You can get TiSpark version information by running the following command in spark-shell:

```
spark.sql("select ti_version()").collect
```

### 13.12.1.6.3 Read data using TiSpark

You can use Spark SQL to read data from TiKV.

```
spark.sql("use tidb_catalog")
spark.sql("select count(*) from ${database}.${table}").show
```

### 13.12.1.6.4 Write data using TiSpark

You can use the Spark DataSource API to write data to TiKV, for which ACID is guaranteed.

```
val tidbOptions: Map[String, String] = Map(
 "tidb.addr" -> "127.0.0.1",
 "tidb.password" -> "",
 "tidb.port" -> "4000",
 "tidb.user" -> "root"
)

val customerDF = spark.sql("select * from customer limit 100000")

customerDF.write
 .format("tidb")
 .option("database", "tpch_test")
 .option("table", "cust_test_select")
 .options(tidbOptions)
 .mode("append")
 .save()
```

See [Data Source API User Guide](#) for more details.

You can also write with Spark SQL since TiSpark 3.1. See [insert SQL](#) for more details.

### 13.12.1.6.5 Write data using JDBC DataSource

You can also use Spark JDBC to write to TiDB without the use of TiSpark.

This is beyond the scope of TiSpark. This document only provides an example here. For detailed information, see [JDBC To Other Databases](#).

```
import org.apache.spark.sql.execution.datasources.jdbc.JDBCOptions

val customer = spark.sql("select * from customer limit 100000")
// you might need to repartition the source to make it balanced across
// ↪ nodes
// and increase concurrency
val df = customer.repartition(32)
df.write
```

```
.mode(saveMode = "append")
.format("jdbc")
.option("driver", "com.mysql.jdbc.Driver")
// replace the host and port with yours and be sure to use rewrite batch
.option("url", "jdbc:mysql://127.0.0.1:4000/test?rewriteBatchedStatements=
 ↪ true")
.option("useSSL", "false")
// as tested, setting to `150` is a good practice
.option(JDBCOptions.JDBC_BATCH_INSERT_SIZE, 150)
.option("dbtable", s"cust_test_select") // database name and table name
 ↪ here
.option("isolationLevel", "NONE") // set isolationLevel to NONE
.option("user", "root") // TiDB user here
.save()
```

Set `isolationLevel` to `NONE` to avoid large single transactions which might lead to TiDB OOM and also avoid the `ISOLATION LEVEL` does not support error (TiDB currently only supports `REPEATABLE-READ`).

#### 13.12.1.6.6 Delete data using TiSpark

You can use Spark SQL to delete data from TiKV.

```
spark.sql("use tidb_catalog")
spark.sql("delete from ${database}.${table} where xxx")
```

See [delete feature](#) for more details.

#### 13.12.1.6.7 Work with other data sources

You can use multiple catalogs to read data from different data sources as follows:

```
// Read from Hive
spark.sql("select * from spark_catalog.default.t").show

// Join Hive tables and TiDB tables
spark.sql("select t1.id,t2.id from spark_catalog.default.t t1 left join
 ↪ tidb_catalog.test.t t2").show
```

#### 13.12.1.7 TiSpark configurations

The configurations in the following table can be put together with `spark-defaults.conf` or passed in the same way as other Spark configuration properties.

| Key                                                       | Default value | Description                                                                         |
|-----------------------------------------------------------|---------------|-------------------------------------------------------------------------------------|
| <code>spark. <del>127.0.0.1</del> <del>12379</del></code> |               | The addresses of PD clusters, which are split by commas.                            |
| <code>↪ <del>tispark</del></code>                         |               |                                                                                     |
| <code>↪ <del>.pd</del></code>                             |               |                                                                                     |
| <code>↪ <del>.</del></code>                               |               |                                                                                     |
| <code>↪ <del>addresses</del></code>                       |               |                                                                                     |
| <code>↪</code>                                            |               |                                                                                     |
| <code>spark. 2147483647</code>                            |               | Maximum frame size of gRPC response in bytes (default to 2G).                       |
| <code>↪ <del>tispark</del></code>                         |               |                                                                                     |
| <code>↪ <del>.</del></code>                               |               |                                                                                     |
| <code>↪ <del>grpc</del></code>                            |               |                                                                                     |
| <code>↪ <del>.</del></code>                               |               |                                                                                     |
| <code>↪ <del>framesize</del></code>                       |               |                                                                                     |
| <code>↪</code>                                            |               |                                                                                     |
| <code>spark. 10</code>                                    |               | The gRPC timeout time in seconds.                                                   |
| <code>↪ <del>tispark</del></code>                         |               |                                                                                     |
| <code>↪ <del>.</del></code>                               |               |                                                                                     |

The format is <code>label_x=value_x,label_y=value_y</code> , and the items are connected by logical conjunction.                                                                                                                                                                                                                                                                                                                                                          |

### 13.12.1.7.1 TLS configurations

TiSpark TLS has two parts: TiKV Client TLS and JDBC connector TLS. To enable TLS in TiSpark, you need to configure both. `spark.tispark.tikv.xxx` is used for TiKV Client to create a TLS connection with PD and TiKV server. `spark.tispark.jdbc.xxx` is used for JDBC to connect with TiDB server in TLS connection.

When TiSpark TLS is enabled, you must configure either the X.509 certificate with `tikv.`  
`↳ trust_cert_collection`, `tikv.key_cert_chain` and `tikv.key_file` configurations, or the JKS certificate with `tikv.jks_enable`, `tikv.jks_trust_path` and `tikv.jks_key_path`  
`↳ .jdbc.server_cert_store` and `jdbc.client_cert_store` are optional.

TiSpark only supports TLSv1.2 and TLSv1.3.

- The following is an example of opening TLS configuration with the X.509 certificate in TiKV Client.

```
spark.tispark.tikv.tls_enable true
spark.tispark.tikv.trust_cert_collection /home/tispark/root.
 ↪ pem
spark.tispark.tikv.key_cert_chain /home/tispark/client
 ↪ .pem
spark.tispark.tikv.key_file /home/tispark/client
 ↪ .key
```

- The following is an example of enabling TLS with JKS configurations in TiKV Client.

```
spark.tispark.tikv.tls_enable true
spark.tispark.tikv.jks_enable true
spark.tispark.tikv.jks_key_path /home/tispark/config
 ↪ /tikv-truststore
spark.tispark.tikv.jks_key_password tikv_truststore_password
 ↪ tikv_truststore_password
spark.tispark.tikv.jks_trust_path /home/tispark/config
 ↪ /tikv-clientstore
spark.tispark.tikv.jks_trust_password tikv_clientstore_password
 ↪ tikv_clientstore_password
```

When both JKS and X.509 certificates are configured, JKS would have a higher priority. That means TLS builder will use JKS certificate first. Therefore, do not set `spark.tispark.tikv.jks_enable=true` when you just want to use a common PEM certificate.

- The following is an example of enabling TLS in JDBC connector.

```
spark.tispark.jdbc.tls_enable true
spark.tispark.jdbc.server_cert_store /home/tispark/jdbc-
 ↪ truststore
spark.tispark.jdbc.server_cert_password jdbc_truststore_password
 ↪ jdbc_truststore_password
spark.tispark.jdbc.client_cert_store /home/tispark/jdbc-
 ↪ clientstore
spark.tispark.jdbc.client_cert_password jdbc_clientstore_password
 ↪ jdbc_clientstore_password
```

- For details about how to open TiDB TLS, see [Enable TLS between TiDB Clients and Servers](#).
- For details about how to generate a JAVA key store, see [Connecting Securely Using SSL](#).

### 13.12.1.7.2 Log4j configuration

When you start `spark-shell` or `spark-sql` and run query, you might see the following warnings:

```
Failed to get database ****, returning NoSuchObjectException
Failed to get database ****, returning NoSuchObjectException
```

where `****` is the database name.

The warnings are benign and occurs because Spark cannot find `****` in its own catalog. You can just ignore these warnings.

To mute them, append the following text to `${SPARK_HOME}/conf/log4j.properties`.

```
tispark disable "WARN ObjectStore:568 - Failed to get database"
log4j.logger.org.apache.hadoop.hive.metastore.ObjectStore=ERROR
```

### 13.12.1.7.3 Time zone configuration

Set time zone by using the `-Duser.timezone` system property (for example, `-Duser.timezone=GMT-7`), which affects the `Timestamp` type.

Do not use `spark.sql.session.timeZone`.

### 13.12.1.8 Features

The major features of TiSpark are as follows:

| Feature support                              | TiSpark 2.4.x | TiSpark 2.5.x | TiSpark 3.0.x | TiSpark 3.1.x |
|----------------------------------------------|---------------|---------------|---------------|---------------|
| SQL select without <code>tidb_catalog</code> |               |               |               |               |
| SQL select with <code>tidb_catalog</code>    |               |               |               |               |
| DataFrame append                             |               |               |               |               |
| DataFrame reads                              |               |               |               |               |
| SQL show databases                           |               |               |               |               |
| SQL show tables                              |               |               |               |               |
| SQL auth                                     |               |               |               |               |
| SQL delete                                   |               |               |               |               |
| SQL insert                                   |               |               |               |               |
| TLS                                          |               |               |               |               |
| DataFrame auth                               |               |               |               |               |

#### 13.12.1.8.1 Support for expression index

TiDB v5.0 supports [expression index](#).

TiSpark currently supports retrieving data from tables with `expression index`, but the `expression index` will not be used by the planner of TiSpark.

### 13.12.1.8.2 Work with TiFlash

TiSpark can read data from TiFlash via the configuration `spark.tispark.isolation_read_engines`

↪ .

### 13.12.1.8.3 Support for partitioned tables

#### Read partitioned tables from TiDB

TiSpark can read the range and hash partitioned tables from TiDB.

Currently, TiSpark does not support a MySQL/TiDB partition table syntax `select ↪ col_name from table_name partition(partition_name)`. However, you can still use the `where` condition to filter the partitions.

TiSpark decides whether to apply partition pruning according to the partition type and the partition expression associated with the table.

TiSpark applies partition pruning on range partitioning only when the partition expression is one of the following:

- column expression
- `YEAR($argument)` where the argument is a column and its type is datetime or string literal that can be parsed as datetime.

If partition pruning is not applicable, TiSpark's reading is equivalent to doing a table scan over all partitions.

#### Write into partitioned tables

Currently, TiSpark only supports writing data into the range and hash partitioned tables under the following conditions:

- The partition expression is a column expression.
- The partition expression is `YEAR($argument)` where the argument is a column and its type is datetime or string literal that can be parsed as datetime.

There are two ways to write into partitioned tables:

- Use datasource API to write into partition table which supports replace and append semantics.
- Use delete statement with Spark SQL.

#### Note:

Currently, TiSpark only supports writing into partitioned tables with `utf8mb4_bin` collation enabled.

#### 13.12.1.8.4 Security

If you are using TiSpark v2.5.0 or a later version, you can authenticate and authorize TiSpark users by using TiDB.

The authentication and authorization feature is disabled by default. To enable it, add the following configurations to the Spark configuration file `spark-defaults.conf`.

```
// Enable authentication and authorization
spark.sql.auth.enable true

// Configure TiDB information
spark.sql.tidb.addr $your_tidb_server_address
spark.sql.tidb.port $your_tidb_server_port
spark.sql.tidb.user $your_tidb_server_user
spark.sql.tidb.password $your_tidb_server_password
```

For more information, see [Authorization and authentication through TiDB server](#).

#### 13.12.1.8.5 Other features

- [Push down](#)
- [Delete with TiSpark](#)
- [Stale read](#)
- [TiSpark with multiple catalogs](#)
- [TiSpark TLS](#)
- [TiSpark plan](#)

#### 13.12.1.9 Statistics information

TiSpark uses the statistic information for:

- Determining which index to use in your query plan with the minimum estimated cost.
- Small table broadcasting, which enables efficient broadcast join.

To allow TiSpark to access statistic information, make sure that relevant tables have been analyzed.

See [Introduction to Statistics](#) for more details about how to analyze tables.

Since TiSpark 2.0, statistics information is automatically loaded by default.

#### 13.12.1.10 FAQ

See [TiSpark FAQ](#).

## 13.13 sync-diff-inspector

### 13.13.1 sync-diff-inspector User Guide

[sync-diff-inspector](#) is a tool used to compare data stored in the databases with the MySQL protocol. For example, it can compare the data in MySQL with that in TiDB, the data in MySQL with that in MySQL, or the data in TiDB with that in TiDB. In addition, you can also use this tool to repair data in the scenario where a small amount of data is inconsistent.

This guide introduces the key features of sync-diff-inspector and describes how to configure and use this tool. To download sync-diff-inspector, use one of the following methods:

- Binary package. The sync-diff-inspector binary package is included in the TiDB Toolkit. To download the TiDB Toolkit, see [Download TiDB Tools](#).
- Docker image. Execute the following command to download:

```
docker pull pingcap/tidb-enterprise-tools:nightly
```

#### 13.13.1.1 Key features

- Compare the table schema and data
- Generate the SQL statements used to repair data if the data inconsistency exists
- Support [data check for tables with different schema or table names](#)
- Support [data check in the sharding scenario](#)
- Support [data check for TiDB upstream-downstream clusters](#)
- Support [data check in the DM replication scenario](#)

#### 13.13.1.2 Restrictions of sync-diff-inspector

- Online check is not supported for data migration between MySQL and TiDB. Ensure that no data is written into the upstream-downstream checklist, and that data in a certain range is not changed. You can check data in this range by setting `range`.
- In TiDB and MySQL, `FLOAT`, `DOUBLE` and other floating-point types are implemented differently. `FLOAT` and `DOUBLE` respectively take 6 and 15 significant digits for calculating checksum. If you do not want to use this feature, set `ignore-columns` to skip checking these columns.
- Support checking tables that do not contain the primary key or the unique index. However, if data is inconsistent, the generated SQL statements might not be able to repair the data correctly.

### 13.13.1.3 Database privileges for sync-diff-inspector

sync-diff-inspector needs to obtain the information of table schema and to query data. The required database privileges are as follows:

- Upstream database
  - SELECT (checks data for comparison)
  - SHOW\_DATABASES (views database name)
  - RELOAD (views table schema)
- Downstream database
  - SELECT (checks data for comparison)
  - SHOW\_DATABASES (views database name)
  - RELOAD (views table schema)

### 13.13.1.4 Configuration file description

The configuration of sync-diff-inspector consists of the following parts:

- **Global config:** General configurations, such as number of threads to check, whether to export SQL statement to fix inconsistent tables, whether to compare the data, and whether to skip checking tables that do not exist in the upstream or downstream.
- **Databases config:** Configures the instances of the upstream and downstream databases.
- **Routes:** Rules for upstream multiple schema names to match downstream single schema names (**optional**).
- **Task config:** Configures the tables for checking. If some tables have a certain mapping relationship between the upstream and downstream databases or have some special requirements, you must configure these tables.
- **Table config:** Special configurations for specific tables, such as specified ranges and columns to be ignored (**optional**).

Below is the description of a complete configuration file:

- Note: configurations with **s** after their name can have multiple values, so you need to use square brackets [] to contain the configuration values.

```
Diff Configuration.

Global config
The number of goroutines created to check data. The number of
 ↳ connections between sync-diff-inspector and upstream/downstream
 ↳ databases is slightly greater than this value.
check-thread-count = 4
```

```
If enabled, SQL statements is exported to fix inconsistent tables.
export-fix-sql = true

Only compares the table structure instead of the data.
check-struct-only = false

If enabled, sync-diff-inspector skips checking tables that do not exist
↳ in the upstream or downstream.
skip-non-existing-table = false

Datasource config
[data-sources]
[data-sources.mysql1] # mysql1 is the only custom ID for the database
↳ instance. It is used for the following `task.source-instances/task.
↳ target-instance` configuration.
host = "127.0.0.1"
port = 3306
user = "root"
password = "" # The password for connecting to the upstream database. It
↳ can be plain text or Base64-encoded.

(optional) Use mapping rules to match multiple upstream sharded tables
↳ . Rule1 and rule2 are configured in the following Routes section.
route-rules = ["rule1", "rule2"]

[data-sources.tidb0]
host = "127.0.0.1"
port = 4000
user = "root"
password = "" # The password for connecting to the downstream database.
↳ It can be plain text or Base64-encoded.

(optional) Use TLS to connect TiDB.
security.ca-path = ".../ca.crt"
security.cert-path = ".../cert.crt"
security.key-path = ".../key.crt"

(optional) Use the snapshot feature. If enabled, historical data is
↳ used for comparison.
snapshot = "386902609362944000"
When "snapshot" is set to "auto", the last syncpoints generated by
↳ TiCDC in the upstream and downstream are used for comparison. For
↳ details, see <https://github.com/pingcap/tidb-tools/issues/663>.
snapshot = "auto"
```

```
Routes
To compare the data of a large number of tables with different schema
↳ names or table names, or check the data of multiple upstream sharded
↳ tables and downstream table family, use the table-rule to configure
↳ the mapping relationship. You can configure the mapping rule only for
↳ the schema or table. Also, you can configure the mapping rules for
↳ both the schema and the table.
[routes]
[routes.rule1] # rule1 is the only custom ID for the configuration. It is
↳ used for the above `data-sources.route-rules` configuration.
schema-pattern = "test_*" # Matches the schema name of the data source.
↳ Supports the wildcards "*" and "?"
table-pattern = "t_*" # Matches the table name of the data source.
↳ Supports the wildcards "*" and "?"
target-schema = "test" # The name of the schema in the target database
target-table = "t" # The name of the target table
[routes.rule2]
schema-pattern = "test2_*" # Matches the schema name of the data source.
↳ Supports the wildcards "*" and "?"
table-pattern = "t2_*" # Matches the table name of the data source.
↳ Supports the wildcards "*" and "?"
target-schema = "test2" # The name of the schema in the target database
target-table = "t2" # The name of the target table

task config
Configures the tables of the target database that need to be compared.
[task]
output-dir saves the following information:
1 sql: The SQL file to fix tables that is generated after error is
↳ detected. One chunk corresponds to one SQL file.
2 log: sync-diff.log
3 summary: summary.txt
4 checkpoint: a dir
output-dir = "./output"
The upstream database. The value is the unique ID declared by data-
↳ sources.
source-instances = ["mysql1"]
The downstream database. The value is the unique ID declared by data-
↳ sources.
target-instance = "tidb0"
The tables of downstream databases to be compared. Each table needs to
↳ contain the schema name and the table name, separated by '.'
Use "?" to match any character and "*" to match characters of any
↳ length.
```

```
For detailed match rules, refer to golang regexp pkg: https://github.
 ↪ com/google/re2/wiki/Syntax.
target-check-tables = ["schema*.table*", "!c.*", "test2.t2"]
(optional) Extra configurations for some tables, Config1 is defined in
 ↪ the following table config example.
target-configs = ["config1"]

Table config
Special configurations for specific tables. The tables to be configured
 ↪ must be in `task.target-check-tables`.
[table-configs.config1] # config1 is the only custom ID for this
 ↪ configuration. It is used for the above `task.target-configs`
 ↪ configuration.
The name of the target table, you can use regular expressions to match
 ↪ multiple tables, but one table is not allowed to be matched by
 ↪ multiple special configurations at the same time.
target-tables = ["schema*.test*", "test2.t2"]
(optional) Specifies the range of the data to be checked
It needs to comply with the syntax of the WHERE clause in SQL.
range = "age > 10 AND age < 20"
(optional) Specifies the column used to divide data into chunks. If you
 ↪ do not configure it,
sync-diff-inspector chooses an appropriate column (primary key, unique
 ↪ key, or a field with index).
index-fields = ["col1","col2"]
(optional) Ignores checking some columns such as some types (json, bit,
 ↪ blob, etc.)
that sync-diff-inspector does not currently support.
The floating-point data type behaves differently in TiDB and MySQL. You
 ↪ can use
`ignore-columns` to skip checking these columns.
ignore-columns = [","]
(optional) Specifies the size of the chunk for dividing the table. If
 ↪ not specified, this configuration can be deleted or be set as 0.
chunk-size = 0
(optional) Specifies the "collation" for the table. If not specified,
 ↪ this configuration can be deleted or be set as an empty string.
collation = ""
```

### 13.13.1.5 Run sync-diff-inspector

Run the following command:

```
./sync_diff_inspector --config=./config.toml
```

This command outputs a check report `summary.txt` in the `output-dir` of `config.toml` and the log `sync_diff.log`. In the `output-dir`, a folder named by the hash value of the `config.toml` file is also generated. This folder includes the checkpoint node information of breakpoints and the SQL file generated when the data is inconsistent.

### 13.13.1.5.1 Progress information

`sync-diff-inspector` sends progress information to `stdout` when running. Progress information includes the comparison results of table structures, comparison results of table data and the progress bar.

#### Note:

To ensure the display effect, keep the display window width above 80 characters.

```
A total of 2 tables need to be compared

Comparing the table structure of `sbtest`.`sbtest96` ... equivalent
Comparing the table structure of `sbtest`.`sbtest99` ... equivalent
Comparing the table data of `sbtest`.`sbtest96` ... failure
Comparing the table data of `sbtest`.`sbtest99` ...

↪
Progress [=====>--] 98%
↪ 193/200
```

```
A total of 2 tables need to be compared

Comparing the table structure of `sbtest`.`sbtest96` ... equivalent
Comparing the table structure of `sbtest`.`sbtest99` ... equivalent
Comparing the table data of `sbtest`.`sbtest96` ... failure
Comparing the table data of `sbtest`.`sbtest99` ... failure

↪
Progress [=====>]
↪ 100% 0/0
The data of `sbtest`.`sbtest99` is not equal
The data of `sbtest`.`sbtest96` is not equal

The rest of tables are all equal.
```

```
A total of 2 tables have been compared, 0 tables finished, 2 tables failed,
↪ 0 tables skipped.
The patch file has been generated in
 'output/fix-on-tidb2/'
You can view the comparison details through 'output/sync_diff.log'
```

### 13.13.1.5.2 Output file

The directory structure of the output file is as follows:

```
output/
|-- checkpoint # Saves the breakpoint information
| |-- bbfec8cc8d1f58a5800e63aa73e5 # Config hash. The placeholder file which
| ↪ identifies the configuration file corresponding to the output
| ↪ directory (output/)
| |-- DO_NOT_EDIT_THIS_DIR
| -- sync_diff_checkpoints.pb # The breakpoint information
|
|-- fix-on-target # Saves SQL files to fix data inconsistency
| |-- xxx.sql
| |-- xxx.sql
| -- xxx.sql
|
|-- summary.txt # Saves the summary of the check results
-- sync_diff.log # Saves the output log information when sync-diff-
 ↪ inspector is running
```

### 13.13.1.5.3 Log

The log of sync-diff-inspector is saved in `${output}/sync_diff.log`, among which `${output}` ↪ `output` is the value of `output-dir` in the `config.toml` file.

### 13.13.1.5.4 Progress

The running sync-diff-inspector periodically (every 10 seconds) prints the progress in checkpoint, which is located at `${output}/checkpoint/sync_diff_checkpoints.pb`, among which `${output}` is the value of `output-dir` in the `config.toml` file.

### 13.13.1.5.5 Result

After the check is finished, sync-diff-inspector outputs a report. It is located at `${output}/summary.txt`, and `${output}` ↪ `output` is the value of `output-dir` in the `config.toml` file.

```

↪
| TABLE | STRUCTURE EQUALITY | DATA DIFF ROWS | UPCOUNT |
↪ DOWNCOUNT |
+-----+-----+-----+-----+
↪
| `sbttest`.`sbttest99` | true | +97/-97 | 999999 | 999999 |
| `sbttest`.`sbttest96` | true | +0/-101 | 999999 | 1000100 |
+-----+-----+-----+-----+
↪
Time Cost: 16.75370462s
Average Speed: 113.277149MB/s

```

- **TABLE:** The corresponding database and table names
- **RESULT:** Whether the check is completed. If you have configured `skip-non-existing` `↪ -table = true`, the value of this column is `skipped` for tables that do not exist in the upstream or downstream
- **STRUCTURE EQUALITY:** Checks whether the table structure is the same
- **DATA DIFF ROWS:** `rowAdd/rowDelete`. Indicates the number of rows that need to be added/deleted to fix the table

### 13.13.1.5.6 SQL statements to fix inconsistent data

If different rows exist during the data checking process, the SQL statements will be generated to fix them. If the data inconsistency exists in a chunk, a SQL file named by `chunk.Index` will be generated. The SQL file is located at `${output}/fix-on-${instance} ↪ }`, and `${instance}` is the value of `task.target-instance` in the `config.toml` file.

A SQL file contains the table to which the chunk belong and the range information. For the SQL files, you should consider the following three situations:

- If the rows in the downstream database are missing, `REPLACE` statements will be applied
- If the rows in the downstream database are redundant, `DELETE` statements will be applied
- If some data of the rows in the downstream database is inconsistent, `REPLACE` statements will be applied and inconsistent columns will be marked with annotation in the SQL file

```

-- table: sbttest.sbttest99
-- range in sequence: (3690708) < (id) <= (3720581)
/*
DIFF COLUMNS `K` `C` `PAD`

```

```

↪
source data 2501808 'hello' 'world'

↪
target data 5003616 '0709824117-9809973320-4456050422'
↪ '1714066100-7057807621-1425865505'

↪
*/
REPLACE INTO `sbtest`.`sbtest99`(`id`,`k`,`c`,`pad`) VALUES
↪ (3700000,2501808,'hello','world');

```

### 13.13.1.6 Note

- sync-diff-inspector consumes a certain amount of server resources when checking data. Avoid using sync-diff-inspector to check data during peak business hours.
- Before comparing the data in MySQL with that in TiDB, pay attention to the collation configuration of the tables. If the primary key or unique key is the `varchar` type and the collation configuration in MySQL differs from that in TiDB, the final check result might be incorrect because of the collation issue. You need to add collation to the sync-diff-inspector configuration file.
- sync-diff-inspector divides data into chunks first according to TiDB statistics and you need to guarantee the accuracy of the statistics. You can manually run the `analyze ↪ table {table_name}` command when the TiDB server's *workload is light*.
- Pay special attention to `table-rules`. If you configure `schema-pattern="test1"`, `table-pattern = "t_1"`, `target-schema="test2"` and `target-table = "t_2"`, the `test1.t_1` schema in the source database and the `test2.t_2` schema in the target database are compared. Sharding is enabled by default in sync-diff-inspector, so if the source database has a `test2.t_2` table, the `test1.t_1` table and `test2.t_2` table in the source database serving as sharding are compared with the `test2.t_2` table in the target database.
- The generated SQL file is only used as a reference for repairing data, and you need to confirm it before executing these SQL statements to repair data.

### 13.13.2 Data Check for Tables with Different Schema or Table Names

When using replication tools such as [TiDB Data Migration](#), you can set `route-rules` to replicate data to a specified table in the downstream. sync-diff-inspector enables you to verify tables with different schema names or table names by setting `rules`.

The following is a simple configuration example. To learn the complete configuration, refer to [Sync-diff-inspector User Guide](#).

```
Datasource config
[data-sources.mysql1]
 host = "127.0.0.1"
 port = 3306
 user = "root"
 password = ""
 route-rules = ["rule1"]

[data-sources.tidb0]
 host = "127.0.0.1"
 port = 4000
 user = "root"
 password = ""
Routes
[routes.rule1]
schema-pattern = "test_1" # Matches the schema name of the data source.
 ↳ Supports the wildcards "*" and "?"
table-pattern = "t_1" # Matches the table name of the data source.
 ↳ Supports the wildcards "*" and "?"
target-schema = "test_2" # The name of the schema in the target database
target-table = "t_2" # The name of the target table
```

This configuration can be used to check `test_2.t_2` in the downstream and `test_1.t_1` in the `mysql1` instance.

To check a large number of tables with different schema names or table names, you can simplify the configuration by setting the mapping relationship by using `rules`. You can configure the mapping relationship of either schema or table, or of both. For example, all the tables in the upstream `test_1` database are replicated to the downstream `test_2` database, which can be checked through the following configuration:

```
Datasource config
[data-sources.mysql1]
 host = "127.0.0.1"
 port = 3306
 user = "root"
 password = ""
 route-rules = ["rule1"]

[data-sources.tidb0]
 host = "127.0.0.1"
 port = 4000
 user = "root"
 password = ""
Routes
```

```
[routes.rule1]
schema-pattern = "test_1" # Matches the schema name of the data source.
 ↳ Supports the wildcards "*" and "?"
table-pattern = "*" # Matches the table name of the data source.
 ↳ Supports the wildcards "*" and "?"
target-schema = "test_2" # The name of the schema in the target database
target-table = "t_2" # The name of the target table
```

### 13.13.2.1 Note

If `test_2.t_2` exists in the upstream database, the downstream database also compares this table.

### 13.13.3 Data Check in the Sharding Scenario

`sync-diff-inspector` supports data check in the sharding scenario. Assume that you use the [TiDB Data Migration](#) tool to replicate data from multiple MySQL instances into TiDB, you can use `sync-diff-inspector` to check upstream and downstream data.

For scenarios where the number of upstream sharded tables is small and the naming rules of sharded tables do not have a pattern as shown below, you can use `Datasource config` to configure `table-0`, set corresponding `rules` and configure the tables that have the mapping relationship between the upstream and downstream databases. This configuration method requires setting all sharded tables.

Figure 296: shard-table-replica-1

Below is a complete example of the `sync-diff-inspector` configuration.

```
Diff Configuration.

Global config
```

```
The number of goroutines created to check data. The number of
↳ connections between upstream and downstream databases are slightly
↳ greater than this value
check-thread-count = 4

If enabled, SQL statements is exported to fix inconsistent tables
export-fix-sql = true

Only compares the table structure instead of the data
check-struct-only = false

Datasource config
[data-sources.mysql1]
 host = "127.0.0.1"
 port = 3306
 user = "root"
 password = ""

 route-rules = ["rule1"]

[data-sources.mysql2]
 host = "127.0.0.1"
 port = 3306
 user = "root"
 password = ""

 route-rules = ["rule2"]

[data-sources.tidb0]
 host = "127.0.0.1"
 port = 4000
 user = "root"
 password = ""

Routes
[routes.rule1]
schema-pattern = "test" # Matches the schema name of the data source.
↳ Supports the wildcards "*" and "?"
table-pattern = "table-[1-2]" # Matches the table name of the data source.
↳ Supports the wildcards "*" and "?"
target-schema = "test" # The name of the schema in the target database
target-table = "table-0" # The name of the target table

[routes.rule2]
schema-pattern = "test" # Matches the schema name of the data source.
```

```

 ↪ Supports the wildcards "*" and "?"
table-pattern = "table-3" # Matches the table name of the data source.
 ↪ Supports the wildcards "*" and "?"
target-schema = "test" # The name of the schema in the target database
target-table = "table-0" # The name of the target table

Task config
[task]
 output-dir = "./output"

 source-instances = ["mysql1", "mysql2"]

 target-instance = "tidb0"

 # The tables of downstream databases to be compared. Each table needs to
 ↪ contain the schema name and the table name, separated by '.'
 target-check-tables = ["test.table-0"]

```

You can use `table-rules` for configuration when there are a large number of upstream sharded tables and the naming rules of all sharded tables have a pattern, as shown below:

Figure 297: shard-table-replica-2

Below is a complete example of the `sync-diff-inspector` configuration.

```

Diff Configuration.
Global config

```

```
The number of goroutines created to check data. The number of
↳ connections between upstream and downstream databases are slightly
↳ greater than this value.
check-thread-count = 4

If enabled, SQL statements is exported to fix inconsistent tables.
export-fix-sql = true

Only compares the table structure instead of the data.
check-struct-only = false

Datasource config
[data-sources.mysql1]
 host = "127.0.0.1"
 port = 3306
 user = "root"
 password = ""

[data-sources.mysql2]
 host = "127.0.0.1"
 port = 3306
 user = "root"
 password = ""

[data-sources.tidb0]
 host = "127.0.0.1"
 port = 4000
 user = "root"
 password = ""

Routes
[routes.rule1]
schema-pattern = "test" # Matches the schema name of the data source.
↳ Supports the wildcards "*" and "?"
table-pattern = "table-*" # Matches the table name of the data source.
↳ Supports the wildcards "*" and "?"
target-schema = "test" # The name of the schema in the target database
target-table = "table-0" # The name of the target table

Task config
[task]
 output-dir = "./output"
 source-instances = ["mysql1", "mysql2"]

 target-instance = "tidb0"
```

```
The tables of downstream databases to be compared. Each table needs to
 ↪ contain the schema name and the table name, separated by '.'
target-check-tables = ["test.table-0"]
```

### 13.13.3.1 Note

If `test.table-0` exists in the upstream database, the downstream database also compares this table.

## 13.13.4 Data Check for TiDB Upstream and Downstream Clusters

When you use TiCDC to build upstream and downstream clusters of TiDB, you might need to verify the consistency of upstream and downstream data without stopping replication. In the regular replication mode, TiCDC only guarantees that the data is eventually consistent, but cannot guarantee that the data is consistent during the replication process. Therefore, it is difficult to verify the consistency of dynamically changing data. To meet such a need, TiCDC provides the Syncpoint feature.

Syncpoint uses the snapshot feature provided by TiDB and enables TiCDC to maintain a `ts-map` that has consistency between upstream and downstream snapshots during the replication process. In this way, the issue of verifying the consistency of dynamic data is converted to the issue of verifying the consistency of static snapshot data, which achieves the effect of nearly real-time verification.

To enable the Syncpoint feature, set the value of the TiCDC configuration item `enable-sync-point` to `true` when creating a replication task. After enabling Syncpoint, TiCDC will periodically align the upstream and downstream snapshots according to the TiCDC parameter `sync-point-interval` during the data replication process, and will save the upstream and downstream TSO correspondences in the downstream `tidb_cdc.syncpoint_v1` table.

Then, you only need to configure `snapshot` in `sync-diff-inspector` to verify the data of the TiDB upstream-downstream clusters. The following TiCDC configuration example enables Syncpoint for a created replication task:

```
Enables SyncPoint.
enable-sync-point = true

Aligns the upstream and downstream snapshots every 5 minutes
sync-point-interval = "5m"

Cleans up the ts-map data in the downstream tidb_cdc.syncpoint_v1 table
 ↪ every hour
sync-point-retention = "1h"
```

### 13.13.4.1 Step 1: obtain ts-map

You can execute the following SQL statement in the downstream TiDB cluster to obtain the upstream TSO (`primary_ts`) and downstream TSO (`secondary_ts`):

```
select * from tidb_cdc.syncpoint_v1;
+--
↪ -----+-----+-----+-----+
↪
| ticdc_cluster_id | changefeed | primary_ts | secondary_ts |
↪ created_at |
+--
↪ -----+-----+-----+-----+
↪
| default | test-2 | 435953225454059520 | 435953235516456963 |
↪ 2022-09-13 08:40:15 |
+--
↪ -----+-----+-----+-----+
↪
```

The fields in the preceding `syncpoint_v1` table are described as follows:

- `ticdc_cluster_id`: The ID of the TiCDC cluster in this record.
- `changefeed`: The ID of the changefeed in this record. Because different TiCDC clusters might have changefeeds with the same name, you need to confirm the `ts-map` inserted by a changefeed with the TiCDC cluster ID and changefeed ID.
- `primary_ts`: The timestamp of the upstream database snapshot.
- `secondary_ts`: The timestamp of the downstream database snapshot.
- `created_at`: The time when this record is inserted.

### 13.13.4.2 Step 2: configure snapshot

Then configure the snapshot information of the upstream and downstream databases by using the `ts-map` information obtained in [Step 1](#).

Here is a configuration example of the `Datasource config` section:

```
Datasource config
[data-sources.uptidb]
 host = "172.16.0.1"
 port = 4000
 user = "root"
 password = ""
 snapshot = "435953225454059520"

[data-sources.downtidb]
 host = "172.16.0.2"
```

```
port = 4000
user = "root"
snapshot = "435953235516456963"
```

### 13.13.4.3 Notes

- Before TiCDC creates a changefeed, make sure that the value of the TiCDC configuration item `enable-sync-point` is set to `true`. Only in this way, Syncpoint is enabled and the `ts-map` is saved in the downstream. For the complete configuration, see [TiCDC task configuration file](#).
- Modify the Garbage Collection (GC) time of TiKV to ensure that the historical data corresponding to snapshot is not collected by GC during the data check. It is recommended that you modify the GC time to 1 hour and recover the setting after the check.
- The above example only shows the section of `Datasource` config. For complete configuration, refer to [sync-diff-inspector User Guide](#).
- Since v6.4.0, only the changefeed with the `SYSTEM_VARIABLES_ADMIN` or `SUPER` privilege can use the TiCDC Syncpoint feature.

### 13.13.5 Data Check in the DM Replication Scenario

When using replication tools such as [TiDB Data Migration](#), you need to check the data consistency before and after the replication process. You can set a specific `task-name` configuration from DM-master to perform a data check.

The following is a simple configuration example. To learn the complete configuration, refer to [Sync-diff-inspector User Guide](#).

```
Diff Configuration.

Global config

The number of goroutines created to check data. The number of
 ↪ connections between upstream and downstream databases are slightly
 ↪ greater than this value.
check-thread-count = 4

If enabled, SQL statements is exported to fix inconsistent tables.
export-fix-sql = true

Only compares the table structure instead of the data.
check-struct-only = false

The IP address of dm-master and the format is "http://127.0.0.1:8261".
```

```
dm-addr = "http://127.0.0.1:8261"

Specifies the `task-name` of DM.
dm-task = "test"

Task config
[task]
 output-dir = "./output"

 # The tables of downstream databases to be compared. Each table needs to
 ↪ contain the schema name and the table name, separated by '.'
 target-check-tables = ["hb_test.*"]
```

This example is configured in `dm-task = "test"`, which checks all the tables of `hb_test` schema under the “test” task. It automatically gets the regular matching of the schemas between upstream and downstream databases to verify the data consistency after DM replication.

## 14 Reference

### 14.1 Cluster Architecture

#### 14.1.1 TiDB Architecture

Compared with the traditional standalone databases, TiDB has the following advantages:

- Has a distributed architecture with flexible and elastic scalability.
- Fully compatible with the MySQL 5.7 protocol, common features and syntax of MySQL. To migrate your applications to TiDB, you do not need to change a single line of code in many cases.
- Supports high availability with automatic failover when a minority of replicas fail; transparent to applications.
- Supports ACID transactions, suitable for scenarios requiring strong consistency such as bank transfer.
  
- Provides a rich series of [data migration tools](#) for migrating, replicating, or backing up data.

As a distributed database, TiDB is designed to consist of multiple components. These components communicate with each other and form a complete TiDB system. The architecture is as follows:

Figure 298: TiDB Architecture

#### 14.1.1.1 TiDB server

The **TiDB server** is a stateless SQL layer that exposes the connection endpoint of the MySQL protocol to the outside. The TiDB server receives SQL requests, performs SQL parsing and optimization, and ultimately generates a distributed execution plan. It is horizontally scalable and provides the unified interface to the outside through the load balancing components such as Linux Virtual Server (LVS), HAProxy, or F5. It does not store data and is only for computing and SQL analyzing, transmitting actual data read request to TiKV nodes (or TiFlash nodes).

#### 14.1.1.2 Placement Driver (PD) server

The **PD server** is the metadata managing component of the entire cluster. It stores metadata of real-time data distribution of every single TiKV node and the topology structure of the entire TiDB cluster, provides the TiDB Dashboard management UI, and allocates transaction IDs to distributed transactions. The PD server is “the brain” of the entire TiDB cluster because it not only stores metadata of the cluster, but also sends data scheduling command to specific TiKV nodes according to the data distribution state reported by TiKV nodes in real time. In addition, the PD server consists of three nodes at least and has high availability. It is recommended to deploy an odd number of PD nodes.

#### 14.1.1.3 Storage servers

### 14.1.1.3.1 TiKV server

The **TiKV server** is responsible for storing data. TiKV is a distributed transactional key-value storage engine.

**Region** is the basic unit to store data. Each Region stores the data for a particular Key Range which is a left-closed and right-open interval from StartKey to EndKey.

Multiple Regions exist in each TiKV node. TiKV APIs provide native support to distributed transactions at the key-value pair level and supports the Snapshot Isolation level isolation by default. This is the core of how TiDB supports distributed transactions at the SQL level. After processing SQL statements, the TiDB server converts the SQL execution plan to an actual call to the TiKV API. Therefore, data is stored in TiKV. All the data in TiKV is automatically maintained in multiple replicas (three replicas by default), so TiKV has native high availability and supports automatic failover.

### 14.1.1.3.2 TiFlash server

The **TiFlash server** is a special type of storage server. Unlike ordinary TiKV nodes, TiFlash stores data by column, mainly designed to accelerate analytical processing.

## 14.1.2 TiDB Storage

This document introduces some design ideas and key concepts of **TiKV**.

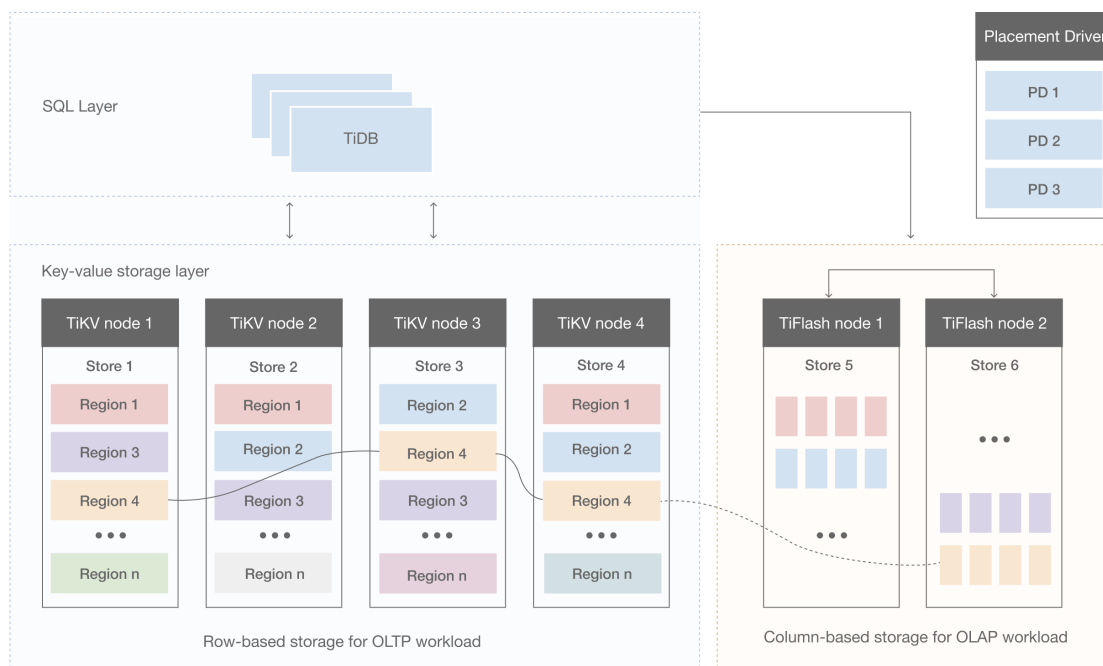

Figure 299: storage-architecture

### 14.1.2.1 Key-Value pairs

The first thing to decide for a data storage system is the data storage model, that is, in what form the data is saved. TiKV's choice is the Key-Value model and provides an ordered traversal method. There are two key points for TiKV data storage model:

- This is a huge Map (similar to `std::Map` in C++) , which stores Key-Value pairs.
- The Key-Value pair in the Map is ordered according to Keys' binary order, which means you can Seek the position of a particular Key and then call the Next method to get the Key-Value pairs larger than this Key in incremental order.

Note that the KV storage model for TiKV described in this document has nothing to do with tables of SQL. This document does not discuss any concepts related to SQL and only focuses on how to implement a high-performance, high-reliability, distributed Key-Value storage such as TiKV.

### 14.1.2.2 Local storage (RocksDB)

For any persistent storage engine, data is eventually saved on disk, and TiKV is no exception. TiKV does not write data directly on the disk, but stores data in RocksDB, which is responsible for the data storage. The reason is that it costs a lot to develop a standalone storage engine, especially a high-performance standalone engine that requires careful optimization.

RocksDB is an excellent standalone storage engine open-sourced by Facebook. This engine can meet various requirements of TiKV for a single engine. Here, you can simply consider RocksDB as a single persistent Key-Value Map.

### 14.1.2.3 Raft protocol

What's more, the implementation of TiKV faces a more difficult thing: to secure data safety in case a single machine fails.

A simple way is to replicate data to multiple machines, so that even if one machine fails, the replicas on other machines are still available. In other words, you need a data replication scheme that is reliable, efficient, and able to handle the situation of a failed replica. All of these are made possible by the Raft algorithm.

Raft is a consensus algorithm. This document only briefly introduces Raft. For more details, you can see [In Search of an Understandable Consensus Algorithm](#). The Raft has several important features:

- Leader election
- Membership changes (such as adding replicas, deleting replicas, and transferring leaders)
- Log replication

TiKV use Raft to perform data replication. Each data change will be recorded as a Raft log. Through Raft log replication, data is safely and reliably replicated to multiple nodes of the Raft group. However, according to Raft protocol, successful writes only need that data is replicated to the majority of nodes.

Figure 300: Raft in TiDB

In summary, TiKV can quickly store data on disk via the standalone machine RocksDB, and replicate data to multiple machines via Raft in case of machine failure. Data is written through the interface of Raft instead of to RocksDB. With the implementation of Raft, TiKV becomes a distributed Key-Value storage. Even with a few machine failures, TiKV can automatically complete replicas by virtue of the native Raft protocol, which does not impact the application.

#### 14.1.2.4 Region

To make it easy to understand, let's assume that all data only has one replica. As mentioned earlier, TiKV can be regarded as a large, orderly KV Map, so data is distributed across multiple machines in order to achieve horizontal scalability. For a KV system, there are two typical solutions to distributing data across multiple machines:

- Hash: Create Hash by Key and select the corresponding storage node according to the Hash value.
- Range: Divide ranges by Key, where a segment of serial Key is stored on a node.

TiKV chooses the second solution that divides the whole Key-Value space into a series of consecutive Key segments. Each segment is called a Region. Each Region can be described by  $[\text{StartKey}, \text{EndKey})$ , a left-closed and right-open interval. The default size limit for each Region is 96 MiB and the size can be configured.

Figure 301: Region in TiDB

Note that the Region here has nothing to do with the table in SQL. In this document, forget about SQL and focus on KV for now. After dividing data into Regions, TiKV will perform two important tasks:

- Distributing data to all nodes in the cluster and use Region as the basic unit. Try its best to ensure that the number of Regions on each node is roughly similar.
- Performing Raft replication and membership management in Region.

These two tasks are very important and will be introduced one by one.

- First, data is divided into many Regions according to Key, and the data for each Region is stored on only one node (ignoring multiple replicas). The TiDB system has a PD component that is responsible for spreading Regions as evenly as possible across all nodes in the cluster. In this way, on one hand, the storage capacity is scaled horizontally (Regions on the other nodes are automatically scheduled to the newly added node); on the other hand, load balancing is achieved (the situation where one node has a lot of data while the others have little will not occur).

At the same time, in order to ensure that the upper client can access the needed data, there is a component (PD) in the system to record the distribution of Regions on the node, that is, the exact Region of a Key and the node of that Region placed through any Key.

- For the second task, TiKV replicates data in Regions, which means that data in one Region will have multiple replicas with the name “Replica”. Multiple Replicas of a Region are stored on different nodes to form a Raft Group, which is kept consistent through the Raft algorithm.

One of the Replicas serves as the Leader of the Group and other as the Follower. By default, all reads and writes are processed through the Leader, where reads are done and write are replicated to followers. The following diagram shows the whole picture about Region and Raft group.

Figure 302: TiDB Storage

As we distribute and replicate data in Regions, we have a distributed Key-Value system that, to some extent, has the capability of disaster recovery. You no longer need to worry about the capacity, or disk failure and data loss.

#### 14.1.2.5 MVCC

Many databases implement multi-version concurrency control (MVCC), and TiKV is no exception. Imagine the situation where two clients modify the value of a Key at the same time. Without MVCC, the data needs to be locked. In a distributed scenario, it might cause performance and deadlock problems. TiKV’s MVCC implementation is achieved by appending a version number to Key. In short, without MVCC, TiKV’s data layout can be seen as:

```
Key1 -> Value
Key2 -> Value
.....
KeyN -> Value
```

With MVCC, the key array of TiKV is like this:

```
Key1_Version3 -> Value
Key1_Version2 -> Value
Key1_Version1 -> Value
.....
Key2_Version4 -> Value
Key2_Version3 -> Value
Key2_Version2 -> Value
Key2_Version1 -> Value
.....
KeyN_Version2 -> Value
KeyN_Version1 -> Value
.....
```

Note that for multiple versions of the same Key, versions with larger numbers are placed first (see the [Key-Value](#) section where Keys are arranged in order), so that when you obtain Value through Key + Version, the Key of MVCC can be constructed with Key and Version, which is Key\_Version. Then you can directly locate the first position greater than or equal to this Key\_Version through RocksDB's `SeekPrefix(Key_Version)` API.

#### 14.1.2.6 Distributed ACID transaction

Transaction of TiKV adopts the model used by Google in BigTable: [Percolator](#). TiKV's implementation is inspired by this paper, with a lot of optimizations. See [transaction overview](#) for details.

#### 14.1.3 TiDB Computing

Based on the distributed storage provided by TiKV, TiDB builds the computing engine that combines great capability of transactional processing with that of data analysis. This document starts by introducing a data mapping algorithm that maps data from TiDB database tables to (Key, Value) key-value pairs in TiKV, then introduces how TiDB manages metadata, and finally illustrates the architecture of the TiDB SQL layer.

For the storage solution on which the computing layer is dependent, this document only introduces the row-based storage structure of TiKV. For OLAP services, TiDB introduces a column-based storage solution [TiFlash](#) as a TiKV extension.

### 14.1.3.1 Mapping table data to Key-Value

This section describes the scheme for mapping data to (Key, Value) key-value pairs in TiDB. Data to be mapped here includes the following two types:

- Data of each row in the table, hereinafter referred to as table data.
- Data of all indexes in the table, hereinafter referred to as index data.

#### 14.1.3.1.1 Mapping of table data to Key-Value

In a relational database, a table might have many columns. To map the data of each column in a row to a (Key, Value) key-value pair, you need to consider how to construct the Key. First of all, in OLTP scenarios, there are many operations such as adding, deleting, changing, and searching for data on a single or multiple rows, which needs the database to read a row of data quickly. Therefore, each key should have a unique ID (either explicit or implicit) to make it quick to locate. Then, many OLAP queries require a full table scan. If you can encode the keys of all rows in a table into a range, the whole table can be efficiently scanned by range queries.

Based on the considerations above, the mapping of table data to Key-Value in TiDB is designed as follows:

- To ensure that data from the same table is kept together for easy searching, TiDB assigns a table ID to each table represented by `TableID`. Table ID is an integer that is unique throughout the cluster.
- TiDB assigns a row ID, represented by `RowID`, to each row of data in the table. The row ID is also an integer, unique within the table. For row ID, TiDB has made a small optimization: if a table has an integer type primary key, TiDB uses the value of this primary key as the row ID.

Each row of data is encoded as a (Key, Value) key-value pair according to the following rule:

```
Key: tablePrefix{TableID}_recordPrefixSep{RowID}
Value: [col1, col2, col3, col4]
```

`tablePrefix` and `recordPrefixSep` are both special string constants used to distinguish other data in Key space. The exact values of the string constants are introduced in [Summary of mapping relationships](#).

#### 14.1.3.1.2 Mapping of indexed data to Key-Value

TiDB supports both primary keys and secondary indexes (both unique and non-unique indexes). Similar to the table data mapping scheme, TiDB assigns an index ID to each index of the table represented by `IndexID`.

For primary keys and unique indexes, it is needed to quickly locate the corresponding `RowID` based on the key-value pair, so such a key-value pair is encoded as follows.

```
Key: tablePrefix{tableID}_indexPrefixSep{indexID}_indexedColumnsValue
Value: RowID
```

For ordinary secondary indexes that do not need to satisfy the uniqueness constraint, a single key might correspond to multiple rows. It needs to query corresponding RowID according to the range of keys. Therefore, the key-value pair must be encoded according to the following rule:

```
Key: tablePrefix{TableID}_indexPrefixSep{IndexID}_indexedColumnsValue_{
 ↪ RowID}
Value: null
```

### 14.1.3.1.3 Summary of mapping relationships

`tablePrefix`, `recordPrefixSep`, and `indexPrefixSep` in all of the above encoding rules are string constants that are used to distinguish a KV from other data in the Key space, which are defined as follows:

```
tablePrefix = []byte{'t'}
recordPrefixSep = []byte{'r'}
indexPrefixSep = []byte{'i'}
```

Also note that in the above encoding schemes, no matter table data or index data key encoding scheme, all rows in a table have the same key prefix, and all data of an index also has the same prefix. Data with the same prefixes are thus arranged together in TiKV's key space. Therefore, by carefully designing the encoding scheme of the suffix part to ensure that the pre-encoding and post-encoding comparisons remain the same, the table data or index data can be stored in TiKV in an ordered manner. Using this encoding scheme, all row data in a table is arranged orderly by RowID in the TiKV's key space, and the data of a particular index is also arranged sequentially in the key space according to the specific value of the index data (`indexedColumnsValue`).

### 14.1.3.1.4 Example of Key-Value mapping relationship

This section shows a simple example for you to understand the Key-Value mapping relationship of TiDB. Suppose the following table exists in TiDB.

```
CREATE TABLE User (
 ID int,
 Name varchar(20),
 Role varchar(20),
 Age int,
 PRIMARY KEY (ID),
 KEY idxAge (Age)
);
```

Suppose there are 3 rows of data in the table.

```
1, "TiDB", "SQL Layer", 10
2, "TiKV", "KV Engine", 20
3, "PD", "Manager", 30
```

Each row of data is mapped to a (Key, Value) key-value pair, and the table has an `int` type primary key, so the value of `RowID` is the value of this primary key. Suppose the table's `TableID` is 10, and then its table data stored on TiKV is:

```
t10_r1 --> ["TiDB", "SQL Layer", 10]
t10_r2 --> ["TiKV", "KV Engine", 20]
t10_r3 --> ["PD", " Manager", 30]
```

In addition to the primary key, the table has a non-unique ordinary secondary index, `idxAge`. Suppose the `IndexID` is 1, and then its index data stored on TiKV is:

```
t10_i1_10_1 --> null
t10_i1_20_2 --> null
t10_i1_30_3 --> null
```

The above example shows the mapping rule from a relational model to a Key-Value model in TiDB, and the consideration behind this mapping scheme.

### 14.1.3.2 Metadata management

Each database and table in TiDB has metadata that indicates its definition and various attributes. This information also needs to be persisted, and TiDB stores this information in TiKV as well.

Each database or table is assigned a unique ID. As the unique identifier, when table data is encoded to Key-Value, this ID is encoded in the Key with the `m_` prefix. This constructs a key-value pair with the serialized metadata stored in it.

In addition, TiDB also uses a dedicated (Key, Value) key-value pair to store the latest version number of structure information of all tables. This key-value pair is global, and its version number is increased by 1 each time the state of the DDL operation changes. TiDB stores this key-value pair persistently in the PD server with the key of `/tidb/ddl`  $\leftrightarrow$  `/global_schema_version`, and Value is the version number value of the `int64` type. Meanwhile, because TiDB applies schema changes online, it keeps a background thread that constantly checks whether the version number of the table structure information stored in the PD server changes. This thread also ensures that the changes of version can be obtained within a certain period of time.

### 14.1.3.3 SQL layer overview

TiDB's SQL layer, TiDB Server, translates SQL statements into Key-Value operations, forwards the operations to TiKV, the distributed Key-Value storage layer, assembles the results returned by TiKV, and finally returns the query results to the client.

The nodes at this layer are stateless. These nodes themselves do not store data and are completely equivalent.

#### 14.1.3.3.1 SQL computing

The simplest solution to SQL computing is the **mapping of table data to Key-Value** as described in the previous section, which maps SQL queries to KV queries, acquires the corresponding data through the KV interface, and performs various computations.

For example, to execute the `select count(*) from user where name = "TiDB"` SQL statement, TiDB needs to read all data in the table, then checks whether the `name` field is TiDB, and if so, returns this row. The process is as follows:

1. Construct the Key Range: all RowID in a table are in  $[0, \text{MaxInt64})$  range. According to the row data Key encoding rule, using 0 and `MaxInt64` can construct a  $[\text{StartKey} \mapsto, \text{EndKey})$  range that is left-closed and right-open.
2. Scan Key Range: read the data in TiKV according to the key range constructed above.
3. Filter data: for each row of data read, calculate the `name = "TiDB"` expression. If the result is `true`, return to this row. If not, skip this row.
4. Calculate `Count(*)`: for each row that meets the requirements, add up to the result of `Count(*)`.

**The entire process is illustrated as follows:**

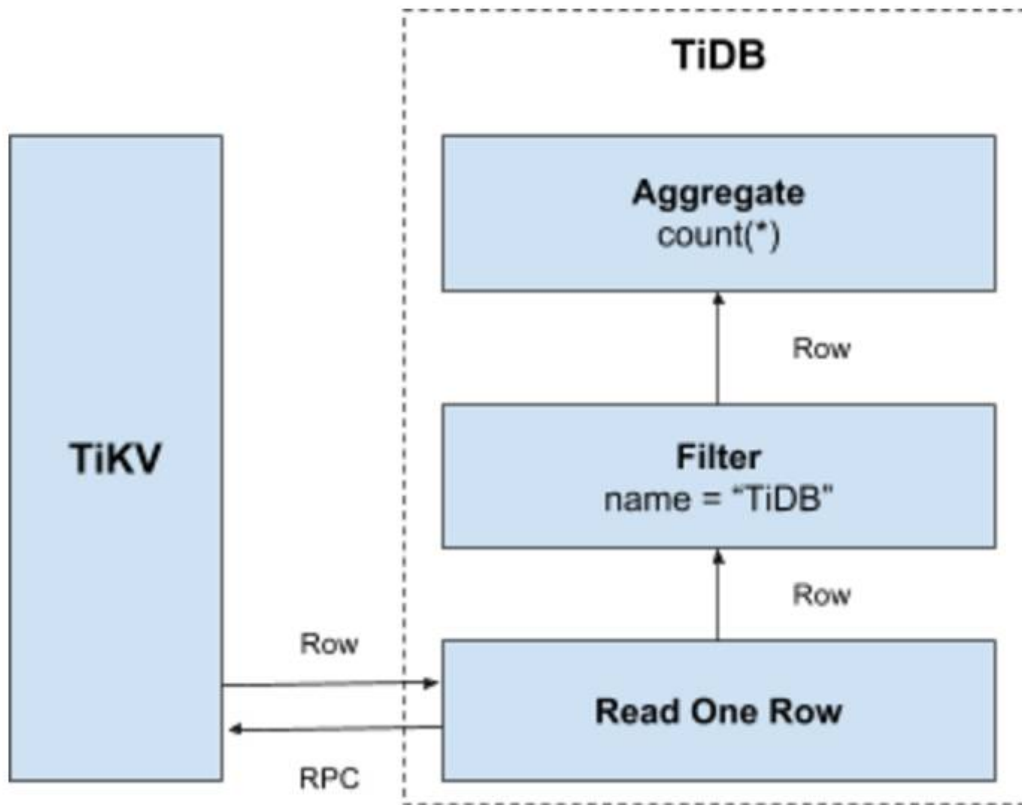

Figure 303: naive sql flow

This solution is intuitive and feasible, but has some obvious problems in a distributed database scenario:

- As the data is being scanned, each row is read from TiKV via a KV operation with at least one RPC overhead, which can be very high if there is a large amount of data to be scanned.
- It is not applicable to all rows. Data that does not meet the conditions does not need to be read.
- From the returned result of this query, only the number of rows that match the requirements is needed, not the value of those rows.

#### 14.1.3.3.2 Distributed SQL operations

To solve the problems above, the computation should be as close to the storage node as possible to avoid a large number of RPC callings. First of all, the SQL predicate condition `name = "TiDB"` should be pushed down to the storage node for computation, so that only valid rows are returned, which avoids meaningless network transfers. Then, the aggregation

function `Count(*)` can also be pushed down to the storage nodes for pre-aggregation, and each node only has to return a result of `Count(*)`. The SQL layer will sum up the `Count(*)` results returned by each node.

The following image shows how data returns layer by layer:

Figure 304: dist sql flow

#### 14.1.3.3.3 Architecture of SQL layer

The previous sections introduce some functions of the SQL layer and I hope you have a basic understanding of how SQL statements are handled. In fact, TiDB's SQL layer is much more complicated, with many modules and layers. The following diagram lists the important modules and calling relationships:

Figure 305: tidb sql layer

The user's SQL request is sent to TiDB Server either directly or via Load Balancer. TiDB Server will parse MySQL Protocol Packet, get the content of requests, parse the SQL request syntactically and semantically, develop and optimize query plans, execute a query plan, get and process the data. All data is stored in the TiKV cluster, so in this process, TiDB Server needs to interact with TiKV and get the data. Finally, TiDB Server needs to return the query results to the user.

#### 14.1.4 TiDB Scheduling

The Placement Driver (PD) works as the manager in a TiDB cluster, and it also schedules Regions in the cluster. This article introduces the design and core concepts of the PD scheduling component.

##### 14.1.4.1 Scheduling situations

TiKV is the distributed key-value storage engine used by TiDB. In TiKV, data is organized as Regions, which are replicated on several stores. In all replicas, a leader is responsible for reading and writing, and followers are responsible for replicating Raft logs from the leader.

Now consider about the following situations:

- To utilize storage space in a high-efficient way, multiple Replicas of the same Region need to be properly distributed on different nodes according to the Region size;
- For multiple data center topologies, one data center failure only causes one replica to fail for all Regions;
- When a new TiKV store is added, data can be rebalanced to it;
- When a TiKV store fails, PD needs to consider:

- Recovery time of the failed store.
  - \* If it's short (for example, the service is restarted), whether scheduling is necessary or not.
  - \* If it's long (for example, disk fault and data is lost), how to do scheduling.
- Replicas of all Regions.
  - \* If the number of replicas is not enough for some Regions, PD needs to complete them.
  - \* If the number of replicas is more than expected (for example, the failed store re-joins into the cluster after recovery), PD needs to delete them.
- Read/Write operations are performed on leaders, which cannot be distributed only on a few individual stores;
- Not all Regions are hot, so loads of all TiKV stores need to be balanced;
- When Regions are in balancing, data transferring utilizes much network/disk traffic and CPU time, which can influence online services.

These situations can occur at the same time, which makes it harder to resolve. Also, the whole system is changing dynamically, so a scheduler is needed to collect all information about the cluster, and then adjust the cluster. So, PD is introduced into the TiDB cluster.

#### 14.1.4.2 Scheduling requirements

The above situations can be classified into two types:

1. A distributed and highly available storage system must meet the following requirements:
  - The right number of replicas.
  - Replicas need to be distributed on different machines according to different topologies.
  - The cluster can perform automatic disaster recovery from TiKV peers' failure.
2. A good distributed system needs to have the following optimizations:
  - All Region leaders are distributed evenly on stores;
  - Storage capacity of all TiKV peers are balanced;
  - Hot spots are balanced;
  - Speed of load balancing for the Regions needs to be limited to ensure that online services are stable;
  - Maintainers are able to take peers online/offline manually.

After the first type of requirements is satisfied, the system will be failure tolerable. After the second type of requirements is satisfied, resources will be utilized more efficiently and the system will have better scalability.

To achieve the goals, PD needs to collect information firstly, such as state of peers, information about Raft groups and the statistics of accessing the peers. Then we need to specify some strategies for PD, so that PD can make scheduling plans from these information and strategies. Finally, PD distributes some operators to TiKV peers to complete scheduling plans.

#### 14.1.4.3 Basic scheduling operators

All scheduling plans contain three basic operators:

- Add a new replica
- Remove a replica
- Transfer a Region leader between replicas in a Raft group

They are implemented by the Raft commands `AddReplica`, `RemoveReplica`, and `TransferLeader`.

#### 14.1.4.4 Information collection

Scheduling is based on information collection. In short, the PD scheduling component needs to know the states of all TiKV peers and all Regions. TiKV peers report the following information to PD:

- State information reported by each TiKV peer:

Each TiKV peer sends heartbeats to PD periodically. PD not only checks whether the store is alive, but also collects `StoreState` in the heartbeat message. `StoreState` includes:

- Total disk space
- Available disk space
- The number of Regions
- Data read/write speed
- The number of snapshots that are sent/received (The data might be replicated between replicas through snapshots)
- Whether the store is overloaded
- Labels (See [Perception of Topology](#))

You can use PD control to check the status of a TiKV store, which can be Up, Disconnect, Offline, Down, or Tombstone. The following is a description of all statuses and their relationship.

- **Up**: The TiKV store is in service.
- **Disconnect**: Heartbeat messages between the PD and the TiKV store are lost for more than 20 seconds. If the lost period exceeds the time specified by `max-store-down-time`, the status “Disconnect” changes to “Down”.

- **Down:** Heartbeat messages between the PD and the TiKV store are lost for a time longer than `max-store-down-time` (30 minutes by default). In this status, the TiKV store starts replenishing replicas of each Region on the surviving store.
- **Offline:** A TiKV store is manually taken offline through PD Control. This is only an intermediate status for the store to go offline. The store in this status moves all its Regions to other “Up” stores that meet the relocation conditions. When `leader_count` and `region_count` (obtained through PD Control) both show 0, the store status changes to “Tombstone” from “Offline”. In the “Offline” status, **do not** disable the store service or the physical server where the store is located. During the process that the store goes offline, if the cluster does not have target stores to relocate the Regions (for example, inadequate stores to hold replicas in the cluster), the store is always in the “Offline” status.
- **Tombstone:** The TiKV store is completely offline. You can use the `remove-tombstone` interface to safely clean up TiKV in this status.

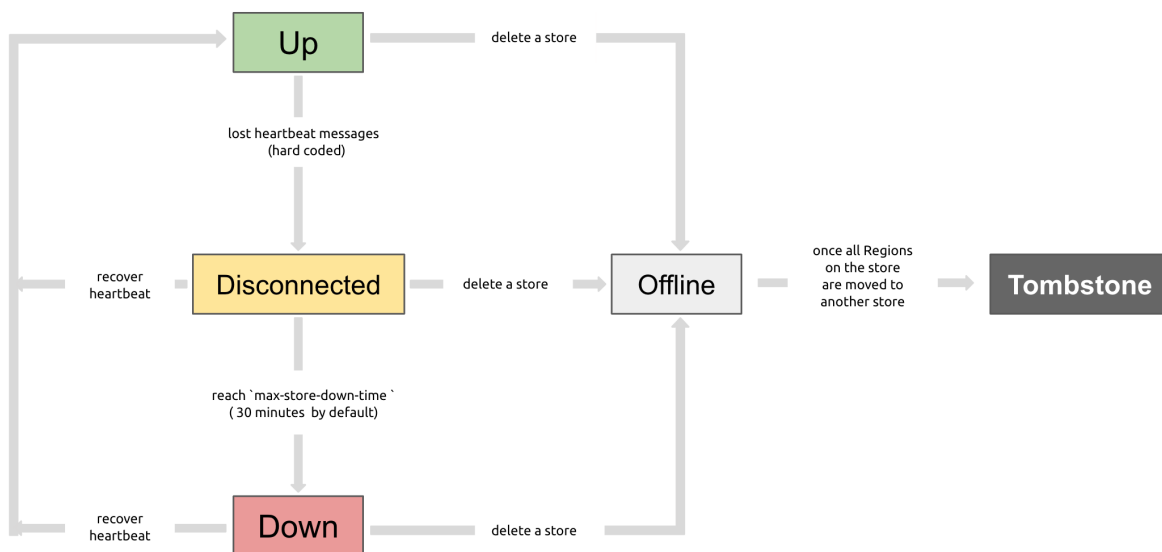

Figure 306: TiKV store status relationship

- Information reported by Region leaders:

Each Region leader sends heartbeats to PD periodically to report `RegionState`, including:

- Position of the leader itself
- Positions of other replicas
- The number of offline replicas

- data read/write speed

PD collects cluster information by the two types of heartbeats and then makes decision based on it.

Besides, PD can get more information from an expanded interface to make a more precise decision. For example, if a store's heartbeats are broken, PD can't know whether the peer steps down temporarily or forever. It just waits a while (by default 30min) and then treats the store as offline if there are still no heartbeats received. Then PD balances all regions on the store to other stores.

But sometimes stores are manually set offline by a maintainer, so the maintainer can tell PD this by the PD control interface. Then PD can balance all regions immediately.

#### 14.1.4.5 Scheduling strategies

After collecting the information, PD needs some strategies to make scheduling plans.

##### **Strategy 1: The number of replicas of a Region needs to be correct**

PD can know that the replica count of a Region is incorrect from the Region leader's heartbeat. If it happens, PD can adjust the replica count by adding/removing replica(s). The reason for incorrect replica count can be:

- Store failure, so some Region's replica count is less than expected;
- Store recovery after failure, so some Region's replica count could be more than expected;
- `max-replicas` is changed.

##### **Strategy 2: Replicas of a Region need to be at different positions**

Note that here "position" is different from "machine". Generally PD can only ensure that replicas of a Region are not at a same peer to avoid that the peer's failure causes more than one replicas to become lost. However in production, you might have the following requirements:

- Multiple TiKV peers are on one machine;
- TiKV peers are on multiple racks, and the system is expected to be available even if a rack fails;
- TiKV peers are in multiple data centers, and the system is expected to be available even if a data center fails;

The key to these requirements is that peers can have the same "position", which is the smallest unit for failure toleration. Replicas of a Region must not be in one unit. So, we can configure `labels` for the TiKV peers, and set `location-labels` on PD to specify which labels are used for marking positions.

### **Strategy 3: Replicas need to be balanced between stores**

The size limit of a Region replica is fixed, so keeping the replicas balanced between stores is helpful for data size balance.

### **Strategy 4: Leaders need to be balanced between stores**

Read and write operations are performed on leaders according to the Raft protocol, so that PD needs to distribute leaders into the whole cluster instead of several peers.

### **Strategy 5: Hot spots need to be balanced between stores**

PD can detect hot spots from store heartbeats and Region heartbeats, so that PD can distribute hot spots.

### **Strategy 6: Storage size needs to be balanced between stores**

When started up, a TiKV store reports capacity of storage, which indicates the store's space limit. PD will consider this when scheduling.

### **Strategy 7: Adjust scheduling speed to stabilize online services**

Scheduling utilizes CPU, memory, network and I/O traffic. Too much resource utilization will influence online services. Therefore, PD needs to limit the number of the concurrent scheduling tasks. By default this strategy is conservative, while it can be changed if quicker scheduling is required.

#### **14.1.4.6 Scheduling implementation**

PD collects cluster information from store heartbeats and Region heartbeats, and then makes scheduling plans from the information and strategies. Scheduling plans are a sequence of basic operators. Every time PD receives a Region heartbeat from a Region leader, it checks whether there is a pending operator on the Region or not. If PD needs to dispatch a new operator to a Region, it puts the operator into heartbeat responses, and monitors the operator by checking follow-up Region heartbeats.

Note that here “operators” are only suggestions to the Region leader, which can be skipped by Regions. Leader of Regions can decide whether to skip a scheduling operator or not based on its current status.

## **14.2 Storage Engine - TiKV**

### **14.2.1 TiKV Overview**

TiKV is a distributed and transactional key-value database, which provides transactional APIs with ACID compliance. With the implementation of the [Raft consensus algorithm](#) and consensus state stored in RocksDB, TiKV guarantees data consistency between multiple replicas and high availability. As the storage layer of the TiDB distributed database, TiKV provides the read and write service, and persist the written data from applications. It also stores the statistics data of the TiDB cluster.

### 14.2.1.1 Architecture Overview

TiKV implements the multi-raft-group replica mechanism based on the design of Google Spanner. A Region is a basic unit of the key-value data movement and refers to a data range in a Store. Each Region is replicated to multiple nodes. These multiple replicas form a Raft group. A replica of a Region is called a Peer. Typically there are 3 peers in a Region. One of them is the leader, which provides the read and write services. The PD component balances all the Regions automatically to guarantee that the read and write throughput is balanced among all the nodes in the TiKV cluster. With PD and carefully designed Raft groups, TiKV excels in horizontal scalability and can easily scale to store more than 100 TBs of data.

Figure 307: TiKV Architecture

#### 14.2.1.1.1 Region and RocksDB

There is a RocksDB database within each Store and it stores data into the local disk. All the Region data are stored in the same RocksDB instance in each Store. All the logs used for the Raft consensus algorithm is stored in another RocksDB instance in each Store. This is because the performance of sequential I/O is better than random I/O. With different RocksDB instances storing raft logs and Region data, TiKV combines all the data write operations of raft logs and TiKV Regions into one I/O operation to improve the performance.

#### 14.2.1.1.2 Region and Raft Consensus Algorithm

Data consistency between replicas of a Region is guaranteed by the Raft Consensus Algorithm. Only the leader of the Region can provide the writing service, and only when the data is written to the majority of replicas of a Region, the write operation succeeds.

TiKV tries to keep an appropriate size for each Region in the cluster. The Region size is currently 96 MiB by default. This mechanism helps the PD component to balance Regions among nodes in a TiKV cluster. When the size of a Region exceeds a threshold (144 MiB by default), TiKV splits it into two or more Regions. When the size of a Region is smaller than the threshold (20 MiB by default), TiKV merges the two smaller adjacent Regions into one Region.

When PD moves a replica from one TiKV node to another, it firstly adds a Learner replica on the target node, after the data in the Learner replica is nearly the same as that in the Leader replica, PD changes it to a Follower replica and removes the Follower replica on the source node.

Moving Leader replica from one node to another has a similar mechanism. The difference is that after the Learner replica becomes the Follower replica, there is a “Leader Transfer” operation in which the Follower replica actively proposes an election to elect itself as the Leader. Finally, the new Leader removes the old Leader replica in the source node.

#### 14.2.1.2 Distributed Transaction

TiKV supports distributed transactions. Users (or TiDB) can write multiple key-value pairs without worrying about whether they belong to the same Region. TiKV uses two-phase commit to achieve ACID constraints. See [TiDB Optimistic Transaction Model](#) for details.

#### 14.2.1.3 TiKV Coprocessor

TiDB pushes some data computation logic to TiKV Coprocessor. TiKV Coprocessor processes the computation for each Region. Each request sent to TiKV Coprocessor only involves the data of one Region.

### 14.2.2 RocksDB Overview

[RocksDB](#) is an LSM-tree storage engine that provides key-value store and read-write functions. It is developed by Facebook and based on LevelDB. Key-value pairs written by the user are firstly inserted into Write Ahead Log (WAL) and then written to the SkipList in memory (a data structure called MemTable). LSM-tree engines convert the random modification (insertion) to sequential writes to the WAL file, so they provide better write throughput than B-tree engines.

Once the data in memory reaches a certain size, RocksDB flushes the content into a Sorted String Table (SST) file in the disk. SST files are organized in multiple levels (the default is up to 6 levels). When the total size of a level reaches the threshold, RocksDB chooses part of the SST files and merges them into the next level. Each subsequent level is 10 times larger than the previous one, so 90% of the data is stored in the last layer.

RocksDB allows users to create multiple Column Families (CFs). CFs have their own SkipList and SST files, and they share the same WAL file. In this way, different CFs can have different settings according to the application characteristics. It does not increase the number of writes to WAL at the same time.

### 14.2.2.1 TiKV architecture

The architecture of TiKV is illustrated as follows:

## TiKV Architecture

Figure 308: TiKV RocksDB

As the storage engine of TiKV, RocksDB is used to store Raft logs and user data. All data in a TiKV node shares two RocksDB instances. One is for Raft log (often called raftdb), and the other is for user data and MVCC metadata (often called kvdb). There are four CFs in kvdb: raft, lock, default, and write:

- raft CF: Store metadata of each Region. It occupies only a very small amount of space, and users do not need to care.
- lock CF: Store the pessimistic lock of pessimistic transactions and the Prewrite lock for distributed transactions. After the transaction is committed, the corresponding data in lock CF is deleted quickly. Therefore, the size of data in lock CF is usually very small (less than 1 GB). If the data in lock CF increases a lot, it means that a large number of transactions are waiting to be committed, and that the system meets a bug or failure.
- write CF: Store the user's real written data and MVCC metadata (the start timestamp and commit timestamp of the transaction to which the data belongs). When the user writes a row of data, it is stored in the write CF if the data length is less than 255 bytes. Otherwise, it is stored in the default CF. In TiDB, the secondary index only occupies the space of write CF, since the value stored in the non-unique index is empty and the value stored in the unique index is the primary key index.
- default CF: Store data longer than 255 bytes.

### 14.2.2.2 RocksDB memory usage

To improve the reading performance and reduce the reading operations to the disk, RocksDB divides the files stored on the disk into blocks based on a certain size (the default is 64 KB). When reading a block, it first checks if the data already exists in BlockCache in memory. If true, it can read the data directly from memory without accessing the disk.

BlockCache discards the least recently used data according to the LRU algorithm. By default, TiKV devotes 45% of the system memory to BlockCache. Users can also modify the `storage.block-cache.capacity` configuration to an appropriate value by themselves. However, it is not recommended to exceed 60% of the total system memory.

The data written to RocksDB is written to MemTable firstly. When the size of a MemTable exceeds 128 MB, it switches to a new MemTable. There are 2 RocksDB instances in TiKV, a total of 4 CFs. The size limit of a single MemTable for each CF is 128 MB. A maximum of 5 MemTables can exist at the same time; otherwise, the foreground writes is blocked. The memory occupied by this part is at most 2.5 GB (4 x 5 x 128 MB). It is not recommended to change this limit since it costs less memory.

### 14.2.2.3 RocksDB space usage

- Multi-version: As RocksDB is a key-value storage engine with LSM-tree structure, the data in MemTable is flushed to L0 first. Because the file is arranged in the order of which they are generated, there might be overlap between the ranges of SSTs at the L0. As a result, the same key might have multiple versions in L0. When a file is merged from L0 to L1, it is cut into multiple files in a certain size (the default is 8 MB). The key range of each file on the same level does not overlap with each other, so there is only one version for each key on L1 and subsequent levels.
- Space amplification: The total size of files on each level is  $x$  (the default is 10) times that of the previous level, so 90% of the data is stored in the last level. It also means that the space amplification of RocksDB does not exceed 1.11 (L0 has fewer data and can be ignored).
- Space amplification of TiKV: TiKV has its own MVCC strategy. When a user writes a key, the real data written to RocksDB is `key + commit_ts`, that is to say, the update and deletion also write a new key to RocksDB. TiKV deletes the old version of the data (through the Delete interface of RocksDB) at intervals, so it can be considered that the actual space of the data stored by the user on TiKV is enlarged to 1.11 plus the data written in the last 10 minutes (assuming that TiKV cleans up the old data promptly).

### 14.2.2.4 RocksDB background threads and compaction

In RocksDB, operations such as converting the MemTable into SST files and merging SST files at various levels are performed in the background thread pool. The default size of the background thread pool is 8. When the number of CPUs in the machine is less than or equal to 8, the default size of the background thread pool is the number of CPUs minus one.

Generally speaking, users do not need to change this configuration. If the user deploys multiple TiKV instances on a machine, or the machine has a relatively high read load and a

low write load, you can adjust the `rocksdb/max-background-jobs` to 3 or 4 as appropriate.

#### 14.2.2.5 WriteStall

The L0 of RocksDB is different from other levels. The SSTs of L0 are arranged in the order of generation. The key ranges between the SSTs can overlap. Therefore, each SST in L0 must be queried in turn when a query is performed. In order not to affect query performance, WriteStall is triggered to block writing when there are too many files in L0.

When encountering a sudden sharp increase in write delay, you can first check the **WriteStall Reason** metric on the Grafana RocksDB KV panel. If it is a WriteStall caused by too many L0 files, you can adjust the following configurations to 64.

```
rocksdb.defaultcf.level0-slowdown-writes-trigger
rocksdb.writecf.level0-slowdown-writes-trigger
rocksdb.lockcf.level0-slowdown-writes-trigger
rocksdb.defaultcf.level0-stop-writes-trigger
rocksdb.writecf.level0-stop-writes-trigger
rocksdb.lockcf.level0-stop-writes-trigger
```

#### 14.2.3 Titan Overview

[Titan](#) is a high-performance [RocksDB](#) plugin for key-value separation. Titan can reduce write amplification in RocksDB when large values are used.

When the value size in Key-Value pairs is large (larger than 1 KB or 512 B), Titan performs better than RocksDB in write, update, and point read scenarios. However, Titan gets a higher write performance by sacrificing storage space and range query performance. As the price of SSDs continues to decrease, this trade-off will be more and more meaningful.

##### 14.2.3.1 Key features

- Reduce write amplification by separating values from the log-structured merge-tree (LSM-tree) and storing them independently.
- Seamlessly upgrade RocksDB instances to Titan. The upgrade does not require human intervention and does not impact online services.
- Achieve 100% compatibility with all RocksDB features used by the current TiKV.

##### 14.2.3.2 Usage scenarios

Titan is suitable for the scenarios where a huge volume of data is written to the TiKV foreground:

- RocksDB triggers a large amount of compactions, which consumes a lot of I/O bandwidth or CPU resources. This causes poor read and write performance of the foreground.

- The RocksDB compaction lags much behind (due to the I/O bandwidth limit or CPU bottleneck) and frequently causes write stalls.
- RocksDB triggers a large amount of compactions, which causes a lot of I/O writes and affects the life of the SSD disk.

### 14.2.3.3 Prerequisites

The prerequisites for enabling Titan are as follows:

- The average size of values is large, or the size of all large values accounts for much of the total value size. Currently, the size of a value greater than 1 KB is considered as a large value. In some situations, this number (1 KB) can be 512 B. Note that a single value written to TiKV cannot exceed 8 MB due to the limitation of the TiKV Raft layer. You can adjust the `raft-entry-max-size` configuration value to relax the limit.
- No range query will be performed or you do not need a high performance of range query. Because the data stored in Titan is not well-ordered, its performance of range query is poorer than that of RocksDB, especially for the query of a large range. According to PingCAP's internal test, Titan's range query performance is 40% to a few times lower than that of RocksDB.
- Sufficient disk space (consider reserving a space twice of the RocksDB disk consumption with the same data volume). This is because Titan reduces write amplification at the cost of disk space. In addition, Titan compresses values one by one, and its compression rate is lower than that of RocksDB. RocksDB compresses blocks one by one. Therefore, Titan consumes more storage space than RocksDB, which is expected and normal. In some situations, Titan's storage consumption can be twice that of RocksDB.

If you want to improve the performance of Titan, see the blog post [Titan: A RocksDB Plugin to Reduce Write Amplification](#).

### 14.2.3.4 Architecture and implementation

The following figure shows the architecture of Titan:

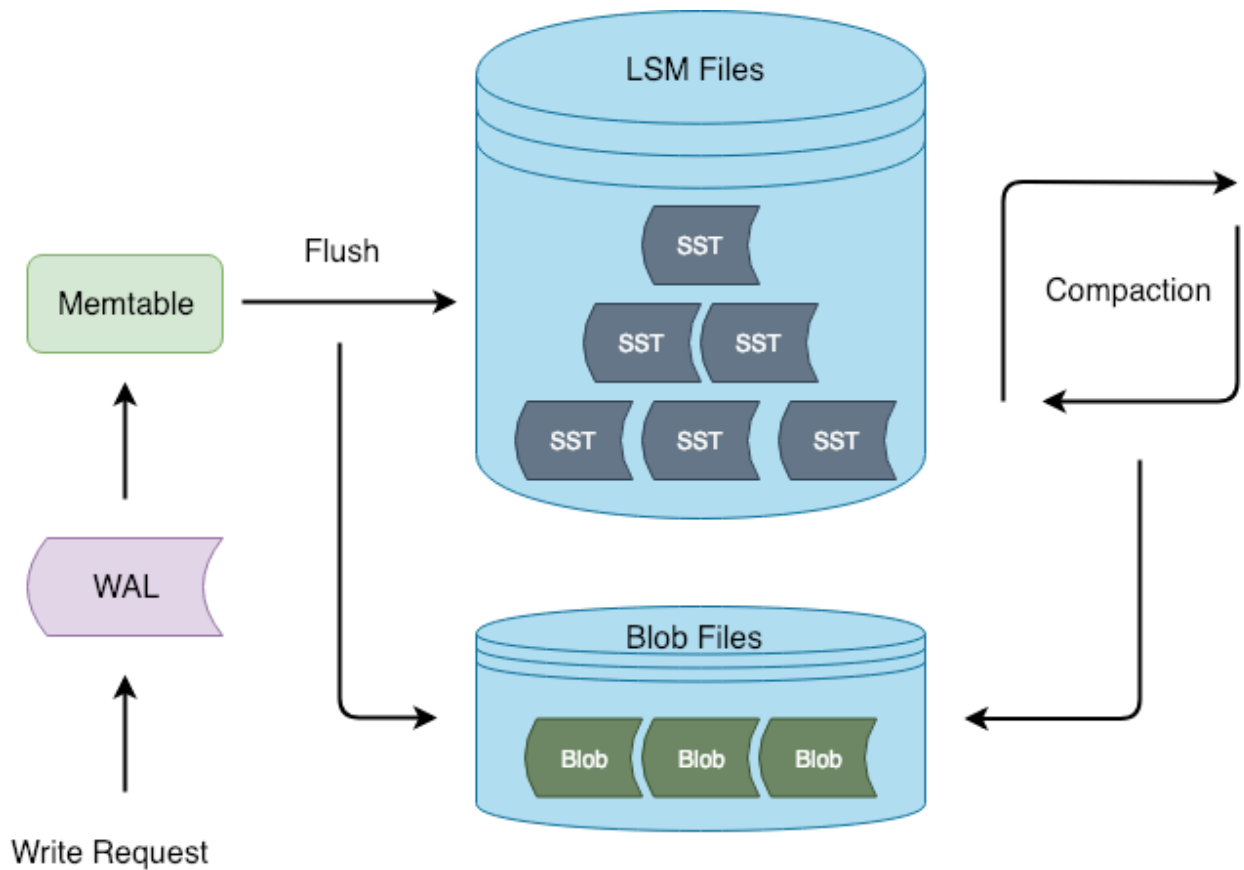

Figure 309: Titan Architecture

During flush and compaction operations, Titan separates values from the LSM-tree. The advantage of this approach is that the write process is consistent with RocksDB, which reduces the chance of invasive changes to RocksDB.

#### 14.2.3.4.1 BlobFile

When Titan separates the value file from the LSM-tree, it stores the value file in the BlobFile. The following figure shows the BlobFile format:

Figure 310: BlobFile Format

A blob file mainly consists of blob records, meta blocks, a meta index block, and a footer. Each block record stores a Key-Value pair. The meta blocks are used for scalability, and store properties related to the blob file. The meta index block is used for meta block searching.

**Note:**

- The Key-Value pairs in the blob file are stored in order, so that when the Iterator is implemented, the sequential reading performance can be improved via prefetching.
- Each blob record keeps a copy of the user key corresponding to the value. This way, when Titan performs Garbage Collection (GC), it can query the user key and identify whether the corresponding value is outdated. However, this process introduces some write amplification.

- BlobFile supports compression at the blob record level. Titan supports multiple compression algorithms, such as [Snappy](#), [LZ4](#), and [Zstd](#). Currently, the default compression algorithm Titan uses is LZ4.

#### 14.2.3.4.2 TitanTableBuilder

Figure 311: TitanTableBuilder

TitanTableBuilder is the key to achieving Key-Value separation. TitanTableBuilder determines the Key-Pair value size, and based on that, decides whether to separate the value from the Key-Value pair and store it in the blob file.

- If the value size is greater than or equal to `min_blob_size`, TitanTableBuilder separates the value and stores it in the blob file. TitanTableBuilder also generates an index and writes it into the SST.
- If the value size is smaller than `min_blob_size`, TitanTableBuilder writes the value directly into the SST.

Titan can also be downgraded to RocksDB in the process above. When RocksDB is performing compactions, the separated value can be written back to the newly generated SST files.

### 14.2.3.5 Garbage Collection

Titan uses Garbage Collection (GC) to reclaim space. As the keys are being reclaimed in the LSM-tree compaction, some values stored in blob files are not deleted at the same time. Therefore, Titan needs to perform GC periodically to delete outdated values. Titan provides the following two types of GC:

- Blob files are periodically integrated and rewritten to delete outdated values. This is the regular way of performing GC.
- Blob files are rewritten while the LSM-tree compaction is performed at the same time. This is the feature of Level Merge.

#### 14.2.3.5.1 Regular GC

Titan uses the TablePropertiesCollector and EventListener components of RocksDB to collect the information for GC.

TablePropertiesCollector

RocksDB supports using BlobFileSizeCollector, a custom table property collector, to collect properties from the SST which are written into corresponding SST files. The collected properties are named BlobFileSizeProperties. The following figure shows the BlobFileSizeCollector workflow and data formats:

Figure 312: BlobFileSizeProperties

On the left is the SST index format. The first column is the blob file ID; the second column is the offset for the blob record in the blob file; the third column is the blob record size.

On the right is the BlobFileSizeProperties format. Each line represents a blob file and how much data is saved in this blob file. The first column is the blob file ID; the second column is the size of the data.

EventListener

RocksDB uses compaction to discard old data and reclaim space. After each compaction, some blob files in Titan might contain partly or entirely outdated data. Therefore, you can

trigger GC by listening to compaction events. During compaction, you can collect and compare the input/output blob file size properties of SST to determine which blob files require GC. The following figure shows the general process:

Figure 313: EventListener

- *inputs* stands for the blob file size properties for all SSTs that participate in the compaction.
- *outputs* stands for the blob file size properties for all SSTs generated in the compaction.
- *discardable size* is the size of the file to be discarded for each blob file, calculated based on inputs and outputs. The first column is the blob file ID. The second column is the size of the file to be discarded.

For each valid blob file, Titan maintains a discardable size variable in memory. After each compaction, this variable is accumulated for the corresponding blob file. Each time when GC starts, it picks the blob file with the greatest discardable size as the candidate file for GC. To reduce write amplification, a certain level of space amplification is allowed, which means GC can be started on a blob file only when the discardable file has reached a specific proportion in size.

For the selected blob file, Titan checks whether the blob index of the key corresponding to each value exists or has been updated to determine whether this value is outdated. If the value is not outdated, Titan merges and sorts the value into a new blob file, and writes the updated blob index into SST using WriteCallback or MergeOperator. Then, Titan records the latest sequence number of RocksDB and does not delete the old blob file until the sequence of the oldest snapshot exceeds the recorded sequence number. The reason is

that after the blob index is written back to SST, the old blob index is still accessible via the previous snapshot. Therefore, we need to ensure that no snapshot will access the old blob index before GC can safely delete the corresponding blob file.

### 14.2.3.5.2 Level Merge

Level Merge is a newly introduced algorithm in Titan. According to the implementation principle of Level Merge, Titan merges and rewrites blob file that corresponds to the SST file, and generates new blob file while compactions are performed in LSM-tree. The following figure shows the general process:

Figure 314: LevelMerge General Process

When compactions are performed on the SSTs of level  $z-1$  and level  $z$ , Titan reads and writes Key-Value pairs in order. Then it writes the values of the selected blob files into new blob files in order, and updates the blob indexes of keys when new SSTs are generated. For the keys deleted in compactions, the corresponding values will not be written to the new blob file, which works similar to GC.

Compared with the regular way of GC, the Level Merge approach completes the blob GC while compactions are performed in LSM-tree. In this way, Titan no longer needs to check the status of blob index in LSM-tree or to write the new blob index into LSM-tree. This reduces the impact of GC on the foreground operations. As the blob file is repeatedly rewritten, fewer files overlap with each other, which makes the whole system in better order and improves the performance of scan.

However, layering blob files similar to tiering compaction brings write amplification. Because 99% of the data in LSM-tree is stored at the lowest two levels, Titan performs the Level Merge operation on the blob files corresponding to the data that is compacted only to the lowest two levels of LSM-tree.

## Range Merge

Range Merge is an optimized approach of GC based on Level Merge. However, the bottom level of LSM-tree might be in poorer order in the following situations:

- When `level_compaction_dynamic_level_bytes` is enabled, data volume at each level of LSM-tree dynamically increases, and the sorted runs at the bottom level keep increasing.
- A specific range of data is frequently compacted, and this causes a lot of sorted runs in that range.

Figure 315: RangeMerge

Therefore, the Range Merge operation is needed to keep the number of sorted runs within a certain level. At the time of `OnCompactionComplete`, Titan counts the number of sorted runs in a range. If the number is large, Titan marks the corresponding blob file as `ToMerge` and rewrites it in the next compaction.

### 14.2.4 Titan Configuration

This document introduces how to enable and disable **Titan** using the corresponding configuration items, as well as the relevant parameters and the Level Merge feature.

#### 14.2.4.1 Enable Titan

Titan is compatible with RocksDB, so you can directly enable Titan on the existing TiKV instances that use RocksDB. You can use one of the following two methods to enable Titan:

- Method 1: If you have deployed the cluster using TiUP, you can execute the `tiup ↪ cluster edit-config ${cluster-name}` command and edit the TiKV configuration file as the following example shows:

```

tikv:
 rocksdb.titan.enabled: true

```

Reload the configuration and TiKV will be rolling restarted dynamically:

```
tiup cluster reload ${cluster-name} -R tikv
```

For the detailed command, see [Modify the configuration using TiUP](#).

- Method 2: Directly edit the TiKV configuration file to enable Titan (**NOT** recommended for the production environment).

```
[rocksdb.titan]
enabled = true
```

After Titan is enabled, the existing data stored in RocksDB is not immediately moved to the Titan engine. As new data is written to the TiKV foreground and RocksDB performs compaction, the values are progressively separated from keys and written to Titan. You can view the **TiKV Details** -> **Titan kv** -> **blob file size** panel to confirm the size of the data stored in Titan.

If you want to speed up the writing process, compact data of the whole TiKV cluster manually using `tikv-ctl`. For details, see [manual compaction](#).

#### Note:

When Titan is disabled, RocksDB cannot read data that has been migrated to Titan. If Titan is incorrectly disabled on a TiKV instance with Titan already enabled (mistakenly set `rocksdb.titan.enabled` to `false`), TiKV will fail to start, and the `You have disabled titan when its data directory is not empty` error appears in the TiKV log. To correctly disabled Titan, see [Disable Titan](#).

#### 14.2.4.2 Parameters

To adjust Titan-related parameters using TiUP, refer to [Modify the configuration](#).

- Titan GC thread count.

From the **TiKV Details** -> **Thread CPU** -> **RocksDB CPU** panel, if you observe that the Titan GC threads are at full capacity for a long time, consider increasing the size of the Titan GC thread pool.

```
[rocksdb.titan]
max-background-gc = 1
```

- Value size threshold.

When the size of the value written to the foreground is smaller than the threshold, this value is stored in RocksDB; otherwise, this value is stored in the blob file of Titan. Based on the distribution of value sizes, if you increase the threshold, more values are stored in RocksDB and TiKV performs better in reading small values. If you decrease the threshold, more values go to Titan, which further reduces RocksDB compactions.

```
[rocksdb.defaultcf.titan]
min-blob-size = "1KB"
```

- The algorithm used for compressing values in Titan, which takes value as the unit.

```
[rocksdb.defaultcf.titan]
blob-file-compression = "lz4"
```

- The size of value caches in Titan.

Larger cache size means higher read performance of Titan. However, too large a cache size causes Out of Memory (OOM). It is recommended to set the value of `storage`  $\leftrightarrow$  `.block-cache.capacity` to the store size minus the blob file size and set `blob`  $\leftrightarrow$  `cache-size` to `memory size * 50% - block cache size` according to the monitoring metrics when the database is running stably. This maximizes the blob cache size when the block cache is large enough for the whole RocksDB engine.

```
[rocksdb.defaultcf.titan]
blob-cache-size = 0
```

- When the ratio of discardable data (the corresponding key has been updated or deleted) in a blob file exceeds the following threshold, Titan GC is triggered.

```
discardable-ratio = 0.5
```

When Titan writes the useful data of this blob file to another file, you can use the `discardable-ratio` value to estimate the upper limits of write amplification and space amplification (assuming the compression is disabled).

Upper limit of write amplification =  $1 / \text{discardable\_ratio}$

Upper limit of space amplification =  $1 / (1 - \text{discardable\_ratio})$

From the two equations above, you can see that decreasing the value of `discardable_ratio`  $\leftrightarrow$  can reduce space amplification but causes GC to be more frequent in Titan. Increasing the value reduces Titan GC, the corresponding I/O bandwidth, and CPU consumption but increases disk usage.

- The following option limits the I/O rate of RocksDB compaction. During peak traffic, limiting RocksDB compaction, its I/O bandwidth, and its CPU consumption reduces its impact on the write and read performance of the foreground.

When Titan is enabled, this option limits the summed I/O rates of RocksDB compaction and Titan GC. If you find that the I/O and/or CPU consumption of RocksDB compaction and Titan GC is too large, set this option to a suitable value according to the disk I/O bandwidth and the actual write traffic.

```
[rocksdb]
rate-bytes-per-sec = 0
```

### 14.2.4.3 Disable Titan

To disable Titan, you can configure the `rocksdb.defaultcf.titan.blob-run-mode` option. The optional values for `blob-run-mode` are as follows:

- When the option is set to `normal`, Titan performs read and write operations normally.
- When the option is set to `read-only`, all newly written values are written into RocksDB, regardless of the value size.
- When the option is set to `fallback`, all newly written values are written into RocksDB, regardless of the value size. Also, all compacted values stored in the Titan blob file are automatically moved back to RocksDB.

To fully disable Titan for all existing and future data, you can follow these steps:

1. Update the configuration of the TiKV nodes you wish to disable Titan for. You can update configuration in two methods:
  - Execute `tiup cluster edit-config`, edit the configuration file, and execute `tiup cluster reload -R tikv`.
  - Manually update the configuration file and restart TiKV.

```
[rocksdb.defaultcf.titan]
blob-run-mode = "fallback"
discardable-ratio = 1.0
```

2. Perform a full compaction using `tikv-ctl`. This process will consume large amount of I/O and CPU resources.

```
tikv-ctl --pd <PD_ADDR> compact-cluster --bottommost force
```

3. After the compaction is finished, you should wait for the **Blob file count** metrics under **TiKV-Details/Titan - kv** to decrease to 0.
4. Update the configuration of these TiKV nodes to disable Titan.

```
[rocksdb.titan]
enabled = false
```

#### 14.2.4.4 Level Merge (experimental)

In TiKV 4.0, **Level Merge**, a new algorithm, is introduced to improve the performance of range query and to reduce the impact of Titan GC on the foreground write operations. You can enable Level Merge using the following option:

```
[rocksdb.defaultcf.titan]
level-merge = true
```

Enabling Level Merge has the following benefits:

- Greatly improve the performance of Titan range query.
- Reduce the impact of Titan GC on the foreground write operations and improve write performance.
- Reduce space amplification of Titan and the disk usage (compared to the disk usage with the default configuration).

Accordingly, the write amplification with Level Merge enabled is slightly higher than that of Titan but is still lower than that of the native RocksDB.

#### 14.2.5 Partitioned Raft KV

##### **Warning:**

Partitioned Raft KV is an experimental feature. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an [issue](#) on GitHub.

Before v6.6.0, TiKV's Raft-based storage engine used a single RocksDB instance to store the data of all Regions of the TiKV instance.

To support larger clusters more stably, starting from TiDB v6.6.0, a new TiKV storage engine is introduced, which uses multiple RocksDB instances to store TiKV Region data, and the data of each Region is independently stored in a separate RocksDB instance.

The new engine can better control the number and level of files in each RocksDB instance, achieve physical isolation of data operations between Regions, and support stably managing more data. You can see it as TiKV managing multiple RocksDB instances through partitioning, which is why the feature is named Partitioned Raft KV.

### 14.2.5.1 Application scenarios

You can use this feature if your TiKV cluster has the following characteristics:

- A single TiKV instance needs to support more data.
- There are many write requests.
- Scale-in and scale-out operations are frequent.
- The workload has a serious read and write amplification.
- TiKV has sufficient memory.

Advantages of this feature are better write performance, faster scaling speed, and larger volume of data supported with the same hardware. It can also support larger cluster scale.

### 14.2.5.2 Usage

To enable Partitioned Raft KV, set the configuration item `storage.engine` to "`partitioned-raft-kv`" when creating a cluster. At the same time, you can use the configuration items `rocksdb.write-buffer-flush-oldest-first` and `rocksdb.write-buffer-limit` to control the memory usage of RocksDB when using Raft KV.

### 14.2.5.3 Restrictions

Partitioned Raft KV has the following restrictions:

- It does not support data import, replication, and backup tools, such as TiDB Lightning, TiCDC, BR, and Dumping.
- It does not support the `tikv-ctl` command-line tool.
- It cannot be used together with TiFlash.
- You can only enable Partitioned Raft KV when creating a cluster and cannot change the type of engine after the cluster is created.

## 14.3 Storage Engine - TiFlash

### 14.3.1 TiFlash Overview

**TiFlash** is the key component that makes TiDB essentially an Hybrid Transactional/Analytical Processing (HTAP) database. As a columnar storage extension of TiKV, TiFlash provides both good isolation level and strong consistency guarantee.

In TiFlash, the columnar replicas are asynchronously replicated according to the Raft Learner consensus algorithm. When these replicas are read, the Snapshot Isolation level of consistency is achieved by validating Raft index and multi-version concurrency control (MVCC).

### 14.3.1.1 Architecture

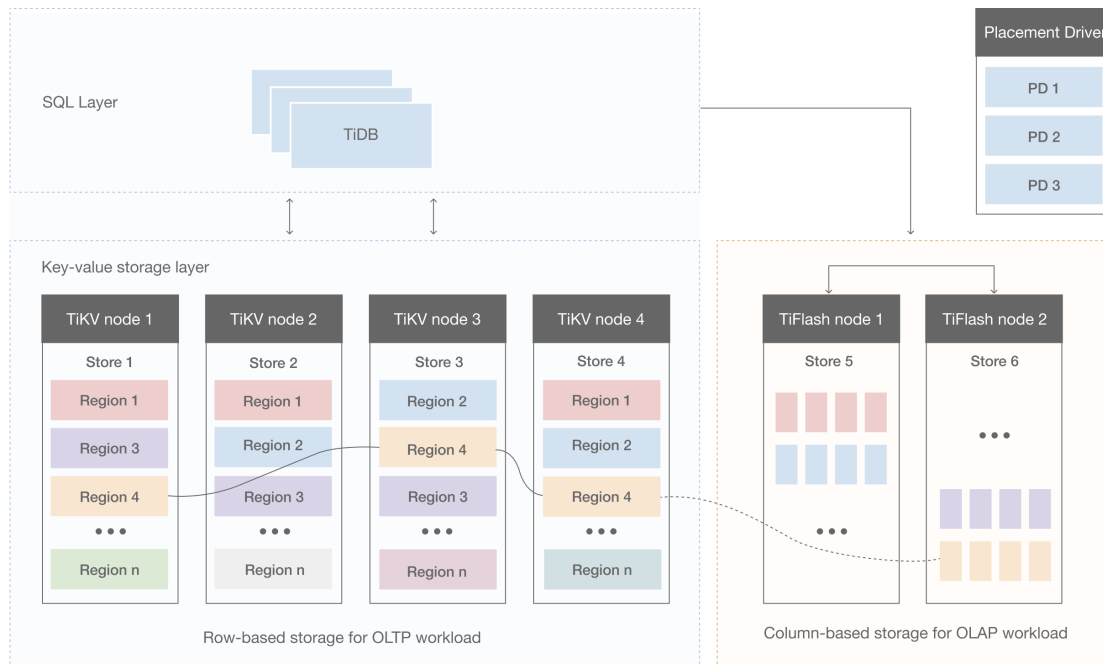

Figure 316: TiFlash Architecture

The above figure is the architecture of TiDB in its HTAP form, including TiFlash nodes.

TiFlash provides the columnar storage, with a layer of coprocessors efficiently implemented by ClickHouse. Similar to TiKV, TiFlash also has a Multi-Raft system, which supports replicating and distributing data in the unit of Region (see [Data Storage](#) for details).

TiFlash conducts real-time replication of data in the TiKV nodes at a low cost that does not block writes in TiKV. Meanwhile, it provides the same read consistency as in TiKV and ensures that the latest data is read. The Region replica in TiFlash is logically identical to those in TiKV, and is split and merged along with the Leader replica in TiKV at the same time.

To deploy TiFlash under the Linux AMD64 architecture, the CPU must support the AVX2 instruction set. Ensure that `cat /proc/cpuinfo | grep avx2` has output. To deploy TiFlash under the Linux ARM64 architecture, the CPU must support the ARMv8 instruction set architecture. Ensure that `cat /proc/cpuinfo | grep 'crc32' | grep 'asimd'` has output. By using the instruction set extensions, TiFlash's vectorization engine can deliver better performance.

TiFlash is compatible with both TiDB and TiSpark, which enables you to freely choose between these two computing engines.

It is recommended that you deploy TiFlash in different nodes from TiKV to ensure workload isolation. It is also acceptable to deploy TiFlash and TiKV in the same node if no business isolation is required.

Currently, data cannot be written directly into TiFlash. You need to write data in TiKV and then replicate it to TiFlash, because it connects to the TiDB cluster as a Learner role. TiFlash supports data replication in the unit of table, but no data is replicated by default after deployment. To replicate data of a specified table, see [Create TiFlash replicas for tables](#).

TiFlash has three components: the columnar storage module, `tiflash proxy`, and `pd`  $\leftrightarrow$  `buddy`. `tiflash proxy` is responsible for the communication using the Multi-Raft consensus algorithm. `pd buddy` works with PD to replicate data from TiKV to TiFlash in the unit of table.

When TiDB receives the DDL command to create replicas in TiFlash, the `pd buddy`  $\leftrightarrow$  component acquires the information of the table to be replicated via the status port of TiDB, and sends the information to PD. Then PD performs the corresponding data scheduling according to the information provided by `pd buddy`.

#### 14.3.1.2 Key features

TiFlash has the following key features:

- [Asynchronous replication](#)
- [Consistency](#)
- [Intelligent choice](#)
- [Computing acceleration](#)

##### 14.3.1.2.1 Asynchronous replication

The replica in TiFlash is asynchronously replicated as a special role, Raft Learner. This means when the TiFlash node is down or high network latency occurs, applications in TiKV can still proceed normally.

This replication mechanism inherits two advantages of TiKV: automatic load balancing and high availability.

- TiFlash does not rely on additional replication channels, but directly receives data from TiKV in a many-to-many manner.
- As long as the data is not lost in TiKV, you can restore the replica in TiFlash at any time.

##### 14.3.1.2.2 Consistency

TiFlash provides the same Snapshot Isolation level of consistency as TiKV, and ensures that the latest data is read, which means that you can read the data previously written in TiKV. Such consistency is achieved by validating the data replication progress.

Every time TiFlash receives a read request, the Region replica sends a progress validation request (a lightweight RPC request) to the Leader replica. TiFlash performs the read operation only after the current replication progress includes the data covered by the timestamp of the read request.

#### 14.3.1.2.3 Intelligent choice

TiDB can automatically choose to use TiFlash (column-wise) or TiKV (row-wise), or use both of them in one query to ensure the best performance.

This selection mechanism is similar to that of TiDB which chooses different indexes to execute query. TiDB optimizer makes the appropriate choice based on statistics of the read cost.

#### 14.3.1.2.4 Computing acceleration

TiFlash accelerates the computing of TiDB in two ways:

- The columnar storage engine is more efficient in performing read operation.
- TiFlash shares part of the computing workload of TiDB.

TiFlash shares the computing workload in the same way as the TiKV Coprocessor does: TiDB pushes down the computing that can be completed in the storage layer. Whether the computing can be pushed down depends on the support of TiFlash. For details, see [Supported pushdown calculations](#).

#### 14.3.1.3 Use TiFlash

After TiFlash is deployed, data replication does not automatically begin. You need to manually specify the tables to be replicated.

You can either use TiDB to read TiFlash replicas for medium-scale analytical processing, or use TiSpark to read TiFlash replicas for large-scale analytical processing, which is based on your own needs. See the following sections for details:

- [Create TiFlash Replicas](#)
- [Use TiDB to Read TiFlash Replicas](#)
- [Use TiSpark to Read TiFlash Replicas](#)
- [Use MPP Mode](#)

To experience the whole process from importing data to querying in a TPC-H dataset, refer to [Quick Start Guide for TiDB HTAP](#).

### 14.3.2 Create TiFlash Replicas

This document introduces how to create TiFlash replicas for tables and for databases, and set available zones for replica scheduling.

#### 14.3.2.1 Create TiFlash replicas for tables

After TiFlash is connected to the TiKV cluster, data replication by default does not begin. You can send a DDL statement to TiDB through a MySQL client to create a TiFlash replica for a specific table:

```
ALTER TABLE table_name SET TIFLASH REPLICA count;
```

The parameter of the above command is described as follows:

- **count** indicates the number of replicas. When the value is 0, the replica is deleted.

If you execute multiple DDL statements on the same table, only the last statement is ensured to take effect. In the following example, two DDL statements are executed on the table `tpch50`, but only the second statement (to delete the replica) takes effect.

Create two replicas for the table:

```
ALTER TABLE `tpch50`.`lineitem` SET TIFLASH REPLICA 2;
```

Delete the replica:

```
ALTER TABLE `tpch50`.`lineitem` SET TIFLASH REPLICA 0;
```

#### Notes:

- If the table `t` is replicated to TiFlash through the above DDL statements, the table created using the following statement will also be automatically replicated to TiFlash:

```
CREATE TABLE table_name like t;
```

- For versions earlier than v4.0.6, if you create the TiFlash replica before using TiDB Lightning to import the data, the data import will fail. You must import data to the table before creating the TiFlash replica for the table.
- If TiDB and TiDB Lightning are both v4.0.6 or later, no matter a table has TiFlash replica(s) or not, you can import data to that table using TiDB Lightning. Note that this might slow the TiDB Lightning procedure, which depends on the NIC bandwidth on the lightning host, the CPU and disk load of the TiFlash node, and the number of TiFlash replicas.
- It is recommended that you do not replicate more than 1,000 tables because this lowers the PD scheduling performance. This limit will be removed in later versions.
- In v5.1 and later versions, setting the replicas for the system tables is no longer supported. Before upgrading the cluster, you need to clear the replicas of the relevant system tables. Otherwise, you cannot modify the replica settings of the system tables after you upgrade the cluster to a later version.

#### 14.3.2.1.1 Check replication progress

You can check the status of the TiFlash replicas of a specific table using the following statement. The table is specified using the `WHERE` clause. If you remove the `WHERE` clause, you will check the replica status of all tables.

```
SELECT * FROM information_schema.tiflash_replica WHERE TABLE_SCHEMA = '<db_name>' and TABLE_NAME = '<table_name>';
```

In the result of above statement:

- `AVAILABLE` indicates whether the TiFlash replicas of this table are available or not. 1 means available and 0 means unavailable. Once the replicas become available, this status does not change. If you use DDL statements to modify the number of replicas, the replication status will be recalculated.
- `PROGRESS` means the progress of the replication. The value is between 0.0 and 1.0. 1 means at least one replica is replicated.

#### 14.3.2.2 Create TiFlash replicas for databases

Similar to creating TiFlash replicas for tables, you can send a DDL statement to TiDB through a MySQL client to create a TiFlash replica for all tables in a specific database:

```
ALTER DATABASE db_name SET TIFLASH REPLICA count;
```

In this statement, `count` indicates the number of replicas. When you set it to 0, replicas are deleted.

Examples:

- Create two replicas for all tables in the database `tpch50`:

```
ALTER DATABASE `tpch50` SET TIFLASH REPLICAS 2;
```

- Delete TiFlash replicas created for the database `tpch50`:

```
ALTER DATABASE `tpch50` SET TIFLASH REPLICAS 0;
```

#### Note:

- This statement actually performs a series of DDL operations, which are resource-intensive. If the statement is interrupted during the execution, executed operations are not rolled back and unexecuted operations do not continue.
- After executing the statement, do not set the number of TiFlash replicas or perform DDL operations on this database until **all tables in this database are replicated**. Otherwise, unexpected results might occur, which include:
  - If you set the number of TiFlash replicas to 2 and then change the number to 1 before all tables in the database are replicated, the final number of TiFlash replicas of all the tables is not necessarily 1 or 2.
  - After executing the statement, if you create tables in this database before the completion of the statement execution, TiFlash replicas **might or might not** be created for these new tables.
  - After executing the statement, if you add indexes for tables in the database before the completion of the statement execution, the statement might hang and resume only after the indexes are added.
- If you create tables in this database **after** the completion of the statement execution, TiFlash replicas are not created automatically for these new tables.
- This statement skips system tables, views, temporary tables, and tables with character sets not supported by TiFlash.

#### 14.3.2.2.1 Check replication progress

Similar to creating TiFlash replicas for tables, successful execution of the DDL statement does not mean the completion of replication. You can execute the following SQL statement to check the progress of replication on target tables:

```
SELECT * FROM information_schema.tiflash_replica WHERE TABLE_SCHEMA = '<
↳ db_name>';
```

To check tables without TiFlash replicas in the database, you can execute the following SQL statement:

```
SELECT TABLE_NAME FROM information_schema.tables where TABLE_SCHEMA = "<
↳ db_name>" and TABLE_NAME not in (SELECT TABLE_NAME FROM
↳ information_schema.tiflash_replica where TABLE_SCHEMA = "<db_name>");
```

### 14.3.2.3 Speed up TiFlash replication

Before TiFlash replicas are added, each TiKV instance performs a full table scan and sends the scanned data to TiFlash as a “snapshot” to create replicas. By default, TiFlash replicas are added slowly with fewer resources usage in order to minimize the impact on the online service. If there are spare CPU and disk IO resources in your TiKV and TiFlash nodes, you can accelerate TiFlash replication by performing the following steps.

1. Temporarily increase the snapshot write speed limit for each TiKV and TiFlash instance by using the [Dynamic Config SQL statement](#):

```
sql -- The default value for both configurations are 100MiB, i.e. the
↳ maximum disk bandwidth used for writing snapshots is no more than 100MiB
↳ /s. SET CONFIG tikv `server.snap-max-write-bytes-per-sec` = '300MiB';
↳ SET CONFIG tiflash `raftstore-proxy.server.snap-max-write-bytes-per-sec`
↳ = '300MiB';
```

After executing these SQL statements, the configuration changes take effect immediately without restarting the cluster. However, since the replication speed is still restricted by the PD limit globally, you cannot observe the acceleration for now.

2. Use [PD Control](#) to progressively ease the new replica speed limit.

The default new replica speed limit is 30, which means, approximately 30 Regions add TiFlash replicas every minute. Executing the following command will adjust the limit to 60 for all TiFlash instances, which doubles the original speed:

```
tiup ctl:v<CLUSTER_VERSION> pd -u http://<PD_ADDRESS>:2379 store limit
↳ all engine tiflash 60 add-peer
```

In the preceding command, you need to replace `v<CLUSTER_VERSION>` with the actual cluster version, such as `v6.5.0` and `<PD_ADDRESS>:2379` with the address of any PD node. For example:

```
tiup ctl:v6.1.1 pd -u http://192.168.1.4:2379 store limit
↳ all engine tiflash 60 add-peer
```

Within a few minutes, you will observe a significant increase in CPU and disk IO resource usage of the TiFlash nodes, and TiFlash should create replicas faster. At the same time, the TiKV nodes' CPU and disk IO resource usage increases as well.

If the TiKV and TiFlash nodes still have spare resources at this point and the latency of your online service does not increase significantly, you can further ease the limit, for example, triple the original speed:

```
tiup ctl:v<CLUSTER_VERSION> pd -u http://<PD_ADDRESS>:2379 store limit
↳ all engine tiflash 90 add-peer
```

3. After the TiFlash replication is complete, revert to the default configuration to reduce the impact on online services.

Execute the following PD Control command to restore the default new replica speed limit:

```
shell tiup ctl:v<CLUSTER_VERSION> pd -u http://<PD_ADDRESS>:2379 store
↳ limit all engine tiflash 30 add-peer
```

Execute the following SQL statements to restore the default snapshot write speed limit:

```
sql SET CONFIG tikv `server.snap-max-write-bytes-per-sec` = '100MiB';
↳ SET CONFIG tiflash `raftstore-proxy.server.snap-max-write-bytes-per-sec`
↳ = '100MiB';
```

#### 14.3.2.4 Set available zones

When configuring replicas, if you need to distribute TiFlash replicas to multiple data centers for disaster recovery, you can configure available zones by following the steps below:

1. Specify labels for TiFlash nodes in the cluster configuration file.

```
tiflash_servers:
- host: 172.16.5.81
 logger.level: "info"
learner_config:
 server.labels:
```

```
 zone: "z1"
- host: 172.16.5.82
 config:
 logger.level: "info"
 learner_config:
 server.labels:
 zone: "z1"
- host: 172.16.5.85
 config:
 logger.level: "info"
 learner_config:
 server.labels:
 zone: "z2"
```

Note that the `flash.proxy.labels` configuration in earlier versions cannot handle special characters in the available zone name correctly. It is recommended to use the `server.labels` in `learner_config` to configure the name of an available zone.

2. After starting a cluster, specify the labels when creating replicas.

```
ALTER TABLE table_name SET TIFLASH REPLICA count LOCATION LABELS
↪ location_labels;
```

For example:

```
ALTER TABLE t SET TIFLASH REPLICA 2 LOCATION LABELS "zone";
```

3. PD schedules the replicas based on the labels. In this example, PD respectively schedules two replicas of the table `t` to two available zones. You can use `pd-ctl` to view the scheduling.

```
> tiup ctl:v<CLUSTER_VERSION> pd -u http://<PD_ADDRESS>:2379 store

...
"address": "172.16.5.82:23913",
"labels": [
 { "key": "engine", "value": "tiflash" },
 { "key": "zone", "value": "z1" }
],
"region_count": 4,

...
"address": "172.16.5.81:23913",
"labels": [
 { "key": "engine", "value": "tiflash" },
 { "key": "zone", "value": "z1" }
```

```

],
"region_count": 5,
...

"address": "172.16.5.85:23913",
"labels": [
 { "key": "engine", "value": "tiflash"},
 { "key": "zone", "value": "z2" }
],
"region_count": 9,
...

```

For more information about scheduling replicas by using labels, see [Schedule Replicas by Topology Labels](#), [Multiple Data Centers in One City Deployment](#), and [Three Data Centers in Two Cities Deployment](#).

### 14.3.3 Use TiDB to Read TiFlash Replicas

This document introduces how to use TiDB to read TiFlash replicas.

TiDB provides three ways to read TiFlash replicas. If you have added a TiFlash replica without any engine configuration, the CBO (cost-based optimization) mode is used by default.

#### 14.3.3.1 Smart selection

For tables with TiFlash replicas, the TiDB optimizer automatically determines whether to use TiFlash replicas based on the cost estimation. You can use the `desc` or `explain`  $\rightarrow$  `analyze` statement to check whether or not a TiFlash replica is selected. For example:

```
desc select count(*) from test.t;
```

```

+-----+-----+-----+-----+
 ↪
| id | estRows | task | access object | operator
 ↪ info |
+-----+-----+-----+-----+
 ↪
| StreamAgg_9 | 1.00 | root | | funcs:count(1)
 ↪ ->Column#4 |
| -TableReader_17 | 1.00 | root | | data:
 ↪ TableFullScan_16 |
| -TableFullScan_16 | 1.00 | cop[tiflash] | table:t | keep order:
 ↪ false, stats:pseudo |

```

```

+-----+-----+-----+-----+
↪
3 rows in set (0.00 sec)

explain analyze select count(*) from test.t;

+-----+-----+-----+-----+
↪
| id | estRows | actRows | task | access object |
↪ execution info | operator
↪ info | memory | disk |
+-----+-----+-----+-----+
↪
| StreamAgg_9 | 1.00 | 1 | root | | time
↪ :83.8372ms, loops:2 | funcs:count
↪ (1)->Column#4 | 372 Bytes | N/A |
| -TableReader_17 | 1.00 | 1 | root | | time
↪ :83.7776ms, loops:2, rpc num: 1, rpc time:83.5701ms, proc keys:0 |
↪ data:TableFullScan_16 | 152 Bytes | N/A |
| -TableFullScan_16 | 1.00 | 1 | cop[tiflash] | table:t |
↪ tiflash_task:{time:43ms, loops:1, threads:1}, tiflash_scan:{...} |
↪ keep order:false, stats:pseudo | N/A | N/A |
+-----+-----+-----+-----+
↪

```

cop[tiflash] means that the task will be sent to TiFlash for processing. If you have not selected a TiFlash replica, you can try to update the statistics using the `analyze table` statement, and then check the result using the `explain analyze` statement.

Note that if a table has only a single TiFlash replica and the related node cannot provide service, queries in the CBO mode will repeatedly retry. In this situation, you need to specify the engine or use the manual hint to read data from the TiKV replica.

### 14.3.3.2 Engine isolation

Engine isolation is to specify that all queries use a replica of the specified engine by configuring the corresponding variable. The optional engines are “tikv”, “tidb” (indicates the internal memory table area of TiDB, which stores some TiDB system tables and cannot be actively used by users), and “tiflash”.

You can specify the engines at the following two configuration levels:

- TiDB instance-level, namely, INSTANCE level. Add the following configuration item in the TiDB configuration file:

```

[isolation-read]
engines = ["tikv", "tidb", "tiflash"]

```

The INSTANCE-level default configuration is ["tikv", "tidb", "tiflash"]  
↪ .

- SESSION level. Use the following statement to configure:

```
set @@session.tidb_isolation_read_engines = "engine list separated by
↪ commas";
```

or

```
set SESSION tidb_isolation_read_engines = "engine list separated by
↪ commas";
```

The default configuration of the SESSION level inherits from the configuration of the TiDB INSTANCE level.

The final engine configuration is the session-level configuration, that is, the session-level configuration overrides the instance-level configuration. For example, if you have configured “tikv” in the INSTANCE level and “tiflash” in the SESSION level, then the TiFlash replicas are read. If the final engine configuration is “tikv” and “tiflash”, then the TiKV and TiFlash replicas are both read, and the optimizer automatically selects a better engine to execute.

#### Note:

Because [TiDB Dashboard](#) and other components need to read some system tables stored in the TiDB memory table area, it is recommended to always add the “tidb” engine to the instance-level engine configuration.

If the queried table does not have a replica of the specified engine (for example, the engine is configured as “tiflash” but the table does not have a TiFlash replica), the query returns an error.

### 14.3.3.3 Manual hint

Manual hint can force TiDB to use specified replicas for specific table(s) on the premise of satisfying engine isolation. Here is an example of using the manual hint:

```
select /*+ read_from_storage(tiflash[table_name]) */ ... from table_name;
```

If you set an alias to a table in a query statement, you must use the alias in the statement that includes a hint for the hint to take effect. For example:

```
select /*+ read_from_storage(tiflash[alias_a,alias_b]) */ ... from
↪ table_name_1 as alias_a, table_name_2 as alias_b where alias_a.
↪ column_1 = alias_b.column_2;
```

In the above statements, `tiflash[]` prompts the optimizer to read the TiFlash replicas. You can also use `tikv[]` to prompt the optimizer to read the TiKV replicas as needed. For hint syntax details, refer to [READ\\_FROM\\_STORAGE](#).

If the table specified by a hint does not have a replica of the specified engine, the hint is ignored and a warning is reported. In addition, a hint only takes effect on the premise of engine isolation. If the engine specified in a hint is not in the engine isolation list, the hint is also ignored and a warning is reported.

#### Note:

The MySQL client of 5.7.7 or earlier versions clears optimizer hints by default. To use the hint syntax in these early versions, start the client with the `--comments` option, for example, `mysql -h 127.0.0.1 -P 4000 -uroot --comments`.

### 14.3.3.4 The relationship of smart selection, engine isolation, and manual hint

In the above three ways of reading TiFlash replicas, engine isolation specifies the overall range of available replicas of engines; within this range, manual hint provides statement-level and table-level engine selection that is more fine-grained; finally, CBO makes the decision and selects a replica of an engine based on cost estimation within the specified engine list.

#### Note:

Before v4.0.3, the behavior of reading from TiFlash replica in a non-read-only SQL statement (for example, `INSERT INTO ... SELECT`, `SELECT ... FOR UPDATE`, `UPDATE ...`, `DELETE ...`) is undefined. In v4.0.3 and later versions, internally TiDB ignores the TiFlash replica for a non-read-only SQL statement to guarantee the data correctness. That is, for [smart selection](#), TiDB automatically selects the non-TiFlash replica; for [engine isolation](#) that specifies TiFlash replica **only**, TiDB reports an error; and for [manual hint](#), TiDB ignores the hint.

### 14.3.4 Use TiSpark to Read TiFlash Replicas

This document introduces how to use TiSpark to read TiFlash replicas.

Currently, you can use TiSpark to read TiFlash replicas in a method similar to the engine isolation in TiDB. This method is to configure the `spark.tispark.isolation_read_engines` parameter. The parameter value defaults to `tikv,tiflash`, which means that TiDB reads data from TiFlash or from TiKV according to CBO's selection. If you set the parameter value to `tiflash`, it means that TiDB forcibly reads data from TiFlash.

#### Note:

When this parameter is set to `tiflash`, only the TiFlash replicas of all tables involved in the query are read and these tables must have TiFlash replicas; for tables that do not have TiFlash replicas, an error is reported. When this parameter is set to `tikv`, only the TiKV replica is read.

You can configure this parameter in one of the following ways:

- Add the following item in the `spark-defaults.conf` file:

```
spark.tispark.isolation_read_engines tiflash
```

- Add `--conf spark.tispark.isolation_read_engines=tiflash` in the initialization command when initializing Spark shell or Thrift server.
- Set `spark.conf.set("spark.tispark.isolation_read_engines", "tiflash")` in Spark shell in a real-time manner.
- Set `set spark.tispark.isolation_read_engines=tiflash` in Thrift server after the server is connected via beeline.

### 14.3.5 Use TiFlash MPP Mode

This document introduces the MPP mode of TiFlash and how to use it.

TiFlash supports using the MPP mode to execute queries, which introduces cross-node data exchange (data shuffle process) into the computation. TiDB automatically determines whether to select the MPP mode using the optimizer's cost estimation. You can change the selection strategy by modifying the values of `tidb_allow_mpp` and `tidb_enforce_mpp`.

#### 14.3.5.1 Control whether to select the MPP mode

The `tidb_allow_mpp` variable controls whether TiDB can select the MPP mode to execute queries. The `tidb_enforce_mpp` variable controls whether the optimizer's cost estimation is ignored and the MPP mode of TiFlash is forcibly used to execute queries.

The results corresponding to all values of these two variables are as follows:

|                                                   | <code>tidb_allow_mpp=off</code> | <code>tidb_allow_mpp=on</code> (by default)                                  |
|---------------------------------------------------|---------------------------------|------------------------------------------------------------------------------|
| <code>tidb_enforce_mpp=off</code><br>(by default) | The MPP mode is not used.       | The optimizer selects the MPP mode based on cost estimation.<br>(by default) |
| <code>tidb_enforce_mpp=on</code>                  | The MPP mode is not used.       | TiDB ignores the cost estimation and selects the MPP mode.                   |

For example, if you do not want to use the MPP mode, you can execute the following statements:

```
set @@session.tidb_allow_mpp=0;
```

If you want TiDB's cost-based optimizer to automatically decide whether to use the MPP mode (by default), you can execute the following statements:

```
set @@session.tidb_allow_mpp=1;
set @@session.tidb_enforce_mpp=0;
```

If you want TiDB to ignore the optimizer's cost estimation and to forcibly select the MPP mode, you can execute the following statements:

```
set @@session.tidb_allow_mpp=1;
set @@session.tidb_enforce_mpp=1;
```

The initial value of the `tidb_enforce_mpp` session variable is equal to the `enforce-mpp` configuration value of this `tidb-server` instance (which is `false` by default). If multiple `tidb-server` instances in a TiDB cluster only perform analytical queries and you want to make sure that the MPP mode is used on these instances, you can change their `enforce-mpp` configuration values to `true`.

### Note:

When `tidb_enforce_mpp=1` takes effect, the TiDB optimizer will ignore the cost estimation to choose the MPP mode. However, if other factors block the MPP mode, TiDB will not select the MPP mode. These factors include the absence of TiFlash replica, unfinished replication of TiFlash replicas, and statements containing operators or functions that are not supported by the MPP mode.

If TiDB optimizer cannot select the MPP mode due to reasons other than cost estimation, when you use the `EXPLAIN` statement to check out the execution plan, a warning is returned to explain the reason. For example:

```

set @@session.tidb_enforce_mpp=1;
create table t(a int);
explain select count(*) from t;
show warnings;

```

```

+-----+-----+-----+
 ↪
| Level | Code | Message
 ↪
 ↪ |
+-----+-----+-----+
 ↪
| Warning | 1105 | MPP mode may be blocked because there aren't
 ↪ tiflash replicas of table `t`. |
+-----+-----+-----+
 ↪

```

### 14.3.5.2 Algorithm support for the MPP mode

The MPP mode supports these physical algorithms: Broadcast Hash Join, Shuffled Hash Join, Shuffled Hash Aggregation, Union All, TopN, and Limit. The optimizer automatically determines which algorithm to be used in a query. To check the specific query execution plan, you can execute the `EXPLAIN` statement. If the result of the `EXPLAIN` statement shows `ExchangeSender` and `ExchangeReceiver` operators, it indicates that the MPP mode has taken effect.

The following statement takes the table structure in the TPC-H test set as an example:

```

explain select count(*) from customer c join nation n on c.c_nationkey=n.
 ↪ n_nationkey;
+--
 ↪
 ↪
| id | estRows | task | access
 ↪ object | operator info
 ↪
+--
 ↪
 ↪
| HashAgg_23 | 1.00 | root |
 ↪ | funcs:count(Column#16)->Column#15
 ↪

```

```

| -TableReader_25 | 1.00 | root |
↳ | data:ExchangeSender_24
↳
| -ExchangeSender_24 | 1.00 | batchCop[tiflash] |
↳ | ExchangeType: PassThrough
↳
| -HashAgg_12 | 1.00 | batchCop[tiflash] |
↳ | funcs:count(1)->Column#16
↳
| -HashJoin_17 | 3000000.00 | batchCop[tiflash] |
↳ | inner join, equal:[eq(tpch.nation.n_nationkey, tpch.
↳ customer.c_nationkey)] |
| -ExchangeReceiver_21(Build) | 25.00 | batchCop[tiflash] |
↳
↳
| -ExchangeSender_20 | 25.00 | batchCop[tiflash] |
↳ | ExchangeType: Broadcast
↳
| -TableFullScan_18 | 25.00 | batchCop[tiflash] |
↳ table:n | keep order:false
↳
| -TableFullScan_22(Probe) | 3000000.00 | batchCop[tiflash] |
↳ table:c | keep order:false
↳
+---
↳ -----+-----+-----+
↳
9 rows in set (0.00 sec)

```

In the example execution plan, the `ExchangeReceiver` and `ExchangeSender` operators are included. The execution plan indicates that after the `nation` table is read, the `ExchangeSender` operator broadcasts the table to each node, the `HashJoin` and `HashAgg` operations are performed on the `nation` table and the `customer` table, and then the results are returned to TiDB.

TiFlash provides the following two global/session variables to control whether to use Broadcast Hash Join:

- `tidb_broadcast_join_threshold_size`: The unit of the value is bytes. If the table size (in the unit of bytes) is less than the value of the variable, the Broadcast Hash Join algorithm is used. Otherwise, the Shuffled Hash Join algorithm is used.
- `tidb_broadcast_join_threshold_count`: The unit of the value is rows. If the objects of the join operation belong to a subquery, the optimizer cannot estimate the size of the subquery result set, so the size is determined by the number of rows in the result set. If the estimated number of rows in the subquery is less than the value of this

variable, the Broadcast Hash Join algorithm is used. Otherwise, the Shuffled Hash Join algorithm is used.

### 14.3.5.3 Access partitioned tables in the MPP mode

To access partitioned tables in the MPP mode, you need to enable [dynamic pruning mode](#) first.

Example:

```
mysql> DROP TABLE if exists test.employees;
Query OK, 0 rows affected, 1 warning (0.00 sec)

mysql> CREATE TABLE test.employees
(id int(11) NOT NULL,
 fname varchar(30) DEFAULT NULL,
 lname varchar(30) DEFAULT NULL,
 hired date NOT NULL DEFAULT '1970-01-01',
 separated date DEFAULT '9999-12-31',
 job_code int DEFAULT NULL,
 store_id int NOT NULL) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=
 ↪ utf8mb4_bin
PARTITION BY RANGE (store_id)
(PARTITION p0 VALUES LESS THAN (6),
 PARTITION p1 VALUES LESS THAN (11),
 PARTITION p2 VALUES LESS THAN (16),
 PARTITION p3 VALUES LESS THAN (MAXVALUE));
Query OK, 0 rows affected (0.10 sec)

mysql> ALTER table test.employees SET tiflash replica 1;
Query OK, 0 rows affected (0.09 sec)

mysql> SET tidb_partition_prune_mode=static;
Query OK, 0 rows affected (0.00 sec)

mysql> explain SELECT count(*) FROM test.employees;
+---+
 ↪ -----+-----+-----+
 ↪
| id | | estRows | task | | access object |
 ↪ | operator info | |
+---+
 ↪ -----+-----+-----+
 ↪

### 14.3.6 Push-down Calculations Supported by TiFlash

This document introduces the push-down calculations supported by TiFlash.

#### 14.3.6.1 Push-down operators

TiFlash supports the push-down of the following operators:

- TableScan: Reads data from tables.
- Selection: Filters data.
- HashAgg: Performs data aggregation based on the [Hash Aggregation](#) algorithm.
- StreamAgg: Performs data aggregation based on the [Stream Aggregation](#) algorithm. StreamAgg only supports the aggregation without the `GROUP BY` condition.
- TopN: Performs the TopN calculation.
- Limit: Performs the limit calculation.
- Project: Performs the projection calculation.
- HashJoin: Performs the join calculation using the [Hash Join](#) algorithm, but with the following conditions:
  - The operator can be pushed down only in the [MPP mode](#).
  - Supported joins are Inner Join, Left Join, Semi Join, Anti Semi Join, Left Semi Join, and Anti Left Semi Join.

- The preceding joins support both Equi Join and Non-Equi Join (Cartesian Join). When calculating Cartesian Join, the Broadcast algorithm, instead of the Shuffle Hash Join algorithm, is used.

- **Window functions:** Currently, TiFlash supports ROW\_NUMBER(), RANK(), DENSE\_RANK() ↪ (), LEAD(), and LAG().

In TiDB, operators are organized in a tree structure. For an operator to be pushed down to TiFlash, all of the following prerequisites must be met:

- All of its child operators can be pushed down to TiFlash.
- If an operator contains expressions (most of the operators contain expressions), all expressions of the operator can be pushed down to TiFlash.

### 14.3.6.2 Push-down expressions

TiFlash supports the following push-down expressions:

| Expression Type                                   | Operations                                                                                                                                                                                                                      |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Numeric functions and operators</b>            | +, -, /, *, %, >=, <=, =, !=, <, >, ROUND(), ABS(), FLOOR(int), CEIL(int), CEILING(int), SQRT(), LOG(), LOG2(), LOG10(), LN(), EXP(), POW(), SIGN(), RADIANS(), DEGREES(), CONV(), CRC32(), GREATEST(int/real), LEAST(int/real) |
| <b>Logical functions and operators</b>            | AND, OR, NOT, CASE WHEN, IF(), IFNULL(), ISNULL(), IN, LIKE, COALESCE, IS                                                                                                                                                       |
| <b>Bitwise operations</b>                         | & (bitand),   (bitor), ~ (bitneg), ^ (bitxor)                                                                                                                                                                                   |
| <b>String functions</b>                           | SUBSTR(), CHAR_LENGTH(), REPLACE(), CONCAT(), CONCAT_WS(), LEFT(), RIGHT(), ASCII(), LENGTH(), TRIM(), LTRIM(), RTRIM(), POSITION(), FORMAT(), LOWER(), UCASE(), UPPER(), SUBSTRING_INDEX(), LPAD(), RPAD(), STRCMP()           |
| <b>Regular expression functions and operators</b> | REGEXP, REGEXP_LIKE(), REGEXP_INSTR(), REGEXP_SUBSTR(), REGEXP_REPLACE()                                                                                                                                                        |

| Expression Type         | Operations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Date functions          | DATE_FORMAT(), TIMESTAMPDIFF(),<br>FROM_UNIXTIME(),<br>UNIX_TIMESTAMP(int),<br>UNIX_TIMESTAMP(decimal),<br>STR_TO_DATE(date),<br>STR_TO_DATE(datetime), DATEDIFF(),<br>YEAR(), MONTH(), DAY(),<br>EXTRACT(datetime), DATE(), HOUR(),<br>MICROSECOND(), MINUTE(), SECOND(),<br>SYSDATE(),<br>DATE_ADD/ADDDATE(datetime, int),<br>DATE_ADD/ADDDATE(string, int/real),<br>DATE_SUB/SUBDATE(datetime, int),<br>DATE_SUB/SUBDATE(string, int/real),<br>QUARTER(), DAYNAME(), DAYOFMONTH(),<br>DAYOFWEEK(), DAYOFYEAR(), LAST_DAY(),<br>MONTHNAME(), TO_SECONDS(), TO_DAYS(),<br>FROM_DAYS(), WEEKOFYEAR() |
| JSON function           | JSON_LENGTH(), →, →>,<br>JSON_EXTRACT()                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Conversion functions    | CAST(int AS DOUBLE), CAST(int AS<br>↔ DECIMAL), CAST(int AS STRING),<br>CAST(int AS TIME),<br>CAST(double AS INT),<br>CAST(double AS DECIMAL),<br>CAST(double AS STRING),<br>CAST(double AS TIME),<br>CAST(string AS INT),<br>CAST(string AS DOUBLE), CAST(<br>↔ string AS DECIMAL),<br>CAST(string AS TIME),<br>CAST(decimal AS INT),<br>CAST(decimal AS STRING),<br>CAST(decimal AS TIME),<br>CAST(time AS INT),<br>CAST(time AS DECIMAL),<br>CAST(time AS STRING),<br>CAST(time AS REAL)                                                                                                          |
| Aggregate functions     | MIN(), MAX(), SUM(), COUNT(), AVG(),<br>APPROX_COUNT_DISTINCT(),<br>GROUP_CONCAT()                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Miscellaneous functions | INET_NTOA(), INET_ATON(),<br>INET6_NTOA(), INET6_ATON()                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### 14.3.6.3 Restrictions

- Expressions that contain the Bit, Set, and Geometry types cannot be pushed down to TiFlash.
- The DATE\_ADD(), DATE\_SUB(), ADDDATE(), and SUBDATE() functions support the following interval types only. If other interval types are used, TiFlash reports errors.
  - DAY
  - WEEK
  - MONTH
  - YEAR
  - HOUR
  - MINUTE
  - SECOND

If a query encounters unsupported push-down calculations, TiDB needs to complete the remaining calculations, which might greatly affect the TiFlash acceleration effect. The currently unsupported operators and expressions might be supported in future versions.

Functions like MAX() are supported for push-down when used as aggregate functions, but not as window functions.

### 14.3.6.4 Examples

This section provides some examples of pushing down operators and expressions to TiFlash.

#### 14.3.6.4.1 Example 1: Push operators down to TiFlash

```
CREATE TABLE t(id INT PRIMARY KEY, a INT);
ALTER TABLE t SET TIFLASH REPLICA 1;

EXPLAIN SELECT * FROM t LIMIT 3;
```

| id      | estRows | task | access object | operator  |
|---------|---------|------|---------------|-----------|
| info    |         |      |               |           |
| Limit_9 | 3.00    | root |               | offset:0, |
| count:3 |         |      |               |           |

```

| -TableReader_17 | 3.00 | root | | data:
↪ ExchangeSender_16			
-ExchangeSender_16	3.00	mpp[tiflash]	
↪ ExchangeType: PassThrough			
-Limit_15	3.00	mpp[tiflash]	
↪ count:3			
-TableFullScan_14	3.00	mpp[tiflash]	table:t
↪ :false, stats:pseudo			
+---			
↪ -----+-----+-----+-----+			
↪			
5 rows in set (0.18 sec)

```

In the preceding example, the operator `Limit` is pushed down to TiFlash for filtering data, which helps reduce the amount of data to be transferred over the network and reduce the network overhead. This is indicated by the `mpp[tiflash]` value of the `task` column on the row of the `Limit_15` operator.

#### 14.3.6.4.2 Example 2: Push expressions down to TiFlash

```

CREATE TABLE t(id INT PRIMARY KEY, a INT);
ALTER TABLE t SET TIFLASH REPLICA 1;
INSERT INTO t(id,a) VALUES (1,2),(2,4),(11,2),(12,4),(13,4),(14,7);

EXPLAIN SELECT MAX(id + a) FROM t GROUP BY a;

+---
| ↪ -----+-----+-----+-----+
| ↪
| id | estRows | task | access object |
| ↪ operator info | | | |
+---
| ↪ -----+-----+-----+-----+
| ↪
| TableReader_45 | 4.80 | root | | data:
↪ ExchangeSender_44			
-ExchangeSender_44	4.80	mpp[tiflash]	
↪ ExchangeType: PassThrough			
-Projection_39	4.80	mpp[tiflash]	
↪ Column#3			
-HashAgg_37	4.80	mpp[tiflash]	
↪ group by:Column#9, funcs:max(Column#8)->Column#3			
-Projection_46	6.00	mpp[tiflash]	
↪ (test.t.id, test.t.a)->Column#8, test.t.a			

```

```

| -ExchangeReceiver_23 | 6.00 | mpp[tiflash] | | |
↳
| -ExchangeSender_22 | 6.00 | mpp[tiflash] | | |
↳ ExchangeType: HashPartition, Hash Cols: [name: test.t.a, collate:
↳ binary] |
| -TableFullScan_21 | 6.00 | mpp[tiflash] | table:t | keep
↳ order:false, stats:pseudo
+--
↳ -----+-----+-----+-----+
↳
8 rows in set (0.18 sec)

```

In the preceding example, the expression `id + a` is pushed down to TiFlash for calculation in advance. This helps reduce the amount of data to be transferred over the network, thus reducing the network transmission overhead and improving the overall calculation performance. This is indicated by the `mpp[tiflash]` value in the `task` column of the row where the operator column has the `plus(test.t.id, test.t.a)` value.

#### 14.3.6.4.3 Example 3: Restrictions for pushdown

```

CREATE TABLE t(id INT PRIMARY KEY, a INT);
ALTER TABLE t SET TIFLASH REPLICA 1;
INSERT INTO t(id,a) VALUES (1,2),(2,4),(11,2),(12,4),(13,4),(14,7);

EXPLAIN SELECT id FROM t WHERE TIME(now()+ a) < '12:00:00';

+--
↳ -----+-----+-----+-----+
↳
| id | estRows | task | access object | operator
↳ info
↳
+--
↳ -----+-----+-----+-----+
↳
| Projection_4 | 4.80 | root | | test.t.id
↳
↳ |
| -Selection_6 | 4.80 | root | | lt(cast(
↳ time(cast(plus(20230110083056, test.t.a), var_string(20))),
↳ var_string(10)), "12:00:00") |
| -TableReader_11 | 6.00 | root | | data:
↳ ExchangeSender_10
↳

```

```

| -ExchangeSender_10 | 6.00 | mpp[tiflash] | |
↳ ExchangeType: PassThrough
↳
| -TableFullScan_9 | 6.00 | mpp[tiflash] | table:t | keep order:
↳ false, stats:pseudo
↳
+--
↳ -----+-----+-----+-----+
↳
5 rows in set, 3 warnings (0.20 sec)

```

The preceding example only performs `TableFullScan` on TiFlash. Other functions are calculated and filtered on `root` and are not pushed down to TiFlash.

You can identify the operators and expressions that cannot be pushed down to TiFlash by running the following command:

```

SHOW WARNINGS;

+--
↳ -----+-----+-----+-----+
↳
| Level | Code | Message
↳
↳ |
+--
↳ -----+-----+-----+-----+
↳
| Warning | 1105 | Scalar function 'time'(signature: Time, return type:
↳ time) is not supported to push down to storage layer now. |
| Warning | 1105 | Scalar function 'cast'(signature: CastDurationAsString,
↳ return type: var_string(10)) is not supported to push down to tiflash
↳ now. |
| Warning | 1105 | Scalar function 'cast'(signature: CastDurationAsString,
↳ return type: var_string(10)) is not supported to push down to tiflash
↳ now. |
+--
↳ -----+-----+-----+-----+
↳
3 rows in set (0.18 sec)

```

The expressions in the preceding example cannot be completely pushed down to TiFlash, because the functions `Time` and `Cast` cannot be pushed down to TiFlash.

#### 14.3.6.4.4 Example 4: Window functions

```

CREATE TABLE t(id INT PRIMARY KEY, c1 VARCHAR(100));
ALTER TABLE t SET TIFLASH REPLICA 1;
INSERT INTO t VALUES(1,"foo"),(2,"bar"),(3,"bar foo"),(10,"foo"),(20,"bar")
 ↪ ,(30,"bar foo");

EXPLAIN SELECT id, ROW_NUMBER() OVER (PARTITION BY id > 10) FROM t;
+--
 ↪ -----+-----+-----+-----+
 ↪
| id | estRows | task | access object |
 ↪ operator info
 ↪ |
+--
 ↪ -----+-----+-----+-----+
 ↪
| TableReader_30 | 10000.00 | root | |
 ↪ MppVersion: 1, data:ExchangeSender_29
 ↪ |
| -ExchangeSender_29 | 10000.00 | mpp[tiflash] | |
 ↪ ExchangeType: PassThrough
 ↪ |
| -Projection_7 | 10000.00 | mpp[tiflash] | | test.
 ↪ t.id, Column#5, stream_count: 4
 ↪ |
| -Window_28 | 10000.00 | mpp[tiflash] | |
 ↪ row_number()->Column#5 over(partition by Column#4 rows between
 ↪ current row and current row), stream_count: 4 |
| -Sort_14 | 10000.00 | mpp[tiflash] | |
 ↪ Column#4, stream_count: 4
 ↪ |
| -ExchangeReceiver_13 | 10000.00 | mpp[tiflash] | |
 ↪ stream_count: 4
 ↪ |
| -ExchangeSender_12 | 10000.00 | mpp[tiflash] | |
 ↪ ExchangeType: HashPartition, Compression: FAST, Hash Cols: [name:
 ↪ Column#4, collate: binary], stream_count: 4 |
| -Projection_10 | 10000.00 | mpp[tiflash] | | test.
 ↪ t.id, gt(test.t.id, 10)->Column#4
 ↪ |
| -TableFullScan_11 | 10000.00 | mpp[tiflash] | table:t | keep

```

```

 ↪ order:false, stats:pseudo
 ↪
+--
 ↪ -----+-----+-----+-----+
 ↪
9 rows in set (0.0073 sec)

```

In this output, you can see that the Window operation has a value of `mpp[tiflash]` in the `task` column, indicating that the `ROW_NUMBER()OVER (PARTITION BY id > 10)` operation can be pushed down to TiFlash.

```

CREATE TABLE t(id INT PRIMARY KEY, c1 VARCHAR(100));
ALTER TABLE t SET TIFLASH REPLICA 1;
INSERT INTO t VALUES(1,"foo"),(2,"bar"),(3,"bar foo"),(10,"foo"),(20,"bar")
 ↪ ,(30,"bar foo");

EXPLAIN SELECT id, MAX(id) OVER (PARTITION BY id > 10) FROM t;
+--
 ↪ -----+-----+-----+-----+
 ↪
| id | estRows | task | access object | operator
 ↪ info
+--
 ↪ -----+-----+-----+-----+
 ↪
| Projection_6 | 10000.00 | root | | test.t1.id,
 ↪ Column#5
| -Shuffle_14 | 10000.00 | root | | execution
 ↪ info: concurrency:5, data sources:[Projection_8] |
| -Window_7 | 10000.00 | root | | max(test.t1.
 ↪ id)->Column#5 over(partition by Column#4) |
| -Sort_13 | 10000.00 | root | | Column#4
 ↪
| -Projection_8 | 10000.00 | root | | test.t1.id,
 ↪ gt(test.t1.id, 10)->Column#4
| -TableReader_10 | 10000.00 | root | | data:
 ↪ TableFullScan_9
| -TableFullScan_9 | 10000.00 | cop[tikv] | table:t1 | keep order
 ↪ :false, stats:pseudo
+--
 ↪ -----+-----+-----+-----+
 ↪
7 rows in set (0.0010 sec)

```

In this output, you can see that the `Window` operation has a value of `root` in the `task`  $\leftrightarrow$  column, indicating that the `MAX(id)OVER (PARTITION BY id > 10)` operation cannot be pushed down to TiFlash. This is because `MAX()` is only supported for push-down as an aggregate function and not as a window function.

### 14.3.7 TiFlash Query Result Materialization

#### Warning:

This is an experimental feature, which might be changed or removed without prior notice. The syntax and implementation might be modified before GA. If you encounter any problems, you can report an [issue](#) on GitHub.

This document introduces how to save the TiFlash query result to a specified TiDB table in an `INSERT INTO SELECT` transaction.

Starting from v6.5.0, TiDB supports saving TiFlash query results in a table, that is, TiFlash query result materialization. During the execution of the `INSERT INTO SELECT` statement, if TiDB pushes down the `SELECT` subquery to TiFlash, the TiFlash query result can be saved to a TiDB table specified in the `INSERT INTO` clause. For TiDB versions earlier than v6.5.0, the TiFlash query results are read-only, so if you want to save TiFlash query results, you have to obtain them from the application level, and then save them in a separate transaction or process.

#### Note:

- By default (`tidb_allow_mpp = ON`), the TiDB optimizer intelligently chooses to push down queries to TiKV or TiFlash based on the query cost. To enforce that the queries are pushed down to TiFlash, you can set the system variable `tidb_enforce_mpp` to `ON`.
- During the experimental phase, this feature is disabled by default. To enable this feature, you can set the system variable `tidb_enable_tiflash_read_for_write_stmt` to `ON`.

The syntax of `INSERT INTO SELECT` is as follows.

```
INSERT [LOW_PRIORITY | HIGH_PRIORITY] [IGNORE]
[INTO] tbl_name
[PARTITION (partition_name [, partition_name] ...)]
```

```
[(col_name [, col_name] ...)]
SELECT ...
[ON DUPLICATE KEY UPDATE assignment_list]value:
{expr | DEFAULT}

assignment:
 col_name = valueassignment_list:
 assignment [, assignment] ...
```

For example, you can save the query result from table `t1` in the `SELECT` clause to table `t2` using the following `INSERT INTO SELECT` statement:

```
INSERT INTO t2 (name, country)
SELECT app_name, country FROM t1;
```

#### 14.3.7.1 Typical and recommended usage scenarios

- Efficient BI solutions

For many BI applications, the analysis query requests are very heavy. For example, when a lot of users access and refresh a report at the same time, a BI application needs to handle a lot of concurrent query requests. To deal with this situation effectively, you can use `INSERT INTO SELECT` to save the query results of the report in a TiDB table. Then, the end users can query data directly from the result table when the report is refreshed, which avoids multiple repeated computations and analyses. Similarly, by saving historical analysis results, you can further reduce the computation volume for long-time historical data analysis. For example, if you have a report A that is used to analyze daily sales profit, you can save the results of report A to a result table T using `INSERT INTO SELECT`. Then, when you need to generate a report B to analyze the sales profit of the past month, you can directly use the daily analysis results in table T. This way not only greatly reduces the computation volume but also improves the query response speed and reduces the system load.

- Serving online applications with TiFlash

The number of concurrent requests supported by TiFlash depends on the volume of data and complexity of the queries, but it typically does not exceed 100 QPS. You can use `INSERT INTO SELECT` to save TiFlash query results, and then use the query result table to support highly concurrent online requests. The data in the result table can be updated in the background at a low frequency (for example, at an interval of 0.5 second), which is well below the TiFlash concurrency limit, while still maintaining a high level of data freshness.

#### 14.3.7.2 Execution process

- During the execution of the `INSERT INTO SELECT` statement, TiFlash first returns the query results of the `SELECT` clause to a TiDB server in the cluster, and then writes the results to the target table, which can have a TiFlash replica.
- The execution of the `INSERT INTO SELECT` statement guarantees ACID properties.

### 14.3.7.3 Restrictions

- The TiDB memory limit on the `INSERT INTO SELECT` statement can be adjusted using the system variable `tidb_mem_quota_query`. Starting from v6.5.0, it is not recommended to use `txn-total-size-limit` to control transaction memory size.

For more information, see [TiDB memory control](#).

- TiDB has no hard limit on the concurrency of the `INSERT INTO SELECT` statement, but it is recommended to consider the following practices:
  - When a “write transaction” is large, such as close to 1 GiB, it is recommended to control concurrency to no more than 10.
  - When a “write transaction” is small, such as less than 100 MiB, it is recommended to control concurrency to no more than 30.
  - Determine the concurrency based on testing results and specific circumstances.

### 14.3.7.4 Example

Data definition:

```
CREATE TABLE detail_data (
 ts DATETIME, -- Fee generation time
 customer_id VARCHAR(20), -- Customer ID
 detail_fee DECIMAL(20,2)); -- Amount of fee

CREATE TABLE daily_data (
 rec_date DATE, -- Date when data is collected
 customer_id VARCHAR(20), -- Customer ID
 daily_fee DECIMAL(20,2)); -- Amount of fee for per day

ALTER TABLE detail_data SET TIFLASH REPLICA 1;
ALTER TABLE daily_data SET TIFLASH REPLICA 1;

-- ... (detail_data table continues updating)
INSERT INTO detail_data(ts,customer_id,detail_fee) VALUES
(
'2023-1-1 12:2:3', 'cus001', 200.86),
(
'2023-1-2 12:2:3', 'cus002', 100.86),
(
'2023-1-3 12:2:3', 'cus002', 2200.86),
(
'2023-1-4 12:2:3', 'cus003', 2020.86),
(
'2023-1-5 12:2:3', 'cus003', 1200.86),
```

```
('2023-1-6 12:2:3', 'cus002', 20.86);
```

Save daily analysis results:

```
SET @@tidb_enable_tiflash_read_for_write_stmt=ON;

INSERT INTO daily_data (rec_date, customer_id, daily_fee)
SELECT DATE(ts), customer_id, sum(detail_fee) FROM detail_data WHERE DATE(
↪ ts) = CURRENT_DATE() GROUP BY DATE(ts), customer_id;
```

Analyze monthly data based on daily analysis data:

```
SELECT MONTH(rec_date), customer_id, sum(daily_fee) FROM daily_data GROUP
↪ BY MONTH(rec_date), customer_id;
```

The preceding example materializes the daily analysis results and saves them to the daily result table, based on which the monthly data analysis is accelerated, thus improving data analysis efficiency.

### 14.3.8 TiFlash Data validation

This document introduces the data validation mechanism and tools for TiFlash.

Data corruptions are usually caused by serious hardware failures. In such cases, even if you attempt to manually recover data, your data become less reliable.

To ensure data integrity, by default, TiFlash performs basic data validation on data files, using the City128 algorithm. In the event of any data validation failure, TiFlash immediately reports an error and exits, avoiding secondary disasters caused by inconsistent data. At this time, you need to manually intervene and replicate the data again before you can restore the TiFlash node.

Starting from v5.4.0, TiFlash introduces more advanced data validation features. TiFlash uses the XXH3 algorithm by default and allows you to customize the validation frame and algorithm.

#### 14.3.8.1 Validation mechanism

The validation mechanism builds upon the DeltaTree File (DTFile). DTFile is the storage file that persists TiFlash data. DTFile has three formats:

---

| Version | State                          | Validation mechanism                                                                   | Notes                                              |
|---------|--------------------------------|----------------------------------------------------------------------------------------|----------------------------------------------------|
| V1      | Deprecated                     | Hashes are embedded in data files.                                                     |                                                    |
| V2      | Default for versions < v6.0.0  | Hashes are embedded in data files.                                                     | Compared to V1, V2 adds statistics of column data. |
| V3      | Default for versions >= v6.0.0 | New contains meta-data and token data checksum, and supports multiple hash algorithms. |                                                    |

---

DTFile is stored in the `stable` folder in the data file directory. All formats currently enabled are in folder format, which means the data is stored in multiple files under a folder with a name like `dmf_<file id>`.

#### 14.3.8.1.1 Use data validation

TiFlash supports both automatic and manual data validation:

- Automatic data validation:
  - v6.0.0 and later versions use the V3 validation mechanism by default.
  - Versions earlier than v6.0.0 use the V2 validation mechanism by default.
  - To manually switch the validation mechanism, refer to [TiFlash configuration file](#). However, the default configuration is verified by tests and therefore recommended.
- Manual data validation. Refer to [DTTool inspect](#).

#### Warning:

After you enable the V3 validation mechanism, the newly generated DTFile cannot be directly read by TiFlash earlier than v5.4.0. Since v5.4.0, TiFlash supports both V2 and V3 and does not actively upgrade or downgrade versions. If you need to upgrade or downgrade versions for existing files, you need to manually [switch versions](#).

#### 14.3.8.1.2 Validation tool

In addition to automatic data validation performed when TiFlash reads data, a tool for manually checking data integrity is introduced in v5.4.0. For details, refer to [DTTool](#).

### 14.3.9 TiFlash Compatibility Notes

TiFlash is incompatible with TiDB in the following situations:

- In the TiFlash computation layer:
  - Checking overflowed numerical values is not supported. For example, adding two maximum values of the `BIGINT` type `9223372036854775807 + ↪ 9223372036854775807`. The expected behavior of this calculation in TiDB is to return the `ERROR 1690 (22003): BIGINT value is out of range` error. However, if this calculation is performed in TiFlash, an overflow value of `-2` is returned without any error.
  - The window function is not supported.

- Reading data from TiKV is not supported.
- Currently, the `sum` function in TiFlash does not support the string-type argument. But TiDB cannot identify whether any string-type argument has been passed into the `sum` function during the compiling. Therefore, when you execute statements similar to `select sum(string_col)from t`, TiFlash returns the `[FLASH:Coprocessor:Unimplemented] CastStringAsReal is not supported ↪ . error`. To avoid such an error in this case, you need to modify this SQL statement to `select sum(cast(string_col as double))from t`.
- Currently, TiFlash's decimal division calculation is incompatible with that of TiDB. For example, when dividing decimal, TiFlash performs the calculation always using the type inferred from the compiling. However, TiDB performs this calculation using a type that is more precise than that inferred from the compiling. Therefore, some SQL statements involving the decimal division return different execution results when executed in TiDB + TiKV and in TiDB + TiFlash. For example:

```
mysql> create table t (a decimal(3,0), b decimal(10, 0));
Query OK, 0 rows affected (0.07 sec)
mysql> insert into t values (43, 1044774912);
Query OK, 1 row affected (0.03 sec)
mysql> alter table t set tiflash replica 1;
Query OK, 0 rows affected (0.07 sec)
mysql> set session tidb_isolation_read_engines='tikv';
Query OK, 0 rows affected (0.00 sec)
mysql> select a/b, a/b + 0.000000000000001 from t where a/b;
+-----+-----+
| a/b | a/b + 0.000000000000001 |
+-----+-----+
| 0.0000 | 0.00000000410001 |
+-----+-----+
1 row in set (0.00 sec)
mysql> set session tidb_isolation_read_engines='tiflash';
Query OK, 0 rows affected (0.00 sec)
mysql> select a/b, a/b + 0.000000000000001 from t where a/b;
Empty set (0.01 sec)
```

In the example above, `a/b`'s inferred type from the compiling is `Decimal(7,4)` both in TiDB and in TiFlash. Constrained by `Decimal(7,4)`, `a/b`'s returned type should be `0.0000`. In TiDB, `a/b`'s runtime precision is higher than `Decimal(7,4)`, so the original table data is not filtered by the `where a/b` condition. However, in TiFlash, the calculation of `a/b` uses `Decimal(7,4)` as the result type, so the original table data is filtered by the `where a/b` condition.

## 14.4 System Variables

TiDB system variables behave similar to MySQL, in that settings apply on a `SESSION` or `GLOBAL` scope:

- Changes on a `SESSION` scope will only affect the current session.
- Changes on a `GLOBAL` scope apply immediately. If this variable is also `SESSION` scoped, all sessions (including your session) will continue to use their current session value.
- Changes are made using the `SET` statement:

```
These two identical statements change a session variable
SET tidb_distsql_scan_concurrency = 10;
SET SESSION tidb_distsql_scan_concurrency = 10;

These two identical statements change a global variable
SET @@global.tidb_distsql_scan_concurrency = 10;
SET GLOBAL tidb_distsql_scan_concurrency = 10;
```

### Note:

Several `GLOBAL` variables persist to the TiDB cluster. Some variables in this document have a `Persists to cluster` setting, which can be configured to `Yes` or `No`.

- For variables with the `Persists to cluster: Yes` setting, when a global variable is changed, a notification is sent to all TiDB servers to refresh their system variable cache. When you add additional TiDB servers or restart existing TiDB servers, the persisted configuration value is automatically used.
- For variables with the `Persists to cluster: No` setting, changes only apply to the local TiDB instance that you are connected to. To retain any values set, you need to specify the variables in your `tidb.toml` configuration file.

Additionally, TiDB presents several MySQL variables as both readable and settable. This is required for compatibility, because it is common for both applications and connectors to read MySQL variables. For example, JDBC connectors both read and set query cache settings, despite not relying on the behavior.

**Note:**

Larger values do not always yield better performance. It is also important to consider the number of concurrent connections that are executing statements, because most settings apply to each connection.

Consider the unit of a variable when you determine safe values:

- For threads, safe values are typically up to the number of CPU cores.
- For bytes, safe values are typically less than the amount of system memory.
- For time, pay attention that the unit might be seconds or milliseconds.

Variables using the same unit might compete for the same set of resources.

## 14.4.1 Variable Reference

### 14.4.1.1 `allow_auto_random_explicit_insert` New in v4.0.3

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- Determines whether to allow explicitly specifying the values of the column with the `AUTO_RANDOM` attribute in the `INSERT` statement.

### 14.4.1.2 `auto_increment_increment`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1
- Range: [1, 65535]
- Controls the step size of `AUTO_INCREMENT` values to be allocated to a column. It is often used in combination with `auto_increment_offset`.

### 14.4.1.3 `auto_increment_offset`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer

- Default value: 1
- Range: [1, 65535]
- Controls the initial offset of `AUTO_INCREMENT` values to be allocated to a column. This setting is often used in combination with `auto_increment_increment`. For example:

```
mysql> CREATE TABLE t1 (a int not null primary key auto_increment);
Query OK, 0 rows affected (0.10 sec)

mysql> set auto_increment_offset=1;
Query OK, 0 rows affected (0.00 sec)

mysql> set auto_increment_increment=3;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (),(),(),();
Query OK, 4 rows affected (0.04 sec)
Records: 4 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+-----+
| a |
+-----+
| 1 |
| 4 |
| 7 |
| 10 |
+-----+
4 rows in set (0.00 sec)
```

#### 14.4.1.4 autocommit

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- Controls whether statements should automatically commit when not in an explicit transaction. See [Transaction Overview](#) for more information.

#### 14.4.1.5 block\_encryption\_mode

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration

- Default value: `aes-128-ecb`
- Value options: `aes-128-ecb`, `aes-192-ecb`, `aes-256-ecb`, `aes-128-cbc`, `aes-192-cbc`, `aes-256-cbc`, `aes-128-ofb`, `aes-192-ofb`, `aes-256-ofb`, `aes-128-cfb`, `aes-192-cfb`, `aes-256-cfb`
- This variable sets the encryption mode for the built-in functions `AES_ENCRYPT()` and `AES_DECRYPT()`.

#### 14.4.1.6 `character_set_client`

- Scope: `SESSION` | `GLOBAL`
- Persists to cluster: Yes
- Default value: `utf8mb4`
- The character set for data sent from the client. See [Character Set and Collation](#) for details on the use of character sets and collations in TiDB. It is recommended to use `SET NAMES` to change the character set when needed.

#### 14.4.1.7 `character_set_connection`

- Scope: `SESSION` | `GLOBAL`
- Persists to cluster: Yes
- Default value: `utf8mb4`
- The character set for string literals that do not have a specified character set.

#### 14.4.1.8 `character_set_database`

- Scope: `SESSION` | `GLOBAL`
- Persists to cluster: Yes
- Default value: `utf8mb4`
- This variable indicates the character set of the default database in use. **It is NOT recommended to set this variable.** When a new default database is selected, the server changes the variable value.

#### 14.4.1.9 `character_set_results`

- Scope: `SESSION` | `GLOBAL`
- Persists to cluster: Yes
- Default value: `utf8mb4`
- The character set that is used when data is sent to the client.

#### 14.4.1.10 `character_set_server`

- Scope: `SESSION` | `GLOBAL`
- Persists to cluster: Yes
- Default value: `utf8mb4`
- The default character set for the server.

#### 14.4.1.11 `collation_connection`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `utf8mb4_bin`
- This variable indicates the collation used in the current connection. It is consistent with the MySQL variable `collation_connection`.

#### 14.4.1.12 `collation_database`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `utf8mb4_bin`
- This variable indicates the default collation of the database in use. **It is NOT recommended to set this variable.** When a new database is selected, TiDB changes this variable value.

#### 14.4.1.13 `collation_server`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `utf8mb4_bin`
- The default collation used when the database is created.

#### 14.4.1.14 `cte_max_recursion_depth`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1000
- Range: [0, 4294967295]
- Controls the maximum recursion depth in Common Table Expressions.

#### 14.4.1.15 `datadir`

- Scope: NONE
- Default value: it depends on the component and the deployment method.
  - `/tmp/tidb`: when you set "unistore" for `--store` or if you don't set `--store`.
  - `/${pd-ip}:${pd-port}`: when you use TiKV, which is the default storage engine for TiUP and TiDB Operator for Kubernetes deployments.
- This variable indicates the location where data is stored. This location can be a local path `/tmp/tidb`, or point to a PD server if the data is stored on TiKV. A value in the format of `/${pd-ip}:${pd-port}` indicates the PD server that TiDB connects to on startup.

#### 14.4.1.16 ddl\_slow\_threshold

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Integer
- Default value: 300
- Range: [0, 2147483647]
- Unit: Milliseconds
- Log DDL operations whose execution time exceeds the threshold value.

#### 14.4.1.17 default\_authentication\_plugin

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `mysql_native_password`
- Possible values: `mysql_native_password`, `caching_sha2_password`, `tidb_sm3_password` ↷ , and `tidb_auth_token`
- The `tidb_auth_token` authentication method is used only for the internal operation of TiDB Cloud. **DO NOT** set the variable to this value.
- This variable sets the authentication method that the server advertises when the server-client connection is being established.
- To authenticate using the `tidb_sm3_password` method, you can connect to TiDB using [TiDB-JDBC](#).

For more possible values of this variable, see [Authentication plugin status](#).

#### 14.4.1.18 default\_password\_lifetime New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 0
- Range: [0, 65535]
- Sets the global policy for automatic password expiration. The default value 0 indicates that the password never expires. If this system variable is set to a positive integer N, it means that the password lifetime is N days, and you must change your password within N days.

#### 14.4.1.19 `default_week_format`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 0
- Range: [0, 7]
- Sets the week format used by the `WEEK()` function.

#### 14.4.1.20 `disconnect_on_expired_password` New in v6.5.0

- Scope: GLOBAL
- Type: Boolean
- Default value: ON
- This variable is read-only. It indicates whether TiDB disconnects the client connection when the password is expired. If the variable is set to ON, the client connection is disconnected when the password is expired. If the variable is set to OFF, the client connection is restricted to the “sandbox mode” and the user can only execute the password reset operation.
- If you need to change the behavior of the client connection for the expired password, modify the `security.disconnect-on-expired-password` configuration item in the configuration file.

#### 14.4.1.21 `error_count`

- Scope: SESSION
- Type: Integer
- Default value: 0
- A read-only variable that indicates the number of errors that resulted from the last statement that generated messages.

#### 14.4.1.22 `foreign_key_checks`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: Before v6.6.0, the default value is OFF. Starting from v6.6.0, the default value is ON.
- This variable controls whether to enable foreign key constraint checking.

#### 14.4.1.23 `group_concat_max_len`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1024
- Range: [4, 18446744073709551615]
- The maximum buffer size for items in the `GROUP_CONCAT()` function.

#### 14.4.1.24 `have_openssl`

- Scope: NONE
- Type: Boolean
- Default value: DISABLED
- A read-only variable for MySQL compatibility. Set to YES by the server when the server has TLS enabled.

#### 14.4.1.25 `have_ssl`

- Scope: NONE
- Type: Boolean
- Default value: DISABLED
- A read-only variable for MySQL compatibility. Set to YES by the server when the server has TLS enabled.

#### 14.4.1.26 `hostname`

- Scope: NONE
- Default value: (system hostname)
- The hostname of the TiDB server as a read-only variable.

#### 14.4.1.27 `identity` New in v5.3.0

This variable is an alias for `last_insert_id`.

#### 14.4.1.28 `init_connect`

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: ""
- The `init_connect` feature permits a SQL statement to be automatically executed when you first connect to a TiDB server. If you have the `CONNECTION_ADMIN` or `SUPER` privileges, this `init_connect` statement will not be executed. If the `init_connect` statement results in an error, your user connection will be terminated.

#### 14.4.1.29 innodb\_lock\_wait\_timeout

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 50
- Range: [1, 3600]
- Unit: Seconds
- The lock wait timeout for pessimistic transactions (default).

#### 14.4.1.30 interactive\_timeout

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 28800
- Range: [1, 31536000]
- Unit: Seconds
- This variable represents the idle timeout of the interactive user session. Interactive user session refers to the session established by calling `mysql_real_connect()` API using the `CLIENT_INTERACTIVE` option (for example, MySQL Shell and MySQL Client). This variable is fully compatible with MySQL.

#### 14.4.1.31 last\_insert\_id

- Scope: SESSION
- Type: Integer
- Default value: 0
- Range: [0, 9223372036854775807]
- This variable returns the last `AUTO_INCREMENT` or `AUTO_RANDOM` value generated by an insert statement.
- The value of `last_insert_id` is the same as the value returned by the function `LAST_INSERT_ID()`.

#### 14.4.1.32 last\_plan\_from\_binding New in v4.0

- Scope: SESSION
- Type: Boolean
- Default value: OFF
- This variable is used to show whether the execution plan used in the previous statement was influenced by a [plan binding](#)

#### 14.4.1.33 `last_plan_from_cache` New in v4.0

- Scope: SESSION
- Type: Boolean
- Default value: OFF
- This variable is used to show whether the execution plan used in the previous `execute` statement is taken directly from the plan cache.

#### 14.4.1.34 `last_sql_use_alloc` New in v6.4.0

- Scope: SESSION
- Default value: OFF
- This variable is read-only. It is used to show whether the previous statement uses a cached chunk object (chunk allocation).

#### 14.4.1.35 `license`

- Scope: NONE
- Default value: Apache License 2.0
- This variable indicates the license of your TiDB server installation.

#### 14.4.1.36 `log_bin`

- Scope: NONE
- Type: Boolean
- Default value: OFF
- This variable indicates whether [TiDB Binlog](#) is used.

#### 14.4.1.37 `max_allowed_packet` New in v6.1.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: 67108864
- Range: [1024, 1073741824]
- The value should be an integer multiple of 1024. If the value is not divisible by 1024, a warning will be prompted and the value will be rounded down. For example, when the value is set to 1025, the actual value in TiDB is 1024.
- The maximum packet size allowed by the server and the client in one transmission of packets.
- This variable is compatible with MySQL.

#### 14.4.1.38 password\_history New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 0
- Range: [0, 4294967295]
- This variable is used to establish a password reuse policy that allows TiDB to limit password reuse based on the number of password changes. The default value 0 means disabling the password reuse policy based on the number of password changes. When this variable is set to a positive integer N, the reuse of the last N passwords is not allowed.

#### 14.4.1.39 mpp\_exchange\_compression\_mode New in v6.6.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: UNSPECIFIED
- Value options: NONE, FAST, HIGH\_COMPRESSION, UNSPECIFIED
- This variable is used to specify the data compression mode of the MPP Exchange operator. This variable takes effect when TiDB selects the MPP execution plan with the version number 1. The meanings of the variable values are as follows:
  - UNSPECIFIED: means unspecified. TiDB will automatically select the compression mode. Currently, TiDB automatically selects the FAST mode.
  - NONE: no data compression is used.
  - FAST: fast mode. The overall performance is good and the compression ratio is less than HIGH\_COMPRESSION.
  - HIGH\_COMPRESSION: the high compression ratio mode.

#### 14.4.1.40 mpp\_version New in v6.6.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: UNSPECIFIED
- Value options: UNSPECIFIED, 0, 1
- This variable is used to specify different versions of the MPP execution plan. After a version is specified, TiDB selects the specified version of the MPP execution plan. The meanings of the variable values are as follows:
  - UNSPECIFIED: means unspecified. TiDB automatically selects the latest version 1.
  - 0: compatible with all TiDB cluster versions. Features with the MPP version greater than 0 do not take effect in this mode.
  - 1: new in v6.6.0, used to enable data exchange with compression on TiFlash. For details, see [MPP version and exchange data compression](#).

#### 14.4.1.41 `password_reuse_interval` New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 0
- Range: [0, 4294967295]
- This variable is used to establish a password reuse policy that allows TiDB to limit password reuse based on time elapsed. The default value 0 means disabling the password reuse policy based on time elapsed. When this variable is set to a positive integer  $N$ , the reuse of any password used in the last  $N$  days is not allowed.

#### 14.4.1.42 `max_connections`

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Integer
- Default value: 0
- Range: [0, 100000]
- The maximum number of concurrent connections permitted for a single TiDB instance. This variable can be used for resources control.
- The default value 0 means no limit. When the value of this variable is larger than 0  $\leftrightarrow$  , and the number of connections reaches the value, the TiDB server rejects new connections from clients.

#### 14.4.1.43 `max_execution_time`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 0
- Range: [0, 2147483647]
- Unit: Milliseconds
- The maximum execution time of a statement. The default value is unlimited (zero).

#### Note:

The `max_execution_time` system variable currently only controls the maximum execution time for read-only SQL statements. The precision of the timeout value is roughly 100ms. This means the statement might not be terminated in accurate milliseconds as you specify.

For a SQL statement with the `MAX_EXECUTION_TIME` hint, the maximum execution time of this statement is limited by the hint instead of this variable. The hint can also be used with SQL bindings as described in the [SQL FAQ](#).

#### 14.4.1.44 `max_prepared_stmt_count`

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: -1
- Range: [-1, 1048576]
- Specifies the maximum number of `PREPARE` statements in the current TiDB instance.
- The value of -1 means no limit on the maximum number of `PREPARE` statements in the current TiDB instance.
- If you set the variable to a value that exceeds the upper limit 1048576, 1048576 is used instead:

```
mysql> SET GLOBAL max_prepared_stmt_count = 1048577;
Query OK, 0 rows affected, 1 warning (0.01 sec)

mysql> SHOW WARNINGS;
+---+
| Level | Code | Message |
+---+
| Warning | 1292 | Truncated incorrect max_prepared_stmt_count value: '
 ↳ 1048577' |
+---+
1 row in set (0.00 sec)

mysql> SHOW GLOBAL VARIABLES LIKE 'max_prepared_stmt_count';
+-----+
| Variable_name | Value |
+-----+
| max_prepared_stmt_count | 1048576 |
+-----+
1 row in set (0.00 sec)
```

#### 14.4.1.45 `plugin_dir`

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Default value: “”
- Indicates the directory to load plugins as specified by a command-line flag.

#### 14.4.1.46 `plugin_load`

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Default value: “”
- Indicates the plugins to load when TiDB is started. These plugins are specified by a command-line flag and separated by commas.

#### 14.4.1.47 `port`

- Scope: NONE
- Type: Integer
- Default value: 4000
- Range: [0, 65535]
- The port that the `tidb-server` is listening on when speaking the MySQL protocol.

#### 14.4.1.48 `rand_seed1`

- Scope: SESSION
- Type: Integer
- Default value: 0
- Range: [0, 2147483647]
- This variable is used to seed the random value generator used in the `RAND()` SQL function.
- The behavior of this variable is MySQL compatible.

#### 14.4.1.49 `rand_seed2`

- Scope: SESSION
- Type: Integer
- Default value: 0
- Range: [0, 2147483647]
- This variable is used to seed the random value generator used in the `RAND()` SQL function.
- The behavior of this variable is MySQL compatible.

#### 14.4.1.50 `require_secure_transport` New in v6.1.0

- Scope: GLOBAL
  - Persists to cluster: Yes
  - Type: Boolean
  - Default value: OFF
- This variable ensures that all connections to TiDB are either on a local socket, or using TLS. See [Enable TLS between TiDB Clients and Servers](#) for additional details.
  - Setting this variable to ON requires you to connect to TiDB from a session that has TLS enabled. This helps prevent lock-out scenarios when TLS is not configured correctly.
  - This setting was previously a `tidb.toml` option (`security.require-secure-transport`), but changed to a system variable starting from TiDB v6.1.0.

#### 14.4.1.51 `skip_name_resolve` New in v5.2.0

- Scope: GLOBAL
  - Persists to cluster: Yes
  - Type: Boolean
  - Default value: OFF
- This variable controls whether the `tidb-server` instance resolves hostnames as a part of the connection handshake.
  - When the DNS is unreliable, you can enable this option to improve network performance.

#### Note:

When `skip_name_resolve=ON`, users with a hostname in their identity will no longer be able to log into the server. For example:

```
CREATE USER 'appuser'@'apphost' IDENTIFIED BY 'app-password';
```

In this example, it is recommended to replace `apphost` with an IP address or the wildcard (%).

#### 14.4.1.52 `socket`

- Scope: NONE
- Default value: ""
- The local unix socket file that the `tidb-server` is listening on when speaking the MySQL protocol.

#### 14.4.1.53 `sql_log_bin`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- Indicates whether to write changes to [TiDB Binlog](#) or not.

##### **Note:**

It is not recommended to set `sql_log_bin` as a global variable because the future versions of TiDB might only allow setting this as a session variable.

#### 14.4.1.54 `sql_mode`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,NO_ENGINE_SUBSTITUTION`
- This variable controls a number of MySQL compatibility behaviors. See [SQL Mode](#) for more information.

#### 14.4.1.55 `sql_require_primary_key` New in v6.3.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable controls whether to enforce the requirement that a table has a primary key. After this variable is enabled, attempting to create or alter a table without a primary key will produce an error.
- This feature is based on the similarly named `sql_require_primary_key` in MySQL 8.0.
- It is strongly recommended to enable this variable when using TiCDC. This is because replicating changes to a MySQL sink requires that tables have a primary key.

#### 14.4.1.56 `sql_select_limit` New in v4.0.2

- Scope: SESSION | GLOBAL

- Persists to cluster: Yes
- Type: Integer
- Default value: 18446744073709551615
- Range: [0, 18446744073709551615]
- Unit: Rows
- The maximum number of rows returned by the `SELECT` statements.

#### 14.4.1.57 `ssl_ca`

- Scope: NONE
- Default value: “”
- The location of the certificate authority file (if there is one). The value of this variable is defined by the TiDB configuration item `ssl-ca`.

#### 14.4.1.58 `ssl_cert`

- Scope: NONE
- Default value: “”
- The location of the certificate file (if there is a file) that is used for SSL/TLS connections. The value of this variable is defined by the TiDB configuration item `ssl-cert`.

#### 14.4.1.59 `ssl_key`

- Scope: NONE
- Default value: “”
- The location of the private key file (if there is one) that is used for SSL/TLS connections. The value of this variable is defined by TiDB configuration item `ssl-key`.

#### 14.4.1.60 `system_time_zone`

- Scope: NONE
- Default value: (system dependent)
- This variable shows the system time zone from when TiDB was first bootstrapped. See also `time_zone`.

#### 14.4.1.61 `tidb_adaptive_closest_read_threshold` New in v6.3.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: 4096
- Range: [0, 9223372036854775807]
- Unit: Bytes

- This variable is used to control the threshold at which the TiDB server prefers to send read requests to a replica in the same availability zone as the TiDB server when `tidb_replica_read` is set to `closest-adaptive`. If the estimated result is higher than or equal to this threshold, TiDB prefers to send read requests to a replica in the same availability zone. Otherwise, TiDB sends read requests to the leader replica.

#### 14.4.1.62 `tidb_allow_batch_cop` New in v4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1
- Range: [0, 2]
- This variable is used to control how TiDB sends a coprocessor request to TiFlash. It has the following values:
  - 0: Never send requests in batches
  - 1: Aggregation and join requests are sent in batches
  - 2: All coprocessor requests are sent in batches

#### 14.4.1.63 `tidb_allow_fallback_to_tikv` New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: “”
- This variable is used to specify a list of storage engines that might fall back to TiKV. If the execution of a SQL statement fails due to a failure of the specified storage engine in the list, TiDB retries executing this SQL statement with TiKV. This variable can be set to “” or “tiflash”. When this variable is set to “tiflash”, if TiFlash returns a timeout error (error code: `ErrTiFlashServerTimeout`), TiDB retries executing this SQL statement with TiKV.

#### 14.4.1.64 `tidb_allow_function_for_expression_index` New in v5.2.0

- Scope: NONE
- Default value: `json_array`, `json_array_append`, `json_array_insert`, `json_contains` ↪ , `json_contains_path`, `json_depth`, `json_extract`, `json_insert`, `json_keys` ↪ , `json_length`, `json_merge_patch`, `json_merge_preserve`, `json_object`, `json_pretty`, `json_quote`, `json_remove`, `json_replace`, `json_search`, `json_set`, `json_storage_size`, `json_type`, `json_unquote`, `json_valid`, `lower`, `md5`, `reverse`, `tidb_shard`, `upper`, `vitess_hash`

- This variable is used to show the functions that are allowed to be used for creating expression indexes.

#### 14.4.1.65 `tidb_allow_mpp` New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- Controls whether to use the MPP mode of TiFlash to execute queries. The value options are as follows:
  - 0 or OFF, which means that the MPP mode will not be used.
  - 1 or ON, which means that the optimizer determines whether to use the MPP mode based on the cost estimation (by default).

MPP is a distributed computing framework provided by the TiFlash engine, which allows data exchange between nodes and provides high-performance, high-throughput SQL algorithms. For details about the selection of the MPP mode, refer to [Control whether to select the MPP mode](#).

#### 14.4.1.66 `tidb_allow_remove_auto_inc` New in v2.1.18 and v3.0.4

- Scope: SESSION
- Type: Boolean
- Default value: OFF
- This variable is used to set whether the `AUTO_INCREMENT` property of a column is allowed to be removed by executing `ALTER TABLE MODIFY` or `ALTER TABLE CHANGE` statements. It is not allowed by default.

#### 14.4.1.67 `tidb_analyze_partition_concurrency`

##### **Warning:**

The feature controlled by this variable is not fully functional in the current TiDB version. Do not change the default value.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: 1
- This variable specifies the concurrency of reading and writing statistics for a partitioned table when TiDB analyzes the partitioned table.

#### 14.4.1.68 `tidb_analyze_version` New in v5.1.0

- Scope: SESSION | GLOBAL
  - Persists to cluster: Yes
  - Type: Integer
  - Default value: 2 for TiDB Self-Hosted and 1 for TiDB Cloud
  - Range: [1, 2]
  - Controls how TiDB collects statistics.
- In v5.3.0 and later versions, the default value of this variable is 2. If your cluster is upgraded from a version earlier than v5.3.0 to v5.3.0 or later, the default value of `tidb_analyze_version` does not change. For detailed introduction, see [Introduction to Statistics](#).

#### 14.4.1.69 `tidb_auto_analyze_end_time`

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Time
- Default value: 23:59 +0000
- This variable is used to restrict the time window that the automatic update of statistics is permitted. For example, to only allow automatic statistics updates between 1 AM and 3 AM in UTC time, set `tidb_auto_analyze_start_time='01:00 +0000'` and `tidb_auto_analyze_end_time='03:00 +0000'`.

#### 14.4.1.70 `tidb_auto_analyze_partition_batch_size` New in v6.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: 1
- Range: [1, 1024]
- This variable specifies the number of partitions that TiDB [automatically analyzes](#) when analyzing a partitioned table (which means automatically collecting statistics on a partitioned table).
- If the value of this variable is smaller than the number of partitions, TiDB automatically analyzes all partitions of the partitioned table in multiple batches. If the value of this variable is greater than or equal to the number of partitions, TiDB analyzes all partitions of the partitioned table at the same time.
- If the number of partitions of a partitioned table is far greater than this variable value and the auto-analyze takes a long time, you can increase the value of this variable to reduce the time consumption.

#### 14.4.1.71 `tidb_auto_analyze_ratio`

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Float
- Default value: 0.5
- Range: [0, 18446744073709551615]
- This variable is used to set the threshold when TiDB automatically executes **ANALYZE**  $\hookrightarrow$  **TABLE** in a background thread to update table statistics. For example, a value of 0.5 means that auto-analyze is triggered when greater than 50% of the rows in a table have been modified. Auto-analyze can be restricted to only execute during certain hours of the day by specifying `tidb_auto_analyze_start_time` and `tidb_auto_analyze_end_time`.

#### **Note:**

This feature requires the system variable `tidb_enable_auto_analyze` set to `ON`.

#### 14.4.1.72 `tidb_auto_analyze_start_time`

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Time
- Default value: 00:00 +0000
- This variable is used to restrict the time window that the automatic update of statistics is permitted. For example, to only allow automatic statistics updates between 1 AM and 3 AM in UTC time, set `tidb_auto_analyze_start_time='01:00 +0000'` and `tidb_auto_analyze_end_time='03:00 +0000'`.

#### 14.4.1.73 `tidb_auto_build_stats_concurrency` New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1
- Range: [1, 256]
- This variable is used to set the concurrency of executing the automatic update of statistics.

#### 14.4.1.74 `tidb_backoff_lock_fast`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 10
- Range: [1, 2147483647]
- This variable is used to set the `backoff` time when the read request meets a lock.

#### 14.4.1.75 `tidb_backoff_weight`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 2
- Range: [0, 2147483647]
- This variable is used to increase the weight of the maximum time of TiDB `backoff`, that is, the maximum retry time for sending a retry request when an internal network or other component (TiKV, PD) failure is encountered. This variable can be used to adjust the maximum retry time and the minimum value is 1.

For example, the base timeout for TiDB to take TSO from PD is 15 seconds. When `tidb_backoff_weight = 2`, the maximum timeout for taking TSO is:  $base\ time * 2 = 30\ seconds$ .

In the case of a poor network environment, appropriately increasing the value of this variable can effectively alleviate error reporting to the application end caused by timeout. If the application end wants to receive the error information more quickly, minimize the value of this variable.

#### 14.4.1.76 `tidb_batch_commit`

##### **Warning:**

It is **NOT** recommended to enable this variable.

- Scope: SESSION
- Type: Boolean
- Default value: OFF

- The variable is used to control whether to enable the deprecated batch-commit feature. When this variable is enabled, a transaction might be split into multiple transactions by grouping a few statements and committed non-atomically, which is not recommended.

#### 14.4.1.77 `tidb_batch_delete`

##### **Warning:**

This variable is associated with the deprecated batch-dml feature, which might cause data corruption. Therefore, it is not recommended to enable this variable for batch-dml. Instead, use [non-transactional DML](#).

- Scope: SESSION
- Type: Boolean
- Default value: OFF
- This variable is used to control whether to enable the batch-delete feature, which is a part of the deprecated batch-dml feature. When this variable is enabled, `DELETE` statements might be split into multiple transactions and committed non-atomically. To make it work, you also need to enable `tidb_enable_batch_dml` and set a positive value for `tidb_dml_batch_size`, which is not recommended.

#### 14.4.1.78 `tidb_batch_insert`

##### **Warning:**

This variable is associated with the deprecated batch-dml feature, which might cause data corruption. Therefore, it is not recommended to enable this variable for batch-dml. Instead, use [non-transactional DML](#).

- Scope: SESSION
- Type: Boolean
- Default value: OFF
- This variable is used to control whether to enable the batch-insert feature, which is a part of the deprecated batch-dml feature. When this variable is enabled, `INSERT` statements might be split into multiple transactions and committed non-atomically. To make it work, you also need to enable `tidb_enable_batch_dml` and set a positive value for `tidb_dml_batch_size`, which is not recommended.

#### 14.4.1.79 `tidb_batch_pending_tiflash_count` New in v6.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 4000
- Range: [0, 4294967295]
- Specifies the maximum number of permitted unavailable tables when you use `ALTER DATABASE SET TIFLASH REPLICA` to add TiFlash replicas. If the number of unavailable tables exceeds this limit, the operation will be stopped or setting TiFlash replicas for the remaining tables will be very slow.

#### 14.4.1.80 `tidb_broadcast_join_threshold_count` New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 10240
- Range: [0, 9223372036854775807]
- Unit: Rows
- If the objects of the join operation belong to a subquery, the optimizer cannot estimate the size of the subquery result set. In this situation, the size is determined by the number of rows in the result set. If the estimated number of rows in the subquery is less than the value of this variable, the Broadcast Hash Join algorithm is used. Otherwise, the Shuffled Hash Join algorithm is used.

#### 14.4.1.81 `tidb_broadcast_join_threshold_size` New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 104857600 (100 MiB)
- Range: [0, 9223372036854775807]
- Unit: Bytes
- If the table size is less than the value of the variable, the Broadcast Hash Join algorithm is used. Otherwise, the Shuffled Hash Join algorithm is used.

#### 14.4.1.82 `tidb_build_stats_concurrency`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 4

- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency of executing the `ANALYZE` statement.
- When the variable is set to a larger value, the execution performance of other queries is affected.

#### 14.4.1.83 `tidb_capture_plan_baselines` New in v4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to control whether to enable the [baseline capturing](#) feature. This feature depends on the statement summary, so you need to enable the statement summary before you use baseline capturing.
- After this feature is enabled, the historical SQL statements in the statement summary are traversed periodically, and bindings are automatically created for SQL statements that appear at least twice.

#### 14.4.1.84 `tidb_cdc_write_source` New in v6.5.0

- Scope: SESSION
- Persists to cluster: No
- Type: Integer
- Default value: 0
- Range: [0, 15]
- When this variable is set to a value other than 0, data written in this session is considered to be written by TiCDC. This variable can only be modified by TiCDC. Do not manually modify this variable in any case.

#### 14.4.1.85 `tidb_check_mb4_value_in_utf8`

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Boolean
- Default value: `ON`
- This variable is used to enforce that the `utf8` character set only stores values from the [Basic Multilingual Plane \(BMP\)](#). To store characters outside the BMP, it is recommended to use the `utf8mb4` character set.
- You might need to disable this option when upgrading your cluster from an earlier version of TiDB where the `utf8` checking was more relaxed. For details, see [FAQs After Upgrade](#).

#### 14.4.1.86 `tidb_checksum_table_concurrency`

- Scope: SESSION
- Type: Integer
- Default value: 4
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the scan index concurrency of executing the `ADMIN`  $\rightarrow$  `CHECKSUM TABLE` statement.
- When the variable is set to a larger value, the execution performance of other queries is affected.

#### 14.4.1.87 `tidb_committer_concurrency` New in v6.1.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 128
- Range: [1, 10000]
- The number of goroutines for requests related to executing commit in the commit phase of the single transaction.
- If the transaction to commit is too large, the waiting time for the flow control queue when the transaction is committed might be too long. In this situation, you can increase the configuration value to speed up the commit.
- This setting was previously a `tidb.toml` option (`performance.committer-concurrency`), but changed to a system variable starting from TiDB v6.1.0.

#### 14.4.1.88 `tidb_config`

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Default value: “”
- This variable is read-only. It is used to obtain the configuration information of the current TiDB server.

#### 14.4.1.89 `tidb_constraint_check_in_place`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean

- Default value: `OFF`
- This variable only applies to optimistic transactions. For pessimistic transactions, use `tidb_constraint_check_in_place_pessimistic` instead.
- When this variable is set to `OFF`, checking for duplicate values in unique indexes is deferred until the transaction commits. This helps improve performance but might be an unexpected behavior for some applications. See [Constraints](#) for details.
  - When setting `tidb_constraint_check_in_place` to `OFF` and using optimistic transactions:

```
tidb> create table t (i int key);
tidb> insert into t values (1);
tidb> begin optimistic;
tidb> insert into t values (1);
Query OK, 1 row affected
tidb> commit; -- Check only when a transaction is committed.
ERROR 1062 : Duplicate entry '1' for key 't.PRIMARY'
```

- When setting `tidb_constraint_check_in_place` to `ON` and using optimistic transactions:

```
tidb> set @@tidb_constraint_check_in_place=ON;
tidb> begin optimistic;
tidb> insert into t values (1);
ERROR 1062 : Duplicate entry '1' for key 't.PRIMARY'
```

#### 14.4.1.90 `tidb_constraint_check_in_place_pessimistic` New in v6.3.0

- Scope: `SESSION`
- Type: `Boolean`
- Default value: By default, the `pessimistic-txn.constraint-check-in-place`  $\leftrightarrow$  `pessimistic` configuration item is `true` so the default value of this variable is `ON`. When `pessimistic-txn.constraint-check-in-place-pessimistic` is set to `false`, the default value of this variable is `OFF`.
- This variable only applies to pessimistic transactions. For optimistic transactions, use `tidb_constraint_check_in_place` instead.
- When this variable is set to `OFF`, TiDB defers the unique constraint check of a unique index (to the next time when executing a statement that requires a lock to the index or to the time when committing the transaction). This helps improve performance but might be an unexpected behavior for some applications. See [Constraints](#) for details.

- Disabling this variable might cause TiDB to return a `LazyUniquenessCheckFailure` error in pessimistic transactions. When this error occurs, TiDB rolls back the current transaction.
- When this variable is disabled, you cannot use `SAVEPOINT` in pessimistic transactions.
- When this variable is disabled, committing a pessimistic transaction might return a `Write conflict` or `Duplicate entry` error. When such an error occurs, TiDB rolls back the current transaction.
  - When setting `tidb_constraint_check_in_place_pessimistic` to `OFF` and using pessimistic transactions:

```
set @@tidb_constraint_check_in_place_pessimistic=OFF;
create table t (i int key);
insert into t values (1);
begin pessimistic;
insert into t values (1);
```

```
Query OK, 1 row affected
```

```
tidb> commit; -- Check only when a transaction is committed.
```

```
ERROR 1062 : Duplicate entry '1' for key 't.PRIMARY'
```

- When setting `tidb_constraint_check_in_place_pessimistic` to `ON` and using pessimistic transactions:

```
set @@tidb_constraint_check_in_place_pessimistic=ON;
begin pessimistic;
insert into t values (1);
```

