of function parameters is invalid [#22174](#)
- Correctly set the process information before building the execution plan [#22148](#)
- Fix the issue of inaccurate runtime statistics of `IndexLookUp` [#22136](#)
- Add cache for the memory usage information when the cluster is deployed in a container [#22116](#)
- Fix the issue of the decoding plan errors [#22022](#)
- Report errors for using invalid window specifications [#21976](#)
- Report errors when the `PREPARE` statement is nested with `EXECUTE`, `DEALLOCATE` or `PREPARE` [#21972](#)
- Fix the issue that no error is reported when the `INSERT IGNORE` statement is used on a non-existing partition [#21971](#)
- Unify the encoding of `EXPLAIN` results and slow log [#21964](#)
- Fix the issue of unknown columns in join when using the aggregate operator [#21957](#)
- Fix the wrong type inference in the `ceiling` function [#21936](#)
- Fix the issue that the `Double` type column ignores its decimal [#21916](#)
- Fix the issue that the correlated aggregation is calculated in subqueries [#21877](#)
- Report errors for the JSON object with key length  $\geq 65536$  [#21870](#)
- Fix the issue that the `dyname` function is incompatible with MySQL [#21850](#)
- Fix the issue that the `to_base64` function returns NULL when the input data is too long [#21813](#)
- Fix the failure of comparing multiple fields in the subquery [#21808](#)
- Fix the issue that occurs when comparing the float type in JSON [#21785](#)
- Fix the issue that occurs when comparing the types of JSON objects [#21718](#)
- Fix the issue that the coercibility value of the `cast` function is incorrectly set [#21714](#)
- Fix an unexpected panic when using the `IF` function [#21711](#)
- Fix the issue that the NULL result returned from JSON search is incompatible with MySQL [#21700](#)
- Fix the issue that occurs when checking the `only_full_group_by` mode using `ORDER BY` and `HAVING` [#21697](#)
- Fix the issue that the units of `Day` and `Time` are incompatible with MySQL [#21676](#)
- Fix the issue that the default values of `LEAD` and `LAG` cannot adapt to the field

- type [#21665](#)
- Perform a check to ensure that the `LOAD DATA` statement can only load data into base tables [#21638](#)
- Fix the issue that occurs when `addtime` and `subtime` functions handle invalid arguments [#21635](#)
- Change the round rule for approximate values to “round to the nearest even number” [#21628](#)
- Fix the issue that `WEEK()` does not recognize `@GLOBAL.default_week_format` until it has been explicitly read [#21623](#)
- TiKV
  - Fix the issue that TiKV is failed to build with `PROST=1` [#9604](#)
  - Fix the unmatched memory diagnostics [#9589](#)
  - Fix the issue that the end key of a partial RawKV-restore range is inclusive [#9583](#)
  - Fix the issue of TiKV panic that occurs when loading the old value of a key of a rolled-back transaction during TiCDC’s incremental scan [#9569](#)
  - Fix the configuration glitch of old values when changefeeds with different settings connect to one Region [#9565](#)
  - Fix a crash issue that occurs when running a TiKV cluster on a machine with a network interface that lacks the MAC address (introduced in v4.0.9) [#9516](#)
  - Fix the issue of TiKV OOM when backing up a huge Region [#9448](#)
  - Fix the issue that `region-split-check-diff` cannot be customized [#9530](#)
  - Fix the issue of TiKV panic when the system time goes back [#9542](#)
- PD
  - Fix the issue that member health metrics are incorrectly displayed [#3368](#)
  - Forbid removing the tombstone store that still has peers [#3352](#)
  - Fix the issue that the store limit cannot be persisted [#3403](#)
  - Fix the limit constriction of the scatter range scheduler [#3401](#)
- TiFlash
  - Fix a bug that the `min/max` result is wrong for the decimal type
  - Fix a bug that TiFlash might crash when reading data
  - Fix the issue that some data written after DDL operations might be lost after data compaction
  - Fix the issue that TiFlash incorrectly handles decimal constants in Coprocessor
  - Fix the potential crash during the learner read process
  - Fix the inconsistent behaviors of division by 0 or NULL between TiDB and TiFlash
- Tools
  - TiCDC

- \* Fix a bug that the TiCDC service might unexpectedly exit when `ErrTaskStatusNotExists` and the closing of `capture` session occur at the same time [#1240](#)
  - \* Fix the old value switch issue that a `changefeed` might be affected by another `changefeed` [#1347](#)
  - \* Fix a bug that the TiCDC service might hang when processing a new `changefeed` with the invalid `sort-engine` parameter [#1309](#)
  - \* Fix the issue of panic that occurs when getting the debugging information on non-owner nodes [#1349](#)
  - \* Fix the issue that the `ticdc_processor_num_of_tables` and `ticdc_processor_table_res`  $\rightarrow$  metrics are not properly updated when adding or removing tables [#1351](#)
  - \* Fix the issue of potential data loss if a processor crashes when adding a table [#1363](#)
  - \* Fix a bug that the owner might lead to abnormal TiCDC server exits during table migrations [#1352](#)
  - \* Fix a bug that TiCDC does not exit in time after the service GC safepoint is lost [#1367](#)
  - \* Fix a bug that the KV client might skip creating the event feed [#1336](#)
  - \* Fix a bug that the atomicity of transactions is broken when the transactions are replicated to the downstream [#1375](#)
- Backup & Restore (BR)
- \* Fix the issue that TiKV might be caused to generate a big Region after BR restores the backup [#702](#)
  - \* Fix the issue that BR restores a table's Auto ID even if the table does not have Auto ID [#720](#)
- TiDB Lightning
- \* Fix a bug that `column count mismatch` might be triggered when using the TiDB-backend [#535](#)
  - \* Fix a bug that TiDB-backend panics if the column count of the source file and the column count of the target table mismatch [#528](#)
  - \* Fix a bug that TiKV might unexpectedly panic during TiDB Lightning's data import [#554](#)

### 16.17.7 TiDB 4.0.10 Release Notes

Release date: January 15, 2021

TiDB version: 4.0.10

#### 16.17.7.1 New Features

- PD

- Add the `enable-redact-log` configuration item to redact user data from logs [#3266](#)
- TiFlash
  - Add the `security.redact_info_log` configuration item to redact user data from logs

### 16.17.7.2 Improvements

- TiDB
  - Make the size limit of a key-value entry in transaction configurable using `txn-  
↪ entry-size-limit` [#21843](#)
- PD
  - Optimize the `store-state-filter` metrics to show more information [#3100](#)
  - Upgrade the `go.etcd.io/bbolt` dependency to v1.3.5 [#3331](#)
- Tools
  - TiCDC
    - \* Enable the old value feature for the `maxwell` protocol [#1144](#)
    - \* Enable the unified sorter feature by default [#1230](#)
  - Dumpling
    - \* Support checking unrecognized arguments and printing the current progress during dumping [#228](#)
  - TiDB Lightning
    - \* Support retrying the error that occurs when reading from S3 [#533](#)

### 16.17.7.3 Bug Fixes

- TiDB
  - Fix a concurrency bug that might cause the batch client timeout [#22336](#)
  - Fix the issue of duplicate bindings caused by concurrent baseline capture [#22295](#)
  - Make the baseline capture bound to the SQL statement work when the log level is `'debug'` [#22293](#)
  - Correctly release GC locks when Region merge occurs [#22267](#)
  - Return correct values for user variables of the `datetime` type [#22143](#)
  - Fix the issue of using index merge when there are multiple table filters [#22124](#)

- Fix the `wrong precision` issue in TiFlash caused by the `prepare` plan cache [#21960](#)
- Fix the issue of incorrect results caused by schema change [#21596](#)
- Avoid unnecessary column flag changes in `ALTER TABLE` [#21474](#)
- Set the database name for table aliases of query blocks used in optimizer hints [#21380](#)
- Generate the proper optimizer hint for `IndexHashJoin` and `IndexMergeJoin` [#21020](#)
  
- TiKV
  - Fix the wrong mapping between `ready` and `peer` [#9409](#)
  - Fix the issue that some logs are not redacted when `security.redact-info-log` is set to `true` [#9314](#)
  
- PD
  - Fix the issue that the ID allocation is not monotonic [#3308](#) [#3323](#)
  - Fix the issue that the PD client might be blocked in some cases [#3285](#)
  
- TiFlash
  - Fix the issue that TiFlash fails to start because TiFlash fails to process the TiDB schema of an old version
  - Fix the issue that TiFlash fails to start due to incorrect handling of `cpu_time` on the RedHat system
  - Fix the issue that TiFlash fails to start when `path_realtime_mode` is set to `true`
  - Fix an issue of incorrect results when calling the `substr` function with three parameters
  - Fix the issue that TiFlash does not support changing the `Enum` type even if the change is lossless
  
- Tools
  - TiCDC
    - \* Fix the `maxwell` protocol issues, including the issue of `base64` data output and the issue of outputting TSO to unix timestamp [#1173](#)
    - \* Fix a bug that outdated metadata might cause the newly created changefeed abnormal [#1184](#)
    - \* Fix the issue of creating the receiver on the closed notifier [#1199](#)
    - \* Fix a bug that the TiCDC owner might consume too much memory in the `etcd` watch client [#1227](#)
    - \* Fix the issue that `max-batch-size` does not take effect [#1253](#)
    - \* Fix the issue of cleaning up stale tasks before the capture information is constructed [#1280](#)

- \* Fix the issue that the recycling of db conn is block because `rollback` is not called in MySQL sink [#1285](#)
- Dumping
  - \* Avoid TiDB out of memory (OOM) by setting the default behavior of `tidb_mem_quota_query` [#233](#)
- Backup & Restore (BR)
  - \* Fix the issue that BR v4.0.9 cannot restore the files backed up using BR v4.0.8 on GCS [#688](#)
  - \* Fix the issue that BR panics when the GCS storage URL has no prefix [#673](#)
  - \* Disable backup statistics by default to avoid BR OOM [#693](#)
- TiDB Binlog
  - \* Fix the issue that when the `AMEND TRANSACTION` feature is enabled, Drainer might choose the incorrect schema version to generate SQL statements [#1033](#)
- TiDB Lightning
  - \* Fix a bug that the Region is not split because the Region key is incorrectly encoded [#531](#)
  - \* Fix the issue that the failure of `CREATE TABLE` might be lost when multiple tables are created [#530](#)
  - \* Fix the issue of `column count mismatch` when using the TiDB-backend [#535](#)

### 16.17.8 TiDB 4.0.9 Release Notes

Release date: December 21, 2020

TiDB version: 4.0.9

#### 16.17.8.1 Compatibility Changes

- TiDB
  - Deprecate the `enable-streaming` configuration item [#21055](#)
- TiKV
  - Reduce I/O and mutex contention when encryption at rest is enabled. The change is backwardly incompatible. If users need to downgrade the cluster to a version earlier than v4.0.9, `security.encryption.enable-file-dictionary-log` must be disabled and TiKV must be restarted before the downgrade. [#9195](#)

### 16.17.8.2 New Features

- TiFlash
  - Support storing the latest data of the storage engine on multiple disks (experimental)
- TiDB Dashboard
  - Support displaying and sorting by all fields in the **SQL Statements** page [#749](#)
  - Support zooming and panning the topology graph [#772](#)
  - Support displaying the disk usage information in the **SQL Statements** and **Slow Queries** pages [#777](#)
  - Support exporting list data in the **SQL Statements** and **Slow Queries** pages [#778](#)
  - Support customizing the Prometheus address [#808](#)
  - Add a page for cluster statistics [#815](#)
  - Add more time-related fields in the **Slow Queries** details [#810](#)

### 16.17.8.3 Improvements

- TiDB
  - Avoid the (index) merge join in a heuristical way when converting equal conditions to other conditions [#21146](#)
  - Differentiate the types of user variables [#21107](#)
  - Support setting the `GOGC` variable in the configuration file [#20922](#)
  - Make the dumped binary time (`Timestamp` and `Datetime`) more compatible with MySQL [#21135](#)
  - Provide an error message for statements that use the `LOCK IN SHARE MODE` syntax [#21005](#)
  - Avoid outputting unnecessary warnings or errors when folding constants in shortcut-able expressions [#21040](#)
  - Raise an error when preparing the `LOAD DATA` statement [#21199](#)
  - Ignore the attribute of the integer zero-fill size when changing the integer column types [#20986](#)
  - Add the executor-related runtime information of DML statements in the result of `EXPLAIN ANALYZE` [#21066](#)
  - Disallow multiple updates on the primary key in a single SQL statements [#21113](#)
  - Add a monitoring metric for the connection idle time [#21301](#)
  - Temporarily enable the slow log when the `runtime/trace` tool is running [#20578](#)
- TiKV
  - Add the tag to trace the source of the `split` command [#8936](#)

- Support dynamically changing the `pessimistic-txn.pipelined` configuration [#9100](#)
  - Reduce the impact on performance when running Backup & Restore and TiDB Lightning [#9098](#)
  - Add monitoring metrics for the ingesting SST errors [#9096](#)
  - Prevent the leader from being hibernated when some peers still need to replicate logs [#9093](#)
  - Increase the success rate of the pipelined pessimistic locking [#9086](#)
  - Change the default value of `apply-max-batch-size` and `store-max-batch-size` to 1024 [#9020](#)
  - Add the `max-background-flushes` configuration item [#8947](#)
  - Disable `force-consistency-checks` by default to improve performance [#9029](#)
  - Offload the queries on the Region size from `pd heartbeat worker` to `split`  $\leftrightarrow$  `check worker` [#9185](#)
- PD
    - Check the TiKV cluster version when a TiKV stores become Tombstone, which prevents users from enabling incompatible features during the process of downgrade or upgrade [#3213](#)
    - Disallow the TiKV store of a lower version to change from Tombstone back to Up [#3206](#)
- TiDB Dashboard
    - Keep expanding when “Expand” is clicked for SQL statements [#775](#)
    - Open detail pages in new windows for **SQL Statements** and **Slow Queries** [#816](#)
    - Improve descriptions for time-related fields in **Slow Queries** details [#817](#)
    - Display detailed error messages [#794](#)
- TiFlash
    - Reduce the latency of replica reads
    - Refine TiFlash’s error messages
    - Limit the memory usage of cache data when the data volume is huge
    - Add a monitoring metric for the number of coprocessor tasks being handled
- Tools
    - Backup & Restore (BR)
      - \* Disallow the ambiguous `--checksum false` argument in the command line, which does not correctly disable checksum. Only `--checksum=false` is accepted. [#588](#)
      - \* Support changing the PD configuration temporarily so that PD can recover the original configuration after BR accidentally exists [#596](#)

- \* Support analyzing tables after restore [#622](#)
- \* Retry for the read index not ready and proposal in merging mode errors [#626](#)
- TiCDC
  - \* Add an alert for enabling TiKV's Hibernate Region feature [#1120](#)
  - \* Reduce memory usage in the schema storage [#1127](#)
  - \* Add the feature of unified sorter, which accelerates replication when the data size of the incremental scan is large (experimental) [#1122](#)
  - \* Support configuring the maximum message size and the maximum message batch in the TiCDC Open Protocol message (only for Kafka sink) [#1079](#)
- Dumpling
  - \* Retry dumping data on failed chunks [#182](#)
  - \* Support configuring both the `-F` and `-r` arguments at the same time [#177](#)
  - \* Exclude system databases in `--filter` by default [#194](#)
  - \* Support the `--transactional-consistency` parameter and support rebuilding MySQL connections during retry [#199](#)
  - \* Support using the `-c,--compress` parameter to specify the compression algorithm used by Dumpling. An empty string means no compression. [#202](#)
- TiDB Lightning
  - \* Filter out all system schemas by default [#459](#)
  - \* Support setting a default value for the auto-random primary key for the Local-backend or Importer-backend [#457](#)
  - \* Use range properties to make the range split more precise in Local-backend [#422](#)
  - \* Support a human-readable format (such as “2.5 GiB”) in `tikv-importer`
    - ↪ `.region-split-size`, `mydumper.read-block-size`, `mydumper.batch-size`, and `mydumper.max-region-size` [#471](#)
- TiDB Binlog
  - \* Exit the Drainer process with the non-zero code if the upstream PD is down or if applying DDL or DML statements to the downstream fails [#1012](#)

#### 16.17.8.4 Bug Fixes

- TiDB
  - Fix the issue of incorrect results when using a prefix index with the OR condition [#21287](#)
  - Fix a bug that might cause panic when automatic retry is enabled [#21285](#)
  - Fix a bug that occurs when checking partition definition according to column type [#21273](#)
  - Fix a bug that the value type of the partition expression is not consistent with the partition column type [#21136](#)

- Fix a bug that the hash-type partition does not check whether the partition name is unique [#21257](#)
- Fix the wrong results returned after inserting a value of the non-INT type into the hash partitioned table [#21238](#)
- Fix the unexpected error when using index join in the INSERT statement in some cases [#21249](#)
- Fix the issue that the `BigInt` unsigned column value in the `CASE WHEN` operator is incorrectly converted to the `BigInt` signed value [#21236](#)
- Fix a bug that index hash join and index merge join do not consider collation [#21219](#)
- Fix a bug that the partitioned table does not consider collation in the `CREATE ↪ TABLE` and `SELECT` syntax [#21181](#)
- Fix the issue that the query result of `slow_query` might miss some rows [#21211](#)
- Fix the issue that `DELETE` might not delete data correctly when the database name is not in a pure lower representation [#21206](#)
- Fix a bug that causes schema change after DML operations [#21050](#)
- Fix the bug that the coalesced column cannot be queried when using join [#21021](#)
- Fix the wrong results of some semi-join queries [#21019](#)
- Fix the issue that the table lock does not take effect on the `UPDATE` statement [#21002](#)
- Fix the issue of stack overflow that occurs when building the recursive view [#21001](#)
- Fix the unexpected result returned when performing index merge join operations on outer join [#20954](#)
- Fix the issue that sometimes a transaction that has an undetermined result might be treated as failed [#20925](#)
- Fix the issue that `EXPLAIN FOR CONNECTION` cannot show the last query plan [#21315](#)
- Fix the issue that when Index Merge is used in a transaction with the Read Committed isolation level, the result might be incorrect [#21253](#)
- Fix the auto-ID allocation failure caused by the transaction retry after the write conflict [#21079](#)
- Fix the issue that JSON data cannot be correctly imported to TiDB using `LOAD ↪ DATA` [#21074](#)
- Fix the issue that the default value of newly added `Enum`-type columns is incorrect [#20998](#)
- Fix the issue that the `adddate` function inserts invalid characters [#21176](#)
- Fix the issue that the wrong `PointGet` plan generated in some situations causes wrong results [#21244](#)
- Ignore the conversion of daylight saving time in the `ADD_DATE` function to be compatible with MySQL [#20888](#)
- Fix a bug that prevents inserting strings with trailing spaces that exceed `varchar` or `char`'s length constraint [#21282](#)
- Fix a bug that does not converting the integer from `[1, 69]` to `[2001, 2069]` or from `[70, 99]` to `[1970, 1999]` when comparing `int` with `year` [#21283](#)

- Fix the panic caused by the overflowing result of the `sum()` function when calculating the `Double` type field [#21272](#)
  - Fix a bug that `DELETE` fails to add lock on the unique key [#20705](#)
  - Fix a bug that snapshot reads hits the lock cache [#21539](#)
  - Fix an issue of potential memory leak after reading a lot of data in a long-lived transaction [#21129](#)
  - Fix the issue that omitting the table alias in a subquery will have a syntax error returned [#20367](#)
  - Fix the issue that when the argument of the `IN` function in a query is the time type, the query might return an incorrect result [#21290](#)
- TiKV
    - Fix the issue that Coprocessor might return wrong results when there are more than 255 columns [#9131](#)
    - Fix the issue that Region Merge might cause data loss during network partition [#9108](#)
    - Fix the issue that the `ANALYZE` statement might cause panic when using the `latin1` character set [#9082](#)
    - Fix the wrong results returned when converting the numeric type to the time type [#9031](#)
    - Fix a bug that TiDB Lightning fails to ingest SST files to TiKV with the Importer-backend or Local-backend when Transparent Data Encryption (TDE) is enabled [#8995](#)
    - Fix the invalid `advertise-status-addr` value (0.0.0.0) [#9036](#)
    - Fix the issue that an error is returned indicating that a key exists when this key is locked and deleted in a committed transaction [#8930](#)
    - Fix the issue that the RocksDB cache mapping error causes data corruption [#9029](#)
    - Fix a bug that Follower Read might return stale data after the leader is transferred [#9240](#)
    - Fix the issue that stale old values might be read in the pessimistic lock [#9282](#)
    - Fix a bug that replica read might get stale data after the leader transfer [#9240](#)
    - Fix the issue of TiKV crash that occurs when receiving `SIGPROF` after profiling [#9229](#)
  - PD
    - Fix the issue that the leader roles specified using placement rules do not take effect in some cases [#3208](#)
    - Fix the issue that the `trace-region-flow` value is unexpectedly set to `false` [#3120](#)
    - Fix a bug that the service safepoint with infinite Time To Live (TTL) does not work [#3143](#)
  - TiDB Dashboard

- Fix a display issue of time in the Chinese language [#755](#)
- Fix a bug that the browser compatibility notice does not work [#776](#)
- Fix the issue that the transaction `start_ts` is incorrectly displayed in some scenarios [#793](#)
- Fix the issue that some SQL texts are incorrectly formatted [#805](#)
- TiFlash
  - Fix the issue that `INFORMATION_SCHEMA.CLUSTER_HARDWARE` might contain the information of disks that are not in use
  - Fix the issue that the estimate on memory usage of Delta Cache is smaller than the actual usage
  - Fix the memory leak caused by thread information statistics
- Tools
  - Backup & Restore (BR)
    - \* Fix the failure caused by special characters in S3 secret access keys [#617](#)
  - TiCDC
    - \* Fix the issue that multiple owners might exist when the owner campaign key is deleted [#1104](#)
    - \* Fix a bug that TiCDC might fail to continue replicating data when a TiKV node crashes or recovers from a crash. This bug only exists in v4.0.8. [#1198](#)
    - \* Fix the issue that the metadata is repeatedly flushed to etcd before a table is initialized [#1191](#)
    - \* Fix an issue of replication interruption caused by early GC or the latency of updating `TableInfo` when the schema storage caches TiDB tables [#1114](#)
    - \* Fix the issue that the schema storage costs too much memory when DDL operations are frequent [#1127](#)
    - \* Fix the goroutine leak when a changefeed is paused or stopped [#1075](#)
    - \* Increase the maximum retry timeout to 600 seconds in Kafka producer to prevent replication interruption caused by the service or network jitter in the downstream Kafka [#1118](#)
    - \* Fix a bug that the Kafka batch size does not take effect [#1112](#)
    - \* Fix a bug that some tables' row change might be lost when the network between TiCDC and PD has jitter and when there are paused changefeeds being resumed at the same time [#1213](#)
    - \* Fix a bug that the TiCDC process might exit when the network between TiCDC and PD is not stable [#1218](#)
    - \* Use a singleton PD client in TiCDC and fix a bug that TiCDC closes PD client by accident which causes replication block [#1217](#)
    - \* Fix a bug that the TiCDC owner might consume too much memory in the etcd watch client [#1224](#)
  - Dumpling

- \* Fix the issue that Dumping might get blocked when its connection to the MySQL database server is closed [#190](#)
- TiDB Lightning
  - \* Fix the issue that keys are encoded using the wrong field information [#437](#)
  - \* Fix the issue that GC life time TTL does not take effect [#448](#)
  - \* Fix the issue that causes panic when manually stops the running TiDB Lightning in the Local-backend mode [#484](#)

### 16.17.9 TiDB 4.0.8 Release Notes

Release date: October 30, 2020

TiDB version: 4.0.8

#### 16.17.9.1 New Features

- TiDB
  - Support the new aggregate function APPROX\_PERCENTILE [#20197](#)
- TiFlash
  - Support pushing down CAST functions
- Tools
  - TiCDC
    - \* Support snapshot-level consistent replication [#932](#)

#### 16.17.9.2 Improvements

- TiDB
  - Prioritize low-selectivity indexes in the greedy search procedure of `Selectivity()` [#20154](#)
  - Record more RPC runtime information in Coprocessor runtime statistics [#19264](#)
  - Speed up parsing the slow log to improve query performance [#20556](#)
  - Wait for timeout execution plans during the plan binding stage to record more debug information when the SQL optimizer is verifying potential new plans [#20530](#)
  - Add the execution retry time in the slow log and the slow query result [#20495](#) [#20494](#)
  - Add the `table_storage_stats` system table [#20431](#)
  - Add the RPC runtime statistical information for the INSERT/UPDATE/REPLACE statement [#20430](#)

- Add the operator information in the result of `EXPLAIN FOR CONNECTION` [#20384](#)
- Adjust the TiDB error log to the `DEBUG` level for the client connection/disconnection activities [#20321](#)
- Add monitoring metrics for Coprocessor Cache [#20293](#)
- Add the runtime information of pessimistic lock keys [#20199](#)
- Add two extra sections of time consumption information in the runtime information and `trace span` [#20187](#)
- Add the runtime information of transaction commit in the slow log [#20185](#)
- Disable the index merge join [#20599](#)
- Add the ISO 8601 and timezone supports for temporal string literals [#20670](#)
- TiKV
  - Add the **Fast-Tune** panel page to assist performance diagnostics [#8804](#)
  - Add the `security.redact-info-log` configuration item, which redacts user data from logs [#8746](#)
  - Reformat the metafile of error codes [#8877](#)
  - Enable dynamically changing the `pessimistic-txn.pipelined` configuration [#8853](#)
  - Enable the memory profiling features by default [#8801](#)
- PD
  - Generate the metafile of errors [#3090](#)
  - Add the additional information for the operator [#3009](#)
- TiFlash
  - Add monitoring metrics of Raft logs
  - Add monitoring metrics of memory usage for `cop` tasks
  - Make the `min/max` index more accurate when data is deleted
  - Improve query performance in the case of a small data volume
  - Add the `errors.toml` file to support the standard error code
- Tools
  - Backup and Restore (BR)
    - \* Speed up the restore process by pipelining `split` and `ingest` [#427](#)
    - \* Support manually restoring PD schedulers [#530](#)
    - \* Use `pause` schedulers instead of `remove` schedulers [#551](#)
  - TiCDC
    - \* Print statistics in MySQL sink periodically [#1023](#)
  - Dumpling
    - \* Support dumping data directly to S3 storages [#155](#)

- \* Support dumping views [#158](#)
- \* Support dumping the table that only contains generated columns [#166](#)
- TiDB Lightning
  - \* Support multi-byte CSV delimiters and separators [#406](#)
  - \* Speed up the restore process by disabling some PD schedulers [#408](#)
  - \* Use the GC-TTL API for checksum GC safepoint in the v4.0 cluster to avoid the GC error [#396](#)

### 16.17.9.3 Bug Fixes

- TiDB
  - Fix the unexpected panic that occurs when using partitioned tables [#20565](#)
  - Fix the wrong result of outer join when filtering the outer side using index merge join [#20427](#)
  - Fix the issue that the NULL value is returned when converting data to the BIT type if the data is too long [#20363](#)
  - Fix the corrupted default value for the BIT type column [#20340](#)
  - Fix the overflow error that might occur when converting the BIT type to the INT64 type [#20312](#)
  - Fix the possible wrong result of the propagate column optimization for the hybrid type column [#20297](#)
  - Fix the panic that might occur when storing outdated plans from the plan cache [#20246](#)
  - Fix the bug that the returned result is mistakenly truncated if FROM\_UNIXTIME and UNION ALL are used together [#20240](#)
  - Fix the issue that wrong results might be returned when the Enum type value is converted to the Float type [#20235](#)
  - Fix the possible panic of RegionStore.accessStore [#20210](#)
  - Fix the wrong result returned when sorting the maximum unsigned integer in BatchPointGet [#20205](#)
  - Fix the bug that the coercibilities of Enum and Set are wrong [#20364](#)
  - Fix an issue of ambiguous YEAR conversion [#20292](#)
  - Fix the issue of wrong reported result that occurs when the KV duration panel contains store0 [#20260](#)
  - Fix the issue that the Float type data is mistakenly inserted regardless of the out of range error [#20252](#)
  - Fix the bug that the generated column does not handle bad NULL values [#20216](#)
  - Fix the inaccurate error information for the YEAR type data that is out of range [#20170](#)
  - Fix the unexpected invalid auto-id error that might occur during the pessimistic transaction retry [#20134](#)
  - Fix the issue that the constraint is not checked when using ALTER TABLE to change the Enum/Set type [#20046](#)

- Fix the wrong runtime information of cop tasks recorded when multiple operators are used for concurrency [#19947](#)
- Fix the issue that read-only system variables cannot be explicitly selected as the session variables [#19944](#)
- Fix the issue that the duplicate ORDER BY condition might cause sub-optimal execution plans [#20333](#)
- Fix the issue that the generated metric profile might fail if the font size exceeds the maximum allowable value [#20637](#)
- TiKV
  - Fix the bug that the mutex conflict in encryption causes pd-worker to process heartbeats slowly [#8869](#)
  - Fix the issue that the memory profile is mistakenly generated [#8790](#)
  - Fix the failure to back up databases on GCS when the storage class is specified [#8763](#)
  - Fix the bug that a learner cannot find a leader when the Region is restarted or newly split [#8864](#)
- PD
  - Fix a bug that Key Visualizer of TiDB Dashboard might cause PD panic in some cases [#3096](#)
  - Fix the bug that PD might panic if a PD store is down for more than 10 minutes [#3069](#)
- TiFlash
  - Fix the issue of wrong timestamp in the log message
  - Fix the issue that during the multi-disk TiFlash deployment, the wrong capacity causes the creation of TiFlash replicas to fail
  - Fix the bug that TiFlash might throw errors about broken data files after restart
  - Fix the issue that broken files might be left on disk after TiFlash crashes
  - Fix the bug that it might take a long time to wait for index during learner reads if the proxy cannot catch up with the latest Raft lease information
  - Fix the bug that the proxy writes too much Region state information to the key-value engine while replaying the outdated Raft log
- Tools
  - Backup and Restore (BR)
    - \* Fix the `send on closed channel` panic during restore [#559](#)
  - TiCDC
    - \* Fix the unexpected exit caused by the failure to update the GC safepoint [#979](#)

- \* Fix the issue that the task status is unexpectedly flushed because of the incorrect mod revision cache [#1017](#)
- \* Fix the unexpected empty Maxwell messages [#978](#)
- TiDB Lightning
  - \* Fix the issue of wrong column information [#420](#)
  - \* Fix the infinity loop that occurs when retrying to get Region information in the local mode [#418](#)

### 16.17.10 TiDB 4.0.7 Release Notes

Release date: September 29, 2020

TiDB version: 4.0.7

#### 16.17.10.1 New Features

- PD
  - Add the `GetAllMembers` function in the PD client to get PD member information [#2980](#)
- TiDB Dashboard
  - Support generating the metrics relationship graph [#760](#)

#### 16.17.10.2 Improvements

- TiDB
  - Add more runtime information for the `join` operator [#20093](#)
  - Add the hit ratio information of coprocessor cache in `EXPLAIN ANALYZE` [#19972](#)
  - Support pushing down the `ROUND` function to TiFlash [#19967](#)
  - Add the default value of `CMSketch` for `ANALYZE` [#19927](#)
  - Refine error message desensitization [#20004](#)
  - Accept connections from clients using connectors from MySQL 8.0 [#19959](#)
- TiKV
  - Support the JSON log format [#8382](#)
- PD
  - Count schedule operators when they are finished rather than added [#2983](#)
  - Set the `make-up-replica` operator to high priority [#2977](#)

- TiFlash
  - Improve the error handling of the Region meta change that occurs during reads
- Tools
  - TiCDC
    - \* Support translating more execution-efficient SQL statements in MySQL sink when the old value feature is enabled [#955](#)
  - Backup & Restore (BR)
    - \* Add connection retry when the connection is broken during backup [#508](#)
  - TiDB Lightning
    - \* Support dynamically updating the log level via the HTTP interface [#393](#)

### 16.17.10.3 Bug Fixes

- TiDB
  - Fix a vectorization bug from `and/or/COALESCE` caused by shortcut [#20092](#)
  - Fix the issue that plan digests are the same when the cop task stores are of different types [#20076](#)
  - Fix the wrong behavior of the `!= any()` function [#20062](#)
  - Fix the query error that occurs when the `slow-log` file does not exist [#20051](#)
  - Fix the issue that Region requests continue to retry when the context is canceled [#20031](#)
  - Fix the issue that querying the time type of the `cluster_slow_query` table in streaming request might result in an error [#19943](#)
  - Fix the issue that DML statements using `case when` might cause schema change [#20095](#)
  - Fix the issue that the `prev_stmt` information in slow log is not desensitized [#20048](#)
  - Fix the issue that tidb-server does not release the table lock when it exits abnormally [#20020](#)
  - Fix the incorrect error message that occurs when inserting data of the `ENUM` and `SET` type [#19950](#)
  - Fix the wrong behavior of the `IsTrue` function in some situations [#19903](#)
  - Fix the issue that the `CLUSTER_INFO` system table might not work normally after PD is scaled in or out [#20026](#)
  - Avoid unnecessary warnings or errors when folding constants in `control` expressions [#19910](#)
  - Update the method of updating statistics to avoid Out of Memory (OOM) [#20013](#)
- TiKV

- Fix the issue of unavailable Status API when TLS handshake fails [#8649](#)
- Fix the potential undefined behaviors [#7782](#)
- Fix the possible panic caused by generating snapshots when executing `UnsafeDestroyRange` [#8681](#)
- PD
  - Fix the bug that PD might panic if some Regions have no Leader when `balance`  $\leftrightarrow$  `-region` is enabled [#2994](#)
  - Fix the statistical deviation of Region size and Region keys after Region merge [#2985](#)
  - Fix the incorrect hotspot statistics [#2991](#)
  - Fix the issue that there is no `nil` check in `redirectSchedulerDelete` [#2974](#)
- TiFlash
  - Fix the wrong result of right outer join
- Tools
  - Backup & Restore (BR)
    - \* Fix a bug that causes the TiDB configuration to change after the restore process [#509](#)
  - Dumpling
    - \* Fix the issue that Dumpling fails to parse metadata when some variables are `NULL` [#150](#)

### 16.17.11 TiDB 4.0.6 Release Notes

Release date: September 15, 2020

TiDB version: 4.0.6

#### 16.17.11.1 New Features

- TiFlash
  - Support outer join in TiFlash broadcast join
- TiDB Dashboard
  - Add Query Editor and execution UI (experimental) [#713](#)
  - Support store location topology visualization [#719](#)
  - Add cluster configuration UI (experimental) [#733](#)
  - Support sharing the current session [#741](#)

- Support displaying the number of execution plans in SQL Statement list [#746](#)
- Tools
  - TiCDC (GA since v4.0.6)
    - \* Support outputting data in the maxwell format [#869](#)

### 16.17.11.2 Improvements

- TiDB
  - Replace error codes and messages with standard errors [#19888](#)
  - Improve the write performance of partitioned table [#19649](#)
  - Record more RPC runtime information in Cop Runtime statistics [#19264](#)
  - Forbid creating tables in `metrics_schema` and `performance_schema` [#19792](#)
  - Support adjusting the concurrency of the union executor [#19886](#)
  - Support out join in broadcast join [#19664](#)
  - Add SQL digest for the process list [#19829](#)
  - Switch to the pessimistic transaction mode for autocommit statement retry [#19796](#)
  - Support the %r and %T data format in `Str_to_date()` [#19693](#)
  - Enable `SELECT INTO OUTFILE` to require the file privilege [#19577](#)
  - Support the `stddev_pop` function [#19541](#)
  - Add the TiDB-Runtime dashboard [#19396](#)
  - Improve compatibility for the `ALTER TABLE` algorithms [#19364](#)
  - Encode `insert/delete/update` plans in the slow log plan field [#19269](#)
- TiKV
  - Reduce QPS drop when `DropTable` or `TruncateTable` is being executed [#8627](#)
  - Support generating metafile of error codes [#8619](#)
  - Add performance statistics for cf scan details [#8618](#)
  - Add the `rocksdb perf context` panel in the Grafana default template [#8467](#)
- PD
  - Update TiDB Dashboard to v2020.09.08.1 [#2928](#)
  - Add more metrics for Region and store heartbeat [#2891](#)
  - Change back to the original way to control the low space threshold [#2875](#)
  - Support standard error codes
    - \* [#2918](#) [#2911](#) [#2913](#) [#2915](#) [#2912](#)
    - \* [#2907](#) [#2906](#) [#2903](#) [#2806](#) [#2900](#) [#2902](#)
- TiFlash

- Add Grafana panels for data replication (apply `Region snapshots` and `ingest`  $\leftrightarrow$  `SST files`)
- Add Grafana panels for `write stall`
- Add `dt_segment_force_merge_delta_rows` and `dt_segment_force_merge_delta_deletes`  $\leftrightarrow$  to adjust the threshold of `write stall`
- Support setting `raftstore.snap-handle-pool-size` to 0 in TiFlash-Proxy to disable applying Region snapshot by multi-thread to reduce memory consumption during data replication
- Support CN check on `https_port` and `metrics_port`
- Tools
  - TiCDC
    - \* Skip resolved lock during puller initialization [#910](#)
    - \* Reduce PD write frequency [#937](#)
  - Backup & Restore (BR)
    - \* Add real time cost in summary log [#486](#)
  - Dumpling
    - \* Support outputting `INSERT` with column names [#135](#)
    - \* Unify the `--filesize` and `--statement-size` definitions with those of `mydumper` [#142](#)
  - TiDB Lightning
    - \* Split and ingest Regions in more precise sizes [#369](#)
  - TiDB Binlog
    - \* Support setting GC time in `go time` package format [#996](#)

### 16.17.11.3 Bug Fixes

- TiDB
  - Fix an issue of collecting the `tikv_cop_wait` time in metric profile [#19881](#)
  - Fix the wrong result of `SHOW GRANTS` [#19834](#)
  - Fix the incorrect query result of `!= ALL (subq)` [#19831](#)
  - Fix a bug of converting the `enum` and `set` types [#19778](#)
  - Add a privilege check for `SHOW STATS_META` and `SHOW STATS_BUCKET` [#19760](#)
  - Fix the error of unmatched column lengths caused by `builtinGreatestStringSig`  $\leftrightarrow$  and `builtinLeastStringSig` [#19758](#)
  - If unnecessary errors or warnings occur, the vectorized control expressions fall back to their scalar execution [#19749](#)
  - Fix the error of the `Apply` operator when the type of the correlation column is `Bit` [#19692](#)

- Fix the issue that occurs when the user queries `processlist` and `cluster_log` in MySQL 8.0 client [#19690](#)
- Fix the issue that plans of the same type have different plan digests [#19684](#)
- Forbid changing the column type from `Decimal` to `Int` [#19682](#)
- Fix the issue that `SELECT ... INTO OUTFILE` returns the runtime error [#19672](#)
- Fix the incorrect implementation of `builtinRealIsFalseSig` [#19670](#)
- Fix the issue that the partition expression check misses the parentheses expression [#19614](#)
- Fix a query error when there is an `Apply` operator upon `HashJoin` [#19611](#)
- Fix an incorrect result of vectorization that casts `Real` as `Time` [#19594](#)
- Fix the bug that the `SHOW GRANTS` statement shows grants for non-existent users [#19588](#)
- Fix a query error when there is an `Apply` executor upon `IndexLookupJoin` [#19566](#)
- Fix the wrong results when converting `Apply` to `HashJoin` on a partitioned table [#19546](#)
- Fix incorrect results when there is an `IndexLookUp` executor on the inner side of an `Apply` [#19508](#)
- Fix an unexpected panic when using view [#19491](#)
- Fix the incorrect result of the `anti-semi-join` query [#19477](#)
- Fix the bug that the `TopN` statistics is not deleted when the statistics is dropped [#19465](#)
- Fix a wrong result caused by mistaken usage of batch point get [#19460](#)
- Fix the bug that a column cannot be found in `indexLookupJoin` with a virtual generated column [#19439](#)
- Fix an error that different plans of the `select` and `update` queries compare datum [#19403](#)
- Fix a data race for TiFlash work index in Region cache [#19362](#)
- Fix the bug that the `logarithm` function does not show a warning [#19291](#)
- Fix an unexpected error that occurs when TiDB persists data to disks [#19272](#)
- Support using a single partitioned table on the inner side of index join [#19197](#)
- Fix the wrong hash key value generated for decimal [#19188](#)
- Fix the issue that TiDB returns a `no regions` error when table `endKey` and Region `endKey` are the same [#19895](#)
- Fix the unexpected success of `alter partition` [#19891](#)
- Fix the wrong value of the default maximum packet length allowed for pushed down expressions [#19876](#)
- Fix a wrong behavior for the `Max/Min` functions on the `ENUM/SET` columns [#19869](#)
- Fix the read failure from the `tiflash_segments` and `tiflash_tables` system tables when some TiFlash nodes are offline [#19748](#)
- Fix a wrong result of the `Count(col)` aggregation function [#19628](#)
- Fix a runtime error of the `TRUNCATE` operation [#19445](#)
- Fix the issue that `PREPARE statement FROM @Var` will fail when `Var` contains uppercase characters [#19378](#)
- Fix the bug that schema charset modification in an uppercase schema will cause panic [#19302](#)

- Fix the inconsistency of plans between `information_schema.statements_summary`  $\leftrightarrow$  and `explain`, when the information contains `tikv/tiflash` [#19159](#)
  - Fix the error in tests that the file does not exist for `select into outfile` [#19725](#)
  - Fix the issue that `INFORMATION_SCHEMA.CLUSTER_HARDWARE` does not have raid device information [#19457](#)
  - Make the `add index` operation that has a generated column with the `case-when` expression can exit normally when it encounters a parse error [#19395](#)
  - Fix the bug that the DDL operation takes too long to retry [#19488](#)
  - Make statements like `alter table db.t1 add constraint fk foreign key (  $\leftrightarrow$  c2)references t2(c1)` execute without first executing `use db` [#19471](#)
  - Change the dispatch error from the `Error` to the `Info` message in the server log file [#19454](#)
- TiKV
    - Fix the estimation error for a non-index column when collation is enabled [#8620](#)
    - Fix the issue that Green GC might miss locks during the process of Region transfer [#8460](#)
    - Fix a panic issue that occurs when TiKV runs very slowly during Raft membership change [#8497](#)
    - Fix the deadlock issue that occurs between the PD client thread and other threads when calling PD sync requests [#8612](#)
    - Upgrade jemalloc to v5.2.1 to address the issue of memory allocation in huge page [#8463](#)
    - Fix the issue that the unified thread pool hangs for long-running queries [#8427](#)
- PD
    - Add the `initial-cluster-token` configuration to prevent different clusters from communicating with each other during bootstrap [#2922](#)
    - Fix the unit of store limit rate when the mode is `auto` [#2826](#)
    - Fix the issue that some schedulers persist configuration without solving errors [#2818](#)
    - Fix the empty HTTP response in scheduler [#2871](#) [#2874](#)
- TiFlash
    - Fix the issue that after renaming the primary key column in previous versions, TiFlash might not start after upgrading to v4.0.4/v4.0.5
    - Fix the exceptions that occur after modifying the column's `nullable` attribute
    - Fix the crash caused by computing a table's replication status
    - Fix the issue that TiFlash is not available for data reads after users applied unsupported DDL operations
    - Fix the exceptions caused by unsupported collations which are treated as `utf8mb4_bin`

- Fix the issue that the QPS panel for the TiFlash coprocessor executor always displays 0 in Grafana
- Fix the wrong result of the `FROM_UNIXTIME` function when input is `NULL`
- Tools
  - TiCDC
    - \* Fix the issue that TiCDC leaks memory in some cases [#942](#)
    - \* Fix the issue that TiCDC might panic in Kafka sink [#912](#)
    - \* Fix the issue that CommitTs or ResolvedTs (CRTs) might be less than `resolvedTs` in puller [#927](#)
    - \* Fix the issue that `changefeed` might be blocked by MySQL driver [#936](#)
    - \* Fix the incorrect Resolved Ts interval of TiCDC [#8573](#)
  - Backup & Restore (BR)
    - \* Fix a panic that might occur during checksum [#479](#)
    - \* Fix a panic that might occur after the change of PD Leader [#496](#)
  - Dumpling
    - \* Fix the issue that the `NULL` value for the binary type is not handled properly [#137](#)
  - TiDB Lightning
    - \* Fix the issue that all failed operations of writes and ingests are mistakenly displayed as successful [#381](#)
    - \* Fix the issue that some checkpoint updates might not be written to the database before TiDB Lightning exits [#386](#)

## 16.17.12 TiDB 4.0.5 Release Notes

Release date: August 31, 2020

TiDB version: 4.0.5

### 16.17.12.1 Compatibility Changes

- TiDB
  - Change `drop partition` and `truncate partition`'s job arguments to support the ID array of multiple partitions [#18930](#)
  - Add the delete-only state for checking `add partition` replicas [#18865](#)

### 16.17.12.2 New Features

- TiKV
  - Define error code for errors [#8387](#)
- TiFlash
  - Support the unified log format with TiDB
- Tools
  - TiCDC
    - \* Support Kafka SSL connection [#764](#)
    - \* Support outputting the old value [#708](#)
    - \* Add the column flags [#796](#)
    - \* Support outputting the DDL statements and table schema of the previous version [#799](#)

### 16.17.12.3 Improvements

- TiDB
  - Optimize the performance of `DecodePlan` for big union queries [#18941](#)
  - Reduce the number of GC lock scans when the `Region cache miss` error occurs [#18876](#)
  - Ease the impact of statistical feedback on cluster performance [#18772](#)
  - Support canceling operations before the RPC response is returned [#18580](#)
  - Add the HTTP API to generate the TiDB metric profile [#18531](#)
  - Support scattering partitioned tables [#17863](#)
  - Add detailed memory usage of each instance in Grafana [#18679](#)
  - Show the detailed runtime information of the `BatchPointGet` operator in the result of `EXPLAIN` [#18892](#)
  - Show the detailed runtime information of the `PointGet` operator in the result of `EXPLAIN` [#18817](#)
  - Warn the potential deadlock for `Consume` in `remove()` [#18395](#)
  - Refine the behaviors of `StrToInt` and `StrToFloat` and support converting JSON to the `date`, `time`, and `timestamp` types [#18159](#)
  - Support limiting the memory usage of the `TableReader` operator [#18392](#)
  - Avoid too many times of backoff when retrying the `batch cop` request [#18999](#)
  - Improve compatibility for `ALTER TABLE` algorithms [#19270](#)
  - Make the single partitioned table support `IndexJoin` on the inner side [#19151](#)
  - Support searching the log file even when the log includes invalid lines [#18579](#)
- PD

- Support scattering Regions in stores with special engines (such as TiFlash) [#2706](#)
  - Support the Region HTTP API to prioritize Region scheduling of a given key range [#2687](#)
  - Improve the leader distribution after Region scattering [#2684](#)
  - Add more tests and logs for the TSO request [#2678](#)
  - Avoid invalid cache updates after the leader of a Region has changed [#2672](#)
  - Add an option to allow `store.GetLimit` to return the tombstone stores [#2743](#)
  - Support synchronizing the Region leader change between the PD leader and followers [#2795](#)
  - Add commands for querying the GC safepoint service [#2797](#)
  - Replace the `region.Clone` call in filters to improve performance [#2801](#)
  - Add an option to disable updating Region flow cache to improve the performance of the large cluster [#2848](#)
- TiFlash
    - Add more Grafana panels to display metrics of CPU, I/O, RAM usages and metrics of the storage engine
    - Reduce I/O operations by optimizing the processing logic of Raft logs
    - Accelerate Region scheduling for the blocked `add partition` DDL statement
    - Optimize compactions of delta data in DeltaTree to reduce read and write amplification
    - Optimize the performance of applying Region snapshots by preprocessing the snapshots using multiple threads
    - Optimize the number of opening file descriptors when the read load of TiFlash is low to reduce system resource consumption
    - Optimize the number of unnecessary small files created when TiFlash restarts
    - Support encryption at rest for data storage
    - Support TLS for data transfer
- Tools
    - TiCDC
      - \* Lower the frequency of getting TSO [#801](#)
    - Backup & Restore (BR)
      - \* Optimize some logs [#428](#)
    - Dumping
      - \* Release FTWRL after connections are created to reduce the lock time for MySQL [#121](#)
    - TiDB Lightning
      - \* Optimize some logs [#352](#)

#### 16.17.12.4 Bug Fixes

- TiDB
  - Fix the `should ensure all columns have the same length` error that occurs because the `ErrTruncate/Overflow` error is incorrectly handled in the `builtinCastRealAsDecimalSig` function [#18967](#)
  - Fix the issue that the `pre_split_regions` table option does not work in the partitioned table [#18837](#)
  - Fix the issue that might cause a large transaction to be terminated prematurely [#18813](#)
  - Fix the issue that using the `collation` functions get wrong query results [#18735](#)
  - Fix the bug that the `getAutoIncrementID()` function does not consider the `tidb_snapshot` session variable, which might cause the dumper tool to fail with the `table not exist` error [#18692](#)
  - Fix the `unknown column` error for SQL statement like `select a from t ↪ having t.a` [#18434](#)
  - Fix the panic issue that writing the 64-bit unsigned type into the hash partitioned table causes overflow and gets an unexpected negative number when the partition key is the integer type [#18186](#)
  - Fix the wrong behavior of the `char` function [#18122](#)
  - Fix the issue that the `ADMIN REPAIR TABLE` statement cannot parse integer in the expressions on the range partition [#17988](#)
  - Fix the wrong behavior of the `SET CHARSET` statement [#17289](#)
  - Fix the bug caused by the wrong collation setting which leads to the wrong result of the `collation` function [#17231](#)
  - Fix the issue that `STR_TO_DATE`'s handling of the format tokens `'%r'`, `'%h'` is inconsistent with that of MySQL [#18727](#)
  - Fix issues that the TiDB version information is inconsistent with that of PD/TiKV in the `cluster_info` table [#18413](#)
  - Fix the existent checks for pessimistic transactions [#19004](#)
  - Fix the issue that executing `union select for update` might cause concurrent race [#19006](#)
  - Fix the wrong query result when `apply` has a child of the `PointGet` operator [#19046](#)
  - Fix the incorrect result that occurs when `IndexLookUp` is in the inner side of the `Apply` operator [#19496](#)
  - Fix the incorrect result of `anti-semi-join` queries [#19472](#)
  - Fix the incorrect result caused by the mistaken usage of `BatchPointGet` [#19456](#)
  - Fix the incorrect result that occurs when `UnionScan` is in the inner side of the `Apply` operator [#19496](#)
  - Fix the panic caused by using the `EXECUTE` statement to print an expensive query log [#17419](#)
  - Fix the index join error when the join key is `ENUM` or `SET` [#19235](#)

- Fix the issue that the query range cannot be built when the NULL value exists on the index column [#19358](#)
- Fix the data race issue caused by updating the global configuration [#17964](#)
- Fix the panic issue occurs when modifying the character set in an uppercase schema [#19286](#)
- Fix an unexpected error caused by changing the temporary directory during the disk spill action [#18970](#)
- Fix the wrong hash key for the decimal type [#19131](#)
- Fix the issue that the `PointGet` and `BatchPointGet` operators do not consider the partition selection syntax and get incorrect results [#19141](#)
- Fix the incorrect results when using the `Apply` operator together with the `UnionScan` operator [#19104](#)
- Fix the bug that causes the indexed virtual generated column to return wrong value [#17989](#)
- Add the lock for runtime statistics to fix a panic caused by concurrent execution [#18983](#)
- TiKV
  - Speed up leader election when Hibernate Region is enabled [#8292](#)
  - Fix the memory leak issue during scheduling [#8357](#)
  - Add the `hibernate-timeout` configuration item to prevent the leader from becoming hibernate too fast [#8208](#)
- PD
  - Fix the bug that the TSO request might fail at the time of leader change [#2666](#)
  - Fix the issue that sometimes Region replicas cannot be scheduled to the optimal state when placement rules are enabled [#2720](#)
  - Fix the issue that `Balance Leader` does not work when placement rules are enabled [#2726](#)
  - Fix the issue that unhealthy stores are not filtered from store load statistics [#2805](#)
- TiFlash
  - Fix the issue that TiFlash cannot start normally after upgrading from an earlier version if the name of the database or table contains special characters
  - Fix the issue that the TiFlash process cannot exit if any exceptions are thrown during initialization
- Tools
  - Backup & Restore (BR)
    - \* Fix the issue of duplicated calculation of total KV and total bytes in the backup summary log [#472](#)

- \* Fix the issue that the import mode does not work in the first 5 minutes after switching to this mode [#473](#)
- Dumping
  - \* Fix the issue that FTWRL lock is not released in time [#128](#)
- TiCDC
  - \* Fix the issue that the failed `changefeed` cannot be removed [#782](#)
  - \* Fix invalid `delete` events by selecting one unique index as the handle index [#787](#)
  - \* Fix the bug that GC safepoint is forwarded beyond the checkpoint of stopped `changefeed` [#797](#)
  - \* Fix the bug that the network I/O waiting blocks tasks to exit [#825](#)
  - \* Fix the bug that some unnecessary data might be mistakenly replicated to the downstream [#743](#)
- TiDB Lightning
  - \* Fix the syntax error on empty binary/hex literals when using TiDB backend [#357](#)

### 16.17.13 TiDB 4.0.4 Release Notes

Release date: July 31, 2020

TiDB version: 4.0.4

#### 16.17.13.1 Bug Fixes

- TiDB
  - Fix the issue of getting stuck when querying `information_schema.columns` [#18849](#)
  - Fix the errors that occur when the `PointGet` and `BatchPointGet` operators encounter `in null` [#18848](#)
  - Fix the wrong result of `BatchPointGet` [#18815](#)
  - Fix the issue of incorrect query result that occurs when the `HashJoin` operator encounters the `set` or `enum` type [#18859](#)

### 16.17.14 TiDB 4.0.3 Release Notes

Release date: July 24, 2020

TiDB version: 4.0.3

### 16.17.14.1 New Features

- TiDB Dashboard
  - Display detailed TiDB Dashboard version information [#679](#)
  - Show browser compatibility notice for unsupported browsers or outdated browsers [#654](#)
  - Support searching in the **SQL Statements** page [#658](#)
- TiFlash
  - Implement file encryption in TiFlash proxy
- Tools
  - Backup & Restore (BR)
    - \* Support compressing backup files using zstd, lz4 or snappy [#404](#)
  - TiCDC
    - \* Support configuring `kafka-client-id` in MQ sink-uri [#706](#)
    - \* Support updating `changefeed` configuration offline [#699](#)
    - \* Support setting customized `changefeed` name [#727](#)
    - \* Support TLS and MySQL SSL connection [#347](#)
    - \* Support outputting changes in the Avro format [#753](#)
    - \* Support the Apache Pulsar sink [#751](#)
  - Dumpling
    - \* Support the specialized CSV separator and delimiter [#116](#)
    - \* Support specifying the format of the output file name [#122](#)

### 16.17.14.2 Improvements

- TiDB
  - Add the `tidb_log_desensitization` global variable to control whether to do desensitization when logging SQL queries [#18581](#)
  - Enable `tidb_allow_batch_cop` by default [#18552](#)
  - Speed up canceling a query [#18505](#)
  - Add a header for the `tidb_decode_plan` result [#18501](#)
  - Make the configuration checker compatible with earlier versions of the configuration file [#18046](#)
  - Enable collecting the execution information by default [#18518](#)
  - Add the `tiflash_tables` and `tiflash_segments` system tables [#18536](#)
  - Move `AUTO_RANDOM` out of experimental features and announce its general availability. The improvements and compatibility changes are as follows:

- \* Deprecate `experimental.allow-auto-random` in the configuration file. No matter how this item is configured, you can always define the `AUTO_RANDOM` feature on columns. [#18613](#) [#18623](#)
  - \* Add the `tidb_allow_auto_random_explicit_insert` session variable to control the explicit writes on `AUTO_RANDOM` columns. The default value is `false`. This is to avoid the unexpected `AUTO_RANDOM_BASE` update caused by explicit writes on columns. [#18508](#)
  - \* Allow defining `AUTO_RANDOM` only on `BIGINT` and `UNSIGNED BIGINT` columns and restrict the maximum number of shard bits to 15, which avoids the allocatable space being consumed too quickly [#18538](#)
  - \* Do not trigger the `AUTO_RANDOM_BASE` update when defining the `AUTO_RANDOM`  $\hookrightarrow$  attribute on the `BIGINT` column and inserting the negative value into the primary key [#17987](#)
  - \* Use the highest bit of an integer for ID allocation when defining the `AUTO_RANDOM` attribute on `UNSIGNED BIGINT` columns, which gets more allocable space [#18404](#)
  - \* Support updating the `AUTO_RANDOM` attribute in the result of `SHOW CREATE`  $\hookrightarrow$  `TABLE` [#18316](#)
- TiKV
    - Introduce the new `backup.num-threads` configuration to control the size of the backup thread pool [#8199](#)
    - Do not send store heartbeats when receiving snapshots [#8136](#)
    - Support dynamically changing the shared block cache's capacity [#8232](#)
  - PD
    - Support the JSON formatted log [#2565](#)
  - TiDB Dashboard
    - Improve the Key Visualizer bucket merge for cold logical ranges [#674](#)
    - Rename the configuration item of `disable-telemetry` to `enable-telemetry` for consistency [#684](#)
    - Show the progress bar when switching pages [#661](#)
    - Ensure that the slow log search now follows the same behavior as log search when there are space separators [#682](#)
  - TiFlash
    - Change the unit of the **DDL Jobs** panel in Grafana to **operations per minute**
    - Add a new dashboard in Grafana to show more metrics about **TiFlash-Proxy**
    - Reduce IOPS in TiFlash proxy
  - Tools

- TiCDC
  - \* Replace table ID with table name in metrics [#695](#)
- Backup & Restore (BR)
  - \* Support outputting JSON logs [#336](#)
  - \* Support enabling pprof during runtime [#372](#)
  - \* Speed up DDL executions by sending DDL concurrently during restore [#377](#)
- TiDB Lightning
  - \* Deprecate `black-white-list` with a newer and easier-to-understand filter format [#332](#)

### 16.17.14.3 Bug Fixes

- TiDB
  - Return an error instead of an empty set for `IndexHashJoin` when an error occurs during execution [#18586](#)
  - Fix the recurring panic when gRPC transportReader is broken [#18562](#)
  - Fix the issue that Green GC does not scan locks on offline stores which might cause data incompleteness [#18550](#)
  - Forbid processing a non-read-only statement using TiFlash engine [#18534](#)
  - Return the actual error message when a query connection panics [#18500](#)
  - Fix the issue that the `ADMIN REPAIR TABLE` execution fails to reload the table metadata on the TiDB node [#18323](#)
  - Fix the data inconsistency issue occurred because the lock of a written and deleted primary key in one transaction is resolved by another transaction [#18291](#)
  - Make spilling disk work well [#18288](#)
  - Fix the error reported when the `REPLACE INTO` statement works on the table that contains generated columns [#17907](#)
  - Return the OOM error when the `IndexHashJoin` and `IndexMergeJoin` workers panic [#18527](#)
  - Fix the bug that the execution of `Index Join` might return wrong results in special cases when the index used by `Index Join` contains the integer primary key [#18565](#)
  - Fix the issue that when the new collation is enabled on the cluster, the data updated on columns with the new collation in a transaction cannot be read through the unique index [#18703](#)
- TiKV
  - Fix the issue that reads might get stale data during merging [#8113](#)
  - Fix the issue that collation does not work on the `min/max` function when aggregation is pushed down to TiKV [#8108](#)

- PD
  - Fix the issue that creating TSO stream might be blocked for a while if the server crashes [#2648](#)
  - Fix the issue that `getSchedulers` might cause a data race [#2638](#)
  - Fix the issue that deleting the scheduler might cause deadlocks [#2637](#)
  - Fix the bug that placement rules are not considered when `balance-leader-scheduler` is enabled [#2636](#)
  - Fix the issue that sometimes service `safepoint` cannot be set properly, which might make BR and dumping fail [#2635](#)
  - Fix the issue that the target store in `hot region scheduler` is incorrectly selected [#2627](#)
  - Fix the issue that the TSO request might take too long when PD leader is switched [#2622](#)
  - Fix the issue of stale scheduler after leader change [#2608](#)
  - Fix the issue that sometimes replicas of a Region cannot be adjusted to the best location when placement rules are enabled [#2605](#)
  - Fix the issue that the deployment path of the store is not updated according to the change of deployment directory [#2600](#)
  - Prevent `store limit` from changing to zero [#2588](#)
- TiDB Dashboard
  - Fix the TiDB connection error when TiDB is scaled out [#689](#)
  - Fix the issue that TiFlash instances are not displayed in the log searching page [#680](#)
  - Fix the issue of metric selection reset after refreshing the overview page [#663](#)
  - Fix a connection issue in some TLS scenarios [#660](#)
  - Fix the issue that the language dropdown box is not displayed correctly in some cases [#677](#)
- TiFlash
  - Fix the issue that TiFlash crashes after renaming the primary key column
  - Fix the issue that concurrent `Learner Read` and `Remove Region` might cause deadlocks
- Tools
  - TiCDC
    - \* Fix the issue that TiCDC leaks memory in some cases [#704](#)
    - \* Fix the issue that unquoted table name causes the SQL syntax error [#676](#)
    - \* Fix the issue that the processor does not fully exit after `p.stop` is called [#693](#)
  - Backup & Restore (BR)
    - \* Fix the issue that the backup time might be negative [#405](#)

- Dumpling
  - \* Fix the issue that Dumpling omits the NULL value when `--r` is specified [#119](#)
  - \* Fix the bug that flushing tables might not work for tables to dump [#117](#)
- TiDB Lightning
  - \* Fix the issue that `--log-file` does not take effect [#345](#)
- TiDB Binlog
  - \* Fix the issue that when TiDB Binlog replicates data to the downstream with TLS enabled, Drainer cannot be started which occurs because TLS is not enabled on the database driver used to update the checkpoint [#988](#)

### 16.17.15 TiDB 4.0.2 Release Notes

Release date: July 1, 2020

TiDB version: 4.0.2

#### 16.17.15.1 Compatibility Changes

- TiDB
  - Remove sensitive information in the slow query log and the statement summary table [#18130](#)
  - Forbid negative value in the sequence cache [#18103](#)
  - Remove tombstone TiKV and TiFlash stores from the `CLUSTER_INFO` table [#17953](#)
  - Change the diagnostic rule from `current-load` to `node-check` [#17660](#)
- PD
  - Persist `store-limit` and remove `store-balance-rate` [#2557](#)

#### 16.17.15.2 New Change

- By default, TiDB and TiDB Dashboard share usage details with PingCAP to help understand how to improve the product [#18180](#). For details about what is shared and how to disable the sharing, see [Telemetry](#).

