- `/*T![feature_id] Specific code */`: This syntax is used to ensure compatibility between different versions of TiDB. TiDB can parse the SQL fragment in this comment only if it implements the corresponding feature of `feature_id` in the current version. For example, as the `AUTO_RANDOM` feature is introduced in v3.1.1, this version of TiDB can parse `/*T![auto_rand] auto_random */` into `auto_random`. Because the `AUTO_RANDOM` feature is not implemented in v3.0.0, the SQL statement fragment above is ignored. **Do not leave any space inside the `/*T![` characters**.

14.13.1.7.3 Optimizer comment syntax

Another type of comment is specially treated as an optimizer hint:

```
SELECT /*+ hint */ FROM ...;
```

For details about the optimizer hints that TiDB supports, see Optimizer hints.

Note:

In MySQL client, the TiDB-specific comment syntax is treated as comments and cleared by default. In MySQL client before 5.7.7, hints are also seen as comments and are cleared by default. It is recommended to use the `--comments` option when you start the client. For example, `mysql -h 127.0.0.1 -P 4000 -uroot --comments`.

For more information, see Comment Syntax.

14.13.2 SQL Statements

14.13.2.1 ADD COLUMN

The `ALTER TABLE.. ADD COLUMN` statement adds a column to an existing table. This operation is online in TiDB, which means that neither reads or writes to the table are blocked by adding a column.

14.13.2.1.1 Synopsis

```
AlterTableStmt
        ::= 'ALTER' 'IGNORE'? 'TABLE' TableName AddColumnSpec ( ','
            ↪ AddColumnSpec )*

TableName ::=
    Identifier ('.' Identifier)?

AddColumnSpec
        ::= 'ADD' 'COLUMN' 'IF NOT EXISTS'? ColumnName ColumnType
            ↪ ColumnOption+ ( 'FIRST' | 'AFTER' ColumnName )?

ColumnType
        ::= NumericType
          | StringType
          | DateAndTimeType
          | 'SERIAL'

ColumnOption
        ::= 'NOT'? 'NULL'
          | 'AUTO_INCREMENT'
          | 'PRIMARY'? 'KEY' ( 'CLUSTERED' | 'NONCLUSTERED' )?
          | 'UNIQUE' 'KEY'?
```

```
          | 'DEFAULT' ( NowSymOptionFraction | SignedLiteral |
             ↪ NextValueForSequence )
          | 'SERIAL' 'DEFAULT' 'VALUE'
          | 'ON' 'UPDATE' NowSymOptionFraction
          | 'COMMENT' stringLit
          | ( 'CONSTRAINT' Identifier? )? 'CHECK' '(' Expression ')' ( 'NOT
             ↪ '? ( 'ENFORCED' | 'NULL' ) )?
          | 'GENERATED' 'ALWAYS' 'AS' '(' Expression ')' ( 'VIRTUAL' | '
             ↪ STORED' )?
          | 'REFERENCES' TableName ( '(' IndexPartSpecificationList ')' )?
             ↪ Match? OnDeleteUpdateOpt
          | 'COLLATE' CollationName
          | 'COLUMN_FORMAT' ColumnFormat
          | 'STORAGE' StorageMedia
          | 'AUTO_RANDOM' ( '(' LengthNum ')' )?
```

14.13.2.1.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 VALUES (NULL);
Query OK, 1 row affected (0.02 sec)

mysql> SELECT * FROM t1;
+----+
| id |
+----+
|  1 |
+----+
1 row in set (0.00 sec)

mysql> ALTER TABLE t1 ADD COLUMN c1 INT NOT NULL;
Query OK, 0 rows affected (0.28 sec)

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  0 |
+----+----+
1 row in set (0.00 sec)

mysql> ALTER TABLE t1 ADD c2 INT NOT NULL AFTER c1;
```

```
Query OK, 0 rows affected (0.28 sec)

mysql> SELECT * FROM t1;
+----+----+----+
| id | c1 | c2 |
+----+----+----+
|  1 |  0 |  0 |
+----+----+----+
1 row in set (0.00 sec)
```

14.13.2.1.3 MySQL compatibility

- Adding a new column and setting it to the `PRIMARY KEY` is not supported.
- Adding a new column and setting it to `AUTO_INCREMENT` is not supported.
- There are limitations on adding generated columns, refer to: generated column limitations.

14.13.2.1.4 See also

- ADD INDEX
- CREATE TABLE

14.13.2.2 ADD INDEX

The `ALTER TABLE.. ADD INDEX` statement adds an index to an existing table. This operation is online in TiDB, which means that neither reads or writes to the table are blocked by adding an index.

Tip:

The TiDB Distributed eXecution Framework (DXF) can be used to speed up the operation of this statement.

Warning:

- **DO NOT** upgrade a TiDB cluster when a DDL statement is being executed in the cluster (usually for the time-consuming DDL statements such as `ADD INDEX` and the column type changes).

- Before the upgrade, it is recommended to use the `ADMIN SHOW DDL` command to check whether the TiDB cluster has an ongoing DDL job. If the cluster has a DDL job, to upgrade the cluster, wait until the DDL execution is finished or use the `ADMIN CANCEL DDL` command to cancel the DDL job before you upgrade the cluster.
- In addition, during the cluster upgrade, **DO NOT** execute any DDL statement. Otherwise, the issue of undefined behavior might occur.

When you upgrade TiDB from v7.1.0 to a later version, you can ignore the preceding limitations. For details, see the limitations of TiDB smooth upgrade.

14.13.2.2.1 Synopsis

```
AlterTableStmt
        ::= 'ALTER' 'IGNORE'? 'TABLE' TableName AddIndexSpec ( ','
           ↪ AddIndexSpec )*

AddIndexSpec
        ::= 'ADD' ( ( 'PRIMARY' 'KEY' | ( 'KEY' | 'INDEX' ) 'IF NOT EXISTS'?
           ↪  | 'UNIQUE' ( 'KEY' | 'INDEX' )? ) ( ( Identifier? 'USING' |
           ↪ Identifier 'TYPE' ) IndexType )? | 'FULLTEXT' ( 'KEY' | '
           ↪ INDEX' )? IndexName ) '(' IndexPartSpecification ( ','
           ↪ IndexPartSpecification )* ')' IndexOption*

IndexPartSpecification
        ::= ( ColumnName ( '(' LengthNum ')' )? | '(' Expression ')' ) ( '
           ↪ ASC' | 'DESC' )

IndexOption
        ::= 'KEY_BLOCK_SIZE' '='? LengthNum
          | IndexType
          | 'WITH' 'PARSER' Identifier
          | 'COMMENT' stringLit
          | 'VISIBLE'
          | 'INVISIBLE'

IndexType
        ::= 'BTREE'
          | 'HASH'
          | 'RTREE'
```

14.13.2.2.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;

```

14.13.2.2.3 MySQL compatibility

- `FULLTEXT`, `HASH` and `SPATIAL` indexes are not supported.
- Descending indexes are not supported (similar to MySQL 5.7).
- Adding the primary key of the `CLUSTERED` type to a table is not supported. For more details about the primary key of the `CLUSTERED` type, refer to clustered index.

14.13.2.2.4 See also

- CREATE TABLE
- EXPLAIN
- TiDB Distributed eXecution Framework (DXF)

14.13.2.3 ADMIN

This statement is a TiDB extension syntax, used to view the status of TiDB and check the data of tables in TiDB. This document introduces the following `ADMIN` related statements:

- `ADMIN RELOAD`
- `ADMIN PLUGINS`
- `ADMIN ... BINDINGS`
- `ADMIN REPAIR`
- `ADMIN SHOW NEXT_ROW_ID`
- `ADMIN SHOW SLOW`

14.13.2.3.1 DDL related statement

Statement	Description
ADMIN CANCEL DDL JOBS	Cancels a currently running DDL jobs.
ADMIN CHECKSUM TABLE	Calculates the CRC64 of all rows + indexes of a table.
[ADMIN CHECK [TABLE|INDEX]](#admin-check-[table index])	
[ADMIN SHOW DDL [JOBS|QUERIES]](#admin-show-ddl-[jobs job-queries])	
ADMIN SHOW TELEMETRY	Shows information that will be reported back to PingCAP as part of the telemetry feature.

14.13.2.3.2 `ADMIN RELOAD` statement

```
ADMIN RELOAD expr_pushdown_blacklist;
```

The above statement is used to reload the blocklist pushed down by the expression.

```
ADMIN RELOAD opt_rule_blacklist;
```

The above statement is used to reload the blocklist of logic optimization rules.

14.13.2.3.3 `ADMIN PLUGINS` related statement

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

```
ADMIN PLUGINS ENABLE plugin_name [, plugin_name] ...;
```

The above statement is used to enable the `plugin_name` plugin.

```
ADMIN PLUGINS DISABLE plugin_name [, plugin_name] ...;
```

The above statement is used to disable the `plugin_name` plugin.

14.13.2.3.4 ADMIN BINDINGS related statement

```
ADMIN FLUSH BINDINGS;
```

The above statement is used to persist SQL Plan binding information.

```
ADMIN CAPTURE BINDINGS;
```

The above statement can generate the binding of SQL Plan from the `SELECT` statement that occurs more than once.

```
ADMIN EVOLVE BINDINGS;
```

After the automatic binding feature is enabled, the evolution of SQL Plan binding information is triggered every `bind-info-leave` (the default value is `3s`). The above statement is used to proactively trigger this evolution.

```
ADMIN RELOAD BINDINGS;
```

The above statement is used to reload SQL Plan binding information.

14.13.2.3.5 ADMIN REPAIR statement

To overwrite the metadata of the stored table in an untrusted way in extreme cases, use `ADMIN REPAIR TABLE`:

```
ADMIN REPAIR TABLE tbl_name CREATE TABLE STATEMENT;
```

Here "untrusted" means that you need to manually ensure that the metadata of the original table can be covered by the `CREATE TABLE STATEMENT` operation. To use this `REPAIR` statement, enable the `repair-mode` configuration item, and make sure that the tables to be repaired are listed in the `repair-table-list`.

14.13.2.3.6 ADMIN SHOW NEXT_ROW_ID statement

```
ADMIN SHOW t NEXT_ROW_ID;
```

The above statement is used to view the details of some special columns of a table. The output is the same as SHOW TABLE NEXT_ROW_ID.

14.13.2.3.7 ADMIN SHOW SLOW statement

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

```
ADMIN SHOW SLOW RECENT N;
```

```
ADMIN SHOW SLOW TOP [INTERNAL | ALL] N;
```

For details, refer to ADMIN SHOW SLOW command.

14.13.2.3.8 Synopsis

```
AdminStmt ::=
    'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
       ↪ 'QUERIES' NumList )? | TableName 'NEXT_ROW_ID' | 'SLOW'
       ↪ AdminShowSlow ) | 'CHECK' ( 'TABLE' TableNameList | 'INDEX'
       ↪ TableName Identifier ( HandleRange ( ',' HandleRange )* )? ) | '
       ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ( 'INDEX'
       ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList ) | 'CHECKSUM'
       ↪  'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
       ↪ ( 'EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS' )
       ↪ | 'PLUGINS' ( 'ENABLE' | 'DISABLE' ) PluginNameList | 'REPAIR' '
       ↪ TABLE' TableName CreateTableStmt | ( 'FLUSH' | 'CAPTURE' | 'EVOLVE
       ↪ ' ) 'BINDINGS' )
```

14.13.2.3.9 Examples

Run the following command to view the last 10 completed DDL jobs in the currently running DDL job queue. When NUM is not specified, only the last 10 completed DDL jobs is presented by default.

```
ADMIN SHOW DDL JOBS;
```

```

    ↪
```

- `JOB_ID`: each DDL operation corresponds to one DDL job. `JOB_ID` is globally unique.
- `DB_NAME`: the name of the database on which the DDL operations are performed.
- `TABLE_NAME`: the name of the table on which the DDL operations are performed.
- `JOB_TYPE`: the type of the DDL operations.
- `SCHEMA_STATE`: the current state of the schema. If the `JOB_TYPE` is `add index`, it is the state of the index; if the `JOB_TYPE` is `add column`, it is the state of the column; if the `JOB_TYPE` is `create table`, it is the state of the table. The common states include:
    - `none`: it indicates not existing. When the `drop` or `create` operation fails and rolls back, it usually becomes the `none` state.
    - `delete only`, `write only`, `delete reorganization`, `write reorganization`: these four states are intermediate states. These states are not visible in common operations, because the conversion from the intermediate states is so quick. You can see the `write reorganization` state only in `add index` operations, which means that the index data is being added.
    - `public`: it indicates existing and usable. When operations like `create table` and `add index/column` are finished, it usually becomes the `public` state, which means that the created table/column/index can be normally read and written now.
- `SCHEMA_ID`: the ID of the database on which the DDL operations are performed.
- `TABLE_ID`: the ID of the table on which the DDL operations are performed.
- `ROW_COUNT`: the number of the data rows that have been added when running the `add index` operation.
- `START_TIME`: the start time of the DDL operations.
- `END_TIME`: the end time of the DDL operations.
- `STATE`: the state of the DDL operations. The common states include:
    - `none`: it indicates that the operation task has been put in the DDL job queue but has not been performed yet, because it is waiting for the previous tasks to complete. Another reason might be that it becomes the `none` state after running the drop operation, but it will soon be updated to the `synced` state, which means that all TiDB instances have been synced to this state.
    - `running`: it indicates that the operation is being performed.

- `synced`: it indicates that the operation has been performed successfully and all TiDB instances have been synced to this state.
- `rollback done`: it indicates that the operation has failed and has finished rolling back.
- `rollingback`: it indicates that the operation has failed and is rolling back.
- `cancelling`: it indicates that the operation is being cancelled. This state only occurs when you cancel DDL jobs using the `ADMIN CANCEL DDL JOBS` command.
- `paused`: it indicates that the operation has been paused. This state only appears when you use the `ADMIN PAUSED DDL JOBS` command to pause the DDL job. You can use the `ADMIN RESUME DDL JOBS` command to resume the DDL job.

14.13.2.3.10 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.4 ADMIN CANCEL DDL

The `ADMIN CANCEL DDL` statement allows you to cancel a running DDL job. The `job_id` can be found by running `ADMIN SHOW DDL JOBS`.

The `ADMIN CANCEL DDL` statement also allows you to cancel a DDL job that is committed but not yet completed executing. After the cancellation, the SQL statement that executes the DDL job returns the `ERROR 8214 (HY000): Cancelled DDL job` error. If you cancel a DDL job that has already been completed, you will see the `DDL Job:90 not found` error in the `RESULT` column, which indicates that the job has been removed from the DDL waiting queue.

14.13.2.4.1 Synopsis

```
AdminStmt ::=
    'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
       ↪ 'QUERIES' NumList )? | TableName 'NEXT_ROW_ID' | 'SLOW'
       ↪ AdminShowSlow ) | 'CHECK' ( 'TABLE' TableNameList | 'INDEX'
       ↪ TableName Identifier ( HandleRange ( ',' HandleRange )* )? ) | '
       ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ( 'INDEX'
       ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList ) | 'CHECKSUM'
       ↪  'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
       ↪ ( 'EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS' )
       ↪ | 'PLUGINS' ( 'ENABLE' | 'DISABLE' ) PluginNameList | 'REPAIR' '
       ↪ TABLE' TableName CreateTableStmt | ( 'FLUSH' | 'CAPTURE' | 'EVOLVE
       ↪ ' ) 'BINDINGS' )

NumList ::=
    Int64Num ( ',' Int64Num )*
```

14.13.2.4.2 Examples

To cancel the currently running DDL jobs and return whether the corresponding jobs are successfully cancelled, use `ADMIN CANCEL DDL JOBS`:

```
ADMIN CANCEL DDL JOBS job_id [, job_id] ...;
```

If the operation fails to cancel the jobs, specific reasons are displayed.

Note:

- Before v6.2.0, only this operation can cancel DDL jobs, and all other operations and environment changes (such as machine restart and cluster restart) cannot cancel these jobs. Starting from v6.2.0, `KILL` statements can also be used to cancel ongoing DDL jobs by killing them.
- This operation can cancel multiple DDL jobs at the same time. You can get the ID of DDL jobs using the `ADMIN SHOW DDL JOBS` statement.
- If the jobs you want to cancel are finished, the cancellation operation fails.

14.13.2.4.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.4.4 See also

- `ADMIN SHOW DDL [JOBS|JOB QUERIES]`

14.13.2.5 ADMIN CHECKSUM TABLE

The `ADMIN CHECKSUM TABLE` statement calculates a CRC64 checksum for the data and indexes of a table. This statement is used by programs such as TiDB Lightning to ensure that import operations have completed successfully.

14.13.2.5.1 Synopsis

```
AdminStmt ::=
    'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
       ↪ 'QUERIES' NumList )? | TableName 'NEXT_ROW_ID' | 'SLOW'
       ↪ AdminShowSlow ) | 'CHECK' ( 'TABLE' TableNameList | 'INDEX'
       ↪ TableName Identifier ( HandleRange ( ',' HandleRange )* )? ) | '
       ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ( 'INDEX'
       ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList ) | 'CHECKSUM'
```

```
        ↪  'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
        ↪ ( 'EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS' )
        ↪ | 'PLUGINS' ( 'ENABLE' | 'DISABLE' ) PluginNameList | 'REPAIR' '
        ↪ TABLE' TableName CreateTableStmt | ( 'FLUSH' | 'CAPTURE' | 'EVOLVE
        ↪ ' ) 'BINDINGS' )

TableNameList ::=
    TableName ( ',' TableName )*
```

14.13.2.5.2 Examples

Create table `t1`:

```
CREATE TABLE t1(id INT PRIMARY KEY);
```

Insert some data into `t1`:

```
INSERT INTO t1 VALUES (1),(2),(3);
```

Calculate the checksum for `t1`:

```
ADMIN CHECKSUM TABLE t1;
```

The output is as follows:

```
+---------+------------+---------------------+-----------+-------------+
| Db_name | Table_name | Checksum_crc64_xor | Total_kvs | Total_bytes |
+---------+------------+---------------------+-----------+-------------+
| test    | t1         | 10909174369497628533 |     3 |         75 |
+---------+------------+---------------------+-----------+-------------+
1 row in set (0.00 sec)
```

14.13.2.5.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.6 ADMIN CHECK [TABLE|INDEX]

The `ADMIN CHECK [TABLE|INDEX]` statement checks for data consistency of tables and indexes.

It does not support the following:

- Checking FOREIGN KEY constraints.
- Checking the PRIMARY KEY index if a clustered primary key is used.

If `ADMIN CHECK [TABLE|INDEX]` finds any issues, you can resolve them by dropping and recreating the index. If the issue is not resolved, you can report a bug.

14.13.2.6.1 Principles

The `ADMIN CHECK TABLE` statement takes the following steps to check the table:

1. For each index, it checks if the number of records in the index is the same as that in the table.
2. For each index, it loops over the values in each row and compares the values with that in the table.

If you use the `ADMIN CHECK INDEX` statement, it only checks the specified index.

14.13.2.6.2 Synopsis

```
AdminStmt ::=
    'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
       ↪ 'QUERIES' NumList )? | TableName 'NEXT_ROW_ID' | 'SLOW'
       ↪ AdminShowSlow ) | 'CHECK' ( 'TABLE' TableNameList | 'INDEX'
       ↪ TableName Identifier ( HandleRange ( ',' HandleRange )* )? ) | '
       ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ( 'INDEX'
       ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList ) | 'CHECKSUM'
       ↪  'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'RELOAD'
       ↪ ( 'EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS' )
       ↪ | 'PLUGINS' ( 'ENABLE' | 'DISABLE' ) PluginNameList | 'REPAIR' '
       ↪ TABLE' TableName CreateTableStmt | ( 'FLUSH' | 'CAPTURE' | 'EVOLVE
       ↪ ' ) 'BINDINGS' )

TableNameList ::=
    TableName ( ',' TableName )*
```

14.13.2.6.3 Examples

To check the consistency of all the data and corresponding indexes in the `tbl_name` table, use `ADMIN CHECK TABLE`:

```
ADMIN CHECK TABLE tbl_name [, tbl_name] ...;
```

If the consistency check is passed, an empty result is returned. Otherwise, an error message is returned indicating that the data is inconsistent.

```
ADMIN CHECK INDEX tbl_name idx_name;
```

The above statement is used to check the consistency of the column data and index data corresponding to the `idx_name` index in the `tbl_name` table. If the consistency check is passed, an empty result is returned; otherwise, an error message is returned indicating that the data is inconsistent.

```
ADMIN CHECK INDEX tbl_name idx_name (lower_val, upper_val) [, (lower_val,
    ↪ upper_val)] ...;
```

The above statement is used to check the consistency of the column data and index data corresponding to the `idx_name` index in the `tbl_name` table, with the data range (to be checked) specified. If the consistency check is passed, an empty result is returned. Otherwise, an error message is returned indicating that the data is inconsistent.

14.13.2.6.4 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.6.5 See also

- ADMIN REPAIR

14.13.2.7 ADMIN CLEANUP INDEX

The `ADMIN CLEANUP INDEX` statement is used to delete redundant indexes from a table when the table has inconsistent data and index. Note that this syntax does not support foreign key constraints yet.

14.13.2.7.1 Synopsis

```
AdminCleanupStmt ::=
    'ADMIN' 'CLEANUP' ( 'INDEX' TableName IndexName | 'TABLE' 'LOCK'
        ↪ TableNameList )

TableNameList ::=
    TableName ( ',' TableName )*
```

14.13.2.7.2 Examples

Assume that the `tbl` table in a database has inconsistent data and index due to some reasons (for example, some row data is lost in the cluster in a disaster recovery scenario):

```
SELECT * FROM tbl;
ERROR 1105 (HY000): inconsistent index idx handle count 3 isn't equal to
    ↪ value count 2

ADMIN CHECK INDEX tbl idx ;
ERROR 1105 (HY000): handle &kv.CommonHandle{encoded:[]uint8{0x1, 0x0, 0x0, 0
    ↪ x0, 0x0, 0x0, 0x0, 0x0, 0xf8}, colEndOffsets:[]uint16{0xa}},
    ↪ index:types.Datum{k:0x5, decimal:0x0, length:0x0, i:0, collation:"
    ↪ utf8mb4_bin", b:[]uint8{0x0}, x:interface {}(nil)} != record:<nil>
```

It can be seen from the error message of the `SELECT` query that, the `tbl` table contains two rows of data and three rows of index data, which means inconsistent row and index data. At the same time, at least one index is in dangling state. In this case, you can use the `ADMIN CLEANUP INDEX` statement to delete the dangling index:

```
ADMIN CLEANUP INDEX tbl idx;
```

The execution result is as follows:

```
ADMIN CLEANUP INDEX tbl idx;
+---------------+
| REMOVED_COUNT |
+---------------+
|             1 |
+---------------+
```

You can execute the `ADMIN CHECK INDEX` statement again to check the consistency of data and index, and verify whether the data has been restored to a normal state:

```
ADMIN CHECK INDEX tbl idx;
Query OK, 0 rows affected (0.01 sec)
```

Note:

When the data and index are inconsistent due to the loss of replicas:

- There might be a loss of both row data and index data. To restore the consistency, use the `ADMIN CLEANUP INDEX` and `ADMIN RECOVER INDEX` statements together.
- The `ADMIN CLEANUP INDEX` statement is always executed in a single thread. When the table data is large, it is recommended to recover the index data by rebuilding the index.
- When you execute the `ADMIN CLEANUP INDEX` statement, the corresponding table or index is not locked and TiDB allows other sessions to modify the table records at the same time. However, in this case, `ADMIN CLEANUP INDEX` might not be able to handle all table records correctly. Therefore, when you execute `ADMIN CLEANUP INDEX`, avoid modifying the table data at the same time.
- If you use the enterprise edition of TiDB, you can submit a request to contact the support engineer for help.

The `ADMIN CLEANUP INDEX` statement is not atomic: if the statement is interrupted during execution, it is recommended to execute it again until it succeeds.

14.13.2.7.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.7.4 See also

- ADMIN CHECK TABLE/INDEX
- ADMIN RECOVER INDEX

14.13.2.8 ADMIN PAUSE DDL JOBS

`ADMIN PAUSE DDL` allows you to pause a running DDL job. The `job_id` can be found by running ADMIN SHOW DDL JOBS.

You can use this statement to pause a DDL job that is issued but not yet completed executing. After the pause, the SQL statement that executes the DDL job does not return immediately, but looks like it is still running. If you try to pause a DDL job that has already been completed, you will see the `DDL Job:90 not found` error in the `RESULT` column, which indicates that the job has been removed from the DDL waiting queue.

14.13.2.8.1 Synopsis

```
AdminStmt ::=
    'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
       ↪ 'QUERIES' NumList )? | TableName 'NEXT_ROW_ID' | 'SLOW'
       ↪ AdminShowSlow ) | 'CHECK' ( 'TABLE' TableNameList | 'INDEX'
       ↪ TableName Identifier ( HandleRange ( ',' HandleRange )* )? ) | '
       ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ( 'INDEX'
       ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList ) | 'CHECKSUM'
       ↪  'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'PAUSE' '
       ↪ DDL' 'JOBS' NumList | 'RESUME' 'DDL' 'JOBS' NumList | 'RELOAD' ( '
       ↪ EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS' ) | '
       ↪ PLUGINS' ( 'ENABLE' | 'DISABLE' ) PluginNameList | 'REPAIR' 'TABLE
       ↪ ' TableName CreateTableStmt | ( 'FLUSH' | 'CAPTURE' | 'EVOLVE' ) '
       ↪ BINDINGS' )

NumList ::=
    Int64Num ( ',' Int64Num )*
```

14.13.2.8.2 Examples

`ADMIN PAUSE DDL JOBS` pauses the currently running DDL job and returns whether the job is paused successfully. The job can be resumed by `ADMIN RESUME DDL JOBS`.

```
ADMIN PAUSE DDL JOBS job_id [, job_id] ...;
```

If the pause fails, the specific reason for the failure is displayed.

Note:

- This statement can pause a DDL job, but other operations and environment changes (such as machine restarts and cluster restarts) do not pause DDL jobs except for cluster upgrades.
- During the cluster upgrade, the ongoing DDL jobs are paused, and the DDL jobs initiated during the upgrade are also paused. After the upgrade, all paused DDL jobs will resume. The pause and resume operations during the upgrade are taken automatically. For details, see TiDB Smooth Upgrade.
- This statement can pause multiple DDL jobs. You can use the `ADMIN SHOW DDL JOBS` statement to obtain the `job_id` of a DDL job.

14.13.2.8.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.8.4 See also

- `ADMIN SHOW DDL [JOBS|QUERIES]`
- `ADMIN CANCEL DDL`
- `ADMIN RESUME DDL`

14.13.2.9 ADMIN RECOVER INDEX

When the row data and index data are inconsistent, you can use the `ADMIN RECOVER INDEX` statement to recover the consistency based on the redundant indexes. Note that this syntax does not support foreign key constraints yet.

14.13.2.9.1 Synopsis

```
AdminCleanupStmt ::=
    'ADMIN' 'RECOVER' 'INDEX' TableName IndexName
```

14.13.2.9.2 Examples

Assume that the `tbl` table in a database has inconsistent row data and index due to some reasons (for example, some row data is lost in the cluster in a disaster recovery scenario):

```
SELECT * FROM tbl;
ERROR 1105 (HY000): inconsistent index idx handle count 2 isn't equal to
    ↪ value count 3

ADMIN CHECK INDEX tbl idx ;
ERROR 1105 (HY000): handle &kv.CommonHandle{encoded:[]uint8{0x1, 0x0, 0x0, 0
    ↪ x0, 0x0, 0x0, 0x0, 0x0, 0x0, 0xf8}, colEndOffsets:[]uint16{0xa}},
    ↪ index:types.Datum{k:0x5, decimal:0x0, length:0x0, i:0, collation:"
    ↪ utf8mb4_bin", b:[]uint8{0x0}, x:interface {}(nil)} != record:<nil>
```

It can be seen from the error message of the `SELECT` query that, the `tbl` table contains three rows of data and two rows of index data, which means inconsistent row data and index data. At the same time, at least one row of data has no corresponding index. In this case, you can use the `ADMIN RECOVER INDEX` statement to supplement the missing index:

```
ADMIN RECOVER INDEX tbl idx;
```

The execution result is as follows:

```
ADMIN RECOVER INDEX tbl idx;
+-------------+------------+
| ADDED_COUNT | SCAN_COUNT |
+-------------+------------+
|           1 |          3 |
+-------------+------------+
1 row in set (0.00 sec)
```

You can execute the `ADMIN CHECK INDEX` statement again to check the consistency of data and index, and verify whether the data has been restored to normal state:

```
ADMIN CHECK INDEX tbl idx;
Query OK, 0 rows affected (0.01 sec)
```

Note:

When the data and index are inconsistent due to the loss of replicas:

- There might be a loss of both row data and index data. To address the issue, use the `ADMIN CLEANUP INDEX` and `ADMIN RECOVER INDEX` statements together to recover the consistency of row data and index data.
- The `ADMIN RECOVER INDEX` statement is always executed in a single thread. When the table data is large, it is recommended to recover the index data by rebuilding the index.

- When you execute the `ADMIN RECOVER INDEX` statement, the corresponding table or index is not locked and TiDB allows other sessions to modify the table records at the same time. However, in this case, `ADMIN RECOVER INDEX` might not be able to handle all table records correctly. Therefore, when you execute `ADMIN RECOVER INDEX`, avoid modifying the table data at the same time.
- If you use the enterprise edition of TiDB, you can submit a request to contact the support engineer for help.

The `ADMIN RECOVER INDEX` statement is not atomic: if the statement is interrupted during execution, it is recommended to execute it again until it succeeds.

14.13.2.9.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

- ADMIN CHECK TABLE/INDEX
- ADMIN CLEANUP INDEX

14.13.2.10 ADMIN RESUME DDL JOBS

`ADMIN RESUME DDL` allows you to resume a paused DDL job. You can find the `job_id` by running ADMIN SHOW DDL JOBS.

You can use this statement to resume a paused DDL job. After the resume is completed, the SQL statement that executes the DDL job continues to show as being executed. If you try to resume a DDL job that has already been completed, you will see the `DDL Job:90 not found` error in the `RESULT` column, which indicates that the job has been removed from the DDL waiting queue.

14.13.2.10.1 Synopsis

```
AdminStmt ::=
    'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
       ↪ 'QUERIES' NumList )? | TableName 'NEXT_ROW_ID' | 'SLOW'
       ↪ AdminShowSlow ) | 'CHECK' ( 'TABLE' TableNameList | 'INDEX'
       ↪ TableName Identifier ( HandleRange ( ',' HandleRange )* )? ) | '
       ↪ RECOVER' 'INDEX' TableName Identifier | 'CLEANUP' ( 'INDEX'
       ↪ TableName Identifier | 'TABLE' 'LOCK' TableNameList ) | 'CHECKSUM'
       ↪  'TABLE' TableNameList | 'CANCEL' 'DDL' 'JOBS' NumList | 'PAUSE' '
```

```
        ↪ DDL' 'JOBS' NumList | 'RESUME' 'DDL' 'JOBS' NumList | 'RELOAD' ( '
        ↪ EXPR_PUSHDOWN_BLACKLIST' | 'OPT_RULE_BLACKLIST' | 'BINDINGS' ) | '
        ↪ PLUGINS' ( 'ENABLE' | 'DISABLE' ) PluginNameList | 'REPAIR' 'TABLE
        ↪ ' TableName CreateTableStmt | ( 'FLUSH' | 'CAPTURE' | 'EVOLVE' ) '
        ↪ BINDINGS' )

NumList ::=
    Int64Num ( ',' Int64Num )*
```

14.13.2.10.2 Examples

`ADMIN RESUME DDL JOBS` resumes the currently paused DDL job and returns whether the job is resumed successfully.

```
ADMIN RESUME DDL JOBS job_id [, job_id] ...;
```

If the resume fails, the specific reason for the failure is displayed.

Note:

- During the cluster upgrade, the ongoing DDL jobs are paused, and the DDL jobs initiated during the upgrade are also paused. After the upgrade, all paused DDL jobs will resume. The pause and resume operations during the upgrade are taken automatically. For details, see TiDB Smooth Upgrade.
- This statement can resume multiple DDL jobs. You can use the `ADMIN ↪ SHOW DDL JOBS` statement to obtain the `job_id` of a DDL job.
- A DDL job in other status (other than `paused`) cannot be resumed and the resume operation will fail.
- If you try to resume a job more than once, TiDB reports an error `Error ↪ Number: 8261`.

14.13.2.10.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.10.4 See also

- `ADMIN SHOW DDL [JOBS|QUERIES]`
- `ADMIN CANCEL DDL`
- `ADMIN PAUSE DDL`

14.13.2.11 ADMIN [SET|SHOW|UNSET] BDR ROLE

- Use `ADMIN SET BDR ROLE` to set the BDR role of the cluster. Currently, you can set the following BDR roles for a TiDB cluster: `PRIMARY` and `SECONDARY`. For more information about BDR roles, see DDL Synchronization in TiCDC Bidirectional Replication.
- Use `ADMIN SHOW BDR ROLE` to show the BDR role of the cluster.
- Use `ADMIN UNSET BDR ROLE` to unset the BDR role of the cluster.

> **Warning:**
>
> This feature is experimental. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an issue on GitHub.

14.13.2.11.1 Synopsis

```
AdminShowBDRRoleStmt ::=
    'ADMIN' 'SHOW' 'BDR' 'ROLE'

AdminSetBDRRoleStmt ::=
    'ADMIN' 'SET' 'BDR' 'ROLE' ('PRIMARY' | 'SECONDARY')

AdminUnsetBDRRoleStmt ::=
    'ADMIN' 'UNSET' 'BDR' 'ROLE'
```

14.13.2.11.2 Examples

By default, a TiDB cluster has no BDR role. Run the following command to show the BDR role of the cluster.

```
ADMIN SHOW BDR ROLE;
```

```
+------------+
| BDR_ROLE   |
+------------+
|            |
+------------+
1 row in set (0.01 sec)
```

Run the following command to set the BDR role to `PRIMARY`.

```
ADMIN SET BDR ROLE PRIMARY;
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
ADMIN SHOW BDR ROLE;
+----------+
| BDR_ROLE |
+----------+
| primary |
+----------+
1 row in set (0.00 sec)
```

Run the following command to unset the BDR role of the cluster.

```
ADMIN UNSET BDR ROLE;
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
ADMIN SHOW BDR ROLE;
+----------+
| BDR_ROLE |
+----------+
|          |
+----------+
1 row in set (0.01 sec)
```

14.13.2.11.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.12 ADMIN SHOW DDL [JOBS|JOB QUERIES]

The `ADMIN SHOW DDL [JOBS|JOB QUERIES]` statement shows information about running and recently completed DDL jobs.

14.13.2.12.1 Synopsis

```
AdminStmt ::=
    'ADMIN' ( 'SHOW' ( 'DDL' ( 'JOBS' Int64Num? WhereClauseOptional | 'JOB'
        ↪ 'QUERIES' NumList | 'JOB' 'QUERIES' 'LIMIT' m 'OFFSET' n )? |
        ↪ TableName 'NEXT_ROW_ID' | 'SLOW' AdminShowSlow ) | 'CHECK' ( '
        ↪ TABLE' TableNameList | 'INDEX' TableName Identifier ( HandleRange
        ↪ ( ',' HandleRange )* )? ) | 'RECOVER' 'INDEX' TableName Identifier
        ↪  | 'CLEANUP' ( 'INDEX' TableName Identifier | 'TABLE' 'LOCK'
        ↪ TableNameList ) | 'CHECKSUM' 'TABLE' TableNameList | 'CANCEL' 'DDL

14.13.2.12.2 Examples

`ADMIN SHOW DDL`

To view the status of the currently running DDL jobs, use `ADMIN SHOW DDL`. The output includes the current schema version, the DDL ID and address of the owner, the running DDL jobs and SQL statements, and the DDL ID of the current TiDB instance.

```
ADMIN SHOW DDL;
```

```
mysql> ADMIN SHOW DDL;
+--
    ↪ ----------+--------------------------------------+--------------+-------------
    ↪
| SCHEMA_VER | OWNER_ID                             | OWNER_ADDRESS | RUNNING_JOBS
    ↪  | SELF_ID                      | QUERY |

`ADMIN SHOW DDL JOBS`

The `ADMIN SHOW DDL JOBS` statement is used to view all the results in the current DDL job queue, including running and queuing tasks, as well as the latest ten results in the completed DDL job queue. The returned result fields are described as follows:

- `JOB_ID`: each DDL operation corresponds to a DDL job. `JOB_ID` is globally unique.
- `DB_NAME`: the name of the database where the DDL operation is performed.
- `TABLE_NAME`: the name of the table where the DDL operation is performed.
- `JOB_TYPE`: the type of DDL operation. Common job types include the following:

    - `ingest`: Ingestion with accelerated index backfilling as configured by `tidb_ddl_enable_fast_reorg`.
    - `txn`: Basic transactional backfill.
    - `txn-merge`: Transactional backfill with a temporary index that gets merged with the original index when the backfill is finished.

- `SCHEMA_STATE`: the current state of the schema object that the DDL operates on. If `JOB_TYPE` is `ADD INDEX`, it is the state of the index; if `JOB_TYPE` is `ADD COLUMN`, it is the state of the column; if `JOB_TYPE` is `CREATE TABLE`, it is the state of the table. Common states include the following:

    - `none`: indicates that it does not exist. Generally, after the `DROP` operation or after the `CREATE` operation fails and rolls back, it will become the `none` state.
    - `delete only`, `write only`, `delete reorganization`, `write reorganization`: these four states are intermediate states. For their specific meanings, see How the Online DDL Asynchronous Change Works in TiDB. As the intermediate state conversion is fast, these states are generally not visible during operation. Only when performing `ADD INDEX` operation can the `write reorganization` state be seen, indicating that index data is being added.
    - `public`: indicates that it exists and is available to users. Generally, after `CREATE TABLE` and `ADD INDEX` (or `ADD COLUMN`) operations are completed, it will become the `public` state, indicating that the newly created table, column, and index can be read and written normally.

- `SCHEMA_ID`: the ID of the database where the DDL operation is performed.
- `TABLE_ID`: the ID of the table where the DDL operation is performed.
- `ROW_COUNT`: when performing the `ADD INDEX` operation, it is the number of data rows that have been added.
- `START_TIME`: the start time of the DDL operation.
- `STATE`: the state of the DDL operation. Common states include the following:

    - `queueing`: indicates that the operation job has entered the DDL job queue but has not been executed because it is still waiting for an earlier DDL job to complete. Another reason might be that after executing the `DROP` operation, it will become the `none` state, but it will soon be updated to the `synced` state, indicating that all TiDB instances have been synchronized to that state.
    - `running`: indicates that the operation is being executed.
    - `synced`: indicates that the operation has been executed successfully and all TiDB instances have been synchronized to this state.
    - `rollback done`: indicates that the operation has failed and the rollback has been completed.
    - `rollingback`: indicates that the operation has failed and is rolling back.
    - `cancelling`: indicates that the operation is being canceled. This state only appears when you use the `ADMIN CANCEL DDL JOBS` command to cancel the DDL job.
    - `paused`: indicates that the operation has been paused. This state only appears when you use the `ADMIN PAUSED DDL JOBS` command to pause the DDL job. You

can use the ADMIN RESUME DDL JOBS command to resume the DDL job.

The following example shows the results of ADMIN SHOW DDL JOBS:

```
ADMIN SHOW DDL JOBS;
```

```
mysql> ADMIN SHOW DDL JOBS;

+--
   ↪ ------+---------+--------------------+-------------+--------------------+----
   ↪
12 rows in set (0.00 sec)
```

From the output above:

- Job 59 is currently in progress (`STATE` of `running`). The schema state is currently in `write reorganization`, but will switch to `public` once the task is completed to note that the change can be observed publicly by user sessions. The `end_time` column is also `NULL` indicating that the completion time for the job is currently not known.
- Job 60 is an `add index` job, which is currently queued waiting for job 59 to complete. When job 59 completes, the `STATE` of job 60 will switch to `running`.
- For destructive changes such as dropping an index or dropping a table, the `SCHEMA ↪ _STATE` will change to `none` when the job is complete. For additive changes, the `SCHEMA_STATE` will change to `public`.

To limit the number of rows shown, specify a number and a where condition:

```
ADMIN SHOW DDL JOBS [NUM] [WHERE where_condition];
```

- `NUM`: to view the last `NUM` results in the completed DDL job queue. If not specified, `NUM` is by default 10.
- `WHERE`: to add filter conditions.

ADMIN SHOW DDL JOB QUERIES

To view the original SQL statements of the DDL job corresponding to `job_id`, use `ADMIN SHOW DDL JOB QUERIES`:

```
ADMIN SHOW DDL JOBS;
ADMIN SHOW DDL JOB QUERIES 51;
```

```
mysql> ADMIN SHOW DDL JOB QUERIES 51;
+--------------------------------------------------------+
| QUERY                                                  |
+--------------------------------------------------------+
```

```
| CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY auto_increment) |
+--------------------------------------------------------------+
1 row in set (0.02 sec)
```

You can only search the running DDL job corresponding to `job_id` within the last ten results in the DDL history job queue.

```
ADMIN SHOW DDL JOB QUERIES LIMIT m OFFSET n
```

To view the original SQL statements of the DDL job within a specified range `[n+1, n+m]` corresponding to `job_id`, use `ADMIN SHOW DDL JOB QUERIES LIMIT m OFFSET n`:

```
sql ADMIN SHOW DDL JOB QUERIES LIMIT m; # Retrieve first m rows ADMIN
↪ SHOW DDL JOB QUERIES LIMIT n, m; # Retrieve rows [n+1, n+m] ADMIN SHOW
↪ DDL JOB QUERIES LIMIT m OFFSET n; # Retrieve rows [n+1, n+m]
```

where `n` and `m` are integers greater or equal to 0.

```
sql ADMIN SHOW DDL JOB QUERIES LIMIT 3; # Retrieve first 3 rows +--------+----------
↪  | JOB_ID | QUERY                                  |  +--------+----------------------
↪  | 59 | ALTER TABLE t1 ADD INDEX index2 (col2)          |  |    60 |
↪ ALTER TABLE t2 ADD INDEX index1 (col1)               |  |    58 | CREATE
↪ TABLE t2 (id INT NOT NULL PRIMARY KEY auto_increment)| +--------+-------------------
↪  3 rows in set (0.00 sec)
```

```
sql ADMIN SHOW DDL JOB QUERIES LIMIT 6, 2; # Retrieve rows 7-8 +--------+-----------
↪  | JOB_ID | QUERY                                          |  +--------+------------
↪  | 52 | ALTER TABLE t1 ADD INDEX index1 (col1)                  |  |
↪    51 | CREATE TABLE IF NOT EXISTS t1 (id INT NOT NULL PRIMARY KEY auto_
↪ increment)| +--------+-----------------------------------------------------------
↪  3 rows in set (0.00 sec)
```

```
sql ADMIN SHOW DDL JOB QUERIES LIMIT 3 OFFSET 4; # Retrieve rows 5-7
↪ +--------+---------------------------------------+ | JOB_ID | QUERY
↪                | +--------+---------------------------------------+
↪ | 54 | DROP TABLE IF EXISTS t3        |  |    53 | ALTER TABLE t1 DROP
↪  INDEX index1  |  |    52 | ALTER TABLE t1 ADD INDEX index1 (col1)|
↪ +--------+---------------------------------------+ 3 rows in set (0.00
↪ sec)
```

You can search the running DDL job corresponding to `job_id` within an arbitrarily specified range of results in the DDL history job queue. This syntax does not have the limitation of the last ten results of `ADMIN SHOW DDL JOB QUERIES`.

14.13.2.12.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.12.4 See also

- ADMIN CANCEL DDL
- ADMIN PAUSE DDL
- ADMIN RESUME DDL

14.13.2.13 ADMIN SHOW TELEMETRY

The `ADMIN SHOW TELEMETRY` statement shows the information that will be reported back to PingCAP as part of the telemetry feature.

> **Note:**
>
> This feature is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

14.13.2.13.3 MySQL compatibility

The `ADMIN` statement is a TiDB extension to MySQL syntax.

14.13.2.13.4 See also

- Telemetry
- `tidb_enable_telemetry` System Variable

14.13.2.14 ALTER DATABASE

`ALTER DATABASE` is used to specify or modify the default character set and collation of the current database. `ALTER SCHEMA` has the same effect as `ALTER DATABASE`.

14.13.2.14.1 Synopsis

```
AlterDatabaseStmt ::=
    'ALTER' 'DATABASE' DBName? DatabaseOptionList

DatabaseOption ::=
    DefaultKwdOpt ( CharsetKw '='? CharsetName | 'COLLATE' '='?
        ↪ CollationName | 'ENCRYPTION' '='? EncryptionOpt )
```

14.13.2.14.2 Examples

Modify the test database schema to use the utf8mb4 character set:

```
ALTER DATABASE test DEFAULT CHARACTER SET = utf8mb4;
```

```
Query OK, 0 rows affected (0.00 sec)
```

Currently, TiDB only supports some character sets and collations. See Character Set and Collation Support for details.

14.13.2.14.3 MySQL compatibility

The `ALTER DATABASE` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.14.4 See also

- CREATE DATABASE
- SHOW DATABASES

14.13.2.15 ALTER INDEX

The `ALTER INDEX` statement is used to modify the visibility of the index to `Visible` or `Invisible`. Invisible indexes are maintained by DML statements, but will not be used by the query optimizer. This is useful in scenarios where you want to double-check before removing an index permanently. Starting from TiDB v8.0.0, you can make the optimizer select invisible indexes by modifying the system variable `tidb_opt_use_invisible_indexes`.

14.13.2.15.1 Synopsis

```
AlterTableStmt
        ::= 'ALTER' 'IGNORE'? 'TABLE' TableName AlterIndexSpec ( ','
            ↪ AlterIndexSpec )*

AlterIndexSpec
        ::= 'ALTER' 'INDEX' Identifier ( 'VISIBLE' | 'INVISIBLE' )
```

14.13.2.15.2 Examples

You can modify the visibility of an index using the `ALTER TABLE ... ALTER INDEX ...` statement.

```
CREATE TABLE t1 (c1 INT, UNIQUE(c1));
ALTER TABLE t1 ALTER INDEX c1 INVISIBLE;
```

```
Query OK, 0 rows affected (0.02 sec)
```

```
SHOW CREATE TABLE t1;
```

```
+--
   ↪ -----+-------------------------------------------------------------------
   ↪
| Table | Create Table
                                  |
+--
   ↪ -----+-------------------------------------------------------------------
   ↪
| t1    | CREATE TABLE `t1` (
  `c1` int(11) DEFAULT NULL,
  UNIQUE KEY `c1` (`c1`) /*!80000 INVISIBLE */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin |
+--
   ↪ -----+-------------------------------------------------------------------
   ↪
1 row in set (0.00 sec)
```

The optimizer cannot use the **invisible index** of `c1`.

```
EXPLAIN SELECT c1 FROM t1 ORDER BY c1;
```

```
+--
   ↪ ----------------------+----------+-----------+--------------+---------------
   ↪
| id                      | estRows | task      | access object | operator info
   ↪             |
+--
   ↪ ----------------------+----------+-----------+--------------+---------------
   ↪
| Sort_4                  | 10000.00 | root      |               | test.t1.c1:asc
   ↪               |
| └─TableReader_8         | 10000.00 | root      |               | data:
   ↪ TableFullScan_7       |
|   └─TableFullScan_7     | 10000.00 | cop[tikv] | table:t1 | keep order:false
   ↪ , stats:pseudo |
```

```
+--
    ↪ ---------------------+----------+-----------+--------------+-----------------
    ↪
3 rows in set (0.00 sec)
```

By comparison, c2 is a **visible index** and can be used by the optimizer.

```
EXPLAIN SELECT c2 FROM t1 ORDER BY c2;
```

```
+--
    ↪ ---------------------+----------+-----------+-----------------------+---------
    ↪
| id                    | estRows | task     | access object        | operator
    ↪ info              |
+--
    ↪ ---------------------+----------+-----------+-----------------------+---------
    ↪
| IndexReader_13       | 10000.00 | root    |                       | index:
    ↪ IndexFullScan_12    |
|  ─IndexFullScan_12   | 10000.00 | cop[tikv] | table:t1, index:c2(c2) |
    ↪ keep order:true, stats:pseudo |
+--
    ↪ ---------------------+----------+-----------+-----------------------+---------
    ↪
2 rows in set (0.00 sec)
```

Even if you use the USE INDEX SQL hint to forcibly use indexes, the optimizer still cannot use invisible indexes; otherwise, an error is returned.

```
SELECT * FROM t1 USE INDEX(c1);
```

```
ERROR 1176 (42000): Key 'c1' doesn't exist in table 't1'
```

> **Note:**
>
> "Invisible" here means invisible only to the optimizer. You can still modify or delete invisible indexes.

```
ALTER TABLE t1 DROP INDEX c1;
```

```
Query OK, 0 rows affected (0.02 sec)
```

14.13.2.15.3 MySQL compatibility

- Invisible indexes in TiDB are modeled on the equivalent feature from MySQL 8.0.
- Similar to MySQL, TiDB does not permit `PRIMARY KEY` indexes to be made invisible.

14.13.2.15.4 See also

- CREATE TABLE
- CREATE INDEX
- ADD INDEX
- DROP INDEX
- RENAME INDEX

14.13.2.16 ALTER INSTANCE

The `ALTER INSTANCE` statement is used to make changes to a single TiDB instance. Currently, TiDB only supports the `RELOAD TLS` clause.

> **Note:**
>
> TiDB Serverless can automatically refresh the TLS certificate, so this feature is not applicable to TiDB Serverless clusters.

14.13.2.16.1 RELOAD TLS

You can execute the `ALTER INSTANCE RELOAD TLS` statement to reload the certificate (`ssl-cert`), the key (`ssl-key`), and the CA (`ssl-ca`) from the original configuration path.

The newly loaded certificate, key, and CA take effect on the connection that is established after the statement is successfully executed. The connection established before this statement execution is not affected.

When an error occurs during reloading, by default, this error message is returned and the previous key and certificate continue to be used. However, if you have added the optional `NO ROLLBACK ON ERROR`, when an error occurs during reloading, the error is not returned, and the subsequent requests are handled with the TLS security connection disabled.

14.13.2.16.2 Syntax diagram

AlterInstanceStmt:

```
AlterInstanceStmt ::=
    'ALTER' 'INSTANCE' InstanceOption
```

```
InstanceOption ::=
    'RELOAD' 'TLS' ('NO' 'ROLLBACK' 'ON' 'ERROR')?
```

14.13.2.16.3 Example

```
ALTER INSTANCE RELOAD TLS;
```

14.13.2.16.4 MySQL compatibility

The `ALTER INSTANCE RELOAD TLS` statement only supports reloading from the original configuration path. It does not support dynamically modifying the loading path or dynamically enabling the TLS encrypted connection feature when TiDB is started. This feature is disabled by default when you restart TiDB.

14.13.2.16.5 See also

Enable TLS Between TiDB Clients and Servers.

Enable TLS Between TiDB Clients and Servers.

14.13.2.17 ALTER PLACEMENT POLICY

`ALTER PLACEMENT POLICY` is used to modify existing placement policies that have previously been created. All the tables and partitions which use the placement policy will automatically be updated.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

`ALTER PLACEMENT POLICY` *replaces* the previous policy with the new definition. It does not *merge* the old policy with the new one. In the following example, `FOLLOWERS=4` is lost when the `ALTER PLACEMENT POLICY` is executed:

```
CREATE PLACEMENT POLICY p1 FOLLOWERS=4;
ALTER PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us-
    ↪ west-1";
```

14.13.2.17.1 Synopsis

```
AlterPolicyStmt ::=
    "ALTER" "PLACEMENT" "POLICY" IfExists PolicyName PlacementOptionList

PolicyName ::=
    Identifier

PlacementOptionList ::=
    PlacementOption
|   PlacementOptionList PlacementOption
|   PlacementOptionList ',' PlacementOption

PlacementOption ::=
    CommonPlacementOption
|   SugarPlacementOption
|   AdvancedPlacementOption

CommonPlacementOption ::=
    "FOLLOWERS" EqOpt LengthNum

SugarPlacementOption ::=
    "PRIMARY_REGION" EqOpt stringLit
|   "REGIONS" EqOpt stringLit
|   "SCHEDULE" EqOpt stringLit

AdvancedPlacementOption ::=
    "LEARNERS" EqOpt LengthNum
|   "CONSTRAINTS" EqOpt stringLit
|   "LEADER_CONSTRAINTS" EqOpt stringLit
|   "FOLLOWER_CONSTRAINTS" EqOpt stringLit
|   "LEARNER_CONSTRAINTS" EqOpt stringLit
|   "SURVIVAL_PREFERENCES" EqOpt stringLit
```

14.13.2.17.2 Examples

> **Note:**
>
> To know which regions are available in your cluster, see SHOW PLACEMENT LABELS.
>
> If you do not see any available regions, your TiKV installation might not have labels set correctly.

```
CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us
    ↪ -west-1";
CREATE TABLE t1 (i INT) PLACEMENT POLICY=p1; -- Assign policy p1 to table
    ↪ t1
ALTER PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us-
    ↪ west-1,us-west-2" FOLLOWERS=4; -- The rules of t1 will be updated
    ↪ automatically.
SHOW CREATE PLACEMENT POLICY p1\G
```

```
Query OK, 0 rows affected (0.08 sec)

Query OK, 0 rows affected (0.10 sec)

***************************[ 1. row ]***************************
Policy      | p1
Create Policy | CREATE PLACEMENT POLICY `p1` PRIMARY_REGION="us-east-1"
    ↪ REGIONS="us-east-1,us-west-1,us-west-2" FOLLOWERS=4
1 row in set (0.00 sec)
```

14.13.2.17.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.17.4 See also

- Placement Rules in SQL
- SHOW PLACEMENT
- CREATE PLACEMENT POLICY
- DROP PLACEMENT POLICY

14.13.2.18 ALTER RANGE

Currently, the `ALTER RANGE` statement can only be used to modify the range of a specific placement policy in TiDB.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

14.13.2.18.1 Synopsis

```
AlterRangeStmt ::=
    'ALTER' 'RANGE' Identifier PlacementPolicyOption
```

`ALTER RANGE` supports the following two parameters:

- `global`: indicates the range of all data in a cluster.
- `meta`: indicates the range of internal metadata stored in TiDB.

14.13.2.18.2 Examples

```
CREATE PLACEMENT POLICY `deploy111` CONSTRAINTS='{"+region=us-east-1":1, "+
    ↪ region=us-east-2": 1, "+region=us-west-1": 1}';
CREATE PLACEMENT POLICY `five_replicas` FOLLOWERS=4;

ALTER RANGE global PLACEMENT POLICY = "deploy111";
ALTER RANGE meta PLACEMENT POLICY = "five_replicas";
```

The preceding example creates two placement policies (`deploy111` and `five_replicas`), specifies constraints for different regions, and then applies the `deploy111` placement policy to all data in the cluster range and the `five_replicas` placement policy to the metadata range.

14.13.2.19 ALTER RESOURCE GROUP

The `ALTER RESOURCE GROUP` statement is used to modify a resource group in a database.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

14.13.2.19.1 Synopsis

```
AlterResourceGroupStmt ::=
   "ALTER" "RESOURCE" "GROUP" IfExists ResourceGroupName
      ↪ ResourceGroupOptionList

IfExists ::=
    ('IF' 'EXISTS')?

ResourceGroupName ::=
    Identifier
```

```
|   "DEFAULT"

ResourceGroupOptionList ::=
    DirectResourceGroupOption
|   ResourceGroupOptionList DirectResourceGroupOption
|   ResourceGroupOptionList ',' DirectResourceGroupOption

DirectResourceGroupOption ::=
    "RU_PER_SEC" EqOpt stringLit
|   "PRIORITY" EqOpt ResourceGroupPriorityOption
|   "BURSTABLE"
|   "BURSTABLE" EqOpt Boolean
|   "QUERY_LIMIT" EqOpt '(' ResourceGroupRunawayOptionList ')'
|   "QUERY_LIMIT" EqOpt '(' ')'
|   "QUERY_LIMIT" EqOpt "NULL"
|   "BACKGROUND" EqOpt '(' BackgroundOptionList ')'
|   "BACKGROUND" EqOpt '(' ')'
|   "BACKGROUND" EqOpt "NULL"

ResourceGroupPriorityOption ::=
    LOW
|   MEDIUM
|   HIGH

ResourceGroupRunawayOptionList ::=
    DirectResourceGroupRunawayOption
|   ResourceGroupRunawayOptionList DirectResourceGroupRunawayOption
|   ResourceGroupRunawayOptionList ',' DirectResourceGroupRunawayOption

DirectResourceGroupRunawayOption ::=
    "EXEC_ELAPSED" EqOpt stringLit
|   "ACTION" EqOpt ResourceGroupRunawayActionOption

```

TiDB supports the following `DirectResourceGroupOption`, where Request Unit (RU) is a unified abstraction unit in TiDB for CPU, IO, and other system resources.

Option	Description	Example
`RU_PER_SEC`	Rate of RU backfilling per second	`RU_PER_SEC = 500` indicates that this resource group is backfilled with 500 RUs per second
`PRIORITY`	The absolute priority of tasks to be processed on TiKV	`PRIORITY = HIGH` indicates that the priority is high. If not specified, the default value is `MEDIUM`.
`BURSTABLE`	If the `BURSTABLE` attribute is set, TiDB allows the corresponding resource group to use the available system resources when the quota is exceeded.	
`QUERY_LIMIT`	When the query execution meets this condition, the query is identified as a runaway query and the corresponding action is executed.	`QUERY_LIMIT=(EXEC_ELAPSED='60s', ACTION=KILL, WATCH=EXACT DURATION='10m')` indicates that the query is identified as a runaway query when the execution time exceeds 60 seconds. The query is terminated. All SQL statements with the same SQL text will be terminated immediately in the coming 10 minutes. `QUERY_LIMIT=()` or `QUERY_LIMIT=NULL` means that runaway control is not enabled. See Runaway Queries.

Option	Description	Example
BACKGROUND	Configure the background tasks. For more details, see Manage background tasks.	BACKGROUND=(TASK_TYPES ↪ ="br,stats") indicates that the backup and restore and statistics collection related tasks are scheduled as background tasks.

Note:

- The ALTER RESOURCE GROUP statement can only be executed when the global variable tidb_enable_resource_control is set to ON.
- The ALTER RESOURCE GROUP statement supports incremental changes, leaving unspecified parameters unchanged. However, both QUERY_LIMIT and BACKGROUND are used as a whole and cannot be partially modified.
- Currently, only the default resource group supports modifying the BACKGROUND configuration.

14.13.2.19.2 Examples

Create a resource group named rg1 and modify its properties.

```
DROP RESOURCE GROUP IF EXISTS rg1;
```

```
Query OK, 0 rows affected (0.22 sec)
```

```
CREATE RESOURCE GROUP IF NOT EXISTS rg1
  RU_PER_SEC = 100
  BURSTABLE;
```

```
Query OK, 0 rows affected (0.08 sec)
```

```
SELECT * FROM information_schema.resource_groups WHERE NAME ='rg1';
```

```
+------+------------+----------+-----------+-------------+------------+
| NAME | RU_PER_SEC | PRIORITY | BURSTABLE | QUERY_LIMIT | BACKGROUND |
+------+------------+----------+-----------+-------------+------------+
| rg1  | 100        | MEDIUM   | NO        | NULL        | NULL       |
+------+------------+----------+-----------+-------------+------------+
1 rows in set (1.30 sec)
```

```
ALTER RESOURCE GROUP rg1
  RU_PER_SEC = 200
  PRIORITY = LOW
  QUERY_LIMIT = (EXEC_ELAPSED='1s' ACTION=COOLDOWN WATCH=EXACT DURATION '30
    ↪ s');
```

```
Query OK, 0 rows affected (0.08 sec)
```

```
SELECT * FROM information_schema.resource_groups WHERE NAME ='rg1';
```

```
+--
   ↪ ----+-----------+----------+-----------+-----------------------------------
   ↪
| NAME | RU_PER_SEC | PRIORITY | BURSTABLE | QUERY_LIMIT
   ↪                                          | BACKGROUND |
+--
   ↪ ----+-----------+----------+-----------+-----------------------------------
   ↪
| rg1 | 200        | LOW      | NO        | EXEC_ELAPSED='1s', ACTION=COOLDOWN,
   ↪ WATCH=EXACT DURATION='30s' | NULL |
+--
   ↪ ----+-----------+----------+-----------+-----------------------------------
   ↪
1 rows in set (1.30 sec)
```

Modify the BACKGROUND option for the default resource group.

```
ALTER RESOURCE GROUP default BACKGROUND = (TASK_TYPES = "br,ddl");
```

```
Query OK, 0 rows affected (0.08 sec)
```

```
SELECT * FROM information_schema.resource_groups WHERE NAME ='default';
```

```
+--
   ↪ -------+-----------+----------+-----------+------------+--------------------+
   ↪
| NAME    | RU_PER_SEC | PRIORITY | BURSTABLE | QUERY_LIMIT | BACKGROUND |
+--
   ↪ -------+-----------+----------+-----------+------------+--------------------+
   ↪
| default | UNLIMITED | MEDIUM | YES     | NULL        | TASK_TYPES='br,ddl' |
+--
   ↪ -------+-----------+----------+-----------+------------+--------------------+
   ↪
1 rows in set (1.30 sec)
```

14.13.2.19.3 MySQL compatibility

MySQL also supports ALTER RESOURCE GROUP. However, the acceptable parameters are different from that of TiDB so that they are not compatible.

14.13.2.19.4 See also

- DROP RESOURCE GROUP
- CREATE RESOURCE GROUP
- Request Unit (RU)

14.13.2.20 ALTER SEQUENCE

The `ALTER SEQUENCE` statement alters sequence objects in TiDB. The sequence is a database object that is on a par with the `Table` and the `View` object. The sequence is used to generate serialized IDs in a customized way.

14.13.2.20.1 Synopsis

```
CreateSequenceStmt ::=
    'ALTER' 'SEQUENCE' TableName CreateSequenceOptionListOpt

TableName ::=
    Identifier ('.' Identifier)?

CreateSequenceOptionListOpt ::=
    SequenceOption*

SequenceOptionList ::=
    SequenceOption

SequenceOption ::=
    ( 'INCREMENT' ( '='? | 'BY' ) | 'START' ( '='? | 'WITH' ) | ( 'MINVALUE'
       ↪  | 'MAXVALUE' | 'CACHE' ) '='? ) SignedNum
|   'COMMENT' '='? stringLit
|   'NOMINVALUE'
|   'NO' ( 'MINVALUE' | 'MAXVALUE' | 'CACHE' | 'CYCLE' )
|   'NOMAXVALUE'
|   'NOCACHE'
|   'CYCLE'
|   'NOCYCLE'
|   'RESTART' ( ( '='? | 'WITH' ) SignedNum )?
```

14.13.2.20.2 Syntax

```
ALTER SEQUENCE sequence_name
    [ INCREMENT [ BY | = ] increment ]
    [ MINVALUE [=] minvalue | NO MINVALUE | NOMINVALUE ]
    [ MAXVALUE [=] maxvalue | NO MAXVALUE | NOMAXVALUE ]
    [ START [ WITH | = ] start ]
    [ CACHE [=] cache | NOCACHE | NO CACHE]
    [ CYCLE | NOCYCLE | NO CYCLE]
    [table_options]
```

14.13.2.20.3 Parameters

Parameters	Default value	Description
INCREMENT ↪	1	Specifies the increment of a sequence. Its positive or negative values can control the growth direction of the sequence.

Parameters	Default value	Description
`MINVALUE` ↪	`1` or `-9223372036854775807` ↪	Specifies the minimum value of a sequence. When `INCREMENT` ↪ `> 0`, the default value is `1`. When `INCREMENT` ↪ `< 0`, the default value is `-922337203685477` ↪ .

Parameters	Default value	Description
`MAXVALUE` ↪	`9223372036854775806` ↪ or `-1`	Specifies the maximum value of a sequence. When `INCREMENT` ↪ `> 0`, the default value is `922337203685477` ↪ . When `INCREMENT` ↪ `< 0`, the default value is `-1`.

Parameters	Default value	Description
`START` ↪	`MINVALUE` ↪ or `MAXVALUE` ↪	Specifies the initial value of a sequence. When `INCREMENT` ↪ > 0, the default value is `MINVALUE` ↪ . When `INCREMENT` ↪ < 0, the default value is `MAXVALUE` ↪ .
`CACHE` ↪	`1000` ↪	Specifies the local cache size of a sequence in TiDB.

Parameters	Default value	Description
`CYCLE` ↪	`NO` ↪ `CYCLE` ↪	Specifies whether a sequence restarts from the minimum value (or maximum for the descending sequence). When `INCREMENT` ↪ > `0`, the default value is `MINVALUE` ↪ . When `INCREMENT` ↪ < `0`, the default value is `MAXVALUE` ↪ .

Parameters	Default value	Description

> **Note:**
>
> Changing the `START` value does not affect the generated values until you execute `ALTER SEQUENCE ... RESTART`.

14.13.2.20.4 `SEQUENCE` function

You can control a sequence through the following expression functions:

- `NEXTVAL` or `NEXT VALUE FOR`

  Essentially, both are the `NEXTVAL()` function that gets the next valid value of a sequence object. The parameter of the `NEXTVAL()` function is the `identifier` of the sequence.

- `LASTVAL`

  This function gets the last used value of this session. If the value does not exist, `NULL` is used. The parameter of this function is the `identifier` of the sequence.

- `SETVAL`

  This function sets the progression of the current value for a sequence. The first parameter of this function is the `identifier` of the sequence; the second parameter is `num`.

> **Note:**
>
> In the implementation of a sequence in TiDB, the `SETVAL` function cannot change the initial progression or cycle progression of this sequence. This function only returns the next valid value based on this progression.

14.13.2.20.5 Examples

Create a sequence named `s1`:

```
CREATE SEQUENCE s1;
```

```
Query OK, 0 rows affected (0.15 sec)
```

Get the next two values from the sequence by executing the following SQL statement twice:

```
SELECT NEXTVAL(s1);
```

```
+-------------+
| NEXTVAL(s1) |
+-------------+
|           1 |
+-------------+
1 row in set (0.01 sec)
```

```
SELECT NEXTVAL(s1);
```

```
+-------------+
| NEXTVAL(s1) |
+-------------+
|           2 |
+-------------+
1 row in set (0.00 sec)
```

Change the increment of the sequence to 2:

```
ALTER SEQUENCE s1 INCREMENT=2;
```

```
Query OK, 0 rows affected (0.18 sec)
```

Now, get the next two values from the sequence again:

```
SELECT NEXTVAL(s1);
```

```
+-------------+
| NEXTVAL(s1) |
+-------------+
|        1001 |
+-------------+
1 row in set (0.02 sec)
```

```
SELECT NEXTVAL(s1);
```

```
+-------------+
| NEXTVAL(s1) |
+-------------+
|        1003 |
+-------------+
1 row in set (0.00 sec)
```

As you can see from the output, the values now increase by two, following the `ALTER SEQUENCE` statement.

You can also change other parameters of the sequence. For example, you can change the `MAXVALUE` of the sequence as follows:

```
CREATE SEQUENCE s2 MAXVALUE=10;
```

```
Query OK, 0 rows affected (0.17 sec)
```

```
ALTER SEQUENCE s2 MAXVALUE=100;
```

```
Query OK, 0 rows affected (0.15 sec)
```

```
SHOW CREATE SEQUENCE s2\G
```

```
*************************** 1. row ***************************
       Sequence: s2
Create Sequence: CREATE SEQUENCE `s2` start with 1 minvalue 1 maxvalue 100
    ↪ increment by 1 cache 1000 nocycle ENGINE=InnoDB
1 row in set (0.00 sec)
```

14.13.2.20.6 MySQL compatibility

This statement is a TiDB extension. The implementation is modeled on sequences available in MariaDB.

Except for the `SETVAL` function, all other functions have the same *progressions* as MariaDB. Here "progression" means that the numbers in a sequence follow a certain arithmetic progression rule defined by the sequence. Although you can use `SETVAL` to set the current value of a sequence, the subsequent values of the sequence still follow the original progression rule.

For example:

```
1, 3, 5, ...          // The sequence starts from 1 and increments by 2.
SELECT SETVAL(seq, 6) // Sets the current value of a sequence to 6.
7, 9, 11, ...         // Subsequent values still follow the progression rule.
```

In the `CYCLE` mode, the initial value of a sequence in the first round is the value of the `START` parameter, and the initial value in the subsequent rounds is the value of `MinValue` (`INCREMENT` > 0) or `MaxValue` (`INCREMENT` < 0).

14.13.2.21 ALTER TABLE

This statement modifies an existing table to conform to a new table structure. The statement `ALTER TABLE` can be used to:

- `ADD`, `DROP`, or `RENAME` indexes
- `ADD`, `DROP`, `MODIFY` or `CHANGE` columns
- `COMPACT` table data

14.13.2.21.1 Synopsis

```
AlterTableStmt ::=
    'ALTER' IgnoreOptional 'TABLE' TableName (
        AlterTableSpecListOpt AlterTablePartitionOpt |
        'ANALYZE' 'PARTITION' PartitionNameList ( 'INDEX' IndexNameList )?
            ↪ AnalyzeOptionListOpt |
        'COMPACT' ( 'PARTITION' PartitionNameList )? 'TIFLASH' 'REPLICA'
    )

TableName ::=

            ↪ TTLEnable EqOpt ( 'ON' | 'OFF' ))?
        | 'REMOVE' 'TTL'
        | TTLEnable EqOpt ( 'ON' | 'OFF' )
        | TTLJobInterval EqOpt stringLit
    )
|   PlacementPolicyOption

PlacementPolicyOption ::=
    "PLACEMENT" "POLICY" EqOpt PolicyName
|   "PLACEMENT" "POLICY" (EqOpt | "SET") "DEFAULT"
```

14.13.2.21.2 Examples

Create a table with some initial data:

```
CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT NOT
    ↪ NULL);
INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
```

```
Query OK, 0 rows affected (0.11 sec)

Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0
```

The following query requires a full table scan because the column c1 is not indexed:

```
EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
```

```
+--
   ↪ ----------------------+---------+----------+--------------+----------------
   ↪
| id                    | estRows | task     | access object | operator info
   ↪            |
+--
   ↪ ----------------------+---------+----------+--------------+----------------
   ↪
| TableReader_7         | 10.00   | root     |               | data:Selection_6
   ↪           |
| ─Selection_6          | 10.00   | cop[tikv] |              | eq(test.t1.c1,
   ↪ 3)          |
|   ─TableFullScan_5    | 10000.00 | cop[tikv] | table:t1 | keep order:false
   ↪ , stats:pseudo |
+--
   ↪ ----------------------+---------+----------+--------------+----------------
   ↪
3 rows in set (0.00 sec)
```

The statement ALTER TABLE .. ADD INDEX can be used to add an index on the table t1. EXPLAIN confirms that the original query now uses an index range scan, which is more efficient:

```
ALTER TABLE t1 ADD INDEX (c1);
EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
```

```
Query OK, 0 rows affected (0.30 sec)

+--
   ↪ ----------------------+---------+----------+-----------------------+---------
   ↪
| id                    | estRows | task     | access object         | operator
   ↪ info                           |
+--
   ↪ ----------------------+---------+----------+-----------------------+---------
   ↪
| IndexReader_6         | 10.00   | root     |                       | index:
   ↪ IndexRangeScan_5                |
| ─IndexRangeScan_5     | 10.00   | cop[tikv] | table:t1, index:c1(c1) | range
   ↪ :[3,3], keep order:false, stats:pseudo |
+--
   ↪ ----------------------+---------+----------+-----------------------+---------
   ↪
```

```
2 rows in set (0.00 sec)
```

TiDB supports the ability to assert that DDL changes will use a particular `ALTER` algorithm. This is only an assertion, and does not change the actual algorithm which will be used to modify the table. It can be useful if you only want to permit instant DDL changes during the peak hours of your cluster:

```
ALTER TABLE t1 DROP INDEX c1, ALGORITHM=INSTANT;
```

```
Query OK, 0 rows affected (0.24 sec)
```

Using the `ALGORITHM=INSTANT` assertion on an operation that requires the `INPLACE` algorithm results in a statement error:

```
ALTER TABLE t1 ADD INDEX (c1), ALGORITHM=INSTANT;
```

```
ERROR 1846 (0A000): ALGORITHM=INSTANT is not supported. Reason: Cannot
    ↪ alter table by INSTANT. Try ALGORITHM=INPLACE.
```

However, using the `ALGORITHM=COPY` assertion for an `INPLACE` operation generates a warning instead of an error. This is because TiDB interprets the assertion as *this algorithm or better*. This behavior difference is useful for MySQL compatibility because the algorithm TiDB uses might differ from MySQL:

```
ALTER TABLE t1 ADD INDEX (c1), ALGORITHM=COPY;
SHOW WARNINGS;
```

```
Query OK, 0 rows affected, 1 warning (0.25 sec)

+--
    ↪ -----+------+-----------------------------------------------------------------
    ↪
| Level | Code | Message
    ↪
    ↪ |
+--
    ↪ -----+------+-----------------------------------------------------------------
    ↪
| Error | 1846 | ALGORITHM=COPY is not supported. Reason: Cannot alter
    ↪ table by COPY. Try ALGORITHM=INPLACE. |
+--
    ↪ -----+------+-----------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

14.13.2.21.3 MySQL compatibility

The following major restrictions apply to `ALTER TABLE` in TiDB:

- When altering multiple schema objects in a single `ALTER TABLE` statement:
    - Modifying the same object in multiple changes is not supported.
    - TiDB validates statements according to the table schema **before execution**. For example, an error returns when `ALTER TABLE t ADD COLUMN c1 INT, ADD COLUMN c2 INT AFTER c1;` is executed because column `c1` does not exist in the table.
    - For an `ALTER TABLE` statement, the order of execution in TiDB is one change after another from left to right, which is incompatible with MySQL in some cases.
- Changes of the Reorg-Data types on primary key columns are not supported.
- Changes of column types on partitioned tables are not supported.
- Changes of column types on generated columns are not supported.
- Changes of some data types (for example, some TIME, Bit, Set, Enum, and JSON types) are not supported due to the compatibility issues of the `CAST` function's behavior between TiDB and MySQL.
- Spatial data types are not supported.
- `ALTER TABLE t CACHE | NOCACHE` is a TiDB extension to MySQL syntax. For details, see Cached Tables.

For further restrictions, see MySQL Compatibility.

14.13.2.22 ALTER TABLE ... COMPACT

To enhance read performance and reduce disk usage, TiDB automatically schedules data compaction on storage nodes in the background. During the compaction, storage nodes rewrite physical data, including cleaning up deleted rows and merging multiple versions of data caused by updates. The `ALTER TABLE ... COMPACT` statement allows you to initiate compaction for a specific table immediately, without waiting until compaction is triggered in the background.

The execution of this statement does not block existing SQL statements or affect any TiDB features, such as transactions, DDL, and GC. Data that can be selected via SQL statements will not be changed either. Executing this statement consumes some IO and CPU resources. Be careful to choose an appropriate timing for execution, such as when resources are available, to avoid negative impact on the business.

The compaction statement will be finished and returned when all replicas of a table are compacted. During the execution process, you can safely interrupt the compaction by executing the `KILL` statement. Interrupting a compaction does not break data consistency or lead to data loss, nor does it affect subsequent manual or background compactions.

This data compaction statement is currently supported only for TiFlash replicas, not for TiKV replicas.

14.13.2.22.1 Synopsis

```
AlterTableCompactStmt ::=
    'ALTER' 'TABLE' TableName 'COMPACT' ( 'PARTITION' PartitionNameList )? (
        ↪ 'TIFLASH' 'REPLICA' )?
```

Since v6.2.0, the `TIFLASH REPLICA` part of the syntax can be omitted. When omitted, the semantic of the statement remains unchanged, and takes effect only for TiFlash.

14.13.2.22.2 Examples

Compact TiFlash replicas in a table

The following takes an `employees` table as an example, which has 4 partitions with 2 TiFlash replicas:

```
CREATE TABLE employees (
    id INT NOT NULL,
    hired DATE NOT NULL DEFAULT '1970-01-01',
    store_id INT
)
PARTITION BY LIST (store_id) (
    PARTITION pNorth VALUES IN (1, 2, 3, 4, 5),
    PARTITION pEast VALUES IN (6, 7, 8, 9, 10),
    PARTITION pWest VALUES IN (11, 12, 13, 14, 15),
    PARTITION pCentral VALUES IN (16, 17, 18, 19, 20)
```

```
);
ALTER TABLE employees SET TIFLASH REPLICA 2;
```

You can execute the following statement to immediately initiate the compaction for the 2 TiFlash replicas for all partitions in the `employees` table:

```
ALTER TABLE employees COMPACT TIFLASH REPLICA;
```

Compact TiFlash replicas of specified partitions in a table

The following takes an `employees` table as an example, which has 4 partitions with 2 TiFlash replicas:

```
CREATE TABLE employees (
    id INT NOT NULL,
    hired DATE NOT NULL DEFAULT '1970-01-01',
    store_id INT
)
PARTITION BY LIST (store_id) (
    PARTITION pNorth VALUES IN (1, 2, 3, 4, 5),
    PARTITION pEast VALUES IN (6, 7, 8, 9, 10),
    PARTITION pWest VALUES IN (11, 12, 13, 14, 15),
    PARTITION pCentral VALUES IN (16, 17, 18, 19, 20)
);

ALTER TABLE employees SET TIFLASH REPLICA 2;
```

You can execute the following statement to immediately initiate the compaction for the 2 TiFlash replicas of the `pNorth` and `pEast` partitions in the `employees` table:

```
ALTER TABLE employees COMPACT PARTITION pNorth, pEast TIFLASH REPLICA;
```

14.13.2.22.3 Concurrency

The `ALTER TABLE ... COMPACT` statement compacts all replicas in a table simultaneously.

To avoid a significant impact on online business, each TiFlash instance only compacts data in one table at a time by default (except for the compaction triggered in the background). This means that if you execute the `ALTER TABLE ... COMPACT` statement on multiple tables at the same time, their executions will be queued on the same TiFlash instance, rather than being executed simultaneously.

To obtain greater table-level concurrency with higher resource usage, you can modify the TiFlash configuration `manual_compact_pool_size`. For example, when `manual_compact_pool_size` is set to 2, compaction for 2 tables can be processed simultaneously.

14.13.2.22.4 Observe data compaction progress

You can observe the progress of data compaction or determine whether to initiate compaction for a table by checking the `TOTAL_DELTA_ROWS` column in the `INFORMATION_SCHEMA.TIFLASH_TABLES` table. The larger the value of `TOTAL_DELTA_ROWS`, the more data that can be compacted. If `TOTAL_DELTA_ROWS` is `0`, all data in the table is in the best state and does not need to be compacted.

Example: Check the compaction state of a non-partitioned table

```
USE test;

CREATE TABLE foo(id INT);

ALTER TABLE foo SET TIFLASH REPLICA 1;

SELECT TOTAL_DELTA_ROWS, TOTAL_STABLE_ROWS FROM INFORMATION_SCHEMA.TIFLASH_
    ↪ TABLES
    WHERE IS_TOMBSTONE = 0 AND
    `TIDB_DATABASE` = "test" AND `TIDB_TABLE` = "foo";
+------------------+------------------+
| TOTAL_DELTA_ROWS | TOTAL_STABLE_ROWS |
+------------------+------------------+
|                0 |                0 |
+------------------+------------------+

INSERT INTO foo VALUES (1), (3), (7);

SELECT TOTAL_DELTA_ROWS, TOTAL_STABLE_ROWS FROM INFORMATION_SCHEMA.TIFLASH_
    ↪ TABLES
    WHERE IS_TOMBSTONE = 0 AND
    `TIDB_DATABASE` = "test" AND `TIDB_TABLE` = "foo";
+------------------+------------------+
| TOTAL_DELTA_ROWS | TOTAL_STABLE_ROWS |
+------------------+------------------+
|                3 |                0 |
+------------------+------------------+
-- Newly written data can be compacted

ALTER TABLE foo COMPACT TIFLASH REPLICA;

SELECT TOTAL_DELTA_ROWS, TOTAL_STABLE_ROWS FROM INFORMATION_SCHEMA.TIFLASH_
    ↪ TABLES
    WHERE IS_TOMBSTONE = 0 AND
    `TIDB_DATABASE` = "test" AND `TIDB_TABLE` = "foo";
+------------------+------------------+
| TOTAL_DELTA_ROWS | TOTAL_STABLE_ROWS |
```

```
+-----------------+------------------+
|               0 |                3 |
+-----------------+------------------+
-- All data is in the best state and no compaction is needed
```

Example: Check the compaction state of a partitioned table

```
USE test;

CREATE TABLE employees
    (id INT NOT NULL, store_id INT)
    PARTITION BY LIST (store_id) (
        PARTITION pNorth VALUES IN (1, 2, 3, 4, 5),
        PARTITION pEast VALUES IN (6, 7, 8, 9, 10),
        PARTITION pWest VALUES IN (11, 12, 13, 14, 15),
        PARTITION pCentral VALUES IN (16, 17, 18, 19, 20)
    );

ALTER TABLE employees SET TIFLASH REPLICA 1;

INSERT INTO employees VALUES (1, 1), (6, 6), (10, 10);

SELECT PARTITION_NAME, TOTAL_DELTA_ROWS, TOTAL_STABLE_ROWS
    FROM INFORMATION_SCHEMA.TIFLASH_TABLES t, INFORMATION_SCHEMA.PARTITIONS
        ↪ p
    WHERE t.IS_TOMBSTONE = 0 AND t.TABLE_ID = p.TIDB_PARTITION_ID AND
    p.TABLE_SCHEMA = "test" AND p.TABLE_NAME = "employees";
+----------------+------------------+------------------+
| PARTITION_NAME | TOTAL_DELTA_ROWS | TOTAL_STABLE_ROWS |
+----------------+------------------+------------------+
| pNorth         |                1 |                0 |
| pEast          |                2 |                0 |
| pWest          |                0 |                0 |
| pCentral       |                0 |                0 |
+----------------+------------------+------------------+
-- Some partitions can be compacted

ALTER TABLE employees COMPACT TIFLASH REPLICA;

SELECT PARTITION_NAME, TOTAL_DELTA_ROWS, TOTAL_STABLE_ROWS
    FROM INFORMATION_SCHEMA.TIFLASH_TABLES t, INFORMATION_SCHEMA.PARTITIONS
        ↪ p
    WHERE t.IS_TOMBSTONE = 0 AND t.TABLE_ID = p.TIDB_PARTITION_ID AND
    p.TABLE_SCHEMA = "test" AND p.TABLE_NAME = "employees";
+----------------+------------------+------------------+
```

```
| PARTITION_NAME | TOTAL_DELTA_ROWS | TOTAL_STABLE_ROWS |
+----------------+------------------+-------------------+
| pNorth         |                0 |                 1 |
| pEast          |                0 |                 2 |
| pWest          |                0 |                 0 |
| pCentral       |                0 |                 0 |
+----------------+------------------+-------------------+
-- Data in all partitions is in the best state and no compaction is needed
```

Note:

- If data is updated during compaction, `TOTAL_DELTA_ROWS` might still be a non-zero value after compaction is done. This is normal and indicates that these updates have not been compacted. To compact these updates, execute the `ALTER TABLE ... COMPACT` statement again.
- `TOTAL_DELTA_ROWS` indicates the data version, not the number of rows. For example, if you insert a row and then delete it, `TOTAL_DELTA_ROWS` will increase by 2.

14.13.2.22.5 Compatibility

MySQL compatibility

The `ALTER TABLE ... COMPACT` syntax is TiDB specific, which is an extension to the standard SQL syntax. Although there is no equivalent MySQL syntax, you can still execute this statement by using MySQL clients or various database drivers that comply with the MySQL protocol.

TiDB Binlog and TiCDC compatibility

The `ALTER TABLE ... COMPACT` statement does not result in logical data changes and are therefore not replicated to downstream by TiDB Binlog or TiCDC.

14.13.2.22.6 See also

- ALTER TABLE
- KILL TIDB

14.13.2.23 ALTER USER

This statement changes an existing user inside the TiDB privilege system. In the MySQL privilege system, a user is the combination of a username and the host from which they are

connecting from. Thus, it is possible to create a user `'newuser2'@'192.168.1.1'` who is only able to connect from the IP address `192.168.1.1`. It is also possible to have two users have the same user-portion, and different permissions as they login from different hosts.

14.13.2.23.1 Synopsis

```
AlterUserStmt ::=
    'ALTER' 'USER' IfExists (UserSpecList RequireClauseOpt ConnectionOptions
       ↪  PasswordOption LockOption AttributeOption | 'USER' '(' ')' '
       ↪ IDENTIFIED' 'BY' AuthString) ResourceGroupNameOption

    ( 'REQUIRE' 'NONE' | 'REQUIRE' 'SSL' | 'REQUIRE' 'X509' | 'REQUIRE'
       ↪ RequireList )?

RequireList ::=
    ( "ISSUER" stringLit | "SUBJECT" stringLit | "CIPHER" stringLit | "SAN"
       ↪ stringLit | "TOKEN_ISSUER" stringLit )*

Username ::=
    StringName ('@' StringName | singleAtIdentifier)? | 'CURRENT_USER'
       ↪ OptionalBraces

AuthOption ::=
    ( 'IDENTIFIED' ( 'BY' ( AuthString | 'PASSWORD' HashString ) | 'WITH'
       ↪ StringName ( 'BY' AuthString | 'AS' HashString )? ) )?

PasswordOption ::= ( 'PASSWORD' 'EXPIRE' ( 'DEFAULT' | 'NEVER' | 'INTERVAL'
    ↪ N 'DAY' )? | 'PASSWORD' 'HISTORY' ( 'DEFAULT' | N ) | 'PASSWORD' '
    ↪ REUSE' 'INTERVAL' ( 'DEFAULT' | N 'DAY' ) | 'FAILED_LOGIN_ATTEMPTS' N
    ↪  | 'PASSWORD_LOCK_TIME' ( N | 'UNBOUNDED' ) )*

LockOption ::= ( 'ACCOUNT' 'LOCK' | 'ACCOUNT' 'UNLOCK' )?

AttributeOption ::= ( 'COMMENT' CommentString | 'ATTRIBUTE' AttributeString
    ↪ )?

ResourceGroupNameOption::= ( 'RESOURCE' 'GROUP' Identifier)?
```

```
RequireClauseOpt ::= ('REQUIRE' ('NONE' | 'SSL' | 'X509' |
    ↪ RequireListElement ('AND'? RequireListElement)*))?

RequireListElement ::= 'ISSUER' Issuer | 'SUBJECT' Subject | 'CIPHER' Cipher
    ↪  | 'SAN' SAN | 'TOKEN_ISSUER' TokenIssuer
```

14.13.2.23.2 Examples

```
mysql> CREATE USER 'newuser' IDENTIFIED BY 'newuserpassword';
Query OK, 1 row affected (0.01 sec)

mysql> SHOW CREATE USER 'newuser';
+--
    ↪ ------------------------------------------------------------------------
    ↪
| CREATE USER for newuser@%
    ↪
    ↪ |
+--
    ↪ ------------------------------------------------------------------------
    ↪
| CREATE USER 'newuser'@'%' IDENTIFIED WITH 'mysql_native_password' AS '
    ↪ *5806E04BBEE79E1899964C6A04D68BCA69B1A879' REQUIRE NONE PASSWORD
    ↪ EXPIRE DEFAULT ACCOUNT UNLOCK |
+--
    ↪ ------------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

Modify basic user information

Change the password for user `newuser`:

```
mysql> ALTER USER 'newuser' IDENTIFIED BY 'newnewpassword';
Query OK, 0 rows affected (0.02 sec)

mysql> SHOW CREATE USER 'newuser';
+-------------------------------------------------------------------------------
    ↪
| CREATE USER for newuser@%
    ↪
    ↪ |
+-------------------------------------------------------------------------------
    ↪
| CREATE USER 'newuser'@'%' IDENTIFIED WITH 'mysql_native_password' AS '*
    ↪ FB8A1EA1353E8775CA836233E367FBDFCB37BE73' REQUIRE NONE PASSWORD
```

```
    ↪ EXPIRE DEFAULT ACCOUNT UNLOCK |
+-----------------------------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

Lock the user `newuser`:

```
ALTER USER 'newuser' ACCOUNT LOCK;
```

```
Query OK, 0 rows affected (0.02 sec)
```

Modify the attributes of `newuser`:

```
ALTER USER 'newuser' ATTRIBUTE '{"newAttr": "value", "deprecatedAttr": null
    ↪ }';
SELECT * FROM information_schema.user_attributes;
```

```
+----------+------+-------------------------+
| USER     | HOST | ATTRIBUTE               |
+----------+------+-------------------------+
| newuser  | %    | {"newAttr": "value"}  |
+----------+------+-------------------------+
1 rows in set (0.00 sec)
```

Modify the comment of `newuser` using `ALTER USER ... COMMENT`:

```
ALTER USER 'newuser' COMMENT 'Here is the comment';
SELECT * FROM information_schema.user_attributes;
```

```
+--
    ↪ ---------+------+-----------------------------------------------------+
    ↪
| USER     | HOST | ATTRIBUTE                                           |
+--
    ↪ ---------+------+-----------------------------------------------------+
    ↪
| newuser  | %    | {"comment": "Here is the comment", "newAttr": "value"} |
+--
    ↪ ---------+------+-----------------------------------------------------+
    ↪
1 rows in set (0.00 sec)
```

Remove the comment of `newuser` using `ALTER USER ... ATTRIBUTE`:

```
ALTER USER 'newuser' ATTRIBUTE '{"comment": null}';
SELECT * FROM information_schema.user_attributes;
```

```
+----------+------+--------------------------+
| USER     | HOST | ATTRIBUTE                |
+----------+------+--------------------------+
| newuser  | %    | {"newAttr": "value"}     |
+----------+------+--------------------------+
1 rows in set (0.00 sec)
```

Change the automatic password expiration policy for `newuser` to never expire via `ALTER USER ... PASSWORD EXPIRE NEVER`:

```
ALTER USER 'newuser' PASSWORD EXPIRE NEVER;
```

```
Query OK, 0 rows affected (0.02 sec)
```

Modify the password reuse policy for `newuser` to disallow the reuse of any password used within the last 90 days using `ALTER USER ... PASSWORD REUSE INTERVAL ... DAY`:

```
ALTER USER 'newuser' PASSWORD REUSE INTERVAL 90 DAY;
```

```
Query OK, 0 rows affected (0.02 sec)
```

Modify the resource group bound to the user

Use `ALTER USER ... RESOURCE GROUP` to modify the resource group of the user `newuser` to `rg1`.

```
ALTER USER 'newuser' RESOURCE GROUP rg1;
```

```
Query OK, 0 rows affected (0.02 sec)
```

View the resource group bound to the current user:

```
SELECT USER, JSON_EXTRACT(User_attributes, "$.resource_group") FROM mysql.
    ↪ user WHERE user = "newuser";
```

```
+---------+-----------------------------------------------------+
| USER    | JSON_EXTRACT(User_attributes, "$.resource_group") |
+---------+-----------------------------------------------------+
| newuser | "rg1"                                               |
+---------+-----------------------------------------------------+
1 row in set (0.02 sec)
```

Unbind the user to a resource group, that is, bind the user to the `default` resource group.

```
ALTER USER 'newuser' RESOURCE GROUP `default`;
SELECT USER, JSON_EXTRACT(User_attributes, "$.resource_group") FROM mysql.
    ↪ user WHERE user = "newuser";
```

```
+---------+-----------------------------------------------------+
| USER    | JSON_EXTRACT(User_attributes, "$.resource_group") |
+---------+-----------------------------------------------------+
| newuser | "default"                                           |
+---------+-----------------------------------------------------+
1 row in set (0.02 sec)
```

14.13.2.24 ANALYZE

This statement updates the statistics that TiDB builds on tables and indexes. It is recommended to run `ANALYZE` after performing a large batch update or import of records, or when you notice that query execution plans are sub-optimal.

TiDB will also automatically update its statistics over time as it discovers that they are inconsistent with its own estimates.

Currently, TiDB collects statistical information as a full collection by using the `ANALYZE TABLE` statement. For more information, see Introduction to statistics.

14.13.2.24.1 Synopsis

```
AnalyzeTableStmt ::=
    'ANALYZE' ( 'TABLE' ( TableNameList ( 'ALL COLUMNS' | 'PREDICATE COLUMNS
       ↪ ' ) | TableName ( 'INDEX' IndexNameList? | AnalyzeColumnOption | '
       ↪ PARTITION' PartitionNameList ( 'INDEX' IndexNameList? |
       ↪ AnalyzeColumnOption )? )? ) ) AnalyzeOptionListOpt

AnalyzeOptionListOpt ::=
( WITH AnalyzeOptionList )?

AnalyzeOptionList ::=
AnalyzeOption ( ',' AnalyzeOption )*

AnalyzeOption ::=
( NUM ( 'BUCKETS' | 'TOPN' | ( 'CMSKETCH' ( 'DEPTH' | 'WIDTH' ) ) | 'SAMPLES
    ↪ ' ) ) | ( FLOATNUM 'SAMPLERATE' )
```

```
AnalyzeColumnOption ::=
( 'ALL COLUMNS' | 'PREDICATE COLUMNS' | 'COLUMNS' ColumnNameList )

TableNameList ::=
    TableName (',' TableName)*

TableName ::=
    Identifier ( '.' Identifier )?

ColumnNameList ::=
    Identifier ( ',' Identifier )*

IndexNameList ::=
    Identifier ( ',' Identifier )*

PartitionNameList ::=
    Identifier ( ',' Identifier )*
```

14.13.2.24.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)
```

```
mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0
```

```
mysql> ALTER TABLE t1 ADD INDEX (c1);
Query OK, 0 rows affected (0.30 sec)
```

```
mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
+--
    ↪ ---------------------+---------+----------+-----------------------+----------
    ↪
| id                    | estRows | task     | access object         | operator
    ↪ info                            |
+--
    ↪ ---------------------+---------+----------+-----------------------+----------
    ↪
| IndexReader_6         | 10.00   | root     |                       | index:
    ↪ IndexRangeScan_5                |
| ─IndexRangeScan_5     | 10.00   | cop[tikv] | table:t1, index:c1(c1) | range
    ↪ :[3,3], keep order:false, stats:pseudo |
```

```
+--
    ↪ --------------------+---------+----------+------------------------+----------
    ↪
2 rows in set (0.00 sec)
```

The status of the current statistics is `pseudo`, which means the statistics is inaccurate.

```
mysql> ANALYZE TABLE t1;
Query OK, 0 rows affected (0.13 sec)

mysql> EXPLAIN SELECT * FROM t1 WHERE c1 = 3;
+--
    ↪ --------------------+---------+----------+------------------------+----------
    ↪
| id                    | estRows | task     | access object          | operator
    ↪ info              |
+--
    ↪ --------------------+---------+----------+------------------------+----------
    ↪
| IndexReader_6         | 1.00    | root     |                        | index:
    ↪ IndexRangeScan_5    |
| └─IndexRangeScan_5    | 1.00    | cop[tikv] | table:t1, index:c1(c1) | range
    ↪ :[3,3], keep order:false |
+--
    ↪ --------------------+---------+----------+------------------------+----------
    ↪
2 rows in set (0.00 sec)
```

The statistics is now correctly updated and loaded.

14.13.2.24.3 MySQL compatibility

TiDB differs from MySQL in **both** the statistics it collects and how it makes use of statistics during query execution. While this statement is syntactically similar to MySQL, the following differences apply:

- TiDB might not include very recently committed changes when running `ANALYZE ↪ TABLE`. After a batch update of rows, you might need to `sleep(1)` before executing `ANALYZE TABLE` in order for the statistics update to reflect these changes. See #16570.
- `ANALYZE TABLE` takes significantly longer to execute in TiDB than MySQL.

14.13.2.24.4 See also

- EXPLAIN
- EXPLAIN ANALYZE

14.13.2.25 BACKUP

This statement is used to perform a distributed backup of the TiDB cluster.

> **Warning:**
>
> - This feature is experimental. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an issue on GitHub.
> - This feature is not available on TiDB Serverless clusters.

The `BACKUP` statement uses the same engine as the BR tool does, except that the backup process is driven by TiDB itself rather than a separate BR tool. All benefits and warnings of BR also apply to this statement.

Executing `BACKUP` requires either the `BACKUP_ADMIN` or `SUPER` privilege. Additionally, both the TiDB node executing the backup and all TiKV nodes in the cluster must have read or write permission to the destination. Local storage (storage paths starting with `local://`) is not permitted when Security Enhanced Mode is enabled.

The `BACKUP` statement is blocked until the entire backup task is finished, failed, or canceled. A long-lasting connection should be prepared for executing `BACKUP`. The task can be canceled using the `KILL TIDB QUERY` statement.

Only one `BACKUP` and `RESTORE` task can be executed at a time. If a `BACKUP` or `RESTORE` statement is already being executed on the same TiDB server, the new `BACKUP` execution will wait until all previous tasks are finished.

`BACKUP` can only be used with "tikv" storage engine. Using `BACKUP` with the "unistore" engine will fail.

14.13.2.25.1 Synopsis

```
BackupStmt ::=
    "BACKUP" BRIETables "TO" stringLit BackupOption*

BRIETables ::=
    "DATABASE" ( '*' | DBName (',' DBName)* )
|   "TABLE" TableNameList

BackupOption ::=
    "RATE_LIMIT" '='? LengthNum "MB" '/' "SECOND"
|   "CONCURRENCY" '='? LengthNum
|   "CHECKSUM" '='? Boolean
```

```
|   "SEND_CREDENTIALS_TO_TIKV" '='? Boolean
|   "LAST_BACKUP" '='? BackupTSO
|   "SNAPSHOT" '='? ( BackupTSO | LengthNum TimestampUnit "AGO" )

Boolean ::=
    NUM | "TRUE" | "FALSE"

BackupTSO ::=
    LengthNum | stringLit
```

14.13.2.25.2 Examples

Back up databases

```
BACKUP DATABASE `test` TO 'local:///mnt/backup/2020/04/';
```

```
+--
    ↪ ----------------------------+----------+----------------+--------------------
    ↪
| Destination                | Size     | BackupTS       | Queue Time         |
    ↪ Execution Time    |
+--
    ↪ ----------------------------+----------+----------------+--------------------
    ↪
| local:///mnt/backup/2020/04/ | 248665063 | 416099531454472 | 2020-04-12
    ↪ 23:09:48 | 2020-04-12 23:09:48 |
+--
    ↪ ----------------------------+----------+----------------+--------------------
    ↪
1 row in set (58.453 sec)
```

In the example above, the `test` database is backed up into the local filesystem. The data is saved as SST files in the `/mnt/backup/2020/04/` directories distributed among all TiDB and TiKV nodes.

The first row of the result above is described as follows:

Column	Description
`Destination` ↪	The destination URL
`Size`	The total size of the backup archive, in bytes

Column	Description
`BackupTS`	The TSO of the snapshot when the backup is created (useful for incremental backup)
`Queue Time`	The timestamp (in current time zone) when the `BACKUP` task is queued.
`Execution Time`	The timestamp (in current time zone) when the `BACKUP` task starts to run.

Back up tables

```
BACKUP TABLE `test`.`sbtest01` TO 'local:///mnt/backup/sbtest01/';
```

```
BACKUP TABLE sbtest02, sbtest03, sbtest04 TO 'local:///mnt/backup/sbtest/';
```

Back up the entire cluster

```
BACKUP DATABASE * TO 'local:///mnt/backup/full/';
```

Note that the system tables (`mysql.*`, `INFORMATION_SCHEMA.*`, `PERFORMANCE_SCHEMA.*`, …) will not be included into the backup.

External storages

BR supports backing up data to S3 or GCS:

```
BACKUP DATABASE `test` TO 's3://example-bucket-2020/backup-05/?access-key={YOUR_ACCESS_KEY}&secret-access-key={YOUR_SECRET_KEY}';
```

The URL syntax is further explained in URI Formats of External Storage Services.

When running on cloud environment where credentials should not be distributed, set the `SEND_CREDENTIALS_TO_TIKV` option to `FALSE`:

```
BACKUP DATABASE `test` TO 's3://example-bucket-2020/backup-05/'
    SEND_CREDENTIALS_TO_TIKV = FALSE;
```

Performance fine-tuning

Use `RATE_LIMIT` to limit the average upload speed per TiKV node to reduce network bandwidth.

By default, every TiKV node would run 4 backup threads. This value can be adjusted with the `CONCURRENCY` option.

Before backup is completed, `BACKUP` would perform a checksum against the data on the cluster to verify correctness. This step can be disabled with the `CHECKSUM` option if you are confident that this is unnecessary.

```
BACKUP DATABASE `test` TO 's3://example-bucket-2020/backup-06/'
    RATE_LIMIT = 120 MB/SECOND
    CONCURRENCY = 8
    CHECKSUM = FALSE;
```

Snapshot

Specify a timestamp, TSO or relative time to backup historical data.

```
-- relative time
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist01'
    SNAPSHOT = 36 HOUR AGO;

-- timestamp (in current time zone)
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist02'
    SNAPSHOT = '2020-04-01 12:00:00';

-- timestamp oracle
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist03'
    SNAPSHOT = 415685305958400;
```

The supported units for relative time are:

- MICROSECOND
- SECOND
- MINUTE
- HOUR
- DAY
- WEEK

Note that, following SQL standard, the units are always singular.

Incremental backup

Supply the `LAST_BACKUP` option to only backup the changes between the last backup to the current snapshot.

```
-- timestamp (in current time zone)
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist02'
    LAST_BACKUP = '2020-04-01 12:00:00';

-- timestamp oracle
BACKUP DATABASE `test` TO 'local:///mnt/backup/hist03'
    LAST_BACKUP = 415685305958400;
```

14.13.2.25.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.25.4 See also

- RESTORE
- SHOW BACKUPS

14.13.2.26 BATCH

The `BATCH` syntax splits a DML statement into multiple statements in TiDB for execution. This means that there are **no guarantees** of transactional atomicity and isolation. Therefore, it is a "non-transactional" statement.

Currently, `INSERT`, `REPLACE`, `UPDATE`, and `DELETE` are supported in `BATCH`.

Based on a column, the `BATCH` syntax divides a DML statement into multiple ranges of scope for execution. In each range, a single SQL statement is executed.

For details about the usage and restrictions, see Non-transactional DML statements.

When you use multi-table join in a `BATCH` statement, you need to specify the full path of the column to avoid ambiguity:

```
BATCH ON test.t2.id LIMIT 1 INSERT INTO t SELECT t2.id, t2.v, t3.v FROM t2
    ↪ JOIN t3 ON t2.k = t3.k;
```

The preceding statement specifies the column to be split as `test.t2.id`, which is unambiguous. If you use the `id` as follows, an error is reported:

```
BATCH ON id LIMIT 1 INSERT INTO t SELECT t2.id, t2.v, t3.v FROM t2 JOIN t3
    ↪ ON t2.k = t3.k;

Non-transactional DML, shard column must be fully specified
```

14.13.2.26.1 Synopsis

```
NonTransactionalDMLStmt ::=
    'BATCH' ( 'ON' ColumnName )? 'LIMIT' NUM DryRunOptions? ShardableStmt

DryRunOptions ::=
    'DRY' 'RUN' 'QUERY'?

ShardableStmt ::=
    DeleteFromStmt
|   UpdateStmt
|   InsertIntoStmt
|   ReplaceIntoStmt
```

14.13.2.26.2 MySQL compatibility

The `BATCH` syntax is TiDB-specific and not compatible with MySQL.

14.13.2.26.3 See also

- Non-transactional DML statements

14.13.2.27 BEGIN

This statement starts a new transaction inside of TiDB. It is similar to the statements `START TRANSACTION` and `SET autocommit=0`.

In the absence of a `BEGIN` statement, every statement will by default autocommit in its own transaction. This behavior ensures MySQL compatibility.

14.13.2.27.1 Synopsis

```
BeginTransactionStmt ::=
    'BEGIN' ( 'PESSIMISTIC' | 'OPTIMISTIC' )?
|   'START' 'TRANSACTION' ( 'READ' ( 'WRITE' | 'ONLY' ( 'WITH' 'TIMESTAMP' '
    ↪ BOUND' TimestampBound )? ) | 'WITH' 'CONSISTENT' 'SNAPSHOT' )?
```

14.13.2.27.2 Examples

```
mysql> CREATE TABLE t1 (a int NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.12 sec)

mysql> BEGIN;
Query OK, 0 rows affected (0.00 sec)
```

```
mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.00 sec)

mysql> COMMIT;
Query OK, 0 rows affected (0.01 sec)
```

14.13.2.27.3 MySQL compatibility

TiDB supports the syntax extension of `BEGIN PESSIMISTIC` or `BEGIN OPTIMISTIC`. This enables you to override the default transactional model for your transaction.

14.13.2.27.4 See also

- COMMIT
- ROLLBACK
- START TRANSACTION
- TiDB optimistic transaction model
- TiDB pessimistic transaction mode

14.13.2.28 `CALIBRATE RESOURCE`

The `CALIBRATE RESOURCE` statement is used to estimate and output the 'Request Unit (RU)' capacity of the current cluster.

> **Note:**
>
> This feature is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

14.13.2.28.1 Synopsis

```
CalibrateResourceStmt ::= 'CALIBRATE' 'RESOURCE' WorkloadOption

WorkloadOption ::=
( 'WORKLOAD' ('TPCC' | 'OLTP_READ_WRITE' | 'OLTP_READ_ONLY' | 'OLTP_WRITE_
    ↪ ONLY') )
| ( 'START_TIME' 'TIMESTAMP' ('DURATION' stringLit | 'END_TIME' 'TIMESTAMP')
    ↪ ?)?
```

14.13.2.28.2 Privileges

To execute this command, make sure that the following requirements are met:

- You have enabled `tidb_enable_resource_control`.
- The user has `SUPER` or `RESOURCE_GROUP_ADMIN` privilege.
- The user has the `SELECT` privilege for all tables in the `METRICS_SCHEMA` schema.

14.13.2.28.3 Methods for estimating capacity

TiDB provides two methods for estimation:

Estimate capacity based on actual workload

If your application is already running in a production environment, or you can run actual business tests, it is recommended to use the actual workload over a period of time to estimate the total capacity. To improve the accuracy of the estimation, observe the following constraints:

- Use the `START_TIME` parameter to specify the time point at which the estimation starts, in the format of `2006-01-02 15:04:05`. The default estimation end time is the current time.
- After specifying the `START_TIME` parameter, you can use the `END_TIME` parameter to specify the estimation end time, or use the `DURATION` parameter to specify the estimation time window from `START_TIME`.
- The time window ranges from 10 minutes to 24 hours.
- In the specified time window, if the CPU utilization of TiDB and TiKV is too low, you cannot estimate the capacity.

> **Note:**
>
> TiKV does not monitor CPU usage metrics on macOS. It does not support capacity estimation based on the actual workload on macOS.

Estimate capacity based on hardware deployment

This method mainly estimates capacity based on the current cluster configuration, combined with the empirical values observed for different workloads. Because different types of workloads require different ratios of hardware, the output capacity of the same configuration of hardware might be different. The `WORKLOAD` parameter here accepts the following different workload types. The default value is `TPCC`.

- `TPCC`: applies to workloads with heavy data write. It is estimated based on a workload model similar to `TPC-C`.

- `OLTP_WRITE_ONLY`: applies to workloads with heavy data write. It is estimated based on a workload model similar to `sysbench oltp_write_only`.
- `OLTP_READ_WRITE`: applies to workloads with even data read and write. It is estimated based on a workload model similar to `sysbench oltp_read_write`.
- `OLTP_READ_ONLY`: applies to workloads with heavy data read. It is estimated based on a workload model similar to `sysbench oltp_read_only`.
- `TPCH_10`: applies to AP queries. It is estimated based on 22 queries from `TPCH-10G`.

> **Note:**
>
> The RU capacity of a cluster varies with the topology of the cluster and the hardware and software configuration of each component. The actual RU that each cluster can provide is also related to the actual workload. The estimated value based on hardware deployment is for reference only and might differ from the actual maximum value. It is recommended to estimate capacity based on actual workload.

14.13.2.28.4 Examples

Specify the start time `START_TIME` and the time window `DURATION` to view the RU capacity according to the actual workload.

```
CALIBRATE RESOURCE START_TIME '2023-04-18 08:00:00' DURATION '20m';
+-------+
| QUOTA |
+-------+
| 27969 |
+-------+
1 row in set (0.01 sec)
```

Specify the start time `START_TIME` and the end time `END_TIME` to view the RU capacity according to the actual workload.

```
CALIBRATE RESOURCE START_TIME '2023-04-18 08:00:00' END_TIME '2023-04-18
    ↪ 08:20:00';
+-------+
| QUOTA |
+-------+
| 27969 |
+-------+
1 row in set (0.01 sec)
```

When the time window range `DURATION` does not fall between 10 minutes and 24 hours, an error occurs.

```
CALIBRATE RESOURCE START_TIME '2023-04-18 08:00:00' DURATION '25h';
ERROR 1105 (HY000): the duration of calibration is too long, which could
    ↪ lead to inaccurate output. Please make the duration between 10m0s and
    ↪  24h0m0s
CALIBRATE RESOURCE START_TIME '2023-04-18 08:00:00' DURATION '9m';
ERROR 1105 (HY000): the duration of calibration is too short, which could
    ↪ lead to inaccurate output. Please make the duration between 10m0s and
    ↪  24h0m0s
```

The monitoring metrics for the capacity estimation based on the actual workload feature include `tikv_cpu_quota`, `tidb_server_maxprocs`, `resource_manager_resource_unit`, `process_cpu_usage`, `tiflash_cpu_quota`, `tiflash_resource_manager_resource_unit`, and `tiflash_process_cpu_usage`. If the CPU quota monitoring data is empty, there will be an error with the corresponding monitoring metric name, as shown in the following example:

```
CALIBRATE RESOURCE START_TIME '2023-04-18 08:00:00' DURATION '60m';
Error 1105 (HY000): There is no CPU quota metrics, metrics 'tikv_cpu_quota'
    ↪  is empty
```

If the workload in the time window is too low, or the `resource_manager_resource_unit` and `process_cpu_usage` monitoring data is missing, the following error will be reported. In addition, because TiKV does not monitor CPU utilization on macOS, it does not support capacity estimation based on the actual workload, and will also report this error.

```
CALIBRATE RESOURCE START_TIME '2023-04-18 08:00:00' DURATION '60m';
ERROR 1105 (HY000): The workload in selected time window is too low, with
    ↪ which TiDB is unable to reach a capacity estimation; please select
    ↪ another time window with higher workload, or calibrate resource by
    ↪ hardware instead
```

Specify `WORKLOAD` to view the RU capacity. The default value is `TPCC`.

```
CALIBRATE RESOURCE;
+-------+
| QUOTA |
+-------+
| 190470 |
+-------+
1 row in set (0.01 sec)

CALIBRATE RESOURCE WORKLOAD OLTP_WRITE_ONLY;
+-------+
| QUOTA |
+-------+
| 27444 |
```

```
+--------+
1 row in set (0.01 sec)
```

14.13.2.29 CANCEL IMPORT

The `CANCEL IMPORT` statement is used to cancel a data import job created in TiDB.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

14.13.2.29.1 Required privileges

To cancel a data import job, you need to be the creator of the import job or have the `SUPER` privilege.

14.13.2.29.2 Synopsis

```
CancelImportJobsStmt ::=
    'CANCEL' 'IMPORT' 'JOB' JobID
```

14.13.2.29.3 Example

To cancel an import job with the ID as `1`, execute the following statement:

```
CANCEL IMPORT JOB 1;
```

The output is as follows:

```
Query OK, 0 rows affected (0.01 sec)
```

14.13.2.29.4 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.29.5 See also

- IMPORT INTO
- SHOW IMPORT JOB

14.13.2.30 CHANGE COLUMN

The `ALTER TABLE.. CHANGE COLUMN` statement changes a column on an existing table. The change can include both renaming the column, and changing the data type to a compatible type.

Since v5.1.0, TiDB has supported changing the Reorg data type, including but not limited to:

- Changing `VARCHAR` to `BIGINT`
- Modifying the `DECIMAL` precision
- Compressing the length of `VARCHAR(10)` to `VARCHAR(5)`

14.13.2.30.1 Synopsis

```
AlterTableStmt
        ::= 'ALTER' 'IGNORE'? 'TABLE' TableName ChangeColumnSpec ( ','
           ↪ ChangeColumnSpec )*

ChangeColumnSpec
        ::= 'CHANGE' ColumnKeywordOpt 'IF EXISTS' ColumnName ColumnName
           ↪ ColumnType ColumnOption* ( 'FIRST' | 'AFTER' ColumnName )?

ColumnType
        ::= NumericType
          | StringType
          | DateAndTimeType
          | 'SERIAL'

ColumnOption
        ::= 'NOT'? 'NULL'
          | 'AUTO_INCREMENT'
          | 'PRIMARY'? 'KEY' ( 'CLUSTERED' | 'NONCLUSTERED' )?
          | 'UNIQUE' 'KEY'?
          | 'DEFAULT' ( NowSymOptionFraction | SignedLiteral |
             ↪ NextValueForSequence )
          | 'SERIAL' 'DEFAULT' 'VALUE'
          | 'ON' 'UPDATE' NowSymOptionFraction
          | 'COMMENT' stringLit
          | ( 'CONSTRAINT' Identifier? )? 'CHECK' '(' Expression ')' ( 'NOT
             ↪ '? ( 'ENFORCED' | 'NULL' ) )?
          | 'GENERATED' 'ALWAYS' 'AS' '(' Expression ')' ( 'VIRTUAL' | '
             ↪ STORED' )?
          | 'REFERENCES' TableName ( '(' IndexPartSpecificationList ')' )?
             ↪ Match? OnDeleteUpdateOpt
          | 'COLLATE' CollationName
```

```
          | 'COLUMN_FORMAT' ColumnFormat
          | 'STORAGE' StorageMedia
          | 'AUTO_RANDOM' ( '(' LengthNum ')' )?

ColumnName ::=
    Identifier ( '.' Identifier ( '.' Identifier )? )?
```

14.13.2.30.2 Examples

```
CREATE TABLE t1 (id int not null primary key AUTO_INCREMENT, col1 INT);
```

```
Query OK, 0 rows affected (0.11 sec)
```

```
INSERT INTO t1 (col1) VALUES (1),(2),(3),(4),(5);
```

```
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0
```

```
ALTER TABLE t1 CHANGE col1 col2 INT;
```

```
Query OK, 0 rows affected (0.09 sec)
```

```
ALTER TABLE t1 CHANGE col2 col3 BIGINT, ALGORITHM=INSTANT;
```

```
Query OK, 0 rows affected (0.08 sec)
```

```
ALTER TABLE t1 CHANGE col3 col4 BIGINT, CHANGE id id2 INT NOT NULL;
```

```
ERROR 1105 (HY000): can't run multi schema change
```

```
CREATE TABLE t (a int primary key);
ALTER TABLE t CHANGE COLUMN a a VARCHAR(10);
```

```
ERROR 8200 (HY000): Unsupported modify column: column has primary key flag
```

```
CREATE TABLE t (c1 INT, c2 INT, c3 INT) partition by range columns(c1) (
    ↪ partition p0 values less than (10), partition p1 values less than (
    ↪ maxvalue));
ALTER TABLE t CHANGE COLUMN c1 c1 DATETIME;
```

```
ERROR 8200 (HY000): Unsupported modify column: table is partition table
```

```
CREATE TABLE t (a INT, b INT as (a+1));
ALTER TABLE t CHANGE COLUMN b b VARCHAR(10);
```

```
ERROR 8200 (HY000): Unsupported modify column: column is generated
```

```
CREATE TABLE t (a DECIMAL(13, 7));
ALTER TABLE t CHANGE COLUMN a a DATETIME;
```

```
ERROR 8200 (HY000): Unsupported modify column: change from original type
    ↪ decimal(13,7) to datetime is currently unsupported yet
```

14.13.2.30.3 MySQL compatibility

- Changes of Reorg-Data types on primary key columns are not supported.
- Changes of column types on partitioned tables are not supported.
- Changes of column types on generated columns are not supported.
- Changes of some data types (for example, some TIME, Bit, Set, Enum, and JSON types) are not supported due to the compatibility issues of the `CAST` function's behavior between TiDB and MySQL.

14.13.2.30.4 See also

- CREATE TABLE
- SHOW CREATE TABLE
- ADD COLUMN
- DROP COLUMN
- MODIFY COLUMN

14.13.2.31 COMMIT

This statement commits a transaction inside of the TIDB server.

In the absence of a `BEGIN` or `START TRANSACTION` statement, the default behavior of TiDB is that every statement will be its own transaction and autocommit. This behavior ensures MySQL compatibility.

14.13.2.31.1 Synopsis

```
CommitStmt ::=
    'COMMIT' CompletionTypeWithinTransaction?

CompletionTypeWithinTransaction ::=
    'AND' ( 'CHAIN' ( 'NO' 'RELEASE' )? | 'NO' 'CHAIN' ( 'NO'? 'RELEASE' )?
        ↪ )
|   'NO'? 'RELEASE'
```

14.13.2.31.2 Examples

```
mysql> CREATE TABLE t1 (a int NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.12 sec)

mysql> START TRANSACTION;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.00 sec)

mysql> COMMIT;
Query OK, 0 rows affected (0.01 sec)
```

14.13.2.31.3 MySQL compatibility

- Currently, TiDB use Metadata Locking (MDL) to prevent DDL statements from modifying tables used by transactions by default. The behavior of metadata lock is different between TiDB and MySQL. For more details, see Metadata Lock.
- By default, TiDB 3.0.8 and later versions use Pessimistic Locking. When using Optimistic Locking, it is important to consider that a `COMMIT` statement might fail because rows have been modified by another transaction.
- When Optimistic Locking is enabled, `UNIQUE` and `PRIMARY KEY` constraint checks are deferred until statement commit. This results in additional situations where a a `COMMIT` statement might fail. This behavior can be changed by setting `tidb_constraint_check_in_place=ON`.
- TiDB parses but ignores the syntax `ROLLBACK AND [NO] RELEASE`. This functionality is used in MySQL to disconnect the client session immediately after committing the transaction. In TiDB, it is recommended to instead use the `mysql_close()` functionality of your client driver.
- TiDB parses but ignores the syntax `ROLLBACK AND [NO] CHAIN`. This functionality is used in MySQL to immediately start a new transaction with the same isolation level while the current transaction is being committed. In TiDB, it is recommended to instead start a new transaction.

14.13.2.31.4 See also

- START TRANSACTION
- ROLLBACK
- BEGIN
- Lazy checking of constraints

14.13.2.32 CHANGE DRAINER

The `CHANGE DRAINER` statement modifies the status information for Drainer in the cluster.

> **Note:**
>
> This feature is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

> **Tip:**
>
> Drainer's state is automatically reported to PD while running. Only when Drainer is under abnormal circumstances and its state is inconsistent with the state information stored in PD, you can use the `CHANGE DRAINER` statement to modify the state information stored in PD.

14.13.2.32.1 Examples

```
SHOW DRAINER STATUS;
```

```
+--
    ↪ --------/----------------/--------/--------------------/--------------------/
    ↪
|  NodeID |     Address    | State |   Max_Commit_Ts  |    Update_Time     |
+--
    ↪ --------/----------------/--------/--------------------/--------------------/
    ↪
| drainer1 | 127.0.0.3:8249 | Online | 408553768673342532 | 2019-04-30
    ↪ 00:00:03 |
+--
    ↪ --------/----------------/--------/--------------------/--------------------/
    ↪
| drainer2 | 127.0.0.4:8249 | Online | 408553768673345531 | 2019-05-01
    ↪ 00:00:04 |
+--
    ↪ --------/----------------/--------/--------------------/--------------------/
    ↪
2 rows in set (0.00 sec)
```

It can be seen that drainer1's state has not been updated for more than a day, the Drainer is in an abnormal state, but the `State` remains `Online`. After using `CHANGE DRAINER`, the Drainer's `State` is changed to 'paused':

```
CHANGE DRAINER TO NODE_STATE ='paused' FOR NODE_ID 'drainer1';
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
SHOW DRAINER STATUS;
```

```
+--
   ↪ --------/----------------/--------/--------------------/--------------------/
   ↪
|  NodeID |     Address    | State |   Max_Commit_Ts  |    Update_Time     |
+--
   ↪ --------/----------------/--------/--------------------/--------------------/
   ↪
| drainer1 | 127.0.0.3:8249 | Paused | 408553768673342532 | 2019-04-30
   ↪ 00:00:03 |
+--
   ↪ --------/----------------/--------/--------------------/--------------------/
   ↪
| drainer2 | 127.0.0.4:8249 | Online | 408553768673345531 | 2019-05-01
   ↪ 00:00:04 |
+--
   ↪ --------/----------------/--------/--------------------/--------------------/
   ↪
2 rows in set (0.00 sec)
```

14.13.2.32.2 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.32.3 See also

- SHOW PUMP STATUS
- SHOW DRAINER STATUS
- CHANGE PUMP STATUS

14.13.2.33 CHANGE PUMP

The `CHANGE PUMP` statement modifies the status information for Pump in the cluster.

Note:

This feature is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

Tip:

Pump's state is automatically reported to PD while running. Only when Pump is under abnormal circumstances and its state is inconsistent with the state information stored in PD, you can use the `CHANGE PUMP` statement to modify the state information stored in PD.

14.13.2.33.1 Examples

```
SHOW PUMP STATUS;
```

```
+--
    ↪ ------/----------------/--------/--------------------/--------------------/
    ↪
| NodeID |    Address    | State |   Max_Commit_Ts  |    Update_Time     |
+--
    ↪ ------/----------------/--------/--------------------/--------------------/
    ↪
| pump1 | 127.0.0.1:8250 | Online | 408553768673342237 | 2019-04-30 00:00:01
    ↪  |
+--
    ↪ ------/----------------/--------/--------------------/--------------------/
    ↪
| pump2 | 127.0.0.2:8250 | Online | 408553768673342335 | 2019-05-01 00:00:02
    ↪  |
+--
    ↪ ------/----------------/--------/--------------------/--------------------/
    ↪
2 rows in set (0.00 sec)
```

It can be seen that pump1's state has not been updated for more than a day, the Pump is in an abnormal state, but the `State` remains `Online`. After using `CHANGE PUMP`, the Pump's `State` is changed to 'paused' :

```
CHANGE PUMP TO NODE_STATE ='paused' FOR NODE_ID 'pump1';
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
SHOW PUMP STATUS;
```

```
+--
    ↪ ------/----------------/--------/--------------------/--------------------/
    ↪
| NodeID |    Address    | State |   Max_Commit_Ts  |    Update_Time     |
+--
    ↪ ------/----------------/--------/--------------------/--------------------/
    ↪
| pump1 | 127.0.0.1:8250 | Paused | 408553768673342237 | 2019-04-30 00:00:01
    ↪  |
+--
    ↪ ------/----------------/--------/--------------------/--------------------/
    ↪
| pump2 | 127.0.0.2:8250 | Online | 408553768673342335 | 2019-05-01 00:00:02
    ↪  |
+--
    ↪ ------/----------------/--------/--------------------/--------------------/
    ↪
2 rows in set (0.00 sec)
```

14.13.2.33.2 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.33.3 See also

- SHOW PUMP STATUS
- SHOW DRAINER STATUS
- CHANGE DRAINER STATUS

14.13.2.34 CREATE [GLOBAL|SESSION] BINDING

This statement creates a new execution plan binding in TiDB. Binding can be used to inject a hint into a statement without requiring changes to the underlying query.

A `BINDING` can be on either a `GLOBAL` or `SESSION` basis. The default is `SESSION`.

The bound SQL statement is parameterized and stored in the system table. When a SQL query is processed, as long as the parameterized SQL statement and a bound one in the system table are consistent and the system variable `tidb_use_plan_baselines` is set to `ON` (default), the corresponding optimizer hint is available. If multiple execution plans are available, the optimizer chooses to bind the plan with the least cost. For more information, see Create a binding.

14.13.2.34.1 Synopsis

```
CreateBindingStmt ::=
    'CREATE' GlobalScope 'BINDING' ( 'FOR' BindableStmt 'USING' BindableStmt
|   'FROM' 'HISTORY' 'USING' 'PLAN' 'DIGEST' PlanDigest )

GlobalScope ::=
    ( 'GLOBAL' | 'SESSION' )?

BindableStmt ::=
    ( SelectStmt | UpdateStmt | InsertIntoStmt | ReplaceIntoStmt |
       ↪ DeleteStmt )
```

14.13.2.34.2 Examples

You can create a binding according to a SQL statement or a historical execution plan.

The following example shows how to create a binding according to a SQL statement.

```
mysql> CREATE TABLE t1 (
     id INT NOT NULL PRIMARY KEY auto_increment,
     b INT NOT NULL,
     pad VARBINARY(255),
     INDEX(b)
    );
Query OK, 0 rows affected (0.07 sec)

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM dual;
Query OK, 1 row affected (0.01 sec)
Records: 1 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 1 row affected (0.00 sec)
Records: 1 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 8 rows affected (0.00 sec)
Records: 8 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
```

```
Query OK, 1000 rows affected (0.04 sec)
Records: 1000 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 100000 rows affected (1.74 sec)
Records: 100000 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 100000 rows affected (2.15 sec)
Records: 100000 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 100000 rows affected (2.64 sec)
Records: 100000 Duplicates: 0 Warnings: 0

mysql> SELECT SLEEP(1);
+----------+
| SLEEP(1) |
+----------+
|        0 |
+----------+
1 row in set (1.00 sec)

14.13.2.35 CREATE DATABASE

This statement creates a new database in TiDB. The MySQL terminology for 'database' most closely maps to a schema in the SQL standard.

14.13.2.35.1 Synopsis

```
CreateDatabaseStmt ::=
    'CREATE' 'DATABASE' IfNotExists DBName DatabaseOptionListOpt

IfNotExists ::=
    ( 'IF' 'NOT' 'EXISTS' )?

DBName ::=
    Identifier

DatabaseOptionListOpt ::=
    DatabaseOptionList?

DatabaseOptionList ::=
    DatabaseOption ( ','? DatabaseOption )*

DatabaseOption ::=
    DefaultKwdOpt ( CharsetKw '='? CharsetName | 'COLLATE' '='?
        ↪ CollationName | 'ENCRYPTION' '='? EncryptionOpt )
|   DefaultKwdOpt PlacementPolicyOption

PlacementPolicyOption ::=
    "PLACEMENT" "POLICY" EqOpt PolicyName
|   "PLACEMENT" "POLICY" (EqOpt | "SET") "DEFAULT"
```

14.13.2.35.2 Syntax

The `CREATE DATABASE` statement is used to create a database, and to specify the default properties of the database, such as the default character set and collation. `CREATE SCHEMA` is a synonym for `CREATE DATABASE`.

```
CREATE {DATABASE | SCHEMA} [IF NOT EXISTS] db_name
    [create_specification] ...

create_specification:
    [DEFAULT] CHARACTER SET [=] charset_name
  | [DEFAULT] COLLATE [=] collation_name
```

If you create an existing database and does not specify `IF NOT EXISTS`, an error is displayed.

The `create_specification` option is used to specify the specific `CHARACTER SET` and `COLLATE` in the database. Currently, TiDB only supports some of the character sets and collations. For details, see Character Set and Collation Support.

14.13.2.35.3 Examples

```
mysql> CREATE DATABASE mynewdatabase;
Query OK, 0 rows affected (0.09 sec)

mysql> USE mynewdatabase;
Database changed
mysql> CREATE TABLE t1 (a int);
Query OK, 0 rows affected (0.11 sec)

mysql> SHOW TABLES;
+------------------------+
| Tables_in_mynewdatabase |
+------------------------+
| t1                     |
+------------------------+
1 row in set (0.00 sec)
```

14.13.2.35.4 MySQL compatibility

The `CREATE DATABASE` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.35.5 See also

- USE
- ALTER DATABASE
- DROP DATABASE
- SHOW DATABASES

14.13.2.36 CREATE INDEX

This statement adds a new index to an existing table. It is an alternative syntax to `ALTER TABLE .. ADD INDEX`, and included for MySQL compatibility.

14.13.2.36.1 Synopsis

```
CreateIndexStmt ::=
    'CREATE' IndexKeyTypeOpt 'INDEX' IfNotExists Identifier IndexTypeOpt 'ON
       ↪ ' TableName '(' IndexPartSpecificationList ')' IndexOptionList
       ↪ IndexLockAndAlgorithmOpt

IndexKeyTypeOpt ::=
    ( 'UNIQUE' | 'SPATIAL' | 'FULLTEXT' )?
```

```
IfNotExists ::=
    ( 'IF' 'NOT' 'EXISTS' )?

IndexTypeOpt ::=
    IndexType?

IndexPartSpecificationList ::=
    IndexPartSpecification ( ',' IndexPartSpecification )*

IndexOptionList ::=
    IndexOption*

IndexLockAndAlgorithmOpt ::=
    ( LockClause AlgorithmClause? | AlgorithmClause LockClause? )?

IndexType ::=
    ( 'USING' | 'TYPE' ) IndexTypeName

IndexPartSpecification ::=
    ( ColumnName OptFieldLen | '(' Expression ')' ) Order

IndexOption ::=
    'KEY_BLOCK_SIZE' '='? LengthNum
|   IndexType
|   'WITH' 'PARSER' Identifier
|   'COMMENT' stringLit
|   IndexInvisible

IndexTypeName ::=
    'BTREE'
|   'HASH'
|   'RTREE'

ColumnName ::=
    Identifier ( '.' Identifier ( '.' Identifier )? )?

OptFieldLen ::=
    FieldLen?

IndexNameList ::=
    ( Identifier | 'PRIMARY' )? ( ',' ( Identifier | 'PRIMARY' ) )*

KeyOrIndex ::=
    'Key' | 'Index'
```

mysql> CREATE UNIQUE INDEX c1 ON t1 (c1);
Query OK, 0 rows affected (0.31 sec)
```

14.13.2.36.3 Expression index

In some scenarios, the filtering condition of a query is based on a certain expression. In these scenarios, the query performance is relatively poor because ordinary indexes cannot take effect, the query can only be executed by scanning the entire table. The expression index is a type of special index that can be created on an expression. Once an expression index is created, TiDB can use the index for the expression-based query, which significantly improves the query performance.

For example, if you want to create an index based on `LOWER(col1)`, execute the following SQL statement:

```
CREATE INDEX idx1 ON t1 ((LOWER(col1)));
```

Or you can execute the following equivalent statement:

```
ALTER TABLE t1 ADD INDEX idx1((LOWER(col1)));
```

You can also specify the expression index when you create the table:

```
CREATE TABLE t1 (
    col1 CHAR(10),
    col2 CHAR(10),
    INDEX ((LOWER(col1)))
);
```

> **Note:**
>
> The expression in an expression index must be surrounded by `(` and `)`. Otherwise, a syntax error is reported.

You can drop an expression index in the same way as dropping an ordinary index:

```
DROP INDEX idx1 ON t1;
```

Expression index involves various kinds of expressions. To ensure correctness, only some fully tested functions are allowed for creating an expression index. This means that only these functions are allowed in expressions in a production environment. You can get these functions by querying the `tidb_allow_function_for_expression_index` variable. Currently, the allowed functions are as follows:

```
JSON_ARRAY, JSON_ARRAY_APPEND, JSON_ARRAY_INSERT, JSON_CONTAINS, JSON_
    ↪ CONTAINS_PATH, JSON_DEPTH, JSON_EXTRACT, JSON_INSERT, JSON_KEYS, JSON
    ↪ _LENGTH, JSON_MERGE_PATCH, JSON_MERGE_PRESERVE, JSON_OBJECT, JSON_
    ↪ PRETTY, JSON_QUOTE, JSON_REMOVE, JSON_REPLACE, JSON_SEARCH, JSON_SET,
    ↪  JSON_STORAGE_SIZE, JSON_TYPE, JSON_UNQUOTE, JSON_VALID, LOWER, MD5,
    ↪ REVERSE, TIDB_SHARD, UPPER, VITESS_HASH
```

For the functions that are not included in the above list, those functions are not fully tested and not recommended for a production environment, which can be seen as experimental. Other expressions such as operators, `CAST`, and `CASE WHEN` are also seen as experimental and not recommended for production.

If you still want to use those expressions, you can make the following configuration in the TiDB configuration file:

```
allow-expression-index = true
```

Note:

An expression index cannot be created on a primary key.

The expression in an expression index cannot contain the following content:

- Volatile functions, such as `RAND()` and `NOW()`.
- System variables and user variables.
- Subqueries.
- `AUTO_INCREMENT` columns. You can remove this restriction by setting the value of `tidb_enable_auto_increment_in_generated` (system variable) to `true`.
- Window functions.
- ROW functions, such as `CREATE TABLE t (j JSON, INDEX k (((j,j)` ↪ `)));`.
- Aggregate functions.

An expression index implicitly takes up a name (for example, `_V$_{index` ↪ `_name}_{index_offset}`). If you try to create a new expression index

with the name that a column has already had, an error occurs. In addition, if you add a new column with the same name, an error also occurs.

Make sure that the number of function parameters in the expression of an expression index is correct.

When the expression of an index contains a string-related function, affected by the returned type and the length, creating the expression index might fail. In this situation, you can use the `CAST()` function to explicitly specify the returned type and the length. For example, to create an expression index based on the `REPEAT(a, 3)` expression, you need to modify this expression to `CAST(REPEAT(a, 3)AS CHAR(20))`.

When the expression in a query statement matches the expression in an expression index, the optimizer can choose the expression index for the query. In some cases, the optimizer might not choose an expression index depending on statistics. In this situation, you can force the optimizer to select an expression index by using optimizer hints.

In the following examples, suppose that you create the expression index `idx` on the expression `LOWER(col1)`:

If the results of the query statement are the same expressions, the expression index applies. Take the following statement as an example:

```
SELECT LOWER(col1) FROM t;
```

If the same expression is included in the filtering conditions, the expression index applies. Take the following statements as an example:

```
SELECT * FROM t WHERE LOWER(col1) = "a";
SELECT * FROM t WHERE LOWER(col1) > "a";
SELECT * FROM t WHERE LOWER(col1) BETWEEN "a" AND "b";
SELECT * FROM t WHERE LOWER(col1) IN ("a", "b");
SELECT * FROM t WHERE LOWER(col1) > "a" AND LOWER(col1) < "b";
SELECT * FROM t WHERE LOWER(col1) > "b" OR LOWER(col1) < "a";
```

When the queries are sorted by the same expression, the expression index applies. Take the following statement as an example:

```
SELECT * FROM t ORDER BY LOWER(col1);
```

If the same expression is included in the aggregate (`GROUP BY`) functions, the expression index applies. Take the following statements as an example:

```
SELECT MAX(LOWER(col1)) FROM t;
SELECT MIN(col1) FROM t GROUP BY LOWER(col1);
```

To see the expression corresponding to the expression index, execute SHOW INDEX, or check the system tables information_schema.tidb_indexes and the table information_schema.STATISTICS. The Expression column in the output indicates the corresponded expression. For the non-expression indexes, the column shows NULL.

The cost of maintaining an expression index is higher than that of maintaining other indexes, because the value of the expression needs to be calculated whenever a row is inserted or updated. The value of the expression is already stored in the index, so this value does not require recalculation when the optimizer selects the expression index.

Therefore, when the query performance outweighs the insert and update performance, you can consider indexing the expressions.

Expression indexes have the same syntax and limitations as in MySQL. They are implemented by creating indexes on generated virtual columns that are invisible, so the supported expressions inherit all limitations of virtual generated columns.

14.13.2.36.4 Multi-valued indexes

Multi-valued indexes are a kind of secondary index defined on an array column. In a normal index, one index record corresponds to one data record (1:1). In a multi-valued index, multiple index records correspond to one data record (N:1). Multi-valued indexes are used to index JSON arrays. For example, a multi-valued index defined on the zipcode field will generate one index record for each element in the zipcode array.

```
{
    "user":"Bob",
    "user_id":31,
    "zipcode":[94477,94536]
}
```

Create multi-valued indexes

You can create multi-valued indexes by using the CAST(... AS ... ARRAY) expression in the index definition, as creating an expression index.

```
mysql> CREATE TABLE customers (
    id BIGINT NOT NULL AUTO_INCREMENT PRIMARY KEY,
    name CHAR(10),
    custinfo JSON,
    INDEX zips((CAST(custinfo->'$.zipcode' AS UNSIGNED ARRAY)))
);
```

You can define a multi-valued index as a unique index.

```
mysql> CREATE TABLE customers (
    id BIGINT NOT NULL AUTO_INCREMENT PRIMARY KEY,
    name CHAR(10),
    custinfo JSON,
```

```
    UNIQUE INDEX zips( (CAST(custinfo->'$.zipcode' AS UNSIGNED ARRAY)))
);
```

When a multi-valued index is defined as a unique index, an error is reported if you try to insert duplicate data.

```
mysql> INSERT INTO customers VALUES (1, 'pingcap', '{"zipcode": [1,2]}');
Query OK, 1 row affected (0.01 sec)

mysql> INSERT INTO customers VALUES (1, 'pingcap', '{"zipcode": [2,3]}');
ERROR 1062 (23000): Duplicate entry '2' for key 'customers.zips'
```

The same record can have duplicate values, but when different records have duplicate values, an error is reported.

```
-- Insert succeeded
mysql> INSERT INTO t1 VALUES('[1,1,2]');
mysql> INSERT INTO t1 VALUES('[3,3,3,4,4,4]');

-- Insert failed
mysql> INSERT INTO t1 VALUES('[1,2]');
mysql> INSERT INTO t1 VALUES('[2,3]');
```

You can also define a multi-valued index as a composite index:

```
mysql> CREATE TABLE customers (
    id BIGINT NOT NULL AUTO_INCREMENT PRIMARY KEY,
    name CHAR(10),
    custinfo JSON,
    INDEX zips(name, (CAST(custinfo->'$.zipcode' AS UNSIGNED ARRAY)))
);
```

When a multi-valued index is defined as a composite index, the multi-valued part can appear in any position, but only once.

```
mysql> CREATE TABLE customers (
    id BIGINT NOT NULL AUTO_INCREMENT PRIMARY KEY,
    name CHAR(10),
    custinfo JSON,
    INDEX zips(name, (CAST(custinfo->'$.zipcode' AS UNSIGNED ARRAY)), (CAST(
        ↪ custinfo->'$.zipcode' AS UNSIGNED ARRAY)))
);
ERROR 1235 (42000): This version of TiDB doesn't yet support 'more than one
    ↪ multi-valued key part per index'.
```

The written data must exactly match the type defined by the multi-valued index; otherwise, the data write fails:

```
-- All elements in the zipcode field must be the UNSIGNED type.
mysql> INSERT INTO customers VALUES (1, 'pingcap', '{"zipcode": [-1]}');
ERROR 3752 (HY000): Value is out of range for expression index 'zips' at
    ↪ row 1

mysql> INSERT INTO customers VALUES (1, 'pingcap', '{"zipcode": ["1"]}');
    ↪ -- Incompatible with MySQL
ERROR 3903 (HY000): Invalid JSON value for CAST for expression index 'zips'

mysql> INSERT INTO customers VALUES (1, 'pingcap', '{"zipcode": [1]}');
Query OK, 1 row affected (0.00 sec)
```

Use multi-valued indexes

See Index Selection - Use multi-valued indexes for more details.

Limitations

- For an empty JSON array, no corresponding index record is generated.
- The target type in `CAST(... AS ... ARRAY)` cannot be any of `BINARY`, `JSON`, `YEAR`, `FLOAT`, and `DECIMAL`. The source type must be JSON.
- You cannot use multi-valued indexes for sorting.
- You can only create multi-valued indexes on a JSON array.
- A multi-valued index cannot be a primary key or a foreign key.
- The extra storage space used by a multi-valued index = the average number of array elements per row * the space used by a normal secondary index.
- Compared with normal indexes, DML operations will modify more index records for multi-valued indexes, so multi-valued indexes will have a greater performance impact than normal indexes.
- Because multi-valued indexes are a special type of expression index, multi-valued indexes have the same limitations as expression indexes.
- If a table uses multi-valued indexes, you cannot back up, replicate, or import the table using BR, TiCDC, or TiDB Lightning to a TiDB cluster earlier than v6.6.0.
- For a query with complex conditions, TiDB might not be able to select multi-valued indexes. For information on the condition patterns supported by multi-valued indexes, refer to Use multi-valued indexes.

14.13.2.36.5 Invisible index

By default, invisible indexes are indexes that are ignored by the query optimizer:

```
CREATE TABLE t1 (c1 INT, c2 INT, UNIQUE(c2));
CREATE UNIQUE INDEX c1 ON t1 (c1) INVISIBLE;
```

Starting from TiDB v8.0.0, you can make the optimizer select invisible indexes by modifying the system variable `tidb_opt_use_invisible_indexes`.

For details, see ALTER INDEX.

14.13.2.36.6 Associated system variables

The system variables associated with the CREATE INDEX statement are tidb_ddl_
↪ enable_fast_reorg, tidb_ddl_reorg_worker_cnt, tidb_ddl_reorg_batch_size, tidb_enable_auto_increment_in_generated, and tidb_ddl_reorg_priority. Refer to system variables for details.

14.13.2.36.7 MySQL compatibility

- TiDB supports parsing the FULLTEXT and SPATIAL syntax but does not support using the FULLTEXT, HASH, and SPATIAL indexes.
- Descending indexes are not supported (similar to MySQL 5.7).
- Adding the primary key of the CLUSTERED type to a table is not supported. For more details about the primary key of the CLUSTERED type, refer to clustered index.
- Expression indexes are incompatible with views. When a query is executed using a view, the expression index cannot be used at the same time.
- Expression indexes have compatibility issues with bindings. When the expression of an expression index has a constant, the binding created for the corresponding query expands its scope. For example, suppose that the expression in the expression index is a+1, and the corresponding query condition is a+1 > 2. In this case, the created binding is a+? > ?, which means that the query with the condition such as a+2 > 2 is also forced to use the expression index and results in a poor execution plan. In addition, this also affects the baseline capturing and baseline evolution in SQL Plan Management (SPM).
- The data written with multi-valued indexes must exactly match the defined data type. Otherwise, data writes fail. For details, see create multi-valued indexes.

14.13.2.37 CREATE PLACEMENT POLICY

CREATE PLACEMENT POLICY is used to create a named placement policy that can later be assigned to tables, partitions, or database schemas.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

14.13.2.37.1 Synopsis

```
CreatePolicyStmt ::=
    "CREATE" "PLACEMENT" "POLICY" IfNotExists PolicyName PlacementOptionList

PolicyName ::=
    Identifier

PlacementOptionList ::=
    PlacementOption
|   PlacementOptionList PlacementOption
|   PlacementOptionList ',' PlacementOption

PlacementOption ::=
    CommonPlacementOption
|   SugarPlacementOption
|   AdvancedPlacementOption

CommonPlacementOption ::=
    "FOLLOWERS" EqOpt LengthNum

SugarPlacementOption ::=
    "PRIMARY_REGION" EqOpt stringLit
|   "REGIONS" EqOpt stringLit
|   "SCHEDULE" EqOpt stringLit

AdvancedPlacementOption ::=
    "LEARNERS" EqOpt LengthNum
|   "CONSTRAINTS" EqOpt stringLit
|   "LEADER_CONSTRAINTS" EqOpt stringLit
|   "FOLLOWER_CONSTRAINTS" EqOpt stringLit
|   "LEARNER_CONSTRAINTS" EqOpt stringLit
|   "SURVIVAL_PREFERENCES" EqOpt stringLit
```

14.13.2.37.2 Examples

Note:

To know which regions are available in your cluster, see SHOW PLACEMENT LABELS.

If you do not see any available regions, your TiKV installation might not have labels set correctly.

```
CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us
    -west-1" FOLLOWERS=4;
CREATE TABLE t1 (a INT) PLACEMENT POLICY=p1;
SHOW CREATE PLACEMENT POLICY p1;
```

```
Query OK, 0 rows affected (0.08 sec)

Query OK, 0 rows affected (0.10 sec)

+--------+-------------------------------------------------------------------------------
    
| Policy | Create Policy
    
    | 
+--------+-------------------------------------------------------------------------------
    
| p1     | CREATE PLACEMENT POLICY `p1` PRIMARY_REGION="us-east-1" REGIONS="
    us-east-1,us-west-1" FOLLOWERS=4 |
+--------+-------------------------------------------------------------------------------
    
1 row in set (0.00 sec)
```

14.13.2.37.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.37.4 See also

- Placement Rules in SQL
- SHOW PLACEMENT
- ALTER PLACEMENT POLICY
- DROP PLACEMENT POLICY

14.13.2.38 CREATE RESOURCE GROUP

You can use the `CREATE RESOURCE GROUP` statement to create a resource group.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

14.13.2.38.1 Synopsis

```
CreateResourceGroupStmt ::=
   "CREATE" "RESOURCE" "GROUP" IfNotExists ResourceGroupName
      ↪ ResourceGroupOptionList

IfNotExists ::=
    ('IF' 'NOT' 'EXISTS')?

ResourceGroupName ::=
    Identifier
|   "DEFAULT"

ResourceGroupOptionList ::=
    DirectResourceGroupOption
|   ResourceGroupOptionList DirectResourceGroupOption
|   ResourceGroupOptionList ',' DirectResourceGroupOption

DirectResourceGroupOption ::=
    "RU_PER_SEC" EqOpt stringLit
|   "PRIORITY" EqOpt ResourceGroupPriorityOption
|   "BURSTABLE"
|   "BURSTABLE" EqOpt Boolean
|   "QUERY_LIMIT" EqOpt '(' ResourceGroupRunawayOptionList ')'
|   "QUERY_LIMIT" EqOpt '(' ')'
|   "QUERY_LIMIT" EqOpt "NULL"
|   "BACKGROUND" EqOpt '(' BackgroundOptionList ')'
|   "BACKGROUND" EqOpt '(' ')'
|   "BACKGROUND" EqOpt "NULL"

ResourceGroupPriorityOption ::=
    LOW
|   MEDIUM
|   HIGH
```

```
ResourceGroupRunawayOptionList ::=
    DirectResourceGroupRunawayOption
|   ResourceGroupRunawayOptionList DirectResourceGroupRunawayOption
|   ResourceGroupRunawayOptionList ',' DirectResourceGroupRunawayOption

DirectResourceGroupRunawayOption ::=
    "EXEC_ELAPSED" EqOpt stringLit
|   "ACTION" EqOpt ResourceGroupRunawayActionOption
|   "WATCH" EqOpt ResourceGroupRunawayWatchOption WatchDurationOption

WatchDurationOption ::=
    ("DURATION" EqOpt stringLit | "DURATION" EqOpt "UNLIMITED")?

ResourceGroupRunawayWatchOption ::=
    EXACT
|   SIMILAR
|   PLAN

ResourceGroupRunawayActionOption ::=
    DRYRUN
|   COOLDOWN
|   KILL
```

The resource group name parameter (`ResourceGroupName`) must be globally unique.

TiDB supports the following `DirectResourceGroupOption`, where Request Unit (RU) is a unified abstraction unit in TiDB for CPU, IO, and other system resources.

Option	Description	Example
`RU_PER_SEC`	Rate of RU backfilling per second	`RU_PER_SEC = 500` indicates that this resource group is backfilled with 500 RUs per second
`PRIORITY`	The absolute priority of tasks to be processed on TiKV	`PRIORITY = HIGH` indicates that the priority is high. If not specified, the default value is `MEDIUM`.
`BURSTABLE`	If the `BURSTABLE` attribute is set, TiDB allows the corresponding resource group to use the available system resources when the quota is exceeded.	

Option	Description	Example
`QUERY_LIMIT`	When the query execution meets this condition, the query is identified as a runaway query and the corresponding action is executed.	`QUERY_LIMIT=(EXEC_ELAPSED='60s', ACTION=KILL, WATCH=EXACT DURATION='10m')` indicates that the query is identified as a runaway query when the execution time exceeds 60 seconds. The query is terminated. All SQL statements with the same SQL text will be terminated immediately in the coming 10 minutes. `QUERY_LIMIT=()` or `QUERY_LIMIT=NULL` means that runaway control is not enabled. See Runaway Queries.

Note:

- The `CREATE RESOURCE GROUP` statement can only be executed when the global variable `tidb_enable_resource_control` is set to `ON`. TiDB automatically creates a `default` resource group during cluster initialization. For this resource group, the default value of `RU_PER_SEC` is `UNLIMITED` (equivalent to the maximum value of the `INT` type, that is, `2147483647`) and it is in `BURSTABLE` mode. All requests that are not bound to any resource group are automatically bound to this `default` resource group. When you create a new configuration for another resource group, it is recommended to modify the `default` resource group configuration as needed.
- Currently, only the `default` resource group supports modifying the `BACKGROUND` configuration.

14.13.2.38.2 Examples

Create two resource groups `rg1` and `rg2`.

```
DROP RESOURCE GROUP IF EXISTS rg1;
```

```
Query OK, 0 rows affected (0.22 sec)
```

```
CREATE RESOURCE GROUP IF NOT EXISTS rg1
  RU_PER_SEC = 100
  PRIORITY = HIGH
  BURSTABLE;
```

```
Query OK, 0 rows affected (0.08 sec)
```

```
CREATE RESOURCE GROUP IF NOT EXISTS rg2
  RU_PER_SEC = 200 QUERY_LIMIT=(EXEC_ELAPSED='100ms', ACTION=KILL);
```

```
Query OK, 0 rows affected (0.08 sec)
```

```
SELECT * FROM information_schema.resource_groups WHERE NAME ='rg1' or NAME
    ↪ = 'rg2';
```

```
+--
    ↪ ----+------------+----------+-----------+-------------------------------+
    ↪
| NAME | RU_PER_SEC | PRIORITY | BURSTABLE | QUERY_LIMIT                   |
+--
    ↪ ----+------------+----------+-----------+-------------------------------+
    ↪
| rg1  | 100        | HIGH     | YES       | NULL                          |
| rg2  | 200        | MEDIUM   | NO        | EXEC_ELAPSED=100ms, ACTION=KILL |
+--
    ↪ ----+------------+----------+-----------+-------------------------------+
    ↪
2 rows in set (1.30 sec)
```

14.13.2.38.3 MySQL compatibility

MySQL also supports CREATE RESOURCE GROUP. However, the acceptable parameters are different from that of TiDB so that they are not compatible.

14.13.2.38.4 See also

- DROP RESOURCE GROUP
- ALTER RESOURCE GROUP
- ALTER USER RESOURCE GROUP
- Request Unit (RU)

14.13.2.39 CREATE ROLE

This statement creates a new role, which can be assigned to users as part of role-based access control.

14.13.2.39.1 Synopsis

```
CreateRoleStmt ::=
    'CREATE' 'ROLE' IfNotExists RoleSpec (',' RoleSpec)*

IfNotExists ::=
    ('IF' 'NOT' 'EXISTS')?

RoleSpec ::=
    Rolename
```

14.13.2.39.2 Examples

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Create a new role `analyticsteam` and a new user `jennifer`:

```
CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Note that by default `jennifer` needs to execute `SET ROLE analyticsteam` in order to be able to use the privileges associated with the `analyticsteam` role:

```
SHOW GRANTS;
+-----------------------------------------------+
| Grants for User                               |
+-----------------------------------------------+
```

```
| GRANT USAGE ON *.* TO 'jennifer'@'%'  |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+---------------------------------------------+
2 rows in set (0.00 sec)

SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

SHOW GRANTS;
+---------------------------------------------+
| Grants for User                             |
+---------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'  |
| GRANT SELECT ON test.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+---------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

The statement `SET DEFAULT ROLE` can be used to associate the role `analyticsteam` to `jennifer`:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
Query OK, 0 rows affected (0.02 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

After this, the user `jennifer` has the privileges associated with the role `analyticsteam` and `jennifer` does not have to execute the statement `SET ROLE`:

```
SHOW GRANTS;
+---------------------------------------------+
```

```
| Grants for User                                |
+------------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'           |
| GRANT SELECT ON test.* TO 'jennifer'@'%'       |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%'    |
+------------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

14.13.2.39.3 MySQL compatibility

The `CREATE ROLE` statement in TiDB is fully compatible with the roles feature in MySQL 8.0. If you find any compatibility differences, report a bug.

14.13.2.39.4 See also

- DROP ROLE
- GRANT <role>
- REVOKE <role>
- SET ROLE
- SET DEFAULT ROLE

- Role-Based Access Control

14.13.2.40 CREATE SEQUENCE

The `CREATE SEQUENCE` statement creates sequence objects in TiDB. The sequence is a database object that is on a par with the table and the `View` object. The sequence is used to generate serialized IDs in a customized way.

14.13.2.40.1 Synopsis

```
CreateSequenceStmt ::=
    'CREATE' 'SEQUENCE' IfNotExists TableName CreateSequenceOptionListOpt

IfNotExists ::=
    ('IF' 'NOT' 'EXISTS')?
```

```
TableName ::=
    Identifier ('.' Identifier)?

CreateSequenceOptionListOpt ::=
    SequenceOption*

SequenceOptionList ::=
    SequenceOption

SequenceOption ::=
    ( 'INCREMENT' ( '='? | 'BY' ) | 'START' ( '='? | 'WITH' ) | ( 'MINVALUE'
       ↪  | 'MAXVALUE' | 'CACHE' ) '='? ) SignedNum
|   'COMMENT' '='? stringLit
|   'NOMINVALUE'
|   'NO' ( 'MINVALUE' | 'MAXVALUE' | 'CACHE' | 'CYCLE' )
|   'NOMAXVALUE'
|   'NOCACHE'
|   'CYCLE'
|   'NOCYCLE'
```

14.13.2.40.2 Syntax

```
CREATE [TEMPORARY] SEQUENCE [IF NOT EXISTS] sequence_name
    [ INCREMENT [ BY | = ] increment ]
    [ MINVALUE [=] minvalue | NO MINVALUE | NOMINVALUE ]
    [ MAXVALUE [=] maxvalue | NO MAXVALUE | NOMAXVALUE ]
    [ START [ WITH | = ] start ]
    [ CACHE [=] cache | NOCACHE | NO CACHE]
    [ CYCLE | NOCYCLE | NO CYCLE]
    [table_options]
```

14.13.2.40.3 Parameters

Parameters	Default value	Description
`TEMPORARY` ↪	`false` ↪	TiDB currently does not support the `TEMPORARY` ↪ option and provides only syntax compatibility for it.

Parameters	Default value	Description
`INCREMENT` ↪	`1`	Specifies the increment of a sequence. Its positive or negative values can control the growth direction of the sequence.

Parameters	Default value	Description
`MINVALUE` ↪	`1` or `-9223372036854775807` ↪	Specifies the minimum value of a sequence. When `INCREMENT` ↪ `> 0`, the default value is `1`. When `INCREMENT` ↪ `< 0`, the default value is `-922337203685477` ↪ .

Parameters	Default value	Description
`MAXVALUE` ↪	`9223372036854775806` ↪ or `-1`	Specifies the maximum value of a sequence. When `INCREMENT` ↪ `> 0`, the default value is `922337203685477` ↪ . When `INCREMENT` ↪ `< 0`, the default value is `-1`.

Parameters	Default value	Description
`START` ↪	`MINVALUE` ↪ or `MAXVALUE` ↪	Specifies the initial value of a sequence. When `INCREMENT` ↪ > 0, the default value is `MINVALUE` ↪ . When `INCREMENT` ↪ < 0, the default value is `MAXVALUE` ↪ .
`CACHE` ↪	`1000` ↪	Specifies the local cache size of a sequence in TiDB.

Parameters	Default value	Description
`CYCLE` ↪	`NO` ↪ `CYCLE` ↪	Specifies whether a sequence restarts from the minimum value (or maximum for the descending sequence). When `INCREMENT` ↪ > 0, the default value is `MINVALUE` ↪ . When `INCREMENT` ↪ < 0, the default value is `MAXVALUE` ↪ .

Parameters	Default value	Description

14.13.2.40.4 `SEQUENCE` function

You can control a sequence through the following expression functions:

- `NEXTVAL` or `NEXT VALUE FOR`

  Essentially, both are the `NEXTVAL()` function that gets the next valid value of a sequence object. The parameter of the `NEXTVAL()` function is the `identifier` of the sequence.

- `LASTVAL`

  This function gets the last used value of this session. If the value does not exist, `NULL` is used. The parameter of this function is the `identifier` of the sequence.

- `SETVAL`

  This function sets the progression of the current value for a sequence. The first parameter of this function is the `identifier` of the sequence; the second parameter is `num`.

> **Note:**
>
> In the implementation of a sequence in TiDB, the `SETVAL` function cannot change the initial progression or cycle progression of this sequence. This function only returns the next valid value based on this progression.

14.13.2.40.5 Examples

- Create a sequence object with the default parameter:

```
CREATE SEQUENCE seq;
```

```
Query OK, 0 rows affected (0.06 sec)
```

- Use the `NEXTVAL()` function to get the next value of the sequence object:

```
SELECT NEXTVAL(seq);
```

```
+--------------+
| NEXTVAL(seq) |
+--------------+
|            1 |
+--------------+
1 row in set (0.02 sec)
```

- Use the `LASTVAL()` function to get the value generated by the last call to a sequence object in this session:

```
SELECT LASTVAL(seq);
```

```
+--------------+
| LASTVAL(seq) |
+--------------+
|            1 |
+--------------+
1 row in set (0.02 sec)
```

- Use the `SETVAL()` function to set the current value (or the current position) of the sequence object:

```
SELECT SETVAL(seq, 10);
```

```
+-----------------+
| SETVAL(seq, 10) |
+-----------------+
|              10 |
+-----------------+
1 row in set (0.01 sec)
```

- You can also use the `next value for` syntax to get the next value of the sequence:

```
SELECT next value for seq;
```

```
+--------------------+
| next value for seq |
+--------------------+
|                 11 |
+--------------------+
1 row in set (0.00 sec)
```

- Create a sequence object with default custom parameters:

```
CREATE SEQUENCE seq2 start 3 increment 2 minvalue 1 maxvalue 10 cache
    ↪ 3;
```

```
Query OK, 0 rows affected (0.01 sec)
```

- When the sequence object has not been used in this session, the `LASTVAL()` function returns a `NULL` value.

```
SELECT LASTVAL(seq2);
```

```
+---------------+
| LASTVAL(seq2) |
+---------------+
|          NULL |
+---------------+
1 row in set (0.01 sec)
```

- The first valid value of the `NEXTVAL()` function for the sequence object is the value of `START` parameter.

```
SELECT NEXTVAL(seq2);
```

```
+---------------+
| NEXTVAL(seq2) |
+---------------+
|             3 |
+---------------+
1 row in set (0.00 sec)
```

- Although the `SETVAL()` function can change the current value of the sequence object, it cannot change the arithmetic progression rule for the next value.

```
SELECT SETVAL(seq2, 6);
```

```
+-----------------+
| SETVAL(seq2, 6) |
+-----------------+
|               6 |
+-----------------+
1 row in set (0.00 sec)
```

- When you use `NEXTVAL()` to get the next value, the next value will follow the arithmetic progression rule defined by the sequence.

```
SELECT next value for seq2;
```

```
+--------------------+
| next value for seq2 |
+--------------------+
|                  7 |
+--------------------+
1 row in set (0.00 sec)
```

- You can use the next value of the sequence as the default value for the column, as in the following example.

```
CREATE table t(a int default next value for seq2);
```

```
Query OK, 0 rows affected (0.02 sec)
```

- In the following example, the value is not specified, so the default value of `seq2` is used.

```
INSERT into t values();
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SELECT * from t;
```

```
+------+
| a    |
+------+
|    9 |
+------+
1 row in set (0.00 sec)
```

- In the following example, the value is not specified, so the default value of `seq2` is used. But the next value of `seq2` is not within the range defined in the above example (`CREATE SEQUENCE seq2 start 3 increment 2 minvalue 1 maxvalue 10 cache 3;`), so an error is returned.

```
INSERT into t values();
```

```
ERROR 4135 (HY000): Sequence 'test.seq2' has run out
```

14.13.2.40.6 MySQL compatibility

This statement is a TiDB extension. The implementation is modeled on sequences available in MariaDB.

Except for the `SETVAL` function, all other functions have the same *progressions* as MariaDB. Here "progression" means that the numbers in a sequence follow a certain arithmetic

progression rule defined by the sequence. Although you can use `SETVAL` to set the current value of a sequence, the subsequent values of the sequence still follow the original progression rule.

For example:

```
1, 3, 5, ...          // The sequence starts from 1 and increments by 2.
select SETVAL(seq, 6) // Sets the current value of a sequence to 6.
7, 9, 11, ...         // Subsequent values still follow the progression rule.
```

In the `CYCLE` mode, the initial value of a sequence in the first round is the value of the `START` parameter, and the initial value in the subsequent rounds is the value of `MinValue` (`INCREMENT` > 0) or `MaxValue` (`INCREMENT` < 0).

14.13.2.40.7 See also

- ALTER SEQUENCE
- DROP SEQUENCE
- SHOW CREATE SEQUENCE
- Sequence Functions

14.13.2.41 CREATE TABLE LIKE

This statement copies the definition of an existing table, without copying any data.

14.13.2.41.1 Synopsis

```
CreateTableLikeStmt ::=
    'CREATE' OptTemporary 'TABLE' IfNotExists TableName
       ↪ LikeTableWithOrWithoutParen OnCommitOpt

OptTemporary ::=
    ( 'TEMPORARY' | ('GLOBAL' 'TEMPORARY') )?

LikeTableWithOrWithoutParen ::=
    'LIKE' TableName
|   '(' 'LIKE' TableName ')'

OnCommitOpt ::=
    ('ON' 'COMMIT' 'DELETE' 'ROWS')?
```

14.13.2.41.2 Examples

```
mysql> CREATE TABLE t1 (a INT NOT NULL);
Query OK, 0 rows affected (0.13 sec)
```

```
mysql> INSERT INTO t1 VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+---+
| a |
+---+
| 1 |
| 2 |
| 3 |
| 4 |
| 5 |
+---+
5 rows in set (0.00 sec)

mysql> CREATE TABLE t2 LIKE t1;
Query OK, 0 rows affected (0.10 sec)

mysql> SELECT * FROM t2;
Empty set (0.00 sec)
```

14.13.2.41.3 Pre-split region

If the table to be copied is defined with the `PRE_SPLIT_REGIONS` attribute, the table created using the `CREATE TABLE LIKE` statement inherits this attribute, and the Region on the new table will be split. For details of `PRE_SPLIT_REGIONS`, see `CREATE TABLE` Statement.

14.13.2.41.4 MySQL compatibility

The `CREATE TABLE LIKE` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.41.5 See also

- CREATE TABLE
- SHOW CREATE TABLE

14.13.2.42 CREATE TABLE

This statement creates a new table in the currently selected database. It behaves similarly to the `CREATE TABLE` statement in MySQL.

14.13.2.42.1 Synopsis

```
CreateTableStmt ::=
    'CREATE' OptTemporary 'TABLE' IfNotExists TableName (
       ↪ TableElementListOpt CreateTableOptionListOpt PartitionOpt
       ↪ DuplicateOpt AsOpt CreateTableSelectOpt |
       ↪ LikeTableWithOrWithoutParen ) OnCommitOpt

OptTemporary ::=
    ( 'TEMPORARY' | ('GLOBAL' 'TEMPORARY') )?

IfNotExists ::=
    ('IF' 'NOT' 'EXISTS')?

TableName ::=
    Identifier ('.' Identifier)?

TableElementListOpt ::=
    ( '(' TableElementList ')' )?

TableElementList ::=
    TableElement ( ',' TableElement )*

TableElement ::=
    ColumnDef
|   Constraint

ColumnDef ::=
    ColumnName ( Type | 'SERIAL' ) ColumnOptionListOpt

PlacementPolicyOption ::=
    "PLACEMENT" "POLICY" EqOpt PolicyName
|   "PLACEMENT" "POLICY" (EqOpt | "SET") "DEFAULT"
```

The following *table_options* are supported. Other options such as `AVG_ROW_LENGTH`, `CHECKSUM`, `COMPRESSION`, `CONNECTION`, `DELAY_KEY_WRITE`, `ENGINE`, `KEY_BLOCK_SIZE`, `MAX_ROWS`, `MIN_ROWS`, `ROW_FORMAT` and `STATS_PERSISTENT` are parsed but ignored.

Options	Description	Example
AUTO_ ↪ INCREMENT ↪	The initial value of the increment field	AUTO_ ↪ INCREMENT ↪ = 5
SHARD_ROW ↪ _ID_ ↪ BITS	To set the number of bits for the implicit _tidb_ ↪ rowid shards	SHARD_ ↪ ROW ↪ _ID ↪ _ ↪ BITS ↪ = 4
PRE_SPLIT ↪ _ ↪ REGIONS ↪	To pre-split 2^(PRE_ ↪ SPLIT_ ↪ REGIONS ↪) Regions when creating a table	PRE_ ↪ SPLIT ↪ _ ↪ REGIONS ↪ = 4
AUTO_ID_ ↪ CACHE	To set the auto ID cache size in a TiDB instance. By default, TiDB automatically changes this size according to allocation speed of auto ID	AUTO_ ↪ ID_ ↪ CACHE ↪ = 200

Options	Description	Example
AUTO_ ↪ RANDOM ↪ _BASE	To set the initial incremental part value of auto_random. This option can be considered as a part of the internal interface. Users can ignore this parameter	AUTO_ ↪ RANDOM ↪ _ ↪ BASE ↪ = 0
CHARACTER ↪ SET	To specify the character set for the table	CHARACTER ↪ ↪ SET = 'utf8mb4'
COMMENT	The comment information	COMMENT ↪ = 'comment info'

Note:

The `split-table` configuration option is enabled by default. When it is enabled, a separate Region is created for each newly created table. For details, see TiDB configuration file.

14.13.2.42.2 Examples

Creating a simple table and inserting one row:

```
CREATE TABLE t1 (a int);
DESC t1;
SHOW CREATE TABLE t1\G
INSERT INTO t1 (a) VALUES (1);
SELECT * FROM t1;
```

```
mysql> drop table if exists t1;
Query OK, 0 rows affected (0.23 sec)

mysql> CREATE TABLE t1 (a int);
Query OK, 0 rows affected (0.09 sec)

mysql> DESC t1;
+-------+---------+------+-----+---------+-------+
| Field | Type    | Null | Key | Default | Extra |
+-------+---------+------+-----+---------+-------+
| a     | int(11) | YES  |     | NULL    |       |
+-------+---------+------+-----+---------+-------+
1 row in set (0.00 sec)

mysql> SHOW CREATE TABLE t1\G
*************************** 1. row ***************************
       Table: t1
Create Table: CREATE TABLE `t1` (
  `a` int(11) DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
1 row in set (0.00 sec)

mysql> INSERT INTO t1 (a) VALUES (1);
Query OK, 1 row affected (0.03 sec)

mysql> SELECT * FROM t1;
+------+
| a    |
+------+
|    1 |
+------+
1 row in set (0.00 sec)
```

Dropping a table if it exists, and conditionally creating a table if it does not exist:

```
DROP TABLE IF EXISTS t1;
CREATE TABLE IF NOT EXISTS t1 (
 id BIGINT NOT NULL PRIMARY KEY auto_increment,
 b VARCHAR(200) NOT NULL
);
DESC t1;
```

```
mysql> DROP TABLE IF EXISTS t1;
Query OK, 0 rows affected (0.22 sec)
```

```
mysql> CREATE TABLE IF NOT EXISTS t1 (
        id BIGINT NOT NULL PRIMARY KEY auto_increment,
        b VARCHAR(200) NOT NULL
       );
Query OK, 0 rows affected (0.08 sec)

mysql> DESC t1;
+-------+--------------+------+------+---------+----------------+
| Field | Type         | Null | Key  | Default | Extra          |
+-------+--------------+------+------+---------+----------------+
| id    | bigint(20)   | NO   | PRI  | NULL    | auto_increment |
| b     | varchar(200) | NO   |      | NULL    |                |
+-------+--------------+------+------+---------+----------------+
2 rows in set (0.00 sec)
```

14.13.2.42.3 MySQL compatibility

- All of the data types except spatial types are supported.
- `FULLTEXT`, `HASH` and `SPATIAL` indexes are not supported.

- For compatibility, the `index_col_name` attribute supports the length option with a maximum length limit of 3072 bytes by default. The length limit can be changed through the `max-index-length` configuration option. For details, see TiDB configuration file.

- The `[ASC | DESC]` in `index_col_name` is currently parsed but ignored (MySQL 5.7 compatible behavior).
- The `COMMENT` attribute does not support the `WITH PARSER` option.
- TiDB supports 1017 columns in a single table by default and 4096 columns at most. The corresponding number limit in InnoDB is 1017 columns, and the hard limit in MySQL is 4096 columns. For details, see TiDB Limitations.
- TiDB supports `HASH`, `RANGE`, `LIST`, and `KEY` partitioning types. For an unsupported partition type, TiDB returns `Warning: Unsupported partition type %s, treat as normal table`, where `%s` is the specific unsupported partition type.

- Data Types
- DROP TABLE
- CREATE TABLE LIKE
- SHOW CREATE TABLE

14.13.2.43 CREATE USER

This statement creates a new user, specified with a password. In the MySQL privilege system, a user is the combination of a username and the host from which they are connecting from. Thus, it is possible to create a user `'newuser2'@'192.168.1.1'` who is only able to connect from the IP address `192.168.1.1`. It is also possible to have two users have the same user-portion, and different permissions as they login from different hosts.

14.13.2.43.1 Synopsis

```
CreateUserStmt ::=
    'CREATE' 'USER' IfNotExists UserSpecList RequireClauseOpt
       ↪ ConnectionOptions PasswordOption LockOption AttributeOption
       ↪ ResourceGroupNameOption

IfNotExists ::=
    ('IF' 'NOT' 'EXISTS')?

UserSpecList ::=
    UserSpec ( ',' UserSpec )*

RequireClauseOpt ::=
    ( 'REQUIRE' 'NONE' | 'REQUIRE' 'SSL' | 'REQUIRE' 'X509' | 'REQUIRE'
       ↪ RequireList )?

RequireList ::=
    ( "ISSUER" stringLit | "SUBJECT" stringLit | "CIPHER" stringLit | "SAN"
       ↪ stringLit | "TOKEN_ISSUER" stringLit )*

UserSpec ::=
    Username AuthOption

AuthOption ::=
    ( 'IDENTIFIED' ( 'BY' ( AuthString | 'PASSWORD' HashString ) | 'WITH'
       ↪ StringName ( 'BY' AuthString | 'AS' HashString )? ) )?

StringName ::=
    stringLit
|   Identifier

PasswordOption ::= ( 'PASSWORD' 'EXPIRE' ( 'DEFAULT' | 'NEVER' | 'INTERVAL'
    ↪ N 'DAY' )? | 'PASSWORD' 'HISTORY' ( 'DEFAULT' | N ) | 'PASSWORD' '
    ↪ REUSE' 'INTERVAL' ( 'DEFAULT' | N 'DAY' ) | 'FAILED_LOGIN_ATTEMPTS' N
    ↪  | 'PASSWORD_LOCK_TIME' ( N | 'UNBOUNDED' ) )*

LockOption ::= ( 'ACCOUNT' 'LOCK' | 'ACCOUNT' 'UNLOCK' )?
```

```
AttributeOption ::= ( 'COMMENT' CommentString | 'ATTRIBUTE' AttributeString
    ↪ )?

ResourceGroupNameOption::= ( 'RESOURCE' 'GROUP' Identifier)?

RequireClauseOpt ::= ('REQUIRE' ('NONE' | 'SSL' | 'X509' |
    ↪ RequireListElement ('AND'? RequireListElement)*))?

RequireListElement ::= 'ISSUER' Issuer | 'SUBJECT' Subject | 'CIPHER' Cipher
    ↪  | 'SAN' SAN | 'TOKEN_ISSUER' TokenIssuer
```

14.13.2.43.2 Examples

Create a user with the `newuserpassword` password.

```
mysql> CREATE USER 'newuser' IDENTIFIED BY 'newuserpassword';
Query OK, 1 row affected (0.04 sec)
```

Create a user who can only log in to `192.168.1.1`.

```
mysql> CREATE USER 'newuser2'@'192.168.1.1' IDENTIFIED BY 'newuserpassword'
    ↪ ;
Query OK, 1 row affected (0.02 sec)
```

Create a user who is enforced to log in using TLS connection.

```
CREATE USER 'newuser3'@'%' IDENTIFIED BY 'newuserpassword' REQUIRE SSL;
Query OK, 1 row affected (0.02 sec)
```

Create a user who is required to use X.509 certificate at login.

```
CREATE USER 'newuser4'@'%' IDENTIFIED BY 'newuserpassword' REQUIRE ISSUER '
    ↪ /C=US/ST=California/L=San Francisco/O=PingCAP';
Query OK, 1 row affected (0.02 sec)
```

Create a user who is locked upon creation.

```
CREATE USER 'newuser5'@'%' ACCOUNT LOCK;
```

```
Query OK, 1 row affected (0.02 sec)
```

Create a user with a comment.

```
CREATE USER 'newuser6'@'%' COMMENT 'This user is created only for test';
SELECT * FROM information_schema.user_attributes;
```

```
+----------+------+-----------------------------------------------------+
| USER     | HOST | ATTRIBUTE                                           |
+----------+------+-----------------------------------------------------+
| newuser6 | %    | {"comment": "This user is created only for test"} |
+----------+------+-----------------------------------------------------+
1 rows in set (0.00 sec)
```

Create a user with an `email` attribute.

```
CREATE USER 'newuser7'@'%' ATTRIBUTE '{"email": "user@pingcap.com"}';
SELECT * FROM information_schema.user_attributes;
```

```
+----------+------+-----------------------------------------------------+
| USER     | HOST | ATTRIBUTE                                           |
+----------+------+-----------------------------------------------------+
| newuser7 | %    | {"email": "user@pingcap.com"} |
+----------+------+-----------------------------------------------------+
1 rows in set (0.00 sec)
```

Create a user who is not allowed to reuse the last 5 passwords:

```
CREATE USER 'newuser8'@'%' PASSWORD HISTORY 5;
```

```
Query OK, 1 row affected (0.02 sec)
```

Create a user whose password is manually expired:

```
CREATE USER 'newuser9'@'%' PASSWORD EXPIRE;
```

```
Query OK, 1 row affected (0.02 sec)
```

Create a user that uses the resource group `rg1`.

```
CREATE USER 'newuser7'@'%' RESOURCE GROUP rg1;
SELECT USER, HOST, USER_ATTRIBUTES FROM MYSQL.USER WHERE USER='newuser7';
```

```
+----------+------+---------------------------+
| USER     | HOST | USER_ATTRIBUTES           |
+----------+------+---------------------------+
| newuser7 | %    | {"resource_group": "rg1"} |
+----------+------+---------------------------+
1 rows in set (0.00 sec)
```

14.13.2.43.3 MySQL compatibility

The following `CREATE USER` options are not yet supported by TiDB, and will be parsed but ignored:

- TiDB does not support `WITH MAX_QUERIES_PER_HOUR`, `WITH MAX_UPDATES_PER_HOUR`, and `WITH MAX_USER_CONNECTIONS` options.
- TiDB does not support the `DEFAULT ROLE` option.

14.13.2.43.4 See also

- Security Compatibility with MySQL
- Privilege Management

- DROP USER
- SHOW CREATE USER
- ALTER USER

14.13.2.44 CREATE VIEW

The `CREATE VIEW` statement saves a `SELECT` statement as a queryable object, similar to a table. Views in TiDB are non-materialized. This means that as a view is queried, TiDB will internally rewrite the query to combine the view definition with the SQL query.

14.13.2.44.1 Synopsis

```
CreateViewStmt ::=
    'CREATE' OrReplace ViewAlgorithm ViewDefiner ViewSQLSecurity 'VIEW'
       ↪ ViewName ViewFieldList 'AS' CreateViewSelectOpt ViewCheckOption

OrReplace ::=
    ( 'OR' 'REPLACE' )?

ViewAlgorithm ::=
    ( 'ALGORITHM' '=' ( 'UNDEFINED' | 'MERGE' | 'TEMPTABLE' ) )?

ViewDefiner ::=
    ( 'DEFINER' '=' Username )?

ViewSQLSecurity ::=
    ( 'SQL' 'SECURITY' ( 'DEFINER' | 'INVOKER' ) )?

ViewName ::= TableName

ViewFieldList ::=
```

```
    ( '(' Identifier ( ',' Identifier )* ')' )?

ViewCheckOption ::=
    ( 'WITH' ( 'CASCADED' | 'LOCAL' ) 'CHECK' 'OPTION' )?
```

14.13.2.44.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> CREATE VIEW v1 AS SELECT * FROM t1 WHERE c1 > 2;
Query OK, 0 rows affected (0.11 sec)

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 |  3 |
|  4 |  4 |
|  5 |  5 |
+----+----+
5 rows in set (0.00 sec)

mysql> SELECT * FROM v1;
+----+----+
| id | c1 |
+----+----+
|  3 |  3 |
|  4 |  4 |
|  5 |  5 |
+----+----+
3 rows in set (0.00 sec)

mysql> INSERT INTO t1 (c1) VALUES (6);
Query OK, 1 row affected (0.01 sec)

mysql> SELECT * FROM v1;
```

```
+----+----+
| id | c1 |
+----+----+
|  3 |  3 |
|  4 |  4 |
|  5 |  5 |
|  6 |  6 |
+----+----+
4 rows in set (0.00 sec)

mysql> INSERT INTO v1 (c1) VALUES (7);
ERROR 1105 (HY000): insert into view v1 is not supported now.
```

14.13.2.44.3 MySQL compatibility

- Currently, any view in TiDB cannot be inserted or updated (that is, `INSERT VIEW` and `UPDATE VIEW` are not supported). `WITH CHECK OPTION` is only syntactically compatible but does not take effect.
- Currently, the view in TiDB does not support `ALTER VIEW`, but you can use `CREATE OR REPLACE` instead.
- Currently, the `ALGORITHM` field is only syntactically compatible in TiDB but does not take effect. TiDB currently only supports the MERGE algorithm.

14.13.2.44.4 See also

- DROP VIEW
- CREATE TABLE
- SHOW CREATE TABLE
- DROP TABLE

14.13.2.45 DEALLOCATE

The `DEALLOCATE` statement provides an SQL interface to server-side prepared statements.

14.13.2.45.1 Synopsis

```
DeallocateStmt ::=
    DeallocateSym 'PREPARE' Identifier

DeallocateSym ::=
    'DEALLOCATE'
|   'DROP'
```

```
Identifier ::=
    identifier
|   UnReservedKeyword
|   NotKeywordToken
|   TiDBKeyword
```

14.13.2.45.2 Examples

```
mysql> PREPARE mystmt FROM 'SELECT ? as num FROM DUAL';
Query OK, 0 rows affected (0.00 sec)

mysql> SET @number = 5;
Query OK, 0 rows affected (0.00 sec)

mysql> EXECUTE mystmt USING @number;
+------+
| num |
+------+
| 5   |
+------+
1 row in set (0.00 sec)

mysql> DEALLOCATE PREPARE mystmt;
Query OK, 0 rows affected (0.00 sec)
```

14.13.2.45.3 MySQL compatibility

The `DEALLOCATE` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.45.4 See also

- PREPARE
- EXECUTE

14.13.2.46 DELETE

The `DELETE` statement removes rows from a specified table.