```
ERROR 1062 : Duplicate entry '1' for key 't.PRIMARY'
```

#### 14.4.1.91 `tidb_cost_model_version` New in v6.2.0

##### Note:

- Since TiDB v6.5.0, the newly created cluster uses Cost Model Version 2 by default. If you upgrade from a TiDB version earlier than v6.5.0 to v6.5.0 or later, the `tidb_cost_model_version` value does not change.
- Switching the version of the cost model might cause changes to query plans.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 2
- Value options:
  - 1: enables the Cost Model Version 1, which is used by default in TiDB v6.4.0 and earlier versions.
  - 2: enables the **Cost Model Version 2**, which is generally available in TiDB v6.5.0 and is more accurate than the version 1 in internal tests.
- The version of cost model affects the plan decision of optimizer. For more details, see **Cost Model**.

#### 14.4.1.92 `tidb_current_ts`

- Scope: SESSION
- Type: Integer
- Default value: 0
- Range: [0, 9223372036854775807]
- This variable is read-only. It is used to obtain the timestamp of the current transaction.

#### 14.4.1.93 `tidb_ddl_disk_quota` New in v6.3.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 107374182400 (100 GiB)
- Range: [107374182400, 1125899906842624] ([100 GiB, 1 PiB])
- Unit: Bytes
- This variable only takes effect when `tidb_ddl_enable_fast_reorg` is enabled. It sets the usage limit of local storage during backfilling when creating an index.

#### 14.4.1.94 `tidb_ddl_enable_fast_reorg` New in v6.3.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable controls whether to enable the acceleration of `ADD INDEX` and `CREATE ↔ INDEX` to improve the speed of backfilling for index creation. Setting this variable value to ON can bring performance improvement for index creation on tables with a large amount of data.

- To verify whether a completed `ADD INDEX` operation is accelerated, you can execute the `ADMIN SHOW DDL JOBS` statement to see whether `ingest` is displayed in the `JOB_TYPE` column.

### Warning:

Currently, this feature is not fully compatible with adding a unique index. When adding a unique index, it is recommended to disable the index acceleration feature (set `tidb_ddl_enable_fast_reorg` to `OFF`).

When `PITR (Point-in-time recovery)` is disabled, the speed of adding indexes is expected to be about 10 times that in v6.1.0. However, there is no performance improvement when both PITR and index acceleration are enabled. To optimize performance, it is recommended that you disable PITR, add indexes in a quick way, then enable PITR and perform a full backup. Otherwise, the following behaviors might occur:

- When PITR starts working first, the index adding job automatically falls back to the legacy mode by default, even if the configuration is set to `ON`. The index is added slowly.
- When the index adding job starts first, it prevents the log backup job of PITR from starting by throwing an error, which does not affect the index adding job in progress. After the index adding job is completed, you need to restart the log backup job and perform a full backup manually.
- When a log backup job of PITR and an index adding job start at the same time, no error is prompted because the two jobs are unable to detect each other. PITR does not back up the newly added index. After the index adding job is completed, you still need to restart the log backup job and perform a full backup manually.

#### 14.4.1.95 `tidb_ddl_distribute_reorg` New in v6.6.0

### Warning:

- This feature is still in the experimental stage. It is not recommended to enable this feature in production environments.
- When this feature is enabled, TiDB only performs simple retries when an exception occurs during the DDL reorg phase. There is currently no retry method that is compatible with DDL operations. That is, you cannot control the number of retries using `tidb_ddl_error_count_limit`.

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: OFF
- This variable is used to control whether to enable distributed execution of the DDL reorg phase to improve the speed of this phase. Currently, this variable is only valid for the `ADD INDEX` statement. Enabling this variable improves the performance of large tables. Distributed DDL execution can control the CPU usage of DDL through dynamic DDL resource management to prevent DDL from affecting the online application.
- To verify whether a completed `ADD INDEX` operation is accelerated by this feature, you can check whether a corresponding task is in the `mysql.tidb_background_subtask_history`  $\rightarrow$  table.

#### 14.4.1.96 `tidb_ddl_error_count_limit`

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 512
- Range: [0, 9223372036854775807]
- This variable is used to set the number of retries when the DDL operation fails. When the number of retries exceeds the parameter value, the wrong DDL operation is canceled.

#### 14.4.1.97 `tidb_ddl_flashback_concurrency` New in v6.3.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 64
- Range: [1, 256]
- This variable controls the concurrency of `FLASHBACK CLUSTER TO TIMESTAMP`.

#### 14.4.1.98 `tidb_ddl_reorg_batch_size`

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 256
- Range: [32, 10240]
- Unit: Rows
- This variable is used to set the batch size during the `re-organize` phase of the DDL operation. For example, when TiDB executes the `ADD INDEX` operation, the index data needs to be backfilled by `tidb_ddl_reorg_worker_cnt` (the number) concurrent workers. Each worker backfills the index data in batches.

- If many updating operations such as `UPDATE` and `REPLACE` exist during the `ADD`  $\leftrightarrow$  `INDEX` operation, a larger batch size indicates a larger probability of transaction conflicts. In this case, you need to adjust the batch size to a smaller value. The minimum value is 32.
- If the transaction conflict does not exist, you can set the batch size to a large value (consider the worker count. See [Interaction Test on Online Workloads and ADD  \$\leftrightarrow\$  INDEX Operations](#) for reference). This can increase the speed of the backfilling data, but the write pressure on TiKV also becomes higher.

#### 14.4.1.99 `tidb_ddl_reorg_priority`

- Scope: `SESSION`
- Type: Enumeration
- Default value: `PRIORITY_LOW`
- Value options: `PRIORITY_LOW`, `PRIORITY_NORMAL`, `PRIORITY_HIGH`
- This variable is used to set the priority of executing the `ADD INDEX` operation in the `re-organize` phase.
- You can set the value of this variable to `PRIORITY_LOW`, `PRIORITY_NORMAL` or `PRIORITY_HIGH`.

#### 14.4.1.100 `tidb_ddl_reorg_worker_cnt`

- Scope: `GLOBAL`
- Persists to cluster: Yes
- Type: Integer
- Default value: 4
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency of the DDL operation in the `re-organize` phase.

#### 14.4.1.101 `tidb_default_string_match_selectivity` New in v6.2.0

- Scope: `SESSION` | `GLOBAL`
- Persists to cluster: Yes
- Type: Float
- Default value: 0.8
- Range: [0, 1]
- This variable is used to set the default selectivity of `like`, `rlike`, and `regexp` functions in the filter condition when estimating the number of rows. This variable also controls whether to enable TopN to help estimate these functions.

- TiDB tries to estimate `like` in the filter condition using statistics. But when `like` matches a complex string, or when using `rlike` or `regexp`, TiDB often fails to fully use statistics, and the default value 0.8 is set as the selectivity rate instead, resulting in inaccurate estimation.
- This variable is used to change the preceding behavior. If the variable is set to a value other than 0, the selectivity rate is the specified variable value instead of 0.8.
- If the variable is set to 0, TiDB tries to evaluate using TopN in statistics to improve the accuracy and consider the NULL number in statistics when estimating the preceding three functions. The prerequisite is that statistics are collected when `tidb_analyze_version` is set to 2. Such evaluation might slightly affect the performance.
- If the variable is set to a value other than the 0.8, TiDB adjusts the estimation for `not like`, `not rlike`, and `not regexp` accordingly.

#### 14.4.1.102 `tidb_disable_txn_auto_retry`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable is used to set whether to disable the automatic retry of explicit optimistic transactions. The default value of ON means that transactions will not automatically retry in TiDB and COMMIT statements might return errors that need to be handled in the application layer.

Setting the value to OFF means that TiDB will automatically retry transactions, resulting in fewer errors from COMMIT statements. Be careful when making this change, because it might result in lost updates.

This variable does not affect automatically committed implicit transactions and internally executed transactions in TiDB. The maximum retry count of these transactions is determined by the value of `tidb_retry_limit`.

For more details, see [limits of retry](#).

This variable only applies to optimistic transactions, not to pessimistic transactions. The number of retries for pessimistic transactions is controlled by `max_retry_count`.

#### 14.4.1.103 `tidb_distsql_scan_concurrency`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer

- Default value: 15
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency of the `scan` operation.
- Use a bigger value in OLAP scenarios, and a smaller value in OLTP scenarios.
- For OLAP scenarios, the maximum value should not exceed the number of CPU cores of all the TiKV nodes.
- If a table has a lot of partitions, you can reduce the variable value appropriately (determined by the size of the data to be scanned and the frequency of the scan) to avoid TiKV becoming out of memory (OOM).

#### 14.4.1.104 `tidb_dml_batch_size`

##### **Warning:**

This variable is associated with the deprecated batch-dml feature, which might cause data corruption. Therefore, it is not recommended to enable this variable for batch-dml. Instead, use [non-transactional DML](#).

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 0
- Range: [0, 2147483647]
- Unit: Rows
- When this value is greater than 0, TiDB will batch commit statements such as `INSERT` or `LOAD DATA` into smaller transactions. This reduces memory usage and helps ensure that the `txn-total-size-limit` is not reached by bulk modifications.
- Only the value 0 provides ACID compliance. Setting this to any other value will break the atomicity and isolation guarantees of TiDB.
- To make this variable work, you also need to enable `tidb_enable_batch_dml` and at least one of `tidb_batch_insert` and `tidb_batch_delete`.

#### 14.4.1.105 `tidb_enable_1pc` New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable is used to specify whether to enable the one-phase commit feature for transactions that only affect one Region. Compared with the often-used two-phase

commit, one-phase commit can greatly reduce the latency of transaction commit and increase the throughput.

**Note:**

- The default value of `ON` only applies to new clusters. If your cluster was upgraded from an earlier version of TiDB, the value `OFF` will be used instead.
- If you have enabled TiDB Binlog, enabling this variable cannot improve the performance. To improve the performance, it is recommended to use [TiCDC](#) instead.
- Enabling this parameter only means that one-phase commit becomes an optional mode of transaction commit. In fact, the most suitable mode of transaction commit is determined by TiDB.

#### 14.4.1.106 `tidb_enable_analyze_snapshot` New in v6.2.0

- Scope: `SESSION | GLOBAL`
- Persists to cluster: `Yes`
- Type: `Boolean`
- Default value: `OFF`
- This variable controls whether to read historical data or the latest data when performing `ANALYZE`. If this variable is set to `ON`, `ANALYZE` reads the historical data available at the time of `ANALYZE`. If this variable is set to `OFF`, `ANALYZE` reads the latest data.
- Before v5.2, `ANALYZE` reads the latest data. From v5.2 to v6.1, `ANALYZE` reads the historical data available at the time of `ANALYZE`.

**Warning:**

If `ANALYZE` reads the historical data available at the time of `ANALYZE`, the long duration of `AUTO ANALYZE` might cause the `GC life time is shorter`  $\leftrightarrow$  `than transaction duration` error because the historical data is garbage-collected.

#### 14.4.1.107 `tidb_enable_async_commit` New in v5.0

- Scope: `SESSION | GLOBAL`

- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls whether to enable the async commit feature for the second phase of the two-phase transaction commit to perform asynchronously in the background. Enabling this feature can reduce the latency of transaction commit.

**Note:**

- The default value of `ON` only applies to new clusters. If your cluster was upgraded from an earlier version of TiDB, the value `OFF` will be used instead.
- If you have enabled TiDB Binlog, enabling this variable cannot improve the performance. To improve the performance, it is recommended to use [TiCDC](#) instead.
- Enabling this parameter only means that Async Commit becomes an optional mode of transaction commit. In fact, the most suitable mode of transaction commit is determined by TiDB.

#### 14.4.1.108 `tidb_enable_auto_analyze` New in v6.1.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- Determines whether TiDB automatically updates table statistics as a background operation.
- This setting was previously a `tidb.toml` option (`performance.run-auto-analyze`), but changed to a system variable starting from TiDB v6.1.0.

#### 14.4.1.109 `tidb_enable_auto_increment_in_generated`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to determine whether to include the `AUTO_INCREMENT` columns when creating a generated column or an expression index.

#### 14.4.1.110 `tidb_enable_batch_dml`

**Warning:**

This variable is associated with the deprecated batch-dml feature, which might cause data corruption. Therefore, it is not recommended to enable this variable for batch-dml. Instead, use [non-transactional DML](#).

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable controls whether to enable the deprecated batch-dml feature. When it is enabled, certain statements might be split into multiple transactions, which is non-atomic and should be used with care. When using batch-dml, you must ensure that there are no concurrent operations on the data you are operating on. To make it work, you must also specify a positive value for `tidb_batch_dml_size` and enable at least one of `tidb_batch_insert` and `tidb_batch_delete`.

#### 14.4.1.111 `tidb_enable_cascades_planner`

**Warning:**

Currently, cascades planner is an experimental feature. It is not recommended that you use it in production environments.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to control whether to enable the cascades planner.

#### 14.4.1.112 `tidb_enable_chunk_rpc` New in v4.0

- Scope: SESSION
- Type: Boolean
- Default value: `ON`
- This variable is used to control whether to enable the `Chunk` data encoding format in Coprocessor.

#### 14.4.1.113 `tidb_enable_clustered_index` New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: ON
- Possible values: OFF, ON, INT\_ONLY
- This variable is used to control whether to create the primary key as a **clustered index** by default. “By default” here means that the statement does not explicitly specify the keyword CLUSTERED/NONCLUSTERED. Supported values are OFF, ON, and INT\_ONLY:
  - OFF indicates that primary keys are created as non-clustered indexes by default.
  - ON indicates that primary keys are created as clustered indexes by default.
  - INT\_ONLY indicates that the behavior is controlled by the configuration item `alter ↔ -primary-key`. If `alter-primary-key` is set to `true`, all primary keys are created as non-clustered indexes by default. If it is set to `false`, only the primary keys which consist of an integer column are created as clustered indexes.

#### 14.4.1.114 `tidb_enable_ddl` New in v6.3.0

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Default value: ON
- Possible values: OFF, ON
- This variable controls whether the corresponding TiDB instance can become a DDL owner or not. If there is only one TiDB instance in the current TiDB cluster, you cannot prevent it from becoming a DDL owner, which means you cannot set it to OFF.

#### 14.4.1.115 `tidb_enable_collect_execution_info`

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Boolean
- Default value: ON
- This variable controls whether to record the execution information of each operator in the slow query log.

#### 14.4.1.116 `tidb_enable_column_tracking` New in v5.4.0

**Warning:**

Currently, collecting statistics on `PREDICATE COLUMNS` is an experimental feature. It is not recommended that you use it in production environments.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable controls whether to enable TiDB to collect `PREDICATE COLUMNS`. After enabling the collection, if you disable it, the information of previously collected `PREDICATE COLUMNS` is cleared. For details, see [Collect statistics on some columns](#).

#### 14.4.1.117 `tidb_enable_enhanced_security`

- Scope: NONE
- Type: Boolean
- Default value: OFF
- This variable indicates whether the TiDB server you are connected to has the Security Enhanced Mode (SEM) enabled. To change its value, you need to modify the value of `enable-sem` in your TiDB server configuration file and restart the TiDB server.
- SEM is inspired by the design of systems such as [Security-Enhanced Linux](#). It reduces the abilities of users with the MySQL `SUPER` privilege and instead requires `RESTRICTED` fine-grained privileges to be granted as a replacement. These fine-grained privileges include:
  - `RESTRICTED_TABLES_ADMIN`: The ability to write data to system tables in the `mysql` schema and to see sensitive columns on `information_schema` tables.
  - `RESTRICTED_STATUS_ADMIN`: The ability to see sensitive variables in the command `SHOW STATUS`.
  - `RESTRICTED_VARIABLES_ADMIN`: The ability to see and set sensitive variables in `SHOW [GLOBAL] VARIABLES` and `SET`.
  - `RESTRICTED_USER_ADMIN`: The ability to prevent other users from making changes or dropping a user account.

#### 14.4.1.118 `tidb_enable_exchange_partition`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes

- Type: Boolean
- Default value: ON
- This variable controls whether to enable the `exchange partitions with tables` feature. The default value is ON, that is, `exchange partitions with tables` is enabled by default.
- This variable is deprecated since v6.3.0. Its value will be fixed to the default value ON, that is, `exchange partitions with tables` is enabled by default.

#### 14.4.1.119 `tidb_enable_extended_stats`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable indicates whether TiDB can collect the extended statistic to guide the optimizer. See [Introduction to Extended Statistics](#) for more information.

#### 14.4.1.120 `tidb_enable_external_ts_read` New in v6.4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- If this variable is set to ON, TiDB reads data with the timestamp specified by `tidb_external_ts`.

#### 14.4.1.121 `tidb_external_ts` New in v6.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 0
- If `tidb_enable_external_ts_read` is set to ON, TiDB reads data with the timestamp specified by this variable.

#### 14.4.1.122 `tidb_enable_fast_analyze`

##### **Warning:**

Currently, `Fast Analyze` is an experimental feature. It is not recommended that you use it in production environments.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable is used to set whether to enable the statistics **Fast Analyze** feature.
- If the statistics **Fast Analyze** feature is enabled, TiDB randomly samples about 10,000 rows of data as statistics. When the data is distributed unevenly or the data size is small, the statistics accuracy is low. This might lead to a non-optimal execution plan, for example, selecting a wrong index. If the execution time of the regular **Analyze** statement is acceptable, it is recommended to disable the **Fast Analyze** feature.

#### 14.4.1.123 `tidb_enable_foreign_key` New in v6.3.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: Before v6.6.0, the default value is OFF. Starting from v6.6.0, the default value is ON.
- This variable controls whether to enable the FOREIGN KEY feature.

#### 14.4.1.124 `tidb_enable_gc_aware_memory_track`

##### **Warning:**

This variable is an internal variable for debugging in TiDB. It might be removed in a future release. **Do not** set this variable.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable controls whether to enable GC-Aware memory track.

#### 14.4.1.125 `tidb_enable_non_prepared_plan_cache`

##### **Warning:**

The feature controlled by this variable is not fully functional in the current TiDB version. Do not change the default value.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable controls whether to enable the General Plan Cache feature.

#### 14.4.1.126 `tidb_enable_gogc_tuner` New in v6.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable controls whether to enable GOGC Tuner.

#### 14.4.1.127 `tidb_enable_historical_stats`

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable controls whether to enable historical statistics. The default value changes from OFF to ON, which means that historical statistics are enabled by default.

#### 14.4.1.128 `tidb_enable_historical_stats_for_capture`

##### **Warning:**

The feature controlled by this variable is not fully functional in the current TiDB version. Do not change the default value.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable controls whether the information captured by `PLAN REPLAYER CAPTURE` includes historical statistics by default. The default value OFF means that historical statistics are not included by default.

#### 14.4.1.129 `tidb_enable_index_merge` New in v4.0

**Note:**

- After upgrading a TiDB cluster from versions earlier than v4.0.0 to v5.4.0 or later, this variable is disabled by default to prevent performance regression due to changes of execution plans.
- After upgrading a TiDB cluster from v4.0.0 or later to v5.4.0 or later, this variable remains the setting before the upgrade.
- Since v5.4.0, for a newly deployed TiDB cluster, this variable is enabled by default.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable is used to control whether to enable the index merge feature.

#### 14.4.1.130 `tidb_enable_index_merge_join`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- Specifies whether to enable the `IndexMergeJoin` operator.
- This variable is used only for the internal operation of TiDB. It is **NOT recommended** to adjust it. Otherwise, data correctness might be affected.

#### 14.4.1.131 `tidb_enable_legacy_instance_scope` New in v6.0.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable permits `INSTANCE` scoped variables to be set using the `SET SESSION` as well as `SET GLOBAL` syntax.
- This option is enabled by default for compatibility with earlier versions of TiDB.

#### 14.4.1.132 `tidb_enable_list_partition` New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable is used to set whether to enable the LIST (COLUMNS)TABLE PARTITION feature.

#### 14.4.1.133 `tidb_enable_local_txn`

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable is used for an unreleased feature. **Do not change the variable value.**

#### 14.4.1.134 `tidb_enable_metadata_lock` New in v6.3.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable is used to set whether to enable the [Metadata lock](#) feature. Note that when setting this variable, you need to make sure that there are no running DDL statements in the cluster. Otherwise, the data might be incorrect or inconsistent.

#### 14.4.1.135 `tidb_enable_mutation_checker` New in v6.0.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable is used to control whether to enable TiDB mutation checker, which is a tool used to check consistency between data and indexes during the execution of DML statements. If the checker returns an error for a statement, TiDB rolls back the execution of the statement. Enabling this variable causes a slight increase in CPU usage. For more information, see [Troubleshoot Inconsistency Between Data and Indexes](#).
- For new clusters of v6.0.0 or later versions, the default value is ON. For existing clusters that upgrade from versions earlier than v6.0.0, the default value is OFF.

#### 14.4.1.136 `tidb_enable_new_cost_interface` New in v6.2.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- TiDB v6.2.0 refactors the implementation of previous cost model. This variable controls whether to enable the refactored Cost Model implementation.
- This variable is enabled by default because the refactored Cost Model uses the same cost formula as before, which does not change the plan decision.
- If your cluster is upgraded from v6.1 to v6.2, this variable remains OFF, and it is recommended to enable it manually. If your cluster is upgraded from a version earlier than v6.1, this variable sets to ON by default.

#### 14.4.1.137 `tidb_enable_new_only_full_group_by_check` New in v6.1.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable controls the behavior when TiDB performs the ONLY\_FULL\_GROUP\_BY check. For detailed information about ONLY\_FULL\_GROUP\_BY, see the [MySQL documentation](#). In v6.1.0, TiDB handles this check more strictly and correctly.
- To avoid potential compatibility issues caused by version upgrades, the default value of this variable is OFF in v6.1.0.

#### 14.4.1.138 `tidb_enable_noop_functions` New in v4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: OFF
- Possible values: OFF, ON, WARN
- By default, TiDB returns an error when you attempt to use the syntax for functionality that is not yet implemented. When the variable value is set to ON, TiDB silently ignores such cases of unavailable functionality, which is helpful if you cannot make changes to the SQL code.
- Enabling `noop` functions controls the following behaviors:
  - LOCK IN SHARE MODE syntax
  - SQL\_CALC\_FOUND\_ROWS syntax
  - START TRANSACTION READ ONLY and SET TRANSACTION READ ONLY syntax
  - The `tx_read_only`, `transaction_read_only`, `offline_mode`, `super_read_only`  $\leftrightarrow$  , `read_only` and `sql_auto_is_null` system variables

- GROUP BY <expr> ASC|DESC syntax

**Warning:**

Only the default value of OFF can be considered safe. Setting `tidb_enable_noop_functions=1` might lead to unexpected behaviors in your application, because it permits TiDB to ignore certain syntax without providing an error. For example, the syntax `START TRANSACTION READ ONLY` is permitted, but the transaction remains in read-write mode.

**14.4.1.139 tidb\_enable\_noop\_variables New in v6.2.0**

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: ON
- If you set the variable value to OFF, TiDB behaves as follows:
  - When you use SET to set a noop variable, TiDB returns the "setting \* ↪ variable\_name\* has no effect in TiDB" warning.
  - The result of SHOW [SESSION | GLOBAL] VARIABLES does not include noop variables.
  - When you use SELECT to read a noop variable, TiDB returns the "variable \* ↪ variable\_name\* has no effect in TiDB" warning.
- To check whether a TiDB instance has set and read the noop variable, you can use the `SELECT * FROM INFORMATION_SCHEMA.CLIENT_ERRORS_SUMMARY_GLOBAL;` statement.

**14.4.1.140 tidb\_enable\_null\_aware\_anti\_join New in v6.3.0**

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: OFF
- Type: Boolean
- This variable controls whether TiDB applies Null Aware Hash Join when ANTI JOIN is generated by subqueries led by special set operators NOT IN and != ALL.

**14.4.1.141 tidb\_enable\_outer\_join\_reorder New in v6.1.0**

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes

- Type: Boolean
- Default value: `ON`
- Since v6.1.0, the `Join Reorder` algorithm of TiDB supports Outer Join. This variable controls whether TiDB enables the Join Reorder's support for Outer Join.
- If your cluster is upgraded from an earlier version of TiDB, note the following:
  - If the TiDB version before the upgrade is earlier than v6.1.0, the default value of this variable after the upgrade is `ON`.
  - If the TiDB version before the upgrade is v6.1.0 or later, the default value of the variable after the upgrade follows the value before the upgrade.

#### 14.4.1.142 `tidb_enable_ordered_result_mode`

- Scope: `SESSION | GLOBAL`
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- Specifies whether to sort the final output result automatically.
- For example, with this variable enabled, TiDB processes `SELECT a, MAX(b)FROM t`  
↔ `GROUP BY a as SELECT a, MAX(b)FROM t GROUP BY a ORDER BY a, MAX(b)`.

#### 14.4.1.143 `tidb_enable_paging` New in v5.4.0

- Scope: `SESSION | GLOBAL`
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls whether to use the method of paging to send coprocessor requests. For TiDB versions in `[v5.4.0, v6.2.0)`, this variable only takes effect on the `IndexLookup` operator; for v6.2.0 and later, this variable takes effect globally. Starting from v6.4.0, the default value of this variable is changed from `OFF` to `ON`.
- User scenarios:
  - In all OLTP scenarios, it is recommended to use the method of paging.
  - For read queries that use `IndexLookup` and `Limit` and that `Limit` cannot be pushed down to `IndexScan`, there might be high latency for the read queries and high usage for TiKV Unified read pool CPU. In such cases, because the `Limit` operator only requires a small set of data, if you set `tidb_enable_paging` to `ON`, TiDB processes less data, which reduces query latency and resource consumption.

- In scenarios such as data export using **Dumpling** and full table scan, enabling paging can effectively reduce the memory consumption of TiDB processes.

**Note:**

In OLAP scenarios where TiKV is used as the storage engine instead of TiFlash, enabling paging might cause performance regression in some cases. If the regression occurs, consider using this variable to disable paging, or using the `tidb_min_paging_size` and `tidb_max_paging_size` variables to adjust the range of rows for paging size.

**14.4.1.144 `tidb_enable_parallel_apply` New in v5.0**

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable controls whether to enable concurrency for the `Apply` operator. The number of concurrencies is controlled by the `tidb_executor_concurrency` variable. The `Apply` operator processes correlated subqueries and has no concurrency by default, so the execution speed is slow. Setting this variable value to 1 can increase concurrency and speed up execution. Currently, concurrency for `Apply` is disabled by default.

**14.4.1.145 `tidb_enable_pipelined_window_function`**

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable specifies whether to use the pipeline execution algorithm for window functions.

**14.4.1.146 `tidb_enable_plan_cache_for_param_limit` New in v6.6.0**

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON

- This variable controls whether Prepared Plan Cache caches execution plans with a variable as the `LIMIT` parameter (`LIMIT ?`). The default value is `ON`, which means Prepared Plan Cache supports caching such execution plans. Note that Prepared Plan Cache does not support caching execution plans with a variable that is greater than 10000.

#### 14.4.1.147 `tidb_enable_plan_replayer_capture`

- Scope: `SESSION | GLOBAL`
- Persists to cluster: `Yes`
- Type: `Boolean`
- Default value: `ON`
- This variable controls whether to enable the `PLAN REPLAYER CAPTURE` feature. The default value `ON` means to enable the `PLAN REPLAYER CAPTURE` feature.

#### 14.4.1.148 `tidb_enable_plan_replayer_continues_capture`

##### **Warning:**

The feature controlled by this variable is not fully functional in the current TiDB version. Do not change the default value.

- Scope: `SESSION | GLOBAL`
- Persists to cluster: `Yes`
- Type: `Boolean`
- Default value: `OFF`

#### 14.4.1.149 `tidb_enable_prepared_plan_cache` **New in v6.1.0**

- Scope: `SESSION | GLOBAL`
- Persists to cluster: `Yes`
- Type: `Boolean`
- Default value: `ON`
- Determines whether to enable `Prepared Plan Cache`. When it is enabled, the execution plans of `Prepare` and `Execute` are cached so that the subsequent executions skip optimizing the execution plans, which brings performance improvement.
- This setting was previously a `tidb.toml` option (`prepared-plan-cache.enabled`), but changed to a system variable starting from TiDB v6.1.0.

#### 14.4.1.150 `tidb_enable_prepared_plan_cache_memory_monitor` New in v6.4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: ON
- This variable controls whether to count the memory consumed by the execution plans cached in the Prepared Plan Cache. For details, see [Memory management of Prepared Plan Cache](#).

#### 14.4.1.151 `tidb_enable_pseudo_for_outdated_stats` New in v5.3.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable controls the behavior of the optimizer on using statistics of a table when the statistics are outdated.
- The optimizer determines whether the statistics of a table is outdated in this way: since the last time `ANALYZE` is executed on a table to get the statistics, if 80% of the table rows are modified (the modified row count divided by the total row count), the optimizer determines that the statistics of this table is outdated. You can change this ratio using the `pseudo-estimate-ratio` configuration.
- By default (with the variable value `OFF`), when the statistics of a table is outdated, the optimizer still keeps using the statistics of the table. If you set the variable value to `ON`, the optimizer determines that the statistics of the table is no longer reliable except for the total row count. Then, the optimizer uses the pseudo statistics.
- If the data on a table is frequently modified without executing `ANALYZE` on this table in time, to keep the execution plan stable, it is recommended to set the variable value to `OFF`.

#### 14.4.1.152 `tidb_enable_rate_limit_action`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable controls whether to enable the dynamic memory control feature for the operator that reads data. By default, this operator enables the maximum number of threads that `tidb_distsql_scan_concurrency` allows to read data. When the memory usage of a single SQL statement exceeds `tidb_mem_quota_query` each time, the operator that reads data stops one thread.

- When the operator that reads data has only one thread left and the memory usage of a single SQL statement constantly exceeds `tidb_mem_quota_query`, this SQL statement triggers other memory control behaviors, such as [spilling data to disk](#).
- This variable controls memory usage effectively when an SQL statement only reads data. If computing operations (such as join or aggregation operations) are required, memory usage might not be under the control of `tidb_mem_quota_query`, which increases the risk of OOM.

#### 14.4.1.153 `tidb_enable_resource_control` New in v6.6.0

##### **Warning:**

This feature is experimental and its form and usage might change in subsequent versions.

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: `OFF`
- Type: Boolean
- This variable is a switch for [the resource control feature](#). When this variable is set to `ON`, the TiDB cluster can isolate application resources based on resource groups.

#### 14.4.1.154 `tidb_enable_reuse_chunk` New in v6.4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: `ON`
- Value options: `OFF`, `ON`
- This variable controls whether TiDB enables chunk objects cache. If the value is `ON`, TiDB prefers to use the cached chunk object and only requests from the system if the requested object is not in the cache. If the value is `OFF`, TiDB requests chunk objects from the system directly.

#### 14.4.1.155 `tidb_enable_slow_log`

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Boolean
- Default value: `ON`
- This variable is used to control whether to enable the slow log feature.

#### 14.4.1.156 `tidb_enable_tmp_storage_on_oom`

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: ON
- Value options: OFF, ON
- Controls whether to enable the temporary storage for some operators when a single SQL statement exceeds the memory quota specified by the system variable `tidb_mem_quota_query`.
- Before v6.3.0, you can enable or disable this feature by using the TiDB configuration item `oom-use-tmp-storage`. After upgrading the cluster to v6.3.0 or a later version, the TiDB cluster will initialize this variable using the value of `oom-use-tmp-storage` automatically. After that, changing the value of `oom-use-tmp-storage` **does not** take effect anymore.

#### 14.4.1.157 `tidb_enable_stmt_summary` New in v3.0.4

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable is used to control whether to enable the statement summary feature. If enabled, SQL execution information like time consumption is recorded to the `information_schema.STATEMENTS_SUMMARY` system table to identify and troubleshoot SQL performance issues.

#### 14.4.1.158 `tidb_enable_strict_double_type_check` New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable is used to control if tables can be created with invalid definitions of type `DOUBLE`. This setting is intended to provide an upgrade path from earlier versions of TiDB, which were less strict in validating types.
- The default value of ON is compatible with MySQL.

For example, the type `DOUBLE(10)` is now considered invalid because the precision of floating point types is not guaranteed. After changing `tidb_enable_strict_double_type_check`  $\hookrightarrow$  to `OFF`, the table is created:

```
mysql> CREATE TABLE t1 (id int, c double(10));
ERROR 1149 (42000): You have an error in your SQL syntax; check the manual
 \hookrightarrow that corresponds to your MySQL server version for the right syntax to
 \hookrightarrow use
```

```
mysql> SET tidb_enable_strict_double_type_check = 'OFF';
Query OK, 0 rows affected (0.00 sec)

mysql> CREATE TABLE t1 (id int, c double(10));
Query OK, 0 rows affected (0.09 sec)
```

#### Note:

This setting only applies to the type `DOUBLE` since MySQL permits precision for `FLOAT` types. This behavior is deprecated starting with MySQL 8.0.17, and it is not recommended to specify precision for either `FLOAT` or `DOUBLE` types.

#### 14.4.1.159 `tidb_enable_table_partition`

- Scope: `SESSION` | `GLOBAL`
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `ON`
- Possible values: `OFF`, `ON`, `AUTO`
- This variable is used to set whether to enable the `TABLE PARTITION` feature:
  - `ON` indicates enabling Range partitioning, Hash partitioning, and Range column partitioning with one single column.
  - `AUTO` functions the same way as `ON` does.
  - `OFF` indicates disabling the `TABLE PARTITION` feature. In this case, the syntax that creates a partition table can be executed, but the table created is not a partitioned one.

#### 14.4.1.160 `tidb_enable_telemetry` New in v4.0.2

- Scope: `GLOBAL`
- Persists to cluster: Yes
- Type: Boolean
- Default value: `OFF`
- This variable is used to dynamically control whether the telemetry collection in TiDB is enabled. In the current version, the telemetry is disabled by default. If the `enable`  $\leftrightarrow$  `-telemetry` TiDB configuration item is set to `false` on all TiDB instances, the telemetry collection is always disabled and this system variable will not take effect. See [Telemetry](#) for details.

#### 14.4.1.161 `tidb_enable_tiflash_read_for_write_stmt` New in v6.3.0

**Warning:**

The feature controlled by this variable is experimental in the current TiDB version. It is not recommended that you use it for production environments.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable controls whether read operations in SQL statements containing INSERT, DELETE, and UPDATE can be pushed down to TiFlash. For example:
  - SELECT queries in INSERT INTO SELECT statements (typical usage scenario: [TiFlash query result materialization](#))
  - WHERE condition filtering in UPDATE and DELETE statements

#### 14.4.1.162 `tidb_enable_top_sql` New in v5.4.0

**Warning:**

Currently, Top SQL is an experimental feature. It is not recommended that you use it for production environments.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable is used to control whether to enable the [Top SQL](#) feature.

#### 14.4.1.163 `tidb_enable_tso_follower_proxy` New in v5.3.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable is used to enable the TSO Follower Proxy feature. When the value is OFF, TiDB only gets TSO from the PD leader. After this feature is enabled, TiDB gets TSO by evenly sending requests to all PD nodes and forwarding TSO requests through PD followers. This helps reduce the CPU pressure of PD leader.
- Scenarios for enabling TSO Follower Proxy:
  - Due to the high pressure of TSO requests, the CPU of the PD leader reaches a bottleneck, which causes high latency of TSO RPC requests.
  - The TiDB cluster has many TiDB instances, and increasing the value of `tidb_tso_client_batch_max_wait_time` cannot alleviate the high latency issue of TSO RPC requests.

#### Note:

Suppose that the TSO RPC latency increases for reasons other than a CPU usage bottleneck of the PD leader (such as network issues). In this case, enabling the TSO Follower Proxy might increase the execution latency in TiDB and affect the QPS performance of the cluster.

#### 14.4.1.164 `tidb_enable_unsafe_substitute` New in v6.3.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable controls whether to replace expressions with generated columns in an unsafe way. The default value is OFF, which means that unsafe replacement is disabled by default. For more details, see [Generated Columns](#).

#### 14.4.1.165 `tidb_enable_vectorized_expression` New in v4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable is used to control whether to enable vectorized execution.

#### 14.4.1.166 `tidb_enable_window_function`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable is used to control whether to enable the support for window functions. Note that window functions may use reserved keywords. This might cause SQL statements that could be executed normally cannot be parsed after upgrading TiDB. In this case, you can set `tidb_enable_window_function` to OFF.

#### 14.4.1.167 `tidb_enforce_mpp` New in v5.1

- Scope: SESSION
- Type: Boolean
- Default value: OFF
- To change this default value, modify the `performance.enforce-mpp` configuration value.
- Controls whether to ignore the optimizer's cost estimation and to forcibly use TiFlash's MPP mode for query execution. The value options are as follows:
  - 0 or OFF, which means that the MPP mode is not forcibly used (by default).
  - 1 or ON, which means that the cost estimation is ignored and the MPP mode is forcibly used. Note that this setting only takes effect when `tidb_allow_mpp`  $\hookrightarrow$  true.

MPP is a distributed computing framework provided by the TiFlash engine, which allows data exchange between nodes and provides high-performance, high-throughput SQL algorithms. For details about the selection of the MPP mode, refer to [Control whether to select the MPP mode](#).

#### 14.4.1.168 `tidb_evolve_plan_baselines` New in v4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable is used to control whether to enable the baseline evolution feature. For detailed introduction or usage, see [Baseline Evolution](#).
- To reduce the impact of baseline evolution on the cluster, use the following configurations:

- Set `tidb_evolve_plan_task_max_time` to limit the maximum execution time of each execution plan. The default value is 600s.
- Set `tidb_evolve_plan_task_start_time` and `tidb_evolve_plan_task_end_time` ↪ to limit the time window. The default values are respectively 00:00 +0000 and 23:59 +0000.

#### 14.4.1.169 `tidb_evolve_plan_task_end_time` New in v4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Time
- Default value: 23:59 +0000
- This variable is used to set the end time of baseline evolution in a day.

#### 14.4.1.170 `tidb_evolve_plan_task_max_time` New in v4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 600
- Range: [-1, 9223372036854775807]
- Unit: Seconds
- This variable is used to limit the maximum execution time of each execution plan in the baseline evolution feature.

#### 14.4.1.171 `tidb_evolve_plan_task_start_time` New in v4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Time
- Default value: 00:00 +0000
- This variable is used to set the start time of baseline evolution in a day.

#### 14.4.1.172 `tidb_executor_concurrency` New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 5
- Range: [1, 256]
- Unit: Threads

This variable is used to set the concurrency of the following SQL operators (to one value):

- index lookup
- index lookup join
- hash join
- hash aggregation (the partial and final phases)
- window
- projection

`tidb_executor_concurrency` incorporates the following existing system variables as a whole for easier management:

- `tidb_index_lookup_concurrency`
- `tidb_index_lookup_join_concurrency`
- `tidb_hash_join_concurrency`
- `tidb_hashagg_partial_concurrency`
- `tidb_hashagg_final_concurrency`
- `tidb_projection_concurrency`
- `tidb_window_concurrency`

Since v5.0, you can still separately modify the system variables listed above (with a deprecation warning returned) and your modification only affects the corresponding single operators. After that, if you use `tidb_executor_concurrency` to modify the operator concurrency, the separately modified operators will not be affected. If you want to use `tidb_executor_concurrency` to modify the concurrency of all operators, you can set the values of all variables listed above to `-1`.

For a system upgraded to v5.0 from an earlier version, if you have not modified any value of the variables listed above (which means that the `tidb_hash_join_concurrency` value is 5 and the values of the rest are 4), the operator concurrency previously managed by these variables will automatically be managed by `tidb_executor_concurrency`. If you have modified any of these variables, the concurrency of the corresponding operators will still be controlled by the modified variables.

#### 14.4.1.173 `tidb_expensive_query_time_threshold`

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Integer
- Default value: 60
- Range: [10, 2147483647]
- Unit: Seconds
- This variable is used to set the threshold value that determines whether to print expensive query logs. The difference between expensive query logs and slow query logs is:

- Slow logs are printed after the statement is executed.
- Expensive query logs print the statements that are being executed, with execution time exceeding the threshold value, and their related information.

#### 14.4.1.174 `tidb_force_priority`

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Enumeration
- Default value: `NO_PRIORITY`
- Possible values: `NO_PRIORITY`, `LOW_PRIORITY`, `HIGH_PRIORITY`, `DELAYED`
- This variable is used to change the default priority for statements executed on a TiDB server. A use case is to ensure that a particular user that is performing OLAP queries receives lower priority than users performing OLTP queries.
- The default value `NO_PRIORITY` means that the priority for statements is not forced to change.

#### 14.4.1.175 `tidb_gc_concurrency` New in v5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: `-1`
- Range: `[1, 256]`
- Unit: Threads
- Specifies the number of threads in the [Resolve Locks](#) step of GC. A value of `-1` means that TiDB will automatically decide the number of garbage collection threads to use.

#### 14.4.1.176 `tidb_gc_enable` New in v5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- Enables garbage collection for TiKV. Disabling garbage collection will reduce system performance, as old versions of rows will no longer be purged.

#### 14.4.1.177 `tidb_gc_life_time` New in v5.0

- Scope: GLOBAL
- Persists to cluster: Yes

- Type: Duration
- Default value: 10m0s
- Range: [10m0s, 8760h0m0s]
- The time limit during which data is retained for each GC, in the format of Go Duration. When a GC happens, the current time minus this value is the safe point.

**Note:**

- In scenarios of frequent updates, a large value (days or even months) for `tidb_gc_life_time` may cause potential issues, such as:
  - Larger storage use
  - A large amount of history data may affect performance to a certain degree, especially for range queries such as `select count(*) from t`
- If there is any transaction that has been running longer than `tidb_gc_life_time`, during GC, the data since `start_ts` is retained for this transaction to continue execution. For example, if `tidb_gc_life_time` is configured to 10 minutes, among all transactions being executed, the transaction that starts earliest has been running for 15 minutes, GC will retain data of the recent 15 minutes.

#### 14.4.1.178 `tidb_gc_max_wait_time` New in v6.1.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 86400
- Range: [600, 31536000]
- Unit: Seconds
- This variable is used to set the maximum time that active transactions block the GC safe point. During each time of GC, the safe point does not exceed the start time of the ongoing transactions by default. If the runtime of active transactions does not exceed this variable value, the GC safe point will be blocked until the runtime exceeds this value.

#### 14.4.1.179 `tidb_gc_run_interval` New in v5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Duration
- Default value: 10m0s

- Range: [10m0s, 8760h0m0s]
- Specifies the GC interval, in the format of Go Duration, for example, "1h30m", and "15m"

#### 14.4.1.180 `tidb_gc_scan_lock_mode` New in v5.0

##### **Warning:**

Currently, Green GC is an experimental feature. It is not recommended that you use it in production environments.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: LEGACY
- Possible values: PHYSICAL, LEGACY
  - LEGACY: Uses the old way of scanning, that is, disable Green GC.
  - PHYSICAL: Uses the physical scanning method, that is, enable Green GC.
- This variable specifies the way of scanning locks in the Resolve Locks step of GC. When the variable value is set to LEGACY, TiDB scans locks by Regions. When the value PHYSICAL is used, it enables each TiKV node to bypass the Raft layer and directly scan data, which can effectively mitigate the impact of GC waking up all Regions when the **Hibernate Region** feature is enabled, thus improving the execution speed in the Resolve Locks step.

#### 14.4.1.181 `tidb_general_log`

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Boolean
- Default value: OFF
- This variable is used to set whether to record all SQL statements in the **log**. This feature is disabled by default. If maintenance personnel needs to trace all SQL statements when locating issues, they can enable this feature.
- To see all records of this feature in the log, you need to set the TiDB configuration item **log.level** to "info" or "debug" and then query the "GENERAL\_LOG" string. The following information is recorded:

- `conn`: The ID of the current session.
- `user`: The current session user.
- `schemaVersion`: The current schema version.
- `txnStartTS`: The timestamp at which the current transaction starts.
- `forUpdateTS`: In the pessimistic transactional mode, `forUpdateTS` is the current timestamp of the SQL statement. When a write conflict occurs in the pessimistic transaction, TiDB retries the SQL statement currently being executed and updates this timestamp. You can configure the number of retries via `max-retry-count`. In the optimistic transactional model, `forUpdateTS` is equivalent to `txnStartTS`.
- `isReadConsistency`: Indicates whether the current transactional isolation level is Read Committed (RC).
- `current_db`: The name of the current database.
- `txn_mode`: The transactional mode. Value options are `OPTIMISTIC` and `PESSIMISTIC`.
- `sql`: The SQL statement corresponding to the current query.

#### 14.4.1.182 `tidb_non_prepared_plan_cache_size`

##### **Warning:**

The feature controlled by this variable is not fully functional in the current TiDB version. Do not change the default value.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 100
- Range: [1, 100000]
- This variable controls the maximum number of execution plans that can be cached by General Plan Cache.

#### 14.4.1.183 `tidb_generate_binary_plan` New in v6.2.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable controls whether to generate binary-encoded execution plans in slow logs and statement summaries.

- When this variable is set to `ON`, you can view visual execution plans in TiDB Dashboard. Note that TiDB Dashboard only provides visual display for execution plans generated after this variable is enabled.
- You can execute the `SELECT tidb_decode_binary_plan('xxx...')` statement to parse the specific plan from a binary plan.

#### 14.4.1.184 `tidb_gogc_tuner_threshold` New in v6.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: 0.6
- Range: [0, 0.9)
- This variable specifies the maximum memory threshold for tuning GOGC. When the memory exceeds this threshold, GOGC Tuner stops working.

#### 14.4.1.185 `tidb_guarantee_linearizability` New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls the way commit TS is calculated for async commit. By default (with the `ON` value), the two-phase commit requests a new TS from the PD server and uses the TS to calculate the final commit TS. In this situation, linearizability is guaranteed for all the concurrent transactions.
- If you set this variable to `OFF`, the process of fetching TS from the PD server is skipped, with the cost that only causal consistency is guaranteed but not linearizability. For more details, see the blog post [Async Commit, the Accelerator for Transaction Commit in TiDB 5.0](#).
- For scenarios that require only causal consistency, you can set this variable to `OFF` to improve performance.

#### 14.4.1.186 `tidb_hash_exchange_with_new_collation`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: `ON`
- This variable controls whether the MPP hash partition exchange operator is generated in a cluster with new collation enabled. `true` means to generate the operator, and `false` means not to generate it.
- This variable is used for the internal operation of TiDB. It is **NOT recommended** to set this variable.

#### 14.4.1.187 `tidb_hash_join_concurrency`

**Warning:**

Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: -1
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency of the `hash join` algorithm.
- A value of -1 means that the value of `tidb_executor_concurrency` will be used instead.

#### 14.4.1.188 `tidb_hashagg_final_concurrency`

**Warning:**

Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: -1
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency of executing the concurrent `hash ↪ aggregation` algorithm in the `final` phase.
- When the parameter of the aggregate function is not distinct, `HashAgg` is run concurrently and respectively in two phases - the `partial` phase and the `final` phase.
- A value of -1 means that the value of `tidb_executor_concurrency` will be used instead.

#### 14.4.1.189 `tidb_hashagg_partial_concurrency`

**Warning:**

Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: -1
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency of executing the concurrent hash  $\leftrightarrow$  aggregation algorithm in the `partial` phase.
- When the parameter of the aggregate function is not distinct, HashAgg is run concurrently and respectively in two phases - the `partial` phase and the `final` phase.
- A value of -1 means that the value of `tidb_executor_concurrency` will be used instead.

#### 14.4.1.190 `tidb_historical_stats_duration` New in v6.6.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Duration
- Default value: 168h, which means 7 days
- This variable controls the duration that the historical statistics are retained in the storage.

#### 14.4.1.191 `tidb_ignore_prepared_cache_close_stmt` New in v6.0.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable is used to set whether to ignore the commands for closing prepared statement cache.
- When this variable is set to ON, the `COM_STMT_CLOSE` command of the Binary protocol and the `DEALLOCATE PREPARE` statement of the text protocol are ignored. For details, see [Ignore the `COM\_STMT\_CLOSE` command and the `DEALLOCATE PREPARE` statement.](#)

#### 14.4.1.192 `tidb_index_join_batch_size`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 25000
- Range: [1, 2147483647]
- Unit: Rows
- This variable is used to set the batch size of the `index lookup join` operation.
- Use a bigger value in OLAP scenarios, and a smaller value in OLTP scenarios.

#### 14.4.1.193 `tidb_index_join_double_read_penalty_cost_rate` New in v6.6.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Default value: 0
- Range: [0, 18446744073709551615]
- This variable determines whether to apply a penalty cost to the selection of index join, which reduces the likelihood of the optimizer selecting index join, and increases the likelihood of selecting alternative join methods such as hash join and tiffash join.
- When index join is selected, many table lookup requests are triggered, which consumes too many resources. You can use this variable to reduce the likelihood of the optimizer selecting index join.
- This variable takes effect only when the `tidb_cost_model_version` variable is set to 2.

#### 14.4.1.194 `tidb_index_lookup_concurrency`

**Warning:**

Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: -1
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency of the `index lookup` operation.

- Use a bigger value in OLAP scenarios, and a smaller value in OLTP scenarios.
- A value of -1 means that the value of `tidb_executor_concurrency` will be used instead.

#### 14.4.1.195 `tidb_index_lookup_join_concurrency`

##### **Warning:**

Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: -1
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency of the index lookup join algorithm.
- A value of -1 means that the value of `tidb_executor_concurrency` will be used instead.

#### 14.4.1.196 `tidb_index_merge_intersection_concurrency` New in v6.5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: -1
- Range: [1, 256]
- This variable sets the maximum concurrency for the intersection operations that index merge performs. It is effective only when TiDB accesses partitioned tables in the dynamic pruning mode. The actual concurrency is the smaller value of `tidb_index_merge_intersection_concurrency` and the number of partitions of the partitioned table.
- The default value -1 means that the value of `tidb_executor_concurrency` is used.

#### 14.4.1.197 `tidb_index_lookup_size`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 20000

- Range: [1, 2147483647]
- Unit: Rows
- This variable is used to set the batch size of the `index lookup` operation.
- Use a bigger value in OLAP scenarios, and a smaller value in OLTP scenarios.

#### 14.4.1.198 `tidb_index_serial_scan_concurrency`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency of the `serial scan` operation.
- Use a bigger value in OLAP scenarios, and a smaller value in OLTP scenarios.

#### 14.4.1.199 `tidb_init_chunk_size`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 32
- Range: [1, 32]
- Unit: Rows
- This variable is used to set the number of rows for the initial chunk during the execution process.

#### 14.4.1.200 `tidb_isolation_read_engines` New in v4.0

- Scope: SESSION
- Default value: `tikv,tiflash,tidb`
- This variable is used to set the storage engine list that TiDB can use when reading data.

#### 14.4.1.201 `tidb_last_ddl_info` New in v6.0.0

- Scope: SESSION
- Default value: ""
- Type: String
- This is a read-only variable. It is internally used in TiDB to get the information of the last DDL operation within the current session.
  - “query”: The last DDL query string.
  - “seq\_num”: The sequence number for each DDL operation. It is used to identify the order of DDL operations.

#### 14.4.1.202 `tidb_last_query_info` New in v4.0.14

- Scope: SESSION
- Default value: ""
- This is a read-only variable. It is internally used in TiDB to query the transaction information of the last DML statement. The information includes:
  - `txn_scope`: The scope of the transaction, which can be `global` or `local`.
  - `start_ts`: The start timestamp of the transaction.
  - `for_update_ts`: The `for_update_ts` of the previously executed DML statement. This is an internal term of TiDB used for tests. Usually, you can ignore this information.
  - `error`: The error message, if any.

#### 14.4.1.203 `tidb_last_txn_info` New in v4.0.9

- Scope: SESSION
- Type: String
- This variable is used to get the last transaction information within the current session. It is a read-only variable. The transaction information includes:
  - The transaction scope.
  - The start and commit TS.
  - The transaction commit mode, which might be a two-phase, one-phase, or async commit.
  - The information of transaction fallback from async commit or one-phase commit to two-phase commit.
  - The error encountered.

#### 14.4.1.204 `tidb_last_plan_replayer_token` New in v6.3.0

- Scope: SESSION
- Type: String
- This variable is read-only and is used to obtain the result of the last `PLAN REPLAYER`  $\leftrightarrow$  `DUMP` execution in the current session.

#### 14.4.1.205 `tidb_log_file_max_days` New in v5.3.0

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Integer
- Default value: 0
- Range: [0, 2147483647]

- This variable is used to set the maximum days that the log is retained on the current TiDB instance. Its value defaults to the value of the `max-days` configuration in the configuration file. Changing the variable value only affects the current TiDB instance. After TiDB is restarted, the variable value is reset and the configuration value is not affected.

#### 14.4.1.206 `tidb_low_resolution_tso`

- Scope: SESSION
- Type: Boolean
- Default value: OFF
- This variable is used to set whether to enable the low precision TSO feature. After this feature is enabled, new transactions use a timestamp updated every 2 seconds to read data.
- The main applicable scenario is to reduce the overhead of acquiring TSO for small read-only transactions when reading old data is acceptable.

#### 14.4.1.207 `tidb_max_auto_analyze_time` New in v6.1.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 43200
- Range: [0, 2147483647]
- Unit: Seconds
- This variable is used to specify the maximum execution time of automatic `ANALYZE` tasks. When the execution time of an automatic `ANALYZE` task exceeds the specified time, the task will be terminated. When the value of this variable is 0, there is no limit to the maximum execution time of automatic `ANALYZE` tasks.

#### 14.4.1.208 `tidb_max_chunk_size`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1024
- Range: [32, 2147483647]
- Unit: Rows
- This variable is used to set the maximum number of rows in a chunk during the execution process. Setting to too large of a value may cause cache locality issues.

#### 14.4.1.209 `tidb_max_delta_schema_count` New in v2.1.18 and v3.0.5

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1024
- Range: [100, 16384]
- This variable is used to set the maximum number of schema versions (the table IDs modified for corresponding versions) allowed to be cached. The value range is 100 ~ 16384.

#### 14.4.1.210 `tidb_max_paging_size` New in v6.3.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 50000
- Range: [1, 9223372036854775807]
- Unit: Rows
- This variable is used to set the maximum number of rows during the coprocessor paging request process. Setting it to too small a value increases the RPC count between TiDB and TiKV, while setting it to too large a value results in excessive memory usage in some cases, such as loading data and full table scan. The default value of this variable brings better performance in OLTP scenarios than in OLAP scenarios. If the application only uses TiKV as the storage engine, consider increasing the value of this variable when executing OLAP workload queries, which might bring you better performance.

#### 14.4.1.211 `tidb_max_tiflash_threads` New in v6.1.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: -1
- Range: [-1, 256]
- Unit: Threads
- This variable is used to set the maximum concurrency for TiFlash to execute a request. The default value is -1, indicating that this system variable is invalid. When the value is 0, the maximum number of threads is automatically configured by TiFlash.

#### 14.4.1.212 `tidb_mem_oom_action` New in v6.1.0

- Scope: GLOBAL

- Persists to cluster: Yes
  - Type: Enumeration
  - Default value: CANCEL
  - Possible values: CANCEL, LOG
- Specifies what operation TiDB performs when a single SQL statement exceeds the memory quota specified by `tidb_mem_quota_query` and cannot be spilled over to disk. See [TiDB Memory Control](#) for details.
- The default value is CANCEL, but in TiDB v4.0.2 and earlier versions, the default value is LOG.
  - This setting was previously a `tidb.toml` option (`oom-action`), but changed to a system variable starting from TiDB v6.1.0.

#### 14.4.1.213 `tidb_mem_quota_analyze` New in v6.1.0

##### **Warning:**

Currently, the `ANALYZE` memory quota is an experimental feature, and the memory statistics might be inaccurate in production environments.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: -1
- Range: [-1, 9223372036854775807]
- Unit: Bytes
- This variable controls the maximum memory usage of TiDB updating statistics. Such a memory usage occurs when you manually execute `ANALYZE TABLE` and when TiDB automatically analyzes tasks in the background. When the total memory usage exceeds this threshold, user-executed `ANALYZE` will exit, and an error message is reported that reminds you to try a lower sampling rate or retry later. If the automatic task in the TiDB background exits because the memory threshold is exceeded, and the sampling rate used is higher than the default value, TiDB will retry the update using the default sampling rate. When this variable value is negative or zero, TiDB does not limit the memory usage of both the manual and automatic update tasks.

##### **Note:**

`auto_analyze` will be triggered in a TiDB cluster only when `run-auto-analyze` is enabled in the TiDB startup configuration file.

#### 14.4.1.214 `tidb_mem_quota_apply_cache` New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 33554432 (32 MiB)
- Range: [0, 9223372036854775807]
- Unit: Bytes
- This variable is used to set the memory usage threshold of the local cache in the `Apply` operator.
- The local cache in the `Apply` operator is used to speed up the computation of the `Apply` operator. You can set the variable to 0 to disable the `Apply` cache feature.

#### 14.4.1.215 `tidb_mem_quota_binding_cache` New in v6.0.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 67108864
- Range: [0, 2147483647]
- Unit: Bytes
- This variable is used to set the threshold of the memory used for caching bindings.
- If a system creates or captures excessive bindings, resulting in overuse of memory space, TiDB returns a warning in the log. In this case, the cache cannot hold all available bindings or determine which bindings to store. For this reason, some queries might miss their bindings. To address this problem, you can increase the value of this variable, which increases the memory used for caching bindings. After modifying this parameter, you need to run `admin reload bindings` to reload bindings and validate the modification.

#### 14.4.1.216 `tidb_mem_quota_query`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1073741824 (1 GiB)
- Range: [-1, 9223372036854775807]
- Unit: Bytes
- For versions earlier than TiDB v6.1.0, this is a session scope variable and uses the value of `mem-quota-query` from `tidb.toml` as an initial value. Starting from v6.1.0, `tidb_mem_quota_query` is a SESSION | GLOBAL scope variable.

- For versions earlier than TiDB v6.5.0, this variable is used to set the threshold value of memory quota for **a query**. If the memory quota of a query during execution exceeds the threshold value, TiDB performs the operation defined by `tidb_mem_oom_action`.
- For TiDB v6.5.0 and later versions, this variable is used to set the threshold value of memory quota for **a session**. If the memory quota of a session during execution exceeds the threshold value, TiDB performs the operation defined by `tidb_mem_oom_action`  $\leftrightarrow$  . Note that starting from TiDB v6.5.0, the memory usage of a session contains the memory consumed by the transactions in the session. For the control behavior of transaction memory usage in TiDB v6.5.0 and later versions, see `txn-total-size-limit`  $\leftrightarrow$  `limit`.
- When you set the variable value to 0 or -1, the memory threshold is positive infinity. When you set a value smaller than 128, the value will be defaulted to 128.

#### 14.4.1.217 `tidb_memory_debug_mode_alarm_ratio`

- Scope: SESSION
- Type: Float
- Default value: 0
- This variable represents the memory statistics error value allowed in the TiDB memory debug mode.
- This variable is used for the internal testing of TiDB. It is **NOT recommended** to set this variable.

#### 14.4.1.218 `tidb_memory_debug_mode_min_heap_inuse`

- Scope: SESSION
- Type: Integer
- Default value: 0
- This variable is used for the internal testing of TiDB. It is **NOT recommended** to set this variable. Enabling this variable will affect the performance of TiDB.
- After configuring this parameter, TiDB will enter the memory debug mode to analyze the accuracy of memory tracking. TiDB will frequently trigger GC during the execution of subsequent SQL statements, and compare the actual memory usage and memory statistics. If the current memory usage is greater than `tidb_memory_debug_mode_min_heap_inuse` and the memory statistics error exceeds `tidb_memory_debug_mode_alarm_ratio`, TiDB will output the relevant memory information to the log and file.

#### 14.4.1.219 `tidb_memory_usage_alarm_ratio`

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Float

- Default value: 0.7
- Range: [0.0, 1.0]
  
- This variable sets the memory usage ratio that triggers the tidb-server memory alarm. By default, TiDB prints an alarm log when TiDB memory usage exceeds 70% of its total memory and any of the [alarm conditions](#) is met.
- When this variable is configured to 0 or 1, it means the memory threshold alarm feature is disabled.
- When this variable is configured to a value greater than 0 and less than 1, it means that the memory threshold alarm feature is enabled.
  - If the value of the system variable `tidb_server_memory_limit` is 0, the memory alarm threshold is `tidb_memory-usage-alarm-ratio * system memory size`.
  - If the value of the system variable `tidb_server_memory_limit` is set to greater than 0, the memory alarm threshold is `tidb_memory-usage-alarm-ratio *  $\hookrightarrow$  tidb_server_memory_limit`.

#### 14.4.1.220 `tidb_memory_usage_alarm_keep_record_num` New in v6.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: 5
- Range: [1, 10000]
- When the tidb-server memory usage exceeds the memory alarm threshold and triggers an alarm, TiDB only retains the status files generated during the recent 5 alarms by default. You can adjust this number with this variable.

#### 14.4.1.221 `tidb_merge_join_concurrency`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Range: [1, 256]
- Default value: 1
- This variable sets the concurrency of the `MergeJoin` operator when a query is executed.
- It is **NOT recommended** to set this variable. Modifying the value of this variable might cause data correctness issues.

#### 14.4.1.222 `tidb_merge_partition_stats_concurrency`

**Warning:**

The feature controlled by this variable is not fully functional in the current TiDB version. Do not change the default value.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: 1
- This variable specifies the concurrency of merging statistics for a partitioned table when TiDB analyzes the partitioned table.

**14.4.1.223 tidb\_metric\_query\_range\_duration New in v4.0**

- Scope: SESSION
- Type: Integer
- Default value: 60
- Range: [10, 216000]
- Unit: Seconds
- This variable is used to set the range duration of the Prometheus statement generated when querying METRICS\_SCHEMA.

**14.4.1.224 tidb\_metric\_query\_step New in v4.0**

- Scope: SESSION
- Type: Integer
- Default value: 60
- Range: [10, 216000]
- Unit: Seconds
- This variable is used to set the step of the Prometheus statement generated when querying METRICS\_SCHEMA.

**14.4.1.225 tidb\_min\_paging\_size New in v6.2.0**

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 128
- Range: [1, 9223372036854775807]
- Unit: Rows

- This variable is used to set the minimum number of rows during the coprocessor paging request process. Setting it to a too small value increases the RPC request count between TiDB and TiKV, while setting it to a too large value might cause a performance decrease when executing queries using IndexLookup with Limit. The default value of this variable brings better performance in OLTP scenarios than in OLAP scenarios. If the application only uses TiKV as the storage engine, consider increasing the value of this variable when executing OLAP workload queries, which might bring you better performance.

Figure 317: Paging size impact on TPCCH

As shown in this diagram, when `tidb_enable_paging` is enabled, the performance of TPCCH is affected by the settings of `tidb_min_paging_size` and `tidb_max_paging_size`. The vertical axis is the execution time, and it is the smaller the better.

#### 14.4.1.226 `tidb_mpp_store_fail_ttl`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Duration
- Default value: 60s

- The newly started TiFlash node does not provide services. To prevent queries from failing, TiDB limits the tidb-server sending queries to the newly started TiFlash node. This variable indicates the time range in which the newly started TiFlash node is not sent requests.

#### 14.4.1.227 `tidb_multi_statement_mode` New in v4.0.11

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: OFF
- Possible values: OFF, ON, WARN
- This variable controls whether to allow multiple queries to be executed in the same `COM_QUERY` call.
- To reduce the impact of SQL injection attacks, TiDB now prevents multiple queries from being executed in the same `COM_QUERY` call by default. This variable is intended to be used as part of an upgrade path from earlier versions of TiDB. The following behaviors apply:

| Client setting            | <code>tidb_multi_statement_mode</code> value | Multiple statements permitted? |
|---------------------------|----------------------------------------------|--------------------------------|
| Multiple Statements = ON  | OFF                                          | Yes                            |
| Multiple Statements = ON  | ON                                           | Yes                            |
| Multiple Statements = ON  | WARN                                         | Yes                            |
| Multiple Statements = OFF | OFF                                          | No                             |
| Multiple Statements = OFF | ON                                           | Yes                            |
| Multiple Statements = OFF | WARN                                         | Yes (+warning returned)        |

#### Note:

Only the default value of OFF can be considered safe. Setting `tidb_multi_statement_mode=ON` might be required if your application was specifically designed for an earlier version of TiDB. If your application requires multiple statement support, it is recommended to use the setting provided by your client library instead of the `tidb_multi_statement_mode` option. For example:

- [go-sql-driver](#) (`multiStatements`)
- [Connector/J](#) (`allowMultiQueries`)
- PHP [mysqli](#) (`mysqli_multi_query`)

#### 14.4.1.228 `tidb_nontransactional_ignore_error` New in v6.1.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable specifies whether to return an error immediately when the error occurs in a non-transactional DML statement.
- When the value is set to OFF, the non-transactional DML statement stops immediately at the first error and returns the error. All the following batches are canceled.
- When the value is set to ON and an error occurs in a batch, the following batches will continue to be executed until all batches are executed. All errors occurred during the execution process are returned together in the result.

#### 14.4.1.229 `tidb_opt_agg_push_down`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable is used to set whether the optimizer executes the optimization operation of pushing down the aggregate function to the position before Join, Projection, and UnionAll.
- When the aggregate operation is slow in query, you can set the variable value to ON.

#### 14.4.1.230 `tidb_opt_broadcast_cartesian_join`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1
- Range: [0, 2]
- Indicates whether to allow the Broadcast Cartesian Join.
- 0 means that the Broadcast Cartesian Join is not allowed. 1 means that it is allowed based on `tidb_broadcast_join_threshold_count`. 2 means that it is always allowed even if the table size exceeds the threshold.
- This variable is internally used in TiDB, and it is **NOT** recommended to modify its value.

#### 14.4.1.231 `tidb_opt_concurrency_factor`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes

- Type: Float
- Range: [0, 18446744073709551615]
- Default value: 3.0
- Indicates the CPU cost of starting a Golang goroutine in TiDB. This variable is internally used in the **Cost Model**, and it is **NOT** recommended to modify its value.

#### 14.4.1.232 `tidb_opt_copcpu_factor`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Range: [0, 18446744073709551615]
- Default value: 3.0
- Indicates the CPU cost for TiKV Coprocessor to process one row. This variable is internally used in the **Cost Model**, and it is **NOT** recommended to modify its value.

#### 14.4.1.233 `tidb_opt_correlation_exp_factor`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1
- Range: [0, 2147483647]
- When the method that estimates the number of rows based on column order correlation is not available, the heuristic estimation method is used. This variable is used to control the behavior of the heuristic method.
  - When the value is 0, the heuristic method is not used.
  - When the value is greater than 0:
    - \* A larger value indicates that an index scan will probably be used in the heuristic method.
    - \* A smaller value indicates that a table scan will probably be used in the heuristic method.

#### 14.4.1.234 `tidb_opt_correlation_threshold`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Default value: 0.9
- Range: [0, 1]
- This variable is used to set the threshold value that determines whether to enable estimating the row count by using column order correlation. If the order correlation between the current column and the `handle` column exceeds the threshold value, this method is enabled.

#### 14.4.1.235 `tidb_opt_cpu_factor`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Range: [0, 2147483647]
- Default value: 3.0
- Indicates the CPU cost for TiDB to process one row. This variable is internally used in the **Cost Model**, and it is **NOT** recommended to modify its value.

#### 14.4.1.236 `tidb_opt_desc_factor`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Range: [0, 18446744073709551615]
- Default value: 3.0
- Indicates the cost for TiKV to scan one row from the disk in descending order. This variable is internally used in the **Cost Model**, and it is **NOT** recommended to modify its value.

#### 14.4.1.237 `tidb_opt_disk_factor`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Range: [0, 18446744073709551615]
- Default value: 1.5
- Indicates the I/O cost for TiDB to read or write one byte of data from or to the temporary disk. This variable is internally used in the **Cost Model**, and it is **NOT** recommended to modify its value.

#### 14.4.1.238 `tidb_opt_distinct_agg_push_down`

- Scope: SESSION
- Type: Boolean
- Default value: OFF
- This variable is used to set whether the optimizer executes the optimization operation of pushing down the aggregate function with `distinct` (such as `select count(distinct ↪ a)from t`) to Coprocessor.
- When the aggregate function with the `distinct` operation is slow in the query, you can set the variable value to 1.

In the following example, before `tidb_opt_distinct_agg_push_down` is enabled, TiDB needs to read all data from TiKV and execute `distinct` on the TiDB side. After `tidb_opt_distinct_agg_push_down` is enabled, `distinct a` is pushed down to Coprocessor, and a group by column `test.t.a` is added to `HashAgg_5`.

```
mysql> desc select count(distinct a) from test.t;
+--
↪ -----+-----+-----+-----+
↪
| id | estRows | task | access object | operator info
↪ | | | |
+--
↪ -----+-----+-----+-----+
↪
| StreamAgg_6 | 1.00 | root | | funcs:count(
↪ distinct test.t.a)->Column#4 |
| -TableReader_10 | 10000.00 | root | | data:
↪ TableFullScan_9 | | | |
| -TableFullScan_9 | 10000.00 | cop[tikv] | table:t | keep order:false
↪ , stats:pseudo | |
+--
↪ -----+-----+-----+-----+
↪
3 rows in set (0.01 sec)

mysql> set session tidb_opt_distinct_agg_push_down = 1;
Query OK, 0 rows affected (0.00 sec)

mysql> desc select count(distinct a) from test.t;
+--
↪ -----+-----+-----+-----+
↪
| id | estRows | task | access object | operator info
↪ | | | |
+--
↪ -----+-----+-----+-----+
↪
| HashAgg_8 | 1.00 | root | | funcs:count(
↪ distinct test.t.a)->Column#3 |
| -TableReader_9 | 1.00 | root | | data:HashAgg_5
↪ |
| -HashAgg_5 | 1.00 | cop[tikv] | | group by:test.
↪ t.a,
| -TableFullScan_7 | 10000.00 | cop[tikv] | table:t | keep order:
↪ false, stats:pseudo | |
```

```

 ↳ -----+-----+-----+-----+-----
 ↳
4 rows in set (0.00 sec)

```

#### 14.4.1.239 tidb\_opt\_enable\_correlation\_adjustment

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable is used to control whether the optimizer estimates the number of rows based on column order correlation

#### 14.4.1.240 tidb\_opt\_force\_inline\_cte New in v6.3.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable is used to control whether common table expressions (CTEs) in the entire session are inlined or not. The default value is OFF, which means that inlining CTE is not enforced by default. However, you can still inline CTE by specifying the MERGE() hint. If the variable is set to ON, all CTEs (except recursive CTE) in this session are forced to be inlined.

#### 14.4.1.241 tidb\_opt\_insubq\_to\_join\_and\_agg

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable is used to set whether to enable the optimization rule that converts a subquery to join and aggregation.
- For example, after you enable this optimization rule, the subquery is converted as follows:

```

select * from t where t.a in (select aa from t1);

```

The subquery is converted to join as follows:

```
select t.* from t, (select aa from t1 group by aa) tmp_t where t.a =
 ↪ tmp_t.aa;
```

If `t1` is limited to be unique and not null in the `aa` column. You can use the following statement, without aggregation.

```
select t.* from t, t1 where t.a=t1.aa;
```

#### 14.4.1.242 `tidb_opt_join_reorder_threshold`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 0
- Range: [0, 2147483647]
- This variable is used to control the selection of the TiDB Join Reorder algorithm. When the number of nodes participating in Join Reorder is greater than this threshold, TiDB selects the greedy algorithm, and when it is less than this threshold, TiDB selects the dynamic programming algorithm.
- Currently, for OLTP queries, it is recommended to keep the default value. For OLAP queries, it is recommended to set the variable value to 10~15 to get better connection orders in OLAP scenarios.

#### 14.4.1.243 `tidb_opt_limit_push_down_threshold`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 100
- Range: [0, 2147483647]
- This variable is used to set the threshold that determines whether to push the Limit or TopN operator down to TiKV.
- If the value of the Limit or TopN operator is smaller than or equal to this threshold, these operators are forcibly pushed down to TiKV. This variable resolves the issue that the Limit or TopN operator cannot be pushed down to TiKV partly due to wrong estimation.

#### 14.4.1.244 `tidb_opt_memory_factor`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float

- Range: [0, 2147483647]
- Default value: 0.001
- Indicates the memory cost for TiDB to store one row. This variable is internally used in the [Cost Model](#), and it is **NOT** recommended to modify its value.

#### 14.4.1.245 `tidb_opt_mpp_outer_join_fixed_build_side` New in v5.1.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- When the variable value is ON, the left join operator always uses inner table as the build side and the right join operator always uses outer table as the build side. If you set the value to OFF, the outer join operator can use either side of the tables as the build side.

#### 14.4.1.246 `tidb_opt_network_factor`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Range: [0, 2147483647]
- Default value: 1.0
- Indicates the net cost of transferring 1 byte of data through the network. This variable is internally used in the [Cost Model](#), and it is **NOT** recommended to modify its value.

#### 14.4.1.247 `tidb_opt_prefer_range_scan` New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- After you set the value of this variable to ON, the optimizer always prefers range scans over full table scans.
- In the following example, before you enable `tidb_opt_prefer_range_scan`, the TiDB optimizer performs a full table scan. After you enable `tidb_opt_prefer_range_scan`, the optimizer selects an index range scan.

```
explain select * from t where age=5;
```

```
+---
```

```
↪
```

```
↪
```

```

| id | estRows | task | access object | operator info
+---+
| TableReader_7 | 1048576.00 | root | | data:
| Selection_6 | | | | eq(test.t.age,
| -Selection_6 | 1048576.00 | cop[tikv] | | 5) |
| -TableFullScan_5 | 1048576.00 | cop[tikv] | table:t | keep order:
| false | | | |
+---+
3 rows in set (0.00 sec)

set session tidb_opt_prefer_range_scan = 1;

explain select * from t where age=5;
+---+
| id | estRows | task | access object
| operator info
+---+
| IndexLookUp_7 | 1048576.00 | root |
| -IndexRangeScan_5(Build) | 1048576.00 | cop[tikv] | table:t, index:
| idx_age(age) | range:[5,5], keep order:false |
| -TableRowIDScan_6(Probe) | 1048576.00 | cop[tikv] | table:t
| keep order:false
+---+
3 rows in set (0.00 sec)

```

#### 14.4.1.248 tidb\_opt\_prefix\_index\_single\_scan New in v6.4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: ON

- This variable controls whether the TiDB optimizer pushes down some filter conditions to the prefix index to avoid unnecessary table lookup and to improve query performance.
- When this variable value is set to ON, some filter conditions are pushed down to the prefix index. Suppose that the col column is the index prefix column in a table. The col is null or col is not null condition in the query is handled as a filter condition on the index instead of a filter condition for the table lookup, so that unnecessary table lookup is avoided.

Usage example of `tidb_opt_prefix_index_single_scan`

Create a table with a prefix index:

```
CREATE TABLE t (a INT, b VARCHAR(10), c INT, INDEX idx_a_b(a, b(5)));
```

Disable `tidb_opt_prefix_index_single_scan`:

```
SET tidb_opt_prefix_index_single_scan = 'OFF';
```

For the following query, the execution plan uses the prefix index `idx_a_b` but requires a table lookup (the `IndexLookUp` operator appears).

```
EXPLAIN FORMAT='brief' SELECT COUNT(1) FROM t WHERE a = 1 AND b IS NOT NULL
↪ ;
+---
↪ -----+-----+-----+
↪
| id | estRows | task | access object |
↪ operator info |
+---
↪ -----+-----+-----+
↪
| HashAgg | 1.00 | root | |
↪ funcs:count(Column#8)->Column#5 |
| -IndexLookUp | 1.00 | root | |
↪ |
| -IndexRangeScan(Build) | 99.90 | cop[tikv] | table:t, index:idx_a_b(a
↪ , b) | range:[1 -inf,1 +inf], keep order:false, stats:pseudo |
| -HashAgg(Probe) | 1.00 | cop[tikv] | |
↪ | funcs:count(1)->Column#8 |
| -Selection | 99.90 | cop[tikv] | |
↪ | not(isnull(test.t.b)) |
| -TableRowIDScan | 99.90 | cop[tikv] | table:t
↪ | keep order:false, stats:pseudo |
+---
↪ -----+-----+-----+
↪
```

```
6 rows in set (0.00 sec)
```

Enable `tidb_opt_prefix_index_single_scan`:

```
SET tidb_opt_prefix_index_single_scan = 'ON';
```

After enabling this variable, for the following query, the execution plan uses the prefix index `idx_a_b` but does not require a table lookup.

```
EXPLAIN FORMAT='brief' SELECT COUNT(1) FROM t WHERE a = 1 AND b IS NOT NULL
 ↪ ;
+--
 ↪ -----+-----+-----+-----+
 ↪
| id | estRows | task | access object |
 ↪ operator info | | | |
+--
 ↪ -----+-----+-----+-----+
 ↪
| StreamAgg | 1.00 | root | |
 ↪ funcs:count(Column#7)->Column#5 |
| -IndexReader | 1.00 | root | |
 ↪ index:StreamAgg |
| -StreamAgg | 1.00 | cop[tikv] | |
 ↪ funcs:count(1)->Column#7 |
| -IndexRangeScan | 99.90 | cop[tikv] | table:t, index:idx_a_b(a, b)
 ↪ | range:[1 -inf,1 +inf], keep order:false, stats:pseudo |
+--
 ↪ -----+-----+-----+-----+
 ↪
4 rows in set (0.00 sec)
```

#### 14.4.1.249 `tidb_opt_projection_push_down` New in v6.1.0

- Scope: SESSION
- Type: Boolean
- Default value: OFF
- Specifies whether to allow the optimizer to push Projection down to the TiKV or TiFlash coprocessor.

#### 14.4.1.250 `tidb_opt_range_max_size` New in v6.4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes

- Default value: 67108864 (64 MiB)
- Scope: [0, 9223372036854775807]
- Unit: Bytes
- This variable is used to set the upper limit of memory usage for the optimizer to build scan ranges. When the variable value is 0, there is no memory limit for building scan ranges. If building exact scan ranges consumes memory that exceeds the limit, the optimizer uses more relaxed scan ranges (such as `[[NULL,+inf]]`). If the execution plan does not use exact scan ranges, you can increase the value of this variable to let the optimizer build exact scan ranges.

The usage example of this variable is as follows:

`tidb_opt_range_max_size` usage examples

View the default value of this variable. From the result, you can see that the optimizer uses up to 64 MiB of memory to build scan ranges.

```
SELECT @@tidb_opt_range_max_size;
```

```
+-----+
| @@tidb_opt_range_max_size |
+-----+
| 67108864 |
+-----+
1 row in set (0.01 sec)
```

```
EXPLAIN SELECT * FROM t use index (idx) WHERE a IN (10,20,30) AND b IN
 ↳ (40,50,60);
```

In the 64 MiB memory upper limit, the optimizer builds the following exact scan ranges [10 40,10 40], [10 50,10 50], [10 60,10 60], [20 40,20 40], [20 50,20 50], ↳ [20 60,20 60], [30 40,30 40], [30 50,30 50], [30 60,30 60], as shown in the following execution plan result.

```
+---
↳ -----+-----+-----+-----+
↳
| id | estRows | task | access object |
↳ operator info
↳ |
+---
↳ -----+-----+-----+-----+
| IndexLookUp_7 | 0.90 | root | |
↳
↳ |
```

```

| -IndexRangeScan_5(Build) | 0.90 | cop[tikv] | table:t, index:idx(a, b)
 ↳ | range:[10 40,10 40], [10 50,10 50], [10 60,10 60], [20 40,20 40],
 ↳ [20 50,20 50], [20 60,20 60], [30 40,30 40], [30 50,30 50], [30 60,30
 ↳ 60], keep order:false, stats:pseudo |
| -TableRowIDScan_6(Probe) | 0.90 | cop[tikv] | table:t |
 ↳ keep order:false, stats:pseudo
 ↳
 ↳ |
+--
 ↳ -----+-----+-----+-----+
 ↳
 ↳
3 rows in set (0.00 sec)

```

Now set the upper limit of memory usage for the optimizer to build scan ranges to 1500 bytes.

```
SET @@tidb_opt_range_max_size = 1500;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
EXPLAIN SELECT * FROM t USE INDEX (idx) WHERE a IN (10,20,30) AND b IN
↳ (40,50,60);
```

In the 1500-byte memory limit, the optimizer builds more relaxed scan ranges [10,10], ↳ [20,20], [30,30], and uses a warning to inform the user that the memory usage required to build exact scan ranges exceeds the limit of `tidb_opt_range_max_size`.

```

+--
 ↳ -----+-----+-----+-----+
 ↳
 ↳
| id | estRows | task | access object |
 ↳ operator info
+--
 ↳ -----+-----+-----+-----+
 ↳
| IndexLookUp_8 | 0.09 | root | |
 ↳
| -Selection_7(Build) | 0.09 | cop[tikv] | | in
 ↳ (test.t.b, 40, 50, 60)
| -IndexRangeScan_5 | 30.00 | cop[tikv] | table:t, index:idx(a, b)
 ↳ | range:[10,10], [20,20], [30,30], keep order:false, stats:pseudo |
| -TableRowIDScan_6(Probe) | 0.09 | cop[tikv] | table:t |
 ↳ keep order:false, stats:pseudo
+--
 ↳ -----+-----+-----+-----+
 ↳
 ↳

```

```
4 rows in set, 1 warning (0.00 sec)
```

```
SHOW WARNINGS;
```

```
+--
 ↪ -----+-----+-----+
 ↪
| Level | Code | Message
 ↪
 ↪ |
+--
 ↪ -----+-----+-----+
 ↪
| Warning | 1105 | Memory capacity of 1500 bytes for '
 ↪ tidb_opt_range_max_size' exceeded when building ranges. Less accurate
 ↪ ranges such as full range are chosen |
+--
 ↪ -----+-----+-----+
 ↪
1 row in set (0.00 sec)
```

Then set the upper limit of memory usage to 100 bytes:

```
set @@tidb_opt_range_max_size = 100;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
EXPLAIN SELECT * FROM t USE INDEX (idx) WHERE a IN (10,20,30) AND b IN
 ↪ (40,50,60);
```

In the 100-byte memory limit, the optimizer chooses `IndexFullScan`, and uses a warning to inform the user that the memory required to build exact scan ranges exceeds the limit of `tidb_opt_range_max_size`.

```

#### 14.4.1.251 tidb\_opt\_scan\_factor

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Float
- Range: [0, 2147483647]
- Default value: 1.5
- Indicates the cost for TiKV to scan one row of data from the disk in ascending order. This variable is internally used in the [Cost Model](#), and it is **NOT** recommended to modify its value.

#### 14.4.1.252 tidb\_opt\_seek\_factor

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes

- Type: Float
- Range: [0, 2147483647]
- Default value: 20
- Indicates the start-up cost for TiDB to request data from TiKV. This variable is internally used in the [Cost Model](#), and it is **NOT** recommended to modify its value.

#### 14.4.1.253 `tidb_opt_skew_distinct_agg` New in v6.2.0

##### Note:

The query performance optimization by enabling this variable is effective **only for TiFlash**.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable sets whether the optimizer rewrites the aggregate functions with `DISTINCT` to the two-level aggregate functions, such as rewriting `SELECT b, COUNT(↔ (DISTINCT a)FROM t GROUP BY b` to `SELECT b, COUNT(a)FROM (SELECT b, ↔ a FROM t GROUP BY b, a)t GROUP BY b`. When the aggregation column has serious skew and the `DISTINCT` column has many different values, this rewriting can avoid the data skew in the query execution and improve the query performance.

#### 14.4.1.254 `tidb_opt_three_stage_distinct_agg` New in v6.3.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable specifies whether to rewrite a `COUNT(DISTINCT)` aggregation into a three-stage aggregation in MPP mode.
- This variable currently applies to an aggregation that only contains one `COUNT(↔ DISTINCT)`.

#### 14.4.1.255 `tidb_opt_tiflash_concurrency_factor`

- Scope: SESSION | GLOBAL
- Persists to cluster: YES
- Type: Float

- Range: [0, 2147483647]
- Default value: 24.0
- Indicates the concurrency number of TiFlash computation. This variable is internally used in the Cost Model, and it is NOT recommended to modify its value.

#### 14.4.1.256 `tidb_opt_write_row_id`

- Scope: SESSION
- Type: Boolean
- Default value: OFF
- This variable is used to control whether to allow INSERT, REPLACE, and UPDATE statements to operate on the `_tidb_rowid` column. This variable can be used only when you import data using TiDB tools.

#### 14.4.1.257 `tidb_optimizer_selectivity_level`

- Scope: SESSION
- Type: Integer
- Default value: 0
- Range: [0, 2147483647]
- This variable controls the iteration of the optimizer's estimation logic. After changing the value of this variable, the estimation logic of the optimizer will change greatly. Currently, 0 is the only valid value. It is not recommended to set it to other values.

#### 14.4.1.258 `tidb_partition_prune_mode` New in v5.1

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `dynamic`
- Possible values: `static`, `dynamic`, `static-only`, `dynamic-only`
- Specifies whether to use `dynamic` or `static` mode for partitioned tables. Note that `dynamic` partitioning is effective only after full table-level statistics, or GlobalStats, are collected. Before GlobalStats are collected, TiDB will use the `static` mode instead. For detailed information about GlobalStats, see [Collect statistics of partitioned tables in dynamic pruning mode](#). For details about the dynamic pruning mode, see [Dynamic Pruning Mode for Partitioned Tables](#).

#### 14.4.1.259 `tidb_persist_analyze_options` New in v5.4.0

- Scope: GLOBAL
- Persists to cluster: Yes

- Type: Boolean
- Default value: ON
- This variable controls whether to enable the **ANALYZE configuration persistence** feature.

#### 14.4.1.260 `tidb_pessimistic_txn_aggressive_locking` New in v6.6.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- Determines whether to use enhanced pessimistic locking wake-up model for pessimistic transactions. This model strictly controls the wake-up order of pessimistic transactions in the pessimistic locking single-point conflict scenarios to avoid unnecessary wake-ups. It greatly reduces the uncertainty brought by the randomness of the existing wake-up mechanism. If you encounter frequent single-point pessimistic locking conflicts in your business scenario (such as frequent updates to the same row of data), and thus cause frequent statement retries, high tail latency, or even occasional **pessimistic lock**  $\leftrightarrow$  **retry limit reached** errors, you can try to enable this variable to solve the problem.

#### Note:

- Depending on the specific business scenario, enabling this option might cause a certain degree of throughput reduction (average latency increase) for transactions with frequent lock conflicts.
- This option only takes effect on statements that need to lock a single key. If a statement needs to lock multiple rows at the same time, this option will not take effect on such statements.

#### 14.4.1.261 `tidb_placement_mode` New in v6.0.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: STRICT
- Possible values: STRICT, IGNORE
- This variable controls whether DDL statements ignore the **placement rules specified in SQL**. When the variable value is IGNORE, all placement rule options are ignored.

- It is intended to be used by logical dump/restore tools to ensure that tables can always be created even if invalid placement rules are assigned. This is similar to how mysqldump writes `SET FOREIGN_KEY_CHECKS=0;` to the start of every dump file.

#### 14.4.1.262 `tidb_pprof_sql_cpu` New in v4.0

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Integer
- Default value: 0
- Range: [0, 1]
- This variable is used to control whether to mark the corresponding SQL statement in the profile output to identify and troubleshoot performance issues.

#### 14.4.1.263 `tidb_prepared_plan_cache_memory_guard_ratio` New in v6.1.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Float
- Default value: 0.1
- Range: [0, 1]
- The threshold at which the prepared plan cache triggers a memory protection mechanism. For details, see [Memory management of Prepared Plan Cache](#).
- This setting was previously a `tidb.toml` option (`prepared-plan-cache.memory-guard-ratio`), but changed to a system variable starting from TiDB v6.1.0.

#### 14.4.1.264 `tidb_prepared_plan_cache_size` New in v6.1.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 100
- Range: [1, 100000]
- The maximum number of plans that can be cached in a session. For details, see [Memory management of Prepared Plan Cache](#).
- This setting was previously a `tidb.toml` option (`prepared-plan-cache.capacity`), but changed to a system variable starting from TiDB v6.1.0.

#### 14.4.1.265 `tidb_projection_concurrency`

**Warning:**

Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: -1
- Range: [-1, 256]
- Unit: Threads
- This variable is used to set the concurrency of the Projection operator.
- A value of -1 means that the value of `tidb_executor_concurrency` will be used instead.

**14.4.1.266 tidb\_query\_log\_max\_len**

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 4096 (4 KiB)
- Range: [0, 1073741824]
- Unit: Bytes
- The maximum length of the SQL statement output. When the output length of a statement is larger than the `tidb_query_log_max_len` value, the statement is truncated to output.
- This setting was previously also available as a `tidb.toml` option (`log.query-log-max` ↔ `-len`), but is only a system variable starting from TiDB v6.1.0.

**14.4.1.267 tidb\_rc\_read\_check\_ts New in v6.0.0****Warning:**

- This feature is incompatible with `replica-read`. Do not enable `tidb_rc_read_check_ts` and `replica-read` at the same time.
- If your client uses a cursor, it is not recommended to enable `tidb_rc_read_check_ts` in case that the previous batch of returned data has already been used by the client and the statement eventually fails.

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Boolean
- Default value: OFF
- This variable is used to optimize the timestamp acquisition, which is suitable for scenarios with read-committed isolation level where read-write conflicts are rare. Enabling this variable can avoid the latency and cost of getting the global timestamp, and can optimize the transaction-level read latency.
- If read-write conflicts are severe, enabling this feature will increase the cost and latency of getting the global timestamp, and might cause performance regression. For details, see [Read Committed isolation level](#).

#### 14.4.1.268 `tidb_rc_write_check_ts` New in v6.3.0

##### **Warning:**

This feature is currently incompatible with `replica-read`. After this variable is enabled, all requests sent by the client cannot use `replica-read`. Therefore, do not enable `tidb_rc_write_check_ts` and `replica-read` at the same time.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable is used to optimize the acquisition of timestamps and is suitable for scenarios with few point-write conflicts in `READ-COMMITTED` isolation level of pessimistic transactions. Enabling this variable can avoid the latency and overhead brought by obtaining the global timestamps during the execution of point-write statements. Currently, this variable is applicable to three types of point-write statements: `UPDATE`, `DELETE`, and `SELECT . . . . . FOR UPDATE`. A point-write statement refers to a write statement that uses the primary key or unique key as a filter condition and the final execution operator contains `POINT-GET`.
- If the point-write conflicts are severe, enabling this variable will increase extra overhead and latency, resulting in performance regression. For details, see [Read Committed isolation level](#).

#### 14.4.1.269 `tidb_read_consistency` New in v5.4.0

- Scope: SESSION

- Type: String
- Default value: **strict**
- This variable is used to control the read consistency for an auto-commit read statement.
- If the variable value is set to **weak**, the locks encountered by the read statement are skipped directly and the read execution might be faster, which is the weak consistency read mode. However, the transaction semantics (such as atomicity) and distributed consistency (such as linearizability) are not guaranteed.
- For user scenarios where the auto-commit read needs to return fast and weak consistency read results are acceptable, you can use the weak consistency read mode.

#### 14.4.1.270 **tidb\_read\_staleness** New in v5.4.0

- Scope: SESSION
- Type: Integer
- Default value: 0
- Range: [-2147483648, 0]
- This variable is used to set the time range of historical data that TiDB can read in the current session. After setting the value, TiDB selects a timestamp as new as possible from the range allowed by this variable, and all subsequent read operations are performed against this timestamp. For example, if the value of this variable is set to -5, on the condition that TiKV has the corresponding historical version's data, TiDB selects a timestamp as new as possible within a 5-second time range.

#### 14.4.1.271 **tidb\_record\_plan\_in\_slow\_log**

- Scope: GLOBAL
- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Boolean
- Default value: **ON**
- This variable is used to control whether to include the execution plan of slow queries in the slow log.

#### 14.4.1.272 **tidb\_redact\_log**

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: **OFF**
- This variable controls whether to hide user information in the SQL statement being recorded into the TiDB log and slow log.
- When you set the variable to 1, user information is hidden. For example, if the executed SQL statement is `insert into t values (1,2)`, the statement is recorded as `insert ↪ into t values (?,?)` in the log.

#### 14.4.1.273 `tidb_regard_null_as_point` New in v5.4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable controls whether the optimizer can use a query condition including null equivalence as a prefix condition for index access.
- This variable is enabled by default. When it is enabled, the optimizer can reduce the volume of index data to be accessed, which accelerates query execution. For example, if a query involves multiple-column indexes `index(a, b)` and the query condition contains `a<=>null and b=1`, the optimizer can use both `a<=>null` and `b=1` in the query condition for index access. If the variable is disabled, because `a<=>null and b → =1` includes the null equivalence condition, the optimizer does not use `b=1` for index access.

#### 14.4.1.274 `tidb_remove_orderby_in_subquery` New in v6.1.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- Specifies whether to remove `ORDER BY` clause in a subquery.

#### 14.4.1.275 `tidb_replica_read` New in v4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: leader
- Possible values: leader, follower, leader-and-follower, prefer-leader, closest → -replicas, closest-adaptive, and learner. The learner value is introduced in v6.6.0.
- This variable is used to control where TiDB reads data.
- For more details about usage and implementation, see [Follower read](#).

#### 14.4.1.276 `tidb_restricted_read_only` New in v5.2.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF

- `tidb_restricted_read_only` and `tidb_super_read_only` behave similarly. In most cases, you should use `tidb_super_read_only` only.
- Users with the `SUPER` or `SYSTEM_VARIABLES_ADMIN` privilege can modify this variable. However, if the `Security Enhanced Mode` is enabled, the additional `RESTRICTED_VARIABLES_ADMIN` privilege is required to read or modify this variable.
- `tidb_restricted_read_only` affects `tidb_super_read_only` in the following cases:
  - Setting `tidb_restricted_read_only` to `ON` will update `tidb_super_read_only` to `ON`.
  - Setting `tidb_restricted_read_only` to `OFF` leaves `tidb_super_read_only` unchanged.
  - If `tidb_restricted_read_only` is `ON`, `tidb_super_read_only` cannot be set to `OFF`.
- For DBaaS providers of TiDB, if a TiDB cluster is a downstream database of another database, to make the TiDB cluster read-only, you might need to use `tidb_restricted_read_only` with `Security Enhanced Mode` enabled, which prevents your customers from using `tidb_super_read_only` to make the cluster writable. To achieve this, you need to enable `Security Enhanced Mode`, use an admin user with the `SYSTEM_VARIABLES_ADMIN` and `RESTRICTED_VARIABLES_ADMIN` privileges to control `tidb_restricted_read_only`, and let your database users use the root user with the `SUPER` privilege to control `tidb_super_read_only` only.
- This variable controls the read-only status of the entire cluster. When the variable is `ON`, all TiDB servers in the entire cluster are in the read-only mode. In this case, TiDB only executes the statements that do not modify data, such as `SELECT`, `USE`, and `SHOW`. For other statements such as `INSERT` and `UPDATE`, TiDB rejects executing those statements in the read-only mode.
- Enabling the read-only mode using this variable only ensures that the entire cluster finally enters the read-only status. If you have changed the value of this variable in a TiDB cluster but the change has not yet propagated to other TiDB servers, the un-updated TiDB servers are still **not** in the read-only mode.
- When this variable is enabled, the SQL statements being executed are not affected. TiDB only performs the read-only check for the SQL statements **to be** executed.
- When this variable is enabled, TiDB handles the uncommitted transactions in the following ways:
  - For uncommitted read-only transactions, you can commit the transactions normally.
  - For uncommitted transactions that are not read-only, SQL statements that perform write operations in these transactions are rejected.
  - For uncommitted read-only transactions with modified data, the commit of these transactions is rejected.
- After the read-only mode is enabled, all users (including the users with the `SUPER` privilege) cannot execute the SQL statements that might write data unless the user is explicitly granted the `RESTRICTED_REPLICA_WRITER_ADMIN` privilege.

#### 14.4.1.277 `tidb_retry_limit`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 10
- Range: [-1, 9223372036854775807]
- This variable is used to set the maximum number of the retries for optimistic transactions. When a transaction encounters retryable errors (such as transaction conflicts, very slow transaction commit, or table schema changes), this transaction is re-executed according to this variable. Note that setting `tidb_retry_limit` to 0 disables the automatic retry. This variable only applies to optimistic transactions, not to pessimistic transactions.

#### 14.4.1.278 `tidb_row_format_version`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 2
- Range: [1, 2]
- Controls the format version of the newly saved data in the table. In TiDB v4.0, the [new storage row format](#) version 2 is used by default to save new data.
- If you upgrade from a TiDB version earlier than v4.0.0 to v4.0.0 or later versions, the format version is not changed, and TiDB continues to use the old format of version 1 to write data to the table, which means that **only newly created clusters use the new data format by default**.
- Note that modifying this variable does not affect the old data that has been saved, but applies the corresponding version format only to the newly written data after modifying this variable.

#### 14.4.1.279 `tidb_scatter_region`

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- By default, Regions are split for a new table when it is being created in TiDB. After this variable is enabled, the newly split Regions are scattered immediately during the execution of the `CREATE TABLE` statement. This applies to the scenario where data need to be written in batches right after the tables are created in batches, because the newly split Regions can be scattered in TiKV beforehand and do not have to wait to be scheduled by PD. To ensure the continuous stability of writing data in batches,

the `CREATE TABLE` statement returns success only after the Regions are successfully scattered. This makes the statement's execution time multiple times longer than that when you disable this variable.

- Note that if `SHARD_ROW_ID_BITS` and `PRE_SPLIT_REGIONS` have been set when a table is created, the specified number of Regions are evenly split after the table creation.

#### 14.4.1.280 `tidb_server_memory_limit` New in v6.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: 80%
- Range:
  - You can set the value in the percentage format, which means the percentage of the memory usage relative to the total memory. The value range is [1%, 99%].
  - You can also set the value in memory size. The value range is 0 and [536870912,  $\hookrightarrow$  9223372036854775807] in bytes. The memory format with the units “KB|MB|GB|TB” is supported. 0 means no memory limit.
  - If this variable is set to a memory size that is less than 512 MB but not 0, TiDB uses 512 MB as the actual size.
- This variable specifies the memory limit for a TiDB instance. When the memory usage of TiDB reaches the limit, TiDB cancels the currently running SQL statement with the highest memory usage. After the SQL statement is successfully canceled, TiDB tries to call Golang GC to immediately reclaim memory to relieve memory stress as soon as possible.
- Only the SQL statements with more memory usage than the `tidb_server_memory_limit_sess_min_limit`  $\hookrightarrow$  limit are selected as the SQL statements to be canceled first.
- Currently, TiDB cancels only one SQL statement at a time. After TiDB completely cancels a SQL statement and recovers resources, if the memory usage is still greater than the limit set by this variable, TiDB starts the next cancel operation.

#### 14.4.1.281 `tidb_server_memory_limit_gc_trigger` New in v6.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: 70%
- Range: [50%, 99%]
- The threshold at which TiDB tries to trigger GC. When the memory usage of TiDB reaches the value of `tidb_server_memory_limit` \* the value of `tidb_server_memory_limit_gc_trigger`, TiDB will actively trigger a Golang GC operation. Only one GC operation will be triggered in one minute.

#### 14.4.1.282 `tidb_server_memory_limit_sess_min_size` New in v6.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: 134217728 (which is 128 MB)
- Range: [128, 9223372036854775807], in bytes. The memory format with the units “KB|MB|GB|TB” is also supported.
- After you enable the memory limit, TiDB will terminate the SQL statement with the highest memory usage on the current instance. This variable specifies the minimum memory usage of the SQL statement to be terminated. If the memory usage of a TiDB instance that exceeds the limit is caused by too many sessions with low memory usage, you can properly lower the value of this variable to allow more sessions to be canceled.

#### 14.4.1.283 `tidb_shard_allocate_step` New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 9223372036854775807
- Range: [1, 9223372036854775807]
- This variable controls the maximum number of continuous IDs to be allocated for the `AUTO_RANDOM` or `SHARD_ROW_ID_BITS` attribute. Generally, `AUTO_RANDOM` IDs or the `SHARD_ROW_ID_BITS` annotated row IDs are incremental and continuous in one transaction. You can use this variable to solve the hotspot issue in large transaction scenarios.

#### 14.4.1.284 `tidb_simplified_metrics`

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- When this variable is enabled, TiDB does not collect or record the metrics that are not used in the Grafana panels.

#### 14.4.1.285 `tidb_skip_ascii_check` New in v5.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable is used to set whether to skip ASCII validation.
- Validating ASCII characters affects the performance. When you are sure that the input characters are valid ASCII characters, you can set the variable value to ON.

#### 14.4.1.286 `tidb_skip_isolation_level_check`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- After this switch is enabled, if an isolation level unsupported by TiDB is assigned to `tx_isolation`, no error is reported. This helps improve compatibility with applications that set (but do not depend on) a different isolation level.

```
tidb> set tx_isolation='serializable';
ERROR 8048 (HY000): The isolation level 'serializable' is not supported.
 ↳ Set tidb_skip_isolation_level_check=1 to skip this error
tidb> set tidb_skip_isolation_level_check=1;
Query OK, 0 rows affected (0.00 sec)

tidb> set tx_isolation='serializable';
Query OK, 0 rows affected, 1 warning (0.00 sec)
```

#### 14.4.1.287 `tidb_skip_utf8_check`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable is used to set whether to skip UTF-8 validation.
- Validating UTF-8 characters affects the performance. When you are sure that the input characters are valid UTF-8 characters, you can set the variable value to ON.

##### Note:

If the character check is skipped, TiDB might fail to detect illegal UTF-8 characters written by the application, cause decoding errors when `ANALYZE` is executed, and introduce other unknown encoding issues. If your application cannot guarantee the validity of the written string, it is not recommended to skip the character check.

#### 14.4.1.288 `tidb_slow_log_threshold`

- Scope: GLOBAL

- Persists to cluster: No, only applicable to the current TiDB instance that you are connecting to.
- Type: Integer
- Default value: 300
- Range: [-1, 9223372036854775807]
- Unit: Milliseconds
- This variable is used to output the threshold value of the time consumed by the slow log. When the time consumed by a query is larger than this value, this query is considered as a slow log and its log is output to the slow query log.

#### 14.4.1.289 `tidb_slow_query_file`

- Scope: SESSION
- Default value: “”
- When `INFORMATION_SCHEMA.SLOW_QUERY` is queried, only the slow query log name set by `slow-query-file` in the configuration file is parsed. The default slow query log name is “tidb-slow.log”. To parse other logs, set the `tidb_slow_query_file` session variable to a specific file path, and then query `INFORMATION_SCHEMA.SLOW_QUERY` to parse the slow query log based on the set file path.

For details, see [Identify Slow Queries](#).

#### 14.4.1.290 `tidb_snapshot`

- Scope: SESSION
- Default value: “”
- This variable is used to set the time point at which the data is read by the session. For example, when you set the variable to “2017-11-11 20:20:20” or a TSO number like “400036290571534337”, the current session reads the data of this moment.

#### 14.4.1.291 `tidb_source_id` New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1
- Range: [1, 15]
- This variable is used to configure the different cluster IDs in a [bi-directional replication](#) cluster.

#### 14.4.1.292 `tidb_stats_cache_mem_quota` New in v6.1.0

**Warning:**

This variable is an experimental feature. It is not recommended to use it in production environments.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 0
- Range: [0, 1099511627776]
- This variable sets the memory quota for the TiDB statistics cache.

#### 14.4.1.293 `tidb_stats_load_pseudo_timeout` New in v5.4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable controls how TiDB behaves when the waiting time of SQL optimization reaches the timeout to synchronously load complete column statistics. The default value ON means that the SQL optimization gets back to using pseudo statistics after the timeout. If this variable to OFF, SQL execution fails after the timeout.

#### 14.4.1.294 `tidb_stats_load_sync_wait` New in v5.4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 100
- Range: [0, 2147483647]
- Unit: Milliseconds
- This variable controls whether to enable the synchronously loading statistics feature. The value 0 means that the feature is disabled. To enable the feature, you can set this variable to a timeout (in milliseconds) that SQL optimization can wait for at most to synchronously load complete column statistics. For details, see [Load statistics](#).

#### 14.4.1.295 `tidb_stmt_summary_enable_persistent` New in v6.6.0

**Warning:**

Statements summary persistence is an experimental feature. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an [issue](#) on GitHub.

- Scope: GLOBAL
- Type: Boolean
- Default value: OFF
- This variable is read-only. It controls whether to enable `statements summary persistence`.
- The value of this variable is the same as that of the configuration item `tidb_stmt_summary_enable_p`  
↔ .

**14.4.1.296 tidb\_stmt\_summary\_filename New in v6.6.0****Warning:**

Statements summary persistence is an experimental feature. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an [issue](#) on GitHub.

- Scope: GLOBAL
- Type: String
- Default value: "tidb-statements.log"
- This variable is read-only. It specifies the file to which persistent data is written when `statements summary persistence` is enabled.
- The value of this variable is the same as that of the configuration item `tidb_stmt_summary_filename`  
↔ .

**14.4.1.297 tidb\_stmt\_summary\_file\_max\_backups New in v6.6.0**

**Warning:**

Statements summary persistence is an experimental feature. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an [issue](#) on GitHub.

- Scope: GLOBAL
- Type: Integer
- Default value: 0
- This variable is read-only. It specifies the maximum number of data files that can be persisted when `statements summary persistence` is enabled.
- The value of this variable is the same as that of the configuration item `tidb_stmt_summary_file_max`  
↔ .

**14.4.1.298 tidb\_stmt\_summary\_file\_max\_days New in v6.6.0****Warning:**

Statements summary persistence is an experimental feature. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an [issue](#) on GitHub.

- Scope: GLOBAL
- Type: Integer
- Default value: 3
- Unit: day
- This variable is read-only. It specifies the maximum number of days to keep persistent data files when `statements summary persistence` is enabled.
- The value of this variable is the same as that of the configuration item `tidb_stmt_summary_file_max`  
↔ .

**14.4.1.299 tidb\_stmt\_summary\_file\_max\_size New in v6.6.0**

**Warning:**

Statements summary persistence is an experimental feature. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an [issue](#) on GitHub.

- Scope: GLOBAL
- Type: Integer
- Default value: 64
- Unit: MiB
- This variable is read-only. It specifies the maximum size of a persistent data file when [statements summary persistence](#) is enabled.
- The value of this variable is the same as that of the configuration item `tidb_stmt_summary_file_max_size`.  
↪ .

**14.4.1.300 `tidb_stmt_summary_history_size` New in v4.0**

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 24
- Range: [0, 255]
- This variable is used to set the history capacity of [statement summary tables](#).

**14.4.1.301 `tidb_stmt_summary_internal_query` New in v4.0**

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable is used to control whether to include the SQL information of TiDB in [statement summary tables](#).

**14.4.1.302 `tidb_stmt_summary_max_sql_length` New in v4.0**

- Scope: GLOBAL
- Persists to cluster: Yes

- Type: Integer
- Default value: 4096
- Range: [0, 2147483647]
- This variable is used to control the length of the SQL string in [statement summary tables](#).

#### 14.4.1.303 `tidb_stmt_summary_max_stmt_count` New in v4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 3000
- Range: [1, 32767]
- This variable is used to set the maximum number of statements that [statement summary tables](#) store in memory.

#### 14.4.1.304 `tidb_stmt_summary_refresh_interval` New in v4.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1800
- Range: [1, 2147483647]
- Unit: Seconds
- This variable is used to set the refresh time of [statement summary tables](#).

#### 14.4.1.305 `tidb_store_batch_size`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 4
- Range: [0, 25000]
- This variable is used to control the batch size of the Coprocessor Tasks of the `IndexLookUp` operator. 0 means to disable batch. When the number of tasks is relatively large and slow queries occur, you can increase this variable to optimize the query.

#### 14.4.1.306 `tidb_store_limit` New in v3.0.4 and v4.0

- Scope: GLOBAL
- Persists to cluster: Yes

- Type: Integer
- Default value: 0
- Range: [0, 9223372036854775807]
- This variable is used to limit the maximum number of requests TiDB can send to TiKV at the same time. 0 means no limit.

#### 14.4.1.307 `tidb_streamagg_concurrency`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1
- This variable sets the concurrency of the `StreamAgg` operator when queries are executed.
- It is **NOT recommended** to set this variable. Modifying the variable value might cause data correctness issues.

#### 14.4.1.308 `tidb_super_read_only` New in v5.3.1

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- `tidb_super_read_only` aims to be implemented as a replacement of the MySQL variable `super_read_only`. However, because TiDB is a distributed database, `tidb_super_read_only` does not make the database read-only immediately after execution, but eventually.
- Users with the `SUPER` or `SYSTEM_VARIABLES_ADMIN` privilege can modify this variable.
- This variable controls the read-only status of the entire cluster. When the variable is `ON`, all TiDB servers in the entire cluster are in the read-only mode. In this case, TiDB only executes the statements that do not modify data, such as `SELECT`, `USE`, and `SHOW`. For other statements such as `INSERT` and `UPDATE`, TiDB rejects executing those statements in the read-only mode.
- Enabling the read-only mode using this variable only ensures that the entire cluster finally enters the read-only status. If you have changed the value of this variable in a TiDB cluster but the change has not yet propagated to other TiDB servers, the un-updated TiDB servers are still **not** in the read-only mode.
- TiDB checks the read-only flag before SQL statements are executed. Since v6.2.0, the flag is also checked before SQL statements are committed. This helps prevent the case where long-running `auto commit` statements might modify data after the server has been placed in read-only mode.
- When this variable is enabled, TiDB handles the uncommitted transactions in the following ways:

- For uncommitted read-only transactions, you can commit the transactions normally.
  - For uncommitted transactions that are not read-only, SQL statements that perform write operations in these transactions are rejected.
  - For uncommitted read-only transactions with modified data, the commit of these transactions is rejected.
- After the read-only mode is enabled, all users (including the users with the SUPER privilege) cannot execute the SQL statements that might write data unless the user is explicitly granted the RESTRICTED\_REPLICA\_WRITER\_ADMIN privilege.
  - When the `tidb_restricted_read_only` system variable is set to ON, `tidb_super_read_only`  $\leftrightarrow$  is affected by `tidb_restricted_read_only` in some cases. For detailed impact, see the description of `tidb_restricted_read_only`.

#### 14.4.1.309 `tidb_sysdate_is_now` New in v6.0.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: OFF
- This variable is used to control whether the SYSDATE function can be replaced by the NOW function. This configuration item has the same effect as the MySQL option `sysdate-is-now`.

#### 14.4.1.310 `tidb_sysproc_scan_concurrency` New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1
- Range: [1, 256]
- This variable is used to set the concurrency of scan operations performed when TiDB executes internal SQL statements (such as an automatic update of statistics).

#### 14.4.1.311 `tidb_table_cache_lease` New in v6.0.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 3
- Range: [1, 10]
- Unit: Seconds

- This variable is used to control the lease time of **cached tables** with a default value of 3. The value of this variable affects the modification to cached tables. After a modification is made to cached tables, the longest waiting time might be `tidb_table_cache_lease` seconds. If the table is read-only or can accept a high write latency, you can increase the value of this variable to increase the valid time for caching tables and to reduce the frequency of lease renewal.

#### 14.4.1.312 `tidb_tmp_table_max_size` New in v5.3.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 67108864
- Range: [1048576, 137438953472]
- Unit: Bytes
- This variable is used to set the maximum size of a single **temporary table**. Any temporary table with a size larger than this variable value causes error.

#### 14.4.1.313 `tidb_top_sql_max_meta_count` New in v6.0.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 5000
- Range: [1, 10000]
- This variable is used to control the maximum number of SQL statement types collected by **Top SQL** per minute.

#### 14.4.1.314 `tidb_top_sql_max_time_series_count` New in v6.0.0

##### **Note:**

Currently, the Top SQL page in TiDB Dashboard only displays the top 5 types of SQL queries that contribute the most to the load, which is irrelevant with the configuration of `tidb_top_sql_max_time_series_count`.

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer

- Default value: 100
- Range: [1, 5000]
- This variable is used to control how many SQL statements that contribute the most to the load (that is, top N) can be recorded by **Top SQL** per minute.

#### 14.4.1.315 `tidb_track_aggregate_memory_usage`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable controls whether TiDB tracks the memory usage of aggregate functions.

##### **Warning:**

If you disable this variable, TiDB might not accurately track the memory usage and cannot control the memory usage of the corresponding SQL statements.

#### 14.4.1.316 `tidb_tso_client_batch_max_wait_time` New in v5.3.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Float
- Default value: 0
- Range: [0, 10]
- Unit: Milliseconds
- This variable is used to set the maximum waiting time for a batch operation when TiDB requests TSO from PD. The default value is 0, which means no extra waiting time.
- When obtaining TSO requests from PD each time, PD Client, used by TiDB, collects as many TSO requests received at the same time as possible. Then, PD Client merges the collected requests in batch into one RPC request and sends the request to PD. This helps reduce the pressure on PD.
- After setting this variable to a value greater than 0, TiDB waits for the maximum duration of this value before the end of each batch merge. This is to collect more TSO requests and improve the effect of batch operations.
- Scenarios for increasing the value of this variable:
  - Due to the high pressure of TSO requests, the CPU of the PD leader reaches a bottleneck, which causes high latency of TSO RPC requests.

- There are not many TiDB instances in the cluster, but every TiDB instance is in high concurrency.
- It is recommended to set this variable to a value as small as possible.

**Note:**

Suppose that the TSO RPC latency increases for reasons other than a CPU usage bottleneck of the PD leader (such as network issues). In this case, increasing the value of `tidb_tso_client_batch_max_wait_time` might increase the execution latency in TiDB and affect the QPS performance of the cluster.

**14.4.1.317 `tidb_ttl_delete_rate_limit` New in v6.5.0****Warning:**

**TTL** is an experimental feature. This system variable might be changed or removed in future releases.

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: 0
- Range: [0, 9223372036854775807]
- This variable is used to limit the rate of DELETE statements in TTL jobs on each TiDB node. The value represents the maximum number of DELETE statements allowed per second in a single node in a TTL job. When this variable is set to 0, no limit is applied.

**14.4.1.318 `tidb_ttl_delete_batch_size` New in v6.5.0****Warning:**

**TTL** is an experimental feature. This system variable might be changed or removed in future releases.

- Scope: GLOBAL

- Persists to cluster: Yes
- Default value: 100
- Range: [1, 10240]
- This variable is used to set the maximum number of rows that can be deleted in a single DELETE transaction in a TTL job.

#### 14.4.1.319 `tidb_ttl_delete_worker_count` New in v6.5.0

**Warning:**

**TTL** is an experimental feature. This system variable might be changed or removed in future releases.

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: 4
- Range: [1, 256]
- This variable is used to set the maximum concurrency of TTL jobs on each TiDB node.

#### 14.4.1.320 `tidb_ttl_job_enable` New in v6.5.0

**Warning:**

**TTL** is an experimental feature. This system variable might be changed or removed in future releases.

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: ON
- Type: Boolean
- This variable is used to control whether TTL jobs are enabled. If it is set to OFF, all tables with TTL attributes automatically stop cleaning up expired data.

#### 14.4.1.321 `tidb_ttl_scan_batch_size` New in v6.5.0

**Warning:**

**TTL** is an experimental feature. This system variable might be changed or removed in future releases.

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: 500
- Range: [1, 10240]
- This variable is used to set the LIMIT value of each SELECT statement used to scan expired data in a TTL job.

**14.4.1.322 tidb\_ttl\_scan\_worker\_count New in v6.5.0****Warning:**

**TTL** is an experimental feature. This system variable might be changed or removed in future releases.

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: 4
- Range: [1, 256]
- This variable is used to set the maximum concurrency of TTL scan jobs on each TiDB node.

**14.4.1.323 tidb\_ttl\_job\_schedule\_window\_start\_time New in v6.5.0****Warning:**

**TTL** is an experimental feature. This system variable might be changed or removed in future releases.

- Scope: GLOBAL
- Type: Time
- Persists to cluster: Yes

- Default value: 00:00 +0000
- This variable is used to control the start time of the scheduling window of TTL jobs in the background. When you modify the value of this variable, be cautious that a small window might cause the cleanup of expired data to fail.

#### 14.4.1.324 `tidb_ttl_job_schedule_window_end_time` New in v6.5.0

##### **Warning:**

**TTL** is an experimental feature. This system variable might be changed or removed in future releases.

- Scope: GLOBAL
- Type: Time
- Persists to cluster: Yes
- Default value: 23:59 +0000
- This variable is used to control the end time of the scheduling window of TTL jobs in the background. When you modify the value of this variable, be cautious that a small window might cause the cleanup of expired data to fail.

#### 14.4.1.325 `tidb_txn_assertion_level` New in v6.0.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: FAST
- Possible values: OFF, FAST, STRICT
- This variable is used to control the assertion level. Assertion is a consistency check between data and indexes, which checks whether a key being written exists in the transaction commit process. For more information, see [Troubleshoot Inconsistency Between Data and Indexes](#).
  - OFF: Disable this check.
  - FAST: Enable most of the check items, with almost no impact on performance.
  - STRICT: Enable all check items, with a minor impact on pessimistic transaction performance when the system workload is high.
- For new clusters of v6.0.0 or later versions, the default value is FAST. For existing clusters that upgrade from versions earlier than v6.0.0, the default value is OFF.

#### 14.4.1.326 `tidb_txn_commit_batch_size` New in v6.2.0

- Scope: GLOBAL
  - Persists to cluster: Yes
  - Type: Integer
  - Default value: 16384
  - Range: [1, 1073741824]
  - Unit: Bytes
- This variable is used to control the batch size of transaction commit requests that TiDB sends to TiKV. If most of the transactions in the application workload have a large number of write operations, adjusting this variable to a larger value can improve the performance of batch processing. However, if this variable is set to too large a value and exceeds the limit of TiKV's `raft-entry-max-size`, the commits might fail.

#### 14.4.1.327 `tidb_txn_mode`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: `pessimistic`
- Possible values: `pessimistic`, `optimistic`
- This variable is used to set the transaction mode. TiDB 3.0 supports the pessimistic transactions. Since TiDB 3.0.8, the `pessimistic transaction mode` is enabled by default.
- If you upgrade TiDB from v3.0.7 or earlier versions to v3.0.8 or later versions, the default transaction mode does not change. **Only the newly created clusters use the pessimistic transaction mode by default.**
- If this variable is set to “`optimistic`” or “”, TiDB uses the `optimistic transaction mode`.

#### 14.4.1.328 `tidb_use_plan_baselines` New in v4.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable is used to control whether to enable the execution plan binding feature. It is enabled by default, and can be disabled by assigning the `OFF` value. For the use of the execution plan binding, see [Execution Plan Binding](#).

#### 14.4.1.329 `tidb_wait_split_region_finish`

- Scope: SESSION

- Type: Boolean
- Default value: ON
- It usually takes a long time to scatter Regions, which is determined by PD scheduling and TiKV loads. This variable is used to set whether to return the result to the client after all Regions are scattered completely when the `SPLIT REGION` statement is being executed:
  - ON requires that the `SPLIT REGIONS` statement waits until all Regions are scattered.
  - OFF permits the `SPLIT REGIONS` statement to return before finishing scattering all Regions.
- Note that when scattering Regions, the write and read performances for the Region that is being scattered might be affected. In batch-write or data importing scenarios, it is recommended to import data after Regions scattering is finished.

#### 14.4.1.330 `tidb_wait_split_region_timeout`

- Scope: SESSION
- Type: Integer
- Default value: 300
- Range: [1, 2147483647]
- Unit: Seconds
- This variable is used to set the timeout for executing the `SPLIT REGION` statement. If a statement is not executed completely within the specified time value, a timeout error is returned.

#### 14.4.1.331 `tidb_window_concurrency` New in v4.0

##### Warning:

Since v5.0, this variable is deprecated. Instead, use `tidb_executor_concurrency` for setting.

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: -1
- Range: [1, 256]
- Unit: Threads
- This variable is used to set the concurrency degree of the window operator.
- A value of -1 means that the value of `tidb_executor_concurrency` will be used instead.

#### 14.4.1.332 `tiflash_fastscan` New in v6.3.0

- Scope: SESSION | GLOBAL
- Default value: OFF
- Type: Boolean
- If **FastScan** is enabled (set to ON), TiFlash provides more efficient query performance, but does not guarantee the accuracy of the query results or data consistency.

#### 14.4.1.333 `tiflash_fine_grained_shuffle_batch_size` New in v6.2.0

- Scope: SESSION | GLOBAL
- Default value: 8192
- Range: [1, 18446744073709551615]
- When Fine Grained Shuffle is enabled, the window function pushed down to TiFlash can be executed in parallel. This variable controls the batch size of the data sent by the sender.
- Impact on performance: set a reasonable size according to your business requirements. Improper setting affects the performance. If the value is set too small, for example 1, it causes one network transfer per Block. If the value is set too large, for example, the total number of rows of the table, it causes the receiving end to spend most of the time waiting for data, and the pipelined computation cannot work. To set a proper value, you can observe the distribution of the number of rows received by the TiFlash receiver. If most threads receive only a few rows, for example a few hundred, you can increase this value to reduce the network overhead.

#### 14.4.1.334 `tiflash_fine_grained_shuffle_stream_count` New in v6.2.0

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 0
- Range: [-1, 1024]
- When the window function is pushed down to TiFlash for execution, you can use this variable to control the concurrency level of the window function execution. The possible values are as follows:
  - -1: the Fine Grained Shuffle feature is disabled. The window function pushed down to TiFlash is executed in a single thread.

- 0: the Fine Grained Shuffle feature is enabled. If `tidb_max_tiflash_threads` is set to a valid value (greater than 0), then `tiflash_fine_grained_shuffle_stream_count`  $\leftrightarrow$  is set to the value of `tidb_max_tiflash_threads`. Otherwise, it is set to 8. The actual concurrency level of the window function on TiFlash is:  $\min(\text{tiflash\_fine\_grained\_shuffle\_stream\_count}, \text{the number of physical threads on TiFlash nodes})$ .
  - Integer greater than 0: the Fine Grained Shuffle feature is enabled. The window function pushed down to TiFlash is executed in multiple threads. The concurrency level is:  $\min(\text{tiflash\_fine\_grained\_shuffle\_stream\_count}, \text{the number of physical threads on TiFlash nodes})$ .
- Theoretically, the performance of the window function increases linearly with this value. However, if the value exceeds the actual number of physical threads, it instead leads to performance degradation.

#### 14.4.1.335 `time_zone`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Default value: SYSTEM
- This variable returns the current time zone. Values can be specified as either an offset such as ‘-8:00’ or a named zone ‘America/Los\_Angeles’.
- The value SYSTEM means that the time zone should be the same as the system host, which is available via the `system_time_zone` variable.

#### 14.4.1.336 `timestamp`

- Scope: SESSION
- Type: Float
- Default value: 0
- Range: [0, 2147483647]
- A non-empty value of this variable indicates the UNIX epoch that is used as the timestamp for `CURRENT_TIMESTAMP()`, `NOW()`, and other functions. This variable might be used in data restore or replication.

#### 14.4.1.337 `transaction_isolation`

- Scope: SESSION | GLOBAL
  - Persists to cluster: Yes
  - Type: Enumeration
  - Default value: REPEATABLE-READ
  - Possible values: READ-UNCOMMITTED, READ-COMMITTED, REPEATABLE-READ, SERIALIZABLE
- $\leftrightarrow$

- This variable sets the transaction isolation. TiDB advertises REPEATABLE-READ for compatibility with MySQL, but the actual isolation level is Snapshot Isolation. See [transaction isolation levels](#) for further details.

#### 14.4.1.338 tx\_isolation

This variable is an alias for `transaction_isolation`.

#### 14.4.1.339 tx\_isolation\_one\_shot

**Note:**

This variable is internally used in TiDB. You are not expected to use it.

Internally, the TiDB parser transforms the `SET TRANSACTION ISOLATION LEVEL`  
↪ `[READ COMMITTED| REPEATABLE READ | ...]` statements to `SET @@SESSION.`  
↪ `TX_ISOLATION_ONE_SHOT = [READ COMMITTED| REPEATABLE READ | ...]`.

#### 14.4.1.340 tx\_read\_ts

- Scope: `SESSION`
- Default value: `“”`
- In the Stale Read scenarios, this session variable is used to help record the Stable Read timestamp value.
- This variable is used for the internal operation of TiDB. It is **NOT recommended** to set this variable.

#### 14.4.1.341 txn\_scope

- Scope: `SESSION`
- Default value: `global`
- Value options: `global` and `local`
- This variable is used to set whether the current session transaction is a global transaction or a local transaction.
- This variable is used for the internal operation of TiDB. It is **NOT recommended** to set this variable.

#### 14.4.1.342 `validate_password.check_user_name` New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: ON
- Type: Boolean
- This variable is a check item in the password complexity check. It checks whether the password matches the username. This variable takes effect only when `validate_password.enable` is enabled.
- When this variable is effective and set to ON, if you set a password, TiDB compares the password with the username (excluding the hostname). If the password matches the username, the password is rejected.
- This variable is independent of `validate_password.policy` and not affected by the password complexity check level.

#### 14.4.1.343 `validate_password.dictionary` New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: ""
- Type: String
- This variable is a check item in the password complexity check. It checks whether the password matches the dictionary. This variable takes effect only when `validate_password.enable` is enabled and `validate_password.policy` is set to 2 (STRONG).
- This variable is a string not longer than 1024 characters. It contains a list of words that cannot exist in the password. Each word is separated by semicolon (;).
- This variable is set to an empty string by default, which means no dictionary check is performed. To perform the dictionary check, you need to include the words to be matched in the string. If this variable is configured, when you set a password, TiDB compares each substring (length in 4 to 100 characters) of the password with the words in the dictionary. If any substring of the password matches a word in the dictionary, the password is rejected. The comparison is case-insensitive.

#### 14.4.1.344 `validate_password.enable` New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Default value: OFF
- Type: Boolean
- This variable controls whether to perform password complexity check. If this variable is set to ON, TiDB performs the password complexity check when you set a password.

#### 14.4.1.345 `validate_password.length` New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 8
- Range: [0, 2147483647]
- This variable is a check item in the password complexity check. It checks whether the password length is sufficient. By default, the minimum password length is 8. This variable takes effect only when `validate_password.enable` is enabled.
- The value of this variable must not be smaller than the expression: `validate_password.number_count + validate_password.special_char_count + (2 * validate_password.mixed_case_count)`.
- If you change the value of `validate_password.number_count`, `validate_password.special_char_count`, or `validate_password.mixed_case_count` such that the expression value is larger than `validate_password.length`, the value of `validate_password.length` is automatically changed to match the expression value.

#### 14.4.1.346 `validate_password.mixed_case_count` New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1
- Range: [0, 2147483647]
- This variable is a check item in the password complexity check. It checks whether the password contains sufficient uppercase and lowercase letters. This variable takes effect only when `validate_password.enable` is enabled and `validate_password.policy` is set to 1 (MEDIUM) or larger.
- Neither the number of uppercase letters nor the number of lowercase letters in the password can be fewer than the value of `validate_password.mixed_case_count`. For example, when the variable is set to 1, the password must contain at least one uppercase letter and one lowercase letter.

#### 14.4.1.347 `validate_password.number_count` New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1
- Range: [0, 2147483647]
- This variable is a check item in the password complexity check. It checks whether the password contains sufficient numbers. This variable takes effect only when `validate_password.enable` is enabled and `validate_password.policy` is set to 1 (MEDIUM) or larger.

#### 14.4.1.348 `validate_password.policy` New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Enumeration
- Default value: 1
- Value options: 0, 1, 2
- This variable controls the policy for the password complexity check. This variable takes effect only when `validate_password.enable` is enabled. The value of this variable determines whether other `validate_password` variables take effect in the password complexity check, except for `validate_password.check_user_name`.
- This value of this variable can be 0, 1, or 2 (corresponds to LOW, MEDIUM, or STRONG). Different policy levels have different checks:
  - 0 or LOW: password length.
  - 1 or MEDIUM: password length, uppercase and lowercase letters, numbers, and special characters.
  - 2 or STRONG: password length, uppercase and lowercase letters, numbers, special characters, and dictionary match.

#### 14.4.1.349 `validate_password.special_char_count` New in v6.5.0

- Scope: GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 1
- Range: [0, 2147483647]
- This variable is a check item in the password complexity check. It checks whether the password contains sufficient special characters. This variable takes effect only when `validate_password.enable` is enabled and `validate_password.policy` is set to 1 (MEDIUM) or larger.

#### 14.4.1.350 `version`

- Scope: NONE
- Default value: 5.7.25-TiDB-(tidb version)
- This variable returns the MySQL version, followed by the TiDB version. For example '5.7.25-TiDB-v4.0.0-beta.2-716-g25e003253'.

#### 14.4.1.351 `version_comment`

- Scope: NONE
- Default value: (string)
- This variable returns additional details about the TiDB version. For example, 'TiDB Server (Apache License 2.0) Community Edition, MySQL 5.7 compatible'.

#### 14.4.1.352 `version_compile_machine`

- Scope: NONE
- Default value: (string)
- This variable returns the name of the CPU architecture on which TiDB is running.

#### 14.4.1.353 `version_compile_os`

- Scope: NONE
- Default value: (string)
- This variable returns the name of the OS on which TiDB is running.

#### 14.4.1.354 `wait_timeout`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Integer
- Default value: 28800
- Range: [0, 31536000]
- Unit: Seconds
- This variable controls the idle timeout of user sessions. A zero-value means unlimited.

#### 14.4.1.355 `warning_count`

- Scope: SESSION
- Default value: 0
- This read-only variable indicates the number of warnings that occurred in the statement that was previously executed.

#### 14.4.1.356 `windowing_use_high_precision`

- Scope: SESSION | GLOBAL
- Persists to cluster: Yes
- Type: Boolean
- Default value: ON
- This variable controls whether to use the high precision mode when computing the window functions.

## 14.5 Configuration File Parameters

### 14.5.1 TiDB Configuration File

The TiDB configuration file supports more options than command-line parameters. You can download the default configuration file [config.toml.example](#) and rename it to `config` ↪ `.toml`. This document describes only the options that are not involved in [command line options](#).

#### Tip:

If you need to adjust the value of a configuration item, refer to [Modify the configuration](#).

#### 14.5.1.0.1 `split-table`

- Determines whether to create a separate Region for each table.
- Default value: `true`
- It is recommended to set it to `false` if you need to create a large number of tables (for example, more than 100 thousand tables).

#### 14.5.1.0.2 `tidb-max-reuse-chunk` New in v6.4.0

- Controls the maximum cached chunk objects of chunk allocation. Setting this configuration item to too large a value might increase the risk of OOM.
- Default value: 64
- Minimum value: 0
- Maximum value: 2147483647

#### 14.5.1.0.3 `tidb-max-reuse-column` New in v6.4.0

- Controls the maximum cached column objects of chunk allocation. Setting this configuration item to too large a value might increase the risk of OOM.
- Default value: 256
- Minimum value: 0
- Maximum value: 2147483647

#### 14.5.1.0.4 token-limit

- The number of sessions that can execute requests concurrently.
- Type: Integer
- Default value: 1000
- Minimum value: 1
- Maximum Value (64-bit platforms): 18446744073709551615
- Maximum Value (32-bit platforms): 4294967295

#### 14.5.1.0.5 temp-dir **New in v6.3.0**

- File system location used by TiDB to store temporary data. If a feature requires local storage in TiDB nodes, TiDB stores the corresponding temporary data in this location.
- When creating an index, if `tidb_ddl_enable_fast_reorg` is enabled, data that needs to be backfilled for a newly created index will be at first stored in the TiDB local temporary directory, and then imported into TiKV in batches, thus accelerating the index creation.
- Default value: `"/tmp/tidb"`

#### 14.5.1.0.6 oom-use-tmp-storage

##### **Warning:**

Since v6.3.0, this configuration item is deprecated and superseded by the system variable `tidb_enable_tmp_storage_on_oom`. When the TiDB cluster is upgraded to v6.3.0 or a later version, it will automatically initialize the variable with the value of `oom-use-tmp-storage`. After that, changing the value of `oom-use-tmp-storage` **does not** take effect anymore.

- Controls whether to enable the temporary storage for some operators when a single SQL statement exceeds the memory quota specified by the system variable `tidb_mem_quota_query`.
- Default value: `true`

#### 14.5.1.0.7 tmp-storage-path

- Specifies the temporary storage path for some operators when a single SQL statement exceeds the memory quota specified by the system variable `tidb_mem_quota_query`.
- Default value: `<temporary directory of OS>/<OS user ID>_tidb/MC4wLjAuMDoOMDAwLzAuMC4wLjA6MTAwODA=`  
↪ `=/tmp-storage.MC4wLjAuMDoOMDAwLzAuMC4wLjA6MTAwODA=` is the Base64 encoding result of `<host>:<port>/<statusHost>:<statusPort>`.
- This configuration takes effect only when the system variable `tidb_enable_tmp_storage_on_oom` ↪ is ON.

#### 14.5.1.0.8 tmp-storage-quota

- Specifies the quota for the storage in `tmp-storage-path`. The unit is byte.
- When a single SQL statement uses a temporary disk and the total volume of the temporary disk of the TiDB server exceeds this configuration value, the current SQL operation is cancelled and the `Out of Global Storage Quota!` error is returned.
- When the value of this configuration is smaller than 0, the above check and limit do not apply.
- Default value: -1
- When the remaining available storage in `tmp-storage-path` is lower than the value defined by `tmp-storage-quota`, the TiDB server reports an error when it is started, and exits.

#### 14.5.1.0.9 lease

- The timeout of the DDL lease.
- Default value: 45s
- Unit: second

#### 14.5.1.0.10 compatible-kill-query

- Determines whether to set the KILL statement to be MySQL compatible.
- Default value: `false`
- `compatible-kill-query` takes effect only when `enable-global-kill` is set to `false`.
- When `enable-global-kill` is `false`, `compatible-kill-query` controls whether you need to append the TIDB keyword when killing a query.
  - When `compatible-kill-query` is `false`, the behavior of `KILL xxx` in TiDB is different from that in MySQL. To kill a query in TiDB, you need to append the TIDB keyword, such as `KILL TIDB xxx`.
  - When `compatible-kill-query` is `true`, to kill a query in TiDB, there is no need to append the TIDB keyword. It is **STRONGLY NOT RECOMMENDED** to set `compatible-kill-query` to `true` in your configuration file UNLESS you are certain that clients will be always connected to the same TiDB instance. This is because pressing Control+C in the default MySQL client opens a new connection in which KILL is executed. If there is a proxy between the client and the TiDB cluster, the new connection might be routed to a different TiDB instance, which possibly kills a different session by mistake.
- When `enable-global-kill` is `true`, `KILL xxx` and `KILL TIDB xxx` have the same effect, but using Control+C to kill a query is not supported.
- For more information about the KILL statement, see [KILL \[TIDB\]](#).

#### 14.5.1.0.11 `check-mb4-value-in-utf8`

- Determines whether to enable the `utf8mb4` character check. When this feature is enabled, if the character set is `utf8` and the `mb4` characters are inserted in `utf8`, an error is returned.
- Default value: `false`
- Since v6.1.0, whether to enable the `utf8mb4` character check is determined by the TiDB configuration item `instance.tidb_check_mb4_value_in_utf8` or the system variable `tidb_check_mb4_value_in_utf8`. `check-mb4-value-in-utf8` still takes effect. But if both `check-mb4-value-in-utf8` and `instance.tidb_check_mb4_value_in_utf8` are set, the latter takes effect.

#### 14.5.1.0.12 `treat-old-version-utf8-as-utf8mb4`

- Determines whether to treat the `utf8` character set in old tables as `utf8mb4`.
- Default value: `true`

#### 14.5.1.0.13 `alter-primary-key` (Deprecated)

- Determines whether to add or remove the primary key constraint to or from a column.
- Default value: `false`
- With this default setting, adding or removing the primary key constraint is not supported. You can enable this feature by setting `alter-primary-key` to `true`. However, if a table already exists before the switch is on, and the data type of its primary key column is an integer, dropping the primary key from the column is not possible even if you set this configuration item to `true`.

#### Note:

This configuration item has been deprecated, and currently takes effect only when the value of `@tidb_enable_clustered_index` is `INT_ONLY`. If you need to add or remove the primary key, use the `NONCLUSTERED` keyword instead when creating the table. For more details about the primary key of the `CLUSTERED` type, refer to [clustered index](#).

#### 14.5.1.0.14 `server-version`

- Modifies the version string returned by TiDB in the following situations:
  - When the built-in `VERSION()` function is used.

- When TiDB establishes the initial connection to the client and returns the initial handshake packet with version string of the server. For details, see [MySQL Initial Handshake Packet](#).
- Default value: “”
- By default, the format of the TiDB version string is `5.7.${mysql_latest_minor_version} ↪ -TiDB-${tidb_version}`.

#### 14.5.1.0.15 `repair-mode`

- Determines whether to enable the untrusted repair mode. When the `repair-mode` is set to `true`, bad tables in the `repair-table-list` cannot be loaded.
- Default value: `false`
- The `repair` syntax is not supported by default. This means that all tables are loaded when TiDB is started.

#### 14.5.1.0.16 `repair-table-list`

- `repair-table-list` is only valid when `repair-mode` is set to `true`. `repair-table- ↪ list` is a list of bad tables that need to be repaired in an instance. An example of the list is: `[“db.table1”,“db.table2”...]`.
- Default value: `[]`
- The list is empty by default. This means that there are no bad tables that need to be repaired.

#### 14.5.1.0.17 `new_collations_enabled_on_first_bootstrap`

- Enables or disables the new collation support.
- Default value: `true`
- Note: This configuration takes effect only for the TiDB cluster that is first initialized. After the initialization, you cannot use this configuration item to enable or disable the new collation support.

#### 14.5.1.0.18 `max-server-connections`

- The maximum number of concurrent client connections allowed in TiDB. It is used to control resources.
- Default value: `0`
- By default, TiDB does not set limit on the number of concurrent client connections. When the value of this configuration item is greater than `0` and the number of actual client connections reaches this value, the TiDB server rejects new client connections.

- Since v6.2.0, the TiDB configuration item `instance.max_connections` or the system variable `max_connections` is used to set the maximum number of concurrent client connections allowed in TiDB. `max-server-connections` still takes effect. But if `max-server-connections` and `instance.max_connections` are set at the same time, the latter takes effect.

#### 14.5.1.0.19 `max-index-length`

- Sets the maximum allowable length of the newly created index.
- Default value: 3072
- Unit: byte
- Currently, the valid value range is [3072, 3072\*4]. MySQL and TiDB (version < v3.0.11) do not have this configuration item, but both limit the length of the newly created index. This limit in MySQL is 3072. In TiDB (version =< 3.0.7), this limit is 3072\*4. In TiDB (3.0.7 < version < 3.0.11), this limit is 3072. This configuration is added to be compatible with MySQL and earlier versions of TiDB.

#### 14.5.1.0.20 `table-column-count-limit` New in v5.0

- Sets the limit on the number of columns in a single table.
- Default value: 1017
- Currently, the valid value range is [1017, 4096].

#### 14.5.1.0.21 `index-limit` New in v5.0

- Sets the limit on the number of indexes in a single table.
- Default value: 64
- Currently, the valid value range is [64, 512].

#### 14.5.1.0.22 `enable-telemetry` New in v4.0.2

- Enables or disables the telemetry collection in TiDB.
- Default value: `false`
- When this configuration is set to `true` on a TiDB instance, the telemetry collection in this TiDB instance is enabled and the `tidb_enable_telemetry` system variable takes effect.
- When this configuration is set to `false` on all TiDB instances, the telemetry collection in TiDB is disabled and the `tidb_enable_telemetry` system variable does not take effect. See [Telemetry](#) for details.

#### 14.5.1.0.23 `enable-tcp4-only` New in v5.0

- Enables or disables listening on TCP4 only.
- Default value: `false`
- Enabling this option is useful when TiDB is used with LVS for load balancing because the [real client IP from the TCP header](#) can be correctly parsed by the “tcp4” protocol.

#### 14.5.1.0.24 `enable-enum-length-limit` New in v5.0

- Determines whether to limit the maximum length of a single ENUM element and a single SET element.
- Default value: `true`
- When this configuration value is `true`, the maximum length of a single ENUM element and a single SET element is 255 characters, which is compatible with [MySQL 8.0](#). When this configuration value is `false`, there is no limit on the length of a single element, which is compatible with TiDB (earlier than v5.0).

#### 14.5.1.0.25 `graceful-wait-before-shutdown` New in v5.0

- Specifies the number of seconds that TiDB waits when you shut down the server, which allows the clients to disconnect.
- Default value: 0
- When TiDB is waiting for shutdown (in the grace period), the HTTP status will indicate a failure, which allows the load balancers to reroute traffic.

#### 14.5.1.0.26 `enable-global-kill` New in v6.1.0

- Controls whether to enable the Global Kill (terminating queries or connections across instances) feature.
- Default value: `true`
- When the value is `true`, both `KILL` and `KILL TIDB` statements can terminate queries or connections across instances so you do not need to worry about erroneously terminating queries or connections. When you use a client to connect to any TiDB instance and execute the `KILL` or `KILL TIDB` statement, the statement will be forwarded to the target TiDB instance. If there is a proxy between the client and the TiDB cluster, the `KILL` and `KILL TIDB` statements will also be forwarded to the target TiDB instance for execution. Currently, using the MySQL command line `ctrl+c` to terminate a query or connection in TiDB is not supported when `enable-global-kill` is `true`. For more information on the `KILL` statement, see [KILL](#).

#### 14.5.1.0.27 `initialize-sql-file` New in v6.6.0

- Specifies the SQL script to be executed when the TiDB cluster is started for the first time.
- Default value: ""
- All SQL statements in this script are executed with the highest privilege without any privilege check. If the specified SQL script fails to execute, the TiDB cluster might fail to start.
- This configuration item is used to perform such operations as modifying the value of a system variable, creating a user, or granting privileges.

#### 14.5.1.0.28 `enable-forwarding` New in v5.0.0

- Controls whether the PD client and TiKV client in TiDB forward requests to the leader via the followers in the case of possible network isolation.
- Default value: `false`
- If the environment might have isolated network, enabling this parameter can reduce the window of service unavailability.
- If you cannot accurately determine whether isolation, network interruption, or downtime has occurred, using this mechanism has the risk of misjudgment and causes reduced availability and performance. If network failure has never occurred, it is not recommended to enable this parameter.

#### 14.5.1.0.29 `enable-table-lock` New in v4.0.0

##### **Warning:**

The table lock is an experimental feature. It is not recommended that you use it in the production environment.

- Controls whether to enable the table lock feature.
- Default value: `false`
- The table lock is used to coordinate concurrent access to the same table among multiple sessions. Currently, the `READ`, `WRITE`, and `WRITE LOCAL` lock types are supported. When the configuration item is set to `false`, executing the `LOCK TABLES` or `UNLOCK TABLES` statement does not take effect and returns the “LOCK/UNLOCK TABLES is not supported” warning. For more information, see [LOCK TABLES and UNLOCK TABLES](#).

### 14.5.1.0.30 labels

- Specify server labels. For example, { zone = "us-west-1", dc = "dc1", rack = "rack1", host = "tidb1" }.
- Default value: {}

#### Note:

- In TiDB, the **zone** label is specially used to specify the zone where a server is located. If **zone** is set to a non-null value, the corresponding value is automatically used by features such as **txn-score** and **Follower read**.
- The **group** label has a special use in TiDB Operator. For clusters deployed using **TiDB Operator**, it is **NOT** recommended that you specify the **group** label manually.

## 14.5.1.1 Log

Configuration items related to log.

### 14.5.1.1.1 level

- Specifies the log output level.
- Value options: **debug**, **info**, **warn**, **error**, and **fatal**.
- Default value: **info**

### 14.5.1.1.2 format

- Specifies the log output format.
- Value options: **json** and **text**.
- Default value: **text**

### 14.5.1.1.3 enable-timestamp

- Determines whether to enable timestamp output in the log.
- Default value: **null**
- If you set the value to **false**, the log does not output timestamp.

**Note:**

- To be backward compatible, the initial `disable-timestamp` configuration item remains valid. But if the value of `disable-timestamp` semantically conflicts with the value of `enable-timestamp` (for example, if both `enable-timestamp` and `disable-timestamp` are set to `true`), TiDB ignores the value for `disable-timestamp`.
- Currently, TiDB use `disable-timestamp` to determine whether to output timestamps in the log. In this situation, the value of `enable-timestamp` is null.
- In later versions, the `disable-timestamp` configuration will be removed. Discard `disable-timestamp` and use `enable-timestamp` which is semantically easier to understand.

**14.5.1.1.4 enable-slow-log**

- Determines whether to enable the slow query log.
- Default value: `true`
- To enable the slow query log, set `enable-slow-log` to `true`. Otherwise, set it to `false`.
- Since v6.1.0, whether to enable slow query log is determined by the TiDB configuration item `instance.tidb_enable_slow_log` or the system variable `tidb_enable_slow_log`. `enable-slow-log` still takes effect. But if `enable-slow-log` and `instance.tidb_enable_slow_log` are set at the same time, the latter takes effect.

**14.5.1.1.5 slow-query-file**

- The file name of the slow query log.
- Default value: `tidb-slow.log`
- The format of the slow log is updated in TiDB v2.1.8, so the slow log is output to the slow log file separately. In versions before v2.1.8, this variable is set to "" by default.
- After you set it, the slow query log is output to this file separately.

**14.5.1.1.6 slow-threshold**

- Outputs the threshold value of consumed time in the slow log.
- Default value: `300`
- Unit: Milliseconds

- If the value in a query is larger than the default value, it is a slow query and is output to the slow log.
- Since v6.1.0, the threshold value of consumed time in the slow log is specified by the TiDB configuration item `instance.tidb_slow_log_threshold` or the system variable `tidb_slow_log_threshold`. `slow-threshold` still takes effect. But if `slow-threshold` and `instance.tidb_slow_log_threshold` are set at the same time, the latter takes effect.

#### 14.5.1.1.7 `record-plan-in-slow-log`

- Determines whether to record execution plans in the slow log.
- Default value: 1
- Since v6.1.0, whether to record execution plans in the slow log is determined by the TiDB configuration item `instance.tidb_record_plan_in_slow_log` or the system variable `tidb_record_plan_in_slow_log`. `record-plan-in-slow-log` still takes effect. But if `record-plan-in-slow-log` and `instance.tidb_record_plan_in_slow_log` are set at the same time, the latter takes effect.

#### 14.5.1.1.8 `expensive-threshold`

- Outputs the threshold value of the number of rows for the `expensive` operation.
- Default value: 10000
- When the number of query rows (including the intermediate results based on statistics) is larger than this value, it is an `expensive` operation and outputs log with the [`EXPENSIVE_QUERY`] prefix.

### 14.5.1.2 `log.file`

Configuration items related to log files.

`filename`

- The file name of the general log file.
- Default value: “”
- If you set it, the log is output to this file.

`max-size`

- The size limit of the log file.
- Default value: 300
- Unit: MB
- The maximum value is 4096.

#### `max-days`

- The maximum number of days that the log is retained.
- Default value: 0
- The log is retained by default. If you set the value, the expired log is cleaned up after `max-days`.

#### `max-backups`

- The maximum number of retained logs.
- Default value: 0
- All the log files are retained by default. If you set it to 7, seven log files are retained at maximum.

### 14.5.1.3 Security

Configuration items related to security.

#### 14.5.1.3.1 `enable-sem`

- Enables the Security Enhanced Mode (SEM).
- Default value: `false`
- The status of SEM is available via the system variable `tidb_enable_enhanced_security`  
↪ .

#### 14.5.1.3.2 `ssl-ca`

- The file path of the trusted CA certificate in the PEM format.
- Default value: “”
- If you set this option and `--ssl-cert`, `--ssl-key` at the same time, TiDB authenticates the client certificate based on the list of trusted CAs specified by this option when the client presents the certificate. If the authentication fails, the connection is terminated.
- If you set this option but the client does not present the certificate, the secure connection continues without client certificate authentication.

#### 14.5.1.3.3 `ssl-cert`

- The file path of the SSL certificate in the PEM format.
- Default value: “”
- If you set this option and `--ssl-key` at the same time, TiDB allows (but not forces) the client to securely connect to TiDB using TLS.
- If the specified certificate or private key is invalid, TiDB starts as usual but cannot receive secure connection.

#### 14.5.1.3.4 `ssl-key`

- The file path of the SSL certificate key in the PEM format, that is, the private key of the certificate specified by `--ssl-cert`.
- Default value: ""
- Currently, TiDB does not support loading the private keys protected by passwords.

#### 14.5.1.3.5 `cluster-ssl-ca`

- The CA root certificate used to connect TiKV or PD with TLS.
- Default value: ""

#### 14.5.1.3.6 `cluster-ssl-cert`

- The path of the SSL certificate file used to connect TiKV or PD with TLS.
- Default value: ""

#### 14.5.1.3.7 `cluster-ssl-key`

- The path of the SSL private key file used to connect TiKV or PD with TLS.
- Default value: ""

#### 14.5.1.3.8 `spilled-file-encryption-method`

- Determines the encryption method used for saving the spilled files to disk.
- Default value: "plaintext", which disables encryption.
- Optional values: "plaintext" and "aes128-ctr"

#### 14.5.1.3.9 `auto-tls`

- Determines whether to automatically generate the TLS certificates on startup.
- Default value: `false`

#### 14.5.1.3.10 `tls-version`

- Set the minimum TLS version for MySQL Protocol connections.
- Default value: "", which allows TLSv1.1 or higher.
- Optional values: "TLSv1.0", "TLSv1.1", "TLSv1.2" and "TLSv1.3"

#### 14.5.1.3.11 `auth-token-jwks` **New in v6.4.0**

**Warning:**

The `tidb_auth_token` authentication method is used only for the internal operation of TiDB Cloud. **DO NOT** change the value of this configuration.

- Set the local file path of the JSON Web Key Sets (JWKS) for the `tidb_auth_token` authentication method.
- Default value: ""

**14.5.1.3.12 `auth-token-refresh-interval` New in v6.4.0****Warning:**

The `tidb_auth_token` authentication method is used only for the internal operation of TiDB Cloud. **DO NOT** change the value of this configuration.

- Set the JWKS refresh interval for the `tidb_auth_token` authentication method.
- Default value: 1h

**14.5.1.3.13 `disconnect-on-expired-password` New in v6.5.0**

- Determines whether TiDB disconnects the client connection when the password is expired.
- Default value: `true`
- Optional values: `true`, `false`
- If you set it to `true`, the client connection is disconnected when the password is expired. If you set it to `false`, the client connection is restricted to the “sandbox mode” and the user can only execute the password reset operation.

**14.5.1.3.14 `session-token-signing-cert` New in v6.4.0****Warning:**

The feature controlled by this parameter is under development. **Do not modify the default value.**

- Default value: ""

#### 14.5.1.3.15 `session-token-signing-key` New in v6.4.0

**Warning:**

The feature controlled by this parameter is under development. **Do not modify the default value.**

- Default value: “”

#### 14.5.1.4 Performance

Configuration items related to performance.

##### 14.5.1.4.1 `max-procs`

- The number of CPUs used by TiDB.
- Default value: 0
- The default 0 indicates using all the CPUs on the machine. You can also set it to n, and then TiDB uses n CPUs.

##### 14.5.1.4.2 `server-memory-quota` New in v4.0.9

**Warning:**

Since v6.5.0, the `server-memory-quota` configuration item is deprecated and replaced by the system variable `tidb_server_memory_limit`.

- The memory usage limit of tidb-server instances.
- Default value: 0 (in bytes), which means no memory limit.

##### 14.5.1.4.3 `max-txn-ttl`

- The longest time that a single transaction can hold locks. If this time is exceeded, the locks of a transaction might be cleared by other transactions so that this transaction cannot be successfully committed.
- Default value: 3600000
- Unit: Millisecond
- The transaction that holds locks longer than this time can only be committed or rolled back. The commit might not be successful.

#### 14.5.1.4.4 `stmt-count-limit`

- The maximum number of statements allowed in a single TiDB transaction.
- Default value: 5000
- If a transaction does not roll back or commit after the number of statements exceeds `stmt-count-limit`, TiDB returns the `statement count 5001 exceeds the transaction limitation, autoccommit = false` error. This configuration takes effect **only** in the retryable optimistic transaction. If you use the pessimistic transaction or have disabled the transaction retry, the number of statements in a transaction is not limited by this configuration.

#### 14.5.1.4.5 `txn-entry-size-limit` New in v5.0

- The size limit of a single row of data in TiDB.
- Default value: 6291456 (in bytes)
- The size limit of a single key-value record in a transaction. If the size limit is exceeded, TiDB returns the `entry too large` error. The maximum value of this configuration item does not exceed 125829120 (120 MB).
- Note that TiKV has a similar limit. If the data size of a single write request exceeds `raft-entry-max-size`, which is 8 MB by default, TiKV refuses to process this request. When a table has a row of large size, you need to modify both configurations at the same time.
- The default value of `max_allowed_packet` (the maximum size of a packet for the MySQL protocol) is 67108864 (64 MiB). If a row is larger than `max_allowed_packet`, the row gets truncated.
- The default value of `txn-total-size-limit` (the size limit of a single transaction in TiDB) is 100 MiB. If you increase the `txn-entry-size-limit` value to be over 100 MiB, you need to increase the `txn-total-size-limit` value accordingly.

#### 14.5.1.4.6 `txn-total-size-limit`

- The size limit of a single transaction in TiDB.
- Default value: 104857600 (in bytes)
- In a single transaction, the total size of key-value records cannot exceed this value. The maximum value of this parameter is 1099511627776 (1 TB). Note that if you have used the binlog to serve the downstream consumer Kafka (such as the `arbiter` cluster), the value of this parameter must be no more than 1073741824 (1 GB). This is because 1 GB is the upper limit of a single message size that Kafka can process. Otherwise, an error is returned if this limit is exceeded.
- In TiDB v6.5.0 and later versions, this configuration is no longer recommended. The memory size of a transaction will be accumulated into the memory usage of the session, and the `tidb_mem_quota_query` variable will take effect when the session memory threshold is exceeded. To be compatible with previous versions, this configuration works as follows when you upgrade from an earlier version to TiDB v6.5.0 or later:

- If this configuration is not set or is set to the default value (104857600), after an upgrade, the memory size of a transaction will be accumulated into the memory usage of the session, and the `tidb_mem_quota_query` variable will take effect.
- If this configuration is not defaulted (104857600), it still takes effect and its behavior on controlling the size of a single transaction remains unchanged before and after the upgrade. This means that the memory size of the transaction is not controlled by the `tidb_mem_quota_query` variable.

#### 14.5.1.4.7 `tcp-keep-alive`

- Determines whether to enable `keepalive` in the TCP layer.
- Default value: `true`

#### 14.5.1.4.8 `tcp-no-delay`

- Determines whether to enable `TCP_NODELAY` at the TCP layer. After it is enabled, TiDB disables the Nagle algorithm in the TCP/IP protocol and allows sending small data packets to reduce network latency. This is suitable for latency-sensitive applications with a small transmission volume of data.
- Default value: `true`

#### 14.5.1.4.9 `cross-join`

- Default value: `true`
- TiDB supports executing the `JOIN` statement without any condition (the `WHERE` field) of both sides tables by default; if you set the value to `false`, the server refuses to execute when such a `JOIN` statement appears.

#### 14.5.1.4.10 `stats-lease`

- The time interval of reloading statistics, updating the number of table rows, checking whether it is needed to perform the automatic analysis, using feedback to update statistics and loading statistics of columns.
- Default value: `3s`
  - At intervals of `stats-lease` time, TiDB checks the statistics for updates and updates them to the memory if updates exist.
  - At intervals of `20 * stats-lease` time, TiDB updates the total number of rows generated by DML and the number of modified rows to the system table.
  - At intervals of `stats-lease`, TiDB checks for tables and indexes that need to be automatically analyzed.
  - At intervals of `stats-lease`, TiDB checks for column statistics that need to be loaded to the memory.

- At intervals of `200 * stats-lease`, TiDB writes the feedback cached in the memory to the system table.
- At intervals of `5 * stats-lease`, TiDB reads the feedback in the system table, and updates the statistics cached in the memory.
- When `stats-lease` is set to 0s, TiDB periodically reads the feedback in the system table, and updates the statistics cached in the memory every three seconds. But TiDB no longer automatically modifies the following statistics-related system tables:
  - `mysql.stats_meta`: TiDB no longer automatically records the number of table rows that are modified by the transaction and updates it to this system table.
  - `mysql.stats_histograms/mysql.stats_buckets` and `mysql.stats_top_n`: TiDB no longer automatically analyzes and proactively updates statistics.
  - `mysql.stats_feedback`: TiDB no longer updates the statistics of the tables and indexes according to a part of statistics returned by the queried data.

#### 14.5.1.4.11 pseudo-estimate-ratio

- The ratio of (number of modified rows)/(total number of rows) in a table. If the value is exceeded, the system assumes that the statistics have expired and the pseudo statistics will be used.
- Default value: 0.8
- The minimum value is 0 and the maximum value is 1.

#### 14.5.1.4.12 force-priority

- Sets the priority for all statements.
- Default value: `NO_PRIORITY`
- Value options: The default value `NO_PRIORITY` means that the priority for statements is not forced to change. Other options are `LOW_PRIORITY`, `DELAYED`, and `HIGH_PRIORITY` in ascending order.
- Since v6.1.0, the priority for all statements is determined by the TiDB configuration item `instance.tidb_force_priority` or the system variable `tidb_force_priority`
  - ↔ `. force-priority` still takes effect. But if `force-priority` and `instance.tidb_force_priority` are set at the same time, the latter takes effect.

#### 14.5.1.4.13 distinct-agg-push-down

- Determines whether the optimizer executes the operation that pushes down the aggregation function with `Distinct` (such as `select count(distinct a)from t`) to Coprocessors.
- Default: `false`
- This variable is the initial value of the system variable `tidb_opt_distinct_agg_push_down`
  - ↔ `.`

#### 14.5.1.4.14 `enforce-mpp`

- Determines whether to ignore the optimizer's cost estimation and to forcibly use TiFlash's MPP mode for query execution.
- Default value: `false`
- This configuration item controls the initial value of `tidb_enforce_mpp`. For example, when this configuration item is set to `true`, the default value of `tidb_enforce_mpp` is `ON`.

#### 14.5.1.4.15 `enable-stats-cache-mem-quota` New in v6.1.0

##### **Warning:**

This variable is an experimental feature. It is not recommended to use it in production environments.

- Controls whether to enable the memory quota for the statistics cache.
- Default value: `false`

#### 14.5.1.4.16 `stats-load-concurrency` New in v5.4.0

##### **Warning:**

Currently, synchronously loading statistics is an experimental feature. It is not recommended that you use it in production environments.

- The maximum number of columns that the TiDB synchronously loading statistics feature can process concurrently.
- Default value: 5
- Currently, the valid value range is `[1, 128]`.

#### 14.5.1.4.17 `stats-load-queue-size` New in v5.4.0

##### **Warning:**

Currently, synchronously loading statistics is an experimental feature. It is not recommended that you use it in production environments.

- The maximum number of column requests that the TiDB synchronously loading statistics feature can cache.
- Default value: 1000
- Currently, the valid value range is [1, 100000].

#### 14.5.1.5 opentracing

Configuration items related to opentracing.

##### 14.5.1.5.1 enable

- Enables opentracing to trace the call overhead of some TiDB components. Note that enabling opentracing causes some performance loss.
- Default value: `false`

##### 14.5.1.5.2 rpc-metrics

- Enables RPC metrics.
- Default value: `false`

#### 14.5.1.6 opentracing.sampler

Configuration items related to opentracing.sampler.

##### 14.5.1.6.1 type

- Specifies the type of the opentracing sampler. The string value is case-insensitive.
- Default value: `"const"`
- Value options: `"const"`, `"probabilistic"`, `"ratelimiting"`, `"remote"`

##### 14.5.1.6.2 param

- The parameter of the opentracing sampler.
  - For the `const` type, the value can be 0 or 1, which indicates whether to enable the `const` sampler.
  - For the `probabilistic` type, the parameter specifies the sampling probability, which can be a float number between 0 and 1.
  - For the `ratelimiting` type, the parameter specifies the number of spans sampled per second.
  - For the `remote` type, the parameter specifies the sampling probability, which can be a float number between 0 and 1.
- Default value: 1.0

#### 14.5.1.6.3 `sampling-server-url`

- The HTTP URL of the jaeger-agent sampling server.
- Default value: ""

#### 14.5.1.6.4 `max-operations`

- The maximum number of operations that the sampler can trace. If an operation is not traced, the default probabilistic sampler is used.
- Default value: 0

#### 14.5.1.6.5 `sampling-refresh-interval`

- Controls the frequency of polling the jaeger-agent sampling policy.
- Default value: 0

### 14.5.1.7 `opentracing.reporter`

Configuration items related to `opentracing.reporter`.

#### 14.5.1.7.1 `queue-size`

- The queue size with which the reporter records spans in memory.
- Default value: 0

#### 14.5.1.7.2 `buffer-flush-interval`

- The interval at which the reporter flushes the spans in memory to the storage.
- Default value: 0

#### 14.5.1.7.3 `log-spans`

- Determines whether to print the log for all submitted spans.
- Default value: `false`

#### 14.5.1.7.4 `local-agent-host-port`

- The address at which the reporter sends spans to the jaeger-agent.
- Default value: ""

### 14.5.1.8 `tikv-client`

#### 14.5.1.8.1 `grpc-connection-count`

- The maximum number of connections established with each TiKV.
- Default value: 4

#### 14.5.1.8.2 `grpc-keepalive-time`

- The `keepalive` time interval of the RPC connection between TiDB and TiKV nodes. If there is no network packet within the specified time interval, the gRPC client executes `ping` command to TiKV to see if it is alive.
- Default: 10
- Unit: second

#### 14.5.1.8.3 `grpc-keepalive-timeout`

- The timeout of the RPC `keepalive` check between TiDB and TiKV nodes.
- Default value: 3
- Unit: second

#### 14.5.1.8.4 `grpc-compression-type`

- Specifies the compression type used for data transfer between TiDB and TiKV nodes. The default value is `"none"`, which means no compression. To enable the gzip compression, set this value to `"gzip"`.
- Default value: `"none"`
- Value options: `"none"`, `"gzip"`

#### 14.5.1.8.5 `commit-timeout`

- The maximum timeout when executing a transaction commit.
- Default value: 41s
- It is required to set this value larger than twice of the Raft election timeout.

#### 14.5.1.8.6 `max-batch-size`

- The maximum number of RPC packets sent in batch. If the value is not 0, the `BatchCommands` API is used to send requests to TiKV, and the RPC latency can be reduced in the case of high concurrency. It is recommended that you do not modify this value.
- Default value: 128

#### 14.5.1.8.7 `max-batch-wait-time`

- Waits for `max-batch-wait-time` to encapsulate the data packets into a large packet in batch and send it to the TiKV node. It is valid only when the value of `tikv-client.max-batch-size` is greater than 0. It is recommended not to modify this value.
- Default value: 0
- Unit: nanoseconds

#### 14.5.1.8.8 `batch-wait-size`

- The maximum number of packets sent to TiKV in batch. It is recommended not to modify this value.
- Default value: 8
- If the value is 0, this feature is disabled.

#### 14.5.1.8.9 `overload-threshold`

- The threshold of the TiKV load. If the TiKV load exceeds this threshold, more batch packets are collected to relieve the pressure of TiKV. It is valid only when the value of `tikv-client.max-batch-size` is greater than 0. It is recommended not to modify this value.
- Default value: 200

### 14.5.1.9 `tikv-client.copr-cache` New in v4.0.0

This section introduces configuration items related to the Coprocessor Cache feature.

#### 14.5.1.9.1 `capacity-mb`

- The total size of the cached data. When the cache space is full, old cache entries are evicted. When the value is 0.0, the Coprocessor Cache feature is disabled.
- Default value: 1000.0
- Unit: MB
- Type: Float

#### 14.5.1.10 `txn-local-latches`

Configuration related to the transaction latch. It is recommended to enable it when many local transaction conflicts occur.

##### 14.5.1.10.1 `enabled`

- Determines whether to enable the memory lock of transactions.
- Default value: `false`

#### 14.5.1.10.2 capacity

- The number of slots corresponding to Hash, which automatically adjusts upward to an exponential multiple of 2. Each slot occupies 32 Bytes of memory. If set too small, it might result in slower running speed and poor performance in the scenario where data writing covers a relatively large range (such as importing data).
- Default value: 2048000

#### 14.5.1.11 binlog

Configurations related to TiDB Binlog.

##### 14.5.1.11.1 enable

- Enables or disables binlog.
- Default value: `false`

##### 14.5.1.11.2 write-timeout

- The timeout of writing binlog into Pump. It is not recommended to modify this value.
- Default: 15s
- unit: second

##### 14.5.1.11.3 ignore-error

- Determines whether to ignore errors occurred in the process of writing binlog into Pump. It is not recommended to modify this value.
- Default value: `false`
- When the value is set to `true` and an error occurs, TiDB stops writing binlog and add 1 to the count of the `tidb_server_critical_error_total` monitoring item. When the value is set to `false`, the binlog writing fails and the entire TiDB service is stopped.

##### 14.5.1.11.4 binlog-socket

- The network address to which binlog is exported.
- Default value: ""

##### 14.5.1.11.5 strategy

- The strategy of Pump selection when binlog is exported. Currently, only the `hash` and `range` methods are supported.
- Default value: `range`

#### 14.5.1.12 status

Configuration related to the status of TiDB service.

##### 14.5.1.12.1 report-status

- Enables or disables the HTTP API service.
- Default value: `true`

##### 14.5.1.12.2 record-db-qps

- Determines whether to transmit the database-related QPS metrics to Prometheus.
- Default value: `false`

#### 14.5.1.13 pessimistic-txn

For pessimistic transaction usage, refer to [TiDB Pessimistic Transaction Mode](#).

##### 14.5.1.13.1 max-retry-count

- The maximum number of retries of each statement in pessimistic transactions. If the number of retries exceeds this limit, an error occurs.
- Default value: 256

##### 14.5.1.13.2 deadlock-history-capacity

- The maximum number of deadlock events that can be recorded in the `INFORMATION_SCHEMA` `↔` `.DEADLOCKS` table of a single TiDB server. If this table is in full volume and an additional deadlock event occurs, the earliest record in the table will be removed to make place for the newest error.
- Default value: 10
- Minimum value: 0
- Maximum value: 10000

##### 14.5.1.13.3 deadlock-history-collect-retryable

- Controls whether the `INFORMATION_SCHEMA.DEADLOCKS` table collects the information of retryable deadlock errors. For the description of retryable deadlock errors, see [Retryable deadlock errors](#).
- Default value: `false`

#### 14.5.1.13.4 pessimistic-auto-commit New in v6.0.0

- Determines the transaction mode that the auto-commit transaction uses when the pessimistic transaction mode is globally enabled (`tidb_txn_mode='pessimistic'`). By default, even if the pessimistic transaction mode is globally enabled, the auto-commit transaction still uses the optimistic transaction mode. After enabling `pessimistic`  $\leftrightarrow$  `-auto-commit` (set to `true`), the auto-commit transaction also uses pessimistic mode, which is consistent with the other explicitly committed pessimistic transactions.
- For scenarios with conflicts, after enabling this configuration, TiDB includes auto-commit transactions into the global lock-waiting management, which avoids deadlocks and mitigates the latency spike brought by deadlock-causing conflicts.
- For scenarios with no conflicts, if there are many auto-commit transactions (the specific number is determined by the real scenarios. For example, the number of auto-commit transactions accounts for more than half of the total number of applications), and a single transaction operates a large data volume, enabling this configuration causes performance regression. For example, the auto-commit `INSERT INTO SELECT` statement.
- Default value: `false`

#### 14.5.1.13.5 constraint-check-in-place-pessimistic New in v6.4.0

- Controls the default value of the system variable `tidb_constraint_check_in_place_pessimistic`  $\leftrightarrow$  `.`
- Default value: `true`

### 14.5.1.14 isolation-read

Configuration items related to read isolation.

#### 14.5.1.14.1 engines

- Controls from which engine TiDB allows to read data.
- Default value: [`“tikv”`, `“tiflash”`, `“tidb”`], indicating that the engine is automatically selected by the optimizer.
- Value options: Any combinations of `“tikv”`, `“tiflash”`, and `“tidb”`, for example, [`“tikv”`, `“tidb”`] or [`“tiflash”`, `“tidb”`]

### 14.5.1.15 instance

#### 14.5.1.15.1 tidb\_enable\_collect\_execution\_info

- This configuration controls whether to record the execution information of each operator in the slow query log.
- Default value: `true`
- Before v6.1.0, this configuration is set by `enable-collect-execution-info`.

#### 14.5.1.15.2 `tidb_enable_slow_log`

- This configuration is used to control whether to enable the slow log feature.
- Default value: `true`
- Value options: `true` or `false`
- Before v6.1.0, this configuration is set by `enable-slow-log`.

#### 14.5.1.15.3 `tidb_slow_log_threshold`

- This configuration is used to output the threshold value of the time consumed by the slow log. When the time consumed by a query is larger than this value, this query is considered as a slow log and its log is output to the slow query log.
- Default value: 300
- Range: [-1, 9223372036854775807]
- Unit: Milliseconds
- Before v6.1.0, this configuration is set by `slow-threshold`.

#### 14.5.1.15.4 `tidb_record_plan_in_slow_log`

- This configuration is used to control whether to include the execution plan of slow queries in the slow log.
- Default value: 1
- Value options: 1 (enabled, default) or 0 (disabled).
- The value of this configuration will initialize the value of system variable `tidb_record_plan_in_slow_log`  
↔
- Before v6.1.0, this configuration is set by `record-plan-in-slow-log`.

#### 14.5.1.15.5 `tidb_force_priority`

- This configuration is used to change the default priority for statements executed on a TiDB server.
- Default value: `NO_PRIORITY`
- The default value `NO_PRIORITY` means that the priority for statements is not forced to change. Other options are `LOW_PRIORITY`, `DELAYED`, and `HIGH_PRIORITY` in ascending order.
- Before v6.1.0, this configuration is set by `force-priority`.

#### 14.5.1.15.6 `max_connections`

- The maximum number of connections permitted for a single TiDB instance. It can be used for resources control.
- Default value: 0

- Range: [0, 100000]
- The default value 0 means no limit. When the value of this variable is larger than 0, and the number of connections reaches the value, the TiDB server will reject new connections from clients.
- The value of this configuration will initialize the value of system variable `max_connections`  
↪
- Before v6.2.0, this configuration is set by `max-server-connections`.

#### 14.5.1.15.7 `tidb_enable_ddl`

- This configuration controls whether the corresponding TiDB instance can become a DDL owner or not.
- Default value: `true`
- Possible values: `OFF`, `ON`
- The value of this configuration will initialize the value of the system variable `tidb_enable_ddl`
- Before v6.3.0, this configuration is set by `run-ddl`.

#### 14.5.1.15.8 `tidb_stmt_summary_enable_persistent` New in v6.6.0

##### **Warning:**

Statements summary persistence is an experimental feature. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an [issue](#) on GitHub.

- Controls whether to enable statements summary persistence.
- Default value: `false`
- For more details, see [Persist statements summary](#).

#### 14.5.1.15.9 `tidb_stmt_summary_filename` New in v6.6.0

##### **Warning:**

Statements summary persistence is an experimental feature. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an [issue](#) on GitHub.

- When statements summary persistence is enabled, this configuration specifies the file to which persistent data is written.
- Default value: `tidb-statements.log`

#### 14.5.1.15.10 `tidb_stmt_summary_file_max_days` New in v6.6.0

##### **Warning:**

Statements summary persistence is an experimental feature. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an [issue](#) on GitHub.

- When statements summary persistence is enabled, this configuration specifies the maximum number of days to keep persistent data files.
- Default value: 3
- Unit: day
- You can adjust the value based on the data retention requirements and disk space usage.

#### 14.5.1.15.11 `tidb_stmt_summary_file_max_size` New in v6.6.0

##### **Warning:**

Statements summary persistence is an experimental feature. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an [issue](#) on GitHub.

- When statements summary persistence is enabled, this configuration specifies the maximum size of a persistent data file.
- Default value: 64
- Unit: MiB
- You can adjust the value based on the data retention requirements and disk space usage.

#### 14.5.1.15.12 `tidb_stmt_summary_file_max_backups` New in v6.6.0

##### **Warning:**

Statements summary persistence is an experimental feature. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an [issue](#) on GitHub.

- When statements summary persistence is enabled, this configuration specifies the maximum number of data files that can be persisted. 0 means no limit on the number of files.
- Default value: 0
- You can adjust the value based on the data retention requirements and disk space usage.

#### 14.5.1.16 `proxy-protocol`

Configuration items related to the PROXY protocol.

##### 14.5.1.16.1 `networks`

- The list of proxy server's IP addresses allowed to connect to TiDB using the [PROXY protocol](#)
- Default value: ""
- In general cases, when you access TiDB behind a reverse proxy, TiDB takes the IP address of the reverse proxy server as the IP address of the client. By enabling the PROXY protocol, reverse proxies that support this protocol, such as HAProxy, can pass the real client IP address to TiDB.
- After configuring this parameter, TiDB allows the configured source IP address to connect to TiDB using the PROXY protocol; if a protocol other than PROXY is used, this connection will be denied. If this parameter is left empty, no IP address can connect to TiDB using the PROXY protocol. The value can be an IP address (192.168.1.50) or CIDR (192.168.1.0/24) with , as the separator. \* means any IP addresses.

##### **Warning:**

Use \* with caution because it might introduce security risks by allowing a client of any IP address to report its IP address. In addition, using \* might also cause the internal component that directly connects to TiDB (such as TiDB Dashboard) to be unavailable.

### 14.5.1.17 experimental

The `experimental` section, introduced in v3.1.0, describes the configurations related to the experimental features of TiDB.

#### 14.5.1.17.1 `allow-expression-index` New in v4.0.0

- Controls whether an expression index can be created. Since TiDB v5.2.0, if the function in an expression is safe, you can create an expression index directly based on this function without enabling this configuration. If you want to create an expression index based on other functions, you can enable this configuration, but correctness issues might exist. By querying the `tidb_allow_function_for_expression_index` variable, you can get the functions that are safe to be directly used for creating an expression.
- Default value: `false`

## 14.5.2 TiKV Configuration File

The TiKV configuration file supports more options than command-line parameters. You can find the default configuration file in [etc/config-template.toml](#) and rename it to `config` ↪ `.toml`.

This document only describes the parameters that are not included in command-line parameters. For more details, see [command-line parameter](#).

### Tip:

If you need to adjust the value of a configuration item, refer to [Modify the configuration](#).

### 14.5.2.1 Global configuration

#### 14.5.2.1.1 `abort-on-panic`

- Sets whether to call `abort()` to exit the process when TiKV panics. This option affects whether TiKV allows the system to generate core dump files.
  - If the value of this configuration item is `false`, when TiKV panics, it calls `exit()` to exit the process.

- If the value of this configuration item is `true`, when TiKV panics, TiKV calls `abort()` to exit the process. At this time, TiKV allows the system to generate core dump files when exiting. To generate the core dump file, you also need to perform the system configuration related to core dump (for example, setting the size limit of the core dump file via `ulimit -c` command, and configure the core dump path. Different operating systems have different related configurations). To avoid the core dump files occupying too much disk space and causing insufficient TiKV disk space, it is recommended to set the core dump generation path to a disk partition different to that of TiKV data.

- Default value: `false`

#### 14.5.2.1.2 `slow-log-file`

- The file that stores slow logs
- If this configuration item is not set, but `log.file.filename` is set, slow logs are output to the log file specified by `log.file.filename`.
- If neither `slow-log-file` nor `log.file.filename` are set, all logs are output to “stderr” by default.
- If both configuration items are set, ordinary logs are output to the log file specified by `log.file.filename`, and slow logs are output to the log file set by `slow-log-file`.
- Default value: `""`

#### 14.5.2.1.3 `slow-log-threshold`

- The threshold for outputting slow logs. If the processing time is longer than this threshold, slow logs are output.
- Default value: `"1s"`

#### 14.5.2.1.4 `memory-usage-limit`

- The limit on memory usage of the TiKV instance. When the memory usage of TiKV almost reaches this threshold, internal cache will be evicted to release memory.
- In most cases, the TiKV instance is set to use 75% of the total available system memory, so you do not need to explicitly specify this configuration item. The rest 25% of the memory is reserved for the OS page cache. See [storage.block-cache.capacity](#) for details.
- When deploying multiple TiKV nodes on a single physical machine, you still do not need to set this configuration item. In this case, the TiKV instance uses  $5/3 * \text{block} \leftrightarrow \text{-cache.capacity}$  of memory.
- The default value for different system memory capacity is as follows:

- system=8G block-cache=3.6G memory-usage-limit=6G page-cache=2G
- system=16G block-cache=7.2G memory-usage-limit=12G page-cache=4G
- system=32G block-cache=14.4G memory-usage-limit=24G page-cache=8G

### 14.5.2.2 log New in v5.4.0

- Configuration items related to the log.
- From v5.4.0, to make the log configuration items of TiKV and TiDB consistent, TiKV deprecates the former configuration item `log-rotation-timespan` and changes `log-rotation-timespan` ↪ `level`, `log-format`, `log-file`, `log-rotation-size` to the following ones. If you only set the old configuration items, and their values are set to non-default values, the old items remain compatible with the new items. If both old and new configuration items are set, the new items take effect.

#### 14.5.2.2.1 level New in v5.4.0

- The log level
- Optional values: "debug", "info", "warn", "error", "fatal"
- Default value: "info"

#### 14.5.2.2.2 format New in v5.4.0

- The log format
- Optional values: "json", "text"
- Default value: "text"

#### 14.5.2.2.3 enable-timestamp New in v5.4.0

- Determines whether to enable or disable the timestamp in the log
- Optional values: true, false
- Default value: true

### 14.5.2.3 log.file New in v5.4.0

- Configuration items related to the log file.

#### 14.5.2.3.1 filename New in v5.4.0

- The log file. If this configuration item is not set, logs are output to “stderr” by default. If this configuration item is set, logs are output to the corresponding file.
- Default value: ""

#### 14.5.2.3.2 `max-size` New in v5.4.0

- The maximum size of a single log file. When the file size is larger than the value set by this configuration item, the system automatically splits the single file into multiple files.
- Default value: 300
- Maximum value: 4096
- Unit: MiB

#### 14.5.2.3.3 `max-days` New in v5.4.0

- The maximum number of days that TiKV keeps log files.
  - If the configuration item is not set, or the value of it is set to the default value 0, TiKV does not clean log files.
  - If the parameter is set to a value other than 0, TiKV cleans up the expired log files after `max-days`.
- Default value: 0

#### 14.5.2.3.4 `max-backups` New in v5.4.0

- The maximum number of log files that TiKV keeps.
  - If the configuration item is not set, or the value of it is set to the default value 0, TiKV keeps all log files.
  - If the configuration item is set to a value other than 0, TiKV keeps at most the number of old log files specified by `max-backups`. For example, if the value is set to 7, TiKV keeps up to 7 old log files.
- Default value: 0

#### 14.5.2.3.5 `pd.enable-forwarding` New in v5.0.0

- Controls whether the PD client in TiKV forwards requests to the leader via the followers in the case of possible network isolation.
- Default value: `false`
- If the environment might have isolated network, enabling this parameter can reduce the window of service unavailability.
- If you cannot accurately determine whether isolation, network interruption, or downtime has occurred, using this mechanism has the risk of misjudgment and causes reduced availability and performance. If network failure has never occurred, it is not recommended to enable this parameter.

#### 14.5.2.4 server

- Configuration items related to the server.

##### 14.5.2.4.1 addr

- The listening IP address and the listening port
- Default value: "127.0.0.1:20160"

##### 14.5.2.4.2 advertise-addr

- Advertise the listening address for client communication
- If this configuration item is not set, the value of `addr` is used.
- Default value: ""

##### 14.5.2.4.3 status-addr

- The configuration item reports TiKV status directly through the HTTP address

**Warning:**

If this value is exposed to the public, the status information of the TiKV server might be leaked.

- To disable the status address, set the value to "".
- Default value: "127.0.0.1:20180"

##### 14.5.2.4.4 status-thread-pool-size

- The number of worker threads for the HTTP API service
- Default value: 1
- Minimum value: 1

##### 14.5.2.4.5 grpc-compression-type

- The compression algorithm for gRPC messages
- Optional values: "none", "deflate", "gzip"
- Default value: "none"

#### 14.5.2.4.6 `grpc-concurrency`

- The number of gRPC worker threads. When you modify the size of the gRPC thread pool, refer to [Performance tuning for TiKV thread pools](#).
- Default value: 5
- Minimum value: 1

#### 14.5.2.4.7 `grpc-concurrent-stream`

- The maximum number of concurrent requests allowed in a gRPC stream
- Default value: 1024
- Minimum value: 1

#### 14.5.2.4.8 `grpc-memory-pool-quota`

- Limits the memory size that can be used by gRPC
- Default value: No limit
- Limit the memory in case OOM is observed. Note that limit the usage can lead to potential stall

#### 14.5.2.4.9 `grpc-raft-conn-num`

- The maximum number of links among TiKV nodes for Raft communication
- Default value: 1
- Minimum value: 1

#### 14.5.2.4.10 `max-grpc-send-msg-len`

- Sets the maximum length of a gRPC message that can be sent
- Default value: 10485760
- Unit: Bytes
- Maximum value: 2147483647

#### 14.5.2.4.11 `grpc-stream-initial-window-size`

- The window size of the gRPC stream
- Default value: 2MB
- Unit: KB|MB|GB
- Minimum value: "1KB"

#### 14.5.2.4.12 `grpc-keepalive-time`

- The time interval at which that gRPC sends `keepalive` Ping messages
- Default value: "10s"
- Minimum value: "1s"

#### 14.5.2.4.13 `grpc-keepalive-timeout`

- Disables the timeout for gRPC streams
- Default value: "3s"
- Minimum value: "1s"

#### 14.5.2.4.14 `concurrent-send-snap-limit`

- The maximum number of snapshots sent at the same time
- Default value: 32
- Minimum value: 1

#### 14.5.2.4.15 `concurrent-recv-snap-limit`

- The maximum number of snapshots received at the same time
- Default value: 32
- Minimum value: 1

#### 14.5.2.4.16 `end-point-recursion-limit`

- The maximum number of recursive levels allowed when TiKV decodes the Coprocessor DAG expression
- Default value: 1000
- Minimum value: 1

#### 14.5.2.4.17 `end-point-request-max-handle-duration`

- The longest duration allowed for a TiDB's push down request to TiKV for processing tasks
- Default value: "60s"
- Minimum value: "1s"

#### 14.5.2.4.18 `snap-max-write-bytes-per-sec`

- The maximum allowable disk bandwidth when processing snapshots
- Default value: "100MB"
- Unit: KB|MB|GB
- Minimum value: "1KB"

#### 14.5.2.4.19 `enable-request-batch`

- Determines whether to process requests in batches
- Default value: `true`

#### 14.5.2.4.20 `labels`

- Specifies server attributes, such as `{ zone = "us-west-1", disk = "ssd" }`.
- Default value: `{}`

#### 14.5.2.4.21 `background-thread-count`

- The working thread count of the background pool, including endpoint threads, BR threads, split-check threads, Region threads, and other threads of delay-insensitive tasks.
- Default value: when the number of CPU cores is less than 16, the default value is 2; otherwise, the default value is 3.

#### 14.5.2.4.22 `end-point-slow-log-threshold`

- The time threshold for a TiDB's push-down request to output slow log. If the processing time is longer than this threshold, the slow logs are output.
- Default value: `"1s"`
- Minimum value: `0`

#### 14.5.2.4.23 `raft-client-queue-size`

- Specifies the queue size of the Raft messages in TiKV. If too many messages not sent in time result in a full buffer, or messages discarded, you can specify a greater value to improve system stability.
- Default value: `8192`

#### 14.5.2.4.24 `simplify-metrics` New in v6.2.0

- Specifies whether to simplify the returned monitoring metrics. After you set the value to `true`, TiKV reduces the amount of data returned for each request by filtering out some metrics.
- Default value: `false`

#### 14.5.2.4.25 `forward-max-connections-per-address` New in v5.0.0

- Sets the size of the connection pool for service and forwarding requests to the server. Setting it to too small a value affects the request latency and load balancing.
- Default value: 4

#### 14.5.2.5 `readpool.unified`

Configuration items related to the single thread pool serving read requests. This thread pool supersedes the original storage thread pool and coprocessor thread pool since the 4.0 version.

##### 14.5.2.5.1 `min-thread-count`

- The minimal working thread count of the unified read pool
- Default value: 1

##### 14.5.2.5.2 `max-thread-count`

- The maximum working thread count of the unified read pool or the `UnifyReadPool` thread pool. When you modify the size of this thread pool, refer to [Performance tuning for TiKV thread pools](#).
- Value range: `[min-thread-count, MAX(4, CPU)]`. In `MAX(4, CPU)`, CPU means the number of your CPU cores. `MAX(4, CPU)` takes the greater value out of 4 and the CPU.
- Default value: `MAX(4, CPU * 0.8)`

##### 14.5.2.5.3 `stack-size`

- The stack size of the threads in the unified thread pool
- Type: Integer + Unit
- Default value: "10MB"
- Unit: KB|MB|GB
- Minimum value: "2MB"
- Maximum value: The number of Kbytes output in the result of the `ulimit -sH` command executed in the system.

##### 14.5.2.5.4 `max-tasks-per-worker`

- The maximum number of tasks allowed for a single thread in the unified read pool. `Server Is Busy` is returned when the value is exceeded.
- Default value: 2000
- Minimum value: 2

#### 14.5.2.5.5 auto-adjust-pool-size New in v6.3.0

- Controls whether to automatically adjust the thread pool size. When it is enabled, the read performance of TiKV is optimized by automatically adjusting the UnifyReadPool thread pool size based on the current CPU usage. The possible range of the thread pool is  $[\text{max-thread-count}, \text{MAX}(4, \text{CPU})]$ . The maximum value is the same as the one of `max-thread-count`.
- Default value: `false`

### 14.5.2.6 readpool.storage

Configuration items related to storage thread pool.

#### 14.5.2.6.1 use-unified-pool

- Determines whether to use the unified thread pool (configured in `readpool.unified`) for storage requests. If the value of this parameter is `false`, a separate thread pool is used, which is configured through the rest parameters in this section (`readpool.storage`).
- Default value: If this section (`readpool.storage`) has no other configurations, the default value is `true`. Otherwise, for the backward compatibility, the default value is `false`. Change the configuration in `readpool.unified` as needed before enabling this option.

#### 14.5.2.6.2 high-concurrency

- The allowable number of concurrent threads that handle high-priority read requests
- When `8 <= cpu_num <= 16`, the default value is `cpu_num * 0.5`; when `cpu_num` is smaller than 8, the default value is 4; when `cpu_num` is greater than 16, the default value is 8.
- Minimum value: 1

#### 14.5.2.6.3 normal-concurrency

- The allowable number of concurrent threads that handle normal-priority read requests
- When `8 <= cpu_num <= 16`, the default value is `cpu_num * 0.5`; when `cpu_num` is smaller than 8, the default value is 4; when `cpu_num` is greater than 16, the default value is 8.
- Minimum value: 1

#### 14.5.2.6.4 low-concurrency

- The allowable number of concurrent threads that handle low-priority read requests
- When `8 <= cpu_num <= 16`, the default value is `cpu_num * 0.5`; when `cpu_num` is smaller than 8, the default value is 4; when `cpu_num` is greater than 16, the default value is 8.
- Minimum value: 1

#### 14.5.2.6.5 `max-tasks-per-worker-high`

- The maximum number of tasks allowed for a single thread in a high-priority thread pool. `Server Is Busy` is returned when the value is exceeded.
- Default value: 2000
- Minimum value: 2

#### 14.5.2.6.6 `max-tasks-per-worker-normal`

- The maximum number of tasks allowed for a single thread in a normal-priority thread pool. `Server Is Busy` is returned when the value is exceeded.
- Default value: 2000
- Minimum value: 2

#### 14.5.2.6.7 `max-tasks-per-worker-low`

- The maximum number of tasks allowed for a single thread in a low-priority thread pool. `Server Is Busy` is returned when the value is exceeded.
- Default value: 2000
- Minimum value: 2

#### 14.5.2.6.8 `stack-size`

- The stack size of threads in the Storage read thread pool
- Type: Integer + Unit
- Default value: "10MB"
- Unit: KB|MB|GB
- Minimum value: "2MB"
- Maximum value: The number of Kbytes output in the result of the `ulimit -sH` command executed in the system.

### 14.5.2.7 `readpool.coprocessor`

Configuration items related to the Coprocessor thread pool.

#### 14.5.2.7.1 `use-unified-pool`

- Determines whether to use the unified thread pool (configured in `readpool.unified`  $\leftrightarrow$ ) for coprocessor requests. If the value of this parameter is `false`, a separate thread pool is used, which is configured through the rest parameters in this section (`readpool.coprocessor`).
- Default value: If none of the parameters in this section (`readpool.coprocessor`) are set, the default value is `true`. Otherwise, the default value is `false` for the backward compatibility. Adjust the configuration items in `readpool.unified` before enabling this parameter.

#### 14.5.2.7.2 **high-concurrency**

- The allowable number of concurrent threads that handle high-priority Coprocessor requests, such as checkpoints
- Default value:  $\text{CPU} * 0.8$
- Minimum value: 1

#### 14.5.2.7.3 **normal-concurrency**

- The allowable number of concurrent threads that handle normal-priority Coprocessor requests
- Default value:  $\text{CPU} * 0.8$
- Minimum value: 1

#### 14.5.2.7.4 **low-concurrency**

- The allowable number of concurrent threads that handle low-priority Coprocessor requests, such as table scan
- Default value:  $\text{CPU} * 0.8$
- Minimum value: 1

#### 14.5.2.7.5 **max-tasks-per-worker-high**

- The number of tasks allowed for a single thread in a high-priority thread pool. When this number is exceeded, `Server Is Busy` is returned.
- Default value: 2000
- Minimum value: 2

#### 14.5.2.7.6 **max-tasks-per-worker-normal**

- The number of tasks allowed for a single thread in a normal-priority thread pool. When this number is exceeded, `Server Is Busy` is returned.
- Default value: 2000
- Minimum value: 2

#### 14.5.2.7.7 **max-tasks-per-worker-low**

- The number of tasks allowed for a single thread in a low-priority thread pool. When this number is exceeded, `Server Is Busy` is returned.
- Default value: 2000
- Minimum value: 2

#### 14.5.2.7.8 `stack-size`

- The stack size of the thread in the Coprocessor thread pool
- Type: Integer + Unit
- Default value: "10MB"
- Unit: KB|MB|GB
- Minimum value: "2MB"
- Maximum value: The number of Kbytes output in the result of the `ulimit -sH` command executed in the system.

### 14.5.2.8 `storage`

Configuration items related to storage.

#### 14.5.2.8.1 `data-dir`

- The storage path of the RocksDB directory
- Default value: "."

#### 14.5.2.8.2 `engine` New in v6.6.0

##### **Warning:**

This feature is experimental. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an [issue](#) on GitHub.

- Specifies the engine type. This configuration can only be specified when creating a new cluster and cannot be modified once being specified.
- Default value: "raft-kv"
- Value options:
  - "raft-kv": The default engine type in versions earlier than TiDB v6.6.0.
  - "partitioned-raft-kv": The new storage engine type introduced in TiDB v6.6.0.

#### 14.5.2.8.3 `scheduler-concurrency`

- A built-in memory lock mechanism to prevent simultaneous operations on a key. Each key has a hash in a different slot.
- Default value: 524288
- Minimum value: 1

#### 14.5.2.8.4 `scheduler-worker-pool-size`

- The number of threads in the Scheduler thread pool. Scheduler threads are mainly used for checking transaction consistency before data writing. If the number of CPU cores is greater than or equal to 16, the default value is 8; otherwise, the default value is 4. When you modify the size of the Scheduler thread pool, refer to [Performance tuning for TiKV thread pools](#).
- Default value: 4
- Value range:  $[1, \text{MAX}(4, \text{CPU})]$ . In  $\text{MAX}(4, \text{CPU})$ , CPU means the number of your CPU cores.  $\text{MAX}(4, \text{CPU})$  takes the greater value out of 4 and the CPU.

#### 14.5.2.8.5 `scheduler-pending-write-threshold`

- The maximum size of the write queue. A `Server Is Busy` error is returned for a new write to TiKV when this value is exceeded.
- Default value: "100MB"
- Unit: MB|GB

#### 14.5.2.8.6 `enable-async-apply-prewrite`

- Determines whether Async Commit transactions respond to the TiKV client before applying prewrite requests. After enabling this configuration item, latency can be easily reduced when the apply duration is high, or the delay jitter can be reduced when the apply duration is not stable.
- Default value: `false`

#### 14.5.2.8.7 `reserve-space`

- When TiKV is started, some space is reserved on the disk as disk protection. When the remaining disk space is less than the reserved space, TiKV restricts some write operations. The reserved space is divided into two parts: 80% of the reserved space is used as the extra disk space required for operations when the disk space is insufficient, and the other 20% is used to store the temporary file. In the process of reclaiming space, if the storage is exhausted by using too much extra disk space, this temporary file serves as the last protection for restoring services.
- The name of the temporary file is `space_placeholder_file`, located in the `storage`.  $\leftrightarrow$  `data-dir` directory. When TiKV goes offline because its disk space ran out, if you restart TiKV, the temporary file is automatically deleted and TiKV tries to reclaim the space.
- When the remaining space is insufficient, TiKV does not create the temporary file. The effectiveness of the protection is related to the size of the reserved space. The size of the reserved space is the larger value between 5% of the disk capacity and this configuration value. When the value of this configuration item is "0MB", TiKV disables this disk protection feature.

- Default value: "5GB"
- Unit: MB|GB

#### 14.5.2.8.8 `enable-ttl`

##### Warning:

- Set `enable-ttl` to `true` or `false` **ONLY WHEN** deploying a new TiKV cluster. **DO NOT** modify the value of this configuration item in an existing TiKV cluster. TiKV clusters with different `enable-ttl` values use different data formats. Therefore, if you modify the value of this item in an existing TiKV cluster, the cluster will store data in different formats, which causes the “can’t enable TTL on a non-ttl” error when you restart the TiKV cluster.
- Use `enable-ttl` **ONLY IN** a TiKV cluster. **DO NOT** use this configuration item in a cluster that has TiDB nodes (which means setting `enable-ttl` to `true` in such clusters). Otherwise, critical issues such as data corruption and the upgrade failure of TiDB clusters will occur.

- TTL is short for “Time to live”. If this item is enabled, TiKV automatically deletes data that reaches its TTL. To set the value of TTL, you need to specify it in the requests when writing data via the client. If the TTL is not specified, it means that TiKV does not automatically delete the corresponding data.
- Default value: `false`

#### 14.5.2.8.9 `ttl-check-poll-interval`

- The interval of checking data to reclaim physical spaces. If data reaches its TTL, TiKV forcibly reclaims its physical space during the check.
- Default value: "12h"
- Minimum value: "0s"

#### 14.5.2.8.10 `background-error-recovery-window` New in v6.1.0

- The maximum allowable time for TiKV to recover after RocksDB detects a recoverable background error. If some background SST files are damaged, RocksDB will report to PD via heartbeat after locating the Peer to which the damaged SST files belong. PD then performs scheduling operations to remove this Peer. Finally, the damaged SST files are deleted directly, and the TiKV background will work as normal again.

- The damaged SST files still exist before the recovery finishes. During such a period, RocksDB can continue writing data, but an error will be reported when the damaged part of the data is read.
- If the recovery fails to finish within this time window, TiKV will panic.
- Default value: 1h

#### 14.5.2.8.11 `api-version` New in v6.1.0

- The storage format and interface version used by TiKV when TiKV serves as the RawKV store.
- Value options:
  - 1: Uses API V1, does not encode the data passed from the client, and stores data as it is. In versions earlier than v6.1.0, TiKV uses API V1 by default.
  - 2: Uses API V2:
    - \* The data is stored in the Multi-Version Concurrency Control (MVCC) format, where the timestamp is obtained from PD (which is TSO) by tikv-server.
    - \* Data is scoped according to different usage and API V2 supports co-existence of TiDB, Transactional KV, and RawKV applications in a single cluster.
    - \* When API V2 is used, you are expected to set `storage.enable-ttl = true` at the same time. Because API V2 supports the TTL feature, you must turn on `enable-ttl` explicitly. Otherwise, it will be in conflict because `storage.enable-ttl` defaults to `false`.
    - \* When API V2 is enabled, you need to deploy at least one tidb-server instance to reclaim obsolete data. This tidb-server instance can provide read and write services at the same time. To ensure high availability, you can deploy multiple tidb-server instances.
    - \* Client support is required for API V2. For details, see the corresponding instruction of the client for the API V2.
    - \* Since v6.2.0, Change Data Capture (CDC) for RawKV is supported. Refer to [RawKV CDC](#).
- Default value: 1

#### Warning:

- API V1 and API V2 are different from each other in the storage format. You can enable or disable API V2 directly **only** when TiKV contains only TiDB data. In other scenarios, you need to deploy a new cluster, and migrate data using [RawKV Backup & Restore](#).

- After API V2 is enabled, you **cannot** downgrade the TiKV cluster to a version earlier than v6.1.0. Otherwise, data corruption might occur.

### 14.5.2.9 storage.block-cache

Configuration items related to the sharing of block cache among multiple RocksDB Column Families (CF).

#### 14.5.2.9.1 capacity

- The size of the shared block cache.
- Default value: 45% of the size of total system memory
- Unit: KB|MB|GB

### 14.5.2.10 storage.flow-control

Configuration items related to the flow control mechanism in TiKV. This mechanism replaces the write stall mechanism in RocksDB and controls flow at the scheduler layer, which avoids secondary disasters caused by the stuck Raftstore or Apply threads.

#### 14.5.2.10.1 enable

- Determines whether to enable the flow control mechanism. After it is enabled, TiKV automatically disables the write stall mechanism of KvDB and the write stall mechanism of RaftDB (excluding memtable).
- Default value: `true`

#### 14.5.2.10.2 memtables-threshold

- When the number of kvDB memtables reaches this threshold, the flow control mechanism starts to work. When `enable` is set to `true`, this configuration item overrides `rocksdb.(defaultcf|writecf|lockcf).max-write-buffer-number`.
- Default value: 5

#### 14.5.2.10.3 10-files-threshold

- When the number of kvDB L0 files reaches this threshold, the flow control mechanism starts to work. When `enable` is set to `true`, this configuration item overrides `rocksdb ↪ .(defaultcf|writecf|lockcf).level0-slowdown-writes-trigger`.
- Default value: 20

#### 14.5.2.10.4 `soft-pending-compaction-bytes-limit`

- When the pending compaction bytes in KvDB reach this threshold, the flow control mechanism starts to reject some write requests and reports the `ServerIsBusy` error. When `enable` is set to `true`, this configuration item overrides `rocksdb.(defaultcf|writecf|lockcf).soft-pending-compaction-bytes-limit`.
- Default value: "192GB"

#### 14.5.2.10.5 `hard-pending-compaction-bytes-limit`

- When the pending compaction bytes in KvDB reach this threshold, the flow control mechanism rejects all write requests and reports the `ServerIsBusy` error. When `enable` is set to `true`, this configuration item overrides `rocksdb.(defaultcf|writecf|lockcf).hard-pending-compaction-bytes-limit`.
- Default value: "1024GB"

### 14.5.2.11 `storage.io-rate-limit`

Configuration items related to the I/O rate limiter.

#### 14.5.2.11.1 `max-bytes-per-sec`

- Limits the maximum I/O bytes that a server can write to or read from the disk (determined by the `mode` configuration item below) in one second. When this limit is reached, TiKV prefers throttling background operations over foreground ones. The value of this configuration item should be set to the disk's optimal I/O bandwidth, for example, the maximum I/O bandwidth specified by your cloud disk vendor. When this configuration value is set to zero, disk I/O operations are not limited.
- Default value: "0MB"

#### 14.5.2.11.2 `mode`

- Determines which types of I/O operations are counted and restrained below the `max-bytes-per-sec` threshold. Currently, only the write-only mode is supported.
- Value options: "read-only", "write-only", and "all-io"
- Default value: "write-only"

### 14.5.2.12 `pd`

#### 14.5.2.12.1 `endpoints`

- The endpoints of PD. When multiple endpoints are specified, you need to separate them using commas.
- Default value: ["127.0.0.1:2379"]

#### 14.5.2.12.2 `retry-interval`

- The interval for retrying to initialize the PD connection
- Default value: "300ms"

#### 14.5.2.12.3 `retry-log-every`

- Specified the frequency at which the PD client skips reporting errors when the client observes errors. For example, when the value is 5, after the PD client observes errors, the client skips reporting errors every 4 times and reports errors every 5th time.
- To disable this feature, set the value to 1.
- Default value: 10

#### 14.5.2.12.4 `retry-max-count`

- The maximum number of times to retry to initialize PD connection
- To disable the retry, set its value to 0. To release the limit on the number of retries, set the value to -1.
- Default value: -1

### 14.5.2.13 `raftstore`

Configuration items related to Raftstore.

#### 14.5.2.13.1 `prevote`

- Enables or disables `prevote`. Enabling this feature helps reduce jitter on the system after recovery from network partition.
- Default value: `true`

#### 14.5.2.13.2 `capacity`

- The storage capacity, which is the maximum size allowed to store data. If `capacity` is left unspecified, the capacity of the current disk prevails. To deploy multiple TiKV instances on the same physical disk, add this parameter to the TiKV configuration. For details, see [Key parameters of the hybrid deployment](#).
- Default value: 0
- Unit: KB|MB|GB

#### 14.5.2.13.3 `raftdb-path`

- The path to the Raft library, which is `storage.data-dir/raft` by default
- Default value: ""

#### 14.5.2.13.4 raft-base-tick-interval

**Note:**

This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The time interval at which the Raft state machine ticks
- Default value: "1s"
- Minimum value: greater than 0

#### 14.5.2.13.5 raft-heartbeat-ticks

**Note:**

This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The number of passed ticks when the heartbeat is sent. This means that a heartbeat is sent at the time interval of `raft-base-tick-interval * raft-heartbeat-ticks`.
- Default value: 2
- Minimum value: greater than 0

#### 14.5.2.13.6 raft-election-timeout-ticks

**Note:**

This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The number of passed ticks when Raft election is initiated. This means that if Raft group is missing the leader, a leader election is initiated approximately after the time interval of `raft-base-tick-interval * raft-election-timeout-ticks`.
- Default value: 10
- Minimum value: `raft-heartbeat-ticks`

#### 14.5.2.13.7 `raft-min-election-timeout-ticks`

**Note:**

This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The minimum number of ticks during which the Raft election is initiated. If the number is 0, the value of `raft-election-timeout-ticks` is used. The value of this parameter must be greater than or equal to `raft-election-timeout-ticks`.
- Default value: 0
- Minimum value: 0

#### 14.5.2.13.8 `raft-max-election-timeout-ticks`

**Note:**

This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The maximum number of ticks during which the Raft election is initiated. If the number is 0, the value of `raft-election-timeout-ticks * 2` is used.
- Default value: 0
- Minimum value: 0

#### 14.5.2.13.9 `raft-max-size-per-msg`

**Note:**

This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The soft limit on the size of a single message packet
- Default value: "1MB"
- Minimum value: greater than 0
- Maximum value: 3GB
- Unit: KB|MB|GB

#### 14.5.2.13.10 `raft-max-inflight-msgs`

**Note:**

This configuration item cannot be queried via SQL statements but can be configured in the configuration file.

- The number of Raft logs to be confirmed. If this number is exceeded, the Raft state machine slows down log sending.
- Default value: 256
- Minimum value: greater than 0
- Maximum value: 16384

#### 14.5.2.13.11 `raft-entry-max-size`

- The hard limit on the maximum size of a single log
- Default value: "8MB"
- Minimum value: 0
- Unit: MB|GB

#### 14.5.2.13.12 `raft-log-compact-sync-interval` New in v5.3

- The time interval to compact unnecessary Raft logs
- Default value: "2s"
- Minimum value: "0s"

#### 14.5.2.13.13 `raft-log-gc-tick-interval`

- The time interval at which the polling task of deleting Raft logs is scheduled. 0 means that this feature is disabled.
- Default value: "3s"
- Minimum value: "0s"

#### 14.5.2.13.14 `raft-log-gc-threshold`

- The soft limit on the maximum allowable count of residual Raft logs
- Default value: 50
- Minimum value: 1

#### 14.5.2.13.15 `raft-log-gc-count-limit`

- The hard limit on the allowable number of residual Raft logs
- Default value: the log number that can be accommodated in the 3/4 Region size (calculated as 1MB for each log)
- Minimum value: 0

#### 14.5.2.13.16 `raft-log-gc-size-limit`

- The hard limit on the allowable size of residual Raft logs
- Default value: 3/4 of the Region size
- Minimum value: greater than 0

#### 14.5.2.13.17 `raft-log-reserve-max-ticks` New in v5.3

- After the number of ticks set by this configuration item passes, even if the number of residual Raft logs does not reach the value set by `raft-log-gc-threshold`, TiKV still performs garbage collection (GC) to these logs.
- Default value: 6
- Minimum value: greater than 0

#### 14.5.2.13.18 `raft-engine-purge-interval`

- The interval for purging old TiKV log files to recycle disk space as soon as possible. Raft engine is a replaceable component, so the purging process is needed for some implementations.
- Default value: "10s"

#### 14.5.2.13.19 `raft-entry-cache-life-time`

- The maximum remaining time allowed for the log cache in memory
- Default value: "30s"
- Minimum value: 0

#### 14.5.2.13.20 `hibernate-regions`

- Enables or disables Hibernate Region. When this option is enabled, a Region idle for a long time is automatically set as hibernated. This reduces the extra overhead caused by heartbeat messages between the Raft leader and the followers for idle Regions. You can use `peer-stale-state-check-interval` to modify the heartbeat interval between the leader and the followers of hibernated Regions.
- Default value: `true` in v5.0.2 and later versions; `false` in versions before v5.0.2

#### **14.5.2.13.21 split-region-check-tick-interval**

- Specifies the interval at which to check whether the Region split is needed. 0 means that this feature is disabled.
- Default value: "10s"
- Minimum value: 0

#### **14.5.2.13.22 region-split-check-diff**

- The maximum value by which the Region data is allowed to exceed before Region split
- Default value: 1/16 of the Region size.
- Minimum value: 0

#### **14.5.2.13.23 region-compact-check-interval**

- The time interval at which to check whether it is necessary to manually trigger RocksDB compaction. 0 means that this feature is disabled.
- Default value: "5m"
- Minimum value: 0

#### **14.5.2.13.24 region-compact-check-step**

- The number of Regions checked at one time for each round of manual compaction
- Default value: 100
- Minimum value: 0

#### **14.5.2.13.25 region-compact-min-tombstones**

- The number of tombstones required to trigger RocksDB compaction
- Default value: 10000
- Minimum value: 0

#### **14.5.2.13.26 region-compact-tombstones-percent**

- The proportion of tombstone required to trigger RocksDB compaction
- Default value: 30
- Minimum value: 1
- Maximum value: 100

#### 14.5.2.13.27 `pd-heartbeat-tick-interval`

- The time interval at which a Region's heartbeat to PD is triggered. 0 means that this feature is disabled.
- Default value: "1m"
- Minimum value: 0

#### 14.5.2.13.28 `pd-store-heartbeat-tick-interval`

- The time interval at which a store's heartbeat to PD is triggered. 0 means that this feature is disabled.
- Default value: "10s"
- Minimum value: 0

#### 14.5.2.13.29 `snap-mgr-gc-tick-interval`

- The time interval at which the recycle of expired snapshot files is triggered. 0 means that this feature is disabled.
- Default value: "1m"
- Minimum value: 0

#### 14.5.2.13.30 `snap-gc-timeout`

- The longest time for which a snapshot file is saved
- Default value: "4h"
- Minimum value: 0

#### 14.5.2.13.31 `snap-generator-pool-size` New in v5.4.0

- Configures the size of the `snap-generator` thread pool.
- To make Regions generate snapshot faster in TiKV in recovery scenarios, you need to increase the count of the `snap-generator` threads of the corresponding worker. You can use this configuration item to increase the size of the `snap-generator` thread pool.
- Default value: 2
- Minimum value: 1

#### 14.5.2.13.32 `lock-cf-compact-interval`

- The time interval at which TiKV triggers a manual compaction for the Lock Column Family
- Default value: "10m"
- Minimum value: 0

#### 14.5.2.13.33 `lock-cf-compact-bytes-threshold`

- The size out of which TiKV triggers a manual compaction for the Lock Column Family
- Default value: "256MB"
- Minimum value: 0
- Unit: MB

#### 14.5.2.13.34 `notify-capacity`

- The longest length of the Region message queue.
- Default value: 40960
- Minimum value: 0

#### 14.5.2.13.35 `messages-per-tick`

- The maximum number of messages processed per batch
- Default value: 4096
- Minimum value: 0

#### 14.5.2.13.36 `max-peer-down-duration`

- The longest inactive duration allowed for a peer. A peer with timeout is marked as `down`, and PD tries to delete it later.
- Default value: "10m"
- Minimum value: When Hibernate Region is enabled, the minimum value is `peer-stale`  $\leftrightarrow$  `-state-check-interval * 2`; when Hibernate Region is disabled, the minimum value is 0.

#### 14.5.2.13.37 `max-leader-missing-duration`

- The longest duration allowed for a peer to be in the state where a Raft group is missing the leader. If this value is exceeded, the peer verifies with PD whether the peer has been deleted.
- Default value: "2h"
- Minimum value: greater than `abnormal-leader-missing-duration`

#### 14.5.2.13.38 `abnormal-leader-missing-duration`

- The longest duration allowed for a peer to be in the state where a Raft group is missing the leader. If this value is exceeded, the peer is seen as abnormal and marked in metrics and logs.
- Default value: "10m"
- Minimum value: greater than `peer-stale-state-check-interval`

#### 14.5.2.13.39 `peer-stale-state-check-interval`

- The time interval to trigger the check for whether a peer is in the state where a Raft group is missing the leader.
- Default value: "5m"
- Minimum value: greater than  $2 * \text{election-timeout}$

#### 14.5.2.13.40 `leader-transfer-max-log-lag`

- The maximum number of missing logs allowed for the transferee during a Raft leader transfer
- Default value: 128
- Minimum value: 10

#### 14.5.2.13.41 `max-snapshot-file-raw-size` New in v6.1.0

- When the size of a snapshot file exceeds this configuration value, this file will be split into multiple files.
- Default value: 100MiB
- Minimum value: 100MiB

#### 14.5.2.13.42 `snap-apply-batch-size`

- The memory cache size required when the imported snapshot file is written into the disk
- Default value: "10MB"
- Minimum value: 0
- Unit: MB

#### 14.5.2.13.43 `consistency-check-interval`

##### **Warning:**

It is **NOT** recommended to enable the consistency check in production environments, because it affects cluster performance and is incompatible with the garbage collection in TiDB.

- The time interval at which the consistency check is triggered. 0 means that this feature is disabled.
- Default value: "0s"
- Minimum value: 0

#### 14.5.2.13.44 `raft-store-max-leader-lease`

- The longest trusted period of a Raft leader
- Default value: "9s"
- Minimum value: 0

#### 14.5.2.13.45 `right-derive-when-split`

- Specifies the start key of the new Region when a Region is split. When this configuration item is set to `true`, the start key is the maximum split key. When this configuration item is set to `false`, the start key is the original Region's start key.
- Default value: `true`

#### 14.5.2.13.46 `merge-max-log-gap`

- The maximum number of missing logs allowed when `merge` is performed
- Default value: 10
- Minimum value: greater than `raft-log-gc-count-limit`

#### 14.5.2.13.47 `merge-check-tick-interval`

- The time interval at which TiKV checks whether a Region needs merge
- Default value: "2s"
- Minimum value: greater than 0

#### 14.5.2.13.48 `use-delete-range`

- Determines whether to delete data from the `rocksdb delete_range` interface
- Default value: `false`

#### 14.5.2.13.49 `cleanup-import-sst-interval`

- The time interval at which the expired SST file is checked. 0 means that this feature is disabled.
- Default value: "10m"
- Minimum value: 0

#### 14.5.2.13.50 `local-read-batch-size`

- The maximum number of read requests processed in one batch
- Default value: 1024
- Minimum value: greater than 0

#### 14.5.2.13.51 `apply-yield-write-size` New in v6.4.0

- The maximum number of bytes that the Apply thread can write for one FSM (Finite-state Machine) in one round of poll. This is a soft limit.
- Default value: "32KiB"
- Minimum value: greater than 0
- Unit: KiB|MiB|GiB

#### 14.5.2.13.52 `apply-max-batch-size`

- Raft state machines process data write requests in batches by the BatchSystem. This configuration item specifies the maximum number of Raft state machines that can process the requests in one batch.
- Default value: 256
- Minimum value: greater than 0
- Maximum value: 10240

#### 14.5.2.13.53 `apply-pool-size`

- The allowable number of threads in the pool that flushes data to the disk, which is the size of the Apply thread pool. When you modify the size of this thread pool, refer to [Performance tuning for TiKV thread pools](#).
- Default value: 2
- Value ranges: [1, CPU \* 10]. CPU means the number of your CPU cores.

#### 14.5.2.13.54 `store-max-batch-size`

- Raft state machines process requests for flushing logs into the disk in batches by the BatchSystem. This configuration item specifies the maximum number of Raft state machines that can process the requests in one batch.
- If `hibernate-regions` is enabled, the default value is 256. If `hibernate-regions` is disabled, the default value is 1024.
- Minimum value: greater than 0
- Maximum value: 10240

#### 14.5.2.13.55 `store-pool-size`

- The allowable number of threads in the pool that processes Raft, which is the size of the Raftstore thread pool. When you modify the size of this thread pool, refer to [Performance tuning for TiKV thread pools](#).
- Default value: 2
- Value ranges: [1, CPU \* 10]. CPU means the number of your CPU cores.

#### 14.5.2.13.56 `store-io-pool-size` New in v5.3.0

- The allowable number of threads that process Raft I/O tasks, which is the size of the StoreWriter thread pool. When you modify the size of this thread pool, refer to [Performance tuning for TiKV thread pools](#).
- Default value: 0
- Minimum value: 0

#### 14.5.2.13.57 `future-poll-size`

- The allowable number of threads that drive `future`
- Default value: 1
- Minimum value: greater than 0

#### 14.5.2.13.58 `cmd-batch`

- Controls whether to enable batch processing of the requests. When it is enabled, the write performance is significantly improved.
- Default value: `true`

#### 14.5.2.13.59 `inspect-interval`

- At a certain interval, TiKV inspects the latency of the Raftstore component. This parameter specifies the interval of the inspection. If the latency exceeds this value, this inspection is marked as timeout.
- Judges whether the TiKV node is slow based on the ratio of timeout inspection.
- Default value: `"500ms"`
- Minimum value: `"1ms"`

#### 14.5.2.13.60 `raft-write-size-limit` New in v5.3.0

- Determines the threshold at which Raft data is written into the disk. If the data size is larger than the value of this configuration item, the data is written to the disk. When the value of `store-io-pool-size` is 0, this configuration item does not take effect.
- Default value: 1MB
- Minimum value: 0

#### 14.5.2.13.61 `report-min-resolved-ts-interval` New in v6.0.0

- Determines the interval at which the minimum resolved timestamp is reported to the PD leader. If this value is set to 0, it means that the reporting is disabled.
- Default value: Before v6.3.0, the default value is `"0s"`. Starting from v6.3.0, the default value is `"1s"`, which is the smallest positive value.
- Minimum value: 0
- Unit: second

#### 14.5.2.14 coprocessor

Configuration items related to Coprocessor.

##### 14.5.2.14.1 split-region-on-table

- Determines whether to split Region by table. It is recommended for you to use the feature only in TiDB mode.
- Default value: `false`

##### 14.5.2.14.2 batch-split-limit

- The threshold of Region split in batches. Increasing this value speeds up Region split.
- Default value: 10
- Minimum value: 1

##### 14.5.2.14.3 region-max-size

- The maximum size of a Region. When the value is exceeded, the Region splits into many.
- Default value: `region-split-size / 2 * 3`
- Unit: KiB|MiB|GiB

##### 14.5.2.14.4 region-split-size

- The size of the newly split Region. This value is an estimate.
- Default value: `"96MiB"`
- Unit: KiB|MiB|GiB

##### 14.5.2.14.5 region-max-keys

- The maximum allowable number of keys in a Region. When this value is exceeded, the Region splits into many.
- Default value: `region-split-keys / 2 * 3`

##### 14.5.2.14.6 region-split-keys

- The number of keys in the newly split Region. This value is an estimate.
- Default value: 960000

#### 14.5.2.14.7 consistency-check-method

- Specifies the method of data consistency check
- For the consistency check of MVCC data, set the value to "mvcc". For the consistency check of raw data, set the value to "raw".
- Default value: "mvcc"

#### 14.5.2.15 coprocessor-v2

##### 14.5.2.15.1 coprocessor-plugin-directory

- The path of the directory where compiled coprocessor plugins are located. Plugins in this directory are automatically loaded by TiKV.
- If this configuration item is not set, the coprocessor plugin is disabled.
- Default value: "./coprocessors"

##### 14.5.2.15.2 enable-region-bucket New in v6.1.0

- Determines whether to divide a Region into smaller ranges called buckets. The bucket is used as the unit of the concurrent query to improve the scan concurrency. For more about the design of the bucket, refer to [Dynamic size Region](#).
- Default value: false

#### Warning:

- `enable-region-bucket` is an experimental feature introduced in TiDB v6.1.0. It is not recommended that you use it in production environments.
- This configuration makes sense only when `region-split-size` is twice of `region-bucket-size` or above; otherwise, no bucket is actually generated.
- Adjusting `region-split-size` to a larger value might have the risk of performance regression and slow scheduling.

##### 14.5.2.15.3 region-bucket-size New in v6.1.0

- The size of a bucket when `enable-region-bucket` is true.
- Default value: 96MiB

**Warning:**

`region-bucket-size` is an experimental feature introduced in TiDB v6.1.0. It is not recommended that you use it in production environments.

**14.5.2.15.4 `report-region-buckets-tick-interval` New in v6.1.0****Warning:**

`report-region-buckets-tick-interval` is an experimental feature introduced in TiDB v6.1.0. It is not recommended that you use it in production environments.