### 16.17.15.3 New Features

- TiDB
  - Support the `MEMORY_QUOTA()` hint in `INSERT` statements [#18101](#)
  - Support authentication based on the `SAN` field of TLS certificate [#17698](#)
  - Support collation for the `REGEXP()` function [#17581](#)
  - Support the `sql_select_limit` session and global variable [#17604](#)
  - Support splitting the Region for the newly added partition by default [#17665](#)
  - Support pushing the `IF()/BITXOR()/BITNEG()/JSON_LENGTH()` functions to the TiFlash Coprocessor [#17651](#) [#17592](#)
  - Support a new aggregate function `APPROX_COUNT_DISTINCT()` to calculate the approximate result of `COUNT(DISTINCT)` [#18120](#)
  - Support collation in TiFlash and pushing collation-related functions to TiFlash [#17705](#)
  - Add the `STATUS_ADDRESS` column in the `INFORMATION_SCHEMA.INSPECTION_RESULT`  $\leftrightarrow$  table to indicate the status address of servers [#17695](#)
  - Add the `SOURCE` column in the `MYSQL.BIND_INFO` table to indicate the how the bindings are created [#17587](#)
  - Add the `PLAN_IN_CACHE` and `PLAN_CACHE_HITS` columns in the `PERFORMANCE_SCHEMA`  $\leftrightarrow$  `.EVENTS_STATEMENTS_SUMMARY_BY_DIGEST` table to indicate the plan cache usage of SQL statements [#17493](#)
  - Add the `enable-collect-execution-info` configuration item and the `tidb_enable_collect_execution_info` session variable to control whether to collect execution information of each operator and record the information in the slow query log [#18073](#) [#18072](#)
  - Add the `tidb_slow_log_masking` global variable to control whether to desensitize the queries in slow query log [#17694](#)
  - Add a diagnostic rule in the `INFORMATION_SCHEMA.INSPECTION_RESULT` table for the `storage.block-cache.capacity` TiKV configuration item [#17671](#)
  - Add the `BACKUP` and `RESTORE` SQL statements to back up and restore data [#15274](#)
- TiKV
  - Support the `encryption-meta` command in TiKV Control [#8103](#)
  - Add a perf context metric for `RocksDB::WriteImpl` [#7991](#)
- PD
  - Support the operator to fail immediately when trying to remove a leader peer [#2551](#)
  - Set a suitable default store limit for TiFlash stores [#2559](#)
- TiFlash
  - Support new aggregation function `APPROX_COUNT_DISTINCT` in Coprocessor

- Enable the `rough set filter` feature by default
- Enable TiFlash to run on the ARM architecture
- Support pushing down the `JSON_LENGTH` function in Coprocessor
- Tools
  - TiCDC
    - \* Support migrating sub-tasks to new captures [#665](#)
    - \* Add a `cli` command to delete the TiCDC GC TTL [#652](#)
    - \* Support canal protocol in MQ sink [#649](#)

#### 16.17.15.4 Improvements

- TiDB
  - Reduce the query latency caused by the Golang memory allocation when CM-Sketch consumes too much memory [#17545](#)
  - Reduce the QPS recovery duration of a cluster when a TiKV server is in the failure recovery process [#17681](#)
  - Support pushing aggregate functions to TiKV/TiFlash Coprocessor on partition tables [#17655](#)
  - Improve the accuracy of row count estimation for index equal conditions [#17611](#)
- TiKV
  - Improve the PD client panic log [#8093](#)
  - Add back the `process_cpu_seconds_total` and `process_start_time_seconds` monitoring metrics [#8029](#)
- TiFlash
  - Improve backward compatibility when upgrading from an older version [#786](#)
  - Reduce memory consumption of delta index [#787](#)
  - Use the more efficient update algorithm for delta index [#794](#)
- Tools
  - Backup & Restore (BR)
    - \* Improve the performance by pipelining the restore process [#266](#)

### 16.17.15.5 Bug Fixes

- TiDB
  - Fix the issue of incorrect execution plan obtained from the plan cache after `tidb_isolation_read_engines` is changed [#17570](#)
  - Fix the occasional runtime error that occurs when executing the `EXPLAIN FOR`  $\leftrightarrow$  `CONNECTION` statement [#18124](#)
  - Fix the incorrect result of the `last_plan_from_cache` session variable in some cases [#18111](#)
  - Fix the runtime error that occurs when executing the `UNIX_TIMESTAMP()` function from the plan cache [#18002](#) [#17673](#)
  - Fix the runtime error when the child of `HashJoin` executor returns the `NULL` column [#17937](#)
  - Fix the runtime error caused by concurrently executing the `DROP DATABASE` statement and other DDL statements in the same database [#17659](#)
  - Fix the incorrect result of the `COERCIBILITY()` function on user variables [#17890](#)
  - Fix the issue that the `IndexMergeJoin` executor occasionally gets stuck [#18091](#)
  - Fix the hang issue of the `IndexMergeJoin` executor when out of memory quota and query cancelling is triggered [#17654](#)
  - Fix the excessive counting memory usage of the `Insert` and `Replace` executors [#18062](#)
  - Fix the issue that the data replication to TiFlash storage is stopped when `DROP`  $\leftrightarrow$  `DATABASE` and `DROP TABLE` are executed concurrently in the same database [#17901](#)
  - Fix the `BACKUP/RESTORE` failure between TiDB and the object storage service [#17844](#)
  - Fix the incorrect error message of privilege check failure when access is denied [#17724](#)
  - Discard the query feedbacks generated from the `DELETE/UPDATE` statement [#17843](#)
  - Forbid altering `AUTO_RANDOM_BASE` for a table without `AUTO_RANDOM` property [#17828](#)
  - Fix the issue that the `AUTO_RANDOM` column is allocated wrong results when the table is moved between databases by `ALTER TABLE ... RENAME` [#18243](#)
  - Fix the issue that some system tables cannot be accessed when setting the value of `tidb_isolation_read_engines` without `tidb` [#17719](#)
  - Fix the inaccurate result of JSON comparison on large integers and float values [#17717](#)
  - Fix the incorrect decimal property for the result of the `COUNT()` function [#17704](#)
  - Fix the incorrect result of the `HEX()` function when the type of input is the binary string [#17620](#)
  - Fix the issue that an empty result is returned when querying the `INFORMATION_SCHEMA`  $\leftrightarrow$  `.INSPECTION_SUMMARY` table without filter condition [#17697](#)

- Fix the issue that the hashed password used by the `ALTER USER` statement to update user information is unexpected [#17646](#)
  - Support collation for `ENUM` and `SET` values [#17701](#)
  - Fix the issue that the timeout mechanism for pre-splitting Regions does not work when creating a table [#17619](#)
  - Fix the issue that the schema is unexpectedly updated when a DDL job is retried, which might break the atomicity of DDL jobs [#17608](#)
  - Fix the incorrect result of the `FIELD()` function when the argument contains the column [#17562](#)
  - Fix the issue that the `max_execution_time` hint does not work occasionally [#17536](#)
  - Fix the issue that the concurrency information is redundantly printed in the result of `EXPLAIN ANALYZE` [#17350](#)
  - Fix the incompatible behavior of `%h` on the `STR_TO_DATE` function [#17498](#)
  - Fix the issue that the follower/learner keeps retrying when `tidb_replica_read` is set to `follower` and there is a network partition between the leader and the follower/learner [#17443](#)
  - Fix the issue that TiDB sends too many pings to PD follower in some cases [#17947](#)
  - Fix the issue that the range partition table of older versions cannot be loaded in TiDB v4.0 [#17983](#)
  - Fix the SQL statement timeout issue when multiple Region requests fail at the same time by assigning different `Backoffer` for each Region [#17585](#)
  - Fix the MySQL incompatible behavior when parsing `DateTime` delimiters [#17501](#)
  - Fix the issue that TiKV requests are occasionally sent to the TiFlash server [#18105](#)
  - Fix the data inconsistency issue occurred because the lock of a written and deleted primary key in one transaction is resolved by another transaction [#18250](#)
- TiKV
    - Fix a memory safety issue for the status server [#8101](#)
    - Fix the issue of lost precision in JSON numeric comparison [#8087](#)
    - Fix the wrong query slow log [#8050](#)
    - Fix the issue that a peer cannot be removed when its store is isolated during multiple merge processes [#8048](#)
    - Fix the issue that `tikv-ctl recover-mvcc` does not remove invalid pessimistic locks [#8047](#)
    - Fix the issue that some Titan histogram metrics are missing [#7997](#)
    - Fix the issue that TiKV returns duplicated error to TiCDC [#7887](#)
  - PD
    - Check the correctness of the `pd-server.dashboard-address` configuration item [#2517](#)

- Fix the panic issue of PD when setting `store-limit-mode` to `auto` [#2544](#)
- Fix the issue that hotspots cannot be identified in some cases [#2463](#)
- Fix the issue that placement rules prevent the store from changing to `tombstone` in some cases [#2546](#)
- Fix the panic issue of PD when upgrading from earlier versions in some cases [#2564](#)

- TiFlash

- Fix the issue that the proxy might panic when the `region not found` error occurs
- Fix the issue that the I/O exception thrown in `drop table` might lead to synchronization failure of TiFlash schema

### 16.17.16 TiDB 4.0.1 Release Notes

Release date: June 12, 2020

TiDB version: 4.0.1

#### 16.17.16.1 New Features

- TiKV

- Add the `--advertise-status-addr` start flag to specify the status address to advertise [#8046](#)

- PD

- Support the internal proxy for the built-in TiDB Dashboard [#2511](#)
- Support setting a custom timeout for PD client [#2509](#)

- TiFlash

- Support the TiDB new collation framework
- Support pushing down the `If/BitAnd/BitOr/BitXor/BitNot/Json_length` functions to TiFlash
- Support the Resolve Lock logic for large transactions in TiFlash

- Tools

- Backup & Restore (BR)

- \* Add a version check when starting BR to avoid the issue that BR and the TiDB cluster are incompatible [#311](#)

### 16.17.16.2 Bug Fixes

- TiKV
  - Fix the issue that the `use-unified-pool` configuration in the startup log is incorrectly printed [#7946](#)
  - Fix the issue that the `tikv-ctl` does not support relative path [#7963](#)
  - Fix the bug that the monitoring metric of Point Selects is inaccurate [#8033](#)
  - Fix the issue that a peer might not be destroyed after the network isolation disappears [#8006](#)
  - Fix the issue that a request for read index might get outdated commit index [#8043](#)
  - Improve the reliability of backup and restore with S3 and GCS storages [#7917](#)
- PD
  - Prevent misconfiguration of Placement Rules in some situations [#2516](#)
  - Fix the issue that deleting the Placement Rule might cause panic [#2515](#)
  - Fix a bug that the store information cannot be obtained when the store's used size is zero [#2474](#)
- TiFlash
  - Fix the issue that default value of the `bit` type column in TiFlash is incorrectly parsed
  - Fix the miscalculation of 1970-01-01 00:00:00 UTC in some timezones in TiFlash

### 16.17.17 TiDB 4.0 GA Release Notes

Release date: May 28, 2020

TiDB version: 4.0.0

#### 16.17.17.1 Compatibility Changes

- TiDB
  - Optimize the error message of the large-sized transactions for easier troubleshooting [#17219](#)
- TiCDC
  - Optimize the structure of the `Changefeed` configuration file to improve usability [#588](#)
  - Add the `ignore-txn-start-ts` configuration item, and change the condition from `commit_ts` to `start_ts` during transactions filtering [#589](#)

### 16.17.17.2 Important Bug Fixes

- TiKV
  - Fix the `DefaultNotFound` error that occurs when backing up using Backup & Restore (BR) [#7937](#)
  - Fix system panics caused by the out-of-order `ReadIndex` packages [#7930](#)
  - Fix system panics caused by incorrectly removing snapshot files after TiKV is restarted [#7927](#)
- TiFlash
  - Fix the possible data loss issue that occurs when the system panics because of incorrect processing logic of Raft Admin Command

### 16.17.17.3 New Features

- TiDB
  - Add the `committer-concurrency` configuration item to control the number of goroutines in the retry-commit phase [#16849](#)
  - Support the `show table partition regions` syntax [#17294](#)
  - Add the `tmp-storage-quota` configuration item to limit the temporary disk space used by the TiDB server [#15700](#)
  - Support checking whether the partitioned table uses a unique prefix index when creating and changing tables [#17213](#)
  - Support the `insert/replace into tbl_name partition(partition_name_list ↪ )` statement [#17313](#)
  - Support checking the value of collations when using the `Distinct` function [#17240](#)
  - Support the `is null` filter condition during the Hash partition pruning [#17310](#)
  - Support `admin check index`, `admin cleanup index`, and `admin recover ↪ index` in partitioned tables [#17392](#) [#17405](#) [#17317](#)
  - Support range partition pruning for the `in` expressions [#17320](#)
- TiFlash
  - Support filtering out the data corresponding to the qualified TSO through the `min commit ts` value of the Lock CF when the Learner reads the data
  - Add the feature that the system explicitly reports an error to avoid incorrect calculation results when the value of `TIMESTAMP` type is less than 1970-01-01 ↪ 00:00:00
  - Support using flags in regular expressions when searching logs
- TiKV
  - Support collation rules of `ascii_bin` and `latin1_bin` encoding [#7919](#)

- PD
  - Support specifying the reverse proxy resource prefix for built-in TiDB Dashboard [#2457](#)
  - Support returning the `pending peer` and `down peer` information in interfaces of the PD client Region [#2443](#)
  - Add monitoring items such as `Direction of hotspot move leader`, `Direction ↔ of hotspot move peer`, and `Hot cache read entry number` [#2448](#)
- Tools
  - Backup & Restore (BR)
    - \* Support the backup and restore of `Sequence` and `View` [#242](#)
  - TiCDC
    - \* Support checking the validity of `Sink URI` when creating `Changefeed` [#561](#)
    - \* Support checking whether the PD and TiKV versions meet the system requirements during system startup [#570](#)
    - \* Support scheduling multiple tables in the same scheduling task generation cycle [#572](#)
    - \* Add information about node roles in HTTP API [#591](#)

#### 16.17.17.4 Bug Fixes

- TiDB
  - Fix the issue of unexpected timeouts when sending and receiving messages by disabling TiDB to send batch commands to TiFlash [#17307](#)
  - Fix the issue of incorrectly distinguishing signed and unsigned integers during partition pruning, which improves performance [#17230](#)
  - Fix the issue of upgrade failure from v3.1.1 to v4.0 because of the incompatible `mysql.user` table [#17300](#)
  - Fix the issue of incorrect selection of the partition in the `update` statement [#17305](#)
  - Fix system panics when receiving an unknown error message from TiKV [#17380](#)
  - Fix system panics caused by incorrect processing logic when creating the table that is `key` partitioned [#17242](#)
  - Fix the issue that the wrong `Index Merge Join` plan is selected because of incorrect optimizer processing logic [#17365](#)
  - Fix the issue of inaccurate `duration` monitoring metric of the `SELECT` statement in Grafana [#16561](#)
  - Fix the issue that the GC worker is blocked when the system error occurs [#16915](#)
  - Fix the issue that the `UNIQUE` constraint on a boolean column results in an incorrect result in a comparison [#17306](#)
  - Fix system panics caused by incorrect processing logic when `tidb_opt_agg_push_down ↔` is enabled and the aggregation function pushes down the partitioned table [#17328](#)

- Fix the issue of accessing failed TiKV nodes in some cases [#17342](#)
- Fix the issue that the `isolation-read` configuration item in `tidb.toml` does not take effect [#17322](#)
- Fix the issue of incorrect order of output results due to incorrect processing logic when `hint` is used to enforce the stream aggregation [#17347](#)
- Fix the behavior that `insert` processes DIV under different `SQL_MODE` [#17314](#)
- TiFlash
  - Fix the issue that the matching behavior of regular expressions in the search log feature is inconsistent with other components
  - Fix the issue of excessive restart time when nodes write large amounts of data by disabling the delay processing optimization of `Raft Compact Log Command` by default
  - Fix the issue that the system fails to start because TiDB incorrectly processes the `DROP DATABASE` statement in some scenarios
  - Fix the issue that the method of collecting CPU information in `Server_info` is different from that in other components
  - Fix the issue that the error `Too Many Pings` is reported when the `Query` statement is executed if `batch coprocessor` is enabled
  - Fix the issue that Dashboard fails to display the correct `deploy path` information because TiFlash does not report the related information
- TiKV
  - Fix the `DefaultNotFound` error that occurs when backing up using BR [#7937](#)
  - Fix system panics caused by out-of-order `ReadIndex` packets [#7930](#)
  - Fix the issue that an unexpected error is returned because the read request callback function is not called [#7921](#)
  - Fix system panics caused by incorrectly removing snapshot files when TiKV is restarted [#7927](#)
  - Fix the issue that the `master key` cannot be rotated due to incorrect processing logic in storage encryption [#7898](#)
  - Fix the issue that the received `lock cf` file of the snapshot is not encrypted when the storage encryption is enabled [#7922](#)
- PD
  - Fix the 404 error when deleting `evict-leader-scheduler` or `grant-leader-scheduler` using `pd-ctl` [#2446](#)
  - Fix the issue that the `presplit` feature might not work properly when the TiFlash replica exists [#2447](#)
- Tools
  - Backup & Restore (BR)

- \* Fix the issue that the data restoration fails due to network issues when BR restores data from cloud storage [#298](#)
- TiCDC
  - \* Fix system panics caused by data race [#565](#) [#566](#)
  - \* Fix resource leaks or system blockages caused by incorrect processing logic [#574](#) [#586](#)
  - \* Fix the issue that the command line gets stuck because CLI cannot connect to PD [#579](#)

## 16.17.18 TiDB 4.0 RC.2 Release Notes

Release date: May 15, 2020

TiDB version: 4.0.0-rc.2

### 16.17.18.1 Compatibility Changes

- TiDB
  - Remove the size limit for a single transaction (100 MB) when TiDB Binlog is enabled. Now the size limit for a transaction is 10 GB. However, if TiDB Binlog is enabled and the downstream is Kafka, configure the `txn-total-size-limit` parameter according to the message size limit of 1 GB in Kafka [#16941](#)
  - Change the behavior from querying the default time range to returning an error and requesting a specified time range if the time range is not specified when querying the `CLUSTER_LOG` table [#17003](#)
  - If the unsupported `sub-partition` or `linear hash` option is specified when creating the partitioned table using the `CREATE TABLE` statement, the normal table is created rather than the partitioned table with the options ignored [#17197](#)
- TiKV
  - Move the encryption-related configuration to the security-related configuration, which means changing `[encryption]` in the TiKV configuration file to `[security ↪ .encryption]` [#7810](#)
- Tools
  - TiDB Lightning
    - \* Change the default SQL mode to `ONLY_FULL_GROUP_BY,NO_AUTO_CREATE_USER` ↪ when importing data to improve compatibility [#316](#)
    - \* Disallow accessing the PD or TiKV port in the `tidb-backend` mode [#312](#)
    - \* Print the log information to the tmp file by default, and print the path of the tmp file when TiDB Lightning is started [#313](#)

### 16.17.18.2 Important Bug Fixes

- TiDB
  - Fix the issue that the wrong partition is chosen when the `WHERE` clause has only one equivalent condition [#17054](#)
  - Fix the issue of wrong results caused by building the incorrect Index range when the `WHERE` clause only contains the string column [#16660](#)
  - Fix the panic issue that occurs when executing the `PointGet` query in the transaction after the `DELETE` operation [#16991](#)
  - Fix the issue that the GC worker might encounter the deadlock when an error occurs [#16915](#)
  - Avoid the unnecessary RegionMiss retry when the TiKV response is slow but not down [#16956](#)
  - Change the log level in the client in the handshake phase of the MySQL protocol to `DEBUG` to solve the problem that interferes with log output [#16881](#)
  - Fix the issue that the Region is not pre-split according to the `PRE_SPLIT_REGIONS` information defined by the table after the `TRUNCATE` operation [#16776](#)
  - Fix the issue of soaring goroutine caused by retry when TiKV is unavailable during the second phase of the two-phase commit [#16876](#)
  - Fix the panic issue of statement execution when some expressions cannot be pushed down [#16869](#)
  - Fix the wrong execution result of the IndexMerge operation on the partitioned table [#17124](#)
  - Fix the performance reduction of `wide_table` caused by the mutex contention of Memory Trackers [#17234](#)
- TiFlash
  - Fix the issue that the system cannot start normally after the upgrade if the name of the database or table contains special characters

### 16.17.18.3 New Features

- TiDB
  - Add support for the `BACKUP` and `RESTORE` commands to back up and restore data [#16960](#)
  - Support pre-checking the data volume in a single Region before commit and pre-splitting the Region when the data volume exceeds the threshold [#16959](#)
  - Add the new `LAST_PLAN_FROM_CACHE` variable with a `Session` scope to indicate whether the last executed statement hits the plan cache [#16830](#)
  - Support recording the `Cop_time` information in slow log and the `SLOW_LOG` table [#16904](#)

- Add in Grafana more metrics that monitor the memory status of Go Runtime [#16928](#)
  - Support outputting the `forUpdateTS` and `Read Consistency` isolation level information in General Log [#16946](#)
  - Support collapsing duplicate requests of resolving locks in TiKV Region [#16925](#)
  - Support using the `SET CONFIG` statement to modify the configuration of PD/TiKV nodes [#16853](#)
  - Support the `auto_random` option in the `CREATE TABLE` statement [#16813](#)
  - Allocate TaskID for the DistSQL request to help TiKV better schedule and process requests [#17155](#)
  - Support displaying the version information of the TiDB server after logging into the MySQL client [#17187](#)
  - Support the `ORDER BY` clause in the `GROUP_CONCAT` function [#16990](#)
  - Support displaying the `Plan_from_cache` information in slow log to indicate whether the statement hits plan cache [#17121](#)
  - Add the feature that TiDB Dashboard can display the capacity information of TiFlash multi-disk deployment
  - Add the feature of querying the TiFlash log using SQL statements in Dashboard
- TiKV
    - Support encryption debugging for `tikv-ctl`, so that `tikv-ctl` can be used to operate and manage the cluster when the encryption storage is enabled [#7698](#)
    - Support encrypting the lock column family in snapshots [#7712](#)
    - Use the heatmap in the Grafana dashboard for Raftstore latency summary to better diagnose the jitter issue [#7717](#)
    - Support setting the upper limit for the size of the gRPC message [#7824](#)
    - Add in Grafana dashboard the encryption-related monitoring metrics [#7827](#)
    - Support Application-Layer Protocol Negotiation (ALPN) [#7825](#)
    - Add more statistics about Titan [#7818](#)
    - Support using the task ID provided by the client as the identifier in the unified read pool to avoid that the priority of a task is lowered by another task in the same transaction [#7814](#)
    - Improve the performance of the `batch insert` request [#7718](#)
  - PD
    - Eliminate the speed limit of removing peers when making a node offline [#2372](#)
  - TiFlash
    - Change the name of the Count graph of **Read Index** in Grafana to **Ops**
    - Optimize the data for opening file descriptors when the system load is low to reduce system resource consumption
    - Add the capacity-related configuration parameter to limit the the data storage capacity

- Tools
  - TiDB Lightning
    - \* Add the `fetch-mode` sub-command in `tidb-lightning-ctl` to print the TiKV cluster mode [#287](#)
  - TiCDC
    - \* Support managing the replication task by using `cdc cli` (changefeed) [#546](#)
  - Backup & Restore (BR)
    - \* Support automatically adjusting GC time during backup [#257](#)
    - \* Adjust PD parameters when restoring data to speed up the restoration [#198](#)

#### 16.17.18.4 Bug Fixes

- TiDB
  - Improve the logic that determines whether to use vectorization for expression execution in multiple operators [#16383](#)
  - Fix the issue that the `IndexMerge` hint fails to check the database name correctly [#16932](#)
  - Forbid truncating the sequence object [#17037](#)
  - Fix the issue that the `INSERT/UPDATE/ANALYZE/DELETE` statements can be performed on a sequence object [#16957](#)
  - Fix the issue that the internal SQL statements in the bootstrap phase are not correctly marked as internal queries in the Statement Summary table [#17062](#)
  - Fix the error that occurs when a filter condition supported by TiFlash but not by TiKV is pushed down to the `IndexLookupJoin` operator [#17036](#)
  - Fix the concurrency issue of the `LIKE` expression that might occur after the collation is enabled [#16997](#)
  - Fix the issue that the `LIKE` function cannot correctly build the `Range` query index after the collation is enabled [#16783](#)
  - Fix the issue that a wrong value is returned when executing `@@LAST_PLAN_FROM_CACHE`  $\leftrightarrow$  after the `Plan Cache` statement is triggered [#16831](#)
  - Fix the issue that `TableFilter` on the index is missed when calculating candidate paths for `IndexMerge` [#16947](#)
  - Fix the issue that a physical query plan cannot be generated when using the `MergeJoin` hint and the `TableDual` operator exists [#17016](#)
  - Fix the wrong capitalization of the values in the `Stmt_Type` column of the Statement Summary table [#17018](#)
  - Fix the issue that the `Permission Denied` error is reported because the service cannot be started when different users use the same `tmp-storage-path` [#16996](#)
  - Fix the issue that the `NotNullFlag` result type is incorrectly set for an expression whose result type is determined by multiple input columns, such as `CASE WHEN` [#16995](#)

- Fix the issue that the green GC might leave unresolved locks when dirty stores exist [#16949](#)
- Fix the issue that the green GC might leave unresolved locks when encountering a single key with multiple different locks [#16948](#)
- Fix the issue of inserting a wrong value in the `INSERT VALUE` statement because a sub-query refers to a parent query column [#16952](#)
- Fix the issue of incorrect results when using the `AND` operator on the `Float` value [#16666](#)
- Fix the wrong information of the `WAIT_TIME` field in the expensive log [#16907](#)
- Fix the issue that the `SELECT FOR UPDATE` statement cannot be recorded in the slow log in the pessimistic transaction mode [#16897](#)
- Fix the wrong result that occurs when executing `SELECT DISTINCT` on a column of the `Enum` or `Set` type [#16892](#)
- Fix the display error of `auto_random_base` in the `SHOW CREATE TABLE` statement [#16864](#)
- Fix the incorrect value of `string_value` in the `WHERE` clause [#16559](#)
- Fix the issue that the error message of the `GROUP BY` window function is inconsistent with that of MySQL [#16165](#)
- Fix the issue that the `FLASH TABLE` statement fails to execute when the database name contains the uppercase letter [#17167](#)
- Fix the inaccurate memory tracing of the Projection executor [#17118](#)
- Fix the issue of incorrect time filtering of the `SLOW_QUERY` table in different time zones [#17164](#)
- Fix the panic issue that occurs when `IndexMerge` is used with the virtual generated column [#17126](#)
- Fix the capitalization issue of the `INSTR` and `LOCATE` function [#17068](#)
- Fix the issue that the `tikv server timeout` error is reported frequently after the `tidb_allow_batch_cop` configuration is enabled [#17161](#)
- Fix the issue that the result of performing `XOR` operation on the `Float` type is inconsistent with that of MySQL 8.0 [#16978](#)
- Fix the issue that no error is reported when the unsupported `ALTER TABLE`  $\leftrightarrow$  `REORGANIZE PARTITION` statement is executed [#17178](#)
- Fix the issue that an error is reported when `EXPLAIN FORMAT="dot" FOR`  $\leftrightarrow$  `CONNECTION ID` encounters an unsupported plan [#17160](#)
- Fix the record issue of the prepared statement in the `EXEC_COUNT` column of the Statement Summary table [#17086](#)
- Fix the issue that the value is not validated when setting the Statement Summary system variable [#17129](#)
- Fix the issue that an error is reported if an overflow value is used to query the `UNSIGNED BIGINT` primary key when the plan cache is enabled [#17120](#)
- Fix the incorrect QPS display by the machine instance and request type on the Grafana **TiDB Summary** dashboard [#17105](#)

- TiKV

- Fix the issue that many empty Regions are generated after restoration [#7632](#)
- Fix the panic issue of Raftstore when receiving out-of-order read index responses [#7370](#)
- Fix the issue that an invalid storage or coprocessor read pool configuration might not be rejected when the unified thread pool is enabled [#7513](#)
- Fix the panic issue of the `join` operation when the TiKV server is shut down [#7713](#)
- Fix the issue that no result is returned when searching TiKV slow logs via diagnostics API [#7776](#)
- Fix the issue that notable memory fragmentation is generated when the TiKV node is running for a long time [#7556](#)
- Fix the issue that the SQL statement fails to execute when an invalid date is stored [#7268](#)
- Fix the issue that the backup data cannot be restored from GCS [#7739](#)
- Fix the issue that KMS key ID is not validated during encryption at rest [#7719](#)
- Fix the underlying correctness issue of the Coprocessor in compilers of different architecture [#7714](#) [#7730](#)
- Fix the `snapshot ingestion` error when encryption is enabled [#7815](#)
- Fix the `Invalid cross-device link` error when rewriting the configuration file [#7817](#)
- Fix the issue of wrong toml format when writing the configuration file to an empty file [#7817](#)
- Fix the issue that a destroyed peer in Raftstore can still process requests [#7836](#)
- PD
  - Fix the 404 issue that occurs when using the `region key` command in `pd-ctl` [#2399](#)
  - Fix the issue that the monitor metrics of TSO and ID allocation are missing from the Grafana dashboard [#2405](#)
  - Fix the issue that `pd-recover` is not included in the Docker image [#2406](#)
  - Parse the path of data directory to an absolute path to fix the issue that TiDB Dashboard might not correctly display PD information [#2420](#)
  - Fix the issue that there is no default output when using the `scheduler config` ↪ `shuffle-region-scheduler` command in `pd-ctl` [#2416](#)
- TiFlash
  - Fix the issue that the wrong information of used capacity is report in some scenarios
- Tools
  - TiDB Binlog
    - \* Fix the issue that data of the `mediumint` type is not processed when the downstream is Kafka [#962](#)

- \* Fix the issue that the repara fails to parse the DDL statement when the database name in DDL is a keyword [#961](#)
- TiCDC
  - \* Fix the issue of using the wrong time zone when the TZ environment variable is not set [#512](#)
  - \* Fix the issue that the owner does not clean up the resources when the server exits because some errors are not handled correctly [#528](#)
  - \* Fix the issue that TiCDC might be stuck when reconnecting to TiKV [#531](#)
  - \* Optimize the memory usage when initializing the table schema [#534](#)
  - \* Use the `watch` mode to monitor the replication status changes and perform quasi-real-time updates to reduce replication delay [#481](#)
- Backup & Restore (BR)
  - \* Fix the issue that inserting data might trigger the `duplicate entry` error after BR restores a table with the `auto_random` attribute [#241](#)

### 16.17.19 TiDB 4.0 RC.1 Release Notes

Release date: April 28, 2020

TiDB version: 4.0.0-rc.1

#### 16.17.19.1 Compatibility Changes

- TiKV
  - Disable the Hibernate Region feature by default [#7618](#)
- TiDB Binlog
  - Support the sequence DDL operation in Drainer [#950](#)

#### 16.17.19.2 Important Bug Fixes

- TiDB
  - Fix the issue that the `INSERT ... ON DUPLICATE UPDATE` statement might be incorrectly executed on multiple rows in an explicit transaction because `MemBuffer` is not checked [#16689](#)
  - Fix the data inconsistency when locking duplicated keys on multiple rows [#16769](#)
  - Fix the panic that occurs when recycling the non-superbatch idle connection between TiDB instances [#16303](#)
- TiKV

- Fix the deadlock issue caused by the probe request from TiDB [#7540](#)
- Fix the issue that the minimum commit timestamp of a transaction might overflow which affects data correctness [#7638](#)
- TiFlash
  - Fix the data loss issue caused by the `rename table` operation when multiple data paths are configured
  - Fix the issue that an error occurs when reading data from a merged Region
  - Fix the issue that an error occurs when reading data from a Region that is in the abnormal state
  - Modify the mapping of table names in TiFlash to correctly support `recover` ↔ `table/flashback table`
  - Modify the storage path to fix the potential data loss issue that occurs when renaming the table
  - Fix the potential panic of TiDB when Super Batch is enabled
  - Modify the read mode in the online update scenario to improve the read performance
- TiCDC
  - Fix the replication failure that occurs because the schema internally maintained in TiCDC fails to correctly handle the timing issue of read and write operations [#438](#) [#450](#) [#478](#) [#496](#)
  - Fix the bug that the TiKV client fails to correctly maintain the internal resources when encountering some TiKV anomalies [#499](#) [#492](#)
  - Fix the bug that meta data is not correctly cleaned up and abnormally remains in the TiCDC nodes [#488](#) [#504](#)
  - Fix the issue that the TiKV client fails to correctly handle the repeated sending of the prewrite event [#446](#)
  - Fix the issue that the TiKV client fails to correctly handle the redundant prewrite events received before the initialization [#448](#)
- Backup & Restore (BR)
  - Fix the issue that checksum is still executed when checksum is disabled [#223](#)
  - Fix the incremental replication failure when `auto-random` or `alter-pk` is enabled in TiDB [#230](#) [#231](#)

### 16.17.19.3 New Features

- TiDB
  - Support sending Coprocessor requests to TiFlash in batches [#16226](#)
  - Enable the Coprocessor cache feature by default [#16710](#)

- Parse only the registered sections of a statement in the special comment of the SQL statement [#16157](#)
- Support using the `SHOW CONFIG` syntax to show the configurations of PD and TiKV instances [#16475](#)
- TiKV
  - Support using the user-owned KMS key for the server-side encryption when backing up data to S3 [#7630](#)
  - Enable the load-based `split region` operation [#7623](#)
  - Support validating common names [#7468](#)
  - Add the file lock check to avoid starting multiple TiKV instances that are bound to the same address [#7447](#)
  - Support AWS KMS in encryption at rest [#7465](#)
- Placement Driver (PD)
  - Remove `config manager` to let other components control their component configurations [#2349](#)
- TiFlash
  - Add the metrics report related to the read and write workloads of DeltaTree engine
  - Cache the `handle` and `version` columns to reduce the disk I/O of a single read or write request
  - Support pushing down the `fromUnixTime` and `dateFormat` functions
  - Evaluate the global state according to the first disk and report this evaluation
  - Add the graphics in Grafana related to the read and write workloads of DeltaTree engine
  - Optimize the decimal data encoding in the `Chunk` codec
  - Implement the gRPC API of Diagnostics (SQL diagnosis) to support querying system tables such as `INFORMATION_SCHEMA.CLUSTER_INFO`
- TiCDC
  - Support sending messages in batches in the Kafka sink module [#426](#)
  - Support file sorting in the processor [#477](#)
  - Support automatic `resolve lock` [#459](#)
  - Add the feature that automatically updates the TiCDC service GC safe point to PD [#487](#)
  - Add the timezone setting for data replication [#498](#)
- Backup and Restore (BR)
  - Support configuring S3/GCS in the storage URL [#246](#)

#### 16.17.19.4 Bug Fixes

- TiDB
- Fix the issue that negative numbers cannot be correctly displayed in the system table because the columns are defined as unsigned [#16004](#)
- Add a warning when the `use_index_merge` hint contains the invalid index name [#15960](#)
- Forbid multiple instances of a TiDB server sharing the same temporary directory [#16026](#)
- Fix the panic that occurs during the execution of `explain for connection` when the plan cache is enabled [#16285](#)
- Fix the issue that the result of the `tidb_capture_plan_baselines` system variable is incorrectly displayed [#16048](#)
- Fix the issue that the `group by` clause in the `prepare` statement is incorrectly parsed [#16377](#)
- Fix the panic that might occur during the execution of the `analyze primary key` statement [#16081](#)
- Fix the issue that the TiFlash store information in the `cluster_info` system table is wrong [#16024](#)
- Fix the panic that might occur during the Index Merge process [#16360](#)
- Fix the issue that an incorrect result might occur when the Index Merge reader reads the generated columns [#16359](#)
- Fix the incorrect display of the default sequence value in the `show create table` statement [#16526](#)
- Fix the issue that the `not-null` error is returned because the sequence is used as the default values of the primary key [#16510](#)
- Fix the issue that no error is reported for a blocked SQL execution when TiKV continues to return the `StaleCommand` error [#16530](#)
- Fix the issue that an error is reported if you only specify `COLLATE` when creating a database; add the missing `COLLATE` part in the result of `SHOW CREATE DATABASE` [#16540](#)
- Fix the partition pruning failure when the plan cache is enabled [#16723](#)
- Fix the bug that `PointGet` returns wrong results when handling the overflow [#16755](#)

- Fix the issue that a wrong result is returned when querying the `slow_query` system table with equal time values [#16806](#)
- TiKV
  - Address the OpenSSL security issue: CVE-2020-1967 [#7622](#)
  - Avoid protecting rollback records written by `BatchRollback` to improve performance when many write conflicts exist in optimistic transactions [#7604](#)
  - Fix the issue that the needless wake-up of transactions results in useless retry and performance reduction in heavy lock-race workloads [#7551](#)
  - Fix the issue that the Region might be stuck in the multi-time merging [#7518](#)
  - Fix the issue that the learner is not deleted when deleting the learner [#7518](#)
  - Fix the issue that follower read might cause panic in raft-rs [#7408](#)
  - Fix the bug that a SQL operation might fail because of the `group by constant` error [#7383](#)
  - Fix the issue that an optimistic lock might block reads if the corresponding primary lock is a pessimistic lock [#7328](#)
- PD
  - Fix the issue that some APIs might fail in the TLS validation [#2363](#)
  - Fix the issue that the configuration API cannot accept a configuration item with a prefix [#2354](#)
  - Fix the issue that the 500 error is returned when the scheduler is not found [#2328](#)
  - Fix the issue that the 404 error is returned for the `scheduler config balance`  $\leftrightarrow$  `-hot-region-scheduler list` command [#2321](#)
- TiFlash
  - Disable the coarse-grained index optimization for the storage engine
  - Fix the bug that an exception is thrown when resolving locks for Regions and some locks need to be skipped
  - Fix the null pointer exception (NPE) when collecting the Coprocessor statistics
  - Fix the check for Region meta to ensure that the process of Region Split/Region Merge is correct
  - Fix the issue that the message size exceeds the limit for gRPC because the size of Coprocessor response is not estimated
  - Fix the handling of the `AdminCmdType::Split` command in TiFlash

### 16.17.20 TiDB 4.0 RC Release Notes

Release date: April 8, 2020

TiDB version: 4.0.0-rc

TiUP version: 0.0.3

**Warning:**

Some known issues are found in this version, and these issues are fixed in new versions. It is recommended that you use the latest 4.0.x version.

### 16.17.20.1 Compatibility Changes

- TiDB
  - Refuse to get started instead of returning an alert log when the tidb-server status port is occupied [#15177](#)
- TiKV
  - Support the `pipelined` feature in pessimistic transactions, which improves the TPC-C performance by 20%. The risk is that the transaction commit might fail because of lock failure during the execution [#6984](#)
  - Enable the `unify-read-pool` configuration item in new clusters by default and use the previous setting of this item in old clusters [#7059](#)
- Tools
  - TiDB Binlog
    - \* Add the configuration item for verifying Common Name [#934](#)

### 16.17.20.2 Important Bug Fixes

- TiDB
  - Fix the issue that replication between the upstream and downstream might go wrong when the DDL job is executed using the `PREPARE` statement because of the incorrect job query in the internal records [#15435](#)
  - Fix the issue of incorrect subquery result in the `Read Committed` isolation level [#15471](#)
  - Fix the issue of incorrect results caused by the Inline Projection optimization [#15411](#)
  - Fix the issue that the SQL Hint `INL_MERGE_JOIN` is executed incorrectly in some cases [#15515](#)
  - Fix the issue that columns with the `AutoRandom` attribute are rebased when the negative number is explicitly written to these columns [#15397](#)

### 16.17.20.3 New Features

- TiDB
  - Add the case-insensitive collation so that users can enable `utf8mb4_general_ci` and `utf8_general_ci` in a new cluster [#33](#)
  - Enhance the `RECOVER TABLE` syntax to support recovering truncated tables [#15398](#)
  - Refuse to get started instead of returning an alert log when the `tidb-server` status port is occupied [#15177](#)
  - Optimize the write performance of using a sequence as the default column values [#15216](#)
  - Add the `DDLJobs` system table to query the details of DDL jobs [#14837](#)
  - Optimize the `aggFuncSum` performance [#14887](#)
  - Optimize the output of `EXPLAIN` [#15507](#)
- TiKV
  - Support the `pipelined` feature in pessimistic transactions, which improves the TPC-C performance by 20%. The risk is that the transaction commit might fail because of lock failure during the execution [#6984](#)
  - Support TLS in the HTTP port [#5393](#)
  - Enable the `unify-read-pool` configuration item in new clusters by default and use the previous setting of this item in old clusters [#7059](#)
- PD
  - Support getting the default PD configuration information through the HTTP API [#2258](#)
- Tools
  - TiDB Binlog
    - \* Add the configuration item for verifying Common Name [#934](#)
  - TiDB Lightning
    - \* Optimize the performance of TiDB Lightning [#281](#) [#275](#)

### 16.17.20.4 Bug Fixes

- TiDB
  - Fix the issue that replication between the upstream and downstream might go wrong when the DDL job is executed using the `PREPARE` statement because of the incorrect job query in the internal records [#15435](#)

- Fix the issue of incorrect subquery result in the `Read Committed` isolation level [#15471](#)
  - Fix the issue of possible wrong behavior when using `INSERT ... VALUES` to specify the `BIT(N)` data type [#15350](#)
  - Fix the issue that the DDL Job internal retry does not fully achieve the expected outcomes because the values of `ErrorCount` fail to be summed correctly [#15373](#)
  - Fix the issue that Garbage Collection might work abnormally when TiDB connects to TiFlash [#15505](#)
  - Fix the issue of incorrect result caused by the Inline Projection optimization [#15411](#)
  - Fix the issue that the SQL Hint `INL_MERGE_JOIN` is executed incorrectly in some cases [#15515](#)
  - Fix the issue that columns with the `AutoRandom` attribute are rebased when the negative number is explicitly written to these columns [#15397](#)
- TiKV
    - Fix the possible panic caused by transferring the leader when the Follower Read feature is enabled [#7101](#)
- Tools
    - TiDB Lightning
      - \* Fix the issue of data error caused by the error of character conversion when the backend is TiDB [#283](#)
    - TiCDC
      - \* Fix the issue that an error is returned if the `test` schema does not exist in the downstream when MySQL sink is executing the DDL statement [#353](#)
      - \* Support the real-time interactive mode in CDC cli [#351](#)
      - \* Support checking whether the table in the upstream can be replicated during data replication [#368](#)
      - \* Support asynchronous write to Kafka [#344](#)

### 16.17.21 TiDB 4.0.0 Beta.2 Release Notes

Release date: March 18, 2020

TiDB version: 4.0.0-beta.2

TiDB Ansible version: 4.0.0-beta.2

#### 16.17.21.1 Compatibility Changes

- Tools

- TiDB Binlog
  - \* Fix the issue that the system returns an error and exits when `disable-dispatch` and `disable-causality` are configured in Drainer [#915](#)

### 16.17.21.2 New Features

- TiKV
  - Support persisting the dynamically updated configuration into the hardware disk [#6684](#)
- PD
  - Support persisting the dynamically updated configuration into the hardware disk [#2153](#)
- Tools
  - TiDB Binlog
    - \* Support the bidirectional data replication between TiDB clusters [#879](#) [#903](#)
  - TiDB Lightning
    - \* Support the TLS configuration [#40](#) [#270](#)
  - TiCDC
    - \* Initial release of the change data capture (CDC), providing the following features:
      - Support capturing changed data from TiKV
      - Support replicating the changed data from TiKV to MySQL compatible databases, and guarantee the eventual data consistency
      - Support replicating the changed data to Kafka, and guarantee either the eventual data consistency or the row-level orderliness
      - Provide process-level high availability
  - Backup & Restore (BR)
    - \* Enable experimental features such as incremental backup and backing up files to Amazon S3 [#175](#)
- TiDB Ansible
  - Support injecting the node information to etcd [#1196](#)
  - Support deploying TiDB services on the ARM platform [#1204](#)

### 16.17.21.3 Bug Fixes

- TiKV
  - Fix the panic issue that might occur when meeting empty short values during the backup [#6718](#)

- Fix the issue that Hibernate Regions might not be correctly awakened in some cases [#6772](#) [#6648](#) [#6376](#)
- PD
  - Fix the panic issue that the rule checker fails to allocate stores to Regions [#2160](#)
  - Fix the issue that after the dynamic configuration is enabled, the configuration might have replication delay when the Leader is being switched [#2154](#)
- Tools
  - Backup & Restore (BR)
    - \* Fix the issue that BR might fail to restore data of a large size because PD cannot process large-sized data [#167](#)
    - \* Fix the BR failure occurred because the BR version is not compatible with the TiDB version [#186](#)
    - \* Fix the BR failure occurred because the BR version is not compatible with TiFlash [#194](#)

## 16.17.22 TiDB 4.0.0 Beta.1 Release Notes

Release date: February 28, 2020

TiDB version: 4.0.0-beta.1

TiDB Ansible version: 4.0.0-beta.1

### 16.17.22.1 Compatibility Changes

- TiDB
  - Modify the type of the `log.enable-slow-log` configuration item from integer to Boolean [#14864](#)
  - Modify the `password` field name to `authentication_string` in the `mysql.user`  $\leftrightarrow$  system table to make it consistent with MySQL 5.7 (**This compatibility change means that you cannot roll back to earlier versions.**) [#14598](#)
  - Adjust the default value of the `txn-total-size-limit` configuration item from 1GB to 100MB [#14522](#)
  - Support dynamically modifying or updating configuration items read from PD [#14750](#) [#14303](#) [#14830](#)
- TiKV
  - Add the `readpool.unify-read-pool` configuration item (**True** by default) to control whether point queries use the same threads with Coprocessor [#6375](#) [#6401](#) [#6534](#) [#6582](#) [#6585](#) [#6593](#) [#6597](#) [#6677](#)
- PD

- Optimize the HTTP API to make it compatible with the configuration manager [#2080](#)
- TiDB Lightning
  - Use the default configurations specified in the document for certain items not configured in the configuration file [#255](#)
- TiDB Ansible
  - Rename `theflash` to `tiflash` [#1130](#)
  - Optimize the default values and related configurations in TiFlash’s configuration file [#1138](#)

### 16.17.22.2 New Features

- TiDB
  - Support querying slow logs of any time in the `SLOW_QUERY` / `CLUSTER_SLOW_QUERY`  $\leftrightarrow$  system table [#14840](#) [#14878](#)
  - Support SQL performance diagnosis
    - \* [#14843](#) [#14810](#) [#14835](#) [#14801](#) [#14743](#)
    - \* [#14718](#) [#14721](#) [#14670](#) [#14663](#) [#14668](#)
    - \* [#14896](#)
  - Support the `Sequence` function [#14731](#) [#14589](#) [#14674](#) [#14442](#) [#14303](#) [#14830](#)
  - Support dynamically modifying or updating configuration items read from PD [#14750](#) [#14303](#) [#14830](#)
  - Add a feature of automatically reading data from different roles according to the load balancing policy and add the `leader-and-follower` system variable to enable this feature [#14761](#)
  - Add the `Coercibility` function [#14739](#)
  - Support setting TiFlash replicas in the partitioned table [#14735](#) [#14713](#) [#14644](#)
  - Improve the privilege check for the `SLOW_QUERY` table [#14451](#)
  - Support automatically write the intermediate results to the disk file if the memory is insufficient when using a SQL join [#14708](#) [#14279](#)
  - Support checking table partitions by querying the `information_schema.PARTITIONS` system table [#14347](#)
  - Add the `json_objectagg` aggregate function [#11154](#)
  - Support logging rejected connection attempts in the audit log [#14594](#)
  - Add the `max-server-connections` configuration item (4096 by default) to control the number of connections to a single server [#14409](#)
  - Support the isolation read specifying multiple storage engines at the server level [#14440](#)
  - Optimize the cost model of the `Apply` operator and the `Sort` operator to improve stability [#13550](#) [#14708](#)
- TiKV

- Support fetching configuration items from the status port via HTTP API [#6480](#)
- Optimize the performance of `Chunk Encoder` in Coprocessor [#6341](#)
- PD
  - Support accessing to the distribution of hotspots in the cluster through Dashboard UI [#2086](#)
  - Support capturing and displaying `START_TIME` and `UPTIME` of cluster components [#2116](#)
  - Add the information of deployment path and component version in the returned message of the `member` API [#2130](#)
  - Add the `component` sub-command in `pd-ctl` to modify and check the configuration of other components (experimental) [#2092](#)
- TiDB Binlog
  - Support TLS between the components [#904](#) [#894](#)
  - Add the `kafka-client-id` configuration item in Drainer to configure Kafka's client ID [#902](#)
  - Support purging the incremental backup data in Drainer [#885](#)
- TiDB Ansible
  - Support deploying multiple Grafana/Prometheus/Alertmanagers in one cluster [#1142](#)
  - Add the `metric_port` configuration item (8234 by default) in TiFlash's configuration file [#1145](#)
  - Add the `flash_proxy_status_port` configuration item (20292 by default) in TiFlash's configuration file [#1141](#)
  - Add the TiFlash monitoring dashboard [#1147](#) [#1151](#)

### 16.17.22.3 Bug Fixes

- TiDB
  - Fix the issue that an error is reported when creating `view` with a column name that exceeds 64 characters [#14850](#)
  - Fix the issue that duplicate data exists in `information_schema.views` because the `create` or `replace view` statement is incorrectly processed [#14832](#)
  - Fix the incorrect results of `BatchPointGet` when `plan cache` is enabled [#14855](#)
  - Fix the issue that data is inserted into the wrong partitioned table after the timezone is modified [#14370](#)
  - Fix the panic occurred when rebuilding expression using the invalid name of the `IsTrue` function during the outer join simplification [#14515](#)
  - Fix the the incorrect privilege check for the `show binding` statement [#14443](#)
- TiKV

- Fix the inconsistent behaviors of the `CAST` function in TiDB and TiKV [#6463](#) [#6461](#) [#6459](#) [#6474](#) [#6492](#) [#6569](#)
- TiDB Lightning
  - Fix the bug that the web interface does not work outside the Server mode [#259](#)