14.13.2.46.1 Synopsis

```
DeleteFromStmt ::=
```

```
    'DELETE' TableOptimizerHints PriorityOpt QuickOptional IgnoreOptional (
        ↪ 'FROM' ( TableName TableAsNameOpt IndexHintListOpt
        ↪ WhereClauseOptional OrderByOptional LimitClause |
        ↪ TableAliasRefList 'USING' TableRefs WhereClauseOptional ) |
        ↪ TableAliasRefList 'FROM' TableRefs WhereClauseOptional )
```

14.13.2.46.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 |  3 |
|  4 |  4 |
|  5 |  5 |
+----+----+
5 rows in set (0.00 sec)

mysql> DELETE FROM t1 WHERE id = 4;
Query OK, 1 row affected (0.02 sec)

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 |  3 |
|  5 |  5 |
+----+----+
4 rows in set (0.00 sec)
```

14.13.2.46.3 MySQL compatibility

The `DELETE` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.46.4 See also

- INSERT
- SELECT
- UPDATE
- REPLACE

14.13.2.47 DESC

This statement is an alias to `EXPLAIN`. It is included for compatibility with MySQL.

14.13.2.48 DESCRIBE

This statement is an alias to `EXPLAIN`. It is included for compatibility with MySQL.

14.13.2.49 DO

`DO` executes the expressions but does not return any results. In most cases, `DO` is equivalent to `SELECT expr, ...` that does not return a result.

> **Note:**
>
> `DO` only executes expressions. It cannot be used in all cases where `SELECT` can be used. For example, `DO id FROM t1` is invalid because it references a table.

In MySQL, a common use case is to execute stored procedure or trigger. Since TiDB does not provide stored procedure or trigger, this function has a limited use.

14.13.2.49.1 Synopsis

```
DoStmt  ::= 'DO' ExpressionList

ExpressionList ::=
    Expression ( ',' Expression )*

Expression ::=
    ( singleAtIdentifier assignmentEq | 'NOT' | Expression ( logOr | 'XOR' |
       ↪ logAnd ) ) Expression
```

```
|   'MATCH' '(' ColumnNameList ')' 'AGAINST' '(' BitExpr
    ↪ FulltextSearchModifierOpt ')'
|   PredicateExpr ( IsOrNotOp 'NULL' | CompareOp ( ( singleAtIdentifier
    ↪ assignmentEq )? PredicateExpr | AnyOrAll SubSelect ) )* ( IsOrNotOp (
    ↪  trueKwd | falseKwd | 'UNKNOWN' ) )?
```

14.13.2.49.2 Examples

This SELECT statement pauses, but also produces a result set.

```
mysql> SELECT SLEEP(5);
+----------+
| SLEEP(5) |
+----------+
|        0 |
+----------+
1 row in set (5.00 sec)
```

DO, on the other hand, pauses without producing a result set.

```
mysql> DO SLEEP(5);
Query OK, 0 rows affected (5.00 sec)

mysql> DO SLEEP(1), SLEEP(1.5);
Query OK, 0 rows affected (2.50 sec)
```

14.13.2.49.3 MySQL compatibility

The `DO` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.49.4 See also

- SELECT

14.13.2.50 DROP [GLOBAL|SESSION] BINDING

This statement removes a binding from a specific SQL statement. Bindings can be used to inject a hint into a statement without requiring changes to the underlying query.

A `BINDING` can be on either a `GLOBAL` or `SESSION` basis. The default is `SESSION`.

14.13.2.50.1 Synopsis

```
DropBindingStmt ::=
    'DROP' GlobalScope 'BINDING' 'FOR' ( BindableStmt ( 'USING' BindableStmt
       ↪ )?
|   'SQL' 'DIGEST' SqlDigest)

GlobalScope ::=
    ( 'GLOBAL' | 'SESSION' )?

BindableStmt ::=
    ( SelectStmt | UpdateStmt | InsertIntoStmt | ReplaceIntoStmt |
       ↪ DeleteStmt )
```

14.13.2.50.2 Examples

You can remove a binding according to a SQL statement or `sql_digest`.

The following example shows how to remove a binding according to a SQL statement.

```
mysql> CREATE TABLE t1 (
        id INT NOT NULL PRIMARY KEY auto_increment,
        b INT NOT NULL,
        pad VARBINARY(255),
        INDEX(b)
       );
Query OK, 0 rows affected (0.07 sec)

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM dual;
Query OK, 1 row affected (0.01 sec)
Records: 1 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 1 row affected (0.00 sec)
Records: 1 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 8 rows affected (0.00 sec)
Records: 8 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 1000 rows affected (0.04 sec)
```

```
Records: 1000 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 100000 rows affected (1.74 sec)
Records: 100000 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)
    ↪ FROM t1 a JOIN t1 b JOIN t1 c LIMIT 100000;
Query OK, 100000 rows affected (2.15 sec)
Records: 100000 Duplicates: 0 Warnings: 0

mysql> INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255)

14.13.2.51 DROP COLUMN

This statement drops a column from a specified table. `DROP COLUMN` is online in TiDB, which means that it does not block read or write operations.

14.13.2.51.1 Synopsis

```
AlterTableStmt
        ::= 'ALTER' 'IGNORE'? 'TABLE' TableName DropColumnSpec ( ','
            ↪ DropColumnSpec )*

DropColumnSpec
        ::= 'DROP' 'COLUMN'? 'IF EXISTS'? ColumnName ( 'RESTRICT' | 'CASCADE
            ↪ ' )?

ColumnName
        ::= Identifier ( '.' Identifier ( '.' Identifier )? )?
```

14.13.2.51.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, col1
    ↪ INT NOT NULL, col2 INT NOT NULL);
Query OK, 0 rows affected (0.12 sec)

mysql> INSERT INTO t1 (col1,col2) VALUES (1,1),(2,2),(3,3),(4,4),(5,5);
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+----+------+------+
| id | col1 | col2 |

```

```
| 3 |   3 |
| 4 |   4 |
| 5 |   5 |
+---+-----+
5 rows in set (0.00 sec)
```

14.13.2.51.3 MySQL compatibility

- Dropping primary key columns or columns covered by the composite index is not supported.

14.13.2.51.4 See also

- ADD COLUMN
- SHOW CREATE TABLE
- CREATE TABLE

14.13.2.52 DROP DATABASE

The `DROP DATABASE` statement permanently removes a specified database schema, and all of the tables and views that were created inside. User privileges that are associated with the dropped database remain unaffected.

14.13.2.52.1 Synopsis

```
DropDatabaseStmt ::=
    'DROP' 'DATABASE' IfExists DBName

IfExists ::= ( 'IF' 'EXISTS' )?
```

14.13.2.52.2 Examples

```
mysql> SHOW DATABASES;
+--------------------+
| Database           |
+--------------------+
| INFORMATION_SCHEMA |
| PERFORMANCE_SCHEMA |
| mysql              |
| test               |
+--------------------+
4 rows in set (0.00 sec)
```

```
mysql> DROP DATABASE test;
Query OK, 0 rows affected (0.25 sec)

mysql> SHOW DATABASES;
+--------------------+
| Database           |
+--------------------+
| INFORMATION_SCHEMA |
| PERFORMANCE_SCHEMA |
| mysql              |
+--------------------+
3 rows in set (0.00 sec)
```

14.13.2.52.3 MySQL compatibility

The `DROP DATABASE` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.52.4 See also

- CREATE DATABASE
- ALTER DATABASE

14.13.2.53 DROP INDEX

This statement removes an index from a specified table, marking space as free in TiKV.

14.13.2.53.1 Synopsis

```
DropIndexStmt ::=
    "DROP" "INDEX" IfExists Identifier "ON" TableName
        ↪ IndexLockAndAlgorithmOpt

IfExists ::=
    ( 'IF' 'EXISTS' )?

IndexLockAndAlgorithmOpt ::=
    ( LockClause AlgorithmClause? | AlgorithmClause LockClause? )?
```

14.13.2.53.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.10 sec)
```

```
mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0

```

14.13.2.53.3 MySQL compatibility

- Dropping the primary key of the `CLUSTERED` type is not supported. For more details about the primary key of the `CLUSTERED` type, refer to clustered index.

14.13.2.53.4 See also

- SHOW INDEXES
- CREATE INDEX
- ADD INDEX
- RENAME INDEX
- ALTER INDEX

14.13.2.54 DROP PLACEMENT POLICY

`DROP PLACEMENT POLICY` is used to drop a previously created placement policy.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

14.13.2.54.1 Synopsis

```
DropPolicyStmt ::=
    "DROP" "PLACEMENT" "POLICY" IfExists PolicyName

PolicyName ::=
    Identifier
```

14.13.2.54.2 Examples

Placement policies can only be dropped when they are not referenced by any tables or partitions.

```
CREATE PLACEMENT POLICY p1 FOLLOWERS=4;
CREATE TABLE t1 (a INT PRIMARY KEY) PLACEMENT POLICY=p1;
DROP PLACEMENT POLICY p1; -- This statement fails because the placement
    ↪ policy p1 is referenced.

-- Finds which tables and partitions reference the placement policy.
SELECT table_schema, table_name FROM information_schema.tables WHERE tidb_
    ↪ placement_policy_name='p1';
SELECT table_schema, table_name FROM information_schema.partitions WHERE
    ↪ tidb_placement_policy_name='p1';

ALTER TABLE t1 PLACEMENT POLICY=default; -- Removes the placement policy
    ↪ from t1.
DROP PLACEMENT POLICY p1; -- Succeeds.
```

```
Query OK, 0 rows affected (0.10 sec)

Query OK, 0 rows affected (0.11 sec)

ERROR 8241 (HY000): Placement policy 'p1' is still in use

+--------------+------------+
| table_schema | table_name |
+--------------+------------+
| test         | t1         |
+--------------+------------+
1 row in set (0.00 sec)

Empty set (0.01 sec)

Query OK, 0 rows affected (0.08 sec)

Query OK, 0 rows affected (0.21 sec)
```

14.13.2.54.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.54.4 See also

- Placement Rules in SQL
- SHOW PLACEMENT
- CREATE PLACEMENT POLICY
- ALTER PLACEMENT POLICY

14.13.2.55 DROP RESOURCE GROUP

You can use the `DROP RESOURCE GROUP` statement to drop a resource group.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

14.13.2.55.1 Synopsis

```
DropResourceGroupStmt ::=
    "DROP" "RESOURCE" "GROUP" IfExists ResourceGroupName

IfExists ::=
    ('IF' 'EXISTS')?

ResourceGroupName ::=
    Identifier
|   "DEFAULT"
```

> **Note:**
>
> - The `DROP RESOURCE GROUP` statement can only be executed when the global variable `tidb_enable_resource_control` is set to `ON`.
> - The `default` resource group is reserved and cannot be dropped.

14.13.2.55.2 Examples

Drop a resource group named `rg1`.

```
DROP RESOURCE GROUP IF EXISTS rg1;
```

```
Query OK, 0 rows affected (0.22 sec)
```

```
CREATE RESOURCE GROUP IF NOT EXISTS rg1 RU_PER_SEC = 500 BURSTABLE;
```

```
Query OK, 0 rows affected (0.08 sec)
```

```
SELECT * FROM information_schema.resource_groups WHERE NAME ='rg1';
```

```
+------+------------+----------+-----------+-------------+
| NAME | RU_PER_SEC | PRIORITY | BURSTABLE | QUERY_LIMIT |
+------+------------+----------+-----------+-------------+
| rg1  | 500        | MEDIUM   | YES       | NULL        |
+------+------------+----------+-----------+-------------+
1 row in set (0.01 sec)
```

```
DROP RESOURCE GROUP IF EXISTS rg1;
```

```
Query OK, 1 rows affected (0.09 sec)
```

```
SELECT * FROM information_schema.resource_groups WHERE NAME ='rg1';
```

```
Empty set (0.00 sec)
```

14.13.2.55.3 MySQL compatibility

MySQL also supports DROP RESOURCE GROUP, but TiDB does not support the `FORCE` parameter.

14.13.2.55.4 See also

- ALTER RESOURCE GROUP
- CREATE RESOURCE GROUP
- Request Unit (RU)

14.13.2.56 DROP ROLE

This statement removes a role, that was previously created with `CREATE ROLE`.

14.13.2.56.1 Synopsis

```
DropRoleStmt ::=
    'DROP' 'ROLE' ( 'IF' 'EXISTS' )? RolenameList

RolenameList ::=
    Rolename ( ',' Rolename )*
```

14.13.2.56.2 Examples

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Create a new role `analyticsteam` and a new user `jennifer`:

```
CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Note that by default `jennifer` needs to execute `SET ROLE analyticsteam` in order to be able to use the privileges associated with the `analyticsteam` role:

```
SHOW GRANTS;
+-------------------------------------------+
| Grants for User                           |
+-------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'      |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-------------------------------------------+
2 rows in set (0.00 sec)

SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

SHOW GRANTS;
+-------------------------------------------+
| Grants for User                           |
+-------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'      |
| GRANT SELECT ON test.* TO 'jennifer'@'%'  |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
```

```
+-------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

The statement `SET DEFAULT ROLE` can be used to associate the role `analyticsteam` to `jennifer`:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
Query OK, 0 rows affected (0.02 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

After this, the user `jennifer` has the privileges associated with the role `analyticsteam` and `jennifer` does not have to execute the statement `SET ROLE`:

```
SHOW GRANTS;
+-------------------------------------------+
| Grants for User                           |
+-------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'      |
| GRANT SELECT ON test.* TO 'jennifer'@'%' |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Drop the role for the `analyticsteam`:

```
DROP ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)
```

`jennifer` no longer has the default role of `analyticsteam` associated, nor can set the role to `analyticsteam`.

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Show the privileges of `jennifer`:

```
SHOW GRANTS;
+-------------------------------------+
| Grants for User                     |
+-------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
+-------------------------------------+
1 row in set (0.00 sec)

SET ROLE analyticsteam;
ERROR 3530 (HY000): `analyticsteam`@`%` is is not granted to jennifer@%
```

14.13.2.56.3 MySQL compatibility

The `DROP ROLE` statement in TiDB is fully compatible with the roles feature in MySQL 8.0. If you find any compatibility differences, report a bug.

14.13.2.56.4 See also

- CREATE ROLE
- GRANT <role>
- REVOKE <role>
- SET ROLE
- SET DEFAULT ROLE

- Role-Based Access Control

14.13.2.57 DROP SEQUENCE

The `DROP SEQUENCE` statement drops the sequence object in TiDB.

14.13.2.57.1 Synopsis

```
DropSequenceStmt ::=
    'DROP' 'SEQUENCE' IfExists TableNameList

IfExists ::= ( 'IF' 'EXISTS' )?

TableNameList ::=
    TableName ( ',' TableName )*

TableName ::=
    Identifier ('.' Identifier)?
```

14.13.2.57.2 Examples

```
DROP SEQUENCE seq;
```

```
Query OK, 0 rows affected (0.10 sec)
```

```
DROP SEQUENCE seq, seq2;
```

```
Query OK, 0 rows affected (0.03 sec)
```

14.13.2.57.3 MySQL compatibility

This statement is a TiDB extension. The implementation is modeled on sequences available in MariaDB.

14.13.2.57.4 See also

- CREATE SEQUENCE
- ALTER SEQUENCE
- SHOW CREATE SEQUENCE

14.13.2.58 DROP STATS

The `DROP STATS` statement is used to delete the statistics of the selected table from the selected database.

14.13.2.58.1 Synopsis

```
DropStatsStmt ::=
    'DROP' 'STATS' TableNameList

TableNameList ::=
    TableName ( ',' TableName )*

TableName ::=
    Identifier ('.' Identifier)?
```

14.13.2.58.2 Examples

```
CREATE TABLE t(a INT);
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
SHOW STATS_META WHERE db_name='test' and table_name='t';
```

```
+--
    ↪ -------+-----------+----------------+---------------------+--------------+-----
    ↪
| Db_name | Table_name | Partition_name | Update_time | Modify_count | Row_
    ↪ count |
+--
    ↪ -------+-----------+----------------+---------------------+--------------+-----
    ↪
| test    | t          |                | 2020-05-25 20:34:33 |            0 |
    ↪         0 |
+--
    ↪ -------+-----------+----------------+---------------------+--------------+-----
    ↪
1 row in set (0.00 sec)
```

```
DROP STATS t;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
SHOW STATS_META WHERE db_name='test' and table_name='t';
```

```
Empty set (0.00 sec)
```

14.13.2.58.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.58.4 See also

- Introduction to Statistics

14.13.2.59 DROP TABLE

This statement drops a table from the currently selected database. An error is returned if the table does not exist, unless the `IF EXISTS` modifier is used.

14.13.2.59.1 Synopsis

```
DropTableStmt ::=
    'DROP' OptTemporary TableOrTables IfExists TableNameList
        ↪ RestrictOrCascadeOpt

OptTemporary ::=
    ( 'TEMPORARY' | ('GLOBAL' 'TEMPORARY') )?

TableOrTables ::=
    'TABLE'
|   'TABLES'

TableNameList ::=
    TableName ( ',' TableName )*
```

14.13.2.59.2 Drop temporary tables

You can use the following syntax to drop ordinary tables and temporary tables:

- Use `DROP TEMPORARY TABLE` to drop local temporary tables.
- Use `DROP GLOBAL TEMPORARY TABLE` to drop global temporary tables.
- Use `DROP TABLE` to drop ordinary tables or temporary tables.

14.13.2.59.3 Examples

```
mysql> CREATE TABLE t1 (a INT);
Query OK, 0 rows affected (0.11 sec)

mysql> DROP TABLE t1;
Query OK, 0 rows affected (0.22 sec)

mysql> DROP TABLE table_not_exists;
ERROR 1051 (42S02): Unknown table 'test.table_not_exists'
```

```
mysql> DROP TABLE IF EXISTS table_not_exists;
Query OK, 0 rows affected, 1 warning (0.01 sec)

mysql> SHOW WARNINGS;
+-------+------+----------------------------------------+
| Level | Code | Message                                |
+-------+------+----------------------------------------+
| Note | 1051 | Unknown table 'test.table_not_exists' |
+-------+------+----------------------------------------+
1 row in set (0.01 sec)

mysql> CREATE VIEW v1 AS SELECT 1;
Query OK, 0 rows affected (0.10 sec)

mysql> DROP TABLE v1;
Query OK, 0 rows affected (0.23 sec)
```

14.13.2.59.4 MySQL compatibility

Currently, `RESTRICT` and `CASCADE` are only supported syntactically.

14.13.2.59.5 See also

- CREATE TABLE
- SHOW CREATE TABLE
- SHOW TABLES

14.13.2.60 DROP USER

This statement removes a user from the TiDB system database. The optional keyword `IF EXISTS` can be used to silence an error if the user does not exist. This statement requires the `CREATE USER` privilege.

14.13.2.60.1 Synopsis

```
DropUserStmt ::=
    'DROP' 'USER' ( 'IF' 'EXISTS' )? UsernameList

Username ::=
    StringName ('@' StringName | singleAtIdentifier)? | 'CURRENT_USER'
        ↪ OptionalBraces
```

14.13.2.60.2 Examples

```
mysql> DROP USER idontexist;
ERROR 1396 (HY000): Operation DROP USER failed for idontexist@%

mysql> DROP USER IF EXISTS 'idontexist';
Query OK, 0 rows affected (0.01 sec)

mysql> CREATE USER 'newuser' IDENTIFIED BY 'mypassword';
Query OK, 1 row affected (0.02 sec)

mysql> GRANT ALL ON test.* TO 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-----------------------------------------------+
| Grants for newuser@%                          |
+-----------------------------------------------+
| GRANT USAGE ON *.* TO 'newuser'@'%'           |
| GRANT ALL PRIVILEGES ON test.* TO 'newuser'@'%' |
+-----------------------------------------------+
2 rows in set (0.00 sec)

mysql> REVOKE ALL ON test.* FROM 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-----------------------------------+
| Grants for newuser@%              |
+-----------------------------------+
| GRANT USAGE ON *.* TO 'newuser'@'%' |
+-----------------------------------+
1 row in set (0.00 sec)

mysql> DROP USER 'newuser';
Query OK, 0 rows affected (0.14 sec)

mysql> SHOW GRANTS FOR 'newuser';
ERROR 1141 (42000): There is no such grant defined for user 'newuser' on
    ↪ host '%'
```

14.13.2.60.3 MySQL compatibility

- Dropping a user that does not exist with `IF EXISTS` will not create a warning in TiDB. Issue #10196.

14.13.2.60.4 See also

- CREATE USER
- ALTER USER
- SHOW CREATE USER

- Privilege Management

14.13.2.61 DROP VIEW

This statement drops an view object from the currently selected database. It does not effect any base tables that a view references.

14.13.2.61.1 Synopsis

```
DropViewStmt ::=
    'DROP' 'VIEW' ( 'IF' 'EXISTS' )? TableNameList RestrictOrCascadeOpt

TableNameList ::=
    TableName ( ',' TableName )*

TableName ::=
    Identifier ('.' Identifier)?
```

14.13.2.61.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> CREATE VIEW v1 AS SELECT * FROM t1 WHERE c1 > 2;
Query OK, 0 rows affected (0.11 sec)

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 |  3 |
```

```
|  4 |  4 |
|  5 |  5 |
+----+----+
5 rows in set (0.00 sec)

mysql> SELECT * FROM v1;
+----+----+
| id | c1 |
+----+----+
|  3 |  3 |
|  4 |  4 |
|  5 |  5 |
+----+----+
3 rows in set (0.00 sec)

mysql> DROP VIEW v1;
Query OK, 0 rows affected (0.23 sec)

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 |  3 |
|  4 |  4 |
|  5 |  5 |
+----+----+
5 rows in set (0.00 sec)
```

14.13.2.61.3 MySQL compatibility

The `DROP VIEW` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.61.4 See also

- CREATE VIEW
- DROP TABLE

14.13.2.62 EXECUTE

The `EXECUTE` statement provides an SQL interface to server-side prepared statements.

14.13.2.62.1 Synopsis

```
ExecuteStmt ::=
    'EXECUTE' Identifier ( 'USING' UserVariable ( ',' UserVariable )* )?
```

14.13.2.62.2 Examples

```
mysql> PREPARE mystmt FROM 'SELECT ? as num FROM DUAL';
Query OK, 0 rows affected (0.00 sec)

mysql> SET @number = 5;
Query OK, 0 rows affected (0.00 sec)

mysql> EXECUTE mystmt USING @number;
+------+
| num |
+------+
| 5   |
+------+
1 row in set (0.00 sec)

mysql> DEALLOCATE PREPARE mystmt;
Query OK, 0 rows affected (0.00 sec)
```

14.13.2.62.3 MySQL compatibility

The `EXECUTE` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.62.4 See also

- PREPARE
- DEALLOCATE

14.13.2.63 EXPLAIN ANALYZE

The `EXPLAIN ANALYZE` statement works similar to `EXPLAIN`, with the major difference being that it will actually execute the statement. This allows you to compare the estimates used as part of query planning to actual values encountered during execution. If the estimates differ significantly from the actual values, you should consider running `ANALYZE TABLE` on the affected tables.

> **Note:**
>
> When you use `EXPLAIN ANALYZE` to execute DML statements, modification to data is normally executed. Currently, the execution plan for DML statements **cannot** be shown yet.

14.13.2.63.1 Synopsis

```
ExplainSym ::=
    'EXPLAIN'
|   'DESCRIBE'
|    'DESC'

ExplainStmt ::=
    ExplainSym ( TableName ColumnName? | 'ANALYZE'? ExplainableStmt | 'FOR'
        ↪ 'CONNECTION' NUM | 'FORMAT' '=' ( stringLit | ExplainFormatType )
        ↪ ( 'FOR' 'CONNECTION' NUM | ExplainableStmt ) )

ExplainableStmt ::=
    SelectStmt
|   DeleteFromStmt
|   UpdateStmt
|   InsertIntoStmt
|   ReplaceIntoStmt
|   UnionStmt
```

14.13.2.63.2 EXPLAIN ANALYZE output format

Different from `EXPLAIN`, `EXPLAIN ANALYZE` executes the corresponding SQL statement, records its runtime information, and returns the information together with the execution plan. Therefore, you can regard `EXPLAIN ANALYZE` as an extension of the `EXPLAIN` statement. Compared to `EXPLAIN` (for debugging query execution), the return results of `EXPLAIN ANALYZE` also include columns of information such as `actRows`, `execution info`, `memory`, and `disk`. The details of these columns are shown as follows:

attribute name	description
actRows	Number of rows output by the operator.

attribute name	description
execution info	Execution information of the operator. `time` represents the total `wall time` from entering the operator to leaving the operator, including the total execution time of all sub-operators. If the operator is called many times by the parent operator (in loops), then the time refers to the accumulated time. `loops` is the number of times the current operator is called by the parent operator.
memory	Memory space occupied by the operator.
disk	Disk space occupied by the operator.

14.13.2.63.3 Examples

```
CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT NOT
    ↪ NULL);
```

```
Query OK, 0 rows affected (0.12 sec)
```

```
INSERT INTO t1 (c1) VALUES (1), (2), (3);
```

```
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0
```

```
EXPLAIN ANALYZE SELECT * FROM t1 WHERE id = 1;
```

```
+--
    ↪ ----------+---------+---------+------+-------------+----------------------
    ↪

```

14.13.2.63.4 Execution information of operators

In addition to the basic `time` and `loop` execution information, `execution info` also contains operator-specific execution information, which mainly includes the time consumed for the operator to send RPC requests and the duration of other steps.

Point_Get

The execution information from a `Point_Get` operator will typically contain the following information:

- `Get:{num_rpc:1, total_time:697.051µs}`: The number of the `Get` RPC requests (`num_rpc`) sent to TiKV and the total duration (`total_time`) of all RPC requests.
- `ResolveLock:{num_rpc:1, total_time:12.117495ms}`: If TiDB encounters a lock when reading data, it has to resolve the lock first, which generally occurs in the scenario of read-write conflict. This information indicates the duration of resolving locks.

- `regionMiss_backoff:{num:11, total_time:2010 ms},tikvRPC_backoff:{num :11, total_time:10691 ms}`: When an RPC request fails, TiDB will wait the backoff time before retrying the request. Backoff statistics include the type of backoff (such as `regionMiss` and `tikvRPC`), the total waiting time (`total_time`), and the total number of backoffs (`num`).

Batch_Point_Get

The execution information of the `Batch_Point_Get` operator is similar to that of the `Point_Get` operator, but `Batch_Point_Get` generally sends `BatchGet` RPC requests to TiKV to read data.

`BatchGet:{num_rpc:2, total_time:83.13µs}`: The number of RPC requests (`num_rpc`) of the `BatchGet` type sent to TiKV and the total time consumed (`total_time`) for all RPC requests.

TableReader

The execution information of a `TableReader` operator is typically as follows:

```
cop_task: {num: 6, max: 1.07587ms, min: 844.312µs, avg: 919.601µs, p95:
    ↪ 1.07587ms, max_proc_keys: 16, p95_proc_keys: 16, tot_proc: 1ms, tot_
    ↪ wait: 1ms, rpc_num: 6, rpc_time: 5.313996 ms, copr_cache_hit_ratio:
    ↪ 0.00}
```

- `cop_task`: Contains the execution information of `cop` tasks. For example:
  - `num`: The number of cop tasks.
  - `max`, `min`, `avg`, `p95`: The maximum, minimum, average, and P95 values of the execution time consumed for executing cop tasks.
  - `max_proc_keys` and `p95_proc_keys`: The maximum and P95 key-values scanned by TiKV in all cop tasks. If the difference between the maximum value and the P95 value is large, the data distribution might be imbalanced.
  - `rpc_num`, `rpc_time`: The total number and total time consumed for `Cop` RPC requests sent to TiKV.
  - `copr_cache_hit_ratio`: The hit rate of Coprocessor Cache for `cop` task requests.
- `backoff`: Contains different types of backoff and the total waiting time of backoff.

Insert

The execution information of an `Insert` operator is typically as follows:

```
prepare:109.616µs, check_insert:{total_time:1.431678ms, mem_insert_time
    ↪ :667.878µs, prefetch:763.8µs, rpc:{BatchGet:{num_rpc:1, total_time
    ↪ :699.166µs},Get:{num_rpc:1, total_time:378.276µs }}}
```

- `prepare`: The time consumed for preparing to write, including expression, default value and auto-increment value calculations.
- `check_insert`: This information generally appears in `insert ignore` and `insert on duplicate` statements, including conflict checking and the time consumed for writing data to TiDB transaction cache. Note that this time consumption does not include the time consumed for transaction commit. It contains the following information:
    - `total_time`: The total time spent on the `check_insert` step.
    - `mem_insert_time`: The time consumed for writing data to the TiDB transaction cache.
    - `prefetch`: The duration of retrieving the data that needs to be checked for conflicts from TiKV. This step sends a `Batch_Get` RPC request to TiKV to retrieve data.
    - `rpc`: The total time consumed for sending RPC requests to TiKV, which generally includes two types of RPC time, `BatchGet` and `Get`, among which:
        - `BatchGet` RPC request is sent in the `prefetch` step.
        - `Get` RPC request is sent when the `insert on duplicate` statement executes `duplicate update`.
- `backoff`: Contains different types of backoff and the total waiting time of backoff.

IndexJoin

The `IndexJoin` operator has 1 outer worker and N inner workers for concurrent execution. The join result preserves the order of the outer table. The detailed execution process is as follows:

1. The outer worker reads N outer rows, then wraps it into a task, and sends it to the result channel and the inner worker channel.
2. The inner worker receives the task, build key ranges from the task, and fetches inner rows according to the key ranges. It then builds the inner row hash table.
3. The main `IndexJoin` thread receives the task from the result channel and waits for the inner worker to finish handling the task.
4. The main `IndexJoin` thread joins each outer row by looking up to the inner rows' hash table.

The `IndexJoin` operator contains the following execution information:

```
inner:{total:4.297515932s, concurrency:5, task:17, construct:97.96291ms,
    ↪ fetch:4.164310088s, build:35.219574ms}, probe:53.574945ms
```

- `Inner`: The execution information of inner worker:
    - `total`: The total time consumed by the inner worker.

    - `concurrency`: The number of concurrent inner workers.
    - `task`: The total number of tasks processed by the inner worker.
    - `construct`: The preparation time before the inner worker reads the inner table rows corresponding to the task.
    - `fetch`: The total time consumed for it takes for the inner worker to read inner table rows.
    - `Build`: The total time consumed for it takes for the inner worker to construct the hash table of the corresponding inner table rows.
- `probe`: The total time consumed by the main `IndexJoin` thread to perform join operations with the hash table of the outer table rows and the inner table rows.

IndexHashJoin

The execution process of the `IndexHashJoin` operator is similar to that of the `IndexJoin` operator. `IndexHashJoin` operator also has 1 outer worker and N inner workers to execute in parallel, but the output order is not guaranteed to be consistent with that of the outer table. The detailed execution process is as follows:

1. The outer worker reads N outer rows, builds a task, and sends it to the inner worker channel.
2. The inner worker receives the tasks from the inner worker channel and performs the following three operations in order for every task:

a. Build a hash table from the outer rows
b. Build key ranges from outer rows and fetches inner rows
c. Probe the hash table and sends the join result to the result channel. Note: step a and step b are running concurrently.

3. The main thread of `IndexHashJoin` receives the join results from the result channel.

The `IndexHashJoin` operator contains the following execution information:

```
inner:{total:4.429220003s, concurrency:5, task:17, construct:96.207725ms,
    ↪ fetch:4.239324006s, build:24.567801ms, join:93.607362ms}
```

- `Inner`: the execution information of inner worker:
    - `total`: the total time consumed by the inner worker.
    - `concurrency`: the number of inner workers.
    - `task`: The total number of tasks processed by the inner worker.
    - `construct`: The preparation time before the inner worker reads the inner table rows.
    - `fetch`: The total time consumed for inner worker to read inner table rows.

- `Build`: The total time consumed for inner worker to construct the hash table of the outer table rows.
- `join`: The total time consumed for inner worker to do join with the inner table rows and the hash table of outer table rows.

HashJoin

The `HashJoin` operator has an inner worker, an outer worker, and N join workers. The detailed execution process is as follows:

1. The inner worker reads inner table rows and constructs a hash table.
2. The outer worker reads the outer table rows, then wraps it into a task and sends it to the join worker.
3. The join worker waits for the hash table construction in step 1 to finish.
4. The join worker uses the outer table rows and hash table in the task to perform join operations, and then sends the join result to the result channel.
5. The main thread of `HashJoin` receives the join result from the result channel.

The `HashJoin` operator contains the following execution information:

```
build_hash_table:{total:146.071334ms, fetch:110.338509ms, build:35.732825ms
    ↪ }, probe:{concurrency:5, total:857.162518ms, max:171.48271ms, probe
    ↪ :125.341665ms, fetch:731.820853ms}
```

- `build_hash_table`: Reads the data of the inner table and constructs the execution information of the hash table:
  - `total`: The total time consumption.
  - `fetch`: The total time spent reading inner table data.
  - `build`: The total time spent constructing a hash table.
- `probe`: The execution information of join workers:
  - `concurrency`: The number of join workers.
  - `total`: The total time consumed by all join workers.
  - `max`: The longest time for a single join worker to execute.
  - `probe`: The total time consumed for joining with outer table rows and the hash table.
  - `fetch`: The total time that the join worker waits to read the outer table rows data.

TableFullScan (TiFlash)

The `TableFullScan` operator executed on a TiFlash node contains the following execution information:

```
tiflash_scan: {
  dtfile: {
    total_scanned_packs: 2,
    total_skipped_packs: 1,
    total_scanned_rows: 16000,
    total_skipped_rows: 8192,
    total_rough_set_index_load_time: 2ms,
    total_read_time: 20ms
  },
  total_create_snapshot_time: 1ms
}
```

- `dtfile`: the DTFile (DeltaTree File) related information during the table scan, which reflects the data scan status of the TiFlash Stable layer.
  - `total_scanned_packs`: the total number of packs that have been scanned in the DTFile. A pack is the minimum unit that can be read in the TiFlash DTFile. By default, every 8192 rows constitute a pack.
  - `total_skipped_packs`: the total number of packs that have been skipped by the scan in the DTFile. When a `WHERE` clause hits rough set indexes or matches the range filtering of a primary key, the irrelevant packs are skipped.
  - `total_scanned_rows`: the total number of rows that have been scanned in the DTFile. If there are multiple versions of updates or deletions because of MVCC, each version is counted independently.
  - `total_skipped_rows`: the total number of rows that are skipped by the scan in the DTFile.
  - `total_rs_index_load_time`: the total time used to read DTFile rough set indexes.
  - `total_read_time`: the total time used to read DTFile data.
- `total_create_snapshot_time`: the total time used to create snapshots during the table scan.

lock_keys execution information

When a DML statement is executed in a pessimistic transaction, the execution information of the operator might also include the execution information of `lock_keys`. For example:

```
lock_keys: {time:94.096168ms, region:6, keys:8, lock_rpc:274.503214ms, rpc_
    ↪ count:6}
```

- `time`: The total duration of executing the `lock_keys` operation.
- `region`: The number of Regions involved in executing the `lock_keys` operation.

- `keys`: The number of `Keys` that need `Lock`.
- `lock_rpc`: The total time spent sending an RPC request of the `Lock` type to TiKV. Because multiple RPC requests can be sent in parallel, the total RPC time consumption might be greater than the total time consumption of the `lock_keys` operation.
- `rpc_count`: The total number of RPC requests of the `Lock` type sent to TiKV.

commit_txn execution information

When a write-type DML statement is executed in a transaction with `autocommit=1`, the execution information of the write operator will also include the duration information of the transaction commit. For example:

```
commit_txn: {prewrite:48.564544ms, wait_prewrite_binlog:47.821579, get_
    ↪ commit_ts:4.277455ms, commit:50.431774ms, region_num:7, write_keys
    ↪ :16, write_byte:536}
```

- `prewrite`: The time consumed for the `prewrite` phase of the 2PC commit of the transaction.
- `wait_prewrite_binlog`:: The time consumed for waiting to write the prewrite Binlog.
- `get_commit_ts`: The time consumed for getting the transaction commit timestamp.
- `commit`: The time consumed for the `commit` phase during the 2PC commit of the transaction.
- `write_keys`: The total `keys` written in the transaction.
- `write_byte`: The total bytes of `key-value` written in the transaction, and the unit is byte.

RU (Request Unit) consumption

Request Unit (RU) is a unified abstraction unit of system resources, which is defined in TiDB resource control. The `execution info` of the top-level operator shows the overall RU consumption of this particular SQL statement.

```
RU:273.842670
```

Note:

This value shows the actual RUs consumed by this execution. The same SQL statement might consume different amounts of RUs each time it is executed due to the effects of caching (for example, coprocessor cache).

You can calculate the RU from the other values in `EXPLAIN ANALYZE`, specifically the `execution info` column. For example:

```
'executeInfo':
  time:2.55ms,
  loops:2,
  RU:0.329460,
  Get:{
      num_rpc:1,
      total_time:2.13ms
  },
  total_process_time: 231.5µs,
  total_wait_time: 732.9µs,
  tikv_wall_time: 995.8µs,
  scan_detail: {
     total_process_keys: 1,
     total_process_keys_size: 150,
     total_keys: 1,
     get_snapshot_time: 691.7µs,
     rocksdb: {
         block: {
             cache_hit_count: 2,
             read_count: 1,
             read_byte: 8.19 KB,
             read_time: 10.3µs
         }
     }
 },
```

The base costs are defined in the `tikv/pd` source code and the calculations are performed in the `model.go` file.

If you are using TiDB v7.1, the calculation is the sum of `BeforeKVRequest()` and `AfterKVRequest()` in `pd/pd-client/model.go`, that is:

```
before key/value request is processed:
     consumption.RRU += float64(kc.ReadBaseCost) -> kv.ReadBaseCost * rpc_
        ↪ nums

after key/value request is processed:
     consumption.RRU += float64(kc.ReadBytesCost) * readBytes -> kc.
        ↪ ReadBytesCost * total_process_keys_size
     consumption.RRU += float64(kc.CPUMsCost) * kvCPUMs -> kc.CPUMsCost *
        ↪ total_process_time
```

For writes and batch gets, the calculation is similar with different base costs.

Other common execution information

The Coprocessor operators usually contain two parts of execution time information: `cop_task` and `tikv_task`. `cop_task` is the time recorded by TiDB, and it is from the moment that the request is sent to the server to the moment that the response is received. `tikv_task` is the time recorded by TiKV Coprocessor itself. If there is much difference between the two, it might indicate that the time spent waiting for the response is too long, or the time spent on gRPC or network is too long.

14.13.2.63.5 MySQL compatibility

`EXPLAIN ANALYZE` is a feature of MySQL 8.0, but both the output format and the potential execution plans in TiDB differ substantially from MySQL.

14.13.2.63.6 See also

- Understanding the Query Execution Plan
- EXPLAIN
- ANALYZE TABLE
- TRACE

14.13.2.64 `EXPLAIN`

The `EXPLAIN` statement shows the execution plan for a query without executing it. It complements the `EXPLAIN ANALYZE` statement, which executes the query. If the output of `EXPLAIN` does not match the expected result, consider executing `ANALYZE TABLE` on each table in the query to make sure the table statistics are up to date.

The statements `DESC` and `DESCRIBE` are aliases of this statement. The alternative usage of `EXPLAIN <tableName>` is documented under `SHOW [FULL] COLUMNS FROM`.

TiDB supports the `EXPLAIN [options] FOR CONNECTION connection_id` statement. However, this statement is different from the `EXPLAIN FOR` statement in MySQL. For more details, see `EXPLAIN FOR CONNECTION`.

14.13.2.64.1 Synopsis

```
ExplainSym ::=
    'EXPLAIN'
|   'DESCRIBE'
|   'DESC'

ExplainStmt ::=
    ExplainSym ( TableName ColumnName? | 'ANALYZE'? ExplainableStmt | 'FOR'
        ↪ 'CONNECTION' NUM | 'FORMAT' '=' ( stringLit | ExplainFormatType )
        ↪ ( 'FOR' 'CONNECTION' NUM | ExplainableStmt ) )

ExplainableStmt ::=
```

```
    SelectStmt
|   DeleteFromStmt
|   UpdateStmt
|   InsertIntoStmt
|   ReplaceIntoStmt
|   UnionStmt
```

14.13.2.64.2 `EXPLAIN` output format

> **Note:**
>
> When you use the MySQL client to connect to TiDB, to read the output result in a clearer way without line wrapping, you can use the `pager less -S` command. Then, after the `EXPLAIN` result is output, you can press the right arrow → button on your keyboard to horizontally scroll through the output.

> **Note:**
>
> In the returned execution plan, for all probe-side child nodes of `IndexJoin` and `Apply` operators, the meaning of `estRows` since v6.4.0 is different from that before v6.4.0. You can find details in TiDB Query Execution Plan Overview.

Currently, `EXPLAIN` in TiDB outputs 5 columns: `id`, `estRows`, `task`, `access object`, `operator info`. Each operator in the execution plan is described by these attributes, with each row in the `EXPLAIN` output describing an operator. The description of each attribute is as follows:

Attribute name	Description
id	The operator ID is the unique identifier of the operator in the entire execution plan. In TiDB 2.1, the ID is formatted to display the tree structure of the operator. Data flows from the child node to the parent node. One and only one parent node for each operator.
estRows	The number of rows that the operator is expected to output. This number is estimated according to the statistics and the operator's logic. `estRows` is called `count` in the earlier versions of TiDB 4.0.

Attribute name	Description
task	The type of task the operator belongs to. Currently, the execution plans are divided into two tasks: **root** task, which is executed on tidb-server, and **cop** task, which is performed in parallel on TiKV or TiFlash. The topology of the execution plan at the task level is that a root task followed by many cop tasks. The root task uses the output of cop tasks as input. The cop tasks refer to tasks that TiDB pushes down to TiKV or TiFlash. Each cop task is distributed in the TiKV cluster or the TiFlash cluster, and is executed by multiple processes.
access object	Data item information accessed by the operator. The information includes `table`, `partition`, and `index` (if any). Only operators that directly access the data have such information.
operator info	Other information about the operator. `operator info` of each operator is different. You can refer to the following examples.

14.13.2.64.3 Examples

```
EXPLAIN SELECT 1;
```

```
+------------------+---------+------+---------------+---------------+
| id               | estRows | task | access object | operator info |

|    └─Selection_7         | 0.00   | cop[tikv] |              | eq(test.t1.c1,
   ↪ 3)          |
|      └─TableFullScan_6   | 3.00   | cop[tikv] | table:t1   | keep order:
   ↪ false, stats:pseudo |
+--
   ↪ ------------------------+--------+----------+--------------+----------------
   ↪
4 rows in set (0.01 sec)
```

To specify the format of the `EXPLAIN` output, you can use the `FORMAT = xxx` syntax. Currently, TiDB supports the following formats:

FORMAT	Description
Not specified	If the format is not specified, `EXPLAIN` uses the default format `row`.
`brief`	The operator IDs in the output of the `EXPLAIN` statement are simplified, compared with those when `FORMAT` is left unspecified.

FORMAT	Description
`dot`	The `EXPLAIN` statement outputs DOT execution plans, which can be used to generate PNG files through a `dot` program (in the `graphviz` package).

FORMAT	Description
`row`	The `EXPLAIN` statement outputs results in a tabular format. See Understand the Query Execution Plan for more information.

FORMAT	Description
`tidb_json`	The `EXPLAIN` statement outputs execution plans in JSON and stores the operator information in a JSON array.

FORMAT	Description
`verbose` ↪	The `EXPLAIN` ↪ statement outputs results in the `row` format, with an additional `estCost` ↪ column for the estimated cost of the query in the results. For more information about how to use this format, see SQL Plan Management.

FORMAT	Description
plan_cache	The EXPLAIN statement outputs results in the row format, with the Plan Cache information as a warning.

The following is an example when FORMAT is "brief" in EXPLAIN:

```
EXPLAIN FORMAT = "brief" DELETE FROM t1 WHERE c1 = 3;
```

```
+----------------------+---------+----------+--------------+-------------------------------+
| id                   | estRows | task     | access object | operator info                 |
+----------------------+---------+----------+--------------+-------------------------------+
| Delete               | N/A     | root     |              | N/A                           |
| └─TableReader        | 0.00    | root     |              | data:Selection                |
|   └─Selection        | 0.00    | cop[tikv] |              | eq(test.t1.c1, 3)             |
|     └─TableFullScan  | 3.00    | cop[tikv] | table:t1     | keep order:false, stats:pseudo |
+----------------------+---------+----------+--------------+-------------------------------+
```

```
4 rows in set (0.001 sec)
```

In addition to the MySQL standard result format, TiDB also supports DotGraph and you need to specify `FORMAT = "dot"` as in the following example:

```
CREATE TABLE t(a bigint, b bigint);
EXPLAIN format = "dot" SELECT A.a, B.b FROM t A JOIN t B ON A.a > B.b WHERE
    ↪  A.a < 10;
```

```
+--
    ↪ ------------------------------------------------------------------------------
    ↪
| dot contents
    ↪
    ↪ |
+--
    ↪ ------------------------------------------------------------------------------
    ↪
|
digraph Projection_8 {
subgraph cluster8{
node [style=filled, color=lightgrey]
color=black
label = "root"
"Projection_8" -> "HashJoin_9"
"HashJoin_9" -> "TableReader_13"
"HashJoin_9" -> "Selection_14"
"Selection_14" -> "TableReader_17"
}
subgraph cluster12{
node [style=filled, color=lightgrey]
color=black
label = "cop"
"Selection_12" -> "TableFullScan_11"
}
subgraph cluster16{
node [style=filled, color=lightgrey]
color=black
label = "cop"
"Selection_16" -> "TableFullScan_15"
}
"TableReader_13" -> "Selection_12"
"TableReader_17" -> "Selection_16"
}
 |
```

```
+--
    ↪ ----------------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

If your computer has a `dot` program, you can generate a PNG file using the following method:

```
dot xx.dot -T png -O

The xx.dot is the result returned by the above statement.
```

If your computer has no `dot` program, copy the result to this website to get a tree diagram:

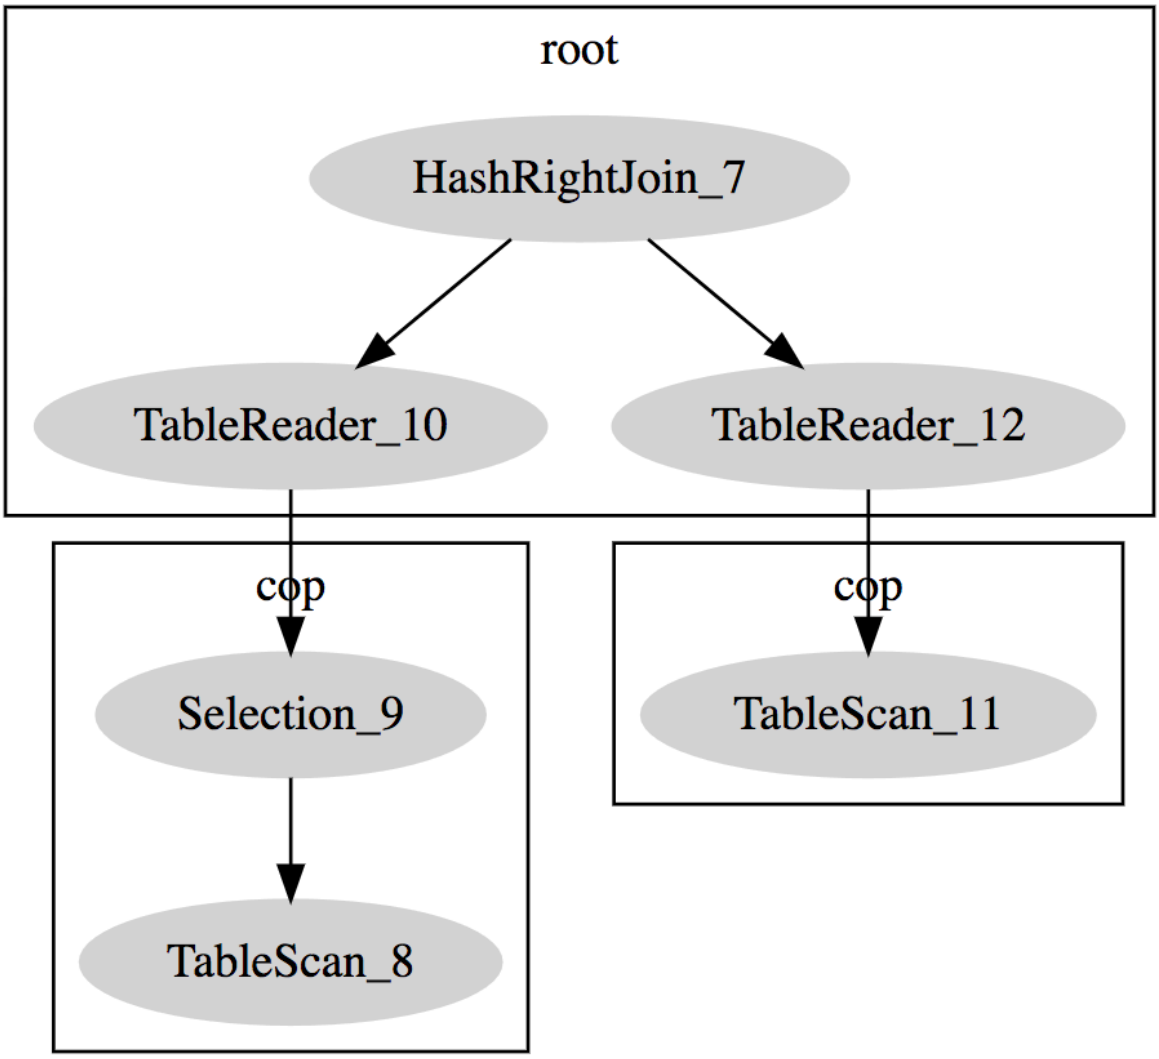

Figure 429: Explain Dot

To get the output in JSON, specify `FORMAT = "tidb_json"` in the `EXPLAIN` statement. The following is an example:

```
CREATE TABLE t(id int primary key, a int, b int, key(a));
EXPLAIN FORMAT = "tidb_json" SELECT id FROM t WHERE a = 1;
```

```
+-------------------------------------------------------------------------------------------
    ↪
| TiDB_JSON
    ↪
    ↪ |
```

```
+-------------------------------------------------------------------------------------------
    ↪
| [
    {
        "id": "Projection_4",
        "estRows": "10.00",
        "taskType": "root",
        "operatorInfo": "test.t.id",
        "subOperators": [
            {
                "id": "IndexReader_6",
                "estRows": "10.00",
                "taskType": "root",
                "operatorInfo": "index:IndexRangeScan_5",
                "subOperators": [
                    {
                        "id": "IndexRangeScan_5",
                        "estRows": "10.00",
                        "taskType": "cop[tikv]",
                        "accessObject": "table:t, index:a(a)",
                        "operatorInfo": "range:[1,1], keep order:false, stats:
                            ↪ pseudo"
                    }
                ]
            }
        ]
    }
]
 |
+-------------------------------------------------------------------------------------------
    ↪
1 row in set (0.01 sec)
```

In the output, `id`, `estRows`, `taskType`, `accessObject`, and `operatorInfo` have the same meaning as the columns in the default format. `subOperators` is an array that stores the sub-nodes. The fields and meanings of the sub-nodes are the same as the parent node. If a field is missing, it means that the field is empty.

14.13.2.64.4 MySQL compatibility

- Both the format of `EXPLAIN` and the potential execution plans in TiDB differ substantially from MySQL.
- TiDB does not support the `FORMAT=JSON` or `FORMAT=TREE` options.
- `FORMAT=tidb_json` in TiDB is the JSON format output of the default `EXPLAIN` result. The format and fields are different from the `FORMAT=JSON` output in MySQL.

`EXPLAIN FOR CONNECTION`

`EXPLAIN FOR CONNECTION` is used to get the execution plan of the currently executed SQL query or the last executed SQL query in a connection. The output format is the same as that of `EXPLAIN`. However, the implementation of `EXPLAIN FOR CONNECTION` in TiDB is different from that in MySQL. Their differences (apart from the output format) are listed as follows:

- If the connection is sleeping, MySQL returns an empty result, while TiDB returns the last executed query plan.
- If you try to get the execution plan of the current session, MySQL returns an error, while TiDB returns the result normally.
- MySQL requires the login user to be the same as the connection being queried, or the login user has the **`PROCESS`** privilege; while TiDB requires the login user to be the same as the connection being queried, or the login user has the **`SUPER`** privilege.

14.13.2.65 FLASHBACK CLUSTER

TiDB v6.4.0 introduces the `FLASHBACK CLUSTER TO TIMESTAMP` syntax. You can use it to restore a cluster to a specific point in time. When specifying the timestamp, you can either set a datetime value or use a time function. The format of datetime is like '2016-10-08 16:45:26.999', with millisecond as the minimum time unit. But in most cases, specifying the timestamp with second as the time unit is sufficient, for example, '2016-10-08 16:45:26'.

Starting from v6.5.6, v7.1.3, v7.5.1, and v7.6.0, TiDB introduces the `FLASHBACK CLUSTER TO TSO` syntax. This syntax enables you to use TSO to specify a more precise recovery point in time, thereby enhancing flexibility in data recovery.

> **Warning:**
>
> The `FLASHBACK CLUSTER TO [TIMESTAMP|TSO]` syntax is not applicable to TiDB Serverless clusters. To avoid unexpected results, do not execute this statement on TiDB Serverless clusters.

Warning:

When specifying a recovery point in time, make sure to check the validity of your target timestamp or TSO and avoid specifying a future time that exceeds the maximum TSO currently allocated by PD (see `Current TSO` on the Grafana PD panel). Otherwise, concurrent processing linear consistency and transaction isolation levels might be violated, leading to serious data correctness issues.

Warning:

When you use this feature in TiDB v7.1.0, some Regions might remain in the FLASHBACK process even after the completion of the FLASHBACK operation. It is recommended to avoid using this feature in v7.1.0. For more information, see issue #44292.

If you have encountered this issue, you can use the TiDB snapshot backup and restore feature to restore data.

Note:

The working principle of `FLASHBACK CLUSTER TO [TIMESTAMP|TSO]` is to write the old data of a specific point in time with the latest timestamp, and will not delete the current data. So before using this feature, you need to ensure that there is enough storage space for the old data and the current data.

14.13.2.65.1 Syntax

```
FLASHBACK CLUSTER TO TIMESTAMP '2022-09-21 16:02:50';
FLASHBACK CLUSTER TO TSO 445494839813079041;
```

Synopsis

```
FlashbackToTimestampStmt
        ::= 'FLASHBACK' 'CLUSTER' 'TO' 'TIMESTAMP' stringLit
          | 'FLASHBACK' 'CLUSTER' 'TO' 'TSO' LengthNum
```

14.13.2.65.2 Notes

- The time specified in the `FLASHBACK` statement must be within the Garbage Collection (GC) lifetime. The system variable `tidb_gc_life_time` (default: `10m0s`) defines the retention time of earlier versions of rows. The current `safePoint` of where garbage collection has been performed up to can be obtained with the following query:

```
SELECT * FROM mysql.tidb WHERE variable_name = 'tikv_gc_safe_point';
```

- Only a user with the `SUPER` privilege can execute the `FLASHBACK CLUSTER` SQL statement.
- `FLASHBACK CLUSTER` does not support rolling back DDL statements that modify PD-related information, such as `ALTER TABLE ATTRIBUTE`, `ALTER TABLE REPLICA`, and `CREATE PLACEMENT POLICY`.
- At the time specified in the `FLASHBACK` statement, there cannot be a DDL statement that is not completely executed. If such a DDL exists, TiDB will reject it.
- Before executing `FLASHBACK CLUSTER`, TiDB disconnects all related connections and prohibits read and write operations on these tables until the `FLASHBACK CLUSTER` statement is completed.
- The `FLASHBACK CLUSTER` statement cannot be canceled after being executed. TiDB will keep retrying until it succeeds.
- During the execution of `FLASHBACK CLUSTER`, if you need to back up data, you can only use Backup & Restore and specify a `BackupTS` that is earlier than the start time of `FLASHBACK CLUSTER`. In addition, during the execution of `FLASHBACK CLUSTER`, enabling log backup will fail. Therefore, try to enable log backup after `FLASHBACK CLUSTER` is completed.
- If the `FLASHBACK CLUSTER` statement causes the rollback of metadata (table structure, database structure), the related modifications will **not** be replicated by TiCDC. Therefore, you need to pause the task manually, wait for the completion of `FLASHBACK CLUSTER`, and manually replicate the schema definitions of the upstream and downstream to make sure that they are consistent. After that, you need to recreate the TiCDC changefeed.

14.13.2.65.3 Example

The following example shows how to flashback a cluster to a specific timestamp to restore newly inserted data:

```
mysql> CREATE TABLE t(a INT);
Query OK, 0 rows affected (0.09 sec)

mysql> SELECT * FROM t;
Empty set (0.01 sec)

mysql> SELECT now();
```

```
+---------------------+
| now()               |
+---------------------+
| 2022-09-28 17:24:16 |
+---------------------+
1 row in set (0.02 sec)

mysql> INSERT INTO t VALUES (1);
Query OK, 1 row affected (0.02 sec)

mysql> SELECT * FROM t;
+------+
| a    |
+------+
|    1 |
+------+
1 row in set (0.01 sec)

mysql> FLASHBACK CLUSTER TO TIMESTAMP '2022-09-28 17:24:16';
Query OK, 0 rows affected (0.20 sec)

mysql> SELECT * FROM t;
Empty set (0.00 sec)
```

The following example shows how to flashback a cluster to a specific TSO to precisely restore mistakenly deleted data:

```
mysql> INSERT INTO t VALUES (1);
Query OK, 1 row affected (0.02 sec)

mysql> SELECT * FROM t;
+------+
| a    |
+------+
|    1 |
+------+
1 row in set (0.01 sec)

mysql> BEGIN;
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT @@tidb_current_ts; -- Get the current TSO
+--------------------+
| @@tidb_current_ts |
```

```
+--------------------+
| 446113975683252225 |
+--------------------+
1 row in set (0.00 sec)

mysql> ROLLBACK;
Query OK, 0 rows affected (0.00 sec)

mysql> DELETE FROM t;
Query OK, 1 rows affected (0.00 sec)

mysql> FLASHBACK CLUSTER TO TSO 446113975683252225;
Query OK, 0 rows affected (0.20 sec)

mysql> SELECT * FROM t;
+------+
| a    |
+------+
|    1 |
+------+
1 row in set (0.01 sec)
```

If there is a DDL statement that is not completely executed at the time specified in the `FLASHBACK` statement, the `FLASHBACK` statement fails:

```
mysql> ALTER TABLE t ADD INDEX k(a);
Query OK, 0 rows affected (0.56 sec)

mysql> ADMIN SHOW DDL JOBS 1;
+--
   ↪ ------+---------+---------------------+----------------------+-------------
   ↪
| JOB_ID | DB_NAME | TABLE_NAME       | JOB_TYPE             | SCHEMA_STATE |
   ↪  SCHEMA_ID | TABLE_ID | ROW_COUNT | CREATE_TIME | START_TIME      |
   ↪ END_TIME          | STATE |
+--
   ↪ ------+---------+---------------------+----------------------+-------------
   ↪
|    84 | test   | t                    | add index /* ingest */ | public  |
   ↪        2 |      82 |         0 | 2023-01-29 14:33:11 | 2023-01-29
   ↪ 14:33:11 | 2023-01-29 14:33:12 | synced |
+--
   ↪ ------+---------+---------------------+----------------------+-------------
```

```
    ↪
1 rows in set (0.01 sec)

mysql> FLASHBACK CLUSTER TO TIMESTAMP '2023-01-29 14:33:12';
ERROR 1105 (HY000): Detected another DDL job at 2023-01-29 14:33:12 +0800
    ↪ CST, can't do flashback
```

Through the log, you can obtain the execution progress of `FLASHBACK`. The following is an example:

```
[2022/10/09 17:25:59.316 +08:00] [INFO] [cluster.go:463] ["flashback cluster
    ↪  stats"] ["complete regions"=9] ["total regions"=10] []
```

14.13.2.65.4 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.66 FLASHBACK DATABASE

TiDB v6.4.0 introduces the `FLASHBACK DATABASE` syntax. You can use `FLASHBACK ↪ DATABASE` to restore a database and its data that are deleted by the `DROP` statement within the Garbage Collection (GC) life time.

You can set the retention time of historical data by configuring the `tidb_gc_life_time` system variable. The default value is `10m0s`. You can query the current `safePoint`, that is, the time point GC has been performed up to, using the following SQL statement:

```
SELECT * FROM mysql.tidb WHERE variable_name = 'tikv_gc_safe_point';
```

As long as a database is deleted by `DROP` after the `tikv_gc_safe_point` time, you can use `FLASHBACK DATABASE` to restore the database.

14.13.2.66.1 Syntax

```
FLASHBACK DATABASE DBName [TO newDBName]
```

Synopsis

```
FlashbackDatabaseStmt ::=
    'FLASHBACK' DatabaseSym DBName FlashbackToNewName
FlashbackToNewName ::=
    ( 'TO' Identifier )?
```

14.13.2.66.2 Notes

- If the database is deleted before the `tikv_gc_safe_point` time, you cannot restore the data using the `FLASHBACK DATABASE` statement. The `FLASHBACK DATABASE` statement returns an error similar to `ERROR 1105 (HY000): Can't find dropped database '
  ↪ test' in GC safe point 2022-11-06 16:10:10 +0800 CST`.
- You cannot restore the same database multiple times using the `FLASHBACK DATABASE`
  ↪ statement. Because the database restored by `FLASHBACK DATABASE` has the same schema ID as the original database, restoring the same database multiple times leads to duplicate schema IDs. In TiDB, the database schema ID must be globally unique.
- When TiDB Binlog is enabled, note the following when you use `FLASHBACK DATABASE`:
  - The downstream secondary database must support `FLASHBACK DATABASE`.
  - The GC life time of the secondary database must be longer than that of the primary database. Otherwise, the latency between the upstream and the downstream might lead to data restoration failure in the downstream.
  - If TiDB Binlog replication encounters an error, you need to filter out the database in TiDB Binlog and then manually import full data for this database.

14.13.2.66.3 Example

- Restore the `test` database that is deleted by `DROP`:

```
DROP DATABASE test;
```

```
FLASHBACK DATABASE test;
```

- Restore the `test` database that is deleted by `DROP` and rename it to `test1`:

```
DROP DATABASE test;
```

```
FLASHBACK DATABASE test TO test1;
```

14.13.2.66.4 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.67 FLASHBACK TABLE

The `FLASHBACK TABLE` syntax is introduced since TiDB 4.0. You can use the `FLASHBACK
↪ TABLE` statement to restore the tables and data dropped by the `DROP` or `TRUNCATE` operation within the Garbage Collection (GC) lifetime.

The system variable `tidb_gc_life_time` (default: `10m0s`) defines the retention time of earlier versions of rows. The current `safePoint` of where garbage collection has been performed up to can be obtained with the following query:

```
SELECT * FROM mysql.tidb WHERE variable_name = 'tikv_gc_safe_point';
```

As long as the table is dropped by `DROP` or `TRUNCATE` statements after the `tikv_gc_safe_point` time, you can restore the table using the `FLASHBACK TABLE` statement.

14.13.2.67.1 Syntax

```
FLASHBACK TABLE table_name [TO other_table_name]
```

14.13.2.67.2 Synopsis

```
FlashbackTableStmt ::=
    'FLASHBACK' 'TABLE' TableName FlashbackToNewName

TableName ::=
    Identifier ( '.' Identifier )?

FlashbackToNewName ::=
    ( 'TO' Identifier )?
```

14.13.2.67.3 Notes

If a table is dropped and the GC lifetime has passed, you can no longer use the `FLASHBACK TABLE` statement to recover the dropped data. Otherwise, an error like `Can't find dropped / truncated table 't' in GC safe point 2020-03-16 16:34:52 +0800 CST` will be returned.

Pay attention to the following conditions and requirements when you enable TiDB Binlog and use the `FLASHBACK TABLE` statement:

- The downstream secondary cluster must also support `FLASHBACK TABLE`.
- The GC lifetime of the secondary cluster must be longer than that of the primary cluster.
- The delay of replication between the upstream and downstream might also cause the failure to recover data to the downstream.
- If an error occurs when TiDB Binlog is replicating a table, you need to filter that table in TiDB Binlog and manually import all data of that table.

14.13.2.67.4 Example

- Recover the table data dropped by the `DROP` operation:

```
DROP TABLE t;
```

```
FLASHBACK TABLE t;
```

- Recover the table data dropped by the `TRUNCATE` operation. Because the truncated table `t` still exists, you need to rename the table `t` to be recovered. Otherwise, an error will be returned because the table `t` already exists.

```
TRUNCATE TABLE t;
```

```
FLASHBACK TABLE t TO t1;
```

14.13.2.67.5 Implementation principle

When deleting a table, TiDB only deletes the table metadata, and writes the table data (row data and index data) to be deleted to the `mysql.gc_delete_range` table. The GC Worker in the TiDB background periodically removes from the `mysql.gc_delete_range` table the keys that exceed the GC lifetime.

Therefore, to recover a table, you only need to recover the table metadata and delete the corresponding row record in the `mysql.gc_delete_range` table before the GC Worker deletes the table data. You can use a snapshot read of TiDB to recover the table metadata. For details of snapshot read, refer to Read Historical Data.

The following is the working process of `FLASHBACK TABLE t TO t1`:

1. TiDB searches the recent DDL history jobs and locates the first DDL operation of the `DROP TABLE` or the `truncate table` type on table `t`. If TiDB fails to locate one, an error is returned.
2. TiDB checks whether the starting time of the DDL job is before `tikv_gc_safe_point`. If it is before `tikv_gc_safe_point`, it means that the table dropped by the `DROP` or `TRUNCATE` operation has been cleaned up by the GC and an error is returned.
3. TiDB uses the starting time of the DDL job as the snapshot to read historical data and read table metadata.
4. TiDB deletes GC tasks related to table `t` in `mysql.gc_delete_range`.
5. TiDB changes `name` in the table's metadata to `t1`, and uses this metadata to create a new table. Note that only the table name is changed but not the table ID. The table ID is the same as that of the previously dropped table `t`.

From the above process, you can see that TiDB always operates on the metadata of the table, and the user data of the table has never been modified. The restored table `t1` has the same ID as the previously dropped table `t`, so `t1` can read the user data of `t`.

Note:

You cannot use `FLASHBACK` statements to restore the same deleted table multiple times, because the ID of the restored table is the same ID of the dropped table, and TiDB requires that all existing tables must have a globally unique table ID.

The `FLASHBACK TABLE` operation is done by TiDB obtaining the table metadata through snapshot read, and then going through the process of table creation similar to `CREATE TABLE`. Therefore, `FLASHBACK TABLE` is, in essence, a kind of DDL operation.

14.13.2.67.6 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.68 FLUSH PRIVILEGES

The statement `FLUSH PRIVILEGES` instructs TiDB to reload the in-memory copy of privileges from the privilege tables. You must execute this statement after manually editing tables such as `mysql.user`. However, executing this statement is not necessary after using privilege statements like `GRANT` or `REVOKE`. To execute this statement, the `RELOAD` privilege is required.

14.13.2.68.1 Synopsis

```
FlushStmt ::=
    'FLUSH' NoWriteToBinLogAliasOpt FlushOption

NoWriteToBinLogAliasOpt ::=
    ( 'NO_WRITE_TO_BINLOG' | 'LOCAL' )?

FlushOption ::=
    'PRIVILEGES'
|   'STATUS'
|    'TIDB' 'PLUGINS' PluginNameList
|    'HOSTS'
|   LogTypeOpt 'LOGS'
|   TableOrTables TableNameListOpt WithReadLockOpt
```

14.13.2.68.2 Examples

```
mysql> FLUSH PRIVILEGES;
Query OK, 0 rows affected (0.01 sec)
```

14.13.2.68.3 MySQL compatibility

The `FLUSH PRIVILEGES` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.68.4 See also

- SHOW GRANTS
- Privilege Management

14.13.2.69 FLUSH STATUS

This statement is included for compatibility with MySQL. It has no effect on TiDB, which uses Prometheus and Grafana for centralized metrics collection instead of `SHOW STATUS`.

14.13.2.69.1 Synopsis

```
FlushStmt ::=
    'FLUSH' NoWriteToBinLogAliasOpt FlushOption

NoWriteToBinLogAliasOpt ::=
    ( 'NO_WRITE_TO_BINLOG' | 'LOCAL' )?

FlushOption ::=
    'PRIVILEGES'
|   'STATUS'
|    'TIDB' 'PLUGINS' PluginNameList
|    'HOSTS'
|   LogTypeOpt 'LOGS'
|   TableOrTables TableNameListOpt WithReadLockOpt
```

14.13.2.69.2 Examples

```
mysql> show status;
+--------------------+--------------------------------------+
| Variable_name    | Value                                |
+--------------------+--------------------------------------+
| Ssl_cipher_list  |                                      |
| server_id        | 93e2e07d-6bb4-4a1b-90b7-e035fae154fe |
| ddl_schema_version | 141                                |
| Ssl_verify_mode  | 0                                    |
| Ssl_version      |                                      |
| Ssl_cipher       |                                      |
```

```
+-------------------+--------------------------------------+
6 rows in set (0.01 sec)

mysql> show global status;
+-------------------+--------------------------------------+
| Variable_name     | Value                                |
+-------------------+--------------------------------------+
| Ssl_cipher        |                                      |
| Ssl_cipher_list   |                                      |
| Ssl_verify_mode   | 0                                    |
| Ssl_version       |                                      |
| server_id         | 93e2e07d-6bb4-4a1b-90b7-e035fae154fe |
| ddl_schema_version | 141                                  |
+-------------------+--------------------------------------+
6 rows in set (0.00 sec)

mysql> flush status;
Query OK, 0 rows affected (0.00 sec)

mysql> show status;
+-------------------+--------------------------------------+
| Variable_name     | Value                                |
+-------------------+--------------------------------------+
| Ssl_cipher        |                                      |
| Ssl_cipher_list   |                                      |
| Ssl_verify_mode   | 0                                    |
| Ssl_version       |                                      |
| ddl_schema_version | 141                                  |
| server_id         | 93e2e07d-6bb4-4a1b-90b7-e035fae154fe |
+-------------------+--------------------------------------+
6 rows in set (0.00 sec)
```

14.13.2.69.3 MySQL compatibility

- This statement is compatible with MySQL.

14.13.2.69.4 See also

- SHOW [GLOBAL|SESSION] STATUS
- Server Status Variables

14.13.2.70 FLUSH TABLES

This statement is included for compatibility with MySQL. It has no effective usage in TiDB.

14.13.2.70.1 Synopsis

```
FlushStmt ::=
    'FLUSH' NoWriteToBinLogAliasOpt FlushOption

NoWriteToBinLogAliasOpt ::=
    ( 'NO_WRITE_TO_BINLOG' | 'LOCAL' )?

FlushOption ::=
    'PRIVILEGES'
|   'STATUS'
|    'TIDB' 'PLUGINS' PluginNameList
|    'HOSTS'
|    LogTypeOpt 'LOGS'
|    TableOrTables TableNameListOpt WithReadLockOpt

LogTypeOpt ::=
    ( 'BINARY' | 'ENGINE' | 'ERROR' | 'GENERAL' | 'SLOW' )?

TableOrTables ::=
    'TABLE'
|   'TABLES'

TableNameListOpt ::=
    TableNameList?

WithReadLockOpt ::=
    ( 'WITH' 'READ' 'LOCK' )?
```

14.13.2.70.2 Examples

```
mysql> FLUSH TABLES;
Query OK, 0 rows affected (0.00 sec)

mysql> FLUSH TABLES WITH READ LOCK;
ERROR 1105 (HY000): FLUSH TABLES WITH READ LOCK is not supported. Please
    ↪ use @@tidb_snapshot
```

14.13.2.70.3 MySQL compatibility

- TiDB does not have a concept of table cache as in MySQL. Thus, `FLUSH TABLES` is parsed but ignored in TiDB for compatibility.
- The statement `FLUSH TABLES WITH READ LOCK` produces an error, as TiDB does not currently support locking tables. It is recommended to use Historical reads for this purpose instead.

14.13.2.70.4 See also

- Read historical data

14.13.2.71 `GRANT <privileges>`

This statement allocates privileges to a pre-existing user in TiDB. The privilege system in TiDB follows MySQL, where credentials are assigned based on a database/table pattern. Executing this statement requires the `GRANT OPTION` privilege and all privileges you allocate.

14.13.2.71.1 Synopsis

```
GrantStmt ::=
    'GRANT' PrivElemList 'ON' ObjectType PrivLevel 'TO' UserSpecList
       ↪ RequireClauseOpt WithGrantOptionOpt

PrivElemList ::=
    PrivElem ( ',' PrivElem )*

PrivElem ::=
    PrivType ( '(' ColumnNameList ')' )?

PrivType ::=
    'ALL' 'PRIVILEGES'?
|    'ALTER' 'ROUTINE'?
|   'CREATE' ( 'USER' | 'TEMPORARY' 'TABLES' | 'VIEW' | 'ROLE' | 'ROUTINE' )
    ↪ ?
|   'TRIGGER'
|   'DELETE'
|   'DROP' 'ROLE'?
|    'PROCESS'
|   'EXECUTE'
|   'INDEX'
|   'INSERT'
|   'SELECT'
|   'SUPER'
|   'SHOW' ( 'DATABASES' | 'VIEW' )
|   'UPDATE'
|    'GRANT' 'OPTION'
```

```
|    'REFERENCES'
|    'REPLICATION' ( 'SLAVE' | 'CLIENT' )
|    'USAGE'
|   'RELOAD'
|   'FILE'
|   'CONFIG'
|   'LOCK' 'TABLES'
|   'EVENT'
|   'SHUTDOWN'

ObjectType ::=
    'TABLE'?

PrivLevel ::=
    '*' ( '.' '*' )?
|    Identifier ( '.' ( '*' | Identifier ) )?

UserSpecList ::=
    UserSpec ( ',' UserSpec )*

RequireClauseOpt ::= ('REQUIRE' ('NONE' | 'SSL' | 'X509' |
    ↪ RequireListElement ('AND'? RequireListElement)*))?

RequireListElement ::= 'ISSUER' Issuer | 'SUBJECT' Subject | 'CIPHER' Cipher
    ↪  | 'SAN' SAN | 'TOKEN_ISSUER' TokenIssuer
```

14.13.2.71.2 Examples

```
mysql> CREATE USER 'newuser' IDENTIFIED BY 'mypassword';
Query OK, 1 row affected (0.02 sec)

mysql> GRANT ALL ON test.* TO 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-------------------------------------------------+
| Grants for newuser@%                            |
+-------------------------------------------------+
| GRANT USAGE ON *.* TO 'newuser'@'%'             |
| GRANT ALL PRIVILEGES ON test.* TO 'newuser'@'%' |
+-------------------------------------------------+
2 rows in set (0.00 sec)
```

14.13.2.71.3 MySQL compatibility

- Similar to MySQL, the `USAGE` privilege denotes the ability to log into a TiDB server.
- Column level privileges are not currently supported.
- Similar to MySQL, when the `NO_AUTO_CREATE_USER` sql mode is not present, the `GRANT` statement will automatically create a new user with an empty password when a user does not exist. Removing this sql-mode (it is enabled by default) presents a security risk.
- In TiDB, after the `GRANT <privileges>` statement is executed successfully, the execution result takes effect immediately on the current connection. Whereas in MySQL, for some privileges, the execution results take effect only on subsequent connections. See TiDB #39356 for details.

14.13.2.71.4 See also

- `GRANT <role>`
- `REVOKE <privileges>`
- SHOW GRANTS

- Privilege Management

14.13.2.72 `GRANT <role>`

Assigns a previously created role to an existing user. The user can use then use the statement `SET ROLE <rolename>` to assume the privileges of the role, or `SET ROLE ALL` to assume all roles that have been assigned.

14.13.2.72.1 Synopsis

```
GrantRoleStmt ::=
    'GRANT' RolenameList 'TO' UsernameList

RolenameList ::=
    Rolename ( ',' Rolename )*

UsernameList ::=
    Username ( ',' Username )*
```

14.13.2.72.2 Examples

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Create a new role `analyticsteam` and a new user `jennifer`:

```
CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Note that by default `jennifer` needs to execute `SET ROLE analyticsteam` in order to be able to use the privileges associated with the `analyticsteam` role:

```
SHOW GRANTS;
+-----------------------------------------------+
| Grants for User                               |
+-----------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'          |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%'   |
+-----------------------------------------------+
2 rows in set (0.00 sec)

SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

SHOW GRANTS;
+-----------------------------------------------+
| Grants for User                               |
+-----------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'          |
| GRANT SELECT ON test.* TO 'jennifer'@'%'      |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%'   |
+-----------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
```

```
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

The statement `SET DEFAULT ROLE` can be used to associate the role `analyticsteam` to `jennifer`:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
Query OK, 0 rows affected (0.02 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

After this, the user `jennifer` has the privileges associated with the role `analyticsteam` and `jennifer` does not have to execute the statement `SET ROLE`:

```
SHOW GRANTS;
+-------------------------------------------+
| Grants for User                           |
+-------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'      |
| GRANT SELECT ON test.* TO 'jennifer'@'%'  |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

14.13.2.72.3 MySQL compatibility

The `GRANT <role>` statement in TiDB is fully compatible with the roles feature in MySQL 8.0. If you find any compatibility differences, report a bug.

14.13.2.72.4 See also

- GRANT <privileges>
- CREATE ROLE
- DROP ROLE
- REVOKE <role>
- SET ROLE
- SET DEFAULT ROLE

- Role-Based Access Control

14.13.2.73 IMPORT INTO

The `IMPORT INTO` statement lets you import data to TiDB via the Physical Import Mode of TiDB Lightning. You can use `IMPORT INTO` in the following two ways:

- `IMPORT INTO ... FROM FILE`: imports data files in formats such as `CSV`, `SQL`, and `PARQUET` into an empty table in TiDB.
- `IMPORT INTO ... FROM SELECT`: imports the query result of a `SELECT` statement into an empty table in TiDB. You can also use it to import historical data queried with `AS OF TIMESTAMP`.

> **Warning:**
>
> Currently, `IMPORT INTO ... FROM SELECT` is experimental. It is not recommended that you use it in production environments. This feature might be changed or removed without prior notice. If you find a bug, you can report an issue on GitHub.

> **Note:**
>
> Compared with TiDB Lightning, `IMPORT INTO` can be directly executed on TiDB nodes, supports automated distributed task scheduling and TiDB Global Sort, and offers significant improvements in deployment, resource utilization, task configuration convenience, ease of invocation and integration, high availability, and scalability. It is recommended that you consider using `IMPORT INTO` instead of TiDB Lightning in appropriate scenarios.

14.13.2.73.1 Restrictions

- `IMPORT INTO` only supports importing data into existing empty tables in the database.
- `IMPORT INTO` does not support transactions or rollback. Executing `IMPORT INTO` within an explicit transaction (`BEGIN`/`END`) will return an error.
- `IMPORT INTO` does not support working simultaneously with features such as Backup & Restore, `FLASHBACK CLUSTER`, acceleration of adding indexes, data import using TiDB Lightning, data replication using TiCDC, or Point-in-Time Recovery (PITR). For more compatibility information, see Compatibility of TiDB Lightning and `IMPORT INTO` with TiCDC and Log Backup.
- During the data import process, do not perform DDL or DML operations on the target table, and do not execute `FLASHBACK DATABASE` for the target database. These operations can lead to import failures or data inconsistencies. In addition, it is **NOT** recommended to perform read operations during the import process, as the data being read might be inconsistent. Perform read and write operations only after the import is completed.
- The import process consumes system resources significantly. For TiDB Self-Hosted, to get better performance, it is recommended to use TiDB nodes with at least 32 cores and 64 GiB of memory. TiDB writes sorted data to the TiDB temporary directory during import, so it is recommended to configure high-performance storage media for TiDB Self-Hosted, such as flash memory. For more information, see Physical Import Mode limitations.
- For TiDB Self-Hosted, the TiDB temporary directory is expected to have at least 90 GiB of available space. It is recommended to allocate storage space that is equal to or greater than the volume of data to be imported.
- One import job supports importing data into one target table only.
- `IMPORT INTO` is not supported during TiDB cluster upgrades.
- Ensure that the data to be imported does not contain any records with primary key or non-null unique index conflicts. Otherwise, the conflicts can result in import task failures.
- Known issue: the `IMPORT INTO` task might fail if the PD address in the TiDB node configuration file is inconsistent with the current PD topology of the cluster. This inconsistency can arise in situations such as that PD was scaled in previously, but the TiDB configuration file was not updated accordingly or the TiDB node was not restarted after the configuration file update.

`IMPORT INTO ... FROM FILE` restrictions

- For TiDB Self-Hosted, each `IMPORT INTO` task supports importing data within 10 TiB. If you enable the Global Sort feature, each `IMPORT INTO` task supports importing data within 40 TiB.
- For TiDB Dedicated, if your data to be imported exceeds 500 GiB, it is recommended to use TiDB nodes with at least 16 cores and enable the Global Sort feature, then each `IMPORT INTO` task supports importing data within 40 TiB. If your data to be

imported is within 500 GiB or if the cores of your TiDB nodes are less than 16, it is not recommended to enable the Global Sort feature.
- The execution of `IMPORT INTO ... FROM FILE` blocks the current connection until the import is completed. To execute the statement asynchronously, you can add the `DETACHED` option.
- Up to 16 `IMPORT INTO` tasks can run simultaneously on each cluster (see TiDB Distributed eXecution Framework (DXF) usage limitations). When a cluster lacks sufficient resources or reaches the maximum number of tasks, newly submitted import tasks are queued for execution.
- When the Global Sort feature is used for data import, the value of the `THREAD` option must be at least `16`.
- When the Global Sort feature is used for data import, the data size of a single row after encoding must not exceed 32 MiB.
- All `IMPORT INTO` tasks that are created when TiDB Distributed eXecution Framework (DXF) is not enabled run directly on the nodes where the tasks are submitted, and these tasks will not be scheduled for execution on other TiDB nodes even after DXF is enabled later. After DXF is enabled, only newly created `IMPORT INTO` tasks that import data from S3 or GCS are automatically scheduled or failed over to other TiDB nodes for execution.

`IMPORT INTO ... FROM SELECT` restrictions

- `IMPORT INTO ... FROM SELECT` can only be executed on the TiDB node that the current user is connected to, and it blocks the current connection until the import is complete.
- `IMPORT INTO ... FROM SELECT` only supports two import options: `THREAD` and `DISABLE_PRECHECK`.
- `IMPORT INTO ... FROM SELECT` does not support the task management statements such as `SHOW IMPORT JOB(s)` and `CANCEL IMPORT JOB <job-id>`.
- The temporary directory of TiDB requires sufficient space to store the entire query result of the `SELECT` statement (configuring the `DISK_QUOTA` option is not supported currently).
- Importing historical data using `tidb_snapshot` is not supported.

14.13.2.73.2 Prerequisites for import

Before using `IMPORT INTO` to import data, make sure the following requirements are met:

- The target table to be imported is already created in TiDB and it is empty.
- The target cluster has sufficient space to store the data to be imported.
- For TiDB Self-Hosted, the temporary directory of the TiDB node connected to the current session has at least 90 GiB of available space. If `tidb_enable_dist_task` is enabled and the data for import is from S3 or GCS, also make sure that the temporary directory of each TiDB node in the cluster has sufficient disk space.

14.13.2.73.3 Required privileges

Executing `IMPORT INTO` requires the `SELECT`, `UPDATE`, `INSERT`, `DELETE`, and `ALTER` privileges on the target table. To import files in TiDB local storage, the `FILE` privilege is also required.

14.13.2.73.4 Synopsis

```
ImportIntoStmt ::=
    'IMPORT' 'INTO' TableName ColumnNameOrUserVarList? SetClause? FROM
       ↪ fileLocation Format? WithOptions?
    |
    'IMPORT' 'INTO' TableName ColumnNameList? FROM SelectStatement
       ↪ WithOptions?

ColumnNameOrUserVarList ::=
    '(' ColumnNameOrUserVar (',' ColumnNameOrUserVar)* ')'

ColumnNameList ::=
    '(' ColumnName (',' ColumnName)* ')'

SetClause ::=
    'SET' SetItem (',' SetItem)*

SetItem ::=
    ColumnName '=' Expr

Format ::=
    'CSV' | 'SQL' | 'PARQUET'

WithOptions ::=
    'WITH' OptionItem (',' OptionItem)*

OptionItem ::=
    optionName '=' optionVal | optionName
```

14.13.2.73.5 Parameter description

ColumnNameOrUserVarList

It specifies how each field in the data file corresponds to the columns in the target table. You can also use it to map fields to variables to skip certain fields for the import, or use it in `SetClause`.

- If this parameter is not specified, the number of fields in each row of the data file must match the number of columns in the target table, and the fields will be imported to

the corresponding columns in order.
- If this parameter is specified, the number of specified columns or variables must match the number of fields in each row of the data file.

SetClause

It specifies how the values of target columns are calculated. In the right side of the `SET` expression, you can reference the variables specified in `ColumnNameOrUserVarList`.

In the left side of the `SET` expression, you can only reference a column name that is not included in `ColumnNameOrUserVarList`. If the target column name already exists in `ColumnNameOrUserVarList`, the `SET` expression is invalid.

fileLocation

It specifies the storage location of the data file, which can be an Amazon S3 or GCS URI path, or a TiDB local file path.

- Amazon S3 or GCS URI path: for URI configuration details, see URI Formats of External Storage Services.
- TiDB local file path: it must be an absolute path, and the file extension must be `.csv`, `.sql`, or `.parquet`. Make sure that the files corresponding to this path are stored on the TiDB node connected by the current user, and the user has the `FILE` privilege.

> **Note:**
>
> If SEM is enabled in the target cluster, the `fileLocation` cannot be specified as a local file path.

In the `fileLocation` parameter, you can specify a single file, or use the `*` and `[]` wildcards to match multiple files for import. Note that the wildcard can only be used in the file name, because it does not match directories or recursively match files in subdirectories. Taking files stored on Amazon S3 as examples, you can configure the parameter as follows:

- Import a single file: `s3://<bucket-name>/path/to/data/foo.csv`
- Import all files in a specified path: `s3://<bucket-name>/path/to/data/*`
- Import all files with the `.csv` suffix in a specified path: `s3://<bucket-name>/path/to/data/*.csv`
- Import all files with the `foo` prefix in a specified path: `s3://<bucket-name>/path/to/data/foo*`
- Import all files with the `foo` prefix and the `.csv` suffix in a specified path: `s3://<bucket-name>/path/to/data/foo*.csv`

- Import `1.csv` and `2.csv` in a specified path: `s3://<bucket-name>/path/to/data/[12].csv`

Format

The `IMPORT INTO` statement supports three data file formats: `CSV`, `SQL`, and `PARQUET`. If not specified, the default format is `CSV`.

WithOptions

You can use `WithOptions` to specify import options and control the data import process. For example, to execute the import of data files asynchronously in the backend, you can enable the `DETACHED` mode for the import by adding the `WITH DETACHED` option to the `IMPORT INTO` statement.

The supported options are described as follows:

Option name	Supported data sources and formats	Description
`CHARACTER_SET='string'`	CSV	Specifies the character set of the data file. The default character set is `utf8mb4`. The supported character sets include `binary`, `utf8`, `utf8mb4`, `gb18030`, `gbk`, `latin1`, and `ascii`.

Option name	Supported data sources and formats	Description
`FIELDS _ TERMINATED _ BY ='< string >'`	CSV	Specifies the field separator. The default separator is `,`.
`FIELDS _ ENCLOSED _ BY ='< char >'`	CSV	Specifies the field delimiter. The default delimiter is `"`.

Option name	Supported data sources and formats	Description
`FIELDS ↪ _ ↪ ESCAPED ↪ _ ↪ BY ↪ ='< ↪ char ↪ >' ↪`	CSV	Specifies the escape character for fields. The default escape character is \.
`FIELDS ↪ _ ↪ DEFINED ↪ _ ↪ NULL ↪ _ ↪ BY ↪ ='< ↪ string ↪ >' ↪`	CSV	Specifies the value that represents `NULL` in the fields. The default value is `\N`.

Option name	Supported data sources and formats	Description
`LINES_TERMINATED_BY='string'`	CSV	Specifies the line terminator. By default, `IMPORT INTO` automatically identifies `\n`, `\r`, or `\r\n` as line terminators. If the line terminator is one of these three, you do not need to explicitly

Option name	Supported data sources and formats	Description
`SKIP_ROWS=number`	CSV	Specifies the number of rows to skip. The default value is `0`. You can use this option to skip the header in a CSV file. If you use a wildcard to specify the source files for import, this option

Option name	Supported data sources and formats	Description
`SPLIT_FILE`	CSV	Splits a single CSV file into multiple smaller chunks of around 256 MiB for parallel processing to improve import efficiency. This parameter only works for **non-compressed** CSV files and has the same usage

Option name	Supported data sources and formats	Description
`DISK_QUOTA='<string>'`	All file formats	Specifies the disk space threshold that can be used during data sorting. The default value is 80% of the disk space in the TiDB temporary directory. If the total disk size cannot be obtained, the

Option name	Supported data sources and formats	Description
`DISABLE_TIKV_IMPORT_MODE`	All file formats	Specifies whether to disable switching TiKV to import mode during the import process. By default, switching TiKV to import mode is not disabled. If there are ongoing read-write operations

Option name	Supported data sources and formats	Description
`THREAD` ↪ `=<` ↪ `number` ↪ `>`	All file formats and query results of `SELECT` ↪	Specifies the concurrency for import. For `IMPORT` ↪ ↪ `INTO` ↪ ↪ `...` ↪ ↪ `FROM` ↪ ↪ `FILE` ↪ , the default value of `THREAD` ↪ is 50% of the number of CPU cores on the TiDB node, the minimum value

Option name	Supported data sources and formats	Description
`MAX_WRITE_SPEED='string'`	All file formats	Controls the write speed to a TiKV node. By default, there is no speed limit. For example, you can specify this option as `1MiB` to limit the write speed to 1 MiB/s.

Option name	Supported data sources and formats	Description
`CHECKSUM_TABLE='string'`	All file formats	Configures whether to perform a checksum check on the target table after the import to validate the import integrity. The supported values include `"required"` (default), `"optional"`, and `"off"`

Option name	Supported data sources and formats	Description
`DETACHED` ↪	All file formats	Controls whether to execute `IMPORT` ↪ ↪ `INTO` ↪ asynchronously. When this option is enabled, executing `IMPORT` ↪ ↪ `INTO` ↪ immediately returns the information of the import job (such as the `Job_` ↪ `ID` ↪),

Option name	Supported data sources and formats	Description
`CLOUD_STORAGE_URI`	All file formats	Specifies the target address where encoded KV data for Global Sort is stored. When `CLOUD_STORAGE_URI` is not specified, `IMPORT INTO` determines whether to use Global Sort based on the value of

Option name	Supported data sources and formats	Description
`DISABLE_PRECHECK`	All file formats and query results of `SELECT`	Setting this option disables prechecks of non-critical items, such as checking whether there are CDC or PITR tasks.

14.13.2.73.6 `IMPORT INTO ... FROM FILE` usage

> **Note:**
>
> `IMPORT INTO ... FROM FILE` is not available on TiDB Serverless clusters.

For TiDB Self-Hosted, `IMPORT INTO ... FROM FILE` supports importing data from files stored in Amazon S3, GCS, and the TiDB local storage. For TiDB Dedicated, `IMPORT INTO ... FROM FILE` supports importing data from files stored in Amazon S3 and GCS.

- For data files stored in Amazon S3 or GCS, `IMPORT INTO ... FROM FILE` supports running in the TiDB Distributed eXecution Framework (DXF).

  - When the DXF is enabled (tidb_enable_dist_task is `ON`), `IMPORT INTO` splits a data import job into multiple sub-jobs and distributes these sub-jobs to different TiDB nodes for execution to improve the import efficiency.
  - When the DXF is disabled, `IMPORT INTO ... FROM FILE` only supports running on the TiDB node where the current user is connected.

- For data files stored locally in TiDB, `IMPORT INTO ... FROM FILE` only supports running on the TiDB node where the current user is connected. Therefore, the data files need to be placed on the TiDB node where the current user is connected. If you access TiDB through a proxy or load balancer, you cannot import data files stored locally in TiDB.

Compressed files

`IMPORT INTO ... FROM FILE` supports importing compressed `CSV` and `SQL` files. It can automatically determine whether a file is compressed and the compression format based on the file extension:

Extension	Compression format
`.gz`, `.gzip`	gzip compression format
`.zstd`, `.zst`	ZStd compression format
`.snappy`	snappy compression format

Note:

- The Snappy compressed file must be in the official Snappy format. Other variants of Snappy compression are not supported.
- Because TiDB Lightning cannot concurrently decompress a single large compressed file, the size of the compressed file affects the import speed. It is recommended that a source file is no greater than 256 MiB after decompression.

Global Sort

`IMPORT INTO ... FROM FILE` splits the data import job of a source data file into multiple sub-jobs, each sub-job independently encoding and sorting data before importing. If the encoded KV ranges of these sub-jobs have significant overlap (to learn how TiDB encodes data to KV, see TiDB computing), TiKV needs to keep compaction during import, leading to a decrease in import performance and stability.

In the following scenarios, there can be significant overlap in KV ranges:

- If rows in the data file assigned to each sub-job have overlapping primary key ranges,

the data KV generated by the encoding of each sub-job will also overlap.

- `IMPORT INTO` splits sub-jobs based on the traversal order of data files, usually sorted by file name in lexicographic order.

- If the target table has many indexes, or the index column values are scattered in the data file, the index KV generated by the encoding of each sub-job will also overlap.

When the TiDB Distributed eXecution Framework (DXF) is enabled, you can enable Global Sort by specifying the `CLOUD_STORAGE_URI` option in the `IMPORT INTO` statement or by specifying the target storage address for encoded KV data using the system variable `tidb_cloud_storage_uri`. Currently, Global Sort supports using Amazon S3 as the storage address. When Global Sort is enabled, `IMPORT INTO` writes encoded KV data to the cloud storage, performs Global Sort in the cloud storage, and then parallelly imports the globally sorted index and table data into TiKV. This prevents problems caused by KV overlap and enhances import stability and performance.

Global Sort consumes a significant amount of memory resources. Before the data import, it is recommended to configure the `tidb_server_memory_limit_gc_trigger` and `tidb_server_memory_limit` variables, which avoids golang GC being frequently triggered and thus affecting the import efficiency.

```
SET GLOBAL tidb_server_memory_limit_gc_trigger=1;
SET GLOBAL tidb_server_memory_limit='75%';
```

Note:

- If the KV range overlap in a source data file is low, enabling Global Sort might decrease import performance. This is because when Global Sort is enabled, TiDB needs to wait for the completion of local sorting in all sub-jobs before proceeding with the Global Sort operations and subsequent import.
- After an import job using Global Sort completes, the files stored in the cloud storage for Global Sort are cleaned up asynchronously in a background thread.

Output

When `IMPORT INTO ... FROM FILE` completes the import or when the `DETACHED` mode is enabled, TiDB returns the current job information in the output, as shown in the following examples. For the description of each field, see `SHOW IMPORT JOB(s)`.

When `IMPORT INTO ... FROM FILE` completes the import, the example output is as follows:

```
IMPORT INTO t FROM '/path/to/small.csv';
+--
   ↪ ------+--------------------+-------------+---------+-------+---------+-------
   ↪
| Job_ID | Data_Source     | Target_Table | Table_ID | Phase | Status |
   ↪ Source_File_Size | Imported_Rows | Result_Message | Create_Time  |
   ↪ Start_Time              | End_Time                | Created_By |
+--
   ↪ ------+--------------------+-------------+---------+-------+---------+-------
   ↪
|  60002 | /path/to/small.csv | `test`.`t` |  363 |      | finished | 16B
   ↪           |            2 |              | 2023-06-08 16:01:22.095698 |
   ↪ 2023-06-08 16:01:22.394418 | 2023-06-08 16:01:26.531821 | root@% |
+--
   ↪ ------+--------------------+-------------+---------+-------+---------+-------
   ↪
```

When the `DETACHED` mode is enabled, executing the `IMPORT INTO ... FROM FILE` statement will immediately return the job information in the output. From the output, you can see that the status of the job is `pending`, which means waiting for execution.

```
IMPORT INTO t FROM '/path/to/small.csv' WITH DETACHED;
+--
   ↪ ------+--------------------+-------------+---------+-------+---------+-------
   ↪
| Job_ID | Data_Source     | Target_Table | Table_ID | Phase | Status |
   ↪ Source_File_Size | Imported_Rows | Result_Message | Create_Time |
   ↪ Start_Time | End_Time | Created_By |
+--
   ↪ ------+--------------------+-------------+---------+-------+---------+-------
   ↪
|  60001 | /path/to/small.csv | `test`.`t` |  361 |      | pending | 16B
   ↪           |         NULL |              | 2023-06-08 15:59:37.047703 |
   ↪ NULL  | NULL    | root@%    |
+--
   ↪ ------+--------------------+-------------+---------+-------+---------+-------
   ↪
```

View and manage import jobs

For an import job with the `DETACHED` mode enabled, you can use `SHOW IMPORT` to view its current job progress.

After an import job is started, you can cancel it using `CANCEL IMPORT JOB <job-id>`.

Examples

Import a CSV file with headers

```
IMPORT INTO t FROM '/path/to/file.csv' WITH skip_rows=1;
```

Import a file asynchronously in the `DETACHED` mode

```
IMPORT INTO t FROM '/path/to/file.csv' WITH DETACHED;
```

Skip importing a specific field in your data file

Assume that your data file is in the CSV format and its content is as follows:

```
id,name,age
1,Tom,23
2,Jack,44
```

And assume that the target table schema for the import is `CREATE TABLE t(id int primary key, name varchar(100))`. To skip importing the `age` field in the data file to the table `t`, you can execute the following SQL statement:

```
IMPORT INTO t(id, name, @1) FROM '/path/to/file.csv' WITH skip_rows=1;
```

Import multiple data files using wildcards

Assume that there are three files named `file-01.csv`, `file-02.csv`, and `file-03.csv` in the `/path/to/` directory. To import these three files into a target table `t` using `IMPORT INTO`, you can execute the following SQL statement:

```
IMPORT INTO t FROM '/path/to/file-*.csv';
```

If you only need to import `file-01.csv` and `file-03.csv` into the target table, execute the following SQL statement:

```
IMPORT INTO t FROM '/path/to/file-0[13].csv';
```

Import data files from Amazon S3 or GCS

- Import data files from Amazon S3:

```
IMPORT INTO t FROM 's3://bucket-name/test.csv?access-key=XXX&secret-
    ↪ access-key=XXX';
```

- Import data files from GCS:

```
IMPORT INTO t FROM 'gs://import/test.csv?credentials-file=${credentials
    ↪ -file-path}';
```

For details about the URI path configuration for Amazon S3 or GCS, see URI Formats of External Storage Services.

Calculate column values using SetClause

Assume that your data file is in the CSV format and its content is as follows:

```
id,name,val
1,phone,230
2,book,440
```

And assume that the target table schema for the import is `CREATE TABLE t(id int primary key, name varchar(100), val int)`. If you want to multiply the `val` column values by 100 during the import, you can execute the following SQL statement:

```
IMPORT INTO t(id, name, @1) SET val=@1*100 FROM '/path/to/file.csv' WITH
    ↪ skip_rows=1;
```

Import a data file in the SQL format

```
IMPORT INTO t FROM '/path/to/file.sql' FORMAT 'sql';
```

Limit the write speed to TiKV

To limit the write speed to a TiKV node to 10 MiB/s, execute the following SQL statement:

```
IMPORT INTO t FROM 's3://bucket/path/to/file.parquet?access-key=XXX&secret-
    ↪ access-key=XXX' FORMAT 'parquet' WITH MAX_WRITE_SPEED='10MiB';
```

14.13.2.73.7 IMPORT INTO ... FROM SELECT usage

`IMPORT INTO ... FROM SELECT` lets you import the query result of a `SELECT` statement to an empty table in TiDB. You can also use it to import historical data queried with `AS OF TIMESTAMP`.

Import the query result of `SELECT`

To import the `UNION` result to the target table `t`, with the import concurrency specified as `8` and precheck of non-critical items configured as disabled, execute the following SQL statement:

```
IMPORT INTO t FROM SELECT * FROM src UNION SELECT * FROM src2 WITH THREAD =
    ↪  8, DISABLE_PRECHECK;
```

Import historical data at a specified time point

To import historical data at a specified time point to the target table `t`, execute the following SQL statement:

```
IMPORT INTO t FROM SELECT * FROM src AS OF TIMESTAMP '2024-02-27 11:38:00';
```

14.13.2.73.8 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.73.9 See also

- SHOW IMPORT JOB(s)
- CANCEL IMPORT JOB
- TiDB Distributed eXecution Framework (DXF)

14.13.2.74 INSERT

This statement inserts new rows into a table.

14.13.2.74.1 Synopsis

```
InsertIntoStmt ::=
    'INSERT' TableOptimizerHints PriorityOpt IgnoreOptional IntoOpt
       ↪ TableName PartitionNameListOpt InsertValues OnDuplicateKeyUpdate

TableOptimizerHints ::=
    hintComment?

PriorityOpt ::=
    ( 'LOW_PRIORITY' | 'HIGH_PRIORITY' | 'DELAYED' )?

IgnoreOptional ::=
    'IGNORE'?

IntoOpt ::= 'INTO'?

TableName ::=
    Identifier ( '.' Identifier )?

PartitionNameListOpt ::=
    ( 'PARTITION' '(' Identifier ( ',' Identifier )* ')' )?

InsertValues ::=
    '(' ( ColumnNameListOpt ')' ( ValueSym ValuesList | SelectStmt | '('
       ↪ SelectStmt ')' | UnionStmt ) | SelectStmt ')' )
|   ValueSym ValuesList
|   SelectStmt
|   UnionStmt
|   'SET' ColumnSetValue? ( ',' ColumnSetValue )*
```

```
OnDuplicateKeyUpdate ::=
    ( 'ON' 'DUPLICATE' 'KEY' 'UPDATE' AssignmentList )?
```

14.13.2.74.2 Examples

```
mysql> CREATE TABLE t1 (a INT);
Query OK, 0 rows affected (0.11 sec)

mysql> CREATE TABLE t2 LIKE t1;
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.02 sec)

mysql> INSERT INTO t1 (a) VALUES (1);
Query OK, 1 row affected (0.01 sec)

mysql> INSERT INTO t2 SELECT * FROM t1;
Query OK, 2 rows affected (0.01 sec)
Records: 2 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+------+
| a    |
+------+
|    1 |
|    1 |
+------+
2 rows in set (0.00 sec)

mysql> SELECT * FROM t2;
+------+
| a    |
+------+
|    1 |
|    1 |
+------+
2 rows in set (0.00 sec)

mysql> INSERT INTO t2 VALUES (2),(3),(4);
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t2;
```

```
+------+
| a    |
+------+
|    1 |
|    1 |
|    2 |
|    3 |
|    4 |
+------+
5 rows in set (0.00 sec)
```

14.13.2.74.3 MySQL compatibility

The `INSERT` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.74.4 See also

- DELETE
- SELECT
- UPDATE
- REPLACE

14.13.2.75 KILL

The `KILL` statement is used to terminate a connection in any TiDB instance in the current TiDB cluster. Starting from TiDB v6.2.0, you can also use the `KILL` statement to terminate ongoing DDL jobs.

14.13.2.75.1 Synopsis

```
KillStmt ::= 'KILL' 'TIDB'? ( 'CONNECTION' | 'QUERY' )? CONNECTION_ID
```

14.13.2.75.2 Examples

The following example shows how to get all active queries in the current cluster and terminate any one of them.

```
SELECT ID, USER, INSTANCE, INFO FROM INFORMATION_SCHEMA.CLUSTER_PROCESSLIST
    ↪ ;
```

```
+--------------------+------+----------------+-----------------------------------
    ↪
```

```
| ID                  | USER | INSTANCE     | INFO                                                
```

Starting from v6.1.0, TiDB supports the Global Kill feature, which is enabled by default and controlled by the `enable-global-kill` configuration.

When the Global Kill feature is enabled, both `KILL` and `KILL TIDB` statements can terminate queries or connections across instances so you do not need to worry about erroneously terminating queries or connections. When you use a client to connect to any TiDB instance and execute the `KILL` or `KILL TIDB` statement, the statement will be forwarded to the target TiDB instance. If there is a proxy between the client and the TiDB cluster, the `KILL` and `KILL TIDB` statements will also be forwarded to the target TiDB instance for execution.

If the Global Kill feature is not enabled or you are using a TiDB version earlier than v6.1.0, note the following:

- By default, `KILL` is not compatible with MySQL. This helps prevent against a case of a connection being terminated by a wrong TiDB server, because it is common to place multiple TiDB servers behind a load balancer. To terminate other connections on the currently connected TiDB instance, you need to add the `TIDB` suffix explicitly by executing the `KILL TIDB` statement.

- It is **STRONGLY NOT RECOMMENDED** to set `compatible-kill-query = true` in your configuration file UNLESS you are certain that clients will be always connected to the same TiDB instance. This is because pressing Control+C in the default MySQL client opens a new connection in which `KILL` is executed. If there is a proxy between the client and the TiDB cluster, the new connection might be routed to a different TiDB instance, which possibly kills a different session by mistake.

- The `KILL TIDB` statement is a TiDB extension. The feature of this statement is similar to the MySQL `KILL [CONNECTION|QUERY]` command and the MySQL command line Control+C. It is safe to use `KILL TIDB` on the same TiDB instance.

14.13.2.76 LOAD DATA

The `LOAD DATA` statement batch loads data into a TiDB table.

Starting from TiDB v7.0.0, the `LOAD DATA` SQL statement supports the following features:

- Support importing data from S3 and GCS
- Add a new parameter `FIELDS DEFINED NULL BY`

Warning:

The new parameter `FIELDS DEFINED NULL BY` and support for importing data from S3 and GCS are experimental. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an issue on GitHub.

14.13.2.76.1 Synopsis

```
LoadDataStmt ::=
    'LOAD' 'DATA' LocalOpt 'INFILE' stringLit DuplicateOpt 'INTO' 'TABLE'
        ↪ TableName CharsetOpt Fields Lines IgnoreLines
        ↪ ColumnNameOrUserVarListOptWithBrackets LoadDataSetSpecOpt

LocalOpt ::= ('LOCAL')?

Fields ::=
    ('TERMINATED' 'BY' stringLit
    | ('OPTIONALLY')? 'ENCLOSED' 'BY' stringLit
    | 'ESCAPED' 'BY' stringLit
    | 'DEFINED' 'NULL' 'BY' stringLit ('OPTIONALLY' 'ENCLOSED')?)?
```

14.13.2.76.2 Parameters

`LOCAL`

You can use `LOCAL` to specify data files on the client to be imported, where the file parameter must be the file system path on the client.

If you are using TiDB Cloud, to use the `LOAD DATA` statement to load local data files, you need to add the `--local-infile` option to the connection string when you connect to TiDB Cloud.

- The following is an example connection string for TiDB Serverless:

```
mysql --connect-timeout 15 -u '<user_name>' -h <host_name> -P 4000 -D
    ↪ test --ssl-mode=VERIFY_IDENTITY --ssl-ca=/etc/ssl/cert.pem -p<
    ↪ your_password> --local-infile
```

- The following is an example connection string for TiDB Dedicated:

```
mysql --connect-timeout 15 --ssl-mode=VERIFY_IDENTITY --ssl-ca=<CA_path
    ↪ > --tls-version="TLSv1.2" -u root -h <host_name> -P 4000 -D test
    ↪ -p<your_password> --local-infile
```

S3 and GCS storage

If you do not specify `LOCAL`, the file parameter must be a valid S3 or GCS path, as detailed in external storage.

When the data files are stored on S3 or GCS, you can import individual files or use the wildcard character `*` to match multiple files to be imported. Note that wildcards do not recursively process files in subdirectories. The following are some examples:

- Import a single file: `s3://<bucket-name>/path/to/data/foo.csv`
- Import all files in the specified path: `s3://<bucket-name>/path/to/data/*`
- Import all files ending with `.csv` under the specified path: `s3://<bucket-name>/path/to/data/*.csv`
- Import all files prefixed with `foo` under the specified path: `s3://<bucket-name>/path/to/data/foo*`
- Import all files prefixed with `foo` and ending with `.csv` under the specified path: `s3://<bucket-name>/path/to/data/foo*.csv`

`Fields`, `Lines`, and `Ignore Lines`

You can use the `Fields` and `Lines` parameters to specify how to handle the data format.

- `FIELDS TERMINATED BY`: specifies the data delimiter.
- `FIELDS ENCLOSED BY`: specifies the enclosing character of the data.
- `LINES TERMINATED BY`: specifies the line terminator, if you want to end a line with a certain character.

You can use `DEFINED NULL BY` to specify how NULL values are represented in the data file.

- Consistent with MySQL behavior, if `ESCAPED BY` is not null, for example, if the default value `\` is used, then `\N` will be considered a NULL value.
- If you use `DEFINED NULL BY`, such as `DEFINED NULL BY 'my-null'`, `my-null` is considered a NULL value.
- If you use `DEFINED NULL BY ... OPTIONALLY ENCLOSED`, such as `DEFINED NULL BY 'my-null' OPTIONALLY ENCLOSED`, `my-null` and `"my-null"` (assuming `ENCLOSED BY '"'`) are considered NULL values.
- If you do not use `DEFINED NULL BY` or `DEFINED NULL BY ... OPTIONALLY ENCLOSED`, but use `ENCLOSED BY`, such as `ENCLOSED BY '"'`, then `NULL` is considered a NULL value. This behavior is consistent with MySQL.
- In other cases, it is not considered a NULL value.

Take the following data format as an example:

```
"bob","20","street 1"\r\n
"alice","33","street 1"\r\n
```

If you want to extract `bob`, `20`, and `street 1`, specify the field delimiter as `','`, and the enclosing character as `'\"'`:

```
FIELDS TERMINATED BY ',' ENCLOSED BY '\"' LINES TERMINATED BY '\r\n'
```

If you do not specify the preceding parameters, the imported data is processed in the following way by default:

```
FIELDS TERMINATED BY '\t' ENCLOSED BY '' ESCAPED BY '\\'
LINES TERMINATED BY '\n' STARTING BY ''
```

You can ignore the first `number` lines of a file by configuring the `IGNORE <number> LINES` parameter. For example, if you configure `IGNORE 1 LINES`, the first line of a file is ignored.

14.13.2.76.3 Examples

The following example imports data using `LOAD DATA`. Comma is specified as the field delimiter. The double quotation marks that enclose the data are ignored. The first line of the file is ignored.

If you see `ERROR 1148 (42000): the used command is not allowed with this TiDB version`, refer to ERROR 1148 (42000): the used command is not allowed with this TiDB version for troubleshooting.

```
LOAD DATA LOCAL INFILE '/mnt/evo970/data-sets/bikeshare-data/2017Q4-
    ↪ capitalbikeshare-tripdata.csv' INTO TABLE trips FIELDS TERMINATED BY
    ↪ ',' ENCLOSED BY '\"' LINES TERMINATED BY '\r\n' IGNORE 1 LINES (
    ↪ duration, start_date, end_date, start_station_number, start_station,
    ↪ end_station_number, end_station, bike_number, member_type);
```

```
Query OK, 815264 rows affected (39.63 sec)
Records: 815264 Deleted: 0 Skipped: 0 Warnings: 0
```

`LOAD DATA` also supports using hexadecimal ASCII character expressions or binary ASCII character expressions as the parameters for `FIELDS ENCLOSED BY` and `FIELDS TERMINATED BY`. See the following example:

```
LOAD DATA LOCAL INFILE '/mnt/evo970/data-sets/bikeshare-data/2017Q4-
    ↪ capitalbikeshare-tripdata.csv' INTO TABLE trips FIELDS TERMINATED BY
    ↪ x'2c' ENCLOSED BY b'100010' LINES TERMINATED BY '\r\n' IGNORE 1 LINES
    ↪  (duration, start_date, end_date, start_station_number, start_station
    ↪ , end_station_number, end_station, bike_number, member_type);
```

In the above example, `x'2c'` is the hexadecimal representation of the `,` character, and `b'100010'` is the binary representation of the `"` character.

14.13.2.76.4 MySQL compatibility

The syntax of the `LOAD DATA` statement is compatible with that of MySQL, except for character set options which are parsed but ignored. If you find any syntax compatibility difference, you can report a bug.

Note:

- For versions earlier than TiDB v4.0.0, `LOAD DATA` commits every 20000 rows, which cannot be configured.
- For versions from TiDB v4.0.0 to v6.6.0, TiDB commits all rows in one transaction by default. But if you need the `LOAD DATA` statement to commit every fixed number of rows, you can set `tidb_dml_batch_size` to the desired number of rows.
- Starting from TiDB v7.0.0, `tidb_dml_batch_size` no longer takes effect on `LOAD DATA`, and TiDB commits all rows in one transaction.
- After upgrading from TiDB v4.0.0 or earlier versions, `ERROR 8004 (HY000)at line 1: Transaction is too large, size: 100000058` might occur. The recommended way to resolve this error is to increase the `txn-total-size-limit` value in your `tidb.toml` file.
- For versions earlier than TiDB v7.6.0, no matter how many rows are committed in a transaction, `LOAD DATA` is not rolled back by the `ROLLBACK` statement in an explicit transaction.
- For versions earlier than TiDB v7.6.0, the `LOAD DATA` statement is always executed in optimistic transaction mode, regardless of the TiDB transaction mode configuration.
- Starting from v7.6.0, TiDB processes `LOAD DATA` in transactions in the same way as other DML statements:
  - The `LOAD DATA` statement does not commit the current transaction or start a new transaction.
  - The `LOAD DATA` statement is affected by the TiDB transaction mode setting (optimistic or pessimistic transaction).
  - The `LOAD DATA` statement in a transaction can be rolled back by the `ROLLBACK` statement in the transaction.

14.13.2.77 LOAD STATS

The `LOAD STATS` statement is used to load the statistics into TiDB.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

14.13.2.77.1 Synopsis

```
LoadStatsStmt ::=
    'LOAD' 'STATS' stringLit
```

14.13.2.77.2 Examples

You can access the address `http://${tidb-server-ip}:${tidb-server-status-port}/stats/dump/${db_name}/${table_name}` to download the TiDB instance's statistics.

You can also use `LOAD STATS ${stats_path}` to load the specific statistics file.

The `${stats_path}` can be an absolute path or a relative path. If you use a relative path, the corresponding file is found starting from the path where `tidb-server` is started. Here is an example:

```
LOAD STATS '/tmp/stats.json';
```

```
Query OK, 0 rows affected (0.00 sec)
```

14.13.2.77.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

- Statistics

14.13.2.78 LOCK STATS

`LOCK STATS` is used to lock the statistics of tables or partitions. When the statistics is locked, TiDB does not automatically update the statistics of the table or partition. For details on the behavior, see Behaviors of locking statistics.

14.13.2.78.1 Synopsis

```
LockStatsStmt ::=
    'LOCK' 'STATS' (TableNameList) | (TableName 'PARTITION'
       ↪ PartitionNameList)

TableNameList ::=
    TableName (',' TableName)*

TableName ::=
    Identifier ( '.' Identifier )?

PartitionNameList ::=
    Identifier ( ',' Identifier )*
```

14.13.2.78.2 Examples

Create table `t`, and insert data into it. When the statistics of table `t` are not locked, the `ANALYZE` statement can be successfully executed.

```
mysql> CREATE TABLE t(a INT, b INT);
Query OK, 0 rows affected (0.03 sec)

mysql> INSERT INTO t VALUES (1,2), (3,4), (5,6), (7,8);
Query OK, 4 rows affected (0.00 sec)
Records: 4 Duplicates: 0 Warnings: 0

mysql> ANALYZE TABLE t;
Query OK, 0 rows affected, 1 warning (0.02 sec)

mysql> SHOW WARNINGS;
+--
   ↪ -----+------+-----------------------------------------------------------
   ↪
| Level | Code | Message
   ↪
   ↪ |
+--
   ↪ -----+------+-----------------------------------------------------------
   ↪
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
   ↪ test.t, reason to use this rate is "Row count in stats_meta is much
   ↪ smaller compared with the row count got by PD, use min(1, 15000/4) as
   ↪  the sample-rate=1" |
+--
   ↪ -----+------+-----------------------------------------------------------
```

```
    ↪
1 row in set (0.00 sec)
```

Lock the statistics of table `t` and execute `ANALYZE`. From the output of `SHOW STATS_LOCKED`, you can see that the statistics of table `t` have been locked. The warning message shows that the `ANALYZE` statement has skipped table `t`.

```
mysql> LOCK STATS t;
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW STATS_LOCKED;
+---------+------------+----------------+--------+
| Db_name | Table_name | Partition_name | Status |
+---------+------------+----------------+--------+
| test    | t          |                | locked |
+---------+------------+----------------+--------+
1 row in set (0.01 sec)

mysql> ANALYZE TABLE t;
Query OK, 0 rows affected, 2 warnings (0.00 sec)

mysql> SHOW WARNINGS;
+--
    ↪ -------+------+-----------------------------------------------------------------------
    ↪
| Level   | Code | Message
    ↪
    ↪ |
+--
    ↪ -------+------+-----------------------------------------------------------------------
    ↪
| Note    | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
    ↪ test.t, reason to use this rate is "use min(1, 110000/8) as the
    ↪ sample-rate=1" |
| Warning | 1105 | skip analyze locked table: test.t
    ↪
    ↪ |
+--
    ↪ -------+------+-----------------------------------------------------------------------
    ↪
2 rows in set (0.00 sec)
```

In addition, you can also lock the statistics of a partition using `LOCK STATS`. For example:

Create a partition table `t`, and insert data into it. When the statistics of partition `p1` are not locked, the `ANALYZE` statement can be successfully executed.

```
mysql> CREATE TABLE t(a INT, b INT) PARTITION BY RANGE (a) (PARTITION p0
    ↪ VALUES LESS THAN (10), PARTITION p1 VALUES LESS THAN (20), PARTITION
    ↪ p2 VALUES LESS THAN (30));
Query OK, 0 rows affected (0.03 sec)

mysql> INSERT INTO t VALUES (1,2), (3,4), (5,6), (7,8);
Query OK, 4 rows affected (0.00 sec)
Records: 4 Duplicates: 0 Warnings: 0

mysql> ANALYZE TABLE t;
Query OK, 0 rows affected, 6 warning (0.02 sec)

mysql> SHOW WARNINGS;
+--
    ↪ -------+------+-----------------------------------------------------------------
    ↪
| Level  | Code | Message
    ↪
    ↪ |
+--
    ↪ -------+------+-----------------------------------------------------------------
    ↪
| Warning | 1105 | disable dynamic pruning due to t has no global stats
    ↪
    ↪ |
| Note   | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
    ↪ test.t's partition p0, reason to use this rate is "Row count in stats
    ↪ _meta is much smaller compared with the row count got by PD, use min
    ↪ (1, 15000/4) as the sample-rate=1" |
| Warning | 1105 | disable dynamic pruning due to t has no global stats
    ↪
    ↪ |
| Note   | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
    ↪ test.t's partition p1, reason to use this rate is "TiDB assumes that
    ↪ the table is empty, use sample-rate=1"
    ↪                                       |
| Warning | 1105 | disable dynamic pruning due to t has no global stats
    ↪
    ↪ |
| Note   | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
    ↪ test.t's partition p2, reason to use this rate is "TiDB assumes that

14.13.2.79 LOCK TABLES and UNLOCK TABLES

> **Warning:**
>
> `LOCK TABLES` and `UNLOCK TABLES` are experimental features for the current version. It is not recommended to use it in the production environment.

TiDB enables client sessions to acquire table locks for the purpose of cooperating with other sessions for access to tables, or to prevent other sessions from modifying tables. A session can acquire or release locks only for itself. One session cannot acquire locks for another session or release locks held by another session.

`LOCK TABLES` acquires table locks for the current client session. If you have the `LOCK TABLES` and `SELECT` privileges for each object to be locked, you can acquire table locks for common tables.

`UNLOCK TABLES` explicitly releases any table locks held by the current session. `LOCK TABLES` implicitly releases all table locks held by the current session before acquiring new locks.

A table lock protects against reads or writes by other sessions. A session that holds a `WRITE` lock can perform table-level operations such as `DROP TABLE` or `TRUNCATE TABLE`.

> **Note:**
>
> The table locks feature is disabled by default.
>
> - For TiDB Self-Hosted, to enable the table locks feature, you need to set `enable-table-lock` to `true` in the configuration files of all TiDB instances.
> - For TiDB Cloud, to enable the table locks feature, you need to contact TiDB Cloud Support to set `enable-table-lock` to `true`.

14.13.2.79.1 Synopsis

```
LockTablesDef
        ::= 'LOCK' ( 'TABLES' | 'TABLE' ) TableName LockType ( ',' TableName
           ↪  LockType)*

UnlockTablesDef
        ::= 'UNLOCK' 'TABLES'

LockType
        ::= 'READ' ('LOCAL')?
          | 'WRITE' ('LOCAL')?
```

14.13.2.79.2 Acquire table locks

You can acquire table locks within the current session by using the `LOCK TABLES` statement. The following lock types are available:

`READ` lock:

- The session that holds this lock can read the table, but cannot write it.
- Multiple sessions can acquire a `READ` lock from the same table at the same time.
- Other sessions can read the table without explicitly acquiring a `READ` lock.

The `READ LOCAL` lock is only for syntax compatibility with MySQL and is not supported.

`WRITE` lock:

- The session that holds this lock can read and write the table.
- Only the session that holds this lock can access the table. No other sessions can access it until the lock is released.

`WRITE LOCAL` lock:

- The session that holds this lock can read and write the table.
- Only the session that holds this lock can access the table. Other sessions can read the table, but cannot write it.

If the lock that the `LOCK TABLES` statement needs is held by another session, the `LOCK TABLES` statement must wait, and an error is returned upon the execution of this statement, for example:

```
> LOCK TABLES t1 READ;
ERROR 8020 (HY000): Table 't1' was locked in WRITE by server: f4799bcb-cad7
   ↪ -4285-8a6d-23d3555173f1_session: 2199023255959
```

The preceding error message indicates that the session with ID `2199023255959` in TiDB `f4799bcb-cad7-4285-8a6d-23d3555173f1` already holds a `WRITE` lock on table `t1`. Therefore, the current session cannot acquire a `READ` lock on table `t1`.

You cannot acquire the same table lock multiple times in a single `LOCK TABLES` statement.

```
> LOCK TABLES t WRITE, t READ;
ERROR 1066 (42000): Not unique table/alias: 't'
```

14.13.2.79.3 Release table locks

When the table locks held by a session are released, they are all released at the same time. A session can release its locks explicitly or implicitly.

- A session can release its locks explicitly with `UNLOCK TABLES`.
- If a session issues a `LOCK TABLES` statement to acquire a lock while already holding locks, its existing locks are released implicitly before the new locks are acquired.

If the connection for a client session terminates, whether normally or abnormally, TiDB implicitly releases all table locks held by the session. If the client reconnects, the locks are no longer in effect. For this reason, it is not recommended to enable auto-reconnection on the client. If you enable auto-reconnection, the client is not notified when reconnection occurs, and all table locks or current transactions are lost. By contrast, with auto-reconnection disabled, if the connection drops, an error occurs when the next statement is issued. The client can detect the error and take appropriate action such as reacquiring the locks or redoing the transaction.

14.13.2.79.4 Table-locking restrictions and conditions

You can safely use `KILL` to terminate a session that holds a table lock.

You cannot acquire table locks on tables in the following databases:

- `INFORMATION_SCHEMA`
- `PERFORMANCE_SCHEMA`
- `METRICS_SCHEMA`
- `mysql`

14.13.2.79.5 MySQL compatibility

Table lock acquisition

- In TiDB, if session A has already held a table lock, an error is returned if session B attempts to write to the table. In MySQL, the write request of session B is blocked until session A releases the table lock, and requests for locking the table from other sessions are blocked until the current session releases the `WRITE` lock.

- In TiDB, if the lock that the `LOCK TABLES` statement needs is held by another session, the `LOCK TABLES` statement must wait, and an error is returned upon the execution of this statement. In MySQL, this statement is blocked until the lock is acquired.
- In TiDB, the `LOCK TABLES` statement is effective in the whole cluster. In MySQL, this statement is effective only in the current MySQL server, and is not compatible with the NDB cluster.

Table lock release

When a transaction is explicitly started in a TiDB session (for example, with the `BEGIN` statement), TiDB does not implicitly release the table locks held by the session; but MySQL does.

14.13.2.80 MODIFY COLUMN

The `ALTER TABLE.. MODIFY COLUMN` statement modifies a column on an existing table. The modification can include changing the data type and attributes. To rename at the same time, use the `CHANGE COLUMN` statement instead.

Since v5.1.0, TiDB has supported changes of data types for Reorg data, including but not limited to:

- Changing `VARCHAR` to `BIGINT`
- Modifying the `DECIMAL` precision
- Compressing the length of `VARCHAR(10)` to `VARCHAR(5)`

14.13.2.80.1 Synopsis

```
AlterTableStmt
        ::= 'ALTER' 'IGNORE'? 'TABLE' TableName ModifyColumnSpec ( ','
           ↪ ModifyColumnSpec )*

ModifyColumnSpec
        ::= 'MODIFY' ColumnKeywordOpt 'IF EXISTS' ColumnName ColumnType
           ↪ ColumnOption* ( 'FIRST' | 'AFTER' ColumnName )?

ColumnType
        ::= NumericType
          | StringType
          | DateAndTimeType
          | 'SERIAL'

ColumnOption
        ::= 'NOT'? 'NULL'
          | 'AUTO_INCREMENT'
          | 'PRIMARY'? 'KEY' ( 'CLUSTERED' | 'NONCLUSTERED' )?
```

```
          | 'UNIQUE' 'KEY'?
          | 'DEFAULT' ( NowSymOptionFraction | SignedLiteral |
             ↪ NextValueForSequence )
          | 'SERIAL' 'DEFAULT' 'VALUE'
          | 'ON' 'UPDATE' NowSymOptionFraction
          | 'COMMENT' stringLit
          | ( 'CONSTRAINT' Identifier? )? 'CHECK' '(' Expression ')' ( 'NOT
             ↪ '? ( 'ENFORCED' | 'NULL' ) )?

ColumnName ::=
    Identifier ( '.' Identifier ( '.' Identifier )? )?
```

14.13.2.80.2 Examples

Meta-Only Change

```
CREATE TABLE t1 (id int not null primary key AUTO_INCREMENT, col1 INT);
```

```
Query OK, 0 rows affected (0.11 sec)
```

```
INSERT INTO t1 (col1) VALUES (1),(2),(3),(4),(5);
```

```
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0
```

```
ALTER TABLE t1 MODIFY col1 BIGINT;
```

```
Query OK, 0 rows affected (0.09 sec)
```

```
SHOW CREATE TABLE t1\G
```

```
*************************** 1. row ***************************
       Table: t1
Create Table: CREATE TABLE `t1` (
  `id` int(11) NOT NULL AUTO_INCREMENT,
  `col1` bigint(20) DEFAULT NULL,
```

```
  PRIMARY KEY (`id`)
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin AUTO_INCREMENT
   ↪ =30001
1 row in set (0.00 sec)
```

Reorg-Data Change

```
CREATE TABLE t1 (id int not null primary key AUTO_INCREMENT, col1 INT);
```

```
Query OK, 0 rows affected (0.11 sec)
```

```
INSERT INTO t1 (col1) VALUES (12345),(67890);
```

```
Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0
```

```
ALTER TABLE t1 MODIFY col1 VARCHAR(5);
```

```
Query OK, 0 rows affected (2.52 sec)
```

```
SHOW CREATE TABLE t1\G
```

```
*************************** 1. row ***************************
       Table: t1
CREATE TABLE `t1` (
  `id` int(11) NOT NULL AUTO_INCREMENT,
  `col1` varchar(5) DEFAULT NULL,
  PRIMARY KEY (`id`) /*T![clustered_index] CLUSTERED */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin AUTO_INCREMENT
   ↪ =30001
1 row in set (0.00 sec)
```

Note:

- TiDB returns an error when the changed data type conflicts with an existing data row. In the above example, TiDB returns the following error:

```
alter table t1 modify column col1 varchar(4); ERROR 1406
↪ (22001): Data Too Long, field len 4, data len 5
```

- Due to the compatibility with the Async Commit feature, the DDL statement waits for a period of time (about 2.5s) before starting to process into Reorg Data.

```
Query OK, 0 rows affected (2.52 sec)
```

14.13.2.80.3 MySQL compatibility

- Does not support modifying the Reorg-Data types on the primary key columns but supports modifying the Meta-Only types. For example:

```
CREATE TABLE t (a int primary key);
ALTER TABLE t MODIFY COLUMN a VARCHAR(10);
ERROR 8200 (HY000): Unsupported modify column: column has primary key
    ↪ flag
```

```
CREATE TABLE t (a int primary key);
ALTER TABLE t MODIFY COLUMN a INT(10) UNSIGNED;
ERROR 8200 (HY000): Unsupported modify column: column has primary key
    ↪ flag
```

```
CREATE TABLE t (a int primary key);
ALTER TABLE t MODIFY COLUMN a bigint;
Query OK, 0 rows affected (0.01 sec)
```

- Does not support modifying the column types on generated columns. For example:

```
CREATE TABLE t (a INT, b INT as (a+1));
ALTER TABLE t MODIFY COLUMN b VARCHAR(10);
ERROR 8200 (HY000): Unsupported modify column: column is generated
```

- Does not support modifying the column types on the partitioned tables. For example:

```
CREATE TABLE t (c1 INT, c2 INT, c3 INT) partition by range columns(c1)
    ↪  ( partition p0 values less than (10), partition p1 values less
    ↪ than (maxvalue));
ALTER TABLE t MODIFY COLUMN c1 DATETIME;
ERROR 8200 (HY000): Unsupported modify column: table is partition
    ↪ table
```

- Does not support modifying some data types (for example, some TIME types, Bit, Set, Enum, JSON) are not supported due to some compatibility issues of the `cast` function's behavior between TiDB and MySQL.

```
CREATE TABLE t (a DECIMAL(13, 7));
ALTER TABLE t MODIFY COLUMN a DATETIME;
ERROR 8200 (HY000): Unsupported modify column: change from original
    ↪ type decimal(13,7) to datetime is currently unsupported yet
```

14.13.2.81 PREPARE

The `PREPARE` statement provides an SQL interface to server-side prepared statements.

14.13.2.81.1 Synopsis

```
PreparedStmt ::=
    'PREPARE' Identifier 'FROM' PrepareSQL

PrepareSQL ::=
    stringLit
|   UserVariable
```

> **Note:**
>
> For each `PREPARE` statement, the maximum number of placeholders is 65535.

To limit the number of `PREPARE` statements in the current TiDB instance, you can use the `max_prepared_stmt_count` system variable.

14.13.2.81.2 Examples

```
mysql> PREPARE mystmt FROM 'SELECT ? as num FROM DUAL';
Query OK, 0 rows affected (0.00 sec)

mysql> SET @number = 5;
Query OK, 0 rows affected (0.00 sec)
```

```
mysql> EXECUTE mystmt USING @number;
+------+
| num  |
+------+
| 5    |
+------+
1 row in set (0.00 sec)

mysql> DEALLOCATE PREPARE mystmt;
Query OK, 0 rows affected (0.00 sec)
```

14.13.2.81.3 MySQL compatibility

The `PREPARE` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.81.4 See also

- EXECUTE
- DEALLOCATE

14.13.2.82 QUERY WATCH

The `QUERY WATCH` statement is used to manually manage the watch list of runaway queries in a resource group.

> **Warning:**
>
> This feature is experimental. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an issue on GitHub.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

14.13.2.82.1 Synopsis

```
AddQueryWatchStmt ::=
    "QUERY" "WATCH" "ADD" QueryWatchOptionList
QueryWatchOptionList ::=
    QueryWatchOption
|   QueryWatchOptionList QueryWatchOption
|   QueryWatchOptionList ',' QueryWatchOption
QueryWatchOption ::=
    "RESOURCE" "GROUP" ResourceGroupName
|   "RESOURCE" "GROUP" UserVariable
|   "ACTION" EqOpt ResourceGroupRunawayActionOption
|   QueryWatchTextOption
ResourceGroupName ::=
    Identifier
|   "DEFAULT"
QueryWatchTextOption ::=
    "SQL" "DIGEST" SimpleExpr
|   "PLAN" "DIGEST" SimpleExpr
|   "SQL" "TEXT" ResourceGroupRunawayWatchOption "TO" SimpleExpr

ResourceGroupRunawayWatchOption ::=
    "EXACT"
|   "SIMILAR"
|   "PLAN"

DropQueryWatchStmt ::=
    "QUERY" "WATCH" "REMOVE" NUM
```

14.13.2.82.2 Parameters

See QUERY WATCH parameters.

14.13.2.82.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.82.4 See also

- Runaway Queries

14.13.2.83 RECOVER TABLE

`RECOVER TABLE` is used to recover a deleted table and the data on it within the GC (Garbage Collection) life time after the `DROP TABLE` statement is executed.

14.13.2.83.1 Syntax

```
RECOVER TABLE table_name;
```

```
RECOVER TABLE BY JOB JOB_ID;
```

14.13.2.83.2 Synopsis

```
RecoverTableStmt ::=
    'RECOVER' 'TABLE' ( 'BY' 'JOB' Int64Num | TableName Int64Num? )

TableName ::=
    Identifier ( '.' Identifier )?

Int64Num ::= NUM

NUM ::= intLit
```

Note:

- If a table is deleted and the GC lifetime is out, the table cannot be recovered with `RECOVER TABLE`. Execution of `RECOVER TABLE` in this scenario returns an error like: `snapshot is older than GC safe point` ↪ `2019-07-10 13:45:57 +0800 CST`.
- If the TiDB version is 3.0.0 or later, it is not recommended for you to use `RECOVER TABLE` when TiDB Binlog is used.
- `RECOVER TABLE` is supported in the Binlog version 3.0.1, so you can use `RECOVER TABLE` in the following three situations:
  - Binlog version is 3.0.1 or later.
  - TiDB 3.0 is used both in the upstream cluster and the downstream cluster.
  - The GC life time of the secondary cluster must be longer than that of the primary cluster. However, as latency occurs during data replication between upstream and downstream databases, data recovery might fail in the downstream.

Troubleshoot errors during TiDB Binlog replication

When you use `RECOVER TABLE` in the upstream TiDB during TiDB Binlog replication, TiDB Binlog might be interrupted in the following three situations:

- The downstream database does not support the `RECOVER TABLE` statement. An error instance: `check the manual that corresponds to your MySQL server version for the right syntax to use near 'RECOVER TABLE table_name'`.
- The GC life time is not consistent between the upstream database and the downstream database. An error instance: `snapshot is older than GC safe point 2019-07-10 13:45:57 +0800 CST`.
- Latency occurs during replication between upstream and downstream databases. An error instance: `snapshot is older than GC safe point 2019-07-10 13:45:57 +0800 CST`.

For the above three situations, you can resume data replication from TiDB Binlog with a full import of the deleted table.

14.13.2.83.3 Examples

- Recover the deleted table according to the table name.

```
DROP TABLE t;
```

```
RECOVER TABLE t;
```

This method searches the recent DDL job history and locates the first DDL operation of the `DROP TABLE` type, and then recovers the deleted table with the name identical to the one table name specified in the `RECOVER TABLE` statement.

- Recover the deleted table according to the table's `DDL JOB ID` used.

Suppose that you had deleted the table `t` and created another `t`, and again you deleted the newly created `t`. Then, if you want to recover the `t` deleted in the first place, you must use the method that specifies the `DDL JOB ID`.

```
DROP TABLE t;
```

```
ADMIN SHOW DDL JOBS 1;
```

The second statement above is used to search for the table's `DDL JOB ID` to delete `t`. In the following example, the ID is 53.

```
+--------+---------+------------+------------+--------------+-----------+----------
    ↪
| JOB_ID | DB_NAME | TABLE_NAME | JOB_TYPE | SCHEMA_STATE | SCHEMA_ID |
    ↪  TABLE_ID | ROW_COUNT | START_TIME          | STATE |
+--------+---------+------------+------------+--------------+-----------+----------
    ↪
```

```
| 53    | test   |           | drop table | none      | 1         | 41
   ↪      | 0         | 2019-07-10 13:23:18.277 +0800 CST | synced |
+--------+--------+-----------+-----------+-------------+-----------+----------
   ↪
```

```
RECOVER TABLE BY JOB 53;
```

This method recovers the deleted table via the `DDL JOB ID`. If the corresponding DDL job is not of the `DROP TABLE` type, an error occurs.

14.13.2.83.4 Implementation principle

When deleting a table, TiDB only deletes the table metadata, and writes the table data (row data and index data) to be deleted to the `mysql.gc_delete_range` table. The GC Worker in the TiDB background periodically removes from the `mysql.gc_delete_range` table the keys that exceed the GC life time.

Therefore, to recover a table, you only need to recover the table metadata and delete the corresponding row record in the `mysql.gc_delete_range` table before the GC Worker deletes the table data. You can use a snapshot read of TiDB to recover the table metadata. Refer to Read Historical Data for details.

Table recovery is done by TiDB obtaining the table metadata through snapshot read, and then going through the process of table creation similar to `CREATE TABLE`. Therefore, `RECOVER TABLE` itself is, in essence, a kind of DDL operation.

14.13.2.83.5 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.84 RENAME USER

`RENAME USER` is used to rename an existing user.

14.13.2.84.1 Synopsis

```
RenameUserStmt ::=
    'RENAME' 'USER' UserToUser ( ',' UserToUser )*
UserToUser ::=
    Username 'TO' Username
Username ::=
    StringName ('@' StringName | singleAtIdentifier)? | 'CURRENT_USER'
       ↪ OptionalBraces
```

14.13.2.84.2 Examples

```
CREATE USER 'newuser' IDENTIFIED BY 'mypassword';
```

```
Query OK, 1 row affected (0.02 sec)
```

```
SHOW GRANTS FOR 'newuser';
```

```
+-------------------------------------+
| Grants for newuser@%                |
+-------------------------------------+
| GRANT USAGE ON *.* TO 'newuser'@'%' |
+-------------------------------------+
1 row in set (0.00 sec)
```

```
RENAME USER 'newuser' TO 'testuser';
```

```
Query OK, 0 rows affected (0.08 sec)
```

```
SHOW GRANTS FOR 'testuser';
```

```
+-------------------------------------+
| Grants for testuser@%               |
+-------------------------------------+
| GRANT USAGE ON *.* TO 'testuser'@'%' |
+-------------------------------------+
1 row in set (0.00 sec)
```

```
SHOW GRANTS FOR 'newuser';
```

```
ERROR 1141 (42000): There is no such grant defined for user 'newuser' on
    ↪ host '%'
```

14.13.2.84.3 MySQL compatibility

`RENAME USER` is expected to be fully compatible with MySQL. If you find any compatibility difference, you can report a bug.

14.13.2.84.4 See also

- CREATE USER
- SHOW GRANTS
- DROP USER

14.13.2.85 RENAME INDEX

The statement `ALTER TABLE .. RENAME INDEX` renames an existing index to a new name. This operation is instant in TiDB, and requires only a meta data change.

14.13.2.85.1 Synopsis

```
AlterTableStmt
        ::= 'ALTER' 'IGNORE'? 'TABLE' TableName RenameIndexSpec ( ','
           ↪ RenameIndexSpec )*

RenameIndexSpec
        ::= 'RENAME' ( 'KEY' | 'INDEX' ) Identifier 'TO' Identifier
```

14.13.2.85.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
   ↪ NOT NULL, INDEX col1 (c1));
Query OK, 0 rows affected (0.11 sec)

mysql> SHOW CREATE TABLE t1\G
*************************** 1. row ***************************
       Table: t1
Create Table: CREATE TABLE `t1` (
  `id` int(11) NOT NULL AUTO_INCREMENT,
  `c1` int(11) NOT NULL,
  PRIMARY KEY (`id`),
  KEY `col1` (`c1`)
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
1 row in set (0.00 sec)

mysql> ALTER TABLE t1 RENAME INDEX col1 TO c1;
Query OK, 0 rows affected (0.09 sec)

mysql> SHOW CREATE TABLE t1\G
*************************** 1. row ***************************
       Table: t1
Create Table: CREATE TABLE `t1` (
  `id` int(11) NOT NULL AUTO_INCREMENT,
  `c1` int(11) NOT NULL,
  PRIMARY KEY (`id`),
  KEY `c1` (`c1`)
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
1 row in set (0.00 sec)
```

14.13.2.85.3 MySQL compatibility

The `RENAME INDEX` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.85.4 See also

- SHOW CREATE TABLE
- CREATE INDEX
- DROP INDEX
- SHOW INDEXES
- ALTER INDEX

14.13.2.86 RENAME TABLE

This statement renames an existing table to a new name.

14.13.2.86.1 Synopsis

```
RenameTableStmt ::=
    'RENAME' 'TABLE' TableToTable ( ',' TableToTable )*

TableToTable ::=
    TableName 'TO' TableName
```

14.13.2.86.2 Examples

```
mysql> CREATE TABLE t1 (a int);
Query OK, 0 rows affected (0.12 sec)

mysql> SHOW TABLES;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)

mysql> RENAME TABLE t1 TO t2;
Query OK, 0 rows affected (0.08 sec)

mysql> SHOW TABLES;
+----------------+
| Tables_in_test |
+----------------+
```

```
| t2           |
+----------------+
1 row in set (0.00 sec)
```

14.13.2.86.3 MySQL compatibility

The `RENAME TABLE` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.86.4 See also

- CREATE TABLE
- SHOW TABLES
- ALTER TABLE

14.13.2.87 REPLACE

The `REPLACE` statement is semantically a combined `DELETE`+`INSERT` statement. It can be used to simplify application code.

14.13.2.87.1 Synopsis

```
ReplaceIntoStmt ::=
    'REPLACE' PriorityOpt IntoOpt TableName PartitionNameListOpt
       ↪ InsertValues

PriorityOpt ::=
    ( 'LOW_PRIORITY' | 'HIGH_PRIORITY' | 'DELAYED' )?

IntoOpt ::= 'INTO'?

TableName ::=
    Identifier ( '.' Identifier )?

PartitionNameListOpt ::=
    ( 'PARTITION' '(' Identifier ( ',' Identifier )* ')' )?

InsertValues ::=
    '(' ( ColumnNameListOpt ')' ( ValueSym ValuesList | SelectStmt | '('
       ↪ SelectStmt ')' | UnionStmt ) | SelectStmt ')' )
|   ValueSym ValuesList
|   SelectStmt
|   UnionStmt
|   'SET' ColumnSetValue? ( ',' ColumnSetValue )*
```

14.13.2.87.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.12 sec)

mysql> INSERT INTO t1 (c1) VALUES (1), (2), (3);
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 |  3 |
+----+----+
3 rows in set (0.00 sec)

mysql> REPLACE INTO t1 (id, c1) VALUES(3, 99);
Query OK, 2 rows affected (0.01 sec)

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 | 99 |
+----+----+
3 rows in set (0.00 sec)
```

14.13.2.87.3 MySQL compatibility

The `REPLACE` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.87.4 See also

- DELETE
- INSERT
- SELECT
- UPDATE

14.13.2.88 RESTORE

This statement performs a distributed restore from a backup archive previously produced by a `BACKUP` statement.

> **Warning:**
>
> - This feature is experimental. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an issue on GitHub.
> - This feature is not available on TiDB Serverless clusters.

The `RESTORE` statement uses the same engine as the BR tool, except that the restore process is driven by TiDB itself rather than a separate BR tool. All benefits and caveats of BR also apply here. In particular, **`RESTORE` is currently not ACID-compliant**. Before running `RESTORE`, ensure that the following requirements are met:

- The cluster is "offline", and the current TiDB session is the only active SQL connection to access all tables being restored.
- When a full restore is being performed, the tables being restored should not already exist, because existing data might be overridden and causes inconsistency between the data and indices.
- When an incremental restore is being performed, the tables should be at the exact same state as the `LAST_BACKUP` timestamp when the backup is created.

Running `RESTORE` requires either the `RESTORE_ADMIN` or `SUPER` privilege. Additionally, both the TiDB node executing the restore and all TiKV nodes in the cluster must have read permission from the destination.

The `RESTORE` statement is blocking, and will finish only after the entire restore task is finished, failed, or canceled. A long-lasting connection should be prepared for running `RESTORE`. The task can be canceled using the `KILL TIDB QUERY` statement.

Only one `BACKUP` and `RESTORE` task can be executed at a time. If a `BACKUP` or `RESTORE` task is already running on the same TiDB server, the new `RESTORE` execution will wait until all previous tasks are done.

`RESTORE` can only be used with "tikv" storage engine. Using `RESTORE` with the "unistore" engine will fail.

14.13.2.88.1 Synopsis

```
RestoreStmt ::=
    "RESTORE" BRIETables "FROM" stringLit RestoreOption*

BRIETables ::=
    "DATABASE" ( '*' | DBName (',' DBName)* )
|   "TABLE" TableNameList

RestoreOption ::=
    "RATE_LIMIT" '='? LengthNum "MB" '/' "SECOND"
|   "CONCURRENCY" '='? LengthNum
|   "CHECKSUM" '='? Boolean
|   "SEND_CREDENTIALS_TO_TIKV" '='? Boolean

Boolean ::=
    NUM | "TRUE" | "FALSE"
```

14.13.2.88.2 Examples

Restore from backup archive

```
RESTORE DATABASE * FROM 'local:///mnt/backup/2020/04/';
```

```
+--
    ↪ ---------------------------+----------+---------+--------------------+------
    ↪
| Destination               | Size     | BackupTS | Queue Time      |
    ↪ Execution Time    |
+--
    ↪ ---------------------------+----------+---------+--------------------+------
    ↪
| local:///mnt/backup/2020/04/ | 248665063 | 0 | 2020-04-21 17:16:55 |
    ↪ 2020-04-21 17:16:55 |
+--
    ↪ ---------------------------+----------+---------+--------------------+------
    ↪
1 row in set (28.961 sec)
```

In the example above, all data is restored from a backup archive at the local filesystem. The data is read as SST files from the `/mnt/backup/2020/04/` directories distributed among all TiDB and TiKV nodes.

The first row of the result above is described as follows:

Column	Description
`Destination` ↪	The destination URL to read from
`Size`	The total size of the backup archive, in bytes
`BackupTS`	(not used)
`Queue` ↪ `Time`	The timestamp (in current time zone) when the `RESTORE` task was queued.
`Execution` ↪ `Time`	The timestamp (in current time zone) when the `RESTORE` task starts to run.

Partial restore

You can specify which databases or tables to restore. If some databases or tables are missing from the backup archive, they will be ignored, and thus `RESTORE` would complete without doing anything.

```
RESTORE DATABASE `test` FROM 'local:///mnt/backup/2020/04/';
```

```
RESTORE TABLE `test`.`sbtest01`, `test`.`sbtest02` FROM 'local:///mnt/
    ↪ backup/2020/04/';
```

External storages

BR supports restoring data from S3 or GCS:

```
RESTORE DATABASE * FROM 's3://example-bucket-2020/backup-05/';
```

The URL syntax is further explained in URI Formats of External Storage Services.

When running on cloud environment where credentials should not be distributed, set the SEND_CREDENTIALS_TO_TIKV option to FALSE:

```
RESTORE DATABASE * FROM 's3://example-bucket-2020/backup-05/'
    SEND_CREDENTIALS_TO_TIKV = FALSE;
```

Performance fine-tuning

Use RATE_LIMIT to limit the average download speed per TiKV node to reduce network bandwidth.

By default, TiDB node would run 128 restore threads. This value can be adjusted with the CONCURRENCY option.

Before restore is completed, RESTORE would perform a checksum against the data from the archive to verify correctness. This step can be disabled with the CHECKSUM option if you are confident that this is unnecessary.

```
RESTORE DATABASE * FROM 's3://example-bucket-2020/backup-06/'
    RATE_LIMIT = 120 MB/SECOND
    CONCURRENCY = 64
    CHECKSUM = FALSE;
```

Incremental restore

There is no special syntax to perform incremental restore. TiDB will recognize whether the backup archive is full or incremental and take appropriate action. You only need to apply each incremental restore in correct order.

For instance, if a backup task is created as follows:

```
BACKUP DATABASE `test` TO 's3://example-bucket/full-backup' SNAPSHOT =
    ↪ 413612900352000;
BACKUP DATABASE `test` TO 's3://example-bucket/inc-backup-1' SNAPSHOT =
    ↪ 414971854848000 LAST_BACKUP = 413612900352000;
BACKUP DATABASE `test` TO 's3://example-bucket/inc-backup-2' SNAPSHOT =
    ↪ 416353458585600 LAST_BACKUP = 414971854848000;
```

then the same order should be applied in the restore:

```
RESTORE DATABASE * FROM 's3://example-bucket/full-backup';
RESTORE DATABASE * FROM 's3://example-bucket/inc-backup-1';
RESTORE DATABASE * FROM 's3://example-bucket/inc-backup-2';
```

14.13.2.88.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.88.4 See also

- BACKUP
- SHOW RESTORES

14.13.2.89 `REVOKE <privileges>`

This statement removes privileges from an existing user. Executing this statement requires the `GRANT OPTION` privilege and all privileges you revoke.

14.13.2.89.1 Synopsis

```
GrantStmt ::=
    'GRANT' PrivElemList 'ON' ObjectType PrivLevel 'TO' UserSpecList
       ↪ RequireClauseOpt WithGrantOptionOpt

PrivElemList ::=
    PrivElem ( ',' PrivElem )*

PrivElem ::=
    PrivType ( '(' ColumnNameList ')' )?

PrivType ::=
    'ALL' 'PRIVILEGES'?
|   'ALTER' 'ROUTINE'?
|   'CREATE' ( 'USER' | 'TEMPORARY' 'TABLES' | 'VIEW' | 'ROLE' | 'ROUTINE' )
    ↪ ?
|    'TRIGGER'
|   'DELETE'
|    'DROP' 'ROLE'?
|    'PROCESS'
|    'EXECUTE'
|   'INDEX'
|   'INSERT'
|   'SELECT'
|   'SUPER'
|    'SHOW' ( 'DATABASES' | 'VIEW' )
|   'UPDATE'
|   'GRANT' 'OPTION'
|   'REFERENCES'
|   'REPLICATION' ( 'SLAVE' | 'CLIENT' )
|   'USAGE'
|    'RELOAD'
|   'FILE'
|   'CONFIG'
```

```
|   'LOCK' 'TABLES'
|    'EVENT'
|   'SHUTDOWN'

ObjectType ::=
    'TABLE'?

PrivLevel ::=
    '*' ( '.' '*' )?
|    Identifier ( '.' ( '*' | Identifier ) )?

UserSpecList ::=
    UserSpec ( ',' UserSpec )*

RequireClauseOpt ::= ('REQUIRE' ('NONE' | 'SSL' | 'X509' |
    ↪ RequireListElement ('AND'? RequireListElement)*))?

RequireListElement ::= 'ISSUER' Issuer | 'SUBJECT' Subject | 'CIPHER' Cipher
    ↪  | 'SAN' SAN | 'TOKEN_ISSUER' TokenIssuer
```

14.13.2.89.2 Examples

```
mysql> CREATE USER 'newuser' IDENTIFIED BY 'mypassword';
Query OK, 1 row affected (0.02 sec)

mysql> GRANT ALL ON test.* TO 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-------------------------------------------------+
| Grants for newuser@%                            |
+-------------------------------------------------+
| GRANT USAGE ON *.* TO 'newuser'@'%'             |
| GRANT ALL PRIVILEGES ON test.* TO 'newuser'@'%' |
+-------------------------------------------------+
2 rows in set (0.00 sec)

mysql> REVOKE ALL ON test.* FROM 'newuser';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GRANTS FOR 'newuser';
+-----------------------------------+
| Grants for newuser@%              |
+-----------------------------------+
```

```
| GRANT USAGE ON *.* TO 'newuser'@'%' |
+-------------------------------------+
1 row in set (0.00 sec)

mysql> DROP USER 'newuser';
Query OK, 0 rows affected (0.14 sec)

mysql> SHOW GRANTS FOR 'newuser';
ERROR 1141 (42000): There is no such grant defined for user 'newuser' on
    ↪ host '%'
```

14.13.2.89.3 MySQL compatibility

- In TiDB, after the `REVOKE <privileges>` statement is executed successfully, the execution result takes effect immediately on the current connection. Whereas in MySQL, for some privileges, the execution results take effect only on subsequent connections. See TiDB #39356 for details.

14.13.2.89.4 See also

- GRANT <privileges>
- SHOW GRANTS

- Privilege Management

14.13.2.90 REVOKE <role>

This statement removes a previously assigned role from a specified user (or list of users).

14.13.2.90.1 Synopsis

```
RevokeRoleStmt ::=
    'REVOKE' RolenameList 'FROM' UsernameList

RolenameList ::=
    Rolename ( ',' Rolename )*

UsernameList ::=
    Username ( ',' Username )*
```

14.13.2.90.2 Examples

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Create a new role `analyticsteam` and a new user `jennifer`:

```
CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Note that by default `jennifer` needs to execute `SET ROLE analyticsteam` in order to be able to use the privileges associated with the `analyticsteam` role:

```
SHOW GRANTS;
+-------------------------------------------+
| Grants for User                           |
+-------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'      |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-------------------------------------------+
2 rows in set (0.00 sec)

SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

SHOW GRANTS;
+-------------------------------------------+
| Grants for User                           |
+-------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'      |
| GRANT SELECT ON test.* TO 'jennifer'@'%'  |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
```

```
+-----------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

The statement `SET DEFAULT ROLE` can be used to associate the role `analyticsteam` to `jennifer`:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
Query OK, 0 rows affected (0.02 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

After this, the user `jennifer` has the privileges associated with the role `analyticsteam` and `jennifer` does not have to execute the statement `SET ROLE`:

```
SHOW GRANTS;
+-----------------------------------------------+
| Grants for User                               |
+-----------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'          |
| GRANT SELECT ON test.* TO 'jennifer'@'%'      |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%'   |
+-----------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Revoke the role of analyticsteam from `jennifer`:

```
REVOKE analyticsteam FROM jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Show the privileges of `jennifer`:

```
SHOW GRANTS;
+-------------------------------------+
| Grants for User                     |
+-------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%' |
+-------------------------------------+
1 row in set (0.00 sec)
```

14.13.2.90.3 MySQL compatibility

The `REVOKE <role>` statement in TiDB is fully compatible with the roles feature in MySQL 8.0. If you find any compatibility differences, report a bug.

14.13.2.90.4 See also

- CREATE ROLE
- DROP ROLE
- GRANT <role>
- SET ROLE
- SET DEFAULT ROLE

- Role-Based Access Control

14.13.2.91 ROLLBACK

This statement reverts all changes in the current transaction inside of TIDB. It is the opposite of a `COMMIT` statement.

14.13.2.91.1 Synopsis

```
RollbackStmt ::=
    'ROLLBACK' CompletionTypeWithinTransaction?

CompletionTypeWithinTransaction ::=
    'AND' ( 'CHAIN' ( 'NO' 'RELEASE' )? | 'NO' 'CHAIN' ( 'NO'? 'RELEASE' )?
       ↪ )
|   'NO'? 'RELEASE'
```

14.13.2.91.2 Examples

```
mysql> CREATE TABLE t1 (a INT NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.12 sec)

mysql> BEGIN;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.00 sec)

mysql> ROLLBACK;
Query OK, 0 rows affected (0.01 sec)

mysql> SELECT * FROM t1;
Empty set (0.01 sec)
```

14.13.2.91.3 MySQL compatibility

- TiDB parses but ignores the syntax `ROLLBACK AND [NO] RELEASE`. This functionality is used in MySQL to disconnect the client session immediately after rolling back the transaction. In TiDB, it is recommended to instead use the `mysql_close()` functionality of your client driver.
- TiDB parses but ignores the syntax `ROLLBACK AND [NO] CHAIN`. This functionality is used in MySQL to immediately start a new transaction with the same isolation level while the current transaction is being rolled back. In TiDB, it is recommended to instead start a new transaction.

14.13.2.91.4 See also

- SAVEPOINT
- COMMIT
- BEGIN
- START TRANSACTION

14.13.2.92 SAVEPOINT

`SAVEPOINT` is a feature introduced in TiDB v6.2.0. The syntax is as follows:

```
SAVEPOINT identifier
ROLLBACK TO [SAVEPOINT] identifier
RELEASE SAVEPOINT identifier
```

Warning:

- You cannot use `SAVEPOINT` with TiDB Binlog enabled.
- You cannot use `SAVEPOINT` in pessimistic transactions when `tidb_constraint_check_in_place_pessimistic` is disabled.

- `SAVEPOINT` is used to set a savepoint of a specified name in the current transaction. If a savepoint with the same name already exists, it will be deleted and a new savepoint with the same name will be set.
- `ROLLBACK TO SAVEPOINT` rolls back a transaction to the savepoint of a specified name and does not terminate the transaction. Data changes made to the table data after the savepoint will be reverted in the rollback, and all savepoints after the savepoint are deleted. In a pessimistic transaction, the locks held by the transaction are not rolled back. Instead, the locks will be released when the transaction ends.

  If the savepoint specified in the `ROLLBACK TO SAVEPOINT` statement does not exist, the statement returns the following error:

  ```
  ERROR 1305 (42000): SAVEPOINT identifier does not exist
  ```

- `RELEASE SAVEPOINT` statement removes the named savepoint and **all savepoints** after this savepoint from the current transaction, without committing or rolling back the current transaction. If the savepoint of the specified name does not exist, the following error is returned:

  ```
  ERROR 1305 (42000): SAVEPOINT identifier does not exist
  ```

  After the transaction is committed or rolled back, all savepoints in the transaction will be deleted.

14.13.2.92.1 Synopsis

```
SavepointStmt ::=
    "SAVEPOINT" Identifier
```

```
RollbackToStmt ::=
    "ROLLBACK" "TO" "SAVEPOINT"? Identifier

ReleaseSavepointStmt ::=
    "RELEASE" "SAVEPOINT" Identifier
```

14.13.2.92.2 Examples

Create a table `t1`:

```
CREATE TABLE t1 (a INT NOT NULL PRIMARY KEY);
```

```
Query OK, 0 rows affected (0.12 sec)
```

Start the current transaction:

```
BEGIN;
```

```
Query OK, 0 rows affected (0.00 sec)
```

Insert data into the table and set a savepoint `sp1`:

```
INSERT INTO t1 VALUES (1);
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SAVEPOINT sp1;
```

```
Query OK, 0 rows affected (0.01 sec)
```

Insert data into the table again and set a savepoint `sp2`:

```
INSERT INTO t1 VALUES (2);
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SAVEPOINT sp2;
```

```
Query OK, 0 rows affected (0.01 sec)
```

Release the savepoint `sp2`:

```
RELEASE SAVEPOINT sp2;
```

```
Query OK, 0 rows affected (0.01 sec)
```

Roll back to the savepoint `sp1`:

```
ROLLBACK TO SAVEPOINT sp1;
```

```
Query OK, 0 rows affected (0.01 sec)
```

Commit the transaction and query the table. Only the data inserted before `sp1` is returned.

```
COMMIT;
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
SELECT * FROM t1;
```

```
+---+
| a |
+---+
| 1 |
+---+
1 row in set
```

14.13.2.92.3 MySQL compatibility

When `ROLLBACK TO SAVEPOINT` is used to roll back a transaction to a specified savepoint, MySQL releases the locks held only after the specified savepoint, while in TiDB pessimistic transaction, TiDB does not immediately release the locks held after the specified savepoint. Instead, TiDB releases all locks when the transaction is committed or rolled back.

TiDB does not support the MySQL syntax `ROLLBACK WORK TO SAVEPOINT ...`.

14.13.2.92.4 See also

14.13.2.93 SELECT

The `SELECT` statement is used to read data from TiDB.

14.13.2.93.1 Synopsis

```
SelectStmt ::=
    ( SelectStmtBasic | SelectStmtFromDualTable | SelectStmtFromTable )
    OrderBy? SelectStmtLimit? SelectLockOpt? SelectStmtIntoOption

SelectStmtBasic ::=
    "SELECT" SelectStmtOpts Field ("," Field)* ( "HAVING" Expression)?

SelectStmtFromDualTable ::=
    "SELECT" SelectStmtOpts Field ("," Field)* "FROM" "DUAL" WhereClause?

SelectStmtFromTable ::=
    "SELECT" SelectStmtOpts Field ("," Field)* "FROM" TableRefsClause
    WhereClause? GroupByClause? ( "HAVING" Expression)? WindowClause?

SelectStmtOpts ::=
    TableOptimizerHints DefaultFalseDistictOpt PriorityOpt
        ↪ SelectStmtSQLSmallResult
    SelectStmtSQLBigResult SelectStmtSQLBufferResult SelectStmtSQLCache
        ↪ SelectStmtCalcFoundRows
    SelectStmtStraightJoin

TableRefsClause ::=
    TableRef AsOfClause? ( ',' TableRef AsOfClause? )*

AsOfClause ::=
    'AS' 'OF' 'TIMESTAMP' Expression

SelectStmtLimit ::=
    ("LIMIT" LimitOption ( "," | "OFFSET") LimitOption )?
| "FETCH" ("FIRST" | "NEXT") LimitOption? ("ROW" | "ROWS") "ONLY" )

SelectLockOpt ::=
    ( 'FOR' 'UPDATE' ( 'OF' TableList )? 'NOWAIT'?
|   'LOCK' 'IN' 'SHARE' 'MODE' )

TableList ::=
    TableName ( ',' TableName )*

WindowClause ::=
    "WINDOW" WindowDefinition "," WindowDefinition)*

TableSampleOpt ::=
    'TABLESAMPLE' 'REGIONS' '(' ')'
```

14.13.2.93.2 Description of the syntax elements

Syntax Element	Description
`TableOptimizerHints`	This is the hint to control the behavior of TiDB's optimizer. For more information, refer to Optimizer Hints.
`ALL`, `DISTINCT`, `DISTINCTROW`	The `ALL`, `DISTINCT`/`DISTINCTROW` modifiers specify whether duplicate rows should be returned. ALL (the default) specifies that all matching rows should be returned.
`HIGH_PRIORITY`	`HIGH_PRIORITY` gives the current statement higher priority than other statements.
`SQL_CALC_FOUND_ROWS`	TiDB does not support this feature, and will return an error unless `tidb_enable_noop_functions=1` is set.
`SQL_CACHE`, `SQL_NO_CACHE`	`SQL_CACHE` and `SQL_NO_CACHE` are used to control whether to cache the request results to the `BlockCache` of TiKV (RocksDB). For a one-time query on a large amount of data, such as the `count(*)` query, it is recommended to fill in `SQL_NO_CACHE` to avoid flushing the hot user data in `BlockCache`.
`STRAIGHT_JOIN`	`STRAIGHT_JOIN` forces the optimizer to do a union query in the order of the tables used in the `FROM` clause. When the optimizer chooses a join order that is not good, you can use this syntax to speed up the execution of the query.
`select_expr`	Each `select_expr` indicates a column to retrieve. including the column names and expressions. `\*` represents all the columns.
`FROM table_references`	The `FROM table_references` clause indicates the table (such as `select * from t;`), or tables (such as `select * from t1 join t2;`) or even 0 tables (such as `select 1+1 from dual;` which is equivalent to `select 1+1;`) from which to retrieve rows.
`WHERE where_condition`	The `WHERE` clause, if given, indicates the condition or conditions that rows must satisfy to be selected. The result contains only the data that meets the condition(s).
`GROUP BY`	The `GROUP BY` statement is used to group the result-set.
`HAVING where_condition`	The `HAVING` clause and the `WHERE` clause are both used to filter the results. The `HAVING` clause filters the results of `GROUP BY`, while the `WHERE` clause filter the results before aggregation.

Syntax Element	Description
`ORDER BY`	The `ORDER BY` clause is used to sort the data in ascending or descending order, based on columns, expressions or items in the `select_expr` list.
`LIMIT`	The `LIMIT` clause can be used to constrain the number of rows. `LIMIT` takes one or two numeric arguments. With one argument, the argument specifies the maximum number of rows to return, the first row to return is the first row of the table by default; with two arguments, the first argument specifies the offset of the first row to return, and the second specifies the maximum number of rows to return. TiDB also supports the `FETCH FIRST/NEXT n ROW/ROWS ONLY` syntax, which has the same effect as `LIMIT n`. You can omit `n` in this syntax and its effect is the same as `LIMIT 1`.
`Window window_definition`	This is the syntax for window function, which is usually used to do some analytical computation. For more information, refer to Window Function.
`FOR UPDATE`	The `SELECT FOR UPDATE` clause locks all the data in the result sets to detect concurrent updates from other transactions. Data that match the query conditions but do not exist in the result sets are not read-locked, such as the row data written by other transactions after the current transaction is started. When TiDB uses the Optimistic Transaction Mode, the transaction conflicts are not detected in the statement execution phase. Therefore, the current transaction does not block other transactions from executing `UPDATE`, `DELETE` or `SELECT FOR UPDATE` like other databases such as PostgreSQL. In the committing phase, the rows read by `SELECT FOR UPDATE` are committed in two phases, which means they can also join the conflict detection. If write conflicts occur, the commit fails for all transactions that include the `SELECT FOR UPDATE` clause. If no conflict is detected, the commit succeeds. And a new version is generated for the locked rows, so that write conflicts can be detected when other uncommitted transactions are being committed later. When TiDB uses the Pessimistic Transaction Mode, the behavior is basically the same as other databases. Refer to Difference with MySQL InnoDB to see the details. TiDB supports the `NOWAIT` modifier for `FOR UPDATE`. See TiDB Pessimistic Transaction Mode for details.

Syntax Element	Description
`LOCK IN SHARE MODE`	To guarantee compatibility, TiDB parses these three modifiers, but will ignore them.
`TABLESAMPLE`	To get a sample of rows from the table.

14.13.2.93.3 Examples

SELECT

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.03 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 |  3 |
|  4 |  4 |
|  5 |  5 |
+----+----+
5 rows in set (0.00 sec)
```

```
mysql> SELECT AVG(s_quantity), COUNT(s_quantity) FROM stock TABLESAMPLE
    ↪ REGIONS();
+-----------------+-------------------+
| AVG(s_quantity) | COUNT(s_quantity) |
+-----------------+-------------------+
|         59.5000 |                 4 |
+-----------------+-------------------+
1 row in set (0.00 sec)

mysql> SELECT AVG(s_quantity), COUNT(s_quantity) FROM stock;
+-----------------+-------------------+
| AVG(s_quantity) | COUNT(s_quantity) |
+-----------------+-------------------+
|         54.9729 |           1000000 |
+-----------------+-------------------+
1 row in set (0.52 sec)
```

The above example uses data generated with `tiup bench tpcc prepare`. The first query shows the use of `TABLESAMPLE`.

SELECT … INTO OUTFILE

The `SELECT ... INTO OUTFILE` statement is used to write the result of a query to a file.

Note:

- This statement is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.
- This statement does not support writing query results to any external storages such as Amazon S3 or GCS.

In the statement, you can specify the format of the output file by using the following clauses:

- `FIELDS TERMINATED BY`: specifies the field delimiter in the file. For example, you can specify it as `','` to output comma-separated values (CSV) or `'\t'` to output tab-separated values (TSV).
- `FIELDS ENCLOSED BY`: specifies the enclosing character that wraps around each field in the file.
- `LINES TERMINATED BY`: specifies the line terminator in the file, if you want to end a line with a certain character.

Assume that there is a table `t` with three columns as follows:

```
mysql> CREATE TABLE t (a INT, b VARCHAR(10), c DECIMAL(10,2));
Query OK, 0 rows affected (0.02 sec)

mysql> INSERT INTO t VALUES (1, 'a', 1.1), (2, 'b', 2.2), (3, 'c', 3.3);
Query OK, 3 rows affected (0.01 sec)
```

The following examples show how to use the `SELECT ... INTO OUTFILE` statement to write the query result to a file.

Example 1:

```
mysql> SELECT * FROM t INTO OUTFILE '/tmp/tmp_file1';
Query OK, 3 rows affected (0.00 sec)
```

In this example, you can find the query result in `/tmp/tmp_file1` as follows:

```
1       a       1.10
2       b       2.20
3       c       3.30
```

Example 2:

```
mysql> SELECT * FROM t INTO OUTFILE '/tmp/tmp_file2' FIELDS TERMINATED BY '
    ↪ ,' ENCLOSED BY '"';
Query OK, 3 rows affected (0.00 sec)
```

In this example, you can find the query result in `/tmp/tmp_file2` as follows:

```
"1","a","1.10"
"2","b","2.20"
"3","c","3.30"
```

Example 3:

```
mysql> SELECT * FROM t INTO OUTFILE '/tmp/tmp_file3'
    -> FIELDS TERMINATED BY ',' ENCLOSED BY '\'' LINES TERMINATED BY '<<<\n'
       ↪ ;
Query OK, 3 rows affected (0.00 sec)
```

In this example, you can find the query result in `/tmp/tmp_file3` as follows:

```
'1','a','1.10'<<<
'2','b','2.20'<<<
'3','c','3.30'<<<
```

14.13.2.93.4 MySQL compatibility

- The syntax `SELECT ... INTO @variable` is not supported.
- The syntax `SELECT ... INTO DUMPFILE` is not supported.
- The syntax `SELECT .. GROUP BY expr` does not imply `GROUP BY expr ORDER BY expr` as it does in MySQL 5.7. TiDB instead matches the behavior of MySQL 8.0 and does not imply a default order.
- The syntax `SELECT ... TABLESAMPLE ...` is a TiDB extension designed for compatibility with other database systems and the ISO/IEC 9075-2 standard, but currently it is not supported by MySQL.

14.13.2.93.5 See also

- INSERT
- DELETE
- UPDATE
- REPLACE

14.13.2.94 SET DEFAULT ROLE

This statement sets a specific role to be applied to a user by default. Thus, they will automatically have the permissions associated with a role without having to execute `SET ROLE <rolename>` or `SET ROLE ALL`.

14.13.2.94.1 Synopsis

```
SetDefaultRoleStmt ::=
    "SET" "DEFAULT" "ROLE" ( "NONE" | "ALL" | Rolename ("," Rolename)* ) "TO
        ↪ " Username ("," Username)*
```

14.13.2.94.2 Examples

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

Create a new role `analyticsteam` and a new user `jennifer`:

```
CREATE ROLE analyticsteam;
Query OK, 0 rows affected (0.02 sec)

GRANT SELECT ON test.* TO analyticsteam;
Query OK, 0 rows affected (0.02 sec)

CREATE USER jennifer;
Query OK, 0 rows affected (0.01 sec)

GRANT analyticsteam TO jennifer;
Query OK, 0 rows affected (0.01 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

Note that by default `jennifer` needs to execute `SET ROLE analyticsteam` in order to be able to use the privileges associated with the `analyticsteam` role:

```
SHOW GRANTS;
+-----------------------------------------------+
| Grants for User                               |
+-----------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'          |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-----------------------------------------------+
2 rows in set (0.00 sec)
```

```
SHOW TABLES in test;
ERROR 1044 (42000): Access denied for user 'jennifer'@'%' to database 'test'
SET ROLE analyticsteam;
Query OK, 0 rows affected (0.00 sec)

SHOW GRANTS;
+-------------------------------------------+
| Grants for User                           |
+-------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'      |
| GRANT Select ON test.* TO 'jennifer'@'%'  |
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+-------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

Connect to TiDB as the `root` user:

```
mysql -h 127.0.0.1 -P 4000 -u root
```

The statement `SET DEFAULT ROLE` can be used to associate the role `analyticsteam` to `jennifer`:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
Query OK, 0 rows affected (0.02 sec)
```

Connect to TiDB as the `jennifer` user:

```
mysql -h 127.0.0.1 -P 4000 -u jennifer
```

After this, the user `jennifer` has the privileges associated with the role `analyticsteam` and `jennifer` does not have to execute the statement `SET ROLE`:

```
SHOW GRANTS;
+-------------------------------------------+
| Grants for User                           |
+-------------------------------------------+
| GRANT USAGE ON *.* TO 'jennifer'@'%'      |
| GRANT Select ON test.* TO 'jennifer'@'%'  |
```

```
| GRANT 'analyticsteam'@'%' TO 'jennifer'@'%' |
+---------------------------------------------+
3 rows in set (0.00 sec)

SHOW TABLES IN test;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
+----------------+
1 row in set (0.00 sec)
```

`SET DEFAULT ROLE` will not automatically `GRANT` the associated role to the user. Attempting to `SET DEFAULT ROLE` for a role that `jennifer` does not have granted results in the following error:

```
SET DEFAULT ROLE analyticsteam TO jennifer;
ERROR 3530 (HY000): `analyticsteam`@`%` is is not granted to jennifer@%
```

14.13.2.94.3 MySQL compatibility

The `SET DEFAULT ROLE` statement in TiDB is fully compatible with the roles feature in MySQL 8.0. If you find any compatibility differences, report a bug.

14.13.2.94.4 See also

- `CREATE ROLE`
- `DROP ROLE`
- `GRANT <role>`
- `REVOKE <role>`
- `SET ROLE`

- Role-Based Access Control

14.13.2.95 SET [NAMES|CHARACTER SET]

The statements `SET NAMES`, `SET CHARACTER SET` and `SET CHARSET` modify the variables `character_set_client`, `character_set_results` and `character_set_connection` for the current connection.

14.13.2.95.1 Synopsis

```
SetNamesStmt ::=
    "SET" ("NAMES" ("DEFAULT" | CharsetName ("COLLATE" ("DEFAULT" |
        ↪ CollationName))?) | ("CHARSET" | ("CHAR" | "CHARACTER") "SET") ("
        ↪ DEFAULT" | CharsetName))
```

14.13.2.95.2 Examples

```
mysql> SHOW VARIABLES LIKE 'character_set%';
+--
   ↪ ----------------------+----------------------------------------------------------
   ↪
| Variable_name         | Value                                                    |
+--
   ↪ ----------------------+----------------------------------------------------------
   ↪
| character_sets_dir    | /usr/local/mysql-5.6.25-osx10.8-x86_64/share/
   ↪ charsets/ |

14.13.2.96 SET PASSWORD

This statement changes the user password for a user account in the TiDB system database.

14.13.2.96.1 Synopsis

```
SetPasswordStmt ::=
    "SET" "PASSWORD" ( "FOR" Username )? "=" ( stringLit | "PASSWORD" "("
       ↪ stringLit ")" )
```

14.13.2.96.2 Examples

```
mysql> SET PASSWORD='test'; -- change my password
Query OK, 0 rows affected (0.01 sec)

mysql> CREATE USER 'newuser' IDENTIFIED BY 'test';
Query OK, 1 row affected (0.00 sec)

mysql> SHOW CREATE USER 'newuser';
+--
   ↪ ------------------------------------------------------------------------
   ↪
| CREATE USER for newuser@%
   ↪
   ↪ |
+--
   ↪ ------------------------------------------------------------------------
   ↪
| CREATE USER 'newuser'@'%' IDENTIFIED WITH 'mysql_native_password' AS '*94
   ↪ BDCEBE19083CE2A1F959FD02F964C7AF4CFC29' REQUIRE NONE PASSWORD EXPIRE
   ↪ DEFAULT ACCOUNT UNLOCK |
+--
   ↪ ------------------------------------------------------------------------
   ↪
1 row in set (0.00 sec)

mysql> SET PASSWORD FOR newuser = 'test';
Query OK, 0 rows affected (0.01 sec)

mysql> SHOW CREATE USER 'newuser';
+--
   ↪ ------------------------------------------------------------------------
   ↪
| CREATE USER for newuser@%
   ↪
   ↪ |
+--
   ↪ ------------------------------------------------------------------------
   ↪
```

```
| CREATE USER 'newuser'@'%' IDENTIFIED WITH 'mysql_native_password' AS '*94
    ↪ BDCEBE19083CE2A1F959FD02F964C7AF4CFC29' REQUIRE NONE PASSWORD EXPIRE
    ↪ DEFAULT ACCOUNT UNLOCK |
+--
    ↪ ----------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)

mysql> SET PASSWORD FOR newuser = PASSWORD('test'); -- deprecated syntax
    ↪ from earlier MySQL releases
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW CREATE USER 'newuser';
+--
    ↪ ----------------------------------------------------------------------
    ↪
| CREATE USER for newuser@%
    ↪
    ↪ |
+--
    ↪ ----------------------------------------------------------------------
    ↪
| CREATE USER 'newuser'@'%' IDENTIFIED WITH 'mysql_native_password' AS '*94
    ↪ BDCEBE19083CE2A1F959FD02F964C7AF4CFC29' REQUIRE NONE PASSWORD EXPIRE
    ↪ DEFAULT ACCOUNT UNLOCK |
+--
    ↪ ----------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

14.13.2.96.3 MySQL compatibility

The `SET PASSWORD` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.96.4 See also

- CREATE USER
- Privilege Management

14.13.2.97 SET RESOURCE GROUP

`SET RESOURCE GROUP` is used to set the resource group for the current session.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

14.13.2.97.1 Synopsis

SetResourceGroupStmt:

```
SetResourceGroupStmt ::=
    "SET" "RESOURCE" "GROUP" ResourceGroupName

ResourceGroupName ::=
    Identifier
|   "DEFAULT"
```

14.13.2.97.2 Examples

Create a user `user1`, create two resource groups `rg1` and `rg2`, and bind the user `user1` to the resource group `rg1`.

```
CREATE USER 'user1';
CREATE RESOURCE GROUP 'rg1' RU_PER_SEC = 1000;
ALTER USER 'user1' RESOURCE GROUP `rg1`;
```

Use `user1` to log in and view the resource group bound to the current user.

```
SELECT CURRENT_RESOURCE_GROUP();
```

```
+--------------------------+
| CURRENT_RESOURCE_GROUP() |
+--------------------------+
| rg1                      |
+--------------------------+
1 row in set (0.00 sec)
```

Execute `SET RESOURCE GROUP` to set the resource group for the current session to `rg2`.

```
SET RESOURCE GROUP `rg2`;
SELECT CURRENT_RESOURCE_GROUP();
```

```
+--------------------------+
| CURRENT_RESOURCE_GROUP() |
+--------------------------+
| rg2                      |
```

```
+--------------------------+
1 row in set (0.00 sec)
```

Execute `SET RESOURCE GROUP` to specify the current session to use the default resource group.