- The interval at which TiKV reports bucket information to PD when `enable-region-bucket` is true.
- Default value: 10s

**14.5.2.16 `rocksdb`**

Configuration items related to RocksDB

**14.5.2.16.1 `max-background-jobs`**

- The number of background threads in RocksDB. When you modify the size of the RocksDB thread pool, refer to [Performance tuning for TiKV thread pools](#).
- Default value:
  - When the number of CPU cores is 10, the default value is 9.
  - When the number of CPU cores is 8, the default value is 7.
  - When the number of CPU cores is  $N$ , the default value is  $\max(2, \min(N - 1, 9))$ .
- Minimum value: 2

**14.5.2.16.2 `max-background-flushes`**

- The maximum number of concurrent background memtable flush jobs
- Default value:

- When the number of CPU cores is 10, the default value is 3.
- When the number of CPU cores is 8, the default value is 2.
- When the number of CPU cores is  $N$ , the default value is  $[(\text{max-background-jobs} + 3) / 4]$ .

- Minimum value: 1

#### 14.5.2.16.3 `max-sub-compactions`

- The number of sub-compaction operations performed concurrently in RocksDB
- Default value: 3
- Minimum value: 1

#### 14.5.2.16.4 `max-open-files`

- The total number of files that RocksDB can open
- Default value: 40960
- Minimum value: -1

#### 14.5.2.16.5 `max-manifest-file-size`

- The maximum size of a RocksDB Manifest file
- Default value: "128MB"
- Minimum value: 0
- Unit: B|KB|MB|GB

#### 14.5.2.16.6 `create-if-missing`

- Determines whether to automatically create a DB switch
- Default value: `true`

#### 14.5.2.16.7 `wal-recovery-mode`

- WAL recovery mode
- Optional values:
  - `"tolerate-corrupted-tail-records"`: tolerates and discards the records that have incomplete trailing data on all logs
  - `"absolute-consistency"`: abandons recovery when corrupted logs are found
  - `"point-in-time"`: recovers logs sequentially until the first corrupted log is encountered
  - `"skip-any-corrupted-records"`: post-disaster recovery. The data is recovered as much as possible, and corrupted records are skipped.
- Default value: `"point-in-time"`

#### 14.5.2.16.8 wal-dir

- The directory in which WAL files are stored
- Default value: `"/tmp/tikv/store"`

#### 14.5.2.16.9 wal-ttl-seconds

- The living time of the archived WAL files. When the value is exceeded, the system deletes these files.
- Default value: 0
- Minimum value: 0
- unit: second

#### 14.5.2.16.10 wal-size-limit

- The size limit of the archived WAL files. When the value is exceeded, the system deletes these files.
- Default value: 0
- Minimum value: 0
- Unit: B|KB|MB|GB

#### 14.5.2.16.11 max-total-wal-size

- The maximum RocksDB WAL size in total, which is the size of `*.log` files in the `data-dir`.
- Default value: `"4GB"`

#### 14.5.2.16.12 stats-dump-period

- The interval at which statistics are output to the log.
- Default value: `10m`

#### 14.5.2.16.13 compaction-readahead-size

- Enables the readahead feature during RocksDB compaction and specifies the size of readahead data. If you are using mechanical disks, it is recommended to set the value to 2MB at least.
- Default value: 0
- Minimum value: 0
- Unit: B|KB|MB|GB

#### 14.5.2.16.14 `writable-file-max-buffer-size`

- The maximum buffer size used in `WritableFileWrite`
- Default value: "1MB"
- Minimum value: 0
- Unit: B|KB|MB|GB

#### 14.5.2.16.15 `use-direct-io-for-flush-and-compaction`

- Determines whether to use `O_DIRECT` for both reads and writes in the background flush and compactions. The performance impact of this option: enabling `O_DIRECT` bypasses and prevents contamination of the OS buffer cache, but the subsequent file reads require re-reading the contents to the buffer cache.
- Default value: `false`

#### 14.5.2.16.16 `rate-bytes-per-sec`

- The maximum rate permitted by RocksDB's compaction rate limiter
- Default value: 10GB
- Minimum value: 0
- Unit: B|KB|MB|GB

#### 14.5.2.16.17 `rate-limiter-refill-period`

- Controls how often I/O tokens are refilled. A smaller value reduces I/O bursts but causes more CPU overhead.
- Default value: "100ms"

#### 14.5.2.16.18 `rate-limiter-mode`

- RocksDB's compaction rate limiter mode
- Optional values: "read-only", "write-only", "all-io"
- Default value: "write-only"

#### 14.5.2.16.19 `rate-limiter-auto-tuned` New in v5.0

- Determines whether to automatically optimize the configuration of the RocksDB's compaction rate limiter based on recent workload. When this configuration is enabled, compaction pending bytes will be slightly higher than usual.
- Default value: `true`

#### 14.5.2.16.20 `enable-pipelined-write`

- Controls whether to enable Pipelined Write. When this configuration is enabled, the previous Pipelined Write is used. When this configuration is disabled, the new Pipelined Commit mechanism is used.
- Default value: `false`

#### 14.5.2.16.21 `bytes-per-sync`

- The rate at which OS incrementally synchronizes files to disk while these files are being written asynchronously
- Default value: `"1MB"`
- Minimum value: `0`
- Unit: `B|KB|MB|GB`

#### 14.5.2.16.22 `wal-bytes-per-sync`

- The rate at which OS incrementally synchronizes WAL files to disk while the WAL files are being written
- Default value: `"512KB"`
- Minimum value: `0`
- Unit: `B|KB|MB|GB`

#### 14.5.2.16.23 `info-log-max-size`

- The maximum size of Info log
- Default value: `"1GB"`
- Minimum value: `0`
- Unit: `B|KB|MB|GB`

#### 14.5.2.16.24 `info-log-roll-time`

- The time interval at which Info logs are truncated. If the value is `0s`, logs are not truncated.
- Default value: `"0s"`

#### 14.5.2.16.25 `info-log-keep-log-file-num`

- The maximum number of kept log files
- Default value: `10`
- Minimum value: `0`

#### 14.5.2.16.26 `info-log-dir`

- The directory in which logs are stored
- Default value: ""

#### 14.5.2.16.27 `info-log-level`

- Log levels of RocksDB
- Default value: "info"

#### 14.5.2.16.28 `write-buffer-flush-oldest-first` New in v6.6.0

##### **Warning:**

This feature is experimental. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an [issue](#) on GitHub.

- Specifies the flush strategy used when the memory usage of `memtable` of the current RocksDB reaches the threshold.
- Default value: `false`
- Value options:
  - `false`: `memtable` with the largest data volume is flushed to SST files.
  - `true`: The earliest `memtable` is flushed to SST files. This strategy can clear the `memtable` of cold data, which is suitable for scenarios with obvious cold and hot data.

#### 14.5.2.16.29 `write-buffer-limit` New in v6.6.0

##### **Warning:**

This feature is experimental. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an [issue](#) on GitHub.

- Specifies the total memory limit of `memtable` for all RocksDB instances in a single TiKV. The default value is 25% of the memory of the machine. It is recommended to configure a memory of at least 5 GiB. This configuration only takes effect for Partitioned Raft KV (`storage.engine="partitioned-raft-kv"`).
- Default value: 25%
- Unit: KiB|MiB|GiB

#### 14.5.2.17 `rocksdb.titan`

Configuration items related to Titan.

##### 14.5.2.17.1 `enabled`

- Enables or disables Titan
- Default value: `false`

##### 14.5.2.17.2 `dirname`

- The directory in which the Titan Blob file is stored
- Default value: `"titandb"`

##### 14.5.2.17.3 `disable-gc`

- Determines whether to disable Garbage Collection (GC) that Titan performs to Blob files
- Default value: `false`

##### 14.5.2.17.4 `max-background-gc`

- The maximum number of GC threads in Titan
- Default value: 4
- Minimum value: 1

#### 14.5.2.18 `rocksdb.defaultcf` | `rocksdb.writecf` | `rocksdb.lockcf`

Configuration items related to `rocksdb.defaultcf`, `rocksdb.writecf`, and `rocksdb.lockcf`.

##### 14.5.2.18.1 `block-size`

- The default size of a RocksDB block
- Default value for `defaultcf` and `writecf`: `"32KB"`
- Default value for `lockcf`: `"16KB"`
- Minimum value: `"1KB"`
- Unit: KB|MB|GB

#### 14.5.2.18.2 `block-cache-size`

**Warning:**

Starting from v6.6.0, this configuration is deprecated.

- The cache size of a RocksDB block.
- Default value for `defaultcf`: Total machine memory \* 25%
- Default value for `writetcf`: Total machine memory \* 15%
- Default value for `lockcf`: Total machine memory \* 2%
- Minimum value: 0
- Unit: KB|MB|GB

#### 14.5.2.18.3 `disable-block-cache`

- Enables or disables block cache
- Default value: `false`

#### 14.5.2.18.4 `cache-index-and-filter-blocks`

- Enables or disables caching index and filter
- Default value: `true`

#### 14.5.2.18.5 `pin-l0-filter-and-index-blocks`

- Determines whether to pin the index and filter blocks of the level 0 SST files in memory.
- Default value: `true`

#### 14.5.2.18.6 `use-bloom-filter`

- Enables or disables bloom filter
- Default value: `true`

#### 14.5.2.18.7 `optimize-filters-for-hits`

- Determines whether to optimize the hit ratio of filters
- Default value for `defaultcf`: `true`
- Default value for `writetcf` and `lockcf`: `false`

#### 14.5.2.18.8 whole-key-filtering

- Determines whether to put the entire key to bloom filter
- Default value for `defaultcf` and `lockcf`: `true`
- Default value for `writectf`: `false`

#### 14.5.2.18.9 bloom-filter-bits-per-key

- The length that bloom filter reserves for each key
- Default value: 10
- Unit: byte

#### 14.5.2.18.10 block-based-bloom-filter

- Determines whether each block creates a bloom filter
- Default value: `false`

#### 14.5.2.18.11 read-amp-bytes-per-bit

- Enables or disables statistics of read amplification.
- Optional values: 0 (disabled), > 0 (enabled).
- Default value: 0
- Minimum value: 0

#### 14.5.2.18.12 compression-per-level

- The default compression algorithm for each level
- Default value for `defaultcf`: ["no", "no", "lz4", "lz4", "lz4", "zstd", "zstd"]
- Default value for `writectf`: ["no", "no", "lz4", "lz4", "lz4", "zstd", "zstd"]
- Default value for `lockcf`: ["no", "no", "no", "no", "no", "no", "no"]

#### 14.5.2.18.13 bottommost-level-compression

- Sets the compression algorithm of the bottommost layer. This configuration item overrides the `compression-per-level` setting.
- Ever since data is written to LSM-tree, RocksDB does not directly adopt the last compression algorithm specified in the `compression-per-level` array for the bottommost layer. `bottommost-level-compression` enables the bottommost layer to use the compression algorithm of the best compression effect from the beginning.
- If you do not want to set the compression algorithm for the bottommost layer, set the value of this configuration item to `disable`.
- Default value: `"zstd"`

#### 14.5.2.18.14 `write-buffer-size`

- Memtable size
- Default value for `defaulttcf` and `writetcf`: "128MB"
- Default value for `lockcf`: "32MB"
- Minimum value: 0
- Unit: KB|MB|GB

#### 14.5.2.18.15 `max-write-buffer-number`

- The maximum number of memtables. When `storage.flow-control.enable` is set to `true`, `storage.flow-control.memtables-threshold` overrides this configuration item.
- Default value: 5
- Minimum value: 0

#### 14.5.2.18.16 `min-write-buffer-number-to-merge`

- The minimum number of memtables required to trigger flush
- Default value: 1
- Minimum value: 0

#### 14.5.2.18.17 `max-bytes-for-level-base`

- The maximum number of bytes at base level (level-1). Generally, it is set to 4 times the size of a memtable. When the level-1 data size reaches the limit value of `max-bytes-for-level-base`, the SST files of level-1 and their overlapping SST files of level-2 will be compacted.
- Default value for `defaulttcf` and `writetcf`: "512MB"
- Default value for `lockcf`: "128MB"
- Minimum value: 0
- Unit: KB|MB|GB
- It is recommended that the value of `max-bytes-for-level-base` is set approximately equal to the data volume in L0 to reduce unnecessary compaction. For example, if the compression method is "no:no:lz4:lz4:lz4:lz4", the value of `max-bytes-for-level-base` should be `write-buffer-size * 4`, because there is no compression of L0 and L1 and the trigger condition of compaction for L0 is that the number of the SST files reaches 4 (the default value). When L0 and L1 both adopt compaction, you need to analyze RocksDB logs to understand the size of an SST file compressed from a memtable. For example, if the file size is 32 MB, it is recommended to set the value of `max-bytes-for-level-base` to 128 MB (32 MB \* 4).

#### 14.5.2.18.18 `target-file-size-base`

- The size of the target file at base level. This value is overridden by `compaction-guard`  $\leftrightarrow$  `-max-output-file-size` when the `enable-compaction-guard` value is true.
- Default value: "8MB"
- Minimum value: 0
- Unit: KB|MB|GB

#### 14.5.2.18.19 `level0-file-num-compaction-trigger`

- The maximum number of files at L0 that trigger compaction
- Default value for `defaultcf` and `writetcf`: 4
- Default value for `lockcf`: 1
- Minimum value: 0

#### 14.5.2.18.20 `level0-slowdown-writes-trigger`

- The maximum number of files at L0 that trigger write stall. When `storage.flow`  $\leftrightarrow$  `-control.enable` is set to `true`, `storage.flow-control.l0-files-threshold` overrides this configuration item.
- Default value: 20
- Minimum value: 0

#### 14.5.2.18.21 `level0-stop-writes-trigger`

- The maximum number of files at L0 required to completely block write
- Default value: 36
- Minimum value: 0

#### 14.5.2.18.22 `max-compaction-bytes`

- The maximum number of bytes written into disk per compaction
- Default value: "2GB"
- Minimum value: 0
- Unit: KB|MB|GB

#### 14.5.2.18.23 `compaction-pri`

- The priority type of compaction
- Optional values:

- "by-compensated-size": compact files in order of file size and large files are compacted with higher priority.
  - "oldest-largest-seq-first": prioritize compaction on files with the oldest update time. Use this value **only** when updating hot keys in small ranges.
  - "oldest-smallest-seq-first": prioritize compaction on files with ranges that are not compacted to the next level for a long time. If you randomly update hot keys across the key space, this value can slightly reduce write amplification.
  - "min-overlapping-ratio": prioritize compaction on files with a high overlap ratio. When a file is small in different levels (the result of **the file size in the** ↪ **next level ÷ the file size in this level** is small), TiKV compacts this file first. In many cases, this value can effectively reduce write amplification.
- Default value for defaultcf and writecf: "min-overlapping-ratio"
  - Default value for lockcf: "by-compensated-size"

#### 14.5.2.18.24 dynamic-level-bytes

- Determines whether to optimize dynamic level bytes
- Default value: true

#### 14.5.2.18.25 num-levels

- The maximum number of levels in a RocksDB file
- Default value: 7

#### 14.5.2.18.26 max-bytes-for-level-multiplier

- The default amplification multiple for each layer
- Default value: 10

#### 14.5.2.18.27 compaction-style

- Compaction method
- Optional values: "level", "universal", "fifo"
- Default value: "level"

#### 14.5.2.18.28 disable-auto-compactions

- Determines whether to disable auto compaction.
- Default value: false

#### 14.5.2.18.29 `soft-pending-compaction-bytes-limit`

- The soft limit on the pending compaction bytes. When `storage.flow-control.enable` is set to `true`, `storage.flow-control.soft-pending-compaction-bytes`
  - ↔ `-limit` overrides this configuration item.
- Default value: "192GB"
- Unit: KB|MB|GB

#### 14.5.2.18.30 `hard-pending-compaction-bytes-limit`

- The hard limit on the pending compaction bytes. When `storage.flow-control.enable` is set to `true`, `storage.flow-control.hard-pending-compaction-bytes`
  - ↔ `-limit` overrides this configuration item.
- Default value: "256GB"
- Unit: KB|MB|GB

#### 14.5.2.18.31 `enable-compaction-guard`

- Enables or disables the compaction guard, which is an optimization to split SST files at TiKV Region boundaries. This optimization can help reduce compaction I/O and allows TiKV to use larger SST file size (thus less SST files overall) and at the time efficiently clean up stale data when migrating Regions.
- Default value for `defaulttcf` and `writetcf`: `true`
- Default value for `lockcf`: `false`

#### 14.5.2.18.32 `compaction-guard-min-output-file-size`

- The minimum SST file size when the compaction guard is enabled. This configuration prevents SST files from being too small when the compaction guard is enabled.
- Default value: "8MB"
- Unit: KB|MB|GB

#### 14.5.2.18.33 `compaction-guard-max-output-file-size`

- The maximum SST file size when the compaction guard is enabled. The configuration prevents SST files from being too large when the compaction guard is enabled. This configuration overrides `target-file-size-base` for the same column family.
- Default value: "128MB"
- Unit: KB|MB|GB

#### 14.5.2.18.34 `format-version` New in v6.2.0

- The format version of SST files. This configuration item only affects newly written tables. For existing tables, the version information is read from the footer.
- Optional values:
  - 0: Can be read by all TiKV versions. The default checksum type is CRC32 and this version does not support changing the checksum type.
  - 1: Can be read by all TiKV versions. Supports non-default checksum types like xxHash. RocksDB only writes data when the checksum type is not CRC32. (version 0 is automatically upgraded)
  - 2: Can be read by all TiKV versions. Changes the encoding of compressed blocks using LZ4, BZip2 and Zlib compression.
  - 3: Can be read by TiKV v2.1 and later versions. Changes the encoding of the keys in index blocks.
  - 4: Can be read by TiKV v3.0 and later versions. Changes the encoding of the values in index blocks.
  - 5: Can be read by TiKV v6.1 and later versions. Full and partitioned filters use a faster and more accurate Bloom filter implementation with a different schema.
- Default value: 2

#### 14.5.2.19 `rocksdb.defaultcf.titan`

Configuration items related to `rocksdb.defaultcf.titan`.

##### 14.5.2.19.1 `min-blob-size`

- The smallest value stored in a Blob file. Values smaller than the specified size are stored in the LSM-Tree.
- Default value: "1KB"
- Minimum value: 0
- Unit: KB|MB|GB

##### 14.5.2.19.2 `blob-file-compression`

- The compression algorithm used in a Blob file
- Optional values: "no", "snappy", "zlib", "bzip2", "lz4", "lz4hc", "zstd"
- Default value: "lz4"

##### 14.5.2.19.3 `blob-cache-size`

- The cache size of a Blob file
- Default value: "0GB"
- Minimum value: 0
- Unit: KB|MB|GB

#### 14.5.2.19.4 `min-gc-batch-size`

- The minimum total size of Blob files required to perform GC for one time
- Default value: "16MB"
- Minimum value: 0
- Unit: KB|MB|GB

#### 14.5.2.19.5 `max-gc-batch-size`

- The maximum total size of Blob files allowed to perform GC for one time
- Default value: "64MB"
- Minimum value: 0
- Unit: KB|MB|GB

#### 14.5.2.19.6 `discardable-ratio`

- The ratio at which GC is triggered for Blob files. The Blob file can be selected for GC only if the proportion of the invalid values in a Blob file exceeds this ratio.
- Default value: 0.5
- Minimum value: 0
- Maximum value: 1

#### 14.5.2.19.7 `sample-ratio`

- The ratio of (data read from a Blob file/the entire Blob file) when sampling the file during GC
- Default value: 0.1
- Minimum value: 0
- Maximum value: 1

#### 14.5.2.19.8 `merge-small-file-threshold`

- When the size of a Blob file is smaller than this value, the Blob file might still be selected for GC. In this situation, `discardable-ratio` is ignored.
- Default value: "8MB"
- Minimum value: 0
- Unit: KB|MB|GB

#### 14.5.2.19.9 blob-run-mode

- Specifies the running mode of Titan.
- Optional values:
  - `normal`: Writes data to the blob file when the value size exceeds `min-blob-size`.
  - `read_only`: Refuses to write new data to the blob file, but still reads the original data from the blob file.
  - `fallback`: Writes data in the blob file back to LSM.
- Default value: `normal`

#### 14.5.2.19.10 level-merge

- Determines whether to optimize the read performance. When `level-merge` is enabled, there is more write amplification.
- Default value: `false`

### 14.5.2.20 raftdb

Configuration items related to `raftdb`

#### 14.5.2.20.1 max-background-jobs

- The number of background threads in RocksDB. When you modify the size of the RocksDB thread pool, refer to [Performance tuning for TiKV thread pools](#).
- Default value: 4
- Minimum value: 2

#### 14.5.2.20.2 max-sub-compactions

- The number of concurrent sub-compaction operations performed in RocksDB
- Default value: 2
- Minimum value: 1

#### 14.5.2.20.3 max-open-files

- The total number of files that RocksDB can open
- Default value: 40960
- Minimum value: -1

#### 14.5.2.20.4 max-manifest-file-size

- The maximum size of a RocksDB Manifest file
- Default value: "20MB"
- Minimum value: 0
- Unit: B|KB|MB|GB

#### 14.5.2.20.5 create-if-missing

- If the value is `true`, the database will be created if it is missing
- Default value: `true`

#### 14.5.2.20.6 stats-dump-period

- The interval at which statistics are output to the log
- Default value: 10m

#### 14.5.2.20.7 wal-dir

- The directory in which Raft RocksDB WAL files are stored, which is the absolute directory path for WAL. **Do not** set this configuration item to the same value as `rocksdb.wal-dir`.
- If this configuration item is not set, the log files are stored in the same directory as data.
- If there are two disks on the machine, storing RocksDB data and WAL logs on different disks can improve performance.
- Default value: ""

#### 14.5.2.20.8 wal-ttl-seconds

- Specifies how long the archived WAL files are retained. When the value is exceeded, the system deletes these files.
- Default value: 0
- Minimum value: 0
- Unit: second

#### 14.5.2.20.9 wal-size-limit

- The size limit of the archived WAL files. When the value is exceeded, the system deletes these files.
- Default value: 0
- Minimum value: 0
- Unit: B|KB|MB|GB

#### **14.5.2.20.10 max-total-wal-size**

- The maximum RocksDB WAL size in total
- Default value: "4GB"

#### **14.5.2.20.11 compaction-readahead-size**

- Controls whether to enable the readahead feature during RocksDB compaction and specify the size of readahead data.
- If you use mechanical disks, it is recommended to set the value to 2MB at least.
- Default value: 0
- Minimum value: 0
- Unit: B|KB|MB|GB

#### **14.5.2.20.12 writable-file-max-buffer-size**

- The maximum buffer size used in WritableFileWrite
- Default value: "1MB"
- Minimum value: 0
- Unit: B|KB|MB|GB

#### **14.5.2.20.13 use-direct-io-for-flush-and-compaction**

- Determines whether to use `O_DIRECT` for both reads and writes in the background flush and compactions. The performance impact of this option: enabling `O_DIRECT` bypasses and prevents contamination of the OS buffer cache, but the subsequent file reads require re-reading the contents to the buffer cache.
- Default value: `false`

#### **14.5.2.20.14 enable-pipelined-write**

- Controls whether to enable Pipelined Write. When this configuration is enabled, the previous Pipelined Write is used. When this configuration is disabled, the new Pipelined Commit mechanism is used.
- Default value: `true`

#### **14.5.2.20.15 allow-concurrent-memtable-write**

- Controls whether to enable concurrent memtable write.
- Default value: `true`

#### 14.5.2.20.16 bytes-per-sync

- The rate at which OS incrementally synchronizes files to disk while these files are being written asynchronously
- Default value: "1MB"
- Minimum value: 0
- Unit: B|KB|MB|GB

#### 14.5.2.20.17 wal-bytes-per-sync

- The rate at which OS incrementally synchronizes WAL files to disk when the WAL files are being written
- Default value: "512KB"
- Minimum value: 0
- Unit: B|KB|MB|GB

#### 14.5.2.20.18 info-log-max-size

- The maximum size of Info logs
- Default value: "1GB"
- Minimum value: 0
- Unit: B|KB|MB|GB

#### 14.5.2.20.19 info-log-roll-time

- The interval at which Info logs are truncated. If the value is 0s, logs are not truncated.
- Default value: "0s" (which means logs are not truncated)

#### 14.5.2.20.20 info-log-keep-log-file-num

- The maximum number of Info log files kept in RaftDB
- Default value: 10
- Minimum value: 0

#### 14.5.2.20.21 info-log-dir

- The directory in which Info logs are stored
- Default value: ""

#### 14.5.2.20.22 info-log-level

- Log levels of RaftDB
- Default value: "info"

### 14.5.2.21 raft-engine

Configuration items related to Raft Engine.

#### Note:

- When you enable Raft Engine for the first time, TiKV transfers its data from RocksDB to Raft Engine. Therefore, you need to wait extra tens of seconds for TiKV to start.
- The data format of Raft Engine in TiDB v5.4.0 is not compatible with earlier TiDB versions. Therefore, if you need to downgrade a TiDB cluster from v5.4.0 to an earlier version, **before** downgrading, disable Raft Engine by setting `enable` to `false` and restart TiKV for the configuration to take effect.

#### 14.5.2.21.1 enable

- Determines whether to use Raft Engine to store Raft logs. When it is enabled, configurations of `raftdb` are ignored.
- Default value: `true`

#### 14.5.2.21.2 dir

- The directory at which raft log files are stored. If the directory does not exist, it will be created when TiKV is started.
- If this configuration item is not set, `{data-dir}/raft-engine` is used.
- If there are multiple disks on your machine, it is recommended to store the data of Raft Engine on a different disk to improve TiKV performance.
- Default value: `""`

#### 14.5.2.21.3 batch-compression-threshold

- Specifies the threshold size of a log batch. A log batch larger than this configuration is compressed. If you set this configuration item to 0, compression is disabled.
- Default value: `"8KB"`

#### 14.5.2.21.4 bytes-per-sync

- Specifies the maximum accumulative size of buffered writes. When this configuration value is exceeded, buffered writes are flushed to the disk.
- If you set this configuration item to 0, incremental sync is disabled.
- Default value: `"4MB"`

#### 14.5.2.21.5 `target-file-size`

- Specifies the maximum size of log files. When a log file is larger than this value, it is rotated.
- Default value: "128MB"

#### 14.5.2.21.6 `purge-threshold`

- Specifies the threshold size of the main log queue. When this configuration value is exceeded, the main log queue is purged.
- This configuration can be used to adjust the disk space usage of Raft Engine.
- Default value: "10GB"

#### 14.5.2.21.7 `recovery-mode`

- Determines how to deal with file corruption during recovery.
- Value options: "absolute-consistency", "tolerate-tail-corruption", "tolerate-any-corruption"
- Default value: "tolerate-tail-corruption"

#### 14.5.2.21.8 `recovery-read-block-size`

- The minimum I/O size for reading log files during recovery.
- Default value: "16KB"
- Minimum value: "512B"

#### 14.5.2.21.9 `recovery-threads`

- The number of threads used to scan and recover log files.
- Default value: 4
- Minimum value: 1

#### 14.5.2.21.10 `memory-limit`

- Specifies the limit on the memory usage of Raft Engine.
- When this configuration value is not set, 15% of the available system memory is used.
- Default value: Total machine memory \* 15%

#### 14.5.2.21.11 `format-version` New in v6.3.0

**Note:**

After `format-version` is set to 2, if you need to downgrade a TiKV cluster from v6.3.0 to an earlier version, take the following steps **before** the downgrade:

1. Disable Raft Engine by setting `enable` to `false` and restart TiKV to make the configuration take effect.
2. Set `format-version` to 1.
3. Enable Raft Engine by setting `enable` to `true` and restart TiKV to make the configuration take effect.

- Specifies the version of log files in Raft Engine.
- Value Options:
  - 1: Default log file version for TiKV earlier than v6.3.0. Can be read by TiKV  $\geq$  v6.1.0.
  - 2: Supports log recycling. Can be read by TiKV  $\geq$  v6.3.0.
- Default value: 2

#### 14.5.2.21.12 `enable-log-recycle` New in v6.3.0

**Note:**

This configuration item is only available when `format-version`  $\geq$  2.

- Determines whether to recycle stale log files in Raft Engine. When it is enabled, logically purged log files will be reserved for recycling. This reduces the long tail latency on write workloads.
- Default value: `false`

#### 14.5.2.22 `security`

Configuration items related to security.

##### 14.5.2.22.1 `ca-path`

- The path of the CA file
- Default value: ""

#### 14.5.2.22.2 `cert-path`

- The path of the Privacy Enhanced Mail (PEM) file that contains the X.509 certificate
- Default value: ""

#### 14.5.2.22.3 `key-path`

- The path of the PEM file that contains the X.509 key
- Default value: ""

#### 14.5.2.22.4 `cert-allowed-cn`

- A list of acceptable X.509 Common Names in certificates presented by clients. Requests are permitted only when the presented Common Name is an exact match with one of the entries in the list.
- Default value: []. This means that the client certificate CN check is disabled by default.

#### 14.5.2.22.5 `redact-info-log` New in v4.0.8

- This configuration item enables or disables log redaction. If the configuration value is set to `true`, all user data in the log will be replaced by `?`.
- Default value: `false`

### 14.5.2.23 `security.encryption`

Configuration items related to **encryption at rest** (TDE).

#### 14.5.2.23.1 `data-encryption-method`

- The encryption method for data files
- Value options: “plaintext”, “aes128-ctr”, “aes192-ctr”, “aes256-ctr”, and “sm4-ctr” (supported since v6.3.0)
- A value other than “plaintext” means that encryption is enabled, in which case the master key must be specified.
- Default value: “plaintext”

#### 14.5.2.23.2 `data-key-rotation-period`

- Specifies how often TiKV rotates the data encryption key.
- Default value: 7d

#### 14.5.2.23.3 `enable-file-dictionary-log`

- Enables the optimization to reduce I/O and mutex contention when TiKV manages the encryption metadata.
- To avoid possible compatibility issues when this configuration parameter is enabled (by default), see [Encryption at Rest - Compatibility between TiKV versions](#) for details.
- Default value: `true`

#### 14.5.2.23.4 `master-key`

- Specifies the master key if encryption is enabled. To learn how to configure a master key, see [Encryption at Rest - Configure encryption](#).

#### 14.5.2.23.5 `previous-master-key`

- Specifies the old master key when rotating the new master key. The configuration format is the same as that of `master-key`. To learn how to configure a master key, see [Encryption at Rest - Configure encryption](#).

### 14.5.2.24 `import`

Configuration items related to TiDB Lightning import and BR restore.

#### 14.5.2.24.1 `num-threads`

- The number of threads to process RPC requests
- Default value: 8
- Minimum value: 1

#### 14.5.2.24.2 `stream-channel-window`

- The window size of Stream channel. When the channel is full, the stream is blocked.
- Default value: 128

#### 14.5.2.24.3 `memory-use-ratio` New in v6.5.0

- Starting from v6.5.0, PITR supports directly accessing backup log files in memory and restoring data. This configuration item specifies the ratio of memory available for PITR to the total memory of TiKV.
- Value range: `[0.0, 0.5]`

- Default value: 0.3, which means that 30% of the system memory is available for PITR. When the value is 0.0, PITR is performed through downloading log files to a local directory.

**Note:**

In versions earlier than v6.5.0, point-in-time recovery (PITR) only supports restoring data by downloading backup files to a local directory.

### 14.5.2.25 gc

#### 14.5.2.25.1 batch-keys

- The number of keys to be garbage-collected in one batch
- Default value: 512

#### 14.5.2.25.2 max-write-bytes-per-sec

- The maximum bytes that GC worker can write to RocksDB in one second.
- If the value is set to 0, there is no limit.
- Default value: "0"

#### 14.5.2.25.3 enable-compaction-filter New in v5.0

- Controls whether to enable the GC in Compaction Filter feature
- Default value: true

#### 14.5.2.25.4 ratio-threshold

- The garbage ratio threshold to trigger GC.
- Default value: 1.1

### 14.5.2.26 backup

Configuration items related to BR backup.

#### 14.5.2.26.1 num-threads

- The number of worker threads to process backup
- Default value:  $\text{MIN}(\text{CPU} * 0.5, 8)$
- Value range: [1, CPU]
- Minimum value: 1

#### 14.5.2.26.2 batch-size

- The number of data ranges to back up in one batch
- Default value: 8

#### 14.5.2.26.3 sst-max-size

- The threshold of the backup SST file size. If the size of a backup file in a TiKV Region exceeds this threshold, the file is backed up to several files with the TiKV Region split into multiple Region ranges. Each of the files in the split Regions is the same size as `sst-max-size` (or slightly larger).
- For example, when the size of a backup file in the Region of [a,e) is larger than `sst-max-size`, the file is backed up to several files with regions [a,b), [b,c), [c,d) and [d,e), and the size of [a,b), [b,c), [c,d) is the same as that of `sst-max-size` (or slightly larger).
- Default value: "144MB"

#### 14.5.2.26.4 enable-auto-tune New in v5.4.0

- Controls whether to limit the resources used by backup tasks to reduce the impact on the cluster when the cluster resource utilization is high. For more information, refer to [BR Auto-Tune](#).
- Default value: `true`

#### 14.5.2.26.5 s3-multi-part-size New in v5.3.2

##### Note:

This configuration is introduced to address backup failures caused by S3 rate limiting. This problem has been fixed by [refining the backup data storage structure](#). Therefore, this configuration is deprecated from v6.1.1 and is no longer recommended.

- The part size used when you perform multipart upload to S3 during backup. You can adjust the value of this configuration to control the number of requests sent to S3.
- If data is backed up to S3 and the backup file is larger than the value of this configuration item, [multipart upload](#) is automatically enabled. Based on the compression ratio, the backup file generated by a 96-MiB Region is approximately 10 MiB to 30 MiB.
- Default value: 5MiB

### 14.5.2.27 `backup.hadoop`

#### 14.5.2.27.1 `home`

- Specifies the location of the HDFS shell command and allows TiKV to find the shell command. This configuration item has the same effect as the environment variable `$HADOOP_HOME`.
- Default value: ""

#### 14.5.2.27.2 `linux-user`

- Specifies the Linux user with which TiKV runs HDFS shell commands.
- If this configuration item is not set, TiKV uses the current linux user.
- Default value: ""

### 14.5.2.28 `log-backup`

Configuration items related to log backup.

#### 14.5.2.28.1 `enable` New in v6.2.0

- Determines whether to enable log backup.
- Default value: `true`

#### 14.5.2.28.2 `file-size-limit` New in v6.2.0

- The size limit on backup log data to be stored.
- Default value: 256MiB
- Note: Generally, the value of `file-size-limit` is greater than the backup file size displayed in external storage. This is because the backup files are compressed before being uploaded to external storage.

#### 14.5.2.28.3 `initial-scan-pending-memory-quota` New in v6.2.0

- The quota of cache used for storing incremental scan data during log backup.
- Default value: `min(Total machine memory * 10%, 512 MB)`

#### 14.5.2.28.4 `initial-scan-rate-limit` New in v6.2.0

- The rate limit on throughput in an incremental data scan during log backup.
- Default value: 60, indicating that the rate limit is 60 MB/s by default.

#### 14.5.2.28.5 `max-flush-interval` New in v6.2.0

- The maximum interval for writing backup data to external storage in log backup.
- Default value: 3min

#### 14.5.2.28.6 `num-threads` New in v6.2.0

- The number of threads used in log backup.
- Default value: CPU \* 0.5
- Value range: [2, 12]

#### 14.5.2.28.7 `temp-path` New in v6.2.0

- The temporary path to which log files are written before being flushed to external storage.
- Default value: `${deploy-dir}/data/log-backup-temp`

### 14.5.2.29 `cdc`

Configuration items related to TiCDC.

#### 14.5.2.29.1 `min-ts-interval`

- The interval at which Resolved TS is calculated and forwarded.
- Default value: "200ms"

#### 14.5.2.29.2 `old-value-cache-memory-quota`

- The upper limit of memory usage by TiCDC old values.
- Default value: 512MB

#### 14.5.2.29.3 `sink-memory-quota`

- The upper limit of memory usage by TiCDC data change events.
- Default value: 512MB

#### 14.5.2.29.4 `incremental-scan-speed-limit`

- The maximum speed at which historical data is incrementally scanned.
- Default value: "128MB", which means 128 MB per second.

#### 14.5.2.29.5 `incremental-scan-threads`

- The number of threads for the task of incrementally scanning historical data.
- Default value: 4, which means 4 threads.

#### 14.5.2.29.6 `incremental-scan-concurrency`

- The maximum number of concurrent executions for the tasks of incrementally scanning historical data.
- Default value: 6, which means 6 tasks can be concurrent executed at most.
- Note: The value of `incremental-scan-concurrency` must be greater than or equal to that of `incremental-scan-threads`; otherwise, TiKV will report an error at startup.

### 14.5.2.30 `resolved-ts`

Configuration items related to maintaining the Resolved TS to serve Stale Read requests.

#### 14.5.2.30.1 `enable`

- Determines whether to maintain the Resolved TS for all Regions.
- Default value: `true`

#### 14.5.2.30.2 `advance-ts-interval`

- The interval at which Resolved TS is calculated and forwarded.
- Default value: "1s"

#### 14.5.2.30.3 `scan-lock-pool-size`

- The number of threads that TiKV uses to scan the MVCC (multi-version concurrency control) lock data when initializing the Resolved TS.
- Default value: 2, which means 2 threads.

### 14.5.2.31 `pessimistic-txn`

For pessimistic transaction usage, refer to [TiDB Pessimistic Transaction Mode](#).

#### 14.5.2.31.1 wait-for-lock-timeout

- The longest time that a pessimistic transaction in TiKV waits for other transactions to release the lock. If the time is out, an error is returned to TiDB, and TiDB retries to add a lock. The lock wait timeout is set by `innodb_lock_wait_timeout`.
- Default value: "1s"
- Minimum value: "1ms"

#### 14.5.2.31.2 wake-up-delay-duration

- When pessimistic transactions release the lock, among all the transactions waiting for lock, only the transaction with the smallest `start_ts` is woken up. Other transactions will be woken up after `wake-up-delay-duration`.
- Default value: "20ms"

#### 14.5.2.31.3 pipelined

- This configuration item enables the pipelined process of adding the pessimistic lock. With this feature enabled, after detecting that data can be locked, TiKV immediately notifies TiDB to execute the subsequent requests and write the pessimistic lock asynchronously, which reduces most of the latency and significantly improves the performance of pessimistic transactions. But there is a still low probability that the asynchronous write of the pessimistic lock fails, which might cause the failure of pessimistic transaction commits.
- Default value: `true`

#### 14.5.2.31.4 in-memory **New in v6.0.0**

- Enables the in-memory pessimistic lock feature. With this feature enabled, pessimistic transactions try to store their locks in memory, instead of writing the locks to disk or replicating the locks to other replicas. This improves the performance of pessimistic transactions. However, there is a still low probability that the pessimistic lock gets lost and causes the pessimistic transaction commits to fail.
- Default value: `true`
- Note that `in-memory` takes effect only when the value of `pipelined` is `true`.

#### 14.5.2.32 quota

Configuration items related to Quota Limiter.

#### 14.5.2.32.1 `max-delay-duration` New in v6.0.0

- The maximum time that a single read or write request is forced to wait before it is processed in the foreground.
- Default value: 500ms
- Recommended setting: It is recommended to use the default value in most cases. If out of memory (OOM) or violent performance jitter occurs in the instance, you can set the value to 1S to make the request waiting time shorter than 1 second.

#### 14.5.2.32.2 `Foreground Quota Limiter`

Configuration items related to foreground Quota Limiter.

Suppose that your machine on which TiKV is deployed has limited resources, for example, with only 4v CPU and 16 G memory. In this situation, the foreground of TiKV might process too many read and write requests so that the CPU resources used by the background are occupied to help process such requests, which affects the performance stability of TiKV. To avoid this situation, you can use the foreground quota-related configuration items to limit the CPU resources to be used by the foreground. When a request triggers Quota Limiter, the request is forced to wait for a while for TiKV to free up CPU resources. The exact waiting time depends on the number of requests, and the maximum waiting time is no longer than the value of `max-delay-duration`.

`foreground-cpu-time` New in v6.0.0

- The soft limit on the CPU resources used by TiKV foreground to process read and write requests.
- Default value: 0 (which means no limit)
- Unit: millicpu (for example, 1500 means that the foreground requests consume 1.5v CPU)
- Recommended setting: For the instance with more than 4 cores, use the default value 0. For the instance with 4 cores, setting the value to the range of 1000 and 1500 can make a balance. For the instance with 2 cores, keep the value smaller than 1200.

`foreground-write-bandwidth` New in v6.0.0

- The soft limit on the bandwidth with which transactions write data.
- Default value: 0KB (which means no limit)
- Recommended setting: Use the default value 0 in most cases unless the `foreground-cpu-time` setting is not enough to limit the write bandwidth. For such an exception, it is recommended to set the value smaller than 50MB in the instance with 4 or less cores.

`foreground-read-bandwidth` New in v6.0.0

- The soft limit on the bandwidth with which transactions and the Coprocessor read data.
- Default value: 0KB (which means no limit)
- Recommended setting: Use the default value 0 in most cases unless the `foreground-cpu-time` setting is not enough to limit the read bandwidth. For such an exception, it is recommended to set the value smaller than 20MB in the instance with 4 or less cores.

### 14.5.2.32.3 Background Quota Limiter

Configuration items related to background Quota Limiter.

Suppose that your machine on which TiKV is deployed has limited resources, for example, with only 4v CPU and 16 G memory. In this situation, the background of TiKV might process too many calculations and read and write requests, so that the CPU resources used by the foreground are occupied to help process such requests, which affects the performance stability of TiKV. To avoid this situation, you can use the background quota-related configuration items to limit the CPU resources to be used by the background. When a request triggers Quota Limiter, the request is forced to wait for a while for TiKV to free up CPU resources. The exact waiting time depends on the number of requests, and the maximum waiting time is no longer than the value of `max-delay-duration`.

#### Warning:

- Background Quota Limiter is an experimental feature introduced in TiDB v6.2.0, and it is **NOT** recommended to use it in the production environment.
- This feature is only suitable for environments with limited resources to ensure that TiKV can run stably in those environments. If you enable this feature in an environment with rich resources, performance degradation might occur when the amount of requests reaches a peak.

`background-cpu-time` New in v6.2.0

- The soft limit on the CPU resources used by TiKV background to process read and write requests.
- Default value: 0 (which means no limit)
- Unit: millicpu (for example, 1500 means that the background requests consume 1.5v CPU)

`background-write-bandwidth` New in v6.2.0

**Note:**

This configuration item is returned in the result of `SHOW CONFIG`, but currently setting it does not take any effect.

- The soft limit on the bandwidth with which background transactions write data.
- Default value: `0KB` (which means no limit)

`background-read-bandwidth` New in v6.2.0

**Note:**

This configuration item is returned in the result of `SHOW CONFIG`, but currently setting it does not take any effect.

- The soft limit on the bandwidth with which background transactions and the Coprocessor read data.
- Default value: `0KB` (which means no limit)

`enable-auto-tune` New in v6.2.0

- Determines whether to enable the auto-tuning of quota. If this configuration item is enabled, TiKV dynamically adjusts the quota for the background requests based on the load of TiKV instances.
- Default value: `false` (which means that the auto-tuning is disabled)

**14.5.2.33 causal-ts New in v6.1.0**

Configuration items related to getting the timestamp when TiKV API V2 is enabled (`storage.api-version = 2`).

To reduce write latency, TiKV periodically fetches and caches a batch of timestamps locally. Cached timestamps help avoid frequent access to PD and allow short-term TSO service failure.

#### 14.5.2.33.1 `alloc-ahead-buffer` New in v6.4.0

- The pre-allocated TSO cache size (in duration).
- Indicates that TiKV pre-allocates the TSO cache based on the duration specified by this configuration item. TiKV estimates the TSO usage based on the previous period, and requests and caches TSOs satisfying `alloc-ahead-buffer` locally.
- This configuration item is often used to increase the tolerance of PD failures when TiKV API V2 is enabled (`storage.api-version = 2`).
- Increasing the value of this configuration item might result in more TSO consumption and memory overhead of TiKV. To obtain enough TSOs, it is recommended to decrease the `tso-update-physical-interval` configuration item of PD.
- According to the test, when `alloc-ahead-buffer` is in its default value, and the PD leader fails and switches to another node, the write request will experience a short-term increase in latency and a decrease in QPS (about 15%).
- To avoid the impact on the business, you can configure `tso-update-physical-interval = "1ms"` in PD and the following configuration items in TiKV:
  - `causal-ts.alloc-ahead-buffer = "6s"`
  - `causal-ts.renew-batch-max-size = 65536`
  - `causal-ts.renew-batch-min-size = 2048`
- Default value: 3s

#### 14.5.2.33.2 `renew-interval`

- The interval at which the locally cached timestamps are updated.
- At an interval of `renew-interval`, TiKV starts a batch of timestamp refresh and adjusts the number of cached timestamps according to the timestamp consumption in the previous period and the setting of `alloc-ahead-buffer`. If you set this parameter to too large a value, the latest TiKV workload changes are not reflected in time. If you set this parameter to too small a value, the load of PD increases. If the write traffic is strongly fluctuating, if timestamps are frequently exhausted, and if write latency increases, you can set this parameter to a smaller value. At the same time, you should also consider the load of PD.
- Default value: "100ms"

#### 14.5.2.33.3 `renew-batch-min-size`

- The minimum number of TSOs in a timestamp request.
- TiKV adjusts the number of cached timestamps according to the timestamp consumption in the previous period. If only a few TSOs are required, TiKV reduces the TSOs requested until the number reaches `renew-batch-min-size`. If large bursty write traffic often occurs in your application, you can set this parameter to a larger value as appropriate. Note that this parameter is the cache size for a single tikv-server. If you set the parameter to too large a value and the cluster contains many tikv-servers, the TSO consumption will be too fast.

- In the **TiKV-RAW > Causal timestamp** panel in Grafana, **TSO batch size** is the number of locally cached timestamps that has been dynamically adjusted according to the application workload. You can refer to this metric to adjust `renew-batch-min-size`.
- Default value: 100

#### 14.5.2.33.4 `renew-batch-max-size` New in v6.4.0

- The maximum number of TSOs in a timestamp request.
- In a default TSO physical time update interval (50ms), PD provides at most 262144 TSOs. When requested TSOs exceed this number, PD provides no more TSOs. This configuration item is used to avoid exhausting TSOs and the reverse impact of TSO exhaustion on other businesses. If you increase the value of this configuration item to improve high availability, you need to decrease the value of `tso-update-physical-interval` at the same time to get enough TSOs.
- Default value: 8192

#### 14.5.2.34 `resource-control`

Configuration items related to resource control of the TiKV storage layer.

##### 14.5.2.34.1 `enabled` New in v6.6.0

- Controls whether to enable scheduling for user foreground read/write requests according to **Request Unit (RU)** of the corresponding resource groups. For information about TiDB resource groups and resource control, see **TiDB resource control**.
- Enabling this configuration item only works when `tidb_enable_resource_control` is enabled on TiDB. When this configuration item is enabled, TiKV will use the priority queue to schedule the queued read/write requests from foreground users. The scheduling priority of a request is inversely related to the amount of resources already consumed by the resource group that receives this request, and positively related to the quota of the corresponding resource group.
- Default value: `false`, which means to disable scheduling based on the RU of the resource group.

### 14.5.3 Configure TiFlash

This document introduces the configuration parameters related to the deployment and use of TiFlash.

#### 14.5.3.1 PD scheduling parameters

You can adjust the PD scheduling parameters using `pd-ctl`. Note that you can use `tiup`  $\hookrightarrow$  `ctl:v<CLUSTER_VERSION> pd` to replace `pd-ctl -u <pd_ip:pd_port>` when using `tiup` to deploy and manage your cluster.

- **replica-schedule-limit**: determines the rate at which the replica-related operator is generated. The parameter affects operations such as making nodes offline and add replicas.

**Note:**

The value of this parameter should be less than that of `region-schedule-limit`. Otherwise, the normal Region scheduling among TiKV nodes is affected.

- **store-balance-rate**: limits the rate at which Regions of each TiKV/TiFlash store are scheduled. Note that this parameter takes effect only when the stores have newly joined the cluster. If you want to change the setting for existing stores, use the following command.

**Note:**

Since v4.0.2, the `store-balance-rate` parameter has been deprecated and changes have been made to the `store limit` command. See [store-limit](#) for details.

```
- Execute the `pd-ctl -u <pd_ip:pd_port> store limit <store_id> <value>`
 ↳ command to set the scheduling rate of a specified store. (To get `
 ↳ store_id`, you can execute the `pd-ctl -u <pd_ip:pd_port> store`
 ↳ command.
- If you do not set the scheduling rate for Regions of a specified store,
 ↳ this store inherits the setting of `store-balance-rate`.
- You can execute the `pd-ctl -u <pd_ip:pd_port> store limit` command to
 ↳ view the current setting value of `store-balance-rate`.
```

- **replication.location-labels**: indicates the topological relationship of TiKV instances. The order of the keys indicates the layering relationship of different labels. If TiFlash is enabled, you need to use `pd-ctl config placement-rules` to set the default value. For details, see [geo-distributed-deployment-topology](#).

### 14.5.3.2 TiFlash configuration parameters

This section introduces the configuration parameters of TiFlash.

**Tip:**

If you need to adjust the value of a configuration item, refer to [Modify the configuration](#).

### 14.5.3.2.1 Configure the `tiflash.toml` file

```
The listening host for supporting services such as TPC/HTTP. It is
 ↳ recommended to configure it as "0.0.0.0", which means to listen on
 ↳ all IP addresses of this machine.
listen_host = "0.0.0.0"
The TiFlash TCP service port.
tcp_port = 9000
The TiFlash HTTP service port.
http_port = 8123
The cache size limit of the metadata of a data block. Generally, you do
 ↳ not need to change this value.
mark_cache_size = 5368709120
The cache size limit of the min-max index of a data block. Generally,
 ↳ you do not need to change this value.
minmax_index_cache_size = 5368709120
The cache size limit of the DeltaIndex. The default value is 0, which
 ↳ means no limit.
delta_index_cache_size = 0

The storage path of TiFlash data. If there are multiple directories,
 ↳ separate each directory with a comma.
path and path_realtime_mode are deprecated since v4.0.9. Use the
 ↳ configurations
in the [storage] section to get better performance in the multi-disk
 ↳ deployment scenarios
Since TiDB v5.2.0, if you need to use the storage.io_rate_limit
 ↳ configuration, you need to set the storage path of TiFlash data to
 ↳ storage.main.dir at the same time.
When the [storage] configurations exist, both path and
 ↳ path_realtime_mode configurations are ignored.
path = "/tidb-data/tiflash-9000"
or
path = "/ssd0/tidb-data/tiflash,/ssd1/tidb-data/tiflash,/ssd2/tidb-data/
 ↳ tiflash"
The default value is false. If you set it to true and multiple
 ↳ directories
```

```
are set in the path, the latest data is stored in the first directory
↳ and older
data is stored in the rest directories.
path_realtime_mode = false

The path in which the TiFlash temporary files are stored. By default it
↳ is the first directory in path
or in storage.latest.dir appended with "/tmp".
tmp_path = "/tidb-data/tiflash-9000/tmp"

Storage paths settings take effect starting from v4.0.9
[storage]

DTFile format
* format_version = 2, the default format for versions < v6.0.0.
* format_version = 3, the default format for v6.0.0 and v6.1.x, which
↳ provides more data validation features.
* format_version = 4, the default format for v6.2.0 and later
↳ versions, which reduces write amplification and background task
↳ resource consumption
format_version = 4

[storage.main]
The list of directories to store the main data. More than 90% of the
↳ total data is stored in
the directory list.
dir = ["/tidb-data/tiflash-9000"]
or
dir = ["/ssd0/tidb-data/tiflash", "/ssd1/tidb-data/tiflash"]

The maximum storage capacity of each directory in storage.main.dir.
If it is not set, or is set to multiple 0, the actual disk (the disk
↳ where the directory is located) capacity is used.
Note that human-readable numbers such as "10GB" are not supported yet
↳ .
Numbers are specified in bytes.
The size of the capacity list should be the same with the dir size.
For example:
capacity = [10737418240, 10737418240]

[storage.latest]
The list of directories to store the latest data. About 10% of the
↳ total data is stored in
the directory list. The directories (or directory) listed here
↳ require higher IOPS
```

```
metrics than those in storage.main.dir.
If it is not set (by default), the values of storage.main.dir are
 ↪ used.
dir = []
The maximum storage capacity of each directory in storage.latest.dir.
If it is not set, or is set to multiple 0, the actual disk (the disk
 ↪ where the directory is located) capacity is used.
capacity = [10737418240, 10737418240]

[storage.io_rate_limit] settings are new in v5.2.0.
[storage.io_rate_limit]
This configuration item determines whether to limit the I/O traffic,
 ↪ which is disabled by default. This traffic limit in TiFlash is
 ↪ suitable for cloud storage that has the disk bandwidth of a small
 ↪ and specific size.
The total I/O bandwidth for disk reads and writes. The unit is bytes
 ↪ and the default value is 0, which means the I/O traffic is not
 ↪ limited by default.
max_bytes_per_sec = 0
max_read_bytes_per_sec and max_write_bytes_per_sec have similar
 ↪ meanings to max_bytes_per_sec. max_read_bytes_per_sec means the
 ↪ total I/O bandwidth for disk reads, and max_write_bytes_per_sec
 ↪ means the total I/O bandwidth for disk writes.
These configuration items limit I/O bandwidth for disk reads and
 ↪ writes separately. You can use them for cloud storage that
 ↪ calculates the limit of I/O bandwidth for disk reads and writes
 ↪ separately, such as the Persistent Disk provided by Google Cloud
 ↪ Platform.
When the value of max_bytes_per_sec is not 0, max_bytes_per_sec is
 ↪ prioritized.
max_read_bytes_per_sec = 0
max_write_bytes_per_sec = 0

The following parameters control the bandwidth weights assigned to
 ↪ different I/O traffic types. Generally, you do not need to adjust
 ↪ these parameters.
TiFlash internally divides I/O requests into four types: foreground
 ↪ writes, background writes, foreground reads, background reads.
When the I/O traffic limit is initialized, TiFlash assigns the
 ↪ bandwidth according to the following weight ratio.
The following default configurations indicate that each type of
 ↪ traffic gets a weight of 25% (25 / (25 + 25 + 25 + 25) = 25%).
If the weight is configured to 0, the corresponding I/O traffic is
 ↪ not limited.
foreground_write_weight = 25
```

```
background_write_weight = 25
foreground_read_weight = 25
background_read_weight = 25
TiFlash supports automatically tuning the traffic limit for different
 ↪ I/O types according to the current I/O load. Sometimes, the tuned
 ↪ bandwidth might exceed the weight ratio set above.
auto_tune_sec indicates the interval of automatic tuning. The unit is
 ↪ seconds. If the value of auto_tune_sec is 0, the automatic tuning
 ↪ is disabled.
auto_tune_sec = 5
```

#### [flash]

```
tidb_status_addr = TiDB status port and address. # Multiple addresses
 ↪ are separated with commas.
service_addr = The listening address of TiFlash Raft services and
 ↪ coprocessor services.
```

```
Multiple TiFlash nodes elect a master to add or delete placement rules
 ↪ to PD,
```

```
and the configurations in flash.flash_cluster control this process.
```

#### [flash.flash\_cluster]

```
refresh_interval = Master regularly refreshes the valid period.
update_rule_interval = Master regularly gets the status of TiFlash
 ↪ replicas and interacts with PD.
master_ttl = The valid period of the elected master.
cluster_manager_path = The absolute path of the pd buddy directory.
log = The pd buddy log path.
```

#### [flash.proxy]

```
addr = The listening address of proxy. If it is left empty,
 ↪ 127.0.0.1:20170 is used by default.
advertise-addr = The external access address of addr. If it is left
 ↪ empty, "addr" is used by default.
data-dir = The data storage path of proxy.
config = The configuration file path of proxy.
log-file = The log path of proxy.
log-level = The log level of proxy. "info" is used by default.
status-addr = The listening address from which the proxy pulls metrics |
 ↪ status information. If it is left empty, 127.0.0.1:20292 is used
 ↪ by default.
advertise-status-addr = The external access address of status-addr. If
 ↪ it is left empty, "status-addr" is used by default.
```

#### [logger]

```
log level (available options: "trace", "debug", "info", "warn", "
```

```
 ↪ error"). The default value is "debug".
level = "debug"
log = TiFlash log path
errorlog = TiFlash error log path
Size of a single log file. The default value is "100M".
size = "100M"
Maximum number of log files to save. The default value is 10.
count = 10
```

#### [raft]

```
PD service address. Multiple addresses are separated with commas.
pd_addr = "10.0.1.11:2379,10.0.1.12:2379,10.0.1.13:2379"
```

#### [status]

```
The port through which Prometheus pulls metrics information. The
 ↪ default value is 8234.
metrics_port = 8234
```

#### [profiles]

##### [profiles.default]

```
The default value is false. This parameter determines whether the
 ↪ segment
of DeltaTree Storage Engine uses logical split.
Using the logical split can reduce the write amplification.
However, these are at the cost of disk space waste.
It is strongly recommended to keep the default value `false` and
not to change it to `true` in v6.2.0 and later versions. For details,
see known issue [#5576] (https://github.com/pingcap/tiflash/issues
 ↪ /5576).
dt_enable_logical_split = false

The memory usage limit for the generated intermediate data in a
 ↪ single query.
When the value is an integer, the unit is byte. For example,
 ↪ 34359738368 means 32 GiB of memory limit, and 0 means no limit.
When the value is a floating-point number in the range of [0.0, 1.0),
 ↪ it means the ratio of the allowed memory usage to the total
 ↪ memory of the node. For example, 0.8 means 80% of the total memory
 ↪ , and 0.0 means no limit.
The default value is 0, which means no limit.
When a query attempts to consume memory that exceeds this limit, the
 ↪ query is terminated and an error is reported.
max_memory_usage = 0
```

```
The memory usage limit for the generated intermediate data in all
 ↪ queries.
When the value is an integer, the unit is byte. For example,
 ↪ 34359738368 means 32 GiB of memory limit, and 0 means no limit.
When the value is a floating-point number in the range of [0.0, 1.0),
 ↪ it means the ratio of the allowed memory usage to the total
 ↪ memory of the node. For example, 0.8 means 80% of the total memory
 ↪ , and 0.0 means no limit.
The default value is 0.8, which means 80% of the total memory.
When the queries attempt to consume memory that exceeds this limit,
 ↪ the queries are terminated and an error is reported.
max_memory_usage_for_all_queries = 0.8

New in v5.0. This item specifies the maximum number of cop requests
 ↪ that TiFlash Coprocessor executes at the same time. If the number
 ↪ of requests exceeds the specified value, the exceeded requests
 ↪ will queue. If the configuration value is set to 0 or not set, the
 ↪ default value is used, which is twice the number of physical
 ↪ cores.
cop_pool_size = 0
New in v5.0. This item specifies the maximum number of batch requests
 ↪ that TiFlash Coprocessor executes at the same time. If the number
 ↪ of requests exceeds the specified value, the exceeded requests
 ↪ will queue. If the configuration value is set to 0 or not set, the
 ↪ default value is used, which is twice the number of physical
 ↪ cores.
batch_cop_pool_size = 0
New in v6.1.0. This item specifies the number of requests that
 ↪ TiFlash can concurrently process when it receives ALTER TABLE ...
 ↪ COMPACT from TiDB.
If the value is set to 0, the default value 1 prevails.
manual_compact_pool_size = 1
New in v5.4.0. This item enables or disables the elastic thread pool
 ↪ feature, which significantly improves CPU utilization in high
 ↪ concurrency scenarios of TiFlash. The default value is true.
enable_elastic_threadpool = true
Compression algorithm of the TiFlash storage engine. The value can be
 ↪ LZ4, zstd, or LZ4HC, and is case-insensitive. By default, LZ4 is
 ↪ used.
dt_compression_method = "LZ4"
Compression level of the TiFlash storage engine. The default value is
 ↪ 1.
It is recommended that you set this value to 1 if
 ↪ dt_compression_method is LZ4.
It is recommended that you set this value to -1 (smaller compression
```

```
 ↪ rate, but better read performance) or 1 if dt_compression_method
 ↪ is zstd.
It is recommended that you set this value to 9 if
 ↪ dt_compression_method is LZ4HC.
dt_compression_level = 1

New in v6.2.0. This item specifies the minimum ratio of valid data in
 ↪ a PageStorage data file. When the ratio of valid data in a
 ↪ PageStorage data file is less than the value of this configuration
 ↪ , GC is triggered to compact data in the file. The default value
 ↪ is 0.5.
dt_page_gc_threshold = 0.5

Security settings take effect starting from v4.0.5.
[security]
New in v5.0. This configuration item enables or disables log
 ↪ redaction. If the configuration value
is set to true, all user data in the log will be replaced by ?.
Note that you also need to set security.redact-info-log for tiflash-
 ↪ learner's logging in tiflash-learner.toml.
redact_info_log = false

Path of the file that contains a list of trusted SSL CAs. If set, the
 ↪ following settings
cert_path and key_path are also needed.
ca_path = "/path/to/ca.pem"
Path of the file that contains X509 certificate in PEM format.
cert_path = "/path/to/tiflash-server.pem"
Path of the file that contains X509 key in PEM format.
key_path = "/path/to/tiflash-server-key.pem"
```

#### 14.5.3.2.2 Configure the tiflash-learner.toml file

```
[server]
engine-addr = The external access address of the TiFlash coprocessor
 ↪ service.
[raftstore]
The allowable number of threads in the pool that flushes Raft data to
 ↪ storage.
apply-pool-size = 4

The allowable number of threads that process Raft, which is the size
 ↪ of the Raftstore thread pool.
```

```
store-pool-size = 4

The number of threads that handle snapshots.
The default number is 2.
If you set it to 0, the multi-thread optimization is disabled.
snap-handle-pool-size = 2

The shortest interval at which Raft store persists WAL.
You can properly increase the latency to reduce IOPS usage.
The default value is "4ms".
If you set it to 0ms, the optimization is disabled.
store-batch-retry-recv-timeout = "4ms"
[security]
New in v5.0. This configuration item enables or disables log
 ↪ redaction.
If the configuration value is set to true,
all user data in the log will be replaced by ?. The default value is
 ↪ false.
redact-info-log = false

[security.encryption]
The encryption method for data files.
Value options: "aes128-ctr", "aes192-ctr", "aes256-ctr", "sm4-ctr" (
 ↪ supported since v6.4.0), and "plaintext".
Default value: `plaintext`, which means encryption is disabled by
 ↪ default. A value other than "plaintext" means that encryption is
 ↪ enabled, in which case the master key must be specified.
data-encryption-method = "aes128-ctr"
Specifies how often the data encryption key is rotated. Default value
 ↪ : `7d`.
data-key-rotation-period = "168h" # 7 days

[security.encryption.master-key]
Specifies the master key if encryption is enabled. To learn how to
 ↪ configure a master key, see Configure encryption: https://docs.
 ↪ pingcap.com/tidb/dev/encryption-at-rest#configure-encryption .

[security.encryption.previous-master-key]
Specifies the old master key when rotating the new master key. The
 ↪ configuration format is the same as that of `master-key`. To learn
 ↪ how to configure a master key, see Configure encryption: https://
 ↪ docs.pingcap.com/tidb/dev/encryption-at-rest#configure-encryption
 ↪ .
```

In addition to the items above, other parameters are the same as those of TiKV. Note that the `label` whose key is `engine` is reserved and cannot be configured manually.

### 14.5.3.2.3 Schedule replicas by topology labels

See [Set available zones](#).

### 14.5.3.2.4 Multi-disk deployment

TiFlash supports multi-disk deployment. If there are multiple disks in your TiFlash node, you can make full use of those disks by configuring the parameters described in the following sections. For TiFlash's configuration template to be used for TiUP, see [The complex template for the TiFlash topology](#).

Multi-disk deployment with TiDB version earlier than v4.0.9

For TiDB clusters earlier than v4.0.9, TiFlash only supports storing the main data of the storage engine on multiple disks. You can set up a TiFlash node on multiple disks by specifying the `path` (`data_dir` in TiUP) and `path_realtime_mode` configuration.

If there are multiple data storage directories in `path`, separate each with a comma. For example, `/nvme_ssd_a/data/tiflash,/sata_ssd_b/data/tiflash,/sata_ssd_c/data/ ↪ tiflash`. If there are multiple disks in your environment, it is recommended that each directory corresponds to one disk and you put disks with the best performance at the front to maximize the performance of all disks.

If there are multiple disks with similar I/O metrics on your TiFlash node, you can leave the `path_realtime_mode` parameter to the default value (or you can explicitly set it to `false ↪` ). It means that data will be evenly distributed among all storage directories. However, the latest data is written only to the first directory, so the corresponding disk is busier than other disks.

If there are multiple disks with different I/O metrics on your TiFlash node, it is recommended to set `path_realtime_mode` to `true` and put disks with the best I/O metrics at the front of `path`. It means that the first directory only stores the latest data, and the older data are evenly distributed among the other directories. Note that in this case, the capacity of the first directory should be planned as 10% of the total capacity of all directories.

Multi-disk deployment with TiDB v4.0.9 or later

For TiDB clusters with v4.0.9 or later versions, TiFlash supports storing the main data and the latest data of the storage engine on multiple disks. If you want to deploy a TiFlash node on multiple disks, it is recommended to specify your storage directories in the `[storage ↪ ]` section to make full use of your node. Note that the configurations earlier than v4.0.9 (`path` and `path_realtime_mode`) are still supported.

If there are multiple disks with similar I/O metrics on your TiFlash node, it is recommended to specify corresponding directories in the `storage.main.dir` list and leave `storage ↪ .latest.dir` empty. TiFlash will distribute I/O pressure and data among all directories.

If there are multiple disks with different I/O metrics on your TiFlash node, it is recommended to specify directories with higher metrics in the `storage.latest.dir` list, and specify directories with lower metrics in the `storage.main.dir` list. For example, for one NVMe-SSD and two SATA-SSDs, you can set `storage.latest.dir` to `["/nvme_ssd_a/data/tiflash"]` and `storage.main.dir` to `["/sata_ssd_b/data/tiflash", "/sata_ssd_c/data/tiflash"]`. TiFlash will distribute I/O pressure and data among these two directories list respectively. Note that in this case, the capacity of `storage.latest.dir` should be planned as 10% of the total planned capacity.

### Warning:

The `[storage]` configuration is supported in TiUP since v1.2.5. If your TiDB cluster version is v4.0.9 or later, make sure that your TiUP version is v1.2.5 or later. Otherwise, the data directories defined in `[storage]` will not be managed by TiUP.

## 14.5.4 PD Configuration File

The PD configuration file supports more options than command-line parameters. You can find the default configuration file [here](#).

This document only describes parameters that are not included in command-line parameters. Check [here](#) for the command line parameters.

### Tip:

If you need to adjust the value of a configuration item, refer to [Modify the configuration](#).

#### 14.5.4.0.1 name

- The unique name of a PD node
- Default value: "pd"
- To start multiply PD nodes, use a unique name for each node.

#### 14.5.4.0.2 data-dir

- The directory in which PD stores data
- Default value: `default.${name}`"

#### 14.5.4.0.3 `client-urls`

- The list of client URLs to be listened to by PD
- Default value: `"http://127.0.0.1:2379"`
- When you deploy a cluster, you must specify the IP address of the current host as `client-urls` (for example, `"http://192.168.100.113:2379"`). If the cluster runs on Docker, specify the IP address of Docker as `"http://0.0.0.0:2379"`.

#### 14.5.4.0.4 `advertise-client-urls`

- The list of advertise URLs for the client to access PD
- Default value: `"${client-urls}"`
- In some situations such as in the Docker or NAT network environment, if a client cannot access PD through the default client URLs listened to by PD, you must manually set the advertise client URLs.
- For example, the internal IP address of Docker is `172.17.0.1`, while the IP address of the host is `192.168.100.113` and the port mapping is set to `-p 2380:2380`. In this case, you can set `advertise-client-urls` to `"http://192.168.100.113:2380"`. The client can find this service through `"http://192.168.100.113:2380"`.

#### 14.5.4.0.5 `peer-urls`

- The list of peer URLs to be listened to by a PD node
- Default value: `"http://127.0.0.1:2380"`
- When you deploy a cluster, you must specify `peer-urls` as the IP address of the current host, such as `"http://192.168.100.113:2380"`. If the cluster runs on Docker, specify the IP address of Docker as `"http://0.0.0.0:2380"`.

#### 14.5.4.0.6 `advertise-peer-urls`

- The list of advertise URLs for other PD nodes (peers) to access a PD node
- Default: `"${peer-urls}"`
- In some situations such as in the Docker or NAT network environment, if the other nodes (peers) cannot access the PD node through the default peer URLs listened to by this PD node, you must manually set the advertise peer URLs.
- For example, the internal IP address of Docker is `172.17.0.1`, while the IP address of the host is `192.168.100.113` and the port mapping is set to `-p 2380:2380`. In this case, you can set `advertise-peer-urls` to `"http://192.168.100.113:2380"`. The other PD nodes can find this service through `"http://192.168.100.113:2380"`.

#### 14.5.4.0.7 `initial-cluster`

- The initial cluster configuration for bootstrapping
- Default value: "`{name}=http://{advertise-peer-url}`"
- For example, if name is "pd", and advertise-peer-urls is "`http://192.168.100.113:2380`"  
↪ , the `initial-cluster` is "`pd=http://192.168.100.113:2380`".
- If you need to start three PD servers, the `initial-cluster` might be:

```
pd1=http://192.168.100.113:2380, pd2=http://192.168.100.114:2380, pd3
↪ =192.168.100.115:2380
```

#### 14.5.4.0.8 `initial-cluster-state`

- The initial state of the cluster
- Default value: "`new`"

#### 14.5.4.0.9 `initial-cluster-token`

- Identifies different clusters during the bootstrap phase
- Default value: "`pd-cluster`"
- If multiple clusters that have nodes with same configurations are deployed successively, you must specify different tokens to isolate different cluster nodes.

#### 14.5.4.0.10 `lease`

- The timeout of the PD Leader Key lease. After the timeout, the system re-elects a Leader.
- Default value: 3
- Unit: second

#### 14.5.4.0.11 `quota-backend-bytes`

- The storage size of the meta-information database, which is 8GiB by default
- Default value: 8589934592

#### 14.5.4.0.12 `auto-compaction-mod`

- The automatic compaction modes of the meta-information database
- Available options: `periodic` (by cycle) and `revision` (by version number).
- Default value: `periodic`

#### 14.5.4.0.13 auto-compact-retention

- The time interval for automatic compaction of the meta-information database when `auto-compact-retention` is `periodic`. When the compaction mode is set to `revision`, this parameter indicates the version number for the automatic compaction.
- Default value: 1h

#### 14.5.4.0.14 force-new-cluster

- Determines whether to force PD to start as a new cluster and modify the number of Raft members to 1
- Default value: `false`

#### 14.5.4.0.15 tso-update-physical-interval

- The interval at which PD updates the physical time of TSO.
- In a default update interval of TSO physical time, PD provides at most 262144 TSOs. To get more TSOs, you can reduce the value of this configuration item. The minimum value is 1ms.
- Decreasing this configuration item might increase the CPU usage of PD. According to the test, compared with the interval of 50ms, the [CPU usage](#) of PD will increase by about 10% when the interval is 1ms.
- Default value: 50ms
- Minimum value: 1ms

### 14.5.4.1 pd-server

Configuration items related to pd-server

#### 14.5.4.1.1 server-memory-limit New in v6.6.0

##### **Warning:**

This configuration is an experimental feature. It is not recommended to use it in production environments.

- The memory limit ratio for a PD instance. The value 0 means no memory limit.
- Default value: 0
- Minimum value: 0
- Maximum value: 0.99

#### 14.5.4.1.2 `server-memory-limit-gc-trigger` New in v6.6.0

**Warning:**

This configuration is an experimental feature. It is not recommended to use it in production environments.

- The threshold ratio at which PD tries to trigger GC. When the memory usage of PD reaches the value of `server-memory-limit` \* the value of `server-memory-limit-gc-trigger`, PD triggers a Golang GC. Only one GC is triggered in one minute.
- Default value: 0.7
- Minimum value: 0.5
- Maximum value: 0.99

#### 14.5.4.1.3 `enable-gogc-tuner` New in v6.6.0

**Warning:**

This configuration is an experimental feature. It is not recommended to use it in production environments.

- Controls whether to enable the GOGC Tuner.
- Default value: `false`

#### 14.5.4.1.4 `gc-tuner-threshold` New in v6.6.0

**Warning:**

This configuration is an experimental feature. It is not recommended to use it in production environments.

- The maximum memory threshold ratio for tuning GOGC. When the memory exceeds this threshold, i.e. the value of `server-memory-limit` \* the value of `gc-tuner-threshold`, GOGC Tuner stops working.
- Default value: 0.6
- Minimum value: 0
- Maximum value: 0.9

#### 14.5.4.1.5 `flow-round-by-digit` New in TiDB 5.1

- Default value: 3
- PD rounds the lowest digits of the flow number, which reduces the update of statistics caused by the changes of the Region flow information. This configuration item is used to specify the number of lowest digits to round for the Region flow information. For example, the flow 100512 will be rounded to 101000 because the default value is 3. This configuration replaces `trace-region-flow`.

##### **Note:**

If you have upgraded your cluster from a TiDB 4.0 version to the current version, the behavior of `flow-round-by-digit` after the upgrading and the behavior of `trace-region-flow` before the upgrading are consistent by default. This means that if the value of `trace-region-flow` is false before the upgrading, the value of `flow-round-by-digit` after the upgrading is 127; if the value of `trace-region-flow` is true before the upgrading, the value of `flow-round-by-digit` after the upgrading is 3.

#### 14.5.4.1.6 `min-resolved-ts-persistence-interval` New in v6.0.0

- Determines the interval at which the minimum resolved timestamp is persistent to the PD. If this value is set to 0, it means that the persistence is disabled.
- Default value: Before v6.3.0, the default value is "0s". Starting from v6.3.0, the default value is "1s", which is the smallest positive value.
- Minimum value: 0
- Unit: second

##### **Note:**

For clusters upgraded from v6.0.0~v6.2.0, the default value of `min-resolved-ts-persistence-interval` does not change after the upgrade, which means that it will remain "0s". To enable this feature, you need to manually change the value of this configuration item.

#### 14.5.4.2 `security`

Configuration items related to security

#### 14.5.4.2.1 cacert-path

- The path of the CA file
- Default value: ""

#### 14.5.4.2.2 cert-path

- The path of the Privacy Enhanced Mail (PEM) file that contains the X509 certificate
- Default value: ""

#### 14.5.4.2.3 key-path

- The path of the PEM file that contains the X509 key
- Default value: ""

#### 14.5.4.2.4 redact-info-log New in v5.0

- Controls whether to enable log redaction in the PD log
- When you set the configuration value to `true`, user data is redacted in the PD log.
- Default value: `false`

### 14.5.4.3 log

Configuration items related to log

#### 14.5.4.3.1 level

- Specifies the level of the output log
- Optional value: "debug", "info", "warn", "error", "fatal"
- Default value: "info"

#### 14.5.4.3.2 format

- The log format
- Optional value: "text", "json"
- Default value: "text"

#### 14.5.4.3.3 disable-timestamp

- Whether to disable the automatically generated timestamp in the log
- Default value: `false`

#### 14.5.4.4 `log.file`

Configuration items related to the log file

##### 14.5.4.4.1 `max-size`

- The maximum size of a single log file. When this value is exceeded, the system automatically splits the log into several files.
- Default value: 300
- Unit: MiB
- Minimum value: 1

##### 14.5.4.4.2 `max-days`

- The maximum number of days in which a log is kept
- If the configuration item is not set, or the value of it is set to the default value 0, PD does not clean log files.
- Default value: 0

##### 14.5.4.4.3 `max-backups`

- The maximum number of log files to keep
- If the configuration item is not set, or the value of it is set to the default value 0, PD keeps all log files.
- Default value: 0

#### 14.5.4.5 `metric`

Configuration items related to monitoring

##### 14.5.4.5.1 `interval`

- The interval at which monitoring metric data is pushed to Prometheus
- Default value: 15s

#### 14.5.4.6 `schedule`

Configuration items related to scheduling

##### 14.5.4.6.1 `max-merge-region-size`

- Controls the size limit of `Region Merge`. When the Region size is greater than the specified value, PD does not merge the Region with the adjacent Regions.
- Default value: 20
- Unit: MiB

#### 14.5.4.6.2 `max-merge-region-keys`

- Specifies the upper limit of the `Region Merge` key. When the `Region` key is greater than the specified value, the PD does not merge the `Region` with its adjacent `Regions`.
- Default value: 200000

#### 14.5.4.6.3 `patrol-region-interval`

- Controls the running frequency at which `replicaChecker` checks the health state of a `Region`. The smaller this value is, the faster `replicaChecker` runs. Normally, you do not need to adjust this parameter.
- Default value: 10ms

#### 14.5.4.6.4 `split-merge-interval`

- Controls the time interval between the `split` and `merge` operations on the same `Region`. That means a newly split `Region` will not be merged for a while.
- Default value: 1h

#### 14.5.4.6.5 `max-snapshot-count`

- Controls the maximum number of snapshots that a single store receives or sends at the same time. PD schedulers depend on this configuration to prevent the resources used for normal traffic from being preempted.
- Default value value: 64

#### 14.5.4.6.6 `max-pending-peer-count`

- Controls the maximum number of pending peers in a single store. PD schedulers depend on this configuration to prevent too many `Regions` with outdated logs from being generated on some nodes.
- Default value: 64

#### 14.5.4.6.7 `max-store-down-time`

- The downtime after which PD judges that the disconnected store cannot be recovered. When PD fails to receive the heartbeat from a store after the specified period of time, it adds replicas at other nodes.
- Default value: 30m

#### **14.5.4.6.8 max-store-preparing-time New in v6.1.0**

- Controls the maximum waiting time for the store to go online. During the online stage of a store, PD can query the online progress of the store. When the specified time is exceeded, PD assumes that the store has been online and cannot query the online progress of the store again. But this does not prevent Regions from transferring to the new online store. In most scenarios, you do not need to adjust this parameter.
- Default value: 48h

#### **14.5.4.6.9 leader-schedule-limit**

- The number of Leader scheduling tasks performed at the same time
- Default value: 4

#### **14.5.4.6.10 region-schedule-limit**

- The number of Region scheduling tasks performed at the same time
- Default value: 2048

#### **14.5.4.6.11 enable-diagnostic New in v6.3.0**

- Controls whether to enable the diagnostic feature. When it is enabled, PD records the state during scheduling to help diagnose. If enabled, it might slightly affect the scheduling speed and consume more memory when there are many stores.
- Default value: false

#### **14.5.4.6.12 hot-region-schedule-limit**

- Controls the hot Region scheduling tasks that are running at the same time. It is independent of the Region scheduling.
- Default value: 4

#### **14.5.4.6.13 hot-region-cache-hits-threshold**

- The threshold used to set the number of minutes required to identify a hot Region. PD can participate in the hotspot scheduling only after the Region is in the hotspot state for more than this number of minutes.
- Default value: 3

#### **14.5.4.6.14 replica-schedule-limit**

- The number of Replica scheduling tasks performed at the same time
- Default value: 64

#### 14.5.4.6.15 `merge-schedule-limit`

- The number of the `Region Merge` scheduling tasks performed at the same time. Set this parameter to 0 to disable `Region Merge`.
- Default value: 8

#### 14.5.4.6.16 `high-space-ratio`

- The threshold ratio below which the capacity of the store is sufficient. If the space occupancy ratio of the store is smaller than this threshold value, PD ignores the remaining space of the store when performing scheduling, and balances load mainly based on the `Region` size. This configuration takes effect only when `region-score-formula-version` is set to `v1`.
- Default value: 0.7
- Minimum value: greater than 0
- Maximum value: less than 1

#### 14.5.4.6.17 `low-space-ratio`

- The threshold ratio above which the capacity of the store is insufficient. If the space occupancy ratio of a store exceeds this threshold value, PD avoids migrating data to this store as much as possible. Meanwhile, to avoid the disk space of the corresponding store being exhausted, PD performs scheduling mainly based on the remaining space of the store.
- Default value: 0.8
- Minimum value: greater than 0
- Maximum value: less than 1

#### 14.5.4.6.18 `tolerant-size-ratio`

- Controls the `balance` buffer size
- Default value: 0 (automatically adjusts the buffer size)
- Minimum value: 0

#### 14.5.4.6.19 `enable-cross-table-merge`

- Determines whether to enable the merging of cross-table `Regions`
- Default value: `true`

#### 14.5.4.6.20 `region-score-formula-version` New in v5.0

- Controls the version of the Region score formula
- Default value: `v2`
- Optional values: `v1` and `v2`. Compared to `v1`, the changes in `v2` are smoother, and the scheduling jitter caused by space reclaim is improved.

##### Note:

If you have upgraded your cluster from a TiDB 4.0 version to the current version, the new formula version is automatically disabled by default to ensure consistent PD behavior before and after the upgrading. If you want to change the formula version, you need to manually switch through the `pd-ctl` setting. For details, refer to [PD Control](#).

#### 14.5.4.6.21 `enable-joint-consensus` New in v5.0

- Controls whether to use Joint Consensus for replica scheduling. If this configuration is disabled, PD schedules one replica at a time.
- Default value: `true`

#### 14.5.4.6.22 `hot-regions-write-interval` New in v5.4.0

- The time interval at which PD stores hot Region information.
- Default value: `10m`

##### Note:

The information about hot Regions is updated every three minutes. If the interval is set to less than three minutes, updates during the interval might be meaningless.

#### 14.5.4.6.23 `hot-regions-reserved-days` New in v5.4.0

- Specifies how many days the hot Region information is retained.
- Default value: `7`

#### 14.5.4.7 replication

Configuration items related to replicas

##### 14.5.4.7.1 max-replicas

- The number of replicas, that is, the sum of the number of leaders and followers. The default value 3 means 1 leader and 2 followers. When this configuration is modified dynamically, PD will schedule Regions in the background so that the number of replicas matches this configuration.
- Default value: 3

##### 14.5.4.7.2 location-labels

- The topology information of a TiKV cluster
- Default value: []
- [Cluster topology configuration](#)

##### 14.5.4.7.3 isolation-level

- The minimum topological isolation level of a TiKV cluster
- Default value: ""
- [Cluster topology configuration](#)

##### 14.5.4.7.4 strictly-match-label

- Enables the strict check for whether the TiKV label matches PD's location-labels.
- Default value: false

##### 14.5.4.7.5 enable-placement-rules

- Enables placement-rules.
- Default value: true
- See [Placement Rules](#).

#### 14.5.4.8 label-property

Configuration items related to labels

##### 14.5.4.8.1 key

- The label key for the store that rejected the Leader
- Default value: ""

#### 14.5.4.8.2 value

- The label value for the store that rejected the Leader
- Default value: ""

#### 14.5.4.9 dashboard

Configuration items related to the [TiDB Dashboard](#) built in PD.

##### 14.5.4.9.1 tidb-cacert-path

- The path of the root CA certificate file. You can configure this path when you connect to TiDB's SQL services using TLS.
- Default value: ""

##### 14.5.4.9.2 tidb-cert-path

- The path of the SSL certificate file. You can configure this path when you connect to TiDB's SQL services using TLS.
- Default value: ""

##### 14.5.4.9.3 tidb-key-path

- The path of the SSL private key file. You can configure this path when you connect to TiDB's SQL services using TLS.
- Default value: ""

##### 14.5.4.9.4 public-path-prefix

- When TiDB Dashboard is accessed behind a reverse proxy, this item sets the public URL path prefix for all web resources.
- Default value: `/dashboard`
- Do **not** modify this configuration item when TiDB Dashboard is accessed not behind a reverse proxy; otherwise, access issues might occur. See [Use TiDB Dashboard behind a Reverse Proxy](#) for details.

##### 14.5.4.9.5 enable-telemetry

- Determines whether to enable the telemetry collection feature in TiDB Dashboard.
- Default value: `false`
- See [Telemetry](#) for details.

#### 14.5.4.10 replication-mode

Configuration items related to the replication mode of all Regions. See [Enable the DR Auto-Sync mode](#) for details.

## 14.6 CLI

### 14.6.1 TiKV Control User Guide

TiKV Control (`tikv-ctl`) is a command line tool of TiKV, used to manage the cluster. Its installation directory is as follows:

- If the cluster is deployed using TiUP, `tikv-ctl` directory is in the in `~/.tiup/components/ctl/{VERSION}/` directory.

#### 14.6.1.1 Use TiKV Control in TiUP

##### Note:

It is recommended that the version of the Control tool you use is consistent with the version of the cluster.

`tikv-ctl` is also integrated in the `tiup` command. Execute the following command to call the `tikv-ctl` tool:

```
tiup ctl:v<CLUSTER_VERSION> tikv
```

```
Starting component `ctl`: /home/tidb/.tiup/components/ctl/v4.0.8/ctl tikv
TiKV Control (tikv-ctl)
Release Version: 4.0.8
Edition: Community
Git Commit Hash: 83091173e960e5a0f5f417e921a0801d2f6635ae
Git Commit Branch: heads/refs/tags/v4.0.8
UTC Build Time: 2020-10-30 08:40:33
Rust Version: rustc 1.42.0-nightly (0de96d37f 2019-12-19)
Enable Features: jemalloc mem-profiling portable sse protobuf-codec
Profile: dist_release
```

A tool for interacting with TiKV deployments.

USAGE:

```
TiKV Control (tikv-ctl) [FLAGS] [OPTIONS] [SUBCOMMAND]
```

FLAGS:

```
-h, --help Prints help information
--skip-paranoid-checks Skip paranoid checks when open rocksdb
-V, --version Prints version information
```

#### OPTIONS:

```
--ca-path <ca-path> Set the CA certificate path
--cert-path <cert-path> Set the certificate path
--config <config> TiKV config path, by default it's <
 ↪ deploy-dir>/conf/tikv.toml
--data-dir <data-dir> TiKV data directory path, check <deploy-
 ↪ dir>/scripts/run.sh to get it
--decode <decode> Decode a key in escaped format
--encode <encode> Encode a key in escaped format
--to-hex <escaped-to-hex> Convert an escaped key to hex key
--to-escaped <hex-to-escaped> Convert a hex key to escaped key
--host <host> Set the remote host
--key-path <key-path> Set the private key path
--log-level <log-level> Set the log level [default: warn]
--pd <pd> Set the address of pd
```

#### SUBCOMMANDS:

```
bad-regions Get all regions with corrupt raft
cluster Print the cluster id
compact Compact a column family in a specified range
compact-cluster Compact the whole cluster in a specified range in one
 ↪ or more column families
consistency-check Force a consistency-check for a specified region
decrypt-file Decrypt an encrypted file
diff Calculate difference of region keys from different
 ↪ dbs
dump-snap-meta Dump snapshot meta file
encryption-meta Dump encryption metadata
fail Inject failures to TiKV and recovery
help Prints this message or the help of the given
 ↪ subcommand(s)
metrics Print the metrics
modify-tikv-config Modify tikv config, eg. tikv-ctl --host ip:port
 ↪ modify-tikv-config -n
 rocksdb.defaultcf.disable-auto-compactions -v true
mvcc Print the mvcc value
print Print the raw value
raft Print a raft log entry
raw-scan Print all raw keys in the range
recover-mvcc Recover mvcc data on one node by deleting corrupted
 ↪ keys
recreate-region Recreate a region with given metadata, but alloc new
 ↪ id for it
```

```
region-properties Show region properties
scan Print the range db range
size Print region size
split-region Split the region
store Print the store id
tombstone Set some regions on the node to tombstone by manual
unsafe-recover Unsafely recover the cluster when the majority
 ↪ replicas are failed
```

You can add corresponding parameters and subcommands after `tiup ctl:v< ↪ CLUSTER_VERSION> tikv`.

### 14.6.1.2 General options

`tikv-ctl` provides two operation modes:

- Remote mode: use the `--host` option to accept the service address of TiKV as the argument

For this mode, if SSL is enabled in TiKV, `tikv-ctl` also needs to specify the related certificate file. For example:

```
tikv-ctl --ca-path ca.pem --cert-path client.pem --key-path client-key.
 ↪ pem --host 127.0.0.1:20160 <subcommands>
```

However, sometimes `tikv-ctl` communicates with PD instead of TiKV. In this case, you need to use the `--pd` option instead of `--host`. Here is an example:

```
tikv-ctl --pd 127.0.0.1:2379 compact-cluster
```

```
store:"127.0.0.1:20160" compact db:KV cf:default range:([], []) success
 ↪ !
```

- Local mode:
  - Use the `--data-dir` option to specify the local TiKV data directory path.
  - Use the `--config` option to specify the local TiKV configuration file path.

In this mode, you need to stop the running TiKV instance.

Unless otherwise noted, all commands support both the remote mode and the local mode.

Additionally, `tikv-ctl` has two simple commands `--to-hex` and `--to-escaped`, which are used to make simple changes to the form of the key.

Generally, use the `escaped` form of the key. For example:

```
tikv-ctl --to-escaped 0xaaff
\252\377
tikv-ctl --to-hex "\252\377"
AAFF
```

#### Note:

When you specify the **escaped** form of the key in a command line, it is required to enclose it in double quotes. Otherwise, bash eats the backslash and a wrong result is returned.

### 14.6.1.3 Subcommands, some options and flags

This section describes the subcommands that `tikv-ctl` supports in detail. Some subcommands support a lot of options. For all details, run `tikv-ctl --help <subcommand>`.

#### 14.6.1.3.1 View information of the Raft state machine

Use the `raft` subcommand to view the status of the Raft state machine at a specific moment. The status information includes two parts: three structs (**RegionLocalState**, **RaftLocalState**, and **RegionApplyState**) and the corresponding Entries of a certain piece of log.

Use the `region` and `log` subcommands to obtain the above information respectively. The two subcommands both support the remote mode and the local mode at the same time.

For the `region` subcommand:

- To specify the Regions to be viewed, use the `-r` option. Multiple Regions are separated by `,`. You can also use the `--all-regions` option to view all Regions. Note that `-r` and `--all-regions` cannot be used at the same time.
- To limit the number of Regions to be printed, use the `--limit` option (default: 16).
- To query which Regions are included in a certain key range, use the `--start` and `--end` options (default: no range limit, in Hex format).

For example, to print the Region with the ID 1239, use the following command:

```
tikv-ctl --host 127.0.0.1:20160 raft region -r 1239
```

The output is as follows:

```
"region id": 1239
"region state": {
 id: 1239,
 start_key: 7480000000000000FF4E5F728000000000FF1443770000000000FA,
 end_key: 7480000000000000FF4E5F728000000000FF21C4420000000000FA,
 region_epoch: {conf_ver: 1 version: 43},
 peers: [{id: 1240 store_id: 1 role: Voter}]
}
"raft state": {
 hard_state {term: 8 vote: 5 commit: 7}
 last_index: 8)
}
"apply state": {
 applied_index: 8 commit_index: 8 commit_term: 8
 truncated_state {index: 5 term: 5}
}
```

To query which Regions are included in a certain key range, use the following command:

- If the key range is in a Region range, the Region information is output.
- If the key range is the same as a Region range, for example, when the given key range is the same as the Region 1239, because the Region range is a left-closed and right-open interval, and Region 1009 takes the `end_key` of Region 1239 as the `start_key`, the Region 1009 information is also output.

```
tikv-ctl --host 127.0.0.1:20160 raft region --start 7480000000000000
↳ FF4E5F728000000000FF1443770000000000FA --end 7480000000000000
↳ FF4E5F728000000000FF21C4420000000000FA
```

The output is as follows:

```
"region state": {
 id: 1009
 start_key: 7480000000000000FF4E5F728000000000FF21C4420000000000FA,
 end_key: 7480000000000000FF5000000000000000F8,
 ...
}
"region state": {
 id: 1239
 start_key: 7480000000000000FF4E5F728000000000FF06C6D60000000000FA,
 end_key: 7480000000000000FF4E5F728000000000FF1443770000000000FA,
 ...
}
```

### 14.6.1.3.2 View the Region size

Use the `size` command to view the Region size:

```
tikv-ctl --data-dir /path/to/tikv size -r 2
```

The output is as follows:

```
region id: 2
cf default region size: 799.703 MB
cf write region size: 41.250 MB
cf lock region size: 27616
```

### 14.6.1.3.3 Scan to view MVCC of a specific range

The `--from` and `--to` options of the `scan` command accept two escaped forms of raw key, and use the `--show-cf` flag to specify the column families that you need to view.

```
tikv-ctl --data-dir /path/to/tikv scan --from 'zm' --limit 2 --show-cf lock,
↳ default,write
```

```
key: zmBootstr\377a\377pKey
↳ \000\000\377\000\000\373\000\000\000\000\000\377\000\000s
↳ \000\000\000\000\000\372
 write cf value: start_ts: 399650102814441473 commit_ts:
 ↳ 399650102814441475 short_value: "20"
key: zmDB:29\000\000\377\000\374\000\000\000\000\000\000\377\000H
↳ \000\000\000\000\000\371
 write cf value: start_ts: 399650105239273474 commit_ts:
 ↳ 399650105239273475 short_value:
 ↳ "\000\000\000\000\000\000\000\002"
 write cf value: start_ts: 399650105199951882 commit_ts:
 ↳ 399650105213059076 short_value:
 ↳ "\000\000\000\000\000\000\000\001"
```

### 14.6.1.3.4 View MVCC of a given key

Similar to the `scan` command, the `mvcc` command can be used to view MVCC of a given key.

```
tikv-ctl --data-dir /path/to/tikv mvcc -k "zmDB
↳ :29\000\000\377\000\374\000\000\000\000\000\000\377\000H
↳ \000\000\000\000\000\371" --show-cf=lock,write,default
```

```
key: zmDB:29\000\000\377\000\374\000\000\000\000\000\000\377\000H
↳ \000\000\000\000\000\371
```

```
write cf value: start_ts: 399650105239273474 commit_ts:
↳ 399650105239273475 short_value:
↳ "\000\000\000\000\000\000\000\002"
write cf value: start_ts: 399650105199951882 commit_ts:
↳ 399650105213059076 short_value:
↳ "\000\000\000\000\000\000\000\001"
```

In this command, the key is also the escaped form of raw key.

#### 14.6.1.3.5 Scan raw keys

The `raw-scan` command scans directly from the RocksDB. Note that to scan data keys you need to add a 'z' prefix to keys.

Use `--from` and `--to` options to specify the range to scan (unbounded by default). Use `--limit` to limit at most how many keys to print out (30 by default). Use `--cf` to specify which cf to scan (can be `default`, `write` or `lock`).

```
tikv-ctl --data-dir /var/lib/tikv raw-scan --from 'zt' --limit 2 --cf
↳ default
```

```
key: "zt\200\000\000\000\000\000\000\377\005_r
↳ \200\000\000\000\000\377\000\000\001\000\000\000\000\372\372b2
↳ ,^\033\377\364", value: "\010\002\002\002%\010\004\002\010root
↳ \010\006\002\000\010\010\t\002\010\n\t\002\010\014\t\002\010\016\t
↳ \002\010\020\t\002\010\022\t\002\010\024\t\002\010\026\t\002\010\030\
↳ t\002\010\032\t\002\010\034\t\002\010\036\t\002\010 \t\002\010"\t
↳ \002\010s\t\002\010&\t\002\010(\t\002\010*\t\002\010,\t\002\010.\t
↳ \002\0100\t\002\0102\t\002\0104\t\002"
key: "zt\200\000\000\000\000\000\000\377\025_r
↳ \200\000\000\000\000\377\000\000\023\000\000\000\000\000\372\372b2
↳ ,^\033\377\364", value: "\010\002\002&slow_query_log_file\010\004\002
↳ P/usr/local/mysql/data/localhost-slow.log"
```

Total scanned keys: 2

#### 14.6.1.3.6 Print a specific key value

To print the value of a key, use the `print` command.

#### 14.6.1.3.7 Print some properties about Region

In order to record Region state details, TiKV writes some statistics into the SST files of Regions. To view these properties, run `tikv-ctl` with the `region-properties` sub-command:

```
tikv-ctl --host localhost:20160 region-properties -r 2
```

```
num_files: 0
num_entries: 0
num_deletes: 0
mvcc.min_ts: 18446744073709551615
mvcc.max_ts: 0
mvcc.num_rows: 0
mvcc.num_puts: 0
mvcc.num_versions: 0
mvcc.max_row_versions: 0
middle_key_by_approximate_size:
```

The properties can be used to check whether the Region is healthy or not. If not, you can use them to fix the Region. For example, splitting the Region manually by `middle_key_approximate_size`.

#### 14.6.1.3.8 Compact data of each TiKV manually

Use the `compact` command to manually compact data of each TiKV.

- Use the `--from` and `--to` options to specify the compaction range in the form of escaped raw key. If not set, the whole range will be compacted.
- Use the `--region` option to compact the range of a specific region. If set, `--from` and `--to` will be ignored.
- Use the `--db` option to specify the RocksDB that performs compaction. The optional values are `kv` and `raft`.
- Use the `--threads` option allows you to specify the concurrency for the TiKV compaction and its default value is 8. Generally, a higher concurrency comes with a faster compaction speed, which might yet affect the service. You need to choose an appropriate concurrency count based on your scenario.
- Use the `--bottommost` option to include or exclude the bottommost files when TiKV performs compaction. The value options are `default`, `skip`, and `force`. The default value is `default`.
  - `default` means that the bottommost files are included only when the Compaction Filter feature is enabled.
  - `skip` means that the bottommost files are excluded when TiKV performs compaction.
  - `force` means that the bottommost files are always included when TiKV performs compaction.

- To compact data in the local mode, use the following command:

```
tikv-ctl --data-dir /path/to/tikv compact --db kv
```

- To compact data in the remote mode, use the following command:

```
tikv-ctl --host ip:port compact --db kv
```

#### 14.6.1.3.9 Compact data of the whole TiKV cluster manually

Use the `compact-cluster` command to manually compact data of the whole TiKV cluster. The flags of this command have the same meanings and usage as those of the `compact` command.

#### 14.6.1.3.10 Set a Region to tombstone

The `tombstone` command is usually used in circumstances where the `sync-log` is not enabled, and some data written in the Raft state machine is lost caused by power down.

In a TiKV instance, you can use this command to set the status of some Regions to tombstone. Then when you restart the instance, those Regions are skipped to avoid the restart failure caused by damaged Raft state machines of those Regions. Those Regions need to have enough healthy replicas in other TiKV instances to be able to continue the reads and writes through the Raft mechanism.

In general cases, you can remove the corresponding Peer of this Region using the `remove` ↪ `-peer` command:

```
pd-ctl operator add remove-peer <region_id> <store_id>
```

Then use the `tikv-ctl` tool to set a Region to tombstone on the corresponding TiKV instance to skip the health check for this Region at startup:

```
tikv-ctl --data-dir /path/to/tikv tombstone -p 127.0.0.1:2379 -r <region_id>
```

```
success!
```

However, in some cases, you cannot easily remove this Peer of this Region from PD, so you can specify the `--force` option in `tikv-ctl` to forcibly set the Peer to tombstone:

```
tikv-ctl --data-dir /path/to/tikv tombstone -p 127.0.0.1:2379 -r <region_id>
↪ >,<region_id> --force
```

```
success!
```

**Note:**

- The `tombstone` command only supports the local mode.
- The argument of the `-p` option specifies the PD endpoints without the `http` prefix. Specifying the PD endpoints is to query whether PD can safely switch to Tombstone.

**14.6.1.3.11 Send a consistency-check request to TiKV**

Use the `consistency-check` command to execute a consistency check among replicas in the corresponding Raft of a specific Region. If the check fails, TiKV itself panics. If the TiKV instance specified by `--host` is not the Region leader, an error is reported.

```
tikv-ctl --host 127.0.0.1:20160 consistency-check -r 2
success!
tikv-ctl --host 127.0.0.1:20161 consistency-check -r 2
DebugClient::check_region_consistency: RpcFailure(RpcStatus { status:
 ↪ Unknown, details: Some("StringError(\"Leader is on store 1\")") })
```

**Note:**

- It is **NOT** recommended to use the `consistency-check` command, because it is incompatible with the garbage collection in TiDB and might mistakenly report an error.
- This command only supports the remote mode.
- Even if this command returns `success!`, you need to check whether TiKV panics. This is because this command is only a proposal that requests a consistency check for the leader, and you cannot know from the client whether the whole check process is successful or not.

**14.6.1.3.12 Dump snapshot meta**

This sub-command is used to parse a snapshot meta file at given path and print the result.

**14.6.1.3.13 Print the Regions where the Raft state machine corrupts**

To avoid checking the Regions while TiKV is started, you can use the `tombstone` command to set the Regions where the Raft state machine reports an error to Tombstone. Before

running this command, use the `bad-regions` command to find out the Regions with errors, so as to combine multiple tools for automated processing.

```
tikv-ctl --data-dir /path/to/tikv bad-regions
```

```
all regions are healthy
```

If the command is successfully executed, it prints the above information. If the command fails, it prints the list of bad Regions. Currently, the errors that can be detected include the mismatches between `last index`, `commit index` and `apply index`, and the loss of Raft log. Other conditions like the damage of snapshot files still need further support.

#### 14.6.1.3.14 View Region properties

- To view in local the properties of Region 2 on the TiKV instance that is deployed in `/path/to/tikv`:

```
tikv-ctl --data-dir /path/to/tikv/data region-properties -r 2
```

- To view online the properties of Region 2 on the TiKV instance that is running on `127.0.0.1:20160`:

```
tikv-ctl --host 127.0.0.1:20160 region-properties -r 2
```

#### 14.6.1.3.15 Modify the TiKV configuration dynamically

You can use the `modify-tikv-config` command to dynamically modify the configuration arguments. Currently, the TiKV configuration items that can be dynamically modified and the detailed modification are consistent with modifying configuration using SQL statements. For details, see [Modify TiKV configuration dynamically](#).

- `-n` is used to specify the full name of the configuration item. For the list of configuration items that can be modified dynamically, see [Modify TiKV configuration dynamically](#).
- `-v` is used to specify the configuration value.

Set the size of shared block cache:

```
tikv-ctl --host ip:port modify-tikv-config -n storage.block-cache.capacity -
↪ v 10GB
```

```
success
```

When shared block cache is disabled, set block cache size for the write CF:

```
tikv-ctl --host ip:port modify-tikv-config -n rocksdb.writecf.block-cache-
↪ size -v 256MB
```

```
success
```

```
tikv-ctl --host ip:port modify-tikv-config -n raftdb.defaultcf.disable-auto-
↳ compactions -v true
```

```
success
```

```
tikv-ctl --host ip:port modify-tikv-config -n raftstore.sync-log -v false
```

```
success
```

When the compaction rate limit causes accumulated compaction pending bytes, disable the `rate-limiter-auto-tuned` mode or set a higher limit for the compaction flow:

```
tikv-ctl --host ip:port modify-tikv-config -n rocksdb.rate-limiter-auto-
↳ tuned -v false
```

```
success
```

```
tikv-ctl --host ip:port modify-tikv-config -n rocksdb.rate-bytes-per-sec -v
↳ "1GB"
```

```
success
```

#### 14.6.1.3.16 Force Regions to recover services from failure of multiple replicas (deprecated)

##### Warning:

It is not recommended to use this feature. Instead, you can use Online Unsafe Recovery in `pd-ctl` which provides one-stop automatic recovery capabilities. Extra operations such as stopping services are not needed. For detailed introduction, see [Online Unsafe Recovery](#).

You can use the `unsafe-recover remove-fail-stores` command to remove the failed machines from the peer list of Regions. Before running this command, you need to stop the service of the target TiKV store to release file locks.

The `-s` option accepts multiple `store_id` separated by comma and uses the `-r` flag to specify involved Regions. If you need to perform this operation on all Regions in a specific store, you can simply specify `--all-regions`.

**Warning:**

- If any misoperation is performed, it might be hard to recover the cluster. Be aware of the potential risks and avoid using this feature in a production environment.
- If the `--all-regions` option is used, you are expected to run this command on all the remaining stores connected to the cluster. You need to ensure that these healthy stores stop providing services before recovering the damaged stores. Otherwise, the inconsistent peer lists in Region replicas will cause errors when you run `split-region` or `remove-peer`. This further causes inconsistency between other metadata, and finally, the Regions will become unavailable.
- Once you have run `remove-fail-stores`, you cannot restart the removed nodes or add these nodes to the cluster. Otherwise, the metadata will be inconsistent, and finally, the Regions will be unavailable.

```
tikv-ctl --data-dir /path/to/tikv unsafe-recover remove-fail-stores -s 3 -r
↪ 1001,1002
```

```
success!
```

```
tikv-ctl --data-dir /path/to/tikv unsafe-recover remove-fail-stores -s 4,5
↪ --all-regions
```

Then, after you restart TiKV, the Regions can continue providing services with the remaining healthy replicas. This command is commonly used when multiple TiKV stores are damaged or deleted.

**Note:**

- You are expected to run this command for all stores where the specified Regions' peers are located.
- This command only supports the local mode. It prints `success!` when successfully run.

#### 14.6.1.3.17 Recover from MVCC data corruption

Use the `recover-mvcc` command in circumstances where TiKV cannot run normally caused by MVCC data corruption. It cross-checks 3 CFs (“default”, “write”, “lock”) to recover from various kinds of inconsistency.

- Use the `-r` option to specify involved Regions by `region_id`.
- Use the `-p` option to specify PD endpoints.

```
tikv-ctl --data-dir /path/to/tikv recover-mvcc -r 1001,1002 -p
 ↪ 127.0.0.1:2379
success!
```

#### Note:

- This command only supports the local mode. It prints `success!` when successfully run.
- The argument of the `-p` option specifies the PD endpoints without the `http` prefix. Specifying the PD endpoints is to query whether the specified `region_id` is validated or not.
- You need to run this command for all stores where specified Regions’ peers are located.

#### 14.6.1.3.18 Ldb Command

The `ldb` command line tool offers multiple data access and database administration commands. Some examples are listed below. For more information, refer to the help message displayed when running `tikv-ctl ldb` or check the documents from RocksDB.

Examples of data access sequence:

To dump an existing RocksDB in HEX:

```
tikv-ctl ldb --hex --db=/tmp/db dump
```

To dump the manifest of an existing RocksDB:

```
tikv-ctl ldb --hex manifest_dump --path=/tmp/db/MANIFEST-000001
```

You can specify the column family that your query is against using the `--column_family` `↪ =<string>` command line.

`--try_load_options` loads the database options file to open the database. It is recommended to always keep this option on when the database is running. If you open the database with default options, the LSM-tree might be messed up, which cannot be recovered automatically.

### 14.6.1.3.19 Dump encryption metadata

Use the `encryption-meta` subcommand to dump encryption metadata. The subcommand can dump two types of metadata: encryption info for data files, and the list of data encryption keys used.

To dump encryption info for data files, use the `encryption-meta dump-file` subcommand. You need to create a TiKV config file to specify `data-dir` for the TiKV deployment:

```
conf.toml
[storage]
data-dir = "/path/to/tikv/data"
```

The `--path` option can be used to specify an absolute or relative path to the data file of interest. The command might give empty output if the data file is not encrypted. If `--path` is not provided, encryption info for all data files will be printed.

```
tikv-ctl --config=./conf.toml encryption-meta dump-file --path=/path/to/tikv
↳ /data/db/CURRENT
```

```
/path/to/tikv/data/db/CURRENT: key_id: 9291156302549018620 iv:
↳ E3C2FDBF63FC03BFC28F265D7E78283F method: Aes128Ctr
```

To dump data encryption keys, use the `encryption-meta dump-key` subcommand. In addition to `data-dir`, you also need to specify the current master key used in the config file. For how to config master key, refer to [Encryption-At-Rest](#). Also with this command, the `security.encryption.previous-master-key` config will be ignored, and the master key rotation will not be triggered.

```
conf.toml
[storage]
data-dir = "/path/to/tikv/data"

[security.encryption.master-key]
type = "kms"
key-id = "0987dcba-09fe-87dc-65ba-ab0987654321"
region = "us-west-2"
```

Note if the master key is a AWS KMS key, `tikv-ctl` needs to have access to the KMS key. Access to a AWS KMS key can be granted to `tikv-ctl` via environment variable, AWS default config file, or IAM role, whichever is suitable. Refer to AWS document for usage.

The `--ids` option can be used to specified a list of comma-separated data encryption key ids to print. If `--ids` is not provided, all data encryption keys will be printed, along with current key id, which is the id of the latest active data encryption key.

When using the command, you will see a prompt warning that the action will expose sensitive information. Type "I consent" to continue.

```
tikv-ctl --config=./conf.toml encryption-meta dump-key
```

This action will expose encryption key(s) as plaintext. Do not output the  
↳ result in file on disk.

Type "I consent" to continue, anything else to exit: I consent

current key id: 9291156302549018620

9291156302549018620: key: 8B6B6B8F83D36BE2467ED55D72AE808B method: Aes128Ctr

↳ creation\_time: 1592938357

```
tikv-ctl --config=./conf.toml encryption-meta dump-key --ids
```

↳ =9291156302549018620

This action will expose encryption key(s) as plaintext. Do not output the  
↳ result in file on disk.

Type "I consent" to continue, anything else to exit: I consent

9291156302549018620: key: 8B6B6B8F83D36BE2467ED55D72AE808B method: Aes128Ctr

↳ creation\_time: 1592938357

#### Note:

The command will expose data encryption keys as plaintext. In production, DO NOT redirect the output to a file. Even deleting the output file afterward may not cleanly wipe out the content from disk.

#### 14.6.1.3.20 Print information related to damaged SST files

Damaged SST files in TiKV might cause TiKV processes to panic. Before TiDB v6.1.0, these files cause TiKV to panic immediately. Since TiDB v6.1.0, TiKV processes panic 1 hour after SST files are damaged.

To clean up the damaged SST files, you can run the `bad-ssts` command in TiKV Control to show the needed information. The following is an example command and output.

#### Note:

Before running this command, stop the running TiKV instance.

```
tikv-ctl --data-dir </path/to/tikv> bad-ssts --pd <endpoint>
```

```

corruption info:
data/tikv-21107/db/000014.sst: Corruption: Bad table magic number: expected
 ↪ 9863518390377041911, found 759105309091689679 in data/tikv-21107/db
 ↪ /000014.sst

sst meta:
14:552997[1 .. 5520]['0101' seq:1, type:1 .. '7
 ↪ A74800000000000000FF0F5F728000000000FF0002160000000000FAFA13AB33020BFFFA
 ↪ ' seq:2032, type:1] at level 0 for Column family "default" (ID 0)
it isn't easy to handle local data, start key:0101

overlap region:
RegionInfo { region: id: 4 end_key: 7480000000000000FF0500000000000000F8
 ↪ region_epoch { conf_ver: 1 version: 2 } peers { id: 5 store_id: 1 },
 ↪ leader: Some(id: 5 store_id: 1) }

suggested operations:
tikv-ctl ldb --db=data/tikv-21107/db unsafe_remove_sst_file "data/tikv
 ↪ -21107/db/000014.sst"
tikv-ctl --db=data/tikv-21107/db tombstone -r 4 --pd <endpoint>

corruption analysis has completed

```

From the output above, you can see that the information of the damaged SST file is printed first and then the meta-information is printed.

- In the `sst meta` part, 14 means the SST file number; 552997 means the file size, followed by the smallest and largest sequence numbers and other meta-information.
- The `overlap region` part shows the information of the Region involved. This information is obtained through the PD server.
- The `suggested operations` part provides you suggestion to clean up the damaged SST file. You can take the suggestion to clean up files and restart the TiKV instance.

## 14.6.2 PD Control User Guide

As a command line tool of PD, PD Control obtains the state information of the cluster and tunes the cluster.

### 14.6.2.1 Install PD Control

**Note:**

It is recommended that the version of the Control tool you use is consistent with the version of the cluster.

#### 14.6.2.1.1 Use TiUP command

To use PD Control, execute the `tiup ctl:v<CLUSTER_VERSION> pd -u http://<pd_ip> ↵>:<pd_port> [-i]` command.

#### 14.6.2.1.2 Download the installation package

To obtain `pd-ctl` of the latest version, download the TiDB server installation package. `pd-ctl` is included in the `ctl-{version}-linux-{arch}.tar.gz` package.

| Installation package                                                                                                                                                                                          | OS    | Architecture | SHA256 checksum                                                                                                                                                                                                             |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="https://download.pingcap.org/↵&gt;tidb-community-server-{↵&gt;version}-linux-amd64.tar.gz">https://download.pingcap.org/↵&gt;tidb-community-server-{↵&gt;version}-linux-amd64.tar.gz</a><br>(pd-ctl) | Linux | amd64        | <a href="https://download.pingcap.org/↵&gt;/tidb-community-server-{↵&gt;version}-linux-amd64.tar.↵&gt;gz.sha256">https://download.pingcap.org/↵&gt;/tidb-community-server-{↵&gt;version}-linux-amd64.tar.↵&gt;gz.sha256</a> |
| <a href="https://download.pingcap.org/↵&gt;tidb-community-server-{↵&gt;version}-linux-arm64.tar.gz">https://download.pingcap.org/↵&gt;tidb-community-server-{↵&gt;version}-linux-arm64.tar.gz</a><br>(pd-ctl) | Linux | arm64        | <a href="https://download.pingcap.org/↵&gt;/tidb-community-server-{↵&gt;version}-linux-arm64.tar.↵&gt;gz.sha256">https://download.pingcap.org/↵&gt;/tidb-community-server-{↵&gt;version}-linux-arm64.tar.↵&gt;gz.sha256</a> |

**Note:**

{version} in the link indicates the version number of TiDB. For example, the download link for v6.6.0 in the amd64 architecture is [https://download ↵>.pingcap.org/tidb-community-server-v6.6.0-linux-amd64.tar.gz](https://download.pingcap.org/tidb-community-server-v6.6.0-linux-amd64.tar.gz).

#### 14.6.2.1.3 Compile from source code

1. [Go](#) 1.19 or later is required because the Go modules are used.
2. In the root directory of the [PD project](#), use the `make` or `make pd-ctl` command to compile and generate `bin/pd-ctl`.

### 14.6.2.2 Usage

Single-command mode:

```
tiup ctl:v<CLUSTER_VERSION> pd store -u http://127.0.0.1:2379
```

Interactive mode:

```
tiup ctl:v<CLUSTER_VERSION> pd -i -u http://127.0.0.1:2379
```

Use environment variables:

```
export PD_ADDR=http://127.0.0.1:2379
tiup ctl:v<CLUSTER_VERSION> pd
```

Use TLS to encrypt:

```
tiup ctl:v<CLUSTER_VERSION> pd -u https://127.0.0.1:2379 --cacert="path/to/
↵ ca" --cert="path/to/cert" --key="path/to/key"
```

### 14.6.2.3 Command line flags

#### 14.6.2.3.1 --cacert

- Specifies the path to the certificate file of the trusted CA in PEM format
- Default: “”

#### 14.6.2.3.2 --cert

- Specifies the path to the certificate of SSL in PEM format
- Default: “”

#### 14.6.2.3.3 --detach / -d

- Uses the single command line mode (not entering readline)
- Default: true

#### 14.6.2.3.4 --help / -h

- Outputs the help information
- Default: false

#### 14.6.2.3.5 --interact / -i

- Uses the interactive mode (entering readline)
- Default: false

#### 14.6.2.3.6 --key

- Specifies the path to the certificate key file of SSL in PEM format, which is the private key of the certificate specified by --cert
- Default: ""

#### 14.6.2.3.7 --pd / -u

- Specifies the PD address
- Default address: `http://127.0.0.1:2379`
- Environment variable: `PD_ADDR`

#### 14.6.2.3.8 --version / -V

- Prints the version information and exit
- Default: false

### 14.6.2.4 Command

#### 14.6.2.4.1 cluster

Use this command to view the basic information of the cluster.

Usage:

```
>> cluster // To show the cluster information
{
 "id": 6493707687106161130,
 "max_peer_count": 3
}
```

#### 14.6.2.4.2 config [show | set <option> <value> | placement-rules]

Use this command to view or modify the configuration information.

Usage:

```
>> config show // Display the config information
 ↪ of the scheduling
{
 "replication": {
 "enable-placement-rules": "true",
 "isolation-level": "",
 "location-labels": "",
 "max-replicas": 3,
```

```
"strictly-match-label": "false"
},
"schedule": {
 "enable-cross-table-merge": "true",
 "high-space-ratio": 0.7,
 "hot-region-cache-hits-threshold": 3,
 "hot-region-schedule-limit": 4,
 "leader-schedule-limit": 4,
 "leader-schedule-policy": "count",
 "low-space-ratio": 0.8,
 "max-merge-region-keys": 200000,
 "max-merge-region-size": 20,
 "max-pending-peer-count": 64,
 "max-snapshot-count": 64,
 "max-store-down-time": "30m0s",
 "merge-schedule-limit": 8,
 "patrol-region-interval": "10ms",
 "region-schedule-limit": 2048,
 "region-score-formula-version": "v2",
 "replica-schedule-limit": 64,
 "scheduler-max-waiting-operator": 5,
 "split-merge-interval": "1h0m0s",
 "tolerant-size-ratio": 0
}
}
>> config show all // Display all config information
>> config show replication // Display the config information
 ↪ of replication
{
 "max-replicas": 3,
 "location-labels": "",
 "isolation-level": "",
 "strictly-match-label": "false",
 "enable-placement-rules": "true"
}

>> config show cluster-version // Display the current version of
 ↪ the cluster, which is the current minimum version of TiKV nodes in
 ↪ the cluster and does not correspond to the binary version.
"5.2.2"
```

- `max-snapshot-count` controls the maximum number of snapshots that a single store receives or sends out at the same time. The scheduler is restricted by this configuration to avoid taking up normal application resources. When you need to improve the speed

of adding replicas or balancing, increase this value.

```
config set max-snapshot-count 64 // Set the maximum number of snapshots
↪ to 64
```

- `max-pending-peer-count` controls the maximum number of pending peers in a single store. The scheduler is restricted by this configuration to avoid producing a large number of Regions without the latest log in some nodes. When you need to improve the speed of adding replicas or balancing, increase this value. Setting it to 0 indicates no limit.

```
config set max-pending-peer-count 64 // Set the maximum number of
↪ pending peers to 64
```

- `max-merge-region-size` controls the upper limit on the size of Region Merge (the unit is MiB). When `regionSize` exceeds the specified value, PD does not merge it with the adjacent Region. Setting it to 0 indicates disabling Region Merge.

```
config set max-merge-region-size 16 // Set the upper limit on the size
↪ of Region Merge to 16 MiB
```

- `max-merge-region-keys` controls the upper limit on the key count of Region Merge. When `regionKeyCount` exceeds the specified value, PD does not merge it with the adjacent Region.

```
config set max-merge-region-keys 50000 // Set the the upper limit on
↪ keyCount to 50000
```

- `split-merge-interval` controls the interval between the `split` and `merge` operations on a same Region. This means the newly split Region won't be merged within a period of time.

```
config set split-merge-interval 24h // Set the interval between `split`
↪ and `merge` to one day
```

- `enable-one-way-merge` controls whether PD only allows a Region to merge with the next Region. When you set it to `false`, PD allows a Region to merge with the adjacent two Regions.

```
config set enable-one-way-merge true // Enables one-way merging.
```

- `enable-cross-table-merge` is used to enable the merging of cross-table Regions. When you set it to `false`, PD does not merge the Regions from different tables. This option only works when key type is "table".

```
config set enable-cross-table-merge true // Enable cross table merge.
```

- **key-type** specifies the key encoding type used for the cluster. The supported options are [“table”, “raw”, “txn”], and the default value is “table”.
  - If no TiDB instance exists in the cluster, **key-type** will be “raw” or “txn”, and PD is allowed to merge Regions across tables regardless of the **enable-cross-table-merge** setting.
  - If any TiDB instance exists in the cluster, **key-type** should be “table”. Whether PD can merge Regions across tables is determined by **enable-cross-table-merge**. If **key-type** is “raw”, placement rules do not work.

```
config set key-type raw // Enable cross table merge.
```

- **region-score-formula-version** controls the version of the Region score formula. The value options are v1 and v2. The version 2 of the formula helps to reduce redundant balance Region scheduling in some scenarios, such as taking TiKV nodes online or offline.

```
config set region-score-formula-version v2
```

- **patrol-region-interval** controls the execution frequency that **replicaChecker** checks the health status of Regions. A shorter interval indicates a higher execution frequency. Generally, you do not need to adjust it.

```
config set patrol-region-interval 10ms // Set the execution frequency
↳ of replicaChecker to 10ms
```

- **max-store-down-time** controls the time that PD decides the disconnected store cannot be restored if exceeded. If PD does not receive heartbeats from a store within the specified period of time, PD adds replicas in other nodes.

```
config set max-store-down-time 30m // Set the time within which PD
↳ receives no heartbeats and after which PD starts to add replicas
↳ to 30 minutes
```

- **max-store-preparing-time** controls the maximum waiting time for the store to go online. During the online stage of a store, PD can query the online progress of the store. When the specified time is exceeded, PD assumes that the store has been online and cannot query the online progress of the store again. But this does not prevent Regions from transferring to the new online store. In most scenarios, you do not need to adjust this parameter.

The following command specifies that the maximum waiting time for the store to go online is 4 hours.

```
config set max-store-preparing-time 4h
```

- `leader-schedule-limit` controls the number of tasks scheduling the leader at the same time. This value affects the speed of leader balance. A larger value means a higher speed and setting the value to 0 closes the scheduling. Usually the leader scheduling has a small load, and you can increase the value in need.

```
config set leader-schedule-limit 4 // 4 tasks of leader scheduling
↳ at the same time at most
```

- `region-schedule-limit` controls the number of tasks of scheduling Regions at the same time. This value avoids too many Region balance operators being created. The default value is 2048 which is enough for all sizes of clusters, and setting the value to 0 closes the scheduling. Usually, the Region scheduling speed is limited by `store-limit`, but it is recommended that you do not customize this value unless you know exactly what you are doing.

```
config set region-schedule-limit 2 // 2 tasks of Region scheduling
↳ at the same time at most
```

- `replica-schedule-limit` controls the number of tasks scheduling the replica at the same time. This value affects the scheduling speed when the node is down or removed. A larger value means a higher speed and setting the value to 0 closes the scheduling. Usually the replica scheduling has a large load, so do not set a too large value. Note that this configuration item is usually kept at the default value. If you want to change the value, you need to try a few values to see which one works best according to the real situation.

```
config set replica-schedule-limit 4 // 4 tasks of replica scheduling
↳ at the same time at most
```

- `merge-schedule-limit` controls the number of Region Merge scheduling tasks. Setting the value to 0 closes Region Merge. Usually the Merge scheduling has a large load, so do not set a too large value. Note that this configuration item is usually kept at the default value. If you want to change the value, you need to try a few values to see which one works best according to the real situation.

```
config set merge-schedule-limit 16 // 16 tasks of Merge scheduling at
↳ the same time at most
```

- `hot-region-schedule-limit` controls the hot Region scheduling tasks that are running at the same time. Setting its value to 0 means disabling the scheduling. It is not recommended to set a too large value. Otherwise, it might affect the system performance. Note that this configuration item is usually kept at the default value. If you want to change the value, you need to try a few values to see which one works best according to the real situation.

```
config set hot-region-schedule-limit 4 // 4 tasks of hot Region
↳ scheduling at the same time at most
```

- `hot-region-cache-hits-threshold` is used to set the number of minutes required to identify a hot Region. PD can participate in the hotspot scheduling only after the Region is in the hotspot state for more than this number of minutes.
- `tolerant-size-ratio` controls the size of the balance buffer area. When the score difference between the leader or Region of the two stores is less than specified multiple times of the Region size, it is considered in balance by PD.

```
config set tolerant-size-ratio 20 // Set the size of the buffer area
↳ to about 20 times of the average Region Size
```

- `low-space-ratio` controls the threshold value that is considered as insufficient store space. When the ratio of the space occupied by the node exceeds the specified value, PD tries to avoid migrating data to the corresponding node as much as possible. At the same time, PD mainly schedules the remaining space to avoid using up the disk space of the corresponding node.

```
config set low-space-ratio 0.9 // Set the threshold value of
↳ insufficient space to 0.9
```

- `high-space-ratio` controls the threshold value that is considered as sufficient store space. This configuration takes effect only when `region-score-formula-version` is set to `v1`. When the ratio of the space occupied by the node is less than the specified value, PD ignores the remaining space and mainly schedules the actual data volume.

```
config set high-space-ratio 0.5 // Set the threshold value of
↳ sufficient space to 0.5
```

- `cluster-version` is the version of the cluster, which is used to enable or disable some features and to deal with the compatibility issues. By default, it is the minimum version of all normally running TiKV nodes in the cluster. You can set it manually only when you need to roll it back to an earlier version.

```
config set cluster-version 1.0.8 // Set the version of the
↳ cluster to 1.0.8
```

- `replication-mode` controls the replication mode of Regions in the dual data center scenario. See [Enable the DR Auto-Sync mode](#) for details.
- `leader-schedule-policy` is used to select the scheduling strategy for the leader. You can schedule the leader according to `size` or `count`.
- `scheduler-max-waiting-operator` is used to control the number of waiting operators in each scheduler.
- `enable-remove-down-replica` is used to enable the feature of automatically deleting DownReplica. When you set it to `false`, PD does not automatically clean up the downtime replicas.

- `enable-replace-offline-replica` is used to enable the feature of migrating `OfflineReplica`. When you set it to `false`, PD does not migrate the offline replicas.
- `enable-make-up-replica` is used to enable the feature of making up replicas. When you set it to `false`, PD does not add replicas for Regions without sufficient replicas.
- `enable-remove-extra-replica` is used to enable the feature of removing extra replicas. When you set it to `false`, PD does not remove extra replicas for Regions with redundant replicas.
- `enable-location-replacement` is used to enable the isolation level checking. When you set it to `false`, PD does not increase the isolation level of a Region replica through scheduling.
- `enable-debug-metrics` is used to enable the metrics for debugging. When you set it to `true`, PD enables some metrics such as `balance-tolerant-size`.
- `enable-placement-rules` is used to enable placement rules, which is enabled by default in v5.0 and later versions.
- `store-limit-mode` is used to control the mode of limiting the store speed. The optional modes are `auto` and `manual`. In `auto` mode, the stores are automatically balanced according to the load (experimental).
- PD rounds the lowest digits of the flow number, which reduces the update of statistics caused by the changes of the Region flow information. This configuration item is used to specify the number of lowest digits to round for the Region flow information. For example, the flow `100512` will be rounded to `101000` because the default value is `3`. This configuration replaces `trace-region-flow`.
- For example, set the value of `flow-round-by-digit` to `4`:

```
config set flow-round-by-digit 4
```

```
config placement-rules [disable | enable | load | save | show | rule-group]
```

For the usage of `config placement-rules [disable | enable | load | save | show | rule-group]`, see [Configure placement rules](#).

#### 14.6.2.4.3 health

Use this command to view the health information of the cluster.

Usage:

```
>> health // Display the health information
[
 {
 "name": "pd",
```

```

 "member_id": 13195394291058371180,
 "client_urls": [
 "http://127.0.0.1:2379"

],
 "health": true
 }

]

```

#### 14.6.2.4.4 hot [read | write | store| history <start\_time> <end\_time> [<key> <value>]]

Use this command to view the hot spot information of the cluster.

Usage:

```

>> hot read // Display hot spot for the read
 ↪ operation
>> hot write // Display hot spot for the write
 ↪ operation
>> hot store // Display hot spot for all the read
 ↪ and write operations
>> hot history 1629294000000 1631980800000 // Display history hot spot for
 ↪ the specified period (milliseconds). 1629294000000 is the start time
 ↪ and 1631980800000 is the end time.
{
 "history_hot_region": [
 {
 "update_time": 1630864801948,
 "region_id": 103,
 "peer_id": 1369002,
 "store_id": 3,
 "is_leader": true,
 "is_learner": false,
 "hot_region_type": "read",
 "hot_degree": 152,
 "flow_bytes": 0,
 "key_rate": 0,
 "query_rate": 305,
 "start_key": "7480000000000000FF5300000000000000F8",
 "end_key": "7480000000000000FF5600000000000000F8"
 },
 ...
]
}

```

```
>> hot history 1629294000000 1631980800000 hot_region_type read region_id
↪ 1,2,3 store_id 1,2,3 peer_id 1,2,3 is_leader true is_learner true //
↪ Display history hotspot for the specified period with more conditions
{
 "history_hot_region": [
 {
 "update_time": 1630864801948,
 "region_id": 103,
 "peer_id": 1369002,
 "store_id": 3,
 "is_leader": true,
 "is_learner": false,
 "hot_region_type": "read",
 "hot_degree": 152,
 "flow_bytes": 0,
 "key_rate": 0,
 "query_rate": 305,
 "start_key": "7480000000000000FF53000000000000F8",
 "end_key": "7480000000000000FF56000000000000F8"
 },
 ...
]
}
```

#### 14.6.2.4.5 label [store <name> <value>]

Use this command to view the label information of the cluster.

Usage:

```
>> label // Display all labels
>> label store zone cn // Display all stores including the "zone"
↪ ":"cn" label
```

#### 14.6.2.4.6 member [delete | leader\_priority | leader [show | resign | transfer <member\_name>]]

Use this command to view the PD members, remove a specified member, or configure the priority of leader.

Usage:

```
>> member // Display the information of all members
{
 "header": {.....},
 "members": [.....],
}
```

```
"leader": {.....},
"etcd_leader": {.....},
}
>> member delete name pd2 // Delete "pd2"
Success!
>> member delete id 1319539429105371180 // Delete a node using id
Success!
>> member leader show // Display the leader information
{
 "name": "pd",
 "member_id": 13155432540099656863,
 "peer_urls": [.....],
 "client_urls": [.....]
}
>> member leader resign // Move leader away from the current member
.....
>> member leader transfer pd3 // Migrate leader to a specified member
.....
```

#### 14.6.2.4.7 operator [check | show | add | remove]

Use this command to view and control the scheduling operation.

Usage:

```
>> operator show // Display all operators
>> operator show admin // Display all admin
 ↪ operators
>> operator show leader // Display all leader
 ↪ operators
>> operator show region // Display all Region
 ↪ operators
>> operator add add-peer 1 2 // Add a replica of Region
 ↪ 1 on store 2
>> operator add add-learner 1 2 // Add a learner replica of
 ↪ Region 1 on store 2
>> operator add remove-peer 1 2 // Remove a replica of
 ↪ Region 1 on store 2
>> operator add transfer-leader 1 2 // Schedule the leader of
 ↪ Region 1 to store 2
>> operator add transfer-region 1 2 3 4 // Schedule Region 1 to
 ↪ stores 2,3,4
>> operator add transfer-peer 1 2 3 // Schedule the replica of
 ↪ Region 1 on store 2 to store 3
>> operator add merge-region 1 2 // Merge Region 1 with
 ↪ Region 2
```

```
>> operator add split-region 1 --policy=approximate // Split Region 1 into
 ↪ two Regions in halves, based on approximately estimated value
>> operator add split-region 1 --policy=scan // Split Region 1 into two
 ↪ Regions in halves, based on accurate scan value
>> operator remove 1 // Remove the scheduling
 ↪ operation of Region 1
>> operator check 1 // Check the status of the
 ↪ operators related to Region 1
```

The splitting of Regions starts from the position as close as possible to the middle. You can locate this position using two strategies, namely “scan” and “approximate”. The difference between them is that the former determines the middle key by scanning the Region, and the latter obtains the approximate position by checking the statistics recorded in the SST file. Generally, the former is more accurate, while the latter consumes less I/O and can be completed faster.

#### 14.6.2.4.8 ping

Use this command to view the time that ping PD takes.

Usage:

```
>> ping
time: 43.12698ms
```

#### 14.6.2.4.9 region <region\_id> [--jq="<query string>"]

Use this command to view the Region information. For a jq formatted output, see [jq-formatted-json-output-usage](#).

Usage:

```
>> region // Display the information of all
 ↪ Regions
{
 "count": 1,
 "regions": [.....]
}

>> region 2 // Display the information of the Region
 ↪ with the ID of 2
{
 "id": 2,
 "start_key": "7480000000000000FF1D0000000000000F8",
 "end_key": "7480000000000000FF1F0000000000000F8",
 "epoch": {
 "conf_ver": 1,
```

```
 "version": 15
 },
 "peers": [
 {
 "id": 40,
 "store_id": 3
 }
],
 "leader": {
 "id": 40,
 "store_id": 3
 },
 "written_bytes": 0,
 "read_bytes": 0,
 "written_keys": 0,
 "read_keys": 0,
 "approximate_size": 1,
 "approximate_keys": 0
}
```

#### 14.6.2.4.10 region key [--format=raw|encode|hex] <key>

Use this command to query the Region that a specific key resides in. It supports the raw, encoding, and hex formats. And you need to use single quotes around the key when it is in the encoding format.

Hex format usage (default):

```
>> region key 7480000000000000FF13000000000000F8
{
 "region": {
 "id": 2,

 }
}
```

Raw format usage:

```
>> region key --format=raw abc
{
 "region": {
 "id": 2,

 }
}
```

Encoding format usage:

```
>> region key --format=encode 't\200\000\000\000\000\000\000\0377\035_r
↳ \200\000\000\000\000\000\0377\017U\320\000\000\000\000\000\372'
{
 "region": {
 "id": 2,

 }
}
```

#### 14.6.2.4.11 region scan

Use this command to get all Regions.

Usage:

```
>> region scan
{
 "count": 20,
 "regions": [.....],
}
```

#### 14.6.2.4.12 region sibling <region\_id>

Use this command to check the adjacent Regions of a specific Region.

Usage:

```
>> region sibling 2
{
 "count": 2,
 "regions": [.....],
}
```

#### 14.6.2.4.13 region keys [--format=raw|encode|hex] <start\_key> <end\_key> <limit>

Use this command to query all Regions in a given range [*startkey*, *endkey*). Ranges without *endKeys* are supported.

The *limit* parameter limits the number of keys. The default value of *limit* is 16, and the value of -1 means unlimited keys.

Usage:

```
>> region keys --format=raw a // Display all Regions that start from the
↳ key a with a default limit count of 16
```

```
{
 "count": 16,
 "regions": [.....],
}

>> region keys --format=raw a z // Display all Regions in the range [a, z)
 ↪ with a default limit count of 16
{
 "count": 16,
 "regions": [.....],
}

>> region keys --format=raw a z -1 // Display all Regions in the range [a,
 ↪ z) without a limit count
{
 "count": ...,
 "regions": [.....],
}

>> region keys --format=raw a "" 20 // Display all Regions that start from
 ↪ the key a with a limit count of 20
{
 "count": 20,
 "regions": [.....],
}
```

#### 14.6.2.4.14 region store <store\_id>

Use this command to list all Regions of a specific store.

Usage:

```
>> region store 2
{
 "count": 10,
 "regions": [.....],
}
```

#### 14.6.2.4.15 region topread [limit]

Use this command to list Regions with top read flow. The default value of the limit is 16.

Usage:

```
>> region topread
```

```
{
 "count": 16,
 "regions": [.....],
}
```

#### 14.6.2.4.16 region topwrite [limit]

Use this command to list Regions with top write flow. The default value of the limit is 16.

Usage:

```
>> region topwrite
{
 "count": 16,
 "regions": [.....],
}
```

#### 14.6.2.4.17 region topconfver [limit]

Use this command to list Regions with top conf version. The default value of the limit is 16.

Usage:

```
>> region topconfver
{
 "count": 16,
 "regions": [.....],
}
```

#### 14.6.2.4.18 region topversion [limit]

Use this command to list Regions with top version. The default value of the limit is 16.

Usage:

```
>> region topversion
{
 "count": 16,
 "regions": [.....],
}
```

#### 14.6.2.4.19 region topsize [limit]

Use this command to list Regions with top approximate size. The default value of the limit is 16.

Usage:

```
>> region topsize
{
 "count": 16,
 "regions": [.....],
}
```

#### 14.6.2.4.20 region check [miss-peer | extra-peer | down-peer | pending-peer | offline-peer | empty-region | hist-size | hist-keys] [--jq=<query string>]

Use this command to check the Regions in abnormal conditions. For a jq formatted output, see [jq formatted JSON output usage](#).

Description of various types:

- miss-peer: the Region without enough replicas
- extra-peer: the Region with extra replicas
- down-peer: the Region in which some replicas are Down
- pending-peer: the Region in which some replicas are Pending

Usage:

```
>> region check miss-peer
{
 "count": 2,
 "regions": [.....],
}
```

#### 14.6.2.4.21 scheduler [show | add | remove | pause | resume | config | describe]

Use this command to view and control the scheduling policy.

Usage:

```
>> scheduler show // Display all created
 ↪ schedulers
>> scheduler add grant-leader-scheduler 1 // Schedule all the leaders of
 ↪ the Regions on store 1 to store 1
>> scheduler add evict-leader-scheduler 1 // Move all the Region leaders
 ↪ on store 1 out
```

```
>> scheduler config evict-leader-scheduler // Display the stores in which
 ↪ the scheduler is located since v4.0.0
>> scheduler add shuffle-leader-scheduler // Randomly exchange the leader
 ↪ on different stores
>> scheduler add shuffle-region-scheduler // Randomly scheduling the
 ↪ Regions on different stores
>> scheduler add evict-slow-store-scheduler // When there is one and only
 ↪ one slow store, evict all Region leaders of that store
>> scheduler remove grant-leader-scheduler-1 // Remove the corresponding
 ↪ scheduler, and `-1` corresponds to the store ID
>> scheduler pause balance-region-scheduler 10 // Pause the balance-region
 ↪ scheduler for 10 seconds
>> scheduler pause all 10 // Pause all schedulers for 10
 ↪ seconds
>> scheduler resume balance-region-scheduler // Continue to run the balance-
 ↪ region scheduler
>> scheduler resume all // Continue to run all
 ↪ schedulers
>> scheduler config balance-hot-region-scheduler // Display the
 ↪ configuration of the balance-hot-region scheduler
>> scheduler describe balance-region-scheduler // Display the running state
 ↪ and related diagnostic information of the balance-region scheduler
```

#### 14.6.2.4.22 scheduler describe balance-region-scheduler

Use this command to view the running state and related diagnostic information of the `balance-region-scheduler`.

Since TiDB v6.3.0, PD provides the running state and brief diagnostic information for `balance-region-scheduler` and `balance-leader-scheduler`. Other schedulers and checkers are not supported yet. To enable this feature, you can modify the `enable-diagnostic` configuration item using `pd-ctl`.

The state of the scheduler can be one of the following:

- **disabled**: the scheduler is unavailable or removed.
- **paused**: the scheduler is paused.
- **scheduling**: the scheduler is generating scheduling operators.
- **pending**: the scheduler cannot generate scheduling operators. For a scheduler in the **pending** state, brief diagnostic information is returned. The brief information describes the state of stores and explains why these stores cannot be selected for scheduling.
- **normal**: there is no need to generate scheduling operators.

#### 14.6.2.4.23 scheduler config balance-leader-scheduler

Use this command to view and control the `balance-leader-scheduler` policy.

Since TiDB v6.0.0, PD introduces the `Batch` parameter for `balance-leader-scheduler` to control the speed at which the balance-leader processes tasks. To use this parameter, you can modify the `balance-leader batch` configuration item using `pd-ctl`.

Before v6.0.0, PD does not have this configuration item, which means `balance-leader`  $\hookrightarrow$  `batch=1`. In v6.0.0 or later versions, the default value of `balance-leader batch` is 4. To set this configuration item to a value greater than 4, you need to set a greater value for `scheduler-max-waiting-operator` (whose default value is 5) at the same time. You can get the expected acceleration effect only after modifying both configuration items.

```
scheduler config balance-leader-scheduler set batch 3 // Set the size of
 \hookrightarrow the operator that the balance-leader scheduler can execute in a batch
 \hookrightarrow to 3
```

```
scheduler config balance-hot-region-scheduler
```

Use this command to view and control the `balance-hot-region-scheduler` policy.

Usage:

```
>> scheduler config balance-hot-region-scheduler // Display all
 \hookrightarrow configuration of the balance-hot-region scheduler
{
 "min-hot-byte-rate": 100,
 "min-hot-key-rate": 10,
 "min-hot-query-rate": 10,
 "max-zombie-rounds": 3,
 "max-peer-number": 1000,
 "byte-rate-rank-step-ratio": 0.05,
 "key-rate-rank-step-ratio": 0.05,
 "query-rate-rank-step-ratio": 0.05,
 "count-rank-step-ratio": 0.01,
 "great-dec-ratio": 0.95,
 "minor-dec-ratio": 0.99,
 "src-tolerance-ratio": 1.05,
 "dst-tolerance-ratio": 1.05,
 "read-priorities": [
 "query",
 "byte"
],
 "write-leader-priorities": [
 "key",
 "byte"
],
 "write-peer-priorities": [
 "byte",
 "key"
],
}
```

```
"strict-picking-store": "true",
"enable-for-tiflash": "true",
"rank-formula-version": "v2"
}
```

- `min-hot-byte-rate` means the smallest number of bytes to be counted, which is usually 100.

```
scheduler config balance-hot-region-scheduler set min-hot-byte-rate 100
```

- `min-hot-key-rate` means the smallest number of keys to be counted, which is usually 10.

```
scheduler config balance-hot-region-scheduler set min-hot-key-rate 10
```

- `min-hot-query-rate` means the smallest number of queries to be counted, which is usually 10.

```
scheduler config balance-hot-region-scheduler set min-hot-query-rate 10
```

- `max-zombie-rounds` means the maximum number of heartbeats with which an operator can be considered as the pending influence. If you set it to a larger value, more operators might be included in the pending influence. Usually, you do not need to adjust its value. Pending influence refers to the operator influence that is generated during scheduling but still has an effect.

```
scheduler config balance-hot-region-scheduler set max-zombie-rounds 3
```

- `max-peer-number` means the maximum number of peers to be solved, which prevents the scheduler from being too slow.

```
scheduler config balance-hot-region-scheduler set max-peer-number 1000
```

- `byte-rate-rank-step-ratio`, `key-rate-rank-step-ratio`, `query-rate-rank-step-ratio`, and `count-rank-step-ratio` respectively mean the step ranks of byte, key, query, and count. The `rank-step-ratio` decides the step when the rank is calculated. `great-dec-ratio` and `minor-dec-ratio` are used to determine the dec rank. Usually, you do not need to modify these items.

```
scheduler config balance-hot-region-scheduler set byte-rate-rank-step-
↪ ratio 0.05
```

- `src-tolerance-ratio` and `dst-tolerance-ratio` are configuration items for the expectation scheduler. The smaller the `tolerance-ratio`, the easier it is for scheduling. When redundant scheduling occurs, you can appropriately increase this value.

```
scheduler config balance-hot-region-scheduler set src-tolerance-ratio
↪ 1.1
```

- `read-priorities`, `write-leader-priorities`, and `write-peer-priorities` control which dimension the scheduler prioritizes for hot Region scheduling. Two dimensions are supported for configuration.
  - `read-priorities` and `write-leader-priorities` control which dimensions the scheduler prioritizes for scheduling hot Regions of the read and write-leader types. The dimension options are `query`, `byte`, and `key`.
  - `write-peer-priorities` controls which dimensions the scheduler prioritizes for scheduling hot Regions of the write-peer type. The dimension options are `byte` and `key`.

#### Note:

If a cluster component is earlier than v5.2, the configuration of `query` dimension does not take effect. If some components are upgraded to v5.2 or later, the `byte` and `key` dimensions still by default have the priority for hot Region scheduling. After all components of the cluster are upgraded to v5.2 or later, such a configuration still takes effect for compatibility. You can view the real-time configuration using the `pd-ctl` command. Usually, you do not need to modify these configurations.

```
scheduler config balance-hot-region-scheduler set read-priorities query
↪ ,byte
```

- `strict-picking-store` controls the search space of hot Region scheduling. Usually, it is enabled. This configuration item only affects the behavior when `rank-formula` ↪ `-version` is `v1`. When it is enabled, hot Region scheduling ensures hot Region balance on the two configured dimensions. When it is disabled, hot Region scheduling only ensures the balance on the dimension with the first priority, which might reduce balance on other dimensions. Usually, you do not need to modify this configuration.

```
scheduler config balance-hot-region-scheduler set strict-picking-store
↪ true
```

- `rank-formula-version` controls which scheduler algorithm version is used in hot Region scheduling. Value options are `v1` and `v2`. The default value is `v2`.
  - The `v1` algorithm is the scheduler strategy used in TiDB v6.3.0 and earlier versions. This algorithm mainly focuses on reducing load difference between stores and avoids introducing side effects in the other dimension.

- The **v2** algorithm is an experimental scheduler strategy introduced in TiDB v6.3.0 and is in General Availability (GA) in TiDB v6.4.0. This algorithm mainly focuses on improving the rate of the equitability between stores and factors in few side effects. Compared with the **v1** algorithm with `strict-picking-store` being `true`  $\leftrightarrow$  , the **v2** algorithm pays more attention to the priority equalization of the first dimension. Compared with the **v1** algorithm with `strict-picking-store` being `false`, the **v2** algorithm considers the balance of the second dimension.
- The **v1** algorithm with `strict-picking-store` being `true` is conservative and scheduling can only be generated when there is a store with a high load in both dimensions. In certain scenarios, it might be impossible to continue balancing due to dimensional conflicts. To achieve better balancing in the first dimension, it is necessary to set the `strict-picking-store` to `false`. The **v2** algorithm can achieve better balancing in both dimensions and reduce invalid scheduling.

```
bash scheduler config balance-hot-region-scheduler set rank-formula-
 \leftrightarrow version v2
```

- `enable-for-tiflash` controls whether hot Region scheduling takes effect for TiFlash instances. Usually, it is enabled. When it is disabled, the hot Region scheduling between TiFlash instances is not performed.

```
scheduler config balance-hot-region-scheduler set enable-for-tiflash
 \leftrightarrow true
```

**14.6.2.4.24** `store` [`delete` | `cancel-delete` | `label` | `weight` | `remove-tombstone` | `limit` ] `<store_id>` [`--jq=<query string>`]

For a jq formatted output, see [jq-formatted-json-output-usage](#).

Get a store

To display the information of all stores, run the following command:

```
store
```

```
{
 "count": 3,
 "stores": [...]
}
```

To get the store with id of 1, run the following command:

```
store 1
```

```
.....
```

Delete a store

To delete the store with id of 1, run the following command:

```
store delete 1
```

To cancel deleting `Offline` state stores which are deleted using `store delete`, run the `store cancel-delete` command. After canceling, the store changes from `Offline` to `Up`. Note that the `store cancel-delete` command cannot change a `Tombstone` state store to the `Up` state.

To cancel deleting the store with id of 1, run the following command:

```
store cancel-delete 1
```

To delete all stores in `Tombstone` state, run the following command:

```
store remove-tombstone
```

#### Note:

If the PD leader changes during store deletion, you need to modify the store limit manually using the `store limit` command.

Manage store labels

To manage the labels of a store, run the `store label` command.

- To set a label with the key being "zone" and value being "cn" to the store with id of 1, run the following command:

```
store label 1 zone=cn
```

- To update the label of a store, for example, changing the value of the key "zone" from "cn" to "us" for the store with id of 1, run the following command:

```
store label 1 zone=us
```

- To rewrite all labels of a store with id of 1, use the `--rewrite` option. Note that this option overwrites all existing labels:

```
store label 1 region=us-est-1 disk=ssd --rewrite
```

- To delete the "disk" label for the store with id of 1, use the `--delete` option:

```
store label 1 disk --delete
```

**Note:**

- The label of a store is updated by merging the label in TiKV and that in PD. Specifically, after you modify a store label in the TiKV configuration file and restart the cluster, PD merges its own store label with the TiKV store label, updates the label, and persists the merged result.
- To manage labels of a store using TiUP, you can run the `store label` ↪ `<id> --force` command to empty the labels stored in PD before restarting the cluster.

## Configure store weight

To set the leader weight to 5 and Region weight to 10 for the store with id of 1, run the following command:

```
store weight 1 5 10
```

## Configure store scheduling speed

You can set the scheduling speed of stores by using `store limit`. For more details about the principles and usage of `store limit`, see [store limit](#).

```
>> store limit // Show the speed limit of adding-peer
 ↪ operations and the limit of removing-peer operations per minute in
 ↪ all stores
>> store limit add-peer // Show the speed limit of adding-peer
 ↪ operations per minute in all stores
>> store limit remove-peer // Show the limit of removing-peer
 ↪ operations per minute in all stores
>> store limit all 5 // Set the limit of adding-peer
 ↪ operations to 5 and the limit of removing-peer operations to 5 per
 ↪ minute for all stores
>> store limit 1 5 // Set the limit of adding-peer
 ↪ operations to 5 and the limit of removing-peer operations to 5 per
 ↪ minute for store 1
>> store limit all 5 add-peer // Set the limit of adding-peer
 ↪ operations to 5 per minute for all stores
>> store limit 1 5 add-peer // Set the limit of adding-peer
 ↪ operations to 5 per minute for store 1
>> store limit 1 5 remove-peer // Set the limit of removing-peer
 ↪ operations to 5 per minute for store 1
>> store limit all 5 remove-peer // Set the limit of removing-peer
 ↪ operations to 5 per minute for all stores
```

**Note:**

You can use `pd-ctl` to check the state (Up, Disconnect, Offline, Down, or Tombstone) of a TiKV store. For the relationship between each state, refer to [Relationship between each state of a TiKV store](#).

**14.6.2.4.25 log [fatal | error | warn | info | debug]**

Use this command to set the log level of the PD leader.

Usage:

```
log warn
```

**14.6.2.4.26 tso**

Use this command to parse the physical and logical time of TSO.

Usage:

```
>> tso 395181938313123110 // Parse TSO
system: 2017-10-09 05:50:59 +0800 CST
logic: 120102
```

**14.6.2.4.27 unsafe remove-failed-stores [store-ids | show]****Warning:**

- This feature is a lossy recovery, so TiKV cannot guarantee data integrity and data indexes integrity after using the feature.
- It is recommended to perform the feature-related operations with the support from the TiDB team. If any misoperation is performed, it might be hard to recover the cluster.

Use this command to perform lossy recovery operations when permanently damaged replicas cause data to be unavailable. See the following example. The details are described in [Online Unsafe Recovery](#)

Execute Online Unsafe Recovery to remove permanently damaged stores:

```
unsafe remove-failed-stores 101,102,103
```

```
Success!
```

Show the current or historical state of Online Unsafe Recovery:

```
unsafe remove-failed-stores show
```

```
[
 "Collecting cluster info from all alive stores, 10/12.",
 "Stores that have reports to PD: 1, 2, 3, ...",
 "Stores that have not reported to PD: 11, 12",
]
```

### 14.6.2.5 Jq formatted JSON output usage

#### 14.6.2.5.1 Simplify the output of store

```
>> store --jq=".stores[].store | { id, address, state_name}"
{ "id":1, "address":"127.0.0.1:20161", "state_name":"Up" }
{ "id":30, "address":"127.0.0.1:20162", "state_name":"Up" }
...
```

#### 14.6.2.5.2 Query the remaining space of the node

```
>> store --jq=".stores[] | {id: .store.id, available: .status.available}"
{ "id":1, "available":"10 GiB" }
{ "id":30, "available":"10 GiB" }
...
```

#### 14.6.2.5.3 Query all nodes whose status is not Up

```
store --jq='.stores[].store | select(.state_name!="Up") | { id, address,
 ↪ state_name}'
```

```
{ "id":1, "address":"127.0.0.1:20161" "state_name":"Offline" }
{ "id":5, "address":"127.0.0.1:20162" "state_name":"Offline" }
...
```

#### 14.6.2.5.4 Query all TiFlash nodes

```
store --jq='.stores[].store | select(.labels | length>0 and contains([{"key
 ↪ ":"engine", "value":"tiflash"}])) | { id, address, state_name}'
```

```
{"id":1,"address":"127.0.0.1:20161""state_name":"Up"}
{"id":5,"address":"127.0.0.1:20162""state_name":"Up"}
...
```

#### 14.6.2.5.5 Query the distribution status of the Region replicas

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id]}"
{"id":2,"peer_stores":[1,30,31]}
{"id":4,"peer_stores":[1,31,34]}
...
```

#### 14.6.2.5.6 Filter Regions according to the number of replicas

For example, to filter out all Regions whose number of replicas is not 3:

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id] |
 ↪ select(length != 3)}"
{"id":12,"peer_stores":[30,32]}
{"id":2,"peer_stores":[1,30,31,32]}
```

#### 14.6.2.5.7 Filter Regions according to the store ID of replicas

For example, to filter out all Regions that have a replica on store30:

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id] |
 ↪ select(any(==(30)))}"
{"id":6,"peer_stores":[1,30,31]}
{"id":22,"peer_stores":[1,30,32]}
...
```

You can also find out all Regions that have a replica on store30 or store31 in the same way:

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id] |
 ↪ select(any(==(30,31)))}"
{"id":16,"peer_stores":[1,30,34]}
{"id":28,"peer_stores":[1,30,32]}
{"id":12,"peer_stores":[30,32]}
...
```

#### 14.6.2.5.8 Look for relevant Regions when restoring data

For example, when [store1, store30, store31] is unavailable at its downtime, you can find all Regions whose Down replicas are more than normal replicas:

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id] |
 ↪ select(length as $total | map(if .==(1,30,31) then . else empty end)
 ↪ | length>=$total-length) }"
{"id":2,"peer_stores":[1,30,31,32]}
{"id":12,"peer_stores":[30,32]}
{"id":14,"peer_stores":[1,30,32]}
...
```

Or when [store1, store30, store31] fails to start, you can find Regions where the data can be manually removed safely on store1. In this way, you can filter out all Regions that have a replica on store1 but don't have other DownPeers:

```
>> region --jq=".regions[] | {id: .id, peer_stores: [.peers[].store_id] |
 ↪ select(length>1 and any(.==1) and all(.!=(30,31)))}"
{"id":24,"peer_stores":[1,32,33]}
```

When [store30, store31] is down, find out all Regions that can be safely processed by creating the `remove-peer` Operator, that is, Regions with one and only DownPeer:

```
>> region --jq=".regions[] | {id: .id, remove_peer: [.peers[].store_id] |
 ↪ select(length>1) | map(if .==(30,31) then . else empty end) | select(
 ↪ length==1)}"
{"id":12,"remove_peer":[30]}
{"id":4,"remove_peer":[31]}
{"id":22,"remove_peer":[30]}
...
```

### 14.6.3 TiDB Control User Guide

TiDB Control is a command-line tool of TiDB, usually used to obtain the status information of TiDB for debugging. This document introduces the features of TiDB Control and how to use these features.

#### 14.6.3.1 Get TiDB Control

You can get TiDB Control by installing it using TiUP or by compiling it from source code.

#### Note:

It is recommended that the version of the Control tool you use is consistent with the version of the cluster.

#### 14.6.3.1.1 Install TiDB Control using TiUP

After installing TiUP, you can use `tiup ctl:v<CLUSTER_VERSION> tidb` command to get and execute TiDB Control.

#### 14.6.3.1.2 Compile from source code

- Compilation environment requirement: [Go 1.19](#) or later
- Compilation procedures: Go to the root directory of the [TiDB Control project](#), use the `make` command to compile, and generate `tidb-ctl`.
- Compilation documentation: you can find the help files in the `doc` directory; if the help files are lost or you want to update them, use the `make doc` command to generate the help files.

#### 14.6.3.2 Usage introduction

This section describes how to use commands, subcommands, options, and flags in `tidb ↪ -ctl`.

- command: characters without `-` or `--`
- subcommand: characters without `-` or `--` that follow a command
- option: characters with `-` or `--`
- flag: characters exactly following a command/subcommand or option, passing value to the command/subcommand or option

Usage example: `tidb-ctl schema in mysql -n db`

- `schema`: the command
- `in`: the subcommand of `schema`
- `mysql`: the flag of `in`
- `-n`: the option
- `db`: the flag of `-n`

Currently, TiDB Control has the following subcommands:

- `tidb-ctl base64decode`: used for BASE64 decoding
- `tidb-ctl decoder`: used for KEY decoding
- `tidb-ctl etcd`: used for operating etcd
- `tidb-ctl log`: used to format the log file to expand the single-line stack information
- `tidb-ctl mvcc`: used to get the MVCC information
- `tidb-ctl region`: used to get the Region information
- `tidb-ctl schema`: used to get the schema information
- `tidb-ctl table`: used to get the table information

### 14.6.3.2.1 Get help

Use `tidb-ctl -h/--help` to get usage information.

TiDB Control consists of multiple layers of commands. You can use `-h/--help` after each command/subcommand to get its respective usage information.

The following example shows how to obtain the schema information:

Use `tidb-ctl schema -h` to get usage details. The `schema` command itself has two subcommands: `in` and `tid`.

- `in` is used to obtain the table schema of all tables in the database through the database name.
- `tid` is used to obtain the table schema by using the unique `table_id` in the whole database.

### 14.6.3.2.2 Global options

`tidb-ctl` has the following connection-related global options:

- `--host`: TiDB Service address (default 127.0.0.1)
- `--port`: TiDB status port (default 10080)
- `--pdhost`: PD Service address (default 127.0.0.1)
- `--pdport`: PD Service port (default 2379)
- `--ca`: The CA file path used for the TLS connection
- `--ssl-key`: The key file path used for the TLS connection
- `--ssl-cert`: The certificate file path used for the TLS connection

`--pdhost` and `--pdport` are mainly used in the `etcd` subcommand. For example, `tidb-ctl etcd ddlinfo`. If you do not specify the address and the port, the following default value is used:

- The default service address of TiDB and PD: 127.0.0.1. The service address must be an IP address.
- The default service port of TiDB: 10080.
- The default service port of PD: 2379.

### 14.6.3.2.3 The `schema` command

The `in` subcommand

`in` is used to obtain the table schema of all tables in the database through the database name.

```
tidb-ctl schema in <database name>
```

For example, running `tidb-ctl schema in mysql` returns the following result:

```
[
 {
 "id": 13,
 "name": {
 "O": "columns_priv",
 "L": "columns_priv"
 },
 ...
 "update_timestamp": 399494726837600268,
 "ShardRowIDBits": 0,
 "Partition": null
 }
]
```

The result is displayed in the JSON format. (The above output is truncated.)

- If you want to specify the table name, use `tidb-ctl schema in <database> -n <table name>` to filter.

For example, `tidb-ctl schema in mysql -n db` returns the table schema of the `db` table in the `mysql` database:

```
{
 "id": 9,
 "name": {
 "O": "db",
 "L": "db"
 },
 ...
 "Partition": null
}
```

(The above output is also truncated.)

If you do not want to use the default TiDB service address and port, use the `--host` and `--port` options to configure. For example, `tidb-ctl --host 172.16.55.88 --port 8898 schema in mysql -n db`.

The `tid` subcommand

`tid` is used to obtain the table schema by using the unique `table_id` in the whole database. You can use the `in` subcommand to get all table IDs of certain schema and use the `tid` subcommand to get the detailed table information.

For example, the table ID of `mysql.stat_meta` is 21. You can use `tidb-ctl schema` `↪ tid -i 21` to obtain the detail of `mysql.stat_meta`.

```
{
 "id": 21,
 "name": {
 "O": "stats_meta",
 "L": "stats_meta"
 },
 "charset": "utf8mb4",
 "collate": "utf8mb4_bin",
 ...
}
```

Like the `in` subcommand, if you do not want to use the default TiDB service address and status port, use the `--host` and `--port` options to specify the host and port.

The `base64decode` command

`base64decode` is used to decode `base64` data.

```
tidb-ctl base64decode [base64_data]
tidb-ctl base64decode [db_name.table_name] [base64_data]
tidb-ctl base64decode [table_id] [base64_data]
```

1. Execute the following SQL statement to prepare the environment:

```
use test;
create table t (a int, b varchar(20), c datetime default
 ↪ current_timestamp , d timestamp default current_timestamp,
 ↪ unique index(a));
insert into t (a,b,c) values(1,"哈哈 hello",NULL);
alter table t add column e varchar(20);
```

2. Obtain MVCC data using the HTTP API interface:

```
$ curl "http://$IP:10080/mvcc/index/test/t/a/1?a=1"
{
 "info": {
 "writes": [
 {
 "start_ts": 407306449994645510,
 "commit_ts": 407306449994645513,
 "short_value": "AAAAAAAAAAE=" # The unique index a stores the
 ↪ handle id of the corresponding row.
 }
]
 }
}%
```

```
$ curl "http://$IP:10080/mvcc/key/test/t/1"
{
 "info": {
 "writes": [
 {
 "start_ts": 407306588892692486,
 "commit_ts": 407306588892692489,
 "short_value": "CAIIAggEAhjl4jlk4ggaGVsbG8IBgAICAmAgIDwjYuuORk=" #
 ↪ Row data that handle id is 1.
 }
]
 }
}%
```

3. Decode handle id (uint64) using `base64decode`.

```
$ tidb-ctl base64decode AAAAAAAAAAAE=
hex: 0000000000000001
uint64: 1
```

4. Decode row data using base64decode.

```
$./tidb-ctl base64decode test.t
 ↪ CAIIAggEAhjl4jlk4ggaGVsbG8IBgAICAmAgIDwjYuuORk=
a: 1
b: 哈哈 hello
c is NULL
d: 2019-03-28 05:35:30
e not found in data

if the table id of test.t is 60, you can also use below command to do
 ↪ the same thing.
$./tidb-ctl base64decode 60
 ↪ CAIIAggEAhjl4jlk4ggaGVsbG8IBgAICAmAgIDwjYuuORk=
a: 1
b: 哈哈 hello
c is NULL
d: 2019-03-28 05:35:30
e not found in data
```

#### 14.6.3.2.4 The decoder command

- The following example shows how to decode the row key, similar to decoding the index key.

```
$./tidb-ctl decoder "t\x00\x00\x00\x00\x00\x00\x00\x1c_r\x00\x00\x00\x00\x00\x00\x00\xfa"
↪ x00\x00\x00\x00\xfa"
format: table_row
table_id: -9223372036854775780 table_id: -9223372036854775780
row_id: -9223372036854775558 row_id: -9223372036854775558
```

- The following example shows how to decode value.

```
$./tidb-ctl decoder AhZoZWxsbyB3b3JsZAIAEA==
format: index_value
type: bigint, value: 1024 index_value[0]: {type: bytes, value: hello
↪ world}
index_value[1]: {type: bigint, value: 1024}
```

#### 14.6.3.2.5 The etcd command

- `tidb-ctl etcd ddlinfo` is used to obtain DDL information.
- `tidb-ctl etcd putkey KEY VALUE` is used to add KEY VALUE to etcd (All the KEYs are added to the `/tidb/ddl/all_schema_versions/` directory).

```
tidb-ctl etcd putkey "foo" "bar"
```

In fact, a key-value pair is added to the etcd whose KEY is `/tidb/ddl/all_schema_versions/foo` and VALUE is `bar`.

- `tidb-ctl etcd delkey` deletes the KEY in etcd. Only those KEYs with the `/tidb/ddl/fg/owner/` or `/tidb/ddl/all_schema_versions/` prefix can be deleted.

```
tidb-ctl etcd delkey "/tidb/ddl/fg/owner/foo"
tidb-ctl etcd delkey "/tidb/ddl/all_schema_versions/bar"
```

#### 14.6.3.2.6 The log command

The stack information for the TiDB error log is in one line format. You could use `tidb-ctl log` to change its format to multiple lines.

#### 14.6.3.2.7 The keyrange command

The `keyrange` subcommand is used to query the global or table-related key range information, which is output in the hexadecimal form.

- Execute the `tidb-ctl keyrange` command to check the global key range information:

```
tidb-ctl keyrange
```

```
global ranges:
 meta: (6d, 6e)
 table: (74, 75)
```

- Add the `--encode` option to display encoded keys (in the same format as in TiKV and PD):

```
tidb-ctl keyrange --encode
```

```
global ranges:
 meta: (6d00000000000000f8, 6e00000000000000f8)
 table: (7400000000000000f8, 7500000000000000f8)
```

- Execute the `tidb-ctl keyrange --database={db} --table={tbl}` command to check the global and table-related key range information:

```
tidb-ctl keyrange --database test --table ttt
```

```
global ranges:
 meta: (6d, 6e)
 table: (74, 75)
table ttt ranges: (NOTE: key range might be changed after DDL)
 table: (74800000000000002f, 748000000000000030)
 table indexes: (74800000000000002f5f69, 74800000000000002f5f72)
 index c2: (74800000000000002f5f698000000000000001,
 ↪ 74800000000000002f5f69800000000000000002)
 index c3: (74800000000000002f5f698000000000000002,
 ↪ 74800000000000002f5f69800000000000000003)
 index c4: (74800000000000002f5f698000000000000003,
 ↪ 74800000000000002f5f69800000000000000004)
 table rows: (74800000000000002f5f72, 748000000000000030)
```

## 14.6.4 PD Recover User Guide

PD Recover is a disaster recovery tool of PD, used to recover the PD cluster which cannot start or provide services normally.

### 14.6.4.1 Compile from source code

- [Go 1.19](#) or later is required because the Go modules are used.
- In the root directory of the [PD project](#), use the `make pd-recover` command to compile and generate `bin/pd-recover`.

**Note:**

Generally, you do not need to compile source code because the PD Control tool already exists in the released binary or Docker. However, developer users can refer to the instructions above for compiling source code.

#### 14.6.4.2 Download TiDB Toolkit

The PD Recover installation package is included in the TiDB Toolkit. To download the TiDB Toolkit, see [Download TiDB Tools](#).

The following sections introduce two methods to recover a PD cluster: recover from a surviving PD node and rebuild a PD cluster entirely.

#### 14.6.4.3 Method 1: Recover a PD cluster using a surviving PD node

When a majority of PD nodes in a cluster experience an unrecoverable error, the cluster becomes unable to provide services. If there are any surviving PD nodes, you can recover the service by selecting a surviving PD node and forcibly modifying the members of the Raft Group. The steps are as follows:

##### 14.6.4.3.1 Step 1: Stop all nodes

To prevent data corruption or other unrecoverable errors caused by interactions with PD parameters during the recovery process, stop the TiDB, TiKV, and TiFlash processes in the cluster.

##### 14.6.4.3.2 Step 2: Start the surviving PD node

Start the surviving PD node using the `--force-new-cluster` startup parameter. The following is an example:

```
./bin/pd-server --force-new-cluster --name=pd-127.0.0.10-2379 --client-urls=
↳ http://0.0.0.0:2379 --advertise-client-urls=http://127.0.0.1:2379 --
↳ peer-urls=http://0.0.0.0:2380 --advertise-peer-urls=http
↳ ://127.0.0.1:2380 --config=conf/pd.toml
```

##### 14.6.4.3.3 Step 3: Repair metadata using `pd-recover`

Since this method relies on a minority PD node to recover the service, the node might contain outdated data. If the `alloc_id` and `tso` data roll back, the cluster data might be corrupted or unavailable. To prevent this, you need to use `pd-recover` to modify the metadata to ensure that the node can provide correct allocation IDs and TSO services. The following is an example:

```
./bin/pd-recover --from-old-member --endpoints=http://127.0.0.1:2379 #
↪ Specify the corresponding PD address
```

### Note:

In this step, the `alloc_id` in the storage automatically increases by a safe value of 100000000. As a result, the subsequent cluster will allocate larger IDs.

Additionally, `pd-recover` does not modify the TSO. Therefore, before performing this step, make sure that the local time is later than the time when the failure occurs, and verify that the NTP clock synchronization service is enabled between the PD components before the failure. If it is not enabled, you need to adjust the local clock to a future time to prevent the TSO from rolling back.

#### 14.6.4.3.4 Step 4: Restart the PD node

Once you see the prompt message `recovery is successful`, restart the PD node.

#### 14.6.4.3.5 Step 5: Scale out PD and start the cluster

Scale out the PD cluster using the deployment tool and start the other components in the cluster. At this point, the PD service is available.

#### 14.6.4.4 Method 2: Entirely rebuild a PD cluster

This method is applicable to scenarios in which all PD data is lost, but the data of other components, such as TiDB, TiKV, and TiFlash, still exists.

##### 14.6.4.4.1 Step 1: Get cluster ID

The cluster ID can be obtained from the log of PD, TiKV, or TiDB. To get the cluster ID, you can view the log directly on the server.

Get cluster ID from PD log (recommended)

To get the cluster ID from the PD log, run the following command:

```
cat {/path/to}/pd.log | grep "init cluster id"
```

```
[2019/10/14 10:35:38.880 +00:00] [INFO] [server.go:212] ["init cluster id"]
↪ [cluster-id=6747551640615446306]
...
```

Get cluster ID from TiDB log

To get the cluster ID from the TiDB log, run the following command:

```
cat {/path/to}/tidb.log | grep "init cluster id"
```

```
2019/10/14 19:23:04.688 client.go:161: [info] [pd] init cluster id
 ↪ 6747551640615446306
...
```

Get cluster ID from TiKV log

To get the cluster ID from the TiKV log, run the following command:

```
cat {/path/to}/tikv.log | grep "connect to PD cluster"
```

```
[2019/10/14 07:06:35.278 +00:00] [INFO] [tikv-server.rs:464] ["connect to PD
 ↪ cluster 6747551640615446306"]
...
```

#### 14.6.4.4.2 Step 2: Get allocated ID

The allocated ID value you specify must be larger than the currently largest allocated ID value. To get allocated ID, you can either get it from the monitor, or view the log directly on the server.

Get allocated ID from the monitor (recommended)

To get allocated ID from the monitor, you need to make sure that the metrics you are viewing are the metrics of **the last PD leader**, and you can get the largest allocated ID from the **Current ID allocation** panel in PD dashboard.

Get allocated ID from PD log

To get the allocated ID from the PD log, you need to make sure that the log you are viewing is the log of **the last PD leader**, and you can get the maximum allocated ID by running the following command:

```
cat {/path/to}/pd*.log | grep "idAllocator allocates a new id" | awk -F
 ↪ '=' '{print $2}' | awk -F'|' '{print $1}' | sort -r -n | head -n 1
```

```
4000
...
```

Or you can simply run the above command in all PD servers to find the largest one.

#### 14.6.4.4.3 Step 3: Deploy a new PD cluster

Before deploying a new PD cluster, you need to stop the existing PD cluster and then delete the previous data directory or specify a new data directory using `--data-dir`.

#### 14.6.4.4.4 Step 4: Use `pd-recover`

You only need to run `pd-recover` on one PD node.

```
./pd-recover -endpoints http://10.0.1.13:2379 -cluster-id
↪ 6747551640615446306 -alloc-id 10000
```

#### 14.6.4.4.5 Step 5: Restart the whole cluster

When you see the prompted information that the recovery is successful, restart the whole cluster.

### 14.6.4.5 FAQ

#### 14.6.4.5.1 Multiple cluster IDs are found when getting the cluster ID

When a PD cluster is created, a new cluster ID is generated. You can determine the cluster ID of the old cluster by viewing the log.

#### 14.6.4.5.2 The error `dial tcp 10.0.1.13:2379: connect: connection refused` is returned when executing `pd-recover`

The PD service is required when you execute `pd-recover`. Deploy and start the PD cluster before you use PD Recover.

## 14.7 Command Line Flags

### 14.7.1 Configuration Options

When you start the TiDB cluster, you can use command-line options or environment variables to configure it. This document introduces TiDB's command options. The default TiDB ports are 4000 for client requests and 10080 for status report.

#### 14.7.1.1 `--advertise-address`

- The IP address through which to log into the TiDB server
- Default: ""
- This address must be accessible by the rest of the TiDB cluster and the user.

#### 14.7.1.2 `--config`

- The configuration file
- Default: ""

- If you have specified the configuration file, TiDB reads the configuration file. If the corresponding configuration also exists in the command line options, TiDB uses the configuration in the command line options to overwrite that in the configuration file. For detailed configuration information, see [TiDB Configuration File Description](#).

#### 14.7.1.3 `--config-check`

- Checks the validity of the configuration file and exits
- Default: `false`

#### 14.7.1.4 `--config-strict`

- Enforces the validity of the configuration file
- Default: `false`

#### 14.7.1.5 `--cors`

- Specifies the `Access-Control-Allow-Origin` value for Cross-Origin Request Sharing (CORS) request of the TiDB HTTP status service
- Default: `" "`

#### 14.7.1.6 `--enable-binlog`

- Enables or disables TiDB binlog generation
- Default: `false`

#### 14.7.1.7 `--host`

- The host address that the TiDB server monitors
- Default: `"0.0.0.0"`
- The TiDB server monitors this address.
- The `"0.0.0.0"` address monitors all network cards by default. If you have multiple network cards, specify the network card that provides service, such as `192.168.100.113`.

#### 14.7.1.8 `--initialize-insecure`

- Bootstraps `tidb-server` in insecure mode
- Default: `true`

#### 14.7.1.9 `--initialize-secure`

- Bootstraps tidb-server in secure mode
- Default: `false`

#### 14.7.1.10 `--initialize-sql-file`

- The SQL script to be executed when the TiDB cluster is started for the first time. For details, see [configuration item initialize-sql-file](#)
- Default: `""`

#### 14.7.1.11 `-L`

- The log level
- Default: `"info"`
- Optional values: `"debug"`, `"info"`, `"warn"`, `"error"`, `"fatal"`

#### 14.7.1.12 `--lease`

- The duration of the schema lease. It is **dangerous** to change the value unless you know what you do.
- Default: `45s`

#### 14.7.1.13 `--log-file`

- The log file
- Default: `""`
- If this option is not set, logs are output to “stderr”. If this option is set, logs are output to the corresponding file.

#### 14.7.1.14 `--log-slow-query`

- The directory for the slow query log
- Default: `""`
- If this option is not set, logs are output to the file specified by `--log-file` by default.

#### 14.7.1.15 `--metrics-addr`

- The Prometheus Pushgateway address
- Default: `""`
- Leaving it empty stops the Prometheus client from pushing.
- The format is `--metrics-addr=192.168.100.115:9091`.

#### 14.7.1.16 `--metrics-interval`

- The Prometheus client push interval in seconds
- Default: 15s
- Setting the value to 0 stops the Prometheus client from pushing.

#### 14.7.1.17 `-P`

- The monitoring port of TiDB services
- Default: "4000"
- The TiDB server accepts MySQL client requests from this port.

#### 14.7.1.18 `--path`

- The path to the data directory for local storage engine like “unistore”
- For `--store = tikv`, you must specify the path; for `--store = unistore`, the default value is used if you do not specify the path.
- For the distributed storage engine like TiKV, `--path` specifies the actual PD address. Assuming that you deploy the PD server on 192.168.100.113:2379, 192.168.100.114:2379 and 192.168.100.115:2379, the value of `--path` is “192.168.100.113:2379, 192.168.100.114:2379, 192.168.100.115:2379”.
- Default: `"/tmp/tidb"`
- You can use `tidb-server --store=unistore --path=""` to enable a pure in-memory TiDB.

#### 14.7.1.19 `--proxy-protocol-networks`

- The list of proxy server’s IP addresses allowed to connect to TiDB using the [PROXY protocol](#).
- Default: ""
- In general cases, when you access TiDB behind a reverse proxy, TiDB takes the IP address of the reverse proxy server as the IP address of the client. By enabling the PROXY protocol, reverse proxies that support this protocol such as HAProxy can pass the real client IP address to TiDB.
- After configuring this flag, TiDB allows the configured source IP address to connect to TiDB using the PROXY protocol; if a protocol other than PROXY is used, this connection will be denied; other addresses are allowed to connect to TiDB without the PROXY protocol. If this flag is left empty, no IP address can connect to TiDB using the PROXY protocol. The value can be the IP address (192.168.1.50) or CIDR (192.168.1.0/24) with `,` as the separator. `*` means any IP addresses.

**Warning:**

Use `*` with caution because it might introduce security risks by allowing a client of any IP address to report its IP address. In addition, using `*`  $\leftrightarrow$  might also cause the internal component that directly connects to TiDB (such as TiDB Dashboard) to be unavailable unless `--proxy-protocol-fallbackable` is set to `true`.

**Note:**

To use an AWS Network Load Balancer (NLB) with the PROXY protocol enabled, you need to configure the `target group` property of NLB. Specifically, set `proxy_protocol_v2.client_to_server.header_place` to `on_first_ack`. At the same time, you need to submit a ticket to AWS Support. Note that after the PROXY protocol is enabled, the client will fail to obtain handshake packets from the server and the packets are blocked until the client times out. This is because NLB sends proxy packets only after the client sends data. However, before the client sends any data packets, data packets sent by the server are dropped in the internal network.

**14.7.1.20 --proxy-protocol-header-timeout**

- Timeout for the PROXY protocol header read
- Default: 5 (seconds)

**Warning:**

Since v6.3.0, this parameter is deprecated. It is no longer used because the PROXY protocol header will be read upon the first time network data is read. Deprecating this parameter avoids affecting the timeout set when network data is read for the first time.

**Note:**

Do not set the value to 0. Use the default value except for special situations.

#### 14.7.1.21 `--report-status`

- Enables (`true`) or disables (`false`) the status report and pprof tool
- Default: `true`
- When set to `true`, this parameter enables metrics and pprof. When set to `false`, this parameter disables metrics and pprof.

#### 14.7.1.22 `--run-ddl`

- To see whether the `tidb-server` runs DDL statements, and set when the number of `tidb-server` is over two in the cluster
- Default: `true`
- The value can be (`true`) or (`false`). (`true`) indicates the `tidb-server` runs DDL itself. (`false`) indicates the `tidb-server` does not run DDL itself.

#### 14.7.1.23 `--socket string`

- The TiDB services use the unix socket file for external connections.
- Default: `""`
- Use `/tmp/tidb.sock` to open the unix socket file.

#### 14.7.1.24 `--status`

- The status report port for TiDB server
- Default: `"10080"`
- This port is used to get server internal data. The data includes [Prometheus metrics](#) and [pprof](#).
- Prometheus metrics can be accessed by `"http://host:status_port/metrics"`.
- pprof data can be accessed by `"http://host:status_port/debug/pprof"`.

#### 14.7.1.25 `--status-host`

- The `HOST` used to monitor the status of TiDB service
- Default: `0.0.0.0`

#### 14.7.1.26 `--store`

- Specifies the storage engine used by TiDB in the bottom layer
- Default: `"unistore"`
- You can choose `"unistore"` or `"tikv"`. (`"unistore"` is the local storage engine; `"tikv"` is a distributed storage engine)

#### 14.7.1.27 `--temp-dir`

- The temporary directory of TiDB
- Default: `"/tmp/tidb"`

#### 14.7.1.28 `--token-limit`

- The number of sessions allowed to run concurrently in TiDB. It is used for traffic control.
- Default: 1000
- If the number of the concurrent sessions is larger than `token-limit`, the request is blocked and waiting for the operations which have been finished to release tokens.

#### 14.7.1.29 `-v`

- Outputs the version of TiDB
- Default: `""`

#### 14.7.1.30 `--plugin-dir`

- The storage directory for plugins.
- Default: `"/data/deploy/plugin"`

#### 14.7.1.31 `--plugin-load`

- The names of the plugins to be loaded, each separated by a comma.
- Default: `""`

#### 14.7.1.32 `--affinity-cpus`

- Sets the CPU affinity of TiDB servers, which is separated by commas. For example, `"1,2,3"`.
- Default: `""`

#### 14.7.1.33 `--repair-mode`

- Determines whether to enable the repair mode, which is only used in the data repair scenario.
- Default: `false`

#### 14.7.1.34 `--repair-list`

- The names of the tables to be repaired in the repair mode.
- Default: ""

### 14.7.2 TiKV Configuration Flags

TiKV supports some readable unit conversions for command line parameters.

- File size (based on byte): KB, MB, GB, TB, PB (or lowercase)
- Time (based on ms): ms, s, m, h

#### 14.7.2.1 `-A, --addr`

- The address that the TiKV server monitors
- Default: "127.0.0.1:20160"
- To deploy a cluster, you must use `--addr` to specify the IP address of the current host, such as "192.168.100.113:20160". If the cluster is run on Docker, specify the IP address of Docker as "0.0.0.0:20160".

#### 14.7.2.2 `--advertise-addr`

- The server advertise address for client traffic from outside
- Default: `${addr}`
- If the client cannot connect to TiKV through the `--addr` address because of Docker or NAT network, you must manually set the `--advertise-addr` address.
- For example, the internal IP address of Docker is 172.17.0.1, while the IP address of the host is 192.168.100.113 and the port mapping is set to `-p 20160:20160`. In this case, you can set `--advertise-addr` to "192.168.100.113:20160". The client can find this service through 192.168.100.113:20160.

#### 14.7.2.3 `--status-addr`

- The port through which the TiKV service status is listened
- Default: "20180"
- The Prometheus can access this status information via `http://host:status_port/`  
↪ `metrics`.
- The Profile can access this status information via `http://host:status_port/debug`  
↪ `/pprof/profile`.

#### 14.7.2.4 `--advertise-status-addr`

- The address through which TiKV accesses service status from outside.
- Default: The value of `--status-addr` is used.
- If the client cannot connect to TiKV through the `--status-addr` address because of Docker or NAT network, you must manually set the `--advertise-status-addr` address.
- For example, the internal IP address of Docker is `172.17.0.1`, while the IP address of the host is `192.168.100.113` and the port mapping is set to `-p 20180:20180`. In this case, set `--advertise-status-addr="192.168.100.113:20180"`. The client can find this service through `192.168.100.113:20180`.

#### 14.7.2.5 `-C, --config`

- The config file
- Default: ""
- If you set the configuration using the command line, the same setting in the config file will be overwritten.

#### 14.7.2.6 `--capacity`

- The store capacity
- Default: 0 (unlimited)
- PD uses this flag to determine how to balance the TiKV servers. (Tip: you can use 10GB instead of 1073741824)

#### 14.7.2.7 `--config-info <FORMAT>`

- When this flag is used, available configuration values are listed according to `FORMAT` and then exit.
- Value option for `FORMAT`: `json`. Currently, only JSON format is supported.
- Only the configuration name (Name), default value (DefaultValue) and current value (ValueInFile) are listed in the output JSON. If the `-C` or `--config` is specified, the current value and the default value of configuration items in the file are listed together, and other items without `-C` or `--config` specified only have default values. The following is an example:

```
{
 "Component": "TiKV Server",
 "Version": "6.2.0",
 "Parameters": [
 {
```

```
"Name": "log-level",
"DefaultValue": "info",
"ValueInFile": "warn"
},
{
"Name": "log-file",
"DefaultValue": ""
},
...
]
}
```

#### 14.7.2.8 --data-dir

- The path to the data directory
- Default: `"/tmp/tikv/store"`

#### 14.7.2.9 -L

- The log level
- Default: `"info"`
- Optional values: `"debug", "info", "warn", "error", "fatal"`

#### 14.7.2.10 --log-file

- The log file
- Default: `""`
- If this flag is not set, logs will be written to `"stderr"`. If this flag is set, logs are output to the corresponding file.

#### 14.7.2.11 --pd

- The address list of PD servers
- Default: `""`
- To make TiKV work, you must use the value of `--pd` to connect the TiKV server to the PD server. Separate multiple PD addresses using comma, for example `"192.168.100.113:2379, 192.168.100.114:2379, 192.168.100.115:2379"`.

### 14.7.3 TiFlash Command-Line Flags

This document introduces the command-line flags that you can use when you launch TiFlash.

### 14.7.3.1 `server --config-file`

- Specifies the path of the TiFlash configuration file
- Default: “”
- You must specify the configuration file. For detailed configuration items, refer to [TiFlash configuration parameters](#).

### 14.7.3.2 `dttool migrate`

- Migrates the file format of DTFile (for testing or downgrading). Data is migrated in the unit of a single DTFile. If you want to migrate the whole table, you need to locate all the paths similar to `<data dir>/t_<table id>/stable/dmf_<file id>` and migrate them one by one. You can use scripts to automate the migration.
- User scenarios:
  - If you need to downgrade TiFlash from a version  $\geq$  v5.4.0 that has enabled data validation to a version  $<$  v5.4.0, you can use this tool to downgrade the data format of the DTFile.
  - If you upgrade TiFlash to a version  $\geq$  v5.4.0, and if you hope to enable data validation for existing data, you can use this tool to upgrade the data format of the DTFile.
  - Test the space usage and read speed of the DTFile in different configurations.
- Parameters:
  - `--imitative`: When you do not use the encryption feature of the DTFile, you can use this flag to avoid using the configuration file and connecting to PD.
  - `--version`: The version of DTFile. The value options are 1 and 2 (default). 1 is the old version, and 2 is the version corresponding to the new checksum.
  - `--algorithm`: The hash algorithm used for data validation. The value options are `xxh3` (default), `city128`, `crc32`, `crc64`, and `none`. This parameter is effective only when `version` is 2.
  - `--frame`: The size of the validation frame. The default value is 1048576. This parameter is effective only when `version` is 2.
  - `--compression`: The target compression algorithm. The value options are LZ4 (default), LZ4HC, `zstd`, and `none`.
  - `--level`: The target compression level. If not specified, the recommended compression level is used by default according to the compression algorithm. If `compression` is set to LZ4 or `zstd`, the default level is 1. If `compression` is set to LZ4HC, the default level is 9.
  - `--config-file`: The configuration file of `dttool migrate` is the same as the [configuration file of server](#). For more information, see `--imitative`.
  - `--file-id`: The ID of the DTFile. For example, the ID of the DTFile `dmf_123` is 123.

- `--workdir`: The parent directory of `dmf_XXX`.
- `--dry`: The dry run mode. Only the migration process is output.
- `--nokeep`: Does not keep the original data. When this option is not enabled, `dmf_XXX.old` files are created.

### Warning:

TiFlash can read DTFile that uses custom compression algorithms and compression levels. However, only the lz4 algorithm with the default compression level is officially supported. Custom compression parameters have not been thoroughly tested and are only experimental.

### Note:

For security reasons, DTTool attempts to add a lock to the working directory in the migration mode. Therefore, in the same directory, only one DTTool can perform the migration task at the same time. If you forcibly stop DTTool where the lock is not released, then when you try to rerun DTTool later, it might refuse to perform the migration task.

If you encounter this situation, and if you are aware that removing the LOCK file does not cause any data corruption, you can manually delete the LOCK file in the working directory to release the lock.

### 14.7.3.3 dttool bench

- Provides a basic I/O speed test for the DTFile.
- Parameters:
  - `--version`: The version of DTFile. See `--version` in `dttool migrate`.
  - `--algorithm`: The hash algorithm used for data validation. See `--algorithm` in `dttool migrate`.
  - `--frame`: The size of the validation frame. See `--frame` in `dttool migrate`.
  - `--column`: The columns of the table to be tested. The default value is 100.
  - `--size`: The rows of the table to be tested. The default value is 1000.
  - `--field`: The field length limit of the table to be tested. The default value is 1024.
  - `--random`: The random seed. If you do not specify this parameter, the random seed is drawn from the system entropy pool.

- `--encryption`: Enables the encryption feature.
- `--repeat`: The number of times to repeat the test. The default value is 5.
- `--workdir`: The temporary data directory, which points to a path in the file system to be tested. The default value is `/tmp/test`.

#### 14.7.3.4 dttool inspect

- Checks the integrity of the DTFile. Data validation is performed in the unit of a single DTFile. If you want to validate the whole table, you need to locate all the paths similar to `<data dir>/t_<table id>/stable/dmf_<file id>` and validate them one by one. You can use scripts to automate the validation.
- User scenarios:
  - After you perform a format upgrade or downgrade, you can validate the data integrity of the DTFile.
  - After you migrate the DTFile to a new environment, you can validate the data integrity of the DTFile.
- Parameters:
  - `--config-file`: The configuration file of `dttool bench`. See `--config-file` in `dttool migrate`.
  - `--check`: Performs hash validation.
  - `--file-id`: The ID of the DTFile. See `--file-id` in `dttool migrate`.
  - `--imitative`: Imitates the database context. See `--imitative` in `dttool ↪ migrate`.
  - `--workdir`: The data directory. See `--workdir` in `dttool migrate`.

#### 14.7.4 PD Configuration Flags

PD is configurable using command-line flags and environment variables.

##### 14.7.4.1 --advertise-client-urls

- The list of advertise URLs for the client to access PD
- Default: `"${client-urls}"`
- In some situations such as in the Docker or NAT network environment, if a client cannot access PD through the default client URLs listened to by PD, you must manually set the advertise client URLs.
- For example, the internal IP address of Docker is `172.17.0.1`, while the IP address of the host is `192.168.100.113` and the port mapping is set to `-p 2379:2379`. In this case, you can set `--advertise-client-urls` to `"http://192.168.100.113:2379"`. The client can find this service through `"http://192.168.100.113:2379"`.

#### 14.7.4.2 `--advertise-peer-urls`

- The list of advertise URLs for other PD nodes (peers) to access a PD node
- Default: "`{peer-urls}`"
- In some situations such as in the Docker or NAT network environment, if the other nodes (peers) cannot access the PD node through the default peer URLs listened to by this PD node, you must manually set the advertise peer URLs.
- For example, the internal IP address of Docker is `172.17.0.1`, while the IP address of the host is `192.168.100.113` and the port mapping is set to `-p 2380:2380`. In this case, you can set `--advertise-peer-urls` to "`http://192.168.100.113:2380`". The other PD nodes can find this service through "`http://192.168.100.113:2380`".

#### 14.7.4.3 `--client-urls`

- The list of client URLs to be listened to by PD
- Default: "`http://127.0.0.1:2379`"
- When you deploy a cluster, you must specify the IP address of the current host as `--client-urls` (for example, "`http://192.168.100.113:2379`"). If the cluster runs on Docker, specify the IP address of Docker as "`http://0.0.0.0:2379`".

#### 14.7.4.4 `--peer-urls`

- The list of peer URLs to be listened to by a PD node
- Default: "`http://127.0.0.1:2380`"
- When you deploy a cluster, you must specify `--peer-urls` as the IP address of the current host, such as "`http://192.168.100.113:2380`". If the cluster runs on Docker, specify the IP address of Docker as "`http://0.0.0.0:2380`".

#### 14.7.4.5 `--config`

- The configuration file
- Default: ""
- If you set the configuration using the command line, the same setting in the configuration file will be overwritten.

#### 14.7.4.6 `--data-dir`

- The path to the data directory
- Default: "`default.{name}`"

#### 14.7.4.7 --initial-cluster

- The initial cluster configuration for bootstrapping
- Default: "{name}=http://{advertise-peer-url}"
- For example, if name is "pd", and advertise-peer-urls is "http://192.168.100.113:2380" ↪ , the initial-cluster is "pd=http://192.168.100.113:2380".
- If you need to start three PD servers, the initial-cluster might be:

```
pd1=http://192.168.100.113:2380, pd2=http://192.168.100.114:2380, pd3
↪ =192.168.100.115:2380
```

#### 14.7.4.8 --join

- Join the cluster dynamically
- Default: ""
- If you want to join an existing cluster, you can use --join="{advertise-client-urls}", the advertise-client-url is any existing PD's, multiply advertise client urls are separated by comma.

#### 14.7.4.9 -L

- The log level
- Default: "info"
- Optional values: "debug", "info", "warn", "error", "fatal"

#### 14.7.4.10 --log-file

- The log file
- Default: ""
- If this flag is not set, logs will be written to "stderr". If this flag is set, logs are output to the corresponding file.

#### 14.7.4.11 --log-rotate

- To enable or disable log rotation
- Default: true
- When the value is true, follow the [log.file] in PD configuration files.

#### 14.7.4.12 `--name`

- The human-readable unique name for this PD member
- Default: "pd"
- If you want to start multiply PDs, you must use different name for each one.

#### 14.7.4.13 `--cacert`

- The file path of CA, used to enable TLS
- Default: ""

#### 14.7.4.14 `--cert`

- The path of the PEM file including the X509 certificate, used to enable TLS
- Default: ""

#### 14.7.4.15 `--key`

- The path of the PEM file including the X509 key, used to enable TLS
- Default: ""

#### 14.7.4.16 `--metrics-addr`

- The address of Prometheus Pushgateway, which does not push data to Prometheus by default.
- Default: ""

## 14.8 Key Monitoring Metrics

### 14.8.1 Key Metrics

If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus & Grafana) is deployed at the same time. For more information, see [TiDB Monitoring Framework Overview](#).

The Grafana dashboard is divided into a series of sub dashboards which include Overview, PD, TiDB, TiKV, Node\_exporter, Disk Performance, and Performance\_overview. A lot of metrics are there to help you diagnose.

For routine operations, you can get an overview of the component (PD, TiDB, TiKV) status and the entire cluster from the Overview dashboard, where the key metrics are displayed. This document provides a detailed description of these key metrics.

#### 14.8.1.1 Key metrics description

To understand the key metrics displayed on the Overview dashboard, check the following table:

| Service Panel Name                             | Description                                                                                                                        | Normal Range                                                                                                            |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Services<br>Services Up<br>Port<br>Sta-<br>tus | The online nodes number of each service.                                                                                           |                                                                                                                         |
| PD PD role                                     | The role of the current PD.                                                                                                        |                                                                                                                         |
| PD Storage capacity                            | The total storage capacity of the TiDB cluster.                                                                                    |                                                                                                                         |
| PD Current storage size                        | The occupied storage capacity of the TiDB cluster, including the space occupied by TiKV replicas.                                  |                                                                                                                         |
| PD Normal stores                               | The number of nodes in the normal state.                                                                                           |                                                                                                                         |
| PD Abnormal stores                             | The number of nodes in the abnormal state.                                                                                         | 0                                                                                                                       |
| PD Number of Regions                           | The total number of Regions in the current cluster. Note that the number of Regions has nothing to do with the number of replicas. |                                                                                                                         |
| PD 99% completed_cmds_duration                 | The 99th percentile duration to complete a pd-server request.                                                                      | less than 5ms                                                                                                           |
| PD Handle_requests_duration                    | The network duration of a PD request.                                                                                              | less than 20ms                                                                                                          |
| PD Region health                               | The state of each Region.                                                                                                          | Generally, the number of pending peers is less than 100, and that of the missing peers cannot always be greater than 0. |
| PD Hot write Region's leader distribution      | The total number of leaders who are the write hotspots on each TiKV instance.                                                      |                                                                                                                         |
| PD Hot read Region's leader distribution       | The total number of leaders who are the read hotspots on each TiKV instance.                                                       |                                                                                                                         |
| PD Region heartbeat report                     | The count of heartbeats reported to PD per instance.                                                                               |                                                                                                                         |
| PD 99% Region heartbeat latency                | The heartbeat latency per TiKV instance (P99).                                                                                     |                                                                                                                         |

| Service Panel Name    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Normal Range |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| TiDB Statement OPS    | The number of different types of SQL statements executed per second, which is counted according to <code>SELECT</code> , <code>INSERT</code> , <code>UPDATE</code> , and other types of statements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |              |
| TiDB Duration         | The execution time.1. The duration between the time that the client's network request is sent to TiDB and the time that the request is returned to the client after TiDB has executed the request. In general, client requests are sent in the form of SQL statements; however, this duration can include the execution time of commands such as <code>COM_PING</code> , <code>COM_SLEEP</code> , <code>COM_STMT_FETCH</code> , and <code>COM_SEND_LONG_DATA</code> .2. Because TiDB supports Multi-Query, TiDB supports sending multiple SQL statements at one time, such as <code>select 1; select 1; select 1;</code> . In this case, the total execution time of this query includes the execution time of all SQL statements. |              |
| TiDB CPS By Instance  | CPS By Instance: the command statistics on each TiDB instance, which is classified according to the success or failure of command execution results.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |              |
| TiDB Failed Query OPM | The statistics of error types (such as syntax errors and primary key conflicts) based on the errors occurred when executing SQL statements per second on each TiDB instance. The module in which the error occurs and the error code are included.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |              |
| TiDB Connection Count | The connection number of each TiDB instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |              |

| Service Panel Name             | Description                                                                                                                                             | Normal Range |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| TiDB Memory Usage              | The memory usage statistics of each TiDB instance, which is divided into the memory occupied by processes and the memory applied by Golang on the heap. |              |
| TiDB Transaction OPS           | The number of transactions executed per second.                                                                                                         |              |
| TiDB Transaction Duration      | The execution time of a transaction                                                                                                                     |              |
| TiDB KV Cmd OPS                | The number of executed KV commands.                                                                                                                     |              |
| TiDB KV Cmd Duration 99        | The execution time of the KV command.                                                                                                                   |              |
| TiDB PD TSO OPS                | The number of TSO that TiDB obtains from PD per second.                                                                                                 |              |
| TiDB PD TSO Wait Duration      | The duration that TiDB waits for PD to return TSO.                                                                                                      |              |
| TiDB TiClient Region Error OPS | The number of Region related errors returned by TiKV.                                                                                                   |              |
| TiDB Lock Resolve OPS          | The number of TiDB operations that resolve locks. When TiDB's read or write request encounters a lock, it tries to resolve the lock.                    |              |
| TiDB KV Backoff OPS            | The number of errors returned by TiKV.                                                                                                                  |              |
| TiKV leader                    | The number of leaders on each TiKV node.                                                                                                                |              |
| TiKV region                    | The number of Regions on each TiKV node.                                                                                                                |              |
| TiKV CPU                       | The CPU usage ratio on each TiKV node.                                                                                                                  |              |
| TiKV Memory                    | The memory usage on each TiKV node.                                                                                                                     |              |
| TiKV store size                | The size of storage space used by each TiKV instance.                                                                                                   |              |
| TiKV cf size                   | The size of each column family (CF for short).                                                                                                          |              |
| TiKV channel full              | The number of "channel full" errors on each TiKV instance.                                                                                              | 0            |
| TiKV server report failures    | The number of error messages reported by each TiKV instance.                                                                                            | 0            |

| Service Panel Name                | Description                                                                                                                        | Normal Range                                                                                                                                                                         |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TiKV scheduler pending commands   | The number of pending commands on each TiKV instance.                                                                              |                                                                                                                                                                                      |
| TiKV coprocessor executor count   | The number of coprocessor operations received by TiKV per second. Each type of coprocessor is counted separately.                  |                                                                                                                                                                                      |
| TiKV coprocessor request duration | The time consumed to process read requests of coprocessor.                                                                         |                                                                                                                                                                                      |
| TiKV raft store CPU               | The CPU usage ratio of the raftstore thread                                                                                        | The default number of threads is 2 (configured by <code>raftstore.store-pool-size</code> ). A value of over 80% for a single thread indicates that the CPU usage ratio is very high. |
| TiKV Coprocessor CPU              | The CPU usage ratio of the coprocessor thread.                                                                                     |                                                                                                                                                                                      |
| System Vcores Info                | The number of CPU cores.                                                                                                           |                                                                                                                                                                                      |
| System Memory Info                | The total memory.                                                                                                                  |                                                                                                                                                                                      |
| System CPU Usage Info             | The CPU usage ratio, 100% at a maximum.                                                                                            |                                                                                                                                                                                      |
| System Load [1m] Info             | The overload within 1 minute.                                                                                                      |                                                                                                                                                                                      |
| System Memory Info Available      | The size of the available memory.                                                                                                  |                                                                                                                                                                                      |
| System Network Traffic Info       | The statistics of the network traffic.                                                                                             |                                                                                                                                                                                      |
| System TCP Retrans Info           | The frequency of the TOC retransmission.                                                                                           |                                                                                                                                                                                      |
| System IO Util Info               | The disk usage ratio, 100% at a maximum; generally you need to consider adding a new node when the usage ratio is up to 80% ~ 90%. |                                                                                                                                                                                      |

### 14.8.1.2 Interface of the Overview dashboard

Figure 318: overview

### 14.8.2 Key Metrics on Performance Overview

If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus & Grafana) is deployed at the same time. For more information, see [TiDB Monitoring Framework Overview](#).

The Grafana dashboard is divided into a series of sub dashboards which include PD, TiDB, TiKV, Node\_exporter, Overview, and Performance Overview. A lot of metrics are there to help you diagnose.

The Performance Overview dashboard orchestrates the metrics of TiDB, PD, and TiKV, and presents each of them in the following sections:

- Overview: Database time and SQL execution time summary. By checking different colors in the overview, you can quickly identify the database workload profile and the

performance bottleneck.

- Load profile: Key metrics and resource usage, including database QPS, connection information, the MySQL command types the application interacts with TiDB, database internal TSO and KV request OPS, and resource usage of the TiKV and TiDB.
- Top-down latency breakdown: Query latency versus connection idle time ratio, query latency breakdown, TSO/KV request latency during execution, breakdown of write latency within TiKV.

With the Performance Overview Dashboard, you can analyze performance efficiently, and confirm whether the bottleneck of user response time is in the database. If the bottleneck is in the database, you can identify the bottleneck inside the database, with database time overview, workload profile and SQL latency breakdown. For details, see [Performance Analysis and Tuning](#).

The following sections illustrate the metrics on the Performance Overview dashboard.

### 14.8.2.1 Performance Overview

#### 14.8.2.1.1 Database Time by SQL Type

- database time: Total database time per second
- sql\_type: Database time consumed by each type of SQL statements per second

#### 14.8.2.1.2 Database Time by SQL Phase

- database time: Total database time per second
- get token/parse/compile/execute: Database time consumed in four SQL processing phases

The SQL execution phase is in green and other phases are in red on general. If non-green areas are large, it means much database time is consumed in other phases than the execution phase and further cause analysis is required.

#### 14.8.2.1.3 SQL Execute Time Overview

- execute time: Database time consumed during SQL execution per second
- tso\_wait: Concurrent TSO waiting time per second during SQL execution
- kv request type: Time waiting for each KV request type per second during SQL execution. The total KV request wait time might exceed SQL execution time, because KV requests are concurrent.
- tiflash\_mpp: Time of processing TiFlash requests per second during SQL execution.

Green metrics stand for common KV write requests (such as prewrite and commit), blue metrics stand for common read requests, purple metrics stand for TiFlash MPP requests, and metrics in other colors stand for unexpected situations which you need to pay attention to. For example, pessimistic lock KV requests are marked red and TSO waiting is marked dark brown.

If non-blue or non-green areas are large, it means there is a bottleneck during SQL execution. For example:

- If serious lock conflicts occur, the red area will take a large proportion.
- If excessive time is consumed in waiting TSO, the dark brown area will take a large proportion.

#### 14.8.2.1.4 QPS

Number of SQL statements executed per second in all TiDB instances, collected by type: such as `SELECT`, `INSERT`, and `UPDATE`

#### 14.8.2.1.5 CPS By Type

Number of commands processed by all TiDB instances per second based on type

#### 14.8.2.1.6 Queries Using Plan Cache OPS

- `avg-hit`: The number of queries using the execution plan cache per second for all TiDB instances
- `avg-miss`: The number of queries not using the execution plan cache per second for all TiDB instances

`avg-hit + avg-miss` is equal to `StmtExecute`, which is the number of all queries executed per second.

#### 14.8.2.1.7 KV/TSO Request OPS

- `kv request total`: Total number of KV requests per second in all TiDB instances
- `kv request by type`: Number of KV requests per second in all TiDB instances based on such types as `Get`, `Prewrite`, and `Commit`.
- `tso - cmd`: Number of `tso cmd` requests per second in all TiDB instances
- `tso - request`: Number of `tso request` requests per second in all TiDB instances

Generally, dividing `tso - cmd` by `tso - request` yields the average batch size of requests per second.

#### 14.8.2.1.8 KV Request Time By Source

- kv request total time: Total time of processing KV and TiFlash requests per second in all TiDB instances
- Each KV request and the corresponding request source form a stacked bar chart, in which `external` identifies normal business requests and `internal` identifies internal activity requests (such as DDL and auto analyze requests)

#### 14.8.2.1.9 TiDB CPU

- avg: Average CPU utilization across all TiDB instances
- delta: Maximum CPU utilization of all TiDB instances minus minimum CPU utilization of all TiDB instances
- max: Maximum CPU utilization across all TiDB instances

#### 14.8.2.1.10 TiKV CPU/IO MBps

- CPU-Avg: Average CPU utilization of all TiKV instances
- CPU-Delta: Maximum CPU utilization of all TiKV instances minus minimum CPU utilization of all TiKV instances
- CPU-MAX: Maximum CPU utilization among all TiKV instances
- IO-Avg: Average MBps of all TiKV instances
- IO-Delt: Maximum MBps of all TiKV instances minus minimum MBps of all TiKV instances
- IO-MAX: Maximum MBps of all TiKV instances

#### 14.8.2.1.11 Duration

- Duration: Execution time
  - The duration from receiving a request from the client to TiDB till TiDB executing the request and returning the result to the client. In general, client requests are sent in the form of SQL statements; however, this duration can include the execution time of commands such as `COM_PING`, `COM_SLEEP`, `COM_STMT_FETCH`, and `COM_SEND_LONG_DATA`.
  - TiDB supports Multi-Query, which means the client can send multiple SQL statements at one time, such as `select 1; select 1; select 1;`. In this case, the total execution time of this query includes the execution time of all SQL statements.
- avg: Average time to execute all requests
- 99: P99 duration to execute all requests
- avg by type: Average time to execute all requests in all TiDB instances, collected by type: `SELECT`, `INSERT`, and `UPDATE`

#### 14.8.2.1.12 Connection Idle Duration

Connection Idle Duration indicates the duration of a connection being idle.

- avg-in-txn: Average connection idle duration when the connection is within a transaction
- avg-not-in-txn: Average connection idle duration when the connection is not within a transaction
- 99-in-txn: P99 connection idle duration when the connection is within a transaction

#### 14.8.2.1.13 Connection Count

- total: Number of connections to all TiDB instances
- active connections: Number of active connections to all TiDB instances
- tidb-{node-number}-peer: Number of connections to each TiDB instance
- disconnection/s: Number of disconnections in a TiDB cluster
- 99-not-in-txn: P99 connection idle duration when the connection is not within a transaction

#### 14.8.2.1.14 Parse Duration, Compile Duration, and Execute Duration

- Parse Duration: Time consumed in parsing SQL statements
- Compile Duration: Time consumed in compiling the parsed SQL AST to execution plans
- Execution Duration: Time consumed in executing execution plans of SQL statements

All these three metrics include the average duration and the 99th percentile duration in all TiDB instances.

#### 14.8.2.1.15 Avg TiDB KV Request Duration

Average time consumed in executing KV requests in all TiDB instances based on the type, including `Get`, `Prewrite`, and `Commit`.

#### 14.8.2.1.16 Avg TiKV GRPC Duration

Average time consumed in executing gRPC requests in all TiKV instances based on the type, including `kv_get`, `kv_prewrite`, and `kv_commit`.

#### 14.8.2.1.17 PD TSO Wait/RPC Duration

- wait - avg: Average time in waiting for PD to return TSO in all TiDB instances
- rpc - avg: Average time from sending TSO requests to PD to receiving TSO in all TiDB instances
- wait - 99: P99 time in waiting for PD to return TSO in all TiDB instances
- rpc - 99: P99 time from sending TSO requests to PD to receiving TSO in all TiDB instances

### 14.8.2.1.18 Storage Async Write Duration, Store Duration, and Apply Duration

- Storage Async Write Duration: Time consumed in asynchronous write
- Store Duration: Time consumed in store loop during asynchronously write
- Apply Duration: Time consumed in apply loop during asynchronously write

All these three metrics include the average duration and P99 duration in all TiKV instances.

Average storage async write duration = Average store duration + Average apply duration

### 14.8.2.1.19 Append Log Duration, Commit Log Duration, and Apply Log Duration

- Append Log Duration: Time consumed by Raft to append logs
- Commit Log Duration: Time consumed by Raft to commit logs
- Apply Log Duration: Time consumed by Raft to apply logs

All these three metrics include the average duration and P99 duration in all TiKV instances.

### 14.8.2.1.20 Interface of the Performance Overview panels

Figure 319: performance overview

### 14.8.2.2 TiFlash

- CPU: The CPU utilization per TiFlash instance.
- Memory: The memory usage per TiFlash instance.
- IO utilization: The IO utilization per TiFlash instance.
- MPP Query count: The number of TiFlash MPP queries per second per TiFlash instance.
- Request QPS: The number of coprocessor requests received by all TiFlash instances.
  - `batch`: Number of batch requests.
  - `batch_cop`: Number of coprocessor requests in the batch requests.
  - `cop`: Number of coprocessor requests that are sent directly via the coprocessor interface.
  - `cop_dag`: Number of dag requests in all coprocessor requests.
  - `super_batch`: Number of requests that enable the Super Batch feature.
- Executor QPS: The number of each type of dag executors in the requests received by all TiFlash instances. `table_scan` is the table scan executor. `selection` is the selection executor. `aggregation` is the aggregation executor. `top_n` is the TopN executor. `limit` is the limit executor.
- Request Duration Overview: Provides a stacked chart of total processing time per second for all request types in all TiFlash instances.
- Request Duration: The total processing duration for each MPP and coprocessor request type in all TiFlash instances. It is from the time that the coprocessor request is received to the time that the response of the request is completed, which includes the average latency and p99 latency.
- Request Handle Duration: The actual processing duration for each MPP and coprocessor request type in all TiFlash instances. It is from the start of executing the coprocessor request to the completion of the execution, which includes the average latency and p99 latency.
- Raft Wait Index Duration: The time used by `wait_index` for all TiFlash instances, namely the time used to wait until `Region index >= read_index` after the `read_index` request is received.
- Raft Batch Read Index Duration: The time used by `read_index` for all TiFlash instances. Most time is used for interaction with the Region leader and retry.
- Write Throughput By Instance: The throughput of write by instance. It includes the throughput by applying the Raft write commands and Raft snapshots.
- Write flow: The traffic of disk writes by all TiFlash instances.
- Read flow: The traffic of disk reads by all TiFlash instances.

### 14.8.2.3 CDC

- CPU usage: The CPU usage per TiCDC node.
- Memory usage: The memory usage per TiCDC node.
- Goroutine count: The number of goroutines per TiCDC node.
- Changefeed checkpoint lag: The progress lag of data replication (the unit is second) between the upstream and the downstream.
- Changefeed resolved ts lag: The progress lag of data replication (the unit is second) between the upstream and TiCDC nodes.
- The status of changefeeds:
  - 0: Normal
  - 1: Error
  - 2: Failed
  - 3: Stopped
  - 4: Finished
  - -1: Unknown
- Puller output events/s: The number of rows that the Puller module of TiCDC nodes sends to the Sorter module per second.
- Sorter output events/s: The number of rows that the Sorter module of TiCDC nodes sends to the Mounter module per second.
- Mounter output events/s: The number of rows that the Mounter module of TiCDC nodes sends to the Sink module per second.
- Table sink output events/s: The number of rows that the Table Sorter module of the TiCDC nodes sends to the Sink module per second.
- SinkV2 - Sink flush rows/s: The number of rows that the Sink module in the TiCDC node sends to the downstream per second.
- Transaction Sink Full Flush Duration: The average latency and p999 latency of writing downstream transactions by the MySQL Sink of TiCDC nodes.
- MQ Worker Send Message Duration Percentile: The latency of sending messages by MQ worker when the downstream is Kafka.
- Kafka Outgoing Bytes: The traffic of writing downstream transactions in MQ Workload.

### 14.8.3 TiDB Monitoring Metrics

If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus & Grafana) is deployed at the same time. For the monitoring architecture, see [TiDB Monitoring Framework Overview](#).

The Grafana dashboard is divided into a series of sub dashboards which include Overview, PD, TiDB, TiKV, Node\_exporter, Disk Performance, and Performance\_overview. The TiDB dashboard consists of the TiDB panel and the TiDB Summary panel. The differences between the two panels are different in the following aspects:

- TiDB panel: provides as comprehensive information as possible for troubleshooting cluster anomalies.
- TiDB Summary Panel: extracts parts of the TiDB panel information with which users are most concerned, with some modifications. It provides data (such as QPS, TPS, response delay) that users care about in the daily database operations, which serves as the monitoring information to be displayed or reported.

This document describes some key monitoring metrics displayed on the TiDB dashboard.

#### 14.8.3.1 Key metrics description

To understand the key metrics displayed on the TiDB dashboard, check the following sections:

##### 14.8.3.1.1 Query Summary

- Duration: execution time
  - The duration between the time that the client's network request is sent to TiDB and the time that the request is returned to the client after TiDB has executed it. In general, client requests are sent in the form of SQL statements, but can also include the execution time of commands such as `COM_PING`, `COM_SLEEP`, `COM_STMT_FETCH`, and `COM_SEND_LONG_DATA`
  - Because TiDB supports Multi-Query, it supports sending multiple SQL statements at one time, such as `select 1; select 1; select 1;`. In this case, the total execution time of this query includes the execution time of all SQL statements
- Command Per Second: the number of commands processed by TiDB per second, which is classified according to the success or failure of command execution results
- QPS: the number of SQL statements executed per second on all TiDB instances, which is counted according to `SELECT`, `INSERT`, `UPDATE`, and other types of statements
- CPS By Instance: the command statistics on each TiDB instance, which is classified according to the success or failure of command execution results

- Failed Query OPM: the statistics of error types (such as syntax errors and primary key conflicts) according to the errors occurred when executing SQL statements per minute on each TiDB instance. It contains the module in which the error occurs and the error code
- Slow query: the statistics of the processing time of slow queries (the time cost of the entire slow query, the time cost of Coprocessor, and the waiting time for Coprocessor scheduling). Slow queries are classified into internal and general SQL statements
- Connection Idle Duration: the duration of idle connections
- 999/99/95/80 Duration: the statistics of the execution time for different types of SQL statements (different percentiles)

#### 14.8.3.1.2 Query Detail

- Duration 80/95/99/999 By Instance: the statistics of the execution time for SQL statements on each TiDB instance (different percentiles)
- Failed Query OPM Detail: the statistics of error types (such as syntax errors and primary key conflicts) according to the errors occurred when executing SQL statements per minute on each TiDB instance
- Internal SQL OPS: the internal SQL statements executed per second in the entire TiDB cluster. The internal SQL statements are internally executed and are generally triggered by user SQL statements or internally scheduled tasks.

#### 14.8.3.1.3 Server

- Uptime: the runtime of each TiDB instance
- Memory Usage: the memory usage statistics of each TiDB instance, which is divided into the memory occupied by processes and the memory applied by Golang on the heap
- CPU Usage: the statistics of CPU usage of each TiDB instance
- Connection Count: the number of clients connected to each TiDB instance
- Open FD Count: the statistics of opened file descriptors of each TiDB instance
- Disconnection Count: the number of clients disconnected to each TiDB instance
- Events OPM: the statistics of key events, such as “start”, “close”, “graceful-shutdown”, “kill”, and “hang”
- Goroutine Count: the number of Goroutines on each TiDB instance
- Prepare Statement Count: the number of `Prepare` statements that are executed on each TiDB instance and the total count of them
- Keep Alive OPM: the number of times that the metrics are refreshed every minute on each TiDB instance. It usually needs no attention.
- Panic And Critical Error: the number of panics and critical errors occurred in TiDB
- Time Jump Back OPS: the number of times that the operating system rewinds every second on each TiDB instance
- Get Token Duration: the time cost of getting Token on each connection
- Skip Binlog Count: the number of binlog write failures in TiDB
- Client Data Traffic: data traffic statistics of TiDB and the client

#### 14.8.3.1.4 Transaction

- Transaction OPS: the number of transactions executed per second
- Duration: the execution duration of a transaction
- Transaction Statement Num: the number of SQL statements in a transaction
- Transaction Retry Num: the number of times that a transaction retries
- Session Retry Error OPS: the number of errors encountered during the transaction retry per second. This metric includes two error types: retry failure and exceeding the maximum number of retries
- Commit Token Wait Duration: the wait duration in the flow control queue during the transaction commit. If the wait duration is long, it means that the transaction to commit is too large and the flow is controlled. If the system still has resources available, you can speed up the commit process by increasing the system variable `tidb_committer_concurrency`.
- KV Transaction OPS: the number of transactions executed per second within each TiDB instance
  - A user transaction might trigger multiple transaction executions in TiDB, including reading internal metadata and atomic retries of the user transaction
  - TiDB's internally scheduled tasks also operate on the database through transactions, which are also included in this panel
- KV Transaction Duration: the time spent on executing transactions within each TiDB
- Transaction Regions Num: the number of Regions operated in the transaction
- Transaction Write KV Num Rate and Sum: the rate at which KVs are written and the sum of these written KVs in the transaction
- Transaction Write KV Num: the number of KVs operated in the transaction
- Statement Lock Keys: the number of locks for a single statement
- Send HeartBeat Duration: the duration for the transaction to send heartbeats
- Transaction Write Size Bytes Rate and sum: the rate at which bytes are written and the sum of these written bytes in the transaction
- Transaction Write Size Bytes: the size of the data written in the transaction
- Acquire Pessimistic Locks Duration: the time consumed by adding locks
- TTL Lifetime Reach Counter: the number of transactions that reach the upper limit of TTL. The default value of the TTL upper limit is 1 hour. It means that 1 hour has passed since the first lock of a pessimistic transaction or the first prewrite of an optimistic transaction. The default value of the upper limit of TTL is 1 hour. The upper limit of TTL life can be changed by modifying `max-txn-TTL` in the TiDB configuration file
- Load Safepoint OPS: the number of times that `Safepoint` is loaded. `Safepoint` is to ensure that the data before `Safepoint` is not read when the transaction reads data, thus ensuring data safety. The data before `Safepoint` might be cleaned up by the GC
- Pessimistic Statement Retry OPS: the number of retry attempts for pessimistic statements. When the statement tries to add lock, it might encounter a write conflict. At this time, the statement will acquire a new snapshot and add lock again

- **Transaction Types Per Seconds:** the number of transactions committed per second using the two-phase commit (2PC), async commit, and one-phase commit (1PC) mechanisms, including both success and failure transactions

#### 14.8.3.1.5 Executor

- **Parse Duration:** the statistics of the parsing time of SQL statements
- **Compile Duration:** the statistics of the time of compiling the parsed SQL AST to the execution plan
- **Execution Duration:** the statistics of the execution time for SQL statements
- **Expensive Executor OPS:** the statistics of the operators that consume many system resources per second, including Merge Join, Hash Join, Index Look Up Join, Hash  $\leftrightarrow$  Agg, Stream Agg, Sort, and TopN
- **Queries Using Plan Cache OPS:** the statistics of queries using the Plan Cache per second
- **Plan Cache Miss OPS:** the statistics of the number of times that the Plan Cache is missed per second
- **Plan Cache Memory Usage:** the total memory consumed by the execution plan cached in each TiDB instance
- **Plan Cache Plan Num:** the total number of execution plans cached in each TiDB instance

#### 14.8.3.1.6 Distsql

- **Distsql Duration:** the processing time of Distsql statements
- **Distsql QPS:** the statistics of Distsql statements
- **Distsql Partial QPS:** the number of Partial results every second
- **Scan Keys Num:** the number of keys that each query scans
- **Scan Keys Partial Num:** the number of keys that each Partial result scans
- **Partial Num:** the number of Partial results for each SQL statement

#### 14.8.3.1.7 KV Errors

- **KV Backoff Duration:** the total duration that a KV retry request lasts. TiDB might encounter an error when sending a request to TiKV. TiDB has a retry mechanism for every request to TiKV. This **KV Backoff Duration** item records the total time of a request retry.
- **TiClient Region Error OPS:** the number of Region related error messages returned by TiKV
- **KV Backoff OPS:** the number of error messages returned by TiKV
- **Lock Resolve OPS:** the number of TiDB operations to resolve locks. When TiDB's read or write request encounters a lock, it tries to resolve the lock
- **Other Errors OPS:** the number of other types of errors, including clearing locks and updating **SafePoint**

#### 14.8.3.1.8 KV Request

- KV Request OPS: the execution times of a KV request, displayed according to TiKV
- KV Request Duration 99 by store: the execution time of a KV request, displayed according to TiKV
- KV Request Duration 99 by type: the execution time of a KV request, displayed according to the request type

#### 14.8.3.1.9 PD Client

- PD Client CMD OPS: the statistics of commands executed by PD Client per second
- PD Client CMD Duration: the time it takes for PD Client to execute commands
- PD Client CMD Fail OPS: the statistics of failed commands executed by PD Client per second
- PD TSO OPS: the number of TSO that TiDB obtains from PD per second
- PD TSO Wait Duration: the time that TiDB waits for PD to return TSO
- PD TSO RPC duration: the duration from the time that TiDB sends request to PD (to get TSO) to the time that TiDB receives TSO
- Start TSO Wait Duration: the duration from the time that TiDB sends request to PD (to get `start TSO`) to the time that TiDB receives `start TSO`

#### 14.8.3.1.10 Schema Load

- Load Schema Duration: the time it takes TiDB to obtain the schema from TiKV
- Load Schema OPS: the statistics of the schemas that TiDB obtains from TiKV per second
- Schema Lease Error OPM: the Schema Lease errors include two types: **change** and **outdate**. **change** means that the schema has changed, and **outdate** means that the schema cannot be updated, which is a more serious error and triggers an alert.
- Load Privilege OPS: the statistics of the number of privilege information obtained by TiDB from TiKV per second

#### 14.8.3.1.11 DDL

- DDL Duration 95: 95% quantile of DDL statement processing time
- Batch Add Index Duration 100: statistics of the maximum time spent by each Batch on creating an index
- DDL Waiting Jobs Count: the number of DDL tasks that are waiting
- DDL META OPM: the number of times that a DDL obtains META every minute
- DDL Worker Duration 99: 99% quantile of the execution time of each DDL worker
- Deploy Syncer Duration: the time consumed by Schema Version Syncer initialization, restart, and clearing up operations

- Owner Handle Syncer Duration: the time that it takes the DDL Owner to update, obtain, and check the Schema Version
- Update Self Version Duration: the time consumed by updating the version information of Schema Version Syncer
- DDL OPM: the number of DDL executions per second
- DDL backfill progress in percentage: the progress of backfilling DDL tasks

#### 14.8.3.1.12 Statistics

- Auto Analyze Duration 95: the time consumed by automatic `ANALYZE`
- Auto Analyze QPS: the statistics of automatic `ANALYZE`
- Stats Inaccuracy Rate: the information of the statistics inaccuracy rate
- Pseudo Estimation OPS: the number of the SQL statements optimized using pseudo statistics
- Dump Feedback OPS: the number of stored statistical feedbacks
- Store Query Feedback QPS: the number of operations per second to store the feedback information of the union query, which is performed in TiDB memory
- Significant Feedback: the number of significant feedback pieces that update the statistics information
- Update Stats OPS: the number of operations of updating statistics with feedback
- Fast Analyze Status 100: the status for quickly collecting statistical information

#### 14.8.3.1.13 Owner

- New ETCD Session Duration 95: the time it takes to create a new etcd session. TiDB connects to etcd in PD through etcd client to save/read some metadata information. This records the time spent creating the session
- Owner Watcher OPS: the number of Goroutine operations per second of DDL owner watch PD's etcd metadata

#### 14.8.3.1.14 Meta

- AutoID QPS: AutoID related statistics, including three operations (global ID allocation, a single table AutoID allocation, a single table AutoID Rebase)
- AutoID Duration: the time consumed by AutoID related operations
- Region Cache Error OPS: the number of errors encountered per second by the cached Region information in TiDB
- Meta Operations Duration 99: the latency of Meta operations

#### 14.8.3.1.15 GC

- Worker Action OPM: the number of GC related operations, including `run_job`, `resolve_lock`, and `delete_range`

- Duration 99: the time consumed by GC related operations
- Config: the configuration of GC data life time and GC running interval
- GC Failure OPM: the number of failed GC related operations
- Delete Range Failure OPM: the number of times the `Delete Range` has failed
- Too Many Locks Error OPM: the number of the error that GC clears up too many locks
- Action Result OPM: the number of results of GC-related operations
- Delete Range Task Status: the task status of `Delete Range`, including completion and failure
- Push Task Duration 95: the time spent pushing GC subtasks to GC workers

#### 14.8.3.1.16 Batch Client

- Pending Request Count by TiKV: the number of Batch messages that are pending processing
- Batch Client Unavailable Duration 95: the unavailable time of the Batch client
- No Available Connection Counter: the number of times the Batch client cannot find an available link

#### 14.8.3.1.17 TTL

- TiDB CPU Usage: the CPU usage of each TiDB instance.
- TiKV IO MBps: the total bytes of I/O in each TiKV instance.
- TiKV CPU: the CPU usage of each TiKV instance.
- TTL QPS By Type: the QPS information of different types of statements generated by TTL jobs.
- TTL Insert Rows Per Second: the number of rows inserted into TTL tables per second.
- TTL Processed Rows Per Second: the number of expired rows processed by TTL jobs per second.
- TTL Insert Rows Per Hour: the number of rows inserted into TTL tables for every hour.
- TTL Delete Rows Per Hour: the number of expired rows deleted by TTL jobs for every hour.
- TTL Scan/Delete Query Duration: the execution time of TTL scan/delete statements.
- TTL Scan/Delete Worker Time By Phase: the time consumed by different phases of TTL internal worker threads.
- TTL Job Count By Status: the number of TTL jobs currently being executed.
- TTL Task Count By Status: the number of TTL tasks currently being executed.

### 14.8.4 Key Monitoring Metrics of PD

If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus & Grafana) is deployed at the same time. For more information, see [Overview of the Monitoring Framework](#).

The Grafana dashboard is divided into a series of sub dashboards which include Overview, PD, TiDB, TiKV, Node\_exporter, Disk Performance, and Performance\_overview. A lot of metrics are there to help you diagnose.

You can get an overview of the component PD status from the PD dashboard, where the key metrics are displayed. This document provides a detailed description of these key metrics.

The following is the description of PD Dashboard metrics items:

- PD role: The role of the current PD instance
- Storage capacity: The total storage capacity for this TiDB cluster
- Current storage size: The storage size that is currently used by the TiDB cluster
- Current storage usage: The current storage usage rate
- Normal stores: The count of healthy storage instances
- Number of Regions: The total count of cluster Regions
- Abnormal stores: The count of unhealthy stores. The normal value is 0. If the number is bigger than 0, it means at least one instance is abnormal.
- Region health: The health status of Regions indicated via the count of unusual Regions including pending peers, down peers, extra peers, offline peers, missing peers, learner peers and incorrect namespaces. Generally, the number of pending peers should be less than 100. The missing peers should not be persistently greater than 0. If many empty Regions exist, enable Region Merge in time.

- Current peer count: The current count of all cluster peers

#### 14.8.4.1 Key metrics description

#### 14.8.4.2 Cluster

- PD scheduler config: The list of PD scheduler configurations
- Cluster ID: The unique identifier of the cluster
- Current TSO: The physical part of current allocated TSO
- Current ID allocation: The maximum allocatable ID for new store/peer
- Region label isolation level: The number of Regions in different label levels
- Label distribution: The distribution status of the labels in the cluster

Figure 320: PD Dashboard - Cluster metrics

### 14.8.4.3 Operator

- Schedule operator create: The number of newly created operators per type
- Schedule operator check: The number of checked operator per type. It mainly checks whether the current step is finished; if yes, it returns the next step to be executed
- Schedule operator finish: The number of finished operators per type
- Schedule operator timeout: The number of timeout operators per type
- Schedule operator replaced or canceled: The number of replaced or canceled operators per type
- Schedule operators count by state: The number of operators per state
- Operator finish duration: The maximum duration of finished operators
- Operator step duration: The maximum duration of finished operator steps

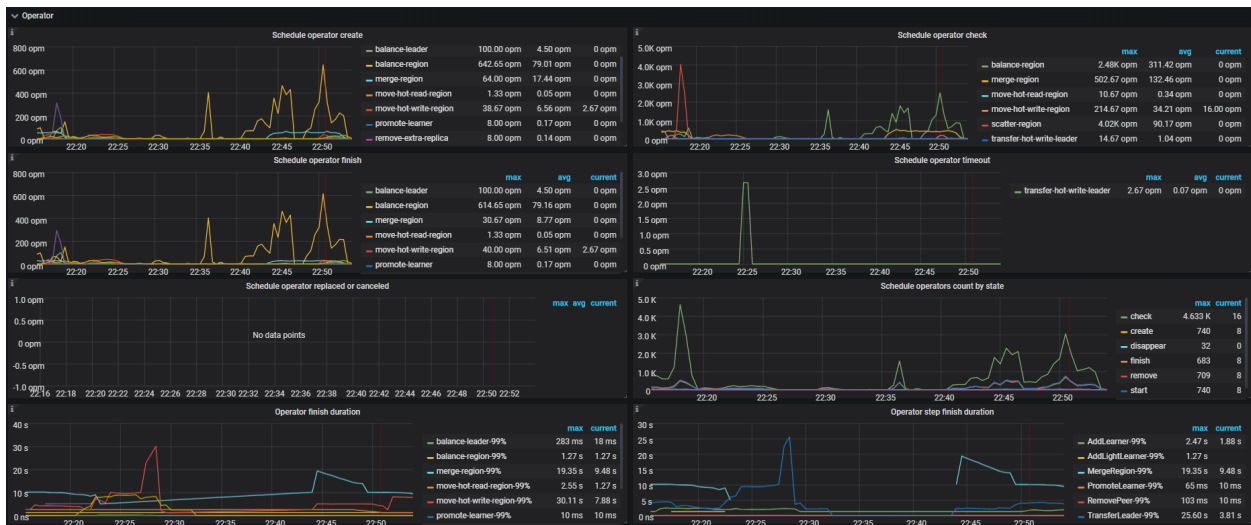

Figure 321: PD Dashboard - Operator metrics

### 14.8.4.4 Statistics - Balance

- Store capacity: The capacity size per TiKV instance

- Store available: The available capacity size per TiKV instance
- Store used: The used capacity size per TiKV instance
- Size amplification: The size amplification ratio per TiKV instance, which is equal to (Store Region size)/(Store used capacity size)
- Size available ratio: The size availability ratio per TiKV instance, which is equal to (Store available capacity size)/(Store capacity size)
- Store leader score: The leader score per TiKV instance
- Store Region score: The Region score per TiKV instance
- Store leader size: The total leader size per TiKV instance
- Store Region size: The total Region size per TiKV instance
- Store leader count: The leader count per TiKV instance
- Store Region count: The Region count per TiKV instance

Figure 322: PD Dashboard - Balance metrics

#### 14.8.4.5 Statistics - hot write

- Hot Region's leader distribution: The total number of leader Regions that have become write hotspots on each TiKV instance
- Total written bytes on hot leader Regions: The total written bytes by leader Regions that have become write hotspots on each TiKV instance

- Hot write Region's peer distribution: The total number of peer Regions that have become write hotspots on each TiKV instance
- Total written bytes on hot peer Regions: The written bytes of all peer Regions that have become write hotspots on each TiKV instance
- Store Write rate bytes: The total written bytes on each TiKV instance
- Store Write rate keys: The total written keys on each TiKV instance
- Hot cache write entry number: The number of peers on each TiKV instance that are in the write hotspot statistics module
- Selector events: The event count of Selector in the hotspot scheduling module
- Direction of hotspot move leader: The direction of leader movement in the hotspot scheduling. The positive number means scheduling into the instance. The negative number means scheduling out of the instance
- Direction of hotspot move peer: The direction of peer movement in the hotspot scheduling. The positive number means scheduling into the instance. The negative number means scheduling out of the instance

Figure 323: PD Dashboard - Hot write metrics

#### 14.8.4.6 Statistics - hot read

- Hot Region's peer distribution: The total number of peer Regions that have become read hotspots on each TiKV instance
- Total read bytes on hot peer Regions: The total read bytes of peers that have become read hotspots on each TiKV instance
- Store read rate bytes: The total read bytes of each TiKV instance
- Store read rate keys: The total read keys of each TiKV instance
- Hot cache read entry number: The number of peers that are in the read hotspot statistics module on each TiKV instance

Figure 324: PD Dashboard - Hot read metrics

#### 14.8.4.7 Scheduler

- Scheduler is running: The current running schedulers
- Balance leader movement: The leader movement details among TiKV instances
- Balance Region movement: The Region movement details among TiKV instances
- Balance leader event: The count of balance leader events
- Balance Region event: The count of balance Region events
- Balance leader scheduler: The inner status of balance leader scheduler
- Balance Region scheduler: The inner status of balance Region scheduler
- Replica checker: The replica checker's status
- Rule checker: The rule checker's status
- Region merge checker: The merge checker's status
- Filter target: The number of attempts that the store is selected as the scheduling target but failed to pass the filter
- Filter source: The number of attempts that the store is selected as the scheduling source but failed to pass the filter
- Balance Direction: The number of times that the Store is selected as the target or source of scheduling
- Store Limit: The flow control limitation of scheduling on the Store

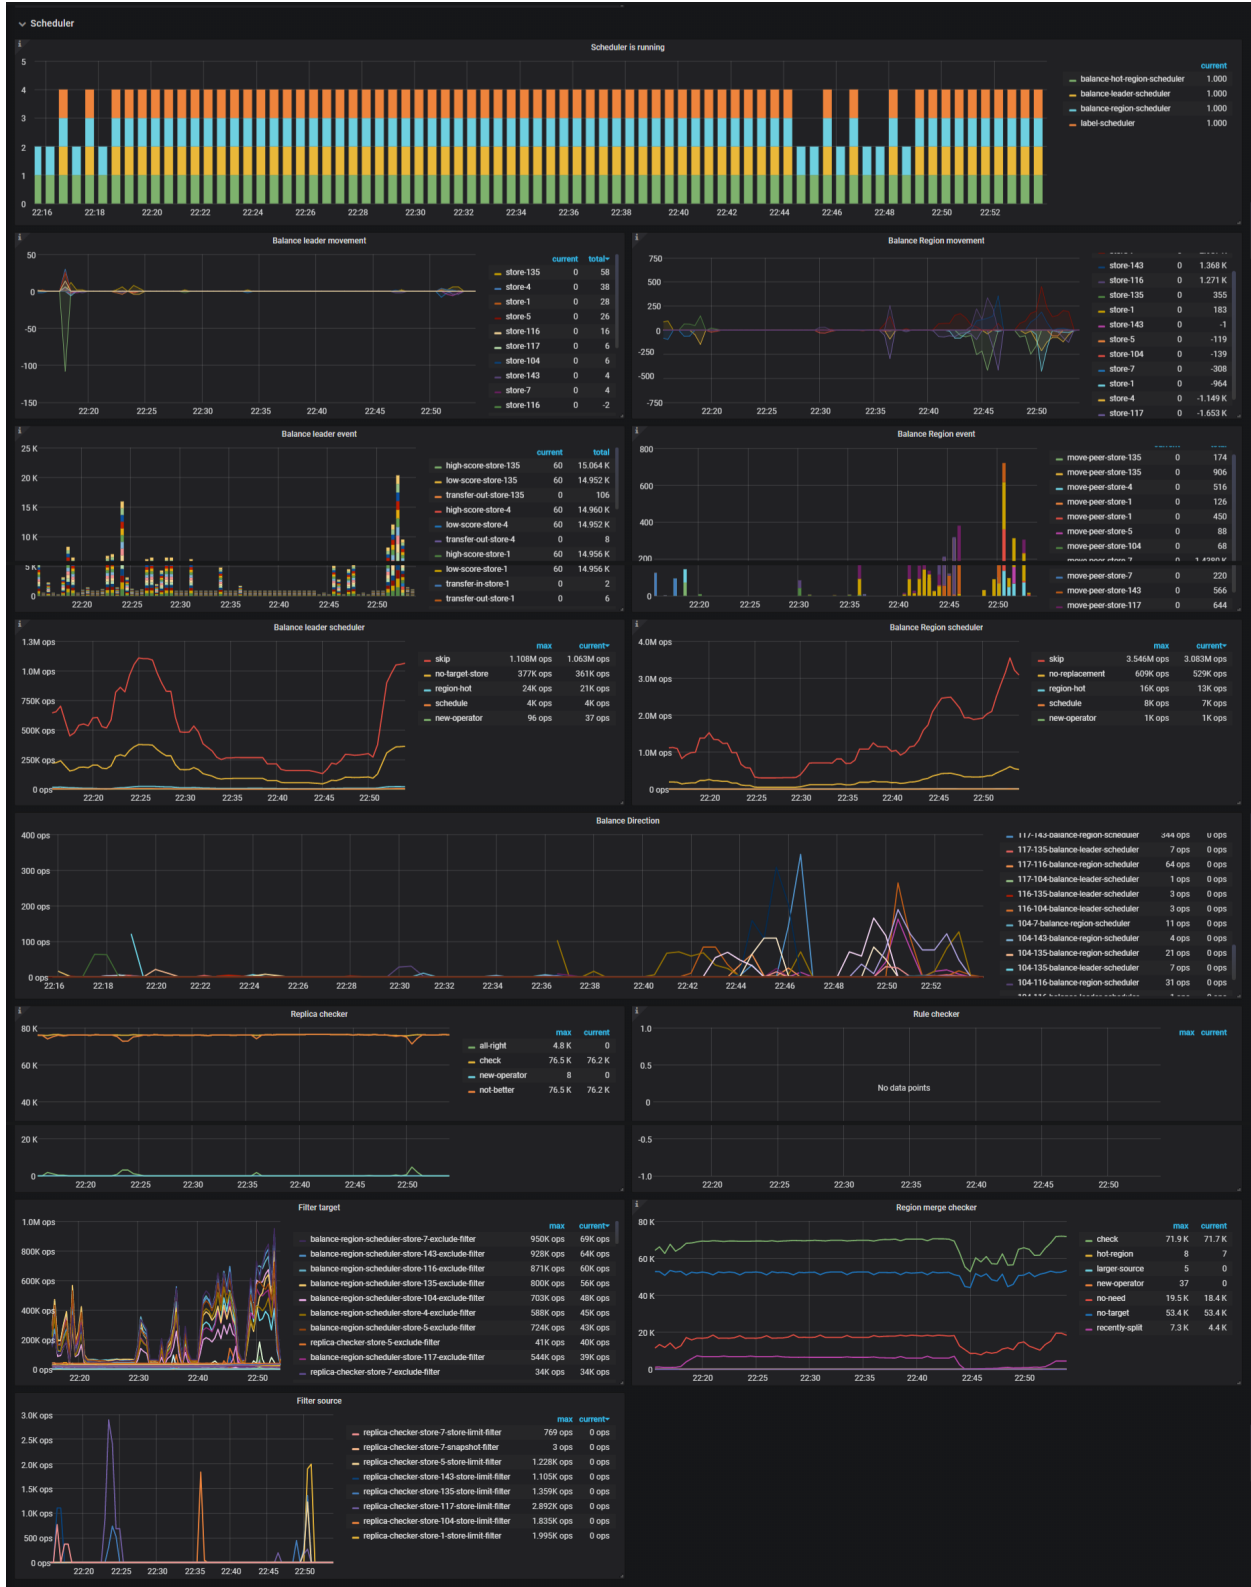

Figure 325: PD Dashboard - Scheduler metrics

### 14.8.4.8 gRPC

- Completed commands rate: The rate per command type at which gRPC commands are completed
- 99% Completed commands duration: The rate per command type at which gRPC commands are completed (P99)

Figure 326: PD Dashboard - gRPC metrics

### 14.8.4.9 etcd

- Handle transactions count: The rate at which etcd handles transactions
- 99% Handle transactions duration: The transaction handling rate (P99)
- 99% WAL fsync duration: The time consumed for writing WAL into the persistent storage. It is less than 1s (P99)
- 99% Peer round trip time seconds: The network latency for etcd (P99) | The value is less than 1s
- etcd disk WAL fsync rate: The rate of writing WAL into the persistent storage
- Raft term: The current term of Raft
- Raft committed index: The last committed index of Raft
- Raft applied index: The last applied index of Raft

Figure 327: PD Dashboard - etcd metrics

#### 14.8.4.10 TiDB

- PD Server TSO handle time and Client rcv time: The duration between PD receiving the TSO request and the PD client getting the TSO response
- Handle requests count: The count of TiDB requests
- Handle requests duration: The time consumed for handling TiDB requests. It should be less than 100ms (P99)

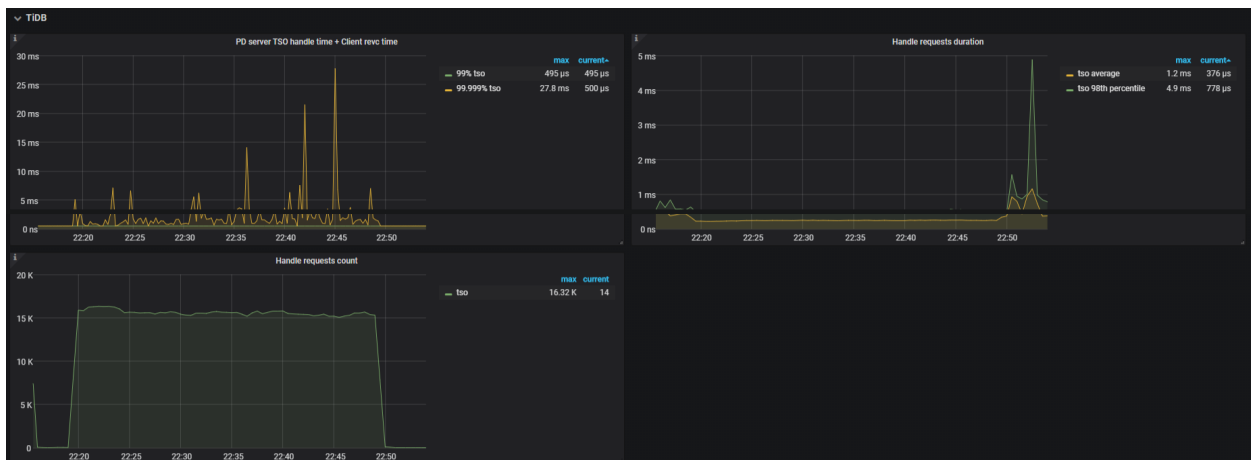

Figure 328: PD Dashboard - TiDB metrics

### 14.8.4.11 Heartbeat

- Heartbeat region event QPS: The QPS of handling heartbeat messages, including updating the cache and persisting data
- Region heartbeat report: The count of heartbeats reported to PD per instance
- Region heartbeat report error: The count of heartbeats with the **error** status
- Region heartbeat report active: The count of heartbeats with the **ok** status
- Region schedule push: The count of corresponding schedule commands sent from PD per TiKV instance
- 99% Region heartbeat latency: The heartbeat latency per TiKV instance (P99)

Figure 329: PD Dashboard - Heartbeat metrics

### 14.8.4.12 Region storage

- Syncer Index: The maximum index in the Region change history recorded by the leader
- history last index: The last index where the Region change history is synchronized successfully with the follower

Figure 330: PD Dashboard - Region storage

## 14.8.5 Key Monitoring Metrics of TiKV

If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus/-Grafana) is deployed at the same time. For more information, see [Overview of the Monitoring Framework](#).

The Grafana dashboard is divided into a series of sub dashboards which include Overview, PD, TiDB, TiKV, Node\_exporter, and Performance\_overview. A lot of metrics are there to help you diagnose.

### 14.8.5.1 TiKV-Details dashboard

You can get an overview of the component TiKV status from the **TiKV-Details** dashboard, where the key metrics are displayed. According to the [Performance Map](#), you can check whether the status of the cluster is as expected.

This section provides a detailed description of these key metrics on the **TiKV-Details** dashboard.

#### 14.8.5.1.1 Cluster

- Store size: The storage size per TiKV instance
- Available size: The available capacity per TiKV instance
- Capacity size: The capacity size per TiKV instance
- CPU: The CPU utilization per TiKV instance
- Memory: The memory usage per TiKV instance
- IO utilization: The I/O utilization per TiKV instance
- MBps: The total bytes of read and write in each TiKV instance
- QPS: The QPS per command in each TiKV instance
- Errps: The rate of gRPC message failures
- leader: The number of leaders per TiKV instance
- Region: The number of Regions per TiKV instance
- Uptime: The runtime of TiKV since last restart

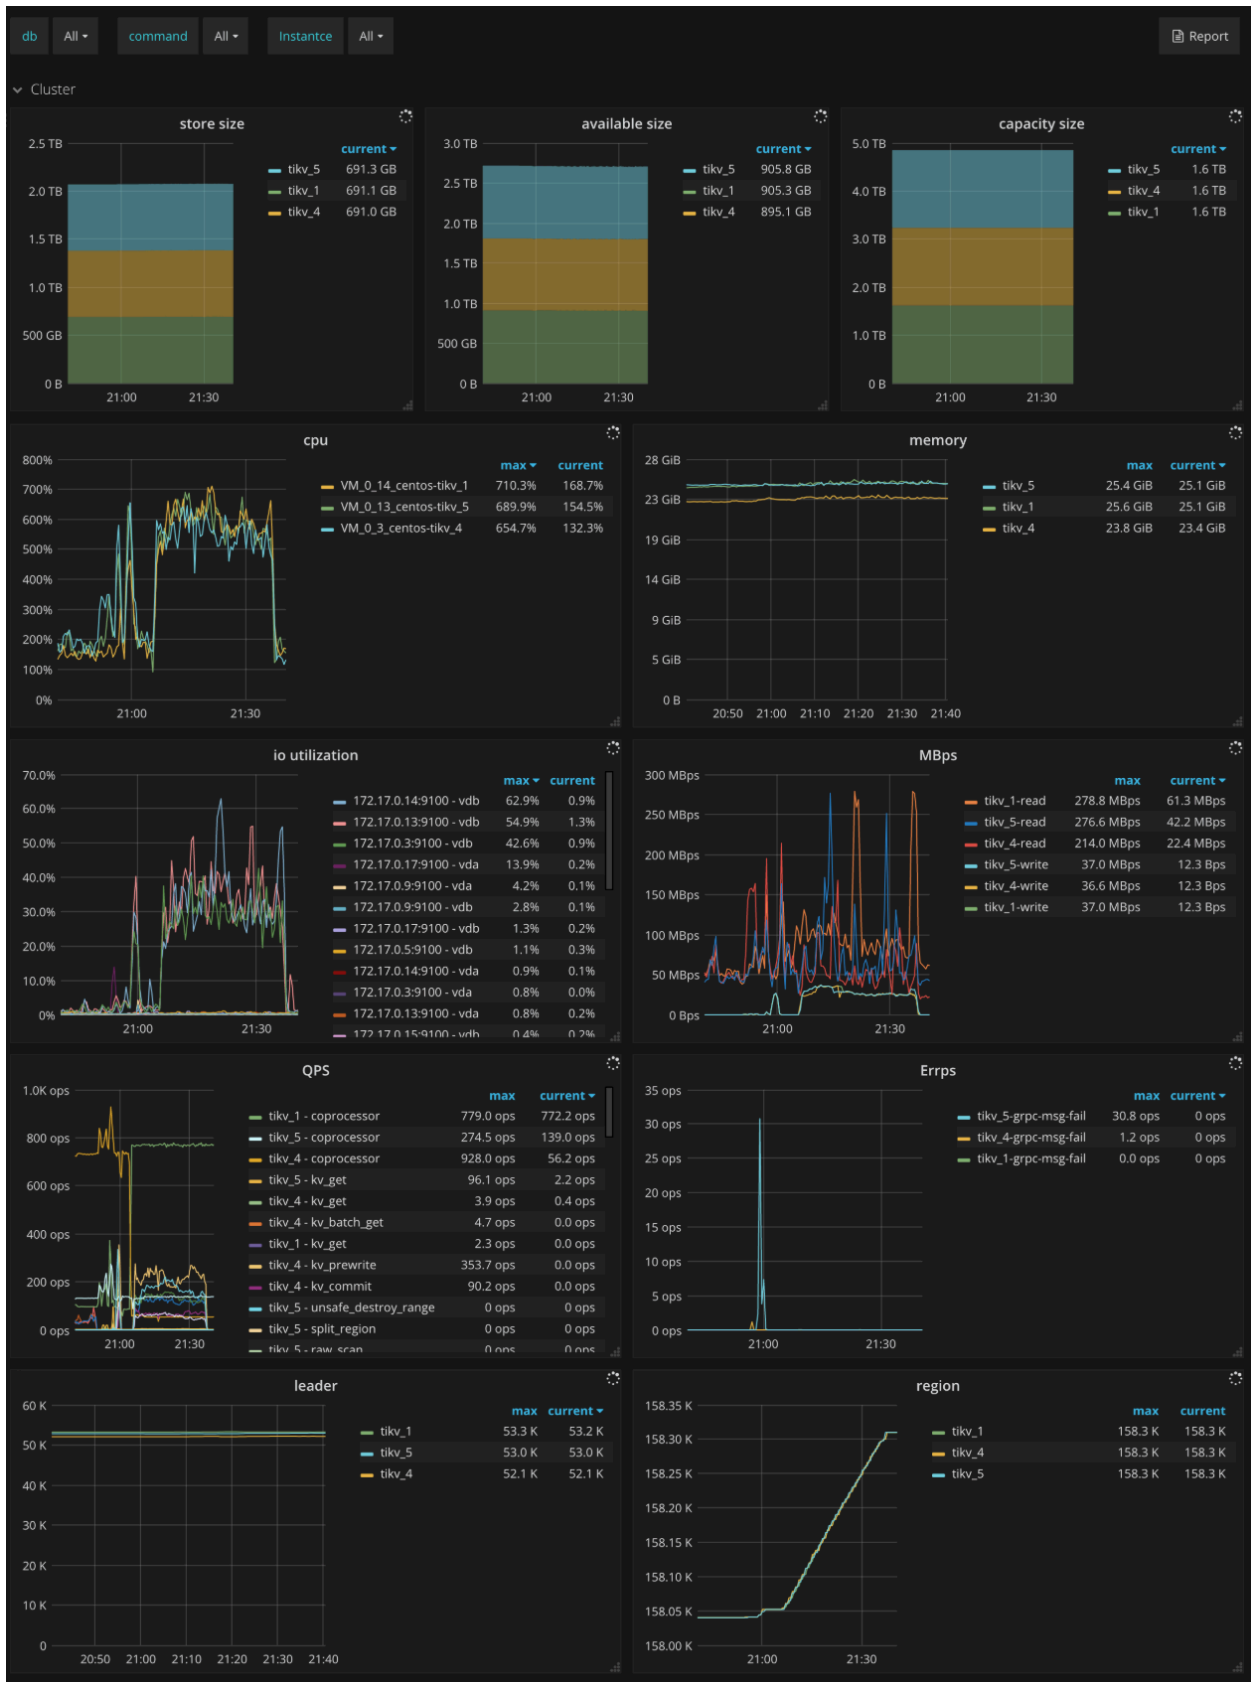

Figure 331: TiKV Dashboard - Cluster metrics  
3175

### 14.8.5.1.2 Errors

- Critical error: The number of critical errors
- Server is busy: Indicates occurrences of events that make the TiKV instance unavailable temporarily, such as Write Stall, and Channel Full. It should be 0 in normal case.
- Server report failures: The number of error messages reported by server. It should be 0 in normal case.
- Raftstore error: The number of Raftstore errors per type on each TiKV instance
- Scheduler error: The number of scheduler errors per type on each TiKV instance
- Coprocessor error: The number of coprocessor errors per type on each TiKV instance
- gRPC message error: The number of gRPC message errors per type on each TiKV instance
- Leader drop: The count of dropped leaders per TiKV instance
- Leader missing: The count of missing leaders per TiKV instance
- Log Replication Reject: The number of logappend messages rejected due to insufficient memory on each TiKV instance

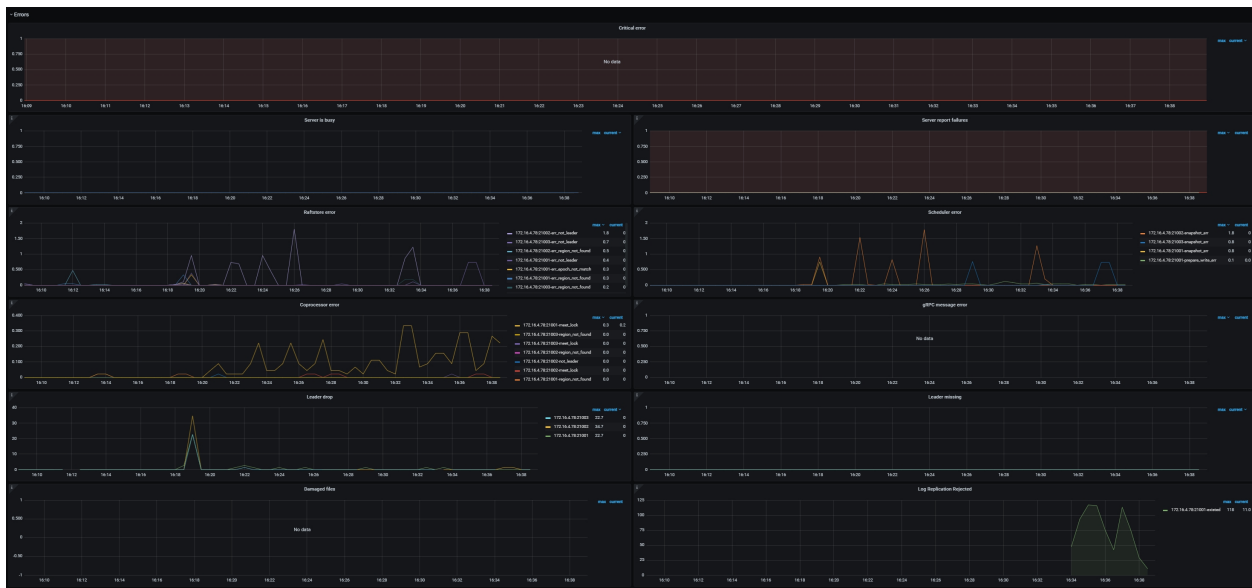

Figure 332: TiKV Dashboard - Errors metrics

### 14.8.5.1.3 Server

- CF size: The size of each column family
- Store size: The storage size per TiKV instance
- Channel full: The number of Channel Full errors per TiKV instance. It should be 0 in normal case.
- Active written leaders: The number of leaders being written on each TiKV instance

- Approximate Region size: The approximate Region size
- Approximate Region size Histogram: The histogram of each approximate Region size
- Region average written keys: The average number of written keys to Regions per TiKV instance
- Region average written bytes: The average written bytes to Regions per TiKV instance

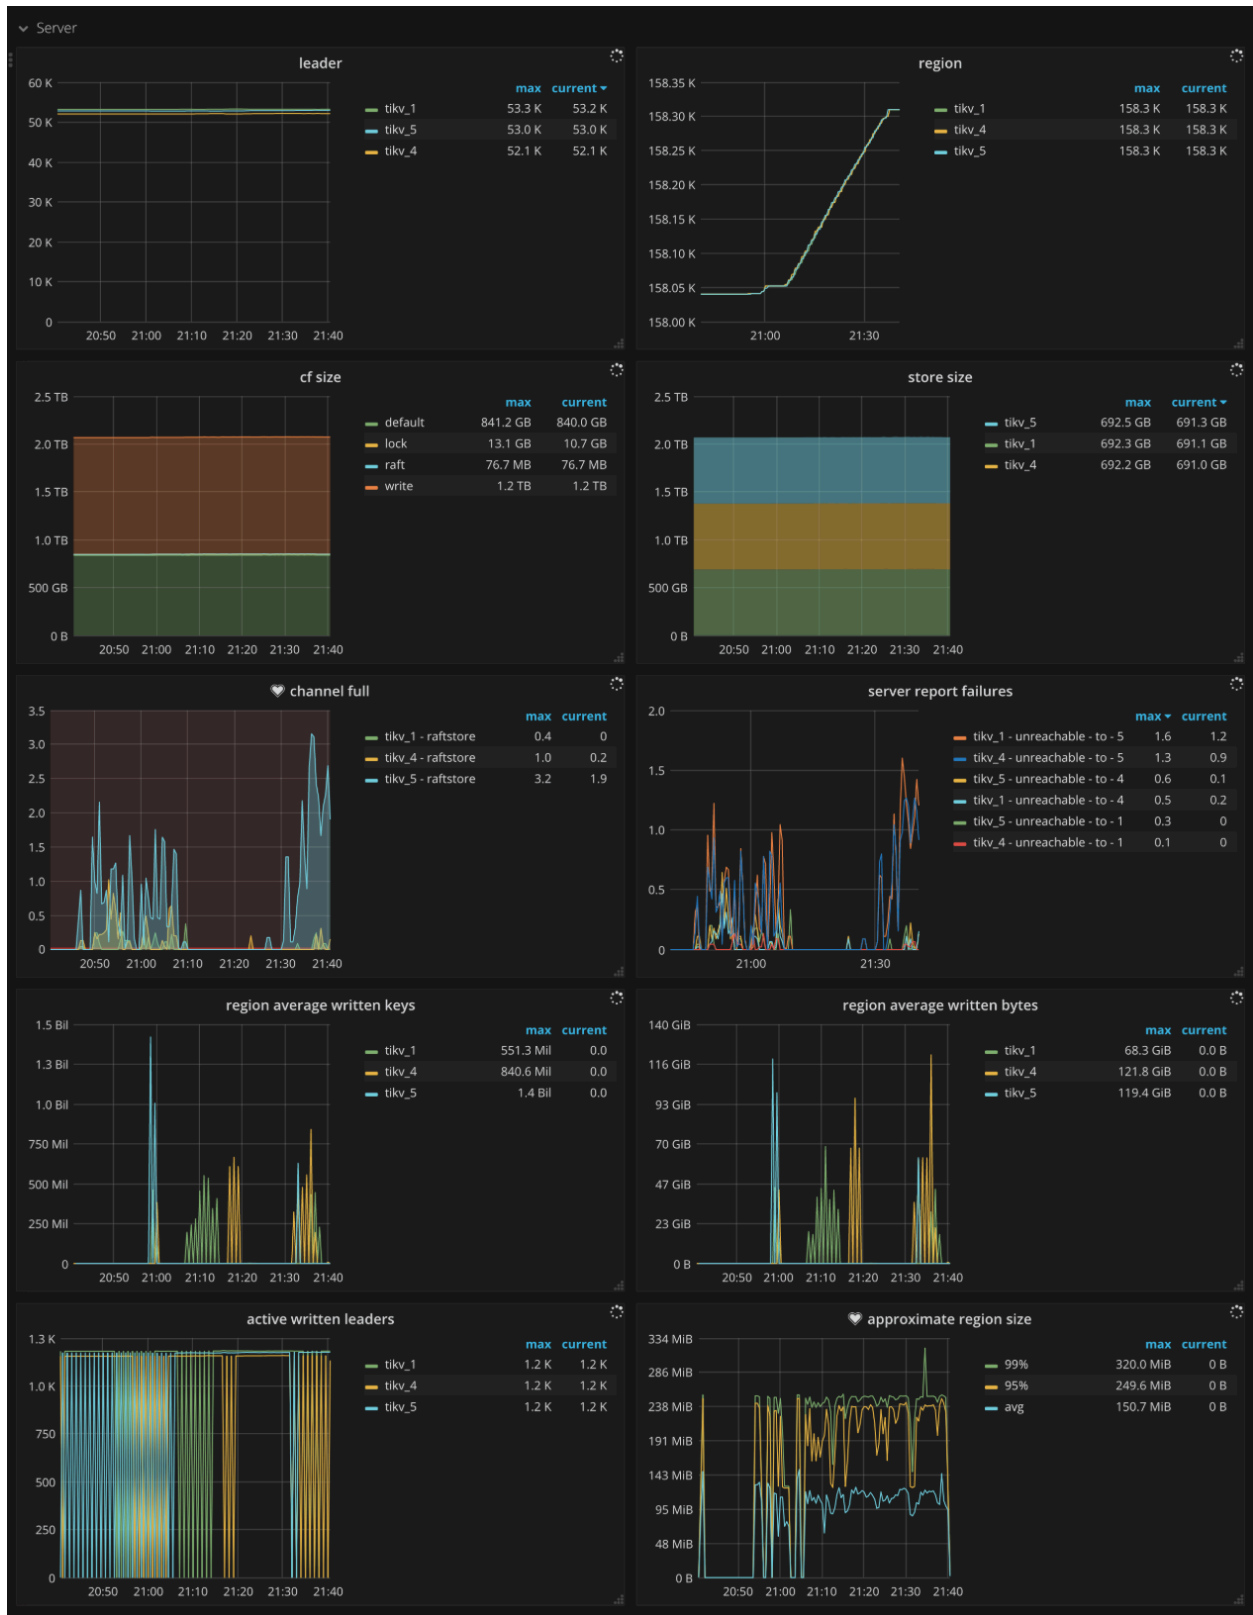

Figure 333: TiKV Dashboard - Server metrics

#### 14.8.5.1.4 gRPC

- gRPC message count: The rate of gRPC messages per type
- gRPC message failed: The rate of failed gRPC messages
- 99% gRPC message duration: The gRPC message duration per message type (P99)
- Average gRPC message duration: The average execution time of gRPC messages
- gRPC batch size: The batch size of gRPC messages between TiDB and TiKV
- Raft message batch size: The batch size of Raft messages between TiKV instances
- gRPC request sources QPS: The QPS of gRPC request sources
- gRPC request sources duration: The execution time of gRPC request sources
- gRPC resource group QPS: The QPS of gRPC request sources by resource groups

#### 14.8.5.1.5 Thread CPU

- Raft store CPU: The CPU utilization of the `raftstore` thread. The CPU utilization should be less than  $80\% * \text{raftstore.store-pool-size}$  in normal case.
- Async apply CPU: The CPU utilization of the `async apply` thread. The CPU utilization should be less than  $90\% * \text{raftstore.apply-pool-size}$  in normal cases.
- Scheduler worker CPU: The CPU utilization of the `scheduler worker` thread. The CPU utilization should be less than  $90\% * \text{storage.scheduler-worker-pool-size}$  in normal cases.
- gRPC poll CPU: The CPU utilization of the `gRPC` thread. The CPU utilization should be less than  $80\% * \text{server.grpc-concurrency}$  in normal cases.
- Unified read pool CPU: The CPU utilization of the `unified read pool` thread
- Storage ReadPool CPU: The CPU utilization of the `storage read pool` thread
- Coprocessor CPU: The CPU utilization of the `coprocessor` thread
- RocksDB CPU: The CPU utilization of the RocksDB thread
- GC worker CPU: The CPU utilization of the `GC worker` thread
- Background worker CPU: The CPU utilization of the `background worker` thread

#### 14.8.5.1.6 PD

- PD requests: The rate at which TiKV sends to PD
- PD request duration (average): The average duration of processing requests that TiKV sends to PD
- PD heartbeats: The rate at which heartbeat messages are sent from TiKV to PD
- PD validate peers: The rate at which messages are sent from TiKV to PD to validate TiKV peers

#### 14.8.5.1.7 Raft IO

- Apply log duration: The time consumed for Raft to apply logs

- Apply log duration per server: The time consumed for Raft to apply logs per TiKV instance
- Append log duration: The time consumed for Raft to append logs
- Append log duration per server: The time consumed for Raft to append logs per TiKV instance
- Commit log duration: The time consumed by Raft to commit logs
- Commit log duration per server: The time consumed by Raft to commit logs per TiKV instance

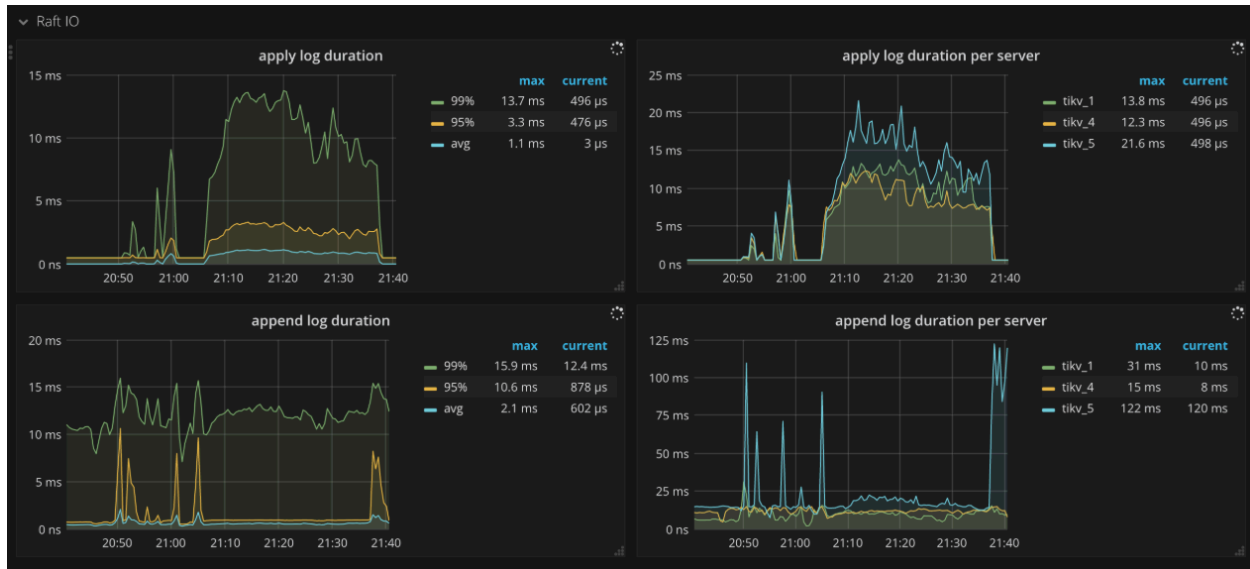

Figure 334: TiKV Dashboard - Raft IO metrics

#### 14.8.5.1.8 Raft process

- Ready handled: The number of handled ready operations per type per second
  - count: The number of handled ready operations per second
  - has\_ready\_region: The number of Regions that have ready per second
  - pending\_region: The operations per second of the Regions being checked for whether it has ready. This metric is deprecated since v3.0.0
  - message: The number of messages that the ready operations per second contain
  - append: The number of Raft log entries that the ready operations per second contain
  - commit: The number of committed Raft log entries that the ready operations per second contain
  - snapshot: The number of snapshots that the ready operations per second contains
- 0.99 Duration of Raft store events: The time consumed by Raftstore events (P99)
- Process ready duration: The time consumed for processes to be ready in Raft

- Process ready duration per server: The time consumed for peer processes to be ready in Raft per TiKV instance. It should be less than 2 seconds (P99.99).

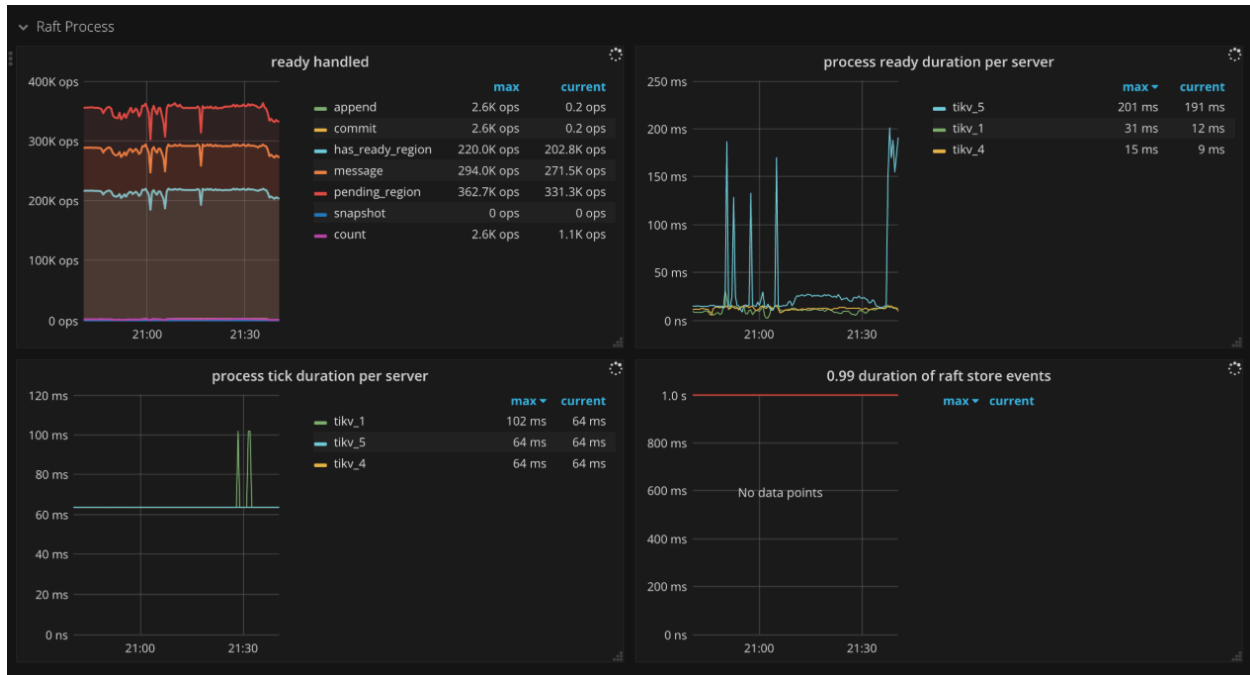

Figure 335: TiKV Dashboard - Raft process metrics

#### 14.8.5.1.9 Raft message

- Sent messages per server: The number of Raft messages sent by each TiKV instance per second
- Flush messages per server: The number of Raft messages flushed by the Raft client in each TiKV instance per second
- Receive messages per server: The number of Raft messages received by each TiKV instance per second
- Messages: The number of Raft messages sent per type per second
- Vote: The number of Vote messages sent in Raft per second
- Raft dropped messages: The number of dropped Raft messages per type per second

Figure 336: TiKV Dashboard - Raft message metrics

#### 14.8.5.1.10 Raft propose

- Raft apply proposals per ready: The histogram of the number of proposals that each ready operation contains in a batch while applying proposal.
- Raft read/write proposals: The number of proposals per type per second
- Raft read proposals per server: The number of read proposals made by each TiKV instance per second
- Raft write proposals per server: The number of write proposals made by each TiKV instance per second
- Propose wait duration: The histogram of waiting time of each proposal
- Propose wait duration per server: The histogram of waiting time of each proposal per TiKV instance
- Apply wait duration: The histogram of apply time of each proposal
- Apply wait duration per server: The histogram of apply time of each proposal per TiKV instance
- Raft log speed: The average rate at which peers propose logs

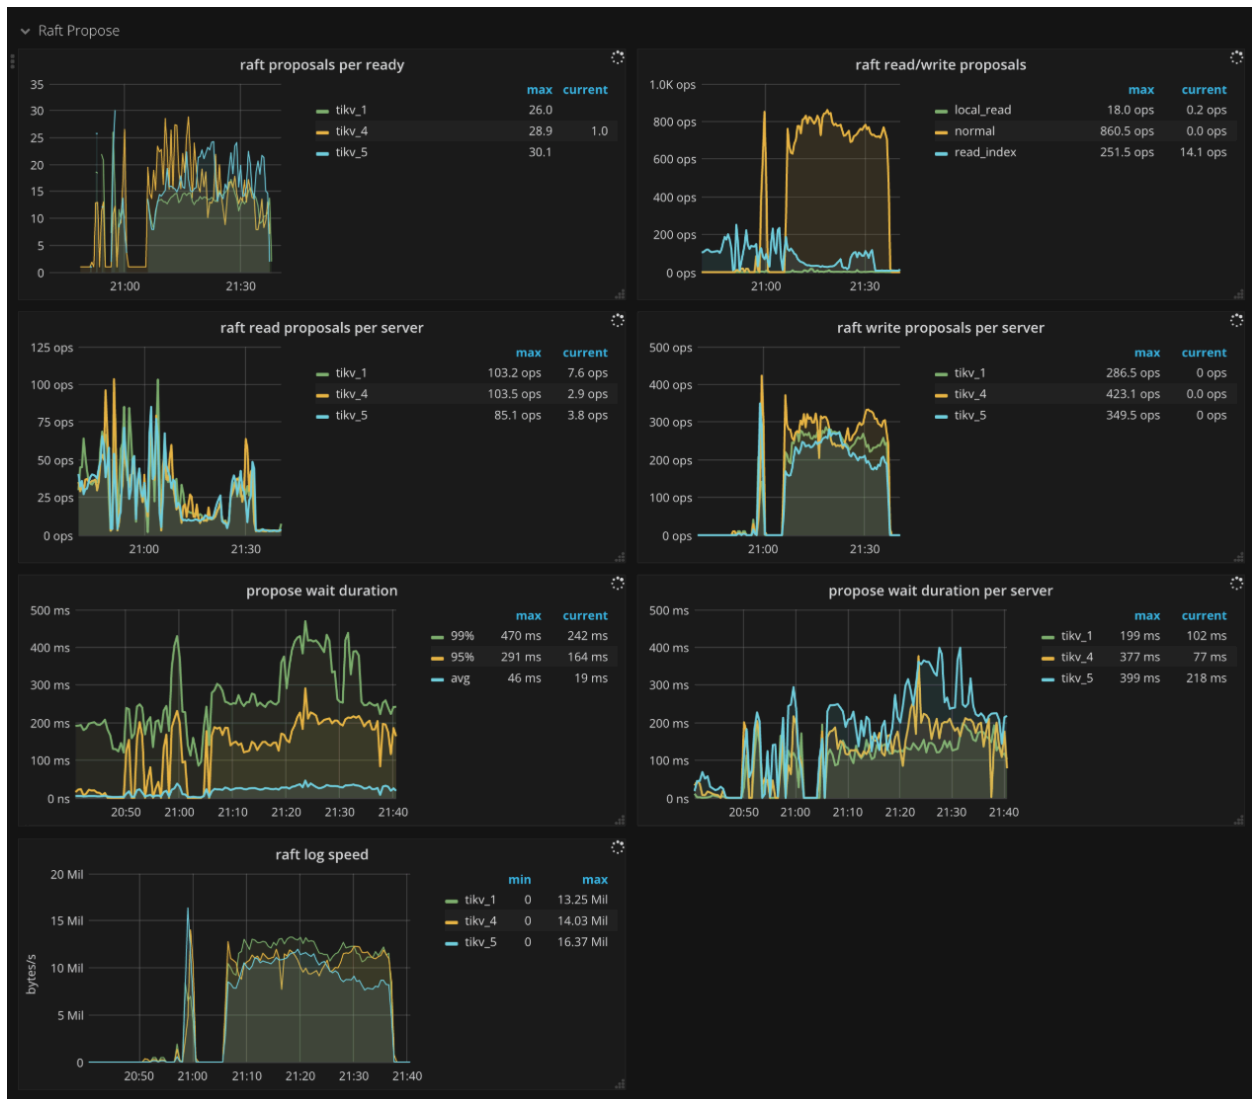

Figure 337: TiKV Dashboard - Raft propose metrics

#### 14.8.5.1.11 Raft admin

- Admin proposals: The number of admin proposals per second
- Admin apply: The number of processed apply commands per second
- Check split: The number of Raftstore split check commands per second
- 99.99% Check split duration: The time consumed when running split check commands (P99.99)

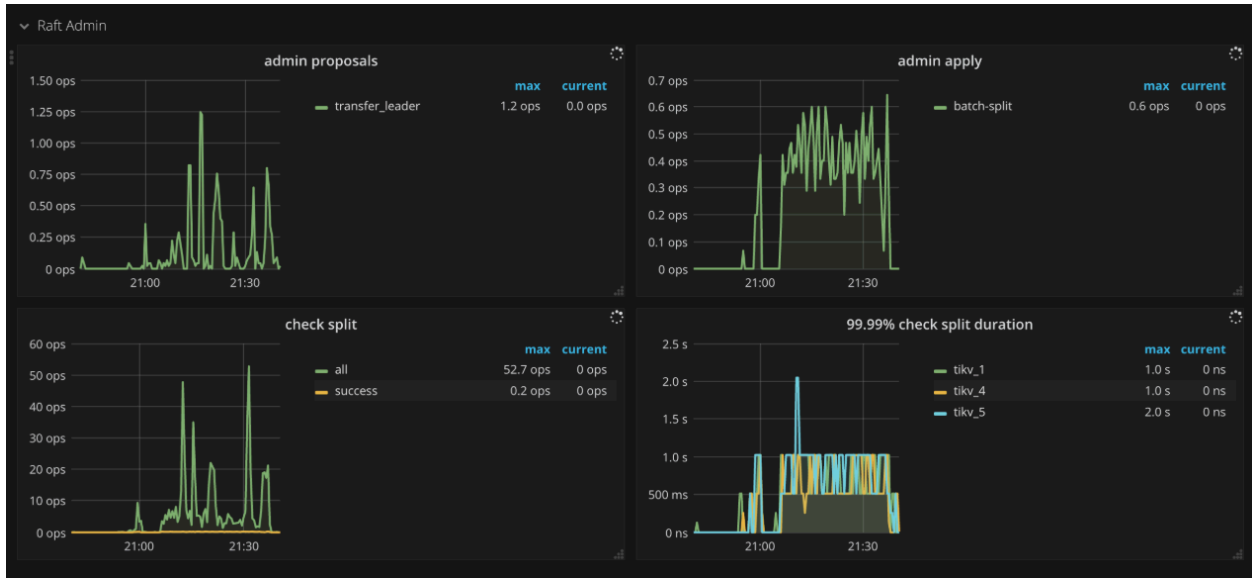

Figure 338: TiKV Dashboard - Raft admin metrics

#### 14.8.5.1.12 Local reader

- Local reader requests: The number of total requests and the number of rejections from the local read thread

Figure 339: TiKV Dashboard - Local reader metrics

#### 14.8.5.1.13 Unified Read Pool

- Time used by level: The time consumed for each level in the unified read pool. Level 0 means small queries.
- Level 0 chance: The proportion of level 0 tasks in unified read pool
- Running tasks: The number of tasks running concurrently in the unified read pool

#### 14.8.5.1.14 Storage

- Storage command total: The number of received command by type per second
- Storage async request error: The number of engine asynchronous request errors per second
- Storage async snapshot duration: The time consumed by processing asynchronous snapshot requests. It should be less than **1s** in **.99**.
- Storage async write duration: The time consumed by processing asynchronous write requests. It should be less than **1s** in **.99**.

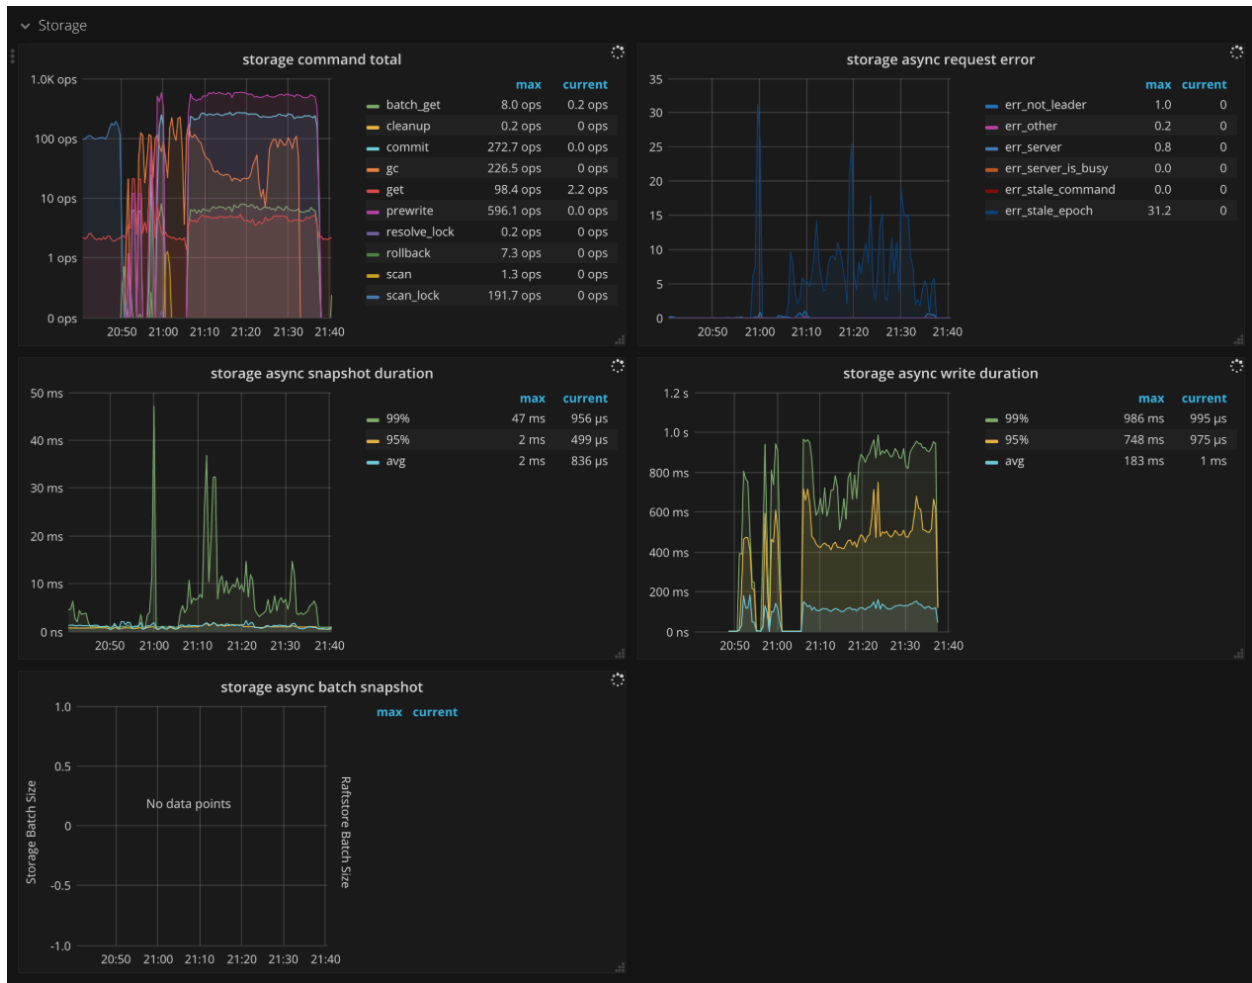

Figure 340: TiKV Dashboard - Storage metrics

### 14.8.5.1.15 Scheduler

- Scheduler stage total: The number of commands at each stage per second. There should not be a lot of errors in a short time.
- Scheduler writing bytes: The total written bytes by commands processed on each TiKV instance
- Scheduler priority commands: The count of different priority commands per second
- Scheduler pending commands: The count of pending commands per TiKV instance per second

Figure 341: TiKV Dashboard - Scheduler metrics

#### 14.8.5.1.16 Scheduler - commit

- Scheduler stage total: The number of commands at each stage per second when executing the commit command. There should not be a lot of errors in a short time.
- Scheduler command duration: The time consumed when executing the commit command. It should be less than 1s.
- Scheduler latch wait duration: The waiting time caused by latch when executing the commit command. It should be less than 1s.
- Scheduler keys read: The count of keys read by a commit command
- Scheduler keys written: The count of keys written by a commit command
- Scheduler scan details: The keys scan details of each CF when executing the commit command.
- Scheduler scan details **lock**: The keys scan details of lock CF when executing the commit command
- Scheduler scan details **write**: The keys scan details of write CF when executing the commit command
- Scheduler scan details [default]: The keys scan details of default CF when executing the commit command

Figure 342: TiKV Dashboard - Scheduler commit metrics

#### 14.8.5.1.17 Scheduler - pessimistic\_rollback

- Scheduler stage total: The number of commands at each stage per second when executing the `pessimistic_rollback` command. There should not be a lot of errors in a short time.
- Scheduler command duration: The time consumed when executing the `pessimistic_rollback`  $\leftrightarrow$  command. It should be less than 1s.

- Scheduler latch wait duration: The waiting time caused by latch when executing the `pessimistic_rollback` command. It should be less than `1s`.
- Scheduler keys read: The count of keys read by a `pessimistic_rollback` command
- Scheduler keys written: The count of keys written by a `pessimistic_rollback` command
- Scheduler scan details: The keys scan details of each CF when executing the `pessimistic_rollback` command.
- Scheduler scan details `lock`: The keys scan details of lock CF when executing the `pessimistic_rollback` command
- Scheduler scan details `write`: The keys scan details of write CF when executing the `pessimistic_rollback` command
- Scheduler scan details [default]: The keys scan details of default CF when executing the `pessimistic_rollback` command

#### 14.8.5.1.18 Scheduler - prewrite

- Scheduler stage total: The number of commands at each stage per second when executing the prewrite command. There should not be a lot of errors in a short time.
- Scheduler command duration: The time consumed when executing the prewrite command. It should be less than `1s`.
- Scheduler latch wait duration: The waiting time caused by latch when executing the prewrite command. It should be less than `1s`.
- Scheduler keys read: The count of keys read by a prewrite command
- Scheduler keys written: The count of keys written by a prewrite command
- Scheduler scan details: The keys scan details of each CF when executing the prewrite command.
- Scheduler scan details `lock`: The keys scan details of lock CF when executing the prewrite command
- Scheduler scan details `write`: The keys scan details of write CF when executing the prewrite command
- Scheduler scan details [default]: The keys scan details of default CF when executing the prewrite command

#### 14.8.5.1.19 Scheduler - rollback

- Scheduler stage total: The number of commands at each stage per second when executing the rollback command. There should not be a lot of errors in a short time.
- Scheduler command duration: The time consumed when executing the rollback command. It should be less than `1s`.
- Scheduler latch wait duration: The waiting time caused by latch when executing the rollback command. It should be less than `1s`.
- Scheduler keys read: The count of keys read by a rollback command
- Scheduler keys written: The count of keys written by a rollback command

- Scheduler scan details: The keys scan details of each CF when executing the rollback command.
- Scheduler scan details **lock**: The keys scan details of lock CF when executing the rollback command
- Scheduler scan details **write**: The keys scan details of write CF when executing the rollback command
- Scheduler scan details [default]: The keys scan details of default CF when executing the rollback command

#### 14.8.5.1.20 GC

- GC tasks: The count of GC tasks processed by gc\_worker
- GC tasks Duration: The time consumed when executing GC tasks
- TiDB GC seconds: The GC duration
- TiDB GC worker actions: The count of TiDB GC worker actions
- ResolveLocks Progress: The progress of the first phase of GC (Resolve Locks)
- TiKV Auto GC Progress: The progress of the second phase of GC
- GC speed: The number of keys deleted by GC per second
- TiKV Auto GC SafePoint: The value of TiKV GC safe point. The safe point is the current GC timestamp
- GC lifetime: The lifetime of TiDB GC
- GC interval: The interval of TiDB GC
- GC in Compaction Filter: The count of filtered versions in the compaction filter of write CF.

#### 14.8.5.1.21 Snapshot

- Rate snapshot message: The rate at which Raft snapshot messages are sent
- 99% Handle snapshot duration: The time consumed to handle snapshots (P99)
- Snapshot state count: The number of snapshots per state
- 99.99% Snapshot size: The snapshot size (P99.99)
- 99.99% Snapshot KV count: The number of KV within a snapshot (P99.99)

#### 14.8.5.1.22 Task

- Worker handled tasks: The number of tasks handled by worker per second
- Worker pending tasks: Current number of pending and running tasks of worker per second. It should be less than 1000 in normal case.
- FuturePool handled tasks: The number of tasks handled by future pool per second
- FuturePool pending tasks: Current number of pending and running tasks of future pool per second

#### 14.8.5.1.23 Coprocessor Overview

- Request duration: The total duration from the time of receiving the coprocessor request to the time of finishing processing the request
- Total Requests: The number of requests by type per second
- Handle duration: The histogram of time spent actually processing coprocessor requests per minute
- Total Request Errors: The number of request errors of Coprocessor per second. There should not be a lot of errors in a short time.
- Total KV Cursor Operations: The total number of the KV cursor operations by type per second, such as `select`, `index`, `analyze_table`, `analyze_index`, `checksum_table`  $\leftrightarrow$  , and `checksum_index`.
- KV Cursor Operations: The histogram of KV cursor operations by type per second
- Total RocksDB Perf Statistics: The statistics of RocksDB performance
- Total Response Size: The total size of coprocessor response

#### 14.8.5.1.24 Coprocessor Detail

- Handle duration: The histogram of time spent actually processing coprocessor requests per minute
- 95% Handle duration by store: The time consumed to handle coprocessor requests per TiKV instance per second (P95)
- Wait duration: The time consumed when coprocessor requests are waiting to be handled. It should be less than 10s (P99.99).
- 95% Wait duration by store: The time consumed when coprocessor requests are waiting to be handled per TiKV instance per second (P95)
- Total DAG Requests: The total number of DAG requests per second
- Total DAG Executors: The total number of DAG executors per second
- Total Ops Details (Table Scan): The number of RocksDB internal operations per second when executing select scan in coprocessor
- Total Ops Details (Index Scan): The number of RocksDB internal operations per second when executing index scan in coprocessor
- Total Ops Details by CF (Table Scan): The number of RocksDB internal operations for each CF per second when executing select scan in coprocessor
- Total Ops Details by CF (Index Scan): The number of RocksDB internal operations for each CF per second when executing index scan in coprocessor

#### 14.8.5.1.25 Threads

- Threads state: The state of TiKV threads
- Threads IO: The I/O traffic of each TiKV thread
- Thread Voluntary Context Switches: The number of TiKV threads voluntary context switches
- Thread Nonvoluntary Context Switches: The number of TiKV threads nonvoluntary context switches

#### 14.8.5.1.26 RocksDB - kv/raft

- Get operations: The count of get operations per second
- Get duration: The time consumed when executing get operations
- Seek operations: The count of seek operations per second
- Seek duration: The time consumed when executing seek operations
- Write operations: The count of write operations per second
- Write duration: The time consumed when executing write operations
- WAL sync operations: The count of WAL sync operations per second
- Write WAL duration: The time consumed for writing WAL
- WAL sync duration: The time consumed when executing WAL sync operations
- Compaction operations: The count of compaction and flush operations per second
- Compaction duration: The time consumed when executing the compaction and flush operations
- SST read duration: The time consumed when reading SST files
- Write stall duration: Write stall duration. It should be 0 in normal case.
- Memtable size: The memtable size of each column family
- Memtable hit: The hit rate of memtable
- Block cache size: The block cache size. Broken down by column family if shared block cache is disabled.
- Block cache hit: The hit rate of block cache
- Block cache flow: The flow rate of block cache operations per type
- Block cache operations: The count of block cache operations per type
- Keys flow: The flow rate of operations on keys per type
- Total keys: The count of keys in each column family
- Read flow: The flow rate of read operations per type
- Bytes / Read: The bytes per read operation
- Write flow: The flow rate of write operations per type
- Bytes / Write: The bytes per write operation
- Compaction flow: The flow rate of compaction operations per type
- Compaction pending bytes: The pending bytes to be compacted
- Read amplification: The read amplification per TiKV instance
- Compression ratio: The compression ratio of each level
- Number of snapshots: The number of snapshots per TiKV instance
- Oldest snapshots duration: The time that the oldest unreleased snapshot survives
- Number files at each level: The number of SST files for different column families in each level
- Ingest SST duration seconds: The time consumed to ingest SST files
- Stall conditions changed of each CF: Stall conditions changed of each column family

#### 14.8.5.1.27 Titan - All

- Blob file count: The number of Titan blob files
- Blob file size: The total size of Titan blob file

- Live blob size: The total size of valid blob record
- Blob cache hit: The hit rate of Titan block cache
- Iter touched blob file count: The number of blob file involved in a single iterator
- Blob file discardable ratio distribution: The ratio distribution of blob record failure of blob files
- Blob key size: The size of Titan blob keys
- Blob value size: The size of Titan blob values
- Blob get operations: The count of get operations in Titan blob
- Blob get duration: The time consumed when executing get operations in Titan blob
- Blob iter operations: The time consumed when executing iter operations in Titan blob
- Blob seek duration: The time consumed when executing seek operations in Titan blob
- Blob next duration: The time consumed when executing next operations in Titan blob
- Blob prev duration: The time consumed when executing prev operations in Titan blob
- Blob keys flow: The flow rate of operations on Titan blob keys
- Blob bytes flow: The flow rate of bytes on Titan blob keys
- Blob file read duration: The time consumed when reading Titan blob file
- Blob file write duration: The time consumed when writing Titan blob file
- Blob file sync operations: The count of blob file sync operations
- Blob file sync duration: The time consumed when synchronizing blob file
- Blob GC action: The count of Titan GC actions
- Blob GC duration: The Titan GC duration
- Blob GC keys flow: The flow rate of keys read and written by Titan GC
- Blob GC bytes flow: The flow rate of bytes read and written by Titan GC
- Blob GC input file size: The size of Titan GC input file
- Blob GC output file size: The size of Titan GC output file
- Blob GC file count: The count of blob files involved in Titan GC

#### 14.8.5.1.28 Pessimistic Locking

- Lock Manager Thread CPU: The CPU utilization of the lock manager thread
- Lock Manager Handled tasks: The number of tasks handled by lock manager
- Waiter lifetime duration: The waiting time of the transaction for the lock to be released
- Wait table: The status information of wait table, including the number of locks and the number of transactions waiting for the lock
- Deadlock detect duration: The time consumed for detecting deadlock
- Detect error: The number of errors encountered when detecting deadlock, including the number of deadlocks
- Deadlock detector leader: The information of the node where the deadlock detector leader is located
- Total pessimistic locks memory size: The memory size occupied by the in-memory pessimistic locks
- In-memory pessimistic locking result: The result of only saving pessimistic locks to memory. `full` means the number of times that the pessimistic lock is not saved to memory because the memory limit is exceeded.

#### 14.8.5.1.29 Memory

- Allocator Stats: The statistics of the memory allocator

#### 14.8.5.1.30 Backup

- Backup CPU: The CPU utilization of the backup thread
- Range Size: The histogram of backup range size
- Backup Duration: The time consumed for backup
- Backup Flow: The total bytes of backup
- Disk Throughput: The disk throughput per instance
- Backup Range Duration: The time consumed for backing up a range
- Backup Errors: The number of errors encountered during a backup

#### 14.8.5.1.31 Encryption

- Encryption data keys: The total number of encrypted data keys
- Encrypted files: The number of encrypted files
- Encryption initialized: Shows whether encryption is enabled. 1 means enabled.
- Encryption meta files size: The size of the encryption meta file
- Encrypt/decrypt data nanos: The histogram of duration on encrypting/decrypting data each time
- Read/write encryption meta duration: The time consumed for reading/writing encryption meta files

#### 14.8.5.1.32 Explanation of Common Parameters

gRPC Message Type

##### 1. Transactional API:

- `kv_get`: The command of getting the latest version of data specified by `ts`
- `kv_scan`: The command of scanning a range of data
- `kv_prewrite`: The command of prewriting the data to be committed at first phase of 2PC
- `kv_pessimistic_lock`: The command of adding a pessimistic lock to the key to prevent other transaction from modifying this key
- `kv_pessimistic_rollback`: The command of deleting the pessimistic lock on the key
- `kv_txn_heart_beat`: The command of updating `lock_ttl` for pessimistic transactions or large transactions to prevent them from rolling back
- `kv_check_txn_status`: The command of checking the status of the transaction
- `kv_commit`: The command of committing the data written by the prewrite command

- `kv_cleanup`: The command of rolling back a transaction, which is deprecated in v4.0
- `kv_batch_get`: The command of getting the value of batch key at once, similar to `kv_get`
- `kv_batch_rollback`: The command of batch rollback of multiple prewrite transactions
- `kv_scan_lock`: The command of scanning all locks with a version number before `max_version` to clean up expired transactions
- `kv_resolve_lock`: The command of committing or rollback the transaction lock, according to the transaction status.
- `kv_gc`: The command of GC
- `kv_delete_range`: The command of deleting a range of data from TiKV

## 2. Raw API:

- `raw_get`: The command of getting the value of key
- `raw_batch_get`: The command of getting the value of batch keys
- `raw_scan`: The command of scanning a range of data
- `raw_batch_scan`: The command of scanning multiple consecutive data range
- `raw_put`: The command of writing a key/value pair
- `raw_batch_put`: The command of writing a batch of key/value pairs
- `raw_delete`: The command of deleting a key/value pair
- `raw_batch_delete`: The command of a batch of key/value pairs
- `raw_delete_range`: The command of deleting a range of data

### 14.8.5.2 TiKV-FastTune dashboard

If performance issues of TiKV occur, such as QPS jitter, latency jitter, and latency increasing trend, you can check the **TiKV-FastTune** dashboard. This dashboard contains a set of panels that help you with diagnostics, especially when the write workload in your cluster is medium or large.

When write-related performance issues occur, you can first check the TiDB-related dashboards. If the issues are at the storage side, open the **TiKV-FastTune** page, browse and check every panel on it.

In the **TiKV-FastTune** dashboard, you can see a title that suggests a possible cause of the performance issues. To check whether the suggested cause is true, check the graph on the page.

The left-Y-axis of the graph represents the write-RPC QPS of the storage side, and a set of graphs on the right-Y-axis are drawn upside down. If the shape of the left graph matches that of the right graphs, the suggested cause is true.

For detailed metrics and descriptions, see the dashboard [user manual](#).

## 14.8.6 Monitor the TiFlash Cluster

This document describes the monitoring items of TiFlash.

If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus & Grafana) is deployed at the same time. For more information, see [Overview of the Monitoring Framework](#).

The Grafana dashboard is divided into a series of sub dashboards which include Overview, PD, TiDB, TiKV, and Node\_exporter. A lot of metrics are there to help you diagnose.

TiFlash has three dashboard panels: **TiFlash-Summary**, **TiFlash-Proxy-Summary**, and **TiFlash-Proxy-Details**. The metrics on these panels indicate the current status of TiFlash. The **TiFlash-Proxy-Summary** and **TiFlash-Proxy-Details** panels mainly show the information of the Raft layer and the metrics are detailed in [Key Monitoring Metrics of TiKV](#).

### Note:

It is recommended that you use TiDB v4.0.5 or later versions for improved monitor on TiFlash.

The following sections introduce the default monitoring information of **TiFlash-Summary**.

### 14.8.6.1 Server

- Store size: The storage size used by each TiFlash instance.
- Available size: The storage size available for each TiFlash instance.
- Capacity size: The storage capacity for each TiFlash instance.
- Uptime: The runtime of TiFlash since last restart.
- Memory: The memory usage per TiFlash instance.
- CPU Usage: The CPU utilization per TiFlash instance.
- FSync OPS: The number of fsync operations per TiFlash instance per second.
- File Open OPS: The number of open operations per TiFlash instance per second.
- Opened File Count: The number of file descriptors currently opened by each TiFlash instance.

### Note:

Store size, FSync OPS, File Open OPS, and Opened File Count currently only cover the monitoring information of the TiFlash storage layer and do not cover that in TiFlash-Proxy.

### 14.8.6.2 Coprocessor

- Request QPS: The number of coprocessor requests received by all TiFlash instances. `batch` is the number of batch requests. `batch_cop` is the number of coprocessor requests in the batch requests. `cop` is the number of coprocessor requests that are sent directly via the coprocessor interface. `cop_dag` is the number of dag requests in all coprocessor requests. `super_batch` is the number of requests to enable the Super Batch feature.
- Executor QPS: The number of each type of dag executors in the requests received by all TiFlash instances. `table_scan` is the table scan executor. `selection` is the selection executor. `aggregation` is the aggregation executor. `top_n` is the TopN executor. `limit` is the limit executor.
- Request Duration: The total duration of all TiFlash instances processing coprocessor requests. The total duration is from the time that the coprocessor request is received to the time that the response to the request is completed.
- Error QPS: The number of errors of all TiFlash instances processing coprocessor requests. `meet_lock` means that the read data is locked. `region_not_found` means that the Region does not exist. `epoch_not_match` means the read Region epoch is inconsistent with the local epoch. `kv_client_error` means that the communication with TiKV returns an error. `internal_error` is the internal system error of TiFlash. `other` is other types of errors.
- Request Handle Duration: The duration of all TiFlash instances processing coprocessor requests. The processing time is from starting to execute the coprocessor request to completing the execution.
- Response Bytes/Seconds: The total bytes of the response from all TiFlash instances.
- Cop task memory usage: The total memory usage of all TiFlash instances processing coprocessor requests.
- Handling Request Number: The total number of all TiFlash instances processing coprocessor requests. The classification of the requests is the same as that of Request QPS.
- Threads of RPC: The real-time number of RPC threads used in each TiFlash instance.
- Max Threads of RPC: The maximum number of RPC threads recently used in each TiFlash instance.
- Threads: The real-time number of threads used in each TiFlash instance.
- Max Threads: The maximum number of threads recently used in each TiFlash instance.

### 14.8.6.3 Task Scheduler

- Min TSO: The minimum TSO among all queries running on each TiFlash instance. This value ensures that queries with the minimum TSO can be scheduled to run. When no queries are running, this value is the maximum unsigned 64-bit integer.
- Estimated Thread Usage and Limit: The estimated amount of threads used by all queries running on each TiFlash instance, and the soft and hard limits on the amount.

- **Active and Waiting Queries Count:** The amount of running queries and that of waiting queries on each TiFlash instance.
- **Active and Waiting Tasks Count:** The amount of running tasks and that of waiting tasks on each TiFlash instance.
- **Hard Limit Exceeded Count:** Times that the estimated amount of threads used by queries running on each TiFlash instance exceeds the hard limit.
- **Task Waiting Duration:** The duration from task initialization to task scheduling on each TiFlash instance.

#### 14.8.6.4 DDL

- **Schema Version:** The version of the schema currently cached in each TiFlash instance.
- **Schema Apply OPM:** The number of TiDB `schema diff` synchronized in `apply` operations by all TiFlash instances per minute. This item includes the count of three types of `apply`: `diff apply`, `full apply`, and `failed apply`. `diff apply` is the normal process of a single `apply`. If `diff apply` fails, `failed apply` increases by 1, and TiFlash rolls back to `full apply` and pulls the latest schema information to update the schema version of TiFlash.
- **Schema Internal DDL OPM:** The number of specific DDL operations executed per minute in all TiFlash instances.
- **Schema Apply Duration:** The time used for a single `apply schema` operation in all TiFlash instances.

#### 14.8.6.5 Storage

- **Write Command OPS:** The number of write requests received per second by the storage layer of all TiFlash instances.
- **Write Amplification:** Write amplification of each TiFlash instance (the actual bytes of disk writes divided by the written bytes of logical data). `total` is the write amplification since this start, and `5min` is the write amplification in the last 5 minutes.
- **Read Tasks OPS:** The number of read tasks in the storage layer per second for each TiFlash instance.
- **Rough Set Filter Rate:** The proportion of the number of packets read by each TiFlash instance in the last minute that are filtered by the rough set index of the storage layer.
- **Internal Tasks OPS:** The number of times that all TiFlash instances perform internal data sorting tasks per second.
- **Internal Tasks Duration:** The time consumed by all TiFlash instances for internal data sorting tasks.
- **Page GC Tasks OPM:** The number of times that all TiFlash instances perform Delta data sorting tasks per minute.
- **Page GC Tasks Duration:** The distribution of time consumed by all TiFlash instances to perform Delta data sorting tasks.
- **Disk Write OPS:** The number of disk writes per second by all TiFlash instances.
- **Disk Read OPS:** The number of disk reads per second by all TiFlash instances.

- Write flow: The traffic of disk writes by all TiFlash instances.
- Read flow: The traffic of disk reads by all TiFlash instances.

**Note:**

These metrics only cover the monitoring information of the TiFlash storage layer and do not cover that in TiFlash-Proxy.

#### 14.8.6.6 Storage Write Stall

- Write & Delta Management Throughput: The throughput of write and data compaction for all instances.
  - `throughput_write` means the throughput of data synchronization through Raft.
  - `throughput_delta-management` means the throughput of data compaction.
  - `total_write` means the total bytes written since the last start.
  - `total_delta-management` means the total bytes of data compacted since the last start.
- Write Stall Duration: The stall duration of write and removing Region data (deleting ranges) by instance.
- Write Throughput By Instance: The throughput of write by instance. It includes the throughput by applying the Raft write commands and Raft snapshots.
- Write Command OPS By Instance: The total count of different kinds of commands received by instance.
  - `write block` means the data logs synchronized through Raft.
  - `delete_range` means that some Regions are removed from or moved to this instance.
  - `ingest` means some Region snapshots are applied to this instance.

#### 14.8.6.7 Raft

- Read Index OPS: The number of times that each TiFlash instance triggers the `read_index` request per second, which equals to the number of Regions triggered.
- Read Index Duration: The time used by `read_index` for all TiFlash instances. Most time is used for interaction with the Region leader and retry.
- Wait Index Duration: The time used by `wait_index` for all TiFlash instances, namely the time used to wait until local index  $\geq$  `read_index` after the `read_index` request is received.

### 14.8.7 Key Monitoring Metrics of TiCDC

If you use TiUP to deploy the TiDB cluster, you can see a sub-dashboard for TiCDC in the monitoring system which is deployed at the same time. You can get an overview of TiCDC's current status from the TiCDC dashboard, where the key metrics are displayed. This document provides a detailed description of these key metrics.

The metric description in this document is based on the following replication task example, which replicates data to MySQL using the default configuration.

```
cdc cli changefeed create --server=http://10.0.10.25:8300 --sink-uri="mysql
↪ ://root:123456@127.0.0.1:3306/" --changefeed-id="simple-replication-
↪ task"
```

The TiCDC dashboard contains four monitoring panels. See the following screenshot:

Figure 343: TiCDC Dashboard - Overview

The description of each panel is as follows:

- **Server**: The summary information of TiKV nodes and TiCDC nodes in the TiDB cluster
- **Changefeed**: The detailed information of TiCDC replication tasks
- **Events**: The detail information about the data flow within the TiCDC cluster
- **TiKV**: TiKV information related to TiCDC

#### 14.8.7.1 Server

The following is an example of the **Server** panel:

Figure 344: TiCDC Dashboard - Server metrics

The description of each metric in the **Server** panel is as follows:

- Uptime: The time for which TiKV nodes and TiCDC nodes have been running
- Goroutine count: The number of goroutines of a TiCDC node
- Open FD count: The number of file handles opened by TiCDC nodes
- Ownership: The current status of nodes in the TiCDC cluster
- Ownership history: The ownership history of the TiCDC cluster
- CPU usage: The CPU usage of TiCDC nodes
- Memory usage: The memory usage of TiCDC nodes

### 14.8.7.2 Changefeed

The following is an example of the **Changefeed** panel:

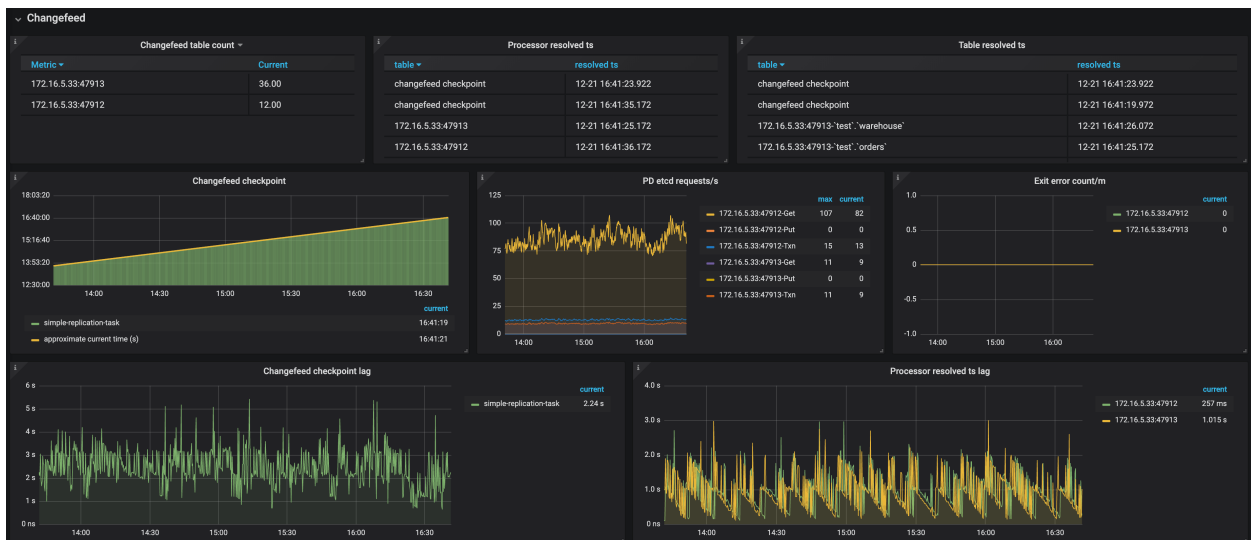

Figure 345: TiCDC Dashboard - Changefeed metrics 1

- Changefeed table count: The number of tables that each TiCDC node needs to replicate in the replication task
- Processor resolved ts: The timestamps that have been resolved in the TiCDC cluster
- Table resolved ts: The replication progress of each table in the replication task
- Changefeed checkpoint: The progress of replicating data to the downstream. Normally, the green bars are connected to the yellow line
- PD etcd requests/s: The number of requests that a TiCDC node sends to PD per second
- Exit error count/m: The number of errors that interrupt the replication task per minute
- Changefeed checkpoint lag: The progress lag of data replication (the unit is second) between the upstream and the downstream
- Processor resolved ts lag: The progress lag of data replication (the unit is second) between the upstream and TiCDC nodes

Figure 346: TiCDC Dashboard - Changefeed metrics 2

- Sink write duration: The histogram of the time spent by TiCDC writing a transaction change to the downstream
- Sink write duration percentile: The time (P95, P99, and P999) spent by TiCDC writing a transaction change to the downstream within one second
- Flush sink duration: The histogram of the time spent by TiCDC asynchronously flushing data to the downstream
- Flush sink duration percentile: The time (P95, P99, and P999) spent by TiCDC asynchronously flushing data to the downstream within one second

Figure 347: TiCDC Dashboard - Changefeed metrics 3

- MySQL sink conflict detect duration: The histogram of the time spent on detecting MySQL sink conflicts
- MySQL sink conflict detect duration percentile: The time (P95, P99, and P999) spent on detecting MySQL sink conflicts within one second
- MySQL sink worker load: The workload of MySQL sink workers of TiCDC nodes

Figure 348: TiCDC Dashboard - Changefeed metrics 4

- Changefeed catch-up ETA: The estimated time needed for the replication task to catch up with the upstream cluster data. When the upstream write speed is faster than the TiCDC replication speed, the metric might be extremely large. Because TiCDC replication speed is subject to many factors, this metric is for reference only and might not be the actual replication time.

### 14.8.7.3 Events

The following is an example of the **Events** panel:

The description of each metric in the **Events** panel is as follows:

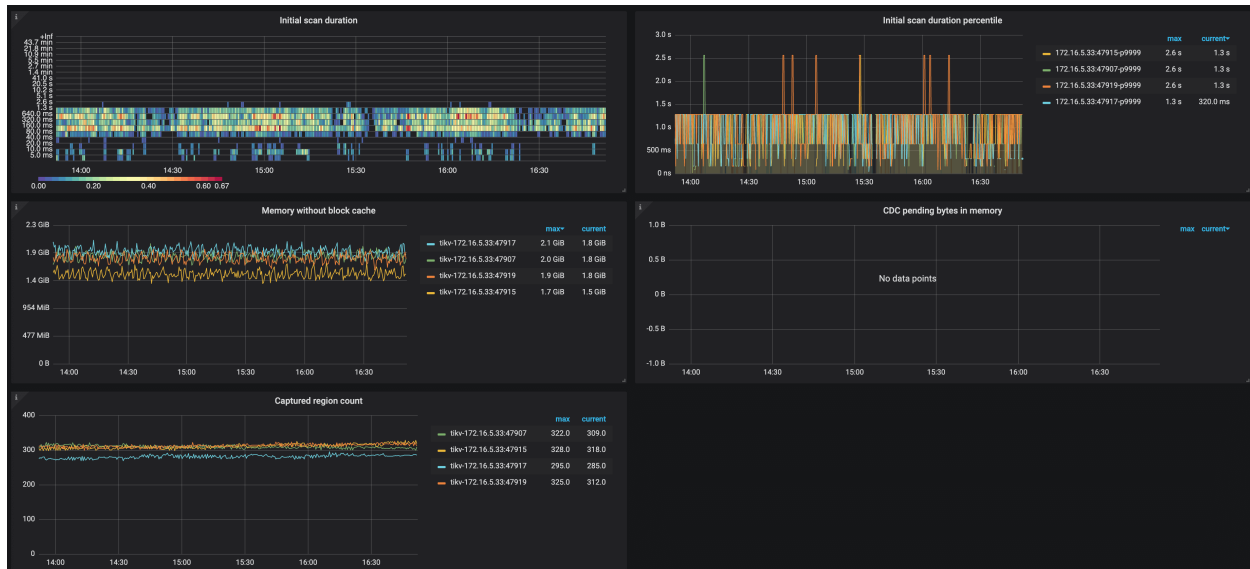

- **Eventfeed count:** The number of Eventfeed RPC requests of TiCDC nodes
- **Event size percentile:** The event size (P95, P99, and P999) which TiCDC receives from TiKV within one second
- **Eventfeed error/m:** The number of errors reported by Eventfeed RPC requests of TiCDC nodes per minute
- **KV client receive events/s:** The number of events that the KV client module of TiCDC nodes receives from TiKV per second

- Puller receive events/s: The number of events that the Puller module of TiCDC nodes receives from the KV client per second
- Puller output events/s: The number of events that the Puller module of TiCDC nodes sends to the Sorter module per second
- Sink flush rows/s: The number of events that TiCDC nodes write to the downstream per second
- Puller buffer size: The number of events that TiCDC nodes cache in the Puller module
- Entry sorter buffer size: The number of events that TiCDC nodes cache in the Sorter module
- Processor/Mounter buffer size: The number of events that TiCDC nodes cache in the Processor module and the Mounter module
- Sink row buffer size: The number of events that TiCDC nodes cache in the Sink module
- Entry sorter sort duration: The histogram of the time spent by TiCDC nodes sorting events
- Entry sorter sort duration percentile: The time (P95, P99, and P999) spent by TiCDC sorting events within one second
- Entry sorter merge duration: The histogram of the time spent by TiCDC nodes merging sorted events
- Entry sorter merge duration percentile: The time (P95, P99, and P999) spent by TiCDC merging sorted events within one second
- Mounter unmarshal duration: The histogram of the time spent by TiCDC nodes unmarshaling events
- Mounter unmarshal duration percentile: The time (P95, P99, and P999) spent by TiCDC unmarshaling events within one second
- KV client dispatch events/s: The number of events that the KV client module dispatches among the TiCDC nodes
- KV client batch resolved size: The batch size of resolved timestamp messages that TiKV sends to TiCDC

#### 14.8.7.4 TiKV

The following is an example of the **TiKV** panel:

The description of each metric in the **TiKV** panel is as follows:

- CDC endpoint CPU: The CPU usage of the CDC endpoint threads on TiKV nodes
- CDC worker CPU: The CPU usage of the CDC worker threads on TiKV nodes
- Min resolved ts: The minimum resolved timestamp on TiKV nodes
- Min resolved region: The Region ID of the minimum resolved timestamp on TiKV nodes
- Resolved ts lag duration percentile: The lag between the minimum resolved timestamp on TiKV nodes and the current time
- Initial scan duration: The histogram of the time spent on incremental scan when TiKV nodes connect to TiCDC nodes
- Initial scan duration percentile: The time (P95, P99, and P999) spent on the incremental scan of TiKV nodes within one second
- Memory without block cache: The memory usage of TiKV nodes excluding the RocksDB block cache
- CDC pending bytes in memory: The memory usage of CDC module on TiKV nodes
- Captured region count: The number of event-capturing Regions on TiKV nodes

### 14.8.8 Key Monitoring Metrics of Resource Control

If you use TiUP to deploy the TiDB cluster, the monitoring system (Prometheus & Grafana) is deployed at the same time. For more information, see [Overview of the Monitoring Framework](#).

The Grafana dashboard is divided into a series of sub dashboards which include Overview, PD, TiDB, TiKV, Node\_exporter, Disk Performance, and Performance\_overview.

If your cluster has used the [Resource Control](#) feature, you can get an overview of the resource consumption status from the Resource Control dashboard.

This document describes some key monitoring metrics displayed on the Resource Control dashboard.

#### 14.8.8.1 Metrics about Request Unit

- RU: the **Request Unit (RU)** consumption information of each resource group, calculated in real time. **total** is the sum of the Request Units consumed by all Resource Groups. The Request Unit consumption of each resource group should be equal to the sum of its read consumption (Read Request Unit) and write consumption (Write Request Unit).
- RU Per Query: the average number of Request Units consumed by each SQL statement per second. It is obtained by dividing the above RU metric by the number of SQL statements executed per second.
- RRU: the Read Request Unit consumption information of each resource group, calculated in real time. **total** is the sum of the Read Request Units consumed by all Resource Groups.
- RRU Per Query: the average number of Read Request Units consumed by each SQL statement per second. It is obtained by dividing the above RRU metric by the number of SQL statements executed per second.
- WRU: the Write Request Unit consumption information of each resource group, calculated in real time. **total** is the sum of the Write Request Units consumed by all Resource Groups.
- WRU Per Query: the average number of Write Request Units consumed by each SQL statement per second. It is obtained by dividing the above WRU metric by the number of SQL statements executed per second.

#### 14.8.8.2 Metrics about resources

- KV Request Count: the number of KV requests for each resource group, calculated per second. The requests are divided into read and write types. **total** is the sum of the KV requests for all Resource Groups.
- KV Request Count Per Query: the average number of read and write KV requests by each SQL statement per second. It is obtained by dividing the above KV Request Count metric by the number of SQL statements executed per second.
- Bytes Read: the amount of data read by each Resource Group, calculated per second. **total** is the sum of the data read by all Resource Groups.
- Bytes Read Per Query: the average amount of data read by each SQL statement per second. It is obtained by dividing the above Bytes Read metric by the number of SQL statements executed per second.
- Bytes Written: the amount of data written by each Resource Group, calculated in real time. **total** is the sum of the data written by all Resource Groups.
- Bytes Written Per Query: the average amount of data written by each SQL statement per second. It is obtained by dividing the above Bytes Written metric by the number of SQL statements executed per second.

- **KV CPU Time:** the KV layer CPU time consumed by each Resource Group, calculated in real time. `total` is the sum of the KV layer CPU time consumed by all Resource Groups.
- **KV CPU Time Per Query:** the average KV layer CPU time consumed by each SQL statement per second. It is obtained by dividing the above KV CPU Time metric by the number of SQL statements executed per second.
- **SQL CPU Time:** the SQL layer CPU time consumed by each Resource Group, calculated in real time. `total` is the sum of the SQL layer CPU time consumed by all Resource Groups.
- **SQL CPU Time Per Query:** the average SQL layer CPU time consumed by each SQL statement per second. It is obtained by dividing the above SQL CPU Time metric by the number of SQL statements executed per second.

## 14.9 Security

### 14.9.1 Enable TLS between TiDB Clients and Servers

Non-encrypted connection between TiDB's server and clients is allowed by default, which enables third parties that monitor channel traffic to know the data sent and received between the server and the client, including query content and query results. If a channel is untrustworthy (such as if the client is connected to the TiDB server via a public network), then a non-encrypted connection is prone to information leakage. In this case, for security reasons, it is recommended to require an encrypted connection.

The TiDB server supports the encrypted connection based on the TLS (Transport Layer Security). The protocol is consistent with MySQL encrypted connections and is directly supported by existing MySQL clients such as MySQL Client, MySQL Shell and MySQL drivers. TLS is sometimes referred to as SSL (Secure Sockets Layer). Because the SSL protocol has [known security vulnerabilities](#), TiDB does not support SSL. TiDB supports the following protocols: TLSv1.0, TLSv1.1, TLSv1.2 and TLSv1.3.

When an encrypted connection is used, the connection has the following security properties:

- **Confidentiality:** the traffic plaintext is encrypted to avoid eavesdropping
- **Integrity:** the traffic plaintext cannot be tampered
- **Authentication:** (optional) the client can verify the identity of the server and the server can verify the identity of the client to avoid man-in-the-middle attacks

To use connections secured with TLS, you first need to configure the TiDB server to enable TLS. Then you need to configure the client application to use TLS. Most client libraries enable TLS automatically when the server has TLS support configured correctly.

Similar to MySQL, TiDB allows TLS and non-TLS connections on the same TCP port. For a TiDB server with TLS enabled, you can choose to securely connect to the TiDB server through an encrypted connection, or to use an unencrypted connection. You can use the following ways to require the use of secure connections:

- Configure the system variable `require_secure_transport` to require secure connections to the TiDB server for all users.
- Specify `REQUIRE SSL` when you create a user (`create user`), or modify an existing user (`alter user`), which is to specify that specified users must use the encrypted connection to access TiDB. The following is an example of creating a user:

```
CREATE USER 'u1'@'%' IDENTIFIED BY 'my_random_password' REQUIRE SSL;
```

#### Note:

If the login user has configured using the [TiDB Certificate-Based Authentication for Login](#), the user is implicitly required to enable the encrypted connection to TiDB.

### 14.9.1.1 Configure TiDB server to use secure connections

See the following descriptions about the related parameters to enable secure connections:

- `auto-tls`: enables automatic certificate generation (since v5.2.0)
- `ssl-cert`: specifies the file path of the SSL certificate
- `ssl-key`: specifies the private key that matches the certificate
- `ssl-ca`: (optional) specifies the file path of the trusted CA certificate
- `tls-version`: (optional) specifies the minimum TLS version, e.g. “TLSv1.2”

`auto-tls` allows secure connections but does not provide client certificate validation. For certificate validation, and to control how certificates are generated, see the advice on configuring the `ssl-cert`, `ssl-key` and `ssl-ca` variables below.

To enable secure connections with your own certificates in the TiDB server, you must specify both of the `ssl-cert` and `ssl-key` parameters in the configuration file when you start the TiDB server. You can also specify the `ssl-ca` parameter for client authentication (see [Enable authentication](#)).

All the files specified by the parameters are in PEM (Privacy Enhanced Mail) format. Currently, TiDB does not support the import of a password-protected private key, so it is required to provide a private key file without a password. If the certificate or private key is invalid, the TiDB server starts as usual, but the client cannot connect to the TiDB server through an encrypted connection.

If the certificate parameters are correct, TiDB outputs `secure connection is enabled` when started; otherwise, it outputs `secure connection is NOT ENABLED`.

For TiDB versions earlier than v5.2.0, you can use `mysql_ssl_rsa_setup --datadir ↪ =./certs` to generate certificates. The `mysql_ssl_rsa_setup` tool is a part of MySQL Server.

### 14.9.1.2 Configure the MySQL client to use encrypted connections

The client of MySQL 5.7 or later versions attempts to establish an encrypted connection by default. If the server does not support encrypted connections, it automatically returns to unencrypted connections. The client of MySQL earlier than version 5.7 uses the unencrypted connection by default.

You can change the connection behavior of the client using the following `--ssl-mode` parameters:

- `--ssl-mode=REQUIRED`: The client requires an encrypted connection. The connection cannot be established if the server side does not support encrypted connections.
- In the absence of the `--ssl-mode` parameter: The client attempts to use an encrypted connection, but the encrypted connection cannot be established if the server side does not support encrypted connections. Then the client uses an unencrypted connection.
- `--ssl-mode=DISABLED`: The client uses an unencrypted connection.

MySQL 8.0 clients have two SSL modes in addition to this parameter:

- `--ssl-mode=VERIFY_CA`: Validates the certificate from the server against the CA that requires `--ssl-ca`.
- `--ssl-mode=VERIFY_IDENTITY`: The same as `VERIFY_CA`, but also validating whether the hostname you are connecting to matches the certificate.

For more information, see [Client-Side Configuration for Encrypted Connections](#) in MySQL.

### 14.9.1.3 Enable authentication

If the `ssl-ca` parameter is not specified in the TiDB server or MySQL client, the client or the server does not perform authentication by default and cannot prevent man-in-the-middle attack. For example, the client might “securely” connect to a disguised client. You can configure the `ssl-ca` parameter for authentication in the server and client. Generally, you only need to authenticate the server, but you can also authenticate the client to further enhance the security.

- To authenticate the TiDB server from the MySQL client:
  1. Specify the `ssl-cert` and `ssl-key` parameters in the TiDB server.
  2. Specify the `--ssl-ca` parameter in the MySQL client.
  3. Specify the `--ssl-mode` to `VERIFY_CA` at least in the MySQL client.
  4. Make sure that the certificate (`ssl-cert`) configured in the TiDB server is signed by the CA specified by the client `--ssl-ca` parameter; otherwise, the authentication fails.
- To authenticate the MySQL client from the TiDB server:

1. Specify the `ssl-cert`, `ssl-key`, and `ssl-ca` parameters in the TiDB server.
  2. Specify the `--ssl-cert` and `--ssl-key` parameters in the client.
  3. Make sure the server-configured certificate and the client-configured certificate are both signed by the `ssl-ca` specified by the server.
- To perform mutual authentication, meet both of the above requirements.

By default, the server-to-client authentication is optional. Even if the client does not present its certificate of identification during the TLS handshake, the TLS connection can be still established. You can also require the client to be authenticated by specifying `require x509` when creating a user (`create user`), granting permissions (`grant`), or modifying an existing user (`alter user`). The following is an example of creating a user:

```
create user 'u1'@'%' require x509;
```

#### Note:

If the login user has configured using the [TiDB Certificate-Based Authentication for Login](#), the user is implicitly required to enable the encrypted connection to TiDB.

#### 14.9.1.4 Check whether the current connection uses encryption

Use the `SHOW STATUS LIKE "%Ss1%";` statement to get the details of the current connection, including whether encryption is used, the encryption protocol used by encrypted connections and the TLS version number.

See the following example of the result in an encrypted connection. The results change according to different TLS versions or encryption protocols supported by the client.

```
mysql> SHOW STATUS LIKE "%Ss1%";
.....
Ssl_verify_mode	5
Ssl_version	TLSv1.2
Ssl_cipher	ECDHE-RSA-AES128-GCM-SHA256
.....
```

For the official MySQL client, you can also use the `STATUS` or `\s` statement to view the connection status:

```
mysql> \s
...
SSL: Cipher in use is ECDHE-RSA-AES128-GCM-SHA256
...
```

### 14.9.1.5 Supported TLS versions, key exchange protocols, and encryption algorithms

The TLS versions, key exchange protocols and encryption algorithms supported by TiDB are determined by the official Golang libraries.

The crypto policy for your operating system and the client library you are using might also impact the list of supported protocols and cipher suites.

#### 14.9.1.5.1 Supported TLS versions

- TLSv1.0 (disabled by default)
- TLSv1.1
- TLSv1.2
- TLSv1.3

The `tls-version` configuration option can be used to limit the TLS versions that can be used.

The actual TLS versions that can be used depend on the OS crypto policy, MySQL client version and the SSL/TLS library that is used by the client.

#### 14.9.1.5.2 Supported key exchange protocols and encryption algorithms

- TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA
- TLS\_RSA\_WITH\_AES\_256\_CBC\_SHA
- TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA256
- TLS\_RSA\_WITH\_AES\_128\_GCM\_SHA256
- TLS\_RSA\_WITH\_AES\_256\_GCM\_SHA384
- TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_CBC\_SHA
- TLS\_ECDHE\_ECDSA\_WITH\_AES\_256\_CBC\_SHA
- TLS\_ECDHE\_RSA\_WITH\_AES\_128\_CBC\_SHA
- TLS\_ECDHE\_RSA\_WITH\_AES\_256\_CBC\_SHA
- TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_CBC\_SHA256
- TLS\_ECDHE\_RSA\_WITH\_AES\_128\_CBC\_SHA256
- TLS\_ECDHE\_RSA\_WITH\_AES\_128\_GCM\_SHA256
- TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_GCM\_SHA256
- TLS\_ECDHE\_RSA\_WITH\_AES\_256\_GCM\_SHA384
- TLS\_ECDHE\_ECDSA\_WITH\_AES\_256\_GCM\_SHA384
- TLS\_ECDHE\_RSA\_WITH\_CHACHA20\_POLY1305\_SHA256
- TLS\_ECDHE\_ECDSA\_WITH\_CHACHA20\_POLY1305\_SHA256
- TLS\_AES\_128\_GCM\_SHA256
- TLS\_AES\_256\_GCM\_SHA384
- TLS\_CHACHA20\_POLY1305\_SHA256

### 14.9.1.6 Reload certificate, key, and CA

To replace the certificate, the key or CA, first replace the corresponding files, then execute the `ALTER INSTANCE RELOAD TLS` statement on the running TiDB instance to reload the certificate (`ssl-cert`), the key (`ssl-key`), and the CA (`ssl-ca`) from the original configuration path. In this way, you do not need to restart the TiDB instance.

The newly loaded certificate, key, and CA take effect on the connection that is established after the statement is successfully executed. The connection established before the statement execution is not affected.

### 14.9.1.7 Monitoring

Since TiDB v5.2.0, you can use the `Ssl_server_not_after` and `Ssl_server_not_before` status variables to monitor the start and end dates of the validity of the certificate.

```
SHOW GLOBAL STATUS LIKE 'Ssl_server_not_%';
```

```
+-----+-----+
| Variable_name | Value |
+-----+-----+
| Ssl_server_not_after | Nov 28 06:42:32 2021 UTC |
| Ssl_server_not_before | Aug 30 06:42:32 2021 UTC |
+-----+-----+
2 rows in set (0.0076 sec)
```

### 14.9.1.8 See also

- [Enable TLS Between TiDB Components.](#)

## 14.9.2 Enable TLS Between TiDB Components

This document describes how to enable encrypted data transmission between components within a TiDB cluster. Once enabled, encrypted transmission is used between the following components:

- Communication between TiDB, TiKV, PD, and TiFlash
- TiDB Control and TiDB; TiKV Control and TiKV; PD Control and PD
- Internal communication within each TiDB, TiKV, PD, and TiFlash cluster

Currently, it is not supported to only enable encrypted transmission of some specific components.

### 14.9.2.1 Configure and enable encrypted data transmission

#### 1. Prepare certificates.

It is recommended to prepare a server certificate for TiDB, TiKV, and PD separately. Make sure that these components can authenticate each other. The Control tools of TiDB, TiKV, and PD can choose to share one client certificate.

You can use tools like `openssl`, `easy-rsa` and `cfssl` to generate self-signed certificates.

If you choose `openssl`, you can refer to [generating self-signed certificates](#).

#### 2. Configure certificates.

To enable mutual authentication among TiDB components, configure the certificates of TiDB, TiKV, and PD as follows.

- TiDB

Configure in the configuration file or command-line arguments:

```
[security]
Path of the file that contains list of trusted SSL CAs for
 ↳ connection with cluster components.
cluster-ssl-ca = "/path/to/ca.pem"
Path of the file that contains X509 certificate in PEM format for
 ↳ connection with cluster components.
cluster-ssl-cert = "/path/to/tidb-server.pem"
Path of the file that contains X509 key in PEM format for
 ↳ connection with cluster components.
cluster-ssl-key = "/path/to/tidb-server-key.pem"
```

- TiKV

Configure in the configuration file or command-line arguments, and set the corresponding URL to `https`:

```
[security]
The path for certificates. An empty string means that secure
 ↳ connections are disabled.
Path of the file that contains a list of trusted SSL CAs. If it
 ↳ is set, the following settings `cert_path` and `key_path`
 ↳ are also needed.
ca-path = "/path/to/ca.pem"
Path of the file that contains X509 certificate in PEM format.
cert-path = "/path/to/tikv-server.pem"
Path of the file that contains X509 key in PEM format.
key-path = "/path/to/tikv-server-key.pem"
```

- PD

Configure in the configuration file or command-line arguments, and set the corresponding URL to https:

```
[security]
The path for certificates. An empty string means that secure
 ↳ connections are disabled.
Path of the file that contains a list of trusted SSL CAs. If it
 ↳ is set, the following settings `cert_path` and `key_path`
 ↳ are also needed.
cacert-path = "/path/to/ca.pem"
Path of the file that contains X509 certificate in PEM format.
cert-path = "/path/to/pd-server.pem"
Path of the file that contains X509 key in PEM format.
key-path = "/path/to/pd-server-key.pem"
```

- TiFlash (New in v4.0.5)

Configure in the `tiflash.toml` file, and change the `http_port` item to `https_port`:

```
toml [security] ## The path for certificates. An empty string means
 ↳ that secure connections are disabled. # Path of the file that
 ↳ contains a list of trusted SSL CAs. If it is set, the following
 ↳ settings `cert_path` and `key_path` are also needed. ca_path
 ↳ = "/path/to/ca.pem" # Path of the file that contains X509
 ↳ certificate in PEM format. cert_path = "/path/to/tiflash-server
 ↳ .pem" # Path of the file that contains X509 key in PEM format.
 ↳ key_path = "/path/to/tiflash-server-key.pem"
```

Configure in the `tiflash-learner.toml` file:

```
[security]
Path of the file that contains a list of trusted SSL CAs. If it
 ↳ is set, the following settings `cert_path` and `key_path`
 ↳ are also needed.
ca-path = "/path/to/ca.pem"
Path of the file that contains X509 certificate in PEM format.
cert-path = "/path/to/tiflash-server.pem"
Path of the file that contains X509 key in PEM format.
key-path = "/path/to/tiflash-server-key.pem"
```

- TiCDC

Configure in the configuration file:

```
[security]
ca-path = "/path/to/ca.pem"
cert-path = "/path/to/cdc-server.pem"
key-path = "/path/to/cdc-server-key.pem"
```

Alternatively, configure in the command-line arguments and set the corresponding URL to https:

```
cdc server --pd=https://127.0.0.1:2379 --log-file=ticdc.log --addr
↳ =0.0.0.0:8301 --advertise-addr=127.0.0.1:8301 --ca=/path/to/
↳ ca.pem --cert=/path/to/ticdc-cert.pem --key=/path/to/ticdc-
↳ key.pem
```

Now, encrypted transmission among TiDB components is enabled.

#### Note:

After enabling encrypted transmission in a TiDB cluster, if you need to connect to the cluster using `tidb-ctl`, `tikv-ctl`, or `pd-ctl`, specify the client certificate. For example:

```
./tidb-ctl -u https://127.0.0.1:10080 --ca /path/to/ca.pem --ssl-cert /
↳ path/to/client.pem --ssl-key /path/to/client-key.pem
```

```
tiup ctl:v<CLUSTER_VERSION> pd -u https://127.0.0.1:2379 --cacert /path
↳ /to/ca.pem --cert /path/to/client.pem --key /path/to/client-key.
↳ pem
```

```
./tikv-ctl --host="127.0.0.1:20160" --ca-path="/path/to/ca.pem" --cert-
↳ path="/path/to/client.pem" --key-path="/path/to/client-key.pem"
```

#### 14.9.2.1.1 Verify component caller's identity

The Common Name is used for caller verification. In general, the callee needs to verify the caller's identity, in addition to verifying the key, the certificates, and the CA provided by the caller. For example, TiKV can only be accessed by TiDB, and other visitors are blocked even though they have legitimate certificates.

To verify component caller's identity, you need to mark the certificate user identity using `Common Name` when generating the certificate, and to check the caller's identity by configuring the `Common Name` list for the callee.

- TiDB

Configure in the configuration file or command-line arguments:

```
[security]
cluster-verify-cn = [
 "TiDB-Server",
 "TiKV-Control",
]
```

- TiKV

Configure in the configuration file or command-line arguments:

```
[security]
cert-allowed-cn = [
 "TiDB-Server", "PD-Server", "TiKV-Control", "RawKvClient1",
]
```

- PD

Configure in the configuration file or command-line arguments:

```
[security]
cert-allowed-cn = ["TiKV-Server", "TiDB-Server", "PD-Control"]
```

- TiFlash (New in v4.0.5)

Configure in the `tiflash.toml` file or command-line arguments:

```
[security]
cert_allowed_cn = ["TiKV-Server", "TiDB-Server"]
```

Configure in the `tiflash-learner.toml` file:

```
[security]
cert-allowed-cn = ["PD-Server", "TiKV-Server", "TiFlash-Server"]
```

### 14.9.2.2 Reload certificates

- If your TiDB cluster is deployed in a local data center, to reload the certificates and keys, TiDB, PD, TiKV, TiFlash, TiCDC, and all kinds of clients reread the current certificates and key files each time a new connection is created, without restarting the TiDB cluster.
- If your TiDB cluster is deployed on your own managed cloud, make sure that the issuance of TLS certificates is integrated with the certificate management service of the cloud provider. The TLS certificates of the TiDB, PD, TiKV, TiFlash, and TiCDC components can be automatically rotated without restarting the TiDB cluster.

### 14.9.2.3 Certificate validity

You can customize the validity period of TLS certificates for each component in a TiDB cluster. For example, when using OpenSSL to issue and generate TLS certificates, you can set the validity period via the `days` parameter. For more information, see [Generate self-signed certificates](#).

#### 14.9.2.4 See also

- [Enable TLS Between TiDB Clients and Servers](#)

### 14.9.3 Generate Self-Signed Certificates

**Note:**

To enable TLS between clients and servers, you only need to set `auto-tls`.

This document provides an example of using `openssl` to generate a self-signed certificate. You can also generate certificates and keys that meet requirements according to your demands.

Assume that the topology of the instance cluster is as follows:

| Name  | Host IP      | Services   |
|-------|--------------|------------|
| node1 | 172.16.10.11 | PD1, TiDB1 |
| node2 | 172.16.10.12 | PD2        |

#### 14.9.3.1 Install OpenSSL

- For Debian or Ubuntu OS:

```
apt install openssl
```

- For RedHat or CentOS OS:

```
yum install openssl
```

You can also refer to OpenSSL's official [download document](#) for installation.

#### 14.9.3.2 Generate the CA certificate

A certificate authority (CA) is a trusted entity that issues digital certificates. In practice, contact your administrator to issue the certificate or use a trusted CA. CA manages multiple certificate pairs. Here you only need to generate an original pair of certificates as follows.

1. Generate the root key:

```
openssl genrsa -out root.key 4096
```

2. Generate root certificates:

```
openssl req -new -x509 -days 1000 -key root.key -out root.crt
```

3. Validate root certificates:

```
openssl x509 -text -in root.crt -noout
```

### 14.9.3.3 Issue certificates for individual components

This section describes how to issue certificates for individual components.

#### 14.9.3.3.1 Certificates that might be used in the cluster

- tidb-server certificate: used by TiDB to authenticate TiDB for other components and clients
- tikv-server certificate: used by TiKV to authenticate TiKV for other components and clients
- pd-server certificate: used by PD to authenticate PD for other components and clients
- client certificate: used to authenticate the clients from PD, TiKV and TiDB, such as `pd-ctl`, `tikv-ctl`

#### 14.9.3.3.2 Issue certificates to TiKV instances

To issue a certificate to a TiKV instance, perform the following steps:

1. Generate the private key corresponding to the certificate:

```
openssl genrsa -out tikv.key 2048
```

2. Make a copy of the OpenSSL configuration template file (Refer to the actual location of your template file because it might have more than one location):

```
cp /usr/lib/ssl/openssl.cnf .
```

If you do not know the actual location, look for it in the root directory:

```
find / -name openssl.cnf
```

3. Edit `openssl.cnf`, add `req_extensions = v3_req` under the `[ req ]` field, and add `subjectAltName = @alt_names` under the `[ v3_req ]` field. Finally, create a new field and edit the information of SAN.

```
[alt_names]
IP.1 = 127.0.0.1
IP.2 = 172.16.10.14
IP.3 = 172.16.10.15
IP.4 = 172.16.10.16
```

4. Save the `openssl.cnf` file, and generate the certificate request file (in this step, you can also assign a Common Name to the certificate, which is used to allow the server to validate the identity of the client. Each component does not enable the validation by default, and you can enable it in the configuration file):

```
openssl req -new -key tikv.key -out tikv.csr -config openssl.cnf
```

5. Issue and generate the certificate:

```
openssl x509 -req -days 365 -CA root.crt -CAkey root.key -
 ↪ CACreateserial -in tikv.csr -out tikv.crt -extensions v3_req -
 ↪ extfile openssl.cnf
```

6. Verify that the certificate includes the SAN field (optional):

```
openssl x509 -text -in tikv.crt -noout
```

7. Confirm that the following files exist in your current directory:

```
root.crt
tikv.crt
tikv.key
```

The process of issuing certificates for other TiDB components is similar and will not be repeated in this document.

#### 14.9.3.3.3 Issue certificates for clients

To issue a certificate to a client, perform the following steps:

1. Generate the private key corresponding to the certificate:

```
openssl genrsa -out client.key 2048
```

2. Generate the certificate request file (in this step, you can also assign a Common Name to the certificate, which is used to allow the server to validate the identity of the client. Each component does not enable the validation by default, and you can enable it in the configuration file):

```
openssl req -new -key client.key -out client.csr
```

3. Issue and generate the certificate:

```
openssl x509 -req -days 365 -CA root.crt -CAkey root.key -
↳ CACreateserial -in client.csr -out client.crt
```

## 14.9.4 Encryption at Rest

### Note:

If your cluster is deployed on AWS and uses the EBS storage, it is recommended to use the EBS encryption. See [AWS documentation - EBS Encryption](#). You are using the non-EBS storage on AWS such as the local NVMe storage, it is recommended to use encryption at rest introduced in this document.

Encryption at rest means that data is encrypted when it is stored. For databases, this feature is also referred to as TDE (transparent data encryption). This is opposed to encryption in flight (TLS) or encryption in use (rarely used). Different things could be doing encryption at rest (such as SSD drive, file system, and cloud vendor), but by having TiKV do the encryption before storage this helps ensure that attackers must authenticate with the database to gain access to data. For example, when an attacker gains access to the physical machine, data cannot be accessed by copying files on disk.

### 14.9.4.1 Encryption support in different TiDB components

In a TiDB cluster, different components use different encryption methods. This section introduces the encryption supports in different TiDB components such as TiKV, TiFlash, PD, and Backup & Restore (BR).

When a TiDB cluster is deployed, the majority of user data is stored on TiKV and TiFlash nodes. Some metadata is stored on PD nodes (for example, secondary index keys used as TiKV Region boundaries). To get the full benefits of encryption at rest, you need to enable encryption for all components. Backups, log files, and data transmitted over the network should also be considered when you implement encryption.

#### 14.9.4.1.1 TiKV

TiKV supports encryption at rest. This feature allows TiKV to transparently encrypt data files using [AES](#) or [SM4](#) in [CTR](#) mode. To enable encryption at rest, an encryption key

must be provided by the user and this key is called master key. TiKV automatically rotates data keys that it used to encrypt actual data files. Manually rotating the master key can be done occasionally. Note that encryption at rest only encrypts data at rest (namely, on disk) and not while data is transferred over network. It is advised to use TLS together with encryption at rest.

Optionally, you can use AWS KMS for both cloud and self-hosted deployments. You can also supply the plaintext master key in a file.

TiKV currently does not exclude encryption keys and user data from core dumps. It is advised to disable core dumps for the TiKV process when using encryption at rest. This is not currently handled by TiKV itself.

TiKV tracks encrypted data files using the absolute path of the files. As a result, once encryption is turned on for a TiKV node, the user should not change data file paths configuration such as `storage.data-dir`, `raftstore.raftdb-path`, `rocksdb.wal-dir` and `raftdb.wal-dir`.

SM4 encryption is only supported in v6.3.0 and later versions of TiKV. TiKV versions earlier than v6.3.0 only support AES encryption. SM4 encryption might lead to 50% to 80% degradation on throughput.

#### 14.9.4.1.2 TiFlash

TiFlash supports encryption at rest. Data keys are generated by TiFlash. All files (including data files, schema files, and temporary files) written into TiFlash (including TiFlash Proxy) are encrypted using the current data key. The encryption algorithms, the encryption configuration (in the `tiflash-learner.toml` file supported by TiFlash, and the meanings of monitoring metrics are consistent with those of TiKV.

If you have deployed TiFlash with Grafana, you can check the **TiFlash-Proxy-Details** -> **Encryption** panel.

SM4 encryption is only supported in v6.4.0 and later versions of TiFlash. TiFlash versions earlier than v6.4.0 only support AES encryption.

#### 14.9.4.1.3 PD

Encryption-at-rest for PD is an experimental feature, which is configured in the same way as in TiKV.

#### 14.9.4.1.4 Backups with BR

BR supports S3 server-side encryption (SSE) when backing up data to S3. A customer-owned AWS KMS key can also be used together with S3 server-side encryption. See [BR S3 server-side encryption](#) for details.

#### 14.9.4.1.5 Logging

TiKV, TiDB, and PD info logs might contain user data for debugging purposes. The info log and this data in it are not encrypted. It is recommended to enable [log redaction](#).

### 14.9.4.2 TiKV encryption at rest

#### 14.9.4.2.1 Overview

TiKV currently supports encrypting data using AES128, AES192, AES256, or SM4 (only in v6.3.0 and later versions), in CTR mode. TiKV uses envelope encryption. As a result, two types of keys are used in TiKV when encryption is enabled.

- Master key. The master key is provided by user and is used to encrypt the data keys TiKV generates. Management of master key is external to TiKV.
- Data key. The data key is generated by TiKV and is the key actually used to encrypt data.

The same master key can be shared by multiple instances of TiKV. The recommended way to provide a master key in production is via AWS KMS. Create a customer master key (CMK) through AWS KMS, and then provide the CMK key ID to TiKV in the configuration file. The TiKV process needs access to the KMS CMK while it is running, which can be done by using an [IAM role](#). If TiKV fails to get access to the KMS CMK, it will fail to start or restart. Refer to AWS documentation for [KMS](#) and [IAM](#) usage.

Alternatively, if using custom key is desired, supplying the master key via file is also supported. The file must contain a 256 bits (or 32 bytes) key encoded as hex string, end with a newline (namely, `\n`), and contain nothing else. Persisting the key on disk, however, leaks the key, so the key file is only suitable to be stored on the `tempfs` in RAM.

Data keys are passed to the underlying storage engine (namely, RocksDB). All files written by RocksDB, including SST files, WAL files, and the MANIFEST file, are encrypted by the current data key. Other temporary files used by TiKV that may include user data are also encrypted using the same data key. Data keys are automatically rotated by TiKV every week by default, but the period is configurable. On key rotation, TiKV does not rewrite all existing files to replace the key, but RocksDB compaction are expected to rewrite old data into new data files, with the most recent data key, if the cluster gets constant write workload. TiKV keeps track of the key and encryption method used to encrypt each of the files and use the information to decrypt the content on reads.

Regardless of data encryption method, data keys are encrypted using AES256 in GCM mode for additional authentication. This required the master key to be 256 bits (32 bytes), when passing from file instead of KMS.

#### 14.9.4.2.2 Key creation

To create a key on AWS, follow these steps:

1. Go to the [AWS KMS](#) on the AWS console.
2. Make sure that you have selected the correct region on the top right corner of your console.
3. Click **Create key** and select **Symmetric** as the key type.
4. Set an alias for the key.

You can also perform the operations using the AWS CLI:

```
aws --region us-west-2 kms create-key
aws --region us-west-2 kms create-alias --alias-name "alias/tidb-tde" --
 ↪ target-key-id 0987dcba-09fe-87dc-65ba-ab0987654321
```

The `--target-key-id` to enter in the second command is in the output of the first command.

#### 14.9.4.2.3 Configure encryption

To enable encryption, you can add the encryption section in the configuration files of TiKV and PD:

```
[security.encryption]
data-encryption-method = "aes128-ctr"
data-key-rotation-period = "168h" # 7 days
```

Possible values for `data-encryption-method` are “aes128-ctr”, “aes192-ctr”, “aes256-ctr”, “sm4-ctr” (only in v6.3.0 and later versions) and “plaintext”. The default value is “plaintext”, which means encryption is not turned on. `data-key-rotation-period` defines how often TiKV rotates the data key. Encryption can be turned on for a fresh TiKV cluster, or an existing TiKV cluster, though only data written after encryption is enabled is guaranteed to be encrypted. To disable encryption, remove `data-encryption-method` in the configuration file, or reset it to “plaintext”, and restart TiKV. To change encryption method, update `data-encryption-method` in the configuration file and restart TiKV. To change the encryption algorithm, replace `data-encryption-method` with a supported encryption algorithm and then restart TiKV. After the replacement, as new data is written in, the encryption file generated by the previous encryption algorithm is gradually rewritten to a file generated by the new encryption algorithm.

The master key has to be specified if encryption is enabled (that is, `data-encryption` ↪ `-method` is not “plaintext”). To specify a AWS KMS CMK as master key, add the `encryption.master-key` section after the `encryption` section:

```
[security.encryption.master-key]
type = "kms"
```

```
key-id = "0987dcba-09fe-87dc-65ba-ab0987654321"
region = "us-west-2"
endpoint = "https://kms.us-west-2.amazonaws.com"
```

The `key-id` specifies the key ID for the KMS CMK. The `region` is the AWS region name for the KMS CMK. The `endpoint` is optional and you do not need to specify it normally unless you are using an AWS KMS-compatible service from a non-AWS vendor or need to use a [VPC endpoint for KMS](#).

You can also use [multi-Region keys](#) in AWS. For this, you need to set up a primary key in a specific region and add replica keys in the regions you require.

To specify a master key that's stored in a file, the master key configuration would look like the following:

```
[security.encryption.master-key]
type = "file"
path = "/path/to/key/file"
```

Here `path` is the path to the key file. The file must contain a 256 bits (or 16 bytes) key encoded as hex string, end with a newline (`\n`) and contain nothing else. Example of the file content:

```
3b5896b5be691006e0f71c3040a29495ddcad20b14aff61806940ebd780d3c62
```

#### 14.9.4.2.4 Rotate the master key

To rotate master key, you have to specify both of the new master key and old master key in the configuration, and restart TiKV. Use `security.encryption.master-key` to specify the new master key, and use `security.encryption.previous-master-key` to specify the old master key. The configuration format for `security.encryption.previous-master-key`  $\leftrightarrow$  is the same as `encryption.master-key`. On restart TiKV must access both of the old and new master key, but once TiKV is up and running, TiKV will only need access to the new key. It is okay to leave the `encryption.previous-master-key` configuration in the configuration file from that on. Even on restart, TiKV only tries to use the old key if it fails to decrypt existing data using the new master key.

Currently online master key rotation is not supported, so you need to restart TiKV. It is advised to do a rolling restart to a running TiKV cluster serving online query.

Here is an example configuration for rotating the KMS CMK:

```
[security.encryption.master-key]
type = "kms"
key-id = "50a0c603-1c6f-11e6-bb9e-3fadde80ce75"
region = "us-west-2"

[security.encryption.previous-master-key]
```

```
type = "kms"
key-id = "0987dcba-09fe-87dc-65ba-ab0987654321"
region = "us-west-2"
```

#### 14.9.4.2.5 Monitoring and debugging

To monitor encryption at rest, if you deploy TiKV with Grafana, you can look at the **Encryption** panel in the **TiKV-Details** dashboard. There are a few metrics to look for:

- Encryption initialized: 1 if encryption is initialized during TiKV startup, 0 otherwise. In case of master key rotation, after encryption is initialized, TiKV do not need access to the previous master key.
- Encryption data keys: number of existing data keys. The number is bumped by 1 after each time data key rotation happened. Use this metrics to monitor if data key rotation works as expected.
- Encrypted files: number of encrypted data files currently exists. Compare this number to existing data files in the data directory to estimate portion of data being encrypted, when turning on encryption for a previously unencrypted cluster.
- Encryption meta file size: size of the encryption meta data files.
- Read/Write encryption meta duration: the extra overhead to operate on metadata for encryption.

For debugging, the `tikv-ctl` command can be used to dump encryption metadata such as encryption method and data key id used to encryption the file, as well as list of data keys. Since the operation can expose sensitive data, it is not recommended to use in production. Please refer to [TiKV Control](#) document.

#### 14.9.4.2.6 Compatibility between TiKV versions

To reduce the overhead caused by I/O and mutex contention when TiKV manages the encryption metadata, an optimization is introduced in TiKV v4.0.9 and controlled by `security.encryption.enable-file-dictionary-log` in the TiKV configuration file. This configuration parameter takes effect only on TiKV v4.0.9 or later versions.

When it is enabled (by default), the data format of encryption metadata is unrecognizable by TiKV v4.0.8 or earlier versions. For example, assume that you use TiKV v4.0.9 or later with encryption at rest and the default `enable-file-dictionary-log` configuration. If you downgrade your cluster to TiKV v4.0.8 or earlier, TiKV will fail to start, with an error in the info log similar to the following one:

```
[2020/12/07 07:26:31.106 +08:00] [ERROR] [mod.rs:110] ["encryption: failed
 ↳ to load file dictionary."
[2020/12/07 07:26:33.598 +08:00] [FATAL] [lib.rs:483] ["called `Result::
 ↳ unwrap()` on an `Err` value: Other(`\"[components/encryption/src/
 ↳ encrypted_file/header.rs:18]: unknown version 2\"")"]
```

To avoid the error above, you can first set `security.encryption.enable-file-dictionary-log` to `false` and start TiKV with v4.0.9 or later. Once TiKV starts successfully, the data format of encryption metadata is downgraded to the version recognizable to earlier TiKV versions. At this point, you can then downgrade your TiKV cluster to an earlier version.

### 14.9.4.3 TiFlash encryption at rest

#### 14.9.4.3.1 Overview

The encryption algorithm currently supported by TiFlash is consistent with that supported by TiKV, including AES128, AES192, AES256, and SM4 (only in v6.4.0 and later versions), in CTR mode. TiFlash also uses envelope encryption. Therefore, two types of keys are used in TiFlash when encryption is enabled.

- Master key. The master key is provided by user and is used to encrypt the data keys TiFlash generates. Management of master key is external to TiFlash.
- Data key. The data key is generated by TiFlash and is the key actually used to encrypt data.

The same master key can be shared by multiple instances of TiFlash, and can also be shared among TiFlash and TiKV. The recommended way to provide a master key in production is via AWS KMS. Alternatively, if using custom key is desired, supplying the master key via file is also supported. The specific method to generate master key and the format of the master key are the same as TiKV.

TiFlash uses the current data key to encrypt all data placed on the disk, including data files, Schema files, and temporary data files generated during calculations. Data keys are automatically rotated by TiFlash every week by default, and the period is configurable. On key rotation, TiFlash does not rewrite all existing files to replace the key, but background compaction tasks are expected to rewrite old data into new data files, with the most recent data key, if the cluster gets constant write workload. TiFlash keeps track of the key and encryption method used to encrypt each of the files and use the information to decrypt the content on reads.

#### 14.9.4.3.2 Key creation

To create a key on AWS, refer to the steps to create a key for TiKV.

#### 14.9.4.3.3 Configure encryption

To enable encryption, you can add the encryption section in the `tiflash-learner.toml` configuration file:

```
[security.encryption]
data-encryption-method = "aes128-ctr"
data-key-rotation-period = "168h" # 7 days
```

Alternatively, add the following contents in the TiUP cluster template:

```
server_configs:
 tiflash-learner:
 security.encryption.data-encryption-method: "aes128-ctr"
 security.encryption.data-key-rotation-period: "168h" # 7 days
```

Possible values for `data-encryption-method` are “aes128-ctr”, “aes192-ctr”, “aes256-ctr”, “sm4-ctr” (only in v6.4.0 and later versions) and “plaintext”. The default value is “plaintext”, which means encryption is not turned on. `data-key-rotation-period` defines how often TiFlash rotates the data key. Encryption can be turned on for a fresh TiFlash cluster, or an existing TiFlash cluster, though only data written after encryption is enabled is guaranteed to be encrypted. To disable encryption, remove `data-encryption-method` ↪ in the configuration file, or reset it to “plaintext”, and restart TiFlash. To change encryption method, update `data-encryption-method` in the configuration file and restart TiFlash. To change the encryption algorithm, replace `data-encryption-method` with a supported encryption algorithm and then restart TiFlash. After the replacement, as new data is written in, the encryption file generated by the previous encryption algorithm is gradually rewritten to a file generated by the new encryption algorithm.

The master key has to be specified if encryption is enabled (that is, `data-encryption` ↪ `-method` is not “plaintext”). To specify an AWS KMS CMK as the master key, add the `encryption.master-key` section after the `encryption` section in the `tiflash-learner` ↪ `.toml` configuration file:

```
[security.encryption.master-key]
type = "kms"
key-id = "0987dcba-09fe-87dc-65ba-ab0987654321"
region = "us-west-2"
endpoint = "https://kms.us-west-2.amazonaws.com"
```

Alternatively, add the following contents in the TiUP cluster template:

```
server_configs:
 tiflash-learner:
 security.encryption.master-key.type: "kms"
 security.encryption.master-key.key-id: "0987dcba-09fe-87dc-65ba-
 ↪ ab0987654321"
 security.encryption.master-key.region: "us-west-2"
 security.encryption.master-key.endpoint: "https://kms.us-west-2.
 ↪ aws.com"
```

The meanings of the preceding configuration items are the same as those of TiKV.

To specify a master key that is stored in a file, add the following configuration in the `tiflash-learner.toml` configuration file:

```
[security.encryption.master-key]
type = "file"
path = "/path/to/key/file"
```

Alternatively, add the following contents in the TiUP cluster template:

```
server_configs:
 tiflash-learner:
 security.encryption.master-key.type: "file"
 security.encryption.master-key.path: "/path/to/key/file"
```

The meanings of the preceding configuration items and the content format of the key file are the same as those of TiKV.

#### 14.9.4.3.4 Rotate the master key

To rotate the master key of TiFlash, follow the steps to rotate the master key of TiKV. Currently, TiFlash does not support online master key rotation, either. Therefore, you need to restart TiFlash to make the rotation effective. It is recommended to do a rolling restart to a running TiFlash cluster serving online query.

To rotate the KMS CMK, add the following contents in the `tiflash-learner.toml` configuration file:

```
[security.encryption.master-key]
type = "kms"
key-id = "50a0c603-1c6f-11e6-bb9e-3fadde80ce75"
region = "us-west-2"

[security.encryption.previous-master-key]
type = "kms"
key-id = "0987dcba-09fe-87dc-65ba-ab0987654321"
region = "us-west-2"
```

Alternatively, add the following contents in the TiUP cluster template:

```
server_configs:
 tiflash-learner:
 security.encryption.master-key.type: "kms"
 security.encryption.master-key.key-id: "50a0c603-1c6f-11e6-bb9e-3
 ↪ fadde80ce75"
 security.encryption.master-key.region: "us-west-2"
 security.encryption.previous-master-key.type: "kms"
```

```
security.encryption.previous-master-key.key-id: "0987dcba-09fe-87dc-65ba
↳ -ab0987654321"
security.encryption.previous-master-key.region: "us-west-2"
```

#### 14.9.4.3.5 Monitoring and debugging

To monitor encryption at rest, if you deploy TiFlash with Grafana, you can look at the **Encryption** panel in the **TiFlash-Proxy-Details** dashboard. The meaning of monitoring items is the same as that of TiKV.

For debugging, since TiFlash reuses TiKV's logic for managing encrypted metadata, the `tikv-ctl` command can be used to dump encryption metadata such as encryption method and data key ID used to encryption the file, as well as list of data keys. This operation can expose sensitive data and is therefore not recommended in production. Refer to [TiKV Control](#) for more details.

#### 14.9.4.3.6 Compatibility between TiKV versions

TiFlash also optimizes encrypted metadata operations in v4.0.9, and its compatibility requirements are the same as those of TiKV. For details, see [Compatibility between TiKV versions](#).

#### 14.9.4.4 BR S3 server-side encryption

To enable S3 server-side encryption when backup to S3 using BR, pass `--s3.sse` argument and set value to "aws:kms". S3 will use its own KMS key for encryption. Example:

```
./br backup full --pd <pd-address> --storage "s3://<bucket>/<prefix>" --s3.
↳ sse aws:kms
```

To use a custom AWS KMS CMK that you created and owned, pass `--s3.sse-kms-↳ key-id` in addition. In this case, both the BR process and all the TiKV nodes in the cluster would need access to the KMS CMK (for example, via AWS IAM), and the KMS CMK needs to be in the same AWS region as the S3 bucket used to store the backup. It is advised to grant access to the KMS CMK to BR process and TiKV nodes via AWS IAM. Refer to AWS documentation for usage of [IAM](#). For example:

```
./br backup full --pd <pd-address> --storage "s3://<bucket>/<prefix>" --s3.
↳ sse aws:kms --s3.sse-kms-key-id 0987dcba-09fe-87dc-65ba-ab0987654321
```

When restoring the backup, both `--s3.sse` and `--s3.sse-kms-key-id` should NOT be used. S3 will figure out encryption settings by itself. The BR process and TiKV nodes in the cluster to restore the backup to would also need access to the KMS CMK, or the restore will fail. Example:

```
./br restore full --pd <pd-address> --storage "s3://<bucket>/<prefix>"
```

## 14.9.5 Enable Encryption for Disk Spill

When the system variable `tidb_enable_tmp_storage_on_oom` is set to ON, if the memory usage of a single SQL statement exceeds the limit of the system variable `tidb_mem_quota_query`, some operators can save the intermediate results during execution as a temporary file to the disk and delete the file after the query is completed.

You can enable encryption for disk spill to prevent attackers from accessing data by reading these temporary files.

### 14.9.5.1 Configure

To enable encryption for the disk spill files, you can configure the item `spilled-file-encryption-method` in the `[security]` section of the TiDB configuration file.

```
[security]
spilled-file-encryption-method = "aes128-ctr"
```

Value options for `spilled-file-encryption-method` are `aes128-ctr` and `plaintext`. The default value is `plaintext`, which means that encryption is disabled.

## 14.9.6 Log Redaction

When TiDB provides detailed log information, it might print sensitive data (for example, user data) in the log, which causes data security risks. To avoid such risks, each component (TiDB, TiKV, and PD) provides a configuration item that enables log redaction to shield user data values.

### 14.9.6.1 Log redaction in TiDB side

To enable log redaction in the TiDB side, set the value of `global.tidb_redact_log` to 1. This configuration value defaults to 0, which means that log redaction is disabled.

You can use the `set` syntax to set the global variable `tidb_redact_log`:

```
set @@global.tidb_redact_log=1;
```

After the setting, all logs generated in new sessions are redacted:

```
create table t (a int, unique key (a));
Query OK, 0 rows affected (0.00 sec)

insert into t values (1),(1);
ERROR 1062 (23000): Duplicate entry '1' for key 't.a'
```

The error log for the INSERT statement above is printed as follows:

```
[2020/10/20 11:45:49.539 +08:00] [INFO] [conn.go:800] ["command dispatched
↳ failed"] [conn=5] [connInfo="id:5, addr:127.0.0.1:57222 status:10,
↳ collation:utf8_general_ci, user:root"] [command=Query] [status="inTxn
↳ :0, autocommit:1"] [sql="insert into t values (?) , (?)"] [
↳ txn_mode=OPTIMISTIC] [err="[kv:1062]Duplicate entry '?' for key 't.a
↳ '"]
```

From the error log above, you can see that all sensitive information is shielded using ? after `tidb_redact_log` is enabled. In this way, data security risks are avoided.

### 14.9.6.2 Log redaction in TiKV side

To enable log redaction in the TiKV side, set the value of `security.redact-info-log` to `true`. This configuration value defaults to `false`, which means that log redaction is disabled.

### 14.9.6.3 Log redaction in PD side

To enable log redaction in the PD side, set the value of `security.redact-info-log` to `true`. This configuration value defaults to `false`, which means that log redaction is disabled.

### 14.9.6.4 Log redaction in TiFlash side

To enable log redaction in the TiFlash side, set both the `security.redact_info_log` value in `tiflash-server` and the `security.redact-info-log` value in `tiflash-learner` to `true`. Both configuration values default to `false`, which means that log redaction is disabled.

## 14.10 Privileges

### 14.10.1 Security Compatibility with MySQL

TiDB supports security features similar to MySQL 5.7, and also supports some security features of MySQL 8.0. The security features of TiDB are different from MySQL in implementation.

#### 14.10.1.1 Unsupported security features

- Column level permissions.
- These permission attributes: `max_questions`, `max_updated`, and `max_user_connections`
  - ↳ .
- Password verification policy, which requires you to verify the current password when you change it.
- Dual password policy.
- Random password generation.
- Multi-factor authentication.

## 14.10.1.2 Differences with MySQL

### 14.10.1.2.1 Password expiration policy

The password expiration policies of TiDB and MySQL have the following differences:

- MySQL supports password expiration policy in v5.7 and v8.0.
- TiDB supports password expiration policy starting from v6.5.0.

The expiration mechanism of TiDB is different from MySQL in the following aspects:

- In MySQL v5.7 and v8.0, the configuration of the client and the server combined together determines whether to enable “sandbox mode” for the client connection.
- In TiDB, the `security.disconnect-on-expired-password` configuration item alone determines whether to enable “sandbox mode” for the client connection.

### 14.10.1.2.2 Password complexity policy

The password complexity policies of TiDB and MySQL have the following differences:

- MySQL v5.7 implements the password complexity policy by using the `validate_password` ↪ plugin.
- MySQL v8.0 re-implements the password complexity policy by using the `validate_password` ↪ component.
- TiDB introduces a built-in password complexity management feature starting from v6.5.0.

The feature implementation has the following differences:

- Enable the feature:
  - In MySQL v5.7, the feature is implemented by using the `validate_password` plugin. You can enable the feature by installing the plugin.
  - In MySQL v8.0, the feature is implemented by using the `validate_password` component. You can enable the feature by installing the component.
  - For TiDB, this feature is built-in. You can enable the feature using the system variable `validate_password.enable`.
- Dictionary check:
  - In MySQL v5.7, you can specify a file path using the `validate_password_dictionary_file` ↪ variable. The file contains a list of words that are not allowed to exist in passwords.

- In MySQL v8.0, you can specify a file path using the `validate_password.dictionary_file` variable. The file contains a list of words that are not allowed to exist in passwords.
- In TiDB, you can specify a string using the `validate_password.dictionary` system variable. The string contains a list of words that are not allowed to exist in passwords.

#### 14.10.1.2.3 Password failure tracking

The password failure tracking policies of TiDB and MySQL have the following differences:

- MySQL v5.7 does not support password failure tracking.
- MySQL v8.0 supports password failure tracking.
- TiDB supports password failure tracking starting from v6.5.0.

Because the number of failed attempts and lock status of accounts need to be globally consistent, and as a distributed database, TiDB cannot record the number of failed attempts and lock status in the server memory like MySQL, so the implementation mechanisms are different between TiDB and MySQL.

- For users that are not locked automatically, the count of failed attempts is reset in the following scenarios:
  - MySQL 8.0:
    - \* When the server is restarted, the count of failed attempts for all accounts is reset.
    - \* When `FLUSH PRIVILEGES` is executed, the count of failed attempts for all accounts is reset.
    - \* When you run `ALTER USER ... ACCOUNT UNLOCK` to unlock an account, the count is reset.
    - \* When an account logs in successfully, the count is reset.
  - TiDB:
    - \* When you run `ALTER USER ... ACCOUNT UNLOCK` to unlock an account, the count is reset.
    - \* When an account logs in successfully, the count is reset.
- For users that are locked automatically, the count of failed attempts is reset in the following scenarios:
  - MySQL 8.0:
    - \* When the server is restarted, the temporary locking for all accounts is reset.
    - \* When `FLUSH PRIVILEGES` is executed, the temporary locking for all accounts is reset.

- \* If the lock time of an account ends, the temporary locking for the account is reset on the next login attempt.
  - \* When you run `ALTER USER . . . ACCOUNT UNLOCK` to unlock an account, the temporary locking for the account is reset.
- TiDB:
- \* If the lock time of an account ends, the temporary locking for the account is reset on the next login attempt.
  - \* When you run `ALTER USER . . . ACCOUNT UNLOCK` to unlock an account, the temporary locking for the account is reset.

#### 14.10.1.2.4 Password reuse policy

The password reuse policies of TiDB and MySQL have the following differences:

- MySQL v5.7 does not support password reuse management.
- MySQL v8.0 supports password reuse management.
- TiDB supports password reuse management starting from v6.5.0.

The implementation mechanisms are consistent between TiDB and MySQL. Both use the `mysql.password_history` system table to implement the password reuse management feature. However, when deleting a user that does not exist in the `mysql.user` system table, TiDB and MySQL have different behaviors:

- Scenario: A user (`user01`) is not created in a normal way; instead, it is created by using the `INSERT INTO mysql.password_history VALUES (...)` statement to append a record of `user01` to the `mysql.password_history` system table. In such cases, because the record of `user01` does not exist in the `mysql.user` system table, when you run `DROP USER` on `user01`, TiDB and MySQL have different behaviors.
  - MySQL: When you run `DROP USER user01`, MySQL tries to find `user01` in `mysql.user` and `mysql.password_history`. If either system table contains `user01`, the `DROP USER` statement is executed successfully and no error is reported.
  - TiDB: When you run `DROP USER user01`, TiDB tries to find `user01` only in `mysql.user`. If no related record is found, the `DROP USER` statement fails and an error is reported. If you want to execute the statement successfully and delete the `user01` record from `mysql.password_history`, use `DROP USER IF EXISTS user01` instead.

#### 14.10.1.3 Authentication plugin status

TiDB supports multiple authentication methods. These methods can be specified on a per user basis using `CREATE USER` and `ALTER USER`. These methods are compatible with the authentication methods of MySQL with the same names.

You can use one of the following supported authentication methods in the table. To specify a default method that the server advertises when the client-server connection is being established, set the `default_authentication_plugin` variable. `tidb_sm3_password` is the SM3 authentication method only supported in TiDB. Therefore, to authenticate using this method, you must connect to TiDB using [TiDB-JDBC](#). `tidb_auth_token` is a JSON Web Token (JWT) based authentication method used only in TiDB Cloud.

The support for TLS authentication is configured differently. For detailed information, see [Enable TLS between TiDB Clients and Servers](#).

| Authentication Method              | Supported        |
|------------------------------------|------------------|
| <code>mysql_native_password</code> | Yes              |
| <code>sha256_password</code>       | No               |
| <code>caching_sha2_password</code> | Yes, since 5.2.0 |
| <code>auth_socket</code>           | Yes, since 5.3.0 |
| <code>tidb_sm3_password</code>     | Yes, since 6.3.0 |
| <code>tidb_auth_token</code>       | Yes, since 6.4.0 |
| TLS Certificates                   | Yes              |
| LDAP                               | No               |
| PAM                                | No               |
| ed25519 (MariaDB)                  | No               |
| GSSAPI (MariaDB)                   | No               |
| FIDO                               | No               |

## 14.10.2 Privilege Management

TiDB supports MySQL 5.7's privilege management system, including the syntax and privilege types. The following features from MySQL 8.0 are also supported:

- SQL Roles, starting with TiDB 3.0.
- Dynamic privileges, starting with TiDB 5.1.

This document introduces privilege-related TiDB operations, privileges required for TiDB operations and implementation of the privilege system.

### 14.10.2.1 Privilege-related operations

#### 14.10.2.1.1 Grant privileges

The `GRANT` statement grants privileges to the user accounts.

For example, use the following statement to grant the `xxx` user the privilege to read the `test` database.

```
GRANT SELECT ON test.* TO 'xxx'@'%';
```

Use the following statement to grant the `xxx` user all privileges on all databases:

```
GRANT ALL PRIVILEGES ON *.* TO 'xxx'@'%';
```

By default, `GRANT` statements will return an error if the user specified does not exist. This behavior depends on if the SQL Mode `NO_AUTO_CREATE_USER` is specified:

```
mysql> SET sql_mode=DEFAULT;
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT @@sql_mode;
+---+
| @@sql_mode
+---+
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_ZERO_DATE,
 ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,NO_ENGINE_SUBSTITUTION
+---+
1 row in set (0.00 sec)

mysql> SELECT * FROM mysql.user WHERE user='idontexist';
Empty set (0.00 sec)

mysql> GRANT ALL PRIVILEGES ON test.* TO 'idontexist';
ERROR 1105 (HY000): You are not allowed to create a user with GRANT

mysql> SELECT user,host,authentication_string FROM mysql.user WHERE user='
 idontexist';
Empty set (0.00 sec)
```

In the following example, the user `idontexist` is automatically created with an empty password because the SQL Mode `NO_AUTO_CREATE_USER` was not set. This is **not recommended** since it presents a security risk: miss-spelling a username will result in a new user created with an empty password:

```
mysql> SET @@sql_mode='ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,
 NO_ZERO_IN_DATE,NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,
 NO_ENGINE_SUBSTITUTION';
```

```

Query OK, 0 rows affected (0.00 sec)

mysql> SELECT @@sql_mode;
+---+
| @@sql_mode
+---+
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_ZERO_DATE,
 ↳ ERROR_FOR_DIVISION_BY_ZERO,NO_ENGINE_SUBSTITUTION |
+---+
1 row in set (0.00 sec)

mysql> SELECT * FROM mysql.user WHERE user='idontexist';
Empty set (0.00 sec)

mysql> GRANT ALL PRIVILEGES ON test.* TO 'idontexist';
Query OK, 1 row affected (0.05 sec)

mysql> SELECT user,host,authentication_string FROM mysql.user WHERE user='
 ↳ idontexist';
+-----+-----+-----+
| user | host | authentication_string |
+-----+-----+-----+
| idontexist | % | |
+-----+-----+-----+
1 row in set (0.01 sec)

```

You can use fuzzy matching in GRANT to grant privileges to databases.

```

mysql> GRANT ALL PRIVILEGES ON `te%`.* TO genius;
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT user,host,db FROM mysql.db WHERE user='genius';
+-----/-----/-----+
| user | host | db |
+-----/-----/-----+
| genius | % | te% |
+-----/-----/-----+

```

```
1 row in set (0.00 sec)
```

In this example, because of the % in `te%`, all the databases starting with `te` are granted the privilege.

#### 14.10.2.1.2 Revoke privileges

The `REVOKE` statement enables system administrators to revoke privileges from the user accounts.

The `REVOKE` statement corresponds with the `REVOKE` statement:

```
REVOKE ALL PRIVILEGES ON `test`.* FROM 'genius'@'localhost';
```

#### Note:

To revoke privileges, you need the exact match. If the matching result cannot be found, an error will be displayed:

```
mysql> REVOKE ALL PRIVILEGES ON `te%`.* FROM 'genius'@'%';
ERROR 1141 (42000): There is no such grant defined for user 'genius' on
↪ host '%'
```

About fuzzy matching, escape, string and identifier:

```
mysql> GRANT ALL PRIVILEGES ON `te\%`.* TO 'genius'@'localhost';
Query OK, 0 rows affected (0.00 sec)
```

This example uses exact match to find the database named `te%`. Note that the % uses the `\` escape character so that % is not considered as a wildcard.

A string is enclosed in single quotation marks ("), while an identifier is enclosed in backticks (""). See the differences below:

```
mysql> GRANT ALL PRIVILEGES ON 'test'.* TO 'genius'@'localhost';
ERROR 1064 (42000): You have an error in your SQL syntax; check the
manual that corresponds to your MySQL server version for the right
syntax to use near ''test'.* to 'genius'@'localhost'' at line 1

mysql> GRANT ALL PRIVILEGES ON `test`.* TO 'genius'@'localhost';
Query OK, 0 rows affected (0.00 sec)
```

If you want to use special keywords as table names, enclose them in backticks (""). For example:

```
mysql> CREATE TABLE `select` (id int);
Query OK, 0 rows affected (0.27 sec)
```

### 14.10.2.1.3 Check privileges granted to users

You can use the `SHOW GRANTS` statement to see what privileges are granted to a user. For example:

```
SHOW GRANTS; -- show grants for the current user

+-----+
| Grants for User |
+-----+
| GRANT ALL PRIVILEGES ON *.* TO 'root'@'%' WITH GRANT OPTION |
+-----+
SHOW GRANTS FOR 'root'@'%'; -- show grants for a specific user
```

For example, create a user `rw_user@192.168.%` and grant the user with write privilege on the `test.write_table` table and global read privilege.

```
CREATE USER `rw_user`@`192.168.%`;
GRANT SELECT ON *.* TO `rw_user`@`192.168.%`;
GRANT INSERT, UPDATE ON `test`.`write_table` TO `rw_user`@`192.168.%`;
```

Show granted privileges of the `rw_user@192.168.%` user:

```
SHOW GRANTS FOR `rw_user`@`192.168.%`;

+-----+
| Grants for rw_user@192.168.% |
+-----+
| GRANT Select ON *.* TO 'rw_user'@'192.168.%' |
| GRANT Insert,Update ON test.write_table TO 'rw_user'@'192.168.%' |
+-----+
```

### 14.10.2.1.4 Dynamic privileges

Since v5.1, TiDB features support dynamic privileges, a feature borrowed from MySQL 8.0. Dynamic privileges are intended to replace the `SUPER` privilege by implementing more fine-grained access to certain operations. For example, using dynamic privileges, system administrators can create a user account that can only perform `BACKUP` and `RESTORE` operations.

Dynamic privileges include:

- `BACKUP_ADMIN`

- RESTORE\_ADMIN
- SYSTEM\_USER
- SYSTEM\_VARIABLES\_ADMIN
- ROLE\_ADMIN
- CONNECTION\_ADMIN
- PLACEMENT\_ADMIN allows privilege owners to create, modify, and remove placement policies.
- DASHBOARD\_CLIENT allows privilege owners to log in to TiDB Dashboard.
- RESTRICTED\_TABLES\_ADMIN allows privilege owners to view system tables when SEM is enabled.
- RESTRICTED\_STATUS\_ADMIN allows privilege owners to view all status variables in `SHOW ↔ [GLOBAL|SESSION] STATUS` when SEM is enabled.
- RESTRICTED\_VARIABLES\_ADMIN allows privilege owners to view all system variables when SEM is enabled.
- RESTRICTED\_USER\_ADMIN prohibits privilege owners to have their access revoked by SUPER users when SEM is enabled.
- RESTRICTED\_CONNECTION\_ADMIN allows privilege owners to kill connections of RESTRICTED\_USER\_ADMIN users. This privilege affects KILL and KILL TIDB statements.
- RESTRICTED\_REPLICA\_WRITER\_ADMIN allows privilege owners to perform write or update operations without being affected when the read-only mode is enabled in the TiDB cluster. For details, see `tidb_restricted_read_only`.

To see the full set of dynamic privileges, execute the `SHOW PRIVILEGES` statement. Because plugins are permitted to add new privileges, the list of privileges that are assignable might differ based on your TiDB installation.

### 14.10.2.2 SUPER privilege

- The SUPER privilege allows the user to perform almost any operation. By default, only the root user is granted with this privilege. Be careful when granting this privilege to other users.
- The SUPER privilege is considered [deprecated in MySQL 8.0](#) and can be replaced by `dynamic privileges` to provide more fine-grained access control.

### 14.10.2.3 Privileges required for TiDB operations

You can check privileges of TiDB users in the `INFORMATION_SCHEMA.USER_PRIVILEGES` table. For example:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.USER_PRIVILEGES WHERE grantee = ''
↔ root'@'%'";
```

| GRANTEE | TABLE_CATALOG | PRIVILEGE_TYPE | IS_GRANTABLE |
|---------|---------------|----------------|--------------|
|---------|---------------|----------------|--------------|

|            |     |                         |     |
|------------|-----|-------------------------|-----|
| 'root'@'%' | def | Select                  | YES |
| 'root'@'%' | def | Insert                  | YES |
| 'root'@'%' | def | Update                  | YES |
| 'root'@'%' | def | Delete                  | YES |
| 'root'@'%' | def | Create                  | YES |
| 'root'@'%' | def | Drop                    | YES |
| 'root'@'%' | def | Process                 | YES |
| 'root'@'%' | def | References              | YES |
| 'root'@'%' | def | Alter                   | YES |
| 'root'@'%' | def | Show Databases          | YES |
| 'root'@'%' | def | Super                   | YES |
| 'root'@'%' | def | Execute                 | YES |
| 'root'@'%' | def | Index                   | YES |
| 'root'@'%' | def | Create User             | YES |
| 'root'@'%' | def | Create Tablespace       | YES |
| 'root'@'%' | def | Trigger                 | YES |
| 'root'@'%' | def | Create View             | YES |
| 'root'@'%' | def | Show View               | YES |
| 'root'@'%' | def | Create Role             | YES |
| 'root'@'%' | def | Drop Role               | YES |
| 'root'@'%' | def | CREATE TEMPORARY TABLES | YES |
| 'root'@'%' | def | LOCK TABLES             | YES |
| 'root'@'%' | def | CREATE ROUTINE          | YES |
| 'root'@'%' | def | ALTER ROUTINE           | YES |
| 'root'@'%' | def | EVENT                   | YES |
| 'root'@'%' | def | SHUTDOWN                | YES |
| 'root'@'%' | def | RELOAD                  | YES |
| 'root'@'%' | def | FILE                    | YES |
| 'root'@'%' | def | CONFIG                  | YES |
| 'root'@'%' | def | REPLICATION CLIENT      | YES |
| 'root'@'%' | def | REPLICATION SLAVE       | YES |

+-----+-----+-----+-----+

31 rows in set (0.00 sec)

### 14.10.2.3.1 ALTER

- For all ALTER statements, users must have the ALTER privilege for the corresponding table.
- For statements except ALTER...DROP and ALTER...RENAME TO, users must have the INSERT and CREATE privileges for the corresponding table.
- For the ALTER...DROP statement, users must have the DROP privilege for the corresponding table.
- For the ALTER...RENAME TO statement, users must have the DROP privilege for the table before renaming, and the CREATE and INSERT privileges for the table after renaming.

**Note:**

In MySQL 5.7 documentation, users need `INSERT` and `CREATE` privileges to perform the `ALTER` operation on a table. But in reality for MySQL 5.7.25, only the `ALTER` privilege is required in this case. Currently, the `ALTER` privilege in TiDB is consistent with the actual behavior in MySQL.

**14.10.2.3.2 BACKUP**

Requires the `SUPER` or `BACKUP_ADMIN` privilege.

**14.10.2.3.3 CREATE DATABASE**

Requires the `CREATE` privilege for the database.

**14.10.2.3.4 CREATE INDEX**

Requires the `INDEX` privilege for the table.

**14.10.2.3.5 CREATE TABLE**

Requires the `CREATE` privilege for the table.

To execute the `CREATE TABLE...LIKE...` statement, the `SELECT` privilege for the table is required.

**14.10.2.3.6 CREATE VIEW**

Requires the `CREATE VIEW` privilege.

**Note:**

If the current user is not the user that creates the View, both the `CREATE VIEW` and `SUPER` privileges are required.

**14.10.2.3.7 DROP DATABASE**

Requires the `DROP` privilege for the table.

**14.10.2.3.8 DROP INDEX**

Requires the `INDEX` privilege for the table.

#### **14.10.2.3.9 DROP TABLES**

Requires the DROP privilege for the table.

#### **14.10.2.3.10 LOAD DATA**

Requires the INSERT privilege for the table. When you use REPLACE INTO, the DELETE privilege is also required.

#### **14.10.2.3.11 TRUNCATE TABLE**

Requires the DROP privilege for the table.

#### **14.10.2.3.12 RENAME TABLE**

Requires the ALTER and DROP privileges for the table before renaming and the CREATE and INSERT privileges for the table after renaming.

#### **14.10.2.3.13 ANALYZE TABLE**

Requires the INSERT and SELECT privileges for the table.

#### **14.10.2.3.14 SHOW**

SHOW CREATE TABLE requires any single privilege to the table.

SHOW CREATE VIEW requires the SHOW VIEW privilege.

SHOW GRANTS requires the SELECT privilege to the mysql database. If the target user is current user, SHOW GRANTS does not require any privilege.

SHOW PROCESSLIST requires SUPER to show connections belonging to other users.

#### **14.10.2.3.15 CREATE ROLE/USER**

CREATE ROLE requires the CREATE ROLE privilege.

CREATE USER requires the CREATE USER privilege.

#### **14.10.2.3.16 DROP ROLE/USER**

DROP ROLE requires the DROP ROLE privilege.

DROP USER requires the CREATE USER privilege.

#### **14.10.2.3.17 ALTER USER**

Requires the CREATE USER privilege.

#### **14.10.2.3.18 GRANT**

Requires the **GRANT** privilege with the privileges granted by **GRANT**.

Requires additional **CREATE USER** privilege to create a user implicitly.

**GRANT ROLE** requires **SUPER** or **ROLE\_ADMIN** privilege.

#### **14.10.2.3.19 REVOKE**

Requires the **GRANT** privilege and those privileges targeted by the **REVOKE** statement.

**REVOKE ROLE** requires **SUPER** or **ROLE\_ADMIN** privilege.

#### **14.10.2.3.20 SET GLOBAL**

Requires **SUPER** or **SYSTEM\_VARIABLES\_ADMIN** privilege to set global variables.

#### **14.10.2.3.21 ADMIN**

Requires **SUPER** privilege.

#### **14.10.2.3.22 SET DEFAULT ROLE**

Requires **SUPER** privilege.

#### **14.10.2.3.23 KILL**

Requires **SUPER** or **CONNECTION\_ADMIN** privilege to kill other user sessions.

#### **14.10.2.3.24 CREATE RESOURCE GROUP**

Requires **SUPER** or **RESOURCE\_GROUP\_ADMIN** privilege.

#### **14.10.2.3.25 ALTER RESOURCE GROUP**

Requires **SUPER** or **RESOURCE\_GROUP\_ADMIN** privilege.

#### **14.10.2.3.26 DROP RESOURCE GROUP**

Requires **SUPER** or **RESOURCE\_GROUP\_ADMIN** privilege.

### **14.10.2.4 Implementation of the privilege system**

#### 14.10.2.4.1 Privilege table

The following system tables are special because all the privilege-related data is stored in them:

- `mysql.user` (user account, global privilege)
- `mysql.db` (database-level privilege)
- `mysql.tables_priv` (table-level privilege)
- `mysql.columns_priv` (column-level privilege; not currently supported)

These tables contain the effective range and privilege information of the data. For example, in the `mysql.user` table:

```
mysql> SELECT User,Host,Select_priv,Insert_priv FROM mysql.user LIMIT 1;
+-----/-----/-----/-----+
| User | Host | Select_priv | Insert_priv |
+-----/-----/-----/-----+
| root | % | Y | Y |
+-----/-----/-----/-----+
1 row in set (0.00 sec)
```

In this record, `Host` and `User` determine that the connection request sent by the `root` user from any host (`%`) can be accepted. `Select_priv` and `Insert_priv` mean that the user has global `Select` and `Insert` privilege. The effective range in the `mysql.user` table is global.

`Host` and `User` in `mysql.db` determine which databases users can access. The effective range is the database.

#### Note:

It is recommended to only update the privilege tables via the supplied syntax such as `GRANT`, `CREATE USER` and `DROP USER`. Making direct edits to the underlying privilege tables will not automatically update the privilege cache, leading to unpredictable behavior until `FLUSH PRIVILEGES` is executed.

#### 14.10.2.4.2 Connection verification

When the client sends a connection request, TiDB server will verify the login operation. TiDB server first checks the `mysql.user` table. If a record of `User` and `Host` matches the connection request, TiDB server then verifies the `authentication_string`.

User identity is based on two pieces of information: `Host`, the host that initiates the connection, and `User`, the user name. If the user name is not empty, the exact match of user named is a must.

`User+Host` may match several rows in `user` table. To deal with this scenario, the rows in the `user` table are sorted. The table rows will be checked one by one when the client connects; the first matched row will be used to verify. When sorting, `Host` is ranked before `User`.

#### 14.10.2.4.3 Request verification

When the connection is successful, the request verification process checks whether the operation has the privilege.

For database-related requests (`INSERT`, `UPDATE`), the request verification process first checks the user's global privileges in the `mysql.user` table. If the privilege is granted, you can access directly. If not, check the `mysql.db` table.

The `user` table has global privileges regardless of the default database. For example, the `DELETE` privilege in `user` can apply to any row, table, or database.

In the `db` table, an empty user is to match the anonymous user name. Wildcards are not allowed in the `User` column. The value for the `Host` and `Db` columns can use `%` and `_`, which can use pattern matching.

Data in the `user` and `db` tables is also sorted when loaded into memory.

The use of `%` in `tables_priv` and `columns_priv` is similar, but column value in `Db`, `Table_name` and `Column_name` cannot contain `%`. The sorting is also similar when loaded.

#### 14.10.2.4.4 Time of effect

When TiDB starts, some privilege-check tables are loaded into memory, and then the cached data is used to verify the privileges. Executing privilege management statements such as `GRANT`, `REVOKE`, `CREATE USER`, `DROP USER` will take effect immediately.

Manually editing tables such as `mysql.user` with statements such as `INSERT`, `DELETE`, `UPDATE` will not take effect immediately. This behavior is compatible with MySQL, and privilege cache can be updated with the following statement:

```
FLUSH PRIVILEGES;
```

### 14.10.3 TiDB User Account Management

This document describes how to manage a TiDB user account.

#### 14.10.3.1 User names and passwords

TiDB stores the user accounts in the table of the `mysql.user` system database. Each account is identified by a user name and the client host. Each account may have a password.

You can connect to the TiDB server using the MySQL client, and use the specified account and password to login. For each user name, make sure that it contains no more than 32 characters.

```
mysql --port 4000 --user xxx --password
```

Or use the abbreviation of command line parameters:

```
mysql -P 4000 -u xxx -p
```

### 14.10.3.2 Add user accounts

You can create TiDB accounts in two ways:

- By using the standard account-management SQL statements intended for creating accounts and establishing their privileges, such as `CREATE USER` and `GRANT`.
- By manipulating the privilege tables directly with statements such as `INSERT`, `UPDATE`, or `DELETE`. It is not recommended to use this method to create accounts, because it might lead to incomplete updates.

You can also create accounts by using third party GUI tools.

```
CREATE USER [IF NOT EXISTS] user [IDENTIFIED BY 'auth_string'];
```

After you assign the password, TiDB encrypts and stores the `auth_string` in the `mysql`  $\hookrightarrow$  `.user` table.

```
CREATE USER 'test'@'127.0.0.1' IDENTIFIED BY 'xxx';
```

The name of a TiDB account consists of a user name and a hostname. The syntax of the account name is `'user_name'@'host_name'`.

- `user_name` is case sensitive.
- `host_name` is a hostname or IP address, which supports the wild card `%` or `_`. For example, the hostname `'%'` matches all hosts, and the hostname `'192.168.1.%'` matches all hosts in the subnet.

The host supports fuzzy matching:

```
CREATE USER 'test'@'192.168.10.%';
```

The `test` user is allowed to log in from any hosts on the `192.168.10` subnet.

If the host is not specified, the user is allowed to log in from any IP. If no password is specified, the default is empty password:

```
CREATE USER 'test';
```

Equivalent to:

```
CREATE USER 'test'@'%' IDENTIFIED BY '';
```

If the specified user does not exist, the behavior of automatically creating users depends on `sql_mode`. If the `sql_mode` includes `NO_AUTO_CREATE_USER`, the `GRANT` statement will not create users with an error returned.

For example, assume that the `sql_mode` does not include `NO_AUTO_CREATE_USER`, and you use the following `CREATE USER` and `GRANT` statements to create four accounts:

```
CREATE USER 'finley'@'localhost' IDENTIFIED BY 'some_pass';
```

```
GRANT ALL PRIVILEGES ON *.* TO 'finley'@'localhost' WITH GRANT OPTION;
```

```
CREATE USER 'finley'@'%' IDENTIFIED BY 'some_pass';
```

```
GRANT ALL PRIVILEGES ON *.* TO 'finley'@'%' WITH GRANT OPTION;
```

```
CREATE USER 'admin'@'localhost' IDENTIFIED BY 'admin_pass';
```

```
GRANT RELOAD,PROCESS ON *.* TO 'admin'@'localhost';
```

```
CREATE USER 'dummy'@'localhost';
```

To see the privileges granted for an account, use the `SHOW GRANTS` statement:

```
SHOW GRANTS FOR 'admin'@'localhost';
```

```
+-----+
| Grants for admin@localhost |
+-----+
| GRANT RELOAD, PROCESS ON *.* TO 'admin'@'localhost' |
+-----+
```

### 14.10.3.3 Remove user accounts

To remove a user account, use the `DROP USER` statement:

```
DROP USER 'test'@'localhost';
```

This operation clears the user's records in the `mysql.user` table and the related records in the privilege table.

### 14.10.3.4 Reserved user accounts

TiDB creates the `'root'@'%'` default account during the database initialization.

### 14.10.3.5 Set account resource limits

Currently, TiDB does not support setting account resource limits.

### 14.10.3.6 Assign account passwords

TiDB stores passwords in the `mysql.user` system database. Operations that assign or update passwords are permitted only to users with the `CREATE USER` privilege, or, alternatively, privileges for the `mysql` database (`INSERT` privilege to create new accounts, `UPDATE` privilege to update existing accounts).

- To assign a password when you create a new account, use `CREATE USER` and include an `IDENTIFIED BY` clause:

```
CREATE USER 'test'@'localhost' IDENTIFIED BY 'mypass';
```

- To assign or change a password for an existing account, use `SET PASSWORD FOR` or `ALTER USER`:

```
SET PASSWORD FOR 'root'@'%' = 'xxx';
```

Or:

```
ALTER USER 'test'@'localhost' IDENTIFIED BY 'mypass';
```

### 14.10.3.7 Forget the root password

1. Modify the configuration file:

1. Log in to the machine where one of the `tidb-server` instances is located.
2. Enter the `conf` directory under the TiDB node deployment directory, and find the `tidb.toml` configuration file.
3. Add the configuration item `skip-grant-table` in the `security` section of the configuration file. If there is no `security` section, add the following two lines to the end of the `tidb.toml` configuration file:

```
[security]
skip-grant-table = true
```

2. Stop the `tidb-server` process:

1. View the `tidb-server` process:

```
ps aux | grep tidb-server
```

2. Find the process ID (PID) corresponding to `tidb-server` and use the `kill` command to stop the process:

```
kill -9 <pid>
```

3. Start TiDB using the modified configuration:

**Note:**

If you set `skip-grant-table` before starting the TiDB process, a check on the operating system user will be initiated. Only the `root` user of the operating system can start the TiDB process.

1. Enter the `scripts` directory under the TiDB node deployment directory.
2. Switch to the `root` account of the operating system.
3. Run the `run_tidb.sh` script in the directory in the foreground.
4. Log in as `root` in a new terminal window and change the password.

```
mysql -h 127.0.0.1 -P 4000 -u root
```

4. Stop running the `run_tidb.sh` script, remove the content added in the TiDB configuration file in step 1, and wait for `tidb-server` to start automatically.

#### 14.10.3.8 FLUSH PRIVILEGES

Information related to users and privileges is stored in the TiKV server, and TiDB caches this information inside the process. Generally, modification of the related information through `CREATE USER`, `GRANT`, and other statements takes effect quickly within the entire cluster. If the operation is affected by some factors such as temporarily unavailable network, the modification will take effect in about 15 minutes because TiDB will periodically reload the cache information.

If you modified the privilege tables directly, run the following command to apply changes immediately:

```
FLUSH PRIVILEGES;
```

For details, see [Privilege Management](#).

#### 14.10.4 TiDB Password Management

To protect the security of user passwords, TiDB supports the following password management policies starting from v6.5.0:

- Password complexity policy: require users to set strong passwords to prevent empty and weak passwords.
- Password expiration policy: require users to change their passwords periodically.
- Password reuse policy: prevent users from reusing old passwords.
- Failed-login tracking and temporary account locking policy: temporarily lock a user account to prevent the same user from trying to log in after multiple login failures caused by wrong passwords.

#### 14.10.4.1 TiDB authentication credential storage

To ensure the authenticity of user identity, TiDB uses passwords as credentials to authenticate users when they log in to the TiDB server.

The *password* described in this document refers to the internal credentials generated, stored, and verified by TiDB. TiDB stores user passwords in the `mysql.user` system table.

The following authentication plugins are related to TiDB password management:

- `mysql_native_password`
- `caching_sha2_password`
- `tidb_sm3_password`

For more information about TiDB authentication plugins, see [Authentication plugin status](#).

#### 14.10.4.2 Password complexity policy

Password complexity check is disabled by default in TiDB. By configuring system variables related to password complexity, you can enable the password complexity check and make sure the user passwords comply with the password complexity policy.

The password complexity policy has the following features:

- For SQL statements that set user passwords in plaintext (including `CREATE USER`, `ALTER USER`, and `SET PASSWORD`), TiDB checks the passwords against the password complexity policy. If a password does not meet the requirements, the password is rejected.
- You can use the SQL function `VALIDATE_PASSWORD_STRENGTH()` to validate the password strength.

**Note:**

- For the `CREATE USER` statement, even if you can lock the account upon creation, you must set an acceptable password. Otherwise, when the account is unlocked, this account can log in to TiDB using a password that does not comply with the password complexity policy.
- The modification to the password complexity policy does not affect the passwords that already exist and only affects the newly set passwords.

You can view all system variables related to the password complexity policy by executing the following SQL statement:

```
mysql> SHOW VARIABLES LIKE 'validate_password.%';
```

| Variable_name                        | Value  |
|--------------------------------------|--------|
| validate_password.check_user_name    | ON     |
| validate_password.dictionary         |        |
| validate_password.enable             | OFF    |
| validate_password.length             | 8      |
| validate_password.mixed_case_count   | 1      |
| validate_password.number_count       | 1      |
| validate_password.policy             | MEDIUM |
| validate_password.special_char_count | 1      |

```
8 rows in set (0.00 sec)
```

For a detailed description of each system variable, see [System Variables](#).

#### 14.10.4.2.1 Configure password complexity policy

This section shows examples of configuring system variables related to the password complexity policy.

Enable the password complexity check:

```
SET GLOBAL validate_password.enable = ON;
```

Do not allow users to use a password that is the same as the user name:

```
SET GLOBAL validate_password.check_user_name = ON;
```

Set the password complexity level to LOW:

```
SET GLOBAL validate_password.policy = LOW;
```

Set the minimum password length to 10:

```
SET GLOBAL validate_password.length = 10;
```

Require a password to contain at least two numbers, one uppercase letter, one lowercase letter, and one special character:

```
SET GLOBAL validate_password.number_count = 2;
SET GLOBAL validate_password.mixed_case_count = 1;
SET GLOBAL validate_password.special_char_count = 1;
```

Enable the dictionary check that prevents a password from containing words like `mysql` or `abcd`:

```
SET GLOBAL validate_password.dictionary = 'mysql;abcd';
```

#### Note:

- The value of `validate_password.dictionary` is a string, no longer than 1024 characters. It contains a list of words that must not exist in the password. Each word is separated by semicolon (;).
- The dictionary check is case-insensitive.

#### 14.10.4.2.2 Password complexity check examples

When the system variable `validate_password.enable` is set to `ON`, TiDB enables the password complexity check. The following are examples of the check results:

TiDB checks the user's plaintext password against the default password complexity policy. If the set password does not meet the policy, the password is rejected.

```
mysql> ALTER USER 'test'@'localhost' IDENTIFIED BY 'abc';
ERROR 1819 (HY000): Require Password Length: 8
```

TiDB does not check the hashed password against the password complexity policy.

```
mysql> ALTER USER 'test'@'localhost' IDENTIFIED WITH mysql_native_password
↪ AS '*0D3CED9BEC10A777AEC23CCC353A8C08A633045E';
Query OK, 0 rows affected (0.01 sec)
```

When creating an account initially locked, you must also set a password that matches the password complexity policy, or the creation will fail.

```
mysql> CREATE USER 'user02'@'localhost' ACCOUNT LOCK;
ERROR 1819 (HY000): Require Password Length: 8
```

### 14.10.4.2.3 Password strength validation function

To check the password strength, you can use the `VALIDATE_PASSWORD_STRENGTH()` function. This function accepts a password argument and returns an integer from 0 (weak) to 100 (strong).

#### Note:

This function evaluates the password strength based on the current password complexity policy. If the password complexity policy is changed, the same password might get different evaluation results.

The following example shows how to use the `VALIDATE_PASSWORD_STRENGTH()` function:

```
mysql> SELECT VALIDATE_PASSWORD_STRENGTH('weak');
+-----+
| VALIDATE_PASSWORD_STRENGTH('weak') |
+-----+
| 25 |
+-----+
1 row in set (0.01 sec)

mysql> SELECT VALIDATE_PASSWORD_STRENGTH('lessweak$_@123');
+-----+
| VALIDATE_PASSWORD_STRENGTH('lessweak$_@123') |
+-----+
| 50 |
+-----+
1 row in set (0.01 sec)

mysql> SELECT VALIDATE_PASSWORD_STRENGTH('NOTweak$_@123!');
+-----+
| VALIDATE_PASSWORD_STRENGTH('NOTweak$_@123!') |
+-----+
| 100 |
+-----+
1 row in set (0.01 sec)
```

### 14.10.4.3 Password expiration policy

TiDB supports configuring a password expiration policy so that users must change their passwords periodically to improve password security. You can manually make account passwords expire or establish a policy for automatic password expiration.

The automatic password expiration policy can be set at the global level and at the account level. As a database administrator, you can establish an automatic password expiration policy at the global level, and also use an account-level policy to override the global policy.

The privileges for setting the password expiration policy are as follows:

- Database administrator with `SUPER` or `CREATE USER` privileges can manually make passwords expire.
- Database administrator with `SUPER` or `CREATE USER` privileges can set the account-level password expiration policy.
- Database administrator with `SUPER` or `SYSTEM_VARIABLES_ADMIN` privileges can set the global-level password expiration policy.

#### 14.10.4.3.1 Manual expiration

To manually make an account password expire, use the `CREATE USER` or `ALTER USER` statements.

```
ALTER USER 'test'@'localhost' PASSWORD EXPIRE;
```

When the account password is set to expire by a database administrator, you must change the password before you can log in to TiDB. The manual expiration cannot be revoked.

For roles created using the `CREATE ROLE` statement, since the role does not require a password, the password field for the role is empty. In such case, TiDB sets the `password_expired` attribute to 'Y', which means that the role's password is manually expired. The purpose of this design is to prevent the role from being unlocked and logged into TiDB with an empty password. When the role is unlocked by the `ALTER USER ... ACCOUNT UNLOCK` statement, you can log in with this account even though the password is empty. Therefore, TiDB makes the password manually expired using the `password_expired` attribute so that the user must set a valid password for the account.

```
mysql> CREATE ROLE testrole;
Query OK, 0 rows affected (0.01 sec)

mysql> SELECT user,password_expired,Account_locked FROM mysql.user WHERE
 ↪ user = 'testrole';
+-----+-----+-----+
| user | password_expired | Account_locked |
+-----+-----+-----+
| testrole | Y | Y |
+-----+-----+-----+
1 row in set (0.02 sec)
```

### 14.10.4.3.2 Automatic expiration

Automatic password expiration is based on the **password age** and the **password lifetime**.

- Password age: the time interval from the last password change date to the current date. The time of the last password change is recorded in the `mysql.user` system table.
- Password lifetime: the number of days the password can be used to log in to TiDB.

If a password is used for a longer period than it is allowed to live, the server automatically treats the password as expired.

TiDB supports automatic password expiration at the global level and at the account level.

- The global level

You can set the system variable `default_password_lifetime` to control the password lifetime. The default value 0 indicates that the password never expires. If this system variable is set to a positive integer `N`, it means that the password lifetime is `N` days, and you must change your password every `N` days.

The global automatic password expiration policy applies to all accounts that do not have an account-level override.

The following example establishes a global automatic password expiration policy with a password lifetime of 180 days:

```
SET GLOBAL default_password_lifetime = 180;
```

- The account level

To establish an automatic password expiration policy for an individual account, use the `PASSWORD EXPIRE` option in the `CREATE USER` or `ALTER USER` statement.

The following examples require that the user password is changed every 90 days:

```
CREATE USER 'test'@'localhost' PASSWORD EXPIRE INTERVAL 90 DAY;
ALTER USER 'test'@'localhost' PASSWORD EXPIRE INTERVAL 90 DAY;
```

The following examples disable the automatic password expiration policy for an individual account:

```
CREATE USER 'test'@'localhost' PASSWORD EXPIRE NEVER;
ALTER USER 'test'@'localhost' PASSWORD EXPIRE NEVER;
```

Remove the account-level automatic password expiration policy for a specified account so that it follows the global automatic password expiration policy:

```
CREATE USER 'test'@'localhost' PASSWORD EXPIRE DEFAULT;
ALTER USER 'test'@'localhost' PASSWORD EXPIRE DEFAULT;
```

### 14.10.4.3.3 Password expiration check mechanism

When a client connects to the TiDB server, the server checks whether the password is expired in the following order:

1. The server checks whether the password has been set as expired manually.
2. If the password is not manually expired, the server checks whether the password age is longer than its configured lifetime. If so, the server treats the password as expired.

### 14.10.4.3.4 Handle an expired password

You can control the behavior of the TiDB server for password expiration. When a password is expired, the server either disconnects the client or restricts the client to the “sandbox mode”. In a “sandbox mode”, the TiDB server allows connections from the expired account. However, in such connections, the user is only allowed to reset the password.

The TiDB server can control whether to restrict the user with an expired password in the “sandbox mode”. To control the behavior of the TiDB server when a password is expired, configure the `security.disconnect-on-expired-password` parameter in the TiDB configuration file:

```
[security]
disconnect-on-expired-password = true
```

- If `disconnect-on-expired-password` is set to `true` (default), the server disconnects the client when the password is expired.
- If `disconnect-on-expired-password` is set to `false`, the server enables the “sandbox mode” and allows the user to connect to the server. However, the user can only reset the password. After the password is reset, the user can execute SQL statements normally.

When `disconnect-on-expired-password` is enabled, if an account password is expired, TiDB rejects the connection from the account. In such cases, you can modify the password in the following ways:

- If the password for a normal account is expired, the administrator can change the password for the account by using SQL statements.
- If the password for an administrator account is expired, another administrator can change the password for the account by using SQL statements.
- If the password for an administrator account is expired and no other administrator is available to help change the password, you can use the `skip-grant-table` mechanism to change the password for the account. For details, see [Forgot password process](#).

#### 14.10.4.4 Password reuse policy

TiDB can limit the reuse of previous passwords. The password reuse policy can be based on the number of password changes or time elapsed, or both.

The password reuse policy can be set at the global level and at the account level. You can establish a password reuse policy at the global level, and also use an account-level policy to override the global policy.

TiDB records the password history for an account and limits the selection of a new password from the history:

- If a password reuse policy is based on the number of password changes, a new password must not be the same as any of the specified number of most recent passwords. For example, if the minimum number of password changes is set to 3, the new password cannot be the same as any of the previous 3 passwords.
- If a password reuse policy is based on time elapsed, a new password must not be the same as any of the passwords used within the specified number of days. For example, if the password reuse interval is set to 60, the new password cannot be the same as any of the passwords used within the last 60 days.

##### Note:

Empty passwords are not recorded in the password history and can be reused at any time.

##### 14.10.4.4.1 Global-level password reuse policy

To establish a global password reuse policy, use the `password_history` and `password_reuse_interval` system variables.

For example, to establish a global password reuse policy that prohibits the reuse of the last 6 passwords and passwords used within the last 365 days:

```
SET GLOBAL password_history = 6;
SET GLOBAL password_reuse_interval = 365;
```

The global password reuse policy applies to all accounts that do not have an account-level override.

##### 14.10.4.4.2 Account-level password reuse policy

To establish an account-level password reuse policy, use the `PASSWORD HISTORY` and `PASSWORD REUSE INTERVAL` options in the `CREATE USER` or `ALTER USER` statement.

For example:

To prohibit the reuse of the last 5 passwords:

```
CREATE USER 'test'@'localhost' PASSWORD HISTORY 5;
ALTER USER 'test'@'localhost' PASSWORD HISTORY 5;
```

To prohibit the reuse of passwords used within the last 365 days:

```
CREATE USER 'test'@'localhost' PASSWORD REUSE INTERVAL 365 DAY;
ALTER USER 'test'@'localhost' PASSWORD REUSE INTERVAL 365 DAY;
```

To combine the two types of reuse policies, use both `PASSWORD HISTORY` and `PASSWORD REUSE INTERVAL`:

```
CREATE USER 'test'@'localhost'
 PASSWORD HISTORY 5
 PASSWORD REUSE INTERVAL 365 DAY;
ALTER USER 'test'@'localhost'
 PASSWORD HISTORY 5
 PASSWORD REUSE INTERVAL 365 DAY;
```

To remove the account-level password reuse policy for a specified account so that it follows the global password reuse policy:

```
CREATE USER 'test'@'localhost'
 PASSWORD HISTORY DEFAULT
 PASSWORD REUSE INTERVAL DEFAULT;
ALTER USER 'test'@'localhost'
 PASSWORD HISTORY DEFAULT
 PASSWORD REUSE INTERVAL DEFAULT;
```

#### Note:

- If you set the password reuse policy multiple times, the last set value takes effect.
- The default value of the `PASSWORD HISTORY` and `PASSWORD REUSE INTERVAL` options is 0, which means that the reuse policy is disabled.
- When you modify a username, TiDB migrates the corresponding password history in the `mysql.password_history` system table from the original username to the new username.

#### 14.10.4.5 Failed-login tracking and temporary account locking policy

TiDB can track the number of failed login attempts for an account. To prevent the password from being cracked by brute force, TiDB can lock the account after a specified number of failed login attempts.

**Note:**

- TiDB only supports failed-login tracking and temporary account locking at the account level, but not at the global level.
- Failed-login means that the client fails to provide the correct password during the connection attempt, and does not include connection failures due to unknown users or network issues.
- When you enable the failed-login tracking and temporary account locking for an account, the account is subject to additional checks when the account attempts to log in. This affects the performance of the login operation, especially in high-concurrency login scenarios.

#### 14.10.4.5.1 Configure the login failure tracking policy

You can configure the number of failed login attempts and the lock time for each account by using the `FAILED_LOGIN_ATTEMPTS` and `PASSWORD_LOCK_TIME` options in the `CREATE` ↪ `USER` or `ALTER USER` statement. The available value options are as follows:

- `FAILED_LOGIN_ATTEMPTS`: N. The account is temporarily locked after N consecutive login failures. The value of N ranges from 0 to 32767.
- `PASSWORD_LOCK_TIME`: N | UNBOUNDED.
  - N means that the account will be temporarily locked for N days after consecutive failed login attempts. The value of N ranges from 0 to 32767.
  - UNBOUNDED means that the lock time is unlimited and the account must be manually unlocked. The value of N ranges from 0 to 32767.

**Note:**

- You can configure only `FAILED_LOGIN_ATTEMPTS` or `PASSWORD_LOCK_TIME` in a single SQL statement. In this case, the account locking does not take effect.
- The account locking takes effect only when both `FAILED_LOGIN_ATTEMPTS` and `PASSWORD_LOCK_TIME` are not 0.

You can configure the account locking policy as follows:

Create a user and configure the account locking policy. When the password is entered incorrectly for 3 consecutive times, the account will be temporarily locked for 3 days:

```
CREATE USER 'test1'@'localhost' IDENTIFIED BY 'password'
↳ FAILED_LOGIN_ATTEMPTS 3 PASSWORD_LOCK_TIME 3;
```

Modify the account locking policy for an existing user. When the password is entered incorrectly for 4 consecutive times, the account will be locked indefinitely until it is manually unlocked:

```
ALTER USER 'test2'@'localhost' FAILED_LOGIN_ATTEMPTS 4 PASSWORD_LOCK_TIME
↳ UNBOUNDED;
```

Disable the account locking policy for an existing user:

```
ALTER USER 'test3'@'localhost' FAILED_LOGIN_ATTEMPTS 0 PASSWORD_LOCK_TIME
↳ 0;
```

#### 14.10.4.5.2 Unlock the locked account

In the following scenarios, the count of consecutive password errors can be reset:

- When you execute the `ALTER USER ... ACCOUNT UNLOCK` statement.
- When you log in successfully.

In the following scenarios, the locked account can be unlocked:

- When the lock time ends, the automatic lock flag of the account will be reset at the next login attempt.
- When you execute the `ALTER USER ... ACCOUNT UNLOCK` statement.

#### Note:

When an account is locked due to consecutive login failures, modifying the account locking policy has the following effects:

- When you modify `FAILED_LOGIN_ATTEMPTS`, the lock status of the account does not change. The modified `FAILED_LOGIN_ATTEMPTS` takes effect after the account is unlocked and attempts to log in again.
- When you modify `PASSWORD_LOCK_TIME`, the lock status of the account does not change. The modified `PASSWORD_LOCK_TIME` takes effect when the account attempts to log in again. At that time, TiDB checks whether the new lock time has reached. If yes, TiDB will unlock the user.

## 14.10.5 Role-Based Access Control

The implementation of TiDB's role-based access control (RBAC) system is similar to that of MySQL 8.0. TiDB is compatible with most RBAC syntax of MySQL.

This document introduces TiDB RBAC-related operations and implementation.

### 14.10.5.1 RBAC operations

A role is a collection of a series of privileges. You can do the following operations:

- Create a role.
- Delete a role.
- Grant a privilege to a role.
- Grant a role to another user. That user can obtain the privileges involved in the role, after enabling the role.

#### 14.10.5.1.1 Create a role

For example, you can use the following statement to create the roles `app_developer`, `app_read`, and `app_write`:

```
CREATE ROLE 'app_developer', 'app_read', 'app_write';
```

For the role naming format and rule, see [TiDB User Account Management](#).

Roles are stored in the `mysql.user` table and the host name part of the role name (if omitted) defaults to `'%'`. The name of the role you are trying to create must be unique; otherwise, an error is reported.

To create a role, you need the `CREATE ROLE` or `CREATE USER` privilege.

#### 14.10.5.1.2 Grant a privilege to a role

The operation of granting a privilege to a role is the same with that of granting a privilege to a user. For details, see [TiDB Privilege Management](#).