### 16.17.23 TiDB 4.0 Beta Release Notes

Release date: January 17, 2020

TiDB version: 4.0.0-beta

TiDB Ansible version: 4.0.0-beta

#### 16.17.23.1 TiDB

- Print the log or cancel the SQL execution when the memory used during the execution of `INSERT/REPLACE/DELETE/UPDATE` exceeds the limit specified by the `MemQuotaQuery`  $\leftrightarrow$  configuration item. The actual behavior depends on the `OOMAction` configuration. [#14179](#) [#14289](#) [#14299](#)
- Increase the accuracy of calculating the cost of `Index Join` by considering the row counts of both driving tables and driven tables [#12085](#)
- Add 15 SQL hints to control the behavior of the optimizer and make the optimizer more stable
  - [#11253](#) [#11364](#) [#11673](#) [#11740](#) [#11746](#)
  - [#11809](#) [#11996](#) [#12043](#) [#12059](#) [#12246](#)
  - [#12382](#)
- Improve the performance when the columns involved in a query can be fully covered by indexes [#12022](#)
- Improve the performance of table query by supporting the Index Merge feature [#10121](#) [#10512](#) [#11245](#) [#12225](#) [#12248](#) [#12305](#) [#12843](#)
- Improve the performance of Range calculation and reduce the CPU overhead by caching index results and eliminating duplicate results [#12856](#)
- Decouple the level of slow logs from the level of ordinary logs [#12359](#)
- Add the `oom-use-tmp-storage` parameter (`true` by default) to control whether to use temporary files to cache intermediate results when the memory usage for the execution of a single SQL statement exceeds `mem-quota-query` and the SQL contains `Hash Join` [#11832](#) [#11937](#) [#12116](#) [#12067](#)
- Support using `create index/alter table` to create expression index and using `drop  $\leftrightarrow$  index` to drop expression index [#14117](#)
- Increase the default value of the `query-log-max-len` parameter to 4096 to reduce the number of truncated SQL outputs. This parameter can be adjusted dynamically. [#12491](#)

- Support adding the `AutoRandom` keyword in the column attribute to control whether the system automatically assigns a random integer to the primary key, which avoids the hotspot problem caused by the `AUTO_INCREMENT` primary key [#13127](#)
- Support Table Locks [#11038](#)
- Support using the `LIKE` or `WHERE` clause in `ADMIN SHOW DDL JOBS` for conditional filtering [#12484](#)
- Add the `TIDB_ROW_ID_SHARDING_INFO` column in the `information_schema.tables`  $\hookrightarrow$  table to output the `RowID` scattering information (for example, the value of the `SHARD_ROW_ID_BITS` column in table A is "`SHARD_BITS={bit_number}`") [#13418](#)
- Optimize the error code of SQL error messages to avoid the situation that the `ERROR`  $\hookrightarrow$  1105 (HY000) code is used for multiple error messages (the `Unknown Error` type)
  - [#14002](#) [#13874](#) [#13733](#) [#13654](#) [#13646](#)
  - [#13540](#) [#13366](#) [#13329](#) [#13300](#) [#13233](#)
  - [#13033](#) [#12866](#) [#14054](#)
- Convert a narrow data range of the discrete type into `point set` and use `CM-Sketch` to improve the estimation accuracy when estimating the number of rows [#11524](#)
- Extract the `TopN` information from `CM-Sketch` for normal `Analyze` and separately maintain the frequently occurring values [#11409](#)
- Support dynamically adjusting the depth and width of `CM-Sketch` and the number of `TopN` information [#11278](#)
- Support automatically capturing and evolving SQL Binding [#13199](#) [#12434](#)
- Optimize the encoding format of communication with TiKV by using `Chunk` to improve communication performance [#12023](#) [#12536](#) [#12613](#) [#12621](#) [#12899](#) [#13060](#) [#13349](#)
- Support the new row store format to improve the performance of the wide table [#12634](#)
- Optimize the `Recover Binlog` interface to ensure waiting all transactions to be committed before returning to the client [#13740](#)
- Support querying the binlog statuses enabled by TiDB servers in the cluster through the HTTP `info/all` interface [#13025](#)
- Support the MySQL-compatible `Read Committed` transaction isolation level when using the pessimistic transaction mode [#14087](#)
- Support large-sized transactions. The transaction size is limited by the size of the physical memory.
  - [#11999](#) [#11986](#) [#11974](#) [#11817](#) [#11807](#)
  - [#12133](#) [#12223](#) [#12980](#) [#13123](#) [#13299](#)
  - [#13432](#) [#13599](#)
- Improve the stability of `Kill` [#10841](#)
- Support hexadecimal and binary expressions as separators in `LOAD DATA` [#11029](#)
- Improve the performance of `IndexLookupJoin` and reduce memory consumption during execution by splitting `IndexLookupJoin` into `IndexHashJoin` and `IndexMergeJoin` [#8861](#) [#12139](#) [#12349](#) [#13238](#) [#13451](#) [#13714](#)
- Fix several issues relating to RBAC [#13896](#) [#13820](#) [#13940](#) [#14090](#) [#13940](#) [#13014](#)
- Fix the issue that `VIEW` cannot be created because the `SELECT` statement contains `union` [#12595](#)

- Fix several issues relating to the `CAST` function
  - [#12858](#) [#11968](#) [#11640](#) [#11483](#) [#11493](#)
  - [#11376](#) [#11355](#) [#11114](#) [#14405](#) [#14323](#)
  - [#13837](#) [#13401](#) [#13334](#) [#12652](#) [#12864](#)
  - [#12623](#) [#11989](#)
- Output the detailed `backoff` information of TiKV RPC in the slow log to facilitate troubleshooting [#13770](#)
- Optimize and unify the format of the memory statistics in the expensive log [#12809](#)
- Optimize the explicit format of `EXPLAIN` and support outputting information about the operator's usage of memory and disk [#13914](#) [#13692](#) [#13686](#) [#11415](#) [#13927](#) [#13764](#) [#13720](#)
- Optimize the check for duplicate values in `LOAD DATA` based on the transaction size and support setting the transaction size by configuring the `tidb_dml_batch_size` parameter [#11132](#)
- Optimize the performance of `LOAD DATA` by separating the data preparing routine and the commit routine and assigning the workload to different Workers [#11533](#) [#11284](#)

### 16.17.23.2 TiKV

- Upgrade the RocksDB version to 6.4.6
- Fix the issue that the system cannot perform the compaction task normally when the disk space is used up by automatically creating a 2GB empty file when TiKV is started [#6321](#)
- Support quick backup and restoration
  - [#6462](#) [#6395](#) [#6378](#) [#6374](#) [#6349](#)
  - [#6339](#) [#6308](#) [#6295](#) [#6286](#) [#6283](#)
  - [#6261](#) [#6222](#) [#6209](#) [#6204](#) [#6202](#)
  - [#6198](#) [#6186](#) [#6177](#) [#6146](#) [#6071](#)
  - [#6042](#) [#5877](#) [#5806](#) [#5803](#) [#5800](#)
  - [#5781](#) [#5772](#) [#5689](#) [#5683](#)
- Support reading data from Follower replicas
  - [#5051](#) [#5118](#) [#5213](#) [#5316](#) [#5401](#)
  - [#5919](#) [#5887](#) [#6340](#) [#6348](#) [#6396](#)
- Improve the performance of TiDB reading data through index [#5682](#)
- Fix the issue that the `CAST` function behaves inconsistently in TiKV and in TiDB
  - [#6459](#) [#6461](#) [#6458](#) [#6447](#) [#6440](#)
  - [#6425](#) [#6424](#) [#6390](#) [#5842](#) [#5528](#)
  - [#5334](#) [#5199](#) [#5167](#) [#5146](#) [#5141](#)
  - [#4998](#) [#5029](#) [#5099](#) [#5006](#) [#5095](#)
  - [#5093](#) [#5090](#) [#4987](#) [#5066](#) [#5038](#)

- [#4962](#) [#4890](#) [#4727](#) [#6060](#) [#5761](#)
- [#5793](#) [#5468](#) [#5540](#) [#5548](#) [#5455](#)
- [#5543](#) [#5433](#) [#5431](#) [#5423](#) [#5179](#)
- [#5134](#) [#4685](#) [#4650](#) [#6463](#)

### 16.17.23.3 PD

- Support optimizing hotspot scheduling according to the load information of storage nodes
  - [#1870](#) [#1982](#) [#1998](#) [#1843](#) [#1750](#)
- Add the Placement Rules feature that supports controlling the number of replicas of any data range, the storage location, the storage host type and roles by combining different scheduling rules
  - [#2051](#) [#1999](#) [#2042](#) [#1917](#) [#1904](#)
  - [#1897](#) [#1894](#) [#1865](#) [#1855](#) [#1834](#)
- Support using plugins (experimental) [#1799](#)
- Add the feature that the schedulers support the customized configuration and key ranges (experimental) [#1735](#) [#1783](#) [#1791](#)
- Support automatically adjusting the scheduling speed according the cluster load information (experimental, disabled by default) [#1875](#) [#1887](#) [#1902](#)

### 16.17.23.4 Tools

- TiDB Lightning
  - Add the parameter in the command-line tool to set the password of the downstream database [#253](#)

### 16.17.23.5 TiDB Ansible

- Add checksum check in the package in case that the downloaded package is incomplete [#1002](#)
- Support checking the systemd version which must be `systemd-219-52` or later [#1020](#) [#1074](#)
- Fix the issue that the log directory is incorrectly created when TiDB Lightning is started [#1103](#)
- Fix the issue that the customized port of TiDB Lightning is invalid [#1107](#)
- Support deploying and maintaining TiFlash [#1119](#)

## 16.18 v3.1

### 16.18.1 TiDB 3.1.2 Release Notes

Release date: June 4, 2020

TiDB version: 3.1.2

#### 16.18.1.1 Bug Fixes

- TiKV
  - Fix the error handling issue during backup and restoration with S3 and GCS [#7965](#)
  - Fix the `DefaultNotFound` error that occurs during restoration [#7838](#)
- Tools
  - Backup & Restore (BR)
    - \* Retry automatically when the network is poor to improve stability with S3 and GCS storages [#314](#) [#7965](#)
    - \* Fix a restoration failure that occurs because the Region leader cannot be found when restoring small tables [#303](#)
    - \* Fix a data loss issue during restoration when a table's row ID exceeds  $2^{63}$  [#323](#)
    - \* Fix the issue that empty databases and tables cannot be restored [#318](#)
    - \* Support using AWS KMS for server-side encryption (SSE) when targeting the S3 storage [#261](#)

### 16.18.2 TiDB 3.1.1 Release Notes

Release date: April 30, 2020

TiDB version: 3.1.1

TiDB Ansible version: 3.1.1

#### 16.18.2.1 New Features

- TiDB
  - Add the table option for `auto_rand_base` [#16812](#)
  - Add the `Feature ID` comment: In the special comments of SQL statements, only the registered statement fragment can be parsed by the parser; otherwise, the statement is ignored [#16155](#)

- TiFlash
  - Cache the `handle` and `version` columns to reduce the disk I/O for a single read request
  - Add in Grafana the graphics related to the read and write workloads of DeltaTree engine
  - Optimize the decimal data encoding in the `Chunk` codec
  - Reduce the number of open file descriptors when TiFlash is in low workload

### 16.18.2.2 Bug Fixes

- TiDB
  - Fix the issue that the isolation read setting at the instance level does not take effect, and that the isolation read setting is incorrectly retained after TiDB is upgraded [#16482](#) [#16802](#)
  - Fix the partition selection syntax on the hash partitioned table so that an error is not reported for syntaxes such as `partition (P0)` [#16076](#)
  - Fix the issue that when an `UPDATE` SQL statement only queries from a view but does not update the view, the update statement still reports an error [#16789](#)
  - Fix the issue of wrong results caused by removing the `not not` from the nested query [#16423](#)
- TiFlash
  - Fix the issue that an error occurs when reading data from a Region that is in the abnormal state
  - Modify the mapping of table names in TiFlash to correctly support `recover`  $\leftrightarrow$  `table/flashback table`
  - Modify the storage path to fix the potential data loss issue that occurs when renaming a table
  - Modify the read mode in the online update scenario to improve the read performance
  - Fix the issue that TiFlash fails to start normally after upgrade if the database/table name contains special characters
- Tools
  - Backup & Restore (BR)
    - \* Fix the issue that after BR restores a table with the `auto_random` attribute, inserting data might trigger the duplicate entry error [#241](#)

### 16.18.3 TiDB 3.1.0 GA Release Notes

Release date: April 16, 2020

TiDB version: 3.1.0 GA

TiDB Ansible version: 3.1.0 GA

#### 16.18.3.1 Compatibility Changes

- TiDB
  - Support directly stopping starting TiDB if the HTTP listening port is unavailable when the `report-status` configuration item is enabled [#16291](#)
- Tools
  - Backup & Restore (BR)
    - \* BR does not support restoring data from the TiKV cluster earlier than 3.1 GA [#233](#)

#### 16.18.3.2 New Features

- TiDB
  - Support displaying the information of Coprocessor tasks in `explain format = ↪ "dot"` [#16125](#)
  - Reduce the redundant stack information of log using the `disable-error-stack` configuration item [#16182](#)
- Placement Driver (PD)
  - Optimize the hot Region scheduling [#2342](#)
- TiFlash
  - Add the metrics report related to the read and write workloads of DeltaTree engine
  - Support pushing down the `fromUnixTime` and `dateFormat` functions
  - Disable the rough set filter by default
- TiDB Ansible
  - Add TiFlash monitor [#1253](#) [#1257](#)
  - Optimize the configuration parameters of TiFlash [#1262](#) [#1265](#) [#1271](#)
  - Optimize the TiDB starting script [#1268](#)

### 16.18.3.3 Bug Fixes

- TiDB
  - Fix the panic issue caused by the merge join operation in some scenarios [#15920](#)
  - Fix the issue that some expressions are repeatedly counted in selectivity calculation [#16052](#)
  - Fix the panic issue occurred when loading the statistics information in extreme cases [#15710](#)
  - Fix the issue that an error is returned in some cases when equivalent expressions cannot be recognized in SQL query [#16015](#)
  - Fix the issue that an error is returned when querying the view of one database from another database [#15867](#)
  - Fix the panic issue that occurs when the column is handled using `fast analyze` [#16080](#)
  - Fix the incorrect character set of the `current_role` print result [#16084](#)
  - Refine the log of MySQL connection handshake error [#15799](#)
  - Fix the panic issue caused by port probing after the audit plugin is loaded [#16065](#)
  - Fix the panic issue of the `sort` operator on left join because the `TypeNull` class is mistaken as a variable-length type [#15739](#)
  - Fix the issue of inaccurate count of monitoring session retry errors [#16120](#)
  - Fix the issue of wrong results of `weekday` in the `ALLOW_INVALID_DATES` mode [#16171](#)
  - Fix the issue that Garbage Collection (GC) might not work normally when the cluster has TiFlash nodes [#15761](#)
  - Fix the issue that TiDB goes out of memory (OOM) when users set a large partition count when creating the hash partitioned table [#16219](#)
  - Fix the issue that warnings are mistaken as errors, and make the `UNION` statement have the same behavior as the `SELECT` statement [#16138](#)
  - Fix the execution error when `TopN` is pushed down to `mocktikv` [#16200](#)
  - Increase the initial length of `chunk.column.nullBitMap` to avoid unnecessary overhead of `runtime.growslice` [#16142](#)
- TiKV
  - Fix the panic issue caused by replica read [#7418](#) [#7369](#)
  - Fix the issue that the restoration process creates empty Regions [#7419](#)
  - Fix the issue that repeated resolve lock requests might harm the atomicity of pessimistic transactions [#7389](#)
- TiFlash
  - Fix the potential issue of the `rename table` operation when replicating the schema from TiDB
  - Fix the issue of data loss caused by the `rename table` operation under multiple data path configurations

- Fix the issue that TiFlash reports incorrect storage space in some scenarios
- Fix the potential issue caused by reading from TiFlash when Region Merge is enabled
- Tools
  - TiDB Binlog
    - \* Fix the issue that TiFlash-related DDL jobs might interrupt the replication of Drainer [#948](#) [#942](#)
  - Backup & Restore (BR)
    - \* Fix the issue that the `checksum` operation is still executed when it is disabled [#223](#)
    - \* Fix the issue that incremental backup fails when TiDB enables `auto-random` or `alter-pk` [#230](#) [#231](#)

#### 16.18.4 TiDB 3.1 RC Release Notes

Release date: April 2, 2020

TiDB version: 3.1.0-rc

TiDB Ansible version: 3.1.0-rc

##### **Warning:**

Some known issues are found in this version, and these issues are fixed in new versions. It is recommended that you use the latest 3.1.x version.

##### 16.18.4.1 New Features

- TiDB
  - Use the binary search to re-implement partition pruning for better performance [#15678](#)
  - Support using the `RECOVER` syntax to recover the truncated table [#15460](#)
  - Add the `AUTO_RANDOM` ID cache for retrying statements and recovering tables [#15393](#)
  - Support restoring the state of the `AUTO_RANDOM` ID allocator using the `recover`  $\leftrightarrow$  `table` statement [#15393](#)
  - Support `YEAR`, `MONTH`, and `TO_DAY` functions as the partitioning keys of the Hash partitioned table [#15619](#)

- Add the table ID to the schema-change related tables only when keys need to be locked in the `SELECT... FOR UPDATE` statement [#15708](#)
- Add the feature of automatically reading data from different roles according to the load balancing policy and add the `leader-and-follower` system variable to enable this feature [#15721](#)
- Support dynamically updating the TLS certificate every time TiDB establishes a new connection to update expired client certificate without restarting the RPC client side [#15163](#)
- Upgrade PD Client to support loading the latest certificate every time TiDB establishes a new connection [#15425](#)
- Forcibly use the HTTPS protocol with the configured TLS certificates between a TiDB server and a PD server, or between two TiDB servers when `cluster-ssl-*` is configured [#15430](#)
- Add the MySQL-compatible `--require-secure-transport` startup option to force the client to enable TLS authentication during the configuration [#15442](#)
- Add the `cluster-verify-cn` configuration item. After configuration, the status service can only be used when with the corresponding CN certificate [#15137](#)
- TiKV
  - Support backing up data with the Raw KV API [#7051](#)
  - Support TLS authentication for the status server [#7142](#)
  - Support TLS authentication for the KV server [#7305](#)
  - Optimize the time to hold locks to improve the performance of backup [#7202](#)
- PD
  - Support scheduling learner using `shuffle-region-scheduler` [#2235](#)
  - Add commands in `pd-ctl` to configure Placement Rules [#2306](#)
- Tools
  - TiDB Binlog
    - \* Support TLS authentication between the components [#931](#) [#937](#) [#939](#)
    - \* Add the `kafka-client-id` configuration item in Drainer to configure Kafka's client ID [#929](#)
  - TiDB Lightning
    - \* Optimize the performance of TiDB Lightning [#281](#) [#275](#)
    - \* Support TLS authentication for TiDB Lightning [#270](#)
  - Backup & Restore (BR)
    - \* Optimize the log output [#189](#)
- TiDB Ansible

- Optimize the way the TiFlash data directories are created [#1242](#)
- Add the `Write Amplification` monitoring item in TiFlash [#1234](#)
- Optimize the error message of failed preflight checks when CPU `epollexclusive` is unavailable [#1243](#)

#### 16.18.4.2 Bug Fixes

- TiDB

- Fix the information schema error caused by frequently updating the TiFlash replica [#14884](#)
- Fix the issue that `last_insert_id` is incorrectly generated when applying `AUTO_RANDOM` [#15149](#)
- Fix the issue that updating the status of TiFlash replica might cause the DDL operation to get stuck [#15161](#)
- Forbid `Aggregation` pushdown and `TopN` pushdown when there are predicates that cannot be pushed down [#15141](#)
- Forbid the nested `view` creation [#15440](#)
- Fix the error occurred when executing `SELECT CURRENT_ROLE()` after `SET ROLE` `↔` `ALL` [#15570](#)
- Fix the failure to identify the `view` name when executing the `select view_name` `↔` `.col_name from view_name` statement [#15573](#)
- Fix the issue that an error might occur when pre-processing DDL statements during the write of binlog information [#15444](#)
- Fix the panic occurred when accessing both `views` and partitioned tables [#15560](#)
- Fix the error occurred when executing the `VALUES` function with the update `↔` `duplicate key` statement that contains the `bit(n)` data type [#15487](#)
- Fix the issue that the specified maximum execution time fails to take effect in some scenarios [#15616](#)
- Fix the issue that whether the current `ReadEngine` contains TiKV server is not checked when generating the execution plan using `Index Scan` [#15773](#)

- TiKV

- Fix the issue of conflict check failure or data index inconsistency caused by inserting an existing key into a transaction and then deleting it immediately when disabling the consistency check parameter [#7112](#)
- Fix the calculation error when `TopN` compares unsigned integers [#7199](#)
- Introduce a flow control mechanism in Raftstore to solve the problem that without flow control, it might cause slow log tracking and cause the cluster to be stuck; and the problem that the large transaction size might cause the frequent reconnection among TiKV servers [#7087](#) [#7078](#)
- Fix the issue that pending read requests sent to replicas might be permanently blocked [#6543](#)
- Fix the issue that replica read might be blocked by applying snapshots [#7249](#)

- Fix the issue that transferring leader might cause TiKV to panic [#7240](#)
- Fix the issue that all SST files are filled with zeroes when backing up data to S3 [#6967](#)
- Fix the issue that the size of SST file is not recorded during backup, resulting in many empty Regions after restoration [#6983](#)
- Support AWS IAM web identity for backup [#7297](#)
- PD
  - Fix the issue of incorrect Region information caused by data race when PD processes Region heartbeats [#2234](#)
  - Fix the issue that `random-merge-scheduler` fails to follow location labels and Placement Rules [#2212](#)
  - Fix the issue that a placement rule is overwritten by another placement rule with the same `startKey` and `endKey` [#2222](#)
  - Fix the issue that the version number of API is inconsistent with that of PD server [#2192](#)
- Tools
  - TiDB Lightning
    - \* Fix the bug that the `&` character is replaced by the EOF character in TiDB backend [#283](#)
  - Backup & Restore (BR)
    - \* Fix the issue that BR cannot restore the TiFlash cluster data [#194](#)

### 16.18.5 TiDB 3.1 Beta.2 Release Notes

Release date: March 9, 2020

TiDB version: 3.1.0-beta.2

TiDB Ansible version: 3.1.0-beta.2

#### **Warning:**

Some known issues are found in this version, and these issues are fixed in new versions. It is recommended that you use the latest 3.1.x version.

### 16.18.5.1 Compatibility Changes

- Tools
  - TiDB Lightning
    - \* Use the default configurations specified in the [TiDB Lightning Configuration](#) for certain items not configured in the configuration file [#255](#)
    - \* Add the `--tidb-password` CLI parameter to set the TiDB password [#253](#)

### 16.18.5.2 New Features

- TiDB
  - Support adding the `AutoRandom` keyword in the column attribute to enable TiDB to automatically assign random integers to the primary key, which avoids the write hot spot caused by the `AUTO_INCREMENT` primary key [#14555](#)
  - Support creating or deleting column store replicas through DDL statements [#14537](#)
  - Add the feature that the optimizer can independently select different storage engines [#14537](#)
  - Add the feature that the SQL hint supports different storage engines [#14537](#)
  - Support reading data from followers by using the `tidb_replica_read` system variable [#13464](#)
- TiKV
  - Raftstore
    - \* Add the `peer_address` parameter to connect other nodes to the TiKV server [#6491](#)
    - \* Add the `read_index` and `read_index_resp` monitoring metrics to monitor the number of `ReadIndex` requests [#6610](#)
- PD Client
  - Support reporting statistics of local threads to PD [#6605](#)
- Backup
  - Replace the `RocksIOLimiter` flow control library with Rust's `async-speed-limit` ↔ flow control library to eliminate extra memory copies when backing up a file [#6462](#)
- PD
  - Tolerate backslash in the location label name [#2084](#)
- TiFlash
  - Initial release

- TiDB Ansible
  - Support deploying multiple Grafana/Prometheus/Alertmanager in one cluster [#1143](#)
  - Support deploying the TiFlash component [#1148](#)
  - Add monitoring metrics related to the TiFlash component [#1152](#)

### 16.18.5.3 Bug Fixes

- TiKV
  - Raftstore
    - \* Fix the issue that the read requests cannot be processed because data is not properly read from Hibernate Regions [#6450](#)
    - \* Fix the panic issue caused by the `ReadIndex` requests during the leader transfer process [#6613](#)
    - \* Fix the issue that Hibernate Regions are not correctly awakened in some special conditions [#6730](#) [#6737](#) [#6972](#)
  - Backup
    - \* Fix the inconsistent data index during the restoration caused by the backup of the extra data [#6659](#)
    - \* Fix the panic caused by incorrectly processing the deleted values during the backup [#6726](#)
- PD
  - Fix the panic occurred because the rule checker fails to assign stores to Regions [#2161](#)
- Tools
  - TiDB Lightning
    - \* Fix the bug that the web interface does not work outside the Server mode [#259](#)
  - BR (Backup and Restore)
    - \* Fix the issue that BR cannot exit in time due to an unrecoverable error it encounters when restoring data [#152](#)
- TiDB Ansible
  - Fix the issue that the rolling update command fails because the PD Leader cannot be obtained in some scenarios [#1122](#)

### 16.18.6 TiDB 3.1 Beta.1 Release Notes

Release date: January 10, 2020

TiDB version: 3.1.0-beta.1

TiDB Ansible version: 3.1.0-beta.1

### 16.18.6.1 TiKV

- backup
  - Change the name of the backup file from `start_key` to the hash value of `start_key` to reduce the file name's length for easy reading [#6198](#)
  - Disable RocksDB's `force_consistency_checks` check to avoid false positives in the consistency check [#6249](#)
  - Add the incremental backup feature [#6286](#)
- sst\_importer
  - Fix the issue that the SST file does not have MVCC properties during restoring [#6378](#)
  - Add the monitoring items such as `tikv_import_download_duration`, `tikv_import_download_time`, `tikv_import_ingest_duration`, `tikv_import_ingest_bytes`, and `tikv_import_error_counter` to observe the overheads of downloading and ingesting SST files [#6404](#)
- raftstore
  - Fix the issue of Follower Read that the follower reads stale data when the leader changes, thus breaking transaction isolation [#6343](#)

### 16.18.6.2 Tools

- BR (Backup and Restore)
  - Fix the inaccurate backup progress information [#127](#)
  - Improve the performance of splitting Regions [#122](#)
  - Add the backup and restore feature for partitioned tables [#137](#)
  - Add the feature of automatically scheduling PD schedulers [#123](#)
  - Fix the issue that data is overwritten after non `PKIsHandle` tables are restored [#139](#)

### 16.18.6.3 TiDB Ansible

- Add the feature of automatically disabling Transparent Huge Pages (THP) in the operating system during the initialization phase [#1086](#)
- Add the Grafana monitoring for BR components [#1093](#)
- Optimize the deployment of TiDB Lightning by automatically creating related directories [#1104](#)

## 16.18.7 TiDB 3.1 Beta Release Notes

Release date: December 20, 2019

TiDB version: 3.1.0-beta

TiDB Ansible version: 3.1.0-beta

### 16.18.7.1 TiDB

- SQL Optimizer
  - Enrich SQL hints [#12192](#)
- New feature
  - Support the Follower Read feature [#12535](#)

### 16.18.7.2 TiKV

- Support the distributed backup and restore feature [#5532](#)
- Support the Follower Read feature [#5562](#)

### 16.18.7.3 PD

- Support the distributed backup and restore feature [#1896](#)

## 16.19 v3.0

### 16.19.1 TiDB 3.0.20 Release Notes

Release date: December 25, 2020

TiDB version: 3.0.20

#### 16.19.1.1 Compatibility Change

- TiDB
  - Deprecate the `enable-streaming` configuration item [#21054](#)

#### 16.19.1.2 Improvements

- TiDB
  - Raise an error when preparing the `LOAD DATA` statement [#21222](#)
- TiKV
  - Add the `end_point_slow_log_threshold` configuration item [#9145](#)

### 16.19.1.3 Bug Fixes

- TiDB
  - Fix the incorrect cache of the transaction status for pessimistic transactions [#21706](#)
  - Fix the issue of inaccurate statistics that occurs when querying `INFORMATION_SCHEMA` `↔ .TIDB_HOT_REGIONS` [#21319](#)
  - Fix the issue that `DELETE` might not delete data correctly when the database name is not in a pure lower representation [#21205](#)
  - Fix the issue of stack overflow that occurs when building the recursive view [#21000](#)
  - Fix the issue of goroutine leak in TiKV client [#20863](#)
  - Fix the wrong default zero value for the `year` type [#20828](#)
  - Fix the issue of goroutine leak in index lookup join [#20791](#)
  - Fix the issue that executing `INSERT SELECT FOR UPDATE` returns the malformed packet in the pessimistic transaction [#20681](#)
  - Fix the unknown time zone '`posixrules`' [#20605](#)
  - Fix the issue that occurs when converting the unsigned integer type to the bit type [#20362](#)
  - Fix the corrupted default value of the bit type column [#20339](#)
  - Fix the potentially incorrect results when one of the equal condition is the `Enum` or `Set` type [#20296](#)
  - Fix a wrong behavior of `!= any()` [#20061](#)
  - Fix the issue that type conversion in `BETWEEN...AND...` returns invalid results [#21503](#)
  - Fix a compatibility issue with the `ADDDATE` function [#21008](#)
  - Set the correct default value for newly added `Enum` column [#20999](#)
  - Fix the result of SQL statements like `SELECT DATE_ADD('2007-03-28' ↔ 22:08:28', INTERVAL "-2.-2" SECOND)` to be compatible with MySQL [#20627](#)
  - Fix the incorrect default value when modifying the column type [#20532](#)
  - Fix the issue that the `timestamp` function gets wrong result when the input argument is the `float` or `decimal` type [#20469](#)
  - Fix a potential deadlock issue in statistics [#20424](#)
  - Fix the issue that the overflown float type data is inserted [#20251](#)
- TiKV
  - Fix the issue that an error is returned indicating that a key exists when this key is locked and deleted in a committed transaction [#8931](#)
- PD
  - Fix the issue that too many logs are printed when starting PD and when there are too many stale Regions [#3064](#)

## 16.19.2 TiDB 3.0.19 Release Notes

Release date: September 25, 2020

TiDB version: 3.0.19

### 16.19.2.1 Compatibility Changes

- PD
  - Change the import path from pingcap/pd to tikv/pd [#2779](#)
  - Change the copyright information from PingCAP, Inc to TiKV Project Authors [#2777](#)

### 16.19.2.2 Improvements

- TiDB
  - Mitigate the impact of failure recovery on QPS performance [#19764](#)
  - Support adjusting the concurrency of the union operator [#19885](#)
- TiKV
  - Set sync-log to true as a nonadjustable value [#8636](#)
- PD
  - Add an alert rule for PD restart [#2789](#)

### 16.19.2.3 Bug Fixes

- TiDB
  - Fix the query error that occurs when the slow-log file does not exist [#20050](#)
  - Add the privilege check for SHOW STATS\_META and SHOW STATS\_BUCKET [#19759](#)
  - Forbid changing the decimal type to the integer type [#19681](#)
  - Fix the issue that the constraint is not checked when altering the ENUM/SET type column [#20045](#)
  - Fix the bug that tidb-server does not release table locks after a panic [#20021](#)
  - Fix the bug that the OR operator is not handled correctly in the WHERE clause [#19901](#)
- TiKV

- Fix the bug that TiKV panics when parsing responses with missing reason phrases [#8540](#)
- Tools
  - TiDB Lightning
    - \* Fix the issue that the TiDB Lightning process does not exit in time when encountering illegal UTF characters in CSV in the strict mode [#378](#)

### 16.19.3 TiDB 3.0.18 Release Notes

Release date: August 21, 2020

TiDB version: 3.0.18

#### 16.19.3.1 Improvements

- Tools
  - TiDB Binlog
    - \* Support the time duration format of Go for the Pump GC configuration [#996](#)

#### 16.19.3.2 Bug Fixes

- TiDB
  - Fix the issue that the wrong handling of the `decimal` type by the `Hash` function causes the wrong `HashJoin` result [#19185](#)
  - Fix the issue that the wrong handling of the `set` and `enum` types by the `Hash` function causes the wrong `HashJoin` result [#19175](#)
  - Fix the issue that the check for duplicate keys fails in the pessimistic locking mode [#19236](#)
  - Fix the issue that the `Apply` and `Union Scan` operators cause the wrong execution result [#19297](#)
  - Fix the issue that some cached execution plans are incorrectly executed in transaction [#19274](#)
- TiKV
  - Change the GC failure log from `error` to the `warning` level [#8444](#)
- Tools
  - TiDB Lightning
    - \* Fix the issue that the `--log-file` argument does not take effect [#345](#)
    - \* Fix the syntax error on empty binary/hex literals when using TiDB-backend [#357](#)
    - \* Fix the unexpected `switch-mode` call when using TiDB-backend [#368](#)

## 16.19.4 TiDB 3.0.17 Release Notes

Release date: Aug 3, 2020

TiDB version: 3.0.17

### 16.19.4.1 Improvements

- TiDB
  - Decrease the default value of the `query-feedback-limit` configuration item from 1024 to 512, and improve the statistics feedback mechanism to ease its impact on the cluster [#18770](#)
  - Limit batch split count for one request [#18694](#)
  - Accelerate `/tiflash/replica` HTTP API when there are many history DDL jobs in the TiDB cluster [#18386](#)
  - Improve row count estimation for index equal condition [#17609](#)
  - Speed up the execution of `kill tidb conn_id` [#18506](#)
- TiKV
  - Add the `hibernate-timeout` configuration that delays region hibernation to improve rolling update performance [#8207](#)
- Tools
  - TiDB Lightning
    - \* `[black-white-list]` has been deprecated with a newer, easier-to-understand filter format [#332](#)

### 16.19.4.2 Bug Fixes

- TiDB
  - Return the actual error message instead of an empty set when a query which contains `IndexHashJoin` or `IndexMergeJoin` encounters a panic [#18498](#)
  - Fix the unknown column error for SQL statements like `SELECT a FROM t HAVING ↵ t.a` [#18432](#)
  - Forbid adding a primary key for a table when the table has no primary key or when the table already has an integer primary key [#18342](#)
  - Return an empty set when executing `EXPLAIN FORMAT="dot" FOR CONNECTION` [#17157](#)
  - Fix `STR_TO_DATE`'s handling for format token `'%r'`, `'%h'` [#18725](#)
- TiKV

- Fix a bug that might read stale data during region merging [#8111](#)
- Fix the issue of memory leak during the scheduling process [#8355](#)

- Tools

- TiDB Lightning
  - \* Fix the issue that the `log-file` flag is ignored [#345](#)

### 16.19.5 TiDB 3.0.16 Release Notes

Release date: July 03, 2020

TiDB version: 3.0.16

#### 16.19.5.1 Improvements

- TiDB

- Support the `is null` filter condition in hash partition pruning [#17308](#)
- Assign different `Backoffers` to each Region to avoid the SQL timeout issue when multiple Region requests fail at the same time [#17583](#)
- Split separate Regions for the newly added partition [#17668](#)
- Discard feedbacks generated from the `delete` or `update` statement [#17841](#)
- Correct the usage of `json.Unmarshal` in `job.DecodeArgs` to be compatible with future Go versions [#17887](#)
- Remove sensitive information in the slow query log and the statement summary table [#18128](#)
- Match the MySQL behavior with `DateTime` delimiters [#17499](#)
- Handle `%h` in date formats in the range that is consistent with MySQL [#17496](#)

- TiKV

- Avoid sending store heartbeats to PD after snapshots are received [#8145](#)
- Improve the PD client log [#8091](#)

#### 16.19.5.2 Bug Fixes

- TiDB

- Fix the data inconsistency issue occurred because the lock of a written and deleted primary key in one transaction is resolved by another transaction [#18248](#)
- Fix the `Got too many pings` gRPC error log in the PD server-side followers [#17944](#)
- Fix the panic issue that might occur when the child of `HashJoin` returns the `TypeNull` column [#17935](#)

- Fix the error message when access is denied [#17722](#)
  - Fix JSON comparison issue for the `int` and `float` types [#17715](#)
  - Update the failpoint which causes data race [#17710](#)
  - Fix the issue that the timeout pre-split Regions might not work when creating tables [#17617](#)
  - Fix the panic caused by ambiguous error messages after the sending failure [#17378](#)
  - Fix the issue that `FLASHBACK TABLE` might fail in some special cases [#17165](#)
  - Fix the issue of inaccurate range calculation results when statements only have string columns [#16658](#)
  - Fix the query error occurred when the `only_full_group_by` SQL mode is set [#16620](#)
  - Fix the issue that the field length of results returned from the `case when` function is inaccurate [#16562](#)
  - Fix the type inference for the decimal property in the `count` aggregate function [#17702](#)
- TiKV
    - Fix the potential wrong result read from ingested files [#8039](#)
    - Fix the issue that a peer cannot be removed when its store is isolated during multiple merge processes [#8005](#)
  - PD
    - Fix the 404 error when querying Region keys in PD Control [#2577](#)

### 16.19.6 TiDB 3.0.15 Release Notes

Release date: June 5, 2020

TiDB version: 3.0.15

#### 16.19.6.1 New Features

- TiDB
  - Forbid the query in partitioned tables to use the plan cache feature [#16759](#)
  - Support the `admin recover index` and `admin check index` statements on partitioned tables [#17315](#) [#17390](#)
  - Support partition pruning of the `in` condition for Range partitioned tables [#17318](#)
  - Optimize the output of `SHOW CREATE TABLE`, and add quotation marks to the partition name [#16315](#)
  - Support the `ORDER BY` clause in the `GROUP_CONCAT` function [#16988](#)
  - Optimize the memory allocation mechanism of `CMSketch` statistics to reduce the impact of garbage collection (GC) on performance [#17543](#)

- PD
  - Add a policy in which PD performs scheduling in terms of the number of Leaders [#2479](#)

### 16.19.6.2 Bug Fixes

- TiDB
  - Use deep copy to copy the `enum` and `set` type data in the `Hash` aggregate function; fix an issue of correctness [#16890](#)
  - Fix the issue that `PointGet` returns incorrect results because of the wrong processing logic of integer overflow [#16753](#)
  - Fix the issue of incorrect results caused by incorrect processing logic when the `CHAR()` function is used in the query predicate [#16557](#)
  - Fix the issue of inconsistent results in the storage layer and calculation layer of the `IsTrue` and `IsFalse` functions [#16627](#)
  - Fix the incorrect `NotNull` flags in some expressions, such as `case when` [#16993](#)
  - Fix the issue that the optimizer cannot find a physical plan for `TableDual` in some scenarios [#17014](#)
  - Fix the issue that the syntax for partition selection does not take effect correctly in the `Hash` partitioned table [#17051](#)
  - Fix the inconsistent results between TiDB and MySQL when XOR operates on a floating-point number [#16976](#)
  - Fix the error that occurs when executing DDL statement in the prepared manner [#17415](#)
  - Fix the incorrect processing logic of computing the batch size in the ID allocator [#17548](#)
  - Fix the issue that the `MAX_EXEC_TIME` SQL hint does not take effect when the time exceeds the expensive threshold [#17534](#)
- TiKV
  - Fix the issue that memory defragmentation is not effective after running for a long time [#7790](#)
  - Fix the panic issue caused by incorrectly removing snapshot files after TiKV is restarted accidentally [#7925](#)
  - Fix the gRPC disconnection caused by too large message packages [#7822](#)

### 16.19.7 TiDB 3.0.14 Release Notes

Release date: May 9, 2020

TiDB version: 3.0.14

### 16.19.7.1 Compatibility Changes

- TiDB
  - Adjust the user privilege in `performance_schema` and `metrics_schema` from read-write to read-only [#15417](#)

### 16.19.7.2 Important Bug Fixes

- TiDB
  - Fix the issue that the query result of `index join` is incorrect when the `join`  $\leftrightarrow$  condition has multiple equivalent conditions on the column with the `handle` attribute [#15734](#)
  - Fix the panic that occurs when performing the `fast analyze` operation on the column with the `handle` attribute [#16079](#)
  - Fix the issue that the `query` field in the DDL job structure is incorrect when the DDL statement is executed in a way of `prepare`. This issue might cause data inconsistency between the upstream and the downstream when Binlog is used for data replication. [#15443](#)
- TiKV
  - Fix the issue that repeated requests on the cleanup of lock might destroy the atomicity of the transaction [#7388](#)

### 16.19.7.3 New Features

- TiDB
  - Add the schema name column and the table name column to the query results of the `admin show ddl jobs` statement [#16428](#)
  - Enhance the `RECOVER TABLE` syntax to support recovering truncated tables [#15458](#)
  - Support the privilege check for the `SHOW GRANTS` statement [#16168](#)
  - Support the privilege check for the `LOAD DATA` statement [#16736](#)
  - Improve the performance of partition pruning when functions related to time and date are used as partition keys [#15618](#)
  - Adjust the log level of `dispatch error` from `WARN` to `ERROR` [#16232](#)
  - Support the `require-secure-transport` startup option to force clients to use TLS [#15415](#)
  - Support HTTP communication between TiDB components when TLS is configured [#15419](#)

- Add the `start_ts` information of the current transaction to the `information_schema` `↔ .processlist` table [#16160](#)
- Support automatically reloading the TLS certificate information used for communication among clusters [#15162](#)
- Improve the read performance of the partitioned tables by restructuring the partition pruning [#15628](#)
- Support the partition pruning feature when `floor(unix_timestamp(a))` is used as the partition expression of the `range` partition table [#16521](#)
- Allow executing the `update` statement that contains a `view` and does not update the `view` [#16787](#)
- Prohibit creating nested `views` [#15424](#)
- Prohibit truncating `view` [#16420](#)
- Prohibit using the `update` statement to explicitly update the values of a column when this column is not in the `public` state [#15576](#)
- Prohibit starting TiDB when the `status` port is occupied [#15466](#)
- Change the character set of the `current_role` function from `binary` to `utf8mb4` [#16083](#)
- Improve `max-execution-time` usability by checking the interrupt signal when the data of a new Region is read [#15615](#)
- Add the `ALTER TABLE ... AUTO_ID_CACHE` syntax for explicitly setting the cache step of `auto_id` [#16287](#)

- TiKV

- Improve the performance when many conflicts and the `BatchRollback` condition exist in optimistic transactions [#7605](#)
- Fix the issue of decreased performance that occurs because the pessimistic lock `waiter` is frequently awakened when many conflicts exist in pessimistic transactions [#7584](#)

- Tools

- TiDB Lightning
  - \* Support printing the TiKV cluster mode using the `fetch-mode` sub-command of `tidb-lightning-ctl` [#287](#)

#### 16.19.7.4 Bug Fixes

- TiDB

- Fix the issue that `WEEKEND` function is not compatible with MySQL when the SQL mode is `ALLOW_INVALID_DATES` [#16170](#)
- Fix the issue that the `DROP INDEX` statement fails to execute when the index column contains the auto-increment primary key [#16008](#)

- Fix the issue of incorrect values of the `TABLE_NAMES` column in the Statement Summary [#15231](#)
- Fix the issue that some expressions have incorrect results when the plan cache is enabled [#16184](#)
- Fix the issue that the result of the `not/istrue/isfalse` function is incorrect [#15916](#)
- Fix the panic caused by the `MergeJoin` operation on tables with redundant indexes [#15919](#)
- Fix the issue caused by incorrectly simplifying the link when the predicate only refers to the outer table [#16492](#)
- Fix the issue that the `CURRENT_ROLE` function reports an error caused by the `SET ROLE` statement [#15569](#)
- Fix the issue that the result of the `LOAD DATA` statement is incompatible with MySQL when this statement encounters `\` [#16633](#)
- Fix the issue that the database visibility is incompatible with MySQL [#14939](#)
- Fix the issue of incorrect privilege check for the `SET DEFAULT ROLE ALL` statement [#15585](#)
- Fix the issue of partition pruning failure caused by the plan cache [#15818](#)
- Fix the issue that `schema change` is reported during the transaction commit when concurrent DDL operations are performed on a table and blocking exists, because the transaction does not lock the related table [#15707](#)
- Fix the incorrect behavior of `IF(not_int, *, *)` [#15356](#)
- Fix the incorrect behavior of `CASE WHEN (not_int)` [#15359](#)
- Fix the issue that the `Unknown column` error message is returned when using a `view` that is not in the current schema [#15866](#)
- Fix the issue that the result of parsing time strings is incompatible with MySQL [#16242](#)
- Fix the possible panic of the collation operator in `left join` when a `null` column exists in the right child node [#16528](#)
- Fix the issue that no error message is returned even though the SQL execution is blocked when TiKV keeps returning the `StaleCommand` error message [#16528](#)
- Fix the possible panic caused by the port probing when the audit plugin is enabled [#15967](#)
- Fix the panic caused when `fast analyze` works on indices only [#15967](#)
- Fix the possible panic of the `SELECT * FROM INFORMATION_SCHEMA.PROCESSLIST` statement execution in some cases [#16309](#)
- Fix the issue of TiDB OOM caused by specifying a large number of partitions (for example, `999999999999`) when the hash partition table is created without checking the number of partitions before allocating memory [#16218](#)
- Fix the issue of incorrect information of partitioned tables in `information_schema` `↔ .tidb_hot_table` [#16726](#)
- Fix the issue that the partition selection algorithm does not take effect on the hash partitioned table [#16070](#)
- Fix the issue that the HTTP API of the MVCC series does not support partitioned tables [#16191](#)

- Keep the error handling of the UNION statement consistent with that of the SELECT statement [#16137](#)
- Fix the issue of incorrect behavior when the parameter type of the VALUES function is bit(n) [#15486](#)
- Fix the issue that the processing logic of TiDB is inconsistent with MySQL when the view column name is too long. In this case, the system automatically generates a short column name. [#14873](#)
- Fix the issue that (not not col) is incorrectly optimized as col [#16094](#)
- Fix the issue of incorrect range of the inner table built by IndexLookupJoin plans [#15753](#)
- Fix the issue that only\_full\_group\_by fails to correctly check expressions with brackets [#16012](#)
- Fix the issue that an error is returned when the select view\_name.col\_name ↪ from view\_name statement is executed [#15572](#)

- TiKV

- Fix the issue that the node cannot be deleted correctly after the isolation recovery in some cases [#7703](#)
- Fix the issue of data loss during network isolation caused by the Region Merge operation [#7679](#)
- Fix the issue that learner cannot be removed correctly in some cases [#7598](#)
- Fix the issue that the scanning result of raw key-value pairs might be out of order [#7597](#)
- Fix the issue of reconnection when the batch of Raft messages is too large [#7542](#)
- Fix the issue of gRPC thread deadlock caused by the empty request [#7538](#)
- Fix the issue that the processing logic of restarting the learner is incorrect during the merge process [#7457](#)
- Fix the issue that repeated requests on the cleanup of lock might destroy the atomicity of the transaction [#7388](#)

## 16.19.8 TiDB 3.0.13 Release Notes

Release date: April 22, 2020

TiDB version: 3.0.13

### 16.19.8.1 Bug Fixes

- TiDB

- Fix the issue caused by unchecked MemBuffer that the INSERT ... ON ↪ DUPLICATE KEY UPDATE statement might be executed incorrectly within a transaction when users need to insert multiple rows of duplicate data [#16690](#)

- TiKV
  - Fix the issue that the system might get stuck and the service is unavailable if `Region Merge` is executed repeatedly [#7612](#)

### 16.19.9 TiDB 3.0.12 Release Notes

Release date: March 16, 2020

TiDB version: 3.0.12

TiDB Ansible version: 3.0.12

#### **Warning:**

Some known issues are found in this version, and these issues are fixed in new versions. It is recommended that you use the latest 3.0.x version.

#### 16.19.9.1 Compatibility Changes

- TiDB
  - Fix the issue of inaccurate timing of prewrite binlog in slow query log. The original timing field was called `Binlog_prewrite_time`. After this fix, the name is changed to `Wait_prewrite_binlog_time`. [#15276](#)

#### 16.19.9.2 New Features

- TiDB
  - Support dynamic loading of the replaced certificate file by using the `alter` ↔ `instance` statement [#15080](#) [#15292](#)
  - Add the `cluster-verify-cn` configuration item. After configuration, the status service can only be used when with the corresponding CN certificate. [#15164](#)
  - Add a flow limiting feature for DDL requests in each TiDB server to reduce the error reporting frequency of DDL request conflicts [#15148](#)
  - Support exiting of the TiDB server when binlog write fails [#15339](#)
- Tools
  - TiDB Binlog
    - \* Add the `kafka-client-id` configuration item in Drainer, which supports connecting to Kafka clients to configure the client ID [#929](#)

### 16.19.9.3 Bug Fixes

- TiDB
  - Make `GRANT`, `REVOKE` guarantee atomicity when modifying multiple users [#15092](#)
  - Fix the issue that the locking of pessimistic lock on the partition table failed to lock the correct row [#15114](#)
  - Make the error message display according to the value of `max-index-length` in the configuration when the index length exceeds the limit [#15130](#)
  - Fix the incorrect decimal point issue of the `FROM_UNIXTIME` function [#15270](#)
  - Fix the issue of conflict detection failure or data index inconsistency caused by deleting records written by oneself in a transaction [#15176](#)
- TiKV
  - Fix the issue of conflict detection failure or data index inconsistency caused by inserting an existing key into a transaction and then deleting it immediately when disabling the consistency check parameter [#7054](#)
  - Introduce a flow control mechanism in Raftstore to solve the problem that without flow control, it might lead to too slow tracking and cause the cluster to be stuck, and the transaction size might cause frequent reconnection of TiKV connections [#7072](#) [#6993](#)
- PD
  - Fix the issue of incorrect Region information caused by data race when PD processes Region heartbeats [#2233](#)
- TiDB Ansible
  - Support deploying multiple Grafana/Prometheus/Alertmanager in a cluster [#1198](#)

### 16.19.10 TiDB 3.0.11 Release Notes

Release date: March 4, 2020

TiDB version: 3.0.11

TiDB Ansible version: 3.0.11

#### **Warning:**

Some known issues are found in this version, and these issues are fixed in new versions. It is recommended that you use the latest 3.0.x version.

### 16.19.10.1 Compatibility Changes

- TiDB
  - Add the `max-index-length` configuration item to control the maximum index length, which is compatible with the behavior of TiDB versions before 3.0.7 or of MySQL [#15057](#)

### 16.19.10.2 New Features

- TiDB
  - Support showing the meta information of partitioned tables in the `information_schema` `.PARTITIONS` table [#14849](#)
- TiDB Binlog
  - Support the bidirectional data replication between TiDB clusters [#884](#) [#909](#)
- TiDB Lightning
  - Support the TLS configuration [#44](#) [#270](#)
- TiDB Ansible
  - Modify the logic of `create_users.yml` so that users of the control machine do not have to be consistent with `ansible_user` [#1184](#)

### 16.19.10.3 Bug Fixes

- TiDB
  - Fix the issue of Goroutine leaks when retrying an optimistic transaction because queries using `Union` are not marked read-only [#15076](#)
  - Fix the issue that `SHOW TABLE STATUS` fails to correctly output the table status at the snapshot time because the value of the `tidb_snapshot` parameter is not correctly used when executing the `SET SESSION tidb_snapshot = 'xxx';` statement [#14391](#)
  - Fix the incorrect result caused by a SQL statement that contains `Sort Merge` `Join` and `ORDER BY DESC` at the same time [#14664](#)
  - Fix the panic of TiDB server when creating partition tables using the unsupported expression. The error information `This partition function is not allowed` is returned after fixing this panic. [#14769](#)
  - Fix the incorrect result occurred when executing the `select max()from` `subquery` statement with the subquery containing `Union` [#14944](#)
  - Fix the issue that an error message is returned when executing the `SHOW BINDINGS` statement after executing `DROP BINDING` that drops the execution binding [#14865](#)

- Fix the issue that the connection is broken because the maximum length of an alias in a query is 256 characters in the MySQL protocol, but TiDB does not [cut the alias](#) in the query results according to this protocol [#14940](#)
- Fix the incorrect query result that might occur when using the string type in DIV. For instance, now you can correctly execute the `select 1 / '2007' div 1` statement [#14098](#)
- TiKV
  - Optimize the log output by removing unnecessary logs [#6657](#)
  - Fix the panic that might occur when the peer is removed under high loads [#6704](#)
  - Fix the issue that Hibernate Regions are not waken up in some cases [#6732](#) [#6738](#)
- TiDB Ansible
  - Update outdated document links in `tidb-ansible` [#1169](#)
  - Fix the issue that undefined variables might occur in the `wait for region`  $\leftrightarrow$  `replication complete` task [#1173](#)

### 16.19.11 TiDB 3.0.10 Release Notes

Release date: February 20, 2020

TiDB version: 3.0.10

TiDB Ansible version: 3.0.10

#### **Warning:**

Some known issues are found in this version, and these issues are fixed in new versions. It is recommended that you use the latest 3.0.x version.

#### 16.19.11.1 TiDB

- Fix wrong Join results when `IndexLookUpJoin` uses `OtherCondition` to construct `InnerRange` [#14599](#)
- Delete the `tidb_pprof_sql_cpu` configuration item and add the `tidb_pprof_sql_cpu` variable [#14416](#)
- Fix the issue that users can query all databases only when they have global privileges [#14386](#)
- Fix the issue that data visibility does not meet expectations due to transaction timeout when executing `PointGet` operations [#14480](#)
- Change the timing of pessimistic transaction activation to delayed activation, consistent with the optimistic transaction mode [#14474](#)

- Fix the incorrect time zone results when the `unixtimestamp` expression calculates the time zone of the table partitions [#14476](#)
- Add the `tidb_session_statement_deadlock_detect_duration_seconds` monitoring item to monitor deadlock detection duration [#14484](#)
- Fix the system panic issue caused by some logic errors of GC workers [#14439](#)
- Correct the expression name of the `IsTrue` function [#14516](#)
- Fix the issue that some memory usage is counted inaccurately [#14533](#)
- Fix the system panic issue caused by incorrect processing logic during CM-Sketch statistics initialization [#14470](#)
- Fix the issue of inaccurate partition pruning when querying partitioned tables [#14546](#)
- Fix the issue that the default database name of the SQL statement in SQL bindings is set incorrectly [#14548](#)
- Fix the issue that `json_key` is not compatible with MySQL [#14561](#)
- Add the feature of automatically updating the statistics of partitioned tables [#14566](#)
- Fix the issue that the plan ID changes when the `PointGet` operation is executed (the plan ID is expected to be 1 always) [#14595](#)
- Fix the system panic issue caused by incorrect processing logic when SQL bindings do not match exactly [#14263](#)
- Add the `tidb_session_statement_pessimistic_retry_count` monitoring item to monitor the number of retries after the failure to lock pessimistic transactions [#14619](#)
- Fix the incorrect privilege check for `show binding` statements [#14618](#)
- Fix the issue that the query cannot be killed because the `backoff` logic does not include checking the `killed` tag [#14614](#)
- Improve the performance of statement summary by reducing the time to hold internal locks [#14627](#)
- Fix the issue that TiDB's result of parsing strings to time is incompatible with MySQL [#14570](#)
- Record the user login failures in audit logs [#14620](#)
- Add the `tidb_session_statement_lock_keys_count` monitoring item to monitor the number of lock keys for pessimistic transactions [#14634](#)
- Fix the issue that characters in JSON such as `&`, `<`, and `>` are incorrectly escaped [#14637](#)
- Fix the system panic issue caused by excessive memory usage when the `HashJoin` operation is building a hash table [#14642](#)
- Fix the panic issue caused by incorrect processing logic when an SQL binding processes illegal records [#14645](#)
- Fix a MySQL incompatibility issue by adding Truncated error detection to decimal division calculation [#14673](#)
- Fix the issue of successfully granting users privileges on a table that does not exist [#14611](#)

### 16.19.11.2 TiKV

- Raftstore

- Fix the system panic issue #6460 or data loss issue #598 caused by Region merge failure #6481
- Support `yield` to optimize scheduling fairness, and support pre-transferring the leader to improve leader scheduling stability #6563

### 16.19.11.3 PD

- Fix the invalid cache issue by supporting automatically updating the Region cache information when the system traffic changes #2103
- Use leader lease time to determine TSO service validity #2117

### 16.19.11.4 Tools

- TiDB Binlog
  - Support relay log in Drainer #893
- TiDB Lightning
  - Make some configuration items use default values when a config file is missing #255
  - Fix the issue that the web interface cannot be opened in the non-server mode #259

### 16.19.11.5 TiDB Ansible

- Fix the issue that the command execution fails due to the failure to obtain PD leader in some scenarios #1121
- Add the `Deadlock Detect Duration` monitoring item in the TiDB dashboard #1127
- Add the `Statement Lock Keys Count` monitoring item in the TiDB dashboard #1132
- Add the `Statement Pessimistic Retry Count` monitoring item in the TiDB dashboard #1133

## 16.19.12 TiDB 3.0.9 Release Notes

Release date: January 14, 2020

TiDB version: 3.0.9

TiDB Ansible version: 3.0.9

### **Warning:**

Some known issues are found in this version, and these issues are fixed in new versions. It is recommended that you use the latest 3.0.x version.