```
SET RESOURCE GROUP `default`;
SELECT CURRENT_RESOURCE_GROUP();
```

```
+--------------------------+
| CURRENT_RESOURCE_GROUP() |
+--------------------------+
| default                  |
+--------------------------+
1 row in set (0.00 sec)
```

14.13.2.97.3 MySQL compatibility

MySQL also supports SET RESOURCE GROUP. But the accepted parameters are different from that of TiDB. They are not compatible.

14.13.2.97.4 See also

- CREATE RESOURCE GROUP
- DROP RESOURCE GROUP
- ALTER RESOURCE GROUP
- Resource Control

14.13.2.98 SET ROLE

The `SET ROLE` statement is used to enable roles in the current session. After enabling roles, users can use the privileges of the role(s).

14.13.2.98.1 Synopsis

```
SetRoleStmt ::=
    "SET" "ROLE" ( "DEFAULT" | "ALL" ( "EXCEPT" Rolename ("," Rolename)* )?
        ↪ | "NONE" | Rolename ("," Rolename)* )?
```

14.13.2.98.2 Examples

Create a user `'u1'@'%'` and three roles: `'r1'@'%'`, `'r2'@'%'` and `'r3'@'%'`. Grant these roles to `'u1'@'%'` and set `'r1'@'%'` as the default role of `'u1'@'%'`.

```
CREATE USER 'u1'@'%';
CREATE ROLE 'r1', 'r2', 'r3';
GRANT 'r1', 'r2', 'r3' TO 'u1'@'%';
SET DEFAULT ROLE 'r1' TO 'u1'@'%';
```

Log in as `'u1'@'%'` and execute the following `SET ROLE` statement to enable all roles.

```
SET ROLE ALL;
SELECT CURRENT_ROLE();
```

```
+----------------------------+
| CURRENT_ROLE()             |
+----------------------------+
| `r1`@`%`,`r2`@`%`,`r3`@`%` |
+----------------------------+
1 row in set (0.000 sec)
```

Execute the following `SET ROLE` statement to enable `'r2'` and `'r3'`.

```
SET ROLE 'r2', 'r3';
SELECT CURRENT_ROLE();
```

```
+-------------------+
| CURRENT_ROLE()    |
+-------------------+
| `r2`@`%`,`r3`@`%` |
+-------------------+
1 row in set (0.000 sec)
```

Execute the following `SET ROLE` statement to enable the default role(s).

```
SET ROLE DEFAULT;
SELECT CURRENT_ROLE();
```

```
+----------------+
| CURRENT_ROLE() |
+----------------+
| `r1`@`%`       |
+----------------+
1 row in set (0.000 sec)
```

Execute the following `SET ROLE` statement to cancel all enabled role(s).

```
SET ROLE NONE;
SELECT CURRENT_ROLE();
```

```
+----------------+
| CURRENT_ROLE() |
+----------------+
|                |
+----------------+
1 row in set (0.000 sec)
```

14.13.2.98.3 MySQL compatibility

The `SET ROLE` statement in TiDB is fully compatible with the roles feature in MySQL 8.0. If you find any compatibility differences, report a bug.

14.13.2.98.4 See also

- CREATE ROLE
- DROP ROLE
- `GRANT <role>`
- `REVOKE <role>`
- SET DEFAULT ROLE

- Role-Based Access Control

14.13.2.99 SET TRANSACTION

The `SET TRANSACTION` statement can be used to change the current isolation level on a `GLOBAL` or `SESSION` basis. This syntax is an alternative to `SET transaction_isolation='new-value'` and is included for compatibility with both MySQL, and the SQL standards.

14.13.2.99.1 Synopsis

```
SetStmt ::=
    'SET' ( VariableAssignmentList |
    'PASSWORD' ('FOR' Username)? '=' PasswordOpt |
    ( 'GLOBAL'| 'SESSION' )? 'TRANSACTION' TransactionChars |
    'CONFIG' ( Identifier | stringLit) ConfigItemName EqOrAssignmentEq
       ↪ SetExpr )

TransactionChars ::=
    ( 'ISOLATION' 'LEVEL' IsolationLevel | 'READ' 'WRITE' | 'READ' 'ONLY'
       ↪ AsOfClause? )

IsolationLevel ::=
    ( 'REPEATABLE' 'READ' | 'READ' ( 'COMMITTED' | 'UNCOMMITTED' ) | '
       ↪ SERIALIZABLE' )
```

```
AsOfClause ::=
    ( 'AS' 'OF' 'TIMESTAMP' Expression)
```

14.13.2.99.2 Examples

```
mysql> SHOW SESSION VARIABLES LIKE 'transaction_isolation';
+-----------------------+-----------------+
| Variable_name         | Value           |
+-----------------------+-----------------+
| transaction_isolation | REPEATABLE-READ |
+-----------------------+-----------------+
1 row in set (0.00 sec)

mysql> SET SESSION TRANSACTION ISOLATION LEVEL READ COMMITTED;
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW SESSION VARIABLES LIKE 'transaction_isolation';
+-----------------------+----------------+
| Variable_name         | Value          |
+-----------------------+----------------+
| transaction_isolation | READ-COMMITTED |
+-----------------------+----------------+
1 row in set (0.01 sec)

mysql> SET SESSION transaction_isolation = 'REPEATABLE-READ';
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW SESSION VARIABLES LIKE 'transaction_isolation';
+-----------------------+-----------------+
| Variable_name         | Value           |
+-----------------------+-----------------+
| transaction_isolation | REPEATABLE-READ |
+-----------------------+-----------------+
1 row in set (0.00 sec)
```

14.13.2.99.3 MySQL compatibility

- TiDB supports the ability to set a transaction as read-only in syntax only.
- The isolation levels `READ-UNCOMMITTED` and `SERIALIZABLE` are not supported.
- The `REPEATABLE-READ` isolation level is achieved through using the snapshot isolation technology, which is partly compatible with MySQL.

- In pessimistic transactions, TiDB supports two isolation levels compatible with MySQL: `REPEATABLE-READ` and `READ-COMMITTED`. For a detailed description, see Isolation Levels.

14.13.2.99.4 See also

- `SET [GLOBAL|SESSION] <variable>`
- Isolation Levels

14.13.2.100 `SET [GLOBAL|SESSION] <variable>`

The statement `SET [GLOBAL|SESSION]` modifies one of TiDB's built in variables. These variables can be system variables of either `SESSION` or `GLOBAL` scope or user variables.

> **Warning:**
>
> User-defined variables are still an experimental feature. It is **NOT** recommended that you use them in the production environment.

> **Note:**
>
> Similar to MySQL, changes to `GLOBAL` variables do not apply to either existing connections, or the local connection. Only new sessions reflect the changes to the value.

14.13.2.100.1 Synopsis

```
SetVariableStmt ::=
    "SET" Variable "=" Expression ("," Variable "=" Expression )*

Variable ::=
    ("GLOBAL" | "SESSION") SystemVariable
|   UserVariable
```

14.13.2.100.2 Examples

Get the value of `sql_mode`.

```
mysql> SHOW GLOBAL VARIABLES LIKE 'sql_mode';
+--
    ↪ -------------+-----------------------------------------------------------------
    ↪
| Variable_name | Value
    ↪
    ↪ |
+--
    ↪ -------------+-----------------------------------------------------------------
    ↪
| sql_mode      | ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_
    ↪ ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,NO_ENGINE_
    ↪ SUBSTITUTION |
+--
    ↪ -------------+-----------------------------------------------------------------
    ↪
1 row in set (0.00 sec)

mysql> SHOW SESSION VARIABLES LIKE 'sql_mode';
+--
    ↪ -------------+-----------------------------------------------------------------
    ↪
| Variable_name | Value
    ↪
    ↪ |
+--
    ↪ -------------+-----------------------------------------------------------------
    ↪
| sql_mode      | ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_
    ↪ ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,NO_ENGINE_
    ↪ SUBSTITUTION |
+--
    ↪ -------------+-----------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

Update the value of `sql_mode` globally. If you check the value of `SQL_mode` after the update, you can see that the value of `SESSION` level has not been updated:

```
mysql> SET GLOBAL sql_mode = 'STRICT_TRANS_TABLES,NO_AUTO_CREATE_USER';
Query OK, 0 rows affected (0.03 sec)

mysql> SHOW GLOBAL VARIABLES LIKE 'sql_mode';
+---------------+-----------------------------------------+
| Variable_name | Value                                   |
```

```
+---------------+-----------------------------------------+
| sql_mode      | STRICT_TRANS_TABLES,NO_AUTO_CREATE_USER |
+---------------+-----------------------------------------+
1 row in set (0.00 sec)

mysql> SHOW SESSION VARIABLES LIKE 'sql_mode';
+--
    ↪ -------------+-----------------------------------------------------------------
    ↪
| Variable_name | Value
    ↪
    ↪ |
+--
    ↪ -------------+-----------------------------------------------------------------
    ↪
| sql_mode      | ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_
    ↪ ZERO_DATE,ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,NO_ENGINE_
    ↪ SUBSTITUTION |
+--
    ↪ -------------+-----------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

Using SET SESSION takes effect immediately:

```
mysql> SET SESSION sql_mode = 'STRICT_TRANS_TABLES,NO_AUTO_CREATE_USER';
Query OK, 0 rows affected (0.01 sec)

mysql> SHOW SESSION VARIABLES LIKE 'sql_mode';
+---------------+-----------------------------------------+
| Variable_name | Value                                   |
+---------------+-----------------------------------------+
| sql_mode      | STRICT_TRANS_TABLES,NO_AUTO_CREATE_USER |
+---------------+-----------------------------------------+
1 row in set (0.00 sec)
```

User variables start with a @.

```
SET @myvar := 5;
Query OK, 0 rows affected (0.00 sec)

SELECT @myvar, @myvar + 1;
+--------+------------+
| @myvar | @myvar + 1 |
+--------+------------+
|      5 |          6 |
```

```
+--------+-----------+
1 row in set (0.00 sec)
```

14.13.2.100.3 MySQL compatibility

The following behavior differences apply:

- Changes made with `SET GLOBAL` will be propagated to all TiDB instances in the cluster. This differs from MySQL, where changes do not propagate to replicas.
- TiDB presents several variables as both readable and settable. This is required for MySQL compatibility, because it is common for both applications and connectors to read MySQL variables. For example: JDBC connectors both read and set query cache settings, despite not relying on the behavior.
- Changes made with `SET GLOBAL` will persist through TiDB server restarts. This means that `SET GLOBAL` in TiDB behaves more similar to `SET PERSIST` as available in MySQL 8.0 and above.
- TiDB does not support `SET PERSIST` and `SET PERSIST_ONLY`, because TiDB persists global variables.

14.13.2.100.4 See also

- SHOW [GLOBAL|SESSION] VARIABLES

14.13.2.101 SHOW ANALYZE STATUS

The `SHOW ANALYZE STATUS` statement shows the statistics collection tasks being executed by TiDB and a limited number of historical task records.

Starting from TiDB v6.1.0, the `SHOW ANALYZE STATUS` statement supports showing cluster-level tasks. Even after a TiDB restart, you can still view task records before the restart using this statement. Before TiDB v6.1.0, the `SHOW ANALYZE STATUS` statement can only show instance-level tasks, and task records are cleared after a TiDB restart.

Starting from TiDB v6.1.0, you can view the history tasks within the last 7 days through the system table `mysql.analyze_jobs`.

Starting from TiDB v7.3.0, you can view the progress of the current `ANALYZE` task through the system table `mysql.analyze_jobs` or `SHOW ANALYZE STATUS`.

14.13.2.101.1 Synopsis

```
ShowAnalyzeStatusStmt ::= 'SHOW' 'ANALYZE' 'STATUS' ShowLikeOrWhereOpt

ShowLikeOrWhereOpt ::= 'LIKE' SimpleExpr | 'WHERE' Expression
```

14.13.2.101.2 Examples

```

14.13.2.102 SHOW [BACKUPS|RESTORES]

These statements show a list of all queued, running and recently finished `BACKUP` and `RESTORE` tasks that were executed on a TiDB instance.

Both statements require `SUPER` privilege to run.

Use `SHOW BACKUPS` to query `BACKUP` tasks and use `SHOW RESTORES` to query `RESTORE` tasks.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

Backups and restores that were started with the `br` commandline tool are not shown.

14.13.2.102.1 Synopsis

```
ShowBRIEStmt ::=
    "SHOW" ("BACKUPS" | "RESTORES") ShowLikeOrWhere?

ShowLikeOrWhere ::=
    "LIKE" SimpleExpr
|   "WHERE" Expression
```

14.13.2.102.2 Examples

In one connection, execute the following statement:

```
BACKUP DATABASE `test` TO 's3://example-bucket/backup-01';
```

Before the backup completes, run `SHOW BACKUPS` in a new connection:

```
SHOW BACKUPS;
```

```
+--
    ↪ ----------------------------+---------+----------+--------------------+------
    ↪
| Destination                 | State   | Progress | Queue_time         |
    ↪ Execution_time    | Finish_time | Connection | Message |
+--
    ↪ ----------------------------+---------+----------+--------------------+------
    ↪
| s3://example-bucket/backup-01/ | Backup | 98.38 | 2020-04-12 23:09:03 |
    ↪ 2020-04-12 23:09:25 | NULL |      4 | NULL   |
+--
    ↪ ----------------------------+---------+----------+--------------------+------
    ↪
1 row in set (0.00 sec)
```

The first row of the result above is described as follows:

Column	Description
`Destination` ↪	The destination URL (with all parameters stripped to avoid leaking secret keys)
`State`	State of the task
`Progress`	Estimated progress in the current state as a percentage
`Queue_` ↪ `time`	When the task was queued

Column	Description
`Execution_time`	When the task was started; the value is `0000-00-00 00:00:00` for queueing tasks
`Finish_time`	The timestamp when the task finished; the value is `0000-00-00 00:00:00` for queueing and running tasks
`Connection`	Connection ID running this task
`Message`	Message with details

The possible states are:

State	Description
Backup	Making a backup
Wait	Waiting for execution
Checksum	Running a checksum operation

The connection ID can be used to cancel a backup/restore task via the `KILL TIDB QUERY` statement.

```
KILL TIDB QUERY 4;
```

```
Query OK, 0 rows affected (0.00 sec)
```

Filtering

Use the `LIKE` clause to filter out tasks by matching the destination URL against a wildcard expression.

```
SHOW BACKUPS LIKE 's3://%';
```

Use the `WHERE` clause to filter by columns.

```
SHOW BACKUPS WHERE `Progress` < 25.0;
```

14.13.2.102.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.103 SHOW [GLOBAL|SESSION] BINDINGS

The `SHOW BINDINGS` statement is used to display information about created SQL bindings. A `BINDING` can be on either a `GLOBAL` or `SESSION` basis. The default is `SESSION`.

14.13.2.103.1 Synopsis

```
ShowBindingsStmt ::=
    "SHOW" ("GLOBAL" | "SESSION")? "BINDINGS" ShowLikeOrWhere?

ShowLikeOrWhere ::=
    "LIKE" SimpleExpr
|   "WHERE" Expression
```

14.13.2.103.2 Syntax description

This statement outputs the execution plan bindings at the GLOBAL or SESSION level. The default scope is SESSION. Currently `SHOW BINDINGS` outputs eight columns, as shown below:

Column Name	Description
original_sql	Original SQL statement after parameterization
bind_sql	Bound SQL statement with hints
default_db	Default database
status	Status including 'Using', 'Deleted', 'Invalid', 'Rejected', and 'Pending verification'
create_time	Created time
update_time	Updated time
charset	Character set
collation	Sorting rule
source	The way in which a binding is created, including `manual` (created by the `create [global] binding` SQL statement), `capture` (captured automatically by TiDB), and `evolve` (evolved automatically by TiDB)

14.13.2.103.3 Examples

```
mysql> CREATE TABLE t1 (
         id INT NOT NULL PRIMARY KEY auto_increment,
```

```
         b INT NOT NULL,
         pad VARBINARY(255),
         INDEX(b)
        );
Query OK, 0 rows affected (0.07 sec)

14.13.2.104.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.105 SHOW CHARACTER SET

This statement provides a static list of available character sets in TiDB. The output does not reflect any attributes of the current connection or user.

14.13.2.105.1 Synopsis

```
ShowCharsetStmt ::=
    "SHOW" ( ("CHARACTER" | "CHAR") "SET" | "CHARSET" ) ShowLikeOrWhere?

ShowLikeOrWhere ::=
    "LIKE" SimpleExpr
|   "WHERE" Expression
```

14.13.2.105.2 Examples

```
SHOW CHARACTER SET;
```

```
+---------+--------------+-------------------+--------+
| Charset | Description | Default collation | Maxlen |
+---------+--------------+-------------------+--------+
| utf8    | UTF-8 Unicode | utf8_bin      |      3 |
```

```
| utf8mb4 | UTF-8 Unicode | utf8mb4_bin |      4 |
| ascii   | US ASCII      | ascii_bin   |      1 |
| latin1  | Latin1        | latin1_bin  |      1 |
| binary  | binary        | binary      |      1 |
+---------+---------------+-------------------+--------+
5 rows in set (0.00 sec)
```

```
SHOW CHARACTER SET LIKE 'utf8%';
```

```
+---------+---------------+-------------------+--------+
| Charset | Description | Default collation | Maxlen |
+---------+---------------+-------------------+--------+
| utf8    | UTF-8 Unicode | utf8_bin      |      3 |
| utf8mb4 | UTF-8 Unicode | utf8mb4_bin |      4 |
+---------+---------------+-------------------+--------+
2 rows in set (0.00 sec)
```

```
SHOW CHARACTER SET WHERE Description='UTF-8 Unicode';
```

```
+---------+---------------+-------------------+--------+
| Charset | Description | Default collation | Maxlen |
+---------+---------------+-------------------+--------+
| utf8    | UTF-8 Unicode | utf8_bin      |      3 |
| utf8mb4 | UTF-8 Unicode | utf8mb4_bin |      4 |
+---------+---------------+-------------------+--------+
2 rows in set (0.00 sec)
```

14.13.2.105.3 MySQL compatibility

The usage of `SHOW CHARACTER SET` statement in TiDB is fully compatible with MySQL. However, charsets in TiDB might have different default collations compared with MySQL. For details, refer to Compatibility with MySQL. If you find any compatibility differences, report a bug.

- Character Set and Collation

14.13.2.106 SHOW COLLATION

This statement provides a static list of collations, and is included to provide compatibility with MySQL client libraries.

> **Note:**
>
> Results of `SHOW COLLATION` vary when the "new collation framework" is enabled. For new collation framework details, refer to Character Set and Collation.

14.13.2.106.1 Synopsis

```
ShowCollationStmt ::=
    "SHOW" "COLLATION" ShowLikeOrWhere?

ShowLikeOrWhere ::=
    "LIKE" SimpleExpr
|   "WHERE" Expression
```

14.13.2.106.2 Examples

When new collation framework is disabled, only binary collations are displayed.

```
SHOW COLLATION;
```

```
+-------------+---------+------+---------+----------+---------+
| Collation | Charset | Id | Default | Compiled | Sortlen |
+-------------+---------+------+---------+----------+---------+
| utf8mb4_bin | utf8mb4 | 46 | Yes  | Yes     |      1 |
| latin1_bin | latin1 |  47 | Yes    | Yes     |      1 |
| binary     | binary |   63 | Yes    | Yes     |      1 |
| ascii_bin  | ascii  |   65 | Yes    | Yes     |      1 |
| utf8_bin   | utf8   |   83 | Yes    | Yes     |      1 |
+-------------+---------+------+---------+----------+---------+
5 rows in set (0.02 sec)
```

When new collation framework is enabled, `utf8_general_ci` and `utf8mb4_general_ci` are additionally supported.

```
SHOW COLLATION;
```

```
+--------------------+---------+------+---------+----------+---------+
| Collation        | Charset | Id | Default | Compiled | Sortlen |
+--------------------+---------+------+---------+----------+---------+
| ascii_bin        | ascii  |   65 | Yes    | Yes     |      1 |
| binary           | binary |   63 | Yes    | Yes     |      1 |
```

```
| gbk_bin          | gbk    |  87 |         | Yes     |       1 |
| gbk_chinese_ci   | gbk    |  28 | Yes     | Yes     |       1 |
| latin1_bin       | latin1 |  47 | Yes     | Yes     |       1 |
| utf8_bin         | utf8   |  83 | Yes     | Yes     |       1 |
| utf8_general_ci  | utf8   |  33 |         | Yes     |       1 |
| utf8_unicode_ci  | utf8   | 192 |         | Yes     |       1 |
| utf8mb4_bin      | utf8mb4 | 46 | Yes     | Yes     |       1 |
| utf8mb4_general_ci | utf8mb4 | 45 |      | Yes     |       1 |
| utf8mb4_unicode_ci | utf8mb4 | 224 |     | Yes     |       1 |
+--------------------+---------+-----+---------+---------+---------+
11 rows in set (0.001 sec)
```

To filter on the character set, you can add a `WHERE` clause.

```
SHOW COLLATION WHERE Charset="utf8mb4";
```

```
+--------------------+---------+-----+---------+----------+---------+
| Collation          | Charset | Id  | Default | Compiled | Sortlen |
+--------------------+---------+-----+---------+----------+---------+
| utf8mb4_0900_ai_ci | utf8mb4 | 255 |     | Yes      |       1 |
| utf8mb4_0900_bin | utf8mb4 | 309 |       | Yes      |       1 |
| utf8mb4_bin      | utf8mb4 | 46 | Yes    | Yes      |       1 |
| utf8mb4_general_ci | utf8mb4 | 45 |     | Yes      |       1 |
| utf8mb4_unicode_ci | utf8mb4 | 224 |    | Yes      |       1 |
+--------------------+---------+-----+---------+----------+---------+
5 rows in set (0.00 sec)
```

14.13.2.106.3 MySQL compatibility

The usage of the `SHOW COLLATION` statement in TiDB is fully compatible with MySQL. However, charsets in TiDB might have different default collations compared with MySQL. For details, refer to Compatibility with MySQL. If you find any compatibility differences, report a bug.

14.13.2.107 SHOW [FULL] COLUMNS FROM

The statement `SHOW [FULL] COLUMNS FROM <table_name>` describes the columns of a table or view in a useful tabular format. The optional keyword `FULL` displays the privileges the current user has to that column, and the `comment` from the table definition.

The statements `SHOW [FULL] FIELDS FROM <table_name>`, `DESC <table_name>`, `DESCRIBE <table_name>`, and `EXPLAIN <table_name>` are aliases of this statement.

> **Note:**
>
> `DESC TABLE <table_name>`, `DESCRIBE TABLE <table_name>`, and `EXPLAIN TABLE <table_name>` are not equivalent to the above statements. They are aliases of `DESC SELECT * FROM <table_name>`.

14.13.2.107.1 Synopsis

```
ShowColumnsFromStmt ::=
    "SHOW" "FULL"? ("COLUMNS" | "FIELDS") ("FROM" | "IN") TableName ( ("FROM
        ↪ " | "IN") SchemaName)? ShowLikeOrWhere?

TableName ::=
    (Identifier ".")? Identifier

ShowLikeOrWhere ::=
    "LIKE" SimpleExpr
|   "WHERE" Expression
```

14.13.2.107.2 Examples

```
mysql> CREATE VIEW v1 AS SELECT 1;
Query OK, 0 rows affected (0.11 sec)

mysql> SHOW COLUMNS FROM v1;
+------+----------+------+------+---------+-------+
| Field | Type    | Null | Key | Default | Extra |
+------+----------+------+------+---------+-------+
| 1    | bigint(1) | YES |    | NULL   |       |
+------+----------+------+------+---------+-------+
1 row in set (0.00 sec)

mysql> DESC v1;
+------+----------+------+------+---------+-------+
| Field | Type    | Null | Key | Default | Extra |
+------+----------+------+------+---------+-------+
| 1    | bigint(1) | YES |    | NULL   |       |
+------+----------+------+------+---------+-------+
1 row in set (0.00 sec)
```

```
mysql> DESCRIBE v1;
+-------+----------+------+-----+---------+-------+
| Field | Type     | Null | Key | Default | Extra |
+-------+----------+------+-----+---------+-------+
| 1     | bigint(1) | YES |     | NULL    |       |
+-------+----------+------+-----+---------+-------+
1 row in set (0.00 sec)

mysql> EXPLAIN v1;
+-------+----------+------+-----+---------+-------+
| Field | Type     | Null | Key | Default | Extra |
+-------+----------+------+-----+---------+-------+
| 1     | bigint(1) | YES |     | NULL    |       |
+-------+----------+------+-----+---------+-------+
1 row in set (0.00 sec)

mysql> SHOW FIELDS FROM v1;
+-------+----------+------+-----+---------+-------+
| Field | Type     | Null | Key | Default | Extra |
+-------+----------+------+-----+---------+-------+
| 1     | bigint(1) | YES |     | NULL    |       |
+-------+----------+------+-----+---------+-------+
1 row in set (0.00 sec)

```

14.13.2.107.3 MySQL compatibility

The `SHOW [FULL] COLUMNS FROM` statement in TiDB is fully compatible with MySQL.

If you find any compatibility differences, report a bug.

14.13.2.107.4 See also

- SHOW CREATE TABLE

14.13.2.108 SHOW CONFIG

The `SHOW CONFIG` statement is used to show the current configuration of various components of TiDB. Note that the configuration and system variables act on different dimensions and should not be mixed up. If you want to obtain the system variable information, use the SHOW VARIABLES syntax.

> **Note:**
>
> This feature is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

14.13.2.108.1 Synopsis

ShowStmt:

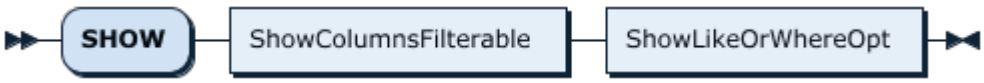

Figure 430: ShowStmt

ShowTargetFilterable:

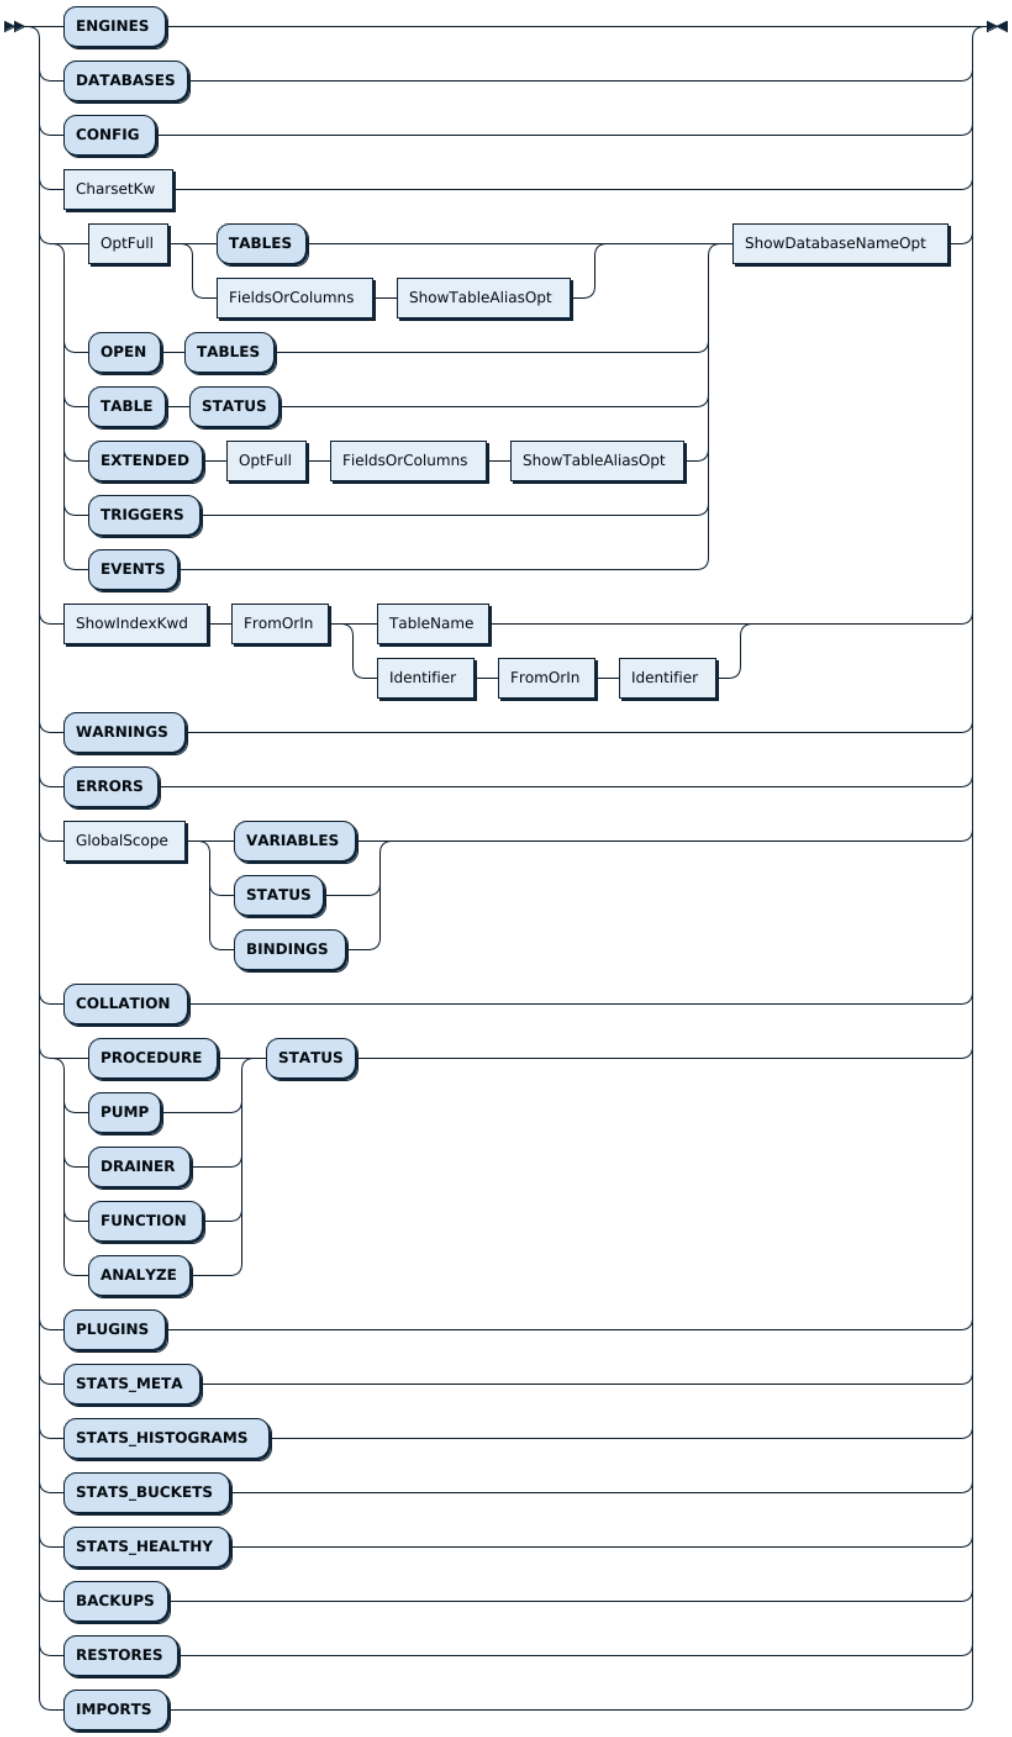

Figure 431: ShowTargetFilterable

14.13.2.108.2 Examples

Show all configurations:

```
SHOW CONFIG;
```

```
+------+----------------+-----------------------------------------------------+-------------
    ↪
| Type | Instance     | Name                                                | Value
    ↪                                                        |
+------+----------------+-----------------------------------------------------+-------------
    ↪
| tidb | 127.0.0.1:4000 | advertise-address                                   | 127.0.0.1
    ↪                                                       |
| tidb | 127.0.0.1:4000 | binlog.binlog-socket                                |
    ↪                                                        |
| tidb | 127.0.0.1:4000 | binlog.enable                                       | false
    ↪                                                        |
...
120 rows in set (0.01 sec)
```

Show the configuration where the `type` is `tidb`:

```
SHOW CONFIG WHERE type = 'tidb' AND name = 'advertise-address';
```

```
+------+----------------+------------------+-----------+
| Type | Instance     | Name             | Value     |
+------+----------------+------------------+-----------+
| tidb | 127.0.0.1:4000 | advertise-address | 127.0.0.1 |
+------+----------------+------------------+-----------+
1 row in set (0.05 sec)
```

You can also use the `LIKE` clause to show the configuration where the `type` is `tidb`:

```
SHOW CONFIG LIKE 'tidb';
```

```
+------+----------------+-----------------------------------------------------+-------------
    ↪
| Type | Instance     | Name                                                | Value
    ↪                                                        |
+------+----------------+-----------------------------------------------------+-------------
    ↪
| tidb | 127.0.0.1:4000 | advertise-address                                   | 127.0.0.1
    ↪                                                       |
| tidb | 127.0.0.1:4000 | binlog.binlog-socket                                |
    ↪                                                        |
```

```
| tidb | 127.0.0.1:4000 | binlog.enable                                  | false
    ↪                                                                |
...
40 rows in set (0.01 sec)
```

14.13.2.108.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.108.4 See also

- SHOW VARIABLES

14.13.2.109 SHOW CREATE DATABASE

`SHOW CREATE DATABASE` is used to show the exact SQL statement for re-creating an existing database. `SHOW CREATE SCHEMA` is a synonym for it.

14.13.2.109.1 Synopsis

ShowCreateDatabaseStmt:

```
ShowCreateDatabaseStmt ::=
    "SHOW" "CREATE" ("DATABASE" | "SCHEMA") ("IF" "NOT" "EXISTS")? DBName
```

14.13.2.109.2 Examples

```
CREATE DATABASE test;
```

```
Query OK, 0 rows affected (0.12 sec)
```

```
SHOW CREATE DATABASE test;
```

```
+--
    ↪ --------+-----------------------------------------------------------------+
    ↪
| Database | Create Database                                                  |
+--
    ↪ --------+-----------------------------------------------------------------+
    ↪
| test     | CREATE DATABASE `test` /*!40100 DEFAULT CHARACTER SET utf8mb4
    ↪ */ |
+--
    ↪ --------+-----------------------------------------------------------------+
    ↪
```

```
1 row in set (0.00 sec)
```

```
SHOW CREATE SCHEMA IF NOT EXISTS test;
```

```
+--
    ↪ --------+-----------------------------------------------------------------------
    ↪
| Database | Create Database
    ↪                                                                          |
+--
    ↪ --------+-----------------------------------------------------------------------
    ↪
| test     | CREATE DATABASE /*!32312 IF NOT EXISTS*/ `test` /*!40100
    ↪ DEFAULT CHARACTER SET utf8mb4 */ |
+--
    ↪ --------+-----------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

14.13.2.109.3 MySQL compatibility

`SHOW CREATE DATABASE` is expected to be fully compatible with MySQL. If you find any compatibility differences, you can report a bug.

14.13.2.109.4 See also

- CREATE TABLE
- DROP TABLE
- SHOW TABLES
- SHOW COLUMNS FROM

14.13.2.110 SHOW CREATE PLACEMENT POLICY

`SHOW CREATE PLACEMENT POLICY` is used to show the definition of a placement policy. This can be used to see the current definition of a placement policy and recreate it in another TiDB cluster.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

14.13.2.110.1 Synopsis

```
ShowCreatePlacementPolicyStmt ::=
    "SHOW" "CREATE" "PLACEMENT" "POLICY" PolicyName

PolicyName ::=
    Identifier
```

14.13.2.110.2 Examples

```
CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us
    ↪ -west-1" FOLLOWERS=4;
CREATE TABLE t1 (a INT) PLACEMENT POLICY=p1;
SHOW CREATE PLACEMENT POLICY p1\G
```

```
Query OK, 0 rows affected (0.08 sec)

Query OK, 0 rows affected (0.10 sec)

***************************[ 1. row ]***************************
Policy      | p1
Create Policy | CREATE PLACEMENT POLICY `p1` PRIMARY_REGION="us-east-1"
    ↪ REGIONS="us-east-1,us-west-1" FOLLOWERS=4
1 row in set (0.00 sec)
```

14.13.2.110.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.110.4 See also

- Placement Rules in SQL
- SHOW PLACEMENT
- CREATE PLACEMENT POLICY
- ALTER PLACEMENT POLICY
- DROP PLACEMENT POLICY

14.13.2.111 SHOW CREATE RESOURCE GROUP

You can use the `SHOW CREATE RESOURCE GROUP` statement to view the current definition of a resource group.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

14.13.2.111.1 Synopsis

```
ShowCreateResourceGroupStmt ::=
    "SHOW" "CREATE" "RESOURCE" "GROUP" ResourceGroupName

ResourceGroupName ::=
    Identifier
|   "DEFAULT"
```

14.13.2.111.2 Examples

Create a resource group `rg1`.

```
CREATE RESOURCE GROUP rg1 RU_PER_SEC=100;
Query OK, 0 rows affected (0.10 sec)
```

View the definition of `rg1`.

```
SHOW CREATE RESOURCE GROUP rg1;
***************************[ 1. row ]***************************
+--
    ↪ --------------+-------------------------------------------------------------+
    ↪
| Resource_Group | Create Resource Group                                      |
+--
    ↪ --------------+-------------------------------------------------------------+
    ↪
| rg1            | CREATE RESOURCE GROUP `rg1` RU_PER_SEC=100 PRIORITY=MEDIUM
    ↪  |
+--
    ↪ --------------+-------------------------------------------------------------+
    ↪
1 row in set (0.01 sec)
```

14.13.2.111.3 MySQL compatibility

This statement is a TiDB extension for MySQL.

14.13.2.111.4 See also

- TiDB RESOURCE CONTROL
- CREATE RESOURCE GROUP
- ALTER RESOURCE GROUP
- DROP RESOURCE GROUP

14.13.2.112 SHOW CREATE SEQUENCE

The `SHOW CREATE SEQUENCE` shows the detailed information of a sequence, which is similar to `SHOW CREATE TABLE`.

14.13.2.112.1 Synopsis

```
ShowCreateSequenceStmt ::=
    "SHOW" "CREATE" "SEQUENCE" ( SchemaName "." )? TableName
```

14.13.2.112.2 Examples

```
CREATE SEQUENCE seq;
```

```
Query OK, 0 rows affected (0.03 sec)
```

```
SHOW CREATE SEQUENCE seq;
```

```
+-------+-----------------------------------------------------------------------------
    ↪
| Table | Create Table
    ↪
    ↪ |
+-------+-----------------------------------------------------------------------------
    ↪
| seq   | CREATE SEQUENCE `seq` start with 1 minvalue 1 maxvalue
    ↪ 9223372036854775806 increment by 1 cache 1000 nocycle ENGINE=InnoDB |
+-------+-----------------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

14.13.2.112.3 MySQL compatibility

This statement is a TiDB extension. The implementation is modeled on sequences available in MariaDB.

14.13.2.112.4 See also

- CREATE SEQUENCE
- ALTER SEQUENCE
- DROP SEQUENCE

14.13.2.113 SHOW CREATE TABLE

This statement shows the exact statement to recreate an existing table using SQL.

14.13.2.113.1 Synopsis

```
ShowCreateTableStmt ::=
    "SHOW" "CREATE" "TABLE" (SchemaName ".")? TableName
```

14.13.2.113.2 Examples

```
mysql> CREATE TABLE t1 (a INT);
Query OK, 0 rows affected (0.12 sec)

mysql> SHOW CREATE TABLE t1\G
*************************** 1. row ***************************
       Table: t1
Create Table: CREATE TABLE `t1` (
  `a` int(11) DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
1 row in set (0.00 sec)
```

14.13.2.113.3 MySQL compatibility

The `SHOW CREATE TABLE` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.113.4 See also

- CREATE TABLE
- DROP TABLE
- SHOW TABLES
- SHOW COLUMNS FROM

14.13.2.114 SHOW CREATE USER

This statement shows how to re-create a user using the `CREATE USER` syntax.

14.13.2.114.1 Synopsis

```
ShowCreateUserStmt ::=
    "SHOW" "CREATE" "USER" (Username ("@" Hostname)? | "CURRENT_USER" ( "("
        ↪ ")" )? )
```

14.13.2.114.2 Examples

```
mysql> SHOW CREATE USER 'root';
+--
    ↪ ----------------------------------------------------------------------------
    ↪
| CREATE USER for root@%
    ↪
    ↪ |
+--
    ↪ ----------------------------------------------------------------------------
    ↪
| CREATE USER 'root'@'%' IDENTIFIED WITH 'mysql_native_password' AS ''
    ↪ REQUIRE NONE PASSWORD EXPIRE DEFAULT ACCOUNT UNLOCK |
+--
    ↪ ----------------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)

mysql> SHOW GRANTS FOR 'root';
+-----------------------------------------+
| Grants for root@%                       |
+-----------------------------------------+
| GRANT ALL PRIVILEGES ON *.* TO 'root'@'%' |
+-----------------------------------------+
1 row in set (0.00 sec)
```

14.13.2.114.3 MySQL compatibility

- The output of `SHOW CREATE USER` is designed to match MySQL, but several of the `CREATE` options are not yet supported by TiDB. Not yet supported options will be parsed but ignored. See Security compatibility for more details.

14.13.2.114.4 See also

- CREATE USER
- SHOW GRANTS
- DROP USER

14.13.2.115 SHOW DATABASES

This statement shows a list of databases that the current user has privileges to. Databases which the current user does not have access to will appear hidden from the list. The `information_schema` database always appears first in the list of databases.

`SHOW SCHEMAS` is an alias of this statement.

14.13.2.115.1 Synopsis

```
ShowDatabasesStmt ::=
    "SHOW" "DATABASES" ShowLikeOrWhere?

ShowLikeOrWhere ::=
    "LIKE" SimpleExpr
|   "WHERE" Expression
```

14.13.2.115.2 Examples

```
mysql> SHOW DATABASES;
+--------------------+
| Database           |
+--------------------+
| INFORMATION_SCHEMA |
| PERFORMANCE_SCHEMA |
| mysql              |
| test               |
+--------------------+
4 rows in set (0.00 sec)

mysql> CREATE DATABASE mynewdb;
Query OK, 0 rows affected (0.10 sec)

mysql> SHOW DATABASES;
+--------------------+
| Database           |
+--------------------+
| INFORMATION_SCHEMA |
| PERFORMANCE_SCHEMA |
| mynewdb            |
| mysql              |
| test               |
+--------------------+
5 rows in set (0.00 sec)
```

14.13.2.115.3 MySQL compatibility

The `SHOW DATABASES` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.115.4 See also

- SHOW SCHEMAS
- DROP DATABASE
- CREATE DATABASE
- `INFORMATION_SCHEMA.SCHEMATA`

14.13.2.116 SHOW DRAINER STATUS

The `SHOW DRAINER STATUS` statement displays the status information for all Drainer nodes in the cluster.

> **Note:**
>
> This feature is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

14.13.2.116.1 Examples

```
SHOW DRAINER STATUS;
```

```
+--
    ↪ --------/---------------/--------/-------------------/--------------------/
    ↪
|  NodeID |     Address    | State |  Max_Commit_Ts  |    Update_Time     |
+--
    ↪ --------/---------------/--------/-------------------/--------------------/
    ↪
| drainer1 | 127.0.0.3:8249 | Online | 408553768673342532 | 2019-05-01
    ↪ 00:00:03 |
+--
    ↪ --------/---------------/--------/-------------------/--------------------/
    ↪
| drainer2 | 127.0.0.4:8249 | Online | 408553768673345531 | 2019-05-01
    ↪ 00:00:04 |
+--
    ↪ --------/---------------/--------/-------------------/--------------------/
    ↪
```

```
2 rows in set (0.00 sec)
```

14.13.2.116.2 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.116.3 See also

- SHOW PUMP STATUS
- CHANGE PUMP STATUS
- CHANGE DRAINER STATUS

14.13.2.117 SHOW ENGINES

This statement is used to list all supported storage engines. The syntax is included only for compatibility with MySQL.

14.13.2.117.1 Synopsis

```
ShowEnginesStmt ::=
    "SHOW" "ENGINES" ShowLikeOrWhere?

ShowLikeOrWhere ::=
    "LIKE" SimpleExpr
|   "WHERE" Expression
```

14.13.2.117.2 Examples

```
mysql> SHOW ENGINES;
+--
    ↪ ------+---------+----------------------------------------------------------------+--
    ↪
| Engine | Support | Comment                                                        |
    ↪ Transactions | XA | Savepoints |
+--
    ↪ ------+---------+----------------------------------------------------------------+--
    ↪
| InnoDB | DEFAULT | Supports transactions, row-level locking, and foreign
    ↪ keys | YES | YES | YES    |
+--
    ↪ ------+---------+----------------------------------------------------------------+--
    ↪
1 row in set (0.00 sec)
```

14.13.2.117.3 MySQL compatibility

- This statement will always only return InnoDB as the supported engine. Internally, TiDB will typically use TiKV as the storage engine.

14.13.2.118 SHOW ERRORS

This statement shows errors from previously executed statements. The error buffer is cleared as soon as a statement executes successfully. In which case, `SHOW ERRORS` will return an empty set.

The behavior of which statements generate errors vs. warnings is highly influenced by the current `sql_mode`.

14.13.2.118.1 Synopsis

```
ShowErrorsStmt ::=
    "SHOW" "ERRORS" ShowLikeOrWhere?

ShowLikeOrWhere ::=
    "LIKE" SimpleExpr
|   "WHERE" Expression
```

14.13.2.118.2 Examples

```

```

14.13.2.118.3 MySQL compatibility

The `SHOW ERRORS` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.118.4 See also

- SHOW WARNINGS

14.13.2.119 SHOW [FULL] FIELDS FROM

This statement is an alias to `SHOW [FULL] COLUMNS FROM`. It is included for compatibility with MySQL.

14.13.2.120 SHOW GRANTS

This statement shows a list of privileges associated with a user. As in MySQL, the `USAGE` privileges denotes the ability to login to TiDB.

14.13.2.120.1 Synopsis

```
ShowGrantsStmt ::=
    "SHOW" "GRANTS" ("FOR" Username ("USING" RolenameList)?)?

Username ::=
    "CURRENT_USER" ( "(" ")" )?
| Username ("@" Hostname)?

RolenameList ::=
    Rolename ("@" Hostname)? ("," Rolename ("@" Hostname)? )*
```

14.13.2.120.2 Examples

```
mysql> SHOW GRANTS;
+----------------------------------------+
| Grants for User                        |
+----------------------------------------+
| GRANT ALL PRIVILEGES ON *.* TO 'root'@'%' |
+----------------------------------------+
1 row in set (0.00 sec)

mysql> SHOW GRANTS FOR 'u1';
ERROR 1141 (42000): There is no such grant defined for user 'u1' on host '%
    ↪ '
mysql> CREATE USER u1;
Query OK, 1 row affected (0.04 sec)

mysql> GRANT SELECT ON test.* TO u1;
Query OK, 0 rows affected (0.04 sec)

mysql> SHOW GRANTS FOR u1;
+-----------------------------------+
| Grants for u1@%                   |
+-----------------------------------+
| GRANT USAGE ON *.* TO 'u1'@'%' |
| GRANT Select ON test.* TO 'u1'@'%' |
+-----------------------------------+
2 rows in set (0.00 sec)
```

14.13.2.120.3 MySQL compatibility

The `SHOW GRANTS` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.120.4 See also

- SHOW CREATE USER
- GRANT

14.13.2.121 SHOW IMPORT

The `SHOW IMPORT` statement is used to show the IMPORT jobs created in TiDB. This statement can only show jobs created by the current user.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

14.13.2.121.1 Required privileges

- `SHOW IMPORT JOBS`: if a user has the `SUPER` privilege, this statement shows all import jobs in TiDB. Otherwise, this statement only shows jobs created by the current user.
- `SHOW IMPORT JOB <job-id>`: only the creator of an import job or users with the `SUPER` privilege can use this statement to view a specific job.

14.13.2.121.2 Synopsis

```
ShowImportJobsStmt ::=
    'SHOW' 'IMPORT' 'JOBS'

ShowImportJobStmt ::=
    'SHOW' 'IMPORT' 'JOB' JobID
```

The output fields of the `SHOW IMPORT` statement are described as follows:

Column	Description
Job_ID	The ID of the task
Data_Source	Information about the data source
Target_Table	The name of the target table
Phase	The current phase of the job, including `importing`, `validating`, and `add-index`

Column	Description
Status	The current status of the job, including `pending` (means created but not started yet), `running`, `canceled`, `failed`, and `finished`
Source_File_Size	The size of the source file
Imported_Rows	The number of data rows that have been read and written to the target table
Result_Message	If the import fails, this field returns the error message. Otherwise, it is empty.
Create_Time	The time when the task is created
Start_Time	The time when the task is started
End_Time	The time when the task is ended
Created_By	The name of the database user who creates the task

14.13.2.121.3 Example

```
SHOW IMPORT JOBS;
```

```
+--------+-------------------+-------------+----------+-------+----------+-------------

- CANCEL IMPORT JOB

14.13.2.122 SHOW INDEXES [FROM|IN]

The statement `SHOW INDEXES [FROM|IN]` lists the indexes on a specified table. The statements `SHOW INDEX [FROM|IN]`, `SHOW KEYS [FROM|IN]` are aliases of this statement, and included for compatibility with MySQL.

14.13.2.122.1 Synopsis

```
ShowIndexStmt ::=
    "SHOW" ( "INDEX" | "INDEXES" | "KEYS" ) ("FROM" | "IN" ) TableName (("
        ↪ FROM" | "IN") SchemaName )? ShowLikeOrWhere?

ShowLikeOrWhere ::=
    "LIKE" SimpleExpr
|   "WHERE" Expression
```

14.13.2.122.2 Examples

```
mysql> CREATE TABLE t1 (id int not null primary key AUTO_INCREMENT, col1
    ↪ INT, INDEX(col1));
Query OK, 0 rows affected (0.12 sec)

mysql> SHOW INDEXES FROM t1;
+--
    ↪ -----+------------+----------+--------------+-------------+-----------+---------
    ↪

mysql> SHOW INDEX FROM t1;
+--
    ↪ -----+------------+----------+--------------+-------------+-----------+---------
    ↪
| Table | Non_unique | Key_name | Seq_in_index | Column_name | Collation |
    ↪ Cardinality | Sub_part | Packed | Null | Index_type | Comment | Index
    ↪ _comment | Visible | Expression |
+--
    ↪ -----+------------+----------+--------------+-------------+-----------+---------
    ↪
| t1    |          0 | PRIMARY |            1 | id          | A         |           0
    ↪  |     NULL | NULL |      | BTREE      |         |               | YES     |
    ↪ NULL       |
| t1    |          1 | col1    |            1 | col1        | A         |           0
    ↪  |     NULL | NULL | YES | BTREE      |         |               | YES     |
    ↪ NULL       |
+--
    ↪ -----+------------+----------+--------------+-------------+-----------+---------
```

```
    ↪
2 rows in set (0.00 sec)

mysql> SHOW KEYS FROM t1;
+--
    ↪ -----+-----------+---------+-------------+-------------+-----------+---------
    ↪
| Table | Non_unique | Key_name | Seq_in_index | Column_name | Collation |
    ↪ Cardinality | Sub_part | Packed | Null | Index_type | Comment | Index
    ↪ _comment | Visible | Expression |
+--
    ↪ -----+-----------+---------+-------------+-------------+-----------+---------
    ↪
| t1    |          0 | PRIMARY |           1 | id          | A         |           0
    ↪  |     NULL | NULL |      | BTREE      |         |               | YES     |
    ↪ NULL       |
| t1    |          1 | col1    |           1 | col1        | A         |           0
    ↪  |     NULL | NULL | YES | BTREE      |         |               | YES     |
    ↪ NULL       |
+--
    ↪ -----+-----------+---------+-------------+-------------+-----------+---------
    ↪
2 rows in set (0.00 sec)
```

14.13.2.122.3 MySQL compatibility

The `SHOW INDEXES [FROM|IN]` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.122.4 See also

- SHOW CREATE TABLE
- DROP INDEX
- CREATE INDEX
- `information_schema.TIDB_INDEXES`
- `information_schema.TIDB_INDEX_USAGE`
- `information_schema.KEY_COLUMN_USAGE`
- `sys.schema_unused_indexes`

14.13.2.123 SHOW MASTER STATUS

The `SHOW MASTER STATUS` statement displays the latest TSO in the cluster.

14.13.2.123.1 Examples

```
SHOW MASTER STATUS;
```

```
+--
    ↪ ----------+------------------+-------------+-----------------+-----------
    ↪
| File       | Position         | Binlog_Do_DB | Binlog_Ignore_DB | Executed_
    ↪ Gtid_Set |
+--
    ↪ ----------+------------------+-------------+-----------------+-----------
    ↪
| tidb-binlog | 416916363252072450 |        |                 |
    ↪                  |
+--
    ↪ ----------+------------------+-------------+-----------------+-----------
    ↪
1 row in set (0.00 sec)
```

14.13.2.123.2 MySQL compatibility

The output of `SHOW MASTER STATUS` is designed to match MySQL. However, the execution results are different in that the MySQL result is the binlog location information and the TiDB result is the latest TSO information.

The `SHOW BINARY LOG STATUS` statement was added in TiDB as an alias for `SHOW ↪ MASTER STATUS`, which has been deprecated in MySQL 8.2.0 and newer versions.

14.13.2.123.3 See also

- SHOW PUMP STATUS

14.13.2.124 SHOW PLACEMENT

`SHOW PLACEMENT` summarizes all placement options from placement policies, and presents them in canonical form.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

The statement returns a result set in which the `Scheduling_State` field indicates the current progress that the Placement Driver (PD) has made in scheduling the placement:

- `PENDING`: The PD has not yet started scheduling the placement. This might indicate that that the placement rules are semantically correct, but cannot currently be satisfied by the cluster. For example, if `FOLLOWERS=4` but there are only 3 TiKV stores which are candidates for followers.
- `INPROGRESS`: The PD is currently scheduling the placement.
- `SCHEDULED`: The PD has successfully scheduled the placement.

14.13.2.124.1 Synopsis

```
ShowStmt ::=
    "SHOW" "PLACEMENT" ShowLikeOrWhere?
```

14.13.2.124.2 Examples

```
CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us
    ↪ -west-1" FOLLOWERS=4;
CREATE TABLE t1 (a INT) PLACEMENT POLICY=p1;
SHOW PLACEMENT;
```

```
Query OK, 0 rows affected (0.01 sec)

Query OK, 0 rows affected (0.00 sec)

   ↪                                                    |
+-----------------------------+----------------------------------------+-----------
   ↪
49 rows in set (0.00 sec)
```

14.13.2.128.3 MySQL compatibility

The `SHOW PRIVILEGES` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.128.4 See also

- SHOW GRANTS
- Privilege Management
- `GRANT <privileges>`

14.13.2.129 SHOW [FULL] PROCESSLIST

This statement lists the current sessions connected to the same TiDB server. The `Info` column contains the query text, which will be truncated unless the optional keyword `FULL` is specified.

14.13.2.129.1 Synopsis

```
ShowProcesslistStmt ::=
    "SHOW" "FULL"? "PROCESSLIST"
```

14.13.2.129.2 Examples

```
mysql> SHOW PROCESSLIST;
+--
   ↪ ----+------+-----------------+------+---------+------+-----------+-----------
   ↪
| Id   | User | Host          | db   | Command | Time | State   | Info
   ↪           |
```

```
+--
    ↪ ----+------+-----------------+------+---------+------+-----------+-----------
    ↪
|    5 | root | 127.0.0.1:45970 | test | Query | 0 | autocommit | SHOW
    ↪ PROCESSLIST |
+--
    ↪ ----+------+-----------------+------+---------+------+-----------+-----------
    ↪
1 rows in set (0.00 sec)
```

14.13.2.129.3 MySQL compatibility

- The `State` column in TiDB is non-descriptive. Representing state as a single value is more complex in TiDB, since queries are executed in parallel and each goroutine will have a different state at any one time.

14.13.2.129.4 See also

- KILL [TIDB]
- `INFORMATION_SCHEMA.PROCESSLIST`

14.13.2.130 SHOW PROFILES

The `SHOW PROFILES` statement currently only returns an empty result.

14.13.2.130.1 Synopsis

```
ShowProfilesStmt ::=
    "SHOW" "PROFILES" ShowLikeOrWhere?

ShowLikeOrWhere ::=
    "LIKE" SimpleExpr
|   "WHERE" Expression
```

14.13.2.130.2 Examples

```
SHOW PROFILES;
```

```
Empty set (0.00 sec)
```

14.13.2.130.3 MySQL compatibility

This statement is included only for compatibility with MySQL. Executing `SHOW PROFILES` always returns an empty result.

As an alternative, TiDB provides statement summary tables to help understand SQL performance issues.

14.13.2.131 SHOW PUMP STATUS

The `SHOW PUMP STATUS` statement displays the status information for all Pump nodes in the cluster.

> **Note:**
>
> This feature is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

14.13.2.131.1 Examples

```
SHOW PUMP STATUS;
```

```
+--
    ↪ ------/----------------/--------/--------------------/--------------------/
    ↪
| NodeID |    Address    | State |   Max_Commit_Ts  |    Update_Time     |
+--
    ↪ ------/----------------/--------/--------------------/--------------------/
    ↪
| pump1 | 127.0.0.1:8250 | Online | 408553768673342237 | 2019-05-01 00:00:01
    ↪  |
+--
    ↪ ------/----------------/--------/--------------------/--------------------/
    ↪
| pump2 | 127.0.0.2:8250 | Online | 408553768673342335 | 2019-05-01 00:00:02
    ↪  |
+--
    ↪ ------/----------------/--------/--------------------/--------------------/
    ↪
2 rows in set (0.00 sec)
```

14.13.2.131.2 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.131.3 See also

- SHOW DRAINER STATUS
- CHANGE PUMP STATUS
- CHANGE DRAINER STATUS

14.13.2.132 SHOW SCHEMAS

This statement is an alias to `SHOW DATABASES`. It is included for compatibility with MySQL.

14.13.2.133 SHOW STATS_HEALTHY

The `SHOW STATS_HEALTHY` statement shows an estimation of how accurate statistics are believed to be. Tables with a low percentage health may generate sub-optimal query execution plans.

The health of a table can be improved by running the `ANALYZE` statement. `ANALYZE` runs automatically when the health drops below the `tidb_auto_analyze_ratio` threshold.

14.13.2.133.1 Synopsis

```
ShowStatsHealthyStmt ::=
    "SHOW" "STATS_HEALTHY" ShowLikeOrWhere?

ShowLikeOrWhere ::=
    "LIKE" SimpleExpr
|   "WHERE" Expression
```

14.13.2.133.2 Examples

Load example data and run `ANALYZE`:

```
CREATE TABLE t1 (
 id INT NOT NULL PRIMARY KEY auto_increment,
 b INT NOT NULL,
 pad VARBINARY(255),
 INDEX(b)
);

INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM dual
    ↪ ;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
    ↪  JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
    ↪  JOIN t1 b JOIN t1 c LIMIT 100000;
```

```
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
    ↪ JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
    ↪ JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
    ↪ JOIN t1 b JOIN t1 c LIMIT 100000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(255) FROM t1 a
    ↪ JOIN t1 b JOIN t1 c LIMIT 100000;
SELECT SLEEP(1);
ANALYZE TABLE t1;
SHOW STATS_HEALTHY; # should be 100% healthy
```

```
...
mysql> SHOW STATS_HEALTHY;
+---------+------------+----------------+---------+
| Db_name | Table_name | Partition_name | Healthy |
+---------+------------+----------------+---------+
| test    | t1         |                |     100 |
+---------+------------+----------------+---------+
1 row in set (0.00 sec)
```

Perform a bulk update deleting approximately 30% of the records. Check the health of the statistics:

```
DELETE FROM t1 WHERE id BETWEEN 101010 AND 201010; # delete about 30% of
    ↪ records
SHOW STATS_HEALTHY;
```

```
mysql> SHOW STATS_HEALTHY;
+---------+------------+----------------+---------+
| Db_name | Table_name | Partition_name | Healthy |
+---------+------------+----------------+---------+
| test    | t1         |                |      50 |
+---------+------------+----------------+---------+
1 row in set (0.00 sec)
```

14.13.2.133.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.135 SHOW STATS_LOCKED

`SHOW STATS_LOCKED` shows the tables whose statistics are locked.

14.13.2.135.1 Synopsis

```
ShowStatsLockedStmt ::= 'SHOW' 'STATS_LOCKED' ShowLikeOrWhereOpt

ShowLikeOrWhereOpt ::= 'LIKE' SimpleExpr | 'WHERE' Expression
```

14.13.2.135.2 Examples

Create table `t`, and insert data into it. When the statistics of table `t` are not locked, the `ANALYZE` statement can be successfully executed.

```
mysql> CREATE TABLE t(a INT, b INT);
Query OK, 0 rows affected (0.03 sec)

mysql> INSERT INTO t VALUES (1,2), (3,4), (5,6), (7,8);
Query OK, 4 rows affected (0.00 sec)
Records: 4 Duplicates: 0 Warnings: 0

mysql> ANALYZE TABLE t;
```

```
Query OK, 0 rows affected, 1 warning (0.02 sec)

mysql> SHOW WARNINGS;
+--
    ↪ -----+------+-----------------------------------------------------------------
    ↪
| Level | Code | Message
    ↪
    ↪ |
+--
    ↪ -----+------+-----------------------------------------------------------------
    ↪
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
    ↪ test.t, reason to use this rate is "Row count in stats_meta is much
    ↪ smaller compared with the row count got by PD, use min(1, 15000/4) as
    ↪  the sample-rate=1" |
+--
    ↪ -----+------+-----------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

Lock the statistics of table `t` and execute `SHOW STATS_LOCKED`. The output shows that the statistics of table `t` have been locked.

```
mysql> LOCK STATS t;
Query OK, 0 rows affected (0.00 sec)

mysql> SHOW STATS_LOCKED;
+---------+------------+----------------+--------+
| Db_name | Table_name | Partition_name | Status |
+---------+------------+----------------+--------+
| test    | t          |                | locked |
+---------+------------+----------------+--------+
1 row in set (0.01 sec)
```

14.13.2.135.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.136 SHOW STATS_META

You can use `SHOW STATS_META` to view how many rows are in a table and how many rows are changed in that table. When using this statement, you can filter the needed information by the `ShowLikeOrWhere` clause.

Currently, the `SHOW STATS_META` statement outputs 6 columns:

Column name	Description
db_name	Database name
table_name	Table name
partition_name	Partition name
update_time	Last updated time
modify_count	The number of rows modified
row_count	The total row count

> **Note:**
>
> The `update_time` is updated when TiDB updates the `modify_count` and `row_count` fields according to DML statements. So `update_time` is not the last execution time of the `ANALYZE` statement.

14.13.2.136.1 Synopsis

```
ShowStatsMetaStmt ::=
    "SHOW" "STATS_META" ShowLikeOrWhere?

ShowLikeOrWhere ::=
    "LIKE" SimpleExpr
|   "WHERE" Expression
```

14.13.2.136.2 Examples

```
SHOW STATS_META;
```

```
+--

14.13.2.137 SHOW [GLOBAL|SESSION] STATUS

This statement is included for compatibility with MySQL. TiDB uses Prometheus and Grafana for centralized metrics collection instead of `SHOW STATUS` for most metrics.

A full description of the variables can be found here: status variables

14.13.2.137.1 Synopsis

```
ShowStatusStmt ::=
    'SHOW' Scope? 'STATUS' ShowLikeOrWhere?

Scope ::=
    ( 'GLOBAL' | 'SESSION' )

ShowLikeOrWhere ::=
    "LIKE" SimpleExpr
|   "WHERE" Expression
```

14.13.2.137.2 Examples

```
mysql> SHOW SESSION STATUS;
+------------------------------+--------------------------------------+
| Variable_name                | Value                                |
+------------------------------+--------------------------------------+

14.13.2.138 SHOW TABLE NEXT_ROW_ID

`SHOW TABLE NEXT_ROW_ID` is used to show the details of some special columns of a table, including:

- `AUTO_INCREMENT` column automatically created by TiDB, namely, `_tidb_rowid` column.
- `AUTO_INCREMENT` column created by users.
- `AUTO_RANDOM` column created by users.
- `SEQUENCE` created by users.

14.13.2.138.1 Synopsis

```
ShowTableNextRowIDStmt ::=
    "SHOW" "TABLE" (SchemaName ".")? TableName "NEXT_ROW_ID"
```

14.13.2.138.2 Examples

For newly created tables, `NEXT_GLOBAL_ROW_ID` is `1` because no Row ID is allocated.

```
CREATE TABLE t(a int);
Query OK, 0 rows affected (0.06 sec)
```

```
SHOW TABLE t NEXT_ROW_ID;
+---------+-----------+-------------+--------------------+
| DB_NAME | TABLE_NAME | COLUMN_NAME | NEXT_GLOBAL_ROW_ID |
+---------+-----------+-------------+--------------------+
| test    | t         | _tidb_rowid |                  1 |
+---------+-----------+-------------+--------------------+
1 row in set (0.00 sec)
```

Data have been written to the table. The TiDB server that inserts the data allocates and caches 30000 IDs at once. Thus, NEXT_GLOBAL_ROW_ID is 30001 now. The number of IDs is controlled by AUTO_ID_CACHE.

```
INSERT INTO t VALUES (), (), ();
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0
```

```
SHOW TABLE t NEXT_ROW_ID;
+---------+-----------+-------------+--------------------+
| DB_NAME | TABLE_NAME | COLUMN_NAME | NEXT_GLOBAL_ROW_ID |
+---------+-----------+-------------+--------------------+
| test    | t         | _tidb_rowid |              30001 |
+---------+-----------+-------------+--------------------+
1 row in set (0.00 sec)
```

14.13.2.138.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.139 SHOW TABLE REGIONS

The `SHOW TABLE REGIONS` statement is used to show the Region information of a table in TiDB.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

14.13.2.139.1 Syntax

```
SHOW TABLE [table_name] REGIONS [WhereClauseOptional];
SHOW TABLE [table_name] INDEX [index_name] REGIONS [WhereClauseOptional];
```

14.13.2.139.2 Synopsis

```
ShowTableRegionStmt ::=
    "SHOW" "TABLE" TableName PartitionNameList? ("INDEX" IndexName)? "
        ↪ REGIONS" ("WHERE" Expression)?

TableName ::=
    (SchemaName ".")? Identifier
```

Executing `SHOW TABLE REGIONS` returns the following columns:

- `REGION_ID`: The Region ID.
- `START_KEY`: The start key of the Region.
- `END_KEY`: The end key of the Region.
- `LEADER_ID`: The Leader ID of the Region.
- `LEADER_STORE_ID`: The ID of the store (TiKV) where the Region leader is located.
- `PEERS`: The IDs of all Region replicas.
- `SCATTERING`: Whether the Region is being scheduled. `1` means true.
- `WRITTEN_BYTES`: The estimated amount of data written into the Region within one heartbeat cycle. The unit is byte.
- `READ_BYTES`: The estimated amount of data read from the Region within one heartbeat cycle. The unit is byte.
- `APPROXIMATE_SIZE(MB)`: The estimated amount of data in the Region. The unit is megabytes (MB).
- `APPROXIMATE_KEYS`: The estimated number of Keys in the Region.

- `SCHEDULING_CONSTRAINTS`: The placement policy settings associated with the table or partition to which a Region belongs.

- `SCHEDULING_STATE`: The scheduling state of the Region which has a placement policy.

> **Note:**
>
> The values of `WRITTEN_BYTES`, `READ_BYTES`, `APPROXIMATE_SIZE(MB)`, `APPROXIMATE_KEYS` are not accurate data. They are estimated data from PD based on the heartbeat information that PD receives from the Region.

14.13.2.139.3 Examples

Create an example table with enough data that fills a few Regions:

```
CREATE TABLE t1 (
 id INT NOT NULL PRIMARY KEY auto_increment,
 b INT NOT NULL,
 pad1 VARBINARY(1024),
 pad2 VARBINARY(1024),
 pad3 VARBINARY(1024)
);
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024), RANDOM_
    ↪ BYTES(1024), RANDOM_BYTES(1024) FROM dual;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024), RANDOM_
    ↪ BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c LIMIT
    ↪ 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024), RANDOM_
    ↪ BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c LIMIT
    ↪ 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024), RANDOM_
    ↪ BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c LIMIT
    ↪ 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024), RANDOM_
    ↪ BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c LIMIT
    ↪ 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024), RANDOM_
    ↪ BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c LIMIT
    ↪ 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024), RANDOM_
    ↪ BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c LIMIT
    ↪ 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024), RANDOM_
    ↪ BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c LIMIT
    ↪ 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024), RANDOM_
    ↪ BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c LIMIT
    ↪ 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024), RANDOM_
    ↪ BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c LIMIT
    ↪ 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024), RANDOM_
    ↪ BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c LIMIT
    ↪ 10000;
INSERT INTO t1 SELECT NULL, FLOOR(RAND()*1000), RANDOM_BYTES(1024), RANDOM_
    ↪ BYTES(1024), RANDOM_BYTES(1024) FROM t1 a JOIN t1 b JOIN t1 c LIMIT
    ↪ 10000;
```

```
SELECT SLEEP(5);
SHOW TABLE t1 REGIONS;
```

The output should show that the table is split into Regions. The `REGION_ID`, `START_KEY` and `END_KEY` may not match exactly:

```
...
mysql> SHOW TABLE t1 REGIONS;
+--
   ↪ ---------+-------------+-------------+----------+----------------+-------+--
   ↪
| REGION_ID | START_KEY | END_KEY    | LEADER_ID | LEADER_STORE_ID | PEERS |
   ↪  SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB) |
   ↪ APPROXIMATE_KEYS | SCHEDULING_CONSTRAINTS | SCHEDULING_STATE |
+--
   ↪ ---------+-------------+-------------+----------+----------------+-------+--
   ↪
|       94 | t_75_      | t_75_r_31717 |     95 |             1 | 95    |
   ↪         0 |           0 |         0 |                112 |
   ↪ 207465 |                     |                |
|       96 | t_75_r_31717 | t_75_r_63434 |   97 |             1 | 97    |
   ↪         0 |           0 |         0 |                 97 |
   ↪ 0 |                       |                 |
|        2 | t_75_r_63434 |          |        3 |             1 | 3     |
   ↪         0 |    269323514 | 66346110 |                245 |
   ↪ 162020 |                     |                |
+--
   ↪ ---------+-------------+-------------+----------+----------------+-------+--
   ↪
3 rows in set (0.00 sec)
```

In the output above, a `START_KEY` of `t_75_r_31717` and `END_KEY` of `t_75_r_63434` shows that data with a PRIMARY KEY between `31717` and `63434` is stored in this Region. The prefix `t_75_` indicates that this is the Region for a table (`t`) which has an internal table ID of `75`. An empty key value for `START_KEY` or `END_KEY` indicates negative infinity or positive infinity respectively.

TiDB automatically rebalances Regions as needed. For manual rebalancing, use the `SPLIT TABLE REGION` statement:

```
mysql> SPLIT TABLE t1 BETWEEN (31717) AND (63434) REGIONS 2;
+--------------------+----------------------+
| TOTAL_SPLIT_REGION | SCATTER_FINISH_RATIO |
+--------------------+----------------------+
|                  1 |                    1 |
+--------------------+----------------------+
```

```
1 row in set (42.34 sec)

mysql> SHOW TABLE t1 REGIONS;
+--
    ↪ ---------+-------------+-------------+----------+----------------+-------+--
    ↪
| REGION_ID | START_KEY | END_KEY    | LEADER_ID | LEADER_STORE_ID | PEERS |
    ↪  SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB) |
    ↪ APPROXIMATE_KEYS | SCHEDULING_CONSTRAINTS | SCHEDULING_STATE |
+--
    ↪ ---------+-------------+-------------+----------+----------------+-------+--
    ↪
|       94 | t_75_      | t_75_r_31717 |     95 |             1 | 95    |
    ↪         0 |           0 |         0 |                112 |
    ↪ 207465 |                     |                |
|       98 | t_75_r_31717 | t_75_r_47575 |   99 |             1 | 99    |
    ↪         0 |         1325 |         0 |                 53 |
    ↪ 12052 |                     |                |
|       96 | t_75_r_47575 | t_75_r_63434 |   97 |             1 | 97    |
    ↪         0 |         1526 |         0 |                 48 |
    ↪ 0 |                     |                |
|        2 | t_75_r_63434 |          |        3 |             1 | 3     |
    ↪         0 |           0 |   55752049 |                 60 |
    ↪ 0 |                     |                |
+--
    ↪ ---------+-------------+-------------+----------+----------------+-------+--
    ↪
4 rows in set (0.00 sec)
```

The above output shows that Region 96 was split, with a new Region 98 being created. The remaining Regions in the table were unaffected by the split operation. This is confirmed by the output statistics:

- `TOTAL_SPLIT_REGION` indicates the number of newly split Regions. In this example, the number is 1.
- `SCATTER_FINISH_RATIO` indicates the rate at which the newly split Regions are successfully scattered. `1.0` means that all Regions are scattered.

For a more detailed example:

```
mysql> SHOW TABLE t REGIONS;
+--
    ↪ ---------+-------------+-------------+----------+----------------+----------
    ↪
```

```
| REGION_ID | START_KEY | END_KEY    | LEADER_ID | LEADER_STORE_ID | PEERS
   ↪    | SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB) |
   ↪ APPROXIMATE_KEYS | SCHEDULING_CONSTRAINTS | SCHEDULING_STATE |
+--
   ↪ ---------+-------------+-------------+----------+----------------+---------
   ↪
| 102       | t_43_r      | t_43_r_20000 | 118    | 7              | 105, 118,
   ↪ 119 | 0       | 0           | 0         | 1                | 0
   ↪               |                       |                |
| 106       | t_43_r_20000 | t_43_r_40000 | 120  | 7              | 107, 108,
   ↪ 120 | 0       | 23          | 0         | 1                | 0
   ↪               |                       |                |
| 110       | t_43_r_40000 | t_43_r_60000 | 112  | 9              | 112, 113,
   ↪ 121 | 0       | 0           | 0         | 1                | 0
   ↪               |                       |                |
| 114       | t_43_r_60000 | t_43_r_80000 | 122  | 7              | 115, 122,
   ↪ 123 | 0       | 35          | 0         | 1                | 0
   ↪               |                       |                |
| 3         | t_43_r_80000 |           | 93       | 8              | 5, 73, 93
   ↪    | 0         | 0           | 0         | 1                | 0
   ↪               |                       |                |
| 98        | t_43_       | t_43_r      | 99       | 1              | 99, 100,
   ↪ 101 | 0        | 0           | 0         | 1                 | 0
   ↪               |                       |                |
+--
   ↪ ---------+-------------+-------------+----------+----------------+---------
   ↪
6 rows in set
```

In the above example:

- Table t corresponds to six Regions. In these Regions, 102, 106, 110, 114, and 3 store the row data and 98 stores the index data.
- For START_KEY and END_KEY of Region 102, t_43 indicates the table prefix and ID. _r is the prefix of the record data in table t. _i is the prefix of the index data.
- In Region 102, START_KEY and END_KEY mean that record data in the range of [-inf, ↪ 20000) is stored. In similar way, the ranges of data storage in Regions (106, 110, 114, 3) can also be calculated.
- Region 98 stores the index data. The start key of table t's index data is t_43_i, which is in the range of Region 98.

To check the Region that corresponds to table t in store 1, use the WHERE clause:

```
test> SHOW TABLE t REGIONS WHERE leader_store_id =1;
```

```
+--
   ↪ --------+----------+--------+----------+----------------+---------------+---
   ↪
| REGION_ID | START_KEY | END_KEY | LEADER_ID | LEADER_STORE_ID | PEERS |
   ↪ SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB) |
   ↪ APPROXIMATE_KEYS | SCHEDULING_CONSTRAINTS | SCHEDULING_STATE |
+--
   ↪ --------+----------+--------+----------+----------------+---------------+---
   ↪
| 98       | t_43_    | t_43_r | 99       | 1              | 99, 100, 101 | 0
   ↪       | 0           | 0         | 1                | 0              |
   ↪                     |                |
+--
   ↪ --------+----------+--------+----------+----------------+---------------+---
   ↪
```

Use `SPLIT TABLE REGION` to split the index data into Regions. In the following example, the index data `name` of table t is split into two Regions in the range of `[a,z]`.

```
test> SPLIT TABLE t INDEX name BETWEEN ("a") AND ("z") REGIONS 2;
+--------------------+----------------------+
| TOTAL_SPLIT_REGION | SCATTER_FINISH_RATIO |
+--------------------+----------------------+
| 2                  | 1.0                  |
+--------------------+----------------------+
1 row in set
```

Now table t corresponds to seven Regions. Five of them (`102`, `106`, `110`, `114`, `3`) store the record data of table t and another two (`135`, `98`) store the index data `name`.

```
test> SHOW TABLE t REGIONS;
+--
   ↪ --------+----------------------------+----------------------------+----------
   ↪
| REGION_ID | START_KEY                  | END_KEY                    | LEADER_ID |
   ↪  LEADER_STORE_ID | PEERS    | SCATTERING | WRITTEN_BYTES | READ_BYTES
   ↪ | APPROXIMATE_SIZE(MB) | APPROXIMATE_KEYS | SCHEDULING_CONSTRAINTS |
   ↪ SCHEDULING_STATE |
+--
   ↪ --------+----------------------------+----------------------------+----------
   ↪
| 102      | t_43_r                     | t_43_r_20000               | 118      |
   ↪ 7              | 105, 118, 119 | 0          | 0             | 0           | 1
   ↪                  | 0              |                          |
   ↪                |
```

```
| 106      | t_43_r_20000              | t_43_r_40000                | 120      |
   ↪ 7             | 108, 120, 126 | 0       | 0           | 0         | 1
   ↪                 | 0             |                       |
   ↪                |
| 110      | t_43_r_40000              | t_43_r_60000                | 112      |
   ↪ 9             | 112, 113, 121 | 0       | 0           | 0         | 1
   ↪                 | 0             |                       |
   ↪                |

14.13.2.139.4 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.139.5 See also

- SPLIT REGION
- CREATE TABLE

14.13.2.140 SHOW TABLE STATUS

This statement shows various statistics about tables in TiDB. If the statistics appear out of date, it is recommended to run `ANALYZE TABLE`.

14.13.2.140.1 Synopsis

```
ShowTableStatusStmt ::=
    "SHOW" "TABLE" "STATUS" ("FROM" Identifier | "IN" Identifier )?
        ↪ ShowLikeOrWhere?

ShowLikeOrWhere ::=
    "LIKE" SimpleExpr
|   "WHERE" Expression
```

14.13.2.140.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.02 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SHOW TABLE STATUS LIKE 't1'\G
*************************** 1. row ***************************
           Name: t1
         Engine: InnoDB
        Version: 10
     Row_format: Compact
           Rows: 0
 Avg_row_length: 0
    Data_length: 0
Max_data_length: 0
   Index_length: 0
      Data_free: 0
 Auto_increment: 30001
    Create_time: 2019-04-19 08:32:06
    Update_time: NULL
     Check_time: NULL
      Collation: utf8mb4_bin
       Checksum:
 Create_options:
        Comment:
1 row in set (0.00 sec)

mysql> ANALYZE TABLE t1;
Query OK, 0 rows affected (0.12 sec)
```

```
mysql> SHOW TABLE STATUS LIKE 't1'\G
*************************** 1. row ***************************
           Name: t1
         Engine: InnoDB
        Version: 10
     Row_format: Compact
           Rows: 5
 Avg_row_length: 16
    Data_length: 80
Max_data_length: 0
   Index_length: 0
      Data_free: 0
 Auto_increment: 30001
    Create_time: 2019-04-19 08:32:06
    Update_time: NULL
     Check_time: NULL
      Collation: utf8mb4_bin
       Checksum:
 Create_options:
        Comment:
1 row in set (0.00 sec)
```

14.13.2.140.3 MySQL compatibility

The `SHOW TABLE STATUS` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.140.4 See also

- SHOW TABLES
- CREATE TABLE
- DROP TABLE
- SHOW CREATE TABLE

14.13.2.141 SHOW [FULL] TABLES

This statement shows a list of tables and views in the currently selected database. The optional keyword `FULL` indicates if a table is of type `BASE TABLE`, `SEQUENCE`, or `VIEW`.

To show tables in a different database, use `SHOW TABLES IN DatabaseName`.

14.13.2.141.1 Synopsis

```
ShowTableStmt ::=
    "SHOW" "FULL"? "TABLES" ("FROM" Identifier | "IN" Identifier )?
        ↪ ShowLikeOrWhere?

ShowLikeOrWhere ::=
    "LIKE" SimpleExpr
|   "WHERE" Expression
```

14.13.2.141.2 Examples

```
mysql> CREATE TABLE t1 (a int);
Query OK, 0 rows affected (0.12 sec)

mysql> CREATE VIEW v1 AS SELECT 1;
Query OK, 0 rows affected (0.10 sec)

mysql> SHOW TABLES;
+----------------+
| Tables_in_test |
+----------------+
| t1             |
| v1             |
+----------------+
2 rows in set (0.00 sec)

mysql> SHOW FULL TABLES;
+----------------+------------+
| Tables_in_test | Table_type |
+----------------+------------+
| t1             | BASE TABLE |
| v1             | VIEW       |

20 rows in set (0.00 sec)
```

14.13.2.141.3 MySQL compatibility

The `SHOW [FULL] TABLES` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.141.4 See also

- CREATE TABLE
- DROP TABLE
- SHOW CREATE TABLE
- `INFORMATION_SCHEMA.TABLES`

14.13.2.142 SHOW [GLOBAL|SESSION] VARIABLES

This statement shows a list of variables for the scope of either `GLOBAL` or `SESSION`. If no scope is specified, the default scope of `SESSION` will apply.

14.13.2.142.1 Synopsis

```
ShowVariablesStmt ::=
    "SHOW" ("GLOBAL" | "SESSION")? VARIABLES ShowLikeOrWhere?

ShowLikeOrWhere ::=
    "LIKE" SimpleExpr
|   "WHERE" Expression
```

14.13.2.142.2 Examples

List all TiDB specific variables. For detailed description, refer to System Variables.

```
mysql> SHOW GLOBAL VARIABLES LIKE 'tidb%';
+-----------------------------------+--------------------+
| Variable_name                     | Value              |

14.13.2.142.3 MySQL compatibility

The `SHOW [GLOBAL|SESSION] VARIABLES` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.142.4 See also

- `SET [GLOBAL|SESSION]`

14.13.2.143 SHOW WARNINGS

This statement shows a list of warnings that occurred for previously executed statements in the current client connection. As in MySQL, the `sql_mode` impacts which statements will cause errors vs. warnings considerably.

14.13.2.143.1 Synopsis

```
ShowWarningsStmt ::=
    "SHOW" "WARNINGS"
```

14.13.2.143.2 Examples

```
mysql> CREATE TABLE t1 (a INT UNSIGNED);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 VALUES (0);
Query OK, 1 row affected (0.02 sec)

mysql> SELECT 1/a FROM t1;
+------+
| 1/a  |
+------+
| NULL |
+------+
```

```
1 row in set, 1 warning (0.00 sec)

mysql> SHOW WARNINGS;
+---------+------+--------------+
| Level   | Code | Message      |
+---------+------+--------------+
| Warning | 1365 | Division by 0 |
+---------+------+--------------+
1 row in set (0.00 sec)

mysql> INSERT INTO t1 VALUES (-1);
ERROR 1264 (22003): Out of range value for column 'a' at row 1
mysql> SELECT * FROM t1;
+------+
| a    |
+------+
|    0 |
+------+
1 row in set (0.00 sec)

mysql> SET sql_mode='';
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (-1);
Query OK, 1 row affected, 1 warning (0.01 sec)

mysql> SHOW WARNINGS;
+---------+------+--------------------------+
| Level   | Code | Message                  |
+---------+------+--------------------------+
| Warning | 1690 | constant -1 overflows int |
+---------+------+--------------------------+
1 row in set (0.00 sec)

mysql> SELECT * FROM t1;
+------+
| a    |
+------+
|    0 |
|    0 |
+------+
2 rows in set (0.00 sec)
```

14.13.2.143.3 MySQL compatibility

The `SHOW WARNINGS` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

14.13.2.143.4 See also

- SHOW ERRORS

14.13.2.144 SHUTDOWN

The `SHUTDOWN` statement is used to perform a shutdown operation in TiDB. Execution of the `SHUTDOWN` statement requires the user to have `SHUTDOWN privilege`.

> **Note:**
>
> This feature is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

14.13.2.144.1 Synopsis

```
ShutdownStmt ::=
    "SHUTDOWN"
```

14.13.2.144.2 Examples

```
SHUTDOWN;
```

```
Query OK, 0 rows affected (0.00 sec)
```

14.13.2.144.3 MySQL compatibility

> **Note:**
>
> Because TiDB is a distributed database, the shutdown operation in TiDB stops the client-connected TiDB instance, not the entire TiDB cluster.

The `SHUTDOWN` statement is partly compatible with MySQL. If you encounter any compatibility issues, you can report a bug.

14.13.2.145 Split Region

For each new table created in TiDB, one Region is segmented by default to store the data of this table. This default behavior is controlled by `split-table` in the TiDB configuration file. When the data in this Region exceeds the default Region size limit, the Region starts to split into two.

In the above case, because there is only one Region at the beginning, all write requests occur on the TiKV where the Region is located. If there are a large number of writes for the newly created table, hotspots are caused.

To solve the hotspot problem in the above scenario, TiDB introduces the pre-split function, which can pre-split multiple Regions for a certain table according to the specified parameters and scatter them to each TiKV node.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

14.13.2.145.1 Synopsis

```
SplitRegionStmt ::=
    "SPLIT" SplitSyntaxOption "TABLE" TableName PartitionNameList? ("INDEX"
        ↪ IndexName)? SplitOption

SplitSyntaxOption ::=
    ("REGION" "FOR")? "PARTITION"?

TableName ::=
    (SchemaName ".")? Identifier

PartitionNameList ::=
    "PARTITION" "(" PartitionName ("," PartitionName)* ")"

SplitOption ::=
    ("BETWEEN" RowValue "AND" RowValue "REGIONS" NUM
|   "BY" RowValue ("," RowValue)* )

RowValue ::=
    "(" ValuesOpt ")"
```

14.13.2.145.2 Usage of Split Region

There are two types of Split Region syntax:

- The syntax of even split:

```
SPLIT TABLE table_name [INDEX index_name] BETWEEN (lower_value) AND (
    ↪ upper_value) REGIONS region_num
```

`BETWEEN lower_value AND upper_value REGIONS region_num` defines the upper boundary, the lower boundary, and the Region amount. Then the current region will be evenly spilt into the number of regions (as specified in `region_num`) between the upper and lower boundaries.

- The syntax of uneven split:

```
SPLIT TABLE table_name [INDEX index_name] BY (value_list) [, (value_
    ↪ list)] ...
```

`BY value_list⋯` specifies a series of points manually, based on which the current Region is spilt. It is suitable for scenarios with unevenly distributed data.

The following example shows the result of the `SPLIT` statement:

```
+--------------------+----------------------+
| TOTAL_SPLIT_REGION | SCATTER_FINISH_RATIO |
+--------------------+----------------------+
| 4                  | 1.0                  |
+--------------------+----------------------+
```

- `TOTAL_SPLIT_REGION`: the number of newly split Regions.
- `SCATTER_FINISH_RATIO`: the completion rate of scattering for newly split Regions. `1.0` means that all Regions are scattered. `0.5` means that only half of the Regions are scattered and the rest are being scattered.

Note:

The following two session variables might affect the behavior of the `SPLIT` statement:

- `tidb_wait_split_region_finish`: It might take a while to scatter the Regions. This duration depends on PD scheduling and TiKV loads. This variable is used to control when executing the `SPLIT REGION` statement whether to return the results to the client until all Regions are scattered. If its value is set to `1` (by default), TiDB returns the results only after the scattering is completed. If its value is set to `0`, TiDB returns the results regardless of the scattering status.

- `tidb_wait_split_region_timeout`: This variable is to set the execution timeout of the `SPLIT REGION` statement, in seconds. The default value is 300s. If the `split` operation is not completed within the duration, TiDB returns a timeout error.

Split Table Region

The key of row data in each table is encoded by `table_id` and `row_id`. The format is as follows:

```
t[table_id]_r[row_id]
```

For example, when `table_id` is 22 and `row_id` is 11:

```
t22_r11
```

Row data in the same table have the same `table_id`, but each row has its unique `row_id` that can be used for Region split.

Even Split

Because `row_id` is an integer, the value of the key to be split can be calculated according to the specified `lower_value`, `upper_value`, and `region_num`. TiDB first calculates the step value (`step = (upper_value - lower_value)/region_num`). Then split will be done evenly per each "step" between `lower_value` and `upper_value` to generate the number of Regions as specified by `region_num`.

For example, if you want 16 evenly split Regions split from key range`minInt64~maxInt64` for table t, you can use this statement:

```
SPLIT TABLE t BETWEEN (-9223372036854775808) AND (9223372036854775807)
    ↪ REGIONS 16;
```

This statement splits table t into 16 Regions between minInt64 and maxInt64. If the given primary key range is smaller than the specified one, for example, 0~1000000000, you can use 0 and 1000000000 take place of minInt64 and maxInt64 respectively to split Regions.

```
SPLIT TABLE t BETWEEN (0) AND (1000000000) REGIONS 16;
```

Uneven split

If the known data is unevenly distributed, and you want a Region to be split respectively in key ranges -inf ~ 10000, 10000 ~ 90000, and 90000 ~ +inf, you can achieve this by setting fixed points, as shown below:

```
SPLIT TABLE t BY (10000), (90000);
```

Split index Region

The key of the index data in the table is encoded by `table_id`, `index_id`, and the value of the index column. The format is as follows:

```
t[table_id]_i[index_id][index_value]
```

For example, when `table_id` is 22, `index_id` is 5, and `index_value` is abc:

```
t22_i5abc
```

The `table_id` and `index_id` of the same index data in one table is the same. To split index Regions, you need to split Regions based on `index_value`.

Even Spilt

The way to split index evenly works the same as splitting data evenly. However, calculating the value of step is more complicated, because `index_value` might not be an integer.

The values of `upper` and `lower` are encoded into a byte array firstly. After removing the longest common prefix of `lower` and `upper` byte array, the first 8 bytes of `lower` and `upper` are converted into the uint64 format. Then `step = (upper - lower)/num` is calculated. After that, the calculated step is encoded into a byte array, which is appended to the longest common prefix of the `lower` and `upper` byte array for index split. Here is an example:

If the column of the `idx` index is of the integer type, you can use the following SQL statement to split index data:

```
SPLIT TABLE t INDEX idx BETWEEN (-9223372036854775808) AND
    ↪ (9223372036854775807) REGIONS 16;
```

This statement splits the Region of index idx in table t into 16 Regions from `minInt64` to `maxInt64`.

If the column of index idx1 is of varchar type, and you want to split index data by prefix letters.

```
SPLIT TABLE t INDEX idx1 BETWEEN ("a") AND ("z") REGIONS 25;
```

This statement splits index idx1 into 25 Regions from a~z. The range of Region 1 is `[minIndexValue, b)`; the range of Region 2 is `[b, c)`; … the range of Region 25 is `[y,
↪ minIndexValue]`. For the `idx` index, data with the `a` prefix is written into Region 1, and data with the `b` prefix is written into Region 2.

In the split method above, both data with the `y` and `z` prefixes are written into Region 25, because the upper bound is not `z`, but `{` (the character next to `z` in ASCII). Therefore, a more accurate split method is as follows:

```
SPLIT TABLE t INDEX idx1 BETWEEN ("a") AND ("{") REGIONS 26;
```

This statement splits index idx1 of the table `t` into 26 Regions from a~{. The range of Region 1 is `[minIndexValue, b)`; the range of Region 2 is `[b, c)`; … the range of Region 25 is `[y, z)`, and the range of Region 26 is `[z, maxIndexValue)`.

If the column of index `idx2` is of time type like timestamp/datetime, and you want to split index Region by year:

```
SPLIT TABLE t INDEX idx2 BETWEEN ("2010-01-01 00:00:00") AND ("2020-01-01
    ↪ 00:00:00") REGIONS 10;
```

This statement splits the Region of index `idx2` in table `t` into 10 Regions from `2010-01-01 00:00:00` to `2020-01-01 00:00:00`. The range of Region 1 is `[minIndexValue , 2011-01-01 00:00:00)`; the range of Region 2 is `[2011-01-01 00:00:00, 2012-01-01 00:00:00)`.

If you want to split the index Region by day, see the following example:

```
SPLIT TABLE t INDEX idx2 BETWEEN ("2020-06-01 00:00:00") AND ("2020-07-01
    ↪ 00:00:00") REGIONS 30;
```

This statement splits the data of June 2020 of index `idex2` in table `t` into 30 Regions, each Region representing 1 day.

Region split methods for other types of index columns are similar.

For data Region split of joint indexes, the only difference is that you can specify multiple columns values.

For example, index `idx3 (a, b)` contains 2 columns, with column `a` of timestamp type and column `b` int. If you just want to do a time range split according to column `a`, you can use the SQL statement for splitting time index of a single column. In this case, do not specify the value of column `b` in `lower_value` and `upper_velue`.

```
SPLIT TABLE t INDEX idx3 BETWEEN ("2010-01-01 00:00:00") AND ("2020-01-01
    ↪ 00:00:00") REGIONS 10;
```

Within the same range of time, if you want to do one more split according to column b column. Just specify the value for column b when splitting.

```
SPLIT TABLE t INDEX idx3 BETWEEN ("2010-01-01 00:00:00", "a") AND ("
    ↪ 2010-01-01 00:00:00", "z") REGIONS 10;
```

This statement splits 10 Regions in the range of a~z according to the value of column b, with the same time prefix as column a. If the value specified for column a is different, the value of column b might not be used in this case.

If the primary key of the table is a non-clustered index, you need to use backticks ` to escape the `PRIMARY` keyword when splitting Regions. For example:

```
SPLIT TABLE t INDEX `PRIMARY` BETWEEN (-9223372036854775808) AND
    ↪ (9223372036854775807) REGIONS 16;
```

Uneven Split

Index data can also be split by specified index values.

For example, there is `idx4 (a,b)`, with column `a` of the varchar type and column `b` of the timestamp type.

```
SPLIT TABLE t1 INDEX idx4 BY ("a", "2000-01-01 00:00:01"), ("b", "
    ↪ 2019-04-17 14:26:19"), ("c", "");
```

This statement specifies 3 values to split 4 Regions. The range of each Region is as follows:

```
region1 [ minIndexValue           , ("a", "2000-01-01 00:00:01"))
region2 [("a", "2000-01-01 00:00:01") , ("b", "2019-04-17 14:26:19"))
region3 [("b", "2019-04-17 14:26:19") , ("c", "")           )
region4 [("c", "")                , maxIndexValue           )
```

Split Regions for partitioned tables

Splitting Regions for partitioned tables is the same as splitting Regions for ordinary tables. The only difference is that the same split operation is performed for every partition.

- The syntax of even split:

```
SPLIT [PARTITION] TABLE t [PARTITION] [(partition_name_list...)] [INDEX
    ↪  index_name] BETWEEN (lower_value) AND (upper_value) REGIONS
    ↪ region_num
```

- The syntax of uneven split:

```
SPLIT [PARTITION] TABLE table_name [PARTITION (partition_name_list...)]
    ↪  [INDEX index_name] BY (value_list) [, (value_list)] ...
```

Examples of Split Regions for partitioned tables

1. Create a partitioned table `t`. Suppose that you want to create a Hash table divided into two partitions. The example statement is as follows:

```
CREATE TABLE t (a INT, b INT, INDEX idx(a)) PARTITION BY HASH(a)
    ↪ PARTITIONS 2;
```

After creating the table `t`, a Region is split for each partition. Use the `SHOW TABLE ↪ REGIONS` syntax to view the Regions of this table:

```
SHOW TABLE t REGIONS;
```

```
+--
    ↪ ---------+-----------+---------+-----------+-----------------+------------
    ↪
| REGION_ID | START_KEY | END_KEY | LEADER_ID | LEADER_STORE_ID | PEERS
    ↪   | SCATTERING | WRITTEN_BYTES | READ_BYTES | APPROXIMATE_SIZE(MB
    ↪ ) | APPROXIMATE_KEYS |
+--
    ↪ ---------+-----------+---------+-----------+-----------------+------------
    ↪
| 1978     | t_1400_  | t_1401_ | 1979    | 4               | 1979, 1980,
    ↪ 1981 | 0       | 0            | 0         | 1                    | 0
    ↪                |
| 6        | t_1401_  |         | 17       | 4               | 17, 18, 21
    ↪     | 0         | 223          | 0         | 1                    | 0
    ↪                |
+--
    ↪ ---------+-----------+---------+-----------+-----------------+------------
    ↪
```

2. Use the `SPLIT` syntax to split a Region for each partition. Suppose that you want to split the data in the `[0,10000]` range of each partition into four Regions. The example statement is as follows:

```
split partition table t between (0) and (10000) regions 4;
```

In the above statement, `0` and `10000` respectively represent the `row_id` of the upper and lower boundaries corresponding to the hotspot data you want to scatter.

> **Note:**
>
> This example only applies to scenarios where hotspot data is evenly distributed. If the hotspot data is unevenly distributed in a specified data range, refer to the syntax of uneven split in Split Regions for partitioned tables.

3. Use the `SHOW TABLE REGIONS` syntax to view the Regions of this table again. You can see that this table now has ten Regions, each partition with five Regions, four of which are the row data and one is the index data.

```
SHOW TABLE t REGIONS;
```

```
+--
    ↪ ---------+--------------+--------------+----------+-----------------+---
    ↪
```

```
| REGION_ID | START_KEY  | END_KEY      | LEADER_ID | LEADER_STORE_ID |
   ↪ PEERS      | SCATTERING | WRITTEN_BYTES | READ_BYTES |
   ↪ APPROXIMATE_SIZE(MB) | APPROXIMATE_KEYS |
+--
   ↪ ---------+--------------+--------------+----------+-----------------+---
   ↪
| 1998      | t_1400_r     | t_1400_r_2500 | 2001    | 5               |
   ↪ 2000, 2001, 2015 | 0       | 132          | 0         | 1
   ↪                  | 0               |
| 2006      | t_1400_r_2500 | t_1400_r_5000 | 2016 | 1               |
   ↪ 2007, 2016, 2017 | 0       | 35           | 0         | 1
   ↪                  | 0               |
| 2010      | t_1400_r_5000 | t_1400_r_7500 | 2012 | 2               |
   ↪ 2011, 2012, 2013 | 0       | 35           | 0         | 1
   ↪                  | 0               |
| 1978      | t_1400_r_7500 | t_1401_      | 1979     | 4               |
   ↪ 1979, 1980, 1981 | 0       | 621          | 0         | 1

+--
   ↪ ---------+--------------+--------------+----------+-----------------+---
   ↪
```

4. You can also split Regions for the index of each partition. For example, you can split the `[1000,10000]` range of the `idx` index into two Regions. The example statement is as follows:

```
SPLIT PARTITION TABLE t INDEX idx BETWEEN (1000) AND (10000) REGIONS
```

```
    ↪ 2;
```

Examples of Split Region for a single partition

You can specify the partition to be split.

1. Create a partitioned table. Suppose that you want to create a Range partitioned table split into three partitions. The example statement is as follows:

```
CREATE TABLE t ( a INT, b INT, INDEX idx(b)) PARTITION BY RANGE( a ) (
    PARTITION p1 VALUES LESS THAN (10000),
    PARTITION p2 VALUES LESS THAN (20000),
    PARTITION p3 VALUES LESS THAN (MAXVALUE) );
```

2. Suppose that you want to split the data in the `[0,10000]` range of the `p1` partition into two Regions. The example statement is as follows:

```
SPLIT PARTITION TABLE t PARTITION (p1) BETWEEN (0) AND (10000) REGIONS
    ↪  2;
```

3. Suppose that you want to split the data in the `[10000,20000]` range of the `p2` partition into two Regions. The example statement is as follows:

```
SPLIT PARTITION TABLE t PARTITION (p2) BETWEEN (10000) AND (20000)
    ↪ REGIONS 2;
```

4. You can use the `SHOW TABLE REGIONS` syntax to view the Regions of this table:

```
SHOW TABLE t REGIONS;
```

```
+--
    ↪ ---------+---------------+---------------+----------+-----------------+-
    ↪
| REGION_ID | START_KEY   | END_KEY       | LEADER_ID | LEADER_STORE_ID |
    ↪  PEERS       | SCATTERING | WRITTEN_BYTES | READ_BYTES |
    ↪ APPROXIMATE_SIZE(MB) | APPROXIMATE_KEYS |
+--
    ↪ ---------+---------------+---------------+----------+-----------------+-
    ↪
| 2040      | t_1406_       | t_1406_r_5000 | 2045     | 3               |
    ↪ 2043, 2045, 2044 | 0       | 0            | 0         | 1
    ↪                  | 0              |
| 2032      | t_1406_r_5000 | t_1407_       | 2033     | 4               |
    ↪ 2033, 2034, 2035 | 0       | 0            | 0         | 1
    ↪                  | 0              |
```

```
| 2046     | t_1407_       | t_1407_r_15000 | 2048   | 2             |
   ↪ 2047, 2048, 2050 | 0       | 35           | 0         | 1
   ↪                  | 0              |
| 2036     | t_1407_r_15000 | t_1408_     | 2037     | 4             |
   ↪ 2037, 2038, 2039 | 0       | 0            | 0         | 1
   ↪                  | 0              |
| 6        | t_1408_       |               | 17       | 4             |
   ↪ 17, 18, 21     | 0         | 214          | 0         | 1
   ↪                  | 0              |
+--
   ↪ ---------+----------------+---------------+----------+-------------------+-
   ↪
```

5. Suppose that you want to split the `[0,20000]` range of the `idx` index of the `p1` and `p2` partitions into two Regions. The example statement is as follows:

```
SPLIT PARTITION TABLE t PARTITION (p1,p2) INDEX idx BETWEEN (0) AND
   ↪ (20000) REGIONS 2;
```

14.13.2.145.3 pre_split_regions

When creating a table with the `AUTO_RANDOM` or `SHARD_ROW_ID_BITS` attribute, you can also specify the `PRE_SPLIT_REGIONS` option if you want to evenly pre-split the table into Regions immediately after the table is created. The number of pre-split Regions for a table is `2^(PRE_SPLIT_REGIONS)`.

> **Note:**
>
> The value of `PRE_SPLIT_REGIONS` must be less than or equal to that of `SHARD_ROW_ID_BITS` or `AUTO_RANDOM`.

The `tidb_scatter_region` global variable affects the behavior of `PRE_SPLIT_REGIONS`. This variable controls whether to wait for Regions to be pre-split and scattered before returning results after the table creation. If there are intensive writes after creating the table, you need to set the value of this variable to `1`, then TiDB will not return the results to the client until all the Regions are split and scattered. Otherwise, TiDB writes the data before the scattering is completed, which will have a significant impact on write performance.

Examples of pre_split_regions

```
CREATE TABLE t (a INT, b INT, INDEX idx1(a)) SHARD_ROW_ID_BITS = 4 PRE_
   ↪ SPLIT_REGIONS=2;
```

After building the table, this statement splits `4 + 1` Regions for table t. `4 (2^2)` Regions are used to save table row data, and 1 Region is for saving the index data of `idx1`.

The ranges of the 4 table Regions are as follows:

```
region1:  [ -inf     ,  1<<61 )
region2:  [ 1<<61    ,  2<<61 )
region3:  [ 2<<61    ,  3<<61 )
region4:  [ 3<<61    ,  +inf  )
```

Note:

The Region split by the Split Region statement is controlled by the Region merge scheduler in PD. To avoid PD re-merging the newly split Region soon after, you need to use table attributes or dynamically modify configuration items related to the Region merge feature.

14.13.2.145.4 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.145.5 See also

- SHOW TABLE REGIONS
- Session variables: `tidb_scatter_region`, `tidb_wait_split_region_finish` and `tidb_wait_split_region_timeout`.

14.13.2.146 START TRANSACTION

This statement starts a new transaction inside of TiDB. It is similar to the statement `BEGIN`.

In the absence of a `START TRANSACTION` statement, every statement will by default autocommit in its own transaction. This behavior ensures MySQL compatibility.

14.13.2.146.1 Synopsis

BeginTransactionStmt:

```
BeginTransactionStmt ::=
    'BEGIN' ( 'PESSIMISTIC' | 'OPTIMISTIC' )?
|   'START' 'TRANSACTION' ( 'READ' ( 'WRITE' | 'ONLY' ( ( 'WITH' 'TIMESTAMP'
    ↪  'BOUND' TimestampBound )? | AsOfClause ) ) | 'WITH' 'CONSISTENT' '
    ↪ SNAPSHOT' | 'WITH' 'CAUSAL' 'CONSISTENCY' 'ONLY' )?
```

```
AsOfClause ::=
    ( 'AS' 'OF' 'TIMESTAMP' Expression)
```

14.13.2.146.2 Examples

```
mysql> CREATE TABLE t1 (a int NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.12 sec)

mysql> START TRANSACTION;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.00 sec)

mysql> COMMIT;
Query OK, 0 rows affected (0.01 sec)
```

14.13.2.146.3 MySQL compatibility

- `START TRANSACTION` immediately starts a transaction inside TiDB. This differs from MySQL, where `START TRANSACTION` lazily creates a transaction. But `START TRANSACTION` in TiDB is equivalent to MySQL's `START TRANSACTION WITH CONSISTENT SNAPSHOT`.
- The statement `START TRANSACTION READ ONLY` is parsed for compatibility with MySQL, but still allows write operations.

14.13.2.146.4 See also

- COMMIT
- ROLLBACK
- BEGIN
- START TRANSACTION WITH CAUSAL CONSISTENCY ONLY

14.13.2.147 TABLE

The `TABLE` statement can be used instead of `SELECT * FROM` when no aggregation or complex filtering is needed.

14.13.2.147.1 Synopsis

```
TableStmt ::=
    "TABLE" Table ( "ORDER BY" Column )? ( "LIMIT" NUM )?
```

14.13.2.147.2 Examples

Create table `t1`:

```
CREATE TABLE t1(id INT PRIMARY KEY);
```

Insert some data into `t1`:

```
INSERT INTO t1 VALUES (1),(2),(3);
```

View the data in table `t1`:

```
TABLE t1;
```

```
+----+
| id |
+----+
|  1 |
|  2 |
|  3 |
+----+
3 rows in set (0.01 sec)
```

Query `t1` and sort the result by the `id` field in descending order:

```
TABLE t1 ORDER BY id DESC;
```

```
+----+
| id |
+----+
|  3 |
|  2 |
|  1 |
+----+
3 rows in set (0.01 sec)
```

Query the first record in `t1`:

```
TABLE t1 LIMIT 1;
```

```
+----+
| id |
+----+
|  1 |
+----+
1 row in set (0.01 sec)
```

14.13.2.147.3 MySQL compatibility

The `TABLE` statement was introduced in MySQL 8.0.19.

- TABLE statements in MySQL

14.13.2.148 TRACE

The `TRACE` statement provides detailed information about query execution. It is intended to be viewed through a Graphical interface exposed by the TiDB server's status port.

14.13.2.148.1 Synopsis

```
TraceStmt ::=
    "TRACE" ( "FORMAT" "=" stringLit )? TracableStmt

TracableStmt ::=
    ( SelectStmt | DeleteFromStmt | UpdateStmt | InsertIntoStmt |
       ↪ ReplaceIntoStmt | UnionStmt | LoadDataStmt | BeginTransactionStmt
       ↪ | CommitStmt | RollbackStmt | SetStmt )
```

Format	Description
row	Output in a tree format
json	Structured output in JSON format
log	Log based output

14.13.2.148.2 Examples

14.13.2.148.4 See also

- EXPLAIN ANALYZE

14.13.2.149 TRUNCATE

The `TRUNCATE` statement removes all data from the table in a non-transactional way. `TRUNCATE` can be thought of as semantically the same as `DROP TABLE` + `CREATE TABLE` with the previous definition.

Both `TRUNCATE TABLE tableName` and `TRUNCATE tableName` are valid syntax.

14.13.2.149.1 Synopsis

```
TruncateTableStmt ::=
    "TRUNCATE" ( "TABLE" )? TableName

TableName ::=
    (Identifier ".")? Identifier
```

14.13.2.149.2 Examples

```
mysql> CREATE TABLE t1 (a INT NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.01 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+---+
| a |
+---+
| 1 |
| 2 |
| 3 |
| 4 |
| 5 |
+---+
5 rows in set (0.00 sec)

mysql> TRUNCATE t1;
Query OK, 0 rows affected (0.11 sec)

mysql> SELECT * FROM t1;
Empty set (0.00 sec)

mysql> INSERT INTO t1 VALUES (1),(2),(3),(4),(5);
Query OK, 5 rows affected (0.01 sec)
Records: 5 Duplicates: 0 Warnings: 0

mysql> TRUNCATE TABLE t1;
Query OK, 0 rows affected (0.11 sec)
```

14.13.2.149.3 MySQL compatibility

The `TRUNCATE` statement in TiDB is fully compatible with MySQL. If you find any compatibility differences, report a bug.

- DELETE
- CREATE TABLE
- SHOW CREATE TABLE

14.13.2.150 UNLOCK STATS

`UNLOCK STATS` is used to unlock the statistics of a table or tables.

14.13.2.150.1 Synopsis

```
UnlockStatsStmt ::=
    'UNLOCK' 'STATS' (TableNameList | TableName 'PARTITION'
       ↪ PartitionNameList)

TableNameList ::=
    TableName (',' TableName)*

TableName ::=
    Identifier ( '.' Identifier )?

PartitionNameList ::=
    Identifier ( ',' Identifier )*
```

14.13.2.150.2 Examples

Refer to the examples in LOCK STATS and create a table `t` and lock its statistics.

Unlock the statistics of table `t`, and `ANALYZE` can be successfully executed.

```
mysql> UNLOCK STATS t;
Query OK, 0 rows affected (0.01 sec)

mysql> ANALYZE TABLE t;
Query OK, 0 rows affected, 1 warning (0.03 sec)

mysql> SHOW WARNINGS;
+--
   ↪ -----+------+-----------------------------------------------------------------
   ↪
| Level | Code | Message
   ↪
   ↪ |
+--
   ↪ -----+------+-----------------------------------------------------------------
   ↪
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
   ↪ test.t, reason to use this rate is "use min(1, 110000/8) as the
   ↪ sample-rate=1" |
+--
   ↪ -----+------+-----------------------------------------------------------------
   ↪
```

```
1 row in set (0.00 sec)
```

Refer to examples in LOCK STATS and create a table `t` and lock the statistics of its partition `p1`.

Unlock the statistics of partition `p1`, and `ANALYZE` can be successfully executed.

```
mysql> UNLOCK STATS t PARTITION p1;
Query OK, 0 rows affected (0.00 sec)

mysql> ANALYZE TABLE t PARTITION p1;
Query OK, 0 rows affected, 1 warning (0.01 sec)

mysql> SHOW WARNINGS;
+--
    ↪ -----+------+-----------------------------------------------------------------
    ↪
| Level | Code | Message
    ↪
    ↪ |
+--
    ↪ -----+------+-----------------------------------------------------------------
    ↪
| Note | 1105 | Analyze use auto adjusted sample rate 1.000000 for table
    ↪ test.t's partition p1, reason to use this rate is "TiDB assumes that
    ↪ the table is empty, use sample-rate=1" |
+-------+------+-----------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

14.13.2.150.3 MySQL compatibility

This statement is a TiDB extension to MySQL syntax.

14.13.2.151 UPDATE

The `UPDATE` statement is used to modify data in a specified table.

14.13.2.151.1 Synopsis

```
UpdateStmt ::=
    "UPDATE" UpdateOption
(   TableRef "SET" Assignment ("," Assignment)* WhereClause? OrderBy? Limit?
|   TableRefs "SET" Assignment ("," Assignment)* WhereClause?
)

UpdateOption ::=
    OptimizerHints? ("LOW_PRIORITY" | "HIGH_PRIORITY" | "DELAYED")? "IGNORE
        ↪ "?

TableRef ::=
    ( TableFactor | JoinTable )

TableRefs ::=
    EscapedTableRef ("," EscapedTableRef)*
```

14.13.2.151.2 Examples

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY AUTO_INCREMENT, c1 INT
    ↪ NOT NULL);
Query OK, 0 rows affected (0.11 sec)

mysql> INSERT INTO t1 (c1) VALUES (1), (2), (3);
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 |  3 |
+----+----+
3 rows in set (0.00 sec)

mysql> UPDATE t1 SET c1=5 WHERE c1=3;
Query OK, 1 row affected (0.01 sec)
Rows matched: 1 Changed: 1 Warnings: 0

mysql> SELECT * FROM t1;
+----+----+
| id | c1 |
```

```
+----+----+
|  1 |  1 |
|  2 |  2 |
|  3 |  5 |
+----+----+
3 rows in set (0.00 sec)
```

14.13.2.151.3 MySQL compatibility

TiDB always uses the original value of a column when evaluating expressions. For example:

```
CREATE TABLE t (a int, b int);
INSERT INTO t VALUES (1,2);
UPDATE t SET a = a+1,b=a;
```

In MySQL, the column `b` is updated to 2 because it is set to the value of `a`, and the value of `a` (which is 1) is updated to `a+1` (which is 2) in the same statement.

TiDB follows the more standard SQL behavior, and updates `b` to 1.

- SHOW TABLES

14.13.2.153 WITH

A Common Table Expression (CTE) is a temporary result set that can be referred multiple times within a SQL statement to improve the statement's readability and execution efficiency. You can apply the `WITH` statement to use Common Table Expressions.

14.13.2.153.1 Synopsis

WithClause:

```
WithClause ::=
       "WITH" WithList
|      "WITH" "RECURSIVE" WithList
```

WithList:

```
WithList ::=
       WithList ',' CommonTableExpr
|      CommonTableExpr
```

CommonTableExpr:

```
CommonTableExpr ::=
       Identifier IdentListWithParenOpt "AS" SubSelect
```

IdentListWithParenOpt:

```
IdentListWithParenOpt ::=
( '(' IdentList ')' )?
```

14.13.2.153.2 Examples

Non-recursive CTE:

```
WITH cte AS (SELECT 1, 2) SELECT * FROM cte t1, cte t2;
```

```
+---+---+---+---+
| 1 | 2 | 1 | 2 |
+---+---+---+---+
| 1 | 2 | 1 | 2 |
+---+---+---+---+
1 row in set (0.00 sec)
```

Recursive CTE:

```
WITH RECURSIVE cte(a) AS (SELECT 1 UNION SELECT a+1 FROM cte WHERE a < 5)
    ↪ SELECT * FROM cte;
```

```
+---+
| a |
+---+
| 1 |
| 2 |
| 3 |
| 4 |
| 5 |
+---+
5 rows in set (0.00 sec)
```

14.13.2.153.3 MySQL compatibility

- In strict mode, when the data length recursively calculated exceeds the data length of the seed part, TiDB returns a warning while MySQL returns an error. In non-strict mode, the behavior of TiDB is consistent with that of MySQL.
- The data type for recursive CTE is determined by the seed part. The data type of the seed part is not completely consistent with MySQL in some cases (such as functions).
- In the case of multiple `UNION` / `UNION ALL` operators, MySQL does not allow `UNION` to be followed by `UNION ALL`, but TiDB does.
- If there is a problem with the definition of a CTE, TiDB will report an error, while MySQL will not if the CTE is not referred.

14.13.3 Data Types

14.13.3.1 Data Types

TiDB supports all the data types in MySQL except the `SPATIAL` type. This includes all the numeric types, string types, date & time types, and the JSON type.

The definitions used for datatypes are specified as `T(M[, D])`. Where by:

- `T` indicates the specific data type.
- `M` indicates the maximum display width for integer types. For floating-point and fixed-point types, `M` is the total number of digits that can be stored (the precision). For string types, `M` is the maximum length. The maximum permissible value of M depends on the data type.
- `D` applies to floating-point and fixed-point types and indicates the number of digits following the decimal point (the scale).
- `fsp` applies to the `TIME`, `DATETIME`, and `TIMESTAMP` types and represents the fractional seconds precision. The `fsp` value, if given, must be in the range 0 to 6. A value of 0 signifies that there is no fractional part. If omitted, the default precision is 0.

14.13.3.2 Default Values

The `DEFAULT` value clause in a data type specification indicates a default value for a column.

You can set default values for all data types. Typically, default values must be constants and cannot be functions or expressions, but there are some exceptions:

- For time types, you can use `NOW`, `CURRENT_TIMESTAMP`, `LOCALTIME`, and `LOCALTIMESTAMP` ↪ functions as default values for `TIMESTAMP` and `DATETIME` columns.
- For integer types, you can use the `NEXT VALUE FOR` function to set the next value of a sequence as the default value for a column, and use the `RAND()` function to generate a random floating-point value as the default value for a column.
- For string types, you can use the `UUID()` function to generate a universally unique identifier (UUID) as the default value for a column.
- For binary types, you can use the `UUID_TO_BIN()` function to convert a UUID to the binary format and set the converted value as the default value for a column.
- Starting from v8.0.0, TiDB additionally supports specifying the default values for `BLOB` ↪ , `TEXT`, and `JSON` data types, but you can only use expressions to set the default values for them.

If a column definition includes no explicit `DEFAULT` value, TiDB determines the default value as follows:

- If the column can take `NULL` as a value, the column is defined with an explicit `DEFAULT NULL` clause.
- If the column cannot take `NULL` as the value, TiDB defines the column with no explicit `DEFAULT` clause.

For data entry into a `NOT NULL` column that has no explicit `DEFAULT` clause, if an `INSERT` or `REPLACE` statement includes no value for the column, TiDB handles the column according to the SQL mode in effect at the time:

- If strict SQL mode is enabled, an error occurs for transactional tables, and the statement is rolled back. For nontransactional tables, an error occurs.
- If strict mode is not enabled, TiDB sets the column to the implicit default value for the column data type.

Implicit defaults are defined as follows:

- For numeric types, the default is 0. If declared with the `AUTO_INCREMENT` attribute, the default is the next value in the sequence.
- For date and time types other than `TIMESTAMP`, the default is the appropriate "zero" value for the type. For `TIMESTAMP`, the default value is the current date and time.
- For string types other than `ENUM`, the default value is the empty string. For `ENUM`, the default is the first enumeration value.

14.13.3.2.1 Specify expressions as default values

> **Warning:**
>
> Currently, this feature is experimental. It is not recommended that you use it in production environments. This feature might be changed or removed without prior notice. If you find a bug, you can report an issue on GitHub.

Starting from 8.0.13, MySQL supports specifying expressions as default values in the `DEFAULT` clause. For more information, see Explicit default handling as of MySQL 8.0.13.

Starting from v8.0.0, TiDB additionally supports specifying the following expressions as default values in the `DEFAULT` clause.

- `UPPER(SUBSTRING_INDEX(USER(), '@', 1))`

- `REPLACE(UPPER(UUID()), '-', '')`
- `DATE_FORMAT` expressions in the following formats:
  - `DATE_FORMAT(NOW(), '%Y-%m')`
  - `DATE_FORMAT(NOW(), '%Y-%m-%d')`
  - `DATE_FORMAT(NOW(), '%Y-%m-%d %H.%i.%s')`
  - `DATE_FORMAT(NOW(), '%Y-%m-%d %H:%i:%s')`
- `STR_TO_DATE('1980-01-01', '%Y-%m-%d')`

Starting from v8.0.0, TiDB additionally supports assigning default values to `BLOB`, `TEXT`, and `JSON` data types. However, you can only use expressions to set the default values for these data types. The following is an example of `BLOB`:

```
CREATE TABLE t2 (b BLOB DEFAULT (RAND()));
```

> **Note:**
>
> Currently, the `ADD COLUMN` statement does not support using expressions as default values.

14.13.3.3 Numeric Types

TiDB supports all the MySQL numeric types, including:

- Integer Types (Exact Value)
- Floating-Point Types (Approximate Value)
- Fixed-Point Types (Exact Value)

14.13.3.3.1 Integer types

TiDB supports all the MySQL integer types, including `INTEGER`/`INT`, `TINYINT`, `SMALLINT` ↪ , `MEDIUMINT`, and `BIGINT`. For more information, see Integer Data Type Syntax in MySQL.

The following table summarizes field descriptions:

Syntax Element	Description
M	the display width of the type. Optional.
UNSIGNED	UNSIGNED. If omitted, it is SIGNED.

Syntax Element	Description
ZEROFILL	If you specify ZEROFILL for a numeric column, TiDB automatically adds the UNSIGNED attribute to the column.

The following table summarizes the required storage and range for integer types supported by TiDB:

Data Type	Storage Required (bytes)	Minimum Value (signed/unsigned)	Maximum value (signed/unsigned)
`TINYINT`	1	-128 / 0	127 / 255
`SMALLINT`	2	-32768 / 0	32767 / 65535
`MEDIUMINT`	3	-8388608 / 0	8388607 / 16777215
`INT`	4	-2147483648 / 0	2147483647 / 4294967295
`BIGINT`	8	-9223372036854775808 / 0	9223372036854775807 / 18446744073709551615

`BIT` type

The BIT data type. A type of BIT(M) enables the storage of M-bit values. M can range from 1 to 64, with the default value of 1:

```
BIT[(M)]
```

`BOOLEAN` type

The `BOOLEAN` type and its alias `BOOL` are equivalent to `TINYINT(1)`. If the value is `0`, it is considered as `False`; otherwise, it is considered `True`. As in MySQL, `True` is `1` and `False` is `0`:

```
BOOLEAN
```

`TINYINT` type

The TINYINT data type stores signed values of range [-128, 127] and unsigned values of range [0, 255]:

```
TINYINT[(M)] [UNSIGNED] [ZEROFILL]
```

SMALLINT type

The SMALLINT data type stores signed values of range [-32768, 32767], and unsigned values of range [0, 65535]:

```
SMALLINT[(M)] [UNSIGNED] [ZEROFILL]
```

MEDIUMINT type

The MEDIUMINT data type stores signed values of range [-8388608, 8388607], and unsigned values of range [0, 16777215]:

```
MEDIUMINT[(M)] [UNSIGNED] [ZEROFILL]
```

INTEGER type

The INTEGER type and its alias INT stores signed values of range [-2147483648, 2147483647], and unsigned values of range [0, 4294967295]:

```
INT[(M)] [UNSIGNED] [ZEROFILL]
```

You can also use another form:

```
INTEGER[(M)] [UNSIGNED] [ZEROFILL]
```

BIGINT type

The BIGINT data type stores signed values of range [-9223372036854775808, 9223372036854775807], and unsigned values of range [0, 18446744073709551615]:

```
BIGINT[(M)] [UNSIGNED] [ZEROFILL]
```

14.13.3.3.2 Floating-point types

TiDB supports all the MySQL floating-point types, including FLOAT, and DOUBLE. For more information, see Floating-Point Types (Approximate Value) - FLOAT, DOUBLE in MySQL.

The following table summarizes field descriptions:

Syntax Element	Description
M	the total number of digits
D	the number of digits following the decimal point

Syntax Element	Description
UNSIGNED	UNSIGNED. If omitted, it is SIGNED.
ZEROFILL	If you specify ZEROFILL for a numeric column, TiDB automatically adds the UNSIGNED attribute to the column.

The following table summarizes the required storage for floating-point types supported by TiDB:

Data Type	Storage Required (bytes)
`FLOAT`	4
`FLOAT(p)`	If 0 <= p <= 24, it is 4; if 25 <= p <= 53, it is 8
`DOUBLE`	8

`FLOAT` type

The `FLOAT` type stores a single-precision floating-point number. Permissible values are -3.402823466E+38 to -1.175494351E-38, 0, and 1.175494351E-38 to 3.402823466E+38. These are the theoretical limits, based on the IEEE standard. The actual range might be slightly smaller depending on your hardware or operating system.

`FLOAT(p)` can be used to represent the required precision in bits. TiDB uses this value only to determine whether to use `FLOAT` or `DOUBLE` for the resulting data type. If p is from 0 to 24, the data type becomes FLOAT with no M or D values. If p is from 25 to 53, the data type becomes `DOUBLE` with no M or D values. The range of the resulting column is the same as for the single-precision `FLOAT` or double-precision `DOUBLE` data type.

```
FLOAT[(M,D)] [UNSIGNED] [ZEROFILL]
FLOAT(p) [UNSIGNED] [ZEROFILL]
```

Note:

As in MySQL, the `FLOAT` data type stores approximate values. For values such as currency, it is recommended to use the `DECIMAL` type instead.

In TiDB, the default precision of the `FLOAT` data type is 8 digits, but in MySQL, the default precision is 6 digits. For example, assuming that you insert `123456789` and `1.23456789` into columns of the `FLOAT` type in both TiDB and MySQL, when you query the corresponding values in MySQL,

you get `123457000` and `1.23457`, while in TiDB, you get `123456790` and `1.2345679`.

`DOUBLE` type

The `DOUBLE` type, and its alias `DOUBLE PRECISION` stores a double-precision floating-point number. Permissible values are -1.7976931348623157E+308 to -2.2250738585072014E-308, 0, and 2.2250738585072014E-308 to 1.7976931348623157E+308. These are the theoretical limits, based on the IEEE standard. The actual range might be slightly smaller depending on your hardware or operating system.

```
DOUBLE[(M,D)] [UNSIGNED] [ZEROFILL]
DOUBLE PRECISION [(M,D)] [UNSIGNED] [ZEROFILL], REAL[(M,D)] [UNSIGNED] [
    ↪ ZEROFILL]
```

Warning:

As in MySQL, the `DOUBLE` data type stores approximate values. For values such as currency, it is recommended to use the `DECIMAL` type instead.

Note:

When TiDB converts a double-precision floating-point number represented in scientific notation to the `CHAR` type, the result is displayed inconsistently with that in MySQL. See Cast functions and operators for details.

14.13.3.3.3 Fixed-point types

TiDB supports all the MySQL floating-point types, including DECIMAL, and NUMERIC. For more information, Fixed-Point Types (Exact Value) - DECIMAL, NUMERIC in MySQL.

The meaning of the fields:

Syntax Element	Description
M	the total number of decimal digits
D	the number of digits after the decimal point

Syntax Element	Description
UNSIGNED	UNSIGNED. If omitted, it is SIGNED.
ZEROFILL	If you specify ZEROFILL for a numeric column, TiDB automatically adds the UNSIGNED attribute to the column.

`DECIMAL` type

`DECIMAL` and its alias `NUMERIC` store a packed "exact" fixed-point number. M is the total number of decimal digits (the precision), and D is the number of digits after the decimal point (the scale). The decimal point and (for negative numbers) the - sign are not counted in M. If D is 0, values have no decimal point or fractional part. The maximum number of digits (M) for DECIMAL is 65. The maximum number of supported decimals (D) is 30. If D is omitted, the default is 0. If M is omitted, the default is 10.

```
DECIMAL[(M[,D])] [UNSIGNED] [ZEROFILL]
NUMERIC[(M[,D])] [UNSIGNED] [ZEROFILL]
```

14.13.3.4 Date and Time Types

TiDB supports all MySQL date and time data types to store temporal values: `DATE`, `TIME`, `DATETIME`, `TIMESTAMP`, and `YEAR`. For more information, see Date and Time Data Types in MySQL.

Each of these types has its range of valid values, and uses a zero value to indicate that it is an invalid value. In addition, the `TIMESTAMP` and `DATETIME` types can automatically generate new time values on modification.

When dealing with date and time value types, note:

- Although TiDB tries to interpret different formats, the date-portion must be in the format of year-month-day (for example, '1998-09-04'), rather than month-day-year or day-month-year.
- If the year-portion of a date is specified as 2 digits, TiDB converts it based on specific rules.
- If a numeric value is needed in the context, TiDB automatically converts the date or time value into a numeric type. For example:

```
mysql> SELECT NOW(), NOW()+0, NOW(3)+0;
+---------------------+---------------+--------------------+
| NOW()               | NOW()+0       | NOW(3)+0           |
```

```
+---------------------+---------------+--------------------+
| 2012-08-15 09:28:00 | 20120815092800 | 20120815092800.889 |
+---------------------+---------------+--------------------+
```

- TiDB might automatically convert invalid values or values beyond the supported range to a zero value of that type. This behavior is dependent on the SQL Mode set. For example:

```
mysql> show create table t1;
+--
    ↪ -----+-----------------------------------------------------------------
    ↪
| Table | Create Table
    ↪
    ↪ |
+--
    ↪ -----+-----------------------------------------------------------------
    ↪
| t1    | CREATE TABLE `t1` (
  `a` time DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin |
+--
    ↪ -----+-----------------------------------------------------------------
    ↪
1 row in set (0.00 sec)

mysql> select @@sql_mode;
+--
    ↪ -----------------------------------------------------------------------
    ↪
| @@sql_mode
    ↪
    ↪ |
+--
    ↪ -----------------------------------------------------------------------
    ↪
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_ZERO_DATE,
    ↪ ERROR_FOR_DIVISION_BY_ZERO,NO_AUTO_CREATE_USER,NO_ENGINE_
    ↪ SUBSTITUTION |
+--
    ↪ -----------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)

mysql> insert into t1 values ('2090-11-32:22:33:44');
```

```
ERROR 1292 (22007): Truncated incorrect time value: '
    ↪ 2090-11-32:22:33:44'
mysql> set @@sql_mode='';
    ↪
    ↪ Query OK, 0 rows affected (0.01 sec)

mysql> insert into t1 values ('2090-11-32:22:33:44');
Query OK, 1 row affected, 1 warning (0.01 sec)

mysql> select * from t1;
+----------+
| a        |
+----------+
| 00:00:00 |
+----------+
1 row in set (0.01 sec)
```

- Setting different SQL modes can change TiDB behaviors.
- If the SQL mode `NO_ZERO_DATE` is not enabled, TiDB allows month or day in the columns of `DATE` and `DATETIME` to be zero value, for example, '2009-00-00' or '2009-01-00'. If this date type is to be calculated in a function, for example, in `DATE_SUB()` or `DATE_ADD()`, the result can be incorrect.
- By default, TiDB enables the SQL mode `NO_ZERO_DATE`. This mode prevents storing zero values such as '0000-00-00'.

Different types of zero value are shown in the following table:

Date Type	"Zero" Value
DATE	'0000-00-00'
TIME	'00:00:00'
DATETIME	'0000-00-00 00:00:00'
TIMESTAMP	'0000-00-00 00:00:00'
YEAR	0000

Invalid `DATE`, `DATETIME`, `TIMESTAMP` values are automatically converted to the corresponding type of zero value ('0000-00-00' or '0000-00-00 00:00:00') if the SQL mode permits such usage.

14.13.3.4.1 Supported types

`DATE` type

`DATE` only contains date-portion and no time-portion, displayed in `YYYY-MM-DD` format. The supported range is '0000-01-01' to '9999-12-31':

```
DATE
```

`TIME` type

For the `TIME` type, the format is `HH:MM:SS[.fraction]` and valid values range from '-838:59:59.000000' to '838:59:59.000000'. `TIME` is used not only to indicate the time within a day but also to indicate the time interval between 2 events. An optional `fsp` value in the range from 0 to 6 may be given to specify fractional seconds precision. If omitted, the default precision is 0:

```
TIME[(fsp)]
```

Note:

Pay attention to the abbreviated form of `TIME`. For example, '11:12' means '11:12:00' instead of '00:11:12'. However, '1112' means '00:11:12'. These differences are caused by the presence or absence of the `:` character.

`DATETIME` type

`DATETIME` contains both date-portion and time-portion. Valid values range from '0000-01-01 00:00:00.000000' to '9999-12-31 23:59:59.999999'.

TiDB displays `DATETIME` values in `YYYY-MM-DD HH:MM:SS[.fraction]` format, but permits assignment of values to `DATETIME` columns using either strings or numbers. An optional fsp value in the range from 0 to 6 may be given to specify fractional seconds precision. If omitted, the default precision is 0:

```
DATETIME[(fsp)]
```

`TIMESTAMP` type

`TIMESTAMP` contains both date-portion and time-portion. Valid values range from '1970-01-01 00:00:01.000000' to '2038-01-19 03:14:07.999999' in UTC time. An optional fsp value in the range from 0 to 6 may be given to specify fractional seconds precision. If omitted, the default precision is 0.

In `TIMESTAMP`, zero is not permitted to appear in the month-portion or day-portion. The only exception is zero value itself '0000-00-00 00:00:00'.

```
TIMESTAMP[(fsp)]
```

Timezone Handling

When TIMESTAMP is to be stored, TiDB converts the TIMESTAMP value from the current time zone to UTC time zone. When TIMESTAMP is to be retrieved, TiDB converts the stored TIMESTAMP value from UTC time zone to the current time zone (Note: DATETIME is not handled in this way). The default time zone for each connection is the server's local time zone, which can be modified by the environment variable time_zone.

> **Warning:**
>
> As in MySQL, the TIMESTAMP data type suffers from the Year 2038 Problem. For storing values that may span beyond 2038, please consider using the DATETIME type instead.

YEAR type

The YEAR type is specified in the format 'YYYY'. Supported values range from 1901 to 2155, or the zero value of 0000:

```
YEAR[(4)]
```

YEAR follows the following format rules:

- Four-digit numeral ranges from 1901 to 2155
- Four-digit string ranges from '1901' to '2155'
- One-digit or two-digit numeral ranges from 1 to 99. Accordingly, 1-69 is converted to 2001-2069 and 70-99 is converted to 1970-1999
- One-digit or two-digit string ranges from '0' to '99'
- Value 0 is taken as 0000 whereas the string '0' or '00' is taken as 2000

Invalid YEAR value is automatically converted to 0000 (if users are not using the NO_ZERO ↪ _DATE SQL mode).

14.13.3.4.2 Automatic initialization and update of TIMESTAMP and DATETIME

Columns with TIMESTAMP or DATETIME value type can be automatically initialized or updated to the current time.

For any column with TIMESTAMP or DATETIME value type in the table, you can set the default or auto-update value as current timestamp.

These properties can be set by setting DEFAULT CURRENT_TIMESTAMP and ON UPDATE ↪ CURRENT_TIMESTAMP when the column is being defined. DEFAULT can also be set as a specific value, such as DEFAULT 0 or DEFAULT '2000-01-01 00:00:00'.

```
CREATE TABLE t1 (
    ts TIMESTAMP DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP,
    dt DATETIME DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP
);
```

The default value for DATETIME is NULL unless it is specified as NOT NULL. For the latter situation, if no default value is set, the default value is be 0.

```
CREATE TABLE t1 (
    dt1 DATETIME ON UPDATE CURRENT_TIMESTAMP,   -- default NULL
    dt2 DATETIME NOT NULL ON UPDATE CURRENT_TIMESTAMP -- default 0
);
```

14.13.3.4.3 Decimal part of time value

DATETIME and TIMESTAMP values can contain a fractional part of up to 6 digits which is accurate to microseconds. In any column of DATETIME or TIMESTAMP types, a fractional part is stored instead of being discarded. With a fractional part, the value is in the format of 'YYYY-MM-DD HH:MM:SS[.fraction]', and the fraction ranges from 000000 to 999999. A decimal point must be used to separate the fraction from the rest.

- Use type_name(fsp) to define a column that supports fractional precision, where type_name can be TIME, DATETIME or TIMESTAMP. For example,

```
CREATE TABLE t1 (t TIME(3), dt DATETIME(6));
```

fsp must range from 0 to 6.

0 means there is no fractional part. If fsp is omitted, the default is 0.

- When inserting TIME, DATETIME or TIMESTAMP which contain a fractional part, if the number of digit of the fraction is too few, or too many, rounding might be needed in the situation. For example:

```
mysql> CREATE TABLE fractest( c1 TIME(2), c2 DATETIME(2), c3 TIMESTAMP
    ↪ (2) );
Query OK, 0 rows affected (0.33 sec)

mysql> INSERT INTO fractest VALUES
    > ('17:51:04.777', '2014-09-08 17:51:04.777', '2014-09-08
        ↪ 17:51:04.777');
Query OK, 1 row affected (0.03 sec)

mysql> SELECT * FROM fractest;
```

```
+-------------/----------------------/----------------------+
| c1          | c2                   | c3                   |
+-------------/----------------------/----------------------+
| 17:51:04.78 | 2014-09-08 17:51:04.78 | 2014-09-08 17:51:04.78 |
+-------------/----------------------/----------------------+
1 row in set (0.00 sec)
```

14.13.3.4.4 Conversions between date and time types

Sometimes we need to make conversions between date and time types. But some conversions might lead to information loss. For example, `DATE`, `DATETIME` and `TIMESTAMP` values all have their own respective ranges. `TIMESTAMP` should be no earlier than the year 1970 in UTC time or no later than UTC time '2038-01-19 03:14:07'. Based on this rule, '1968-01-01' is a valid date value of `DATE` or `DATETIME`, but becomes 0 when it is converted to `TIMESTAMP`.

The conversions of `DATE`:

- When `DATE` is converted to `DATETIME` or `TIMESTAMP`, a time-portion '00:00:00' is added, because DATE does not contain any time information
- When `DATE` is converted to `TIME`, the result is '00:00:00'

Conversions of `DATETIME` or `TIMESTAMP`:

- When `DATETIME` or `TIMESTAMP` is converted to `DATE`, the time and fractional part is discarded. For example, '1999-12-31 23:59:59.499' is converted to '1999-12-31'
- When `DATETIME` or `TIMESTAMP` is converted to TIME, the date-portion is discarded, because `TIME` does not contain any date information

When we convert `TIME` to other time and date formats, the date-portion is automatically specified as `CURRENT_DATE()`. The final converted result is a date that consists of `TIME` and `CURRENT_DATE()`. This is to say that if the value of TIME is beyond the range from '00:00:00' to '23:59:59', the converted date-portion does not indicate the current day.

When `TIME` is converted to `DATE`, the process is similar, and the time-portion is discarded.

Using the `CAST()` function can explicitly convert a value to a `DATE` type. For example:

```
date_col = CAST(datetime_col AS DATE)
```

Converting `TIME` and `DATETIME` to numeric format. For example:

```
mysql> SELECT CURTIME(), CURTIME()+0, CURTIME(3)+0;
+-----------/-------------/--------------+
| CURTIME() | CURTIME()+0 | CURTIME(3)+0 |
+-----------/-------------/--------------+
| 09:28:00 |      92800 |   92800.887 |
```

```
+----------/-------------/--------------+
mysql> SELECT NOW(), NOW()+0, NOW(3)+0;
+---------------------/----------------/--------------------+
| NOW()               | NOW()+0      | NOW(3)+0           |
+---------------------/----------------/--------------------+
| 2012-08-15 09:28:00 | 20120815092800 | 20120815092800.889 |
+---------------------/----------------/--------------------+
```

14.13.3.4.5 Two-digit year-portion contained in the date

The two-digit year-portion contained in date does not explicitly indicate the actual year and is ambiguous.

For `DATETIME`, `DATE` and `TIMESTAMP` types, TiDB follows the following rules to eliminate ambiguity:

- Values between 01 and 69 is converted to a value between 2001 and 2069
- Values between 70 and 99 is converted to a value between 1970 and 1999

These rules also apply to the `YEAR` type, with one exception:

When numeral `00` is inserted to `YEAR(4)`, the result is 0000 rather than 2000.

If you want the result to be 2000, specify the value to be 2000.

The two-digit year-portion might not be properly calculated in some functions such `MIN()` and `MAX()`. For these functions, the four-digit format suites better.

14.13.3.5 String Types

TiDB supports all the MySQL string types, including `CHAR`, `VARCHAR`, `BINARY`, `VARBINARY` ↪ , `BLOB`, `TEXT`, `ENUM`, and `SET`. For more information, see String Types in MySQL.

14.13.3.5.1 Supported types

`CHAR` type

`CHAR` is a fixed length string. M represents the column-length in characters (not bytes). The range of M is 0 to 255. Different from the `VARCHAR` type, when data is inserted into a `CHAR` column, the trailing spaces are truncated.

```
[NATIONAL] CHAR[(M)] [CHARACTER SET charset_name] [COLLATE collation_name]
```

`VARCHAR` type

`VARCHAR` is a string of variable-length. M represents the maximum column length in characters (not bytes). The maximum size of `VARCHAR` cannot exceed 65,535 bytes. The maximum row length and the character set being used determine the `VARCHAR` length.

The space occupied by a single character might differ for different character sets. The following table shows the bytes consumed by a single character, and the range of the `VARCHAR` column length in each character set:

Character Set	Byte(s) per Character	Range of the Maximum `VARCHAR` Column Length
ascii	1	(0, 65535]
latin1	1	(0, 65535]
binary	1	(0, 65535]
utf8	3	(0, 21845]
utf8mb4	4	(0, 16383]

```
[NATIONAL] VARCHAR(M) [CHARACTER SET charset_name] [COLLATE collation_name]
```

`TEXT` type

`TEXT` is a string of variable-length. The maximum column length is 65,535 bytes. The optional M argument is in characters and is used to automatically select the fittest type of a `TEXT` column. For example `TEXT(60)` will yield a `TINYTEXT` data type that can hold up to 255 bytes, which fits a 60-character UTF-8 string that has up to 4 bytes per character (4×60=240). Using the M argument is not recommended.

```
TEXT[(M)] [CHARACTER SET charset_name] [COLLATE collation_name]
```

`TINYTEXT` type

The `TINYTEXT` type is similar to the TEXT type. The difference is that the maximum column length of `TINYTEXT` is 255.

```
TINYTEXT [CHARACTER SET charset_name] [COLLATE collation_name]
```

`MEDIUMTEXT` type

The `MEDIUMTEXT` type is similar to the TEXT type. The difference is that the maximum column length of `MEDIUMTEXT` is 16,777,215. But due to the limitation of `txn-entry-size-limit`, the maximum storage size of a single row in TiDB is 6 MiB by default and can be increased to 120 MiB by changing the configuration.

```
MEDIUMTEXT [CHARACTER SET charset_name] [COLLATE collation_name]
```

`LONGTEXT` type

The `LONGTEXT` type is similar to the TEXT type. The difference is that the maximum column length of `LONGTEXT` is 4,294,967,295. But due to the limitation of `txn-entry-size-limit`, the maximum storage size of a single row in TiDB is 6 MiB by default and can be increased to 120 MiB by changing the configuration.

```
LONGTEXT [CHARACTER SET charset_name] [COLLATE collation_name]
```

`BINARY` type

The `BINARY` type is similar to the `CHAR` type. The difference is that `BINARY` stores binary byte strings.

```
BINARY(M)
```

`VARBINARY` type

The `VARBINARY` type is similar to the `VARCHAR` type. The difference is that the `VARBINARY` stores binary byte strings.

```
VARBINARY(M)
```

`BLOB` type

`BLOB` is a large binary file. M represents the maximum column length in bytes, ranging from 0 to 65,535.

```
BLOB[(M)]
```

`TINYBLOB` type

The `TINYBLOB` type is similar to the `BLOB` type. The difference is that the maximum column length of `TINYBLOB` is 255.

```
TINYBLOB
```

`MEDIUMBLOB` type

The `MEDIUMBLOB` type is similar to the `BLOB` type. The difference is that the maximum column length of `MEDIUMBLOB` is 16,777,215. But due to the limitation of `txn-entry-size-limit`, the maximum storage size of a single row in TiDB is 6 MiB by default and can be increased to 120 MiB by changing the configuration.

```
MEDIUMBLOB
```

`LONGBLOB` type

The `LONGBLOB` type is similar to the `BLOB` type. The difference is that the maximum column length of `LONGBLOB` is 4,294,967,295. But due to the limitation of `txn-entry-size-limit`, the maximum storage size of a single row in TiDB is 6 MiB by default and can be increased to 120 MiB by changing the configuration.

```
LONGBLOB
```

`ENUM` type

An `ENUM` is a string object with a value chosen from a list of permitted values that are enumerated explicitly in the column specification when the table is created. The syntax is:

```
ENUM('value1','value2',...) [CHARACTER SET charset_name] [COLLATE collation
    ↪ _name]

#### For example:
ENUM('apple', 'orange', 'pear')
```

The value of the `ENUM` data type is stored as numbers. Each value is converted to a number according the definition order. In the previous example, each string is mapped to a number:

Value	Number
NULL	NULL
”	0
‘apple’	1
‘orange’	2
‘pear’	3

For more information, see the ENUM type in MySQL.

`SET` type

A `SET` is a string object that can have zero or more values, each of which must be chosen from a list of permitted values specified when the table is created. The syntax is:

```
SET('value1','value2',...) [CHARACTER SET charset_name] [COLLATE collation_
    ↪ name]

#### For example:
SET('1', '2') NOT NULL
```

In the example, any of the following values can be valid:

```
''
'1'
'2'
'1,2'
```

In TiDB, the values of the `SET` type is internally converted to `Int64`. The existence of each element is represented using a binary: 0 or 1. For a column specified as `SET('a','b ↪ ','c','d')`, the members have the following decimal and binary values.

Member	Decimal Value	Binary Value
‘a’	1	0001
‘b’	2	0010
‘c’	4	0100

Member	Decimal Value	Binary Value
'd'	8	1000

In this case, for an element of `('a', 'c')`, it is `0101` in binary.

For more information, see the SET type in MySQL.

14.13.3.6 JSON Type

TiDB supports the `JSON` (JavaScript Object Notation) data type, which is useful for storing semi-structured data. The `JSON` data type provides the following advantages over storing `JSON`-format strings in a string column:

- Use the Binary format for serialization. The internal format permits quick read access to `JSON` document elements.
- Automatic validation of the JSON documents stored in `JSON` columns. Only valid documents can be stored.

`JSON` columns, like columns of other binary types, are not indexed directly, but you can index the fields in the `JSON` document in the form of generated column:

```
CREATE TABLE city (
    id INT PRIMARY KEY,
    detail JSON,
    population INT AS (JSON_EXTRACT(detail, '$.population')),
    index index_name (population)
    );
INSERT INTO city (id,detail) VALUES (1, '{"name": "Beijing", "population":
    ↪ 100}');
SELECT id FROM city WHERE population >= 100;
```

For more information, see JSON Functions and Generated Columns.

14.13.3.6.1 Restrictions

- Currently, TiDB only supports pushing down limited `JSON` functions to TiFlash. For more information, see Push-down expressions.
- TiDB Backup & Restore (BR) changes how JSON column data is encoded in v6.3.0. Therefore, it is not recommended to use BR to restore data containing JSON columns to a TiDB cluster earlier than v6.3.0.
- Do not use any replication tool to replicate data containing non-standard `JSON` data types, such as `DATE`, `DATETIME`, and `TIME`.

14.13.3.6.2 MySQL compatibility

- When you create JSON columns with data in the `BINARY` type, MySQL mislabels the data as the `STRING` type currently, while TiDB processes it as the `BINARY` type correctly.

```
CREATE TABLE test(a json);
INSERT INTO test SELECT json_objectagg('a', b'01010101');

-- In TiDB, executing the following SQL statement returns `0, 0`. In
   ↪ MySQL, executing the following SQL statement returns `0, 1`.
mysql> SELECT JSON_EXTRACT(JSON_OBJECT('a', b'01010101'), '$.a') = "
   ↪ base64:type15:VQ==" AS r1, JSON_EXTRACT(a, '$.a') = "base64:
   ↪ type15:VQ==" AS r2 FROM test;
+------+------+
| r1   | r2   |
+------+------+
|    0 |    0 |
+------+------+
1 row in set (0.01 sec)
```

  For more information, see issue #37443.

- When converting the data type from `ENUM` or `SET` to `JSON`, TiDB checks the correctness of data format. For example, executing the following SQL statements in TiDB will return an error.

```
CREATE TABLE t(e ENUM('a'));
INSERT INTO t VALUES ('a');
mysql> SELECT CAST(e AS JSON) FROM t;
ERROR 3140 (22032): Invalid JSON text: The document root must not be
   ↪ followed by other values.
```

  For more information, see issue #9999.

- In TiDB, you can use `ORDER BY` to sort JSON arrays or JSON objects.

  In MySQL, if you use `ORDER BY` to sort JSON arrays or JSON objects, MySQL returns a warning and the sorting result does not match the result of the comparison operation:

```
CREATE TABLE t(j JSON);
INSERT INTO t VALUES ('[1,2,3,4]');
INSERT INTO t VALUES ('[5]');

mysql> SELECT j FROM t WHERE j < JSON_ARRAY(5);
+--------------+
| j            |
+--------------+
```

```
| [1, 2, 3, 4] |
+--------------+
1 row in set (0.00 sec)

-- In TiDB, executing the following SQL statement returns the correct
   ↪  sorting result. In MySQL, executing the following SQL
   ↪ statement returns the "This version of MySQL doesn't yet
   ↪ support 'sorting of non-scalar JSON values'." warning and the
   ↪ sorting result is inconsistent with the comparison result of
   ↪ `<`.
mysql> SELECT j FROM t ORDER BY j;
+--------------+
| j            |
+--------------+
| [1, 2, 3, 4] |
| [5]          |
+--------------+
2 rows in set (0.00 sec)
```

For more information, see issue #37506.

- When you insert data to a JSON column, TiDB implicitly converts the value of the data to the `JSON` type.

```
CREATE TABLE t(col JSON);

-- In TiDB, the following INSERT statement is executed successfully.
   ↪ In MySQL, executing the following INSERT statement returns the
   ↪ "Invalid JSON text" error.
INSERT INTO t VALUES (3);
```

For more information about the `JSON` data type, see JSON functions and Generated Columns.

14.13.4 Functions and Operators

14.13.4.1 Function and Operator Reference

The usage of the functions and operators in TiDB is similar to MySQL. See Functions and Operators in MySQL.

In SQL statements, expressions can be used on the `ORDER BY` and `HAVING` clauses of the `SELECT` statement, the `WHERE` clause of `SELECT`/`DELETE`/`UPDATE` statements, and `SET` statements.

You can write expressions using literals, column names, NULL, built-in functions, operators and so on. For expressions that TiDB supports pushing down to TiKV, see List of Expressions for Pushdown.

14.13.4.2 Type Conversion in Expression Evaluation

TiDB behaves the same as MySQL: https://dev.mysql.com/doc/refman/8.0/en/type-conversion.html

14.13.4.3 Operators

This document describes the operators precedence, comparison functions and operators, logical operators, and assignment operators.

- Operator precedence
- Comparison functions and operators
- Logical operators
- Assignment operators

Name	Description
AND, &&	Logical AND
=	Assign a value (as part of a `SET` statement, or as part of the `SET` clause in an `UPDATE` statement)
:=	Assign a value
BETWEEN ... AND ...	Check whether a value is within a range of values
BINARY	Cast a string to a binary string
&	Bitwise AND
~	Bitwise inversion
|	Bitwise OR
[^](https://dev.mysql.com/doc/refman/8.0/en/bit-functions.html#operator_bitwise-xor)	Bitwise XOR
CASE	Case operator
DIV	Integer division
/	Division operator
=	Equal operator
`<=>`	NULL-safe equal to operator
>	Greater than operator
>=	Greater than or equal operator
IS	Test a value against a boolean
IS NOT	Test a value against a boolean
IS NOT NULL	NOT NULL value test
IS NULL	NULL value test
->	Return value from JSON column after evaluating path; equivalent to `JSON_EXTRACT()`

Name	Description
->>	Return value from JSON column after evaluating path and unquoting the result; equivalent to `JSON_UNQUOTE(JSON_EXTRACT())`
<<	Left shift
<	Less than operator
<=	Less than or equal operator
LIKE	Simple pattern matching
ILIKE	Simple pattern matching with case insensitive (Supported in TiDB, but not supported in MySQL)
-	Minus operator
%, MOD	Modulo operator
NOT, !	Negates value
NOT BETWEEN … AND …	Check whether a value is not within a range of values
!=, <>	Not equal operator
NOT LIKE	Negation of simple pattern matching
NOT REGEXP	Negation of REGEXP
||, OR	Logical OR
+	Addition operator
REGEXP	Pattern matching using regular expressions
>>	Right shift
RLIKE	Synonym for REGEXP
*	Multiplication operator
-	Change the sign of the argument
XOR	Logical XOR

14.13.4.3.1 Unsupported operators

- SOUNDS LIKE

14.13.4.3.2 Operator precedence

Operator precedences are shown in the following list, from highest precedence to the lowest. Operators that are shown together on a line have the same precedence.

```
INTERVAL
BINARY, COLLATE
!
- (unary minus), ~ (unary bit inversion)
^
*, /, DIV, %, MOD
```

```
-, +
<<, >>
&
|
= (comparison), <=>, >=, >, <=, <, <>, !=, IS, LIKE, REGEXP, IN
BETWEEN, CASE, WHEN, THEN, ELSE
NOT
AND, &&
XOR
OR, ||
= (assignment), :=
```

For details, see Operator Precedence.

14.13.4.3.3 Comparison functions and operators

Name	Description
BETWEEN … AND …	Check whether a value is within a range of values
COALESCE()	Return the first non-NULL argument
=	Equal operator
<=>	NULL-safe equal to operator
>	Greater than operator
>=	Greater than or equal operator
GREATEST()	Return the largest argument
IN()	Check whether a value is within a set of values
INTERVAL()	Return the index of the argument that is less than the first argument
IS	Test a value against a boolean
IS NOT	Test a value against a boolean
IS NOT NULL	NOT NULL value test
IS NULL	NULL value test
ISNULL()	Test whether the argument is NULL
LEAST()	Return the smallest argument
<	Less than operator
<=	Less than or equal operator
LIKE	Simple pattern matching
ILIKE	Simple pattern matching with case insensitive (Supported in TiDB, but not supported in MySQL)
NOT BETWEEN … AND …	Check whether a value is not within a range of values
!=, <>	Not equal operator

Name	Description
NOT IN()	Check whether a value is not within a set of values
NOT LIKE	Negation of simple pattern matching
STRCMP()	Compare two strings

For details, see Comparison Functions and Operators.

14.13.4.3.4 Logical operators

Name	Description
AND, &&	Logical AND
NOT, !	Negates value
||, OR	Logical OR
XOR	Logical XOR

For details, see MySQL Handling of GROUP BY.

14.13.4.3.5 Assignment operators

Name	Description
=	Assign a value (as part of a `SET` statement, or as part of the `SET` clause in an `UPDATE` statement)
:=	Assign a value

For details, see Detection of Functional Dependence.

14.13.4.3.6 MySQL compatibility

- MySQL does not support the `ILIKE` operator.

14.13.4.4 Control Flow Functions

TiDB supports all of the control flow functions available in MySQL 8.0.

Name	Description
`CASE`	Case operator
`IF()`	If/else construct
`IFNULL()`	Null if/else construct
`NULLIF()`	Return `NULL` if expr1 = expr2

14.13.4.4.1 CASE

The CASE operator enables you to perform conditional logic and customize query results based on specified conditions.

Syntax:

```
CASE
    WHEN condition1 THEN result1
    WHEN condition2 THEN result2
    ...
    ELSE default_result
END
```

Example:

```
WITH RECURSIVE d AS (SELECT 1 AS n UNION ALL SELECT n+1 FROM d WHERE n<10)
SELECT n, CASE WHEN n MOD 2 THEN "odd" ELSE "even" END FROM d;
```

```
+----+-----------------------------------------------+
| n  | CASE WHEN n MOD 2 THEN "odd" ELSE "even" END  |
+----+-----------------------------------------------+
|  1 | odd                                           |
|  2 | even                                          |
|  3 | odd                                           |
|  4 | even                                          |
|  5 | odd                                           |
|  6 | even                                          |
|  7 | odd                                           |
|  8 | even                                          |
|  9 | odd                                           |
| 10 | even                                          |
+----+-----------------------------------------------+
10 rows in set (0.00 sec)
```

14.13.4.4.2 IF()

The IF() function enables you to perform different actions based on whether a value or expression is true or not.

Syntax:

```
IF(condition, value_if_true, value_if_false)
```

Example:

```
WITH RECURSIVE d AS (SELECT 1 AS n UNION ALL SELECT n+1 FROM d WHERE n<10)
SELECT n, IF(n MOD 2, "odd", "even") FROM d;
```

```
+----+----------------------------+
| n  | IF(n MOD 2, "odd", "even") |
+----+----------------------------+
|  1 | odd                        |
|  2 | even                       |
|  3 | odd                        |
|  4 | even                       |
|  5 | odd                        |
|  6 | even                       |
|  7 | odd                        |
|  8 | even                       |
|  9 | odd                        |
| 10 | even                       |
+----+----------------------------+
10 rows in set (0.00 sec)
```

14.13.4.4.3 IFNULL()

The `IFNULL(expr1,expr2)` function is used to handle NULL values in queries. If `expr1` is not `NULL`, it returns `expr1`; otherwise, it returns `expr2`.

Example:

```
WITH data AS (SELECT NULL AS x UNION ALL SELECT 1 )
SELECT x, IFNULL(x,'x has no value') FROM data;
```

```
+------+----------------------------+
| x    | IFNULL(x,'x has no value') |
+------+----------------------------+
| NULL | x has no value             |
|    1 | 1                          |
+------+----------------------------+
2 rows in set (0.0006 sec)
```

14.13.4.4.4 NULLIF()

The `NULLIF(expr1,expr2)` function returns `NULL` if both arguments are the same or if the first argument is `NULL`. Otherwise, it returns the first argument.

Example:

```
WITH RECURSIVE d AS (SELECT 1 AS n UNION ALL SELECT n+1 FROM d WHERE n<10)
SELECT n, NULLIF(n+n, n+2) FROM d;
```

```
+----+------------------+
| n  | NULLIF(n+n, n+2) |
+----+------------------+
|  1 |                2 |
|  2 |             NULL |
|  3 |                6 |
|  4 |                8 |
|  5 |               10 |
|  6 |               12 |
|  7 |               14 |
|  8 |               16 |
|  9 |               18 |
| 10 |               20 |
+----+------------------+
10 rows in set (0.00 sec)
```

In this example, when `n` equals `2`, both `n+n` and `n+2` equal `4`, making both arguments the same and causing the function to return `NULL`.

14.13.4.5 String Functions

TiDB supports most of the string functions available in MySQL 8.0, and some of the functions available in Oracle 21.

For comparisons between functions and syntax of Oracle and TiDB, see Comparisons between Functions and Syntax of Oracle and TiDB.

14.13.4.5.1 Supported functions

`ASCII()`

The `ASCII(str)` function is used to get the ASCII value of the leftmost character in the given argument. The argument can be either a string or a number.

- If the argument is not empty, the function returns the ASCII value of the leftmost character.
- If the argument is an empty string, the function returns `0`.
- If the argument is `NULL`, the function returns `NULL`.

> **Note:**
>
> `ASCII(str)` only works for characters represented using 8 bits of binary digits (one byte).

Example:

```
SELECT ASCII('A'), ASCII('TiDB'), ASCII(23);
```

Output:

```
+-----------+--------------+-----------+
| ASCII('A') | ASCII('TiDB') | ASCII(23) |
+-----------+--------------+-----------+
|        65 |           84 |        50 |
+-----------+--------------+-----------+
```

BIN()

The `BIN()` function is used to convert the given argument into a string representation of its binary value. The argument can be either a string or a number.

- If the argument is a positive number, the function returns a string representation of its binary value.
- If the argument is a negative number, the function converts the absolute value of the argument to its binary representation, inverts each bit of the binary value (changing `0` to `1` and `1` to `0`), and then adds `1` to the inverted value.
- If the argument is a string containing only digits, the function returns the result according to those digits. For example, the results for `"123"` and `123` are the same.
- If the argument is a string and its first character is not a digit (such as `"q123"`), the function returns `0`.
- If the argument is a string that consists of digits and non-digits, the function returns the result according to the consecutive digits at the beginning of the argument. For example, the results for `"123q123"` and `123` are the same, but `BIN('123q123')` generates a warning like `Truncated incorrect INTEGER value: '123q123'`.
- If the argument is `NULL`, the function returns `NULL`.

Example 1:

```
SELECT BIN(123), BIN('123q123');
```

Output 1:

```
+----------+----------------+
| BIN(123) | BIN('123q123') |
+----------+----------------+
| 1111011 | 1111011      |
+----------+----------------+
```

Example 2:

```
SELECT BIN(-7);
```

Output 2:

```
+-----------------------------------------------------------------------+
| BIN(-7)                                                               |
+-----------------------------------------------------------------------+
| 1111111111111111111111111111111111111111111111111111111111111001 |
+-----------------------------------------------------------------------+
```

BIT_LENGTH()

The BIT_LENGTH() function is used to return the length of a given argument in bits.

Examples:

```
SELECT BIT_LENGTH("TiDB");

+--------------------+
| BIT_LENGTH("TiDB") |
+--------------------+
|                 32 |
+--------------------+
```

8 bits per character x 4 characters = 32 bits

```
SELECT BIT_LENGTH("PingCAP 123");

+--------------------------+
| BIT_LENGTH("PingCAP 123") |
+--------------------------+
|                       88 |
+--------------------------+
```

8 bits per character (space is counted because it is a non-alphanumeric character) x 11 characters = 88 bits

```
SELECT CustomerName, BIT_LENGTH(CustomerName) AS BitLengthOfName FROM
    ↪ Customers;

+-------------------+-----------------+
| CustomerName      | BitLengthOfName |
+-------------------+-----------------+
| Albert Einstein   |             120 |
| Robert Oppenheimer |            144 |
+-------------------+-----------------+
```

> **Note:**
>
> The preceding example operates under the assumption that there is a database with a table named `Customers` and a column inside the table named `CustomerName`.

CHAR()

The `CHAR()` function is used to get the corresponding character of a specific ASCII value. It performs the opposite operation of `ASCII()`, which returns the ASCII value of a specific character. If multiple arguments are supplied, the function works on all arguments and are then concaternated together.

Examples:

```
SELECT CHAR(65);

+------------+
| CHAR(65) |
+------------+
|          A |
+------------+
```

```
SELECT CHAR(84);

+------------+
| CHAR(84) |
+------------+
|          T |
+------------+
```

The `CHAR()` function can also be used to get the corresponding character of ASCII values that extend beyond the standard ASCII range (`0 - 127`).

```
/*For extended ASCII: */

SELECT CHAR(128);

+------------+
| CHAR(128) |
+------------+
|       0x80 |
+------------+
```

The `CHAR()` function can also get the corresponding character value of a unicode value.

```
/* For Unicode: */

--skip-binary-as-hex

SELECT CHAR(50089);

+--------------+
|  CHAR(50089) |
+--------------+
|           é |
+--------------+
```

```
SELECT CHAR(65,66,67);
```

```
+----------------+
| CHAR(65,66,67) |
+----------------+
| ABC            |
+----------------+
1 row in set (0.00 sec)
```

CHAR_LENGTH()

The CHAR_LENGTH() function is used to get the total number of characters in a given argument as an integer.

Examples:

```
SELECT CHAR_LENGTH("TiDB") AS LengthOfString;

+----------------+
| LengthOfString |
+----------------+
|              4 |
+----------------+
```

```
SELECT CustomerName, CHAR_LENGTH(CustomerName) AS LengthOfName FROM
    ↪ Customers;

+--------------------+--------------+
| CustomerName       | LengthOfName |
+--------------------+--------------+
| Albert Einstein    |           15 |
| Robert Oppenheimer |           18 |
+--------------------+--------------+
```

> **Note:**
>
> The preceding example operates under the assumption that there is a database with a table named `Customers` and a column inside the table named `CustomerName`.

CHARACTER_LENGTH()

The `CHARACTER_LENGTH()` function is the same as the `CHAR_LENGTH()` function. Both functions can be used synonymously because they generate the same output.

CONCAT()

The `CONCAT()` function concatenates one or more arguments into a single string.

Syntax:

```
CONCAT(str1,str2,...)
```

`str1, str2, ...` is a list of arguments to be concatenated. Each argument can be a string or a number.

Example:

```
SELECT CONCAT('TiDB', ' ', 'Server', '-', 1, TRUE);
```

Output:

```
+-------------------------------------------+
| CONCAT('TiDB', ' ', 'Server', '-', 1, TRUE) |
+-------------------------------------------+
| TiDB Server-11                            |
+-------------------------------------------+
```

If any of the arguments is `NULL`, `CONCAT()` returns `NULL`.

Example:

```
SELECT CONCAT('TiDB', NULL, 'Server');
```

Output:

```
+-------------------------------+
| CONCAT('TiDB', NULL, 'Server') |
+-------------------------------+
| NULL                          |
+-------------------------------+
```

In addition to the `CONCAT()` function, you can concatenate strings by placing them adjacent to each other as in the following example. Note that this method does not support numeric types.

```
SELECT 'Ti' 'DB' ' ' 'Server';
```

Output:

```
+-------------+
| Ti          |
+-------------+
| TiDB Server |
+-------------+
```

CONCAT_WS()

The `CONCAT_WS()` function is a form of `CONCAT()` with a separator, which returns a string concatenated by the specified separator.

Syntax:

```
CONCAT_WS(separator,str1,str2,...)
```

- `separator`: the first argument is the separator, which concatenates the remaining arguments that are not `NULL`.
- `str1, str2, ...`: a list of arguments to be concatenated. Each argument can be a string or a number.

Example:

```
SELECT CONCAT_WS(',', 'TiDB Server', 'TiKV', 'PD');
```

Output:

```
+--------------------------------------------+
| CONCAT_WS(',', 'TiDB Server', 'TiKV', 'PD') |
+--------------------------------------------+
| TiDB Server,TiKV,PD                        |
+--------------------------------------------+
```

- If the separator is an empty string, `CONCAT_WS()` is equivalent to `CONCAT()` and returns the concatenated string of the remaining arguments.

  Example:

  ```
  SELECT CONCAT_WS('', 'TiDB Server', 'TiKV', 'PD');
  ```

  Output:

```
+-----------------------------------------+
| CONCAT_WS('', 'TiDB Server', 'TiKV', 'PD') |
+-----------------------------------------+
| TiDB ServerTiKVPD                       |
+-----------------------------------------+
```

- If the separator is `NULL`, `CONCAT_WS()` returns `NULL`.

  Example:

```
SELECT CONCAT_WS(NULL, 'TiDB Server', 'TiKV', 'PD');
```

  Output:

```
+-------------------------------------------+
| CONCAT_WS(NULL, 'TiDB Server', 'TiKV', 'PD') |
+-------------------------------------------+
| NULL                                      |
+-------------------------------------------+
```

- If only one of the arguments to be concatenated is not `NULL`, `CONCAT_WS()` returns that argument.

  Example:

```
SELECT CONCAT_WS(',', 'TiDB Server', NULL);
```

  Output:

```
+-----------------------------------+
| CONCAT_WS(',', 'TiDB Server', NULL) |
+-----------------------------------+
| TiDB Server                       |
+-----------------------------------+
```

- If there are `NULL` arguments to be concatenated, `CONCAT_WS()` skips these `NULL` arguments.

  Example:

```
SELECT CONCAT_WS(',', 'TiDB Server', NULL, 'PD');
```

  Output:

```
+---------------------------------------+
| CONCAT_WS(',', 'TiDB Server', NULL, 'PD') |
+---------------------------------------+
| TiDB Server,PD                        |
+---------------------------------------+
```

- If there are empty strings to be concatenated, `CONCAT_WS()` does not skip empty strings.

  Example:

```
SELECT CONCAT_WS(',', 'TiDB Server', '', 'PD');
```

  Output:

```
+----------------------------------------+
| CONCAT_WS(',', 'TiDB Server', '', 'PD') |
+----------------------------------------+
| TiDB Server,,PD                        |
+----------------------------------------+
```

ELT()

The `ELT()` function returns the element at the index number.

```
SELECT ELT(3, 'This', 'is', 'TiDB');
```

```
+-----------------------------+
| ELT(3, 'This', 'is', 'TiDB') |
+-----------------------------+
| TiDB                        |
+-----------------------------+
1 row in set (0.00 sec)
```

The preceding example returns the third element, which is `'TiDB'`.

EXPORT_SET()

The `EXPORT_SET()` function returns a string that consists of a specified number (`number_of_bits`) of `on`/`off` values, optionally separated by `separator`. These values are based on whether the corresponding bit in the `bits` argument is `1`, where the first value corresponds to the rightmost (lowest) bit of `bits`.

Syntax:

```
EXPORT_SET(bits, on, off, [separator[, number_of_bits]])
```

- `bits`: an integer representing the bit value.
- `on`: the string to be returned if the corresponding bit is `1`.
- `off`: the string to be returned if the corresponding bit is `0`.
- `separator` (optional): the separator character in the result string.
- `number_of_bits` (optional): the number of bits to be processed. If it is not set, `64` (the max size of bits) is used by default, which means that `bits` is treated as an unsigned 64-bit integer.

Examples:

In the following example, `number_of_bits` is set to `5`, resulting in 5 values, separated by `|`. Because only 3 bits are given, the other bits are considered unset. Therefore, setting `number_of_bits` to either `101` or `00101` results in the same output.

```
SELECT EXPORT_SET(b'101',"ON",'off','|',5);
```

```
+-----------------------------------+
| EXPORT_SET(b'101',"ON",'off','|',5) |
+-----------------------------------+
| ON|off|ON|off|off                |
+-----------------------------------+
1 row in set (0.00 sec)
```

In the following example, `bits` is set to `00001111`, `on` is set to `x`, and `off` is set to `_`. This causes the function to return `____` for the `0` bits and `xxxx` for the `1` bits. Therefore, when processing with the bits in `00001111` from right to left, the function returns `xxxx____`.

```
SELECT EXPORT_SET(b'00001111', 'x', '_', '', 8);
```

```
+---------------------------------------+
| EXPORT_SET(b'00001111', 'x', '_', '', 8) |
+---------------------------------------+
| xxxx____                              |
+---------------------------------------+
1 row in set (0.00 sec)
```

In the following example, `bits` is set to `00001111`, `on` is set to `x`, and `off` is set to `_`. This causes the function to return `x` for each `1` bit and `_` for each `0` bit. Therefore, when processing with the bits in `01010101` from right to left, the function returns `x_x_x_x_`.

```
SELECT EXPORT_SET(b'01010101', 'x', '_', '', 8);
```

```
+---------------------------------------+
| EXPORT_SET(b'01010101', 'x', '_', '', 8) |
+---------------------------------------+
| x_x_x_x_                              |
+---------------------------------------+
1 row in set (0.00 sec)
```

FIELD()

Return the index (position) of the first argument in the subsequent arguments.

In the following example, the first argument of `FIELD()` is `needle`, and it matches the second argument in the following list, so the function returns `2`.

```
SELECT FIELD('needle', 'A', 'needle', 'in', 'a', 'haystack');
+-----------------------------------------------------+
| FIELD('needle', 'A', 'needle', 'in', 'a', 'haystack') |
+-----------------------------------------------------+
|                                                   2 |
+-----------------------------------------------------+
1 row in set (0.00 sec)
```

FIND_IN_SET()

Return the index position of the first argument within the second argument.

This function is often used with the SET data type.

In the following example, `Go` is the fourth element in the set `COBOL,BASIC,Rust,Go,Java,Fortran`, so the function returns `4`.

```
SELECT FIND_IN_SET('Go', 'COBOL,BASIC,Rust,Go,Java,Fortran');
+-------------------------------------------------------+
| FIND_IN_SET('Go', 'COBOL,BASIC,Rust,Go,Java,Fortran') |
+-------------------------------------------------------+
|                                                     4 |
+-------------------------------------------------------+
1 row in set (0.00 sec)
```

FORMAT()

The `FORMAT(X,D[,locale])` function is used to format the number `X` to a format similar to `"#,###,###. ##"`, rounded to `D` decimal places, and return the result as a string.

Arguments:

- `X`: the number to be formatted. It can be a direct numeric value, a numeric string, or a number in scientific notation.
- `D`: the number of decimal places for the returned value. The function rounds the number `X` to `D` decimal places. If `D` is greater than the actual number of decimal places in `X`, the result is padded with zeros to the corresponding length.
- `[locale]`: specifies a locale setting to be used for grouping between decimal points, thousands separators, and separators for resultant numbers. A valid locale value is the same as the valid value of the `lc_time_names` system variable. If not specified or the region setting is `NULL`, the `'en_US'` region setting is used by default. This argument is optional.

Behaviors:

- If the first argument is a string and contains only numbers, the function returns a result based on that numeric value. For example, `FORMAT('12.34', 1)` and `FORMAT(12.34, 1)` return the same result.

- If the first argument is a number represented in scientific notation (using `E/e`), the function returns the result based on that number. For example, `FORMAT('1E2', 3)` returns `100.000`.
- If the first argument is a string starting with non-numeric characters, the function returns zero and a warning `(Code 1292)`. For example, `FORMAT('q12.36', 5)` returns `0.00000`, but also includes a warning `Warning (Code 1292): Truncated incorrect DOUBLE value: 'q12.36'`.
- If the first argument is a string mixing numbers and non-numbers, the function returns a result based on the consecutive numeric part at the beginning of the argument, and also includes a warning `(Code 1292)`. For example, `FORMAT('12.36q56.78', 1)` returns the same numeric result as `FORMAT('12.36', 1)`, but includes a warning `Warning (Code 1292): Truncated incorrect DOUBLE value: '12.36q56.78'`.
- If the second argument is zero or a negative number, the function truncates the decimal part and returns an integer.
- If any of the arguments is `NULL`, the function returns `NULL`.

Examples:

The following examples show how to format the number 12.36 to different decimal places:

```
mysql> SELECT FORMAT(12.36, 1);
+------------------+
| FORMAT(12.36, 1) |
+------------------+
| 12.4             |
+------------------+
```

```
mysql> SELECT FORMAT(12.36, 5);
+------------------+
| FORMAT(12.36, 5) |
+------------------+
| 12.36000         |
+------------------+
```

```
mysql> SELECT FORMAT(12.36, 2);
+------------------+
| FORMAT(12.36, 2) |
+------------------+
| 12.36            |
+------------------+
```

FROM_BASE64()

The `FROM_BASE64()` function is used to decode a Base64 encoded string and return the decoded result in its hexadecimal form.

- This function accepts a single argument, that is, the Base64 encoded string to be decoded.
- If the argument is `NULL` or not a valid Base64 encoded string, the `FROM_BASE64()` function returns `NULL`.

Examples:

The following example shows how to decode the Base64 encoded string `'SGVsbG8gVGlEQg==='`. This string is the result of encoding `'Hello TiDB'`, using the `TO_BASE64()` function.

```
mysql> SELECT TO_BASE64('Hello TiDB');
+-------------------------+
| TO_BASE64('Hello TiDB') |
+-------------------------+
| SGVsbG8gVGlEQg==        |
+-------------------------+

mysql> SELECT FROM_BASE64('SGVsbG8gVGlEQg==');
+-----------------------------------------------------------------------+
| FROM_BASE64('SGVsbG8gVGlEQg==')                                       |
+-----------------------------------------------------------------------+
| 0x48656C6C6F2054694442                                                |
+-----------------------------------------------------------------------+
```

```
mysql> SELECT CONVERT(FROM_BASE64('SGVsbG8gVGlEQg==') USING utf8mb4);
+-----------------------------------------------------------+
| CONVERT(FROM_BASE64('SGVsbG8gVGlEQg==') USING utf8mb4) |
+-----------------------------------------------------------+
| Hello TiDB                                                |
+-----------------------------------------------------------+
```

The following example shows how to decode the Base64 encoded number `MTIzNDU2`. This string is the result of encoding `123456`, which can be done using the `TO_BASE64()` function.

```
mysql> SELECT FROM_BASE64('MTIzNDU2');
+-------------------------------------------------+
| FROM_BASE64('MTIzNDU2')                         |
+-------------------------------------------------+
| 0x313233343536                                  |
+-------------------------------------------------+
```

HEX()

The `HEX()` function is used to convert the given argument into a string representation of its hexadecimal value. The argument can be either a string or a number.

- If the argument is a string, `HEX(str)` returns a hexadecimal string representation of `str`. The function converts each byte of each character in `str` into two hexadecimal digits. For example, the character `a` in a UTF-8 or ASCII character set is represented as a binary value of `00111101`, or `61` in hexadecimal notation.
- If the argument is a number, `HEX(n)` returns a hexadecimal string representation of `n` ↪ . The function treats the argument `n` as a `BIGINT` number, equivalent to using `CONV(n, 10, 16)`.
- If the argument is `NULL`, the function returns `NULL`.

Examples:

```
SELECT X'616263', HEX('abc'), UNHEX(HEX('abc')), 0x616263;
+----------+-----------+------------------+----------+
| X'616263' | HEX('abc') | UNHEX(HEX('abc')) | 0x616263 |
+----------+-----------+------------------+----------+
| abc      | 616263    | abc              | abc      |
+----------+-----------+------------------+----------+
```

```
SELECT X'F09F8DA3', HEX('🍣'), UNHEX(HEX('🍣')), 0xF09F8DA3;
+------------+------------+-------------------+------------+
| X'F09F8DA3' | HEX('🍣') | UNHEX(HEX('🍣'))  | 0xF09F8DA3 |
+------------+------------+-------------------+------------+
| 🍣          | F09F8DA3   | 🍣                | 🍣         |
+------------+------------+-------------------+------------+
```

```
SELECT HEX(255), CONV(HEX(255), 16, 10);
+---------+-----------------------+
| HEX(255) | CONV(HEX(255), 16, 10) |
+---------+-----------------------+
| FF      | 255                   |
+---------+-----------------------+
```

```
SELECT HEX(NULL);
+-----------+
| HEX(NULL) |
+-----------+
| NULL      |
+-----------+
```

INSERT()

The `INSERT(str, pos, len, newstr)` function is used to replace a substring in `str` ↪ (that starts at position `pos` and is `len` characters long) with the string `newstr`. This function is multibyte safe.

- If `pos` exceeds the length of `str`, the function returns the original string `str` without modification.
- If `len` exceeds the remaining length of `str` from position `pos`, the function replaces the rest of the string from position `pos`.
- If any argument is `NULL`, the function returns `NULL`.

Examples:

```
SELECT INSERT('He likes tennis', 4, 5, 'plays');
+-----------------------------------------+
| INSERT('He likes tennis', 4, 5, 'plays') |
+-----------------------------------------+
| He plays tennis                         |
+-----------------------------------------+
```

```
SELECT INSERT('He likes tennis', -1, 5, 'plays');
+------------------------------------------+
| INSERT('He likes tennis', -1, 5, 'plays') |
+------------------------------------------+
| He likes tennis                          |
+------------------------------------------+
```

```
SELECT INSERT('He likes tennis', 4, 100, 'plays');
+-------------------------------------------+
| INSERT('He likes tennis', 4, 100, 'plays') |
+-------------------------------------------+
| He plays                                  |
+-------------------------------------------+
```

```
SELECT INSERT('He likes tenis', 10, 100, '□');
+----------------------------------------+
| INSERT('He likes tenis', 10, 100, '□') |
+----------------------------------------+
| He likes □                             |
+----------------------------------------+
```

```
SELECT INSERT('あああああああ', 2, 3, 'いいいい');
+-------------------------------------------------+
| INSERT('あああああああ', 2, 3, 'いいいい')      |
+-------------------------------------------------+
| あいいいいあああ                                |
+-------------------------------------------------+
```

```
SELECT INSERT('あああああああ', 2, 3, 'xx');
+-----------------------------------------+
```

```
| INSERT('あああああああ', 2, 3, 'xx')  |
+----------------------------------------+
| あxxあああ                             |
+----------------------------------------+
```

INSTR()

The `INSTR(str, substr)` function is used to get the position of the first occurrence of `substr` in `str`. Each argument can be either a string or a number. This function is the same as the two-argument version of `LOCATE(substr, str)`, but with the order of the arguments reversed.