For example, you can use the following statement to grant the `app_read` role the privilege to read the `app_db` database:

```
GRANT SELECT ON app_db.* TO 'app_read'@'%';
```

You can use the following statement to grant the `app_write` role the privilege to write data to the `app_db` database:

```
GRANT INSERT, UPDATE, DELETE ON app_db.* TO 'app_write'@'%';
```

You can use the following statement to grant the `app_developer` role all privileges on the `app_db` database:

```
GRANT ALL ON app_db.* TO 'app_developer';
```

### 14.10.5.1.3 Grant a role to a user

Assume that a user `dev1` has the developer role with all the privileges on `app_db`; two users `read_user1` and `read_user2` have the read-only privilege on `app_db`; and a user `rw_user1` has read and write privileges on `app_db`.

Use `CREATE USER` to create the users:

```
CREATE USER 'dev1'@'localhost' IDENTIFIED BY 'dev1pass';
CREATE USER 'read_user1'@'localhost' IDENTIFIED BY 'read_user1pass';
CREATE USER 'read_user2'@'localhost' IDENTIFIED BY 'read_user2pass';
CREATE USER 'rw_user1'@'localhost' IDENTIFIED BY 'rw_user1pass';
```

Then use `GRANT` to grant roles to users

```
GRANT 'app_developer' TO 'dev1'@'localhost';
GRANT 'app_read' TO 'read_user1'@'localhost', 'read_user2'@'localhost';
GRANT 'app_read', 'app_write' TO 'rw_user1'@'localhost';
```

To grant a role to another user or revoke a role, you need the `SUPER` privilege.

Granting a role to a user does not mean enabling the role immediately. Enabling a role is another operation.

The following operations might form a “relation loop:”

```
CREATE USER 'u1', 'u2';
CREATE ROLE 'r1', 'r2';

GRANT 'u1' TO 'u1';
GRANT 'r1' TO 'r1';

GRANT 'r2' TO 'u2';
GRANT 'u2' TO 'r2';
```

TiDB supports this multi-level authorization relationship. You can use it to implement privilege inheritance.

### 14.10.5.1.4 Check a role’s privileges

You can use the `SHOW GRANTS` statement to check what privileges have been granted to the user.

To check privilege-related information of another user, you need the `SELECT` privilege on the `mysql` database.

```
SHOW GRANTS FOR 'dev1'@'localhost';
```

```

+-----+
| Grants for dev1@localhost |
+-----+
| GRANT USAGE ON *.* TO `dev1`@`localhost` |
| GRANT `app_developer`@`%` TO `dev1`@`localhost` |
+-----+

```

You can use the USING option in SHOW GRANTS to check a role's privileges:

```
SHOW GRANTS FOR 'dev1'@'localhost' USING 'app_developer';
```

```

+-----+
| Grants for dev1@localhost |
+-----+
| GRANT USAGE ON *.* TO `dev1`@`localhost` |
| GRANT ALL PRIVILEGES ON `app_db`.* TO `dev1`@`localhost` |
| GRANT `app_developer`@`%` TO `dev1`@`localhost` |
+-----+

```

```
SHOW GRANTS FOR 'rw_user1'@'localhost' USING 'app_read', 'app_write';
```

```

+-----+
| Grants for rw_user1@localhost |
+-----+
| GRANT USAGE ON *.* TO `rw_user1`@`localhost` |
| GRANT SELECT, INSERT, UPDATE, DELETE ON `app_db`.* TO `rw_user1`@`
 ↳ localhost` |
| GRANT `app_read`@`%`,`app_write`@`%` TO `rw_user1`@`localhost` |
+-----+
 ↳

```

```
SHOW GRANTS FOR 'read_user1'@'localhost' USING 'app_read';
```

```

+-----+
| Grants for read_user1@localhost |
+-----+
| GRANT USAGE ON *.* TO `read_user1`@`localhost` |
| GRANT SELECT ON `app_db`.* TO `read_user1`@`localhost` |
| GRANT `app_read`@`%` TO `read_user1`@`localhost` |
+-----+

```

You can use `SHOW GRANTS` or `SHOW GRANTS FOR CURRENT_USER()` to check the current user's privileges. `SHOW GRANTS` and `SHOW GRANTS FOR CURRENT_USER()` are different in the following aspects:

- `SHOW GRANTS` shows the privilege of the enabled role for the current user.
- `SHOW GRANTS FOR CURRENT_USER()` does not show the enabled role's privilege.

#### 14.10.5.1.5 Set the default role

After a role is granted to a user, it does not take effect immediately. Only after the user enables this role, he can use the privilege the role owns.

You can set default roles for a user. When the user logs in, the default roles are automatically enabled.

```
SET DEFAULT ROLE
 {NONE | ALL | role [, role] ...}
 TO user [, user]
```

For example, you can use the following statement to set default roles of `rw_user1@localhost` ↪ to `app_read` and `app_write`:

```
SET DEFAULT ROLE app_read, app_write TO 'rw_user1'@'localhost';
```

You can use the following statement to set default roles of `dev1@localhost` to all roles:

```
SET DEFAULT ROLE ALL TO 'dev1'@'localhost';
```

You can use the following statement to disable all default roles of `dev1@localhost`:

```
SET DEFAULT ROLE NONE TO 'dev1'@'localhost';
```

#### Note:

You need to grant the role to the user before you set the default role to this role.

#### 14.10.5.1.6 Enable a role in the current session

You can enable some role(s) in the current session.

```
SET ROLE {
 DEFAULT
 | NONE
 | ALL
```

```
| ALL EXCEPT role [, role] ...
| role [, role] ...
}
```

For example, after `rw_user1` logs in, you can use the following statement to enable roles `app_read` and `app_write` that are valid only in the current session:

```
SET ROLE 'app_read', 'app_write';
```

You can use the following statement to enable the default role of the current user:

```
SET ROLE DEFAULT
```

You can use the following statement to enable all roles granted to the current user:

```
SET ROLE ALL
```

You can use the following statement to disable all roles:

```
SET ROLE NONE
```

You can use the following statement to enable roles except `app_read`:

```
SET ROLE ALL EXCEPT 'app_read'
```

#### Note:

If you use `SET ROLE` to enable a role, this role is valid only in the current session.

#### 14.10.5.1.7 Check the current enabled role

The current user can use the `CURRENT_ROLE()` function to check which role has been enabled by the current user.

For example, you can grant default roles to `rw_user1'@'localhost`:

```
SET DEFAULT ROLE ALL TO 'rw_user1'@'localhost';
```

After `rw_user1@localhost` logs in, you can execute the following statement:

```
SELECT CURRENT_ROLE();
```

```
+-----+
| CURRENT_ROLE() |
+-----+
| `app_read`@`%`,`app_write`@`%` |
+-----+
```

```
SET ROLE 'app_read'; SELECT CURRENT_ROLE();
```

```
+-----+
| CURRENT_ROLE() |
+-----+
| `app_read`@`%` |
+-----+
```

#### 14.10.5.1.8 Revoke a role

You can use the following statement to revoke the `app_read` role granted to the users `read_user1@localhost` and `read_user2@localhost`:

```
REVOKE 'app_read' FROM 'read_user1'@'localhost', 'read_user2'@'localhost';
```

You can use the following statement to revoke the roles `app_read` and `app_write` granted to the `rw_user1@localhost` user:

```
REVOKE 'app_read', 'app_write' FROM 'rw_user1'@'localhost';
```

The operation of revoking a role from a user is atomic. If you fail to revoke a role, this operation rolls back.

#### 14.10.5.1.9 Revoke a privilege

The `REVOKE` statement is reverse to `GRANT`. You can use `REVOKE` to revoke the privileges of `app_write`.

```
REVOKE INSERT, UPDATE, DELETE ON app_db.* FROM 'app_write';
```

For details, see [TiDB Privilege Management](#).

#### 14.10.5.1.10 Delete a role

You can use the following statement to delete roles `app_read` and `app_write`:

```
DROP ROLE 'app_read', 'app_write';
```

This operation deletes the role records of `app_read` and `app_write` in the `mysql.user` table and related records in the authorization table, and terminates the authorization related to the two roles.

To delete a role, you need the `DROP ROLE` or `DROP USER` privilege.

#### 14.10.5.1.11 Authorization table

In addition to four system [privilege tables](#), the RBAC system introduces two new system privilege tables:

- `mysql.role_edges`: records the authorization relationship of the role and user.
- `mysql.default_roles`: records default roles of each user.

`mysql.role_edges`

`mysql.role_edges` contains the following data:

```
SELECT * FROM mysql.role_edges;
```

```
+-----+-----+-----+-----+-----+
| FROM_HOST | FROM_USER | TO_HOST | TO_USER | WITH_ADMIN_OPTION |
+-----+-----+-----+-----+-----+
| % | r_1 | % | u_1 | N |
+-----+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

- `FROM_HOST` and `FROM_USER` indicate the role's host name and user name respectively.
- `TO_HOST` and `TO_USER` indicate the host name and user name of the user to which a role is granted.

`mysql.default_roles`

`mysql.default_roles` shows which roles have been enabled by default for each user.

```
SELECT * FROM mysql.default_roles;
```

```
+-----+-----+-----+-----+
| HOST | USER | DEFAULT_ROLE_HOST | DEFAULT_ROLE_USER |
+-----+-----+-----+-----+
| % | u_1 | % | r_1 |
| % | u_1 | % | r_2 |
+-----+-----+-----+-----+
2 rows in set (0.00 sec)
```

- `HOST` and `USER` indicate the user's host name and user name respectively.
- `DEFAULT_ROLE_HOST` and `DEFAULT_ROLE_USER` indicate the host name and user name of the default role respectively.

#### 14.10.5.1.12 References

Because RBAC, user management, and privilege management are closely related, you can refer to operation details in the following resources:

- [TiDB Privilege Management](#)
- [TiDB User Account Management](#)

### 14.10.6 Certificate-Based Authentication for Login

TiDB supports a certificate-based authentication method for users to log into TiDB. With this method, TiDB issues certificates to different users, uses encrypted connections to transfer data, and verifies certificates when users log in. This approach is more secure than the traditional password-based authentication method commonly used by MySQL users and is thus adopted by an increasing number of users.

To use certificate-based authentication, you might need to perform the following operations:

- Create security keys and certificates
- Configure certificates for TiDB and the client
- Configure the user certificate information to be verified when the user logs in
- Update and replace certificates

The rest of the document introduces in detail how to perform these operations.

#### 14.10.6.1 Create security keys and certificates

It is recommended that you use [OpenSSL](#) to create keys and certificates. The certificate generation process is similar to the process described in [Enable TLS Between TiDB Clients and Servers](#). The following paragraphs demonstrate how to configure more attribute fields that need to be verified in the certificate.

##### 14.10.6.1.1 Generate CA key and certificate

1. Execute the following command to generate the CA key:

```
sudo openssl genrsa 2048 > ca-key.pem
```

The output of the above command:

```
Generating RSA private key, 2048 bit long modulus (2 primes)
.....+++++
.....+++++
e is 65537 (0x010001)
```

2. Execute the following command to generate the certificate corresponding to the CA key:

```
sudo openssl req -new -x509 -nodes -days 365000 -key ca-key.pem -out ca
↳ -cert.pem
```

3. Enter detailed certificate information. For example:

```
Country Name (2 letter code) [AU]:US
State or Province Name (full name) [Some-State]:California
Locality Name (e.g. city) []:San Francisco
Organization Name (e.g. company) [Internet Widgits Pty Ltd]:PingCAP Inc
↳ .
Organizational Unit Name (e.g. section) []:TiDB
Common Name (e.g. server FQDN or YOUR name) []:TiDB admin
Email Address []:s@pingcap.com
```

**Note:**

In the above certificate details, texts after : are the entered information.

#### 14.10.6.1.2 Generate server key and certificate

1. Execute the following command to generate the server key:

```
sudo openssl req -newkey rsa:2048 -days 365000 -nodes -keyout server-
↳ key.pem -out server-req.pem
```

2. Enter detailed certificate information. For example:

```
Country Name (2 letter code) [AU]:US
State or Province Name (full name) [Some-State]:California
Locality Name (e.g. city) []:San Francisco
Organization Name (e.g. company) [Internet Widgits Pty Ltd]:PingCAP Inc
↳ .
Organizational Unit Name (e.g. section) []:TiKV
Common Name (e.g. server FQDN or YOUR name) []:TiKV Test Server
Email Address []:k@pingcap.com

Please enter the following 'extra' attributes
to be sent with your certificate request
A challenge password []:
An optional company name []:
```

- Execute the following command to generate the RSA key of the server:

```
sudo openssl rsa -in server-key.pem -out server-key.pem
```

The output of the above command:

```
writing RSA key
```

- Use the CA certificate signature to generate the signed server certificate:

```
sudo openssl x509 -req -in server-req.pem -days 365000 -CA ca-cert.pem
↳ -CAkey ca-key.pem -set_serial 01 -out server-cert.pem
```

The output of the above command (for example):

```
Signature ok
subject=C = US, ST = California, L = San Francisco, O = PingCAP Inc.,
↳ OU = TiKV, CN = TiKV Test Server, emailAddress = k@pingcap.com
Getting CA Private Key
```

#### Note:

When you log in, TiDB checks whether the information in the `subject` section of the above output is consistent or not.

### 14.10.6.1.3 Generate client key and certificate

After generating the server key and certificate, you need to generate the key and certificate for the client. It is often necessary to generate different keys and certificates for different users.

- Execute the following command to generate the client key:

```
sudo openssl req -newkey rsa:2048 -days 365000 -nodes -keyout client-
↳ key.pem -out client-req.pem
```

- Enter detailed certificate information. For example:

```
Country Name (2 letter code) [AU]:US
State or Province Name (full name) [Some-State]:California
Locality Name (e.g. city) []:San Francisco
Organization Name (e.g. company) [Internet Widgits Pty Ltd]:PingCAP Inc
↳ .
Organizational Unit Name (e.g. section) []:TiDB
Common Name (e.g. server FQDN or YOUR name) []:tpch-user1
Email Address []:zz@pingcap.com
```

```
Please enter the following 'extra' attributes
to be sent with your certificate request
A challenge password []:
An optional company name []:
```

3. Execute the following command to generate the RSA key of the client:

```
sudo openssl rsa -in client-key.pem -out client-key.pem
```

The output of the above command:

```
writing RSA key
```

4. Use the CA certificate signature to generate the client certificate:

```
sudo openssl x509 -req -in client-req.pem -days 365000 -CA ca-cert.pem
↳ -CAkey ca-key.pem -set_serial 01 -out client-cert.pem
```

The output of the above command (for example):

```
Signature ok
subject=C = US, ST = California, L = San Francisco, O = PingCAP Inc.,
↳ OU = TiDB, CN = tpch-user1, emailAddress = zz@pingcap.com
Getting CA Private Key
```

#### Note:

The information of the **subject** section in the above output is used for **certificate configuration for login verification** in the **require** section.

#### 14.10.6.1.4 Verify certificate

Execute the following command to verify certificate:

```
openssl verify -CAfile ca-cert.pem server-cert.pem client-cert.pem
```

If the certificate is verified, you will see the following result:

```
server-cert.pem: OK
client-cert.pem: OK
```

#### 14.10.6.2 Configure TiDB and the client to use certificates

After generating the certificates, you need to configure the TiDB server and the client to use the corresponding server certificate or client certificate.

#### 14.10.6.2.1 Configure TiDB to use server certificate

Modify the [security] section in the TiDB configuration file. This step specifies the directory in which the CA certificate, the server key, and the server certificate are stored. You can replace `path/to/server-cert.pem`, `path/to/server-key.pem`, `path/to/ca-cert.pem` with your own directory.

```
[security]
ssl-cert = "path/to/server-cert.pem"
ssl-key = "path/to/server-key.pem"
ssl-ca = "path/to/ca-cert.pem"
```

Start TiDB and check logs. If the following information is displayed in the log, the configuration is successful:

```
[INFO] [server.go:264] ["secure connection is enabled"] ["client
↳ verification enabled"=true]
```

#### 14.10.6.2.2 Configure the client to use client certificate

Configure the client so that the client uses the client key and certificate for login.

Taking the MySQL client as an example, you can use the newly created client certificate, client key and CA by specifying `ssl-cert`, `ssl-key`, and `ssl-ca`:

```
mysql -utest -h0.0.0.0 -P4000 --ssl-cert /path/to/client-cert.new.pem --ssl-
↳ key /path/to/client-key.new.pem --ssl-ca /path/to/ca-cert.pem
```

#### Note:

`/path/to/client-cert.new.pem`, `/path/to/client-key.new.pem`, and `/path/to/ca-cert.pem` are the directory of the CA certificate, client key, and client certificate. You can replace them with your own directory.

#### 14.10.6.3 Configure the user certificate information for login verification

First, connect TiDB using the client to configure the login verification. Then, you can get and configure the user certificate information to be verified.

##### 14.10.6.3.1 Get user certificate information

The user certificate information can be specified by `require subject`, `require issuer`, `require san`, and `require cipher`, which are used to check the X509 certificate attributes.

- **require subject:** Specifies the **subject** information of the client certificate when you log in. With this option specified, you do not need to configure **require ssl** or **x509**. The information to be specified is consistent with the entered **subject** information in [Generate client keys and certificates](#).

To get this option, execute the following command:

```
openssl x509 -noout -subject -in client-cert.pem | sed 's/.\{8\}//' |
 ↪ sed 's/, /\//g' | sed 's/ = /=/g' | sed 's/^/\//'
```

- **require issuer:** Specifies the **subject** information of the CA certificate that issues the user certificate. The information to be specified is consistent with the entered **subject** information in [Generate CA key and certificate](#).

To get this option, execute the following command:

```
openssl x509 -noout -subject -in ca-cert.pem | sed 's/.\{8\}//' | sed '
 ↪ s/, /\//g' | sed 's/ = /=/g' | sed 's/^/\//'
```

- **require san:** Specifies the Subject Alternative Name information of the CA certificate that issues the user certificate. The information to be specified is consistent with the [alt\\_names of the openssl.cnf configuration file](#) used to generate the client certificate.

- Execute the following command to get the information of the **require san** item in the generated certificate:

```
openssl x509 -noout -extensions subjectAltName -in client.crt
```

- **require san** currently supports the following Subject Alternative Name check items:

- \* URI
- \* IP
- \* DNS

- Multiple check items can be configured after they are connected by commas. For example, configure **require san** as follows for the **u1** user:

```
create user 'u1'@%' require san 'DNS:d1,URI:spiffe://example.org/
 ↪ myservice1,URI:spiffe://example.org/myservice2';
```

The above configuration only allows the **u1** user to log in to TiDB using the certificate with the URI item **spiffe://example.org/myservice1** or **spiffe://example.org/myservice2** and the DNS item **d1**.

- **require cipher:** Checks the cipher method supported by the client. Use the following statement to check the list of supported cipher methods:

```
SHOW SESSION STATUS LIKE 'Ssl_cipher_list';
```

### 14.10.6.3.2 Configure user certificate information

After getting the user certificate information (`require subject`, `require issuer`, `require san`, `require cipher`), configure these information to be verified when creating a user, granting privileges, or altering a user. Replace `<replaceable>` with the corresponding information in the following statements.

You can configure one option or multiple options using the space or `and` as the separator.

- Configure user certificate when creating a user (`create user`):

```
create user 'u1'@'%' require issuer '<replaceable>' subject '<
↳ replaceable>' san '<replaceable>' cipher '<replaceable>';
```

- Configure user certificate when granting privileges:

```
grant all on *.* to 'u1'@'%' require issuer '<replaceable>' subject '<
↳ replaceable>' san '<replaceable>' cipher '<replaceable>';
```

- Configure user certificate when altering a user:

```
alter user 'u1'@'%' require issuer '<replaceable>' subject '<
↳ replaceable>' san '<replaceable>' cipher '<replaceable>';
```

After the above configuration, the following items will be verified when you log in:

- SSL is used; the CA that issues the client certificate is consistent with the CA configured in the server.
- The `issuer` information of the client certificate matches the information specified in `require issuer`.
- The `subject` information of the client certificate matches the information specified in `require cipher`.
- The `Subject Alternative Name` information of the client certificate matches the information specified in `require san`.

You can log into TiDB only after all the above items are verified. Otherwise, the `ERROR` `↳ 1045 (28000): Access denied` error is returned. You can use the following command to check the TLS version, the cipher algorithm and whether the current connection uses the certificate for the login.

Connect the MySQL client and execute the following statement:

```
\s
```

The output:

```

mysql Ver 15.1 Distrib 10.4.10-MariaDB, for Linux (x86_64) using readline
 ↵ 5.1

Connection id: 1
Current database: test
Current user: root@127.0.0.1
SSL: Cipher in use is TLS_AES_256_GCM_SHA384
```

Then execute the following statement:

```
show variables like '%ssl%';
```

The output:

```
+-----+-----+
| Variable_name | Value |
+-----+-----+
ssl_cert	/path/to/server-cert.pem
ssl_ca	/path/to/ca-cert.pem
have_ssl	YES
have_openssl	YES
ssl_key	/path/to/server-key.pem
+-----+-----+
6 rows in set (0.067 sec)
```

#### 14.10.6.4 Update and replace certificate

The key and certificate are updated regularly. The following sections introduce how to update the key and certificate.

The CA certificate is the basis for mutual verification between the client and server. To replace the CA certificate, generate a combined certificate that supports the authentication for both old and new certificates. On the client and server, first replace the CA certificate, then replace the client/server key and certificate.

##### 14.10.6.4.1 Update CA key and certificate

1. Back up the old CA key and certificate (suppose that `ca-key.pem` is stolen):

```
mv ca-key.pem ca-key.old.pem && \
mv ca-cert.pem ca-cert.old.pem
```

2. Generate the new CA key:

```
sudo openssl genrsa 2048 > ca-key.pem
```

3. Generate the new CA certificate using the newly generated CA key:

```
sudo openssl req -new -x509 -nodes -days 365000 -key ca-key.pem -out ca-
↪ -cert.new.pem
```

**Note:**

Generating the new CA certificate is to replace the keys and certificates on the client and server, and to ensure that online users are not affected. Therefore, the appended information in the above command must be consistent with the `require issuer` information.

4. Generate the combined CA certificate:

```
cat ca-cert.new.pem ca-cert.old.pem > ca-cert.pem
```

After the above operations, restart the TiDB server with the newly created combined CA certificate. Then the server accepts both the new and old CA certificates.

Also replace the old CA certificate with the combined certificate so that the client accepts both the old and new CA certificates.

#### 14.10.6.4.2 Update client key and certificate

**Note:**

Perform the following steps **only after** you have replaced the old CA certificate on the client and server with the combined CA certificate.

1. Generate the new RSA key of the client:

```
sudo openssl req -newkey rsa:2048 -days 365000 -nodes -keyout client-
↪ key.new.pem -out client-req.new.pem && \
sudo openssl rsa -in client-key.new.pem -out client-key.new.pem
```

**Note:**

The above command is to replace the client key and certificate, and to ensure that the online users are not affected. Therefore, the appended information in the above command must be consistent with the `require` ↪ `subject` information.

2. Use the combined certificate and the new CA key to generate the new client certificate:

```
sudo openssl x509 -req -in client-req.new.pem -days 365000 -CA ca-cert.
↪ pem -CAkey ca-key.pem -set_serial 01 -out client-cert.new.pem
```

3. Make the client (for example, MySQL) connect TiDB with the new client key and certificate:

```
mysql -utest -h0.0.0.0 -P4000 --ssl-cert /path/to/client-cert.new.pem
↪ --ssl-key /path/to/client-key.new.pem --ssl-ca /path/to/ca-cert.
↪ pem
```

**Note:**

`/path/to/client-cert.new.pem`, `/path/to/client-key.new.pem`, and `/path/to/ca-cert.pem` specify the directory of the CA certificate, client key, and client certificate. You can replace them with your own directory.

#### 14.10.6.4.3 Update the server key and certificate

1. Generate the new RSA key of the server:

```
sudo openssl req -newkey rsa:2048 -days 365000 -nodes -keyout server-
↪ key.new.pem -out server-req.new.pem && \
sudo openssl rsa -in server-key.new.pem -out server-key.new.pem
```

2. Use the combined CA certificate and the new CA key to generate the new server certificate:

```
sudo openssl x509 -req -in server-req.new.pem -days 365000 -CA ca-cert.
↪ pem -CAkey ca-key.pem -set_serial 01 -out server-cert.new.pem
```

3. Configure the TiDB server to use the new server key and certificate. See [Configure TiDB server](#) for details.

## 14.11 SQL

### 14.11.1 SQL Language Structure and Syntax

#### 14.11.1.1 Attributes

##### 14.11.1.1.1 AUTO\_INCREMENT

This document introduces the `AUTO_INCREMENT` column attribute, including its concept, implementation principles, auto-increment related features, and restrictions.

#### Note:

The `AUTO_INCREMENT` attribute might cause hotspot in production environments. See [Troubleshoot HotSpot Issues](#) for details. It is recommended to use `AUTO_RANDOM` instead.

#### Concept

`AUTO_INCREMENT` is a column attribute that is used to automatically fill in default column values. When the `INSERT` statement does not specify values for the `AUTO_INCREMENT` column, the system automatically assigns values to this column.

For performance reasons, `AUTO_INCREMENT` numbers are allocated in a batch of values (30 thousand by default) to each TiDB server. This means that while `AUTO_INCREMENT` numbers are guaranteed to be unique, values assigned to an `INSERT` statement will only be monotonic on a per TiDB server basis.

#### Note:

If you want the `AUTO_INCREMENT` numbers to be monotonic on all TiDB servers and your TiDB version is v6.5.0 or later, it is recommended to enable the [MySQL compatibility mode](#).

The following is a basic example of `AUTO_INCREMENT`:

```
CREATE TABLE t(id int PRIMARY KEY AUTO_INCREMENT, c int);
```

```
INSERT INTO t(c) VALUES (1);
INSERT INTO t(c) VALUES (2);
INSERT INTO t(c) VALUES (3), (4), (5);
```

```
mysql> SELECT * FROM t;
+-----+-----+
| id | c |
+-----+-----+
1	1
2	2
3	3
4	4
5	5
+-----+-----+
5 rows in set (0.01 sec)
```

In addition, `AUTO_INCREMENT` also supports the `INSERT` statements that explicitly specify column values. In such cases, TiDB stores the explicitly specified values:

```
INSERT INTO t(id, c) VALUES (6, 6);
```

```
mysql> SELECT * FROM t;
+-----+-----+
| id | c |
+-----+-----+
1	1
2	2
3	3
4	4
5	5
6	6
+-----+-----+
6 rows in set (0.01 sec)
```

The usage above is the same as that of `AUTO_INCREMENT` in MySQL. However, in terms of the specific value that is implicitly assigned, TiDB differs from MySQL significantly.

#### Implementation principles

TiDB implements the `AUTO_INCREMENT` implicit assignment in the following way:

For each auto-increment column, a globally visible key-value pair is used to record the maximum ID that has been assigned. In a distributed environment, communication between nodes has some overhead. Therefore, to avoid the issue of write amplification, each TiDB node applies for a batch of consecutive IDs as caches when assigning IDs, and then applies for the next batch of IDs after the first batch is assigned. Therefore, TiDB nodes do not apply to the storage node for IDs when assigning IDs each time. For example:

```
CREATE TABLE t(id int UNIQUE KEY AUTO_INCREMENT, c int);
```

Assume two TiDB instances, A and B, in the cluster. If you execute an `INSERT` statement on the `t` table on A and B respectively:

```
INSERT INTO t (c) VALUES (1)
```

Instance A might cache the auto-increment IDs of `[1,30000]`, and instance B might cache the auto-increment IDs of `[30001,60000]`. In `INSERT` statements to be executed, these cached IDs of each instance will be assigned to the `AUTO_INCREMENT` column as the default values.

Basic Features

Uniqueness

### Warning:

When the cluster has multiple TiDB instances, if the table schema contains the auto-increment IDs, it is recommended not to use explicit insert and implicit assignment at the same time, which means using the default values of the auto-increment column and the custom values. Otherwise, it might break the uniqueness of implicitly assigned values.

In the example above, perform the following operations in order:

1. The client inserts a statement `INSERT INTO t VALUES (2, 1)` to instance B, which sets `id` to 2. The statement is successfully executed.
2. The client sends a statement `INSERT INTO t (c)(1)` to instance A. This statement does not specify the value of `id`, so the ID is assigned by A. At present, because A caches the IDs of `[1, 30000]`, it might assign 2 as the value of the auto-increment ID, and increases the local counter by 1. At this time, the data whose ID is 2 already exists in the database, so the `Duplicated Error` error is returned.

Monotonicity

TiDB guarantees that `AUTO_INCREMENT` values are monotonic (always increasing) on a per-server basis. Consider the following example where consecutive `AUTO_INCREMENT` values of 1-3 are generated:

```
CREATE TABLE t (a int PRIMARY KEY AUTO_INCREMENT, b timestamp NOT NULL
↳ DEFAULT NOW());
INSERT INTO t (a) VALUES (NULL), (NULL), (NULL);
SELECT * FROM t;
```

Query OK, 0 rows affected (0.11 sec)

Query OK, 3 rows affected (0.02 sec)

Records: 3 Duplicates: 0 Warnings: 0

```
+-----+
| a | b |
+-----+
1	2020-09-09 20:38:22
2	2020-09-09 20:38:22
3	2020-09-09 20:38:22
+-----+
3 rows in set (0.00 sec)
```

Monotonicity is not the same guarantee as consecutive. Consider the following example:

```
CREATE TABLE t (id INT NOT NULL PRIMARY KEY auto_increment, a VARCHAR(10),
 ↪ cnt INT NOT NULL DEFAULT 1, UNIQUE KEY (a));
INSERT INTO t (a) VALUES ('A'), ('B');
SELECT * FROM t;
INSERT INTO t (a) VALUES ('A'), ('C') ON DUPLICATE KEY UPDATE cnt = cnt +
 ↪ 1;
SELECT * FROM t;
```

Query OK, 0 rows affected (0.00 sec)

Query OK, 2 rows affected (0.00 sec)

Records: 2 Duplicates: 0 Warnings: 0

```
+-----+-----+
| id | a | cnt |
+-----+-----+
| 1 | A | 1 |
| 2 | B | 1 |
+-----+-----+
2 rows in set (0.00 sec)
```

Query OK, 3 rows affected (0.00 sec)

Records: 2 Duplicates: 1 Warnings: 0

```
+-----+-----+
| id | a | cnt |
+-----+-----+
| 1 | A | 2 |
| 2 | B | 1 |
```

```
| 4 | C | 1 |
+-----+-----+
3 rows in set (0.00 sec)
```

In this example, the `AUTO_INCREMENT` value of 3 is allocated for the `INSERT` of the key A in `INSERT INTO t (a)VALUES ('A'), ('C')ON DUPLICATE KEY UPDATE cnt = cnt + ↵ 1`; but never used because this `INSERT` statement contains a duplicate key A. This leads to a gap where the sequence is non-consecutive. This behavior is considered legal, even though it differs from MySQL. MySQL will also have gaps in the sequence in other scenarios such as transactions being aborted and rolled back.

### AUTO\_ID\_CACHE

The `AUTO_INCREMENT` sequence might appear to *jump* dramatically if an `INSERT` operation is performed against a different TiDB server. This is caused by the fact that each server has its own cache of `AUTO_INCREMENT` values:

```
CREATE TABLE t (a int PRIMARY KEY AUTO_INCREMENT, b timestamp NOT NULL
↵ DEFAULT NOW());
INSERT INTO t (a) VALUES (NULL), (NULL), (NULL);
INSERT INTO t (a) VALUES (NULL);
SELECT * FROM t;
```

```
Query OK, 1 row affected (0.03 sec)
```

```
+-----+-----+
| a | b |
+-----+-----+
1	2020-09-09 20:38:22
2	2020-09-09 20:38:22
3	2020-09-09 20:38:22
2000001	2020-09-09 20:43:43
+-----+-----+
4 rows in set (0.00 sec)
```

A new `INSERT` operation against the initial TiDB server generates the `AUTO_INCREMENT` value of 4. This is because the initial TiDB server still has space left in the `AUTO_INCREMENT` ↵ cache for allocation. In this case, the sequence of values cannot be considered globally monotonic, because the value of 4 is inserted after the value of 2000001:

```
mysql> INSERT INTO t (a) VALUES (NULL);
Query OK, 1 row affected (0.01 sec)
```

```
mysql> SELECT * FROM t ORDER BY b;
+-----+-----+
| a | b |
+-----+-----+
```

```

1	2020-09-09 20:38:22
2	2020-09-09 20:38:22
3	2020-09-09 20:38:22
2000001	2020-09-09 20:43:43
4	2020-09-09 20:44:43
+-----+
5 rows in set (0.00 sec)

```

The `AUTO_INCREMENT` cache does not persist across TiDB server restarts. The following `INSERT` statement is performed after the initial TiDB server is restarted:

```

mysql> INSERT INTO t (a) VALUES (NULL);
Query OK, 1 row affected (0.01 sec)

mysql> SELECT * FROM t ORDER BY b;
+-----+
| a | b |
+-----+
1	2020-09-09 20:38:22
2	2020-09-09 20:38:22
3	2020-09-09 20:38:22
2000001	2020-09-09 20:43:43
4	2020-09-09 20:44:43
2030001	2020-09-09 20:54:11
+-----+
6 rows in set (0.00 sec)

```

A high rate of TiDB server restarts might contribute to the exhaustion of `AUTO_INCREMENT` values. In the above example, the initial TiDB server still has values `[5-30000]` free in its cache. These values are lost, and will not be reallocated.

It is not recommended to rely on `AUTO_INCREMENT` values being continuous. Consider the following example, where a TiDB server has a cache of values `[2000001-2030000]`. By manually inserting the value `2029998`, you can see the behavior as a new cache range is retrieved:

```

mysql> INSERT INTO t (a) VALUES (2029998);
Query OK, 1 row affected (0.01 sec)

mysql> INSERT INTO t (a) VALUES (NULL);
Query OK, 1 row affected (0.01 sec)

mysql> INSERT INTO t (a) VALUES (NULL);
Query OK, 1 row affected (0.00 sec)

mysql> INSERT INTO t (a) VALUES (NULL);

```

```

Query OK, 1 row affected (0.02 sec)

mysql> INSERT INTO t (a) VALUES (NULL);
Query OK, 1 row affected (0.01 sec)

mysql> SELECT * FROM t ORDER BY b;
+-----+-----+
| a | b |
+-----+-----+
1	2020-09-09 20:38:22
2	2020-09-09 20:38:22
3	2020-09-09 20:38:22
2000001	2020-09-09 20:43:43
4	2020-09-09 20:44:43
2030001	2020-09-09 20:54:11
2029998	2020-09-09 21:08:11
2029999	2020-09-09 21:08:11
2030000	2020-09-09 21:08:11
2060001	2020-09-09 21:08:11
2060002	2020-09-09 21:08:11
+-----+-----+
11 rows in set (0.00 sec)

```

After the value 2030000 is inserted, the next value is 2060001. This jump in sequence is due to another TiDB server obtaining the intermediate cache range of [2030001-2060000]  $\leftrightarrow$  . When multiple TiDB servers are deployed, there will be gaps in the `AUTO_INCREMENT` sequence because cache requests are interleaved.

#### Cache size control

In earlier versions of TiDB, the cache size of the auto-increment ID was transparent to users. Starting from v3.0.14, v3.1.2, and v4.0.rc-2, TiDB has introduced the `AUTO_ID_CACHE` table option to allow users to set the cache size for allocating the auto-increment ID.

```

mysql> CREATE TABLE t(a int AUTO_INCREMENT key) AUTO_ID_CACHE 100;
Query OK, 0 rows affected (0.02 sec)

mysql> INSERT INTO t values();
Query OK, 1 row affected (0.00 sec)
Records: 1 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t;
+----+
| a |
+----+
| 1 |
+----+

```

```
1 row in set (0.01 sec)
```

At this time, if you invalidate the auto-increment cache of this column and redo the implicit insertion, the result is as follows:

```
mysql> DELETE FROM t;
Query OK, 1 row affected (0.01 sec)

mysql> RENAME TABLE t to t1;
Query OK, 0 rows affected (0.01 sec)

mysql> INSERT INTO t1 values()
Query OK, 1 row affected (0.00 sec)

mysql> SELECT * FROM t;
+-----+
| a |
+-----+
| 101 |
+-----+
1 row in set (0.00 sec)
```

The re-assigned value is 101. This shows that the size of cache for allocating the auto-increment ID is 100.

In addition, when the length of consecutive IDs in a batch `INSERT` statement exceeds the length of `AUTO_ID_CACHE`, TiDB increases the cache size accordingly to ensure that the statement can be inserted properly.

#### Auto-increment step size and offset

Starting from v3.0.9 and v4.0.0-rc.1, similar to the behavior of MySQL, the value implicitly assigned to the auto-increment column is controlled by the `@@auto_increment_increment` ↔ and `@@auto_increment_offset` session variables.

The value (ID) implicitly assigned to auto-increment columns satisfies the following equation:

$$(ID - auto\_increment\_offset) \% auto\_increment\_increment == 0$$

MySQL compatibility mode

TiDB v6.4.0 introduces a centralized auto-increment ID allocating service. In each request, an auto-increment ID is allocated from this service instead of caching data in TiDB instances.

Currently, the centralized allocating service is in the TiDB process and works like DDL Owner. One TiDB instance allocates IDs as the primary node and other TiDB instances work as secondary nodes. To ensure high availability, when the primary instance fails, TiDB starts automatic failover.

To use the MySQL compatibility mode, you can set `AUTO_ID_CACHE` to 1 when creating a table:

```
CREATE TABLE t(a int AUTO_INCREMENT key) AUTO_ID_CACHE 1;
```

### Note:

In TiDB, setting `AUTO_ID_CACHE` to 1 means that TiDB no longer caches IDs. But the implementation varies with TiDB versions:

- Before TiDB v6.4.0, since allocating ID requires a TiKV transaction to persist the `AUTO_INCREMENT` value for each request, setting `AUTO_ID_CACHE` to 1 causes performance degradation.
- Since TiDB v6.4.0, the modification of the `AUTO_INCREMENT` value is faster because it is only an in-memory operation in the TiDB process as the centralized allocating service is introduced.
- Setting `AUTO_ID_CACHE` to 0 means that TiDB uses the default cache size 30000.

After you enable the MySQL compatibility mode, the allocated IDs are **unique** and **monotonically increasing**, and the behavior is almost the same as MySQL. Even if you access across TiDB instances, the IDs will keep monotonic. Only when the primary instance of the centralized service crashes, there might be a few IDs that are not continuous. This is because the secondary instance discards some IDs that are supposed to have been allocated by the primary instance during the failover to ensure ID uniqueness.

### Restrictions

Currently, `AUTO_INCREMENT` has the following restrictions when used in TiDB:

- It must be defined on the first column of the primary key or the first column of an index.
- It must be defined on the column of `INTEGER`, `FLOAT`, or `DOUBLE` type.
- It cannot be specified on the same column with the `DEFAULT` column value.
- `ALTER TABLE` cannot be used to add the `AUTO_INCREMENT` attribute.
- `ALTER TABLE` can be used to remove the `AUTO_INCREMENT` attribute. However, starting from v2.1.18 and v3.0.4, TiDB uses the session variable `@@tidb_allow_remove_auto_inc`  $\leftrightarrow$  to control whether `ALTER TABLE MODIFY` or `ALTER TABLE CHANGE` can be used to remove the `AUTO_INCREMENT` attribute of a column. By default, you cannot use `ALTER TABLE MODIFY` or `ALTER TABLE CHANGE` to remove the `AUTO_INCREMENT` attribute.
- `ALTER TABLE` requires the `FORCE` option to set the `AUTO_INCREMENT` value to a smaller value.
- Setting the `AUTO_INCREMENT` to a value smaller than `MAX(<auto_increment_column>)` leads to duplicate keys because pre-existing values are not skipped.

### 14.11.1.1.2 AUTO\_RANDOM New in v3.1.0

User scenario

Since the value of `AUTO_RANDOM` is random and unique, `AUTO_RANDOM` is often used in place of `AUTO_INCREMENT` to avoid write hotspot in a single storage node caused by TiDB assigning consecutive IDs. If the current `AUTO_INCREMENT` column is a primary key and the type is `BIGINT`, you can execute the `ALTER TABLE t MODIFY COLUMN id BIGINT AUTO_RANDOM(5) ↵ ;` statement to switch from `AUTO_INCREMENT` to `AUTO_RANDOM`.

For more information about how to handle highly concurrent write-heavy workloads in TiDB, see [Highly concurrent write best practices](#).

Basic concepts

`AUTO_RANDOM` is a column attribute that is used to automatically assign values to a `BIGINT` column. Values assigned automatically are **random** and **unique**.

To create a table with an `AUTO_RANDOM` column, you can use the following statements. The `AUTO_RANDOM` column must be included in a primary key, and the `AUTO_RANDOM` column is the first column in the primary key.

```
CREATE TABLE t (a BIGINT AUTO_RANDOM, b VARCHAR(255), PRIMARY KEY (a));
CREATE TABLE t (a BIGINT PRIMARY KEY AUTO_RANDOM, b VARCHAR(255));
CREATE TABLE t (a BIGINT AUTO_RANDOM(6), b VARCHAR(255), PRIMARY KEY (a));
CREATE TABLE t (a BIGINT AUTO_RANDOM(5, 54), b VARCHAR(255), PRIMARY KEY (a
↵));
CREATE TABLE t (a BIGINT AUTO_RANDOM(5, 54), b VARCHAR(255), PRIMARY KEY (a
↵ , b));
```

You can wrap the keyword `AUTO_RANDOM` in an executable comment. For more details, refer to [TiDB specific comment syntax](#).

```
CREATE TABLE t (a bigint /*T![auto_rand] AUTO_RANDOM */, b VARCHAR(255),
↵ PRIMARY KEY (a));
CREATE TABLE t (a bigint PRIMARY KEY /*T![auto_rand] AUTO_RANDOM */, b
↵ VARCHAR(255));
CREATE TABLE t (a BIGINT /*T![auto_rand] AUTO_RANDOM(6) */, b VARCHAR(255),
↵ PRIMARY KEY (a));
CREATE TABLE t (a BIGINT /*T![auto_rand] AUTO_RANDOM(5, 54) */, b VARCHAR
↵ (255), PRIMARY KEY (a));
```

When you execute an `INSERT` statement:

- If you explicitly specify the value of the `AUTO_RANDOM` column, it is inserted into the table as is.
- If you do not explicitly specify the value of the `AUTO_RANDOM` column, TiDB generates a random value and inserts it into the table.

```

tidb> CREATE TABLE t (a BIGINT PRIMARY KEY AUTO_RANDOM, b VARCHAR(255));
Query OK, 0 rows affected, 1 warning (0.01 sec)

tidb> INSERT INTO t(a, b) VALUES (1, 'string');
Query OK, 1 row affected (0.00 sec)

tidb> SELECT * FROM t;
+----+-----+
| a | b |
+----+-----+
| 1 | string |
+----+-----+
1 row in set (0.01 sec)

tidb> INSERT INTO t(b) VALUES ('string2');
Query OK, 1 row affected (0.00 sec)

tidb> INSERT INTO t(b) VALUES ('string3');
Query OK, 1 row affected (0.00 sec)

tidb> SELECT * FROM t;
+-----+-----+
| a | b |
+-----+-----+
1	string
1152921504606846978	string2
4899916394579099651	string3
+-----+-----+
3 rows in set (0.00 sec)

```

The `AUTO_RANDOM(S, R)` column value automatically assigned by TiDB has a total of 64 bits:

- `S` is the number of shard bits. The value ranges from 1 to 15. The default value is 5.
- `R` is the total length of the automatic allocation range. The value ranges from 32 to 64. The default value is 64.

The structure of an `AUTO_RANDOM` value is as follows:

| Total number of bits | Sign bit | Reserved bits | Shard bits | Auto-increment bits |
|----------------------|----------|---------------|------------|---------------------|
| 64 bits              | 0/1 bit  | (64-R) bits   | S bits     | (R-1-S) bits        |

- The length of the sign bit is determined by the existence of an `UNSIGNED` attribute. If

there is an `UNSIGNED` attribute, the length is 0. Otherwise, the length is 1.

- The length of the reserved bits is  $64-R$ . The reserved bits are always 0.
- The content of the shard bits is obtained by calculating the hash value of the starting time of the current transaction. To use a different length of shard bits (such as 10), you can specify `AUTO_RANDOM(10)` when creating the table.
- The value of the auto-increment bits is stored in the storage engine and allocated sequentially. Each time a new value is allocated, the value is incremented by 1. The auto-increment bits ensure that the values of `AUTO_RANDOM` are unique globally. When the auto-increment bits are exhausted, an error `Failed to read auto-increment ↪ value from storage engine` is reported when the value is allocated again.

### Note:

Selection of shard bits (**S**):

- Since there is a total of 64 available bits, the shard bits length affects the auto-increment bits length. That is, as the shard bits length increases, the length of auto-increment bits decreases, and vice versa. Therefore, you need to balance the randomness of allocated values and available space.
- The best practice is to set the shard bits as  $\log_2(x)$ , in which  $x$  is the current number of storage engines. For example, if there are 16 TiKV nodes in a TiDB cluster, you can set the shard bits as  $\log_2(16)$ , that is 4. After all regions are evenly scheduled to each TiKV node, the load of bulk writes can be uniformly distributed to different TiKV nodes to maximize resource utilization.

Selection of range (**R**):

- Typically, the `R` parameter needs to be set when the numeric type of the application cannot represent a full 64-bit integer.
- For example, the range of `JSON` number is  $[-2^{53}+1, 2^{53}-1]$ . TiDB can easily assign an integer outside this range to a column of `AUTO_RANDOM(5)`, causing unexpected behaviors when the application reads the column. In this case, you can replace `AUTO_RANDOM(5)` with `AUTO_RANDOM(5, 54)` and TiDB does not assign an integer greater than 9007199254740991 ( $2^{53}-1$ ) to the column.

Values allocated implicitly to the `AUTO_RANDOM` column affect `last_insert_id()`. To get the ID that TiDB last implicitly allocates, you can use the `SELECT last_insert_id ()` statement.

To view the shard bits number of the table with an `AUTO_RANDOM` column, you can execute

the `SHOW CREATE TABLE` statement. You can also see the value of the `PK_AUTO_RANDOM_BITS`  $\leftrightarrow$  `=x` mode in the `TIDB_ROW_ID_SHARDING_INFO` column in the `information_schema`.  $\leftrightarrow$  `tables` system table. `x` is the number of shard bits.

After creating a table with an `AUTO_RANDOM` column, you can use `SHOW WARNINGS` to view the maximum implicit allocation times:

```
CREATE TABLE t (a BIGINT AUTO_RANDOM, b VARCHAR(255), PRIMARY KEY (a));
SHOW WARNINGS;
```

The output is as follows:

```
+-----+-----+-----+
| Level | Code | Message |
+-----+-----+-----+
| Note | 1105 | Available implicit allocation times: 288230376151711743 |
+-----+-----+-----+
1 row in set (0.00 sec)
```

### Restrictions

Pay attention to the following restrictions when you use `AUTO_RANDOM`:

- To insert values explicitly, you need to set the value of the `@allow_auto_random_explicit_insert`  $\leftrightarrow$  system variable to 1 (0 by default). It is **not** recommended that you explicitly specify a value for the column with the `AUTO_RANDOM` attribute when you insert data. Otherwise, the numeral values that can be automatically allocated for this table might be used up in advance.
- Specify this attribute for the primary key column **ONLY** as the `BIGINT` type. Otherwise, an error occurs. In addition, when the attribute of the primary key is `NONCLUSTERED`, `AUTO_RANDOM` is not supported even on the integer primary key. For more details about the primary key of the `CLUSTERED` type, refer to [clustered index](#).
- You cannot use `ALTER TABLE` to modify the `AUTO_RANDOM` attribute, including adding or removing this attribute.
- You cannot use `ALTER TABLE` to change from `AUTO_INCREMENT` to `AUTO_RANDOM` if the maximum value is close to the maximum value of the column type.
- You cannot change the column type of the primary key column that is specified with `AUTO_RANDOM` attribute.
- You cannot specify `AUTO_RANDOM` and `AUTO_INCREMENT` for the same column at the same time.
- You cannot specify `AUTO_RANDOM` and `DEFAULT` (the default value of a column) for the same column at the same time.
- When `AUTO_RANDOM` is used on a column, it is difficult to change the column attribute back to `AUTO_INCREMENT` because the auto-generated values might be very large.

#### 14.11.1.1.3 SHARD\_ROW\_ID\_BITS

This document introduces the `SHARD_ROW_ID_BITS` table attribute, which is used to set the number of bits of the shards after the implicit `_tidb_rowid` is sharded.

### Concept

For the tables with a non-clustered primary key or no primary key, TiDB uses an implicit auto-increment row ID. When a large number of `INSERT` operations are performed, the data is written into a single Region, causing a write hot spot.

To mitigate the hot spot issue, you can configure `SHARD_ROW_ID_BITS`. The row IDs are scattered and the data are written into multiple different Regions.

- `SHARD_ROW_ID_BITS = 4` indicates 16 shards
- `SHARD_ROW_ID_BITS = 6` indicates 64 shards
- `SHARD_ROW_ID_BITS = 0` indicates the default 1 shard

For details on the usage, see [the Troubleshoot Hotspot Issues guide](#).

### Examples

```
CREATE TABLE t (
 id INT PRIMARY KEY NONCLUSTERED
) SHARD_ROW_ID_BITS = 4;
```

```
ALTER TABLE t SHARD_ROW_ID_BITS = 4;
```

## 14.11.1.2 Literal Values

TiDB literal values include character literals, numeric literals, time and date literals, hexadecimal, binary literals, and `NULL` literals. This document introduces each of these literal values.

This document describes String literals, Numeric literals, `NULL` values, Hexadecimal literals, Date and time literals, Boolean literals, and Bit-value literals.

### 14.11.1.2.1 String literals

A string is a sequence of bytes or characters, enclosed within either single quote `'` or double quote `"` characters. For example:

```
'example string'
"example string"
```

Quoted strings placed next to each other are concatenated to a single string. The following lines are equivalent:

```
'a string'
'a' ' ' 'string'
"a" ' ' "string"
```

If the `ANSI_QUOTES SQL MODE` is enabled, string literals can be quoted only within single quotation marks because a string quoted within double quotation marks is interpreted as an identifier.

The string is divided into the following two types:

- **Binary string:** It consists of a sequence of bytes, whose charset and collation are both `binary`, and uses `byte` as the unit when compared with each other.
- **Non-binary string:** It consists of a sequence of characters and has various charsets and collations other than `binary`. When compared with each other, non-binary strings use `characters` as the unit. A character might contain multiple bytes, depending on the charset.

A string literal may have an optional `character set introducer` and `COLLATE clause`, to designate it as a string that uses a specific character set and collation.

```
[_charset_name]'string' [COLLATE collation_name]
```

For example:

```
SELECT _latin1'string';
SELECT _binary'string';
SELECT _utf8'string' COLLATE utf8_bin;
```

You can use `N'literal'` (or `n'literal'`) to create a string in the national character set. The following statements are equivalent:

```
SELECT N'some text';
SELECT n'some text';
SELECT _utf8'some text';
```

To represent some special characters in a string, you can use escape characters to escape:

| Escape Characters | Meaning                          |
|-------------------|----------------------------------|
| <code>\0</code>   | An ASCII NUL (X'00') character   |
| <code>\'</code>   | A single quote ' character       |
| <code>\“</code>   | A double quote " character       |
| <code>\b</code>   | A backspace character            |
| <code>\n</code>   | A line break (newline) character |
| <code>\r</code>   | A carriage return character      |
| <code>\t</code>   | A tab character                  |
| <code>\z</code>   | ASCII 26 (Ctrl + Z)              |
| <code>\\</code>   | A backslash \ character          |
| <code>\%</code>   | A % character                    |
| <code>\_</code>   | A _ character                    |

If you want to represent " in the string surrounded by ', or ' in the string surrounded by ", you do not need to use escape characters.

For more information, see [String Literals in MySQL](#).

#### 14.11.1.2.2 Numeric literals

Numeric literals include integer and DECIMAL literals and floating-point literals.

Integer may include . as a decimal separator. Numbers may be preceded by - or + to indicate a negative or positive value respectively.

Exact-value numeric literals can be represented as 1, .2, 3.4, -5, -6.78, +9.10.

Numeric literals can also be represented in scientific notation, such as 1.2E3, 1.2E-3, ↪ -1.2E3, -1.2E-3.

For more information, see [Numeric Literals in MySQL](#).

#### 14.11.1.2.3 Date and time literals

Date and time literal values can be represented in several formats, such as quoted strings or as numbers. When TiDB expects a date, it interprets any of '2017-08-24', '20170824' and 20170824 as a date.

TiDB supports the following date formats:

- 'YYYY-MM-DD' or 'YY-MM-DD': The - delimiter here is not strict. It can be any punctuation. For example, '2017-08-24', '2017&08&24', '2012@12^31' are all valid date formats. The only special punctuation is '.', which is treated as a decimal point to separate the integer and fractional parts. Date and time can be separated by T or a white space. For example, 2017-8-24 10:42:00 and 2017-8-24T10:42:00 represents the same date and time.
- 'YYYYMMDDHHMMSS' or 'YMMDDHHMMSS': For example, '20170824104520' and '170824104520' are regarded as '2017-08-24 10:45:20'. However, if you provide a value out of range, such as '170824304520', it is not treated as a valid date. Note that incorrect formats such as YYYYMMDD HHMMSS, YYYYMMDD HH:MM:DD, or YYYY-MM-DD HHMMSS will fail to insert.
- YYYYMMDDHHMMSS or YMMDDHHMMSS: Note that these formats have no single or double quotes, but a number. For example, 20170824104520 is interpreted as '2017-08-24 ↪ 10:45:20'.

DATETIME or TIMESTAMP values can be followed by a fractional part, used to represent microseconds precision (6 digits). The fractional part should always be separated from the rest of the time by a decimal point ..

The year value containing only two digits is ambiguous. It is recommended to use the four-digit year format. TiDB interprets the two-digit year value according to the following rules:

- If the year value is in the range of 70–99, it is converted to 1970–1999.
- If the year value is in the range of 00–69, it is converted to 2000–2069.

For month or day values less than 10, '2017-8-4' is the same as '2017-08-04'. The same is true for Time. For example, '2017-08-24 1:2:3' is the same as '2017-08-24 ↪ 01:02:03'.

When the date or time value is required, TiDB selects the specified format according to the length of the value:

- 6 digits: YYMMDD.
- 12 digits: YYMMDDHHMMSS.
- 8 digits: YYYYMMDD.
- 14 digits: YYYYMMDDHHMMSS.

TiDB supports the following formats for time values:

- 'D HH:MM:SS', or 'HH:MM:SS', 'HH:MM', 'D HH:MM', 'D HH', 'SS': D means days and the valid value range is 0–34.
- A number in HHMMSS format: For example, 231010 is interpreted as '23:10:10'.
- A number in any of SS, MMSS, and HHMMSS formats can be regarded as time.

The decimal point of the Time type is also ., with a precision of up to 6 digits after the decimal point.

See [MySQL date and time literals](#) for more details.

#### 14.11.1.2.4 Boolean Literals

The constants TRUE and FALSE are equal to 1 and 0 respectively, which are not case sensitive.

```
SELECT TRUE, true, tRuE, FALSE, FaLsE, false;
```

```
+-----+-----+-----+-----+-----+-----+
| TRUE | true | tRuE | FALSE | FaLsE | false |
+-----+-----+-----+-----+-----+-----+
| 1 | 1 | 1 | 0 | 0 | 0 |
+-----+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

### 14.11.1.2.5 Hexadecimal literals

Hexadecimal literal values are written using `X'val'` or `Oxval` notation, where `val` contains hexadecimal digits. A leading `Ox` is case sensitive and cannot be written as `OX`.

Legal hexadecimal literals:

```
X'ac12'
X'12AC'
x'ac12'
x'12AC'
Oxac12
Ox12AC
```

Illegal hexadecimal literals:

```
X'1z' (z is not a hexadecimal legal digit)
OX12AC (OX must be written as Ox)
```

Hexadecimal literals written using `X'val'` notation must contain an even number of digits. If the length of `val` is an odd number (for example, `X'A'` or `X'11A'`), to avoid the syntax error, pad the value with a leading zero:

```
mysql> select X'aff';
ERROR 1105 (HY000): line 0 column 13 near ""hex literal: invalid
 ↪ hexadecimal format, must even numbers, but 3 (total length 13)
mysql> select X'0aff';
+-----+
| X'0aff' |
+-----+
| Ox0aff |
+-----+
1 row in set (0.00 sec)
```

By default, a hexadecimal literal is a binary string.

To convert a string or a number to a string in hexadecimal format, use the `HEX()` function:

```
mysql> SELECT HEX('TiDB');
+-----+
| HEX('TiDB') |
+-----+
| 54694442 |
+-----+
1 row in set (0.01 sec)

mysql> SELECT X'54694442';
+-----+
| X'54694442' |
```

```
+-----+
| TiDB |
+-----+
1 row in set (0.00 sec)
```

#### 14.11.1.2.6 Bit-value literals

Bit-value literals are written using `b'val'` or `Obval` notation. The `val` is a binary value written using zeros and ones. A leading `Ob` is case sensitive and cannot be written as `OB`.

Legal bit-value literals:

```
b'01'
B'01'
Ob01
```

Illegal bit-value literals:

```
b'2' (2 is not a binary digit; it must be 0 or 1)
OB01 (OB must be written as Ob)
```

By default, a bit-value literal is a binary string.

Bit values are returned as binary values, which may not display well in the MySQL client. To convert a bit value to printable form, you can use a conversion function such as `BIN()` or `HEX()`.

```
CREATE TABLE t (b BIT(8));
INSERT INTO t SET b = b'00010011';
INSERT INTO t SET b = b'1110';
INSERT INTO t SET b = b'100101';

mysql> SELECT b+0, BIN(b), HEX(b) FROM t;
+-----+-----+-----+
| b+0 | BIN(b) | HEX(b) |
+-----+-----+-----+
19	10011	13
14	1110	E
37	100101	25
+-----+-----+-----+
3 rows in set (0.00 sec)
```

#### 14.11.1.2.7 NULL Values

NULL means the data is empty, which is case-insensitive, and is synonymous with `\N` (case-sensitive).

**Note:**

NULL is not the same as 0, nor the empty string ''.

### 14.11.1.3 Schema Object Names

This document introduces schema object names in TiDB SQL statements.

Schema object names are used to name all schema objects in TiDB, including database, table, index, column, and alias. You can quote these objects using identifiers in SQL statements.

You can use backticks to enclose the identifier. For example, `SELECT * FROM t` can also be written as `SELECT * FROM `t``. But if the identifier includes one or more special characters or is a reserved keyword, it must be enclosed in backticks to quote the schema object it represents.

```
SELECT * FROM `table` WHERE `table`.id = 20;
```

If you set `ANSI_QUOTES` in SQL MODE, TiDB will recognize the string enclosed in double quotation marks " as an identifier.

```
CREATE TABLE "test" (a varchar(10));
```

```
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual
↳ that corresponds to your TiDB version for the right syntax to use
↳ line 1 column 19 near "\"test\" (a varchar(10))"
```

```
SET SESSION sql_mode='ANSI_QUOTES';
```

```
Query OK, 0 rows affected (0.000 sec)
```

```
CREATE TABLE "test" (a varchar(10));
```

```
Query OK, 0 rows affected (0.012 sec)
```

If you want to use the backtick character in the quoted identifier, repeat the backtick twice. For example, to create a table a`b:

```
CREATE TABLE `a``b` (a int);
```

In a `SELECT` statement, you can use an identifier or a string to specify an alias:

```
SELECT 1 AS `identifier`, 2 AS 'string';
```

```
+-----+-----+
| identifier | string |
+-----+-----+
| 1 | 2 |
+-----+-----+
1 row in set (0.00 sec)
```

For more information, see [MySQL Schema Object Names](#).

#### 14.11.1.3.1 Identifier qualifiers

Object names can be unqualified or qualified. For example, the following statement creates a table without a qualified name:

```
CREATE TABLE t (i int);
```

If you have not used the `USE` statement or the connection parameter to configure the database, the `ERROR 1046 (3D000): No database selected` error is displayed. At this time, you can specify the database qualified name:

```
CREATE TABLE test.t (i int);
```

White spaces can exist around `.. table_name.col_name` and `table_name . col_name` are equivalent.

To quote this identifier, use:

```
`table_name`.`col_name`
```

Instead of:

```
`table_name.col_name`
```

For more information, see [MySQL Identifier Qualifiers](#).

#### 14.11.1.4 Keywords

This article introduces the keywords in TiDB, the differences between reserved words and non-reserved words and summarizes all keywords for the query.

Keywords are words that have special meanings in SQL statements, such as `SELECT`, `UPDATE`, and `DELETE`. Some of them can be used as identifiers directly, which are called **non-reserved keywords**. Some of them require special treatment before being used as identifiers, which are called **reserved keywords**. However, there are special non-reserved keywords that might still require special treatment. It is recommended that you treat them as reserved keywords.

To use the reserved keywords as identifiers, you must enclose them in backticks ```:

```
CREATE TABLE select (a INT);
```

```
ERROR 1105 (HY000): line 0 column 19 near " (a INT)" (total length 27)
```

```
CREATE TABLE `select` (a INT);
```

```
Query OK, 0 rows affected (0.09 sec)
```

The non-reserved keywords do not require backticks, such as BEGIN and END, which can be successfully used as identifiers in the following statement:

```
CREATE TABLE `select` (BEGIN int, END int);
```

```
Query OK, 0 rows affected (0.09 sec)
```

In the special case, the reserved keywords do not need backticks if they are used with the . delimiter:

```
CREATE TABLE test.select (BEGIN int, END int);
```

```
Query OK, 0 rows affected (0.08 sec)
```

#### 14.11.1.4.1 Keyword list

The following list shows the keywords in TiDB. Reserved keywords are marked with (↔ R). Reserved keywords for [Window Functions](#) are marked with (R-Window). Special non-reserved keywords that need to be escaped with backticks ` are marked with (S).

A

- ACCOUNT
- ACTION
- ADD (R)
- ADMIN (R)
- ADVISE
- AFTER
- AGAINST
- AGO
- ALGORITHM
- ALL (R)
- ALTER (R)
- ALWAYS
- ANALYZE (R)
- AND (R)

- ANY
- AS (R)
- ASC (R)
- ASCII
- AUTO\_ID\_CACHE
- AUTO\_INCREMENT
- AUTO\_RANDOM
- AUTO\_RANDOM\_BASE
- AVG
- AVG\_ROW\_LENGTH

## B

- BACKEND
- BACKUP
- BACKUPS
- BEGIN
- BETWEEN (R)
- BIGINT (R)
- BINARY (R)
- BINDING
- BINDINGS
- BINLOG
- BIT
- BLOB (R)
- BLOCK
- BOOL
- BOOLEAN
- BOTH (R)
- BTREE
- BUCKETS (R)
- BUILTINS (R)
- BY (R)
- BYTE

## C

- CACHE
- CANCEL (R)
- CAPTURE
- CASCADE (R)
- CASCADED
- CASE (R)
- CHAIN

- CHANGE (R)
- CHAR (R)
- CHARACTER (R)
- CHARSET
- CHECK (R)
- CHECKPOINT
- CHECKSUM
- CIPHER
- CLEANUP
- CLIENT
- CMSKETCH (R)

### 14.11.1.5 User-Defined Variables

This document describes the concept of user-defined variables in TiDB and the methods to set and read the user-defined variables.

#### **Warning:**

User-defined variables are still an experimental feature. It is **NOT** recommended that you use them in the production environment.

The format of the user-defined variables is `@var_name`. The characters that compose `var_name` can be any characters that can compose an identifier, including the numbers 0-9  $\hookrightarrow$  , the letters a-zA-Z, the underscore `_`, the dollar sign `$`, and the UTF-8 characters. In addition, it also includes the English period `.`. The user-defined variables are case-insensitive.

The user-defined variables are session-specific, which means a user variable defined by one client connection cannot be seen or used by other client connections.

#### 14.11.1.5.1 Set the user-defined variables

You can use the `SET` statement to set a user-defined variable, and the syntax is `SET  $\hookrightarrow$  @var_name = expr [, @var_name = expr] ...;`. For example:

```
SET @favorite_db = 'TiDB';
```

```
SET @a = 'a', @b = 'b', @c = 'c';
```

For the assignment operator, you can also use `:=`. For example:

```
SET @favorite_db := 'TiDB';
```

The content to the right of the assignment operator can be any valid expression. For example:

```
SET @c = @a + @b;
```

```
set @c = b'1000001' + b'1000001';
```

#### 14.11.1.5.2 Read the user-defined variables

To read a user-defined variable, you can use the `SELECT` statement to query:

```
SELECT @a1, @a2, @a3
```

```
+-----+-----+-----+
| @a1 | @a2 | @a3 |
+-----+-----+-----+
| 1 | 2 | 4 |
+-----+-----+-----+
```

You can also assign values in the `SELECT` statement:

```
SELECT @a1, @a2, @a3, @a4 := @a1+@a2+@a3;
```

```
+-----+-----+-----+-----+
| @a1 | @a2 | @a3 | @a4 := @a1+@a2+@a3 |
+-----+-----+-----+-----+
| 1 | 2 | 4 | 7 |
+-----+-----+-----+-----+
```

Before the variable @a4 is modified or the connection is closed, its value is always 7.

If a hexadecimal literal or binary literal is used when setting the user-defined variable, TiDB will treat it as a binary string. If you want to set it to a number, you can manually add the CAST conversion, or use the numeric operator in the expression:

```
SET @v1 = b'1000001';
SET @v2 = b'1000001'+0;
SET @v3 = CAST(b'1000001' AS UNSIGNED);
```

```
SELECT @v1, @v2, @v3;
```

```
+-----+-----+-----+
| @v1 | @v2 | @v3 |
+-----+-----+-----+
| A | 65 | 65 |
+-----+-----+-----+
```

If you refer to a user-defined variable that has not been initialized, it has a value of NULL and a type of string.

```
SELECT @not_exist;
```

```
+-----+
| @not_exist |
+-----+
| NULL |
+-----+
```

In addition to using the SELECT statement to read the user-defined variables, another common usage is the PREPARE statement. For example:

```
SET @s = 'SELECT SQRT(POW(?,2) + POW(?,2)) AS hypotenuse';
PREPARE stmt FROM @s;
SET @a = 6;
SET @b = 8;
EXECUTE stmt USING @a, @b;
```

```
+-----+
| hypotenuse |
+-----+
| 10 |
+-----+
```

The contents of the user-defined variables are not recognized as identifiers in the SQL statements. For example:

```
SELECT * from t;
```

```
+----+
| a |
+----+
| 1 |
+----+
```

```
SET @col = "`a`";
SELECT @col FROM t;
```

```
+-----+
| @col |
+-----+
| `a` |
+-----+
```

### 14.11.1.5.3 MySQL compatibility

Except for `SELECT ... INTO <variable>`, the syntax supported in MySQL and TiDB is identical.

For more information, see [User-Defined Variables in MySQL](#).

### 14.11.1.6 Expression Syntax

An expression is a combination of one or more values, operators, or functions. In TiDB, expressions are mainly used in various clauses of the `SELECT` statement, including Group by clause, Where clause, Having clause, Join condition and window function. In addition, some DDL statements also use expressions, such as the setting of the default values, columns, and partition rules when creating tables.

The expressions can be divided into the following types:

- Identifier. For reference, see [Schema object names](#).
- Predicates, numeric values, strings, date expressions. The [Literal values](#) of these types are also expressions.
- Function calls and window functions. For reference, see [Functions and operators overview](#) and [Window functions](#)
- ParamMarker (?), system variables, user variables and CASE expressions.

The following rules are the expression syntax, which is based on the [parser.y](#) rules of TiDB parser. For the navigable version of the following syntax diagram, refer to [TiDB SQL Syntax Diagram](#).

```

Expression ::=
 (singleAtIdentifier assignmentEq | 'NOT' | Expression (logOr | 'XOR' |
 ↪ logAnd)) Expression
| 'MATCH' '(' ColumnNameList ')' 'AGAINST' '(' BitExpr
 ↪ FulltextSearchModifierOpt ')'
| PredicateExpr (IsOrNotOp 'NULL' | CompareOp ((singleAtIdentifier
 ↪ assignmentEq)? PredicateExpr | AnyOrAll SubSelect)) * (IsOrNotOp (
 ↪ trueKwd | falseKwd | 'UNKNOWN'))?

PredicateExpr ::=
 BitExpr (BetweenOrNotOp BitExpr 'AND' BitExpr) * (InOrNotOp ('('
 ↪ ExpressionList ')' | SubSelect) | LikeOrNotOp SimpleExpr
 ↪ LikeEscapeOpt | RegexpOrNotOp SimpleExpr)?

BitExpr ::=
 BitExpr (('|' | '&' | '<<' | '>>' | '*' | '/' | '%' | 'DIV' | 'MOD' |
 ↪ '^') BitExpr | ('+' | '-') (BitExpr | "INTERVAL" Expression
 ↪ TimeUnit))
| SimpleExpr

SimpleExpr ::=
 SimpleIdent (('->' | '->>') stringLit)?
| FunctionCallKeyword
| FunctionCallNonKeyword
| FunctionCallGeneric
| SimpleExpr ('COLLATE' CollationName | pipes SimpleExpr)
| WindowFuncCall
| Literal
| paramMarker
| Variable
| SumExpr
| ('!' | '~' | '-' | '+' | 'NOT' | 'BINARY') SimpleExpr
| 'EXISTS'? SubSelect
| (('(' (ExpressionList ',')? | 'ROW' '(' ExpressionList ',')
 ↪ Expression | builtinCast '(' Expression 'AS' CastType | ('DEFAULT' |
 ↪ 'VALUES') '(' SimpleIdent | 'CONVERT' '(' Expression (',' CastType
 ↪ | 'USING' CharsetName))))
| 'CASE' ExpressionOpt WhenClause+ ElseOpt 'END'

```

#### 14.11.1.7 Comment Syntax

This document describes the comment syntax supported by TiDB.

TiDB supports three comment styles:

- Use # to comment a line:

```
SELECT 1+1; # comments
```

```
+-----+
| 1+1 |
+-----+
| 2 |
+-----+
1 row in set (0.00 sec)
```

- Use -- to comment a line:

```
SELECT 1+1; -- comments
```

```
+-----+
| 1+1 |
+-----+
| 2 |
+-----+
1 row in set (0.00 sec)
```

And this style requires at least one whitespace after --:

```
SELECT 1+1--1;
```

```
+-----+
| 1+1--1 |
+-----+
| 3 |
+-----+
1 row in set (0.01 sec)
```

- Use /\* \*/ to comment a block or multiple lines:

```
SELECT 1 /* this is an in-line comment */ + 1;
```

```
+-----+
| 1 + 1 |
+-----+
| 2 |
+-----+
1 row in set (0.01 sec)
```

```
SELECT 1+
/*
/*> this is a
/*> multiple-line comment
/*> */
1;
```

```
+-----+
| 1+
 1 |
+-----+
| 2 |
+-----+
1 row in set (0.001 sec)
```

#### 14.11.1.7.1 MySQL-compatible comment syntax

The same as MySQL, TiDB supports a variant of C comment style:

```
/*! Specific code */
```

or

```
/*!50110 Specific code */
```

In this style, TiDB runs the statements in the comment.

For example:

```
SELECT /*! STRAIGHT_JOIN */ col1 FROM table1,table2 WHERE ...
```

In TiDB, you can also use another version:

```
SELECT STRAIGHT_JOIN col1 FROM table1,table2 WHERE ...
```

If the server version number is specified in the comment, for example, `/*!50110 ↪ KEY_BLOCK_SIZE=1024 */`, in MySQL it means that the contents in this comment are processed only when the MySQL version is or higher than 5.1.10. But in TiDB, the MySQL version number does not work and all contents in the comment are processed.

#### 14.11.1.7.2 TiDB specific comment syntax

TiDB has its own comment syntax (that is, TiDB specific comment syntax), which can be divided into the following two types:

- `/*T! Specific code */`: This syntax can only be parsed and executed by TiDB, and be ignored in other databases.

- `/*T![feature_id] Specific code */`: This syntax is used to ensure compatibility between different versions of TiDB. TiDB can parse the SQL fragment in this comment only if it implements the corresponding feature of `feature_id` in the current version. For example, as the `AUTO_RANDOM` feature is introduced in v3.1.1, this version of TiDB can parse `/*T![auto_rand] auto_random */` into `auto_random`. Because the `AUTO_RANDOM` feature is not implemented in v3.0.0, the SQL statement fragment above is ignored. **Do not leave any space inside the `/*T!` characters.**

### 14.11.1.7.3 Optimizer comment syntax

Another type of comment is specially treated as an optimizer hint:

```
SELECT /*+ hint */ FROM ...;
```

For details about the optimizer hints that TiDB supports, see [Optimizer hints](#).

#### Note:

In MySQL client, the TiDB-specific comment syntax is treated as comments and cleared by default. In MySQL client before 5.7.7, hints are also seen as comments and are cleared by default. It is recommended to use the `--comments` option when you start the client. For example, `mysql -h ↵ 127.0.0.1 -P 4000 -uroot --comments`.

For more information, see [Comment Syntax](#).

## 14.11.2 SQL Statements

### 14.11.2.1 ADD COLUMN

The `ALTER TABLE.. ADD COLUMN` statement adds a column to an existing table. This operation is online in TiDB, which means that neither reads or writes to the table are blocked by adding a column.

#### 14.11.2.1.1 Synopsis

```
AlterTableStmt
 ::= 'ALTER' 'IGNORE'? 'TABLE' TableName AddColumnSpec (','
 ↵ AddColumnSpec)*

TableName ::=
 Identifier ('.' Identifier)?
```

```

AddColumnSpec
 ::= 'ADD' 'COLUMN' 'IF NOT EXISTS'? ColumnName ColumnType
 ↪ ColumnOption+ ('FIRST' | 'AFTER' ColumnName)?

ColumnType
 ::= NumericType
 | StringType
 | DateAndTimeType
 | 'SERIAL'

ColumnOption
 ::= 'NOT'? 'NULL'
 | 'AUTO_INCREMENT'
 | 'PRIMARY'? 'KEY' ('CLUSTERED' | 'NONCLUSTERED')?
 | 'UNIQUE' 'KEY'?
 | 'DEFAULT' (NowSymOptionFraction | SignedLiteral |
 ↪ NextValueForSequence)
 | 'SERIAL' 'DEFAULT' 'VALUE'
 | 'ON' 'UPDATE' NowSymOptionFraction
 | 'COMMENT' stringLit
 | ('CONSTRAINT' Identifier?)? 'CHECK' '(' Expression ')' ('NOT
 ↪ '?' ('ENFORCED' | 'NULL'))?
 | 'GENERATED' 'ALWAYS' 'AS' '(' Expression ')' ('VIRTUAL' | '
 ↪ STORED')?
 | 'REFERENCES' TableName ('(' IndexPartSpecificationList ')')?
 ↪ Match? OnDeleteUpdateOpt
 | 'COLLATE' CollationName
 | 'COLUMN_FORMAT' ColumnFormat
 | 'STORAGE' StorageMedia
 | 'AUTO_RANDOM' ('(' LengthNum ')')?

```

#### 14.11.2.1.2 Examples

```

mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 VALUES (NULL);
Query OK, 1 row affected (0.02 sec)

mysql> SELECT * FROM t1;
+-----+
| id |
+-----+
| 1 |

```

```
+-----+
1 row in set (0.00 sec)

mysql> ALTER TABLE t1 ADD COLUMN c1 INT NOT NULL;
Query OK, 0 rows affected (0.28 sec)

mysql> SELECT * FROM t1;
+-----+-----+
| id | c1 |
+-----+-----+
| 1 | 0 |
+-----+-----+
1 row in set (0.00 sec)

mysql> ALTER TABLE t1 ADD c2 INT NOT NULL AFTER c1;
Query OK, 0 rows affected (0.28 sec)

mysql> SELECT * FROM t1;
+-----+-----+-----+
| id | c1 | c2 |
+-----+-----+-----+
| 1 | 0 | 0 |
+-----+-----+-----+
1 row in set (0.00 sec)
```

### 14.11.2.1.3 MySQL compatibility

- Adding a new column and setting it to the PRIMARY KEY is not supported.
- Adding a new column and setting it to AUTO\_INCREMENT is not supported.
- There are limitations on adding generated columns, refer to: [generated column limitations](#).

### 14.11.2.1.4 See also

- [ADD INDEX](#)
- [CREATE TABLE](#)

### 14.11.2.2 ADD INDEX

The ALTER TABLE.. ADD INDEX statement adds an index to an existing table. This operation is online in TiDB, which means that neither reads or writes to the table are blocked by adding an index.

### Warning:

- **DO NOT** upgrade a TiDB cluster when a DDL statement is being executed in the cluster (usually for the time-consuming DDL statements such as `ADD INDEX` and the column type changes).
- Before the upgrade, it is recommended to use the `ADMIN SHOW DDL` command to check whether the TiDB cluster has an ongoing DDL job. If the cluster has a DDL job, to upgrade the cluster, wait until the DDL execution is finished or use the `ADMIN CANCEL DDL` command to cancel the DDL job before you upgrade the cluster.
- In addition, during the cluster upgrade, **DO NOT** execute any DDL statement. Otherwise, the issue of undefined behavior might occur.

#### 14.11.2.2.1 Synopsis

```

AlterTableStmt
 ::= 'ALTER' 'IGNORE'? 'TABLE' TableName AddIndexSpec (','
 ↪ AddIndexSpec)*

AddIndexSpec
 ::= 'ADD' (('PRIMARY' 'KEY' | ('KEY' | 'INDEX') 'IF NOT EXISTS'?
 ↪ | 'UNIQUE' ('KEY' | 'INDEX')?) ((Identifier? 'USING' |
 ↪ Identifier 'TYPE') IndexType)? | 'FULLTEXT' ('KEY' | '
 ↪ INDEX')? IndexName) '(' IndexPartSpecification (','
 ↪ IndexPartSpecification)* ')' IndexOption*

IndexPartSpecification
 ::= (ColumnName ('(' LengthNum ')')? | '(' Expression ')') ('
 ↪ ASC' | 'DESC')

IndexOption
 ::= 'KEY_BLOCK_SIZE' '='? LengthNum
 | IndexType
 | 'WITH' 'PARSER' Identifier
 | 'COMMENT' stringLit
 | 'VISIBLE'
 | 'INVISIBLE'

IndexType
 ::= 'BTREE'
 | 'HASH'

```

| 'RTREE'

### 14.11.2.2.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
 ↳ NOT NULL);
```

Query OK, 0 rows affected (0.11 sec)

```
mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
```

Query OK, 5 rows affected (0.03 sec)

Records: 5 Duplicates: 0 Warnings: 0

```
mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
```

```
+--
 ↳
 ↳
| id | estRows | task | access object | operator info
 ↳ | | | |
+--
 ↳

 ↳ | | | | eq(3)
| -TableFullScan_5 | 10000.00 | cop[tikv] | table:t1 | keep order:false
 ↳ | | | | , stats:pseudo |
```

```
+--
 ↳
 ↳
3 rows in set (0.00 sec)
```

```
mysql> ALTER TABLE t1 ADD INDEX (c1);
```

Query OK, 0 rows affected (0.30 sec)

```
mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
```

```
+--
 ↳
 ↳
| id | estRows | task | access object | operator
 ↳ | | | | info
+--
 ↳
 ↳
```

```

| IndexReader_6 | 0.01 | root | | index:
 ↳ IndexRangeScan_5 | | |
| -IndexRangeScan_5 | 0.01 | cop[tikv] | table:t1, index:c1(c1) | range
 ↳ :[3,3], keep order:false, stats:pseudo |
+---+
 ↳ -----+-----+-----+-----+-----+
 ↳
2 rows in set (0.00 sec)

```

### 14.11.2.2.3 MySQL compatibility

- FULLTEXT, HASH and SPATIAL indexes are not supported.
- Descending indexes are not supported (similar to MySQL 5.7).
- Adding the primary key of the CLUSTERED type to a table is not supported. For more details about the primary key of the CLUSTERED type, refer to [clustered index](#).

### 14.11.2.2.4 See also

- [Index Selection](#)

- [CREATE INDEX](#)
- [DROP INDEX](#)
- [RENAME INDEX](#)
- [ALTER INDEX](#)
- [ADD COLUMN](#)
- [CREATE TABLE](#)
- [EXPLAIN](#)

### 14.11.2.3 ADMIN

This statement is a TiDB extension syntax, used to view the status of TiDB and check the data of tables in TiDB. This document introduces the following ADMIN related statements:

- [ADMIN RELOAD](#)
- [ADMIN PLUGINS](#)
- [ADMIN ... BINDINGS](#)
- [ADMIN REPAIR](#)
- [ADMIN SHOW SLOW](#)

#### 14.11.2.3.1 DDL related statement

| Statement                                                                                                                                                        | Description                                                                               |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------|
| <code>ADMIN CANCEL DDL JOBS</code>                                                                                                                               | Cancels a currently running DDL jobs.                                                     |
| <code>ADMIN CHECKSUM TABLE</code>                                                                                                                                | Calculates the CRC64 of all rows + indexes of a table.                                    |
| <code>[ADMIN CHECK [TABLE INDEX]](#admin-check-[table<br/>[ADMIN SHOW DDL<br/>[JOBS QUERIES]](#admin-show-ddl-[jobs<br/><code>ADMIN SHOW TELEMETRY</code></code> | Shows information that will be reported back to PingCAP as part of the telemetry feature. |

#### 14.11.2.3.2 ADMIN RELOAD statement

```
ADMIN RELOAD expr_pushdown_blacklist;
```

The above statement is used to reload the blacklist pushed down by the expression.

```
ADMIN RELOAD opt_rule_blacklist;
```

The above statement is used to reload the blacklist of logic optimization rules.

#### 14.11.2.3.3 ADMIN PLUGINS related statement

```
ADMIN PLUGINS ENABLE plugin_name [, plugin_name] ...;
```

The above statement is used to enable the `plugin_name` plugin.

```
ADMIN PLUGINS DISABLE plugin_name [, plugin_name] ...;
```

The above statement is used to disable the `plugin_name` plugin.

#### 14.11.2.3.4 ADMIN BINDINGS related statement

```
ADMIN FLUSH BINDINGS;
```

The above statement is used to persist SQL Plan binding information.

```
ADMIN CAPTURE BINDINGS;
```

The above statement can generate the binding of SQL Plan from the `SELECT` statement that occurs more than once.

```
ADMIN EVOLVE BINDINGS;
```

After the automatic binding feature is enabled, the evolution of SQL Plan binding information is triggered every `bind-info-leave` (the default value is 3s). The above statement is used to proactively trigger this evolution.

```
ADMIN RELOAD BINDINGS;
```

The above statement is used to reload SQL Plan binding information.

#### 14.11.2.3.5 ADMIN REPAIR statement

To overwrite the metadata of the stored table in an untrusted way in extreme cases, use `ADMIN REPAIR TABLE`:

```
ADMIN REPAIR TABLE tbl_name CREATE TABLE STATEMENT;
```

Here “untrusted” means that you need to manually ensure that the metadata of the original table can be covered by the `CREATE TABLE STATEMENT` operation. To use this `REPAIR` statement, enable the `repair-mode` configuration item, and make sure that the tables to be repaired are listed in the `repair-table-list`.

#### 14.11.2.3.6 ADMIN SHOW SLOW statement

```
ADMIN SHOW SLOW RECENT N;
```

```
ADMIN SHOW SLOW TOP [INTERNAL | ALL] N;
```

For details, refer to [admin show slow statement](#)

#### 14.11.2.3.7 Synopsis

```
AdminStmt ::=
 'ADMIN' ('SHOW' ('DDL' ('JOBS' Int64Num? WhereClauseOptional | 'JOB'
 ↪ 'QUERIES' NumList)? | TableName 'NEXT_ROW_ID' | 'SLOW'
 ↪ AdminShowSlow) | 'CHECK' ('TABLE' TableNameList | 'INDEX'
 ↪ TableName Identifier (HandleRange (',' HandleRange)*)?) | '
 ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ('INDEX'
 ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList) | 'CHECKSUM'
 ↪ 'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
 ↪ ('EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS')
 ↪ | 'PLUGINS' ('ENABLE' | 'DISABLE') PluginNameList | 'REPAIR' '
 ↪ TABLE' TableName CreateTableStmt | ('FLUSH' | 'CAPTURE' | 'EVOLVE
 ↪ ') 'BINDINGS')
```

### 14.11.2.3.8 Examples

Run the following command to view the last 10 completed DDL jobs in the currently running DDL job queue. When NUM is not specified, only the last 10 completed DDL jobs is presented by default.

```
ADMIN SHOW DDL JOBS;
```

```

+-----+-----+-----+-----+-----+-----+

| ↪      |          |            |                                   |                      |            |

- **JOB\_ID**: each DDL operation corresponds to one DDL job. **JOB\_ID** is globally unique.
- **DB\_NAME**: the name of the database on which the DDL operations are performed.
- **TABLE\_NAME**: the name of the table on which the DDL operations are performed.
- **JOB\_TYPE**: the type of the DDL operations.
- **SCHEMA\_STATE**: the current state of the schema. If the **JOB\_TYPE** is `add index`, it is the state of the index; if the **JOB\_TYPE** is `add column`, it is the state of the column; if the **JOB\_TYPE** is `create table`, it is the state of the table. The common states include:
  - **none**: it indicates not existing. When the `drop` or `create` operation fails and rolls back, it usually becomes the **none** state.
  - **delete only**, **write only**, **delete reorganization**, **write reorganization**: these four states are intermediate states. These states are not visible in common operations, because the conversion from the intermediate states is so quick. You can see the **write reorganization** state only in `add index` operations, which means that the index data is being added.
  - **public**: it indicates existing and usable. When operations like `create table` and `add index/column` are finished, it usually becomes the **public** state, which means that the created table/column/index can be normally read and written now.
- **SCHEMA\_ID**: the ID of the database on which the DDL operations are performed.
- **TABLE\_ID**: the ID of the table on which the DDL operations are performed.
- **ROW\_COUNT**: the number of the data rows that have been added when running the `add index` operation.
- **START\_TIME**: the start time of the DDL operations.
- **END\_TIME**: the end time of the DDL operations.
- **STATE**: the state of the DDL operations. The common states include:
  - **none**: it indicates that the operation task has been put in the DDL job queue but has not been performed yet, because it is waiting for the previous tasks to complete. Another reason might be that it becomes the **none** state after running

the drop operation, but it will soon be updated to the `synced` state, which means that all TiDB instances have been synced to this state.

- `running`: it indicates that the operation is being performed.
- `synced`: it indicates that the operation has been performed successfully and all TiDB instances have been synced to this state.
- `rollback done`: it indicates that the operation has failed and has finished rolling back.
- `rollingback`: it indicates that the operation has failed and is rolling back.
- `cancelling`: it indicates that the operation is being cancelled. This state only occurs when you cancel DDL jobs using the `ADMIN CANCEL DDL JOBS` command.

#### 14.11.2.3.9 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.11.2.4 ADMIN CANCEL DDL

The `ADMIN CANCEL DDL` statement allows you to cancel a running DDL job. The `job_id` can be found by running `ADMIN SHOW DDL JOBS`.

The `ADMIN CANCEL DDL` statement also allows you to cancel a DDL job that is committed but not yet completed executing. After the cancellation, the SQL statement that executes the DDL job returns the `ERROR 8214 (HY000): Cancelled DDL job` error. If you cancel a DDL job that has already been completed, you will see the `DDL Job:90 not found` error in the `RESULT` column, which indicates that the job has been removed from the DDL waiting queue.

##### 14.11.2.4.1 Synopsis

```
AdminStmt ::=
 'ADMIN' ('SHOW' ('DDL' ('JOBS' Int64Num? WhereClauseOptional | 'JOB'
 ↪ 'QUERIES' NumList)? | TableName 'NEXT_ROW_ID' | 'SLOW'
 ↪ AdminShowSlow) | 'CHECK' ('TABLE' TableNameList | 'INDEX'
 ↪ TableName Identifier (HandleRange (',' HandleRange)*)?) | '
 ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ('INDEX'
 ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList) | 'CHECKSUM'
 ↪ 'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
 ↪ ('EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS')
 ↪ | 'PLUGINS' ('ENABLE' | 'DISABLE') PluginNameList | 'REPAIR' '
 ↪ TABLE' TableName CreateTableStmt | ('FLUSH' | 'CAPTURE' | 'EVOLVE'
 ↪ ') 'BINDINGS')
```

```
NumList ::=
 Int64Num (',' Int64Num)*
```

#### 14.11.2.4.2 Examples

To cancel the currently running DDL jobs and return whether the corresponding jobs are successfully cancelled, use `ADMIN CANCEL DDL JOBS`:

```
ADMIN CANCEL DDL JOBS job_id [, job_id] ...;
```

If the operation fails to cancel the jobs, specific reasons are displayed.

#### Note:

- Only this operation can cancel DDL jobs. All other operations and environment changes (such as machine restart and cluster restart) cannot cancel these jobs.
- This operation can cancel multiple DDL jobs at the same time. You can get the ID of DDL jobs using the `ADMIN SHOW DDL JOBS` statement.
- If the jobs you want to cancel are finished, the cancellation operation fails.

#### 14.11.2.4.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.11.2.4.4 See also

- `ADMIN SHOW DDL [JOBS|JOB QUERIES]`

### 14.11.2.5 ADMIN CHECKSUM TABLE

The `ADMIN CHECKSUM TABLE` statement calculates a CRC64 checksum for the data and indexes of a table. This statement is used by programs such as TiDB Lightning to ensure that import operations have completed successfully.

#### 14.11.2.5.1 Synopsis

```
AdminStmt ::=
 'ADMIN' ('SHOW' ('DDL' ('JOBS' Int64Num? WhereClauseOptional | 'JOB'
 ↪ 'QUERIES' NumList)? | TableName 'NEXT_ROW_ID' | 'SLOW'
 ↪ AdminShowSlow) | 'CHECK' ('TABLE' TableNameList | 'INDEX'
 ↪ TableName Identifier (HandleRange (',' HandleRange)*)?) | '
 ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ('INDEX'
 ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList) | 'CHECKSUM'
 ↪ 'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
```

```

↪ ('EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS')
↪ | 'PLUGINS' ('ENABLE' | 'DISABLE') PluginNameList | 'REPAIR' '
↪ TABLE' TableName CreateTableStmt | ('FLUSH' | 'CAPTURE' | 'EVOLVE
↪ ') 'BINDINGS')

```

```

TableNameList ::=
 TableName (',' TableName)*

```

### 14.11.2.5.2 Examples

Create table t1:

```
CREATE TABLE t1(id INT PRIMARY KEY);
```

Insert some data into t1:

```
INSERT INTO t1 VALUES (1),(2),(3);
```

Calculate the checksum for t1:

```
ADMIN CHECKSUM TABLE t1;
```

The output is as follows:

```

+-----+-----+-----+-----+-----+
| Db_name | Table_name | Checksum_crc64_xor | Total_kvs | Total_bytes |
+-----+-----+-----+-----+-----+
| test | t1 | 10909174369497628533 | 3 | 75 |
+-----+-----+-----+-----+-----+
1 row in set (0.00 sec)

```

### 14.11.2.5.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.11.2.6 ADMIN CHECK [TABLE|INDEX]

The ADMIN CHECK [TABLE|INDEX] statement checks for data consistency of tables and indexes. It does not support checking **FOREIGN KEY constraints**.

#### 14.11.2.6.1 Synopsis

```
AdminStmt ::=
```

```
'ADMIN' ('SHOW' ('DDL' ('JOBS' Int64Num? WhereClauseOptional | 'JOB'
 ↪ 'QUERIES' NumList)? | TableName 'NEXT_ROW_ID' | 'SLOW'
 ↪ AdminShowSlow) | 'CHECK' ('TABLE' TableNameList | 'INDEX'
 ↪ TableName Identifier (HandleRange (',' HandleRange)*)?) | '
 ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ('INDEX'
 ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList) | 'CHECKSUM'
 ↪ 'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
 ↪ ('EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS')
 ↪ | 'PLUGINS' ('ENABLE' | 'DISABLE') PluginNameList | 'REPAIR' '
 ↪ TABLE' TableName CreateTableStmt | ('FLUSH' | 'CAPTURE' | 'EVOLVE'
 ↪ ') 'BINDINGS')
```

```
TableNameList ::=
 TableName (',' TableName)*
```

#### 14.11.2.6.2 Examples

To check the consistency of all the data and corresponding indexes in the `tbl_name` table, use `ADMIN CHECK TABLE`:

```
ADMIN CHECK TABLE tbl_name [, tbl_name] ...;
```

If the consistency check is passed, an empty result is returned. Otherwise, an error message is returned indicating that the data is inconsistent.

```
ADMIN CHECK INDEX tbl_name idx_name;
```

The above statement is used to check the consistency of the column data and index data corresponding to the `idx_name` index in the `tbl_name` table. If the consistency check is passed, an empty result is returned; otherwise, an error message is returned indicating that the data is inconsistent.

```
ADMIN CHECK INDEX tbl_name idx_name (lower_val, upper_val) [, (lower_val,
 ↪ upper_val)] ...;
```

The above statement is used to check the consistency of the column data and index data corresponding to the `idx_name` index in the `tbl_name` table, with the data range (to be checked) specified. If the consistency check is passed, an empty result is returned. Otherwise, an error message is returned indicating that the data is inconsistent.

#### 14.11.2.6.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.11.2.6.4 See also

- [ADMIN REPAIR](#)

### 14.11.2.7 ADMIN CLEANUP INDEX

The `ADMIN CLEANUP INDEX` statement is used to delete redundant indexes from a table when the table has inconsistent data and index. Note that this syntax does not support [foreign key constraints](#) yet.

#### 14.11.2.7.1 Synopsis

```
AdminCleanupStmt ::=
 'ADMIN' 'CLEANUP' ('INDEX' TableName IndexName | 'TABLE' 'LOCK'
 ↪ TableNameList)

TableNameList ::=
 TableName (',' TableName)*
```

#### 14.11.2.7.2 Examples

Assume that the `tbl` table in a database has inconsistent data and index due to some reasons (for example, some row data is lost in the cluster in a disaster recovery scenario):

```
SELECT * FROM tbl;
ERROR 1105 (HY000): inconsistent index idx handle count 3 isn't equal to
 ↪ value count 2

ADMIN CHECK INDEX tbl idx ;
ERROR 1105 (HY000): handle &kv.CommonHandle{encoded:[]uint8{0x1, 0x0, 0x0, 0
 ↪ x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0xf8}, colEndOffsets:[]uint16{0xa}},
 ↪ index:types.Datum{k:0x5, decimal:0x0, length:0x0, i:0, collation:"
 ↪ utf8mb4_bin", b:[]uint8{0x0}, x:interface {}(nil)} != record:<nil>
```

It can be seen from the error message of the `SELECT` query that, the `tbl` table contains two rows of data and three rows of index data, which means inconsistent row and index data. At the same time, at least one index is in dangling state. In this case, you can use the `ADMIN CLEANUP INDEX` statement to delete the dangling index:

```
ADMIN CLEANUP INDEX tbl idx;
```

The execution result is as follows:

```
ADMIN CLEANUP INDEX tbl idx;
+-----+
| REMOVED_COUNT |
+-----+
| 1 |
+-----+
```

You can execute the `ADMIN CHECK INDEX` statement again to check the consistency of data and index, and verify whether the data has been restored to a normal state:

```
ADMIN CHECK INDEX tbl idx;
Query OK, 0 rows affected (0.01 sec)
```

#### Note:

When the data and index are inconsistent due to the loss of replicas:

- There might be a loss of both row data and index data. To restore the consistency, use the `ADMIN CLEANUP INDEX` and `ADMIN RECOVER INDEX` statements together.
- The `ADMIN CLEANUP INDEX` statement is always executed in a single thread. When the table data is large, it is recommended to recover the index data by rebuilding the index.
- When you execute the `ADMIN CLEANUP INDEX` statement, the corresponding table or index is not locked and TiDB allows other sessions to modify the table records at the same time. However, in this case, `ADMIN CLEANUP INDEX` might not be able to handle all table records correctly. Therefore, when you execute `ADMIN CLEANUP INDEX`, avoid modifying the table data at the same time.
- If you use the enterprise edition of TiDB, you can [submit a request](#) to contact the support engineer for help.

The `ADMIN CLEANUP INDEX` statement is not atomic: if the statement is interrupted during execution, it is recommended to execute it again until it succeeds.

#### 14.11.2.7.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.11.2.7.4 See also

- `ADMIN CHECK TABLE/INDEX`
- `ADMIN RECOVER INDEX`

#### 14.11.2.8 ADMIN RECOVER INDEX

When the row data and index data are inconsistent, you can use the `ADMIN RECOVER`  $\leftrightarrow$  `INDEX` statement to recover the consistency based on the redundant indexes. Note that this syntax does not support `foreign key constraints` yet.

### 14.11.2.8.1 Synopsis

```
AdminCleanupStmt ::=
 'ADMIN' 'RECOVER' 'INDEX' TableName IndexName
```

### 14.11.2.8.2 Examples

Assume that the `tbl` table in a database has inconsistent row data and index due to some reasons (for example, some row data is lost in the cluster in a disaster recovery scenario):

```
SELECT * FROM tbl;
ERROR 1105 (HY000): inconsistent index idx handle count 2 isn't equal to
↳ value count 3

ADMIN CHECK INDEX tbl idx ;
ERROR 1105 (HY000): handle &kv.CommonHandle{encoded:[]uint8{0x1, 0x0, 0x0, 0
↳ x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0xf8}, colEndOffsets:[]uint16{0xa}},
↳ index:types.Datum{k:0x5, decimal:0x0, length:0x0, i:0, collation:"
↳ utf8mb4_bin", b:[]uint8{0x0}, x:interface {}(nil)} != record:<nil>
```

It can be seen from the error message of the `SELECT` query that, the `tbl` table contains three rows of data and two rows of index data, which means inconsistent row data and index data. At the same time, at least one row of data has no corresponding index. In this case, you can use the `ADMIN RECOVER INDEX` statement to supplement the missing index:

```
ADMIN RECOVER INDEX tbl idx;
```

The execution result is as follows:

```
ADMIN RECOVER INDEX tbl idx;
+-----+-----+
| ADDED_COUNT | SCAN_COUNT |
+-----+-----+
| 1 | 3 |
+-----+-----+
1 row in set (0.00 sec)
```

You can execute the `ADMIN CHECK INDEX` statement again to check the consistency of data and index, and verify whether the data has been restored to normal state:

```
ADMIN CHECK INDEX tbl idx;
Query OK, 0 rows affected (0.01 sec)
```

#### Note:

When the data and index are inconsistent due to the loss of replicas:

- There might be a loss of both row data and index data. To address the issue, use the **ADMIN CLEANUP INDEX** and **ADMIN RECOVER INDEX** statements together to recover the consistency of row data and index data.
- The **ADMIN RECOVER INDEX** statement is always executed in a single thread. When the table data is large, it is recommended to recover the index data by rebuilding the index.
- When you execute the **ADMIN RECOVER INDEX** statement, the corresponding table or index is not locked and TiDB allows other sessions to modify the table records at the same time. However, in this case, **ADMIN RECOVER INDEX** might not be able to handle all table records correctly. Therefore, when you execute **ADMIN RECOVER INDEX**, avoid modifying the table data at the same time.
- If you use the enterprise edition of TiDB, you can [submit a request](#) to contact the support engineer for help.

The **ADMIN RECOVER INDEX** statement is not atomic: if the statement is interrupted during execution, it is recommended to execute it again until it succeeds.

### 14.11.2.8.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.11.2.8.4 See also

- **ADMIN CHECK TABLE/INDEX**
- **ADMIN CLEANUP INDEX**

### 14.11.2.9 ADMIN SHOW DDL [JOBS|JOB QUERIES]

The **ADMIN SHOW DDL [JOBS|JOB QUERIES]** statement shows information about running and recently completed DDL jobs.

#### 14.11.2.9.1 Synopsis

```
AdminStmt ::=
 'ADMIN' ('SHOW' ('DDL' ('JOBS' Int64Num? WhereClauseOptional | 'JOB'
 ↪ 'QUERIES' NumList | 'JOB' 'QUERIES' 'LIMIT' m 'OFFSET' n)? |
 ↪ TableName 'NEXT_ROW_ID' | 'SLOW' AdminShowSlow) | 'CHECK' ('
 ↪ TABLE' TableNameList | 'INDEX' TableName Identifier (HandleRange
 ↪ (',' HandleRange)*)?) | 'RECOVER' 'INDEX' TableName Identifier
 ↪ | 'CLEANUP' ('INDEX' TableName Identifier | 'TABLE' 'LOCK'
 ↪ TableNameList) | 'CHECKSUM' 'TABLE' TableNameList | 'CANCEL' 'DDL'
```

```

↪ ' 'JOBS' NumList | 'RELOAD' ('EXPR_PUSHDOWN_BLACKLIST' | '
↪ OPT_RULE_BLACKLIST' | 'BINDINGS') | 'PLUGINS' ('ENABLE' | '
↪ DISABLE') PluginNameList | 'REPAIR' 'TABLE' TableName
↪ CreateTableStmt | ('FLUSH' | 'CAPTURE' | 'EVOLVE') 'BINDINGS')

```

```

NumList ::=
 Int64Num (',' Int64Num)*

```

```

WhereClauseOptional ::=

↪ -----+-----+-----+-----+
↪
| 26 | 2d1982af-fa63-43ad-a3d5-73710683cc63 | 0.0.0.0:4000 | 2
↪ d1982af-fa63-43ad-a3d5-73710683cc63 | |
+---
↪ -----+-----+-----+-----+
↪
1 row in set (0.00 sec)

```

#### ADMIN SHOW DDL JOBS

The `ADMIN SHOW DDL JOBS` statement is used to view all the results in the current DDL job queue, including running and queuing tasks, as well as the latest ten results in the completed DDL job queue. The returned result fields are described as follows:

- `JOB_ID`: each DDL operation corresponds to a DDL job. `JOB_ID` is globally unique.
- `DB_NAME`: the name of the database where the DDL operation is performed.
- `TABLE_NAME`: the name of the table where the DDL operation is performed.

- `JOB_TYPE`: the type of DDL operation.
- `SCHEMA_STATE`: the current state of the schema object that the DDL operates on. If `JOB_TYPE` is `ADD INDEX`, it is the state of the index; if `JOB_TYPE` is `ADD COLUMN`, it is the state of the column; if `JOB_TYPE` is `CREATE TABLE`, it is the state of the table. Common states include the following:
  - `none`: indicates that it does not exist. Generally, after the `DROP` operation or after the `CREATE` operation fails and rolls back, it will become the `none` state.
  - `delete only`, `write only`, `delete reorganization`, `write reorganization`: these four states are intermediate states. For their specific meanings, see [How the Online DDL Asynchronous Change Works in TiDB](#). As the intermediate state conversion is fast, these states are generally not visible during operation. Only when performing `ADD INDEX` operation can the `write reorganization` state be seen, indicating that index data is being added.
  - `public`: indicates that it exists and is available to users. Generally, after `CREATE` ↔ `TABLE` and `ADD INDEX` (or `ADD COLUMN`) operations are completed, it will become the `public` state, indicating that the newly created table, column, and index can be read and written normally.
- `SCHEMA_ID`: the ID of the database where the DDL operation is performed.
- `TABLE_ID`: the ID of the table where the DDL operation is performed.
- `ROW_COUNT`: when performing the `ADD INDEX` operation, it is the number of data rows that have been added.
- `START_TIME`: the start time of the DDL operation.
- `STATE`: the state of the DDL operation. Common states include the following:
  - `queueing`: indicates that the operation job has entered the DDL job queue but has not been executed because it is still waiting for an earlier DDL job to complete. Another reason might be that after executing the `DROP` operation, it will become the `none` state, but it will soon be updated to the `synced` state, indicating that all TiDB instances have been synchronized to that state.
  - `running`: indicates that the operation is being executed.
  - `synced`: indicates that the operation has been executed successfully and all TiDB instances have been synchronized to this state.
  - `rollback done`: indicates that the operation has failed and the rollback has been completed.
  - `rollingback`: indicates that the operation has failed and is rolling back.
  - `cancelling`: indicates that the operation is being canceled. This state only appears when you use the `ADMIN CANCEL DDL JOBS` command to cancel the DDL job.

The following example shows the results of `ADMIN SHOW DDL JOBS`:

```
ADMIN SHOW DDL JOBS;
```

```
mysql> ADMIN SHOW DDL JOBS;
```

```

```

```
+--
| ↵ -----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| ↵
12 rows in set (0.00 sec)
```

From the output above:

- Job 59 is currently in progress (STATE of **running**). The schema state is currently in **write reorganization**, but will switch to **public** once the task is completed to note that the change can be observed publicly by user sessions. The **end\_time** column is also **NULL** indicating that the completion time for the job is currently not known.
- Job 60 is an **add index** job, which is currently queued waiting for job 59 to complete. When job 59 completes, the **STATE** of job 60 will switch to **running**.
- For destructive changes such as dropping an index or dropping a table, the **SCHEMA\_STATE** will change to **none** when the job is complete. For additive changes, the **SCHEMA\_STATE** will change to **public**.

To limit the number of rows shown, specify a number and a where condition:

```
ADMIN SHOW DDL JOBS [NUM] [WHERE where_condition];
```

- **NUM**: to view the last NUM results in the completed DDL job queue. If not specified, NUM is by default 10.
- **WHERE**: to add filter conditions.

ADMIN SHOW DDL JOB QUERIES

To view the original SQL statements of the DDL job corresponding to **job\_id**, use **ADMIN SHOW DDL JOB QUERIES**:

```
ADMIN SHOW DDL JOBS;
ADMIN SHOW DDL JOB QUERIES 51;
```

```
mysql> ADMIN SHOW DDL JOB QUERIES 51;
+-----+-----+
| QUERY |
+-----+-----+
| CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY auto_increment) |
+-----+-----+
1 row in set (0.02 sec)
```

You can only search the running DDL job corresponding to `job_id` within the last ten results in the DDL history job queue.

```
ADMIN SHOW DDL JOB QUERIES LIMIT m OFFSET n
```

To view the original SQL statements of the DDL job within a specified range [`n+1`, `n+m`] corresponding to `job_id`, use `ADMIN SHOW DDL JOB QUERIES LIMIT m OFFSET n`:

```
sql ADMIN SHOW DDL JOB QUERIES LIMIT m; # Retrieve first m rows ADMIN
↪ SHOW DDL JOB QUERIES LIMIT n, m; # Retrieve rows [n+1, n+m] ADMIN SHOW
↪ DDL JOB QUERIES LIMIT m OFFSET n; # Retrieve rows [n+1, n+m]
```

where `n` and `m` are integers greater or equal to 0.

```
sql ADMIN SHOW DDL JOB QUERIES LIMIT 3; # Retrieve first 3 rows +-----+-----+
↪ | JOB_ID | QUERY | +-----+-----+
↪ | 59 | ALTER TABLE t1 ADD INDEX index2 (col2) | | 60 |
↪ ALTER TABLE t2 ADD INDEX index1 (col1) | | 58 | CREATE
↪ TABLE t2 (id INT NOT NULL PRIMARY KEY auto_increment)| +-----+-----+
↪ 3 rows in set (0.00 sec)
```

```
sql ADMIN SHOW DDL JOB QUERIES LIMIT 6, 2; # Retrieve rows 7-8 +-----+-----+
↪ | JOB_ID | QUERY | +-----+-----+
↪ | 52 | ALTER TABLE t1 ADD INDEX index1 (col1) | |
↪ 51 | CREATE TABLE IF NOT EXISTS t1 (id INT NOT NULL PRIMARY KEY
↪ auto_increment)| +-----+-----+
↪ 3 rows in set (0.00 sec)
```

```
sql ADMIN SHOW DDL JOB QUERIES LIMIT 3 OFFSET 4; # Retrieve rows 5-7
↪ +-----+-----+ | JOB_ID | QUERY
↪ | +-----+-----+
↪ | 54 | DROP TABLE IF EXISTS t3 | | 53 | ALTER TABLE t1 DROP
↪ INDEX index1 | | 52 | ALTER TABLE t1 ADD INDEX index1 (col1)|
↪ +-----+-----+ 3 rows in set (0.00
↪ sec)
```

You can search the running DDL job corresponding to `job_id` within an arbitrarily specified range of results in the DDL history job queue. This syntax does not have the limitation of the last ten results of `ADMIN SHOW DDL JOB QUERIES`.

### 14.11.2.9.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.11.2.9.4 See also

- [ADMIN CANCEL DDL](#)

## 14.11.2.10 ADMIN SHOW TELEMETRY

The ADMIN SHOW TELEMETRY statement shows the information that will be reported back to PingCAP as part of the **telemetry** feature.

### 14.11.2.10.1 Synopsis

```
AdminStmt ::=
 'ADMIN' ('SHOW' ('DDL' ('JOBS' Int64Num? WhereClauseOptional | 'JOB'
 ↪ 'QUERIES' NumList)? | TableName 'NEXT_ROW_ID' | 'SLOW'
 ↪ AdminShowSlow | 'TELEMETRY') | 'CHECK' ('TABLE' TableNameList |
 ↪ 'INDEX' TableName Identifier (HandleRange (',' HandleRange)*)?
 ↪) | 'RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ('INDEX'
 ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList) | 'CHECKSUM'
 ↪ 'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
 ↪ ('EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS')
 ↪ | 'PLUGINS' ('ENABLE' | 'DISABLE') PluginNameList | 'REPAIR' '
 ↪ TABLE' TableName CreateTableStmt | ('FLUSH' | 'CAPTURE' | 'EVOLVE'
 ↪ ') 'BINDINGS')
```

### 14.11.2.10.2 Examples

```
ADMIN SHOW TELEMETRY\G
```

```

### 14.11.2.10.3 MySQL compatibility

The ADMIN statement is a TiDB extension to MySQL syntax.

### 14.11.2.10.4 See also

- [Telemetry](#)
- [tidb\\_enable\\_telemetry System Variable](#)

## 14.11.2.11 ALTER DATABASE

ALTER DATABASE is used to specify or modify the default character set and collation of the current database. ALTER SCHEMA has the same effect as ALTER DATABASE.

### 14.11.2.11.1 Synopsis

```

AlterDatabaseStmt ::=
 'ALTER' 'DATABASE' DBName? DatabaseOptionList

DatabaseOption ::=
 DefaultKwdOpt (CharsetKw '='? CharSetName | 'COLLATE' '='?
 ↳ CollationName | 'ENCRYPTION' '='? EncryptionOpt)

```

### 14.11.2.11.2 Examples

Modify the test database schema to use the utf8mb4 character set:

```
ALTER DATABASE test DEFAULT CHARACTER SET = utf8mb4;
```

```
Query OK, 0 rows affected (0.00 sec)
```

Currently, TiDB only supports some character sets and collations. See [Character Set and Collation Support](#) for details.

#### 14.11.2.11.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

#### 14.11.2.11.4 See also

- [CREATE DATABASE](#)
- [SHOW DATABASES](#)

### 14.11.2.12 ALTER INDEX

The ALTER INDEX statement is used to modify the visibility of the index to `Visible` or `Invisible`. Invisible indexes are maintained by DML statements, but will not be used by the query optimizer. This is useful in scenarios where you want to double-check before removing an index permanently.

#### 14.11.2.12.1 Synopsis

```
AlterTableStmt
 ::= 'ALTER' 'IGNORE'? 'TABLE' TableName AlterIndexSpec (','
 ↪ AlterIndexSpec)*

AlterIndexSpec
 ::= 'ALTER' 'INDEX' Identifier ('VISIBLE' | 'INVISIBLE')
```

#### 14.11.2.12.2 Examples

You can modify the visibility of an index using the ALTER TABLE ... ALTER INDEX ... statement.

```
CREATE TABLE t1 (c1 INT, UNIQUE(c1));
ALTER TABLE t1 ALTER INDEX c1 INVISIBLE;
```

```
Query OK, 0 rows affected (0.02 sec)
```

```
SHOW CREATE TABLE t1;
```

```
+--
 ↪ -----+
 ↪
| Table | Create Table
 |
+--
 ↪ -----+
 ↪
| t1 | CREATE TABLE `t1` (
 `c1` int(11) DEFAULT NULL,
 UNIQUE KEY `c1` (`c1`) /*!80000 INVISIBLE */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin |
+--
 ↪ -----+
 ↪
1 row in set (0.00 sec)
```

The optimizer cannot use the **invisible index** of c1.

```
EXPLAIN SELECT c1 FROM t1 ORDER BY c1;
```

```
+--
 ↪ -----+
 ↪
| id | estRows | task | access object | operator info
 |
+--
 ↪ -----+
 ↪
| Sort_4 | 10000.00 | root | | test.t1.c1:asc
 |
| -TableReader_8 | 10000.00 | root | | data:
 ↪ TableFullScan_7 |
| -TableFullScan_7 | 10000.00 | cop[tikv] | table:t1 | keep order:false
 ↪ , stats:pseudo |
+--
 ↪ -----+
 ↪
3 rows in set (0.00 sec)
```

By comparison, c2 is a **visible index** and can be used by the optimizer.

```
EXPLAIN SELECT c2 FROM t1 ORDER BY c2;
```

```

+--

↪ -----+-----+-----+-----+
↪
2 rows in set (0.00 sec)

```

Even if you use the `USE INDEX` SQL hint to forcibly use indexes, the optimizer still cannot use invisible indexes; otherwise, an error is returned.

```
SELECT * FROM t1 USE INDEX(c1);
```

```
ERROR 1176 (42000): Key 'c1' doesn't exist in table 't1'
```

#### Note:

“Invisible” here means invisible only to the optimizer. You can still modify or delete invisible indexes.

```
ALTER TABLE t1 DROP INDEX c1;
```

```
Query OK, 0 rows affected (0.02 sec)
```

### 14.11.2.12.3 MySQL compatibility

- Invisible indexes in TiDB are modeled on the equivalent feature from MySQL 8.0.
- Similar to MySQL, TiDB does not permit `PRIMARY KEY` indexes to be made invisible.
- MySQL provides an optimizer switch `use_invisible_indexes=on` to make all invisible indexes *visible* again. This functionality is not available in TiDB.

#### 14.11.2.12.4 See also

- [CREATE TABLE](#)
- [CREATE INDEX](#)
- [ADD INDEX](#)
- [DROP INDEX](#)
- [RENAME INDEX](#)

### 14.11.2.13 ALTER INSTANCE

The `ALTER INSTANCE` statement is used to make changes to a single TiDB instance. Currently, TiDB only supports the `RELOAD TLS` clause.

#### 14.11.2.13.1 RELOAD TLS

You can execute the `ALTER INSTANCE RELOAD TLS` statement to reload the certificate (`ssl-cert`), the key (`ssl-key`), and the CA (`ssl-ca`) from the original configuration path.

The newly loaded certificate, key, and CA take effect on the connection that is established after the statement is successfully executed. The connection established before this statement execution is not affected.

When an error occurs during reloading, by default, this error message is returned and the previous key and certificate continue to be used. However, if you have added the optional `NO ROLLBACK ON ERROR`, when an error occurs during reloading, the error is not returned, and the subsequent requests are handled with the TLS security connection disabled.

#### 14.11.2.13.2 Syntax diagram

**AlterInstanceStmt:**

```
AlterInstanceStmt ::=
 'ALTER' 'INSTANCE' InstanceOption

InstanceOption ::=
 'RELOAD' 'TLS' ('NO' 'ROLLBACK' 'ON' 'ERROR')?
```

#### 14.11.2.13.3 Example

```
ALTER INSTANCE RELOAD TLS;
```

#### 14.11.2.13.4 MySQL compatibility

The `ALTER INSTANCE RELOAD TLS` statement only supports reloading from the original configuration path. It does not support dynamically modifying the loading path or dynamically enabling the TLS encrypted connection feature when TiDB is started. This feature is disabled by default when you restart TiDB.

### 14.11.2.13.5 See also

[Enable TLS Between TiDB Clients and Servers.](#)

## 14.11.2.14 ALTER PLACEMENT POLICY

ALTER PLACEMENT POLICY is used to modify existing placement policies that have previously been created. All the tables and partitions which use the placement policy will automatically be updated.

ALTER PLACEMENT POLICY *replaces* the previous policy with the new definition. It does not *merge* the old policy with the new one. In the following example, FOLLOWERS=4 is lost when the ALTER PLACEMENT POLICY is executed:

```
CREATE PLACEMENT POLICY p1 FOLLOWERS=4;
ALTER PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us-
↳ west-1";
```

### 14.11.2.14.1 Synopsis

```
AlterPolicyStmt ::=
 "ALTER" "PLACEMENT" "POLICY" IfExists PolicyName PlacementOptionList

PolicyName ::=
 Identifier

PlacementOptionList ::=
 PlacementOption
| PlacementOptionList PlacementOption
| PlacementOptionList ',' PlacementOption

PlacementOption ::=
 CommonPlacementOption
| SugarPlacementOption
| AdvancedPlacementOption

CommonPlacementOption ::=
 "FOLLOWERS" EqOpt LengthNum

SugarPlacementOption ::=
 "PRIMARY_REGION" EqOpt stringLit
| "REGIONS" EqOpt stringLit
| "SCHEDULE" EqOpt stringLit

AdvancedPlacementOption ::=
 "LEARNERS" EqOpt LengthNum
```

```
| "CONSTRAINTS" EqOpt stringLit
| "LEADER_CONSTRAINTS" EqOpt stringLit
| "FOLLOWER_CONSTRAINTS" EqOpt stringLit
| "LEARNER_CONSTRAINTS" EqOpt stringLit
```

#### 14.11.2.14.2 Examples

##### Note:

To know which regions are available in your cluster, see [SHOW PLACEMENT](#) ↪ [LABELS](#).

If you do not see any available regions, your TiKV installation might not have labels set correctly.

```
CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us
↪ -west-1";
CREATE TABLE t1 (i INT) PLACEMENT POLICY=p1; -- Assign policy p1 to table
↪ t1
ALTER PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us-
↪ west-1,us-west-2" FOLLOWERS=4; -- The rules of t1 will be updated
↪ automatically.
SHOW CREATE PLACEMENT POLICY p1\G;
```

Query OK, 0 rows affected (0.08 sec)

Query OK, 0 rows affected (0.10 sec)

```
*****[1. row]*****
Policy | p1
Create Policy | CREATE PLACEMENT POLICY `p1` PRIMARY_REGION="us-east-1"
↪ REGIONS="us-east-1,us-west-1,us-west-2" FOLLOWERS=4
1 row in set (0.00 sec)
```

#### 14.11.2.14.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.11.2.14.4 See also

- [Placement Rules in SQL](#)

- [SHOW PLACEMENT](#)
- [CREATE PLACEMENT POLICY](#)
- [DROP PLACEMENT POLICY](#)

### 14.11.2.15 ALTER RESOURCE GROUP

The ALTER RESOURCE GROUP statement is used to modify a resource group in a database.

#### 14.11.2.15.1 Synopsis

```
AlterResourceGroupStmt:
 "ALTER" "RESOURCE" "GROUP" IfExists ResourceGroupName
 ↪ ResourceGroupOptionList

IfExists ::=
 ('IF' 'EXISTS')?

ResourceGroupName:
 Identifier

ResourceGroupOptionList:
 DirectResourceGroupOption
| ResourceGroupOptionList DirectResourceGroupOption
| ResourceGroupOptionList ',' DirectResourceGroupOption

DirectResourceGroupOption:
 "RU_PER_SEC" EqOpt stringLit
| "BURSTABLE"
```

TiDB supports the following DirectResourceGroupOption, where [Request Unit \(RU\)](#) is a unified abstraction unit in TiDB for CPU, IO, and other system resources.

| Option     | Description                       | Example                                                                                   |
|------------|-----------------------------------|-------------------------------------------------------------------------------------------|
| RU_PER_SEC | Rate of RU backfilling per second | RU_PER_SEC = 500 indicates that this resource group is backfilled with 500 RUs per second |

If the BURSTABLE attribute is set, TiDB allows the corresponding resource group to use the available system resources when the quota is exceeded.

### Note:

The ALTER RESOURCE GROUP statement can only be executed when the global variable `tidb_enable_resource_control` is set to ON.

#### 14.11.2.15.2 Examples

Create a resource group named `rg1` and modify its properties.

```
mysql> DROP RESOURCE GROUP IF EXISTS rg1;
Query OK, 0 rows affected (0.22 sec)
mysql> CREATE RESOURCE GROUP IF NOT EXISTS rg1
 -> RU_PER_SEC = 100
 -> BURSTABLE;
Query OK, 0 rows affected (0.08 sec)
mysql> SELECT * FROM information_schema.resource_groups WHERE NAME = 'rg1';
+-----+-----+-----+
| NAME | RU_PER_SEC | BURSTABLE |
+-----+-----+-----+
| rg1 | 100 | YES |
+-----+-----+-----+
1 rows in set (1.30 sec)
mysql> ALTER RESOURCE GROUP rg1
 -> RU_PER_SEC = 200;
Query OK, 0 rows affected (0.08 sec)
mysql> SELECT * FROM information_schema.resource_groups WHERE NAME = 'rg1';
+-----+-----+-----+
| NAME | RU_PER_SEC | BURSTABLE |
+-----+-----+-----+
| rg1 | 200 | NO |
+-----+-----+-----+
1 rows in set (1.30 sec)
```

#### 14.11.2.15.3 MySQL compatibility

MySQL also supports `ALTER RESOURCE GROUP`. However, the acceptable parameters are different from that of TiDB so that they are not compatible.

#### 14.11.2.15.4 See also

- `DROP RESOURCE GROUP`

- **CREATE RESOURCE GROUP**
- **Request Unit (RU)**

### 14.11.2.16 ALTER TABLE

This statement modifies an existing table to conform to a new table structure. The statement ALTER TABLE can be used to:

- **ADD**, **DROP**, or **RENAME** indexes
- **ADD**, **DROP**, **MODIFY** or **CHANGE** columns
- **COMPACT** table data

#### 14.11.2.16.1 Synopsis

```
AlterTableStmt ::=
 'ALTER' IgnoreOptional 'TABLE' TableName (

| 'SECONDARY_LOAD'
| 'SECONDARY_UNLOAD'
| ('AUTO_INCREMENT' | 'AUTO_ID_CACHE' | 'AUTO_RANDOM_BASE' | '
↳ SHARD_ROW_ID_BITS') EqOpt LengthNum
| ('CACHE' | 'NOCACHE')
| (
 'TTL' EqOpt TimeColumnName '+' 'INTERVAL' Expression TimeUnit (
↳ TTLEnable EqOpt ('ON' | 'OFF'))?
 | 'REMOVE' 'TTL'
 | TTLEnable EqOpt ('ON' | 'OFF')
 | TTLJobInterval EqOpt stringLit
)
| PlacementPolicyOption

PlacementPolicyOption ::=
 "PLACEMENT" "POLICY" EqOpt PolicyName
| "PLACEMENT" "POLICY" (EqOpt | "SET") "DEFAULT"

```

### 14.11.2.16.2 Examples

Create a table with some initial data:

```

CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT NOT
↳ NULL);
INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);

```

Query OK, 0 rows affected (0.11 sec)

Query OK, 5 rows affected (0.03 sec)

Records: 5 Duplicates: 0 Warnings: 0

The following query requires a full table scan because the column `c1` is not indexed:

```
EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
```

```
+--
 ↪ -----+-----+-----+-----+
 ↪
| id | estRows | task | access object | operator info
 ↪ | | | |
+--
 ↪ -----+-----+-----+-----+
 ↪
| TableReader_7 | 10.00 | root | | data:Selection_6
 ↪ | | | |
| -Selection_6 | 10.00 | cop[tikv] | | eq(test.t1.c1,
 ↪ | | | | eq(3)
| -TableFullScan_5 | 10000.00 | cop[tikv] | table:t1 | keep order:false
 ↪ | | | | , stats:pseudo |
+--
 ↪ -----+-----+-----+-----+
 ↪
3 rows in set (0.00 sec)
```

The statement `ALTER TABLE .. ADD INDEX` can be used to add an index on the table `t1`. `EXPLAIN` confirms that the original query now uses an index range scan, which is more efficient:

```
ALTER TABLE t1 ADD INDEX (c1);
EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
```

```
Query OK, 0 rows affected (0.30 sec)

+--
 ↪ -----+-----+-----+-----+
 ↪
| id | estRows | task | access object | operator
 ↪ | | | |
 ↪ info
+--
 ↪ -----+-----+-----+-----+
 ↪
| IndexReader_6 | 10.00 | root | | index:
 ↪ | | | | IndexRangeScan_5
| -IndexRangeScan_5 | 10.00 | cop[tikv] | table:t1, index:c1(c1) | range
 ↪ | | | | :[3,3], keep order:false, stats:pseudo |
+--
 ↪ -----+-----+-----+-----+
 ↪
```

```
↪
2 rows in set (0.00 sec)
```

TiDB supports the ability to assert that DDL changes will use a particular ALTER algorithm. This is only an assertion, and does not change the actual algorithm which will be used to modify the table. It can be useful if you only want to permit instant DDL changes during the peak hours of your cluster:

```
ALTER TABLE t1 DROP INDEX c1, ALGORITHM=INSTANT;
```

```
Query OK, 0 rows affected (0.24 sec)
```

Using the ALGORITHM=INSTANT assertion on an operation that requires the INPLACE algorithm results in a statement error:

```
ALTER TABLE t1 ADD INDEX (c1), ALGORITHM=INSTANT;
```

```
ERROR 1846 (0A000): ALGORITHM=INSTANT is not supported. Reason: Cannot
↪ alter table by INSTANT. Try ALGORITHM=INPLACE.
```

However, using the ALGORITHM=COPY assertion for an INPLACE operation generates a warning instead of an error. This is because TiDB interprets the assertion as *this algorithm or better*. This behavior difference is useful for MySQL compatibility because the algorithm TiDB uses might differ from MySQL:

```
ALTER TABLE t1 ADD INDEX (c1), ALGORITHM=COPY;
SHOW WARNINGS;
```

```
Query OK, 0 rows affected, 1 warning (0.25 sec)
```

```
+--
↪ -----+-----+
↪
| Level | Code | Message
↪
↪ |
+--
↪ -----+-----+
↪
| Error | 1846 | ALGORITHM=COPY is not supported. Reason: Cannot alter
↪ table by COPY. Try ALGORITHM=INPLACE. |
+--
↪ -----+-----+
↪
1 row in set (0.00 sec)
```

### 14.11.2.16.3 MySQL compatibility

The following major restrictions apply to `ALTER TABLE` in TiDB:

- When altering multiple schema objects in a single `ALTER TABLE` statement:
  - Modifying the same object in multiple changes is not supported.
  - TiDB validates statements according to the table schema **before execution**. For example, an error returns when `ALTER TABLE ADD INDEX i(b), DROP INDEX i;` is executed because the index `i` does not exist in the table.
  - For an `ALTER TABLE` statement, the order of execution in TiDB is one change after another from left to right, which is incompatible with MySQL in some cases.
- Changes of the [Reorg-Data](#) types on primary key columns are not supported.
- Changes of column types on partitioned tables are not supported.
- Changes of column types on generated columns are not supported.
- Changes of some data types (for example, some `TIME`, `Bit`, `Set`, `Enum`, and `JSON` types) are not supported due to the compatibility issues of the `CAST` function's behavior between TiDB and MySQL.
- Spatial data types are not supported.
- `ALTER TABLE t CACHE | NOCACHE` is a TiDB extension to MySQL syntax. For details, see [Cached Tables](#).

For further restrictions, see [MySQL Compatibility](#).

### 14.11.2.17 ALTER TABLE ... COMPACT

To enhance read performance and reduce disk usage, TiDB automatically schedules data compaction on storage nodes in the background. During the compaction, storage nodes rewrite physical data, including cleaning up deleted rows and merging multiple versions of data caused by updates. The `ALTER TABLE ... COMPACT` statement allows you to initiate compaction for a specific table immediately, without waiting until compaction is triggered in the background.

The execution of this statement does not block existing SQL statements or affect any TiDB features, such as transactions, DDL, and GC. Data that can be selected via SQL statements will not be changed either. Executing this statement consumes some IO and CPU resources. Be careful to choose an appropriate timing for execution, such as when resources are available, to avoid negative impact on the business.

The compaction statement will be finished and returned when all replicas of a table are compacted. During the execution process, you can safely interrupt the compaction by executing the `KILL` statement. Interrupting a compaction does not break data consistency or lead to data loss, nor does it affect subsequent manual or background compactions.

This data compaction statement is currently supported only for TiFlash replicas, not for TiKV replicas.

#### 14.11.2.17.1 Synopsis

```
AlterTableCompactStmt ::=
 'ALTER' 'TABLE' TableName 'COMPACT' ('PARTITION' PartitionNameList)? (
 ↪ 'TIFLASH' 'REPLICA')?
```

Since v6.2.0, the `TIFLASH REPLICA` part of the syntax can be omitted. When omitted, the semantic of the statement remains unchanged, and takes effect only for TiFlash.

#### 14.11.2.17.2 Examples

Compact TiFlash replicas in a table

The following takes an `employees` table as an example, which has 4 partitions with 2 TiFlash replicas:

```
CREATE TABLE employees (
 id INT NOT NULL,
 hired DATE NOT NULL DEFAULT '1970-01-01',
 store_id INT
)
PARTITION BY LIST (store_id) (
 PARTITION pNorth VALUES IN (1, 2, 3, 4, 5),
 PARTITION pEast VALUES IN (6, 7, 8, 9, 10),
 PARTITION pWest VALUES IN (11, 12, 13, 14, 15),
 PARTITION pCentral VALUES IN (16, 17, 18, 19, 20)
```

```
);
ALTER TABLE employees SET TIFLASH REPLICAS 2;
```

You can execute the following statement to immediately initiate the compaction for the 2 TiFlash replicas for all partitions in the `employees` table:

```
ALTER TABLE employees COMPACT TIFLASH REPLICAS;
```

Compact TiFlash replicas of specified partitions in a table

The following takes an `employees` table as an example, which has 4 partitions with 2 TiFlash replicas:

```
CREATE TABLE employees (
 id INT NOT NULL,
 hired DATE NOT NULL DEFAULT '1970-01-01',
 store_id INT
)
PARTITION BY LIST (store_id) (
 PARTITION pNorth VALUES IN (1, 2, 3, 4, 5),
 PARTITION pEast VALUES IN (6, 7, 8, 9, 10),
 PARTITION pWest VALUES IN (11, 12, 13, 14, 15),
 PARTITION pCentral VALUES IN (16, 17, 18, 19, 20)
);

ALTER TABLE employees SET TIFLASH REPLICAS 2;
```

You can execute the following statement to immediately initiate the compaction for the 2 TiFlash replicas of the `pNorth` and `pEast` partitions in the `employees` table:

```
ALTER TABLE employees COMPACT PARTITION pNorth, pEast TIFLASH REPLICAS;
```

### 14.11.2.17.3 Concurrency

The `ALTER TABLE ... COMPACT` statement compacts all replicas in a table simultaneously.

To avoid a significant impact on online business, each TiFlash instance only compacts data in one table at a time by default (except for the compaction triggered in the background). This means that if you execute the `ALTER TABLE ... COMPACT` statement on multiple tables at the same time, their executions will be queued on the same TiFlash instance, rather than being executed simultaneously.

To obtain greater table-level concurrency with higher resource usage, you can modify the TiFlash configuration `manual_compact_pool_size`. For example, when `manual_compact_pool_size` is set to 2, compaction for 2 tables can be processed simultaneously.

#### 14.11.2.17.4 Observe data compaction progress

You can observe the progress of data compaction or determine whether to initiate compaction for a table by checking the `TOTAL_DELTA_ROWS` column in the `INFORMATION_SCHEMA.TIFLASH_TABLES` table. The larger the value of `TOTAL_DELTA_ROWS`, the more data that can be compacted. If `TOTAL_DELTA_ROWS` is 0, all data in the table is in the best state and does not need to be compacted.

Example: Check the compaction state of a non-partitioned table

```
USE test;

CREATE TABLE foo(id INT);

ALTER TABLE foo SET TIFLASH REPLICA 1;

SELECT TOTAL_DELTA_ROWS, TOTAL_STABLE_ROWS FROM INFORMATION_SCHEMA.
↪ TIFLASH_TABLES
WHERE IS_TOMBSTONE = 0 AND
 `TIDB_DATABASE` = "test" AND `TIDB_TABLE` = "foo";
+-----+-----+
| TOTAL_DELTA_ROWS | TOTAL_STABLE_ROWS |
+-----+-----+
| 0 | 0 |
+-----+-----+

INSERT INTO foo VALUES (1), (3), (7);

SELECT TOTAL_DELTA_ROWS, TOTAL_STABLE_ROWS FROM INFORMATION_SCHEMA.
↪ TIFLASH_TABLES
WHERE IS_TOMBSTONE = 0 AND
 `TIDB_DATABASE` = "test" AND `TIDB_TABLE` = "foo";
+-----+-----+
| TOTAL_DELTA_ROWS | TOTAL_STABLE_ROWS |
+-----+-----+
| 3 | 0 |
+-----+-----+
-- Newly written data can be compacted

ALTER TABLE foo COMPACT TIFLASH REPLICA;

SELECT TOTAL_DELTA_ROWS, TOTAL_STABLE_ROWS FROM INFORMATION_SCHEMA.
↪ TIFLASH_TABLES
WHERE IS_TOMBSTONE = 0 AND
 `TIDB_DATABASE` = "test" AND `TIDB_TABLE` = "foo";
+-----+-----+
| TOTAL_DELTA_ROWS | TOTAL_STABLE_ROWS |
```

```

+-----+
| 0 | 3 |
+-----+
-- All data is in the best state and no compaction is needed

```

Example: Check the compaction state of a partitioned table

```

USE test;

CREATE TABLE employees
(id INT NOT NULL, store_id INT)
PARTITION BY LIST (store_id) (
 PARTITION pNorth VALUES IN (1, 2, 3, 4, 5),
 PARTITION pEast VALUES IN (6, 7, 8, 9, 10),
 PARTITION pWest VALUES IN (11, 12, 13, 14, 15),
 PARTITION pCentral VALUES IN (16, 17, 18, 19, 20)
);

ALTER TABLE employees SET TIFLASH REPLICA 1;

INSERT INTO employees VALUES (1, 1), (6, 6), (10, 10);

SELECT PARTITION_NAME, TOTAL_DELTA_ROWS, TOTAL_STABLE_ROWS
FROM INFORMATION_SCHEMA.TIFLASH_TABLES t, INFORMATION_SCHEMA.PARTITIONS
 ↪ p
WHERE t.IS_TOMBSTONE = 0 AND t.TABLE_ID = p.TIDB_PARTITION_ID AND
p.TABLE_SCHEMA = "test" AND p.TABLE_NAME = "employees";
+-----+
| PARTITION_NAME | TOTAL_DELTA_ROWS | TOTAL_STABLE_ROWS |
+-----+
pNorth	1	0
pEast	2	0
pWest	0	0
pCentral	0	0
+-----+
-- Some partitions can be compacted

ALTER TABLE employees COMPACT TIFLASH REPLICA;

SELECT PARTITION_NAME, TOTAL_DELTA_ROWS, TOTAL_STABLE_ROWS
FROM INFORMATION_SCHEMA.TIFLASH_TABLES t, INFORMATION_SCHEMA.PARTITIONS
 ↪ p
WHERE t.IS_TOMBSTONE = 0 AND t.TABLE_ID = p.TIDB_PARTITION_ID AND
p.TABLE_SCHEMA = "test" AND p.TABLE_NAME = "employees";
+-----+

```

| PARTITION_NAME | TOTAL_DELTA_ROWS | TOTAL_STABLE_ROWS |
|----------------|------------------|-------------------|
| pNorth         | 0                | 1                 |
| pEast          | 0                | 2                 |
| pWest          | 0                | 0                 |
| pCentral       | 0                | 0                 |

*-- Data in all partitions is in the best state and no compaction is needed*

### Note:

- If data is updated during compaction, `TOTAL_DELTA_ROWS` might still be a non-zero value after compaction is done. This is normal and indicates that these updates have not been compacted. To compact these updates, execute the `ALTER TABLE ... COMPACT` statement again.
- `TOTAL_DELTA_ROWS` indicates the data version, not the number of rows. For example, if you insert a row and then delete it, `TOTAL_DELTA_ROWS` will increase by 2.

#### 14.11.2.17.5 Compatibility

##### MySQL compatibility

The `ALTER TABLE ... COMPACT` syntax is TiDB specific, which is an extension to the standard SQL syntax. Although there is no equivalent MySQL syntax, you can still execute this statement by using MySQL clients or various database drivers that comply with the MySQL protocol.

##### TiDB Binlog and TiCDC compatibility

The `ALTER TABLE ... COMPACT` statement does not result in logical data changes and are therefore not replicated to downstream by TiDB Binlog or TiCDC.

#### 14.11.2.17.6 See also

- [ALTER TABLE](#)
- [KILL TIDB](#)

#### 14.11.2.18 ALTER USER

This statement changes an existing user inside the TiDB privilege system. In the MySQL privilege system, a user is the combination of a username and the host from which they are

connecting from. Thus, it is possible to create a user 'newuser2'@'192.168.1.1' who is only able to connect from the IP address 192.168.1.1. It is also possible to have two users have the same user-portion, and different permissions as they login from different hosts.

#### 14.11.2.18.1 Synopsis

```
AlterUserStmt ::=
 'ALTER' 'USER' IfExists (UserSpecList RequireClauseOpt ConnectionOptions
 ↪ PasswordOption LockOption AttributeOption | 'USER' '(' ')' ' '
 ↪ IDENTIFIED' 'BY' AuthString) ResourceGroupNameOption

UserSpecList ::=
 UserSpec (',' UserSpec)*

UserSpec ::=

Username ::=
 StringName ('@' StringName | singleAtIdentifier)? | 'CURRENT_USER'
 ↪ OptionalBraces

AuthOption ::=
 ('IDENTIFIED' ('BY' (AuthString | 'PASSWORD' HashString) | 'WITH'
 ↪ StringName ('BY' AuthString | 'AS' HashString)?))?

PasswordOption ::= ('PASSWORD' 'EXPIRE' ('DEFAULT' | 'NEVER' | 'INTERVAL'
 ↪ N 'DAY')? | 'PASSWORD' 'HISTORY' ('DEFAULT' | N) | 'PASSWORD' '
 ↪ REUSE' 'INTERVAL' ('DEFAULT' | N 'DAY') | 'FAILED_LOGIN_ATTEMPTS' N
 ↪ | 'PASSWORD_LOCK_TIME' (N | 'UNBOUNDED')))*

LockOption ::= ('ACCOUNT' 'LOCK' | 'ACCOUNT' 'UNLOCK')?

AttributeOption ::= ('COMMENT' CommentString | 'ATTRIBUTE' AttributeString
 ↪)?

ResourceGroupNameOption ::= ('RESOURCE' 'GROUP' Identifier)?
```

#### 14.11.2.18.2 Examples

```
mysql> CREATE USER 'newuser' IDENTIFIED BY 'newuserpassword';
Query OK, 1 row affected (0.01 sec)

mysql> SHOW CREATE USER 'newuser';
+---
↪ -----
```

```
↳
| CREATE USER for newuser@%
↳
↳ |
+--
↳ -----
↳
| CREATE USER 'newuser'@'%' IDENTIFIED WITH 'mysql_native_password' AS '
↳ *5806E04BBEE79E1899964C6A04D68BCA69B1A879' REQUIRE NONE PASSWORD
↳ EXPIRE DEFAULT ACCOUNT UNLOCK |
+--
↳ -----
↳
1 row in set (0.00 sec)

mysql> ALTER USER 'newuser' IDENTIFIED BY 'newnewpassword';
Query OK, 0 rows affected (0.02 sec)

mysql> SHOW CREATE USER 'newuser';
+--
↳ -----
↳
| CREATE USER for newuser@%
↳
↳ |
+--
↳ -----
↳
| CREATE USER 'newuser'@'%' IDENTIFIED WITH 'mysql_native_password' AS '*
↳ FB8A1EA1353E8775CA836233E367FBDFCB37BE73' REQUIRE NONE PASSWORD
↳ EXPIRE DEFAULT ACCOUNT UNLOCK |
+--
↳ -----
↳
1 row in set (0.00 sec)
```

```
ALTER USER 'newuser' ACCOUNT LOCK;
```

```
Query OK, 0 rows affected (0.02 sec)
```

Modify the attributes of newuser:

```
ALTER USER 'newuser' ATTRIBUTE '{"newAttr": "value", "deprecatedAttr": null
↳ }';
SELECT * FROM information_schema.user_attributes;
```

```

+-----+-----+-----+
| USER | HOST | ATTRIBUTE |
+-----+-----+-----+
| newuser | % | {"newAttr": "value"} |
+-----+-----+-----+
1 rows in set (0.00 sec)

```

Modify the comment of newuser using ALTER USER ... COMMENT:

```

ALTER USER 'newuser' COMMENT 'Here is the comment';
SELECT * FROM information_schema.user_attributes;

```

```

+--
 ↪ -----+-----+-----+
 ↪
| USER | HOST | ATTRIBUTE |
+--
 ↪ -----+-----+-----+
 ↪
| newuser | % | {"comment": "Here is the comment", "newAttr": "value"} |
+--
 ↪ -----+-----+-----+
 ↪
1 rows in set (0.00 sec)

```

Remove the comment of newuser using ALTER USER ... ATTRIBUTE:

```

ALTER USER 'newuser' ATTRIBUTE '{"comment": null}';
SELECT * FROM information_schema.user_attributes;

```

```

+-----+-----+-----+
| USER | HOST | ATTRIBUTE |
+-----+-----+-----+
| newuser | % | {"newAttr": "value"} |
+-----+-----+-----+
1 rows in set (0.00 sec)

```

Change the automatic password expiration policy for newuser to never expire via ALTER  
↪ USER ... PASSWORD EXPIRE NEVER:

```

ALTER USER 'newuser' PASSWORD EXPIRE NEVER;

```

```

Query OK, 0 rows affected (0.02 sec)

```

Modify the password reuse policy for newuser to disallow the reuse of any password used within the last 90 days using ALTER USER ... PASSWORD REUSE INTERVAL ... DAY:

```
ALTER USER 'newuser' PASSWORD REUSE INTERVAL 90 DAY;
```

```
Query OK, 0 rows affected (0.02 sec)
```

Use `ALTER USER ... RESOURCE GROUP` to modify the resource group of the user `newuser` to `rg1`.

```
ALTER USER 'newuser' RESOURCE GROUP rg1;
```

```
Query OK, 0 rows affected (0.02 sec)
```

### 14.11.2.19 ANALYZE

This statement updates the statistics that TiDB builds on tables and indexes. It is recommended to run `ANALYZE` after performing a large batch update or import of records, or when you notice that query execution plans are sub-optimal.

TiDB will also automatically update its statistics over time as it discovers that they are inconsistent with its own estimates.

Currently, TiDB collects statistical information in two ways: full collection (implemented using the `ANALYZE TABLE` statement) and incremental collection (implemented using the `ANALYZE INCREMENTAL TABLE` statement). For detailed usage of these two statements, refer to [introduction to statistics](#)

#### 14.11.2.19.1 Synopsis

```
AnalyzeTableStmt ::=
 'ANALYZE' ('TABLE' (TableNameList ('ALL COLUMNS' | 'PREDICATE COLUMNS
 ↪ ') | TableName ('INDEX' IndexNameList? | AnalyzeColumnOption | '
 ↪ PARTITION' PartitionNameList ('INDEX' IndexNameList? |
 ↪ AnalyzeColumnOption)?)?) | 'INCREMENTAL' 'TABLE' TableName ('
 ↪ PARTITION' PartitionNameList)? 'INDEX' IndexNameList?)
 ↪ AnalyzeOptionListOpt
```

```
AnalyzeOptionListOpt ::=
```

```

(WITH AnalyzeOptionList)?

AnalyzeOptionList ::=
AnalyzeOption (',' AnalyzeOption)*

AnalyzeOption ::=
(NUM ('BUCKETS' | 'TOPN' | ('CMSKETCH' ('DEPTH' | 'WIDTH')) | 'SAMPLES
 ↪ ')) | (FLOATNUM 'SAMPLERATE')

AnalyzeColumnOption ::=
('ALL COLUMNS' | 'PREDICATE COLUMNS' | 'COLUMNS' ColumnNameList)

TableNameList ::=
 TableName (',' TableName)*

TableName ::=
 Identifier ('.' Identifier)?

ColumnNameList ::=
 Identifier (',' Identifier)*

IndexNameList ::=
 Identifier (',' Identifier)*

PartitionNameList ::=
 Identifier (',' Identifier)*

```

### 14.11.2.19.2 Examples

```

mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
 ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> ALTER TABLE t1 ADD INDEX (c1);
Query OK, 0 rows affected (0.30 sec)

mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
+---
 ↪ -----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
 ↪

```

```

| id | estRows | task | access object | operator

 ↳ :[3,3], keep order:false |
+---
 ↳ -----+-----+-----+-----+
 ↳
2 rows in set (0.00 sec)

```

### 14.11.2.19.3 MySQL compatibility

TiDB differs from MySQL in **both** the statistics it collects and how it makes use of statistics during query execution. While this statement is syntactically similar to MySQL, the following differences apply:

1. TiDB might not include very recently committed changes when running `ANALYZE TABLE`. After a batch-update of rows, you might need to `sleep(1)` before executing `ANALYZE TABLE` in order for the statistics update to reflect these changes. [#16570](#).

2. `ANALYZE TABLE` takes significantly longer to execute in TiDB than MySQL. This performance difference can be partially mitigated by enabling fast analyze with `SET GLOBAL tidb_enable_fast_analyze=1`. Fast analyze makes use of sampling, leading to less accurate statistics. Its usage is still considered experimental.

MySQL does not support the `ANALYZE INCREMENTAL TABLE` statement. TiDB supports incremental collection of statistics. For detailed usage, refer to [incremental collection](#).

#### 14.11.2.19.4 See also

- [EXPLAIN](#)
- [EXPLAIN ANALYZE](#)

#### 14.11.2.20 BACKUP

This statement is used to perform a distributed backup of the TiDB cluster.

The `BACKUP` statement uses the same engine as the [BR tool](#) does, except that the backup process is driven by TiDB itself rather than a separate BR tool. All benefits and warnings of BR also apply in this statement.

Executing `BACKUP` requires either the `BACKUP_ADMIN` or `SUPER` privilege. Additionally, both the TiDB node executing the backup and all TiKV nodes in the cluster must have read or write permission to the destination. Local storage (storage paths starting with `local://`) is not permitted when [Security Enhanced Mode](#) is enabled.

The `BACKUP` statement is blocked until the entire backup task is finished, failed, or canceled. A long-lasting connection should be prepared for executing `BACKUP`. The task can be canceled using the `KILL TIDB QUERY` statement.

Only one `BACKUP` and `RESTORE` task can be executed at a time. If a `BACKUP` or `RESTORE` statement is already being executed on the same TiDB server, the new `BACKUP` execution will wait until all previous tasks are finished.

`BACKUP` can only be used with “tikv” storage engine. Using `BACKUP` with the “unistore” engine will fail.

##### 14.11.2.20.1 Synopsis

```
BackupStmt ::=
 "BACKUP" BRIETables "TO" stringLit BackupOption*

BRIETables ::=
 "DATABASE" ('*' | DBName (',' DBName)*)
| "TABLE" TableNameList

BackupOption ::=
```

```

"RATE_LIMIT" '='? LengthNum "MB" '/' "SECOND"
| "CONCURRENCY" '='? LengthNum
| "CHECKSUM" '='? Boolean
| "SEND_CREDENTIALS_TO_TIKV" '='? Boolean
| "LAST_BACKUP" '='? BackupTSO
| "SNAPSHOT" '='? (BackupTSO | LengthNum TimestampUnit "AGO")

Boolean ::=
 NUM | "TRUE" | "FALSE"

BackupTSO ::=
 LengthNum | stringLit

```

### 14.11.2.20.2 Examples

Back up databases

```
BACKUP DATABASE `test` TO 'local:///mnt/backup/2020/04/';
```

```

+--
↪ -----+-----+-----+
↪
| Destination | Size | BackupTS | Queue Time |
↪ Execution Time |
+--
↪ -----+-----+-----+
↪
| local:///mnt/backup/2020/04/ | 248665063 | 416099531454472 | 2020-04-12
↪ 23:09:48 | 2020-04-12 23:09:48 |
+--
↪ -----+-----+-----+
↪
1 row in set (58.453 sec)

```

In the example above, the `test` database is backed up into the local filesystem. The data is saved as SST files in the `/mnt/backup/2020/04/` directories distributed among all TiDB and TiKV nodes.

The first row of the result above is described as follows:

| Column      | Description         |
|-------------|---------------------|
| Destination | The destination URL |

| Column              | Description                                                                                |
|---------------------|--------------------------------------------------------------------------------------------|
| Size                | The total size of the backup archive, in bytes                                             |
| BackupTS            | The TSO of the snapshot when the backup is created (useful for <b>incremental backup</b> ) |
| Queue<br>↪ Time     | The timestamp (in current time zone) when the BACKUP task is queued.                       |
| Execution<br>↪ Time | The timestamp (in current time zone) when the BACKUP task starts to run.                   |

Back up tables

```
BACKUP TABLE `test`.`sbtest01` TO 'local:///mnt/backup/sbtest01/';
```

```
BACKUP TABLE sbtest02, sbtest03, sbtest04 TO 'local:///mnt/backup/sbtest/';
```

Back up the entire cluster

```
BACKUP DATABASE * TO 'local:///mnt/backup/full/';
```

Note that the system tables (`mysql.*`, `INFORMATION_SCHEMA.*`, `PERFORMANCE_SCHEMA` ↪ `.*`, ...) will not be included into the backup.

## External storages

BR supports backing up data to S3 or GCS:

```
BACKUP DATABASE `test` TO 's3://example-bucket-2020/backup-05/?access-key={
↪ YOUR_ACCESS_KEY}&secret-access-key={YOUR_SECRET_KEY}';
```

The URL syntax is further explained in [external storage URI](#).

When running on cloud environment where credentials should not be distributed, set the `SEND_CREDENTIALS_TO_TIKV` option to `FALSE`:

```
BACKUP DATABASE `test` TO 's3://example-bucket-2020/backup-05/'
SEND_CREDENTIALS_TO_TIKV = FALSE;
```

## Performance fine-tuning

Use `RATE_LIMIT` to limit the average upload speed per TiKV node to reduce network bandwidth.

By default, every TiKV node would run 4 backup threads. This value can be adjusted with the `CONCURRENCY` option.

Before backup is completed, `BACKUP` would perform a checksum against the data on the cluster to verify correctness. This step can be disabled with the `CHECKSUM` option if you are confident that this is unnecessary.

```
BACKUP DATABASE `test` TO 's3://example-bucket-2020/backup-06/'
RATE_LIMIT = 120 MB/SECOND
CONCURRENCY = 8
CHECKSUM = FALSE;
```

## Snapshot

Specify a timestamp, TSO or relative time to backup historical data.

```
-- relative time
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist01'
SNAPSHOT = 36 HOUR AGO;

-- timestamp (in current time zone)
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist02'
SNAPSHOT = '2020-04-01 12:00:00';

-- timestamp oracle
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist03'
SNAPSHOT = 415685305958400;
```

The supported units for relative time are:

- MICROSECOND

- SECOND
- MINUTE
- HOUR
- DAY
- WEEK

Note that, following SQL standard, the units are always singular.

Incremental backup

Supply the `LAST_BACKUP` option to only backup the changes between the last backup to the current snapshot.

```
-- timestamp (in current time zone)
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist02'
 LAST_BACKUP = '2020-04-01 12:00:00';

-- timestamp oracle
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist03'
 LAST_BACKUP = 415685305958400;
```

#### 14.11.2.20.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.11.2.20.4 See also

- [RESTORE](#)
- [SHOW BACKUPS](#)

#### 14.11.2.21 BATCH

The `BATCH` syntax splits a DML statement into multiple statements in TiDB for execution. This means that there are **no guarantees** of transactional atomicity and isolation. Therefore, it is a “non-transactional” statement.

Currently, `INSERT`, `REPLACE`, `UPDATE`, and `DELETE` are supported in `BATCH`.

Based on a column, the `BATCH` syntax divides a DML statement into multiple ranges of scope for execution. In each range, a single SQL statement is executed.

For details about the usage and restrictions, see [Non-transactional DML statements](#).

When you use multi-table join in a `BATCH` statement, you need to specify the full path of the column to avoid ambiguity:

```
BATCH ON test.t2.id LIMIT 1 INSERT INTO t SELECT t2.id, t2.v, t3.v FROM t2
 ↪ JOIN t3 ON t2.k = t3.k;
```

The preceding statement specifies the column to be split as `test.t2.id`, which is unambiguous. If you use the `id` as follows, an error is reported:

```
BATCH ON id LIMIT 1 INSERT INTO t SELECT t2.id, t2.v, t3.v FROM t2 JOIN t3
 ↪ ON t2.k = t3.k;
```

Non-transactional DML, shard **column** must be fully specified

#### 14.11.2.21.1 Synopsis

```
NonTransactionalDMLStmt ::=
 'BATCH' ('ON' ColumnName)? 'LIMIT' NUM DryRunOptions? ShardableStmt

DryRunOptions ::=
 'DRY' 'RUN' 'QUERY'?

ShardableStmt ::=
 DeleteFromStmt
| UpdateStmt
| InsertIntoStmt
| ReplaceIntoStmt
```

#### 14.11.2.21.2 MySQL compatibility

The BATCH syntax is TiDB-specific and not compatible with MySQL.

#### 14.11.2.21.3 See also

- [Non-transactional DML statements](#)

#### 14.11.2.22 BEGIN

This statement starts a new transaction inside of TiDB. It is similar to the statements `START TRANSACTION` and `SET autocommit=0`.

In the absence of a `BEGIN` statement, every statement will by default autocommit in its own transaction. This behavior ensures MySQL compatibility.

#### 14.11.2.22.1 Synopsis

```
BeginTransactionStmt ::=
 'BEGIN' ('PESSIMISTIC' | 'OPTIMISTIC')?
| 'START' 'TRANSACTION' ('READ' ('WRITE' | 'ONLY' ('WITH' 'TIMESTAMP' '
 ↪ BOUND' TimestampBound)?) | 'WITH' 'CONSISTENT' 'SNAPSHOT')?
```

#### 14.11.2.22.2 Examples

```
mysql> CREATE TABLE t1 (a int NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.12 sec)

mysql> BEGIN;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.00 sec)

mysql> COMMIT;
Query OK, 0 rows affected (0.01 sec)
```

#### 14.11.2.22.3 MySQL compatibility

TiDB supports the syntax extension of `BEGIN PESSIMISTIC` or `BEGIN OPTIMISTIC`. This enables you to override the default transactional model for your transaction.

#### 14.11.2.22.4 See also

- [COMMIT](#)
- [ROLLBACK](#)
- [START TRANSACTION](#)
- [TiDB optimistic transaction model](#)
- [TiDB pessimistic transaction mode](#)

#### 14.11.2.23 CHANGE COLUMN

The `ALTER TABLE... CHANGE COLUMN` statement changes a column on an existing table. The change can include both renaming the column, and changing the data type to a compatible type.

Since v5.1.0, TiDB has supported changing the Reorg data type, including but not limited to:

- Changing `VARCHAR` to `BIGINT`
- Modifying the `DECIMAL` precision
- Compressing the length of `VARCHAR(10)` to `VARCHAR(5)`

#### 14.11.2.23.1 Synopsis

```
AlterTableStmt
 ::= 'ALTER' 'IGNORE'? 'TABLE' TableName ChangeColumnSpec (','
 ↪ ChangeColumnSpec)*
```

```

ChangeColumnSpec
 ::= 'CHANGE' ColumnKeywordOpt 'IF EXISTS' ColumnName ColumnName
 ↪ ColumnType ColumnOption* ('FIRST' | 'AFTER' ColumnName)?

ColumnType
 ::= NumericType
 | StringType
 | DateAndTimeType
 | 'SERIAL'

ColumnOption
 ::= 'NOT'? 'NULL'
 | 'AUTO_INCREMENT'
 | 'PRIMARY'? 'KEY' ('CLUSTERED' | 'NONCLUSTERED')?
 | 'UNIQUE' 'KEY'?
 | 'DEFAULT' (NowSymOptionFraction | SignedLiteral |
 ↪ NextValueForSequence)
 | 'SERIAL' 'DEFAULT' 'VALUE'
 | 'ON' 'UPDATE' NowSymOptionFraction
 | 'COMMENT' stringLit
 | ('CONSTRAINT' Identifier?)? 'CHECK' '(' Expression ')' ('NOT
 ↪ '?' ('ENFORCED' | 'NULL'))?
 | 'GENERATED' 'ALWAYS' 'AS' '(' Expression ')' ('VIRTUAL' | '
 ↪ STORED')?
 | 'REFERENCES' TableName ('(' IndexPartSpecificationList ')')?
 ↪ Match? OnDeleteUpdateOpt
 | 'COLLATE' CollationName
 | 'COLUMN_FORMAT' ColumnFormat
 | 'STORAGE' StorageMedia
 | 'AUTO_RANDOM' ('(' LengthNum ')')?

ColumnName ::=
 Identifier ('.' Identifier ('.' Identifier)?)?

```

### 14.11.2.23.2 Examples

```
CREATE TABLE t1 (id int not null primary key AUTO_INCREMENT, col1 INT);
```

```
Query OK, 0 rows affected (0.11 sec)
```

```
INSERT INTO t1 (col1) VALUES (1),(2),(3),(4),(5);
```

```
Query OK, 5 rows affected (0.02 sec)
```

```
Records: 5 Duplicates: 0 Warnings: 0
```

```
ALTER TABLE t1 CHANGE col1 col2 INT;
```

```
Query OK, 0 rows affected (0.09 sec)
```

```
ALTER TABLE t1 CHANGE col2 col3 BIGINT, ALGORITHM=INSTANT;
```

```
Query OK, 0 rows affected (0.08 sec)
```

```
ALTER TABLE t1 CHANGE col3 col4 BIGINT, CHANGE id id2 INT NOT NULL;
```

```
ERROR 1105 (HY000): can't run multi schema change
```

```
CREATE TABLE t (a int primary key);
ALTER TABLE t CHANGE COLUMN a a VARCHAR(10);
```

```
ERROR 8200 (HY000): Unsupported modify column: column has primary key flag
```

```
CREATE TABLE t (c1 INT, c2 INT, c3 INT) partition by range columns(c1) (
 ↪ partition p0 values less than (10), partition p1 values less than (
 ↪ maxvalue));
ALTER TABLE t CHANGE COLUMN c1 c1 DATETIME;
```

```
ERROR 8200 (HY000): Unsupported modify column: table is partition table
```

```
CREATE TABLE t (a INT, b INT as (a+1));
ALTER TABLE t CHANGE COLUMN b b VARCHAR(10);
```

```
ERROR 8200 (HY000): Unsupported modify column: column is generated
```

```
CREATE TABLE t (a DECIMAL(13, 7));
ALTER TABLE t CHANGE COLUMN a a DATETIME;
```

```
ERROR 8200 (HY000): Unsupported modify column: change from original type
 ↪ decimal(13,7) to datetime is currently unsupported yet
```

### 14.11.2.23.3 MySQL compatibility

- Changes of **Reorg-Data** types on primary key columns are not supported.
- Changes of column types on partitioned tables are not supported.
- Changes of column types on generated columns are not supported.
- Changes of some data types (for example, some TIME, Bit, Set, Enum, and JSON types) are not supported due to the compatibility issues of the CAST function's behavior between TiDB and MySQL.

#### 14.11.2.23.4 See also

- [CREATE TABLE](#)
- [SHOW CREATE TABLE](#)
- [ADD COLUMN](#)
- [DROP COLUMN](#)
- [MODIFY COLUMN](#)

#### 14.11.2.24 COMMIT

This statement commits a transaction inside of the TiDB server.

In the absence of a `BEGIN` or `START TRANSACTION` statement, the default behavior of TiDB is that every statement will be its own transaction and autocommit. This behavior ensures MySQL compatibility.

##### 14.11.2.24.1 Synopsis

```
CommitStmt ::=
 'COMMIT' CompletionTypeWithinTransaction?

CompletionTypeWithinTransaction ::=
 'AND' ('CHAIN' ('NO' 'RELEASE')? | 'NO' 'CHAIN' ('NO'? 'RELEASE')?
 ↔)
| 'NO'? 'RELEASE'
```

##### 14.11.2.24.2 Examples

```
mysql> CREATE TABLE t1 (a int NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.12 sec)

mysql> START TRANSACTION;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.00 sec)

mysql> COMMIT;
Query OK, 0 rows affected (0.01 sec)
```

##### 14.11.2.24.3 MySQL compatibility

- Currently, TiDB use Metadata Locking (MDL) to prevent DDL statements from modifying tables used by transactions by default. The behavior of metadata lock is different between TiDB and MySQL. For more details, see [Metadata Lock](#).

- By default, TiDB 3.0.8 and later versions use **Pessimistic Locking**. When using **Optimistic Locking**, it is important to consider that a **COMMIT** statement might fail because rows have been modified by another transaction.
- When Optimistic Locking is enabled, **UNIQUE** and **PRIMARY KEY** constraint checks are deferred until statement commit. This results in additional situations where a **COMMIT** statement might fail. This behavior can be changed by setting `tidb_constraint_check_in_place=ON`.
- TiDB parses but ignores the syntax **ROLLBACK AND [NO] RELEASE**. This functionality is used in MySQL to disconnect the client session immediately after committing the transaction. In TiDB, it is recommended to instead use the `mysql_close()` functionality of your client driver.
- TiDB parses but ignores the syntax **ROLLBACK AND [NO] CHAIN**. This functionality is used in MySQL to immediately start a new transaction with the same isolation level while the current transaction is being committed. In TiDB, it is recommended to instead start a new transaction.

#### 14.11.2.24.4 See also

- **START TRANSACTION**
- **ROLLBACK**
- **BEGIN**
- **Lazy checking of constraints**

#### 14.11.2.25 CHANGE DRAINER

The **CHANGE DRAINER** statement modifies the status information for Drainer in the cluster.

##### Tip:

Drainer's state is automatically reported to PD while running. Only when Drainer is under abnormal circumstances and its state is inconsistent with the state information stored in PD, you can use the **CHANGE DRAINER** statement to modify the state information stored in PD.

##### 14.11.2.25.1 Examples

```
SHOW DRAINER STATUS;
```

```
+--
 ↪ -----/-----/-----/-----/-----/
 ↪
```

```

| NodeID | Address | State | Max_Commit_Ts | Update_Time |
+---+
|< ↪ -----/-----/-----/-----/-----/
|< ↪
| drainer1 | 127.0.0.3:8249 | Online | 408553768673342532 | 2019-04-30
|< ↪ 00:00:03 |
+---+
|< ↪ -----/-----/-----/-----/-----/
|< ↪
| drainer2 | 127.0.0.4:8249 | Online | 408553768673345531 | 2019-05-01
|< ↪ 00:00:04 |
+---+
|< ↪ -----/-----/-----/-----/-----/
|< ↪
2 rows in set (0.00 sec)

```

It can be seen that drainer1's state has not been updated for more than a day, the Drainer is in an abnormal state, but the State remains Online. After using CHANGE DRAINER, the Drainer's State is changed to 'paused':

```
CHANGE DRAINER TO NODE_STATE ='paused' FOR NODE_ID 'drainer1';
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
SHOW DRAINER STATUS;
```

```

+---+
|< ↪ -----/-----/-----/-----/-----/
|< ↪
| NodeID | Address | State | Max_Commit_Ts | Update_Time |
+---+
|< ↪ -----/-----/-----/-----/-----/
|< ↪
| drainer1 | 127.0.0.3:8249 | Paused | 408553768673342532 | 2019-04-30
|< ↪ 00:00:03 |
+---+
|< ↪ -----/-----/-----/-----/-----/
|< ↪
| drainer2 | 127.0.0.4:8249 | Online | 408553768673345531 | 2019-05-01
|< ↪ 00:00:04 |
+---+
|< ↪ -----/-----/-----/-----/-----/
|< ↪
2 rows in set (0.00 sec)

```

### 14.11.2.25.2 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.11.2.25.3 See also

- [SHOW PUMP STATUS](#)
- [SHOW DRAINER STATUS](#)
- [CHANGE PUMP STATUS](#)

## 14.11.2.26 CHANGE PUMP

The `CHANGE PUMP` statement modifies the status information for Pump in the cluster.

### Tip:

Pump's state is automatically reported to PD while running. Only when Pump is under abnormal circumstances and its state is inconsistent with the state information stored in PD, you can use the `CHANGE PUMP` statement to modify the state information stored in PD.

### 14.11.2.26.1 Examples

```
SHOW PUMP STATUS;
```

```
+---
 ↪ -----/-----/-----/-----/-----/
 ↪
| NodeID | Address | State | Max_Commit_Ts | Update_Time |
+---
 ↪ -----/-----/-----/-----/-----/
 ↪
| pump1 | 127.0.0.1:8250 | Online | 408553768673342237 | 2019-04-30 00:00:01
 ↪ |
+---
 ↪ -----/-----/-----/-----/-----/
 ↪
| pump2 | 127.0.0.2:8250 | Online | 408553768673342335 | 2019-05-01 00:00:02
 ↪ |
+---
 ↪ -----/-----/-----/-----/-----/
 ↪
2 rows in set (0.00 sec)
```

It can be seen that pump1's state has not been updated for more than a day, the Pump is in an abnormal state, but the State remains Online. After using CHANGE PUMP, the Pump's State is changed to 'paused' :

```
CHANGE PUMP TO NODE_STATE = 'paused' FOR NODE_ID 'pump1';
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
SHOW PUMP STATUS;
```

```
+--
 ↪ -----/-----/-----/-----/-----/
 ↪
| NodeID | Address | State | Max_Commit_Ts | Update_Time |
+--
 ↪ -----/-----/-----/-----/-----/
 ↪
| pump1 | 127.0.0.1:8250 | Paused | 408553768673342237 | 2019-04-30 00:00:01
 ↪ |
+--
 ↪ -----/-----/-----/-----/-----/
 ↪
| pump2 | 127.0.0.2:8250 | Online | 408553768673342335 | 2019-05-01 00:00:02
 ↪ |
+--
 ↪ -----/-----/-----/-----/-----/
 ↪
2 rows in set (0.00 sec)
```

#### 14.11.2.26.2 MySQL compatibility

#### 14.11.2.27 CREATE [GLOBAL|SESSION] BINDING

This statement creates a new execution plan binding in TiDB. Binding can be used to inject a hint into a statement without requiring changes to the underlying query.

A BINDING can be on either a GLOBAL or SESSION basis. The default is SESSION.

The bound SQL statement is parameterized and stored in the system table. When a SQL query is processed, as long as the parameterized SQL statement and a bound one in the system table are consistent and the system variable `tidb_use_plan_baselines` is set to ON (default), the corresponding optimizer hint is available. If multiple execution plans are available, the optimizer chooses to bind the plan with the least cost. For more information, see [Create a binding](#).

#### 14.11.2.27.1 Synopsis

```
CreateBindingStmt ::=
 'CREATE' GlobalScope 'BINDING' ('FOR' BindableStmt 'USING' BindableStmt
 | 'FROM' 'HISTORY' 'USING' 'PLAN' 'DIGEST' PlanDigest)

GlobalScope ::=
 ('GLOBAL' | 'SESSION')?

BindableStmt ::=
 (SelectStmt | UpdateStmt | InsertIntoStmt | ReplaceIntoStmt |
 ↪ DeleteStmt)
```

---

#### 14.11.2.27.2 Examples

You can create a binding according to a SQL statement or a historical execution plan.

The following example shows how to create a binding according to a SQL statement.

```
mysql> CREATE TABLE t1 (
 -> id INT NOT NULL PRIMARY KEY auto_increment,
 -> b INT NOT NULL,
 -> pad VARBINARY(255),
 -> INDEX(b)
 ->);
Query OK, 0 rows affected (0.07 sec)

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
 ↪ FROM dual;
Query OK, 1 row affected (0.01 sec)
Records: 1 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
 ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 1 row affected (0.00 sec)
Records: 1 Duplicates: 0 Warnings: 0
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
 ↳ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 8 rows affected (0.00 sec)
Records: 8 Duplicates: 0 Warnings: 0
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
 ↳ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 1000 rows affected (0.04 sec)
Records: 1000 Duplicates: 0 Warnings: 0
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
 ↳ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 100000 rows affected (1.74 sec)
Records: 100000 Duplicates: 0 Warnings: 0
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
 ↳ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 100000 rows affected (2.15 sec)
Records: 100000 Duplicates: 0 Warnings: 0
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
 ↳ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 100000 rows affected (2.64 sec)
Records: 100000 Duplicates: 0 Warnings: 0
```

```
mysql> SELECT SLEEP(1);
```

```
+-----+
| SLEEP(1) |

## 14.11.2.28 CREATE DATABASE

This statement creates a new database in TiDB. The MySQL terminology for ‘database’ most closely maps to a schema in the SQL standard.

### 14.11.2.28.1 Synopsis

```

CreateDatabaseStmt ::=
 'CREATE' 'DATABASE' IfNotExists DBName DatabaseOptionListOpt

IfNotExists ::=
 ('IF' 'NOT' 'EXISTS')?

DBName ::=
 Identifier

DatabaseOptionListOpt ::=
 DatabaseOptionList?

DatabaseOptionList ::=
 DatabaseOption (',' DatabaseOption)*

DatabaseOption ::=
 DefaultKwdOpt (CharsetKw '='? CharsetName | 'COLLATE' '='?
 ↳ CollationName | 'ENCRYPTION' '='? EncryptionOpt)
 | DefaultKwdOpt PlacementPolicyOption

PlacementPolicyOption ::=
 "PLACEMENT" "POLICY" EqOpt PolicyName
 | "PLACEMENT" "POLICY" (EqOpt | "SET") "DEFAULT"

```

### 14.11.2.28.2 Syntax

The `CREATE DATABASE` statement is used to create a database, and to specify the default properties of the database, such as the default character set and collation. `CREATE SCHEMA` is a synonym for `CREATE DATABASE`.

```

CREATE {DATABASE | SCHEMA} [IF NOT EXISTS] db_name
 [create_specification] ...

create_specification:
 [DEFAULT] CHARACTER SET [=] charset_name
 | [DEFAULT] COLLATE [=] collation_name

```

If you create an existing database and does not specify `IF NOT EXISTS`, an error is displayed.

The `create_specification` option is used to specify the specific `CHARACTER SET` and `COLLATE` in the database. Currently, TiDB only supports some of the character sets and collations. For details, see [Character Set and Collation Support](#).

### 14.11.2.28.3 Examples

```
mysql> CREATE DATABASE mynewdatabase;
Query OK, 0 rows affected (0.09 sec)

mysql> USE mynewdatabase;
Database changed
mysql> CREATE TABLE t1 (a int);
Query OK, 0 rows affected (0.11 sec)

mysql> SHOW TABLES;
+-----+
| Tables_in_mynewdatabase |
+-----+
| t1 |
+-----+
1 row in set (0.00 sec)
```

### 14.11.2.28.4 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.28.5 See also

- [USE](#)
- [ALTER DATABASE](#)
- [DROP DATABASE](#)
- [SHOW DATABASES](#)

## 14.11.2.29 CREATE INDEX

This statement adds a new index to an existing table. It is an alternative syntax to `ALTER TABLE .. ADD INDEX`, and included for MySQL compatibility.

### 14.11.2.29.1 Synopsis

```
CreateIndexStmt ::=
 'CREATE' IndexKeyTypeOpt 'INDEX' IfNotExists Identifier IndexTypeOpt 'ON'
 ↪ ' TableName '(' IndexPartSpecificationList ')' IndexOptionList
 ↪ IndexLockAndAlgorithmOpt
```

```
IndexKeyTypeOpt ::=
 ('UNIQUE' | 'SPATIAL' | 'FULLTEXT')?

IfNotExists ::=
 ('IF' 'NOT' 'EXISTS')?

IndexTypeOpt ::=
 IndexType?

IndexPartSpecificationList ::=
 IndexPartSpecification (',' IndexPartSpecification)*

IndexOptionList ::=
 IndexOption*

IndexLockAndAlgorithmOpt ::=
 (LockClause AlgorithmClause? | AlgorithmClause LockClause?)?

IndexType ::=
 ('USING' | 'TYPE') IndexTypeName

IndexPartSpecification ::=
 (ColumnName OptFieldLen | '(' Expression ')') Order

IndexOption ::=
 'KEY_BLOCK_SIZE' '='? LengthNum
| IndexType
| 'WITH' 'PARSER' Identifier
| 'COMMENT' stringLit
| IndexInvisible

IndexTypeName ::=
 'BTREE'
| 'HASH'
| 'RTREE'

ColumnName ::=
 Identifier ('.' Identifier ('.' Identifier)?)?

OptFieldLen ::=
 FieldLen?

IndexNameList ::=
 (Identifier | 'PRIMARY')? (',' (Identifier | 'PRIMARY'))*
```

```
KeyOrIndex ::=
 'Key' | 'Index'
```

### 14.11.2.29.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
 ↪ NOT NULL);
```

Query OK, 0 rows affected (0.10 sec)

```
mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
```

Query OK, 5 rows affected (0.02 sec)

Records: 5 Duplicates: 0 Warnings: 0

```
mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
```

```

 ↪ 3) |
| -TableFullScan_5 | 10000.00 | cop[tikv] | table:t1 | keep order:false
 ↪ , stats:pseudo |
```

```
+--
 ↪ -----+-----+-----+-----+
 ↪
3 rows in set (0.00 sec)
```

```
mysql> CREATE INDEX c1 ON t1 (c1);
```

Query OK, 0 rows affected (0.30 sec)

```
mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
```

```
+--
 ↪ -----+-----+-----+-----+
 ↪
| id | estRows | task | access object | operator
 ↪ | | | |
 ↪ info | | | |
```

You can drop an expression index in the same way as dropping an ordinary index:

```
DROP INDEX idx1 ON t1;
```

Expression index involves various kinds of expressions. To ensure correctness, only some fully tested functions are allowed for creating an expression index. This means that only these functions are allowed in expressions in a production environment. You can get these functions by querying the `tidb_allow_function_for_expression_index` variable. Currently, the allowed functions are as follows:

```
json_array, json_array_append, json_array_insert, json_contains,
↳ json_contains_path, json_depth, json_extract, json_insert, json_keys,
↳ json_length, json_merge_patch, json_merge_preserve, json_object,
↳ json_pretty, json_quote, json_remove, json_replace, json_search,
↳ json_set, json_storage_size, json_type, json_unquote, json_valid,
↳ lower, md5, reverse, tidb_shard, upper, vitess_hash
```

For the functions that are not included in the above list, those functions are not fully tested and not recommended for a production environment, which can be seen as experimental. Other expressions such as operators, `cast`, and `case when` are also seen as experimental and not recommended for production.

If you still want to use those expressions, you can make the following configuration in the [TiDB configuration file](#):

```
allow-expression-index = true
```

### Note:

An expression index cannot be created on a primary key.

The expression in an expression index cannot contain the following content:

- Volatile functions, such as `rand()` and `now()`.
- System variables and user variables.
- Subqueries.
- `AUTO_INCREMENT` column. You can remove this restriction by setting the value of `tidb_enable_auto_increment_in_generated` (system variable) to `true`.
- Window functions.
- ROW functions, such as `create table t (j json, key k (((j,j)))  
↳ );`.
- Aggregate functions.

An expression index implicitly takes up a name (for example, `_V$_{  
↳ index_name}_index_offset`). If you try to create a new expression

index with the name that a column has already had, an error occurs. In addition, if you add a new column with the same name, an error also occurs.

Make sure that the number of function parameters in the expression of an expression index is correct.

When the expression of an index contains a string-related function, affected by the returned type and the length, creating the expression index might fail. In this situation, you can use the `cast()` function to explicitly specify the returned type and the length. For example, to create an expression index based on the `repeat(a, 3)` expression, you need to modify this expression to `cast(repeat(a, 3) as char(20))`.

When the expression in a query statement matches the expression in an expression index, the optimizer can choose the expression index for the query. In some cases, the optimizer might not choose an expression index depending on statistics. In this situation, you can force the optimizer to select an expression index by using optimizer hints.

In the following examples, suppose that you create the expression index `idx` on the expression `lower(col1)`:

If the results of the query statement are the same expressions, the expression index applies. Take the following statement as an example:

```
SELECT lower(col1) FROM t;
```

If the same expression is included in the filtering conditions, the expression index applies. Take the following statements as an example:

```
SELECT * FROM t WHERE lower(col1) = "a";
SELECT * FROM t WHERE lower(col1) > "a";
SELECT * FROM t WHERE lower(col1) BETWEEN "a" AND "b";
SELECT * FROM t WHERE lower(col1) in ("a", "b");
SELECT * FROM t WHERE lower(col1) > "a" AND lower(col1) < "b";
SELECT * FROM t WHERE lower(col1) > "b" OR lower(col1) < "a";
```

When the queries are sorted by the same expression, the expression index applies. Take the following statement as an example:

```
SELECT * FROM t ORDER BY lower(col1);
```

If the same expression is included in the aggregate (`GROUP BY`) functions, the expression index applies. Take the following statements as an example:

```
SELECT max(lower(col1)) FROM t;
SELECT min(col1) FROM t GROUP BY lower(col1);
```

To see the expression corresponding to the expression index, execute `show index ↔`, or check the system tables `information_schema.tidb_indexes` and the table `information_schema.STATISTICS`. The `Expression` column in the output indicates the corresponded expression. For the non-expression indexes, the column shows `NULL`.

The cost of maintaining an expression index is higher than that of maintaining other indexes, because the value of the expression needs to be calculated whenever a row is inserted or updated. The value of the expression is already stored in the index, so this value does not require recalculation when the optimizer selects the expression index.

Therefore, when the query performance outweighs the insert and update performance, you can consider indexing the expressions.

Expression indexes have the same syntax and limitations as in MySQL. They are implemented by creating indexes on generated virtual columns that are invisible, so the supported expressions inherit all [limitations of virtual generated columns](#).

#### 14.11.2.29.4 Multi-valued index

##### **Warning:**

For the current version, this feature is still experimental and not recommended for production environments.

Multi-valued index is a kind of secondary index defined on an array column. In a normal index, one index record corresponds to one data record (1:1). In a multi-valued index, multiple index records correspond to one data record (N:1). Multi-valued indexes are used to index JSON arrays. For example, a multi-valued index defined on the `zipcode` field will generate one index record for each element in the `zipcode` array.

```
{
 "user": "Bob",
 "user_id": 31,
 "zipcode": [94477, 94536]
}
```

Create a multi-valued index

You can create a multi-valued index by using the `CAST(... AS ... ARRAY)` expression in the index definition, as creating an expression index.

```
mysql> CREATE TABLE customers (
 id BIGINT NOT NULL AUTO_INCREMENT PRIMARY KEY,
 name CHAR(10),
 custinfo JSON,
```

```
INDEX zips((CAST(custinfo->'$.zipcode' AS UNSIGNED ARRAY)))
);
```

You can define a multi-valued index as a unique index.

```
mysql> CREATE TABLE customers (
 id BIGINT NOT NULL AUTO_INCREMENT PRIMARY KEY,
 name CHAR(10),
 custinfo JSON,
 UNIQUE INDEX zips((CAST(custinfo->'$.zipcode' AS UNSIGNED ARRAY)))
);
```

When a multi-valued index is defined as a unique index, an error is reported if you try to insert duplicate data.

```
mysql> INSERT INTO customers VALUES (1, 'pingcap', '{"zipcode": [1,2]}');
Query OK, 1 row affected (0.01 sec)

mysql> INSERT INTO customers VALUES (1, 'pingcap', '{"zipcode": [2,3]}');
ERROR 1062 (23000): Duplicate entry '2' for key 'customers.zips'
```

The same record can have duplicate values, but when different records have duplicate values, an error is reported.

```
-- Insert succeeded
mysql> INSERT INTO t1 VALUES('[1,1,2]');
mysql> INSERT INTO t1 VALUES('[3,3,3,4,4,4]');

-- Insert failed
mysql> INSERT INTO t1 VALUES('[1,2]');
mysql> INSERT INTO t1 VALUES('[2,3]');
```

You can also define a multi-valued index as a composite index:

```
mysql> CREATE TABLE customers (
 id BIGINT NOT NULL AUTO_INCREMENT PRIMARY KEY,
 name CHAR(10),
 custinfo JSON,
 INDEX zips(name, (CAST(custinfo->'$.zipcode' AS UNSIGNED ARRAY)))
);
```

When a multi-valued index is defined as a composite index, the multi-valued part can appear in any position, but only once.

```
mysql> CREATE TABLE customers (
 id BIGINT NOT NULL AUTO_INCREMENT PRIMARY KEY,
 name CHAR(10),
```

```
custinfo JSON,
INDEX zips(name, (CAST(custinfo->'$.zipcode' AS UNSIGNED ARRAY)), (CAST(
 ↪ custinfo->'$.zipcode' AS UNSIGNED ARRAY)))
);
ERROR 1235 (42000): This version of TiDB doesn't yet support 'more than one
 ↪ multi-valued key part per index'.
```

The written data must exactly match the type defined by the multi-valued index; otherwise, the data write fails:

```
-- All elements in the zipcode field must be the UNSIGNED type.
mysql> INSERT INTO customers VALUES (1, 'pingcap', '{"zipcode": [-1]}');
ERROR 3752 (HY000): Value is out of range for expression index 'zips' at
 ↪ row 1

mysql> INSERT INTO customers VALUES (1, 'pingcap', '{"zipcode": ["1"]}');
 ↪ -- Incompatible with MySQL
ERROR 3903 (HY000): Invalid JSON value for CAST for expression index 'zips'

mysql> INSERT INTO customers VALUES (1, 'pingcap', '{"zipcode": [1]}');
Query OK, 1 row affected (0.00 sec)
```

Use a multi-valued index

See [Index Selection - Use multi-valued indexes](#) for more details.

Limitations

- For an empty JSON array, no corresponding index record is generated.
- The target type in `CAST(... AS ... ARRAY)` cannot be any of `BINARY`, `JSON`, `YEAR`, `FLOAT`, `DOUBLE`, and `DECIMAL`. The source type must be `JSON`.
- You cannot use a multi-valued index for sorting.
- You can only create a multi-valued index on a JSON array.
- A multi-valued index cannot be a primary key or a foreign key.
- The extra storage space used by a multi-valued index = the average number of array elements per row \* the space used by a normal secondary index.
- Compared with normal indexes, DML operations will modify more index records for multi-valued indexes, so multi-valued indexes will have a greater performance impact than normal indexes.
- Because multi-valued indexes are a special type of expression index, multi-valued indexes have the same limitations as expression indexes.

Compatibility with TiDB tools

Multi-valued index is an experimental feature. It has some known compatibility issues with TiDB tools or features:

- The **LOAD DATA** statement and **TiDB Lightning** do not support importing data into tables with multi-valued indexes.
- **DM** and **TiCDC** do not support migrating or replicating tables with multi-valued indexes.
- **sync-diff-inspector** does not support validating data for tables with multi-valued indexes.

#### 14.11.2.29.5 Invisible index

Invisible indexes are indexes that are ignored by the query optimizer:

```
CREATE TABLE t1 (c1 INT, c2 INT, UNIQUE(c2));
CREATE UNIQUE INDEX c1 ON t1 (c1) INVISIBLE;
```

For details, see **ALTER INDEX**.

#### 14.11.2.29.6 Associated system variables

The system variables associated with the **CREATE INDEX** statement are `tidb_ddl_enable_fast_reorg`, `tidb_ddl_reorg_worker_cnt`, `tidb_ddl_reorg_batch_size`, `tidb_enable_auto_increment_in_g`, and `tidb_ddl_reorg_priority`. Refer to **system variables** for details.

#### 14.11.2.29.7 MySQL compatibility

- TiDB supports parsing the **FULLTEXT** and **SPATIAL** syntax but does not support using the **FULLTEXT**, **HASH**, and **SPATIAL** indexes.
- Descending indexes are not supported (similar to MySQL 5.7).
- Adding the primary key of the **CLUSTERED** type to a table is not supported. For more details about the primary key of the **CLUSTERED** type, refer to **clustered index**.
- Expression indexes are incompatible with views. When a query is executed using a view, the expression index cannot be used at the same time.
- Expression indexes have compatibility issues with bindings. When the expression of an expression index has a constant, the binding created for the corresponding query expands its scope. For example, suppose that the expression in the expression index is `a+1`, and the corresponding query condition is `a+1 > 2`. In this case, the created binding is `a+? > ?`, which means that the query with the condition such as `a+2 > 2` is also forced to use the expression index and results in a poor execution plan. In addition, this also affects the baseline capturing and baseline evolution in SQL Plan Management (SPM).
- The data written with the multi-valued index must exactly match the defined data type. Otherwise, data writes fail. For details, see **Creat a multi-valued index**.

### 14.11.2.30 CREATE PLACEMENT POLICY

CREATE PLACEMENT POLICY is used to create a named placement policy that can later be assigned to tables, partitions, or database schemas.

#### 14.11.2.30.1 Synopsis

```
CreatePolicyStmt ::=
 "CREATE" "PLACEMENT" "POLICY" IfNotExists PolicyName PlacementOptionList

PolicyName ::=
 Identifier

PlacementOptionList ::=
 PlacementOption
| PlacementOptionList PlacementOption
| PlacementOptionList ',' PlacementOption

PlacementOption ::=
 CommonPlacementOption
| SugarPlacementOption
| AdvancedPlacementOption

CommonPlacementOption ::=
 "FOLLOWERS" EqOpt LengthNum

SugarPlacementOption ::=
 "PRIMARY_REGION" EqOpt stringLit
| "REGIONS" EqOpt stringLit
| "SCHEDULE" EqOpt stringLit

AdvancedPlacementOption ::=
 "LEARNERS" EqOpt LengthNum
| "CONSTRAINTS" EqOpt stringLit
| "LEADER_CONSTRAINTS" EqOpt stringLit
| "FOLLOWER_CONSTRAINTS" EqOpt stringLit
```

```
| "LEARNER_CONSTRAINTS" EqOpt stringLit
```

### 14.11.2.30.2 Examples

**Note:**

To know which regions are available in your cluster, see [SHOW PLACEMENT](#)  
 ↪ [LABELS](#).

If you do not see any available regions, your TiKV installation might not have labels set correctly.

```
CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us
 ↪ -west-1" FOLLOWERS=4;
CREATE TABLE t1 (a INT) PLACEMENT POLICY=p1;
SHOW CREATE PLACEMENT POLICY p1;
```

```
Query OK, 0 rows affected (0.08 sec)
```

```
Query OK, 0 rows affected (0.10 sec)
```

```
+-----+-----+
 ↪
| Policy | Create Policy
 ↪
 ↪ |
+-----+-----+
 ↪
| p1 | CREATE PLACEMENT POLICY `p1` PRIMARY_REGION="us-east-1" REGIONS="
 ↪ us-east-1,us-west-1" FOLLOWERS=4 |
+-----+-----+
 ↪
1 row in set (0.00 sec)
```

### 14.11.2.30.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.11.2.30.4 See also

- [Placement Rules in SQL](#)

- [SHOW PLACEMENT](#)
- [ALTER PLACEMENT POLICY](#)
- [DROP PLACEMENT POLICY](#)

### 14.11.2.31 CREATE RESOURCE GROUP

You can use the `CREATE RESOURCE GROUP` statement to create a resource group.

#### 14.11.2.31.1 Synopsis

```

CreateResourceGroupStmt:
 "CREATE" "RESOURCE" "GROUP" IfNotExists ResourceGroupName
 ↪ ResourceGroupOptionList

IfNotExists ::=
 ('IF' 'NOT' 'EXISTS')?

ResourceGroupName:
 Identifier

ResourceGroupOptionList:
 DirectResourceGroupOption
| ResourceGroupOptionList DirectResourceGroupOption
| ResourceGroupOptionList ',' DirectResourceGroupOption

DirectResourceGroupOption:
 "RU_PER_SEC" EqOpt stringLit
| "BURSTABLE"

```

The resource group name parameter (`ResourceGroupName`) must be globally unique.

TiDB supports the following `DirectResourceGroupOption`, where [Request Unit \(RU\)](#) is a unified abstraction unit in TiDB for CPU, IO, and other system resources.

| Option                  | Description                       | Example                                                                                                |
|-------------------------|-----------------------------------|--------------------------------------------------------------------------------------------------------|
| <code>RU_PER_SEC</code> | Rate of RU backfilling per second | <code>RU_PER_SEC = 500</code> indicates that this resource group is backfilled with 500 RUs per second |

If the `BURSTABLE` attribute is set, TiDB allows the corresponding resource group to use the available system resources when the quota is exceeded.

### Note:

The `CREATE RESOURCE GROUP` statement can only be executed when the global variable `tidb_enable_resource_control` is set to `ON`.

#### 14.11.2.31.2 Examples

Create two resource groups `rg1` and `rg2`.

```
mysql> DROP RESOURCE GROUP IF EXISTS rg1;
Query OK, 0 rows affected (0.22 sec)
mysql> CREATE RESOURCE GROUP IF NOT EXISTS rg1
 -> RU_PER_SEC = 100
 -> BURSTABLE;
Query OK, 0 rows affected (0.08 sec)
mysql> CREATE RESOURCE GROUP IF NOT EXISTS rg2
 -> RU_PER_SEC = 200;
Query OK, 0 rows affected (0.08 sec)
mysql> SELECT * FROM information_schema.resource_groups WHERE NAME = 'rg1'
 ↪ or NAME = 'rg2';
+-----+-----+-----+
| NAME | RU_PER_SEC | BURSTABLE |
+-----+-----+-----+
| rg1 | 100 | YES |
| rg2 | 200 | NO |
+-----+-----+-----+
2 rows in set (1.30 sec)
```

#### 14.11.2.31.3 MySQL compatibility

MySQL also supports `CREATE RESOURCE GROUP`. However, the acceptable parameters are different from that of TiDB so that they are not compatible.

#### 14.11.2.31.4 See also

- [DROP RESOURCE GROUP](#)
- [ALTER RESOURCE GROUP](#)
- [Request Unit \(RU\)](#)

#### 14.11.2.32 CREATE ROLE

This statement creates a new role, which can be assigned to users as part of role-based access control.

### 14.11.2.32.1 Synopsis

```
CreateRoleStmt ::=
 'CREATE' 'ROLE' IfNotExists RoleSpec (',' RoleSpec)*

IfNotExists ::=
 ('IF' 'NOT' 'EXISTS')?

RoleSpec ::=
 Rolename
```

### 14.11.2.32.2 Examples

Connect to TiDB as the root user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Create a new role `analyticsteam` and a new user `jennifer`:

```
CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Note that by default `jennifer` needs to execute `SET ROLE analyticsteam` in order to be able to use the privileges associated with the `analyticsteam` role:

```
SHOW GRANTS;
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@%' |
| GRANT 'analyticsteam'@%' TO 'jennifer'@%' |
+-----+
2 rows in set (0.00 sec)
```

```

SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@ '%' to database 'test'
SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

SHOW GRANTS;
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@ '%' |
| GRANT SELECT ON test.* TO 'jennifer'@ '%' |
| GRANT 'analyticsteam'@ '%' TO 'jennifer'@ '%' |
+-----+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+-----+
| Tables_in_test |
+-----+
| t1 |
+-----+
1 row in set (0.00 sec)

```

Connect to TiDB as the root user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

The statement `SET DEFAULT ROLE` can be used to associate the role `analyticsteam` to `jennifer`:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
Query OK, 0 rows affected (0.02 sec)
```

Connect to TiDB as the jennifer user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

After this, the user `jennifer` has the privileges associated with the role `analyticsteam` and `jennifer` does not have to execute the statement `SET ROLE`:

```

SHOW GRANTS;
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@ '%' |
| GRANT SELECT ON test.* TO 'jennifer'@ '%' |
| GRANT 'analyticsteam'@ '%' TO 'jennifer'@ '%' |
+-----+

```

```

+-----+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+-----+
| Tables_in_test |
+-----+
| t1 |
+-----+
1 row in set (0.00 sec)

```

### 14.11.2.32.3 MySQL compatibility

This statement is understood to be fully compatible with roles, which are a feature of MySQL 8.0. Any compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.32.4 See also

- [DROP ROLE](#)
- [GRANT <role>](#)
- [REVOKE <role>](#)
- [SET ROLE](#)
- [SET DEFAULT ROLE](#)

## 14.11.2.33 CREATE SEQUENCE

The `CREATE SEQUENCE` statement creates sequence objects in TiDB. The sequence is a database object that is on a par with the table and the View object. The sequence is used to generate serialized IDs in a customized way.

### 14.11.2.33.1 Synopsis

```

CreateSequenceStmt ::=
 'CREATE' 'SEQUENCE' IfNotExists TableName CreateSequenceOptionListOpt
 ↪ CreateTableOptionListOpt

IfNotExists ::=
 ('IF' 'NOT' 'EXISTS')?

TableName ::=
 Identifier ('.' Identifier)?

```

```
CreateSequenceOptionListOpt ::=
 SequenceOption*

SequenceOptionList ::=
 SequenceOption

SequenceOption ::=
 ('INCREMENT' ('='? | 'BY') | 'START' ('='? | 'WITH') | ('MINVALUE'
 ↪ | 'MAXVALUE' | 'CACHE') '='?) SignedNum
| 'NOMINVALUE'
| 'NO' ('MINVALUE' | 'MAXVALUE' | 'CACHE' | 'CYCLE')
| 'NOMAXVALUE'
| 'NOCACHE'
| 'CYCLE'
| 'NOCYCLE'
```

#### 14.11.2.33.2 Syntax

```
CREATE [TEMPORARY] SEQUENCE [IF NOT EXISTS] sequence_name
 [INCREMENT [BY | =] increment]
 [MINVALUE [=] minvalue | NO MINVALUE | NOMINVALUE]
 [MAXVALUE [=] maxvalue | NO MAXVALUE | NOMAXVALUE]
 [START [WITH | =] start]
 [CACHE [=] cache | NOCACHE | NO CACHE]
 [CYCLE | NOCYCLE | NO CYCLE]
 [table_options]
```

#### 14.11.2.33.3 Parameters

| Parameter              | Default value    | Description                                                                                                             |
|------------------------|------------------|-------------------------------------------------------------------------------------------------------------------------|
| <code>TEMPORARY</code> | <code>OFF</code> | <p>TiDB currently does not support the <code>TEMPORARY</code> option and provides only syntax compatibility for it.</p> |

|                             | Default |                                                                                                                          |
|-----------------------------|---------|--------------------------------------------------------------------------------------------------------------------------|
| Parameter                   | Value   | Description                                                                                                              |
| <code>INCREMENT</code><br>↪ |         | Specifies the increment of a sequence. Its positive or negative values can control the growth direction of the sequence. |

| Parameter                           | Default        | Description                       |
|-------------------------------------|----------------|-----------------------------------|
| <code>MINVALUE</code>               |                | Specifies                         |
| <code>↪ -9223372036854775807</code> |                |                                   |
|                                     | <code>↪</code> | min-                              |
|                                     |                | i-                                |
|                                     |                | mum                               |
|                                     |                | value                             |
|                                     |                | of a                              |
|                                     |                | se-                               |
|                                     |                | quence.                           |
|                                     |                | When                              |
|                                     |                | <code>INCREMENT</code>            |
|                                     | <code>↪</code> |                                   |
|                                     |                | <code>&gt; 0,</code>              |
|                                     |                | the                               |
|                                     |                | de-                               |
|                                     |                | fault                             |
|                                     |                | value                             |
|                                     |                | is 1.                             |
|                                     |                | When                              |
|                                     |                | <code>INCREMENT</code>            |
|                                     | <code>↪</code> |                                   |
|                                     |                | <code>&lt; 0,</code>              |
|                                     |                | the                               |
|                                     |                | de-                               |
|                                     |                | fault                             |
|                                     |                | value                             |
|                                     |                | is                                |
|                                     |                | <code>-9223372036854775807</code> |
|                                     | <code>↪</code> | .                                 |

| Parameter | Default value       | Description                                                                                                                                                                             |
|-----------|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAXVALUE  | 9223372036854775806 | Specifies the maximum value of a sequence. When INCREMENT $\rightarrow$ $> 0$ , the default value is 9223372036854775806. When INCREMENT $\rightarrow$ $< 0$ , the default value is -1. |

| Parameter             | Default value | Description                                                         |
|-----------------------|---------------|---------------------------------------------------------------------|
| <b>START MINVALUE</b> |               | Specifies the or initial value of a sequence. When <b>INCREMENT</b> |
|                       | $\rightarrow$ | $\rightarrow$ the                                                   |
|                       |               | or ini-                                                             |
| <b>MAXVALUE</b>       |               | value                                                               |
|                       | $\rightarrow$ | of a                                                                |
|                       |               | se-                                                                 |
|                       |               | quence.                                                             |
|                       |               | When                                                                |

| Parameter | Default value | Description |
|-----------|---------------|-------------|
|-----------|---------------|-------------|

#### 14.11.2.33.4 SEQUENCE function

You can control a sequence through the following expression functions:

- NEXTVAL or NEXT VALUE FOR

Essentially, both are the `nextval()` function that gets the next valid value of a sequence object. The parameter of the `nextval()` function is the `identifier` of the sequence.

- LASTVAL

This function gets the last used value of this session. If the value does not exist, `NULL` is used. The parameter of this function is the `identifier` of the sequence.

- SETVAL

This function sets the progression of the current value for a sequence. The first parameter of this function is the `identifier` of the sequence; the second parameter is `num`.

#### Note:

In the implementation of a sequence in TiDB, the `SETVAL` function cannot change the initial progression or cycle progression of this sequence. This function only returns the next valid value based on this progression.

#### 14.11.2.33.5 Examples

- Create a sequence object with the default parameter:

```
CREATE SEQUENCE seq;
```

```
Query OK, 0 rows affected (0.06 sec)
```

- Use the `nextval()` function to get the next value of the sequence object:

```
SELECT nextval(seq);
```

```
+-----+
| nextval(seq) |
+-----+
| 1 |
+-----+
1 row in set (0.02 sec)
```

- Use the `lastval()` function to get the value generated by the last call to a sequence object in this session:

```
SELECT lastval(seq);
```

```
+-----+
| lastval(seq) |
+-----+
| 1 |
+-----+
1 row in set (0.02 sec)
```

- Use the `setval()` function to set the current value (or the current position) of the sequence object:

```
SELECT setval(seq, 10);
```

```
+-----+
| setval(seq, 10) |
+-----+
| 10 |
+-----+
1 row in set (0.01 sec)
```

- You can also use the `next value for` syntax to get the next value of the sequence:

```
SELECT next value for seq;
```

```
+-----+
| next value for seq |
+-----+
| 11 |
+-----+
1 row in set (0.00 sec)
```

- Create a sequence object with default custom parameters:

```
CREATE SEQUENCE seq2 start 3 increment 2 minvalue 1 maxvalue 10 cache
↪ 3;
```

```
Query OK, 0 rows affected (0.01 sec)
```

- When the sequence object has not been used in this session, the `lastval()` function returns a `NULL` value.

```
SELECT lastval(seq2);
```

```
+-----+
| lastval(seq2) |
+-----+
| NULL |
+-----+
1 row in set (0.01 sec)
```

- The first valid value of the `nextval()` function for the sequence object is the value of `START` parameter.

```
SELECT nextval(seq2);
```

```
+-----+
| nextval(seq2) |
+-----+
| 3 |
+-----+
1 row in set (0.00 sec)
```

- Although the `setval()` function can change the current value of the sequence object, it cannot change the arithmetic progression rule for the next value.

```
SELECT setval(seq2, 6);
```

```
+-----+
| setval(seq2, 6) |
+-----+
| 6 |
+-----+
1 row in set (0.00 sec)
```

- When you use `nextval()` to get the next value, the next value will follow the arithmetic progression rule defined by the sequence.

```
SELECT next value for seq2;
```

```

+-----+
| next value for seq2 |
+-----+
| 7 |
+-----+
1 row in set (0.00 sec)

```

- You can use the next value of the sequence as the default value for the column, as in the following example.

```
CREATE table t(a int default next value for seq2);
```

```
Query OK, 0 rows affected (0.02 sec)
```

- In the following example, the value is not specified, so the default value of `seq2` is used.

```
INSERT into t values();
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SELECT * from t;
```

```

+-----+
| a |
+-----+
| 9 |
+-----+
1 row in set (0.00 sec)

```

- In the following example, the value is not specified, so the default value of `seq2` is used. But the next value of `seq2` is not within the range defined in the above example (`CREATE SEQUENCE seq2 start 3 increment 2 minvalue 1 maxvalue 10 ↪ cache 3;`), so an error is returned.

```
INSERT into t values();
```

```
ERROR 4135 (HY000): Sequence 'test.seq2' has run out
```

#### 14.11.2.33.6 MySQL compatibility

This statement is a TiDB extension. The implementation is modeled on sequences available in MariaDB.

Except for the `SETVAL` function, all other functions have the same *progressions* as MariaDB. Here “progression” means that the numbers in a sequence follow a certain arithmetic

progression rule defined by the sequence. Although you can use `SETVAL` to set the current value of a sequence, the subsequent values of the sequence still follow the original progression rule.

For example:

```
1, 3, 5, ... // The sequence starts from 1 and increments by 2.
select setval(seq, 6) // Sets the current value of a sequence to 6.
7, 9, 11, ... // Subsequent values still follow the progression rule.
```

In the `CYCLE` mode, the initial value of a sequence in the first round is the value of the `START` parameter, and the initial value in the subsequent rounds is the value of `MinValue` (`INCREMENT > 0`) or `MaxValue` (`INCREMENT < 0`).

### 14.11.2.34 CREATE TABLE LIKE

This statement copies the definition of an existing table, without copying any data.

#### 14.11.2.34.1 Synopsis

```
CreateTableLikeStmt ::=
 'CREATE' OptTemporary 'TABLE' IfNotExists TableName
 ↔ LikeTableWithOrWithoutParen OnCommitOpt

OptTemporary ::=
 ('TEMPORARY' | ('GLOBAL' 'TEMPORARY'))?

LikeTableWithOrWithoutParen ::=
 'LIKE' TableName
| '(' 'LIKE' TableName ')'

OnCommitOpt ::=
 ('ON' 'COMMIT' 'DELETE' 'ROWS')?
```

#### 14.11.2.34.2 Examples

```
mysql> CREATE TABLE t1 (a INT NOT NULL);
Query OK, 0 rows affected (0.13 sec)

mysql> INSERT INTO t1 VALUES (1),(2),(3),(4),(5);
```

```
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0
```

```
mysql> SELECT * FROM t1;
```

```
+----+
```

```
| a |
```

```
+----+
```

```
| 1 |
```

```
| 2 |
```

```
| 3 |
```

```
| 4 |
```

```
| 5 |
```

```
+----+
```

```
5 rows in set (0.00 sec)
```

```
mysql> CREATE TABLE t2 LIKE t1;
```

```
Query OK, 0 rows affected (0.10 sec)
```

```
mysql> SELECT * FROM t2;
```

```
Empty set (0.00 sec)
```

#### 14.11.2.34.3 Pre-split region

If the table to be copied is defined with the `PRE_SPLIT_REGIONS` attribute, the table created using the `CREATE TABLE LIKE` statement inherits this attribute, and the Region on the new table will be split. For details of `PRE_SPLIT_REGIONS`, see [CREATE TABLE Statement](#).

#### 14.11.2.34.4 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

#### 14.11.2.34.5 See also

- [CREATE TABLE](#)
- [SHOW CREATE TABLE](#)

#### 14.11.2.35 CREATE TABLE

This statement creates a new table in the currently selected database. It behaves similarly to the `CREATE TABLE` statement in MySQL.

### 14.11.2.35.1 Synopsis

|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------|
| <code>AUTO_RANDOM_BASE</code><br>↔ | Set the initial incremental part value of <code>auto_random</code> . This option can be considered as a part of the internal interface. Users can ignore this parameter | <code>AUTO_RANDOM_BASE</code><br>↔ =<br>0      |
| <code>CHARACTER SET</code><br>↔    | To specify the <b>character set</b> for the table                                                                                                                       | <code>CHARACTER SET</code><br>↔ =<br>'utf8mb4' |
| <code>COMMENT</code><br>↔          | The comment information                                                                                                                                                 | <code>COMMENT</code><br>↔ =<br>'comment info'  |

### Note:

The `split-table` configuration option is enabled by default. When it is enabled, a separate Region is created for each newly created table. For details, see [TiDB configuration file](#).

### 14.11.2.35.2 Examples

Creating a simple table and inserting one row:

```
CREATE TABLE t1 (a INT);
DESC t1;
SHOW CREATE TABLE t1\G
INSERT INTO t1 (a) VALUES (1);
SELECT * FROM t1;
```

```
mysql> drop table if exists t1;
Query OK, 0 rows affected (0.23 sec)

mysql> CREATE TABLE t1 (a int);
Query OK, 0 rows affected (0.09 sec)

mysql> DESC t1;
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
| a | int(11) | YES | | NULL | |
+-----+-----+-----+-----+-----+
1 row in set (0.00 sec)

mysql> SHOW CREATE TABLE t1\G
***** 1. row *****
 Table: t1
Create Table: CREATE TABLE `t1` (
 `a` int(11) DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
1 row in set (0.00 sec)

mysql> INSERT INTO t1 (a) VALUES (1);
Query OK, 1 row affected (0.03 sec)

mysql> SELECT * FROM t1;
+-----+
| a |
+-----+
| 1 |
+-----+
1 row in set (0.00 sec)
```

Dropping a table if it exists, and conditionally creating a table if it does not exist:

```
DROP TABLE IF EXISTS t1;
CREATE TABLE IF NOT EXISTS t1 (
 id BIGINT NOT NULL PRIMARY KEY auto_increment,
 b VARCHAR(200) NOT NULL
);
DESC t1;
```

```
mysql> DROP TABLE IF EXISTS t1;
Query OK, 0 rows affected (0.22 sec)
```

```
mysql> CREATE TABLE IF NOT EXISTS t1 (
 -> id BIGINT NOT NULL PRIMARY KEY auto_increment,
 -> b VARCHAR(200) NOT NULL
 ->);
```

Query OK, 0 rows affected (0.08 sec)

```
mysql> DESC t1;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
| id | bigint(20) | NO | PRI | NULL | auto_increment |
| b | varchar(200) | NO | | NULL | |
+-----+-----+-----+-----+-----+-----+
```

2 rows in set (0.00 sec)

### 14.11.2.35.3 MySQL compatibility

- All of the data types except spatial types are supported.
- FULLTEXT, HASH and SPATIAL indexes are not supported.
- For compatibility, the `index_col_name` attribute supports the length option with a maximum length limit of 3072 bytes by default. The length limit can be changed through the `max-index-length` configuration option. For details, see [TiDB configuration file](#).
- The `[ASC | DESC]` in `index_col_name` is currently parsed but ignored (MySQL 5.7 compatible behavior).
- The `COMMENT` attribute does not support the `WITH PARSER` option.
- TiDB supports 1017 columns in a single table by default and 4096 columns at most. The corresponding number limit in InnoDB is 1017 columns, and the hard limit in MySQL is 4096 columns. For details, see [TiDB Limitations](#).
- For partitioned tables, only Range, Hash and Range Columns (single column) are supported. For details, see [partitioned table](#).
- `CHECK` constraints are parsed but ignored (MySQL 5.7 compatible behavior). For details, see [Constraints](#).

### 14.11.2.35.4 See also

- [Data Types](#)
- [DROP TABLE](#)
- [CREATE TABLE LIKE](#)
- [SHOW CREATE TABLE](#)

### 14.11.2.36 CREATE USER

This statement creates a new user, specified with a password. In the MySQL privilege system, a user is the combination of a username and the host from which they are connecting from. Thus, it is possible to create a user 'newuser2'@'192.168.1.1' who is only able to connect from the IP address 192.168.1.1. It is also possible to have two users have the same user-portion, and different permissions as they login from different hosts.

#### 14.11.2.36.1 Synopsis

```

CreateUserStmt ::=
 'CREATE' 'USER' IfNotExists UserSpecList RequireClauseOpt
 ↪ ConnectionOptions PasswordOption LockOption AttributeOption
 ↪ ResourceGroupNameOption

IfNotExists ::=
 ('IF' 'NOT' 'EXISTS')?