### 16.19.12.1 TiDB

- Executor
  - Fix the incorrect result when the aggregate function is applied to the `ENUM` column and the collection column [#14364](#)
- Server
  - Support the `auto_increment_increment` and `auto_increment_offset` system variables [#14396](#)
  - Add the `tidb_tikvclient_ttl_lifetime_reach_total` monitoring metric to monitor the number of pessimistic transactions with a TTL of 10 minutes [#14300](#)
  - Output the SQL information in the log when the SQL query causes a panic during its execution [#14322](#)
  - Add the `plan` and `plan_digest` fields in the statement summary table to record the `plan` that is being executed and the `plan` signature [#14285](#)
  - Adjust the default value of the `stmt-summary.max-stmt-count` configuration item from 100 to 200 [#14285](#)
  - Add the `plan_digest` field in the slow query table to record the `plan` signature [#14292](#)
- DDL
  - Fix the issue that the results of anonymous indexes created using `alter table` `↔ ... add index` on the `primary` column is inconsistent with MySQL [#14310](#)
  - Fix the issue that `VIEWS` are mistakenly dropped by the `drop table` syntax [#14052](#)
- Planner
  - Optimize the performance of statements such as `select max(a), min(a) from t`. If an index exists in the `a` column, the statement is optimized to `select * from (select a from t order by a desc limit 1)as t1, (select a from t order by a limit 1)as t2` to avoid full table scan [#14410](#)

### 16.19.12.2 TiKV

- Raftstore
  - Speed up the configuration change to speed up the Region scattering [#6421](#)
- Transaction
  - Add the `tikv_lock_manager_waiter_lifetime_duration`, `tikv_lock_manager_detect_duration`, and `tikv_lock_manager_detect_duration` monitoring metrics to monitor waiters' lifetime, the time cost of detecting deadlocks, and the status of Wait table [#6392](#)

- Optimize the following configuration items to reduce transaction execution latency caused by changing Region leader or the leader of deadlock detector in extreme situations [#6429](#)
  - \* Change the default value of `wait-for-lock-time` from 3s to 1s
  - \* Change the default value of `wake-up-delay-duration` from 100ms to 20ms
- Fix the issue that the leader of the deadlock detector might be incorrect during the Region Merge process [#6431](#)

### 16.19.12.3 PD

- Support using backlash / in the location label name [#2083](#)
- Fix the incorrect statistics because the tombstone store is mistakenly included by the label counter [#2067](#)

### 16.19.12.4 Tools

- TiDB Binlog
  - Add the unique key information in the binlog protocol output by Drainer [#862](#)
  - Support using the encrypted password for database connection for Drainer [#868](#)

### 16.19.12.5 TiDB Ansible

- Support automatically creating directories to optimize the deployment of TiDB Lightning [#1105](#)

## 16.19.13 TiDB 3.0.8 Release Notes

Release date: December 31, 2019

TiDB version: 3.0.8

TiDB Ansible version: 3.0.8

### 16.19.13.1 TiDB

- SQL Optimizer
  - Fix the wrong SQL binding plan caused by untimely cache updates [#13891](#)
  - Fix the issue that the SQL binding might be invalid when an SQL statement contains a symbol list [#14004](#)
  - Fix the issue that an SQL binding cannot be created or deleted because an SQL statement ends with ; [#14113](#)

- Fix the issue that a wrong SQL query plan might be selected because the `PhysicalUnionScan` operator sets wrong statistics [#14133](#)
- Remove the `minAutoAnalyzeRatio` restriction to make `autoAnalyze` more timely [#14015](#)
- SQL Execution Engine
  - Fix issues that the `INSERT/REPLACE/UPDATE ... SET ... = DEFAULT` syntax might report an error and combining the usage of the `DEFAULT` expression with a virtual generated column might report an error [#13682](#)
  - Fix the issue that the `INSERT` statement might report an error when converting a string to a float [#14011](#)
  - Fix the issue that sometimes the aggregate operation is low effective because the concurrency value of the `HashAgg` executor is incorrectly initialized [#13811](#)
  - Fix the issue that an error is reported in the execution of `group by item` when the clause is in the parentheses [#13658](#)
  - Fix the issue that the execution of `OUTER JOIN` might report an error because TiDB incorrectly calculates `group by item` [#14014](#)
  - Fix the issue that the error message is inaccurate when Range-exceeding data is written into Range partitioned tables [#14107](#)
  - Revert [PR #10124](#) and cancel the `PadCharToFullLength` effect to avoid unexpected query results in special cases, considering that MySQL 8 will discard `PadCharToFullLength` soon [#14157](#)
  - Fix the goroutine leak issue when executing the `EXPLAIN ANALYZE` statement caused by unguaranteed `close()` calling in `ExplainExec` [#14226](#)
- DDL
  - Optimize the error message output of `change column/modify column` to make it easier to understand [#13796](#)
  - Add the `SPLIT PARTITION TABLE` syntax to support splitting Regions for partitioned tables [#13929](#)
  - Fix the issue that the index length exceeds 3072 bytes and no error is reported because the index length is incorrectly checked when an index is created [#13779](#)
  - Fix the issue that the `GC life time is shorter than transaction duration` error message might be reported because it takes too much time to add an index in partitioned tables [#14132](#)
  - Fix the panic when `SELECT * FROM information_schema.KEY_COLUMN_USAGE` is executed because the foreign key is not checked when `DROP COLUMN/MODIFY COLUMN/CHANGE COLUMN` is executed [#14105](#)
- Server
  - Statement Summary improvements:
    - \* Add a large number of SQL metric fields to facilitate analyzing SQL statements in more detail [#14151](#), [#14168](#)

- \* Add the `stmt-summary.refresh-interval` parameter to control whether to move the stale data from the `events_statements_summary_by_digest` table to the `events_statements_summary_by_digest_history` table (the default interval: 30 minutes) [#14161](#)
- \* Add the `events_statements_summary_by_digest_history` table to save the stale data in `events_statements_summary_by_digest` [#14166](#)
- Fix the issue that the binlog is incorrectly output when RBAC-related internal SQL statements are executed [#13890](#)
- Add the `server-version` configuration item to control the feature of modifying the TiDB server version [#13906](#)
- Add the feature of using the HTTP interface to recover writing the TiDB binlog [#13892](#)
- Update the privilege required by `GRANT roles TO user` from `GrantPriv` to `ROLE_ADMIN` or `SUPER`, to keep consistency with the MySQL behavior [#13932](#)
- Modify the TiDB behavior from using the current database to reporting the `No ↔ database selected` error when the `GRANT` statement does not specify a database name, to keep compatibility with the MySQL behavior [#13784](#)
- Modify the execution privilege for the `REVOKE` statement from `SuperPriv` to `REVOKE` being executable only if the user has the privilege for the corresponding schema, to keep consistency with the MySQL behavior [#13306](#)
- Fix the issue that `GrantPriv` is mistakenly granted to the target user when the `GRANT ALL` syntax does not contain `WITH GRANT OPTION` [#13943](#)
- Fix the issue that the error message does not contain the cause for the `LOAD DATA` statement's wrong behavior when `LoadDataInfo` fails to call `addRecord` [#13980](#)
- Fix the issue that wrong slow query information is output because multiple SQL statements in a query share the same `StartTime` [#13898](#)
- Fix the issue that the memory might leak when `batchClient` processes a large transaction [#14032](#)
- Fix the issue that `system_time_zone` is always displayed as `CST` and now TiDB's `system_time_zone` is obtained from `systemTZ` in the `mysql.tidb` table [#14086](#)
- Fix the issue that the `GRANT ALL` syntax does not grant all privileges to the user [#14092](#)
- Fix the issue that the `Priv_create_user` privilege is invalid for `CREATE ROLE` and `DROP ROLE` [#14088](#)
- Modify the error code of `ErrInvalidFieldSize` from `1105(Unknow Error)` to `3013` [#13737](#)
- Add the `SHUTDOWN` command to stop a TiDB server and add the `ShutdownPriv` privilege [#14104](#)
- Fix the atomicity issue for the `DROP ROLE` statement to avoid some roles being deleted unexpectedly when TiDB fails to execute a statement [#14130](#)
- Fix the issue that the `tidb_enable_window_function` in the `SHOW VARIABLE` result incorrectly outputs `1` when a TiDB version is upgraded to `3.0`, and replace the wrong result with `0` [#14131](#)
- Fix the issue that the goroutine might leak because `gcworker` continuously retries

- when the TiKV node is offline [#14106](#)
- Record the binlog `Prewrite` time in the slow query log to improve the usability for issue tracking [#14138](#)
- Make the `tidb_enable_table_partition` variable support `GLOBAL SCOPE` [#14091](#)
- Fix the issue that the user privilege might be missing or mistakenly added because the newly added privilege is not correctly granted to the corresponding user when a new privilege is added [#14178](#)
- Fix the issue that the `CheckStreamTimeoutLoop` goroutine might leak because `rpcClient` does not close when the TiKV server is disconnected [#14227](#)
- Support certificate-based authentication ([User document](#)) [#13955](#)
- Transaction
  - Update the default value of the `tidb_txn_mode` variable from "" to "pessimistic"  $\leftrightarrow$  " when a new cluster is created [#14171](#)
  - Fix the issue that the lock waiting time is too long for a pessimistic transaction because the lock waiting time for a single statement is not reset when a transaction is retried [#13990](#)
  - Fix the issue that wrong data might be read because unmodified data is unlocked for the pessimistic transaction mode [#14050](#)
  - Fix repeated insert value restriction checks because transaction types are not distinguished when prewrite is performed in mocktikv [#14175](#)
  - Fix the panic because transactions are not correctly handled when `session.TxnState` is `Invalid` [#13988](#)
  - Fix the issue that the `ErrConflict` structure in mocktikv does not contain `ConflictCommitTS` [#14080](#)
  - Fix the issue that the transaction is blocked because TiDB does not correctly check lock timeout after resolving the lock [#14083](#)
- Monitor
  - Add the `pessimistic_lock_keys_duration` monitoring item in `LockKeys` [#14194](#)

### 16.19.13.2 TiKV

- Coprocessor
  - Modify the level of the output log from `error` to `warn` when an error occurs in Coprocessor [#6051](#)
  - Modify the update behavior of statistics sampling data from directly updating the row to deleting before inserting, to keep consistency with the update behavior of `tidb-server` [#6069](#)
- Raftstore

- Fix the panic caused by repeatedly sending the `destroy` message to `peerfsm` and `peerfsm` being destroyed multiple times [#6297](#)
- Update the default value of `split-region-on-table` from `true` to `false` to disable splitting Regions by table by default [#6253](#)
- Engine
  - Fix the issue that empty data might be returned because RocksDB iterator errors are not correctly processed in extreme conditions [#6326](#)
- Transaction
  - Fix the issue that TiKV fails to write data into keys and GC is blocked because the pessimistic locks are incorrectly cleaned up [#6354](#)
  - Optimize the pessimistic lock waiting mechanism to improve the performance in scenarios where the lock conflict is severe [#6296](#)
- Update the default value of `tikv_alloc` from `tikv_alloc/default` to `jemalloc` [#6206](#)

### 16.19.13.3 PD

- Client
  - Support using `context` to create a client and setting the timeout duration when creating a new client [#1994](#)
  - Support creating the `KeepAlive` connection [#2035](#)
- Optimize the performance for the `/api/v1/regions` API [#1986](#)
- Fix the issue that deleting stores in a `tombstone` state might cause a panic [#2038](#)
- Fix the issue that overlapped Regions are mistakenly deleted when loading the Region information from disks [#2011](#), [#2040](#)
- Upgrade `etcd` from `v3.4.0` to `v3.4.3` (note that after upgrading you can only degrade `etcd` using `pd-recover`) [#2058](#)

### 16.19.13.4 Tools

- TiDB Binlog
  - Fix the issue that the binlog is ignored because Pump does not receive the DDL committed binlog [#853](#)

### 16.19.13.5 TiDB Ansible

- Revert the simplified configuration item [#1053](#)
- Optimize the logic for checking the TiDB version when performing a rolling update [#1056](#)

- Upgrade TiSpark to v2.1.8 [#1061](#)
- Fix the issue that the PD role monitoring item is wrongly displayed on Grafana [#1065](#)
- Optimize Thread Voluntary Context Switches and Thread Nonvoluntary Context Switches monitoring items on the TiKV Detail page on Grafana [#1071](#)

#### 16.19.14 TiDB 3.0.7 Release Notes

Release date: December 4, 2019

TiDB version: 3.0.7

TiDB Ansible version: 3.0.7

##### 16.19.14.1 TiDB

- Fix the issue that the lock TTL's value is too large because the TiDB server's local time is behind PD's timestamp [#13868](#)
- Fix the issue that the timezone is incorrect after parsing the date from strings using `gotime.Local` [#13793](#)
- Fix the issue that the result might be incorrect because the `binSearch` function does not return an error in the implementation of `builtinIntervalRealSig` [#13767](#)
- Fix the issue that data is incorrect because the precision is lost when an integer is converted to an unsigned floating point or decimal type [#13755](#)
- Fix the issue that the result is incorrect because the `not null` flag is not properly reset when the `USING` clause is used in Natural Outer Join and Outer Join [#13739](#)
- Fix the issue that the statistics are not accurate because a data race occurs when statistics are updated [#13687](#)

##### 16.19.14.2 TiKV

- Make the deadlock detector only observe valid Regions to make sure the deadlock manager is in a valid Region [#6110](#)
- Fix a potential memory leak issue [#6128](#)

#### 16.19.15 TiDB 3.0.6 Release Notes

Release date: November 28, 2019

TiDB version: 3.0.6

TiDB Ansible version: 3.0.6

### 16.19.15.1 TiDB

- SQL Optimizer
  - Fix the issue that the result is incorrect after the window function AST restores SQL text, for example, `over w` being mistakenly restored to `over (w)` [#12933](#)
  - Fix the issue of pushing down `STREAM AGG()` to `doubleRead` [#12690](#)
  - Fix the issue that quotes are incorrectly handled for SQL binding [#13117](#)
  - Optimize the `select max(_tidb_rowid)from t` scenario to avoid full table scans [#13095](#)
  - Fix the issue that the query result is incorrect when the query statement contains a variable assignment expression [#13231](#)
  - Fix the issue that the result is incorrect when the `UPDATE` statement contains both a sub-query and a generated column; fix the `UPDATE` statement execution error when this statement contains two same-named tables from different source databases [#13350](#)
  - Support `_tidb_rowid` for point queries [#13416](#)
  - Fix the issue that the generated query execution plan is incorrect, caused by incorrect usage of partitioned table statistics [#13628](#)
- SQL Execution Engine
  - Fix the issue that TiDB is incompatible with MySQL when handling invalid values of the year type [#12745](#)
  - Reuse `Chunk` in the `INSERT ON DUPLICATE UPDATE` statement to reduce the memory overhead [#12998](#)
  - Add the support for the `JSON_VALID` built-in function [#13133](#)
  - Support executing `ADMIN CHECK TABLE` on partitioned tables [#13140](#)
  - Fix the panic issue when `FAST ANALYZE` is executed on empty tables [#13343](#)
  - Fix the panic issue when executing `FAST ANALYZE` on an empty table that contains multi-column indexes [#13394](#)
  - Fix the issue that the estimated number of rows is greater than 1 when the `WHERE` clause contains an equal condition on the unique key [#13382](#)
  - Fix the issue that the returned data might be duplicated when `Streaming` is enabled in TiDB [#13254](#)
  - Extract the top N values from the count-min sketch to improve the estimation accuracy [#13429](#)
- Server
  - Make requests sent to TiKV fail quickly when the gRPC dial times out [#12926](#)
  - Add the following virtual tables: [#13009](#)
    - \* `performance_schema.tidb_profile_allocs`
    - \* `performance_schema.tidb_profile_block`
    - \* `performance_schema.tidb_profile_cpu`
    - \* `performance_schema.tidb_profile_goroutines`

- Fix the issue that the `kill` command does not work when the query is waiting for pessimistic locking [#12989](#)
  - Do not do asynchronous rollback when acquiring pessimistic locking fails and the transaction only involves modifying a single key [#12707](#)
  - Fix the panic issue when the response for the request of splitting Regions is empty [#13092](#)
  - Avoid unnecessary backoff when `PessimisticLock` returns a locking error [#13116](#)
  - Modify the TiDB behavior for checking configurations by printing a warning log for unrecognized configuration option [#13272](#)
  - Support obtaining the binlog status of all TiDB nodes via the `/info/all` interface [#13187](#)
  - Fix the issue that goroutine might leak when TiDB kills connections [#13251](#)
  - Make the `innodb_lock_wait_timeout` parameter work in pessimistic transactions to control the lock wait timeout for pessimistic locking [#13165](#)
  - Stop updating pessimistic transaction TTL when pessimistic transactional queries are killed to prevent other transactions from waiting unnecessarily [#13046](#)
- DDL
    - Fix the issue that the execution result of `SHOW CREATE VIEW` in TiDB is inconsistent with that in MySQL [#12912](#)
    - Support creating View based on union, for example, `create view v as select ↵ * from t1 union select * from t2` [#12955](#)
    - Add more transaction-related fields for the `slow_query` table: [#13072](#)
      - \* `Prewrite_time`
      - \* `Commit_time`
      - \* `Get_commit_ts_time`
      - \* `Commit_backoff_time`
      - \* `Backoff_types`
      - \* `Resolve_lock_time`
      - \* `Local_latch_wait_time`
      - \* `Write_key`
      - \* `Write_size`
      - \* `Prewrite_region`
      - \* `Txn_retry`
    - Use the table's `COLLATE` instead of the system's default charset in the column when a table is created and the table contains `COLLATE` [#13174](#)
    - Limit the length of the index name when creating a table [#13310](#)
    - Fix the issue that the table name length is not checked when a table is renamed [#13346](#)
    - Add the `alter-primary-key` configuration (disabled by default) to support adding/dropping the primary key in TiDB [#13522](#)

### 16.19.15.2 TiKV

- Fix the issue that the `acquire_pessimistic_lock` interface returns a wrong `txn_size` [#5740](#)
- Limit the writes for GC worker per second to reduce the impact on the performance [#5735](#)
- Make `lock_manager` accurate [#5845](#)
- Support `innodb_lock_wait_timeout` for pessimistic locking [#5848](#)
- Add the configuration check for Titan [#5720](#)
- Support using `tikv-ctl` to dynamically modify the GC I/O limit: `tikv-ctl --host=ip:port modify-tikv-config -m server -n gc.max_write_bytes_per_sec -v 10MB` [#5957](#)
- Reduce useless clean up requests to decrease the pressure on the deadlock detector [#5965](#)
- Avoid reducing TTL in pessimistic locking prewrite requests [#6056](#)
- Fix the issue that a missing blob file might occur in Titan [#5968](#)
- Fix the issue that `RocksDBOptions` might not take effect in Titan [#6009](#)

### 16.19.15.3 PD

- Add an `ActOn` dimension for each filter to indicate that each scheduler and checker is affected by the filter, and delete two unused filters: `disconnectFilter` and `rejectLeaderFilter` [#1911](#)
- Print a warning log when it takes more than 5 milliseconds to generate a timestamp in PD [#1867](#)
- Lower the client log level when passing unavailable endpoint to the client [#1856](#)
- Fix the issue that the gRPC message package might exceed the maximum size in the `region_syncer` replication process [#1952](#)

### 16.19.15.4 Tools

- TiDB Binlog
  - Obtain the initial replication timestamp from PD when `initial-commit-ts` is set to “-1” in Drainer [#788](#)
  - Decouple Drainer’s `Checkpoint` storage from the downstream and support saving `Checkpoint` in MySQL or local files [#790](#)
  - Fix the Drainer panic issue caused by using empty values when configuring replication database/table filtering [#801](#)
  - Fix the issue that processes get into the deadlock status instead of exiting after a panic occurs because Drainer fails to apply binlog files to the downstream [#807](#)
  - Fix the issue that Pump blocks when it exits because of gRPC’s `GracefulStop` [#817](#)
  - Fix the issue that Drainer fails when it receives a binlog which misses a column during the execution of a `DROP COLUMN` statement in TiDB (v3.0.6 or later) [#827](#)
- TiDB Lightning

- Add the `max-allowed-packet` configuration (64 M by default) for the TiDB backend [#248](#)

## 16.19.16 TiDB 3.0.5 Release Notes

Release date: October 25, 2019

TiDB version: 3.0.5

TiDB Ansible version: 3.0.5

### 16.19.16.1 TiDB

- SQL Optimizer
  - Support boundary checking on Window Functions [#12404](#)
  - Fix the issue that `IndexJoin` on the partition table returns incorrect results [#12712](#)
  - Fix the issue that the `ifnull` function on the top of the outer join `Apply` operator returns incorrect results [#12694](#)
  - Fix the issue of update failure when a subquery was included in the `where` condition of `UPDATE` [#12597](#)
  - Fix the issue that outer join was incorrectly converted to inner join when the `cast` function was included in the query conditions [#12790](#)
  - Fix incorrect expression passing in the join condition of `AntiSemiJoin` [#12799](#)
  - Fix the statistics error caused by shallow copy when initializing statistics [#12817](#)
  - Fix the issue that the `str_to_date` function in TiDB returns a different result from MySQL when the date string and the format string do not match [#12725](#)
- SQL Execution Engine
  - Fix the panic issue when the `from_unixtime` function handles null [#12551](#)
  - Fix the `invalid list index` error reported when canceling DDL jobs [#12671](#)
  - Fix the issue that arrays were out of bounds when Window Functions are used [#12660](#)
  - Improve the behavior of the `AutoIncrement` column when it is implicitly allocated, to keep it consistent with the default mode of MySQL auto-increment locking (“consecutive” lock mode): for the implicit allocation of multiple `AutoIncrement` IDs in a single-line `Insert` statement, TiDB guarantees the continuity of the allocated values. This improvement ensures that the JDBC `getGeneratedKeys()` method will get the correct results in any scenario. [#12602](#)
  - Fix the issue that the query is hanged when `HashAgg` serves as a child node of `Apply` [#12766](#)
  - Fix the issue that the `AND` and `OR` logical expressions return incorrect results when it comes to type conversion [#12811](#)
- Server

- Implement the interface function that modifies transaction TTL to help support large transactions later [#12397](#)
  - Support extending the transaction TTL as needed (up to 10 minutes) to support pessimistic transactions [#12579](#)
  - Adjust the number of times that TiDB caches schema changes and corresponding changed table information from 100 to 1024, and support modification by using the `tidb_max_delta_schema_count` system variable [#12502](#)
  - Update the behavior of the `kvrpc.Cleanup` protocol to no longer clean locks of transactions that are not overtime [#12417](#)
  - Support logging Partition table information to the `information_schema.tables` table [#12631](#)
  - Support modifying the TTL of Region Cache by configuring `region-cache-ttl` [#12683](#)
  - Support printing the execution plan compression-encoded information in the slow log. This feature is enabled by default and can be controlled by using the `slow-  
↔ log-plan` configuration or the `tidb_record_plan_in_slow_log` variable. In addition, the `tidb_decode_plan` function can decode the execution plan column encoded information in the slow log into execution plan information. [#12808](#)
  - Support displaying memory usage information in the `information_schema.  
↔ processlist` table [#12801](#)
  - Fix the issue that an error and an unexpected alarm might occur when the TiKV Client judges an idle connection [#12846](#)
  - Fix the issue that the `INSERT IGNORE` statement performance is decreased because `tikvSnapshot` does not properly cache the KV results of `BatchGet()` [#12872](#)
  - Fix the issue that the TiDB response speed was relatively low because of slow connection to some KV services [#12814](#)
- DDL
    - Fix the issue that the `Create Table` operation does not correctly set the Int type default value for the Set column [#12267](#)
    - Support multiple uniques when creating a unique index in the `Create Table` statement [#12463](#)
    - Fix the issue that populating the default value of this column for existing rows might cause an error when adding a Bit type column using `Alter Table` [#12489](#)
    - Fix the failure of adding a partition when the Range partitioned table uses a Date or Datetime type column as the partitioning key [#12815](#)
    - Support checking the consistency of the partition type and the partition key type when creating a table or adding a partition, for the Range partitioned table with the Date or Datetime type column as the partition key [#12792](#)
    - Add a check that the Unique Key column set needs to be greater than or equal to the partitioned column set when creating a Range partitioned table [#12718](#)
  - Monitor
    - Add the monitoring metrics of Commit and Rollback operations to the Transaction OPS dashboard [#12505](#)

- Add the monitoring metrics of `Add Index` operation progress [#12390](#)

### 16.19.16.2 TiKV

- Storage
  - Add a new feature of pessimistic transactions: the transaction cleanup interface supports only cleaning up locks whose TTL is outdated [#5589](#)
  - Fix the issue that Rollback of the transaction Primary key is collapsed [#5646](#), [#5671](#)
  - Fix the issue that under pessimistic locks, point queries might return the previous version data [#5634](#)
- Raftstore
  - Reduce message flush operations in Raftstore to improve performance and reduce CPU usage [#5617](#)
  - Optimize the cost of obtaining the Region size and estimated number of keys, to reduce heartbeat overhead and CPU usage [#5620](#)
  - Fix the issue that Raftstore prints an error log and encounters a panic when getting invalid data [#5643](#)
- Engine
  - Enable RocksDB `force_consistency_checks` to improve data safety [#5662](#)
  - Fix the issue that concurrent flush operations in Titan might cause data loss [#5672](#)
  - Update the rust-rocksdb version to avoid the issue of TiKV crash and restart caused by intra-L0 compaction [#5710](#)

### 16.19.16.3 PD

- Improve the precision of storage occupied by Regions [#1782](#)
- Improve the output of the `--help` command [#1763](#)
- Fix the issue that the HTTP request fails to redirect after TLS is enabled [#1777](#)
- Fix the panic issue occurred when `pd-ctl` uses the `store shows limit` command [#1808](#)
- Improve readability of label monitoring metrics and reset the original leader's monitoring data when the leader switches, to avoid false reports [#1815](#)

### 16.19.16.4 Tools

- TiDB Binlog
  - Fix the issue that `ALTER DATABASE` related DDL operations cause Drainer to exit abnormally [#769](#)

- Support querying the transaction status information for Commit binlog to improve replication efficiency [#757](#)
- Fix the issue that a Pump panic might occur when Drainer's `start_ts` is greater than Pump's largest `commit_ts` [#758](#)
- TiDB Lightning
  - Integrate the full logic import feature of Loader and support configuring the back-end mode [#221](#)

#### 16.19.16.5 TiDB Ansible

- Add the monitoring metrics of adding index speed [#986](#)
- Simplify the configuration file content and remove parameters that users do not need to configure [#1043c](#), [#998](#)
- Fix the monitoring expression error of performance read and performance write [#e90e7](#)
- Update the monitoring display method and the alarm rules of Raftstore CPU usage [#992](#)
- Update the TiKV CPU monitoring item in the Overview monitoring dashboard to filter out the excess monitoring content [#1001](#)

#### 16.19.17 TiDB 3.0.4 Release Notes

Release date: October 8, 2019

TiDB version: 3.0.4

TiDB Ansible version: 3.0.4

- New features
  - Add the `performance_schema.events_statements_summary_by_digest` system table to troubleshoot performance issues at the SQL level
  - Add the `WHERE` clause in TiDB's `SHOW TABLE REGIONS` syntax
  - Add the `worker-count` and `txn-batch` configuration items in Reparo to control the recovery speed
- Improvements
  - Support batch Region split command and empty split command in TiKV to improve split performance
  - Support double linked list for RocksDB in TiKV to improve performance of reverse scan
  - Add two perf tools `iosnoop` and `funcslower` in TiDB Ansible to better diagnose the cluster state
  - Optimize the output of slow query logs in TiDB by deleting redundant fields

- Changed behaviors
  - Update the default value of `txn-local-latches.enable` to `false` to disable the default behavior of checking conflicts of local transactions in TiDB
  - Add the `tidb_txn_mode` system variable of global scope in TiDB and allow using the pessimistic lock; note that TiDB still adopts the optimistic lock by default
  - Replace the `Index_ids` field in TiDB slow query logs with `Index_names` to improve the usability of slow query logs
  - Add the `split-region-max-num` parameter in the TiDB configuration file to modify the maximum number of Regions allowed in the `SPLIT TABLE` syntax
  - Return the `Out Of Memory Quota` error instead of disconnecting the link when a SQL execution exceeds the memory limit
  - Disallow dropping the `AUTO_INCREMENT` attribute of columns in TiDB to avoid misoperations. To drop this attribute, change the `tidb_allow_remove_auto_inc` system variable
- Fixed issues
  - Fix the issue that the uncommented TiDB-specific syntax `PRE_SPLIT_REGIONS` might cause errors in the downstream database during data replication
  - Fix the issue in TiDB that the slow query logs are incorrect when getting the result of `PREPARE + EXECUTE` by using the cursor
  - Fix the issue in PD that adjacent small Regions cannot be merged
  - Fix the issue in TiKV that file descriptor leak in idle clusters might cause TiKV processes to exit abnormally when the processes run for a long time
- Contributors

Our thanks go to the following contributors from the community for helping this release:

  - [sduzh](#)
  - [lizhenda](#)

### 16.19.17.1 TiDB

- SQL Optimizer
  - Fix the issue that invalid query ranges might be resulted when splitted by feedback [#12170](#)
  - Display the returned error of the `SHOW STATS_BUCKETS` statement in hexadecimal rather than return errors when the result contains invalid Keys [#12094](#)
  - Fix the issue that when a query contains the `SLEEP` function (for example, `select ↵ 1 from (select sleep(1))t;)`, column pruning causes invalid `sleep(1)` during query [#11953](#)
  - Use index scan to lower IO when a query only concerns the number of columns rather than the table data [#12112](#)

- Do not use any index when no index is specified in `use index()` to be compatible with MySQL [#12100](#)
- Strictly limit the number of TopN records in the `CMSketch` statistics to fix the issue that the `ANALYZE` statement fails because the statement count exceeds TiDB's limit on the size of a transaction [#11914](#)
- Fix the error occurred when converting the subqueries contained in the `Update` statement [#12483](#)
- Optimize execution performance of the `select ... limit ... offset ...` statement by pushing the `Limit` operator down to the `IndexLookUpReader` execution logic [#12378](#)
- SQL Execution Engine
  - Print the SQL statement in the log when the `PREPARED` statement is incorrectly executed [#12191](#)
  - Support partition pruning when the `UNIX_TIMESTAMP` function is used to implement partitioning [#12169](#)
  - Fix the issue that no error is reported when `AUTO_INCREMENT` incorrectly allocates `MAX int64` and `MAX uint64` [#12162](#)
  - Add the `WHERE` clause in the `SHOW TABLE ... REGIONS` and `SHOW TABLE .. INDEX`  $\leftrightarrow$  `... REGIONS` syntaxes [#12123](#)
  - Return the `Out Of Memory Quota` error instead of disconnecting the link when a SQL execution exceeds the memory limit [#12127](#)
  - Fix the issue that incorrect result is returned when `JSON_UNQUOTE` function handles JSON text [#11955](#)
  - Fix the issue that `LAST INSERT ID` is incorrect when assigning values to the `AUTO_INCREMENT` column in the first row (for example, `insert into t (pk,  $\leftrightarrow$  c) values (1, 2), (NULL, 3)`) [#12002](#)
  - Fix the issue that the `GROUPBY` parsing rule is incorrect in the `PREPARE` statement [#12351](#)
  - Fix the issue that the privilege check is incorrect in the point queries [#12340](#)
  - Fix the issue that the duration by `sql_type` for the `PREPARE` statement is not shown in the monitoring record [#12331](#)
  - Support using aliases for tables in the point queries (for example, `select * from  $\leftrightarrow$  t tmp where a = "aa"`) [#12282](#)
  - Fix the error occurred when not handling negative values as unsigned when inserting negative numbers into `BIT` type columns [#12423](#)
  - Fix the incorrectly rounding of time (for example, `2019-09-11 11:17:47.999999666`  $\leftrightarrow$  should be rounded to `2019-09-11 11:17:48.`) [#12258](#)
  - Refine the usage of expression blacklist (for example, `<` is equivalent to `It.`) [#11975](#)
  - Add the database prefix to the message of non-existing function error (for example, `[expression:1305]FUNCTION test.std_samp does not exist`) [#12111](#)
- Server
  - Add the `Prev_stmt` field in slow query logs to output the previous statement

- when the last statement is COMMIT [#12180](#)
- Optimize the output of slow query logs by deleting redundant fields [#12144](#)
- Update the default value of `txn-local-latches.enable` to `false` to disable the default behavior of checking conflicts of local transactions in TiDB [#12095](#)
- Replace the `Index_ids` field in TiDB slow query logs with `Index_names` to improve the usability of slow query logs [#12061](#)
- Add the `tidb_txn_mode` system variable of global scope in TiDB and allow using pessimistic lock [#12049](#)
- Add the `Backoff` field in the slow query logs to record the Backoff information in the commit phase of 2PC [#12335](#)
- Fix the issue that the slow query logs are incorrect when getting the result of PREPARE + EXECUTE by using the cursor (for example, PREPARE stmt1FROM ↵ SELECT \* FROM t WHERE a > ?; EXECUTE stmt1 USING @variable) [#12392](#)
- Support `tidb_enable_stmt_summary`. When this feature is enabled, TiDB counts the SQL statements and the result can be queried by using the system table `performance_schema.events_statements_summary_by_digest` [#12308](#)
- Adjust the level of some logs in tikv-client (for example, change the log level of `batchRecvLoop` fails from ERROR to INFO) [#12383](#)
- DDL
  - Add the `tidb_allow_remove_auto_inc` variable. Dropping the AUTO INCREMENT attribute of the column is disabled by default [#12145](#)
  - Fix the issue that the uncommented TiDB-specific syntax `PRE_SPLIT_REGIONS` might cause errors in the downstream database during data replication [#12120](#)
  - Add the `split-region-max-num` variable in the configuration file so that the maximum allowable number of Regions is adjustable [#12097](#)
  - Support splitting a Region into multiple Regions and fix the timeout issue during Region scatterings [#12343](#)
  - Fix the issue that the `drop index` statement fails when the index that contains an AUTO\_INCREMENT column referenced by two indexes [#12344](#)
- Monitor
  - Add the `connection_transient_failure_count` monitoring metrics to count the number of gRPC connection errors in `tikvclient` [#12093](#)

### 16.19.17.2 TiKV

- Raftstore
  - Fix the issue that Raftstore inaccurately counts the number of keys in empty Regions [#5414](#)
  - Support double linked list for RocksDB to improve the performance of reverse scan [#5368](#)

- Support batch Region split command and empty split command to improve split performance [#5470](#)
- Server
  - Fix the issue that the output format of the `-V` command is not consistent with the format of 2.X [#5501](#)
  - Upgrade Titan to the latest version in the 3.0 branch [#5517](#)
  - Upgrade grpcio to v0.4.5 [#5523](#)
  - Fix the issue of gRPC coredump and support shared memory to avoid OOM [#5524](#)
  - Fix the issue in TiKV that file descriptor leak in idle clusters might cause TiKV processes to exit abnormally when the processes run for a long time [#5567](#)
- Storage
  - Support the `txn_heart_beat` API to make the pessimistic lock in TiDB consistent with that in MySQL as much as possible [#5507](#)
  - Fix the issue that the performance of point queries is low in some situations [#5495](#) [#5463](#)

### 16.19.17.3 PD

- Fix the issue that adjacent small Regions cannot be merged [#1726](#)
- Fix the issue that the TLS enabling parameter in `pd-ctl` is invalid [#1738](#)
- Fix the thread-safety issue that the PD operator is accidentally removed [#1734](#)
- Support TLS for Region syncer [#1739](#)

### 16.19.17.4 Tools

- TiDB Binlog
  - Add the `worker-count` and `txn-batch` configuration items in Reparo to control the recovery speed [#746](#)
  - Optimize the memory usage of Drainer to enhance the efficiency of simultaneous execution [#737](#)
- TiDB Lightning
  - Fix the issue that re-importing data from checkpoint might cause TiDB Lightning to panic [#237](#)
  - Optimize the algorithm of `AUTO_INCREMENT` to reduce the risk of overflowing `AUTO_INCREMENT` columns [#227](#)

### 16.19.17.5 TiDB Ansible

- Upgrade TiSpark to v2.2.0 [#926](#)
- Update the default value of the TiDB configuration item `pessimistic_txn` to `true` [#933](#)
- Add more system-level monitoring metrics to `node_exporter` [#938](#)
- Add two perf tools `iosnoop` and `funclower` in TiDB Ansible to better diagnose the cluster state [#946](#)
- Replace the raw module to shell module to address the long waiting time in such situations as the password expires [#949](#)
- Update the default value of the TiDB configuration item `txn_local_latches` to `false`
- Optimize the monitoring metrics and alert rules of Grafana dashboard [#962](#) [#963](#) [#969](#)
- Check the configuration file before the deployment and upgrade [#934](#) [#972](#)

### 16.19.18 TiDB 3.0.3 Release Notes

Release date: August 29, 2019

TiDB version: 3.0.3

TiDB Ansible version: 3.0.3

#### 16.19.18.1 TiDB

- SQL Optimizer
  - Add the `opt_rule_blacklist` table to disable logic optimization rules such as `aggregation_eliminate` and `column_prune` [#11658](#)
  - Fix the issue that incorrect results might be returned for `Index Join` when the join key uses a prefix index or an unsigned index column that is equal to a negative value [#11759](#)
  - Fix the issue that `”` or `\` in the `SELECT` statements of `create ... binding ...` might result in parsing errors [#11726](#)
- SQL Execution Engine
  - Fix the issue that type errors in the return value might occur when the `Quote` function handles a null value [#11619](#)
  - Fix the issue that incorrect results for `ifnull` might be returned when `Max/Min` is used for type inferring with `NotNullFlag` retained [#11641](#)
  - Fix the potential error that occurs when comparing bit type data in string form [#11660](#)
  - Decrease the concurrency for data that requires sequential read to lower the possibility of OOM [#11679](#)

- Fix the issue that incorrect type inferring might be caused when multiple parameters are unsigned for some built-in functions (for example, `if` and `coalesce`) [#11621](#)
- Fix the incompatibility with MySQL when the `Div` function handles unsigned decimal types [#11813](#)
- Fix the issue that panic might occur when executing SQL statements that modify the status of Pump/Drainer [#11827](#)
- Fix the issue that panic might occur for `select ... for update` when `Autocommit = 1` and there is no `begin` statement [#11736](#)
- Fix the permission check error that might occur when the `set default role` statement is executed [#11777](#)
- Fix the permission check error that might occur when `create user` or `drop user` is executed [#11814](#)
- Fix the issue that the `select ... for update` statement might auto retry when it is constructed into the `PointGetExecutor` function [#11718](#)
- Fix the boundary error that might occur when the `Window` function handles partition [#11825](#)
- Fix the issue that the `time` function hits EOF errors when handling an incorrectly formatted argument [#11893](#)
- Fix the issue that the `Window` function does not check the passed-in parameters [#11705](#)
- Fix the issue that the plan result viewed via `Explain` is inconsistent with the actually executed plan [#11186](#)
- Fix the issue that duplicate memory referenced by the `Window` function might result in a crash or incorrect results [#11823](#)
- Update the incorrect information in the `Succ` field in the slow log [#11887](#)
- Server
  - Rename the `tidb_back_off_wexight` variable to `tidb_backoff_weight` [#11665](#)
  - Update the minimum TiKV version compatible with the current TiDB to v3.0.0 [#11618](#)
  - Support `make testSuite` to ensure the suites in the test are correctly used [#11685](#)
- DDL
  - Skip the execution of unsupported partition-related DDL statements, including statements that modify the partition type while deleting multiple partitions [#11373](#)
  - Disallow a Generated Column to be placed before its dependent columns [#11686](#)
  - Modify the default values of `tidb_ddl_reorg_worker_cnt` and `tidb_ddl_reorg_batch_size` ↪ [#11874](#)
- Monitor
  - Add new backoff monitoring types to record duration for each backoff type; add more backoff metrics to cover previously uncounted types such as commit backoff

[#11728](#)

### 16.19.18.2 TiKV

- Fix the issue that ReadIndex might fail to respond to requests because of duplicate context [#5256](#)
- Fix potential scheduling jitters caused by premature PutStore [#5277](#)
- Fix incorrect timestamps reported from Region heartbeats [#5296](#)
- Reduce the size of core dump by excluding the shared block cache from it [#5322](#)
- Fix potential TiKV panics during region merge [#5291](#)
- Speed up leader change check for the dead lock detector [#5317](#)
- Support using `grpc env` to create deadlock clients [#5346](#)
- Add `config-check` to check whether the configuration is correct [#5349](#)
- Fix the issue that ReadIndex does not return anything when there is no leader [#5351](#)

### 16.19.18.3 PD

- Return success message for `pdctl` [#1685](#)

### 16.19.18.4 Tools

- TiDB Binlog
  - Modify the default value of `defaultBinlogItemCount` in Drainer from 65536 to 512 to reduce the chance of OOM on Drainer startup [#721](#)
  - Optimize the offline logic for pump server to avoid potential offline congestions [#701](#)
- TiDB Lightning:
  - Skip the system databases `mysql`, `information_schema`, `performance_schema`, and `sys` by default when importing [#225](#)

### 16.19.18.5 TiDB Ansible

- Optimize PD operations for rolling update to improve stability [#894](#)
- Remove the Grafana Collector components that are not supported by the current Grafana version [#892](#)
- Update TiKV alerting rules [#898](#)
- Fix the issue that the generated TiKV configuration misses the `pessimistic-txn` parameter [#911](#)
- Update Spark to V2.4.3, and update TiSpark to V2.1.4 that is compatible with Spark V2.4.3 [#913](#), [#918](#)

## 16.19.19 TiDB 3.0.2 Release Notes

Release date: August 7, 2019

TiDB version: 3.0.2

TiDB Ansible version: 3.0.2

### 16.19.19.1 TiDB

- SQL Optimizer
  - Fix the issue that the “Can’t find column in schema” message is reported when the same table occurs multiple times in a query and logically the query result is always empty [#11247](#)
  - Fix the issue that the query plan does not meet the expectation caused by the `TIDB_INLJ` hint not working correctly in some cases (like `explain select /*+ ↪ TIDB_INLJ(t1)*/ t1.b, t2.a from t t1, t t2 where t1.b = t2.a`) [#11362](#)
  - Fix the issue that the column name in the query result is wrong in some cases (like `SELECT IF(1,c,c)FROM t`) [#11379](#)
  - Fix the issue that some queries like `SELECT 0 LIKE 'a string'` return `TRUE` because the `LIKE` expression is implicitly converted to `0` in some cases [#11411](#)
  - Support sub-queries in the `SHOW` statement, like `SHOW COLUMNS FROM tbl WHERE ↪ FIELDS IN (SELECT 'a')` [#11459](#)
  - Fix the issue that the related column of the aggregate function cannot be found and an error is reported caused by the `outerJoinElimination` optimizing rule not correctly handling the column alias; improve alias parsing in the optimizing process to make optimization cover more query types [#11377](#)
  - Fix the issue that no error is reported when the syntax restriction is violated in the Window function (for example, `UNBOUNDED PRECEDING` is not allowed to appear at the end of the Frame definition) [#11543](#)
  - Fix the issue that `FUNCTION_NAME` is in uppercase in the `ERROR 3593 (HY000)`:  
↪ You cannot use the window function `FUNCTION_NAME` in this context error message, which causes incompatibility with MySQL [#11535](#)
  - Fix the issue that the unimplemented `IGNORE NULLS` syntax in the Window function is used but no error is reported [#11593](#)
  - Fix the issue that the Optimizer does not correctly estimate time equal conditions [#11512](#)
  - Support updating the Top-N statistics based on the feedback information [#11507](#)
- SQL Execution Engine
  - Fix the issue that the returned value is not `NULL` when the `INSERT` function contains `NULL` in parameters [#11248](#)
  - Fix the issue that the computing result might be wrong when the partitioned table is checked by the `ADMIN CHECKSUM` operation [#11266](#)

- Fix the issue that the result might be wrong when INDEX JOIN uses the prefix index [#11246](#)
- Fix the issue that result might be wrong caused by incorrectly aligning fractions when the DATE\_ADD function does subtraction on date numbers involving microseconds [#11288](#)
- Fix the wrong result caused by the DATE\_ADD function incorrectly processing the negative numbers in INTERVAL [#11325](#)
- Fix the issue that the number of fractional digits returned by Mod(%), Multiple  $\leftrightarrow$  (\*) or Minus(-) is different from that in MySQL when Mod(%), Multiple(\*) or Minus(-) returns 0 and the number of fractional digits is large (like `select  $\leftrightarrow$  0.000 % 0.11234500000000000000`) [#11251](#)
- Fix the issue that NULL with a warning is incorrectly returned when the length of the result returned by CONCAT and CONCAT\_WS functions exceeds `max_allowed_packet` [#11275](#)
- Fix the issue that NULL with a warning is incorrectly returned when parameters in the SUBTIME and ADDTIME functions are invalid [#11337](#)
- Fix the issue that NULL is incorrectly returned when parameters in the CONVERT\_TZ function are invalid [#11359](#)
- Add the MEMORY column to the result returned by EXPLAIN ANALYZE to show the memory usage of this query [#11418](#)
- Add CARTESIAN Join to the result of EXPLAIN [#11429](#)
- Fix the incorrect data of auto-increment columns of the float and double types [#11385](#)
- Fix the panic issue caused by some nil information when pseudo statistics are dumped [#11460](#)
- Fix the incorrect query result of SELECT ... CASE WHEN ... ELSE NULL ... caused by constant folding optimization [#11441](#)
- Fix the issue that floatToStrToIntStr does not correctly parse the input such as `+999.9999e2` [#11473](#)
- Fix the issue that NULL is not returned in some cases when the result of the DATE\_ADD and DATE\_SUB function overflows [#11476](#)
- Fix the issue that the conversion result is different from that in MySQL if the string contains an invalid character when a long string is converted to an integer [#11469](#)
- Fix the issue that the result of the REGEXP BINARY function is incompatible with MySQL caused by case sensitiveness of this function [#11504](#)
- Fix the issue that an error is reported when the GRANT ROLE statement receives CURRENT\_ROLE; fix the issue that the REVOKE ROLE statement does not correctly revoke the `mysql.default_role` privilege [#11356](#)
- Fix the display format issue of the Incorrect datetime value warning information when executing statements like `SELECT ADDDATE('2008-01-34', -1)` [#11447](#)
- Fix the issue that the error message reports `constant ... overflows float  $\leftrightarrow$`  rather than `constant ... overflows bigint` if the result overflows when a float field of the JSON data is converted to an integer [#11534](#)

- Fix the issue that the result might be wrong caused by incorrect type conversion when the `DATE_ADD` function receives `FLOAT`, `DOUBLE` and `DECIMAL` column parameters [#11527](#)
  - Fix the wrong result caused by incorrectly processing the sign of the `INTERVAL` fraction in the `DATE_ADD` function [#11615](#)
  - Fix the incorrect query result when Index Lookup Join contains the prefix index caused by `Ranger` not correctly handling the prefix index [#11565](#)
  - Fix the issue that the “Incorrect arguments to `NAME_CONST`” message is reported if the `NAME_CONST` function is executed when the second parameter of `NAME_CONST` is a negative number [#11268](#)
  - Fix the issue that the result is incompatible with MySQL when an SQL statement involves computing the current time and the value is fetched multiple times; use the same value when fetching the current time for the same SQL statement [#11394](#)
  - Fix the issue that `Close` is not called for `ChildExecutor` when the `Close` of `baseExecutor` reports an error. This issue might lead to Goroutine leaks when the `KILL` statements do not take effect and `ChildExecutor` is not closed [#11576](#)
- Server
    - Fix the issue that the auto-added value is 0 instead of the current timestamp when `LOAD DATA` processes the missing `TIMESTAMP` field in the CSV file [#11250](#)
    - Fix issues that the `SHOW CREATE USER` statement does not correctly check related privileges, and `USER` and `HOST` returned by `SHOW CREATE USER CURRENT_USER()` might be wrong [#11229](#)
    - Fix the issue that the returned result might be wrong when `executeBatch` is used in JDBC [#11290](#)
    - Reduce printing the log information of the streaming client when changing the TiKV server’s port [#11370](#)
    - Optimize the logic of reconnecting the streaming client to the TiKV server so that the streaming client will not be blocked for a long time [#11372](#)
    - Add `REGION_ID` in `INFORMATION_SCHEMA.TIDB_HOT_REGIONS` [#11350](#)
    - Cancel the timeout duration of obtaining Region information from the PD API to ensure that obtaining Region information will not end in a failure when TiDB API `http://{TiDBIP}:10080/regions/hot` is called due to PD timeout when the number of Regions is large [#11383](#)
    - Fix the issue that Region related requests do not return partitioned table-related Regions in the HTTP API [#11466](#)
    - Make the following changes to reduce the probability of locking timeout caused by slow operations when the user manually validates pessimistic locking [#11521](#):
      - \* Increase the default TTL of pessimistic locking from 30 seconds to 40 seconds
      - \* Increase the maximum TTL from 60 seconds to 120 seconds
      - \* Calculate the pessimistic locking duration from the first `LockKeys` request
    - Change the `SendRequest` function logic in the TiKV client: try to immediately connect to another peer instead of keeping waiting when the connect cannot be built [#11531](#)

- Optimize the Region cache: label the removed store as invalid when a store is moved while another store goes online with a same address, to update the store information in the cache as soon as possible [#11567](#)
  - Add the Region ID to the result returned by the `http://{TiDB_ADDRESS:TIDB_IP}↔ }/mvcc/key/{db}/{table}/{handle}` API [#11557](#)
  - Fix the issue that Scatter Table does not work caused by the Scatter Table API not escaping the Range key [#11298](#)
  - Optimize the Region cache: label the store where the Region exists as invalid when the correspondent store is inaccessible, to avoid reduced query performance caused by accessing this store [#11498](#)
  - Fix the error that the table schema can still be obtained through the HTTP API after dropping the database with the same name multiple times [#11585](#)
- DDL
    - Fix the issue that an error occurs when a non-string column with a zero length is being indexed [#11214](#)
    - Disallow modifying the columns with foreign key constraints and full-text indexes (Note: TiDB still supports foreign key constraints and full-text indexes in syntax) [#11274](#)
    - Fix the issue that the index offset of the column might be wrong because the position changed by the `ALTER TABLE` statement and the default value of the column are used concurrently [#11346](#)
    - Fix two issues that occur when parsing JSON files:
      - \* `int64` is used as the intermediate parsing result of `uint64` in `ConvertJSONToFloat` ↔ , which leads to the precision overflow error [#11433](#)
      - \* `int64` is used as the intermediate parsing result of `uint64` in `ConvertJSONToInt` ↔ , which leads to the precision overflow error [#11551](#)
    - Disallow dropping indexes on the auto-increment column to avoid that the auto-increment column might get an incorrect result [#11399](#)
    - Fix the following issues [#11492](#):
      - \* The character set and the collation of the column are not consistent when explicitly specifying the collation but not the character set
      - \* The error is not correctly reported when there is a conflict between the character set and the collation that are specified by `ALTER TABLE ... MODIFY` ↔ `COLUMN`
      - \* Incompatibility with MySQL when using `ALTER TABLE ... MODIFY COLUMN` to specify character sets and collations multiple times
    - Add the trace details of the subquery to the result of the `TRACE` query [#11458](#)
    - Optimize the performance of executing `ADMIN CHECK TABLE` and greatly reduce its execution time [#11547](#)
    - Add the result returned by `SPLIT TABLE ... REGIONS/INDEX` and make `TOTAL_SPLIT_REGION` and `SCATTER_FINISH_RATIO` display the number of Regions that have been split successfully before timeout in the result [#11484](#)

- Fix the issue that the precision displayed by statements like `SHOW CREATE TABLE` is incomplete when `ON UPDATE CURRENT_TIMESTAMP` is the column attribute and the float precision is specified [#11591](#)
- Fix the issue that the index result of the column cannot be correctly calculated when the expression of a virtual generated column contains another virtual generated column [#11475](#)
- Fix the issue that the minus sign cannot be added after `VALUE LESS THAN` in the `ALTER TABLE ... ADD PARTITION ...` statement [#11581](#)
- Monitor
  - Fix the issue that data is not collected and reported because the `TiKVTxnCmdCounter`  $\hookrightarrow$  monitoring metric is not registered [#11316](#)
  - Add the `BindUsageCounter`, `BindTotalGauge` and `BindMemoryUsage` monitoring metrics for the Bind Info [#11467](#)

### 16.19.19.2 TiKV

- Fix the bug that TiKV panics if the Raft log is not written in time [#5160](#)
- Fix the bug that the panic information is not written into the log file after TiKV panics [#5198](#)
- Fix the bug that the Insert operation might be incorrectly performed in the pessimistic transaction [#5203](#)
- Lower the output level of some logs that require no manual intervention to INFO [#5193](#)
- Improve the accuracy of monitoring the storage engine size [#5200](#)
- Improve the accuracy of the Region size in `tikv-ctl` [#5195](#)
- Improve the performance of the deadlock detector for pessimistic locking [#5192](#)
- Improve the performance of GC in the Titan storage engine [#5197](#)

### 16.19.19.3 PD

- Fix the bug that the Scatter Region scheduler cannot work [#1642](#)
- Fix the bug that the merge Region operation cannot be performed in `pd-ctl` [#1653](#)
- Fix the bug that the remove-tombstone operation cannot be performed in `pd-ctl` [#1651](#)
- Fix the issue that the Region overlapping with the key scope cannot be found when performing the scan Region operation [#1648](#)
- Add the retrying mechanism to make sure that the members are added successfully in PD [#1643](#)

### 16.19.19.4 Tools

#### TiDB Binlog

- Add the configuration item check feature when starting, which will stop the Binlog service and report an error when an invalid item is found [#687](#)

- Add the `node-id` configuration in Drainer to specify a specific logic used by Drainer [#684](#)

### TiDB Lightning

- Fix the issue that `tikv_gc_life_time` fails to be changed back to its original value when 2 checksums are running at the same time [#218](#)
- Add the configuration item check feature when starting, which will stop the Binlog service and report an error when an invalid item is found [#217](#)

### 16.19.19.5 TiDB Ansible

- Fix the unit error that the Disk Performance monitor treats seconds as milliseconds [#840](#)
- Add the `log4j` configuration file in Spark [#841](#)
- Fix the issue that the Prometheus configuration file is generated in the wrong format when Binlog is enabled and Kafka or ZooKeeper is configured [#844](#)
- Fix the issue that the `pessimistic-txn` configuration parameter is left out in the generated TiDB configuration file [#850](#)
- Add and optimize metrics on the TiDB Dashboard [#853](#)
- Add descriptions for each monitoring item on the TiDB Dashboard [#854](#)
- Add the TiDB Summary Dashboard to better view the cluster status and troubleshoot issues [#855](#)
- Update the Allocator Stats monitoring item on the TiKV Dashboard [#857](#)
- Fix the unit error in the Node Exporter's alerting expression [#860](#)
- Upgrade the TiSpark jar package to v2.1.2 [#862](#)
- Update the descriptions of the Ansible Task feature [#867](#)
- Update the expression of the local reader requests monitoring item on the TiDB Dashboard [#874](#)
- Update the expression of the TiKV Memory monitoring item on the Overview Dashboard, and fix the issue of wrongly displayed monitoring [#879](#)
- Remove the Binlog support in the Kafka mode [#878](#)
- Fix the issue that PD fails to transfer the Leader when executing the `rolling_update`  $\leftrightarrow$  `.yaml` operation [#887](#)

### 16.19.20 TiDB 3.0.1 Release Notes

Release date: July 16, 2019

TiDB version: 3.0.1

TiDB Ansible version: 3.0.1

### 16.19.20.1 TiDB

- Add support for the `MAX_EXECUTION_TIME` feature [#11026](#)
- Add the `tidb_wait_split_region_finish_backoff` session variable to control the backoff time of splitting Regions [#11166](#)
- Support automatically adjusting the incremental gap allocated by auto-increment IDs based on the load, and the auto-adjustment scope of the incremental gap is 1000~2000000 [#11006](#)
- Add the `ADMIN PLUGINS ENABLE/ADMIN PLUGINS DISABLE SQL` statement to dynamically enable or disable plugins [#11157](#)
- Add the session connection information in the Audit plugin [#11013](#)
- Change the default behavior during the period of splitting Regions to wait for PD to finish scheduling [#11166](#)
- Prohibit Window Functions from being cached in Prepare Plan Cache to avoid incorrect results in some cases [#11048](#)
- Prohibit `ALTER` statements from modifying the definition of stored generated columns [#11068](#)
- Disallow changing virtual generated columns to stored generated columns [#11068](#)
- Disallow changing the generated column expression with indexes [#11068](#)
- Support compiling TiDB on the ARM64 architecture [#11150](#)
- Support modifying the collation of a database or a table, but the character set of the database/table has to be UTF-8 or utf8mb4 [#11086](#)
- Fix the issue that an error is reported when the `SELECT` subquery in the `UPDATE ... ↪ SELECT` statement fails to parse the column in the `UPDATE` expression and the column is wrongly pruned [#11252](#)
- Fix the panic issue that happens when a column is queried on multiple times and the returned result is `NULL` during point queries [#11226](#)
- Fix the data race issue caused by non-thread safe `rand.Rand` when using the `RAND` function [#11169](#)
- Fix the bug that the memory usage of a SQL statement exceeds the threshold but the execution of this statement is not canceled in some cases when `oom-action="cancel"` is configured, and the returned result is incorrect [#11004](#)
- Fix the issue that `SHOW PROCESSLIST` shows that the memory usage is not 0 because the memory usage of MemTracker was not correctly cleaned [#10970](#)
- Fix the bug that the result of comparing integers and non-integers is not correct in some cases [#11194](#)
- Fix the bug that the query result is not correct when the query on table partitions contains a predicate in explicit transactions [#11196](#)
- Fix the DDL job panic issue because `infoHandle` might be `NULL` [#11022](#)
- Fix the issue that the query result is not correct because the queried column is not referenced in the subquery and is then wrongly pruned when running a nested aggregation query [#11020](#)
- Fix the issue that the `Sleep` function does not respond to the `KILL` statement in time [#11028](#)

- Fix the issue that the `DB` and `INFO` columns shown by the `SHOW PROCESSLIST` command are incompatible with MySQL [#11003](#)
- Fix the system panic issue caused by the `FLUSH PRIVILEGES` statement when `skip-grant-table=true` is configured [#11027](#)
- Fix the issue that the primary key statistics collected by `FAST ANALYZE` are not correct when the table primary key is an `UNSIGNED` integer [#11099](#)
- Fix the issue that the “invalid key” error is reported by the `FAST ANALYZE` statement in some cases [#11098](#)
- Fix the issue that the precision shown by the `SHOW CREATE TABLE` statement is incomplete when `CURRENT_TIMESTAMP` is used as the default value of the column and the float precision is specified [#11088](#)
- Fix the issue that the function name is not in lowercase when window functions report an error to make it compatible with MySQL [#11118](#)
- Fix the issue that TiDB fails to connect to TiKV and thus cannot provide service after the background thread of TiKV Client Batch gRPC panics [#11101](#)
- Fix the issue that the variable is set incorrectly by `SetVar` because of the shallow copy of the string [#11044](#)
- Fix the issue that the execution fails and an error is reported when the `INSERT ... ON DUPLICATE` statement is applied on table partitions [#11231](#)
- Pessimistic locking (experimental feature)
  - Fix the issue that an incorrect result is returned because of the invalid lock on the row when point queries are run using the pessimistic locking and the returned data is empty [#10976](#)
  - Fix the issue that the query result is not correct because `SELECT ... FOR UPDATE` does not use the correct TSO when using the pessimistic locking in the query [#11015](#)
  - Change the detection behavior from immediate conflict detection to waiting when an optimistic transaction meets a pessimistic lock to avoid worsening the lock conflict [#11051](#)

### 16.19.20.2 TiKV

- Add the statistics of the size of blob files in statistics information [#5060](#)
- Fix the core dump issue caused by the incorrectly cleaned memory resources when the process exits [#5053](#)
- Add all monitoring metrics related to the Titan engine [#4772](#), [#4836](#)
- Add the number of open file handles for Titan when counting the number of open file handles to avoid the issue that no file handle is available because of inaccurate statistics of file handles [#5026](#)
- Set `blob_run_mode` to decide whether to enable the Titan engine on a specific CF [#4991](#)
- Fix the issue that the read operations cannot get the commit information of pessimistic transactions [#5067](#)

- Add the `blob-run-mode` configuration parameter to control the running mode of the Titan engine, and its value can be `normal`, `read-only` or `fallback` [#4865](#)
- Improve the performance of detecting deadlocks [#5089](#)

### 16.19.20.3 PD

- Fix the issue that the scheduling limit is automatically adjusted to 0 when PD schedules hot Regions [#1552](#)
- Add the `enable-grpc-gateway` configuration option to enable the gRPC gateway feature of etcd [#1596](#)
- Add `store-balance-rate`, `hot-region-schedule-limit` and other statistics related to scheduler configuration [#1601](#)
- Optimize the hot Region scheduling strategy and skip the Regions that lack replicas during scheduling to prevent multiple replicas from being scheduled to the same IDC [#1609](#)
- Optimize the Region merge processing logic and support giving priority to merging the Regions with smaller sizes to speed up Region merging [#1613](#)
- Adjust the default limit of hot Region scheduling in a single time to 64 to prevent too many scheduling tasks from occupying system resources and impacting performance [#1616](#)
- Optimize the Region scheduling strategy and support giving high priority to scheduling Regions in the `Pending` status [#1617](#)
- Fix the issue that `random-merge` and `admin-merge-region` operators cannot be added [#1634](#)
- Adjust the format of the Region key in the log to hexadecimal notation to make it easier to view [#1639](#)

### 16.19.20.4 Tools

#### TiDB Binlog

- Optimize the Pump GC strategy and remove the restriction that the unconsumed binlog cannot be cleaned to make sure that the resources are not occupied for a long time [#646](#)

#### TiDB Lightning

- Fix the import error that happens when the column names specified by the SQL dump are not in lowercase [#210](#)

### 16.19.20.5 TiDB Ansible

- Add the precheck feature for the ansible command and its `jmespath` and `jinja2` dependency packages [#803](#), [#813](#)

- Add the `stop-write-at-available-space` parameter (10 GiB by default) in Pump to stop writing binlog files in Pump when the available disk space is less than the parameter value [#806](#)
- Update the I/O monitoring items in the TiKV monitoring information and make them compatible with the monitoring components of the new version [#820](#)
- Update the PD monitoring information, and fix the anomaly that Disk Latency is empty in the disk performance dashboard [#817](#)
- Add monitoring items for Titan in the TiKV details dashboard [#824](#)

### 16.19.21 TiDB 3.0 GA Release Notes

Release date: June 28, 2019

TiDB version: 3.0.0

TiDB Ansible version: 3.0.0

#### 16.19.21.1 Overview

On June 28, 2019, TiDB 3.0 GA is released. The corresponding TiDB Ansible version is 3.0.0. Compared with TiDB 2.1, this release has greatly improved in the following aspects:

- **Stability.** TiDB 3.0 has demonstrated long-term stability for large-scale clusters with up to 150+ nodes and 300+ TB of storage.
- **Usability.** TiDB 3.0 has multi-facet improvements in usability, including standardized slow query logs, well-developed log file specification, and new features such as `EXPLAIN`  $\leftrightarrow$  `ANALYZE` and SQL Trace to save operation costs for users.
- **Performance.** The performance of TiDB 3.0 is 4.5 times greater than TiDB 2.1 in TPC-C benchmarks, and over 1.5 times in Sysbench benchmarks. Thanks to the support for Views, TPC-H 50G Q15 can now run normally.
- **New features** including Window Functions, Views (**Experimental**), partitioned tables, the plugin framework, pessimistic locking (**Experimental**), and SQL Plan  $\leftrightarrow$  Management.