> **Note:**
>
> The case sensitivity of `INSTR(str, substr)` is determined by the collations used in TiDB. Binary collations (with the suffix `_bin`) are case-sensitive, while general collations (with the suffix `_general_ci` or `_ai_ci`, and) are case-insensitive.

- If either argument is a number, the function treats the number as a string.
- If `substr` is not in `str`, the function returns `0`. Otherwise, it returns the position of the first occurrence of `substr` in `str`.
- If either argument is `NULL`, the function returns `NULL`.

Examples:

```
SELECT INSTR("pingcap.com", "tidb");

+-----------------------------+
| INSTR("pingcap.com", "tidb") |
+-----------------------------+
|                           0 |
+-----------------------------+
```

```
SELECT INSTR("pingcap.com/tidb", "tidb");

+---------------------------------+
| INSTR("pingcap.com/tidb", "tidb") |
+---------------------------------+
|                              13 |
+---------------------------------+
```

```
SELECT INSTR("pingcap.com/tidb" COLLATE utf8mb4_bin, "TiDB");

+-------------------------------------------------------+
| INSTR("pingcap.com/tidb" COLLATE utf8mb4_bin, "TiDB") |
+-------------------------------------------------------+
|                                                     0 |
+-------------------------------------------------------+
```

```
SELECT INSTR("pingcap.com/tidb" COLLATE utf8mb4_general_ci, "TiDB");

+-------------------------------------------------------------+
| INSTR("pingcap.com/tidb" COLLATE utf8mb4_general_ci, "TiDB") |
+-------------------------------------------------------------+
|                                                          13 |
+-------------------------------------------------------------+
```

```
SELECT INSTR(0123, "12");

+-------------------+
| INSTR(0123, "12") |
+-------------------+
|                 1 |
+-------------------+
```

LCASE()

The `LCASE(str)` function is a synonym for `LOWER(str)`, which returns the lowercase of the given argument.

LEFT()

The `LEFT()` function returns a specified number of characters from the left side of a string.

Syntax:

```
LEFT(`str`, `len`)
```

- `str`: the original string to extract characters. If `str` contains a multibyte character, the function counts it as a single code point.
- `len`: the length of characters to be returned.
    - If `len` is equal to or less than 0, the function returns an empty string.
    - If `len` is equal to or greater than the length of `str`, the function returns the original `str`.
- If any argument is `NULL`, the function returns `NULL`.

Examples:

```
SELECT LEFT('ABCED', 3);
+------------------+
| LEFT('ABCED', 3) |
+------------------+
| ABC              |
+------------------+

SELECT LEFT('ABCED', 6);
+------------------+
| LEFT('ABCED', 6) |
+------------------+
| ABCED            |
+------------------+
```

```
SELECT LEFT('ABCED', 0);
+------------------+
| LEFT('ABCED', 0) |
+------------------+
|                  |
+------------------+

SELECT LEFT('ABCED', -1);
+-------------------+
| LEFT('ABCED', -1) |
+-------------------+
|                   |
+-------------------+
```

```
SELECT LEFT('□ABC', 3);
+--------------------+
| LEFT('□ABC', 3)    |
+--------------------+
| □AB                |
+--------------------+
```

```
SELECT LEFT('ABC', NULL);
+-------------------+
| LEFT('ABC', NULL) |
+-------------------+
| NULL              |
+-------------------+

SELECT LEFT(NULL, 3);
```

```
+------------------------------+
| LEFT(NULL, 3)                |
+------------------------------+
| NULL                         |
+------------------------------+
```

LENGTH()

The `LENGTH()` function returns the length of a string in bytes.

`LENGTH()` counts a multibyte character as multiple bytes while `CHAR_LENGTH()` counts a multibyte character as a single code point.

If the argument is `NULL`, the function returns `NULL`.

Examples:

```
SELECT LENGTH('ABC');
+---------------+
| LENGTH('ABC') |
+---------------+
|             3 |
+---------------+

SELECT LENGTH('□ABC');
+-------------------+
| LENGTH('□ABC')    |
+-------------------+
|                 7 |
+-------------------+

SELECT CHAR_LENGTH('□ABC');
+------------------------+
| CHAR_LENGTH('□ABC')    |
+------------------------+
|                      4 |
+------------------------+
```

```
SELECT LENGTH(NULL);
+--------------+
| LENGTH(NULL) |
+--------------+
|         NULL |
+--------------+
```

LIKE

The `LIKE` operator is used for simple string matching. The expression `expr LIKE pat [ESCAPE 'escape_char']` returns `1` (`TRUE`) or `0` (`FALSE`). If either `expr` or `pat` is `NULL`,

the result is `NULL`.

You can use the following two wildcard parameters with `LIKE`:

- `%` matches any number of characters, including zero characters.
- `_` matches exactly one character.

The following examples use the `utf8mb4_bin` collation:

```
SET collation_connection='utf8mb4_bin';
SHOW VARIABLES LIKE 'collation_connection';
+----------------------+-------------+
| Variable_name        | Value       |
+----------------------+-------------+
| collation_connection | utf8mb4_bin |
+----------------------+-------------+
```

```
SELECT NULL LIKE '%' as result;
+--------+
| result |
+--------+
|   NULL |
+--------+
```

```
SELECT 'sushi!!!' LIKE 'sushi_' AS result;
+--------+
| result |
+--------+
|      0 |
+--------+
```

```
SELECT '□ □sushi□ □' LIKE '%sushi%' AS result;
+--------+
| result |
+--------+
|      1 |
+--------+
```

```
SELECT '□ □sushi□ □' LIKE '%SUSHI%' AS result;
+--------+
| result |
+--------+
|      0 |
+--------+
```

```
SELECT '□□sushi□□' LIKE '%□%' AS result;
+--------+
| result |
+--------+
|      1 |
+--------+
```

The default escape character is \:

```
SELECT 'sushi!!!' LIKE 'sushi\_' AS result;
+--------+
| result |
+--------+
|      0 |
+--------+
```

```
SELECT 'sushi_' LIKE 'sushi\_' AS result;
+--------+
| result |
+--------+
|      1 |
+--------+
```

To specify a different escape character, such as *, you can use the ESCAPE clause:

```
SELECT 'sushi_' LIKE 'sushi*_' ESCAPE '*' AS result;
+--------+
| result |
+--------+
|      1 |
+--------+
```

```
SELECT 'sushi!' LIKE 'sushi*_' ESCAPE '*' AS result;
+--------+
| result |
+--------+
|      0 |
+--------+
```

You can use the LIKE operator to match a numeric value:

```
SELECT 10 LIKE '1%' AS result;
+--------+
| result |
+--------+
```

```
|      1 |
+--------+
```

```
SELECT 10000 LIKE '12%' AS result;
+--------+
| result |
+--------+
|      0 |
+--------+
```

To specify a collation explicitly, such as `utf8mb4_unicode_ci`, you can use `COLLATE`:

```
SELECT '□□Sushi□□' COLLATE utf8mb4_unicode_ci LIKE '%SUSHI%' AS result;
+--------+
| result |
+--------+
|      1 |
+--------+
```

LOCATE()

The `LOCATE(substr, str[, pos])` function is used to get the position of the first occurrence of a specified substring `substr` in a string `str`. The `pos` argument is optional and specifies the starting position for the search.

- If the substring `substr` is not present in `str`, the function returns `0`.
- If any argument is `NULL`, the function returns `NULL`.
- This function is multibyte safe and performs a case-sensitive search only if at least one argument is a binary string.

The following examples use the `utf8mb4_bin` collation:

```
SET collation_connection='utf8mb4_bin';
SHOW VARIABLES LIKE 'collation_connection';
+----------------------+-------------+
| Variable_name        | Value       |
+----------------------+-------------+
| collation_connection | utf8mb4_bin |
+----------------------+-------------+
```

```
SELECT LOCATE('bar', 'foobarbar');
+----------------------------+
| LOCATE('bar', 'foobarbar') |
+----------------------------+
|                          4 |
+----------------------------+
```

```
SELECT LOCATE('baz', 'foobarbar');
+----------------------------+
| LOCATE('baz', 'foobarbar') |
+----------------------------+
|                          0 |
+----------------------------+
```

```
SELECT LOCATE('bar', 'fooBARBAR');
+----------------------------+
| LOCATE('bar', 'fooBARBAR') |
+----------------------------+
|                          0 |
+----------------------------+
```

```
SELECT LOCATE('bar', 'foobarBAR', 100);
+---------------------------------+
| LOCATE('bar', 'foobarBAR', 100) |
+---------------------------------+
|                               0 |
+---------------------------------+
```

```
SELECT LOCATE('bar', 'foobarbar', 5);
+-------------------------------+
| LOCATE('bar', 'foobarbar', 5) |
+-------------------------------+
|                             7 |
+-------------------------------+
```

```
SELECT LOCATE('bar', NULL);
+---------------------+
| LOCATE('bar', NULL) |
+---------------------+
|                NULL |
+---------------------+
```

```
SELECT LOCATE('い', 'たいでぃーびー');
+--------------------------------------+
| LOCATE('い', 'たいでぃーびー')     |
+--------------------------------------+
|                                    2 |
+--------------------------------------+
```

```
SELECT LOCATE('い', 'たいでぃーびー', 3);
+-----------------------------------------+
```

```
| LOCATE('い', 'たいでぃーびー', 3)    |
+--------------------------------------+
|                                    0 |
+--------------------------------------+
```

The following examples use the `utf8mb4_unicode_ci` collation:

```
SET collation_connection='utf8mb4_unicode_ci';
SHOW VARIABLES LIKE 'collation_connection';
+----------------------+--------------------+
| Variable_name        | Value              |
+----------------------+--------------------+
| collation_connection | utf8mb4_unicode_ci |
+----------------------+--------------------+
```

```
SELECT LOCATE('い', 'たいでぃーびー', 3);
+--------------------------------------+
| LOCATE('い', 'たいでぃーびー', 3)    |
+--------------------------------------+
|                                    4 |
+--------------------------------------+
```

```
SELECT LOCATE('□', '□□□□□');
+-----------------------------------+
| LOCATE('□', '□□□□□')       |
+-----------------------------------+
|                                 1 |
+-----------------------------------+
```

The following multibyte and binary string examples use the `utf8mb4_bin` collation:

```
SET collation_connection='utf8mb4_bin';
SHOW VARIABLES LIKE 'collation_connection';
+----------------------+-------------+
| Variable_name        | Value       |
+----------------------+-------------+
| collation_connection | utf8mb4_bin |
+----------------------+-------------+
```

```
SELECT LOCATE('□', '□□□□□');
+-----------------------------------+
| LOCATE('□', '□□□□□')                  |
+-----------------------------------+
|                                 4 |
+-----------------------------------+
```

```
SELECT LOCATE('b', _binary'aBcde');
+----------------------------+
| LOCATE('b', _binary'aBcde') |
+----------------------------+
|                          0 |
+----------------------------+
```

```
SELECT LOCATE('B', _binary'aBcde');
+----------------------------+
| LOCATE('B', _binary'aBcde') |
+----------------------------+
|                          2 |
+----------------------------+
```

```
SELECT LOCATE(_binary'b', 'aBcde');
+----------------------------+
| LOCATE(_binary'b', 'aBcde') |
+----------------------------+
|                          0 |
+----------------------------+
```

```
SELECT LOCATE(_binary'B', 'aBcde');
+----------------------------+
| LOCATE(_binary'B', 'aBcde') |
+----------------------------+
|                          2 |
+----------------------------+
```

LOWER()

The `LOWER(str)` function is used to convert all characters in the given argument `str` to lowercase. The argument can be either a string or a number.

- If the argument is a string, the function returns the string in lowercase.
- If the argument is a number, the function returns the number without leading zeros.
- If the argument is `NULL`, the function returns `NULL`.

Examples:

```
SELECT LOWER("TiDB");

+---------------+
| LOWER("TiDB") |
+---------------+
| tidb          |
+---------------+
```

```
SELECT LOWER(-012);

+-------------+
| LOWER(-012) |
+-------------+
| -12         |
+-------------+
```

LPAD()

The `LPAD(str, len, padstr)` function returns the string argument, left-padded with the specified string `padstr` to a length of `len` characters.

- If `len` is less than the length of the string `str`, the function truncates the string `str` to the length of `len`.
- If `len` is a negative number, the function returns `NULL`.
- If any argument is `NULL`, the function returns `NULL`.

Examples:

```
SELECT LPAD('TiDB',8,'>');
+--------------------+
| LPAD('TiDB',8,'>') |
+--------------------+
| >>>>TiDB           |
+--------------------+
1 row in set (0.00 sec)
```

```
SELECT LPAD('TiDB',2,'>');
+--------------------+
| LPAD('TiDB',2,'>') |
+--------------------+
| Ti                 |
+--------------------+
1 row in set (0.00 sec)
```

```
SELECT LPAD('TiDB',-2,'>');
+---------------------+
| LPAD('TiDB',-2,'>') |
+---------------------+
| NULL                |
+---------------------+
1 row in set (0.00 sec)
```

LTRIM()

The `LTRIM()` function removes leading spaces from a given string.

If the argument is `NULL`, this function returns `NULL`.

> **Note:**
>
> This function only removes the space character (U+0020) and does not remove other space-like characters such as tab (U+0009) or non-breaking space (U+00A0).

Examples:

In the following example, the `LTRIM()` function removes the leading spaces from `'  hello'` and returns `hello`.

```
SELECT LTRIM('  hello');
```

```
+--------------------+
| LTRIM('  hello') |
+--------------------+
| hello            |
+--------------------+
1 row in set (0.00 sec)
```

In the following example, `CONCAT()` is used to enclose the result of `LTRIM('  hello')` with « and ». This formatting makes it a bit easier to see that all leading spaces are removed.

```
SELECT CONCAT('«',LTRIM(' hello'),'»');
```

```
+-----------------------------------+
| CONCAT('«',LTRIM(' hello'),'») |
+-----------------------------------+
| «hello»                          |
+-----------------------------------+
1 row in set (0.00 sec)
```

MAKE_SET()

The `MAKE_SET()` function returns a set of comma-separated strings based on whether a corresponding bit in the `bits` argument is set to `1`.

Syntax:

```
MAKE_SET(bits, str1, str2, ...)
```

- `bits`: controls which subsequent string arguments to include in the result set. If `bits` is set to `NULL`, the function returns `NULL`.
- `str1, str2, ...`: a list of strings. Each string corresponds to a bit in the `bits` argument from right to left. `str1` corresponds to the first bit from the right, `str2` corresponds to the second bit from the right, and so on. If the corresponding bit is `1`, the string is included in the result; otherwise, it is not included.

Examples:

In the following example, because all bits are set to `0` in the `bits` argument, the function does not include any subsequent strings in the result and returns an empty string.

```
SELECT MAKE_SET(b'000','foo','bar','baz');
```

```
+-----------------------------------+
| MAKE_SET(b'000','foo','bar','baz') |
+-----------------------------------+
|                                   |
+-----------------------------------+
1 row in set (0.00 sec)
```

In the following example, because only the first bit from the right is `1`, the function only returns the first string `foo`.

```
SELECT MAKE_SET(b'001','foo','bar','baz');
```

```
+-----------------------------------+
| MAKE_SET(b'001','foo','bar','baz') |
+-----------------------------------+
| foo                               |
+-----------------------------------+
1 row in set (0.00 sec)
```

In the following example, because only the second bit from the right is `1`, the function only returns the second string `bar`.

```
SELECT MAKE_SET(b'010','foo','bar','baz');
```

```
+-----------------------------------+
| MAKE_SET(b'010','foo','bar','baz') |
+-----------------------------------+
| bar                               |
+-----------------------------------+
1 row in set (0.00 sec)
```

In the following example, because only the third bit from the right is `1`, the function only returns the third string `baz`.

```
SELECT MAKE_SET(b'100','foo','bar','baz');
```

```
+-----------------------------------+
| MAKE_SET(b'100','foo','bar','baz') |
+-----------------------------------+
| baz                               |
+-----------------------------------+
1 row in set (0.00 sec)
```

In the following example, because all bits are `1`, the function returns all three strings in a comma-separated result set.

```
SELECT MAKE_SET(b'111','foo','bar','baz');
```

```
+-----------------------------------+
| MAKE_SET(b'111','foo','bar','baz') |
+-----------------------------------+
| foo,bar,baz                       |
+-----------------------------------+
1 row in set (0.0002 sec)
```

MID()

The `MID(str, pos, len)` function returns a substring starting from the specified `pos` position with the `len` length.

If any of the arguments are `NULL`, the function returns `NULL`.

TiDB does not support the two-argument variant of this function. For more information, see #52420.

Examples:

In the following example, `MID()` returns the substring of the input string starting from the second character (`b`) with a length of `3` characters.

```
SELECT MID('abcdef',2,3);
```

```
+-------------------+
| MID('abcdef',2,3) |
+-------------------+
| bcd               |
+-------------------+
1 row in set (0.00 sec)
```

NOT LIKE

Negation of simple pattern matching.

This function performs the inverse operation of LIKE.

Examples:

In the following example, NOT LIKE returns 0 (False) because aaa matches the a% pattern.

```
SELECT 'aaa' LIKE 'a%', 'aaa' NOT LIKE 'a%';
```

```
+-----------------+---------------------+
| 'aaa' LIKE 'a%' | 'aaa' NOT LIKE 'a%' |
+-----------------+---------------------+
|               1 |                   0 |
+-----------------+---------------------+
1 row in set (0.00 sec)
```

In the following example, NOT LIKE returns 1 (True) because aaa does not match the b% pattern.

```
SELECT 'aaa' LIKE 'b%', 'aaa' NOT LIKE 'b%';
```

```
+-----------------+---------------------+
| 'aaa' LIKE 'b%' | 'aaa' NOT LIKE 'b%' |
+-----------------+---------------------+
|               0 |                   1 |
+-----------------+---------------------+
1 row in set (0.00 sec)
```

NOT REGEXP

Negation of REGEXP.

OCT()

Return a string containing octal (base 8) representation of a number.

Examples:

The following example generates a sequence of numbers from 0 to 20 using a recursive common table expression (CTE) and then uses the OCT() function to convert each number to its octal representation. Decimal values from 0 to 7 have identical representations in octal. Decimal numbers from 8 to 15 correspond to octal numbers from 10 to 17.

```
WITH RECURSIVE nr(n) AS (
    SELECT 0 AS n
    UNION ALL
    SELECT n+1 FROM nr WHERE n<20
)
SELECT n, OCT(n) FROM nr;
```

```
+------+--------+
| n    | OCT(n) |
+------+--------+
|    0 | 0      |
|    1 | 1      |
|    2 | 2      |
|    3 | 3      |
|    4 | 4      |
|    5 | 5      |
|    6 | 6      |
|    7 | 7      |
|    8 | 10     |
|    9 | 11     |
|   10 | 12     |
|   11 | 13     |
|   12 | 14     |
|   13 | 15     |
|   14 | 16     |
|   15 | 17     |
|   16 | 20     |
|   17 | 21     |
|   18 | 22     |
|   19 | 23     |
|   20 | 24     |
+------+--------+
20 rows in set (0.00 sec)
```

`OCTET_LENGTH()`

Synonym for `LENGTH()`.

`ORD()`

Return the character code for the leftmost character of the given argument.

This function is similar to `CHAR()` but works the other way around.

Examples:

Taking `a` and `A` as an example, `ORD()` returns `97` for `a` and `65` for `A`.

```
SELECT ORD('a'), ORD('A');
```

```
+----------+----------+
| ORD('a') | ORD('A') |
+----------+----------+
|       97 |       65 |
+----------+----------+
```

```
1 row in set (0.00 sec)
```

If you take the character code obtained from `ORD()` as input, you can get the original characters back using the `CHAR()` function. Note that the output format might vary depending on whether the `binary-as-hex` option is enabled in your MySQL client.

```
SELECT CHAR(97), CHAR(65);
```

```
+----------+----------+
| CHAR(97) | CHAR(65) |
+----------+----------+
| a        | A        |
+----------+----------+
1 row in set (0.01 sec)
```

The following example shows how `ORD()` handles multibyte characters. Here, both `101` and `0x65` are the UTF-8 encoded values for the `e` character, but in different formats. And both `50091` and `0xC3AB` represent the same values, but for the `ë` character.

```
SELECT ORD('e'), ORD('ë'), HEX('e'), HEX('ë');
```

```
+----------+-----------+----------+-----------+
| ORD('e') | ORD('ë') | HEX('e') | HEX('ë') |
+----------+-----------+----------+-----------+
|      101 |    50091 | 65       | C3AB      |
+----------+-----------+----------+-----------+
1 row in set (0.00 sec)
```

`POSITION()`

Synonym for `LOCATE()`.

`QUOTE()`

Escape the argument for use in an SQL statement.

If the argument is `NULL`, the function returns `NULL`.

Example:

To display the result directly instead of showing a hexadecimal-encoded value, you need to start the MySQL client with the `--skip-binary-as-hex` option.

The following example shows that the ASCII NULL character is escaped as `\0` and the single quote character `'` is escaped as `\'`:

```
SELECT QUOTE(0x002774657374);
```

```
+-----------------------+
| QUOTE(0x002774657374) |
+-----------------------+
| '\0\'test'            |
+-----------------------+
1 row in set (0.00 sec)
```

REGEXP

Pattern matching using regular expressions.

Examples:

In this example a number of strings are matched against two regular expressions.

```
WITH vals AS (
    SELECT 'TiDB' AS v
    UNION ALL
    SELECT 'Titanium'
    UNION ALL
    SELECT 'Tungsten'
    UNION ALL
    SELECT 'Rust'
)
SELECT
    v,
    v REGEXP '^Ti' AS 'starts with "Ti"',
    v REGEXP '^.{4}$' AS 'Length is 4 characters'
FROM
    vals;
```

```
+----------+------------------+------------------------+
| v        | starts with "Ti" | Length is 4 characters |
+----------+------------------+------------------------+
| TiDB     |                1 |                      1 |
| Titanium |                1 |                      0 |
| Tungsten |                0 |                      0 |
| Rust     |                0 |                      1 |
+----------+------------------+------------------------+
4 rows in set (0.00 sec)
```

The following example demonstrates that `REGEXP` is not limited to the `SELECT` clause. For example, you can also use it in the `WHERE` clause of the query.

```
SELECT
    v
FROM (
```

```
        SELECT 'TiDB' AS v
    ) AS vals
WHERE
    v REGEXP 'DB$';
```

```
+------+
| v    |
+------+
| TiDB |
+------+
1 row in set (0.01 sec)
```

REGEXP_INSTR()

Return the starting index of the substring that matches the regular expression (Partly compatible with MySQL. For more details, see Regular expression compatibility with MySQL).

The `REGEXP_INSTR(str, regexp, [start, [match, [ret, [match_type]]]])` function returns the position of the match if the regular expression (`regexp`) matches the string (`str`).

If either the `str` or `regexp` is `NULL`, then the function returns `NULL`.

Examples:

In the example below you can see that the `^.b.$` matches `abc`.

```
SELECT REGEXP_INSTR('abc','^.b.$');
```

```
+-----------------------------+
| REGEXP_INSTR('abc','^.b.$') |
+-----------------------------+
|                           1 |
+-----------------------------+
1 row in set (0.00 sec)
```

The following example uses the third argument to look for a match with a different start position in the string.

```
SELECT REGEXP_INSTR('abcabc','a');
```

```
+----------------------------+
| REGEXP_INSTR('abcabc','a') |
+----------------------------+
|                          1 |
+----------------------------+
1 row in set (0.00 sec)
```

```
SELECT REGEXP_INSTR('abcabc','a',2);
```

```
+-----------------------------+
| REGEXP_INSTR('abcabc','a',2) |
+-----------------------------+
|                           4 |
+-----------------------------+
1 row in set (0.00 sec)
```

The following example uses the 4th argument to look for the second match.

```
SELECT REGEXP_INSTR('abcabc','a',1,2);
```

```
+-------------------------------+
| REGEXP_INSTR('abcabc','a',1,2) |
+-------------------------------+
|                             4 |
+-------------------------------+
1 row in set (0.00 sec)
```

The following example uses the 5th argument to return the value *after* the mach, instead of the value of the match.

```
SELECT REGEXP_INSTR('abcabc','a',1,1,1);
```

```
+---------------------------------+
| REGEXP_INSTR('abcabc','a',1,1,1) |
+---------------------------------+
|                               2 |
+---------------------------------+
1 row in set (0.00 sec)
```

The following example uses the 6th argument to add the `i` flag to get a case insensitive match. For more details about regular expression `match_type`, see match_type compatibility.

```
SELECT REGEXP_INSTR('abcabc','A',1,1,0,'');
```

```
+-----------------------------------+
| REGEXP_INSTR('abcabc','A',1,1,0,'') |
+-----------------------------------+
|                                 0 |
+-----------------------------------+
1 row in set (0.00 sec)
```

```
SELECT REGEXP_INSTR('abcabc','A',1,1,0,'i');
```

```
+-------------------------------------+
| REGEXP_INSTR('abcabc','A',1,1,0,'i') |
+-------------------------------------+
|                                   1 |
+-------------------------------------+
1 row in set (0.00 sec)
```

Besides `match_type`, the collation also influences the matching. The following example uses a case-sensitive and a case-insensitive collation to demonstrate this.

```
SELECT REGEXP_INSTR('abcabc','A' COLLATE utf8mb4_general_ci);
```

```
+-----------------------------------------------------+
| REGEXP_INSTR('abcabc','A' COLLATE utf8mb4_general_ci) |
+-----------------------------------------------------+
|                                                   1 |
+-----------------------------------------------------+
1 row in set (0.01 sec)
```

```
SELECT REGEXP_INSTR('abcabc','A' COLLATE utf8mb4_bin);
```

```
+-------------------------------------------+
| REGEXP_INSTR('abcabc','A' COLLATE utf8mb4_bin) |
+-------------------------------------------+
|                                         0 |
+-------------------------------------------+
1 row in set (0.00 sec)
```

REGEXP_LIKE()

Whether the string matches the regular expression (Partly compatible with MySQL. For more details, see Regular expression compatibility with MySQL).

The `REGEXP_LIKE(str, regex, [match_type])` function is used to test if a regular expression matches a string. Optionally the `match_type` can be used to change the matching behavior.

Examples:

The following example shows that `^a` matches `abc`.

```
SELECT REGEXP_LIKE('abc','^a');
```

```
+-----------------------+
| REGEXP_LIKE('abc','^a') |
```

```
+------------------------+
|                      1 |
+------------------------+
1 row in set (0.00 sec)
```

This following example shows that `^A` does not match `abc`.

```
SELECT REGEXP_LIKE('abc','^A');
```

```
+------------------------+
| REGEXP_LIKE('abc','^A') |
+------------------------+
|                      0 |
+------------------------+
1 row in set (0.00 sec)
```

This example matches `^A` against `abc`, which now matches because of the `i` flag which enabled case insensitive matching. For more details about the regular expression `match_type`, see match_type compatibility.

```
SELECT REGEXP_LIKE('abc','^A','i');
```

```
+----------------------------+
| REGEXP_LIKE('abc','^A','i') |
+----------------------------+
|                          1 |
+----------------------------+
1 row in set (0.00 sec)
```

REGEXP_REPLACE()

Replace substrings that match the regular expression (Partly compatible with MySQL. For more details, see Regular expression compatibility with MySQL).

The `REGEXP_REPLACE(str, regexp, replace, [start, [match, [match_type]]])` function can be used to replace strings based on regular expressions.

Examples:

In the following example, two o's are replaced by `i`.

```
SELECT REGEXP_REPLACE('TooDB', 'o{2}', 'i');
```

```
+-------------------------------------+
| REGEXP_REPLACE('TooDB', 'o{2}', 'i') |
+-------------------------------------+
| TiDB                                |
+-------------------------------------+
1 row in set (0.00 sec)
```

The following example starts the match at the third character, causing the regular expression not to match and not do any replacement.

```
SELECT REGEXP_REPLACE('TooDB', 'o{2}', 'i',3);
```

```
+---------------------------------------+
| REGEXP_REPLACE('TooDB', 'o{2}', 'i',3) |
+---------------------------------------+
| TooDB                                 |
+---------------------------------------+
1 row in set (0.00 sec)
```

In the following example, the 5th argument is used to set if the first or the second match is used for the replacement.

```
SELECT REGEXP_REPLACE('TooDB', 'o', 'i',1,1);
```

```
+--------------------------------------+
| REGEXP_REPLACE('TooDB', 'o', 'i',1,1) |
+--------------------------------------+
| TioDB                                |
+--------------------------------------+
1 row in set (0.00 sec)
```

```
SELECT REGEXP_REPLACE('TooDB', 'o', 'i',1,2);
```

```
+--------------------------------------+
| REGEXP_REPLACE('TooDB', 'o', 'i',1,2) |
+--------------------------------------+
| ToiDB                                |
+--------------------------------------+
1 row in set (0.00 sec)
```

The following example uses the 6th argument to set the `match_type` for case insensitive matching. For more details about the regular expression `match_type`, see match_type compatibility.

```
SELECT REGEXP_REPLACE('TooDB', 'O{2}','i',1,1);
```

```
+---------------------------------------+
| REGEXP_REPLACE('TooDB', 'O{2}','i',1,1) |
+---------------------------------------+
| TooDB                                 |
+---------------------------------------+
1 row in set (0.00 sec)
```

```
SELECT REGEXP_REPLACE('TooDB', 'O{2}','i',1,1,'i');
```

```
+-----------------------------------------+
| REGEXP_REPLACE('TooDB', 'O{2}','i',1,1,'i') |
+-----------------------------------------+
| TiDB                                    |
+-----------------------------------------+
1 row in set (0.00 sec)
```

REGEXP_SUBSTR()

Return the substring that matches the regular expression (Partly compatible with MySQL. For more details, see Regular expression compatibility with MySQL).

The `REGEXP_SUBSTR(str, regexp, [start, [match, [match_type]]])` function is used to get a substring based on a regular expression.

The following example uses the `Ti.{2}` regular expression to get the `TiDB` substring of the `This is TiDB` string.

```
SELECT REGEXP_SUBSTR('This is TiDB','Ti.{2}');
```

```
+---------------------------------------+
| REGEXP_SUBSTR('This is TiDB','Ti.{2}') |
+---------------------------------------+
| TiDB                                  |
+---------------------------------------+
1 row in set (0.00 sec)
```

REPEAT()

Repeat a string the specified number of times.

Examples:

The following example generates a sequence of numbers from 1 to 20 using a recursive common table expression (CTE). For each number in the sequence, the character `x` is repeated the number of times equal to the number itself.

```
WITH RECURSIVE nr(n) AS (
    SELECT 1 AS n
    UNION ALL
    SELECT n+1 FROM nr WHERE n<20
)
SELECT n, REPEAT('x',n) FROM nr;
```

```
+------+---------------------+
| n    | REPEAT('x',n)       |
```

```
+------+----------------------+
|    1 | x                    |
|    2 | xx                   |
|    3 | xxx                  |
|    4 | xxxx                 |
|    5 | xxxxx                |
|    6 | xxxxxx               |
|    7 | xxxxxxx              |
|    8 | xxxxxxxx             |
|    9 | xxxxxxxxx            |
|   10 | xxxxxxxxxx           |
|   11 | xxxxxxxxxxx          |
|   12 | xxxxxxxxxxxx         |
|   13 | xxxxxxxxxxxxx        |
|   14 | xxxxxxxxxxxxxx       |
|   15 | xxxxxxxxxxxxxxx      |
|   16 | xxxxxxxxxxxxxxxx     |
|   17 | xxxxxxxxxxxxxxxxx    |
|   18 | xxxxxxxxxxxxxxxxxx   |
|   19 | xxxxxxxxxxxxxxxxxxx  |
|   20 | xxxxxxxxxxxxxxxxxxxx |
+------+----------------------+
20 rows in set (0.01 sec)
```

The following example demonstrates that `REPEAT()` can operate on strings consisting of multiple characters.

```
SELECT REPEAT('ha',3);
```

```
+----------------+
| REPEAT('ha',3) |
+----------------+
| hahaha         |
+----------------+
1 row in set (0.00 sec)
```

`REPLACE()`

Replace occurrences of a specified string.

`REVERSE()`

Reverse the characters in a string.

`RIGHT()`

Return the specified rightmost number of characters.

`RLIKE`

Synonym for REGEXP.

RPAD()

Append string the specified number of times.

RTRIM()

Remove trailing spaces.

SPACE()

Return a string of the specified number of spaces.

STRCMP()

Compare two strings.

SUBSTR()

Return the substring as specified.

SUBSTRING()

Return the substring as specified.

SUBSTRING_INDEX()

The SUBSTRING_INDEX() function is used to extract a substring from a string based on a specified delimiter and count. This function is particularly useful when dealing with data separated by a specific delimiter, such as parsing CSV data or processing log files.

Syntax:

```
SUBSTRING_INDEX(str, delim, count)
```

- `str`: specifies the string to be processed.
- `delim`: specifies the delimiter in the string, which is case-sensitive.
- `count`: specifies the number of occurrences of the delimiter.
    - If `count` is a positive number, the function returns the substring before the `count` occurrences (counting from the left of the string) of the delimiter.
    - If `count` is a negative number, the function returns the substring after the `count` occurrences (counting from the right of the string) of the delimiter.
    - If `count` is `0`, the function returns an empty string.

Example 1:

```
SELECT SUBSTRING_INDEX('www.tidbcloud.com', '.', 2);
```

Output 1:

```
+----------------------------------------+
| SUBSTRING_INDEX('www.tidbcloud.com', '.', 2) |
+----------------------------------------+
| www.tidbcloud                          |
+----------------------------------------+
```

Example 2:

```
SELECT SUBSTRING_INDEX('www.tidbcloud.com', '.', -1);
```

Output 2:

```
+-----------------------------------------+
| SUBSTRING_INDEX('www.tidbcloud.com', '.', -1) |
+-----------------------------------------+
| com                                     |
+-----------------------------------------+
```

TO_BASE64()

The `TO_BASE64()` function is used to convert the given argument to a string in the base-64 encoded form and return the result according to the character set and collation of the current connection. A base-64 encoded string can be decoded using the `FROM_BASE64()` function.

Syntax:

```
TO_BASE64(str)
```

- If the argument is not a string, the function converts it to a string before base-64 encoding.
- If the argument is `NULL`, the function returns `NULL`.

Example 1:

```
SELECT TO_BASE64('abc');
```

Output 1:

```
+------------------+
| TO_BASE64('abc') |
+------------------+
| YWJj             |
+------------------+
```

Example 2:

```
SELECT TO_BASE64(6);
```

Output 2:

```
+--------------+
| TO_BASE64(6) |
+--------------+
| Ng==         |
+--------------+
```

`TRANSLATE()`

Replace all occurrences of characters by other characters in a string. It does not treat empty strings as `NULL` as Oracle does.

`TRIM()`

Remove leading and trailing spaces.

`UCASE()`

The `UCASE()` function is used to convert a string to uppercase letters. This function is equivalent to the `UPPER()` function.

> **Note:**
>
> When the string is null, the `UCASE()` function returns `NULL`.

Example:

```
SELECT UCASE('bigdata') AS result_upper, UCASE(null) AS result_null;
```

Output:

```
+--------------+-------------+
| result_upper | result_null |
+--------------+-------------+
| BIGDATA      | NULL        |
+--------------+-------------+
```

`UNHEX()`

The `UNHEX()` function performs the reverse operation of the `HEX()` function. It treats each pair of characters in the argument as a hexadecimal number and converts it to the character represented by that number, returning the result as a binary string.

> **Note:**
>
> The argument must be a valid hexadecimal value that contains `0`–`9`, `A`–`F`, or `a`–`f`. If the argument is `NULL` or falls outside this range, the function returns `NULL`.

Example:

```
SELECT UNHEX('54694442');
```

Output:

```
+------------------------------------+
| UNHEX('54694442')                  |
+------------------------------------+
| 0x54694442                         |
+------------------------------------+
```

UPPER()

The `UPPER()` function is used to convert a string to uppercase letters. This function is equivalent to the `UCASE()` function.

> **Note:**
>
> When the string is null, the `UPPER()` function returns `NULL`.

Example:

```
SELECT UPPER('bigdata') AS result_upper, UPPER(null) AS result_null;
```

Output:

```
+--------------+-------------+
| result_upper | result_null |
+--------------+-------------+
| BIGDATA      | NULL        |
+--------------+-------------+
```

WEIGHT_STRING()

The `WEIGHT_STRING()` function returns the weight string (binary characters) for the input string, primarily used for sorting and comparison operations in multi-character set scenarios. If the argument is `NULL`, it returns `NULL`. The syntax is as follows:

```
WEIGHT_STRING(str [AS {CHAR|BINARY}(N)])
```

- `str`: the input string expression. If it is a non-binary string, such as a `CHAR`, `VARCHAR`, or `TEXT` value, the return value contains the collation weights for the string. If it is a binary string, such as a `BINARY`, `VARBINARY`, or `BLOB` value, the return value is the same as the input.
- `AS {CHAR|BINARY}(N)`: optional parameters used to specify the type and length of the output. `CHAR` represents the character data type, and `BINARY` represents the binary data type. `N` specifies the output length, which is an integer greater than or equal to 1.

> **Note:**
>
> If `N` is less than the string length, the string is truncated. If `N` exceeds the string length, `AS CHAR(N)` pads the string with spaces to the specified length, and `AS BINARY(N)` pads the string with `0x00` to the specified length.

Example:

```
SET NAMES 'utf8mb4';
SELECT HEX(WEIGHT_STRING('ab' AS CHAR(3))) AS char_result, HEX(WEIGHT_
    ↪ STRING('ab' AS BINARY(3))) AS binary_result;
```

Output:

```
+-------------+---------------+
| char_result | binary_result |
+-------------+---------------+
| 6162        | 616200        |
+-------------+---------------+
```

14.13.4.5.2 Unsupported functions

- `LOAD_FILE()`
- `MATCH()`
- `SOUNDEX()`

14.13.4.5.3 Regular expression compatibility with MySQL

The following sections describe the regular expression compatibility with MySQL, including `REGEXP_INSTR()`, `REGEXP_LIKE()`, `REGEXP_REPLACE()`, and `REGEXP_SUBSTR()`.

Syntax compatibility

MySQL implements regular expression using International Components for Unicode (ICU), and TiDB uses RE2. To learn the syntax differences between the two libraries, you can refer to the ICU documentation and RE2 Syntax.

`match_type` compatibility

The value options of `match_type` between TiDB and MySQL are:

- Value options in TiDB are `"c"`, `"i"`, `"m"`, and `"s"`, and value options in MySQL are `"c"`, `"i"`, `"m"`, `"n"`, and `"u"`.
- The `"s"` in TiDB corresponds to `"n"` in MySQL. When `"s"` is set in TiDB, the `.` character also matches line terminators (`\n`).

  For example, the `SELECT REGEXP_LIKE(a, b, "n")FROM t1` in MySQL is the same as the `SELECT REGEXP_LIKE(a, b, "s")FROM t1` in TiDB.
- TiDB does not support `"u"`, which means Unix-only line endings in MySQL.

`match_type`	MySQL	TiDB	Description
c	Yes	Yes	Case-sensitive matching
i	Yes	Yes	Case-insensitive matching
m	Yes	Yes	Multi-line mode
s	No	Yes	Matches newlines, same as `n` in MySQL
n	Yes	No	Matches newlines, same as `s` in TiDB
u	Yes	No	UNIX™ line endings

Data type compatibility

The difference between TiDB and MySQL support for the binary string type:

- MySQL does not support binary strings in regular expression functions since 8.0.22. For more details, refer to MySQL documentation. But in practice, regular functions can work in MySQL when all parameters or return types are binary strings. Otherwise, an error will be reported.
- Currently, TiDB prohibits using binary strings and an error will be reported under any circumstances.

Other compatibility

- The behavior of replacing empty strings in TiDB is different from MySQL. Taking `REGEXP_REPLACE("", "^$", "123")` as an example:
    - MySQL does not replace the empty string and returns `""` as the result.
    - TiDB replaces the empty string and returns `"123"` as the result.
- The keyword used for capturing groups in TiDB is different from MySQL. MySQL uses `$` as the keyword, while TiDB uses `\\` as the keyword. In addition, TiDB only supports capturing groups numbered from `0` to `9`.

  For example, the following SQL statement returns `ab` in TiDB:

```
SELECT REGEXP_REPLACE('abcd','(.*)(.{2})$','\\1') AS s;
```

Known issues

- GitHub Issue #37981

14.13.4.6 Numeric Functions and Operators

TiDB supports all of the numeric functions and operators available in MySQL 8.0.

14.13.4.6.1 Arithmetic operators

Name	Description
+	Addition operator
-	Minus operator
*	Multiplication operator
/	Division operator
DIV	Integer division
lstinlineMOD!	Modulo operator
-	Change the sign of the argument

14.13.4.6.2 Mathematical functions

Name	Description
ABS()	Return the absolute value
ACOS()	Return the arc cosine
ASIN()	Return the arc sine
ATAN()	Return the arc tangent
ATAN2(), ATAN()	Return the arc tangent of the two arguments
CEIL()	Return the smallest integer value not less than the argument
CEILING()	Return the smallest integer value not less than the argument

Name	Description
CONV()	Convert numbers between different number bases
COS()	Return the cosine
COT()	Return the cotangent
CRC32()	Compute a cyclic redundancy check value
DEGREES()	Convert radians to degrees
EXP()	Raise to the power of
FLOOR()	Return the largest integer value not greater than the argument
LN()	Return the natural logarithm of the argument
LOG()	Return the natural logarithm of the first argument
LOG10()	Return the base-10 logarithm of the argument
LOG2()	Return the base-2 logarithm of the argument
MOD()	Return the remainder
PI()	Return the value of pi
POW()	Return the argument raised to the specified power
POWER()	Return the argument raised to the specified power
RADIANS()	Return argument converted to radians
RAND()	Return a random floating-point value
ROUND()	Round the argument
SIGN()	Return the sign of the argument
SIN()	Return the sine of the argument
SQRT()	Return the square root of the argument
TAN()	Return the tangent of the argument
TRUNCATE()	Truncate to specified number of decimal places

14.13.4.6.3 Related system variables

`div_precision_increment` is used to set the precision for the `/` operator.

14.13.4.7 Date and Time Functions

TiDB supports all of the date and time functions available in MySQL 8.0.

Note:

- MySQL will often accept the incorrectly formatted date and time values. For example, `'2020-01-01\n\t01:01:01'` and `'2020-01_01\n\` ↪ `t01:01'` are treated as valid date and time values.
- TiDB makes the best effort to match MySQL's behavior, but it might not match in all instances. It is recommended to correctly format dates, because the intended behavior for incorrectly formatted values is not documented, and is often inconsistent.

Date/Time functions:

Name	Description
ADDDATE()	Add time values (intervals) to a date value
ADDTIME()	Add time
CONVERT_TZ()	Convert from one time zone to another
CURDATE()	Return the current date
CURRENT_DATE(), CURRENT_DATE	Synonyms for CURDATE()
CURRENT_TIME(), CURRENT_TIME	Synonyms for CURTIME()
CURRENT_TIMESTAMP(), CURRENT_TIMESTAMP	Synonyms for NOW()
CURTIME()	Return the current time
DATE()	Extract the date part of a date or datetime expression
DATE_ADD()	Add time values (intervals) to a date value
DATE_FORMAT()	Format date as specified
DATE_SUB()	Subtract a time value (interval) from a date
DATEDIFF()	Subtract two dates
DAY()	Synonym for DAYOFMONTH()
DAYNAME()	Return the name of the weekday
DAYOFMONTH()	Return the day of the month (0-31)
DAYOFWEEK()	Return the weekday index of the argument
DAYOFYEAR()	Return the day of the year (1-366)
EXTRACT()	Extract part of a date
FROM_DAYS()	Convert a day number to a date
FROM_UNIXTIME()	Format Unix timestamp as a date
GET_FORMAT()	Return a date format string
HOUR()	Extract the hour
LAST_DAY	Return the last day of the month for the argument
LOCALTIME(), LOCALTIME	Synonym for NOW()
LOCALTIMESTAMP, LOCALTIMESTAMP()	Synonym for NOW()
MAKEDATE()	Create a date from the year and day of year
MAKETIME()	Create time from hour, minute, second
MICROSECOND()	Return the microseconds from argument
MINUTE()	Return the minute from the argument
MONTH()	Return the month from the date passed
MONTHNAME()	Return the name of the month
NOW()	Return the current date and time
PERIOD_ADD()	Add a period to a year-month
PERIOD_DIFF()	Return the number of months between periods

Name	Description
QUARTER()	Return the quarter from a date argument
SEC_TO_TIME()	Converts seconds to 'HH:MM:SS' format
SECOND()	Return the second (0-59)
STR_TO_DATE()	Convert a string to a date
SUBDATE()	Synonym for DATE_SUB() when invoked with three arguments
SUBTIME()	Subtract times
SYSDATE()	Return the time at which the function executes
TIME()	Extract the time portion of the expression passed
TIME_FORMAT()	Format as time
TIME_TO_SEC()	Return the argument converted to seconds
TIMEDIFF()	Subtract time
TIMESTAMP()	With a single argument, this function returns the date or datetime expression; with two arguments, the sum of the arguments
TIMESTAMPADD()	Add an interval to a datetime expression
TIMESTAMPDIFF()	Subtract an interval from a datetime expression
TO_DAYS()	Return the date argument converted to days
TO_SECONDS()	Return the date or datetime argument converted to seconds since Year 0
UNIX_TIMESTAMP()	Return a Unix timestamp
UTC_DATE()	Return the current UTC date
UTC_TIME()	Return the current UTC time
UTC_TIMESTAMP()	Return the current UTC date and time
WEEK()	Return the week number
WEEKDAY()	Return the weekday index
WEEKOFYEAR()	Return the calendar week of the date (1-53)
YEAR()	Return the year
YEARWEEK()	Return the year and week

For details, see Date and Time Functions.

14.13.4.7.1 MySQL compatibility

The function `STR_TO_DATE()` is supported by TiDB, but is unable to parse all date and time values. In addition, the following date and time formatting options are **not implemented**:

Format	Description
“%a”	Abbreviated weekday name (Sun..Sat)
“%D”	Day of the month with English suffix (0th, 1st, 2nd, 3rd)
“%U”	Week (00..53), where Sunday is the first day of the week; WEEK() mode 0
“%u”	Week (00..53), where Monday is the first day of the week; WEEK() mode 1
“%V”	Week (01..53), where Sunday is the first day of the week; WEEK() mode 2; used with %X
“%v”	Week (01..53), where Monday is the first day of the week; WEEK() mode 3; used with %x
“%W”	Weekday name (Sunday..Saturday)
“%w”	Day of the week (0=Sunday..6=Saturday)
“%X”	Year for the week where Sunday is the first day of the week, numeric, four digits.
“%x”	Year for the week, where Monday is the first day of the week, numeric, four digits.

See issue #30082 for more details.

14.13.4.7.2 Related system variables

The `default_week_format` variable affects the `WEEK()` function.

14.13.4.8 Bit Functions and Operators

TiDB supports all of the bit functions and operators available in MySQL 8.0.

Bit functions and operators:

Name	Description
`BIT_COUNT()`	Return the number of bits that are set as 1
`&`	Bitwise AND
`~`	Bitwise inversion
`|`	Bitwise OR
[^](https://dev.mysql.com/doc/refman/8.0/en/bit-functions.html#operator_bitwise-xor)	Bitwise XOR
`<<`	Left shift
`>>`	Right shift

14.13.4.8.1 MySQL compatibility

There are some differences between MySQL 8.0 and earlier versions of MySQL in handling bit functions and operators. TiDB aims to follow the behavior of MySQL 8.0.

14.13.4.8.2 Known issues

In the following cases, the query results in TiDB are the same as MySQL 5.7 but different from MySQL 8.0.

- Bitwise operations with binary arguments. For more information, see #30637.
- The result of the `BIT_COUNT()` function. For more information, see #44621.

14.13.4.9 Cast Functions and Operators

Cast functions and operators enable conversion of values from one data type to another. TiDB supports all of the cast functions and operators available in MySQL 8.0.

Name	Description
`BINARY`	Cast a string to a binary string
`CAST()`	Cast a value as a certain type
`CONVERT()`	Cast a value as a certain type

Note:

TiDB and MySQL display inconsistent results for `SELECT CAST(MeN AS CHAR ↪ )` (or its equivalent form `SELECT CONVERT(MeM, CHAR)`), where `MeN` represents a double-precision floating-point number in scientific notation. MySQL displays the complete numeric value when `-15 <= N <= 14` and the scientific notation when `N < -15` or `N > 14`. However, TiDB always displays the complete numeric value. For example, MySQL displays the result of `SELECT ↪ CAST(3.1415e15 AS CHAR)` as `3.1415e15`, while TiDB displays the result as `3141500000000000`.

14.13.4.9.1 BINARY

The `BINARY` operator has been deprecated since MySQL 8.0.27. It is recommended to use `CAST(... AS BINARY)` instead both in TiDB and MySQL.

14.13.4.9.2 CAST

The `CAST(<expression> AS <type> [ARRAY])` function is used to cast an expression to a specific type.

This function is also used to create Multi-valued indexes.

The following types are supported:

Type	Description	Whether it can be used with multi-valued indexes
`BINARY(n)`	Binary string	No
`CHAR(n)`	Character string	Yes, but only if a length is specified
`DATE`	Date	Yes
`DATETIME(fsp)`	Date/time, where `fsp` is optional	Yes
`DECIMAL(n, m)`	Decimal number, where `n` and `m` are optional and are `10` and `0` if not specified	No
`DOUBLE`	Double precision floating-point number	No
`FLOAT(n)`	Floating-point number, where `n` is optional and should be between `0` and `53`	No
`JSON`	JSON	No
`REAL`	Floating-point number	Yes
`SIGNED [INTEGER ↪ ]`	Signed integer	Yes
`TIME(fsp)`	Time	Yes
`UNSIGNED [ ↪ INTEGER]`	Unsigned integer	Yes
`YEAR`	Year	No

Examples:

The following statement converts a binary string from a HEX literal to a `CHAR`.

```
SELECT CAST(0x54694442 AS CHAR);
```

```
+-------------------------+
| CAST(0x54694442 AS CHAR) |
```

```
+-------------------------+
| TiDB                    |
+-------------------------+
1 row in set (0.0002 sec)
```

The following statement casts the values of the `a` attribute extracted from the JSON column to an unsigned array. Note that casting to an array is only supported as part of an index definition for multi-valued indexes.

```
CREATE TABLE t (
    id INT PRIMARY KEY,
    j JSON,
    INDEX idx_a ((CAST(j->'$.a' AS UNSIGNED ARRAY)))
);
INSERT INTO t VALUES (1, JSON_OBJECT('a',JSON_ARRAY(1,2,3)));
INSERT INTO t VALUES (2, JSON_OBJECT('a',JSON_ARRAY(4,5,6)));
INSERT INTO t VALUES (3, JSON_OBJECT('a',JSON_ARRAY(7,8,9)));
ANALYZE TABLE t;
```

```
 EXPLAIN SELECT * FROM t WHERE 1 MEMBER OF(j->'$.a')\G
*************************** 1. row ***************************
          id: IndexMerge_10
      estRows: 2.00
        task: root
access object:
operator info: type: union
*************************** 2. row ***************************
          id: ├─IndexRangeScan_8(Build)
      estRows: 2.00
        task: cop[tikv]
access object: table:t, index:idx_a(cast(json_extract(`j`, _utf8mb4'$.a')
    ↪ as unsigned array))
operator info: range:[1,1], keep order:false, stats:partial[j:unInitialized
    ↪ ]
*************************** 3. row ***************************
          id: └─TableRowIDScan_9(Probe)
      estRows: 2.00
        task: cop[tikv]
access object: table:t
operator info: keep order:false, stats:partial[j:unInitialized]
3 rows in set (0.00 sec)
```

14.13.4.9.3 CONVERT

The `CONVERT()` function is used to convert between character sets.

Example:

```
SELECT CONVERT(0x616263 USING utf8mb4);
```

```
+--------------------------------+
| CONVERT(0x616263 USING utf8mb4) |
+--------------------------------+
| abc                            |
+--------------------------------+
1 row in set (0.0004 sec)
```

14.13.4.9.4 MySQL compatibility

- TiDB does not support cast operations on `SPATIAL` types. For more information, see #6347.
- TiDB does not support `AT TIME ZONE` for `CAST()`. For more information, see #51742.
- `CAST(24 AS YEAR)` returns 2 digits in TiDB and 4 digits in MySQL. For more information, see #29629.

14.13.4.10 Encryption and Compression Functions

TiDB supports most of the encryption and compression functions available in MySQL 8.0.

14.13.4.10.1 Supported functions

Name	Description
MD5()	Calculate MD5 checksum
PASSWORD()	Calculate and return a password string
RANDOM_BYTES()	Return a random byte vector
SHA1(), SHA()	Calculate an SHA-1 160-bit checksum
SHA2()	Calculate an SHA-2 checksum
SM3()	Calculate an SM3 checksum (currently MySQL does not support this
AES_DECRYPT()	Decrypt using AES
AES_ENCRYPT()	Encrypt using AES
COMPRESS()	Return result as a binary string
UNCOMPRESS()	Uncompress a string compressed
UNCOMPRESSED_LENGTH()	Return the length of a string before compression
VALIDATE_PASSWORD_STRENGTH()	Validate the password strength

14.13.4.10.2 Related system variables

The block_encryption_mode variable sets the encryption mode that is used for AES_

↪ `ENCRYPT()` and `AES_DECRYPT()`.

The `validate_password.*` variables affect the `VALIDATE_PASSWORD_STRENGTH()` function.

14.13.4.10.3 Unsupported functions

- `DES_DECRYPT()`, `DES_ENCRYPT()`, `OLD_PASSWORD()`, `ENCRYPT()`: these functions were deprecated in MySQL 5.7 and removed in 8.0.
- Functions only available in MySQL Enterprise Issue #2632.

14.13.4.10.4 MySQL compatibility

- TiDB does not support the `STATEMENT_DIGEST()` and `STATEMENT_DIGEST_TEXT()` functions.

14.13.4.11 Locking Functions

TiDB supports most of the user-level locking functions available in MySQL 8.0.

14.13.4.11.1 Supported functions

Name	Description
`GET_LOCK(lockName, timeout)`	Acquires an advisory lock. The `lockName` parameter must be NO longer than 64 characters. Waits maximum `timeout` seconds before timing out and returns a failure.
`IS_FREE_LOCK(lockName)`	Checks if a lock is free.
`IS_USED_LOCK(lockName)`	Checks if a lock is in use. If true, it returns the corresponding connection ID.
`RELEASE_ALL_LOCKS()`	Releases all locks held by the current session.
`RELEASE_LOCK(lockName)`	Releases a previously acquired lock. The `lockName` parameter must be NO longer than 64 characters.

14.13.4.11.2 MySQL compatibility

- The minimum timeout permitted by TiDB is 1 second, and the maximum timeout is

1 hour (3600 seconds). This differs from MySQL, where both 0 second and unlimited timeouts (`timeout=-1`) are permitted. TiDB will automatically convert out-of-range values to the nearest permitted value and convert `timeout=-1` to 3600 seconds.
- TiDB does not automatically detect deadlocks caused by user-level locks. Deadlocked sessions will timeout after a maximum of 1 hour, but can also be manually resolved by using `KILL` on one of the affected sessions. You can also prevent deadlocks by always acquiring user-level locks in the same order.
- Locks take effect on all TiDB servers in the cluster. This differs from MySQL Cluster and Group Replication where locks are local to a single server.
- `IS_USED_LOCK()` returns `1` if it is called from another session and is unable to return the ID of the process that is holding the lock.

14.13.4.12 Information Functions

TiDB supports most of the information functions available in MySQL 8.0.

14.13.4.12.1 TiDB supported MySQL functions

Name	Description
`BENCHMARK` ↪ `()`	Execute an expression in a loop
`CONNECTION` ↪ `_ID` ↪ `()`	Return the connection ID (thread ID) for the connection
`CURRENT` ↪ `_` ↪ `ROLE` ↪ `()`	Return the role that is in use by the connection
`CURRENT` ↪ `_` ↪ `USER` ↪ `()`, `CURRENT` ↪ `_` ↪ `USER` ↪	Return the authenticated user name and host name
`DATABASE` ↪ `()`	Return the default (current) database name

Name	Description
FOUND_ ↪ ROWS ↪ ()	For a SELECT with a LIMIT clause, the number of the rows that are returned if there is no LIMIT clause
LAST_ ↪ INSERT ↪ _ID ↪ ()	Return the value of the AUTOINCREMENT ↪ column for the last INSERT
ROW_ ↪ COUNT ↪ ()	The number of rows affected
SCHEMA ↪ ()	Synonym for DATABASE()
SESSION ↪ _ ↪ USER ↪ ()	Synonym for USER()
SYSTEM ↪ _ ↪ USER ↪ ()	Synonym for USER()
USER()	Return the user name and host name provided by the client
VERSION ↪ ()	Return a string that indicates the MySQL server version

BENCHMARK()

The BENCHMARK() function executes the given expression a specified number of times.

Syntax:

```
BENCHMARK(count, expression)
```

- `count`: the number of times the expression to be executed.
- `expression`: the expression to be executed repeatedly.

Example:

```
SELECT BENCHMARK(5, SLEEP(2));
```

```
+------------------------+
| BENCHMARK(5, SLEEP(2)) |
+------------------------+
|                      0 |
+------------------------+
1 row in set (10.00 sec)
```

CONNECTION_ID()

The `CONNECTION_ID()` function returns the ID of the connection. Based on the value of the `enable-32bits-connection-id` configuration item for TiDB, this function returns a 32-bit or 64-bit connection ID.

If `enable-global-kill` is enabled, the connection ID can be used to kill queries across multiple TiDB instances of the same cluster.

```
SELECT CONNECTION_ID();
```

```
+-----------------+
| CONNECTION_ID() |
+-----------------+
|      322961414 |
+-----------------+
1 row in set (0.00 sec)
```

CURRENT_ROLE()

The `CURRENT_ROLE()` function returns the current role for the current session.

```
SELECT CURRENT_ROLE();
```

```
+----------------+
| CURRENT_ROLE() |
+----------------+
| NONE           |
+----------------+
1 row in set (0.00 sec)
```

CURRENT_USER()

The `CURRENT_USER()` function returns the account that is used in the current session.

```
SELECT CURRENT_USER();
```

```
+----------------+
| CURRENT_USER() |
+----------------+
| root@%         |
+----------------+
1 row in set (0.00 sec)
```

DATABASE()

The `DATABASE()` function returns the database schema that the current session is using.

```
SELECT DATABASE();
```

```
+------------+
| DATABASE() |
+------------+
| test       |
+------------+
1 row in set (0.00 sec)
```

FOUND_ROWS()

The `FOUND_ROWS()` function returns the number of rows in the result set of the last executed `SELECT` statement.

```
SELECT 1 UNION ALL SELECT 2;
```

```
+------+
| 1    |
+------+
|    2 |
|    1 |
+------+
2 rows in set (0.01 sec)
```

```
SELECT FOUND_ROWS();
```

```
+--------------+
| FOUND_ROWS() |
+--------------+
|            2 |
+--------------+
1 row in set (0.00 sec)
```

Note:

The `SQL_CALC_FOUND_ROWS` query modifier, which calculates the total number of rows in a result set without considering the `LIMIT` clause, is only accepted if `tidb_enable_noop_functions` is enabled. This query modifier is deprecated starting from MySQL 8.0.17. It is recommended to use `COUNT(*)` instead.

LAST_INSERT_ID()

The `LAST_INSERT_ID()` function returns the ID of the last inserted row in a table that contains an `AUTO_INCREMENT` or `AUTO_RANDOM` column.

```
CREATE TABLE t1(id SERIAL);
Query OK, 0 rows affected (0.17 sec)

INSERT INTO t1() VALUES();
Query OK, 1 row affected (0.03 sec)

INSERT INTO t1() VALUES();
Query OK, 1 row affected (0.00 sec)

SELECT LAST_INSERT_ID();
+------------------+
| LAST_INSERT_ID() |
+------------------+
|                3 |
+------------------+
1 row in set (0.00 sec)

TABLE t1;
+----+
| id |
+----+
|  1 |
|  3 |
+----+
2 rows in set (0.00 sec)
```

Note

- In TiDB, AUTO_ID_CACHE might lead to results that differ from those returned by MySQL. This discrepancy arises because TiDB caches IDs on each node, potentially leading to IDs that are out of order or have gaps. If maintaining strict ID ordering is essential for your application, you can enable MySQL compatible mode.
- In the preceding example, IDs increase by 2 while MySQL would generate IDs incrementing by 1 in the same scenario. For more compatibility information, see Auto-increment ID.

ROW_COUNT()

The ROW_COUNT() function returns the number of affected rows.

```
CREATE TABLE t1(id BIGINT UNSIGNED PRIMARY KEY AUTO_RANDOM);
Query OK, 0 rows affected, 1 warning (0.16 sec)

INSERT INTO t1() VALUES (),(),();
Query OK, 3 rows affected (0.02 sec)
Records: 3 Duplicates: 0 Warnings: 0

SELECT ROW_COUNT();
+--------------+
| ROW_COUNT() |
+--------------+
|          3 |
+--------------+
1 row in set (0.00 sec)
```

SCHEMA()

The SCHEMA() function is a synonym for DATABASE().

SESSION_USER()

The SESSION_USER() function is a synonym for USER().

SYSTEM_USER()

The SYSTEM_USER() function is a synonym for USER().

USER()

The USER() function returns the user of the current connection. This might differ slightly from the output of CURRENT_USER(), as USER() displays the actual IP address instead of a wildcard.

```
SELECT USER(), CURRENT_USER();
```

```
+----------------+----------------+
| USER()         | CURRENT_USER() |
+----------------+----------------+
| root@127.0.0.1 | root@%         |
+----------------+----------------+
1 row in set (0.00 sec)
```

VERSION()

The `VERSION()` function returns the TiDB version in a format that is compatible with MySQL. To get a more detailed result, you can use the `TIDB_VERSION()` function.

```
SELECT VERSION();
+--------------------+
| VERSION()          |
+--------------------+
| 8.0.11-TiDB-v7.5.1 |
+--------------------+
1 row in set (0.00 sec)
```

```
SELECT TIDB_VERSION()\G
*************************** 1. row ***************************
TIDB_VERSION(): Release Version: v7.5.1
Edition: Community
Git Commit Hash: 7d16cc79e81bbf573124df3fd9351c26963f3e70
Git Branch: heads/refs/tags/v7.5.1
UTC Build Time: 2024-02-27 14:28:32
GoVersion: go1.21.6
Race Enabled: false
Check Table Before Drop: false
Store: tikv
1 row in set (0.00 sec)
```

The preceding example is from TiDB v7.5.1, which identifies itself as MySQL 8.0.11.

If you want to change the returned version, you can modify the `server-version` configuration item.

14.13.4.12.2 TiDB specific functions

The following function is only supported by TiDB, and there is no equivalent function in MySQL.

Name	Description
CURRENT_RESOURCE_GROUP()	Return the name of the resource group that the current session is bound to

14.13.4.12.3 Unsupported functions

- CHARSET()
- COERCIBILITY()
- COLLATION()
- ICU_VERSION()
- ROLES_GRAPHML()

14.13.4.13 JSON Functions

TiDB supports most of the JSON functions available in MySQL 8.0.

14.13.4.13.1 Functions that create JSON values

Function Name	Description
JSON_ARRAY([val[, val] ...])	Evaluates a (possibly empty) list of values and returns a JSON array containing those values
JSON_OBJECT(key, val[, key, val] ...)	Evaluates a (possibly empty) list of key-value pairs and returns a JSON object containing those pairs

Function Name	Description
JSON_QUOTE(string)	Returns a string as a JSON value with quotes

14.13.4.13.2 Functions that search JSON values

Function Name	Description
JSON_CONTAINS(target, candidate[, path])	Indicates by returning 1 or 0 whether a given candidate JSON document is contained within a target JSON document
JSON_CONTAINS_PATH(json_doc, one_or_all, path[, path] ...)	Returns 0 or 1 to indicate whether a JSON document contains data at a given path or paths
JSON_EXTRACT(json_doc, path[, path] ...)	Returns data from a JSON document, selected from the parts of the document matched by the `path` arguments

Function Name	Description
->	Returns the value from a JSON column after the evaluating path; an alias for `JSON_EXTRACT(doc, path_literal)`
->>	Returns the value from a JSON column after the evaluating path and unquoting the result; an alias for `JSON_UNQUOTE(JSON_EXTRACT(doc, path_literal))`

Function Name	Description
JSON_KEYS(json_doc[, path])	Returns the keys from the top-level value of a JSON object as a JSON array, or, if a path argument is given, the top-level keys from the selected path
JSON_SEARCH(json_doc, one_or_all, search_str[, escape_char[, path] ...])	Search a JSON document for one or all matches of a string
value MEMBER OF(json_array)	If the passed value is an element of the JSON array, returns 1. Otherwise, returns 0.
JSON_OVERLAPS(json_doc1, json_doc2)	Indicates whether two JSON documents have overlapping part. If yes, returns 1. If not, returns 0.

14.13.4.13.3 Functions that modify JSON values

Function Name	Description
JSON_APPEND(json_doc, path, value)	An alias to JSON_ARRAY_APPEND
JSON_ARRAY_APPEND(json_doc, path, val[, path, val] ...)	Appends values to the end of the indicated arrays within a JSON document and returns the result
JSON_ARRAY_INSERT(json_doc, path, val[, path, val] ...)	Insert values into the specified locations of a JSON document and returns the result
JSON_INSERT(json_doc, path, val[, path, val] ...)	Inserts data into a JSON document and returns the result
JSON_MERGE_PATCH(json_doc, json_doc[, json_doc] ...)	Merge JSON documents
JSON_MERGE_PRESERVE(json_doc, json_doc[, json_doc] ...)	Merges two or more JSON documents and returns the merged result
JSON_MERGE(json_doc, json_doc[, json_doc] ...)	A deprecated alias for JSON_MERGE_PRESERVE

Function Name	Description
JSON_REMOVE(json_doc, path[, path] …)	Removes data from a JSON document and returns the result
JSON_REPLACE(json_doc, path, val[, path, val] …)	Replaces existing values in a JSON document and returns the result
JSON_SET(json_doc, path, val[, path, val] …)	Inserts or updates data in a JSON document and returns the result
JSON_UNQUOTE(json_val)	Unquotes a JSON value and returns the result as a string

14.13.4.13.4 Functions that return JSON value attributes

Function Name	Description
JSON_DEPTH(json_doc)	Returns the maximum depth of a JSON document

Function Name	Description
JSON_LENGTH(json_doc[, path])	Returns the length of a JSON document, or, if a path argument is given, the length of the value within the path
JSON_TYPE(json_val)	Returns a string indicating the type of a JSON value
JSON_VALID(json_doc)	Checks if a json_doc is valid JSON. Useful for checking a column before converting it to the json type.

14.13.4.13.5 Utility functions

Function Name	Description
JSON_PRETTY(json_doc)	Pretty formatting of a JSON document

Function Name	Description
JSON_STORAGE_FREE(json_doc)	Returns how much storage space was freed in the binary representation of the JSON value after it was updated in place. As TiDB has different storage architecture from MySQL, this function always returns 0 for a valid JSON value, and it is implemented for compatibility with MySQL 8.0.

Function Name	Description
JSON_STORAGE_SIZE(json_doc)	Returns an approximate size of bytes required to store the json value. As the size does not account for TiKV using compression, the output of this function is not strictly compatible with MySQL.

14.13.4.13.6 Aggregate functions

Function Name	Description
JSON_ARRAYAGG(key)	Provides an aggregation of keys.
JSON_OBJECTAGG(key, value)	Provides an aggregation of values for a given key.

14.13.4.13.7 See also

- JSON Function Reference
- JSON Data Type

14.13.4.13.8 Unsupported functions

- `JSON_SCHEMA_VALID()`
- `JSON_SCHEMA_VALIDATION_REPORT()`
- `JSON_TABLE()`
- `JSON_VALUE()`

For more information, see #14486.

14.13.4.14 Aggregate (GROUP BY) Functions

This document describes details about the supported aggregate functions in TiDB.

14.13.4.14.1 Supported aggregate functions

This section describes the supported MySQL `GROUP BY` aggregate functions in TiDB.

Name	Description
`COUNT()`	Return a count of the number of rows returned
`COUNT(DISTINCT)`	Return the count of a number of different values
`SUM()`	Return the sum
`AVG()`	Return the average value of the argument
`MAX()`	Return the maximum value
`MIN()`	Return the minimum value
`GROUP_CONCAT()`	Return a concatenated string
`VARIANCE()`, `VAR_POP()`	Return the population standard variance
`STD()`, `STDDEV()`, `STDDEV_POP`	Return the population standard deviation
`VAR_SAMP()`	Return the sample variance
`STDDEV_SAMP()`	Return the sample standard deviation
`JSON_OBJECTAGG(key, value)`	Return the result set as a single JSON object containing key-value pairs

- Unless otherwise stated, group functions ignore `NULL` values.
- If you use a group function in a statement containing no `GROUP BY` clause, it is equivalent to grouping on all rows.

In addition, TiDB also provides the following aggregate functions:

- `APPROX_PERCENTILE(expr, constant_integer_expr)`

  This function returns the percentile of `expr`. The `constant_integer_expr` argument indicates the percentage value which is a constant integer in the range of `[1,100]`. A percentile Pk (`k` represents percentage) indicates that there are at least `k%` values in the data set that are less than or equal to Pk.

  This function only supports the numeric type and the date and time type as the returned type of `expr`. For other returned types, `APPROX_PERCENTILE` only returns `NULL`.

  The following example shows how to calculate the fiftieth percentile of a `INT` column:

```
drop table if exists t;
create table t(a int);
insert into t values(1), (2), (3);
```

```
select approx_percentile(a, 50) from t;
```

```
+--------------------------+
| approx_percentile(a, 50) |
+--------------------------+
|                        2 |
+--------------------------+
1 row in set (0.00 sec)
```

Except for the `GROUP_CONCAT()` and `APPROX_PERCENTILE()` functions, all the preceding functions can serve as Window functions.

14.13.4.14.2 GROUP BY modifiers

Starting from v7.4.0, the `GROUP BY` clause of TiDB supports the `WITH ROLLUP` modifier. For more information, see GROUP BY modifiers.

14.13.4.14.3 SQL mode support

TiDB supports the SQL Mode `ONLY_FULL_GROUP_BY`, and when enabled TiDB will refuse queries with ambiguous non-aggregated columns. For example, this query is illegal with `ONLY_FULL_GROUP_BY` enabled because the non-aggregated column "b" in the `SELECT` list does not appear in the `GROUP BY` statement:

```
drop table if exists t;
create table t(a bigint, b bigint, c bigint);
insert into t values(1, 2, 3), (2, 2, 3), (3, 2, 3);

mysql> select a, b, sum(c) from t group by a;
+------+------+--------+
| a    | b    | sum(c) |
+------+------+--------+
|    1 |    2 |      3 |
|    2 |    2 |      3 |
|    3 |    2 |      3 |
+------+------+--------+
3 rows in set (0.01 sec)

mysql> set sql_mode = 'ONLY_FULL_GROUP_BY';
Query OK, 0 rows affected (0.00 sec)
```

```
mysql> select a, b, sum(c) from t group by a;
ERROR 1055 (42000): Expression #2 of SELECT list is not in GROUP BY clause
    ↪ and contains nonaggregated column 'b' which is not functionally
    ↪ dependent on columns in GROUP BY clause; this is incompatible with
    ↪ sql_mode=only_full_group_by
```

TiDB currently enables the ONLY_FULL_GROUP_BY mode by default.

Differences from MySQL

The current implementation of ONLY_FULL_GROUP_BY is less strict than that in MySQL 5.7. For example, suppose that we execute the following query, expecting the results to be ordered by "c":

```
drop table if exists t;
create table t(a bigint, b bigint, c bigint);
insert into t values(1, 2, 1), (1, 2, 2), (1, 3, 1), (1, 3, 2);
select distinct a, b from t order by c;
```

To order the result, duplicates must be eliminated first. But to do so, which row should we keep? This choice influences the retained value of "c", which in turn influences ordering and makes it arbitrary as well.

In MySQL, a query that has DISTINCT and ORDER BY is rejected as invalid if any ORDER
↪ BY expression does not satisfy at least one of these conditions:

- The expression is equal to one in the SELECT list
- All columns referenced by the expression and belonging to the query's selected tables are elements of the SELECT list

But in TiDB, the above query is legal, for more information see #4254.

Another TiDB extension to standard SQL permits references in the HAVING clause to aliased expressions in the SELECT list. For example, the following query returns "name" values that occur only once in table "orders":

```
select name, count(name) from orders
group by name
having count(name) = 1;
```

The TiDB extension permits the use of an alias in the HAVING clause for the aggregated column:

```
select name, count(name) as c from orders
group by name
having c = 1;
```

Standard SQL permits only column expressions in `GROUP BY` clauses, so a statement such as this is invalid because "FLOOR(value/100)" is a noncolumn expression:

```
select id, floor(value/100)
from tbl_name
group by id, floor(value/100);
```

TiDB extends standard SQL to permit noncolumn expressions in `GROUP BY` clauses and considers the preceding statement valid.

Standard SQL also does not permit aliases in `GROUP BY` clauses. TiDB extends standard SQL to permit aliases, so another way to write the query is as follows:

```
select id, floor(value/100) as val
from tbl_name
group by id, val;
```

14.13.4.14.4 Related system variables

The `group_concat_max_len` variable sets the maximum number of items for the `GROUP_CONCAT()` function.

14.13.4.15 GROUP BY Modifiers

Starting from v7.4.0, the `GROUP BY` clause of TiDB supports the `WITH ROLLUP` modifier.

In the `GROUP BY` clause, you can specify one or more columns as a group list and append the `WITH ROLLUP` modifier after the list. Then, TiDB will conduct multidimensional descending grouping based on the columns in the group list and provide you with summary results for each group in the output.

- Grouping method:
    - The first grouping dimension includes all columns in the group list.
    - Subsequent grouping dimensions start from the right end of the grouping list and exclude one more column at a time to form new groups.
- Aggregation summaries: for each dimension, the query performs aggregation operations, and then aggregates the results of this dimension with the results of all previous dimensions. This means that you can get aggregated data at different dimensions, from detailed to overall.

With this grouping method, if there are `N` columns in the group list, TiDB aggregates the query results on `N+1` groups.

For example:**:**

```
SELECT count(1) FROM t GROUP BY a,b,c WITH ROLLUP;
```

In this example, TiDB will aggregate the calculation results of `count(1)` on 4 groups (that is, `{a, b, c}`, `{a, b}`, `{a}`, and `{}`) and output the summary results for each group.

> **Note:**
>
> Currently, TiDB does not support the Cube syntax.

14.13.4.15.1 Use cases

Aggregating and summarizing data from multiple columns is commonly used in OLAP (Online Analytical Processing) scenarios. By using the `WITH ROLLUP` modifier, you can get additional rows that display super summary information from other high-level dimensions in your aggregated results. Then, you can use the super summary information for advanced data analysis and report generation.

14.13.4.15.2 Prerequisites

Currently, TiDB supports generating valid execution plans for the `WITH ROLLUP` syntax only in TiFlash MPP mode. Therefore, make sure that your TiDB cluster has been deployed with TiFlash nodes and that target fact tables are configured with TiFlash replicas properly.

For more information, see Scale out a TiFlash cluster.

14.13.4.15.3 Examples

Suppose you have a profit table named `bank` with the `year`, `month`, `day`, and `profit` columns.

```
CREATE TABLE bank
(
    year   INT,
    month  VARCHAR(32),
    day    INT,
    profit DECIMAL(13, 7)
);

ALTER TABLE bank SET TIFLASH REPLICA 1; -- Add a TiFlash replica for the
    ↪ table

INSERT INTO bank VALUES(2000, "Jan", 1, 10.3),(2001, "Feb", 2, 22.4),(2000,
    ↪ "Mar", 3, 31.6)
```

To get the profit for the bank per year, you can use a simple `GROUP BY` clause as follows:

```
SELECT year, SUM(profit) AS profit FROM bank GROUP BY year;
+------+--------------------+
| year | profit             |
+------+--------------------+
| 2001 | 22.399999618530273 |
| 2000 | 41.90000057220459  |
+------+--------------------+
2 rows in set (0.15 sec)
```

In addition to yearly profits, bank reports usually also need to include the overall profit for all years or monthly divided profits for detailed profit analysis. Before v7.4.0, you have to use different `GROUP BY` clauses in multiple queries and join the results using UNION to obtain aggregated summaries. Starting from v7.4.0, you can simply achieve the desired results in a single query by appending the `WITH ROLLUP` modifier to the `GROUP BY` clause.

```
SELECT year, month, SUM(profit) AS profit from bank GROUP BY year, month
    ↪ WITH ROLLUP ORDER BY year desc, month desc;
+------+-------+--------------------+
| year | month | profit             |
+------+-------+--------------------+
| 2001 | Feb   | 22.399999618530273 |
| 2001 | NULL  | 22.399999618530273 |
| 2000 | Mar   | 31.600000381469727 |
| 2000 | Jan   | 10.300000190734863 |
| 2000 | NULL  | 41.90000057220459  |
| NULL | NULL  | 64.30000019073486  |
+------+-------+--------------------+
6 rows in set (0.025 sec)
```

The preceding results include aggregated data at different dimensions: by both year and month, by year, and overall. In the results, a row without `NULL` values indicates that the `profit` in that row is calculated by grouping both year and month. A row with a `NULL` value in the `month` column indicates that `profit` in that row is calculated by aggregating all months in a year, while a row with a `NULL` value in the `year` column indicates that `profit` in that row is calculated by aggregating all years.

Specifically:

- The `profit` value in the first row comes from the 2-dimensional group `{year, month}`, representing the aggregation result for the fine-grained `{2000, "Jan"}` group.
- The `profit` value in the second row comes from the 1-dimensional group `{year}`, representing the aggregation result for the mid-level `{2001}` group.
- The `profit` value in the last row comes from the 0-dimensional grouping `{}`, representing the overall aggregation result.

`NULL` values in the `WITH ROLLUP` results are generated just before the Aggregate operator is applied. Therefore, you can use `NULL` values in `SELECT`, `HAVING`, and `ORDER BY` clauses to further filter the aggregated results.

For example, you can use `NULL` in the `HAVING` clause to filter and view the aggregated results of 2-dimensional groups only:

```
SELECT year, month, SUM(profit) AS profit FROM bank GROUP BY year, month
    ↪ WITH ROLLUP HAVING year IS NOT null AND month IS NOT null;
+------+-------+--------------------+
| year | month | profit             |
+------+-------+--------------------+
| 2000 | Mar | 31.600000381469727 |
| 2000 | Jan | 10.300000190734863 |
| 2001 | Feb | 22.399999618530273 |
+------+-------+--------------------+
3 rows in set (0.02 sec)
```

Note that if a column in the `GROUP BY` list contains native `NULL` values, the aggregation results of `WITH ROLLUP` might mislead the query results. To address this issue, you can use the `GROUPING()` function to distinguish native `NULL` values from `NULL` values generated by `WITH ROLLUP`. This function takes a grouping expression as a parameter and returns `0` or `1` to indicate whether the grouping expression is aggregated in the current result. `1` represents aggregated, and `0` represents not aggregated.

The following example shows how to use the `GROUPING()` function:

```
SELECT year, month, SUM(profit) AS profit, grouping(year) as grp_year,
    ↪ grouping(month) as grp_month FROM bank GROUP BY year, month WITH
    ↪ ROLLUP ORDER BY year DESC, month DESC;
+------+-------+--------------------+----------+-----------+
| year | month | profit             | grp_year | grp_month |
+------+-------+--------------------+----------+-----------+
| 2001 | Feb | 22.399999618530273 |    0 |        0 |
| 2001 | NULL | 22.399999618530273 |    0 |        1 |
| 2000 | Mar | 31.600000381469727 |    0 |        0 |
| 2000 | Jan | 10.300000190734863 |    0 |        0 |
| 2000 | NULL | 41.90000057220459 |    0 |        1 |
| NULL | NULL | 64.30000019073486 |    1 |        1 |
+------+-------+--------------------+----------+-----------+
6 rows in set (0.028 sec)
```

From this output, you can get an understanding of the aggregation dimension of a row directly from the results of `grp_year` and `grp_month`, which prevents interference from native `NULL` values in the `year` and `month` grouping expressions.

The `GROUPING()` function can accept up to 64 grouping expressions as parameters. In the output of multiple parameters, each parameter generates a result of `0` or `1`, and these

parameters collectively form a 64-bit `UNSIGNED LONGLONG` with each bit as `0` or `1`. You can use the following formula to get the bit position of each parameter as follows:

```
GROUPING(day, month, year):
  result for GROUPING(year)
+ result for GROUPING(month) << 1
+ result for GROUPING(day) << 2
```

By using multiple parameters in the `GROUPING()` function, you can efficiently filter aggregate results at any high dimension. For example, you can quickly filter the aggregate results for each year and all years by using `GROUPING(year, month)`.

```
SELECT year, month, SUM(profit) AS profit, grouping(year) as grp_year,
    ↪ grouping(month) as grp_month FROM bank GROUP BY year, month WITH
    ↪ ROLLUP HAVING GROUPING(year, month) <> 0 ORDER BY year DESC, month
    ↪ DESC;
+------+-------+--------------------+----------+-----------+
| year | month | profit             | grp_year | grp_month |
+------+-------+--------------------+----------+-----------+
| 2001 | NULL | 22.399999618530273 |    0 |        1 |
| 2000 | NULL | 41.90000057220459 |    0 |        1 |
| NULL | NULL | 64.30000019073486 |    1 |        1 |
+------+-------+--------------------+----------+-----------+
3 rows in set (0.023 sec)
```

14.13.4.15.4 How to interpret the ROLLUP execution plan

To meet the requirements of multidimensional grouping, multidimensional data aggregation uses the `Expand` operator to replicate data. Each replica corresponds to a group at a specific dimension. With the data shuffling capability of MPP, the `Expand` operator can rapidly reorganize and calculate a large volume of data between multiple TiFlash nodes, fully utilizing the computational power of each node.

The implementation of the `Expand` operator is similar to that of the `Projection` operator. The difference is that `Expand` is a multi-level `Projection`, which contains multiple levels of projection operation expressions. For each row of the raw data, the `Projection` operator generates only one row in results, whereas the `Expand` operator generates multiple rows in results (the number of rows is equal to the number of levels in projection operation expressions).

The following is an example of an execution plan:

```
explain SELECT year, month, grouping(year), grouping(month), SUM(profit) AS
    ↪  profit FROM bank GROUP BY year, month WITH ROLLUP;
+--
    ↪ ------------------------------------+---------+--------------+----------------+
    ↪
```

```
| id                                  | estRows | task      | access object |
   ↪ operator info
   ↪
   ↪ |
+--
   ↪ -------------------------------------+---------+-------------+---------------+
   ↪
| TableReader_44                      | 2.40    | root      |               |
   ↪ MppVersion: 2, data:ExchangeSender_43
   ↪
   ↪ |
|  ─ExchangeSender_43                 | 2.40    | mpp[tiflash] |               |
   ↪ ExchangeType: PassThrough
   ↪
   ↪ |
|    ─Projection_8                    | 2.40    | mpp[tiflash] |               |
   ↪ Column#6->Column#12, Column#7->Column#13, grouping(gid)->Column#14,
   ↪ grouping(gid)->Column#15, Column#9->Column#16
   ↪
   ↪ |
|      ─Projection_38                 | 2.40    | mpp[tiflash] |               |
   ↪ Column#9, Column#6, Column#7, gid
   ↪
   ↪ |
|        ─HashAgg_36                  | 2.40    | mpp[tiflash] |               |
   ↪ group by:Column#6, Column#7, gid, funcs:sum(test.bank.profit)->Column
   ↪ #9, funcs:firstrow(Column#6)->Column#6, funcs:firstrow(Column#7)->
   ↪ Column#7, funcs:firstrow(gid)->gid, stream_count: 8              |
|          ─ExchangeReceiver_22       | 3.00    | mpp[tiflash] |               |
   ↪ stream_count: 8
   ↪
   ↪ |
|            ─ExchangeSender_21       | 3.00    | mpp[tiflash] |               |
   ↪ ExchangeType: HashPartition, Compression: FAST, Hash Cols: [name:
   ↪ Column#6, collate: binary], [name: Column#7, collate: utf8mb4_bin], [
   ↪ name: gid, collate: binary], stream_count: 8                     |
|              ─Expand_20             | 3.00    | mpp[tiflash] |               |
   ↪ level-projection:[test.bank.profit, <nil>->Column#6, <nil>->Column#7,
   ↪  0->gid],[test.bank.profit, Column#6, <nil>->Column#7, 1->gid],[test.
   ↪ bank.profit, Column#6, Column#7, 3->gid]; schema: [test.bank.profit,
   ↪ Column#6,Column#7,gid] |
|                ─Projection_16       | 3.00    | mpp[tiflash] |               |
   ↪ test.bank.profit, test.bank.year->Column#6, test.bank.month->Column#7
   ↪
   ↪
```

```
    ↪ |
|                 └─TableFullScan_17   | 3.00   | mpp[tiflash] | table:bank |
    ↪ keep order:false, stats:pseudo
    ↪
    ↪ |
+--
    ↪ ------------------------------------+---------+--------------+----------------+
    ↪
10 rows in set (0.05 sec)
```

In this example execution plan, you can view the multiple-level expression of the `Expand` operator in the `operator info` column of the `Expand_20` row. It consists of 2-dimensional expressions, and you can view the schema information of the `Expand` operator at the end of the row, which is `schema: [test.bank.profit, Column#6, Column#7, gid]`.

In the schema information of the `Expand` operator, `GID` is generated as an additional column. Its value is calculated by the `Expand` operator based on the grouping logic of different dimensions, and the value reflects the relationship between the current data replica and the `grouping set`. In most cases, the `Expand` operator uses a Bit-And operation, which can represent 63 combinations of grouping items for ROLLUP, corresponding to 64 dimensions of grouping. In this mode, TiDB generates the `GID` value depending on whether the `grouping set` of the required dimension contains grouping expressions when the current data replica is replicated, and it fills a 64-bit UINT64 value in the order of columns to be grouped.

In the preceding example, the order of columns in the grouping list is `[year, month]`, and the dimension groups generated by the ROLLUP syntax are `{year, month}`, `{year}` ↪ , and `{}`. For the dimension group `{year, month}`, both `year` and `month` are required columns, so TiDB fills the bit positions for them with 1 and 1 correspondingly. This forms a UINT64 of `11...0`, which is 3 in decimal. Therefore, the projection expression is `[test.` ↪ `bank.profit, Column#6, Column#7, 3->gid]` (where `column#6` corresponds to `year`, and `column#7` corresponds to `month`).

The following is an example row of the raw data:

```
+------+-------+-----+------------+
| year | month | day | profit  |
+------+-------+-----+------------+
| 2000 | Jan |   1 | 10.3000000 |
+------+-------+-----+------------+
```

After the `Expand` operator is applied, you can get the following three rows of results:

```
+------------+------+-------+-----+
| profit    | year | month | gid |
+------------+------+-------+-----+
| 10.3000000 | 2000 | Jan | 3 |
+------------+------+-------+-----+
```

```
| 10.3000000 | 2000 | NULL | 1 |
+------------+------+------+-----+
| 10.3000000 | NULL | NULL | 0 |
+------------+------+------+-----+
```

Note that the `SELECT` clause in the query uses the `GROUPING` function. When the `GROUPING` function is used in the `SELECT`, `HAVING`, or `ORDER BY` clauses, TiDB rewrites it during the logical optimization phase, transforms the relationship between the `GROUPING` function and the `GROUP BY` items into a `GID` related to the logic of dimension group (also known as `grouping set`), and fills this `GID` as metadata into the new `GROUPING` function.

14.13.4.16 Window Functions

The usage of window functions in TiDB is similar to that in MySQL 8.0. For details, see MySQL Window Functions.

Because window functions reserve additional words in the parser, TiDB provides an option to disable window functions. If you receive errors parsing SQL statements after upgrading, try setting `tidb_enable_window_function=0`.

The window functions listed here can be pushed down to TiFlash.

Except for `GROUP_CONCAT()` and `APPROX_PERCENTILE()`, TiDB supports all `GROUP BY` aggregate functions. In addition, TiDB supports the following window functions:

Function name	Feature description
`CUME_DIST()`	Returns the cumulative distribution of a value within a group of values.
`DENSE_RANK()`	Returns the rank of the current row within the partition, and the rank is without gaps.
`FIRST_VALUE()`	Returns the expression value of the first row in the current window.
`LAG()`	Returns the expression value from the row that precedes the current row by N rows within the partition.
`LAST_VALUE()`	Returns the expression value of the last row in the current window.
`LEAD()`	Returns the expression value from the row that follows the current row by N rows within the partition.
`NTH_VALUE()`	Returns the expression value from the N-th row of the current window.
`NTILE()`	Divides a partition into N buckets, assigns the bucket number to each row in the partition, and returns the bucket number of the current row within the partition.

Function name	Feature description
PERCENT_RANK()	Returns the percentage of partition values that are less than the value in the current row.
RANK()	Returns the rank of the current row within the partition. The rank may be with gaps.
ROW_NUMBER()	Returns the number of the current row in the partition.

14.13.4.17 Miscellaneous Functions

TiDB supports most of the miscellaneous functions available in MySQL 8.0.

14.13.4.17.1 Supported functions

Name	Description
ANY_VALUE()	Suppress ONLY_FULL_GROUP_BY value rejection
BIN_TO_UUID()	Convert UUID from binary format to text format
DEFAULT()	Returns the default value for a table column
GROUPING()	Modifier for GROUP BY operations
INET_ATON()	Return the numeric value of an IP address
INET_NTOA()	Return the IP address from a numeric value
INET6_ATON()	Return the numeric value of an IPv6 address
INET6_NTOA()	Return the IPv6 address from a numeric value
IS_IPV4()	Whether argument is an IPv4 address
IS_IPV4_COMPAT()	Whether argument is an IPv4-compatible address
IS_IPV4_MAPPED()	Whether argument is an IPv4-mapped address
IS_IPV6()	Whether argument is an IPv6 address
IS_UUID()	Whether argument is an UUID
NAME_CONST()	Can be used to rename a column name

Name	Description
SLEEP()	Sleep for a number of seconds. Note that for TiDB Serverless clusters, the SLEEP() function has a limitation wherein it can only support a maximum sleep time of 300 seconds.
UUID()	Return a Universal Unique Identifier (UUID)
UUID_TO_BIN()	Convert UUID from text format to binary format
VALUES()	Defines the values to be used during an INSERT

ANY_VALUE()

The ANY_VALUE() function returns any value from a group of values. Typically, it is used in scenarios where you need to include non-aggregated columns in your SELECT statement along with a GROUP BY clause.

```
CREATE TABLE fruits (id INT PRIMARY KEY, name VARCHAR(255));
Query OK, 0 rows affected (0.14 sec)

INSERT INTO fruits VALUES (1,'apple'),(2,'apple'),(3,'pear'),(4,'banana')
    ↪ ,(5, 'pineapple');
Query OK, 5 rows affected (0.01 sec)
Records: 5 Duplicates: 0 Warnings: 0

SELECT id,name FROM fruits GROUP BY name;
ERROR 1055 (42000): Expression #1 of SELECT list is not in GROUP BY clause
    ↪ and contains nonaggregated column 'test.fruits.id' which is not
    ↪ functionally dependent on columns in GROUP BY clause; this is
    ↪ incompatible with sql_mode=only_full_group_by

SELECT ANY_VALUE(id),GROUP_CONCAT(id),name FROM fruits GROUP BY name;
+---------------+------------------+-----------+
| ANY_VALUE(id) | GROUP_CONCAT(id) | name |
+---------------+------------------+-----------+
|           1 | 1,2              | apple    |
|           3 | 3                | pear     |
|           4 | 4                | banana   |
|           5 | 5                | pineapple |
+---------------+------------------+-----------+
4 rows in set (0.00 sec)
```

In the preceding example, TiDB returns an error for the first SELECT statement because the id column is non-aggregated and not included in the GROUP BY clause. To address the issue, the second SELECT query uses ANY_VALUE() to get any value from each group and uses GROUP_CONCAT() to concatenate all values of the id column within each group into a single string. This approach enables you to get one value from each group and all values of the

group without changing the SQL mode for non-aggregated columns.

BIN_TO_UUID()

`BIN_TO_UUID()` and `UUID_TO_BIN()` can be used to convert between a textual format UUID and a binary format. Both functions accept two arguments.

- The first argument specifies the value to be converted.
- The second argument (optional) controls the ordering of the fields in the binary format.

```
SET @a := UUID();
Query OK, 0 rows affected (0.00 sec)

SELECT @a;
+--------------------------------------+
| @a                                   |
+--------------------------------------+
| 9a17b457-eb6d-11ee-bacf-5405db7aad56 |
+--------------------------------------+
1 row in set (0.00 sec)

SELECT UUID_TO_BIN(@a);
+----------------------------------+
| UUID_TO_BIN(@a)                  |
+----------------------------------+
| 0x9A17B457EB6D11EEBACF5405DB7AAD56 |
+----------------------------------+
1 row in set (0.00 sec)

SELECT BIN_TO_UUID(0x9A17B457EB6D11EEBACF5405DB7AAD56);
+-----------------------------------------------+
| BIN_TO_UUID(0x9A17B457EB6D11EEBACF5405DB7AAD56) |
+-----------------------------------------------+
| 9a17b457-eb6d-11ee-bacf-5405db7aad56      |
+-----------------------------------------------+
1 row in set (0.00 sec)

SELECT UUID_TO_BIN(@a, 1);
+-----------------------------------+
| UUID_TO_BIN(@a, 1)                |
+-----------------------------------+
| 0x11EEEB6D9A17B457BACF5405DB7AAD56 |
+-----------------------------------+
1 row in set (0.00 sec)

SELECT BIN_TO_UUID(0x11EEEB6D9A17B457BACF5405DB7AAD56, 1);
```

```
+-----------------------------------------------+
| BIN_TO_UUID(0x11EEEB6D9A17B457BACF5405DB7AAD56, 1) |
+-----------------------------------------------+
| 9a17b457-eb6d-11ee-bacf-5405db7aad56          |
+-----------------------------------------------+
1 row in set (0.00 sec)
```

See also UUID() and Best practices for UUID.

DEFAULT()

The `DEFAULT()` function is used to get the default value of a column.

```
CREATE TABLE t1 (id INT PRIMARY KEY, c1 INT DEFAULT 5);
Query OK, 0 rows affected (0.15 sec)

INSERT INTO t1 VALUES (1, 1);
Query OK, 1 row affected (0.01 sec)

UPDATE t1 SET c1=DEFAULT(c1)+3;
Query OK, 1 row affected (0.02 sec)
Rows matched: 1 Changed: 1 Warnings: 0

TABLE t1;
+----+------+
| id | c1   |
+----+------+
|  1 |    8 |
+----+------+
1 row in set (0.00 sec)
```

In the preceding example, the `UPDATE` statement sets the value of the `c1` column to the default value of the column (which is `5`) plus `3`, resulting in a new value of `8`.

GROUPING()

See `GROUP BY` modifiers.

INET_ATON()

The `INET_ATON()` function converts an IPv4 address in dotted-quad notation into a binary version that can be stored efficiently.

```
SELECT INET_ATON('127.0.0.1');
```

```
+------------------------+
| INET_ATON('127.0.0.1') |
+------------------------+
|             2130706433 |
```

```
+------------------------+
1 row in set (0.00 sec)
```

INET_NTOA()

The `INET_NTOA()` function converts a binary IPv4 address into a dotted-quad notation.

```
SELECT INET_NTOA(2130706433);
```

```
+----------------------+
| INET_NTOA(2130706433) |
+----------------------+
| 127.0.0.1            |
+----------------------+
1 row in set (0.00 sec)
```

INET6_ATON()

The `INET6_ATON()` function is similar to `INET_ATON()`, but `INET6_ATON()` can also handle IPv6 addresses.

```
SELECT INET6_ATON('::1');
```

```
+-------------------------------------+
| INET6_ATON('::1')                   |
+-------------------------------------+
| 0x00000000000000000000000000000001 |
+-------------------------------------+
1 row in set (0.00 sec)
```

INET6_NTOA()

The `INET6_NTOA()` function is similar to `INET_NTOA()`, but `INET6_NTOA()` can also handle IPv6 addresses.

```
SELECT INET6_NTOA(0x00000000000000000000000000000001);
```

```
+-----------------------------------------------+
| INET6_NTOA(0x00000000000000000000000000000001) |
+-----------------------------------------------+
| ::1                                           |
+-----------------------------------------------+
1 row in set (0.00 sec)
```

IS_IPV4()

The `IS_IPV4()` function tests whether the given argument is an IPv4 address or not.

```
SELECT IS_IPV4('127.0.0.1');
```

```
+----------------------+
| IS_IPV4('127.0.0.1') |
+----------------------+
|                    1 |
+----------------------+
1 row in set (0.00 sec)
```

```
SELECT IS_IPV4('300.0.0.1');
```

```
+----------------------+
| IS_IPV4('300.0.0.1') |
+----------------------+
|                    0 |
+----------------------+
1 row in set (0.00 sec)
```

IS_IPV4_COMPAT()

The `IS_IPV4_COMPAT()` function tests whether the given argument is an IPv4-compatible address.

```
SELECT IS_IPV4_COMPAT(INET6_ATON('::127.0.0.1'));
```

```
+-------------------------------------------+
| IS_IPV4_COMPAT(INET6_ATON('::127.0.0.1')) |
+-------------------------------------------+
|                                         1 |
+-------------------------------------------+
1 row in set (0.00 sec)
```

IS_IPV4_MAPPED()

The `IS_IPV4_MAPPED()` function tests whether the given argument is an IPv4-mapped address.

```
SELECT IS_IPV4_MAPPED(INET6_ATON('::ffff:127.0.0.1'));
```

```
+---------------------------------------------+
| IS_IPV4_MAPPED(INET6_ATON('::ffff:127.0.0.1')) |
+---------------------------------------------+
|                                           1 |
+---------------------------------------------+
1 row in set (0.00 sec)
```

IS_IPV6()

The `IS_IPV6()` function tests whether the given argument is an IPv6 address.

```
SELECT IS_IPV6('::1');
```

```
+----------------+
| IS_IPV6('::1') |
+----------------+
|              1 |
+----------------+
1 row in set (0.00 sec)
```

IS_UUID()

The IS_UUID() function tests whether the given argument is a UUID.

```
SELECT IS_UUID('eb48c08c-eb71-11ee-bacf-5405db7aad56');
```

```
+-------------------------------------------------+
| IS_UUID('eb48c08c-eb71-11ee-bacf-5405db7aad56') |
+-------------------------------------------------+
|                                               1 |
+-------------------------------------------------+
1 row in set (0.00 sec)
```

NAME_CONST()

The NAME_CONST() function is used to name columns. It is recommended to use column aliases instead.

```
SELECT NAME_CONST('column name', 'value') UNION ALL SELECT 'another value';
```

```
+---------------+
| column name |
+---------------+
| another value |
| value       |
+---------------+
2 rows in set (0.00 sec)
```

The preceding statement uses NAME_CONST() and the following statement uses the recommended way of aliasing columns.

```
SELECT 'value' AS 'column name' UNION ALL SELECT 'another value';
```

```
+---------------+
| column name |
+---------------+
| value       |
```

```
| another value |
+---------------+
2 rows in set (0.00 sec)
```

SLEEP()

The `SLEEP()` function is used to pause the execution of queries for a specified number of seconds.

```
SELECT SLEEP(1.5);
```

```
+------------+
| SLEEP(1.5) |
+------------+
|          0 |
+------------+
1 row in set (1.50 sec)
```

UUID()

The `UUID()` function returns a universally unique identifier (UUID) version 1 as defined in RFC 4122.

```
SELECT UUID();
```

```
+--------------------------------------+
| UUID()                               |
+--------------------------------------+
| cb4d5ae6-eb6b-11ee-bacf-5405db7aad56 |
+--------------------------------------+
1 row in set (0.00 sec)
```

See also Best practices for UUID.

UUID_TO_BIN

See BIN_TO_UUID().

VALUES()

The `VALUES(col_name)` function is used to reference the value of a specific column in the `ON DUPLICATE KEY UPDATE` clause of an `INSERT` statement.

```
CREATE TABLE t1 (id INT PRIMARY KEY, c1 INT);
Query OK, 0 rows affected (0.17 sec)

INSERT INTO t1 VALUES (1,51),(2,52),(3,53),(4,54),(5,55);
Query OK, 5 rows affected (0.01 sec)
Records: 5 Duplicates: 0 Warnings: 0
```

```
INSERT INTO t1 VALUES(2,22),(4,44) ON DUPLICATE KEY UPDATE c1=VALUES(id)
    ↪ +100;
Query OK, 4 rows affected (0.01 sec)
Records: 2 Duplicates: 2 Warnings: 0

TABLE t1;
+----+------+
| id | c1   |
+----+------+
|  1 |   51 |
|  2 |  102 |
|  3 |   53 |
|  4 |  104 |
|  5 |   55 |
+----+------+
5 rows in set (0.00 sec)
```

14.13.4.17.2 Unsupported functions

Name	Description
UUID_ ↪ SHORT ↪ ()	Provides a UUID that is unique given certain assumptions not present in TiDB TiDB #4620

14.13.4.18 Precision Math

The precision math support in TiDB is consistent with MySQL. For more information, see Precision Math in MySQL.

14.13.4.18.1 Numeric types

The scope of precision math for exact-value operations includes the exact-value data types (integer and DECIMAL types) and exact-value numeric literals. Approximate-value data types and numeric literals are handled as floating-point numbers.

Exact-value numeric literals have an integer part or fractional part, or both. They may be signed. Examples: `1`, `.2`, `3.4`, `-5`, `-6.78`, `+9.10`.

Approximate-value numeric literals are represented in scientific notation (power-of-10) with a mantissa and exponent. Either or both parts may be signed. Examples: `1.2E3`, `1.2E-3`, `-1.2E3`, `-1.2E-3`.

Two numbers that look similar might be treated differently. For example, `2.34` is an exact-value (fixed-point) number, whereas `2.34E0` is an approximate-value (floating-point) number.

The DECIMAL data type is a fixed-point type and the calculations are exact. The FLOAT and DOUBLE data types are floating-point types and calculations are approximate.

14.13.4.18.2 DECIMAL data type characteristics

This section discusses the following topics of the characteristics of the DECIMAL data type (and its synonyms):

- Maximum number of digits
- Storage format
- Storage requirements

The declaration syntax for a DECIMAL column is `DECIMAL(M,D)`. The ranges of values for the arguments are as follows:

- M is the maximum number of digits (the precision). 1<= M <= 65.
- D is the number of digits to the right of the decimal point (the scale). 1 <= D <= 30 and D must be no larger than M.

The maximum value of 65 for M means that calculations on DECIMAL values are accurate up to 65 digits. This limit of 65 digits of precision also applies to exact-value numeric literals.

Values for DECIMAL columns are stored using a binary format that packs 9 decimal digits into 4 bytes. The storage requirements for the integer and fractional parts of each value are determined separately. Each multiple of 9 digits requires 4 bytes, and any remaining digits left over require some fraction of 4 bytes. The storage required for remaining digits is given by the following table.

Leftover Digits	Number of Bytes
0	0
1–2	1
3–4	2
5–6	3
7–9	4

For example, a `DECIMAL(18,9)` column has 9 digits on each side of the decimal point, so the integer part and the fractional part each require 4 bytes. A `DECIMAL(20,6)` column has 14 integer digits and 6 fractional digits. The integer digits require 4 bytes for 9 of the digits and 3 bytes for the remaining 5 digits. The 6 fractional digits require 3 bytes.

DECIMAL columns do not store a leading `+` character or `-` character or leading `0` digits. If you insert `+0003.1` into a `DECIMAL(5,1)` column, it is stored as `3.1`. For negative numbers, a literal `-` character is not stored.

DECIMAL columns do not permit values larger than the range implied by the column definition. For example, a `DECIMAL(3,0)` column supports a range of `-999` to `999`. A `DECIMAL(M,D)` column permits at most `M - D` digits to the left of the decimal point.

For more information about the internal format of the DECIMAL values, see `mydecimal.go` in TiDB source code.

14.13.4.18.3 Expression handling

For expressions with precision math, TiDB uses the exact-value numbers as given whenever possible. For example, numbers in comparisons are used exactly as given without a change in value. In strict SQL mode, if you add an exact data type into a column, a number is inserted with its exact value if it is within the column range. When retrieved, the value is the same as what is inserted. If strict SQL mode is not enabled, truncation for INSERT is permitted in TiDB.

How to handle a numeric expression depends on the values of the expression:

- If the expression contains any approximate values, the result is approximate. TiDB evaluates the expression using floating-point arithmetic.
- If the expression contains no approximate values are present, which means only exact values are contained, and if any exact value contains a fractional part, the expression is evaluated using DECIMAL exact arithmetic and has a precision of 65 digits.
- Otherwise, the expression contains only integer values. The expression is exact. TiDB evaluates the expression using integer arithmetic and has a precision the same as BIGINT (64 bits).

If a numeric expression contains strings, the strings are converted to double-precision floating-point values and the result of the expression is approximate.

Inserts into numeric columns are affected by the SQL mode. The following discussions mention strict mode and `ERROR_FOR_DIVISION_BY_ZERO`. To turn on all the restrictions, you can simply use the `TRADITIONAL` mode, which includes both strict mode values and `ERROR_FOR_DIVISION_BY_ZERO`:

```
SET sql_mode = 'TRADITIONAL`;
```

If a number is inserted into an exact type column (DECIMAL or integer), it is inserted with its exact value if it is within the column range. For this number:

- If the value has too many digits in the fractional part, rounding occurs and a warning is generated.
- If the value has too many digits in the integer part, it is too large and is handled as follows:
    - If strict mode is not enabled, the value is truncated to the nearest legal value and a warning is generated.

- If strict mode is enabled, an overflow error occurs.

To insert strings into numeric columns, TiDB handles the conversion from string to number as follows if the string has nonnumeric contents:

- In strict mode, a string (including an empty string) that does not begin with a number cannot be used as a number. An error, or a warning occurs.
- A string that begins with a number can be converted, but the trailing nonnumeric portion is truncated. In strict mode, if the truncated portion contains anything other than spaces, an error, or a warning occurs.

By default, the result of the division by 0 is NULL and no warning. By setting the SQL mode appropriately, division by 0 can be restricted. If you enable the `ERROR_FOR_DIVISION_BY_ZERO` SQL mode, TiDB handles division by 0 differently:

- In strict mode, inserts and updates are prohibited, and an error occurs.
- If it's not in the strict mode, a warning occurs.

In the following SQL statement:

```
INSERT INTO t SET i = 1/0;
```

The following results are returned in different SQL modes:

`sql_mode` Value	Result
''	No warning, no error; i is set to NULL.
strict	No warning, no error; i is set to NULL.
`ERROR_FOR_DIVISION_BY_ZERO`	Warning, no error; i is set to NULL.
strict, `ERROR_FOR_DIVISION_BY_ZERO`	Error; no row is inserted.

14.13.4.18.4 Rounding behavior

The result of the `ROUND()` function depends on whether its argument is exact or approximate:

- For exact-value numbers, the `ROUND()` function uses the "round half up" rule.
- For approximate-value numbers, the results in TiDB differs from that in MySQL:

```
TiDB > SELECT ROUND(2.5), ROUND(25E-1);
+------------+--------------+
| ROUND(2.5) | ROUND(25E-1) |
+------------+--------------+
|          3 |            3 |
```

```
+------------+--------------+
1 row in set (0.00 sec)
```

For inserts into a DECIMAL or integer column, the rounding uses round half away from zero.

```
TiDB > CREATE TABLE t (d DECIMAL(10,0));
Query OK, 0 rows affected (0.01 sec)

TiDB > INSERT INTO t VALUES(2.5),(2.5E0);
Query OK, 2 rows affected, 2 warnings (0.00 sec)

TiDB > SELECT d FROM t;
+------+
| d    |
+------+
|    3 |
|    3 |
+------+
2 rows in set (0.00 sec)
```

14.13.4.19 Set Operations

TiDB supports three set operations using the UNION, EXCEPT, and INTERSECT operators. The smallest unit of a set is a SELECT statement.

14.13.4.19.1 UNION operator

In mathematics, the union of two sets A and B consists of all elements that are in A or in B. For example:

```
SELECT 1 UNION SELECT 2;
+---+
| 1 |
+---+
| 2 |
| 1 |
+---+
2 rows in set (0.00 sec)
```

TiDB supports both `UNION DISTINCT` and `UNION ALL` operators. `UNION DISTINCT` removes duplicate records from the result set, while `UNION ALL` keeps all records including duplicates. `UNION DISTINCT` is used by default in TiDB.

```
CREATE TABLE t1 (a int);
CREATE TABLE t2 (a int);
INSERT INTO t1 VALUES (1),(2);
INSERT INTO t2 VALUES (1),(3);
```

Examples for `UNION DISTINCT` and `UNION ALL` queries are respectively as follows:

```
SELECT * FROM t1 UNION DISTINCT SELECT * FROM t2;
+---+
| a |
+---+
| 1 |
| 2 |
| 3 |
+---+
3 rows in set (0.00 sec)

SELECT * FROM t1 UNION ALL SELECT * FROM t2;
+---+
| a |
+---+
| 1 |
| 2 |
| 1 |
| 3 |
+---+
4 rows in set (0.00 sec)
```

14.13.4.19.2 EXCEPT operator

If A and B are two sets, EXCEPT returns the difference set of A and B which consists of elements that are in A but not in B.

```
SELECT * FROM t1 EXCEPT SELECT * FROM t2;
+---+
| a |
+---+
| 2 |
+---+
1 rows in set (0.00 sec)
```

`EXCEPT ALL` operator is not yet supported.

14.13.4.19.3 INTERSECT operator

In mathematics, the intersection of two sets A and B consists of all elements that are both in A and B, and no other elements.

```
SELECT * FROM t1 INTERSECT SELECT * FROM t2;
+---+
| a |
+---+
| 1 |
+---+
1 rows in set (0.00 sec)
```

`INTERSECT ALL` operator is not yet supported. INTERSECT operator has higher precedence over EXCEPT and UNION operators.

```
SELECT * FROM t1 UNION ALL SELECT * FROM t1 INTERSECT SELECT * FROM t2;
+---+
| a |
+---+
| 1 |
| 1 |
| 2 |
+---+
3 rows in set (0.00 sec)
```

14.13.4.19.4 Parentheses

TiDB supports using parentheses to specify the precedence of set operations. Expressions in parentheses are processed first.

```
(SELECT * FROM t1 UNION ALL SELECT * FROM t1) INTERSECT SELECT * FROM t2;
+---+
| a |
+---+
| 1 |
+---+
1 rows in set (0.00 sec)
```

14.13.4.19.5 Use `ORDER BY` and `LIMIT`

TiDB supports using `ORDER BY` or `LIMIT` clause on the entire result of set operations. These two clauses must be at the end of the entire statement.

```
(SELECT * FROM t1 UNION ALL SELECT * FROM t1 INTERSECT SELECT * FROM t2)
    ↪ ORDER BY a LIMIT 2;
+---+
| a |
```

```
+---+
| 1 |
| 1 |
+---+
2 rows in set (0.00 sec)
```

14.13.4.20 Sequence Functions

Sequence functions in TiDB are used to return or set values of sequence objects created using the `CREATE SEQUENCE` statement.

Function name	Feature description
`NEXTVAL()` or `NEXT VALUE FOR`	Returns the next value of a sequence
`SETVAL()`	Sets the current value of a sequence
`LASTVAL()`	Returns the last used value of a sequence

14.13.4.20.1 MySQL compatibility

MySQL does not support the functions and statements for creating and manipulating sequences as defined in ISO/IEC 9075-2.

14.13.4.21 List of Expressions for Pushdown

When TiDB reads data from TiKV, TiDB tries to push down some expressions (including calculations of functions or operators) to be processed to TiKV. This reduces the amount of transferred data and offloads processing from a single TiDB node. This document introduces the expressions that TiDB already supports pushing down and how to prohibit specific expressions from being pushed down using blocklist.

TiFlash also supports pushdown for the functions and operators listed on this page.

14.13.4.21.1 Supported expressions for pushdown to TiKV

Expression Type	Operations
Logical operators	AND (&&), OR (||), NOT (!), XOR
Bit operators	&, ~, |, ^, <<, >>
Comparison functions and operators	<, <=, =, != (<>), >, >=, <=>, BETWEEN … AND …, COALESCE(), IN(), INTERVAL(), IS NOT NULL, IS NOT, IS NULL, IS, ISNULL(), LIKE, NOT BETWEEN … AND …, NOT IN(), NOT LIKE, STRCMP()

Expression Type	Operations
Numeric functions and operators	+, -, *, /, DIV, % (MOD), -, ABS(), ACOS(), ASIN(), ATAN(), ATAN2(), ATAN(), CEIL(), CEILING(), CONV(), COS(), COT(), CRC32(), DEGREES(), EXP(), FLOOR(), LN(), LOG(), LOG10(), LOG2(), MOD(), PI(), POW(), POWER(), RADIANS(), RAND(), ROUND(), SIGN(), SIN(), SQRT()
Control flow functions	CASE, IF(), IFNULL()
JSON functions	JSON_ARRAY([val[, val] ...]), JSON_CONTAINS(target, candidate[, path]), JSON_EXTRACT(json_doc, path[, path] ...), JSON_INSERT(json_doc, path, val[, path, val] ...), JSON_LENGTH(json_doc[, path]), JSON_MERGE(json_doc, json_doc[, json_doc] ...), JSON_OBJECT([key, val[, key, val] ...]), JSON_REMOVE(json_doc, path[, path] ...), JSON_SET(json_doc, path, val[, path, val] ...), JSON_TYPE(json_val), JSON_UNQUOTE(json_val), JSON_VALID(val), value MEMBER OF(json_array)
Date and time functions	DATE(), DATE_FORMAT(), DATEDIFF(), DAYOFMONTH(), DAYOFWEEK(), DAYOFYEAR(), FROM_DAYS(), HOUR(), MAKEDATE(), MAKETIME(), MICROSECOND(), MINUTE(), MONTH(), MONTHNAME(), PERIOD_ADD(), PERIOD_DIFF(), SEC_TO_TIME(), SECOND(), SYSDATE(), TIME_TO_SEC(), TIMEDIFF(), WEEK(), WEEKOFYEAR(), YEAR()

Expression Type	Operations
String functions	ASCII(), BIT_LENGTH(), CHAR(), CHAR_LENGTH(), CONCAT(), CONCAT_WS(), ELT(), FIELD(), HEX(), LENGTH(), LIKE, LOWER(), LTRIM(), MID(), NOT LIKE, NOT REGEXP, REGEXP, REGEXP_INSTR(), REGEXP_LIKE(), REGEXP_REPLACE(), REGEXP_SUBSTR(), REPLACE(), REVERSE(), RIGHT(), RLIKE, RTRIM(), SPACE(), STRCMP(), SUBSTR(), SUBSTRING(), UPPER()
Aggregation functions	COUNT(), COUNT(DISTINCT), SUM(), AVG(), MAX(), MIN(), VARIANCE(), VAR_POP(), STD(), STDDEV(), STDDEV_POP, VAR_SAMP(), STDDEV_SAMP(), JSON_ARRAYAGG(key), JSON_OBJECTAGG(key, value)
Encryption and compression functions	MD5(), SHA1(), SHA(), UNCOMPRESSED_LENGTH()
Cast functions and operators	CAST(), CONVERT()
Miscellaneous functions	UUID()

14.13.4.21.2 Blocklist specific expressions

If unexpected behavior occurs in the calculation process when pushing down the supported expressions or specific data types (**only** the `ENUM` type and the `BIT` type), you can restore the application quickly by prohibiting the pushdown of the corresponding functions, operators, or data types. Specifically, you can prohibit the functions, operators, or data types from being pushed down by adding them to the blocklist `mysql.expr_pushdown_blacklist`. For details, refer to Add to the blocklist.

14.13.4.22 TiDB Specific Functions

The following functions are TiDB extensions, and are not present in MySQL:

Function name	Function description
TIDB_BOUNDED_ ↪ STALENESS()	The TIDB_BOUNDED_STALENESS function instructs TiDB to read the data as new as possible within the time range. See also: Read Historical Data Using the AS OF TIMESTAMP Clause
TIDB_DECODE_ ↪ KEY(str)	The TIDB_DECODE_KEY function can be used to decode a TiDB-encoded key entry into a JSON structure containing _tidb_rowid and table_id. These encoded keys can be found in some system tables and in logging outputs.
TIDB_DECODE_ ↪ PLAN(str)	The TIDB_DECODE_PLAN function can be used to decode a TiDB execution plan.
TIDB_IS_DDL_ ↪ OWNER()	The TIDB_IS_DDL_OWNER function can be used to check whether or not the TiDB instance you are connected to is the one that is the DDL Owner. The DDL Owner is the TiDB instance that is tasked with executing DDL statements on behalf of all other nodes in the cluster.
TIDB_PARSE_TSO ↪ (num)	The TIDB_PARSE_TSO function can be used to extract the physical timestamp from a TiDB TSO timestamp. See also: tidb_current_ts.
TIDB_PARSE_TSO ↪ _LOGICAL(↪ num)	The TIDB_PARSE_TSO_LOGICAL function can be used to extract the logical timestamp from a TiDB TSO timestamp.
TIDB_VERSION()	The TIDB_VERSION function returns the TiDB version with additional build information.
TIDB_DECODE_ ↪ SQL_DIGESTS ↪ (digests, ↪ stmtTruncateLength ↪)	The TIDB_DECODE_SQL_DIGESTS() function is used to query the normalized SQL statements (a form without formats and arguments) corresponding to the set of SQL digests in the cluster.
VITESS_HASH(↪ str)	The VITESS_HASH function returns the hash of a string that is compatible with Vitess' HASH function. This is intended to help the data migration from Vitess.

Function name	Function description
`TIDB_SHARD()`	The `TIDB_SHARD` function can be used to create a shard index to scatter the index hotspot. A shard index is an expression index with a `TIDB_SHARD` function as the prefix.
`TIDB_ROW_CHECKSUM()`	The `TIDB_ROW_CHECKSUM` function is used to query the checksum value of a row. This function can only be used in `SELECT` statements within the FastPlan process. That is, you can query through statements like `SELECT TIDB_ROW_CHECKSUM()FROM t WHERE id = ?` or `SELECT TIDB_ROW_CHECKSUM()FROM t WHERE id IN (?, ?, ...)`. See also: Data integrity validation for single-row data.
`CURRENT_RESOURCE_GROUP()`	The `CURRENT_RESOURCE_GROUP` function is used to return the resource group name that the current session is bound to. See also: Use Resource Control to Achieve Resource Isolation.

14.13.4.22.1 Examples

This section provides examples for some of the functions above.

TIDB_DECODE_KEY

In the following example, the table `t1` has a hidden `rowid` that is generated by TiDB. The `TIDB_DECODE_KEY` is used in the statement. From the result, you can see that the hidden `rowid` is decoded and output, which is a typical result for the non-clustered primary key.

```
SELECT START_KEY, TIDB_DECODE_KEY(START_KEY) FROM information_schema.tikv_
    ↪ region_status WHERE table_name='t1' AND REGION_ID=2\G
```

```
*************************** 1. row ***************************
               START_KEY: 7480000000000000
                   ↪ FF3B5F728000000000FF1DE3F10000000000FA
TIDB_DECODE_KEY(START_KEY): {"_tidb_rowid":1958897,"table_id":"59"}
1 row in set (0.00 sec)
```

In the following example, the table `t2` has a compound clustered primary key. From the JSON output, you can see a `handle` that contains the name and value for both of the columns that are part of the primary key.

```
SHOW CREATE TABLE t2\G
```

```
*************************** 1. row ***************************
       Table: t2
Create Table: CREATE TABLE `t2` (
  `id` binary(36) NOT NULL,
  `a` tinyint(3) unsigned NOT NULL,
  `v` varchar(512) DEFAULT NULL,
  PRIMARY KEY (`a`,`id`) /*T![clustered_index] CLUSTERED */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
1 row in set (0.001 sec)
```

```
SELECT * FROM information_schema.tikv_region_status WHERE table_name='t2'
    ↪ LIMIT 1\G
```

```
*************************** 1. row ***************************
               REGION_ID: 48

`TIDB_DECODE_KEY` returns valid JSON on success and returns the argument value if it fails to decode.

TIDB_DECODE_PLAN

You can find TiDB execution plans in encoded form in the slow query log. The `TIDB_DECODE_PLAN()` function is then used to decode the encoded plans into a human-readable form.

This function is useful because a plan is captured at the time the statement is executed. Re-executing the statement in `EXPLAIN` might produce different results as data distribution and statistics evolves over time.

```
SELECT tidb_decode_plan('8
    ↪ QIYMAkzMV83CQEH8E85LjA0CWRhdGE6U2VsZWN0aW9uXzYJOTYwCXRpbWU6NzEzLjHCtXMsIGxvb3BzOjI
    ↪ ')\G
```

```
*************************** 1. row ***************************
  tidb_decode_plan('8

      └─TableFullScan_5  cop[tikv]   960       table:t, keep order:false,
        ↪ stats:pseudo 960     tikv_task:{time:153µs, loops:960}
        ↪
        ↪ N/A       N/A
```

TIDB_PARSE_TSO

The `TIDB_PARSE_TSO` function can be used to extract the physical timestamp from a TiDB TSO timestamp. TSO stands for Time Stamp Oracle and is a monotonically increasing

timestamp given out by PD (Placement Driver) for every transaction.

A TSO is a number that consists of two parts:

- A physical timestamp
- A logical counter

```
BEGIN;
SELECT TIDB_PARSE_TSO(@@tidb_current_ts);
ROLLBACK;
```

```
+----------------------------------+
| TIDB_PARSE_TSO(@@tidb_current_ts) |
+----------------------------------+
| 2021-05-26 11:33:37.776000    |
+----------------------------------+
1 row in set (0.0012 sec)
```

Here `TIDB_PARSE_TSO` is used to extract the physical timestamp from the timestamp number that is available in the `tidb_current_ts` session variable. Because timestamps are given out per transaction, this function is running in a transaction.

TIDB_VERSION

The `TIDB_VERSION` function can be used to get the version and build details of the TiDB server that you are connected to. You can use this function when reporting issues on GitHub.

```
SELECT TIDB_VERSION()\G
```

```
*************************** 1. row ***************************

```

TIDB_DECODE_SQL_DIGESTS

The `TIDB_DECODE_SQL_DIGESTS()` function is used to query the normalized SQL statements (a form without formats and arguments) corresponding to the set of SQL digests in the cluster. This function accepts 1 or 2 arguments:

- `digests`: A string. This parameter is in the format of a JSON string array, and each string in the array is a SQL digest.
- `stmtTruncateLength`: An integer (optional). It is used to limit the length of each SQL statement in the returned result. If a SQL statement exceeds the specified length, the statement is truncated. `0` means that the length is unlimited.

This function returns a string, which is in the format of a JSON string array. The i-th item in the array is the normalized SQL statement corresponding to the i-th element in the `digests` parameter. If an element in the `digests` parameter is not a valid SQL digest or the system cannot find the corresponding SQL statement, the corresponding item in the returned result is `null`. If the truncation length is specified (`stmtTruncateLength > 0`), for each statement in the returned result that exceeds this length, the first `stmtTruncateLength` characters are retained and the suffix `"..."` is added at the end to indicate the truncation. If the `digests` parameter is `NULL`, the returned value of the function is `NULL`.

Note:

- Only users with the PROCESS privilege can use this function.
- When `TIDB_DECODE_SQL_DIGESTS` is executed, TiDB queries the statement corresponding to each SQL digest from the statement summary tables, so there is no guarantee that the corresponding statement can always be found for any SQL digest. Only the statements that have been executed in the cluster can be found, and whether these SQL statements can be queried or not is also affected by the related configuration of the statement summary tables. For the detailed description of the statement summary table, see Statement Summary Tables.
- This function has a high overhead. In queries with a large number of rows (for example, querying the full table of `information_schema.cluster_tidb_trx` on a large and busy cluster), using this function might cause the queries to run for too long. Use it with caution.
  - This function has a high overhead because every time it is called, it internally queries the `STATEMENTS_SUMMARY`, `STATEMENTS_SUMMARY_HISTORY`, `CLUSTER_STATEMENTS_SUMMARY`, and `CLUSTER_STATEMENTS_SUMMARY_HISTORY` tables, and the query involves the `UNION` operation. This function currently does not support vectorization, that is, when calling this function for multiple rows of data, the above query is performed separately for each row.

```
set @digests = '["
    ↪ e6f07d43b5c21db0fbb9a31feac2dc599787763393dd5acbfad80e247eb02ad5","38
```

```
    ↪ b03afa5debbdf0326a014dbe5012a62c51957f1982b3093e748460f8b00821","
    ↪ e5796985ccafe2f71126ed6c0ac939ffa015a8c0744a24b7aee6d587103fd2f7"]';

select tidb_decode_sql_digests(@digests);
```

```
+------------------------------------+
| tidb_decode_sql_digests(@digests) |
+------------------------------------+
| ["begin",null,"select * from `t`"] |
+------------------------------------+
1 row in set (0.00 sec)
```

In the above example, the parameter is a JSON array containing 3 SQL digests, and the corresponding SQL statements are the three items in the query results. But the SQL statement corresponding to the second SQL digest cannot be found from the cluster, so the second item in the result is `null`.

```
select tidb_decode_sql_digests(@digests, 10);
```

```
+---------------------------------------+
| tidb_decode_sql_digests(@digests, 10) |
+---------------------------------------+
| ["begin",null,"select * f..."]    |
+---------------------------------------+
1 row in set (0.01 sec)
```

The above call specifies the second parameter (that is, the truncation length) as 10, and the length of the third statement in the query result is greater than 10. Therefore, only the first 10 characters are retained, and `"..."` is added at the end, which indicates the truncation.

- Statement Summary Tables
- INFORMATION_SCHEMA.TIDB_TRX

TIDB_SHARD

The `TIDB_SHARD` function can be used to create a shard index to scatter the index hotspot. A shard index is an expression index prefixed with a `TIDB_SHARD` function.

- Creation:

  To create a shard index for the index field `a`, you can use `uk((tidb_shard(a)), a))`. When there is a hotspot caused by monotonically increasing or decreasing data on the index field `a` in the unique secondary index `uk((tidb_shard(a)), a))`, the index's prefix `tidb_shard(a)` can scatter the hotspot to improve the scalability of the cluster.

- Scenarios:

    - There is a write hotspot caused by monotonically increasing or decreasing keys on the unique secondary index, and the index contains integer type fields.
    - The SQL statement executes an equality query based on all fields of the secondary index, either as a separate `SELECT` or as an internal query generated by `UPDATE`, `DELETE` and so on. The equality query includes two ways: `a = 1` or `a IN (1, 2, ...)`.

- Limitations:

    - Cannot be used in inequality queries.
    - Cannot be used in queries that contain `OR` mixed with an outmost `AND` operator.
    - Cannot be used in the `GROUP BY` clause.
    - Cannot be used in the `ORDER BY` clause.
    - Cannot be used in the `ON` clause.
    - Cannot be used in the `WHERE` subquery.
    - Can be used to scatter unique indexes of only the integer fields.
    - Might not take effect in composite indexes.
    - Cannot go through FastPlan process, which affects optimizer performance.
    - Cannot be used to prepare the execution plan cache.

The following example shows how to use the `TIDB_SHARD` function.

- Use the `TIDB_SHARD` function to calculate the SHARD value.

    The following statement shows how to use the `TIDB_SHARD` function to calculate the SHARD value of `12373743746`:

```
SELECT TIDB_SHARD(12373743746);
```

- The SHARD value is:

```
+-------------------------+
| TIDB_SHARD(12373743746) |
+-------------------------+
|                     184 |
+-------------------------+
1 row in set (0.00 sec)
```

- Create a shard index using the `TIDB_SHARD` function:

```
CREATE TABLE test(id INT PRIMARY KEY CLUSTERED, a INT, b INT, UNIQUE
    ↪ KEY uk((tidb_shard(a)), a));
```

TIDB_ROW_CHECKSUM

The `TIDB_ROW_CHECKSUM` function is used to query the checksum value of a row. This function can only be used in `SELECT` statements within the FastPlan process. That is, you can query through statements like `SELECT TIDB_ROW_CHECKSUM()FROM t WHERE id = ?` or `SELECT TIDB_ROW_CHECKSUM()FROM t WHERE id IN (?, ?, ...)`.

To enable the checksum feature of single-row data in TiDB (controlled by the system variable tidb_enable_row_level_checksum), run the following statement:

```
SET GLOBAL tidb_enable_row_level_checksum = ON;
```

Create table `t` and insert data:

```
USE test;
CREATE TABLE t (id INT PRIMARY KEY, k INT, c int);
INSERT INTO TABLE t values (1, 10, a);
```

The following statement shows how to query the checksum value of the row where `id = 1` in table `t`:

```
SELECT *, TIDB_ROW_CHECKSUM() FROM t WHERE id = 1;
```

The output is as follows:

```
+----+------+------+--------------------+
| id | k    | c    | TIDB_ROW_CHECKSUM() |
+----+------+------+--------------------+
|  1 |   10 | a    | 3813955661         |
+----+------+------+--------------------+
1 row in set (0.000 sec)
```

CURRENT_RESOURCE_GROUP

The `CURRENT_RESOURCE_GROUP` function is used to show the resource group name that the current session is bound to. When the Resource control feature is enabled, the available resources that can be used by SQL statements are restricted by the resource quota of the bound resource group.

When a session is established, TiDB binds the session to the resource group that the login user is bound to by default. If the user is not bound to any resource groups, the session is bound to the `default` resource group. Once the session is established, the bound resource group will not change by default, even if the bound resource group of the user is changed via modifying the resource group bound to the user. To change the bound resource group of the current session, you can use `SET RESOURCE GROUP`.

Example

Create a user `user1`, create two resource groups `rg1` and `rg2`, and bind the user `user1` to the resource group `rg1`:

```
CREATE USER 'user1';
CREATE RESOURCE GROUP 'rg1' RU_PER_SEC = 1000;
CREATE RESOURCE GROUP 'rg2' RU_PER_SEC = 2000;
ALTER USER 'user1' RESOURCE GROUP `rg1`;
```

Use `user1` to log in and view the resource group bound to the current user:

```
SELECT CURRENT_RESOURCE_GROUP();
```

```
+--------------------------+
| CURRENT_RESOURCE_GROUP() |
+--------------------------+
| rg1                      |
+--------------------------+
1 row in set (0.00 sec)
```

Execute `SET RESOURCE GROUP` to set the resource group for the current session to `rg2`, and then view the resource group bound to the current user:

```
SET RESOURCE GROUP `rg2`;
SELECT CURRENT_RESOURCE_GROUP();
```

```
+--------------------------+
| CURRENT_RESOURCE_GROUP() |
+--------------------------+
| rg2                      |
+--------------------------+
1 row in set (0.00 sec)
```

14.13.4.23 Comparisons between Functions and Syntax of Oracle and TiDB

This document describes the comparisons between functions and syntax of Oracle and TiDB. It helps you find the corresponding TiDB functions based on the Oracle functions, and understand the syntax differences between Oracle and TiDB.

> **Note:**
>
> The functions and syntax in this document are based on Oracle 12.2.0.1.0 and TiDB v5.4.0. They might be different in other versions.

14.13.4.23.1 Comparisons of functions

The following table shows the comparisons between some Oracle and TiDB functions.

Function	Oracle syntax	TiDB syntax	Note

| Cast a value as a certain type |

`TO_NUMBER(key)`

`TO_CHAR(key)`

| `CONVERT(key,dataType)` | TiDB supports casting a value as one of the following types: `BINARY`, `CHAR`, `DATE`, `DATETIME`, `TIME`, `SIGNED INTEGER`, `UNSIGNED INTEGER` and `DECIMAL`. |
| Convert a date to a string |

`TO_CHAR(SYSDATE,'yyyy-MM-dd hh24:mi:ss')`

`TO_CHAR(SYSDATE,'yyyy-MM-dd')`

|

`DATE_FORMAT(NOW(),'%Y-%m-%d %H:%i:%s')`

`DATE_FORMAT(NOW(),'%Y-%m-%d')`

| The format string of TiDB is case-sensitive. | | Convert a string to a date |

`TO_DATE('2021-05-28 17:31:37','yyyy-MM-dd hh24:mi:ss')`

`TO_DATE('2021-05-28','yyyy-MM-dd hh24:mi:ss')`

|

`STR_TO_DATE('2021-05-28 17:31:37','%Y-%m-%d %H:%i:%s')`

`STR_TO_DATE('2021-05-28','%Y-%m-%d%T')`

| The format string of TiDB is case-sensitive. | | Get the current system time in second precision | `SYSDATE` | `NOW()` | | | Get the current system time in microsecond precision | `SYSTIMESTAMP` | `CURRENT_TIMESTAMP(6)` | | | Get the number of days between two dates | `date1 - date2` | `DATEDIFF(date1, date2)` | | | Get the number of months between two dates | `MONTHS_BETWEEN(ENDDATE,SYSDATE)` | `TIMESTAMPDIFF(MONTH,SYSDATE,ENDDATE)` | The results of `MONTHS_BETWEEN()` in Oracle and `TIMESTAMPDIFF()` in TiDB are different. `TIMESTAMPDIFF()` returns an integer. Note that the parameters in the two functions are swapped. | | Add `n` days to a date | `DATEVAL + n` | `DATE_ADD(dateVal,INTERVAL n DAY)` | `n` can be a negative value.| | Add `n` months to a date | `ADD_MONTHS(dateVal,n)`| `DATE_ADD` ↪ `(dateVal,INTERVAL n MONTH)` | `n` can be a negative value. | | Get the day of a date | `TRUNC(SYSDATE)` |

`CAST(NOW()AS DATE)`

`DATE_FORMAT(NOW(),'%Y-%m-%d')`

| In TiDB, `CAST` and `DATE_FORMAT` return the same result. | | Get the month of a date | `TRUNC(SYSDATE,'mm')` | `DATE_ADD(CURDATE(),interval - day(CURDATE())+ 1 day)` | | | Truncate a value | `TRUNC(2.136)= 2` `TRUNC(2.136,2)= 2.13` | `TRUNCATE(2.136,0)= 2` ↪ `TRUNCATE(2.136,2)= 2.13` | Data precision is preserved. Truncate the corresponding

decimal places without rounding. | | Get the next value in a sequence | `sequence_name .NEXTVAL` | `NEXTVAL(sequence_name)` | | | Get a random sequence value | `SYS_GUID ()` | `UUID()` | TiDB returns a Universal Unique Identifier (UUID). | | Left join or right join | `SELECT * FROM a, b WHERE a.id = b.id(+);SELECT * FROM a, b WHERE a .id(+)= b.id;` | `SELECT * FROM a LEFT JOIN b ON a.id = b.id;SELECT * FROM a RIGHT JOIN b ON a.id = b.id;` | In a correlated query, TiDB does not support using (+) to left join or right join. You can use `LEFT JOIN` or `RIGHT JOIN` instead. | | `NVL()` | `NVL(key,val)` | `IFNULL(key,val)` | If the value of the field is `NULL`, it returns `val`; otherwise, it returns the value of the field. | | `NVL2()` | `NVL2(key, val1, val2)` | `IF(key is NOT NULL, val1, val2)` | If the value of the field is not `NULL`, it returns `val1`; otherwise, it returns `val2`. | | `DECODE()` |

`DECODE(key,val1,val2,val3)`

`DECODE(value,if1,val1,if2,val2,...,ifn,valn,val)`

|

`IF(key=val1,val2,val3)`

`CASE WHEN value=if1 THEN val1 WHEN value=if2 THEN val2,...,WHEN value= ifn THEN valn ELSE val END`

|

If the value of the field is `val1`, then it returns `val2`; otherwise it returns `val3`.

When the value of the field satisfies condition 1 (`if1`), it returns `val1`. When it satisfies condition 2 (`if2`), it returns `val2`. When it satisfies condition 3 (`if3`), it returns `val3`.

| | Concatenate the string `a` and `b` | 'a' || 'b' | `CONCAT('a','b')` | | | Get the length of a string | `LENGTH(str)` | `CHAR_LENGTH(str)` | | | Get the substring as specified | `SUBSTR(' abcdefg',0,2)= 'ab' SUBSTR('abcdefg',1,2)= 'ab'` | `SUBSTRING('abcdefg',0,2) = ''SUBSTRING('abcdefg',1,2)= 'ab'` |

In Oracle, the starting position 0 has the same effect as 1.

In TiDB, the starting position 0 returns an empty string. If you want to get a substring from the beginning, the starting position should be 1.

| | Get the position of a substring | `INSTR('abcdefg','b',1,1)` | `INSTR('abcdefg ','b')` | Search from the first character of `'abcdefg'` and return the position of the first occurrence of `'b'`. | | Get the position of a substring | `INSTR('stst','s',1,2)` | `LENGTH(SUBSTRING_INDEX('stst','s',2))+ 1` | Search from the first character of `'stst '` and return the position of the second occurrence of `'s'`. | | Get the position of a substring | `INSTR('abcabc','b',2,1)` | `LOCATE('b','abcabc',2)` | Search from the second character of `abcabc` and return the position of the first occurrence of `b`. | | Concatenate values of a column | `LISTAGG(CONCAT(E.dimensionid,'---',E.DIMENSIONNAME),'***')within GROUP(ORDER BY DIMENSIONNAME)` | `GROUP_CONCAT(CONCAT(E.dimensionid,'---',E. DIMENSIONNAME)ORDER BY DIMENSIONNAME SEPARATOR '***')` | Concatenate values of a specified column to one row with the `***` delimiter. | | Convert an ASCII code to a character

| CHR(n) | CHAR(n) | The Tab (CHR(9)), LF (CHR(10)), and CR (CHR(13)) characters in Oracle correspond to CHAR(9), CHAR(10), and CHAR(13) in TiDB. |

14.13.4.23.2 Comparisons of syntax

This section describes some syntax differences between Oracle and TiDB.

String syntax

In Oracle, a string can only be enclosed in single quotes (''). For example 'a'.

In TiDB, a string can be enclosed in single quotes ('') or double quotes (""). For example, 'a' and "a".

Difference between NULL and an empty string

Oracle does not distinguish between NULL and an empty string '', that is, NULL is equivalent to ''.

TiDB distinguishes between NULL and an empty string ''.

Read and write to the same table in an INSERT statement

Oracle supports reading and writing to the same table in an INSERT statement. For example:

```
INSERT INTO table1 VALUES (field1,(SELECT field2 FROM table1 WHERE...))
```

TiDB does not support reading and writing to the same table in a INSERT statement. For example:

```
INSERT INTO table1 VALUES (field1,(SELECT T.fields2 FROM table1 T WHERE...)
    ↪ )
```

Get the first n rows from a query

In Oracle, to get the first n rows from a query, you can use the ROWNUM <= n clause. For example ROWNUM <= 10.

In TiDB, to get the first n rows from a query, you can use the LIMIT n clause. For example LIMIT 10. The Hibernate Query Language (HQL) running SQL statements with LIMIT results in an error. You need to change the Hibernate statements to SQL statements.

Update multiple tables in an UPDATE statement

In Oracle, it is not necessary to list the specific field update relationship when updating multiple tables. For example:

```
UPDATE test1 SET(test1.name,test1.age) = (SELECT test2.name,test2.age FROM
    ↪ test2 WHERE test2.id=test1.id)
```

In TiDB, when updating multiple tables, you need to list all the specific field update relationships in SET. For example:

```
UPDATE test1,test2 SET test1.name=test2.name,test1.age=test2.age WHERE
    ↪ test1.id=test2.id
```

Derived table alias

In Oracle, when querying multiple tables, it is unnecessary to add an alias to the derived table. For example:

```
SELECT * FROM (SELECT * FROM test)
```

In TiDB, when querying multiple tables, every derived table must have its own alias. For example:

```
SELECT * FROM (SELECT * FROM test) t
```

Set operations

In Oracle, to get the rows that are in the first query result but not in the second, you can use the `MINUS` set operation. For example:

```
SELECT * FROM t1 MINUS SELECT * FROM t2
```

TiDB does not support the `MINUS` operation. You can use the `EXCEPT` set operation. For example:

```
SELECT * FROM t1 EXCEPT SELECT * FROM t2
```

Comment syntax

In Oracle, the comment syntax is `--Comment`.

In TiDB, the comment syntax is `-- Comment`. Note that there is a white space after `--` in TiDB.

Pagination

In Oracle, you can use the `OFFSET m ROWS` to skip `m` rows and use the `FETCH NEXT n ROWS ONLY`to fetch `n` rows. For example:

```
SELECT * FROM tables OFFSET 0 ROWS FETCH NEXT 2000 ROWS ONLY
```

In TiDB, you can use the `LIMIT n OFFSET m` to replace `OFFSET m ROWS FETCH NEXT n ROWS ONLY`. For example:

```
SELECT * FROM tables LIMIT 2000 OFFSET 0
```

Sorting order on `NULL` values

In Oracle, `NULL` values are sorted by the `ORDER BY` clause in the following cases:

- In the `ORDER BY column ASC` statement, `NULL` values are returned last.

- In the `ORDER BY column DESC` statement, `NULL` values are returned first.
- In the `ORDER BY column [ASC|DESC] NULLS FIRST` statement, `NULL` values are returned before non-NULL values. Non-NULL values are returned in ascending order or descending order specified in `ASC|DESC`.
- In the `ORDER BY column [ASC|DESC] NULLS LAST` statement, `NULL` values are returned after non-NULL values. Non-NULL values are returned in ascending order or descending order specified in `ASC|DESC`.

In TiDB, `NULL` values are sorted by the `ORDER BY` clause in the following cases:

- In the `ORDER BY column ASC` statement, `NULL` values are returned first.
- In the `ORDER BY column DESC` statement, `NULL` values are returned last.

The following table shows some examples of equivalent `ORDER BY` statements in Oracle and TiDB:

`ORDER BY` in Oracle	Equivalent statements in TiDB
`SELECT * FROM t1 ORDER BY name NULLS FIRST;`	`SELECT * FROM t1 ORDER BY name;`
`SELECT * FROM t1 ORDER BY name DESC NULLS LAST ;`	`SELECT * FROM t1 ORDER BY name DESC;`
`SELECT * FROM t1 ORDER BY name DESC NULLS FIRST;`	`SELECT * FROM t1 ORDER BY ISNULL(name) DESC, name DESC;`
`SELECT * FROM t1 ORDER BY name ASC NULLS LAST;`	`SELECT * FROM t1 ORDER BY ISNULL(name), name;`

14.13.5 Clustered Indexes

TiDB supports the clustered index feature since v5.0. This feature controls how data is stored in tables containing primary keys. It provides TiDB the ability to organize tables in a way that can improve the performance of certain queries.

The term *clustered* in this context refers to the *organization of how data is stored* and

not *a group of database servers working together*. Some database management systems refer to clustered indexes as *index-organized tables* (IOT).

Currently, tables containing primary keys in TiDB are divided into the following two categories:

- `NONCLUSTERED`: The primary key of the table is non-clustered index. In tables with non-clustered indexes, the keys for row data consist of internal `_tidb_rowid` implicitly assigned by TiDB. Because primary keys are essentially unique indexes, tables with non-clustered indexes need at least two key-value pairs to store a row, which are:
    - `_tidb_rowid` (key) - row data (value)
    - Primary key data (key) - `_tidb_rowid` (value)
- `CLUSTERED`: The primary key of the table is clustered index. In tables with clustered indexes, the keys for row data consist of primary key data given by the user. Therefore, tables with clustered indexes need only one key-value pair to store a row, which is:
    - Primary key data (key) - row data (value)

> **Note:**
>
> TiDB supports clustering only by a table's `PRIMARY KEY`. With clustered indexes enabled, the terms *the* `PRIMARY KEY` and *the clustered index* might be used interchangeably. `PRIMARY KEY` refers to the constraint (a logical property), and clustered index describes the physical implementation of how the data is stored.

14.13.5.1 User scenarios

Compared to tables with non-clustered indexes, tables with clustered indexes offer greater performance and throughput advantages in the following scenarios:

- When data is inserted, the clustered index reduces one write of the index data from the network.
- When a query with an equivalent condition only involves the primary key, the clustered index reduces one read of index data from the network.
- When a query with a range condition only involves the primary key, the clustered index reduces multiple reads of index data from the network.
- When a query with an equivalent or range condition only involves the primary key prefix, the clustered index reduces multiple reads of index data from the network.

On the other hand, tables with clustered indexes have certain disadvantages. See the following:

- There might be write hotspot issues when inserting a large number of primary keys with close values.
- The table data takes up more storage space if the data type of the primary key is larger than 64 bits, especially when there are multiple secondary indexes.

14.13.5.2 Usages

14.13.5.3 Create a table with clustered indexes

Since TiDB v5.0, you can add non-reserved keywords `CLUSTERED` or `NONCLUSTERED` after `PRIMARY KEY` in a `CREATE TABLE` statement to specify whether the table's primary key is a clustered index. For example:

```
CREATE TABLE t (a BIGINT PRIMARY KEY CLUSTERED, b VARCHAR(255));
CREATE TABLE t (a BIGINT PRIMARY KEY NONCLUSTERED, b VARCHAR(255));
CREATE TABLE t (a BIGINT KEY CLUSTERED, b VARCHAR(255));
CREATE TABLE t (a BIGINT KEY NONCLUSTERED, b VARCHAR(255));
CREATE TABLE t (a BIGINT, b VARCHAR(255), PRIMARY KEY(a, b) CLUSTERED);
CREATE TABLE t (a BIGINT, b VARCHAR(255), PRIMARY KEY(a, b) NONCLUSTERED);
```

Note that keywords `KEY` and `PRIMARY KEY` have the same meaning in the column definition.

You can also use the comment syntax in TiDB to specify the type of the primary key. For example:

```
CREATE TABLE t (a BIGINT PRIMARY KEY /*T![clustered_index] CLUSTERED */, b
    ↪  VARCHAR(255));
CREATE TABLE t (a BIGINT PRIMARY KEY /*T![clustered_index] NONCLUSTERED */
    ↪ , b VARCHAR(255));
CREATE TABLE t (a BIGINT, b VARCHAR(255), PRIMARY KEY(a, b) /*T![clustered_
    ↪ index] CLUSTERED */);
CREATE TABLE t (a BIGINT, b VARCHAR(255), PRIMARY KEY(a, b) /*T![clustered_
    ↪ index] NONCLUSTERED */);
```

For statements that do not explicitly specify the keyword `CLUSTERED`/`NONCLUSTERED`, the default behavior is controlled by the system variable `@@global.tidb_enable_clustered_index`. Supported values for this variable are as follows:

- `OFF` indicates that primary keys are created as non-clustered indexes by default.
- `ON` indicates that primary keys are created as clustered indexes by default.
- `INT_ONLY` indicates that the behavior is controlled by the configuration item `alter-primary-key`. If `alter-primary-key` is set to `true`, primary keys are created as non-clustered indexes by default. If it is set to `false`, only the primary keys which consist of an integer column are created as clustered indexes.

The default value of `@@global.tidb_enable_clustered_index` is `ON`.

14.13.5.3.1 Add or drop clustered indexes

TiDB does not support adding or dropping clustered indexes after tables are created. Nor does it support the mutual conversion between clustered indexes and non-clustered indexes. For example:

```
ALTER TABLE t ADD PRIMARY KEY(b, a) CLUSTERED; -- Currently not supported.
ALTER TABLE t DROP PRIMARY KEY; -- If the primary key is a clustered index
    ↪ , then not supported.
ALTER TABLE t DROP INDEX `PRIMARY`; -- If the primary key is a clustered
    ↪ index, then not supported.
```

14.13.5.3.2 Add or drop non-clustered indexes

TiDB supports adding or dropping non-clustered indexes after tables are created. You can explicitly specify the keyword `NONCLUSTERED` or omit it. For example:

```
ALTER TABLE t ADD PRIMARY KEY(b, a) NONCLUSTERED;
ALTER TABLE t ADD PRIMARY KEY(b, a); -- If you omit the keyword, the
    ↪ primary key is a non-clustered index by default.
ALTER TABLE t DROP PRIMARY KEY;
ALTER TABLE t DROP INDEX `PRIMARY`;
```

14.13.5.3.3 Check whether the primary key is a clustered index

You can check whether the primary key of a table is a clustered index using one of the following methods:

- Execute the command `SHOW CREATE TABLE`.
- Execute the command `SHOW INDEX FROM`.
- Query the `TIDB_PK_TYPE` column in the system table `information_schema.tables`.

By running the command `SHOW CREATE TABLE`, you can see whether the attribute of `PRIMARY KEY` is `CLUSTERED` or `NONCLUSTERED`. For example:

```
mysql> SHOW CREATE TABLE t;
+--
    ↪ -----+-------------------------------------------------------------------
    ↪
| Table | Create Table
    ↪
    ↪ |
+--
    ↪ -----+-------------------------------------------------------------------
    ↪
| t     | CREATE TABLE `t` (
```

```
  `a` bigint(20) NOT NULL,
  `b` varchar(255) DEFAULT NULL,
  PRIMARY KEY (`a`) /*T![clustered_index] CLUSTERED */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin |
+--
   ↪ -----+-----------------------------------------------------------------------
   ↪
1 row in set (0.01 sec)
```

By running the command `SHOW INDEX FROM`, you can check whether the result in the column `Clustered` shows `YES` or `NO`. For example:

```
mysql> SHOW INDEX FROM t;
+--
   ↪ -----+-----------+---------+-------------+-------------+-----------+---------
   ↪
| Table | Non_unique | Key_name | Seq_in_index | Column_name | Collation |
   ↪ Cardinality | Sub_part | Packed | Null | Index_type | Comment | Index
   ↪ _comment | Visible | Expression | Clustered |
+--
   ↪ -----+-----------+---------+-------------+-------------+-----------+---------
   ↪
| t     |          0 | PRIMARY |           1 | a           | A         |           0
   ↪  |     NULL | NULL |      | BTREE     |         |               | YES     |
   ↪ NULL       | YES      |
+--
   ↪ -----+-----------+---------+-------------+-------------+-----------+---------
   ↪
1 row in set (0.01 sec)
```

You can also query the column `TIDB_PK_TYPE` in the system table `information_schema` ↪ `.tables` to see whether the result is `CLUSTERED` or `NONCLUSTERED`. For example:

```
mysql> SELECT TIDB_PK_TYPE FROM information_schema.tables WHERE table_
   ↪ schema = 'test' AND table_name = 't';
+--------------+
| TIDB_PK_TYPE |
+--------------+
| CLUSTERED    |
+--------------+
1 row in set (0.03 sec)
```

14.13.5.4 Limitations

Currently, there are several different types of limitations for the clustered index feature. See the following:

- Situations that are not supported and not in the support plan:
    - Using clustered indexes together with the attribute `SHARD_ROW_ID_BITS` is not supported. Also, the attribute `PRE_SPLIT_REGIONS` does not take effect on tables with clustered indexes.
    - Downgrading tables with clustered indexes is not supported. If you need to downgrade such tables, use logical backup tools to migrate data instead.
- Situations that are not supported yet but in the support plan:
    - Adding, dropping, and altering clustered indexes using `ALTER TABLE` statements are not supported.
- Limitations for specific versions:
    - In v5.0, using the clustered index feature together with TiDB Binlog is not supported. After TiDB Binlog is enabled, TiDB only allows creating a single integer column as the clustered index of a primary key. TiDB Binlog does not replicate data changes (such as insertion, deletion, and update) on existing tables with clustered indexes to the downstream. If you need to replicate tables with clustered indexes to the downstream, upgrade your cluster to v5.1 or use TiCDC for replication instead.

After TiDB Binlog is enabled, if the clustered index you create is not a single integer primary key, TiDB returns the following error:

```
mysql> CREATE TABLE t (a VARCHAR(255) PRIMARY KEY CLUSTERED);
ERROR 8200 (HY000): Cannot create clustered index table when the binlog is
    ↪ ON
```

If you use clustered indexes together with the attribute `SHARD_ROW_ID_BITS`, TiDB reports the following error:

```
mysql> CREATE TABLE t (a VARCHAR(255) PRIMARY KEY CLUSTERED) SHARD_ROW_ID_
    ↪ BITS = 3;
ERROR 8200 (HY000): Unsupported shard_row_id_bits for table with primary
    ↪ key as row id
```

14.13.5.5 Compatibility

14.13.5.5.1 Compatibility with earlier and later TiDB versions

TiDB supports upgrading tables with clustered indexes but not downgrading such tables, which means that data in tables with clustered indexes on a later TiDB version is not available on an earlier one.

The clustered index feature is partially supported in TiDB v3.0 and v4.0. It is enabled by default when the following requirements are fully met:

- The table contains a `PRIMARY KEY`.
- The `PRIMARY KEY` consists of only one column.
- The `PRIMARY KEY` is an `INTEGER`.

Since TiDB v5.0, the clustered index feature is fully supported for all types of primary keys, but the default behavior is consistent with TiDB v3.0 and v4.0. To change the default behavior, you can configure the system variable `@@tidb_enable_clustered_index` to `ON` or `OFF`. For more details, see Create a table with clustered indexes.

14.13.5.5.2 Compatibility with MySQL

TiDB specific comment syntax supports wrapping the keywords `CLUSTERED` and `NONCLUSTERED` in a comment. The result of `SHOW CREATE TABLE` also contains TiDB specific SQL comments. MySQL databases and TiDB databases of an earlier version will ignore these comments.

14.13.5.5.3 Compatibility with TiDB migration tools

The clustered index feature is only compatible with the following migration tools in v5.0 and later versions:

- Backup and restore tools: BR, Dumpling, and TiDB Lightning.
- Data migration and replication tools: DM and TiCDC.

However, you cannot convert a table with non-clustered indexes to a table with clustered indexes by backing up and restoring the table using the v5.0 BR tool, and vice versa.

14.13.5.5.4 Compatibility with other TiDB features

For a table with a combined primary key or a single non-integer primary key, if you change the primary key from a non-clustered index to a clustered index, the keys of its row data change as well. Therefore, `SPLIT TABLE BY/BETWEEN` statements that are executable in TiDB versions earlier than v5.0 are no longer workable in v5.0 and later versions of TiDB. If you want to split a table with clustered indexes using `SPLIT TABLE BY/BETWEEN`, you need to provide the value of the primary key column, instead of specifying an integer value. See the following example:

```
mysql> create table t (a int, b varchar(255), primary key(a, b) clustered);
Query OK, 0 rows affected (0.01 sec)
mysql> split table t between (0) and (1000000) regions 5;
ERROR 1105 (HY000): Split table region lower value count should be 2
mysql> split table t by (0), (50000), (100000);
ERROR 1136 (21S01): Column count doesn't match value count at row 0
mysql> split table t between (0, 'aaa') and (1000000, 'zzz') regions 5;
+--------------------+----------------------+
```

```
| TOTAL_SPLIT_REGION | SCATTER_FINISH_RATIO |
+--------------------+----------------------+
|                  4 |                    1 |
+--------------------+----------------------+
1 row in set (0.00 sec)
mysql> split table t by (0, ''), (50000, ''), (100000, '');
+--------------------+----------------------+
| TOTAL_SPLIT_REGION | SCATTER_FINISH_RATIO |
+--------------------+----------------------+
|                  3 |                    1 |
+--------------------+----------------------+
1 row in set (0.01 sec)
```

The attribute AUTO_RANDOM can only be used on clustered indexes. Otherwise, TiDB returns the following error:

```
mysql> create table t (a bigint primary key nonclustered auto_random);
ERROR 8216 (HY000): Invalid auto random: column a is not the integer
    ↪ primary key, or the primary key is nonclustered
```

14.13.6 Constraints

TiDB supports almost the same constraints as MySQL.

14.13.6.1 NOT NULL

NOT NULL constraints supported by TiDB are the same as those supported by MySQL.

For example:

```
CREATE TABLE users (
 id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
 age INT NOT NULL,
 last_login TIMESTAMP
);
```

```
INSERT INTO users (id,age,last_login) VALUES (NULL,123,NOW());
```

```
Query OK, 1 row affected (0.02 sec)
```

```
INSERT INTO users (id,age,last_login) VALUES (NULL,NULL,NOW());
```

```
ERROR 1048 (23000): Column 'age' cannot be null
```

```
INSERT INTO users (id,age,last_login) VALUES (NULL,123,NULL);
```

```
Query OK, 1 row affected (0.03 sec)
```

- The first `INSERT` statement succeeds because it is possible to assign `NULL` to the `AUTO_INCREMENT` column. TiDB generates sequence numbers automatically.
- The second `INSERT` statement fails because the `age` column is defined as `NOT NULL`.
- The third `INSERT` statement succeeds because the `last_login` column is not explicitly defined as `NOT NULL`. NULL values are allowed by default.

14.13.6.2 CHECK

> **Note:**
>
> The `CHECK` constraint feature is disabled by default. To enable it, you need to set the `tidb_enable_check_constraint` variable to `ON`.

A `CHECK` constraint restricts the values of a column in a table to meet your specified conditions. When the `CHECK` constraint is added to a table, TiDB checks whether the constraint is satisfied during the insertion or updates of data into the table. If the constraint is not met, an error is returned.

The syntax for the `CHECK` constraint in TiDB is the same as that in MySQL:

```
[CONSTRAINT [symbol]] CHECK (expr) [[NOT] ENFORCED]
```

Syntax explanation:

- `[]`: the content within `[]` is optional.
- `CONSTRAINT [symbol]`: specifies the name of the `CHECK` constraint.
- `CHECK (expr)`: specifies the constraint condition, where `expr` needs to be a boolean expression. For each row in the table, the calculation result of this expression must be one of `TRUE`, `FALSE`, or `UNKNOWN` (for `NULL` values). If the calculation result is `FALSE` for a row, it indicates that the constraint is violated.
- `[NOT] ENFORCED`: specifies whether to implement the constraint check. You can use it to enable or disable a `CHECK` constraint.

14.13.6.2.1 Add `CHECK` constraints

In TiDB, you can add a `CHECK` constraint to a table using either the `CREATE TABLE` or the `ALTER TABLE` statement.

- Example of adding a `CHECK` constraint using the `CREATE TABLE` statement:

```
CREATE TABLE t(a INT CHECK(a > 10) NOT ENFORCED, b INT, c INT,
    ↪ CONSTRAINT c1 CHECK (b > c));
```

- Example of adding a `CHECK` constraint using the `ALTER TABLE` statement:

```
ALTER TABLE t ADD CONSTRAINT CHECK (1 < c);
```

When adding or enabling a `CHECK` constraint, TiDB checks the existing data in the table. If any data violates the constraint, the operation of adding the `CHECK` constraint will fail and return an error.

When adding a `CHECK` constraint, you can either specify a constraint name or leave the name unspecified. If no constraint name is specified, TiDB automatically generates a constraint name in the `<tableName>_chk_<1, 2, 3...>` format.

14.13.6.2.2 View `CHECK` constraints

You can view the constraint information in a table using the `SHOW CREATE TABLE` statement. For example:

```
SHOW CREATE TABLE t;
+--
    ↪ -----+-----------------------------------------------------------------------
    ↪
| Table | Create Table
    ↪
    ↪ |
+--
    ↪ -----+-----------------------------------------------------------------------
    ↪
| t     | CREATE TABLE `t` (
  `a` int(11) DEFAULT NULL,
  `b` int(11) DEFAULT NULL,
  `c` int(11) DEFAULT NULL,
CONSTRAINT `c1` CHECK ((`b` > `c`)),
CONSTRAINT `t_chk_1` CHECK ((`a` > 10)) /*!80016 NOT ENFORCED */,
CONSTRAINT `t_chk_2` CHECK ((1 < `c`))
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin |
+--
    ↪ -----+-----------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

14.13.6.2.3 Delete CHECK constraints

When deleting a CHECK constraint, you need to specify the name of the constraint to be deleted. For example:

```
ALTER TABLE t DROP CONSTRAINT t_chk_1;
```

14.13.6.2.4 Enable or disable CHECK constraints

When adding a CHECK constraint to a table, you can specify whether TiDB needs to implement the constraint check during data insertion or updates.

- If NOT ENFORCED is specified, TiDB does not check the constraint conditions during data insertion or updates.
- If NOT ENFORCED is not specified or ENFORCED is specified, TiDB checks the constraint conditions during data insertion or updates.

In addition to specifying [NOT] ENFORCED when adding the constraint, you can also enable or disable a CHECK constraint using the ALTER TABLE statement. For example:

```
ALTER TABLE t ALTER CONSTRAINT c1 NOT ENFORCED;
```

14.13.6.2.5 MySQL compatibility

- It is not supported to add a CHECK constraint while adding a column (for example, ALTER TABLE t ADD COLUMN a CHECK(a > 0)). In this case, only the column is added successfully, and TiDB ignores the CHECK constraint without reporting any error.
- It is not supported to use ALTER TABLE t CHANGE a b int CHECK(b > 0) to add a CHECK constraint. When this statement is executed, TiDB reports an error.

14.13.6.3 UNIQUE KEY

Unique constraints mean that all non-null values in a unique index and a primary key column are unique.

14.13.6.3.1 Optimistic transactions

By default, for optimistic transactions, TiDB checks unique constraints lazily in the execution phase and strictly in the commit phase, which helps reduce network overhead and improve performance.

For example:

```
DROP TABLE IF EXISTS users;
CREATE TABLE users (
 id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
 username VARCHAR(60) NOT NULL,
 UNIQUE KEY (username)
);
INSERT INTO users (username) VALUES ('dave'), ('sarah'), ('bill');
```

With optimistic locking and `tidb_constraint_check_in_place=OFF`:

```
BEGIN OPTIMISTIC;
INSERT INTO users (username) VALUES ('jane'), ('chris'), ('bill');
```

```
Query OK, 3 rows affected (0.00 sec)
Records: 3 Duplicates: 0 Warnings: 0
```

```
INSERT INTO users (username) VALUES ('steve'),('elizabeth');
```

```
Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0
```

```
COMMIT;
```

```
ERROR 1062 (23000): Duplicate entry 'bill' for key 'users.username'
```

In the preceding optimistic example, the unique check was deferred until the transaction is committed. This resulted in a duplicate key error, because the value `bill` was already present.

You can disable this behavior by setting `tidb_constraint_check_in_place` to `ON`. When `tidb_constraint_check_in_place=ON`, the unique constraint is checked when a statement is executed. Note that this variable is only applicable to optimistic transactions. For pessimistic transactions, you can control this behavior using the `tidb_constraint_check_in_place_pessimistic` variable.

For example:

```
DROP TABLE IF EXISTS users;
CREATE TABLE users (
 id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
 username VARCHAR(60) NOT NULL,
 UNIQUE KEY (username)
);
INSERT INTO users (username) VALUES ('dave'), ('sarah'), ('bill');
```

```
SET tidb_constraint_check_in_place = ON;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
BEGIN OPTIMISTIC;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
INSERT INTO users (username) VALUES ('jane'), ('chris'), ('bill');
```

```
ERROR 1062 (23000): Duplicate entry 'bill' for key 'users.username'
```

The first `INSERT` statement caused a duplicate key error. This causes additional network communication overhead and may reduce the throughput of insert operations.

14.13.6.3.2 Pessimistic transactions

In pessimistic transactions, by default, TiDB checks `UNIQUE` constraints when a SQL statement that requires inserting or updating unique indexes is executed.

```
DROP TABLE IF EXISTS users;
CREATE TABLE users (
 id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
 username VARCHAR(60) NOT NULL,
 UNIQUE KEY (username)
);
INSERT INTO users (username) VALUES ('dave'), ('sarah'), ('bill');

BEGIN PESSIMISTIC;
INSERT INTO users (username) VALUES ('jane'), ('chris'), ('bill');
```

```
ERROR 1062 (23000): Duplicate entry 'bill' for key 'users.username'
```

To achieve better performance of pessimistic transactions, you can set the `tidb_constraint_check_in_place_pessimistic` variable to `OFF`, which allows TiDB to defer the unique constraint check of a unique index (to the next time when this index requires a lock or to the time when the transaction is committed) and skip the corresponding pessimistic lock. When using this variable, pay attention to the following:

- Due to the deferred unique constraint check, TiDB might read results that do not meet the unique constraints and return a `Duplicate entry` error when you commit a pessimistic transaction. When this error occurs, TiDB rolls back the current transaction.

  The following example skips the lock to `bill`, so TiDB might get results that do not satisfy the uniqueness constraints.

```
SET tidb_constraint_check_in_place_pessimistic = OFF;
BEGIN PESSIMISTIC;
INSERT INTO users (username) VALUES ('jane'), ('chris'), ('bill'); --
    ↪ Query OK, 3 rows affected
SELECT * FROM users FOR UPDATE;
```

As in the following example output, the query results of TiDB contain two `bills`, which does not satisfy the uniqueness constraints.

````
```sql
+----+----------+
| id | username |
+----+----------+
| 1  | dave     |
| 2  | sarah    |
| 3  | bill     |
| 7  | jane     |
| 8  | chris    |
| 9  | bill     |
+----+----------+
```

At this time, if the transaction is committed, TiDB will perform a unique
    ↪ constraint check, report a `Duplicate entry` error, and roll back the
    ↪  transaction.

```sql
COMMIT;
```

```
ERROR 1062 (23000): Duplicate entry 'bill' for key 'users.username'
```
````

- When this variable is disabled, committing a pessimistic transaction that needs to write data might return a `Write conflict` error. When this error occurs, TiDB rolls back the current transaction.

  As in the following example, if two concurrent transactions need to insert data to the same table, skipping the pessimistic lock causes TiDB to return a `Write conflict` error when you commit a transaction. And the transaction will be rolled back.

```
DROP TABLE IF EXISTS users;
CREATE TABLE users (
```

```
id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
username VARCHAR(60) NOT NULL,
UNIQUE KEY (username)
);

SET tidb_constraint_check_in_place_pessimistic = OFF;
BEGIN PESSIMISTIC;
INSERT INTO users (username) VALUES ('jane'), ('chris'), ('bill'); --
    ↪ Query OK, 3 rows affected
```

At the same time, another session inserts `bill` to the same table.

```
INSERT INTO users (username) VALUES ('bill'); -- Query OK, 1 row
    ↪ affected
```

Then, when you commit the transaction in the first session, TiDB reports a `Write conflict` error.

```
COMMIT;
```

```
ERROR 9007 (HY000): Write conflict, txnStartTS=435688780611190794,
    ↪ conflictStartTS=435688783311536129, conflictCommitTS
    ↪ =435688783311536130, key={tableID=74, indexID=1, indexValues={
    ↪ bill, }} primary={tableID=74, indexID=1, indexValues={bill, }},
    ↪ reason=LazyUniquenessCheck [try again later]
```

- When this variable is disabled, if there is a write conflict among multiple pessimistic transactions, the pessimistic lock might be forced to roll back when other pessimistic transactions are committed, thus resulting in a `Pessimistic lock not found` error. When this error occurs, it means that deferring the unique constraint check of the pessimistic transaction is not suitable for your application scenario. In this case, consider adjusting the application logic to avoid the conflict or retrying the transaction after an error occurs.
- When this variable is disabled, executing a DML statement in a pessimistic transaction might return an error `8147: LazyUniquenessCheckFailure`.

> **Note:**
>
> When the `8147` error occurs, TiDB rolls back the current transaction.

As in the following example, at the execution of the `INSERT` statement, TiDB skips a lock. Then, at the execution of the `DELETE` statement, TiDB locks the unique index and checks the unique constraints, so you will see an error is reported at the `DELETE` statement.

```
SET tidb_constraint_check_in_place_pessimistic = OFF;
BEGIN PESSIMISTIC;
INSERT INTO users (username) VALUES ('jane'), ('chris'), ('bill'); --
    ↪ Query OK, 3 rows affected
DELETE FROM users where username = 'bill';
```

```
ERROR 8147 (23000): transaction aborted because lazy uniqueness check
    ↪ is enabled and an error occurred: [kv:1062]Duplicate entry 'bill'
    ↪  for key 'users.username'
```

- When this variable is disabled, the `1062 Duplicate entry` error might be not from the current SQL statement. Therefore, when a transaction operates on multiple tables that have indexes with the same name, you need to check the `1062` error message to find which index the error is actually from.

14.13.6.4 PRIMARY KEY

Like MySQL, primary key constraints contain unique constraints, that is, creating a primary key constraint is equivalent to having a unique constraint. In addition, other primary key constraints of TiDB are also similar to those of MySQL.

For example:

```
CREATE TABLE t1 (a INT NOT NULL PRIMARY KEY);
```

```
Query OK, 0 rows affected (0.12 sec)
```

```
CREATE TABLE t2 (a INT NULL PRIMARY KEY);
```

```
ERROR 1171 (42000): All parts of a PRIMARY KEY must be NOT NULL; if you need
    ↪  NULL in a key, use UNIQUE instead
```

```
CREATE TABLE t3 (a INT NOT NULL PRIMARY KEY, b INT NOT NULL PRIMARY KEY);
```

```
ERROR 1068 (42000): Multiple primary key defined
```

```
CREATE TABLE t4 (a INT NOT NULL, b INT NOT NULL, PRIMARY KEY (a,b));
```

```
Query OK, 0 rows affected (0.10 sec)
```

- Table `t2` failed to be created, because column `a` is defined as the primary key and does not allow NULL values.
- Table `t3` failed to be created, because a table can only have one primary key.

- Table `t4` was created successfully, because even though there can be only one primary key, TiDB supports defining multiple columns as the composite primary key.

In addition to the rules above, TiDB currently only supports adding and deleting the primary keys of the `NONCLUSTERED` type. For example:

```
CREATE TABLE t5 (a INT NOT NULL, b INT NOT NULL, PRIMARY KEY (a,b)
    ↪ CLUSTERED);
ALTER TABLE t5 DROP PRIMARY KEY;
```

```
ERROR 8200 (HY000): Unsupported drop primary key when the table is using
    ↪ clustered index
```

```
CREATE TABLE t5 (a INT NOT NULL, b INT NOT NULL, PRIMARY KEY (a,b)
    ↪ NONCLUSTERED);
ALTER TABLE t5 DROP PRIMARY KEY;
```

```
Query OK, 0 rows affected (0.10 sec)
```

For more details about the primary key of the `CLUSTERED` type, refer to clustered index.

14.13.6.5 FOREIGN KEY

> **Note:**
>
> Starting from v6.6.0, TiDB supports the FOREIGN KEY constraints as an experimental feature. Before v6.6.0, TiDB supports creating and deleting foreign key constraints, but the constraints are not actually effective. After upgrading TiDB to v6.6.0, you can delete the invalid foreign key and create a new one to make the foreign key constraints effective.

TiDB supports creating `FOREIGN KEY` constraints in DDL commands.

For example:

```
CREATE TABLE users (
 id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
 doc JSON
);
CREATE TABLE orders (
 id INT NOT NULL PRIMARY KEY AUTO_INCREMENT,
 user_id INT NOT NULL,
 doc JSON,
```

```
 FOREIGN KEY fk_user_id (user_id) REFERENCES users(id)
);
```

```
SELECT table_name, column_name, constraint_name, referenced_table_name,
    ↪ referenced_column_name
FROM information_schema.key_column_usage WHERE table_name IN ('users', '
    ↪ orders');
```

```
+------------+-------------+-----------------+-----------------------+-----------------
    ↪
| table_name | column_name | constraint_name | referenced_table_name |
    ↪ referenced_column_name |
+------------+-------------+-----------------+-----------------------+-----------------
    ↪
| users      | id          | PRIMARY         | NULL                  | NULL
    ↪                  |
| orders     | id          | PRIMARY         | NULL                  | NULL
    ↪                  |
| orders     | user_id     | fk_user_id      | users                 | id
    ↪                   |
+------------+-------------+-----------------+-----------------------+-----------------
    ↪
3 rows in set (0.00 sec)
```

TiDB also supports the syntax to `DROP FOREIGN KEY` and `ADD FOREIGN KEY` via the `ALTER TABLE` command.

```
ALTER TABLE orders DROP FOREIGN KEY fk_user_id;
ALTER TABLE orders ADD FOREIGN KEY fk_user_id (user_id) REFERENCES users(id
    ↪ );
```

14.13.7 Generated Columns

This document introduces the concept and usage of generated columns.

14.13.7.1 Basic concepts

Unlike general columns, the value of the generated column is calculated by the expression in the column definition. When inserting or updating a generated column, you cannot assign a value, but only use `DEFAULT`.

There are two kinds of generated columns: virtual and stored. A virtual generated column occupies no storage and is computed when it is read. A stored generated column is computed when it is written (inserted or updated) and occupies storage. Compared with

the virtual generated columns, the stored generated columns have better read performance, but take up more disk space.

You can create an index on a generated column whether it is virtual or stored.

14.13.7.2 Usage

One of the main usage of generated columns is to extract data from the JSON data type and indexing the data.

In both MySQL 8.0 and TiDB, columns of type JSON cannot be indexed directly. That is, the following table schema is **not supported**:

```
CREATE TABLE person (
    id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
    name VARCHAR(255) NOT NULL,
    address_info JSON,
    KEY (address_info)
);
```

To index a JSON column, you must extract it as a generated column first.

Using the `city` field in `address_info` as an example, you can create a virtual generated column and add an index for it:

```
CREATE TABLE person (
    id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
    name VARCHAR(255) NOT NULL,
    address_info JSON,
    city VARCHAR(64) AS (JSON_UNQUOTE(JSON_EXTRACT(address_info, '$.city')))
        ↪ , -- virtual generated column
    -- city VARCHAR(64) AS (JSON_UNQUOTE(JSON_EXTRACT(address_info, '$.city
        ↪ ')))  VIRTUAL, -- virtual generated column
    -- city VARCHAR(64) AS (JSON_UNQUOTE(JSON_EXTRACT(address_info, '$.city
        ↪ ')))  STORED, -- stored generated column
    KEY (city)
);
```

In this table, the `city` column is a **virtual generated column** and has an index. The following query can use the index to speed up the execution:

```
SELECT name, id FROM person WHERE city = 'Beijing';
```

```
EXPLAIN SELECT name, id FROM person WHERE city = 'Beijing';
```

```
+--
    ↪ ------------------------------+---------+-----------+-----------------------
    ↪
```

```
| id                           | estRows | task    | access object
   ↪               | operator info                                          |
+--
   ↪ ------------------------------+---------+-----------+--------------------------
   ↪
| Projection_4                 | 10.00   | root      |
   ↪                              | test.person.name, test.person.id
   ↪                        |
|  ─IndexLookUp_10             | 10.00   | root      |
   ↪                              |
   ↪                                                        |
|    ─IndexRangeScan_8(Build)  | 10.00   | cop[tikv] | table:person, index:
   ↪ city(city) | range:["Beijing","Beijing"], keep order:false, stats:
   ↪ pseudo |
|    ─TableRowIDScan_9(Probe)  | 10.00   | cop[tikv] | table:person
   ↪               | keep order:false, stats:pseudo                        |
+--
   ↪ ------------------------------+---------+-----------+--------------------------
   ↪
```

From the query execution plan, it can be seen that the `city` index is used to read the `HANDLE` of the row that meets the condition `city ='Beijing'`, and then it uses this `HANDLE` to read the data of the row.

If no data exists at path `$.city`, `JSON_EXTRACT` returns `NULL`. If you want to enforce a constraint that `city` must be `NOT NULL`, you can define the virtual generated column as follows:

```
CREATE TABLE person (
    id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
    name VARCHAR(255) NOT NULL,
    address_info JSON,
    city VARCHAR(64) AS (JSON_UNQUOTE(JSON_EXTRACT(address_info, '$.city')))
       ↪  NOT NULL,
    KEY (city)
);
```

14.13.7.3 Validation of generated columns

Both `INSERT` and `UPDATE` statements check virtual column definitions. Rows that do not pass validation return errors:

```
mysql> INSERT INTO person (name, address_info) VALUES ('Morgan', JSON_
   ↪ OBJECT('Country', 'Canada'));
ERROR 1048 (23000): Column 'city' cannot be null
```

14.13.7.4 Generated columns index replacement rule

When an expression in a query is strictly equivalent to a generated column with an index, TiDB replaces the expression with the corresponding generated column, so that the optimizer can take that index into account during execution plan construction.

The following example creates a generated column for the expression `a+1` and adds an index. The column type of `a` is int and the column type of `a+1` is bigint. If the type of the generated column is set to int, the replacement will not occur. For type conversion rules, see Type Conversion of Expression Evaluation.

```
create table t(a int);
desc select a+1 from t where a+1=3;
```

```
+--
   ↪ ------------------------+---------+----------+--------------+--------------
   ↪
| id                        | estRows | task     | access object | operator info
   ↪             |
+--
   ↪ ------------------------+---------+----------+--------------+--------------
   ↪
| Projection_4              | 8000.00 | root     |               | plus(test.t.a,
   ↪ 1)->Column#3 |
| └─TableReader_7           | 8000.00 | root     |               | data:Selection
   ↪ _6           |
|   └─Selection_6           | 8000.00 | cop[tikv] |              | eq(plus(test.t
   ↪ .a, 1), 3)   |
|     └─TableFullScan_5     | 10000.00 | cop[tikv] | table:t      | keep order:
   ↪ false, stats:pseudo |
+--
   ↪ ------------------------+---------+----------+--------------+--------------
   ↪
4 rows in set (0.00 sec)
```

```
alter table t add column b bigint as (a+1) virtual;
alter table t add index idx_b(b);
desc select a+1 from t where a+1=3;
```

```
+--
   ↪ ---------------------+---------+----------+-------------------------+---------
   ↪
| id                     | estRows | task     | access object           | operator
   ↪ info                          |
+--
   ↪ ---------------------+---------+----------+-------------------------+---------
   ↪
```

```
| IndexReader_6       | 10.00  | root     |                          | index:
    ↪ IndexRangeScan_5                 |
|  ─IndexRangeScan_5  | 10.00  | cop[tikv] | table:t, index:idx_b(b) |
    ↪ range:[3,3], keep order:false, stats:pseudo |
+--
    ↪ ---------------------+---------+----------+-------------------------+---------
    ↪
2 rows in set (0.01 sec)
```

> **Note:**
>
> If the expression to be replaced and the generated column are both the string type but with different lengths, you can still replace the expression by setting the system variable `tidb_enable_unsafe_substitute` to `ON`. When configuring this system variable, ensure that the value calculated by the generated column strictly satisfies the definition of the generated column. Otherwise, the data might be truncated due to the difference in length, resulting in an incorrect result. See GitHub issue #35490.