UserSpecList ::=
 UserSpec (',' UserSpec)*

UserSpec ::=
 Username AuthOption

AuthOption ::=
 ('IDENTIFIED' ('BY' (AuthString | 'PASSWORD' HashString) | 'WITH'
 ↪ StringName ('BY' AuthString | 'AS' HashString)?))?

StringName ::=
 stringLit
 | Identifier

PasswordOption ::= ('PASSWORD' 'EXPIRE' ('DEFAULT' | 'NEVER' | 'INTERVAL'
 ↪ N 'DAY')? | 'PASSWORD' 'HISTORY' ('DEFAULT' | N) | 'PASSWORD' '
 ↪ REUSE' 'INTERVAL' ('DEFAULT' | N 'DAY') | 'FAILED_LOGIN_ATTEMPTS' N
 ↪ | 'PASSWORD_LOCK_TIME' (N | 'UNBOUNDED')) *

LockOption ::= ('ACCOUNT' 'LOCK' | 'ACCOUNT' 'UNLOCK')?

AttributeOption ::= ('COMMENT' CommentString | 'ATTRIBUTE' AttributeString
 ↪)?

ResourceGroupNameOption ::= ('RESOURCE' 'GROUP' Identifier)?

```

#### 14.11.2.36.2 Examples

Create a user with the newuserpassword password.

```
mysql> CREATE USER 'newuser' IDENTIFIED BY 'newuserpassword';
Query OK, 1 row affected (0.04 sec)
```

Create a user who can only log in to 192.168.1.1.

```
mysql> CREATE USER 'newuser2'@'192.168.1.1' IDENTIFIED BY 'newuserpassword'
↪ ;
Query OK, 1 row affected (0.02 sec)
```

Create a user who is enforced to log in using TLS connection.

```
CREATE USER 'newuser3'@'%' IDENTIFIED BY 'newuserpassword' REQUIRE SSL;
Query OK, 1 row affected (0.02 sec)
```

Create a user who is required to use X.509 certificate at login.

```
CREATE USER 'newuser4'@'%' IDENTIFIED BY 'newuserpassword' REQUIRE ISSUER '
↪ /C=US/ST=California/L=San Francisco/O=PingCAP';
Query OK, 1 row affected (0.02 sec)
```

Create a user who is locked upon creation.

```
CREATE USER 'newuser5'@'%' ACCOUNT LOCK;
```

```
Query OK, 1 row affected (0.02 sec)
```

Create a user with a comment.

```
CREATE USER 'newuser6'@'%' COMMENT 'This user is created only for test';
SELECT * FROM information_schema.user_attributes;
```

```
+-----+-----+-----+-----+
| USER | HOST | ATTRIBUTE |
+-----+-----+-----+-----+
| newuser6 | % | {"comment": "This user is created only for test"} |
+-----+-----+-----+-----+
1 rows in set (0.00 sec)
```

Create a user with an email attribute.

```
CREATE USER 'newuser7'@'%' ATTRIBUTE '{"email": "user@pingcap.com"}';
SELECT * FROM information_schema.user_attributes;
```

```
+-----+-----+-----+-----+
| USER | HOST | ATTRIBUTE |
+-----+-----+-----+-----+
```

```
| newuser7 | % | {"email": "user@pingcap.com"} |
+-----+-----+-----+
1 rows in set (0.00 sec)
```

Create a user who is not allowed to reuse the last 5 passwords:

```
CREATE USER 'newuser8'@'%' PASSWORD HISTORY 5;
```

```
Query OK, 1 row affected (0.02 sec)
```

Create a user whose password is manually expired:

```
CREATE USER 'newuser9'@'%' PASSWORD EXPIRE;
```

```
Query OK, 1 row affected (0.02 sec)
```

Create a user that uses the resource group rg1.

```
CREATE USER 'newuser7'@'%' RESOURCE GROUP rg1;
SELECT USER, HOST, USER_ATTRIBUTES FROM MYSQL.USER WHERE USER='newuser7';
```

```
+-----+-----+-----+
| USER | HOST | USER_ATTRIBUTES |
+-----+-----+-----+
| newuser7 | % | {"resource_group": "rg1"} |
+-----+-----+-----+
1 rows in set (0.00 sec)
```

### 14.11.2.36.3 MySQL compatibility

The following CREATE USER options are not yet supported by TiDB, and will be parsed but ignored:

- TiDB does not support WITH MAX\_QUERIES\_PER\_HOUR, WITH MAX\_UPDATES\_PER\_HOUR, and WITH MAX\_USER\_CONNECTIONS options.
- TiDB does not support the DEFAULT ROLE option.
- TiDB does not support PASSWORD EXPIRE, PASSWORD HISTORY or other options related to password.

### 14.11.2.36.4 See also

- [Security Compatibility with MySQL](#)
- [Privilege Management](#)
- [DROP USER](#)
- [SHOW CREATE USER](#)
- [ALTER USER](#)

### 14.11.2.37 CREATE VIEW

The `CREATE VIEW` statement saves a `SELECT` statement as a queryable object, similar to a table. Views in TiDB are non-materialized. This means that as a view is queried, TiDB will internally rewrite the query to combine the view definition with the SQL query.

#### 14.11.2.37.1 Synopsis

```
CreateViewStmt ::=
 'CREATE' OrReplace ViewAlgorithm ViewDefiner ViewSQLSecurity 'VIEW'
 ↪ ViewName ViewFieldList 'AS' CreateViewSelectOpt ViewCheckOption

OrReplace ::=
 ('OR' 'REPLACE')?

ViewAlgorithm ::=
 ('ALGORITHM' '=' ('UNDEFINED' | 'MERGE' | 'TEMPTABLE'))?

ViewDefiner ::=
 ('DEFINER' '=' Username)?

ViewSQLSecurity ::=
 ('SQL' 'SECURITY' ('DEFINER' | 'INVOKER'))?

ViewName ::= TableName

ViewFieldList ::=
 ('(' Identifier (',' Identifier)* ')')?

ViewCheckOption ::=
 ('WITH' ('CASCADED' | 'LOCAL') 'CHECK' 'OPTION')?
```

#### 14.11.2.37.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
 ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> CREATE VIEW v1 AS SELECT * FROM t1 WHERE c1 > 2;
Query OK, 0 rows affected (0.11 sec)
```

```
mysql> SELECT * FROM t1;
+----+-----+
| id | c1 |
+----+-----+
1	1
2	2
3	3
4	4
5	5
+----+-----+
5 rows in set (0.00 sec)

mysql> SELECT * FROM v1;
+----+-----+
| id | c1 |
+----+-----+
3	3
4	4
5	5
+----+-----+
3 rows in set (0.00 sec)

mysql> INSERT INTO t1 (c1) VALUES (6);
Query OK, 1 row affected (0.01 sec)

mysql> SELECT * FROM v1;
+----+-----+
| id | c1 |
+----+-----+
3	3
4	4
5	5
6	6
+----+-----+
4 rows in set (0.00 sec)

mysql> INSERT INTO v1 (c1) VALUES (7);
ERROR 1105 (HY000): insert into view v1 is not supported now.
```

### 14.11.2.37.3 MySQL compatibility

- Currently, any view in TiDB cannot be inserted or updated (that is, `INSERT VIEW` and `UPDATE VIEW` are not supported). `WITH CHECK OPTION` is only syntactically compatible but does not take effect.

- Currently, the view in TiDB does not support ALTER VIEW, but you can use CREATE ↪ OR REPLACE instead.
- Currently, the ALGORITHM field is only syntactically compatible in TiDB but does not take effect. TiDB currently only supports the MERGE algorithm.

#### 14.11.2.37.4 See also

- DROP VIEW
- CREATE TABLE
- SHOW CREATE TABLE
- DROP TABLE

### 14.11.2.38 DEALLOCATE

The DEALLOCATE statement provides an SQL interface to server-side prepared statements.

#### 14.11.2.38.1 Synopsis

```
DeallocateStmt ::=
 DeallocateSym 'PREPARE' Identifier

DeallocateSym ::=
 'DEALLOCATE'
| 'DROP'

Identifier ::=
 identifier
| UnReservedKeyword
| NotKeywordToken
| TiDBKeyword
```

#### 14.11.2.38.2 Examples

```
mysql> PREPARE mystmt FROM 'SELECT ? as num FROM DUAL';
Query OK, 0 rows affected (0.00 sec)

mysql> SET @number = 5;
Query OK, 0 rows affected (0.00 sec)

mysql> EXECUTE mystmt USING @number;
+-----+
| num |
+-----+
| 5 |
```

```
+-----+
1 row in set (0.00 sec)

mysql> DEALLOCATE PREPARE mystmt;
Query OK, 0 rows affected (0.00 sec)
```

### 14.11.2.38.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.38.4 See also

- [PREPARE](#)
- [EXECUTE](#)

## 14.11.2.39 DELETE

The DELETE statement removes rows from a specified table.

### 14.11.2.39.1 Synopsis

```
DeleteFromStmt ::=
 'DELETE' TableOptimizerHints PriorityOpt QuickOptional IgnoreOptional (
 ↪ 'FROM' (TableName TableAsNameOpt IndexHintListOpt
 ↪ WhereClauseOptional OrderByOptional LimitClause |
 ↪ TableAliasRefList 'USING' TableRefs WhereClauseOptional) |
 ↪ TableAliasRefList 'FROM' TableRefs WhereClauseOptional)
```

### 14.11.2.39.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
 ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+-----+-----+
| id | c1 |
+-----+-----+
| 1 | 1 |
```

```
2	2
3	3
4	4
5	5
+----+----+
5 rows in set (0.00 sec)

mysql> DELETE FROM t1 WHERE id = 4;
Query OK, 1 row affected (0.02 sec)

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
1	1
2	2
3	3
5	5
+----+----+
4 rows in set (0.00 sec)
```

### 14.11.2.39.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.39.4 See also

- [INSERT](#)
- [SELECT](#)
- [UPDATE](#)
- [REPLACE](#)

### 14.11.2.40 DESC

This statement is an alias to [EXPLAIN](#). It is included for compatibility with MySQL.

### 14.11.2.41 DESCRIBE

This statement is an alias to [EXPLAIN](#). It is included for compatibility with MySQL.

### 14.11.2.42 DO

DO executes the expressions but does not return any results. In most cases, DO is equivalent to `SELECT expr, ...` that does not return a result.

**Note:**

DO only executes expressions. It cannot be used in all cases where SELECT can be used. For example, DO id FROM t1 is invalid because it references a table.

In MySQL, a common use case is to execute stored procedure or trigger. Since TiDB does not provide stored procedure or trigger, this function has a limited use.

#### 14.11.2.42.1 Synopsis

```
DoStmt ::= 'DO' ExpressionList

ExpressionList ::=
 Expression (',' Expression) *

Expression ::=
 (singleAtIdentifier assignmentEq | 'NOT' | Expression (logOr | 'XOR' |
 ↪ logAnd)) Expression
| 'MATCH' '(' ColumnNameList ')' 'AGAINST' '(' BitExpr
 ↪ FulltextSearchModifierOpt ')'
| PredicateExpr (IsOrNotOp 'NULL' | CompareOp ((singleAtIdentifier
 ↪ assignmentEq) ? PredicateExpr | AnyOrAll SubSelect)) * (IsOrNotOp (
 ↪ trueKwd | falseKwd | 'UNKNOWN')) ?
```

#### 14.11.2.42.2 Examples

This SELECT statement pauses, but also produces a result set.

```
mysql> SELECT SLEEP(5);
+-----+
| SLEEP(5) |
+-----+
| 0 |
+-----+
1 row in set (5.00 sec)
```

DO, on the other hand, pauses without producing a result set.

```
mysql> DO SLEEP(5);
Query OK, 0 rows affected (5.00 sec)

mysql> DO SLEEP(1), SLEEP(1.5);
```

```
Query OK, 0 rows affected (2.50 sec)
```

### 14.11.2.42.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.42.4 See also

- [SELECT](#)

## 14.11.2.43 DROP [GLOBAL|SESSION] BINDING

This statement removes a binding from a specific SQL statement. Bindings can be used to inject a hint into a statement without requiring changes to the underlying query.

A BINDING can be on either a GLOBAL or SESSION basis. The default is SESSION.

### 14.11.2.43.1 Synopsis

```
DropBindingStmt ::=
 'DROP' GlobalScope 'BINDING' 'FOR' (BindableStmt ('USING' BindableStmt
 ↔)?
 | 'SQL' 'DIGEST' SqlDigest)

GlobalScope ::=
 ('GLOBAL' | 'SESSION')?

BindableStmt ::=
 (SelectStmt | UpdateStmt | InsertIntoStmt | ReplaceIntoStmt |
 ↔ DeleteStmt)
```

### 14.11.2.43.2 Examples

You can remove a binding according to a SQL statement or `sql_digest`.

The following example shows how to remove a binding according to a SQL statement.

```
mysql> CREATE TABLE t1 (
 -> id INT NOT NULL PRIMARY KEY auto_increment,
 -> b INT NOT NULL,
 -> pad VARBINARY(255),
 -> INDEX(b)
 ->);
Query OK, 0 rows affected (0.07 sec)
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
↳ FROM dual;
```

```
Query OK, 1 row affected (0.01 sec)
Records: 1 Duplicates: 0 Warnings: 0
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
↳ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
```

```
Query OK, 1 row affected (0.00 sec)
Records: 1 Duplicates: 0 Warnings: 0
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
↳ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
```

```
Query OK, 8 rows affected (0.00 sec)
Records: 8 Duplicates: 0 Warnings: 0
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
↳ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
```

```
Query OK, 1000 rows affected (0.04 sec)
Records: 1000 Duplicates: 0 Warnings: 0
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
↳ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
```

```
Query OK, 100000 rows affected (1.74 sec)
Records: 100000 Duplicates: 0 Warnings: 0
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
↳ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
```

```
Query OK, 100000 rows affected (2.15 sec)
Records: 100000 Duplicates: 0 Warnings: 0
```

```
mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
↳ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
```

```
Query OK, 100000 rows affected (2.64 sec)
Records: 100000 Duplicates: 0 Warnings: 0
```

```
mysql> SELECT SLEEP(1);
```

```
+-----+
| SLEEP(1) |
+-----+
| 0 |
+-----+
```

```
1 row in set (1.00 sec)
```

```
mysql> ANALYZE TABLE t1;
```

Query OK, 0 rows affected (1.33 sec)

```
mysql> EXPLAIN ANALYZE SELECT * FROM t1 WHERE b = 123;
```

## 14.11.2.44 DROP COLUMN

This statement drops a column from a specified table. `DROP COLUMN` is online in TiDB, which means that it does not block read or write operations.

### 14.11.2.44.1 Synopsis

```
AlterTableStmt
 ::= 'ALTER' 'IGNORE'? 'TABLE' TableName DropColumnSpec (','
 ↪ DropColumnSpec)*

DropColumnSpec
 ::= 'DROP' 'COLUMN'? 'IF EXISTS'? ColumnName ('RESTRICT' | 'CASCADE
 ↪ ')?

ColumnName
 ::= Identifier ('.' Identifier ('.' Identifier)?)?
```

### 14.11.2.44.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, col1
 ↪ INT NOT NULL, col2 INT NOT NULL);
Query OK, 0 rows affected (0.12 sec)
```

```
mysql> INSERT INTO t1 (col1,col2) VALUES (1,1),(2,2),(3,3),(4,4),(5,5);
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0
```

```
mysql> SELECT * FROM t1;
```

```
+----+-----+-----+
| id | col1 | col2 |
+----+-----+-----+
1	1	1
2	2	2
3	3	3
4	4	4
5	5	5
+----+-----+-----+
```

```
5 rows in set (0.01 sec)
```

```
mysql> ALTER TABLE t1 DROP COLUMN col1, DROP COLUMN col2;
ERROR 1105 (HY000): can't run multi schema change
```

```
mysql> SELECT * FROM t1;
```

```
+----+-----+-----+
| id | col1 | col2 |
```

```
+----+-----+-----+
1	1	1
2	2	2
3	3	3
4	4	4
5	5	5
+----+-----+-----+
5 rows in set (0.00 sec)

mysql> ALTER TABLE t1 DROP COLUMN col1;
Query OK, 0 rows affected (0.27 sec)

mysql> SELECT * FROM t1;
+----+-----+
| id | col2 |
+----+-----+
1	1
2	2
3	3
4	4
5	5
+----+-----+
5 rows in set (0.00 sec)
```

#### 14.11.2.44.3 MySQL compatibility

- Dropping primary key columns or columns covered by the composite index is not supported.

#### 14.11.2.44.4 See also

- [ADD COLUMN](#)
- [SHOW CREATE TABLE](#)
- [CREATE TABLE](#)

#### 14.11.2.45 DROP DATABASE

The `DROP DATABASE` statement permanently removes a specified database schema, and all of the tables and views that were created inside. User privileges that are associated with the dropped database remain unaffected.

### 14.11.2.45.1 Synopsis

```
DropDatabaseStmt ::=
 'DROP' 'DATABASE' IfExists DBName

IfExists ::= ('IF' 'EXISTS')?
```

### 14.11.2.45.2 Examples

```
mysql> SHOW DATABASES;
+-----+
| Database |
+-----+
| INFORMATION_SCHEMA |
| PERFORMANCE_SCHEMA |
| mysql |
| test |
+-----+
4 rows in set (0.00 sec)

mysql> DROP DATABASE test;
Query OK, 0 rows affected (0.25 sec)

mysql> SHOW DATABASES;
+-----+
| Database |
+-----+
| INFORMATION_SCHEMA |
| PERFORMANCE_SCHEMA |
| mysql |
+-----+
3 rows in set (0.00 sec)
```

### 14.11.2.45.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.45.4 See also

- [CREATE DATABASE](#)
- [ALTER DATABASE](#)

### 14.11.2.46 DROP INDEX

This statement removes an index from a specified table, marking space as free in TiKV.

#### 14.11.2.46.1 Synopsis

```
DropIndexStmt ::=
 "DROP" "INDEX" IfExists Identifier "ON" TableName
 ↪ IndexLockAndAlgorithmOpt

IfExists ::=
 ('IF' 'EXISTS')?

IndexLockAndAlgorithmOpt ::=
 (LockClause AlgorithmClause? | AlgorithmClause LockClause?)?
```

#### 14.11.2.46.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
 ↪ NOT NULL);
Query OK, 0 rows affected (0.10 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
+---
 ↪ -----+-----+-----+-----+
 ↪
| id | estRows | task | access object | operator info
 ↪ | | | |
+---
 ↪ -----+-----+-----+-----+
 ↪
| TableReader_7 | 10.00 | root | | data:Selection_6
 ↪ | | | |
| -Selection_6 | 10.00 | cop[tikv] | | eq(test.t1.c1,
 ↪ | | | | eq(3)
| -TableFullScan_5 | 10000.00 | cop[tikv] | table:t1 | keep order:false
 ↪ | | | | , stats:pseudo |
+---
 ↪ -----+-----+-----+-----+
 ↪
3 rows in set (0.00 sec)
```

```
mysql> CREATE INDEX c1 ON t1 (c1);
Query OK, 0 rows affected (0.30 sec)

mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
+---+
↪ -----+-----+-----+-----+
↪
| id | estRows | task | access object | operator
↪ info
+---+
↪ -----+-----+-----+-----+
↪
| IndexReader_6 | 0.01 | root | | index:
↪ IndexRangeScan_5
| -IndexRangeScan_5 | 0.01 | cop[tikv] | table:t1, index:c1(c1) | range
↪ :[3,3], keep order:false, stats:pseudo |
+---+
↪ -----+-----+-----+-----+
↪
2 rows in set (0.00 sec)

mysql> DROP INDEX c1 ON t1;
Query OK, 0 rows affected (0.30 sec)
```

### 14.11.2.46.3 MySQL compatibility

- Dropping the primary key of the CLUSTERED type is not supported. For more details about the primary key of the CLUSTERED type, refer to [clustered index](#).

### 14.11.2.46.4 See also

- [SHOW INDEX](#)
- [CREATE INDEX](#)
- [ADD INDEX](#)
- [RENAME INDEX](#)
- [ALTER INDEX](#)

### 14.11.2.47 DROP PLACEMENT POLICY

DROP PLACEMENT POLICY is used to drop a previously created placement policy.

### 14.11.2.47.1 Synopsis

```
DropPolicyStmt ::=
 "DROP" "PLACEMENT" "POLICY" IfExists PolicyName

PolicyName ::=
 Identifier
```

### 14.11.2.47.2 Examples

Placement policies can only be dropped when they are not referenced by any tables or partitions.

```
CREATE PLACEMENT POLICY p1 FOLLOWERS=4;
CREATE TABLE t1 (a INT PRIMARY KEY) PLACEMENT POLICY=p1;
DROP PLACEMENT POLICY p1; -- This statement fails because the placement
 ↪ policy p1 is referenced.

-- Finds which tables and partitions reference the placement policy.
SELECT table_schema, table_name FROM information_schema.tables WHERE
 ↪ tidb_placement_policy_name='p1';
SELECT table_schema, table_name FROM information_schema.partitions WHERE
 ↪ tidb_placement_policy_name='p1';

ALTER TABLE t1 PLACEMENT POLICY=default; -- Removes the placement policy
 ↪ from t1.
DROP PLACEMENT POLICY p1; -- Succeeds.
```

Query OK, 0 rows affected (0.10 sec)

Query OK, 0 rows affected (0.11 sec)

ERROR 8241 (HY000): Placement policy 'p1' is still in use

```
+-----+-----+
| table_schema | table_name |
+-----+-----+
| test | t1 |
+-----+-----+
```

1 row in set (0.00 sec)

Empty set (0.01 sec)

Query OK, 0 rows affected (0.08 sec)

Query OK, 0 rows affected (0.21 sec)

### 14.11.2.47.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.11.2.47.4 See also

- [Placement Rules in SQL](#)
- [SHOW PLACEMENT](#)
- [CREATE PLACEMENT POLICY](#)
- [ALTER PLACEMENT POLICY](#)

## 14.11.2.48 DROP RESOURCE GROUP

You can use the `DROP RESOURCE GROUP` statement to drop a resource group.

### 14.11.2.48.1 Synopsis

```
DropResourceGroupStmt:
 "DROP" "RESOURCE" "GROUP" IfExists ResourceGroupName

IfExists ::=
 ('IF' 'EXISTS')?

ResourceGroupName:
 Identifier
```

#### Note:

The `DROP RESOURCE GROUP` statement can only be executed when the global variable `tidb_enable_resource_control` is set to `ON`.

### 14.11.2.48.2 Examples

Drop a resource group named `rg1`.

```
mysql> DROP RESOURCE GROUP IF EXISTS rg1;
Query OK, 0 rows affected (0.22 sec)
mysql> CREATE RESOURCE GROUP IF NOT EXISTS rg1 RU_PER_SEC = 500 BURSTABLE;
Query OK, 0 rows affected (0.08 sec)
mysql> SELECT * FROM information_schema.resource_groups WHERE NAME = 'rg1';
+-----+-----+-----+
| NAME | RU_PER_SEC | BURSTABLE |
+-----+-----+-----+
```

```

| rg1 | 500 | YES |
+-----+-----+-----+
1 row in set (0.01 sec)

mysql> DROP RESOURCE GROUP IF EXISTS rg1;
Query OK, 1 rows affected (0.09 sec)

mysql> SELECT * FROM information_schema.resource_groups WHERE NAME ='rg1';
Empty set (0.00 sec)

```

### 14.11.2.48.3 MySQL compatibility

MySQL also supports `DROP RESOURCE GROUP`, but TiDB does not support the `FORCE` parameter.

### 14.11.2.48.4 See also

- [ALTER RESOURCE GROUP](#)
- [CREATE RESOURCE GROUP](#)
- [Request Unit \(RU\)](#)

## 14.11.2.49 DROP ROLE

This statement removes a role, that was previously created with `CREATE ROLE`.

### 14.11.2.49.1 Synopsis

```

DropRoleStmt ::=
 'DROP' 'ROLE' ('IF' 'EXISTS')? RolenameList

RolenameList ::=
 Rolename (',' Rolename)*

```

### 14.11.2.49.2 Examples

Connect to TiDB as the root user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Create a new role `analyticsteam` and a new user `jennifer`:

```

CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

GRANT SELECT ON test.* TO analyticsteam;

```

```
Query OK, 0 rows affected (0.02 sec)
```

```
CREATE USER jennifer;
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
GRANT analyticsteam TO jennifer;
```

```
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the jennifer user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Note that by default jennifer needs to execute SET ROLE analyticsteam in order to be able to use the privileges associated with the analyticsteam role:

```
SHOW GRANTS;
```

```
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
2 rows in set (0.00 sec)
```

```
SHOW TABLES in test;
```

```
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
```

```
SET ROLE analyticsteam;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
SHOW GRANTS;
```

```
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT SELECT ON test.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
3 rows in set (0.00 sec)
```

```
SHOW TABLES IN test;
```

```
+-----+
| Tables_in_test |
+-----+
| t1 |
+-----+
1 row in set (0.00 sec)
```

Connect to TiDB as the root user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

The statement `SET DEFAULT ROLE` can be used to associate the role `analyticsteam` to `jennifer`:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
Query OK, 0 rows affected (0.02 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

After this, the user `jennifer` has the privileges associated with the role `analyticsteam` and `jennifer` does not have to execute the statement `SET ROLE`:

```
SHOW GRANTS;
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT SELECT ON test.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+-----+
| Tables_in_test |
+-----+
| t1 |
+-----+
1 row in set (0.00 sec)
```

Connect to TiDB as the root user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Drop the role for the `analyticsteam`:

```
DROP ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)
```

`jennifer` no longer has the default role of `analyticsteam` associated, nor can set the role to `analyticsteam`.

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Show the privileges of jennifer:

```
SHOW GRANTS;
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
+-----+
1 row in set (0.00 sec)

SET ROLE analyticsteam;
ERROR 3530 (HY000): `analyticsteam`@`%` is is not granted to jennifer@%
```

### 14.11.2.49.3 MySQL compatibility

This statement is understood to be fully compatible with roles, which are a feature of MySQL 8.0. Any compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.49.4 See also

- [CREATE ROLE](#)
- [GRANT <role>](#)
- [REVOKE <role>](#)
- [SET ROLE](#)
- [SET DEFAULT ROLE](#)
  
- [Role-Based Access Control](#)

### 14.11.2.50 DROP SEQUENCE

The DROP SEQUENCE statement drops the sequence object in TiDB.

#### 14.11.2.50.1 Synopsis

```
DropSequenceStmt ::=
 'DROP' 'SEQUENCE' IfExists TableNameList

IfExists ::= ('IF' 'EXISTS')?

TableNameList ::=
 TableName (',' TableName)*
```

```
TableName ::=
 Identifier ('.' Identifier)?
```

#### 14.11.2.50.2 Examples

```
DROP SEQUENCE seq;
```

```
Query OK, 0 rows affected (0.10 sec)
```

```
DROP SEQUENCE seq, seq2;
```

```
Query OK, 0 rows affected (0.03 sec)
```

#### 14.11.2.50.3 MySQL compatibility

This statement is a TiDB extension. The implementation is modeled on sequences available in MariaDB.

#### 14.11.2.50.4 See also

- [CREATE SEQUENCE](#)
- [SHOW CREATE SEQUENCE](#)

#### 14.11.2.51 DROP STATS

The `DROP STATS` statement is used to delete the statistics of the selected table from the selected database.

##### 14.11.2.51.1 Synopsis

```
DropStatsStmt ::=
 'DROP' 'STATS' TableNameList

TableNameList ::=
 TableName (',' TableName) *

TableName ::=
 Identifier ('.' Identifier)?
```

### 14.11.2.51.2 Examples

```
CREATE TABLE t(a INT);
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
SHOW STATS_META WHERE db_name='test' and table_name='t';
```

```
+--
 ↪ -----+-----+-----+-----+-----+-----+
 ↪
 | Db_name | Table_name | Partition_name | Update_time | Modify_count |
 ↪ Row_count |
+--
 ↪ -----+-----+-----+-----+-----+-----+
 ↪
 | test | t | | 2020-05-25 20:34:33 | 0 |
 ↪ 0 |
+--
 ↪ -----+-----+-----+-----+-----+-----+
 ↪
 1 row in set (0.00 sec)
```

```
DROP STATS t;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
SHOW STATS_META WHERE db_name='test' and table_name='t';
```

```
Empty set (0.00 sec)
```

### 14.11.2.51.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.11.2.51.4 See also

- [Introduction to Statistics](#)

### 14.11.2.52 DROP TABLE

This statement drops a table from the currently selected database. An error is returned if the table does not exist, unless the `IF EXISTS` modifier is used.

### 14.11.2.52.1 Synopsis

```
DropTableStmt ::=
 'DROP' OptTemporary TableOrTables IfExists TableNameList
 ↪ RestrictOrCascadeOpt

OptTemporary ::=
 ('TEMPORARY' | ('GLOBAL' 'TEMPORARY'))?

TableOrTables ::=
 'TABLE'
| 'TABLES'

TableNameList ::=
 TableName (',' TableName)*
```

### 14.11.2.52.2 Drop temporary tables

You can use the following syntax to drop ordinary tables and temporary tables:

- Use `DROP TEMPORARY TABLE` to drop local temporary tables.
- Use `DROP GLOBAL TEMPORARY TABLE` to drop global temporary tables.
- Use `DROP TABLE` to drop ordinary tables or temporary tables.

### 14.11.2.52.3 Examples

```
mysql> CREATE TABLE t1 (a INT);
Query OK, 0 rows affected (0.11 sec)

mysql> DROP TABLE t1;
Query OK, 0 rows affected (0.22 sec)

mysql> DROP TABLE table_not_exists;
ERROR 1051 (42S02): Unknown table 'test.table_not_exists'

mysql> DROP TABLE IF EXISTS table_not_exists;
Query OK, 0 rows affected, 1 warning (0.01 sec)

mysql> SHOW WARNINGS;
+-----+-----+-----+-----+
| Level | Code | Message |
+-----+-----+-----+-----+
| Note | 1051 | Unknown table 'test.table_not_exists' |
+-----+-----+-----+-----+
1 row in set (0.01 sec)
```

```
mysql> CREATE VIEW v1 AS SELECT 1;
Query OK, 0 rows affected (0.10 sec)

mysql> DROP TABLE v1;
Query OK, 0 rows affected (0.23 sec)
```

#### 14.11.2.52.4 MySQL compatibility

Currently, RESTRICT and CASCADE are only supported syntactically.

#### 14.11.2.52.5 See also

- [CREATE TABLE](#)

### 14.11.2.53 DROP USER

This statement removes a user from the TiDB system database. The optional keyword IF EXISTS can be used to silence an error if the user does not exist. This statement requires the CREATE USER privilege.

#### 14.11.2.53.1 Synopsis

```
DropUserStmt ::=
 'DROP' 'USER' ('IF' 'EXISTS')? UsernameList

Username ::=
 StringName ('@' StringName | singleAtIdentifier)? | 'CURRENT_USER'
 ↪ OptionalBraces
```

#### 14.11.2.53.2 Examples

```
mysql> DROP USER idontexist;
ERROR 1396 (HY000): Operation DROP USER failed for idontexist@%

mysql> DROP USER IF EXISTS 'idontexist';
Query OK, 0 rows affected (0.01 sec)

mysql> CREATE USER 'newuser' IDENTIFIED BY 'mypassword';
Query OK, 1 row affected (0.02 sec)

mysql> GRANT ALL ON test.* TO 'newuser';
```

```
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-----+
| Grants for newuser@% |
+-----+
| GRANT USAGE ON *.* TO 'newuser'@'%' |
| GRANT ALL PRIVILEGES ON test.* TO 'newuser'@'%' |
+-----+
2 rows in set (0.00 sec)

mysql> REVOKE ALL ON test.* FROM 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-----+
| Grants for newuser@% |
+-----+
| GRANT USAGE ON *.* TO 'newuser'@'%' |
+-----+
1 row in set (0.00 sec)

mysql> DROP USER 'newuser';
Query OK, 0 rows affected (0.14 sec)

mysql> SHOW GRANTS FOR 'newuser';
ERROR 1141 (42000): There is no such grant defined for user 'newuser' on
 ↪ host '%'
```

### 14.11.2.53.3 MySQL compatibility

- Dropping a user that does not exist with IF EXISTS will not create a warning in TiDB. [Issue #10196](#).

### 14.11.2.54 DROP VIEW

This statement drops an view object from the currently selected database. It does not effect any base tables that a view references.

#### 14.11.2.54.1 Synopsis

```
DropViewStmt ::=
 'DROP' 'VIEW' ('IF' 'EXISTS')? TableNameList RestrictOrCascadeOpt

TableNameList ::=
 TableName (',' TableName)*

TableName ::=
 Identifier ('.' Identifier)?
```

#### 14.11.2.54.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> CREATE VIEW v1 AS SELECT * FROM t1 WHERE c1 > 2;
Query OK, 0 rows affected (0.11 sec)

mysql> SELECT * FROM t1;
+----+-----+
| id | c1 |
+----+-----+
1	1
2	2
3	3
4	4
5	5
+----+-----+
5 rows in set (0.00 sec)

mysql> SELECT * FROM v1;
+----+-----+
| id | c1 |
+----+-----+
```

```
3	3
4	4
5	5
+----+----+
3 rows in set (0.00 sec)

mysql> DROP VIEW v1;
Query OK, 0 rows affected (0.23 sec)

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
1	1
2	2
3	3
4	4
5	5
+----+----+
5 rows in set (0.00 sec)
```

#### 14.11.2.54.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

#### 14.11.2.54.4 See also

- [CREATE VIEW](#)

#### 14.11.2.55 EXECUTE

The EXECUTE statement provides an SQL interface to server-side prepared statements.

##### 14.11.2.55.1 Synopsis

```
ExecuteStmt ::=
 'EXECUTE' Identifier ('USING' UserVariable (',' UserVariable)*)?
```

##### 14.11.2.55.2 Examples

```
mysql> PREPARE mystmt FROM 'SELECT ? as num FROM DUAL';
Query OK, 0 rows affected (0.00 sec)

mysql> SET @number = 5;
Query OK, 0 rows affected (0.00 sec)

mysql> EXECUTE mystmt USING @number;
+-----+
| num |
+-----+
| 5 |
+-----+
1 row in set (0.00 sec)

mysql> DEALLOCATE PREPARE mystmt;
Query OK, 0 rows affected (0.00 sec)
```

### 14.11.2.55.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.55.4 See also

- [PREPARE](#)

### 14.11.2.56 EXPLAIN ANALYZE

The `EXPLAIN ANALYZE` statement works similar to `EXPLAIN`, with the major difference being that it will actually execute the statement. This allows you to compare the estimates used as part of query planning to actual values encountered during execution. If the estimates differ significantly from the actual values, you should consider running `ANALYZE TABLE` on the affected tables.

#### Note:

When you use `EXPLAIN ANALYZE` to execute DML statements, modification to data is normally executed. Currently, the execution plan for DML statements **cannot** be shown yet.

### 14.11.2.56.1 Synopsis

```

ExplainSym ::=
 'EXPLAIN'
 | 'DESCRIBE'
 | 'DESC'

ExplainStmt ::=
 ExplainSym (TableName ColumnName? | 'ANALYZE'? ExplainableStmt | 'FOR'
 ↪ 'CONNECTION' NUM | 'FORMAT' '=' (stringLit | ExplainFormatType)
 ↪ ('FOR' 'CONNECTION' NUM | ExplainableStmt))

ExplainableStmt ::=
 SelectStmt
 | DeleteFromStmt
 | UpdateStmt
 | InsertIntoStmt
 | ReplaceIntoStmt
 | UnionStmt

```

### 14.11.2.56.2 EXPLAIN ANALYZE output format

Different from `EXPLAIN`, `EXPLAIN ANALYZE` executes the corresponding SQL statement, records its runtime information, and returns the information together with the execution plan. Therefore, you can regard `EXPLAIN ANALYZE` as an extension of the `EXPLAIN` statement. Compared to `EXPLAIN` (for debugging query execution), the return results of `EXPLAIN` ↪ `ANALYZE` also include columns of information such as `actRows`, `execution info`, `memory`, and `disk`. The details of these columns are shown as follows:

| attribute name              | description                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>actRows</code>        | Number of rows output by the operator.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>execution info</code> | Execution information of the operator. <code>time</code> represents the total <code>wall time</code> from entering the operator to leaving the operator, including the total execution time of all sub-operators. If the operator is called many times by the parent operator (in loops), then the time refers to the accumulated time. <code>loops</code> is the number of times the current operator is called by the parent operator. |

| attribute name | description                            |
|----------------|----------------------------------------|
| memory         | Memory space occupied by the operator. |
| disk           | Disk space occupied by the operator.   |

### 14.11.2.56.3 Examples

```
CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT NOT
↳ NULL);
```

```
Query OK, 0 rows affected (0.12 sec)
```

```

#### 14.11.2.56.4 Execution information of operators

In addition to the basic `time` and `loop` execution information, `execution info` also contains operator-specific execution information, which mainly includes the time consumed for the operator to send RPC requests and the duration of other steps.

##### Point\_Get

The execution information from a `Point_Get` operator will typically contain the following information:

- `Get:{num_rpc:1, total_time:697.051µs}`: The number of the `Get` RPC requests (`num_rpc`) sent to TiKV and the total duration (`total_time`) of all RPC requests.
- `ResolveLock:{num_rpc:1, total_time:12.117495ms}`: If TiDB encounters a lock when reading data, it has to resolve the lock first, which generally occurs in the scenario of read-write conflict. This information indicates the duration of resolving locks.
- `regionMiss_backoff:{num:11, total_time:2010 ms},tikvRPC_backoff:{num ↪ :11, total_time:10691 ms}`: When an RPC request fails, TiDB will wait the backoff time before retrying the request. Backoff statistics include the type of backoff (such as `regionMiss` and `tikvRPC`), the total waiting time (`total_time`), and the total number of backoffs (`num`).

##### Batch\_Point\_Get

The execution information of the `Batch_Point_Get` operator is similar to that of the `Point_Get` operator, but `Batch_Point_Get` generally sends `BatchGet` RPC requests to TiKV to read data.

`BatchGet`: {`num_rpc`:2, `total_time`:83.13 $\mu$ s}: The number of RPC requests (`num_rpc`) of the `BatchGet` type sent to TiKV and the total time consumed (`total_time`) for all RPC requests.

### TableReader

The execution information of a `TableReader` operator is typically as follows:

```
cop_task: {num: 6, max: 1.07587ms, min: 844.312 μ s, avg: 919.601 μ s, p95:
 ↪ 1.07587ms, max_proc_keys: 16, p95_proc_keys: 16, tot_proc: 1ms,
 ↪ tot_wait: 1ms, rpc_num: 6, rpc_time: 5.313996 ms,
 ↪ copr_cache_hit_ratio: 0.00}
```

- `cop_task`: Contains the execution information of `cop` tasks. For example:
  - `num`: The number of `cop` tasks.
  - `max`, `min`, `avg`, `p95`: The maximum, minimum, average, and P95 values of the execution time consumed for executing `cop` tasks.
  - `max_proc_keys` and `p95_proc_keys`: The maximum and P95 key-values scanned by TiKV in all `cop` tasks. If the difference between the maximum value and the P95 value is large, the data distribution might be imbalanced.
  - `rpc_num`, `rpc_time`: The total number and total time consumed for `Cop` RPC requests sent to TiKV.
  - `copr_cache_hit_ratio`: The hit rate of Coprocessor Cache for `cop` task requests.
- `backoff`: Contains different types of backoff and the total waiting time of backoff.

### Insert

The execution information of an `Insert` operator is typically as follows:

```
prepare:109.616 μ s, check_insert:{total_time:1.431678ms, mem_insert_time
 ↪ :667.878 μ s, prefetch:763.8 μ s, rpc:{BatchGet:{num_rpc:1, total_time
 ↪ :699.166 μ s},Get:{num_rpc:1, total_time:378.276 μ s }}}
```

- `prepare`: The time consumed for preparing to write, including expression, default value and auto-increment value calculations.
- `check_insert`: This information generally appears in `insert ignore` and `insert ↪ on duplicate` statements, including conflict checking and the time consumed for writing data to TiDB transaction cache. Note that this time consumption does not include the time consumed for transaction commit. It contains the following information:
  - `total_time`: The total time spent on the `check_insert` step.
  - `mem_insert_time`: The time consumed for writing data to the TiDB transaction cache.

- **prefetch**: The duration of retrieving the data that needs to be checked for conflicts from TiKV. This step sends a `Batch_Get` RPC request to TiKV to retrieve data.
- **rpc**: The total time consumed for sending RPC requests to TiKV, which generally includes two types of RPC time, `BatchGet` and `Get`, among which:
  - \* `BatchGet` RPC request is sent in the `prefetch` step.
  - \* `Get` RPC request is sent when the `insert on duplicate` statement executes `duplicate update`.
- **backoff**: Contains different types of backoff and the total waiting time of backoff.

## IndexJoin

The `IndexJoin` operator has 1 outer worker and N inner workers for concurrent execution. The join result preserves the order of the outer table. The detailed execution process is as follows:

1. The outer worker reads N outer rows, then wraps it into a task, and sends it to the result channel and the inner worker channel.
2. The inner worker receives the task, build key ranges from the task, and fetches inner rows according to the key ranges. It then builds the inner row hash table.
3. The main `IndexJoin` thread receives the task from the result channel and waits for the inner worker to finish handling the task.
4. The main `IndexJoin` thread joins each outer row by looking up to the inner rows' hash table.

The `IndexJoin` operator contains the following execution information:

```
inner:{total:4.297515932s, concurrency:5, task:17, construct:97.96291ms,
↪ fetch:4.164310088s, build:35.219574ms}, probe:53.574945ms
```

- **Inner**: The execution information of inner worker:
  - **total**: The total time consumed by the inner worker.
  - **concurrency**: The number of concurrent inner workers.
  - **task**: The total number of tasks processed by the inner worker.
  - **construct**: The preparation time before the inner worker reads the inner table rows corresponding to the task.
  - **fetch**: The total time consumed for it takes for the inner worker to read inner table rows.
  - **Build**: The total time consumed for it takes for the inner worker to construct the hash table of the corresponding inner table rows.
- **probe**: The total time consumed by the main `IndexJoin` thread to perform join operations with the hash table of the outer table rows and the inner table rows.

## IndexHashJoin

The execution process of the `IndexHashJoin` operator is similar to that of the `IndexJoin` operator. `IndexHashJoin` operator also has 1 outer worker and N inner workers to execute in parallel, but the output order is not guaranteed to be consistent with that of the outer table. The detailed execution process is as follows:

1. The outer worker reads N outer rows, builds a task, and sends it to the inner worker channel.
2. The inner worker receives the tasks from the inner worker channel and performs the following three operations in order for every task:
  - a. Build a hash table from the outer rows
  - b. Build key ranges from outer rows and fetches inner rows
  - c. Probe the hash table and sends the join result to the result channel. Note: step a and step b are running concurrently.
3. The main thread of `IndexHashJoin` receives the join results from the result channel.

The `IndexHashJoin` operator contains the following execution information:

```
inner:{total:4.429220003s, concurrency:5, task:17, construct:96.207725ms,
↪ fetch:4.239324006s, build:24.567801ms, join:93.607362ms}
```

- **Inner:** the execution information of inner worker:
  - **total:** the total time consumed by the inner worker.
  - **concurrency:** the number of inner workers.
  - **task:** The total number of tasks processed by the inner worker.
  - **construct:** The preparation time before the inner worker reads the inner table rows.
  - **fetch:** The total time consumed for inner worker to read inner table rows.
  - **Build:** The total time consumed for inner worker to construct the hash table of the outer table rows.
  - **join:** The total time consumed for inner worker to do join with the inner table rows and the hash table of outer table rows.

## HashJoin

The `HashJoin` operator has an inner worker, an outer worker, and N join workers. The detailed execution process is as follows:

1. The inner worker reads inner table rows and constructs a hash table.
2. The outer worker reads the outer table rows, then wraps it into a task and sends it to the join worker.

3. The join worker waits for the hash table construction in step 1 to finish.
4. The join worker uses the outer table rows and hash table in the task to perform join operations, and then sends the join result to the result channel.
5. The main thread of HashJoin receives the join result from the result channel.

The HashJoin operator contains the following execution information:

```
build_hash_table:{total:146.071334ms, fetch:110.338509ms, build:35.732825ms
 ↪ }, probe:{concurrency:5, total:857.162518ms, max:171.48271ms, probe
 ↪ :125.341665ms, fetch:731.820853ms}
```

- **build\_hash\_table**: Reads the data of the inner table and constructs the execution information of the hash table:
  - **total**: The total time consumption.
  - **fetch**: The total time spent reading inner table data.
  - **build**: The total time spent constructing a hash table.
- **probe**: The execution information of join workers:
  - **concurrency**: The number of join workers.
  - **total**: The total time consumed by all join workers.
  - **max**: The longest time for a single join worker to execute.
  - **probe**: The total time consumed for joining with outer table rows and the hash table.
  - **fetch**: The total time that the join worker waits to read the outer table rows data.

### TableFullScan (TiFlash)

The TableFullScan operator executed on a TiFlash node contains the following execution information:

```
tiflash_scan: {
 dtfile: {
 total_scanned_packs: 2,
 total_skipped_packs: 1,
 total_scanned_rows: 16000,
 total_skipped_rows: 8192,
 total_rough_set_index_load_time: 2ms,
 total_read_time: 20ms
 },
 total_create_snapshot_time: 1ms
}
```

- **dtfile**: the DTFile (DeltaTree File) related information during the table scan, which reflects the data scan status of the TiFlash Stable layer.

- `total_scanned_packs`: the total number of packs that have been scanned in the DTFile. A pack is the minimum unit that can be read in the TiFlash DTFile. By default, every 8192 rows constitute a pack.
  - `total_skipped_packs`: the total number of packs that have been skipped by the scan in the DTFile. When a `WHERE` clause hits rough set indexes or matches the range filtering of a primary key, the irrelevant packs are skipped.
  - `total_scanned_rows`: the total number of rows that have been scanned in the DTFile. If there are multiple versions of updates or deletions because of MVCC, each version is counted independently.
  - `total_skipped_rows`: the total number of rows that are skipped by the scan in the DTFile.
  - `total_rs_index_load_time`: the total time used to read DTFile rough set indexes.
  - `total_read_time`: the total time used to read DTFile data.
- `total_create_snapshot_time`: the total time used to create snapshots during the table scan.

#### `lock_keys` execution information

When a DML statement is executed in a pessimistic transaction, the execution information of the operator might also include the execution information of `lock_keys`. For example:

```
lock_keys: {time:94.096168ms, region:6, keys:8, lock_rpc:274.503214ms,
 ↪ rpc_count:6}
```

- `time`: The total duration of executing the `lock_keys` operation.
- `region`: The number of Regions involved in executing the `lock_keys` operation.
- `keys`: The number of Keys that need Lock.
- `lock_rpc`: The total time spent sending an RPC request of the Lock type to TiKV. Because multiple RPC requests can be sent in parallel, the total RPC time consumption might be greater than the total time consumption of the `lock_keys` operation.
- `rpc_count`: The total number of RPC requests of the Lock type sent to TiKV.

#### `commit_txn` execution information

When a write-type DML statement is executed in a transaction with `autocommit=1`, the execution information of the write operator will also include the duration information of the transaction commit. For example:

```
commit_txn: {prewrite:48.564544ms, wait_prewrite_binlog:47.821579,
 ↪ get_commit_ts:4.277455ms, commit:50.431774ms, region_num:7,
 ↪ write_keys:16, write_byte:536}
```

- `prewrite`: The time consumed for the `prewrite` phase of the 2PC commit of the transaction.
- `wait_prewrite_binlog`:: The time consumed for waiting to write the prewrite Binlog.
- `get_commit_ts`: The time consumed for getting the transaction commit timestamp.
- `commit`: The time consumed for the `commit` phase during the 2PC commit of the transaction.
- `write_keys`: The total keys written in the transaction.
- `write_byte`: The total bytes of key-value written in the transaction, and the unit is byte.

#### Other common execution information

The Coprocessor operators usually contain two parts of execution time information: `cop_task` and `tikv_task`. `cop_task` is the time recorded by TiDB, and it is from the moment that the request is sent to the server to the moment that the response is received. `tikv_task` is the time recorded by TiKV Coprocessor itself. If there is much difference between the two, it might indicate that the time spent waiting for the response is too long, or the time spent on gRPC or network is too long.

#### 14.11.2.56.5 MySQL compatibility

`EXPLAIN ANALYZE` is a feature of MySQL 8.0, but both the output format and the potential execution plans in TiDB differ substantially from MySQL.

#### 14.11.2.56.6 See also

- [Understanding the Query Execution Plan](#)
- [EXPLAIN](#)
- [ANALYZE TABLE](#)
- [TRACE](#)

#### 14.11.2.57 EXPLAIN

The `EXPLAIN` statement shows the execution plan for a query without executing it. It is complimented by `EXPLAIN ANALYZE` which will execute the query. If the output of `EXPLAIN` does not match the expected result, consider executing `ANALYZE TABLE` on each table in the query.

The statements `DESC` and `DESCRIBE` are aliases of this statement. The alternative usage of `EXPLAIN <tableName>` is documented under [SHOW \[FULL\] COLUMNS FROM](#).

TiDB supports the `EXPLAIN [options] FOR CONNECTION connection_id` statement. However, this statement is different from the `EXPLAIN FOR` statement in MySQL. For more details, see [EXPLAIN FOR CONNECTION](#).

### 14.11.2.57.1 Synopsis

```
ExplainSym ::=
 'EXPLAIN'
| 'DESCRIBE'
| 'DESC'

ExplainStmt ::=
 ExplainSym (TableName ColumnName? | 'ANALYZE'? ExplainableStmt | 'FOR'
 ↪ 'CONNECTION' NUM | 'FORMAT' '=' (stringLit | ExplainFormatType)
 ↪ ('FOR' 'CONNECTION' NUM | ExplainableStmt))

ExplainableStmt ::=
 SelectStmt
| DeleteFromStmt
| UpdateStmt
| InsertIntoStmt
| ReplaceIntoStmt
| UnionStmt
```

### 14.11.2.57.2 EXPLAIN output format

#### Note:

When you use the MySQL client to connect to TiDB, to read the output result in a clearer way without line wrapping, you can use the pager `less` ↪ `-S` command. Then, after the `EXPLAIN` result is output, you can press the right arrow `→` button on your keyboard to horizontally scroll through the output.

#### Note:

In the returned execution plan, for all probe-side child nodes of `IndexJoin` ↪ and `Apply` operators, the meaning of `estRows` since v6.4.0 is different from that before v6.4.0. You can find details in [TiDB Query Execution Plan Overview](#).

Currently, `EXPLAIN` in TiDB outputs 5 columns: `id`, `estRows`, `task`, `access object`, `operator info`. Each operator in the execution plan is described by these attributes, with

each row in the `EXPLAIN` output describing an operator. The description of each attribute is as follows:

| Attribute name | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id             | The operator ID is the unique identifier of the operator in the entire execution plan. In TiDB 2.1, the ID is formatted to display the tree structure of the operator. Data flows from the child node to the parent node. One and only one parent node for each operator.                                                                                                                                                                                                                                                                                                         |
| estRows        | The number of rows that the operator is expected to output. This number is estimated according to the statistics and the operator's logic. <code>estRows</code> is called <code>count</code> in the earlier versions of TiDB 4.0.                                                                                                                                                                                                                                                                                                                                                 |
| task           | The type of task the operator belongs to. Currently, the execution plans are divided into two tasks: <b>root</b> task, which is executed on tidb-server, and <b>cop</b> task, which is performed in parallel on TiKV or TiFlash. The topology of the execution plan at the task level is that a root task followed by many cop tasks. The root task uses the output of cop tasks as input. The cop tasks refer to tasks that TiDB pushes down to TiKV or TiFlash. Each cop task is distributed in the TiKV cluster or the TiFlash cluster, and is executed by multiple processes. |
| access object  | Data item information accessed by the operator. The information includes <code>table</code> , <code>partition</code> , and <code>index</code> (if any). Only operators that directly access the data have such information.                                                                                                                                                                                                                                                                                                                                                       |
| operator info  | Other information about the operator. <code>operator info</code> of each operator is different. You can refer to the following examples.                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### 14.11.2.57.3 Examples

```
EXPLAIN SELECT 1;
```

```
+-----+-----+-----+-----+-----+
| id | estRows | task | access object | operator info |
+-----+-----+-----+-----+-----+
| Projection_3 | 1.00 | root | | 1->Column#1 |
| -TableDual_4 | 1.00 | root | | rows:1 |
+-----+-----+-----+-----+-----+
2 rows in set (0.00 sec)
```

```
CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT NOT
↳ NULL);
```

```
Query OK, 0 rows affected (0.10 sec)
```

```
INSERT INTO t1 (c1) VALUES (1), (2), (3);
```

```
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0
```

```
EXPLAIN SELECT * FROM t1 WHERE id = 1;
```

```
+-----+-----+-----+-----+-----+
| id | estRows | task | access object | operator info |
+-----+-----+-----+-----+-----+
| Point_Get_1 | 1.00 | root | table:t1 | handle:1 |
+-----+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

```
DESC SELECT * FROM t1 WHERE id = 1;
```

```
+-----+-----+-----+-----+-----+
| id | estRows | task | access object | operator info |
+-----+-----+-----+-----+-----+
| Point_Get_1 | 1.00 | root | table:t1 | handle:1 |
+-----+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

```
DESCRIBE SELECT * FROM t1 WHERE id = 1;
```

```
+-----+-----+-----+-----+-----+
| id | estRows | task | access object | operator info |
+-----+-----+-----+-----+-----+
| Point_Get_1 | 1.00 | root | table:t1 | handle:1 |
+-----+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

```
EXPLAIN INSERT INTO t1 (c1) VALUES (4);
```

```
+-----+-----+-----+-----+-----+
| id | estRows | task | access object | operator info |
+-----+-----+-----+-----+-----+
| Insert_1 | N/A | root | | N/A |
+-----+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

```
EXPLAIN UPDATE t1 SET c1=5 WHERE c1=3;
```

```
+--
 ↪ -----+-----+-----+-----+-----+
 ↪
```

```

| id | estRows | task | access object | operator info
+---+
| Update_4 | N/A | root | | N/A
+---+
| -TableReader_8 | 0.00 | root | | data:
| Selection_7 | | | |
| -Selection_7 | 0.00 | cop[tikv] | | eq(test.t1.c1,
| 3) | | | |
| -TableFullScan_6 | 3.00 | cop[tikv] | table:t1 | keep order:
| false, stats:pseudo | | | |
+---+
4 rows in set (0.00 sec)

```

```
EXPLAIN DELETE FROM t1 WHERE c1=3;
```

```

+---+
| id | estRows | task | access object | operator info
+---+
| Delete_4 | N/A | root | | N/A
+---+
| -TableReader_8 | 0.00 | root | | data:
| Selection_7 | | | |
| -Selection_7 | 0.00 | cop[tikv] | | eq(test.t1.c1,
| 3) | | | |
| -TableFullScan_6 | 3.00 | cop[tikv] | table:t1 | keep order:
| false, stats:pseudo | | | |
+---+
4 rows in set (0.01 sec)

```

To specify the format of the EXPLAIN output, you can use the `FORMAT = xxx` syntax. Currently, TiDB supports the following formats:

| FORMAT        | Description                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Not specified | If the format is not specified, <b>EXPLAIN</b> $\hookrightarrow$ uses the default format <b>row</b> .                                                             |
| <b>row</b>    | The <b>EXPLAIN</b> $\hookrightarrow$ statement outputs results in a tabular format. See <a href="#">Understand the Query Execution Plan</a> for more information. |

---

| FORMAT | Description |
|--------|-------------|
|--------|-------------|

---

|              |                                                                                                                                                              |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>brief</b> | The operator IDs in the output of the <b>EXPLAIN</b> $\hookrightarrow$ statement are simplified, compared with those when <b>FORMAT</b> is left unspecified. |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|

---

| FORMAT | Description |
|--------|-------------|
|--------|-------------|

---

|     |                                                                                                                                                                                                                                                         |
|-----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dot | The<br><b>EXPLAIN</b><br>↔<br>state-<br>ment<br>out-<br>puts<br>DOT<br>execu-<br>tion<br>plans,<br>which<br>can be<br>used to<br>gener-<br>ate<br>PNG<br>files<br>through<br>a dot<br>pro-<br>gram<br>(in the<br><b>graphviz</b><br>↔<br>pack-<br>age). |
|-----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

---

**FORMAT**Description

`tidb_json` The  
`↔` `EXPLAIN`  
`↔`  
 statement  
 out-  
 puts  
 execu-  
 tion  
 plans  
 in  
 JSON  
 and  
 stores  
 the op-  
 erator  
 infor-  
 mation  
 in a  
 JSON  
 array.

---

The following is an example when `FORMAT` is "brief" in `EXPLAIN`:

```
EXPLAIN FORMAT = "brief" DELETE FROM t1 WHERE c1 = 3;
```

```
+--
↔ -----+-----+-----+-----+
↔
| id | estRows | task | access object | operator info
↔ |
+--
↔ -----+-----+-----+-----+
↔
| Delete | N/A | root | | N/A
↔ |
| -TableReader | 0.00 | root | | data:Selection
↔ |
| -Selection | 0.00 | cop[tikv] | | eq(test.t1.c1, 3)
↔ |
| -TableFullScan | 3.00 | cop[tikv] | table:t1 | keep order:false,
↔ stats:pseudo |
+--
↔ -----+-----+-----+-----+
```

```
↪
4 rows in set (0.001 sec)
```

In addition to the MySQL standard result format, TiDB also supports DotGraph and you need to specify `FORMAT = "dot"` as in the following example:

```
CREATE TABLE t(a bigint, b bigint);
EXPLAIN format = "dot" SELECT A.a, B.b FROM t A JOIN t B ON A.a > B.b WHERE
↪ A.a < 10;
```

```
+--
↪ -----
↪
| dot contents
↪
↪ |
+--
↪ -----
↪
|
digraph Projection_8 {
subgraph cluster8{
node [style=filled, color=lightgrey]
color=black
label = "root"
"Projection_8" -> "HashJoin_9"
"HashJoin_9" -> "TableReader_13"
"HashJoin_9" -> "Selection_14"
"Selection_14" -> "TableReader_17"
}
subgraph cluster12{
node [style=filled, color=lightgrey]
color=black
label = "cop"
"Selection_12" -> "TableFullScan_11"
}
subgraph cluster16{
node [style=filled, color=lightgrey]
color=black
label = "cop"
"Selection_16" -> "TableFullScan_15"
}
"TableReader_13" -> "Selection_12"
"TableReader_17" -> "Selection_16"
}
```

```
|
+---
 ↳ -----
 ↳ -----
1 row in set (0.00 sec)
```

If your computer has a `dot` program, you can generate a PNG file using the following method:

```
dot xx.dot -T png -O
```

The `xx.dot` is the result returned by the above statement.

If your computer has no `dot` program, copy the result to [this website](#) to get a tree diagram:

Figure 349: Explain Dot

To get the output in JSON, specify `FORMAT = "tidb_json"` in the `EXPLAIN` statement. The following is an example:

```
CREATE TABLE t(id int primary key, a int, b int, key(a));
EXPLAIN FORMAT = "tidb_json" SELECT id FROM t WHERE a = 1;
```

```
+-----+
| TiDB_JSON |
+-----+
```

```

↔
| [
 {
 "id": "Projection_4",
 "estRows": "10.00",
 "taskType": "root",
 "operatorInfo": "test.t.id",
 "subOperators": [
 {
 "id": "IndexReader_6",
 "estRows": "10.00",
 "taskType": "root",
 "operatorInfo": "index:IndexRangeScan_5",
 "subOperators": [
 {
 "id": "IndexRangeScan_5",
 "estRows": "10.00",
 "taskType": "cop[tikv]",
 "accessObject": "table:t, index:a(a)",
 "operatorInfo": "range:[1,1], keep order:false, stats:
↔ pseudo"
 }
]
 }
]
 }
]
|
↔
1 row in set (0.01 sec)

```

In the output, `id`, `estRows`, `taskType`, `accessObject`, and `operatorInfo` have the same meaning as the columns in the default format. `subOperators` is an array that stores the sub-nodes. The fields and meanings of the sub-nodes are the same as the parent node. If a field is missing, it means that the field is empty.

#### 14.11.2.57.4 MySQL compatibility

- Both the format of `EXPLAIN` and the potential execution plans in TiDB differ substantially from MySQL.
- TiDB does not support the `FORMAT=JSON` or `FORMAT=TREE` options.
- `FORMAT=tidb_json` in TiDB is the JSON format output of the default `EXPLAIN` result. The format and fields are different from the `FORMAT=JSON` output in MySQL.

## EXPLAIN FOR CONNECTION

`EXPLAIN FOR CONNECTION` is used to get the execution plan of the currently executed SQL query or the last executed SQL query in a connection. The output format is the same as that of `EXPLAIN`. However, the implementation of `EXPLAIN FOR CONNECTION` in TiDB is different from that in MySQL. Their differences (apart from the output format) are listed as follows:

- If the connection is sleeping, MySQL returns an empty result, while TiDB returns the last executed query plan.
- If you try to get the execution plan of the current session, MySQL returns an error, while TiDB returns the result normally.
- MySQL requires the login user to be the same as the connection being queried, or the login user has the **PROCESS** privilege; while TiDB requires the login user to be the same as the connection being queried, or the login user has the **SUPER** privilege.

## 14.11.2.58 FLASHBACK CLUSTER TO TIMESTAMP

TiDB v6.4.0 introduces the `FLASHBACK CLUSTER TO TIMESTAMP` syntax. You can use it to restore a cluster to a specific point in time.

### Note:

The working principle of `FLASHBACK CLUSTER TO TIMESTAMP` is to write the old data of a specific point in time with the latest timestamp, and will not delete the current data. So before using this feature, you need to ensure that there is enough storage space for the old data and the current data.

### 14.11.2.58.1 Syntax

```
FLASHBACK CLUSTER TO TIMESTAMP '2022-09-21 16:02:50';
```

#### Synopsis

```
FlashbackToTimestampStmt ::=
 "FLASHBACK" "CLUSTER" "TO" "TIMESTAMP" stringLit
```

### 14.11.2.58.2 Notes

- The time specified in the FLASHBACK statement must be within the Garbage Collection (GC) lifetime. The system variable `tidb_gc_life_time` (default: 10m0s) defines the retention time of earlier versions of rows. The current `safePoint` of where garbage collection has been performed up to can be obtained with the following query:

```
SELECT * FROM mysql.tidb WHERE variable_name = 'tikv_gc_safe_point';
```

- Only a user with the SUPER privilege can execute the FLASHBACK CLUSTER SQL statement.
- FLASHBACK CLUSTER does not support rolling back DDL statements that modify PD-related information, such as ALTER TABLE ATTRIBUTE, ALTER TABLE REPLICA, and CREATE PLACEMENT POLICY.
- At the time specified in the FLASHBACK statement, there cannot be a DDL statement that is not completely executed. If such a DDL exists, TiDB will reject it.
- Before executing FLASHBACK CLUSTER TO TIMESTAMP, TiDB disconnects all related connections and prohibits read and write operations on these tables until the FLASHBACK CLUSTER statement is completed.
- The FLASHBACK CLUSTER TO TIMESTAMP statement cannot be canceled after being executed. TiDB will keep retrying until it succeeds.
- During the execution of FLASHBACK CLUSTER, if you need to back up data, you can only use Backup & Restore and specify a BackupTS that is earlier than the start time of FLASHBACK CLUSTER. In addition, during the execution of FLASHBACK CLUSTER, enabling log backup will fail. Therefore, try to enable log backup after FLASHBACK → CLUSTER is completed.
- If the FLASHBACK CLUSTER statement causes the rollback of metadata (table structure, database structure), the related modifications will **not** be replicated by TiCDC. Therefore, you need to pause the task manually, wait for the completion of FLASHBACK → CLUSTER, and manually replicate the schema definitions of the upstream and downstream to make sure that they are consistent. After that, you need to recreate the TiCDC changefeed.

### 14.11.2.58.3 Example

The following example shows how to restore the newly inserted data:

```
mysql> CREATE TABLE t(a INT);
Query OK, 0 rows affected (0.09 sec)

mysql> SELECT * FROM t;
Empty set (0.01 sec)

mysql> SELECT now();
+-----+
```

```

mysql> SELECT now();
+-----+
| now() |
+-----+
| 2022-09-28 17:24:16 |
+-----+
1 row in set (0.02 sec)

mysql> INSERT INTO t VALUES (1);
Query OK, 1 row affected (0.02 sec)

mysql> SELECT * FROM t;
+-----+
| a |
+-----+
| 1 |
+-----+
1 row in set (0.01 sec)

mysql> FLASHBACK CLUSTER TO TIMESTAMP '2022-09-28 17:24:16';
Query OK, 0 rows affected (0.20 sec)

mysql> SELECT * FROM t;
Empty set (0.00 sec)

```

If there is a DDL statement that is not completely executed at the time specified in the FLASHBACK statement, the FLASHBACK statement fails:

```

mysql> ALTER TABLE t ADD INDEX k(a);
Query OK, 0 rows affected (0.56 sec)

mysql> ADMIN SHOW DDL JOBS 1;
+---+
↪ -----+-----+-----+-----+
↪
| JOB_ID | DB_NAME | TABLE_NAME | JOB_TYPE | SCHEMA_STATE |
↪ SCHEMA_ID | TABLE_ID | ROW_COUNT | CREATE_TIME | START_TIME |
↪ END_TIME | STATE |
+---+
↪ -----+-----+-----+-----+
↪
| 84 | test | t | add index /* ingest */ | public |
↪ 2 | 82 | 0 | 2023-01-29 14:33:11 | 2023-01-29
↪ 14:33:11 | 2023-01-29 14:33:12 | synced |
+---+
↪ -----+-----+-----+-----+
↪

```

```
1 rows in set (0.01 sec)

mysql> FLASHBACK CLUSTER TO TIMESTAMP '2023-01-29 14:33:12';
ERROR 1105 (HY000): Detected another DDL job at 2023-01-29 14:33:12 +0800
 ↳ CST, can't do flashback
```

Through the log, you can obtain the execution progress of FLASHBACK. The following is an example:

```
[2022/10/09 17:25:59.316 +08:00] [INFO] [cluster.go:463] ["flashback cluster
 ↳ stats"] ["complete regions"]=9] ["total regions"]=10] []
```

#### 14.11.2.58.4 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.11.2.59 FLASHBACK DATABASE

TiDB v6.4.0 introduces the FLASHBACK DATABASE syntax. You can use FLASHBACK  $\leftrightarrow$  DATABASE to restore a database and its data that are deleted by the DROP statement within the Garbage Collection (GC) life time.

You can set the retention time of historical data by configuring the `tidb_gc_life_time` system variable. The default value is 10m0s. You can query the current `safePoint`, that is, the time point GC has been performed up to, using the following SQL statement:

```
SELECT * FROM mysql.tidb WHERE variable_name = 'tikv_gc_safe_point';
```

As long as a database is deleted by DROP after the `tikv_gc_safe_point` time, you can use FLASHBACK DATABASE to restore the database.

##### 14.11.2.59.1 Syntax

```
FLASHBACK DATABASE DBName [TO newDBName]
```

Synopsis

```
FlashbackDatabaseStmt ::=
 'FLASHBACK' DatabaseSym DBName FlashbackToNewName
FlashbackToNewName ::=
 ('TO' Identifier)?
```

##### 14.11.2.59.2 Notes

- If the database is deleted before the `tikv_gc_safe_point` time, you cannot restore the data using the `FLASHBACK DATABASE` statement. The `FLASHBACK DATABASE` statement returns an error similar to `ERROR 1105 (HY000): Can't find dropped database '↔ test' in GC safe point 2022-11-06 16:10:10 +0800 CST`.
- You cannot restore the same database multiple times using the `FLASHBACK DATABASE ↔` statement. Because the database restored by `FLASHBACK DATABASE` has the same schema ID as the original database, restoring the same database multiple times leads to duplicate schema IDs. In TiDB, the database schema ID must be globally unique.
- When TiDB Binlog is enabled, note the following when you use `FLASHBACK DATABASE`:
  - The downstream secondary database must support `FLASHBACK DATABASE`.
  - The GC life time of the secondary database must be longer than that of the primary database. Otherwise, the latency between the upstream and the downstream might lead to data restoration failure in the downstream.
  - If TiDB Binlog replication encounters an error, you need to filter out the database in TiDB Binlog and then manually import full data for this database.

#### 14.11.2.59.3 Example

- Restore the `test` database that is deleted by `DROP`:

```
DROP DATABASE test;
```

```
FLASHBACK DATABASE test;
```

- Restore the `test` database that is deleted by `DROP` and rename it to `test1`:

```
DROP DATABASE test;
```

```
FLASHBACK DATABASE test TO test1;
```

#### 14.11.2.59.4 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.11.2.60 FLASHBACK TABLE

The `FLASHBACK TABLE` syntax is introduced since TiDB 4.0. You can use the `FLASHBACK ↔ TABLE` statement to restore the tables and data dropped by the `DROP` or `TRUNCATE` operation within the Garbage Collection (GC) lifetime.

The system variable `tidb_gc_life_time` (default: `10m0s`) defines the retention time of earlier versions of rows. The current `safePoint` of where garbage collection has been performed up to can be obtained with the following query:

```
SELECT * FROM mysql.tidb WHERE variable_name = 'tikv_gc_safe_point';
```

As long as the table is dropped by DROP or TRUNCATE statements after the tikv\_gc\_safe\_point time, you can restore the table using the FLASHBACK TABLE statement.

#### 14.11.2.60.1 Syntax

```
FLASHBACK TABLE table_name [TO other_table_name]
```

#### 14.11.2.60.2 Synopsis

```
FlashbackTableStmt ::=
 'FLASHBACK' 'TABLE' TableName FlashbackToNewName

TableName ::=
 Identifier ('.' Identifier)?

FlashbackToNewName ::=
 ('TO' Identifier)?
```

#### 14.11.2.60.3 Notes

If a table is dropped and the GC lifetime has passed, you can no longer use the FLASHBACK TABLE statement to recover the dropped data. Otherwise, an error like Can't ↪ find dropped / truncated table 't' in GC safe point 2020-03-16 16:34:52 ↪ +0800 CST will be returned.

Pay attention to the following conditions and requirements when you enable TiDB Binlog and use the FLASHBACK TABLE statement:

- The downstream secondary cluster must also support FLASHBACK TABLE.
- The GC lifetime of the secondary cluster must be longer than that of the primary cluster.
- The delay of replication between the upstream and downstream might also cause the failure to recover data to the downstream.
- If an error occurs when TiDB Binlog is replicating a table, you need to filter that table in TiDB Binlog and manually import all data of that table.

#### 14.11.2.60.4 Example

- Recover the table data dropped by the DROP operation:

```
DROP TABLE t;
```

```
FLASHBACK TABLE t;
```

- Recover the table data dropped by the `TRUNCATE` operation. Because the truncated table `t` still exists, you need to rename the table `t` to be recovered. Otherwise, an error will be returned because the table `t` already exists.

```
TRUNCATE TABLE t;
```

```
FLASHBACK TABLE t TO t1;
```

#### 14.11.2.60.5 Implementation principle

When deleting a table, TiDB only deletes the table metadata, and writes the table data (row data and index data) to be deleted to the `mysql.gc_delete_range` table. The GC Worker in the TiDB background periodically removes from the `mysql.gc_delete_range` table the keys that exceed the GC lifetime.

Therefore, to recover a table, you only need to recover the table metadata and delete the corresponding row record in the `mysql.gc_delete_range` table before the GC Worker deletes the table data. You can use a snapshot read of TiDB to recover the table metadata. For details of snapshot read, refer to [Read Historical Data](#).

The following is the working process of `FLASHBACK TABLE t TO t1`:

1. TiDB searches the recent DDL history jobs and locates the first DDL operation of the `DROP TABLE` or the `truncate table` type on table `t`. If TiDB fails to locate one, an error is returned.
2. TiDB checks whether the starting time of the DDL job is before `tikv_gc_safe_point`. If it is before `tikv_gc_safe_point`, it means that the table dropped by the `DROP` or `TRUNCATE` operation has been cleaned up by the GC and an error is returned.
3. TiDB uses the starting time of the DDL job as the snapshot to read historical data and read table metadata.
4. TiDB deletes GC tasks related to table `t` in `mysql.gc_delete_range`.
5. TiDB changes `name` in the table's metadata to `t1`, and uses this metadata to create a new table. Note that only the table name is changed but not the table ID. The table ID is the same as that of the previously dropped table `t`.

From the above process, you can see that TiDB always operates on the metadata of the table, and the user data of the table has never been modified. The restored table `t1` has the same ID as the previously dropped table `t`, so `t1` can read the user data of `t`.

**Note:**

You cannot use `FLASHBACK` statements to restore the same deleted table multiple times, because the ID of the restored table is the same ID of the dropped table, and TiDB requires that all existing tables must have a globally unique table ID.

The `FLASHBACK TABLE` operation is done by TiDB obtaining the table metadata through snapshot read, and then going through the process of table creation similar to `CREATE TABLE`. Therefore, `FLASHBACK TABLE` is, in essence, a kind of DDL operation.

#### 14.11.2.60.6 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.11.2.61 FLUSH PRIVILEGES

This statement triggers TiDB to reload the in-memory copy of privileges from the privilege tables. You should execute `FLUSH PRIVILEGES` after making manual edits to tables such as `mysql.user`. Executing this statement is not required after using privilege statements such as `GRANT` or `REVOKE`. Executing this statement requires the `RELOAD` privilege.

##### 14.11.2.61.1 Synopsis

```
FlushStmt ::=
 'FLUSH' NoWriteToBinLogAliasOpt FlushOption

NoWriteToBinLogAliasOpt ::=
 ('NO_WRITE_TO_BINLOG' | 'LOCAL')?

FlushOption ::=
 'PRIVILEGES'
| 'STATUS'
| 'TIDB' 'PLUGINS' PluginNameList
| 'HOSTS'
| LogTypeOpt 'LOGS'
| TableOrTables TableNameListOpt WithReadLockOpt
```

##### 14.11.2.61.2 Examples

```
mysql> FLUSH PRIVILEGES;
Query OK, 0 rows affected (0.01 sec)
```

### 14.11.2.61.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.61.4 See also

- [SHOW GRANTS](#)
- [Privilege Management](#)

### 14.11.2.62 FLUSH STATUS

This statement is included for compatibility with MySQL. It has no effect on TiDB, which uses Prometheus and Grafana for centralized metrics collection instead of `SHOW STATUS`.

#### 14.11.2.62.1 Synopsis

```
FlushStmt ::=
 'FLUSH' NoWriteToBinLogAliasOpt FlushOption

NoWriteToBinLogAliasOpt ::=
 ('NO_WRITE_TO_BINLOG' | 'LOCAL')?

FlushOption ::=
 'PRIVILEGES'
| 'STATUS'
| 'TIDB' 'PLUGINS' PluginNameList
| 'HOSTS'
| LogTypeOpt 'LOGS'
| TableOrTables TableNameListOpt WithReadLockOpt
```

#### 14.11.2.62.2 Examples

```
mysql> show status;
+-----+-----+
| Variable_name | Value |
+-----+-----+
Ssl_cipher_list	
server_id	93e2e07d-6bb4-4a1b-90b7-e035fae154fe
ddl_schema_version	141
Ssl_verify_mode	0
Ssl_version	
Ssl_cipher	
```

```

+-----+
6 rows in set (0.01 sec)

mysql> show global status;
+-----+
| Variable_name | Value |
+-----+
Ssl_cipher	
Ssl_cipher_list	
Ssl_verify_mode	0
Ssl_version	
server_id	93e2e07d-6bb4-4a1b-90b7-e035fae154fe
ddl_schema_version	141
+-----+
6 rows in set (0.00 sec)

mysql> flush status;
Query OK, 0 rows affected (0.00 sec)

mysql> show status;
+-----+
| Variable_name | Value |
+-----+
Ssl_cipher	
Ssl_cipher_list	
Ssl_verify_mode	0
Ssl_version	
ddl_schema_version	141
server_id	93e2e07d-6bb4-4a1b-90b7-e035fae154fe
+-----+
6 rows in set (0.00 sec)

```

### 14.11.2.62.3 MySQL compatibility

- This statement is included only for compatibility with MySQL.

### 14.11.2.62.4 See also

- [SHOW \[GLOBAL|SESSION\] STATUS](#)

### 14.11.2.63 FLUSH TABLES

This statement is included for compatibility with MySQL. It has no effective usage in TiDB.

### 14.11.2.63.1 Synopsis

```
FlushStmt ::=
 'FLUSH' NoWriteToBinLogAliasOpt FlushOption

NoWriteToBinLogAliasOpt ::=
 ('NO_WRITE_TO_BINLOG' | 'LOCAL')?

FlushOption ::=
 'PRIVILEGES'
| 'STATUS'
| 'TIDB' 'PLUGINS' PluginNameList
| 'HOSTS'
| LogTypeOpt 'LOGS'
| TableOrTables TableNameListOpt WithReadLockOpt

LogTypeOpt ::=
 ('BINARY' | 'ENGINE' | 'ERROR' | 'GENERAL' | 'SLOW')?

TableOrTables ::=
 'TABLE'
| 'TABLES'

TableNameListOpt ::=
 TableNameList?

WithReadLockOpt ::=
 ('WITH' 'READ' 'LOCK')?
```

### 14.11.2.63.2 Examples

```
mysql> FLUSH TABLES;
Query OK, 0 rows affected (0.00 sec)

mysql> FLUSH TABLES WITH READ LOCK;
ERROR 1105 (HY000): FLUSH TABLES WITH READ LOCK is not supported. Please
↪ use @@tidb_snapshot
```

### 14.11.2.63.3 MySQL compatibility

- TiDB does not have a concept of table cache as in MySQL. Thus, `FLUSH TABLES` is parsed but ignored in TiDB for compatibility.
- The statement `FLUSH TABLES WITH READ LOCK` produces an error, as TiDB does not currently support locking tables. It is recommended to use [Historical reads](#) for this purpose instead.

#### 14.11.2.63.4 See also

- [Read historical data](#)

#### 14.11.2.64 GRANT <privileges>

This statement allocates privileges to a pre-existing user in TiDB. The privilege system in TiDB follows MySQL, where credentials are assigned based on a database/table pattern. Executing this statement requires the `GRANT OPTION` privilege and all privileges you allocate.

##### 14.11.2.64.1 Synopsis

```

GrantStmt ::=
 'GRANT' PrivElemList 'ON' ObjectType PrivLevel 'TO' UserSpecList
 ↪ RequireClauseOpt WithGrantOptionOpt

PrivElemList ::=
 PrivElem (',' PrivElem)*

PrivElem ::=
 PrivType ('(' ColumnNameList ')')?

PrivType ::=
 'ALL' 'PRIVILEGES'?
| 'ALTER' 'ROUTINE'?
| 'CREATE' ('USER' | 'TEMPORARY' 'TABLES' | 'VIEW' | 'ROLE' | 'ROUTINE')
 ↪ ?
| 'TRIGGER'
| 'DELETE'
| 'DROP' 'ROLE'?
| 'PROCESS'
| 'EXECUTE'
| 'INDEX'
| 'INSERT'
| 'SELECT'
| 'SUPER'
| 'SHOW' ('DATABASES' | 'VIEW')
| 'UPDATE'
| 'GRANT' 'OPTION'
| 'REFERENCES'
| 'REPLICATION' ('SLAVE' | 'CLIENT')
| 'USAGE'
| 'RELOAD'
| 'FILE'
| 'CONFIG'

```

```

| 'LOCK' 'TABLES'
| 'EVENT'
| 'SHUTDOWN'

ObjectType ::=
 'TABLE'?

PrivLevel ::=
 '*' ('.' '*')?
| Identifier ('.' ('*' | Identifier))?

UserSpecList ::=
 UserSpec (',' UserSpec)*

```

#### 14.11.2.64.2 Examples

```

mysql> CREATE USER 'newuser' IDENTIFIED BY 'mypassword';
Query OK, 1 row affected (0.02 sec)

mysql> GRANT ALL ON test.* TO 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-----+
| Grants for newuser@% |
+-----+
| GRANT USAGE ON *.* TO 'newuser'@'%' |
| GRANT ALL PRIVILEGES ON test.* TO 'newuser'@'%' |
+-----+
2 rows in set (0.00 sec)

```

#### 14.11.2.64.3 MySQL compatibility

- Similar to MySQL, the `USAGE` privilege denotes the ability to log into a TiDB server.
- Column level privileges are not currently supported.
- Similar to MySQL, when the `NO_AUTO_CREATE_USER` sql mode is not present, the `GRANT` statement will automatically create a new user with an empty password when a user does not exist. Removing this sql-mode (it is enabled by default) presents a security risk.

#### 14.11.2.64.4 See also

- `GRANT <role>`

- REVOKE <privileges>
- SHOW GRANTS

- Privilege Management

#### 14.11.2.65 GRANT <role>

Assigns a previously created role to an existing user. The user can use then use the statement SET ROLE <rolename> to assume the privileges of the role, or SET ROLE ALL to assume all roles that have been assigned.

##### 14.11.2.65.1 Synopsis

```
GrantRoleStmt ::=
 'GRANT' RolenameList 'TO' UsernameList

RolenameList ::=
 Rolename (',' Rolename)*

UsernameList ::=
 Username (',' Username)*
```

##### 14.11.2.65.2 Examples

Connect to TiDB as the root user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Create a new role analyticsteam and a new user jennifer:

```
CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the jennifer user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Note that by default `jennifer` needs to execute `SET ROLE analyticsteam` in order to be able to use the privileges associated with the `analyticsteam` role:

```
SHOW GRANTS;
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
2 rows in set (0.00 sec)

SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

SHOW GRANTS;
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT SELECT ON test.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+-----+
| Tables_in_test |
+-----+
| t1 |
+-----+
1 row in set (0.00 sec)
```

Connect to TiDB as the root user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

The statement `SET DEFAULT ROLE` can be used to associate the role `analyticsteam` to `jennifer`:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
Query OK, 0 rows affected (0.02 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

After this, the user `jennifer` has the privileges associated with the role `analyticsteam` and `jennifer` does not have to execute the statement `SET ROLE`:

```
SHOW GRANTS;
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT SELECT ON test.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+-----+
| Tables_in_test |
+-----+
| t1 |
+-----+
1 row in set (0.00 sec)
```

### 14.11.2.65.3 MySQL compatibility

This statement is understood to be fully compatible with roles, which are a feature of MySQL 8.0. Any compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.65.4 See also

- `GRANT <privileges>`
- `CREATE ROLE`
- `DROP ROLE`

### 14.11.2.66 INSERT

This statement inserts new rows into a table.

### 14.11.2.66.1 Synopsis

```

InsertIntoStmt ::=
 'INSERT' TableOptimizerHints PriorityOpt IgnoreOptional IntoOpt
 ↪ TableName PartitionNameListOpt InsertValues OnDuplicateKeyUpdate

TableOptimizerHints ::=
 hintComment?

PriorityOpt ::=
 ('LOW_PRIORITY' | 'HIGH_PRIORITY' | 'DELAYED')?

IgnoreOptional ::=
 'IGNORE'?

IntoOpt ::= 'INTO'?

TableName ::=
 Identifier ('.' Identifier)?

PartitionNameListOpt ::=
 ('PARTITION' '(' Identifier (',' Identifier)* ')')?

InsertValues ::=
 '(' (ColumnNameListOpt ')' (ValueSym ValuesList | SelectStmt | '('
 ↪ SelectStmt ')' | UnionStmt) | SelectStmt ')')
| ValueSym ValuesList
| SelectStmt
| UnionStmt
| 'SET' ColumnSetValue? (',' ColumnSetValue)*

OnDuplicateKeyUpdate ::=
 ('ON' 'DUPLICATE' 'KEY' 'UPDATE' AssignmentList)?

```

### 14.11.2.66.2 Examples

```

mysql> CREATE TABLE t1 (a INT);
Query OK, 0 rows affected (0.11 sec)

mysql> CREATE TABLE t2 LIKE t1;
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.02 sec)

```

```
mysql> INSERT INTO t1 (a) VALUES (1);
Query OK, 1 row affected (0.01 sec)

mysql> INSERT INTO t2 SELECT * FROM t1;
Query OK, 2 rows affected (0.01 sec)
Records: 2 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+-----+
| a |
+-----+
| 1 |
| 1 |
+-----+
2 rows in set (0.00 sec)

mysql> SELECT * FROM t2;
+-----+
| a |
+-----+
| 1 |
| 1 |
+-----+
2 rows in set (0.00 sec)

mysql> INSERT INTO t2 VALUES (2),(3),(4);
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t2;
+-----+
| a |
+-----+
| 1 |
| 1 |
| 2 |
| 3 |
| 4 |
+-----+
5 rows in set (0.00 sec)
```

#### 14.11.2.66.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility

differences should be [reported via an issue](#) on GitHub.

- [DELETE](#)
- [SELECT](#)
- [UPDATE](#)
- [REPLACE](#)

#### 14.11.2.67 KILL

The KILL statement is used to terminate a connection in any TiDB instance in the current TiDB cluster.

##### 14.11.2.67.1 Synopsis

```
KillStmt ::= 'KILL' 'TiDB'? ('CONNECTION' | 'QUERY')? CONNECTION_ID
```

##### 14.11.2.67.2 Examples

The following example shows how to get all active queries in the current cluster and terminate any one of them.

```
SELECT ID, USER, INSTANCE, INFO FROM INFORMATION_SCHEMA.CLUSTER_PROCESSLIST
↪ ;
```

```
+-----+-----+-----+-----+
↪
| ID | USER | INSTANCE | INFO
↪
+-----+-----+-----+-----+
↪
| 8306449708033769879 | root | 127.0.0.1:10082 | select sleep(30), 'foo'
↪
| 5857102839209263511 | root | 127.0.0.1:10080 | select sleep(50)
↪
| 5857102839209263513 | root | 127.0.0.1:10080 | SELECT ID, USER, INSTANCE,
↪ INFO FROM INFORMATION_SCHEMA.CLUSTER_PROCESSLIST |
+-----+-----+-----+-----+
↪
```

```
KILL 5857102839209263511;
```

```
Query OK, 0 rows affected (0.00 sec)
```

### 14.11.2.67.3 MySQL compatibility

- The KILL statement of MySQL can only terminate a connection in the currently connected MySQL instance, while the KILL statement of TiDB can terminate a connection in any TiDB instance in the entire cluster.
- Currently, using the MySQL command line ctrl+c to terminate a query or connection in TiDB is not supported.

### 14.11.2.67.4 Behavior change descriptions

Starting from v6.1.0, TiDB supports the Global Kill feature, which is enabled by default and controlled by the `enable-global-kill` configuration.

When the Global Kill feature is enabled, both KILL and KILL TIDB statements can terminate queries or connections across instances so you do not need to worry about erroneously terminating queries or connections. When you use a client to connect to any TiDB instance and execute the KILL or KILL TIDB statement, the statement will be forwarded to the target TiDB instance. If there is a proxy between the client and the TiDB cluster, the KILL and KILL TIDB statements will also be forwarded to the target TiDB instance for execution.

If the Global Kill feature is not enabled or you are using a TiDB version earlier than v6.1.0, note the following:

- By default, KILL is not compatible with MySQL. This helps prevent against a case of a connection being terminated by a wrong TiDB server, because it is common to place multiple TiDB servers behind a load balancer. To terminate other connections on the currently connected TiDB instance, you need to add the TIDB suffix explicitly by executing the KILL TIDB statement.
- It is **STRONGLY NOT RECOMMENDED** to set `compatible-kill-query = true` in your configuration file UNLESS you are certain that clients will be always connected to the same TiDB instance. This is because pressing ctrl+c in the default MySQL client opens a new connection in which KILL is executed. If there is a proxy between the client and the TiDB cluster, the new connection might be routed to a different TiDB instance, which possibly kills a different session by mistake.
- The KILL TIDB statement is a TiDB extension. The feature of this statement is similar to the MySQL KILL [CONNECTION|QUERY] command and the MySQL command line ctrl+c. It is safe to use KILL TIDB on the same TiDB instance.

### 14.11.2.67.5 See also

- `SHOW [FULL] PROCESSLIST`
- `CLUSTER_PROCESSLIST`

### 14.11.2.68 LOAD DATA

The `LOAD DATA` statement batch loads data into a TiDB table.

#### 14.11.2.68.1 Synopsis

```
LoadDataStmt ::=
 'LOAD' 'DATA' LocalOpt 'INFILE' stringLit DuplicateOpt 'INTO' 'TABLE'
 ↪ TableName CharsetOpt Fields Lines IgnoreLines
 ↪ ColumnNameOrUserVarListOptWithBrackets LoadDataSetSpecOpt
```

#### 14.11.2.68.2 Parameters

##### LocalOpt

You can specify that the imported data file is located on the client or on the server by configuring the `LocalOpt` parameter. Currently, TiDB only supports data import from the client. Therefore, when importing data, set the value of `LocalOpt` to `Local`.

##### Fields and Lines

You can specify how to process the data format by configuring the `Fields` and `Lines` parameters.

- `FIELDS TERMINATED BY`: Specifies the separating character of each data.
- `FIELDS ENCLOSED BY`: Specifies the enclosing character of each data.
- `LINES TERMINATED BY`: Specifies the line terminator, if you want to end a line with a certain character.

Take the following data format as an example:

```
"bob","20","street 1"\r\n
"alice","33","street 1"\r\n
```

If you want to extract `bob`, `20`, and `street 1`, specify the separating character as `,`, and the enclosing character as `\`:

```
FIELDS TERMINATED BY ',' ENCLOSED BY '\\' LINES TERMINATED BY '\r\n'
```

If you do not specify the parameters above, the imported data is processed in the following way by default:

```
FIELDS TERMINATED BY '\t' ENCLOSED BY ''
LINES TERMINATED BY '\n'
```

##### IGNORE number LINES

You can ignore the first `number` lines of a file by configuring the `IGNORE number LINES` parameter. For example, if you configure `IGNORE 1 LINES`, the first line of a file is ignored.

### 14.11.2.68.3 Examples

```
CREATE TABLE trips (
 trip_id bigint NOT NULL PRIMARY KEY AUTO_INCREMENT,
 duration integer not null,
 start_date datetime,
 end_date datetime,
 start_station_number integer,
 start_station varchar(255),
 end_station_number integer,
 end_station varchar(255),
 bike_number varchar(255),
 member_type varchar(255)
);
```

```
Query OK, 0 rows affected (0.14 sec)
```

The following example imports data using `LOAD DATA`. Comma is specified as the separating character. The double quotation marks that enclose the data is ignored. The first line of the file is ignored.

If you see the error message `ERROR 1148 (42000): the used command is not allowed with this TiDB version`, refer to [ERROR 1148 \(42000\): the used command is not allowed with this TiDB version](#).

```
LOAD DATA LOCAL INFILE '/mnt/evo970/data-sets/bikeshare-data/2017Q4-
 ↳ capitalbikeshare-tripdata.csv' INTO TABLE trips FIELDS TERMINATED BY
 ↳ ',' ENCLOSED BY '\"' LINES TERMINATED BY '\r\n' IGNORE 1 LINES (
 ↳ duration, start_date, end_date, start_station_number, start_station,
 ↳ end_station_number, end_station, bike_number, member_type);
```

```
Query OK, 815264 rows affected (39.63 sec)
Records: 815264 Deleted: 0 Skipped: 0 Warnings: 0
```

`LOAD DATA` also supports using hexadecimal ASCII character expressions or binary ASCII character expressions as the parameters for `FIELDS ENCLOSED BY` and `FIELDS TERMINATED BY`. See the following example:

```
LOAD DATA LOCAL INFILE '/mnt/evo970/data-sets/bikeshare-data/2017Q4-
 ↳ capitalbikeshare-tripdata.csv' INTO TABLE trips FIELDS TERMINATED BY
 ↳ x'2c' ENCLOSED BY b'100010' LINES TERMINATED BY '\r\n' IGNORE 1 LINES
 ↳ (duration, start_date, end_date, start_station_number, start_station
 ↳ , end_station_number, end_station, bike_number, member_type);
```

In the above example, `x'2c'` is the hexadecimal representation of the `,` character and `b'100010'` is the binary representation of the `"` character.

#### 14.11.2.68.4 MySQL compatibility

The syntax of the `LOAD DATA` statement is compatible with that of MySQL, except for character set options which are parsed but ignored. If you find any syntax compatibility difference, you can [report it via an issue](#) on GitHub.

##### Note:

- In earlier releases of TiDB, `LOAD DATA` committed every 20000 rows. By default, TiDB now commits all rows in one transaction. This can result in the error `ERROR 8004 (HY000)at line 1: Transaction is too large, size: 100000058` after upgrading from TiDB 4.0 or earlier versions. The recommended way to resolve this error is to increase the `txn-total-size-limit` value in your `tidb.toml` file. If you are unable to increase this limit, you can also restore the previous behavior by setting `tidb_dml_batch_size` to 20000.
- No matter how many rows are committed in a transaction, `LOAD DATA` is not rolled back by the `ROLLBACK` statement in an explicit transaction.
- The `LOAD DATA` statement is always executed in optimistic transaction mode, regardless of the TiDB transaction mode configuration.

#### 14.11.2.68.5 See also

- [TiDB Pessimistic Transaction Mode](#)
- [TiDB Lightning](#)

#### 14.11.2.69 LOAD STATS

The `LOAD STATS` statement is used to load the statistics into TiDB.

##### 14.11.2.69.1 Synopsis

```
LoadStatsStmt ::=
 'LOAD' 'STATS' stringLit
```

##### 14.11.2.69.2 Examples

You can access the address `http://${tidb-server-ip}:${tidb-server-status-port}/stats/dump/${db_name}/${table_name}` to download the TiDB instance's statistics.

You can also use `LOAD STATS ${stats_path}` to load the specific statistics file.

The `${stats_path}` can be an absolute path or a relative path. If you use a relative path, the corresponding file is found starting from the path where `tidb-server` is started. Here is an example:

```
LOAD STATS '/tmp/stats.json';
```

```
Query OK, 0 rows affected (0.00 sec)
```

### 14.11.2.69.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.11.2.69.4 See also

- [Statistics](#)

## 14.11.2.70 LOCK STATS

`LOCK STATS` is used to lock the statistics of a table or tables.

### Warning:

Locking statistics is an experimental feature for the current version. It is not recommended to use it in the production environment.

### 14.11.2.70.1 Synopsis

```
LockStatsStmt ::=
 'LOCK' 'STATS' TableNameList

TableNameList ::=
 TableName (',' TableName)*

TableName ::=
 Identifier ('.' Identifier)?
```

### 14.11.2.70.2 Examples

Create table `t`, and insert data into it. When the statistics of table `t` are not locked, the `ANALYZE` statement can be successfully executed.

```
mysql> create table t(a int, b int);
Query OK, 0 rows affected (0.03 sec)

mysql> insert into t values (1,2), (3,4), (5,6), (7,8);
Query OK, 4 rows affected (0.00 sec)
Records: 4 Duplicates: 0 Warnings: 0

mysql> analyze table t;
Query OK, 0 rows affected, 1 warning (0.02 sec)

mysql> show warnings;
+---+
| Level | Code | Message |
+---+
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
| test.t |
+---+
1 row in set (0.00 sec)
```

Lock the statistics of table `t` and execute `ANALYZE`. From the output of `SHOW` `STATS_LOCKED`, you can see that the statistics of table `t` have been locked. The warning message shows that the `ANALYZE` statement has skipped table `t`.

```
mysql> lock stats t;
Query OK, 0 rows affected (0.00 sec)

mysql> show stats_locked;
+-----+-----+-----+-----+
| Db_name | Table_name | Partition_name | Status |
+-----+-----+-----+-----+
| test | t | | locked |
+-----+-----+-----+-----+
1 row in set (0.01 sec)

mysql> analyze table t;
Query OK, 0 rows affected, 2 warnings (0.00 sec)
```

```
mysql> show warnings;
+---
↪ -----+-----+-----
↪
| Level | Code | Message |
+---
↪ -----+-----+-----
↪
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
↪ test.t |
| Warning | 1105 | skip analyze locked table: t |
+---
↪ -----+-----+-----
↪
2 rows in set (0.00 sec)
```

Unlock the statistics of table `t` and `ANALYZE` can be successfully executed again.

```
mysql> unlock stats t;
Query OK, 0 rows affected (0.01 sec)

mysql> analyze table t;
Query OK, 0 rows affected, 1 warning (0.03 sec)

mysql> show warnings;
+---
↪ -----+-----+-----+
↪
| Level | Code | Message |
+---
↪ -----+-----+-----+
↪
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
↪ test.t |
+---
↪ -----+-----+-----+
↪
1 row in set (0.00 sec)
```

### 14.11.2.70.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.11.2.70.4 See also

- [Statistics](#)
- [UNLOCK STATS](#)

### 14.11.2.71 LOCK TABLES and UNLOCK TABLES

#### Warning:

LOCK TABLES and UNLOCK TABLES are experimental features for the current version. It is not recommended to use it in the production environment.

TiDB enables client sessions to acquire table locks for the purpose of cooperating with other sessions for access to tables, or to prevent other sessions from modifying tables. A session can acquire or release locks only for itself. One session cannot acquire locks for another session or release locks held by another session.

LOCK TABLES acquires table locks for the current client session. If you have the LOCK ↔ TABLES and SELECT privileges for each object to be locked, you can acquire table locks for common tables.

UNLOCK TABLES explicitly releases any table locks held by the current session. LOCK ↔ TABLES implicitly releases all table locks held by the current session before acquiring new locks.

A table lock protects against reads or writes by other sessions. A session that holds a WRITE lock can perform table-level operations such as DROP TABLE or TRUNCATE TABLE.

#### Warning:

To enable table locks, you need to set `enable-table-lock` to `true` in the configuration files of all TiDB instances.

#### 14.11.2.71.1 Synopsis

```

LockTablesDef
 ::= 'LOCK' ('TABLES' | 'TABLE') TableName LockType (',' TableName
 ↔ LockType)*

UnlockTablesDef
 ::= 'UNLOCK' 'TABLES'

```

```
LockType
 ::= 'READ' ('LOCAL')?
 | 'WRITE' ('LOCAL')?
```

### 14.11.2.71.2 Acquire table locks

You can acquire table locks within the current session by using the `LOCK TABLES` statement. The following lock types are available:

`READ` lock:

- The session that holds this lock can read the table, but cannot write it.
- Multiple sessions can acquire a `READ` lock from the same table at the same time.
- Other sessions can read the table without explicitly acquiring a `READ` lock.

The `READ LOCAL` lock is only for syntax compatibility with MySQL and is not supported.

`WRITE` lock:

- The session that holds this lock can read and write the table.
- Only the session that holds this lock can access the table. No other sessions can access it until the lock is released.

`WRITE LOCAL` lock:

- The session that holds this lock can read and write the table.
- Only the session that holds this lock can access the table. Other sessions can read the table, but cannot write it.

If the lock that the `LOCK TABLES` statement needs is held by another session, the `LOCK TABLES` statement must wait, and an error is returned upon the execution of this statement, for example:

```
> LOCK TABLES t1 READ;
ERROR 8020 (HY000): Table 't1' was locked in WRITE by server: f4799bcb-cad7
↳ -4285-8a6d-23d3555173f1_session: 2199023255959
```

The preceding error message indicates that the session with ID 2199023255959 in TiDB f4799bcb-cad7-4285-8a6d-23d3555173f1 already holds a `WRITE` lock on table `t1`. Therefore, the current session cannot acquire a `READ` lock on table `t1`.

You cannot acquire the same table lock multiple times in a single `LOCK TABLES` statement.

```
> LOCK TABLES t WRITE, t READ;
ERROR 1066 (42000): Not unique table/alias: 't'
```

### 14.11.2.71.3 Release table locks

When the table locks held by a session are released, they are all released at the same time. A session can release its locks explicitly or implicitly.

- A session can release its locks explicitly with `UNLOCK TABLES`.
- If a session issues a `LOCK TABLES` statement to acquire a lock while already holding locks, its existing locks are released implicitly before the new locks are acquired.

If the connection for a client session terminates, whether normally or abnormally, TiDB implicitly releases all table locks held by the session. If the client reconnects, the locks are no longer in effect. For this reason, it is not recommended to enable auto-reconnection on the client. If you enable auto-reconnection, the client is not notified when reconnection occurs, and all table locks or current transactions are lost. By contrast, with auto-reconnection disabled, if the connection drops, an error occurs when the next statement is issued. The client can detect the error and take appropriate action such as reacquiring the locks or redoing the transaction.

### 14.11.2.71.4 Table-locking restrictions and conditions

You can safely use `KILL` to terminate a session that holds a table lock.

You cannot acquire table locks on tables in the following databases:

- `INFORMATION_SCHEMA`
- `PERFORMANCE_SCHEMA`
- `METRICS_SCHEMA`
- `mysql`

### 14.11.2.71.5 MySQL compatibility

Table lock acquisition

- In TiDB, if session A has already held a table lock, an error is returned if session B attempts to write to the table. In MySQL, the write request of session B is blocked until session A releases the table lock, and requests for locking the table from other sessions are blocked until the current session releases the `WRITE` lock.
- In TiDB, if the lock that the `LOCK TABLES` statement needs is held by another session, the `LOCK TABLES` statement must wait, and an error is returned upon the execution of this statement. In MySQL, this statement is blocked until the lock is acquired.
- In TiDB, the `LOCK TABLES` statement is effective in the whole cluster. In MySQL, this statement is effective only in the current MySQL server, and is not compatible with the NDB cluster.

Table lock release

When a transaction is explicitly started in a TiDB session (for example, with the `BEGIN` statement), TiDB does not implicitly release the table locks held by the session; but MySQL does.

## 14.11.2.72 MODIFY COLUMN

The ALTER TABLE.. MODIFY COLUMN statement modifies a column on an existing table. The modification can include changing the data type and attributes. To rename at the same time, use the **CHANGE COLUMN** statement instead.

Since v5.1.0, TiDB has supported changes of data types for Reorg data, including but not limited to:

- Changing VARCHAR to BIGINT
- Modifying the DECIMAL precision
- Compressing the length of VARCHAR(10) to VARCHAR(5)

### 14.11.2.72.1 Synopsis

```
AlterTableStmt
 ::= 'ALTER' 'IGNORE'? 'TABLE' TableName ModifyColumnSpec (','
 ↪ ModifyColumnSpec)*

ModifyColumnSpec
 ::= 'MODIFY' ColumnKeywordOpt 'IF EXISTS' ColumnName ColumnType
 ↪ ColumnOption* ('FIRST' | 'AFTER' ColumnName)?

ColumnType
 ::= NumericType
 | StringType
 | DateAndTimeType
 | 'SERIAL'

ColumnOption
 ::= 'NOT'? 'NULL'
 | 'AUTO_INCREMENT'
 | 'PRIMARY'? 'KEY' ('CLUSTERED' | 'NONCLUSTERED')?
 | 'UNIQUE' 'KEY'?
 | 'DEFAULT' (NowSymOptionFraction | SignedLiteral |
 ↪ NextValueForSequence)
 | 'SERIAL' 'DEFAULT' 'VALUE'
 | 'ON' 'UPDATE' NowSymOptionFraction
 | 'COMMENT' stringLit
 | ('CONSTRAINT' Identifier?)? 'CHECK' '(' Expression ')' ('NOT
 ↪ '?' ('ENFORCED' | 'NULL'))?
 | 'GENERATED' 'ALWAYS' 'AS' '(' Expression ')' ('VIRTUAL' | '
 ↪ STORED')?
 | 'REFERENCES' TableName ('(' IndexPartSpecificationList ')')?
 ↪ Match? OnDeleteUpdateOpt
 | 'COLLATE' CollationName
```

```

| 'COLUMN_FORMAT' ColumnFormat
| 'STORAGE' StorageMedia
| 'AUTO_RANDOM' ('(' LengthNum ')')?

```

```

ColumnName ::=
 Identifier ('.' Identifier ('.' Identifier)?)?

```

### 14.11.2.72.2 Examples

Meta-Only Change

```
CREATE TABLE t1 (id int not null primary key AUTO_INCREMENT, col1 INT);
```

Query OK, 0 rows affected (0.11 sec)

```
INSERT INTO t1 (col1) VALUES (1),(2),(3),(4),(5);
```

Query OK, 5 rows affected (0.02 sec)  
Records: 5 Duplicates: 0 Warnings: 0

```
ALTER TABLE t1 MODIFY col1 BIGINT;
```

Query OK, 0 rows affected (0.09 sec)

```
SHOW CREATE TABLE t1\G;
```

```

***** 1. row *****
 Table: t1
Create Table: CREATE TABLE `t1` (
 `id` int(11) NOT NULL AUTO_INCREMENT,
 `col1` bigint(20) DEFAULT NULL,
 PRIMARY KEY (`id`)
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin AUTO_INCREMENT
 ↳ =30001
1 row in set (0.00 sec)

```

Reorg-Data Change

```
CREATE TABLE t1 (id int not null primary key AUTO_INCREMENT, col1 INT);
```

Query OK, 0 rows affected (0.11 sec)

```
INSERT INTO t1 (col1) VALUES (12345),(67890);
```

```
Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0
```

```
ALTER TABLE t1 MODIFY col1 VARCHAR(5);
```

```
Query OK, 0 rows affected (2.52 sec)
```

```
SHOW CREATE TABLE t1\G;
```

```
***** 1. row *****
 Table: t1
CREATE TABLE `t1` (
 `id` int(11) NOT NULL AUTO_INCREMENT,
 `col1` varchar(5) DEFAULT NULL,
 PRIMARY KEY (`id`) /*T![clustered_index] CLUSTERED */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin AUTO_INCREMENT
 ↪ =30001
1 row in set (0.00 sec)
```

#### Note:

- TiDB returns an error when the changed data type conflicts with an existing data row. In the above example, TiDB returns the following error:

```
alter table t1 modify column col1 varchar(4); ERROR 1406
 ↪ (22001): Data Too Long, field len 4, data len 5
```

- Due to the compatibility with the Async Commit feature, the DDL statement waits for a period of time (about 2.5s) before starting to process into Reorg Data.

```
Query OK, 0 rows affected (2.52 sec)
```

#### 14.11.2.72.3 MySQL compatibility

- Does not support modifying the Reorg-Data types on the primary key columns but supports modifying the Meta-Only types. For example:

```
CREATE TABLE t (a int primary key);
ALTER TABLE t MODIFY COLUMN a VARCHAR(10);
ERROR 8200 (HY000): Unsupported modify column: column has primary key
↳ flag
```

```
CREATE TABLE t (a int primary key);
ALTER TABLE t MODIFY COLUMN a INT(10) UNSIGNED;
ERROR 8200 (HY000): Unsupported modify column: column has primary key
↳ flag
```

```
CREATE TABLE t (a int primary key);
ALTER TABLE t MODIFY COLUMN a bigint;
Query OK, 0 rows affected (0.01 sec)
```

- Does not support modifying the column types on generated columns. For example:

```
CREATE TABLE t (a INT, b INT as (a+1));
ALTER TABLE t MODIFY COLUMN b VARCHAR(10);
ERROR 8200 (HY000): Unsupported modify column: column is generated
```

- Does not support modifying the column types on the partitioned tables. For example:

```
CREATE TABLE t (c1 INT, c2 INT, c3 INT) partition by range columns(c1)
↳ (partition p0 values less than (10), partition p1 values less
↳ than (maxvalue));
ALTER TABLE t MODIFY COLUMN c1 DATETIME;
ERROR 8200 (HY000): Unsupported modify column: table is partition
↳ table
```

- Does not support modifying some data types (for example, some TIME types, Bit, Set, Enum, JSON) are not supported due to some compatibility issues of the cast function's behavior between TiDB and MySQL.

```
CREATE TABLE t (a DECIMAL(13, 7));
ALTER TABLE t MODIFY COLUMN a DATETIME;
ERROR 8200 (HY000): Unsupported modify column: change from original
↳ type decimal(13,7) to datetime is currently unsupported yet
```

#### 14.11.2.72.4 See also

- [SHOW CREATE TABLE](#)
- [ADD COLUMN](#)
- [DROP COLUMN](#)
- [CHANGE COLUMN](#)

### 14.11.2.73 PREPARE

The PREPARE statement provides an SQL interface to server-side prepared statements.

#### 14.11.2.73.1 Synopsis

```
PreparedStmt ::=
 'PREPARE' Identifier 'FROM' PrepareSQL

PrepareSQL ::=
 stringLit
| UserVariable
```

#### 14.11.2.73.2 Examples

```
mysql> PREPARE mystmt FROM 'SELECT ? as num FROM DUAL';
Query OK, 0 rows affected (0.00 sec)

mysql> SET @number = 5;
Query OK, 0 rows affected (0.00 sec)

mysql> EXECUTE mystmt USING @number;
+-----+
| num |
+-----+
| 5 |
+-----+
1 row in set (0.00 sec)

mysql> DEALLOCATE PREPARE mystmt;
Query OK, 0 rows affected (0.00 sec)
```

#### 14.11.2.73.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

#### 14.11.2.73.4 See also

- [EXECUTE](#)
- [DEALLOCATE](#)

### 14.11.2.74 RECOVER TABLE

RECOVER TABLE is used to recover a deleted table and the data on it within the GC (Garbage Collection) life time after the DROP TABLE statement is executed.

#### 14.11.2.74.1 Syntax

```
RECOVER TABLE table_name;
```

```
RECOVER TABLE BY JOB JOB_ID;
```

#### 14.11.2.74.2 Synopsis

```
RecoverTableStmt ::=
 'RECOVER' 'TABLE' ('BY' 'JOB' Int64Num | TableName Int64Num?)

TableName ::=
 Identifier ('.' Identifier)?

Int64Num ::= NUM

NUM ::= intLit
```

#### Note:

- If a table is deleted and the GC lifetime is out, the table cannot be recovered with `RECOVER TABLE`. Execution of `RECOVER TABLE` in this scenario returns an error like: `snapshot is older than GC safe point`  
↪ 2019-07-10 13:45:57 +0800 CST.
- If the TiDB version is 3.0.0 or later, it is not recommended for you to use `RECOVER TABLE` when TiDB Binlog is used.
- `RECOVER TABLE` is supported in the Binlog version 3.0.1, so you can use `RECOVER TABLE` in the following three situations:
  - Binlog version is 3.0.1 or later.
  - TiDB 3.0 is used both in the upstream cluster and the downstream cluster.
  - The GC life time of the secondary cluster must be longer than that of the primary cluster. However, as latency occurs during data replication between upstream and downstream databases, data recovery might fail in the downstream.

#### Troubleshoot errors during TiDB Binlog replication

When you use `RECOVER TABLE` in the upstream TiDB during TiDB Binlog replication, TiDB Binlog might be interrupted in the following three situations:

- The downstream database does not support the `RECOVER TABLE` statement. An error instance: `check the manual that corresponds to your MySQL server version ↪ for the right syntax to use near 'RECOVER TABLE table_name'.`
- The GC life time is not consistent between the upstream database and the downstream database. An error instance: `snapshot is older than GC safe point 2019-07-10 ↪ 13:45:57 +0800 CST.`
- Latency occurs during replication between upstream and downstream databases. An error instance: `snapshot is older than GC safe point 2019-07-10 13:45:57 ↪ +0800 CST.`

For the above three situations, you can resume data replication from TiDB Binlog with a [full import of the deleted table](#).

### 14.11.2.74.3 Examples

- Recover the deleted table according to the table name.

```
DROP TABLE t;
```

```
RECOVER TABLE t;
```

This method searches the recent DDL job history and locates the first DDL operation of the `DROP TABLE` type, and then recovers the deleted table with the name identical to the one table name specified in the `RECOVER TABLE` statement.

- Recover the deleted table according to the table's DDL `JOB ID` used.

Suppose that you had deleted the table `t` and created another `t`, and again you deleted the newly created `t`. Then, if you want to recover the `t` deleted in the first place, you must use the method that specifies the DDL `JOB ID`.

```
DROP TABLE t;
```

```
ADMIN SHOW DDL JOBS 1;
```

The second statement above is used to search for the table's DDL `JOB ID` to delete `t`. In the following example, the ID is 53.

```
+-----+-----+-----+-----+-----+-----+-----+
↪
| JOB_ID | DB_NAME | TABLE_NAME | JOB_TYPE | SCHEMA_STATE | SCHEMA_ID |
↪ TABLE_ID | ROW_COUNT | START_TIME | STATE |
+-----+-----+-----+-----+-----+-----+-----+
↪
```

|                                             |      |  |                                   |        |   |    |
|---------------------------------------------|------|--|-----------------------------------|--------|---|----|
| 53                                          | test |  | drop table                        | none   | 1 | 41 |
| ↪                                           | 0    |  | 2019-07-10 13:23:18.277 +0800 CST | synced |   |    |
| +-----+-----+-----+-----+-----+-----+-----+ |      |  |                                   |        |   |    |
| ↪                                           |      |  |                                   |        |   |    |

```
RECOVER TABLE BY JOB 53;
```

This method recovers the deleted table via the DDL JOB ID. If the corresponding DDL job is not of the DROP TABLE type, an error occurs.

#### 14.11.2.74.4 Implementation principle

When deleting a table, TiDB only deletes the table metadata, and writes the table data (row data and index data) to be deleted to the `mysql.gc_delete_range` table. The GC Worker in the TiDB background periodically removes from the `mysql.gc_delete_range` table the keys that exceed the GC life time.

Therefore, to recover a table, you only need to recover the table metadata and delete the corresponding row record in the `mysql.gc_delete_range` table before the GC Worker deletes the table data. You can use a snapshot read of TiDB to recover the table metadata. Refer to [Read Historical Data](#) for details.

Table recovery is done by TiDB obtaining the table metadata through snapshot read, and then going through the process of table creation similar to CREATE TABLE. Therefore, RECOVER TABLE itself is, in essence, a kind of DDL operation.

#### 14.11.2.74.5 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.11.2.75 RENAME USER

RENAME USER is used to rename an existing user.

#### 14.11.2.75.1 Synopsis

```
RenameUserStmt ::=
 'RENAME' 'USER' UserToUser (',' UserToUser)*
UserToUser ::=
 Username 'TO' Username
Username ::=
 StringName ('@' StringName | singleAtIdentifier)? | 'CURRENT_USER'
 ↪ OptionalBraces
```

### 14.11.2.75.2 Examples

```
CREATE USER 'newuser' IDENTIFIED BY 'mypassword';
```

```
Query OK, 1 row affected (0.02 sec)
```

```
SHOW GRANTS FOR 'newuser';
```

```
+-----+
| Grants for newuser@% |
+-----+
| GRANT USAGE ON *.* TO 'newuser'@ '%' |
+-----+
1 row in set (0.00 sec)
```

```
RENAME USER 'newuser' TO 'testuser';
```

```
Query OK, 0 rows affected (0.08 sec)
```

```
SHOW GRANTS FOR 'testuser';
```

```
+-----+
| Grants for testuser@% |
+-----+
| GRANT USAGE ON *.* TO 'testuser'@ '%' |
+-----+
1 row in set (0.00 sec)
```

```
SHOW GRANTS FOR 'newuser';
```

```
ERROR 1141 (42000): There is no such grant defined for user 'newuser' on
↳ host '%'
```

### 14.11.2.75.3 MySQL compatibility

RENAME USER is expected to be fully compatible with MySQL. If you find any compatibility difference, submit a [GitHub issue](#).

### 14.11.2.75.4 See also

- [CREATE USER](#)
- [SHOW GRANTS](#)
- [DROP USER](#)

## 14.11.2.76 RENAME INDEX

The statement `ALTER TABLE .. RENAME INDEX` renames an existing index to a new name. This operation is instant in TiDB, and requires only a meta data change.

### 14.11.2.76.1 Synopsis

```
AlterTableStmt
 ::= 'ALTER' 'IGNORE'? 'TABLE' TableName RenameIndexSpec (','
 ↪ RenameIndexSpec)*

RenameIndexSpec
 ::= 'RENAME' ('KEY' | 'INDEX') Identifier 'TO' Identifier
```

### 14.11.2.76.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
 ↪ NOT NULL, INDEX col1 (c1));
Query OK, 0 rows affected (0.11 sec)

mysql> SHOW CREATE TABLE t1\G
***** 1. row *****
 Table: t1
Create Table: CREATE TABLE `t1` (
 `id` int(11) NOT NULL AUTO_INCREMENT,
 `c1` int(11) NOT NULL,
 PRIMARY KEY (`id`),
 KEY `col1` (`c1`)
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
1 row in set (0.00 sec)

mysql> ALTER TABLE t1 RENAME INDEX col1 TO c1;
Query OK, 0 rows affected (0.09 sec)

mysql> SHOW CREATE TABLE t1\G
***** 1. row *****
 Table: t1
Create Table: CREATE TABLE `t1` (
 `id` int(11) NOT NULL AUTO_INCREMENT,
 `c1` int(11) NOT NULL,

## 14.11.2.77 RENAME TABLE

This statement renames an existing table to a new name.

### 14.11.2.77.1 Synopsis

```
RenameTableStmt ::=
 'RENAME' 'TABLE' TableToTable (',' TableToTable)*

TableToTable ::=
 TableName 'TO' TableName
```

### 14.11.2.77.2 Examples

```
mysql> CREATE TABLE t1 (a int);
Query OK, 0 rows affected (0.12 sec)

mysql> SHOW TABLES;
+-----+
| Tables_in_test |
+-----+
| t1 |
+-----+
1 row in set (0.00 sec)

mysql> RENAME TABLE t1 TO t2;
Query OK, 0 rows affected (0.08 sec)

mysql> SHOW TABLES;
+-----+
| Tables_in_test |
+-----+
```

```
| t2 |
+-----+
1 row in set (0.00 sec)
```

### 14.11.2.77.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

## 14.11.2.78 REPLACE

The REPLACE statement is semantically a combined DELETE+INSERT statement. It can be used to simplify application code.

### 14.11.2.78.1 Synopsis

```
ReplaceIntoStmt ::=
 'REPLACE' PriorityOpt IntoOpt TableName PartitionNameListOpt
 ↪ InsertValues

PriorityOpt ::=
 ('LOW_PRIORITY' | 'HIGH_PRIORITY' | 'DELAYED')?

IntoOpt ::= 'INTO'?

TableName ::=
 Identifier ('.' Identifier)?

PartitionNameListOpt ::=
 ('PARTITION' '(' Identifier (',' Identifier)* ')')?

InsertValues ::=
 '(' (ColumnNameListOpt ')' (ValueSym ValuesList | SelectStmt | '('
 ↪ SelectStmt ')' | UnionStmt) | SelectStmt ')')
| ValueSym ValuesList
| SelectStmt
| UnionStmt
| 'SET' ColumnSetValue? (',' ColumnSetValue)*
```

### 14.11.2.78.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
 ↪ NOT NULL);
Query OK, 0 rows affected (0.12 sec)

mysql> INSERT INTO t1 (c1) VALUES (1), (2), (3);
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+----+-----+
| id | c1 |
+----+-----+
1	1
2	2
3	3
+----+-----+
3 rows in set (0.00 sec)

mysql> REPLACE INTO t1 (id, c1) VALUES(3, 99);
Query OK, 2 rows affected (0.01 sec)

mysql> SELECT * FROM t1;
+----+-----+
| id | c1 |
+----+-----+
1	1
2	2
3	99
+----+-----+
3 rows in set (0.00 sec)
```

- [DELETE](#)
- [INSERT](#)
- [SELECT](#)
- [UPDATE](#)

### 14.11.2.79 RESTORE

This statement performs a distributed restore from a backup archive previously produced by a **BACKUP statement**.

The **RESTORE** statement uses the same engine as the **BR tool**, except that the restore process is driven by TiDB itself rather than a separate BR tool. All benefits and caveats of BR also apply here. In particular, **RESTORE is currently not ACID-compliant**. Before running **RESTORE**, ensure that the following requirements are met:

- The cluster is “offline”, and the current TiDB session is the only active SQL connection to access all tables being restored.
- When a full restore is being performed, the tables being restored should not already exist, because existing data might be overridden and causes inconsistency between the data and indices.
- When an incremental restore is being performed, the tables should be at the exact same state as the **LAST\_BACKUP** timestamp when the backup is created.

Running **RESTORE** requires either the **RESTORE\_ADMIN** or **SUPER** privilege. Additionally, both the TiDB node executing the restore and all TiKV nodes in the cluster must have read permission from the destination.

The **RESTORE** statement is blocking, and will finish only after the entire restore task is finished, failed, or canceled. A long-lasting connection should be prepared for running **RESTORE**. The task can be canceled using the **KILL TIDB QUERY** statement.

Only one **BACKUP** and **RESTORE** task can be executed at a time. If a **BACKUP** or **RESTORE** task is already running on the same TiDB server, the new **RESTORE** execution will wait until all previous tasks are done.

**RESTORE** can only be used with “tikv” storage engine. Using **RESTORE** with the “unistore” engine will fail.

#### 14.11.2.79.1 Synopsis

```
RestoreStmt ::=
 "RESTORE" BRIETables "FROM" stringLit RestoreOption*

BRIETables ::=
 "DATABASE" ('*' | DBName (',' DBName)*)
| "TABLE" TableNameList

RestoreOption ::=
 "RATE_LIMIT" '='? LengthNum "MB" '/' "SECOND"
| "CONCURRENCY" '='? LengthNum
| "CHECKSUM" '='? Boolean
| "SEND_CREDENTIALS_TO_TIKV" '='? Boolean
```

```
Boolean ::=
 NUM | "TRUE" | "FALSE"
```

### 14.11.2.79.2 Examples

Restore from backup archive

```
RESTORE DATABASE * FROM 'local:///mnt/backup/2020/04/';
```

```
+--
 ↪ -----+-----+-----+-----+
 ↪
| Destination | Size | BackupTS | Queue Time |
 ↪ Execution Time | | | |
+--
 ↪ -----+-----+-----+-----+
 ↪
| local:///mnt/backup/2020/04/ | 248665063 | 0 | 2020-04-21 17:16:55 |
 ↪ 2020-04-21 17:16:55 |
+--
 ↪ -----+-----+-----+-----+
 ↪
1 row in set (28.961 sec)
```

In the example above, all data is restored from a backup archive at the local filesystem. The data is read as SST files from the `/mnt/backup/2020/04/` directories distributed among all TiDB and TiKV nodes.

The first row of the result above is described as follows:

| Column           | Description                                    |
|------------------|------------------------------------------------|
| Destination<br>↪ | The destination URL to read from               |
| Size             | The total size of the backup archive, in bytes |
| BackupTS         | (not used)                                     |

| Column              | Description                                                               |
|---------------------|---------------------------------------------------------------------------|
| Queue<br>↪ Time     | The timestamp (in current time zone) when the RESTORE task was queued.    |
| Execution<br>↪ Time | The timestamp (in current time zone) when the RESTORE task starts to run. |

### Partial restore

You can specify which databases or tables to restore. If some databases or tables are missing from the backup archive, they will be ignored, and thus RESTORE would complete without doing anything.

```
RESTORE DATABASE `test` FROM 'local:///mnt/backup/2020/04/';
```

```
RESTORE TABLE `test`.`sbtest01`, `test`.`sbtest02` FROM 'local:///mnt/
↪ backup/2020/04/';
```

### External storages

BR supports restoring data from S3 or GCS:

```
RESTORE DATABASE * FROM 's3://example-bucket-2020/backup-05/';
```

The URL syntax is further explained in [external storage URI](#).

When running on cloud environment where credentials should not be distributed, set the SEND\_CREDENTIALS\_TO\_TIKV option to FALSE:

```
RESTORE DATABASE * FROM 's3://example-bucket-2020/backup-05/'
SEND_CREDENTIALS_TO_TIKV = FALSE;
```

### Performance fine-tuning

Use RATE\_LIMIT to limit the average download speed per TiKV node to reduce network bandwidth.

By default, TiDB node would run 128 restore threads. This value can be adjusted with the `CONCURRENCY` option.

Before restore is completed, `RESTORE` would perform a checksum against the data from the archive to verify correctness. This step can be disabled with the `CHECKSUM` option if you are confident that this is unnecessary.

```
RESTORE DATABASE * FROM 's3://example-bucket-2020/backup-06/'
RATE_LIMIT = 120 MB/SECOND
CONCURRENCY = 64
CHECKSUM = FALSE;
```

### Incremental restore

There is no special syntax to perform incremental restore. TiDB will recognize whether the backup archive is full or incremental and take appropriate action. You only need to apply each incremental restore in correct order.

For instance, if a backup task is created as follows:

```
BACKUP DATABASE `test` TO 's3://example-bucket/full-backup' SNAPSHOT =
 ↪ 413612900352000;
BACKUP DATABASE `test` TO 's3://example-bucket/inc-backup-1' SNAPSHOT =
 ↪ 414971854848000 LAST_BACKUP = 413612900352000;
BACKUP DATABASE `test` TO 's3://example-bucket/inc-backup-2' SNAPSHOT =
 ↪ 416353458585600 LAST_BACKUP = 414971854848000;
```

then the same order should be applied in the restore:

```
RESTORE DATABASE * FROM 's3://example-bucket/full-backup';
RESTORE DATABASE * FROM 's3://example-bucket/inc-backup-1';
RESTORE DATABASE * FROM 's3://example-bucket/inc-backup-2';
```

### 14.11.2.79.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.11.2.80 REVOKE <privileges>

This statement removes privileges from an existing user. Executing this statement requires the `GRANT OPTION` privilege and all privileges you revoke.

### 14.11.2.80.1 Synopsis

```

GrantStmt ::=
 'GRANT' PrivElemList 'ON' ObjectType PrivLevel 'TO' UserSpecList
 ↪ RequireClauseOpt WithGrantOptionOpt

PrivElemList ::=
 PrivElem (',' PrivElem)*

PrivElem ::=
 PrivType ('(' ColumnNameList ')')?

PrivType ::=
 'ALL' 'PRIVILEGES'?
| 'ALTER' 'ROUTINE'?
| 'CREATE' ('USER' | 'TEMPORARY' 'TABLES' | 'VIEW' | 'ROLE' | 'ROUTINE')
 ↪ ?
| 'TRIGGER'
| 'DELETE'
| 'DROP' 'ROLE'?
| 'PROCESS'
| 'EXECUTE'
| 'INDEX'
| 'INSERT'
| 'SELECT'
| 'SUPER'
| 'SHOW' ('DATABASES' | 'VIEW')
| 'UPDATE'
| 'GRANT' 'OPTION'
| 'REFERENCES'
| 'REPLICATION' ('SLAVE' | 'CLIENT')
| 'USAGE'
| 'RELOAD'
| 'FILE'
| 'CONFIG'
| 'LOCK' 'TABLES'
| 'EVENT'
| 'SHUTDOWN'

ObjectType ::=
 'TABLE'?

PrivLevel ::=
 '*' ('.' '*')?
| Identifier ('.' ('*' | Identifier))?

```

```
UserSpecList ::=
 UserSpec (',' UserSpec)*
```

### 14.11.2.80.2 Examples

```
mysql> CREATE USER 'newuser' IDENTIFIED BY 'mypassword';
Query OK, 1 row affected (0.02 sec)

mysql> GRANT ALL ON test.* TO 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-----+
| Grants for newuser@% |
+-----+
| GRANT USAGE ON *.* TO 'newuser'@'%' |
| GRANT ALL PRIVILEGES ON test.* TO 'newuser'@'%' |
+-----+
2 rows in set (0.00 sec)

mysql> REVOKE ALL ON test.* FROM 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-----+
| Grants for newuser@% |
+-----+
| GRANT USAGE ON *.* TO 'newuser'@'%' |
+-----+
1 row in set (0.00 sec)

mysql> DROP USER 'newuser';
Query OK, 0 rows affected (0.14 sec)

mysql> SHOW GRANTS FOR 'newuser';
ERROR 1141 (42000): There is no such grant defined for user 'newuser' on
↪ host '%'
```

### 14.11.2.80.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

#### 14.11.2.80.4 See also

- [GRANT <privileges>](#)
- [SHOW GRANTS](#)
  
- [Privilege Management](#)

#### 14.11.2.81 REVOKE <role>

This statement removes a previously assigned role from a specified user (or list of users).

##### 14.11.2.81.1 Synopsis

```
RevokeRoleStmt ::=
 'REVOKE' RolenameList 'FROM' UsernameList

RolenameList ::=
 Rolename (',' Rolename) *

UsernameList ::=
 Username (',' Username) *
```

##### 14.11.2.81.2 Examples

Connect to TiDB as the root user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Create a new role `analyticsteam` and a new user `jennifer`:

```
CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Note that by default `jennifer` needs to execute `SET ROLE analyticsteam` in order to be able to use the privileges associated with the `analyticsteam` role:

```
SHOW GRANTS;
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
2 rows in set (0.00 sec)

SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

SHOW GRANTS;
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT SELECT ON test.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+-----+
| Tables_in_test |
+-----+
| t1 |
+-----+
1 row in set (0.00 sec)
```

Connect to TiDB as the root user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

The statement `SET DEFAULT ROLE` can be used to associate the role `analyticsteam` to `jennifer`:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
Query OK, 0 rows affected (0.02 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

After this, the user `jennifer` has the privileges associated with the role `analyticsteam` and `jennifer` does not have to execute the statement `SET ROLE`:

```
SHOW GRANTS;
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@%' |
| GRANT SELECT ON test.* TO 'jennifer'@%' |
| GRANT 'analyticsteam'@%' TO 'jennifer'@%' |
+-----+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+-----+
| Tables_in_test |
+-----+
| t1 |
+-----+
1 row in set (0.00 sec)
```

Connect to TiDB as the root user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Revoke the role of `analyticsteam` from `jennifer`:

```
REVOKE analyticsteam FROM jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Show the privileges of `jennifer`:

```
SHOW GRANTS;
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@%' |
+-----+
1 row in set (0.00 sec)
```

### 14.11.2.81.3 MySQL compatibility

This statement is understood to be fully compatible with roles, which are a feature of MySQL 8.0. Any compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.81.4 See also

- [CREATE ROLE](#)
- [DROP ROLE](#)
- [GRANT <role>](#)
- [SET ROLE](#)
- [SET DEFAULT ROLE](#)
  
- [Role-Based Access Control](#)

## 14.11.2.82 ROLLBACK

This statement reverts all changes in the current transaction inside of TIDB. It is the opposite of a COMMIT statement.

### 14.11.2.82.1 Synopsis

```
RollbackStmt ::=
 'ROLLBACK' CompletionTypeWithinTransaction?

CompletionTypeWithinTransaction ::=
 'AND' ('CHAIN' ('NO' 'RELEASE')? | 'NO' 'CHAIN' ('NO'? 'RELEASE')?
 ↔)
| 'NO'? 'RELEASE'
```

### 14.11.2.82.2 Examples

```
mysql> CREATE TABLE t1 (a INT NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.12 sec)

mysql> BEGIN;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.00 sec)

mysql> ROLLBACK;
Query OK, 0 rows affected (0.01 sec)

mysql> SELECT * FROM t1;
Empty set (0.01 sec)
```

### 14.11.2.82.3 MySQL compatibility

- TiDB parses but ignores the syntax `ROLLBACK AND [NO] RELEASE`. This functionality is used in MySQL to disconnect the client session immediately after rolling back the transaction. In TiDB, it is recommended to instead use the `mysql_close()` functionality of your client driver.
- TiDB parses but ignores the syntax `ROLLBACK AND [NO] CHAIN`. This functionality is used in MySQL to immediately start a new transaction with the same isolation level while the current transaction is being rolled back. In TiDB, it is recommended to instead start a new transaction.

### 14.11.2.82.4 See also

- [SAVEPOINT](#)
- [COMMIT](#)
- [BEGIN](#)
- [START TRANSACTION](#)

### 14.11.2.83 SAVEPOINT

SAVEPOINT is a feature introduced in TiDB v6.2.0. The syntax is as follows:

```
SAVEPOINT identifier
ROLLBACK TO [SAVEPOINT] identifier
RELEASE SAVEPOINT identifier
```

#### Warning:

- You cannot use `SAVEPOINT` with TiDB Binlog enabled.
- You cannot use `SAVEPOINT` in pessimistic transactions when `tidb_constraint_check_in_place_pessimistic` is disabled.

- `SAVEPOINT` is used to set a savepoint of a specified name in the current transaction. If a savepoint with the same name already exists, it will be deleted and a new savepoint with the same name will be set.
- `ROLLBACK TO SAVEPOINT` rolls back a transaction to the savepoint of a specified name and does not terminate the transaction. Data changes made to the table data after the savepoint will be reverted in the rollback, and all savepoints after the savepoint are deleted. In a pessimistic transaction, the locks held by the transaction are not rolled back. Instead, the locks will be released when the transaction ends.

If the savepoint specified in the `ROLLBACK TO SAVEPOINT` statement does not exist, the statement returns the following error:

```
ERROR 1305 (42000): SAVEPOINT identifier does not exist
```

- `RELEASE SAVEPOINT` statement removes the named savepoint and **all savepoints** after this savepoint from the current transaction, without committing or rolling back the current transaction. If the savepoint of the specified name does not exist, the following error is returned:

```
ERROR 1305 (42000): SAVEPOINT identifier does not exist
```

After the transaction is committed or rolled back, all savepoints in the transaction will be deleted.

#### 14.11.2.83.1 Examples

Create a table `t1`:

```
CREATE TABLE t1 (a INT NOT NULL PRIMARY KEY);
```

```
Query OK, 0 rows affected (0.12 sec)
```

Start the current transaction:

```
BEGIN;
```

```
Query OK, 0 rows affected (0.00 sec)
```

Insert data into the table and set a savepoint `sp1`:

```
INSERT INTO t1 VALUES (1);
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SAVEPOINT sp1;
```

```
Query OK, 0 rows affected (0.01 sec)
```

Insert data into the table again and set a savepoint `sp2`:

```
INSERT INTO t1 VALUES (2);
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SAVEPOINT sp2;
```

```
Query OK, 0 rows affected (0.01 sec)
```

Release the savepoint sp2:

```
RELEASE SAVEPOINT sp2;
```

```
Query OK, 0 rows affected (0.01 sec)
```

Roll back to the savepoint sp1:

```
ROLLBACK TO SAVEPOINT sp1;
```

```
Query OK, 0 rows affected (0.01 sec)
```

Commit the transaction and query the table. Only the data inserted before sp1 is returned.

```
COMMIT;
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
SELECT * FROM t1;
```

```
+----+
| a |
+----+
| 1 |
+----+
1 row in set
```

### 14.11.2.83.2 MySQL compatibility

When `ROLLBACK TO SAVEPOINT` is used to roll back a transaction to a specified savepoint, MySQL releases the locks held only after the specified savepoint, while in TiDB pessimistic transaction, TiDB does not immediately release the locks held after the specified savepoint. Instead, TiDB releases all locks when the transaction is committed or rolled back.

#### 14.11.2.84.2 Description of the syntax elements

| Syntax Element             | Description                                                                                                                                                                                                                                                                                                    |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TableOptimizerHints        | This is the hint to control the behavior of TiDB's optimizer. For more information, refer to <a href="#">Optimizer Hints</a> .                                                                                                                                                                                 |
| ALL, DISTINCT, DISTINCTROW | The ALL, DISTINCT/DISTINCTROW modifiers specify whether duplicate rows should be returned. ALL (the default) specifies that all matching rows should be returned.                                                                                                                                              |
| HIGH_PRIORITY              | HIGH_PRIORITY gives the current statement higher priority than other statements.                                                                                                                                                                                                                               |
| SQL_CALC_FOUND_ROWS        | TiDB does not support this feature, and will return an error unless <code>tidb_enable_noop_functions=1</code> is set.                                                                                                                                                                                          |
| SQL_CACHE, SQL_NO_CACHE    | SQL_CACHE and SQL_NO_CACHE are used to control whether to cache the request results to the BlockCache of TiKV (RocksDB). For a one-time query on a large amount of data, such as the <code>count(*)</code> query, it is recommended to fill in SQL_NO_CACHE to avoid flushing the hot user data in BlockCache. |
| STRAIGHT_JOIN              | STRAIGHT_JOIN forces the optimizer to do a union query in the order of the tables used in the FROM clause. When the optimizer chooses a join order that is not good, you can use this syntax to speed up the execution of the query.                                                                           |

| Syntax Element                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>select_expr</code>                             | Each <code>select_expr</code> indicates a column to retrieve, including the column names and expressions. <code>\*</code> represents all the columns.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| FROM<br>↪ <code>table_references</code>              | The FROM <code>table_references</code> clause indicates the table (such as <code>select * from t;</code> ), or tables (such as <code>select * from t1 join t2;</code> ) or even 0 tables (such as <code>select 1+1 from dual;</code> which is equivalent to <code>select 1+1;</code> ) from which to retrieve rows.                                                                                                                                                                                                                                                                                                                               |
| WHERE<br>↪ <code>where_condition</code>              | The WHERE clause, if given, indicates the condition or conditions that rows must satisfy to be selected. The result contains only the data that meets the condition(s).                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| GROUP BY<br>HAVING<br>↪ <code>where_condition</code> | The GROUP BY statement is used to group the result-set. The HAVING clause and the WHERE clause are both used to filter the results. The HAVING clause filters the results of GROUP BY, while the WHERE clause filter the results before aggregation.                                                                                                                                                                                                                                                                                                                                                                                              |
| ORDER BY                                             | The ORDER BY clause is used to sort the data in ascending or descending order, based on columns, expressions or items in the <code>select_expr</code> list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| LIMIT                                                | The LIMIT clause can be used to constrain the number of rows. LIMIT takes one or two numeric arguments. With one argument, the argument specifies the maximum number of rows to return, the first row to return is the first row of the table by default; with two arguments, the first argument specifies the offset of the first row to return, and the second specifies the maximum number of rows to return. TiDB also supports the <code>FETCH FIRST/NEXT n ROW/ROWS ONLY</code> syntax, which has the same effect as <code>LIMIT n</code> . You can omit <code>n</code> in this syntax and its effect is the same as <code>LIMIT 1</code> . |
| Window<br>↪ <code>window_definition</code>           | This is the syntax for window function, which is usually used to do some analytical computation. For more information, refer to <a href="#">Window Function</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Syntax Element     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FOR UPDATE         | The <code>SELECT FOR UPDATE</code> clause locks all the data in the result sets to detect concurrent updates from other transactions. Data that match the query conditions but do not exist in the result sets are not read-locked, such as the row data written by other transactions after the current transaction is started. TiDB uses the <a href="#">Optimistic Transaction Model</a> . The transaction conflicts are not detected in the statement execution phase. Therefore, the current transaction does not block other transactions from executing <code>UPDATE</code> , <code>DELETE</code> or <code>SELECT FOR UPDATE</code> like other databases such as PostgreSQL. In the committing phase, the rows read by <code>SELECT FOR UPDATE</code> are committed in two phases, which means they can also join the conflict detection. If write conflicts occur, the commit fails for all transactions that include the <code>SELECT FOR UPDATE</code> clause. If no conflict is detected, the commit succeeds. And a new version is generated for the locked rows, so that write conflicts can be detected when other uncommitted transactions are being committed later. When using pessimistic transaction mode, the behavior is basically the same as other databases. Refer to <a href="#">Difference with MySQL InnoDB</a> to see the details. TiDB supports the <code>NOWAIT</code> modifier for <code>FOR UPDATE</code> . See <a href="#">TiDB Pessimistic Transaction Mode</a> for details. |
| LOCK IN SHARE MODE | To guarantee compatibility, TiDB parses these three modifiers, but will ignore them.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TABLESAMPLE        | To get a sample of rows from the table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

### 14.11.2.84.3 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+-----+-----+
| id | c1 |
+-----+-----+
```

```
1	1
2	2
3	3
4	4
5	5
+-----+
5 rows in set (0.00 sec)
```

```
mysql> SELECT AVG(s_quantity), COUNT(s_quantity) FROM stock TABLESAMPLE
↳ REGIONS();
```

```
+-----+-----+
| AVG(s_quantity) | COUNT(s_quantity) |
+-----+-----+
| 59.5000 | 4 |
+-----+-----+
1 row in set (0.00 sec)
```

```
mysql> SELECT AVG(s_quantity), COUNT(s_quantity) FROM stock;
```

```
+-----+-----+
| AVG(s_quantity) | COUNT(s_quantity) |
+-----+-----+
| 54.9729 | 1000000 |
+-----+-----+
1 row in set (0.52 sec)
```

The above example uses data generated with `tiup bench tpcc prepare`. The first query shows the use of `TABLESAMPLE`.

#### 14.11.2.84.4 MySQL compatibility

- The syntax `SELECT ... INTO @variable` is not supported.
- The syntax `SELECT ... GROUP BY ... WITH ROLLUP` is not supported.
- The syntax `SELECT .. GROUP BY expr` does not imply `GROUP BY expr ORDER BY ↳ expr` as it does in MySQL 5.7. TiDB instead matches the behavior of MySQL 8.0 and does not imply a default order.
- The syntax `SELECT ... TABLESAMPLE ...` is a TiDB extension and not supported by MySQL.

### 14.11.2.85 SET DEFAULT ROLE

This statement sets a specific role to be applied to a user by default. Thus, they will automatically have the permissions associated with a role without having to execute `SET ↵ ROLE <rolename>` or `SET ROLE ALL`.

#### 14.11.2.85.1 Synopsis

**SetDefaultRoleStmt:**

Figure 363: SetDefaultRoleStmt

**SetDefaultRoleOpt:**

Figure 364: SetDefaultRoleOpt

**RolenameList:**

Figure 365: RolenameList

**UsernameList:**

Figure 366: UsernameList

### 14.11.2.85.2 Examples

Connect to TiDB as the root user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Create a new role `analyticsteam` and a new user `jennifer`:

```
CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Note that by default `jennifer` needs to execute `SET ROLE analyticsteam` in order to be able to use the privileges associated with the `analyticsteam` role:

```
SHOW GRANTS;
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@ '%' |
| GRANT 'analyticsteam'@ '%' TO 'jennifer'@ '%' |
+-----+
2 rows in set (0.00 sec)

SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@ '%' to database 'test'
SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

SHOW GRANTS;
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@ '%' |
| GRANT Select ON test.* TO 'jennifer'@ '%' |
| GRANT 'analyticsteam'@ '%' TO 'jennifer'@ '%' |
```

```
+-----+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+-----+
| Tables_in_test |
+-----+
| t1 |
+-----+
1 row in set (0.00 sec)
```

Connect to TiDB as the root user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

The statement `SET DEFAULT ROLE` can be used to associate the role `analyticsteam` to `jennifer`:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
Query OK, 0 rows affected (0.02 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

After this, the user `jennifer` has the privileges associated with the role `analyticsteam` and `jennifer` does not have to execute the statement `SET ROLE`:

```
SHOW GRANTS;
+-----+
| Grants for User |
+-----+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
| GRANT Select ON test.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+-----+
| Tables_in_test |
+-----+
| t1 |
+-----+
1 row in set (0.00 sec)
```

SET DEFAULT ROLE will not automatically GRANT the associated role to the user. Attempting to SET DEFAULT ROLE for a role that jennifer does not have granted results in the following error:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
ERROR 3530 (HY000): `analyticsteam`@`%` is is not granted to jennifer@%
```

### 14.11.2.85.3 MySQL compatibility

This statement is understood to be fully compatible with roles, which are a feature of MySQL 8.0. Any compatibility differences should be [reported via an issue](#) on GitHub.

## 14.11.2.88 SET ROLE

The SET ROLE statement is used to enable roles in the current session. After enabling roles, users can use the privileges of the role(s).

### 14.11.2.88.1 Synopsis

**SetRoleStmt:**

Figure 375: SetRoleStmt

**SetRoleOpt:**

Figure 376: SetRoleOpt

SetDefaultRoleOpt:

Figure 377: SetDefaultRoleOpt

#### 14.11.2.88.2 Examples

Create a user 'u1'@%' and three roles: 'r1'@%', 'r2'@%' and 'r3'@%'. Grant these roles to 'u1'@%' and set 'r1'@%' as the default role of 'u1'@%'.

```
CREATE USER 'u1'@'%';
CREATE ROLE 'r1', 'r2', 'r3';
GRANT 'r1', 'r2', 'r3' TO 'u1'@'%';
SET DEFAULT ROLE 'r1' TO 'u1'@'%';
```

Log in as 'u1'@%' and execute the following SET ROLE statement to enable all roles.

```
SET ROLE ALL;
SELECT CURRENT_ROLE();
```

```
+-----+
| CURRENT_ROLE() |
+-----+
| `r1`@`%`,`r2`@`%`,`r3`@`%` |
+-----+
1 row in set (0.000 sec)
```

Execute the following SET ROLE statement to enable 'r2' and 'r3'.

```
SET ROLE 'r2', 'r3';
SELECT CURRENT_ROLE();
```

```
+-----+
| CURRENT_ROLE() |
+-----+
| `r2`@`%`,`r3`@`%` |
+-----+
1 row in set (0.000 sec)
```

Execute the following SET ROLE statement to enable the default role(s).

```
SET ROLE DEFAULT;
SELECT CURRENT_ROLE();
```

```
+-----+
| CURRENT_ROLE() |
+-----+
| `r1`@`%` |
+-----+
1 row in set (0.000 sec)
```

Execute the following SET ROLE statement to cancel all enabled role(s).

```
SET ROLE NONE;
SELECT CURRENT_ROLE();
```

```
+-----+
| CURRENT_ROLE() |
+-----+
| |
+-----+
1 row in set (0.000 sec)
```

### 14.11.2.88.3 MySQL compatibility

This statement is understood to be fully compatible with roles, which are a feature of MySQL 8.0. Any compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.88.4 See also

- [CREATE ROLE](#)
- [DROP ROLE](#)
- [GRANT <role>](#)
- [REVOKE <role>](#)
- [SET DEFAULT ROLE](#)
  
- [Role-Based Access Control](#)

### 14.11.2.89 SET TRANSACTION

The SET TRANSACTION statement can be used to change the current isolation level on a GLOBAL or SESSION basis. This syntax is an alternative to SET transaction\_isolation='↪ new-value' and is included for compatibility with both MySQL, and the SQL standards.

#### 14.11.2.89.1 Synopsis

```

SetStmt ::=
 'SET' (VariableAssignmentList |
 'PASSWORD' ('FOR' Username)? '=' PasswordOpt |
 ('GLOBAL'| 'SESSION')? 'TRANSACTION' TransactionChars |
 'CONFIG' (Identifier | stringLit) ConfigItemName EqOrAssignmentEq
 ↪ SetExpr)

TransactionChars ::=
 ('ISOLATION' 'LEVEL' IsolationLevel | 'READ' 'WRITE' | 'READ' 'ONLY'
 ↪ AsOfClause?)

IsolationLevel ::=
 ('REPEATABLE' 'READ' | 'READ' ('COMMITTED' | 'UNCOMMITTED') | '
 ↪ SERIALIZABLE')

AsOfClause ::=
 ('AS' 'OF' 'TIMESTAMP' Expression)

```

#### 14.11.2.89.2 Examples

```

mysql> SHOW SESSION VARIABLES LIKE 'transaction_isolation';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| transaction_isolation | REPEATABLE-READ |
+-----+-----+
1 row in set (0.00 sec)

mysql> SET SESSION TRANSACTION ISOLATION LEVEL READ COMMITTED;
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW SESSION VARIABLES LIKE 'transaction_isolation';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| transaction_isolation | READ-COMMITTED |
+-----+-----+

```

```
1 row in set (0.01 sec)

mysql> SET SESSION transaction_isolation = 'REPEATABLE-READ';
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW SESSION VARIABLES LIKE 'transaction_isolation';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| transaction_isolation | REPEATABLE-READ |
+-----+-----+
1 row in set (0.00 sec)
```

### 14.11.2.89.3 MySQL compatibility

- TiDB supports the ability to set a transaction as read-only in syntax only.
- The isolation levels `READ-UNCOMMITTED` and `SERIALIZABLE` are not supported.
- The `REPEATABLE-READ` isolation level is achieved through using the snapshot isolation technology, which is partly compatible with MySQL.
- In pessimistic transactions, TiDB supports two isolation levels compatible with MySQL: `REPEATABLE-READ` and `READ-COMMITTED`. For a detailed description, see [Isolation Levels](#).

### 14.11.2.89.4 See also

- [SET \[GLOBAL|SESSION\] <variable>](#)
- [Isolation Levels](#)

### 14.11.2.90 SET [GLOBAL|SESSION] <variable>

The statement `SET [GLOBAL|SESSION]` modifies one of TiDB's built in variables, of either `SESSION` or `GLOBAL` scope.

#### Note:

Similar to MySQL, changes to `GLOBAL` variables do not apply to either existing connections, or the local connection. Only new sessions reflect the changes to the value.

### 14.11.2.90.1 Synopsis

SetStmt:

Figure 378: SetStmt

VariableAssignment:

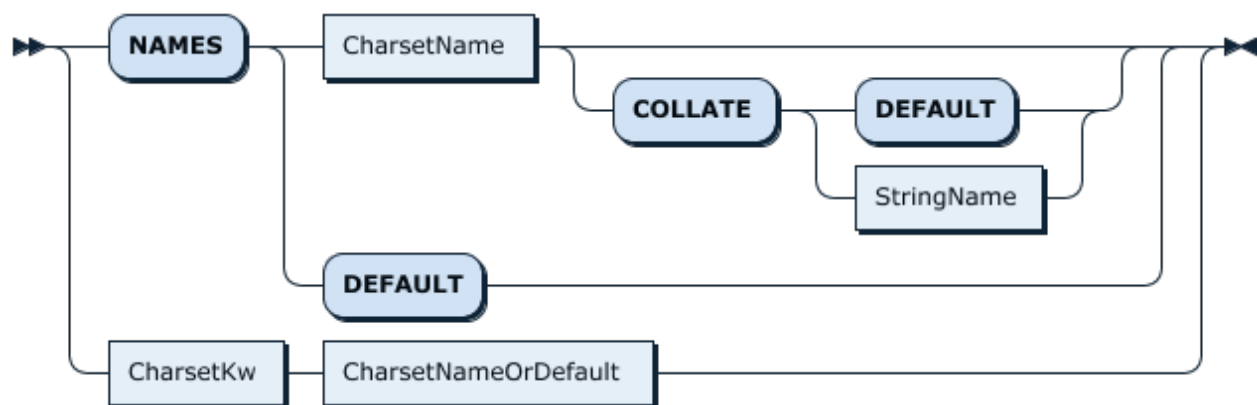

Figure 379: VariableAssignment

### 14.11.2.90.2 Examples

Get the value of `sql_mode`.

```
mysql> SHOW GLOBAL VARIABLES LIKE 'sql_mode';
+---
↪ -----+
↪
| Variable_name | Value
↪
↪ |
+---
↪ -----+
↪
| sql_mode | ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,
↪ NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,
↪ NO_ENGINE_SUBSTITUTION |
+---
↪ -----+
↪
1 row in set (0.00 sec)

mysql> SHOW SESSION VARIABLES LIKE 'sql_mode';
+---
↪ -----+
↪
| Variable_name | Value
↪
↪ |
+---
↪ -----+
↪
| sql_mode | ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,
↪ NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,
↪ NO_ENGINE_SUBSTITUTION |
+---
↪ -----+
↪
1 row in set (0.00 sec)
```

Update the value of `sql_mode` globally. If you check the value of `SQL_mode` after the update, you can see that the value of `SESSION` level has not been updated:

```
mysql> SET GLOBAL sql_mode = 'STRICT_TRANS_TABLES,NO_AUTO_CREATE_USER';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GLOBAL VARIABLES LIKE 'sql_mode';
```

```

+-----+
| Variable_name | Value |
+-----+
| sql_mode | STRICT_TRANS_TABLES,NO_AUTO_CREATE_USER |
+-----+
1 row in set (0.00 sec)

mysql> SHOW SESSION VARIABLES LIKE 'sql_mode';
+--
↪ -----+
↪
| Variable_name | Value |
↪
↪ |
+--
↪ -----+
↪
| sql_mode | ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,
↪ NO_ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,
↪ NO_ENGINE_SUBSTITUTION |
+--
↪ -----+
↪
1 row in set (0.00 sec)

```

Using SET SESSION takes effect immediately:

```

mysql> SET SESSION sql_mode = 'STRICT_TRANS_TABLES,NO_AUTO_CREATE_USER';
Query OK, 0 rows affected (0.01 sec)

mysql> SHOW SESSION VARIABLES LIKE 'sql_mode';
+-----+
| Variable_name | Value |
+-----+
| sql_mode | STRICT_TRANS_TABLES,NO_AUTO_CREATE_USER |
+-----+
1 row in set (0.00 sec)

```

### 14.11.2.90.3 MySQL compatibility

The following behavior differences apply:

- Changes made with SET GLOBAL will be propagated to all TiDB instances in the cluster. This differs from MySQL, where changes do not propagate to replicas.

- TiDB presents several variables as both readable and settable. This is required for MySQL compatibility, because it is common for both applications and connectors to read MySQL variables. For example: JDBC connectors both read and set query cache settings, despite not relying on the behavior.
- Changes made with `SET GLOBAL` will persist through TiDB server restarts. This means that `SET GLOBAL` in TiDB behaves more similar to `SET PERSIST` as available in MySQL 8.0 and above.

#### 14.11.2.90.4 See also

- [SHOW \[GLOBAL|SESSION\] VARIABLES](#)

### 14.11.2.91 SHOW ANALYZE STATUS

The `SHOW ANALYZE STATUS` statement shows the statistics collection tasks being executed by TiDB and a limited number of historical task records.

Starting from TiDB v6.1.0, the `SHOW ANALYZE STATUS` statement supports showing cluster-level tasks. Even after a TiDB restart, you can still view task records before the restart using this statement. Before TiDB v6.1.0, the `SHOW ANALYZE STATUS` statement can only show instance-level tasks, and task records are cleared after a TiDB restart.

Starting from TiDB v6.1.0, you can view the history tasks within the last 7 days through the system table `mysql.analyze_jobs`.

#### 14.11.2.91.1 Synopsis

```
ShowAnalyzeStatusStmt ::= 'SHOW' 'ANALYZE' 'STATUS' ShowLikeOrWhereOpt
ShowLikeOrWhereOpt ::= 'LIKE' SimpleExpr | 'WHERE' Expression
```

#### 14.11.2.91.2 Examples

```
mysql> create table t(x int, index idx(x)) partition by hash(x) partitions
 ↪ 2;
Query OK, 0 rows affected (0.69 sec)

mysql> set @@tidb_analyze_version = 1;
Query OK, 0 rows affected (0.00 sec)

mysql> analyze table t;
Query OK, 0 rows affected (0.20 sec)

mysql> show analyze status;

#### 14.11.2.91.4 See also

- [ANALYZE\\_STATUS table](#)

#### 14.11.2.92 SHOW [BACKUPS|RESTORES]

These statements show a list of all queued, running and recently finished **BACKUP** and **RESTORE** tasks that were executed on a TiDB instance.

Both statements require **SUPER** privilege to run.

Use **SHOW BACKUPS** to query **BACKUP** tasks and use **SHOW RESTORES** to query **RESTORE** tasks.

Backups and restores that were started with the **br** commandline tool are not shown.

### 14.11.2.92.1 Synopsis

```
ShowBRIEStmt ::=
 "SHOW" ("BACKUPS" | "RESTORES") ShowLikeOrWhere?

ShowLikeOrWhere ::=
 "LIKE" SimpleExpr
| "WHERE" Expression
```

### 14.11.2.92.2 Examples

In one connection, execute the following statement:

```
BACKUP DATABASE `test` TO 's3://example-bucket/backup-01';
```

Before the backup completes, run `SHOW BACKUPS` in a new connection:

```
SHOW BACKUPS;
```

```
+--
 ↪ -----+-----+-----+-----+
 ↪
| Destination | State | Progress | Queue_time |
 ↪ Execution_time | Finish_time | Connection | Message |
+--
 ↪ -----+-----+-----+-----+
 ↪
| s3://example-bucket/backup-01/ | Backup | 98.38 | 2020-04-12 23:09:03 |
 ↪ 2020-04-12 23:09:25 | NULL | 4 | NULL |
+--
 ↪ -----+-----+-----+-----+
 ↪
1 row in set (0.00 sec)
```

The first row of the result above is described as follows:

| Column        | Description                                                                     |
|---------------|---------------------------------------------------------------------------------|
| ↪ Destination | The destination URL (with all parameters stripped to avoid leaking secret keys) |

| Column              | Description                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------------------|
| State               | State of the task                                                                                                    |
| Progress            | Estimated progress in the current state as a percentage                                                              |
| Queue_time<br>↔     | When the task was queued                                                                                             |
| Execution_time<br>↔ | When the task was started; the value is 0000-00-00<br>↔<br>↔ 00:00:00<br>↔ for queueing tasks                        |
| Finish_time<br>↔    | The timestamp when the task finished; the value is 0000-00-00<br>↔<br>↔ 00:00:00<br>↔ for queueing and running tasks |
| Connection<br>↔     | Connection ID running this task                                                                                      |
| Message             | Message with details                                                                                                 |

The possible states are:

| State    | Description                  |
|----------|------------------------------|
| Backup   | Making a backup              |
| Wait     | Waiting for execution        |
| Checksum | Running a checksum operation |

The connection ID can be used to cancel a backup/restore task via the **KILL TIDB QUERY** statement.

```
KILL TIDB QUERY 4;
```

```
Query OK, 0 rows affected (0.00 sec)
```

#### Filtering

Use the **LIKE** clause to filter out tasks by matching the destination URL against a wildcard expression.

```
SHOW BACKUPS LIKE 's3://%';
```

Use the **WHERE** clause to filter by columns.

```
SHOW BACKUPS WHERE `Progress` < 25.0;
```

#### 14.11.2.92.3 MySQL compatibility

#### 14.11.2.93.2 Syntax description

```
SHOW [GLOBAL | SESSION] BINDINGS [ShowLikeOrWhereOpt];
```

This statement outputs the execution plan bindings at the GLOBAL or SESSION level. The default scope is SESSION. Currently SHOW BINDINGS outputs eight columns, as shown below:

| Column Name  | Description                                                                            |
|--------------|----------------------------------------------------------------------------------------|
| original_sql | Original SQL statement after parameterization                                          |
| bind_sql     | Bound SQL statement with hints                                                         |
| default_db   | Default database                                                                       |
| status       | Status including 'Using', 'Deleted', 'Invalid', 'Rejected', and 'Pending verification' |

| Column Name | Description                                                                                                                                                                                              |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| create_time | Created time                                                                                                                                                                                             |
| update_time | Updated time                                                                                                                                                                                             |
| charset     | Character set                                                                                                                                                                                            |
| collation   | Sorting rule                                                                                                                                                                                             |
| source      | The way in which a binding is created, including manual (created by the create ↪ [global] ↪ binding SQL statement), capture (captured automatically by TiDB), and evolve (evolved automatically by TiDB) |

### 14.11.2.93.3 Examples

```
mysql> CREATE TABLE t1 (
 -> id INT NOT NULL PRIMARY KEY auto_increment,

### 14.11.2.94.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

## 14.11.2.95 SHOW CHARACTER SET

This statement provides a static list of available character sets in TiDB. The output does not reflect any attributes of the current connection or user.

### 14.11.2.95.1 Synopsis

ShowCharsetStmt:

Figure 385: ShowCharsetStmt

CharsetKw:

Figure 386: CharsetKw

### 14.11.2.95.2 Examples

```

mysql> SHOW CHARACTER SET;
+-----+-----+-----+-----+
| Charset | Description | Default collation | Maxlen |
+-----+-----+-----+-----+
utf8	UTF-8 Unicode	utf8_bin	3
utf8mb4	UTF-8 Unicode	utf8mb4_bin	4
ascii	US ASCII	ascii_bin	1

```

|                           |        |            |   |  |
|---------------------------|--------|------------|---|--|
| latin1                    | Latin1 | latin1_bin | 1 |  |
| binary                    | binary | binary     | 1 |  |
| +-----+-----+-----+-----+ |        |            |   |  |
| 5 rows in set (0.00 sec)  |        |            |   |  |

### 14.11.2.95.3 MySQL compatibility

The usage of this statement is understood to be fully compatible with MySQL. However, charsets in TiDB may have different default collations compared with MySQL. For details, refer to [Compatibility with MySQL](#). Any other compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.95.4 See also

- [SHOW COLLATION](#)
- [Character Set and Collation](#)

## 14.11.2.96 SHOW COLLATION

This statement provides a static list of collations, and is included to provide compatibility with MySQL client libraries.

### Note:

Results of `SHOW COLLATION` vary when the “[new collation framework](#)” is enabled. For new collation framework details, refer to [Character Set and Collation](#).

### 14.11.2.96.1 Synopsis

ShowCollationStmt:

Figure 387: ShowCollationStmt

### 14.11.2.96.2 Examples

When new collation framework is disabled, only binary collations are displayed.

```
mysql> SHOW COLLATION;
+-----+-----+-----+-----+-----+-----+
| Collation | Charset | Id | Default | Compiled | Sortlen |
+-----+-----+-----+-----+-----+-----+
utf8mb4_bin	utf8mb4	46	Yes	Yes	1
latin1_bin	latin1	47	Yes	Yes	1
binary	binary	63	Yes	Yes	1
ascii_bin	ascii	65	Yes	Yes	1
utf8_bin	utf8	83	Yes	Yes	1
+-----+-----+-----+-----+-----+-----+
5 rows in set (0.02 sec)
```

When new collation framework is enabled, `utf8_general_ci` and `utf8mb4_general_ci` are additionally supported.

```
mysql> SHOW COLLATION;
+-----+-----+-----+-----+-----+-----+
| Collation | Charset | Id | Default | Compiled | Sortlen |
+-----+-----+-----+-----+-----+-----+
ascii_bin	ascii	65	Yes	Yes	1
binary	binary	63	Yes	Yes	1
gbk_bin	gbk	87		Yes	1
gbk_chinese_ci	gbk	28	Yes	Yes	1
latin1_bin	latin1	47	Yes	Yes	1
utf8_bin	utf8	83	Yes	Yes	1
utf8_general_ci	utf8	33		Yes	1
utf8_unicode_ci	utf8	192		Yes	1
utf8mb4_bin	utf8mb4	46	Yes	Yes	1
utf8mb4_general_ci	utf8mb4	45		Yes	1
utf8mb4_unicode_ci	utf8mb4	224		Yes	1
+-----+-----+-----+-----+-----+-----+
11 rows in set (0.001 sec)
```

### 14.11.2.96.3 MySQL compatibility

The usage of this statement is understood to be fully compatible with MySQL. However, charsets in TiDB may have different default collations compared with MySQL. For details, refer to [Compatibility with MySQL](#). Any other compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.96.4 See also

### 14.11.2.97 SHOW [FULL] COLUMNS FROM

The statement `SHOW [FULL] COLUMNS FROM <table_name>` describes the columns of a table or view in a useful tabular format. The optional keyword `FULL` displays the privileges the current user has to that column, and the `comment` from the table definition.

The statements `SHOW [FULL] FIELDS FROM <table_name>`, `DESC <table_name>`, `DESCRIBE <table_name>`, and `EXPLAIN <table_name>` are aliases of this statement.

#### Note:

`DESC TABLE <table_name>`, `DESCRIBE TABLE <table_name>`, and `EXPLAIN ↔ TABLE <table_name>` are not equivalent to the above statements. They are aliases of `DESC SELECT * FROM <table_name>`.

```

### 14.11.2.97.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.97.4 See also

- [SHOW CREATE TABLE](#)

## 14.11.2.98 SHOW CONFIG

The `SHOW CONFIG` statement is used to show the current configuration of various components of TiDB. Note that the configuration and system variables act on different dimensions and should not be mixed up. If you want to obtain the system variable information, use the [SHOW VARIABLES](#) syntax.

### 14.11.2.98.1 Synopsis

ShowStmt:

Figure 398: ShowStmt

`ShowTargetFilterable`:

Figure 399: ShowTargetFilterable

### 14.11.2.98.2 Examples

Show all configurations:

```
SHOW CONFIG;
```

```
+-----+-----+-----+-----+
 ↪
| Type | Instance | Name | Value
 ↪
+-----+-----+-----+-----+
 ↪
| tidb | 127.0.0.1:4000 | advertise-address | 127.0.0.1
 ↪
| tidb | 127.0.0.1:4000 | binlog.binlog-socket |
 ↪
| tidb | 127.0.0.1:4000 | binlog.enable | false
 ↪
...
120 rows in set (0.01 sec)
```

Show the configuration where the type is tidb:

```
SHOW CONFIG WHERE type = 'tidb' AND name = 'advertise-address';
```

```
+-----+-----+-----+-----+
| Type | Instance | Name | Value |
+-----+-----+-----+-----+
| tidb | 127.0.0.1:4000 | advertise-address | 127.0.0.1 |
+-----+-----+-----+-----+
1 row in set (0.05 sec)
```

You can also use the LIKE clause to show the configuration where the type is tidb:

```
SHOW CONFIG LIKE 'tidb';
```

```
+-----+-----+-----+-----+
 ↪
| Type | Instance | Name | Value
 ↪
+-----+-----+-----+-----+
 ↪
| tidb | 127.0.0.1:4000 | advertise-address | 127.0.0.1
 ↪
| tidb | 127.0.0.1:4000 | binlog.binlog-socket |
 ↪
```

```
| tidb | 127.0.0.1:4000 | binlog.enable | false
↪
...
40 rows in set (0.01 sec)
```

### 14.11.2.98.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.11.2.98.4 See also

- [SHOW VARIABLES](#)

## 14.11.2.99 SHOW CREATE DATABASE

SHOW CREATE DATABASE is used to show the exact SQL statement for re-creating an existing database. SHOW CREATE SCHEMA is a synonym for it.

### 14.11.2.99.1 Synopsis

ShowCreateDatabaseStmt:

```
ShowCreateDatabaseStmt ::=
 "SHOW" "CREATE" "DATABASE" | "SCHEMA" ("IF" "NOT" "EXISTS")? DBName
```

### 14.11.2.99.2 Examples

```
CREATE DATABASE test;
```

```
Query OK, 0 rows affected (0.12 sec)
```

```
SHOW CREATE DATABASE test;
```

```
+--
↪ -----+-----+
↪
| Database | Create Database |
+--
↪ -----+-----+
↪
| test | CREATE DATABASE `test` /*!40100 DEFAULT CHARACTER SET utf8mb4
↪ */ |
+--
↪ -----+-----+
↪
```

```
1 row in set (0.00 sec)
```

```
SHOW CREATE SCHEMA IF NOT EXISTS test;
```

```
+--
 ↪ -----+-----
 ↪
 | Database | Create Database
 ↪
+--
 ↪ -----+-----
 ↪
 | test | CREATE DATABASE /*!32312 IF NOT EXISTS*/ `test` /*!40100
 ↪ DEFAULT CHARACTER SET utf8mb4 */ |
+--
 ↪ -----+-----
 ↪
1 row in set (0.00 sec)
```

### 14.11.2.99.3 MySQL compatibility

SHOW CREATE DATABASE is expected to be fully compatible with MySQL. If you find any compatibility differences, submit a GitHub [issue](#).

### 14.11.2.99.4 See also

- [CREATE TABLE](#)
- [DROP TABLE](#)
- [SHOW TABLES](#)
- [SHOW COLUMNS FROM](#)

### 14.11.2.100 SHOW CREATE PLACEMENT POLICY

SHOW CREATE PLACEMENT POLICY is used to show the definition of a placement policy. This can be used to see the current definition of a placement policy and recreate it in another TiDB cluster.

#### 14.11.2.100.1 Synopsis

```
ShowCreatePlacementPolicyStmt ::=
 "SHOW" "CREATE" "PLACEMENT" "POLICY" PolicyName

PolicyName ::=
 Identifier
```

### 14.11.2.100.2 Examples

```
CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us
↳ -west-1" FOLLOWERS=4;
CREATE TABLE t1 (a INT) PLACEMENT POLICY=p1;
SHOW CREATE PLACEMENT POLICY p1\G;
```

```
Query OK, 0 rows affected (0.08 sec)
```

```
Query OK, 0 rows affected (0.10 sec)
```

```
*****[1. row]*****
Policy | p1
Create Policy | CREATE PLACEMENT POLICY `p1` PRIMARY_REGION="us-east-1"
↳ REGIONS="us-east-1,us-west-1" FOLLOWERS=4
1 row in set (0.00 sec)
```

### 14.11.2.100.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.11.2.100.4 See also

- [Placement Rules in SQL](#)
- [SHOW PLACEMENT](#)
- [CREATE PLACEMENT POLICY](#)
- [ALTER PLACEMENT POLICY](#)
- [DROP PLACEMENT POLICY](#)

## 14.11.2.101 SHOW CREATE RESOURCE GROUP

You can use the `SHOW CREATE RESOURCE GROUP` statement to view the current definition of a resource group.

### 14.11.2.101.1 Synopsis

```
ShowCreateResourceGroupStmt ::=
 "SHOW" "CREATE" "RESOURCE" "GROUP" ResourceGroupName

ResourceGroupName ::=
 Identifier
```

### 14.11.2.101.2 Examples

Create a resource group rg1.

```
CREATE RESOURCE GROUP rg1 RU_PER_SEC=100;
Query OK, 0 rows affected (0.10 sec)
```

View the definition of rg1.

```
SHOW CREATE RESOURCE GROUP rg1;
***** [1. row]*****
+-----+-----+
| Resource_Group | Create Resource Group |
+-----+-----+
| rg1 | CREATE RESOURCE GROUP `rg1` RU_PER_SEC=100 |
+-----+-----+
1 row in set (0.01 sec)
```

### 14.11.2.101.3 MySQL compatibility

This statement is a TiDB extension for MySQL.

### 14.11.2.101.4 See also

- [TiDB RESOURCE CONTROL](#)
- [CREATE RESOURCE GROUP](#)
- [ALTER RESOURCE GROUP](#)
- [DROP RESOURCE GROUP](#)

### 14.11.2.102 SHOW CREATE SEQUENCE

The SHOW CREATE SEQUENCE shows the detailed information of a sequence, which is similar to SHOW CREATE TABLE.

#### 14.11.2.102.1 Synopsis

ShowCreateSequenceStmt:

Figure 400: ShowCreateSequenceStmt

TableName:

Figure 401: TableName

### 14.11.2.102.2 Examples

```
CREATE SEQUENCE seq;
```

```
Query OK, 0 rows affected (0.03 sec)
```

```
SHOW CREATE SEQUENCE seq;
```

```
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
 ↪
| Table | Create Table
 ↪
 ↪ |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
 ↪
| seq | CREATE SEQUENCE `seq` start with 1 minvalue 1 maxvalue
 ↪ | 9223372036854775806 increment by 1 cache 1000 nocycle ENGINE=InnoDB |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
 ↪
1 row in set (0.00 sec)
```

### 14.11.2.102.3 MySQL compatibility

This statement is a TiDB extension. The implementation is modeled on sequences available in MariaDB.

### 14.11.2.102.4 See also

- [CREATE SEQUENCE](#)
- [DROP SEQUENCE](#)

### 14.11.2.103 SHOW CREATE TABLE

This statement shows the exact statement to recreate an existing table using SQL.

### 14.11.2.103.1 Synopsis

ShowCreateTableStmt:

Figure 402: ShowCreateTableStmt

TableName:

Figure 403: TableName

### 14.11.2.103.2 Examples

```

mysql> CREATE TABLE t1 (a INT);
Query OK, 0 rows affected (0.12 sec)

mysql> SHOW CREATE TABLE t1;
+---
 ↪ -----+-----
 ↪
 | Table | Create Table
 ↪
 ↪ |
+---
 ↪ -----+-----
 ↪
 | t1 | CREATE TABLE `t1` (
 ↪ `a` int(11) DEFAULT NULL
 ↪) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin |
+---
 ↪ -----+-----
 ↪
1 row in set (0.00 sec)

```

### 14.11.2.103.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

#### 14.11.2.103.4 See also

- [CREATE TABLE](#)
- [DROP TABLE](#)
- [SHOW TABLES](#)
- [SHOW COLUMNS FROM](#)

#### 14.11.2.104 SHOW CREATE USER

This statement shows how to re-create a user using the `CREATE USER` syntax.

##### 14.11.2.104.1 Synopsis

ShowCreateUserStmt:

Figure 404: ShowCreateUserStmt

Username:

Figure 405: Username

##### 14.11.2.104.2 Examples

```

mysql> SHOW CREATE USER 'root';
+---+
| CREATE USER for root@%
+---+

```

```

| CREATE USER 'root'@'%' IDENTIFIED WITH 'mysql_native_password' AS ''
 ↳ REQUIRE NONE PASSWORD EXPIRE DEFAULT ACCOUNT UNLOCK |
+---
 ↳
 ↳
1 row in set (0.00 sec)

mysql> SHOW GRANTS FOR 'root';
+-----+
| Grants for root@% |
+-----+
| GRANT ALL PRIVILEGES ON *.* TO 'root'@'%' |
+-----+
1 row in set (0.00 sec)

```

### 14.11.2.104.3 MySQL compatibility

- The output of `SHOW CREATE USER` is designed to match MySQL, but several of the `CREATE` options are not yet supported by TiDB. Not yet supported options will be parsed but ignored. See [security compatibility] for more details.

### 14.11.2.104.4 See also

- [CREATE USER](#)
- [SHOW GRANTS](#)
- [DROP USER](#)

## 14.11.2.105 SHOW DATABASES

This statement shows a list of databases that the current user has privileges to. Databases which the current user does not have access to will appear hidden from the list. The `information_schema` database always appears first in the list of databases.

`SHOW SCHEMAS` is an alias of this statement.

### 14.11.2.105.1 Synopsis

ShowDatabasesStmt:

Figure 406: ShowDatabasesStmt

ShowLikeOrWhereOpt:

Figure 407: ShowLikeOrWhereOpt

### 14.11.2.105.2 Examples

```

mysql> SHOW DATABASES;
+-----+
| Database |
+-----+
| INFORMATION_SCHEMA |
| PERFORMANCE_SCHEMA |
| mysql |
| test |
+-----+
4 rows in set (0.00 sec)

mysql> CREATE DATABASE mynewdb;
Query OK, 0 rows affected (0.10 sec)

mysql> SHOW DATABASES;
+-----+
| Database |
+-----+
| INFORMATION_SCHEMA |
| PERFORMANCE_SCHEMA |
| mynewdb |
| mysql |
| test |
+-----+
5 rows in set (0.00 sec)

```

### 14.11.2.105.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.105.4 See also

- [SHOW SCHEMAS](#)
- [DROP DATABASE](#)
- [CREATE DATABASE](#)

### 14.11.2.106 SHOW DRAINER STATUS

The `SHOW DRAINER STATUS` statement displays the status information for all Drainer nodes in the cluster.

#### 14.11.2.106.1 Examples

```
SHOW DRAINER STATUS;
```

```
+--
 ↪ -----/-----/-----/-----/-----/
 ↪
| NodeID | Address | State | Max_Commit_Ts | Update_Time |
+--
 ↪ -----/-----/-----/-----/-----/
 ↪
| drainer1 | 127.0.0.3:8249 | Online | 408553768673342532 | 2019-05-01
 ↪ 00:00:03 |
+--
 ↪ -----/-----/-----/-----/-----/
 ↪
| drainer2 | 127.0.0.4:8249 | Online | 408553768673345531 | 2019-05-01
 ↪ 00:00:04 |
+--
 ↪ -----/-----/-----/-----/-----/
 ↪
2 rows in set (0.00 sec)
```

#### 14.11.2.106.2 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.11.2.106.3 See also

- [SHOW PUMP STATUS](#)
- [CHANGE PUMP STATUS](#)
- [CHANGE DRAINER STATUS](#)

### 14.11.2.107 SHOW ENGINES

This statement is used to list all supported storage engines. The syntax is included only for compatibility with MySQL.

### 14.11.2.107.1 Synopsis

ShowEnginesStmt:

Figure 408: ShowEnginesStmt

```
SHOW ENGINES;
```

### 14.11.2.107.2 Examples

```
mysql> SHOW ENGINES;
+---
 ↪ -----+-----+
 ↪
 | Engine | Support | Comment |
 ↪ Transactions | XA | Savepoints |
+---
 ↪ -----+-----+
 ↪
 | InnoDB | DEFAULT | Supports transactions, row-level locking, and foreign
 ↪ keys | YES | YES | YES |
+---
 ↪ -----+-----+
 ↪
1 row in set (0.00 sec)
```

### 14.11.2.107.3 MySQL compatibility

- This statement will always only return InnoDB as the supported engine. Internally, TiDB will typically use TiKV as the storage engine.

### 14.11.2.108 SHOW ERRORS

This statement shows errors from previously executed statements. The error buffer is cleared as soon as a statement executes successfully. In which case, `SHOW ERRORS` will return an empty set.

The behavior of which statements generate errors vs. warnings is highly influenced by the current `sql_mode`.

### 14.11.2.108.1 Synopsis

ShowErrorsStmt:

Figure 409: ShowErrorsStmt

### 14.11.2.108.2 Examples

```
mysql> select invalid;
ERROR 1054 (42S22): Unknown column 'invalid' in 'field list'
mysql> create invalid;
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual
 ↳ that corresponds to your TiDB version for the right syntax to use
 ↳ line 1 column 14 near "invalid"
mysql> SHOW ERRORS;
+---
 ↳ -----+-----+
 ↳
 ↳ | Level | Code | Message
 ↳ |
 ↳ |
+---
 ↳ -----+-----+
 ↳
 ↳ | Error | 1054 | Unknown column 'invalid' in 'field list'
 ↳ |
 ↳ |
 ↳ | Error | 1064 | You have an error in your SQL syntax; check the manual
 ↳ | ↳ that corresponds to your TiDB version for the right syntax to use
 ↳ | ↳ line 1 column 14 near "invalid" |
+---
 ↳ -----+-----+
 ↳
 ↳
2 rows in set (0.00 sec)

mysql> CREATE invalid2;
ERROR 1064 (42000): You have an error in your SQL syntax; check the manual
 ↳ that corresponds to your TiDB version for the right syntax to use
 ↳ line 1 column 15 near "invalid2"
mysql> SELECT 1;
+-----+
| 1 |
+-----+
```

```

| 1 |
+---+
1 row in set (0.00 sec)

mysql> SHOW ERRORS;
Empty set (0.00 sec)

```

### 14.11.2.108.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.108.4 See also

- [SHOW WARNINGS](#)

### 14.11.2.109 SHOW [FULL] FIELDS FROM

This statement is an alias to [SHOW \[FULL\] COLUMNS FROM](#). It is included for compatibility with MySQL.

### 14.11.2.110 SHOW GRANTS

This statement shows a list of privileges associated with a user. As in MySQL, the `USAGE` privileges denotes the ability to login to TiDB.

#### 14.11.2.110.1 Synopsis

ShowGrantsStmt:

Figure 410: ShowGrantsStmt

Username:

Figure 411: Username

UsingRoles:

Figure 412: UsingRoles

RolenameList:

Figure 413: RolenameList

Rolename:

Figure 414: Rolename

#### 14.11.2.110.2 Examples

```
mysql> SHOW GRANTS;
```

```
+-----+-----+
```

```
| Grants for User |
+-----+
| GRANT ALL PRIVILEGES ON *.* TO 'root'@'%' |
+-----+
1 row in set (0.00 sec)

mysql> SHOW GRANTS FOR 'u1';
ERROR 1141 (42000): There is no such grant defined for user 'u1' on host '%'
↪ '

mysql> CREATE USER u1;
Query OK, 1 row affected (0.04 sec)

mysql> GRANT SELECT ON test.* TO u1;
Query OK, 0 rows affected (0.04 sec)

mysql> SHOW GRANTS FOR u1;
+-----+
| Grants for u1@% |
+-----+
| GRANT USAGE ON *.* TO 'u1'@'%' |
| GRANT Select ON test.* TO 'u1'@'%' |
+-----+
2 rows in set (0.00 sec)
```

### 14.11.2.110.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

- [SHOW CREATE USER](#)
- [GRANT](#)

### 14.11.2.111 SHOW INDEX [FROM|IN]

This statement is an alias to [SHOW INDEXES \[FROM|IN\]](#). It is included for compatibility with MySQL.

### 14.11.2.112 SHOW INDEXES [FROM|IN]

The statement [SHOW INDEXES \[FROM|IN\]](#) lists the indexes on a specified table. The statements [SHOW INDEX \[FROM|IN\]](#), [SHOW KEYS \[FROM|IN\]](#) are aliases of this statement, and included for compatibility with MySQL.

### 14.11.2.112.1 Synopsis

2 rows in set (0.00 sec)

```

### 14.11.2.112.3 MySQL compatibility

The Cardinality column in MySQL shows the number of different values on the index. In TiDB, the Cardinality column always shows 0.

### 14.11.2.112.4 See also

- [SHOW CREATE TABLE](#)
- [DROP INDEX](#)
- [CREATE INDEX](#)

### 14.11.2.113 SHOW KEYS [FROM|IN]

This statement is an alias to `SHOW INDEXES [FROM|IN]`. It is included for compatibility with MySQL.

### 14.11.2.114 SHOW MASTER STATUS

The `SHOW MASTER STATUS` statement displays the latest TSO in the cluster.

#### 14.11.2.114.1 Examples

```
SHOW MASTER STATUS;
```

```
+--
 ↪ -----+-----+-----+-----+
 ↪
 | File | Position | Binlog_Do_DB | Binlog_Ignore_DB |
 ↪ Executed_Gtid_Set |
+--
 ↪ -----+-----+-----+-----+
 ↪
 | tidb-binlog | 416916363252072450 | | |
 ↪ |
+--
 ↪ -----+-----+-----+-----+
 ↪
1 row in set (0.00 sec)
```

#### 14.11.2.114.2 MySQL compatibility

The output of `SHOW MASTER STATUS` is designed to match MySQL. However, the execution results are different in that the MySQL result is the binlog location information and the TiDB result is the latest TSO information.

### 14.11.2.115 SHOW PLACEMENT

`SHOW PLACEMENT` summarizes all placement options from placement policies, and presents them in canonical form.

The statement returns a result set in which the `Scheduling_State` field indicates the current progress that the Placement Driver (PD) has made in scheduling the placement:

- **PENDING:** The PD has not yet started scheduling the placement. This might indicate that the placement rules are semantically correct, but cannot currently be satisfied by the cluster. For example, if FOLLOWERS=4 but there are only 3 TiKV stores which are candidates for followers.
- **INPROGRESS:** The PD is currently scheduling the placement.
- **SCHEDULED:** The PD has successfully scheduled the placement.

### 14.11.2.115.1 Synopsis

```
ShowStmt ::=
 "PLACEMENT"
```

### 14.11.2.115.2 Examples

```
CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us
↳ -west-1" FOLLOWERS=4;
CREATE TABLE t1 (a INT) PLACEMENT POLICY=p1;
SHOW PLACEMENT;
```

Query OK, 0 rows affected (0.01 sec)

Query OK, 0 rows affected (0.00 sec)

```

- [Placement Rules in SQL](#)
- [SHOW PLACEMENT FOR](#)
- [CREATE PLACEMENT POLICY](#)

#### 14.11.2.116 SHOW PLACEMENT FOR

SHOW PLACEMENT FOR summarizes all placement options, and presents them in the canonical form for a specific table, database schema, or partition.

The statement returns a result set in which the `Scheduling_State` field indicates the current progress that the Placement Driver (PD) has made in scheduling the placement:

- **PENDING:** The PD has not yet started scheduling the placement. This might indicate that the placement rules are semantically correct, but cannot currently be satisfied by the cluster. For example, if `FOLLOWERS=4` but there are only 3 TiKV stores that are candidates for followers.
- **INPROGRESS:** The PD is currently scheduling the placement.
- **SCHEDULED:** The PD has successfully scheduled the placement.

##### 14.11.2.116.1 Synopsis

### 14.11.2.119.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.119.4 See also

- [SHOW GRANTS](#)
- [GRANT <privileges>](#)

### 14.11.2.120 SHOW [FULL] PROCESSLIST

This statement lists the current sessions connected to the same TiDB server. The Info column contains the query text, which will be truncated unless the optional keyword FULL is specified.

#### 14.11.2.120.1 Synopsis

ShowProcesslistStmt:

Figure 423: ShowProcesslistStmt

**OptFull:**

Figure 424: OptFull

### 14.11.2.120.2 Examples

```
mysql> SHOW PROCESSLIST;
+---+
↵ -----+-----+-----+-----+-----+-----+-----+-----+
↵
| Id | User | Host | db | Command | Time | State | Info
↵ | | | | | | |
+---+
↵ -----+-----+-----+-----+-----+-----+-----+-----+
↵
| 5 | root | 127.0.0.1:45970 | test | Query | 0 | autocommit | SHOW
↵ PROCESSLIST |
+---+
↵ -----+-----+-----+-----+-----+-----+-----+-----+
↵
1 rows in set (0.00 sec)
```

### 14.11.2.120.3 MySQL compatibility

- The **State** column in TiDB is non-descriptive. Representing state as a single value is more complex in TiDB, since queries are executed in parallel and each goroutine will have a different state at any one time.

### 14.11.2.120.4 See also

- [KILL \[TIDB\]](#)

### 14.11.2.121 SHOW PROFILES

The `SHOW PROFILES` statement currently only returns an empty result.

### 14.11.2.121.1 Synopsis

ShowStmt:

Figure 425: ShowStmt

### 14.11.2.121.2 Examples

```
SHOW PROFILES;
```

```
Empty set (0.00 sec)
```

### 14.11.2.121.3 MySQL compatibility

This statement is included only for compatibility with MySQL. Executing `SHOW ↪ PROFILES` always returns an empty result.

## 14.11.2.122 SHOW PUMP STATUS

The `SHOW PUMP STATUS` statement displays the status information for all Pump nodes in the cluster.

### 14.11.2.122.1 Examples

```
SHOW PUMP STATUS;
```

```

+--
↪ -----/-----/-----/-----/-----/
↪
| NodeID | Address | State | Max_Commit_Ts | Update_Time |
+--
↪ -----/-----/-----/-----/-----/

↪ -----/-----/-----/-----/-----/
↪

```

```
2 rows in set (0.00 sec)
```

#### 14.11.2.122.2 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.11.2.122.3 See also

- [SHOW DRAINER STATUS](#)
- [CHANGE PUMP STATUS](#)
- [CHANGE DRAINER STATUS](#)

#### 14.11.2.123 SHOW SCHEMAS

This statement is an alias to [SHOW DATABASES](#). It is included for compatibility with MySQL.

#### 14.11.2.124 SHOW STATS\_HEALTHY

The `SHOW STATS_HEALTHY` statement shows an estimation of how accurate statistics are believed to be. Tables with a low percentage health may generate sub-optimal query execution plans.

The health of a table can be improved by running the `ANALYZE` table command. `ANALYZE` runs automatically when the health drops below the `tidb_auto_analyze_ratio` threshold.

#### 14.11.2.124.1 Synopsis

ShowStmt

Figure 426: ShowStmt

ShowTargetFiltertable

Figure 427: ShowTargetFilterable

## ShowLikeOrWhereOpt

Figure 428: ShowLikeOrWhereOpt

### 14.11.2.124.2 Examples

Load example data and run ANALYZE:

```
CREATE TABLE t1 (
 id INT NOT NULL PRIMARY KEY auto_increment,
 b INT NOT NULL,
 pad VARBINARY(255),
 INDEX(b)
);

INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM dual
↪ ;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
↪ JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
↪ JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
↪ JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
↪ JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
↪ JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
↪ JOIN t1 b JOIN t1 c LIMIT 100000;
SELECT SLEEP(1);
ANALYZE TABLE t1;
SHOW STATS_HEALTHY; # should be 100% healthy
```

```
...
mysql> SHOW STATS_HEALTHY;
+-----+-----+-----+-----+
| Db_name | Table_name | Partition_name | Healthy |
+-----+-----+-----+-----+
| test | t1 | | 100 |
+-----+-----+-----+-----+
```

```
1 row in set (0.00 sec)
```

Perform a bulk update deleting approximately 30% of the records. Check the health of the statistics:

```
DELETE FROM t1 WHERE id BETWEEN 101010 AND 201010; # delete about 30% of
↳ records
SHOW STATS_HEALTHY;
```

```
mysql> SHOW STATS_HEALTHY;
+-----+-----+-----+-----+
| Db_name | Table_name | Partition_name | Healthy |
+-----+-----+-----+-----+
| test | t1 | | 50 |
+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

#### 14.11.2.124.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

## 14.11.2.126 SHOW STATS\_LOCKED

SHOW STATS\_LOCKED shows the tables whose statistics are locked.

### Warning:

Locking statistics is an experimental feature for the current version. It is not recommended to use it in the production environment.

### 14.11.2.126.1 Synopsis

```
ShowStatsLockedStmt ::= 'SHOW' 'STATS_LOCKED' ShowLikeOrWhereOpt
```

```
ShowLikeOrWhereOpt ::= 'LIKE' SimpleExpr | 'WHERE' Expression
```

### 14.11.2.126.2 Examples

Create table `t`, and insert data into it. When the statistics of table `t` are not locked, the ANALYZE statement can be successfully executed.

```
mysql> create table t(a int, b int);
Query OK, 0 rows affected (0.03 sec)
```

```
mysql> insert into t values (1,2), (3,4), (5,6), (7,8);
Query OK, 4 rows affected (0.00 sec)
Records: 4 Duplicates: 0 Warnings: 0
```

```
mysql> analyze table t;
Query OK, 0 rows affected, 1 warning (0.02 sec)
```

```
mysql> show warnings;
```

```
+--
↪ -----+-----+-----+
↪
| Level | Code | Message |
+--
↪ -----+-----+-----+
↪
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
↪ test.t |
+--
↪ -----+-----+-----+
↪
1 row in set (0.00 sec)
```

Lock the statistics of table `t` and execute `ANALYZE`. From the output of `SHOW ↪ STATS_LOCKED`, you can see that the statistics of table `t` have been locked. The warning message shows that the `ANALYZE` statement has skipped table `t`.

```
mysql> lock stats t;
Query OK, 0 rows affected (0.00 sec)
```

```
mysql> show stats_locked;
```

```
+-----+-----+-----+
| Db_name | Table_name | Partition_name | Status |
+-----+-----+-----+
| test | t | | locked |
+-----+-----+-----+
1 row in set (0.01 sec)
```

```
mysql> analyze table t;
Query OK, 0 rows affected, 2 warnings (0.00 sec)
```

```
mysql> show warnings;
```

```
+--
↪ -----+-----+-----+
↪
| Level | Code | Message |
+--
```

```
+--
 ↪ -----+-----+-----
 ↪
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
 ↪ test.t |
| Warning | 1105 | skip analyze locked table: t
+--
 ↪ -----+-----+-----
 ↪
2 rows in set (0.00 sec)
```

Unlock the statistics of table t and ANALYZE can be successfully executed again.

```
mysql> unlock stats t;
Query OK, 0 rows affected (0.01 sec)

mysql> analyze table t;
Query OK, 0 rows affected, 1 warning (0.03 sec)

mysql> show warnings;
+--
 ↪ -----+-----+-----+-----+
 ↪
| Level | Code | Message
+--
 ↪ -----+-----+-----+-----+
 ↪
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
 ↪ test.t |
+--
 ↪ -----+-----+-----+-----+
 ↪
1 row in set (0.00 sec)
```

### 14.11.2.127 SHOW STATS\_META

You can use `SHOW STATS_META` to view how many rows are in a table and how many rows are changed in that table. When using this statement, you can filter the needed information by the `ShowLikeOrWhere` clause.

Currently, the `SHOW STATS_META` statement outputs 6 columns:

| Column name                 | Description                 |
|-----------------------------|-----------------------------|
| <code>db_name</code>        | Database name               |
| <code>table_name</code>     | Table name                  |
| <code>partition_name</code> | Partition name              |
| <code>update_time</code>    | Last updated time           |
| <code>modify_count</code>   | The number of rows modified |
| <code>row_count</code>      | The total row count         |

#### Note:

The `update_time` is updated when TiDB updates the `modify_count` and `row_count` fields according to DML statements. So `update_time` is not the last execution time of the `ANALYZE` statement.

#### 14.11.2.127.1 Synopsis

### 14.11.2.128 SHOW [GLOBAL|SESSION] STATUS

This statement is included for compatibility with MySQL. It has no effect on TiDB, which uses Prometheus and Grafana for centralized metrics collection instead of `SHOW STATUS`.

#### 14.11.2.128.1 Synopsis

ShowStmt:

Figure 435: ShowStmt

ShowTargetFilterable:

Figure 436: ShowTargetFilterable

GlobalScope:

Figure 437: GlobalScope

### 14.11.2.128.2 Examples

```
mysql> show status;
+-----+-----+
| Variable_name | Value |
+-----+-----+
Ssl_cipher_list	
server_id	93e2e07d-6bb4-4a1b-90b7-e035fae154fe
ddl_schema_version	141
Ssl_verify_mode	0
Ssl_version	
Ssl_cipher	
+-----+-----+
6 rows in set (0.01 sec)

mysql> show global status;
+-----+-----+
| Variable_name | Value |
+-----+-----+
Ssl_cipher	
Ssl_cipher_list	
Ssl_verify_mode	0
Ssl_version	
server_id	93e2e07d-6bb4-4a1b-90b7-e035fae154fe
ddl_schema_version	141
+-----+-----+
6 rows in set (0.00 sec)
```

### 14.11.2.128.3 MySQL compatibility

- This statement is included only for compatibility with MySQL.

### 14.11.2.128.4 See also

- [FLUSH STATUS](#)

### 14.11.2.129 SHOW TABLE NEXT\_ROW\_ID

SHOW TABLE NEXT\_ROW\_ID is used to show the details of some special columns of a table, including:

- AUTO\_INCREMENT column automatically created by TiDB, namely, `_tidb_rowid` column.
- AUTO\_INCREMENT column created by users.
- **AUTO\_RANDOM** column created by users.
- **SEQUENCE** created by users.

#### 14.11.2.129.1 Synopsis

ShowTableNextRowIDStmt:

Figure 438: ShowTableNextRowIDStmt

TableName:

Figure 439: TableName

#### 14.11.2.129.2 Examples

For newly created tables, NEXT\_GLOBAL\_ROW\_ID is 1 because no Row ID is allocated.

```

create table t(a int);
Query OK, 0 rows affected (0.06 sec)

```

```

show table t next_row_id;
+-----+-----+-----+-----+
| DB_NAME | TABLE_NAME | COLUMN_NAME | NEXT_GLOBAL_ROW_ID |
+-----+-----+-----+-----+
| test | t | _tidb_rowid | 1 |
+-----+-----+-----+-----+
1 row in set (0.00 sec)

```

Data have been written to the table. The TiDB server that inserts the data allocates and caches 30000 IDs at once. Thus, NEXT\_GLOBAL\_ROW\_ID is 30001 now.

```
insert into t values (), (), ();
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0
```

```
show table t next_row_id;
+-----+-----+-----+-----+
| DB_NAME | TABLE_NAME | COLUMN_NAME | NEXT_GLOBAL_ROW_ID |
+-----+-----+-----+-----+
| test | t | _tidb_rowid | 30001 |
+-----+-----+-----+-----+
1 row in set (0.00 sec)
```

### 14.11.2.129.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

### 14.11.2.129.4 See also

## 14.11.2.130 SHOW TABLE REGIONS

The SHOW TABLE REGIONS statement is used to show the Region information of a table in TiDB.

### 14.11.2.130.1 Syntax

```
SHOW TABLE [table_name] REGIONS [WhereClauseOptional];
SHOW TABLE [table_name] INDEX [index_name] REGIONS [WhereClauseOptional];
```

### 14.11.2.130.2 Synopsis

ShowTableRegionStmt:

Figure 440: ShowTableRegionStmt

**TableName:**

Figure 441: TableName

**PartitionNameListOpt:**

Figure 442: PartitionNameListOpt

**WhereClauseOptional:**

Figure 443: WhereClauseOptional

**WhereClause:**

Figure 444: WhereClause

Executing `SHOW TABLE REGIONS` returns the following columns:

- `REGION_ID`: The Region ID.
- `START_KEY`: The start key of the Region.
- `END_KEY`: The end key of the Region.
- `LEADER_ID`: The Leader ID of the Region.
- `LEADER_STORE_ID`: The ID of the store (TiKV) where the Region leader is located.
- `PEERS`: The IDs of all Region replicas.
- `SCATTERING`: Whether the Region is being scheduled. 1 means true.

- **WRITTEN\_BYTES**: The estimated amount of data written into the Region within one heartbeat cycle. The unit is byte.
- **READ\_BYTES**: The estimated amount of data read from the Region within one heartbeat cycle. The unit is byte.
- **APPROXIMATE\_SIZE(MB)**: The estimated amount of data in the Region. The unit is megabytes (MB).
- **APPROXIMATE\_KEYS**: The estimated number of Keys in the Region.
  
- **SCHEDULING\_CONSTRAINTS**: The **placement policy settings** associated with the table or partition to which a Region belongs.
  
- **SCHEDULING\_STATE**: The scheduling state of the Region which has a placement policy.

#### Note:

The values of **WRITTEN\_BYTES**, **READ\_BYTES**, **APPROXIMATE\_SIZE(MB)**, **APPROXIMATE\_KEYS** are not accurate data. They are estimated data from PD based on the heartbeat information that PD receives from the Region.

#### 14.11.2.130.3 Examples

Create an example table with enough data that fills a few Regions:

```
CREATE TABLE t1 (
 id INT NOT NULL PRIMARY KEY auto_increment,
 b INT NOT NULL,
 pad1 VARBINARY(1024),
 pad2 VARBINARY(1024),
 pad3 VARBINARY(1024)
);
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
 ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM dual;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
 ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
 ↪ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
 ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
 ↪ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
 ↪ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
 ↪ LIMIT 10000;
```

```

INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
↳ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
↳ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
↳ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
↳ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
↳ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
↳ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
↳ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
↳ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
↳ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
↳ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
↳ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
↳ LIMIT 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024),
↳ RANDOM_BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c
↳ LIMIT 10000;
SELECT SLEEP(5);
SHOW TABLE t1 REGIONS;

```

The output should show that the table is split into Regions. The REGION\_ID, START\_KEY and END\_KEY may not match exactly:

```

...
mysql> SHOW TABLE t1 REGIONS;
+---
↳ -----+-----+-----+-----+-----+-----+-----+
↳
| REGION_ID | START_KEY | END_KEY | LEADER_ID | LEADER_STORE_ID | PEERS |
↳ SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB) |
↳ APPROXIMATE_KEYS | SCHEDULING_CONSTRAINTS | SCHEDULING_STATE |
+---
↳ -----+-----+-----+-----+-----+-----+-----+
↳
| 94 | t_75_ | t_75_r_31717 | 95 | 1 | 95 |
↳ 0 | 0 | 0 | 112 |
↳ 207465 | | | |
| 96 | t_75_r_31717 | t_75_r_63434 | 97 | 1 | 97 |

```

```

↳ 0 | 0 | 0 | 97 |
↳ 0 | | | |
| 2 | t_75_r_63434 | | 3 | 1 | 3 |
↳ 0 | 269323514 | 66346110 | 245 |
↳ 162020 | | | |
+--
↳ -----+-----+-----+-----+-----+
↳
3 rows in set (0.00 sec)

```

In the output above, a `START_KEY` of `t_75_r_31717` and `END_KEY` of `t_75_r_63434` shows that data with a `PRIMARY KEY` between 31717 and 63434 is stored in this Region. The prefix `t_75_` indicates that this is the Region for a table (`t`) which has an internal table ID of 75. An empty key value for `START_KEY` or `END_KEY` indicates negative infinity or positive infinity respectively.

TiDB automatically rebalances Regions as needed. For manual rebalancing, use the `SPLIT TABLE REGION` statement:

```

mysql> SPLIT TABLE t1 BETWEEN (31717) AND (63434) REGIONS 2;
+-----+-----+
| TOTAL_SPLIT_REGION | SCATTER_FINISH_RATIO |
+-----+-----+
| 1 | 1 |
+-----+-----+
1 row in set (42.34 sec)

mysql> SHOW TABLE t1 REGIONS;
+--
↳ -----+-----+-----+-----+-----+
↳
| REGION_ID | START_KEY | END_KEY | LEADER_ID | LEADER_STORE_ID | PEERS |
↳ SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB) |
↳ APPROXIMATE_KEYS | SCHEDULING_CONSTRAINTS | SCHEDULING_STATE |
+--
↳ -----+-----+-----+-----+-----+
↳
| 94 | t_75_ | t_75_r_31717 | 95 | 1 | 95 |
↳ 0 | 0 | 0 | 112 |
↳ 207465 | | | |
| 98 | t_75_r_31717 | t_75_r_47575 | 99 | 1 | 99 |
↳ 0 | 1325 | 0 | 53 |
↳ 12052 | | | |
| 96 | t_75_r_47575 | t_75_r_63434 | 97 | 1 | 97 |
↳ 0 | 1526 | 0 | 48 |
↳ 0 | | | |

```

```

| 2 | t_75_r_63434 | | 3 | 1 | 3 |
↪ 0 | 0 | 55752049 | 60 |
↪ 0 | | |
+---
↪ -----+-----+-----+-----+-----+-----+
↪
4 rows in set (0.00 sec)

```

The above output shows that Region 96 was split, with a new Region 98 being created. The remaining Regions in the table were unaffected by the split operation. This is confirmed by the output statistics:

- `TOTAL_SPLIT_REGION` indicates the number of newly split Regions. In this example, the number is 1.
- `SCATTER_FINISH_RATIO` indicates the rate at which the newly split Regions are successfully scattered. 1.0 means that all Regions are scattered.

For a more detailed example:

```

mysql> show table t regions;
+---
↪ -----+-----+-----+-----+-----+-----+
↪
| REGION_ID | START_KEY | END_KEY | LEADER_ID | LEADER_STORE_ID | PEERS
↪ | SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB) |
↪ APPROXIMATE_KEYS | SCHEDULING_CONSTRAINTS | SCHEDULING_STATE |
+---
↪ -----+-----+-----+-----+-----+-----+
↪
| 102 | t_43_r | t_43_r_20000 | 118 | 7 | 105, 118,
↪ 119 | 0 | 0 | 0 | 1 | 0
↪ | | | | | |
| 106 | t_43_r_20000 | t_43_r_40000 | 120 | 7 | 107, 108,
↪ 120 | 0 | 23 | 0 | 1 | 0
↪ | | | | | |
| 110 | t_43_r_40000 | t_43_r_60000 | 112 | 9 | 112, 113,
↪ 121 | 0 | 0 | 0 | 1 | 0
↪ | | | | | |
| 114 | t_43_r_60000 | t_43_r_80000 | 122 | 7 | 115, 122,
↪ 123 | 0 | 35 | 0 | 1 | 0
↪ | | | | | |
| 3 | t_43_r_80000 | | 93 | 8 | 5, 73, 93
↪ | 0 | 0 | 0 | 1 | 0
↪ | | | | | |

```

```

| 98 | t_43_ | t_43_r | 99 | 1 | 99, 100,
 ↳ 101 | 0 | 0 | 0 | 1 | 0
 ↳
+---
 ↳ -----+-----+-----+-----+-----+
 ↳
6 rows in set

```

In the above example:

- Table t corresponds to six Regions. In these Regions, 102, 106, 110, 114, and 3 store the row data and 98 stores the index data.
- For `START_KEY` and `END_KEY` of Region 102, `t_43` indicates the table prefix and ID. `_r` is the prefix of the record data in table t. `_i` is the prefix of the index data.
- In Region 102, `START_KEY` and `END_KEY` mean that record data in the range of `[-inf, 20000)` is stored. In similar way, the ranges of data storage in Regions (106, 110, 114, 3) can also be calculated.
- Region 98 stores the index data. The start key of table t's index data is `t_43_i`, which is in the range of Region 98.

To check the Region that corresponds to table t in store 1, use the `WHERE` clause:

```

test> show table t regions where leader_store_id =1;
+---
 ↳ -----+-----+-----+-----+-----+
 ↳
| REGION_ID | START_KEY | END_KEY | LEADER_ID | LEADER_STORE_ID | PEERS |
 ↳ SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB) |
 ↳ APPROXIMATE_KEYS | SCHEDULING_CONSTRAINTS | SCHEDULING_STATE |
+---
 ↳ -----+-----+-----+-----+-----+
 ↳
| 98 | t_43_ | t_43_r | 99 | 1 | 99, 100, 101 | 0
 ↳ | 0 | 0 | 1 | 1 | 0 |
 ↳
+---
 ↳ -----+-----+-----+-----+-----+
 ↳

```

Use `SPLIT TABLE REGION` to split the index data into Regions. In the following example, the index data name of table t is split into two Regions in the range of `[a,z]`.

```

test> split table t index name between ("a") and ("z") regions 2;
+-----+
| TOTAL_SPLIT_REGION | SCATTER_FINISH_RATIO |

```

```

+-----+
| 2 | 1.0 |
+-----+
1 row in set

```

Now table t corresponds to seven Regions. Five of them (102, 106, 110, 114, 3) store the record data of table t and another two (135, 98) store the index data name.

```
test> show table t regions;
```

```

+---

## 14.11.2.134 SHOW WARNINGS

This statement shows a list of warnings that occurred for previously executed statements in the current client connection. As in MySQL, the `sql_mode` impacts which statements will cause errors vs. warnings considerably.