#### 16.19.21.2 TiDB

- **New Features**
  - Support Window Functions; compatible with all window functions in MySQL 8.0, including `NTILE`, `LEAD`, `LAG`, `PERCENT_RANK`, `NTH_VALUE`, `CUME_DIST`, `FIRST_VALUE`, `LAST_VALUE`, `RANK`, `DENSE_RANK`, and `ROW_NUMBER`
  - Support Views (**Experimental**)
  - Improve Table Partition
    - \* Support Range Partition
    - \* Support Hash Partition

- Add the plug-in framework, supporting plugins such as IP Whitelist (**Enterprise**) and Audit Log (**Enterprise**).
- Support the SQL Plan Management function to create SQL execution plan binding to ensure query stability (**Experimental**)
- SQL Optimizer
  - Optimize the NOT EXISTS subquery and convert it to **Anti Semi Join** to improve performance
  - Optimize the constant propagation on the **Outer Join**, and add the optimization rule of **Outer Join** elimination to reduce non-effective computations and improve performance
  - Optimize the IN subquery to execute **Inner Join** after aggregation to improve performance
  - Optimize **Index Join** to adapt to more scenarios
  - Improve the Partition Pruning optimization rule of Range Partition
  - Optimize the query logic for `_tidb_rowid` to avoid full table scan and improve performance
  - Match more prefix columns of the indexes when extracting access conditions of composite indexes if there are relevant columns in the filter to improve performance
  - Improve the accuracy of cost estimates by using order correlation between columns
  - Optimize **Join Order** based on the greedy strategy and the dynamic programming algorithm to speed up the join operation of multiple tables
  - Support Skyline Pruning, with some rules to prevent the execution plan from relying too heavily on statistics to improve query stability
  - Improve the accuracy of row count estimation for single-column indexes with NULL values
  - Support **FAST ANALYZE** that randomly samples in each Region to avoid full table scan and improve performance with statistics collection
  - Support the incremental Analyze operation on monotonically increasing index columns to improve performance with statistics collection
  - Support using subqueries in the **DO** statement
  - Support using **Index Join** in transactions
  - Optimize **prepare/execute** to support DDL statements with no parameters
  - Modify the system behavior to auto load statistics when the `stats-lease` variable value is 0
  - Support exporting historical statistics
  - Support the **dump/load** correlation of histograms
- SQL Execution Engine
  - Optimize log output: **EXECUTE** outputs user variables and **COMMIT** outputs slow query logs to facilitate troubleshooting
  - Support the **EXPLAIN ANALYZE** function to improve SQL tuning usability
  - Support the `admin show next_row_id` command to get the ID of the next row

- Add six built-in functions: `JSON_QUOTE`, `JSON_ARRAY_APPEND`, `JSON_MERGE_PRESERVE`, `↔`, `BENCHMARK`, `COALESCE`, and `NAME_CONST`
- Optimize control logics on the chunk size to dynamically adjust based on the query context, to reduce the SQL execution time and resource consumption
- Support tracking and controlling memory usage in three operators - `TableReader`, `IndexReader` and `IndexLookupReader`
- Optimize the Merge Join operator to support an empty `ON` condition
- Optimize write performance for single tables that contains too many columns
- Improve the performance of `admin show ddl jobs` by supporting scanning data in reverse order
- Add the `split table region` statement to manually split the table Region to alleviate hotspot issues
- Add the `split index region` statement to manually split the index Region to alleviate hotspot issues
- Add a blacklist to prohibit pushing down expressions to Coprocessor
- Optimize the `Expensive Query` log to print the SQL query in the log when it exceeds the configured limit of execution time or memory
- DDL
  - Support migrating from character set `utf8` to `utf8mb4`
  - Change the default character set from `utf8` to `utf8mb4`
  - Add the `alter schema` statement to modify the character set and the collation of the database
  - Support ALTER algorithm `INPLACE/INSTANT`
  - Support `SHOW CREATE VIEW`
  - Support `SHOW CREATE USER`
  - Support fast recovery of mistakenly deleted tables
  - Support adjusting the number of concurrencies of `ADD INDEX` dynamically
  - Add the `pre_split_regions` option that pre-allocates Regions when creating the table using the `CREATE TABLE` statement, to relieve write hot Regions caused by lots of writes after the table creation
  - Support splitting Regions by the index and range of the table specified using SQL statements to relieve hotspot issues
  - Add the `ddl_error_count_limit` global variable to limit the number of DDL task retries
  - Add a feature to use `SHARD_ROW_ID_BITS` to scatter row IDs when the column contains an `AUTO_INCREMENT` attribute to relieve hotspot issues
  - Optimize the lifetime of invalid DDL metadata to speed up recovering the normal execution of DDL operations after upgrading the TiDB cluster
- Transactions
  - Support the pessimistic transaction mode (**Experimental**)
  - Optimize transaction processing logics to adapt to more scenarios:
    - \* Change the default value `tidd_disable_txn_auto_retry` to `on`, which means non-auto committed transactions will not be retried

- \* Add the `tidb_batch_commit` system variable to split a transaction into multiple ones to be executed concurrently
  - \* Add the `tidb_low_resolution_tso` system variable to control the number of TSOs to obtain in batches and reduce the number of times that transactions request for TSOs, to improve performance in scenarios with relatively low requirement of consistency
  - \* Add the `tidb_skip_isolation_level_check` variable to control whether to report errors when the isolation level is set to `SERIALIZABLE`
  - \* Modify the `tidb_disable_txn_auto_retry` system variable to make it work on all retryable errors
- Permission Management
    - Perform permission check on the `ANALYZE`, `USE`, `SET GLOBAL`, and `SHOW`  $\leftrightarrow$  `PROCESSLIST` statements
    - Support Role Based Access Control (RBAC) (**Experimental**)
  - Server
    - Optimize slow query logs:
      - \* Restructure the log format
      - \* Optimize the log content
      - \* Optimize the log query method to support using the `INFORMATION_SCHEMA`  $\leftrightarrow$  `.SLOW_QUERY` and `ADMIN SHOW SLOW` statements of the memory table to query slow query logs
    - Develop a unified log format specification with restructured log system to facilitate collection and analysis by tools
    - Support using SQL statements to manage TiDB Binlog services, including querying status, enabling TiDB Binlog, maintaining and sending TiDB Binlog strategies.
    - Support using `unix_socket` to connect to the database
    - Support `Trace` for SQL statements
    - Support getting information for a TiDB instance via the `/debug/zip` HTTP interface to facilitate troubleshooting.
    - Optimize monitoring items to facilitate troubleshooting:
      - \* Add the `high_error_rate_feedback_total` monitoring item to monitor the difference between the actual data volume and the estimated data volume based on statistics
      - \* Add a QPS monitoring item in the database dimension
    - Optimize the system initialization process to only allow the DDL owner to perform the initialization. This reduces the startup time for initialization or upgrading.
    - Optimize the execution logic of `kill query` to improve performance and ensure resource is release properly
    - Add a startup option `config-check` to check the validity of the configuration file
    - Add the `tidb_back_off_weight` system variable to control the backoff time of internal error retries

- Add the `wait_timeout` and `interactive_timeout` system variables to control the maximum idle connections allowed
- Add the connection pool for TiKV to shorten the connection establishing time
- Compatibility
  - Support the `ALLOW_INVALID_DATES` SQL mode
  - Support the MySQL 320 Handshake protocol
  - Support manifesting unsigned BIGINT columns as auto-increment columns
  - Support the `SHOW CREATE DATABASE IF NOT EXISTS` syntax
  - Optimize the fault tolerance of `load data` for CSV files
  - Abandon the predicate pushdown operation when the filtering condition contains a user variable to improve the compatibility with MySQL's behavior of using user variables to simulate Window Functions

### 16.19.21.3 PD

- Support re-creating a cluster from a single node
- Migrate Region metadata from etcd to the go-leveldb storage engine to solve the storage bottleneck in etcd for large-scale clusters
- API
  - Add the `remove-tombstone` API to clear Tombstone stores
  - Add the `ScanRegions` API to batch query Region information
  - Add the `GetOperator` API to query running operators
  - Optimize the performance of the `GetStores` API
- Configurations
  - Optimize configuration check logic to avoid configuration item errors
  - Add `enable-two-way-merge` to control the direction of Region merge
  - Add `hot-region-schedule-limit` to control the scheduling rate for hot Regions
  - Add `hot-region-cache-hits-threshold` to identify hotspot when hitting multiple thresholds consecutively
  - Add the `store-balance-rate` configuration item to control the maximum numbers of balance Region operators allowed per minute
- Scheduler Optimizations
  - Add the store limit mechanism for separately controlling the speed of operators for each store
  - Support the `waitingOperator` queue to optimize the resource race among different schedulers
  - Support scheduling rate limit to actively send scheduling operations to TiKV. This improves the scheduling rate by limiting the number of concurrent scheduling tasks on a single node.
  - Optimize the `Region Scatter` scheduling to be not restrained by the limit mechanism

- Add the `shuffle-hot-region` scheduler to facilitate TiKV stability test in scenarios of poor hotspot scheduling
- Simulator
  - Add simulator for data import scenarios
  - Support setting different heartbeats intervals for the Store
- Others
  - Upgrade etcd to solve the issues of inconsistent log output formats, Leader selection failure in prevote, and lease deadlocking
  - Develop a unified log format specification with restructured log system to facilitate collection and analysis by tools
  - Add monitoring metrics including scheduling parameters, cluster label information, and time consumed by PD to process TSO requests, Store ID, and address information.

#### 16.19.21.4 TiKV

- Support distributed GC and concurrent lock resolving for improved GC performance
- Support reversed `raw_scan` and `raw_batch_scan`
- Support Multi-thread Raftstore and Multi-thread Apply to improve scalabilities, concurrency capacity, and resource usage within a single node. Performance improves by 70% under the same level of pressure
- Support batch receiving and sending Raft messages, improving TPS by 7% for write intensive scenarios
- Support checking RocksDB Level 0 files before applying snapshots to avoid write stall
- Introduce Titan, a key-value plugin that improves write performance for scenarios with value sizes greater than 1KiB, and relieves write amplification in certain degrees
- Support the pessimistic transaction mode (**Experimental**)
- Support getting monitoring information via HTTP
- Modify the semantics of `Insert` to allow Prewrite to succeed only when there is no Key
- Develop a unified log format specification with restructured log system to facilitate collection and analysis by tools
- Add performance metrics related to configuration information and key bound crossing
- Support Local Reader in RawKV to improve performance
- Engine
  - Optimize memory management to reduce memory allocation and copying for `Iterator Key Bound Option`
  - Support `block cache` sharing among different column families
- Server
  - Reduce context switch overhead from `batch commands`

- Remove `txn scheduler`
- Add monitoring items related to `read index` and `GC worker`
- RaftStore
  - Support Hibernate Regions to optimize CPU consumption from RaftStore (**Experimental**)
  - Remove the local reader thread
- Coprocessor
  - Refactor the computation framework to implement vector operators, computation using vector expressions, and vector aggregations to improve performance
  - Support providing operator execution status for the `EXPLAIN ANALYZE` statement in TiDB
  - Switch to the `work-stealing` thread pool model to reduce context switch cost

#### 16.19.21.5 Tools

- TiDB Lightning
  - Support redirected replication of data tables
  - Support importing CSV files
  - Improve performance for conversion from SQL to KV pairs
  - Support batch import of single tables to improve performance
  - Support separately importing data and indexes for big tables to improve the performance of TiKV-importer
  - Support filling the missing column using the `row_id` or the default column value when column data is missing in the new file
  - Support setting a speed limit in `TIKV-importer` when uploading SST files to TiKV
- TiDB Binlog
  - Add the `advertise-addr` configuration in Drainer to support the bridge mode in the container environment
  - Add the `GetMvccByEncodeKey` function in Pump to speed up querying the transaction status
  - Support compressing communication data among components to reduce network resource consumption
  - Add the Arbiter tool that supports reading binlog from Kafka and replicate the data into MySQL
  - Support filtering out files that don't require replication via Reparo
  - Support replicating generated columns
  - Add the `syncer.sql-mode` configuration item to support using different sql-modes to parse DDL queries
  - Add the `syncer.ignore-table` configuration item to support filtering tables not to be replicated

- sync-diff-inspector
  - Support checkpoint to record verification status and continue the verification from last saved point after restarting
  - Add the `only-use-checksum` configuration item to check data consistency by calculating checksum
  - Support using TiDB statistics and multiple columns to split chunks for comparison to adapt to more scenarios

#### 16.19.21.6 TiDB Ansible

- Upgrade the following monitoring components to a stable version:
  - Prometheus from V2.2.1 to V2.8.1
  - Pushgateway from V0.4.0 to V0.7.0
  - Node\_exporter from V0.15.2 to V0.17.0
  - Alertmanager from V0.14.0 to V0.17.0
  - Grafana from V4.6.3 to V6.1.6
  - Ansible from V2.5.14 to V2.7.11
- Add the TiKV summary monitoring dashboard to view cluster status conveniently
- Add the TiKV trouble\_shooting monitoring dashboard to remove duplicate items and facilitate troubleshooting
- Add the TiKV details monitoring dashboard to facilitate debugging and troubleshooting
- Add concurrent check for version consistency during rolling updates to improve the update performance
- Support deployment and operations for TiDB Lightning
- Optimize the `table-regions.py` script to support displaying Leader distribution by tables
- Optimize TiDB monitoring and add latency related monitoring items by SQL categories
- Modify the operating system version limit to only support the CentOS 7.0+ and Red Hat 7.0+ operating systems
- Add the monitoring item to predict the maximum QPS of the cluster (hidden by default)

#### 16.19.22 TiDB 3.0.0-rc.3 Release Notes

Release date: June 21, 2019

TiDB version: 3.0.0-rc.3

TiDB Ansible version: 3.0.0-rc.3

### 16.19.22.1 Overview

On June 21, 2019, TiDB 3.0.0-rc.3 is released. The corresponding TiDB Ansible version is 3.0.0-rc.3. Compared with TiDB 3.0.0-rc.2, this release has greatly improved the stability, usability, features, the SQL optimizer, statistics, and the execution engine.

### 16.19.22.2 TiDB

- SQL Optimizer
  - Remove the feature of collecting virtual generated column statistics [#10629](#)
  - Fix the issue that the primary key constant overflows during point queries [#10699](#)
  - Fix the issue that using uninitialized information in `fast analyze` causes panic [#10691](#)
  - Fix the issue that executing the `create view` statement using `prepare` causes panic because of wrong column information [#10713](#)
  - Fix the issue that the column information is not cloned when handling window functions [#10720](#)
  - Fix the wrong estimation for the selectivity rate of the inner table selection in index join [#10854](#)
  - Support automatic loading statistics when the `stats-lease` variable value is 0 [#10811](#)
- Execution Engine
  - Fix the issue that resources are not correctly released when calling the `Close` function in `StreamAggExec` [#10636](#)
  - Fix the issue that the order of `table_option` and `partition_options` is incorrect in the result of executing the `show create table` statement for partitioned tables [#10689](#)
  - Improve the performance of `admin show ddl jobs` by supporting scanning data in reverse order [#10687](#)
  - Fix the issue that the result of the `show grants` statement in RBAC is incompatible with that of MySQL when this statement has the `current_user` field [#10684](#)
  - Fix the issue that UUIDs might generate duplicate values on multiple nodes [#10712](#)
  - Fix the issue that the `show view` privilege is not considered in `explain` [#10635](#)
  - Add the `split table region` statement to manually split the table Region to alleviate the hotspot issue [#10765](#)
  - Add the `split index region` statement to manually split the index Region to alleviate the hotspot issue [#10764](#)
  - Fix the incorrect execution issue when you execute multiple statements such as `create user`, `grant`, or `revoke` consecutively [#10737](#)
  - Add a blacklist to prohibit pushing down expressions to Coprocessor [#10791](#)
  - Add the feature of printing the `expensive query` log when a query exceeds the memory configuration limit [#10849](#)

- Add the `bind-info-lease` configuration item to control the update time of the modified binding execution plan [#10727](#)
- Fix the OOM issue in high concurrent scenarios caused by the failure to quickly release Coprocessor resources, resulted from the `execdetails.ExecDetails` pointer [#10832](#)
- Fix the panic issue caused by the `kill` statement in some cases [#10876](#)
- Server
  - Fix the issue that goroutine might leak when repairing GC [#10683](#)
  - Support displaying the `host` information in slow queries [#10693](#)
  - Support reusing idle links that interact with TiKV [#10632](#)
  - Fix the support for enabling the `skip-grant-table` option in RBAC [#10738](#)
  - Fix the issue that `pessimistic-txn` configuration goes invalid [#10825](#)
  - Fix the issue that the actively canceled ticlient requests are still retried [#10850](#)
  - Improve performance in the case where pessimistic transactions conflict with optimistic transactions [#10881](#)
- DDL
  - Fix the issue that modifying charset using `alter table` causes the `blob` type change [#10698](#)
  - Add a feature to use `SHARD_ROW_ID_BITS` to scatter row IDs when the column contains an `AUTO_INCREMENT` attribute to alleviate the hotspot issue [#10794](#)
  - Prohibit adding stored generated columns by using the `alter table` statement [#10808](#)
  - Optimize the invalid survival time of DDL metadata to shorten the period during which the DDL operation is slower after cluster upgrade [#10795](#)

### 16.19.22.3 PD

- Add the `enable-two-way-merge` configuration item to allow only one-way merging [#1583](#)
- Add scheduling operations for `AddLightLearner` and `AddLightPeer` to make Region Scatter scheduling unrestricted by the limit mechanism [#1563](#)
- Fix the issue of insufficient reliability because the data might only have one replica replication when the system is started [#1581](#)
- Optimize configuration check logic to avoid configuration item errors [#1585](#)
- Adjust the definition of the `store-balance-rate` configuration to the upper limit of the number of balance operators generated per minute [#1591](#)
- Fix the issue that the store might have been unable to generate scheduled operations [#1590](#)

### 16.19.22.4 TiKV

- Engine

- Fix the issue that incomplete snapshots are generated in the system caused by the iterator not checking the status [#4936](#)
- Fix the data loss issue caused by a delay of flushing data to the disk when receiving snapshots after a power failure in abnormal conditions [#4850](#)
- Server
  - Add a feature to check the validity of the `block-size` configuration [#4928](#)
  - Add `READ_INDEX`-related monitoring metrics [#4830](#)
  - Add GC worker-related monitoring metrics [#4922](#)
- Raftstore
  - Fix the issue that the cache of the local reader is not cleared correctly [#4778](#)
  - Fix the issue that the request delay might be increased when transferring the leader and changing `conf` [#4734](#)
  - Fix the issue that a stale command is wrongly reported [#4682](#)
  - Fix the issue that the command might be pending for a long time [#4810](#)
  - Fix the issue that files are damaged after a power failure, which is caused by a delay of synchronizing the snapshot file to the disk [#4807](#), [#4850](#)
- Coprocessor
  - Support Top-N in vector calculation [#4827](#)
  - Support `Stream` aggregation in vector calculation [#4786](#)
  - Support the `AVG` aggregate function in vector calculation [#4777](#)
  - Support the `First` aggregate function in vector calculation [#4771](#)
  - Support the `SUM` aggregate function in vector calculation [#4797](#)
  - Support the `MAX/MIN` aggregate function in vector calculation [#4837](#)
  - Support the `Like` expression in vector calculation [#4747](#)
  - Support the `MultiplyDecimal` expression in vector calculation [#4849](#)
  - Support the `BitAnd/BitOr/BitXor` expression in vector calculation [#4724](#)
  - Support the `UnaryNot` expression in vector calculation [#4808](#)
- Transaction
  - Fix the issue that an error occurs caused by non-pessimistic locking conflicts in pessimistic transactions [#4801](#), [#4883](#)
  - Reduce unnecessary calculation for optimistic transactions after enabling pessimistic transactions to improve the performance [#4813](#)
  - Add a feature of single statement rollback to ensure that the whole transaction does not need a rollback operation in a deadlock situation [#4848](#)
  - Add pessimistic transaction-related monitoring items [#4852](#)
  - Support using the `ResolveLockLite` command to resolve lightweight locks to improve the performance when severe conflicts exist [#4882](#)
- tikv-ctl
  - Add the `bad-regions` command to support checking more abnormal conditions [#4862](#)

- Add a feature of forcibly executing the `tombstone` command [#4862](#)
- Misc
  - Add the `dist_release` compiling command [#4841](#)

### 16.19.22.5 Tools

- TiDB Binlog
  - Fix the wrong offset issue caused by Pump not checking the returned value when it fails to write data [#640](#)
  - Add the `advertise-addr` configuration in Drainer to support the bridge mode in the container environment [#634](#)
  - Add the `GetMvccByEncodeKey` function in Pump to speed up querying the transaction status [#632](#)

### 16.19.22.6 TiDB Ansible

- Add a monitoring item to predict the maximum QPS value of the cluster (“hide” by default) [#f5cfa4d](#)

## 16.19.23 TiDB 3.0.0-rc.2 Release Notes

Release date: May 28, 2019

TiDB version: 3.0.0-rc.2

TiDB Ansible version: 3.0.0-rc.2

### 16.19.23.1 Overview

On May 28, 2019, TiDB 3.0.0-rc.2 is released. The corresponding TiDB Ansible version is 3.0.0-rc.2. Compared with TiDB 3.0.0-rc.1, this release has greatly improved the stability, usability, features, the SQL optimizer, statistics, and the execution engine.

### 16.19.23.2 TiDB

- SQL Optimizer
  - Support Index Join in more scenarios [#10540](#)
  - Support exporting historical statistics [#10291](#)
  - Support the incremental `Analyze` operation on monotonically increasing index columns [#10355](#)
  - Neglect the NULL value in the `Order By` clause [#10488](#)

- Fix the wrong schema information calculation of the `UnionAll` logical operator when simplifying the column information [#10384](#)
- Avoid modifying the original expression when pushing down the `Not` operator [#10363](#)
- Support the `dump/load` correlation of histograms [#10573](#)
- Execution Engine
  - Handle virtual columns with a unique index properly when fetching duplicate rows in `batchChecker` [#10370](#)
  - Fix the scanning range calculation issue for the `CHAR` column [#10124](#)
  - Fix the issue of `PointGet` incorrectly processing negative numbers [#10113](#)
  - Merge `Window` functions with the same name to improve execution efficiency [#9866](#)
  - Allow the `RANGE` frame in a `Window` function to contain no `OrderBy` clause [#10496](#)
- Server
  - Fix the issue that TiDB continuously creates a new connection to TiKV when a fault occurs in TiKV [#10301](#)
  - Make `tidb_disable_txn_auto_retry` affect all retryable errors instead of only write conflict errors [#10339](#)
  - Allow DDL statements without parameters to be executed using `prepare`  $\leftrightarrow$  `/execute` [#10144](#)
  - Add the `tidb_back_off_weight` variable to control the backoff time [#10266](#)
  - Prohibit TiDB retrying non-automatically committed transactions in default conditions by setting the default value of `tidb_disable_txn_auto_retry` to `on` [#10266](#)
  - Fix the database privilege judgment of `role` in RBAC [#10261](#)
  - Support the pessimistic transaction mode (experimental) [#10297](#)
  - Reduce the wait time for handling lock conflicts in some cases [#10006](#)
  - Make the Region cache able to visit follower nodes when a fault occurs in the leader node [#10256](#)
  - Add the `tidb_low_resolution_tso` variable to control the number of TSOs obtained in batches and reduce the times of transactions obtaining TSO to adapt for scenarios where data consistency is not so strictly required [#10428](#)
- DDL
  - Fix the uppercase issue of the charset name in the storage of the old version of TiDB [#10272](#)
  - Support `preSplit` of table partition, which pre-allocates table Regions when creating a table to avoid write hotspots after the table is created [#10221](#)
  - Fix the issue that TiDB incorrectly updates the version information in PD in some cases [#10324](#)
  - Support modifying the charset and collation using the `ALTER DATABASE` statement [#10393](#)

- Support splitting Regions based on the index and range of the specified table to relieve hotspot issues [#10203](#)
- Prohibit modifying the precision of the decimal column using the `alter table` statement [#10433](#)
- Fix the restriction for expressions and functions in hash partition [#10273](#)
- Fix the issue that adding indexes in a table that contains partitions will in some cases cause TiDB panic [#10475](#)
- Validate table information before executing the DDL to avoid invalid table schemas [#10464](#)
- Enable hash partition by default; and enable range columns partition when there is only one column in the partition definition [#9936](#)

### 16.19.23.3 PD

- Enable the Region storage by default to store the Region metadata [#1524](#)
- Fix the issue that hot Region scheduling is preempted by another scheduler [#1522](#)
- Fix the issue that the priority for the leader does not take effect [#1533](#)
- Add the gRPC interface for `ScanRegions` [#1535](#)
- Push operators actively [#1536](#)
- Add the store limit mechanism for separately controlling the speed of operators for each store [#1474](#)
- Fix the issue of inconsistent `Config` status [#1476](#)

### 16.19.23.4 TiKV

- Engine
  - Support multiple column families sharing a block cache [#4563](#)
- Server
  - Remove `TxnScheduler` [#4098](#)
  - Support pessimistic lock transactions [#4698](#)
- Raftstore
  - Support hibernate Regions to reduce the consumption of the raftstore CPU [#4591](#)
  - Fix the issue that the leader does not reply to the `ReadIndex` requests for the learner [#4653](#)
  - Fix transferring leader failures in some cases [#4684](#)
  - Fix the dirty read issue in some cases [#4688](#)
  - Fix the issue that a snapshot may lose applied data in some cases [#4716](#)
- Coprocessor
  - Add more RPN functions
    - \* `LogicalOr` [#4691](#)

- \* `LTReal` [#4602](#)
- \* `LEReal` [#4602](#)
- \* `GTReal` [#4602](#)
- \* `GEReal` [#4602](#)
- \* `NEReal` [#4602](#)
- \* `EQReal` [#4602](#)
- \* `IsNull` [#4720](#)
- \* `IsTrue` [#4720](#)
- \* `IsFalse` [#4720](#)
- \* Support comparison arithmetic for `Int` [#4625](#)
- \* Support comparison arithmetic for `Decimal` [#4625](#)
- \* Support comparison arithmetic for `String` [#4625](#)
- \* Support comparison arithmetic for `Time` [#4625](#)
- \* Support comparison arithmetic for `Duration` [#4625](#)
- \* Support comparison arithmetic for `Json` [#4625](#)
- \* Support plus arithmetic for `Int` [#4733](#)
- \* Support plus arithmetic for `Real` [#4733](#)
- \* Support plus arithmetic for `Decimal` [#4733](#)
- \* Support MOD functions for `Int` [#4727](#)
- \* Support MOD functions for `Real` [#4727](#)
- \* Support MOD functions for `Decimal` [#4727](#)
- \* Support minus arithmetic for `Int` [#4746](#)
- \* Support minus arithmetic for `Real` [#4746](#)
- \* Support minus arithmetic for `Decimal` [#4746](#)

### 16.19.23.5 Tools

- TiDB Binlog
  - Add a metric to track the delay of data replication downstream [#594](#)
- TiDB Lightning
  - Support merging sharded databases and tables [#95](#)
  - Add the retry mechanism for KV write failure [#176](#)
  - Update the default value of `table-concurrency` to 6 [#175](#)
  - Reduce required configuration items by automatically discovering `tidb.pd-addr` and `tidb.port` if they are not provided [#173](#)

### 16.19.24 TiDB 3.0.0-rc.1 Release Notes

Release Date: May 10, 2019

TiDB version: 3.0.0-rc.1

TiDB Ansible version: 3.0.0-rc.1

### 16.19.24.1 Overview

On May 10, 2019, TiDB 3.0.0-rc.1 is released. The corresponding TiDB Ansible version is 3.0.0-rc.1. Compared with TiDB 3.0.0-beta.1, this release has greatly improved the stability, usability, features, the SQL optimizer, statistics, and the execution engine.

### 16.19.24.2 TiDB

- SQL Optimizer
  - Improve the accuracy of cost estimates by using order correlation between columns; introduce a heuristic parameter `tidb_opt_correlation_exp_factor` to control the preference for index scans for scenarios when correlation cannot be directly used for estimation. [#9839](#)
  - Match more prefix columns of the indexes when extracting access conditions of composite indexes if there are relevant columns in the filter [#10053](#)
  - Use the dynamic programming algorithm to specify the execution order of join operations when the number of tables participating in the join is less than the value of `tidb_opt_join_reorder_threshold`. [#8816](#)
  - Match more prefix columns of the indexes in the inner tables that build the index join when using composite indexes as the access conditions [#8471](#)
  - Improve the accuracy of row count estimation for single-column indexes with NULL values [#9474](#)
  - Specially handle `GROUP_CONCAT` when eliminating aggregate functions during the logical optimization phase to prevent incorrect executions [#9967](#)
  - Properly push the filter down to child nodes of the join operator if the filter is a constant [#9848](#)
  - Specially handle some functions such as `RAND()` when pruning columns during the logical optimization phase to prevent incompatibilities with MySQL [#10064](#)
  - Support `FAST ANALYZE`, which speeds up statistics collection by sampling the region instead of scanning the entire region. This feature is controlled by the variable `tidb_enable_fast_analyze`. [#10258](#)
  - Support SQL Plan Management, which ensures execution stability by performing execution plan binding for SQL statements. This feature is currently in beta and only supports bound execution plans for `SELECT` statements. It is not recommended to use it in the production environment. [#10284](#)
- Execution Engine
  - Support tracking and controlling memory usage in three operators - `TableReader`, `IndexReader` and `IndexLookupReader` [#10003](#)
  - Support showing more information about coprocessor tasks in the slow log such as the number of tasks in coprocessor, the average/longest/90% of execution/waiting time and the addresses of the TiKVs which take the longest execution time or waiting time [#10165](#)
  - Support the prepared DDL statements with no placeholders [#10144](#)

- Server
  - Only allow the DDL owner to execute bootstrap when TiDB is started [#10029](#)
  - Add the variable `tidb_skip_isolation_level_check` to prevent TiDB from reporting errors when setting the transaction isolation level to `SERIALIZABLE` [#10065](#)
  - Merge the implicit commit time and the SQL execution time in the slow log [#10294](#)
    - \* Support for SQL Roles (RBAC Privilege Management)
    - \* Support `SHOW GRANT` [#10016](#)
    - \* Support `SET DEFAULT ROLE` [#9949](#)
  - Support `GRANT ROLE` [#9721](#)
  - Fix the `ConnectionEvent` error from the `whitelist` plugin that makes TiDB exit [#9889](#)
  - Fix the issue of mistakenly adding read-only statements to the transaction history [#9723](#)
  - Improve `kill` statements to stop SQL execution and release resources more quickly [#9844](#)
  - Add a startup option `config-check` to check the validity of the configuration file [#9855](#)
  - Fix the validity check of inserting `NULL` fields when the strict SQL mode is disabled [#10161](#)
- DDL
  - Add the `pre_split_regions` option for `CREATE TABLE` statements; this option supports pre-splitting the Table Region when creating a table to avoid write hot spots caused by lots of writes after the table creation [#10138](#)
  - Optimize the execution performance of some DDL statements [#10170](#)
  - Add the warning that full-text indexes are not supported for `FULLTEXT KEY` [#9821](#)
  - Fix the compatibility issue for the `UTF8` and `UTF8MB4` charsets in the old versions of TiDB [#9820](#)
  - Fix the potential bug in `shard_row_id_bits` of a table [#9868](#)
  - Fix the bug that the column charset is not changed after the table charset is changed [#9790](#)
  - Fix a potential bug in `SHOW COLUMN` when using `BINARY/BIT` as the column default value [#9897](#)
  - Fix the compatibility issue in displaying `CHARSET/COLLATION` descriptions in the `SHOW FULL COLUMNS` statement [#10007](#)
  - Fix the issue that the `SHOW COLLATIONS` statement only lists collations supported by TiDB [#10186](#)

### 16.19.24.3 PD

- Upgrade ETCD [#1452](#)

- Unify the log format of etcd and PD server
- Fix the issue of failing to elect Leader by PreVote
- Support fast dropping the “propose” and “read” requests that are to fail to avoid blocking the subsequent requests
- Fix the deadlock issue of Lease
- Fix the issue that a hot store makes incorrect statistics of keys [#1487](#)
- Support forcibly rebuilding a PD cluster from a single PD node [#1485](#)
- Fix the issue that `regionScatterer` might generate an invalid `OperatorStep` [#1482](#)
- Fix the too short timeout issue of the `MergeRegion` operator [#1495](#)
- Support giving high priority to hot region scheduling [#1492](#)
- Add the metrics for recording the time of handling TSO requests on the PD server side [#1502](#)
- Add the corresponding Store ID and Address to the metrics related to the store [#1506](#)
- Support the `GetOperator` service [#1477](#)
- Fix the issue that the error cannot be sent in the Heartbeat stream because the store cannot be found [#1521](#)

#### 16.19.24.4 TiKV

- Engine
  - Fix the issue that may cause incorrect statistics on read traffic [#4436](#)
  - Fix the issue that may cause prefix extractor panic when deleting a range [#4503](#)
  - Optimize memory management to reduce memory allocation and copying for `Iterator Key Bound Option` [#4537](#)
  - Fix the issue that failing to consider learner log gap may in some cases cause panic [#4559](#)
  - Support `block cache` sharing among different `column families` [#4612](#)
- Server
  - Reduce context switch overhead of `batch commands` [#4473](#)
  - Check the validity of seek iterator status [#4470](#)
- RaftStore
  - Support configurable properties `index distance` [#4517](#)
- Coprocessor
  - Add batch index scan executor [#4419](#)
  - Add vectorized evaluation framework [#4322](#)
  - Add execution summary framework for batch executors [#4433](#)
  - Check the maximum column when constructing the RPN expression to avoid invalid column offset that may cause evaluation panic [#4481](#)
  - Add `BatchLimitExecutor` [#4469](#)

- Replace the original `futures-cpool` with `tokio-threadpool` in `ReadPool` to reduce context switch [#4486](#)
  - Add batch aggregation framework [#4533](#)
  - Add `BatchSelectionExecutor` [#4562](#)
  - Add batch aggregation function `AVG` [#4570](#)
  - Add RPN function `LogicalAnd` [#4575](#)
- Misc
    - Support `tcmalloc` as a memory allocator [#4370](#)

#### 16.19.24.5 Tools

- TiDB Binlog
  - Fix the replication abortion issue when binlog data for the primary key column of unsigned int type is negative [#573](#)
  - Provide no compression option when downstream is `pb`; modify the downstream name from `pb` to `file` [#559](#)
  - Add the `storage.sync-log` configuration item in Pump that allows asynchronous flush on local storage [#509](#)
  - Support traffic compression for communications between Pump and Drainer [#495](#)
  - Add the `syncer.sql-mode` configuration item in Drainer to support parsing DDL queries in different sql-mode [#511](#)
  - Add the `syncer.ignore-table` configuration item to support filtering out tables that do not require replication [#520](#)
- Lightning
  - Use row IDs or default column values to populate the column data missed in the dump file [#170](#)
  - Fix the bug in Importer that import success may still be returned even if part of the SST failed to be imported [#4566](#)
  - Support speed limit in Importer when uploading SST to TiKV [#4412](#)
  - Support importing tables by size to reduce impacts on the cluster brought by Checksum and Analyze for big tables, and improve the success rate for Checksum and Analyze [#156](#)
  - Improve Lightning's SQL encoding performance by 50% by directly parsing data source file as `types.Datum` of TiDB and saving extra parsing overhead from the KV encoder [#145](#)
  - Change log format to [Unified Log Format](#) [#162](#)
  - Add some command line options for use when the configuration file is missing [#157](#)
- sync-diff-inspector
  - Support checkpoint to record verification status and continue the verification from last saved point after restarting [#224](#)

- Add the `only-use-checksum` configuration item to check data consistency by calculating checksum [#215](#)

#### 16.19.24.6 TiDB Ansible

- Support more TiKV monitoring panels and update versions for Ansible, Grafana, and Prometheus [#727](#)
  - Summary dashboard for viewing cluster status
  - `trouble_shooting` dashboard for troubleshooting issues
  - Details dashboard for developers to analyze issues
- Fix the bug that causes the downloading failure of TiDB Binlog of Kafka version [#730](#)
- Modify version limits on supported operating systems as CentOS 7.0+ and later, and Red Hat 7.0 and later [#733](#)
- Change version detection mode during the rolling update to multi-concurrent [#736](#)
- Update documentation links in README [#740](#)
- Remove redundant TiKV monitoring metrics; add new metrics for troubleshooting [#735](#)
- Optimize `table-regions.py` script to display leader distribution by table [#739](#)
- Update configuration file for Drainer [#745](#)
- Optimize TiDB monitoring with new panels that display latencies by SQL categories [#747](#)
- Update the Lightning configuration file and add the `tidb_lightning_ctl` script [#1e946f8](#)

#### 16.19.25 TiDB 3.0.0 Beta.1 Release Notes

Release Date: March 26, 2019

TiDB version: 3.0.0-beta.1

TiDB Ansible version: 3.0.0-beta.1

##### 16.19.25.1 Overview

On March 26, 2019, TiDB 3.0.0 Beta.1 is released. The corresponding TiDB Ansible version is 3.0.0 Beta.1. Compared with TiDB 3.0.0 Beta, this release has greatly improved the stability, usability, features, the SQL optimizer, statistics, and the execution engine.

##### 16.19.25.2 TiDB

- SQL Optimizer
  - Support calculating the Cartesian product by using `Sort Merge Join` [#9032](#)

- Support Skyline Pruning, with some rules to prevent the execution plan from relying too heavily on statistics [#9337](#)
- Support Window Functions
  - \* NTILE [#9682](#)
  - \* LEAD and LAG [#9672](#)
  - \* PERCENT\_RANK [#9671](#)
  - \* NTH\_VALUE [#9596](#)
  - \* CUME\_DIST [#9619](#)
  - \* FIRST\_VALUE and LAST\_VALUE [#9560](#)
  - \* RANK and DENSE\_RANK [#9500](#)
  - \* RANGE FRAMED [#9450](#)
  - \* ROW FRAMED [#9358](#)
  - \* ROW NUMBER [#9098](#)
- Add a type of statistic that indicates the order correlation between columns and the handle column [#9315](#)
- SQL Execution Engine
  - Add built-in functions
    - \* JSON\_QUOTE [#7832](#)
    - \* JSON\_ARRAY\_APPEND [#9609](#)
    - \* JSON\_MERGE\_PRESERVE [#8931](#)
    - \* BENCHMARK [#9252](#)
    - \* COALESCE [#9087](#)
    - \* NAME\_CONST [#9261](#)
  - Optimize the Chunk size based on the query context, to reduce the execution time of SQL statements and resources consumption of the cluster [#6489](#)
- Privilege management
  - Support SET ROLE and CURRENT\_ROLE [#9581](#)
  - Support DROP ROLE [#9616](#)
  - Support CREATE ROLE [#9461](#)
- Server
  - Add the /debug/zip HTTP interface to get information of the current TiDB instance [#9651](#)
  - Support the show pump status and show drainer status SQL statements to check the Pump or Drainer status [#9456](#)
  - Support modifying the Pump or Drainer status by using SQL statements [#9789](#)
  - Support adding HASH fingerprints to SQL text for easy tracking of slow SQL statements [#9662](#)
  - Add the log\_bin system variable (“0” by default) to control the enabling state of binlog; only support checking the state currently [#9343](#)
  - Support managing the sending binlog strategy by using the configuration file [#9864](#)

- Support querying the slow log by using the `INFORMATION_SCHEMA.SLOW_QUERY` memory table [#9290](#)
- Change the MySQL version displayed in TiDB from 5.7.10 to 5.7.25 [#9553](#)
- Unify the `log format` for easy collection and analysis by tools
- Add the `high_error_rate_feedback_total` monitoring item to record the difference between the actual data volume and the estimated data volume based on statistics [#9209](#)
- Add the QPS monitoring item in the database dimension, which can be enabled by using a configuration item [#9151](#)
- DDL
  - Add the `ddl_error_count_limit` global variable (“512” by default) to limit the number of DDL task retries (If this number exceeds the limit, the DDL task is canceled) [#9295](#)
  - Support `ALTER ALGORITHM INPLACE/INSTANT` [#8811](#)
  - Support the `SHOW CREATE VIEW` statement [#9309](#)
  - Support the `SHOW CREATE USER` statement [#9240](#)

### 16.19.25.3 PD

- Unify the `log format` for easy collection and analysis by tools
- Simulator
  - Support different heartbeat intervals in different stores [#1418](#)
  - Add a case about importing data [#1263](#)
- Make hotspot scheduling configurable [#1412](#)
- Add the store address as the dimension monitoring item to replace the previous Store ID [#1429](#)
- Optimize the `GetStores` overhead to speed up the Region inspection cycle [#1410](#)
- Add an interface to delete the Tombstone Store [#1472](#)

### 16.19.25.4 TiKV

- Optimize the Coprocessor calculation execution framework and implement the TableScan section, with the Single TableScan performance improved by 5% ~ 30%
  - Implement the definition of the `BatchRows` row and the `BatchColumn` column [#3660](#)
  - Implement `VectorLike` to support accessing encoded and decoded data in the same way [#4242](#)
  - Define the `BatchExecutor` to interface and implement the way of converting requests to `BatchExecutor` [#4243](#)
  - Implement transforming the expression tree into the RPN format [#4329](#)

- Implement the `BatchTableScanExecutor` vectorization operator to accelerate calculation [#4351](#)
- Unify the [log format](#) for easy collection and analysis by tools
- Support using the Local Reader to read in the Raw Read interface [#4222](#)
- Add metrics about configuration information [#4206](#)
- Add metrics about key exceeding bound [#4255](#)
- Add an option to control panic or return an error when encountering the key exceeding bound error [#4254](#)
- Add support for the INSERT operation, make prewrite succeed only when keys do not exist, and eliminate `Batch Get` [#4085](#)
- Use more fair batch strategy in the Batch System [#4200](#)
- Support Raw scan in `tikv-ctl` [#3825](#)

### 16.19.25.5 Tools

- TiDB Binlog
  - Add the Arbiter tool that supports reading binlog from Kafka and replicate the data into MySQL
  - Support filtering files that do not need to be replicated
  - Support replicating generated columns
- Lightning
  - Support disabling TiKV periodic Level-1 compaction, and when the TiKV cluster version is 2.1.4 or later, Level-1 compaction is automatically executed in the import mode [#119](#), [#4199](#)
  - Add the `table_concurrency` configuration item to limit the number of import engines (“16” by default) and avoid overusing the importer disk space [#119](#)
  - Support saving the intermediate state SST to the disk, to reduce memory usage [#4369](#)
  - Optimize the import performance of TiKV-Importer and support separate import of data and indexes for large tables [#132](#)
  - Support importing CSV files [#111](#)
- Data replication comparison tool (`sync-diff-inspector`)
  - Support using TiDB statistics to split chunks to be compared [#197](#)
  - Support using multiple columns to split chunks to be compared [#197](#)

### 16.19.26 TiDB 3.0 Beta Release Notes

On January 19, 2019, TiDB 3.0 Beta is released. The corresponding TiDB Ansible 3.0 Beta is also released. TiDB 3.0 Beta builds on TiDB 2.1 with an added focus in stability, the SQL optimizer, statistics, and the execution engine.