14.13.7.5 Limitations

The current limitations of JSON and generated columns are as follows:

- You cannot add a stored generated column through `ALTER TABLE`.
- You can neither convert a stored generated column to a normal column through the `ALTER TABLE` statement nor convert a normal column to a stored generated column.
- You cannot modify the expression of a stored generated column through the `ALTER TABLE` statement.
- Not all JSON functions are supported;
- Currently, the generated column index replacement rule is valid only when the generated column is a virtual generated column. It is not valid on the stored generated column, but the index can still be used by directly using the generated column itself.

— title: SQL Mode summary: Learn SQL mode. —

14.13.8 SQL Mode

TiDB servers operate in different SQL modes and apply these modes differently for different clients. SQL mode defines the SQL syntaxes that TiDB supports and the type of data validation check to perform, as described below:

After TiDB is started, you can use the `SET [ SESSION | GLOBAL ] sql_mode='modes'` statement to set SQL mode.

- Ensure that you have `SUPER` privilege when setting SQL mode at `GLOBAL` level, and your setting at this level only affects the connections established afterwards.
- Changes to SQL mode at `SESSION` level only affect the current client.

In this statement, `modes` is a set of modes separated by commas (','). You can use the `SELECT @@sql_mode` statement to check the current SQL mode. The default value of SQL mode: `ONLY_FULL_GROUP_BY, STRICT_TRANS_TABLES, NO_ZERO_IN_DATE, NO_ZERO_DATE, ERROR_FOR_DIVISION_BY_ZERO, NO_AUTO_CREATE_USER, NO_ENGINE_SUBSTITUTION`.

14.13.8.1 Important `sql_mode` values

- `ANSI`: This mode complies with standard SQL. In this mode, data is checked. If data does not comply with the defined type or length, the data type is adjusted or trimmed and a `warning` is returned.
- `STRICT_TRANS_TABLES`: Strict mode, where data is strictly checked. If any data is incorrect, it cannot be inserted into a table and an error is returned.
- `TRADITIONAL`: In this mode, TiDB behaves like a "traditional" SQL database system. An error instead of a warning is returned when any incorrect value is inserted into a column. Then, the `INSERT` or `UPDATE` statement is immediately stopped.

14.13.8.2 SQL mode table

Name	Description
`PIPES_AS_CONCAT`	Treats “||” as a string concatenation operator (`+`) (the same as `CONCAT()`), not as an `OR` (full support)

Name	Description
`ANSI_QUOTES`	Treats `"` as an identifier. If `ANSI_QUOTES` is enabled, only single quotes are treated as string literals, and double quotes are treated as identifiers. Therefore, double quotes cannot be used to quote strings. (full support)

Name	Description
`IGNORE_SPACE`	If this mode is enabled, the system ignores space. For example: “user” and “user” are the same. (full support)

Name	Description
`ONLY_FULL_GROUP_BY`	A SQL statement is invalid if it refers to a column in `SELECT`, `HAVING`, or `ORDER BY` that is neither aggregated nor included in the `GROUP BY` clause. This is because displaying such a column in

Name	Description
NO_ ↪ UNSIGNED ↪ _ ↪ SUBTRACTION ↪	Does not mark the result as UNSIGNED ↪ if an operand has no symbol in subtraction. (full support)

Name	Description
`NO_DIR_IN_CREATE`	Ignores all `INDEX DIRECTORY` and `DATA DIRECTORY` directives when a table is created. This option is only useful for secondary replication servers (syntax support only)

Name	Description
NO_KEY_OPTIONS	When you use the SHOW CREATE TABLE statement, MySQL-specific syntaxes such as ENGINE are not exported. Consider this option when migrating across DB types using mysqldump. (syntax support only)

Name	Description
`NO_FIELD_OPTIONS`	When you use the `SHOW CREATE TABLE` statement, MySQL-specific syntaxes such as `ENGINE` are not exported. Consider this option when migrating across DB types using mysqldump. (syntax support only)

Name	Description
`NO_TABLE_OPTIONS`	When you use the `SHOW CREATE TABLE` statement, MySQL-specific syntaxes such as `ENGINE` are not exported. Consider this option when migrating across DB types using mysqldump. (syntax support only)

Name	Description
NO_ ↪ AUTO ↪ _ ↪ VALUE ↪ _ ↪ ON ↪ _ ↪ ZERO ↪	If this mode is enabled, when the value passed in the AUTO ↪ _ ↪ INCREMENT ↪ column is 0 or a specific value, the system directly writes this value to this column. When NULL is passed, the system automatically generates the

Name	Description
NO_ ↪ BACKSLASH ↪ _ ↪ ESCAPES ↪	If this mode is enabled, the \ backslash symbol only stands for itself. (full support)

Name	Description
`STRICT_TRANS_TABLES`	Enables the strict mode for the transaction storage engine and rolls back the entire statement after an illegal value is inserted. (full support)

Name	Description
`STRICT` ↪ `_` ↪ `ALL` ↪ `_` ↪ `TABLES` ↪	For transactional tables, rolls back the entire transaction statement after an illegal value is inserted. (full support)

Name	Description
`NO_ZERO_IN_DATE`	Strict mode, where dates with a month or day part of `0` are not accepted. If you use the `IGNORE` option, TiDB inserts '0000-00-00' for a similar date. In non-strict mode, this date is accepted but a warning is returned. (full sup-

Name	Description
`NO_ZERO_DATE`	Does not use '0000-00-00' as a legal date in strict mode. You can still insert a zero date with the `IGNORE` option. In non-strict mode, this date is accepted but a warning is returned. (full support)

Name	Description
`ALLOW_INVALID_DATES`	In this mode, the system does not check the validity of all dates. It only checks the month value ranging from `1` to `12` and the date value ranging from `1` to `31`. The mode only applies to `DATE` and `DATATIME` columns. All `TIMESTAMP`

Name	Description
`ERROR_FOR_DIVISION_BY_ZERO`	If this mode is enabled, the system returns an error when handling division by `0` in data-change operations (`INSERT` or `UPDATE`). If this mode is not enabled, the system returns a warning and `NULL` is used

Name	Description
NO_ ↪ AUTO ↪ _ ↪ CREATE ↪ _ ↪ USER ↪	Prevents GRANT ↪ ↪ from automatically creating new users, except for the specified password (full support)

Name	Description
`HIGH_NOT_PRECEDENCE`	The precedence of the NOT operator is such that expressions such as `NOT a BETWEEN b AND c` are parsed as `NOT ( a BETWEEN b AND c )`. In some older versions of MySQL,

Name	Description
NO_ ↪ ENGINE ↪ _ ↪ SUBSTITUTION ↪	Prevents the automatic replacement of storage engines if the required storage engine is disabled or not compiled. (syntax support only)

Name	Description
`PAD_` ↪ `CHAR` ↪ `_` ↪ `TO` ↪ `_` ↪ `FULL` ↪ `_` ↪ `LENGTH` ↪	If this mode is enabled, the system does not trim the trailing spaces for `CHAR` types. (syntax support only. This mode has been deprecated in MySQL 8.0.)

Name	Description
`REAL` ↪ `_` ↪ `AS` ↪ `_` ↪ `FLOAT` ↪	Treats `REAL` as the synonym of `FLOAT` ↪ , not the synonym of `DOUBLE` ↪ (full support)

Name	Description
POSTGRESQL ↪	Equivalent to PIPES ↪ _ ↪ AS ↪ _ ↪ CONCAT ↪ , ANSI ↪ _ ↪ QUOTES ↪ , IGNORE ↪ _ ↪ SPACE ↪ , NO_ ↪ KEY ↪ _ ↪ OPTIONS ↪ , NO_ ↪ TABLE ↪ _ ↪ OPTIONS ↪ , NO_ ↪ FIELD ↪ _ ↪ OPTIONS ↪ (syntax support only)

Name	Description

14.13.9 Table Attributes

The Table Attributes feature is introduced in TiDB v5.3.0. Using this feature, you can add specific attributes to a table or partition to perform the operations corresponding to the attributes. For example, you can use table attributes to control the Region merge behavior.

Currently, TiDB only supports adding the `merge_option` attribute to a table or partition to control the Region merge behavior. The `merge_option` attribute is only part of how to deal with hotspots. For more information, refer to Troubleshoot Hotspot Issues.

> **Note:**
>
> - When you use TiDB Binlog or TiCDC to perform replication or use BR to perform incremental backup, the replication or backup operations skip the DDL statement that sets table attributes. To use table attributes in the downstream or in the backup cluster, you need to manually execute the DDL statement in the downstream or in the backup cluster.

14.13.9.1 Usage

The table attribute is in the form of `key=value`. Multiple attributes are separated by commas. In the following examples, `t` is the name of the table to be modified, `p` is the name of the partition to be modified. Items in `[]` are optional.

- Set attributes for a table or partition:

```
ALTER TABLE t [PARTITION p] ATTRIBUTES [=] 'key=value[, key1=value1...]
    ↪ ';
```

- Reset attributes for a table or partition:

```
ALTER TABLE t [PARTITION p] ATTRIBUTES [=] DEFAULT;
```

- See the attributes of all tables and partitions:

```
SELECT * FROM information_schema.attributes;
```

- See the attribute configured to a table or partition:

```
SELECT * FROM information_schema.attributes WHERE id='schema/t[/p]';
```

- See all tables and partitions that have a specific attribute:

```
SELECT * FROM information_schema.attributes WHERE attributes LIKE '%
    ↪ key%';
```

14.13.9.2 Attribute override rules

The attribute configured to a table takes effect on all partitions of the table. However, there is one exception: If the table and partition are configured with the same attribute but different attribute values, the partition attribute overrides the table attribute. For example, suppose that the table `t` is configured with the `key=value` attribute, and the partition `p` is configured with `key=value1`.

```
ALTER TABLE t ATTRIBUTES[=]'key=value';
ALTER TABLE t PARTITION p ATTRIBUTES[=]'key=value1';
```

In this case, `key=value1` is the attribute that actually takes effect on the `p1` partition.

14.13.9.3 Control the Region merge behavior using table attributes

14.13.9.3.1 User scenarios

If there is a write hotspot or read hotspot, you can use table attributes to control the Region merge behavior. You can first add the `merge_option` attribute to a table or partition and then set its value to `deny`. The two scenarios are as follows.

Write hotspot on a newly created table or partition

If a hotspot issue occurs when data is written to a newly created table or partition, you usually need to split and scatter Regions. However, if there is a certain time interval between the split/scatter operation and writes, these operations do not truly avoid the write hotspot. This is because the split operation performed when the table or partition is created produces empty Regions, so if the time interval exists, the split Regions might be merged. To handle this case, you can add the `merge_option` attribute to the table or partition and set the attribute value to `deny`.

Periodic read hotspot in read-only scenarios

Suppose that in a read-only scenario, you try to reduce the periodic read hotspot that occurs on a table or partition by manually splitting Regions, and you do not want the manually split Regions to be merged after the hotspot issue is resolved. In this case, you can add the `merge_option` attribute to the table or partition and set its value to `deny`.

14.13.9.3.2 Usage

- Prevent the Regions of a table from merging:

```
ALTER TABLE t ATTRIBUTES 'merge_option=deny';
```

- Allow merging Regions belonging to a table:

```
ALTER TABLE t ATTRIBUTES 'merge_option=allow';
```

- Reset attributes of a table:

```
ALTER TABLE t ATTRIBUTES DEFAULT;
```

- Prevent the Regions of a partition from merging:

```
ALTER TABLE t PARTITION p ATTRIBUTES 'merge_option=deny';
```

- Allow merging Regions belonging to a partition:

```
ALTER TABLE t PARTITION p ATTRIBUTES 'merge_option=allow';
```

- See all tables or partitions configured the `merge_option` attribution:

```
SELECT * FROM information_schema.attributes WHERE attributes LIKE '%
    ↪ merge_option%';
```

14.13.9.3.3 Attribute override rules

```
ALTER TABLE t ATTRIBUTES 'merge_option=deny';
ALTER TABLE t PARTITION p ATTRIBUTES 'merge_option=allow';
```

When the above two attributes are configured at the same time, the Regions belonging to the partition `p` can actually be merged. When the attribute of the partition is reset, the partition `p` inherits the attribute from the table `t`, and the Regions cannot be merged.

Note:

- For a table with partitions, if the `merge_option` attribute is configured at the table level only, even if `merge_option=allow`, the table is still split into multiple Regions by default according to the actual number of partitions. To merge all Regions, you need to reset the attribute of the table.
- When using the `merge_option` attribute, you need to pay attention to the PD configuration parameter `split-merge-interval`. Suppose that the `merge_option` attribute is not configured. In this case, if Regions meet conditions, Regions can be merged after the interval specified by `split-merge-interval`. If the `merge_option` attribute is configured, PD decides whether to merge Regions after the specified interval according to the `merge_option` configuration.

Note:

- For a table with partitions, if the `merge_option` attribute is configured at the table level only, even if `merge_option=allow`, the table is still split into multiple Regions by default according to the actual number of partitions. To merge all Regions, you need to reset the attribute of the table.
- Suppose that the `merge_option` attribute is not configured. In this case, if Regions meet conditions, Regions can be merged after one hour. If the `merge_option` attribute is configured, PD decides whether to merge Regions after one hour according to the `merge_option` configuration.

14.13.10 Transactions

14.13.10.1 Transactions

TiDB supports distributed transactions using either pessimistic or optimistic transaction mode. Starting from TiDB 3.0.8, TiDB uses the pessimistic transaction mode by default.

This document introduces commonly used transaction-related statements, explicit and implicit transactions, isolation levels, lazy check for constraints, and transaction sizes.

The common variables include `autocommit`, `tidb_disable_txn_auto_retry`, `tidb_retry_limit`, and `tidb_txn_mode`.

Note:

The `tidb_disable_txn_auto_retry` and `tidb_retry_limit` variables only apply to optimistic transactions, not to pessimistic transactions.

14.13.10.1.1 Common statements

Starting a transaction

The statements `BEGIN` and `START TRANSACTION` can be used interchangeably to explicitly start a new transaction.

Syntax:

```
BEGIN;
```

```
START TRANSACTION;
```

```
START TRANSACTION WITH CONSISTENT SNAPSHOT;
```

```
START TRANSACTION WITH CAUSAL CONSISTENCY ONLY;
```

If the current session is in the process of a transaction when one of these statements is executed, TiDB automatically commits the current transaction before starting a new transaction.

> **Note:**
>
> Unlike MySQL, TiDB takes a snapshot of the current database after executing the statements above. MySQL's `BEGIN` and `START TRANSACTION` take a snapshot after executing the first `SELECT` statement (not `SELECT FOR UPDATE` ↪) that reads data from InnoDB after a transaction is started. `START` ↪ `TRANSACTION WITH CONSISTENT SNAPSHOT` takes a snapshot during the execution of the statement. As a result, `BEGIN`, `START TRANSACTION`, and `START TRANSACTION WITH CONSISTENT SNAPSHOT` are equivalent to `START` ↪ `TRANSACTION WITH CONSISTENT SNAPSHOT` in MySQL.

Committing a transaction

The statement `COMMIT` instructs TiDB to apply all changes made in the current transaction.

Syntax:

```
COMMIT;
```

> **Tip:**
>
> Make sure that your application correctly handles that a `COMMIT` statement could return an error before enabling optimistic transactions. If you are unsure of how your application handles this, it is recommended to instead use the default of pessimistic transactions.

Rolling back a transaction

The statement `ROLLBACK` rolls back and cancels all changes in the current transaction.

Syntax:

```
ROLLBACK;
```

Transactions are also automatically rolled back if the client connection is aborted or closed.

14.13.10.1.2 Autocommit

As required for MySQL compatibility, TiDB will by default *autocommit* statements immediately following their execution.

For example:

```
mysql> CREATE TABLE t1 (
    id INT NOT NULL PRIMARY KEY auto_increment,
    pad1 VARCHAR(100)
   );
Query OK, 0 rows affected (0.09 sec)

mysql> SELECT @@autocommit;
+--------------+
| @@autocommit |
+--------------+
| 1            |
+--------------+
1 row in set (0.00 sec)

mysql> INSERT INTO t1 VALUES (1, 'test');
Query OK, 1 row affected (0.02 sec)

mysql> ROLLBACK;
Query OK, 0 rows affected (0.01 sec)

mysql> SELECT * FROM t1;
+----+------+
| id | pad1 |
+----+------+
|  1 | test |
+----+------+
1 row in set (0.00 sec)
```

In the above example, the `ROLLBACK` statement has no effect. This is because the `INSERT` ↪ statement is executed in autocommit. That is, it was the equivalent of the following single-statement transaction:

```
START TRANSACTION;
INSERT INTO t1 VALUES (1, 'test');
```

```
COMMIT;
```

Autocommit will not apply if a transaction has been explicitly started. In the following example, the `ROLLBACK` statement successfully reverts the `INSERT` statement:

```
mysql> CREATE TABLE t2 (
     id INT NOT NULL PRIMARY KEY auto_increment,
     pad1 VARCHAR(100)
    );
Query OK, 0 rows affected (0.10 sec)

mysql> SELECT @@autocommit;
+--------------+
| @@autocommit |
+--------------+
| 1            |
+--------------+
1 row in set (0.00 sec)

mysql> START TRANSACTION;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t2 VALUES (1, 'test');
Query OK, 1 row affected (0.02 sec)

mysql> ROLLBACK;
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT * FROM t2;
Empty set (0.00 sec)
```

The `autocommit` system variable can be changed on either a global or session basis.

For example:

```
SET autocommit = 0;
```

```
SET GLOBAL autocommit = 0;
```

14.13.10.1.3 Explicit and implicit transaction

Note:

> Some statements are committed implicitly. For example, executing `[BEGIN|START TRANSACTION]` implicitly commits the last transaction and starts a new transaction. This behavior is required for MySQL compatibility. Refer to implicit commit for more details.

TiDB supports explicit transactions (use `[BEGIN|START TRANSACTION]` and `COMMIT` to define the start and end of the transaction) and implicit transactions (`SET autocommit = 1`).

If you set the value of `autocommit` to `1` and start a new transaction through the `[BEGIN|START TRANSACTION]` statement, the autocommit is disabled before `COMMIT` or `ROLLBACK` which makes the transaction becomes explicit.

For DDL statements, the transaction is committed automatically and does not support rollback. If you run the DDL statement while the current session is in the process of a transaction, the DDL statement is executed after the current transaction is committed.

14.13.10.1.4 Lazy check of constraints

By default, optimistic transactions will not check the primary key or unique constraints when a DML statement is executed. These checks are instead performed on transaction `COMMIT`.

For example:

```
CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY);
INSERT INTO t1 VALUES (1);
BEGIN OPTIMISTIC;
INSERT INTO t1 VALUES (1); -- MySQL returns an error; TiDB returns success
    ↪ .
INSERT INTO t1 VALUES (2);
COMMIT; -- It is successfully committed in MySQL; TiDB returns an error
    ↪ and the transaction rolls back.
SELECT * FROM t1; -- MySQL returns 1 2; TiDB returns 1.
```

```
mysql> CREATE TABLE t1 (id INT NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.10 sec)

mysql> INSERT INTO t1 VALUES (1);
Query OK, 1 row affected (0.02 sec)

mysql> BEGIN OPTIMISTIC;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (1); -- MySQL returns an error; TiDB returns
    ↪ success.
```

```
Query OK, 1 row affected (0.00 sec)

mysql> INSERT INTO t1 VALUES (2);
Query OK, 1 row affected (0.00 sec)

mysql> COMMIT; -- It is successfully committed in MySQL; TiDB returns an
    ↪ error and the transaction rolls back.
ERROR 1062 (23000): Duplicate entry '1' for key 't1.PRIMARY'
mysql> SELECT * FROM t1; -- MySQL returns 1 2; TiDB returns 1.
+----+
| id |
+----+
|  1 |
+----+
1 row in set (0.01 sec)
```

The lazy check optimization improves performance by batching constraint checks and reducing network communication. The behavior can be disabled by setting `tidb_constraint_check_in_place=ON`.

Note:

- This optimization only applies to optimistic transactions.
- This optimization does not take effect for `INSERT IGNORE` and `INSERT ON DUPLICATE KEY UPDATE`, but only for normal `INSERT` statements.

14.13.10.1.5 Statement rollback

TiDB supports atomic rollback after statement execution failure. If a statement results in an error, the changes it made will not take effect. The transaction will remain open, and additional changes can be made before issuing a `COMMIT` or `ROLLBACK` statement.

```
CREATE TABLE test (id INT NOT NULL PRIMARY KEY);
BEGIN;
INSERT INTO test VALUES (1);
INSERT INTO tset VALUES (2); -- Statement does not take effect because "
    ↪ test" is misspelled as "tset".
INSERT INTO test VALUES (1),(2); -- Entire statement does not take effect
    ↪ because it violates a PRIMARY KEY constraint
INSERT INTO test VALUES (3);
COMMIT;
SELECT * FROM test;
```

```
mysql> CREATE TABLE test (id INT NOT NULL PRIMARY KEY);
Query OK, 0 rows affected (0.09 sec)

mysql> BEGIN;
Query OK, 0 rows affected (0.00 sec)

mysql> INSERT INTO test VALUES (1);
Query OK, 1 row affected (0.02 sec)

mysql> INSERT INTO tset VALUES (2); -- Statement does not take effect
    ↪ because "test" is misspelled as "tset".
ERROR 1146 (42S02): Table 'test.tset' doesn't exist
mysql> INSERT INTO test VALUES (1),(2); -- Entire statement does not take
    ↪ effect because it violates a PRIMARY KEY constraint
ERROR 1062 (23000): Duplicate entry '1' for key 'test.PRIMARY'
mysql> INSERT INTO test VALUES (3);
Query OK, 1 row affected (0.00 sec)

mysql> COMMIT;
Query OK, 0 rows affected (0.01 sec)

mysql> SELECT * FROM test;
+----+
| id |
+----+
|  1 |
|  3 |
+----+
2 rows in set (0.00 sec)
```

In the above example, the transaction remains open after the failed `INSERT` statements. The final insert statement is then successful and changes are committed.

14.13.10.1.6 Transaction size limit

Due to the limitations of the underlying storage engine, TiDB requires a single row to be no more than 6 MB. All columns of a row are converted to bytes according to their data types and summed up to estimate the size of a single row.

TiDB supports both optimistic and pessimistic transactions, and optimistic transactions are the basis for pessimistic transactions. Because optimistic transactions first cache the changes in private memory, TiDB limits the size of a single transaction.

By default, TiDB sets the total size of a single transaction to no more than 100 MB. You can modify this default value via `txn-total-size-limit` in the configuration file. The

maximum value of `txn-total-size-limit` is 1 TB. The individual transaction size limit also depends on the size of remaining memory available in the server. This is because when a transaction is executed, the memory usage of the TiDB process is scaled up comparing with the transaction size, up to two to three times or more of the transaction size.

TiDB previously limited the total number of key-value pairs for a single transaction to 300,000. This restriction was removed in TiDB v4.0.

> **Note:**
>
> Usually, TiDB Binlog is enabled to replicate data to the downstream. In some scenarios, message middleware such as Kafka is used to consume binlogs that are replicated to the downstream.
>
> Taking Kafka as an example, the upper limit of Kafka's single message processing capability is 1 GB. Therefore, when `txn-total-size-limit` is set to more than 1 GB, it might happen that the transaction is successfully executed in TiDB, but the downstream Kafka reports an error. To avoid this situation, you need to decide the actual value of `txn-total-size-limit` according to the limit of the end consumer. For example, if Kafka is used downstream, `txn-total-size-limit` must not exceed 1 GB.

14.13.10.1.7 Causal consistency

> **Note:**
>
> Transactions with causal consistency take effect only when the async commit and one-phase commit features are enabled. For details of the two features, see `tidb_enable_async_commit` and `tidb_enable_1pc`.

TiDB supports enabling causal consistency for transactions. Transactions with causal consistency, when committed, do not need to get timestamp from PD and have lower commit latency. The syntax to enable causal consistency is as follows:

```
START TRANSACTION WITH CAUSAL CONSISTENCY ONLY;
```

By default, TiDB guarantees linear consistency. In the case of linear consistency, if transaction 2 is committed after transaction 1 is committed, logically, transaction 2 should occur after transaction 1. Causal consistency is weaker than linear consistency. In the case of causal consistency, the commit order and occurrence order of two transactions can be guaranteed consistent only when the data locked or written by transaction 1 and transaction 2

have an intersection, which means that the two transactions have a causal relationship known to the database. Currently, TiDB does not support passing in external causal relationship.

Two transactions with causal consistency enabled have the following characteristics:

- Transactions with potential causal relationship have the consistent logical order and physical commit order
- Transactions with no causal relationship do not guarantee consistent logical order and physical commit order
- Reads without lock do not create causal relationship

Transactions with potential causal relationship have the consistent logical order and physical commit order

Assume that both transaction 1 and transaction 2 adopt causal consistency and have the following statements executed:

Transaction 1	Transaction 2
START TRANSACTION WITH CAUSAL CONSISTENCY ONLY	START TRANSACTION WITH CAUSAL CONSISTENCY ONLY
x = SELECT v FROM t WHERE id = 1 FOR UPDATE	
UPDATE t set v = $(x + 1) WHERE id = 2	
COMMIT	

Transaction 1	Transaction 2
	UPDATE t SET v = 2 WHERE id = 1 COMMIT

In the example above, transaction 1 locks the `id = 1` record and transaction 2 modifies the `id = 1` record. Therefore, transaction 1 and transaction 2 have a potential causal relationship. Even with the causal consistency enabled, as long as transaction 2 is committed after transaction 1 is successfully committed, logically, transaction 2 must occur after transaction 1. Therefore, it is impossible that a transaction reads transaction 2's modification on the `id = 1` record without reading transaction 1's modification on the `id = 2` record.

Transactions with no causal relationship do not guarantee consistent logical order and physical commit order

Assume that the initial values of `id = 1` and `id = 2` are both `0`. Assume that both transaction 1 and transaction 2 adopt causal consistency and have the following statements executed:

Transaction 1	Transaction 2	Transaction 3
START TRANSACTION WITH CAUSAL CONSISTENCY ONLY	START TRANSACTION WITH CAUSAL CONSISTENCY ONLY	
UPDATE t set v = 3 WHERE id = 2		
	UPDATE t SET v = 2 WHERE id = 1	

Transaction 1	Transaction 2	Transaction 3
		BEGIN
COMMIT		
	COMMIT	
		SELECT v FROM t WHERE id IN (1, 2)

In the example above, transaction 1 does not read the `id = 1` record, so transaction 1 and transaction 2 have no causal relationship known to the database. With causal consistency enabled for the transactions, even if transaction 2 is committed after transaction 1 is committed in terms of physical time order, TiDB does not guarantee that transaction 2 logically occurs after transaction 1.

If transaction 3 begins before transaction 1 is committed, and if transaction 3 reads the `id = 1` and `id = 2` records after transaction 2 is committed, transaction 3 might read the value of `id = 1` to be `2` but the value of `id = 2` to be `0`.

Reads without lock do not create causal relationship

Assume that both transaction 1 and transaction 2 adopt causal consistency and have the following statements executed:

Transaction 1	Transaction 2
START TRANSACTION WITH CAUSAL CONSISTENCY ONLY	START TRANSACTION WITH CAUSAL CONSISTENCY ONLY
	UPDATE t SET v = 2 WHERE id = 1

Transaction 1	Transaction 2
SELECT v FROM t WHERE id = 1	
UPDATE t set v = 3 WHERE id = 2	
	COMMIT
COMMIT	

In the example above, reads without lock do not create causal relationship. Transaction 1 and transaction 2 have created write skew. In this case, it would have been unreasonable if the two transactions still had causal relationship. Therefore, the two transactions with causal consistency enabled have no definite logical order.

14.13.10.2 TiDB Transaction Isolation Levels

Transaction isolation is one of the foundations of database transaction processing. Isolation is one of the four key properties of a transaction (commonly referred as ACID).

The SQL-92 standard defines four levels of transaction isolation: Read Uncommitted, Read Committed, Repeatable Read, and Serializable. See the following table for details:

Isolation Level	Dirty Write	Dirty Read	Fuzzy Read	Phantom
READ UNCOMMITTED	Not Possible	Possible	Possible	Possible
READ COMMITTED	Not Possible	Not possible	Possible	Possible
REPEATABLE READ	Not Possible	Not possible	Not possible	Possible
SERIALIZABLE	Not Possible	Not possible	Not possible	Not possible

TiDB implements Snapshot Isolation (SI) consistency, which it advertises as `REPEATABLE-READ` for compatibility with MySQL. This differs from the ANSI Repeatable Read isolation level and the MySQL Repeatable Read level.

> **Note:**
>
> Starting from TiDB v3.0, the automatic retry of transactions is disabled by default. It is not recommended to enable the automatic retry because it

might **break the transaction isolation level**. Refer to Transaction Retry for details.

Starting from TiDB v3.0.8, newly created TiDB clusters use the pessimistic transaction mode by default. The current read (`for update` read) is **non-repeatable read**. Refer to pessimistic transaction mode for details.

14.13.10.2.1 Repeatable Read isolation level

The Repeatable Read isolation level only sees data committed before the transaction begins, and it never sees either uncommitted data or changes committed during transaction execution by concurrent transactions. However, the transaction statement does see the effects of previous updates executed within its own transaction, even though they are not yet committed.

For transactions running on different nodes, the start and commit order depends on the order that the timestamp is obtained from PD.

Transactions of the Repeatable Read isolation level cannot concurrently update a same row. When committing, if the transaction finds that the row has been updated by another transaction after it starts, then the transaction rolls back. For example:

```
create table t1(id int);
insert into t1 values(0);

start transaction;          |             start transaction;
select * from t1;           |             select * from t1;
update t1 set id=id+1;      |             update t1 set id=id+1; -- In
   ↪ pessimistic transactions, the `update` statement executed later
   ↪ waits for the lock until the transaction holding the lock commits or
   ↪  rolls back and releases the row lock.
commit;                     |
                            |             commit; -- The transaction commit
                               ↪  fails and rolls back. Pessimistic
                               ↪ transactions can commit successfully.
```

Difference between TiDB and ANSI Repeatable Read

The Repeatable Read isolation level in TiDB differs from ANSI Repeatable Read isolation level, though they sharing the same name. According to the standard described in the A Critique of ANSI SQL Isolation Levels paper, TiDB implements the Snapshot Isolation level. This isolation level does not allow strict phantoms (A3) but allows broad phantoms (P3) and write skews. In contrast, the ANSI Repeatable Read isolation level allows phantom reads but does not allow write skews.

Difference between TiDB and MySQL Repeatable Read

The Repeatable Read isolation level in TiDB differs from that in MySQL. The MySQL Repeatable Read isolation level does not check whether the current version is visible when updating, which means it can continue to update even if the row has been updated after the transaction starts. In contrast, if the row has been updated after the transaction starts, the TiDB optimistic transaction is rolled back and retried. Transaction retries in TiDB's optimistic concurrency control might fail, leading to a final failure of the transaction, while in TiDB's pessimistic concurrency control and MySQL, the updating transaction can be successful.

14.13.10.2.2 Read Committed isolation level

Starting from TiDB v4.0.0-beta, TiDB supports the Read Committed isolation level.

For historical reasons, the Read Committed isolation level of current mainstream databases is essentially the Consistent Read isolation level defined by Oracle. In order to adapt to this situation, the Read Committed isolation level in TiDB pessimistic transactions is also a consistent read behavior in essence.

> **Note:**
>
> The Read Committed isolation level only takes effect in the pessimistic transaction mode. In the optimistic transaction mode, setting the transaction isolation level to `Read Committed` does not take effect and transactions still use the Repeatable Read isolation level.

Starting from v6.0.0, TiDB supports using the `tidb_rc_read_check_ts` system variable to optimize the timestamp acquisition in scenarios where read-write conflicts are rare. After enabling this variable, TiDB will try to use the previous valid timestamp to read data when `SELECT` is executed. The initial value of this variable is the `start_ts` of the transaction.

- If TiDB does not encounter any data update during the read process, it returns the result to the client and the `SELECT` statement is successfully executed.
- If TiDB encounters data update during the read process:
    - If TiDB has not yet sent the result to the client, TiDB tries to acquire a new timestamp and retry this statement.
    - If TiDB has already sent partial data to the client, TiDB reports an error to the client. The amount of data sent to the client each time is controlled by `tidb_init_chunk_size` and `tidb_max_chunk_size`.

In scenarios where the `READ-COMMITTED` isolation level is used, the `SELECT` statements are many, and read-write conflicts are rare, enabling this variable can avoid the latency and cost of getting the global timestamp.

Since v6.3.0, TiDB supports optimizing the acquisition of timestamps by enabling the system variable `tidb_rc_write_check_ts` in scenarios where point-write conflicts are few. After enabling this variable, during the execution of point-write statements, TiDB will try to use valid timestamps of the current transaction to read and lock data. TiDB will read data in the same way when `tidb_rc_read_check_ts` is enabled.

Currently, the applicable types of point-write statements include `UPDATE`, `DELETE`, and `SELECT ..... FOR UPDATE`. A point-write statement refers to a write statement that uses the primary key or unique key as a filter condition and the final execution operator contains `POINT-GET`. Currently, the three types of point-write statements have these in common: they first perform a point query based on the key value. If the key exists, they lock the key. If the key does not exist, they return an empty set.

- If the entire read process of a point-write statement does not encounter an updated data version, TiDB continues to use the timestamp of the current transaction to lock the data.
    - If a write conflict occurs due to an old timestamp during the lock acquisition process, TiDB retries the lock acquisition process by obtaining the latest global timestamp.
    - If no write conflicts or other errors occur during the lock acquisition process, the lock is acquired successfully.
- If an updated data version is encountered during the read process, TiDB tries to acquire a new timestamp and retries this statement.

In transactions with many point-write statements but a few point-write conflicts in the `READ-COMMITTED` isolation level, enabling this variable can avoid the latency and overhead of getting the global timestamp.

14.13.10.2.3 Difference between TiDB and MySQL Read Committed

The MySQL Read Committed isolation level is in line with the Consistent Read features in most cases. There are also exceptions, such as semi-consistent read. This special behavior is not supported in TiDB.

14.13.10.3 TiDB Optimistic Transaction Model

With optimistic transactions, conflicting changes are detected as part of a transaction commit. This helps improve the performance when concurrent transactions are infrequently modifying the same rows, because the process of acquiring row locks can be skipped. In the case that concurrent transactions frequently modify the same rows (a conflict), optimistic transactions may perform worse than Pessimistic Transactions.

Before enabling optimistic transactions, make sure that your application correctly handles that a `COMMIT` statement could return errors. If you are unsure of how your application handles this, it is recommended to instead use Pessimistic Transactions.

Note:

Starting from v3.0.8, TiDB uses the pessimistic transaction mode by default. However, this does not affect your existing cluster if you upgrade it from v3.0.7 or earlier to v3.0.8 or later. In other words, **only newly created clusters default to using the pessimistic transaction mode**.

14.13.10.3.1 Principles of optimistic transactions

To support distributed transactions, TiDB adopts two-phase commit (2PC) in optimistic transactions. The procedure is as follows:

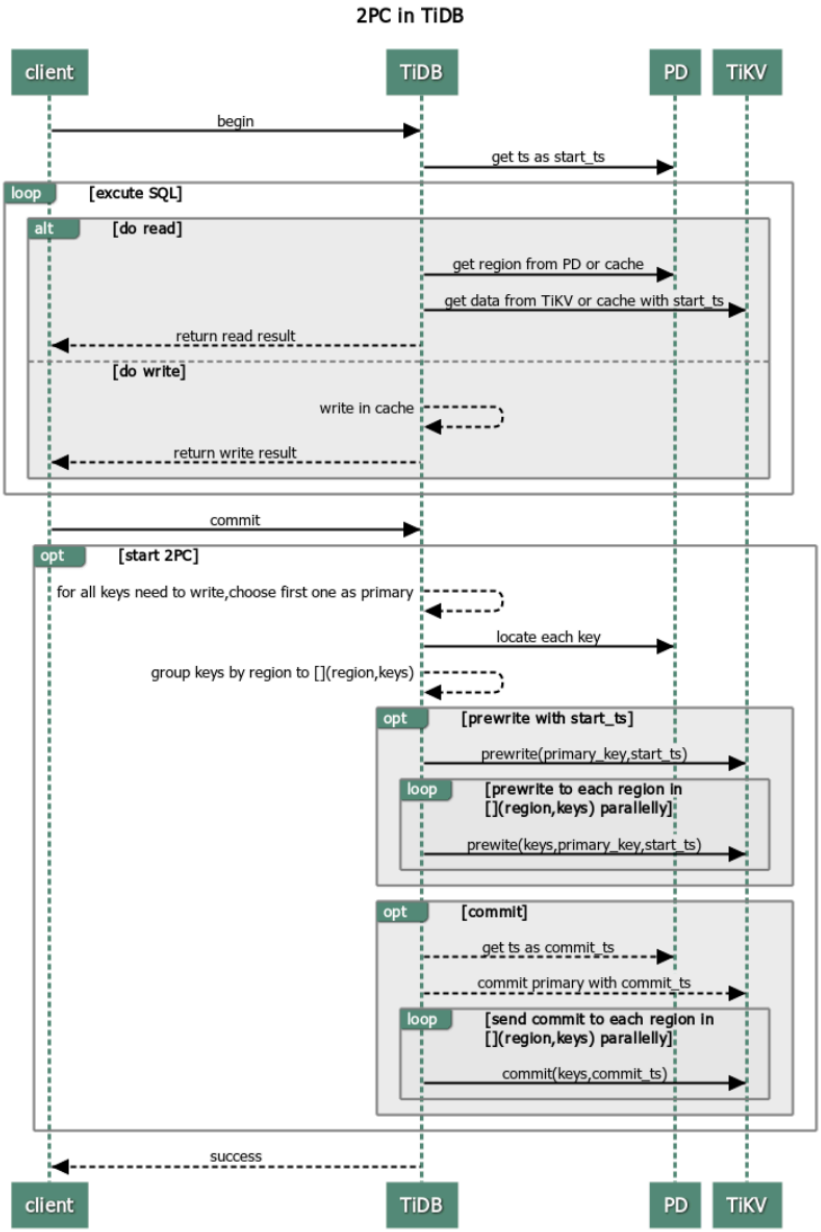

Figure 434: 2PC in TiDB

1. The client begins a transaction.

   TiDB gets a timestamp (monotonically increasing in time and globally unique) from PD as the unique transaction ID of the current transaction, which is called `start_ts`. TiDB implements multi-version concurrency control, so `start_ts` also serves as the version of the database snapshot obtained by this transaction. This means that the transaction can only read the data from the database at `start_ts`.

2. The client issues a read request.

1. TiDB receives routing information (how data is distributed among TiKV nodes) from PD.
2. TiDB receives the data of the `start_ts` version from TiKV.

3. The client issues a write request.

   TiDB checks whether the written data satisfies constraints (to ensure the data types are correct, the NOT NULL constraint is met). **Valid data is stored in the private memory of this transaction in TiDB**.

4. The client issues a commit request.

5. TiDB begins 2PC, and persists data in store while guaranteeing the atomicity of transactions.

   1. TiDB selects a Primary Key from the data to be written.
   2. TiDB receives the information of Region distribution from PD, and groups all keys by Region accordingly.
   3. TiDB sends prewrite requests to all TiKV nodes involved. Then, TiKV checks whether there are conflict or expired versions. Valid data is locked.
   4. TiDB receives all responses in the prewrite phase and the prewrite is successful.
   5. TiDB receives a commit version number from PD and marks it as `commit_ts`.
   6. TiDB initiates the second commit to the TiKV node where Primary Key is located. TiKV checks the data, and cleans the locks left in the prewrite phase.
   7. TiDB receives the message that reports the second phase is successfully finished.

6. TiDB returns a message to inform the client that the transaction is successfully committed.

7. TiDB asynchronously cleans the locks left in this transaction.

14.13.10.3.2 Advantages and disadvantages

From the process of transactions in TiDB above, it is clear that TiDB transactions have the following advantages:

- Simple to understand
- Implement cross-node transaction based on single-row transaction
- Decentralized lock management

However, TiDB transactions also have the following disadvantages:

- Transaction latency due to 2PC
- In need of a centralized timestamp allocation service
- OOM (out of memory) when extensive data is written in the memory

14.13.10.3.3 Transaction retries

> **Note:**
>
> Starting from v8.0.0, the `tidb_disable_txn_auto_retry` system variable is deprecated, and TiDB no longer supports automatic retries of optimistic transactions. It is recommended to use the Pessimistic transaction mode. If you encounter optimistic transaction conflicts, you can capture the error and retry transactions in your application.

In the optimistic transaction model, transactions might fail to be committed because of write–write conflict in heavy contention scenarios. TiDB uses optimistic concurrency control by default, whereas MySQL applies pessimistic concurrency control. This means that MySQL adds locks during the execution of write-type SQL statements, and its Repeatable Read isolation level allows for current reads, so commits generally do not encounter exceptions. To lower the difficulty of adapting applications, TiDB provides an internal retry mechanism.

Automatic retry

If a write-write conflict occurs during the transaction commit, TiDB automatically retries the SQL statement that includes write operations. You can enable the automatic retry by setting `tidb_disable_txn_auto_retry` to `OFF` and set the retry limit by configuring `tidb_retry_limit`:

```
#### Whether to disable automatic retry. ("on" by default)
tidb_disable_txn_auto_retry = OFF
#### Set the maximum number of the retires. ("10" by default)
#### When "tidb_retry_limit = 0", automatic retry is completely disabled.
tidb_retry_limit = 10
```

You can enable the automatic retry in either session level or global level:

1. Session level:

```
SET tidb_disable_txn_auto_retry = OFF;
```

```
SET tidb_retry_limit = 10;
```

2. Global level:

```
SET GLOBAL tidb_disable_txn_auto_retry = OFF;
```

```
SET GLOBAL tidb_retry_limit = 10;
```

Note:

The `tidb_retry_limit` variable decides the maximum number of retries. When this variable is set to `0`, none of the transactions automatically retries, including the implicit single statement transactions that are automatically committed. This is the way to completely disable the automatic retry mechanism in TiDB. After the automatic retry is disabled, all conflicting transactions report failures (including the `try again later` message) to the application layer in the fastest way.

Limits of retry

By default, TiDB will not retry transactions because this might lead to lost updates and damaged `REPEATABLE READ` isolation.

The reason can be observed from the procedures of retry:

1. Allocate a new timestamp and mark it as `start_ts`.
2. Retry the SQL statements that contain write operations.
3. Implement the two-phase commit.

In Step 2, TiDB only retries SQL statements that contain write operations. However, during retrying, TiDB receives a new version number to mark the beginning of the transaction. This means that TiDB retries SQL statements with the data in the new `start_ts` version. In this case, if the transaction updates data using other query results, the results might be inconsistent because the `REPEATABLE READ` isolation is violated.

If your application can tolerate lost updates, and does not require `REPEATABLE READ` isolation consistency, you can enable this feature by setting `tidb_disable_txn_auto_retry = OFF`.

14.13.10.3.4 Conflict detection

As a distributed database, TiDB performs in-memory conflict detection in the TiKV layer, mainly in the prewrite phase. TiDB instances are stateless and unaware of each other, which means they cannot know whether their writes result in conflicts across the cluster. Therefore, conflict detection is performed in the TiKV layer.

The configuration is as follows:

```
#### Controls the number of slots. ("2048000" by default)
scheduler-concurrency = 2048000
```

In addition, TiKV supports monitoring the time spent on waiting latches in the scheduler.

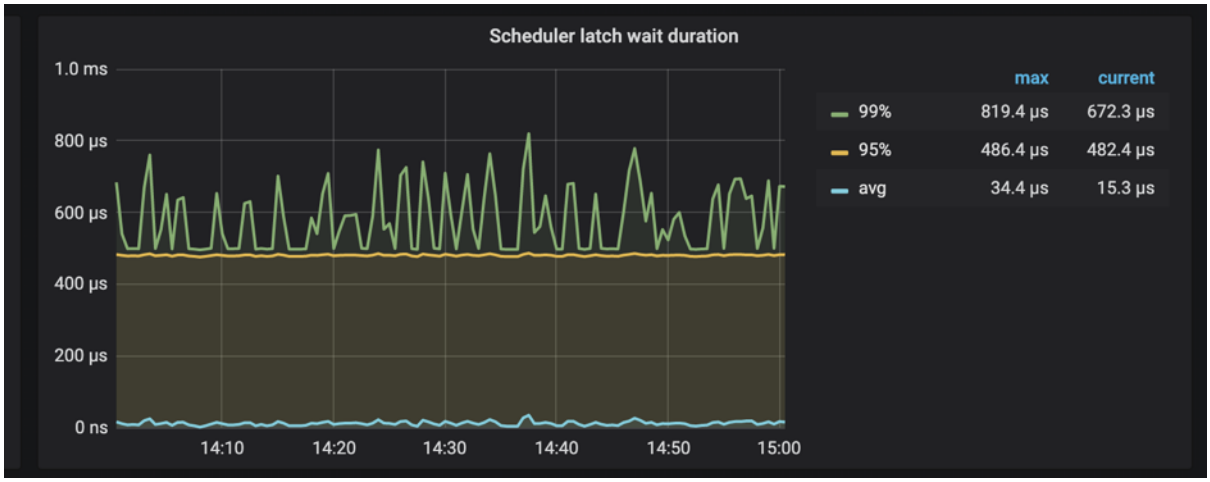

Figure 435: Scheduler latch wait duration

When `Scheduler latch wait duration` is high and there are no slow writes, it can be safely concluded that there are many write conflicts at this time.

14.13.10.4 TiDB Pessimistic Transaction Mode

To make the usage of TiDB closer to traditional databases and reduce the cost of migration, starting from v3.0, TiDB supports the pessimistic transaction mode on top of the optimistic transaction model. This document describes the features of the TiDB pessimistic transaction mode.

> **Note:**
>
> Starting from v3.0.8, newly created TiDB clusters use the pessimistic transaction mode by default. However, this does not affect your existing cluster if you upgrade it from v3.0.7 or earlier to v3.0.8 or later. In other words, **only newly created clusters default to using the pessimistic transaction mode**.

14.13.10.4.1 Switch transaction mode

You can set the transaction mode by configuring the `tidb_txn_mode` system variable. The following command sets all explicit transactions (that is, non-autocommit transactions) executed by newly created sessions in the cluster to the pessimistic transaction mode:

```
SET GLOBAL tidb_txn_mode = 'pessimistic';
```

You can also explicitly enable the pessimistic transaction mode by executing the following SQL statements:

```
BEGIN PESSIMISTIC;
```

```
BEGIN /*T! PESSIMISTIC */;
```

The `BEGIN PESSIMISTIC;` and `BEGIN OPTIMISTIC;` statements take precedence over the `tidb_txn_mode` system variable. Transactions started with these two statements ignore the system variable and support using both the pessimistic and optimistic transaction modes.

14.13.10.4.2 Behaviors

Pessimistic transactions in TiDB behave similarly to those in MySQL. See the minor differences in Difference with MySQL InnoDB.

- For pessimistic transactions, TiDB introduces snapshot read and current read.
    - Snapshot read: it is an unlocked read that reads a version committed before the transaction starts. The read in the `SELECT` statement is a snapshot read.
    - Current read: it is a locked read that reads the latest committed version. The read in the `UPDATE`, `DELETE`, `INSERT`, or `SELECT FOR UPDATE` statement is a current read.

    The following examples provide a detailed description of snapshot read and current read.

Session 1	Session 2	Session 3
CREATE TABLE t (a INT);		
INSERT INTO T VALUES(1);		
BEGIN PESSIMISTIC;		
UPDATE t SET a = a + 1;		

Session 1	Session 2	Session 3
	BEGIN PESSIMISTIC; SELECT * FROM t; – Use the snapshot read to read the version committed before the current transaction starts. The result returns a=1.	
		BEGIN PESSIMISTIC;

Session 1	Session 2	Session 3
		SELECT * FROM t FOR UPDATE; – Use the current read. Wait for the lock.

Session 1	Session 2	Session 3
COMMIT; – Release the lock. The SELECT FOR UPDATE operation of session 3 obtains the lock and TiDB uses the current read to read the latest committed version. The result returns a=2.		

Session 1	Session 2	Session 3
	SELECT * FROM t; – Use the snapshot read to read the version committed before the current transaction starts. The result returns a=1.	

- When you execute `UPDATE`, `DELETE` or `INSERT` statements, the **latest** committed data is read, data is modified, and a pessimistic lock is applied on the modified rows.
- For `SELECT FOR UPDATE` statements, a pessimistic lock is applied on the latest version of the committed data, instead of on the modified rows.
- Locks will be released when the transaction is committed or rolled back. Other transactions attempting to modify the data are blocked and have to wait for the lock to be released. Transactions attempting to *read* the data are not blocked, because TiDB uses multi-version concurrency control (MVCC).
- You can set the system variable `tidb_constraint_check_in_place_pessimistic` to control whether to skip the pessimistic locks with unique constraint checks. See con-

straints for details.

- If several transactions are trying to acquire each other's respective locks, a deadlock will occur. This is automatically detected, and one of the transactions will randomly be terminated with a MySQL-compatible error code `1213` returned.
- Transactions will wait up to `innodb_lock_wait_timeout` seconds (default: 50) to acquire new locks. When this timeout is reached, a MySQL-compatible error code `1205` is returned. If multiple transactions are waiting for the same lock, the order of priority is approximately based on the `start ts` of the transaction.
- TiDB supports both the optimistic transaction mode and pessimistic transaction mode in the same cluster. You can specify either mode for transaction execution.
- TiDB supports the `FOR UPDATE NOWAIT` syntax and does not block and wait for locks to be released. Instead, a MySQL-compatible error code `3572` is returned.
- If the `Point Get` and `Batch Point Get` operators do not read data, they still lock the given primary key or unique key, which blocks other transactions from locking or writing data to the same primary key or unique key.
- TiDB supports the `FOR UPDATE OF TABLES` syntax. For a statement that joins multiple tables, TiDB only applies pessimistic locks on the rows that are associated with the tables in `OF TABLES`.

14.13.10.4.3 Difference with MySQL InnoDB

1. When TiDB executes DML or `SELECT FOR UPDATE` statements that use range in the WHERE clause, concurrent DML statements within the range are not blocked.

   For example:

```
CREATE TABLE t1 (
 id INT NOT NULL PRIMARY KEY,
 pad1 VARCHAR(100)
);
INSERT INTO t1 (id) VALUES (1),(5),(10);
```

```
BEGIN /*T! PESSIMISTIC */;
SELECT * FROM t1 WHERE id BETWEEN 1 AND 10 FOR UPDATE;
```

```
BEGIN /*T! PESSIMISTIC */;
INSERT INTO t1 (id) VALUES (6); -- blocks only in MySQL
UPDATE t1 SET pad1='new value' WHERE id = 5; -- blocks waiting in both
    ↪ MySQL and TiDB
```

   This behavior is because TiDB does not currently support *gap locking*.

2. TiDB does not support `SELECT LOCK IN SHARE MODE`.

   When `SELECT LOCK IN SHARE MODE` is executed, it has the same effect as that without the lock, so the read or write operation of other transactions is not blocked.

3. DDL may result in failure of the pessimistic transaction commit.

   When DDL is executed in MySQL, it might be blocked by the transaction that is being executed. However, in this scenario, the DDL operation is not blocked in TiDB, which leads to failure of the pessimistic transaction commit: `ERROR 1105 (HY000) ↪ : Information schema is changed. [try again later]`. TiDB executes the `TRUNCATE TABLE` statement during the transaction execution, which might result in the `table doesn't exist` error.

4. After executing `START TRANSACTION WITH CONSISTENT SNAPSHOT`, MySQL can still read the tables that are created later in other transactions, while TiDB cannot.

5. The autocommit transactions prefer the optimistic locking.

   When using the pessimistic model, the autocommit transactions first try to commit the statement using the optimistic model that has less overhead. If a write conflict occurs, the pessimistic model is used for transaction retry. Therefore, if `tidb_retry_limit` is set to `0`, the autocommit transaction still reports the `Write Conflict` error when a write conflict occurs.

   The autocommit `SELECT FOR UPDATE` statement does not wait for lock.

6. The data read by `EMBEDDED SELECT` in the statement is not locked.

7. Open transactions in TiDB do not block garbage collection (GC). By default, this limits the maximum execution time of pessimistic transactions to 1 hour. You can modify this limit by editing `max-txn-ttl` under `[performance]` in the TiDB configuration file.

14.13.10.4.4 Isolation level

TiDB supports the following two isolation levels in the pessimistic transaction mode:

- Repeatable Read by default, which is the same as MySQL.

> **Note:**
> In this isolation level, DML operations are performed based on the latest committed data. The behavior is the same as MySQL, but differs from the optimistic transaction mode in TiDB. See Difference between TiDB and MySQL Repeatable Read.

- Read Committed. You can set this isolation level using the `SET TRANSACTION` statement.

14.13.10.4.5 Pessimistic transaction commit process

In the transaction commit process, pessimistic transactions and optimistic transactions have the same logic. Both transactions adopt the two-phase commit (2PC) mode. The important adaptation of pessimistic transactions is DML execution.

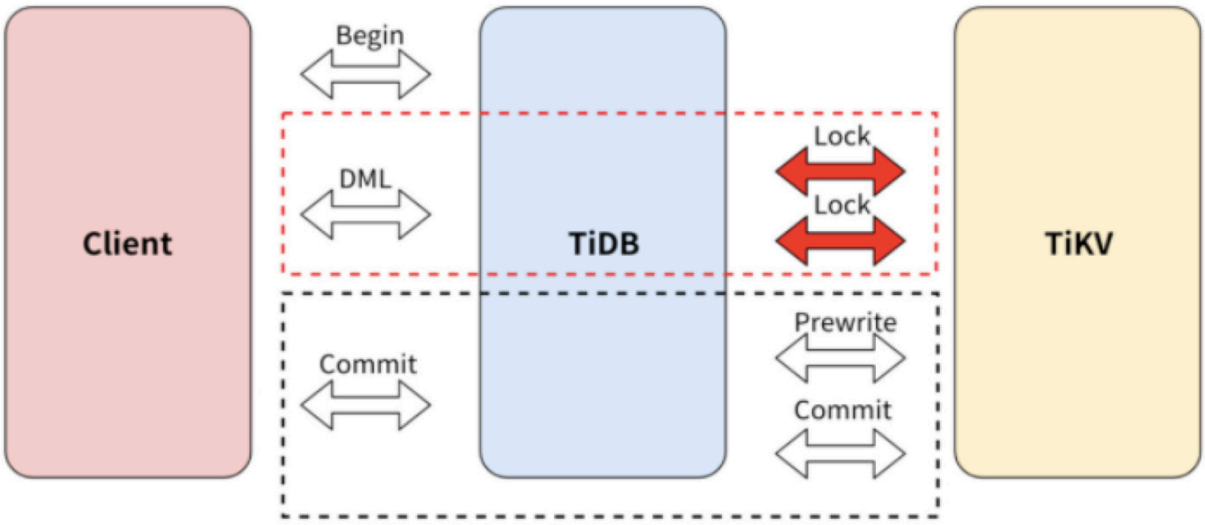

Figure 436: TiDB pessimistic transaction commit process

The pessimistic transaction adds an `Acquire Pessimistic Lock` phase before 2PC. This phase includes the following steps:

1. (Same as the optimistic transaction mode) TiDB receives the `begin` request from the client, and the current timestamp is this transaction's start_ts.
2. When the TiDB server receives a writing request from the client, the TiDB server initiates a pessimistic lock request to the TiKV server, and the lock is persisted to the TiKV server.
3. (Same as the optimistic transaction mode) When the client sends the commit request, TiDB starts to perform the two-phase commit similar to the optimistic transaction mode.

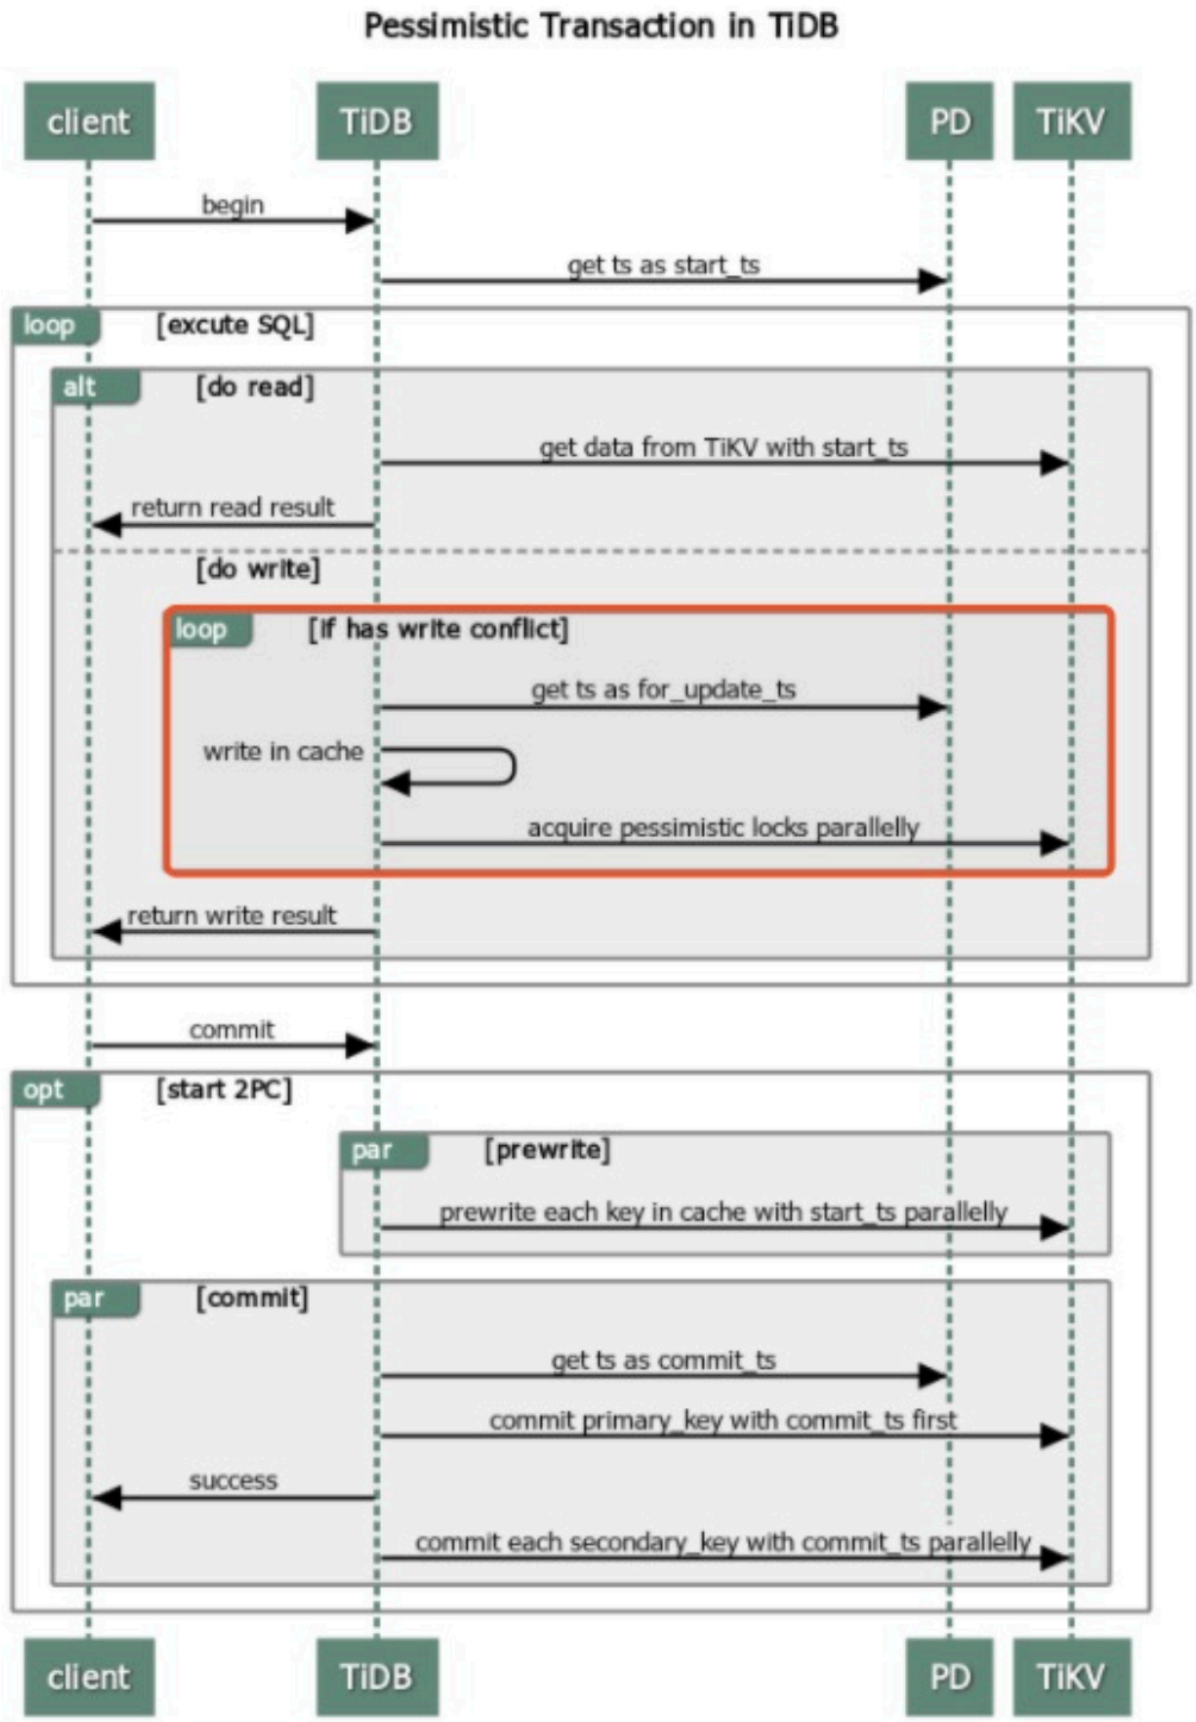

Figure 437: Pessimistic transactions in TiDB

14.13.10.4.6 Pipelined locking process

Adding a pessimistic lock requires writing data into TiKV. The response of successfully adding a lock can only be returned to TiDB after commit and apply through Raft. Therefore, compared with optimistic transactions, the pessimistic transaction mode inevitably has higher latency.

To reduce the overhead of locking, TiKV implements the pipelined locking process: when the data meets the requirements for locking, TiKV immediately notifies TiDB to execute subsequent requests and writes into the pessimistic lock asynchronously. This process reduces most latency and significantly improves the performance of pessimistic transactions. However, when network partition occurs in TiKV or a TiKV node is down, the asynchronous write into the pessimistic lock might fail and affect the following aspects:

- Other transactions that modify the same data cannot be blocked. If the application logic relies on locking or lock waiting mechanisms, the correctness of the application logic is affected.
- There is a low probability that the transaction commit fails, but it does not affect the correctness of the transactions.

If the application logic relies on the locking or lock waiting mechanisms, or if you want to guarantee as much as possible the success rate of transaction commits even in the case of TiKV cluster anomalies, you should disable the pipelined locking feature.

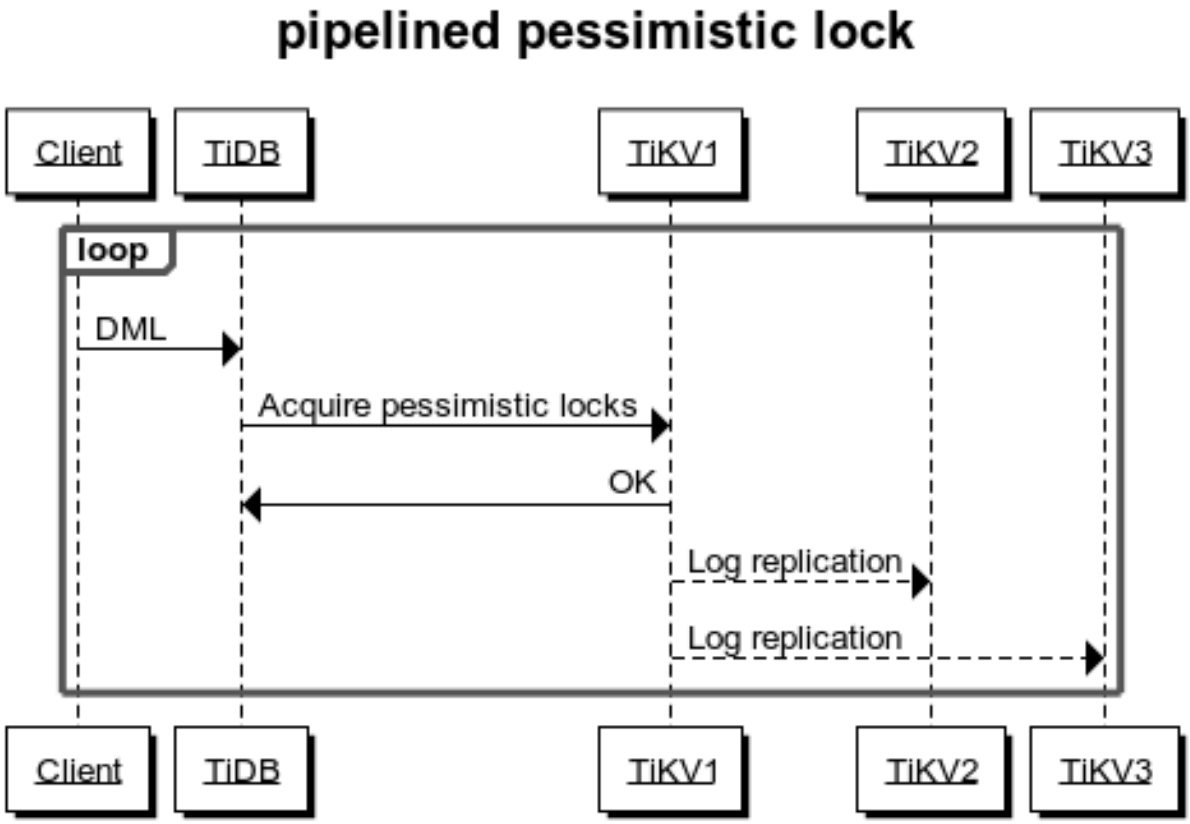

Figure 438: Pipelined pessimistic lock

This feature is enabled by default. To disable it, modify the TiKV configuration:

```
[pessimistic-txn]
pipelined = false
```

If the TiKV cluster is v4.0.9 or later, you can also dynamically disable this feature by modifying TiKV configuration dynamically:

```
set config tikv pessimistic-txn.pipelined='false';
```

14.13.10.4.7 In-memory pessimistic lock

In v6.0.0, TiKV introduces the feature of in-memory pessimistic lock. When this feature is enabled, pessimistic locks are usually stored in the memory of the Region leader only, and are not persisted to disk or replicated through Raft to other replicas. This feature can greatly reduce the overhead of acquiring pessimistic locks and improve the throughput of pessimistic transactions.

When the memory usage of in-memory pessimistic locks exceeds the memory threshold of the Region or the TiKV node, the acquisition of pessimistic locks turns to the pipelined locking process. When the Region is merged or the leader is transferred, to avoid the loss of the pessimistic lock, TiKV writes the in-memory pessimistic lock to disk and replicates it to other replicas.

The in-memory pessimistic lock performs similarly to the pipelined locking process, which does not affect the lock acquisition when the cluster is healthy. However, when network isolation occurs in TiKV or a TiKV node is down, the acquired pessimistic lock might be lost.

If the application logic relies on the lock acquiring or lock waiting mechanism, or if you want to guarantee as much as possible the success rate of transaction commits even when the cluster is in an abnormal state, you need to **disable** the in-memory pessimistic lock feature.

This feature is enabled by default. To disable it, modify the TiKV configuration:

```
[pessimistic-txn]
in-memory = false
```

To dynamically disable this feature, modify the TiKV configuration dynamically:

```
set config tikv pessimistic-txn.in-memory='false';
```

14.13.10.5 Non-Transactional DML Statements

This document describes the usage scenarios, usage methods, and restrictions of non-transactional DML statements in TiDB. In addition, the implementation principle and common issues are also explained.

A non-transactional DML statement is a DML statement split into multiple SQL statements (which is, multiple batches) to be executed in sequence. It enhances the performance and ease of use in batch data processing at the expense of transactional atomicity and isolation.

Usually, memory-consuming transactions need to be split into multiple SQL statements to bypass the transaction size limit. Non-transactional DML statements integrate this process into the TiDB kernel to achieve the same effect. It is helpful to understand the effect of non-transactional DML statements by splitting SQL statements. The `DRY RUN` syntax can be used to preview the split statements.

Non-transactional DML statements include:

- `INSERT INTO ... SELECT`
- `REPLACE INTO .. SELECT`
- `UPDATE`
- `DELETE`

For detailed syntax, see `BATCH`.

Note:

- A non-transactional DML statement does not guarantee the atomicity and isolation of the statement, and is not equivalent to the original DML statement.
- After a DML statement is rewritten into a non-transactional DML statement, you cannot assume that its behavior is consistent with that of the original statement.
- Before using a non-transactional DML, you need to analyze whether the split statements will affect each other.

14.13.10.5.1 Usage scenarios

In the scenarios of large data processing, you might often need to perform same operations on a large batch of data. If the operation is performed directly using a single SQL statement, the transaction size might exceed the limit and affect the execution performance.

Batch data processing often has no overlap of time or data with the online application operations. Isolation (I in ACID) is unnecessary when no concurrent operations exist. Atomicity is also unnecessary if bulk data operations are idempotent or easily retryable. If your application needs neither data isolation nor atomicity, you can consider using non-transactional DML statements.

Non-transactional DML statements are used to bypass the size limit on large transactions in certain scenarios. One statement is used to complete tasks that would otherwise require manually splitting of transactions, with higher execution efficiency and less resource consumption.

For example, to delete expired data, if you ensure that no application will access the expired data, you can use a non-transactional DML statement to improve the `DELETE` performance.

14.13.10.5.2 Prerequisites

Before using non-transactional DML statements, make sure that the following conditions are met:

- The statement does not require atomicity, which permits some rows to be modified and some rows to remain unmodified in the execution result.
- The statement is idempotent, or you are prepared to retry on a part of the data according to the error message. If the system variables are set to `tidb_redact_log = 1` and `tidb_nontransactional_ignore_error = 1`, this statement must be

idempotent. Otherwise, when the statement partially fails, the failed part cannot be accurately located.

- The data to be operated on has no other concurrent writes, which means it is not updated by other statements at the same time. Otherwise, unexpected results such as missing writes, wrong writes, and modifying the same line multiple times might occur.
- The statement does not modify the data to be read by the statement itself. Otherwise, the following batch will read the data written by the previous batch and easily causes unexpected results.
    - Avoid modifying the shard column when you select from and modify the same table within a non-transactional `INSERT INTO ... SELECT` statement. Otherwise, multiple batches might read the same row and insert data multiple times:
        - It is not recommended to use `BATCH ON test.t.id LIMIT 10000 INSERT INTO t SELECT id+1, value FROM t;`.
        - It is recommended to use `BATCH ON test.t.id LIMIT 10000 INSERT INTO t SELECT id, value FROM t;`.
        - If the shard column `id` has the `AUTO_INCREMENT` attribute, it is recommended to use `BATCH ON test.t.id LIMIT 10000 INSERT INTO t(value)SELECT value FROM t;`.
    - Avoid updating the shard column in the non-transactional `UPDATE`, `INSERT ... ON DUPLICATE KEY UPDATE`, or `REPLACE INTO` statement:
        - For example, for a non-transactional `UPDATE` statement, the split SQL statements are executed in sequence. The modification of the previous batch is read by the next batch after the previous batch is committed, which causes the same line of data to be modified multiple times.
        - These statements do not support `BATCH ON test.t.id LIMIT 10000 UPDATE t SET test.t.id = test.t.id-1;`.
        - It is not recommended to use `BATCH ON test.t.id LIMIT 1 INSERT INTO t SELECT id+1, value FROM t ON DUPLICATE KEY UPDATE id = id + 1;`.
    - The shard column should not be used as a Join key. For example, the following example uses the shard column `test.t.id` as a Join key, which causes a non-transactional `UPDATE` statement to modify the same line multiple times:

```
CREATE TABLE t(id int, v int, key(id));
CREATE TABLE t2(id int, v int, key(id));
INSERT INTO t VALUES (1, 1), (2, 2), (3, 3);
INSERT INTO t2 VALUES (1, 1), (2, 2), (4, 4);
BATCH ON test.t.id LIMIT 1 UPDATE t JOIN t2 ON t.id = t2.id SET t2
    ↪ .id = t2.id+1;
SELECT * FROM t2; -- (4, 1) (4, 2) (4, 4)
```

- The statement meets the restrictions.
- It is not recommended to perform concurrent DDL operations on the table to be read or written by this DML statement.

> **Warning:**
>
> If `tidb_redact_log` and `tidb_nontransactional_ignore_error` are enabled at the same time, you might not get the complete error information of each batch, and you cannot retry the failed batch only. Therefore, if both of the system variables are turned on, the non-transactional DML statement must be idempotent.

14.13.10.5.3 Usage examples

Use a non-transactional DML statement

The following sections describe the use of non-transactional DML statements with examples:

Create a table `t` with the following schema:

```
CREATE TABLE t (id INT, v INT, KEY(id));
```

```
Query OK, 0 rows affected
```

Insert some data into table `t`.

```
INSERT INTO t VALUES (1, 2), (2, 3), (3, 4), (4, 5), (5, 6);
```

```
Query OK, 5 rows affected
```

The following operation uses a non-transactional DML statement to delete rows with values less than the integer 6 on column `v` of table `t`. This statement is split into two SQL statements, with a batch size of 2, sharded by the `id` column and executed.

```
BATCH ON id LIMIT 2 DELETE FROM t WHERE v < 6;
```

```
+---------------+--------------+
| number of jobs | job status |
+---------------+--------------+
| 2             | all succeeded |
+---------------+--------------+
1 row in set
```

Check the deletion results of the above non-transactional DML statement.

```
SELECT * FROM t;
```

```
+----+---+
| id | v |
+----+---+
| 5  | 6 |
+----+---+
1 row in set
```

The following example describes how to use multiple table joins. First, create table `t2` and insert data:

```
CREATE TABLE t2(id int, v int, key(id));
INSERT INTO t2 VALUES (1,1), (3,3), (5,5);
```

Then, update the data of table `t2` by joining table `t` and `t2`. Note that you need to specify the shard column along with the complete database name, table name, and column name (`test.t.id`):

```
BATCH ON test.t._tidb_rowid LIMIT 1 UPDATE t JOIN t2 ON t.id = t2.id SET t2
    ↪ .id = t2.id+1;
```

Query the results:

```
SELECT * FROM t2;
```

```
+----+---+
| id | v |
+----+---+
| 1  | 1 |
| 3  | 3 |
| 6  | 5 |
+----+---+
```

Check the execution progress

During the execution of a non-transactional DML statement, you can view the progress using `SHOW PROCESSLIST`. The `Time` field in the returned result indicates the time consumption of the current batch execution. Logs and slow logs also record the progress of each split statement throughout the non-transactional DML execution. For example:

```
SHOW PROCESSLIST;
```

```
+--
    ↪ ----+------+--------------------+--------+---------+------+-----------+--------
    ↪
```

```
| Id   | User | Host              | db    | Command | Time | State   | Info
    ↪
    ↪ |
+--
    ↪ ----+------+-------------------+-------+---------+------+-----------+-------
    ↪
| 1203 | root | 100.64.10.62:52711 | test | Query | 0 | autocommit | /* job
    ↪  506/500000 */ DELETE FROM `test`.`t1` WHERE `test`.`t1`.`_tidb_rowid
    ↪ ` BETWEEN 2271 AND 2273 |
| 1209 | root | 100.64.10.62:52735 | <null> | Query | 0 | autocommit | show
    ↪  full processlist
    ↪                                                                    |
+--
    ↪ ----+------+-------------------+-------+---------+------+-----------+-------
    ↪
```

Terminate a non-transactional DML statement

To terminate a non-transactional DML statement, you can use `KILL TIDB <processlist_id>`. Then TiDB will cancel all batches after the batch that is currently being executed. You can get the execution result from the log.

For more information about `KILL TIDB`, see the reference KILL.

Query the batch-dividing statement

During the execution of a non-transactional DML statement, a statement is internally used to divide the DML statement into multiple batches. To query this batch-dividing statement, you can add `DRY RUN QUERY` to this non-transactional DML statement. Then TiDB will not execute this query and the subsequent DML operations.

The following statement queries the batch-dividing statement during the execution of `BATCH ON id LIMIT 2 DELETE FROM t WHERE v < 6`:

```
BATCH ON id LIMIT 2 DRY RUN QUERY DELETE FROM t WHERE v < 6;
```

```
+--
    ↪ ------------------------------------------------------------------------+
    ↪

Query the statements corresponding to the first and the last batches

To query the actual DML statements corresponding to the first and the last batches in a non-transactional DML statement, you can add `DRY RUN` to this non-transactional DML statement. Then, TiDB only divides batches and does not execute these SQL statements. Because there might be many batches, not all batches are displayed, and only the first one and the last one are displayed.

```
BATCH ON id LIMIT 2 DRY RUN DELETE FROM t WHERE v < 6;
```

```
+-----------------------------------------------------------------+
| split statement examples                                        |
+-----------------------------------------------------------------+
| DELETE FROM `test`.`t` WHERE (`id` BETWEEN 1 AND 2 AND (`v` < 6)) |
| DELETE FROM `test`.`t` WHERE (`id` BETWEEN 3 AND 4 AND (`v` < 6)) |
+-----------------------------------------------------------------+
2 rows in set
```

Use the optimizer hint

If an optimizer hint is originally supported in the `DELETE` statement, the optimizer hint is also supported in the non-transactional `DELETE` statement. The position of the hint is the same as that in the ordinary `DELETE` statement:

```
BATCH ON id LIMIT 2 DELETE /*+ USE_INDEX(t)*/ FROM t WHERE v < 6;
```

14.13.10.5.4 Best practices

To use a non-transactional DML statement, the following steps are recommended:

1. Select an appropriate shard column. Integer or string types are recommended.
2. Add `DRY RUN QUERY` to the non-transactional DML statement, execute the query manually, and confirm whether the data range affected by the DML statement is roughly correct.
3. Add `DRY RUN` to the non-transactional DML statement, execute the query manually, and check the split statements and the execution plans. You need to pay attention to the following points:
    - Whether the split statement can read the result written by the previous statement, which might cause an anomaly.
    - The index selectivity.
    - Whether the shard column automatically selected by TiDB will be modified.

4. Execute the non-transactional DML statement.
5. If an error is reported, get the specific failed data range from the error message or log, and retry or handle it manually.

14.13.10.5.5 Parameter description

Parameter	Description	Default value	Required or not	Recommended value

| Parameter | Description | Default value | Required or not | Recommended value |

Shard column	The column used to shard batches, such as the `id` column in the above non-transactional DML statement `BATCH ON id LIMIT 2 DELETE FROM t WHERE v < 4537`	TiDB tries to automatically select a shard column (not recommended).	No	Select a column that can meet the `WHERE` condition in the most efficient way.

Parameter	Description	Default value	Required or not	Recommended value
Batch size	Used to control the size of each batch. The number of batches is the number of SQL statements into which DML operations are split, such as `LIMIT ↪ ↪ 2 ↪` in the above non-transactional DML statement `BATCH ↪`	N/A	Yes	1000-1000000. Too small or too large a batch will lead to performance degradation.

Parameter	Description	Default value	Required or not	Recommended value

How to select a shard column

A non-transactional DML statement uses a column as the basis for data batching, which is the shard column. For higher execution efficiency, a shard column is required to use index. The execution efficiency brought by different indexes and shard columns might vary by dozens of times. When choosing the shard column, consider the following suggestions:

- If you know the application data distribution, according to the `WHERE` condition, choose the column that divides data with smaller ranges after the batching.
    - Ideally, the `WHERE` condition can take advantage of the index of the shard column to reduce the amount of data to be scanned per batch. For example, there is a transaction table that records the start and end time of each transaction, and you want to delete all transaction records whose end time is before one month. If there is an index on the start time of the transaction, and the start and end times of the transaction are relatively close, then you can choose the start time column as the shard column.
    - In a less-than-ideal case, the data distribution of the shard column is completely independent of the `WHERE` condition, and the index of the shard column cannot be used to reduce the scope of the data scan.
- When a clustered index exists, it is recommended to use the primary key (including an `INT` primary key and `_tidb_rowid`) as the shard column, so that the execution efficiency is higher.
- Choose the column with fewer duplicate values.

You can also choose not to specify a shard column. Then, TiDB will use the first column of `handle` as the shard column by default. But if the first column of the primary key of the clustered index is of a data type not supported by non-transactional DML statements (which is `ENUM`, `BIT`, `SET`, `JSON`), TiDB will report an error. You can choose an appropriate shard column according to your application needs.

How to set batch size

In non-transactional DML statements, the larger the batch size, the fewer SQL statements are split and the slower each SQL statement is executed. The optimal batch size depends on the workload. It is recommended to start from 50000. Either too small or too large batch sizes will cause decreased execution efficiency.

The information of each batch is stored in memory, so too many batches can significantly increase memory consumption. This explains why the batch size cannot be too small. The upper limit of memory consumed by non-transactional statements for storing batch information is the same as `tidb_mem_quota_query`, and the action triggered when this limit is exceeded is determined by the configuration item `tidb_mem_oom_action`.

14.13.10.5.6 Restrictions

The following are hard restrictions on non-transactional DML statements. If these restrictions are not met, TiDB will report an error.

- The DML statements cannot contain `ORDER BY` or `LIMIT` clauses.
- Subqueries or set operations are not supported.
- The shard column must be indexed. The index can be a single-column index, or the first column of a joint index.
- Must be used in the `autocommit` mode.
- Cannot be used when batch-dml is enabled.
- Cannot be used when `tidb_snapshot` is set.
- Cannot be used with the `prepare` statement.
- `ENUM`, `BIT`, `SET`, `JSON` types are not supported as the shard columns.
- Not supported for temporary tables.
- Common Table Expression is not supported.

14.13.10.5.7 Control batch execution failure

Non-transactional DML statements do not satisfy atomicity. Some batches might succeed and some might fail. The system variable `tidb_nontransactional_ignore_error` controls how the non-transactional DML statements handle errors.

An exception is that if the first batch fails, there is a high probability that the statement itself is wrong. In this case, the entire non-transactional statement will directly return an error.

14.13.10.5.8 How it works

The working principle of non-transactional DML statements is to build into TiDB the automatic splitting of SQL statements. Without non-transactional DML statements, you will need to manually split the SQL statements. To understand the behavior of a non-transactional DML statement, think of it as a user script doing the following tasks:

For the non-transactional DML `BATCH ON $C$ LIMIT $N$ DELETE FROM ... WHERE $P$`, C is the column used for dividing, N is the batch size, and P is the filter condition.

1. According to the filter condition P of the original statement and the specified column C for dividing, TiDB queries all C that satisfy P. TiDB sorts these C into groups $B_1 \dots B_k$ according to N. For each of all B_i, TiDB keeps its first and last C as S_i and E_i. The query statement executed in this step can be viewed through `DRY RUN QUERY`.
2. The data involved in B_i is a subset that satisfies P_i: C BETWEEN S_i AND E_i. You can use P_i to narrow down the range of data that each batch needs to process.
3. For B_i, TiDB embeds the above condition into the `WHERE` condition of the original statement, which makes it WHERE (P_i) AND (P). The execution result of this step can be viewed through `DRY RUN`.

4. For all batches, execute new statements in sequence. The errors for each grouping are collected and combined, and returned as the result of the entire non-transactional DML statement after all groupings are complete.

14.13.10.5.9 Comparison with batch-dml

batch-dml is a mechanism for splitting a transaction into multiple transaction commits during the execution of a DML statement.

> **Note:**
>
> It is not recommended to use batch-dml which has been deprecated. When the batch-dml feature is not properly used, there is a risk of data index inconsistency.

Non-transactional DML statements are not yet a replacement for all batch-dml usage scenarios. Their main differences are as follows:

- Performance: When the shard column is efficient, the performance of non-transactional DML statements is close to that of batch-dml. When the shard column is less efficient, the performance of non-transactional DML statements is significantly lower than that of batch-dml.
- Stability: batch-dml is prone to data index inconsistencies due to improper use. Non-transactional DML statements do not cause data index inconsistencies. However, when used improperly, non-transactional DML statements are not equivalent to the original statements, and the applications might observe unexpected behavior. See the common issues section for details.

14.13.10.5.10 Common issues

Executing a multiple table joins statement results in the `Unknown column xxx in 'where clause'` error

This error occurs when the `WHERE` clause concatenated in a query involves tables other than the table in which the shard column is defined. For example, in the following SQL statement, the shard column is `t2.id` and it is defined in table `t2`, but the `WHERE` clause involves table `t2` and `t3`.

```
BATCH ON test.t2.id LIMIT 1
INSERT INTO t
SELECT t2.id, t2.v, t3. FROM t2, t3 WHERE t2.id = t3.id
```

```
(1054, "Unknown column 't3.id' in 'where clause'")
```

If the error occurs, you can print the query statement for confirmation by using `DRY RUN QUERY`. For example:

```
BATCH ON test.t2.id LIMIT 1
DRY RUN QUERY INSERT INTO t
SELECT t2.id, t2.v, t3. FROM t2, t3 WHERE t2.id = t3.id
```

To avoid the error, you can move the condition related to other tables in the `WHERE` clause to the `ON` condition in the `JOIN` clause. For example:

```
BATCH ON test.t2.id LIMIT 1
INSERT INTO t
SELECT t2.id, t2.v, t3. FROM t2 JOIN t3 ON t2.id=t3.id
```

```
+----------------+---------------+
| number of jobs | job status |
+----------------+---------------+
| 0              | all succeeded |
+----------------+---------------+
```

The actual batch size is not the same as the specified batch size

During the execution of a non-transactional DML statement, the size of data to be processed in the last batch might be smaller than the specified batch size.

When **duplicated values exist in the shard column**, each batch will contain all the duplicated values of the last element of the shard column in this batch. Therefore, the number of rows in this batch might be greater than the specified batch size.

In addition, when other concurrent writes occur, the number of rows processed in each batch might be different from the specified batch size.

The `Failed to restore the delete statement, probably because of unsupported type of the shard column` error occurs during execution

The shard column does not support `ENUM`, `BIT`, `SET`, `JSON` types. Try to specify a new shard column. It is recommended to use an integer or string type column.

If the error occurs when the selected shard column is not one of these unsupported types, get support from PingCAP or the community.

Non-transactional `DELETE` has "exceptional" behavior that is not equivalent to ordinary `DELETE`

A non-transactional DML statement is not equivalent to the original form of this DML statement, which might have the following reasons:

- There are other concurrent writes.

- The non-transactional DML statement modifies a value that the statement itself will read.
- The SQL statement executed in each batch might cause a different execution plan and expression calculation order because the `WHERE` condition is changed. Therefore, the execution result might be different from the original statement.
- The DML statements contain non-deterministic operations.

14.13.10.5.11 MySQL compatibility

Non-transactional statements are TiDB-specific and are not compatible with MySQL.

14.13.10.5.12 See also

- The `BATCH` syntax
- `tidb_nontransactional_ignore_error`

14.13.11 Views

TiDB supports views. A view acts as a virtual table, whose schema is defined by the `SELECT` statement that creates the view. Using views has the following benefits:

- Exposing only safe fields and data to users to ensure security of sensitive fields and data stored in the underlying table.
- Defining complex queries that frequently appear as views to make complex queries easier and more convenient.

14.13.11.1 Query views

Querying a view is similar to querying an ordinary table. However, when TiDB queries a view, it actually queries the `SELECT` statement associated with the view.

14.13.11.2 Show metadata

To obtain the metadata of views, choose any of the following methods.

14.13.11.2.1 Use the `SHOW CREATE TABLE view_name` or `SHOW CREATE VIEW view_name` statement

Usage example:

```
show create view v;
```

This statement shows the `CREATE VIEW` statement corresponding to this view and the value of the `character_set_client` and `collation_connection` system variables when the view was created.

```
+--
    ↪ ----+----------------------------------------------------------------------
    ↪
| View | Create View
    ↪
    ↪ | character_set_client | collation_connection |
+--
    ↪ ----+----------------------------------------------------------------------
    ↪
| v    | CREATE ALGORITHM=UNDEFINED DEFINER=`root`@`127.0.0.1` SQL SECURITY
    ↪ DEFINER VIEW `v` (`a`) AS SELECT `s`.`a` FROM `test`.`t` LEFT JOIN `
    ↪ test`.`s` ON `t`.`a`=`s`.`a` | utf8 | utf8_general_ci |
+--
    ↪ ----+----------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

14.13.11.2.2 Query the INFORMATION_SCHEMA.VIEWS table

Usage example:

```
select * from information_schema.views;
```

You can view the relevant meta information of the view by querying this table, such as TABLE_CATALOG, TABLE_SCHEMA, TABLE_NAME, VIEW_DEFINITION, CHECK_OPTION, IS_UPDATABLE, DEFINER, SECURITY_TYPE, CHARACTER_SET_CLIENT, and COLLATION_
↪ CONNECTION.

```
+--
    ↪ ------------+-------------+-----------+-----------------------------------
    ↪
| TABLE_CATALOG | TABLE_SCHEMA | TABLE_NAME | VIEW_DEFINITION
    ↪                                          | CHECK_OPTION | IS_UPDATABLE
    ↪  | DEFINER  | SECURITY_TYPE | CHARACTER_SET_CLIENT | COLLATION_
    ↪ CONNECTION |
+--
    ↪ ------------+-------------+-----------+-----------------------------------
    ↪
| def          | test        | v         | SELECT `s`.`a` FROM `test`.`t` LEFT
    ↪  JOIN `test`.`s` ON `t`.`a`=`s`.`a` | CASCADED | NO  | root@127.0.0.1
    ↪ | DEFINER   | utf8                 | utf8_general_ci    |
+--
    ↪ ------------+-------------+-----------+-----------------------------------
    ↪
1 row in set (0.00 sec)
```

14.13.11.2.3 Use the HTTP APIs

Usage example:

```
curl http://127.0.0.1:10080/schema/test/v
```

By visiting `http://{TiDBIP}:10080/schema/{db}/{view}`, you can get all the metadata for the view.

14.13.11.3 Example

The following example creates a view, queries this view, and delete this view:

```
create table t(a int, b int);
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
insert into t values(1, 1),(2,2),(3,3);
```

```
Query OK, 3 rows affected (0.00 sec)
Records: 3 Duplicates: 0 Warnings: 0
```

```
create table s(a int);
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
insert into s values(2),(3);
```

```
Query OK, 2 rows affected (0.01 sec)
Records: 2 Duplicates: 0 Warnings: 0
```

```
create view v as select s.a from t left join s on t.a = s.a;
```

```
Query OK, 0 rows affected (0.01 sec)
```

```
select * from v;
```

```
+------+
| a    |
+------+
| NULL |
|    2 |
|    3 |
+------+
3 rows in set (0.00 sec)
```

```
drop view v;
```

```
Query OK, 0 rows affected (0.02 sec)
```

14.13.11.4 Limitations

Currently, views in TiDB are subject to the following limitations:

- Materialized views are not supported yet.
- Views in TiDB are read-only and do not support write operations such as `UPDATE`, `INSERT`, `DELETE`, and `TRUNCATE`.
- For created views, the only supported DDL operation is `DROP [VIEW | TABLE]`

14.13.11.5 See also

- CREATE VIEW
- DROP VIEW

14.13.12 Partitioning

This document introduces TiDB's implementation of partitioning.

14.13.12.1 Partitioning types

This section introduces the types of partitioning in TiDB. Currently, TiDB supports Range partitioning, Range COLUMNS partitioning, List partitioning, List COLUMNS partitioning, Hash partitioning, and Key partitioning.

- Range partitioning, Range COLUMNS partitioning, List partitioning, and List COLUMNS partitioning are used to resolve the performance issues caused by a large number of deletions in the application, and support dropping partitions quickly.
- Hash partitioning and Key partitioning are used to distribute data in scenarios with a large number of writes. Compared with Hash partitioning, Key partitioning supports distributing data of multiple columns and partitioning by non-integer columns.

14.13.12.1.1 Range partitioning

When a table is partitioned by Range, each partition contains rows for which the partitioning expression value lies within a given Range. Ranges have to be contiguous but not overlapping. You can define it by using `VALUES LESS THAN`.

Assume you need to create a table that contains personnel records as follows:

```
CREATE TABLE employees (
    id INT NOT NULL,
    fname VARCHAR(30),
    lname VARCHAR(30),
    hired DATE NOT NULL DEFAULT '1970-01-01',
    separated DATE DEFAULT '9999-12-31',
    job_code INT,
    store_id INT NOT NULL
);
```

You can partition a table by Range in various ways as needed. For example, you can partition it by using the `store_id` column:

```
CREATE TABLE employees (
    id INT NOT NULL,
    fname VARCHAR(30),
```

```
    lname VARCHAR(30),
    hired DATE NOT NULL DEFAULT '1970-01-01',
    separated DATE DEFAULT '9999-12-31',
    job_code INT,
    store_id INT NOT NULL
)

PARTITION BY RANGE (store_id) (
    PARTITION p0 VALUES LESS THAN (6),
    PARTITION p1 VALUES LESS THAN (11),
    PARTITION p2 VALUES LESS THAN (16),
    PARTITION p3 VALUES LESS THAN (21)
);
```

In this partition scheme, all rows corresponding to employees whose `store_id` is 1 through 5 are stored in the `p0` partition while all employees whose `store_id` is 6 through 10 are stored in `p1`. Range partitioning requires the partitions to be ordered, from lowest to highest.

If you insert a row of data `(72, 'Tom', 'John', '2015-06-25', NULL, NULL, 15)`, it falls in the `p2` partition. But if you insert a record whose `store_id` is larger than 20, an error is reported because TiDB cannot know which partition this record should be inserted into. In this case, you can use `MAXVALUE` when creating a table:

```
CREATE TABLE employees (
    id INT NOT NULL,
    fname VARCHAR(30),
    lname VARCHAR(30),
    hired DATE NOT NULL DEFAULT '1970-01-01',
    separated DATE DEFAULT '9999-12-31',
    job_code INT,
    store_id INT NOT NULL
)

PARTITION BY RANGE (store_id) (
    PARTITION p0 VALUES LESS THAN (6),
    PARTITION p1 VALUES LESS THAN (11),
    PARTITION p2 VALUES LESS THAN (16),
    PARTITION p3 VALUES LESS THAN MAXVALUE
);
```

`MAXVALUE` represents an integer value that is larger than all other integer values. Now, all records whose `store_id` is equal to or larger than 16 (the highest value defined) are stored in the `p3` partition.

You can also partition a table by employees' job codes, which are the values of the `job_code` column. Assume that two-digit job codes stand for regular employees, three-

digit codes stand for office and customer support personnel, and four-digit codes stand for managerial personnel. Then you can create a partitioned table like this:

```
CREATE TABLE employees (
    id INT NOT NULL,
    fname VARCHAR(30),
    lname VARCHAR(30),
    hired DATE NOT NULL DEFAULT '1970-01-01',
    separated DATE DEFAULT '9999-12-31',
    job_code INT,
    store_id INT NOT NULL
)

PARTITION BY RANGE (job_code) (
    PARTITION p0 VALUES LESS THAN (100),
    PARTITION p1 VALUES LESS THAN (1000),
    PARTITION p2 VALUES LESS THAN (10000)
);
```

In this example, all rows relating to regular employees are stored in the `p0` partition, all office and customer support personnel in the `p1` partition, and all managerial personnel in the `p2` partition.

Besides splitting up the table by `store_id`, you can also partition a table by dates. For example, you can partition by employees' separation year:

```
CREATE TABLE employees (
    id INT NOT NULL,
    fname VARCHAR(30),
    lname VARCHAR(30),
    hired DATE NOT NULL DEFAULT '1970-01-01',
    separated DATE DEFAULT '9999-12-31',
    job_code INT,
    store_id INT
)

PARTITION BY RANGE ( YEAR(separated) ) (
    PARTITION p0 VALUES LESS THAN (1991),
    PARTITION p1 VALUES LESS THAN (1996),
    PARTITION p2 VALUES LESS THAN (2001),
    PARTITION p3 VALUES LESS THAN MAXVALUE
);
```

In Range partitioning, you can partition based on the values of the `timestamp` column and use the `unix_timestamp()` function, for example:

```
CREATE TABLE quarterly_report_status (
```

```
    report_id INT NOT NULL,
    report_status VARCHAR(20) NOT NULL,
    report_updated TIMESTAMP NOT NULL DEFAULT CURRENT_TIMESTAMP ON UPDATE
        ↪ CURRENT_TIMESTAMP
)

PARTITION BY RANGE ( UNIX_TIMESTAMP(report_updated) ) (
    PARTITION p0 VALUES LESS THAN ( UNIX_TIMESTAMP('2008-01-01 00:00:00') ),
    PARTITION p1 VALUES LESS THAN ( UNIX_TIMESTAMP('2008-04-01 00:00:00') ),
    PARTITION p2 VALUES LESS THAN ( UNIX_TIMESTAMP('2008-07-01 00:00:00') ),
    PARTITION p3 VALUES LESS THAN ( UNIX_TIMESTAMP('2008-10-01 00:00:00') ),
    PARTITION p4 VALUES LESS THAN ( UNIX_TIMESTAMP('2009-01-01 00:00:00') ),
    PARTITION p5 VALUES LESS THAN ( UNIX_TIMESTAMP('2009-04-01 00:00:00') ),
    PARTITION p6 VALUES LESS THAN ( UNIX_TIMESTAMP('2009-07-01 00:00:00') ),
    PARTITION p7 VALUES LESS THAN ( UNIX_TIMESTAMP('2009-10-01 00:00:00') ),
    PARTITION p8 VALUES LESS THAN ( UNIX_TIMESTAMP('2010-01-01 00:00:00') ),
    PARTITION p9 VALUES LESS THAN (MAXVALUE)
);
```

It is not allowed to use any other partitioning expression that contains the timestamp column.

Range partitioning is particularly useful when one or more of the following conditions are satisfied:

- You want to delete the old data. If you use the `employees` table in the previous example, you can delete all records of employees who left this company before the year 1991 by simply using `ALTER TABLE employees DROP PARTITION p0;`. It is faster than executing the `DELETE FROM employees WHERE YEAR(separated)<= 1990;` operation.
- You want to use a column that contains time or date values, or containing values arising from some other series.
- You need to frequently run queries on the columns used for partitioning. For example, when executing a query like `EXPLAIN SELECT COUNT(*)FROM employees WHERE separated BETWEEN '2000-01-01' AND '2000-12-31' GROUP BY store_id;`, TiDB can quickly know that only the data in the `p2` partition needs to be scanned, because the other partitions do not match the `WHERE` condition.

14.13.12.1.2 Range COLUMNS partitioning

Range COLUMNS partitioning is a variant of Range partitioning. You can use one or more columns as partitioning keys. The data types of partition columns can be integer, string (`CHAR` or `VARCHAR`), `DATE`, and `DATETIME`. Any expressions, such as non-COLUMNS partitioning, are not supported.

Suppose that you want to partition by name, and drop old and invalid data, then you can create a table as follows:

```
CREATE TABLE t (
  valid_until datetime,
  name varchar(255) CHARACTER SET ascii,
  notes text
)
PARTITION BY RANGE COLUMNS(name, valid_until)
(PARTITION `p2022-g` VALUES LESS THAN ('G','2023-01-01 00:00:00'),
 PARTITION `p2023-g` VALUES LESS THAN ('G','2024-01-01 00:00:00'),
 PARTITION `p2022-m` VALUES LESS THAN ('M','2023-01-01 00:00:00'),
 PARTITION `p2023-m` VALUES LESS THAN ('M','2024-01-01 00:00:00'),
 PARTITION `p2022-s` VALUES LESS THAN ('S','2023-01-01 00:00:00'),
 PARTITION `p2023-s` VALUES LESS THAN ('S','2024-01-01 00:00:00'))
```

The preceding SQL statement will partition the data by year and by name in the ranges `[ ('', ''), ('G', '2023-01-01 00:00:00'))`, `[ ('G', '2023-01-01 00:00:00'), ('G', '2024-01-01 00:00:00'))`, `[ ('G', '2024-01-01 00:00:00'), ('M', '2023-01-01 00:00:00'))`, `[ ('M', '2023-01-01 00:00:00'), ('M', '2024-01-01 00:00:00'))`, `[ ('M', '2024-01-01 00:00:00'), ('S', '2023-01-01 00:00:00'))`, and `[ ('S', '2023-01-01 00:00:00'), ('S', '2024-01-01 00:00:00'))`. It allows you to easily drop invalid data while still benefit from partition pruning on both `name` and `valid_until` columns. In this example, `[,)` indicates a left-closed, right-open range. For example, `[ ('G', '2023-01-01 00:00:00'), ('G', '2024-01-01 00:00:00'))` indicates a range of data whose name is `'G'`, the year contains `2023-01-01 00:00:00` and is greater than `2023-01-01 00:00:00` but less than `2024-01-01 00:00:00`. It does not include `(G, 2024-01-01 00:00:00)`.

14.13.12.1.3 Range INTERVAL partitioning

Range INTERVAL partitioning is an extension of Range partitioning, which allows you to create partitions of a specified interval easily. Starting from v6.3.0, INTERVAL partitioning is introduced in TiDB as syntactic sugar.

The syntax is as follows:

```
PARTITION BY RANGE [COLUMNS] (<partitioning expression>)
INTERVAL (<interval expression>)
FIRST PARTITION LESS THAN (<expression>)
LAST PARTITION LESS THAN (<expression>)
[NULL PARTITION]
[MAXVALUE PARTITION]
```

For example:

```
CREATE TABLE employees (
    id int unsigned NOT NULL,
    fname varchar(30),
```

```
    lname varchar(30),
    hired date NOT NULL DEFAULT '1970-01-01',
    separated date DEFAULT '9999-12-31',
    job_code int,
    store_id int NOT NULL
) PARTITION BY RANGE (id)
INTERVAL (100) FIRST PARTITION LESS THAN (100) LAST PARTITION LESS THAN
    ↪ (10000) MAXVALUE PARTITION
```

It creates the following table:

```
CREATE TABLE `employees` (
  `id` int unsigned NOT NULL,
  `fname` varchar(30) DEFAULT NULL,
  `lname` varchar(30) DEFAULT NULL,
  `hired` date NOT NULL DEFAULT '1970-01-01',
  `separated` date DEFAULT '9999-12-31',
  `job_code` int DEFAULT NULL,
  `store_id` int NOT NULL
)
PARTITION BY RANGE (`id`)
(PARTITION `P_LT_100` VALUES LESS THAN (100),
 PARTITION `P_LT_200` VALUES LESS THAN (200),
...
 PARTITION `P_LT_9900` VALUES LESS THAN (9900),
 PARTITION `P_LT_10000` VALUES LESS THAN (10000),
 PARTITION `P_MAXVALUE` VALUES LESS THAN (MAXVALUE))
```

Range INTERVAL partitioning also works with Range COLUMNS partitioning.

For example:

```
CREATE TABLE monthly_report_status (
    report_id int NOT NULL,
    report_status varchar(20) NOT NULL,
    report_date date NOT NULL
)
PARTITION BY RANGE COLUMNS (report_date)
INTERVAL (1 MONTH) FIRST PARTITION LESS THAN ('2000-01-01') LAST PARTITION
    ↪ LESS THAN ('2025-01-01')
```

It creates this table:

```
CREATE TABLE `monthly_report_status` (
  `report_id` int(11) NOT NULL,
  `report_status` varchar(20) NOT NULL,
  `report_date` date NOT NULL
```

```
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
PARTITION BY RANGE COLUMNS(`report_date`)
(PARTITION `P_LT_2000-01-01` VALUES LESS THAN ('2000-01-01'),
 PARTITION `P_LT_2000-02-01` VALUES LESS THAN ('2000-02-01'),
...
 PARTITION `P_LT_2024-11-01` VALUES LESS THAN ('2024-11-01'),
 PARTITION `P_LT_2024-12-01` VALUES LESS THAN ('2024-12-01'),
 PARTITION `P_LT_2025-01-01` VALUES LESS THAN ('2025-01-01'))
```

The optional parameter `NULL PARTITION` creates a partition with the definition as `PARTITION P_NULL VALUES LESS THAN (<minimum value of the column type>)`, only matching when the partitioning expression evaluates to `NULL`. See Handling of NULL with Range partitioning, which explains that `NULL` is considered to be less than any other value.

The optional parameter `MAXVALUE PARTITION` creates the last partition as `PARTITION P_MAXVALUE VALUES LESS THAN (MAXVALUE)`.

ALTER INTERVAL partitioned tables

INTERVAL partitioning also adds simpler syntaxes for adding and dropping partitions.

The following statement changes the first partition. It drops all partitions whose values are less than the given expression, and makes the matched partition the new first partition. It does not affect a NULL PARTITION.

```
ALTER TABLE table_name FIRST PARTITION LESS THAN (<expression>)
```

The following statement changes the last partition, meaning adding more partitions with higher ranges and room for new data. It will add new partitions with the current INTERVAL up to and including the given expression. It does not work if a `MAXVALUE PARTITION` exists, because it needs data reorganization.

```
ALTER TABLE table_name LAST PARTITION LESS THAN (<expression>)
```

INTERVAL partitioning details and limitations

- The INTERVAL partitioning feature only involves the `CREATE/ALTER TABLE` syntax. There is no change in metadata, so tables created or altered with the new syntax are still MySQL-compatible.
- There is no change in the output format of `SHOW CREATE TABLE` to keep MySQL compatibility.
- The new `ALTER` syntax applies to existing tables conforming to INTERVAL. You do not need to create these tables with the `INTERVAL` syntax.
- To use the `INTERVAL` syntax for `RANGE COLUMNS` partitioning, you can only specify a single column in the `INTEGER`, `DATE`, or `DATETIME` type as the partitioning key.

14.13.12.1.4 List partitioning

Before creating a List partitioned table, make sure the following system variables are set to their default values of `ON`:

- `tidb_enable_list_partition`
- `tidb_enable_table_partition`

List partitioning is similar to Range partitioning. Unlike Range partitioning, in List partitioning, the partitioning expression values for all rows in each partition are in a given value set. This value set defined for each partition can have any number of values but cannot have duplicate values. You can use the `PARTITION ... VALUES IN (...)` clause to define a value set.

Suppose that you want to create a personnel record table. You can create a table as follows:

```
CREATE TABLE employees (
    id INT NOT NULL,
    hired DATE NOT NULL DEFAULT '1970-01-01',
    store_id INT
);
```

Suppose that there are 20 stores distributed in 4 districts, as shown in the table below:

```
| Region | Store ID Numbers  |
| ------- | -------------------- |
| North  | 1, 2, 3, 4, 5      |
| East   | 6, 7, 8, 9, 10     |
| West   | 11, 12, 13, 14, 15 |
| Central | 16, 17, 18, 19, 20 |
```

If you want to store the personnel data of employees of the same region in the same partition, you can create a List partitioned table based on `store_id`:

```
CREATE TABLE employees (
    id INT NOT NULL,
    hired DATE NOT NULL DEFAULT '1970-01-01',
    store_id INT
)
PARTITION BY LIST (store_id) (
    PARTITION pNorth VALUES IN (1, 2, 3, 4, 5),
    PARTITION pEast VALUES IN (6, 7, 8, 9, 10),
    PARTITION pWest VALUES IN (11, 12, 13, 14, 15),
    PARTITION pCentral VALUES IN (16, 17, 18, 19, 20)
);
```

After creating the partitions as above, you can easily add or delete records related to a specific region in the table. For example, suppose that all stores in the East region (East) are sold to another company. Then all the row data related to the store employees of this region can be deleted by executing `ALTER TABLE employees TRUNCATE PARTITION pEast`, which is much more efficient than the equivalent statement `DELETE FROM employees WHERE store_id IN (6, 7, 8, 9, 10)`.

You can also execute `ALTER TABLE employees DROP PARTITION pEast` to delete all related rows, but this statement also deletes the `pEast` partition from the table definition. In this situation, you must execute the `ALTER TABLE ... ADD PARTITION` statement to recover the original partitioning scheme of the table.

Default List partition

Starting from v7.3.0, you can add a default partition to a List or List COLUMNS partitioned table. The default partition acts as a fallback partition, where rows that do not match value sets of any partitions can be placed.

> **Note:**
>
> This feature is a TiDB extension to MySQL syntax. For a List or List COLUMNS partitioned table with a default partition, the data in the table cannot be directly replicated to MySQL.

Take the following List partitioned table as an example:

```
CREATE TABLE t (
  a INT,
  b INT
)
PARTITION BY LIST (a) (
  PARTITION p0 VALUES IN (1, 2, 3),
  PARTITION p1 VALUES IN (4, 5, 6)
);
Query OK, 0 rows affected (0.11 sec)
```

You can add a default list partition named `pDef` to the table as follows:

```
ALTER TABLE t ADD PARTITION (PARTITION pDef DEFAULT);
```

or

```
ALTER TABLE t ADD PARTITION (PARTITION pDef VALUES IN (DEFAULT));
```

In this way, newly inserted values that do not match value sets of any partitions can automatically go into the default partition.

```
INSERT INTO t VALUES (7, 7);
Query OK, 1 row affected (0.01 sec)
```

You can also add a default partition when creating a List or List COLUMNS partitioned table. For example:

```
CREATE TABLE employees (
    id INT NOT NULL,
    hired DATE NOT NULL DEFAULT '1970-01-01',
    store_id INT
)
PARTITION BY LIST (store_id) (
    PARTITION pNorth VALUES IN (1, 2, 3, 4, 5),
    PARTITION pEast VALUES IN (6, 7, 8, 9, 10),
    PARTITION pWest VALUES IN (11, 12, 13, 14, 15),
    PARTITION pCentral VALUES IN (16, 17, 18, 19, 20),
    PARTITION pDefault DEFAULT
);
```

For a List or List COLUMNS partitioned table without a default partition, the values to be inserted using an `INSERT` statement must match value sets defined in the `PARTITION ... VALUES IN (...)` clauses of the table. If the values to be inserted do not match value sets of any partitions, the statement will fail and an error is returned, as shown in the following example:

```
CREATE TABLE t (
  a INT,
  b INT
)
PARTITION BY LIST (a) (
  PARTITION p0 VALUES IN (1, 2, 3),
  PARTITION p1 VALUES IN (4, 5, 6)
);
Query OK, 0 rows affected (0.11 sec)

INSERT INTO t VALUES (7, 7);
ERROR 1525 (HY000): Table has no partition for value 7
```

To ignore the preceding error, you can add the `IGNORE` keyword to the `INSERT` statement. After this keyword is added, the `INSERT` statement will only insert rows that match the partition value sets and will not insert unmatched rows, without returning an error:

```
test> TRUNCATE t;
Query OK, 1 row affected (0.00 sec)

test> INSERT IGNORE INTO t VALUES (1, 1), (7, 7), (8, 8), (3, 3), (5, 5);
```

```
Query OK, 3 rows affected, 2 warnings (0.01 sec)
Records: 5 Duplicates: 2 Warnings: 2

test> select * from t;
+------+------+
| a    | b    |
+------+------+
|    5 |    5 |
|    1 |    1 |
|    3 |    3 |
+------+------+
3 rows in set (0.01 sec)
```

14.13.12.1.5 List COLUMNS partitioning

List COLUMNS partitioning is a variant of List partitioning. You can use multiple columns as partition keys. Besides the integer data type, you can also use the columns in the string, `DATE`, and `DATETIME` data types as partition columns.

Suppose that you want to divide the store employees from the following 12 cities into 4 regions, as shown in the following table:

```
| Region | Cities                        |
| :----- | ----------------------------- |
| 1      | LosAngeles,Seattle, Houston |
| 2      | Chicago, Columbus, Boston  |
| 3      | NewYork, LongIsland, Baltimore |
| 4      | Atlanta, Raleigh, Cincinnati |
```

You can use List COLUMNS partitioning to create a table and store each row in the partition that corresponds to the employee's city, as shown below:

```
CREATE TABLE employees_1 (
    id INT NOT NULL,
    fname VARCHAR(30),
    lname VARCHAR(30),
    hired DATE NOT NULL DEFAULT '1970-01-01',
    separated DATE DEFAULT '9999-12-31',
    job_code INT,
    store_id INT,
    city VARCHAR(15)
)
PARTITION BY LIST COLUMNS(city) (
    PARTITION pRegion_1 VALUES IN('LosAngeles', 'Seattle', 'Houston'),
    PARTITION pRegion_2 VALUES IN('Chicago', 'Columbus', 'Boston'),
    PARTITION pRegion_3 VALUES IN('NewYork', 'LongIsland', 'Baltimore'),
```

```
    PARTITION pRegion_4 VALUES IN('Atlanta', 'Raleigh', 'Cincinnati')
);
```

Unlike List partitioning, in List COLUMNS partitioning, you do not need to use the expression in the `COLUMNS()` clause to convert column values to integers.

List COLUMNS partitioning can also be implemented using columns of the `DATE` and `DATETIME` types, as shown in the following example. This example uses the same names and columns as the previous `employees_1` table, but uses List COLUMNS partitioning based on the `hired` column:

```
CREATE TABLE employees_2 (
    id INT NOT NULL,
    fname VARCHAR(30),
    lname VARCHAR(30),
    hired DATE NOT NULL DEFAULT '1970-01-01',
    separated DATE DEFAULT '9999-12-31',
    job_code INT,
    store_id INT,
    city VARCHAR(15)
)
PARTITION BY LIST COLUMNS(hired) (
    PARTITION pWeek_1 VALUES IN('2020-02-01', '2020-02-02', '2020-02-03',
        '2020-02-04', '2020-02-05', '2020-02-06', '2020-02-07'),
    PARTITION pWeek_2 VALUES IN('2020-02-08', '2020-02-09', '2020-02-10',
        '2020-02-11', '2020-02-12', '2020-02-13', '2020-02-14'),
    PARTITION pWeek_3 VALUES IN('2020-02-15', '2020-02-16', '2020-02-17',
        '2020-02-18', '2020-02-19', '2020-02-20', '2020-02-21'),
    PARTITION pWeek_4 VALUES IN('2020-02-22', '2020-02-23', '2020-02-24',
        '2020-02-25', '2020-02-26', '2020-02-27', '2020-02-28')
);
```

In addition, you can also add multiple columns in the `COLUMNS()` clause. For example:

```
CREATE TABLE t (
    id int,
    name varchar(10)
)
PARTITION BY LIST COLUMNS(id,name) (
     partition p0 values IN ((1,'a'),(2,'b')),
     partition p1 values IN ((3,'c'),(4,'d')),
     partition p3 values IN ((5,'e'),(null,null))
);
```

14.13.12.1.6 Hash partitioning

Hash partitioning is used to make sure that data is evenly scattered into a certain number of partitions. With Range partitioning, you must specify the range of the column values for each partition when you use Range partitioning, while you just need to specify the number of partitions when you use Hash partitioning.

To create a Hash partitioned table, you need to append a `PARTITION BY HASH (expr)` clause to the `CREATE TABLE` statement. `expr` is an expression that returns an integer. It can be a column name if the type of this column is integer. In addition, you might also need to append `PARTITIONS num`, where `num` is a positive integer indicating how many partitions a table is divided into.

The following operation creates a Hash partitioned table, which is divided into 4 partitions by `store_id`:

```
CREATE TABLE employees (
    id INT NOT NULL,
    fname VARCHAR(30),
    lname VARCHAR(30),
    hired DATE NOT NULL DEFAULT '1970-01-01',
    separated DATE DEFAULT '9999-12-31',
    job_code INT,
    store_id INT
)

PARTITION BY HASH(store_id)
PARTITIONS 4;
```

If `PARTITIONS num` is not specified, the default number of partitions is 1.

You can also use an SQL expression that returns an integer for `expr`. For example, you can partition a table by the hire year:

```
CREATE TABLE employees (
    id INT NOT NULL,
    fname VARCHAR(30),
    lname VARCHAR(30),
    hired DATE NOT NULL DEFAULT '1970-01-01',
    separated DATE DEFAULT '9999-12-31',
    job_code INT,
    store_id INT
)

PARTITION BY HASH( YEAR(hired) )
PARTITIONS 4;
```

The most efficient Hash function is one which operates upon a single table column, and whose value increases or decreases consistently with the column value.

For example, `date_col` is a column whose type is `DATE`, and the value of the `TO_DAYS (date_col)` expression varies with the value of `date_col`. `YEAR(date_col)` is different from `TO_DAYS(date_col)`, because not every possible change in `date_col` produces an equivalent change in `YEAR(date_col)`.

In contrast, assume that you have an `int_col` column whose type is `INT`. Now consider about the expression `POW(5-int_col,3)+ 6`. It is not a good Hash function though, because as the value of `int_col` changes, the result of the expression does not change proportionally. A value change in `int_col` might result in a huge change in the expression result. For example, when `int_col` changes from 5 to 6, the change of the expression result is -1. But the result change might be -7 when `int_col` changes from 6 to 7.

In conclusion, when the expression has a form that is closer to `y = cx`, it is more suitable to be a Hash function. Because the more non-linear an expression is, the more unevenly scattered the data among the partitions tends to be.

In theory, pruning is also possible for expressions involving more than one column value, but determining which of such expressions are suitable can be quite difficult and time-consuming. For this reason, the use of hashing expressions involving multiple columns is not particularly recommended.

When using `PARTITION BY HASH`, TiDB decides which partition the data should fall into based on the modulus of the result of the expression. In other words, if a partitioning expression is `expr` and the number of partitions is `num`, `MOD(expr, num)` decides the partition in which the data is stored. Assume that `t1` is defined as follows:

```
CREATE TABLE t1 (col1 INT, col2 CHAR(5), col3 DATE)
    PARTITION BY HASH( YEAR(col3) )
    PARTITIONS 4;
```

When you insert a row of data into `t1` and the value of `col3` is '2005-09-15', then this row is inserted into partition 1:

```
MOD(YEAR('2005-09-01'),4)
=  MOD(2005,4)
=  1
```

14.13.12.1.7 Key partitioning

Starting from v7.0.0, TiDB supports Key partitioning. For TiDB versions earlier than v7.0.0, if you try creating a Key partitioned table, TiDB creates it as a non-partitioned table and returns a warning.

Both Key partitioning and Hash partitioning can evenly distribute data into a certain number of partitions. The difference is that Hash partitioning only supports distributing data based on a specified integer expression or an integer column, while Key partitioning supports distributing data based on a column list, and partitioning columns of Key partitioning are not limited to the integer type. The Hash algorithm of TiDB for Key partitioning is different from that of MySQL, so the table data distribution is also different.

To create a Key partitioned table, you need to append a `PARTITION BY KEY ( columnList)` clause to the `CREATE TABLE` statement. `columnList` is a column list with one or more column names. The data type of each column in the list can be any type except `BLOB`, `JSON`, and `GEOMETRY` (Note that TiDB does not support `GEOMETRY`). In addition, you might also need to append `PARTITIONS num` (where `num` is a positive integer indicating how many partitions a table is divided into), or append the definition of the partition names. For example, adding `(PARTITION p0, PARTITION p1)` means dividing the table into two partitions named `p0` and `p1`.

The following operation creates a Key partitioned table, which is divided into 4 partitions by `store_id`:

```
CREATE TABLE employees (
    id INT NOT NULL,
    fname VARCHAR(30),
    lname VARCHAR(30),
    hired DATE NOT NULL DEFAULT '1970-01-01',
    separated DATE DEFAULT '9999-12-31',
    job_code INT,
    store_id INT
)

PARTITION BY KEY(store_id)
PARTITIONS 4;
```

If `PARTITIONS num` is not specified, the default number of partitions is 1.

You can also create a Key partitioned table based on non-integer columns such as VARCHAR. For example, you can partition a table by the `fname` column:

```
CREATE TABLE employees (
    id INT NOT NULL,
    fname VARCHAR(30),
    lname VARCHAR(30),
    hired DATE NOT NULL DEFAULT '1970-01-01',
    separated DATE DEFAULT '9999-12-31',
    job_code INT,
    store_id INT
)

PARTITION BY KEY(fname)
PARTITIONS 4;
```

You can also create a Key partitioned table based on multiple columns. For example, you can divide a table into 4 partitions based on `fname` and `store_id`:

```
CREATE TABLE employees (
    id INT NOT NULL,
```

```
    fname VARCHAR(30),
    lname VARCHAR(30),
    hired DATE NOT NULL DEFAULT '1970-01-01',
    separated DATE DEFAULT '9999-12-31',
    job_code INT,
    store_id INT
)

PARTITION BY KEY(fname, store_id)
PARTITIONS 4;
```

Similar to MySQL, TiDB supports creating Key partitioned tables with an empty partition column list specified in `PARTITION BY KEY`. For example, the following statement creates a partitioned table using the primary key `id` as the partitioning key:

```
CREATE TABLE employees (
    id INT NOT NULL PRIMARY KEY,
    fname VARCHAR(30),
    lname VARCHAR(30),
    hired DATE NOT NULL DEFAULT '1970-01-01',
    separated DATE DEFAULT '9999-12-31',
    job_code INT,
    store_id INT
)

PARTITION BY KEY()
PARTITIONS 4;
```

If the table lacks a primary key but contains a unique key, the unique key is used as the partitioning key:

```
CREATE TABLE k1 (
    id INT NOT NULL,
    name VARCHAR(20),
    UNIQUE KEY (id)
)
PARTITION BY KEY()
PARTITIONS 2;
```

However, the previous statement will fail if the unique key column is not defined as `NOT NULL`.

How TiDB handles Linear Hash partitions

Before v6.4.0, if you execute DDL statements of MySQL Linear Hash partitions in TiDB, TiDB can only create non-partitioned tables. In this case, if you still want to use partitioned tables in TiDB, you need to modify the DDL statements.

Since v6.4.0, TiDB supports parsing the MySQL `PARTITION BY LINEAR HASH` syntax but ignores the `LINEAR` keyword in it. If you have some existing DDL and DML statements of MySQL Linear Hash partitions, you can execute them in TiDB without modification:

- For a `CREATE` statement of MySQL Linear Hash partitions, TiDB will create a non-linear Hash partitioned table (note that there is no Linear Hash partitioned table in TiDB). If the number of partitions is a power of 2, the rows in the TiDB Hash partitioned table are distributed the same as that in the MySQL Linear Hash partitioned table. Otherwise, the distribution of these rows in TiDB is different from MySQL. This is because non-linear partitioned tables use a simple "modulus number of partition", while linear partitioned tables use "modulus next power of 2 and fold the values between the number of partitions and the next power of 2". For details, see #38450.
- For all other statements of MySQL Linear Hash partitions, they work in TiDB the same as that in MySQL, except that the rows are distributed differently if the number of partitions is not a power of 2, which will give different results for partition selection, `TRUNCATE PARTITION`, and `EXCHANGE PARTITION`.

14.13.12.1.8 How TiDB handles Linear Key partitions

Starting from v7.0.0, TiDB supports parsing the MySQL `PARTITION BY LINEAR KEY` ↪ syntax for Key partitioning. However, TiDB ignores the `LINEAR` keyword and uses a non-linear hash algorithm instead.

Before v7.0.0, if you try creating a Key partitioned table, TiDB creates it as a non-partitioned table and returns a warning.

14.13.12.1.9 How TiDB partitioning handles NULL

It is allowed in TiDB to use `NULL` as the calculation result of a partitioning expression.

> **Note:**
>
> `NULL` is not an integer. TiDB's partitioning implementation treats `NULL` as being less than any other integer values, just as `ORDER BY` does.

Handling of NULL with Range partitioning

When you insert a row into a table partitioned by Range, and the column value used to determine the partition is `NULL`, then this row is inserted into the lowest partition.

```
CREATE TABLE t1 (
    c1 INT,
    c2 VARCHAR(20)
```

```
)

PARTITION BY RANGE(c1) (
    PARTITION p0 VALUES LESS THAN (0),
    PARTITION p1 VALUES LESS THAN (10),
    PARTITION p2 VALUES LESS THAN MAXVALUE
);
```

```
Query OK, 0 rows affected (0.09 sec)
```

```
select * from t1 partition(p0);
```

```
+------|--------+
| c1   | c2     |
+------|--------+
| NULL | mothra |
+------|--------+
1 row in set (0.00 sec)
```

```
select * from t1 partition(p1);
```

```
Empty set (0.00 sec)
```

```
select * from t1 partition(p2);
```

```
Empty set (0.00 sec)
```

Drop the p0 partition and verify the result:

```
alter table t1 drop partition p0;
```

```
Query OK, 0 rows affected (0.08 sec)
```

```
select * from t1;
```

```
Empty set (0.00 sec)
```

Handling of NULL with Hash partitioning

When partitioning tables by Hash, there is a different way of handling NULL value - if the calculation result of the partitioning expression is NULL, it is considered as 0.

```
CREATE TABLE th (
    c1 INT,
    c2 VARCHAR(20)
```

```
)

PARTITION BY HASH(c1)
PARTITIONS 2;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
INSERT INTO th VALUES (NULL, 'mothra'), (0, 'gigan');
```

```
Query OK, 2 rows affected (0.04 sec)
```

```
select * from th partition (p0);
```

```
+------|--------+
| c1   | c2     |
+------|--------+
| NULL | mothra |
|    0 | gigan  |
+------|--------+
2 rows in set (0.00 sec)
```

```
select * from th partition (p1);
```

```
Empty set (0.00 sec)
```

You can see that the inserted record `(NULL, 'mothra')` falls into the same partition as `(0, 'gigan')`.

> **Note:**
>
> `NULL` values by Hash partitions in TiDB are handled in the same way as described in How MySQL Partitioning Handles NULL, which, however, is not consistent with the actual behavior of MySQL. In other words, MySQL's implementation in this case is not consistent with its documentation.
>
> In this case, the actual behavior of TiDB is in line with the description of this document.

Handling of NULL with Key partitioning

For Key partitioning, the way of handling `NULL` value is consistent with that of Hash partitioning. If the value of a partitioning field is `NULL`, it is treated as `0`.

14.13.12.2 Partition management

For `RANGE`, `RANGE COLUMNS`, `LIST`, and `LIST COLUMNS` partitioned tables, you can manage the partitions as follows:

- Add partitions using the `ALTER TABLE <table name> ADD PARTITION (<partition specification>)` statement.
- Drop partitions using the `ALTER TABLE <table name> DROP PARTITION <list of partitions>` statement.
- Remove all data from specified partitions using the `ALTER TABLE <table name> TRUNCATE PARTITION <list of partitions>` statement. The logic of `TRUNCATE PARTITION` is similar to `TRUNCATE TABLE` but it is for partitions.
- Merge, split, or make other changes to the partitions using the `ALTER TABLE <table name> REORGANIZE PARTITION <list of partitions> INTO (<new partition definitions>)` statement.

For `HASH` and `KEY` partitioned tables, you can manage the partitions as follows:

- Decrease the number of partitions using the `ALTER TABLE <table name> COALESCE PARTITION <number of partitions to decrease by>` statement. This operation reorganizes the partitions by copying the whole table to the new number of partitions online.
- Increase the number of partitions using the `ALTER TABLE <table name> ADD PARTITION <number of partitions to increase by | (additional partition definitions)>` statement. This operation reorganizes the partitions by copying the whole table to the new number of partitions online.
- Remove all data from specified partitions using the `ALTER TABLE <table name> TRUNCATE PARTITION <list of partitions>` statement. The logic of `TRUNCATE PARTITION` is similar to `TRUNCATE TABLE` but it is for partitions.

`EXCHANGE PARTITION` works by swapping a partition and a non-partitioned table, similar to how renaming a table like `RENAME TABLE t1 TO t1_tmp, t2 TO t1, t1_tmp TO t2` works.

For example, `ALTER TABLE partitioned_table EXCHANGE PARTITION p1 WITH TABLE non_partitioned_table` swaps the `partitioned_table` table `p1` partition with the `non_partitioned_table` table.

Ensure that all rows that you are exchanging into the partition match the partition definition; otherwise, the statement will fail.

Note that TiDB has some specific features that might affect `EXCHANGE PARTITION`. When the table structure contains such features, you need to ensure that `EXCHANGE PARTITION` meets the MySQL's EXCHANGE PARTITION condition. Meanwhile, ensure that these specific features are defined the same for both partitioned and non-partitioned tables. These specific features include the following:

- Placement Rules in SQL: placement policies are the same.

- TiFlash: the numbers of TiFlash replicas are the same.
- Clustered Indexes: partitioned and non-partitioned tables are both `CLUSTERED`, or both `NONCLUSTERED`.

In addition, there are limitations on the compatibility of `EXCHANGE PARTITION` with other components. Both partitioned and non-partitioned tables must have the same definition.

- TiFlash: when the TiFlash replica definitions in partitioned and non-partitioned tables are different, the `EXCHANGE PARTITION` operation cannot be performed.
- TiCDC: TiCDC replicates the `EXCHANGE PARTITION` operation when both partitioned and non-partitioned tables have primary keys or unique keys. Otherwise, TiCDC will not replicate the operation.
- TiDB Lightning and BR: do not perform the `EXCHANGE PARTITION` operation during import using TiDB Lightning or during restore using BR.

14.13.12.2.1 Manage Range, Range COLUMNS, List, and List COLUMNS partitions

This section uses the partitioned tables created by the following SQL statements as examples to show you how to manage Range and List partitions.

```
CREATE TABLE members (
    id int,
    fname varchar(255),
    lname varchar(255),
    dob date,
    data json
)
PARTITION BY RANGE (YEAR(dob)) (
 PARTITION pBefore1950 VALUES LESS THAN (1950),
 PARTITION p1950 VALUES LESS THAN (1960),
 PARTITION p1960 VALUES LESS THAN (1970),
 PARTITION p1970 VALUES LESS THAN (1980),
 PARTITION p1980 VALUES LESS THAN (1990),
 PARTITION p1990 VALUES LESS THAN (2000));

CREATE TABLE member_level (
 id int,
 level int,
 achievements json
)
PARTITION BY LIST (level) (
 PARTITION l1 VALUES IN (1),
```

```
 PARTITION l2 VALUES IN (2),
 PARTITION l3 VALUES IN (3),
 PARTITION l4 VALUES IN (4),
 PARTITION l5 VALUES IN (5));
```

Drop partitions

```
ALTER TABLE members DROP PARTITION p1990;

ALTER TABLE member_level DROP PARTITION l5;
```

Truncate partitions

```
ALTER TABLE members TRUNCATE PARTITION p1980;

ALTER TABLE member_level TRUNCATE PARTITION l4;
```

Add partitions

```
ALTER TABLE members ADD PARTITION (PARTITION `p1990to2010` VALUES LESS THAN
    ↪  (2010));

ALTER TABLE member_level ADD PARTITION (PARTITION l5_6 VALUES IN (5,6));
```

For a Range partitioned table, `ADD PARTITION` will append new partitions after the last existing partition. Compared with the existing partitions, the value defined in `VALUES LESS ↪ THAN` for new partitions must be greater. Otherwise, an error is reported:

```
ALTER TABLE members ADD PARTITION (PARTITION p1990 VALUES LESS THAN (2000))
    ↪ ;
```

```
ERROR 1493 (HY000): VALUES LESS THAN value must be strictly increasing for
    ↪ each partition
```

Reorganize partitions

Split a partition:

```
ALTER TABLE members REORGANIZE PARTITION `p1990to2010` INTO
(PARTITION p1990 VALUES LESS THAN (2000),
 PARTITION p2000 VALUES LESS THAN (2010),
 PARTITION p2010 VALUES LESS THAN (2020),
 PARTITION p2020 VALUES LESS THAN (2030),
 PARTITION pMax VALUES LESS THAN (MAXVALUE));

ALTER TABLE member_level REORGANIZE PARTITION l5_6 INTO
(PARTITION l5 VALUES IN (5),
 PARTITION l6 VALUES IN (6));
```

Merge partitions:

```
ALTER TABLE members REORGANIZE PARTITION pBefore1950,p1950 INTO (PARTITION
    ↪ pBefore1960 VALUES LESS THAN (1960));

ALTER TABLE member_level REORGANIZE PARTITION l1,l2 INTO (PARTITION l1_2
    ↪ VALUES IN (1,2));
```

Change the partitioning scheme definition:

```
ALTER TABLE members REORGANIZE PARTITION pBefore1960,p1960,p1970,p1980,
    ↪ p1990,p2000,p2010,p2020,pMax INTO
(PARTITION p1800 VALUES LESS THAN (1900),
 PARTITION p1900 VALUES LESS THAN (2000),
 PARTITION p2000 VALUES LESS THAN (2100));

ALTER TABLE member_level REORGANIZE PARTITION l1_2,l3,l4,l5,l6 INTO
(PARTITION lOdd VALUES IN (1,3,5),
 PARTITION lEven VALUES IN (2,4,6));
```

When reorganizing partitions, you need to note the following key points:

- Reorganizing partitions (including merging or splitting partitions) can change the listed partitions into a new set of partition definitions but cannot change the type of partitioning (for example, change the List type to the Range type, or change the Range COLUMNS type to the Range type).
- For a Range partition table, you can reorganize only adjacent partitions in it.

  ```
  ALTER TABLE members REORGANIZE PARTITION p1800,p2000 INTO (PARTITION
      ↪ p2000 VALUES LESS THAN (2100));
  ```

  ```
  ERROR 8200 (HY000): Unsupported REORGANIZE PARTITION of RANGE; not
      ↪ adjacent partitions
  ```

- For a Range partitioned table, to modify the end of the range, the new end defined in `VALUES LESS THAN` must cover the existing rows in the last partition. Otherwise, existing rows no longer fit and an error is reported:

  ```
  INSERT INTO members VALUES (313, "John", "Doe", "2022-11-22", NULL);
  ALTER TABLE members REORGANIZE PARTITION p2000 INTO (PARTITION p2000
      ↪ VALUES LESS THAN (2050)); -- This statement will work as
      ↪ expected, because 2050 covers the existing rows.
  ALTER TABLE members REORGANIZE PARTITION p2000 INTO (PARTITION p2000
      ↪ VALUES LESS THAN (2020)); -- This statement will fail with an
      ↪ error, because 2022 does not fit in the new range.
  ```

```
ERROR 1526 (HY000): Table has no partition for value 2022
```

- For a List partitioned table, to modify the set of values defined for a partition, the new definition must cover the existing values in that partition. Otherwise, an error is reported:

```
INSERT INTO member_level (id, level) values (313, 6);
ALTER TABLE member_level REORGANIZE PARTITION lEven INTO (PARTITION
    ↪ lEven VALUES IN (2,4));
```

```
ERROR 1526 (HY000): Table has no partition for value 6
```

- After partitions are reorganized, the statistics of the corresponding partitions are outdated, so you will get the following warning. In this case, you can use the ANALYZE ↪ TABLE statement to update the statistics.

```
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
| Level   | Code | Message
    ↪
    ↪ |
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
| Warning | 1105 | The statistics of related partitions will be
    ↪ outdated after reorganizing partitions. Please use 'ANALYZE TABLE
    ↪ ' statement if you want to update it now |
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

14.13.12.2.2 Manage Hash and Key partitions

This section uses the partitioned table created by the following SQL statement as examples to show you how to manage Hash partitions. For Key partitions, you can use the same management statements as well.

```
CREATE TABLE example (
  id INT PRIMARY KEY,
  data VARCHAR(1024)
)
PARTITION BY HASH(id)
PARTITIONS 2;
```

Increase the number of partitions

Increase the number of partitions for the `example` table by 1 (from 2 to 3):

```
ALTER TABLE example ADD PARTITION PARTITIONS 1;
```

You can also specify partition options by adding partition definitions. For example, you can use the following statement to increase the number of partitions from 3 to 5 and specify the names of the newly added partitions as `pExample4` and `pExample5`:

```
ALTER TABLE example ADD PARTITION
(PARTITION pExample4 COMMENT = 'not p3, but pExample4 instead',
 PARTITION pExample5 COMMENT = 'not p4, but pExample5 instead');
```

Decrease the number of partitions

Unlike Range and List partitioning, `DROP PARTITION` is not supported for Hash and Key partitioning, but you can decrease the number of partitions with `COALESCE PARTITION` or delete all data from specific partitions with `TRUNCATE PARTITION`.

Decrease the number of partitions for the `example` table by 1 (from 5 to 4):

```
ALTER TABLE example COALESCE PARTITION 1;
```

Note:

The process of changing the number of partitions for Hash or Key partitioned tables reorganizes the partitions by copying all data to the new number of partitions. Therefore, after changing the number of partitions for a Hash or Key partitioned table, you will get the following warning about the outdated statistics. In this case, you can use the `ANALYZE TABLE` statement to update the statistics.

```
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
| Level   | Code | Message
    ↪
    ↪ |
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
| Warning | 1105 | The statistics of related partitions will be
    ↪  outdated after reorganizing partitions. Please use '
    ↪ ANALYZE TABLE' statement if you want to update it now |
```

```
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

To better understand how the `example` table is organized now, you can show the SQL statement that is used to recreate the `example` table as follows:

```
SHOW CREATE TABLE\G
```

```
*************************** 1. row ***************************
       Table: example
Create Table: CREATE TABLE `example` (
  `id` int(11) NOT NULL,
  `data` varchar(1024) DEFAULT NULL,
  PRIMARY KEY (`id`) /*T![clustered_index] CLUSTERED */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
PARTITION BY HASH (`id`)
(PARTITION `p0`,
 PARTITION `p1`,
 PARTITION `p2`,
 PARTITION `pExample4` COMMENT 'not p3, but pExample4 instead')
1 row in set (0.01 sec)
```

Truncate partitions

Delete all data from a partition:

```
ALTER TABLE example TRUNCATE PARTITION p0;
```

```
Query OK, 0 rows affected (0.03 sec)
```

14.13.12.2.3 Convert a partitioned table to a non-partitioned table

To convert a partitioned table to a non-partitioned table, you can use the following statement, which removes the partitioning, copies all rows of the table, and recreates the indexes online for the table:

```
ALTER TABLE <table_name> REMOVE PARTITIONING
```

For example, to convert the `members` partitioned table to the non-partitioned table, you can execute the following statement:

```
ALTER TABLE members REMOVE PARTITIONING
```

14.13.12.2.4 Partition an existing table

To partition an existing non-partitioned table or modify the partition type of an existing partitioned table, you can use the following statement, which copies all rows and recreates the indexes online according to the new partition definitions:

```
ALTER TABLE <table_name> PARTITION BY <new partition type and definitions>
```

Examples:

To convert the existing `members` table to a HASH partitioned table with 10 partitions, you can execute the following statement:

```
ALTER TABLE members PARTITION BY HASH(id) PARTITIONS 10;
```

To convert the existing `member_level` table to a RANGE partitioned table, you can execute the following statement:

```
ALTER TABLE member_level PARTITION BY RANGE(level)
(PARTITION pLow VALUES LESS THAN (1),
 PARTITION pMid VALUES LESS THAN (3),
 PARTITION pHigh VALUES LESS THAN (7)
 PARTITION pMax VALUES LESS THAN (MAXVALUE));
```

14.13.12.3 Partition pruning

Partition pruning is an optimization which is based on a very simple idea - do not scan the partitions that do not match.

Assume that you create a partitioned table `t1`:

```
CREATE TABLE t1 (
    fname VARCHAR(50) NOT NULL,
    lname VARCHAR(50) NOT NULL,
    region_code TINYINT UNSIGNED NOT NULL,
    dob DATE NOT NULL
)

PARTITION BY RANGE( region_code ) (
    PARTITION p0 VALUES LESS THAN (64),
    PARTITION p1 VALUES LESS THAN (128),
    PARTITION p2 VALUES LESS THAN (192),
    PARTITION p3 VALUES LESS THAN MAXVALUE
);
```

If you want to get the result of this `SELECT` statement:

```
SELECT fname, lname, region_code, dob
    FROM t1
```

```
WHERE region_code > 125 AND region_code < 130;
```

It is evident that the result falls in either the `p1` or the `p2` partition, that is, you just need to search for the matching rows in `p1` and `p2`. Excluding the unneeded partitions is so-called "pruning". If the optimizer is able to prune a part of partitions, the execution of the query in the partitioned table will be much faster than that in a non-partitioned table.

The optimizer can prune partitions through `WHERE` conditions in the following two scenarios:

- partition_column = constant
- partition_column IN (constant1, constant2, ..., constantN)

Currently, partition pruning does not work with `LIKE` conditions.

14.13.12.3.1 Some cases for partition pruning to take effect

1. Partition pruning uses the query conditions on the partitioned table, so if the query conditions cannot be pushed down to the partitioned table according to the planner's optimization rules, partition pruning does not apply for this query.

   For example:

   ```
   create table t1 (x int) partition by range (x) (
          partition p0 values less than (5),
          partition p1 values less than (10));
   create table t2 (x int);
   ```

   ```
   explain select * from t1 left join t2 on t1.x = t2.x where t2.x > 5;
   ```

   In this query, the left out join is converted to the inner join, and then `t1.x > 5` is derived from `t1.x = t2.x` and `t2.x > 5`, so it could be used in partition pruning and only the partition `p1` remains.

   ```
   explain select * from t1 left join t2 on t1.x = t2.x and t2.x > 5;
   ```

   In this query, `t2.x > 5` cannot be pushed down to the `t1` partitioned table, so partition pruning would not take effect for this query.

2. Since partition pruning is done during the plan optimizing phase, it does not apply for those cases that filter conditions are unknown until the execution phase.

   For example:

   ```
   create table t1 (x int) partition by range (x) (
          partition p0 values less than (5),
          partition p1 values less than (10));
   ```

```
explain select * from t2 where x < (select * from t1 where t2.x < t1.x
    ↪  and t2.x < 2);
```

This query reads a row from `t2` and uses the result for the subquery on `t1`. Theoretically, partition pruning could benefit from `t1.x > val` expression in the subquery, but it does not take effect there as that happens in the execution phase.

3. As a result of a limitation from current implementation, if a query condition cannot be pushed down to TiKV, it cannot be used by the partition pruning.

   Take the `fn(col)` expression as an example. If the TiKV coprocessor supports this `fn` ↪ function, `fn(col)` may be pushed down to the leaf node (that is, partitioned table) according to the predicate push-down rule during the plan optimizing phase, and partition pruning can use it.

   If the TiKV coprocessor does not support this `fn` function, `fn(col)` would not be pushed down to the leaf node. Instead, it becomes a `Selection` node above the leaf node. The current partition pruning implementation does not support this kind of plan tree.

4. For Hash and Key partition types, the only query supported by partition pruning is the equal condition.

5. For Range partition, for partition pruning to take effect, the partition expression must be in those forms: `col` or `fn(col)`, and the query condition must be one of `>`, `<`, `=`, `>=`, and `<=`. If the partition expression is in the form of `fn(col)`, the `fn` function must be monotonous.

   If the `fn` function is monotonous, for any `x` and `y`, if `x > y`, then `fn(x) > fn(y)`. Then this `fn` function can be called strictly monotonous. For any `x` and `y`, if `x > y`, then `fn(x) >= fn(y)`. In this case, `fn` could also be called "monotonous". In theory, all monotonous functions are supported by partition pruning.

   Currently, partition pruning in TiDB only support those monotonous functions:

   - `UNIX_TIMESTAMP()`
   - `TO_DAYS()`

   For example, the partition expression is a simple column:

```
create table t (id int) partition by range (id) (
       partition p0 values less than (5),
       partition p1 values less than (10));
select * from t where id > 6;
```

   Or the partition expression is in the form of `fn(col)` where `fn` is `to_days`:

```
create table t (dt datetime) partition by range (to_days(id)) (
       partition p0 values less than (to_days('2020-04-01')),
       partition p1 values less than (to_days('2020-05-01')));
select * from t where dt > '2020-04-18';
```

An exception is `floor(unix_timestamp())` as the partition expression. TiDB does some optimization for that case by case, so it is supported by partition pruning.

```
create table t (ts timestamp(3) not null default current_timestamp(3))
partition by range (floor(unix_timestamp(ts))) (
       partition p0 values less than (unix_timestamp('2020-04-01
          ↪ 00:00:00')),
       partition p1 values less than (unix_timestamp('2020-05-01
          ↪ 00:00:00')));
select * from t where ts > '2020-04-18 02:00:42.123';
```

14.13.12.4 Partition selection

`SELECT` statements support partition selection, which is implemented by using a `PARTITION` option.

```
SET @@sql_mode = '';

CREATE TABLE employees (
    id INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
    fname VARCHAR(25) NOT NULL,
    lname VARCHAR(25) NOT NULL,
    store_id INT NOT NULL,
    department_id INT NOT NULL
)

PARTITION BY RANGE(id) (
    PARTITION p0 VALUES LESS THAN (5),
    PARTITION p1 VALUES LESS THAN (10),
    PARTITION p2 VALUES LESS THAN (15),
    PARTITION p3 VALUES LESS THAN MAXVALUE
);

INSERT INTO employees VALUES
    ('', 'Bob', 'Taylor', 3, 2), ('', 'Frank', 'Williams', 1, 2),
    ('', 'Ellen', 'Johnson', 3, 4), ('', 'Jim', 'Smith', 2, 4),
    ('', 'Mary', 'Jones', 1, 1), ('', 'Linda', 'Black', 2, 3),
    ('', 'Ed', 'Jones', 2, 1), ('', 'June', 'Wilson', 3, 1),
    ('', 'Andy', 'Smith', 1, 3), ('', 'Lou', 'Waters', 2, 4),
    ('', 'Jill', 'Stone', 1, 4), ('', 'Roger', 'White', 3, 2),
```

```
    ('', 'Howard', 'Andrews', 1, 2), ('', 'Fred', 'Goldberg', 3, 3),
    ('', 'Barbara', 'Brown', 2, 3), ('', 'Alice', 'Rogers', 2, 2),
    ('', 'Mark', 'Morgan', 3, 3), ('', 'Karen', 'Cole', 3, 2);
```

You can view the rows stored in the `p1` partition:

```
SELECT * FROM employees PARTITION (p1);
```

```
+----|-------|--------|----------|---------------+
| id | fname | lname | store_id | department_id |
+----|-------|--------|----------|---------------+
|  5 | Mary | Jones |       1 |             1 |
|  6 | Linda | Black |       2 |             3 |
|  7 | Ed   | Jones |       2 |             1 |
|  8 | June | Wilson |       3 |             1 |
|  9 | Andy | Smith |       1 |             3 |
+----|-------|--------|----------|---------------+
5 rows in set (0.00 sec)
```

If you want to get the rows in multiple partitions, you can use a list of partition names which are separated by commas. For example, `SELECT * FROM employees PARTITION (p1 ↪ , p2)` returns all rows in the `p1` and `p2` partitions.

When you use partition selection, you can still use `WHERE` conditions and options such as `ORDER BY` and `LIMIT`. It is also supported to use aggregation options such as `HAVING` and `GROUP BY`.

```
SELECT * FROM employees PARTITION (p0, p2)
    WHERE lname LIKE 'S%';
```

```
+----|-------|-------|----------|---------------+
| id | fname | lname | store_id | department_id |
+----|-------|-------|----------|---------------+
|  4 | Jim  | Smith |       2 |             4 |
| 11 | Jill | Stone |       1 |             4 |
+----|-------|-------|----------|---------------+
2 rows in set (0.00 sec)
```

```
SELECT id, CONCAT(fname, ' ', lname) AS name
    FROM employees PARTITION (p0) ORDER BY lname;
```

```
+----|----------------+
| id | name          |
+----|----------------+
|  3 | Ellen Johnson |
|  4 | Jim Smith     |
```

```
|  1 | Bob Taylor   |
|  2 | Frank Williams |
+----|----------------+
4 rows in set (0.06 sec)
```

```
SELECT store_id, COUNT(department_id) AS c
    FROM employees PARTITION (p1,p2,p3)
    GROUP BY store_id HAVING c > 4;
```

```
+---|----------+
| c | store_id |
+---|----------+
| 5 |        2 |
| 5 |        3 |
+---|----------+
2 rows in set (0.00 sec)
```

Partition selection is supported for all types of table partitioning, including Range partitioning and Hash partitioning. For Hash partitions, if partition names are not specified, `p0`, `p1`, `p2`,..., or `pN-1` is automatically used as the partition name.

`SELECT` in `INSERT ... SELECT` can also use partition selection.

14.13.12.5 Restrictions and limitations on partitions

This section introduces some restrictions and limitations on partitioned tables in TiDB.

- Using the `ALTER TABLE ... CHANGE COLUMN` statement to change column types of partitioned tables is not supported.
- Using the `ALTER TABLE ... CACHE` statement to set partitioned tables to cached tables is not supported.
- Temporary tables in TiDB are **NOT** compatible with partitioned tables.
- Creating a foreign key on a partitioned table is not supported.
- The `ORDER_INDEX(t1_name, idx1_name [, idx2_name ...])` hint does not work for partitioned tables and their related indexes, because indexes on partitioned tables cannot be read in order.

14.13.12.5.1 Partitioning keys, primary keys and unique keys

This section discusses the relationship of partitioning keys with primary keys and unique keys. The rule governing this relationship can be expressed as follows: **Every unique key on the table must use every column in the table's partitioning expression**. This also includes the table's primary key, because it is by definition a unique key.

For example, the following table creation statements are invalid:

```
CREATE TABLE t1 (
    col1 INT NOT NULL,
    col2 DATE NOT NULL,
    col3 INT NOT NULL,
    col4 INT NOT NULL,
    UNIQUE KEY (col1, col2)
)

PARTITION BY HASH(col3)
PARTITIONS 4;

CREATE TABLE t2 (
    col1 INT NOT NULL,
    col2 DATE NOT NULL,
    col3 INT NOT NULL,
    col4 INT NOT NULL,
    UNIQUE KEY (col1),
    UNIQUE KEY (col3)
)

PARTITION BY HASH(col1 + col3)
PARTITIONS 4;
```

In each case, the proposed table has at least one unique key that does not include all columns used in the partitioning expression.

The valid statements are as follows:

```
CREATE TABLE t1 (
    col1 INT NOT NULL,
    col2 DATE NOT NULL,
    col3 INT NOT NULL,
    col4 INT NOT NULL,
    UNIQUE KEY (col1, col2, col3)
)

PARTITION BY HASH(col3)
PARTITIONS 4;

CREATE TABLE t2 (
    col1 INT NOT NULL,
    col2 DATE NOT NULL,
    col3 INT NOT NULL,
    col4 INT NOT NULL,
    UNIQUE KEY (col1, col3)
```

```
)

PARTITION BY HASH(col1 + col3)
PARTITIONS 4;
```

The following example displays an error:

```
CREATE TABLE t3 (
    col1 INT NOT NULL,
    col2 DATE NOT NULL,
    col3 INT NOT NULL,
    col4 INT NOT NULL,
    UNIQUE KEY (col1, col2),
    UNIQUE KEY (col3)
)

PARTITION BY HASH(col1 + col3)
PARTITIONS 4;
```

```
ERROR 1491 (HY000): A PRIMARY KEY must include all columns in the table's
    ↪ partitioning function
```

The `CREATE TABLE` statement fails because both `col1` and `col3` are included in the proposed partitioning key, but neither of these columns is part of both of unique keys on the table. After the following modifications, the `CREATE TABLE` statement becomes valid:

```
CREATE TABLE t3 (
    col1 INT NOT NULL,
    col2 DATE NOT NULL,
    col3 INT NOT NULL,
    col4 INT NOT NULL,
    UNIQUE KEY (col1, col2, col3),
    UNIQUE KEY (col1, col3)
)
PARTITION BY HASH(col1 + col3)
    PARTITIONS 4;
```

The following table cannot be partitioned at all, because there is no way to include in a partitioning key any columns that belong to both unique keys:

```
CREATE TABLE t4 (
    col1 INT NOT NULL,
    col2 INT NOT NULL,
    col3 INT NOT NULL,
    col4 INT NOT NULL,
    UNIQUE KEY (col1, col3),
```

```
    UNIQUE KEY (col2, col4)
);
```

Because every primary key is by definition a unique key, so the next two statements are invalid:

```
CREATE TABLE t5 (
    col1 INT NOT NULL,
    col2 DATE NOT NULL,
    col3 INT NOT NULL,
    col4 INT NOT NULL,
    PRIMARY KEY(col1, col2)
)

PARTITION BY HASH(col3)
PARTITIONS 4;

CREATE TABLE t6 (
    col1 INT NOT NULL,
    col2 DATE NOT NULL,
    col3 INT NOT NULL,
    col4 INT NOT NULL,
    PRIMARY KEY(col1, col3),
    UNIQUE KEY(col2)
)

PARTITION BY HASH( YEAR(col2) )
PARTITIONS 4;
```

In the above examples, the primary key does not include all columns referenced in the partitioning expression. After adding the missing column in the primary key, the `CREATE TABLE` statement becomes valid:

```
CREATE TABLE t5 (
    col1 INT NOT NULL,
    col2 DATE NOT NULL,
    col3 INT NOT NULL,
    col4 INT NOT NULL,
    PRIMARY KEY(col1, col2, col3)
)
PARTITION BY HASH(col3)
PARTITIONS 4;
CREATE TABLE t6 (
    col1 INT NOT NULL,
    col2 DATE NOT NULL,
    col3 INT NOT NULL,
```

```
    col4 INT NOT NULL,
    PRIMARY KEY(col1, col2, col3),
    UNIQUE KEY(col2)
)
PARTITION BY HASH( YEAR(col2) )
PARTITIONS 4;
```

If a table has neither unique keys nor primary keys, then this restriction does not apply.

When you change tables using DDL statements, you also need to consider this restriction when adding a unique index. For example, when you create a partitioned table as shown below:

```
CREATE TABLE t_no_pk (c1 INT, c2 INT)
    PARTITION BY RANGE(c1) (
        PARTITION p0 VALUES LESS THAN (10),
        PARTITION p1 VALUES LESS THAN (20),
        PARTITION p2 VALUES LESS THAN (30),
        PARTITION p3 VALUES LESS THAN (40)
    );
```

```
Query OK, 0 rows affected (0.12 sec)
```

You can add a non-unique index by using `ALTER TABLE` statements. But if you want to add a unique index, the `c1` column must be included in the unique index.

When using a partitioned table, you cannot specify the prefix index as a unique attribute:

```
CREATE TABLE t (a varchar(20), b blob,
    UNIQUE INDEX (a(5)))
    PARTITION by range columns (a) (
    PARTITION p0 values less than ('aaaaa'),
    PARTITION p1 values less than ('bbbbb'),
    PARTITION p2 values less than ('ccccc'));
```

```
ERROR 1503 (HY000): A UNIQUE INDEX must include all columns in the table's
    ↪ partitioning function
```

14.13.12.5.2 Partitioning limitations relating to functions

Only the functions shown in the following list are allowed in partitioning expressions:

```
ABS()
CEILING()
DATEDIFF()
DAY()
DAYOFMONTH()
```

```
DAYOFWEEK()
DAYOFYEAR()
EXTRACT() (see EXTRACT() function with WEEK specifier)
FLOOR()
HOUR()
MICROSECOND()
MINUTE()
MOD()
MONTH()
QUARTER()
SECOND()
TIME_TO_SEC()
TO_DAYS()
TO_SECONDS()
UNIX_TIMESTAMP() (with TIMESTAMP columns)
WEEKDAY()
YEAR()
YEARWEEK()
```

14.13.12.5.3 Compatibility with MySQL

Currently, TiDB supports Range partitioning, Range COLUMNS partitioning, List partitioning, List COLUMNS partitioning, Hash partitioning, and Key partitioning. Other partitioning types that are available in MySQL are not supported yet in TiDB.

With regard to partition management, any operation that requires moving data in the bottom implementation is not supported currently, including but not limited to: adjust the number of partitions in a Hash partitioned table, modify the Range of a Range partitioned table, and merge partitions.

For the unsupported partitioning types, when you create a table in TiDB, the partitioning information is ignored and the table is created in the regular form with a warning reported.

The `LOAD DATA` syntax does not support partition selection currently in TiDB.

```
create table t (id int, val int) partition by hash(id) partitions 4;
```

The regular `LOAD DATA` operation is supported:

```
load local data infile "xxx" into t ...
```

But `Load Data` does not support partition selection:

```
load local data infile "xxx" into t partition (p1)...
```

For a partitioned table, the result returned by `select * from t` is unordered between the partitions. This is different from the result in MySQL, which is ordered between the partitions but unordered inside the partitions.

```
create table t (id int, val int) partition by range (id) (
    partition p0 values less than (3),
    partition p1 values less than (7),
    partition p2 values less than (11));
```

```
Query OK, 0 rows affected (0.10 sec)
```

```
insert into t values (1, 2), (3, 4),(5, 6),(7,8),(9,10);
```

```
Query OK, 5 rows affected (0.01 sec)
Records: 5 Duplicates: 0 Warnings: 0
```

TiDB returns a different result every time, for example:

```
select * from t;
```

```
+------|------+
| id   | val  |
+------|------+
|    7 |    8 |
|    9 |   10 |
|    1 |    2 |
|    3 |    4 |
|    5 |    6 |
+------|------+
5 rows in set (0.00 sec)
```

The result returned in MySQL:

```
select * from t;
```

```
+------|------+
| id   | val  |
+------|------+
|    1 |    2 |
|    3 |    4 |
|    5 |    6 |
|    7 |    8 |
|    9 |   10 |
+------|------+
5 rows in set (0.00 sec)
```

The `tidb_enable_list_partition` environment variable controls whether to enable the partitioned table feature. If this variable is set to `OFF`, the partition information will be ignored when a table is created, and this table will be created as a normal table.

This variable is only used in table creation. After the table is created, modify this variable value takes no effect. For details, see system variables.

14.13.12.5.4 Dynamic pruning mode

TiDB accesses partitioned tables in either `dynamic` or `static` mode. `dynamic` mode is used by default since v6.3.0. However, dynamic partitioning is effective only after the full table-level statistics, or GlobalStats, are collected. Before GlobalStats are collected, TiDB will use the `static` mode instead. For detailed information about GlobalStats, see Collect statistics of partitioned tables in dynamic pruning mode.

```
set @@session.tidb_partition_prune_mode = 'dynamic'
```

Manual ANALYZE and normal queries use the session-level `tidb_partition_prune_mode` setting. The `auto-analyze` operation in the background uses the global `tidb_partition_prune_mode` setting.

In `static` mode, partitioned tables use partition-level statistics. In `dynamic` mode, partitioned tables use table-level GlobalStats.

When switching from `static` mode to `dynamic` mode, you need to check and collect statistics manually. This is because after the switch to `dynamic` mode, partitioned tables have only partition-level statistics but no table-level statistics. GlobalStats are collected only upon the next `auto-analyze` operation.

```
set session tidb_partition_prune_mode = 'dynamic';
show stats_meta where table_name like "t";
```

```
+---------+------------+---------------+---------------------+-------------+---------
    ↪
| Db_name | Table_name | Partition_name | Update_time | Modify_count | Row_
    ↪ count |
+---------+------------+---------------+---------------------+-------------+---------
    ↪
| test    | t          | p0            | 2022-05-27 20:23:34 |           1 |
    ↪           2 |
| test    | t          | p1            | 2022-05-27 20:23:34 |           2 |
    ↪           4 |
| test    | t          | p2            | 2022-05-27 20:23:34 |           2 |
    ↪           4 |
+---------+------------+---------------+---------------------+-------------+---------
    ↪
3 rows in set (0.01 sec)
```

To make sure that the statistics used by SQL statements are correct after you enable global `dynamic` pruning mode, you need to manually trigger `analyze` on the tables or on a partition of the table to obtain GlobalStats.

```
analyze table t partition p1;
show stats_meta where table_name like "t";
```

```
+---------+------------+----------------+---------------------+--------------+----------
   ↪
| Db_name | Table_name | Partition_name | Update_time | Modify_count | Row_
   ↪ count |
+---------+------------+----------------+---------------------+--------------+----------
   ↪
| test    | t          | global         | 2022-05-27 20:50:53 |        0 |
   ↪        5 |
| test    | t          | p0             | 2022-05-27 20:23:34 |        1 |
   ↪        2 |
| test    | t          | p1             | 2022-05-27 20:50:52 |        0 |
   ↪        2 |
| test    | t          | p2             | 2022-05-27 20:50:08 |        0 |
   ↪        2 |
+---------+------------+----------------+---------------------+--------------+----------
   ↪
4 rows in set (0.00 sec)
```

If the following warning is displayed during the `analyze` process, partition statistics are inconsistent, and you need to collect statistics of these partitions or the entire table again.

```
| Warning | 8244 | Build table: `t` column: `a` global-level stats failed
   ↪ due to missing partition-level column stats, please run analyze table
   ↪  to refresh columns of all partitions
```

You can also use scripts to update statistics of all partitioned tables. For details, see Update statistics of partitioned tables in dynamic pruning mode.

After table-level statistics are ready, you can enable the global dynamic pruning mode, which is effective to all SQL statements and `auto-analyze` operations.

```
set global tidb_partition_prune_mode = dynamic
```

In `static` mode, TiDB accesses each partition separately using multiple operators, and then merges the results using `Union`. The following example is a simple read operation where TiDB merges the results of two corresponding partitions using `Union`:

```
mysql> create table t1(id int, age int, key(id)) partition by range(id) (
       partition p0 values less than (100),
       partition p1 values less than (200),
       partition p2 values less than (300),
       partition p3 values less than (400));
Query OK, 0 rows affected (0.01 sec)
```

```
mysql> explain select * from t1 where id < 150;
```

```
+-----------------------------+---------+----------+----------------------+--------
   ↪
| id                          | estRows | task     | access object        |
   ↪ operator info              |
+-----------------------------+---------+----------+----------------------+--------
   ↪
| PartitionUnion_9            | 6646.67 | root     |                      |
   ↪                             |
| ├─TableReader_12            | 3323.33 | root     |                      | data
   ↪ :Selection_11             |
| │ └─Selection_11            | 3323.33 | cop[tikv] |                     | lt(
   ↪ test.t1.id, 150)          |
| │   └─TableFullScan_10      | 10000.00 | cop[tikv] | table:t1, partition:p0
   ↪ | keep order:false, stats:pseudo |
| ├─TableReader_18            | 3323.33 | root     |                      | data
   ↪ :Selection_17             |
| │ └─Selection_17            | 3323.33 | cop[tikv] |                     | lt(
   ↪ test.t1.id, 150)          |
| │   └─TableFullScan_16      | 10000.00 | cop[tikv] | table:t1, partition:p1
   ↪ | keep order:false, stats:pseudo |
+-----------------------------+---------+----------+----------------------+--------
   ↪
7 rows in set (0.00 sec)
```

In `dynamic` mode, each operator supports direct access to multiple partitions, so TiDB no longer uses `Union`.

```
mysql> set @@session.tidb_partition_prune_mode = 'dynamic';
Query OK, 0 rows affected (0.00 sec)

mysql> explain select * from t1 where id < 150;
+--
   ↪ ----------------------+---------+----------+----------------+---------------
   ↪
| id                    | estRows | task     | access object | operator info
   ↪              |
+--
   ↪ ----------------------+---------+----------+----------------+---------------
   ↪
| TableReader_7         | 3323.33 | root     | partition:p0,p1 | data:
   ↪ Selection_6          |
| └─Selection_6         | 3323.33 | cop[tikv] |               | lt(test.t1.id,
```

```
    ↪  150)        |
|   └─TableFullScan_5   | 10000.00 | cop[tikv] | table:t1   | keep order:
    ↪ false, stats:pseudo |
+--
    ↪ ----------------------+---------+----------+----------------+-------------
    ↪
3 rows in set (0.00 sec)
```

From the above query results, you can see that the `Union` operator in the execution plan disappears while the partition pruning still takes effect and the execution plan only accesses `p0` and `p1`.

`dynamic` mode makes execution plans simpler and clearer. Omitting the Union operation can improve the execution efficiency and avoid the problem of Union concurrent execution. In addition, `dynamic` mode also allows execution plans with IndexJoin which cannot be used in `static` mode. (See examples below)

Example 1: In the following example, a query is performed in `static` mode using the execution plan with IndexJoin:

```
mysql> create table t1 (id int, age int, key(id)) partition by range(id)
    (partition p0 values less than (100),
     partition p1 values less than (200),
     partition p2 values less than (300),
     partition p3 values less than (400));
Query OK, 0 rows affected (0,08 sec)

mysql> create table t2 (id int, code int);
Query OK, 0 rows affected (0.01 sec)

mysql> set @@tidb_partition_prune_mode = 'static';
Query OK, 0 rows affected (0.00 sec)

mysql> explain select /*+ TIDB_INLJ(t1, t2) */ t1.* from t1, t2 where t2.
    ↪ code = 0 and t2.id = t1.id;
+--
    ↪ ----------------------------+---------+----------+----------------------+-
    ↪
| id                           | estRows | task     | access object        |

    ↪ p1 | keep order:false, stats:pseudo     |
|   └─TableReader_30          | 9990.00 | root     |                    |
    ↪ data:Selection_29                        |
|     └─Selection_29          | 9990.00 | cop[tikv] |                    |
    ↪ not(isnull(test.t1.id))                  |
|       └─TableFullScan_28    | 10000.00 | cop[tikv] | table:t1, partition:
    ↪ p2 | keep order:false, stats:pseudo     |
|   └─TableReader_36          | 9990.00 | root     |                    |
    ↪ data:Selection_35                        |
|     └─Selection_35          | 9990.00 | cop[tikv] |                    |
    ↪ not(isnull(test.t1.id))                  |
|       └─TableFullScan_34    | 10000.00 | cop[tikv] | table:t1, partition:
    ↪ p3 | keep order:false, stats:pseudo     |
+--
    ↪ ----------------------------+---------+----------+--------------------+-
    ↪
17 rows in set, 1 warning (0.00 sec)

mysql> show warnings;
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
| Level   | Code | Message
    ↪                                                                  |
+--
    ↪ -------+------+-----------------------------------------------------------
    ↪
| Warning | 1815 | Optimizer Hint /*+ INL_JOIN(t1, t2) */ or /*+ TIDB_INLJ(
```

```
    ↪ t1, t2) */ is inapplicable |
+--
    ↪ -------+------+-----------------------------------------------------------------------
    ↪
1 row in set (0,00 sec)
```

From example 1, you can see that even if the `TIDB_INLJ` hint is used, the query on the partitioned table cannot select the execution plan with IndexJoin.

Example 2: In the following example, the query is performed in `dynamic` mode using the execution plan with IndexJoin:

```
mysql> set @@tidb_partition_prune_mode = 'dynamic';
Query OK, 0 rows affected (0.00 sec)

mysql> explain select /*+ TIDB_INLJ(t1, t2) */ t1.* from t1, t2 where t2.

    ↪ |
+--
    ↪ ---------------------------------+---------+-----------+----------------------+
    ↪
8 rows in set (0.00 sec)
```

From example 2, you can see that in `dynamic` mode, the execution plan with IndexJoin is selected when you execute the query.

Currently, `static` pruning mode does not support plan cache for both prepared and non-prepared statements.

Update statistics of partitioned tables in dynamic pruning mode

1. Locate all partitioned tables:

```
SELECT DISTINCT CONCAT(TABLE_SCHEMA,'.', TABLE_NAME)
    FROM information_schema.PARTITIONS
    WHERE TIDB_PARTITION_ID IS NOT NULL
    AND TABLE_SCHEMA NOT IN ('INFORMATION_SCHEMA', 'mysql', 'sys', '
       ↪ PERFORMANCE_SCHEMA', 'METRICS_SCHEMA');
```

```
+-------------------------------------+
| concat(TABLE_SCHEMA,'.',TABLE_NAME) |
+-------------------------------------+
| test.t                              |
+-------------------------------------+
1 row in set (0.02 sec)
```

2. Generate the statements for updating the statistics of all partitioned tables:

```
SELECT DISTINCT CONCAT('ANALYZE TABLE ',TABLE_SCHEMA,'.',TABLE_NAME,'
    ↪ ALL COLUMNS;')
    FROM information_schema.PARTITIONS
    WHERE TIDB_PARTITION_ID IS NOT NULL
    AND TABLE_SCHEMA NOT IN ('INFORMATION_SCHEMA','mysql','sys','
       ↪ PERFORMANCE_SCHEMA','METRICS_SCHEMA');
```

```
+-------------------------------------------------------------------------+
    ↪
| concat('ANALYZE TABLE ',TABLE_SCHEMA,'.',TABLE_NAME,' ALL COLUMNS;')
    ↪ |
+-------------------------------------------------------------------------+
    ↪
| ANALYZE TABLE test.t ALL COLUMNS;                                       |
+-------------------------------------------------------------------------+
    ↪
1 row in set (0.01 sec)
```

You can change `ALL COLUMNS` to the columns you need.

3. Export the batch update statements to a file:

```
mysql --host xxxx --port xxxx -u root -p -e "SELECT DISTINCT CONCAT('
    ↪ ANALYZE TABLE ',TABLE_SCHEMA,'.',TABLE_NAME,' ALL COLUMNS;') \
    FROM information_schema.PARTITIONS \
    WHERE TIDB_PARTITION_ID IS NOT NULL \
    AND TABLE_SCHEMA NOT IN ('INFORMATION_SCHEMA','mysql','sys','
        ↪ PERFORMANCE_SCHEMA','METRICS_SCHEMA');" | tee
        ↪ gatherGlobalStats.sql
```

4. Execute a batch update:

   Process SQL statements before executing the `source` command:

```
sed -i "" '1d' gatherGlobalStats.sql --- mac
sed -i '1d' gatherGlobalStats.sql --- linux
```

```
SET session tidb_partition_prune_mode = dynamic;
source gatherGlobalStats.sql
```

14.13.13 Temporary Tables

The temporary tables feature is introduced in TiDB v5.3.0. This feature solves the issue of temporarily storing the intermediate results of an application, which frees you from frequently creating and dropping tables. You can store the intermediate calculation data in temporary tables. When the intermediate data is no longer needed, TiDB automatically cleans up and recycles the temporary tables. This avoids user applications being too complicated, reduces table management overhead, and improves performance.

This document introduces the user scenarios and the types of temporary tables, provides usage examples and instruction on how to limit the memory usage of temporary tables, and explains compatibility restrictions with other TiDB features.

14.13.13.1 User scenarios

You can use TiDB temporary tables in the following scenarios:

- Cache the intermediate temporary data of an application. After the calculation is completed, the data is dumped to the ordinary table, and the temporary table is automatically released.
- Perform multiple DML operations on the same data in a short period of time. For example, in an e-commerce shopping cart application, add, modify, and delete products, complete the payment, and remove the shopping cart information.
- Quickly import intermediate temporary data in batches to improve the performance of importing temporary data.
- Update data in batches. Import data into temporary tables in the database in batches, and export the data to files after finishing modify the data.

14.13.13.2 Types of temporary tables

Temporary tables in TiDB are divided into two types: local temporary tables and global temporary tables.

- For a local temporary table, the table definition and data in the table are visible only to the current session. This type is suitable for temporarily storing intermediate data in the session.
- For a global temporary table, the table definition is visible to the entire TiDB cluster, and the data in the table is visible only to the current transaction. This type is suitable for temporarily storing intermediate data in the transaction.

14.13.13.3 Local temporary tables

The semantics of the local temporary table in TiDB is consistent with that of the MySQL temporary table. The characteristics are as follows:

- The table definition of a local temporary table is not persistent. A local temporary table is visible only to the session in which the table is created, and other sessions cannot access the table.
- You can create local temporary tables with the same name in different sessions, and each session reads only from and writes only to the local temporary table created in the session.
- The data of a local temporary table is visible to all transactions in the session.
- After a session ends, the local temporary table created in the session is automatically dropped.
- A local temporary table can have the same name as an ordinary table. In this case, in the DDL and DML statements, the ordinary table is hidden until the local temporary table is dropped.

To create a local temporary table, you can use the `CREATE TEMPORARY TABLE` statement. To drop a local temporary table, you can use the `DROP TABLE` or `DROP TEMPORARY TABLE` statement.

Different from MySQL, the local temporary tables in TiDB are all external tables, and no internal temporary tables will be created automatically when SQL statements are executed.

14.13.13.3.1 Usage examples of local temporary tables

> **Note:**
>
> - Before you use the temporary table in TiDB, pay attention to the compatibility restrictions with other TiDB features and the compatibility with MySQL temporary tables.
> - If you have created local temporary tables on a cluster earlier than TiDB v5.3.0, these tables are actually ordinary tables, and treated as ordinary tables after the cluster is upgraded to TiDB v5.3.0 or a later version.

Assume that there is an ordinary table `users`:

```
CREATE TABLE users (
    id BIGINT,
    name VARCHAR(100),
    PRIMARY KEY(id)
);
```

In session A, creating a local temporary table `users` does not conflict with the ordinary table `users`. When session A accesses the `users` table, it accesses the local temporary table `users`.

```
CREATE TEMPORARY TABLE users (
    id BIGINT,
    name VARCHAR(100),
    city VARCHAR(50),
    PRIMARY KEY(id)
);
```

```
Query OK, 0 rows affected (0.01 sec)
```

If you insert data into `users`, data is inserted to the local temporary table `users` in session A.

```
INSERT INTO users(id, name, city) VALUES(1001, 'Davis', 'LosAngeles');
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SELECT * FROM users;
```

```
+------+-------+------------+
| id   | name | city       |
+------+-------+------------+
| 1001 | Davis | LosAngeles |
+------+-------+------------+
1 row in set (0.00 sec)
```

In session B, creating a local temporary table `users` does not conflict with the ordinary table `users` or the local temporary table `users` in session A. When session B accesses the `users` table, it accesses the local temporary table `users` in session B.

```
CREATE TEMPORARY TABLE users (
    id BIGINT,
    name VARCHAR(100),
    city VARCHAR(50),
    PRIMARY KEY(id)
);
```

```
Query OK, 0 rows affected (0.01 sec)
```

If you insert data into `users`, data is inserted to the local temporary table `users` in session B.

```
INSERT INTO users(id, name, city) VALUES(1001, 'James', 'NewYork');
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SELECT * FROM users;
```

```
+------+-------+---------+
| id   | name | city    |
+------+-------+---------+
| 1001 | James | NewYork |
+------+-------+---------+
1 row in set (0.00 sec)
```

14.13.13.3.2 Compatibility with MySQL temporary tables

The following features and limitations of TiDB local temporary tables are the same with those of MySQL temporary tables:

- When you create or drop local temporary tables, the current transaction is not automatically committed.
- After dropping the schema where a local temporary table is located, the temporary table is not dropped and is still readable and writable.
- Creating a local temporary table requires the `CREATE TEMPORARY TABLES` permission. All subsequent operations on the table do not require any permission.
- Local temporary tables do not support foreign keys and partitioned tables.
- Does not support creating views based on local temporary tables.
- `SHOW [FULL] TABLES` does not show local temporary tables.

Local temporary tables in TiDB are incompatible with MySQL temporary tables in the following aspects:

- TiDB local temporary tables do not support `ALTER TABLE`.
- TiDB local temporary tables ignore the `ENGINE` table option, and always store temporary table data in TiDB memory with a memory limit.
- When `MEMORY` is declared as the storage engine, TiDB local temporary tables are not restricted by the `MEMORY` storage engine.
- When `INNODB` or `MYISAM` is declared as the storage engine, TiDB local temporary tables ignore the system variables specific to the InnoDB temporary tables.
- MySQL does not permit referencing to the same temporary table multiple times in the same SQL statement. TiDB local temporary tables do not have this restriction.
- The system table `information_schema.INNODB_TEMP_TABLE_INFO` that shows temporary tables in MySQL does not exist in TiDB. Currently, TiDB does not have a system table that shows local temporary tables.
- TiDB does not have internal temporary tables. The MySQL system variables for internal temporary tables do not take effect for TiDB.

14.13.13.4 Global temporary tables

The global temporary table is an extension of TiDB. The characteristics are as follows:

- The table definition of a global temporary table is persistent and visible to all sessions.
- The data of a global temporary table is visible only in the current transaction. When the transaction ends, the data is automatically cleared.
- A global temporary table cannot have the same name as an ordinary table.

To create a global temporary table, you can use the `CREATE GLOBAL TEMPORARY TABLE` statement ended with `ON COMMIT DELETE ROWS`. To drop a global temporary table, you can use the `DROP TABLE` or `DROP GLOBAL TEMPORARY TABLE` statement.

14.13.13.4.1 Usage examples of global temporary tables

Note:

- Before you use the temporary table in TiDB, pay attention to the compatibility restrictions with other TiDB features.
- If you have created global temporary tables on a TiDB cluster of v5.3.0 or later, when the cluster is downgraded to a version earlier than v5.3.0, these tables are handled as ordinary tables. In this case, a data error occurs.

Create a global temporary table `users` in session A:

```
CREATE GLOBAL TEMPORARY TABLE users (
    id BIGINT,
    name VARCHAR(100),
    city VARCHAR(50),
    PRIMARY KEY(id)
) ON COMMIT DELETE ROWS;
```

```
Query OK, 0 rows affected (0.01 sec)
```

The data written to `users` is visible to the current transaction:

```
BEGIN;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
INSERT INTO users(id, name, city) VALUES(1001, 'Davis', 'LosAngeles');
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SELECT * FROM users;
```

```
+------+-------+------------+
| id   | name | city       |
+------+-------+------------+
| 1001 | Davis | LosAngeles |
+------+-------+------------+
1 row in set (0.00 sec)
```

After the transaction ends, the data is automatically cleared:

```
COMMIT;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
SELECT * FROM users;
```

```
Empty set (0.00 sec)
```

After `users` is created in session A, session B can also read from and write to the `users` table:

```
SELECT * FROM users;
```

```
Empty set (0.00 sec)
```

> **Note:**
>
> If the transaction is automatically committed, after the SQL statement is executed, the inserted data is automatically cleared and unavailable to subsequent SQL executions. Therefore, you should use non-autocommit transactions to read from and write to global temporary tables.

14.13.13.5 Limit the memory usage of temporary tables

No matter which storage engine is declared as `ENGINE` when you define a table, the data of local temporary tables and global temporary tables is only stored in the memory of TiDB instances. This data is not persisted.

To avoid memory overflow, you can limit the size of each temporary table using the `tidb_tmp_table_max_size` system variable. Once a temporary table is larger than the `tidb_tmp_table_max_size` threshold value, TiDB reports an error. The default value of `tidb_tmp_table_max_size` is `64MB`.

For example, set the maximum size of a temporary table to `256MB`:

```
SET GLOBAL tidb_tmp_table_max_size=268435456;
```

14.13.13.6 Compatibility restrictions with other TiDB features

Local temporary tables and global temporary tables in TiDB are **NOT** compatible with the following TiDB features:

- `AUTO_RANDOM` columns
- `SHARD_ROW_ID_BITS` and `PRE_SPLIT_REGIONS` table options

- Partitioned tables
- `SPLIT REGION` statements
- `ADMIN CHECK TABLE` and `ADMIN CHECKSUM TABLE` statements
- `FLASHBACK TABLE` and `RECOVER TABLE` statements
- Executing `CREATE TABLE LIKE` statements based on a temporary table
- Stale Read
- Foreign keys
- SQL bindings
- TiFlash replicas
- Creating views on a temporary table
- Placement Rules
- Execution plans involving a temporary table are not cached by `prepare plan cache`.