### 14.11.2.134.1 Synopsis

ShowWarningsStmt:

Figure 455: ShowWarningsStmt

### 14.11.2.134.2 Examples

```
mysql> CREATE TABLE t1 (a INT UNSIGNED);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 VALUES (0);
Query OK, 1 row affected (0.02 sec)

mysql> SELECT 1/a FROM t1;
+-----+
| 1/a |
+-----+
| NULL |
+-----+
1 row in set, 1 warning (0.00 sec)

mysql> SHOW WARNINGS;
+-----+-----+-----+
| Level | Code | Message |
+-----+-----+-----+
| Warning | 1365 | Division by 0 |
```

```
+-----+
1 row in set (0.00 sec)

mysql> INSERT INTO t1 VALUES (-1);
ERROR 1264 (22003): Out of range value for column 'a' at row 1
mysql> SELECT * FROM t1;
+-----+
| a |
+-----+
| 0 |
+-----+
1 row in set (0.00 sec)

mysql> SET sql_mode='';
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (-1);
Query OK, 1 row affected, 1 warning (0.01 sec)

mysql> SHOW WARNINGS;
+-----+-----+-----+
| Level | Code | Message |
+-----+-----+-----+
| Warning | 1690 | constant -1 overflows int |
+-----+-----+-----+
1 row in set (0.00 sec)

mysql> SELECT * FROM t1;
+-----+
| a |
+-----+
| 0 |
| 0 |
+-----+
2 rows in set (0.00 sec)
```

#### 14.11.2.134.3 MySQL compatibility

### 14.11.2.135 SHUTDOWN

The `SHUTDOWN` statement is used to perform a shutdown operation in TiDB. Execution of the `SHUTDOWN` statement requires the user to have `SHUTDOWN` privilege.

#### 14.11.2.135.1 Synopsis

Statement:

Figure 456: Statement

#### 14.11.2.135.2 Examples

```
SHUTDOWN;
```

```
Query OK, 0 rows affected (0.00 sec)
```

#### 14.11.2.135.3 MySQL compatibility

##### Note:

Because TiDB is a distributed database, the shutdown operation in TiDB stops the client-connected TiDB instance, not the entire TiDB cluster.

The `SHUTDOWN` statement is partly compatible with MySQL. If you encounter any compatibility issues, you can report the issues [on GitHub](#).

### 14.11.2.136 Split Region

For each new table created in TiDB, one **Region** is segmented by default to store the data of this table. This default behavior is controlled by `split-table` in the TiDB configuration file. When the data in this Region exceeds the default Region size limit, the Region starts to split into two.

In the above case, because there is only one Region at the beginning, all write requests occur on the TiKV where the Region is located. If there are a large number of writes for the newly created table, hotspots are caused.

To solve the hotspot problem in the above scenario, TiDB introduces the pre-split function, which can pre-split multiple Regions for a certain table according to the specified parameters and scatter them to each TiKV node.

### 14.11.2.136.1 Synopsis

#### 14.11.2.136.2 Usage of Split Region

There are two types of Split Region syntax:

- The syntax of even split:

```
SPLIT TABLE table_name [INDEX index_name] BETWEEN (lower_value) AND (
 ↪ upper_value) REGIONS region_num
```

`BETWEEN lower_value AND upper_value REGIONS region_num` defines the upper boundary, the lower boundary, and the Region amount. Then the current region will be evenly split into the number of regions (as specified in `region_num`) between the upper and lower boundaries.

- The syntax of uneven split:

```
SPLIT TABLE table_name [INDEX index_name] BY (value_list) [, (
 ↪ value_list)] ...
```

`BY value_list...` specifies a series of points manually, based on which the current Region is split. It is suitable for scenarios with unevenly distributed data.

The following example shows the result of the `SPLIT` statement:

| TOTAL_SPLIT_REGION | SCATTER_FINISH_RATIO |
|--------------------|----------------------|
| 4                  | 1.0                  |

- `TOTAL_SPLIT_REGION`: the number of newly split Regions.
- `SCATTER_FINISH_RATIO`: the completion rate of scattering for newly split Regions. 1.0 means that all Regions are scattered. 0.5 means that only half of the Regions are scattered and the rest are being scattered.

### Note:

The following two session variables might affect the behavior of the `SPLIT` statement:

- `tidb_wait_split_region_finish`: It might take a while to scatter the Regions. This duration depends on PD scheduling and TiKV loads. This variable is used to control when executing the `SPLIT REGION` statement whether to return the results to the client until all Regions are scattered. If its value is set to 1 (by default), TiDB returns the results only after the scattering is completed. If its value is set to 0, TiDB returns the results regardless of the scattering status.
- `tidb_wait_split_region_timeout`: This variable is to set the execution timeout of the `SPLIT REGION` statement, in seconds. The default value is 300s. If the `split` operation is not completed within the duration, TiDB returns a timeout error.

### Split Table Region

The key of row data in each table is encoded by `table_id` and `row_id`. The format is as follows:

```
t[table_id]_r[row_id]
```

For example, when `table_id` is 22 and `row_id` is 11:

```
t22_r11
```

Row data in the same table have the same `table_id`, but each row has its unique `row_id` that can be used for Region split.

## Even Split

Because `row_id` is an integer, the value of the key to be split can be calculated according to the specified `lower_value`, `upper_value`, and `region_num`. TiDB first calculates the step value ( $\text{step} = (\text{upper\_value} - \text{lower\_value}) / \text{region\_num}$ ). Then split will be done evenly per each “step” between `lower_value` and `upper_value` to generate the number of Regions as specified by `region_num`.

For example, if you want 16 evenly split Regions split from key `rangeminInt64~maxInt64` for table `t`, you can use this statement:

```
SPLIT TABLE t BETWEEN (-9223372036854775808) AND (9223372036854775807)
↳ REGIONS 16;
```

This statement splits table `t` into 16 Regions between `minInt64` and `maxInt64`. If the given primary key range is smaller than the specified one, for example, `0~1000000000`, you can use `0` and `1000000000` take place of `minInt64` and `maxInt64` respectively to split Regions.

```
SPLIT TABLE t BETWEEN (0) AND (1000000000) REGIONS 16;
```

## Uneven split

If the known data is unevenly distributed, and you want a Region to be split respectively in key ranges `-inf ~ 10000`, `10000 ~ 90000`, and `90000 ~ +inf`, you can achieve this by setting fixed points, as shown below:

```
SPLIT TABLE t BY (10000), (90000);
```

## Split index Region

The key of the index data in the table is encoded by `table_id`, `index_id`, and the value of the index column. The format is as follows:

```
t[table_id]_i[index_id][index_value]
```

For example, when `table_id` is 22, `index_id` is 5, and `index_value` is `abc`:

```
t22_i5abc
```

The `table_id` and `index_id` of the same index data in one table is the same. To split index Regions, you need to split Regions based on `index_value`.

## Even Spilt

The way to split index evenly works the same as splitting data evenly. However, calculating the value of step is more complicated, because `index_value` might not be an integer.

The values of `upper` and `lower` are encoded into a byte array firstly. After removing the longest common prefix of `lower` and `upper` byte array, the first 8 bytes of `lower` and `upper` are converted into the `uint64` format. Then  $\text{step} = (\text{upper} - \text{lower}) / \text{num}$  is calculated. After that, the calculated step is encoded into a byte array, which is appended to the longest common prefix of the `lower` and `upper` byte array for index split. Here is an example:

If the column of the `idx` index is of the integer type, you can use the following SQL statement to split index data:

```
SPLIT TABLE t INDEX idx BETWEEN (-9223372036854775808) AND
↪ (9223372036854775807) REGIONS 16;
```

This statement splits the Region of index `idx` in table `t` into 16 Regions from `minInt64` to `maxInt64`.

If the column of index `idx1` is of `varchar` type, and you want to split index data by prefix letters.

```
SPLIT TABLE t INDEX idx1 BETWEEN ("a") AND ("z") REGIONS 25;
```

This statement splits index `idx1` into 25 Regions from `a~z`. The range of Region 1 is [`minIndexValue`, `b`); the range of Region 2 is [`b`, `c`); ... the range of Region 25 is [`y`, `↪ minIndexValue`]. For the `idx` index, data with the `a` prefix is written into Region 1, and data with the `b` prefix is written into Region 2.

In the split method above, both data with the `y` and `z` prefixes are written into Region 25, because the upper bound is not `z`, but `{` (the character next to `z` in ASCII). Therefore, a more accurate split method is as follows:

```
SPLIT TABLE t INDEX idx1 BETWEEN ("a") AND ("{" REGIONS 26;
```

This statement splits index `idx1` of the table `t` into 26 Regions from `a~{`. The range of Region 1 is [`minIndexValue`, `b`); the range of Region 2 is [`b`, `c`); ... the range of Region 25 is [`y`, `z`), and the range of Region 26 is [`z`, `maxIndexValue`).

If the column of index `idx2` is of time type like `timestamp/datetime`, and you want to split index Region by year:

```
SPLIT TABLE t INDEX idx2 BETWEEN ("2010-01-01 00:00:00") AND ("2020-01-01
↪ 00:00:00") REGIONS 10;
```

This statement splits the Region of index `idx2` in table `t` into 10 Regions from `2010-01-01 00:00:00` to `2020-01-01 00:00:00`. The range of Region 1 is [`minIndexValue` `↪` , `2011-01-01 00:00:00`); the range of Region 2 is [`2011-01-01 00:00:00`, `↪ 2012-01-01 00:00:00`).

If you want to split the index Region by day, see the following example:

```
SPLIT TABLE t INDEX idx2 BETWEEN ("2020-06-01 00:00:00") AND ("2020-07-01
↪ 00:00:00") REGIONS 30;
```

This statement splits the data of June 2020 of index `idx2` in table `t` into 30 Regions, each Region representing 1 day.

Region split methods for other types of index columns are similar.

For data Region split of joint indexes, the only difference is that you can specify multiple columns values.

For example, index `idx3` (a, b) contains 2 columns, with column a of timestamp type and column b int. If you just want to do a time range split according to column a, you can use the SQL statement for splitting time index of a single column. In this case, do not specify the value of column b in `lower_value` and `upper_value`.

```
SPLIT TABLE t INDEX idx3 BETWEEN ("2010-01-01 00:00:00") AND ("2020-01-01
↳ 00:00:00") REGIONS 10;
```

Within the same range of time, if you want to do one more split according to column b column. Just specify the value for column b when splitting.

```
SPLIT TABLE t INDEX idx3 BETWEEN ("2010-01-01 00:00:00", "a") AND ("
↳ 2010-01-01 00:00:00", "z") REGIONS 10;
```

This statement splits 10 Regions in the range of a~z according to the value of column b, with the same time prefix as column a. If the value specified for column a is different, the value of column b might not be used in this case.

If the primary key of the table is a **non-clustered index**, you need to use backticks ` to escape the PRIMARY keyword when splitting Regions. For example:

```
SPLIT TABLE t INDEX `PRIMARY` BETWEEN (-9223372036854775808) AND
↳ (9223372036854775807) REGIONS 16;
```

### Uneven Split

Index data can also be split by specified index values.

For example, there is `idx4` (a,b), with column a of the varchar type and column b of the timestamp type.

```
SPLIT TABLE t1 INDEX idx4 BY ("a", "2000-01-01 00:00:01"), ("b", "
↳ 2019-04-17 14:26:19"), ("c", "");
```

This statement specifies 3 values to split 4 Regions. The range of each Region is as follows:

```
region1 [minIndexValue , ("a", "2000-01-01 00:00:01"))
region2 [("a", "2000-01-01 00:00:01") , ("b", "2019-04-17 14:26:19"))
region3 [("b", "2019-04-17 14:26:19") , ("c", ""))
region4 [("c", "") , maxIndexValue)
```

### Split Regions for partitioned tables

Splitting Regions for partitioned tables is the same as splitting Regions for ordinary tables. The only difference is that the same split operation is performed for every partition.

- The syntax of even split:

```
SPLIT [PARTITION] TABLE t [PARTITION] [(partition_name_list...)] [INDEX
↳ index_name] BETWEEN (lower_value) AND (upper_value) REGIONS
↳ region_num
```

- The syntax of uneven split:

```
SPLIT [PARTITION] TABLE table_name [PARTITION (partition_name_list...)]
↳ [INDEX index_name] BY (value_list) [, (value_list)] ...
```

Examples of Split Regions for partitioned tables

- Create a partitioned table `t`. Suppose that you want to create a Hash table divided into two partitions. The example statement is as follows:

```
create table t (a int,b int,index idx(a)) partition by hash(a)
↳ partitions 2;
```

After creating the table `t`, a Region is split for each partition. Use the `SHOW TABLE` `↳ REGIONS` syntax to view the Regions of this table:

```
show table t regions;
```

```
+--
↳ -----+-----+-----+-----+-----+
↳
| REGION_ID | START_KEY | END_KEY | LEADER_ID | LEADER_STORE_ID | PEERS
↳ | SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB
↳) | APPROXIMATE_KEYS |
+--
↳ -----+-----+-----+-----+-----+
↳
| 1978 | t_1400_ | t_1401_ | 1979 | 4 | 1979, 1980,
↳ 1981 | 0 | 0 | 0 | 1 | 0
↳
| 6 | t_1401_ | | 17 | 4 | 17, 18, 21
↳ | 0 | 223 | 0 | 1 | 0
↳
+--
↳ -----+-----+-----+-----+-----+
↳
```

- Use the `SPLIT` syntax to split a Region for each partition. Suppose that you want to split the data in the `[0,10000]` range of each partition into four Regions. The example statement is as follows:

```
split partition table t between (0) and (10000) regions 4;
```

In the above statement, 0 and 10000 respectively represent the `row_id` of the upper and lower boundaries corresponding to the hotspot data you want to scatter.

**Note:**

This example only applies to scenarios where hotspot data is evenly distributed. If the hotspot data is unevenly distributed in a specified data range, refer to the syntax of uneven split in [Split Regions for partitioned tables](#).

- Use the `SHOW TABLE REGIONS` syntax to view the Regions of this table again. You can see that this table now has ten Regions, each partition with five Regions, four of which are the row data and one is the index data.

```
show table t regions;
```

```
+--
 ↪ -----+-----+-----+-----+-----+

| ↪    |                                | 0             |      |   |     |
| 6    | t_1401_r_7500                  |               | 17   | 4 | 17, |
| ↪    | 18, 21                         | 0             | 601  | 0 | 1   |
| ↪    |                                | 0             |      |   |     |
| 1986 | t_1401_                        | t_1401_r      | 1989 | 5 |     |
| ↪    | 1989, 2018, 2019               | 0             | 123  | 0 | 1   |
| ↪    |                                | 0             |      |   |     |
| +--  |                                |               |      |   |     |
| ↪    | -----+-----+-----+-----+-----+ |               |      |   |     |
| ↪    |                                |               |      |   |     |

4. You can also split Regions for the index of each partition. For example, you can split the [1000,10000] range of the `idx` index into two Regions. The example statement is as follows:

```
split partition table t index idx between (1000) and (10000) regions
↪ 2;
```

#### Examples of Split Region for a single partition

You can specify the partition to be split.

1. Create a partitioned table. Suppose that you want to create a Range partitioned table split into three partitions. The example statement is as follows:

```
create table t (a int, b int, index idx(b)) partition by range(a) (
 partition p1 values less than (10000),
 partition p2 values less than (20000),
 partition p3 values less than (MAXVALUE));
```

2. Suppose that you want to split the data in the [0,10000] range of the p1 partition into two Regions. The example statement is as follows:

```
split partition table t partition (p1) between (0) and (10000) regions
↪ 2;
```

3. Suppose that you want to split the data in the [10000,20000] range of the p2 partition into two Regions. The example statement is as follows:

```
split partition table t partition (p2) between (10000) and (20000)
↪ regions 2;
```

4. You can use the `SHOW TABLE REGIONS` syntax to view the Regions of this table:

```
show table t regions;
```

```
+--
↪ -----+-----+-----+-----+
↪
| REGION_ID | START_KEY | END_KEY | LEADER_ID | LEADER_STORE_ID |
↪ PEERS | SCATTERING | WRITTEN_BYTES | READ_BYTES |
↪ APPROXIMATE_SIZE(MB) | APPROXIMATE_KEYS |
+--
↪ -----+-----+-----+-----+
↪
| 2040 | t_1406_ | t_1406_r_5000 | 2045 | 3 |
↪ 2043, 2045, 2044 | 0 | 0 | 0 | 1 |
↪ | 0 | | | |
| 2032 | t_1406_r_5000 | t_1407_ | 2033 | 4 |
↪ 2033, 2034, 2035 | 0 | 0 | 0 | 1 |
↪ | 0 | | | |
| 2046 | t_1407_ | t_1407_r_15000 | 2048 | 2 |
↪ 2047, 2048, 2050 | 0 | 35 | 0 | 1 |
↪ | 0 | | | |
| 2036 | t_1407_r_15000 | t_1408_ | 2037 | 4 |
↪ 2037, 2038, 2039 | 0 | 0 | 0 | 1 |
↪ | 0 | | | |
| 6 | t_1408_ | | 17 | 4 |
↪ 17, 18, 21 | 0 | 214 | 0 | 1 |
↪ | 0 | | | |
+--
↪ -----+-----+-----+-----+
↪
```

5. Suppose that you want to split the `[0,20000]` range of the `idx` index of the `p1` and `p2` partitions into two Regions. The example statement is as follows:

```
split partition table t partition (p1,p2) index idx between (0) and
↪ (20000) regions 2;
```

### 14.11.2.136.3 pre\_split\_regions

To have evenly split Regions when a table is created, it is recommended you use `SHARD_ROW_ID_BITS` together with `PRE_SPLIT_REGIONS`. When a table is created successfully, `PRE_SPLIT_REGIONS` pre-splits tables into the number of Regions as specified by `2^(PRE_SPLIT_REGIONS)`.

**Note:**

The value of `PRE_SPLIT_REGIONS` must be less than or equal to that of `SHARD_ROW_ID_BITS`.

The `tidb_scatter_region` global variable affects the behavior of `PRE_SPLIT_REGIONS`  $\leftrightarrow$  . This variable controls whether to wait for Regions to be pre-split and scattered before returning results after the table creation. If there are intensive writes after creating the table, you need to set the value of this variable to 1, then TiDB will not return the results to the client until all the Regions are split and scattered. Otherwise, TiDB writes the data before the scattering is completed, which will have a significant impact on write performance.

Examples of `pre_split_regions`

```
create table t (a int, b int, index idx1(a)) shard_row_id_bits = 4
 \leftrightarrow pre_split_regions=2;
```

After building the table, this statement splits 4 + 1 Regions for table t. 4 ( $2^2$ ) Regions are used to save table row data, and 1 Region is for saving the index data of `idx1`.

The ranges of the 4 table Regions are as follows:

```
region1: [-inf , 1<<61)
region2: [1<<61 , 2<<61)
region3: [2<<61 , 3<<61)
region4: [3<<61 , +inf)
```

**Note:**

The Region split by the Split Region statement is controlled by the **Region merge** scheduler in PD. To avoid PD re-merging the newly split Region soon after, you need to **dynamically modify** configuration items related to the Region merge feature.

#### 14.11.2.136.4 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.11.2.136.5 See also

- **SHOW TABLE REGIONS**

- Session variables: `tidb_scatter_region`, `tidb_wait_split_region_finish` and `tidb_wait_split_region_timeout`.

### 14.11.2.137 START TRANSACTION

This statement starts a new transaction inside of TiDB. It is similar to the statement `BEGIN`.

In the absence of a `START TRANSACTION` statement, every statement will by default autocommit in its own transaction. This behavior ensures MySQL compatibility.

#### 14.11.2.137.1 Synopsis

##### BeginTransactionStmt:

```
BeginTransactionStmt ::=
 'BEGIN' ('PESSIMISTIC' | 'OPTIMISTIC')?
| 'START' 'TRANSACTION' ('READ' ('WRITE' | 'ONLY' (('WITH' 'TIMESTAMP'
 ↳ 'BOUND' TimestampBound)? | AsOfClause)) | 'WITH' 'CONSISTENT' '
 ↳ SNAPSHOT' | 'WITH' 'CAUSAL' 'CONSISTENCY' 'ONLY')?

AsOfClause ::=
 ('AS' 'OF' 'TIMESTAMP' Expression)
```

#### 14.11.2.137.2 Examples

```
mysql> CREATE TABLE t1 (a int NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.12 sec)

mysql> START TRANSACTION;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.00 sec)

mysql> COMMIT;
Query OK, 0 rows affected (0.01 sec)
```

#### 14.11.2.137.3 MySQL compatibility

- `START TRANSACTION` immediately starts a transaction inside TiDB. This differs from MySQL, where `START TRANSACTION` lazily creates a transaction. But `START TRANSACTION` in TiDB is equivalent to MySQL's `START TRANSACTION WITH CONSISTENT SNAPSHOT`.
- The statement `START TRANSACTION READ ONLY` is parsed for compatibility with MySQL, but still allows write operations.

14.11.2.137.4 See also

- COMMIT
- ROLLBACK
- BEGIN
- START TRANSACTION WITH CAUSAL CONSISTENCY ONLY

### 14.11.2.138 TABLE

The TABLE statement can be used instead of SELECT \* FROM when no aggregation or complex filtering is needed.

#### 14.11.2.138.1 Synopsis

```
TableStmt ::=
 "TABLE" Table ("ORDER BY" Column)? ("LIMIT" NUM)?
```

#### 14.11.2.138.2 Examples

Create table t1:

```
CREATE TABLE t1(id INT PRIMARY KEY);
```

Insert some data into t1:

```
INSERT INTO t1 VALUES (1),(2),(3);
```

View the data in table t1:

```
TABLE t1;
```

```
+-----+
| id |
+-----+
| 1 |
| 2 |
| 3 |
+-----+
3 rows in set (0.01 sec)
```

Query t1 and sort the result by the id field in descending order:

```
TABLE t1 ORDER BY id DESC;
```

```
+-----+
| id |
+-----+
| 3 |
| 2 |
| 1 |
+-----+
3 rows in set (0.01 sec)
```

Query the first record in t1:

```
TABLE t1 LIMIT 1;
```

```
+-----+
| id |
+-----+
| 1 |
+-----+
1 row in set (0.01 sec)
```

### 14.11.2.138.3 MySQL compatibility

The TABLE statement was introduced in MySQL 8.0.19.

### 14.11.2.138.4 See also

- [SELECT](#)
- [TABLE statements in MySQL](#)

### 14.11.2.139 TRACE

The TRACE statement provides detailed information about query execution. It is intended to be viewed through a Graphical interface exposed by the TiDB server's status port.

#### 14.11.2.139.1 Synopsis

TraceStmt:

Figure 464: TraceStmt

## TraceableStmt:

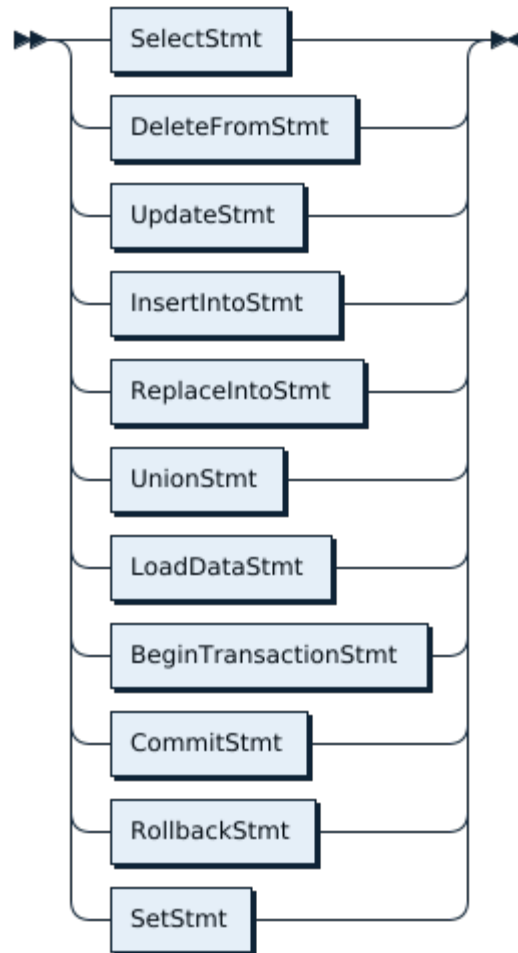

Figure 465: TraceableStmt

### 14.11.2.139.2 Examples

```
trace format='row' select * from mysql.user;
```

| operation              | startTS         | duration  |
|------------------------|-----------------|-----------|
| trace                  | 17:03:31.938237 | 886.086µs |
| - session.Execute      | 17:03:31.938247 | 507.812µs |
| - session.ParseSQL     | 17:03:31.938254 | 22.504µs  |

- [EXPLAIN ANALYZE](#)

### 14.11.2.140 TRUNCATE

The TRUNCATE statement removes all data from the table in a non-transactional way. TRUNCATE can be thought of as semantically the same as DROP TABLE + CREATE TABLE with the previous definition.

Both TRUNCATE TABLE `tableName` and TRUNCATE `tableName` are valid syntax.

#### 14.11.2.140.1 Synopsis

**TruncateTableStmt:**

Figure 468: TruncateTableStmt

OptTable:

Figure 469: OptTable

TableName:

Figure 470: TableName

#### 14.11.2.140.2 Examples

```
mysql> CREATE TABLE t1 (a INT NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.01 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+----+
| a |
+----+
| 1 |
| 2 |
| 3 |
| 4 |
| 5 |
+----+
5 rows in set (0.00 sec)

mysql> TRUNCATE t1;
Query OK, 0 rows affected (0.11 sec)
```

```
mysql> SELECT * FROM t1;
Empty set (0.00 sec)

mysql> INSERT INTO t1 VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.01 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> TRUNCATE TABLE t1;
Query OK, 0 rows affected (0.11 sec)
```

### 14.11.2.140.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

### 14.11.2.140.4 See also

- [DROP TABLE](#)
- [DELETE](#)
- [CREATE TABLE](#)
- [SHOW CREATE TABLE](#)

### 14.11.2.141 UNLOCK STATS

UNLOCK STATS is used to unlock the statistics of a table or tables.

#### **Warning:**

Locking statistics is an experimental feature for the current version. It is not recommended to use it in the production environment.

### 14.11.2.141.1 Synopsis

```
UnlockStatsStmt ::=
 'UNLOCK' 'STATS' TableNameList

TableNameList ::=
 TableName (',' TableName)*

TableName ::=
 Identifier ('.' Identifier)?
```

### 14.11.2.141.2 Examples

Create table `t`, and insert data into it. When the statistics of table `t` are not locked, the `ANALYZE` statement can be successfully executed.

```
mysql> create table t(a int, b int);
Query OK, 0 rows affected (0.03 sec)

mysql> insert into t values (1,2), (3,4), (5,6), (7,8);
Query OK, 4 rows affected (0.00 sec)
Records: 4 Duplicates: 0 Warnings: 0

mysql> analyze table t;
Query OK, 0 rows affected, 1 warning (0.02 sec)

mysql> show warnings;
+---+
| Level | Code | Message |
+---+
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
| test.t |
+---+
1 row in set (0.00 sec)
```

Lock the statistics of table `t` and execute `ANALYZE`. From the output of `SHOW` `STATS_LOCKED`, you can see that the statistics of table `t` have been locked. The warning message shows that the `ANALYZE` statement has skipped table `t`.

```
mysql> lock stats t;
Query OK, 0 rows affected (0.00 sec)

mysql> show stats_locked;
+-----+-----+-----+-----+
| Db_name | Table_name | Partition_name | Status |
+-----+-----+-----+-----+
| test | t | | locked |
+-----+-----+-----+-----+
1 row in set (0.01 sec)

mysql> analyze table t;
Query OK, 0 rows affected, 2 warnings (0.00 sec)
```

```
mysql> show warnings;
+---
↪ -----+-----+-----
↪
| Level | Code | Message |
+---
↪ -----+-----+-----
↪
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
↪ test.t |
| Warning | 1105 | skip analyze locked table: t |
+---
↪ -----+-----+-----
↪
2 rows in set (0.00 sec)
```

Unlock the statistics of table `t` and `ANALYZE` can be successfully executed again.

```
mysql> unlock stats t;
Query OK, 0 rows affected (0.01 sec)

mysql> analyze table t;
Query OK, 0 rows affected, 1 warning (0.03 sec)

mysql> show warnings;
+---
↪ -----+-----+-----+
↪
| Level | Code | Message |
+---
↪ -----+-----+-----+
↪
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
↪ test.t |
+---
↪ -----+-----+-----+
↪
1 row in set (0.00 sec)
```

### 14.11.2.141.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

#### 14.11.2.142.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
 ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1), (2), (3);
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+----+-----+
| id | c1 |
+----+-----+
1	1
2	2
3	3
+----+-----+
3 rows in set (0.00 sec)
```

```
mysql> UPDATE t1 SET c1=5 WHERE c1=3;
Query OK, 1 row affected (0.01 sec)
Rows matched: 1 Changed: 1 Warnings: 0

mysql> SELECT * FROM t1;
+-----+-----+
| id | c1 |
+-----+-----+
1	1
2	2
3	5
+-----+-----+
3 rows in set (0.00 sec)
```

### 14.11.2.142.3 MySQL compatibility

TiDB always uses the original value of a column when evaluating expressions. For example:

```
CREATE TABLE t (a int, b int);
INSERT INTO t VALUES (1,2);
UPDATE t SET a = a+1,b=a;
```

In MySQL, the column `b` is updated to 2 because it is set to the value of `a`, and the value of `a` (which is 1) is updated to `a+1` (which is 2) in the same statement.

TiDB follows the more standard SQL behavior, and updates `b` to 1.

mysql> USE newtest;
```

```
Database changed
mysql> SHOW TABLES;
Empty set (0.00 sec)

mysql> CREATE TABLE t1 (a int);
Query OK, 0 rows affected (0.10 sec)

mysql> SHOW TABLES;
+-----+
| Tables_in_newtest |
+-----+
| t1 |
+-----+
1 row in set (0.00 sec)
```

#### 14.11.2.143.3 MySQL compatibility

This statement is understood to be fully compatible with MySQL. Any compatibility differences should be [reported via an issue](#) on GitHub.

#### 14.11.2.143.4 See also

- [CREATE DATABASE](#)
- [SHOW TABLES](#)

#### 14.11.2.144 WITH

A Common Table Expression (CTE) is a temporary result set that can be referred multiple times within a SQL statement to improve the statement's readability and execution efficiency. You can apply the `WITH` statement to use Common Table Expressions.

##### 14.11.2.144.1 Synopsis

**WithClause:**

```
WithClause ::=
 "WITH" WithList
|
 "WITH" recursive WithList
```

**WithList:**

```
WithList ::=
 WithList ',' CommonTableExpr
|
 CommonTableExpr
```

### CommonTableExpr:

```
CommonTableExpr ::=
 Identifier IdentListWithParenOpt "AS" SubSelect
```

### IdentListWithParenOpt:

```
IdentListWithParenOpt ::=
 ('(' IdentList ')')?
```

### 14.11.2.144.2 Examples

Non-recursive CTE:

```
WITH CTE AS (SELECT 1, 2) SELECT * FROM cte t1, cte t2;
```

```
+---+---+---+---+
| 1 | 2 | 1 | 2 |
+---+---+---+---+
| 1 | 2 | 1 | 2 |
+---+---+---+---+
1 row in set (0.00 sec)
```

Recursive CTE:

```
WITH RECURSIVE cte(a) AS (SELECT 1 UNION SELECT a+1 FROM cte WHERE a < 5)
↪ SELECT * FROM cte;
```

```
+---+
| a |
+---+
| 1 |
| 2 |
| 3 |
| 4 |
| 5 |
+---+
5 rows in set (0.00 sec)
```

### 14.11.2.144.3 MySQL compatibility

- In strict mode, when the data length recursively calculated exceeds the data length of the seed part, TiDB returns a warning while MySQL returns an error. In non-strict mode, the behavior of TiDB is consistent with that of MySQL.

- The data type for recursive CTE is determined by the seed part. The data type of the seed part is not completely consistent with MySQL in some cases (such as functions).
- In the case of multiple UNION / UNION ALL operators, MySQL does not allow UNION to be followed by UNION ALL, but TiDB does.
- If there is a problem with the definition of a CTE, TiDB will report an error, while MySQL will not if the CTE is not referred.

#### 14.11.2.144.4 See also

- [SELECT](#)
- [INSERT](#)
- [DELETE](#)
- [UPDATE](#)
- [REPLACE](#)

### 14.11.3 Data Types

#### 14.11.3.1 Data Types

TiDB supports all the data types in MySQL except the SPATIAL type. This includes all the [numeric types](#), [string types](#), [date & time types](#), and [the JSON type](#).

The definitions used for datatypes are specified as T(M[, D]). Where by:

- T indicates the specific data type.
- M indicates the maximum display width for integer types. For floating-point and fixed-point types, M is the total number of digits that can be stored (the precision). For string types, M is the maximum length. The maximum permissible value of M depends on the data type.
- D applies to floating-point and fixed-point types and indicates the number of digits following the decimal point (the scale).
- fsp applies to the TIME, DATETIME, and TIMESTAMP types and represents the fractional seconds precision. The fsp value, if given, must be in the range 0 to 6. A value of 0 signifies that there is no fractional part. If omitted, the default precision is 0.

#### 14.11.3.2 Default Values

The DEFAULT value clause in a data type specification indicates a default value for a column. The default value must be a constant and cannot be a function or an expression. But for the time type, you can specify the NOW, CURRENT\_TIMESTAMP, LOCALTIME, and LOCALTIMESTAMP functions as the default for TIMESTAMP and DATETIME columns.

The BLOB, TEXT, and JSON columns **cannot** be assigned a default value.

If a column definition includes no explicit DEFAULT value, TiDB determines the default value as follows:

- If the column can take NULL as a value, the column is defined with an explicit DEFAULT  $\leftrightarrow$  NULL clause.
- If the column cannot take NULL as the value, TiDB defines the column with no explicit DEFAULT clause.

For data entry into a NOT NULL column that has no explicit DEFAULT clause, if an INSERT or REPLACE statement includes no value for the column, TiDB handles the column according to the SQL mode in effect at the time:

- If strict SQL mode is enabled, an error occurs for transactional tables, and the statement is rolled back. For nontransactional tables, an error occurs.
- If strict mode is not enabled, TiDB sets the column to the implicit default value for the column data type.

Implicit defaults are defined as follows:

- For numeric types, the default is 0. If declared with the AUTO\_INCREMENT attribute, the default is the next value in the sequence.
- For date and time types other than TIMESTAMP, the default is the appropriate “zero” value for the type. For TIMESTAMP, the default value is the current date and time.
- For string types other than ENUM, the default value is the empty string. For ENUM, the default is the first enumeration value.

### 14.11.3.3 Numeric Types

TiDB supports all the MySQL numeric types, including:

- **Integer Types** (Exact Value)
- **Floating-Point Types** (Approximate Value)
- **Fixed-Point Types** (Exact Value)

#### 14.11.3.3.1 Integer types

TiDB supports all the MySQL integer types, including INTEGER/INT, TINYINT, SMALLINT  $\leftrightarrow$  , MEDIUMINT, and BIGINT. For more information, see [Integer Data Type Syntax in MySQL](#).

The following table summarizes field descriptions:

| Syntax   | Description                              |
|----------|------------------------------------------|
| M        | the display width of the type. Optional. |
| UNSIGNED | UNSIGNED. If omitted, it is SIGNED.      |

| Syntax Element | Description                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------|
| ZEROFILL       | If you specify ZEROFILL for a numeric column, TiDB automatically adds the UNSIGNED attribute to the column. |

The following table summarizes the required storage and range for integer types supported by TiDB:

| Data Type | Storage Required (bytes) | Minimum Value (signed/unsigned) | Maximum value (signed/unsigned)            |
|-----------|--------------------------|---------------------------------|--------------------------------------------|
| TINYINT   | 1                        | -128 / 0                        | 127 / 255                                  |
| ↔         |                          |                                 |                                            |
| SMALLINT  | 2                        | -32768 / 0                      | 32767 / 65535                              |
| ↔         |                          |                                 |                                            |
| MEDIUMINT | 3                        | -8388608 / 0                    | 8388607 / 16777215                         |
| ↔         |                          |                                 |                                            |
| INT       | 4                        | -2147483648 / 0                 | 2147483647 / 4294967295                    |
| ↔         |                          |                                 |                                            |
| BIGINT    | 8                        | -9223372036854775808 / 0        | 9223372036854775807 / 18446744073709551615 |

### BIT type

The BIT data type. A type of BIT(M) enables the storage of M-bit values. M can range from 1 to 64, with the default value of 1:

```
BIT[(M)]
```

### BOOLEAN type

The BOOLEAN type and its alias BOOL are equivalent to TINYINT(1). If the value is 0, it is considered as False; otherwise, it is considered True. As in MySQL, True is 1 and False is 0:

```
BOOLEAN
```

### TINYINT type

The TINYINT data type stores signed values of range [-128, 127] and unsigned values of range [0, 255]:

```
TINYINT[(M)] [UNSIGNED] [ZEROFILL]
```

SMALLINT type

The SMALLINT data type stores signed values of range [-32768, 32767], and unsigned values of range [0, 65535]:

```
SMALLINT[(M)] [UNSIGNED] [ZEROFILL]
```

MEDIUMINT type

The MEDIUMINT data type stores signed values of range [-8388608, 8388607], and unsigned values of range [0, 16777215]:

```
MEDIUMINT[(M)] [UNSIGNED] [ZEROFILL]
```

INTEGER type

The INTEGER type and its alias INT stores signed values of range [-2147483648, 2147483647], and unsigned values of range [0, 4294967295]:

```
INT[(M)] [UNSIGNED] [ZEROFILL]
```

You can also use another form:

```
INTEGER[(M)] [UNSIGNED] [ZEROFILL]
```

BIGINT type

The BIGINT data type stores signed values of range [-9223372036854775808, 9223372036854775807], and unsigned values of range [0, 18446744073709551615]:

```
BIGINT[(M)] [UNSIGNED] [ZEROFILL]
```

### 14.11.3.3.2 Floating-point types

TiDB supports all the MySQL floating-point types, including FLOAT, and DOUBLE. For more information, see [Floating-Point Types \(Approximate Value\) - FLOAT, DOUBLE in MySQL](#).

The following table summarizes field descriptions:

| Syntax Element | Description                                      |
|----------------|--------------------------------------------------|
| M              | the total number of digits                       |
| D              | the number of digits following the decimal point |

| Syntax   | Description                                                                                                 |
|----------|-------------------------------------------------------------------------------------------------------------|
| UNSIGNED | UNSIGNED. If omitted, it is SIGNED.                                                                         |
| ZEROFILL | If you specify ZEROFILL for a numeric column, TiDB automatically adds the UNSIGNED attribute to the column. |

The following table summarizes the required storage for floating-point types supported by TiDB:

| Data Type | Storage Required (bytes)                                          |
|-----------|-------------------------------------------------------------------|
| FLOAT     | 4                                                                 |
| FLOAT(p)  | If $0 \leq p \leq 24$ , it is 4; if $25 \leq p \leq 53$ , it is 8 |
| DOUBLE    | 8                                                                 |

#### FLOAT type

The `FLOAT` type stores a single-precision floating-point number. Permissible values are  $-3.402823466E+38$  to  $-1.175494351E-38$ , 0, and  $1.175494351E-38$  to  $3.402823466E+38$ . These are the theoretical limits, based on the IEEE standard. The actual range might be slightly smaller depending on your hardware or operating system.

`FLOAT(p)` can be used to represent the required precision in bits. TiDB uses this value only to determine whether to use `FLOAT` or `DOUBLE` for the resulting data type. If `p` is from 0 to 24, the data type becomes `FLOAT` with no `M` or `D` values. If `p` is from 25 to 53, the data type becomes `DOUBLE` with no `M` or `D` values. The range of the resulting column is the same as for the single-precision `FLOAT` or double-precision `DOUBLE` data type.

`FLOAT[(M,D)] [UNSIGNED] [ZEROFILL]`  
`FLOAT(p) [UNSIGNED] [ZEROFILL]`

#### Note:

As in MySQL, the `FLOAT` data type stores approximate values. For values such as currency, it is recommended to use the `DECIMAL` type instead.

In TiDB, the default precision of the `FLOAT` data type is 8 digits, but in MySQL, the default precision is 6 digits. For example, assuming that you insert 123456789 and 1.23456789 into columns of the `FLOAT` type in both TiDB and MySQL, when you query the corresponding values in MySQL,

you get 123457000 and 1.23457, while in TiDB, you get 123456790 and 1.2345679.

## DOUBLE type

The `DOUBLE` type, and its alias `DOUBLE PRECISION` stores a double-precision floating-point number. Permissible values are  $-1.7976931348623157E+308$  to  $-2.2250738585072014E-308$ , 0, and  $2.2250738585072014E-308$  to  $1.7976931348623157E+308$ . These are the theoretical limits, based on the IEEE standard. The actual range might be slightly smaller depending on your hardware or operating system.

```
DOUBLE[(M,D)] [UNSIGNED] [ZEROFILL]
DOUBLE PRECISION [(M,D)] [UNSIGNED] [ZEROFILL], REAL[(M,D)] [UNSIGNED] [
↪ ZEROFILL]
```

### Warning:

As in MySQL, the `DOUBLE` data type stores approximate values. For values such as currency, it is recommended to use the `DECIMAL` type instead.

### Note:

When TiDB converts a double-precision floating-point number represented in scientific notation to the `CHAR` type, the result is displayed inconsistently with that in MySQL. See [Cast functions and operators](#) for details.

### 14.11.3.3.3 Fixed-point types

TiDB supports all the MySQL floating-point types, including `DECIMAL`, and `NUMERIC`. For more information, [Fixed-Point Types \(Exact Value\) - DECIMAL, NUMERIC in MySQL](#).

The meaning of the fields:

| Syntax Element | Description                                  |
|----------------|----------------------------------------------|
| M              | the total number of decimal digits           |
| D              | the number of digits after the decimal point |

3702

| Syntax Element | Description                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------|
| UNSIGNED       | UNSIGNED. If omitted, it is SIGNED.                                                                         |
| ZEROFILL       | If you specify ZEROFILL for a numeric column, TiDB automatically adds the UNSIGNED attribute to the column. |

### DECIMAL type

DECIMAL and its alias NUMERIC store a packed “exact” fixed-point number. M is the total number of decimal digits (the precision), and D is the number of digits after the decimal point (the scale). The decimal point and (for negative numbers) the - sign are not counted in M. If D is 0, values have no decimal point or fractional part. The maximum number of digits (M) for DECIMAL is 65. The maximum number of supported decimals (D) is 30. If D is omitted, the default is 0. If M is omitted, the default is 10.

```
DECIMAL[(M[,D])] [UNSIGNED] [ZEROFILL]
NUMERIC[(M[,D])] [UNSIGNED] [ZEROFILL]
```

### 14.11.3.4 Date and Time Types

TiDB supports all MySQL date and time data types to store temporal values: DATE, TIME, DATETIME, TIMESTAMP, and YEAR. For more information, see [Date and Time Data Types in MySQL](#).

Each of these types has its range of valid values, and uses a zero value to indicate that it is an invalid value. In addition, the TIMESTAMP and DATETIME types can automatically generate new time values on modification.

When dealing with date and time value types, note:

- Although TiDB tries to interpret different formats, the date-portion must be in the format of year-month-day (for example, ‘1998-09-04’), rather than month-day-year or day-month-year.
- If the year-portion of a date is specified as 2 digits, TiDB converts it based on [specific rules](#).
- If a numeric value is needed in the context, TiDB automatically converts the date or time value into a numeric type. For example:

```
mysql> SELECT NOW(), NOW()+0, NOW(3)+0;
+-----+-----+-----+
| NOW() | NOW()+0 | NOW(3)+0 |
```

```
+-----+-----+
| 2012-08-15 09:28:00 | 20120815092800 | 20120815092800.889 |
+-----+-----+
```

- TiDB might automatically convert invalid values or values beyond the supported range to a zero value of that type. This behavior is dependent on the SQL Mode set. For example:

```
mysql> show create table t1;
+--
↪ -----+-----+
↪
| Table | Create Table
↪
↪ |
+--
↪ -----+-----+
↪
| t1 | CREATE TABLE `t1` (
 `a` time DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin |
+--
↪ -----+-----+
↪
1 row in set (0.00 sec)

mysql> select @@sql_mode;
+--
↪ -----+-----+
↪
| @@sql_mode
↪
↪ |
+--
↪ -----+-----+
↪
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_ZERO_DATE,
↪ ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,
↪ NO_ENGINE_SUBSTITUTION |
+--
↪ -----+-----+
↪
1 row in set (0.00 sec)

mysql> insert into t1 values ('2090-11-32:22:33:44');
```

```

ERROR 1292 (22007): Truncated incorrect time value: '
 ↪ 2090-11-32:22:33:44'
mysql> set @@sql_mode='';
 ↪
 ↪ Query OK, 0 rows affected (0.01 sec)

mysql> insert into t1 values ('2090-11-32:22:33:44');
Query OK, 1 row affected, 1 warning (0.01 sec)

mysql> select * from t1;
+-----+
| a |
+-----+
| 00:00:00 |
+-----+
1 row in set (0.01 sec)

```

- Setting different SQL modes can change TiDB behaviors.
- If the SQL mode `NO_ZERO_DATE` is not enabled, TiDB allows month or day in the columns of `DATE` and `DATETIME` to be zero value, for example, '2009-00-00' or '2009-01-00'. If this date type is to be calculated in a function, for example, in `DATE_SUB()` or `DATE_ADD()`, the result can be incorrect.
- By default, TiDB enables the SQL mode `NO_ZERO_DATE`. This mode prevents storing zero values such as '0000-00-00'.

Different types of zero value are shown in the following table:

| Date Type | “Zero” Value          |
|-----------|-----------------------|
| DATE      | '0000-00-00'          |
| TIME      | '00:00:00'            |
| DATETIME  | '0000-00-00 00:00:00' |
| TIMESTAMP | '0000-00-00 00:00:00' |
| YEAR      | 0000                  |

Invalid `DATE`, `DATETIME`, `TIMESTAMP` values are automatically converted to the corresponding type of zero value ( '0000-00-00' or '0000-00-00 00:00:00' ) if the SQL mode permits such usage.

#### 14.11.3.4.1 Supported types

`DATE` type

DATE only contains date-portion and no time-portion, displayed in YYYY-MM-DD format. The supported range is ‘0000-01-01’ to ‘9999-12-31’:

**DATE**

#### TIME type

For the TIME type, the format is HH:MM:SS[.fraction] and valid values range from ‘-838:59:59.000000’ to ‘838:59:59.000000’. TIME is used not only to indicate the time within a day but also to indicate the time interval between 2 events. An optional fsp value in the range from 0 to 6 may be given to specify fractional seconds precision. If omitted, the default precision is 0:

**TIME[(fsp)]**

#### Note:

Pay attention to the abbreviated form of TIME. For example, ‘11:12’ means ‘11:12:00’ instead of ‘00:11:12’. However, ‘1112’ means ‘00:11:12’. These differences are caused by the presence or absence of the : character.

#### DATETIME type

DATETIME contains both date-portion and time-portion. Valid values range from ‘0000-01-01 00:00:00.000000’ to ‘9999-12-31 23:59:59.999999’.

TiDB displays DATETIME values in YYYY-MM-DD HH:MM:SS[.fraction] format, but permits assignment of values to DATETIME columns using either strings or numbers. An optional fsp value in the range from 0 to 6 may be given to specify fractional seconds precision. If omitted, the default precision is 0:

**DATETIME[(fsp)]**

#### TIMESTAMP type

TIMESTAMP contains both date-portion and time-portion. Valid values range from ‘1970-01-01 00:00:01.000000’ to ‘2038-01-19 03:14:07.999999’ in UTC time. An optional fsp value in the range from 0 to 6 may be given to specify fractional seconds precision. If omitted, the default precision is 0.

In TIMESTAMP, zero is not permitted to appear in the month-portion or day-portion. The only exception is zero value itself ‘0000-00-00 00:00:00’.

**TIMESTAMP[(fsp)]**

#### Timezone Handling

When `TIMESTAMP` is to be stored, TiDB converts the `TIMESTAMP` value from the current time zone to UTC time zone. When `TIMESTAMP` is to be retrieved, TiDB converts the stored `TIMESTAMP` value from UTC time zone to the current time zone (Note: `DATETIME` is not handled in this way). The default time zone for each connection is the server's local time zone, which can be modified by the environment variable `time_zone`.

### Warning:

As in MySQL, the `TIMESTAMP` data type suffers from the [Year 2038 Problem](#). For storing values that may span beyond 2038, please consider using the `DATETIME` type instead.

### YEAR type

The `YEAR` type is specified in the format 'YYYY'. Supported values range from 1901 to 2155, or the zero value of 0000:

```
YEAR[(4)]
```

`YEAR` follows the following format rules:

- Four-digit numeral ranges from 1901 to 2155
- Four-digit string ranges from '1901' to '2155'
- One-digit or two-digit numeral ranges from 1 to 99. Accordingly, 1-69 is converted to 2001-2069 and 70-99 is converted to 1970-1999
- One-digit or two-digit string ranges from '0' to '99'
- Value 0 is taken as 0000 whereas the string '0' or '00' is taken as 2000

Invalid `YEAR` value is automatically converted to 0000 (if users are not using the `NO_ZERO_DATE` SQL mode).

#### 14.11.3.4.2 Automatic initialization and update of `TIMESTAMP` and `DATETIME`

Columns with `TIMESTAMP` or `DATETIME` value type can be automatically initialized or updated to the current time.

For any column with `TIMESTAMP` or `DATETIME` value type in the table, you can set the default or auto-update value as current timestamp.

These properties can be set by setting `DEFAULT CURRENT_TIMESTAMP` and `ON UPDATE`  $\leftrightarrow$  `CURRENT_TIMESTAMP` when the column is being defined. `DEFAULT` can also be set as a specific value, such as `DEFAULT 0` or `DEFAULT '2000-01-01 00:00:00'`.

```
CREATE TABLE t1 (
 ts TIMESTAMP DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP,
 dt DATETIME DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP
);
```

The default value for DATETIME is NULL unless it is specified as NOT NULL. For the latter situation, if no default value is set, the default value is be 0.

```
CREATE TABLE t1 (
 dt1 DATETIME ON UPDATE CURRENT_TIMESTAMP, -- default NULL
 dt2 DATETIME NOT NULL ON UPDATE CURRENT_TIMESTAMP -- default 0
);
```

#### 14.11.3.4.3 Decimal part of time value

DATETIME and TIMESTAMP values can contain a fractional part of up to 6 digits which is accurate to microseconds. In any column of DATETIME or TIMESTAMP types, a fractional part is stored instead of being discarded. With a fractional part, the value is in the format of 'YYYY-MM-DD HH:MM:SS[.fraction]', and the fraction ranges from 000000 to 999999. A decimal point must be used to separate the fraction from the rest.

- Use `type_name(fsp)` to define a column that supports fractional precision, where `type_name` can be TIME, DATETIME or TIMESTAMP. For example,

```
CREATE TABLE t1 (t TIME(3), dt DATETIME(6));
```

`fsp` must range from 0 to 6.

0 means there is no fractional part. If `fsp` is omitted, the default is 0.

- When inserting TIME, DATETIME or TIMESTAMP which contain a fractional part, if the number of digit of the fraction is too few, or too many, rounding might be needed in the situation. For example:

```
mysql> CREATE TABLE fractest(c1 TIME(2), c2 DATETIME(2), c3 TIMESTAMP
 ↪ (2));
Query OK, 0 rows affected (0.33 sec)

mysql> INSERT INTO fractest VALUES
 > ('17:51:04.777', '2014-09-08 17:51:04.777', '2014-09-08
 ↪ 17:51:04.777');
Query OK, 1 row affected (0.03 sec)

mysql> SELECT * FROM fractest;
```

```

+-----+-----+-----+
| c1 | c2 | c3 |
+-----+-----+-----+
| 17:51:04.78 | 2014-09-08 17:51:04.78 | 2014-09-08 17:51:04.78 |
+-----+-----+-----+
1 row in set (0.00 sec)

```

#### 14.11.3.4.4 Conversions between date and time types

Sometimes we need to make conversions between date and time types. But some conversions might lead to information loss. For example, DATE, DATETIME and TIMESTAMP values all have their own respective ranges. TIMESTAMP should be no earlier than the year 1970 in UTC time or no later than UTC time ‘2038-01-19 03:14:07’. Based on this rule, ‘1968-01-01’ is a valid date value of DATE or DATETIME, but becomes 0 when it is converted to TIMESTAMP.

The conversions of DATE:

- When DATE is converted to DATETIME or TIMESTAMP, a time-portion ‘00:00:00’ is added, because DATE does not contain any time information
- When DATE is converted to TIME, the result is ‘00:00:00’

Conversions of DATETIME or TIMESTAMP:

- When DATETIME or TIMESTAMP is converted to DATE, the time and fractional part is discarded. For example, ‘1999-12-31 23:59:59.499’ is converted to ‘1999-12-31’
- When DATETIME or TIMESTAMP is converted to TIME, the date-portion is discarded, because TIME does not contain any date information

When we convert TIME to other time and date formats, the date-portion is automatically specified as CURRENT\_DATE(). The final converted result is a date that consists of TIME and CURRENT\_DATE(). This is to say that if the value of TIME is beyond the range from ‘00:00:00’ to ‘23:59:59’, the converted date-portion does not indicate the current day.

When TIME is converted to DATE, the process is similar, and the time-portion is discarded.

Using the CAST() function can explicitly convert a value to a DATE type. For example:

```
date_col = CAST(datetime_col AS DATE)
```

Converting TIME and DATETIME to numeric format. For example:

```

mysql> SELECT CURTIME(), CURTIME()+0, CURTIME(3)+0;
+-----+-----+-----+
| CURTIME() | CURTIME()+0 | CURTIME(3)+0 |
+-----+-----+-----+
| 09:28:00 | 92800 | 92800.887 |

```

```

+-----+-----+-----+
mysql> SELECT NOW(), NOW()+0, NOW(3)+0;
+-----+-----+-----+
| NOW() | NOW()+0 | NOW(3)+0 |
+-----+-----+-----+
| 2012-08-15 09:28:00 | 20120815092800 | 20120815092800.889 |
+-----+-----+-----+

```

#### 14.11.3.4.5 Two-digit year-portion contained in the date

The two-digit year-portion contained in date does not explicitly indicate the actual year and is ambiguous.

For DATETIME, DATE and TIMESTAMP types, TiDB follows the following rules to eliminate ambiguity:

- Values between 01 and 69 is converted to a value between 2001 and 2069
- Values between 70 and 99 is converted to a value between 1970 and 1999

These rules also apply to the YEAR type, with one exception:

When numeral 00 is inserted to YEAR(4), the result is 0000 rather than 2000.

If you want the result to be 2000, specify the value to be 2000.

The two-digit year-portion might not be properly calculated in some functions such MIN() and MAX(). For these functions, the four-digit format suites better.

#### 14.11.3.5 String Types

TiDB supports all the MySQL string types, including CHAR, VARCHAR, BINARY, VARBINARY ↪ , BLOB, TEXT, ENUM, and SET. For more information, see [String Types in MySQL](#).

##### 14.11.3.5.1 Supported types

CHAR type

CHAR is a fixed length string. M represents the column-length in characters (not bytes). The range of M is 0 to 255. Different from the VARCHAR type, when data is inserted into a CHAR column, the trailing spaces are truncated.

```
[NATIONAL] CHAR[(M)] [CHARACTER SET charset_name] [COLLATE collation_name]
```

VARCHAR type

VARCHAR is a string of variable-length. M represents the maximum column length in characters (not bytes). The maximum size of VARCHAR cannot exceed 65,535 bytes. The maximum row length and the character set being used determine the VARCHAR length.

The space occupied by a single character might differ for different character sets. The following table shows the bytes consumed by a single character, and the range of the `VARCHAR` column length in each character set:

| Character Set | Byte(s) per Character | Range of the Maximum <code>VARCHAR</code> Column Length |
|---------------|-----------------------|---------------------------------------------------------|
| ascii         | 1                     | (0, 65535]                                              |
| latin1        | 1                     | (0, 65535]                                              |
| binary        | 1                     | (0, 65535]                                              |
| utf8          | 3                     | (0, 21845]                                              |
| utf8mb4       | 4                     | (0, 16383]                                              |

```
[NATIONAL] VARCHAR(M) [CHARACTER SET charset_name] [COLLATE collation_name]
```

#### TEXT type

`TEXT` is a string of variable-length. The maximum column length is 65,535 bytes. The optional `M` argument is in characters and is used to automatically select the fittest type of a `TEXT` column. For example `TEXT(60)` will yield a `TINYTEXT` data type that can hold up to 255 bytes, which fits a 60-character UTF-8 string that has up to 4 bytes per character ( $4 \times 60 = 240$ ). Using the `M` argument is not recommended.

```
TEXT[(M)] [CHARACTER SET charset_name] [COLLATE collation_name]
```

#### TINYTEXT type

The `TINYTEXT` type is similar to the `TEXT` type. The difference is that the maximum column length of `TINYTEXT` is 255.

```
TINYTEXT [CHARACTER SET charset_name] [COLLATE collation_name]
```

#### MEDIUMTEXT type

The `MEDIUMTEXT` type is similar to the `TEXT` type. The difference is that the maximum column length of `MEDIUMTEXT` is 16,777,215. But due to the limitation of `txn-entry-size`  $\leftrightarrow$  `limit`, the maximum storage size of a single row in TiDB is 6 MiB by default and can be increased to 120 MiB by changing the configuration.

```
MEDIUMTEXT [CHARACTER SET charset_name] [COLLATE collation_name]
```

#### LONGTEXT type

The `LONGTEXT` type is similar to the `TEXT` type. The difference is that the maximum column length of `LONGTEXT` is 4,294,967,295. But due to the limitation of `txn-entry-size`  $\leftrightarrow$  `-limit`, the maximum storage size of a single row in TiDB is 6 MiB by default and can be increased to 120 MiB by changing the configuration.

```
LONGTEXT [CHARACTER SET charset_name] [COLLATE collation_name]
```

### BINARY type

The BINARY type is similar to the **CHAR type**. The difference is that BINARY stores binary byte strings.

```
BINARY(M)
```

### VARBINARY type

The VARBINARY type is similar to the **VARCHAR type**. The difference is that the VARBINARY stores binary byte strings.

```
VARBINARY(M)
```

### BLOB type

BLOB is a large binary file. M represents the maximum column length in bytes, ranging from 0 to 65,535.

```
BLOB[(M)]
```

### TINYBLOB type

The TINYBLOB type is similar to the **BLOB type**. The difference is that the maximum column length of TINYBLOB is 255.

```
TINYBLOB
```

### MEDIUMBLOB type

The MEDIUMBLOB type is similar to the **BLOB type**. The difference is that the maximum column length of MEDIUMBLOB is 16,777,215. But due to the limitation of **txn-entry-size**  $\leftrightarrow$  **limit**, the maximum storage size of a single row in TiDB is 6 MiB by default and can be increased to 120 MiB by changing the configuration.

```
MEDIUMBLOB
```

### LOB type

The LOB type is similar to the **BLOB type**. The difference is that the maximum column length of LOB is 4,294,967,295. But due to the limitation of **txn-entry-size**  $\leftrightarrow$  **-limit**, the maximum storage size of a single row in TiDB is 6 MiB by default and can be increased to 120 MiB by changing the configuration.

```
LOB
```

### ENUM type

An ENUM is a string object with a value chosen from a list of permitted values that are enumerated explicitly in the column specification when the table is created. The syntax is:

```
ENUM('value1', 'value2', ...) [CHARACTER SET charset_name] [COLLATE
 ↪ collation_name]
```

#### For example:

```
ENUM('apple', 'orange', 'pear')
```

The value of the ENUM data type is stored as numbers. Each value is converted to a number according to the definition order. In the previous example, each string is mapped to a number:

| Value    | Number |
|----------|--------|
| NULL     | NULL   |
| ''       | 0      |
| 'apple'  | 1      |
| 'orange' | 2      |
| 'pear'   | 3      |

For more information, see [the ENUM type in MySQL](#).

SET type

A SET is a string object that can have zero or more values, each of which must be chosen from a list of permitted values specified when the table is created. The syntax is:

```
SET('value1', 'value2', ...) [CHARACTER SET charset_name] [COLLATE
 ↪ collation_name]
```

#### For example:

```
SET('1', '2') NOT NULL
```

In the example, any of the following values can be valid:

```
' '
'1'
'2'
'1,2'
```

In TiDB, the values of the SET type is internally converted to Int64. The existence of each element is represented using a binary: 0 or 1. For a column specified as SET('a', 'b' ↪ ', 'c', 'd'), the members have the following decimal and binary values.

| Member | Decimal Value | Binary Value |
|--------|---------------|--------------|
| 'a'    | 1             | 0001         |
| 'b'    | 2             | 0010         |
| 'c'    | 4             | 0100         |

| Member | Decimal Value | Binary Value |
|--------|---------------|--------------|
| 'd'    | 8             | 1000         |

In this case, for an element of ('a', 'c'), it is 0101 in binary.

For more information, see [the SET type in MySQL](#).

### 14.11.3.6 JSON Type

TiDB supports the JSON (JavaScript Object Notation) data type, which is useful for storing semi-structured data. The JSON data type provides the following advantages over storing JSON-format strings in a string column:

- Use the Binary format for serialization. The internal format permits quick read access to JSON document elements.
- Automatic validation of the JSON documents stored in JSON columns. Only valid documents can be stored.

JSON columns, like columns of other binary types, are not indexed directly, but you can index the fields in the JSON document in the form of generated column:

```
CREATE TABLE city (
 id INT PRIMARY KEY,
 detail JSON,
 population INT AS (JSON_EXTRACT(detail, '$.population')),
 index index_name (population)
);
INSERT INTO city (id,detail) VALUES (1, '{"name": "Beijing", "population":
↪ 100}');
SELECT id FROM city WHERE population >= 100;
```

For more information, see [JSON Functions](#) and [Generated Columns](#).

#### 14.11.3.6.1 Restrictions

- Currently, TiDB does not support pushing down JSON functions to TiFlash.
- TiDB Backup & Restore (BR) versions earlier than v6.3.0 do not support recovering data containing JSON columns. No version of BR supports recovering data containing JSON columns to TiDB clusters earlier than v6.3.0.
- Do not use any replication tool to replicate data containing non-standard JSON data types, such as DATE, DATETIME, and TIME.

### 14.11.3.6.2 MySQL compatibility

- When you create JSON columns with data in the BINARY type, MySQL mislabels the data as the STRING type currently, while TiDB processes it as the BINARY type correctly.

```
CREATE TABLE test(a json);
INSERT INTO test SELECT json_objectagg('a', b'01010101');

-- In TiDB, executing the following SQL statement returns `0, 0`. In
 ↳ MySQL, executing the following SQL statement returns `0, 1`.
mysql> SELECT JSON_EXTRACT(JSON_OBJECT('a', b'01010101'), '$.a') = "
 ↳ base64:type15:VQ==" AS r1, JSON_EXTRACT(a, '$.a') = "base64:
 ↳ type15:VQ==" AS r2 FROM test;
+-----+-----+
| r1 | r2 |
+-----+-----+
| 0 | 0 |
+-----+-----+
1 row in set (0.01 sec)
```

For more information, see issue [#37443](#).

- When converting the data type from ENUM or SET to JSON, TiDB checks the correctness of data format. For example, executing the following SQL statements in TiDB will return an error.

```
CREATE TABLE t(e ENUM('a'));
INSERT INTO t VALUES ('a');
mysql> SELECT CAST(e AS JSON) FROM t;
ERROR 3140 (22032): Invalid JSON text: The document root must not be
 ↳ followed by other values.
```

For more information, see issue [#9999](#).

- In TiDB, you can use ORDER BY to sort JSON arrays or JSON objects.

In MySQL, if you use ORDER BY to sort JSON arrays or JSON objects, MySQL returns a warning and the sorting result does not match the result of the comparison operation:

```
CREATE TABLE t(j JSON);
INSERT INTO t VALUES ('[1,2,3,4]');
INSERT INTO t VALUES ('[5]');

mysql> SELECT j FROM t WHERE j < JSON_ARRAY(5);
+-----+
| j |
+-----+
```

```

| [1, 2, 3, 4] |
+-----+
1 row in set (0.00 sec)

-- In TiDB, executing the following SQL statement returns the correct
 ↪ sorting result. In MySQL, executing the following SQL
 ↪ statement returns the "This version of MySQL doesn't yet
 ↪ support 'sorting of non-scalar JSON values'." warning and the
 ↪ sorting result is inconsistent with the comparison result of
 ↪ '<`.

mysql> SELECT j FROM t ORDER BY j;
+-----+
| j |
+-----+
| [1, 2, 3, 4] |
| [5] |
+-----+
2 rows in set (0.00 sec)

```

For more information, see issue [#37506](#).

- When you insert data to a JSON column, TiDB implicitly converts the value of the data to the JSON type.

```

CREATE TABLE t(col JSON);

-- In TiDB, the following INSERT statement is executed successfully.
 ↪ In MySQL, executing the following INSERT statement returns the
 ↪ "Invalid JSON text" error.

INSERT INTO t VALUES (3);

```

For more information about the JSON data type, see [JSON functions](#) and [Generated Columns](#).

## 14.11.4 Functions and Operators

### 14.11.4.1 Function and Operator Reference

The usage of the functions and operators in TiDB is similar to MySQL. See [Functions and Operators in MySQL](#).

In SQL statements, expressions can be used on the ORDER BY and HAVING clauses of the SELECT statement, the WHERE clause of SELECT/DELETE/UPDATE statements, and SET statements.

You can write expressions using literals, column names, NULL, built-in functions, operators and so on. For expressions that TiDB supports pushing down to TiKV, see [List of Expressions for Pushdown](#).

### 14.11.4.2 Type Conversion in Expression Evaluation

TiDB behaves the same as MySQL: <https://dev.mysql.com/doc/refman/5.7/en/type-conversion.html>

### 14.11.4.3 Operators

This document describes the operators precedence, comparison functions and operators, logical operators, and assignment operators.

| >>                      | Right shift                                                                                                                              |
| RLIKE                   | Synonym for REGEXP                                                                                                                       |
| *                       | Multiplication operator                                                                                                                  |
| -                       | Change the sign of the argument                                                                                                          |
| XOR                     | Logical XOR                                                                                                                              |

#### 14.11.4.3.1 Unsupported operators

- [SOUNDS LIKE](#)

#### 14.11.4.3.2 Operator precedence

Operator precedences are shown in the following list, from highest precedence to the lowest. Operators that are shown together on a line have the same precedence.

```

INTERVAL
BINARY, COLLATE
!
- (unary minus), ~ (unary bit inversion)
^
*, /, DIV, %, MOD
-, +
<<, >>
&

```

```

|
= (comparison), <=>, >=, >, <=, <, <>, !=, IS, LIKE, REGEXP, IN
BETWEEN, CASE, WHEN, THEN, ELSE
NOT
AND, &&
XOR
OR, ||
= (assignment), :=

```

For details, see [Operator Precedence](#).

#### 14.11.4.3.3 Comparison functions and operators

| Name                                    | Description                                                           |
|-----------------------------------------|-----------------------------------------------------------------------|
| <a href="#">BETWEEN ... AND ...</a>     | Check whether a value is within a range of values                     |
| <a href="#">COALESCE()</a>              | Return the first non-NULL argument                                    |
| <a href="#">=</a>                       | Equal operator                                                        |
| <a href="#">&lt;=&gt;</a>               | NULL-safe equal to operator                                           |
| <a href="#">&gt;</a>                    | Greater than operator                                                 |
| <a href="#">&gt;=</a>                   | Greater than or equal operator                                        |
| <a href="#">GREATEST()</a>              | Return the largest argument                                           |
| <a href="#">IN()</a>                    | Check whether a value is within a set of values                       |
| <a href="#">INTERVAL()</a>              | Return the index of the argument that is less than the first argument |
| <a href="#">IS</a>                      | Test a value against a boolean                                        |
| <a href="#">IS NOT</a>                  | Test a value against a boolean                                        |
| <a href="#">IS NOT NULL</a>             | NOT NULL value test                                                   |
| <a href="#">IS NULL</a>                 | NULL value test                                                       |
| <a href="#">ISNULL()</a>                | Test whether the argument is NULL                                     |
| <a href="#">LEAST()</a>                 | Return the smallest argument                                          |
| <a href="#">&lt;</a>                    | Less than operator                                                    |
| <a href="#">&lt;=</a>                   | Less than or equal operator                                           |
| <a href="#">LIKE</a>                    | Simple pattern matching                                               |
| <a href="#">NOT BETWEEN ... AND ...</a> | Check whether a value is not within a range of values                 |
| <a href="#">!=, &lt;&gt;</a>            | Not equal operator                                                    |
| <a href="#">NOT IN()</a>                | Check whether a value is not within a set of values                   |
| <a href="#">NOT LIKE</a>                | Negation of simple pattern matching                                   |
| <a href="#">STRCMP()</a>                | Compare two strings                                                   |

For details, see [Comparison Functions and Operators](#).

#### 14.11.4.3.4 Logical operators

| Name                            | Description   |
|---------------------------------|---------------|
| <a href="#">AND, &amp;&amp;</a> | Logical AND   |
| <a href="#">NOT, !</a>          | Negates value |
| <a href="#">  , OR</a>          | Logical OR    |
| <a href="#">XOR</a>             | Logical XOR   |

For details, see [MySQL Handling of GROUP BY](#).

#### 14.11.4.3.5 Assignment operators

| Name               | Description                                                                                                                                      |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">=</a>  | Assign a value (as part of a <a href="#">SET</a> statement, or as part of the <a href="#">SET</a> clause in an <a href="#">UPDATE</a> statement) |
| <a href="#">:=</a> | Assign a value                                                                                                                                   |

For details, see [Detection of Functional Dependence](#).

#### 14.11.4.4 Control Flow Functions

TiDB supports all of the [control flow functions](#) available in MySQL 5.7.

| Name                      | Description                               |
|---------------------------|-------------------------------------------|
| <a href="#">CASE</a>      | Case operator                             |
| <a href="#">IF ()</a>     | If/else construct                         |
| <a href="#">IFNULL ()</a> | Null if/else construct                    |
| <a href="#">NULLIF ()</a> | Return NULL if <code>expr1 = expr2</code> |

#### 14.11.4.5 String Functions

TiDB supports most of the [string functions](#) available in MySQL 5.7, some of the [string functions](#) available in MySQL 8.0, and some of the [functions](#) available in Oracle 21.

For comparisons between functions and syntax of Oracle and TiDB, see [Comparisons between Functions and Syntax of Oracle and TiDB](#).

##### 14.11.4.5.1 Supported functions

| Name                     | Description                                 |
|--------------------------|---------------------------------------------|
| <a href="#">ASCII ()</a> | Return numeric value of left-most character |

| Name                               | Description                                                                                                                        |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">BIN()</a>              | Return a string containing binary representation of a number                                                                       |
| <a href="#">BIT_LENGTH()</a>       | Return length of argument in bits                                                                                                  |
| <a href="#">CHAR()</a>             | Return the character for each integer passed                                                                                       |
| <a href="#">CHAR_LENGTH()</a>      | Return number of characters in argument                                                                                            |
| <a href="#">CHARACTER_LENGTH()</a> | Synonym for <a href="#">CHAR_LENGTH()</a>                                                                                          |
| <a href="#">CONCAT()</a>           | Return concatenated string                                                                                                         |
| <a href="#">CONCAT_WS()</a>        | Return concatenate with separator                                                                                                  |
| <a href="#">ELT()</a>              | Return string at index number                                                                                                      |
| <a href="#">EXPORT_SET()</a>       | Return a string such that for every bit set in the value bits, you get an on string and for every unset bit, you get an off string |
| <a href="#">FIELD()</a>            | Return the index (position) of the first argument in the subsequent arguments                                                      |
| <a href="#">FIND_IN_SET()</a>      | Return the index position of the first argument within the second argument                                                         |
| <a href="#">FORMAT()</a>           | Return a number formatted to specified number of decimal places                                                                    |
| <a href="#">FROM_BASE64()</a>      | Decode to a base-64 string and return result                                                                                       |
| <a href="#">HEX()</a>              | Return a hexadecimal representation of a decimal or string value                                                                   |
| <a href="#">INSERT()</a>           | Insert a substring at the specified position up to the specified number of characters                                              |
| <a href="#">INSTR()</a>            | Return the index of the first occurrence of substring                                                                              |
| <a href="#">LCASE()</a>            | Synonym for <a href="#">LOWER()</a>                                                                                                |
| <a href="#">LEFT()</a>             | Return the leftmost number of characters as specified                                                                              |
| <a href="#">LENGTH()</a>           | Return the length of a string in bytes                                                                                             |
| <a href="#">LIKE</a>               | Simple pattern matching                                                                                                            |
| <a href="#">LOCATE()</a>           | Return the position of the first occurrence of substring                                                                           |
| <a href="#">LOWER()</a>            | Return the argument in lowercase                                                                                                   |
| <a href="#">LPAD()</a>             | Return the string argument, left-padded with the specified string                                                                  |
| <a href="#">LTRIM()</a>            | Remove leading spaces                                                                                                              |
| <a href="#">MAKE_SET()</a>         | Return a set of comma-separated strings that have the corresponding bit in bits set                                                |
| <a href="#">MID()</a>              | Return a substring starting from the specified position                                                                            |
| <a href="#">NOT LIKE</a>           | Negation of simple pattern matching                                                                                                |

| Name                          | Description                                                                                                                                                                                       |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>NOT REGEXP</code>       | Negation of <code>REGEXP</code>                                                                                                                                                                   |
| <code>OCT()</code>            | Return a string containing octal representation of a number                                                                                                                                       |
| <code>OCTET_LENGTH()</code>   | Synonym for <code>LENGTH()</code>                                                                                                                                                                 |
| <code>ORD()</code>            | Return character code for leftmost character of the argument                                                                                                                                      |
| <code>POSITION()</code>       | Synonym for <code>LOCATE()</code>                                                                                                                                                                 |
| <code>QUOTE()</code>          | Escape the argument for use in an SQL statement                                                                                                                                                   |
| <code>REGEXP</code>           | Pattern matching using regular expressions                                                                                                                                                        |
| <code>REGEXP_INSTR()</code>   | Return the starting index of the substring that matches the regular expression (Partly compatible with MySQL. For more details, see <a href="#">Regular expression compatibility with MySQL</a> ) |
| <code>REGEXP_LIKE()</code>    | Whether the string matches the regular expression (Partly compatible with MySQL. For more details, see <a href="#">Regular expression compatibility with MySQL</a> )                              |
| <code>REGEXP_REPLACE()</code> | Replace substrings that match the regular expression (Partly compatible with MySQL. For more details, see <a href="#">Regular expression compatibility with MySQL</a> )                           |
| <code>REGEXP_SUBSTR()</code>  | Return the substring that matches the regular expression (Partly compatible with MySQL. For more details, see <a href="#">Regular expression compatibility with MySQL</a> )                       |
| <code>REPEAT()</code>         | Repeat a string the specified number of times                                                                                                                                                     |
| <code>REPLACE()</code>        | Replace occurrences of a specified string                                                                                                                                                         |
| <code>REVERSE()</code>        | Reverse the characters in a string                                                                                                                                                                |
| <code>RIGHT()</code>          | Return the specified rightmost number of characters                                                                                                                                               |
| <code>RLIKE</code>            | Synonym for <code>REGEXP</code>                                                                                                                                                                   |
| <code>RPAD()</code>           | Append string the specified number of times                                                                                                                                                       |
| <code>RTRIM()</code>          | Remove trailing spaces                                                                                                                                                                            |
| <code>SPACE()</code>          | Return a string of the specified number of spaces                                                                                                                                                 |
| <code>STRCMP()</code>         | Compare two strings                                                                                                                                                                               |
| <code>SUBSTR()</code>         | Return the substring as specified                                                                                                                                                                 |

---

| Name                              | Description                                                                                                                    |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SUBSTRING()</a>       | Return the substring as specified                                                                                              |
| <a href="#">SUBSTRING_INDEX()</a> | Return a substring from a string before the specified number of occurrences of the delimiter                                   |
| <a href="#">TO_BASE64()</a>       | Return the argument converted to a base-64 string                                                                              |
| <a href="#">TRANSLATE()</a>       | Replace all occurrences of characters by other characters in a string. It does not treat empty strings as NULL as Oracle does. |
| <a href="#">TRIM()</a>            | Remove leading and trailing spaces                                                                                             |
| <a href="#">UCASE()</a>           | Synonym for <a href="#">UPPER()</a>                                                                                            |
| <a href="#">UNHEX()</a>           | Return a string containing hex representation of a number                                                                      |
| <a href="#">UPPER()</a>           | Convert to uppercase                                                                                                           |
| <a href="#">WEIGHT_STRING()</a>   | Return the weight string for the input string                                                                                  |

---

#### 14.11.4.5.2 Unsupported functions

- [LOAD\\_FILE\(\)](#)
- [MATCH\(\)](#)
- [SOUNDEX\(\)](#)

#### 14.11.4.5.3 Regular expression compatibility with MySQL

The following sections describe the regular expression compatibility with MySQL.

Syntax compatibility

MySQL implements regular expression using International Components for Unicode (ICU), and TiDB uses RE2. To learn the syntax differences between the two libraries, you can refer to the [ICU documentation](#) and [RE2 Syntax](#).

`match_type` compatibility

The value options of `match_type` between TiDB and MySQL are:

- Value options in TiDB are "c", "i", "m", and "s", and value options in MySQL are "c", "i", "m", "n", and "u".
- The "s" in TiDB corresponds to "n" in MySQL. When "s" is set in TiDB, the `.` character also matches line terminators (`\n`).

For example, the `SELECT REGEXP_LIKE(a, b, "n")FROM t1` in MySQL is the same as the `SELECT REGEXP_LIKE(a, b, "s")FROM t1` in TiDB.

- TiDB does not support "u", which means Unix-only line endings in MySQL.

#### Data type compatibility

The difference between TiDB and MySQL support for the binary string type:

- MySQL does not support binary strings in regular expression functions since 8.0.22. For more details, refer to [MySQL documentation](#). But in practice, regular functions can work in MySQL when all parameters or return types are binary strings. Otherwise, an error will be reported.
- Currently, TiDB prohibits using binary strings and an error will be reported under any circumstances.

#### Other compatibility

The difference between TiDB and MySQL support in replacing empty strings:

The following takes `REGEXP_REPLACE("", "^$", "123")` as an example:

- MySQL does not replace the empty string and returns "" as the result.
- TiDB replaces the empty string and returns "123" as the result.

### 14.11.4.6 Numeric Functions and Operators

TiDB supports all of the [numeric functions and operators](#) available in MySQL 5.7.

#### 14.11.4.6.1 Arithmetic operators

| Name                       | Description                     |
|----------------------------|---------------------------------|
| <code>+</code>             | Addition operator               |
| <code>-</code>             | Minus operator                  |
| <code>*</code>             | Multiplication operator         |
| <code>/</code>             | Division operator               |
| <code>DIV</code>           | Integer division                |
| <code>lstinlineMOD!</code> | Modulo operator                 |
| <code>-</code>             | Change the sign of the argument |

#### 14.11.4.6.2 Mathematical functions

| Name                 | Description                                       |
|----------------------|---------------------------------------------------|
| <code>POW()</code>   | Return the argument raised to the specified power |
| <code>POWER()</code> | Return the argument raised to the specified power |
| <code>EXP()</code>   | Raise to the power of                             |
| <code>SQRT()</code>  | Return the square root of the argument            |

| Name                                             | Description                                                    |
|--------------------------------------------------|----------------------------------------------------------------|
| <a href="#">LN()</a>                             | Return the natural logarithm of the argument                   |
| <a href="#">LOG()</a>                            | Return the natural logarithm of the first argument             |
| <a href="#">LOG2()</a>                           | Return the base-2 logarithm of the argument                    |
| <a href="#">LOG10()</a>                          | Return the base-10 logarithm of the argument                   |
| <a href="#">PI()</a>                             | Return the value of pi                                         |
| <a href="#">TAN()</a>                            | Return the tangent of the argument                             |
| <a href="#">COT()</a>                            | Return the cotangent                                           |
| <a href="#">SIN()</a>                            | Return the sine of the argument                                |
| <a href="#">COS()</a>                            | Return the cosine                                              |
| <a href="#">ATAN()</a>                           | Return the arc tangent                                         |
| <a href="#">ATAN2()</a> , <a href="#">ATAN()</a> | Return the arc tangent of the two arguments                    |
| <a href="#">ASIN()</a>                           | Return the arc sine                                            |
| <a href="#">ACOS()</a>                           | Return the arc cosine                                          |
| <a href="#">RADIANS()</a>                        | Return argument converted to radians                           |
| <a href="#">DEGREES()</a>                        | Convert radians to degrees                                     |
| <a href="#">MOD()</a>                            | Return the remainder                                           |
| <a href="#">ABS()</a>                            | Return the absolute value                                      |
| <a href="#">CEIL()</a>                           | Return the smallest integer value not less than the argument   |
| <a href="#">CEILING()</a>                        | Return the smallest integer value not less than the argument   |
| <a href="#">FLOOR()</a>                          | Return the largest integer value not greater than the argument |
| <a href="#">ROUND()</a>                          | Round the argument                                             |
| <a href="#">RAND()</a>                           | Return a random floating-point value                           |
| <a href="#">SIGN()</a>                           | Return the sign of the argument                                |
| <a href="#">CONV()</a>                           | Convert numbers between different number bases                 |
| <a href="#">TRUNCATE()</a>                       | Truncate to specified number of decimal places                 |
| <a href="#">CRC32()</a>                          | Compute a cyclic redundancy check value                        |

#### 14.11.4.7 Date and Time Functions

TiDB supports all of the [date and time functions](#) available in MySQL 5.7.

##### Note:

- MySQL will often accept the incorrectly formatted date and time values. For example, '2020-01-01\n\t01:01:01' and '2020-01\_01\n\ ↳ \t01:01' are treated as valid date and time values.
- TiDB makes the best effort to match MySQL's behavior, but it might not match in all instances. It is recommended to correctly format dates, because the intended behavior for incorrectly formatted values is not documented, and is often inconsistent.

## Date/Time functions:

| Name                                      | Description                                               |
|-------------------------------------------|-----------------------------------------------------------|
| ADDDATE()                                 | Add time values (intervals) to a date value               |
| ADDTIME()                                 | Add time                                                  |
| CONVERT_TZ()                              | Convert from one time zone to another                     |
| CURDATE()                                 | Return the current date                                   |
| CURRENT_DATE(), CURRENT_DATE              | Synonyms for CURDATE()                                    |
| CURRENT_TIME(), CURRENT_TIME              | Synonyms for CURTIME()                                    |
| CURRENT_TIMESTAMP(),<br>CURRENT_TIMESTAMP | Synonyms for NOW()                                        |
| CURTIME()                                 | Return the current time                                   |
| DATE()                                    | Extract the date part of a date or<br>datetime expression |
| DATE_ADD()                                | Add time values (intervals) to a date value               |
| DATE_FORMAT()                             | Format date as specified                                  |
| DATE_SUB()                                | Subtract a time value (interval) from a<br>date           |
| DATEDIFF()                                | Subtract two dates                                        |
| DAY()                                     | Synonym for DAYOFMONTH()                                  |
| DAYNAME()                                 | Return the name of the weekday                            |
| DAYOFMONTH()                              | Return the day of the month (0-31)                        |
| DAYOFWEEK()                               | Return the weekday index of the argument                  |
| DAYOFYEAR()                               | Return the day of the year (1-366)                        |
| EXTRACT()                                 | Extract part of a date                                    |
| FROM_DAYS()                               | Convert a day number to a date                            |
| FROM_UNIXTIME()                           | Format Unix timestamp as a date                           |
| GET_FORMAT()                              | Return a date format string                               |
| HOUR()                                    | Extract the hour                                          |
| LAST_DAY                                  | Return the last day of the month for the<br>argument      |
| LOCALTIME(), LOCALTIME                    | Synonym for NOW()                                         |
| LOCALTIMESTAMP, LOCALTIMESTAMP()          | Synonym for NOW()                                         |
| MAKEDATE()                                | Create a date from the year and day of<br>year            |
| MAKETIME()                                | Create time from hour, minute, second                     |
| MICROSECOND()                             | Return the microseconds from argument                     |
| MINUTE()                                  | Return the minute from the argument                       |
| MONTH()                                   | Return the month from the date passed                     |
| MONTHNAME()                               | Return the name of the month                              |
| NOW()                                     | Return the current date and time                          |
| PERIOD_ADD()                              | Add a period to a year-month                              |
| PERIOD_DIFF()                             | Return the number of months between<br>periods            |

---

| Name                             | Description                                                                                                                 |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <a href="#">QUARTER()</a>        | Return the quarter from a date argument                                                                                     |
| <a href="#">SEC_TO_TIME()</a>    | Converts seconds to 'HH:MM:SS' format                                                                                       |
| <a href="#">SECOND()</a>         | Return the second (0-59)                                                                                                    |
| <a href="#">STR_TO_DATE()</a>    | Convert a string to a date                                                                                                  |
| <a href="#">SUBDATE()</a>        | Synonym for <a href="#">DATE_SUB()</a> when invoked with three arguments                                                    |
| <a href="#">SUBTIME()</a>        | Subtract times                                                                                                              |
| <a href="#">SYSDATE()</a>        | Return the time at which the function executes                                                                              |
| <a href="#">TIME()</a>           | Extract the time portion of the expression passed                                                                           |
| <a href="#">TIME_FORMAT()</a>    | Format as time                                                                                                              |
| <a href="#">TIME_TO_SEC()</a>    | Return the argument converted to seconds                                                                                    |
| <a href="#">TIMEDIFF()</a>       | Subtract time                                                                                                               |
| <a href="#">TIMESTAMP()</a>      | With a single argument, this function returns the date or datetime expression; with two arguments, the sum of the arguments |
| <a href="#">TIMESTAMPADD()</a>   | Add an interval to a datetime expression                                                                                    |
| <a href="#">TIMESTAMPDIFF()</a>  | Subtract an interval from a datetime expression                                                                             |
| <a href="#">TO_DAYS()</a>        | Return the date argument converted to days                                                                                  |
| <a href="#">TO_SECONDS()</a>     | Return the date or datetime argument converted to seconds since Year 0                                                      |
| <a href="#">UNIX_TIMESTAMP()</a> | Return a Unix timestamp                                                                                                     |
| <a href="#">UTC_DATE()</a>       | Return the current UTC date                                                                                                 |
| <a href="#">UTC_TIME()</a>       | Return the current UTC time                                                                                                 |
| <a href="#">UTC_TIMESTAMP()</a>  | Return the current UTC date and time                                                                                        |
| <a href="#">WEEK()</a>           | Return the week number                                                                                                      |
| <a href="#">WEEKDAY()</a>        | Return the weekday index                                                                                                    |
| <a href="#">WEEKOFYEAR()</a>     | Return the calendar week of the date (1-53)                                                                                 |
| <a href="#">YEAR()</a>           | Return the year                                                                                                             |
| <a href="#">YEARWEEK()</a>       | Return the year and week                                                                                                    |

---

For details, see [Date and Time Functions](#).

#### 14.11.4.7.1 MySQL compatibility

The function `str_to_date()` is supported by TiDB, but is unable to parse all date and time values. In addition, the following date and time formatting options are **not implemented**:

| Format | Description                                                                           |
|--------|---------------------------------------------------------------------------------------|
| “%a”   | Abbreviated weekday name (Sun..Sat)                                                   |
| “%D”   | Day of the month with English suffix (0th, 1st, 2nd, 3rd)                             |
| “%U”   | Week (00..53), where Sunday is the first day of the week; WEEK() mode 0               |
| “%u”   | Week (00..53), where Monday is the first day of the week; WEEK() mode 1               |
| “%V”   | Week (01..53), where Sunday is the first day of the week; WEEK() mode 2; used with %X |
| “%v”   | Week (01..53), where Monday is the first day of the week; WEEK() mode 3; used with %x |
| “%W”   | Weekday name (Sunday..Saturday)                                                       |
| “%w”   | Day of the week (0=Sunday..6=Saturday)                                                |
| “%X”   | Year for the week where Sunday is the first day of the week, numeric, four digits.    |
| “%x”   | Year for the week, where Monday is the first day of the week, numeric, four digits.   |

See [issue #30082](#) for more details.

#### 14.11.4.7.2 Related system variables

The `default_week_format` variable affects the `WEEK()` function.

#### 14.11.4.8 Bit Functions and Operators

TiDB supports all of the [bit functions and operators](#) available in MySQL 5.7.

##### Bit functions and operators:

| Name                                 | Description                                 |
|--------------------------------------|---------------------------------------------|
| <a href="#">BIT_COUNT</a>            | Return the number of bits that are set as 1 |
| $\leftrightarrow$ <a href="#">()</a> |                                             |
| <a href="#">&amp;</a>                | Bitwise AND                                 |
| <a href="#">~</a>                    | Bitwise inversion                           |
| <a href="#"> </a>                    | Bitwise OR                                  |
| <a href="#">^</a>                    | Bitwise XOR                                 |
| <a href="#">&lt;&lt;</a>             | Left shift                                  |
| <a href="#">&gt;&gt;</a>             | Right shift                                 |

#### 14.11.4.9 Cast Functions and Operators

Cast functions and operators enable conversion of values from one data type to another. TiDB supports all of the [cast functions and operators](#) available in MySQL 5.7.

#### 14.11.4.9.1 List of cast functions and operators

| Name                      | Description                      |
|---------------------------|----------------------------------|
| <a href="#">BINARY</a>    | Cast a string to a binary string |
| <a href="#">CAST()</a>    | Cast a value as a certain type   |
| <a href="#">CONVERT()</a> | Cast a value as a certain type   |

#### Note:

TiDB and MySQL display inconsistent results for `SELECT CAST(MeN AS CHAR ↵ )` (or its equivalent form `SELECT CONVERT(MeM, CHAR)`), where `MeN` represents a double-precision floating-point number in scientific notation. MySQL displays the complete numeric value when  $-15 \leq N \leq 14$  and the scientific notation when  $N < -15$  or  $N > 14$ . However, TiDB always displays the complete numeric value. For example, MySQL displays the result of `SELECT ↵ CAST(3.1415e15 AS CHAR)` as `3.1415e15`, while TiDB displays the result as `3141500000000000`.

#### 14.11.4.10 Encryption and Compression Functions

TiDB supports most of the [encryption and compression functions](#) available in MySQL 5.7.

##### 14.11.4.10.1 Supported functions

| Name                                           | Description                                                       |
|------------------------------------------------|-------------------------------------------------------------------|
| <a href="#">MD5()</a>                          | Calculate MD5 checksum                                            |
| <a href="#">PASSWORD()</a>                     | Calculate and return a password string                            |
| <a href="#">RANDOM_BYTES()</a>                 | Return a random byte vector                                       |
| <a href="#">SHA1()</a> , <a href="#">SHA()</a> | Calculate an SHA-1 160-bit checksum                               |
| <a href="#">SHA2()</a>                         | Calculate an SHA-2 checksum                                       |
| <a href="#">SM3()</a>                          | Calculate an SM3 checksum (currently MySQL does not support this) |
| <a href="#">AES_DECRYPT()</a>                  | Decrypt using AES                                                 |
| <a href="#">AES_ENCRYPT()</a>                  | Encrypt using AES                                                 |
| <a href="#">COMPRESS()</a>                     | Return result as a binary string                                  |
| <a href="#">UNCOMPRESS()</a>                   | Uncompress a string compressed                                    |
| <a href="#">UNCOMPRESSED_LENGTH()</a>          | Return the length of a string before compression                  |

| Name                                         | Description                    |
|----------------------------------------------|--------------------------------|
| <a href="#">VALIDATE_PASSWORD_STRENGTH()</a> | Validate the password strength |

#### 14.11.4.10.2 Related system variables

The `block_encryption_mode` variable sets the encryption mode that is used for `AES_ENCRYPT()` and `AES_DECRYPT()`.

#### 14.11.4.10.3 Unsupported functions

- `DES_DECRYPT()`, `DES_ENCRYPT()`, `OLD_PASSWORD()`, `ENCRYPT()`: these functions were deprecated in MySQL 5.7 and removed in 8.0.
- Functions only available in MySQL Enterprise [Issue #2632](#).

#### 14.11.4.11 Locking Functions

TiDB supports most of the user-level [locking functions](#) available in MySQL 5.7.

##### 14.11.4.11.1 Supported functions

| Name                                        | Description                                                                                                                                                                              |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">GET_LOCK(lockName, timeout)</a> | Acquires an advisory lock. The <code>lockName</code> parameter must be NO longer than 64 characters. Waits maximum <code>timeout</code> seconds before timing out and returns a failure. |
| <a href="#">RELEASE_LOCK(lockName)</a>      | Releases a previously acquired lock. The <code>lockName</code> parameter must be NO longer than 64 characters.                                                                           |
| <a href="#">RELEASE_ALL_LOCKS()</a>         | Releases all locks held by the current session.                                                                                                                                          |

##### 14.11.4.11.2 MySQL compatibility

- The minimum timeout permitted by TiDB is 1 second, and the maximum timeout is 1 hour (3600 seconds). This differs from MySQL, where both 0 second and unlimited timeouts (`timeout=-1`) are permitted. TiDB will automatically convert out-of-range values to the nearest permitted value and convert `timeout=-1` to 3600 seconds.
- TiDB does not automatically detect deadlocks caused by user-level locks. Deadlocked sessions will timeout after a maximum of 1 hour, but can also be manually resolved by

using KILL on one of the affected sessions. You can also prevent deadlocks by always acquiring user-level locks in the same order.

- Locks take effect on all TiDB servers in the cluster. This differs from MySQL Cluster and Group Replication where locks are local to a single server.

### 14.11.4.11.3 Unsupported functions

- IS\_FREE\_LOCK()
- IS\_USED\_LOCK()

### 14.11.4.12 Information Functions

TiDB supports most of the [information functions](#) available in MySQL 5.7.

#### 14.11.4.12.1 Supported functions

| Name                                  | Description                                                                                            |
|---------------------------------------|--------------------------------------------------------------------------------------------------------|
| <a href="#">BENCHMARK</a><br>↪ ()     | Execute an expression in a loop                                                                        |
| <a href="#">CONNECTION_ID</a><br>↪ () | Return the connection ID (thread ID) for the connection                                                |
| <a href="#">CURRENT_USER</a><br>↪ (), | Return the authenticated user name and host name                                                       |
| <a href="#">CURRENT_USER</a><br>↪     | host name                                                                                              |
| <a href="#">DATABASE</a><br>↪ ()      | Return the default (current) database name                                                             |
| <a href="#">FOUND_ROWS</a><br>↪ ()    | For a SELECT with a LIMIT clause, the number of the rows that are returned if there is no LIMIT clause |

| Name                          | Description                                                      |
|-------------------------------|------------------------------------------------------------------|
| <code>LAST_INSERT_ID()</code> | Return the value of the AUTOINCREMENT column for the last INSERT |
| <code>ROW_COUNT()</code>      | The number of rows affected                                      |
| <code>SCHEMA()</code>         | Synonym for <code>DATABASE()</code>                              |
| <code>SESSION_USER()</code>   | Synonym for <code>USER()</code>                                  |
| <code>SYSTEM_USER()</code>    | Synonym for <code>USER()</code>                                  |
| <code>USER()</code>           | Return the user name and host name provided by the client        |
| <code>VERSION()</code>        | Return a string that indicates the MySQL server version          |

#### 14.11.4.12.2 Unsupported functions

- `CHARSET()`
- `COERCIBILITY()`
- `COLLATION()`

#### 14.11.4.13 JSON Functions

TiDB supports most of the JSON functions that shipped with the GA release of MySQL 5.7.

##### 14.11.4.13.1 Functions that create JSON values

| Function Name                                      | Description                                                                                           |
|----------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| <code>JSON_ARRAY([val[, val] ...])</code>          | Evaluates a (possibly empty) list of values and returns a JSON array containing those values          |
| <code>JSON_OBJECT(key, val[, key, val] ...)</code> | Evaluates a (possibly empty) list of key-value pairs and returns a JSON object containing those pairs |
| <code>JSON_QUOTE(string)</code>                    | Returns a string as a JSON value with quotes                                                          |

#### 14.11.4.13.2 Functions that search JSON values

| Function Name                                         | Description                                                                                                      |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <code>JSON_CONTAINS(target, candidate[, path])</code> | Indicates by returning 1 or 0 whether a given candidate JSON document is contained within a target JSON document |

| Function Name                                                           | Description                                                                                                                                                                       |
|-------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>JSON_CONTAINS_PATH(json_doc, one_or_all, path[, path] ...)</code> | Returns 0 or 1 to indicate whether a JSON document contains data at a given path or paths                                                                                         |
| <code>JSON_EXTRACT(json_doc, path[, path] ...)</code>                   | Returns data from a JSON document, selected from the parts of the document matched by the <code>path</code> arguments                                                             |
| <code>-&gt;</code>                                                      | Returns the value from a JSON column after the evaluating path; an alias for <code>JSON_EXTRACT</code><br><code>↪ (doc,</code><br><code>↪ path_literal</code><br><code>↪ )</code> |

| Function Name                                                 | Description                                                                                                                                                                                                                                                    |
|---------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>-&gt;&gt;</code>                                        | Returns the value from a JSON column after the evaluating path and unquoting the result; an alias for <code>JSON_UNQUOTE</code><br><code>↪ (</code><br><code>↪ JSON_EXTRACT</code><br><code>↪ (doc,</code><br><code>↪ path_literal</code><br><code>↪ ))</code> |
| <code>JSON_KEYS(json_doc[, path])</code>                      | Returns the keys from the top-level value of a JSON object as a JSON array, or, if a path argument is given, the top-level keys from the selected path                                                                                                         |
| <code>JSON_SEARCH(json_doc, one_or_all, search_string)</code> | Search a JSON document for one or all matches of a string                                                                                                                                                                                                      |

| Function Name                                    | Description                                                                                       |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------|
| <code>value MEMBER OF(json_array)</code>         | If the passed value is an element of the JSON array, returns 1. Otherwise, returns 0.             |
| <code>JSON_OVERLAPS(json_doc1, json_doc2)</code> | Indicates whether two JSON documents have overlapping part. If yes, returns 1. If not, returns 0. |

#### 14.11.4.13.3 Functions that modify JSON values

| Function Name                                                        | Description                                                               |
|----------------------------------------------------------------------|---------------------------------------------------------------------------|
| <code>JSON_APPEND(json_doc, path, value)</code>                      | An alias to <code>JSON_ARRAY_APPEND</code>                                |
| <code>JSON_ARRAY_APPEND(json_doc, path, value)</code>                | Appends a value to the end of a JSON array at a specified path            |
| <code>JSON_ARRAY_INSERT(json_doc, path, val[, path, val] ...)</code> | Inserts an array into the json document and returns the modified document |

| Function Name                                                        | Description                                                        |
|----------------------------------------------------------------------|--------------------------------------------------------------------|
| <code>JSON_INSERT(json_doc, path, val[, path, val] ...)</code>       | Inserts data into a JSON document and returns the result           |
| <code>JSON_MERGE(json_doc, json_doc[, json_doc] ...)</code>          | A deprecated alias for <code>JSON_MERGE_PRESERVE</code><br>↔       |
| <code>JSON_MERGE_PATCH(json_doc, json_doc[, json_doc] ...)</code>    | Merge JSON documents                                               |
| <code>JSON_MERGE_PRESERVE(json_doc, json_doc[, json_doc] ...)</code> | Merges two or more JSON documents and returns the merged result    |
| <code>JSON_REMOVE(json_doc, path[, path] ...)</code>                 | Removes data from a JSON document and returns the result           |
| <code>JSON_REPLACE(json_doc, path, val[, path, val] ...)</code>      | Replaces existing values in a JSON document and returns the result |
| <code>JSON_SET(json_doc, path, val[, path, val] ...)</code>          | Inserts or updates data in a JSON document and returns the result  |

| Function Name                                                        | Description                                                                                     |
|----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| <code>JSON_UNQUOTE(json_val)</code>                                  | Unquotes a JSON value and returns the result as a string                                        |
| <code>JSON_ARRAY_APPEND(json_doc, path, val[, path, val] ...)</code> | Appends values to the end of the indicated arrays within a JSON document and returns the result |
| <code>JSON_ARRAY_INSERT(json_doc, path, val[, path, val] ...)</code> | Insert values into the specified location of a JSON document and returns the result             |

#### 14.11.4.13.4 Functions that return JSON value attributes

| Function Name                              | Description                                                                                                     |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| <code>JSON_DEPTH(json_doc)</code>          | Returns the maximum depth of a JSON document                                                                    |
| <code>JSON_LENGTH(json_doc[, path])</code> | Returns the length of a JSON document, or, if a path argument is given, the length of the value within the path |

| Function Name                        | Description                                                                                             |
|--------------------------------------|---------------------------------------------------------------------------------------------------------|
| <a href="#">JSON_TYPE(json_val)</a>  | Returns a string indicating the type of a JSON value                                                    |
| <a href="#">JSON_VALID(json_doc)</a> | Checks if a json_doc is valid JSON. Useful for checking a column before converting it to the json type. |

#### 14.11.4.13.5 Utility Functions

| Function Name                         | Description                          |
|---------------------------------------|--------------------------------------|
| <a href="#">JSON_PRETTY(json_doc)</a> | Pretty formatting of a JSON document |

| Function Name                               | Description                                                                                                                                                                                                                                                                                  |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">JSON_STORAGE_FREE(json_doc)</a> | Returns how much storage space was freed in the binary representation of the JSON value after it was updated in place. As TiDB has different storage architecture from MySQL, this function always returns 0 for a valid JSON value, and it is implemented for compatibility with MySQL 8.0. |

---

| Function Name                               | Description                                                                                                                                                                                        |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">JSON_STORAGE_SIZE(json_doc)</a> | Returns an approximate size of bytes required to store the json value. As the size does not account for TiKV using compression, the output of this function is not strictly compatible with MySQL. |

---

#### 14.11.4.13.6 Aggregate Functions

---

| Function Name                              | Description                                        |
|--------------------------------------------|----------------------------------------------------|
| <a href="#">JSON_ARRAYAGG(key)</a>         | Provides an aggregation of keys.                   |
| <a href="#">JSON_OBJECTAGG(key, value)</a> | Provides an aggregation of values for a given key. |

---

#### 14.11.4.14 Aggregate (GROUP BY) Functions

This document describes details about the supported aggregate functions in TiDB.

##### 14.11.4.14.1 Supported aggregate functions

This section describes the supported MySQL GROUP BY aggregate functions in TiDB.

| Name                                                                   | Description                                                              |
|------------------------------------------------------------------------|--------------------------------------------------------------------------|
| <code>COUNT()</code>                                                   | Return a count of the number of rows returned                            |
| <code>COUNT(DISTINCT)</code>                                           | Return the count of a number of different values                         |
| <code>SUM()</code>                                                     | Return the sum                                                           |
| <code>AVG()</code>                                                     | Return the average value of the argument                                 |
| <code>MAX()</code>                                                     | Return the maximum value                                                 |
| <code>MIN()</code>                                                     | Return the minimum value                                                 |
| <code>GROUP_CONCAT()</code>                                            | Return a concatenated string                                             |
| <code>VARIANCE()</code> , <code>VAR_POP()</code>                       | Return the population standard variance                                  |
| <code>STD()</code> , <code>STDDEV()</code> , <code>STDDEV_POP()</code> | Return the population standard deviation                                 |
| <code>VAR_SAMP()</code>                                                | Return the sample variance                                               |
| <code>STDDEV_SAMP()</code>                                             | Return the sample standard deviation                                     |
| <code>JSON_OBJECTAGG(key, value)</code>                                | Return the result set as a single JSON object containing key-value pairs |

- Unless otherwise stated, group functions ignore NULL values.
- If you use a group function in a statement containing no `GROUP BY` clause, it is equivalent to grouping on all rows.

In addition, TiDB also provides the following aggregate functions:

- `APPROX_PERCENTILE(expr, constant_integer_expr)`

This function returns the percentile of `expr`. The `constant_integer_expr` argument indicates the percentage value which is a constant integer in the range of [1,100]. A percentile `Pk` (`k` represents percentage) indicates that there are at least `k%` values in the data set that are less than or equal to `Pk`.

This function only supports the **numeric type** and the **date and time type** as the returned type of `expr`. For other returned types, `APPROX_PERCENTILE` only returns NULL.

The following example shows how to calculate the fiftieth percentile of a `INT` column:

```
drop table if exists t;
create table t(a int);
insert into t values(1), (2), (3);
```

```
select approx_percentile(a, 50) from t;
```

```
+-----+
| approx_percentile(a, 50) |
+-----+
| 2 |
+-----+
1 row in set (0.00 sec)
```

Except for the `GROUP_CONCAT()` and `APPROX_PERCENTILE()` functions, all the preceding functions can serve as [Window functions](#).

#### 14.11.4.14.2 GROUP BY modifiers

TiDB does not currently support `GROUP BY` modifiers such as `WITH ROLLUP`. We plan to add support in the future. See [TiDB #4250](#).

#### 14.11.4.14.3 SQL mode support

TiDB supports the SQL Mode `ONLY_FULL_GROUP_BY`, and when enabled TiDB will refuse queries with ambiguous non-aggregated columns. For example, this query is illegal with `ONLY_FULL_GROUP_BY` enabled because the non-aggregated column “b” in the `SELECT` list does not appear in the `GROUP BY` statement:

```
drop table if exists t;
create table t(a bigint, b bigint, c bigint);
insert into t values(1, 2, 3), (2, 2, 3), (3, 2, 3);

mysql> select a, b, sum(c) from t group by a;
+-----+
| a | b | sum(c) |
+-----+
1	2	3
2	2	3
3	2	3
+-----+
3 rows in set (0.01 sec)

mysql> set sql_mode = 'ONLY_FULL_GROUP_BY';
Query OK, 0 rows affected (0.00 sec)

mysql> select a, b, sum(c) from t group by a;
```

```
ERROR 1055 (42000): Expression #2 of SELECT list is not in GROUP BY clause
↳ and contains nonaggregated column 'b' which is not functionally
↳ dependent on columns in GROUP BY clause; this is incompatible with
↳ sql_mode=only_full_group_by
```

TiDB currently enables the `ONLY_FULL_GROUP_BY` mode by default.

Differences from MySQL

The current implementation of `ONLY_FULL_GROUP_BY` is less strict than that in MySQL 5.7. For example, suppose that we execute the following query, expecting the results to be ordered by “c”:

```
drop table if exists t;
create table t(a bigint, b bigint, c bigint);
insert into t values(1, 2, 1), (1, 2, 2), (1, 3, 1), (1, 3, 2);
select distinct a, b from t order by c;
```

To order the result, duplicates must be eliminated first. But to do so, which row should we keep? This choice influences the retained value of “c”, which in turn influences ordering and makes it arbitrary as well.

In MySQL, a query that has `DISTINCT` and `ORDER BY` is rejected as invalid if any `ORDER BY` expression does not satisfy at least one of these conditions:

- The expression is equal to one in the `SELECT` list
- All columns referenced by the expression and belonging to the query’s selected tables are elements of the `SELECT` list

But in TiDB, the above query is legal, for more information see [#4254](#).

Another TiDB extension to standard SQL permits references in the `HAVING` clause to aliased expressions in the `SELECT` list. For example, the following query returns “name” values that occur only once in table “orders”:

```
select name, count(name) from orders
group by name
having count(name) = 1;
```

The TiDB extension permits the use of an alias in the `HAVING` clause for the aggregated column:

```
select name, count(name) as c from orders
group by name
having c = 1;
```

Standard SQL permits only column expressions in `GROUP BY` clauses, so a statement such as this is invalid because “`FLOOR(value/100)`” is a noncolumn expression:

```
select id, floor(value/100)
from tbl_name
group by id, floor(value/100);
```

TiDB extends standard SQL to permit noncolumn expressions in **GROUP BY** clauses and considers the preceding statement valid.

Standard SQL also does not permit aliases in **GROUP BY** clauses. TiDB extends standard SQL to permit aliases, so another way to write the query is as follows:

```
select id, floor(value/100) as val
from tbl_name
group by id, val;
```

#### 14.11.4.14.4 Related system variables

The `group_concat_max_len` variable sets the maximum number of items for the `GROUP_CONCAT()` function.

#### 14.11.4.15 Window Functions

The usage of window functions in TiDB is similar to that in MySQL 8.0. For details, see [MySQL Window Functions](#).

Because window functions reserve additional words in the parser, TiDB provides an option to disable window functions. If you receive errors parsing SQL statements after upgrading, try setting `tidb_enable_window_function=0`.

The window functions [listed here](#) can be pushed down to TiFlash.

Except for `GROUP_CONCAT()` and `APPROX_PERCENTILE()`, TiDB supports all **GROUP BY aggregate functions**. In addition, TiDB supports the following window functions:

| Function name              | Feature description                                                                                     |
|----------------------------|---------------------------------------------------------------------------------------------------------|
| <code>CUME_DIST()</code>   | Returns the cumulative distribution of a value within a group of values.                                |
| <code>DENSE_RANK()</code>  | Returns the rank of the current row within the partition, and the rank is without gaps.                 |
| <code>FIRST_VALUE()</code> | Returns the expression value of the first row in the current window.                                    |
| <code>LAG()</code>         | Returns the expression value from the row that precedes the current row by N rows within the partition. |
| <code>LAST_VALUE()</code>  | Returns the expression value of the last row in the current window.                                     |

| Function name                  | Feature description                                                                                                                                                |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">LEAD()</a>         | Returns the expression value from the row that follows the current row by N rows within the partition.                                                             |
| <a href="#">NTH_VALUE()</a>    | Returns the expression value from the N-th row of the current window.                                                                                              |
| <a href="#">NTILE()</a>        | Divides a partition into N buckets, assigns the bucket number to each row in the partition, and returns the bucket number of the current row within the partition. |
| <a href="#">PERCENT_RANK()</a> | Returns the percentage of partition values that are less than the value in the current row.                                                                        |
| <a href="#">RANK()</a>         | Returns the rank of the current row within the partition. The rank may be with gaps.                                                                               |
| <a href="#">ROW_NUMBER()</a>   | Returns the number of the current row in the partition.                                                                                                            |

#### 14.11.4.16 Miscellaneous Functions

TiDB supports most of the [miscellaneous functions](#) available in MySQL 5.7.

##### 14.11.4.16.1 Supported functions

| Name                             | Description                                    |
|----------------------------------|------------------------------------------------|
| <a href="#">ANY_VALUE()</a>      | Suppress ONLY_FULL_GROUP_BY value rejection    |
| <a href="#">BIN_TO_UUID()</a>    | Convert UUID from binary format to text format |
| <a href="#">DEFAULT()</a>        | Returns the default value for a table column   |
| <a href="#">INET_ATON()</a>      | Return the numeric value of an IP address      |
| <a href="#">INET_NTOA()</a>      | Return the IP address from a numeric value     |
| <a href="#">INET6_ATON()</a>     | Return the numeric value of an IPv6 address    |
| <a href="#">INET6_NTOA()</a>     | Return the IPv6 address from a numeric value   |
| <a href="#">IS_IPV4()</a>        | Whether argument is an IPv4 address            |
| <a href="#">IS_IPV4_COMPAT()</a> | Whether argument is an IPv4-compatible address |
| <a href="#">IS_IPV4_MAPPED()</a> | Whether argument is an IPv4-mapped address     |
| <a href="#">IS_IPV6()</a>        | Whether argument is an IPv6 address            |
| <a href="#">NAME_CONST()</a>     | Can be used to rename a column name            |
| <a href="#">SLEEP()</a>          | Sleep for a number of seconds                  |
| <a href="#">UUID()</a>           | Return a Universal Unique Identifier (UUID)    |
| <a href="#">UUID_TO_BIN()</a>    | Convert UUID from text format to binary format |
| <a href="#">VALUES()</a>         | Defines the values to be used during an INSERT |

#### 14.11.4.16.2 Unsupported functions

| Name                                    | Description                                                                                             |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------|
| <a href="#">UUID_SHORT</a><br>↪ ()      | Provides a UUID that is unique given certain assumptions not present in TiDB <a href="#">TiDB #4620</a> |
| <a href="#">MASTER_WAIT_POS</a><br>↪ () | Refers to MySQL replication                                                                             |

#### 14.11.4.17 Precision Math

The precision math support in TiDB is consistent with MySQL. For more information, see [Precision Math in MySQL](#).

##### 14.11.4.17.1 Numeric types

The scope of precision math for exact-value operations includes the exact-value data types (integer and DECIMAL types) and exact-value numeric literals. Approximate-value data types and numeric literals are handled as floating-point numbers.

Exact-value numeric literals have an integer part or fractional part, or both. They may be signed. Examples: 1, .2, 3.4, -5, -6.78, +9.10.

Approximate-value numeric literals are represented in scientific notation (power-of-10) with a mantissa and exponent. Either or both parts may be signed. Examples: 1.2E3, 1.2E-3, -1.2E3, -1.2E-3.

Two numbers that look similar might be treated differently. For example, 2.34 is an exact-value (fixed-point) number, whereas 2.34E0 is an approximate-value (floating-point) number.

The DECIMAL data type is a fixed-point type and the calculations are exact. The FLOAT and DOUBLE data types are floating-point types and calculations are approximate.

##### 14.11.4.17.2 DECIMAL data type characteristics

This section discusses the following topics of the characteristics of the DECIMAL data type (and its synonyms):

- Maximum number of digits
- Storage format
- Storage requirements

The declaration syntax for a DECIMAL column is `DECIMAL(M,D)`. The ranges of values for the arguments are as follows:

- M is the maximum number of digits (the precision).  $1 \leq M \leq 65$ .

- D is the number of digits to the right of the decimal point (the scale).  $1 \leq D \leq 30$  and D must be no larger than M.

The maximum value of 65 for M means that calculations on DECIMAL values are accurate up to 65 digits. This limit of 65 digits of precision also applies to exact-value numeric literals.

Values for DECIMAL columns are stored using a binary format that packs 9 decimal digits into 4 bytes. The storage requirements for the integer and fractional parts of each value are determined separately. Each multiple of 9 digits requires 4 bytes, and any remaining digits left over require some fraction of 4 bytes. The storage required for remaining digits is given by the following table.

| Leftover Digits | Number of Bytes |
|-----------------|-----------------|
| 0               | 0               |
| 1–2             | 1               |
| 3–4             | 2               |
| 5–6             | 3               |
| 7–9             | 4               |

For example, a DECIMAL(18,9) column has 9 digits on each side of the decimal point, so the integer part and the fractional part each require 4 bytes. A DECIMAL(20,6) column has 14 integer digits and 6 fractional digits. The integer digits require 4 bytes for 9 of the digits and 3 bytes for the remaining 5 digits. The 6 fractional digits require 3 bytes.

DECIMAL columns do not store a leading + character or - character or leading 0 digits. If you insert +0003.1 into a DECIMAL(5,1) column, it is stored as 3.1. For negative numbers, a literal - character is not stored.

DECIMAL columns do not permit values larger than the range implied by the column definition. For example, a DECIMAL(3,0) column supports a range of -999 to 999. A DECIMAL(M,D) column permits at most M - D digits to the left of the decimal point.

For more information about the internal format of the DECIMAL values, see [mydecimal](#) ↪ [.go](#) in TiDB source code.

#### 14.11.4.17.3 Expression handling

For expressions with precision math, TiDB uses the exact-value numbers as given whenever possible. For example, numbers in comparisons are used exactly as given without a change in value. In strict SQL mode, if you add an exact data type into a column, a number is inserted with its exact value if it is within the column range. When retrieved, the value is the same as what is inserted. If strict SQL mode is not enabled, truncation for INSERT is permitted in TiDB.

How to handle a numeric expression depends on the values of the expression:

- If the expression contains any approximate values, the result is approximate. TiDB evaluates the expression using floating-point arithmetic.
- If the expression contains no approximate values are present, which means only exact values are contained, and if any exact value contains a fractional part, the expression is evaluated using DECIMAL exact arithmetic and has a precision of 65 digits.
- Otherwise, the expression contains only integer values. The expression is exact. TiDB evaluates the expression using integer arithmetic and has a precision the same as BIG-INT (64 bits).

If a numeric expression contains strings, the strings are converted to double-precision floating-point values and the result of the expression is approximate.

Inserts into numeric columns are affected by the SQL mode. The following discussions mention strict mode and `ERROR_FOR_DIVISION_BY_ZERO`. To turn on all the restrictions, you can simply use the `TRADITIONAL` mode, which includes both strict mode values and `ERROR_FOR_DIVISION_BY_ZERO`:

```
SET sql_mode = 'TRADITIONAL`;
```

If a number is inserted into an exact type column (DECIMAL or integer), it is inserted with its exact value if it is within the column range. For this number:

- If the value has too many digits in the fractional part, rounding occurs and a warning is generated.
- If the value has too many digits in the integer part, it is too large and is handled as follows:
  - If strict mode is not enabled, the value is truncated to the nearest legal value and a warning is generated.
  - If strict mode is enabled, an overflow error occurs.

To insert strings into numeric columns, TiDB handles the conversion from string to number as follows if the string has nonnumeric contents:

- In strict mode, a string (including an empty string) that does not begin with a number cannot be used as a number. An error, or a warning occurs.
- A string that begins with a number can be converted, but the trailing nonnumeric portion is truncated. In strict mode, if the truncated portion contains anything other than spaces, an error, or a warning occurs.

By default, the result of the division by 0 is NULL and no warning. By setting the SQL mode appropriately, division by 0 can be restricted. If you enable the `ERROR_FOR_DIVISION_BY_ZERO` SQL mode, TiDB handles division by 0 differently:

- In strict mode, inserts and updates are prohibited, and an error occurs.

- If it's not in the strict mode, a warning occurs.

In the following SQL statement:

```
INSERT INTO t SET i = 1/0;
```

The following results are returned in different SQL modes:

| sql_mode Value                     | Result                                  |
|------------------------------------|-----------------------------------------|
| ''                                 | No warning, no error; i is set to NULL. |
| strict                             | No warning, no error; i is set to NULL. |
| ERROR_FOR_DIVISION_BY_ZERO         | Warning, no error; i is set to NULL.    |
| strict, ERROR_FOR_DIVISION_BY_ZERO | Error; no row is inserted.              |

#### 14.11.4.17.4 Rounding behavior

The result of the ROUND() function depends on whether its argument is exact or approximate:

- For exact-value numbers, the ROUND() function uses the “round half up” rule.
- For approximate-value numbers, the results in TiDB differs from that in MySQL:

```
TiDB > SELECT ROUND(2.5), ROUND(25E-1);
+-----+-----+
| ROUND(2.5) | ROUND(25E-1) |
+-----+-----+
| 3 | 3 |
+-----+-----+
1 row in set (0.00 sec)
```

For inserts into a DECIMAL or integer column, the rounding uses [round half away from zero](#).

```
TiDB > CREATE TABLE t (d DECIMAL(10,0));
Query OK, 0 rows affected (0.01 sec)

TiDB > INSERT INTO t VALUES(2.5),(2.5E0);
Query OK, 2 rows affected, 2 warnings (0.00 sec)

TiDB > SELECT d FROM t;
+-----+
| d |
+-----+
| 3 |
```

```
| 3 |
+----+
2 rows in set (0.00 sec)
```

#### 14.11.4.18 Set Operations

TiDB supports three set operations using the UNION, EXCEPT, and INTERSECT operators. The smallest unit of a set is a **SELECT statement**.

##### 14.11.4.18.1 UNION operator

In mathematics, the union of two sets A and B consists of all elements that are in A or in B. For example:

```
SELECT 1 UNION SELECT 2;
+----+
| 1 |
+----+
| 2 |
| 1 |
+----+
2 rows in set (0.00 sec)
```

TiDB supports both UNION DISTINCT and UNION ALL operators. UNION DISTINCT removes duplicate records from the result set, while UNION ALL keeps all records including duplicates. UNION DISTINCT is used by default in TiDB.

```
CREATE TABLE t1 (a int);
CREATE TABLE t2 (a int);
INSERT INTO t1 VALUES (1),(2);
INSERT INTO t2 VALUES (1),(3);
```

Examples for UNION DISTINCT and UNION ALL queries are respectively as follows:

```
SELECT * FROM t1 UNION DISTINCT SELECT * FROM t2;
+----+
| a |
+----+
| 1 |
| 2 |
| 3 |
+----+
3 rows in set (0.00 sec)

SELECT * FROM t1 UNION ALL SELECT * FROM t2;
+----+
```

```

| a |
+---+
| 1 |
| 2 |
| 1 |
| 3 |
+---+
4 rows in set (0.00 sec)

```

#### 14.11.4.18.2 EXCEPT operator

If A and B are two sets, EXCEPT returns the difference set of A and B which consists of elements that are in A but not in B.

```

SELECT * FROM t1 EXCEPT SELECT * FROM t2;
+---+
| a |
+---+
| 2 |
+---+
1 rows in set (0.00 sec)

```

EXCEPT ALL operator is not yet supported.

#### 14.11.4.18.3 INTERSECT operator

In mathematics, the intersection of two sets A and B consists of all elements that are both in A and B, and no other elements.

```

SELECT * FROM t1 INTERSECT SELECT * FROM t2;
+---+
| a |
+---+
| 1 |
+---+
1 rows in set (0.00 sec)

```

INTERSECT ALL operator is not yet supported. INTERSECT operator has higher precedence over EXCEPT and UNION operators.

```

SELECT * FROM t1 UNION ALL SELECT * FROM t1 INTERSECT SELECT * FROM t2;
+---+
| a |
+---+
| 1 |
| 1 |

```

```
| 2 |
+----+
3 rows in set (0.00 sec)
```

#### 14.11.4.18.4 Parentheses

TiDB supports using parentheses to specify the precedence of set operations. Expressions in parentheses are processed first.

```
(SELECT * FROM t1 UNION ALL SELECT * FROM t1) INTERSECT SELECT * FROM t2;
+----+
| a |
+----+
| 1 |
+----+
1 rows in set (0.00 sec)
```

#### 14.11.4.18.5 Use ORDER BY and LIMIT

TiDB supports using `ORDER BY` or `LIMIT` clause in set operations. These two clauses must be at the end of the entire statement.

```
(SELECT * FROM t1 UNION ALL SELECT * FROM t1 INTERSECT SELECT * FROM t2)
 ↪ ORDER BY a LIMIT 2;
+----+
| a |
+----+
| 1 |
| 1 |
+----+
2 rows in set (0.00 sec)
```

#### 14.11.4.19 List of Expressions for Pushdown

When TiDB reads data from TiKV, TiDB tries to push down some expressions (including calculations of functions or operators) to be processed to TiKV. This reduces the amount of transferred data and offloads processing from a single TiDB node. This document introduces the expressions that TiDB already supports pushing down and how to prohibit specific expressions from being pushed down using blocklist.

Tiflash also supports pushdown for the functions and operators [listed on this page](#).

##### 14.11.4.19.1 Supported expressions for pushdown to TiKV

| Expression Type                    | Operations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Logical operators                  | AND (&&), OR (  ), NOT (!), XOR                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Bit operators                      | &, ~,  , ^, <<, >>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Comparison functions and operators | <, <=, =, != (<>), >, >=, <=>, BETWEEN ... AND ..., COALESCE(), IN(), INTERVAL(), IS NOT NULL, IS NOT, IS NULL, IS, ISNULL(), LIKE, NOT BETWEEN ... AND ..., NOT IN(), NOT LIKE, STRCMP()                                                                                                                                                                                                                                                                                                              |
| Numeric functions and operators    | +, -, *, /, DIV, % (MOD), -, ABS(), ACOS(), ASIN(), ATAN(), ATAN2(), ATAN(), CEIL(), CEILING(), CONV(), COS(), COT(), CRC32(), DEGREES(), EXP(), FLOOR(), LN(), LOG(), LOG10(), LOG2(), MOD(), PI(), POW(), POWER(), RADIANS(), RAND(), ROUND(), SIGN(), SIN(), SQRT()                                                                                                                                                                                                                                 |

#### 14.11.4.19.2 Blocklist specific expressions

If unexpected behavior occurs in the calculation process when pushing down the **supported expressions** or specific data types (**only** the **ENUM type** and the **BIT type**), you can restore the application quickly by prohibiting the pushdown of the corresponding functions, operators, or data types. Specifically, you can prohibit the functions, operators, or data types from being pushed down by adding them to the blocklist `mysql.expr_pushdown_blacklist`. For details, refer to [Add to the blocklist](#).

#### 14.11.4.20 TiDB Specific Functions

The following functions are TiDB extensions, and are not present in MySQL:

| Function name                                                     | Function description                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>TIDB_BOUNDED_STALENESS()</code>                             | The <code>TIDB_BOUNDED_STALENESS</code> function instructs TiDB to read the data as new as possible within the time range. See also: <a href="#">Read Historical Data Using the AS OF TIMESTAMP Clause</a>                                                                            |
| <code>TIDB_DECODE_KEY(str)</code>                                 | The <code>TIDB_DECODE_KEY</code> function can be used to decode a TiDB-encoded key entry into a JSON structure containing <code>_tidb_rowid</code> and <code>table_id</code> . These encoded keys can be found in some system tables and in logging outputs.                          |
| <code>TIDB_DECODE_PLAN(str)</code>                                | The <code>TIDB_DECODE_PLAN</code> function can be used to decode a TiDB execution plan.                                                                                                                                                                                               |
| <code>TIDB_IS_DDL_OWNER()</code>                                  | The <code>TIDB_IS_DDL_OWNER</code> function can be used to check whether or not the TiDB instance you are connected to is the one that is the DDL Owner. The DDL Owner is the TiDB instance that is tasked with executing DDL statements on behalf of all other nodes in the cluster. |
| <code>TIDB_PARSE_TSO(num)</code>                                  | The <code>TIDB_PARSE_TSO</code> function can be used to extract the physical timestamp from a TiDB TSO timestamp. See also: <a href="#">tidb_current_ts</a> .                                                                                                                         |
| <code>TIDB_VERSION()</code>                                       | The <code>TIDB_VERSION</code> function returns the TiDB version with additional build information.                                                                                                                                                                                    |
| <code>TIDB_DECODE_SQL_DIGESTS(digests, stmtTruncateLength)</code> | The <code>TIDB_DECODE_SQL_DIGESTS()</code> function is used to query the normalized SQL statements (a form without formats and arguments) corresponding to the set of SQL digests in the cluster.                                                                                     |
| <code>VITNESS_HASH(str)</code>                                    | The <code>VITNESS_HASH</code> function returns the hash of a string that is compatible with Vitess' <code>HASH</code> function. This is intended to help the data migration from Vitess.                                                                                              |

| Function name | Function description                                                                                                                                                     |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TIDB_SHARD()  | The TIDB_SHARD function can be used to create a shard index to scatter the index hotspot. A shard index is an expression index with a TIDB_SHARD function as the prefix. |

#### 14.11.4.20.1 Examples

This section provides examples for some of the functions above.

##### TIDB\_DECODE\_KEY

In the following example, the table `t1` has a hidden `rowid` that is generated by TiDB. The `TIDB_DECODE_KEY` is used in the statement. From the result, you can see that the hidden `rowid` is decoded and output, which is a typical result for the non-clustered primary key.

```
SELECT START_KEY, TIDB_DECODE_KEY(START_KEY) FROM information_schema.
 ↪ tikv_region_status WHERE table_name='t1' AND REGION_ID=2\G
```

```
***** 1. row *****
 START_KEY: 7480000000000000
 ↪ FF3B5F728000000000FF1DE3F10000000000FA
TIDB_DECODE_KEY(START_KEY): {"_tidb_rowid":1958897,"table_id":"59"}
1 row in set (0.00 sec)
```

In the following example, the table `t2` has a compound clustered primary key. From the JSON output, you can see a `handle` that contains the name and value for both of the columns that are part of the primary key.

```
show create table t2\G
```

```
***** 1. row *****
 Table: t2
Create Table: CREATE TABLE `t2` (
 `id` binary(36) NOT NULL,
 `a` tinyint(3) unsigned NOT NULL,
 `v` varchar(512) DEFAULT NULL,
 PRIMARY KEY (`a`,`id`) /*T![clustered_index] CLUSTERED */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
1 row in set (0.001 sec)
```

```
select * from information_schema.tikv_region_status where table_name='t2'
 ↪ limit 1\G
```

```

***** 1. row *****

## TIDB\_DECODE\_PLAN

You can find TiDB execution plans in encoded form in the slow query log. The `TIDB_DECODE_PLAN()` function is then used to decode the encoded plans into a human-readable form.

This function is useful because a plan is captured at the time the statement is executed. Re-executing the statement in `EXPLAIN` might produce different results as data distribution and statistics evolves over time.

```
SELECT tidb_decode_plan('8
↳ QIYMAkzMV83CQEH8E85LjA0CWRhdGE6U2VsZWN0aW9uXzYJOTYwCXRpWU6NzEzLjHCtXMsIGxvb3Bz0j
↳ ')\G
```

```
***** 1. row *****
tidb_decode_plan('8
↳ QIYMAkzMV83CQEH8E85LjA0CWRhdGE6U2VsZWN0aW9uXzYJOTYwCXRpWU6NzEzLjHCtXMsIGxvb3Bz0j
↳ : id task estRows operator info actRows
↳ execution info
↳
↳ memory disk
TableReader_7 root 319.04 data:Selection_6
↳ 960 time:713.1µs, loops:2, cop_task: {
↳ num: 1, max: 568.5µs, proc_keys: 0, rpc_num: 1, rpc_time: 549.1µs,
↳ copr_cache_hit_ratio: 0.00} 3.99 KB N/A

↳ stats:pseudo 960 tikv_task:{time:153µs, loops:960}
↳
↳ N/A N/A
```

## TIDB\_PARSE\_TSO

The `TIDB_PARSE_TSO` function can be used to extract the physical timestamp from a TiDB TSO timestamp. TSO stands for Time Stamp Oracle and is a monotonically increasing timestamp given out by PD (Placement Driver) for every transaction.

A TSO is a number that consists of two parts:

- A physical timestamp
- A logical counter

```
BEGIN;
SELECT TIDB_PARSE_TSO(@@tidb_current_ts);
ROLLBACK;
```

```
+-----+
| TIDB_PARSE_TSO(@@tidb_current_ts) |
+-----+
| 2021-05-26 11:33:37.776000 |
+-----+
1 row in set (0.0012 sec)
```

Here `TIDB_PARSE_TSO` is used to extract the physical timestamp from the timestamp number that is available in the `tidb_current_ts` session variable. Because timestamps are given out per transaction, this function is running in a transaction.

### TIDB\_VERSION

The `TIDB_VERSION` function can be used to get the version and build details of the TiDB server that you are connected to. You can use this function when reporting issues on GitHub.

```
SELECT TIDB_VERSION()\G
```

```
***** 1. row *****
TIDB_VERSION(): Release Version: v5.1.0-alpha-13-gd5e0ed0aa-dirty

```

### TIDB\_DECODE\_SQL\_DIGESTS

The `TIDB_DECODE_SQL_DIGESTS()` function is used to query the normalized SQL statements (a form without formats and arguments) corresponding to the set of SQL digests in the cluster. This function accepts 1 or 2 arguments:

- **digests**: A string. This parameter is in the format of a JSON string array, and each string in the array is a SQL digest.
- **stmtTruncateLength**: An integer (optional). It is used to limit the length of each SQL statement in the returned result. If a SQL statement exceeds the specified length, the statement is truncated. 0 means that the length is unlimited.

This function returns a string, which is in the format of a JSON string array. The  $i$ -th item in the array is the normalized SQL statement corresponding to the  $i$ -th element in the `digests` parameter. If an element in the `digests` parameter is not a valid SQL digest or the system cannot find the corresponding SQL statement, the corresponding item in the

returned result is `null`. If the truncation length is specified (`stmtTruncateLength > 0`), for each statement in the returned result that exceeds this length, the first `stmtTruncateLength` characters are retained and the suffix `"..."` is added at the end to indicate the truncation. If the `digests` parameter is `NULL`, the returned value of the function is `NULL`.

### Note:

- Only users with the [PROCESS](#) privilege can use this function.
- When `TIDB_DECODE_SQL_DIGESTS` is executed, TiDB queries the statement corresponding to each SQL digest from the statement summary tables, so there is no guarantee that the corresponding statement can always be found for any SQL digest. Only the statements that have been executed in the cluster can be found, and whether these SQL statements can be queried or not is also affected by the related configuration of the statement summary tables. For the detailed description of the statement summary table, see [Statement Summary Tables](#).
- This function has a high overhead. In queries with a large number of rows (for example, querying the full table of `information_schema.cluster_tidb_trx` on a large and busy cluster), using this function might cause the queries to run for too long. Use it with caution.
  - This function has a high overhead because every time it is called, it internally queries the `STATEMENTS_SUMMARY`, `STATEMENTS_SUMMARY_HISTORY`, `CLUSTER_STATEMENTS_SUMMARY`, and `CLUSTER_STATEMENTS_SUMMARY_HISTORY` tables, and the query involves the `UNION` operation. This function currently does not support vectorization, that is, when calling this function for multiple rows of data, the above query is performed separately for each row.

```
set @digests = '['
 ↪ e6f07d43b5c21db0fbb9a31feac2dc599787763393dd5acbfad80e247eb02ad5',"38
 ↪ b03afa5debbdf0326a014dbe5012a62c51957f1982b3093e748460f8b00821',"
 ↪ e5796985ccafe2f71126ed6c0ac939ffa015a8c0744a24b7aee6d587103fd2f7']';

select tidb_decode_sql_digests(@digests);
```

```
+-----+
| tidb_decode_sql_digests(@digests) |
+-----+
| ["begin",null,"select * from `t`"] |
+-----+
1 row in set (0.00 sec)
```

In the above example, the parameter is a JSON array containing 3 SQL digests, and the corresponding SQL statements are the three digest items in the query results. But the SQL statement corresponding to the second SQL digest cannot be found from the cluster, so the second item in the result is null.

```
select tidb_decode_sql_digests(@digests, 10);
```

```
+-----+
| tidb_decode_sql_digests(@digests, 10) |
+-----+
| ["begin",null,"select * f..."] |
+-----+
1 row in set (0.01 sec)
```

The above call specifies the second parameter (that is, the truncation length) as 10, and the length of the third statement in the query result is greater than 10. Therefore, only the first 10 characters are retained, and "..." is added at the end, which indicates the truncation.

## TIDB\_SHARD

The TIDB\_SHARD function can be used to create a shard index to scatter the index hotspot. A shard index is an expression index prefixed with a TIDB\_SHARD function.

- Creation:

To create a shard index for the index field `a`, you can use `uk((tidb_shard(a)), a)`. When there is a hotspot caused by monotonically increasing or decreasing data on the index field `a` in the unique secondary index `uk((tidb_shard(a)), a)`, the index's prefix `tidb_shard(a)` can scatter the hotspot to improve the scalability of the cluster.

- Scenarios:

- There is a write hotspot caused by monotonically increasing or decreasing keys on the unique secondary index, and the index contains integer type fields.
- The SQL statement executes an equality query based on all fields of the secondary index, either as a separate `SELECT` or as an internal query generated by `UPDATE`, `DELETE` and so on. The equality query includes two ways: `a = 1` or `a IN (1, 2, ↵ . . . . .)`.

- Limitations:

- Cannot be used in inequality queries.
- Cannot be used in queries that contain **OR** mixed with an outmost **AND** operator.
- Cannot be used in the **GROUP BY** clause.
- Cannot be used in the **ORDER BY** clause.
- Cannot be used in the **ON** clause.
- Cannot be used in the **WHERE** subquery.
- Can be used to scatter unique indexes of only the integer fields.
- Might not take effect in composite indexes.
- Cannot go through FastPlan process, which affects optimizer performance.
- Cannot be used to prepare the execution plan cache.

The following example shows how to use the `TIDB_SHARD` function.

- Use the `TIDB_SHARD` function to calculate the `SHARD` value.

The following statement shows how to use the `TIDB_SHARD` function to calculate the `SHARD` value of 12373743746:

```
SELECT TIDB_SHARD(12373743746);
```

- The `SHARD` value is:

```
+-----+
| TIDB_SHARD(12373743746) |
+-----+
| 184 |
+-----+
1 row in set (0.00 sec)
```

- Create a shard index using the `TIDB_SHARD` function:

```
CREATE TABLE test(id INT PRIMARY KEY CLUSTERED, a INT, b INT, UNIQUE
↳ KEY uk((tidb_shard(a)), a));
```

#### 14.11.4.21 Comparisons between Functions and Syntax of Oracle and TiDB

This document describes the comparisons between functions and syntax of Oracle and TiDB. It helps you find the corresponding TiDB functions based on the Oracle functions, and understand the syntax differences between Oracle and TiDB.

##### Note:

The functions and syntax in this document are based on Oracle 12.2.0.1.0 and TiDB v5.4.0. They might be different in other versions.

#### 14.11.4.21.1 Comparisons of functions

The following table shows the comparisons between some Oracle and TiDB functions.

| Function | Oracle syntax                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | TiDB syntax | Note |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|------|
|          | Cast a value as a certain type                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |             |      |

|          | The format string of TiDB is case-sensitive.     Get the current system time in second precision   SYSDATE   NOW()       Get the current system time in microsecond precision   SYSTIMESTAMP   CURRENT_TIMESTAMP(6)       Get the number of days between two dates   date1 - date2   DATEDIFF(date1, date2)       Get the number of months between two dates   MONTHS_BETWEEN(ENDDATE, SYSDATE)   TIMESTAMPDIFF(MONTH, SYSDATE, ENDDATE)   The results of MONTHS_BETWEEN() in Oracle and TIMESTAMPDIFF() in TiDB are different. TIMESTAMPDIFF() returns an integer. Note that the parameters in the two functions are swapped.     Add n days to a date   DATEVAL + n   DATE_ADD(dateVal, INTERVAL n DAY)   n can be a negative value.     Add n months to a date   ADD_MONTHS(dateVal, n)   DATE_ADD ↔ (dateVal, INTERVAL n MONTH)   n can be a negative value.     Get the day of a date   TRUNC(SYSDATE) |             |      |
|          | CAST(NOW() AS DATE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |             |      |
|          | DATE_FORMAT(NOW(), '%Y-%m-%d')                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |             |      |
|          | In TiDB, CAST and DATE_FORMAT return the same result.     Get the month of a date   TRUNC(SYSDATE, 'mm')   DATE_ADD(CURDATE(), interval - day(CURDATE()) + 1 day)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |             |      |

| Truncate a value | `TRUNC(2.136)= 2` `TRUNC(2.136,2)= 2.13` | `TRUNCATE(2.136,0)= 2`  
 ↪ `TRUNCATE(2.136,2)= 2.13` | Data precision is preserved. Truncate the corresponding  
 decimal places without rounding. | | Get the next value in a sequence | `sequence_name`  
 ↪ `.NEXTVAL` | `NEXTVAL(sequence_name)` | | Get a random sequence value | `SYS_GUID`  
 ↪ `()` | `UUID()` | TiDB returns a Universal Unique Identifier (UUID). | | Left join or  
 right join | `SELECT * FROM a, b WHERE a.id = b.id(+);SELECT * FROM a, b WHERE a`  
 ↪ `.id(+)= b.id;` | `SELECT * FROM a LEFT JOIN b ON a.id = b.id;SELECT * FROM a`  
 ↪ `RIGHT JOIN b ON a.id = b.id;` | In a correlated query, TiDB does not support using  
 (+) to left join or right join. You can use `LEFT JOIN` or `RIGHT JOIN` instead. | | `NVL()` |  
`NVL(key, val)` | `IFNULL(key, val)` | If the value of the field is `NULL`, it returns `val`; otherwise,  
 it returns the value of the field. | | `NVL2()` | `NVL2(key, val1, val2)` | `IF(key is NULL,`  
 ↪ `val1, val2)` | If the value of the field is not `NULL`, it returns `val1`; otherwise, it returns  
`val2.` | | `DECODE()` |

```
DECODE(key, val1, val2, val3)
```

```
DECODE(value, if1, val1, if2, val2, ..., ifn, valn, val)
```

```
|
```

```
IF(key=val1, val2, val3)
```

```
CASE WHEN value=if1 THEN val1 WHEN value=if2 THEN val2, ..., WHEN value=
```

↪ `ifn THEN valn ELSE val END`

```
|
```

If the value of the field is `val1`, then it returns `val2`; otherwise it returns `val3`.

When the value of the field satisfies condition 1 (`if1`), it returns `val1`. When it satisfies condition 2 (`if2`), it returns `val2`. When it satisfies condition 3 (`if3`), it returns `val3`.

| | Concatenate the string `a` and `b` | `'a'` | `'b'` | `CONCAT('a', 'b')` | | | Get the length of  
 a string | `LENGTH(str)` | `CHAR_LENGTH(str)` | | | Get the substring as specified | `SUBSTR('`  
 ↪ `abcdefg', 0, 2)= 'ab'` `SUBSTR('abcdefg', 1, 2)= 'ab'` | `SUBSTRING('abcdefg', 0, 2)`  
 ↪ `= 'SUBSTRING('abcdefg', 1, 2)= 'ab'` |

In Oracle, the starting position 0 has the same effect as 1.

In TiDB, the starting position 0 returns an empty string. If you want to get a substring from the beginning, the starting position should be 1.

| | Get the position of a substring | `INSTR('abcdefg', 'b', 1, 1)` | `INSTR('abcdefg`  
 ↪ `', 'b')` | Search from the first character of `'abcdefg'` and return the position of the  
 first occurrence of `'b'`. | | Get the position of a substring | `INSTR('stst', 's', 1, 2)` |  
`LENGTH(SUBSTRING_INDEX('stst', 's', 2))+ 1` | Search from the first character of `'stst`  
 ↪ `'` and return the position of the second occurrence of `'s'`. | | Get the position of a  
 substring | `INSTR('abcabc', 'b', 2, 1)` | `LOCATE('b', 'abcabc', 2)` | Search from the second  
 character of `abcabc` and return the position of the first occurrence of `b`. | | Concatenate values  
 of a column | `LISTAGG(CONCAT(E.dimensionid, '---', E.DIMENSIONNAME), '***')within`  
 ↪ `GROUP(ORDER BY DIMENSIONNAME)` | `GROUP_CONCAT(CONCAT(E.dimensionid, '---', E.`  
 ↪ `DIMENSIONNAME)ORDER BY DIMENSIONNAME SEPARATOR '***')` | Concatenate values of

a specified column to one row with the \*\*\* delimiter. | | Convert an ASCII code to a character | CHR(n) | CHAR(n) | The Tab (CHR(9)), LF (CHR(10)), and CR (CHR(13)) characters in Oracle correspond to CHAR(9), CHAR(10), and CHAR(13) in TiDB. |

#### 14.11.4.21.2 Comparisons of syntax

This section describes some syntax differences between Oracle and TiDB.

##### String syntax

In Oracle, a string can only be enclosed in single quotes ("). For example 'a'.

In TiDB, a string can be enclosed in single quotes (") or double quotes (""). For example, 'a' and "a".

##### Difference between NULL and an empty string

Oracle does not distinguish between NULL and an empty string '', that is, NULL is equivalent to ''.

TiDB distinguishes between NULL and an empty string ''.

##### Read and write to the same table in an INSERT statement

Oracle supports reading and writing to the same table in an INSERT statement. For example:

```
INSERT INTO table1 VALUES (feild1,(SELECT feild2 FROM table1 WHERE...))
```

TiDB does not support reading and writing to the same table in a INSERT statement. For example:

```
INSERT INTO table1 VALUES (feild1,(SELECT T.fields2 FROM table1 T WHERE...))
↪)
```

##### Get the first n rows from a query

In Oracle, to get the first n rows from a query, you can use the ROWNUM <= n clause. For example ROWNUM <= 10.

In TiDB, to get the first n rows from a query, you can use the LIMIT n clause. For example LIMIT 10. The Hibernate Query Language (HQL) running SQL statements with LIMIT results in an error. You need to change the Hibernate statements to SQL statements.

##### Update multiple tables in an UPDATE statement

In Oracle, it is not necessary to list the specific field update relationship when updating multiple tables. For example:

```
UPDATE test1 SET(test1.name,test1.age) = (SELECT test2.name,test2.age FROM
↪ test2 WHERE test2.id=test1.id)
```

In TiDB, when updating multiple tables, you need to list all the specific field update relationships in SET. For example:

```
UPDATE test1, test2 SET test1.name=test2.name, test1.age=test2.age WHERE
↪ test1.id=test2.id
```

### Derived table alias

In Oracle, when querying multiple tables, it is unnecessary to add an alias to the derived table. For example:

```
SELECT * FROM (SELECT * FROM test)
```

In TiDB, when querying multiple tables, every derived table must have its own alias. For example:

```
SELECT * FROM (SELECT * FROM test) t
```

### Set operations

In Oracle, to get the rows that are in the first query result but not in the second, you can use the MINUS set operation. For example:

```
SELECT * FROM t1 MINUS SELECT * FROM t2
```

TiDB does not support the MINUS operation. You can use the EXCEPT set operation. For example:

```
SELECT * FROM t1 EXCEPT SELECT * FROM t2
```

### Comment syntax

In Oracle, the comment syntax is `--Comment`.

In TiDB, the comment syntax is `-- Comment`. Note that there is a white space after `--` in TiDB.

### Pagination

In Oracle, you can use the `OFFSET m ROWS` to skip `m` rows and use the `FETCH NEXT n ↪ ROWS ONLY` to fetch `n` rows. For example:

```
SELECT * FROM tables OFFSET 0 ROWS FETCH NEXT 2000 ROWS ONLY
```

In TiDB, you can use the `LIMIT n OFFSET m` to replace `OFFSET m ROWS FETCH NEXT ↪ n ROWS ONLY`. For example:

```
SELECT * FROM tables LIMIT 2000 OFFSET 0
```

### Sorting order on NULL values

In Oracle, NULL values are sorted by the `ORDER BY` clause in the following cases:

- In the `ORDER BY column ASC` statement, NULL values are returned last.

- In the `ORDER BY column DESC` statement, `NULL` values are returned first.
- In the `ORDER BY column [ASC|DESC] NULLS FIRST` statement, `NULL` values are returned before non-`NULL` values. Non-`NULL` values are returned in ascending order or descending order specified in `ASC|DESC`.
- In the `ORDER BY column [ASC|DESC] NULLS LAST` statement, `NULL` values are returned after non-`NULL` values. Non-`NULL` values are returned in ascending order or descending order specified in `ASC|DESC`.

In TiDB, `NULL` values are sorted by the `ORDER BY` clause in the following cases:

- In the `ORDER BY column ASC` statement, `NULL` values are returned first.
- In the `ORDER BY column DESC` statement, `NULL` values are returned last.

The following table shows some examples of equivalent `ORDER BY` statements in Oracle and TiDB:

| ORDER BY in Oracle             | Equivalent statements in TiDB |
|--------------------------------|-------------------------------|
| <code>SELECT * FROM t1</code>  | <code>SELECT * FROM t1</code> |
| <code>↪ ORDER BY name</code>   | <code>↪ ORDER BY</code>       |
| <code>↪ NULLS FIRST;</code>    | <code>↪ name;</code>          |
| <code>SELECT * FROM t1</code>  | <code>SELECT * FROM t1</code> |
| <code>↪ ORDER BY name</code>   | <code>↪ ORDER BY</code>       |
| <code>↪ DESC NULLS LAST</code> | <code>↪ name DESC;</code>     |
| <code>↪ ;</code>               |                               |
| <code>SELECT * FROM t1</code>  | <code>SELECT * FROM t1</code> |
| <code>↪ ORDER BY name</code>   | <code>↪ ORDER BY</code>       |
| <code>↪ DESC NULLS</code>      | <code>↪ ISNULL(name)</code>   |
| <code>↪ FIRST;</code>          | <code>↪ DESC, name</code>     |
|                                | <code>↪ DESC;</code>          |
| <code>SELECT * FROM t1</code>  | <code>SELECT * FROM t1</code> |
| <code>↪ ORDER BY name</code>   | <code>↪ ORDER BY</code>       |
| <code>↪ ASC NULLS LAST;</code> | <code>↪ ISNULL(name),</code>  |
|                                | <code>↪ name;</code>          |

#### 14.11.5 Clustered Indexes

TiDB supports the clustered index feature since v5.0. This feature controls how data is stored in tables containing primary keys. It provides TiDB the ability to organize tables in a way that can improve the performance of certain queries.

The term *clustered* in this context refers to the *organization of how data is stored* and

not a group of database servers working together. Some database management systems refer to clustered indexes as *index-organized tables* (IOT).

Currently, tables containing primary keys in TiDB are divided into the following two categories:

- **NONCLUSTERED:** The primary key of the table is non-clustered index. In tables with non-clustered indexes, the keys for row data consist of internal `_tidb_rowid` implicitly assigned by TiDB. Because primary keys are essentially unique indexes, tables with non-clustered indexes need at least two key-value pairs to store a row, which are:
  - `_tidb_rowid` (key) - row data (value)
  - Primary key data (key) - `_tidb_rowid` (value)
- **CLUSTERED:** The primary key of the table is clustered index. In tables with clustered indexes, the keys for row data consist of primary key data given by the user. Therefore, tables with clustered indexes need only one key-value pair to store a row, which is:
  - Primary key data (key) - row data (value)

#### Note:

TiDB supports clustering only by a table's **PRIMARY KEY**. With clustered indexes enabled, the terms *the PRIMARY KEY* and *the clustered index* might be used interchangeably. **PRIMARY KEY** refers to the constraint (a logical property), and clustered index describes the physical implementation of how the data is stored.

#### 14.11.5.1 User scenarios

Compared to tables with non-clustered indexes, tables with clustered indexes offer greater performance and throughput advantages in the following scenarios:

- When data is inserted, the clustered index reduces one write of the index data from the network.
- When a query with an equivalent condition only involves the primary key, the clustered index reduces one read of index data from the network.
- When a query with a range condition only involves the primary key, the clustered index reduces multiple reads of index data from the network.
- When a query with an equivalent or range condition only involves the primary key prefix, the clustered index reduces multiple reads of index data from the network.

On the other hand, tables with clustered indexes have certain disadvantages. See the following:

- There might be write hotspot issues when inserting a large number of primary keys with close values.
- The table data takes up more storage space if the data type of the primary key is larger than 64 bits, especially when there are multiple secondary indexes.

### 14.11.5.2 Usages

### 14.11.5.3 Create a table with clustered indexes

Since TiDB v5.0, you can add non-reserved keywords `CLUSTERED` or `NONCLUSTERED` after `PRIMARY KEY` in a `CREATE TABLE` statement to specify whether the table's primary key is a clustered index. For example:

```
CREATE TABLE t (a BIGINT PRIMARY KEY CLUSTERED, b VARCHAR(255));
CREATE TABLE t (a BIGINT PRIMARY KEY NONCLUSTERED, b VARCHAR(255));
CREATE TABLE t (a BIGINT KEY CLUSTERED, b VARCHAR(255));
CREATE TABLE t (a BIGINT KEY NONCLUSTERED, b VARCHAR(255));
CREATE TABLE t (a BIGINT, b VARCHAR(255), PRIMARY KEY(a, b) CLUSTERED);
CREATE TABLE t (a BIGINT, b VARCHAR(255), PRIMARY KEY(a, b) NONCLUSTERED);
```

Note that keywords `KEY` and `PRIMARY KEY` have the same meaning in the column definition.

You can also use the `comment syntax` in TiDB to specify the type of the primary key. For example:

```
CREATE TABLE t (a BIGINT PRIMARY KEY /*T![clustered_index] CLUSTERED */, b
↳ VARCHAR(255));
CREATE TABLE t (a BIGINT PRIMARY KEY /*T![clustered_index] NONCLUSTERED */
↳ , b VARCHAR(255));
CREATE TABLE t (a BIGINT, b VARCHAR(255), PRIMARY KEY(a, b) /*T![
↳ clustered_index] CLUSTERED */);
CREATE TABLE t (a BIGINT, b VARCHAR(255), PRIMARY KEY(a, b) /*T![
↳ clustered_index] NONCLUSTERED */);
```

For statements that do not explicitly specify the keyword `CLUSTERED`/`NONCLUSTERED`, the default behavior is controlled by the system variable `@@global.tidb_enable_clustered_index` `↳` . Supported values for this variable are as follows:

- `OFF` indicates that primary keys are created as non-clustered indexes by default.
- `ON` indicates that primary keys are created as clustered indexes by default.
- `INT_ONLY` indicates that the behavior is controlled by the configuration item `alter-  
↳ primary-key`. If `alter-primary-key` is set to `true`, primary keys are created as non-clustered indexes by default. If it is set to `false`, only the primary keys which consist of an integer column are created as clustered indexes.

The default value of `@@global.tidb_enable_clustered_index` is `ON`.

### 14.11.5.3.1 Add or drop clustered indexes

TiDB does not support adding or dropping clustered indexes after tables are created. Nor does it support the mutual conversion between clustered indexes and non-clustered indexes. For example:

```
ALTER TABLE t ADD PRIMARY KEY(b, a) CLUSTERED; -- Currently not supported.
ALTER TABLE t DROP PRIMARY KEY; -- If the primary key is a clustered index
 ↪ , then not supported.
ALTER TABLE t DROP INDEX `PRIMARY`; -- If the primary key is a clustered
 ↪ index, then not supported.
```

### 14.11.5.3.2 Add or drop non-clustered indexes

TiDB supports adding or dropping non-clustered indexes after tables are created. You can explicitly specify the keyword `NONCLUSTERED` or omit it. For example:

```
ALTER TABLE t ADD PRIMARY KEY(b, a) NONCLUSTERED;
ALTER TABLE t ADD PRIMARY KEY(b, a); -- If you omit the keyword, the
 ↪ primary key is a non-clustered index by default.
ALTER TABLE t DROP PRIMARY KEY;
ALTER TABLE t DROP INDEX `PRIMARY`;
```

### 14.11.5.3.3 Check whether the primary key is a clustered index

You can check whether the primary key of a table is a clustered index using one of the following methods:

- Execute the command `SHOW CREATE TABLE`.
- Execute the command `SHOW INDEX FROM`.
- Query the `TIDB_PK_TYPE` column in the system table `information_schema.tables`.

By running the command `SHOW CREATE TABLE`, you can see whether the attribute of `PRIMARY KEY` is `CLUSTERED` or `NONCLUSTERED`. For example:

```
mysql> SHOW CREATE TABLE t;
+---
 ↪ -----+-----
 ↪
| Table | Create Table
 ↪
 ↪ |
+---
 ↪ -----+-----
 ↪
| t | CREATE TABLE `t` (
```

```

`a` bigint(20) NOT NULL,
`b` varchar(255) DEFAULT NULL,
PRIMARY KEY (`a`) /*T![clustered_index] CLUSTERED */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin |
+--
 ↪ -----+
 ↪
1 row in set (0.01 sec)

```

By running the command `SHOW INDEX FROM`, you can check whether the result in the column `Clustered` shows YES or NO. For example:

```

mysql> SHOW INDEX FROM t;
+--
 ↪ -----+-----+-----+-----+-----+-----+-----+
 ↪
| Table | Non_unique | Key_name | Seq_in_index | Column_name | Collation |
 ↪ Cardinality | Sub_part | Packed | Null | Index_type | Comment |
 ↪ Index_comment | Visible | Expression | Clustered |
+--
 ↪ -----+-----+-----+-----+-----+-----+-----+
 ↪
| t | 0 | PRIMARY | 1 | a | A |
 ↪ | NULL | NULL | | BTREE | | YES |
 ↪ NULL | YES |
+--
 ↪ -----+-----+-----+-----+-----+-----+-----+
 ↪
1 row in set (0.01 sec)

```

You can also query the column `TIDB_PK_TYPE` in the system table `information_schema.tables` to see whether the result is `CLUSTERED` or `NONCLUSTERED`. For example:

```

mysql> SELECT TIDB_PK_TYPE FROM information_schema.tables WHERE
 ↪ table_schema = 'test' AND table_name = 't';
+-----+
| TIDB_PK_TYPE |
+-----+
| CLUSTERED |
+-----+
1 row in set (0.03 sec)

```

#### 14.11.5.4 Limitations

Currently, there are several different types of limitations for the clustered index feature. See the following:

- Situations that are not supported and not in the support plan:
  - Using clustered indexes together with the attribute `SHARD_ROW_ID_BITS` is not supported. Also, the attribute `PRE_SPLIT_REGIONS` does not take effect on tables with clustered indexes.
  - Downgrading tables with clustered indexes is not supported. If you need to downgrade such tables, use logical backup tools to migrate data instead.
- Situations that are not supported yet but in the support plan:
  - Adding, dropping, and altering clustered indexes using `ALTER TABLE` statements are not supported.
- Limitations for specific versions:
  - In v5.0, using the clustered index feature together with TiDB Binlog is not supported. After TiDB Binlog is enabled, TiDB only allows creating a single integer column as the clustered index of a primary key. TiDB Binlog does not replicate data changes (such as insertion, deletion, and update) on existing tables with clustered indexes to the downstream. If you need to replicate tables with clustered indexes to the downstream, upgrade your cluster to v5.1 or use [TiCDC](#) for replication instead.

After TiDB Binlog is enabled, if the clustered index you create is not a single integer primary key, TiDB returns the following error:

```
mysql> CREATE TABLE t (a VARCHAR(255) PRIMARY KEY CLUSTERED);
ERROR 8200 (HY000): Cannot create clustered index table when the binlog is
↳ ON
```

If you use clustered indexes together with the attribute `SHARD_ROW_ID_BITS`, TiDB reports the following error:

```
mysql> CREATE TABLE t (a VARCHAR(255) PRIMARY KEY CLUSTERED)
↳ SHARD_ROW_ID_BITS = 3;
ERROR 8200 (HY000): Unsupported shard_row_id_bits for table with primary
↳ key as row id
```

## 14.11.5.5 Compatibility

### 14.11.5.5.1 Compatibility with earlier and later TiDB versions

TiDB supports upgrading tables with clustered indexes but not downgrading such tables, which means that data in tables with clustered indexes on a later TiDB version is not available on an earlier one.

The clustered index feature is partially supported in TiDB v3.0 and v4.0. It is enabled by default when the following requirements are fully met:

- The table contains a **PRIMARY KEY**.
- The **PRIMARY KEY** consists of only one column.
- The **PRIMARY KEY** is an **INTEGER**.

Since TiDB v5.0, the clustered index feature is fully supported for all types of primary keys, but the default behavior is consistent with TiDB v3.0 and v4.0. To change the default behavior, you can configure the system variable `@@tidb_enable_clustered_index` to **ON** or **OFF**. For more details, see [Create a table with clustered indexes](#).

#### 14.11.5.5.2 Compatibility with MySQL

TiDB specific comment syntax supports wrapping the keywords **CLUSTERED** and **NONCLUSTERED** in a comment. The result of `SHOW CREATE TABLE` also contains TiDB specific SQL comments. MySQL databases and TiDB databases of an earlier version will ignore these comments.

#### 14.11.5.5.3 Compatibility with TiDB migration tools

The clustered index feature is only compatible with the following migration tools in v5.0 and later versions:

- Backup and restore tools: BR, Dumpling, and TiDB Lightning.
- Data migration and replication tools: DM and TiCDC.

However, you cannot convert a table with non-clustered indexes to a table with clustered indexes by backing up and restoring the table using the v5.0 BR tool, and vice versa.

#### 14.11.5.5.4 Compatibility with other TiDB features

For a table with a combined primary key or a single non-integer primary key, if you change the primary key from a non-clustered index to a clustered index, the keys of its row data change as well. Therefore, `SPLIT TABLE BY/BETWEEN` statements that are executable in TiDB versions earlier than v5.0 are no longer workable in v5.0 and later versions of TiDB. If you want to split a table with clustered indexes using `SPLIT TABLE BY/BETWEEN`, you need to provide the value of the primary key column, instead of specifying an integer value. See the following example:

```
mysql> create table t (a int, b varchar(255), primary key(a, b) clustered);
Query OK, 0 rows affected (0.01 sec)
mysql> split table t between (0) and (1000000) regions 5;
ERROR 1105 (HY000): Split table region lower value count should be 2
mysql> split table t by (0), (50000), (100000);
ERROR 1136 (21S01): Column count doesn't match value count at row 0
mysql> split table t between (0, 'aaa') and (1000000, 'zzz') regions 5;
+-----+-----+
```

```

| TOTAL_SPLIT_REGION | SCATTER_FINISH_RATIO |
+-----+-----+
| 4 | 1 |
+-----+-----+
1 row in set (0.00 sec)
mysql> split table t by (0, ''), (50000, ''), (100000, '');
+-----+-----+
| TOTAL_SPLIT_REGION | SCATTER_FINISH_RATIO |
+-----+-----+
| 3 | 1 |
+-----+-----+
1 row in set (0.01 sec)

```

The attribute `AUTO_RANDOM` can only be used on clustered indexes. Otherwise, TiDB returns the following error:

```

mysql> create table t (a bigint primary key nonclustered auto_random);
ERROR 8216 (HY000): Invalid auto random: column a is not the integer
↳ primary key, or the primary key is nonclustered

```

#### 14.11.6 Constraints

TiDB supports almost the same constraints as MySQL.

##### 14.11.6.1 NOT NULL

NOT NULL constraints supported by TiDB are the same as those supported by MySQL.

For example:

```

CREATE TABLE users (
 id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
 age INT NOT NULL,
 last_login TIMESTAMP
);

```

```

INSERT INTO users (id,age,last_login) VALUES (NULL,123,NOW());

```

```

Query OK, 1 row affected (0.02 sec)

```

```

INSERT INTO users (id,age,last_login) VALUES (NULL,NULL,NOW());

```

```

ERROR 1048 (23000): Column 'age' cannot be null

```

```

INSERT INTO users (id,age,last_login) VALUES (NULL,123,NULL);

```

```
Query OK, 1 row affected (0.03 sec)
```

- The first INSERT statement succeeds because it is possible to assign NULL to the AUTO\_INCREMENT column. TiDB generates sequence numbers automatically.
- The second INSERT statement fails because the age column is defined as NOT NULL.
- The third INSERT statement succeeds because the last\_login column is not explicitly defined as NOT NULL. NULL values are allowed by default.

#### 14.11.6.2 CHECK

TiDB parses but ignores CHECK constraints. This is MySQL 5.7 compatible behavior.

For example:

```
DROP TABLE IF EXISTS users;
CREATE TABLE users (
 id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
 username VARCHAR(60) NOT NULL,
 UNIQUE KEY (username),
 CONSTRAINT min_username_length CHECK (CHARACTER_LENGTH(username) >=4)
);
INSERT INTO users (username) VALUES ('a');
SELECT * FROM users;
```

#### 14.11.6.3 UNIQUE KEY

Unique constraints mean that all non-null values in a unique index and a primary key column are unique.

##### 14.11.6.3.1 Optimistic transactions

By default, for optimistic transactions, TiDB checks unique constraints lazily in the execution phase and strictly in the commit phase, which helps reduce network overhead and improve performance.

For example:

```
DROP TABLE IF EXISTS users;
CREATE TABLE users (
 id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
 username VARCHAR(60) NOT NULL,
 UNIQUE KEY (username)
);
INSERT INTO users (username) VALUES ('dave'), ('sarah'), ('bill');
```

With optimistic locking and `tidb_constraint_check_in_place=OFF`:

```
BEGIN OPTIMISTIC;
INSERT INTO users (username) VALUES ('jane'), ('chris'), ('bill');
```

```
Query OK, 3 rows affected (0.00 sec)
Records: 3 Duplicates: 0 Warnings: 0
```

```
INSERT INTO users (username) VALUES ('steve'),('elizabeth');
```

```
Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0
```

```
COMMIT;
```

```
ERROR 1062 (23000): Duplicate entry 'bill' for key 'users.username'
```

In the preceding optimistic example, the unique check was deferred until the transaction is committed. This resulted in a duplicate key error, because the value `bill` was already present.

You can disable this behavior by setting `tidb_constraint_check_in_place` to `ON`  $\leftrightarrow$  `.` When `tidb_constraint_check_in_place=ON`, the unique constraint is checked when a statement is executed. Note that this variable is only applicable to optimistic transactions. For pessimistic transactions, you can control this behavior using the `tidb_constraint_check_in_place_pessimistic` variable.

For example:

```
DROP TABLE IF EXISTS users;
CREATE TABLE users (
 id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
 username VARCHAR(60) NOT NULL,
 UNIQUE KEY (username)
);
INSERT INTO users (username) VALUES ('dave'), ('sarah'), ('bill');
```

```
SET tidb_constraint_check_in_place = ON;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
BEGIN OPTIMISTIC;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
INSERT INTO users (username) VALUES ('jane'), ('chris'), ('bill');
```

```
ERROR 1062 (23000): Duplicate entry 'bill' for key 'users.username'
```

The first `INSERT` statement caused a duplicate key error. This causes additional network communication overhead and may reduce the throughput of insert operations.

### 14.11.6.3.2 Pessimistic transactions

In pessimistic transactions, by default, TiDB checks `UNIQUE` constraints when a SQL statement that requires inserting or updating unique indexes is executed.

```
DROP TABLE IF EXISTS users;
CREATE TABLE users (
 id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
 username VARCHAR(60) NOT NULL,
 UNIQUE KEY (username)
);
INSERT INTO users (username) VALUES ('dave'), ('sarah'), ('bill');

BEGIN PESSIMISTIC;
INSERT INTO users (username) VALUES ('jane'), ('chris'), ('bill');
```

```
ERROR 1062 (23000): Duplicate entry 'bill' for key 'users.username'
```

To achieve better performance of pessimistic transactions, you can set the `tidb_constraint_check_in_place_pessimistic` variable to `OFF`, which allows TiDB to defer the unique constraint check of a unique index (to the next time when this index requires a lock or to the time when the transaction is committed) and skip the corresponding pessimistic lock. When using this variable, pay attention to the following:

- Due to the deferred unique constraint check, TiDB might read results that do not meet the unique constraints and return a `Duplicate entry` error when you commit a pessimistic transaction. When this error occurs, TiDB rolls back the current transaction. The following example skips the lock to bill, so TiDB might get results that do not satisfy the uniqueness constraints.

```
SET tidb_constraint_check_in_place_pessimistic = OFF;
BEGIN PESSIMISTIC;
INSERT INTO users (username) VALUES ('jane'), ('chris'), ('bill'); --
 ↪ Query OK, 3 rows affected
SELECT * FROM users FOR UPDATE;
```

As in the following example output, the query results of TiDB contain two bills, which does not satisfy the uniqueness constraints.

```
```sql
+----+-----+
| id | username |
+----+-----+
| 1  | dave    |
| 2  | sarah   |
| 3  | bill    |
| 7  | jane    |
| 8  | chris   |
| 9  | bill    |
+----+-----+
```
```

At this time, if the transaction is committed, TiDB will perform a unique  
↳ constraint check, report a `Duplicate entry` error, and roll back the  
↳ transaction.

```
```sql
COMMIT;
```

```

ERROR 1062 (23000): Duplicate entry 'bill' for key 'users.username'
```
```

- When this variable is disabled, committing a pessimistic transaction that needs to write data might return a `Write conflict` error. When this error occurs, TiDB rolls back the current transaction.

As in the following example, if two concurrent transactions need to insert data to the same table, skipping the pessimistic lock causes TiDB to return a `Write conflict` error when you commit a transaction. And the transaction will be rolled back.

```
DROP TABLE IF EXISTS users;
CREATE TABLE users (
 id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
 username VARCHAR(60) NOT NULL,
 UNIQUE KEY (username)
);

SET tidb_constraint_check_in_place_pessimistic = OFF;
BEGIN PESSIMISTIC;
INSERT INTO users (username) VALUES ('jane'), ('chris'), ('bill'); --
↳ Query OK, 3 rows affected
```

At the same time, another session inserts `bill` to the same table.

```
INSERT INTO users (username) VALUES ('bill'); -- Query OK, 1 row
 ↪ affected
```

Then, when you commit the transaction in the first session, TiDB reports a `Write`  
↪ `conflict` error.

```
COMMIT;
```

```
ERROR 9007 (HY000): Write conflict, txnStartTS=435688780611190794,
 ↪ conflictStartTS=435688783311536129, conflictCommitTS
 ↪ =435688783311536130, key={tableID=74, indexID=1, indexValues={
 ↪ bill, }} primary={tableID=74, indexID=1, indexValues={bill, }},
 ↪ reason=LazyUniquenessCheck [try again later]
```

- When this variable is disabled, if there is a write conflict among multiple pessimistic transactions, the pessimistic lock might be forced to roll back when other pessimistic transactions are committed, thus resulting in a `Pessimistic lock not found` error. When this error occurs, it means that deferring the unique constraint check of the pessimistic transaction is not suitable for your application scenario. In this case, consider adjusting the application logic to avoid the conflict or retrying the transaction after an error occurs.
- When this variable is disabled, executing a DML statement in a pessimistic transaction might return an error `8147: LazyUniquenessCheckFailure`.

#### Note:

When the `8147` error occurs, TiDB rolls back the current transaction.

As in the following example, at the execution of the `INSERT` statement, TiDB skips a lock. Then, at the execution of the `DELETE` statement, TiDB locks the unique index and checks the unique constraints, so you will see an error is reported at the `DELETE` statement.

```
SET tidb_constraint_check_in_place_pessimistic = OFF;
BEGIN PESSIMISTIC;
INSERT INTO users (username) VALUES ('jane'), ('chris'), ('bill'); --
 ↪ Query OK, 3 rows affected
DELETE FROM users where username = 'bill';
```

```
ERROR 8147 (23000): transaction aborted because lazy uniqueness check
 ↪ is enabled and an error occurred: [kv:1062]Duplicate entry 'bill'
 ↪ for key 'users.username'
```

- When this variable is disabled, the 1062 Duplicate entry error might be not from the current SQL statement. Therefore, when a transaction operates on multiple tables that have indexes with the same name, you need to check the 1062 error message to find which index the error is actually from.

#### 14.11.6.4 PRIMARY KEY

Like MySQL, primary key constraints contain unique constraints, that is, creating a primary key constraint is equivalent to having a unique constraint. In addition, other primary key constraints of TiDB are also similar to those of MySQL.

For example:

```
CREATE TABLE t1 (a INT NOT NULL PRIMARY KEY);
```

```
Query OK, 0 rows affected (0.12 sec)
```

```
CREATE TABLE t2 (a INT NULL PRIMARY KEY);
```

```
ERROR 1171 (42000): All parts of a PRIMARY KEY must be NOT NULL; if you need
↳ NULL in a key, use UNIQUE instead
```

```
CREATE TABLE t3 (a INT NOT NULL PRIMARY KEY, b INT NOT NULL PRIMARY KEY);
```

```
ERROR 1068 (42000): Multiple primary key defined
```

```
CREATE TABLE t4 (a INT NOT NULL, b INT NOT NULL, PRIMARY KEY (a,b));
```

```
Query OK, 0 rows affected (0.10 sec)
```

- Table t2 failed to be created, because column a is defined as the primary key and does not allow NULL values.
- Table t3 failed to be created, because a table can only have one primary key.
- Table t4 was created successfully, because even though there can be only one primary key, TiDB supports defining multiple columns as the composite primary key.

In addition to the rules above, TiDB currently only supports adding and deleting the primary keys of the NONCLUSTERED type. For example:

```
CREATE TABLE t5 (a INT NOT NULL, b INT NOT NULL, PRIMARY KEY (a,b)
↳ CLUSTERED);
ALTER TABLE t5 DROP PRIMARY KEY;
```

```
ERROR 8200 (HY000): Unsupported drop primary key when the table is using
↳ clustered index
```

```
CREATE TABLE t5 (a INT NOT NULL, b INT NOT NULL, PRIMARY KEY (a,b)
 ↪ NONCLUSTERED);
ALTER TABLE t5 DROP PRIMARY KEY;
```

```
Query OK, 0 rows affected (0.10 sec)
```

For more details about the primary key of the CLUSTERED type, refer to [clustered index](#).

#### 14.11.6.5 FOREIGN KEY

##### Note:

Starting from v6.6.0, TiDB supports the **FOREIGN KEY constraints** feature. Before v6.6.0, TiDB supports creating and deleting foreign key constraints, but the constraints are not actually effective. After upgrading TiDB to v6.6.0, you can delete the invalid foreign key and create a new one to make the foreign key constraints effective.

TiDB supports creating FOREIGN KEY constraints in DDL commands.

For example:

```
CREATE TABLE users (
 id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
 doc JSON
);
CREATE TABLE orders (
 id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
 user_id INT NOT NULL,
 doc JSON,
 FOREIGN KEY fk_user_id (user_id) REFERENCES users(id)
);
```

```
SELECT table_name, column_name, constraint_name, referenced_table_name,
 ↪ referenced_column_name
FROM information_schema.key_column_usage WHERE table_name IN ('users', '
 ↪ orders');
```

```
+-----+-----+-----+-----+
 ↪
| table_name | column_name | constraint_name | referenced_table_name |
 ↪ referenced_column_name |
```

```

+-----+-----+-----+-----+
 ↪
| users | id | PRIMARY | NULL | NULL
 ↪
| orders | id | PRIMARY | NULL | NULL
 ↪
| orders | user_id | fk_user_id | users | id
 ↪
+-----+-----+-----+-----+
 ↪
3 rows in set (0.00 sec)

```

TiDB also supports the syntax to `DROP FOREIGN KEY` and `ADD FOREIGN KEY` via the `ALTER TABLE` command.

```

ALTER TABLE orders DROP FOREIGN KEY fk_user_id;
ALTER TABLE orders ADD FOREIGN KEY fk_user_id (user_id) REFERENCES users(id
 ↪);

```

### 14.11.7 Generated Columns

#### Warning:

This is still an experimental feature. It is **NOT** recommended that you use it in the production environment.

This document introduces the concept and usage of generated columns.

#### 14.11.7.1 Basic concepts

Unlike general columns, the value of the generated column is calculated by the expression in the column definition. When inserting or updating a generated column, you cannot assign a value, but only use `DEFAULT`.

There are two kinds of generated columns: virtual and stored. A virtual generated column occupies no storage and is computed when it is read. A stored generated column is computed when it is written (inserted or updated) and occupies storage. Compared with the virtual generated columns, the stored generated columns have better read performance, but take up more disk space.

You can create an index on a generated column whether it is virtual or stored.

### 14.11.7.2 Usage

One of the main usage of generated columns is to extract data from the JSON data type and indexing the data.

In both MySQL 5.7 and TiDB, columns of type JSON cannot be indexed directly. That is, the following table schema is **not supported**:

```
CREATE TABLE person (
 id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
 name VARCHAR(255) NOT NULL,
 address_info JSON,
 KEY (address_info)
);
```

To index a JSON column, you must extract it as a generated column first.

Using the `city` field in `address_info` as an example, you can create a virtual generated column and add an index for it:

```
CREATE TABLE person (
 id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
 name VARCHAR(255) NOT NULL,
 address_info JSON,
 city VARCHAR(64) AS (JSON_UNQUOTE(JSON_EXTRACT(address_info, '$.city')))
 ↪ , -- virtual generated column
 -- city VARCHAR(64) AS (JSON_UNQUOTE(JSON_EXTRACT(address_info, '$.city
 ↪ '))) VIRTUAL, -- virtual generated column
 -- city VARCHAR(64) AS (JSON_UNQUOTE(JSON_EXTRACT(address_info, '$.city
 ↪ '))) STORED, -- stored generated column
 KEY (city)
);
```

In this table, the `city` column is a **virtual generated column** and has an index. The following query can use the index to speed up the execution:

```
SELECT name, id FROM person WHERE city = 'Beijing';
```

```
EXPLAIN SELECT name, id FROM person WHERE city = 'Beijing';
```

```
+--
↪ -----+-----+-----+-----+-----+
↪
| id | estRows | task | access object |
↪ | | | |
+--
↪ -----+-----+-----+-----+
↪
```

```

| Projection_4 | 10.00 | root |
 ↳ | test.person.name, test.person.id
 ↳
| -IndexLookUp_10 | 10.00 | root |
 ↳
 ↳
| -IndexRangeScan_8(Build) | 10.00 | cop[tikv] | table:person, index:
 ↳ city(city) | range:["Beijing","Beijing"], keep order:false, stats:
 ↳ pseudo |
| -TableRowIDScan_9(Probe) | 10.00 | cop[tikv] | table:person
 ↳ | keep order:false, stats:pseudo |
+---
 ↳ -----+-----+-----+
 ↳

```

From the query execution plan, it can be seen that the city index is used to read the HANDLE of the row that meets the condition `city = 'Beijing'`, and then it uses this HANDLE to read the data of the row.

If no data exists at path `$.city`, `JSON_EXTRACT` returns NULL. If you want to enforce a constraint that city must be NOT NULL, you can define the virtual generated column as follows:

```

CREATE TABLE person (
 id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
 name VARCHAR(255) NOT NULL,
 address_info JSON,
 city VARCHAR(64) AS (JSON_UNQUOTE(JSON_EXTRACT(address_info, '$.city')))
 ↳ NOT NULL,
 KEY (city)
);

```

### 14.11.7.3 Validation of generated columns

Both INSERT and UPDATE statements check virtual column definitions. Rows that do not pass validation return errors:

```

mysql> INSERT INTO person (name, address_info) VALUES ('Morgan',
 ↳ JSON_OBJECT('Country', 'Canada'));
ERROR 1048 (23000): Column 'city' cannot be null

```

### 14.11.7.4 Generated columns index replacement rule

When an expression in a query is strictly equivalent to a generated column with an index, TiDB replaces the expression with the corresponding generated column, so that the optimizer can take that index into account during execution plan construction.

The following example creates a generated column for the expression `a+1` and adds an index. The column type of `a` is `int` and the column type of `a+1` is `bigint`. If the type of the generated column is set to `int`, the replacement will not occur. For type conversion rules, see [Type Conversion of Expression Evaluation](#).

```
create table t(a int);
desc select a+1 from t where a+1=3;
```

```
+--
 ↪ -----+-----+-----+-----+
 ↪
| id | estRows | task | access object | operator info
 ↪ | | | |
+--
 ↪ -----+-----+-----+-----+
 ↪
| Projection_4 | 8000.00 | root | | plus(test.t.a,
 ↪ 1)->Column#3 |
| -TableReader_7 | 8000.00 | root | | data:
 ↪ Selection_6 | | | |
| -Selection_6 | 8000.00 | cop[tikv] | | eq(plus(test.t
 ↪ .a, 1), 3) |
| -TableFullScan_5 | 10000.00 | cop[tikv] | table:t | keep order:
 ↪ false, stats:pseudo |
+--
 ↪ -----+-----+-----+-----+
 ↪
4 rows in set (0.00 sec)
```

```
alter table t add column b bigint as (a+1) virtual;
alter table t add index idx_b(b);
desc select a+1 from t where a+1=3;
```

```
+--
 ↪ -----+-----+-----+-----+
 ↪
| id | estRows | task | access object | operator
 ↪ info | | | |
+--
 ↪ -----+-----+-----+-----+
 ↪
| IndexReader_6 | 10.00 | root | | index:
 ↪ IndexRangeScan_5 | | | |
| -IndexRangeScan_5 | 10.00 | cop[tikv] | table:t, index:idx_b(b) |
 ↪ range:[3,3], keep order:false, stats:pseudo |
```

```
+---
↪
↪
2 rows in set (0.01 sec)
```

**Note:**

If the expression to be replaced and the generated column are both the string type but with different lengths, you can still replace the expression by setting the system variable `tidb_enable_unsafe_substitute` to ON. When configuring this system variable, ensure that the value calculated by the generated column strictly satisfies the definition of the generated column. Otherwise, the data might be truncated due to the difference in length, resulting in an incorrect result. See GitHub issue [#35490](#).

**14.11.7.5 Limitations**

The current limitations of JSON and generated columns are as follows:

- You cannot add a stored generated column through `ALTER TABLE`.
- You can neither convert a stored generated column to a normal column through the `ALTER TABLE` statement nor convert a normal column to a stored generated column.
- You cannot modify the expression of a stored generated column through the `ALTER ↷ TABLE` statement.
- Not all **JSON functions** are supported;
- Currently, the generated column index replacement rule is valid only when the generated column is a virtual generated column. It is not valid on the stored generated column, but the index can still be used by directly using the generated column itself.

— title: SQL Mode summary: Learn SQL mode. —

**14.11.8 SQL Mode**

TiDB servers operate in different SQL modes and apply these modes differently for different clients. SQL mode defines the SQL syntaxes that TiDB supports and the type of data validation check to perform, as described below:

After TiDB is started, modify `SET [ SESSION | GLOBAL ] sql_mode='modes'` to set SQL mode.

Ensure that you have `SUPER` privilege when setting SQL mode at `GLOBAL` level, and your setting at this level only affects the connections established afterwards. Changes to SQL mode at `SESSION` level only affect the current client.

Modes are a series of different modes separated by commas (`,`). You can use the `SELECT` `↔ @sql_mode` statement to check the current SQL mode. The default value of SQL mode: `ONLY_FULL_GROUP_BY, STRICT_TRANS_TABLES, NO_ZERO_IN_DATE, NO_ZERO_DATE, ↔ ERROR_FOR_DIVISION_BY_ZERO, NO_AUTO_CREATE_USER, NO_ENGINE_SUBSTITUTION`.

#### 14.11.8.1 Important `sql_mode` values

- **ANSI:** This mode complies with standard SQL. In this mode, data is checked. If data does not comply with the defined type or length, the data type is adjusted or trimmed and a warning is returned.
- **STRICT\_TRANS\_TABLES:** Strict mode, where data is strictly checked. If any data is incorrect, it cannot be inserted into a table and an error is returned.
- **TRADITIONAL:** In this mode, TiDB behaves like a “traditional” SQL database system. An error instead of a warning is returned when any incorrect value is inserted into a column. Then, the `INSERT` or `UPDATE` statement is immediately stopped.

#### 14.11.8.2 SQL mode table

| Name                         | Description                                                                                                                                                                                                                   |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 14.11.9 Table Attributes

The Table Attributes feature is introduced in TiDB v5.3.0. Using this feature, you can add specific attributes to a table or partition to perform the operations corresponding to the attributes. For example, you can use table attributes to control the Region merge behavior.

Currently, TiDB only supports adding the `merge_option` attribute to a table or partition to control the Region merge behavior. The `merge_option` attribute is only part of how to deal with hotspots. For more information, refer to [Troubleshoot Hotspot Issues](#).

#### Note:

- When you use TiDB Binlog or TiCDC to perform replication or use BR to perform incremental backup, the replication or backup operations skip the DDL statement that sets table attributes. To use table attributes in the downstream or in the backup cluster, you need to manually execute the DDL statement in the downstream or in the backup cluster.

### 14.11.9.1 Usage

The table attribute is in the form of `key=value`. Multiple attributes are separated by commas. In the following examples, `t` is the name of the table to be modified, `p` is the name of the partition to be modified. Items in `[]` are optional.

- Set attributes for a table or partition:

```
ALTER TABLE t [PARTITION p] ATTRIBUTES [=] 'key=value[, key1=value1...]
↪ ';
```

- Reset attributes for a table or partition:

```
ALTER TABLE t [PARTITION p] ATTRIBUTES [=] DEFAULT;
```

- See the attributes of all tables and partitions:

```
SELECT * FROM information_schema.attributes;
```

- See the attribute configured to a table or partition:

```
SELECT * FROM information_schema.attributes WHERE id='schema/t[/p]';
```

- See all tables and partitions that have a specific attribute:

```
SELECT * FROM information_schema.attributes WHERE attributes LIKE '%
↪ key%';
```

### 14.11.9.2 Attribute override rules

The attribute configured to a table takes effect on all partitions of the table. However, there is one exception: If the table and partition are configured with the same attribute but different attribute values, the partition attribute overrides the table attribute. For example, suppose that the table `t` is configured with the `key=value` attribute, and the partition `p` is configured with `key=value1`.

```
ALTER TABLE t ATTRIBUTES [=] 'key=value';
ALTER TABLE t PARTITION p ATTRIBUTES [=] 'key=value1';
```

In this case, `key=value1` is the attribute that actually takes effect on the `p1` partition.

### 14.11.9.3 Control the Region merge behavior using table attributes

### 14.11.9.3.1 User scenarios

If there is a write hotspot or read hotspot, you can use table attributes to control the Region merge behavior. You can first add the `merge_option` attribute to a table or partition and then set its value to `deny`. The two scenarios are as follows.

Write hotspot on a newly created table or partition

If a hotspot issue occurs when data is written to a newly created table or partition, you usually need to split and scatter Regions. However, if there is a certain time interval between the split/scatter operation and writes, these operations do not truly avoid the write hotspot. This is because the split operation performed when the table or partition is created produces empty Regions, so if the time interval exists, the split Regions might be merged. To handle this case, you can add the `merge_option` attribute to the table or partition and set the attribute value to `deny`.

Periodic read hotspot in read-only scenarios

Suppose that in a read-only scenario, you try to reduce the periodic read hotspot that occurs on a table or partition by manually splitting Regions, and you do not want the manually split Regions to be merged after the hotspot issue is resolved. In this case, you can add the `merge_option` attribute to the table or partition and set its value to `deny`.

### 14.11.9.3.2 Usage

- Prevent the Regions of a table from merging:

```
ALTER TABLE t ATTRIBUTES 'merge_option=deny';
```

- Allow merging Regions belonging to a table:

```
ALTER TABLE t ATTRIBUTES 'merge_option=allow';
```

- Reset attributes of a table:

```
ALTER TABLE t ATTRIBUTES DEFAULT;
```

- Prevent the Regions of a partition from merging:

```
ALTER TABLE t PARTITION p ATTRIBUTES 'merge_option=deny';
```

- Allow merging Regions belonging to a partition:

```
ALTER TABLE t PARTITION p ATTRIBUTES 'merge_option=allow';
```

- See all tables or partitions configured the `merge_option` attribution:

```
SELECT * FROM information_schema.attributes WHERE attributes LIKE '%
↪ merge_option%';
```

### 14.11.9.3.3 Attribute override rules

```
ALTER TABLE t ATTRIBUTES 'merge_option=deny';
ALTER TABLE t PARTITION p ATTRIBUTES 'merge_option=allow';
```

When the above two attributes are configured at the same time, the Regions belonging to the partition `p` can actually be merged. When the attribute of the partition is reset, the partition `p` inherits the attribute from the table `t`, and the Regions cannot be merged.

#### Note:

- For a table with partitions, if the `merge_option` attribute is configured at the table level only, even if `merge_option=allow`, the table is still split into multiple Regions by default according to the actual number of partitions. To merge all Regions, you need to **reset the attribute of the table**.
- When using the `merge_option` attribute, you need to pay attention to the PD configuration parameter `split-merge-interval`. Suppose that the `merge_option` attribute is not configured. In this case, if Regions meet conditions, Regions can be merged after the interval specified by `split-merge-interval`. If the `merge_option` attribute is configured, PD decides whether to merge Regions after the specified interval according to the `merge_option` configuration.

#### Note:

- For a table with partitions, if the `merge_option` attribute is configured at the table level only, even if `merge_option=allow`, the table is still split into multiple Regions by default according to the actual number of partitions. To merge all Regions, you need to **reset the attribute of the table**.
- Suppose that the `merge_option` attribute is not configured. In this case, if Regions meet conditions, Regions can be merged after one hour. If the `merge_option` attribute is configured, PD decides whether to merge Regions after one hour according to the `merge_option` configuration.

## 14.11.10 Transactions

### 14.11.10.1 Transactions

TiDB supports distributed transactions using either **pessimistic** or **optimistic** transaction mode. Starting from TiDB 3.0.8, TiDB uses the pessimistic transaction mode by default.

This document introduces commonly used transaction-related statements, explicit and implicit transactions, isolation levels, lazy check for constraints, and transaction sizes.

The common variables include **autocommit**, **tidb\_disable\_txn\_auto\_retry**, **tidb\_retry\_limit**, and **tidb\_txn\_mode**.

#### Note:

The **tidb\_disable\_txn\_auto\_retry** and **tidb\_retry\_limit** variables only apply to optimistic transactions, not to pessimistic transactions.

#### 14.11.10.1.1 Common statements

Starting a transaction

The statements **BEGIN** and **START TRANSACTION** can be used interchangeably to explicitly start a new transaction.

Syntax:

```
BEGIN;
```

```
START TRANSACTION;
```

```
START TRANSACTION WITH CONSISTENT SNAPSHOT;
```

```
START TRANSACTION WITH CAUSAL CONSISTENCY ONLY;
```

If the current session is in the process of a transaction when one of these statements is executed, TiDB automatically commits the current transaction before starting a new transaction.

#### Note:

Unlike MySQL, TiDB takes a snapshot of the current database after executing the statements above. MySQL's **BEGIN** and **START TRANSACTION** take a snapshot after executing the first **SELECT** statement (not **SELECT FOR UPDATE**  $\leftrightarrow$ ) that reads data from InnoDB after a transaction is started. **START**  $\leftrightarrow$  **TRANSACTION WITH CONSISTENT SNAPSHOT** takes a snapshot during the execution of the statement. As a result, **BEGIN**, **START TRANSACTION**, and **START TRANSACTION WITH CONSISTENT SNAPSHOT** are equivalent to **START**  $\leftrightarrow$  **TRANSACTION WITH CONSISTENT SNAPSHOT** in MySQL.

Committing a transaction

The statement **COMMIT** instructs TiDB to apply all changes made in the current transaction.

Syntax:

```
COMMIT;
```

### Tip:

Make sure that your application correctly handles that a **COMMIT** statement could return an error before enabling **optimistic transactions**. If you are unsure of how your application handles this, it is recommended to instead use the default of **pessimistic transactions**.

Rolling back a transaction

The statement **ROLLBACK** rolls back and cancels all changes in the current transaction.

Syntax:

```
ROLLBACK;
```

Transactions are also automatically rolled back if the client connection is aborted or closed.

#### 14.11.10.1.2 Autocommit

As required for MySQL compatibility, TiDB will by default *autocommit* statements immediately following their execution.

For example:

```
mysql> CREATE TABLE t1 (
-> id INT NOT NULL PRIMARY KEY auto_increment,
-> pad1 VARCHAR(100)
->);
Query OK, 0 rows affected (0.09 sec)
```

```
mysql> SELECT @@autocommit;
```

```
+-----+
| @@autocommit |
+-----+
| 1 |
+-----+
```

```
1 row in set (0.00 sec)

mysql> INSERT INTO t1 VALUES (1, 'test');
Query OK, 1 row affected (0.02 sec)

mysql> ROLLBACK;
Query OK, 0 rows affected (0.01 sec)

mysql> SELECT * FROM t1;
+----+-----+
| id | pad1 |
+----+-----+
| 1 | test |
+----+-----+
1 row in set (0.00 sec)
```

In the above example, the ROLLBACK statement has no effect. This is because the INSERT  $\leftrightarrow$  statement is executed in autocommit. That is, it was the equivalent of the following single-statement transaction:

```
START TRANSACTION;
INSERT INTO t1 VALUES (1, 'test');
COMMIT;
```

Autocommit will not apply if a transaction has been explicitly started. In the following example, the ROLLBACK statement successfully reverts the INSERT statement:

```
mysql> CREATE TABLE t2 (
 -> id INT NOT NULL PRIMARY KEY auto_increment,
 -> pad1 VARCHAR(100)
 ->);
Query OK, 0 rows affected (0.10 sec)

mysql> SELECT @@autocommit;
+-----+
| @@autocommit |
+-----+
| 1 |
+-----+
1 row in set (0.00 sec)

mysql> START TRANSACTION;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t2 VALUES (1, 'test');
Query OK, 1 row affected (0.02 sec)
```

```
mysql> ROLLBACK;
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT * FROM t2;
Empty set (0.00 sec)
```

The `autocommit` system variable **can be changed** on either a global or session basis.

For example:

```
SET autocommit = 0;
```

```
SET GLOBAL autocommit = 0;
```

### 14.11.10.1.3 Explicit and implicit transaction

#### Note:

Some statements are committed implicitly. For example, executing `[BEGIN|↔ START TRANSACTION]` implicitly commits the last transaction and starts a new transaction. This behavior is required for MySQL compatibility. Refer to [implicit commit](#) for more details.

TiDB supports explicit transactions (use `[BEGIN|START TRANSACTION]` and `COMMIT` to define the start and end of the transaction) and implicit transactions (`SET autocommit = 1`).

If you set the value of `autocommit` to 1 and start a new transaction through the `[BEGIN|↔ START TRANSACTION]` statement, the `autocommit` is disabled before `COMMIT` or `ROLLBACK` which makes the transaction becomes explicit.

For DDL statements, the transaction is committed automatically and does not support rollback. If you run the DDL statement while the current session is in the process of a transaction, the DDL statement is executed after the current transaction is committed.

### 14.11.10.1.4 Lazy check of constraints

By default, optimistic transactions will not check the **primary key** or **unique constraints** when a DML statement is executed. These checks are instead performed on transaction `COMMIT`.

For example:

```
CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY);
INSERT INTO t1 VALUES (1);
BEGIN OPTIMISTIC;
INSERT INTO t1 VALUES (1); -- MySQL returns an error; TiDB returns success
↳ .
INSERT INTO t1 VALUES (2);
COMMIT; -- It is successfully committed in MySQL; TiDB returns an error
↳ and the transaction rolls back.
SELECT * FROM t1; -- MySQL returns 1 2; TiDB returns 1.
```

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.10 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.02 sec)

mysql> BEGIN OPTIMISTIC;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (1); -- MySQL returns an error; TiDB returns
↳ success.
Query OK, 1 row affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (2);
Query OK, 1 row affected (0.00 sec)

mysql> COMMIT; -- It is successfully committed in MySQL; TiDB returns an
↳ error and the transaction rolls back.
ERROR 1062 (23000): Duplicate entry '1' for key 't1.PRIMARY'
mysql> SELECT * FROM t1; -- MySQL returns 1 2; TiDB returns 1.
+-----+
| id |
+-----+
| 1 |
+-----+
1 row in set (0.01 sec)
```

The lazy check optimization improves performance by batching constraint checks and reducing network communication. The behavior can be disabled by setting `tidb_constraint_check_in_place=ON`.

**Note:**

- This optimization only applies to optimistic transactions.
- This optimization does not take effect for INSERT IGNORE and INSERT  
↳ ON DUPLICATE KEY UPDATE, but only for normal INSERT statements.

#### 14.11.10.1.5 Statement rollback

TiDB supports atomic rollback after statement execution failure. If a statement results in an error, the changes it made will not take effect. The transaction will remain open, and additional changes can be made before issuing a COMMIT or ROLLBACK statement.