### 16.19.26.1 TiDB

- New Features
  - Support Views
  - Support Window Functions
  - Support Range Partitioning
  - Support Hash Partitioning
- SQL Optimizer
  - Re-support the optimization rule of `AggregationElimination` [#7676](#)
  - Optimize the `NOT EXISTS` subquery and convert it to Anti Semi Join [#7842](#)
  - Add the `tidb_enable_cascades_planner` variable to support the new Cascades optimizer. Currently, the Cascades optimizer is not yet fully implemented and is turned off by default [#7879](#)
  - Support using Index Join in transactions [#7877](#)
  - Optimize the constant propagation on the Outer Join, so that the filtering conditions related to the Outer table in the Join result can be pushed down through the Outer Join to the Outer table, reducing the useless calculation of the Outer Join and improving the execution performance [#7794](#)
  - Adjust the optimization rule of Projection Elimination to the position after the Aggregation Elimination, to avoid redundant `Project` operators [#7909](#)
  - Optimize the `IFNULL` function and eliminate this function when the input parameter has a non-NULL attribute [#7924](#)
  - Support Range for `_tidb_rowid` construction queries, to avoid full table scan and reduce cluster stress [#8047](#)
  - Optimize the `IN` subquery to do the Inner Join after the aggregation, and add the `tidb_opt_insubq_to_join_and_agg` variable to control whether to enable this optimization rule and open it by default [#7531](#)
  - Support using subqueries in the `DO` statement [#8343](#)
  - Add the optimization rule of Outer Join elimination to reduce unnecessary table scan and Join operations and improve execution performance [#8021](#)
  - Modify the Hint behavior of the `TIDB_INLJ` optimizer, and the optimizer will use the table specified in Hint as the Inner table of Index Join [#8243](#)
  - Use `PointGet` in a wide range so that it can be used when the execution plan cache of the `Prepare` statement takes effect [#8108](#)
  - Introduce the greedy `Join Reorder` algorithm to optimize the join order selection when joining multiple tables [#8394](#)
  - Support View [#8757](#)
  - Support Window Function [#8630](#)
  - Return warning to the client when `TIDB_INLJ` is not in effect, to enhance usability [#9037](#)
  - Support deducing the statistics for filtered data based on filtering conditions and table statistics [#7921](#)
  - Improve the Partition Pruning optimization rule of Range Partition [#8885](#)

- SQL Executor
  - Optimize the Merge Join operator to support the empty ON condition [#9037](#)
  - Optimize the log and print the user variables used when executing the EXECUTE statement [#7684](#)
  - Optimize the log to print slow query information for the COMMIT statement [#7951](#)
  - Support the EXPLAIN ANALYZE feature to make the SQL tuning process easier [#7827](#)
  - Optimize the write performance of wide tables with many columns [#7935](#)
  - Support admin show next\_row\_id [#8242](#)
  - Add the tidb\_init\_chunk\_size variable to control the size of the initial Chunk used by the execution engine [#8480](#)
  - Improve shard\_row\_id\_bits and cross-check the auto-increment ID [#8936](#)
- Prepare Statement
  - Prohibit adding the Prepare statement containing subqueries to the query plan cache to guarantee the query plan is correct when different user variables are input [#8064](#)
  - Optimize the query plan cache to guarantee the plan can be cached when the statement contains non-deterministic functions [#8105](#)
  - Optimize the query plan cache to guarantee the query plan of DELETE/UPDATE  $\leftrightarrow$  /INSERT can be cached [#8107](#)
  - Optimize the query plan cache to remove the corresponding plan when executing the DEALLOCATE statement [#8332](#)
  - Optimize the query plan cache to avoid the TiDB OOM issue caused by caching too many plans by limiting the memory usage [#8339](#)
  - Optimize the Prepare statement to support using the ? placeholder in the ORDER  $\leftrightarrow$  BY/GROUP BY/LIMIT clause [#8206](#)
- Privilege Management
  - Add the privilege check for the ANALYZE statement [#8486](#)
  - Add the privilege check for the USE statement [#8414](#)
  - Add the privilege check for the SET GLOBAL statement [#8837](#)
  - Add the privilege check for the SHOW PROCESSLIST statement [#7858](#)
- Server
  - Support the Trace feature [#9029](#)
  - Support the plugin framework [#8788](#)
  - Support using unix\_socket and TCP simultaneously to connect to the database [#8836](#)
  - Support the interactive\_timeout system variable [#8573](#)
  - Support the wait\_timeout system variable [#8346](#)
  - Support splitting a transaction into multiple transactions based on the number of statements using the tidb\_batch\_commit variable [#8293](#)
  - Support using the ADMIN SHOW SLOW statement to check slow logs [#7785](#)

- Compatibility
  - Support the `ALLOW_INVALID_DATES` SQL mode [#9027](#)
  - Improve `LoadData` fault-tolerance for the CSV file [#9005](#)
  - Support the MySQL 320 handshake protocol [#8812](#)
  - Support using the unsigned `bigint` column as the auto-increment column [#8181](#)
  - Support the `SHOW CREATE DATABASE IF NOT EXISTS` syntax [#8926](#)
  - Abandon the predicate pushdown operation when the filtering condition contains a user variable to improve the compatibility with MySQL's behavior of using user variables to mock the Window Function behavior [#8412](#)
- DDL
  - Support fast recovery of mistakenly deleted tables [#7937](#)
  - Support adjusting the number of concurrencies of `ADD INDEX` dynamically [#8295](#)
  - Support changing the character set of tables or columns to `utf8/utf8mb4` [#8037](#)
  - Change the default character set from `utf8` to `utf8mb4` [#7965](#)
  - Support Range Partition [#8011](#)

#### 16.19.26.2 Tools

- TiDB Lightning
  - Speed up converting SQL statements to KV pairs remarkably [#110](#)
  - Support batch import for a single table to improve import performance and stability [#113](#)

#### 16.19.26.3 PD

- Add `RegionStorage` to store Region metadata separately [#1237](#)
- Add shuffle hot Region scheduler [#1361](#)
- Add scheduling parameter related metrics [#1406](#)
- Add cluster label related metrics [#1402](#)
- Add the importing data simulator [#1263](#)
- Fix the `Watch` issue about leader election [#1396](#)

#### 16.19.26.4 TiKV

- Support distributed GC [#3179](#)
- Check RocksDB Level 0 files before applying snapshots to avoid Write Stall [#3606](#)
- Support reverse `raw_scan` and `raw_batch_scan` [#3742](#)
- Support using HTTP to obtain monitoring information [#3855](#)
- Support DST better [#3786](#)
- Support receiving and sending Raft messages in batch [#3931](#)
- Introduce a new storage engine Titan [#3985](#)

- Upgrade gRPC to v1.17.2 [#4023](#)
- Support receiving the client requests and sending replies in batch [#4043](#)
- Support multi-thread Apply [#4044](#)
- Support multi-thread Raftstore [#4066](#)

## 16.20 v2.1

### 16.20.1 TiDB 2.1.19 Release Notes

Release date: December 27, 2019

TiDB version: 2.1.19

TiDB Ansible version: 2.1.19

#### 16.20.1.1 TiDB

- SQL Optimizer
  - Optimize the scenario of `select max(_tidb_rowid)from t` to avoid full table scan [#13294](#)
  - Fix the incorrect results caused by the incorrect value assigned to the user variable in the query and the push-down of predicates [#13230](#)
  - Fix the issue that the statistics are not accurate because a data race occurs when statistics are updated [#13690](#)
  - Fix the issue that the result is incorrect when the `UPDATE` statement contains both a sub-query and a stored generated column; fix the `UPDATE` statement execution error when this statement contains two same-named tables from different databases [#13357](#)
  - Fix the issue that the query plan might be incorrectly selected because the `PhysicalUnionScan` operator incorrectly sets the statistics [#14134](#)
  - Remove the `minAutoAnalyzeRatio` constraint to make the automatic `ANALYZE` more timely [#14013](#)
  - Fix the issue that the estimated number of rows is greater than 1 when the `WHERE` clause contains an equal condition on the unique key [#13385](#)
- SQL Execution Engine
  - Fix the precision overflow when using `int64` as the intermediate result of `unit64` in `ConvertJSONToInt` [#13036](#)
  - Fix the issue that when the `SLEEP` function is in a query (for example, `select ↵ 1 from (select sleep(1))t;`), column pruning causes `sleep(1)` in the query to be invalid [#13039](#)
  - Reduce memory overhead by reusing `Chunk` in the `INSERT ON DUPLICATE UPDATE` statement [#12999](#)
  - Add more transaction-related fields for the `slow_query` table [#13129](#):

- \* `Prewrite_time`
  - \* `Commit_time`
  - \* `Get_commit_ts_time`
  - \* `Commit_backoff_time`
  - \* `Backoff_types`
  - \* `Resolve_lock_time`
  - \* `Local_latch_wait_time`
  - \* `Write_key`
  - \* `Write_size`
  - \* `Prewrite_region`
  - \* `Txn_retry`
- Fix the issue that a subquery contained in an `UPDATE` statement is incorrectly converted; fix the `UPDATE` execution failure when the `WHERE` clause contains a subquery [#13120](#)
  - Support executing `ADMIN CHECK TABLE` on partitioned tables [#13143](#)
  - Fix the issue that the precision of statements such as `SHOW CREATE TABLE` is incomplete when `ON UPDATE CURRENT_TIMESTAMP` is used as a column attribute and floating point precision is specified [#12462](#)
  - Fix the panic occurred when executing the `SELECT * FROM information_schema ↪ .KEY_COLUMN_USAGE` statement because the foreign key is not checked when dropping, modifying or changing the column [#14162](#)
  - Fix the issue that the returned data might be duplicated when `Streaming` is enabled in TiDB [#13255](#)
  - Fix the `Invalid time format` error caused by daylight saving time [#13624](#)
  - Fix the issue that data is incorrect because the precision is lost when an integer is converted to an unsigned floating point or decimal type [#13756](#)
  - Fix the issue that an incorrect type of value is returned when the `Quote` function handles the `NULL` value [#13681](#)
  - Fix the issue that the timezone is incorrect after parsing the date from strings using `gotime.Local` [#13792](#)
  - Fix the issue that the result might be incorrect because the `binSearch` function does not return an error in the implementation of `builtinIntervalRealSig` [#13768](#)
  - Fix the issue that an error might occur when converting the string type to the floating point type in the `INSERT` statement execution [#14009](#)
  - Fix the incorrect result returned from the `sum(distinct)` function [#13041](#)
  - Fix the issue that `data too long` is returned when `CAST` converting the data in `union` of the same location to the merged type because the returned type length of the `jsonUnquoteFunction` function is given an incorrect value [#13645](#)
  - Fix the issue that the password cannot be set because the privilege check is too strict [#13805](#)
- Server
    - Fix the issue that `KILL CONNECTION` might cause the goroutine leak [#13252](#)

- Support getting the binlog status of all TiDB nodes via the `info/all` interface of the HTTP API [#13188](#)
- Fix the failure to build the TiDB project on Windows [#13650](#)
- Add the `server-version` configuration item to control and modify the version of TiDB server [#13904](#)
- Fix the issue that the binary `plugin` compiled with Go1.13 does not run normally [#13527](#)
- DDL
  - Use the table's `COLLATE` instead of the system's default charset in the column when a table is created and the table contains `COLLATE` [#13190](#)
  - Limit the length of the index name when creating a table [#13311](#)
  - Fix the issue that the length of the table name is not checked when renaming a table [#13345](#)
  - Check the width range of the `BIT` column [#13511](#)
  - Make the error information output from `change/modify column` more understandable [#13798](#)
  - Fix the issue that when executing the `drop column` operation that has not yet been handled by the downstream Drainer, the downstream might receive DML operations without the affected column [#13974](#)

#### 16.20.1.2 TiKV

- Raftstore
  - Fix the panic occurred when restarting TiKV and `is_merging` is given an incorrect value in the process of merging Regions and applying the Compact log [#5884](#)
- Importer
  - Remove the limit on the gRPC message length [#5809](#)

#### 16.20.1.3 PD

- Improve the performance of the HTTP API for getting all Regions [#1988](#)
- Upgrade etcd to fix the issue that etcd PreVote cannot elect a leader (downgrade not supported) [#2052](#)

#### 16.20.1.4 Tools

- TiDB Binlog
  - Optimize the node status information output through `binlogctl` [#777](#)

- Fix the panic occurred because of the `nil` value in the Drainer filter configuration [#802](#)
- Optimize the `Graceful` exit of Pump [#825](#)
- Add more detailed monitoring metrics when Pump writes binlog data [#830](#)
- Optimize Drainer's logic to refresh table information after Drainer has executed a DDL operation [#836](#)
- Fix the issue that the commit binlog of a DDL operation is ignored when Pump does not receive this binlog [#855](#)

### 16.20.1.5 TiDB Ansible

- Rename the `Uncommon Error OPM` monitoring item of TiDB service to `Write Binlog`  
↔ `Error` and add the corresponding alert message [#1038](#)
- Upgrade TiSpark to 2.1.8 [#1063](#)

## 16.20.2 TiDB 2.1.18 Release Notes

Release date: November 4, 2019

TiDB version: 2.1.18

TiDB Ansible version: 2.1.18

### 16.20.2.1 TiDB

- SQL Optimizer
  - Fix the issue that invalid query ranges might appear when split by feedback [#12172](#)
  - Fix the issue that the privilege check is incorrect in point get plan [#12341](#)
  - Optimize execution performance of the `select ... limit ... offset ...` statement by pushing the Limit operator down to the `IndexLookUpReader` execution logic [#12380](#)
  - Support using parameters in `ORDER BY`, `GROUP BY` and `LIMIT OFFSET` [#12514](#)
  - Fix the issue that `IndexJoin` on the partition table returns incorrect results [#12713](#)
  - Fix the issue that the `str_to_date` function in TiDB returns a different result from MySQL when the date string and the format string do not match [#12757](#)
  - Fix the issue that outer join is incorrectly converted to inner join when the `cast` function is included in the query conditions [#12791](#)
  - Fix incorrect expression passing in the join condition of `AntiSemiJoin` [#12800](#)
- SQL Engine
  - Fix the incorrectly rounding of time (for example, `2019-09-11 11:17:47.999999666` ↔ should be rounded to `2019-09-11 11:17:48`) [#12259](#)

- Fix the issue that the duration by `sql_type` for the `PREPARE` statement is not shown in the monitoring record [#12329](#)
  - Fix the panic issue when the `from_unixtime` function handles null [#12572](#)
  - Fix the compatibility issue that when an invalid value is inserted as the `YEAR` type, the result is `NULL` instead of `0000` [#12744](#)
  - Improve the behavior of the `AutoIncrement` column when it is implicitly allocated, to keep it consistent with the default mode of MySQL auto-increment locking (“consecutive” lock mode): for the implicit allocation of multiple `AutoIncrement` IDs in a single-line `Insert` statement, TiDB guarantees the continuity of the allocated values. This improvement ensures that the JDBC `getGeneratedKeys()` method will get the correct results in any scenario [#12619](#)
  - Fix the issue that the query is hanged when `HashAgg` serves as a child node of `Apply` [#12769](#)
  - Fix the issue that the `AND` and `OR` logical expressions return incorrect results when it comes to type conversion [#12813](#)
- Server
    - Fix the issue that the `SLEEP()` function is invalid for the `KILL TIDB QUERY` statements [#12159](#)
    - Fix the issue that no error is reported when `AUTO_INCREMENT` incorrectly allocates `MAX int64` and `MAX uint64` [#12210](#)
    - Fix the issue that the slow query logs are not recorded when the log level is `ERROR` [#12373](#)
    - Adjust the number of times that TiDB caches schema changes and corresponding changed table information from 100 to 1024, and support modification by using the `tidb_max_delta_schema_count` system variable [#12515](#)
    - Change the query start time from the point of “starting to execute” to “starting to compile” to make SQL statistics more accurate [#12638](#)
    - Add the record of `set session autocommit` in TiDB logs [#12568](#)
    - Record SQL query start time in `SessionVars` to prevent it from being reset during plan execution [#12676](#)
    - Support `?` placeholder in `ORDER BY`, `GROUP BY` and `LIMIT OFFSET` [#12514](#)
    - Add the `Prev_stmt` field in slow query logs to output the previous statement when the last statement is `COMMIT` [#12724](#)
    - Record the last statement before `COMMIT` into the log when the `COMMIT` fails in an explicitly committed transaction [#12747](#)
    - Optimize the saving method of the previous statement when the TiDB server executes a SQL statement to improve performance [#12751](#)
    - Fix the panic issue caused by `FLUSH PRIVILEGES` statements under the `skip-grant-table=true` configuration [#12816](#)
    - Increase the default minimum step of applying `AutoID` from 1000 to 30000 to avoid performance bottleneck when there are many write requests in a short time [#12891](#)
    - Fix the issue that the failed `Prepared` statement is not print in the error log when TiDB panics [#12954](#)

- Fix the issue that the `COM_STMT_FETCH` time record in slow query logs is inconsistent with that in MySQL [#12953](#)
- Add an error code in the error message for write conflicts to quickly locate the cause [#12878](#)
- DDL
  - Disallow dropping the `AUTO INCREMENT` attribute of a column by default. Modify the value of the `tidb_allow_remove_auto_inc` variable if you do need to drop this attribute. See [System Variables](#) for more details. [#12146](#)
  - Support multiple `uniques` when creating a unique index in the `Create Table` statement [#12469](#)
  - Fix a compatibility issue that if the foreign key constraint in `CREATE TABLE` statement has no schema, schema of the created table should be used instead of returning a `No Database selected` error [#12678](#)
  - Fix the issue that the `invalid list index` error is reported when executing `ADMIN CANCEL DDL JOBS` [#12681](#)
- Monitor
  - Add types for backoff monitoring and supplement the backoff time that is not recorded before, such as the backoff time when committing [#12326](#)
  - Add a new metric to monitor `Add Index` operation progress [#12389](#)

#### 16.20.2.2 PD

- Improve the `--help` command output of `pd-ctl` [#1772](#)

#### 16.20.2.3 Tools

- TiDB Binlog
  - Fix the issue that `ALTER DATABASE` related DDL operations cause Drainer to exit abnormally [#770](#)
  - Support querying the transaction status information for Commit binlog to improve replication efficiency [#761](#)
  - Fix the issue that a Pump panic might occur when Drainer's `start_ts` is greater than Pump's largest `commit_ts` [#759](#)

#### 16.20.2.4 TiDB Ansible

- Add two monitoring items “queue size” and “query histogram” for TiDB Binlog [#952](#)
- Update TiDB alerting rules [#961](#)
- Check the configuration file before the deployment and upgrade [#973](#)
- Add a new metric to monitor index speed in TiDB [#987](#)
- Update TiDB Binlog monitoring dashboard to make it compatible with Grafana v4.6.3 [#993](#)

### 16.20.3 TiDB 2.1.17 Release Notes

Release date: September 11, 2019

TiDB version: 2.1.17

TiDB Ansible version: 2.1.17

- New features
  - Add the `WHERE` clause in TiDB's `SHOW TABLE REGIONS` syntax
  - Add the `config-check` feature in TiKV and PD to check the configuration items
  - Add the `remove-tombstone` command in `pd-ctl` to clear tombstone store records
  - Add the `worker-count` and `txn-batch` configuration items in `Reparo` to control the recovery speed
- Improvements
  - Optimize PD's scheduling process by supporting actively pushing operators
  - Optimize TiKV's starting process to reduce jitters caused by restarting nodes
- Changed behaviors
  - Change `start ts` in TiDB slow query logs from the last retry time to the first execution time
  - Replace the `Index_ids` field in TiDB slow query logs with the `Index_names` field to improve the usability of slow query logs
  - Add the `split-region-max-num` parameter in TiDB's configuration files to modify the maximum number of Regions allowed by the `SPLIT TABLE` syntax, which is increased from 1,000 to 10,000 in the default configuration

#### 16.20.3.1 TiDB

- SQL Optimizer
  - Fix the issue that the error message is not returned correctly when an error occurs during `EvalSubquery` building `Executor` [#11811](#)
  - Fix the issue that the query result might be incorrect when the number of rows in the outer table is greater than that in a single batch in `Index Lookup Join`; expand the functional scope of `Index Lookup Join`; `UnionScan` can be used as a subnode of `IndexJoin` [#11843](#)
  - Add the display of invalid keys (like `invalid encoded key flag 252`) in the `SHOW STAT_BUCKETS` syntax, for the situation where invalid keys might occur during the statistics feedback process [#12098](#)
- SQL Execution Engine
  - Fix some incorrect results (like `select cast(13835058000000000000 as double)`) caused by the number value that is first converted to `UINT` when the `CAST` function is converting the number value type [#11712](#)

- Fix the issue that the calculation result might be incorrect when the dividend of the DIV calculation is a decimal and this calculation contains a negative number [#11812](#)
  - Add the `ConvertStrToIntStrict` function to fix the MySQL incompatibility issue caused by some strings being converted to the INT type when executing the `SELECT/EXPLAIN` statement [#11892](#)
  - Fix the issue that the `Explain` result might be incorrect caused by wrong configuration of `stmtCtx` when `EXPLAIN ... FOR CONNECTION` is used [#11978](#)
  - Fix the issue that the result returned by the `unaryMinus` function is incompatible with MySQL, caused by the non-decimal result when the integer result overflows [#11990](#)
  - Fix the issue that `last_insert_id()` might be incorrect, caused by the counting order when the `LOAD DATA` statement is being executed [#11994](#)
  - Fix the issue that `last_insert_id()` might be incorrect when the user writes auto-increment column data in an explicit-implicit mixed way [#12001](#)
  - Fix an over-quoted bug for the `JSON_UNQUOTE` function: only values enclosed by double quote marks (") should be unquoted. For example, the result of “`SELECT ↪ JSON_UNQUOTE("“”)`” should be “`“`” (not changed) [#12096](#)
- Server
    - Change `start ts` recorded in slow query logs from the last retry time to the first execution time when retrying TiDB transactions [#11878](#)
    - Add the number of keys of a transaction in `LockResolver` to avoid the scan operation on the whole Region and reduce costs of resolving locking when the number of keys is reduced [#11889](#)
    - Fix the issue that the `succ` field value might be incorrect in slow query logs [#11886](#)
    - Replace the `Index_ids` filed in slow query logs with the `Index_names` field to improve the usability of slow query logs [#12063](#)
    - Fix the connection break issue caused by TiDB parsing `-` into EOF Error when `Duration` contains `-` (like `select time( '--' )`) [#11910](#)
    - Remove an invalid Region from `RegionCache` more quickly to reduce the number of requests sent to this Region [#11931](#)
    - Fix the connection break issue caused by incorrectly handling the OOM panic issue when `oom-action = "cancel"` and OOM occurs in the `Insert Into ... ↪ Select` syntax [#12126](#)
  - DDL
    - Add the reverse scan interface for `tikvSnapshot` to efficiently query DDL history jobs. After using this interface, the execution time of `ADMIN SHOW DDL JOBS` is remarkably decreased [#11789](#)
    - Improve the `CREATE TABLE ... PRE_SPLIT_REGION` syntax: change the number of pre-splitting Regions from  $2^{(N-1)}$  to  $2^N$  when `PRE_SPLIT_REGION = N` [#11797](#)

- Decrease the default parameter value for the background worker thread of the `Add Index` operation to avoid great impacts on online workloads [#11875](#)
- Improve the `SPLIT TABLE` syntax behavior: generate N data Region(s) and one index Region when `SPLIT TABLE ... REGIONS N` is used to divide Regions [#11929](#)
- Add the `split-region-max-num` parameter (10000 by default) in the configuration file to make the maximum number of Regions allowed by the `SPLIT TABLE` syntax adjustable [#12080](#)
- Fix the issue that the `CREATE TABLE` clause cannot be parsed by the downstream MySQL, caused by uncommented `PRE_SPLIT_REGIONS` in this clause when the system writes the binlog [#12121](#)
- Add the `WHERE` sub-clause in `SHOW TABLE ... REGIONS` and `SHOW TABLE ... INDEX ... REGIONS` [#12124](#)
- Monitor
  - Add the `connection_transient_failure_count` monitoring metric to count gRPC connection errors of `tikvclient` [#12092](#)

### 16.20.3.2 TiKV

- Fix the incorrect result of counting keys in a Region in some cases [#5415](#)
- Add the `config-check` option in TiKV to check whether the TiKV configuration item is valid [#5391](#)
- Optimize the starting process to reduce jitters caused by restarting nodes [#5277](#)
- Optimize the resolving locking process in some cases to speed up resolving locking for transactions [#5339](#)
- Optimize the `get_txn_commit_info` process to speed up committing transactions [#5062](#)
- Simplify Raft-related logs [#5425](#)
- Resolve the issue that TiKV exits abnormally in some cases [#5441](#)

### 16.20.3.3 PD

- Add the `config-check` option in PD to check whether the PD configuration item is valid [#1725](#)
- Add the `remove-tombstone` command in `pd-ctl` to support clearing tombstone store records [#1705](#)
- Support actively pushing operators to speed up scheduling [#1686](#)

### 16.20.3.4 Tools

- TiDB Binlog
  - Add `worker-count` and `txn-batch` configuration items in `Reparo` to control the recovery speed [#746](#)

- Optimize the memory usage of Drainer to improve the parallel execution efficiency [#735](#)
- Fix the bug that Pump cannot quit normally in some cases [#739](#)
- Optimize the processing logic of LevelDB in Pump to improve the execution efficiency of GC [#720](#)
- TiDB Lightning
  - Fix the bug that tidb-lightning might crash caused by re-importing data from the checkpoint [#239](#)

### 16.20.3.5 TiDB Ansible

- Update the Spark version to 2.4.3, and update the TiSpark version to 2.2.0 that is compatible with Spark 2.4.3 [#914](#), [#919](#)
- Fix the issue that there is a long waiting time when the remote machine password has expired [#937](#), [#948](#)

### 16.20.4 TiDB 2.1.16 Release Notes

Release date: August 15, 2019

TiDB version: 2.1.16

TiDB Ansible version: 2.1.16

#### 16.20.4.1 TiDB

- SQL Optimizer
  - Fix the issue that row count is estimated inaccurately for the equal condition on the time column [#11526](#)
  - Fix the issue that `TIDB_INLJ` Hint does not take effect or take effect on the specified table [#11361](#)
  - Change the implementation of `NOT EXISTS` in a query from `OUTER JOIN` to `ANTI JOIN` to find a more optimized execution plan [#11291](#)
  - Support subqueries within `SHOW` statements, allowing syntaxes such as `SHOW ↵ COLUMNS FROM tbl WHERE FIELDS IN (SELECT 'a')` [#11461](#)
  - Fix the issue that the `SELECT ... CASE WHEN ... ELSE NULL ...` query gets an incorrect result caused by the constant folding optimization [#11441](#)
- SQL Execution Engine
  - Fix the issue that the `DATE_ADD` function gets a wrong result when `INTERVAL` is negative [#11616](#)
  - Fix the issue that the `DATE_ADD` function might get an incorrect result because it performs type conversion wrongly when it accepts an argument of the `FLOAT`, `DOUBLE`, or `DECIMAL` type [#11628](#)

- Fix the issue that the error message is inaccurate when `CAST(JSON AS SIGNED)` overflows [#11562](#)
- Fix the issue that other child nodes are not closed when one child node fails to be closed and returns an error during the process of closing Executor [#11598](#)
- Support `SPLIT TABLE` statements that return the number of Regions that are successfully split and a finished percentage rather than an error when the scheduling is not finished for Region scatter before the timeout [#11487](#)
- Make `REGEXP BINARY` function case sensitive to be compatible with MySQL [#11505](#)
- Fix the issue that `NULL` is not returned correctly because the value of `YEAR` in the `DATE_ADD/DATE_SUB` result overflows when it is smaller than 0 or larger than 65535 [#11477](#)
- Add in the slow query table a `Succ` field that indicates whether the execution succeeds [#11412](#)
- Fix the MySQL incompatibility issue caused by fetching the current timestamp multiple times when a SQL statement involves calculations of the current time (such as `CURRENT_TIMESTAMP` or `NOW`) [#11392](#)
- Fix the issue that the `AUTO_INCREMENT` columns do not handle the `FLOAT` or `DOUBLE` type [#11389](#)
- Fix the issue that `NULL` is not returned correctly when the `CONVERT_TZ` function accepts an invalid argument [#11357](#)
- Fix the issue that an error is reported by the `PARTITION BY LIST` statement. (Currently only the syntax is supported; when TiDB executes the statement, a regular table is created and a prompting message is provided) [#11236](#)
- Fix the issue that `Mod(%)`, `Multiple(*)`, and `Minus(-)` operations return an inconsistent 0 result with that in MySQL when there are many decimal digits (such as `select 0.000 % 0.11234500000000000000`) [#11353](#)
- Server
  - Fix the issue that the plugin gets a `NULL` domain when `OnInit` is called back [#11426](#)
  - Fix the issue that the table information in a schema can still be obtained through the HTTP interface after the schema has been deleted [#11586](#)
- DDL
  - Disallow dropping indexes on auto-increment columns to avoid incorrect results of the auto-increment columns caused by this operation [#11402](#)
  - Fix the issue that the character set of the column is not correct when creating and modifying the table with different character sets and collations [#11423](#)
  - Fix the issue that the column schema might get wrong when `alter table ...` `↔ set default...` and another DDL statement that modifies this column are executed in parallel [#11374](#)
  - Fix the issue that data fails to be backfilled when Generated Column A depends on Generated Column B and A is used to create an index [#11538](#)
  - Speed up `ADMIN CHECK TABLE` operations [#11538](#)

#### 16.20.4.2 TiKV

- Support returning an error message when the client accesses a TiKV Region that is being closed [#4820](#)
- Support reverse `raw_scan` and `raw_batch_scan` interfaces [#5148](#)

#### 16.20.4.3 Tools

- TiDB Binlog
  - Add the `ignore-txn-commit-ts` configuration item in Drainer to skip executing some statements in a transaction [#697](#)
  - Add the configuration item check on startup, which stops Pump and Drainer from running and returns an error message when meeting invalid configuration items [#708](#)
  - Add the `node-id` configuration in Drainer to specify Drainer's node ID [#706](#)
- TiDB Lightning
  - Fix the issue that `tikv_gc_life_time` fails to be changed back to its original value when 2 checksums are running at the same time [#224](#)

#### 16.20.4.4 TiDB Ansible

- Add the `log4j` configuration file in Spark [#842](#)
- Update the `tispark` jar package to v2.1.2 [#863](#)
- Fix the issue that the Prometheus configuration file is generated in the wrong format when TiDB Binlog uses Kafka or ZooKeeper [#845](#)
- Fix the bug that PD fails to switch the Leader when executing the `rolling_update`.  
↪ `yml` operation [#888](#)
- Optimize the logic of rolling updating PD nodes - upgrade Followers first and then the Leader - to improve stability [#895](#)

#### 16.20.5 TiDB 2.1.15 Release Notes

Release date: July 16, 2019

TiDB version: 2.1.15

TiDB Ansible version: 2.1.15

### 16.20.5.1 TiDB

- Fix the issue that the `DATE_ADD` function returns wrong results due to incorrect alignment when dealing with microseconds [#11289](#)
- Fix the issue that an error is reported when the empty value in the string column is compared with `FLOAT` or `INT` [#11279](#)
- Fix the issue that the `INSERT` function fails to correctly return the `NULL` value when a parameter is `NULL` [#11249](#)
- Fix the issue that an error occurs when indexing the column of the non-string type and 0 length [#11215](#)
- Add the `SHOW TABLE REGIONS` statement to query the Region distribution of a table through SQL statements [#11238](#)
- Fix the issue that an error is reported when using the `UPDATE ... SELECT` statement because the projection elimination is used to optimize rules in the `SELECT` subqueries [#11254](#)
- Add the `ADMIN PLUGINS ENABLE/ADMIN PLUGINS DISABLE` SQL statement to dynamically enable or disable plugins [#11189](#)
- Add the session connection information in the Audit plugin [#11189](#)
- Fix the panic issue that happens when a column is queried on multiple times and the returned result is `NULL` during point queries [#11227](#)
- Add the `tidb_scatter_region` configuration item to scatter table Regions when creating a table [#11213](#)
- Fix the data race issue caused by non-thread safe `rand.Rand` when using the `RAND` function [#11170](#)
- Fix the issue that the comparison result of integers and non-integers is incorrect in some cases [#11191](#)
- Support modifying the collation of a database or a table, but the character set of the database/table has to be `UTF-8` or `utf8mb4` [#11085](#)
- Fix the issue that the precision shown by the `SHOW CREATE TABLE` statement is incomplete when `CURRENT_TIMESTAMP` is used as the default value of the column and the float precision is specified [#11087](#)

### 16.20.5.2 TiKV

- Unify the log format [#5083](#)
- Improve the accuracy of Region's approximate size or keys in extreme cases to improve the accuracy of scheduling [#5085](#)

### 16.20.5.3 PD

- Unify the log format [#1625](#)

#### 16.20.5.4 Tools

##### TiDB Binlog

- Optimize the Pump GC strategy and remove the restriction that the unconsumed binlog cannot be cleaned to make sure that the resources are not occupied for a long time [#663](#)

##### TiDB Lightning

- Fix the import error that happens when the column names specified by the SQL dump are not in lowercase [#210](#)

#### 16.20.5.5 TiDB Ansible

- Add the `parse duration` and `compile duration` monitoring items in TiDB Dashboard to monitor the time that it takes to parse SQL statements and execute compilation [#815](#)

#### 16.20.6 TiDB 2.1.14 Release Notes

Release date: July 04, 2019

TiDB version: 2.1.14

TiDB Ansible version: 2.1.14

##### 16.20.6.1 TiDB

- Fix wrong query results caused by column pruning in some cases [#11019](#)
- Fix the wrongly displayed information in `db` and `info` columns of `show processlist` [#11000](#)
- Fix the issue that `MAX_EXECUTION_TIME` as a SQL hint and global variable does not work in some cases [#10999](#)
- Support automatically adjust the incremental gap allocated by auto-increment ID based on the load [#10997](#)
- Fix the issue that the `Distsql` memory information of `MemTracker` is not correctly cleaned when a query ends [#10971](#)
- Add the `MEM` column in the `information_schema.processlist` table to describe the memory usage of a query [#10896](#)
- Add the `max_execution_time` global system variable to control the maximum execution time of a query [#10940](#)
- Fix the panic caused by using unsupported aggregate functions [#10911](#)
- Add an automatic rollback feature for the last transaction when the `load data` statement fails [#10862](#)

- Fix the issue that TiDB returns a wrong result in some cases when the `OOMAction` configuration item is set to `Cancel` [#11016](#)
- Disable the `TRACE` statement to avoid the TiDB panic issue [#11039](#)
- Add the `mysql.expr_pushdown_blacklist` system table that dynamically enables/disables pushing down specific functions to Coprocessor [#10998](#)
- Fix the issue that the `ANY_VALUE` function does not work in the `ONLY_FULL_GROUP_BY` mode [#10994](#)
- Fix the incorrect evaluation caused by not doing a deep copy when evaluating the user variable of the string type [#11043](#)

#### 16.20.6.2 TiKV

- Optimize processing the empty callback when processing the Raftstore message to avoid sending unnecessary message [#4682](#)

#### 16.20.6.3 PD

- Adjust the log output level from `Error` to `Warning` when reading an invalid configuration item [#1577](#)

#### 16.20.6.4 Tools

##### TiDB Binlog

- Reparo
  - Add the `safe-mode` configuration item, and support importing duplicated data after this item is enabled [#662](#)
- Pump
  - Add the `stop-write-at-available-space` configuration item to limit the available binlog space [#659](#)
  - Fix the issue that Garbage Collector does not work sometimes when the number of LevelDB L0 files is 0 [#648](#)
  - Optimize the algorithm of deleting log files to speed up releasing the space [#648](#)
- Drainer
  - Fix the failure to update BIT columns in the downstream [#655](#)

#### 16.20.6.5 TiDB Ansible

- Add the precheck feature for the `ansible` command and its `jmespath` and `jinja2` dependency packages [#807](#)
- Add the `stop-write-at-available-space` parameter (10 GiB by default) in Pump, and stop writing binlog files in Pump when the available disk space is less than the parameter value [#807](#)

## 16.20.7 TiDB 2.1.13 Release Notes

Release date: June 21, 2019

TiDB version: 2.1.13

TiDB Ansible version: 2.1.13

### 16.20.7.1 TiDB

- Add a feature to use `SHARD_ROW_ID_BITS` to scatter row IDs when the column contains an `AUTO_INCREMENT` attribute to relieve the hotspot issue [#10788](#)
- Optimize the lifetime of invalid DDL metadata to speed up recovering the normal execution of DDL operations after upgrading the TiDB cluster [#10789](#)
- Fix the OOM issue in high concurrent scenarios caused by the failure to quickly release Coprocessor resources, resulted from the `execdetails.ExecDetails` pointer [#10833](#)
- Add the `update-stats` configuration item to control whether to update statistics [#10772](#)
- Add the following TiDB-specific syntax to support Region presplit to solve the hotspot issue:
  - Add the `PRE_SPLIT_REGIONS` table option [#10863](#)
  - Add the `SPLIT TABLE table_name INDEX index_name` syntax [#10865](#)
  - Add the `SPLIT TABLE [table_name] BETWEEN (min_value...)AND (max_value ↪ ...)`REGIONS [region\_num] syntax [#10882](#)
- Fix the panic issue caused by the `KILL` syntax in some cases [#10879](#)
- Improve the compatibility with MySQL for `ADD_DATE` in some cases [#10718](#)
- Fix the wrong estimation for the selectivity rate of the inner table selection in index join [#10856](#)

### 16.20.7.2 TiKV

- Fix the issue that incomplete snapshots are generated in the system caused by the iterator not checking the status [#4940](#)
- Add a feature to check the validity for the `block-size` configuration [#4930](#)

### 16.20.7.3 Tools

- TiDB Binlog
  - Fix the wrong offset issue caused by Pump not checking the returned value when it fails to write data [#640](#)
  - Add the `advertise-addr` configuration in Drainer to support the bridge mode in the container environment [#634](#)

## 16.20.8 TiDB 2.1.12 Release Notes

Release date: June 13, 2019

TiDB version: 2.1.12

TiDB Ansible version: 2.1.12

### 16.20.8.1 TiDB

- Fix the issue caused by unmatched data types when using the index query feedback [#10755](#)
- Fix the issue that the blob column is changed to the text column caused by charset altering in some cases [#10745](#)
- Fix the issue that the `GRANT` operation in the transaction mistakenly reports “Duplicate Entry” in some cases [#10739](#)
- Improve the compatibility with MySQL of the following features
  - The `DAYNAME` function [#10732](#)
  - The `MONTHNAME` function [#10733](#)
  - Support the 0 value for the `EXTRACT` function when processing `MONTH` [#10702](#)
  - The `DECIMAL` type can be converted to `TIMESTAMP` or `DATETIME` [#10734](#)
- Change the column charset while changing the table charset [#10714](#)
- Fix the overflow issue when converting a decimal to a float in some cases [#10730](#)
- Fix the issue that some extremely large messages report the “grpc: received message larger than max” error caused by inconsistent maximum sizes of messages sent/received by gRPC of TiDB and TiKV [#10710](#)
- Fix the panic issue caused by `ORDER BY` not filtering `NULL` in some cases [#10488](#)
- Fix the issue that values returned by the `UUID` function might be duplicate when multiple nodes exist [#10711](#)
- Change the value returned by `CAST(-num as datetime)` from error to `NULL` [#10703](#)
- Fix the issue that an unsigned histogram meets signed ranges in some cases [#10695](#)
- Fix the issue that an error is reported mistakenly for reading data when the statistics feedback meets the bigint unsigned primary key [#10307](#)
- Fix the issue that the result of `Show Create Table` for partitioned tables is not correctly displayed in some cases [#10690](#)
- Fix the issue that the calculation result of the `GROUP_CONCAT` aggregate function is not correct for some correlated subqueries [#10670](#)
- Fix the issue that the result is wrongly displayed when the memory table of slow queries parses the slow query log in some cases [#10776](#)

### 16.20.8.2 PD

- Fix the issue that etcd leader election is blocked in extreme conditions [#1576](#)

### 16.20.8.3 TiKV

- Fix the issue that Regions are not available during the leader transfer process in extreme conditions [#4799](#)
- Fix the issue that TiKV loses data when the power of the machine fails abnormally, caused by delayed data flush to the disk when receiving snapshots [#4850](#)

### 16.20.9 TiDB 2.1.11 Release Notes

Release date: June 03, 2019

TiDB version: 2.1.11

TiDB Ansible version: 2.1.11

#### 16.20.9.1 TiDB

- Fix the issue that incorrect schema is used for `delete from join` [#10595](#)
- Fix the issue that the built-in `CONVERT()` may return incorrect field type [#10263](#)
- Merge non-overlapped feedback when updating bucket count [#10569](#)
- Fix calculation errors of `unix_timestamp()-unix_timestamp(now())` [#10491](#)
- Fix the incompatibility issue of `period_diff` with MySQL 8.0 [#10501](#)
- Skip `Virtual Column` when collecting statistics to avoid exceptions [#10628](#)
- Support the `SHOW OPEN TABLES` statement [#10374](#)
- Fix the issue that goroutine leak may happen in some cases [#10656](#)
- Fix the issue that setting the `tidb_snapshot` variable in some cases may cause incorrect parsing of time format [#10637](#)

#### 16.20.9.2 PD

- Fix the issue that hots Region may fail to be scheduled due to `balance-region` [#1551](#)
- Set hotspot related scheduling priorities to high [#1551](#)
- Add two configuration items [#1551](#)
  - `hot-region-schedule-limit` to control the maximum number of concurrent hotspot scheduling tasks
  - `hot-region-cache-hits-threshold` to identify a hot Region

#### 16.20.9.3 TiKV

- Fix the issue that the learner reads an empty index when there is only one leader and one learner [#4751](#)
- Process `ScanLock` and `ResolveLock` in the thread pool with a high priority to reduce their impacts on commands with a normal priority [#4791](#)
- Sync all files of received snapshots [#4811](#)

#### 16.20.9.4 Tools

- TiDB Binlog
  - Limit data deletion speed during GC to avoid QPS degrading caused by `WritePause` [#620](#)

#### 16.20.9.5 TiDB Ansible

- Add Drainer parameters [#760](#)

#### 16.20.10 TiDB 2.1.10 Release Notes

Release date: May 22, 2019

TiDB version: 2.1.10

TiDB Ansible version: 2.1.10

##### 16.20.10.1 TiDB

- Fix the issue that some abnormalities cause incorrect table schema when using `tidb_snapshot` to read the history data [#10359](#)
- Fix the issue that the `NOT` function causes wrong read results in some cases [#10363](#)
- Fix the wrong behavior of `Generated Column` in the `Replace` or `Insert on`  $\leftrightarrow$  `duplicate update` statement [#10385](#)
- Fix a bug of the `BETWEEN` function in the `DATE/DATETIME` comparison [#10407](#)
- Fix the issue that a single line of a slow log that is too long causes an error report when using the `SLOW_QUERY` table to query a slow log [#10412](#)
- Fix the issue that the result of `DATETIME` plus `INTERVAL` is not the same with that of MySQL in some cases [#10416](#), [#10418](#)
- Add the check for the invalid time of February in a leap year [#10417](#)
- Execute the internal initialization operation limitation only in the DDL owner to avoid a large number of conflict error reports when initializing the cluster [#10426](#)
- Fix the issue that `DESC` is incompatible with MySQL when the default value of the output timestamp column is `default current_timestamp on update`  $\leftrightarrow$  `current_timestamp` [#10337](#)
- Fix the issue that an error occurs during the privilege check in the `Update` statement [#10439](#)
- Fix the issue that wrong calculation of `RANGE` causes a wrong result in the `CHAR` column in some cases [#10455](#)
- Fix the issue that the data might be overwritten after decreasing `SHARD_ROW_ID_BITS` [#9868](#)
- Fix the issue that `ORDER BY RAND()` does not return random numbers [#10064](#)
- Prohibit the `ALTER` statement modifying the precision of decimals [#10458](#)

- Fix the compatibility issue of the `TIME_FORMAT` function with MySQL [#10474](#)
- Check the parameter validity of `PERIOD_ADD` [#10430](#)
- Fix the issue that the behavior of the invalid `YEAR` string in TiDB is incompatible with that in MySQL [#10493](#)
- Support the `ALTER DATABASE` syntax [#10503](#)
- Fix the issue that the `SLOW_QUERY` memory engine reports an error when no `;` exists in the slow query statement [#10536](#)
- Fix the issue that the `Add index` operation in partitioned tables cannot be canceled in some cases [#10533](#)
- Fix the issue that the OOM panic cannot be recovered in some cases [#10545](#)
- Improve the security of the DDL operation rewriting the table metadata [#10547](#)

#### 16.20.10.2 PD

- Fix the issue that the priority of the leader does not take effect [#1533](#)

#### 16.20.10.3 TiKV

- Reject transferring the leader in a Region whose configuration has been changed recently to avoid transfer failure [#4684](#)
- Add the priority label for Coprocessor metrics [#4643](#)
- Fix the possible dirty read issue during transferring the leader [#4724](#)
- Fix the issue that `CommitMerge` causes the restart failure of TiKV in some cases [#4615](#)
- Fix unknown logs [#4730](#)

#### 16.20.10.4 Tools

- TiDB Lightning
  - Add the retry feature when TiDB Lightning fails to send data to importer [#176](#)
- TiDB Binlog
  - Optimize the Pump storage log to facilitate troubleshooting [#607](#)

#### 16.20.10.5 TiDB Ansible

- Update the configuration file of TiDB Lightning and add the `tidb_lightning_ctl` script [#d3a4a368](#)

### 16.20.11 TiDB 2.1.9 Release Notes

Release date: May 6, 2019

TiDB version: 2.1.9

TiDB Ansible version: 2.1.9

### 16.20.11.1 TiDB

- Fix compatibility of the `MAKETIME` function when unsigned type overflows [#10089](#)
- Fix the stack overflow caused by constant folding in some cases [#10189](#)
- Fix the privilege check issue for `Update` when an alias exists in some cases [#10157](#), [#10326](#)
- Track and control memory usage in `DistSQL` [#10197](#)
- Support specifying collation as `utf8mb4_0900_ai_ci` [#10201](#)
- Fix the wrong result issue of the `MAX` function when the primary key is of the Unsigned type [#10209](#)
- Fix the issue that NULL values can be inserted into NOT NULL columns in the non-strict SQL mode [#10254](#)
- Fix the wrong result issue of the `COUNT` function when multiple columns exist in `DISTINCT` [#10270](#)
- Fix the panic issue occurred when `LOAD DATA` parses irregular CSV files [#10269](#)
- Ignore the overflow error when the outer and inner join key types are inconsistent in `Index Lookup Join` [#10244](#)
- Fix the issue that a statement is wrongly judged as point-get in some cases [#10299](#)
- Fix the wrong result issue when the time type does not convert the time zone in some cases [#10345](#)
- Fix the issue that TiDB character set cases are inconsistent in some cases [#10354](#)
- Support controlling the number of rows returned by operator [#9166](#)
  - Selection & Projection [#10110](#)
  - StreamAgg & HashAgg [#10133](#)
  - TableReader & IndexReader & IndexLookup [#10169](#)
- Improve the slow query log
  - Add `SQL Digest` to distinguish similar SQL [#10093](#)
  - Add version information of statistics used by slow query statements [#10220](#)
  - Show memory consumption of a statement in slow query log [#10246](#)
  - Adjust the output format of Coprocessor related information so it can be parsed by `pt-query-digest` [#10300](#)
  - Fix the `#` character issue in slow query statements [#10275](#)
  - Add some information columns to the memory table of slow query statements [#10317](#)
  - Add the transaction commit time to slow query log [#10310](#)
  - Fix the issue some time formats cannot be parsed by `pt-query-digest` [#10323](#)

### 16.20.11.2 PD

- Support the `GetOperator` service [#1514](#)

### 16.20.11.3 TiKV

- Fix potential quorum changes when transferring leader [#4604](#)

#### 16.20.11.4 Tools

- TiDB Binlog
  - Fix the issue that data replication is interrupted because data in the unsigned int type of primary key column are minus numbers [#574](#)
  - Remove the compression option when the downstream is pb and change the downstream name from pb to file [#597](#)
  - Fix the bug that Reparo introduced in 2.1.7 generates wrong UPDATE statements [#576](#)
- TiDB Lightning
  - Fix the bug that the bit type of column data is incorrectly parsed by the parser [#164](#)
  - Fill the lacking column data in dump files using row id or the default column value [#174](#)
  - Fix the Importer bug that some SST files fail to be imported but it still returns successful import result [#4566](#)
  - Support setting a speed limit in Importer when uploading SST files to TiKV [#4607](#)
  - Change Importer RocksDB SST compression method to lz4 to reduce CPU consumption [#4624](#)
- sync-diff-inspector
  - Support checkpoint [#227](#)

#### 16.20.11.5 TiDB Ansible

- Update links in tidb-ansible documentation according to docs refactoring [#740](#), [#741](#)
- Remove the `enable_slow_query_log` parameter in the `inventory.ini` file and output the slow query log to a separate log file by default [#742](#)

#### 16.20.12 TiDB 2.1.8 Release Notes

Release date: April 12, 2019

TiDB version: 2.1.8

TiDB Ansible version: 2.1.8

#### 16.20.12.1 TiDB

- Fix the issue that the processing logic of `GROUP_CONCAT` function is incompatible with MySQL when there is a NULL-valued parameter [#9930](#)
- Fix the equality check issue of decimal values in the `Distinct` mode [#9931](#)

- Fix the collation compatibility issue of the date, datetime, and timestamp types for the `SHOW FULL COLUMNS` statement
  - [#9938](#)
  - [#10114](#)
- Fix the issue that the row count estimation is inaccurate when the filtering condition contains correlated columns [#9937](#)
- Fix the compatibility issue between the `DATE_ADD` and `DATE_SUB` functions
  - [#9963](#)
  - [#9966](#)
- Support the `%H` format for the `STR_TO_DATE` function to improve compatibility [#9964](#)
- Fix the issue that the result is wrong when the `GROUP_CONCAT` function groups by a unique index [#9969](#)
- Return a warning when the Optimizer Hints contains an unmatched table name [#9970](#)
- Unify the log format to facilitate collecting logs using tools for analysis Unified Log Format
- Fix the issue that a lot of NULL values cause inaccurate statistics estimation [#9979](#)
- Fix the issue that an error is reported when the default value of the `TIMESTAMP` type is the boundary value [#9987](#)
- Validate the value of `time_zone` [#10000](#)
- Support the `2019.01.01` time format [#10001](#)
- Fix the issue that the row count estimation is displayed incorrectly in the result returned by the `EXPLAIN` statement in some cases [#10044](#)
- Fix the issue that `KILL TIDB [session id]` cannot instantly stop the execution of a statement in some cases [#9976](#)
- Fix the predicate pushdown issue of constant filtering conditions in some cases [#10049](#)
- Fix the issue that a read-only statement is not processed correctly in some cases [#10048](#)

### 16.20.12.2 PD

- Fix the issue that `regionScatterer` might generate an invalid `OperatorStep` [#1482](#)
- Fix the issue that a hot store makes incorrect statistics of keys [#1487](#)
- Fix the too short timeout issue of the `MergeRegion` operator [#1495](#)
- Add elapsed time metrics of the PD server handling TSO requests [#1502](#)

### 16.20.12.3 TiKV

- Fix the issue of wrong statistics of the read traffic [#4441](#)
- Fix the raftstore performance issue when too many Regions exist [#4484](#)
- Do not ingest files when the number of level 0 SST files exceeds `level_zero_slowdown_writes_trigger`  
↪ `/2` [#4464](#)

#### 16.20.12.4 Tools

- Optimize the order of importing tables for Lightning to reduce the effects of large tables executing `Checksum` and `Analyze` on the cluster during the importing process and improve the success rate of `Checksum` and `Analyze` [#156](#)
- Improve the encoding SQL performance by 50% for Lightning by directly parsing the data source file content to `types.Datum` of TiDB to avoid additional parsing working of the KV encoder [#145](#)
- Add the `storage.sync-log` configuration item in TiDB Binlog Pump to support flushing disks of the local storage asynchronously in Pump [#529](#)
- Support traffic compression of communication between TiDB Binlog Pump and Drainer [#530](#)
- Add the `syncer.sql-mode` configuration item in TiDB Binlog Drainer to support using different `sql-modes` to parse DDL queries [#513](#)
- Add the `syncer.ignore-table` configuration item in TiDB Binlog Drainer to support filtering tables not to be replicated [#526](#)

#### 16.20.12.5 TiDB Ansible

- Modify the version limit for the operating system and only support CentOS 7.0 or later and Red Hat 7.0 or later [#734](#)
- Add the feature of checking whether `epollexclusive` is supported in every OS [#728](#)
- Add the version limit for rolling update to prohibit upgrading a version of 2.0.1 or earlier to a version of 2.1 or later [#728](#)

#### 16.20.13 TiDB 2.1.7 Release Notes

Release Date: March 28, 2019

TiDB version: 2.1.7

TiDB Ansible version: 2.1.7

##### 16.20.13.1 TiDB

- Fix the issue of longer startup time when upgrading the program caused by canceling DDL operations [#9768](#)
- Fix the issue that the `check-mb4-value-in-utf8` configuration item is in the wrong position in the `config.example.toml` file [#9852](#)
- Improve the compatibility of the `str_to_date` built-in function with MySQL [#9817](#)
- Fix the compatibility issue of the `last_day` built-in function [#9750](#)
- Add the `tidb_table_id` column for `infoschema.tables` to facilitate getting `table_id`  $\leftrightarrow$  by using SQL statements and add the `tidb_indexes` system table to manage the relationship between Table and Index [#9862](#)

- Add a check about the null definition of Table Partition [#9663](#)
- Change the privileges required by `Truncate Table` from `Delete` to `Drop` to make it consistent with MySQL [#9876](#)
- Support using subqueries in the `DO` statement [#9877](#)
- Fix the issue that the `default_week_format` variable does not take effect in the `week` function [#9753](#)
- Support the plugin framework [#9880](#), [#9888](#)
- Support checking the enabling state of binlog by using the `log_bin` system variable [#9634](#)
- Support checking the Pump/Drainer status by using SQL statements [#9896](#)
- Fix the compatibility issue about checking mb4 character on utf8 when upgrading TiDB [#9887](#)
- Fix the panic issue when the aggregate function calculates JSON data in some cases [#9927](#)

### 16.20.13.2 PD

- Fix the issue that the transferring leader step cannot be created in the balance-region when the number of replicas is one [#1462](#)

### 16.20.13.3 Tools

- Support replicating generated columns by using binlog

### 16.20.13.4 TiDB Ansible

Change the default retention time of Prometheus monitoring data to 30d

## 16.20.14 TiDB 2.1.6 Release Notes

On March 15, 2019, TiDB 2.1.6 is released. The corresponding TiDB Ansible 2.1.6 is also released. Compared with TiDB 2.1.5, this release has greatly improved the stability, the SQL optimizer, statistics, and the execution engine.

### 16.20.14.1 TiDB

- SQL Optimizer/Executor
  - Optimize planner to select the outer table based on cost when both tables are specified in Hint of `TIDB_INLJ` [#9615](#)
  - Fix the issue that `IndexScan` cannot be selected correctly in some cases [#9587](#)
  - Fix incompatibility with MySQL of check in the `agg` function in subqueries [#9551](#)
  - Make `show stats_histograms` only output valid columns to avoid panics [#9502](#)

- Server
  - Support the `log_bin` variable to enable/disable Binlog [#9634](#)
  - Add a sanity check for transactions to avoid false transaction commit [#9559](#)
  - Fix the issue that setting variables may lead to panic [#9539](#)
- DDL
  - Fix the issue that the `Create Table Like` statement causes panic in some cases [#9652](#)
  - Enable the `AutoSync` feature of `etcd` clients to avoid connection issues between TiDB and `etcd` in some cases [#9600](#)

#### 16.20.14.2 TiKV

- Fix the issue that a `protobuf` parsing failure would in some cases cause a `StoreNotMatch` error [#4303](#)

#### 16.20.14.3 Tools

- Lightning
  - Change the default `region-split-size` of importer to 512 MiB [#4369](#)
  - Save the intermediate SST previously cached in memory to the local disk to reduce memory usage [#4369](#)
  - Limit the memory usage of RocksDB [#4369](#)
  - Fix the issue that Regions are scattered before scheduling is finished [#4369](#)
  - Separate importing of data and indexes for large tables to effectively reduce time consumption when importing in batches [#132](#)
  - Support CSV [#111](#)
  - Fix the error of import failure due to non-alphanumeric characters in schema names [#9547](#)

#### 16.20.15 TiDB 2.1.5 Release Notes

On February 28, 2019, TiDB 2.1.5 is released. The corresponding TiDB Ansible 2.1.5 is also released. Compared with TiDB 2.1.4, this release has greatly improved the stability, the SQL optimizer, statistics, and the execution engine.

##### 16.20.15.1 TiDB

- SQL Optimizer/Executor
  - Make `SHOW CREATE TABLE` do not print the column charset information when the charset information of a column is the same with that of a table, to improve the compatibility of `SHOW CREATE TABLE` with MySQL [#9306](#)

- Fix the panic or the wrong result of the `Sort` operator in some cases by extracting `ScalarFunc` from `Sort` to a `Projection` operator for computing to simplify the computing logic of `Sort` [#9319](#)
- Remove the sorting field with constant values in the `Sort` operator [#9335](#), [#9440](#)
- Fix the data overflow issue when inserting data into an unsigned integer column [#9339](#)
- Set `cast_as_binary` to `NULL` when the length of the target binary exceeds `max_allowed_packet` [#9349](#)
- Optimize the constant folding process of `IF` and `IFNULL` [#9351](#)
- Optimize the index selection of TiDB using skyline pruning to improve the stability of simple queries [#9356](#)
- Support computing the selectivity of the DNF expression [#9405](#)
- Fix the wrong SQL query result of `!=ANY()` and `=ALL()` in some cases [#9403](#)
- Fix the panic or the wrong result when the Join Key types of two tables on which the `Merge Join` operation is performed are different [#9438](#)
- Fix the issue that the result of the `RAND()` function is not compatible with MySQL [#9446](#)
- Refactor the logic of `Semi Join` processing `NULL` and the empty result set to get the correct result and improve the compatibility with MySQL [#9449](#)
- Server
  - Add the `tidb_constraint_check_in_place` system variable to check the data uniqueness constraint when executing the `INSERT` statement [#9401](#)
  - Fix the issue that the value of the `tidb_force_priority` system variable is different from that set in the configuration file [#9347](#)
  - Add the `current_db` field in general logs to print the name of the currently used database [#9346](#)
  - Add an HTTP API of obtaining the table information with the table ID [#9408](#)
  - Fix the issue that `LOAD DATA` loads incorrect data in some cases [#9414](#)
  - Fix the issue that it takes a long time to build a connection between the MySQL client and TiDB in some cases [#9451](#)
- DDL
  - Fix some issues when canceling the `DROP COLUMN` operation [#9352](#)
  - Fix some issues when canceling the `DROP` or `ADD` partitioned table operation [#9376](#)
  - Fix the issue that `ADMIN CHECK TABLE` mistakenly reports the data index inconsistency in some cases [#9399](#)
  - Fix the time zone issue of the `TIMESTAMP` default value [#9108](#)

### 16.20.15.2 PD

- Provide the `exclude_tombstone_stores` option in the `GetAllStores` interface to remove the Tombstone store from the returned result [#1444](#)

### 16.20.15.3 TiKV

- Fix the issue that Importer fails to import data in some cases [#4223](#)
- Fix the `KeyNotInRegion` error in some cases [#4125](#)
- Fix the panic issue caused by Region merge in some cases [#4235](#)
- Add the detailed `StoreNotMatch` error message [#3885](#)

### 16.20.15.4 Tools

- Lightning
  - Do not report an error or exit when a Tombstone store exists in the cluster [#4223](#)
- TiDB Binlog
  - Update the DDL binlog replication plan to guarantee the correctness of DDL event replication [#9304](#)

## 16.20.16 TiDB 2.1.4 Release Notes

On February 15, 2019, TiDB 2.1.4 is released. The corresponding TiDB Ansible 2.1.4 is also released. Compared with TiDB 2.1.3, this release has greatly improved the stability, the SQL optimizer, statistics, and the execution engine.

### 16.20.16.1 TiDB

- SQL Optimizer/Executor
  - Fix the issue that the `VALUES` function does not handle the `FLOAT` type correctly [#9223](#)
  - Fix the wrong result issue when casting Float to String in some cases [#9227](#)
  - Fix the wrong result issue of the `FORMAT` function in some cases [#9235](#)
  - Fix the panic issue when handling the Join query in some cases [#9264](#)
  - Fix the issue that the `VALUES` function does not handle the `ENUM` type correctly [#9280](#)
  - Fix the wrong result issue of `DATE_ADD/DATE_SUB` in some cases [#9284](#)
- Server
  - Optimize the “reload privilege success” log and change it to the `DEBUG` level [#9274](#)
- DDL
  - Change `tidb_ddl_reorg_worker_cnt` and `tidb_ddl_reorg_batch_size` to global variables [#9134](#)
  - Fix the bug caused by adding an index to a generated column in some abnormal conditions [#9289](#)

### 16.20.16.2 TiKV

- Fix the duplicate write issue when closing TiKV [#4146](#)
- Fix the abnormal result issue of the event listener in some cases [#4132](#)

### 16.20.16.3 Tools

- Lightning
  - Optimize the memory usage [#107](#), [#108](#)
  - Remove the chunk separation of dump files to avoid an extra parsing of dump files [#109](#)
  - Limit the I/O concurrency of reading dump files, to avoid performance degradation caused by too many cache misses [#110](#)
  - Support importing data in batches for a single table, to improve import stability [#110](#)
  - Enable auto compactions in the import mode in TiKV [#4199](#)
  - Support disabling the TiKV periodic Level-1 compaction parameter, because the Level-1 compaction is automatically executed in the import mode when the TiKV cluster version is 2.1.4 or later [#119](#)
  - Limit the number of import engines to avoid consuming too much importer disk space [#119](#)
- Support splitting chunks using the TiDB statistics in sync-diff-inspector [#197](#)

## 16.20.17 TiDB 2.1.3 Release Notes

On January 28, 2019, TiDB 2.1.3 is released. The corresponding TiDB Ansible 2.1.3 is also released. Compared with TiDB 2.1.2, this release has great improvement in system stability, SQL optimizer, statistics information, and execution engine.