Local temporary tables in TiDB do **NOT** support the following feature:

- Reading historical data using the `tidb_snapshot` system variable.

14.13.13.7 TiDB migration tool support

Local temporary tables are not exported, backed up or replicated by TiDB migration tools, because these tables are visible only to the current session.

Global temporary tables are exported, backed up, and replicated by TiDB migration tools, because the table definition is globally visible. Note that the data on the tables are not exported.

> **Note:**
>
> - Replicating temporary tables using TiCDC requires TiCDC v5.3.0 or later. Otherwise, the table definition of the downstream table is wrong.
> - Backing up temporary tables using BR requires BR v5.3.0 or later. Otherwise, the table definitions of the backed temporary tables are wrong.
> - The cluster to export, the cluster after data restore, and the downstream cluster of a replication should support global temporary tables. Otherwise, an error is reported.

- CREATE TABLE
- CREATE TABLE LIKE
- DROP TABLE

14.13.14 Cached Tables

In v6.0.0, TiDB introduces the cached table feature for frequently accessed but rarely updated small hotspot tables. When this feature is used, the data of an entire table is loaded into the memory of the TiDB server, and TiDB directly gets the table data from the memory without accessing TiKV, which improves the read performance.

This document describes the usage scenarios of cached tables, the examples, and the compatibility restrictions with other TiDB features.

14.13.14.1 Usage scenarios

The cached table feature is suitable for tables with the following characteristics:

- The data volume of the table is small, for example, less than 4 MiB.
- The table is read-only or rarely updated, for example, with a write QPS (queries per second) of less than 10 times per minute.
- The table is frequently accessed, and you expect a better read performance, for example, when encountering hotspots on small tables during direct reads from from TiKV.

When the data volume of the table is small but the data is frequently accessed, the data is concentrated on a Region in TiKV and makes it a hotspot Region, which affects the performance. Therefore, the typical usage scenarios of cached tables are as follows:

- Configuration tables, from which applications read the configuration information.
- The tables of exchange rates in the financial sector. These tables are updated only once a day but not in real-time.
- Bank branch or network information tables, which are rarely updated.

Take configuration tables as an example. When the application restarts, the configuration information is loaded in all connections, which causes a high read latency. In this case, you can solve this problem by using the cached tables feature.

14.13.14.2 Examples

This section describes the usage of cached tables by examples.

14.13.14.2.1 Set a normal table to a cached table

Suppose that there is a table `users`:

```
CREATE TABLE users (
    id BIGINT,
    name VARCHAR(100),
    PRIMARY KEY(id)
);
```

To set this table to a cached table, use the `ALTER TABLE` statement:

```
ALTER TABLE users CACHE;
```

```
Query OK, 0 rows affected (0.01 sec)
```

14.13.14.2.2 Verify a cached table

To verify a cached table, use the `SHOW CREATE TABLE` statement. If the table is cached, the returned result contains the `CACHED ON` attribute:

```
SHOW CREATE TABLE users;
```

```
+--
    ↪ -----+-------------------------------------------------------------------------
    ↪
| Table | Create Table
    ↪
    ↪ |
+--
    ↪ -----+-------------------------------------------------------------------------
    ↪
| users | CREATE TABLE `users` (
  `id` bigint(20) NOT NULL,
  `name` varchar(100) DEFAULT NULL,
  PRIMARY KEY (`id`) /*T![clustered_index] CLUSTERED */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin /* CACHED ON */
    ↪  |
+--
    ↪ -----+-------------------------------------------------------------------------
    ↪
1 row in set (0.00 sec)
```

After reading data from a cached table, TiDB loads the data in memory. You can use the `trace` statement to check whether the data is loaded into memory. When the cache is not loaded, the returned result contains the `regionRequest.SendReqCtx` attribute, which indicates that TiDB reads data from TiKV.

```
TRACE SELECT * FROM users;
```

```
+--
    ↪ ---------------------------------------------+----------------+------------+
    ↪
| operation                                    | startTS        | duration |
+--
    ↪ ---------------------------------------------+----------------+------------+
    ↪
```

```
| trace                                          | 17:47:39.969980 | 827.73µs |
|   ─session.ExecuteStmt                          | 17:47:39.969986 | 413.31µs |
|     ─executor.Compile                           | 17:47:39.969993 | 198.29µs |
|     ─session.runStmt                            | 17:47:39.970221 | 157.252µs |
|       ─TableReaderExecutor.Open                 | 17:47:39.970294 | 47.068µs |
|         ─distsql.Select                         | 17:47:39.970312 | 24.729µs |
|           ─regionRequest.SendReqCtx             | 17:47:39.970454 | 189.601µs |
|   ─* executor.UnionScanExec.Next                | 17:47:39.970407 | 353.073µs |
|     ─* executor.TableReaderExecutor.Next        | 17:47:39.970411 | 301.106µs |
|     ─* executor.TableReaderExecutor.Next        | 17:47:39.970746 | 6.57µs |
|   ─* executor.UnionScanExec.Next                | 17:47:39.970772 | 17.589µs |
|     ─* executor.TableReaderExecutor.Next        | 17:47:39.970776 | 6.59µs |
+--
   ↪ ------------------------------------------------+-----------------+-----------+
   ↪
12 rows in set (0.01 sec)
```

After executing `trace` again, the returned result no longer contains the `regionRequest.SendReqCtx` attribute, which indicates that TiDB no longer reads data from TiKV but reads data from the memory instead.

```
+---------------------------------------+-----------------+-----------+
| operation                             | startTS         | duration  |
+---------------------------------------+-----------------+-----------+
| trace                                 | 17:47:40.533888 | 453.547µs |
|   ─session.ExecuteStmt                | 17:47:40.533894 | 402.341µs |
|     ─executor.Compile                 | 17:47:40.533903 | 205.54µs |
|     ─session.runStmt                  | 17:47:40.534141 | 132.084µs |
|       ─TableReaderExecutor.Open       | 17:47:40.534202 | 14.749µs |
|   ─* executor.UnionScanExec.Next      | 17:47:40.534306 | 3.21µs |
|   ─* executor.UnionScanExec.Next      | 17:47:40.534316 | 1.219µs |
+---------------------------------------+-----------------+-----------+
7 rows in set (0.00 sec)
```

Note that the `UnionScan` operator is used to read the cached tables, so you can see `UnionScan` in the execution plan of the cached tables through `explain`:

```
+--
   ↪ ----------------------+---------+-----------+--------------+-----------------
   ↪
| id                     | estRows | task    | access object | operator info
   ↪            |
+--
   ↪ ----------------------+---------+-----------+--------------+-----------------
   ↪
```

```
| UnionScan_5          | 1.00   | root     |              |
   ↪                                |
|  └─TableReader_7       | 1.00   | root     |              | data:
   ↪ TableFullScan_6        |
|    └─TableFullScan_6   | 1.00   | cop[tikv] | table:users | keep order:
   ↪ false, stats:pseudo |
+--
   ↪ ----------------------+---------+-----------+--------------+-----------------
   ↪
3 rows in set (0.00 sec)
```

14.13.14.2.3 Write data to a cached table

Cached tables support data writes. For example, you can insert a record into the `users` table:

```
INSERT INTO users(id, name) VALUES(1001, 'Davis');
```

```
Query OK, 1 row affected (0.00 sec)
```

```
SELECT * FROM users;
```

```
+------+-------+
| id   | name |
+------+-------+
| 1001 | Davis |
+------+-------+
1 row in set (0.00 sec)
```

Note:

When you insert data to a cached table, second-level write latency might occur. The latency is controlled by the global environment variable `tidb_table_cache_lease`. You can decide whether to use the cached table feature by checking whether the latency is acceptable based on your application. For example, in a read-only scenario, you can increase the value of `tidb_table_cache_lease`:

```
set @@global.tidb_table_cache_lease = 10;
```

The write latency of cached tables is high, because the cached table feature is implemented with a complex mechanism that requires a lease to be set for each cache. When there are multiple TiDB instances, one instance does not

know whether the other instances have cached data. If an instance modifies the table data directly, the other instances read the old cache data. To ensure correctness, the cached table implementation uses a lease mechanism to ensure that the data is not modified before the lease expires. That is why the write latency is high.

The metadata of cached tables is stored in the `mysql.table_cache_meta` table. This table records the IDs of all cached tables, the current lock status (`lock_type`), and the lock lease information (`lease`). This table is only internally used in TiDB and you are not recommended to modify it. Otherwise, unexpected errors might occur.

```
SHOW CREATE TABLE mysql.table_cache_meta\G
*************************** 1. row ***************************
       Table: table_cache_meta
Create Table: CREATE TABLE `table_cache_meta` (
  `tid` bigint(11) NOT NULL DEFAULT '0',
  `lock_type` enum('NONE','READ','INTEND','WRITE') NOT NULL DEFAULT 'NONE',
  `lease` bigint(20) NOT NULL DEFAULT '0',
  `oldReadLease` bigint(20) NOT NULL DEFAULT '0',
  PRIMARY KEY (`tid`) /*T![clustered_index] CLUSTERED */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
1 row in set (0.00 sec)
```

14.13.14.2.4 Revert a cached table to a normal table

Note:

Executing DDL statements on a cached table will fail. Before executing DDL statements on a cached table, you need to remove the cache attribute first and set the cached table back to a normal table.

```
TRUNCATE TABLE users;
```

```
ERROR 8242 (HY000): 'Truncate Table' is unsupported on cache tables.
```

```
mysql> ALTER TABLE users ADD INDEX k_id(id);
```

```
ERROR 8242 (HY000): 'Alter Table' is unsupported on cache tables.
```

To revert a cached table to a normal table, use `ALTER TABLE t NOCACHE`:

```
ALTER TABLE users NOCACHE;
```

```
Query OK, 0 rows affected (0.00 sec)
```

14.13.14.3 Size limit of cached tables

Cached tables are only suitable for scenarios with small tables, because TiDB loads the data of an entire table into memory, and the cached data becomes invalid after modification and needs to be reloaded.

Currently, the size limit of a cached table is 64 MB in TiDB. If the table data exceeds 64 MB, executing `ALTER TABLE t CACHE` will fail.

14.13.14.4 Compatibility restrictions with other TiDB features

Cached tables **DO NOT** support the following features:

- Performing the `ALTER TABLE t ADD PARTITION` operation on partitioned tables is not supported.
- Performing the `ALTER TABLE t CACHE` operation on temporary tables is not supported.
- Performing the `ALTER TABLE t CACHE` operation on views is not supported.
- Stale Read is not supported.
- Direct DDL operations on a cached table are not supported. You need to set the cached table back to a normal table first by using `ALTER TABLE t NOCACHE` before performing DDL operations.

Cached tables **CANNOT** be used in the following scenarios:

- Setting the system variable `tidb_snapshot` to read historical data.
- During modification, the cached data becomes invalid until the data is reloaded.

14.13.14.5 Compatibility with TiDB migration tools

The cached table is a TiDB extension to MySQL syntax. Only TiDB can recognize the `ALTER TABLE ... CACHE` statement. TiDB migration tools **DO NOT** support cached tables, including Backup & Restore (BR), TiCDC, and Dumpling. These tools treat cached tables as normal tables.

That is to say, when a cached table is backed up and restored, it becomes a normal table. If the downstream cluster is a different TiDB cluster and you want to continue using the cached table feature, you can manually enable cached tables on the downstream cluster by executing `ALTER TABLE ... CACHE` on the downstream table.

- ALTER TABLE
- System Variables

14.13.15 FOREIGN KEY Constraints

Starting from v6.6.0, TiDB supports the foreign key feature, which allows cross-table referencing of related data, and foreign key constraints to maintain data consistency.

> **Warning:**
>
> - Currently, the foreign key feature is experimental. It is not recommended that you use it in production environments. This feature might be changed or removed without prior notice. If you find a bug, you can report an issue on GitHub.
> - The foreign key feature is typically employed to enforce referential integrity constraint checks. It might cause performance degradation, so it is recommended to conduct thorough testing before using it in performance-sensitive scenarios.

The foreign key is defined in the child table. The syntax is as follows:

```
ForeignKeyDef
        ::= ( 'CONSTRAINT' Identifier )? 'FOREIGN' 'KEY'
            Identifier? '(' ColumnName ( ',' ColumnName )* ')'
            'REFERENCES' TableName '(' ColumnName ( ',' ColumnName )* ')'
            ( 'ON' 'DELETE' ReferenceOption )?
            ( 'ON' 'UPDATE' ReferenceOption )?

ReferenceOption
        ::= 'RESTRICT'
          | 'CASCADE'
          | 'SET' 'NULL'
          | 'SET' 'DEFAULT'
          | 'NO' 'ACTION'
```

14.13.15.1 Naming

The naming of a foreign key follows the following rules:

- If a name is specified in `CONSTRAINT identifier`, the specified name is used.
- If no name is specified in `CONSTRAINT identifier`, but a name is specified in `FOREIGN KEY identifier`, the name specified in the `FOREIGN KEY identifier` is used.
- If neither `CONSTRAINT identifier` nor `FOREIGN KEY identifier` specifies a name, a name is automatically generated, such as `fk_1`, `fk_2`, and `fk_3`.
- The foreign key name must be unique in the current table. Otherwise, an error `ERROR 1826: Duplicate foreign key constraint name 'fk'` is reported when the foreign key is created.

14.13.15.2 Restrictions

When creating a foreign key, the following conditions must be met:

- Neither the parent table nor the child table is a temporary table.
- The user has the `REFERENCES` privilege on the parent table.
- The columns referenced by the foreign key in the parent table and the child table are of the same data type and have the same size, precision, length, character set, and collation.
- The columns in the foreign key cannot reference themselves.
- The columns in the foreign key and the columns in the referenced parent table have the same index, and the order of the columns in the index matches that in the foreign key. This is to use the index to avoid full table scans when performing foreign key constraint checks.
    - If there is no corresponding foreign key index in the parent table, an error `ERROR 1822: Failed to add the foreign key constraint. Missing index for constraint 'fk' in the referenced table 't'` is reported.
    - If there is no corresponding foreign key index in the child table, an index is automatically created with the same name as the foreign key.
- It is not supported to create a foreign key on a column of the `BLOB` or `TEXT` type.
- It is not supported to create a foreign key on a partitioned table.
- It is not supported to create a foreign key on a virtual generated column.

14.13.15.3 Reference operations

If an `UPDATE` or `DELETE` operation affects a foreign key value in the parent table, the corresponding foreign key value in the child table is determined by the reference operation defined by the `ON UPDATE` or `ON DELETE` clause in the foreign key definition. The reference operations include the following:

- `CASCADE`: automatically updates or deletes the matching rows in the child table when the `UPDATE` or `DELETE` operation affects the parent table. The cascade operation is performed in a depth-first manner.
- `SET NULL`: automatically sets the matching foreign key columns in the child table to `NULL` when the `UPDATE` or `DELETE` operation affects the parent table.
- `RESTRICT`: denies the `UPDATE` or `DELETE` operation if the child table contains matching rows.
- `NO ACTION`: the same as `RESTRICT`.
- `SET DEFAULT`: the same as `RESTRICT`.

If there is no matching foreign key value in the parent table, the `INSERT` or `UPDATE` operation on the child table is denied.

If the foreign key definition does not specify `ON DELETE` or `ON UPDATE`, the default behavior is `NO ACTION`.

If the foreign key is defined on a `STORED GENERATED COLUMN`, the `CASCADE`, `SET NULL`, and `SET DEFAULT` references are not supported.

14.13.15.4 Usage examples of foreign keys

The following example uses a single-column foreign key to associate the parent table and the child table:

```
CREATE TABLE parent (
    id INT KEY
);

CREATE TABLE child (
    id INT,
    pid INT,
    INDEX idx_pid (pid),
    FOREIGN KEY (pid) REFERENCES parent(id) ON DELETE CASCADE
);
```

The following is a more complex example where the `product_order` table has two foreign keys that reference the other two tables. One foreign key references two indexes on the `product` table, and the other references a single index on the `customer` table:

```
CREATE TABLE product (
    category INT NOT NULL,
    id INT NOT NULL,
    price DECIMAL(20,10),
    PRIMARY KEY(category, id)
);

CREATE TABLE customer (
```

```
    id INT KEY
);

CREATE TABLE product_order (
    id INT NOT NULL AUTO_INCREMENT,
    product_category INT NOT NULL,
    product_id INT NOT NULL,
    customer_id INT NOT NULL,

    PRIMARY KEY(id),
    INDEX (product_category, product_id),
    INDEX (customer_id),

    FOREIGN KEY (product_category, product_id)
      REFERENCES product(category, id)
      ON UPDATE CASCADE ON DELETE RESTRICT,

    FOREIGN KEY (customer_id)
      REFERENCES customer(id)
);
```

14.13.15.5 Create a foreign key constraint

To create a foreign key constraint, you can use the following `ALTER TABLE` statement:

```
ALTER TABLE table_name
    ADD [CONSTRAINT [identifier]] FOREIGN KEY
    [identifier] (col_name, ...)
    REFERENCES tbl_name (col_name,...)
    [ON DELETE reference_option]
    [ON UPDATE reference_option]
```

The foreign key can be self-referencing, that is, referencing the same table. When you add a foreign key constraint to a table using `ALTER TABLE`, you need to first create an index on the parent table column that the foreign key references.

14.13.15.6 Delete a foreign key constraint

To delete a foreign key constraint, you can use the following `ALTER TABLE` statement:

```
ALTER TABLE table_name DROP FOREIGN KEY fk_identifier;
```

If the foreign key constraint is named when it is created, you can reference the name to delete the foreign key constraint. Otherwise, you have to use the constraint name automatically generated to delete the constraint. You can use `SHOW CREATE TABLE` to view the foreign key name:

```
mysql> SHOW CREATE TABLE child\G
*************************** 1. row ***************************
       Table: child
Create Table: CREATE TABLE `child` (
  `id` int(11) DEFAULT NULL,
  `pid` int(11) DEFAULT NULL,
  KEY `idx_pid` (`pid`),
  CONSTRAINT `fk_1` FOREIGN KEY (`pid`) REFERENCES `test`.`parent` (`id`)
    ↪ ON DELETE CASCADE
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
```

14.13.15.7 Foreign key constraint check

TiDB supports foreign key constraint check, which is controlled by the system variable `foreign_key_checks`. By default, this variable is set to `ON`, meaning that the foreign key constraint check is enabled. This variable has two scopes: `GLOBAL` and `SESSION`. Keeping this variable enabled can ensure the integrity of foreign key reference relationships.

The effect of disabling foreign key constraint check is as follows:

- When you delete a parent table referenced by a foreign key, the deletion can succeed only when the foreign key constraint check is disabled.
- When you import data to a database, the order of creating tables might be different from the foreign key dependency order, which might cause the creation of tables to fail. Only when the foreign key constraint check is disabled can the tables be created successfully. In addition, disabling the foreign key constraint check can speed up data import.
- When you import data to a database, if the data of the child table is imported first, an error will be reported. Only when the foreign key constraint check is disabled can the data of the child table be imported successfully.
- If an `ALTER TABLE` operation to be executed involves a change of the foreign key, this operation succeeds only when the foreign key constraint check is disabled.

When the foreign key constraint check is disabled, the foreign key constraint check and reference operation are not executed, except for the following scenarios:

- If the execution of `ALTER TABLE` might result in wrong definition of the foreign key, an error is still reported during the execution.
- When deleting the index required by the foreign key, you should delete the foreign key first. Otherwise, an error is reported.
- When you create a foreign key but it does not meet related conditions or restrictions, an error is reported.

14.13.15.8 Locking

When `INSERT` or `UPDATE` a child table, the foreign key constraint checks whether the corresponding foreign key value exists in the parent table, and locks the row in the parent table to avoid the foreign key value being deleted by other operations violating the foreign key constraint. The locking behavior is equivalent to performing a `SELECT FOR UPDATE` operation on the row where the foreign key value is located in the parent table.

Because TiDB currently does not support `LOCK IN SHARE MODE`, if a child table accepts a large number of concurrent writes and most of the referenced foreign key values are the same, there might be serious locking conflicts. It is recommended to disable `foreign_key_checks` when writing a large number of child table data.

14.13.15.9 Definition and metadata of foreign keys

To view the definition of a foreign key constraint, execute the `SHOW CREATE TABLE` statement:

```
mysql> SHOW CREATE TABLE child\G
*************************** 1. row ***************************
       Table: child
Create Table: CREATE TABLE `child` (
  `id` int(11) DEFAULT NULL,
  `pid` int(11) DEFAULT NULL,
  KEY `idx_pid` (`pid`),
  CONSTRAINT `fk_1` FOREIGN KEY (`pid`) REFERENCES `test`.`parent` (`id`)
    ↪ ON DELETE CASCADE
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
```

You can also get information about foreign keys using either of the following system tables:

- `INFORMATION_SCHEMA.KEY_COLUMN_USAGE`
- `INFORMATION_SCHEMA.TABLE_CONSTRAINTS`
- `INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS`

The following provides examples:

Get information about foreign keys from the `INFORMATION_SCHEMA.KEY_COLUMN_USAGE` system table:

```
mysql> SELECT TABLE_SCHEMA, TABLE_NAME, COLUMN_NAME, CONSTRAINT_NAME FROM
    ↪ INFORMATION_SCHEMA.KEY_COLUMN_USAGE WHERE REFERENCED_TABLE_SCHEMA IS
    ↪ NOT NULL;
+--------------+--------------+-----------------+-----------------+
| TABLE_SCHEMA | TABLE_NAME | COLUMN_NAME   | CONSTRAINT_NAME |
+--------------+--------------+-----------------+-----------------+
```

```
| test        | child       | pid              | fk_1          |
| test        | product_order | product_category | fk_1      |
| test        | product_order | product_id   | fk_1          |
| test        | product_order | customer_id  | fk_2          |
+-------------+---------------+------------------+---------------+
```

Get information about foreign keys from the `INFORMATION_SCHEMA.TABLE_CONSTRAINTS` system table:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.TABLE_CONSTRAINTS WHERE CONSTRAINT_
    ↪ TYPE='FOREIGN KEY'\G
***************************[ 1. row ]***************************
CONSTRAINT_CATALOG | def
CONSTRAINT_SCHEMA | test
CONSTRAINT_NAME  | fk_1
TABLE_SCHEMA     | test
TABLE_NAME       | child
CONSTRAINT_TYPE  | FOREIGN KEY
```

Get information about foreign keys from the `INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS` system table:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS\G
***************************[ 1. row ]***************************
CONSTRAINT_CATALOG     | def
CONSTRAINT_SCHEMA      | test
CONSTRAINT_NAME        | fk_1
UNIQUE_CONSTRAINT_CATALOG | def
UNIQUE_CONSTRAINT_SCHEMA | test
UNIQUE_CONSTRAINT_NAME | PRIMARY
MATCH_OPTION           | NONE
UPDATE_RULE            | NO ACTION
DELETE_RULE            | CASCADE
TABLE_NAME             | child
REFERENCED_TABLE_NAME  | parent
```

14.13.15.10 View execution plans with foreign keys

You can use the `EXPLAIN` statement to view execution plans. The `Foreign_Key_Check` operator performs the foreign key constraint check on DML statements that are executed.

```
mysql> explain insert into child values (1,1);
+--
    ↪ --------------------+---------+------+--------------+-----------------------
    ↪
```

```
| id                  | estRows | task | access object | operator info
   ↪         |
+--
   ↪ --------------------+---------+------+---------------+----------------------
   ↪
| Insert_1            | N/A     | root |               | N/A
   ↪                        |
|  ─Foreign_Key_Check_3 | 0.00 | root | table:parent | foreign_key:fk_1,
   ↪ check_exist |
+--
   ↪ --------------------+---------+------+---------------+----------------------
   ↪
```

You can use the `EXPLAIN ANALYZE` statement to view the execution of the foreign key reference behavior. The `Foreign_Key_Cascade` operator performs foreign key referencing for DML statements that are executed.

```
mysql> explain analyze delete from parent where id = 1;
+--
   ↪ ---------------------------------+---------+---------+-----------+--------------
   ↪
| id                              | estRows | actRows | task   | access object
   ↪               | execution info
   ↪
   ↪ | operator info                           | memory   | disk |
+--
   ↪ ---------------------------------+---------+---------+-----------+--------------
   ↪
| Delete_2                      | N/A     | 0       | root     |
   ↪                             | time:117.3µs, loops:1
   ↪
   ↪ | N/A                                     | 380 Bytes | N/A |
|  ─Point_Get_1                 | 1.00    | 1       | root     | table:parent
   ↪                | time:63.6µs, loops:2, Get:{num_rpc:1, total_time
   ↪ :29.9µs}
   ↪
   ↪ | handle:1                                | N/A       | N/A |
|  ─Foreign_Key_Cascade_3       | 0.00    | 0       | root     | table:child,
   ↪ index:idx_pid  | total:1.28ms, foreign_keys:1
   ↪
   ↪ | foreign_key:fk_1, on_delete:CASCADE   | N/A       | N/A |
|    ─Delete_7                  | N/A     | 0       | root     |
   ↪                             | time:904.8µs, loops:1
   ↪
   ↪ | N/A                                     | 1.11 KB  | N/A |
```

```
|     └─IndexLookUp_11          | 10.00  | 1      | root     |
   ↪                              | time:869.5µs, loops:2, index_task: {
   ↪ total_time: 371.1µs, fetch_handle: 357.3µs, build: 1.25µs, wait: 12.5
   ↪ µs}, table_task: {total_time: 382.6µs, num: 1, concurrency: 5} |
   ↪                                       | 9.13 KB  | N/A |

   ↪ : 0.00, distsql_concurrency: 15}, tikv_task:{time:145.6µs, loops:0} |
   ↪  keep order:false, stats:pseudo | N/A | N/A |
+--
   ↪ -------------------------------+---------+---------+-----------+--------------
   ↪
```

14.13.15.11 Compatibility

14.13.15.11.1 Compatibility between TiDB versions

Before v6.6.0, TiDB supports the syntax of creating foreign keys, but the created foreign keys are ineffective. If you upgrade a TiDB cluster created before v6.6.0 to v6.6.0 or later, the foreign keys created before the upgrade are still ineffective. Only the foreign keys created in v6.6.0 or later versions are effective. You can delete the invalid foreign key and create a new one to make the foreign key constraints effective. You can use the `SHOW CREATE TABLE` statement to check whether the foreign keys are effective. The invalid foreign key has a `/* FOREIGN KEY INVALID */` comment.

```
mysql> SHOW CREATE TABLE child\G
***************************[ 1. row ]***************************
Table       | child
Create Table | CREATE TABLE `child` (
  `id` int(11) DEFAULT NULL,
  `pid` int(11) DEFAULT NULL,
  KEY `idx_pid` (`pid`),
  CONSTRAINT `fk_1` FOREIGN KEY (`pid`) REFERENCES `test`.`parent` (`id`)
     ↪ ON DELETE CASCADE /* FOREIGN KEY INVALID */
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin
```

14.13.15.11.2 Compatibility with TiDB tools

- TiDB Binlog does not support foreign keys.
- DM does not support foreign keys. DM disables the `foreign_key_checks` of the downstream TiDB when replicating data to TiDB. Therefore, the cascading operations caused by foreign keys are not replicated from the upstream to the downstream, which might cause data inconsistency.
- TiCDC v6.6.0 is compatible with foreign keys. The previous versions of TiCDC might report an error when replicating tables with foreign keys. It is recommended to disable the `foreign_key_checks` of the downstream TiDB cluster when using a TiCDC version earlier than v6.6.0.
- BR v6.6.0 is compatible with foreign keys. The previous versions of BR might report an error when restoring tables with foreign keys to a v6.6.0 or later cluster. It is recommended to disable the `foreign_key_checks` of the downstream TiDB cluster before restoring the cluster when using a BR earlier than v6.6.0.
- When you use TiDB Lightning, if the target table uses a foreign key, it is recommended to disable the `foreign_key_checks` of the downstream TiDB cluster before importing data. For versions earlier than v6.6.0, disabling this system variable does not take effect, and you need to grant the `REFERENCES` privilege for the downstream database user, or manually create the target table in the downstream database in advance to ensure smooth data import.

- Dumpling is compatible with foreign keys.

- When you use sync-diff-inspector to compare data between the upstream and downstream databases, if the database versions are different and there is an invalid foreign key in the downstream TiDB, sync-diff-inspector might report a table schema inconsistent error. This is because TiDB v6.6.0 adds a `/* FOREIGN KEY INVALID */` comment for the invalid foreign key.

14.13.15.11.3 Compatibility with MySQL

When you create a foreign key without specifying a name, the name generated by TiDB is different from that generated by MySQL. For example, the foreign key name generated by TiDB is `fk_1`, `fk_2`, and `fk_3`, while the foreign key name generated by MySQL is `table_name_ibfk_1`, `table_name_ibfk_2`, and `table_name_ibfk_3`.

Both MySQL and TiDB parse but ignore "inline `REFERENCES` specifications". Only `REFERENCES` specifications that are part of `FOREIGN KEY` definitions are checked and enforced. The following example creates a foreign key constraint using a `REFERENCES` clause:

```
CREATE TABLE parent (
    id INT KEY
);

CREATE TABLE child (
    id INT,
    pid INT REFERENCES parent(id)
```

```
);

SHOW CREATE TABLE child;
```

The output shows that the `child` table does not contain any foreign keys:

```
+-------+-----------------------------------------------------------------+
| Table | Create Table                                                    |
+-------+-----------------------------------------------------------------+
| child | CREATE TABLE `child` (                                          |
|       |   `id` int(11) DEFAULT NULL,                                    |
|       |   `pid` int(11) DEFAULT NULL                                    |
|       | ) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin |
+-------+-----------------------------------------------------------------+
```

14.13.16 Character Set and Collation

14.13.16.1 Character Set and Collation

This document introduces the character sets and collations supported by TiDB.

14.13.16.1.1 Concepts

A character set is a set of symbols and encodings. The default character set in TiDB is utf8mb4, which matches the default in MySQL 8.0 and above.

A collation is a set of rules for comparing characters in a character set, and the sorting order of characters. For example in a binary collation `A` and `a` do not compare as equal:

```
SET NAMES utf8mb4 COLLATE utf8mb4_bin;
SELECT 'A' = 'a';
SET NAMES utf8mb4 COLLATE utf8mb4_general_ci;
SELECT 'A' = 'a';
```

```
SELECT 'A' = 'a';
```

```
+-----------+
| 'A' = 'a' |
+-----------+
|         0 |
+-----------+
1 row in set (0.00 sec)
```

```
SET NAMES utf8mb4 COLLATE utf8mb4_general_ci;
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
SELECT 'A' = 'a';
```

```
+-----------+
| 'A' = 'a' |

```

14.13.16.1.2 Character sets and collations supported by TiDB

Currently, TiDB supports the following character sets:

```
SHOW CHARACTER SET;
```

```
+--
    ↪ -------+-----------------------------------+-------------------+--------+
    ↪
| Charset | Description                       | Default collation | Maxlen |
+--
    ↪ -------+-----------------------------------+-------------------+--------+
    ↪
| ascii  | US ASCII                          | ascii_bin         |      1 |
| binary | binary                            | binary            |      1 |
| gbk    | Chinese Internal Code Specification | gbk_bin         |      2 |
| latin1 | Latin1                            | latin1_bin        |      1 |
| utf8   | UTF-8 Unicode                     | utf8_bin          |      3 |
| utf8mb4 | UTF-8 Unicode                    | utf8mb4_bin       |      4 |
+--
    ↪ -------+-----------------------------------+-------------------+--------+
    ↪
6 rows in set (0.00 sec)
```

TiDB supports the following collations:

```
SHOW COLLATION;
```

```
+-------------------+---------+------+---------+----------+---------+
| Collation         | Charset | Id | Default | Compiled | Sortlen |
+-------------------+---------+------+---------+----------+---------+
| ascii_bin         | ascii   |   65 | Yes     | Yes      |       1 |
| binary            | binary  |   63 | Yes     | Yes      |       1 |
| gbk_bin           | gbk     |   87 |         | Yes      |       1 |
| gbk_chinese_ci    | gbk     |   28 | Yes     | Yes      |       1 |
```

```
| latin1_bin         | latin1 |  47 | Yes    | Yes     |       1 |
| utf8_bin           | utf8   |  83 | Yes    | Yes     |       1 |
| utf8_general_ci    | utf8   |  33 |        | Yes     |       1 |
| utf8_unicode_ci    | utf8   | 192 |        | Yes     |       1 |
| utf8mb4_0900_ai_ci | utf8mb4 | 255 |    | Yes     |       1 |
| utf8mb4_0900_bin | utf8mb4 | 309 |      | Yes     |       1 |
| utf8mb4_bin        | utf8mb4 |  46 | Yes    | Yes     |       1 |
| utf8mb4_general_ci | utf8mb4 |  45 |     | Yes     |       1 |
| utf8mb4_unicode_ci | utf8mb4 | 224 |    | Yes     |       1 |
+--------------------+---------+-----+--------+---------+---------+
13 rows in set (0.00 sec)
```

Warning:

TiDB incorrectly treats latin1 as a subset of utf8. This can lead to unexpected behaviors when you store characters that differ between latin1 and utf8 encodings. It is strongly recommended to the utf8mb4 character set. See TiDB #18955 for more details.

Note:

The default collations in TiDB (binary collations, with the suffix `_bin`) are different than the default collations in MySQL (typically general collations, with the suffix `_general_ci` or `_ai_ci`). This can cause incompatible behavior when specifying an explicit character set but relying on the implicit default collation to be chosen.

However, the default collations in TiDB are also affected by the connection collation settings of your clients. For example, the MySQL 8.x client defaults to `utf8mb4_0900_ai_ci` as the connection collation for the `utf8mb4` character set.

- Before TiDB v7.4.0, if your client uses `utf8mb4_0900_ai_ci` as the connection collation, TiDB falls back to using the TiDB server default collation `utf8mb4_bin` because TiDB does not support the `utf8mb4_0900_ai_ci` collation.
- Starting from v7.4.0, if your client uses `utf8mb4_0900_ai_ci` as the connection collation, TiDB follows the client's configuration to use `utf8mb4_0900_ai_ci` as the default collation.

You can use the following statement to view the collations (under the new framework for collations) that corresponds to the character set.

```
SHOW COLLATION WHERE Charset = 'utf8mb4';
```

```
+--------------------+---------+------+---------+----------+---------+
| Collation          | Charset | Id | Default | Compiled | Sortlen |
+--------------------+---------+------+---------+----------+---------+
| utf8mb4_0900_ai_ci | utf8mb4 | 255 |     | Yes     |       1 |
| utf8mb4_0900_bin | utf8mb4 | 309 |       | Yes     |       1 |
| utf8mb4_bin      | utf8mb4 | 46 | Yes    | Yes     |       1 |
| utf8mb4_general_ci | utf8mb4 | 45 |     | Yes     |       1 |
| utf8mb4_unicode_ci | utf8mb4 | 224 |    | Yes     |       1 |
+--------------------+---------+------+---------+----------+---------+
5 rows in set (0.00 sec)
```

For details about the TiDB support of the GBK character set, see GBK.

14.13.16.1.3 utf8 and utf8mb4 in TiDB

In MySQL, the character set `utf8` is limited to a maximum of three bytes. This is sufficient to store characters in the Basic Multilingual Plane (BMP), but not enough to store characters such as emojis. For this, it is recommended to use the character set `utf8mb4` instead.

By default, TiDB also limits the character set `utf8` to a maximum of three bytes to ensure that data created in TiDB can still safely be restored in MySQL. You can disable it by changing the value of the system variable `tidb_check_mb4_value_in_utf8` to `OFF`.

The following demonstrates the default behavior when inserting a 4-byte emoji character into a table. The `INSERT` statement fails for the `utf8` character set, but succeeds for `utf8mb4`:

```
CREATE TABLE utf8_test (
    c char(1) NOT NULL
   ) CHARACTER SET utf8;
```

```
Query OK, 0 rows affected (0.09 sec)
```

```
CREATE TABLE utf8m4_test (
    c char(1) NOT NULL
   ) CHARACTER SET utf8mb4;
```

```
Query OK, 0 rows affected (0.09 sec)
```

```
INSERT INTO utf8_test VALUES ('');
```

```
ERROR 1366 (HY000): incorrect utf8 value f09f9889() for column c
```

```
INSERT INTO utf8m4_test VALUES ('□');
```

```
Query OK, 1 row affected (0.02 sec)
```

```
SELECT char_length(c), length(c), c FROM utf8_test;
```

```
Empty set (0.01 sec)
```

```
SELECT char_length(c), length(c), c FROM utf8m4_test;
```

```
+----------------+-----------+------+
| char_length(c) | length(c) | c |
+----------------+-----------+------+
|              1 |         4 | □    |
+----------------+-----------+------+
1 row in set (0.00 sec)
```

14.13.16.1.4 Character set and collation in different layers

The character set and collation can be set at different layers.

Database character set and collation

Each database has a character set and a collation. You can use the following statements to specify the database character set and collation:

```
CREATE DATABASE db_name
    [[DEFAULT] CHARACTER SET charset_name]
    [[DEFAULT] COLLATE collation_name]

ALTER DATABASE db_name
    [[DEFAULT] CHARACTER SET charset_name]
    [[DEFAULT] COLLATE collation_name]
```

`DATABASE` can be replaced with `SCHEMA` here.

Different databases can use different character sets and collations. Use the `character_set_database` and `collation_database` to see the character set and collation of the current database:

```
CREATE SCHEMA test1 CHARACTER SET utf8mb4 COLLATE utf8mb4_general_ci;
```

```
Query OK, 0 rows affected (0.09 sec)
```

```
USE test1;
```

```
Database changed
```

```
SELECT @@character_set_database, @@collation_database;
```

```
+--------------------------/----------------------+
| @@character_set_database | @@collation_database |
+--------------------------/----------------------+
| utf8mb4                  | utf8mb4_general_ci   |
+--------------------------/----------------------+
1 row in set (0.00 sec)
```

```
CREATE SCHEMA test2 CHARACTER SET latin1 COLLATE latin1_bin;
```

```
Query OK, 0 rows affected (0.09 sec)
```

```
USE test2;
```

```
Database changed
```

```
SELECT @@character_set_database, @@collation_database;
```

```
+--------------------------/----------------------+
| @@character_set_database | @@collation_database |
+--------------------------/----------------------+
| latin1                   | latin1_bin           |
+--------------------------/----------------------+
1 row in set (0.00 sec)
```

You can also see the two values in INFORMATION_SCHEMA:

```
SELECT DEFAULT_CHARACTER_SET_NAME, DEFAULT_COLLATION_NAME
FROM INFORMATION_SCHEMA.SCHEMATA WHERE SCHEMA_NAME = 'db_name';
```

Table character set and collation

You can use the following statement to specify the character set and collation for tables:

```
CREATE TABLE tbl_name (column_list)
    [[DEFAULT] CHARACTER SET charset_name]
    [COLLATE collation_name]]

ALTER TABLE tbl_name
    [[DEFAULT] CHARACTER SET charset_name]
    [COLLATE collation_name]
```

For example:

```
CREATE TABLE t1(a int) CHARACTER SET utf8mb4 COLLATE utf8mb4_general_ci;
```

```
Query OK, 0 rows affected (0.08 sec)
```

If the table character set and collation are not specified, the database character set and collation are used as their default values. If you only specify the character set as `utf8mb4` ↪ without specifying the collation, the collation is determined by the value of the system variable `default_collation_for_utf8mb4`.

Column character set and collation

You can use the following statement to specify the character set and collation for columns:

```
col_name {CHAR | VARCHAR | TEXT} (col_length)
    [CHARACTER SET charset_name]
    [COLLATE collation_name]

col_name {ENUM | SET} (val_list)
    [CHARACTER SET charset_name]
    [COLLATE collation_name]
```

If the column character set and collation are not specified, the table character set and collation are used as their default values. If you only specify the character set as `utf8mb4` ↪ without specifying the collation, the collation is determined by the value of the system variable `default_collation_for_utf8mb4`.

String character sets and collation

Each string corresponds to a character set and a collation. When you use a string, this option is available:

```
[_charset_name]'string' [COLLATE collation_name]
```

Example:

```
SELECT 'string';
SELECT _utf8mb4'string';
SELECT _utf8mb4'string' COLLATE utf8mb4_general_ci;
```

Rules:

- Rule 1: If you specify `CHARACTER SET charset_name` and `COLLATE collation_name` ↪ , then the `charset_name` character set and the `collation_name` collation are used directly.
- Rule 2: If you specify `CHARACTER SET charset_name` but do not specify `COLLATE` ↪ `collation_name`, the `charset_name` character set and the default collation of `charset_name` are used.

- Rule 3: If you specify neither `CHARACTER SET charset_name` nor `COLLATE collation_name`, the character set and collation given by the system variables `character_set_connection` and `collation_connection` are used.

Client connection character set and collation

- The server character set and collation are the values of the `character_set_server` and `collation_server` system variables.
- The character set and collation of the default database are the values of the `character_set_database` and `collation_database` system variables.

You can use `character_set_connection` and `collation_connection` to specify the character set and collation for each connection. The `character_set_client` variable is to set the client character set.

Before returning the result, the `character_set_results` system variable indicates the character set in which the server returns query results to the client, including the metadata of the result.

You can use the following statement to set the character set and collation that is related to the client:

- `SET NAMES 'charset_name' [COLLATE 'collation_name']`

  `SET NAMES` indicates what character set the client will use to send SQL statements to the server. `SET NAMES utf8mb4` indicates that all the requests from the client use utf8mb4, as well as the results from the server.

  The `SET NAMES 'charset_name'` statement is equivalent to the following statement combination:

```
SET character_set_client = charset_name;
SET character_set_results = charset_name;
SET character_set_connection = charset_name;
```

  `COLLATE` is optional, if absent, the default collation of the `charset_name` is used to set the `collation_connection`.

- `SET CHARACTER SET 'charset_name'`

  Similar to `SET NAMES`, the `SET NAMES 'charset_name'` statement is equivalent to the following statement combination:

```
SET character_set_client = charset_name;
SET character_set_results = charset_name;
SET charset_connection = @@charset_database;
SET collation_connection = @@collation_database;
```

14.13.16.1.5 Selection priorities of character sets and collations

String > Column > Table > Database > Server

14.13.16.1.6 General rules on selecting character sets and collation

- Rule 1: If you specify `CHARACTER SET charset_name` and `COLLATE collation_name` ↪ , then the `charset_name` character set and the `collation_name` collation are used directly.
- Rule 2: If you specify `CHARACTER SET charset_name` and do not specify `COLLATE` ↪ `collation_name`, then the `charset_name` character set and the default collation of `charset_name` are used.
- Rule 3: If you specify neither `CHARACTER SET charset_name` nor `COLLATE collation` ↪ `_name`, the character set and collation with higher optimization levels are used.

14.13.16.1.7 Validity check of characters

If the specified character set is `utf8` or `utf8mb4`, TiDB only supports the valid `utf8` characters. For invalid characters, TiDB reports the `incorrect utf8 value` error. This validity check of characters in TiDB is compatible with MySQL 8.0 but incompatible with MySQL 5.7 or earlier versions.

To disable this error reporting, use `set @@tidb_skip_utf8_check=1;` to skip the character check.

> **Note:**
>
> If the character check is skipped, TiDB might fail to detect illegal UTF-8 characters written by the application, cause decoding errors when `ANALYZE` is executed, and introduce other unknown encoding issues. If your application cannot guarantee the validity of the written string, it is not recommended to skip the character check.

14.13.16.1.8 Collation support framework

The syntax support and semantic support for the collation are influenced by the `new` ↪ `_collations_enabled_on_first_bootstrap` configuration item. The syntax support and semantic support are different. The former indicates that TiDB can parse and set collations. The latter indicates that TiDB can correctly use collations when comparing strings.

Before v4.0, TiDB provides only the old framework for collations. In this framework, TiDB supports syntactically parsing most of the MySQL collations but semantically takes all collations as binary collations.

Since v4.0, TiDB supports a new framework for collations. In this framework, TiDB semantically parses different collations and strictly follows the collations when comparing strings.

Old framework for collations

Before v4.0, you can specify most of the MySQL collations in TiDB, and these collations are processed according to the default collations, which means that the byte order determines the character order. Different from MySQL, TiDB does not handle the trailing spaces of a character, which causes the following behavior differences:

```
CREATE TABLE t(a varchar(20) charset utf8mb4 collate utf8mb4_general_ci
    ↪ PRIMARY KEY);
```

```
Query OK, 0 rows affected
```

```
INSERT INTO t VALUES ('A');
```

```
Query OK, 1 row affected
```

```
INSERT INTO t VALUES ('a');
```

```
Query OK, 1 row affected
```

In TiDB, the preceding statement is successfully executed. In MySQL, because `utf8mb4 ↪ _general_ci` is case-insensitive, the `Duplicate entry 'a'` error is reported.

```
INSERT INTO t1 VALUES ('a ');
```

```
Query OK, 1 row affected
```

In TiDB, the preceding statement is successfully executed. In MySQL, because comparison is performed after the spaces are filled in, the `Duplicate entry 'a '` error is returned.

New framework for collations

Since TiDB v4.0, a complete framework for collations is introduced.

This new framework supports semantically parsing collations and introduces the `new ↪ _collations_enabled_on_first_bootstrap` configuration item to decide whether to enable the new framework when a cluster is first initialized. To enable the new framework, set `new_collations_enabled_on_first_bootstrap` to `true`. For details, see new_collations ↪ _enabled_on_first_bootstrap.

For a TiDB cluster that is already initialized, you can check whether the new collation is enabled through the `new_collation_enabled` variable in the `mysql.tidb` table:

> **Note:**
>
> If the query result of the `mysql.tidb` table is different from the value of `new_collations_enabled_on_first_bootstrap`, the result of the `mysql.tidb` table is the actual value.

```
SELECT VARIABLE_VALUE FROM mysql.tidb WHERE VARIABLE_NAME='new_collation_enabled';
```

```
+----------------+
| VARIABLE_VALUE |
+----------------+
| True           |
+----------------+
1 row in set (0.00 sec)
```

Under the new framework, TiDB supports the `utf8_general_ci`, `utf8mb4_general_ci`, `utf8_unicode_ci`, `utf8mb4_unicode_ci`, `utf8mb4_0900_bin`, `utf8mb4_0900_ai_ci`, `gbk_chinese_ci`, and `gbk_bin` collations, which is compatible with MySQL.

When one of `utf8_general_ci`, `utf8mb4_general_ci`, `utf8_unicode_ci`, `utf8mb4_unicode_ci`, `utf8mb4_0900_ai_ci` and `gbk_chinese_ci` is used, the string comparison is case-insensitive and accent-insensitive. At the same time, TiDB also corrects the collation's `PADDING` behavior:

```
CREATE TABLE t(a varchar(20) charset utf8mb4 collate utf8mb4_general_ci PRIMARY KEY);
```

```
Query OK, 0 rows affected (0.00 sec)
```

```
INSERT INTO t VALUES ('A');
```

```
Query OK, 1 row affected (0.00 sec)
```

```
INSERT INTO t VALUES ('a');
```

```
ERROR 1062 (23000): Duplicate entry 'a' for key 't.PRIMARY' -- TiDB is compatible with the case-insensitive collation of MySQL.
```

```
INSERT INTO t VALUES ('a ');
```

```
ERROR 1062 (23000): Duplicate entry 'a ' for key 't.PRIMARY' -- TiDB
    ↪ modifies the `PADDING` behavior to be compatible with MySQL.
```

Note:

The implementation of padding in TiDB is different from that in MySQL. In MySQL, padding is implemented by filling in spaces. In TiDB, padding is implemented by cutting out the spaces at the end. The two approaches are the same in most cases. The only exception is when the end of the string contains characters that are less than spaces (0x20). For example, the result of `'a' < 'a\t'` in TiDB is `1`, but in MySQL, `'a' < 'a\t'` is equivalent to `'a ' < 'a\t'`, and the result is `0`.

14.13.16.1.9 Coercibility values of collations in expressions

If an expression involves multiple clauses of different collations, you need to infer the collation used in the calculation. The rules are as follows:

- The coercibility value of the explicit `COLLATE` clause is `0`.
- If the collations of two strings are incompatible, the coercibility value of the concatenation of two strings with different collations is `1`.
- The collation of the column, `CAST()`, `CONVERT()`, or `BINARY()` has a coercibility value of `2`.
- The system constant (the string returned by `USER ()` or `VERSION ()`) has a coercibility value of `3`.
- The coercibility value of constants is `4`.
- The coercibility value of numbers or intermediate variables is `5`.
- `NULL` or expressions derived from `NULL` has a coercibility value of `6`.

When inferring collations, TiDB prefers using the collation of expressions with lower coercibility values. If the coercibility values of two clauses are the same, the collation is determined according to the following priority:

binary > utf8mb4_bin > (utf8mb4_general_ci = utf8mb4_unicode_ci) > utf8_bin > (utf8_general_ci = utf8_unicode_ci) > latin1_bin > ascii_bin

TiDB cannot infer the collation and reports an error in the following situations:

- If the collations of two clauses are different and the coercibility value of both clauses is `0`.
- If the collations of two clauses are incompatible and the returned type of expression is `String`.

14.13.16.1.10 `COLLATE` clause

TiDB supports using the `COLLATE` clause to specify the collation of an expression. The coercibility value of this expression is `0`, which has the highest priority. See the following example:

```
SELECT 'a' = _utf8mb4 'A' collate utf8mb4_general_ci;
```

```
+-----------------------------------------------+
| 'a' = _utf8mb4 'A' collate utf8mb4_general_ci |
+-----------------------------------------------+
|                                             1 |
+-----------------------------------------------+
1 row in set (0.00 sec)
```

For more details, see Connection Character Sets and Collations.

14.13.16.2 GBK

Since v5.4.0, TiDB supports the GBK character set. This document provides the TiDB support and compatibility information of the GBK character set.

```
SHOW CHARACTER SET WHERE CHARSET = 'gbk';
+--
    ↪ -------+-----------------------------------+------------------+--------+
    ↪
| Charset | Description                       | Default collation | Maxlen |
+--
    ↪ -------+-----------------------------------+------------------+--------+
    ↪
| gbk     | Chinese Internal Code Specification | gbk_bin    |      2 |
+--
    ↪ -------+-----------------------------------+------------------+--------+
    ↪
1 row in set (0.00 sec)

SHOW COLLATION WHERE CHARSET = 'gbk';
+---------------+---------+------+---------+----------+---------+
| Collation     | Charset | Id | Default | Compiled | Sortlen |
+---------------+---------+------+---------+----------+---------+
| gbk_bin       | gbk     |   87 |         | Yes      |       1 |
+---------------+---------+------+---------+----------+---------+
1 rows in set (0.00 sec)
```

14.13.16.2.1 MySQL compatibility

This section provides the compatibility information between MySQL and TiDB.

Collations

The default collation of the GBK character set in MySQL is `gbk_chinese_ci`. Unlike MySQL, the default collation of the GBK character set in TiDB is `gbk_bin`. Additionally, because TiDB converts GBK to UTF8MB4 and then uses a binary collation, the `gbk_bin` collation in TiDB is not the same as the `gbk_bin` collation in MySQL.

To make TiDB compatible with the collations of MySQL GBK character set, when you first initialize the TiDB cluster, you need to set the TiDB option `new_collations_enabled_on_first_bootstrap` to `true` to enable the new framework for collations.

After enabling the new framework for collations, if you check the collations corresponding to the GBK character set, you can see that the TiDB GBK default collation is changed to `gbk_chinese_ci`.

```
SHOW CHARACTER SET WHERE CHARSET = 'gbk';
+--
    ↪ -------+---------------------------------+------------------+--------+
    ↪
| Charset | Description                     | Default collation | Maxlen |
+--
    ↪ -------+---------------------------------+------------------+--------+
    ↪
| gbk     | Chinese Internal Code Specification | gbk_chinese_ci | 2 |
+--
    ↪ -------+---------------------------------+------------------+--------+
    ↪
1 row in set (0.00 sec)

SHOW COLLATION WHERE CHARSET = 'gbk';
+---------------+---------+-----+---------+----------+---------+
| Collation     | Charset | Id | Default | Compiled | Sortlen |
+---------------+---------+-----+---------+----------+---------+
| gbk_bin       | gbk     |  87 |         | Yes      |       1 |
| gbk_chinese_ci | gbk   |  28 | Yes     | Yes      |       1 |
+---------------+---------+-----+---------+----------+---------+
2 rows in set (0.00 sec)
```

Illegal character compatibility

- If the system variables `character_set_client` and `character_set_connection` are not set to `gbk` at the same time, TiDB handles illegal characters in the same way as MySQL.
- If `character_set_client` and `character_set_connection` are both set to `gbk`, TiDB handles illegal characters differently than MySQL.

- MySQL handles illegal GBK character sets in reading and writing operations differently.
- TiDB handles illegal GBK character sets in reading and writing operations in the same way. In the SQL strict mode, TiDB reports an error when either reading or writing illegal GBK characters. In the non-strict mode, TiDB replaces illegal GBK characters with `?` when either reading or writing illegal GBK characters.

For example, after `SET NAMES gbk`, if you create a table using the `CREATE TABLE gbk_table(a VARCHAR(32)CHARACTER SET gbk)` statement in MySQL and TiDB respectively and then execute the SQL statements in the following table, you can see the detailed differences.

Database	If the configured SQL mode contains either `STRICT_ALL_TABLES` or `STRICT_TRANS_TABLES`	If the configured SQL mode contains neither `STRICT_ALL_TABLES` nor `STRICT_TRANS_TABLES`
MySQL	`SELECT HEX('一a'); e4b88061INSERT INTO gbk_table values('一a'); Incorrect Error`	`SELECT HEX('一a'); e4b88061INSERT INTO gbk_table VALUES('一a'); SELECT HEX(a)FROM gbk_table; e4b8`
TiDB	`SELECT HEX('一a'); Incorrect ErrorINSERT INTO gbk_table VALUES('一a'); Incorrect Error`	`SELECT HEX('一a'); e4b83fINSERT INTO gbk_table VALUES('一a');SELECT HEX(a)FROM gbk_table; e4b83f`

In the above table, the result of `SELECT HEX('a');` in the `utf8mb4` byte set is `e4b88061`.

Other MySQL compatibility

- Currently, TiDB does not support using the `ALTER TABLE` statement to convert other character set types to `gbk` or from `gbk` to other character set types.
- TiDB does not support the use of `_gbk`. For example:

```
sql  CREATE TABLE t(a CHAR(10)CHARSET BINARY); Query OK, 0 rows affected
↪  (0.00 sec)INSERT INTO t VALUES (_gbk'啊'); ERROR 1115 (42000): Unsupported
↪  character introducer: 'gbk'
```

- Currently, for binary characters of the `ENUM` and `SET` types, TiDB deals with them as the `utf8mb4` character set.

14.13.16.2.2 Component compatibility

- Currently, TiFlash does not support the GBK character set.

- TiDB Data Migration (DM) does not support migrating `charset=GBK` tables to TiDB clusters earlier than v5.4.0.
- TiDB Lightning does not support importing `charset=GBK` tables to TiDB clusters earlier than v5.4.0.
- TiCDC versions earlier than v6.1.0 do not support replicating `charset=GBK` tables. No version of TiCDC supports replicating `charset=GBK` tables to TiDB clusters earlier than v6.1.0.
- Backup & Restore (BR) versions earlier than v5.4.0 do not support recovering `charset=GBK` tables. No version of BR supports recovering `charset=GBK` tables to TiDB clusters earlier than v5.4.0.

14.13.17 Placement Rules in SQL

Placement Rules in SQL is a feature that enables you to specify where data is stored in a TiKV cluster using SQL statements. With this feature, you can schedule data of clusters, databases, tables, or partitions to specific regions, data centers, racks, or hosts.

This feature can fulfill the following use cases:

- Deploy data across multiple data centers and configure rules to optimize high availability strategies.
- Merge multiple databases from different applications and isolate data of different users physically, which meets the isolation requirements of different users within an instance.
- Increase the number of replicas for important data to improve application availability and data reliability.

> **Note:**
>
> This feature is not available on TiDB Serverless clusters.

14.13.17.1 Overview

With the Placement Rules in SQL feature, you can create placement policies and configure desired placement policies for data at different levels, with granularity from coarse to fine as follows:

Level	Description
Cluster	By default, TiDB configures a policy of 3 replicas for a cluster. You can configure a global placement policy for your cluster. For more information, see Specify the number of replicas globally for a cluster.

Level	Description
Database	You can configure a placement policy for a specific database. For more information, see Specify a default placement policy for a database.
Table	You can configure a placement policy for a specific table. For more information, see Specify a placement policy for a table.
Partition	You can create partitions for different rows in a table and configure placement policies for partitions separately. For more information, see Specify a placement policy for a partitioned table.

Tip:

The implementation of *Placement Rules in SQL* relies on the *placement rules feature* of PD. For details, refer to Configure Placement Rules. In the context of Placement Rules in SQL, *placement rules* might refer to *placement policies* attached to other objects, or to rules that are sent from TiDB to PD.

14.13.17.2 Limitations

- To simplify maintenance, it is recommended to limit the number of placement policies within a cluster to 10 or fewer.
- It is recommended to limit the total number of tables and partitions attached with placement policies to 10,000 or fewer. Attaching policies to too many tables and partitions can increase computation workloads on PD, thereby affecting service performance.
- It is recommended to use the Placement Rules in SQL feature according to examples provided in this document rather than using other complex placement policies.

14.13.17.3 Prerequisites

Placement policies rely on the configuration of labels on TiKV nodes. For example, the `PRIMARY_REGION` placement option relies on the `region` label in TiKV.

When you create a placement policy, TiDB does not check whether the labels specified in the policy exist. Instead, TiDB performs the check when you attach the policy. Therefore, before attaching a placement policy, make sure that each TiKV node is configured with correct labels. The configuration method for a TiDB Self-Hosted cluster is as follows:

```
tikv-server --labels region=<region>,zone=<zone>,host=<host>
```

For detailed configuration methods, see the following examples:

Deployment method	Example
Manual deployment	Schedule replicas by topology labels
Deployment with TiUP	Geo-distributed deployment topology
Deployment with TiDB Operator	Configure a TiDB cluster in Kubernetes

> **Note:**
>
> For TiDB Dedicated clusters, you can skip these label configuration steps because the labels on TiKV nodes in TiDB Dedicated clusters are configured automatically.

To view all available labels in the current TiKV cluster, you can use the `SHOW PLACEMENT LABELS` statement:

```
SHOW PLACEMENT LABELS;
+--------+----------------+
| Key    | Values         |
+--------+----------------+
| disk   | ["ssd"]        |
| region | ["us-east-1"]  |
| zone   | ["us-east-1a"] |
+--------+----------------+
3 rows in set (0.00 sec)
```

14.13.17.4 Usage

This section describes how to create, attach, view, modify, and delete placement policies using SQL statements.

14.13.17.4.1 Create and attach placement policies

1. To create a placement policy, use the `CREATE PLACEMENT POLICY` statement:

```
CREATE PLACEMENT POLICY myplacementpolicy PRIMARY_REGION="us-east-1"
    ↪ REGIONS="us-east-1,us-west-1";
```

In this statement:

- The `PRIMARY_REGION="us-east-1"` option means placing Raft Leaders on nodes with the `region` label as `us-east-1`.

- The `REGIONS="us-east-1,us-west-1"` option means placing Raft Followers on nodes with the `region` label as `us-east-1` and nodes with the `region` label as `us-west-1`.

For more configurable placement options and their meanings, see the Placement options.

2. To attach a placement policy to a table or a partitioned table, use the `CREATE TABLE` or `ALTER TABLE` statement to specify the placement policy for that table or partitioned table:

```
CREATE TABLE t1 (a INT) PLACEMENT POLICY=myplacementpolicy;
CREATE TABLE t2 (a INT);
ALTER TABLE t2 PLACEMENT POLICY=myplacementpolicy;
```

`PLACEMENT POLICY` is not associated with any database schema and can be attached in a global scope. Therefore, specifying a placement policy using `CREATE TABLE` does not require any additional privileges.

14.13.17.4.2 View placement policies

- To view an existing placement policy, you can use the `SHOW CREATE PLACEMENT POLICY` statement:

```
SHOW CREATE PLACEMENT POLICY myplacementpolicy\G
*************************** 1. row ***************************
       Policy: myplacementpolicy
Create Policy: CREATE PLACEMENT POLICY myplacementpolicy PRIMARY_
    ↪ REGION="us-east-1" REGIONS="us-east-1,us-west-1"
1 row in set (0.00 sec)
```

- To view the placement policy attached to a specific table, you can use the `SHOW CREATE TABLE` statement:

```
SHOW CREATE TABLE t1\G
*************************** 1. row ***************************
       Table: t1
Create Table: CREATE TABLE `t1` (
  `a` int(11) DEFAULT NULL
) ENGINE=InnoDB DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_bin /*T![
    ↪ placement] PLACEMENT POLICY=`myplacementpolicy` */
1 row in set (0.00 sec)
```

- To view the definitions of placement policies in a cluster, you can query the `INFORMATION_SCHEMA.PLACEMENT_POLICIES` system table:

```
SELECT * FROM information_schema.placement_policies\G
***************************[ 1. row ]***************************
POLICY_ID          | 1
CATALOG_NAME       | def
POLICY_NAME        | p1
PRIMARY_REGION     | us-east-1
REGIONS            | us-east-1,us-west-1
CONSTRAINTS        |
LEADER_CONSTRAINTS |
FOLLOWER_CONSTRAINTS |
LEARNER_CONSTRAINTS |
SCHEDULE           |
FOLLOWERS          | 4
LEARNERS           | 0
1 row in set
```

- To view all tables that are attached with placement policies in a cluster, you can query the `tidb_placement_policy_name` column of the `information_schema.tables` system table:

```
SELECT * FROM information_schema.tables WHERE tidb_placement_policy_
    ↪ name IS NOT NULL;
```

- To view all partitions that are attached with placement policies in a cluster, you can query the `tidb_placement_policy_name` column of the `information_schema.partitions` system table:

```
SELECT * FROM information_schema.partitions WHERE tidb_placement_
    ↪ policy_name IS NOT NULL;
```

- Placement policies attached to all objects are applied *asynchronously*. To check the scheduling progress of placement policies, you can use the `SHOW PLACEMENT` statement:

```
SHOW PLACEMENT;
```

14.13.17.4.3 Modify placement policies

To modify a placement policy, you can use the `ALTER PLACEMENT POLICY` statement. The modification will apply to all objects that are attached with the corresponding policy.

```
ALTER PLACEMENT POLICY myplacementpolicy FOLLOWERS=4;
```

In this statement, the `FOLLOWERS=4` option means configuring 5 replicas for the data, including 4 Followers and 1 Leader. For more configurable placement options and their meanings, see Placement option reference.

14.13.17.4.4 Drop placement policies

To drop a policy that is not attached to any table or partition, you can use the `DROP PLACEMENT POLICY` statement:

```
DROP PLACEMENT POLICY myplacementpolicy;
```

14.13.17.5 Placement option reference

When creating or modifying placement policies, you can configure placement options as needed.

> **Note:**
>
> The `PRIMARY_REGION`, `REGIONS`, and `SCHEDULE` options cannot be specified together with the `CONSTRAINTS` option, or an error will occur.

14.13.17.5.1 Regular placement options

Regular placement options can meet the basic requirements of data placement.

Option name	Description
`PRIMARY_REGION`	Specifies that placing Raft Leaders on nodes with a `region` label that matches the value of this option.
`REGIONS`	Specifies that placing Raft Followers on nodes with a `region` label that matches the value of this option.
`SCHEDULE`	Specifies the strategy for scheduling the placement of Followers. The value options are `EVEN` (default) or `MAJORITY_IN_PRIMARY`.
`FOLLOWERS`	Specifies the number of Followers. For example, `FOLLOWERS=2` means there will be 3 replicas of the data (2 Followers and 1 Leader).

14.13.17.5.2 Advanced placement options

Advanced configuration options provide more flexibility for data placement to meet the requirements of complex scenarios. However, configuring advanced options is more complex than regular options and requires you to have a deep understanding of the cluster topology and the TiDB data sharding.

Option name	Description
CONSTRAINTS	A list of constraints that apply to all roles. For example, CONSTRAINTS ↪ ="[+disk ↪ =ssd]".
LEADER_ ↪ CONSTRAINTS ↪	A list of constraints that only apply to Leader.
FOLLOWER_ ↪ CONSTRAINTS ↪	A list of constraints that only apply to Followers.
LEARNER_ ↪ CONSTRAINTS ↪	A list of constraints that only apply to learners.
LEARNERS	The number of learners.
SURVIVAL_ ↪ PREFERENCE	The replica placement priority according to the disaster tolerance level of the labels. For example, SURVIVAL_ ↪ PREFERENCE ↪ ="[↪ region, ↪ zone, ↪ host]".

14.13.17.5.3 CONSTRAINTS formats

You can configure `CONSTRAINTS`, `FOLLOWER_CONSTRAINTS`, and `LEARNER_CONSTRAINTS` placement options using either of the following formats:

CONSTRAINTS format	Description
List format	If a constraint to be specified applies to all replicas, you can use a key-value list format. Each key starts with `+` or `-`. For example: `[+region=us-east-1]` means placing data on nodes that have a `region` label as `us-east-1`. `[+region=us-east-1,-type=fault]` means placing data on nodes that have a `region` label as `us-east-1` but do not have a `type` label as `fault`.
Dictionary format	If you need to specify different numbers of replicas for different constraints, you can use the dictionary format. For example: `FOLLOWER_CONSTRAINTS="{+region=us-east-1: 1,+region=us-east-2: 1,+region=us-west-1: 1}";` means placing one Follower in `us-east-1`, one Follower in `us-east-2`, and one Follower in `us-west-1`. `FOLLOWER_CONSTRAINTS='{"+region=us-east-1,+type=scale-node": 1,"+region=us-west-1": 1}';` means placing one Follower on a node that is located in the `us-east-1` region and has the `type` label as `scale-node`, and one Follower in `us-west-1`. The dictionary format supports each key starting with `+` or `-` and allows you to configure the special `#evict-leader` attribute. For example, `FOLLOWER_CONSTRAINTS='{"+region=us-east-1":1, "+region=us-east-2": 2, "+region=us-west-1,#evict-leader": 1}'` means that the Leaders elected in `us-west-1` will be evicted as much as possible during disaster recovery.

Note:

- The `LEADER_CONSTRAINTS` placement option only supports the list format.
- Both list and dictionary formats are based on the YAML parser, but YAML syntax might be incorrectly parsed in some cases. For example, `"{+region=east:1,+region=west:2}"` (no space after `:`) can be incorrectly parsed as `'{"+region=east:1": null, "+region=west:2": null}'`, which is unexpected. However, `"{+region=east: 1,+region=west: 2}"` (space after `:`) can be correctly parsed as `'{"+region=east": 1, "+region=west": 2}'`. Therefore, it is recommended to add a space after `:`.

14.13.17.6 Basic examples

14.13.17.6.1 Specify the number of replicas globally for a cluster

After a cluster is initialized, the default number of replicas is `3`. If a cluster needs more replicas, you can increase this number by configuring a placement policy, and then apply the policy at the cluster level using `ALTER RANGE`. For example:

```
CREATE PLACEMENT POLICY five_replicas FOLLOWERS=4;
ALTER RANGE global PLACEMENT POLICY five_replicas;
```

Note that because TiDB defaults the number of Leaders to `1`, `five replicas` means `4` Followers and `1` Leader.

14.13.17.6.2 Specify a default placement policy for a database

You can specify a default placement policy for a database. This works similarly to setting a default character set or collation for a database. If no other placement policy is specified for a table or partition in the database, the placement policy for the database will apply to the table and partition. For example:

```
CREATE PLACEMENT POLICY p1 PRIMARY_REGION="us-east-1" REGIONS="us-east-1,us
    ↪ -east-2"; -- Creates a placement policy

CREATE PLACEMENT POLICY p2 FOLLOWERS=4;

CREATE PLACEMENT POLICY p3 FOLLOWERS=2;

CREATE TABLE t1 (a INT); -- Creates a table t1 without specifying any
    ↪ placement policy.

ALTER DATABASE test PLACEMENT POLICY=p2; -- Changes the default placement
    ↪ policy of the database to p2, which does not apply to the existing
    ↪ table t1.

CREATE TABLE t2 (a INT); -- Creates a table t2. The default placement
    ↪ policy p2 applies to t2.

CREATE TABLE t3 (a INT) PLACEMENT POLICY=p1; -- Creates a table t3. Because
    ↪  this statement has specified another placement rule, the default
    ↪ placement policy p2 does not apply to table t3.

ALTER DATABASE test PLACEMENT POLICY=p3; -- Changes the default policy of
    ↪ the database again, which does not apply to existing tables.

CREATE TABLE t4 (a INT); -- Creates a table t4. The default placement
    ↪ policy p3 applies to t4.
```

```
ALTER PLACEMENT POLICY p3 FOLLOWERS=3; -- `FOLLOWERS=3` applies to the
    ↪ table attached with policy p3 (that is, table t4).
```

Note that the policy inheritance from a table to its partitions differs from the policy inheritance in the preceding example. When you change the default policy of a table, the new policy also applies to partitions in that table. However, a table inherits the policy from the database only if it is created without any policy specified. Once a table inherits the policy from the database, modifying the default policy of the database does not apply to that table.

14.13.17.6.3 Specify a placement policy for a table

You can specify a default placement policy for a table. For example:

```
CREATE PLACEMENT POLICY five_replicas FOLLOWERS=4;

CREATE TABLE t (a INT) PLACEMENT POLICY=five_replicas; -- Creates a table t
    ↪  and attaches the 'five_replicas' placement policy to it.

ALTER TABLE t PLACEMENT POLICY=default; -- Removes the placement policy '
    ↪ five_replicas' from the table t and resets the placement policy to
    ↪ the default one.
```

14.13.17.6.4 Specify a placement policy for a partitioned table

You can also specify a placement policy for a partitioned table or a partition. For example:

```
CREATE PLACEMENT POLICY storageforhisotrydata CONSTRAINTS="[+node=history]"
    ↪ ;
CREATE PLACEMENT POLICY storagefornewdata CONSTRAINTS="[+node=new]";
CREATE PLACEMENT POLICY companystandardpolicy CONSTRAINTS="";

CREATE TABLE t1 (id INT, name VARCHAR(50), purchased DATE)
PLACEMENT POLICY=companystandardpolicy
PARTITION BY RANGE( YEAR(purchased) ) (
  PARTITION p0 VALUES LESS THAN (2000) PLACEMENT POLICY=
     ↪ storageforhisotrydata,
  PARTITION p1 VALUES LESS THAN (2005),
  PARTITION p2 VALUES LESS THAN (2010),
  PARTITION p3 VALUES LESS THAN (2015),
  PARTITION p4 VALUES LESS THAN MAXVALUE PLACEMENT POLICY=storagefornewdata
);
```

If no placement policy is specified for a partition in a table, the partition attempts to inherit the policy (if any) from the table. In the preceding example:

- The `p0` partition will apply the `storageforhisotrydata` policy.
- The `p4` partition will apply the `storagefornewdata` policy.
- The `p1`, `p2`, and `p3` partitions will apply the `companystandardpolicy` placement policy inherited from the table `t1`.
- If no placement policy is specified for the table `t1`, the `p1`, `p2`, and `p3` partitions will inherit the database default policy or the global default policy.

After placement policies are attached to these partitions, you can change the placement policy for a specific partition as in the following example:

```
ALTER TABLE t1 PARTITION p1 PLACEMENT POLICY=storageforhisotrydata;
```

14.13.17.7 High availability examples

Assume that there is a cluster with the following topology, where TiKV nodes are distributed across 3 regions, with each region containing 3 available zones:

```
SELECT store_id,address,label from INFORMATION_SCHEMA.TIKV_STORE_STATUS;
+--
   ↪ --------+-----------------+-----------------------------------------------------------
   ↪
| store_id | address      | label
   ↪
   ↪ |
+--
   ↪ --------+-----------------+-----------------------------------------------------------
   ↪
|        1 | 127.0.0.1:20163 | [{"key": "region", "value": "us-east-1"}, {"
   ↪ key": "zone", "value": "us-east-1a"}, {"key": "host", "value": "host1
   ↪ "}] |
|        2 | 127.0.0.1:20162 | [{"key": "region", "value": "us-east-1"}, {"
   ↪ key": "zone", "value": "us-east-1b"}, {"key": "host", "value": "host2
   ↪ "}] |
|        3 | 127.0.0.1:20164 | [{"key": "region", "value": "us-east-1"}, {"
   ↪ key": "zone", "value": "us-east-1c"}, {"key": "host", "value": "host3
   ↪ "}] |
|        4 | 127.0.0.1:20160 | [{"key": "region", "value": "us-east-2"}, {"
   ↪ key": "zone", "value": "us-east-2a"}, {"key": "host", "value": "host4
   ↪ "}] |
|        5 | 127.0.0.1:20161 | [{"key": "region", "value": "us-east-2"}, {"
   ↪ key": "zone", "value": "us-east-2b"}, {"key": "host", "value": "host5
   ↪ "}] |
```

```
|       6 | 127.0.0.1:20165 | [{"key": "region", "value": "us-east-2"}, {"
    ↪ key": "zone", "value": "us-east-2c"}, {"key": "host", "value": "host6
    ↪ "}] |
|       7 | 127.0.0.1:20166 | [{"key": "region", "value": "us-west-1"}, {"
    ↪ key": "zone", "value": "us-west-1a"}, {"key": "host", "value": "host7
    ↪ "}] |
|       8 | 127.0.0.1:20167 | [{"key": "region", "value": "us-west-1"}, {"
    ↪ key": "zone", "value": "us-west-1b"}, {"key": "host", "value": "host8
    ↪ "}] |
|       9 | 127.0.0.1:20168 | [{"key": "region", "value": "us-west-1"}, {"
    ↪ key": "zone", "value": "us-west-1c"}, {"key": "host", "value": "host9
    ↪ "}] |
+--
    ↪ --------+-----------------+-------------------------------------------------
    ↪
```

14.13.17.7.1 Specify survival preferences

If you are not particularly concerned about the exact data distribution but prioritize fulfilling disaster recovery requirements, you can use the `SURVIVAL_PREFERENCES` option to specify data survival preferences.

As in the preceding example, the TiDB cluster is distributed across 3 regions, with each region containing 3 zones. When creating placement policies for this cluster, assume that you configure the `SURVIVAL_PREFERENCES` as follows:

```
CREATE PLACEMENT POLICY multiaz SURVIVAL_PREFERENCES="[region, zone, host]"
    ↪ ;
CREATE PLACEMENT POLICY singleaz CONSTRAINTS="[+region=us-east-1]" SURVIVAL
    ↪ _PREFERENCES="[zone]";
```

After creating the placement policies, you can attach them to the corresponding tables as needed:

- For tables attached with the `multiaz` placement policy, data will be placed in 3 replicas in different regions, prioritizing to meet the cross-region survival goal of data isolation, followed by the cross-zone survival goal, and finally the cross-host survival goal.
- For tables attached with the `singleaz` placement policy, data will be placed in 3 replicas in the `us-east-1` region first, and then meet the cross-zone survival goal of data isolation.

> **Note:**
>
> `SURVIVAL_PREFERENCES` is equivalent to `location-labels` in PD. For more information, see Schedule Replicas by Topology Labels.

14.13.17.7.2 Specify a cluster with 5 replicas distributed 2:2:1 across multiple data centers

If you need a specific data distribution, such as a 5-replica distribution in the proportion of 2:2:1, you can specify different numbers of replicas for different constraints by configuring these `CONSTRAINTS` in the dictionary formats:

```
CREATE PLACEMENT POLICY `deploy221` CONSTRAINTS='{"+region=us-east-1":2, "+
    ↪ region=us-east-2": 2, "+region=us-west-1": 1}';

ALTER RANGE global PLACEMENT POLICY = "deploy221";

SHOW PLACEMENT;
+--
    ↪ -----------------+-------------------------------------------------------------
    ↪
| Target          | Placement
    ↪
    ↪ | Scheduling_State |
+--
    ↪ -----------------+-------------------------------------------------------------
    ↪
| POLICY deploy221 | CONSTRAINTS="{\"+region=us-east-1\":2, \"+region=us-
    ↪ east-2\": 2, \"+region=us-west-1\": 1}" | NULL |
| RANGE TiDB_GLOBAL | CONSTRAINTS="{\"+region=us-east-1\":2, \"+region=us-
    ↪ east-2\": 2, \"+region=us-west-1\": 1}" | SCHEDULED |
+--
    ↪ -----------------+-------------------------------------------------------------
    ↪
```

After the global `deploy221` placement policy is set for the cluster, TiDB distributes data according to this policy: placing two replicas in the `us-east-1` region, two replicas in the `us-east-2` region, and one replica in the `us-west-1` region.

14.13.17.7.3 Specify the distribution of Leaders and Followers

You can specify a specific distribution of Leaders and Followers using constraints or `PRIMARY_REGION`.

Use constraints

If you have specific requirements for the distribution of Raft Leaders among nodes, you can specify the placement policy using the following statement:

```
CREATE PLACEMENT POLICY deploy221_primary_east1 LEADER_CONSTRAINTS="[+
    ↪ region=us-east-1]" FOLLOWER_CONSTRAINTS='{"+region=us-east-1": 1, "+
    ↪ region=us-east-2": 2, "+region=us-west-1: 1}';
```

After this placement policy is created and attached to the desired data, the Raft Leader replicas of the data will be placed in the `us-east-1` region specified by the `LEADER_CONSTRAINTS` option, while other replicas of the data will be placed in regions specified by the `FOLLOWER_CONSTRAINTS` option. Note that if the cluster fails, such as a node outage in the `us-east-1` region, a new Leader will still be elected from other regions, even if these regions are specified in `FOLLOWER_CONSTRAINTS`. In other words, ensuring service availability takes the highest priority.

In the event of a failure in the `us-east-1` region, if you do not want to place new Leaders in `us-west-1`, you can configure a special `evict-leader` attribute to evict the newly elected Leaders in that region:

```
CREATE PLACEMENT POLICY deploy221_primary_east1 LEADER_CONSTRAINTS="[+
    ↪ region=us-east-1]" FOLLOWER_CONSTRAINTS='{"+region=us-east-1": 1, "+
    ↪ region=us-east-2": 2, "+region=us-west-1,#evict-leader": 1}';
```

Use `PRIMARY_REGION`

If the `region` label is configured in your cluster topology, you can also use the `PRIMARY_REGION` and `REGIONS` options to specify a placement policy for Followers:

```
CREATE PLACEMENT POLICY eastandwest PRIMARY_REGION="us-east-1" REGIONS="us-
    ↪ east-1,us-east-2,us-west-1" SCHEDULE="MAJORITY_IN_PRIMARY" FOLLOWERS
    ↪ =4;
CREATE TABLE t1 (a INT) PLACEMENT POLICY=eastandwest;
```

- `PRIMARY_REGION` specifies the distribution region of the Leaders. You can only specify one region in this option.
- The `SCHEDULE` option specifies how TiDB balances the distribution of Followers.
    - The default `EVEN` scheduling rule ensures a balanced distribution of Followers across all regions.
    - If you want to ensure a sufficient number of Follower replicas are placed in the `PRIMARY_REGION` (that is, `us-east-1`), you can use the `MAJORITY_IN_PRIMARY` scheduling rule. This scheduling rule provides lower latency transactions at the expense of some availability. If the primary region fails, `MAJORITY_IN_PRIMARY` does not provide automatic failover.

14.13.17.8 Data isolation examples

As in the following example, when creating placement policies, you can configure a constraint for each policy, which requires data to be placed on TiKV nodes with the specified `app` label.

```
CREATE PLACEMENT POLICY app_order CONSTRAINTS="[+app=order]";
CREATE PLACEMENT POLICY app_list CONSTRAINTS="[+app=list_collection]";
CREATE TABLE order (id INT, name VARCHAR(50), purchased DATE)
```

```
PLACEMENT POLICY=app_order
CREATE TABLE list (id INT, name VARCHAR(50), purchased DATE)
PLACEMENT POLICY=app_list
```

In this example, the constraints are specified using the list format, such as `[+app=order]`. You can also specify them using the dictionary format, such as `{+app=order: 3}`.

After executing the statements in the example, TiDB will place the `app_order` data on TiKV nodes with the `app` label as `order`, and place the `app_list` data on TiKV nodes with the `app` label as `list_collection`, thus achieving physical data isolation in storage.

14.13.17.9 Compatibility

14.13.17.10 Compatibility with other features

- Temporary tables do not support placement policies.
- Placement policies only ensure that data at rest resides on the correct TiKV nodes but do not guarantee that data in transit (via either user queries or internal operations) only occurs in a specific region.
- To configure TiFlash replicas for your data, you need to create TiFlash replicas rather than using placement policies.
- Syntactic sugar rules are permitted for setting `PRIMARY_REGION` and `REGIONS`. In the future, we plan to add varieties for `PRIMARY_RACK`, `PRIMARY_ZONE`, and `PRIMARY_HOST`. See issue #18030.

14.13.17.11 Compatibility with tools

Tool Name	Minimum supported version	Description

Tool Name	Minimum supported version	Description

Backup & Restore (BR)	6.0	Before v6.0, BR does not support backing up and restoring placement policies. For more information, see Why does an error occur when I restore placement rules to a clus-

Tool Name	Minimum supported version	Description
TiDB Lightning	Not compatible yet	An error is reported when TiDB Lightning imports backup data that contains placement policies
TiCDC	6.0	Ignores placement policies, and does not replicate the policies to the downstream

Tool Name	Minimum supported version	Description
TiDB Binlog	6.0	Ignores placement policies, and does not replicate the policies to the downstream

Tool Name	Minimum supported version	Description
TiDB Lightning	Not compatible yet	An error is reported when TiDB Lightning imports backup data that contains placement policies
TiCDC	6.0	Ignores placement policies, and does not replicate the policies to the downstream

14.13.18 System Tables

14.13.18.1 `mysql` Schema

The `mysql` schema contains TiDB system tables. The design is similar to the `mysql` schema in MySQL, where tables such as `mysql.user` can be edited directly. It also contains a number of tables which are extensions to MySQL.

14.13.18.1.1 Grant system tables

These system tables contain grant information about user accounts and their privileges:

- `user`: user accounts, global privileges, and other non-privilege columns
- `db`: database-level privileges
- `tables_priv`: table-level privileges
- `columns_priv`: column-level privileges
- `password_history`: password change history
- `default_roles`: the default roles for a user
- `global_grants`: dynamic privileges
- `global_priv`: the authentication information based on certificates
- `role_edges`: the relationship between roles

14.13.18.1.2 Cluster status system tables

- The `tidb` table contains some global information about TiDB:
    - `bootstrapped`: whether the TiDB cluster has been initialized. Note that this value is read-only and cannot be modified.
    - `tidb_server_version`: the version information of TiDB when it is initialized. Note that this value is read-only and cannot be modified.
    - `system_tz`: the system time zone of TiDB.
    - `new_collation_enabled`: whether TiDB has enabled the new framework for collations. Note that this value is read-only and cannot be modified.

14.13.18.1.3 Server-side help system tables

Currently, the `help_topic` is NULL.

14.13.18.1.4 Statistics system tables

- `stats_buckets`: the buckets of statistics
- `stats_histograms`: the histograms of statistics
- `stats_top_n`: the TopN of statistics
- `stats_meta`: the meta information of tables, such as the total number of rows and updated rows

- `stats_extended`: extended statistics, such as the order correlation between columns
- `stats_feedback`: the query feedback of statistics
- `stats_fm_sketch`: the FMSketch distribution of the histogram of the statistics column
- `analyze_options`: the default `analyze` options for each table
- `column_stats_usage`: the usage of column statistics
- `schema_index_usage`: the usage of indexes
- `analyze_jobs`: the ongoing statistics collection tasks and the history task records within the last 7 days

14.13.18.1.5 Execution plan-related system tables

- `bind_info`: the binding information of execution plans
- `capture_plan_baselines_blacklist`: the blocklist for the automatic binding of the execution plan

14.13.18.1.6 GC worker system tables

> **Note:**
>
> The GC worker system tables are only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

- `gc_delete_range`: the KV range to be deleted
- `gc_delete_range_done`: the deleted KV range

14.13.18.1.7 System tables related to cached tables

- `table_cache_meta` stores the metadata of cached tables.

14.13.18.1.8 TTL related system tables

- `tidb_ttl_table_status`: the previously executed TTL job and ongoing TTL job for all TTL tables
- `tidb_ttl_task`: the current ongoing TTL subtasks
- `tidb_ttl_job_history`: the execution history of TTL tasks in the last 90 days

14.13.18.1.9 System tables related to runaway queries

- `tidb_runaway_queries`: the history records of all identified runaway queries in the past 7 days
- `tidb_runaway_watch`: the watch list of runaway queries
- `tidb_runaway_watch_done`: a watch list of deleted or expired runaway queries

14.13.18.1.10 System tables related to metadata locks

- `tidb_mdl_view`: a view of metadata locks. You can use it to view information about the currently blocked DDL statements
- `tidb_mdl_info`: used internally by TiDB to synchronize metadata locks across nodes

14.13.18.1.11 System tables related to DDL statements

- `tidb_ddl_history`: the history records of DDL statements
- `tidb_ddl_jobs`: the metadata of DDL statements that are currently being executed by TiDB
- `tidb_ddl_reorg`: the metadata of physical DDL statements (such as adding indexes) that are currently being executed by TiDB

14.13.18.1.12 System tables related to TiDB Distributed eXecution Framework (DXF)

- `dist_framework_meta`: the metadata of the Distributed eXecution Framework (DXF) task scheduler
- `tidb_global_task`: the metadata of the current DXF task
- `tidb_global_task_history`: the metadata of the historical DXF tasks, including both succeeded and failed tasks
- `tidb_background_subtask`: the metadata of the current DXF subtask
- `tidb_background_subtask_history`: the metadata of the historical DXF subtasks

14.13.18.1.13 System tables related to Resource Control

- `request_unit_by_group`: the history records of consumed resource units (RUs) of all resource groups

14.13.18.1.14 Miscellaneous system tables

> **Note:**
>
> The `tidb`, `expr_pushdown_blacklist`, `opt_rule_blacklist`, `table_cache ↪ _meta`, `tidb_import_jobs`, and `tidb_timers` system tables are only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

- `GLOBAL_VARIABLES`: global system variable table

- `expr_pushdown_blacklist`: the blocklist for expression pushdown
- `opt_rule_blacklist`: the blocklist for logical optimization rules
- `tidb_import_jobs`: the job information of `IMPORT INTO`
- `tidb_timers`: the metadata of internal timers

- `GLOBAL_VARIABLES`: global system variable table

14.13.18.2 INFORMATION_SCHEMA

14.13.18.2.1 Information Schema

Information Schema provides an ANSI-standard way of viewing system metadata. TiDB also provides a number of custom `INFORMATION_SCHEMA` tables, in addition to the tables included for MySQL compatibility.

Many `INFORMATION_SCHEMA` tables have a corresponding `SHOW` statement. The benefit of querying `INFORMATION_SCHEMA` is that it is possible to join between tables.

Tables for MySQL compatibility

Table name	Description
`CHARACTER_SETS`	Provides a list of character sets the server supports.
`CHECK_CONSTRAINTS`	Provides information about `CHECK` constraints on tables.
`COLLATIONS`	Provides a list of collations that the server supports.
`COLLATION_CHARACTER_SET_APPLICABILITY`	Explains which collations apply to which character sets.
`COLUMNS`	Provides a list of columns for all tables.
`COLUMN_PRIVILEGES`	Not implemented by TiDB. Returns zero rows.
`COLUMN_STATISTICS`	Not implemented by TiDB. Returns zero rows.
`ENGINES`	Provides a list of supported storage engines.

Table name	Description
EVENTS	Not implemented by TiDB. Returns zero rows.
FILES	Not implemented by TiDB. Returns zero rows.
GLOBAL_STATUS	Not implemented by TiDB. Returns zero rows.
GLOBAL_VARIABLES	Not implemented by TiDB. Returns zero rows.
KEYWORDS	Provides a full list of keywords.
KEY_COLUMN_USAGE	Describes the key constraints of the columns, such as the primary key constraint.
OPTIMIZER_TRACE	Not implemented by TiDB. Returns zero rows.
PARAMETERS	Not implemented by TiDB. Returns zero rows.
PARTITIONS	Provides a list of table partitions.
PLUGINS	Not implemented by TiDB. Returns zero rows.
PROCESSLIST	Provides similar information to the command SHOW PROCESSLIST.
PROFILING	Not implemented by TiDB. Returns zero rows.
REFERENTIAL_CONSTRAINTS	Provides information on FOREIGN KEY constraints.
ROUTINES	Not implemented by TiDB. Returns zero rows.

Table name	Description
SCHEMATA	Provides similar information to SHOW DATABASES.
SCHEMA_PRIVILEGES	Not implemented by TiDB. Returns zero rows.
SESSION_STATUS	Not implemented by TiDB. Returns zero rows.
SESSION_VARIABLES	Provides similar functionality to the command SHOW SESSION ↪ VARIABLES
STATISTICS	Provides information on table indexes.
TABLES	Provides a list of tables that the current user has visibility of. Similar to SHOW TABLES.
TABLESPACES	Not implemented by TiDB. Returns zero rows.
TABLE_CONSTRAINTS	Provides information on primary keys, unique indexes and foreign keys.
TABLE_PRIVILEGES	Not implemented by TiDB. Returns zero rows.
TRIGGERS	Not implemented by TiDB. Returns zero rows.
USER_ATTRIBUTES	Summarizes information about user comments and user attributes.
USER_PRIVILEGES	Summarizes the privileges associated with the current user.

Table name	Description
VARIABLES_INFO	Provides information about TiDB system variables.
VIEWS	Provides a list of views that the current user has visibility of. Similar to running `SHOW FULL TABLES WHERE table_type = 'VIEW'`

Tables that are TiDB extensions

> **Note:**
>
> Some of the following tables are only supported on TiDB Self-Hosted and not supported on TiDB Cloud. To get a full list of unsupported tables on TiDB Cloud, see System tables.

Table name	Description
ANALYZE_STATUS	Provides information about tasks to collect statistics.
CLIENT_ERRORS_SUMMARY_BY_HOST	Provides a summary of errors and warnings generated by client requests and returned to clients.

Table name	Description
CLIENT_ERRORS_SUMMARY_BY_USER	Provides a summary of errors and warnings generated by clients.
CLIENT_ERRORS_SUMMARY_GLOBAL	Provides a summary of errors and warnings generated by clients.
CLUSTER_CONFIG	Provides details about configuration settings for the entire TiDB cluster. This table is not applicable to TiDB Cloud.
CLUSTER_DEADLOCKS	Provides a cluster-level view of the DEADLOCKS table.

Table name	Description
CLUSTER_HARDWARE	Provides details on the underlying physical hardware discovered on each TiDB component. This table is not applicable to TiDB Cloud.
CLUSTER_INFO	Provides details on the current cluster topology. This table is not available on TiDB Serverless clusters.
CLUSTER_LOAD	Provides current load information for TiDB servers in the cluster. This table is not applicable to TiDB Cloud.

Table name	Description
CLUSTER_LOG	Provides a log for the entire TiDB cluster. This table is not applicable to TiDB Cloud.
CLUSTER_MEMORY_USAGE	Provides a cluster-level view of the MEMORY_ ↪ USAGE table.
CLUSTER_MEMORY_USAGE_OPS_HISTORY	Provides a cluster-level view of the MEMORY_ ↪ USAGE_ ↪ OPS_ ↪ HISTORY ↪ table.
CLUSTER_PROCESSLIST	Provides a cluster-level view of the PROCESSLIST ↪ table.
CLUSTER_SLOW_QUERY	Provides a cluster-level view of the SLOW_ ↪ QUERY table. This table is not available on TiDB Serverless clusters.

Table name	Description
CLUSTER_STATEMENTS_SUMMARY	Provides a cluster-level view of the STATEMENTS_SUMMARY table. This table is not available on TiDB Serverless clusters.
CLUSTER_STATEMENTS_SUMMARY_HISTORY	Provides a cluster-level view of the STATEMENTS_SUMMARY_HISTORY table. This table is not available on TiDB Serverless clusters.
CLUSTER_TIDB_INDEX_USAGE	Provides a cluster-level view of the TIDB_INDEX_USAGE table.
CLUSTER_TIDB_TRX	Provides a cluster-level view of the TIDB_TRX table.

Table name	Description
CLUSTER_SYSTEMINFO	Provides details about kernel parameter configuration for servers in the cluster. This table is not applicable to TiDB Cloud.
DATA_LOCK_WAITS	Provides the lock-waiting information on the TiKV server.
DDL_JOBS	Provides similar output to ADMIN ↪ SHOW ↪ DDL ↪ JOBS
DEADLOCKS	Provides the information of several deadlock errors that have recently occurred.

Table name	Description
INSPECTION_RESULT	Triggers internal diagnostics checks. This table is not applicable to TiDB Cloud.
INSPECTION_RULES	A list of internal diagnostic checks performed. This table is not applicable to TiDB Cloud.
INSPECTION_SUMMARY	A summarized report of important monitoring metrics. This table is not applicable to TiDB Cloud.
MEMORY_USAGE	The memory usage of the current TiDB instance.

Table name	Description
MEMORY_USAGE_OPS_HISTORY	The history of memory-related operations and the execution basis of the current TiDB instance.
METRICS_SUMMARY	A summary of metrics extracted from Prometheus. This table is not applicable to TiDB Cloud.
METRICS_SUMMARY_BY_LABEL	See METRICS_SUMMARY table. This table is not applicable to TiDB Cloud.
METRICS_TABLES	Provides the PromQL definitions for tables in METRICS_SCHEMA. This table is not applicable to TiDB Cloud.

Table name	Description
PLACEMENT_POLICIES	Provides information on all placement policies. This table is not available on TiDB Serverless clusters.
SEQUENCES	The TiDB implementation of sequences is based on MariaDB.
SLOW_QUERY	Provides information on slow queries on the current TiDB server. This table is not available on TiDB Serverless clusters.
STATEMENTS_SUMMARY	Similar to performance_schema statement summary in MySQL. This table is not available on TiDB Serverless clusters.

Table name	Description
STATEMENTS_SUMMARY_HISTORY	Similar to performance_schema statement summary history in MySQL. This table is not available on TiDB Serverless clusters.
TABLE_STORAGE_STATS	Provides details about table sizes in storage.
TIDB_HOT_REGIONS	Provides statistics about which regions are hot.
TIDB_HOT_REGIONS_HISTORY	Provides history statistics about which Regions are hot.
TIDB_INDEXES	Provides index information about TiDB tables.

Table name	Description
TIDB_INDEX_USAGE	Provides the information of the index usage statistics on the TiDB node. |
TIDB_SERVERS_INFO	Provides a list of TiDB servers (namely, tidb-server component)
TIDB_TRX	Provides the information of the transactions that are being executed on the TiDB node.
TIFLASH_REPLICA	Provides details about TiFlash replicas.
TIKV_REGION_PEERS	Provides details about where regions are stored.
TIKV_REGION_STATUS	Provides statistics about regions.

Table name	Description
TIKV_STORE_STATUS	Provides basic information about TiKV servers.

14.13.18.2.2 ANALYZE_STATUS

The ANALYZE_STATUS table provides information about the running tasks that collect statistics and a limited number of history tasks.

Starting from TiDB v6.1.0, the ANALYZE_STATUS table supports showing cluster-level tasks. Even after a TiDB restart, you can still view task records before the restart using this table. Before TiDB v6.1.0, the ANALYZE_STATUS table can only show instance-level tasks, and task records are cleared after a TiDB restart.

Starting from TiDB v6.1.0, you can view the history tasks within the last 7 days through the system table mysql.analyze_jobs.

```
USE information_schema;
DESC analyze_status;
```

```

```
+--
    ↪ ------------+------------+---------------+--------------------------------
    ↪
6 rows in set (0.00 sec)
```

Fields in the `ANALYZE_STATUS` table are described as follows:

- `TABLE_SCHEMA`: The name of the database to which the table belongs.
- `TABLE_NAME`: The name of the table.
- `PARTITION_NAME`: The name of the partitioned table.
- `JOB_INFO`: The information of the `ANALYZE` task. If an index is analyzed, this information will include the index name. When `tidb_analyze_version = 2`, this information will include configuration items such as sample rate.
- `PROCESSED_ROWS`: The number of rows that have been processed.
- `START_TIME`: The start time of the `ANALYZE` task.
- `END_TIME`: The end time of the `ANALYZE` task.
- `STATE`: The execution status of the `ANALYZE` task. Its value can be `pending`, `running` ↪ ,`finished` or `failed`.
- `FAIL_REASON`: The reason why the task fails. If the execution is successful, the value is `NULL`.
- `INSTANCE`: The TiDB instance that executes the task.
- `PROCESS_ID`: The process ID that executes the task.
- `REMAINING_SECONDS`: The estimated time (in seconds) remaining for the task to complete.
- `PROGRESS`: The progress of the task.
- `ESTIMATED_TOTAL_ROWS`: The total rows that need to be analyzed by the task.

See also

- `ANALYZE TABLE`
- `SHOW ANALYZE STATUS`

14.13.18.2.3 CHECK_CONSTRAINTS

The `CHECK_CONSTRAINTS` table provides information about `CHECK` constraints on tables.

```
USE INFORMATION_SCHEMA;
DESC CHECK_CONSTRAINTS;
```

The output is as follows:

```
+--------------------+-------------+------+-----+---------+-------+
| Field              | Type        | Null | Key | Default | Extra |
+--------------------+-------------+------+-----+---------+-------+
| CONSTRAINT_CATALOG | varchar(64) | NO   |     | NULL    |       |
```

```
| CONSTRAINT_SCHEMA | varchar(64) | NO |  | NULL   |       |
| CONSTRAINT_NAME   | varchar(64) | NO |  | NULL   |       |
| CHECK_CLAUSE      | longtext    | NO |  | NULL   |       |
+-------------------+-------------+----+----+--------+-------+
4 rows in set (0.00 sec)
```

The following example adds a `CHECK` constraint using the `CREATE TABLE` statement:

```
CREATE TABLE test.t1 (id INT PRIMARY KEY, CHECK (id%2 = 0));
SELECT * FROM CHECK_CONSTRAINTS\G
```

The output is as follows:

```
*************************** 1. row ***************************
CONSTRAINT_CATALOG: def
 CONSTRAINT_SCHEMA: test
   CONSTRAINT_NAME: t1_chk_1
      CHECK_CLAUSE: (`id` % 2 = 0)
1 row in set (0.00 sec)
```

Fields in the `CHECK_CONSTRAINTS` table are described as follows:

- `CONSTRAINT_CATALOG`: The catalog of the constraint, which is always `def`.
- `CONSTRAINT_SCHEMA`: The schema of the constraint.
- `CONSTRAINT_NAME`: The name of the constraint.
- `CHECK_CLAUSE`: The clause of the check constraint.

14.13.18.2.4 CLIENT_ERRORS_SUMMARY_BY_HOST

The table `CLIENT_ERRORS_SUMMARY_BY_HOST` provides a summary of SQL errors and warnings that have been returned to clients that connect to a TiDB server. These include:

- Malformed SQL statements.
- Division by zero errors.
- The attempt to insert out-of-range or duplicate key values.
- Permission errors.
- A table that does not exist.

These errors are returned to the client via the MySQL server protocol, where applications are expected to take appropriate action. The `INFORMATION_SCHEMA.CLIENT_ERRORS_SUMMARY_BY_HOST` table provides a useful method to inspect errors in the scenario where applications are not correctly handling (or logging) errors returned by the TiDB server.

Because `CLIENT_ERRORS_SUMMARY_BY_HOST` summarizes the errors on a per-remote-host basis, it can be useful to diagnose scenarios where one application server is generating more errors than other servers. Possible scenarios include:

- An outdated MySQL client library.
- An outdated application (possibly this server was missed when rolling out a new deployment).
- Incorrect usage of the "host" portion of user permissions.
- Unreliable network connectivity generating more timeouts or disconnected connections.

The summarized counts can be reset using the statement `FLUSH CLIENT_ERRORS_SUMMARY`. The summary is local to each TiDB server and is only retained in memory. Summaries will be lost if the TiDB server restarts.

```
USE INFORMATION_SCHEMA;
DESC CLIENT_ERRORS_SUMMARY_BY_HOST;
```

The output is as follows:

```
+--------------+---------------+------+------+---------+-------+
| Field        | Type          | Null | Key | Default | Extra |
+--------------+---------------+------+------+---------+-------+
| HOST         | varchar(255) | NO |     | NULL   |       |
| ERROR_NUMBER | bigint(64) | NO  |     | NULL   |       |
| ERROR_MESSAGE | varchar(1024) | NO |  | NULL   |       |
| ERROR_COUNT | bigint(64)  | NO  |     | NULL   |       |
| WARNING_COUNT | bigint(64) | NO |     | NULL   |       |
| FIRST_SEEN  | timestamp   | YES |     | NULL   |       |

7 rows in set (0.00 sec)
```

Field description:

- `HOST`: The remote host of the client.
- `ERROR_NUMBER`: The MySQL-compatible error number that was returned.
- `ERROR_MESSAGE`: The error message which matches the error number (in prepared statement form).
- `ERROR_COUNT`: The number of times this error was returned to the client host.
- `WARNING_COUNT`: The number of times this warning was returned to the client host.
- `FIRST_SEEN`: The first time this error (or warning) was seen from the client host.
- `LAST_SEEN`: The most recent time this error (or warning) was seen from the client host.

The following example shows a warning being generated when the client connects to a local TiDB server. The summary is reset after executing `FLUSH CLIENT_ERRORS_SUMMARY`:

```
SELECT 0/0;
SELECT * FROM CLIENT_ERRORS_SUMMARY_BY_HOST;
FLUSH CLIENT_ERRORS_SUMMARY;
SELECT * FROM CLIENT_ERRORS_SUMMARY_BY_HOST;
```

The output is as follows:

```
+-----+
| 0/0 |

14.13.18.2.5 CLIENT_ERRORS_SUMMARY_BY_USER

The table `CLIENT_ERRORS_SUMMARY_BY_USER` provides a summary of SQL errors and warnings that have been returned to clients that connect to a TiDB server. These include:

- Malformed SQL statements.
- Division by zero errors.
- The attempt to insert out-of-range or duplicate key values.
- Permission errors.
- A table that does not exist.

Client errors are returned to the client via the MySQL server protocol, where applications are expected to take appropriate action. The `INFORMATION_SCHEMA.CLIENT_ERRORS_SUMMARY_BY_USER` table provides an useful method to inspect errors in the scenario where applications are not correctly handling (or logging) errors returned by the TiDB server.

Because `CLIENT_ERRORS_SUMMARY_BY_USER` summarizes the errors on a per-user basis, it can be useful to diagnose scenarios where one user server is generating more errors than other servers. Possible scenarios include:

- Permission errors.
- Missing tables, or relational objects.
- Incorrect SQL syntax, or incompatibilities between the application and the version of TiDB.

The summarized counts can be reset with the statement `FLUSH CLIENT_ERRORS_SUMMARY` ↪ . The summary is local to each TiDB server and is only retained in memory. Summaries will be lost if the TiDB server restarts.

```
USE INFORMATION_SCHEMA;
DESC CLIENT_ERRORS_SUMMARY_BY_USER;
```

The output is as follows:

```
+--------------+--------------+------+------+---------+-------+
| Field        | Type         | Null | Key | Default | Extra |
+--------------+--------------+------+------+---------+-------+
| USER         | varchar(64) | NO  |     | NULL   |       |
| ERROR_NUMBER | bigint(64) | NO  |     | NULL   |       |
| ERROR_MESSAGE | varchar(1024) | NO |  | NULL   |       |
| ERROR_COUNT | bigint(64)  | NO  |     | NULL   |       |
| WARNING_COUNT | bigint(64) | NO |     | NULL   |       |
| FIRST_SEEN  | timestamp   | YES |     | NULL   |       |
| LAST_SEEN   | timestamp   | YES |     | NULL   |       |
+--------------+--------------+------+------+---------+-------+
7 rows in set (0.00 sec)
```

Field description:

- `USER`: The authenticated user.
- `ERROR_NUMBER`: The MySQL-compatible error number that was returned.
- `ERROR_MESSAGE`: The error message which matches the error number (in prepared statement form).
- `ERROR_COUNT`: The number of times this error was returned to the user.
- `WARNING_COUNT`: The number of times this warning was returned to the user.
- `FIRST_SEEN`: The first time this error (or warning) was sent to the user.
- `LAST_SEEN`: The most recent time this error (or warning) was sent to the user.

The following example shows a warning being generated when the client connects to a local TiDB server. The summary is reset after executing `FLUSH CLIENT_ERRORS_SUMMARY`:

```
SELECT 0/0;
SELECT * FROM CLIENT_ERRORS_SUMMARY_BY_USER;
FLUSH CLIENT_ERRORS_SUMMARY;

```

14.13.18.2.6 CLIENT_ERRORS_SUMMARY_GLOBAL

The table `CLIENT_ERRORS_SUMMARY_GLOBAL` provides a global summary of all SQL errors and warnings that have been returned to clients that connect to a TiDB server. These include:

- Malformed SQL statements.
- Division by zero errors.
- The attempt to insert out-of-range of duplicate key values.
- Permission errors.
- A table does not exist.

Client errors are returned to the client via the MySQL server protocol, where applications are expected to take appropriate action. The `INFORMATION_SCHEMA.CLIENT_ERRORS_SUMMARY_GLOBAL` table provides a high-level overview, and is useful in the scenario where applications are not correctly handling (or logging) errors returned by the TiDB server.

The summarized counts can be reset with the statement `FLUSH CLIENT_ERRORS_SUMMARY`. The summary is local to each TiDB server and is only retained in memory. Summaries will be lost if the TiDB server restarts.

```
USE INFORMATION_SCHEMA;
DESC CLIENT_ERRORS_SUMMARY_GLOBAL;
```

The output is as follows:

```
+---------------+---------------+------+------+---------+-------+
| Field         | Type          | Null | Key | Default | Extra |
+---------------+---------------+------+------+---------+-------+
| ERROR_NUMBER | bigint(64) | NO  |     | NULL   |       |
| ERROR_MESSAGE | varchar(1024) | NO |  | NULL   |       |
| ERROR_COUNT | bigint(64)  | NO  |     | NULL   |       |
| WARNING_COUNT | bigint(64) | NO |     | NULL   |       |
| FIRST_SEEN  | timestamp   | YES |     | NULL   |       |
| LAST_SEEN   | timestamp   | YES |     | NULL   |       |
+---------------+---------------+------+------+---------+-------+
6 rows in set (0.00 sec)
```

Field description:

- `ERROR_NUMBER`: The MySQL-compatible error number that was returned.
- `ERROR_MESSAGE`: The error message which matches the error number (in prepared statement form).
- `ERROR_COUNT`: The number of times this error was returned.
- `WARNING_COUNT`: The number of times this warning was returned.
- `FIRST_SEEN`: The first time this error (or warning) was sent.
- `LAST_SEEN`: The most recent time this error (or warning) was sent.

The following example shows a warning being generated when connecting to a local TiDB server. The summary is reset after executing `FLUSH CLIENT_ERRORS_SUMMARY`:

```
SELECT 0/0;
SELECT * FROM CLIENT_ERRORS_SUMMARY_GLOBAL;
FLUSH CLIENT_ERRORS_SUMMARY;
SELECT * FROM CLIENT_ERRORS_SUMMARY_GLOBAL;
```

The output is as follows:

```

14.13.18.2.7 CHARACTER_SETS

The CHARACTER_SETS table provides information about character sets. Currently, TiDB only supports some of the character sets.

```
USE INFORMATION_SCHEMA;
DESC CHARACTER_SETS;
```

The output is as follows:

```
+---------------------+-------------+------+------+---------+-------+
| Field               | Type        | Null | Key | Default | Extra |
+---------------------+-------------+------+------+---------+-------+
| CHARACTER_SET_NAME | varchar(32) | YES |   | NULL   |       |
| DEFAULT_COLLATE_NAME | varchar(32) | YES | | NULL   |       |
| DESCRIPTION         | varchar(60) | YES |    | NULL   |       |
| MAXLEN              | bigint(3)  | YES |     | NULL   |       |
+---------------------+-------------+------+------+---------+-------+
4 rows in set (0.00 sec)
```

View the CHARACTER_SETS table:

```
SELECT * FROM `CHARACTER_SETS`;
```

The output is as follows:

```
+--
    ↪ -----------------+--------------------+---------------------------------+
    ↪
| CHARACTER_SET_NAME | DEFAULT_COLLATE_NAME | DESCRIPTION                     |
    ↪ MAXLEN |
+--
    ↪ -----------------+--------------------+---------------------------------+
    ↪
| ascii              | ascii_bin          | US ASCII                        |
    ↪      1 |

    ↪   | 2 |
| latin1             | latin1_bin         | Latin1                          |
    ↪      1 |
| utf8               | utf8_bin           | UTF-8 Unicode                   |
    ↪      3 |
| utf8mb4            | utf8mb4_bin        | UTF-8 Unicode                   |
    ↪      4 |
+--
    ↪ -----------------+--------------------+---------------------------------+
    ↪
6 rows in set (0.00 sec)
```

The description of columns in the CHARACTER_SETS table is as follows:

- CHARACTER_SET_NAME: The name of the character set.
- DEFAULT_COLLATE_NAME The default collation name of the character set.
- DESCRIPTION The description of the character set.
- MAXLEN The maximum length required to store a character in this character set.

14.13.18.2.8 CLUSTER_CONFIG

You can use the `CLUSTER_CONFIG` cluster configuration table to get the current configuration of all server components in the cluster. This simplifies the usage over earlier releases of TiDB, where obtaining similar information would require accessing the HTTP API endpoints of each instance.

> **Note:**
>
> This table is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

```
USE information_schema;
DESC cluster_config;
```

```
+---------+-------------+------+------+---------+-------+
| Field   | Type        | Null | Key | Default | Extra |
+---------+-------------+------+------+---------+-------+
| TYPE    | varchar(64) | YES |     | NULL   |       |
| INSTANCE | varchar(64) | YES |    | NULL   |       |
| KEY     | varchar(256) | YES |    | NULL   |       |
| VALUE   | varchar(128) | YES |    | NULL   |       |
+---------+-------------+------+------+---------+-------+
```

Field description:

- `TYPE`: The instance type. The optional values are `tidb`, `pd`, and `tikv`.
- `INSTANCE`: The service address of the instance.
- `KEY`: The configuration item name.
- `VALUE`: The configuration item value.

The following example shows how to query the `coprocessor` configuration on the TiKV instance using the `CLUSTER_CONFIG` table:

```
SELECT * FROM cluster_config WHERE type='tikv' AND `key` LIKE 'coprocessor%
    ↪ ';
```

```
+------+----------------+-----------------------------------+---------+
| TYPE | INSTANCE      | KEY                               | VALUE  |
+------+----------------+-----------------------------------+---------+
| tikv | 127.0.0.1:20165 | coprocessor.batch-split-limit | 10 |
| tikv | 127.0.0.1:20165 | coprocessor.region-max-keys | 1440000 |
```

```
| tikv | 127.0.0.1:20165 | coprocessor.region-max-size | 144MiB |
| tikv | 127.0.0.1:20165 | coprocessor.region-split-keys | 960000 |
| tikv | 127.0.0.1:20165 | coprocessor.region-split-size | 96MiB |
| tikv | 127.0.0.1:20165 | coprocessor.split-region-on-table | false |
+------+-----------------+-----------------------------------+---------+
6 rows in set (0.00 sec)
```

14.13.18.2.9 CLUSTER_HARDWARE

The `CLUSTER_HARDWARE` hardware system table provides the hardware information of the server where each instance of the cluster is located.

> **Note:**
>
> This table is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

```
USE information_schema;
DESC cluster_hardware;
```

```
+-------------+-------------+------+-----+---------+-------+
| Field       | Type        | Null | Key | Default | Extra |
+-------------+-------------+------+-----+---------+-------+
| TYPE        | varchar(64) | YES  |     | NULL    |       |
| INSTANCE    | varchar(64) | YES  |     | NULL    |       |
| DEVICE_TYPE | varchar(64) | YES  |     | NULL    |       |
| DEVICE_NAME | varchar(64) | YES  |     | NULL    |       |
| NAME        | varchar(256) | YES |     | NULL    |       |
| VALUE       | varchar(128) | YES |     | NULL    |       |
+-------------+-------------+------+-----+---------+-------+
6 rows in set (0.00 sec)
```

Field description:

- `TYPE`: Corresponds to the `TYPE` field in the `information_schema.cluster_info` table. The optional values are `tidb`, `pd`, and `tikv`.
- `INSTANCE`: Corresponds to the `INSTANCE` field in the `information_schema.cluster_info` cluster information table.
- `DEVICE_TYPE`: Hardware type. Currently, you can query the `cpu`, `memory`, `disk`, and `net` types.
- `DEVICE_NAME`: Hardware name. The value of `DEVICE_NAME` varies with `DEVICE_TYPE`.

- `cpu`: The hardware name is cpu.
- `memory`: The hardware name is memory.
- `disk`: The disk name.
- `net`: The network card name.

- `NAME`: The different information names of the hardware. For example, cpu has two information names: `cpu-logical-cores` and `cpu-physical-cores`, which respectively mean logical core numbers and physical core numbers.
- `VALUE`: The value of the corresponding hardware information, such as the disk volume and CPU core numbers.

The following example shows how to query the CPU information using the `CLUSTER_HARDWARE` table:

```
SELECT * FROM cluster_hardware WHERE device_type='cpu' AND device_name='cpu' AND name LIKE '%cores';
```

```
+------+-----------------+-------------+-------------+-------------------+-------+
| TYPE | INSTANCE        | DEVICE_TYPE | DEVICE_NAME | NAME              | VALUE |
+------+-----------------+-------------+-------------+-------------------+-------+
| tidb | 0.0.0.0:4000    | cpu         | cpu         | cpu-logical-cores | 16    |
| tidb | 0.0.0.0:4000    | cpu         | cpu         | cpu-physical-cores | 8    |
| pd   | 127.0.0.1:2379  | cpu         | cpu         | cpu-logical-cores | 16    |
| pd   | 127.0.0.1:2379  | cpu         | cpu         | cpu-physical-cores | 8    |
| tikv | 127.0.0.1:20165 | cpu         | cpu         | cpu-logical-cores | 16    |
| tikv | 127.0.0.1:20165 | cpu         | cpu         | cpu-physical-cores | 8    |
+------+-----------------+-------------+-------------+-------------------+-------+
6 rows in set (0.03 sec)
```

14.13.18.2.10 CLUSTER_INFO

The `CLUSTER_INFO` cluster topology table provides the current topology information of the cluster, the version information of each instance, the Git Hash corresponding to the instance version, the starting time of each instance, and the running time of each instance.

> **Note:**
>
> This table is not available on TiDB Serverless clusters.

```
USE information_schema;
desc cluster_info;
```

```
+---------------+-------------+------+------+---------+-------+
| Field         | Type        | Null | Key  | Default | Extra |
+---------------+-------------+------+------+---------+-------+
| TYPE          | varchar(64) | YES  |      | NULL    |       |
| INSTANCE      | varchar(64) | YES  |      | NULL    |       |
| STATUS_ADDRESS | varchar(64) | YES  |      | NULL    |       |
| VERSION       | varchar(64) | YES  |      | NULL    |       |
| GIT_HASH      | varchar(64) | YES  |      | NULL    |       |
| START_TIME    | varchar(32) | YES  |      | NULL    |       |
| UPTIME        | varchar(32) | YES  |      | NULL    |       |
| SERVER_ID     | bigint(21)  | YES  |      | NULL    |       |
+---------------+-------------+------+------+---------+-------+
8 rows in set (0.01 sec)
```

Field description:

- `TYPE`: The instance type. The optional values are `tidb`, `pd`, and `tikv`.
- `INSTANCE`: The instance address, which is a string in the format of `IP:PORT`.
- `STATUS_ADDRESS`: The service address of HTTP API. Some commands in tikv-ctl, pd-ctl, or tidb-ctl might use this API and this address. You can also get more cluster information via this address. Refer to TiDB HTTP API document for details.
- `VERSION`: The semantic version number of the corresponding instance. To be compatible with the MySQL version number, the TiDB version is displayed in the format of `${mysql-version}-${tidb-version}`.
- `GIT_HASH`: The Git Commit Hash when compiling the instance version, which is used to identify whether two instances are of the absolutely consistent version.
- `START_TIME`: The starting time of the corresponding instance.
- `UPTIME`: The uptime of the corresponding instance.
- `SERVER_ID`: The server ID of the corresponding instance.

```
SELECT * FROM cluster_info;
```

```

14.13.18.2.11 CLUSTER_LOAD

The `CLUSTER_LOAD` cluster load table provides the current load information of the server where each instance of the TiDB cluster is located.

> **Note:**
>
> This table is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

```
USE information_schema;
DESC cluster_load;
```

```
+------------+-------------+------+-----+---------+-------+
| Field      | Type        | Null | Key | Default | Extra |
+------------+-------------+------+-----+---------+-------+
| TYPE       | varchar(64) | YES |     | NULL    |       |
| INSTANCE   | varchar(64) | YES |     | NULL    |       |
| DEVICE_TYPE | varchar(64) | YES |   | NULL    |       |
| DEVICE_NAME | varchar(64) | YES |   | NULL    |       |
| NAME       | varchar(256) | YES |    | NULL    |       |
| VALUE      | varchar(128) | YES |    | NULL    |       |
+------------+-------------+------+-----+---------+-------+
6 rows in set (0.00 sec)
```

Field description:

- `TYPE`: Corresponds to the `TYPE` field in the `information_schema.cluster_info` table. The optional values are `tidb`, `pd`, and `tikv`.

- `INSTANCE`: Corresponds to the `INSTANCE` field in the `information_schema.cluster_info` cluster information table.
- `DEVICE_TYPE`: Hardware type. Currently, you can query the `cpu`, `memory`, `disk`, and `net` types.
- `DEVICE_NAME`: Hardware name. The value of `DEVICE_NAME` varies with `DEVICE_TYPE`.
    - `cpu`: The hardware name is cpu.
    - `disk`: The disk name.
    - `net`: The network card name.
    - `memory`: The hardware name is memory.
- `NAME`: Different load types. For example, cpu has three load types: `load1`, `load5`, and `load15`, which respectively mean the average load of cpu within 1 minute, 5 minutes, and 15 minutes.
- `VALUE`: The value of the hardware load. For example, `1min`, `5min`, and `15min` respectively mean the average load of the hardware within 1 minute, 5 minutes, and 15 minutes.

The following example shows how to query the current load information of cpu using the `CLUSTER_LOAD` table:

```
SELECT * FROM cluster_load WHERE device_type='cpu' AND device_name='cpu';
```

```
+------+-----------------+-------------+-------------+--------+-------+

14.13.18.2.12 CLUSTER_LOG

You can query cluster logs on the `CLUSTER_LOG` cluster log table. By pushing down query conditions to each instance, the impact of the query on cluster performance is less than that of the `grep` command.

Note:

This table is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

To get the logs of the TiDB cluster before v4.0, you need to log in to each instance to summarize logs. This cluster log table in 4.0 provides the global and time-ordered log search result, which makes it easier to track full-link events. For example, by searching logs according to the `region id`, you can query all logs in the life cycle of this Region. Similarly, by searching the full link log through the slow log's `txn id`, you can query the flow and the number of keys scanned by this transaction at each instance.

```
USE information_schema;
DESC cluster_log;
```

```
+---------+-----------------+------+------+---------+-------+
| Field   | Type            | Null | Key | Default | Extra |
+---------+-----------------+------+------+---------+-------+
| TIME    | varchar(32)     | YES |     | NULL   |       |
| TYPE    | varchar(64)     | YES |     | NULL   |       |
| INSTANCE | varchar(64)    | YES |     | NULL   |       |
| LEVEL   | varchar(8)      | YES |     | NULL   |       |
| MESSAGE | var_string(1024) | YES |   | NULL   |       |
+---------+-----------------+------+------+---------+-------+
5 rows in set (0.00 sec)
```

Field description:

- `TIME`: The time to print the log.
- `TYPE`: The instance type. The optional values are `tidb`, `pd`, and `tikv`.
- `INSTANCE`: The service address of the instance.
- `LEVEL`: The log level.
- `MESSAGE`: The log content.

Note:

- All fields of the cluster log table are pushed down to the corresponding instance for execution. To reduce the overhead of using the cluster log table, you must specify the keywords used for the

search, the time range, and as many conditions as possible. For example, `select * from cluster_log where message like '%ddl%' and time > '2020-05-18 20:40:00' and time<'2020-05-18 21:40:00' and type='tidb'`.

- The `message` field supports the `like` and `regexp` regular expressions, and the corresponding pattern is encoded as `regexp`. Specifying multiple `message` conditions is equivalent to the `pipeline` form of the `grep` command. For example, executing the `select * from cluster_log where message like 'coprocessor%' and message regexp '.*slow.*' and time > '2020-05-18 20:40:00' and time <'2020-05-18 21:40:00'` statement is equivalent to executing `grep 'coprocessor' xxx.log | grep -E '.*slow.*'` on all cluster instances.

The following example shows how to query the execution process of a DDL statement using the `CLUSTER_LOG` table:

```
SELECT time,instance,left(message,150) FROM cluster_log WHERE message LIKE
    ↪ '%ddl%job%ID.80%' AND type='tidb' AND time > '2020-05-18 20:40:00'
    ↪ AND time < '2020-05-18 21:40:00'
```

```
+--
    ↪ ----------------------+---------------+-----------------------------------
    ↪
| time                    | instance      | left(message,150)
    ↪
    ↪ |
+--
    ↪ ----------------------+---------------+-----------------------------------
    ↪
| 2020/05/18 21:37:54.784 | 127.0.0.1:4002 | [ddl_worker.go:261] ["[ddl] add
    ↪  DDL jobs"] ["batch count"=1] [jobs="ID:80, Type:create table, State:
    ↪ none, SchemaState:none, SchemaID:1, TableID:79, Ro |
| 2020/05/18 21:37:54.784 | 127.0.0.1:4002 | [ddl.go:477] ["[ddl] start DDL
    ↪ job"] [job="ID:80, Type:create table, State:none, SchemaState:none,
    ↪ SchemaID:1, TableID:79, RowCount:0, ArgLen:1, start |
| 2020/05/18 21:37:55.327 | 127.0.0.1:4000 | [ddl_worker.go:568] ["[ddl] run
    ↪  DDL job"] [worker="worker 1, tp general"] [job="ID:80, Type:create
    ↪ table, State:none, SchemaState:none, SchemaID:1, Ta |
| 2020/05/18 21:37:55.381 | 127.0.0.1:4000 | [ddl_worker.go:763] ["[ddl]
    ↪ wait latest schema version changed"] [worker="worker 1, tp general"]
    ↪ [ver=70] ["take time"=50.809848ms] [job="ID:80, Type: |
```

```
| 2020/05/18 21:37:55.382 | 127.0.0.1:4000 | [ddl_worker.go:359] ["[ddl]
    ↪ finish DDL job"] [worker="worker 1, tp general"] [job="ID:80, Type:
    ↪ create table, State:synced, SchemaState:public, SchemaI |
| 2020/05/18 21:37:55.786 | 127.0.0.1:4002 | [ddl.go:509] ["[ddl] DDL job is
    ↪  finished"] [jobID=80]
    ↪
    ↪ |
+-------------------------+----------------+-------------------------------------------
    ↪
```

The query results above show the process of executing a DDL statement:

1. The request with a DDL JOB ID of `80` is sent to the `127.0.0.1:4002` TiDB instance.
2. The `127.0.0.1:4000` TiDB instance processes this DDL request, which indicates that the `127.0.0.1:4000` instance is the DDL owner at that time.
3. The request with a DDL JOB ID of `80` has been processed.

14.13.18.2.13 CLUSTER_SYSTEMINFO

You can use the `CLUSTER_SYSTEMINFO` kernel parameter table to query the kernel configuration information of the server where all instances of the cluster are located. Currently, you can query the information of the `sysctl` system.

> **Note:**
>
> This table is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

```
USE information_schema;
DESC cluster_systeminfo;
```

```
+-------------+--------------+------+-----+---------+-------+
| Field       | Type         | Null | Key | Default | Extra |
+-------------+--------------+------+-----+---------+-------+
| TYPE        | varchar(64)  | YES  |     | NULL    |       |
| INSTANCE    | varchar(64)  | YES  |     | NULL    |       |
| SYSTEM_TYPE | varchar(64)  | YES  |     | NULL    |       |

| COLLATION_NAME     | varchar(32) | YES |     | NULL    |       |
| CHARACTER_SET_NAME | varchar(32) | YES | | NULL    |       |
| ID                 | bigint(11)  | YES |     | NULL    |       |
| IS_DEFAULT         | varchar(3)  | YES |     | NULL    |       |
| IS_COMPILED        | varchar(3)  | YES |     | NULL    |       |
| SORTLEN            | bigint(3)   | YES |     | NULL    |       |
+--------------------+-------------+------+-----+---------+-------+
6 rows in set (0.00 sec)
```

```
SELECT * FROM collations WHERE character_set_name='utf8mb4';
```

```
+--
   ↪ -----------------+--------------------+-----+-----------+-------------+------
   ↪
| COLLATION_NAME     | CHARACTER_SET_NAME | ID | IS_DEFAULT | IS_COMPILED |
   ↪ SORTLEN |
+--
   ↪ -----------------+--------------------+-----+-----------+-------------+------
   ↪
| utf8mb4_bin        | utf8mb4            |  46 | Yes        | Yes         |      1
   ↪ |
| utf8mb4_general_ci | utf8mb4            |  45 |            | Yes         |      1
   ↪ |
| utf8mb4_unicode_ci | utf8mb4            | 224 |            | Yes         |      1
   ↪ |
+--
   ↪ -----------------+--------------------+-----+-----------+-------------+------
   ↪
3 rows in set (0.001 sec)
```

The description of columns in the `COLLATIONS` table is as follows:

- `COLLATION_NAME`: The name of the collation.
- `CHARACTER_SET_NAME`: The name of the character set which the collation belongs to.
- `ID`: The ID of the collation.
- `IS_DEFAULT`: Whether this collation is the default collation of the character set it belongs to.
- `IS_COMPILED`: Whether the character set is compiled into the server.
- `SORTLEN`: The minimum length of memory allocated when the collation sorts characters.

- INFORMATION_SCHEMA.COLLATION_CHARACTER_SET_APPLICABILITY

14.13.18.2.15 COLLATION_CHARACTER_SET_APPLICABILITY

The COLLATION_CHARACTER_SET_APPLICABILITY table maps collations to the applicable character set name. Similar to the COLLATIONS table, it is included only for compatibility with MySQL.

```
USE INFORMATION_SCHEMA;
DESC COLLATION_CHARACTER_SET_APPLICABILITY;
```

The output is as follows:

```
+--------------------+-------------+------+-----+---------+-------+
| Field              | Type        | Null | Key | Default | Extra |
+--------------------+-------------+------+-----+---------+-------+
| COLLATION_NAME     | varchar(32) | NO   |     | NULL    |       |
| CHARACTER_SET_NAME | varchar(32) | NO   |     | NULL    |       |
+--------------------+-------------+------+-----+---------+-------+
2 rows in set (0.00 sec)
```

View the collation mapping for the utf8mb4 character set in the COLLATION_CHARACTER_SET_APPLICABILITY table:

```
SELECT * FROM COLLATION_CHARACTER_SET_APPLICABILITY WHERE character_set_name='utf8mb4';
```

The output is as follows:

```
+--------------------+--------------------+
| COLLATION_NAME     | CHARACTER_SET_NAME |
+--------------------+--------------------+
| utf8mb4_bin        | utf8mb4            |
| utf8mb4_general_ci | utf8mb4            |
| utf8mb4_unicode_ci | utf8mb4            |
+--------------------+--------------------+
3 rows in set (0.00 sec)
```

The description of columns in the COLLATION_CHARACTER_SET_APPLICABILITY table is as follows:

- COLLATION_NAME: The name of the collation.
- CHARACTER_SET_NAME: The name of the character set which the collation belongs to.

| NUMERIC_PRECISION      | bigint(21)   | YES |     | NULL    |       |
| NUMERIC_SCALE          | bigint(21)   | YES |     | NULL    |       |
| DATETIME_PRECISION     | bigint(21)   | YES |     | NULL    |       |
| CHARACTER_SET_NAME     | varchar(32)  | YES |     | NULL    |       |
| COLLATION_NAME         | varchar(32)  | YES |     | NULL    |       |
| COLUMN_TYPE            | text         | YES |     | NULL    |       |
| COLUMN_KEY             | varchar(3)   | YES |     | NULL    |       |
| EXTRA                  | varchar(30)  | YES |     | NULL    |       |
| PRIVILEGES             | varchar(80)  | YES |     | NULL    |       |
| COLUMN_COMMENT         | varchar(1024) | YES |    | NULL    |       |
| GENERATION_EXPRESSION | text         | NO  |     | NULL    |       |
+--
    ↪ ----------------------+--------------+------+------+---------+-------+
    ↪
21 rows in set (0.00 sec)
```

Create a table `test.t1` and query the information in the `COLUMNS` table:

```
CREATE TABLE test.t1 (a int);
SELECT * FROM COLUMNS WHERE table_schema='test' AND TABLE_NAME='t1'\G
```

The output is as follows:

```
*************************** 1. row ***************************
           TABLE_CATALOG: def
            TABLE_SCHEMA: test
              TABLE_NAME: t1
             COLUMN_NAME: a
        ORDINAL_POSITION: 1
          COLUMN_DEFAULT: NULL
             IS_NULLABLE: YES
               DATA_TYPE: int
CHARACTER_MAXIMUM_LENGTH: NULL
  CHARACTER_OCTET_LENGTH: NULL
       NUMERIC_PRECISION: 11
           NUMERIC_SCALE: 0
      DATETIME_PRECISION: NULL
      CHARACTER_SET_NAME: NULL
          COLLATION_NAME: NULL
             COLUMN_TYPE: int(11)
              COLUMN_KEY:
                   EXTRA:
              PRIVILEGES: select,insert,update,references
          COLUMN_COMMENT:
   GENERATION_EXPRESSION:
1 row in set (0.02 sec)
```

The description of columns in the `COLUMNS` table is as follows:

- `TABLE_CATALOG`: The name of the catalog to which the table with the column belongs. The value is always `def`.
- `TABLE_SCHEMA`: The name of the schema in which the table with the column is located.
- `TABLE_NAME`: The name of the table with the column.
- `COLUMN_NAME`: The name of the column.
- `ORDINAL_POSITION`: The position of the column in the table.
- `COLUMN_DEFAULT`: The default value of the column. If the explicit default value is `NULL`, or if the column definition does not include the `default` clause, this value is `NULL`.
- `IS_NULLABLE`: Whether the column is nullable. If the column can store null values, this value is `YES`; otherwise, it is `NO`.
- `DATA_TYPE`: The type of data in the column.
- `CHARACTER_MAXIMUM_LENGTH`: For string columns, the maximum length in characters.
- `CHARACTER_OCTET_LENGTH`: For string columns, the maximum length in bytes.

- NUMERIC_PRECISION: The numeric precision of a number-type column.
- NUMERIC_SCALE: The numeric scale of a number-type column.
- DATETIME_PRECISION: For time-type columns, the fractional seconds precision.
- CHARACTER_SET_NAME: The name of the character set of a string column.
- COLLATION_NAME: The name of the collation of a string column.
- COLUMN_TYPE: The column type.
- COLUMN_KEY: Whether this column is indexed. This field might have the following values:
    - Empty: This column is not indexed, or this column is indexed and is the second column in a multi-column non-unique index.
    - PRI: This column is the primary key or one of multiple primary keys.
    - UNI: This column is the first column of the unique index.
    - MUL: The column is the first column of a non-unique index, in which a given value is allowed to occur for multiple times.
- EXTRA: Any additional information of the given column.
- PRIVILEGES: The privilege that the current user has on this column. Currently, this value is fixed in TiDB, and is always `select,insert,update,references`.
- COLUMN_COMMENT: Comments contained in the column definition.
- GENERATION_EXPRESSION: For generated columns, this value displays the expression used to calculate the column value. For non-generated columns, the value is empty.

The corresponding SHOW statement is as follows:

```
SHOW COLUMNS FROM t1 FROM test;
```

The output is as follows:

```
+-------+---------+------+-----+---------+-------+
| Field | Type    | Null | Key | Default | Extra |
+-------+---------+------+-----+---------+-------+
| a     | int(11) | YES  |     | NULL    |       |
+-------+---------+------+-----+---------+-------+
1 row in set (0.00 sec)
```

    ↪ ---------------------+---------------------+------+------+---------+-------+
    ↪
| KEY                  | text                | NO   |     | NULL    |       |
| KEY_INFO             | text                | YES  |     | NULL    |       |
| TRX_ID               | bigint(21) unsigned | NO   |     | NULL    |       |
| CURRENT_HOLDING_TRX_ID | bigint(21) unsigned | NO | | NULL    |       |
| SQL_DIGEST           | varchar(64)         | YES  |     | NULL    |       |
| SQL_DIGEST_TEXT      | text                | YES  |     | NULL    |       |
+--
    ↪ ---------------------+---------------------+------+------+---------+-------+
    ↪
```

The meaning of each column field in the `DATA_LOCK_WAITS` table is as follows:

- `KEY`: The key that is waiting for the lock and in the hexadecimal form.
- `KEY_INFO`: The detailed information of `KEY`. See the KEY_INFO section.
- `TRX_ID`: The ID of the transaction that is waiting for the lock. This ID is also the `start_ts` of the transaction.
- `CURRENT_HOLDING_TRX_ID`: The ID of the transaction that currently holds the lock. This ID is also the `start_ts` of the transaction.
- `SQL_DIGEST`: The digest of the SQL statement that is currently blocked in the lock-waiting transaction.
- `SQL_DIGEST_TEXT`: The normalized SQL statement (the SQL statement without arguments and formats) that is currently blocked in the lock-waiting transaction. It corresponds to `SQL_DIGEST`.

Warning:

- Only the users with the PROCESS privilege can query this table.
- Currently, the `SQL_DIGEST` and `SQL_DIGEST_TEXT` fields are `null` (which means unavailable) for optimistic transactions. As a workaround, to find out the SQL statement that causes the blocking, you can join this table with `CLUSTER_TIDB_TRX` to get all the SQL statements of the optimistic transaction.

- The information in the `DATA_LOCK_WAITS` table is obtained in real time from all TiKV nodes during the query. Currently, even if a query has the `WHERE` condition, the information collection is still performed on all TiKV nodes. If your cluster is large and the load is high, querying this table might cause potential risk of performance jitter. Therefore, use it according to your actual situation.
- Information from different TiKV nodes is NOT guaranteed to be snapshots of the same time.
- The information (SQL digest) in the `SQL_DIGEST` column is the hash value calculated from the normalized SQL statement. The information in the `SQL_DIGEST_TEXT` column is internally queried from statements summary tables, so it is possible that the corresponding statement cannot be found internally. For the detailed description of SQL digests and the statements summary tables, see Statement Summary Tables.

`KEY_INFO`

The `KEY_INFO` column shows the detailed information of the `KEY` column. The information is shown in the JSON format. The description of each field is as follows:

- `"db_id"`: The ID of the schema to which the key belongs.
- `"db_name"`: The name of the schema to which the key belongs.
- `"table_id"`: The ID of the table to which the key belongs.
- `"table_name"`: The name of the table to which the key belongs.
- `"partition_id"`: The ID of the partition where the key is located.
- `"partition_name"`: The name of the partition where the key is located.
- `"handle_type"`: The handle type of the row key (that is, the key that stores a row of data). The possible values are as follows:
  - `"int"`: The handle type is int, which means that the handle is the row ID.
  - `"common"`: The handle type is not int64. This type is shown in the non-int primary key when clustered index is enabled.
  - `"unknown"`: The handle type is currently not supported.
- `"handle_value"`: The handle value.
- `"index_id"`: The index ID to which the index key (the key that stores the index) belongs.
- `"index_name"`: The name of the index to which the index key belongs.
- `"index_values"`: The index value in the index key.

In the above fields, if the information of a field is not applicable or currently unavailable, the field is omitted in the query result. For example, the row key information does not contain `index_id`, `index_name`, and `index_values`; the index key does not contain `handle_type`

and `handle_value`; non-partitioned tables do not display `partition_id` and `partition_name`; the key information in the deleted table cannot obtain schema information such as `table_name`, `db_id`, `db_name`, and `index_name`, and it is unable to distinguish whether the table is a partitioned table.

> **Note:**
>
> If a key comes from a table with partitioning enabled, and the information of the schema to which the key belongs cannot be queried due to some reasons (for example, the table to which the key belongs has been deleted) during the query, the ID of the partition to which the key belongs might be appear in the `table_id` field. This is because TiDB encodes the keys of different partitions in the same way as it encodes the keys of several independent tables. Therefore, when the schema information is missing, TiDB cannot confirm whether the key belongs to an unpartitioned table or to one partition of a table.

Example

```
select * from information_schema.data_lock_waits\G
```

```
*************************** 1. row ***************************
                KEY: 7480000000000000355F728000000000000001
           KEY_INFO: {"db_id":1,"db_name":"test","table_id":53,"table_name
              ↪ ":"t","handle_type":"int","handle_value":"1"}
             TRX_ID: 426790594290122753
CURRENT_HOLDING_TRX_ID: 426790590082449409
          SQL_DIGEST: 38
              ↪ b03afa5debbdf0326a014dbe5012a62c51957f1982b3093e748460f8b00821
              ↪
      SQL_DIGEST_TEXT: update `t` set `v` = `v` + ? where `id` = ?
1 row in set (0.01 sec)
```

The above query result shows that the transaction of the ID `426790594290122753` is trying to obtain the pessimistic lock on the key `"7480000000000000355F728000000000000001"` when executing a statement that has digest `"38b03afa5debbdf0326a014dbe5012a62c51957f1982b3093e74
↪ "` and is in the form of `update `t` set `v` = `v` + ? where `id` = ?`, but the lock on this key was held by the transaction of the ID `426790590082449409`.

14.13.18.2.18 DDL_JOBS

The `DDL_JOBS` table provides an `INFORMATION_SCHEMA` interface to the `ADMIN SHOW DDL JOBS` command. It provides information about DDL operations in the TiDB cluster,

such as the current status, DDL statements, start time, end time, database names, and table names.

```
USE information_schema;
DESC ddl_jobs;
```

```
+--------------+-------------+------+-----+---------+-------+
| Field        | Type        | Null | Key | Default | Extra |
+--------------+-------------+------+-----+---------+-------+
| JOB_ID       | bigint(21)  | YES  |     | NULL    |       |
| DB_NAME      | varchar(64) | YES  |     | NULL    |       |

3 rows in set (0.01 sec)
```

14.13.18.2.19 DEADLOCKS

The DEADLOCKS table shows the information of the several deadlock errors that have occurred recently on the current TiDB node.

```
USE INFORMATION_SCHEMA;
DESC deadlocks;
```

The output is as follows:

```
+--
    ↪ ---------------------+---------------------+------+-----+---------+-------+
    ↪
| Field                | Type                | Null | Key | Default | Extra |

+--
    ↪ ---------------------+---------------------+------+-----+---------+-------+
    ↪
```

The `DEADLOCKS` table uses multiple rows to show the same deadlock event, and each row displays the information about one of the transactions involved in the deadlock event. If the TiDB node records multiple deadlock errors, each error is distinguished using the `DEADLOCK_ID` column. The same `DEADLOCK_ID` indicates the same deadlock event. Note that `DEADLOCK_ID` **does not guarantee global uniqueness and will not be persisted**. It only shows the same deadlock event in the same result set.

The meaning of each column field in the `DEADLOCKS` table is as follows:

- `DEADLOCK_ID`: The ID of the deadlock event. When multiple deadlock errors exist in the table, you can use this column to distinguish rows that belong to different deadlock errors.
- `OCCUR_TIME`: The time when the deadlock error occurs.
- `RETRYABLE`: Whether the deadlock error can be retried. For the description of retryable deadlock errors, see the Retryable deadlock errors section.
- `TRY_LOCK_TRX_ID`: The ID of the transaction that tries to acquire lock. This ID is also the `start_ts` of the transaction.
- `CURRENT_SQL_DIGEST`: The digest of the SQL statement currently being executed in the lock-acquiring transaction.
- `CURRENT_SQL_DIGEST_TEXT`: The normalized form of the SQL statement that is currently being executed in the lock-acquiring transaction.
- `KEY`: The blocked key that the transaction tries to lock. The value of this field is displayed in the form of hexadecimal string.
- `KEY_INFO`: The detailed information of `KEY`. See the `KEY_INFO` section.
- `TRX_HOLDING_LOCK`: The ID of the transaction that currently holds the lock on the key and causes blocking. This ID is also the `start_ts` of the transaction.

To adjust the maximum number of deadlock events that can be recorded in the `DEADLOCKS` table, adjust the `pessimistic-txn.deadlock-history-capacity` configuration in the TiDB configuration file. By default, the information of the recent 10 deadlock events is recorded in the table.

Warning:

- Only users with the PROCESS privilege can query this table.
- The information (SQL digest) in the `CURRENT_SQL_DIGEST` column is the hash value calculated from the normalized SQL statement. The information in the `CURRENT_SQL_DIGEST_TEXT` column is internally queried from statements summary tables, so it is possible that the corresponding statement cannot be found internally. For the detailed description of SQL digests and the statements summary tables, see Statement Summary Tables.

`KEY_INFO`

The `KEY_INFO` column shows the detailed information of the `KEY` column. The information is shown in the JSON format. The description of each field is as follows:

- `"db_id"`: The ID of the schema to which the key belongs.
- `"db_name"`: The name of the schema to which the key belongs.
- `"table_id"`: The ID of the table to which the key belongs.
- `"table_name"`: The name of the table to which the key belongs.
- `"partition_id"`: The ID of the partition where the key is located.
- `"partition_name"`: The name of the partition where the key is located.
- `"handle_type"`: The handle type of the row key (that is, the key that stores a row of data). The possible values are as follows:
  - `"int"`: The handle type is int, which means that the handle is the row ID.
  - `"common"`: The handle type is not int64. This type is shown in the non-int primary key when clustered index is enabled.
  - `"unknown"`: The handle type is currently not supported.
- `"handle_value"`: The handle value.
- `"index_id"`: The index ID to which the index key (the key that stores the index) belongs.
- `"index_name"`: The name of the index to which the index key belongs.
- `"index_values"`: The index value in the index key.

In the above fields, if the information of a field is not applicable or currently unavailable, the field is omitted in the query result. For example, the row key information does not contain

`index_id`, `index_name`, and `index_values`; the index key does not contain `handle_type` and `handle_value`; non-partitioned tables do not display `partition_id` and `partition_name`; the key information in the deleted table cannot obtain schema information such as `table_name`, `db_id`, `db_name`, and `index_name`, and it is unable to distinguish whether the table is a partitioned table.

> **Note:**
>
> If a key comes from a table with partitioning enabled, and the information of the schema to which the key belongs cannot be queried due to some reasons (for example, the table to which the key belongs has been deleted) during the query, the ID of the partition to which the key belongs might be appear in the `table_id` field. This is because TiDB encodes the keys of different partitions in the same way as it encodes the keys of several independent tables. Therefore, when the schema information is missing, TiDB cannot confirm whether the key belongs to an unpartitioned table or to one partition of a table.

Retryable deadlock errors

> **Note:**
>
> The `DEADLOCKS` table does not collect the information of retryable deadlock errors by default. If you want the table to collect the retryable deadlock error information, you can adjust the value of `pessimistic-txn.deadlock-history-collect-retryable` in the TiDB configuration file.

When transaction A is blocked by a lock already held by transaction B, and transaction B is directly or indirectly blocked by the lock held by the current transaction A, a deadlock error will occur. In this deadlock, there might be two cases:

- Case 1: Transaction B might be (directly or indirectly) blocked by a lock generated by a statement that has been executed after transaction A starts and before transaction A gets blocked.
- Case 2: Transaction B might also be blocked by the statement currently being executed in transaction A.

In case 1, TiDB will report a deadlock error to the client of transaction A and terminate the transaction.

In case 2, the statement currently being executed in transaction A will be automatically retried in TiDB. For example, suppose that transaction A executes the following statement:

```
UPDATE t SET v = v + 1 WHERE id = 1 OR id = 2;
```

Transaction B executes the following two statements successively.

```
UPDATE t SET v = 4 WHERE id = 2;
UPDATE t SET v = 2 WHERE id = 1;
```

Then if transaction A locks the two rows with `id = 1` and `id = 2`, and the two transactions run in the following sequence:

1. Transaction A locks the row with `id = 1`.
2. Transaction B executes the first statement and locks the row with `id = 2`.
3. Transaction B executes the second statement and tries to lock the row with `id = 1`, which is blocked by transaction A.
4. Transaction A tries to lock the row with `id = 2` and is blocked by transaction B, which forms a deadlock.

For this case, because the statement of transaction A that blocks other transactions is also the statement currently being executed, the pessimistic lock on the current statement can be resolved (so that transaction B can continue to run), and the current statement can be retried. TiDB uses the key hash internally to determine whether this is the case.

When a retryable deadlock occurs, the internal automatic retry will not cause a transaction error, so it is transparent to the client. However, if this situation occurs frequently, the performance might be affected. When this occurs, you can see `single statement deadlock, retry statement` in the TiDB log.

Example 1

Assume that the table definition and the initial data is as follows:

```
CREATE TABLE t (id int primary key, v int);
INSERT INTO t VALUES (1, 10), (2, 20);
```

Two transactions are executed in the following order:

Transaction 1	Transaction 2	Description
`UPDATE t SET v = 11 WHERE id = 1;`		
	`UPDATE t SET v = 21 WHERE id = 2;`	
`UPDATE t SET v = 12 WHERE id = 2;`		Transaction 1 gets bl
	`UPDATE t SET v = 22 WHERE id = 1;`	Transaction 2 reports

Next, transaction 2 reports a deadlock error. At this time, query the `DEADLOCKS` table:

```
SELECT * FROM INFORMATION_SCHEMA.DEADLOCKS;
```

The expected output is as follows:

```
+--
    ↪ ----------+----------------------------+----------+-----------------+------
    ↪
| DEADLOCK_ID | OCCUR_TIME                 | RETRYABLE | TRY_LOCK_TRX_ID |

+--
    ↪ ----------+----------------------------+----------+-----------------+------
    ↪
```

Two rows of data are generated in the `DEADLOCKS` table. The `DEADLOCK_ID` field of both rows is `1`, which means that the information in both rows belongs to the same deadlock error. The first row shows that on the key of `"74800000000000000355F728000000000000002"` ↪ , the transaction of the ID `"426812829645406216"` is blocked by the transaction of the ID `"426812829645406217"`. The second row shows that on the key of `"7480000000000000355` ↪ `F728000000000000001"`, the transaction of the ID `"426812829645406217"` is blocked by the transaction of the ID `426812829645406216`, which constitutes mutual blocking and forms a deadlock.

Example 2

Assume that you query the `DEADLOCKS` table and get the following result:

```
+--
    ↪ ----------+----------------------------+----------+-----------------+------
    ↪
```

```
| DEADLOCK_ID | OCCUR_TIME              | RETRYABLE | TRY_LOCK_TRX_ID |

+--
    ↪ ----------+----------------------------+----------+-------------------+------
    ↪
```

The `DEADLOCK_ID` column in the preceding query result shows that the first two rows together represent the information of a deadlock error, and the two transactions that wait for each other form the deadlock. The next three rows together represent the information of

another deadlock error, and the three transactions that wait in a cycle form the deadlock.

CLUSTER_DEADLOCKS

The `CLUSTER_DEADLOCKS` table returns information about the recent deadlock errors on each TiDB node in the entire cluster, which is the combined information of the `DEADLOCKS` table on each node. `CLUSTER_DEADLOCKS` also includes an additional `INSTANCE` column to display the IP address and port of the node to distinguish between different TiDB nodes.

Note that, because `DEADLOCK_ID` does not guarantee global uniqueness, in the query result of the `CLUSTER_DEADLOCKS` table, you need to use the `INSTANCE` and `DEADLOCK_ID` together to distinguish the information of different deadlock errors in the result set.

```
USE INFORMATION_SCHEMA;
DESC CLUSTER_DEADLOCKS;
```

The output is as follows:

```
+--
    ↪ ----------------------+--------------------+------+------+---------+-------+
    ↪

```

14.13.18.2.20 ENGINES

The `ENGINES` table provides information about storage engines. For compatibility, TiDB will always describe InnoDB as the only supported engine. In addition, other column values in the `ENGINES` table are also fixed values.

```
USE information_schema;
DESC engines;
```

```
+--------------+------------+------+-----+---------+-------+
| Field        | Type       | Null | Key | Default | Extra |
+--------------+------------+------+-----+---------+-------+
| ENGINE       | varchar(64) | YES |    | NULL    |       |
| SUPPORT      | varchar(8) | YES |     | NULL    |       |
| COMMENT      | varchar(80) | YES |    | NULL    |       |
| TRANSACTIONS | varchar(3) | YES |    | NULL    |       |
| XA           | varchar(3) | YES |     | NULL    |       |
| SAVEPOINTS | varchar(3) | YES |     | NULL    |       |
+--------------+------------+------+-----+---------+-------+
6 rows in set (0.00 sec)
```

```
SELECT * FROM engines;
```

```
+--------+---------+----------------------------------------------------------------+-------
   ↪
| ENGINE | SUPPORT | COMMENT                                                        |
   ↪ TRANSACTIONS | XA | SAVEPOINTS |
+--------+---------+----------------------------------------------------------------+-------
   ↪
| InnoDB | DEFAULT | Supports transactions, row-level locking, and foreign
   ↪ keys | YES | YES | YES    |
+--------+---------+----------------------------------------------------------------+-------
   ↪
1 row in set (0.01 sec)
```

The description of columns in the `ENGINES` table is as follows:

- `ENGINES`: The name of the storage engine.
- `SUPPORT`: The level of support that the server has on the storage engine. In TiDB, the value is always `DEFAULT`.
- `COMMENT`: The brief comment on the storage engine.
- `TRANSACTIONS`: Whether the storage engine supports transactions.
- `XA`: Whether the storage engine supports XA transactions.
- `SAVEPOINTS`: Whether the storage engine supports `savepoints`.

- SHOW ENGINES

14.13.18.2.21 INSPECTION_RESULT

TiDB has some built-in diagnostic rules for detecting faults and hidden issues in the system.

The `INSPECTION_RESULT` diagnostic table can help you quickly find problems and reduce your repetitive manual work. You can use the `select * from information_schema.inspection_result` statement to trigger the internal diagnostics.

> **Note:**
>
> This table is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

The structure of the `information_schema.inspection_result` diagnostic result table `information_schema.inspection_result` is as follows:

```
USE information_schema;
DESC inspection_result;
```

```
+---------------+-------------+------+------+---------+-------+
| Field         | Type        | Null | Key  | Default | Extra |
+---------------+-------------+------+------+---------+-------+
| RULE          | varchar(64) | YES  |      | NULL    |       |
| ITEM          | varchar(64) | YES  |      | NULL    |       |
| TYPE          | varchar(64) | YES  |      | NULL    |       |
| INSTANCE      | varchar(64) | YES  |      | NULL    |       |
| STATUS_ADDRESS | varchar(64) | YES |  | NULL    |       |
| VALUE         | varchar(64) | YES  |      | NULL    |       |
| REFERENCE     | varchar(64) | YES  |      | NULL    |       |
| SEVERITY      | varchar(64) | YES  |      | NULL    |       |
| DETAILS       | varchar(256) | YES |    | NULL    |       |
+---------------+-------------+------+------+---------+-------+
9 rows in set (0.00 sec)
```

Field description:

- `RULE`: The name of the diagnostic rule. Currently, the following rules are available:
    - `config`: Checks whether the configuration is consistent and proper. If the same configuration is inconsistent on different instances, a `warning` diagnostic result is generated.
    - `version`: The consistency check of version. If the same version is inconsistent on different instances, a `warning` diagnostic result is generated.
    - `node-load`: Checks the server load. If the current system load is too high, the corresponding `warning` diagnostic result is generated.
    - `critical-error`: Each module of the system defines critical errors. If a critical error exceeds the threshold within the corresponding time period, a warning diagnostic result is generated.

    - `threshold-check`: The diagnostic system checks the thresholds of key metrics. If a threshold is exceeded, the corresponding diagnostic information is generated.

- `ITEM`: Each rule diagnoses different items. This field indicates the specific diagnostic items corresponding to each rule.
- `TYPE`: The instance type of the diagnostics. The optional values are `tidb`, `pd`, and `tikv`.
- `INSTANCE`: The specific address of the diagnosed instance.
- `STATUS_ADDRESS`: The HTTP API service address of the instance.
- `VALUE`: The value of a specific diagnostic item.
- `REFERENCE`: The reference value (threshold value) for this diagnostic item. If `VALUE` exceeds the threshold, the corresponding diagnostic information is generated.
- `SEVERITY`: The severity level. The optional values are `warning` and `critical`.
- `DETAILS`: Diagnostic details, which might also contain SQL statement(s) or document links for further diagnostics.

Diagnostics example

Diagnose issues currently existing in the cluster.

```
SELECT * FROM information_schema.inspection_result\G
```

```
***************************[ 1. row ]***************************
RULE     | config
ITEM     | log.slow-threshold
TYPE     | tidb
INSTANCE | 172.16.5.40:4000
VALUE    | 0
REFERENCE | not 0
SEVERITY | warning
DETAILS  | slow-threshold = 0 will record every query to slow log, it may
   ↪ affect performance
***************************[ 2. row ]***************************
RULE     | version
ITEM     | git_hash
TYPE     | tidb
INSTANCE |
VALUE    | inconsistent
REFERENCE | consistent
SEVERITY | critical
DETAILS  | the cluster has 2 different tidb version, execute the sql to see
   ↪ more detail: select * from information_schema.cluster_info where type
   ↪ ='tidb'
***************************[ 3. row ]***************************
RULE     | threshold-check
ITEM     | storage-write-duration
```

```
TYPE     | tikv
INSTANCE | 172.16.5.40:23151
VALUE    | 130.417
REFERENCE | < 0.100
SEVERITY | warning
DETAILS  | max duration of 172.16.5.40:23151 tikv storage-write-duration was
   ↪  too slow
***************************[ 4. row ]***************************
RULE     | threshold-check
ITEM     | rocksdb-write-duration
TYPE     | tikv
INSTANCE | 172.16.5.40:20151
VALUE    | 108.105
REFERENCE | < 0.100
SEVERITY | warning
DETAILS  | max duration of 172.16.5.40:20151 tikv rocksdb-write-duration was
   ↪  too slow
```

The following issues can be detected from the diagnostic result above:

- The first row indicates that TiDB's `log.slow-threshold` value is configured to `0`, which might affect performance.
- The second row indicates that two different TiDB versions exist in the cluster.
- The third and fourth rows indicate that the TiKV write delay is too long. The expected delay is no more than 0.1 second, while the actual delay is far longer than expected.

You can also diagnose issues existing within a specified range, such as from "2020-03-26 00:03:00" to "2020-03-26 00:08:00". To specify the time range, use the SQL Hint of `/*+ ↪ time_range()*/`. See the following query example:

```
select /*+ time_range("2020-03-26 00:03:00", "2020-03-26 00:08:00") */ *
   ↪ from information_schema.inspection_result\G
```

```
***************************[ 1. row ]***************************
RULE     | critical-error
ITEM     | server-down
TYPE     | tidb
INSTANCE | 172.16.5.40:4009
VALUE    |
REFERENCE |
SEVERITY | critical
DETAILS  | tidb 172.16.5.40:4009 restarted at time '2020/03/26 00:05:45.670'
***************************[ 2. row ]***************************
RULE     | threshold-check
ITEM     | get-token-duration
```

```
TYPE     | tidb
INSTANCE | 172.16.5.40:10089
VALUE    | 0.234
REFERENCE | < 0.001
SEVERITY | warning
DETAILS  | max duration of 172.16.5.40:10089 tidb get-token-duration is too
   ↪ slow
```

The following issues can be detected from the diagnostic result above:

- The first row indicates that the `172.16.5.40:4009` TiDB instance is restarted at `2020/03/26 00:05:45.670`.
- The second row indicates that the maximum `get-token-duration` time of the `172.16.5.40:10089` TiDB instance is 0.234s, but the expected time is less than 0.001s.

You can also specify conditions, for example, to query the `critical` level diagnostic results:

```
select * from information_schema.inspection_result where severity='critical
   ↪ ';
```

Query only the diagnostic result of the `critical-error` rule:

```
select * from information_schema.inspection_result where rule='critical-
   ↪ error';
```

Diagnostic rules

The diagnostic module contains a series of rules. These rules compare the results with the thresholds after querying the existing monitoring tables and cluster information tables. If the results exceed the thresholds, the diagnostics of `warning` or `critical` is generated and the corresponding information is provided in the `details` column.

You can query the existing diagnostic rules by querying the `inspection_rules` system table:

```
select * from information_schema.inspection_rules where type='inspection';
```

```
+----------------+------------+---------+
| NAME           | TYPE       | COMMENT |
+----------------+------------+---------+
| config         | inspection |         |
| version        | inspection |         |
| node-load      | inspection |         |
| critical-error | inspection |         |
| threshold-check | inspection |        |
+----------------+------------+---------+
```

`config` diagnostic rule

In the `config` diagnostic rule, the following two diagnostic rules are executed by querying the `CLUSTER_CONFIG` system table:

- Check whether the configuration values of the same component are consistent. Not all configuration items has this consistency check. The allowlist of consistency check is as follows:

```
// The allowlist of the TiDB configuration consistency check
port
status.status-port
host
path
advertise-address
status.status-port
log.file.filename
log.slow-query-file
tmp-storage-path

// The allowlist of the PD configuration consistency check
advertise-client-urls
advertise-peer-urls
client-urls
data-dir
log-file
log.file.filename
metric.job
name
peer-urls

// The allowlist of the TiKV configuration consistency check
server.addr
server.advertise-addr
server.status-addr
log-file
raftstore.raftdb-path
storage.data-dir
storage.block-cache.capacity
```

- Check whether the values of the following configuration items are as expected.

Component	Configuration item	Expected value
TiDB	log.slow-threshold	larger than `0`
TiKV	raftstore.sync-log	`true`

`version` diagnostic rule

The `version` diagnostic rule checks whether the version hash of the same component is consistent by querying the `CLUSTER_INFO` system table. See the following example:

```
SELECT * FROM information_schema.inspection_result WHERE rule='version'\G
```

```
***************************[ 1. row ]***************************
RULE     | version
ITEM     | git_hash
TYPE     | tidb
INSTANCE |
VALUE    | inconsistent
REFERENCE | consistent
SEVERITY | critical
DETAILS  | the cluster has 2 different tidb versions, execute the sql to see
   ↪  more detail: SELECT * FROM information_schema.cluster_info WHERE
   ↪ type='tidb'
```

`critical-error` diagnostic rule

In `critical-error` diagnostic rule, the following two diagnostic rules are executed:

- Detect whether the cluster has the following errors by querying the related monitoring system tables in the metrics schema:

Component	Error name	Monitoring table	Error description
TiDB	panic-count	tidb_panic_count_total_count	Panic occurs in TiDB.
TiDB	binlog-error	tidb_binlog_error_total_count	An error occurs when TiDB writes binlog.

Component	Error name	Monitoring table	Error description
TiKV	critical-error	tikv_critical_error_total_count	The critical error of TiKV.
TiKV	scheduler-is-busy	tikv_scheduler_is_busy_total_count	The TiKV scheduler is too busy, which makes TiKV temporarily unavailable.
TiKV	coprocessor-is-busy	tikv_coprocessor_is_busy_total_count	The TiKV Coprocessor is too busy.
TiKV	channel-is-full	tikv_channel_full_total_count	The “channel full” error occurs in TiKV.

Component	Error name	Monitoring table	Error description
TiKV	tikv_engine_write_stall	tikv_engine_write_stall	The "stall" error occurs in TiKV.

- Check whether any component is restarted by querying the `metrics_schema.up` monitoring table and the `CLUSTER_LOG` system table.

`threshold-check` diagnostic rule

The `threshold-check` diagnostic rule checks whether the following metrics in the cluster exceed the threshold by querying the related monitoring system tables in the metrics schema:

Component	Monitoring metric	Monitoring table	Expected value	Description
TiDB	tso-duration	pd_tso_wait_duration	< 50ms	The wait duration of getting the TSO of transaction.

Component	Monitoring metric	Monitoring table	Expected value	Description
TiDB	get-token-duration	tidb_get_token_duration	< 1ms	Queries the time it takes to get the token. The related TiDB configuration item is `token-limit`.
TiDB	load-schema-duration	tidb_load_schema_duration	< 1s	The time it takes for TiDB to update the schema metadata.

Component	Monitoring metric	Monitoring table	Expected value	Description
TiKV	scheduler-cmd-duration	tikv_scheduler_command_duration	< 0.1s	The time it takes for TiKV to execute the KV `cmd` request.
TiKV	handle-snapshot-duration	tikv_handle_snapshot_duration	< 30s	The time it takes for TiKV to handle the snapshot.
TiKV	storage-write-duration	tikv_storage_async_request_duration	< 0.1s	The write latency of TiKV.

Component	Monitoring metric	Monitoring table	Expected value	Description
TiKV	storage-snapshot-duration	tikv_storage_async_request_duration	< 50ms	The time it takes for TiKV to get the snapshot.
TiKV	rocksdb-write-duration	tikv_engine_write_duration	< 100ms	The write latency of TiKV RocksDB.
TiKV	rocksdb-get-duration	tikv_engine_max_get_duration	< 50ms	The read latency of TiKV RocksDB.
TiKV	rocksdb-seek-duration	tikv_engine_max_seek_duration	< 50ms	The latency of TiKV RocksDB to execute `seek`.

Component	Monitoring metric	Monitoring table	Expected value	Description
TiKV	scheduler-pending-cmd-coun	tikv_scheduler_pending_commands	< 1000	The number of commands stalled in TiKV.
TiKV	index-block-cache-hit	tikv_block_index_cache_hit	> 0.95	The hit rate of index block cache in TiKV.
TiKV	filter-block-cache-hit	tikv_block_filter_cache_hit	> 0.95	The hit rate of filter block cache in TiKV.
TiKV	data-block-cache-hit	tikv_block_data_cache_hit	> 0.80	The hit rate of data block cache in TiKV.

Component	Monitoring metric	Monitoring table	Expected value	Description
TiKV	leader-score-balance	pd_scheduler_store_status	< 0.05	Checks whether the leader score of each TiKV instance is balanced. The expected difference between instances is less than 5%.

Component	Monitoring metric	Monitoring table	Expected value	Description
TiKV	region-score-balance	pd_scheduler_store_status	< 0.05	Checks whether the Region score of each TiKV instance is balanced. The expected difference between instances is less than 5%.

Component	Monitoring metric	Monitoring table	Expected value	Description
TiKV	store-available-balance	pd_scheduler_store_status	< 0.2	Checks whether the available storage of each TiKV instance is balanced. The expected difference between instances is less than 20%.

Component	Monitoring metric	Monitoring table	Expected value	Description
TiKV	region-count	pd_scheduler_store_status	< 20000	Checks the number of Regions on each TiKV instance. The expected number of Regions in a single instance is less than 20,000.

Component	Monitoring metric	Monitoring table	Expected value	Description
PD	region-health	pd_region_health	< 100	Detects the number of Regions that are in the process of scheduling in the cluster. The expected number is less than 100 in total.

In addition, this rule also checks whether the CPU usage of the following threads in a TiKV instance is too high:

- scheduler-worker-cpu
- coprocessor-normal-cpu
- coprocessor-high-cpu
- coprocessor-low-cpu
- grpc-cpu
- raftstore-cpu
- apply-cpu

- storage-readpool-normal-cpu
- storage-readpool-high-cpu
- storage-readpool-low-cpu
- split-check-cpu

The built-in diagnostic rules are constantly being improved. If you have more diagnostic rules, welcome to create a PR or an issue in the `tidb` repository.

14.13.18.2.22 INSPECTION_RULES

The `INSPECTION_RULES` table provides information about which diagnostic tests are run in an inspection result. See inspection result for example usage.

> **Note:**
>
> This table is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

```
USE information_schema;
DESC inspection_rules;
```

```
+---------+-------------+------+------+---------+-------+
| Field   | Type        | Null | Key  | Default | Extra |
+---------+-------------+------+------+---------+-------+
| NAME    | varchar(64) | YES  |      | NULL    |       |
| TYPE    | varchar(64) | YES  |      | NULL    |       |
| COMMENT | varchar(256)| YES  |      | NULL    |       |
+---------+-------------+------+------+---------+-------+
3 rows in set (0.00 sec)
```

```
SELECT * FROM inspection_rules;
```

```
+-----------------+------------+---------+
| NAME            | TYPE       | COMMENT |
+-----------------+------------+---------+
| config          | inspection |         |
| version         | inspection |         |
| node-load       | inspection |         |
| critical-error  | inspection |         |
| threshold-check | inspection |         |
| ddl             | summary    |         |
| gc              | summary    |         |
```

```

| read-link     | summary   |        |
| rocksdb       | summary   |        |
| stats         | summary   |        |
| wait-events   | summary   |        |
| write-link    | summary   |        |
+-----------------+-----------+--------+
15 rows in set (0.00 sec)
```

14.13.18.2.23 INSPECTION_SUMMARY

In some scenarios, you might need to pay attention only to the monitoring summary of specific links or modules. For example, the number of threads for Coprocessor in the thread pool is configured as 8. If the CPU usage of Coprocessor reaches 750%, you can determine that a risk exists and Coprocessor might become a bottleneck in advance. However, some monitoring metrics vary greatly due to different user workloads, so it is difficult to define specific thresholds. It is important to troubleshoot issues in this scenario, so TiDB provides the `inspection_summary` table for link summary.

> **Note:**
>
> This table is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

The structure of the `information_schema.inspection_summary` inspection summary table is as follows:

```
USE information_schema;
DESC inspection_summary;
```

```
+-------------+-------------+------+------+---------+-------+
| Field       | Type        | Null | Key | Default | Extra |
+-------------+-------------+------+------+---------+-------+
| RULE        | varchar(64) | YES |     | NULL    |       |
| INSTANCE    | varchar(64) | YES |     | NULL    |       |
| METRICS_NAME | varchar(64) | YES |   | NULL    |       |
| LABEL       | varchar(64) | YES |     | NULL    |       |
| QUANTILE    | double      | YES |     | NULL    |       |
| AVG_VALUE   | double(22,6) | YES |    | NULL    |       |
| MIN_VALUE   | double(22,6) | YES |    | NULL    |       |
```

```
| MAX_VALUE   | double(22,6) | YES |    | NULL   |       |
| COMMENT     | varchar(256) | YES |    | NULL   |       |
+-------------+--------------+-----+-----+---------+-------+
9 rows in set (0.00 sec)
```

Field description:

- `RULE`: Summary rules. Because new rules are being added continuously, you can execute the `select * from inspection_rules where type='summary'` statement to query the latest rule list.
- `INSTANCE`: The monitored instance.
- `METRICS_NAME`: The monitoring metrics name.
- `QUANTILE`: Takes effect on monitoring tables that contain `QUANTILE`. You can specify multiple percentiles by pushing down predicates. For example, you can execute `select * from inspection_summary where rule='ddl' and quantile in (0.80, 0.90, 0.99, 0.999)` to summarize the DDL-related monitoring metrics and query the P80/P90/P99/P999 results. `AVG_VALUE`, `MIN_VALUE`, and `MAX_VALUE` respectively indicate the average value, minimum value, and maximum value of the aggregation.
- `COMMENT`: The comment about the corresponding monitoring metric.

> **Note:**
>
> Because summarizing all results causes overhead, it is recommended to display the specific `rule` in the SQL predicate to reduce overhead. For example, executing `select * from inspection_summary where rule in ('read-link', 'ddl')` summarizes the read link and DDL-related monitoring metrics.

Usage example:

Both the diagnostic result table and the diagnostic monitoring summary table can specify the diagnostic time range using `hint`. `select /*+ time_range('2020-03-07 12:00:00','2020-03-07 13:00:00')*/* from inspection_summary` is the monitoring summary for the `2020-03-07 12:00:00` to `2020-03-07 13:00:00` period. Like the monitoring summary table, you can use the `inspection_summary` table to quickly find the monitoring items with large differences by comparing the data of two different periods.

The following example compares the monitoring metrics of read links in two time periods:

- `(2020-01-16 16:00:54.933, 2020-01-16 16:10:54.933)`
- `(2020-01-16 16:10:54.933, 2020-01-16 16:20:54.933)`

```
SELECT
  t1.avg_value / t2.avg_value AS ratio,
  t1.*,
  t2.*
FROM
  (
    SELECT
      /*+ time_range("2020-01-16 16:00:54.933", "2020-01-16 16:10:54.933")
          ↪ */ *
    FROM information_schema.inspection_summary WHERE rule='read-link'
  ) t1
  JOIN
  (
    SELECT
      /*+ time_range("2020-01-16 16:10:54.933", "2020-01-16 16:20:54.933")
          ↪ */ *
    FROM information_schema.inspection_summary WHERE rule='read-link'
  ) t2
  ON t1.metrics_name = t2.metrics_name
  and t1.instance = t2.instance
  and t1.label = t2.label
ORDER BY
  ratio DESC;
```

14.13.18.2.24 KEYWORDS

Starting from v7.5.3 and v7.6.0, TiDB provides the `KEYWORDS` table. You can use this table to get information about keywords in TiDB.

```
USE INFORMATION_SCHEMA;
DESC keywords;
```

The output is as follows:

```
+----------+-------------+------+------+---------+-------+
| Field    | Type        | Null | Key | Default | Extra |
+----------+-------------+------+------+---------+-------+
| WORD     | varchar(128) | YES |     | NULL    |       |
| RESERVED | int(11)     | YES |      | NULL    |       |
+----------+-------------+------+------+---------+-------+
2 rows in set (0.00 sec)
```

Field description:

- `WORD`: The keyword.

- RESERVED: Whether the keyword is reserved.

The following statement queries the information about ADD and USER keywords:

```
SELECT * FROM INFORMATION_SCHEMA.KEYWORDS WHERE WORD IN ('ADD','USER');
```

From the output, you can see that ADD is a reserved keyword and USER is a non-reserved keyword.

```
+------+----------+
| WORD | RESERVED |
+------+----------+
| ADD |        1 |
| USER |        0 |
+------+----------+
2 rows in set (0.00 sec)
```

14.13.18.2.25 KEY_COLUMN_USAGE

The KEY_COLUMN_USAGE table describes the key constraints of the columns, such as the primary key constraint.

```
USE information_schema;
DESC key_column_usage;
```

```
+------------------------------+-------------+------+-----+---------+-------+
   ↪
| Field                        | Type        | Null | Key | Default | Extra |

     REFERENCED_TABLE_SCHEMA: NULL
       REFERENCED_TABLE_NAME: NULL
      REFERENCED_COLUMN_NAME: NULL
2 rows in set (0.00 sec)
```

The description of columns in the `KEY_COLUMN_USAGE` table is as follows:

- `CONSTRAINT_CATALOG`: The name of the catalog to which the constraint belongs. The value is always `def`.
- `CONSTRAINT_SCHEMA`: The name of the schema to which the constraint belongs.
- `CONSTRAINT_NAME`: The name of the constraint.
- `TABLE_CATALOG`: The name of the catalog to which the table belongs. The value is always `def`.
- `TABLE_SCHEMA`: The name of the schema to which the table belongs.
- `TABLE_NAME`: The name of the table with constraints.
- `COLUMN_NAME`: The name of the column with constraints.
- `ORDINAL_POSITION`: The position of the column in the constraint, rather than in the table. The position number starts from `1`.

- `POSITION_IN_UNIQUE_CONSTRAINT`: The unique constraint and the primary key constraint are empty. For foreign key constraints, this column is the position of the referenced table's key.
- `REFERENCED_TABLE_SCHEMA`: The name of the schema referenced by the constraint. Currently in TiDB, the value of this column in all constraints is `nil`, except for the foreign key constraint.
- `REFERENCED_TABLE_NAME`: The name of the table referenced by the constraint. Currently in TiDB, the value of this column in all constraints is `nil`, except for the foreign key constraint.
- `REFERENCED_COLUMN_NAME`: The name of the column referenced by the constraint. Currently in TiDB, the value of this column in all constraints is `nil`, except for the foreign key constraint.

14.13.18.2.26 MEMORY_USAGE

The `MEMORY_USAGE` table describes the current memory usage of the current TiDB instance.

```
USE information_schema;
DESC memory_usage;
```

```
+-------------------+-------------+------+-----+---------+-------+
| Field             | Type        | Null | Key | Default | Extra |
+-------------------+-------------+------+-----+---------+-------+
| MEMORY_TOTAL      | bigint(21)  | NO   |     | NULL    |       |
| MEMORY_LIMIT      | bigint(21)  | NO   |     | NULL    |       |
| MEMORY_CURRENT    | bigint(21)  | NO   |     | NULL    |       |
| MEMORY_MAX_USED   | bigint(21)  | NO   |     | NULL    |       |
| CURRENT_OPS       | varchar(50) | YES  |     | NULL    |       |
| SESSION_KILL_LAST | datetime    | YES  |     | NULL    |       |
| SESSION_KILL_TOTAL | bigint(21) | NO   |     | NULL    |       |
| GC_LAST           | datetime    | YES  |     | NULL    |       |
| GC_TOTAL          | bigint(21)  | NO   |     | NULL    |       |
| DISK_USAGE        | bigint(21)  | NO   |     | NULL    |       |
| QUERY_FORCE_DISK  | bigint(21)  | NO   |     | NULL    |       |
+-------------------+-------------+------+-----+---------+-------+
11 rows in set (0.000 sec)
```

```
SELECT * FROM information_schema.memory_usage;
```

```
+--
   ↪ ------------+--------------+---------------+----------------+-------------+---
   ↪
| MEMORY_TOTAL | MEMORY_LIMIT | MEMORY_CURRENT | MEMORY_MAX_USED | CURRENT_
   ↪ OPS | SESSION_KILL_LAST | SESSION_KILL_TOTAL | GC_LAST | GC_TOTAL |
   ↪ DISK_USAGE | QUERY_FORCE_DISK |
```

```
+--
    ↪ -----------+-------------+---------------+----------------+-------------+---
    ↪
|  33674170368 | 10737418240 |  5097644032 |   10826604544 | NULL     |
    ↪ 2022-10-17 22:47:47 |             1 | 2022-10-17 22:47:47 |   20 |
    ↪         0 |              0 |
+--
    ↪ -----------+-------------+---------------+----------------+-------------+---
    ↪
2 rows in set (0.002 sec)
```

The columns in the `MEMORY_USAGE` table are described as follows:

- MEMORY_TOTAL: The total available memory of TiDB, in bytes.
- MEMORY_LIMIT: The memory usage limit of TiDB, in bytes. The value is the same as that of the system variable `tidb_server_memory_limit`.
- MEMORY_CURRENT: The current memory usage of TiDB, in bytes.
- MEMORY_MAX_USED: The maximum memory usage of TiDB from the time it is started to the current time, in bytes.
- CURRENT_OPS: "shrinking" | null. "shrinking" means that TiDB is performing operations that shrink memory usage.
- SESSION_KILL_LAST: The timestamp of the last time a session is terminated.
- SESSION_KILL_TOTAL: The number of times sessions are terminated, from the time TiDB is started to the current time.
- GC_LAST: The timestamp of the last time Golang GC is triggered by memory usage.
- GC_TOTAL: The number of times Golang GC is triggered by memory usage, from the time TiDB is started to the current time.
- DISK_USAGE: The disk usage for the current data spill operation, in bytes.
- QUERY_FORCE_DISK: The number of times data is spilled to disk, from the time TiDB is started to the current time.

14.13.18.2.27 MEMORY_USAGE_OPS_HISTORY

The `MEMORY_USAGE_OPS_HISTORY` table describes the history of memory-related operations and the execution basis of the current TiDB instance.

```
USE information_schema;
DESC memory_usage_ops_history;
```

```
+---------------+---------------------+------+-----+---------+-------+
| Field         | Type                | Null | Key | Default | Extra |

2 rows in set (0.002 sec)
```

The columns in the `MEMORY_USAGE_OPS_HISTORY` table are described as follows:

- `TIME`: The timestamp when the session is terminated.
- `OPS`: "SessionKill"
- `MEMORY_LIMIT`: The memory usage limit of TiDB at the time of termination, in bytes. Its value is the same as that of the system variable `tidb_server_memory_limit`](/system-variables.md#tidb_server_memory_limit-new-in-v640).
- `MEMORY_CURRENT`: The current memory usage of TiDB, in bytes.
- `PROCESSID`: The connection ID of the terminated session.
- `MEM`: The memory usage of the terminated session, in bytes.
- `DISK`: The disk usage of the terminated session, in bytes.
- `CLIENT`: The client connection address of the terminated session.
- `DB`: The name of the database connected to the terminated session.
- `USER`: The user name of the terminated session.
- `SQL_DIGEST`: The digest of the SQL statement being executed in the terminated session.
- `SQL_TEXT`: The SQL statement being executed in the terminated session.

14.13.18.2.28 METRICS_SUMMARY

The TiDB cluster has many monitoring metrics. To make it easy to detect abnormal monitoring metrics, TiDB 4.0 introduces the following two monitoring summary tables:

- `information_schema.metrics_summary`
- `information_schema.metrics_summary_by_label`

> **Note:**
>
> The preceding two monitoring summary tables are only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

The two tables summarize all monitoring data for you to check each monitoring metric efficiently. Compared with `information_schema.metrics_summary`, the `information_schema.metrics_summary_by_label` table has an additional `label` column and performs differentiated statistics according to different labels.