```
CREATE TABLE test (id INT NOT NULL PRIMARY KEY);
BEGIN;
INSERT INTO test VALUES (1);
INSERT INTO tset VALUES (2); -- Statement does not take effect because "
↳ test" is misspelled as "tset".
INSERT INTO test VALUES (1),(2); -- Entire statement does not take effect
↳ because it violates a PRIMARY KEY constraint
INSERT INTO test VALUES (3);
COMMIT;
SELECT * FROM test;
```

```
mysql> CREATE TABLE test (id INT NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.09 sec)

mysql> BEGIN;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO test VALUES (1);
Query OK, 1 row affected (0.02 sec)

mysql> INSERT INTO tset VALUES (2); -- Statement does not take effect
↳ because "test" is misspelled as "tset".
ERROR 1146 (42S02): Table 'test.tset' doesn't exist
mysql> INSERT INTO test VALUES (1),(2); -- Entire statement does not take
↳ effect because it violates a PRIMARY KEY constraint
ERROR 1062 (23000): Duplicate entry '1' for key 'test.PRIMARY'
mysql> INSERT INTO test VALUES (3);
Query OK, 1 row affected (0.00 sec)

mysql> COMMIT;
Query OK, 0 rows affected (0.01 sec)

mysql> SELECT * FROM test;
```

```
+-----+
| id |
+-----+
| 1 |
| 3 |
+-----+
2 rows in set (0.00 sec)
```

In the above example, the transaction remains open after the failed `INSERT` statements. The final insert statement is then successful and changes are committed.

#### 14.11.10.1.6 Transaction size limit

Due to the limitations of the underlying storage engine, TiDB requires a single row to be no more than 6 MB. All columns of a row are converted to bytes according to their data types and summed up to estimate the size of a single row.

TiDB supports both optimistic and pessimistic transactions, and optimistic transactions are the basis for pessimistic transactions. Because optimistic transactions first cache the changes in private memory, TiDB limits the size of a single transaction.

By default, TiDB sets the total size of a single transaction to no more than 100 MB. You can modify this default value via `txn-total-size-limit` in the configuration file. The maximum value of `txn-total-size-limit` is 1 TB. The individual transaction size limit also depends on the size of remaining memory available in the server. This is because when a transaction is executed, the memory usage of the TiDB process is scaled up comparing with the transaction size, up to two to three times or more of the transaction size.

TiDB previously limited the total number of key-value pairs for a single transaction to 300,000. This restriction was removed in TiDB v4.0.

#### Note:

Usually, TiDB Binlog is enabled to replicate data to the downstream. In some scenarios, message middleware such as Kafka is used to consume binlogs that are replicated to the downstream.

Taking Kafka as an example, the upper limit of Kafka's single message processing capability is 1 GB. Therefore, when `txn-total-size-limit` is set to more than 1 GB, it might happen that the transaction is successfully executed in TiDB, but the downstream Kafka reports an error. To avoid this situation, you need to decide the actual value of `txn-total-size-limit` according to the limit of the end consumer. For example, if Kafka is used downstream, `txn-total-size-limit` must not exceed 1 GB.

### 14.11.10.1.7 Causal consistency

**Note:**

Transactions with causal consistency take effect only when the async commit and one-phase commit features are enabled. For details of the two features, see `tidb_enable_async_commit` and `tidb_enable_1pc`.

TiDB supports enabling causal consistency for transactions. Transactions with causal consistency, when committed, do not need to get timestamp from PD and have lower commit latency. The syntax to enable causal consistency is as follows:

```
START TRANSACTION WITH CAUSAL CONSISTENCY ONLY;
```

By default, TiDB guarantees linear consistency. In the case of linear consistency, if transaction 2 is committed after transaction 1 is committed, logically, transaction 2 should occur after transaction 1. Causal consistency is weaker than linear consistency. In the case of causal consistency, the commit order and occurrence order of two transactions can be guaranteed consistent only when the data locked or written by transaction 1 and transaction 2 have an intersection, which means that the two transactions have a causal relationship known to the database. Currently, TiDB does not support passing in external causal relationship.

Two transactions with causal consistency enabled have the following characteristics:

- Transactions with potential causal relationship have the consistent logical order and physical commit order
- Transactions with no causal relationship do not guarantee consistent logical order and physical commit order
- Reads without lock do not create causal relationship

Transactions with potential causal relationship have the consistent logical order and physical commit order

Assume that both transaction 1 and transaction 2 adopt causal consistency and have the following statements executed:

| Transaction<br>1 | Transaction<br>2 |
|------------------|------------------|
| START            | START            |
| TRANS-           | TRANS-           |
| AC-              | AC-              |
| TION             | TION             |
| WITH             | WITH             |
| CAUSAL           | CAUSAL           |
| CON-             | CON-             |
| SIS-             | SIS-             |
| TENCY            | TENCY            |
| ONLY             | ONLY             |
| x = SE-          |                  |
| LECT v           |                  |
| FROM             |                  |
| t                |                  |
| WHERE            |                  |
| id = 1           |                  |
| FOR              |                  |
| UP-              |                  |
| DATE             |                  |
| UPDATE           |                  |
| t set v          |                  |
| =                |                  |
| \$(x + 1)        |                  |
| WHERE            |                  |
| id = 2           |                  |
| COMMIT           |                  |
|                  | UPDATE           |
|                  | t SET v          |
|                  | = 2              |
|                  | WHERE            |
|                  | id = 1           |
|                  | COMMIT           |

In the example above, transaction 1 locks the `id = 1` record and transaction 2 modifies the `id = 1` record. Therefore, transaction 1 and transaction 2 have a potential causal relationship. Even with the causal consistency enabled, as long as transaction 2 is committed after transaction 1 is successfully committed, logically, transaction 2 must occur after transaction 1. Therefore, it is impossible that a transaction reads transaction 2's modification on the `id = 1` record without reading transaction 1's modification on the `id = 2` record.

Transactions with no causal relationship do not guarantee consistent logical order and physical commit order

Assume that the initial values of `id = 1` and `id = 2` are both 0. Assume that both transaction 1 and transaction 2 adopt causal consistency and have the following statements executed:

| Transaction<br>1 | Transaction<br>2 | Transaction<br>3 |
|------------------|------------------|------------------|
| START            | START            |                  |
| TRANS-           | TRANS-           |                  |
| AC-              | AC-              |                  |
| TION             | TION             |                  |

| ONLY             | ONLY             |                  |
| UPDATE           |                  |                  |
| t set v          |                  |                  |
| = 3              |                  |                  |
| WHERE            |                  |                  |
| id = 2           |                  |                  |
|                  | UPDATE           |                  |
|                  | t SET v          |                  |
|                  | = 2              |                  |
|                  | WHERE            |                  |
|                  | id = 1           |                  |
|                  |                  | BEGIN            |
| COMMIT           |                  |                  |
|                  | COMMIT           |                  |
|                  |                  | SELECT           |
|                  |                  | v                |
|                  |                  | FROM             |
|                  |                  | t                |
|                  |                  | WHERE            |
|                  |                  | id IN            |
|                  |                  | (1, 2)           |

In the example above, transaction 1 does not read the `id = 1` record, so transaction 1 and transaction 2 have no causal relationship known to the database. With causal consistency enabled for the transactions, even if transaction 2 is committed after transaction 1 is committed in terms of physical time order, TiDB does not guarantee that transaction 2 logically occurs after transaction 1.

If transaction 3 begins before transaction 1 is committed, and if transaction 3 reads the `id = 1` and `id = 2` records after transaction 2 is committed, transaction 3 might read the

value of `id = 1` to be 2 but the value of `id = 2` to be 0.

Reads without lock do not create causal relationship

Assume that both transaction 1 and transaction 2 adopt causal consistency and have the following statements executed:

| Transaction<br>1                                                                           | Transaction<br>2                                                         |
|--------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| START                                                                                      | START                                                                    |
| TRANS-<br>AC-<br>TION<br>WITH<br>CAUSAL<br>CON-<br>SIS-<br>TENCY<br>ONLY                   | TRANS-<br>AC-<br>TION<br>WITH<br>CAUSAL<br>CON-<br>SIS-<br>TENCY<br>ONLY |
|                                                                                            | UPDATE<br>t SET v<br>= 2<br>WHERE<br>id = 1                              |
| SELECT<br>v<br>FROM<br>t<br>WHERE<br>id = 1<br>UPDATE<br>t set v<br>= 3<br>WHERE<br>id = 2 |                                                                          |
|                                                                                            | COMMIT                                                                   |
| COMMIT                                                                                     |                                                                          |

In the example above, reads without lock do not create causal relationship. Transaction 1 and transaction 2 have created write skew. In this case, it would have been unreasonable if the two transactions still had causal relationship. Therefore, the two transactions with causal consistency enabled have no definite logical order.

#### 14.11.10.2 TiDB Transaction Isolation Levels

Transaction isolation is one of the foundations of database transaction processing. Isolation is one of the four key properties of a transaction (commonly referred as **ACID**).

The SQL-92 standard defines four levels of transaction isolation: Read Uncommitted, Read Committed, Repeatable Read, and Serializable. See the following table for details:

| Isolation Level  | Dirty Write  | Dirty Read   | Fuzzy Read   | Phantom      |
|------------------|--------------|--------------|--------------|--------------|
| READ UNCOMMITTED | Not Possible | Possible     | Possible     | Possible     |
| READ COMMITTED   | Not Possible | Not possible | Possible     | Possible     |
| REPEATABLE READ  | Not Possible | Not possible | Not possible | Possible     |
| SERIALIZABLE     | Not Possible | Not possible | Not possible | Not possible |

TiDB implements Snapshot Isolation (SI) consistency, which it advertises as **REPEATABLE**  $\leftrightarrow$  **-READ** for compatibility with MySQL. This differs from the **ANSI Repeatable Read isolation level** and the **MySQL Repeatable Read level**.

#### Note:

Starting from TiDB v3.0, the automatic retry of transactions is disabled by default. It is not recommended to enable the automatic retry because it might **break the transaction isolation level**. Refer to **Transaction Retry** for details.

Starting from TiDB v3.0.8, newly created TiDB clusters use the **pessimistic transaction mode** by default. The current read (for update read) is **non-repeatable read**. Refer to **pessimistic transaction mode** for details.

#### 14.11.10.2.1 Repeatable Read isolation level

The Repeatable Read isolation level only sees data committed before the transaction begins, and it never sees either uncommitted data or changes committed during transaction execution by concurrent transactions. However, the transaction statement does see the effects of previous updates executed within its own transaction, even though they are not yet committed.

For transactions running on different nodes, the start and commit order depends on the order that the timestamp is obtained from PD.

Transactions of the Repeatable Read isolation level cannot concurrently update a same row. When committing, if the transaction finds that the row has been updated by another transaction after it starts, then the transaction rolls back. For example:

```
create table t1(id int);
insert into t1 values(0);
```

|                                                                                |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>start transaction; select * from t1; update t1 set id=id+1; commit;</pre> | <pre>           </pre> | <pre>start transaction; select * from t1; update t1 set id=id+1; -- In commit; -- The transaction commit</pre> <p>↪ <i>pessimistic transactions, the `update` statement executed later</i></p> <p>↪ <i>waits for the lock until the transaction holding the lock commits or</i></p> <p>↪ <i>rolls back and releases the row lock.</i></p> <p>↪ <i>fails and rolls back. Pessimistic</i></p> <p>↪ <i>transactions can commit successfully.</i></p> |
|--------------------------------------------------------------------------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Difference between TiDB and ANSI Repeatable Read

The Repeatable Read isolation level in TiDB differs from ANSI Repeatable Read isolation level, though they sharing the same name. According to the standard described in the [A Critique of ANSI SQL Isolation Levels](#) paper, TiDB implements the Snapshot Isolation level. This isolation level does not allow strict phantoms (A3) but allows broad phantoms (P3) and write skews. In contrast, the ANSI Repeatable Read isolation level allows phantom reads but does not allow write skews.

### Difference between TiDB and MySQL Repeatable Read

The Repeatable Read isolation level in TiDB differs from that in MySQL. The MySQL Repeatable Read isolation level does not check whether the current version is visible when updating, which means it can continue to update even if the row has been updated after the transaction starts. In contrast, if the row has been updated after the transaction starts, the TiDB optimistic transaction is rolled back and retried. Transaction retries in TiDB's optimistic concurrency control might fail, leading to a final failure of the transaction, while in TiDB's pessimistic concurrency control and MySQL, the updating transaction can be successful.

#### 14.11.10.2.2 Read Committed isolation level

Starting from TiDB v4.0.0-beta, TiDB supports the Read Committed isolation level.

For historical reasons, the Read Committed isolation level of current mainstream databases is essentially the [Consistent Read isolation level defined by Oracle](#). In order to adapt to this situation, the Read Committed isolation level in TiDB pessimistic transactions is also a consistent read behavior in essence.

#### Note:

The Read Committed isolation level only takes effect in the **pessimistic transaction mode**. In the **optimistic transaction mode**, setting the transaction

isolation level to `Read Committed` does not take effect and transactions still use the `Repeatable Read` isolation level.

Starting from v6.0.0, TiDB supports using the `tidb_rc_read_check_ts` system variable to optimize the timestamp acquisition in scenarios where read-write conflicts are rare. After enabling this variable, TiDB will try to use the previous valid timestamp to read data when `SELECT` is executed. The initial value of this variable is the `start_ts` of the transaction.

- If TiDB does not encounter any data update during the read process, it returns the result to the client and the `SELECT` statement is successfully executed.
- If TiDB encounters data update during the read process:
  - If TiDB has not yet sent the result to the client, TiDB tries to acquire a new timestamp and retry this statement.
  - If TiDB has already sent partial data to the client, TiDB reports an error to the client. The amount of data sent to the client each time is controlled by `tidb_init_chunk_size` and `tidb_max_chunk_size`.

In scenarios where the `READ-COMMITTED` isolation level is used, the `SELECT` statements are many, and read-write conflicts are rare, enabling this variable can avoid the latency and cost of getting the global timestamp.

Since v6.3.0, TiDB supports optimizing the acquisition of timestamps by enabling the system variable `tidb_rc_write_check_ts` in scenarios where point-write conflicts are few. After enabling this variable, during the execution of point-write statements, TiDB will try to use valid timestamps of the current transaction to read and lock data. TiDB will read data in the same way when `tidb_rc_read_check_ts` is enabled.

Currently, the applicable types of point-write statements include `UPDATE`, `DELETE`, and `SELECT . . . . . FOR UPDATE`. A point-write statement refers to a write statement that uses the primary key or unique key as a filter condition and the final execution operator contains `POINT-GET`. Currently, the three types of point-write statements have these in common: they first perform a point query based on the key value. If the key exists, they lock the key. If the key does not exist, they return an empty set.

- If the entire read process of a point-write statement does not encounter an updated data version, TiDB continues to use the timestamp of the current transaction to lock the data.
  - If a write conflict occurs due to an old timestamp during the lock acquisition process, TiDB retries the lock acquisition process by obtaining the latest global timestamp.
  - If no write conflicts or other errors occur during the lock acquisition process, the lock is acquired successfully.

- If an updated data version is encountered during the read process, TiDB tries to acquire a new timestamp and retries this statement.

In transactions with many point-write statements but a few point-write conflicts in the `READ-COMMITTED` isolation level, enabling this variable can avoid the latency and overhead of getting the global timestamp.

#### 14.11.10.2.3 Difference between TiDB and MySQL Read Committed

The MySQL Read Committed isolation level is in line with the Consistent Read features in most cases. There are also exceptions, such as [semi-consistent read](#). This special behavior is not supported in TiDB.

#### 14.11.10.3 TiDB Optimistic Transaction Model

With optimistic transactions, conflicting changes are detected as part of a transaction commit. This helps improve the performance when concurrent transactions are infrequently modifying the same rows, because the process of acquiring row locks can be skipped. In the case that concurrent transactions frequently modify the same rows (a conflict), optimistic transactions may perform worse than [Pessimistic Transactions](#).

Before enabling optimistic transactions, make sure that your application correctly handles that a `COMMIT` statement could return errors. If you are unsure of how your application handles this, it is recommended to instead use Pessimistic Transactions.

##### Note:

Starting from v3.0.8, TiDB uses the [pessimistic transaction mode](#) by default. However, this does not affect your existing cluster if you upgrade it from v3.0.7 or earlier to v3.0.8 or later. In other words, **only newly created clusters default to using the pessimistic transaction mode.**

#### 14.11.10.3.1 Principles of optimistic transactions

To support distributed transactions, TiDB adopts two-phase commit (2PC) in optimistic transactions. The procedure is as follows:

Figure 479: 2PC in TiDB

1. The client begins a transaction.

TiDB gets a timestamp (monotonically increasing in time and globally unique) from PD as the unique transaction ID of the current transaction, which is called `start_ts`. TiDB implements multi-version concurrency control, so `start_ts` also serves as the version of the database snapshot obtained by this transaction. This means that the transaction can only read the data from the database at `start_ts`.

2. The client issues a read request.

1. TiDB receives routing information (how data is distributed among TiKV nodes) from PD.
2. TiDB receives the data of the `start_ts` version from TiKV.
3. The client issues a write request.  
TiDB checks whether the written data satisfies constraints (to ensure the data types are correct, the NOT NULL constraint is met). **Valid data is stored in the private memory of this transaction in TiDB.**
4. The client issues a commit request.
5. TiDB begins 2PC, and persists data in store while guaranteeing the atomicity of transactions.
  1. TiDB selects a Primary Key from the data to be written.
  2. TiDB receives the information of Region distribution from PD, and groups all keys by Region accordingly.
  3. TiDB sends prewrite requests to all TiKV nodes involved. Then, TiKV checks whether there are conflict or expired versions. Valid data is locked.
  4. TiDB receives all responses in the prewrite phase and the prewrite is successful.
  5. TiDB receives a commit version number from PD and marks it as `commit_ts`.
  6. TiDB initiates the second commit to the TiKV node where Primary Key is located. TiKV checks the data, and cleans the locks left in the prewrite phase.
  7. TiDB receives the message that reports the second phase is successfully finished.
6. TiDB returns a message to inform the client that the transaction is successfully committed.
7. TiDB asynchronously cleans the locks left in this transaction.

#### 14.11.10.3.2 Advantages and disadvantages

From the process of transactions in TiDB above, it is clear that TiDB transactions have the following advantages:

- Simple to understand
- Implement cross-node transaction based on single-row transaction
- Decentralized lock management

However, TiDB transactions also have the following disadvantages:

- Transaction latency due to 2PC
- In need of a centralized timestamp allocation service
- OOM (out of memory) when extensive data is written in the memory

### 14.11.10.3.3 Transaction retries

In the optimistic transaction model, transactions might fail to be committed because of write–write conflict in heavy contention scenarios. TiDB uses optimistic concurrency control by default, whereas MySQL applies pessimistic concurrency control. This means that MySQL adds locks during the execution of write-type SQL statements, and its Repeatable Read isolation level allows for current reads, so commits generally do not encounter exceptions. To lower the difficulty of adapting applications, TiDB provides an internal retry mechanism.

#### Automatic retry

If a write-write conflict occurs during the transaction commit, TiDB automatically retries the SQL statement that includes write operations. You can enable the automatic retry by setting `tidb_disable_txn_auto_retry` to `OFF` and set the retry limit by configuring `tidb_retry_limit`:

```
Whether to disable automatic retry. ("on" by default)
tidb_disable_txn_auto_retry = OFF
Set the maximum number of the retries. ("10" by default)
When "tidb_retry_limit = 0", automatic retry is completely disabled.
tidb_retry_limit = 10
```

You can enable the automatic retry in either session level or global level:

#### 1. Session level:

```
SET tidb_disable_txn_auto_retry = OFF;
```

```
SET tidb_retry_limit = 10;
```

#### 2. Global level:

```
SET GLOBAL tidb_disable_txn_auto_retry = OFF;
```

```
SET GLOBAL tidb_retry_limit = 10;
```

#### Note:

The `tidb_retry_limit` variable decides the maximum number of retries. When this variable is set to 0, none of the transactions automatically retries, including the implicit single statement transactions that are automatically committed. This is the way to completely disable the automatic retry mechanism in TiDB. After the automatic retry is disabled, all conflicting transactions report failures (including the `try again later` message) to the application layer in the fastest way.

## Limits of retry

By default, TiDB will not retry transactions because this might lead to lost updates and damaged **REPEATABLE READ isolation**.

The reason can be observed from the procedures of retry:

1. Allocate a new timestamp and mark it as `start_ts`.
2. Retry the SQL statements that contain write operations.
3. Implement the two-phase commit.

In Step 2, TiDB only retries SQL statements that contain write operations. However, during retrying, TiDB receives a new version number to mark the beginning of the transaction. This means that TiDB retries SQL statements with the data in the new `start_ts` version. In this case, if the transaction updates data using other query results, the results might be inconsistent because the **REPEATABLE READ isolation** is violated.

If your application can tolerate lost updates, and does not require **REPEATABLE READ isolation consistency**, you can enable this feature by setting `tidb_disable_txn_auto_retry`  $\leftrightarrow$  = **OFF**.

### 14.11.10.3.4 Conflict detection

As a distributed database, TiDB performs in-memory conflict detection in the TiKV layer, mainly in the prewrite phase. TiDB instances are stateless and unaware of each other, which means they cannot know whether their writes result in conflicts across the cluster. Therefore, conflict detection is performed in the TiKV layer.

The configuration is as follows:

```
Controls the number of slots. ("2048000" by default)
scheduler-concurrency = 2048000
```

In addition, TiKV supports monitoring the time spent on waiting latches in the scheduler.

Figure 480: Scheduler latch wait duration

When `Scheduler latch wait duration` is high and there are no slow writes, it can be safely concluded that there are many write conflicts at this time.

#### 14.11.10.4 TiDB Pessimistic Transaction Mode

To make the usage of TiDB closer to traditional databases and reduce the cost of migration, starting from v3.0, TiDB supports the pessimistic transaction mode on top of the optimistic transaction model. This document describes the features of the TiDB pessimistic transaction mode.

##### Note:

Starting from v3.0.8, newly created TiDB clusters use the pessimistic transaction mode by default. However, this does not affect your existing cluster if you upgrade it from v3.0.7 or earlier to v3.0.8 or later. In other words, **only newly created clusters default to using the pessimistic transaction mode.**

##### 14.11.10.4.1 Switch transaction mode

You can set the transaction mode by configuring the `tidb_txn_mode` system variable. The following command sets all explicit transactions (that is, non-autocommit transactions) executed by newly created sessions in the cluster to the pessimistic transaction mode:

```
SET GLOBAL tidb_txn_mode = 'pessimistic';
```

You can also explicitly enable the pessimistic transaction mode by executing the following SQL statements:

```
BEGIN PESSIMISTIC;
```

```
BEGIN /*T! PESSIMISTIC */;
```

The `BEGIN PESSIMISTIC;` and `BEGIN OPTIMISTIC;` statements take precedence over the `tidb_txn_mode` system variable. Transactions started with these two statements ignore the system variable and support using both the pessimistic and optimistic transaction modes.

##### 14.11.10.4.2 Behaviors

Pessimistic transactions in TiDB behave similarly to those in MySQL. See the minor differences in [Difference with MySQL InnoDB](#).

- For pessimistic transactions, TiDB introduces snapshot read and current read.

- Snapshot read: it is an unlocked read that reads a version committed before the transaction starts. The read in the `SELECT` statement is a snapshot read.
- Current read: it is a locked read that reads the latest committed version. The read in the `UPDATE`, `DELETE`, `INSERT`, or `SELECT FOR UPDATE` statement is a current read.

The following examples provide a detailed description of snapshot read and current read.

| Session                 | Session                | Session |
|-------------------------|------------------------|---------|
| 1                       | 2                      | 3       |
| <code>CREATE</code>     |                        |         |
| <code>TABLE t</code>    |                        |         |
| <code>(a</code>         |                        |         |
| <code>INT);</code>      |                        |         |
| <code>INSERT</code>     |                        |         |
| <code>INTO</code>       |                        |         |
| <code>t</code>          |                        |         |
| <code>VALUES(1);</code> |                        |         |
| <code>BEGIN</code>      |                        |         |
| <code>PES-</code>       |                        |         |

a=1.

- When you execute UPDATE, DELETE or INSERT statements, the **latest** committed data is read, data is modified, and a pessimistic lock is applied on the modified rows.
- For SELECT FOR UPDATE statements, a pessimistic lock is applied on the latest version of the committed data, instead of on the modified rows.
- Locks will be released when the transaction is committed or rolled back. Other transactions attempting to modify the data are blocked and have to wait for the lock to be released. Transactions attempting to *read* the data are not blocked, because TiDB uses multi-version concurrency control (MVCC).
- You can set the system variable `tidb_constraint_check_in_place_pessimistic` to control whether to skip the pessimistic locks with unique constraint checks. See [con-](#)

[straints](#) for details.

- If several transactions are trying to acquire each other's respective locks, a deadlock will occur. This is automatically detected, and one of the transactions will randomly be terminated with a MySQL-compatible error code 1213 returned.
- Transactions will wait up to `innodb_lock_wait_timeout` seconds (default: 50) to acquire new locks. When this timeout is reached, a MySQL-compatible error code 1205 is returned. If multiple transactions are waiting for the same lock, the order of priority is approximately based on the `start ts` of the transaction.
- TiDB supports both the optimistic transaction mode and pessimistic transaction mode in the same cluster. You can specify either mode for transaction execution.
- TiDB supports the `FOR UPDATE NOWAIT` syntax and does not block and wait for locks to be released. Instead, a MySQL-compatible error code 3572 is returned.
- If the `Point Get` and `Batch Point Get` operators do not read data, they still lock the given primary key or unique key, which blocks other transactions from locking or writing data to the same primary key or unique key.
- TiDB supports the `FOR UPDATE OF TABLES` syntax. For a statement that joins multiple tables, TiDB only applies pessimistic locks on the rows that are associated with the tables in `OF TABLES`.

#### 14.11.10.4.3 Difference with MySQL InnoDB

1. When TiDB executes DML or `SELECT FOR UPDATE` statements that use range in the `WHERE` clause, concurrent DML statements within the range are not blocked.

For example:

```
CREATE TABLE t1 (
 id INT NOT NULL PRIMARY KEY,
 pad1 VARCHAR(100)
);
INSERT INTO t1 (id) VALUES (1),(5),(10);
```

```
BEGIN /*T! PESSIMISTIC */;
SELECT * FROM t1 WHERE id BETWEEN 1 AND 10 FOR UPDATE;
```

```
BEGIN /*T! PESSIMISTIC */;
INSERT INTO t1 (id) VALUES (6); -- blocks only in MySQL
UPDATE t1 SET pad1='new value' WHERE id = 5; -- blocks waiting in both
↳ MySQL and TiDB
```

This behavior is because TiDB does not currently support *gap locking*.

2. TiDB does not support `SELECT LOCK IN SHARE MODE`.

When `SELECT LOCK IN SHARE MODE` is executed, it has the same effect as that without the lock, so the read or write operation of other transactions is not blocked.

3. DDL may result in failure of the pessimistic transaction commit.

When DDL is executed in MySQL, it might be blocked by the transaction that is being executed. However, in this scenario, the DDL operation is not blocked in TiDB, which leads to failure of the pessimistic transaction commit: `ERROR 1105 (HY000) ↪ : Information schema is changed. [try again later]`. TiDB executes the `TRUNCATE TABLE` statement during the transaction execution, which might result in the `table doesn't exist` error.

4. After executing `START TRANSACTION WITH CONSISTENT SNAPSHOT`, MySQL can still read the tables that are created later in other transactions, while TiDB cannot.

5. The autocommit transactions prefer the optimistic locking.

When using the pessimistic model, the autocommit transactions first try to commit the statement using the optimistic model that has less overhead. If a write conflict occurs, the pessimistic model is used for transaction retry. Therefore, if `tidb_retry_limit` is set to 0, the autocommit transaction still reports the `Write Conflict` error when a write conflict occurs.

The autocommit `SELECT FOR UPDATE` statement does not wait for lock.

6. The data read by `EMBEDDED SELECT` in the statement is not locked.

7. Open transactions in TiDB do not block garbage collection (GC). By default, this limits the maximum execution time of pessimistic transactions to 1 hour. You can modify this limit by editing `max-txn-ttl` under `[performance]` in the TiDB configuration file.

#### 14.11.10.4.4 Isolation level

TiDB supports the following two isolation levels in the pessimistic transaction mode:

- **Repeatable Read** by default, which is the same as MySQL.

##### Note:

In this isolation level, DML operations are performed based on the latest committed data. The behavior is the same as MySQL, but differs from the optimistic transaction mode in TiDB. See [Difference between TiDB and MySQL Repeatable Read](#).

- **Read Committed**. You can set this isolation level using the `SET TRANSACTION` statement.

#### 14.11.10.4.5 Pessimistic transaction commit process

In the transaction commit process, pessimistic transactions and optimistic transactions have the same logic. Both transactions adopt the two-phase commit (2PC) mode. The important adaptation of pessimistic transactions is DML execution.

Figure 481: TiDB pessimistic transaction commit process

The pessimistic transaction adds an **Acquire Pessimistic Lock** phase before 2PC. This phase includes the following steps:

1. (Same as the optimistic transaction mode) TiDB receives the `begin` request from the client, and the current timestamp is this transaction's `start_ts`.
2. When the TiDB server receives a writing request from the client, the TiDB server initiates a pessimistic lock request to the TiKV server, and the lock is persisted to the TiKV server.
3. (Same as the optimistic transaction mode) When the client sends the commit request, TiDB starts to perform the two-phase commit similar to the optimistic transaction mode.

### Pessimistic Transaction in TiDB

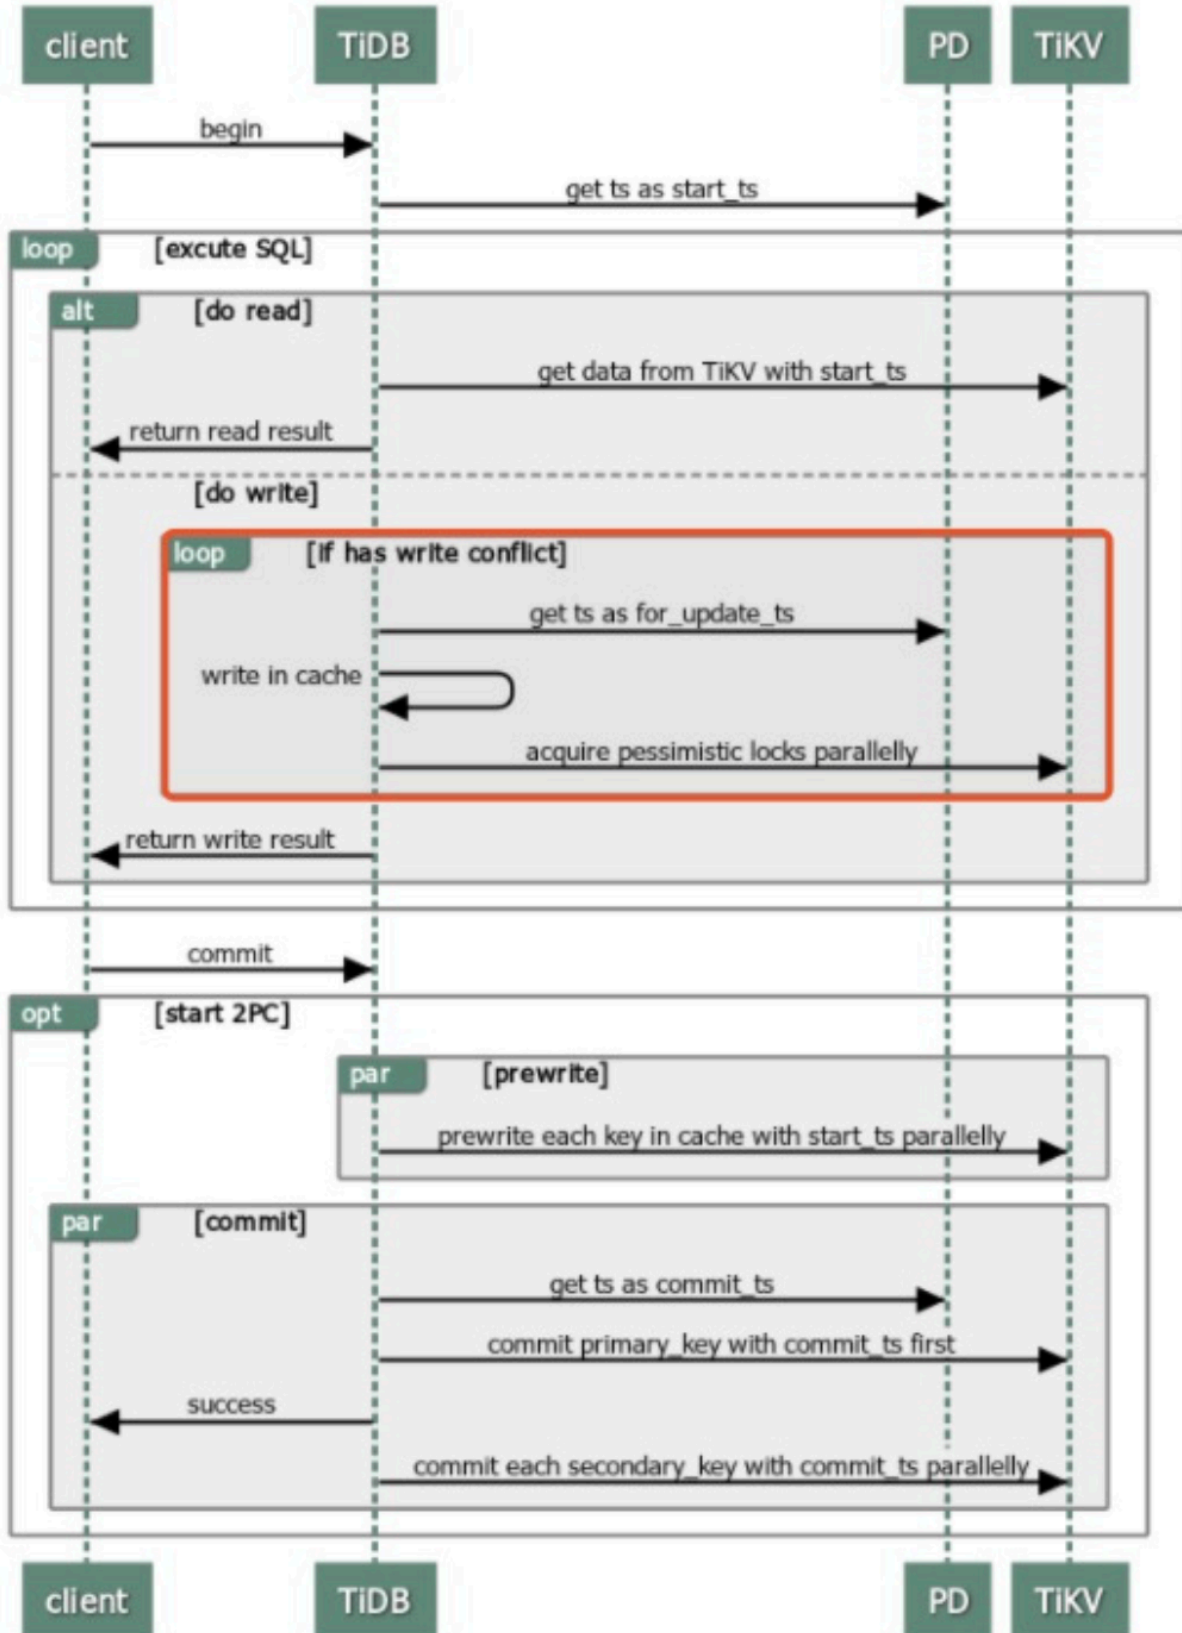

Figure 482: Pessimistic transactions in TiDB

#### 14.11.10.4.6 Pipelined locking process

Adding a pessimistic lock requires writing data into TiKV. The response of successfully adding a lock can only be returned to TiDB after commit and apply through Raft. Therefore, compared with optimistic transactions, the pessimistic transaction mode inevitably has higher latency.

To reduce the overhead of locking, TiKV implements the pipelined locking process: when the data meets the requirements for locking, TiKV immediately notifies TiDB to execute subsequent requests and writes into the pessimistic lock asynchronously. This process reduces most latency and significantly improves the performance of pessimistic transactions. However, when network partition occurs in TiKV or a TiKV node is down, the asynchronous write into the pessimistic lock might fail and affect the following aspects:

- Other transactions that modify the same data cannot be blocked. If the application logic relies on locking or lock waiting mechanisms, the correctness of the application logic is affected.
- There is a low probability that the transaction commit fails, but it does not affect the correctness of the transactions.

If the application logic relies on the locking or lock waiting mechanisms, or if you want to guarantee as much as possible the success rate of transaction commits even in the case of TiKV cluster anomalies, you should disable the pipelined locking feature.

## pipelined pessimistic lock

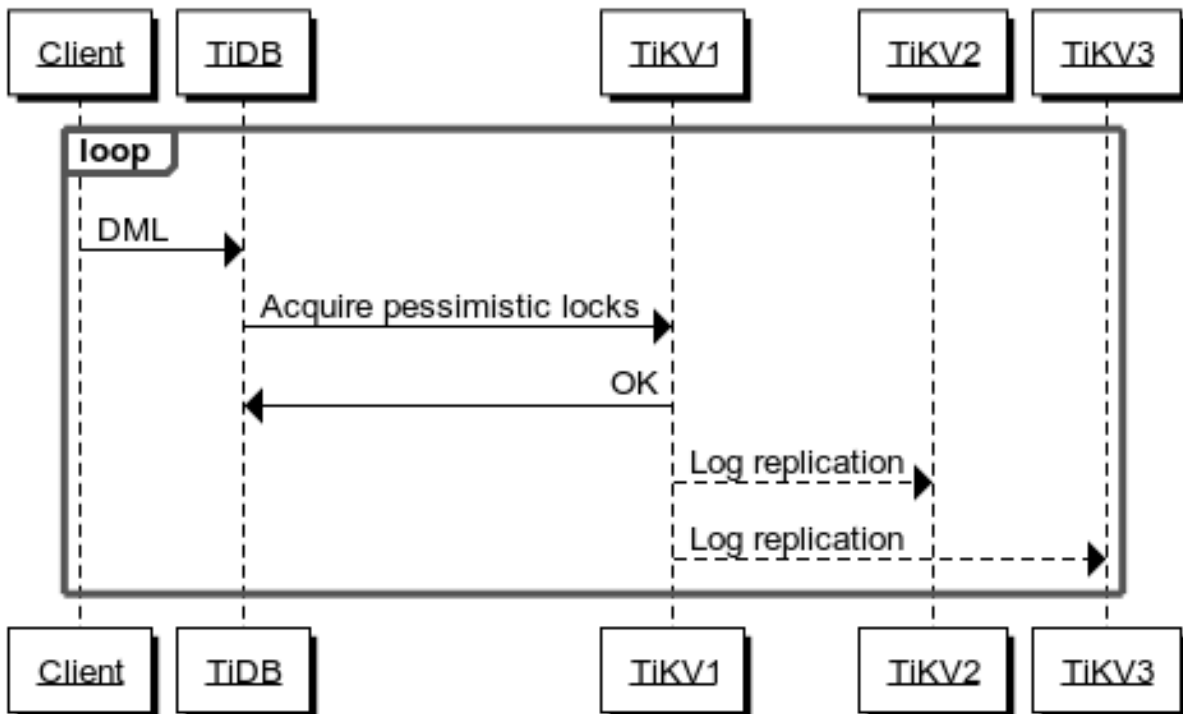

Figure 483: Pipelined pessimistic lock

This feature is enabled by default. To disable it, modify the TiKV configuration:

```
[pessimistic-txn]
pipelined = false
```

If the TiKV cluster is v4.0.9 or later, you can also dynamically disable this feature by [modifying TiKV configuration dynamically](#):

```
set config tikv pessimistic-txn.pipelined='false';
```

### 14.11.10.4.7 In-memory pessimistic lock

In v6.0.0, TiKV introduces the feature of in-memory pessimistic lock. When this feature is enabled, pessimistic locks are usually stored in the memory of the Region leader only, and are not persisted to disk or replicated through Raft to other replicas. This feature can greatly reduce the overhead of acquiring pessimistic locks and improve the throughput of pessimistic transactions.

When the memory usage of in-memory pessimistic locks exceeds the memory threshold of the Region or the TiKV node, the acquisition of pessimistic locks turns to the **pipelined locking process**. When the Region is merged or the leader is transferred, to avoid the loss of the pessimistic lock, TiKV writes the in-memory pessimistic lock to disk and replicates it to other replicas.

The in-memory pessimistic lock performs similarly to the pipelined locking process, which does not affect the lock acquisition when the cluster is healthy. However, when network isolation occurs in TiKV or a TiKV node is down, the acquired pessimistic lock might be lost.

If the application logic relies on the lock acquiring or lock waiting mechanism, or if you want to guarantee as much as possible the success rate of transaction commits even when the cluster is in an abnormal state, you need to **disable** the in-memory pessimistic lock feature.

This feature is enabled by default. To disable it, modify the TiKV configuration:

```
[pessimistic-txn]
in-memory = false
```

To dynamically disable this feature, modify the TiKV configuration dynamically:

```
set config tikv pessimistic-txn.in-memory='false';
```

#### 14.11.10.5 Non-Transactional DML Statements

This document describes the usage scenarios, usage methods, and restrictions of non-transactional DML statements in TiDB. In addition, the implementation principle and common issues are also explained.

A non-transactional DML statement is a DML statement split into multiple SQL statements (which is, multiple batches) to be executed in sequence. It enhances the performance and ease of use in batch data processing at the expense of transactional atomicity and isolation.

Usually, memory-consuming transactions need to be split into multiple SQL statements to bypass the transaction size limit. Non-transactional DML statements integrate this process into the TiDB kernel to achieve the same effect. It is helpful to understand the effect of non-transactional DML statements by splitting SQL statements. The `DRY RUN` syntax can be used to preview the split statements.

Non-transactional DML statements include:

- `INSERT INTO ... SELECT`
- `REPLACE INTO .. SELECT`
- `UPDATE`
- `DELETE`

For detailed syntax, see **BATCH**.

**Note:**

- A non-transactional DML statement does not guarantee the atomicity and isolation of the statement, and is not equivalent to the original DML statement.
- After a DML statement is rewritten into a non-transactional DML statement, you cannot assume that its behavior is consistent with that of the original statement.
- Before using a non-transactional DML, you need to analyze whether the split statements will affect each other.

#### 14.11.10.5.1 Usage scenarios

In the scenarios of large data processing, you might often need to perform same operations on a large batch of data. If the operation is performed directly using a single SQL statement, the transaction size might exceed the limit and affect the execution performance.

Batch data processing often has no overlap of time or data with the online application operations. Isolation (I in ACID) is unnecessary when no concurrent operations exist. Atomicity is also unnecessary if bulk data operations are idempotent or easily retryable. If your application needs neither data isolation nor atomicity, you can consider using non-transactional DML statements.

Non-transactional DML statements are used to bypass the size limit on large transactions in certain scenarios. One statement is used to complete tasks that would otherwise require manually splitting of transactions, with higher execution efficiency and less resource consumption.

For example, to delete expired data, if you ensure that no application will access the expired data, you can use a non-transactional DML statement to improve the `DELETE` performance.

#### 14.11.10.5.2 Prerequisites

Before using non-transactional DML statements, make sure that the following conditions are met:

- The statement does not require atomicity, which permits some rows to be modified and some rows to remain unmodified in the execution result.
- The statement is idempotent, or you are prepared to retry on a part of the data according to the error message. If the system variables are set to `tidb_redact_log`  $\leftrightarrow$  = 1 and `tidb_nontransactional_ignore_error` = 1, this statement must be

idempotent. Otherwise, when the statement partially fails, the failed part cannot be accurately located.

- The data to be operated on has no other concurrent writes, which means it is not updated by other statements at the same time. Otherwise, unexpected results such as missing writes, wrong writes, and modifying the same line multiple times might occur.
- The statement does not modify the data to be read by the statement itself. Otherwise, the following batch will read the data written by the previous batch and easily causes unexpected results.
  - Avoid modifying the shard column when you select from and modify the same table within a non-transactional `INSERT INTO ... SELECT` statement. Otherwise, multiple batches might read the same row and insert data multiple times:
    - \* It is not recommended to use `BATCH ON test.t.id LIMIT 10000 INSERT INTO t SELECT id+1, value FROM t;`
    - \* It is recommended to use `BATCH ON test.t.id LIMIT 10000 INSERT INTO t SELECT id, value FROM t;`
    - \* If the shard column `id` has the `AUTO_INCREMENT` attribute, it is recommended to use `BATCH ON test.t.id LIMIT 10000 INSERT INTO t(value)SELECT value FROM t;`
  - Avoid updating the shard column in the non-transactional `UPDATE, INSERT ... ON DUPLICATE KEY UPDATE`, or `REPLACE INTO` statement:
    - \* For example, for a non-transactional `UPDATE` statement, the split SQL statements are executed in sequence. The modification of the previous batch is read by the next batch after the previous batch is committed, which causes the same line of data to be modified multiple times.
    - \* These statements do not support `BATCH ON test.t.id LIMIT 10000 UPDATE t SET test.t.id = test.t.id-1;`
    - \* It is not recommended to use `BATCH ON test.t.id LIMIT 1 INSERT INTO t SELECT id+1, value FROM t ON DUPLICATE KEY UPDATE id = id + 1;`
  - The shard column should not be used as a Join key. For example, the following example uses the shard column `test.t.id` as a Join key, which causes a non-transactional `UPDATE` statement to modify the same line multiple times:

```
CREATE TABLE t(id int, v int, key(id));
CREATE TABLE t2(id int, v int, key(id));
INSERT INTO t VALUES (1, 1), (2, 2), (3, 3);
INSERT INTO t2 VALUES (1, 1), (2, 2), (4, 4);
BATCH ON test.t.id LIMIT 1 UPDATE t JOIN t2 ON t.id = t2.id SET t2
 ↪ .id = t2.id+1;
SELECT * FROM t2; -- (4, 1) (4, 2) (4, 4)
```

- The statement meets the [restrictions](#).
- It is not recommended to perform concurrent DDL operations on the table to be read or written by this DML statement.

### Warning:

If `tidb_redact_log` and `tidb_nontransactional_ignore_error` are enabled at the same time, you might not get the complete error information of each batch, and you cannot retry the failed batch only. Therefore, if both of the system variables are turned on, the non-transactional DML statement must be idempotent.

#### 14.11.10.5.3 Usage examples

Use a non-transactional DML statement

The following sections describe the use of non-transactional DML statements with examples:

Create a table `t` with the following schema:

```
CREATE TABLE t (id INT, v INT, KEY(id));
```

```
Query OK, 0 rows affected
```

Insert some data into table `t`.

```
INSERT INTO t VALUES (1, 2), (2, 3), (3, 4), (4, 5), (5, 6);
```

```
Query OK, 5 rows affected
```

The following operation uses a non-transactional DML statement to delete rows with values less than the integer 6 on column `v` of table `t`. This statement is split into two SQL statements, with a batch size of 2, sharded by the `id` column and executed.

```
BATCH ON id LIMIT 2 DELETE FROM t WHERE v < 6;
```

```
+-----+-----+
| number of jobs | job status |
+-----+-----+
| 2 | all succeeded |
+-----+-----+
1 row in set
```

Check the deletion results of the above non-transactional DML statement.

```
SELECT * FROM t;
```

```
+-----+-----+
| id | v |
+-----+-----+
| 5 | 6 |
+-----+-----+
1 row in set
```

The following example describes how to use multiple table joins. First, create table t2 and insert data:

```
CREATE TABLE t2(id int, v int, key(id));
INSERT INTO t2 VALUES (1,1), (3,3), (5,5);
```

Then, update the data of table t2 by joining table t and t2. Note that you need to specify the shard column along with the complete database name, table name, and column name (test.t.id):

```
BATCH ON test.t._tidb_rowid LIMIT 1 UPDATE t JOIN t2 ON t.id = t2.id SET t2
↪ .id = t2.id+1;
```

Query the results:

```
SELECT * FROM t2;
```

```
+-----+-----+
| id | v |
+-----+-----+
1	1
3	3
6	5
+-----+-----+
```

Check the execution progress

During the execution of a non-transactional DML statement, you can view the progress using SHOW PROCESSLIST. The Time field in the returned result indicates the time consumption of the current batch execution. Logs and slow logs also record the progress of each split statement throughout the non-transactional DML execution. For example:

```
SHOW PROCESSLIST;
```

```
+---
↪ -----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪
```

```

| Id | User | Host | db | Command | Time | State | Info
↵
↵ |
+--
↵ -----+-----+-----+-----+-----+-----+-----+-----+
↵
| 1203 | root | 100.64.10.62:52711 | test | Query | 0 | autocommit | /* job
↵ 506/500000 */ DELETE FROM `test`.`t1` WHERE `test`.`t1`.`_tidb_rowid`
↵ ` BETWEEN 2271 AND 2273 |
| 1209 | root | 100.64.10.62:52735 | <null> | Query | 0 | autocommit | show
↵ full processlist
↵
+--
↵ -----+-----+-----+-----+-----+-----+-----+-----+
↵

```

Terminate a non-transactional DML statement

To terminate a non-transactional DML statement, you can use `KILL TIDB <processlist_id>`. Then TiDB will cancel all batches after the batch that is currently being executed. You can get the execution result from the log.

For more information about `KILL TIDB`, see the reference [KILL](#).

Query the batch-dividing statement

During the execution of a non-transactional DML statement, a statement is internally used to divide the DML statement into multiple batches. To query this batch-dividing statement, you can add `DRY RUN QUERY` to this non-transactional DML statement. Then TiDB will not execute this query and the subsequent DML operations.

The following statement queries the batch-dividing statement during the execution of `BATCH ON id LIMIT 2 DELETE FROM t WHERE v < 6`:

```
BATCH ON id LIMIT 2 DRY RUN QUERY DELETE FROM t WHERE v < 6;
```

```

+--
↵ -----+-----+-----+-----+-----+-----+-----+-----+
↵
| query statement |
+--
↵ -----+-----+-----+-----+-----+-----+-----+-----+
↵
| SELECT `id` FROM `test`.`t` WHERE (`v` < 6) ORDER BY IF(ISNULL(`id`),0,1)
↵ ,`id` |
+--
↵ -----+-----+-----+-----+-----+-----+-----+-----+
↵

```

```
1 row in set
```

Query the statements corresponding to the first and the last batches

To query the actual DML statements corresponding to the first and the last batches in a non-transactional DML statement, you can add `DRY RUN` to this non-transactional DML statement. Then, TiDB only divides batches and does not execute these SQL statements. Because there might be many batches, not all batches are displayed, and only the first one and the last one are displayed.

```
BATCH ON id LIMIT 2 DRY RUN DELETE FROM t WHERE v < 6;
```

```
+-----+
| split statement examples |
+-----+
| DELETE FROM `test`.`t` WHERE (`id` BETWEEN 1 AND 2 AND (`v` < 6)) |
| DELETE FROM `test`.`t` WHERE (`id` BETWEEN 3 AND 4 AND (`v` < 6)) |
+-----+
2 rows in set
```

Use the optimizer hint

If an optimizer hint is originally supported in the `DELETE` statement, the optimizer hint is also supported in the non-transactional `DELETE` statement. The position of the hint is the same as that in the ordinary `DELETE` statement:

```
BATCH ON id LIMIT 2 DELETE /*+ USE_INDEX(t)*/ FROM t WHERE v < 6;
```

#### 14.11.10.5.4 Best practices

To use a non-transactional DML statement, the following steps are recommended:

1. Select an appropriate **shard column**. Integer or string types are recommended.
2. Add `DRY RUN QUERY` to the non-transactional DML statement, execute the query manually, and confirm whether the data range affected by the DML statement is roughly correct.
3. Add `DRY RUN` to the non-transactional DML statement, execute the query manually, and check the split statements and the execution plans. You need to pay attention to the following points:
  - Whether the split statement can read the result written by the previous statement, which might cause an anomaly.
  - The index selectivity.
  - Whether the shard column automatically selected by TiDB will be modified.

4. Execute the non-transactional DML statement.
5. If an error is reported, get the specific failed data range from the error message or log, and retry or handle it manually.

### How to select a shard column

A non-transactional DML statement uses a column as the basis for data batching, which is the shard column. For higher execution efficiency, a shard column is required to use index. The execution efficiency brought by different indexes and shard columns might vary by dozens of times. When choosing the shard column, consider the following suggestions:

- If you know the application data distribution, according to the **WHERE** condition, choose the column that divides data with smaller ranges after the batching.
  - Ideally, the **WHERE** condition can take advantage of the index of the shard column to reduce the amount of data to be scanned per batch. For example, there is a transaction table that records the start and end time of each transaction, and you want to delete all transaction records whose end time is before one month. If there is an index on the start time of the transaction, and the start and end times of the transaction are relatively close, then you can choose the start time column as the shard column.
  - In a less-than-ideal case, the data distribution of the shard column is completely independent of the **WHERE** condition, and the index of the shard column cannot be used to reduce the scope of the data scan.
- When a clustered index exists, it is recommended to use the primary key (including an INT primary key and `_tidb_rowid`) as the shard column, so that the execution efficiency is higher.
- Choose the column with fewer duplicate values.

You can also choose not to specify a shard column. Then, TiDB will use the first column of `handle` as the shard column by default. But if the first column of the primary key of the clustered index is of a data type not supported by non-transactional DML statements (which is **ENUM**, **BIT**, **SET**, **JSON**), TiDB will report an error. You can choose an appropriate shard column according to your application needs.

### How to set batch size

In non-transactional DML statements, the larger the batch size, the fewer SQL statements are split and the slower each SQL statement is executed. The optimal batch size depends on the workload. It is recommended to start from 50000. Either too small or too large batch sizes will cause decreased execution efficiency.

The information of each batch is stored in memory, so too many batches can significantly increase memory consumption. This explains why the batch size cannot be too small. The upper limit of memory consumed by non-transactional statements for storing batch information is the same as `tidb_mem_quota_query`, and the action triggered when this limit is exceeded is determined by the configuration item `tidb_mem_oom_action`.

#### 14.11.10.5.6 Restrictions

The following are hard restrictions on non-transactional DML statements. If these restrictions are not met, TiDB will report an error.

- The DML statements cannot contain `ORDER BY` or `LIMIT` clauses.
- Subqueries or set operations are not supported.
- The shard column must be indexed. The index can be a single-column index, or the first column of a joint index.
- Must be used in the `autocommit` mode.
- Cannot be used when batch-dml is enabled.
- Cannot be used when `tidb_snapshot` is set.
- Cannot be used with the `prepare` statement.
- `ENUM`, `BIT`, `SET`, `JSON` types are not supported as the shard columns.
- Not supported for `temporary tables`.
- `Common Table Expression` is not supported.

#### 14.11.10.5.7 Control batch execution failure

Non-transactional DML statements do not satisfy atomicity. Some batches might succeed and some might fail. The system variable `tidb_nontransactional_ignore_error` controls how the non-transactional DML statements handle errors.

An exception is that if the first batch fails, there is a high probability that the statement itself is wrong. In this case, the entire non-transactional statement will directly return an error.

#### 14.11.10.5.8 How it works

The working principle of non-transactional DML statements is to build into TiDB the automatic splitting of SQL statements. Without non-transactional DML statements, you will need to manually split the SQL statements. To understand the behavior of a non-transactional DML statement, think of it as a user script doing the following tasks:

For the non-transactional DML `BATCH ON  $C$  LIMIT  $N$  DELETE FROM ... WHERE  $P$` ,  $C$  is the column used for dividing,  $N$  is the batch size, and  $P$  is the filter condition.

1. According to the filter condition  $P$  of the original statement and the specified column  $C$  for dividing, TiDB queries all  $C$  that satisfy  $P$ . TiDB sorts these  $C$  into groups  $B_1 \dots B_k$  according to  $N$ . For each of all  $B_i$ , TiDB keeps its first and last  $C$  as  $S_i$  and  $E_i$ . The query statement executed in this step can be viewed through `DRY RUN QUERY`.
2. The data involved in  $B_i$  is a subset that satisfies  $P_i$ :  `$C$  BETWEEN  $S_i$  AND  $E_i$` . You can use  $P_i$  to narrow down the range of data that each batch needs to process.
3. For  $B_i$ , TiDB embeds the above condition into the `WHERE` condition of the original statement, which makes it `WHERE ( $P_i$ ) AND ( $P$ )`. The execution result of this step can be viewed through `DRY RUN`.

4. For all batches, execute new statements in sequence. The errors for each grouping are collected and combined, and returned as the result of the entire non-transactional DML statement after all groupings are complete.

#### 14.11.10.5.9 Comparison with batch-dml

batch-dml is a mechanism for splitting a transaction into multiple transaction commits during the execution of a DML statement.

##### Note:

It is not recommended to use batch-dml which has been deprecated. When the batch-dml feature is not properly used, there is a risk of data index inconsistency.

Non-transactional DML statements are not yet a replacement for all batch-dml usage scenarios. Their main differences are as follows:

- Performance: When the **shard column** is efficient, the performance of non-transactional DML statements is close to that of batch-dml. When the shard column is less efficient, the performance of non-transactional DML statements is significantly lower than that of batch-dml.
- Stability: batch-dml is prone to data index inconsistencies due to improper use. Non-transactional DML statements do not cause data index inconsistencies. However, when used improperly, non-transactional DML statements are not equivalent to the original statements, and the applications might observe unexpected behavior. See the **common issues section** for details.

#### 14.11.10.5.10 Common issues

The actual batch size is not the same as the specified batch size

During the execution of a non-transactional DML statement, the size of data to be processed in the last batch might be smaller than the specified batch size.

When **duplicated values exist in the shard column**, each batch will contain all the duplicated values of the last element of the shard column in this batch. Therefore, the number of rows in this batch might be greater than the specified batch size.

In addition, when other concurrent writes occur, the number of rows processed in each batch might be different from the specified batch size.

The `Failed to restore the delete statement, probably because of unsupported type of the shard column` error occurs during execution

The shard column does not support `ENUM`, `BIT`, `SET`, `JSON` types. Try to specify a new shard column. It is recommended to use an integer or string type column.

If the error occurs when the selected shard column is not one of these unsupported types, [get support](#) from PingCAP or the community.

Non-transactional `DELETE` has “exceptional” behavior that is not equivalent to ordinary `DELETE`

A non-transactional DML statement is not equivalent to the original form of this DML statement, which might have the following reasons:

- There are other concurrent writes.
- The non-transactional DML statement modifies a value that the statement itself will read.
- The SQL statement executed in each batch might cause a different execution plan and expression calculation order because the `WHERE` condition is changed. Therefore, the execution result might be different from the original statement.
- The DML statements contain non-deterministic operations.

#### 14.11.10.5.11 MySQL compatibility

Non-transactional statements are TiDB-specific and are not compatible with MySQL.

#### 14.11.10.5.12 See also

- The `BATCH` syntax
- `tidb_nontransactional_ignore_error`

### 14.11.11 Views

TiDB supports views. A view acts as a virtual table, whose schema is defined by the `SELECT` statement that creates the view. Using views has the following benefits:

- Exposing only safe fields and data to users to ensure security of sensitive fields and data stored in the underlying table.
- Defining complex queries that frequently appear as views to make complex queries easier and more convenient.

#### 14.11.11.1 Query views

Querying a view is similar to querying an ordinary table. However, when TiDB queries a view, it actually queries the `SELECT` statement associated with the view.

#### 14.11.11.2 Show metadata

To obtain the metadata of views, choose any of the following methods.

### 14.11.11.2.1 Use the SHOW CREATE TABLE view\_name or SHOW CREATE VIEW view\_name statement

Usage example:

```
show create view v;
```

This statement shows the CREATE VIEW statement corresponding to this view and the value of the character\_set\_client and collation\_connection system variables when the view was created.

```
+--
 ↪ -----+-----
 ↪
| View | Create View
 ↪
 ↪ | character_set_client | collation_connection |
+--
 ↪ -----+-----
 ↪
| v | CREATE ALGORITHM=UNDEFINED DEFINER=`root`@`127.0.0.1` SQL SECURITY
 ↪ DEFINER VIEW `v` (`a`) AS SELECT `s`.`a` FROM `test`.`t` LEFT JOIN `
 ↪ test`.`s` ON `t`.`a`=`s`.`a` | utf8 | utf8_general_ci |
+--
 ↪ -----+-----
 ↪
1 row in set (0.00 sec)
```

### 14.11.11.2.2 Query the INFORMATION\_SCHEMA.VIEWS table

Usage example:

```
select * from information_schema.views;
```

You can view the relevant meta information of the view by querying this table, such as TABLE\_CATALOG, TABLE\_SCHEMA, TABLE\_NAME, VIEW\_DEFINITION, CHECK\_OPTION, IS\_UPDATABLE, DEFINER, SECURITY\_TYPE, CHARACTER\_SET\_CLIENT, and COLLATION\_CONNECTION  
↪ .

```
+--
 ↪ -----+-----+-----+-----
 ↪
| TABLE_CATALOG | TABLE_SCHEMA | TABLE_NAME | VIEW_DEFINITION
 ↪ | CHECK_OPTION | IS_UPDATABLE
 ↪ | DEFINER | SECURITY_TYPE | CHARACTER_SET_CLIENT |
 ↪ COLLATION_CONNECTION |
```

```

+--
 ↪ -----+-----+-----+-----
 ↪
| def | test | v | SELECT `s`.`a` FROM `test`.`t` LEFT
 ↪ JOIN `test`.`s` ON `t`.`a`=`s`.`a` | CASCADED | NO | root@127.0.0.1
 ↪ | DEFINER | utf8 | utf8_general_ci |
+--
 ↪ -----+-----+-----+-----
 ↪
1 row in set (0.00 sec)

```

### 14.11.11.2.3 Use the HTTP APIs

Usage example:

```
curl http://127.0.0.1:10080/schema/test/v
```

By visiting `http://{TiDBIP}:10080/schema/{db}/{view}`, you can get all the meta-data for the view.

### 14.11.11.3 Example

The following example creates a view, queries this view, and delete this view:

```
create table t(a int, b int);
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
insert into t values(1, 1),(2,2),(3,3);
```

```
Query OK, 3 rows affected (0.00 sec)
Records: 3 Duplicates: 0 Warnings: 0
```

```
create table s(a int);
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
insert into s values(2),(3);
```

```
Query OK, 2 rows affected (0.01 sec)
Records: 2 Duplicates: 0 Warnings: 0
```

```
create view v as select s.a from t left join s on t.a = s.a;
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
select * from v;
```

```
+-----+
| a |
+-----+
| NULL |
| 2 |
| 3 |
+-----+
3 rows in set (0.00 sec)
```

```
drop view v;
```

```
Query OK, 0 rows affected (0.02 sec)
```

#### 14.11.11.4 Limitations

Currently, views in TiDB are subject to the following limitations:

- Materialized views are not supported yet.
- Views in TiDB are read-only and do not support write operations such as UPDATE, INSERT, DELETE, and TRUNCATE.
- For created views, the only supported DDL operation is DROP [VIEW | TABLE]

#### 14.11.11.5 See also

- [CREATE VIEW](#)
- [DROP VIEW](#)

#### 14.11.12 Partitioning

This document introduces TiDB's implementation of partitioning.

##### 14.11.12.1 Partitioning types

This section introduces the types of partitioning in TiDB. Currently, TiDB supports [Range partitioning](#), [Range COLUMNS partitioning](#), [List partitioning](#), [List COLUMNS partitioning](#), and [Hash partitioning](#).

Range partitioning, Range COLUMNS partitioning, List partitioning and List COLUMNS partitioning are used to resolve the performance issues caused by a large amount of deletions in the application, and support fast drop partition operations. Hash partitioning is used to scatter the data when there are a large amount of writes.

##### 14.11.12.1.1 Range partitioning

When a table is partitioned by Range, each partition contains rows for which the partitioning expression value lies within a given Range. Ranges have to be contiguous but not overlapping. You can define it by using VALUES LESS THAN.

Assume you need to create a table that contains personnel records as follows:

```
CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
```

```
hired DATE NOT NULL DEFAULT '1970-01-01',
separated DATE DEFAULT '9999-12-31',
job_code INT,
store_id INT NOT NULL
);
```

You can partition a table by Range in various ways as needed. For example, you can partition it by using the `store_id` column:

```
CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE DEFAULT '9999-12-31',
 job_code INT,
 store_id INT NOT NULL
)
PARTITION BY RANGE (store_id) (
 PARTITION p0 VALUES LESS THAN (6),
 PARTITION p1 VALUES LESS THAN (11),
 PARTITION p2 VALUES LESS THAN (16),
 PARTITION p3 VALUES LESS THAN (21)
);
```

In this partition scheme, all rows corresponding to employees whose `store_id` is 1 through 5 are stored in the `p0` partition while all employees whose `store_id` is 6 through 10 are stored in `p1`. Range partitioning requires the partitions to be ordered, from lowest to highest.

If you insert a row of data (72, 'Tom', 'John', '2015-06-25', NULL, NULL, 15), it falls in the `p2` partition. But if you insert a record whose `store_id` is larger than 20, an error is reported because TiDB cannot know which partition this record should be inserted into. In this case, you can use `MAXVALUE` when creating a table:

```
CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE DEFAULT '9999-12-31',
 job_code INT,
 store_id INT NOT NULL
)
```

```
PARTITION BY RANGE (store_id) (
 PARTITION p0 VALUES LESS THAN (6),
 PARTITION p1 VALUES LESS THAN (11),
 PARTITION p2 VALUES LESS THAN (16),
 PARTITION p3 VALUES LESS THAN MAXVALUE
);
```

MAXVALUE represents an integer value that is larger than all other integer values. Now, all records whose `store_id` is equal to or larger than 16 (the highest value defined) are stored in the p3 partition.

You can also partition a table by employees' job codes, which are the values of the `job_code` column. Assume that two-digit job codes stand for regular employees, three-digit codes stand for office and customer support personnel, and four-digit codes stand for managerial personnel. Then you can create a partitioned table like this:

```
CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE DEFAULT '9999-12-31',
 job_code INT,
 store_id INT NOT NULL
)

PARTITION BY RANGE (job_code) (
 PARTITION p0 VALUES LESS THAN (100),
 PARTITION p1 VALUES LESS THAN (1000),
 PARTITION p2 VALUES LESS THAN (10000)
);
```

In this example, all rows relating to regular employees are stored in the p0 partition, all office and customer support personnel in the p1 partition, and all managerial personnel in the p2 partition.

Besides splitting up the table by `store_id`, you can also partition a table by dates. For example, you can partition by employees' separation year:

```
CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE DEFAULT '9999-12-31',
 job_code INT,
 store_id INT
```

```
)

PARTITION BY RANGE (YEAR(separated)) (
 PARTITION p0 VALUES LESS THAN (1991),
 PARTITION p1 VALUES LESS THAN (1996),
 PARTITION p2 VALUES LESS THAN (2001),
 PARTITION p3 VALUES LESS THAN MAXVALUE
);
```

In Range partitioning, you can partition based on the values of the `timestamp` column and use the `unix_timestamp()` function, for example:

```
CREATE TABLE quarterly_report_status (
 report_id INT NOT NULL,
 report_status VARCHAR(20) NOT NULL,
 report_updated TIMESTAMP NOT NULL DEFAULT CURRENT_TIMESTAMP ON UPDATE
 ↪ CURRENT_TIMESTAMP
)

PARTITION BY RANGE (UNIX_TIMESTAMP(report_updated)) (
 PARTITION p0 VALUES LESS THAN (UNIX_TIMESTAMP('2008-01-01 00:00:00')),
 PARTITION p1 VALUES LESS THAN (UNIX_TIMESTAMP('2008-04-01 00:00:00')),
 PARTITION p2 VALUES LESS THAN (UNIX_TIMESTAMP('2008-07-01 00:00:00')),
 PARTITION p3 VALUES LESS THAN (UNIX_TIMESTAMP('2008-10-01 00:00:00')),
 PARTITION p4 VALUES LESS THAN (UNIX_TIMESTAMP('2009-01-01 00:00:00')),
 PARTITION p5 VALUES LESS THAN (UNIX_TIMESTAMP('2009-04-01 00:00:00')),
 PARTITION p6 VALUES LESS THAN (UNIX_TIMESTAMP('2009-07-01 00:00:00')),
 PARTITION p7 VALUES LESS THAN (UNIX_TIMESTAMP('2009-10-01 00:00:00')),
 PARTITION p8 VALUES LESS THAN (UNIX_TIMESTAMP('2010-01-01 00:00:00')),
 PARTITION p9 VALUES LESS THAN (MAXVALUE)
);
```

It is not allowed to use any other partitioning expression that contains the timestamp column.

Range partitioning is particularly useful when one or more of the following conditions are satisfied:

- You want to delete the old data. If you use the `employees` table in the previous example, you can delete all records of employees who left this company before the year 1991 by simply using `ALTER TABLE employees DROP PARTITION p0;`. It is faster than executing the `DELETE FROM employees WHERE YEAR(separated) <= 1990;` operation.
- You want to use a column that contains time or date values, or containing values arising from some other series.
- You need to frequently run queries on the columns used for partitioning. For example, when executing a query like `EXPLAIN SELECT COUNT(*) FROM employees WHERE`

↪ separated BETWEEN '2000-01-01' AND '2000-12-31' GROUP BY store\_id;, TiDB can quickly know that only the data in the p2 partition needs to be scanned, because the other partitions do not match the WHERE condition.

#### 14.11.12.1.2 Range COLUMNS partitioning

Range COLUMNS partitioning is a variant of Range partitioning. You can use one or more columns as partitioning keys. The data types of partition columns can be integer, string (CHAR or VARCHAR), DATE, and DATETIME. Any expressions, such as non-COLUMNS partitioning, are not supported.

Suppose that you want to partition by name, and drop old and invalid data, then you can create a table as follows:

```
CREATE TABLE t (
 valid_until datetime,
 name varchar(255) CHARACTER SET ascii,
 notes text
)
PARTITION BY RANGE COLUMNS(name,valid_until)
(PARTITION `p2022-g` VALUES LESS THAN ('G','2023-01-01 00:00:00'),
PARTITION `p2023-g` VALUES LESS THAN ('G','2024-01-01 00:00:00'),
PARTITION `p2024-g` VALUES LESS THAN ('G','2025-01-01 00:00:00'),
PARTITION `p2022-m` VALUES LESS THAN ('M','2023-01-01 00:00:00'),
PARTITION `p2023-m` VALUES LESS THAN ('M','2024-01-01 00:00:00'),
PARTITION `p2024-m` VALUES LESS THAN ('M','2025-01-01 00:00:00'),
PARTITION `p2022-s` VALUES LESS THAN ('S','2023-01-01 00:00:00'),
PARTITION `p2023-s` VALUES LESS THAN ('S','2024-01-01 00:00:00'),
PARTITION `p2024-s` VALUES LESS THAN ('S','2025-01-01 00:00:00'),
PARTITION `p2022-` VALUES LESS THAN (0x7f,'2023-01-01 00:00:00'),
PARTITION `p2023-` VALUES LESS THAN (0x7f,'2024-01-01 00:00:00'),
PARTITION `p2024-` VALUES LESS THAN (0x7f,'2025-01-01 00:00:00'))
```

It will partition the data by year and by name in the ranges ['', 'G'), ['G', 'M'), ['M', 'S') and ['S',). It allows you to easily drop invalid data while still benefit from partition pruning on both name and valid\_until columns. In this example, [,) indicates a left-closed, right-open range. For example, ['G', 'M') indicates a range containing G and from G to M, but excluding M.

#### 14.11.12.1.3 Range INTERVAL partitioning

Range INTERVAL partitioning is an extension of Range partitioning, which allows you to create partitions of a specified interval easily. Starting from v6.3.0, INTERVAL partitioning is introduced in TiDB as syntactic sugar.

**Warning:**

This is an experimental feature, which might be changed or removed without prior notice. The syntax and implementation may change before GA. If you find a bug, please open an issue in the [TiDB repository](#).

The syntax is as follows:

```
PARTITION BY RANGE [COLUMNS] (<partitioning expression>)
INTERVAL (<interval expression>)
FIRST PARTITION LESS THAN (<expression>)
LAST PARTITION LESS THAN (<expression>)
[NULL PARTITION]
[MAXVALUE PARTITION]
```

For example:

```
CREATE TABLE employees (
 id int unsigned NOT NULL,
 fname varchar(30),
 lname varchar(30),
 hired date NOT NULL DEFAULT '1970-01-01',
 separated date DEFAULT '9999-12-31',
 job_code int,
 store_id int NOT NULL
) PARTITION BY RANGE (id)
INTERVAL (100) FIRST PARTITION LESS THAN (100) LAST PARTITION LESS THAN
↔ (10000) MAXVALUE PARTITION
```

It creates the following table:

```
CREATE TABLE `employees` (
 `id` int unsigned NOT NULL,
 `fname` varchar(30) DEFAULT NULL,
 `lname` varchar(30) DEFAULT NULL,
 `hired` date NOT NULL DEFAULT '1970-01-01',
 `separated` date DEFAULT '9999-12-31',
 `job_code` int DEFAULT NULL,
 `store_id` int NOT NULL
)
PARTITION BY RANGE (`id`)
(PARTITION `P_LT_100` VALUES LESS THAN (100),
PARTITION `P_LT_200` VALUES LESS THAN (200),
```

```
...
PARTITION `P_LT_9900` VALUES LESS THAN (9900),
PARTITION `P_LT_10000` VALUES LESS THAN (10000),
PARTITION `P_MAXVALUE` VALUES LESS THAN (MAXVALUE))
```

Range INTERVAL partitioning also works with [Range COLUMNS](#) partitioning.

For example:

```
CREATE TABLE monthly_report_status (
 report_id int NOT NULL,
 report_status varchar(20) NOT NULL,
 report_date date NOT NULL
)
PARTITION BY RANGE COLUMNS (report_date)
INTERVAL (1 MONTH) FIRST PARTITION LESS THAN ('2000-01-01') LAST PARTITION
↪ LESS THAN ('2025-01-01')
```

It creates this table:

```
CREATE TABLE `monthly_report_status` (
 `report_id` int(11) NOT NULL,
 `report_status` varchar(20) NOT NULL,
 `report_date` date NOT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
PARTITION BY RANGE COLUMNS(`report_date`)
(PARTITION `P_LT_2000-01-01` VALUES LESS THAN ('2000-01-01'),
PARTITION `P_LT_2000-02-01` VALUES LESS THAN ('2000-02-01'),
...
PARTITION `P_LT_2024-11-01` VALUES LESS THAN ('2024-11-01'),
PARTITION `P_LT_2024-12-01` VALUES LESS THAN ('2024-12-01'),
PARTITION `P_LT_2025-01-01` VALUES LESS THAN ('2025-01-01'))
```

The optional parameter `NULL PARTITION` creates a partition with the definition as `PARTITION P_NULL VALUES LESS THAN (<minimum value of the column type>)`, only matching when the partitioning expression evaluates to `NULL`. See [Handling of NULL with Range partitioning](#), which explains that `NULL` is considered to be less than any other value.

The optional parameter `MAXVALUE PARTITION` creates the last partition as `PARTITION ↪ P_MAXVALUE VALUES LESS THAN (MAXVALUE)`.

`ALTER INTERVAL` partitioned tables

`INTERVAL` partitioning also adds simpler syntaxes for adding and dropping partitions.

The following statement changes the first partition. It drops all partitions whose values are less than the given expression, and makes the matched partition the new first partition. It does not affect a `NULL PARTITION`.

```
ALTER TABLE table_name FIRST PARTITION LESS THAN (<expression>)
```

The following statement changes the last partition, meaning adding more partitions with higher ranges and room for new data. It will add new partitions with the current `INTERVAL` up to and including the given expression. It does not work if a `MAXVALUE PARTITION` exists, because it needs data reorganization.

```
ALTER TABLE table_name LAST PARTITION LESS THAN (<expression>)
```

`INTERVAL` partitioning details and limitations

- The `INTERVAL` partitioning feature only involves the `CREATE/ALTER TABLE` syntax. There is no change in metadata, so tables created or altered with the new syntax are still MySQL-compatible.
- There is no change in the output format of `SHOW CREATE TABLE` to keep MySQL compatibility.
- The new `ALTER` syntax applies to existing tables conforming to `INTERVAL`. You do not need to create these tables with the `INTERVAL` syntax.
- For `RANGE COLUMNS`, only integer, date, and datetime column types are supported.

#### 14.11.12.1.4 List partitioning

Before creating a List partitioned table, you need to set the value of the session variable `tidb_enable_list_partition` to `ON`.

```
set @@session.tidb_enable_list_partition = ON
```

Also, make sure that `tidb_enable_table_partition` is set to `ON`, which is the default setting.

List partitioning is similar to Range partitioning. Unlike Range partitioning, in List partitioning, the partitioning expression values for all rows in each partition are in a given value set. This value set defined for each partition can have any number of values but cannot have duplicate values. You can use the `PARTITION ... VALUES IN (...)` clause to define a value set.

Suppose that you want to create a personnel record table. You can create a table as follows:

```
CREATE TABLE employees (
 id INT NOT NULL,
 hired DATE NOT NULL DEFAULT '1970-01-01',
 store_id INT
);
```

Suppose that there are 20 stores distributed in 4 districts, as shown in the table below:

```
Region	Store ID Numbers
North	1, 2, 3, 4, 5
East	6, 7, 8, 9, 10
West	11, 12, 13, 14, 15
Central	16, 17, 18, 19, 20
```

If you want to store the personnel data of employees of the same region in the same partition, you can create a List partitioned table based on `store_id`:

```
CREATE TABLE employees (
 id INT NOT NULL,
 hired DATE NOT NULL DEFAULT '1970-01-01',
 store_id INT
)
PARTITION BY LIST (store_id) (
 PARTITION pNorth VALUES IN (1, 2, 3, 4, 5),
 PARTITION pEast VALUES IN (6, 7, 8, 9, 10),
 PARTITION pWest VALUES IN (11, 12, 13, 14, 15),
 PARTITION pCentral VALUES IN (16, 17, 18, 19, 20)
);
```

After creating the partitions as above, you can easily add or delete records related to a specific region in the table. For example, suppose that all stores in the East region (East) are sold to another company. Then all the row data related to the store employees of this region can be deleted by executing `ALTER TABLE employees TRUNCATE PARTITION pEast`, which is much more efficient than the equivalent statement `DELETE FROM employees WHERE store_id IN (6, 7, 8, 9, 10)`.

You can also execute `ALTER TABLE employees DROP PARTITION pEast` to delete all related rows, but this statement also deletes the `pEast` partition from the table definition. In this situation, you must execute the `ALTER TABLE ... ADD PARTITION` statement to recover the original partitioning scheme of the table.

Unlike Range partitioning, List partitioning does not have a similar `MAXVALUE` partition to store all values that do not belong to other partitions. Instead, all expected values of the partition expression must be included in the `PARTITION ... VALUES IN (...)` clause. If the value to be inserted in an `INSERT` statement does not match the column value set of any partition, the statement fails to execute and an error is reported. See the following example:

```
test> CREATE TABLE t (
-> a INT,
-> b INT
->)
-> PARTITION BY LIST (a) (
-> PARTITION p0 VALUES IN (1, 2, 3),
```

```

-> PARTITION p1 VALUES IN (4, 5, 6)
->);
Query OK, 0 rows affected (0.11 sec)

test> INSERT INTO t VALUES (7, 7);
ERROR 1525 (HY000): Table has no partition for value 7

```

To ignore the error type above, you can use the `IGNORE` keyword. After using this keyword, if a row contains values that do not match the column value set of any partition, this row will not be inserted. Instead, any row with matched values is inserted, and no error is reported:

```

test> TRUNCATE t;
Query OK, 1 row affected (0.00 sec)

test> INSERT IGNORE INTO t VALUES (1, 1), (7, 7), (8, 8), (3, 3), (5, 5);
Query OK, 3 rows affected, 2 warnings (0.01 sec)
Records: 5 Duplicates: 2 Warnings: 2

test> select * from t;
+-----+-----+
| a | b |
+-----+-----+
5	5
1	1
3	3
+-----+-----+
3 rows in set (0.01 sec)

```

#### 14.11.12.1.5 List COLUMNS partitioning

List COLUMNS partitioning is a variant of List partitioning. You can use multiple columns as partition keys. Besides the integer data type, you can also use the columns in the string, DATE, and DATETIME data types as partition columns.

Suppose that you want to divide the store employees from the following 12 cities into 4 regions, as shown in the following table:

| Region | Cities                         |
|--------|--------------------------------|
| 1      | LosAngeles,Seattle, Houston    |
| 2      | Chicago, Columbus, Boston      |
| 3      | NewYork, LongIsland, Baltimore |
| 4      | Atlanta, Raleigh, Cincinnati   |

You can use List COLUMNS partitioning to create a table and store each row in the partition that corresponds to the employee's city, as shown below:

```
CREATE TABLE employees_1 (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE DEFAULT '9999-12-31',
 job_code INT,
 store_id INT,
 city VARCHAR(15)
)
PARTITION BY LIST COLUMNS(city) (
 PARTITION pRegion_1 VALUES IN('LosAngeles', 'Seattle', 'Houston'),
 PARTITION pRegion_2 VALUES IN('Chicago', 'Columbus', 'Boston'),
 PARTITION pRegion_3 VALUES IN('NewYork', 'LongIsland', 'Baltimore'),
 PARTITION pRegion_4 VALUES IN('Atlanta', 'Raleigh', 'Cincinnati')
);
```

Unlike List partitioning, in List COLUMNS partitioning, you do not need to use the expression in the COLUMNS() clause to convert column values to integers.

List COLUMNS partitioning can also be implemented using columns of the DATE and DATETIME types, as shown in the following example. This example uses the same names and columns as the previous `employees_1` table, but uses List COLUMNS partitioning based on the `hired` column:

```
CREATE TABLE employees_2 (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE DEFAULT '9999-12-31',
 job_code INT,
 store_id INT,
 city VARCHAR(15)
)
PARTITION BY LIST COLUMNS(hired) (
 PARTITION pWeek_1 VALUES IN('2020-02-01', '2020-02-02', '2020-02-03',
 '2020-02-04', '2020-02-05', '2020-02-06', '2020-02-07'),
 PARTITION pWeek_2 VALUES IN('2020-02-08', '2020-02-09', '2020-02-10',
 '2020-02-11', '2020-02-12', '2020-02-13', '2020-02-14'),
 PARTITION pWeek_3 VALUES IN('2020-02-15', '2020-02-16', '2020-02-17',
 '2020-02-18', '2020-02-19', '2020-02-20', '2020-02-21'),
 PARTITION pWeek_4 VALUES IN('2020-02-22', '2020-02-23', '2020-02-24',
 '2020-02-25', '2020-02-26', '2020-02-27', '2020-02-28')
);
```

In addition, you can also add multiple columns in the `COLUMNS()` clause. For example:

```
CREATE TABLE t (
 id int,
 name varchar(10)
)
PARTITION BY LIST COLUMNS(id,name) (
 partition p0 values IN ((1,'a'),(2,'b')),
 partition p1 values IN ((3,'c'),(4,'d')),
 partition p3 values IN ((5,'e'),(null,null))
);
```

#### 14.11.12.1.6 Hash partitioning

Hash partitioning is used to make sure that data is evenly scattered into a certain number of partitions. With Range partitioning, you must specify the range of the column values for each partition when you use Range partitioning, while you just need to specify the number of partitions when you use Hash partitioning.

Partitioning by Hash requires you to append a `PARTITION BY HASH (expr)` clause to the `CREATE TABLE` statement. `expr` is an expression that returns an integer. It can be a column name if the type of this column is integer. In addition, you might also need to append `PARTITIONS num`, where `num` is a positive integer indicating how many partitions a table is divided into.

The following operation creates a Hash partitioned table, which is divided into 4 partitions by `store_id`:

```
CREATE TABLE employees (
 id INT NOT NULL,
 fname VARCHAR(30),
 lname VARCHAR(30),
 hired DATE NOT NULL DEFAULT '1970-01-01',
 separated DATE DEFAULT '9999-12-31',
 job_code INT,
 store_id INT
)

PARTITION BY HASH(store_id)
PARTITIONS 4;
```

If `PARTITIONS num` is not specified, the default number of partitions is 1.

You can also use an SQL expression that returns an integer for `expr`. For example, you can partition a table by the hire year:

```
CREATE TABLE employees (
 id INT NOT NULL,
```

```
fname VARCHAR(30),
lname VARCHAR(30),
hired DATE NOT NULL DEFAULT '1970-01-01',
separated DATE DEFAULT '9999-12-31',
job_code INT,
store_id INT
)
PARTITION BY HASH(YEAR(hired))
PARTITIONS 4;
```

The most efficient Hash function is one which operates upon a single table column, and whose value increases or decreases consistently with the column value.

For example, `date_col` is a column whose type is `DATE`, and the value of the `TO_DAYS`  $\leftrightarrow$  (`date_col`) expression varies with the value of `date_col`. `YEAR(date_col)` is different from `TO_DAYS(date_col)`, because not every possible change in `date_col` produces an equivalent change in `YEAR(date_col)`.

In contrast, assume that you have an `int_col` column whose type is `INT`. Now consider about the expression `POW(5-int_col,3)+ 6`. It is not a good Hash function though, because as the value of `int_col` changes, the result of the expression does not change proportionally. A value change in `int_col` might result in a huge change in the expression result. For example, when `int_col` changes from 5 to 6, the change of the expression result is -1. But the result change might be -7 when `int_col` changes from 6 to 7.

In conclusion, when the expression has a form that is closer to  $y = cx$ , it is more suitable to be a Hash function. Because the more non-linear an expression is, the more unevenly scattered the data among the partitions tends to be.

In theory, pruning is also possible for expressions involving more than one column value, but determining which of such expressions are suitable can be quite difficult and time-consuming. For this reason, the use of hashing expressions involving multiple columns is not particularly recommended.

When using `PARTITION BY HASH`, TiDB decides which partition the data should fall into based on the modulus of the result of the expression. In other words, if a partitioning expression is `expr` and the number of partitions is `num`, `MOD(expr, num)` decides the partition in which the data is stored. Assume that `t1` is defined as follows:

```
CREATE TABLE t1 (col1 INT, col2 CHAR(5), col3 DATE)
PARTITION BY HASH(YEAR(col3))
PARTITIONS 4;
```

When you insert a row of data into `t1` and the value of `col3` is '2005-09-15', then this row is inserted into partition 1:

```
MOD(YEAR('2005-09-01'),4)
= MOD(2005,4)
```

= 1

## How TiDB handles Linear Hash partitions

Before v6.4.0, if you execute DDL statements of [MySQL Linear Hash](#) partitions in TiDB, TiDB can only create non-partitioned tables. In this case, if you still want to use partitioned tables in TiDB, you need to modify the DDL statements.

Since v6.4.0, TiDB supports parsing the MySQL `PARTITION BY LINEAR HASH` syntax but ignores the `LINEAR` keyword in it. If you have some existing DDL and DML statements of MySQL Linear Hash partitions, you can execute them in TiDB without modification:

- For a `CREATE` statement of MySQL Linear Hash partitions, TiDB will create a non-linear Hash partitioned table (note that there is no Linear Hash partitioned table in TiDB). If the number of partitions is a power of 2, the rows in the TiDB Hash partitioned table are distributed the same as that in the MySQL Linear Hash partitioned table. Otherwise, the distribution of these rows in TiDB is different from MySQL. This is because non-linear partitioned tables use a simple “modulus number of partition”, while linear partitioned tables use “modulus next power of 2 and fold the values between the number of partitions and the next power of 2”. For details, see [#38450](#).
- For all other statements of MySQL Linear Hash partitions, they work in TiDB the same as that in MySQL, except that the rows are distributed differently if the number of partitions is not a power of 2, which will give different results for [partition selection](#), `TRUNCATE PARTITION`, and `EXCHANGE PARTITION`.

### 14.11.12.1.7 How TiDB partitioning handles NULL

It is allowed in TiDB to use `NULL` as the calculation result of a partitioning expression.

#### Note:

`NULL` is not an integer. TiDB’s partitioning implementation treats `NULL` as being less than any other integer values, just as `ORDER BY` does.

## Handling of NULL with Range partitioning

When you insert a row into a table partitioned by Range, and the column value used to determine the partition is `NULL`, then this row is inserted into the lowest partition.

```
CREATE TABLE t1 (
 c1 INT,
 c2 VARCHAR(20)
)
```

```
PARTITION BY RANGE(c1) (
 PARTITION p0 VALUES LESS THAN (0),
 PARTITION p1 VALUES LESS THAN (10),
 PARTITION p2 VALUES LESS THAN MAXVALUE
);
```

Query OK, 0 rows affected (0.09 sec)

```
select * from t1 partition(p0);
```

```
+-----+|-----+
| c1 | c2 |
+-----+|-----+
| NULL | mothra |
+-----+|-----+
1 row in set (0.00 sec)
```

```
select * from t1 partition(p1);
```

Empty set (0.00 sec)

```
select * from t1 partition(p2);
```

Empty set (0.00 sec)

Drop the p0 partition and verify the result:

```
alter table t1 drop partition p0;
```

Query OK, 0 rows affected (0.08 sec)

```
select * from t1;
```

Empty set (0.00 sec)

Handling of NULL with Hash partitioning

When partitioning tables by Hash, there is a different way of handling NULL value - if the calculation result of the partitioning expression is NULL, it is considered as 0.

```
CREATE TABLE th (
 c1 INT,
 c2 VARCHAR(20)
)

PARTITION BY HASH(c1)
PARTITIONS 2;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
INSERT INTO th VALUES (NULL, 'mothra'), (0, 'gigan');
```

```
Query OK, 2 rows affected (0.04 sec)
```

```
select * from th partition (p0);
```

```
+-----+-----+
| c1 | c2 |
+-----+-----+
| NULL | mothra |
| 0 | gigan |
+-----+-----+
2 rows in set (0.00 sec)
```

```
select * from th partition (p1);
```

```
Empty set (0.00 sec)
```

You can see that the inserted record (NULL, 'mothra') falls into the same partition as (0, 'gigan').

#### Note:

NULL values by Hash partitions in TiDB are handled in the same way as described in [How MySQL Partitioning Handles NULL](#), which, however, is not consistent with the actual behavior of MySQL. In other words, MySQL's implementation in this case is not consistent with its documentation.

In this case, the actual behavior of TiDB is in line with the description of this document.

### 14.11.12.2 Partition management

For LIST and RANGE partitioned tables, you can add and drop partitions using the ALTER TABLE <table name> ADD PARTITION (<partition specification>) or ALTER ↵ TABLE <table name> DROP PARTITION <list of partitions> statement.

For LIST and RANGE partitioned tables, REORGANIZE PARTITION is not yet supported.

For HASH partitioned tables, COALESCE PARTITION and ADD PARTITION are not yet supported.

`EXCHANGE PARTITION` works by swapping a partition and a non-partitioned table, similar to how renaming a table like `RENAME TABLE t1 TO t1_tmp, t2 TO t1, t1_tmp TO t2` works.

For example, `ALTER TABLE partitioned_table EXCHANGE PARTITION p1 WITH`  $\leftrightarrow$  `TABLE non_partitioned_table` swaps the `partitioned_table` table `p1` partition with the `non_partitioned_table` table.

Ensure that all rows that you are exchanging into the partition match the partition definition; otherwise, the statement will fail.

Note that TiDB has some specific features that might affect `EXCHANGE PARTITION`. When the table structure contains such features, you need to ensure that `EXCHANGE PARTITION` meets the [MySQL's EXCHANGE PARTITION condition](#). Meanwhile, ensure that these specific features are defined the same for both partitioned and non-partitioned tables. These specific features include the following:

- **Placement Rules in SQL**: placement policies are the same.
- **TiFlash**: the numbers of TiFlash replicas are the same.
- **Clustered Indexes**: partitioned and non-partitioned tables are both `CLUSTERED`, or both `NONCLUSTERED`.

In addition, there are limitations on the compatibility of `EXCHANGE PARTITION` with other components. Both partitioned and non-partitioned tables must have the same definition.

- TiFlash: when the TiFlash replica definitions in partitioned and non-partitioned tables are different, the `EXCHANGE PARTITION` operation cannot be performed.
- TiCDC: TiCDC replicates the `EXCHANGE PARTITION` operation when both partitioned and non-partitioned tables have primary keys or unique keys. Otherwise, TiCDC will not replicate the operation.
- TiDB Lightning and BR: do not perform the `EXCHANGE PARTITION` operation during import using TiDB Lightning or during restore using BR.

#### 14.11.12.2.1 Range partition management

Create a partitioned table:

```
CREATE TABLE members (
 id INT,
 fname VARCHAR(25),
 lname VARCHAR(25),
 dob DATE
)

PARTITION BY RANGE(YEAR(dob)) (

```

```
PARTITION p0 VALUES LESS THAN (1980),
PARTITION p1 VALUES LESS THAN (1990),
PARTITION p2 VALUES LESS THAN (2000)
);
```

Drop a partition:

```
ALTER TABLE members DROP PARTITION p2;
```

```
Query OK, 0 rows affected (0.03 sec)
```

Empty a partition:

```
ALTER TABLE members TRUNCATE PARTITION p1;
```

```
Query OK, 0 rows affected (0.03 sec)
```

#### Note:

ALTER TABLE ... REORGANIZE PARTITION is currently unsupported in TiDB.

Add a partition:

```
ALTER TABLE members ADD PARTITION (PARTITION p3 VALUES LESS THAN (2010));
```

When partitioning tables by Range, ADD PARTITION can be only appended to the very end of a partition list. If it is appended to an existing Range partition, an error is reported:

```
ALTER TABLE members
ADD PARTITION (
PARTITION n VALUES LESS THAN (1970));
```

```
ERROR 1463 (HY000): VALUES LESS THAN value must be strictly »
increasing for each partition
```

#### 14.11.12.2 Hash partition management

Unlike Range partitioning, DROP PARTITION is not supported in Hash partitioning.

Currently, ALTER TABLE ... COALESCE PARTITION is not supported in TiDB as well. For partition management statements that are not currently supported, TiDB returns an error.

```
alter table members optimize partition p0;
```

```
ERROR 8200 (HY000): Unsupported optimize partition
```

### 14.11.12.3 Partition pruning

**Partition pruning** is an optimization which is based on a very simple idea - do not scan the partitions that do not match.

Assume that you create a partitioned table `t1`:

```
CREATE TABLE t1 (
 fname VARCHAR(50) NOT NULL,
 lname VARCHAR(50) NOT NULL,
 region_code TINYINT UNSIGNED NOT NULL,
 dob DATE NOT NULL
)

PARTITION BY RANGE(region_code) (
 PARTITION p0 VALUES LESS THAN (64),
 PARTITION p1 VALUES LESS THAN (128),
 PARTITION p2 VALUES LESS THAN (192),
 PARTITION p3 VALUES LESS THAN MAXVALUE
);
```

If you want to get the result of this `SELECT` statement:

```
SELECT fname, lname, region_code, dob
FROM t1
WHERE region_code > 125 AND region_code < 130;
```

It is evident that the result falls in either the `p1` or the `p2` partition, that is, you just need to search for the matching rows in `p1` and `p2`. Excluding the unneeded partitions is so-called “pruning”. If the optimizer is able to prune a part of partitions, the execution of the query in the partitioned table will be much faster than that in a non-partitioned table.

The optimizer can prune partitions through `WHERE` conditions in the following two scenarios:

- `partition_column = constant`
- `partition_column IN (constant1, constant2, ..., constantN)`

Currently, partition pruning does not work with `LIKE` conditions.

### 14.11.12.3.1 Some cases for partition pruning to take effect

1. Partition pruning uses the query conditions on the partitioned table, so if the query conditions cannot be pushed down to the partitioned table according to the planner's optimization rules, partition pruning does not apply for this query.

For example:

```
create table t1 (x int) partition by range (x) (
 partition p0 values less than (5),
 partition p1 values less than (10));
create table t2 (x int);
```

```
explain select * from t1 left join t2 on t1.x = t2.x where t2.x > 5;
```

In this query, the left out join is converted to the inner join, and then  $t1.x > 5$  is derived from  $t1.x = t2.x$  and  $t2.x > 5$ , so it could be used in partition pruning and only the partition p1 remains.

```
explain select * from t1 left join t2 on t1.x = t2.x and t2.x > 5;
```

In this query,  $t2.x > 5$  cannot be pushed down to the t1 partitioned table, so partition pruning would not take effect for this query.

2. Since partition pruning is done during the plan optimizing phase, it does not apply for those cases that filter conditions are unknown until the execution phase.

For example:

```
create table t1 (x int) partition by range (x) (
 partition p0 values less than (5),
 partition p1 values less than (10));
```

```
explain select * from t2 where x < (select * from t1 where t2.x < t1.x
 ↪ and t2.x < 2);
```

This query reads a row from t2 and uses the result for the subquery on t1. Theoretically, partition pruning could benefit from  $t1.x > val$  expression in the subquery, but it does not take effect there as that happens in the execution phase.

3. As a result of a limitation from current implementation, if a query condition cannot be pushed down to TiKV, it cannot be used by the partition pruning.

Take the  $fn(col)$  expression as an example. If the TiKV coprocessor supports this fn function,  $fn(col)$  may be pushed down to the leaf node (that is, partitioned table) according to the predicate push-down rule during the plan optimizing phase, and partition pruning can use it.

If the TiKV coprocessor does not support this fn function,  $fn(col)$  would not be pushed down to the leaf node. Instead, it becomes a Selection node above the leaf

node. The current partition pruning implementation does not support this kind of plan tree.

4. For Hash partition, the only query supported by partition pruning is the equal condition.
5. For Range partition, for partition pruning to take effect, the partition expression must be in those forms: `col` or `fn(col)`, and the query condition must be one of `>`, `<`, `=`, `>=`, and `<=`. If the partition expression is in the form of `fn(col)`, the `fn` function must be monotonous.

If the `fn` function is monotonous, for any `x` and `y`, if `x > y`, then `fn(x) > fn(y)`. Then this `fn` function can be called strictly monotonous. For any `x` and `y`, if `x > y`, then `fn(x) >= fn(y)`. In this case, `fn` could also be called “monotonous”. In theory, all monotonous functions are supported by partition pruning.

Currently, partition pruning in TiDB only support those monotonous functions:

- `UNIX_TIMESTAMP()`
- `TO_DAYS()`

For example, the partition expression is a simple column:

```
create table t (id int) partition by range (id) (
 partition p0 values less than (5),
 partition p1 values less than (10));
select * from t where id > 6;
```

Or the partition expression is in the form of `fn(col)` where `fn` is `to_days`:

```
create table t (dt datetime) partition by range (to_days(id)) (
 partition p0 values less than (to_days('2020-04-01')),
 partition p1 values less than (to_days('2020-05-01')));
select * from t where dt > '2020-04-18';
```

An exception is `floor(unix_timestamp())` as the partition expression. TiDB does some optimization for that case by case, so it is supported by partition pruning.

```
create table t (ts timestamp(3) not null default current_timestamp(3))
partition by range (floor(unix_timestamp(ts))) (
 partition p0 values less than (unix_timestamp('2020-04-01
 ↪ 00:00:00')),
 partition p1 values less than (unix_timestamp('2020-05-01
 ↪ 00:00:00')));
select * from t where ts > '2020-04-18 02:00:42.123';
```

#### 14.11.12.4 Partition selection

SELECT statements support partition selection, which is implemented by using a PARTITION option.

```

SET @@sql_mode = '';

CREATE TABLE employees (
 id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
 fname VARCHAR(25) NOT NULL,
 lname VARCHAR(25) NOT NULL,
 store_id INT NOT NULL,
 department_id INT NOT NULL
)
PARTITION BY RANGE(id) (
 PARTITION p0 VALUES LESS THAN (5),
 PARTITION p1 VALUES LESS THAN (10),
 PARTITION p2 VALUES LESS THAN (15),
 PARTITION p3 VALUES LESS THAN MAXVALUE
);

INSERT INTO employees VALUES
 ('', 'Bob', 'Taylor', 3, 2), ('', 'Frank', 'Williams', 1, 2),
 ('', 'Ellen', 'Johnson', 3, 4), ('', 'Jim', 'Smith', 2, 4),
 ('', 'Mary', 'Jones', 1, 1), ('', 'Linda', 'Black', 2, 3),
 ('', 'Ed', 'Jones', 2, 1), ('', 'June', 'Wilson', 3, 1),
 ('', 'Andy', 'Smith', 1, 3), ('', 'Lou', 'Waters', 2, 4),
 ('', 'Jill', 'Stone', 1, 4), ('', 'Roger', 'White', 3, 2),
 ('', 'Howard', 'Andrews', 1, 2), ('', 'Fred', 'Goldberg', 3, 3),
 ('', 'Barbara', 'Brown', 2, 3), ('', 'Alice', 'Rogers', 2, 2),
 ('', 'Mark', 'Morgan', 3, 3), ('', 'Karen', 'Cole', 3, 2);

```

You can view the rows stored in the p1 partition:

```
SELECT * FROM employees PARTITION (p1);
```

| id | fname | lname  | store_id | department_id |
|----|-------|--------|----------|---------------|
| 5  | Mary  | Jones  | 1        | 1             |
| 6  | Linda | Black  | 2        | 3             |
| 7  | Ed    | Jones  | 2        | 1             |
| 8  | June  | Wilson | 3        | 1             |
| 9  | Andy  | Smith  | 1        | 3             |

```
5 rows in set (0.00 sec)
```

If you want to get the rows in multiple partitions, you can use a list of partition names which are separated by commas. For example, `SELECT * FROM employees PARTITION (p1 ↵ , p2)` returns all rows in the p1 and p2 partitions.

When you use partition selection, you can still use `WHERE` conditions and options such as `ORDER BY` and `LIMIT`. It is also supported to use aggregation options such as `HAVING` and `GROUP BY`.

```
SELECT * FROM employees PARTITION (p0, p2)
WHERE lname LIKE 'S%';
```

```
+----|-----|-----|-----|-----+
| id | fname | lname | store_id | department_id |
+----|-----|-----|-----|-----+
| 4 | Jim | Smith | 2 | 4 |
| 11 | Jill | Stone | 1 | 4 |
+----|-----|-----|-----|-----+
2 rows in set (0.00 sec)
```

```
SELECT id, CONCAT(fname, ' ', lname) AS name
FROM employees PARTITION (p0) ORDER BY lname;
```

```
+----|-----+
| id | name |
+----|-----+
3	Ellen Johnson
4	Jim Smith
1	Bob Taylor
2	Frank Williams
+----|-----+
4 rows in set (0.06 sec)
```

```
SELECT store_id, COUNT(department_id) AS c
FROM employees PARTITION (p1,p2,p3)
GROUP BY store_id HAVING c > 4;
```

```
+----|-----+
| c | store_id |
+----|-----+
| 5 | 2 |
| 5 | 3 |
+----|-----+
2 rows in set (0.00 sec)
```

Partition selection is supported for all types of table partitioning, including Range partitioning and Hash partitioning. For Hash partitions, if partition names are not specified, p0, p1, p2,..., or pN-1 is automatically used as the partition name.

SELECT in INSERT ... SELECT can also use partition selection.

#### 14.11.12.5 Restrictions and limitations on partitions

This section introduces some restrictions and limitations on partitioned tables in TiDB.

##### 14.11.12.5.1 Partitioning keys, primary keys and unique keys

This section discusses the relationship of partitioning keys with primary keys and unique keys. The rule governing this relationship can be expressed as follows: **Every unique key on the table must use every column in the table's partitioning expression.** This also includes the table's primary key, because it is by definition a unique key.

For example, the following table creation statements are invalid:

```
CREATE TABLE t1 (
 col1 INT NOT NULL,
 col2 DATE NOT NULL,
 col3 INT NOT NULL,
 col4 INT NOT NULL,
 UNIQUE KEY (col1, col2)
)

PARTITION BY HASH(col3)
PARTITIONS 4;

CREATE TABLE t2 (
 col1 INT NOT NULL,
 col2 DATE NOT NULL,
 col3 INT NOT NULL,
 col4 INT NOT NULL,
 UNIQUE KEY (col1),
 UNIQUE KEY (col3)
)

PARTITION BY HASH(col1 + col3)
PARTITIONS 4;
```

In each case, the proposed table has at least one unique key that does not include all columns used in the partitioning expression.

The valid statements are as follows:

```
CREATE TABLE t1 (

```

```
col1 INT NOT NULL,
col2 DATE NOT NULL,
col3 INT NOT NULL,
col4 INT NOT NULL,
UNIQUE KEY (col1, col2, col3)
)

PARTITION BY HASH(col3)
PARTITIONS 4;

CREATE TABLE t2 (
col1 INT NOT NULL,
col2 DATE NOT NULL,
col3 INT NOT NULL,
col4 INT NOT NULL,
UNIQUE KEY (col1, col3)
)

PARTITION BY HASH(col1 + col3)
PARTITIONS 4;
```

The following example displays an error:

```
CREATE TABLE t3 (
col1 INT NOT NULL,
col2 DATE NOT NULL,
col3 INT NOT NULL,
col4 INT NOT NULL,
UNIQUE KEY (col1, col2),
UNIQUE KEY (col3)
)

PARTITION BY HASH(col1 + col3)
PARTITIONS 4;
```

```
ERROR 1491 (HY000): A PRIMARY KEY must include all columns in the table's
↪ partitioning function
```

The CREATE TABLE statement fails because both `col1` and `col3` are included in the proposed partitioning key, but neither of these columns is part of both of unique keys on the table. After the following modifications, the CREATE TABLE statement becomes valid:

```
CREATE TABLE t3 (
col1 INT NOT NULL,
col2 DATE NOT NULL,
col3 INT NOT NULL,
```

```
col4 INT NOT NULL,
UNIQUE KEY (col1, col2, col3),
UNIQUE KEY (col1, col3)
)
PARTITION BY HASH(col1 + col3)
PARTITIONS 4;
```

The following table cannot be partitioned at all, because there is no way to include in a partitioning key any columns that belong to both unique keys:

```
CREATE TABLE t4 (
col1 INT NOT NULL,
col2 INT NOT NULL,
col3 INT NOT NULL,
col4 INT NOT NULL,
UNIQUE KEY (col1, col3),
UNIQUE KEY (col2, col4)
);
```

Because every primary key is by definition a unique key, so the next two statements are invalid:

```
CREATE TABLE t5 (
col1 INT NOT NULL,
col2 DATE NOT NULL,
col3 INT NOT NULL,
col4 INT NOT NULL,
PRIMARY KEY(col1, col2)
)

PARTITION BY HASH(col3)
PARTITIONS 4;

CREATE TABLE t6 (
col1 INT NOT NULL,
col2 DATE NOT NULL,
col3 INT NOT NULL,
col4 INT NOT NULL,
PRIMARY KEY(col1, col3),
UNIQUE KEY(col2)
)

PARTITION BY HASH(YEAR(col2))
PARTITIONS 4;
```

In the above examples, the primary key does not include all columns referenced in the partitioning expression. After adding the missing column in the primary key, the `CREATE TABLE` statement becomes valid:

```
CREATE TABLE t5 (
 col1 INT NOT NULL,
 col2 DATE NOT NULL,
 col3 INT NOT NULL,
 col4 INT NOT NULL,
 PRIMARY KEY(col1, col2, col3)
)
PARTITION BY HASH(col3)
PARTITIONS 4;
CREATE TABLE t6 (
 col1 INT NOT NULL,
 col2 DATE NOT NULL,
 col3 INT NOT NULL,
 col4 INT NOT NULL,
 PRIMARY KEY(col1, col2, col3),
 UNIQUE KEY(col2)
)
PARTITION BY HASH(YEAR(col2))
PARTITIONS 4;
```

If a table has neither unique keys nor primary keys, then this restriction does not apply.

When you change tables using DDL statements, you also need to consider this restriction when adding a unique index. For example, when you create a partitioned table as shown below:

```
CREATE TABLE t_no_pk (c1 INT, c2 INT)
PARTITION BY RANGE(c1) (
 PARTITION p0 VALUES LESS THAN (10),
 PARTITION p1 VALUES LESS THAN (20),
 PARTITION p2 VALUES LESS THAN (30),
 PARTITION p3 VALUES LESS THAN (40)
);
```

```
Query OK, 0 rows affected (0.12 sec)
```

You can add a non-unique index by using `ALTER TABLE` statements. But if you want to add a unique index, the `c1` column must be included in the unique index.

When using a partitioned table, you cannot specify the prefix index as a unique attribute:

```
CREATE TABLE t (a varchar(20), b blob,
 UNIQUE INDEX (a(5)))
PARTITION by range columns (a) (

```

```
PARTITION p0 values less than ('aaaaa'),
PARTITION p1 values less than ('bbbbbb'),
PARTITION p2 values less than ('ccccc');
```

```
ERROR 1503 (HY000): A UNIQUE INDEX must include all columns in the table's
↪ partitioning function
```

#### 14.11.12.5.2 Partitioning limitations relating to functions

Only the functions shown in the following list are allowed in partitioning expressions:

```
ABS()
CEILING()
DATEDIFF()
DAY()
DAYOFMONTH()
DAYOFWEEK()
DAYOFYEAR()
EXTRACT() (see EXTRACT() function with WEEK specifier)
FLOOR()
HOUR()
MICROSECOND()
MINUTE()
MOD()
MONTH()
QUARTER()
SECOND()
TIME_TO_SEC()
TO_DAYS()
TO_SECONDS()
UNIX_TIMESTAMP() (with TIMESTAMP columns)
WEEKDAY()
YEAR()
YEARWEEK()
```

#### 14.11.12.5.3 Compatibility with MySQL

Currently, TiDB supports Range partitioning, Range COLUMNS partitioning, List partitioning, List COLUMNS partitioning, and Hash partitioning. Other partitioning types that are available in MySQL such as key partitioning are not supported yet in TiDB.

With regard to partition management, any operation that requires moving data in the bottom implementation is not supported currently, including but not limited to: adjust the number of partitions in a Hash partitioned table, modify the Range of a Range partitioned table, merge partitions and exchange partitions.

For the unsupported partitioning types, when you create a table in TiDB, the partitioning information is ignored and the table is created in the regular form with a warning reported.

The LOAD DATA syntax does not support partition selection currently in TiDB.

```
create table t (id int, val int) partition by hash(id) partitions 4;
```

The regular LOAD DATA operation is supported:

```
load local data infile "xxx" into t ...
```

But Load Data does not support partition selection:

```
load local data infile "xxx" into t partition (p1)...
```

For a partitioned table, the result returned by `select * from t` is unordered between the partitions. This is different from the result in MySQL, which is ordered between the partitions but unordered inside the partitions.

```
create table t (id int, val int) partition by range (id) (
 partition p0 values less than (3),
 partition p1 values less than (7),
 partition p2 values less than (11));
```

```
Query OK, 0 rows affected (0.10 sec)
```

```
insert into t values (1, 2), (3, 4),(5, 6),(7,8),(9,10);
```

```
Query OK, 5 rows affected (0.01 sec)
Records: 5 Duplicates: 0 Warnings: 0
```

TiDB returns a different result every time, for example:

```
select * from t;
```

```
+-----+-----+
| id | val |
+-----+-----+
7	8
9	10
1	2
3	4
5	6
+-----+-----+
5 rows in set (0.00 sec)
```

The result returned in MySQL:

```
select * from t;
```

```
+-----+-----+
| id | val |
+-----+-----+
1	2
3	4
5	6
7	8
9	10
+-----+-----+
5 rows in set (0.00 sec)
```

The `tidb_enable_list_partition` environment variable controls whether to enable the partitioned table feature. If this variable is set to `OFF`, the partition information will be ignored when a table is created, and this table will be created as a normal table.

This variable is only used in table creation. After the table is created, modify this variable value takes no effect. For details, see [system variables](#).

#### 14.11.12.5.4 Dynamic pruning mode

TiDB accesses partitioned tables in either `dynamic` or `static` mode. `dynamic` mode is used by default since v6.3.0. However, dynamic partitioning is effective only after the full table-level statistics, or GlobalStats, are collected. Before GlobalStats are collected, TiDB will use the `static` mode instead. For detailed information about GlobalStats, see [Collect statistics of partitioned tables in dynamic pruning mode](#).

```
set @@session.tidb_partition_prune_mode = 'dynamic'
```

Manual `ANALYZE` and normal queries use the session-level `tidb_partition_prune_mode` setting. The `auto-analyze` operation in the background uses the global `tidb_partition_prune_mode` setting.

In `static` mode, partitioned tables use partition-level statistics. In `dynamic` mode, partitioned tables use table-level GlobalStats.

When switching from `static` mode to `dynamic` mode, you need to check and collect statistics manually. This is because after the switch to `dynamic` mode, partitioned tables have only partition-level statistics but no table-level statistics. GlobalStats are collected only upon the next `auto-analyze` operation.

```
set session tidb_partition_prune_mode = 'dynamic';
show stats_meta where table_name like "t";
```

```
↪
```

```

| Db_name | Table_name | Partition_name | Update_time | Modify_count |
 ↳ Row_count |
+-----+-----+-----+-----+-----+
 ↳
| test | t | p0 | 2022-05-27 20:23:34 | 1 |
 ↳ 2 |
| test | t | p1 | 2022-05-27 20:23:34 | 2 |
 ↳ 4 |
| test | t | p2 | 2022-05-27 20:23:34 | 2 |
 ↳ 4 |
+-----+-----+-----+-----+-----+
 ↳
3 rows in set (0.01 sec)

```

To make sure that the statistics used by SQL statements are correct after you enable global dynamic pruning mode, you need to manually trigger `analyze` on the tables or on a partition of the table to obtain GlobalStats.

```

analyze table t partition p1;
show stats_meta where table_name like "t";

```

```

+-----+-----+-----+-----+-----+
 ↳
| Db_name | Table_name | Partition_name | Update_time | Modify_count |
 ↳ Row_count |
+-----+-----+-----+-----+-----+
 ↳
| test | t | global | 2022-05-27 20:50:53 | 0 |
 ↳ 5 |
| test | t | p0 | 2022-05-27 20:23:34 | 1 |
 ↳ 2 |
| test | t | p1 | 2022-05-27 20:50:52 | 0 |
 ↳ 2 |
| test | t | p2 | 2022-05-27 20:50:08 | 0 |
 ↳ 2 |
+-----+-----+-----+-----+-----+
 ↳
4 rows in set (0.00 sec)

```

If the following warning is displayed during the `analyze` process, partition statistics are inconsistent, and you need to collect statistics of these partitions or the entire table again.

```

| Warning | 8244 | Build table: `t` column: `a` global-level stats failed
 ↳ due to missing partition-level column stats, please run analyze table
 ↳ to refresh columns of all partitions

```

You can also use scripts to update statistics of all partitioned tables. For details, see [Update statistics of partitioned tables in dynamic pruning mode](#).

After table-level statistics are ready, you can enable the global dynamic pruning mode, which is effective to all SQL statements and auto-analyze operations.

```
set global tidb_partition_prune_mode = dynamic
```

In **static** mode, TiDB accesses each partition separately using multiple operators, and then merges the results using **Union**. The following example is a simple read operation where TiDB merges the results of two corresponding partitions using **Union**:

```
mysql> create table t1(id int, age int, key(id)) partition by range(id) (
-> partition p0 values less than (100),
-> partition p1 values less than (200),
-> partition p2 values less than (300),
-> partition p3 values less than (400));
Query OK, 0 rows affected (0.01 sec)
```

```
mysql> explain select * from t1 where id < 150;
```

```
+-----+-----+-----+-----+
 ↪
| id | estRows | task | access object |
 ↪ operator info |
+-----+-----+-----+-----+
 ↪
| PartitionUnion_9 | 6646.67 | root | |
 ↪
| -TableReader_12 | 3323.33 | root | | data
 ↪ :Selection_11 |
| -Selection_11 | 3323.33 | cop[tikv] | | lt(
 ↪ test.t1.id, 150) |
| -TableFullScan_10 | 10000.00 | cop[tikv] | table:t1, partition:p0
 ↪ | keep order:false, stats:pseudo |
| -TableReader_18 | 3323.33 | root | | data
 ↪ :Selection_17 |
| -Selection_17 | 3323.33 | cop[tikv] | | lt(
 ↪ test.t1.id, 150) |
| -TableFullScan_16 | 10000.00 | cop[tikv] | table:t1, partition:p1
 ↪ | keep order:false, stats:pseudo |
+-----+-----+-----+-----+
 ↪
7 rows in set (0.00 sec)
```

In **dynamic** mode, each operator supports direct access to multiple partitions, so TiDB no longer uses **Union**.

```
mysql> set @@session.tidb_partition_prune_mode = 'dynamic';
Query OK, 0 rows affected (0.00 sec)

mysql> explain select * from t1 where id < 150;
+---
 ↪ -----+-----+-----+-----+-----+
 ↪
| id | estRows | task | access object | operator info
 ↪ | | | |
+---
 ↪ -----+-----+-----+-----+-----+
 ↪
| TableReader_7 | 3323.33 | root | partition:p0,p1 | data:
 ↪ Selection_6 | | | |
| -Selection_6 | 3323.33 | cop[tikv] | | lt(test.t1.id,
 ↪ 150) | | | |
| -TableFullScan_5 | 10000.00 | cop[tikv] | table:t1 | keep order:
 ↪ false, stats:pseudo | | | |
+---
 ↪ -----+-----+-----+-----+-----+
 ↪
3 rows in set (0.00 sec)
```

From the above query results, you can see that the Union operator in the execution plan disappears while the partition pruning still takes effect and the execution plan only accesses p0 and p1.

dynamic mode makes execution plans simpler and clearer. Omitting the Union operation can improve the execution efficiency and avoid the problem of Union concurrent execution. In addition, dynamic mode also allows execution plans with IndexJoin which cannot be used in static mode. (See examples below)

**Example 1:** In the following example, a query is performed in static mode using the execution plan with IndexJoin:

```
mysql> create table t1 (id int, age int, key(id)) partition by range(id)
-> (partition p0 values less than (100),
-> partition p1 values less than (200),
-> partition p2 values less than (300),
-> partition p3 values less than (400));
Query OK, 0 rows affected (0,08 sec)

mysql> create table t2 (id int, code int);
Query OK, 0 rows affected (0.01 sec)

mysql> set @@tidb_partition_prune_mode = 'static';
```

Query OK, 0 rows affected (0.00 sec)

```
mysql> explain select /*+ TIDB_INLJ(t1, t2) */ t1.* from t1, t2 where t2.
```

```
↳ code = 0 and t2.id = t1.id;
```

```
+--
```

```
↳ -----+-----+-----+-----+
↳
```

| id              | estRows | task | access object |
|-----------------|---------|------|---------------|
| ↳ operator info |         |      |               |

```
+--
```

```
↳ -----+-----+-----+-----+
↳
```

|                                                  |          |           |                      |
|--------------------------------------------------|----------|-----------|----------------------|
| HashJoin_13                                      | 12.49    | root      |                      |
| ↳ inner join, equal:[eq(test.t1.id, test.t2.id)] |          |           |                      |
| -TableReader_42(Build)                           | 9.99     | root      |                      |
| ↳ data:Selection_41                              |          |           |                      |
| -Selection_41                                    | 9.99     | cop[tikv] | eq                   |
| ↳ (test.t2.code, 0), not(isnull(test.t2.id))     |          |           |                      |
| -TableFullScan_40                                | 10000.00 | cop[tikv] | table:t2             |
| ↳ keep order:false, stats:pseudo                 |          |           |                      |
| -PartitionUnion_15(Probe)                        | 39960.00 | root      |                      |

| -Selection_29                                    | 9990.00  | cop[tikv] |                      |
| ↳ not(isnull(test.t1.id))                        |          |           |                      |
| -TableFullScan_28                                | 10000.00 | cop[tikv] | table:t1, partition: |
| ↳ p2   keep order:false, stats:pseudo            |          |           |                      |
| -TableReader_36                                  | 9990.00  | root      |                      |
| ↳ data:Selection_35                              |          |           |                      |
| -Selection_35                                    | 9990.00  | cop[tikv] |                      |
| ↳ not(isnull(test.t1.id))                        |          |           |                      |
| -TableFullScan_34                                | 10000.00 | cop[tikv] | table:t1, partition: |

```

 ↪ p3 | keep order:false, stats:pseudo |
+--
 ↪ -----+-----+-----+-----+
 ↪
17 rows in set, 1 warning (0.00 sec)

mysql> show warnings;
+--
 ↪ -----+-----+-----+-----+
 ↪
| Level | Code | Message
 ↪
+--
 ↪ -----+-----+-----+-----+
 ↪
| Warning | 1815 | Optimizer Hint /** INL_JOIN(t1, t2) */ or /** TIDB_INLJ(
 ↪ t1, t2) */ is inapplicable |
+--
 ↪ -----+-----+-----+-----+
 ↪
1 row in set (0,00 sec)

```

From example 1, you can see that even if the TIDB\_INLJ hint is used, the query on the partitioned table cannot select the execution plan with IndexJoin.

**Example 2:** In the following example, the query is performed in dynamic mode using the execution plan with IndexJoin:

```

mysql> set @@tidb_partition_prune_mode = 'dynamic';
Query OK, 0 rows affected (0.00 sec)

mysql> explain select /** TIDB_INLJ(t1, t2) */ t1.* from t1, t2 where t2.
 ↪ code = 0 and t2.id = t1.id;
+--
 ↪ -----+-----+-----+-----+
 ↪
| id | id | estRows | task | access object |
 ↪ operator info
 ↪
 ↪ |
+--
 ↪ -----+-----+-----+-----+
 ↪
| IndexJoin_11 | | 12.49 | root | |
 ↪ inner join, inner:IndexLookup_10, outer key:test.t2.id, inner key:
 ↪ test.t1.id, equal cond:eq(test.t2.id, test.t1.id) |

```

```
| -TableReader_16(Build) | 9.99 | root | |
| ↳ data:Selection_15
| ↳
| ↳ |
| -Selection_15 | 9.99 | cop[tikv] | |
| ↳ eq(test.t2.code, 0), not(isnull(test.t2.id))
| ↳
| -TableFullScan_14 | 10000.00 | cop[tikv] | table:t2
| ↳ keep order:false, stats:pseudo
| ↳
| ↳ |
| -IndexLookUp_10(Probe) | 12.49 | root | partition:all
| ↳
| ↳ |
| -Selection_9(Build) | 12.49 | cop[tikv] | |
| ↳ not(isnull(test.t1.id))
| ↳
| ↳ |
| -IndexRangeScan_7 | 12.50 | cop[tikv] | table:t1, index:id(id
| ↳) | range: decided by [eq(test.t1.id, test.t2.id)], keep order:false,
| ↳ stats:pseudo
| -TableRowIDScan_8(Probe) | 12.49 | cop[tikv] | table:t1
| ↳ keep order:false, stats:pseudo
| ↳
| ↳ |
+--
| ↳ -----+-----+-----+-----+
| ↳
8 rows in set (0.00 sec)
```

From example 2, you can see that in dynamic mode, the execution plan with IndexJoin is selected when you execute the query.

Currently, neither static nor dynamic pruning mode supports prepared statements plan cache.

Update statistics of partitioned tables in dynamic pruning mode

#### 1. Locate all partitioned tables:

```
SELECT DISTINCT CONCAT(TABLE_SCHEMA, '.', TABLE_NAME)
FROM information_schema.PARTITIONS
WHERE TIDB_PARTITION_ID IS NOT NULL
AND TABLE_SCHEMA NOT IN ('INFORMATION_SCHEMA', 'mysql', 'sys', '
↳ PERFORMANCE_SCHEMA', 'METRICS_SCHEMA');
```

```

+-----+
| concat(TABLE_SCHEMA, '.', TABLE_NAME) |
+-----+
| test.t |
+-----+
1 row in set (0.02 sec)

```

2. Generate the statements for updating the statistics of all partitioned tables:

```

select distinct concat('ANALYZE TABLE ', TABLE_SCHEMA, '.', TABLE_NAME, '
↳ ALL COLUMNS;')
 from information_schema.PARTITIONS
 where TABLE_SCHEMA not in ('INFORMATION_SCHEMA', 'mysql', 'sys', '
↳ PERFORMANCE_SCHEMA', 'METRICS_SCHEMA');
+--
↳ -----+
↳
| concat('ANALYZE TABLE ', TABLE_SCHEMA, '.', TABLE_NAME, ' ALL COLUMNS;')
↳ |
+--
↳ -----+
↳
| ANALYZE TABLE test.t ALL COLUMNS; |
+--
↳ -----+
↳
1 row in set (0.01 sec)

```

You can change ALL COLUMNS to the columns you need.

3. Export the batch update statements to a file:

```

mysql --host xxx --port xxx -u root -p -e "select distinct concat('
↳ ANALYZE TABLE ', TABLE_SCHEMA, '.', TABLE_NAME, ' ALL COLUMNS;') \
 from information_schema.PARTITIONS \
 where TABLE_SCHEMA not in ('INFORMATION_SCHEMA', 'mysql', 'sys', '
↳ PERFORMANCE_SCHEMA', 'METRICS_SCHEMA');" | tee
↳ gatherGlobalStats.sql

```

4. Execute a batch update:

Process SQL statements before executing the source command:

```

sed -i "" '1d' gatherGlobalStats.sql --- mac
sed -i '1d' gatherGlobalStats.sql --- linux

```

```
SET session tidb_partition_prune_mode = dynamic;
source gatherGlobalStats.sql
```

### 14.11.13 Temporary Tables

The temporary tables feature is introduced in TiDB v5.3.0. This feature solves the issue of temporarily storing the intermediate results of an application, which frees you from frequently creating and dropping tables. You can store the intermediate calculation data in temporary tables. When the intermediate data is no longer needed, TiDB automatically cleans up and recycles the temporary tables. This avoids user applications being too complicated, reduces table management overhead, and improves performance.

This document introduces the user scenarios and the types of temporary tables, provides usage examples and instruction on how to limit the memory usage of temporary tables, and explains compatibility restrictions with other TiDB features.

#### 14.11.13.1 User scenarios

You can use TiDB temporary tables in the following scenarios:

- Cache the intermediate temporary data of an application. After the calculation is completed, the data is dumped to the ordinary table, and the temporary table is automatically released.
- Perform multiple DML operations on the same data in a short period of time. For example, in an e-commerce shopping cart application, add, modify, and delete products, complete the payment, and remove the shopping cart information.
- Quickly import intermediate temporary data in batches to improve the performance of importing temporary data.
- Update data in batches. Import data into temporary tables in the database in batches, and export the data to files after finishing modify the data.

#### 14.11.13.2 Types of temporary tables

Temporary tables in TiDB are divided into two types: local temporary tables and global temporary tables.

- For a local temporary table, the table definition and data in the table are visible only to the current session. This type is suitable for temporarily storing intermediate data in the session.
- For a global temporary table, the table definition is visible to the entire TiDB cluster, and the data in the table is visible only to the current transaction. This type is suitable for temporarily storing intermediate data in the transaction.

### 14.11.13.3 Local temporary tables

The semantics of the local temporary table in TiDB is consistent with that of the MySQL temporary table. The characteristics are as follows:

- The table definition of a local temporary table is not persistent. A local temporary table is visible only to the session in which the table is created, and other sessions cannot access the table.
- You can create local temporary tables with the same name in different sessions, and each session reads only from and writes only to the local temporary table created in the session.
- The data of a local temporary table is visible to all transactions in the session.
- After a session ends, the local temporary table created in the session is automatically dropped.
- A local temporary table can have the same name as an ordinary table. In this case, in the DDL and DML statements, the ordinary table is hidden until the local temporary table is dropped.

To create a local temporary table, you can use the `CREATE TEMPORARY TABLE` statement. To drop a local temporary table, you can use the `DROP TABLE` or `DROP TEMPORARY TABLE` statement.

Different from MySQL, the local temporary tables in TiDB are all external tables, and no internal temporary tables will be created automatically when SQL statements are executed.

#### 14.11.13.3.1 Usage examples of local temporary tables

##### Note:

- Before you use the temporary table in TiDB, pay attention to the [compatibility restrictions with other TiDB features](#) and the [compatibility with MySQL temporary tables](#).
- If you have created local temporary tables on a cluster earlier than TiDB v5.3.0, these tables are actually ordinary tables, and treated as ordinary tables after the cluster is upgraded to TiDB v5.3.0 or a later version.

Assume that there is an ordinary table `users`:

```
CREATE TABLE users (
 id BIGINT,
 name VARCHAR(100),
 PRIMARY KEY(id)
);
```

In session A, creating a local temporary table `users` does not conflict with the ordinary table `users`. When session A accesses the `users` table, it accesses the local temporary table `users`.

```
CREATE TEMPORARY TABLE users (
 id BIGINT,
 name VARCHAR(100),
 city VARCHAR(50),
 PRIMARY KEY(id)
);
```

```
Query OK, 0 rows affected (0.01 sec)
```

If you insert data into `users`, data is inserted to the local temporary table `users` in session A.

```
INSERT INTO users(id, name, city) VALUES(1001, 'Davis', 'LosAngeles');
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SELECT * FROM users;
```

```
+-----+-----+-----+
| id | name | city |
+-----+-----+-----+
| 1001 | Davis | LosAngeles |
+-----+-----+-----+
1 row in set (0.00 sec)
```

In session B, creating a local temporary table `users` does not conflict with the ordinary table `users` or the local temporary table `users` in session A. When session B accesses the `users` table, it accesses the local temporary table `users` in session B.

```
CREATE TEMPORARY TABLE users (
 id BIGINT,
 name VARCHAR(100),
 city VARCHAR(50),
 PRIMARY KEY(id)
);
```

```
Query OK, 0 rows affected (0.01 sec)
```

If you insert data into `users`, data is inserted to the local temporary table `users` in session B.

```
INSERT INTO users(id, name, city) VALUES(1001, 'James', 'NewYork');
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SELECT * FROM users;
```

```
+-----+-----+-----+
| id | name | city |
+-----+-----+-----+
| 1001 | James | NewYork |
+-----+-----+-----+
1 row in set (0.00 sec)
```

### 14.11.13.3.2 Compatibility with MySQL temporary tables

The following features and limitations of TiDB local temporary tables are the same with those of MySQL temporary tables:

- When you create or drop local temporary tables, the current transaction is not automatically committed.
- After dropping the schema where a local temporary table is located, the temporary table is not dropped and is still readable and writable.
- Creating a local temporary table requires the `CREATE TEMPORARY TABLES` permission. All subsequent operations on the table do not require any permission.
- Local temporary tables do not support foreign keys and partitioned tables.
- Does not support creating views based on local temporary tables.
- `SHOW [FULL] TABLES` does not show local temporary tables.

Local temporary tables in TiDB are incompatible with MySQL temporary tables in the following aspects:

- TiDB local temporary tables do not support `ALTER TABLE`.
- TiDB local temporary tables ignore the `ENGINE` table option, and always store temporary table data in TiDB memory with a **memory limit**.
- When `MEMORY` is declared as the storage engine, TiDB local temporary tables are not restricted by the `MEMORY` storage engine.
- When `INNODB` or `MYISAM` is declared as the storage engine, TiDB local temporary tables ignore the system variables specific to the InnoDB temporary tables.
- MySQL does not permit referencing to the same temporary table multiple times in the same SQL statement. TiDB local temporary tables do not have this restriction.
- The system table `information_schema.INNODB_TEMP_TABLE_INFO` that shows temporary tables in MySQL does not exist in TiDB. Currently, TiDB does not have a system table that shows local temporary tables.
- TiDB does not have internal temporary tables. The MySQL system variables for internal temporary tables do not take effect for TiDB.

#### 14.11.13.4 Global temporary tables

The global temporary table is an extension of TiDB. The characteristics are as follows:

- The table definition of a global temporary table is persistent and visible to all sessions.
- The data of a global temporary table is visible only in the current transaction. When the transaction ends, the data is automatically cleared.
- A global temporary table cannot have the same name as an ordinary table.

To create a global temporary table, you can use the `CREATE GLOBAL TEMPORARY TABLE` statement ended with `ON COMMIT DELETE ROWS`. To drop a global temporary table, you can use the `DROP TABLE` or `DROP GLOBAL TEMPORARY TABLE` statement.

##### 14.11.13.4.1 Usage examples of global temporary tables

###### Note:

- Before you use the temporary table in TiDB, pay attention to the [compatibility restrictions with other TiDB features](#).
- If you have created global temporary tables on a TiDB cluster of v5.3.0 or later, when the cluster is downgraded to a version earlier than v5.3.0, these tables are handled as ordinary tables. In this case, a data error occurs.

Create a global temporary table `users` in session A:

```
CREATE GLOBAL TEMPORARY TABLE users (
 id BIGINT,
 name VARCHAR(100),
 city VARCHAR(50),
 PRIMARY KEY(id)
) ON COMMIT DELETE ROWS;
```

```
Query OK, 0 rows affected (0.01 sec)
```

The data written to `users` is visible to the current transaction:

```
BEGIN;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
INSERT INTO users(id, name, city) VALUES(1001, 'Davis', 'LosAngeles');
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SELECT * FROM users;
```

```
+-----+-----+-----+
| id | name | city |
+-----+-----+-----+
| 1001 | Davis | LosAngeles |
+-----+-----+-----+
1 row in set (0.00 sec)
```

After the transaction ends, the data is automatically cleared:

```
COMMIT;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
SELECT * FROM users;
```

```
Empty set (0.00 sec)
```

After `users` is created in session A, session B can also read from and write to the `users` table:

```
SELECT * FROM users;
```

```
Empty set (0.00 sec)
```

#### Note:

If the transaction is automatically committed, after the SQL statement is executed, the inserted data is automatically cleared and unavailable to subsequent SQL executions. Therefore, you should use non-autocommit transactions to read from and write to global temporary tables.

#### 14.11.13.5 Limit the memory usage of temporary tables

No matter which storage engine is declared as `ENGINE` when you define a table, the data of local temporary tables and global temporary tables is only stored in the memory of TiDB instances. This data is not persisted.

To avoid memory overflow, you can limit the size of each temporary table using the `tidb_tmp_table_max_size` system variable. Once a temporary table is larger than the `tidb_tmp_table_max_size` threshold value, TiDB reports an error. The default value of `tidb_tmp_table_max_size` is 64MB.

For example, set the maximum size of a temporary table to 256MB:

```
SET GLOBAL tidb_tmp_table_max_size=268435456;
```

#### 14.11.13.6 Compatibility restrictions with other TiDB features

Local temporary tables and global temporary tables in TiDB are **NOT** compatible with the following TiDB features:

- `AUTO_RANDOM` columns
- `SHARD_ROW_ID_BITS` and `PRE_SPLIT_REGIONS` table options
- Partitioned tables
- `SPLIT REGION` statements
- `ADMIN CHECK TABLE` and `ADMIN CHECKSUM TABLE` statements
- `FLASHBACK TABLE` and `RECOVER TABLE` statements
- Executing `CREATE TABLE LIKE` statements based on a temporary table
- Stale Read
- Foreign keys
- SQL bindings
- TiFlash replicas
- Creating views on a temporary table
- Placement Rules
- Execution plans involving a temporary table are not cached by `prepare plan cache`.

Local temporary tables in TiDB do **NOT** support the following feature:

- Reading historical data using the `tidb_snapshot` system variable.

#### 14.11.13.7 TiDB migration tool support

Local temporary tables are not exported, backed up or replicated by TiDB migration tools, because these tables are visible only to the current session.

Global temporary tables are exported, backed up, and replicated by TiDB migration tools, because the table definition is globally visible. Note that the data on the tables are not exported.

**Note:**

- Replicating temporary tables using TiCDC requires TiCDC v5.3.0 or later. Otherwise, the table definition of the downstream table is wrong.
- Backing up temporary tables using BR requires BR v5.3.0 or later. Otherwise, the table definitions of the backed temporary tables are wrong.
- The cluster to export, the cluster after data restore, and the downstream cluster of a replication should support global temporary tables. Otherwise, an error is reported.

- [CREATE TABLE](#)
- [CREATE TABLE LIKE](#)
- [DROP TABLE](#)

#### 14.11.14 Cached Tables

In v6.0.0, TiDB introduces the cached table feature for frequently accessed but rarely updated small hotspot tables. When this feature is used, the data of an entire table is loaded into the memory of the TiDB server, and TiDB directly gets the table data from the memory without accessing TiKV, which improves the read performance.

This document describes the usage scenarios of cached tables, the examples, and the compatibility restrictions with other TiDB features.

##### 14.11.14.1 Usage scenarios

The cached table feature is suitable for tables with the following characteristics:

- The data volume of the table is small.
- The table is read-only or rarely updated.
- The table is frequently accessed, and you expect a better read performance.

When the data volume of the table is small but the data is frequently accessed, the data is concentrated on a Region in TiKV and makes it a hotspot Region, which affects the performance. Therefore, the typical usage scenarios of cached tables are as follows:

- Configuration tables, from which applications read the configuration information.
- The tables of exchange rates in the financial sector. These tables are updated only once a day but not in real-time.
- Bank branch or network information tables, which are rarely updated.

Take configuration tables as an example. When the application restarts, the configuration information is loaded in all connections, which causes a high read latency. In this case, you can solve this problem by using the cached tables feature.

### 14.11.14.2 Examples

This section describes the usage of cached tables by examples.

#### 14.11.14.2.1 Set a normal table to a cached table

Suppose that there is a table users:

```
CREATE TABLE users (
 id BIGINT,
 name VARCHAR(100),
 PRIMARY KEY(id)
);
```

To set this table to a cached table, use the ALTER TABLE statement:

```
ALTER TABLE users CACHE;
```

```
Query OK, 0 rows affected (0.01 sec)
```

#### 14.11.14.2.2 Verify a cached table

To verify a cached table, use the SHOW CREATE TABLE statement. If the table is cached, the returned result contains the CACHED ON attribute:

```
SHOW CREATE TABLE users;
```

```
+--
 ↪ -----+-----
 ↪
| Table | Create Table
 ↪
 ↪ |
+--
 ↪ -----+-----
 ↪
| users | CREATE TABLE `users` (
 `id` bigint(20) NOT NULL,
 `name` varchar(100) DEFAULT NULL,
 PRIMARY KEY (`id`) /*T![clustered_index] CLUSTERED */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin /* CACHED ON */
 ↪ |
+--
 ↪ -----+-----
 ↪
1 row in set (0.00 sec)
```

After reading data from a cached table, TiDB loads the data in memory. You can use the `trace` statement to check whether the data is loaded into memory. When the cache is not loaded, the returned result contains the `regionRequest.SendReqCtx` attribute, which indicates that TiDB reads data from TiKV.

```
TRACE SELECT * FROM users;
```

```
+--
↪ -----+-----+
↪
| operation | startTS | duration |
+--
↪ -----+-----+
↪
trace	17:47:39.969980	827.73µs
- session.ExecuteStmt	17:47:39.969986	413.31µs
- executor.Compile	17:47:39.969993	198.29µs
- session.runStmt	17:47:39.970221	157.252µs
- TableReaderExecutor.Open	17:47:39.970294	47.068µs
- distsql.Select	17:47:39.970312	24.729µs
- regionRequest.SendReqCtx	17:47:39.970454	189.601µs
-* executor.UnionScanExec.Next	17:47:39.970407	353.073µs
-* executor.TableReaderExecutor.Next	17:47:39.970411	301.106µs
-* executor.TableReaderExecutor.Next	17:47:39.970746	6.57µs
-* executor.UnionScanExec.Next	17:47:39.970772	17.589µs
-* executor.TableReaderExecutor.Next	17:47:39.970776	6.59µs
+--
↪ -----+-----+
↪
12 rows in set (0.01 sec)
```

After executing `trace` again, the returned result no longer contains the `regionRequest.SendReqCtx` attribute, which indicates that TiDB no longer reads data from TiKV but reads data from the memory instead.

```
+-----+-----+
| operation | startTS | duration |
+-----+-----+
trace	17:47:40.533888	453.547µs
- session.ExecuteStmt	17:47:40.533894	402.341µs
- executor.Compile	17:47:40.533903	205.54µs
- session.runStmt	17:47:40.534141	132.084µs
- TableReaderExecutor.Open	17:47:40.534202	14.749µs
-* executor.UnionScanExec.Next	17:47:40.534306	3.21µs
-* executor.UnionScanExec.Next	17:47:40.534316	1.219µs
+-----+-----+
```

```
7 rows in set (0.00 sec)
```

Note that the `UnionScan` operator is used to read the cached tables, so you can see `UnionScan` in the execution plan of the cached tables through `explain`:

```
+--
 ↳ -----+-----+-----+-----+
 ↳
 | id | estRows | task | access object | operator info
 ↳ |
+--
 ↳ -----+-----+-----+-----+
 ↳
 | UnionScan_5 | 1.00 | root | |
 ↳ |
 | -TableReader_7 | 1.00 | root | | data:
 ↳ TableFullScan_6 |
 | -TableFullScan_6 | 1.00 | cop[tikv] | table:users | keep order:
 ↳ false, stats:pseudo |
+--
 ↳ -----+-----+-----+-----+
 ↳
3 rows in set (0.00 sec)
```

#### 14.11.14.2.3 Write data to a cached table

Cached tables support data writes. For example, you can insert a record into the `users` table:

```
INSERT INTO users(id, name) VALUES(1001, 'Davis');
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SELECT * FROM users;
```

```
+-----+-----+
| id | name |
+-----+-----+
| 1001 | Davis |
+-----+-----+
1 row in set (0.00 sec)
```

### Note:

When you insert data to a cached table, second-level write latency might occur. The latency is controlled by the global environment variable `tidb_table_cache_lease`. You can decide whether to use the cached table feature by checking whether the latency is acceptable based on your application. For example, in a read-only scenario, you can increase the value of `tidb_table_cache_lease`:

```
set @@global.tidb_table_cache_lease = 10;
```

The write latency of cached tables is high, because the cached table feature is implemented with a complex mechanism that requires a lease to be set for each cache. When there are multiple TiDB instances, one instance does not know whether the other instances have cached data. If an instance modifies the table data directly, the other instances read the old cache data. To ensure correctness, the cached table implementation uses a lease mechanism to ensure that the data is not modified before the lease expires. That is why the write latency is high.

The metadata of cached tables is stored in the `mysql.table_cache_meta` table. This table records the IDs of all cached tables, the current lock status (`lock_type`), and the lock lease information (`lease`). This table is only internally used in TiDB and you are not recommended to modify it. Otherwise, unexpected errors might occur.

```
SHOW CREATE TABLE mysql.table_cache_meta\G
***** 1. row *****
 Table: table_cache_meta
Create Table: CREATE TABLE `table_cache_meta` (
 `tid` bigint(11) NOT NULL DEFAULT '0',
 `lock_type` enum('NONE','READ','INTEND','WRITE') NOT NULL DEFAULT 'NONE',
 `lease` bigint(20) NOT NULL DEFAULT '0',
 `oldReadLease` bigint(20) NOT NULL DEFAULT '0',
 PRIMARY KEY (`tid`) /*T! [clustered_index] CLUSTERED */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
1 row in set (0.00 sec)
```

#### 14.11.14.2.4 Revert a cached table to a normal table

### Note:

Executing DDL statements on a cached table will fail. Before executing DDL statements on a cached table, you need to remove the cache attribute first and set the cached table back to a normal table.

```
TRUNCATE TABLE users;
```

```
ERROR 8242 (HY000): 'Truncate Table' is unsupported on cache tables.
```

```
mysql> ALTER TABLE users ADD INDEX k_id(id);
```

```
ERROR 8242 (HY000): 'Alter Table' is unsupported on cache tables.
```

To revert a cached table to a normal table, use `ALTER TABLE t NOCACHE`:

```
ALTER TABLE users NOCACHE;
```

```
Query OK, 0 rows affected (0.00 sec)
```

#### 14.11.14.3 Size limit of cached tables

Cached tables are only suitable for scenarios with small tables, because TiDB loads the data of an entire table into memory, and the cached data becomes invalid after modification and needs to be reloaded.

Currently, the size limit of a cached table is 64 MB in TiDB. If the table data exceeds 64 MB, executing `ALTER TABLE t CACHE` will fail.

#### 14.11.14.4 Compatibility restrictions with other TiDB features

Cached tables **DO NOT** support the following features:

- Performing the `ALTER TABLE t ADD PARTITION` operation on partitioned tables is not supported.
- Performing the `ALTER TABLE t CACHE` operation on temporary tables is not supported.
- Performing the `ALTER TABLE t CACHE` operation on views is not supported.
- Stale Read is not supported.
- Direct DDL operations on a cached table are not supported. You need to set the cached table back to a normal table first by using `ALTER TABLE t NOCACHE` before performing DDL operations.

Cached tables **CANNOT** be used in the following scenarios:

- Setting the system variable `tidb_snapshot` to read historical data.
- During modification, the cached data becomes invalid until the data is reloaded.

#### 14.11.14.5 Compatibility with TiDB migration tools

The cached table is a TiDB extension to MySQL syntax. Only TiDB can recognize the `ALTER TABLE ... CACHE` statement. TiDB migration tools **DO NOT** support cached tables, including Backup & Restore (BR), TiCDC, and Duplicating. These tools treat cached tables as normal tables.

That is to say, when a cached table is backed up and restored, it becomes a normal table. If the downstream cluster is a different TiDB cluster and you want to continue using the cached table feature, you can manually enable cached tables on the downstream cluster by executing `ALTER TABLE ... CACHE` on the downstream table.

#### 14.11.14.6 See also

- [ALTER TABLE](#)
- [System Variables](#)

#### 14.11.15 FOREIGN KEY Constraints

Starting from v6.6.0, TiDB supports the foreign key feature, which allows cross-table referencing of related data, and foreign key constraints to maintain data consistency.

##### Note:

The foreign key feature is usually used for providing integrity and consistency constraint checks for data in small or medium volumes. However, for large data volumes in a distributed database system, the use of foreign keys might lead to serious performance issues and could have unpredictable effects on the system. If you plan to use foreign keys, conduct thorough validation first and use them with caution.

The foreign key is defined in the child table. The syntax is as follows:

```
ForeignKeyDef
 ::= ('CONSTRAINT' Identifier)? 'FOREIGN' 'KEY'
 Identifier? '(' ColumnName (',' ColumnName)* ')'
 'REFERENCES' TableName '(' ColumnName (',' ColumnName)* ')'
 ('ON' 'DELETE' ReferenceOption)?
 ('ON' 'UPDATE' ReferenceOption)?

ReferenceOption
 ::= 'RESTRICT'
 | 'CASCADE'
```

```
| 'SET' 'NULL'
| 'SET' 'DEFAULT'
| 'NO' 'ACTION'
```

#### 14.11.15.1 Naming

The naming of a foreign key follows the following rules:

- If a name is specified in `CONSTRAINT identifier`, the specified name is used.
- If no name is specified in `CONSTRAINT identifier`, but a name is specified in `FOREIGN KEY identifier`, the name specified in the `FOREIGN KEY identifier` is used.
- If neither `CONSTRAINT identifier` nor `FOREIGN KEY identifier` specifies a name, a name is automatically generated, such as `fk_1`, `fk_2`, and `fk_3`.
- The foreign key name must be unique in the current table. Otherwise, an error `ERROR 1826: Duplicate foreign key constraint name 'fk' is reported` when the foreign key is created.

#### 14.11.15.2 Restrictions

When creating a foreign key, the following conditions must be met:

- Neither the parent table nor the child table is a temporary table.
- The user has the `REFERENCES` privilege on the parent table.
- The columns referenced by the foreign key in the parent table and the child table are of the same data type and have the same size, precision, length, character set, and collation.
- The columns in the foreign key cannot reference themselves.
- The columns in the foreign key and the columns in the referenced parent table have the same index, and the order of the columns in the index matches that in the foreign key. This is to use the index to avoid full table scans when performing foreign key constraint checks.
  - If there is no corresponding foreign key index in the parent table, an error `ERROR 1822: Failed to add the foreign key constraint. Missing index for constraint 'fk' in the referenced table 't'` is reported.
  - If there is no corresponding foreign key index in the child table, an index is automatically created with the same name as the foreign key.
- It is not supported to create a foreign key on a column of the `BLOB` or `TEXT` type.
- It is not supported to create a foreign key on a partitioned table.
- It is not supported to create a foreign key on a virtual generated column.

### 14.11.15.3 Reference operations

If an UPDATE or DELETE operation affects a foreign key value in the parent table, the corresponding foreign key value in the child table is determined by the reference operation defined by the ON UPDATE or ON DELETE clause in the foreign key definition. The reference operations include the following:

- **CASCADE**: automatically updates or deletes the matching rows in the child table when the UPDATE or DELETE operation affects the parent table. The cascade operation is performed in a depth-first manner.
- **SET NULL**: automatically sets the matching foreign key columns in the child table to NULL when the UPDATE or DELETE operation affects the parent table.
- **RESTRICT**: denies the UPDATE or DELETE operation if the child table contains matching rows.
- **NO ACTION**: the same as RESTRICT.
- **SET DEFAULT**: the same as RESTRICT.

If there is no matching foreign key value in the parent table, the INSERT or UPDATE operation on the child table is denied.

If the foreign key definition does not specify ON DELETE or ON UPDATE, the default behavior is NO ACTION.

If the foreign key is defined on a STORED GENERATED COLUMN, the CASCADE, SET NULL, and SET DEFAULT references are not supported.

### 14.11.15.4 Usage examples of foreign keys

The following example uses a single-column foreign key to associate the parent table and the child table:

```
CREATE TABLE parent (
 id INT KEY
);

CREATE TABLE child (
 id INT,
 pid INT,
 INDEX idx_pid (pid),
 FOREIGN KEY (pid) REFERENCES parent(id) ON DELETE CASCADE
);
```

The following is a more complex example where the `product_order` table has two foreign keys that reference the other two tables. One foreign key references two indexes on the `product` table, and the other references a single index on the `customer` table:

```
CREATE TABLE product (
 category INT NOT NULL,
 id INT NOT NULL,
 price DECIMAL(20,10),
 PRIMARY KEY(category, id)
);

CREATE TABLE customer (
 id INT KEY
);

CREATE TABLE product_order (
 id INT NOT NULL AUTO_INCREMENT,
 product_category INT NOT NULL,
 product_id INT NOT NULL,
 customer_id INT NOT NULL,

 PRIMARY KEY(id),
 INDEX (product_category, product_id),
 INDEX (customer_id),

 FOREIGN KEY (product_category, product_id)
 REFERENCES product(category, id)
 ON UPDATE CASCADE ON DELETE RESTRICT,

 FOREIGN KEY (customer_id)
 REFERENCES customer(id)
);
```

#### 14.11.15.5 Create a foreign key constraint

To create a foreign key constraint, you can use the following `ALTER TABLE` statement:

```
ALTER TABLE table_name
 ADD [CONSTRAINT [identifier]] FOREIGN KEY
 [identifier] (col_name, ...)
 REFERENCES tbl_name (col_name,...)
 [ON DELETE reference_option]
 [ON UPDATE reference_option]
```

The foreign key can be self-referencing, that is, referencing the same table. When you add a foreign key constraint to a table using `ALTER TABLE`, you need to first create an index on the parent table column that the foreign key references.

### 14.11.15.6 Delete a foreign key constraint

To delete a foreign key constraint, you can use the following `ALTER TABLE` statement:

```
ALTER TABLE table_name DROP FOREIGN KEY fk_identifier;
```

If the foreign key constraint is named when it is created, you can reference the name to delete the foreign key constraint. Otherwise, you have to use the constraint name automatically generated to delete the constraint. You can use `SHOW CREATE TABLE` to view the foreign key name:

```
mysql> SHOW CREATE TABLE child\G
***** 1. row *****
 Table: child
Create Table: CREATE TABLE `child` (
 `id` int(11) DEFAULT NULL,
 `pid` int(11) DEFAULT NULL,
 KEY `idx_pid` (`pid`),
 CONSTRAINT `fk_1` FOREIGN KEY (`pid`) REFERENCES `test`.`parent` (`id`)
 ↪ ON DELETE CASCADE
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
```

### 14.11.15.7 Foreign key constraint check

TiDB supports foreign key constraint check, which is controlled by the system variable `foreign_key_checks`. By default, this variable is set to `ON`, meaning that the foreign key constraint check is enabled. This variable has two scopes: `GLOBAL` and `SESSION`. Keeping this variable enabled can ensure the integrity of foreign key reference relationships.

The effect of disabling foreign key constraint check is as follows:

- When you delete a parent table referenced by a foreign key, the deletion can succeed only when the foreign key constraint check is disabled.
- When you import data to a database, the order of creating tables might be different from the foreign key dependency order, which might cause the creation of tables to fail. Only when the foreign key constraint check is disabled can the tables be created successfully. In addition, disabling the foreign key constraint check can speed up data import.
- When you import data to a database, if the data of the child table is imported first, an error will be reported. Only when the foreign key constraint check is disabled can the data of the child table be imported successfully.
- If an `ALTER TABLE` operation to be executed involves a change of the foreign key, this operation succeeds only when the foreign key constraint check is disabled.

When the foreign key constraint check is disabled, the foreign key constraint check and reference operation are not executed, except for the following scenarios:

- If the execution of `ALTER TABLE` might result in wrong definition of the foreign key, an error is still reported during the execution.
- When deleting the index required by the foreign key, you should delete the foreign key first. Otherwise, an error is reported.
- When you create a foreign key but it does not meet related conditions or restrictions, an error is reported.

#### 14.11.15.8 Locking

When `INSERT` or `UPDATE` a child table, the foreign key constraint checks whether the corresponding foreign key value exists in the parent table, and locks the row in the parent table to avoid the foreign key value being deleted by other operations violating the foreign key constraint. The locking behavior is equivalent to performing a `SELECT FOR UPDATE` operation on the row where the foreign key value is located in the parent table.

Because TiDB currently does not support `LOCK IN SHARE MODE`, if a child table accepts a large number of concurrent writes and most of the referenced foreign key values are the same, there might be serious locking conflicts. It is recommended to disable `foreign_key_checks` when writing a large number of child table data.

#### 14.11.15.9 Definition and metadata of foreign keys

To view the definition of a foreign key constraint, execute the `SHOW CREATE TABLE` statement:

```
mysql> SHOW CREATE TABLE child\G
***** 1. row *****
 Table: child
Create Table: CREATE TABLE `child` (
 `id` int(11) DEFAULT NULL,
 `pid` int(11) DEFAULT NULL,
 KEY `idx_pid` (`pid`),
 CONSTRAINT `fk_1` FOREIGN KEY (`pid`) REFERENCES `test`.`parent` (`id`)
 ↪ ON DELETE CASCADE
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
```

You can also get information about foreign keys using either of the following system tables:

- `INFORMATION_SCHEMA.KEY_COLUMN_USAGE`
- `INFORMATION_SCHEMA.TABLE_CONSTRAINTS`
- `INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS`

The following provides examples:

Get information about foreign keys from the `INFORMATION_SCHEMA.KEY_COLUMN_USAGE` system table:

```
mysql> SELECT TABLE_SCHEMA, TABLE_NAME, COLUMN_NAME, CONSTRAINT_NAME FROM
 ↪ INFORMATION_SCHEMA.KEY_COLUMN_USAGE WHERE REFERENCED_TABLE_SCHEMA IS
 ↪ NOT NULL;
```

```
+-----+-----+-----+-----+
| TABLE_SCHEMA | TABLE_NAME | COLUMN_NAME | CONSTRAINT_NAME |
+-----+-----+-----+-----+
test	child	pid	fk_1
test	product_order	product_category	fk_1
test	product_order	product_id	fk_1
test	product_order	customer_id	fk_2
+-----+-----+-----+-----+
```

Get information about foreign keys from the INFORMATION\_SCHEMA.TABLE\_CONSTRAINTS system table:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.TABLE_CONSTRAINTS WHERE
 ↪ CONSTRAINT_TYPE='FOREIGN KEY'\G
*****[1. row]*****
CONSTRAINT_CATALOG | def
CONSTRAINT_SCHEMA | test
CONSTRAINT_NAME | fk_1
TABLE_SCHEMA | test
TABLE_NAME | child
CONSTRAINT_TYPE | FOREIGN KEY
```

Get information about foreign keys from the INFORMATION\_SCHEMA.REFERENTIAL\_CONSTRAINTS ↪ system table:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS\G
*****[1. row]*****
CONSTRAINT_CATALOG | def
CONSTRAINT_SCHEMA | test
CONSTRAINT_NAME | fk_1
UNIQUE_CONSTRAINT_CATALOG | def
UNIQUE_CONSTRAINT_SCHEMA | test
UNIQUE_CONSTRAINT_NAME | PRIMARY
MATCH_OPTION | NONE
UPDATE_RULE | NO ACTION
DELETE_RULE | CASCADE
TABLE_NAME | child
REFERENCED_TABLE_NAME | parent
```

#### 14.11.15.10 View execution plans with foreign keys

You can use the `EXPLAIN` statement to view execution plans. The `Foreign_Key_Check` operator performs the foreign key constraint check on DML statements that are executed.

```
mysql> explain insert into child values (1,1);
+---+
| id | estRows | task | access object | operator info |
+---+
| Insert_1 | N/A | root | | N/A |
| -Foreign_Key_Check_3 | 0.00 | root | table:parent | foreign_key:fk_1,
| check_exist | | | | |
+---+

```

You can use the `EXPLAIN ANALYZE` statement to view the execution of the foreign key reference behavior. The `Foreign_Key_Cascade` operator performs foreign key referencing for DML statements that are executed.

```
mysql> explain analyze delete from parent where id = 1;
+---+
| id | estRows | actRows | task | access object |
| execution info |
| operator info | memory | disk |
+---+
| Delete_2 | N/A | 0 | root | |
| time:117.3µs, loops:1 |
| N/A | 380 Bytes | N/A |
| -Point_Get_1 | 1.00 | 1 | root | table:parent |
| time:63.6µs, loops:2, Get:{num_rpc:1, total_time:29.9µs} |
| handle:1 | N/A | N/A |
| -Foreign_Key_Cascade_3 | 0.00 | 0 | root | table:child,
| index:idx_pid | total:1.28ms, foreign_keys:1 |
+---+

```

```
↪
↪ | foreign_key:fk_1, on_delete:CASCADE | N/A | N/A |
| -Delete_7 | N/A | 0 | root |
↪ | time:904.8µs, loops:1
↪
↪ | N/A | 1.11 KB | N/A |
| -IndexLookup_11 | 10.00 | 1 | root |
↪ | time:869.5µs, loops:2, index_task: {
↪ total_time: 371.1µs, fetch_handle: 357.3µs, build: 1.25µs, wait: 12.5
↪ µs}, table_task: {total_time: 382.6µs, num: 1, concurrency: 5} |
↪ | 9.13 KB | N/A |
| -IndexRangeScan_9(Build) | 10.00 | 1 | cop[tikv] | table:child,
↪ index:idx_pid(pid) | time:351.2µs, loops:3, cop_task: {num: 1, max:
↪ 282.3µs, proc_keys: 0, rpc_num: 1, rpc_time: 263µs,
↪ copr_cache_hit_ratio: 0.00, distsql_concurrency: 15}, tikv_task:{time
↪ :220.2µs, loops:0} | range:[1,1], keep order:false, stats:pseudo | N/
↪ A | N/A |
| -TableRowIDScan_10(Probe) | 10.00 | 1 | cop[tikv] | table:child
↪ | time:223.9µs, loops:2, cop_task: {num: 1, max: 168.8
↪ µs, proc_keys: 0, rpc_num: 1, rpc_time: 154.5µs, copr_cache_hit_ratio
↪ : 0.00, distsql_concurrency: 15}, tikv_task:{time:145.6µs, loops:0} |
↪ keep order:false, stats:pseudo | N/A | N/A |
+--
↪ -----+-----+-----+-----+-----
↪
```

## 14.11.15.11 Compatibility

### 14.11.15.11.1 Compatibility between TiDB versions

Before v6.6.0, TiDB supports the syntax of creating foreign keys, but the created foreign keys are ineffective. If you upgrade a TiDB cluster created before v6.6.0 to v6.6.0 or later, the foreign keys created before the upgrade are still ineffective. Only the foreign keys created in v6.6.0 or later versions are effective. You can delete the invalid foreign key and create a new one to make the foreign key constraints effective. You can use the `SHOW CREATE TABLE` statement to check whether the foreign keys are effective. The invalid foreign key has a `/* FOREIGN KEY INVALID */` comment.

```
mysql> SHOW CREATE TABLE child\G
*****[1. row]*****
Table | child
Create Table | CREATE TABLE `child` (
 `id` int(11) DEFAULT NULL,
 `pid` int(11) DEFAULT NULL,
 KEY `idx_pid` (`pid`),
```

```

CONSTRAINT `fk_1` FOREIGN KEY (`pid`) REFERENCES `test`.`parent` (`id`)
 ↪ ON DELETE CASCADE /* FOREIGN KEY INVALID */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin

```

### 14.11.15.11.2 Compatibility with TiDB tools

- **TiDB Binlog** does not support foreign keys.
- **DM** does not support foreign keys. DM v6.6.0 disables the `foreign_key_checks` of the downstream TiDB when replicating data to TiDB. Therefore, the cascading operations caused by foreign keys are not replicated from the upstream to the downstream, which might cause data inconsistency. This behavior is consistent with the previous DM versions.
- **TiCDC** v6.6.0 is compatible with foreign keys. The previous versions of TiCDC might report an error when replicating tables with foreign keys. It is recommended to disable the `foreign_key_checks` of the downstream TiDB cluster when using a TiCDC version earlier than v6.6.0.
- **BR** v6.6.0 is compatible with foreign keys. The previous versions of BR might report an error when restoring tables with foreign keys to a v6.6.0 or later cluster. It is recommended to disable the `foreign_key_checks` of the downstream TiDB cluster before restoring the cluster when using a BR earlier than v6.6.0.
- When you use **TiDB Lightning**, it is recommended to disable the `foreign_key_checks` of the downstream TiDB cluster before importing data.
- **Dumpling** is compatible with foreign keys.
- When you use `sync-diff-inspector` to compare data between the upstream and downstream databases, if the database versions are different and there is **an invalid foreign key in the downstream TiDB**, `sync-diff-inspector` might report a table schema inconsistent error. This is because TiDB v6.6.0 adds a `/* FOREIGN KEY INVALID */` comment for the invalid foreign key.

### 14.11.15.11.3 Compatibility with MySQL

When you create a foreign key without specifying a name, the name generated by TiDB is different from that generated by MySQL. For example, the foreign key name generated by TiDB is `fk_1`, `fk_2`, and `fk_3`, while the foreign key name generated by MySQL is `table_name_ibfk_1`, `table_name_ibfk_2`, and `table_name_ibfk_3`.

Both MySQL and TiDB parse but ignore “inline `REFERENCES` specifications”. Only `REFERENCES` specifications that are part of `FOREIGN KEY` definitions are checked and enforced. The following example creates a foreign key constraint using a `REFERENCES` clause:

```

CREATE TABLE parent (
 id INT KEY

```

```
);

CREATE TABLE child (
 id INT,
 pid INT REFERENCES parent(id)
);

SHOW CREATE TABLE child;
```

The output shows that the `child` table does not contain any foreign keys:

```
+-----+
| Table | Create Table |
+-----+
| child | CREATE TABLE `child` (
| | `id` int(11) DEFAULT NULL,
| | `pid` int(11) DEFAULT NULL
| |) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin |
+-----+
```

## 14.11.16 Character Set and Collation

### 14.11.16.1 Character Set and Collation

This document introduces the character sets and collations supported by TiDB.

#### 14.11.16.1.1 Concepts

A character set is a set of symbols and encodings. The default character set in TiDB is `utf8mb4`, which matches the default in MySQL 8.0 and above.

A collation is a set of rules for comparing characters in a character set, and the sorting order of characters. For example in a binary collation `A` and `a` do not compare as equal:

```
SET NAMES utf8mb4 COLLATE utf8mb4_bin;
SELECT 'A' = 'a';
SET NAMES utf8mb4 COLLATE utf8mb4_general_ci;
SELECT 'A' = 'a';
```

```
SELECT 'A' = 'a';
```

```
+-----+
| 'A' = 'a' |
+-----+
| 0 |
+-----+
1 row in set (0.00 sec)
```

```
SET NAMES utf8mb4 COLLATE utf8mb4_general_ci;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
SELECT 'A' = 'a';
```

```
+-----+
| 'A' = 'a' |
+-----+
| 1 |
+-----+
1 row in set (0.00 sec)
```

TiDB defaults to using a binary collation. This differs from MySQL, which uses a case-insensitive collation by default.

#### 14.11.16.1.2 Character sets and collations supported by TiDB

Currently, TiDB supports the following character sets:

```
SHOW CHARACTER SET;
```

```
+--
↔ -----+-----+-----+
↔
| Charset | Description | Default collation | Maxlen |
+--
↔ -----+-----+-----+
↔
ascii	US ASCII	ascii_bin	1
binary	binary	binary	1
gbk	Chinese Internal Code Specification	gbk_bin	2
latin1	Latin1	latin1_bin	1
utf8	UTF-8 Unicode	utf8_bin	3
utf8mb4	UTF-8 Unicode	utf8mb4_bin	4
+--
↔ -----+-----+-----+
↔
6 rows in set (0.00 sec)
```

TiDB supports the following collations:

```
SHOW COLLATION;
```

```

+-----+-----+-----+-----+-----+-----+
| Collation | Charset | Id | Default | Compiled | Sortlen |
+-----+-----+-----+-----+-----+-----+
ascii_bin	ascii	65	Yes	Yes	1
binary	binary	63	Yes	Yes	1
gbk_bin	gbk	87		Yes	1
gbk_chinese_ci	gbk	28	Yes	Yes	1
latin1_bin	latin1	47	Yes	Yes	1
utf8_bin	utf8	83	Yes	Yes	1
utf8_general_ci	utf8	33		Yes	1
utf8_unicode_ci	utf8	192		Yes	1
utf8mb4_bin	utf8mb4	46	Yes	Yes	1
utf8mb4_general_ci	utf8mb4	45		Yes	1
utf8mb4_unicode_ci	utf8mb4	224		Yes	1
+-----+-----+-----+-----+-----+-----+
11 rows in set (0.00 sec)

```

### Warning:

TiDB incorrectly treats latin1 as a subset of utf8. This can lead to unexpected behaviors when you store characters that differ between latin1 and utf8 encodings. It is strongly recommended to the utf8mb4 character set. See [TiDB #18955](#) for more details.

### Note:

The default collations in TiDB (binary collations, with the suffix `_bin`) are different than [the default collations in MySQL](#) (typically general collations, with the suffix `_general_ci`). This can cause incompatible behavior when specifying an explicit character set but relying on the implicit default collation to be chosen.

You can use the following statement to view the collations (under the [new framework for collations](#)) that corresponds to the character set.

```
SHOW COLLATION WHERE Charset = 'utf8mb4';
```

```

+-----+-----+-----+-----+-----+-----+
| Collation | Charset | Id | Default | Compiled | Sortlen |

```

```

+-----+-----+-----+-----+-----+
utf8mb4_bin	utf8mb4	46	Yes	Yes	1
utf8mb4_general_ci	utf8mb4	45		Yes	1
utf8mb4_unicode_ci	utf8mb4	224		Yes	1
+-----+-----+-----+-----+-----+
3 rows in set (0.00 sec)

```

For details about the TiDB support of the GBK character set, see [GBK](#).

#### 14.11.16.1.3 utf8 and utf8mb4 in TiDB

In MySQL, the character set `utf8` is limited to a maximum of three bytes. This is sufficient to store characters in the Basic Multilingual Plane (BMP), but not enough to store characters such as emojis. For this, it is recommended to use the character set `utf8mb4` instead.

By default, TiDB also limits the character set `utf8` to a maximum of three bytes to ensure that data created in TiDB can still safely be restored in MySQL. You can disable it by changing the value of the system variable `tidb_check_mb4_value_in_utf8` to `OFF`.

The following demonstrates the default behavior when inserting a 4-byte emoji character into a table. The `INSERT` statement fails for the `utf8` character set, but succeeds for `utf8mb4`:

```

CREATE TABLE utf8_test (
 -> c char(1) NOT NULL
 ->) CHARACTER SET utf8;

```

```

Query OK, 0 rows affected (0.09 sec)

```

```

CREATE TABLE utf8m4_test (
 -> c char(1) NOT NULL
 ->) CHARACTER SET utf8mb4;

```

```

Query OK, 0 rows affected (0.09 sec)

```

```

INSERT INTO utf8_test VALUES ('👍');

```

```

ERROR 1366 (HY000): incorrect utf8 value f09f9889(👍) for column c

```

```

INSERT INTO utf8m4_test VALUES ('👍');

```

```

Query OK, 1 row affected (0.02 sec)

```

```

SELECT char_length(c), length(c), c FROM utf8_test;

```

```

Empty set (0.01 sec)

```

```
SELECT char_length(c), length(c), c FROM utf8m4_test;
```

```
+-----+-----+-----+
| char_length(c) | length(c) | c |
+-----+-----+-----+
| 1 | 4 | |
+-----+-----+-----+
1 row in set (0.00 sec)
```

#### 14.11.16.1.4 Character set and collation in different layers

The character set and collation can be set at different layers.

Database character set and collation

Each database has a character set and a collation. You can use the following statements to specify the database character set and collation:

```
CREATE DATABASE db_name
 [[DEFAULT] CHARACTER SET charset_name]
 [[DEFAULT] COLLATE collation_name]

ALTER DATABASE db_name
 [[DEFAULT] CHARACTER SET charset_name]
 [[DEFAULT] COLLATE collation_name]
```

DATABASE can be replaced with SCHEMA here.

Different databases can use different character sets and collations. Use the `character_set_database` and `collation_database` to see the character set and collation of the current database:

```
CREATE SCHEMA test1 CHARACTER SET utf8mb4 COLLATE utf8mb4_general_ci;
```

```
Query OK, 0 rows affected (0.09 sec)
```

```
USE test1;
```

```
Database changed
```

```
SELECT @@character_set_database, @@collation_database;
```

```
+-----/-----+
| @@character_set_database | @@collation_database |
+-----/-----+
| utf8mb4 | utf8mb4_general_ci |
```

```
+-----+-----+
1 row in set (0.00 sec)
```

```
CREATE SCHEMA test2 CHARACTER SET latin1 COLLATE latin1_bin;
```

```
Query OK, 0 rows affected (0.09 sec)
```

```
USE test2;
```

```
Database changed
```

```
SELECT @@character_set_database, @@collation_database;
```

```
+-----+-----+
| @@character_set_database | @@collation_database |
+-----+-----+
| latin1 | latin1_bin |
+-----+-----+
1 row in set (0.00 sec)
```

You can also see the two values in INFORMATION\_SCHEMA:

```
SELECT DEFAULT_CHARACTER_SET_NAME, DEFAULT_COLLATION_NAME
FROM INFORMATION_SCHEMA.SCHEMATA WHERE SCHEMA_NAME = 'db_name';
```

Table character set and collation

You can use the following statement to specify the character set and collation for tables:

```
CREATE TABLE tbl_name (column_list)
 [[DEFAULT] CHARACTER SET charset_name]
 [COLLATE collation_name]

ALTER TABLE tbl_name
 [[DEFAULT] CHARACTER SET charset_name]
 [COLLATE collation_name]
```

For example:

```
CREATE TABLE t1(a int) CHARACTER SET utf8mb4 COLLATE utf8mb4_general_ci;
```

```
Query OK, 0 rows affected (0.08 sec)
```

If the table character set and collation are not specified, the database character set and collation are used as their default values.

Column character set and collation

You can use the following statement to specify the character set and collation for columns:

```
col_name {CHAR | VARCHAR | TEXT} (col_length)
 [CHARACTER SET charset_name]
 [COLLATE collation_name]

col_name {ENUM | SET} (val_list)
 [CHARACTER SET charset_name]
 [COLLATE collation_name]
```

If the column character set and collation are not specified, the table character set and collation are used as their default values.

#### String character sets and collation

Each string corresponds to a character set and a collation. When you use a string, this option is available:

```
[_charset_name]'string' [COLLATE collation_name]
```

Example:

```
SELECT 'string';
SELECT _utf8mb4'string';
SELECT _utf8mb4'string' COLLATE utf8mb4_general_ci;
```

Rules:

- Rule 1: If you specify `CHARACTER SET charset_name` and `COLLATE collation_name`  $\rightarrow$  , then the `charset_name` character set and the `collation_name` collation are used directly.
- Rule 2: If you specify `CHARACTER SET charset_name` but do not specify `COLLATE collation_name`, the `charset_name` character set and the default collation of `charset_name` are used.
- Rule 3: If you specify neither `CHARACTER SET charset_name` nor `COLLATE collation_name`, the character set and collation given by the system variables `character_set_connection` and `collation_connection` are used.

#### Client connection character set and collation

- The server character set and collation are the values of the `character_set_server` and `collation_server` system variables.
- The character set and collation of the default database are the values of the `character_set_database` and `collation_database` system variables.

You can use `character_set_connection` and `collation_connection` to specify the character set and collation for each connection. The `character_set_client` variable is to set the client character set.

Before returning the result, the `character_set_results` system variable indicates the character set in which the server returns query results to the client, including the metadata of the result.

You can use the following statement to set the character set and collation that is related to the client:

- `SET NAMES 'charset_name' [COLLATE 'collation_name']`

`SET NAMES` indicates what character set the client will use to send SQL statements to the server. `SET NAMES utf8mb4` indicates that all the requests from the client use `utf8mb4`, as well as the results from the server.

The `SET NAMES 'charset_name'` statement is equivalent to the following statement combination:

```
SET character_set_client = charset_name;
SET character_set_results = charset_name;
SET character_set_connection = charset_name;
```

`COLLATE` is optional, if absent, the default collation of the `charset_name` is used to set the `collation_connection`.

- `SET CHARACTER SET 'charset_name'`

Similar to `SET NAMES`, the `SET NAMES 'charset_name'` statement is equivalent to the following statement combination:

```
SET character_set_client = charset_name;
SET character_set_results = charset_name;
SET charset_connection = @@charset_database;
SET collation_connection = @@collation_database;
```

#### 14.11.16.1.5 Selection priorities of character sets and collations

String > Column > Table > Database > Server

#### 14.11.16.1.6 General rules on selecting character sets and collation

- Rule 1: If you specify `CHARACTER SET charset_name` and `COLLATE collation_name`  $\leftrightarrow$ , then the `charset_name` character set and the `collation_name` collation are used directly.
- Rule 2: If you specify `CHARACTER SET charset_name` and do not specify `COLLATE collation_name`, then the `charset_name` character set and the default collation of `charset_name` are used.

- Rule 3: If you specify neither `CHARACTER SET charset_name` nor `COLLATE ↔ collation_name`, the character set and collation with higher optimization levels are used.

#### 14.11.16.1.7 Validity check of characters

If the specified character set is `utf8` or `utf8mb4`, TiDB only supports the valid `utf8` characters. For invalid characters, TiDB reports the `incorrect utf8 value` error. This validity check of characters in TiDB is compatible with MySQL 8.0 but incompatible with MySQL 5.7 or earlier versions.

To disable this error reporting, use `set @@tidb_skip_utf8_check=1;` to skip the character check.

#### Note:

If the character check is skipped, TiDB might fail to detect illegal UTF-8 characters written by the application, cause decoding errors when `ANALYZE` is executed, and introduce other unknown encoding issues. If your application cannot guarantee the validity of the written string, it is not recommended to skip the character check.

#### 14.11.16.1.8 Collation support framework

The syntax support and semantic support for the collation are influenced by the `new_collations_enabled_on_first_bootstrap` configuration item. The syntax support and semantic support are different. The former indicates that TiDB can parse and set collations. The latter indicates that TiDB can correctly use collations when comparing strings.

Before v4.0, TiDB provides only the `old framework for collations`. In this framework, TiDB supports syntactically parsing most of the MySQL collations but semantically takes all collations as binary collations.

Since v4.0, TiDB supports a `new framework for collations`. In this framework, TiDB semantically parses different collations and strictly follows the collations when comparing strings.

#### Old framework for collations

Before v4.0, you can specify most of the MySQL collations in TiDB, and these collations are processed according to the default collations, which means that the byte order determines the character order. Different from MySQL, TiDB does not handle the trailing spaces of a character, which causes the following behavior differences:

```
CREATE TABLE t(a varchar(20) charset utf8mb4 collate utf8mb4_general_ci
↳ PRIMARY KEY);
```

```
Query OK, 0 rows affected
```

```
INSERT INTO t VALUES ('A');
```

```
Query OK, 1 row affected
```

```
INSERT INTO t VALUES ('a');
```

```
Query OK, 1 row affected
```

In TiDB, the preceding statement is successfully executed. In MySQL, because `utf8mb4_general_ci` is case-insensitive, the `Duplicate entry 'a'` error is reported.

```
INSERT INTO t1 VALUES ('a ');
```

```
Query OK, 1 row affected
```

In TiDB, the preceding statement is successfully executed. In MySQL, because comparison is performed after the spaces are filled in, the `Duplicate entry 'a '` error is returned.

### New framework for collations

Since TiDB v4.0, a complete framework for collations is introduced.

This new framework supports semantically parsing collations and introduces the `new_collations_enabled_on_first_bootstrap` configuration item to decide whether to enable the new framework when a cluster is first initialized. To enable the new framework, set `new_collations_enabled_on_first_bootstrap` to `true`. For details, see [new\\_collations\\_enabled\\_on\\_first\\_bootstrap](#). If you initialize the cluster after the configuration item is enabled, you can check whether the new collation is enabled through the `new_collation_enabled` variable in the `mysql.tidb` table:

```
SELECT VARIABLE_VALUE FROM mysql.tidb WHERE VARIABLE_NAME='
↳ new_collation_enabled';
```

```
+-----+
| VARIABLE_VALUE |
+-----+
| True |
+-----+
1 row in set (0.00 sec)
```

Under the new framework, TiDB supports the `utf8_general_ci`, `utf8mb4_general_ci`, `utf8_unicode_ci`, `utf8mb4_unicode_ci`, `gbk_chinese_ci`, and `gbk_bin` collations, which is compatible with MySQL.

When one of `utf8_general_ci`, `utf8mb4_general_ci`, `utf8_unicode_ci`, `utf8mb4_unicode_ci`, `gbk_chinese_ci` is used, the string comparison is case-insensitive and accent-insensitive. At the same time, TiDB also corrects the collation's `PADDING` behavior:

```
CREATE TABLE t(a varchar(20) charset utf8mb4 collate utf8mb4_general_ci
↳ PRIMARY KEY);
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
INSERT INTO t VALUES ('A');
```

```
Query OK, 1 row affected (0.00 sec)
```

```
INSERT INTO t VALUES ('a');
```

```
ERROR 1062 (23000): Duplicate entry 'a' for key 't.PRIMARY' # TiDB is
↳ compatible with the case-insensitive collation of MySQL.
```

```
INSERT INTO t VALUES ('a ');
```

```
ERROR 1062 (23000): Duplicate entry 'a ' for key 't.PRIMARY' # TiDB
↳ modifies the `PADDING` behavior to be compatible with MySQL.
```

#### Note:

The implementation of padding in TiDB is different from that in MySQL. In MySQL, padding is implemented by filling in spaces. In TiDB, padding is implemented by cutting out the spaces at the end. The two approaches are the same in most cases. The only exception is when the end of the string contains characters that are less than spaces (0x20). For example, the result of `'a' < 'a\t'` in TiDB is 1, but in MySQL, `'a' < 'a\t'` is equivalent to `'a ' < 'a\t'`, and the result is 0.

#### 14.11.16.1.9 Coercibility values of collations in expressions

If an expression involves multiple clauses of different collations, you need to infer the collation used in the calculation. The rules are as follows:

- The coercibility value of the explicit `COLLATE` clause is 0.
- If the collations of two strings are incompatible, the coercibility value of the concatenation of two strings with different collations is 1.
- The collation of the column, `CAST()`, `CONVERT()`, or `BINARY()` has a coercibility value of 2.
- The system constant (the string returned by `USER ()` or `VERSION ()`) has a coercibility value of 3.
- The coercibility value of constants is 4.
- The coercibility value of numbers or intermediate variables is 5.
- `NULL` or expressions derived from `NULL` has a coercibility value of 6.

When inferring collations, TiDB prefers using the collation of expressions with lower coercibility values. If the coercibility values of two clauses are the same, the collation is determined according to the following priority:

binary > utf8mb4\_bin > (utf8mb4\_general\_ci = utf8mb4\_unicode\_ci) > utf8\_bin > (utf8\_general\_ci = utf8\_unicode\_ci) > latin1\_bin > ascii\_bin

TiDB cannot infer the collation and reports an error in the following situations:

- If the collations of two clauses are different and the coercibility value of both clauses is 0.
- If the collations of two clauses are incompatible and the returned type of expression is `String`.

#### 14.11.16.1.10 COLLATE clause

TiDB supports using the `COLLATE` clause to specify the collation of an expression. The coercibility value of this expression is 0, which has the highest priority. See the following example:

```
SELECT 'a' = _utf8mb4 'A' collate utf8mb4_general_ci;
```

```
+-----+
| 'a' = _utf8mb4 'A' collate utf8mb4_general_ci |
+-----+
| 1 |
+-----+
1 row in set (0.00 sec)
```

For more details, see [Connection Character Sets and Collations](#).

#### 14.11.16.2 GBK

Since v5.4.0, TiDB supports the GBK character set. This document provides the TiDB support and compatibility information of the GBK character set.

```
SHOW CHARACTER SET WHERE CHARSET = 'gbk';
+---+
↪ -----+-----+-----+-----+
↪
| Charset | Description | Default collation | Maxlen |
+---+
↪ -----+-----+-----+-----+
↪
| gbk | Chinese Internal Code Specification | gbk_bin | 2 |
+---+
↪ -----+-----+-----+-----+
↪
1 row in set (0.00 sec)

SHOW COLLATION WHERE CHARSET = 'gbk';
+---+
| Collation | Charset | Id | Default | Compiled | Sortlen |
+---+
| gbk_bin | gbk | 87 | | Yes | 1 |
+---+
1 rows in set (0.00 sec)
```

#### 14.11.16.2.1 MySQL compatibility

This section provides the compatibility information between MySQL and TiDB.

##### Collations

The default collation of the GBK character set in MySQL is `gbk_chinese_ci`. Unlike MySQL, the default collation of the GBK character set in TiDB is `gbk_bin`. Additionally, because TiDB converts GBK to UTF8MB4 and then uses a binary collation, the `gbk_bin` collation in TiDB is not the same as the `gbk_bin` collation in MySQL.

To make TiDB compatible with the collations of MySQL GBK character set, when you first initialize the TiDB cluster, you need to set the TiDB option `new_collations_enabled_on_first_bootstrap` to `true` to enable the [new framework for collations](#).

After enabling the new framework for collations, if you check the collations corresponding to the GBK character set, you can see that the TiDB GBK default collation is changed to `gbk_chinese_ci`.

```
SHOW CHARACTER SET WHERE CHARSET = 'gbk';
+---+
↪ -----+-----+-----+-----+
↪
| Charset | Description | Default collation | Maxlen |
+---+
↪ -----+-----+-----+-----+
↪
```

```

+---
 ↪ -----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
 ↪
| gbk | Chinese Internal Code Specification | gbk_chinese_ci | 2 |
+---
 ↪ -----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
 ↪
1 row in set (0.00 sec)

SHOW COLLATION WHERE CHARSET = 'gbk';
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| Collation | Charset | Id | Default | Compiled | Sortlen |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| gbk_bin | gbk | 87 | | Yes | 1 |
| gbk_chinese_ci | gbk | 28 | Yes | Yes | 1 |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
2 rows in set (0.00 sec)

```

### Illegal character compatibility

- If the system variables `character_set_client` and `character_set_connection` are not set to `gbk` at the same time, TiDB handles illegal characters in the same way as MySQL.
- If `character_set_client` and `character_set_connection` are both set to `gbk`, TiDB handles illegal characters differently than MySQL.
  - MySQL handles illegal GBK character sets in reading and writing operations differently.
  - TiDB handles illegal GBK character sets in reading and writing operations in the same way. In the SQL strict mode, TiDB reports an error when either reading or writing illegal GBK characters. In the non-strict mode, TiDB replaces illegal GBK characters with `?` when either reading or writing illegal GBK characters.

For example, after `SET NAMES gbk`, if you create a table using the `CREATE TABLE ↪ gbk_table(a VARCHAR(32) CHARACTER SET gbk)` statement in MySQL and TiDB respectively and then execute the SQL statements in the following table, you can see the detailed differences.

| If the configured SQL mode contains either <code>STRICT_ALL_TABLES</code> or <code>STRICT_TRANS_TABLES</code> | If the configured SQL mode contains neither <code>STRICT_ALL_TABLES</code> nor <code>STRICT_TRANS_TABLES</code> |
|---------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| MySQL<br><pre>SELECT HEX('—a'); e4b88061INSERT INTO gbk_table ↪ values('—a'); Incorrect Error</pre>           | <pre>SELECT HEX('—a'); e4b88061INSERT ↪ INTO gbk_table VALUES('—a'); ↪ SELECT HEX(a)FROM gbk_table; e4b8</pre>  |
| TiDB<br><pre>SELECT HEX('—a'); Incorrect ErrorINSERT INTO ↪ gbk_table VALUES('—a'); Incorrect Error</pre>     | <pre>SELECT HEX('—a'); e4b83fINSERT INTO ↪ gbk_table VALUES('—a');SELECT ↪ HEX(a)FROM gbk_table; e4b83f</pre>   |

In the above table, the result of `SELECT HEX('a')`; in the `utf8mb4` byte set is `e4b88061`.

Other MySQL compatibility

- Currently, TiDB does not support using the `ALTER TABLE` statement to convert other character set types to `gbk` or from `gbk` to other character set types.
- TiDB does not support the use of `_gbk`. For example:

```
sql CREATE TABLE t(a CHAR(10)CHARSET BINARY); Query OK, 0 rows affected
↪ (0.00 sec)INSERT INTO t VALUES (_gbk'啊'); ERROR 1115 (42000): Unsupported
↪ character introducer: 'gbk'
```

- Currently, for binary characters of the `ENUM` and `SET` types, TiDB deals with them as the `utf8mb4` character set.

#### 14.11.16.2.2 Component compatibility

- Currently, TiFlash does not support the GBK character set.
- TiDB Data Migration (DM) does not support migrating `charset=GBK` tables to TiDB clusters earlier than `v5.4.0`.
- TiDB Lightning does not support importing `charset=GBK` tables to TiDB clusters earlier than `v5.4.0`.
- TiCDC versions earlier than `v6.1.0` do not support replicating `charset=GBK` tables. No version of TiCDC supports replicating `charset=GBK` tables to TiDB clusters earlier than `v6.1.0`.
- Backup & Restore (BR) versions earlier than `v5.4.0` do not support recovering `charset=GBK` tables. No version of BR supports recovering `charset=GBK` tables to TiDB clusters earlier than `v5.4.0`.

### 14.11.17 Placement Rules in SQL

Placement Rules in SQL is a feature that enables you to specify where data is stored in a TiKV cluster using SQL interfaces. Using this feature, tables and partitions are scheduled to specific regions, data centers, racks, or hosts. This is useful for scenarios including optimizing a high availability strategy with lower cost, ensuring that local replicas of data are available for local stale reads, and adhering to data locality requirements.

#### Note:

The implementation of *Placement Rules in SQL* relies on the *placement rules feature* of PD. For details, refer to [Configure Placement Rules](#). In the context of Placement Rules in SQL, *placement rules* might refer to *placement policies* attached to other objects, or to rules that are sent from TiDB to PD.

The detailed user scenarios are as follows:

- Merge multiple databases of different applications to reduce the cost on database maintenance
- Increase replica count for important data to improve the application availability and data reliability
- Store new data into NVMe storage and store old data into SSDs to lower the cost on data archiving and storage
- Schedule the leaders of hotspot data to high-performance TiKV instances
- Separate cold data to lower-cost storage mediums to improve cost efficiency
- Support the physical isolation of computing resources between different users, which meets the isolation requirements of different users in a cluster, and the isolation requirements of CPU, I/O, memory, and other resources with different mixed loads

#### 14.11.17.1 Specify placement rules

To specify placement rules, first create a placement policy using `CREATE PLACEMENT POLICY`:

```
CREATE PLACEMENT POLICY myplacementpolicy PRIMARY_REGION="us-east-1"
↳ REGIONS="us-east-1,us-west-1";
```

Then attach the policy to a table or partition using either `CREATE TABLE` or `ALTER TABLE`. Then, the placement rules are specified on the table or the partition:

```
CREATE TABLE t1 (a INT) PLACEMENT POLICY=myplacementpolicy;
CREATE TABLE t2 (a INT);
ALTER TABLE t2 PLACEMENT POLICY=myplacementpolicy;
```

A placement policy is not associated with any database schema and has the global scope. Therefore, assigning a placement policy does not require any additional privileges over the `CREATE TABLE` privilege.

To modify a placement policy, you can use `ALTER PLACEMENT POLICY`, and the changes will propagate to all objects assigned with the corresponding policy.

```
ALTER PLACEMENT POLICY myplacementpolicy FOLLOWERS=5;
```

To drop policies that are not attached to any table or partition, you can use `DROP PLACEMENT POLICY`:

```
DROP PLACEMENT POLICY myplacementpolicy;
```

### 14.11.17.2 View current placement rules

If a table has placement rules attached, you can view the placement rules in the output of `SHOW CREATE TABLE`. To view the definition of the policy available, execute `SHOW CREATE PLACEMENT POLICY`:

```
tidb> SHOW CREATE TABLE t1\G
***** 1. row *****
 Table: t1
Create Table: CREATE TABLE `t1` (
 `a` int(11) DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin /*T![placement]
 ↪ PLACEMENT POLICY=`myplacementpolicy` */
1 row in set (0.00 sec)

tidb> SHOW CREATE PLACEMENT POLICY myplacementpolicy\G
***** 1. row *****
 Policy: myplacementpolicy
Create Policy: CREATE PLACEMENT POLICY myplacementpolicy PRIMARY_REGION="us
 ↪ -east-1" REGIONS="us-east-1,us-west-1"
1 row in set (0.00 sec)
```

You can also view definitions of placement policies using the `INFORMATION_SCHEMA.PLACEMENT_POLICIES` table.

```
tidb> select * from information_schema.placement_policies\G
***** [1. row]*****
POLICY_ID | 1
CATALOG_NAME | def
POLICY_NAME | p1
PRIMARY_REGION | us-east-1
REGIONS | us-east-1,us-west-1
CONSTRAINTS |
```

```
LEADER_CONSTRAINTS |
FOLLOWER_CONSTRAINTS |
LEARNER_CONSTRAINTS |
SCHEDULE |
FOLLOWERS | 4
LEARNERS | 0
1 row in set
```

The `information_schema.tables` and `information_schema.partitions` tables also include a column for `tidb_placement_policy_name`, which shows all objects with placement rules attached:

```
SELECT * FROM information_schema.tables WHERE tidb_placement_policy_name IS
↳ NOT NULL;
SELECT * FROM information_schema.partitions WHERE
↳ tidb_placement_policy_name IS NOT NULL;
```

Rules that are attached to objects are applied *asynchronously*. To view the current scheduling progress of placement, use `SHOW PLACEMENT`.

### 14.11.17.3 Option reference

#### Note:

- Placement options depend on labels correctly specified in the configuration of each TiKV node. For example, the `PRIMARY_REGION` option depends on the `region` label in TiKV. To see a summary of all labels available in your TiKV cluster, use the statement `SHOW PLACEMENT` `↳ LABELS`:

```
sql mysql> show placement labels; +-----+-----+
↳ | Key | Values | +-----+-----+ | disk
↳ | ["ssd"] | | region | ["us-east-1"] | | zone | ["
↳ us-east-1a"] | +-----+-----+ 3 rows in set
↳ (0.00 sec)
```

- When you use `CREATE PLACEMENT POLICY` to create a placement policy, TiDB does not check whether the labels exist. Instead, TiDB performs the check when you attach the policy to a table.

| Option Name    | Description                                                                                                                                       |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| PRIMARY_REGION | Raft leaders are placed in stores that have the <code>region</code> label that matches the value of this option.                                  |
| REGIONS        | Raft followers are placed in stores that have the <code>region</code> label that matches the value of this option.                                |
| SCHEDULE       | The strategy used to schedule the placement of followers. The value options are <code>EVEN</code> (default) or <code>MAJORITY_IN_PRIMARY</code> . |
| FOLLOWERS      | The number of followers. For example, <code>FOLLOWERS=2</code> means that there will be 3 replicas of the data (2 followers and 1 leader).        |

In addition to the placement options above, you can also use the advance configurations. For details, see [Advance placement options](#).

| Option Name          | Description                                                                                               |
|----------------------|-----------------------------------------------------------------------------------------------------------|
| CONSTRAINTS          | A list of constraints that apply to all roles. For example, <code>CONSTRAINTS ↪ "[+disk ↪ =ssd]"</code> . |
| LEADER_CONSTRAINTS   | List of constraints that only apply to leader.                                                            |
| FOLLOWER_CONSTRAINTS | List of constraints that only apply to followers.                                                         |
| LEARNER_CONSTRAINTS  | List of constraints that only apply to learners.                                                          |
| LEARNERS             | The number of learners.                                                                                   |

| Option Name                      | Description                                                                                                                                                                                     |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>SURVIVAL_PREFERENCE</code> | <p>ENGINE replica placement priority according to the disaster tolerance level of the labels. For example, <code>SURVIVAL_PREFERENCE</code></p> <pre> ↪ =" [ ↪ region, ↪ zone, ↪ host]". </pre> |

#### 14.11.17.4 Examples

##### 14.11.17.4.1 Increase the number of replicas

The default configuration of `max-replicas` is 3. To increase this for a specific set of tables, you can use a placement policy as follows:

```

CREATE PLACEMENT POLICY fivereplicas FOLLOWERS=4;
CREATE TABLE t1 (a INT) PLACEMENT POLICY=fivereplicas;

```

Note that the PD configuration includes the leader and follower count, thus 4 followers + 1 leader equals 5 replicas in total.

To expand on this example, you can also use `PRIMARY_REGION` and `REGIONS` placement options to describe the placement for the followers:

```

CREATE PLACEMENT POLICY eastandwest PRIMARY_REGION="us-east-1" REGIONS="us-
↪ east-1,us-east-2,us-west-1" SCHEDULE="MAJORITY_IN_PRIMARY" FOLLOWERS
↪ =4;
CREATE TABLE t1 (a INT) PLACEMENT POLICY=eastandwest;

```

The `SCHEDULE` option instructs TiDB on how to balance the followers. The default schedule of `EVEN` ensures a balance of followers in all regions.

To ensure that enough followers are placed in the primary region (`us-east-1`) so that quorum can be achieved, you can use the `MAJORITY_IN_PRIMARY` schedule. This schedule helps provide lower latency transactions at the expense of some availability. If the primary region fails, `MAJORITY_IN_PRIMARY` cannot provide automatic failover.

#### 14.11.17.4.2 Assign placement to a partitioned table

In addition to assigning placement options to tables, you can also assign the options to table partitions. For example:

```
CREATE PLACEMENT POLICY p1 FOLLOWERS=5;
CREATE PLACEMENT POLICY europe PRIMARY_REGION="eu-central-1" REGIONS="eu-
↳ central-1,eu-west-1";
CREATE PLACEMENT POLICY northamerica PRIMARY_REGION="us-east-1" REGIONS="us
↳ -east-1";

SET tidb_enable_list_partition = 1;
CREATE TABLE t1 (
 country VARCHAR(10) NOT NULL,
 userdata VARCHAR(100) NOT NULL
) PLACEMENT POLICY=p1 PARTITION BY LIST COLUMNS (country) (
 PARTITION pEurope VALUES IN ('DE', 'FR', 'GB') PLACEMENT POLICY=europe,
 PARTITION pNorthAmerica VALUES IN ('US', 'CA', 'MX') PLACEMENT POLICY=
 ↳ northamerica,
 PARTITION pAsia VALUES IN ('CN', 'KR', 'JP')
);
```

If a partition has no attached policies, it tries to apply possibly existing policies on the table. For example, the pEurope partition will apply the europe policy, but the pAsia partition will apply the p1 policy from table t1. If t1 has no assigned policies, pAsia will not apply any policy, too.

You can also alter the placement policies assigned to a specific partition. For example:

```
ALTER TABLE t1 PARTITION pEurope PLACEMENT POLICY=p1;
```

#### 14.11.17.4.3 Set the default placement for a schema

You can directly attach the default placement rules to a database schema. This works similar to setting the default character set or collation for a schema. Your specified placement options apply when no other options are specified. For example:

```
CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us
↳ -east-2"; -- Create placement policies

CREATE PLACEMENT POLICY p2 FOLLOWERS=4;

CREATE PLACEMENT POLICY p3 FOLLOWERS=2;

CREATE TABLE t1 (a INT); -- Creates a table t1 with no placement options.

ALTER DATABASE test PLACEMENT POLICY=p2; -- Changes the default placement
↳ option, and does not apply to the existing table t1.
```

```
CREATE TABLE t2 (a INT); -- Creates a table t2 with the default placement
↳ policy p2.

CREATE TABLE t3 (a INT) PLACEMENT POLICY=p1; -- Creates a table t3 without
↳ the default policy p2, because this statement has specified another
↳ placement rule.

ALTER DATABASE test PLACEMENT POLICY=p3; -- Changes the default policy, and
↳ does not apply to existing tables.

CREATE TABLE t4 (a INT); -- Creates a table t4 with the default policy p3.

ALTER PLACEMENT POLICY p3 FOLLOWERS=3; -- The table with policy p3 (t4)
↳ will have FOLLOWERS=3.
```

Note that this is different from the inheritance between partitions and tables, where changing the policy of tables will affect their partitions. Tables inherit the policy of schema only when they are created without policies attached, and modifying the policies of schemas does not affect created tables.

#### 14.11.17.4.4 Advanced placement options

The placement options `PRIMARY_REGION`, `REGIONS`, and `SCHEDULE` meet the basic needs of data placement at the loss of some flexibility. For more complex scenarios with the need for higher flexibility, you can also use the advanced placement options of `CONSTRAINTS` and `FOLLOWER_CONSTRAINTS`. You cannot specify the `PRIMARY_REGION`, `REGIONS`, or `SCHEDULE` option with the `CONSTRAINTS` option at the same time. If you specify both at the same time, an error will be returned.

For example, to set constraints that data must reside on a TiKV store where the label `disk` must match a value:

```
CREATE PLACEMENT POLICY storageonnvme CONSTRAINTS="[+disk=nvme]";
CREATE PLACEMENT POLICY storageonssd CONSTRAINTS="[+disk=ssd]";
CREATE PLACEMENT POLICY companystandardpolicy CONSTRAINTS="";

CREATE TABLE t1 (id INT, name VARCHAR(50), purchased DATE)
PLACEMENT POLICY=companystandardpolicy
PARTITION BY RANGE(YEAR(purchased)) (
 PARTITION p0 VALUES LESS THAN (2000) PLACEMENT POLICY=storageonssd,
 PARTITION p1 VALUES LESS THAN (2005),
 PARTITION p2 VALUES LESS THAN (2010),
 PARTITION p3 VALUES LESS THAN (2015),
 PARTITION p4 VALUES LESS THAN MAXVALUE PLACEMENT POLICY=storageonnvme
);
```

You can either specify constraints in list format (`[+disk=ssd]`) or in dictionary format (`{+disk=ssd: 1,+disk=nvme: 2}`).

In list format, constraints are specified as a list of key-value pairs. The key starts with either a `+` or a `-`. `+disk=ssd` indicates that the label `disk` must be set to `ssd`, and `-disk=`  
 $\hookrightarrow$  `nvme` indicates that the label `disk` must not be `nvme`.

In dictionary format, constraints also indicate a number of instances that apply to that rule. For example, `FOLLOWER_CONSTRAINTS="{+region=us-east-1: 1,+region=us-east`  
 $\hookrightarrow$  `-2: 1,+region=us-west-1: 1}"`; indicates that 1 follower is in `us-east-1`, 1 follower is in `us-east-2` and 1 follower is in `us-west-1`. For another example, `FOLLOWER_CONSTRAINTS='{`  
 $\hookrightarrow$  `region=us-east-1,+disk=nvme":1,"+region=us-west-1":1}'`; indicates that 1 follower is in `us-east-1` with an `nvme` disk, and 1 follower is in `us-west-1`.

### Note:

Dictionary and list formats are based on the YAML parser, but the YAML syntax might be incorrectly parsed. For example, `"{+disk=ssd:1,+disk`  
 $\hookrightarrow$  `=nvme:2}"` is incorrectly parsed as `'{"+disk=ssd:1": null, "+disk=`  
 $\hookrightarrow$  `nvme:1": null}'`. But `"{+disk=ssd: 1,+disk=nvme: 1}"` is correctly parsed as `'{"+disk=ssd": 1, "+disk=nvme": 1}'`.

#### 14.11.17.4.5 Survival preferences

When you create or modify a placement policy, you can use the `SURVIVAL_PREFERENCES` option to set the preferred survivability for your data.

For example, assuming that you have a TiDB cluster across 3 availability zones, with multiple TiKV instances deployed on each host in each zone. And when creating placement policies for this cluster, you have set the `SURVIVAL_PREFERENCES` as follows:

```
CREATE PLACEMENT POLICY multiaz SURVIVAL_PREFERENCES="[zone, host]";
CREATE PLACEMENT POLICY singleaz CONSTRAINTS="+zone=zone1 "
 \hookrightarrow SURVIVAL_PREFERENCES="[host]";
```

After creating the placement policies, you can attach them to the corresponding tables as needed:

- For tables attached with the `multiaz` placement policy, data will be placed in 3 replicas in different availability zones, prioritizing survival goals of data isolation cross zones, followed by survival goals of data isolation cross hosts.
- For tables attached with the `singleaz` placement policy, data will be placed in 3 replicas in the `zone1` availability zone first, and then meet survival goals of data isolation cross hosts.

**Note:**

SURVIVAL\_PREFERENCES is equivalent to location-labels in PD. For more information, see [Schedule Replicas by Topology Labels](#).

### 14.11.17.5 Compatibility with tools

| Tool Name             | Version | Description                                                                                              |
|-----------------------|---------|----------------------------------------------------------------------------------------------------------|
| Backup & Restore (BR) | 6.0     | Supports importing and exporting placement rules. Refer to <a href="#">BR Compatibility</a> for details. |

| Tool Name      | Version            | Description                                                                                   |
|----------------|--------------------|-----------------------------------------------------------------------------------------------|
| TiDB Lightning | Not compatible yet | An error is reported when TiDB Lightning imports backup data that contains placement policies |
| TiCDC          | 6.0                | Ignores placement rules, and does not replicate the rules to the downstream                   |

| Tool Name   | Version | Description                                                                 |
|-------------|---------|-----------------------------------------------------------------------------|
| TiDB Binlog | 6.0     | Ignores placement rules, and does not replicate the rules to the downstream |

#### 14.11.17.6 Known limitations

The following known limitations are as follows:

- Temporary tables do not support placement options.
- Syntactic sugar rules are permitted for setting `PRIMARY_REGION` and `REGIONS`. In the future, we plan to add varieties for `PRIMARY_RACK`, `PRIMARY_ZONE`, and `PRIMARY_HOST`. See [issue #18030](#).
- Placement rules only ensure that data at rest resides on the correct TiKV store. The rules do not guarantee that data in transit (via either user queries or internal operations) only occurs in a specific region.

#### 14.11.18 System Tables

##### 14.11.18.1 mysql Schema

The `mysql` schema contains TiDB system tables. The design is similar to the `mysql` schema in MySQL, where tables such as `mysql.user` can be edited directly. It also contains a number of tables which are extensions to MySQL.

##### 14.11.18.1.1 Grant system tables

These system tables contain grant information about user accounts and their privileges:

- `user`: user accounts, global privileges, and other non-privilege columns
- `db`: database-level privileges
- `tables_priv`: table-level privileges
- `columns_priv`: column-level privileges
- `password_history`: password change history
- `default_roles`: the default roles for a user
- `global_grants`: dynamic privileges
- `global_priv`: the authentication information based on certificates
- `role_edges`: the relationship between roles

#### 14.11.18.1.2 Server-side help system tables

Currently, the `help_topic` is NULL.

#### 14.11.18.1.3 Statistics system tables

- `stats_buckets`: the buckets of statistics
- `stats_histograms`: the histograms of statistics
- `stats_top_n`: the TopN of statistics
- `stats_meta`: the meta information of tables, such as the total number of rows and updated rows
- `stats_extended`: extended statistics, such as the order correlation between columns
- `stats_feedback`: the query feedback of statistics
- `stats_fm_sketch`: the FMSketch distribution of the histogram of the statistics column
- `analyze_options`: the default `analyze` options for each table
- `column_stats_usage`: the usage of column statistics
- `schema_index_usage`: the usage of indexes
- `analyze_jobs`: the ongoing statistics collection tasks and the history task records within the last 7 days

#### 14.11.18.1.4 Execution plan-related system tables

- `bind_info`: the binding information of execution plans
- `capture_plan_baselines_blacklist`: the blacklist for the automatic binding of the execution plan

#### 14.11.18.1.5 GC worker system tables

- `gc_delete_range`: the KV range to be deleted
- `gc_delete_range_done`: the deleted KV range

#### 14.11.18.1.6 System tables related to cached tables

- `table_cache_meta` stores the metadata of cached tables.

### 14.11.18.1.7 TTL related system tables

- `mysql.tidb_ttl_table_status` the previously executed TTL job and ongoing TTL job for all TTL tables
- `mysql.tidb_ttl_task` the current ongoing TTL subtasks
- `mysql.tidb_ttl_job_history` the execution history of TTL tasks in the last 90 days

### 14.11.18.1.8 Miscellaneous system tables

- `GLOBAL_VARIABLES`: global system variable table
- `tidb`: to record the version information when TiDB executes `bootstrap`
- `expr_pushdown_blacklist`: the blacklist for expression pushdown
- `opt_rule_blacklist`: the blacklist for logical optimization rules
- `table_cache_meta`: the metadata of cached tables

## 14.11.18.2 INFORMATION\_SCHEMA

### 14.11.18.2.1 Information Schema

Information Schema provides an ANSI-standard way of viewing system metadata. TiDB also provides a number of custom `INFORMATION_SCHEMA` tables, in addition to the tables included for MySQL compatibility.

Many `INFORMATION_SCHEMA` tables have a corresponding `SHOW` command. The benefit of querying `INFORMATION_SCHEMA` is that it is possible to join between tables.

Tables for MySQL compatibility

| Table Name                                         | Description                                              |
|----------------------------------------------------|----------------------------------------------------------|
| <code>CHARACTER_SETS</code>                        | Provides a list of character sets the server supports.   |
| <code>COLLATIONS</code>                            | Provides a list of collations that the server supports.  |
| <code>COLLATION_CHARACTER_SET_APPLICABILITY</code> | Explains which collations apply to which character sets. |
| <code>COLUMNS</code>                               | Provides a list of columns for all tables.               |
| <code>COLUMN_PRIVILEGES</code>                     | Not implemented by TiDB. Returns zero rows.              |

| Table Name        | Description                                                                       |
|-------------------|-----------------------------------------------------------------------------------|
| COLUMN_STATISTICS | Not implemented by TiDB. Returns zero rows.                                       |
| ENGINES           | Provides a list of supported storage engines.                                     |
| EVENTS            | Not implemented by TiDB. Returns zero rows.                                       |
| FILES             | Not implemented by TiDB. Returns zero rows.                                       |
| GLOBAL_STATUS     | Not implemented by TiDB. Returns zero rows.                                       |
| GLOBAL_VARIABLES  | Not implemented by TiDB. Returns zero rows.                                       |
| KEY_COLUMN_USAGE  | Describes the key constraints of the columns, such as the primary key constraint. |
| OPTIMIZER_TRACE   | Not implemented by TiDB. Returns zero rows.                                       |
| PARAMETERS        | Not implemented by TiDB. Returns zero rows.                                       |
| PARTITIONS        | Provides a list of table partitions.                                              |
| PLUGINS           | Not implemented by TiDB. Returns zero rows.                                       |
| PROCESSLIST       | Provides similar information to the command <code>SHOW PROCESSLIST</code> .       |
| PROFILING         | Not implemented by TiDB. Returns zero rows.                                       |

| Table Name              | Description                                                                                |
|-------------------------|--------------------------------------------------------------------------------------------|
| REFERENTIAL_CONSTRAINTS | Provides information on FOREIGN KEY constraints.                                           |
| ROUTINES                | Not implemented by TiDB. Returns zero rows.                                                |
| SCHEMATA                | Provides similar information to SHOW DATABASES.                                            |
| SCHEMA_PRIVILEGES       | Not implemented by TiDB. Returns zero rows.                                                |
| SESSION_STATUS          | Not implemented by TiDB. Returns zero rows.                                                |
| SESSION_VARIABLES       | Provides similar functionality to the command SHOW SESSION ↔ VARIABLES                     |
| STATISTICS              | Provides information on table indexes.                                                     |
| TABLES                  | Provides a list of tables that the current user has visibility of. Similar to SHOW TABLES. |
| TABLESPACES             | Not implemented by TiDB. Returns zero rows.                                                |
| TABLE_CONSTRAINTS       | Provides information on primary keys, unique indexes and foreign keys.                     |
| TABLE_PRIVILEGES        | Not implemented by TiDB. Returns zero rows.                                                |
| TRIGGERS                | Not implemented by TiDB. Returns zero rows.                                                |

| Table Name                   | Description                                                                                                                                                                      |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>USER_ATTRIBUTES</code> | Summarizes information about user comments and user attributes.                                                                                                                  |
| <code>USER_PRIVILEGES</code> | Summarizes the privileges associated with the current user.                                                                                                                      |
| <code>VARIABLES_INFO</code>  | Provides information about TiDB system variables.                                                                                                                                |
| <code>VIEWS</code>           | Provides a list of views that the current user has visibility of. Similar to running <code>SHOW FULL TABLES</code><br>↳ <code>WHERE</code><br>↳ <code>table_type = 'VIEW'</code> |

Tables that are TiDB extensions

| Table Name                                 | Description                                                                                     |
|--------------------------------------------|-------------------------------------------------------------------------------------------------|
| <code>ANALYZE_STATUS</code>                | Provides information about tasks to collect statistics.                                         |
| <code>CLIENT_ERRORS_SUMMARY_BY_HOST</code> | Provides a summary of errors and warnings generated by client requests and returned to clients. |
| <code>CLIENT_ERRORS_SUMMARY_BY_USER</code> | Provides a summary of errors and warnings generated by clients.                                 |

| Table Name                                | Description                                                                             |
|-------------------------------------------|-----------------------------------------------------------------------------------------|
| <code>CLIENT_ERRORS_SUMMARY_GLOBAL</code> | Provides a summary of errors and warnings generated by clients.                         |
| <code>CLUSTER_CONFIG</code>               | Provides details about configuration settings for the entire TiDB cluster.              |
| <code>CLUSTER_DEADLOCKS</code>            | Provides a cluster-level view of the DEADLOCKS table.                                   |
| <code>CLUSTER_HARDWARE</code>             | Provides details on the underlying physical hardware discovered on each TiDB component. |
| <code>CLUSTER_INFO</code>                 | Provides details on the current cluster topology.                                       |
| <code>CLUSTER_LOAD</code>                 | Provides current load information for TiDB servers in the cluster.                      |

| Table Name                         | Description                                                            |
|------------------------------------|------------------------------------------------------------------------|
| <b>CLUSTER_LOG</b>                 | Provides a log for the entire TiDB cluster.                            |
| CLUSTER_MEMORY_USAGE               | Provides a cluster-level view of the MEMORY_USAGE table.               |
| CLUSTER_MEMORY_USAGE_OPS_HISTORY   | Provides a cluster-level view of the MEMORY_USAGE_OPS_HISTORY table.   |
| CLUSTER_PROCESSLIST                | Provides a cluster-level view of the PROCESSLIST table.                |
| CLUSTER_SLOW_QUERY                 | Provides a cluster-level view of the SLOW_QUERY table.                 |
| CLUSTER_STATEMENTS_SUMMARY         | Provides a cluster-level view of the STATEMENTS_SUMMARY table.         |
| CLUSTER_STATEMENTS_SUMMARY_HISTORY | Provides a cluster-level view of the STATEMENTS_SUMMARY_HISTORY table. |

| Table Name         | Description                                                                       |
|--------------------|-----------------------------------------------------------------------------------|
| CLUSTER_TIDB_TRX   | Provides a cluster-level view of the TIDB_TRX table.                              |
| CLUSTER_SYSTEMINFO | Provides details about kernel parameter configuration for servers in the cluster. |
| DATA_LOCK_WAITS    | Provides the lock-waiting information on the TiKV server.                         |
| DDL_JOBS           | Provides similar output to ADMIN<br>↔ SHOW<br>↔ DDL<br>↔ JOBS                     |
| DEADLOCKS          | Provides the information of several deadlock errors that have recently occurred.  |
| INSPECTION_RESULT  | Triggers internal diagnostics checks.                                             |

| Table Name                            | Description                                                                                    |
|---------------------------------------|------------------------------------------------------------------------------------------------|
| <code>INSPECTION_RULES</code>         | A list of internal diagnostic checks performed.                                                |
| <code>INSPECTION_SUMMARY</code>       | A summarized report of important monitoring metrics.                                           |
| <code>MEMORY_USAGE</code>             | The memory usage of the current TiDB instance.                                                 |
| <code>MEMORY_USAGE_OPS_HISTORY</code> | The history of memory-related operations and the execution basis of the current TiDB instance. |
| <code>METRICS_SUMMARY</code>          | A summary of metrics extracted from Prometheus.                                                |
| <code>METRICS_SUMMARY_BY_LABEL</code> | See <code>METRICS_SUMMARY</code> $\leftrightarrow$                                             |
| <code>METRICS_TABLES</code>           | Provides the PromQL definitions for tables in <code>METRICS_SCHEMA</code> $\leftrightarrow$ .  |

| Table Name                 | Description                                                       |
|----------------------------|-------------------------------------------------------------------|
| PLACEMENT_POLICIES         | Provides information on all placement policies.                   |
| SEQUENCES                  | The TiDB implementation of sequences is based on MariaDB.         |
| SLOW_QUERY                 | Provides information on slow queries on the current TiDB server.  |
| STATEMENTS_SUMMARY         | Similar to performance_schema statement summary in MySQL.         |
| STATEMENTS_SUMMARY_HISTORY | Similar to performance_schema statement summary history in MySQL. |
| TABLE_STORAGE_STATS        | Provides details about table sizes in storage.                    |
| TIDB_HOT_REGIONS           | Provides statistics about which regions are hot.                  |

| Table Name               | Description                                                                            |
|--------------------------|----------------------------------------------------------------------------------------|
| TIDB_HOT_REGIONS_HISTORY | Provides history statistics about which Regions are hot.                               |
| TIDB_INDEXES             | Provides index information about TiDB tables.                                          |
| TIDB_SERVERS_INFO        | Provides a list of TiDB servers (namely, tidb-server component)                        |
| TIDB_TRX                 | Provides the information of the transactions that are being executed on the TiDB node. |
| TIFLASH_REPLICA          | Provides details about TiFlash replicas.                                               |
| TIKV_REGION_PEERS        | Provides details about where regions are stored.                                       |

| Table Name                      | Description                                    |
|---------------------------------|------------------------------------------------|
| <code>TIKV_REGION_STATUS</code> | Provides statistics about regions.             |
| <code>TIKV_STORE_STATUS</code>  | Provides basic information about TiKV servers. |

#### 14.11.18.2.2 ANALYZE\_STATUS

The `ANALYZE_STATUS` table provides information about the running tasks that collect statistics and a limited number of history tasks.

Starting from TiDB v6.1.0, the `ANALYZE_STATUS` table supports showing cluster-level tasks. Even after a TiDB restart, you can still view task records before the restart using this table. Before TiDB v6.1.0, the `ANALYZE_STATUS` table can only show instance-level tasks, and task records are cleared after a TiDB restart.

Starting from TiDB v6.1.0, you can view the history tasks within the last 7 days through the system table `mysql.analyze_jobs`.

```
USE information_schema;
DESC analyze_status;
```

```
+-----+-----+-----+-----+-----+-----+
| Field | Type | Null | Key | Default | Extra |
+-----+-----+-----+-----+-----+-----+
TABLE_SCHEMA	varchar(64)	YES		NULL	
TABLE_NAME	varchar(64)	YES		NULL	
PARTITION_NAME	varchar(64)	YES		NULL	
JOB_INFO	longtext	YES		NULL	
PROCESSED_ROWS	bigint(64) unsigned	YES		NULL	
START_TIME	datetime	YES		NULL	
END_TIME	datetime	YES		NULL	
STATE	varchar(64)	YES		NULL	
FAIL_REASON	longtext	YES		NULL	
INSTANCE	varchar(512)	YES		NULL	
PROCESS_ID	bigint(64) unsigned	YES		NULL	
+-----+-----+-----+-----+-----+
11 rows in set (0.00 sec)
```

```
SELECT * FROM information_schema.analyze_status;
```

```

6 rows in set (0.00 sec)

```

Fields in the `ANALYZE_STATUS` table are described as follows:

- `TABLE_SCHEMA`: The name of the database to which the table belongs.
- `TABLE_NAME`: The name of the table.
- `PARTITION_NAME`: The name of the partitioned table.
- `JOB_INFO`: The information of the `ANALYZE` task. If an index is analyzed, this information will include the index name. When `tidb_analyze_version =2`, this information

will include configuration items such as sample rate.

- `PROCESSED_ROWS`: The number of rows that have been processed.
- `START_TIME`: The start time of the `ANALYZE` task.
- `END_TIME`: The end time of the `ANALYZE` task.
- `STATE`: The execution status of the `ANALYZE` task. Its value can be `pending`, `running`  $\hookrightarrow$  `finished` or `failed`.
- `FAIL_REASON`: The reason why the task fails. If the execution is successful, the value is `NULL`.
- `INSTANCE`: The TiDB instance that executes the task.
- `PROCESS_ID`: The process ID that executes the task.

#### 14.11.18.2.3 `CLIENT_ERRORS_SUMMARY_BY_HOST`

The table `CLIENT_ERRORS_SUMMARY_BY_HOST` provides a summary of SQL errors and warnings that have been returned to clients that connect to a TiDB server. These include:

- Malformed SQL statements.
- Division by zero errors.
- The attempt to insert out-of-range or duplicate key values.
- Permission errors.
- A table that does not exist.

These errors are returned to the client via the MySQL server protocol, where applications are expected to take appropriate action. The `INFORMATION_SCHEMA.CLIENT_ERRORS_SUMMARY_BY_HOST` table provides a useful method to inspect errors in the scenario where applications are not correctly handling (or logging) errors returned by the TiDB server.

Because `CLIENT_ERRORS_SUMMARY_BY_HOST` summarizes the errors on a per-remote-host basis, it can be useful to diagnose scenarios where one application server is generating more errors than other servers. Possible scenarios include:

- An outdated MySQL client library.
- An outdated application (possibly this server was missed when rolling out a new deployment).
- Incorrect usage of the “host” portion of user permissions.
- Unreliable network connectivity generating more timeouts or disconnected connections.