### 16.20.17.1 TiDB

- SQL Optimizer/Executor
  - Fix the panic issue of Prepared Plan Cache in some cases [#8826](#)
  - Fix the issue that Range computing is wrong when the index is a prefix index [#8851](#)
  - Make `CAST(str AS TIME(N))` return null if the string is in the illegal TIME format when `SQL_MODE` is not strict [#8966](#)
  - Fix the panic issue of Generated Column during the process of UPDATE in some cases [#8980](#)
  - Fix the upper bound overflow issue of the statistics histogram in some cases [#8989](#)
  - Support Range for `_tidb_rowid` construction queries, to avoid full table scan and reduce cluster stress [#9059](#)

- Return an error when the `CAST(AS TIME)` precision is too big [#9058](#)
- Allow using `Sort Merge Join` in the Cartesian product [#9037](#)
- Fix the issue that the statistics worker cannot resume after the panic in some cases [#9085](#)
- Fix the issue that `Sort Merge Join` returns the wrong result in some cases [#9046](#)
- Support returning the JSON type in the `CASE` clause [#8355](#)
- Server
  - Return a warning instead of an error when the non-TiDB hint exists in the comment [#8766](#)
  - Verify the validity of the configured `TIMEZONE` value [#8879](#)
  - Optimize the `QueryDurationHistogram` metrics item to display more statement types [#8875](#)
  - Fix the lower bound overflow issue of `bigint` in some cases [#8544](#)
  - Support the `ALLOW_INVALID_DATES` SQL mode [#9110](#)
- DDL
  - Fix a `RENAME TABLE` compatibility issue to keep the behavior consistent with that of MySQL [#8808](#)
  - Support making concurrent changes of `ADD INDEX` take effect immediately [#8786](#)
  - Fix the `UPDATE` panic issue during the process of `ADD COLUMN` in some cases [#8906](#)
  - Fix the issue of concurrently creating Table Partition in some cases [#8902](#)
  - Support converting the `utf8` character set to `utf8mb4` [#8951](#) [#9152](#)
  - Fix the issue of Shard Bits overflow [#8976](#)
  - Support outputting the column character sets in `SHOW CREATE TABLE` [#9053](#)
  - Fix the issue of the maximum length limit of the `varchar` type column in `utf8mb4` [#8818](#)
  - Support `ALTER TABLE TRUNCATE TABLE PARTITION` [#9093](#)
  - Resolve the charset when the charset is not provided [#9147](#)

#### 16.20.17.2 PD

- Fix the Watch issue related to leader election [#1396](#)

#### 16.20.17.3 TiKV

- Support obtaining the monitoring information using the HTTP method [#3855](#)
- Fix the NULL issue of `data_format` [#4075](#)
- Add verifying the range for scan requests [#4124](#)

#### 16.20.17.4 Tools

- TiDB Binlog

- Fix the `no available pump` issue while TiDB is started or restarted [#157](#)
- Enable outputting the Pump client log [#165](#)
- Fix the data inconsistency issue caused by the unique key containing the NULL value when the table only has the unique key and does not have the primary key

## 16.20.18 TiDB 2.1.2 Release Notes

On December 22, 2018, TiDB 2.1.2 is released. The corresponding TiDB Ansible 2.1.2 is also released. Compared with TiDB 2.1.1, this release has great improvement in system compatibility and stability.

### 16.20.18.1 TiDB

- Make TiDB compatible with TiDB Binlog of the Kafka version [#8747](#)
- Improve the exit mechanism of TiDB in a rolling update [#8707](#)
- Fix the panic issue caused by adding the index for the generated column in some cases [#8676](#)
- Fix the issue that the optimizer cannot find the optimal query plan when `TIDB_SMJ`  $\leftrightarrow$  `Hint` exists in the SQL statement in some cases [#8729](#)
- Fix the issue that `AntiSemiJoin` returns an incorrect result in some cases [#8730](#)
- Improve the valid character check of the `utf8` character set [#8754](#)
- Fix the issue that the field of the time type might return an incorrect result when the write operation is performed before the read operation in a transaction [#8746](#)

### 16.20.18.2 PD

- Fix the Region information update issue about Region merge [#1377](#)

### 16.20.18.3 TiKV

- Support the configuration format in the unit of DAY (d) and fix the configuration compatibility issue [#3931](#)
- Fix the possible panic issue caused by `Approximate Size Split` [#3942](#)
- Fix two issues about Region merge [#3822](#), [#3873](#)

### 16.20.18.4 Tools

- TiDB Lightning
  - Make TiDB 2.1.0 the minimum cluster version supported by Lightning
  - Fix the content error of the file involving parsed JSON data in Lightning [#144](#)
  - Fix the issue that `Too many open engines` occurs after the checkpoint is used to restart Lightning

- TiDB Binlog
  - Eliminate some bottlenecks of Drainer writing data to Kafka
  - Support the Kafka version of TiDB Binlog

## 16.20.19 TiDB 2.1.1 Release Notes

On December 12, 2018, TiDB 2.1.1 is released. Compared with TiDB 2.1.0, this release has great improvement in stability, SQL optimizer, statistics information, and execution engine.

### 16.20.19.1 TiDB

- SQL Optimizer/Executor
  - Fix the round error of the negative date [#8574](#)
  - Fix the issue that the `uncompress` function does not check the data length [#8606](#)
  - Reset bind arguments of the `prepare` statement after the `execute` command is executed [#8652](#)
  - Support automatically collecting the statistics information of a partition table [#8649](#)
  - Fix the wrongly configured integer type when pushing down the `abs` function [#8628](#)
  - Fix the data race on the JSON column [#8660](#)
- Server
  - Fix the issue that the transaction obtained TSO is incorrect when PD breaks down [#8567](#)
  - Fix the bootstrap failure caused by the statement that does not conform to ANSI standards [#8576](#)
  - Fix the issue that incorrect parameters are used in transaction retries [#8638](#)
- DDL
  - Change the default character set and collation of tables into `utf8mb4` [#8590](#)
  - Add the `ddl_reorg_batch_size` variable to control the speed of adding indexes [#8614](#)
  - Make the character set and collation options content in DDL case-insensitive [#8611](#)
  - Fix the issue of adding indexes for generated columns [#8655](#)

### 16.20.19.2 PD

- Fix the issue that some configuration items cannot be set to 0 in the configuration file [#1334](#)

- Check the undefined configuration when starting PD [#1362](#)
- Avoid transferring the leader to a newly created peer, to optimize the possible delay [#1339](#)
- Fix the issue that `RaftCluster` cannot stop caused by deadlock [#1370](#)

### 16.20.19.3 TiKV

- Avoid transferring the leader to a newly created peer, to optimize the possible delay [#3878](#)

### 16.20.19.4 Tools

- Lightning
  - Optimize the `analyze` mechanism on imported tables to increase the import speed
  - Support storing the checkpoint information to a local file
- TiDB Binlog
  - Fix the output bug of pb files that a table only with the primary key column cannot generate the pb event

## 16.20.20 TiDB 2.1 GA Release Notes

On November 30, 2018, TiDB 2.1 GA is released. See the following updates in this release. Compared with TiDB 2.0, this release has great improvements in stability, performance, compatibility, and usability.

### 16.20.20.1 TiDB

- SQL Optimizer
  - Optimize the selection range of `Index Join` to improve the execution performance
  - Optimize the selection of outer table for `Index Join` and use the table with smaller estimated value of `Row Count` as the outer table
  - Optimize Join Hint `TIDB_SMJ` so that Merge Join can be used even without proper index available
  - Optimize Join Hint `TIDB_INLJ` to specify the Inner table to Join
  - Optimize correlated subquery, push down Filter, and extend the index selection range, to improve the efficiency of some queries by orders of magnitude
  - Support using Index Hint and Join Hint in the `UPDATE` and `DELETE` statement
  - Support pushing down more functions: `ABS/CEIL/FLOOR/IS TRUE/IS FALSE`

- Optimize the constant folding algorithm for the **IF** and **IFNULL** built-in functions
- Optimize the output of the **EXPLAIN** statement and use hierarchy structure to show the relationship between operators
- SQL executor
  - Refactor all the aggregation functions and improve execution efficiency of the **Stream** and **Hash** aggregation operators
  - Implement the parallel **Hash Aggregate** operators and improve the computing performance by 350% in some scenarios
  - Implement the parallel **Project** operators and improve the performance by 74% in some scenarios
  - Read the data of the Inner table and Outer table of **Hash Join** concurrently to improve the execution performance
  - Optimize the execution speed of the **REPLACE INTO** statement and increase the performance nearly by 10 times
  - Optimize the memory usage of the time data type and decrease the memory usage of the time data type by fifty percent
  - Optimize the point select performance and improve the point select efficiency result of Sysbench by 60%
  - Improve the performance of TiDB on inserting or updating wide tables by 20 times
  - Support configuring the memory upper limit of a single statement in the configuration file
  - Optimize the execution of Hash Join, if the Join type is Inner Join or Semi Join and the inner table is empty, return the result without reading data from the outer table
  - Support using the **EXPLAIN ANALYZE statement** to check the runtime statistics including the execution time and the number of returned rows of each operator
- Statistics
  - Support enabling auto **ANALYZE** statistics only during certain period of the day
  - Support updating the table statistics automatically according to the feedback of the queries
  - Support configuring the number of buckets in the histogram using the **ANALYZE ↪ TABLE WITH BUCKETS** statement
  - Optimize the Row Count estimation algorithm using histogram for mixed queries of equality query and range queries
- Expressions

- Support following built-in function:
  - \* `json_contains`
  - \* `json_contains_path`
  - \* `encode/decode`
- Server
  - Support queuing the locally conflicted transactions within tidb-server instance to optimize the performance of conflicted transactions
  - Support Server Side Cursor
  - Add the [HTTP API](#)
    - \* Scatter the distribution of table Regions in the TiKV cluster
    - \* Control whether to open the `general log`
    - \* Support modifying the log level online
    - \* Check the TiDB cluster information
  - Add the `auto_analyze_ratio` system variables to control the ratio of Analyze
  - Add the `tidb_retry_limit` system variable to control the automatic retry times of transactions
  - Add the `tidb_disable_txn_auto_retry` system variable to control whether the transaction retries automatically
  - Support `usingadmin show slow` statement to obtain the slow queries
  - Add the `tidb_slow_log_threshold` environment variable to set the threshold of slow log automatically
  - Add the `tidb_query_log_max_len` environment variable to set the length of the SQL statement to be truncated in the log dynamically
- DDL
  - Support the parallel execution of the Add index statement and other statements to avoid the time consuming Add index operation blocking other operations
  - Optimize the execution speed of `ADD INDEX` and improve it greatly in some scenarios
  - Support the `select tidb_is_ddl_owner()` statement to facilitate deciding whether TiDB is DDL Owner
  - Support the `ALTER TABLE FORCE` syntax
  - Support the `ALTER TABLE RENAME KEY TO` syntax
  - Add the table name and database name in the output information of `admin show ↵ ddl jobs`

- Support using the `ddl/owner/resign` HTTP interface to release the DDL owner and start electing a new DDL owner
- Compatibility
  - Support more MySQL syntaxes
  - Make the BIT aggregate function support the ALL parameter
  - Support the SHOW PRIVILEGES statement
  - Support the CHARACTER SET syntax in the LOAD DATA statement
  - Support the IDENTIFIED WITH syntax in the CREATE USER statement
  - Support the LOAD DATA IGNORE LINES statement
  - The Show ProcessList statement returns more accurate information

### 16.20.20.2 Placement Driver (PD)

- Optimize availability
  - Introduce the version control mechanism and support rolling update of the cluster compatibly
  - Enable Raft PreVote among PD nodes to avoid leader reelection when network recovers after network isolation
  - Enable raft learner by default to lower the risk of unavailable data caused by machine failure during scheduling
  - TSO allocation is no longer affected by the system clock going backwards
  - Support the Region merge feature to reduce the overhead brought by metadata
- Optimize the scheduler
  - Optimize the processing of Down Store to speed up making up replicas
  - Optimize the hotspot scheduler to improve its adaptability when traffic statistics information jitters
  - Optimize the start of Coordinator to reduce the unnecessary scheduling caused by restarting PD
  - Optimize the issue that Balance Scheduler schedules small Regions frequently
  - Optimize Region merge to consider the number of rows within the Region
  - Add more commands to control the scheduling policy
  - Improve PD simulator to simulate the scheduling scenarios
- API and operation tools

- Add the [GetPrevRegion interface](#) to support the TiDB reverse scan feature
- Add the [BatchSplitRegion interface](#) to speed up TiKV Region splitting
- Add the [GCSafePoint interface](#) to support distributed GC in TiDB
- Add the [GetAllStores interface](#), to support distributed GC in TiDB
- pd-ctl supports:
  - \* using statistics for Region split
  - \* calling jq to format the JSON output
  - \* checking the Region information of the specified store
  - \* checking topN Region list sorted by versions
  - \* checking topN Region list sorted by size
  - \* more precise TSO encoding
- [pd-recover](#) doesn't need to provide the `max-replica` parameter
- Metrics
  - Add related metrics for `Filter`
  - Add metrics about etcd Raft state machine
- Performance
  - Optimize the performance of Region heartbeat to reduce the memory overhead brought by heartbeats
  - Optimize the Region tree performance
  - Optimize the performance of computing hotspot statistics

### 16.20.20.3 TiKV

- Coprocessor
  - Add more built-in functions
  - [Add Coprocessor ReadPool to improve the concurrency in processing the requests](#)
  - Fix the time function parsing issue and the time zone related issues
  - Optimize the memory usage for pushdown aggregation computing
- Transaction
  - Optimize the read logic and memory usage of MVCC to improve the performance of the scan operation and the performance of full table scan is 1 time better than that in TiDB 2.0
  - Fold the continuous Rollback records to ensure the read performance

- Add the `UnsafeDestroyRange` API to support to collecting space for the dropping table/index
- Separate the GC module to reduce the impact on write
- Add the upper bound support in the `kv_scan` command
- Raftstore
  - Improve the snapshot writing process to avoid RocksDB stall
  - Add the `LocalReader` thread to process read requests and reduce the delay for read requests
  - Support `BatchSplit` to avoid large Region brought by large amounts of write
  - Support `Region Split` according to statistics to reduce the I/O overhead
  - Support `Region Split` according to the number of keys to improve the concurrency of index scan
  - Improve the Raft message process to avoid unnecessary delay brought by `Region`  $\leftrightarrow$  `Split`
  - Enable the `PreVote` feature by default to reduce the impact of network isolation on services
- Storage Engine
  - Fix the `CompactFilesbug` in RocksDB and reduce the impact on importing data using `Lightning`
  - Upgrade RocksDB to v5.15 to fix the possible issue of snapshot file corruption
  - Improve `IngestExternalFile` to avoid the issue that flush could block write
- tikv-ctl
  - Add the `ldb` command to diagnose RocksDB related issues
  - The `compact` command supports specifying whether to compact data in the bottommost level

#### 16.20.20.4 Tools

- Fast full import of large amounts of data: `TiDB Lightning`
- Support new `TiDB Binlog`

### 16.20.20.5 Upgrade caveat

- TiDB 2.1 does not support downgrading to v2.0.x or earlier due to the adoption of the new storage engine
- Parallel DDL is enabled in TiDB 2.1, so the clusters with TiDB version earlier than 2.0.1 cannot upgrade to 2.1 using rolling update. You can choose either of the following two options:
  - Stop the cluster and upgrade to 2.1 directly
  - Roll update to 2.0.1 or later 2.0.x versions, and then roll update to the 2.1 version
- If you upgrade from TiDB 2.0.6 or earlier to TiDB 2.1, check if there is any ongoing DDL operation, especially the time consuming `Add Index` operation, because the DDL operations slow down the upgrading process. If there is ongoing DDL operation, wait for the DDL operation finishes and then roll update.

### 16.20.21 TiDB 2.1 RC5 Release Notes

On November 12, 2018, TiDB 2.1 RC5 is released. Compared with TiDB 2.1 RC4, this release has great improvement in stability, SQL optimizer, statistics information, and execution engine.

#### 16.20.21.1 TiDB

- SQL Optimizer
  - Fix the issue that `IndexReader` reads the wrong handle in some cases [#8132](#)
  - Fix the issue occurred while the `IndexScan Prepared` statement uses `Plan Cache` [#8055](#)
  - Fix the issue that the result of the `Union` statement is unstable [#8165](#)
- SQL Execution Engine
  - Improve the performance of TiDB on inserting or updating wide tables [#8024](#)
  - Support the unsigned `int` flag in the `Truncate` built-in function [#8068](#)
  - Fix the error occurred while converting JSON data to the decimal type [#8109](#)
  - Fix the error occurred when you `Update` the float type [#8170](#)
- Statistics
  - Fix the incorrect statistics issue during point queries in some cases [#8035](#)
  - Fix the selectivity estimation of statistics for primary key in some cases [#8149](#)
  - Fix the issue that the statistics of deleted tables are not cleared up for a long period of time [#8182](#)
- Server

- Improve the readability of logs and make logs better
  - \* [#8063](#)
  - \* [#8053](#)
  - \* [#8224](#)
- Fix the error occurred when obtaining the table data of `infoschema.profilings` [#8096](#)
- Replace the unix socket with the pumps client to write binlogs [#8098](#)
- Add the threshold value for the `tidb_slow_log_threshold` environment variable, which dynamically sets the slow log [#8094](#)
- Add the original length of a SQL statement truncated while the `tidb_query_log_max_len`  $\leftrightarrow$  environment variable dynamically sets logs [#8200](#)
- Add the `tidb_opt_write_row_id` environment variable to control whether to allow writing `_tidb_rowid` [#8218](#)
- Add an upper bound to the `Scan` command of ticlient, to avoid overbound scan [#8081](#), [#8247](#)
- DDL
  - Fix the issue that executing DDL statements in transactions encounters an error in some cases [#8056](#)
  - Fix the issue that executing `truncate table` in partition tables does not take effect [#8103](#)
  - Fix the issue that the DDL operation does not roll back correctly after being cancelled in some cases [#8057](#)
  - Add the `admin show next_row_id` command to return the next available row ID [#8268](#)

### 16.20.21.2 PD

- Fix the issues related to `pd-ctl` reading the Region key
  - [#1298](#)
  - [#1299](#)
  - [#1308](#)
- Fix the issue that the `regions/check` API returns the wrong result [#1311](#)
- Fix the issue that PD cannot restart join after a PD join failure [#1279](#)
- Fix the issue that `watch leader` might lose events in some cases [#1317](#)

### 16.20.21.3 TiKV

- Improve the error message of `WriteConflict` [#3750](#)
- Add the panic mark file [#3746](#)
- Downgrade `grpcio` to avoid the segment fault issue caused by the new version of `gRPC` [#3650](#)
- Add an upper limit to the `kv_scan` interface [#3749](#)

#### 16.20.21.4 Tools

- Support the TiDB-Binlog cluster, which is not compatible with the older version of binlog [#8093](#), [documentation](#)

#### 16.20.22 TiDB 2.1 RC4 Release Notes

On October 23, 2018, TiDB 2.1 RC4 is released. Compared with TiDB 2.1 RC3, this release has great improvement in stability, SQL optimizer, statistics information, and execution engine.

##### 16.20.22.1 TiDB

- SQL Optimizer
  - Fix the issue that column pruning of `UnionAll` is incorrect in some cases [#7941](#)
  - Fix the issue that the result of the `UnionAll` operator is incorrect in some cases [#8007](#)
- SQL Execution Engine
  - Fix the precision issue of the `AVG` function [#7874](#)
  - Support using the `EXPLAIN ANALYZE` statement to check the runtime statistics including the execution time and the number of returned rows of each operator during the query execution process [#7925](#)
  - Fix the panic issue of the `PointGet` operator when a column of a table appears multiple times in the result set [#7943](#)
  - Fix the panic issue caused by too large values in the `Limit` subclause [#8002](#)
  - Fix the panic issue during the execution process of the `AddDate/SubDate` statement in some cases [#8009](#)
- Statistics
  - Fix the issue of judging the prefix of the histogram low-bound of the combined index as out of range [#7856](#)
  - Fix the memory leak issue caused by statistics collecting [#7873](#)
  - Fix the panic issue when the histogram is empty [#7928](#)
  - Fix the issue that the histogram bound is out of range when the statistics is being uploaded [#7944](#)
  - Limit the maximum length of values in the statistics sampling process [#7982](#)
- Server
  - Refactor `Latch` to avoid misjudgment of transaction conflicts and improve the execution performance of concurrent transactions [#7711](#)
  - Fix the panic issue caused by collecting slow queries in some cases [#7874](#)

- Fix the panic issue when `ESCAPED BY` is an empty string in the `LOAD DATA` statement [#8005](#)
- Complete the “coprocessor error” log information [#8006](#)
- Compatibility
  - Set the `Command` field of the `SHOW PROCESSLIST` result to `Sleep` when the query is empty [#7839](#)
- Expressions
  - Fix the constant folding issue of the `SYSDATE` function [#7895](#)
  - Fix the issue that `SUBSTRING_INDEX` panics in some cases [#7897](#)
- DDL
  - Fix the stack overflow issue caused by throwing the `invalid ddl job type` error [#7958](#)
  - Fix the issue that the result of `ADMIN CHECK TABLE` is incorrect in some cases [#7975](#)

#### 16.20.22.2 PD

- Fix the issue that the tombstone TiKV is not removed from Grafana [#1261](#)
- Fix the data race issue when `grpc-go` configures the status [#1265](#)
- Fix the issue that the PD server gets stuck caused by `etcd` startup failure [#1267](#)
- Fix the issue that data race might occur during leader switching [#1273](#)
- Fix the issue that extra warning logs might be output when TiKV becomes tombstone [#1280](#)

#### 16.20.22.3 TiKV

- Optimize the RocksDB Write stall issue caused by applying snapshots [#3606](#)
- Add `raftstore tick` metrics [#3657](#)
- Upgrade RocksDB and fix the Write block issue and that the source file might be damaged by the Write operation when performing `IngestExternalFile` [#3661](#)
- Upgrade `grpcio` and fix the issue that “too many pings” is wrongly reported [#3650](#)

#### 16.20.23 TiDB 2.1 RC3 Release Notes

On September 29, 2018, TiDB 2.1 RC3 is released. Compared with TiDB 2.1 RC2, this release has great improvement in stability, compatibility, SQL optimizer, and execution engine.

### 16.20.23.1 TiDB

- SQL Optimizer
  - Fix the incorrect result issue when a statement contains embedded `LEFT OUTER`  
↔ `JOIN` [#7689](#)
  - Enhance the optimization rule of predicate pushdown on the `JOIN` statement [#7645](#)
  - Fix the optimization rule of predicate pushdown for the `UnionScan` operator [#7695](#)
  - Fix the issue that the unique key property of the `Union` operator is not correctly set [#7680](#)
  - Enhance the optimization rule of constant folding [#7696](#)
  - Optimize the data source in which the filter is null after propagation to table dual [#7756](#)
- SQL Execution Engine
  - Optimize the performance of read requests in a transaction [#7717](#)
  - Optimize the cost of allocating `Chunk` memory in some executors [#7540](#)
  - Fix the “index out of range” panic caused by the columns where point queries get all `NULL` values [#7790](#)
- Server
  - Fix the issue that the memory quota in the configuration file does not take effect [#7729](#)
  - Add the `tidb_force_priority` system variable to set the execution priority for each statement [#7694](#)
  - Support using the `admin show slow` statement to obtain the slow query log [#7785](#)
- Compatibility
  - Fix the issue that the result of `charset/collation` is incorrect in `information_schema`  
↔ `.schemata` [#7751](#)
  - Fix the issue that the value of the `hostname` system variable is empty [#7750](#)
- Expressions
  - Support the `init_vector` argument in the `AES_ENCRYPT/AES_DECRYPT` built-in function [#7425](#)
  - Fix the issue that the result of `Format` is incorrect in some expressions [#7770](#)
  - Support the `JSON_LENGTH` built-in function [#7739](#)
  - Fix the incorrect result issue when casting the unsigned integer type to the decimal type [#7792](#)
- DML

- Fix the issue that the result of the `INSERT ... ON DUPLICATE KEY UPDATE` statement is incorrect while updating the unique key [#7675](#)
- DDL
  - Fix the issue that the index value is not converted between time zones when you create a new index on a new column of the timestamp type [#7724](#)
  - Support appending new values for the enum type [#7767](#)
  - Support creating an etcd session quickly, which improves the cluster availability after network isolation [#7774](#)

### 16.20.23.2 PD

- New feature
  - Add the API to get the Region list by size in reverse order [#1254](#)
- Improvement
  - Return more detailed information in the Region API [#1252](#)
- Bug fix
  - Fix the issue that `adjacent-region-scheduler` might lead to a crash after PD switches the leader [#1250](#)

### 16.20.23.3 TiKV

- Performance
  - Optimize the concurrency for coprocessor requests [#3515](#)
- New features
  - Add the support for Log functions [#3603](#)
  - Add the support for the `sha1` function [#3612](#)
  - Add the support for the `truncate_int` function [#3532](#)
  - Add the support for the `year` function [#3622](#)
  - Add the support for the `truncate_real` function [#3633](#)
- Bug fixes
  - Fix the reporting error behavior related to time functions [#3487](#), [#3615](#)
  - Fix the issue that the time parsed from string is inconsistent with that in TiDB [#3589](#)

### 16.20.24 TiDB 2.1 RC2 Release Notes

On September 14, 2018, TiDB 2.1 RC2 is released. Compared with TiDB 2.1 RC1, this release has great improvement in stability, SQL optimizer, statistics information, and execution engine.

### 16.20.24.1 TiDB

- SQL Optimizer
  - Put forward a proposal of the next generation Planner [#7543](#)
  - Improve the optimization rules of constant propagation [#7276](#)
  - Enhance the computing logic of `Range` to enable it to handle multiple `IN` or `EQUAL` conditions simultaneously [#7577](#)
  - Fix the issue that the estimation result of `TableScan` is incorrect when `Range` is empty [#7583](#)
  - Support the `PointGet` operator for the `UPDATE` statement [#7586](#)
  - Fix the panic issue during the process of executing the `FirstRow` aggregate function in some conditions [#7624](#)
- SQL Execution Engine
  - Fix the potential `DataRace` issue when the `HashJoin` operator encounters an error [#7554](#)
  - Make the `HashJoin` operator read the inner table and build the hash table simultaneously [#7544](#)
  - Optimize the performance of Hash aggregate operators [#7541](#)
  - Optimize the performance of Join operators [#7493](#), [#7433](#)
  - Fix the issue that the result of `UPDATE JOIN` is incorrect when the Join order is changed [#7571](#)
  - Improve the performance of `Chunk`'s iterator [#7585](#)
- Statistics
  - Fix the issue that the auto Analyze work repeatedly analyzes the statistics [#7550](#)
  - Fix the statistics update error that occurs when there is no statistics change [#7530](#)
  - Use the `RC` isolation level and low priority when building `Analyze` requests [#7496](#)
  - Support enabling statistics auto-analyze on certain period of a day [#7570](#)
  - Fix the panic issue when logging the statistics information [#7588](#)
  - Support configuring the number of buckets in the histogram using the `ANALYZE` `↔` `TABLE WITH BUCKETS` statement [#7619](#)
  - Fix the panic issue when updating an empty histogram [#7640](#)
  - Update `information_schema.tables.data_length` using the statistics information [#7657](#)
- Server
  - Add Trace related dependencies [#7532](#)
  - Enable the `mutex profile` feature of Golang [#7512](#)
  - The `Admin` statement requires the `Super_priv` privilege [#7486](#)
  - Forbid users to Drop crucial system tables [#7471](#)
  - Switch from `juju/errors` to `pkg/errors` [#7151](#)
  - Complete the functional prototype of SQL Tracing [#7016](#)

- Remove the goroutine pool [#7564](#)
- Support viewing the goroutine information using the `USER1` signal [#7587](#)
- Set the internal SQL to high priority while TiDB is started [#7616](#)
- Use different labels to filter internal SQL and user SQL in monitoring metrics [#7631](#)
- Store the top 30 slow queries in the last week to the TiDB server [#7646](#)
- Put forward a proposal of setting the global system time zone for the TiDB cluster [#7656](#)
- Enrich the error message of “GC life time is shorter than transaction duration” [#7658](#)
- Set the global system time zone when starting the TiDB cluster [#7638](#)
- Compatibility
  - Add the unsigned flag for the `Year` type [#7542](#)
  - Fix the issue of configuring the result length of the `Year` type in the `Prepare` ↔ `/Execute` mode [#7525](#)
  - Fix the issue of inserting zero timestamp in the `Prepare/Execute` mode [#7506](#)
  - Fix the error handling issue of the integer division [#7492](#)
  - Fix the compatibility issue when processing `ComStmtSendLongData` [#7485](#)
  - Fix the error handling issue during the process of converting string to integer [#7483](#)
  - Optimize the accuracy of values in the `information_schema.columns_in_table` table [#7463](#)
  - Fix the compatibility issue when writing or updating the string type of data using the MariaDB client [#7573](#)
  - Fix the compatibility issue of aliases of the returned value [#7600](#)
  - Fix the issue that the `NUMERIC_SCALE` value of the float type is incorrect in the `information_schema.COLUMNS` table [#7602](#)
  - Fix the issue that Parser reports an error when the single line comment is empty [#7612](#)
- Expressions
  - Check the value of `max_allowed_packet` in the `insert` function [#7528](#)
  - Support the built-in function `json_contains` [#7443](#)
  - Support the built-in function `json_contains_path` [#7596](#)
  - Support the built-in function `encode/decode` [#7622](#)
  - Fix the issue that some time related functions are not compatible with the MySQL behaviors in some cases [#7636](#)
  - Fix the compatibility issue of parsing the time type of data in string [#7654](#)
  - Fix the issue that the time zone is not considered when computing the default value of the `DateTime` data [#7655](#)
- DML
  - Set correct `last_insert_id` in the `InsertOnDuplicateUpdate` statement [#7534](#)
  - Reduce the cases of updating the `auto_increment_id` counter [#7515](#)

- Optimize the error message of Duplicate Key [#7495](#)
- Fix the `insert...select...on duplicate key update` issue [#7406](#)
- Support the `LOAD DATA IGNORE LINES` statement [#7576](#)
- DDL
  - Add the DDL job type and the current schema version information in the monitor [#7472](#)
  - Complete the design of the Admin Restore Table feature [#7383](#)
  - Fix the issue that the default value of the Bit type exceeds 128 [#7249](#)
  - Fix the issue that the default value of the Bit type cannot be NULL [#7604](#)
  - Reduce the interval of checking `CREATE TABLE/DATABASE` in the DDL queue [#7608](#)
  - Use the `ddl/owner/resign` HTTP interface to release the DDL owner and start electing a new owner [#7649](#)
- TiKV Go Client
  - Support the issue that the `Seek` operation only obtains Key [#7419](#)
- Table Partition (Experimental)
  - Fix the issue that the `Bigint` type cannot be used as the partition key [#7520](#)
  - Support the rollback operation when an issue occurs during adding an index in the partitioned table [#7437](#)

## 16.20.24.2 PD

- Features
  - Support the `GetAllStores` interface [#1228](#)
  - Add the statistics of scheduling estimation in Simulator [#1218](#)
- Improvements
  - Optimize the handling process of down stores to make up replicas as soon as possible [#1222](#)
  - Optimize the start of Coordinator to reduce the unnecessary scheduling caused by restarting PD [#1225](#)
  - Optimize the memory usage to reduce the overhead caused by heartbeats [#1195](#)
  - Optimize error handling and improve the log information [#1227](#)
  - Support querying the Region information of a specific store in `pd-ctl` [#1231](#)
  - Support querying the topN Region information based on version comparison in `pd-ctl` [#1233](#)
  - Support more accurate TSO decoding in `pd-ctl` [#1242](#)
- Bug fix
  - Fix the issue that `pd-ctl` uses the `hot store` command to exit wrongly [#1244](#)

### 16.20.24.3 TiKV

- Performance
  - Support splitting Regions based on statistics estimation to reduce the I/O cost [#3511](#)
  - Reduce clone in the transaction scheduler [#3530](#)
- Improvements
  - Add the pushdown support for a large number of built-in functions
  - Add the `leader-transfer-max-log-lag` configuration to fix the failure issue of leader scheduling in specific scenarios [#3507](#)
  - Add the `max-open-engines` configuration to limit the number of engines opened by `tikv-importer` simultaneously [#3496](#)
  - Limit the cleanup speed of garbage data to reduce the impact on `snapshot apply` [#3547](#)
  - Broadcast the commit message for crucial Raft messages to avoid unnecessary delay [#3592](#)
- Bug fixes
  - Fix the leader election issue caused by discarding the `PreVote` message of the newly split Region [#3557](#)
  - Fix follower related statistics after merging Regions [#3573](#)
  - Fix the issue that the local reader uses obsolete Region information [#3565](#)

### 16.20.25 TiDB 2.1 RC1 Release Notes

On August 24, 2018, TiDB 2.1 RC1 is released! Compared with TiDB 2.1 Beta, this release has great improvement in stability, SQL optimizer, statistics information, and execution engine.

#### 16.20.25.1 TiDB

- SQL Optimizer
  - Fix the issue that a wrong result is returned after the correlated subquery is decorrelated in some cases [#6972](#)
  - Optimize the output result of `Explain` [#7011](#)[#7041](#)
  - Optimize the choosing strategy of the outer table for `IndexJoin` [#7019](#)
  - Remove the Plan Cache of the non-`PREPARE` statement [#7040](#)
  - Fix the issue that the `INSERT` statement is not parsed and executed correctly in some cases [#7068](#)
  - Fix the issue that the `IndexJoin` result is not correct in some cases [#7150](#)
  - Fix the issue that the `NULL` value cannot be found using the unique index in some cases [#7163](#)

- Fix the range computing issue of the prefix index in UTF-8 [#7194](#)
- Fix the issue that result is not correct caused by eliminating the `Project` operator in some cases [#7257](#)
- Fix the issue that `USE INDEX(PRIMARY)` cannot be used when the primary key is an integer [#7316](#)
- Fix the issue that the index range cannot be computed using the correlated column in some cases [#7357](#)
- SQL Execution Engine
  - Fix the issue that the daylight saving time is not computed correctly in some cases [#6823](#)
  - Refactor the aggregation function framework to improve the execution efficiency of the `Stream` and `Hash` aggregation operators [#6852](#)
  - Fix the issue that the `Hash` aggregation operator cannot exit normally in some cases [#6982](#)
  - Fix the issue that `BIT_AND`/`BIT_OR`/`BIT_XOR` does not handle the non-integer data correctly [#6994](#)
  - Optimize the execution speed of the `REPLACE INTO` statement and increase the performance nearly 10 times [#7027](#)
  - Optimize the memory usage of time type data and decrease the memory usage of the time type data by fifty percent [#7043](#)
  - Fix the issue that the returned result is mixed with signed and unsigned integers in the `UNION` statement is not compatible with MySQL [#7112](#)
  - Fix the panic issue caused by the too much memory applied by `LPAD`/`RPAD`  $\leftrightarrow$  `/TO_BASE64`/`FROM_BASE64`/`REPEAT` [#7171](#) [#7266](#) [#7409](#) [#7431](#)
  - Fix the incorrect result when `MergeJoin`/`IndexJoin` handles the `NULL` value [#7255](#)
  - Fix the incorrect result of `Outer Join` in some cases [#7288](#)
  - Improve the error message of `Data Truncated` to facilitate locating the wrong data and the corresponding field in the table [#7401](#)
  - Fix the incorrect result for `decimal` in some cases [#7001](#) [#7113](#) [#7202](#) [#7208](#)
  - Optimize the point select performance [#6937](#)
  - Prohibit the isolation level of `Read Committed` to avoid the underlying problem [#7211](#)
  - Fix the incorrect result of `LTRIM`/`RTRIM`/`TRIM` in some cases [#7291](#)
  - Fix the issue that the `MaxOneRow` operator cannot guarantee that the returned result does not exceed one row [#7375](#)
  - Divide the Coprocessor requests with too many ranges [#7454](#)
- Statistics
  - Optimize the mechanism of statistics dynamic collection [#6796](#)
  - Fix the issue that `Auto Analyze` does not work when data is updated frequently [#7022](#)
  - Decrease the Write conflicts during the statistics dynamic update process [#7124](#)
  - Optimize the cost estimation when the statistics is incorrect [#7175](#)

- Optimize the `AccessPath` cost estimation strategy [#7233](#)
- Server
  - Fix the bug in loading privilege information [#6976](#)
  - Fix the issue that the `Kill` command is too strict with privilege check [#6954](#)
  - Fix the issue of removing some binary numeric types [#6922](#)
  - Shorten the output log [#7029](#)
  - Handle the `mismatchClusterID` issue [#7053](#)
  - Add the `advertise-address` configuration item [#7078](#)
  - Add the `GrpcKeepAlive` option [#7100](#)
  - Add the connection or `Token` time monitor [#7110](#)
  - Optimize the data decoding performance [#7149](#)
  - Add the `PROCESLIST` table in `INFORMMATION_SCHEMA` [#7236](#)
  - Fix the order issue when multiple rules are hit in verifying the privilege [#7211](#)
  - Change some default values of encoding related system variables to UTF-8 [#7198](#)
  - Make the slow query log show more detailed information [#7302](#)
  - Support registering `tidb-server` related information in PD and obtaining this information by HTTP API [#7082](#)
- Compatibility
  - Support Session variables `warning_count` and `error_count` [#6945](#)
  - Add `Scope` check when reading the system variables [#6958](#)
  - Support the `MAX_EXECUTION_TIME` syntax [#7012](#)
  - Support more statements of the `SET` syntax [#7020](#)
  - Add validity check when setting system variables [#7117](#)
  - Add the verification of the number of `PlaceHolders` in the `Prepare` statement [#7162](#)
  - Support `set character_set_results = null` [#7353](#)
  - Support the `flush status` syntax [#7369](#)
  - Fix the column size of `SET` and `ENUM` types in `information_schema` [#7347](#)
  - Support the `NATIONAL CHARACTER` syntax of statements for creating a table [#7378](#)
  - Support the `CHARACTER SET` syntax in the `LOAD DATA` statement [#7391](#)
  - Fix the column information of the `SET` and `ENUM` types [#7417](#)
  - Support the `IDENTIFIED WITH` syntax in the `CREATE USER` statement [#7402](#)
  - Fix the precision losing issue during `TIMESTAMP` computing process [#7418](#)
  - Support the validity verification of more `SYSTEM` variables [#7196](#)
  - Fix the incorrect result when the `CHAR_LENGTH` function computes the binary string [#7410](#)
  - Fix the incorrect `CONCAT` result in a statement involving `GROUP BY` [#7448](#)
  - Fix the imprecise type length issue when casting the `DECIMAL` type to the `STRING` type [#7451](#)
- DML
  - Fix the stability issue of the `Load Data` statement [#6927](#)
  - Fix the memory usage issue when performing some `Batch` operations [#7086](#)

- Improve the performance of the `Replace Into` statement [#7027](#)
- Fix the inconsistent precision issue when writing `CURRENT_TIMESTAMP` [#7355](#)
- DDL
  - Improve the method of DDL judging whether `Schema` is replicated to avoid misjudgement in some cases [#7319](#)
  - Fix the `SHOW CREATE TABLE` result in adding index process [#6993](#)
  - Allow the default value of `text/blob/json` to be `NULL` in non-restrict `sql-mode` [#7230](#)
  - Fix the `ADD INDEX` issue in some cases [#7142](#)
  - Increase the speed of adding `UNIQUE-KEY` index operation largely [#7132](#)
  - Fix the truncating issue of the prefix index in UTF-8 character set [#7109](#)
  - Add the environment variable `tidb_ddl_reorg_priority` to control the priority of the `add-index` operation [#7116](#)
  - Fix the display issue of `AUTO-INCREMENT` in `information_schema.tables` [#7037](#)
  - Support the `admin show ddl jobs <number>` command and support output specified number of DDL jobs [#7028](#)
  - Support parallel DDL job execution [#6955](#)
- [Table Partition](#) (Experimental)
  - Support top level partition
  - Support Range Partition

## 16.20.25.2 PD

- Features
  - Introduce the version control mechanism and support rolling update of the cluster with compatibility
  - Enable the `region merge` feature
  - Support the `GetPrevRegion` interface
  - Support splitting Regions in batch
  - Support storing the GC safepoint
- Improvements
  - Optimize the issue that TSO allocation is affected by the system clock going backwards
  - Optimize the performance of handling Region heartbeats
  - Optimize the Region tree performance
  - Optimize the performance of computing hotspot statistics
  - Optimize returning the error code of API interface
  - Add options of controlling scheduling strategies
  - Prohibit using special characters in `label`
  - Improve the scheduling simulator

- Support splitting Regions using statistics in `pd-ctl`
- Support formatting JSON output by calling `jq` in `pd-ctl`
- Add metrics about etcd Raft state machine
- Bug fixes
  - Fix the issue that the namespace is not reloaded after switching Leader
  - Fix the issue that namespace scheduling exceeds the schedule limit
  - Fix the issue that hotspot scheduling exceeds the schedule limit
  - Fix the issue that wrong logs are output when the PD client closes
  - Fix the wrong statistics of Region heartbeat latency

### 16.20.25.3 TiKV

- Features
  - Support `batch split` to avoid too large Regions caused by the Write operation on hot Regions
  - Support splitting Regions based on the number of rows to improve the index scan efficiency
- Performance
  - Use `LocalReader` to separate the Read operation from the raftstore thread to lower the Read latency
  - Refactor the MVCC framework, optimize the memory usage and improve the scan Read performance
  - Support splitting Regions based on statistics estimation to reduce the I/O usage
  - Optimize the issue that the Read performance is affected by continuous Write operations on the rollback record
  - Reduce the memory usage of pushdown aggregation computing
- Improvements
  - Add the pushdown support for a large number of built-in functions and better charset support
  - Optimize the GC workflow, improve the GC speed and decrease the impact of GC on the system
  - Enable `prevote` to speed up service recovery when the network is abnormal
  - Add the related configuration items of RocksDB log files
  - Adjust the default configuration of `scheduler_latch`
  - Support setting whether to compact the data in the bottom layer of RocksDB when using `tikv-ctl` to compact data manually
  - Add the check for environment variables when starting TiKV
  - Support dynamically configuring the `dynamic_level_bytes` parameter based on the existing data
  - Support customizing the log format

- Integrate tikv-fail in tikv-ctl
- Add I/O metrics of threads
- Bug fixes
  - Fix decimal related issues
  - Fix the issue that gRPC `max_send_message_len` is set mistakenly
  - Fix the issue caused by misconfiguration of `region_size`

## 16.20.26 TiDB 2.1 Beta Release Notes

On June 29, 2018, TiDB 2.1 Beta is released! Compared with TiDB 2.0, this release has great improvement in stability, SQL optimizer, statistics information, and execution engine.

### 16.20.26.1 TiDB

- SQL Optimizer
  - Optimize the selection range of `Index Join` to improve the execution performance
  - Optimize correlated subquery, push down `Filter`, and extend the index range, to improve the efficiency of some queries by orders of magnitude
  - Support `Index Hint` and `Join Hint` in the `UPDATE` and `DELETE` statements
  - Validate Hint `TIDM_SMJ` when no available index exists
  - Support pushdown of the `ABS`, `CEIL`, `FLOOR`, `IS TRUE`, and `IS FALSE` functions
  - Handle the `IF` and `IFNULL` functions especially in the constant folding process
- SQL Execution Engine
  - Implement parallel `Hash Aggregate` operators and improve the computing performance of `Hash Aggregate` by 350% in some scenarios
  - Implement parallel `Project` operators and improve the performance by 74% in some scenarios
  - Read the data of the `Inner` table and `Outer` table of `Hash Join` concurrently to improve the execution performance
  - Fix incorrect results of `INSERT ... ON DUPLICATE KEY UPDATE ...` in some scenarios
  - Fix incorrect results of the `CONCAT_WS`, `FLOOR`, `CEIL`, and `DIV` built-in functions
- Server
  - Add the HTTP API to scatter the distribution of table `Regions` in the TiKV cluster
  - Add the `auto_analyze_ratio` system variable to control the threshold value of automatic `Analyze`
  - Add the HTTP API to control whether to open the general log
  - Add the HTTP API to modify the log level online
  - Add the user information in the general log and the slow query log

- Support the server side cursor
- Compatibility
  - Support more MySQL syntax
  - Make the `bit` aggregate function support the `ALL` parameter
  - Support the `SHOW PRIVILEGES` statement
- DML
  - Decrease the memory usage of the `INSERT INTO SELECT` statement
  - Fix the performance issue of `PlanCache`
  - Add the `tidb_retry_limit` system variable to control the automatic retry times of transactions
  - Add the `tidb_disable_txn_auto_retry` system variable to control whether the transaction tries automatically
  - Fix the accuracy issue of the written data of the `time` type
  - Support the queue of locally conflicted transactions to optimize the conflicted transaction performance
  - Fix `Affected Rows` of the `UPDATE` statement
  - Optimize the statement performance of `insert ignore on duplicate key ↪ update`
- DDL
  - Optimize the execution speed of the `CreateTable` statement
  - Optimize the execution speed of `ADD INDEX` and improve it greatly in some scenarios
  - Fix the issue that the number of added columns by `Alter table add column` exceeds the limit of the number of table columns
  - Fix the issue that DDL job retries lead to an increasing pressure on TiKV in abnormal conditions
  - Fix the issue that TiDB continuously reloads the schema information in abnormal conditions
  - Do not output the `FOREIGN KEY` related information in the result of `SHOW CREATE ↪ TABLE`
  - Support the `select tidb_is_ddl_owner()` statement to facilitate judging whether TiDB is DDL Owner
  - Fix the issue that the index is deleted in the `Year` type in some scenarios
  - Fix the renaming table issue in the concurrent execution scenario
  - Support the `AlterTableForce` syntax
  - Support the `AlterTableRenameIndex` syntax with `FromKey` and `ToKey`
  - Add the table name and database name in the output information of `admin show ↪ ddl jobs`

## 16.20.26.2 PD

- Enable Raft PreVote between PD nodes to avoid leader reelection when network recovers after network isolation
- Optimize the issue that Balance Scheduler schedules small Regions frequently
- Optimize the hotspot scheduler to improve its adaptability in traffic statistics information jitters
- Skip the Regions with a large number of rows when scheduling `region merge`
- Enable `raft learner` by default to lower the risk of unavailable data caused by machine failure during scheduling
- Remove `max-replica` from `pd-recover`
- Add `Filter` metrics
- Fix the issue that Region information is not updated after `tikv-ctl unsafe recovery`
- Fix the issue that TiKV disk space is used up caused by replica migration in some scenarios
- Compatibility notes
  - Do not support rolling back to v2.0.x or earlier due to update of the new version storage engine
  - Enable `raft learner` by default in the new version of PD. If the cluster is upgraded from 1.x to 2.1, the machine should be stopped before upgrade or a rolling update should be first applied to TiKV and then PD

### 16.20.26.3 TiKV

- Upgrade Rust to the `nightly-2018-06-14` version
- Enable Raft PreVote to avoid leader reelection generated when network recovers after network isolation
- Add a metric to display the number of files and `ingest` related information in each layer of RocksDB
- Print `key` with too many versions when GC works
- Use `static metric` to optimize multi-label metric performance (YCSB `raw get` is improved by 3%)
- Remove `box` in multiple modules and use patterns to improve the operating performance (YCSB `raw get` is improved by 3%)
- Use `asynchronous log` to improve the performance of writing logs
- Add a metric to collect the thread status
- Decrease memory copy times by decreasing `box` used in the application to improve the performance

## 16.21 v2.0

### 16.21.1 TiDB 2.0.11 Release Notes

On January 03, 2019, TiDB 2.0.11 is released. The corresponding TiDB Ansible 2.0.11 is also released. Compared with TiDB 2.0.10, this release has great improvement in system compatibility and stability.

### 16.21.1.1 TiDB

- Fix the issue that the error is not handled properly when PD is in an abnormal condition [#8764](#)
- Fix the issue that the `Rename` operation on a table in TiDB is not compatible with that in MySQL [#8809](#)
- Fix the issue that the error message is wrongly reported when the `ADMIN CHECK TABLE` operation is performed in the process of executing the `ADD INDEX` statement [#8750](#)
- Fix the issue that the prefix index range is incorrect in some cases [#8877](#)
- Fix the panic issue of the `UPDATE` statement when columns are added in some cases [#8904](#)

### 16.21.1.2 TiKV

- Fix two issues about Region merge [#4003](#), [#4004](#)

## 16.21.2 TiDB 2.0.10 Release Notes

On December 18, 2018, TiDB 2.0.10 is released. The corresponding TiDB Ansible 2.0.10 is also released. Compared with TiDB 2.0.9, this release has great improvement in system compatibility and stability.

### 16.21.2.1 TiDB

- Fix the possible issue caused by canceling a DDL job [#8513](#)
- Fix the issue that the `ORDER BY` and `UNION` clauses cannot quote the column including a table name [#8514](#)
- Fix the issue that the `UNCOMPRESS` function does not judge the incorrect input length [#8607](#)
- Fix the issue encountered by `ANSI_QUOTES SQL_MODE` when upgrading TiDB [#8575](#)
- Fix the issue that `select` returns the wrong result in some cases [#8570](#)
- Fix the possible issue that TiDB cannot exit when it receives the exit signal [#8501](#)
- Fix the issue that `IndexLookUpJoin` returns the wrong result in some cases [#8508](#)
- Avoid pushing down the filter containing `GetVar` or `SetVar` [#8454](#)
- Fix the issue that the result length of the `UNION` clauses is incorrect in some cases [#8491](#)
- Fix the issue of `PREPARE FROM @var_name` [#8488](#)
- Fix the panic issue when dumping statistics information in some cases [#8464](#)
- Fix the statistics estimation issue of point queries in some cases [#8493](#)
- Fix the panic issue when the returned default `enum` value is a string [#8476](#)
- Fix the issue that too much memory is consumed in the scenario of wide tables [#8467](#)
- Fix the issue encountered when Parser incorrectly formats the mod opcode [#8431](#)

- Fix the panic issue caused by adding foreign key constraints in some cases [#8421](#), [#8410](#)
- Fix the issue that the `YEAR` column type incorrectly converts the zero value [#8396](#)
- Fix the panic issue occurred when the argument of the `VALUES` function is not a column [#8404](#)
- Disable Plan Cache for statements containing subqueries [#8395](#)

#### 16.21.2.2 PD

- Fix the possible issue that RaftCluster cannot stop caused by deadlock [#1370](#)

#### 16.21.2.3 TiKV

- Avoid transferring the leader to a newly created peer, to optimize the possible delay [#3929](#)
- Fix redundant Region heartbeats [#3930](#)

### 16.21.3 TiDB 2.0.9 Release Notes

On November 19, 2018, TiDB 2.0.9 is released. Compared with TiDB 2.0.8, this release has great improvement in system compatibility and stability.

#### 16.21.3.1 TiDB

- Fix the issue caused by the empty statistics histogram [#7927](#)
- Fix the panic issue of the `UNION ALL` statement in some cases [#7942](#)
- Fix the stack overflow issue caused by wrong DDL Jobs [#7959](#)
- Add the slow log for the `Commit` operation [#7983](#)
- Fix the panic issue caused by the too large `Limit` value [#8004](#)
- Support specifying the `utf8mb4` character set in the `USING` clause [#8048](#)
- Make the `TRUNCATE` built-in function support parameters of unsigned integer type [#8069](#)
- Fix the selectivity estimation issue of the primary key for the statistics module in some cases [#8150](#)
- Add the `Session` variable to control whether `_tidb_rowid` is allowed to be written in [#8126](#)
- Fix the panic issue of `PhysicalProjection` in some cases [#8154](#)
- Fix the unstable results of the `Union` statement in some cases [#8168](#)
- Fix the issue that `NULL` is not returned by `values` in the non-`Insert` statement [#8179](#)
- Fix the issue that the statistics module cannot clear the outdated data in some cases [#8184](#)
- Make the maximum allowed running time for a transaction a configurable option [#8209](#)
- Fix the wrong comparison algorithm of `expression rewriter` in some cases [#8288](#)

- Eliminate the extra columns generated by the `UNION ORDER BY` statement [#8307](#)
- Support the `admin show next_row_id` statement [#8274](#)
- Fix the escape issue of special characters in the `Show Create Table` statement [#8321](#)
- Fix the unexpected errors in the `UNION` statement in some cases [#8318](#)
- Fix the issue that canceling a DDL job causes no rollback of a schema in some cases [#8312](#)
- Change `tidb_max_chunk_size` to a global variable [#8333](#)
- Add an upper bound to the `Scan` command of ticlient, to avoid overbound scan [#8309](#) [#8310](#)

### 16.21.3.2 PD

- Fix the issue that the PD server gets stuck caused by etcd startup failure [#1267](#)
- Fix the issues related to `pd-ctl` reading the Region key [#1298](#) [#1299](#) [#1308](#)
- Fix the issue that the `regions/check` API returns the wrong result [#1311](#)
- Fix the issue that PD cannot restart join after a PD join failure [#1279](#)

### 16.21.3.3 TiKV

- Add the end-key limit to the `kv_scan` interface [#3749](#)
- Abandon the `max-tasks-xxx` configuration and add `max-tasks-per-worker-xxx` [#3093](#)
- Fix the `CompactFiles` issue in RocksDB [#3789](#)

## 16.21.4 TiDB 2.0.8 Release Notes

On October 16, 2018, TiDB 2.0.8 is released. Compared with TiDB 2.0.7, this release has great improvement in system compatibility and stability.

### 16.21.4.1 TiDB

- Improvement
  - Slow down the AUTO-ID increasing speed when the `Update` statement does not modify the corresponding AUTO-INCREMENT column [#7846](#)
- Bug fixes
  - Quickly create a new etcd session to recover the service when the PD leader goes down [#7810](#)
  - Fix the issue that the time zone is not considered when the default value of the `DateTime` type is calculated [#7672](#)
  - Fix the issue that `duplicate key update` inserts values incorrectly in some conditions [#7685](#)

- Fix the issue that the predicate conditions of `UnionScan` are not pushed down [#7726](#)
- Fix the issue that the time zone is not correctly handled when you add the `TIMESTAMP` index [#7812](#)
- Fix the memory leak issue caused by the statistics module in some conditions [#7864](#)
- Fix the issue that the results of `ANALYZE` cannot be obtained in some abnormal conditions [#7871](#)
- Do not fold the function `SYSDATE`, to ensure the returned results are correct [#7894](#)
- Fix the `substring_index` panic issue in some conditions [#7896](#)
- Fix the issue that `OUTER JOIN` is mistakenly converted to `INNER JOIN` in some conditions [#7899](#)

#### 16.21.4.2 TiKV

- Bug fix
  - Fix the issue that the memory consumed by Raftstore `EntryCache` keeps increasing when a node goes down [#3529](#)

#### 16.21.5 TiDB 2.0.7 Release Notes

On September 7, 2018, TiDB 2.0.7 is released. Compared with TiDB 2.0.6, this release has great improvement in system compatibility and stability.

##### 16.21.5.1 TiDB

- New Feature
  - Add the `PROCESSLIST` table in `information_schema` [#7286](#)
- Improvement
  - Collect more details about SQL statement execution and output the information in the `SLOW QUERY` log [#7364](#)
  - Drop the partition information in `SHOW CREATE TABLE` [#7388](#)
  - Improve the execution efficiency of the `ANALYZE` statement by setting it to the RC isolation level and low priority [#7500](#)
  - Speed up adding a unique index [#7562](#)
  - Add an option of controlling the DDL concurrency [#7563](#)
- Bug Fixes
  - Fix the issue that `USE INDEX(PRIMARY)` cannot be used in a table whose primary key is an integer [#7298](#)

- Fix the issue that `Merge Join` and `Index Join` output incorrect results when the inner row is `NULL` [#7301](#)
- Fix the issue that `Join` outputs an incorrect result when the chunk size is set too small [#7315](#)
- Fix the panic issue caused by a statement of creating a table involving `range`  $\hookrightarrow$  `column` [#7379](#)
- Fix the issue that `admin check table` mistakenly reports an error of a time-type column [#7457](#)
- Fix the issue that the data with a default value `current_timestamp` cannot be queried using the `=` condition [#7467](#)
- Fix the issue that the zero-length parameter inserted by using the `ComStmtSendLongData`  $\hookrightarrow$  `command` is mistakenly parsed to `NULL` [#7508](#)
- Fix the issue that `auto analyze` is repeatedly executed in specific scenarios [#7556](#)
- Fix the issue that the parser cannot parse a single line comment ended with a newline character [#7635](#)

### 16.21.5.2 TiKV

- Improvement
  - Open the `dynamic-level-bytes` parameter in an empty cluster by default, to reduce space amplification
- Bug Fix
  - Update `approximate size` and `approximate keys count` of a Region after Region merging

### 16.21.6 TiDB 2.0.6 Release Notes

On August 6, 2018, TiDB 2.0.6 is released. Compared with TiDB 2.0.5, this release has great improvement in system compatibility and stability.