```
USE information_schema;
DESC metrics_summary;
```

```
+--------------+--------------+------+------+---------+-------+
| Field        | Type         | Null | Key  | Default | Extra |
+--------------+--------------+------+------+---------+-------+
| METRICS_NAME | varchar(64)  | YES  |      | NULL    |       |
| QUANTILE     | double       | YES  |      | NULL    |       |
```

```
| SUM_VALUE   | double(22,6) | YES |    | NULL   |       |
| AVG_VALUE   | double(22,6) | YES |    | NULL   |       |
| MIN_VALUE   | double(22,6) | YES |    | NULL   |       |
| MAX_VALUE   | double(22,6) | YES |    | NULL   |       |
| COMMENT     | varchar(256) | YES |    | NULL   |       |
+-------------+--------------+-----+-----+--------+-------+
7 rows in set (0.00 sec)
```

Field description:

- `METRICS_NAME`: The monitoring table name.
- `QUANTILE`: The percentile. You can specify `QUANTILE` using SQL statements. For example:
  - `select * from metrics_summary where quantile=0.99` specifies viewing the data of the 0.99 percentile.
  - `select * from metrics_summary where quantile in (0.80, 0.90, 0.99, 0.999)` specifies viewing the data of the 0.8, 0.90, 0.99, 0.999 percentiles at the same time.
- `SUM_VALUE`, `AVG_VALUE`, `MIN_VALUE`, and `MAX_VALUE` respectively mean the sum, the average value, the minimum value, and the maximum value.
- `COMMENT`: The comment for the corresponding monitoring table.

For example:

To query the three groups of monitoring items with the highest average time consumption in the TiDB cluster within the time range of `'2020-03-08 13:23:00', '2020-03-08 13: 33: 00'`, you can directly query the `information_schema.metrics_summary` table and use the `/*+ time_range()*/` hint to specify the time range. The SQL statement is as follows:

```
SELECT /*+ time_range('2020-03-08 13:23:00','2020-03-08 13:33:00') */ *
FROM information_schema.metrics_summary
WHERE metrics_name LIKE 'tidb%duration'
 AND avg_value > 0
 AND quantile = 0.99
ORDER BY avg_value DESC
LIMIT 3\G
```

```
***************************[ 1. row ]***************************
METRICS_NAME | tidb_get_token_duration
QUANTILE     | 0.99
SUM_VALUE    | 8.972509
AVG_VALUE    | 0.996945
MIN_VALUE    | 0.996515
```

```
MAX_VALUE   | 0.997458
COMMENT     |  The quantile of Duration (us) for getting token, it should be
    ↪ small until concurrency limit is reached(second)
***************************[ 2. row ]***************************
METRICS_NAME | tidb_query_duration
QUANTILE    | 0.99
SUM_VALUE   | 0.269079
AVG_VALUE   | 0.007272
MIN_VALUE   | 0.000667
MAX_VALUE   | 0.01554
COMMENT     | The quantile of TiDB query durations(second)
***************************[ 3. row ]***************************
METRICS_NAME | tidb_kv_request_duration
QUANTILE    | 0.99
SUM_VALUE   | 0.170232
AVG_VALUE   | 0.004601
MIN_VALUE   | 0.000975
MAX_VALUE   | 0.013
COMMENT     | The quantile of kv requests durations by store
```

Similarly, the following example queries the `metrics_summary_by_label` monitoring summary table:

```
SELECT /*+ time_range('2020-03-08 13:23:00','2020-03-08 13:33:00') */ *
FROM information_schema.metrics_summary_by_label
WHERE metrics_name LIKE 'tidb%duration'
 AND avg_value > 0
 AND quantile = 0.99
ORDER BY avg_value DESC
LIMIT 10\G
```

```
***************************[ 1. row ]***************************
INSTANCE    | 172.16.5.40:10089
METRICS_NAME | tidb_get_token_duration
LABEL       |
QUANTILE    | 0.99
SUM_VALUE   | 8.972509
AVG_VALUE   | 0.996945

***************************[ 3. row ]***************************
INSTANCE    | 172.16.5.40:10089
METRICS_NAME | tidb_query_duration
LABEL       | Rollback
QUANTILE    | 0.99
SUM_VALUE   | 0.072083
AVG_VALUE   | 0.008009
MIN_VALUE   | 0.007905
MAX_VALUE   | 0.008241
COMMENT     | The quantile of TiDB query durations(second)
```

The second and third rows of the query results above indicate that the `Select` and `Rollback` statements on `tidb_query_duration` have a long average execution time.

In addition to the example above, you can use the monitoring summary table to quickly find the module with the largest change from the monitoring data by comparing the full link monitoring items of the two time periods, and quickly locate the bottleneck. The following example compares all monitoring items in two periods (where t1 is the baseline) and sorts these items according to the greatest difference:

- Period t1: `("2020-03-03 17:08:00", "2020-03-03 17:11:00")`
- Period t2: `("2020-03-03 17:18:00", "2020-03-03 17:21:00")`

The monitoring items of the two time periods are joined according to `METRICS_NAME` and sorted according to the difference value. `TIME_RANGE` is the hint that specifies the query time.

```
SELECT GREATEST(t1.avg_value,t2.avg_value)/LEAST(t1.avg_value,
        t2.avg_value) AS ratio,
        t1.metrics_name,
        t1.avg_value as t1_avg_value,

```

From the query result above, you can get the following information:

- `tib_slow_query_cop_process_total_time` (the time consumption of `cop process` in TiDB slow queries) in the period t2 is 5,865 times higher than that in period t1.
- `tidb_distsql_partial_scan_key_total_num` (the number of keys to scan requested by TiDB's `distsql`) in period t2 is 3,648 times higher than that in period t1. During period t2, `tidb_slow_query_cop_wait_total_time` (the waiting time of Coprocessor requesting to queue up in the TiDB slow query) is 267 times higher than that in period t1.
- `tikv_cop_total_response_size` (the size of the TiKV Coprocessor request result) in period t2 is 192 times higher than that in period t1.
- `tikv_cop_scan_details` in period t2 (the scan requested by the TiKV Coprocessor) is 105 times higher than that in period t1.

From the result above, you can see that the Coprocessor requests in period t2 are much more than those in period t1. This causes TiKV Coprocessor to be overloaded, and the `cop task` has to wait. It might be that some large queries appear in period t2 that bring more load.

In fact, during the entire time period from t1 to t2, the `go-ycsb` pressure test is running. Then 20 `tpch` queries are running during period t2. So it is the `tpch` queries that cause many Coprocessor requests.

14.13.18.2.29 METRICS_TABLES

The `METRICS_TABLES` table provides the PromQL (Prometheus Query Language) definition for each of the views in the `METRICS_SCHEMA` database.

> **Note:**
>
> This table is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

```
USE INFORMATION_SCHEMA;
DESC METRICS_TABLES;
```

The output is as follows:

```
+------------+-------------+------+-----+---------+-------+
| Field      | Type        | Null | Key | Default | Extra |
+------------+-------------+------+-----+---------+-------+
| TABLE_NAME | varchar(64) | YES  |     | NULL    |       |
| PROMQL     | varchar(64) | YES  |     | NULL    |       |
| LABELS     | varchar(64) | YES  |     | NULL    |       |
| QUANTILE   | double      | YES  |     | NULL    |       |
| COMMENT    | varchar(256)| YES  |     | NULL    |       |
+------------+-------------+------+-----+---------+-------+
```

Field description:

- TABLE_NAME: Corresponds to the table name in METRICS_SCHEMA.
- PROMQL: The working principle of the monitoring table is to map SQL statements to PromQL and convert Prometheus results into SQL query results. This field is the expression template of PromQL. When you query the data of the monitoring table, the query conditions are used to rewrite the variables in this template to generate the final query expression.
- LABELS: The label for the monitoring item. Each label corresponds to a column in the monitoring table. If the SQL statement contains the filter of the corresponding column, the corresponding PromQL changes accordingly.
- QUANTILE: The percentile. For monitoring data of the histogram type, a default percentile is specified. If the value of this field is 0, it means that the monitoring item corresponding to the monitoring table is not a histogram.
- COMMENT: The comment about the monitoring table.

```
SELECT * FROM metrics_tables LIMIT 5\G
```

The output is as follows:

```
*************************** 1. row ***************************
TABLE_NAME: abnormal_stores
    PROMQL: sum(pd_cluster_status{ type=~"store_disconnected_count|store_

14.13.18.2.31 PLACEMENT_POLICIES

The PLACEMENT_POLICIES table provides information on all placement policies. For details, refer to Placement Rules in SQL.

> **Note:**
>
> This table is not available on TiDB Serverless clusters.

```
USE information_schema;
DESC placement_policies;
```

```
+----------------------+---------------+------+-----+---------+-------+
| Field                | Type          | Null | Key | Default | Extra |

+----------------------+---------------+------+-----+---------+-------+
12 rows in set (0.00 sec)
```

Examples

The PLACEMENT_POLICIES table only shows all placement policies. To view the canonical version of placement rules (including all placement policies and objects assigned placement policies), use the statement SHOW PLACEMENT instead:

```
CREATE TABLE t1 (a INT);
CREATE PLACEMENT POLICY p1 primary_region="us-east-1" regions="us-east-1";
CREATE TABLE t3 (a INT) PLACEMENT POLICY=p1;
SHOW PLACEMENT; -- Shows all information, including table t3.
SELECT * FROM information_schema.placement_policies; -- Only shows
    ↪ placement policies, excluding t3.
```

```
Query OK, 0 rows affected (0.09 sec)

Query OK, 0 rows affected (0.11 sec)

Query OK, 0 rows affected (0.08 sec)

14.13.18.2.32 PROCESSLIST

`PROCESSLIST`, just like `SHOW PROCESSLIST`, is used to view the requests that are being handled.

The `PROCESSLIST` table has additional columns not present in `SHOW PROCESSLIST`:

- A `DIGEST` column to show the digest of the SQL statement.
- A `MEM` column to show the memory used by the request that is being processed, in bytes.
- A `DISK` column to show the disk usage in bytes.
- A `TxnStart` column to show the start time of the transaction.
- A `RESOURCE_GROUP` column to show the resource group name.

```
USE information_schema;
DESC processlist;
```

```

1 row in set (0.00 sec)
```

Fields in the `PROCESSLIST` table are described as follows:

- ID: The ID of the user connection.
- USER: The name of the user who is executing `PROCESS`.
- HOST: The address that the user is connecting to.
- DB: The name of the currently connected default database.
- COMMAND: The command type that `PROCESS` is executing.
- TIME: The current execution duration of `PROCESS`, in seconds.
- STATE: The current connection state.
- INFO: The requested statement that is being processed.
- DIGEST: The digest of the SQL statement.
- MEM: The memory used by the request that is being processed, in bytes.
- DISK: The disk usage in bytes.
- TxnStart: The start time of the transaction.
- RESOURCE_GROUP: The resource group name.

CLUSTER_PROCESSLIST

`CLUSTER_PROCESSLIST` is the cluster system table corresponding to `PROCESSLIST`. It is used to query the `PROCESSLIST` information of all TiDB nodes in the cluster. The table schema of `CLUSTER_PROCESSLIST` has one more column than `PROCESSLIST`, the `INSTANCE` column, which stores the address of the TiDB node this row of data is from.

```
SELECT * FROM information_schema.cluster_processlist;
```

```
+--
    ↪ --------------+-----+------+----------+------+---------+------+------------+---
    ↪

```

14.13.18.2.34 RESOURCE_GROUPS

The RESOURCE_GROUPS table shows the information about all resource groups. For more information, see Use Resource Control to Achieve Resource Isolation.

> **Note:**
>
> This table is not available on TiDB Serverless clusters.

```
USE information_schema;
DESC resource_groups;
```

```
+------------+-------------+------+------+---------+-------+
| Field      | Type        | Null | Key | Default | Extra |
+------------+-------------+------+------+---------+-------+
| NAME       | varchar(32) | NO |     | NULL    |       |
| RU_PER_SEC | bigint(21) | YES |    | NULL    |       |
| PRIORITY   | varchar(6) | YES |     | NULL    |       |
| BURSTABLE  | varchar(3) | YES |    | NULL    |       |
+------------+-------------+------+------+---------+-------+
3 rows in set (0.00 sec)
```

Examples

```
SELECT * FROM information_schema.resource_groups; -- View all resource
    ↪ groups. TiDB has a `default` resource group.
```

```
+---------+------------+----------+-----------+
| NAME    | RU_PER_SEC | PRIORITY | BURSTABLE |
+---------+------------+----------+-----------+
| default | UNLIMITED | MEDIUM | YES     |
+---------+------------+----------+-----------+
```

```
CREATE RESOURCE GROUP rg1 RU_PER_SEC=1000; -- Create a resource group `rg1`
```

```
Query OK, 0 rows affected (0.34 sec)
```

```
SHOW CREATE RESOURCE GROUP rg1; -- Show the definition of the `rg1`
    ↪ resource group
```

```
+--
    ↪ -------------+-----------------------------------------------------------+
    ↪
| Resource_Group | Create Resource Group                                      |
+--
    ↪ -------------+-----------------------------------------------------------+
    ↪
| rg1            | CREATE RESOURCE GROUP `rg1` RU_PER_SEC=1000 PRIORITY="
    ↪ MEDIUM" |
+--
    ↪ -------------+-----------------------------------------------------------+
    ↪
1 row in set (0.00 sec)
```

```
SELECT * FROM information_schema.resource_groups WHERE NAME = 'rg1'; --
    ↪ View the resource groups `rg1`
```

```
+------+------------+----------+-----------+-------------+
| NAME | RU_PER_SEC | PRIORITY | BURSTABLE | QUERY_LIMIT |
+------+------------+----------+-----------+-------------+
| rg1  | 1000       | MEDIUM   | NO        | NULL        |
+------+------------+----------+-----------+-------------+
1 row in set (0.00 sec)
```

The descriptions of the columns in the `RESOURCE_GROUPS` table are as follows:

- `NAME`: the name of the resource group.
- `RU_PER_SEC`: the backfilling speed of the resource group. The unit is RU/second, in which RU means Request Unit.
- `PRIORITY`: the absolute priority of tasks to be processed on TiKV. Different resources are scheduled according to the `PRIORITY` setting. Tasks with high `PRIORITY` are scheduled first. For resource groups with the same `PRIORITY`, tasks will be scheduled proportionally according to the `RU_PER_SEC` configuration. If `PRIORITY` is not specified, the default priority is `MEDIUM`.
- `BURSTABLE`: whether to allow the resource group to overuse the available system resources.

Note:

TiDB automatically creates a `default` resource group during cluster initialization. For this resource group, the default value of `RU_PER_SEC` is `UNLIMITED` (equivalent to the maximum value of the `INT` type, that is, `2147483647`) and it is in `BURSTABLE` mode. All requests that are not bound to any resource group are automatically bound to this `default` resource group. When you create a new configuration for another resource group, it is recommended to modify the `default` resource group configuration as needed.

14.13.18.2.35 RUNAWAY_WATCHES

The `RUNAWAY_WATCHES` table shows the watch list of runaway queries that consume more resources than expected. For more information, see Runaway Queries.

Note:

This table is not available on TiDB Serverless clusters.

```
USE INFORMATION_SCHEMA;
DESC RUNAWAY_WATCHES;
```

```
+--------------------+-------------+------+------+---------+-------+
| Field              | Type        | Null | Key | Default | Extra |
+--------------------+-------------+------+------+---------+-------+
| ID                 | bigint(64)  | NO   |     | NULL    |       |
| RESOURCE_GROUP_NAME | varchar(32) | NO |   | NULL    |       |
| START_TIME         | varchar(32) | NO |     | NULL    |       |
| END_TIME           | varchar(32) | YES |    | NULL    |       |
| WATCH              | varchar(12) | NO |     | NULL    |       |
| WATCH_TEXT         | text        | NO   |     | NULL    |       |
| SOURCE             | varchar(128) | NO |    | NULL    |       |
| ACTION             | varchar(12) | NO |     | NULL    |       |
+--------------------+-------------+------+------+---------+-------+
8 rows in set (0.00 sec)
```

Warning:

This feature is experimental. It is not recommended that you use it in the production environment. This feature might be changed or removed without prior notice. If you find a bug, you can report an issue on GitHub.

Examples

Query the watch list of runaway queries:

```
SELECT * FROM INFORMATION_SCHEMA.RUNAWAY_WATCHES\G
```

The output is as follows:

```
*************************** 1. row ***************************
                ID: 20003
RESOURCE_GROUP_NAME: rg2
        START_TIME: 2023-07-28 13:06:08
          END_TIME: UNLIMITED
             WATCH: Similar
        WATCH_TEXT: 5
            ↪ b7fd445c5756a16f910192ad449c02348656a5e9d2aa61615e6049afbc4a82e
            ↪
            SOURCE: 127.0.0.1:4000
            ACTION: Kill
*************************** 2. row ***************************
                ID: 16004
RESOURCE_GROUP_NAME: rg2
        START_TIME: 2023-07-28 01:45:30
          END_TIME: UNLIMITED
             WATCH: Similar
        WATCH_TEXT: 3
            ↪ d48fca401d8cbb31a9f29adc9c0f9d4be967ca80a34f59c15f73af94e000c84
            ↪
            SOURCE: 127.0.0.1:4000
            ACTION: Kill
2 rows in set (0.00 sec)
```

Add a watch item into list to the resource group `rg1`:

```
QUERY WATCH ADD RESOURCE GROUP rg1 SQL TEXT EXACT TO 'select * from sbtest.
    ↪ sbtest1';
```

Query the watch list of runaway queries again:

```
SELECT * FROM INFORMATION_SCHEMA.RUNAWAY_WATCHES\G
```

The output is as follows:

```
*************************** 1. row ***************************
                ID: 20003
RESOURCE_GROUP_NAME: rg2
        START_TIME: 2023-07-28 13:06:08
          END_TIME: UNLIMITED
```

```
             WATCH: Similar
        WATCH_TEXT: 5

            ↪
            SOURCE: 127.0.0.1:4000
            ACTION: Kill
*************************** 2. row ***************************
               ID: 16004
RESOURCE_GROUP_NAME: rg2
        START_TIME: 2023-07-28 01:45:30
          END_TIME: UNLIMITED
             WATCH: Similar
        WATCH_TEXT: 3
            ↪ d48fca401d8cbb31a9f29adc9c0f9d4be967ca80a34f59c15f73af94e000c84
            ↪
            SOURCE: 127.0.0.1:4000
            ACTION: Kill
*************************** 3. row ***************************
               ID: 20004
RESOURCE_GROUP_NAME: rg1
        START_TIME: 2023-07-28 14:23:04
          END_TIME: UNLIMITED
             WATCH: Exact
        WATCH_TEXT: select * from sbtest.sbtest1
            SOURCE: manual
            ACTION: NoneAction
3 row in set (0.00 sec)
```

The meaning of each column field in the `RUNAWAY_WATCHES` table is as follows:

- `ID`: the ID of the watch item.
- `RESOURCE_GROUP_NAME`: the name of the resource group.
- `START_TIME`: the start time.
- `END_TIME`: the end time. `UNLIMITED` means that the watch item has an unlimited validity period.
- `WATCH`: the match type of the quick identification. The values are as follows:
    - `Plan` indicates that the Plan Digest is matched. In this case, the `WATCH_TEXT` column shows the Plan Digest.
    - `Similar` indicates that the SQL Digest is matched. In this case, the `WATCH_TEXT` column shows the SQL Digest.
    - `Exact` indicates that the SQL text is matched. In this case, the `WATCH_TEXT` column shows the SQL text.
- `SOURCE`: the source of the watch item. If it is identified by the `QUERY_LIMIT` rule, the identified TiDB IP address is displayed. If it is manually added, `manual` is displayed.

- ACTION: the corresponding operation after the identification.

14.13.18.2.36 SCHEMATA

The SCHEMATA table provides information about databases. The table data is equivalent to the result of the SHOW DATABASES statement.

```
USE information_schema;
desc SCHEMATA;
```

```
+----------------------------+-------------+------+------+---------+-------+
   ↪
| Field                      | Type        | Null | Key | Default | Extra |
+----------------------------+-------------+------+------+---------+-------+
   ↪
| CATALOG_NAME               | varchar(512) | YES |    | NULL    |       |
| SCHEMA_NAME                | varchar(64) | YES |     | NULL    |       |
| DEFAULT_CHARACTER_SET_NAME | varchar(64) | YES | | NULL    |       |
| DEFAULT_COLLATION_NAME  | varchar(32) | YES |     | NULL    |       |
| SQL_PATH                   | varchar(512) | YES |    | NULL    |       |
+----------------------------+-------------+------+------+---------+-------+
   ↪
5 rows in set (0.00 sec)
```

```
SELECT * FROM SCHEMATA;
```

```
+--------------+--------------------+----------------------------+----------------------
   ↪
| CATALOG_NAME | SCHEMA_NAME    | DEFAULT_CHARACTER_SET_NAME | DEFAULT_
   ↪ COLLATION_NAME | SQL_PATH |
+--------------+--------------------+----------------------------+----------------------
   ↪
| def          | INFORMATION_SCHEMA | utf8mb4                | utf8mb4_bin
   ↪          | NULL    |
| def          | METRICS_SCHEMA   | utf8mb4                | utf8mb4_bin
   ↪          | NULL    |
| def          | mysql            | utf8mb4                | utf8mb4_bin
   ↪          | NULL    |
| def          | PERFORMANCE_SCHEMA | utf8mb4              | utf8mb4_bin
   ↪          | NULL    |
| def          | test             | utf8mb4                | utf8mb4_bin
   ↪          | NULL    |
+--------------+--------------------+----------------------------+----------------------
   ↪
5 rows in set (0.00 sec)
```

Fields in the SCHEMATA table are described as follows:

- CATALOG_NAME: The catalog to which the database belongs.
- SCHEMA_NAME: The database name.
- DEFAULT_CHARACTER_SET_NAME: The default character set of the database.
- DEFAULT_COLLATION_NAME: The default collation of the database.
- SQL_PATH: The value of this item is always NULL.

14.13.18.2.37 SEQUENCES

The SEQUENCES table provides information about sequences. The sequences feature is modeled on a similar feature in MariaDB.

```
USE INFORMATION_SCHEMA;
DESC SEQUENCES;
```

The output is as follows:

```
+----------------+-------------+------+-----+---------+-------+
| Field          | Type        | Null | Key | Default | Extra |
+----------------+-------------+------+-----+---------+-------+
| TABLE_CATALOG  | varchar(512) | NO |     | NULL    |       |
| SEQUENCE_SCHEMA | varchar(64) | NO |    | NULL    |       |
| SEQUENCE_NAME  | varchar(64) | NO |     | NULL    |       |
| CACHE          | tinyint(0)  | NO  |     | NULL    |       |
| CACHE_VALUE    | bigint(21)  | YES |     | NULL    |       |
| CYCLE          | tinyint(0)  | NO  |     | NULL    |       |
| INCREMENT      | bigint(21)  | NO  |     | NULL    |       |
| MAX_VALUE      | bigint(21)  | YES |     | NULL    |       |
| MIN_VALUE      | bigint(21)  | YES |     | NULL    |       |
| START          | bigint(21)  | YES |     | NULL    |       |
| COMMENT        | varchar(64) | YES |     | NULL    |       |
+----------------+-------------+------+-----+---------+-------+
11 rows in set (0.00 sec)
```

Create a sequence test.seq and query the next value of the sequence:

```
CREATE SEQUENCE test.seq;
SELECT NEXTVAL(test.seq);
SELECT * FROM sequences\G
```

The output is as follows:

```
+------------------+
| NEXTVAL(test.seq) |
+------------------+
|                1 |
```

```
+-------------------+
1 row in set (0.01 sec)
```

View all sequences:

```
SELECT * FROM SEQUENCES\G
```

The output is as follows:

```
*************************** 1. row ***************************
  TABLE_CATALOG: def
SEQUENCE_SCHEMA: test
  SEQUENCE_NAME: seq
          CACHE: 1
    CACHE_VALUE: 1000
          CYCLE: 0
      INCREMENT: 1
      MAX_VALUE: 9223372036854775806
      MIN_VALUE: 1
          START: 1
        COMMENT:
1 row in set (0.00 sec)
```

See also

- CREATE SEQUENCE
- SHOW CREATE SEQUENCE
- ALTER SEQUENCE
- DROP SEQUENCE
- Sequence functions

14.13.18.2.38 SESSION_VARIABLES

The SESSION_VARIABLES table provides information about session variables. The table data is similar to the result of the SHOW SESSION VARIABLES statement.

```
USE INFORMATION_SCHEMA;
DESC SESSION_VARIABLES;
```

The output is as follows:

```
+----------------+---------------+------+-----+---------+-------+
| Field          | Type          | Null | Key | Default | Extra |
+----------------+---------------+------+-----+---------+-------+
| VARIABLE_NAME  | varchar(64)   | YES  |     | NULL    |       |

2 rows in set (0.00 sec)
```

Query the first 10 rows of the SESSION_VARIABLES table:

```
SELECT * FROM SESSION_VARIABLES ORDER BY variable_name LIMIT 10;
```

The output is as follows:

```
+-----------------------------------+------------------+
| VARIABLE_NAME                     | VARIABLE_VALUE |
+-----------------------------------+------------------+
| allow_auto_random_explicit_insert | OFF              |
| auto_increment_increment          | 1                |
| auto_increment_offset             | 1                |
| autocommit                        | ON               |
| automatic_sp_privileges           | 1                |
| avoid_temporal_upgrade            | OFF              |
| back_log                          | 80               |
| basedir                           | /usr/local/mysql |

| bind_address                      | *                |
+-----------------------------------+------------------+
10 rows in set (0.00 sec)
```

The description of columns in the SESSION_VARIABLES table is as follows:

- VARIABLE_NAME: The name of the session-level variable in the database.
- VARIABLE_VALUE: The value of the session-level variable in the database.

14.13.18.2.39 SLOW_QUERY

The SLOW_QUERY table provides the slow query information of the current node, which is the parsing result of the TiDB slow log file. The column names in the table are corresponding to the field names in the slow log.

> **Note:**
>
> This table is not available on TiDB Serverless clusters.

For how to use this table to identify problematic statements and improve query performance, see Slow Query Log Document.

```
USE INFORMATION_SCHEMA;
DESC SLOW_QUERY;
```

The output is as follows:

```
+------------------------------+---------------------+------+------+---------+-------+

```

The maximum statement length of the `Query` column is limited by the `tidb_stmt_summary_max_sql_length` system variable.

CLUSTER_SLOW_QUERY table

The `CLUSTER_SLOW_QUERY` table provides the slow query information of all nodes in the cluster, which is the parsing result of the TiDB slow log files. You can use the `CLUSTER_SLOW_QUERY` table the way you do with `SLOW_QUERY`. The table schema of the `CLUSTER_SLOW_QUERY` table differs from that of the `SLOW_QUERY` table in that an `INSTANCE` column is added to `CLUSTER_SLOW_QUERY`. The `INSTANCE` column represents the TiDB node address of the row information on the slow query.

> **Note:**
>
> This table is not available on TiDB Serverless clusters.

For how to use this table to identify problematic statements and improve query performance, see Slow Query Log Document.

```
DESC CLUSTER_SLOW_QUERY;
```

The output is as follows:

```
+--
   ↪ ----------------------------+--------------------+------+------+---------+----

    ↪ |
+--
    ↪ ----------------------------+-------------------+------+------+---------+----
    ↪
80 rows in set (0.00 sec)
```

When the cluster system table is queried, TiDB does not obtain data from all nodes, but pushes down the related calculation to other nodes. The execution plan is as follows:

```
DESC SELECT COUNT(*) FROM CLUSTER_SLOW_QUERY WHERE user = 'u1';
```

The output is as follows:

```
+--
    ↪ -------------------------+----------+----------+------------------------+---
    ↪
| id                         | estRows | task     | access object          |

    ↪  | keep order:false, stats:pseudo          |
+--
    ↪ -------------------------+----------+----------+------------------------+---
    ↪
4 rows in set (0.00 sec)
```

In the preceding execution plan, the `user = u1` condition is pushed down to other (`cop`) TiDB nodes, and the aggregate operator is also pushed down (the `StreamAgg` operator in the graph).

Currently, because statistics of the system tables are not collected, sometimes some aggregation operators cannot be pushed down, which results in slow execution. In this case, you can manually specify the SQL HINT to push down the aggregation operators. For example:

```
SELECT /*+ AGG_TO_COP() */ COUNT(*) FROM CLUSTER_SLOW_QUERY GROUP BY user;
```

14.13.18.2.40 STATISTICS

The `STATISTICS` table provides information about table indexes.

```
USE information_schema;
DESC statistics;
```

```
+---------------+---------------+------+------+---------+-------+

18 rows in set (0.00 sec)
```

Fields in the `STATISTICS` table are described as follows:

- `TABLE_CATALOG`: The name of the catalog to which the table containing the index belongs. This value is always `def`.
- `TABLE_SCHEMA`: The name of the database to which the table containing the index belongs.
- `TABLE_NAME`: The name of the table containing the index.
- `NON_UNIQUE`: If the index must not contain duplicate values, the value is `0`; if duplicate values are allowed in the index, the value is `1`.
- `INDEX_SCHEMA`: The name of the database to which the index belongs.
- `INDEX_NAME`: The name of the index. If the index is the primary key, then the value is always `PRIMARY`.
- `SEQ_IN_INDEX`: The column number in the index, starting from `1`.
- `COLUMN_NAME`: The column name. See the description of the `Expression` column.

- `COLLATION`: The sorting method of the columns in the index. The value can be `A` (ascending order), `D` (descending order) or `NULL` (unsorted).
- `CARDINALITY`: TiDB does not use this field. The field value is always `0`.
- `SUB_PART`: The prefix of the index. If only part of the prefix of the column is indexed, the value is the number of indexed characters; if the entire column is indexed, the value is `NULL`.
- `PACKED`: TiDB does not use this field. This value is always `NULL`.
- `NULLABLE`: If the column might contain a `NULL` value, the value is `YES`; if not, the value is `''`.
- `INDEX_TYPE`: The type of the index.
- `COMMENT`: Other information related to the index.
- `INDEX_COMMENT`: Any comment with comment attribute provided for the index when creating the index.
- `IS_VISIBLE`: Whether the optimizer can use this index.
- `Expression` For the index key of the non-expression part, this value is `NULL`; for the index key of the expression part, this value is the expression itself. Refer to Expression Index.

The following statements are equivalent:

```
SELECT * FROM INFORMATION_SCHEMA.STATISTICS
  WHERE table_name = 'tbl_name'
  AND table_schema = 'db_name'

SHOW INDEX
  FROM tbl_name
  FROM db_name
```

14.13.18.2.41 TABLES

The `TABLES` table provides information about tables in databases:

```
USE information_schema;
DESC tables;
```

```
+--
    ↪ -------------------------+---------------+------+------+----------+-------+
    ↪
| Field                  | Type         | Null | Key | Default | Extra |

           TIDB_TABLE_ID: 5
TIDB_ROW_ID_SHARDING_INFO: NULL
1 row in set (0.00 sec)
```

The following statements are equivalent:

```
SELECT table_name FROM INFORMATION_SCHEMA.TABLES
  WHERE table_schema = 'db_name'
  [AND table_name LIKE 'wild']

SHOW TABLES
  FROM db_name
  [LIKE 'wild']
```

The description of columns in the `TABLES` table is as follows:

- `TABLE_CATALOG`: The name of the catalog which the table belongs to. The value is always `def`.
- `TABLE_SCHEMA`: The name of the schema which the table belongs to.
- `TABLE_NAME`: The name of the table.
- `TABLE_TYPE`: The type of the table.
- `ENGINE`: The type of the storage engine. The value is currently `InnoDB`.
- `VERSION`: Version. The value is `10` by default.
- `ROW_FORMAT`: The row format. The value is currently `Compact`.
- `TABLE_ROWS`: The number of rows in the table in statistics.
- `AVG_ROW_LENGTH`: The average row length of the table. `AVG_ROW_LENGTH = DATA_LENGTH / TABLE_ROWS`.
- `DATA_LENGTH`: Data length. `DATA_LENGTH = TABLE_ROWS` * the sum of storage lengths of the columns in the tuple. The replicas of TiKV are not taken into account.
- `MAX_DATA_LENGTH`: The maximum data length. The value is currently `0`, which means the data length has no upper limit.
- `INDEX_LENGTH`: The index length. `INDEX_LENGTH = TABLE_ROWS` * the sum of lengths of the columns in the index tuple. The replicas of TiKV are not taken into account.
- `DATA_FREE`: Data fragment. The value is currently `0`.
- `AUTO_INCREMENT`: The current step of the auto- increment primary key.
- `CREATE_TIME`: The time at which the table is created.
- `UPDATE_TIME`: The time at which the table is updated.
- `CHECK_TIME`: The time at which the table is checked.
- `TABLE_COLLATION`: The collation of strings in the table.
- `CHECKSUM`: Checksum.
- `CREATE_OPTIONS`: Creates options.

- `TABLE_COMMENT`: The comments and notes of the table.

Most of the information in the table is the same as MySQL. Only two columns are newly defined by TiDB:

- `TIDB_TABLE_ID`: to indicate the internal ID of a table. This ID is unique in a TiDB cluster.
- `TIDB_ROW_ID_SHARDING_INFO`: to indicate the sharding type of a table. The possible values are as follows:
  - `"NOT_SHARDED"`: the table is not sharded.
  - `"NOT_SHARDED(PK_IS_HANDLE)"`: the table that defines an integer Primary Key as its row id is not sharded.
  - `"PK_AUTO_RANDOM_BITS={bit_number}"`: the table that defines an integer Primary Key as its row id is sharded because the Primary Key is assigned with `AUTO_RANDOM` attribute.
  - `"SHARD_BITS={bit_number}"`: the table is sharded using `SHARD_ROW_ID_BITS={bit_number}`.
  - NULL: the table is a system table or view, and thus cannot be sharded.

14.13.18.2.42 TABLE_CONSTRAINTS

The `TABLE_CONSTRAINTS` table describes which tables have constraints.

```
USE information_schema;
DESC table_constraints;
```

```
+--------------------+--------------+------+------+---------+-------+
| Field              | Type         | Null | Key | Default | Extra |

| def               | mysql             | tbl                     | mysql
    ↪             | stats_buckets                   | UNIQUE         |
| def               | mysql             | delete_range_index      | mysql
    ↪             | gc_delete_range                 | UNIQUE         |
| def               | mysql             | delete_range_done_index | mysql
    ↪         | gc_delete_range_done            | UNIQUE         |
| def               | PERFORMANCE_SCHEMA | SCHEMA_NAME            | PERFORMANCE_
    ↪ SCHEMA | events_statements_summary_by_digest | UNIQUE |
+--
    ↪ -----------------+--------------------+-------------------------+-------------
    ↪
7 rows in set (0.01 sec)
```

Fields in the `TABLE_CONSTRAINTS` table are described as follows:

- `CONSTRAINT_CATALOG`: The name of the catalog to which the constraint belongs. This value is always `def`.
- `CONSTRAINT_SCHEMA`: The name of the database to which the constraint belongs.
- `CONSTRAINT_NAME`: The name of the constraint.
- `TABLE_NAME`: The name of the table.
- `CONSTRAINT_TYPE`: The type of the constraint. The value can be `UNIQUE`, `PRIMARY KEY` or `FOREIGN KEY`. The `UNIQUE` and `PRIMARY KEY` information is similar to the execution result of the `SHOW INDEX` statement.

14.13.18.2.43 TABLE_STORAGE_STATS

The `TABLE_STORAGE_STATS` table provides information about table sizes as stored by the storage engine (TiKV).

```
USE INFORMATION_SCHEMA;
DESC TABLE_STORAGE_STATS;
```

The output is as follows:

```
+-------------------+-------------+------+------+---------+-------+
| Field             | Type        | Null | Key | Default | Extra |
+-------------------+-------------+------+------+---------+-------+
```

```
| TABLE_SCHEMA     | varchar(64) | YES |    | NULL   |       |
| TABLE_NAME       | varchar(64) | YES |    | NULL   |       |
| TABLE_ID         | bigint(21) | YES |     | NULL   |       |
| PEER_COUNT       | bigint(21) | YES |     | NULL   |       |
| REGION_COUNT     | bigint(21) | YES |     | NULL   |       |
| EMPTY_REGION_COUNT | bigint(21) | YES |  | NULL   |       |
| TABLE_SIZE       | bigint(64) | YES |     | NULL   |       |
| TABLE_KEYS       | bigint(64) | YES |     | NULL   |       |
+------------------+------------+------+------+---------+-------+
8 rows in set (0.00 sec)
```

```
CREATE TABLE test.t1 (id INT);
INSERT INTO test.t1 VALUES (1);
SELECT * FROM TABLE_STORAGE_STATS WHERE table_schema = 'test' AND table_
   ↪ name = 't1'\G
```

The output is as follows:

```
*************************** 1. row ***************************
     TABLE_SCHEMA: test
       TABLE_NAME: t1
         TABLE_ID: 56
       PEER_COUNT: 1
     REGION_COUNT: 1
EMPTY_REGION_COUNT: 1
       TABLE_SIZE: 1
       TABLE_KEYS: 0
1 row in set (0.00 sec)
```

Fields in the `TABLE_STORAGE_STATS` table are described as follows:

- `TABLE_SCHEMA`: The name of the schema to which the table belongs.
- `TABLE_NAME`: The name of the table.
- `TABLE_ID`: The ID of the table.
- `PEER_COUNT`: The number of replicas of the table.
- `REGION_COUNT`: The number of Regions.
- `EMPTY_REGION_COUNT`: The number of Regions that do not contain data in this table.
- `TABLE_SIZE`: The total size of the table, in the unit of MiB.
- `TABLE_KEYS`: The total number of records in the table.

14.13.18.2.44 TIDB_HOT_REGIONS

The `TIDB_HOT_REGIONS` table provides information about the current hot Regions. For information about history hot Regions, see `[TIDB_HOT_REGIONS_HISTORY](#tidb_hot_regions_history)`.

> **Note:**
>
> This table is only applicable to TiDB Self-Hosted and not available on TiDB Cloud.

```
USE information_schema;
DESC tidb_hot_regions;
```

```
+----------------+-------------+------+------+---------+-------+
| Field          | Type        | Null | Key  | Default | Extra |
+----------------+-------------+------+------+---------+-------+
| TABLE_ID       | bigint(21)  | YES  |      | NULL    |       |
| INDEX_ID       | bigint(21)  | YES  |      | NULL    |       |
| DB_NAME        | varchar(64) | YES  |      | NULL    |       |

```

The description of columns in the `TIDB_HOT_REGIONS` table is as follows:

- `TABLE_ID`: The ID of the table in which the hot Region is located.
- `INDEX_ID`: The ID of the index in which the hot Region is located.
- `DB_NAME`: The database name of the object in which the hot Region is located.
- `TABLE_NAME`: The name of the table in which the hot Region is located.
- `INDEX_NAME`: The name of the index in which the hot Region is located.
- `REGION_ID`: The ID of the hot Region.
- `TYPE`: The type of the hot Region.
- `MAX_HOT_DEGREE`: The maximum hot degree of the Region.
- `REGION_COUNT`: The number of hot Regions in the instance.
- `FLOW_BYTES`: The number of bytes written and read in the Region.

14.13.18.2.45 TIDB_HOT_REGIONS_HISTORY

The `TIDB_HOT_REGIONS_HISTORY` table provides information about history hot Regions that are periodically recorded locally by PD.

> **Note:**
>
> This table is not available on TiDB Serverless clusters.

You can specify the record interval by configuring `hot-regions-write-interval`. The default value is 10 minutes. You can specify the period for reserving history information about hot Regions by configuring `hot-regions-reserved-days`. The default value is 7 days. See PD configuration file description for details.

```
USE information_schema;
DESC tidb_hot_regions_history;
```

```
+-------------+-------------+------+-----+---------+-------+
| Field       | Type        | Null | Key | Default | Extra |

+-------------+-------------+------+-----+---------+-------+
16 rows in set (0.00 sec)
```

The fields in the `TIDB_HOT_REGIONS_HISTORY` table are described as follows:

- UPDATE_TIME: The update time of the hot Region.
- DB_NAME: The database name of the object in which the hot Region is located.
- TABLE_ID: The ID of the table in which the hot Region is located.
- TABLE_NAME: The name of the table in which the hot Region is located.
- INDEX_NAME: The name of the index in which the hot Region is located.
- INDEX_ID: The ID of the index in which the hot Region is located.

- REGION_ID: The ID of the hot Region.
- STORE_ID: The ID of the store in which the hot Region is located.
- PEER_ID: The ID of the Peer corresponding to the hot Region.
- IS_LEARNER: Whether the PEER is the LEARNER.
- IS_LEADER: Whether the PEER is the LEADER.
- TYPE: The type of the hot Region.
- HOT_DEGREE: The hot degree of the hot Region.
- FLOW_BYTES: The number of bytes written and read in the Region.
- KEY_RATE: The number of keys written and read in the Region.
- QUERY_RATE: The number of queries written and read in the Region.

> **Note:**
>
> `UPDATE_TIME`, `REGION_ID`, `STORE_ID`, `PEER_ID`, `IS_LEARNER`, `IS_LEADER` and `TYPE` fields are pushed down to the PD servers for execution. To reduce the overhead of using the table, you must specify the time range for the search, and specify as many conditions as possible. For example, `select * from tidb_hot_regions_history where store_id = 11 ↪ and update_time > '2020-05-18 20:40:00' and update_time < ↪ '2020-05-18 21:40:00' and type='write'`.

Common user scenarios

- Query hot Regions within a specific period of time. Replace `update_time` with your actual time.

```
SELECT * FROM INFORMATION_SCHEMA.TIDB_HOT_REGIONS_HISTORY WHERE update
    ↪ _time >'2021-08-18 21:40:00' and update_time <'2021-09-19
    ↪ 00:00:00';
```

> **Note:**
>
> `UPDATE_TIME` also supports Unix timestamps. For example, `update_time ↪ >TIMESTAMP('2021-08-18 21:40:00')` or `update_time > FROM_ ↪ UNIXTIME(1629294000.000)`.

- Query hot Regions in a table within a specific period of time. Replace `update_time` and `table_name` with your actual values.

```
SELECT * FROM INFORMATION_SCHEMA.TIDB_HOT_REGIONS_HISTORY WHERE update
    ↪ _time >'2021-08-18 21:40:00' and update_time <'2021-09-19
    ↪ 00:00:00' and TABLE_NAME = 'table_name';
```

- Query the distribution of hot Regions within a specific period of time. Replace `update_time` and `table_name` with your actual values.

```
SELECT count(region_id) cnt, store_id FROM INFORMATION_SCHEMA.TIDB_HOT
    ↪ _REGIONS_HISTORY WHERE update_time >'2021-08-18 21:40:00' and
    ↪ update_time <'2021-09-19 00:00:00' and table_name = 'table_name'
    ↪  GROUP BY STORE_ID ORDER BY cnt DESC;
```

- Query the distribution of hot Leader Regions within a specific period of time. Replace `update_time` and `table_name` with your actual values.

```
SELECT count(region_id) cnt, store_id FROM INFORMATION_SCHEMA.TIDB_HOT
    ↪ _REGIONS_HISTORY WHERE update_time >'2021-08-18 21:40:00' and
    ↪ update_time <'2021-09-19 00:00:00' and table_name = 'table_name'
    ↪  and is_leader=1 GROUP BY STORE_ID ORDER BY cnt DESC;
```

- Query the distribution of hot Index Regions within a specific period of time. Replace `update_time` and `table_name` with your actual values.

```
SELECT count(region_id) cnt, index_name, store_id FROM INFORMATION_
    ↪ SCHEMA.TIDB_HOT_REGIONS_HISTORY WHERE update_time >'2021-08-18
    ↪ 21:40:00' and update_time <'2021-09-19 00:00:00' and table_name
    ↪ = 'table_name' group by index_name, store_id order by index_name
    ↪ ,cnt desc;
```

- Query the distribution of hot Index Leader Regions within a specific period of time. Replace `update_time` and `table_name` with your actual values.

```
SELECT count(region_id) cnt, index_name, store_id FROM INFORMATION_
    ↪ SCHEMA.TIDB_HOT_REGIONS_HISTORY WHERE update_time >'2021-08-18
    ↪ 21:40:00' and update_time <'2022-09-19 00:00:00' and table_name
    ↪ = 'table_name' and is_leader=1 group by index_name, store_id
    ↪ order by index_name,cnt desc;
```

14.13.18.2.46 TIDB_INDEXES

The `TIDB_INDEXES` table provides the INDEX information of all tables.

```
USE information_schema;
DESC tidb_indexes;
```

```
+--------------+--------------+------+------+---------+-------+
| Field        | Type         | Null | Key | Default | Extra |
+--------------+--------------+------+------+---------+-------+
| TABLE_SCHEMA | varchar(64) | YES |     | NULL    |       |
| TABLE_NAME   | varchar(64) | YES |     | NULL    |       |
```

```
| NON_UNIQUE   | bigint(21)   | YES |     | NULL   |       |
| KEY_NAME     | varchar(64)  | YES |     | NULL   |       |
| SEQ_IN_INDEX | bigint(21)   | YES |     | NULL   |       |
| COLUMN_NAME  | varchar(64)  | YES |     | NULL   |       |
| SUB_PART     | bigint(21)   | YES |     | NULL   |       |
| INDEX_COMMENT | varchar(2048) | YES | | NULL   |       |
| Expression   | varchar(64)  | YES |     | NULL   |       |
| INDEX_ID     | bigint(21)   | YES |     | NULL   |       |
| IS_VISIBLE   | varchar(64)  | YES |     | NULL   |       |
| CLUSTERED    | varchar(64)  | YES |     | NULL   |       |
+--------------+--------------+-----+-----+--------+-------+
12 rows in set (0.00 sec)
```

`INDEX_ID` is the unique ID that TiDB allocates for each index. It can be used to do a join operation with `INDEX_ID` obtained from another table or API.

For example, you can obtain `TABLE_ID` and `INDEX_ID` that are involved in some slow query in the `SLOW_QUERY` table and then obtain the specific index information using the following SQL statements:

```
SELECT
 tidb_indexes.*
FROM
 tidb_indexes,
 tables
WHERE
  tidb_indexes.table_schema = tables.table_schema
 AND tidb_indexes.table_name = tidb_indexes.table_name
 AND tables.tidb_table_id = ?
 AND index_id = ?
```

Fields in the `TIDB_INDEXES` table are described as follows:

- `TABLE_SCHEMA`: The name of the schema to which the index belongs.
- `TABLE_NAME`: The name of the table to which the index belongs.
- `NON_UNIQUE`: If the index is unique, the value is `0`; otherwise, the value is `1`.
- `KEY_NAME`: The index name. If the index is the primary key, the name is `PRIMARY`.
- `SEQ_IN_INDEX`: The sequential number of columns in the index, which starts from `1`.
- `COLUMN_NAME`: The name of the column where the index is located.
- `SUB_PART`: The prefix length of the index. If the column is partly indexed, the `SUB_PART` value is the count of the indexed characters; otherwise, the value is `NULL`.
- `INDEX_COMMENT`: The comment of the index, which is made when the index is created.
- `INDEX_ID`: The index ID.
- `IS_VISIBLE`: Whether the index is visible.
- `CLUSTERED`: Whether it is a clustered index.

14.13.18.2.47 TIDB_INDEX_USAGE

Starting from v8.0.0, TiDB provides the `TIDB_INDEX_USAGE` table. You can use `TIDB_INDEX_USAGE` to get the usage statistics of all indexes on the current TiDB node. By default, TiDB collects these index usage statistics during SQL statement execution. You can disable this feature by turning off the `instance.tidb_enable_collect_execution_info` configuration item or the `tidb_enable_collect_execution_info` system variable.

```
USE INFORMATION_SCHEMA;
DESC TIDB_INDEX_USAGE;
```

```
+-------------------------+-------------+------+------+---------+-------+
| Field                   | Type        | Null | Key  | Default | Extra |
+-------------------------+-------------+------+------+---------+-------+
| TABLE_SCHEMA            | varchar(64) | YES  |      | NULL    |       |
| TABLE_NAME              | varchar(64) | YES  |      | NULL    |       |
| INDEX_NAME              | varchar(64) | YES  |      | NULL    |       |
| QUERY_TOTAL             | bigint(21)  | YES  |      | NULL    |       |
| KV_REQ_TOTAL            | bigint(21)  | YES  |      | NULL    |       |
| ROWS_ACCESS_TOTAL       | bigint(21)  | YES  |      | NULL    |       |
| PERCENTAGE_ACCESS_0     | bigint(21)  | YES  |      | NULL    |       |
| PERCENTAGE_ACCESS_0_1   | bigint(21)  | YES  |      | NULL    |       |
| PERCENTAGE_ACCESS_1_10  | bigint(21)  | YES  |      | NULL    |       |
| PERCENTAGE_ACCESS_10_20 | bigint(21)  | YES  |      | NULL    |       |
| PERCENTAGE_ACCESS_20_50 | bigint(21)  | YES  |      | NULL    |       |
| PERCENTAGE_ACCESS_50_100| bigint(21)  | YES  |      | NULL    |       |
| PERCENTAGE_ACCESS_100   | bigint(21)  | YES  |      | NULL    |       |
| LAST_ACCESS_TIME        | datetime    | YES  |      | NULL    |       |
+-------------------------+-------------+------+------+---------+-------+
14 rows in set (0.00 sec)
```

The columns in the `TIDB_INDEX_USAGE` table are as follows:

- `TABLE_SCHEMA`: The name of the database to which the table containing the index belongs.
- `TABLE_NAME`: The name of the table containing the index.
- `INDEX_NAME`: The name of the index.
- `QUERY_TOTAL`: The total number of statements accessing the index.
- `KV_REQ_TOTAL`: The total number of KV requests generated when accessing the index.
- `ROWS_ACCESS_TOTAL`: The total number of rows scanned when accessing the index.
- `PERCENTAGE_ACCESS_0`: The number of times the row access ratio (the percentage of accessed rows out of the total number of rows in the table) is 0.
- `PERCENTAGE_ACCESS_0_1`: The number of times the row access ratio is between 0% and 1%.
- `PERCENTAGE_ACCESS_1_10`: The number of times the row access ratio is between 1% and 10%.

- `PERCENTAGE_ACCESS_10_20`: The number of times the row access ratio is between 10% and 20%.
- `PERCENTAGE_ACCESS_20_50`: The number of times the row access ratio is between 20% and 50%.
- `PERCENTAGE_ACCESS_50_100`: The number of times the row access ratio is between 50% and 100%.
- `PERCENTAGE_ACCESS_100`: The number of times the row access ratio is 100%.
- `LAST_ACCESS_TIME`: The time of the most recent access to the index.

CLUSTER_TIDB_INDEX_USAGE

The `TIDB_INDEX_USAGE` table only provides usage statistics of all indexes on a single TiDB node. To obtain the index usage statistics on all TiDB nodes in the cluster, you need to query the `CLUSTER_TIDB_INDEX_USAGE` table.

Compared with the `TIDB_INDEX_USAGE` table, the query result of the `CLUSTER_TIDB_INDEX_USAGE` table includes an additional `INSTANCE` field. This field displays the IP address and port of each node in the cluster, which helps you distinguish the statistics across different nodes.

```
USE INFORMATION_SCHEMA;
DESC CLUSTER_TIDB_INDEX_USAGE;
```

The output is as follows:

```
+--
   ↪ ----------------------+-------------------------------------------------------
   ↪
| Field                 | Type
   ↪                                                    | Null | Key |

   ↪
15 rows in set (0.00 sec)
```

Limitations

- The data in the `TIDB_INDEX_USAGE` table might be delayed by up to 5 minutes.
- After TiDB restarts, the data in the `TIDB_INDEX_USAGE` table is cleared.

14.13.18.2.48 TIDB_SERVERS_INFO

The `TIDB_SERVERS_INFO` table provides information about TiDB servers in the TiDB Cluster (namely, tidb-server processes).

> **Note:**
>
> This table is not available on TiDB Serverless clusters.

```
USE INFORMATION_SCHEMA;
DESC tidb_servers_info;
```

The output is as follows:

```
+--------------+-------------+------+------+---------+-------+
| Field        | Type        | Null | Key | Default | Extra |
+--------------+-------------+------+------+---------+-------+
| DDL_ID       | varchar(64) | YES |     | NULL   |       |
| IP           | varchar(64) | YES |     | NULL   |       |
| PORT         | bigint(21)  | YES |     | NULL   |       |
| STATUS_PORT  | bigint(21)  | YES |     | NULL   |       |
| LEASE        | varchar(64) | YES |     | NULL   |       |
| VERSION      | varchar(64) | YES |     | NULL   |       |

14.13.18.2.49 TIDB_TRX

The TIDB_TRX table provides information about the transactions currently being executed on the TiDB node.

```
USE INFORMATION_SCHEMA;
DESC TIDB_TRX;
```

The output is as follows:

```

```

The meaning of each column field in the `TIDB_TRX` table is as follows:

- `ID`: The transaction ID, which is the `start_ts` (start timestamp) of the transaction.
- `START_TIME`: The start time of the transaction, which is the physical time corresponding to the `start_ts` of the transaction.
- `CURRENT_SQL_DIGEST`: The digest of the SQL statement currently being executed in the transaction.
- `CURRENT_SQL_DIGEST_TEXT`: The normalized form of the SQL statement currently being executed by the transaction, that is, the SQL statement without arguments and format. It corresponds to `CURRENT_SQL_DIGEST`.
- `STATE`: The current state of the transaction. The possible values include:
    - `Idle`: The transaction is in an idle state, that is, it is waiting for the user to input a query.
    - `Running`: The transaction is executing a query.
    - `LockWaiting`: The transaction is waiting for the pessimistic lock to be acquired. Note that the transaction enters this state at the beginning of the pessimistic locking operation, no matter whether it is blocked by other transactions or not.
    - `Committing`: The transaction is in the process of commit.
    - `RollingBack`: The transaction is being rolled back.
- `WAITING_START_TIME`: When the value of `STATE` is `LockWaiting`, this column shows the start time of the waiting.
- `MEM_BUFFER_KEYS`: The number of keys written into the memory buffer by the current transaction.
- `MEM_BUFFER_BYTES`: The total number of key-value bytes written into the memory buffer by the current transaction.
- `SESSION_ID`: The ID of the session to which this transaction belongs.
- `USER`: The name of the user who performs the transaction.
- `DB`: The current default database name of the session in which the transaction is executed.
- `ALL_SQL_DIGESTS`: The digest list of statements that have been executed by the transaction. The list is shown as a string array in JSON format. Each transaction records

at most the first 50 statements. Using the TIDB_DECODE_SQL_DIGESTS function, you can convert the information in this column into a list of corresponding normalized SQL statements.

- RELATED_TABLE_IDS: The IDs of the tables, views, and other objects that the transaction accesses.

Note:

- Only users with the PROCESS privilege can obtain the complete information in this table. Users without the PROCESS privilege can only query information of the transactions performed by the current user.
- The information (SQL digest) in the CURRENT_SQL_DIGEST and ALL_SQL ↪ _DIGESTS columns is the hash value calculated from the normalized SQL statement. The information in the CURRENT_SQL_DIGEST_TEXT column and the result returned from the TIDB_DECODE_SQL_DIGESTS function are internally queried from the statements summary tables, so it is possible that the corresponding statement cannot be found internally. For the detailed description of SQL digests and the statements summary tables, see Statement Summary Tables.
- The TIDB_DECODE_SQL_DIGESTS function call has a high overhead. If the function is called to query historical SQL statements for a large number of transactions, the query might take a long time. If the cluster is large with many concurrent transactions, avoid directly using this function on the ALL_SQL_DIGEST column while querying the full table of TIDB_TRX. This means to avoid an SQL statement like SELECT *, tidb_decode_ ↪ sql_digests(all_sql_digests)FROM TIDB_TRX.
- Currently the TIDB_TRX table does not support showing information of TiDB internal transactions.

Example

View the TIDB_TRX table:

```
SELECT * FROM INFORMATION_SCHEMA.TIDB_TRX\G
```

The output is as follows:

```
*************************** 1. row ***************************
                  ID: 426789913200689153
          START_TIME: 2021-08-04 10:51:54.883000
    CURRENT_SQL_DIGEST: NULL
CURRENT_SQL_DIGEST_TEXT: NULL
               STATE: Idle
```

```
    WAITING_START_TIME: NULL
       MEM_BUFFER_KEYS: 1
      MEM_BUFFER_BYTES: 29
            SESSION_ID: 7

          ↪ ","38
          ↪ b03afa5debbdf0326a014dbe5012a62c51957f1982b3093e748460f8b00821
          ↪ "]
2 rows in set (0.01 sec)
```

From the query result of this example, you can see that: the current node has two on-going transactions. One transaction is in the idle state (`STATE` is `Idle` and `CURRENT_SQL_DIGEST` is `NULL`), and this transaction has executed 3 statements (there are three records in the `ALL_SQL_DIGESTS` list, which are the digests of the three SQL statements that have been executed). Another transaction is executing a statement and waiting for the lock (`STATE` is `LockWaiting` and `WAITING_START_TIME` shows the start time of the waiting lock). The transaction has executed 2 statements, and the statement currently being executed is in the form of `"update `t` set `v` = `v` + ? where `id` = ?"`.

```
SELECT id, all_sql_digests, tidb_decode_sql_digests(all_sql_digests) AS all
   ↪ _sqls FROM INFORMATION_SCHEMA.TIDB_TRX\G
```

The output is as follows:

```
*************************** 1. row ***************************
           id: 426789913200689153
all_sql_digests: ["
   ↪ e6f07d43b5c21db0fbb9a31feac2dc599787763393dd5acbfad80e247eb02ad5","04

   ↪ b03afa5debbdf0326a014dbe5012a62c51957f1982b3093e748460f8b00821"]
      all_sqls: ["begin","update `t` set `v` = `v` + ? where `id` = ?"]
```

This query calls the TIDB_DECODE_SQL_DIGESTS function on the ALL_SQL_DIGESTS column of the TIDB_TRX table, and converts the SQL digest array into an array of normalized SQL statement through the system internal query. This helps you visually obtain the information of the statements that have been historically executed by the transaction. However, note that the preceding query scans the entire table of TIDB_TRX and calls the TIDB_DECODE ↪ _SQL_DIGESTS function for each row. Calling the TIDB_DECODE_SQL_DIGESTS function has a high overhead. Therefore, if many concurrent transactions exist in the cluster, try to avoid this type of query.

CLUSTER_TIDB_TRX

The TIDB_TRX table only provides information about the transactions that are being executed on a single TiDB node. If you want to view the information of the transactions that are being executed on all TiDB nodes in the entire cluster, you need to query the CLUSTER_TIDB_TRX table. Compared with the query result of the TIDB_TRX table, the query result of the CLUSTER_TIDB_TRX table includes an extra INSTANCE field. The INSTANCE field displays the IP address and port of each node in the cluster, which is used to distinguish the TiDB nodes where the transactions are located.

```
USE INFORMATION_SCHEMA;
DESC CLUSTER_TIDB_TRX;
```

The output is as follows:

```
+--
   ↪ ----------------------+-----------------------------------------------------
   ↪
| Field                | Type

14.13.18.2.50 TIFLASH_REPLICA

The TIFLASH_REPLICA table provides information about TiFlash replicas available.

```
USE INFORMATION_SCHEMA;
DESC TIFLASH_REPLICA;
```

The output is as follows:

```
+-----------------+-------------+------+-----+---------+-------+
| Field           | Type        | Null | Key | Default | Extra |
+-----------------+-------------+------+-----+---------+-------+
| TABLE_SCHEMA    | varchar(64) | YES  |     | NULL    |       |
| TABLE_NAME      | varchar(64) | YES  |     | NULL    |       |
| TABLE_ID        | bigint(21)  | YES  |     | NULL    |       |
| REPLICA_COUNT   | bigint(64)  | YES  |     | NULL    |       |
| LOCATION_LABELS | varchar(64) | YES  |     | NULL    |       |
| AVAILABLE       | tinyint(1)  | YES  |     | NULL    |       |
| PROGRESS        | double      | YES  |     | NULL    |       |
+-----------------+-------------+------+-----+---------+-------+
7 rows in set (0.01 sec)
```

Fields in the TIFLASH_REPLICA table are described as follows:

- TABLE_SCHEMA: the name of the database to which the table belongs.
- TABLE_NAME: the name of the table.
- TABLE_ID: the internal ID of the table, which is unique within a TiDB cluster.
- REPLICA_COUNT: the number of TiFlash replicas.
- LOCATION_LABELS: the LocationLabelList that is set when a TiFlash replica is created.
- AVAILABLE: indicates whether the TiFlash replica of the table is available. When the value is 1 (available), the TiDB optimizer can intelligently choose to push down queries to TiKV or TiFlash based on query cost. When the value is 0 (unavailable), TiDB will not push down queries to TiFlash. Once the value of this field becomes 1 (available), it will not change anymore.
- PROGRESS: the replication progress of TiFlash replicas, with the accuracy to two decimal places and at the minute level. The scope of this field is [0, 1]. When the AVAILABLE field is 1 and PROGRESS is less than 1, the TiFlash replica is far behind TiKV, and the queries pushed down to TiFlash will probably fail due to timeout of waiting for data replication.

14.13.18.2.51 TIFLASH_SEGMENTS

Warning:

Do not use this table in production environments, as the fields of the table are unstable, and subject to change in new releases of TiDB, without prior notice.

Note:

This table is not available on TiDB Serverless clusters.

The `TIFLASH_SEGMENTS` table provides statistical information about data tables in TiFlash.

```
USE information_schema;
DESC tiflash_segments;
```

Fields in the `TIFLASH_SEGMENTS` table are described as follows:

- `DATABASE`: Database name in TiFlash. The segment belongs to a table in this database.
- `TABLE`: Table name in TiFlash. The segment belongs to this table.
- `TIDB_DATABASE`: Database name in TiDB. The segment belongs to a table in this database.
- `TIDB_TABLE`: Table name in TiDB. The segment belongs to this table.
- `TABLE_ID`: The internal ID of the table to which the segment belongs. This ID is unique within a TiDB cluster.
- `IS_TOMBSTONE`: Indicates whether the table the segment belongs to can be recycled. `1` indicates that the table can be recycled. `0` indicates that the table is in a normal state.
- `SEGMENT_ID`: Segment ID, which is unique within a table.
- `RANGE`: The range of data that the segment contains.
- `EPOCH`: The updated version of the segment. The version number of each segment increases monotonically.
- `ROWS`: The total number of rows in the segment.
- `SIZE`: The total size of the segment data (in bytes).
- `DELTA_RATE`: The ratio of the total number of rows in the Delta layer to that in the segment.
- `DELTA_MEMTABLE_ROWS`: The total number of cached rows in the Delta layer.
- `DELTA_MEMTABLE_SIZE`: The total size of the data cached in the Delta layer (in bytes).
- `DELTA_MEMTABLE_COLUMN_FILES`: The number of Column Files cached in the Delta layer.

- `DELTA_MEMTABLE_DELETE_RANGES`: The number of Delete Ranges cached in the Delta layer.
- `DELTA_PERSISTED_PAGE_ID`: The ID of the data stored on a disk in the Delta layer.
- `DELTA_PERSISTED_ROWS`: The total number of rows of persisted data in the Delta layer.
- `DELTA_PERSISTED_SIZE`: The total size of the persisted data in the Delta layer (in bytes).
- `DELTA_PERSISTED_COLUMN_FILES`: The number of persisted Column Files in the Delta layer.
- `DELTA_PERSISTED_DELETE_RANGES`: The number of persisted Delete Ranges in the Delta layer.
- `DELTA_CACHE_SIZE`: The size of the cache in the Delta layer (in bytes).
- `DELTA_INDEX_SIZE`: The size of the indexes in the Delta layer (in bytes).
- `STABLE_PAGE_ID`: The disk storage ID of the data in the Stable layer.
- `STABLE_ROWS`: The total number of rows in the Stable layer.
- `STABLE_SIZE`: The total size of the data in the Stable layer (in bytes).
- `STABLE_DMFILES`: The number of DMFiles in the Stable layer.
- `STABLE_DMFILES_ID_0`: The disk storage ID of the first DMFile in the Stable layer.
- `STABLE_DMFILES_ROWS`: The total number of rows in the DMFile in the Stable layer.
- `STABLE_DMFILES_SIZE`: The total size of the data in the DMFile in the Stable layer (in bytes).
- `STABLE_DMFILES_SIZE_ON_DISK`: The disk space occupied by the DMFile in the Stable layer (in bytes).
- `STABLE_DMFILES_PACKS`: The number of Packs in the DMFile in the Stable layer.
- `TIFLASH_INSTANCE`: The address of the TiFlash instance.

14.13.18.2.52 TIFLASH_TABLES

> **Warning:**
>
> Do not use this table in production environments, as the fields of the table are unstable, and subject to change in new releases of TiDB, without prior notice.

> **Note:**
>
> This table is not available on TiDB Serverless clusters.

The `TIFLASH_TABLES` table provides statistical information about data tables in TiFlash.

```

Fields in the `TIFLASH_TABLES` table are described as follows:

- `DATABASE`: The name of the database that the table belongs to in TiFlash.
- `TABLE`: The name of the table in TiFlash.
- `TIDB_DATABASE`: The name of the database that the table belongs to in TiDB.
- `TIDB_TABLE`: The name of the table in TiDB.
- `TABLE_ID`: The internal ID of the table, which is unique within a TiDB cluster.
- `IS_TOMBSTONE`: Indicates whether the table can be recycled. `1` indicates that the table can be recycled, and `0` indicates that the table is in a normal state.
- `SEGMENT_COUNT`: The number of segments in the table. A segment is a data management unit in TiFlash.
- `TOTAL_ROWS`: The total number of rows in the table.

- `TOTAL_SIZE`: The total size of the table (in bytes).
- `TOTAL_DELETE_RANGES`: The total number of Delete Ranges in the table.
- `DELTA_RATE_ROWS`: The ratio of the total rows of the table in the Delta layer to the total rows of that table.
- `DELTA_RATE_SEGMENTS`: The proportion of segments that contain a non-empty Delta layer in the table.
- `DELTA_PLACED_RATE`: The proportion of rows that have completed index construction of the table in the Delta layer.
- `DELTA_CACHE_SIZE`: The size of the cache of the table in the Delta layer (in bytes).
- `DELTA_CACHE_RATE`: The proportion of cache data of the table in the Delta layer.
- `DELTA_CACHE_WASTED_RATE`: The proportion of invalid cache data of the table in the Delta layer.
- `DELTA_INDEX_SIZE`: The size of the memory occupied by indexes in the Delta layer (in bytes).
- `AVG_SEGMENT_ROWS`: The average number of rows in all segments of the table.
- `AVG_SEGMENT_SIZE`: The average size of all segments of the table (in bytes).
- `DELTA_COUNT`: The number of segments that contain a non-empty Delta layer in the table.
- `TOTAL_DELTA_ROWS`: The total number of rows in the Delta layer.
- `TOTAL_DELTA_SIZE`: The total size of the data in the Delta layer (in bytes).
- `AVG_DELTA_ROWS`: The average number of rows of data in all Delta layers.
- `AVG_DELTA_SIZE`: The average size of data in all Delta layers (in bytes).
- `AVG_DELTA_DELETE_RANGES`: The average number of Delete Range operations in all Delta layers.
- `STABLE_COUNT`: The number of segments that contain a non-empty Stable layer in the table.
- `TOTAL_STABLE_ROWS`: The total number of rows in all Stable layers.
- `TOTAL_STABLE_SIZE`: The total size of the data in all Stable layers (in bytes).
- `TOTAL_STABLE_SIZE_ON_DISK`: The disk space occupied by the data in all Stable layers (in bytes).
- `AVG_STABLE_ROWS`: The average number of rows of data in all Stable layers.
- `AVG_STABLE_SIZE`: The average size of data in all Stable layers (in bytes).
- `TOTAL_PACK_COUNT_IN_DELTA`: The total number of Column Files in all Delta layers.
- `MAX_PACK_COUNT_IN_DELTA`: The maximum number of Column Files in a single Delta layer.
- `AVG_PACK_COUNT_IN_DELTA`: The average number of Column Files in all Delta layers.
- `AVG_PACK_ROWS_IN_DELTA`: The average number of rows in all Column Files in all Delta layers.
- `AVG_PACK_SIZE_IN_DELTA`: The average size of data in all Column Files in all Delta layers (in bytes).
- `TOTAL_PACK_COUNT_IN_STABLE`: The total number of Packs in all Stable layers.
- `AVG_PACK_COUNT_IN_STABLE`: The average number of Packs in all Stable layers.
- `AVG_PACK_ROWS_IN_STABLE`: The average number of rows in all Packs in all Stable layers.
- `AVG_PACK_SIZE_IN_STABLE`: The average size of data in all Packs in the Stable layer

(in bytes).

- `STORAGE_STABLE_NUM_SNAPSHOTS`: The number of snapshots in the Stable layer.
- `STORAGE_STABLE_OLDEST_SNAPSHOT_LIFETIME`: The duration of the earliest snapshot in the Stable layer (in seconds).
- `STORAGE_STABLE_OLDEST_SNAPSHOT_THREAD_ID`: The thread ID of the earliest snapshot in the Stable layer.
- `STORAGE_STABLE_OLDEST_SNAPSHOT_TRACING_ID`: The tracing ID of the earliest snapshot in the Stable layer.
- `STORAGE_DELTA_NUM_SNAPSHOTS`: The number of snapshots in the Delta layer.
- `STORAGE_DELTA_OLDEST_SNAPSHOT_LIFETIME`: The duration of the earliest snapshot in the Delta layer (in seconds).
- `STORAGE_DELTA_OLDEST_SNAPSHOT_THREAD_ID`: The thread ID of the earliest snapshot in the Delta layer.
- `STORAGE_DELTA_OLDEST_SNAPSHOT_TRACING_ID`: The tracing ID of the earliest snapshot in the Delta layer.
- `STORAGE_META_NUM_SNAPSHOTS`: The number of snapshots in the meta information.
- `STORAGE_META_OLDEST_SNAPSHOT_LIFETIME`: The duration of the earliest snapshot in the meta information (in seconds).
- `STORAGE_META_OLDEST_SNAPSHOT_THREAD_ID`: The thread ID of the earliest snapshot in the meta information.
- `STORAGE_META_OLDEST_SNAPSHOT_TRACING_ID`: The tracing ID of the earliest snapshot in the meta information.
- `BACKGROUND_TASKS_LENGTH`: The length of the task queue in the background.
- `TIFLASH_INSTANCE`: The address of the TiFlash instance.

14.13.18.2.53 TIKV_REGION_PEERS

The `TIKV_REGION_PEERS` table shows detailed information of a single Region node in TiKV, such as whether it is a learner or leader.

> **Note:**
>
> This table is not available on TiDB Serverless clusters.

```
USE INFORMATION_SCHEMA;
DESC TIKV_REGION_PEERS;
```

The output is as follows:

```
+--------------+-------------+------+------+---------+-------+
| Field        | Type        | Null | Key | Default | Extra |
+--------------+-------------+------+------+---------+-------+
| REGION_ID    | bigint(21) | YES |     | NULL    |       |
```

```
| PEER_ID     | bigint(21) | YES |     | NULL   |       |
| STORE_ID    | bigint(21) | YES |     | NULL   |       |
| IS_LEARNER  | tinyint(1) | NO  |     | 0      |       |
| IS_LEADER   | tinyint(1) | NO  |     | 0      |       |
| STATUS      | varchar(10) | YES |    | 0      |       |
| DOWN_SECONDS | bigint(21) | YES |   | 0      |       |
+--------------+-------------+------+------+---------+-------+
7 rows in set (0.01 sec)
```

For example, you can query the specific TiKV addresses for the top 3 Regions with the maximum value of `WRITTEN_BYTES` using the following SQL statement:

```
SELECT
  address,
  tikv.address,
  region.region_id
FROM
  TIKV_STORE_STATUS tikv,
  TIKV_REGION_PEERS peer,
  (SELECT * FROM tikv_region_status ORDER BY written_bytes DESC LIMIT 3)
     ↪ region
WHERE
  region.region_id = peer.region_id
  AND peer.is_leader = 1
  AND peer.store_id = tikv.store_id;
```

Fields in the `TIKV_REGION_PEERS` table are described as follows:

- REGION_ID: The Region ID.
- PEER_ID: The ID of the Region peer.
- STORE_ID: The ID of the TiKV store where the Region is located.
- IS_LEARNER: Whether the peer is learner.
- IS_LEADER: Whether the peer is leader.
- STATUS: The statuses of a peer:
    - PENDING: Temporarily unavailable.
    - DOWN: Offline and converted. This peer no longer provides service.
    - NORMAL: Running normally.
- DOWN_SECONDS: The duration of being offline, in seconds.

14.13.18.2.54 TIKV_REGION_STATUS

The `TIKV_REGION_STATUS` table shows some basic information of TiKV Regions via PD's API, like the Region ID, starting and ending key-values, and read and write traffic.

> **Note:**
>
> This table is not available on TiDB Serverless clusters.

```
USE information_schema;
DESC tikv_region_status;
```

```

```

The descriptions of the columns in the `TIKV_REGION_STATUS` table are as follows:

- `REGION_ID`: The ID of the Region.
- `START_KEY`: The value of the start key of the Region.
- `END_KEY`: The value of the end key of the Region.

- `TABLE_ID`: The ID of the table to which the Region belongs.
- `DB_NAME`: The name of the database to which `TABLE_ID` belongs.
- `TABLE_NAME`: The name of the table to which the Region belongs.
- `IS_INDEX`: Whether the Region data is an index. 0 means that it is not an index, while 1 means that it is an index. If the current Region contains both table data and index data, there will be multiple rows of records, and `IS_INDEX` is 0 and 1 respectively.
- `INDEX_ID`: The ID of the index to which the Region belongs. If `IS_INDEX` is 0, the value of this column is NULL.
- `INDEX_NAME`: The name of the index to which the Region belongs. If `IS_INDEX` is 0, the value of this column is NULL.
- `EPOCH_CONF_VER`: The version number of the Region configuration. The version number increases when a peer is added or removed.
- `EPOCH_VERSION`: The current version number of the Region. The version number increases when the Region is split or merged.
- `WRITTEN_BYTES`: The amount of data (bytes) written to the Region.
- `READ_BYTES`: The amount of data (bytes) that has been read from the Region.
- `APPROXIMATE_SIZE`: The approximate data size (MB) of the Region.
- `APPROXIMATE_KEYS`: The approximate number of keys in the Region.
- `REPLICATIONSTATUS_STATE`: The current replication status of the Region. The status might be `UNKNOWN`, `SIMPLE_MAJORITY`, or `INTEGRITY_OVER_LABEL`.
- `REPLICATIONSTATUS_STATEID`: The identifier corresponding to `REPLICATIONSTATUS_STATE`.

Also, you can implement the `top confver`, `top read` and `top write` operations in pd-ctl via the `ORDER BY X LIMIT Y` operation on the `EPOCH_CONF_VER`, `WRITTEN_BYTES` and `READ_BYTES` columns.

You can query the top 3 Regions with the most write data using the following SQL statement:

```
SELECT * FROM tikv_region_status ORDER BY written_bytes DESC LIMIT 3;
```

14.13.18.2.55 TIKV_STORE_STATUS

The `TIKV_STORE_STATUS` table shows some basic information of TiKV nodes via PD's API, like the ID allocated in the cluster, address and port, and status, capacity, and the number of Region leaders of the current node.

> **Note:**
>
> This table is not available on TiDB Serverless clusters.

```
USE INFORMATION_SCHEMA;
DESC TIKV_STORE_STATUS;
```

The output is as follows:

```
+------------------+-------------+------+------+---------+-------+
| Field            | Type        | Null | Key  | Default | Extra |
+------------------+-------------+------+------+---------+-------+
| STORE_ID         | bigint(21)  | YES  |      | NULL    |       |
| ADDRESS          | varchar(64) | YES  |      | NULL    |       |
| STORE_STATE      | bigint(21)  | YES  |      | NULL    |       |
| STORE_STATE_NAME | varchar(64) | YES  |      | NULL    |       |
| LABEL            | json        | YES  |      | NULL    |       |
| VERSION          | varchar(64) | YES  |      | NULL    |       |
| CAPACITY         | varchar(64) | YES  |      | NULL    |       |
| AVAILABLE        | varchar(64) | YES  |      | NULL    |       |
| LEADER_COUNT     | bigint(21)  | YES  |      | NULL    |       |
| LEADER_WEIGHT    | double      | YES  |      | NULL    |       |
| LEADER_SCORE     | double      | YES  |      | NULL    |       |
| LEADER_SIZE      | bigint(21)  | YES  |      | NULL    |       |
| REGION_COUNT     | bigint(21)  | YES  |      | NULL    |       |
| REGION_WEIGHT    | double      | YES  |      | NULL    |       |
| REGION_SCORE     | double      | YES  |      | NULL    |       |
| REGION_SIZE      | bigint(21)  | YES  |      | NULL    |       |
| START_TS         | datetime    | YES  |      | NULL    |       |
| LAST_HEARTBEAT_TS | datetime   | YES  |      | NULL    |       |
| UPTIME           | varchar(64) | YES  |      | NULL    |       |
+------------------+-------------+------+------+---------+-------+
19 rows in set (0.00 sec)
```

The descriptions of the columns in the `TIKV_STORE_STATUS` table are as follows:

- `STORE_ID`: The ID of the Store.
- `ADDRESS`: The address of the Store.
- `STORE_STATE`: The identifier of the Store state, which corresponds to `STORE_STATE_NAME`.
- `STORE_STATE_NAME`: The name of the Store state. The name is `Up`, `Offline`, or `Tombstone`.
- `LABEL`: The label set for the Store.
- `VERSION`: The version number of the Store.
- `CAPACITY`: The storage capacity of the Store.
- `AVAILABLE`: The remaining storage space of the Store.
- `LEADER_COUNT`: The number of leaders on the Store.
- `LEADER_WEIGHT`: The leader weight of the Store.

- LEADER_SCORE: The leader score of the Store.
- LEADER_SIZE: The approximate total data size (MB) of all leaders on the Store.
- REGION_COUNT: The number of Regions on the Store.
- REGION_WEIGHT: The Region weight of the Store.
- REGION_SCORE: The Region score of the Store.
- REGION_SIZE: The approximate total data size (MB) of all Regions on the Store.
- START_TS: The timestamp when the Store is started.
- LAST_HEARTBEAT_TS: The timestamp of the last heartbeat sent by the Store.
- UPTIME: The total time since the Store starts.

14.13.18.2.56 USER_ATTRIBUTES

The USER_PRIVILEGES table provides information about user comments and user attributes. This information comes from the mysql.user system table.

```
USE information_schema;
DESC user_attributes;
```

```
+-----------+--------------+------+------+---------+-------+
| Field     | Type         | Null | Key | Default | Extra |
+-----------+--------------+------+------+---------+-------+
| USER      | varchar(32)  | NO |      | NULL    |       |
| HOST      | varchar(255) | NO |      | NULL    |       |
| ATTRIBUTE | longtext     | YES |     | NULL    |       |
+-----------+--------------+------+------+---------+-------+
3 rows in set (0.00 sec)
```

Fields in the USER_ATTRIBUTES table are described as follows:

- USER: The user name.
- HOST: The host from which the user can connect to TiDB. If the value of this field is %, it means that the user can connect to TiDB from any host.
- ATTRIBUTE: The comment and attribute of the user, which are set by the CREATE USER or ALTER USER statement.

The following is an example:

```
CREATE USER testuser1 COMMENT 'This user is created only for test';
CREATE USER testuser2 ATTRIBUTE '{"email": "user@pingcap.com"}';
SELECT * FROM information_schema.user_attributes;
```

```
+-----------+------+-----------------------------------------------------+
| USER      | HOST | ATTRIBUTE                                           |
+-----------+------+-----------------------------------------------------+
| root      | %    | NULL                                                |
```

```
| testuser1 | %  | {"comment": "This user is created only for test"} |
| testuser2 | %  | {"email": "user@pingcap.com"}                     |
+-----------+------+---------------------------------------------------+
3 rows in set (0.00 sec)
```

14.13.18.2.57 USER_PRIVILEGES

The USER_PRIVILEGES table provides information about global privileges. This information comes from the mysql.user system table:

```
USE INFORMATION_SCHEMA;
DESC USER_PRIVILEGES;
```

The output is as follows:

```
+----------------+-------------+------+-----+---------+-------+
| Field          | Type        | Null | Key | Default | Extra |
+----------------+-------------+------+-----+---------+-------+
| GRANTEE        | varchar(81) | YES  |     | NULL    |       |
| TABLE_CATALOG  | varchar(512) | YES |     | NULL    |       |
| PRIVILEGE_TYPE | varchar(64) | YES  |     | NULL    |       |
| IS_GRANTABLE   | varchar(3)  | YES  |     | NULL    |       |
+----------------+-------------+------+-----+---------+-------+
4 rows in set (0.00 sec)
```

View the information in the USER_PRIVILEGES table:

```
SELECT * FROM USER_PRIVILEGES;
```

The output is as follows:

```
+------------+---------------+-------------------------+--------------+
| GRANTEE    | TABLE_CATALOG | PRIVILEGE_TYPE          | IS_GRANTABLE |
+------------+---------------+-------------------------+--------------+
| 'root'@'%' | def           | SELECT                  | YES          |
| 'root'@'%' | def           | INSERT                  | YES          |
| 'root'@'%' | def           | UPDATE                  | YES          |
| 'root'@'%' | def           | DELETE                  | YES          |
| 'root'@'%' | def           | CREATE                  | YES          |
| 'root'@'%' | def           | DROP                    | YES          |
| 'root'@'%' | def           | PROCESS                 | YES          |
| 'root'@'%' | def           | REFERENCES              | YES          |
| 'root'@'%' | def           | ALTER                   | YES          |
| 'root'@'%' | def           | SHOW DATABASES          | YES          |
| 'root'@'%' | def           | SUPER                   | YES          |
| 'root'@'%' | def           | EXECUTE                 | YES          |
```

```
| 'root'@'%' | def        | INDEX                  | YES        |
| 'root'@'%' | def        | CREATE USER            | YES        |
| 'root'@'%' | def        | CREATE TABLESPACE      | YES        |
| 'root'@'%' | def        | TRIGGER                | YES        |
| 'root'@'%' | def        | CREATE VIEW            | YES        |
| 'root'@'%' | def        | SHOW VIEW              | YES        |
| 'root'@'%' | def        | CREATE ROLE            | YES        |
| 'root'@'%' | def        | DROP ROLE              | YES        |
| 'root'@'%' | def        | CREATE TEMPORARY TABLES | YES       |
| 'root'@'%' | def        | LOCK TABLES            | YES        |
| 'root'@'%' | def        | CREATE ROUTINE         | YES        |
| 'root'@'%' | def        | ALTER ROUTINE          | YES        |
| 'root'@'%' | def        | EVENT                  | YES        |
| 'root'@'%' | def        | SHUTDOWN               | YES        |
| 'root'@'%' | def        | RELOAD                 | YES        |
| 'root'@'%' | def        | FILE                   | YES        |
| 'root'@'%' | def        | CONFIG                 | YES        |
| 'root'@'%' | def        | REPLICATION CLIENT     | YES        |
| 'root'@'%' | def        | REPLICATION SLAVE      | YES        |
+------------+---------------+-------------------------+--------------+
31 rows in set (0.00 sec)
```

Fields in the `USER_PRIVILEGES` table are described as follows:

- `GRANTEE`: The name of the granted user, which is in the format of `'user_name'@'host_name'`.
- `TABLE_CATALOG`: The name of the catalog to which the table belongs. This value is always `def`.
- `PRIVILEGE_TYPE`: The privilege type to be granted. Only one privilege type is shown in each row.
- `IS_GRANTABLE`: If you have the `GRANT OPTION` privilege, the value is `YES`; otherwise, the value is `NO`.

See also

- `SHOW GRANTS`

14.13.18.2.58 VARIABLES_INFO

The `VARIABLES_INFO` table provides information about the default value, current value, and scope of system variables in the current TiDB instance or TiDB cluster.

```
USE information_schema;
DESC variables_info;
```

```
+----------------+---------------------+------+-----+---------+-------+
| Field          | Type                | Null | Key | Default | Extra |
+----------------+---------------------+------+-----+---------+-------+
| VARIABLE_NAME  | varchar(64)         | NO   |     | NULL    |       |
| VARIABLE_SCOPE | varchar(64)         | NO   |     | NULL    |       |
| DEFAULT_VALUE  | varchar(64)         | NO   |     | NULL    |       |
| CURRENT_VALUE  | varchar(64)         | NO   |     | NULL    |       |
| MIN_VALUE      | bigint(64)          | YES  |     | NULL    |       |
| MAX_VALUE      | bigint(64) unsigned | YES  |     | NULL    |       |
| POSSIBLE_VALUES | varchar(256)       | YES  |     | NULL    |       |
| IS_NOOP        | varchar(64)         | NO   |     | NULL    |       |
+----------------+---------------------+------+-----+---------+-------+
8 rows in set (0.00 sec)
```

```
SELECT * FROM variables_info ORDER BY variable_name LIMIT 3;
```

```
+--
   ↪ ---------------------------------+---------------+--------------+-----------
   ↪
| VARIABLE_NAME                    | VARIABLE_SCOPE | DEFAULT_VALUE | CURRENT_
   ↪ VALUE | MIN_VALUE | MAX_VALUE | POSSIBLE_VALUES | IS_NOOP |
+--
   ↪ ---------------------------------+---------------+--------------+-----------
   ↪
| allow_auto_random_explicit_insert | SESSION,GLOBAL | OFF   | OFF          |
   ↪       NULL |     NULL | NULL           | NO      |
| auto_increment_increment      | SESSION,GLOBAL | 1         | 1            |
   ↪          1 |    65535 | NULL           | NO      |
| auto_increment_offset         | SESSION,GLOBAL | 1         | 1            |
   ↪          1 |    65535 | NULL           | NO      |
+--
   ↪ ---------------------------------+---------------+--------------+-----------
   ↪
3 rows in set (0.01 sec)
```

Fields in the `VARIABLES_INFO` table are described as follows:

- `VARIABLE_NAME`: the name of the system variable.
- `VARIABLE_SCOPE`: the scope of the system variable. `SESSION` means that the system variable is only valid in the current session. `INSTANCE` means that the system variable is valid in the TiDB instance. `GLOBAL` means that the system variable is valid in the TiDB cluster. `NONE` means that the system variable is read only in the TiDB cluster.
- `DEFAULT_VALUE`: the default value of the system variable.

- `CURRENT_VALUE`: the current value of the system variable. If the scope includes `SESSION` ↪ , `CURRENT_VALUE` is the value in the current session.
- `MIN_VALUE`: the minimum value allowed for the system variable. If the system variable is not numeric, `MIN_VALUE` is NULL.
- `MAX_VALUE`: the maximum value allowed for the system variable. If the system variable is not numeric, `MAX_VALUE` is NULL.
- `POSSIBLE_VALUES`: the possible values of the system variable. If the system variable is not an enum type, `POSSIBLE_VALUES` is NULL.
- `IS_NOOP`: whether the system variable is a `noop` system variable.

14.13.18.2.59 VIEWS

The `VIEWS` table provides information about SQL views.

```
USE INFORMATION_SCHEMA;
DESC VIEWS;
```

The output is as follows:

```
+----------------------+-------------+------+-----+---------+-------+
| Field                | Type        | Null | Key | Default | Extra |
+----------------------+-------------+------+-----+---------+-------+
| TABLE_CATALOG        | varchar(512) | NO |     | NULL    |       |
| TABLE_SCHEMA         | varchar(64) | NO |     | NULL    |       |
| TABLE_NAME           | varchar(64) | NO |     | NULL    |       |
| VIEW_DEFINITION      | longtext    | NO  |     | NULL    |       |
| CHECK_OPTION         | varchar(8) | NO  |     | NULL    |       |
| IS_UPDATABLE         | varchar(3) | NO  |     | NULL    |       |
| DEFINER              | varchar(77) | NO |     | NULL    |       |
| SECURITY_TYPE        | varchar(7) | NO  |     | NULL    |       |
| CHARACTER_SET_CLIENT | varchar(32) | NO |   | NULL    |       |
| COLLATION_CONNECTION | varchar(32) | NO |   | NULL    |       |
+----------------------+-------------+------+-----+---------+-------+
10 rows in set (0.00 sec)
```

Create a view and query the `VIEWS` table:

```
CREATE VIEW test.v1 AS SELECT 1;
SELECT * FROM VIEWS\G
```

The output is as follows:

```
*************************** 1. row ***************************
       TABLE_CATALOG: def
        TABLE_SCHEMA: test
          TABLE_NAME: v1
     VIEW_DEFINITION: SELECT 1
```

```
       CHECK_OPTION: CASCADED
       IS_UPDATABLE: NO
            DEFINER: root@127.0.0.1
      SECURITY_TYPE: DEFINER
CHARACTER_SET_CLIENT: utf8mb4
COLLATION_CONNECTION: utf8mb4_0900_ai_ci
1 row in set (0.00 sec)
```

Fields in the `VIEWS` table are described as follows:

- `TABLE_CATALOG`: The name of the catalog to which the view belongs. This value is always `def`.
- `TABLE_SCHEMA`: The name of the schema to which the view belongs.
- `TABLE_NAME`: The view name.
- `VIEW_DEFINITION`: The definition of view, which is made by the `SELECT` statement when the view is created.
- `CHECK_OPTION`: The `CHECK_OPTION` value. The value options are `NONE`, `CASCADE`, and `LOCAL`.
- `IS_UPDATABLE`: Whether `UPDATE`/`INSERT`/`DELETE` is applicable to the view. In TiDB, the value is always `NO`.
- `DEFINER`: The name of the user who creates the view, which is in the format of `'user_name'@'host_name'`.
- `SECURITY_TYPE`: The value of `SQL SECURITY`. The value options are `DEFINER` and `INVOKER`.
- `CHARACTER_SET_CLIENT`: The value of the `character_set_client` session variable when the view is created.
- `COLLATION_CONNECTION`: The value of the `collation_connection` session variable when the view is created.

- `CREATE VIEW`
- `DROP VIEW`

14.13.18.3 Metrics Schema

The `METRICS_SCHEMA` is a set of views on top of TiDB metrics that are stored in Prometheus. The source of the PromQL (Prometheus Query Language) for each of the tables is available in `INFORMATION_SCHEMA.METRICS_TABLES`.

```
USE metrics_schema;
SELECT * FROM uptime;
SELECT * FROM information_schema.metrics_tables WHERE table_name='uptime'\G
```

```
+--
   ↪ -------------------------+----------------+-----------+--------------------+
   ↪

```

The `METRICS_SCHEMA` is used as a data source for monitoring-related summary tables such as (`metrics_summary`, `metrics_summary_by_label` and `inspection_summary`.

14.13.18.3.1 Additional Examples

Taking the `tidb_query_duration` monitoring table in `metrics_schema` as an example, this section illustrates how to use this monitoring table and how it works. The working principles of other monitoring tables are similar to `tidb_query_duration`.

Query the information related to the `tidb_query_duration` table on `information_schema.metrics_tables`:

```
SELECT * FROM information_schema.metrics_tables WHERE table_name='tidb_
    ↪ query_duration';
```

```
+--
    ↪ ------------------+-----------------------------------------------------------
    ↪
| TABLE_NAME        | PROMQL
    ↪
    ↪ | LABELS           | QUANTILE | COMMENT                                  |
+--
    ↪ ------------------+-----------------------------------------------------------
    ↪
| tidb_query_duration | histogram_quantile($QUANTILE, sum(rate(tidb_server_
    ↪ handle_query_duration_seconds_bucket{$LABEL_CONDITIONS}[$RANGE_
    ↪ DURATION])) by (le,sql_type,instance)) | instance,sql_type | 0.9 |
    ↪ The quantile of TiDB query durations(second) |
+--
    ↪ ------------------+-----------------------------------------------------------
    ↪
```

Field description:

- TABLE_NAME: Corresponds to the table name in metrics_schema . In this example, the table name is tidb_query_duration.
- PROMQL: The working principle of the monitoring table is to first map SQL statements to PromQL, then to request data from Prometheus, and to convert Prometheus results into SQL query results. This field is the expression template of PromQL. When you query the data of the monitoring table, the query conditions are used to rewrite the variables in this template to generate the final query expression.
- LABELS: The label for the monitoring item. tidb_query_duration has two labels: instance and sql_type.
- QUANTILE: The percentile. For monitoring data of the histogram type, a default percentile is specified. If the value of this field is 0, it means that the monitoring item corresponding to the monitoring table is not a histogram.
- COMMENT: Explanations for the monitoring table. You can see that the tidb_query_
  ↪ duration table is used to query the percentile time of the TiDB query execution, such as the query time of P999/P99/P90. The unit is second.

To query the schema of the tidb_query_duration table, execute the following statement:

```
SHOW CREATE TABLE metrics_schema.tidb_query_duration;
```

```
+--
    ↪ ------------------+-----------------------------------------------------------
    ↪
| Table              | Create Table

    ↪ utf8mb4_bin COMMENT='The quantile of TiDB query durations(second)' |
+--
    ↪ ------------------+-----------------------------------------------------------
    ↪
```

- `time`: The time of the monitoring item.
- `instance` and `sql_type`: The labels of the `tidb_query_duration` monitoring item. `instance` means the monitoring address. `sql_type` means the type of the executed SQL statement.
- `quantile`: The percentile. The monitoring item of the histogram type has this column, which indicates the percentile time of the query. For example, `quantile = 0.9` means to query the time of P90.
- `value`: The value of the monitoring item.

The following statement queries the P99 time within the range of [`2020-03-25 23:40:00` ↪ , `2020-03-25 23:42:00`].

```
SELECT * FROM metrics_schema.tidb_query_duration WHERE value is not null
    ↪ AND time>='2020-03-25 23:40:00' AND time <= '2020-03-25 23:42:00' AND
    ↪  quantile=0.99;
```

```

+--
    ↪ ------------------+------------------+---------+---------+----------------+
    ↪
```

The first row of the query result above means that at the time of 2020-03-25 23:40:00, on the TiDB instance `172.16.5.40:10089`, the P99 execution time of the `Insert` type statement is 0.509929485256 seconds. The meanings of other rows are similar. Other values of the `sql_type` column are described as follows:

- `Select`: The `select` type statement is executed.
- `internal`: The internal SQL statement of TiDB, which is used to update the statistical information and get the global variables.

To view the execution plan of the statement above, execute the following statement:

```
DESC SELECT * FROM metrics_schema.tidb_query_duration WHERE value is not
    ↪ null AND time>='2020-03-25 23:40:00' AND time <= '2020-03-25 23:42:00
    ↪ ' AND quantile=0.99;
```

```
+--
    ↪ ---------------+----------+------+-------------------------+-----------------
    ↪
```

```
| id             | estRows | task | access object         | operator info
   ↪
   ↪ |
+--
   ↪ ---------------+----------+------+-------------------------+----------------
   ↪
| Selection_5    | 8000.00 | root |                         | not(isnull(Column
   ↪ #5))
   ↪
   ↪ |
|  └─MemTableScan_6 | 10000.00 | root | table:tidb_query_duration | PromQL:
   ↪ histogram_quantile(0.99, sum(rate(tidb_server_handle_query_duration_
   ↪ seconds_bucket{}[60s])) by (le,sql_type,instance)), start_time
   ↪ :2020-03-25 23:40:00, end_time:2020-03-25 23:42:00, step:1m0s |
+--
   ↪ ---------------+----------+------+-------------------------+----------------
   ↪
```

From the result above, you can see that `PromQL`, `start_time`, `end_time`, and `step` are in the execution plan. During the execution process, TiDB calls the `query_range` HTTP API of Prometheus to query the monitoring data.

You might find that in the range of [2020-03-25 23:40:00, 2020-03-25 23:42:00], each label only has three time values. In the execution plan, the value of `step` is 1 minute, which means that the interval of these values is 1 minute. `step` is determined by the following two session variables:

- `tidb_metric_query_step`: The query resolution step width. To get the `query_range` data from Prometheus, you need to specify `start_time`, `end_time`, and `step`. `step` uses the value of this variable.
- `tidb_metric_query_range_duration`: When the monitoring data is queried, the value of the `$ RANGE_DURATION` field in `PROMQL` is replaced with the value of this variable. The default value is 60 seconds.

To view the values of monitoring items with different granularities, you can modify the two session variables above before querying the monitoring table. For example:

1. Modify the values of the two session variables and set the time granularity to 30 seconds.

> **Note:**
> The minimum granularity supported by Prometheus is 30 seconds.

```
set @@tidb_metric_query_step=30;
set @@tidb_metric_query_range_duration=30;
```

2. Query the `tidb_query_duration` monitoring item as follows. From the result, you can see that within the 3-minute time range, each label has 6 time values, and the interval between each value is 30 seconds.

```
select * from metrics_schema.tidb_query_duration where value is not
    ↪ null and time>='2020-03-25 23:40:00' and time <= '2020-03-25
    ↪ 23:42:00' and quantile=0.99;
```

tidb_profile_goroutines	
tidb_profile_memory	
tidb_profile_mutex	
tikv_profile_cpu	

14.13.18.4.2 SESSION_CONNECT_ATTRS

The SESSION_CONNECT_ATTRS table provides information about connection attributes. Session attributes are key-value pairs that are sent by the client when establishing a connection.

Common attributes:

Attribute Name	Example	Description
_client_name	libmysql	Client library name
_client_version	8.0.33	Client library version
_os	Linux	Operating System
_pid	712927	Process ID
_platform	x86_64	CPU Architecture
program_name	mysqlsh	Program name

You can view the columns of the SESSION_CONNECT_ATTRS table as follows:

```
USE performance_schema;
DESCRIBE session_connect_attrs;
```

```
+-----------------+---------------------+------+-----+---------+-------+
| Field           | Type                | Null | Key | Default | Extra |
+-----------------+---------------------+------+-----+---------+-------+
| PROCESSLIST_ID | bigint(20) unsigned | NO |   | NULL   |       |
| ATTR_NAME      | varchar(32)         | NO  |     | NULL   |       |
| ATTR_VALUE     | varchar(1024)       | YES |     | NULL   |       |
| ORDINAL_POSITION | int(11)           | YES |     | NULL   |       |
+-----------------+---------------------+------+-----+---------+-------+
```

You can view the information on session attributes stored in the SESSION_CONNECT_
↪ ATTRS table as follows:

```
USE performance_schema;
TABLE SESSION_CONNECT_ATTRS;
```

```
+---------------+----------------+-----------+-----------------+
| PROCESSLIST_ID | ATTR_NAME   | ATTR_VALUE | ORDINAL_POSITION |
+---------------+----------------+-----------+-----------------+
|       2097154 | _client_name | libmysql |              0 |
|       2097154 | _client_version | 8.1.0 |              1 |
|       2097154 | _os          | Linux    |              2 |
|       2097154 | _pid         | 1299203  |              3 |
|       2097154 | _platform    | x86_64   |              4 |
|       2097154 | program_name | mysqlsh  |              5 |
+---------------+----------------+-----------+-----------------+
```

Fields in the SESSION_CONNECT_ATTRS table are described as follows:

- PROCESSLIST_ID: Processlist ID of the session.
- ATTR_NAME: Attribute name.

- `ATTR_VALUE`: Attribute value.
- `ORDINAL_POSITION`: Ordinal position of the name/value pair.

14.13.18.5 SYS

14.13.18.5.1 sys Schema

Starting from v8.0.0, TiDB provides the `sys` schema. You can use the views in `sys` schema to understand the data in the system tables, `INFORMATION_SCHEMA`, and `PERFORMANCE_SCHEMA` of TiDB.

Tables for MySQL compatibility

Table name	Description
schema_unused_indexes	Records indexes that have not been used since the last start of TiDB.

14.13.18.5.2 schema_unused_indexes

`schema_unused_indexes` records indexes that have not been used since the last start of TiDB. It includes the following columns:

- `OBJECT_SCHEMA`: The name of the database to which the table containing the index belongs.
- `OBJECT_NAME`: The name of the table containing the index.
- `INDEX_NAME`: The name of the index.

```
USE SYS;
DESC SCHEMA_UNUSED_INDEXES;
```

The output is as follows:

```
+---------------+-------------+------+-----+---------+-------+
| Field         | Type        | Null | Key | Default | Extra |
+---------------+-------------+------+-----+---------+-------+
| object_schema | varchar(64) | YES  |     | NULL    |       |
| object_name   | varchar(64) | YES  |     | NULL    |       |
| index_name    | varchar(64) | YES  |     | NULL    |       |
+---------------+-------------+------+-----+---------+-------+
3 rows in set (0.00 sec)
```

Manually create the `schema_unused_indexes` view

For clusters upgraded from versions earlier than v8.0.0, the `sys` schema and the views in it are not created automatically. You can manually create them using the following SQL statements:

```
CREATE DATABASE IF NOT EXISTS sys;
CREATE OR REPLACE VIEW sys.schema_unused_indexes AS
  SELECT
    table_schema as object_schema,
    table_name as object_name,
    index_name
  FROM information_schema.cluster_tidb_index_usage
  WHERE
    table_schema not in ('sys', 'mysql', 'INFORMATION_SCHEMA', 'PERFORMANCE_
        ↪ SCHEMA') and
    index_name != 'PRIMARY'
  GROUP BY table_schema, table_name, index_name
  HAVING
    sum(last_access_time) is null;
```

14.13.19 Metadata Lock

This document introduces the metadata lock in TiDB.

14.13.19.1 Concept

TiDB uses the online asynchronous schema change algorithm to support changing metadata objects. When a transaction is executed, it obtains the corresponding metadata snapshot at the transaction start. If the metadata is changed during a transaction, to ensure data consistency, TiDB returns an `Information schema is changed` error and the transaction fails to commit.

To solve the problem, TiDB v6.3.0 introduces metadata lock into the online DDL algorithm. To avoid most DML errors, TiDB coordinates the priority of DMLs and DDLs during table metadata change and makes executing DDLs wait for the DMLs with old metadata to commit.

14.13.19.2 Scenarios

The metadata lock in TiDB applies to all DDL statements, such as:

- ADD INDEX
- ADD COLUMN
- DROP COLUMN
- DROP INDEX

- DROP PARTITION
- TRUNCATE TABLE
- EXCHANGE PARTITION
- CHANGE COLUMN
- MODIFY COLUMN

Enabling metadata lock might have some performance impact on the execution of the DDL task in TiDB. To reduce the impact, the following lists some scenarios that do not require metadata lock:

- `SELECT` queries with auto-commit enabled
- Stale Read is enabled
- Access temporary tables

14.13.19.3 Usage

Starting from v6.5.0, TiDB enables metadata lock by default. When you upgrade your existing cluster from v6.4.0 or earlier to v6.5.0 or later, TiDB automatically enables metadata lock. To disable metadata lock, you can set the system variable `tidb_enable_metadata_lock` to `OFF`.

14.13.19.4 Impact

- For DMLs, metadata lock does not block its execution, nor causes any deadlock.
- When metadata lock is enabled, the information of a metadata object in a transaction is determined on the first access and does not change after that.
- For DDLs, when changing metadata state, DDLs might be blocked by old transactions. The following is an example:

Session 1	Session 2

`CREATE TABLE t (a INT);`
`INSERT INTO t VALUES(1);`
`BEGIN;`	

	`ALTER TABLE t ADD COLUMN b INT;`
`SELECT * FROM t;`(Uses the current metadata version of table `t`. Returns `(a=1, b=NULL)` and locks table `t`.)	

Session 1	Session 2
	`ALTER TABLE t ADD COLUMN c INT;` (blocked by Session 1)

At the repeatable read isolation level, from the transaction start to the timepoint of determining the metadata of a table, if a DDL that requires data changes is performed, such as adding an index, or changing column types, the DDL returns an error as follows:

Session 1	Session 2
`CREATE TABLE t (a INT);`	
`INSERT INTO t VALUES(1);`	
`BEGIN;`	
	`ALTER TABLE t`
`SELECT * FROM t;` (index `idx` is not available)	
`COMMIT;`	
`BEGIN;`	
	`ALTER TABLE t`
`SELECT * FROM t;` (returns `ERROR 8028 (HY000): public column a has changed`)	

14.13.19.5 Observability

TiDB v6.3.0 introduces the `mysql.tidb_mdl_view` view to help you obtain the information of the current blocked DDL.

> **Note:**
>
> To select the `mysql.tidb_mdl_view` view, the PROCESS privilege is required.

The following takes adding an index for table `t` as an example. Assume that there is a DDL statement `ALTER TABLE t ADD INDEX idx(a)`:

```
SELECT * FROM mysql.tidb_mdl_view\G
*************************** 1. row ***************************
    JOB_ID: 141
   DB_NAME: test
TABLE_NAME: t
```

```
    QUERY: ALTER TABLE t ADD INDEX idx(a)
SESSION ID: 2199023255957
  TxnStart: 08-30 16:35:41.313(435643624013955072)
SQL_DIGESTS: ["begin","select * from `t`"]
1 row in set (0.02 sec)
```

From the preceding output, you can see that the transaction whose `SESSION ID` is `2199023255957` blocks the `ADD INDEX` DDL. `SQL_DIGEST` shows the SQL statements executed by this transaction, which is `["begin","select * from `t`"]`. To make the blocked DDL continue to execute, you can use the following global `KILL` statement to kill the `2199023255957` transaction:

```
mysql> KILL 2199023255957;
Query OK, 0 rows affected (0.00 sec)
```

After killing the transaction, you can select the `mysql.tidb_mdl_view` view again. At this time, the preceding transaction is not shown in the output, which means the DDL is not blocked.

```
SELECT * FROM mysql.tidb_mdl_view\G
Empty set (0.01 sec)
```

14.13.19.6 Principles

14.13.19.6.1 Description of the issue

DDL operations in TiDB are the online DDL mode. When a DDL statement is being executed, the metadata version of the defined object to be modified might go through multiple minor version changes. The online asynchronous metadata change algorithm only establishes that two adjacent minor versions are compatible, that is, operations between two versions do not break data consistency of the object that DDL changes.

When adding an index to a table, the state of the DDL statement changes as follows: None -> Delete Only, Delete Only -> Write Only, Write Only -> Write Reorg, Write Reorg -> Public.

The following commit process of transactions violates the preceding constraint:

Transaction	Version used by transaction	Latest version in the cluster	Version difference
txn1	None	None	0
txn2	DeleteOnly	DeleteOnly	0
txn3	WriteOnly	WriteOnly	0
txn4	None	WriteOnly	2
txn5	WriteReorg	WriteReorg	0

Transaction	Version used by transaction	Latest version in the cluster	Version difference
txn6	WriteOnly	WriteReorg	1
txn7	Public	Public	0

In the preceding table, the metadata version used when `txn4` is committed is two versions different from the latest version in the cluster. This might cause data inconsistency.

14.13.19.6.2 Implementation details

Metadata lock can ensure that the metadata versions used by all transactions in a TiDB cluster differ by one version at most. To achieve this goal, TiDB implements the following two rules:

- When executing a DML, TiDB records metadata objects accessed by the DML in the transaction context, such as tables, views, and corresponding metadata versions. These records are cleaned up when the transaction is committed.
- When a DDL statement changes state, the latest version of metadata is pushed to all TiDB nodes. If the difference between the metadata version used by all transactions related to this state change on a TiDB node and the current metadata version is less than two, the TiDB node is considered to acquire the metadata lock of the metadata object. The next state change can only be executed after all TiDB nodes in the cluster have obtained the metadata lock of the metadata object.

14.13.20 TiDB Accelerated Table Creation

TiDB v7.6.0 introduces the system variable `tidb_ddl_version` to support accelerating table creation, which improves the efficiency of bulk table creation. Starting from v8.0.0, this system variable is renamed to `tidb_enable_fast_create_table`.

TiDB uses the online asynchronous schema change algorithm to change the metadata. All DDL jobs are submitted to the `mysql.tidb_ddl_job` table, and the owner node pulls the DDL job to execute. After executing each phase of the online DDL algorithm, the DDL job is marked as completed and moved to the `mysql.tidb_ddl_history` table. Therefore, DDL statements can only be executed on the owner node and cannot be linearly extended.

However, for some DDL statements, it is not necessary to strictly follow the online DDL algorithm. For example, the `CREATE TABLE` statement only has two states for the job: `none` and `public`. Therefore, TiDB can simplify the execution process of DDL, and executes the `CREATE TABLE` statement on a non-owner node to accelerate table creation.

Warning:

This feature is currently an experimental feature and it is not recommended to use in a production environment. This feature might change or be removed without prior notice. If you find a bug, please give feedback by raising an issue on GitHub.

14.13.20.1 Compatibility with TiDB tools

- TiCDC does not support replicating the tables that are created by `tidb_enable_fast_create_table`.

14.13.20.2 Limitation

You can now use performance optimization for table creation only in the `CREATE TABLE` statement, and this statement must not include any foreign key constraints.

14.13.20.3 Use `tidb_enable_fast_create_table` to accelerate table creation

You can enable or disable performance optimization for creating tables by specifying the value of the system variable `tidb_enable_fast_create_table`.

To enable performance optimization for creating tables, set the value of this variable to `ON`:

```
SET GLOBAL tidb_enable_fast_create_table = ON;
```

To disable performance optimization for creating tables, set the value of this variable to `OFF`:

```
SET GLOBAL tidb_enable_fast_create_table = OFF;
```

14.13.20.4 Implementation principle

The detailed implementation principle of performance optimization for table creation is as follows:

1. Create a `CREATE TABLE` Job.

   The corresponding DDL Job is generated by parsing the `CREATE TABLE` statement.

2. Execute the `CREATE TABLE` job.

The TiDB node that receives the `CREATE TABLE` statement executes it directly, and then persists the table structure to TiKV. At the same time, the `CREATE TABLE` job is marked as completed and inserted into the `mysql.tidb_ddl_history` table.

3. Synchronize the table information.

TiDB notifies other nodes to synchronize the newly created table structure.

14.14 UI

14.14.1 TiDB Dashboard

14.14.1.1 TiDB Dashboard Introduction

TiDB Dashboard is a Web UI for monitoring, diagnosing, and managing the TiDB cluster, which is available since v4.0. It is built into the PD component and does not require an independent deployment.

> **Note:**
>
> TiDB v6.5.0 (and later) and TiDB Operator v1.4.0 (and later) support deploying TiDB Dashboard as an independent Pod on Kubernetes. For details, see Deploy TiDB Dashboard independently in TiDB Operator.

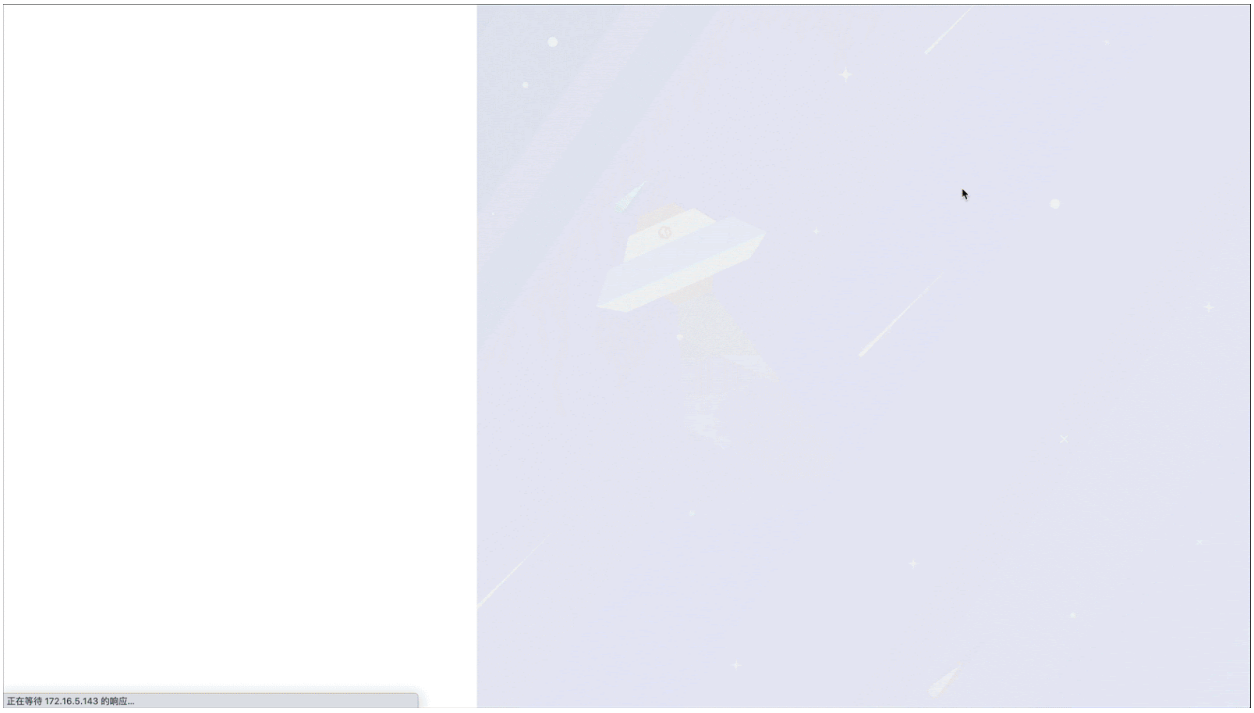

Figure 439: TiDB Dashboard interface

TiDB Dashboard is open-sourced on GitHub.

This document introduces the main features of TiDB Dashboard. You can click links in the following sections to learn more details.

14.14.1.1.1 Show the overall running status of the TiDB cluster

You can use TiDB Dashboard to learn the TiDB cluster's queries per second (QPS), execution time, the types of SQL statements that consume the most resources, and other overview information.

See TiDB Dashboard Overview for details.

14.14.1.1.2 Show the running status of components and hosts

You can use TiDB Dashboard to view the running status of TiDB, TiKV, PD, TiFlash components in the entire cluster and the running status of the host on which these components are located.

See TiDB Dashboard Cluster Information Page for details.

14.14.1.1.3 Show distribution and trends of read and write traffic

The Key Visualizer feature of TiDB Dashboard visually shows the change of read and write traffic over time in the entire cluster in the form of heatmap. You can use this feature to timely discover changes of application modes or locate hotspot issues with uneven performance.

See Key Visualizer Page for details.

14.14.1.1.4 Show a list of execution information of all SQL statements

The execution information of all SQL statements is listed on the SQL Statements page. You can use this page to learn the execution time and total executions at all stages, which helps you analyze and locate the SQL queries that consume the most resources and improve the overall cluster performance.

See SQL Statements Page of TiDB Dashboard for details.

14.14.1.1.5 Learn the detailed execution information of slow queries

The Slow Queries page of TiDB Dashboard shows a list of all SQL statements that take a long time to execute, including the SQL texts and execution information. This page helps you locate the cause of slow queries or performance jitter.

See Slow Queries Page for details.

14.14.1.1.6 Diagnose common cluster problems and generate reports

The diagnostic feature of TiDB Dashboard automatically determines whether some common risks (such as inconsistent configurations) or problems exist in the cluster, generates reports, and gives operation suggestions, or compares the status of each cluster metric in different time ranges for you to analyze possible problems.

See TiDB Dashboard Cluster Diagnostics Page for details.

14.14.1.1.7 Query logs of all components

On the Search Logs page of TiDB Dashboard, you can quickly search logs of all running instances in the cluster by keywords, time range, and other conditions, package these logs, and download them to your local machine.

See Search Logs Page for details.

14.14.1.1.8 Estimate cluster capacity for resource control

To implement resource isolation using the Resource Control feature, cluster administrators can create resource groups and set quotas for each group.

Before resource planning, you need to know the overall capacity of the cluster. For more details, see Resource Manager page.

14.14.1.1.9 Collect profiling data for each instance

This is an advanced debugging feature that lets you profile each instance online and analyze various internal operations an instance performed during the profiling data collection period and the proportion of the operation execution time in this period without third-party tools.

See Profile Instances Page for details.

14.14.1.2 Maintain

14.14.1.2.1 Deploy TiDB Dashboard

The TiDB Dashboard UI is built into the PD component for v4.0 or higher versions, and no additional deployment is required. Simply deploy a standard TiDB cluster, and TiDB Dashboard will be there.

> **Note:**
>
> TiDB v6.5.0 (and later) and TiDB Operator v1.4.0 (and later) support deploying TiDB Dashboard as an independent Pod on Kubernetes. For details, see Deploy TiDB Dashboard independently in TiDB Operator.

See the following documents to learn how to deploy a standard TiDB cluster:

- Quick Start Guide for the TiDB Database Platform
- Deploy TiDB in Production Environment
- Kubernetes environment deployment

> **Note:**
>
> You cannot deploy TiDB Dashboard in a TiDB cluster earlier than v4.0.

Deployment with multiple PD instances

When multiple PD instances are deployed in the cluster, only one of these instances serves the TiDB Dashboard.

When PD instances are running for the first time, they automatically negotiate with each other to choose one instance to serve the TiDB Dashboard. TiDB Dashboard will not run on other PD instances. The TiDB Dashboard service will always be provided by the chosen

PD instance no matter PD instances are restarted or new PD instances are joined. However, there will be a re-negotiation when the PD instance that serves TiDB Dashboard is removed from the cluster (scaled-in). The negotiation process does not need user intervention.

When you access a PD instance that does not serve TiDB Dashboard, the browser will be redirected automatically to guide you to access the PD instance that serves the TiDB Dashboard, so that you can access the service normally. This process is illustrated in the image below.

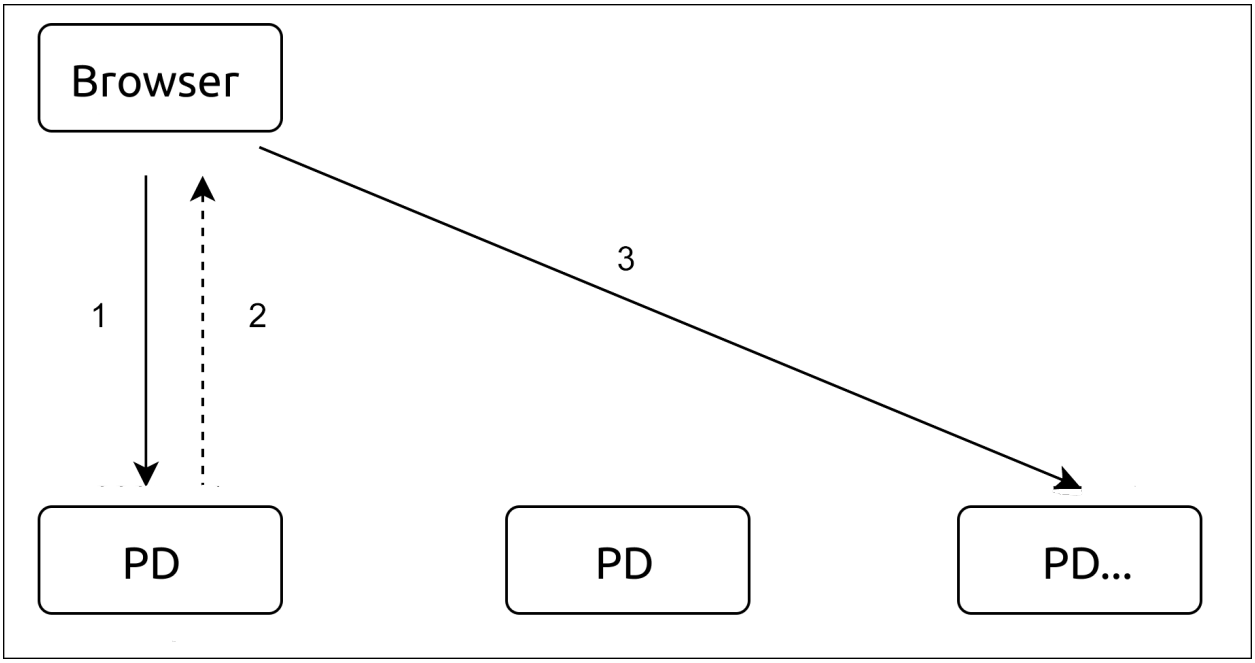

Figure 440: Process Schematic

Note:

The PD instance that serves TiDB Dashboard might not be a PD leader.

Check the PD instance that actually serves TiDB Dashboard

For a running cluster deployed using TiUP, you can use the `tiup cluster display` command to see which PD instance serves TiDB Dashboard. Replace `CLUSTER_NAME` with the cluster name.

```
tiup cluster display CLUSTER_NAME --dashboard
```

A sample output is as follows:

```
http://192.168.0.123:2379/dashboard/
```

Note:

This feature is available only in the later version of the `tiup cluster` deployment tool (v1.0.3 or later).

Upgrade TiUP Cluster

```
tiup update --self
tiup update cluster --force
```

Switch to another PD instance to serve TiDB Dashboard

For a running cluster deployed using TiUP, you can use the `tiup ctl:v<CLUSTER_VERSION> pd` command to change the PD instance that serves TiDB Dashboard, or re-specify a PD instance to serve TiDB Dashboard when it is disabled:

```
tiup ctl:v<CLUSTER_VERSION> pd -u http://127.0.0.1:2379 config set
    ↪ dashboard-address http://9.9.9.9:2379
```

In the command above:

- Replace `127.0.0.1:2379` with the IP and port of any PD instance.
- Replace `9.9.9.9:2379` with the IP and port of the new PD instance that you desire to run the TiDB Dashboard service.

You can use the `tiup cluster display` command to see whether the modification is taking effect (replace `CLUSTER_NAME` with the cluster name):

```
tiup cluster display CLUSTER_NAME --dashboard
```

Warning:

If you change the instance to run TiDB Dashboard, the local data stored in the previous TiDB Dashboard instance will be lost, including the Key Visualize history and search history.

Disable TiDB Dashboard

For a running cluster deployed using TiUP, use the `tiup ctl:v<CLUSTER_VERSION> pd` command to disable TiDB Dashboard on all PD instances (replace `127.0.0.1:2379` with the IP and port of any PD instance):

```
tiup ctl:v<CLUSTER_VERSION> pd -u http://127.0.0.1:2379 config set
    ↪ dashboard-address none
```

After disabling TiDB Dashboard, checking which PD instance provides the TiDB Dashboard service will fail:

```
Error: TiDB Dashboard is disabled
```

Visiting the TiDB Dashboard address of any PD instance via the browser will also fail:

```
Dashboard is not started.
```

Re-enable TiDB Dashboard

For a running cluster deployed using TiUP, use the `tiup ctl:v<CLUSTER_VERSION> pd` ↪ command to request PD to renegotiate an instance to run TiDB Dashboard (replace `127.0.0.1:2379` with the IP and port of any PD instance):

```
tiup ctl:v<CLUSTER_VERSION> pd -u http://127.0.0.1:2379 config set
    ↪ dashboard-address auto
```

After executing the command above, you can use the `tiup cluster display` command to view the TiDB Dashboard instance address automatically negotiated by PD (replace `CLUSTER_NAME` with the cluster name):

```
tiup cluster display CLUSTER_NAME --dashboard
```

You can also re-enable TiDB Dashboard by manually specifying the PD instance that serves TiDB Dashboard. See Switch to another PD instance to serve TiDB Dashboard.

> **Warning:**
>
> If the newly enabled TiDB Dashboard instance is different with the previous instance that served the TiDB Dashboard, the local data stored in the previous TiDB Dashboard instance will be lost, including Key Visualize history and search history.

What's next

- To learn how to access and log into the TiDB Dashboard UI, see Access TiDB Dashboard.

- To learn how to enhance the security of TiDB Dashboard, such as configuring a firewall, see Secure TiDB Dashboard.

14.14.1.2.2 Use TiDB Dashboard behind a Reverse Proxy

You can use a reverse proxy to safely expose the TiDB Dashboard service from the internal network to the external.

Procedures

Step 1: Get the actual TiDB Dashboard address

When multiple PD instances are deployed in the cluster, only one of the PD instances actually runs TiDB Dashboard. Therefore, you need to ensure that the upstream of the reverse proxy points to the correct address. For details of this mechanism, see Deployment with multiple PD instances.

When you use the TiUP tool for deployment, execute the following command to get the actual TiDB Dashboard address (replace `CLUSTER_NAME` with your cluster name):

```
tiup cluster display CLUSTER_NAME --dashboard
```

The output is the actual TiDB Dashboard address. A sample is as follows:

```
http://192.168.0.123:2379/dashboard/
```

Note:

This feature is available only in the later version of the `tiup cluster` deployment tool (v1.0.3 or later).

Upgrade TiUP Cluster

```
tiup update --self
tiup update cluster --force
```

Step 2: Configure the reverse proxy

Use HAProxy

When you use HAProxy as the reverse proxy, take the following steps:

1. Use reverse proxy for TiDB Dashboard on the `8033` port (for example). In the HAProxy configuration file, add the following configuration:

```
frontend tidb_dashboard_front
  bind *:8033
  use_backend tidb_dashboard_back if { path /dashboard } or { path_beg
     ↪ /dashboard/ }

backend tidb_dashboard_back
  mode http
  server tidb_dashboard 192.168.0.123:2379
```

Replace `192.168.0.123:2379` with IP and port of the actual address of the TiDB Dashboard obtained in Step 1.

> **Warning:**
> You must retain the `if` part in the `use_backend` directive to ensure that services **only in this path** are behind reverse proxy; otherwise, security risks might be introduced. See Secure TiDB Dashboard.

2. Restart HAProxy for the configuration to take effect.
3. Test whether the reverse proxy is effective: access the `/dashboard/` address on the `8033` port of the machine where HAProxy is located (such as `http://example.com` ↪ `:8033/dashboard/`) to access TiDB Dashboard.

Use NGINX

When you use NGINX as the reverse proxy, take the following steps:

1. Use reverse proxy for TiDB Dashboard on the `8033` port (for example). In the NGINX configuration file, add the following configuration:

```
server {
    listen 8033;
    location /dashboard/ {
    proxy_pass http://192.168.0.123:2379/dashboard/;
    }
}
```

Replace `http://192.168.0.123:2379/dashboard/` with the actual address of the TiDB Dashboard obtained in Step 1.

> **Warning:**
> You must keep the `/dashboard/` path in the `proxy_pass` directive to ensure that only the services under this path are reverse proxied. Otherwise, security risks will be introduced. See Secure TiDB Dashboard.

2. Reload NGINX for the configuration to take effect.

```
sudo nginx -s reload
```

3. Test whether the reverse proxy is effective: access the `/dashboard/` address on the `8033` port of the machine where NGINX is located (such as `http://example.com :8033/dashboard/`) to access TiDB Dashboard.

Customize path prefix

TiDB Dashboard provides services by default in the `/dashboard/` path, such as `http://example.com:8033/dashboard/`, which is the case even for reverse proxies. To configure the reverse proxy to provide the TiDB Dashboard service with a non-default path, such as `http://example.com:8033/foo/` or `http://example.com:8033/`, take the following steps.

Step 1: Modify PD configuration to specify the path prefix of TiDB Dashboard service

Modify the `public-path-prefix` configuration item in the `[dashboard]` category of the PD configuration to specify the path prefix of the TiDB Dashboard service. After this item is modified, restart the PD instance for the modification to take effect.

For example, if the cluster is deployed using TiUP and you want the service to run on `http://example.com:8033/foo/`, you can specify the following configuration:

```
server_configs:
  pd:
    dashboard.public-path-prefix: /foo
```

Modify configuration when deploying a new cluster using TiUP

If you are deploying a new cluster, you can add the configuration above to the `topology.yaml` TiUP topology file and deploy the cluster. For specific instruction, see TiUP deployment document.

Modify configuration of a deployed cluster using TiUP

For a deployed cluster:

1. Open the configuration file of the cluster in the edit mode (replace `CLUSTER_NAME` with the cluster name).

```
tiup cluster edit-config CLUSTER_NAME
```

2. Modify or add configuration items under the `pd` configuration of `server_configs`. If no `server_configs` exists, add it at the top level:

```
monitored:
  ...
server_configs:
  tidb: ...
```

```
  tikv: ...
  pd:
    dashboard.public-path-prefix: /foo
  ...
```

The configuration file after the modification is similar to the following file:

```
server_configs:
  pd:
    dashboard.public-path-prefix: /foo
  global:
    user: tidb
    ...
```

Or

```
monitored:
  ...
server_configs:
  tidb: ...
  tikv: ...
  pd:
    dashboard.public-path-prefix: /foo
```

3. Perform a rolling restart to all PD instances for the modified configuration to take effect (replace `CLUSTER_NAME` with your cluster name):

```
tiup cluster reload CLUSTER_NAME -R pd
```

See Common TiUP Operations - Modify the configuration for details.

If you want that the TiDB Dashboard service is run in the root path (such as `http://example.com:8033/`), use the following configuration:

```
server_configs:
  pd:
    dashboard.public-path-prefix: /
```

Warning:

After the modified and customized path prefix takes effect, you cannot directly access TiDB Dashboard. You can only access TiDB Dashboard through a reverse proxy that matches the path prefix.

Step 2: Modify the reverse proxy configuration

Use HAProxy

Taking `http://example.com:8033/foo/` as an example, the corresponding HAProxy configuration is as follows:

```
frontend tidb_dashboard_front
  bind *:8033
  use_backend tidb_dashboard_back if { path /foo } or { path_beg /foo/ }

backend tidb_dashboard_back
  mode http
  http-request set-path %[path,regsub(^/foo/?,/dashboard/)]
  server tidb_dashboard 192.168.0.123:2379
```

Replace `192.168.0.123:2379` with IP and port of the actual address of the TiDB Dashboard obtained in Step 1.

> **Warning:**
>
> You must retain the `if` part in the `use_backend` directive to ensure that services **only in this path** are behind reverse proxy; otherwise, security risks might be introduced. See Secure TiDB Dashboard.

If you want that the TiDB Dashboard service is run in the root path (such as `http://example.com:8033/`), use the following configuration:

```
frontend tidb_dashboard_front
  bind *:8033
  use_backend tidb_dashboard_back
backend tidb_dashboard_back
  mode http
  http-request set-path /dashboard%[path]
  server tidb_dashboard 192.168.0.123:2379
```

Modify the configuration and restart HAProxy for the modified configuration to take effect.

Use NGINX

Taking `http://example.com:8033/foo/` as an example, the corresponding NGINX configuration is as follows:

```
server {
  listen 8033;
```

```
  location /foo/ {
    proxy_pass http://192.168.0.123:2379/dashboard/;
  }
}
```

Replace `http://192.168.0.123:2379/dashboard/` with the actual address of the TiDB Dashboard obtained in Step 1.

> **Warning:**
>
> You must retain the `/dashboard/` path in the `proxy_pass` directive to ensure that services **only in this path** are behind reverse proxy; otherwise, security risks might be introduced. See Secure TiDB Dashboard.

If you want that the TiDB Dashboard service is run in the root path (such as `http://example.com:8033/`), use the following configuration:

```
server {
  listen 8033;
  location / {
    proxy_pass http://192.168.0.123:2379/dashboard/;
  }
}
```

Modify the configuration and restart NGINX for the modified configuration to take effect.

```
sudo nginx -s reload
```

What's next

To learn how to enhance the security of TiDB Dashboard, such as configuring a firewall, see Secure TiDB Dashboard.

14.14.1.2.3 TiDB Dashboard User Management

TiDB Dashboard uses the same user privilege system and sign-in authentication as TiDB. You can control and manage TiDB SQL users to limit their access to TiDB Dashboard. This document describes the least privileges required for TiDB SQL users to access TiDB Dashboard and exemplifies how to create a least-privileged SQL user and how to authorize via RBAC.

For details about how to control and manage TiDB SQL users, see TiDB User Account Management.

Required privileges

- To access TiDB Dashboard when Security Enhanced Mode (SEM) is not enabled on the connected TiDB server, the SQL user should have **all** the following privileges:

    - PROCESS
    - SHOW DATABASES
    - CONFIG
    - DASHBOARD_CLIENT

- To access TiDB Dashboard when Security Enhanced Mode (SEM) is enabled on the connected TiDB server, the SQL user should have **all** the following privileges:

    - PROCESS
    - SHOW DATABASES
    - CONFIG
    - DASHBOARD_CLIENT
    - RESTRICTED_TABLES_ADMIN
    - RESTRICTED_STATUS_ADMIN
    - RESTRICTED_VARIABLES_ADMIN

- To modify the configurations on the interface after signing in to TiDB Dashboard, the SQL user must also have the following privilege:

    - SYSTEM_VARIABLES_ADMIN

- To use the Fast Bind Executions Plan feature on the interface after signing in to TiDB Dashboard, the SQL user must also have the following privileges:

    - SYSTEM_VARIABLES_ADMIN
    - SUPER

> **Note:**
>
> Users with high privileges such as `ALL PRIVILEGES` or `SUPER` can sign in to TiDB Dashboard as well. Therefore, to comply with the least privilege principle, it is highly recommended that you create users with the required privileges only to prevent unintended operations. See Privilege Management for more information on these privileges.

If an SQL user does not meet the preceding privilege requirements, the user fails to sign in to TiDB Dashboard, as shown below.

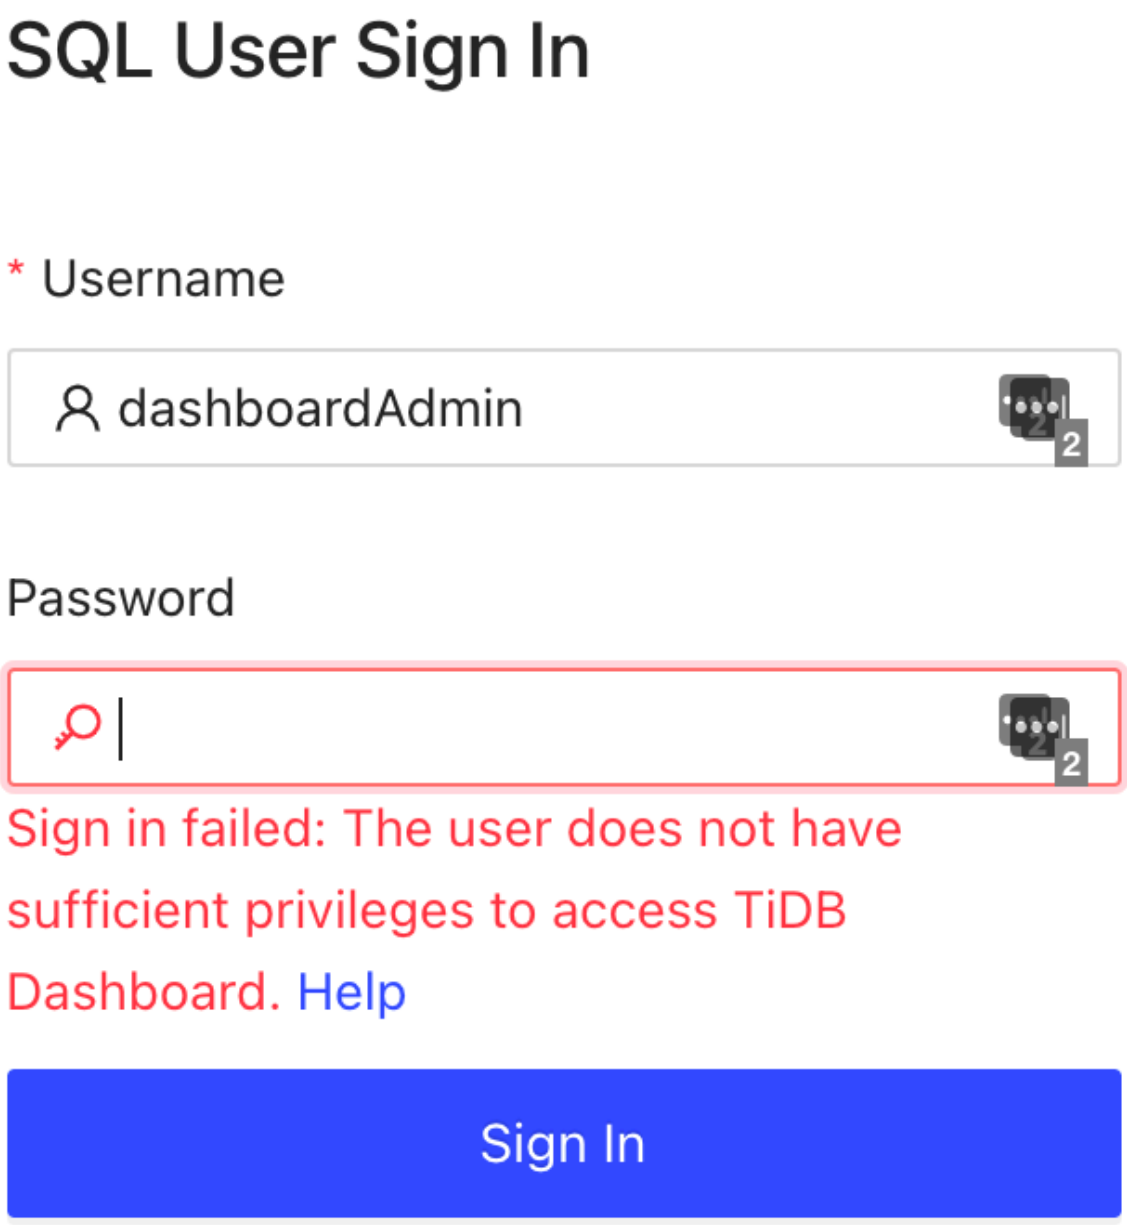

Figure 441: insufficient-privileges

Example: Create a least-privileged SQL user to access TiDB Dashboard

- When Security Enhanced Mode (SEM) is not enabled on the connected TiDB server, to create an SQL user `dashboardAdmin` that can sign in to TiDB Dashboard, execute the following SQL statements:

```
CREATE USER 'dashboardAdmin'@'%' IDENTIFIED BY '<YOUR_PASSWORD>';
```

```
GRANT PROCESS, CONFIG ON *.* TO 'dashboardAdmin'@'%';
GRANT SHOW DATABASES ON *.* TO 'dashboardAdmin'@'%';
GRANT DASHBOARD_CLIENT ON *.* TO 'dashboardAdmin'@'%';

-- To modify the configuration items on the interface after signing
   ↪ in to TiDB Dashboard, the user-defined SQL user must be granted
   ↪  with the following privilege.
GRANT SYSTEM_VARIABLES_ADMIN ON *.* TO 'dashboardAdmin'@'%';

-- To use the Fast Bind Executions Plan feature (https://docs.pingcap
   ↪ .com/tidb/dev/dashboard-statement-details#fast-plan-binding) on
   ↪  the interface after signing in to TiDB Dashboard, the user-
   ↪ defined SQL user must be granted with the following privileges.
GRANT SYSTEM_VARIABLES_ADMIN ON *.* TO 'dashboardAdmin'@'%';
GRANT SUPER ON *.* TO 'dashboardAdmin'@'%';
```

- When Security Enhanced Mode (SEM) is enabled on the connected TiDB server, disable SEM first and execute the following SQL statements to create an SQL user `dashboardAdmin` that can sign in to TiDB Dashboard. After creating the user, enable SEM again:

```
CREATE USER 'dashboardAdmin'@'%' IDENTIFIED BY '<YOUR_PASSWORD>';
GRANT PROCESS, CONFIG ON *.* TO 'dashboardAdmin'@'%';
GRANT SHOW DATABASES ON *.* TO 'dashboardAdmin'@'%';
GRANT DASHBOARD_CLIENT ON *.* TO 'dashboardAdmin'@'%';
GRANT RESTRICTED_STATUS_ADMIN ON *.* TO 'dashboardAdmin'@'%';
GRANT RESTRICTED_TABLES_ADMIN ON *.* TO 'dashboardAdmin'@'%';
GRANT RESTRICTED_VARIABLES_ADMIN ON *.* TO 'dashboardAdmin'@'%';

-- To modify the configuration items on the interface after signing
   ↪ in to TiDB Dashboard, the user-defined SQL user must be granted
   ↪  with the following privilege.
GRANT SYSTEM_VARIABLES_ADMIN ON *.* TO 'dashboardAdmin'@'%';

-- To use the Fast Bind Executions Plan feature (https://docs.pingcap
   ↪ .com/tidb/dev/dashboard-statement-details#fast-plan-binding) on
   ↪  the interface after signing in to TiDB Dashboard, the user-
   ↪ defined SQL user must be granted with the following privileges.
GRANT SYSTEM_VARIABLES_ADMIN ON *.* TO 'dashboardAdmin'@'%';
GRANT SUPER ON *.* TO 'dashboardAdmin'@'%';
```

Example: Authorize SQL user to access TiDB Dashboard via RBAC

The following example demonstrates how to create a role and a user to access TiDB Dashboard through the role-based access control (RBAC) mechanism.

1. Create a `dashboard_access` role that meets all privilege requirements of TiDB Dashboard:

```
CREATE ROLE 'dashboard_access';
GRANT PROCESS, CONFIG ON *.* TO 'dashboard_access'@'%';
GRANT SHOW DATABASES ON *.* TO 'dashboard_access'@'%';
GRANT DASHBOARD_CLIENT ON *.* TO 'dashboard_access'@'%';
GRANT SYSTEM_VARIABLES_ADMIN ON *.* TO 'dashboard_access'@'%';
GRANT SUPER ON *.* TO 'dashboardAdmin'@'%';
```

2. Grant the `dashboard_access` role to other users and set `dashboard_access` as the default role:

```
CREATE USER 'dashboardAdmin'@'%' IDENTIFIED BY '<YOUR_PASSWORD>';
GRANT 'dashboard_access' TO 'dashboardAdmin'@'%';
-- You need to set dashboard_access as the default role to the user
SET DEFAULT ROLE dashboard_access to 'dashboardAdmin'@'%';
```

After the above steps, you can use the `dashboardAdmin` user to sign in to TiDB Dashboard.

Sign in to TiDB Dashboard

After creating an SQL user that meets the privilege requirements of TiDB Dashboard, you can use this user to Sign in to TiDB Dashboard.

14.14.1.2.4 Secure TiDB Dashboard

Although you need to sign into TiDB Dashboard before accessing it, TiDB Dashboard is designed to be accessed by trusted user entities by default. When you want to provide TiDB Dashboard to external network users or untrusted users for access, take the following measures to avoid security vulnerabilities.

Enhance security of TiDB users

Set a strong password for the TiDB `root` user

The account system of TiDB Dashboard is consistent with that of TiDB SQL users. By default, TiDB's `root` user has no password, so accessing TiDB Dashboard does not require password authentication, which will give the malicious visitor high privileges, including executing privileged SQL statements.

It is recommended that you set a strong password for the TiDB `root` user. See TiDB User Account Management for details. Alternatively, you can disable the TiDB `root` user.

Create a least-privileged user for TiDB Dashboard

The account system of TiDB Dashboard is consistent with that of TiDB SQL. Users accessing TiDB Dashboard are authenticated and authorized based on TiDB SQL user's privileges. Therefore, TiDB Dashboard requires limited privileges, or merely the read-only

privilege. You can configure users to access TiDB Dashboard based on the principle of least privilege, thus avoiding access of high-privileged users.

It is recommended that you create a least-privileged SQL user to access and sign in to TiDB Dashboard. This avoids access of high-privileged users and improves security. See TiDB Dashboard User Management for details.

Use a firewall to block untrusted access

> **Note:**
>
> TiDB v6.5.0 (and later) and TiDB Operator v1.4.0 (and later) support deploying TiDB Dashboard as an independent Pod on Kubernetes. Using TiDB Operator, you can access the IP address of this Pod to start TiDB Dashboard. This port does not communicate with other privileged interfaces of PD and no extra firewall is required if provided externally. For details, see Deploy TiDB Dashboard independently in TiDB Operator.

TiDB Dashboard provides services through the PD client port, which defaults to http://IP:2379/dashboard/. Although TiDB Dashboard requires identity authentication, other privileged interfaces (such as http://IP:2379/pd/api/v1/members) in PD carried on the PD client port do not require identity authentication and can perform privileged operations. Therefore, exposing the PD client port directly to the external network is extremely risky.

It is recommended that you take the following measures:

- Use a firewall to prohibit a component from accessing **any** client port of the PD component via the external network or untrusted network.

> **Note:**
>
> TiDB, TiKV, and other components need to communicate with the PD component through the PD client port, so do not block access to the internal network between components. Otherwise, the cluster will become unavailable.

- See Use TiDB Dashboard behind a Reverse Proxy to learn how to configure the reverse proxy to safely provide the TiDB Dashboard service on another port to the external network.

How to open access to TiDB Dashboard port when deploying multiple PD instances

> **Warning:**
>
> This section describes an unsafe access solution, which is for the test environment only. **DO NOT** use this solution in the production environment.

In the test environment, you might need to configure the firewall to open the TiDB Dashboard port for external access.

When multiple PD instances are deployed, only one of the PD instances actually runs TiDB Dashboard, and browser redirection occurs when you access other PD instances. Therefore, you need to ensure that the firewall is configured with the correct IP address. For details of this mechanism, see Deployment with multiple PD instances.

When using the TiUP deployment tool, you can view the address of the PD instance that actually runs TiDB Dashboard by running the following command (replace `CLUSTER_NAME` with the cluster name):

```
tiup cluster display CLUSTER_NAME --dashboard
```

The output is the actual TiDB Dashboard address.

> **Note:**
>
> This feature is available only in the later version of the `tiup cluster` deployment tool (v1.0.3 or later).
>
> Upgrade TiUP Cluster
>
> ```
> tiup update --self
> tiup update cluster --force
> ```

The following is a sample output:

```
http://192.168.0.123:2379/dashboard/
```

In this example, the firewall needs to be configured with inbound access for the `2379` port of the `192.168.0.123` open IP, and the TiDB Dashboard is accessed via http://192.168.0.123:2379/dashboard/.

Reverse proxy only for TiDB Dashboard

As mentioned in Use a firewall to block untrusted access, the services provided under the PD client port include not only TiDB Dashboard (located at http://IP:2379/dashboard/),

but also other privileged interfaces in PD (such as http://IP:2379/pd/api/v1/members). Therefore, when using a reverse proxy to provide TiDB Dashboard to the external network, ensure that the services **ONLY** with the `/dashboard` prefix are provided (**NOT** all services under the port) to avoid that the external network can access the privileged interface in PD through the reverse proxy.

It is recommended that you see Use TiDB Dashboard behind a Reverse Proxy to learn a safe and recommended reverse proxy configuration.

Enable TLS for reverse proxy

To further enhance the security of the transport layer, you can enable TLS for reverse proxy, and even introduce mTLS to authenticate user certificates.

See Configuring HTTPS servers and HAProxy SSL Termination for more details.

Other recommended safety measures

- Enable TLS Authentication and Encrypt the Stored Data
- Enable TLS Between TiDB Clients and Servers

14.14.1.3 Access TiDB Dashboard

To access TiDB Dashboard, visit http://127.0.0.1:2379/dashboard via your browser. Replace `127.0.0.1:2379` with the actual PD instance address and port.

> **Note:**
>
> TiDB v6.5.0 (and later) and TiDB Operator v1.4.0 (and later) support deploying TiDB Dashboard as an independent Pod on Kubernetes. Using TiDB Operator, you can access the IP address of this Pod to start TiDB Dashboard. For details, see Deploy TiDB Dashboard independently in TiDB Operator.

14.14.1.3.1 Access TiDB Dashboard when multiple PD instances are deployed

When multiple multiple PD instances are deployed in your cluster and you can directly access **every** PD instance and port, you can simply replace `127.0.0.1:2379` in the http://127.0.0.1:2379/dashboard/ address with **any** PD instance address and port.

> **Note:**
>
> If a firewall or reverse proxy is configured and you cannot directly access every PD instance, you might not be able to access TiDB Dashboard. Usually, this

is because the firewall or reverse proxy is not correctly configured. See Use TiDB Dashboard behind Reverse Proxy and Secure TiDB Dashboard to learn how to correctly configure the firewall or reverse proxy when multiple PD instances are deployed.

14.14.1.3.2 Browser compatibility

You can use TiDB Dashboard in the following common desktop browsers of a relatively newer version:

- Chrome >= 77
- Firefox >= 68
- Edge >= 17

Note:

If you use the browsers above of earlier versions or other browsers to access TiDB Dashboard, some functions might not work properly.

14.14.1.3.3 Sign in

After accessing TiDB Dashboard, you will be directed to the user login interface, as shown in the image below.

- You can sign in to TiDB Dashboard using the TiDB `root` account.
- If you have created a User-defined SQL User, you can sign in using this account and the corresponding password.

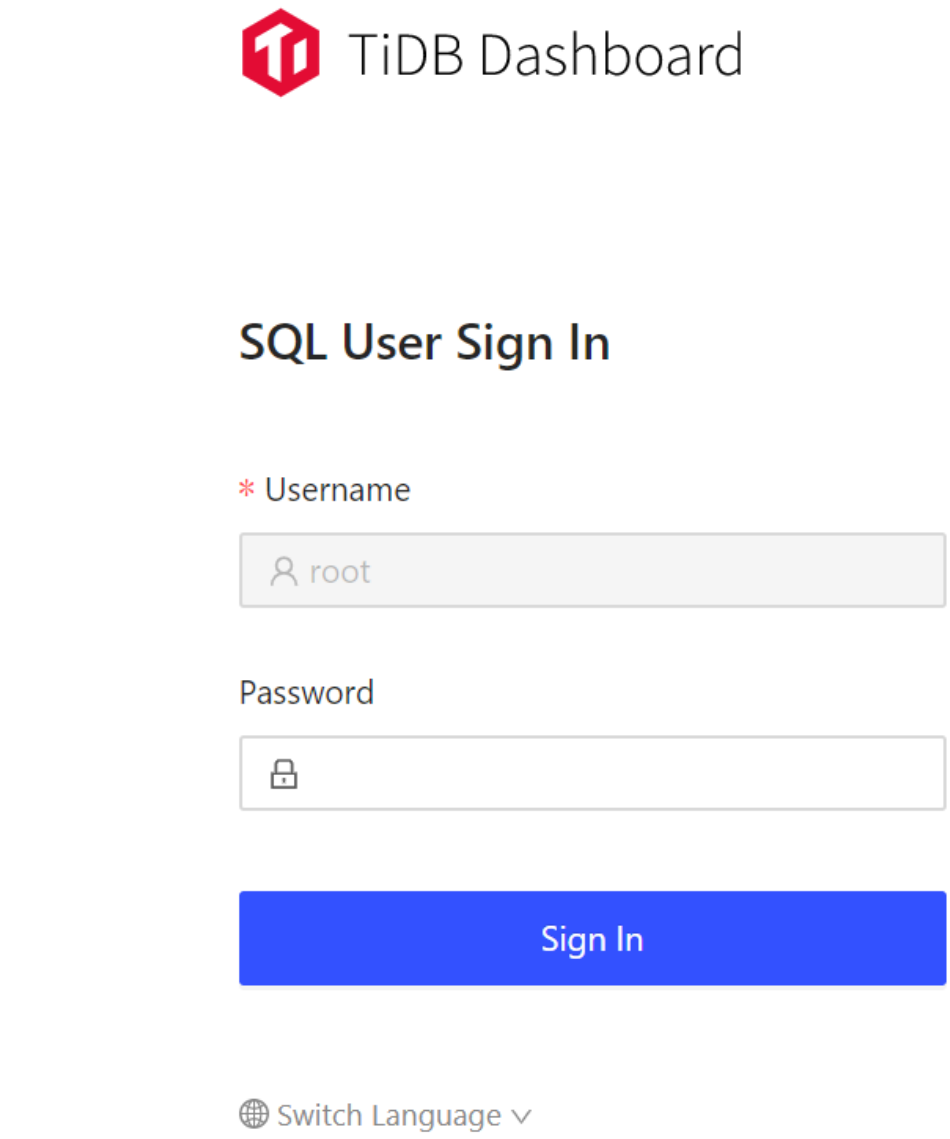

Figure 442: Login interface

If one of the following situations exists, the login might fail:

- TiDB `root` user does not exist.
- PD is not started or cannot be accessed.
- TiDB is not started or cannot be accessed.
- Wrong `root` password.

Once you have signed in, the session remains valid within the next 24 hours. To learn how to sign out, refer to the Logout section.

14.14.1.3.4 Switch language

The following languages are supported in TiDB Dashboard:

- English
- Chinese (simplified)

In the **SQL User Sign In** page, you can click the **Switch Language** drop-down list to switch the interface language.

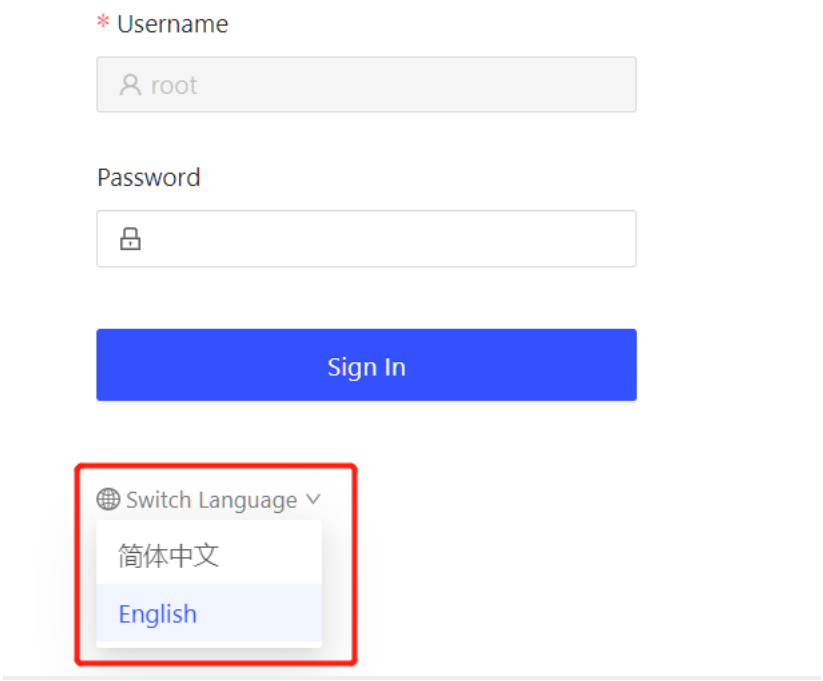

Figure 443: Switch language

14.14.1.3.5 Logout

Once you have logged in, click the login user name in the left navigation bar to switch to the user page. Click the **Logout** button on the user page to log out the current user. After logging out, you need to re-enter your username and password.

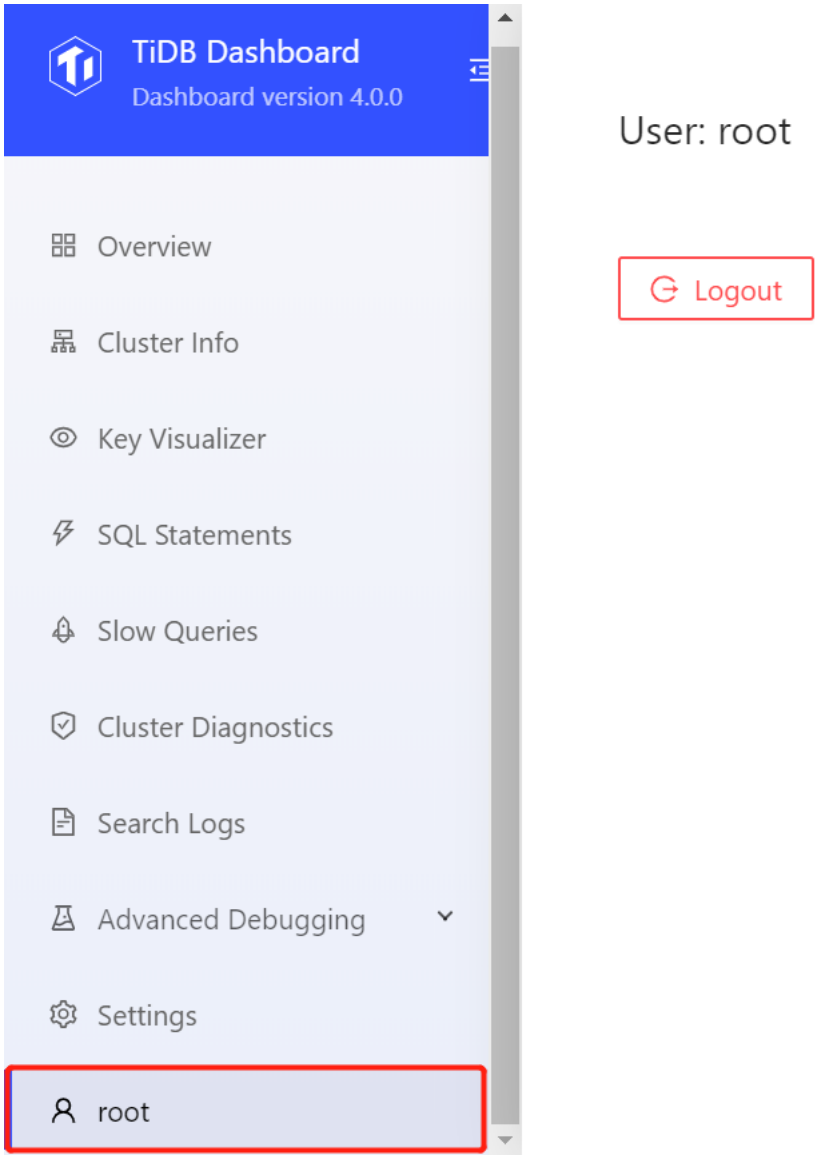

Figure 444: Logout

14.14.1.4 Overview Page

This page shows the overview of the entire TiDB cluster, including the following information:

- Queries per second (QPS) of the entire cluster.
- The query latency of the entire cluster.
- The SQL statements that have accumulated the longest execution time over the recent period.
- The slow queries whose execution time over the recent period exceeds the threshold.
- The node count and status of each instance.
- Monitor and alert messages.

14.14.1.4.1 Access the page

After logging in to TiDB Dashboard, the overview page is entered by default, or you can click **Overview** in the left navigation menu to enter this page:

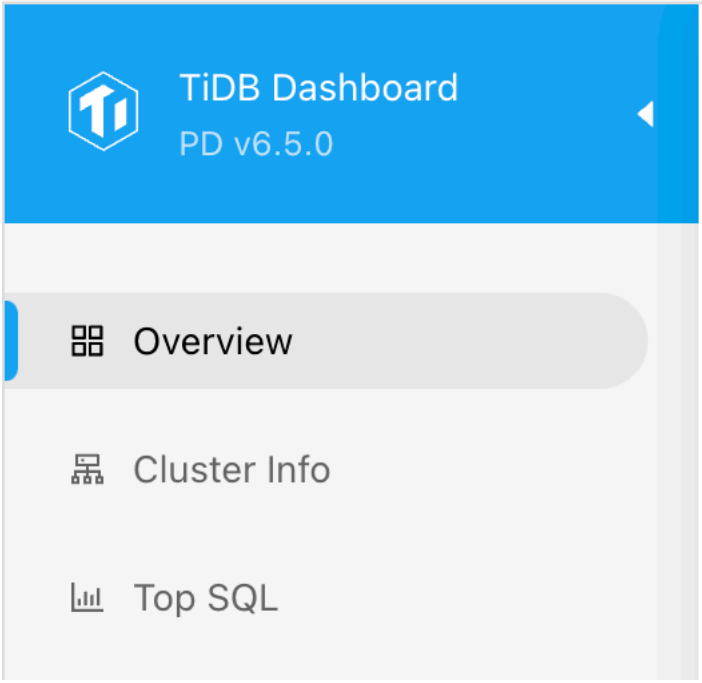

Figure 445: Enter overview page

14.14.1.4.2 QPS

This area shows the number of successful and failed queries per second for the entire cluster over the recent hour:

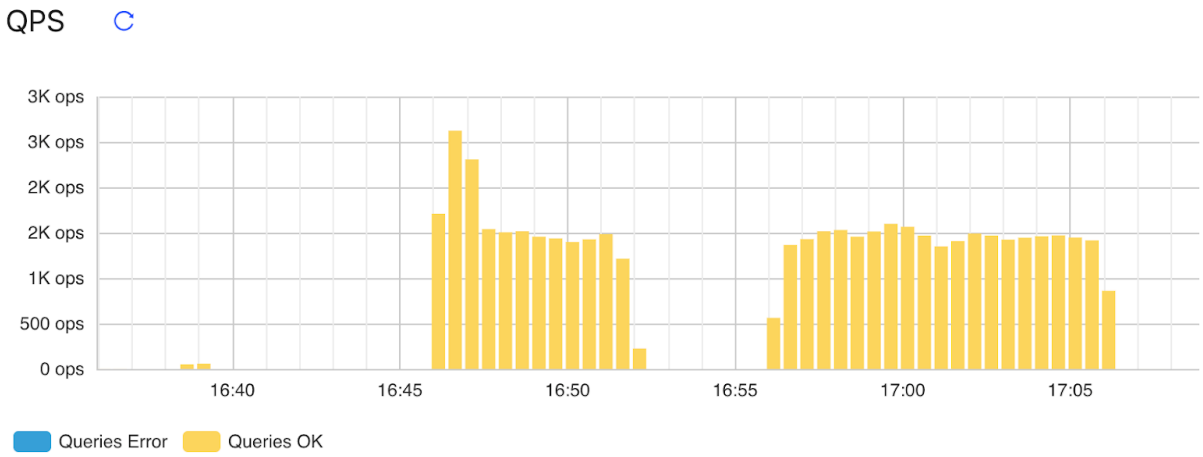

Figure 446: QPS

Note:

This feature is available only in the cluster where the Prometheus monitoring component is deployed. If Prometheus is not deployed, an error will be displayed.

14.14.1.4.3 Latency

This area shows the latency of 99.9%, 99%, and 90% of queries in the entire cluster over the recent one hour:

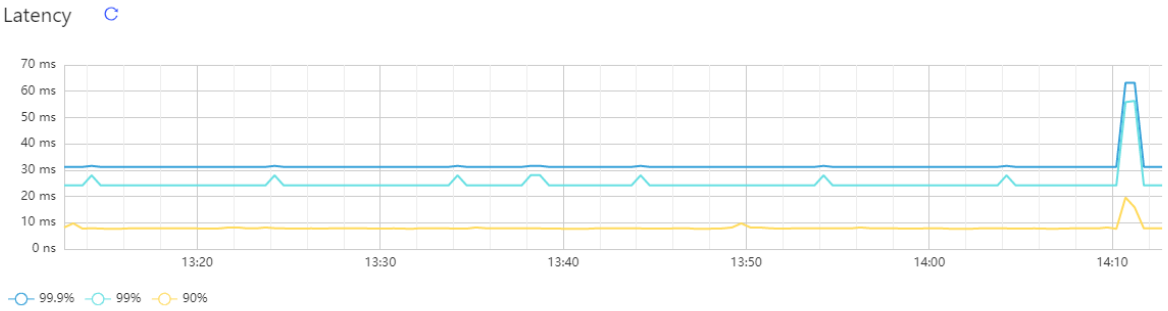

Figure 447: Latency

Note:

This feature is available only on the cluster where the Prometheus monitoring component is deployed. If Prometheus is not deployed, an error will be displayed.

14.14.1.4.4 Top SQL statements

This area shows the ten types of SQL statements that have accumulated the longest execution time in the entire cluster over the recent period. SQL statements with different query parameters but of the same structure are classified into the same SQL type and displayed in the same row:

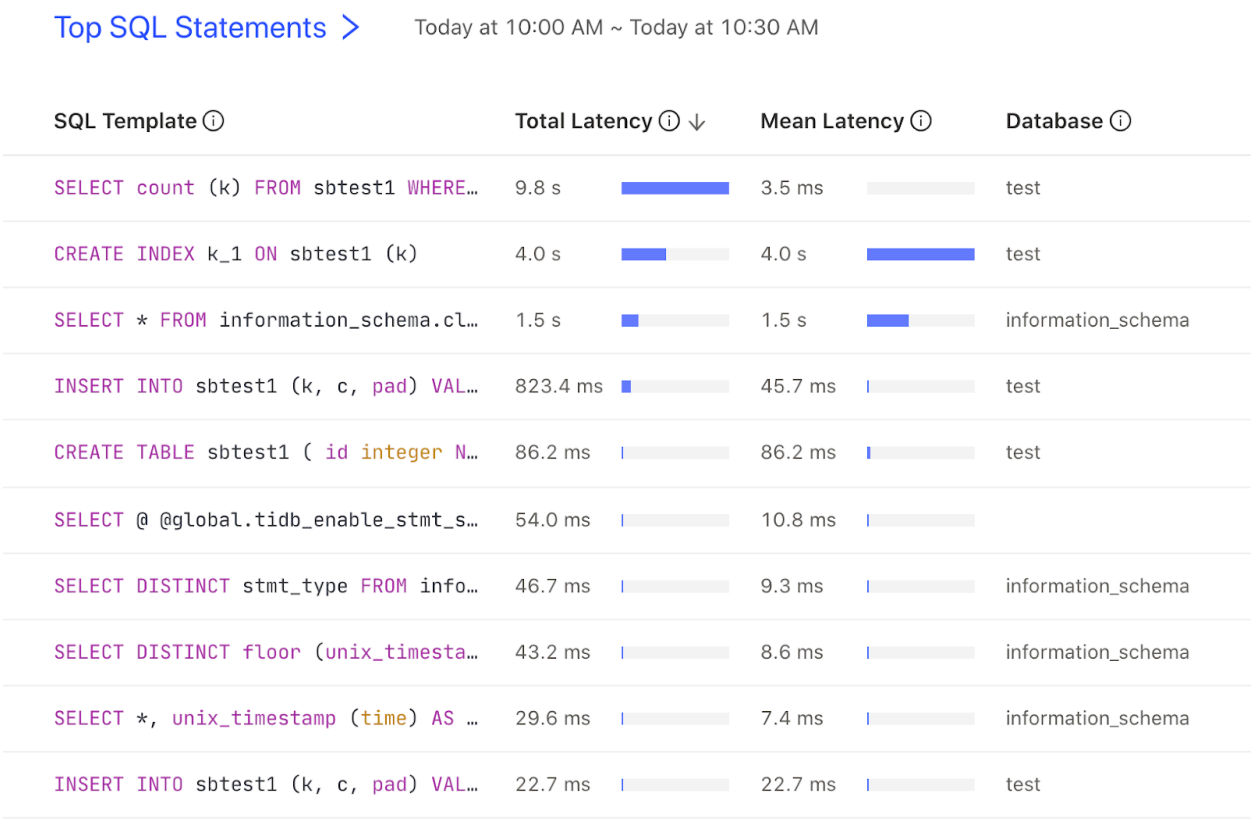

Figure 448: Top SQL

The information shown in this area is consistent with the more detailed SQL Statements Page. You can click the **Top SQL Statements** heading to view the complete list. For details of the columns in this table, see SQL Statements Page.

> **Note:**
>
> This feature is available only on the cluster where SQL Statements feature is enabled.

14.14.1.4.5 Recent slow queries

By default, this area shows the latest 10 slow queries in the entire cluster over the recent 30 minutes:

Figure 449: Recent slow queries

By default, the SQL query that is executed longer than 300 milliseconds is counted as a slow query and displayed on the table. You can change this threshold by modifying the tidb_slow_log_threshold variable or the instance.tidb_slow_log_threshold TiDB parameter.

The content displayed in this area is consistent with the more detailed Slow Queries Page. You can click the **Recent Slow Queries** title to view the complete list. For details of the columns in this table, see this Slow Queries Page.

> **Note:**
>
> This feature is available only in the cluster with slow query logs enabled. By default, slow query logs are enabled in the cluster deployed using TiUP.

14.14.1.4.6 Instances

This area summarizes the total number of instances and abnormal instances of TiDB, TiKV, PD, and TiFlash in the entire cluster:

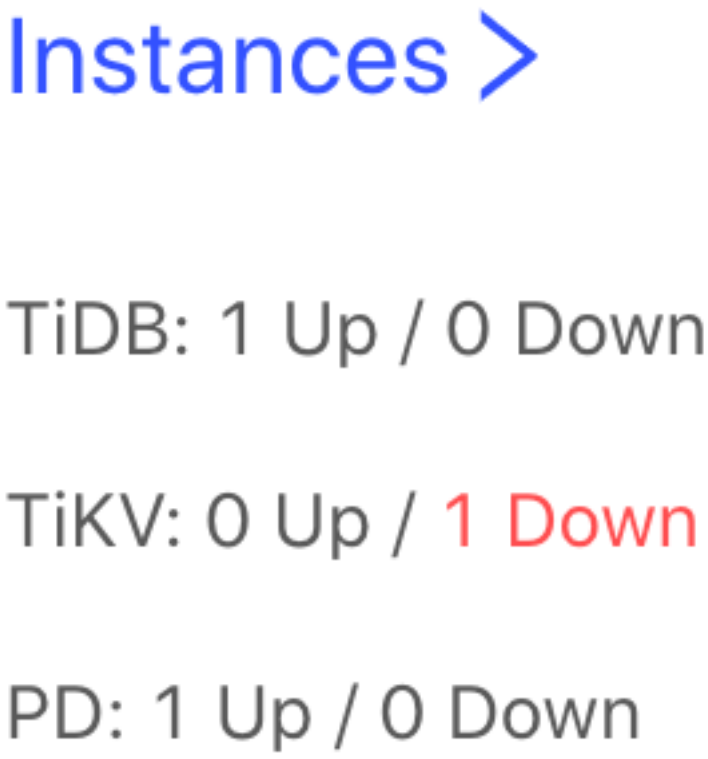

Figure 450: Instances

The statuses in the preceding image are described as follows:

- Up: The instance is running properly (including the offline storage instance).
- Down: The instance is running abnormally, such as network disconnection and process crash.

Click the **Instance** title to enter the Cluster Info Page that shows the detailed running status of each instance.

14.14.1.4.7 Monitor and alert

This area provides links for you to view detailed monitor and alert:

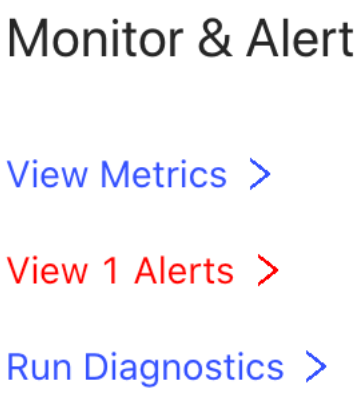

Figure 451: Monitor and alert

- **View Metrics**: Click this link to jump to the Grafana dashboard where you can view detailed monitoring information of the cluster. For details of each monitoring metric in the Grafana dashboard, see monitoring metrics.
- **View Alerts**: Click this link to jump to the AlertManager page where you can view detailed alert information of the cluster. If alerts exist in the cluster, the number of alerts is directly shown in the link text.
- **Run Diagnostics**: Click this link to jump to the more detailed cluster diagnostics page.

> **Note:**
>
> The **View Metrics** link is available only in the cluster where the Grafana node is deployed. The **View Alerts** link is available only in the cluster where the AlertManager node is deployed.

14.14.1.5 TiDB Dashboard Cluster Information Page

On the cluster information page, you can view the running status of TiDB, TiKV, PD, TiFlash components in the entire cluster and the running status of the host on which these components are located.

14.14.1.5.1 Access the page

You can use one of the following two methods to access the cluster information page:

- After logging in to TiDB Dashboard, click **Cluster Info** in the left navigation menu.
- Visit http://127.0.0.1:2379/dashboard/#/cluster_info/instance in your browser. Replace `127.0.0.1:2379` with the actual PD instance address and port.

14.14.1.5.2 Instance list

Click **Instances** to view the list of instances:

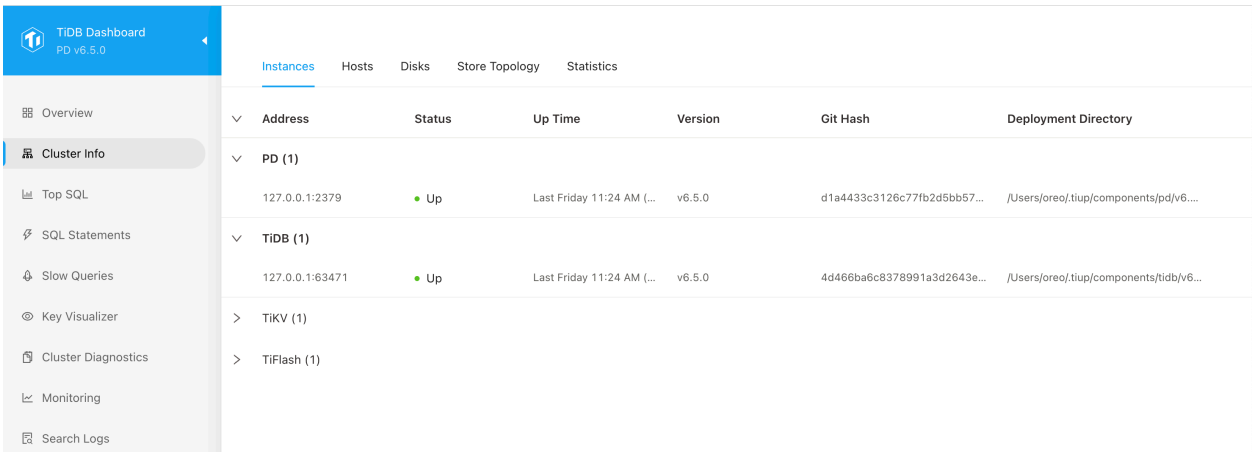

Figure 452: Instance list

This instance list shows the overview information of all instances of TiDB, TiKV, PD, and TiFlash components in the cluster.

The list includes the following information:

- Address: The instance address.
- Status: The running status of the instance.
- Up Time: The start time of the instance.
- Version: The instance version number.
- Git Hash: The Git Hash value corresponding to the instance binary file.
- Deployment directory: The directory in which the instance binary file is located.

Instance status

An instance can run in one of the following statuses:

- Up: The instance is running normally.
- Down or Unreachable: The instance is not running or a network problem exists on the corresponding host.
- Tombstone: The data on the instance has been completely migrated out and the scaling-in is complete. This status exists only on TiKV or TiFlash instances.

- Leaving: The data on the instance is being migrated out and the scaling-in is in process. This status exists only on TiKV or TiFlash instances.
- Unknown: The running state of the instance is unknown.

> **Note:**
>
> - `Leaving` in TiDB Dashboard, `Offline` returned by PD API, and `Pending Offline` in TiUP indicate the same status.
> - Some columns in the table can be displayed only when the instance is up.

Instance status derives from the PD scheduling information. For more details, see Information collection.

14.14.1.5.3 Host list

Click **Hosts** to view the list of hosts:

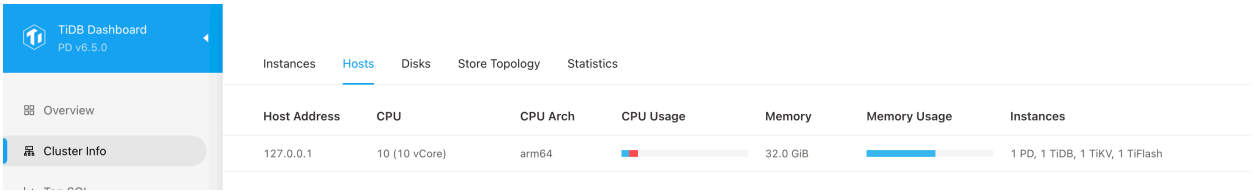

Figure 453: Host list

This host list shows the running status of hosts that correspond to all instances of TiDB, TiKV, PD, and TiFlash components in the cluster.

The list includes the following information:

- Host Address: The Host IP address.
- CPU: The number of logical cores of the host CPU.
- CPU Usage: The user-mode and kernel-mode CPU usage in the current 1 second.
- Memory: The total physical memory size of the host.
- Memory Usage: The current memory usage of the host.

> **Note:**
>
> The host list information is provided by each instance process, so when all instances on the host are down, the host information is not displayed.

14.14.1.5.4 Disk list

Click **Disks** to view the list of disks:

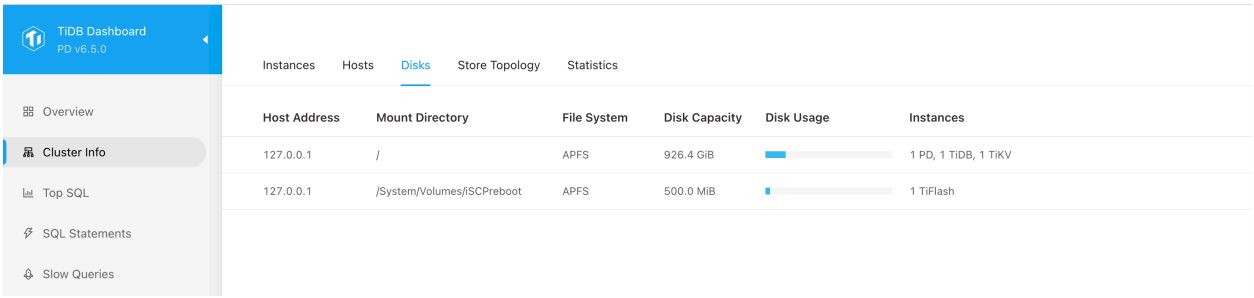

Figure 454: Disk list

This disk list shows the status of disks on which the TiDB, TiKV, PD, and TiFlash instances run.

The list includes the following information:

- Host Address: The Host IP address.
- Mount Directory: The mount path of this disk on the host on which the instance is running.
- File System: The file system type of this disk on the host on which the instance is running.
- Disk Capacity: The total space of the disk on the host on which the instance is running.
- Disk Usage: The space usage of the disk on the host on which the instance is running.
- Instance: The instance running on this host.

14.14.1.6 TiDB Dashboard Top SQL Page

With Top SQL, you can monitor and visually explore the CPU overhead of each SQL statement in your database in real-time, which helps you optimize and resolve database performance issues. Top SQL continuously collects and stores CPU load data summarized by SQL statements at any seconds from all TiDB and TiKV instances. The collected data can be stored for up to 30 days. Top SQL presents you with visual charts and tables to quickly pinpoint which SQL statements are contributing the high CPU load of a TiDB or TiKV instance over a certain period of time.

Top SQL provides the following features:

- Visualize the top 5 types of SQL statements with the highest CPU overhead through charts and tables.
- Display detailed execution information such as queries per second, average latency, and query plan.
- Collect all SQL statements that are executed, including those that are still running.
- Allow viewing data of a specific TiDB and TiKV instance.

14.14.1.6.1 Recommended scenarios

Top SQL is suitable for analyzing performance issues. The following are some typical Top SQL scenarios:

- You discovered that an individual TiKV instance in the cluster has a very high CPU usage through the Grafana charts. You want to know which SQL statements cause the CPU hotspots so that you can optimize them and better leverage all of your distributed resources.
- You discovered that the cluster has a very high CPU usage overall and queries are slow. You want to quickly figure out which SQL statements are currently consuming the most CPU resources so that you can optimize them.
- The CPU usage of the cluster has drastically changed and you want to know the major cause.
- Analyze the most resource-intensive SQL statements in the cluster and optimize them to reduce hardware costs.

Top SQL cannot be used to pinpoint non-performance issues, such as incorrect data or abnormal crashes.

The Top SQL feature is still in an early stage and is being continuously enhanced. Here are some scenarios that are **not supported** at the moment:

- Analyzing the overhead of SQL statements outside of Top 5 (for example, when multiple business workloads are mixed).
- Analyzing the overhead of Top N SQL statements by various dimensions such as users and databases.
- Analyzing database performance issues that are not caused by high CPU load, such as transaction lock conflicts.

14.14.1.6.2 Access the page

You can access the Top SQL page using either of the following methods:

- After logging in to TiDB Dashboard, click **Top SQL** in the left navigation menu.