#### 16.21.6.1 TiDB

- Improvements
  - Make “set system variable” log shorter to save disk space [#7031](#)
  - Record slow operations during the execution of `ADD INDEX` in the log, to make troubleshooting easier [#7083](#)
  - Reduce transaction conflicts when updating statistics [#7138](#)
  - Improve the accuracy of row count estimation when the values pending to be estimated exceeds the statistics range [#7185](#)
  - Choose the table with a smaller estimated row count as the outer table for `Index`  $\hookrightarrow$  `Join` to improve its execution efficiency [#7277](#)

- Add the recover mechanism for panics occurred during the execution of `ANALYZE ↔ TABLE`, to avoid that the tidb-server is unavailable caused by abnormal behavior in the process of collecting statistics [#7228](#)
- Return NULL and the corresponding warning when the results of `RPAD/LPAD` exceed the value of the `max_allowed_packet` system variable, compatible with MySQL [#7244](#)
- Set the upper limit of placeholders count in the `PREPARE` statement to 65535, compatible with MySQL [#7250](#)
- Bug Fixes
  - Fix the issue that the `DROP USER` statement is incompatible with MySQL behavior in some cases [#7014](#)
  - Fix the issue that statements like `INSERT/LOAD DATA` meet OOM after opening `tidb_batch_insert` [#7092](#)
  - Fix the issue that the statistics fail to automatically update when the data of a table keeps updating [#7093](#)
  - Fix the issue that the firewall breaks inactive gPRC connections [#7099](#)
  - Fix the issue that prefix index returns a wrong result in some scenarios [#7126](#)
  - Fix the panic issue caused by outdated statistics in some scenarios [#7155](#)
  - Fix the issue that one piece of index data is missed after the `ADD INDEX` operation in some scenarios [#7156](#)
  - Fix the wrong result issue when querying NULL values using the unique index in some scenarios [#7172](#)
  - Fix the messy code issue of the `DECIMAL` multiplication result in some scenarios [#7212](#)
  - Fix the wrong result issue of `DECIMAL` modulo operation in some scenarios [#7245](#)
  - Fix the issue that the `UPDATE/DELETE` statement in a transaction returns a wrong result under some special sequence of statements [#7219](#)
  - Fix the panic issue of the `UNION ALL/UPDATE` statement during the process of building the execution plan in some scenarios [#7225](#)
  - Fix the issue that the range of prefix index is calculated incorrectly in some scenarios [#7231](#)
  - Fix the issue that the `LOAD DATA` statement fails to write the binlog in some scenarios [#7242](#)
  - Fix the wrong result issue of `SHOW CREATE TABLE` during the execution process of `ADD INDEX` in some scenarios [#7243](#)
  - Fix the issue that panic occurs when `Index Join` does not initialize timestamps in some scenarios [#7246](#)
  - Fix the false alarm issue when `ADMIN CHECK TABLE` mistakenly uses the timezone in the session [#7258](#)
  - Fix the issue that `ADMIN CLEANUP INDEX` does not clean up the index in some scenarios [#7265](#)
  - Disable the Read Committed isolation level [#7282](#)

### 16.21.6.2 TiKV

- Improvements
  - Enlarge scheduler's default slots to reduce false conflicts
  - Reduce continuous records of rollback transactions, to improve the Read performance when conflicts are extremely severe
  - Limit the size and number of RocksDB log files, to reduce unnecessary disk usage in long-running condition
- Bug Fixes
  - Fix the crash issue when converting the data type from string to decimal

### 16.21.7 TiDB 2.0.5 Release Notes

On July 6, 2018, TiDB 2.0.5 is released. Compared with TiDB 2.0.4, this release has great improvement in system compatibility and stability.

#### 16.21.7.1 TiDB

- New Features
  - Add the `tidb_disable_txn_auto_retry` system variable which is used to disable the automatic retry of transactions [#6877](#)
- Improvements
  - Optimize the cost calculation of `Selection` to make the result more accurate [#6989](#)
  - Select the query condition that completely matches the unique index or the primary key as the query path directly [#6966](#)
  - Execute necessary cleanup when failing to start the service [#6964](#)
  - Handle `\N` as `NULL` in the `Load Data` statement [#6962](#)
  - Optimize the code structure of `CBO` [#6953](#)
  - Report the monitoring metrics earlier when starting the service [#6931](#)
  - Optimize the format of slow queries by removing the line breaks in SQL statements and adding user information [#6920](#)
  - Support multiple asterisks in comments [#6858](#)
- Bug Fixes
  - Fix the issue that `KILL QUERY` always requires `SUPER` privilege [#7003](#)
  - Fix the issue that users might fail to login when the number of users exceeds 1024 [#6986](#)
  - Fix an issue about inserting unsigned `float/double` data [#6940](#)
  - Fix the compatibility of the `COM_FIELD_LIST` command to resolve the panic issue in some MariaDB clients [#6929](#)
  - Fix the `CREATE TABLE IF NOT EXISTS LIKE` behavior [#6928](#)
  - Fix an issue in the process of TopN pushdown [#6923](#)
  - Fix the ID record issue of the currently processing row when an error occurs in executing `Add Index` [#6903](#)

### 16.21.7.2 PD

- Fix the issue that replicas migration uses up TiKV disks space in some scenarios
- Fix the crash issue caused by `AdjacentRegionScheduler`

### 16.21.7.3 TiKV

- Fix the potential overflow issue in decimal operations
- Fix the dirty read issue that might occur in the process of merging

## 16.21.8 TiDB 2.0.4 Release Notes

On June 15, 2018, TiDB 2.0.4 is released. Compared with TiDB 2.0.3, this release has great improvement in system compatibility and stability.

### 16.21.8.1 TiDB

- Support the `ALTER TABLE t DROP COLUMN a CASCADE` syntax
- Support configuring the value of `tidb_snapshot` to TSO
- Refine the display of statement types in monitoring items
- Optimize the accuracy of query cost estimation
- Configure the `backoff max delay` parameter of gRPC
- Support configuring the memory threshold of a single statement in the configuration file
- Refactor the error of Optimizer
- Fix the side effects of the `Cast Decimal` data
- Fix the wrong result issue of the `Merge Join` operator in specific scenarios
- Fix the issue of converting the Null object to String
- Fix the issue of casting the JSON type of data to the JSON type
- Fix the issue that the result order is not consistent with MySQL in the condition of `Union + OrderBy`
- Fix the compliance rules issue when the `Union` statement checks the `Limit/OrderBy` clause
- Fix the compatibility issue of the `Union All` result
- Fix a bug in predicate pushdown
- Fix the compatibility issue of the `Union` statement with the `For Update` clause
- Fix the issue that the `concat_ws` function mistakenly truncates the result

### 16.21.8.2 PD

- Improve the behavior of the unset scheduling argument `max-pending-peer-count` by changing it to no limit for the maximum number of `PendingPeers`

### 16.21.8.3 TiKV

- Add the RocksDB `PerfContext` interface for debugging
- Remove the `import-mode` parameter
- Add the `region-properties` command for `tikv-ctl`
- Fix the issue that `reverse-seek` is slow when many RocksDB tombstones exist
- Fix the crash issue caused by `do_sub`
- Make GC record the log when GC encounters many versions of data

### 16.21.9 TiDB 2.0.3 Release Notes

On June 1, 2018, TiDB 2.0.3 is released. Compared with TiDB 2.0.2, this release has great improvement in system compatibility and stability.

#### 16.21.9.1 TiDB

- Support modifying the log level online
- Support the `COM_CHANGE_USER` command
- Support using the `TIME` type parameters under the binary protocol
- Optimize the cost estimation of query conditions with the `BETWEEN` expression
- Do not display the `FOREIGN KEY` information in the result of `SHOW CREATE TABLE`
- Optimize the cost estimation for queries with the `LIMIT` clause
- Fix the issue about the `YEAR` type as the unique index
- Fix the issue about `ON DUPLICATE KEY UPDATE` in conditions without the unique index
- Fix the compatibility issue of the `CEIL` function
- Fix the accuracy issue of the `DIV` calculation in the `DECIMAL` type
- Fix the false alarm of `ADMIN CHECK TABLE`
- Fix the panic issue of `MAX/MIN` under specific expression parameters
- Fix the issue that the result of `JOIN` is null in special conditions
- Fix the `IN` expression issue when building and querying Range
- Fix a Range calculation issue when using `Prepare` to query and `Plan Cache` is enabled
- Fix the issue that the Schema information is frequently loaded in abnormal conditions

#### 16.21.9.2 PD

- Fix the panic issue when collecting hot-cache metrics in specific conditions
- Fix the issue about scheduling of the obsolete Regions

#### 16.21.9.3 TiKV

- Fix the bug that the learner flag mistakenly reports to PD
- Report an error instead of getting a result if `divisor/dividend` is 0 in `do_div_mod`

### 16.21.10 TiDB 2.0.2 Release Notes

On May 21, 2018, TiDB 2.0.2 is released. Compared with TiDB 2.0.1, this release has great improvement in system stability.

#### 16.21.10.1 TiDB

- Fix the issue of pushing down the Decimal division expression
- Support using the `USE INDEX` syntax in the `Delete` statement
- Forbid using the `shard_row_id_bits` feature in columns with `Auto-Increment`
- Add the timeout mechanism for writing Binlog

#### 16.21.10.2 PD

- Make the balance leader scheduler filter the disconnected nodes
- Modify the timeout of the transfer leader operator to 10s
- Fix the issue that the label scheduler does not schedule when the cluster Regions are in an unhealthy state
- Fix the improper scheduling issue of `evict leader scheduler`

#### 16.21.10.3 TiKV

- Fix the issue that the Raft log is not printed
- Support configuring more gRPC related parameters
- Support configuring the timeout range of leader election
- Fix the issue that the obsolete learner is not deleted
- Fix the issue that the snapshot intermediate file is mistakenly deleted

### 16.21.11 TiDB 2.0.1 Release Notes

On May 16, 2018, TiDB 2.0.1 is released. Compared with TiDB 2.0.0 (GA), this release has great improvement in MySQL compatibility and system stability.

#### 16.21.11.1 TiDB

- Update the progress of `Add Index` to the DDL job information in real time
- Add the `tidb_auto_analyze_ratio` session variable to control the threshold value of automatic statistics update
- Fix an issue that not all residual states are cleaned up when the transaction commit fails
- Fix a bug about adding indexes in some conditions

- Fix the correctness related issue when DDL modifies surface operations in some concurrent scenarios
- Fix a bug that the result of `LIMIT` is incorrect in some conditions
- Fix a capitalization issue of the `ADMIN CHECK INDEX` statement to make its index name case insensitive
- Fix a compatibility issue of the `UNION` statement
- Fix a compatibility issue when inserting data of `TIME` type
- Fix a goroutine leak issue caused by `copIteratorTaskSender` in some conditions
- Add an option for TiDB to control the behaviour of Binlog failure
- Refactor the `Coprocessor` slow log to distinguish between the scenario of tasks with long processing time and long waiting time
- Log nothing when meeting MySQL protocol handshake error, to avoid too many logs caused by the load balancer Keep Alive mechanism
- Refine the “Out of range value for column” error message
- Fix a bug when there is a subquery in an `Update` statement
- Change the behaviour of handling `SIGTERM`, and do not wait for all queries to terminate anymore

#### 16.21.11.2 PD

- Add the `Scatter Range` scheduler to balance Regions with the specified key range
- Optimize the scheduling of Merge Region to prevent the newly split Region from being merged
- Add Learner related metrics
- Fix the issue that the scheduler is mistakenly deleted after restart
- Fix the error that occurs when parsing the configuration file
- Fix the issue that the etcd leader and the PD leader are not replicated
- Fix the issue that Learner still appears after it is closed
- Fix the issue that Regions fail to load because the packet size is too large

#### 16.21.11.3 TiKV

- Fix the issue that `SELECT FOR UPDATE` prevents others from reading
- Optimize the slow query log
- Reduce the number of `thread_yield` calls
- Fix the bug that raftstore is accidentally blocked when generating the snapshot
- Fix the issue that Learner cannot be successfully elected in special conditions
- Fix the issue that split might cause dirty read in extreme conditions
- Correct the default value of the read thread pool configuration
- Speed up Delete Range

#### 16.21.12 TiDB 2.0 Release Notes

On April 27, 2018, TiDB 2.0 GA is released! Compared with TiDB 1.0, this release has great improvement in MySQL compatibility, SQL optimizer, executor, and stability.

### 16.21.12.1 TiDB

- SQL Optimizer
  - Use more compact data structure to reduce the memory usage of statistics information
  - Speed up loading statistics information when starting a tidb-server process
  - Support updating statistics information dynamically **experimental**
  - Optimize the cost model to provide more accurate query cost evaluation
  - Use **Count-Min Sketch** to estimate the cost of point queries more accurately
  - Support analyzing more complex conditions to make full use of indexes
  - Support manually specifying the **Join** order using the **STRAIGHT\_JOIN** syntax
  - Use the Stream Aggregation operator when the **GROUP BY** clause is empty to improve the performance
  - Support using indexes for the **MAX/MIN** function
  - Optimize the processing algorithms for correlated subqueries to support decorrelating more types of correlated subqueries and transform them to **Left Outer**  $\leftrightarrow$  **Join**
  - Extend **IndexLookupJoin** to be used in matching the index prefix
- SQL Execution Engine
  - Refactor all operators using the Chunk architecture, improve the execution performance of analytical queries, and reduce memory usage. There is a significant improvement in the TPC-H benchmark result.
  - Support the Streaming Aggregation operators pushdown
  - Optimize the **Insert Into Ignore** statement to improve the performance by over 10 times
  - Optimize the **Insert On Duplicate Key Update** statement to improve the performance by over 10 times
  - Optimize **Load Data** to improve the performance by over 10 times
  - Push down more data types and functions to TiKV
  - Support computing the memory usage of physical operators, and specifying the processing behavior in the configuration file and system variables when the memory usage exceeds the threshold
  - Support limiting the memory usage by a single SQL statement to reduce the risk of OOM
  - Support using implicit RowID in CRUD operations
  - Improve the performance of point queries
- Server
  - Support the Proxy Protocol
  - Add more monitoring metrics and refine the log
  - Support validating the configuration files
  - Support obtaining the information of TiDB parameters through HTTP API
  - Resolve Lock in the Batch mode to speed up garbage collection

- Support multi-threaded garbage collection
- Support TLS
- Compatibility
  - Support more MySQL syntaxes
  - Support modifying the `lower_case_table_names` system variable in the configuration file to support the OGG data replication tool
  - Improve compatibility with the Navicat management tool
  - Support displaying the table creating time in `Information_Schema`
  - Fix the issue that the return types of some functions/expressions differ from MySQL
  - Improve compatibility with JDBC
  - Support more SQL Modes
- DDL
  - Optimize the `Add Index` operation to greatly improve the execution speed in some scenarios
  - Attach a lower priority to the `Add Index` operation to reduce the impact on online business
  - Output more detailed status information of the DDL jobs in `Admin Show DDL ↔ Jobs`
  - Support querying the original statements of currently running DDL jobs using `Admin Show DDL Job Queries JobID`
  - Support recovering the index data using `Admin Recover Index` for disaster recovery
  - Support modifying Table Options using the `Alter` statement

### 16.21.12.2 PD

- Support `Region Merge`, to merge empty Regions after deleting data **experimental**
- Support `Raft Learner` **experimental**
- Optimize the scheduler
  - Make the scheduler to adapt to different Region sizes
  - Improve the priority and speed of restoring data during TiKV outage
  - Speed up data transferring when removing a TiKV node
  - Optimize the scheduling policies to prevent the disks from becoming full when the space of TiKV nodes is insufficient
  - Improve the scheduling efficiency of the balance-leader scheduler
  - Reduce the scheduling overhead of the balance-region scheduler
  - Optimize the execution efficiency of the the hot-region scheduler
- Operations interface and configuration
  - Support TLS

- Support prioritizing the PD leaders
- Support configuring the scheduling policies based on labels
- Support configuring stores with a specific label not to schedule the Raft leader
- Support splitting Region manually to handle the hotspot in a single Region
- Support scattering a specified Region to manually adjust Region distribution in some cases
- Add check rules for configuration parameters and improve validity check of the configuration items
- Debugging interface
  - Add the Drop Region debugging interface
  - Add the interfaces to enumerate the health status of each PD
- Statistics
  - Add statistics about abnormal Regions
  - Add statistics about Region isolation level
  - Add scheduling related metrics
- Performance
  - Keep the PD leader and the etcd leader together in the same node to improve write performance
  - Optimize the performance of Region heartbeat

### 16.21.12.3 TiKV

- Features
  - Protect critical configuration from incorrect modification
  - Support Region Merge **experimental**
  - Add the Raw DeleteRange API
  - Add the GetMetric API
  - Add Raw Batch Put, Raw Batch Get, Raw Batch Delete and Raw Batch Scan
  - Add Column Family options for the RawKV API and support executing operation on a specific Column Family
  - Support Streaming and Streaming Aggregation in Coprocessor
  - Support configuring the request timeout of Coprocessor
  - Carry timestamps with Region heartbeats
  - Support modifying some RocksDB parameters online, such as `block-cache-size`
  - Support configuring the behavior of Coprocessor when it encounters some warnings or errors
  - Support starting in the importing data mode to reduce write amplification during the data importing process
  - Support manually splitting Region in halves
  - Improve the data recovery tool `tikv-ctl`

- Return more statistics in Coprocessor to guide the behavior of TiDB
- Support the `ImportSST` API to import SST files **experimental**
- Add the TiKV Importer binary to integrate with TiDB Lightning to import data quickly **experimental**
- Performance
  - Optimize read performance using `ReadPool` and increase the `raw_get/get/`  $\leftrightarrow$  `batch_get` by 30%
  - Improve metrics performance
  - Inform PD immediately once the Raft snapshot process is completed to speed up balancing
  - Solve performance jitter caused by RocksDB flushing
  - Optimize the space reclaiming mechanism after deleting data
  - Speed up garbage cleaning while starting the server
  - Reduce the I/O overhead during replica migration using `DeleteFilesInRanges`
- Stability
  - Fix the issue that gRPC call does not get returned when the PD leader switches
  - Fix the issue that it is slow to offline nodes caused by snapshots
  - Limit the temporary space usage consumed by migrating replicas
  - Report the Regions that cannot elect a leader for a long time
  - Update the Region size information in time according to compaction events
  - Limit the size of scan lock to avoid request timeout
  - Limit the memory usage when receiving snapshots to avoid OOM
  - Increase the speed of CI test
  - Fix the OOM issue caused by too many snapshots
  - Configure `keepalive` of gRPC
  - Fix the OOM issue caused by an increase of the Region number

#### 16.21.12.4 TiSpark

TiSpark uses a separate version number. The current TiSpark version is 1.0 GA. The components of TiSpark 1.0 provide distributed computing of TiDB data using Apache Spark.

- Provide a gRPC communication framework to read data from TiKV
- Provide encoding and decoding of TiKV component data and communication protocol
- Provide calculation pushdown, which includes:
  - Aggregate pushdown
  - Predicate pushdown
  - TopN pushdown
  - Limit pushdown
- Provide index related support
  - Transform predicate into Region key range or secondary index

- Optimize `Index Only` queries - Adaptively downgrade index scan to table scan per Region
- Provide cost-based optimization
  - Support statistics
  - Select index
  - Estimate broadcast table cost
- Provide support for multiple Spark interfaces
  - Support Spark Shell
  - Support ThriftServer/JDBC
  - Support Spark-SQL interaction
  - Support PySpark Shell
  - Support SparkR

### 16.21.13 TiDB 2.0 RC5 Release Notes

On April 17, 2018, TiDB 2.0 RC5 is released. This release has great improvement in MySQL compatibility, SQL optimization and stability.

#### 16.21.13.1 TiDB

- Fix the issue about applying the `Top-N` pushdown rule
- Fix the estimation of the number of rows for the columns that contain `NULL` values
- Fix the zero value of the `Binary` type
- Fix the `BatchGet` issue within a transaction
- Clean up the written data while rolling back the `Add Index` operation, to reduce consumed space
- Optimize the `insert on duplicate key update` statement to improve the performance by 10 times
- Fix the issue about the type of the results returned by the `UNIX_TIMESTAMP` function
- Fix the issue that the `NULL` value is inserted while adding `NOT NULL` columns
- Support showing memory usage of the executing statements in the `Show Process List` statement
- Fix the issue that `Alter Table Modify Column` reports an error in extreme conditions
- Support setting the table comment using the `Alter` statement

#### 16.21.13.2 PD

- Add support for Raft Learner
- Optimize the Balance Region Scheduler to reduce scheduling overhead
- Adjust the default value of `schedule-limit` configuration
- Fix the issue of allocating ID frequently
- Fix the compatibility issue when adding a new scheduler

### 16.21.13.3 TiKV

- Support the Region specified by `compact` in `tikv-ctl`
- Support Batch Put, Batch Get, Batch Delete and Batch Scan in the RawKVClient
- Fix the OOM issue caused by too many snapshots
- Return more detailed error information in Coprocessor
- Support dynamically modifying the `block-cache-size` in TiKV through `tikv-ctl`
- Further improve `importer`
- Simplify the `ImportSST::Upload` interface
- Configure the `keepalive` property of gRPC
- Split `tikv-importer` from TiKV as an independent binary
- Provide statistics about the number of rows scanned by each `scan range` in Coprocessor
- Fix the compilation issue on the macOS system
- Fix the issue of misusing a RocksDB metric
- Support the `overflow` as `warning` option in Coprocessor

### 16.21.14 TiDB 2.0 RC4 Release Notes

On March 30, 2018, TiDB 2.0 RC4 is released. This release has great improvement in MySQL compatibility, SQL optimization and stability.

#### 16.21.14.1 TiDB

- Support `SHOW GRANTS FOR CURRENT_USER();`
- Fix the issue that the `Expression` in `UnionScan` is not cloned
- Support the `SET TRANSACTION` syntax
- Fix the potential goroutine leak issue in `copIterator`
- Fix the issue that `admin check table` misjudges the unique index including null
- Support displaying floating point numbers using scientific notation
- Fix the type inference issue during binary literal computing
- Fix the issue in parsing the `CREATE VIEW` statement
- Fix the panic issue when one statement contains both `ORDER BY` and `LIMIT 0`
- Improve the execution performance of `DecodeBytes`
- Optimize `LIMIT 0` to `TableDual`, to avoid building useless execution plans

#### 16.21.14.2 PD

- Support splitting Region manually to handle the hot spot in a single Region
- Fix the issue that the label property is not displayed when `pdctl runs config show`  
↪ `all`
- Optimize metrics and code structure

### 16.21.14.3 TiKV

- Limit the memory usage during receiving snapshots, to avoid OOM in extreme conditions
- Support configuring the behavior of Coprocessor when it encounters warnings
- Support importing the data pattern in TiKV
- Support splitting Region in the middle
- Increase the speed of CI test
- Use `crossbeam channel`
- Fix the issue that too many logs are output caused by leader missing when TiKV is isolated

### 16.21.15 TiDB 2.0 RC3 Release Notes

On March 23, 2018, TiDB 2.0 RC3 is released. This release has great improvement in MySQL compatibility, SQL optimization and stability.

#### 16.21.15.1 TiDB

- Fix the wrong result issue of `MAX/MIN` in some scenarios
- Fix the issue that the result of `Sort Merge Join` does not show in order of Join Key in some scenarios
- Fix the error of comparison between `uint` and `int` in boundary conditions
- Optimize checks on length and precision of the floating point type, to improve compatibility with MySQL
- Improve the parsing error log of time type and add more error information
- Improve memory control and add statistics about `IndexLookupExecutor` memory
- Optimize the execution speed of `ADD INDEX` to greatly increase the speed in some scenarios
- Use the Stream Aggregation operator when the `GROUP BY` substatement is empty, to increase the speed
- Support closing the `Join Reorder` optimization in the optimizer using `STRAIGHT_JOIN`
- Output more detailed status information of DDL jobs in `ADMIN SHOW DDL JOBS`
- Support querying the original statements of currently running DDL jobs using `ADMIN ↔ SHOW DDL JOB QUERIES`
- Support recovering the index data using `ADMIN RECOVER INDEX` for disaster recovery
- Attach a lower priority to the `ADD INDEX` operation to reduce the impact on online business
- Support aggregation functions with JSON type parameters, such as `SUM/AVG`
- Support modifying the `lower_case_table_names` system variable in the configuration file, to support the OGG data replication tool
- Improve compatibility with the Navicat management tool
- Support using implicit RowID in CRUD operations

### 16.21.15.2 PD

- Support Region Merge, to merge empty Regions or small Regions after deleting data
- Ignore the nodes that have a lot of pending peers during adding replicas, to improve the speed of restoring replicas or making nodes offline
- Fix the frequent scheduling issue caused by a large number of empty Regions
- Optimize the scheduling speed of leader balance in scenarios of unbalanced resources within different labels
- Add more statistics about abnormal Regions

### 16.21.15.3 TiKV

- Support Region Merge
- Inform PD immediately once the Raft snapshot process is completed, to speed up balancing
- Add the Raw DeleteRange API
- Add the GetMetric API
- Reduce the I/O fluctuation caused by RocksDB sync files
- Optimize the space reclaiming mechanism after deleting data
- Improve the data recovery tool `tikv-ctl`
- Fix the issue that it is slow to make nodes down caused by snapshot
- Support streaming in Coprocessor
- Support Readpool and increase the `raw_get/get/batch_get` by 30%
- Support configuring the request timeout of Coprocessor
- Support streaming aggregation in Coprocessor
- Carry time information in Region heartbeats
- Limit the space usage of snapshot files to avoid consuming too much disk space
- Record and report the Regions that cannot elect a leader for a long time
- Speed up garbage cleaning when starting the server
- Update the size information about the corresponding Region according to compaction events
- Limit the size of `scan lock` to avoid request timeout
- Use `DeleteRange` to speed up Region deletion
- Support modifying RocksDB parameters online

### 16.21.16 TiDB 2.0 RC1 Release Notes

On March 9, 2018, TiDB 2.0 RC1 is released. This release has great improvement in MySQL compatibility, SQL optimization and stability.

#### 16.21.16.1 TiDB

- Support limiting the memory usage by a single SQL statement, to reduce the risk of OOM

- Support pushing the Stream Aggregate operator down to TiKV
- Support validating the configuration file
- Support obtaining the information of TiDB configuration through HTTP API
- Compatible with more MySQL syntax in Parser
- Improve the compatibility with Navicat
- Improve the optimizer and extract common expressions with multiple OR conditions, to choose better query plan
- Improve the optimizer and convert subqueries to Join operators in more scenarios, to choose better query plan
- Resolve Lock in the Batch mode to increase the garbage collection speed
- Fix the length of Boolean field to improve compatibility
- Optimize the Add Index operation and give lower priority to all write and read operations, to reduce the impact on online business

### 16.21.16.2 PD

- Optimize the logic of code used to check the Region status to improve performance
- Optimize the output of log information in abnormal conditions to facilitate debugging
- Fix the monitor statistics that the disk space of TiKV nodes is not enough
- Fix the wrong reporting issue of the health interface when TLS is enabled
- Fix the issue that concurrent addition of replicas might exceed the threshold value of configuration, to improve stability

### 16.21.16.3 TiKV

- Fix the issue that gRPC call is not cancelled when PD leaders switch
- Protect important configuration which cannot be changed after initial configuration
- Add gRPC APIs used to obtain metrics
- Check whether SSD is used when you start the cluster
- Optimize the read performance using ReadPool, and improve the performance by 30% in the `raw get` test
- Improve metrics and optimize the usage of metrics

## 16.21.17 TiDB 1.1 Beta Release Notes

On February 24, 2018, TiDB 1.1 Beta is released. This release has great improvement in MySQL compatibility, SQL optimization, stability, and performance.

### 16.21.17.1 TiDB

- Add more monitoring metrics and refine the log
- Compatible with more MySQL syntax
- Support displaying the table creating time in `information_schema`

- Optimize queries containing the `MaxOneRow` operator
- Configure the size of intermediate result sets generated by `Join`, to further reduce the memory used by `Join`
- Add the `tidb_config` session variable to output the current TiDB configuration
- Fix the panic issue in the `Union` and `Index Join` operators
- Fix the wrong result issue of the `Sort Merge Join` operator in some scenarios
- Fix the issue that the `Show Index` statement shows indexes that are in the process of adding
- Fix the failure of the `Drop Stats` statement
- Optimize the query performance of the SQL engine to improve the test result of the Sysbench Select/OLTP by 10%
- Improve the computing speed of subqueries in the optimizer using the new execution engine; compared with TiDB 1.0, TiDB 1.1 Beta has great improvement in tests like TPC-H and TPC-DS

### 16.21.17.2 PD

- Add the Drop Region debug interface
- Support setting priority of the PD leader
- Support configuring stores with a specific label not to schedule Raft leaders
- Add the interfaces to enumerate the health status of each PD
- Add more metrics
- Keep the PD leader and the etcd leader together as much as possible in the same node
- Improve the priority and speed of restoring data when TiKV goes down
- Enhance the validity check of the `data-dir` configuration item
- Optimize the performance of Region heartbeat
- Fix the issue that hot spot scheduling violates label constraint
- Fix other stability issues

### 16.21.17.3 TiKV

- Traverse locks using `offset + limit` to avoid potential GC problems
- Support resolving locks in batches to improve GC speed
- Support GC concurrency to improve GC speed
- Update the Region size using the RocksDB compaction listener for more accurate PD scheduling
- Delete the outdated data in batches using `DeleteFilesInRanges`, to make TiKV start faster
- Configure the Raft snapshot max size to avoid the retained files taking up too much space
- Support more recovery operations in `tikv-ctl`
- Optimize the ordered flow aggregation operation
- Improve metrics and fix bugs

## 16.21.18 TiDB 1.1 Alpha Release Notes

On January 19, 2018, TiDB 1.1 Alpha is released. This release has great improvement in MySQL compatibility, SQL optimization, stability, and performance.

### 16.21.18.1 TiDB

- SQL parser
  - Support more syntax
- SQL query optimizer
  - Use more compact structure to reduce statistics info memory usage
  - Speed up loading statistics info when starting tidb-server
  - Provide more accurate query cost evaluation
  - Use **Count-Min Sketch** to estimate the cost of queries using unique index more accurately
  - Support more complex conditions to make full use of index
- SQL executor
  - Refactor all executor operators using Chunk architecture, improve the execution performance of analytical statements and reduce memory usage
  - Optimize performance of the **INSERT IGNORE** statement
  - Push down more types and functions to TiKV
  - Support more **SQL\_MODE**
  - Optimize the **Load Data** performance to increase the speed by 10 times
  - Optimize the **Use Database** performance
  - Support statistics on the memory usage of physical operators
- Server
  - Support the **PROXY** protocol

### 16.21.18.2 PD

- Add more APIs
- Support TLS
- Add more cases for scheduling Simulator
- Schedule to adapt to different Region sizes
- Fix some bugs about scheduling

### 16.21.18.3 TiKV

- Support Raft learner
- Optimize Raft Snapshot and reduce the I/O overhead
- Support TLS
- Optimize the RocksDB configuration to improve performance
- Optimize `count (*)` and query performance of unique index in Coprocessor
- Add more failpoints and stability test cases
- Solve the reconnection issue between PD and TiKV
- Enhance the features of the data recovery tool `tikv-ctl`
- Support splitting according to table in Region
- Support the `Delete Range` feature
- Support setting the I/O limit caused by snapshot
- Improve the flow control mechanism

## 16.22 v1.0

### 16.22.1 TiDB 1.0.8 Release Notes

On February 11, 2018, TiDB 1.0.8 is released with the following updates:

#### 16.22.1.1 TiDB

- Fix issues in the `Outer Join` result in some scenarios
- Optimize the performance of the `InsertIntoIgnore` statement
- Fix the issue in the `ShardRowID` option
- Add limitation (Configurable, the default value is 5000) to the DML statements number within a transaction
- Fix an issue in the Table/Column aliases returned by the `Prepare` statement
- Fix an issue in updating statistics delta
- Fix a panic error in the `Drop Column` statement
- Fix an DML issue when running the `Add Column After` statement
- Improve the stability of the GC process by ignoring the regions with GC errors
- Run GC concurrently to accelerate the GC process
- Provide syntax support for the `CREATE INDEX` statement

#### 16.22.1.2 PD

- Reduce the lock overheat of the region heartbeats
- Fix the issue that a hot region scheduler selects the wrong Leader

### 16.22.1.3 TiKV

- Use `DeleteFilesInRanges` to clear stale data and improve the TiKV starting speed
- Using `Decimal` in Coprocessor sum
- Sync the metadata of the received Snapshot compulsorily to ensure its safety

To upgrade from 1.0.7 to 1.0.8, follow the rolling upgrade order of PD -> TiKV -> TiDB.

### 16.22.2 TiDB 1.0.7 Release Notes

On January 22, 2018, TiDB 1.0.7 is released with the following updates:

#### 16.22.2.1 TiDB

- Optimize the `FIELD_LIST` command
- Fix data race of the information schema
- Avoid adding read-only statements to history
- Add the `session` variable to control the log query
- Fix the resource leak issue in statistics
- Fix the goroutine leak issue
- Add schema info API for the http status server
- Fix an issue about `IndexJoin`
- Update the behavior when `RunWorker` is false in DDL
- Improve the stability of test results in statistics
- Support `PACK_KEYS` syntax for the `CREATE TABLE` statement
- Add `row_id` column for the null pushdown schema to optimize performance

#### 16.22.2.2 PD

- Fix possible scheduling loss issue in abnormal conditions
- Fix the compatibility issue with proto3
- Add the log

#### 16.22.2.3 TiKV

- Support `Table Scan`
- Support the remote mode in `tikv-ctl`
- Fix the format compatibility issue of `tikv-ctl` proto
- Fix the loss of scheduling command from PD
- Add timeout in Push metric

To upgrade from 1.0.6 to 1.0.7, follow the rolling upgrade order of PD -> TiKV -> TiDB.

### 16.22.3 TiDB 1.0.6 Release Notes

On January 08, 2018, TiDB 1.0.6 is released with the following updates:

#### 16.22.3.1 TiDB

- Support the `Alter Table Auto_Increment` syntax
- Fix the bug in Cost Based computation and the `Null Json` issue in statistics
- Support the extension syntax to shard the implicit row ID to avoid write hot spot for a single table
- Fix a potential DDL issue
- Consider the timezone setting in the `curtime`, `sysdate` and `curdate` functions
- Support the `SEPARATOR` syntax in the `GROUP_CONCAT` function
- Fix the wrong return type issue of the `GROUP_CONCAT` function.

#### 16.22.3.2 PD

- Fix store selection problem of hot-region scheduler

#### 16.22.3.3 TiKV

None.

To upgrade from 1.0.5 to 1.0.6, follow the rolling upgrade order of PD -> TiKV -> TiDB.

### 16.22.4 TiDB 1.0.5 Release Notes

On December 26, 2017, TiDB 1.0.5 is released with the following updates:

#### 16.22.4.1 TiDB

- Add the max value for the current `Auto_Increment` ID in the `Show Create Table` statement.
- Fix a potential goroutine leak.
- Support outputting slow queries into a separate file.
- Load the `TimeZone` variable from TiKV when creating a new session.
- Support the schema state check so that the `Show Create Table` and `Analyze` statements process the public table/index only.
- The `set transaction read only` should affect the `tx_read_only` variable.
- Clean up incremental statistic data when rolling back.
- Fix the issue of missing index length in the `Show Create Table` statement.

#### 16.22.4.2 PD

- Fix the issue that the leaders stop balancing under some circumstances.
  - 869
  - 874
- [Fix potential panic during bootstrapping.](#)

#### 16.22.4.3 TiKV

- Fix the issue that it is slow to get the CPU ID using the [get\\_cpuid](#) function.
- Support the [dynamic-level-bytes](#) parameter to improve the space collection situation.

To upgrade from 1.0.4 to 1.0.5, follow the rolling upgrade order of PD -> TiKV -> TiDB.

### 16.22.5 TiDB 1.0.4 Release Notes

On December 11, 2017, TiDB 1.0.4 is released with the following updates:

#### 16.22.5.1 TiDB

- [Speed up the loading of the statistics when starting the tidb-server](#)
- [Improve the performance of the show variables statement](#)
- [Fix a potential issue when using the Add Index statement to handle the combined indexes](#)
- [Fix a potential issue when using the Rename Table statement to move a table to another database](#)
- [Accelerate the effectiveness for the Alter/Drop User statement](#)

#### 16.22.5.2 TiKV

- [Fix a possible performance issue when a snapshot is applied](#)
- [Fix the performance issue for reverse scan after removing a lot of data](#)
- [Fix the wrong encoded result for the Decimal type under special circumstances](#)

To upgrade from 1.0.3 to 1.0.4, follow the rolling upgrade order of PD -> TiKV -> TiDB.

### 16.22.6 TiDB 1.0.3 Release Notes

On November 28, 2017, TiDB 1.0.3 is released with the following updates:

### 16.22.6.1 TiDB

- Optimize the performance in transaction conflicts scenario
- Add the `TokenLimit` option in the config file
- Output the default database in slow query logs
- Remove the DDL statement from query duration metrics
- Optimize the query cost estimation
- Fix the index prefix issue when creating tables
- Support pushing down the expressions for the Float type to TiKV
- Fix the issue that it is slow to add index for tables with discrete integer primary index
- Reduce the unnecessary statistics updates
- Fix a potential issue during the transaction retry

### 16.22.6.2 PD

- Support adding more types of schedulers using API

### 16.22.6.3 TiKV

- Fix the deadlock issue with the PD client
- Fix the issue that the wrong leader value is prompted for `NotLeader`
- Fix the issue that the chunk size is too large in the coprocessor

To upgrade from 1.0.2 to 1.0.3, follow the rolling upgrade order of PD -> TiKV -> TiDB.

## 16.22.7 TiDB 1.0.2 Release Notes

On November 13, 2017, TiDB 1.0.2 is released with the following updates:

### 16.22.7.1 TiDB

- Optimize the cost estimation of index point query
- Support the `Alter Table Add Column (ColumnDef ColumnPosition)` syntax
- Optimize the queries whose `where` conditions are contradictory
- Optimize the `Add Index` operation to rectify the progress and reduce repetitive operations
- Optimize the `Index Look Join` operator to accelerate the query speed for small data size
- Fix the issue with prefix index judgment

### 16.22.7.2 Placement Driver (PD)

- Improve the stability of scheduling under exceptional situations

### 16.22.7.3 TiKV

- Support splitting table to ensure one region does not contain data from multiple tables
- Limit the length of a key to be no more than 4 KB
- More accurate read traffic statistics
- Implement deep protection on the coprocessor stack
- Fix the LIKE behavior and the do\_div\_mod bug

### 16.22.8 TiDB 1.0.1 Release Notes

On November 1, 2017, TiDB 1.0.1 is released with the following updates:

#### 16.22.8.1 TiDB

- Support canceling DDL Job.
- Optimize the IN expression.
- Correct the result type of the Show statement.
- Support log slow query into a separate log file.
- Fix bugs.

#### 16.22.8.2 TiKV

- Support flow control with write bytes.
- Reduce Raft allocation.
- Increase coprocessor stack size to 10MB.
- Remove the useless log from the coprocessor.

### 16.22.9 TiDB 1.0 Release Notes

On October 16, 2017, TiDB 1.0 is now released! This release is focused on MySQL compatibility, SQL optimization, stability, and performance.

#### 16.22.9.1 TiDB

- The SQL query optimizer:
  - Adjust the cost model
  - Analyze pushdown
  - Function signature pushdown
- Optimize the internal data format to reduce the interim data size
- Enhance the MySQL compatibility
- Support the NO\_SQL\_CACHE syntax and limit the cache usage in the storage engine
- Refactor the Hash Aggregator operator to reduce the memory usage
- Support the Stream Aggregator operator

### 16.22.9.2 PD

- Support read flow based balancing
- Support setting the Store weight and weight based balancing

### 16.22.9.3 TiKV

- Coprocessor now supports more pushdown functions
- Support pushing down the sampling operation
- Support manually triggering data compact to collect space quickly
- Improve the performance and stability
- Add a Debug API for debugging
- TiSpark Beta Release:
- Support configuration framework
- Support ThriftServer/JDBC and Spark SQL

### 16.22.9.4 Acknowledgement

#### 16.22.9.4.1 Special thanks to the following enterprises and teams

- Archon
- Mobike
- Samsung Electronics
- SpeedyCloud
- Tencent Cloud
- UCloud

#### 16.22.9.4.2 Thanks to the open source software and services from the following organizations and individuals

- Asta Xie
- CNCF
- CoreOS
- Databricks
- Docker
- Github
- Grafana
- gRPC
- Jepsen
- Kubernetes
- Namazu
- Prometheus
- RedHat
- RocksDB Team
- Rust Team

### 16.22.10 Pre-GA Release Notes

On August 30, 2017, TiDB Pre-GA is released! This release is focused on MySQL compatibility, SQL optimization, stability, and performance.

#### 16.22.10.1 TiDB

- The SQL query optimizer:
  - Adjust the cost model
  - Use index scan to handle the `where` clause with the `compare` expression which has different types on each side
  - Support the Greedy algorithm based Join Reorder
- Many enhancements have been introduced to be more compatible with MySQL
- Support `Natural Join`
- Support the JSON type (Experimental), including the query, update and index of the JSON fields
- Prune the useless data to reduce the consumption of the executor memory
- Support configuring prioritization in the SQL statements and automatically set the prioritization for some of the statements according to the query type
- Completed the expression refactor and the speed is increased by about 30%

### 16.22.10.2 Placement Driver (PD)

- Support manually changing the leader of the PD cluster

### 16.22.10.3 TiKV

- Use dedicated Rocksdb instance to store Raft log
- Use `DeleteRange` to speed up the deleting of replicas
- Coprocessor now supports more pushdown operators
- Improve the performance and stability

### 16.22.10.4 TiDB Connector for Spark Beta Release

- Implement the predicates pushdown
- Implement the aggregation pushdown
- Implement range pruning
- Capable of running full set of TPC+H except for one query that needs view support

## 16.22.11 TiDB RC4 Release Notes

On August 4, 2017, TiDB RC4 is released! This release is focused on MySQL compatibility, SQL optimization, stability, and performance.

### 16.22.11.1 Highlight

- For performance, the write performance is improved significantly, and the computing task scheduling supports prioritizing to avoid the impact of OLAP on OLTP.
- The optimizer is revised for a more accurate query cost estimating and for an automatic choice of the `Join` physical operator based on the cost.
- Many enhancements have been introduced to be more compatible with MySQL.
- TiSpark is now released to better support the OLAP business scenarios. You can now use Spark to access the data in TiKV.

### 16.22.11.2 Detailed updates

#### 16.22.11.2.1 TiDB

- The SQL query optimizer refactoring:
  - Better support for TopN queries
  - Support the automatic choice of the of the `Join` physical operator based on the cost

- Improved Projection Elimination

- The version check of schema is based on Table to avoid the impact of DDL on the ongoing transactions
- Support `BatchIndexJoin`
- Improve the `Explain` statement
- Improve the `Index Scan` performance
- Many enhancements have been introduced to be more compatible with MySQL
- Support the JSON type and operations
- Support the configuration of query prioritizing and isolation level

#### 16.22.11.2.2 Placement Driver (PD)

- Support using PD to set the TiKV location labels
- Optimize the scheduler
  - PD is now supported to initialize the scheduling commands to TiKV.
  - Accelerate the response speed of the region heartbeat.
  - Optimize the `balance` algorithm
- Optimize data loading to speed up failover

#### 16.22.11.2.3 TiKV

- Support the configuration of query prioritizing
- Support the RC isolation level
- Improve Jepsen test results and the stability
- Support Document Store
- Coprocessor now supports more pushdown functions
- Improve the performance and stability

#### 16.22.11.2.4 TiSpark Beta Release

- Implement the prediction pushdown
- Implement the aggregation pushdown
- Implement range pruning
- Capable of running full set of TPC-H except one query that needs view support

### 16.22.12 TiDB RC3 Release Notes

On June 16, 2017, TiDB RC3 is released! This release is focused on MySQL compatibility, SQL optimization, stability, and performance.

### 16.22.12.1 Highlight

- The privilege management is refined to enable users to manage the data access privileges using the same way as in MySQL.
- DDL is accelerated.
- The load balancing policy and process are optimized for performance.
- TiDB Ansible is open sourced. By using TiDB-Ansible, you can deploy, upgrade, start and shutdown a TiDB cluster with one click.

### 16.22.12.2 Detailed updates

### 16.22.12.3 TiDB

- The following features are added or improved in the SQL query optimizer:
  - Support incremental statistics
  - Support the `Merge Sort Join` operator
  - Support the `Index Lookup Join` operator
  - Support the `Optimizer Hint Syntax`
  - Optimize the memory consumption of the `Scan`, `Join`, `Aggregation` operators
  - Optimize the Cost Based Optimizer (CBO) framework
  - Refactor `Expression`
- Support more complete privilege management
- DDL acceleration
- Support using HTTP API to get the data distribution information of tables
- Support using system variables to control the query concurrency
- Add more MySQL built-in functions
- Support using system variables to automatically split a big transaction into smaller ones to commit

### 16.22.12.4 Placement Driver (PD)

- Support gRPC
- Provide the Disaster Recovery Toolkit
- Use Garbage Collection to clear stale data automatically
- Support more efficient data balance
- Support hot Region scheduling to enable load balancing and speed up the data importing
- Performance
  - Accelerate getting Client TSO
  - Improve the efficiency of Region Heartbeat processing
- Improve the `pd-ctl` function

- Update the Replica configuration dynamically
- Get the Timestamp Oracle (TSO)
- Use ID to get the Region information

#### 16.22.12.5 TiKV

- Support gRPC
- Support the Sorted String Table (SST) format snapshot to improve the load balancing speed of a cluster
- Support using the Heap Profile to uncover memory leaks
- Support Streaming SIMD Extensions (SSE) and speed up the CRC32 calculation
- Accelerate transferring leader for faster load balancing
- Use Batch Apply to reduce CPU usage and improve the write performance
- Support parallel Prewrite to improve the transaction write speed
- Optimize the scheduling of the coprocessor thread pool to reduce the impact of big queries on point get
- The new Loader supports data importing at the table level, as well as splitting a big table into smaller logical blocks to import concurrently to improve the data importing speed.

#### 16.22.13 TiDB RC2 Release Notes

On March 1, 2017, TiDB RC2 is released! This release is focused on the compatibility with MySQL, SQL query optimizer, system stability and performance in this version. What's more, a new permission management mechanism is added and users can control data access in the same way as the MySQL privilege management system.

##### 16.22.13.1 TiDB

- Query optimizer
  - Collect column/index statistics and use them in the query optimizer
  - Optimize the correlated subquery
  - Optimize the Cost Based Optimizer (CBO) framework
  - Eliminate aggregation using unique key information
  - Refactor expression evaluation framework
  - Convert Distinct to GroupBy
  - Support the topn operation push-down
- Support basic privilege management
- Add lots of MySQL built-in functions
- Improve the Alter Table statement and support the modification of table name, default value and comment
- Support the Create Table Like statement

- Support the Show Warnings statement
- Support the Rename Table statement
- Restrict the size of a single transaction to avoid the cluster blocking of large transactions
- Automatically split data in the process of Load Data
- Optimize the performance of the AddIndex and Delete statement
- Support “ANSI\_QUOTES” sql\_mode
- Improve the monitoring system
- Fix Bugs
- Solve the problem of memory leak

### 16.22.13.2 PD

- Support location aware replica scheduling
- Conduct fast scheduling based on the number of region
- pd-ctl support more features
  - Add or delete PD
  - Obtain Region information with Key
  - Add or delete scheduler and operator
  - Obtain cluster label information

### 16.22.13.3 TiKV

- Support Async Apply to improve the entire write performance
- Use prefix seek to improve the read performance of Write CF
- Use memory hint prefix to improve the insert performance of Raft CF
- Optimize the single read transaction performance
- Support more push-down expressions
- Improve the monitoring system
- Fix Bugs

### 16.22.14 TiDB RC1 Release Notes

On December 23, 2016, TiDB RC1 is released. See the following updates in this release:

#### 16.22.14.1 TiKV

- The write speed has been improved.
- The disk space usage is reduced.
- Hundreds of TBs of data can be supported.
- The stability is improved and TiKV can support a cluster with 200 nodes.
- Supports the Raw KV API and the Golang client.

#### 16.22.14.2 Placement Driver (PD)

- The scheduling strategy framework is optimized and now the strategy is more flexible and reasonable.
- The support for `label` is added to support Cross Data Center scheduling.
- PD Controller is provided to operate the PD cluster more easily.

#### 16.22.14.3 TiDB

- The following features are added or improved in the SQL query optimizer:
  - Eager aggregation
  - More detailed `EXPLAIN` information
  - Parallelization of the `UNION` operator
  - Optimization of the subquery performance
  - Optimization of the conditional push-down
  - Optimization of the Cost Based Optimizer (CBO) framework
- The implementation of the time related data types are refactored to improve the compatibility with MySQL.
- More built-in functions in MySQL are supported.
- The speed of the `add index` statement is enhanced.
- The following statements are supported:
  - Use the `CHANGE COLUMN` statement to change the name of a column.
  - Use `MODIFY COLUMN` and `CHANGE COLUMN` of the `ALTER TABLE` statement for some of the column type transfer.

#### 16.22.14.4 New tools

- `Loader` is added to be compatible with the `mydumper` data format in Percona and provides the following functions:
  - Multi-thread import
  - Retry if error occurs
  - Breakpoint resume
  - Targeted optimization for TiDB
- The tool for one-click deployment is added.

## 17 Glossary

### 17.1 A

#### 17.1.1 ACID

ACID refers to the four key properties of a transaction: atomicity, consistency, isolation, and durability. Each of these properties is described below.

- **Atomicity** means that either all the changes of an operation are performed, or none of them are. TiDB ensures the atomicity of the [Region](#) that stores the Primary Key to achieve the atomicity of transactions.
- **Consistency** means that transactions always bring the database from one consistent state to another. In TiDB, data consistency is ensured before writing data to the memory.
- **Isolation** means that a transaction in process is invisible to other transactions until it completes. This allows concurrent transactions to read and write data without sacrificing consistency. TiDB currently supports the isolation level of REPEATABLE  $\leftrightarrow$  READ.
- **Durability** means that once a transaction is committed, it remains committed even in the event of a system failure. TiKV uses persistent storage to ensure durability.

### 17.2 B

#### 17.2.1 Batch Create Table

Batch Create Table is a feature introduced in TiDB v6.0.0. This feature is enabled default. When restoring data with a large number of tables (nearly 50000) using BR (Backup & Restore), the feature can greatly speed up the restore process by creating tables in batches. For details, see [Batch Create Table](#).

#### 17.2.2 Baseline Capturing

Baseline Capturing captures queries that meet capturing conditions and create bindings for them. It is used for [preventing regression of execution plans during an upgrade](#).

#### 17.2.3 Bucket

A [Region](#) is logically divided into several small ranges called bucket. TiKV collects query statistics by buckets and reports the bucket status to PD. For details, see the [Bucket design doc](#).

## 17.3 C

### 17.3.1 Cached Table

With the cached table feature, TiDB loads the data of an entire table into the memory of the TiDB server, and TiDB directly gets the table data from the memory without accessing TiKV, which improves the read performance.

### 17.3.2 Continuous Profiling

Introduced in TiDB 5.3.0, Continuous Profiling is a way to observe resource overhead at the system call level. With the support of Continuous Profiling, TiDB provides performance insight as clear as directly looking into the database source code, and helps R&D and operation and maintenance personnel to locate the root cause of performance problems using a flame graph. For details, see [TiDB Dashboard Instance Profiling - Continuous Profiling](#).

## 17.4 D

### 17.4.1 Dynamic Pruning

Dynamic pruning mode is one of the modes that TiDB accesses partitioned tables. In dynamic pruning mode, each operator supports direct access to multiple partitions. Therefore, TiDB no longer uses Union. Omitting the Union operation can improve the execution efficiency and avoid the problem of Union concurrent execution.

## 17.5 I

### 17.5.1 Index Merge

Index Merge is a method introduced in TiDB v4.0 to access tables. Using this method, the TiDB optimizer can use multiple indexes per table and merge the results returned by each index. In some scenarios, this method makes the query more efficient by avoiding full table scans. Since v5.4, Index Merge has become a GA feature.

### 17.5.2 In-Memory Pessimistic Lock

The in-memory pessimistic lock is a new feature introduced in TiDB v6.0.0. When this feature is enabled, pessimistic locks are usually stored in the memory of the Region leader only, and are not persisted to disk or replicated through Raft to other replicas. This feature can greatly reduce the overhead of acquiring pessimistic locks and improve the throughput of pessimistic transactions.

## 17.6 L

### 17.6.1 leader/follower/learner

Leader/Follower/Learner each corresponds to a role in a Raft group of **peers**. The leader services all client requests and replicates data to the followers. If the group leader fails, one of the followers will be elected as the new leader. Learners are non-voting followers that only serves in the process of replica addition.

## 17.7 O

### 17.7.1 Old value

The “original value” in the incremental change log output by TiCDC. You can specify whether the incremental change log output by TiCDC contains the “original value”.

### 17.7.2 Operator

An operator is a collection of actions that applies to a Region for scheduling purposes. Operators perform scheduling tasks such as “migrate the leader of Region 2 to Store 5” and “migrate replicas of Region 2 to Store 1, 4, 5”.

An operator can be computed and generated by a **scheduler**, or created by an external API.

### 17.7.3 Operator step

An operator step is a step in the execution of an operator. An operator normally contains multiple Operator steps.

Currently, available steps generated by PD include:

- **TransferLeader**: Transfers leadership to a specified member
- **AddPeer**: Adds peers to a specified store
- **RemovePeer**: Removes a peer of a Region
- **AddLearner**: Adds learners to a specified store
- **PromoteLearner**: Promotes a specified learner to a voting member
- **SplitRegion**: Splits a specified Region into two

## 17.8 P

### 17.8.1 pending/down

“Pending” and “down” are two special states of a peer. Pending indicates that the Raft log of followers or learners is vastly different from that of leader. Followers in pending cannot

be elected as leader. “Down” refers to a state that a peer ceases to respond to leader for a long time, which usually means the corresponding node is down or isolated from the network.

### 17.8.2 Point Get

Point get means reading a single row of data by a unique index or primary index, the returned resultset is up to one row.

### 17.8.3 Predicate columns

In most cases, when executing SQL statements, the optimizer only uses statistics of some columns (such as columns in the `WHERE`, `JOIN`, `ORDER BY`, and `GROUP BY` statements). These used columns are called predicate columns. For details, see [Collect statistics on some columns](#).

## 17.9 Q

### 17.9.1 Quota Limiter

Quota Limiter is an experimental feature introduced in TiDB v6.0.0. If the machine on which TiKV is deployed has limited resources, for example, with only 4v CPU and 16 G memory, and the foreground of TiKV processes too many read and write requests, the CPU resources used by the background are occupied to help process such requests, which affects the performance stability of TiKV. To avoid this situation, the [quota-related configuration items](#) can be set to limit the CPU resources to be used by the foreground.

## 17.10 R

### 17.10.1 Raft Engine

Raft Engine is an embedded persistent storage engine with a log-structured design. It is built for TiKV to store multi-Raft logs. Since v5.4, TiDB supports using Raft Engine as the log storage engine. For details, see [Raft Engine](#).

### 17.10.2 Region/peer/Raft group

Region is the minimal piece of data storage in TiKV, each representing a range of data (96 MiB by default). Each Region has three replicas by default. A replica of a Region is called a peer. Multiple peers of the same Region replicate data via the Raft consensus algorithm, so peers are also members of a Raft instance. TiKV uses Multi-Raft to manage data. That is, for each Region, there is a corresponding, isolated Raft group.

### 17.10.3 Region split

Regions are generated as data writes increase. The process of splitting is called Region split.

The mechanism of Region split is to use one initial Region to cover the entire key space, and generate new Regions through splitting existing ones every time the size of the Region or the number of keys has reached a threshold.

### 17.10.4 restore

Restore is the reverse of the backup operation. It is the process of bringing back the system to an earlier state by retrieving data from a prepared backup.

## 17.11 S

### 17.11.1 scheduler

Schedulers are components in PD that generate scheduling tasks. Each scheduler in PD runs independently and serves different purposes. The commonly used schedulers are:

- `balance-leader-scheduler`: Balances the distribution of leaders
- `balance-region-scheduler`: Balances the distribution of peers
- `hot-region-scheduler`: Balances the distribution of hot Regions
- `evict-leader-{store-id}`: Evicts all leaders of a node (often used for rolling upgrades)

### 17.11.2 Store

A store refers to the storage node in the TiKV cluster (an instance of `tikv-server`). Each store has a corresponding TiKV instance.

## 17.12 T

### 17.12.1 Top SQL

Top SQL helps locate SQL queries that contribute to a high load of a TiDB or TiKV node in a specified time range. For details, see [Top SQL user document](#).

### 17.12.2 TSO

Because TiKV is a distributed storage system, it requires a global timing service, Timestamp Oracle (TSO), to assign a monotonically increasing timestamp. In TiKV, such a feature is provided by PD, and in Google [Spanner](#), this feature is provided by multiple atomic clocks and GPS.

### 17.12.3 TTL

**Time to live (TTL)** is a feature that allows you to manage TiDB data lifetime at the row level. For a table with the TTL attribute, TiDB automatically checks data lifetime and deletes expired data at the row level.