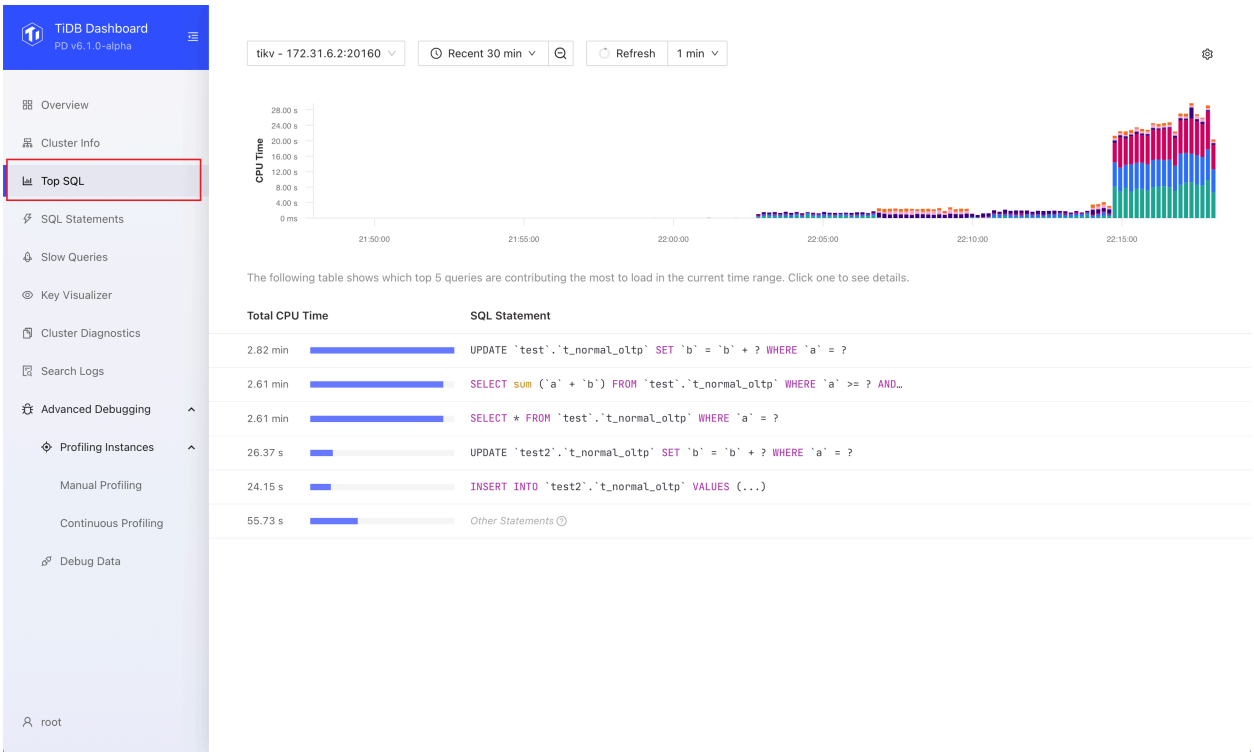

Figure 455: Top SQL

- Visit http://127.0.0.1:2379/dashboard/#/topsql in your browser. Replace `127.0.0.1:2379` with the actual PD instance address and port.

14.14.1.6.3 Enable Top SQL

> **Note:**
>
> To use Top SQL, your cluster should be deployed or upgraded with a recent version of TiUP (v1.9.0 or above) or TiDB Operator (v1.3.0 or above). If your cluster was upgraded using an earlier version of TiUP or TiDB Operator, see FAQ for instructions.

Top SQL is not enabled by default as it has a slight impact on cluster performance (within 3% on average) when enabled. You can enable Top SQL by the following steps:

1. Visit the Top SQL page.
2. Click **Open Settings**. On the right side of the **Settings** area, switch on **Enable Feature**.

3. Click **Save**.

After enabling the feature, wait up to 1 minute for Top SQL to load the data. Then you can see the CPU load details.

In addition to the UI, you can also enable the Top SQL feature by setting the TiDB system variable `tidb_enable_top_sql`:

```
SET GLOBAL tidb_enable_top_sql = 1;
```

14.14.1.6.4 Use Top SQL

The following are the common steps to use Top SQL.

1. Visit the Top SQL page.
2. Select a particular TiDB or TiKV instance that you want to observe the load.

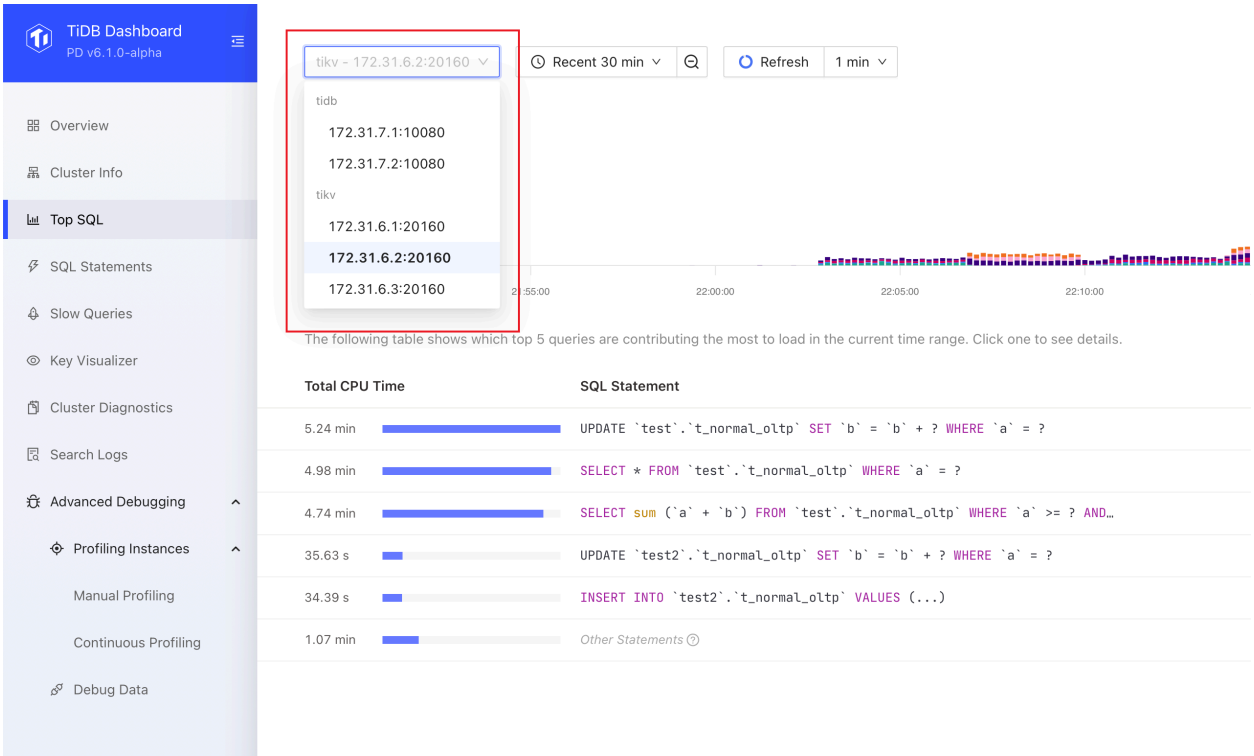

Figure 456: Select Instance

If you are unsure of which TiDB or TiKV instance to observe, you can select an arbitrary instance. Also, when the cluster CPU load is extremely unbalanced, you can first use Grafana charts to determine the specific instance you want to observe.

3. Observe the charts and tables presented by Top SQL.

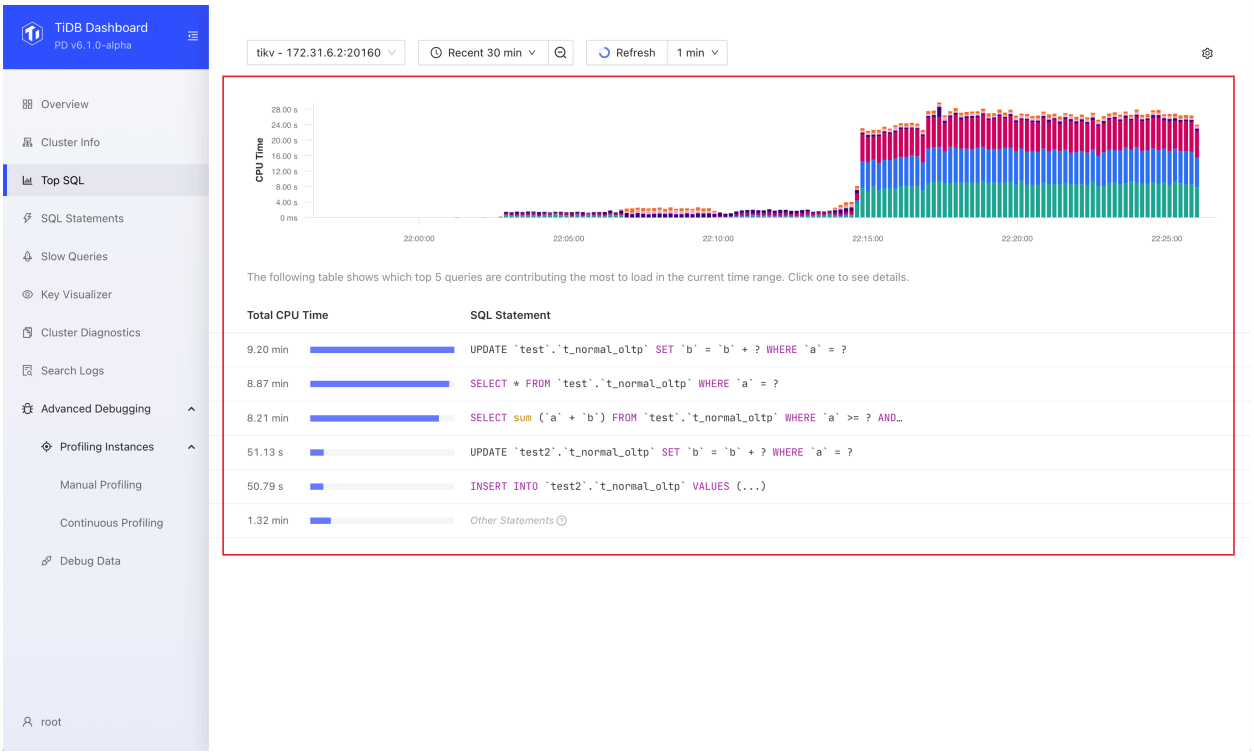

Figure 457: Chart and Table

The size of the bars in the bar chart represents the size of CPU resources consumed by the SQL statement at that moment. Different colors distinguish different types of SQL statements. In most cases, you only need to focus on the SQL statements that have a higher CPU resource overhead in the corresponding time range in the chart.

4. Click a SQL statement in the table to show more information. You can see detailed execution metrics of different plans of that statement, such as Call/sec (average queries per second) and Scan Indexes/sec (average number of index rows scanned per second).

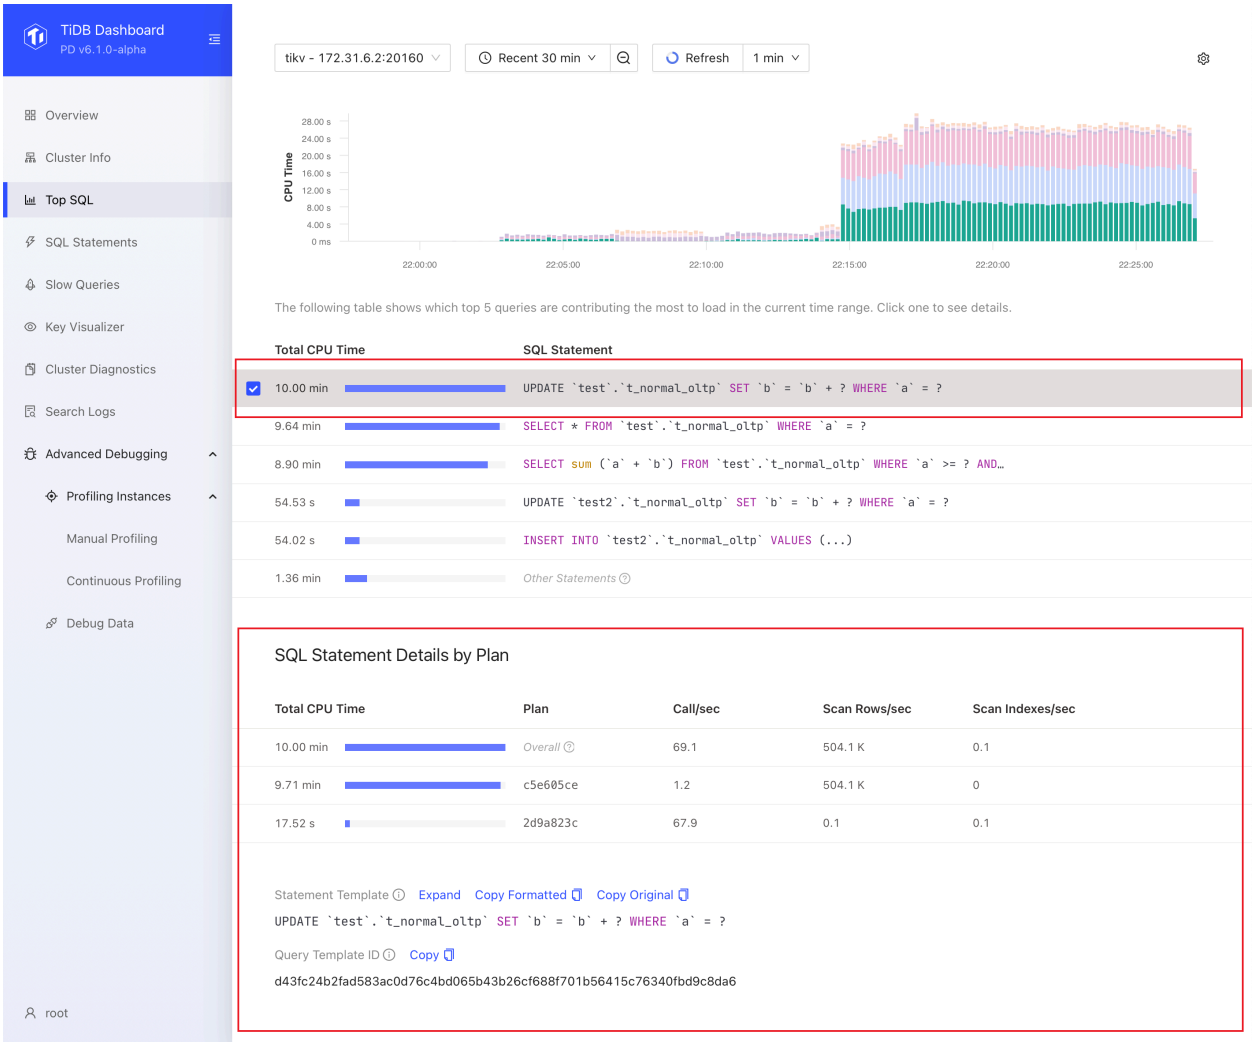

Figure 458: Details

5. Based on these initial clues, you can further explore the SQL Statement or Slow Queries page to find the root cause of high CPU consumption or large data scans of the SQL statement.

Additionally, you can configure Top SQL as follows:

- You can adjust the time range in the time picker or select a time range in the chart to get a more precise and detailed look at the problem. A smaller time range can provide more detailed data, with precision of up to 1 second.

Figure 459: Change time range

- If the chart is out of date, you can click the **Refresh** button or select Auto Refresh options from the **Refresh** drop-down list.

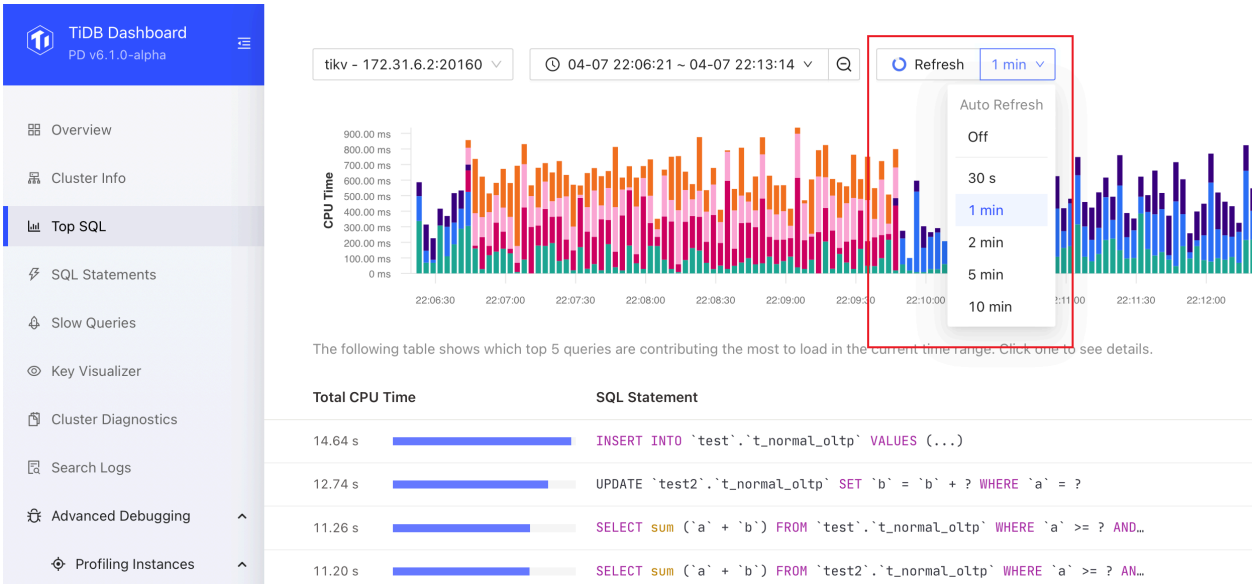

Figure 460: Refresh

14.14.1.6.5 Disable Top SQL

You can disable this feature by following these steps:

1. Visit Top SQL page.
2. Click the gear icon in the upper right corner to open the settings screen and switch off **Enable Feature**.
3. Click **Save**.
4. In the popped-up dialog box, click **Disable**.

In addition to the UI, you can also disable the Top SQL feature by setting the TiDB system variable `tidb_enable_top_sql`:

```
SET GLOBAL tidb_enable_top_sql = 0;
```

14.14.1.6.6 Frequently asked questions

1. Top SQL cannot be enabled and the UI displays "required component NgMonitoring is not started".

See TiDB Dashboard FAQ.

2. Will performance be affected after enabling Top SQL?

This feature has a slight impact on cluster performance. According to our benchmark, the average performance impact is usually less than 3% when the feature is enabled.

3. What is the status of this feature?

It is now a generally available (GA) feature and can be used in production environments.

4. What is the meaning of "Other Statements"?

"Other Statement" counts the total CPU overhead of all non-Top 5 statements. With this information, you can learn the CPU overhead contributed by the Top 5 statements compared with the overall.

5. What is the relationship between the CPU overhead displayed by Top SQL and the actual CPU usage of the process?

Their correlation is strong but they are not exactly the same thing. For example, the cost of writing multiple replicas is not counted in the TiKV CPU overhead displayed by Top SQL. In general, SQL statements with higher CPU usage result in higher CPU overhead displayed in Top SQL.

6. What is the meaning of the Y-axis of the Top SQL chart?

It represents the size of CPU resources consumed. The more resources consumed by a SQL statement, the higher the value is. In most cases, you do not need to care about the meaning or unit of the specific value.

7. Does Top SQL collect running (unfinished) SQL statements?

Yes. The bars displayed in the Top SQL chart at each moment indicate the CPU overhead of all running SQL statements at that moment.

14.14.1.7 Key Visualizer Page

The Key Visualizer page of TiDB Dashboard is used to analyze the usage of TiDB and troubleshoot traffic hotspots. This page visually shows the traffic of the TiDB cluster over a period of time.

14.14.1.7.1 Access Key Visualizer page

You can use one of the following two methods to access the Key Visualizer page:

- After logging in to TiDB Dashboard, click **Key Visualizer** in the left navigation menu.

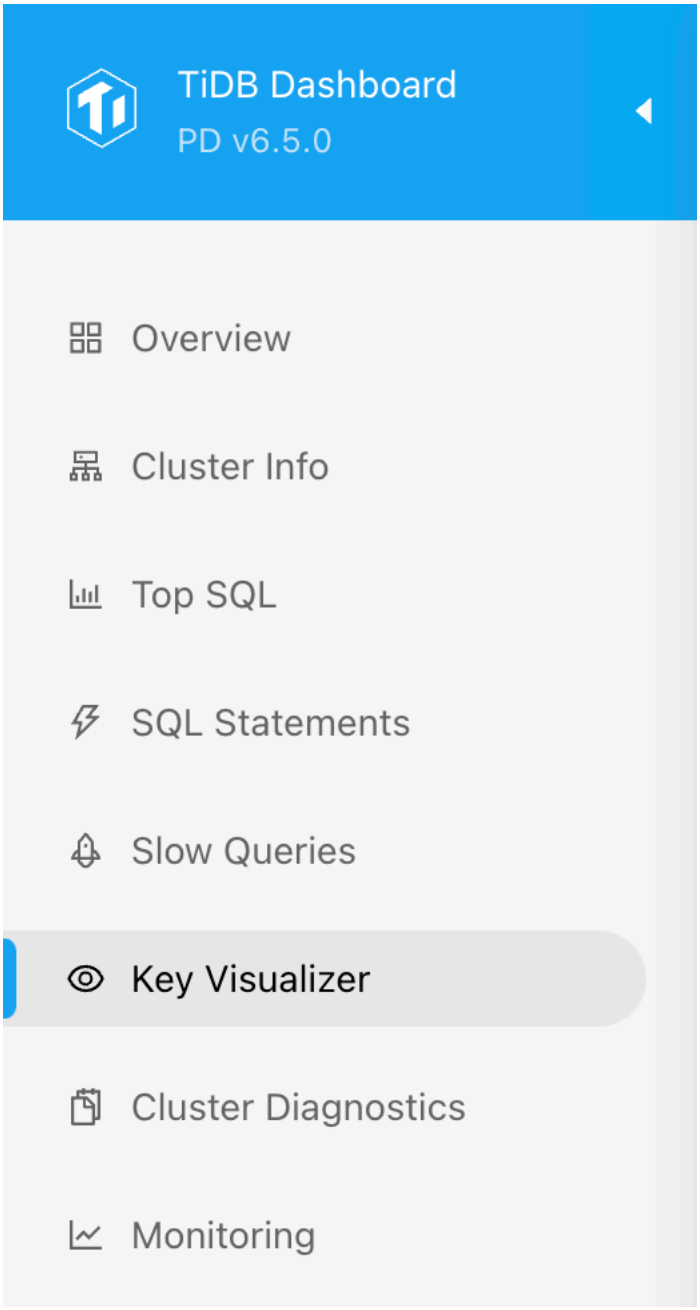

Figure 461: Access Key Visualizer

- Visit http://127.0.0.1:2379/dashboard/#/keyviz in your browser. Replace `127.0.0.1:2379` with the actual PD instance address and port.

14.14.1.7.2 Interface demonstration

The following image is a demonstration of the Key Visualizer page:

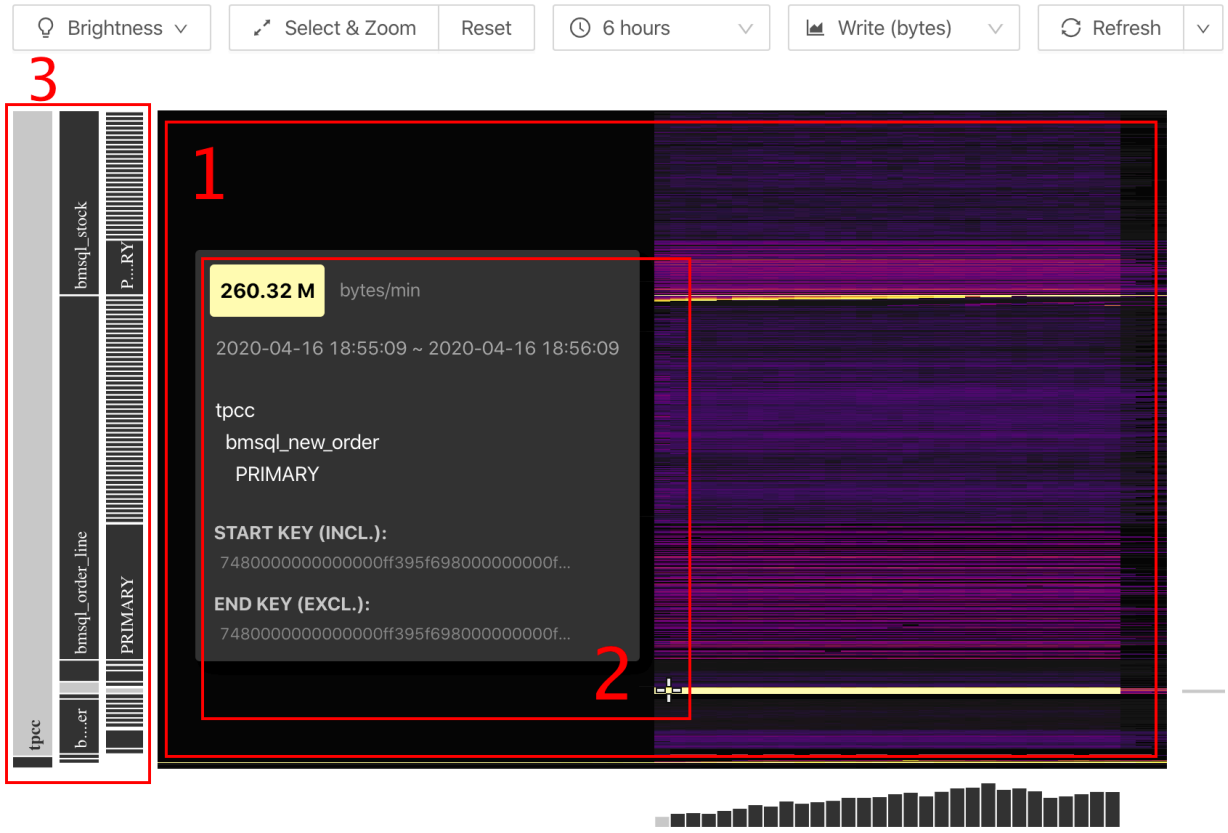

Figure 462: Key Visualizer page

From the preceding interface, you can see the following objects:

- A large heatmap that shows changes of the overall traffic over time.
- The detailed information of a certain coordinate point.
- Information of tables, and indexes (on the left side of the heatmap).

14.14.1.7.3 Basic concepts

This section introduces the basic concepts that relate to Key Visualizer.

Region

In a TiDB cluster, the stored data is distributed among TiKV instances. Logically, TiKV is a huge and orderly key-value map. The whole key-value space is divided into many segments and each segment consists of a series of adjacent keys. Such segment is called a `Region`.

For detailed introduction of Region, refer to TiDB Internal (I) - Data Storage.

Hotspot

When you use the TiDB database, the hotspot issue is typical, where high traffic is concentrated on a small range of data. Because consecutive data ranges are often processed on the same TiKV instance, the TiKV instance on which the hotspot occurs becomes the performance bottleneck of the whole application. The hotspot issue often occurs in the following scenarios:

- Write adjacent data into a table with the `AUTO_INCREMENT` primary key, which causes a hotspot issue on this table.
- Write adjacent time data into the time index of a table, which causes a hotspot issue on the table index.

For more details about hotspot, refer to Highly Concurrent Write Best Practices

Heatmap

The heatmap is the core part of Key Visualizer, which shows the change of a metric over time. The X-axis of the heatmap indicates the time. The Y-axis of the heatmap indicates the consecutive Regions based on key ranges that cover all schemas and tables of the TiDB cluster.

Colder colors in the heatmap indicate lower read and write traffic of Regions in that period of time. Hotter (brighter) colors indicate higher traffic.

Region compression

A TiDB cluster might have up to hundreds of thousands of Regions. It is difficult to display so many Regions on screen. Therefore, on each heatmap, these Regions are compressed into 1,500 consecutive ranges, each range called a Bucket. In the heatmap, because hotter instances need more attention, Key Visualizer tends to compress a large number of Regions with lower traffic into one Bucket, and displays the Region with higher traffic also in one Bucket.

14.14.1.7.4 Use Key Visualizer

This section introduces how to use Key Visualizer.

Settings

To use the Key Visualizer page for the first time, you need to manually enable this feature on the **Settings** page. Follow the page guide and click **Open Settings** to open the settings page:

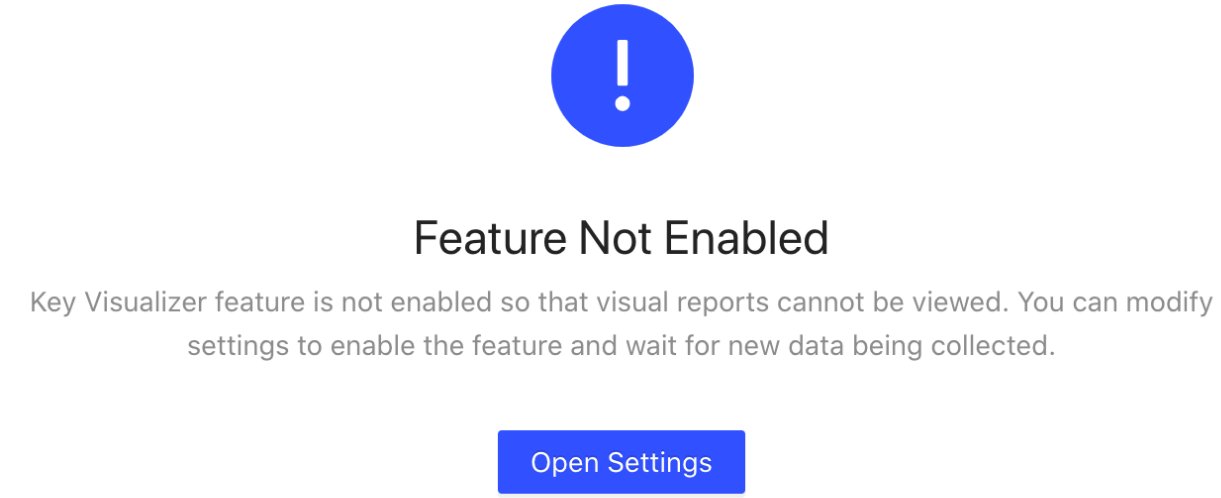

Figure 463: Feature disabled

After this feature is enabled, you can open the settings page by clicking the **Settings** icon in the upper right corner:

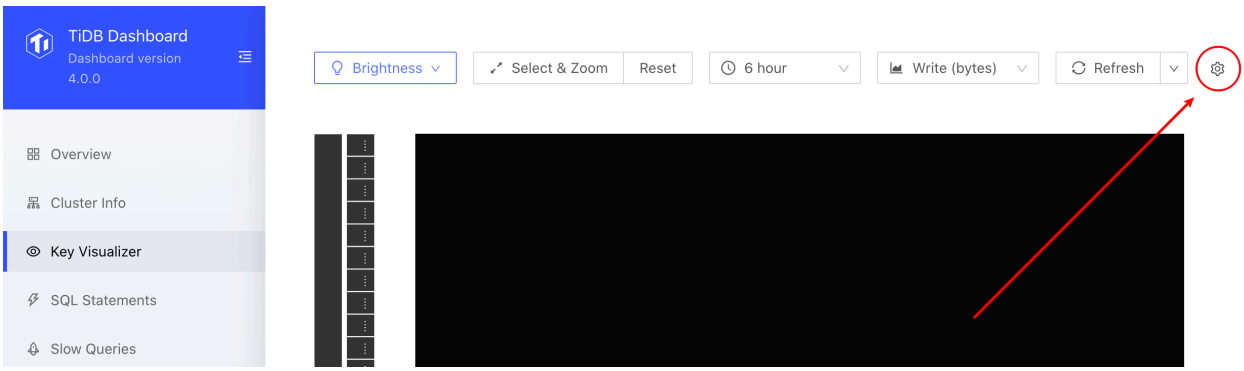

Figure 464: Settings icon

The settings page is shown as follows:

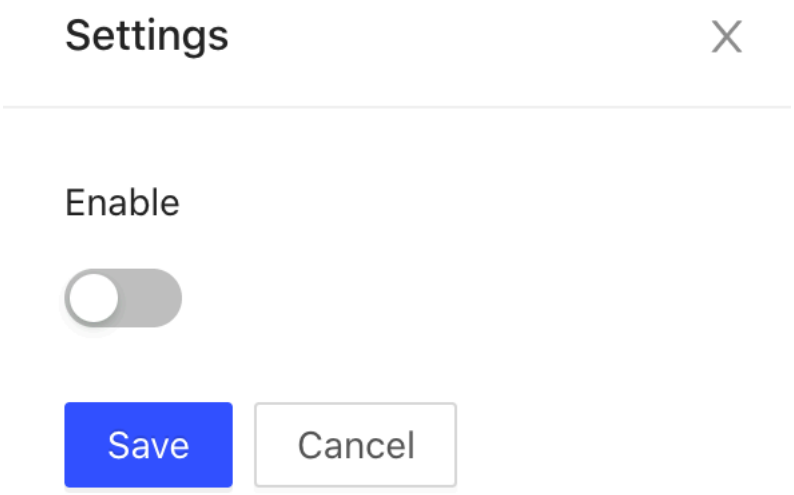

Figure 465: Settings page

Set whether to start data collection through the switch, and click **Save** to take effect. After enabling the feature, you can see that the toolbar is available:

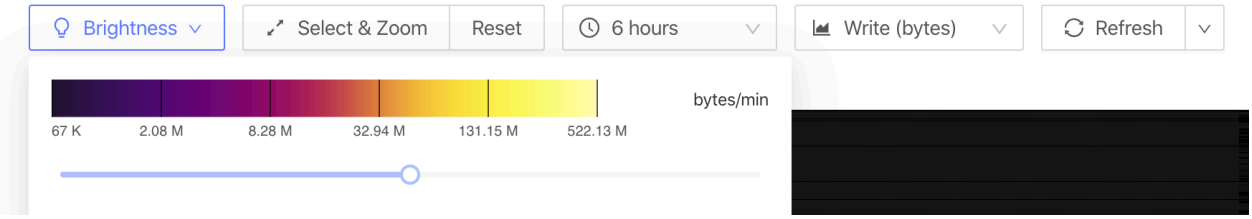

Figure 466: Toolbar

After this feature is enabled, data collection is going on at the backend. You can see the heatmap shortly.

Observe a certain period of time or Region range

When you open Key Visualizer, the heatmap of the entire database over the recent six hours is displayed by default. In this heatmap, the closer to the right side (current time), the shorter the time interval corresponding to each column of Buckets. If you want to observe a specific time period or a specific Region range, you can zoom in to get more details. The specific instructions are as follows:

1. Scroll up or down in the heatmap.
2. Click and drag one of the following buttons to select the range.

- Click the **Select & Zoom** button. Then click and drag this button to select the area to zoom in.

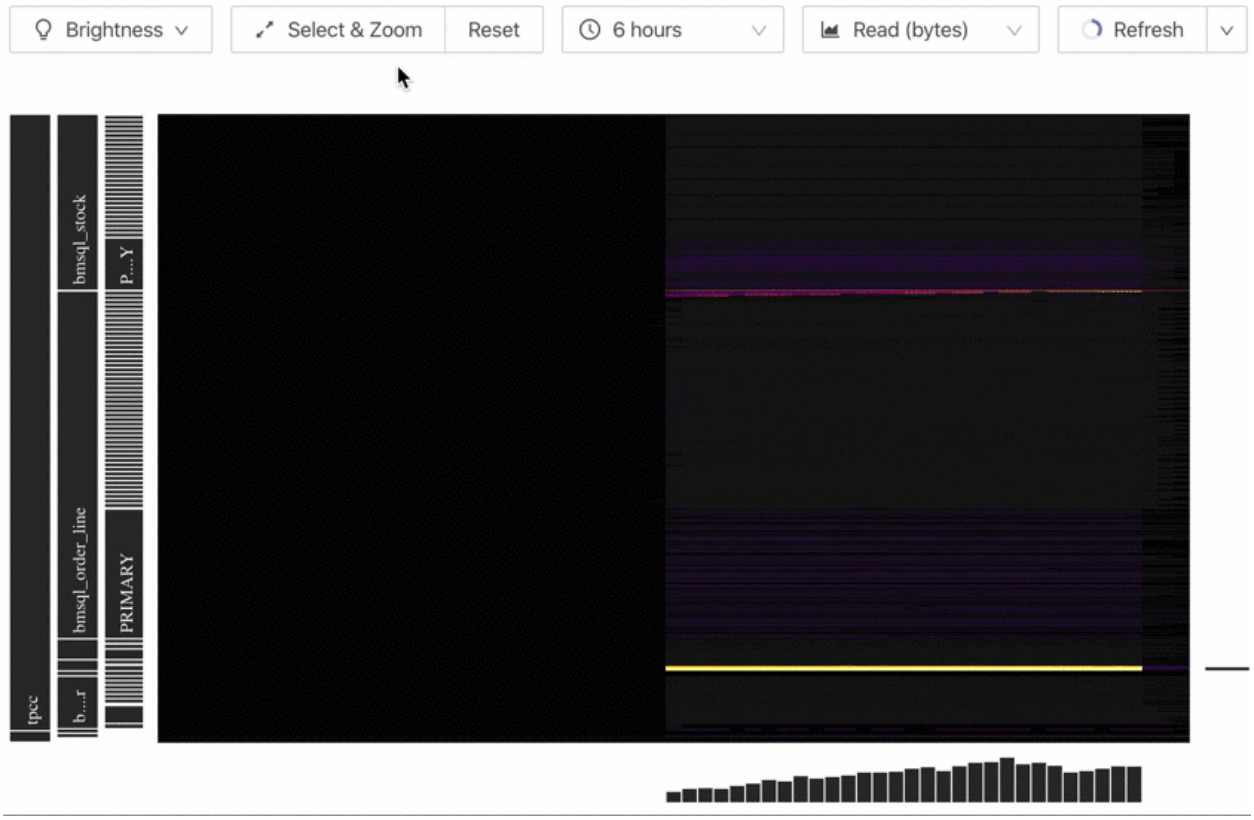

Figure 467: Selection box

- Click the **Reset** button to reset the Region range to the entire database.
- Click the **time selection box** (at the position of `6 hour` on the preceding interface) and select the observation time period again.

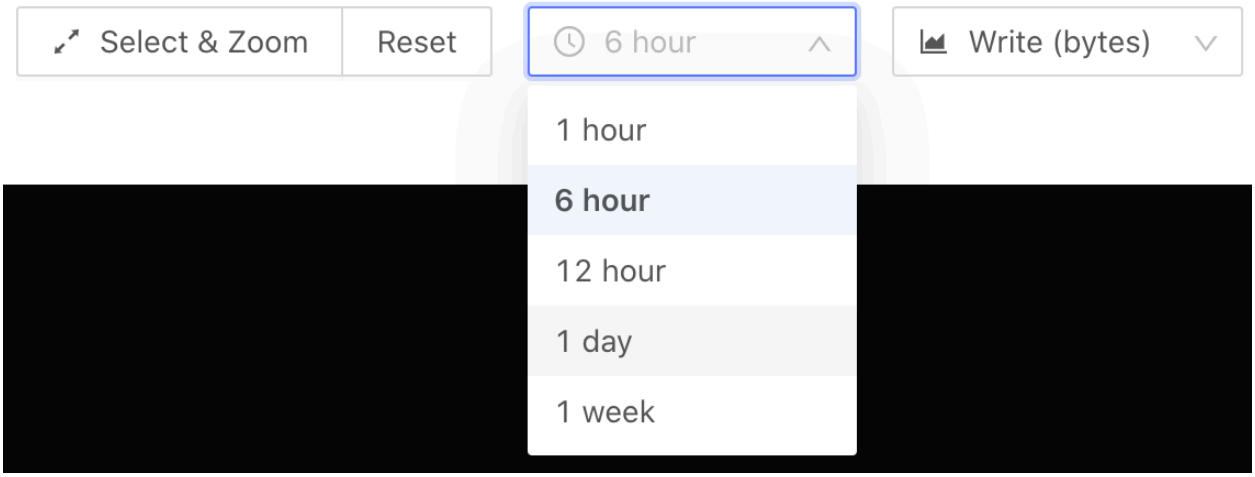

Figure 468: Select time

> **Note:**
>
> If you follow step 2 in the instruction above, the heatmap is redrawn, which might be very different from the original heatmap. This difference is normal because if you observe in more detail, the granularity of the Region compression has changed, or the basis of `hot` in a specific range has changed.

Adjust brightness

The heatmap uses colors of different brightnesses to indicate the Bucket traffic. Colder colors in the heatmap indicate lower read and write traffic of the Region in that period of time. Hotter (brighter) colors indicate higher traffic. If the color is too cold or too hot, it is difficult to observe in details. In this situation, you can click the **Brightness** button and then use the slider to adjust the brightness of the page.

> **Note:**
>
> When Key Visualizer displays the heatmap of an area, it defines the basis of being cold and hot according to the traffic of this area. When the traffic in the entire area is relatively even, even if the overall traffic is low in value, you might still see a large bright-colored area. Remember to include the value into your analysis.

Select metrics

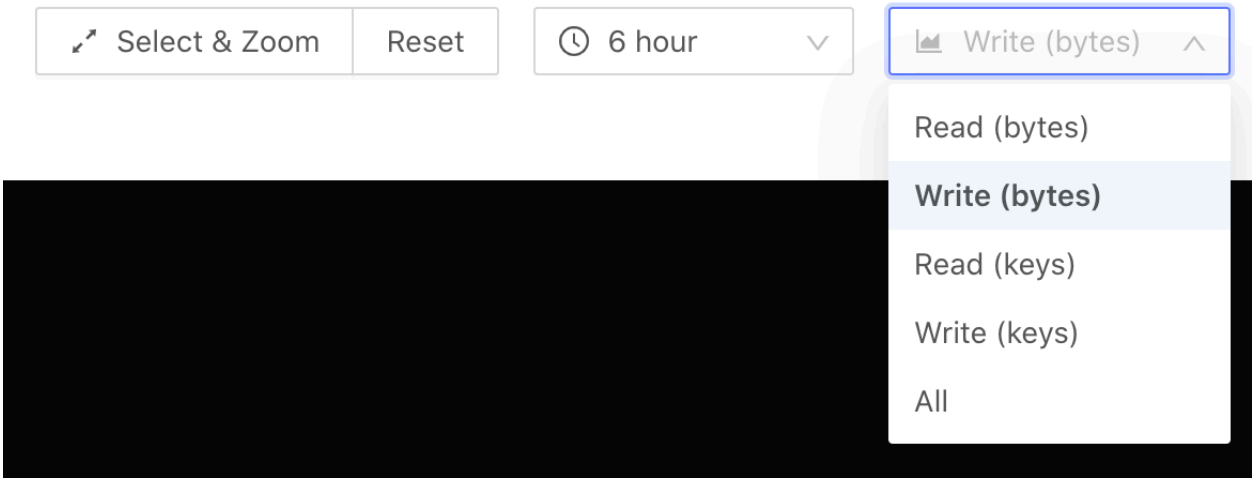

Figure 469: Select metrics

You can view a metric you are interested in by selecting this metric in the **metrics selection box** (at the `Write (bytes)` position in the interface above):

- `Read (bytes)`: Read traffic.
- `Write (bytes)`: Write traffic.
- `Read (keys)`: The number of read rows.
- `Write (keys)`: The number of written rows.
- `All`: The sum of read and write traffic.

Refresh and automatic refresh

To regain a heatmap based on the current time, click the **Refresh** button. If you need to observe the traffic distribution of the database in real time, click the down arrow on the right side of the **Refresh** button and select a fixed time interval for the heatmap to automatically refresh at this interval.

> **Note:**
>
> If you adjust the time range or Region range, the automatic refresh is disabled.

See Bucket details

You can hover your mouse over the Bucket you are interested in to view the detailed information of this Region range. The image below is an example of this information:

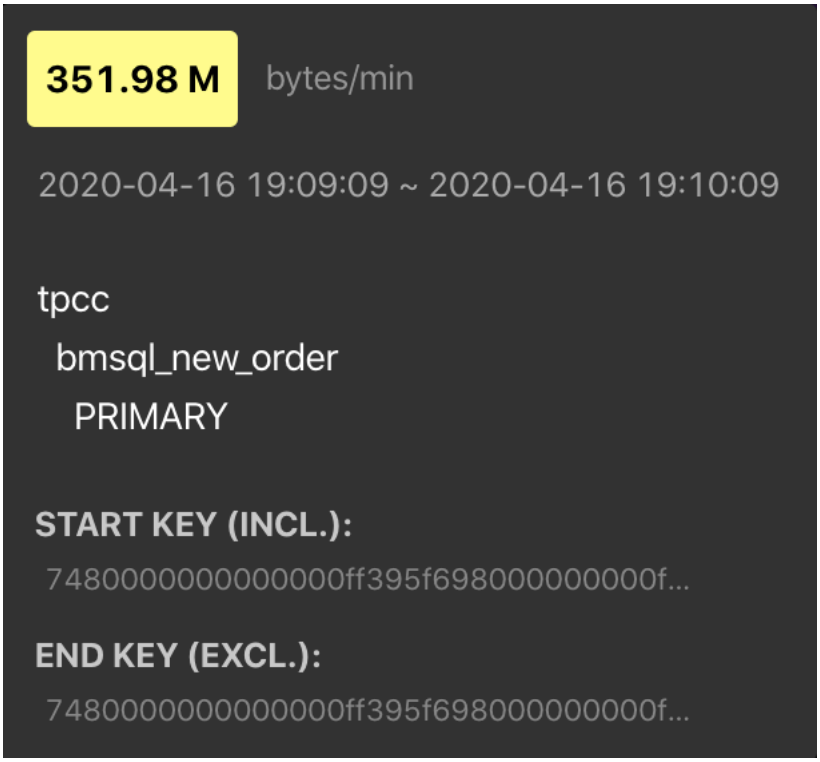

Figure 470: Bucket details

If you want to copy this information, click a Bucket. Then, the page with relevant details is temporarily pinned. Click on the information, and you have copied it to the clipboard.

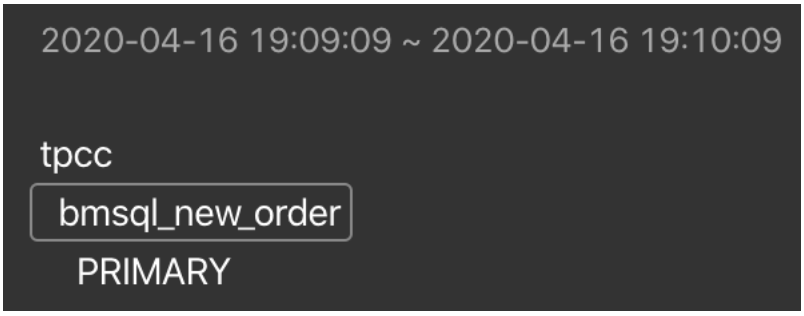

Figure 471: Copy Bucket details

14.14.1.7.5 Common heatmap types

This section shows and interprets four common types of heatmap in Key Visualizer.

Evenly distributed workload

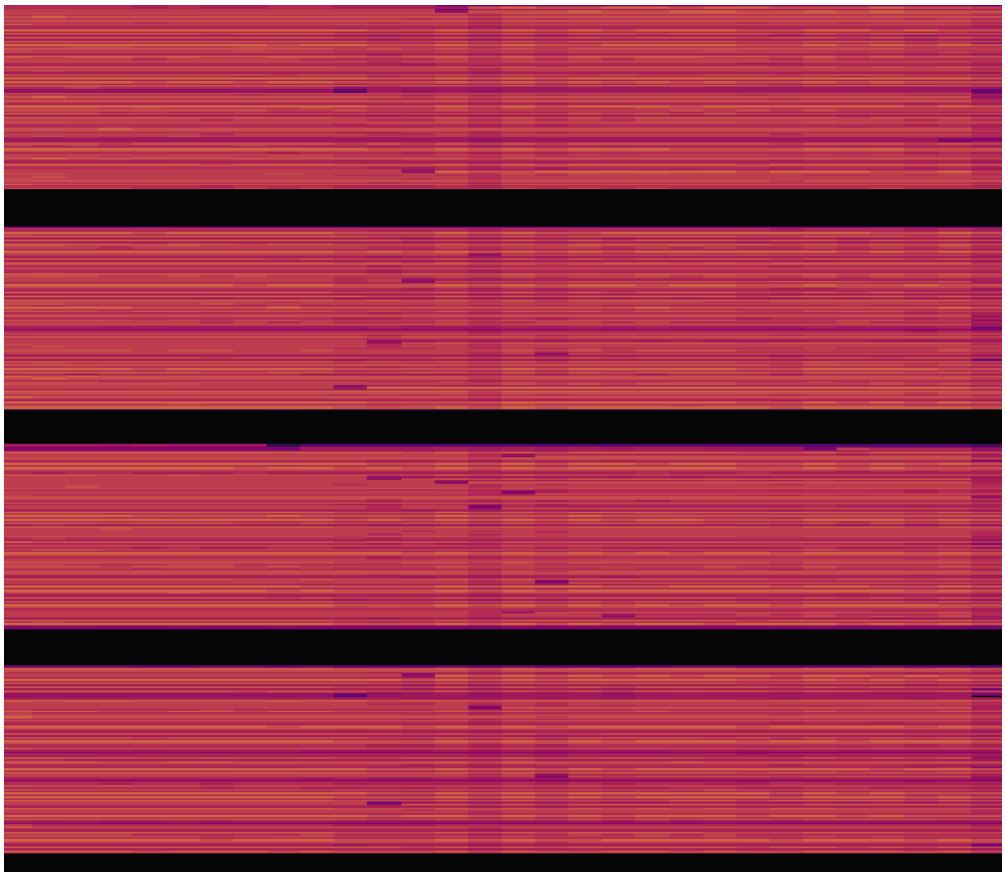

Figure 472: Balanced

In the heatmap above, bright and dark colors are a fine-grained mix. This indicates that reads or writes are evenly distributed over time and among key ranges. The workload is evenly distributed to all nodes, which is ideal for a distributed database.

Periodically reads and writes

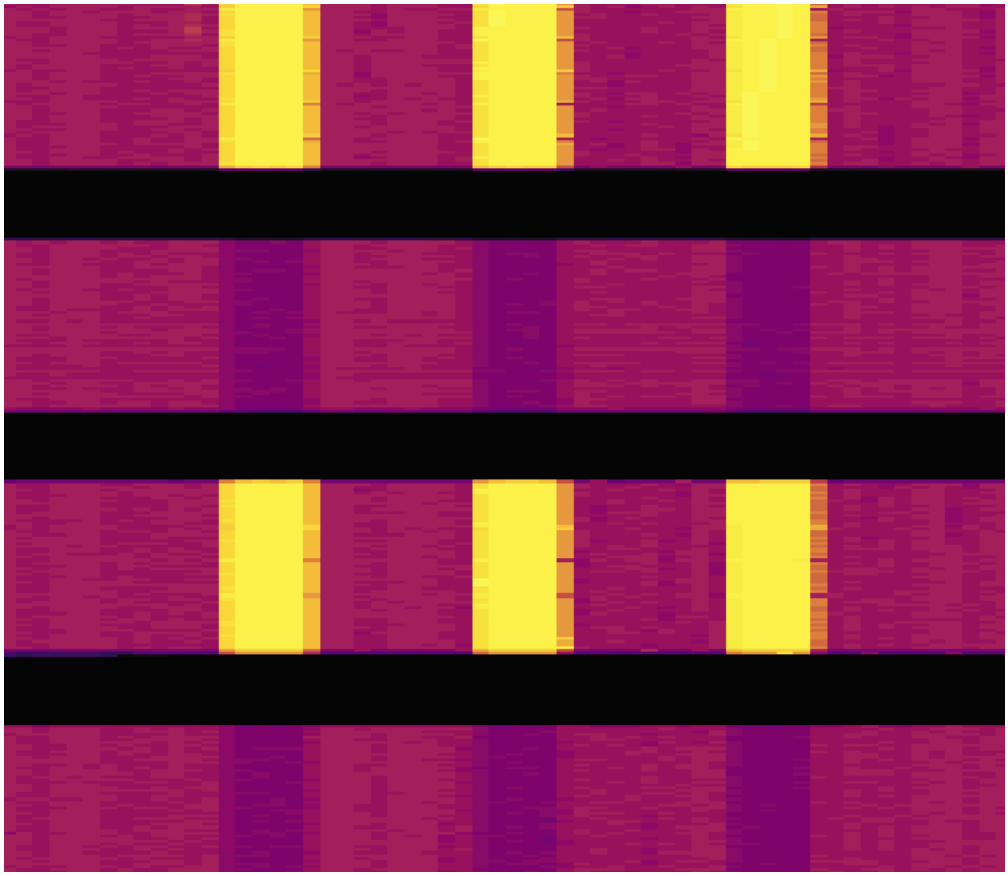

Figure 473: Periodically

In the heatmap above, there is an alternating brightness and darkness along the X-axis (time) but the brightness is relatively even along the Y-axis (Region). This indicates that the reads and writes change periodically, which might occur in scenarios of periodically scheduled tasks. For example, the big data platform periodically extracts data from TiDB every day. In this kind of scenarios, pay attention to whether the resources are sufficient during peak usage.

Concentrated reads or writes

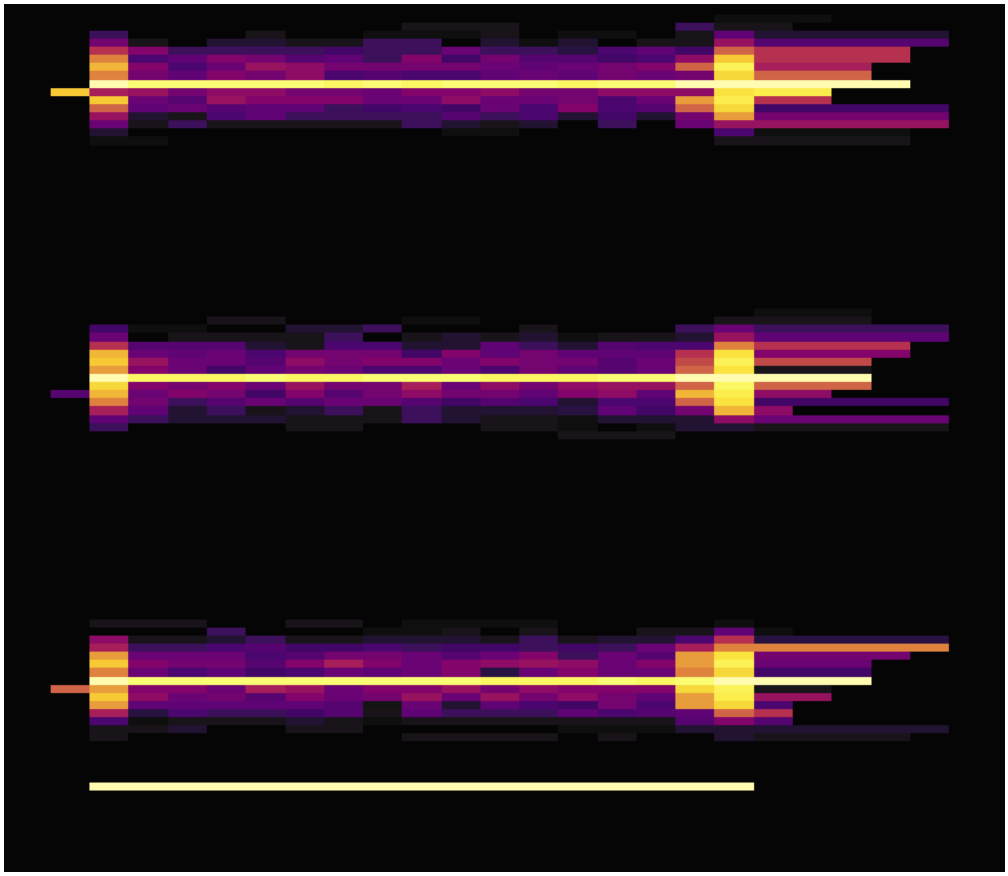

Figure 474: Concentrated

In the heatmap above, you can see several bright lines. Along the Y-axis, the fringes around the bright lines are dark, which indicates that the Regions corresponding to bright lines have high read and write traffic. You can observe whether the traffic distribution is expected by your application. For example, when all services are associated with the user table, the overall traffic of the user table can be high, so it is reasonable to show bright lines in the heatmap.

In addition, the height of the bright lines (the thickness along the Y-axis) is important. Because TiKV has its own Region-based hotspot balancing mechanism, the more Regions involved in the hotspot, the better it is for balancing traffic across all TiKV instances. The thicker and more bright lines indicate that hotspots are more scattered, and TiKV is better used. The thinner and fewer bright lines indicate that hotspots are more concentrated, and the hotspot issue is more obvious in TiKV, which might requires manual intervention.

Sequential reads or writes

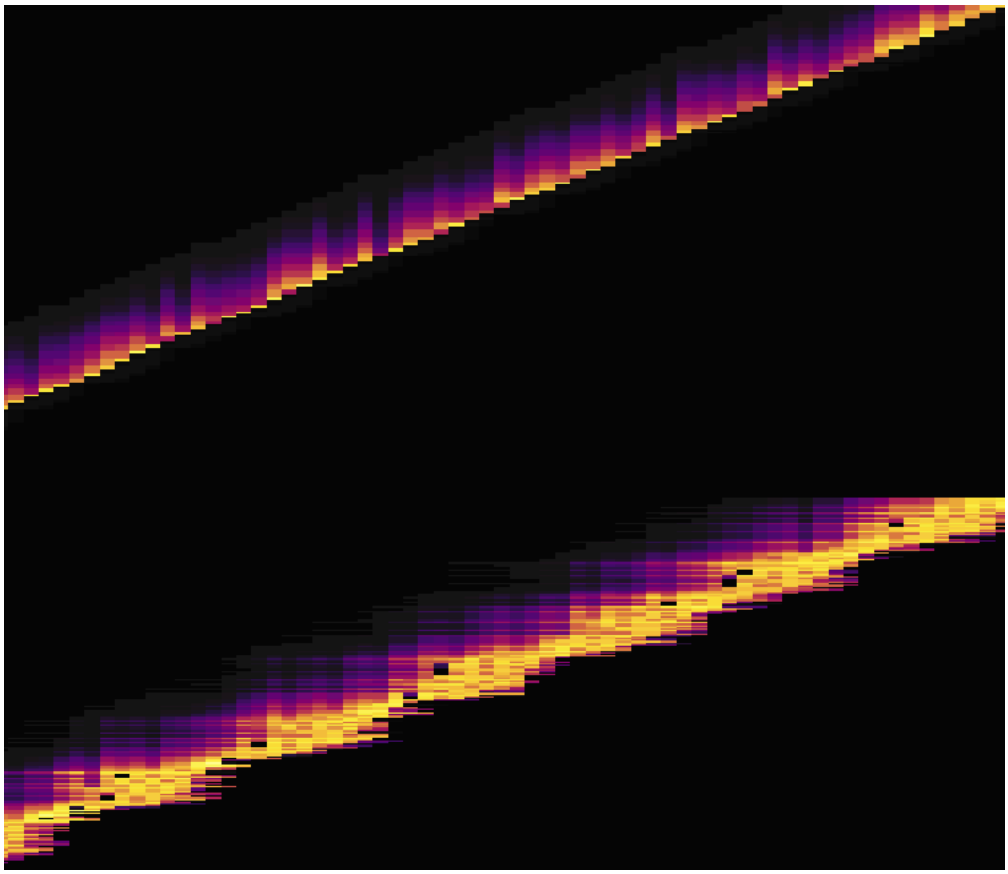

Figure 475: Sequential

In the heatmap above, you can see a bright line. This means that the data reads or writes are sequential. Typical scenarios of sequential data reads or writes are importing data or scanning tables and indexes. For example, you continuously write data to tables with auto-increment IDs.

Regions in the bright areas are the hotspots of read and write traffic, which often become the performance bottleneck of the entire cluster. In this situation, you might need to readjust the primary key for the application. By doing this, you scatter Regions much as possible to spread the pressure across multiple Regions. You can also schedule application tasks during the low-peak period.

Note:

In this section, only the common types of heatmap are shown. Key Visualizer actually displays the heatmap of all schemas and tables in the entire cluster, so you might see different types of heatmap in different areas, or mixed results of multiple heatmap types. Use the heatmap based on the actual situation.

14.14.1.7.6 Address hotspot issues

TiDB has some built-in features to mitigate the common hotspot issue. Refer to Highly Concurrent Write Best Practices for details.

14.14.1.8 TiDB Dashboard Metrics Relation Graph

TiDB Dashboard metrics relation graph is a feature introduced in v4.0.7. This feature presents a relation graph of the monitoring data of each internal process's duration in a TiDB cluster. The aim is to help you quickly understand the duration of each process and their relations.

14.14.1.8.1 Access graph

After logging in to TiDB Dashboard, click **Cluster Diagnostics** in the left navigation menu, and you can see the page of generating the metrics relation graph.

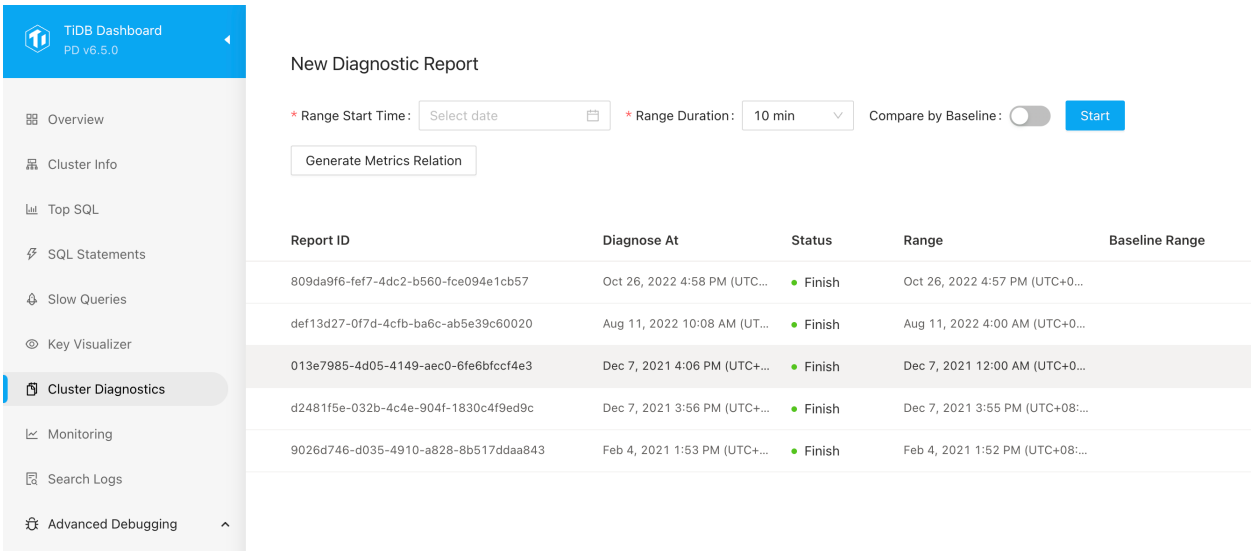

Figure 476: Metrics relation graph homepage

After setting **Range Start Time** and **Range Duration**, click **Generate Metrics Relation** and you will enter the page of metrics relation graph.

14.14.1.8.2 Understand graph

The following image is an example of the metrics relation graph. This graph illustrates the proportion of each monitoring metric's duration to the total query duration in a TiDB cluster within 5 minutes after 2020-07-29 16:36:00. The graph also illustrates the relations of each monitoring metric.

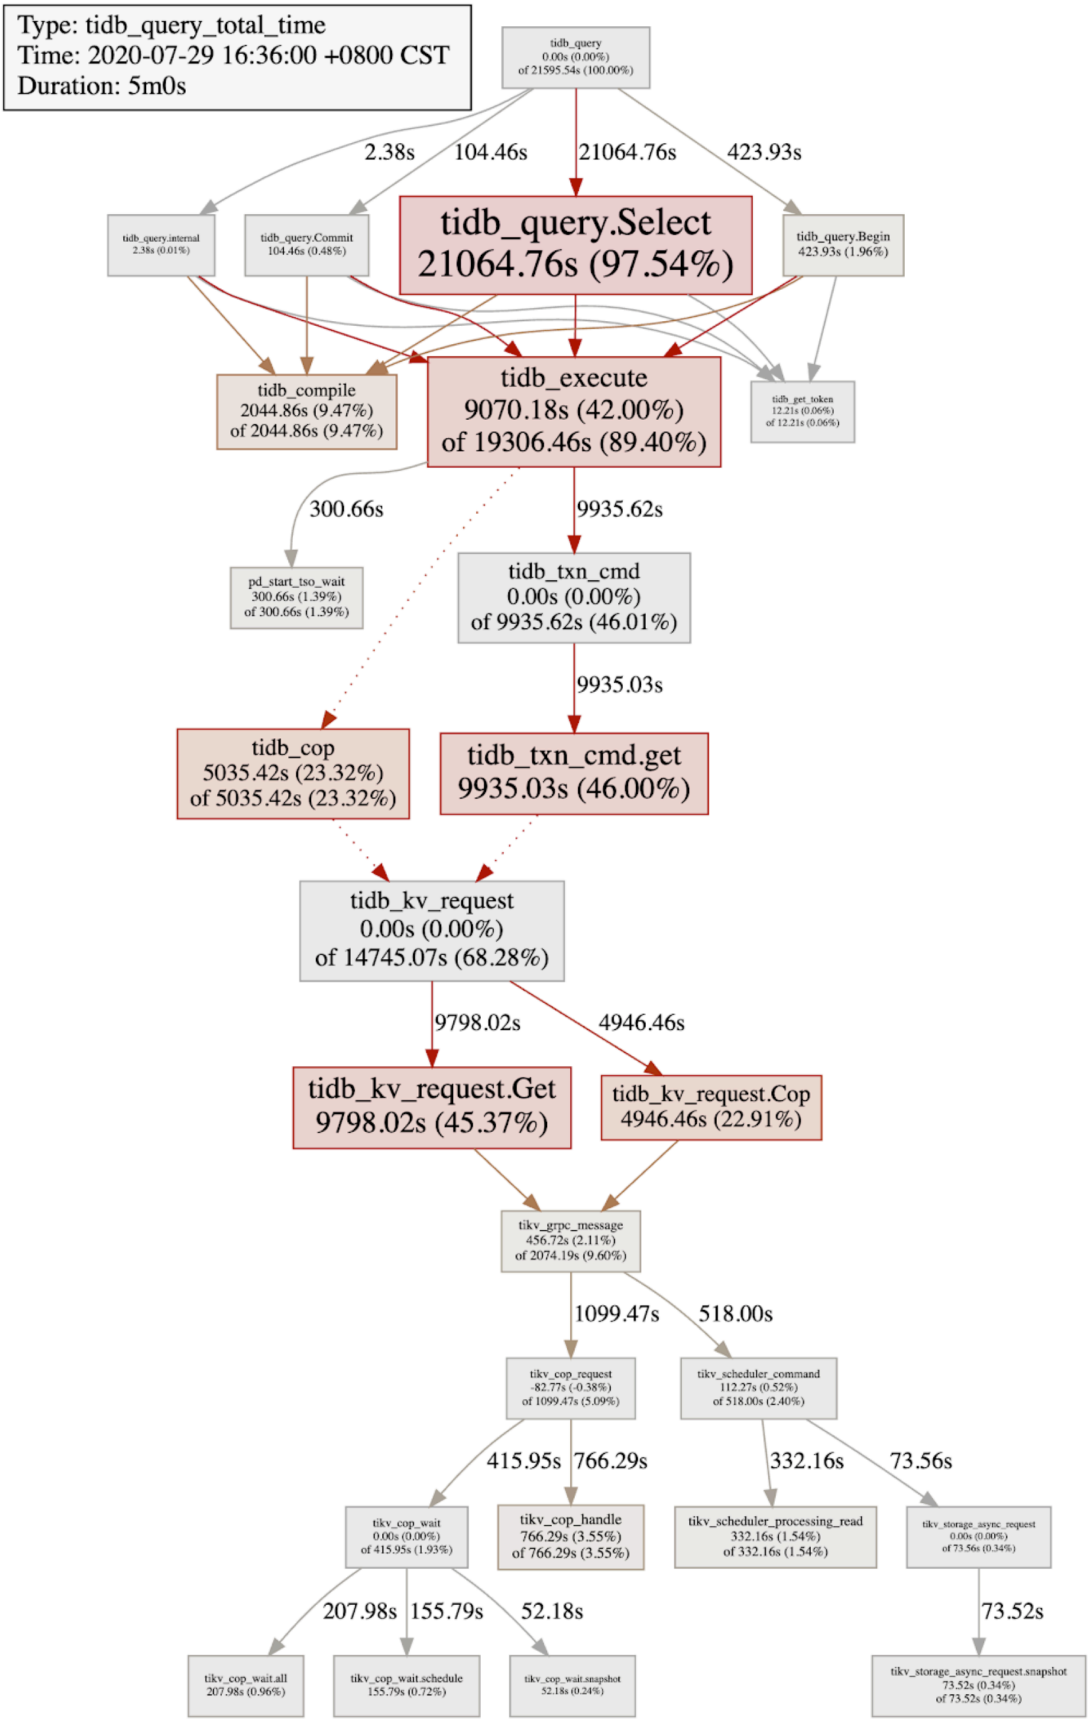

Figure 477: Metrics relation graph example

For example, the node meaning of the `tidb_execute` monitoring metric is as follows:

- The total duration of the `tidb_execute` monitoring metric is 19306.46 seconds, which accounts for 89.4% of the total query duration.
- The duration of the `tidb_execute` node itself is 9070.18 seconds, which accounts for 42% of the total query duration.
- Hover your mouse over the box area, and you can see the detailed information of the metric, including the total duration, the average duration, and the average P99 (99th percentile) duration.

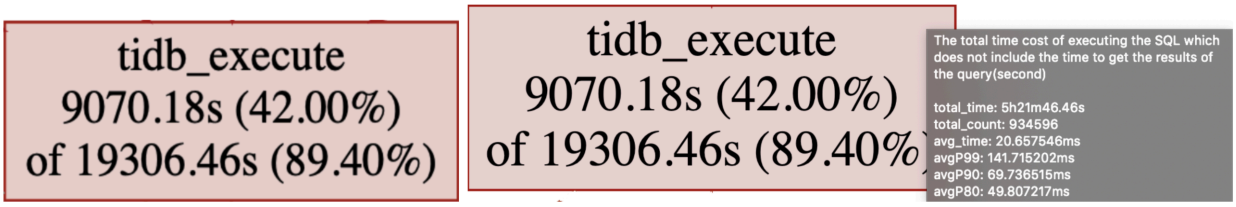

Figure 478: tidb_execute node example

Node information

Each box area represents a monitoring metric and provides the following information:

- The name of the monitoring metric
- The total duration of the monitoring metric
- The proportion of the metric's total duration to the total query duration

The total duration of the metric node = the duration of the metric node itself + the duration of its child nodes. Therefore, the metric graph of some nodes displays the proportion of the node itself's duration to the total duration, such as the graph of `tidb_execute`.

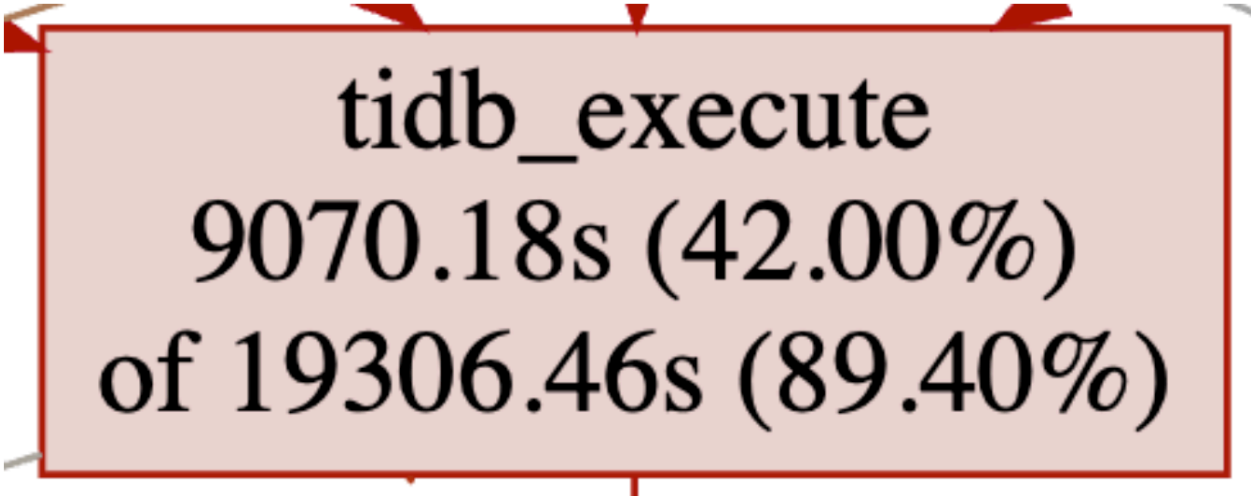

Figure 479: tidb_execute node example1

- `tidb_execute` is the name of the monitoring metric, which represents the execution duration of a SQL query in the TiDB execution engine.
- `19306.46s` represents that total duration of the `tidb_execute` metric is 19306.46 seconds. `89.40%` represents that 19306.46 seconds account for 89.40% of the total time consumed for all SQL queries (including user SQL queries and TiDB's internal SQL queries). The total query duration is the total duration of `tidb_query`.
- `9070.18s` represents that the total execution duration of the `tidb_execute` node itself is 9070.18 seconds, and the rest is the time consumed by its child nodes. `42.00%` represents that 9070.18 seconds account for 42.00% of the total query duration of all queries.

Hover your mouse over the box area and you can see more details of the `tidb_execute` metric node:

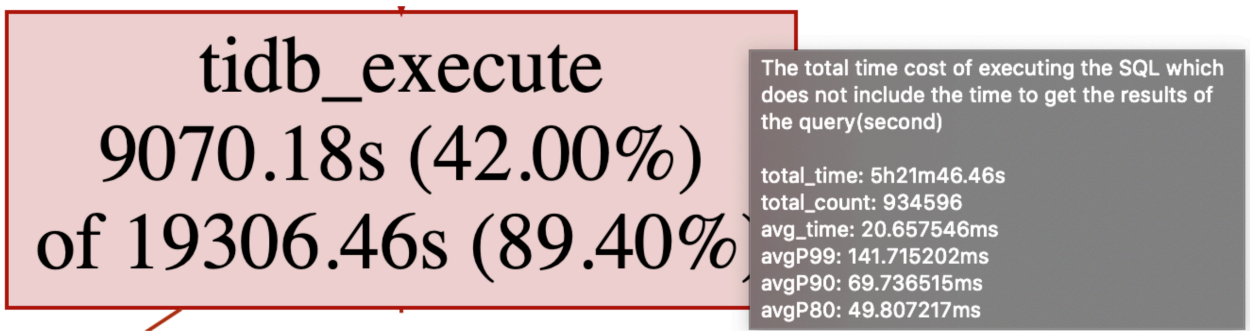

Figure 480: tidb_execute node example2

The text information displayed in the image above is the description of the metric node, including the total duration, the total times, the average duration, and the average duration

P99, P90, and P80.

The parent-child relations between nodes

Taking the `tidb_execute` metric node as an example, this section introduces a metric's child nodes.

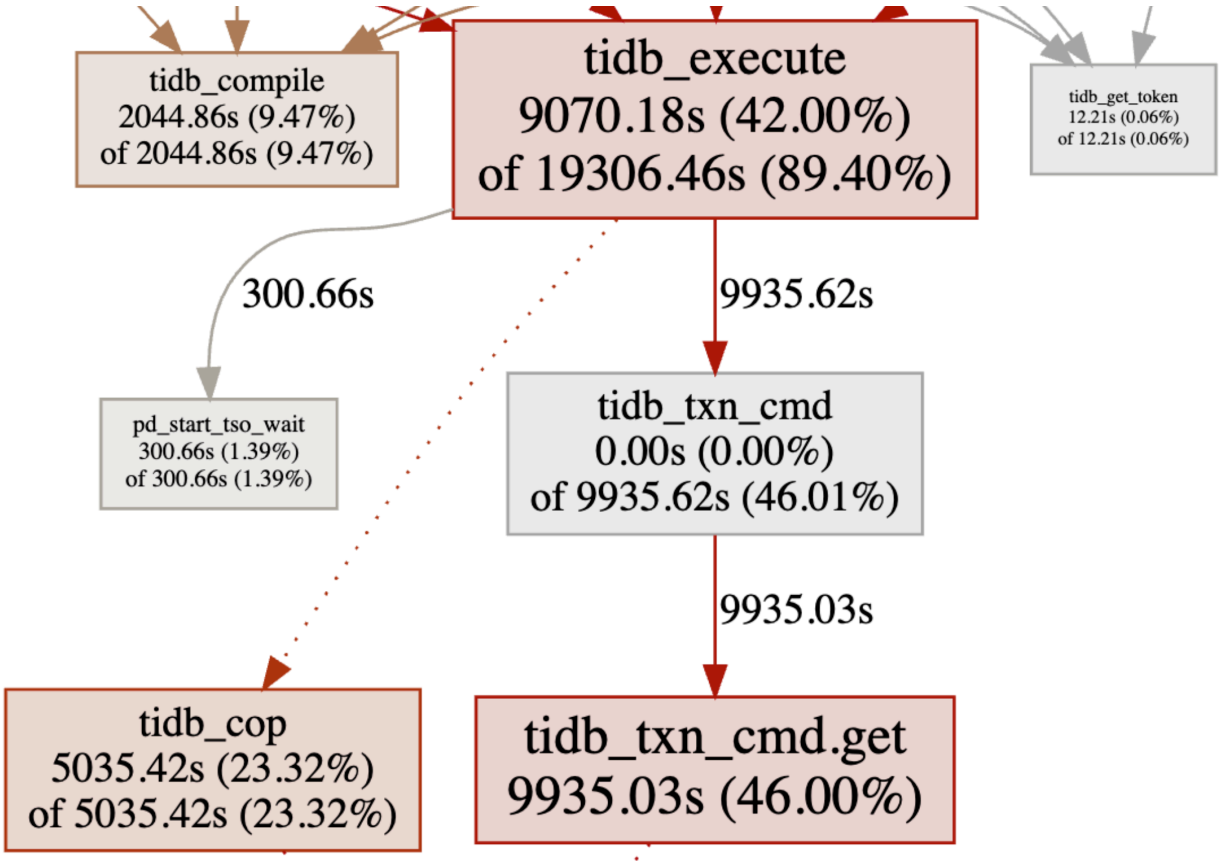

Figure 481: tidb_execute node relation example1

From the graph above, you can see the two child nodes of `tidb_execute`:

- `pd_start_tso_wait`: The total duration of waiting for the transaction's `start_tso`, which is 300.66 seconds.
- `tidb_txn_cmd`: The total duration of TiDB executing the relevant transaction commands, which is 9935.62 seconds.

In addition, `tidb_execute` also has a dotted arrow pointing to the `tidb_cop` box area, which indicates as follows:

`tidb_execute` includes the duration of the `tidb_cop` metric, but `cop` requests might be executed concurrently. For example, the `execute` duration of performing `join` queries on two tables is 60 seconds, during which table scan requests are concurrently executed on

the joined two tables. If the execution durations of `cop` requests are respectively 40 seconds and 30 seconds, the total duration of `cop` requests are 70 seconds. However, the `execute` duration is only 60 seconds. Therefore, if the duration of a parent node does not completely include the duration of a child node, the dotted arrow is used to point to the child node.

> **Note:**
>
> When a node have a dotted arrow pointing to its child node, the duration of this node itself is inaccurate. For example, in the `tidb_execute` node, the duration of the node itself is 9070.18 seconds (`9070.18 = 19306.46 - 300.66 - 9935.62`). In this equation, the duration of the `tidb_cop` child node is not calculated into the duration of `tidb_execute`'s child nodes. But in fact, this is not true. 9070.18 seconds, the duration of `tidb_execute` itself, includes a part of the `tidb_cop` duration, and the duration of this part cannot be determined.

`tidb_kv_request` and its parent nodes

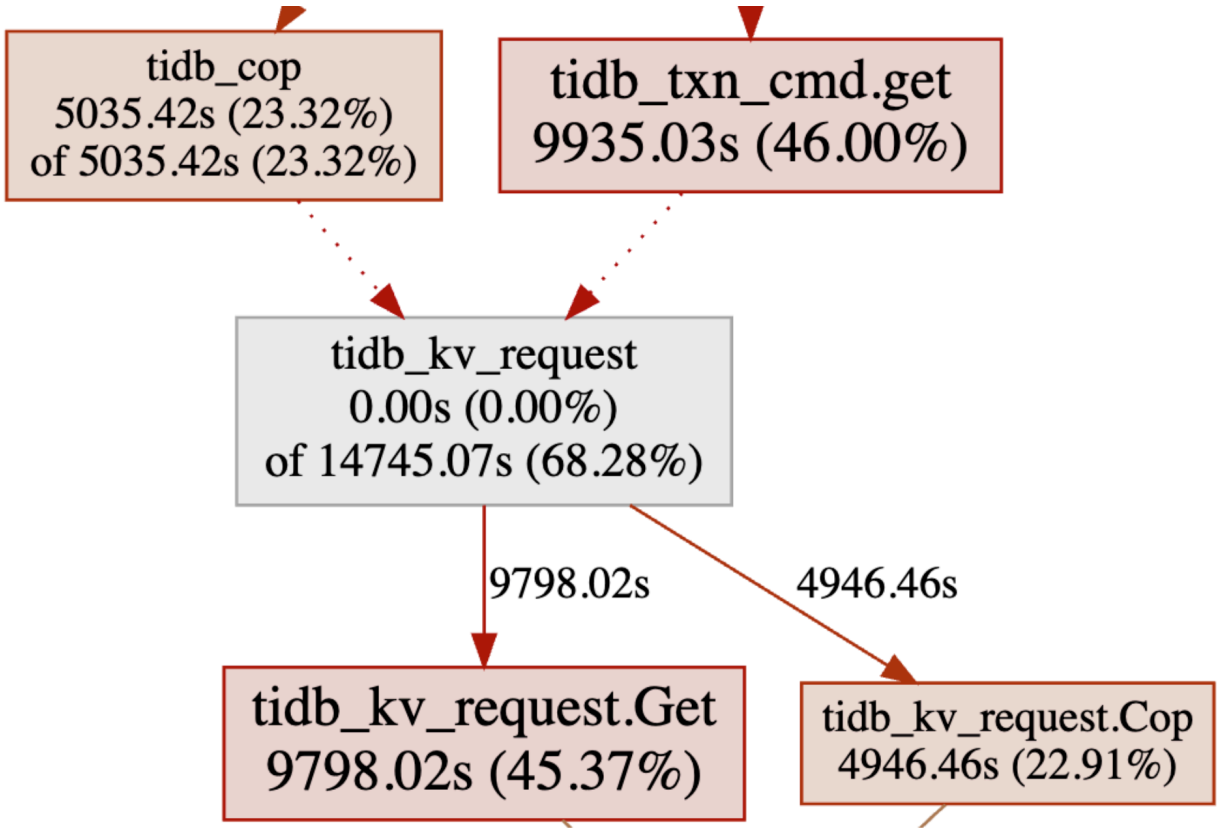

Figure 482: tidb_execute node relation example2

`tidb_cop` and `tidb_txn_cmd.get`, the parent nodes of `tidb_kv_request`, both have dotted arrows pointing to `tidb_kv_request`, which indicates as follows:

- The duration of `tidb_cop` includes a part of `tidb_kv_request`'s duration.
- The duration of `tidb_txn_cmd.get` also includes a part of `tidb_kv_request`'s duration.

However, it is hard to determine how much duration of `tidb_kv_request` is included in `tidb_cop`.

- `tidb_kv_request.Get`: The duration of TiDB sending the `Get` type key-value requests.
- `tidb_kv_request.Cop`: The duration of TiDB sending the `Cop` type key-value requests.

`tidb_kv_request` does not include `tidb_kv_request.Get` and `tidb_kv_request.Cop` nodes as its child nodes, but consists of the latter two nodes. The name prefix of the child node is the name of the parent node plus `.xxx`, which means that the child node is the sub-class of the parent node. You can understand this case in the following way:

The total duration of TiDB sending key-value requests is 14745.07 seconds, during which the key-value requests for the `Get` and `Cop` types respectively consume 9798.02 seconds and 4946.46 seconds.

14.14.1.9 SQL Statements Analysis

14.14.1.9.1 SQL Statements Page of TiDB Dashboard

The SQL statements page shows the execution status of all SQL statements in the cluster. This page is often used to analyze the SQL statement whose total or single execution time is long.

On this page, SQL queries with a consistent structure (even if the query parameters are inconsistent) are classified as the same SQL statement. For example, both `SELECT * FROM employee WHERE id IN (1, 2, 3)` and `select * from EMPLOYEE where ID in (4, 5)` are classified as the same `select * from employee where id in (...)` SQL statement.

Access the page

You can use one of the following two methods to access the SQL statement summary page:

- After logging in to TiDB Dashboard, click **SQL Statements** in the left navigation menu.
- Visit http://127.0.0.1:2379/dashboard/#/statement in your browser. Replace `127.0.0.1:2379` with the actual PD instance address and port.

All the data shown on the SQL statement summary page are from the TiDB statement summary tables. For more details about the tables, see TiDB Statement Summary Tables.

> **Note:**
>
> In the **Mean Latency** column of the SQL statement summary page, the blue bar indicates the average execution time. If there is a yellow line on the blue bar for an SQL statement, the left and right sides of the yellow line respectively represent the minimum and maximum execution time of the SQL statement during the recent data collection cycle.

Change Filters

On the top of the SQL statement summary page, you can modify the time range of SQL executions to be displayed. You can also filter the list by database in which SQL statements are executed, or by SQL types. The following image shows all SQL executions over the recent data collection cycle (recent 30 minutes by default).

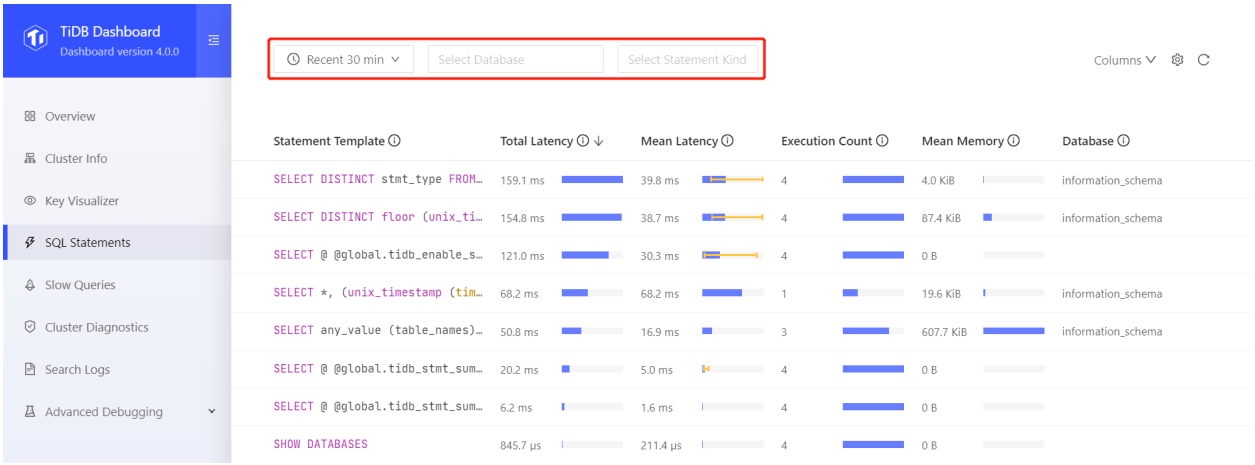

Figure 483: Modify filters

Display More Columns

Click **Columns** on the page and you can choose to see more columns. You can move your mouse to the **(i)** icon at the right side of a column name to view the description of this column:

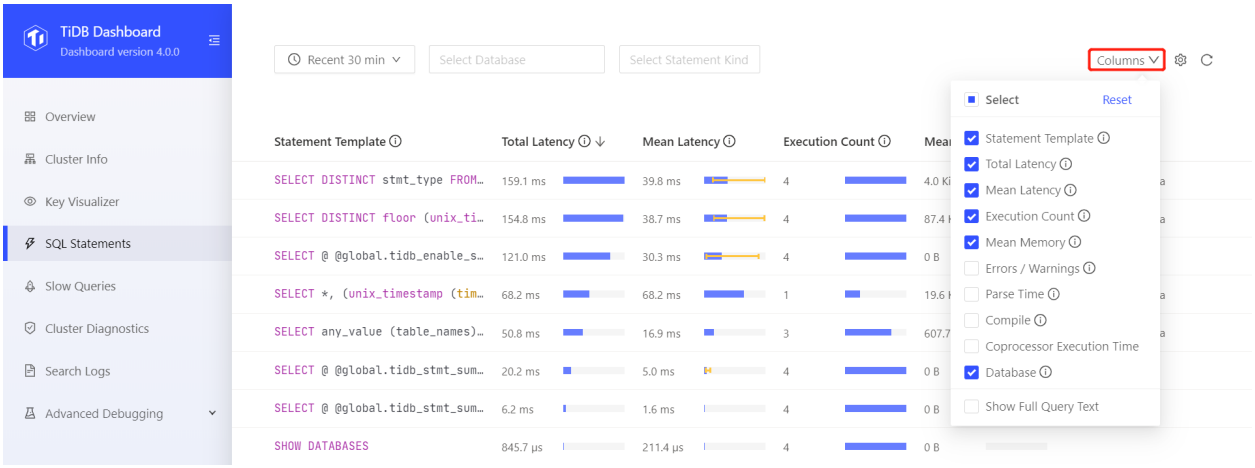

Figure 484: Choose columns

Sort by Column

By default, the list is sorted by **Total Latency** from high to low. Click on different column headings to modify the sorting basis or switch the sorting order:

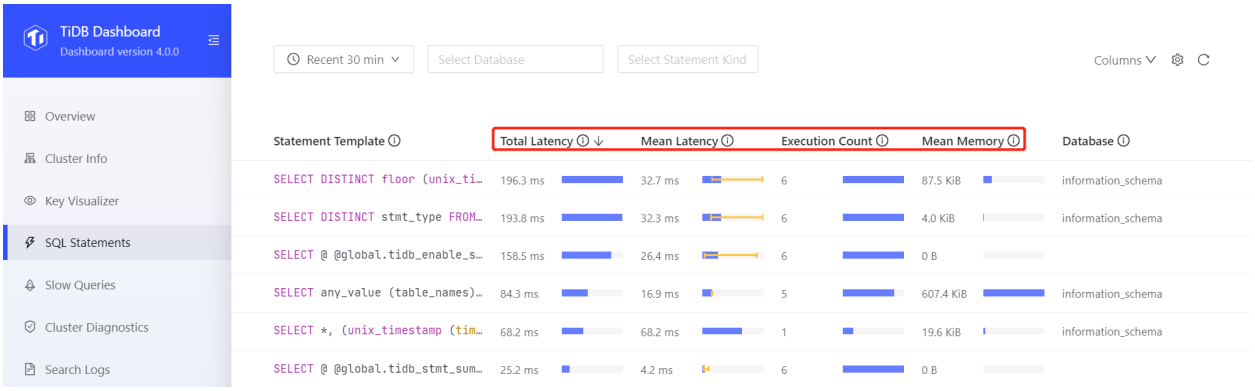

Figure 485: Modify list sorting

Change Settings

On the list page, click the **Settings** button on the top right to change the settings of the SQL statements feature:

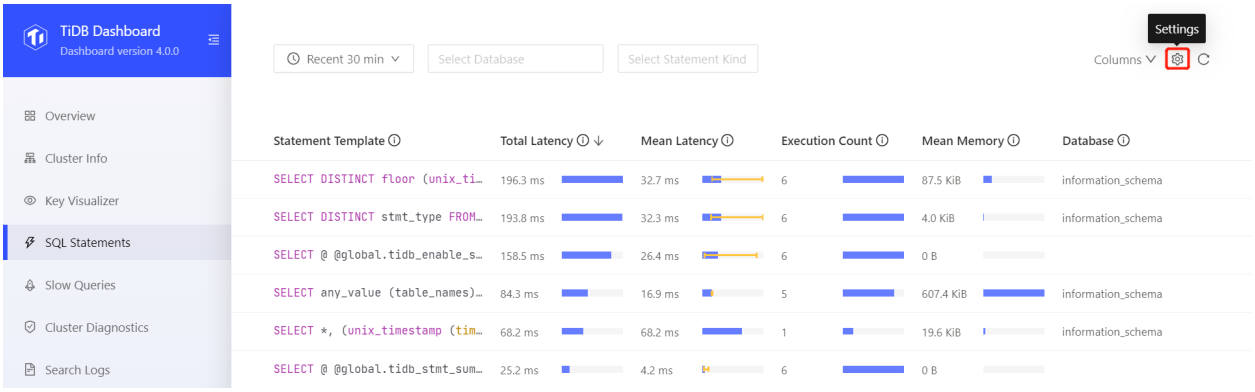

Figure 486: Settings entry

After clicking the **Settings** button, you can see the following setting dialog box:

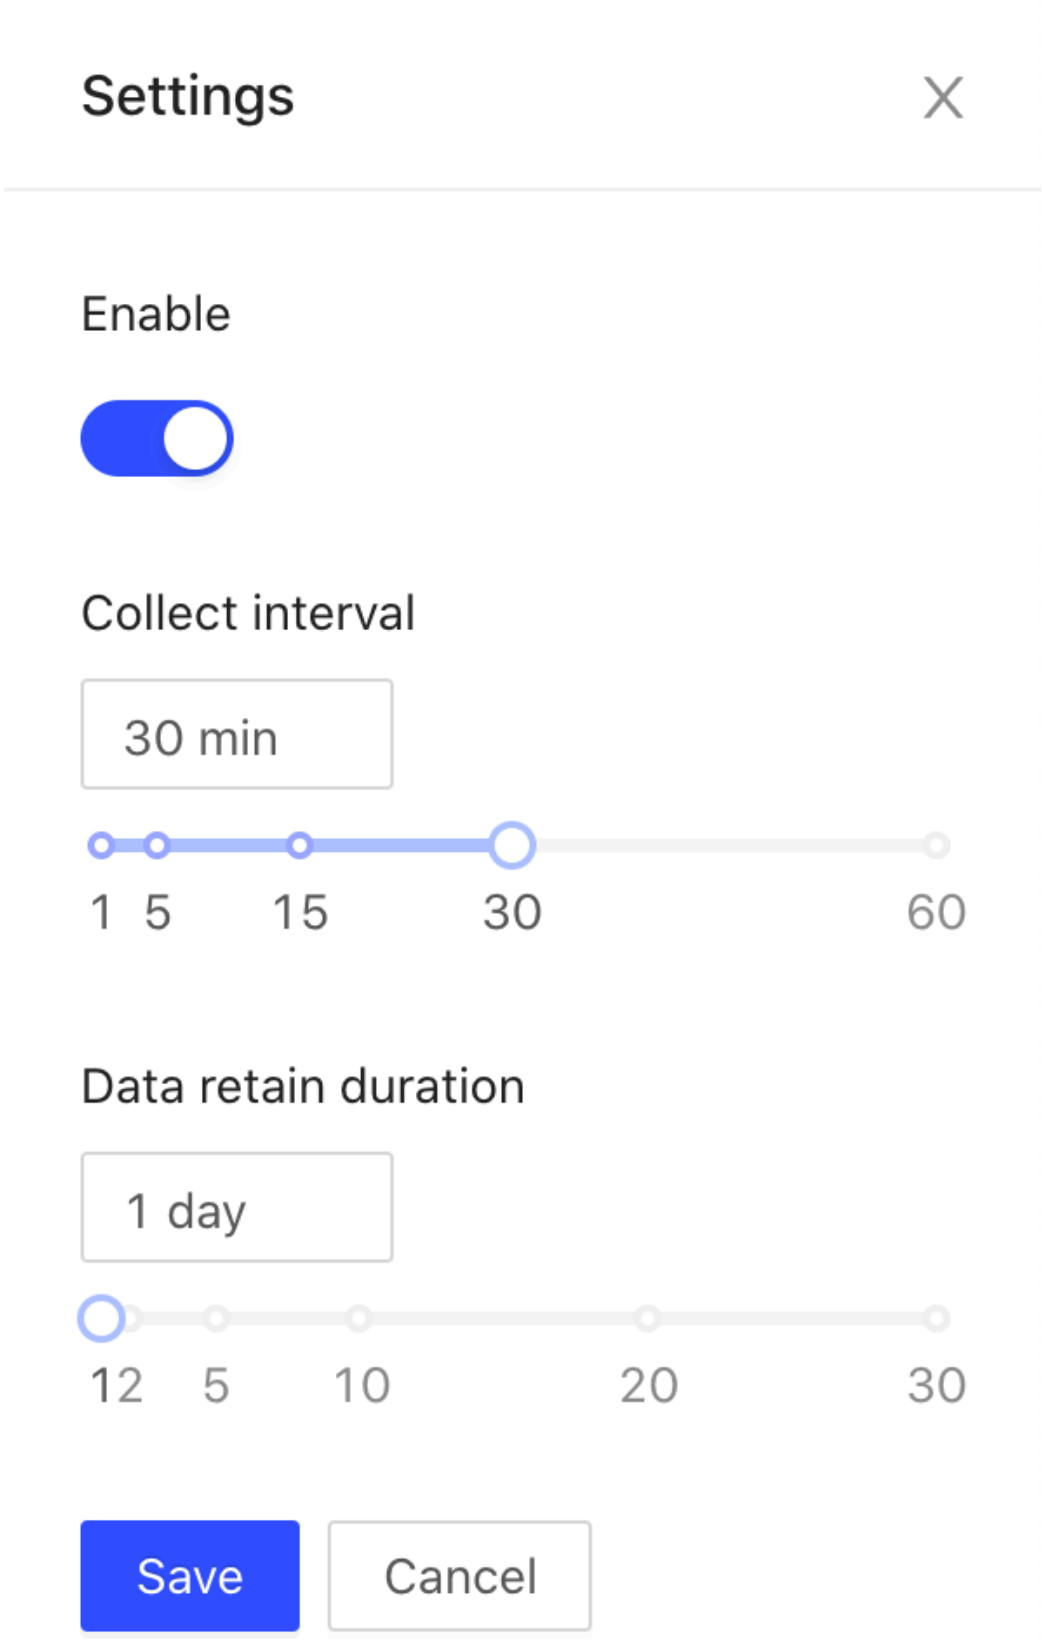

Figure 487: Settings

On the setting page, you can disable or enable the SQL statements feature. When the SQL statements feature is enabled, you can modify the following settings:

- Collect interval: The length of period for each SQL statement analysis, which is 30 minutes by default. The SQL statements feature summarizes and counts all SQL statements within a period of time. If the period is too long, the granularity of the summary is coarse, which is not good for locating problems; if the period is too short, the granularity of the statistics is fine, which is good for locating problems, but this will result in more records and more memory usage within the same data retention duration. Therefore, you need to adjust this value based on the actual situation, and properly lower this value when locating problems.
- Data retain duration: The retention duration of summary information, which is 1 day by default. Data retained longer than this duration will be deleted from system tables.

See Configurations of Statement Summary Tables for details.

Note:

- Because the statement system table is only stored in memory, after the SQL Statements feature is disabled, the data in the system table will be cleared.
- The values of `Collect interval` and `retain duration` affect the memory usage, so it is recommended to adjust these values according to the actual situation. The value of `retain duration` should not be set too large.

Others

`tidb_stmt_summary_max_stmt_count` limits the number of SQL statements that can be stored in statement summary tables. If the limit is exceeded, TiDB clears the SQL statements that recently remain unused. These cleared SQL statements are represented as rows with `DIGEST` set to `NULL`. On the SQL statement page of TiDB Dashboard, the information of these rows is displayed as `Others`.

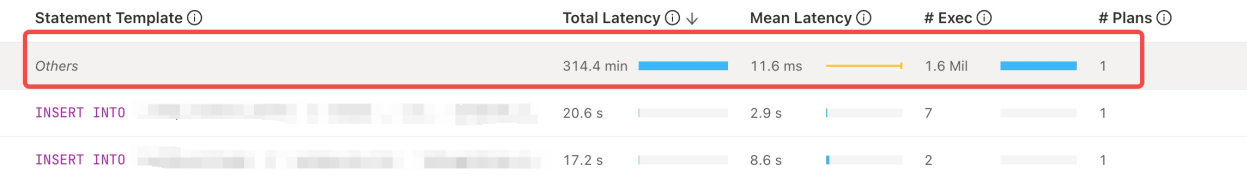

Figure 488: Others

Next step

For more information about how to view the execution details of SQL statements, see Statement execution details of TiDB Dashboard.

14.14.1.9.2 Statement Execution Details of TiDB Dashboard

Click any item in the list to enter the detail page of the SQL statement to view more detailed information. This information includes the following parts:

- The overview of SQL statements, which includes the SQL template, the SQL template ID, the current time range of displayed SQL executions, the number of execution plans, the database in which the SQL statement is executed, and the fast plan binding feature (area 1 in the following figure).
- The execution plan list: If a SQL statement has multiple execution plans, this list is displayed. Besides text information of execution plans, TiDB v6.2.0 introduces visual execution plans, through which you can learn each operator of a statement and detailed information more intuitively. You can select different execution plans, and the details of the selected plans are displayed below the list (area 2 in the following figure).
- Execution detail of plans, which displays the detailed information of the selected execution plans. See Execution plan in details (area 3 in the following figure).

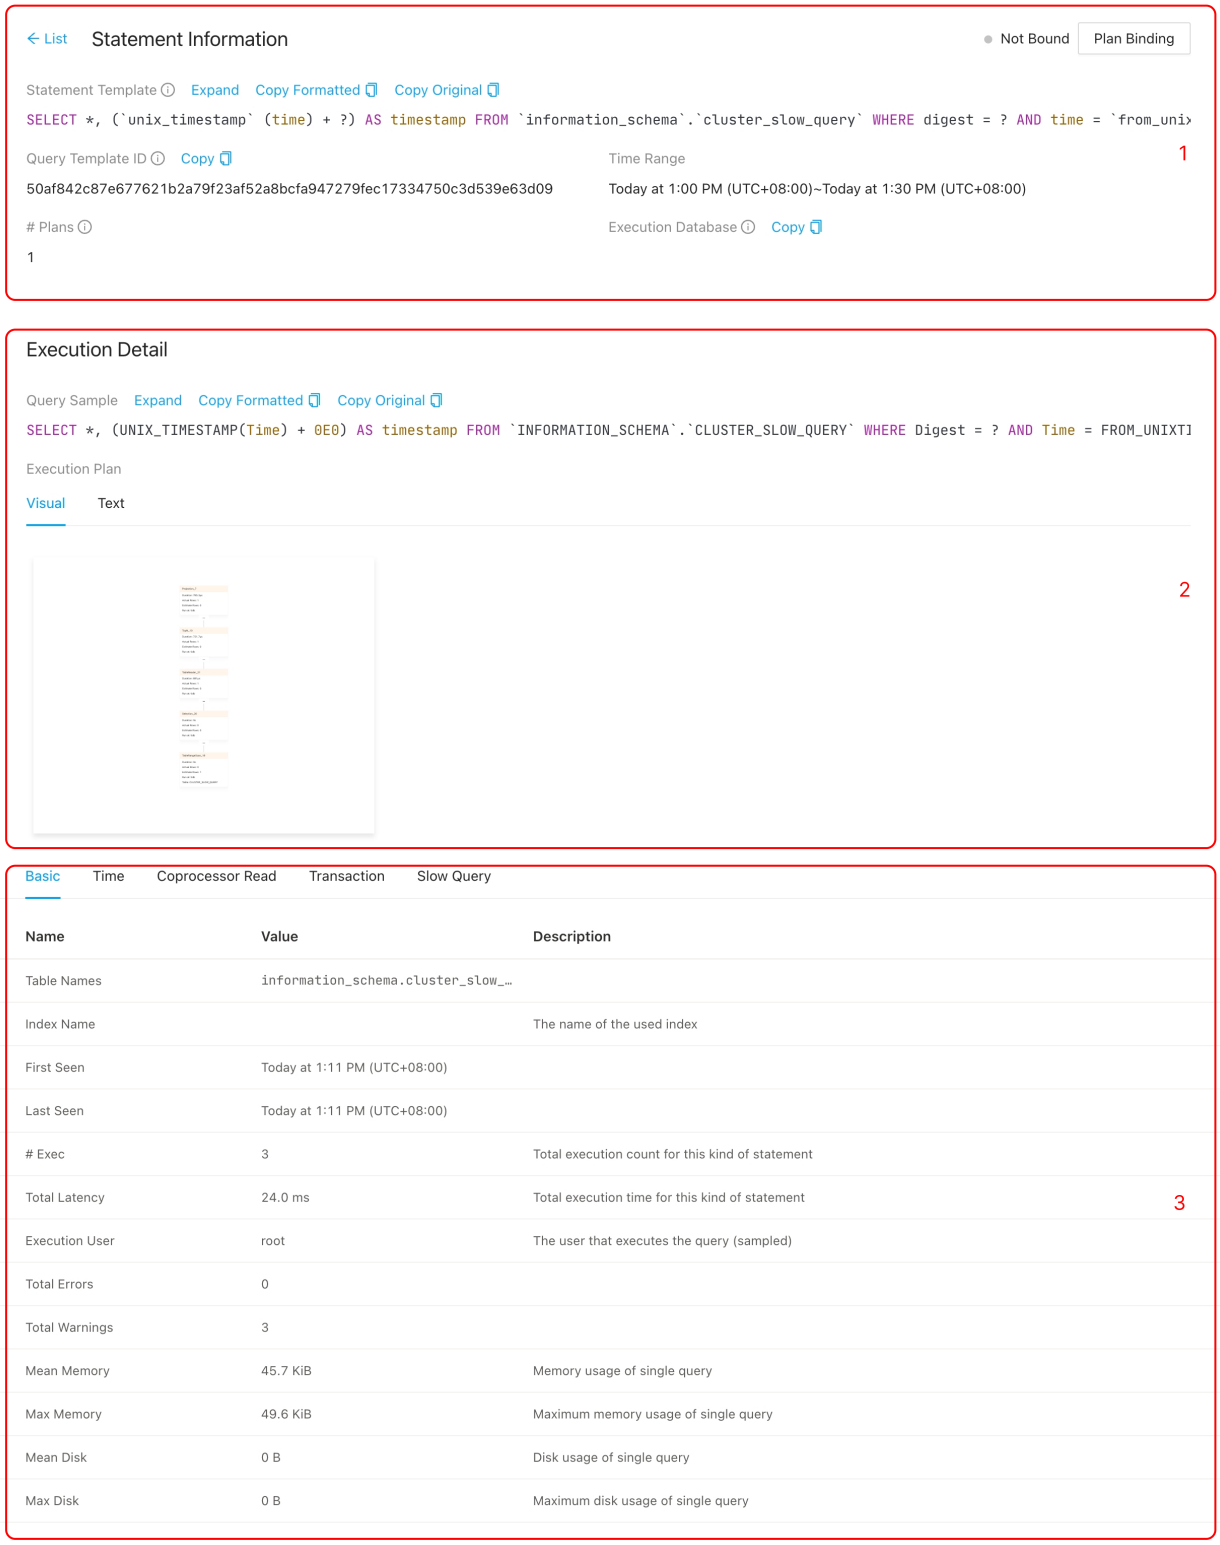

Figure 489: Details

Fast plan binding

Starting from v6.6.0, TiDB introduces the fast plan binding feature. You can quickly bind a SQL statement to a specific execution plan in TiDB Dashboard.

Usage

Bind an execution plan

1. Click **Plan Binding**. The **Plan Binding** dialog box is displayed.

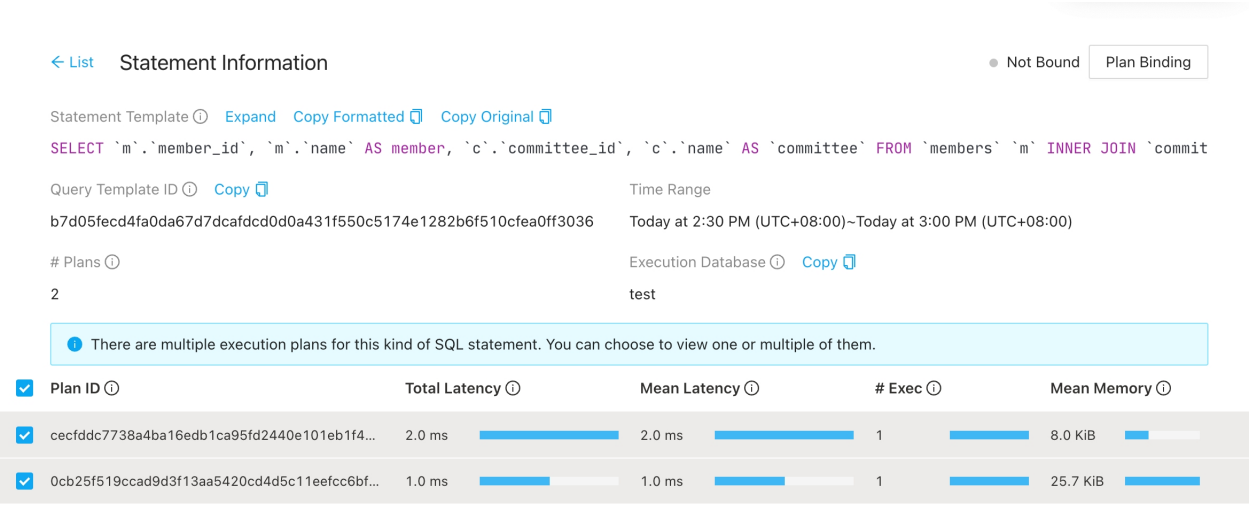

Figure 490: Fast plan binding - not bound - entry

2. Select a plan that you want to bind and click **Bind**.

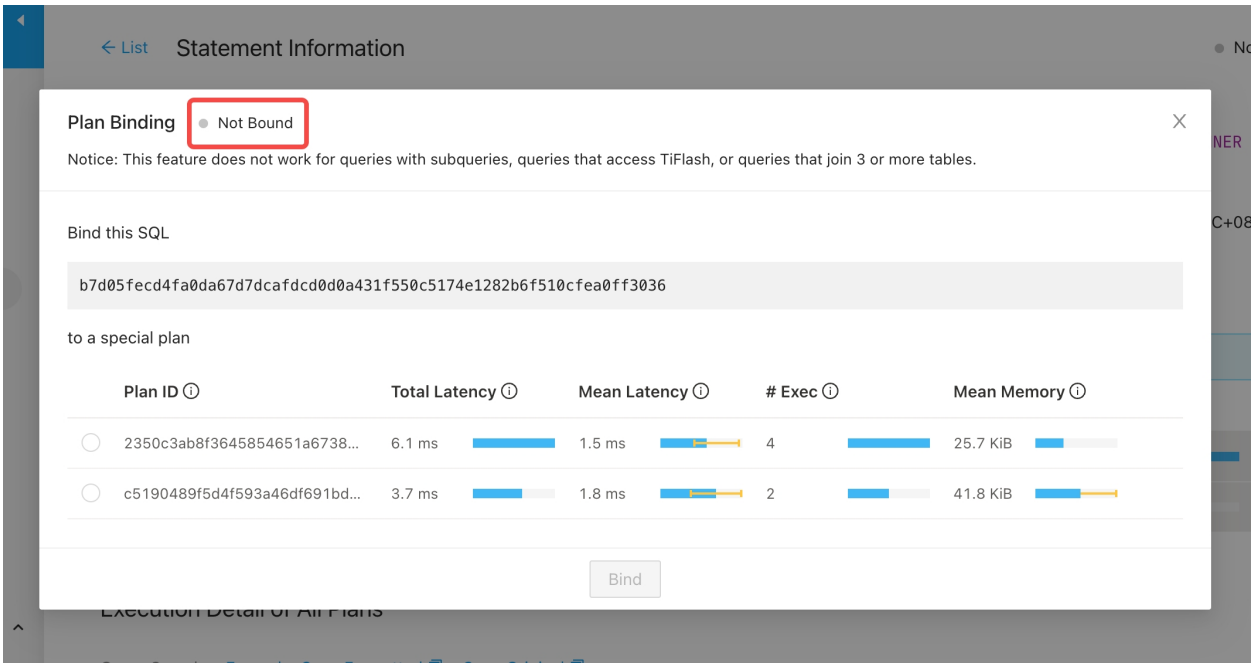

Figure 491: Fast plan binding - popup

3. After the binding is completed, you can see the **Bound** label.

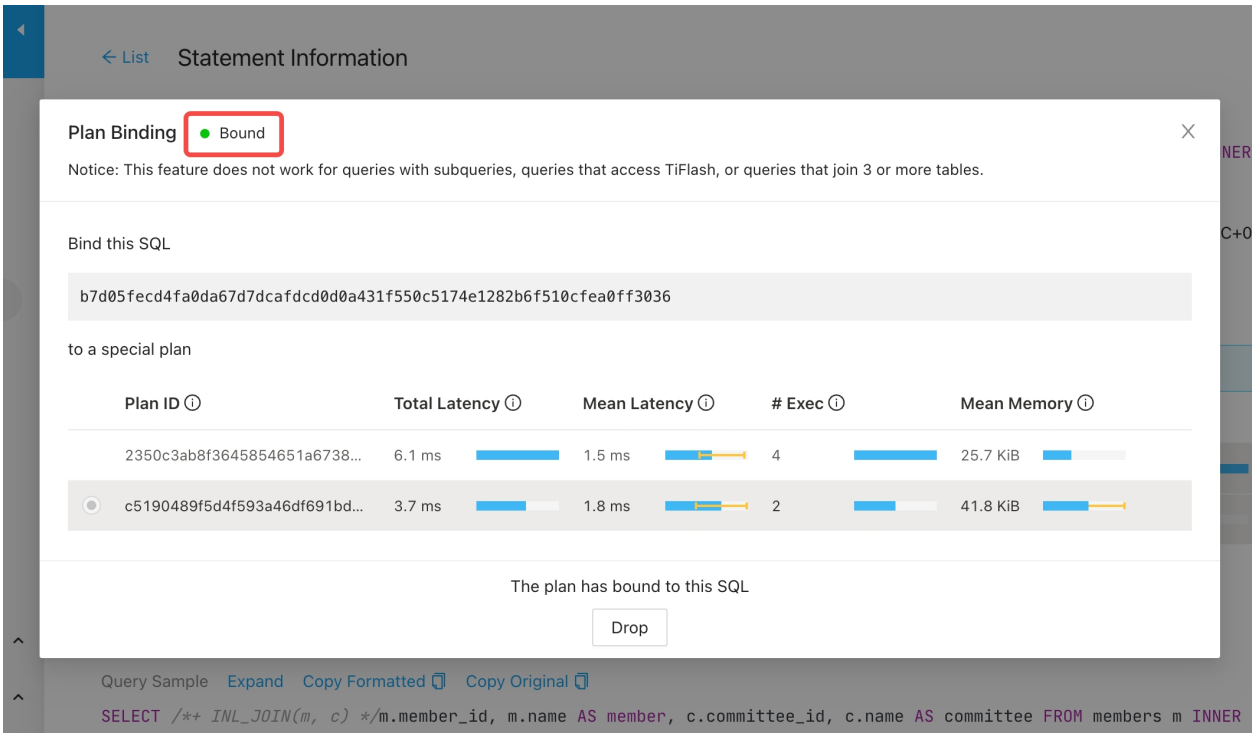

Figure 492: Fast plan binding - popup - binding completed

Drop an existing binding

1. On the page of a SQL statement that has an existing binding, click **Plan Binding**. The **Plan Binding** dialog box is displayed.

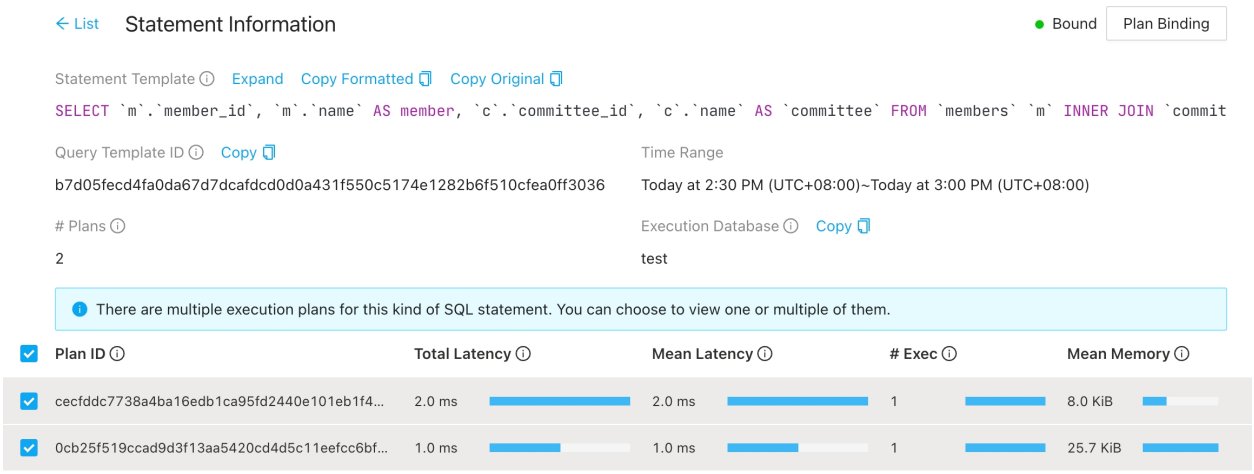

Figure 493: Fast plan binding - bound - entry

2. Click **Drop**.

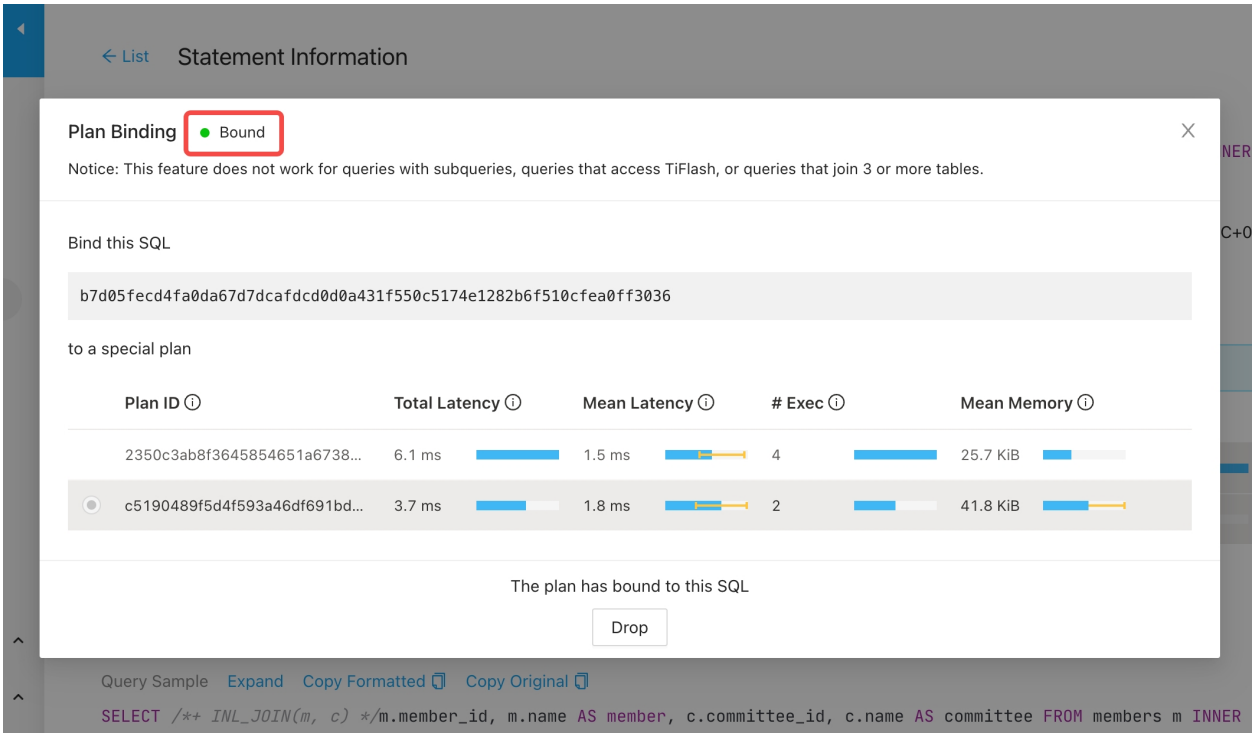

Figure 494: Fast plan binding - popup - bound

3. After the binding is dropped, you can see the **Not bound** label.

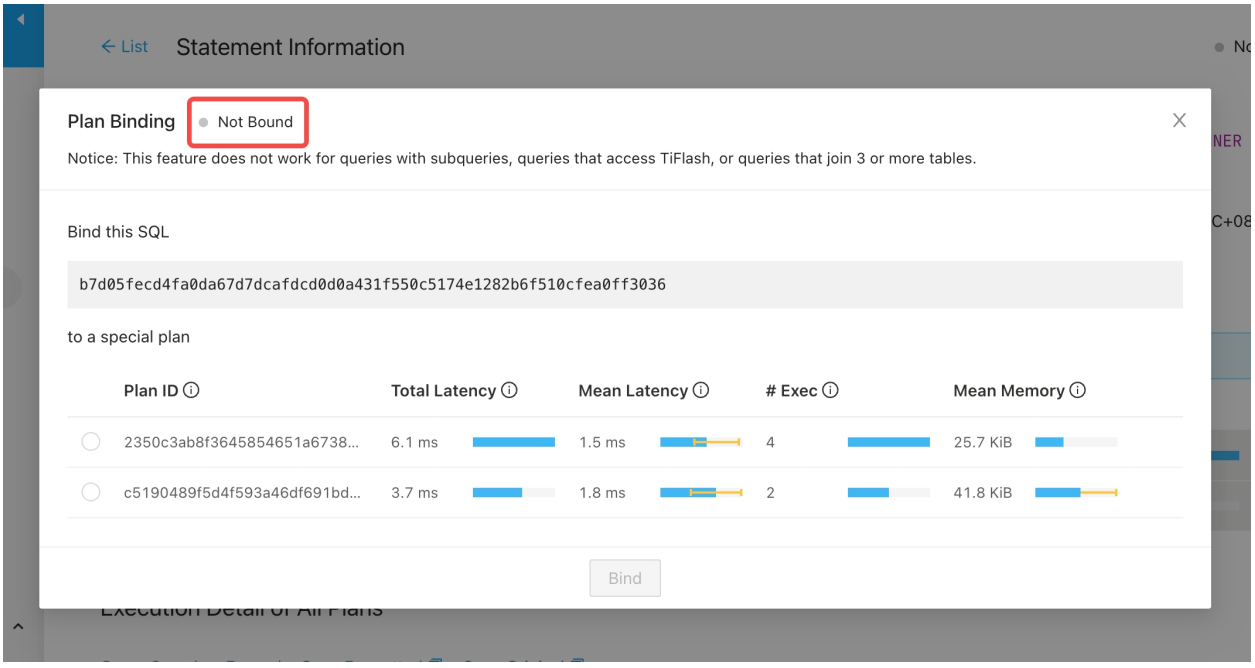

Figure 495: Fast plan binding - popup

Limitation

Currently, the fast plan binding feature does not support the following types of SQL statements:

- Statements that are not `SELECT`, `DELETE`, `UPDATE`, `INSERT`, or `REPLACE`
- Queries with subqueries
- Queries that access TiFlash
- Queries that join three or more tables

To use this feature, you must have the SUPER privilege. If you encounter permission issues while using it, refer to TiDB Dashboard User Management to add the necessary privileges.

Execution details of plans

The execution detail of plans includes the following information:

- SQL sample: The text of a certain SQL statement that is actually executed corresponding to the plan. Any SQL statement that has been executed within the time range might be used as a SQL sample.
- Execution plan: Complete information about execution plans, displayed in table, graph, and text. For details of the execution plan, see Understand the Query Execution Plan. If multiple execution plans are selected, only (any) one of them is displayed.
- For basic information, execution time, Coprocessor read, transaction, and slow query of the SQL statement, you can click the corresponding tab titles to switch among different information.

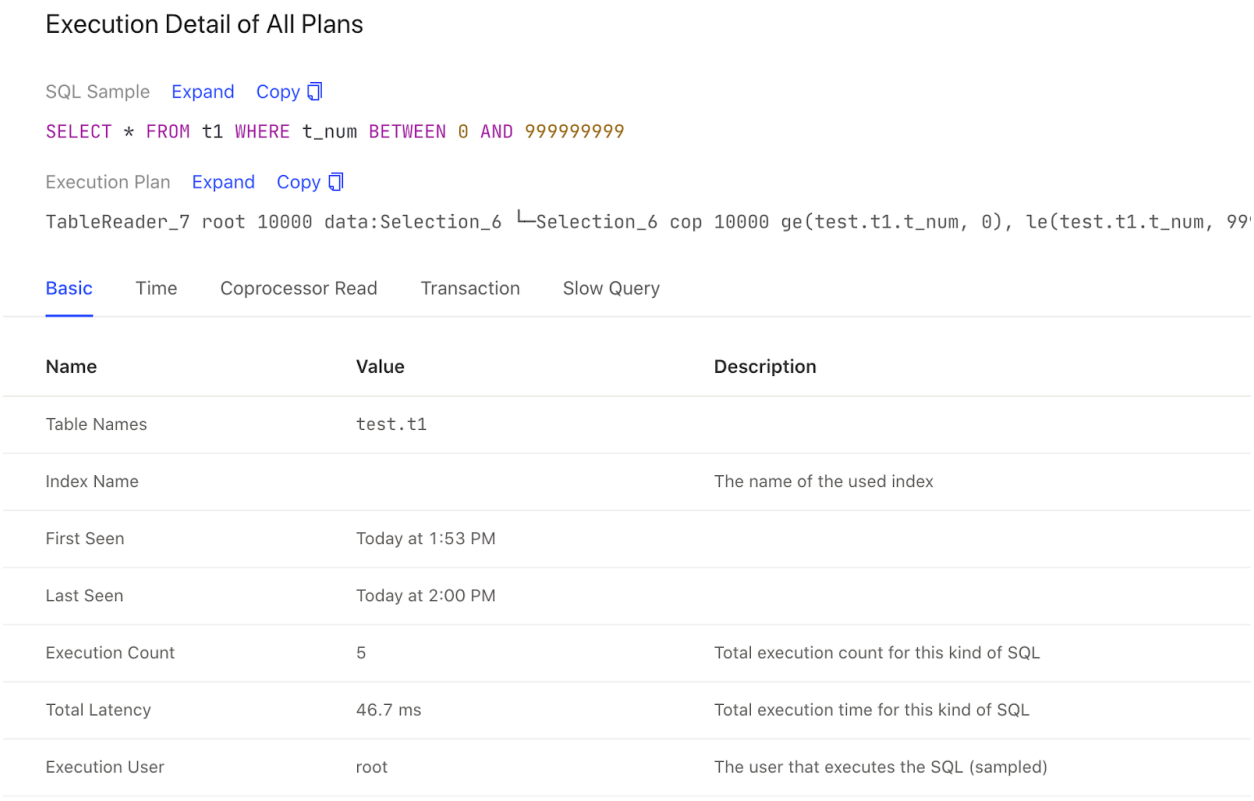

Figure 496: Execution details of plans

SQL sample

To view the detailed information of an item, you can click **Expand**. To copy the detailed information to the clipboard, click **Copy**.

Execution plans

On TiDB Dashboard, you can view execution plans in three ways: table, text, and graph. To learn how to read an execution plan, see Understand the query execution plan.

Execution plan in table format

The table format provides detailed information about the execution plan, which helps you quickly identify abnormal operator metrics and compare the status of different operators. The following figure shows an execution plan in table format:

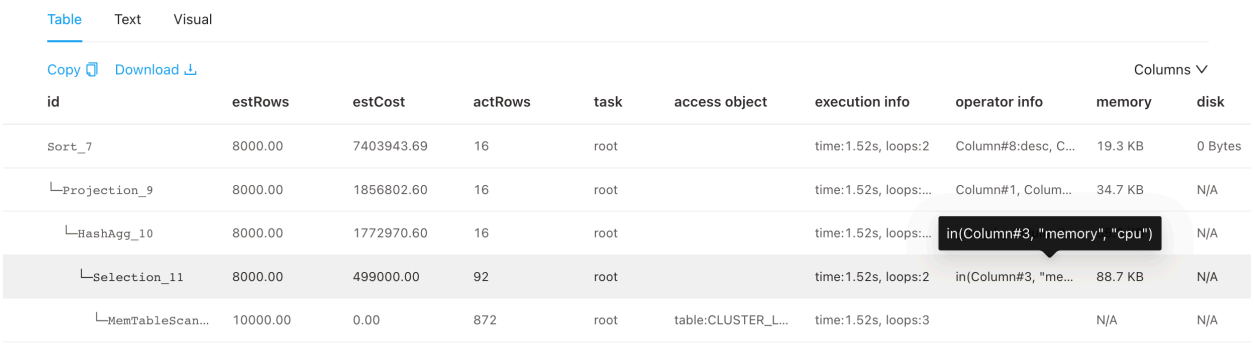

Figure 497: Execution plan in table format

The table format displays similar information to the text format but provides more user-friendly interactions:

- You can adjust the column width freely.
- When content exceeds the column width, it is automatically truncated and a tooltip is shown for the full information.
- If the execution plan is large, you can download it as a text file for local analysis.
- You can hide and manage columns using the column picker.

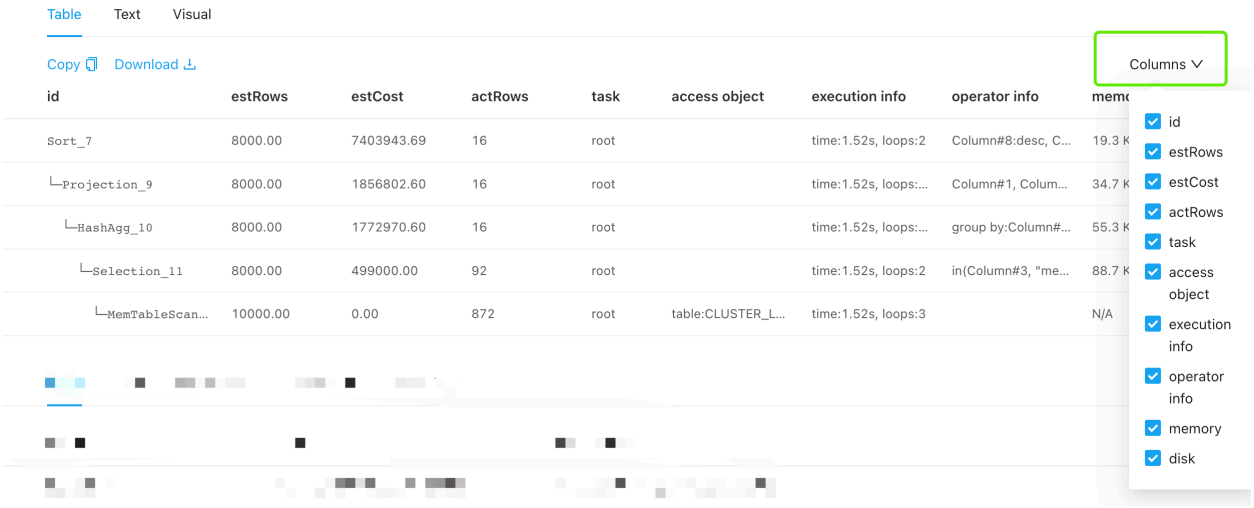

Figure 498: Execution plan in table format - column picker

Execution plan in graph format

The graph format is more suitable for viewing the execution plan tree of a complex SQL statement and understanding each operator and its corresponding content in detail. The following figure shows an execution plan in graph format:

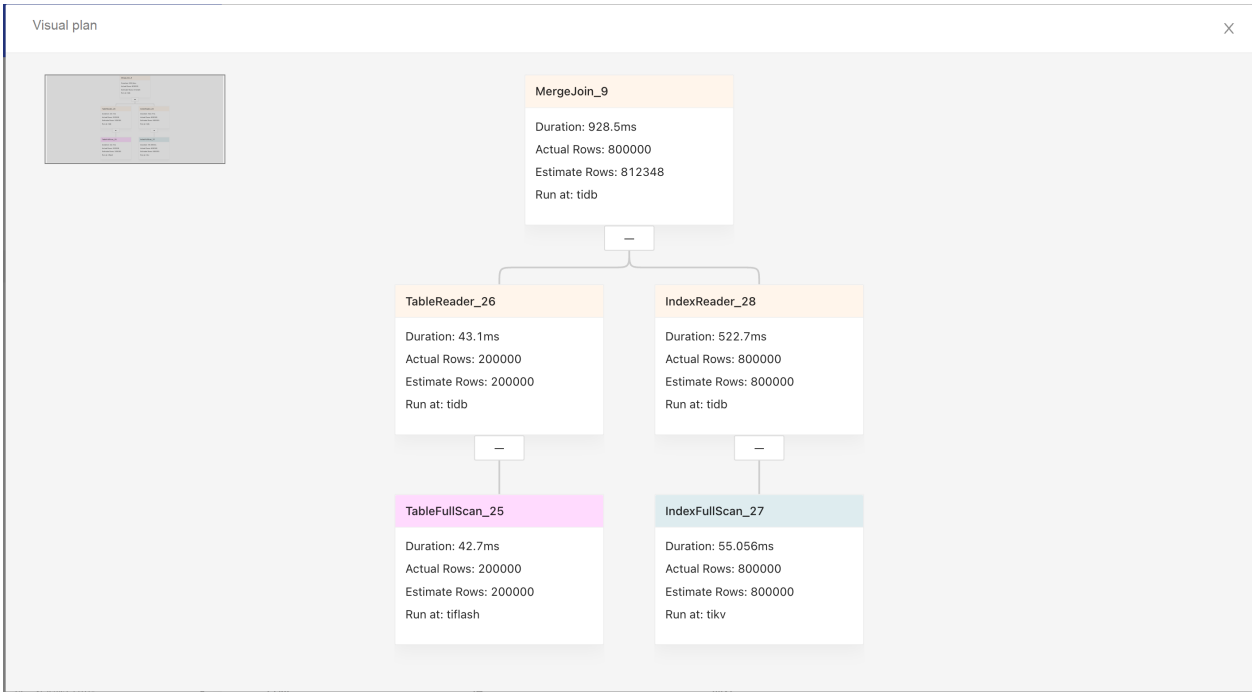

Figure 499: Execution plan in graph format

- The graph shows the execution from left to right, and from top to bottom.
- Upper nodes are parent operators and lower nodes are child operators.
- The color of the title bar indicates the component where the operator is executed: yellow stands for TiDB, blue stands for TiKV, and pink stands for TiFlash.
- The title bar shows the operator name and the text shown below is the basic information of the operator.

Click the node area, and the detailed operator information is displayed on the right sidebar.

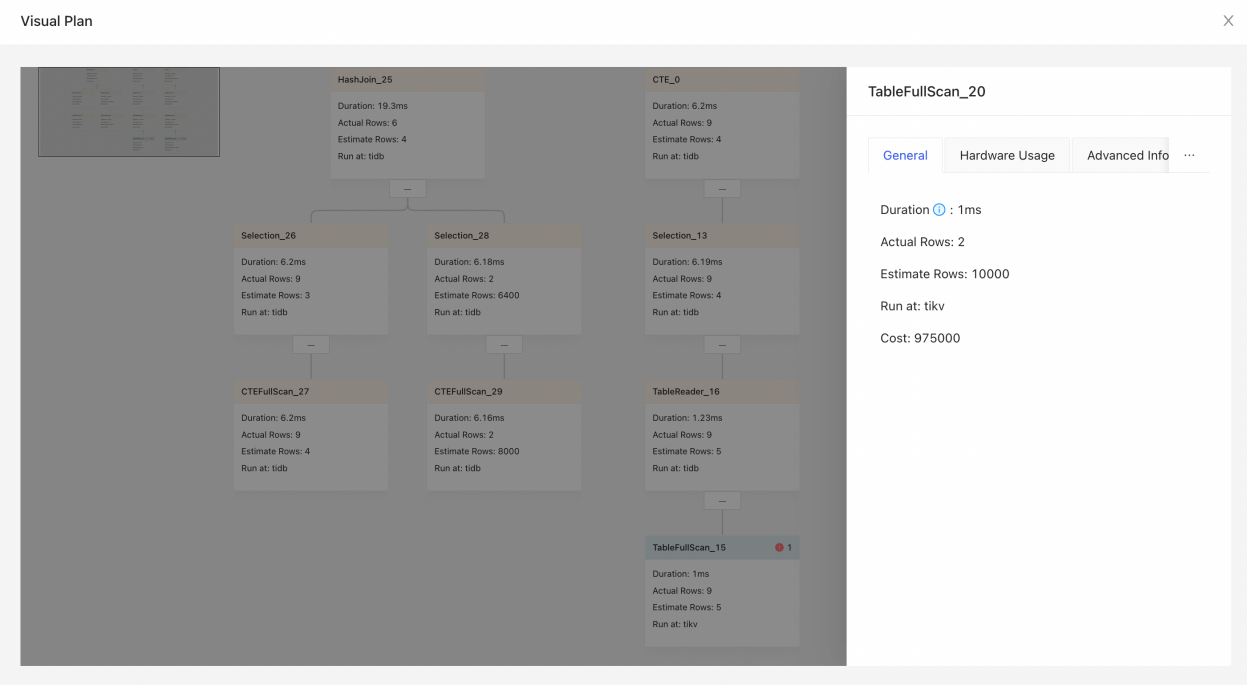

Figure 500: Execution plan in graph format - sidebar

SQL execution details

For basic information, execution time, Coprocessor read, transaction, and slow query of the SQL statement, you can click the corresponding tab titles to switch among different information.

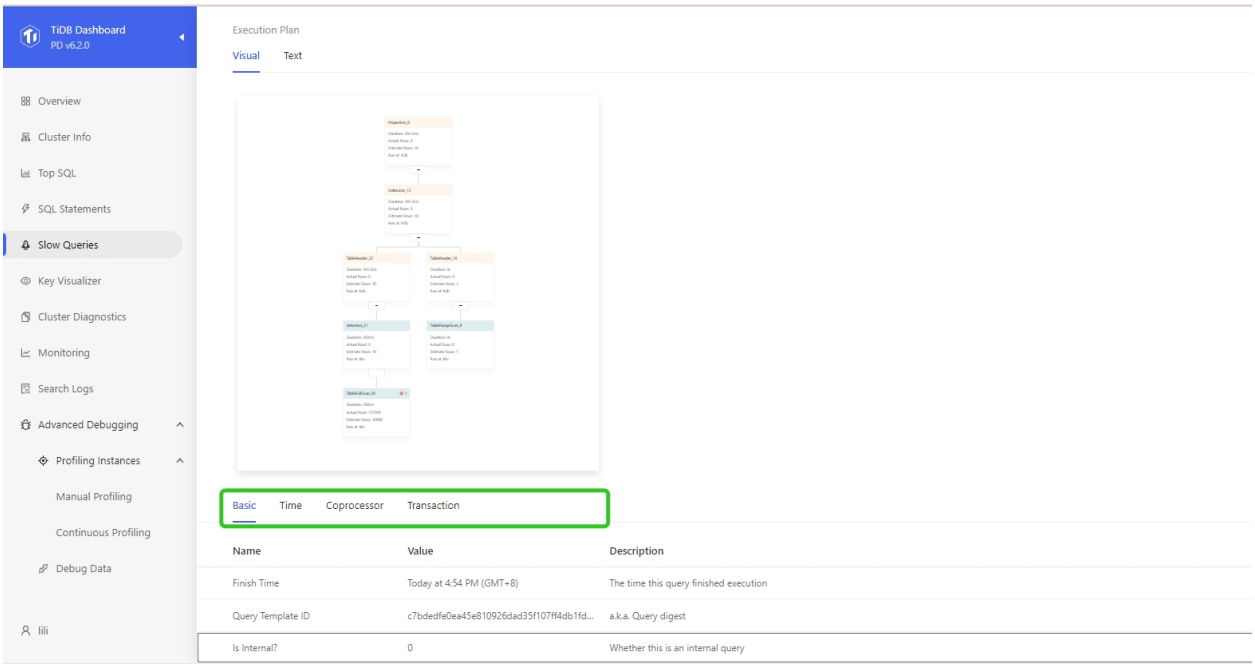

Figure 501: Show different execution information

Basic tab

The basic information of a SQL execution includes the table names, index name, execution count, and total latency. The **Description** column provides detailed description of each field.

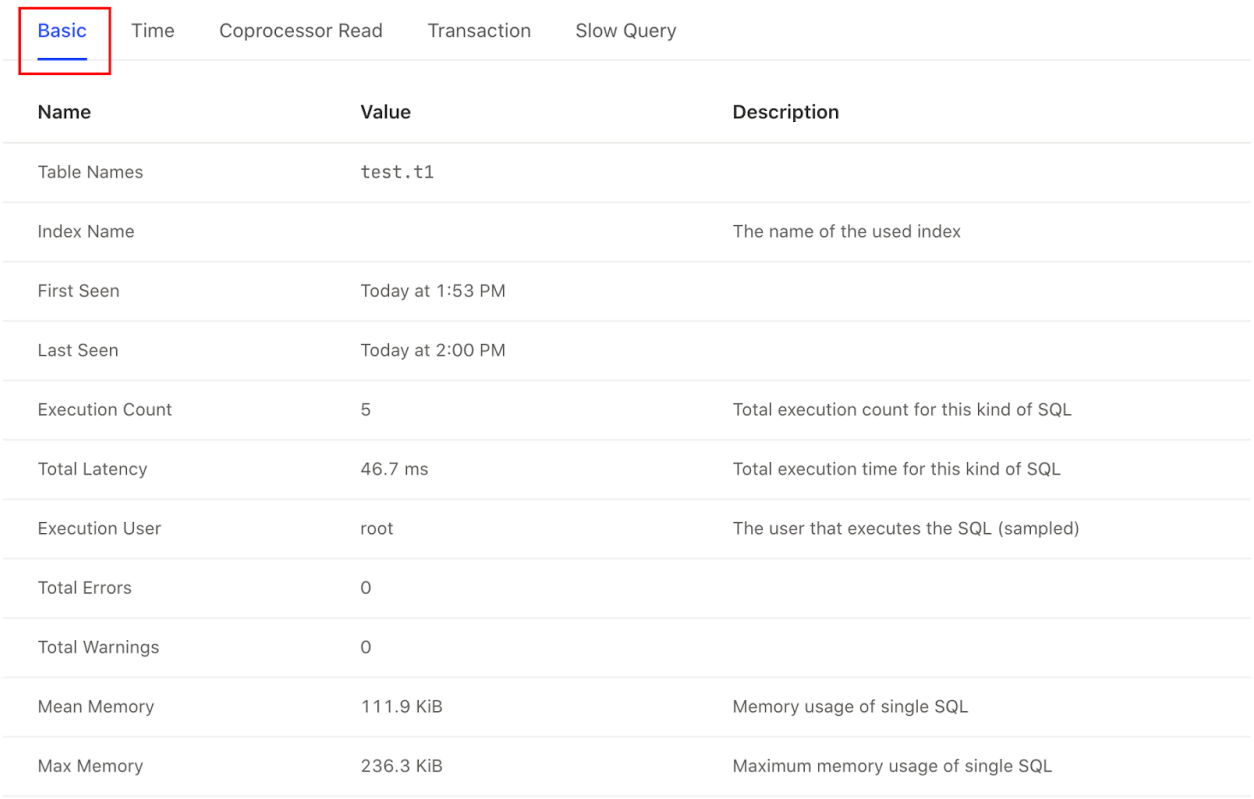

Figure 502: Basic information

Time tab

Click the **Time** tab, and you can see how long each stage of the execution plan lasts.

> **Note:**
>
> Because some operations might be performed in parallel within a single SQL statement, the cumulative duration of each stage might exceed the actual execution time of the SQL statement.

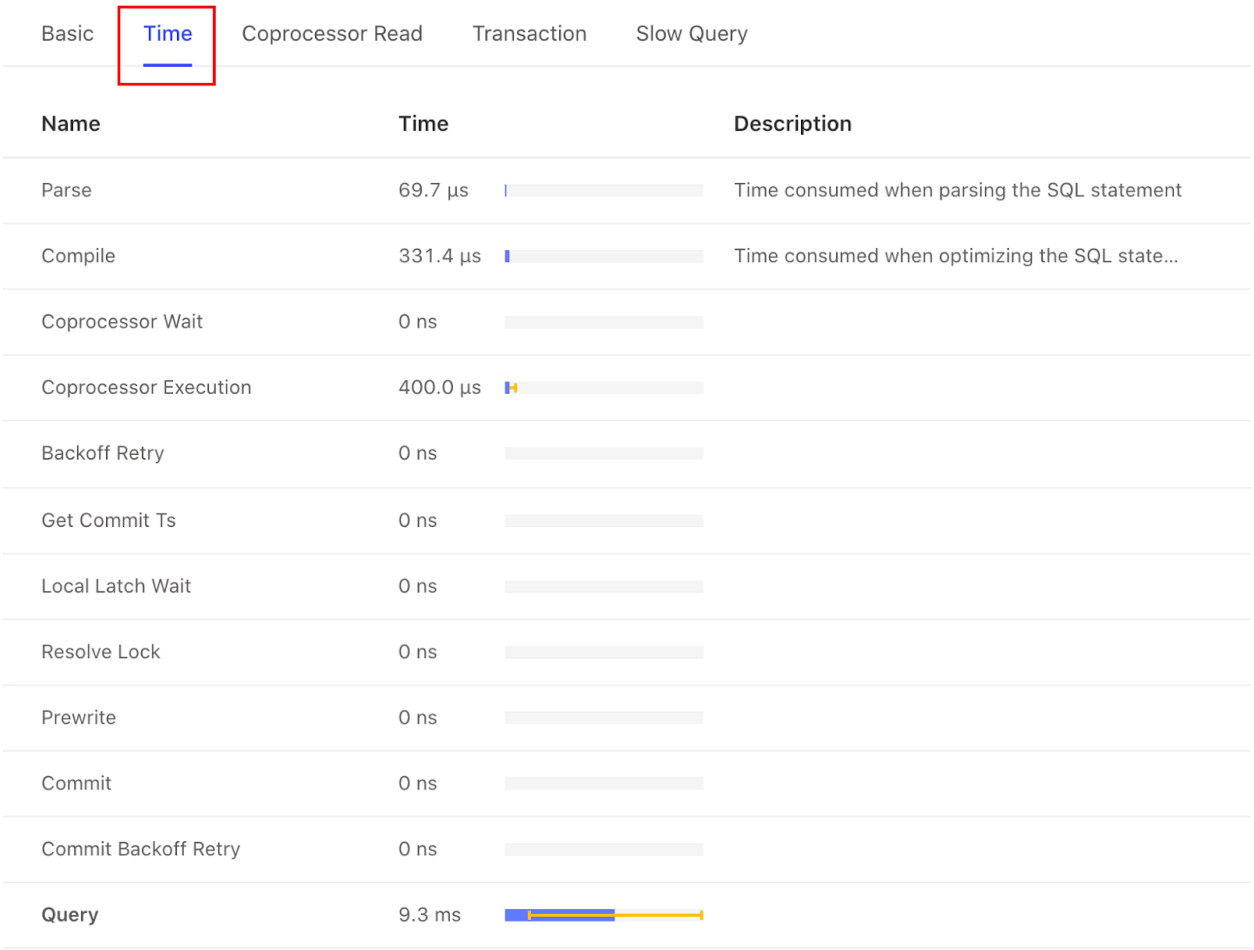

Figure 503: Execution time

Coprocessor Read tab

Click the **Coprocessor Read** tab, and you can see information related to Coprocessor read.

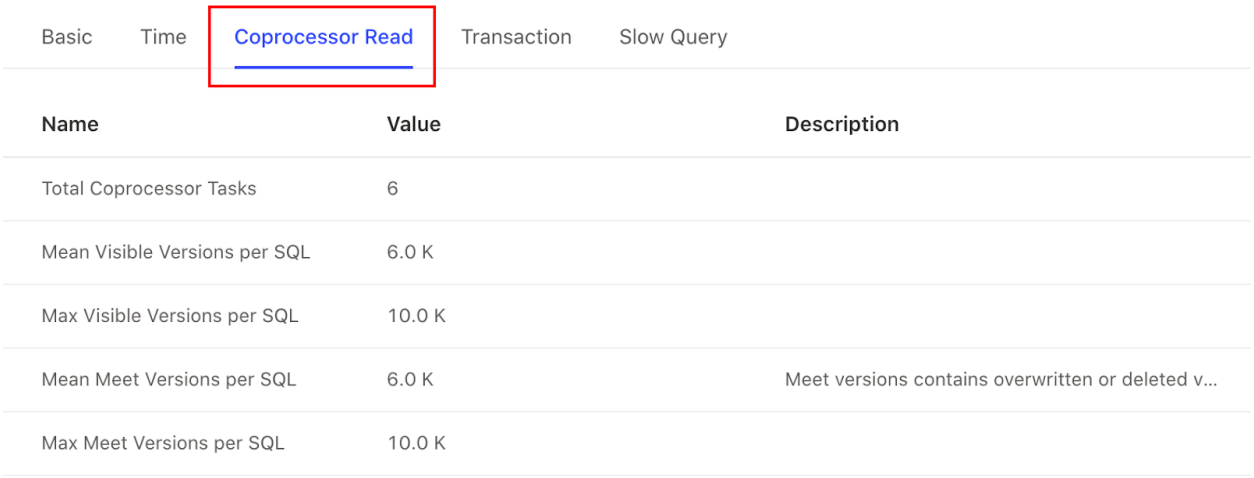

Figure 504: Coprocessor read

Transaction tab

Click the **Transaction** tab, and you can see information related to execution plans and transactions, such as the average number of written keys or the maximum number of written keys.

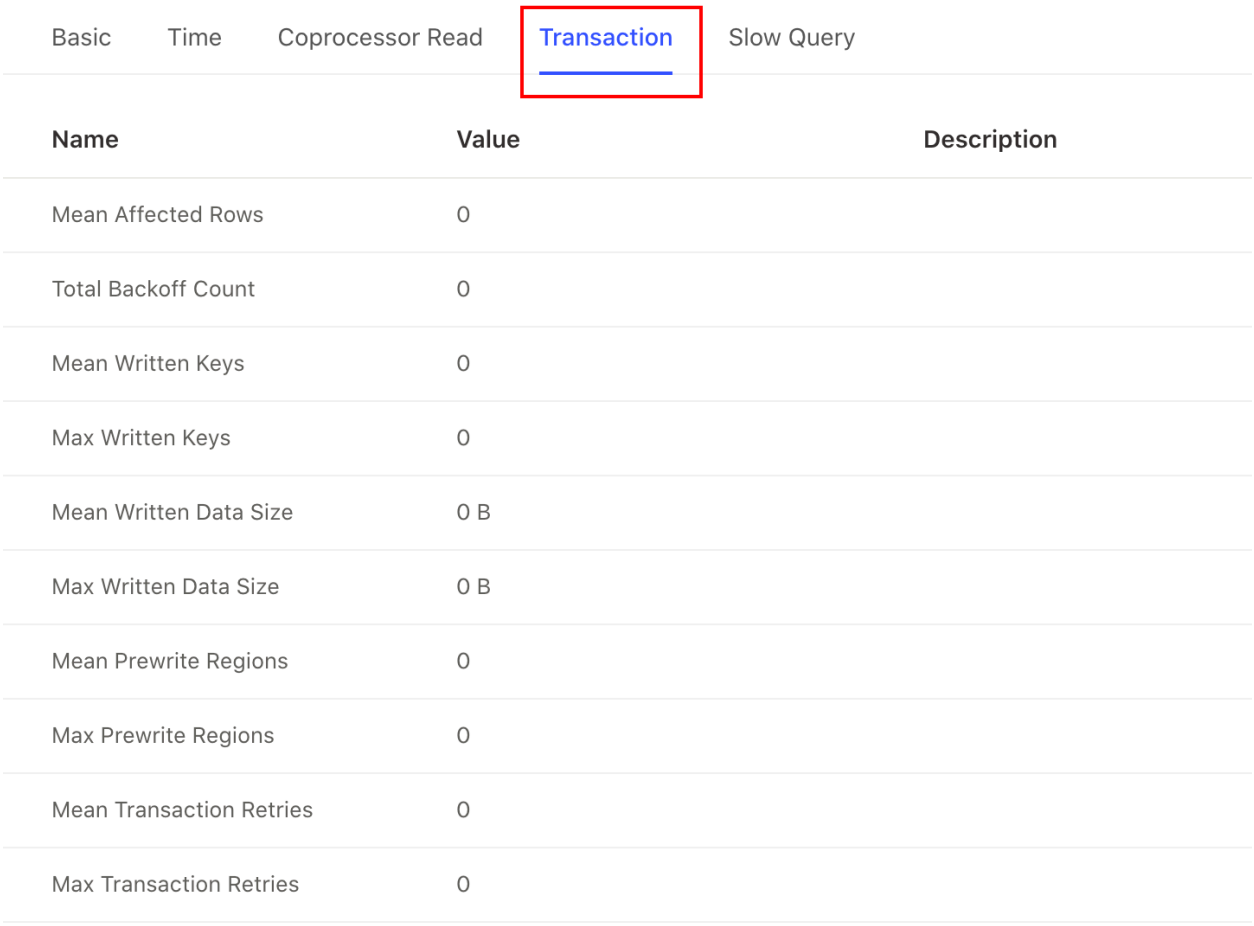

Figure 505: Transaction

Slow Query tab

If an execution plan is executed too slowly, you can see its associated slow query records under the **Slow Query** tab.

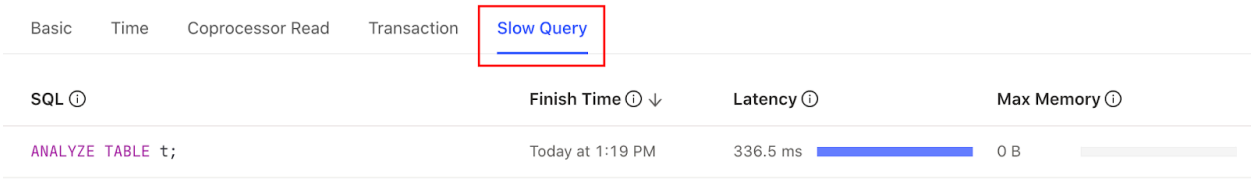

Figure 506: Slow Query

The information displayed in this area has the same structure with the slow query page. See TiDB Dashboard Slow Query Page for details.

14.14.1.10 Slow Queries Page of TiDB Dashboard

On the Slow Queries page of TiDB Dashboard, you can search and view all slow queries in the cluster.

By default, SQL queries with an execution time of more than 300 milliseconds are considered as slow queries. These queries are recorded in the slow query logs and can be searched via TiDB Dashboard. You can adjust the threshold of slow queries through the `tidb_slow_log_threshold` session variable or the `instance.tidb_slow_log_threshold` TiDB parameter.

> **Note:**
>
> If the slow query log is disabled, this feature will be unavailable. The slow query log is enabled by default, and you can enable or disable it through the system variable `tidb_enable_slow_log`.

14.14.1.10.1 Access the page

You can use one of the following two methods to access the slow query page:

- After logging in to TiDB Dashboard, click **Slow Queries** in the left navigation menu.
- Visit http://127.0.0.1:2379/dashboard/#/slow_query in your browser. Replace `127.0.0.1:2379` with the actual PD address and port.

All data displayed on the slow query page comes from TiDB slow query system tables and slow query logs. See slow query logs for details.

Change filters

You can filter slow queries based on the time range, the related database, SQL keywords, SQL types, the number of slow queries to be displayed. In the image below, 100 slow queries over the recent 30 minutes are displayed by default.

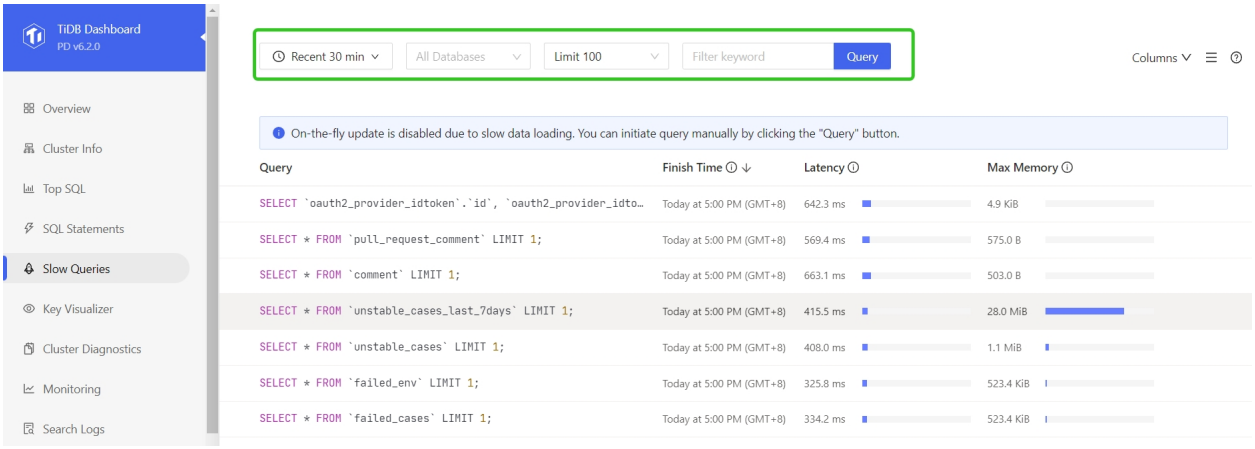

Figure 507: Modify list filters

Display more columns

Click **Columns** on the page and you can choose to see more columns. You can move your mouse to the **(i)** icon at the right side of a column name to view the description of this column:

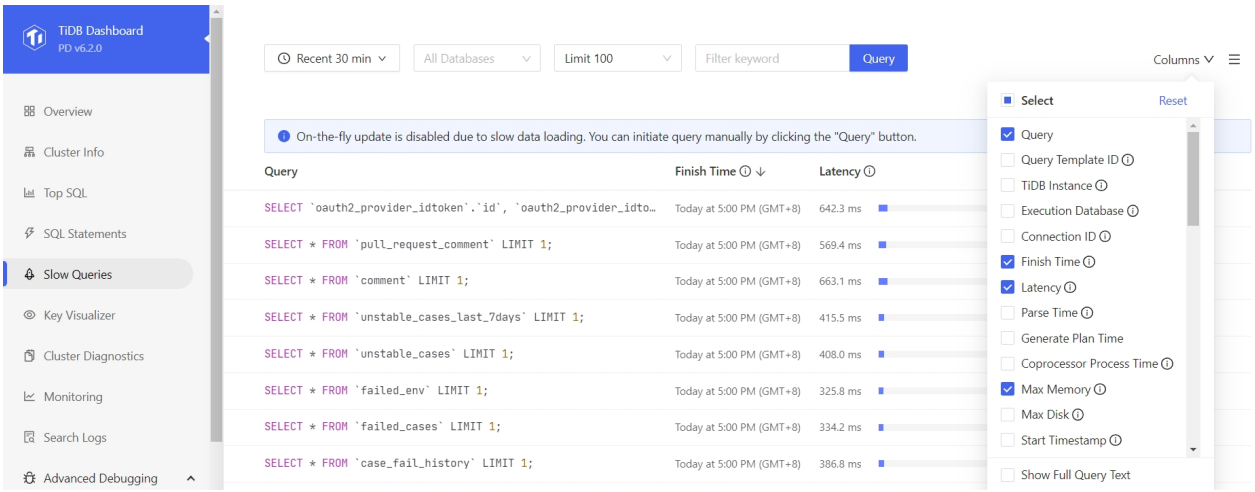

Figure 508: Show more columns

Export slow queries locally

Click (**More**) in the upper-right corner of the page to display the **Export** option. After you click **Export**, TiDB Dashboard exports slow queries in the current list as a CSV file.

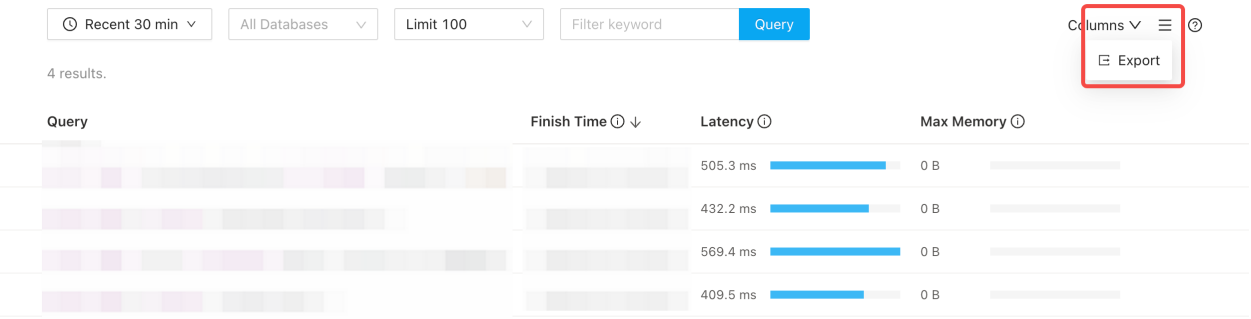

Figure 509: Export slow queries locally

Sort by column

By default, the list is sorted by **Finish Time** in the descending order. Click column headings to sort by the column or switch the sorting order:

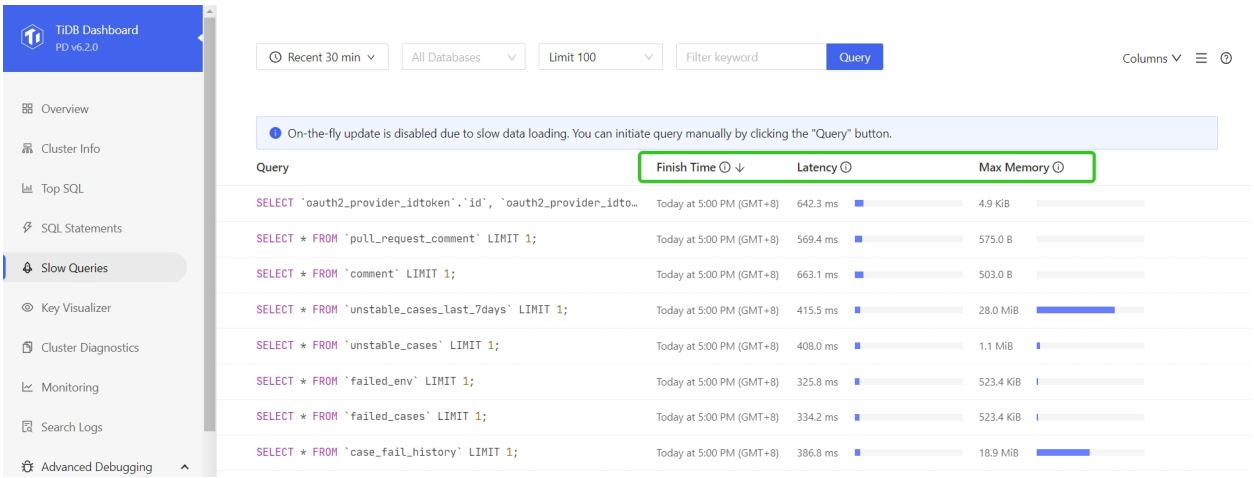

Figure 510: Modify sorting basis

14.14.1.10.2 View execution details

Click any item in the list to display detailed execution information of the slow query, including:

- Query: The text of the SQL statement (area 1 in the following figure)

- Plan: The execution plan of the slow query (area 2 in the following figure)
- Other sorted SQL execution information (area 3 in the following figure)

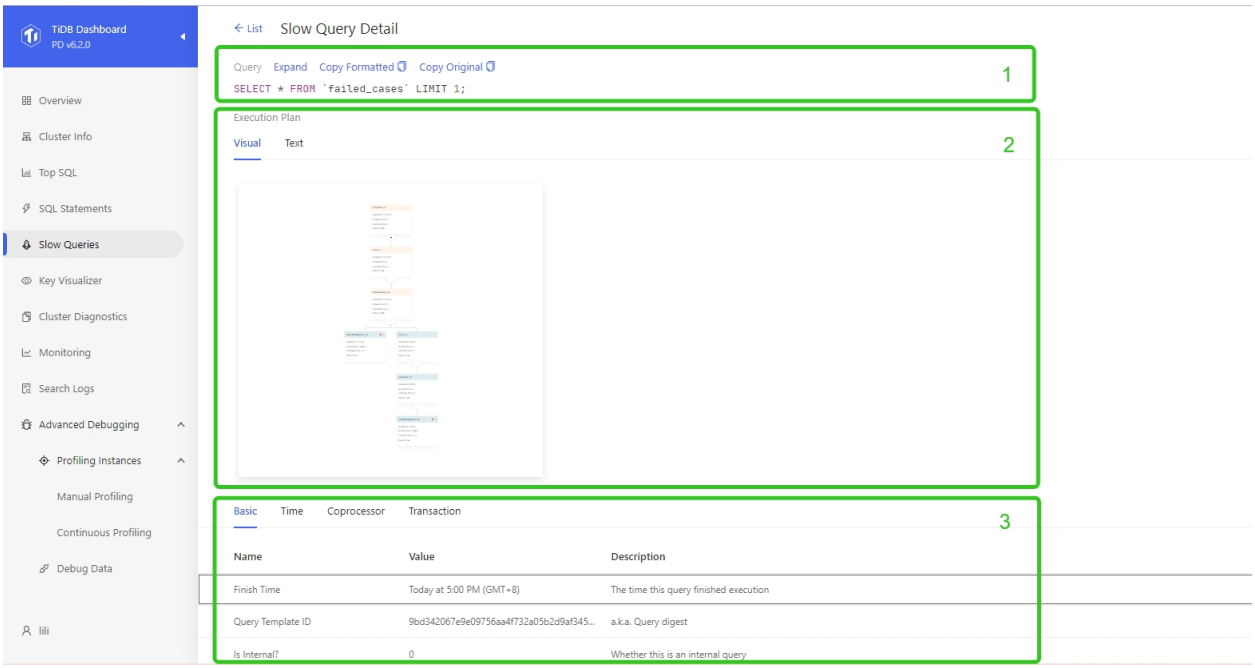

Figure 511: View execution details

SQL

> **Note:**
>
> The maximum length of the query recorded in the `Query` column is limited by the `tidb_stmt_summary_max_sql_length` system variable.

Click the **Expand** button to view the detailed information of an item. Click the **Copy** button to copy the detailed information to the clipboard.

Execution plans

On TiDB Dashboard, you can view execution plans in three ways: table, text, and graph. To learn how to read an execution plan, see Understand the query execution plan.

Execution plan in table format

The table format provides detailed information about the execution plan, which helps you quickly identify abnormal operator metrics and compare the status of different operators. The following figure shows an execution plan in table format:

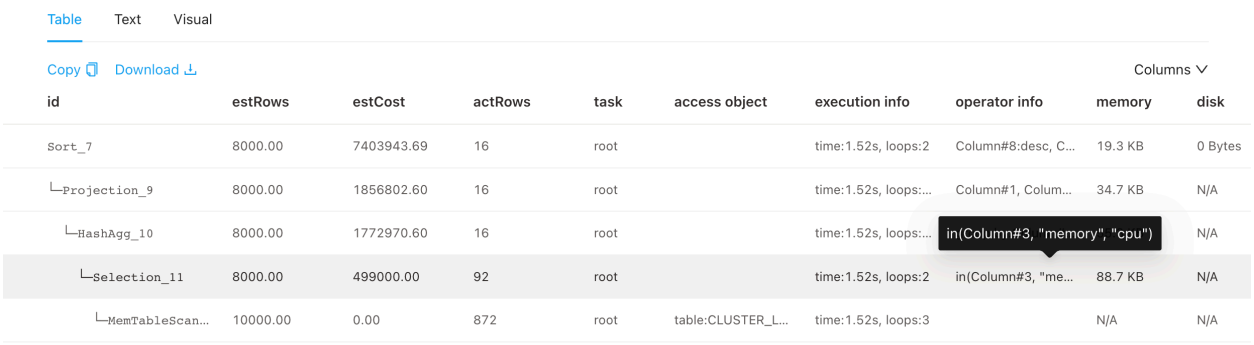

Figure 512: Execution plan in table format

The table format displays similar information to the text format but provides more user-friendly interactions:

- You can adjust the column width freely.
- When content exceeds the column width, it is automatically truncated and a tooltip is shown for the full information.
- If the execution plan is large, you can download it as a text file for local analysis.
- You can hide and manage columns using the column picker.

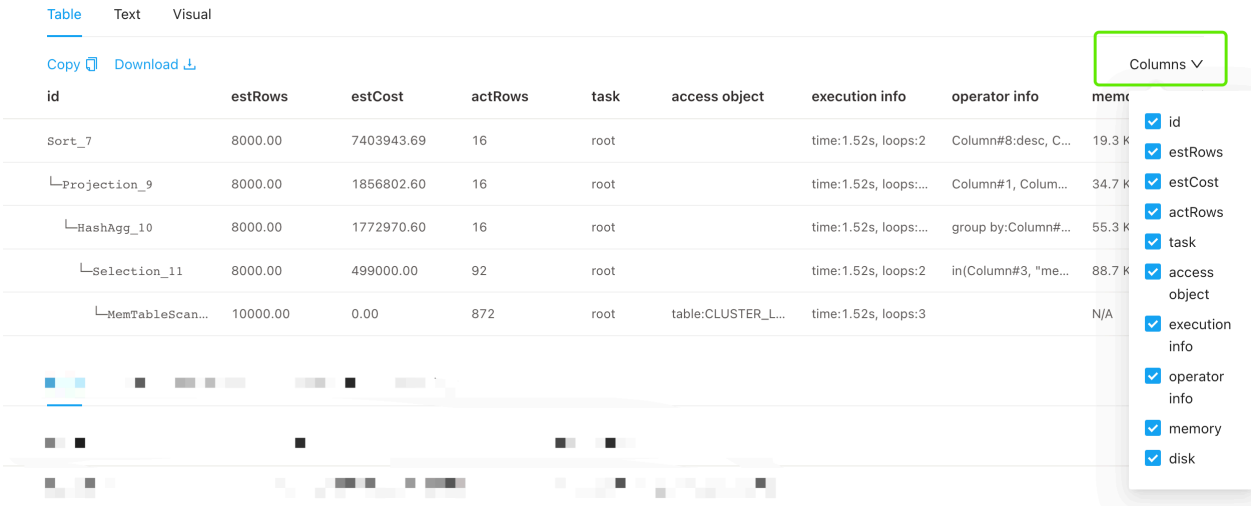

Figure 513: Execution plan in table format - column picker

Execution plan in graph format

The graph format is more suitable for viewing the execution plan tree of a complex SQL statement and understanding each operator and its corresponding content in detail. The following figure shows an execution plan in graph format:

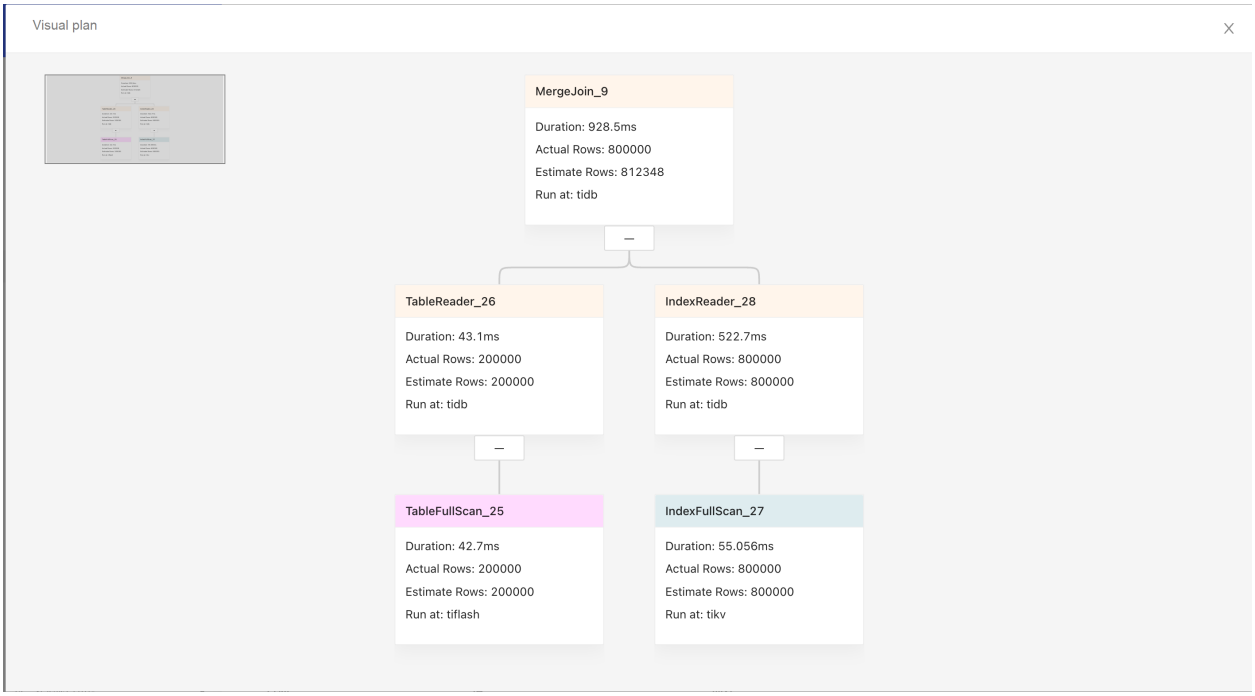

Figure 514: Execution plan in graph format

- The graph shows the execution from left to right, and from top to bottom.
- Upper nodes are parent operators and lower nodes are child operators.
- The color of the title bar indicates the component where the operator is executed: yellow stands for TiDB, blue stands for TiKV, and pink stands for TiFlash.
- The title bar shows the operator name and the text shown below is the basic information of the operator.

Click the node area, and the detailed operator information is displayed on the right sidebar.

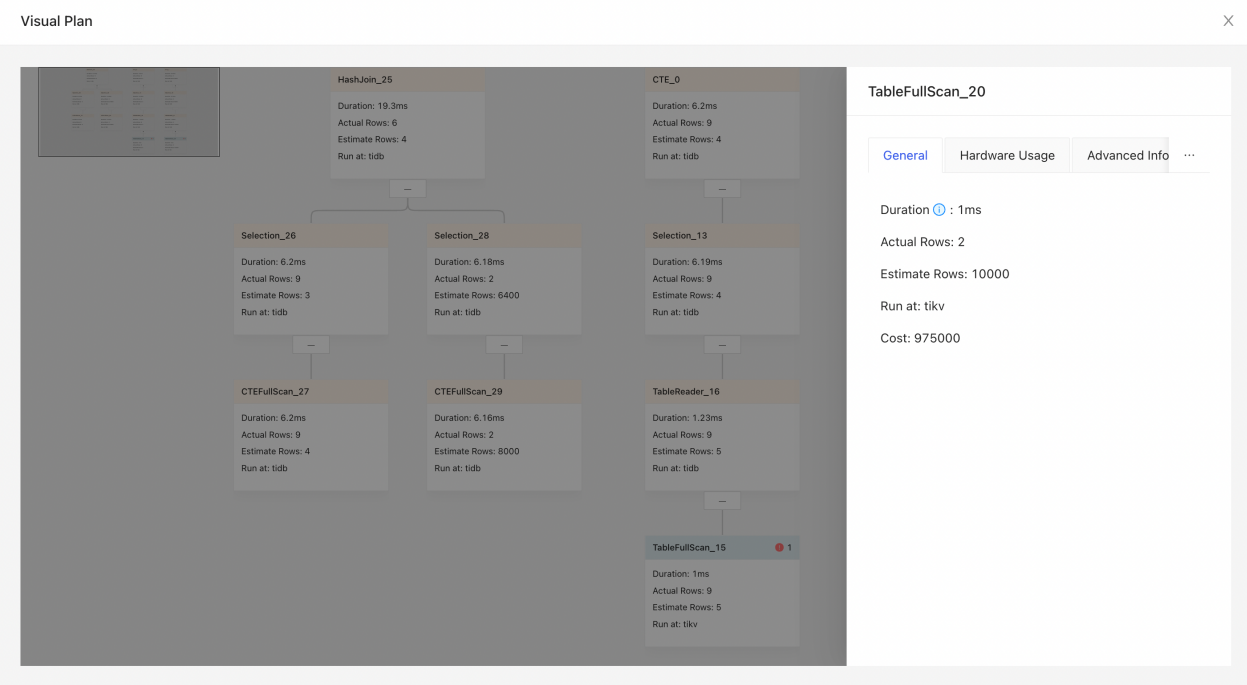

Figure 515: Execution plan in graph format - sidebar

SQL execution details

For basic information, execution time, Coprocessor read, transaction, and slow query of the SQL statement, you can click the corresponding tab titles to switch among different information.

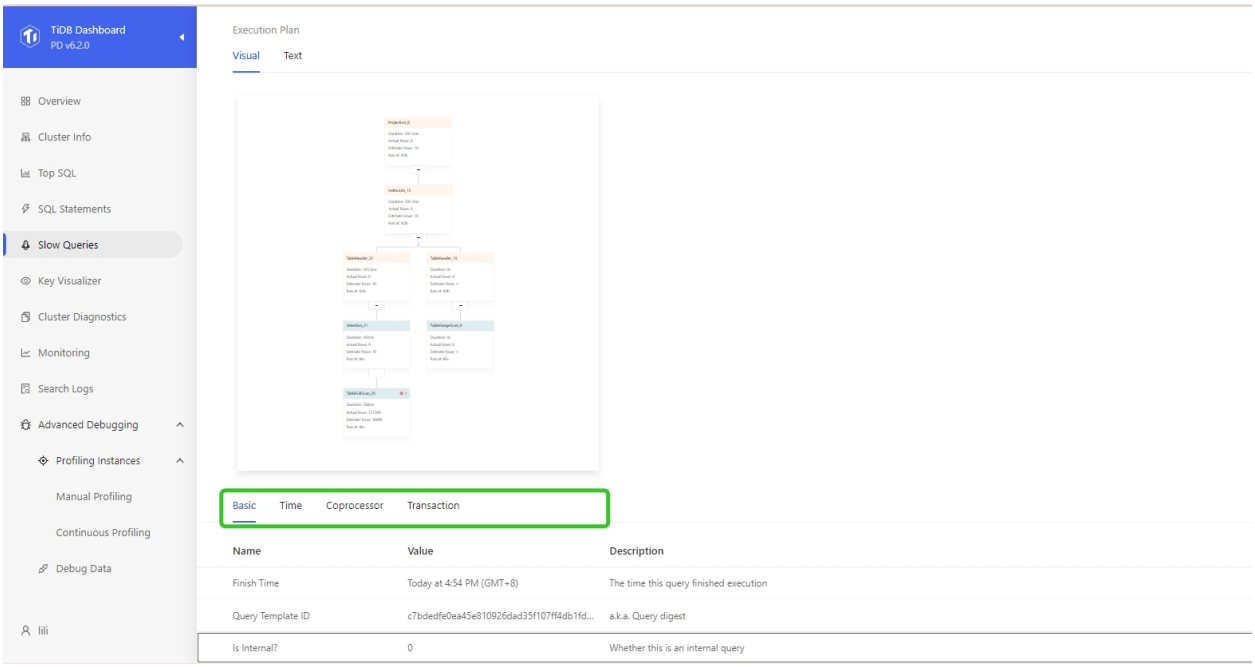

Figure 516: Show different execution information

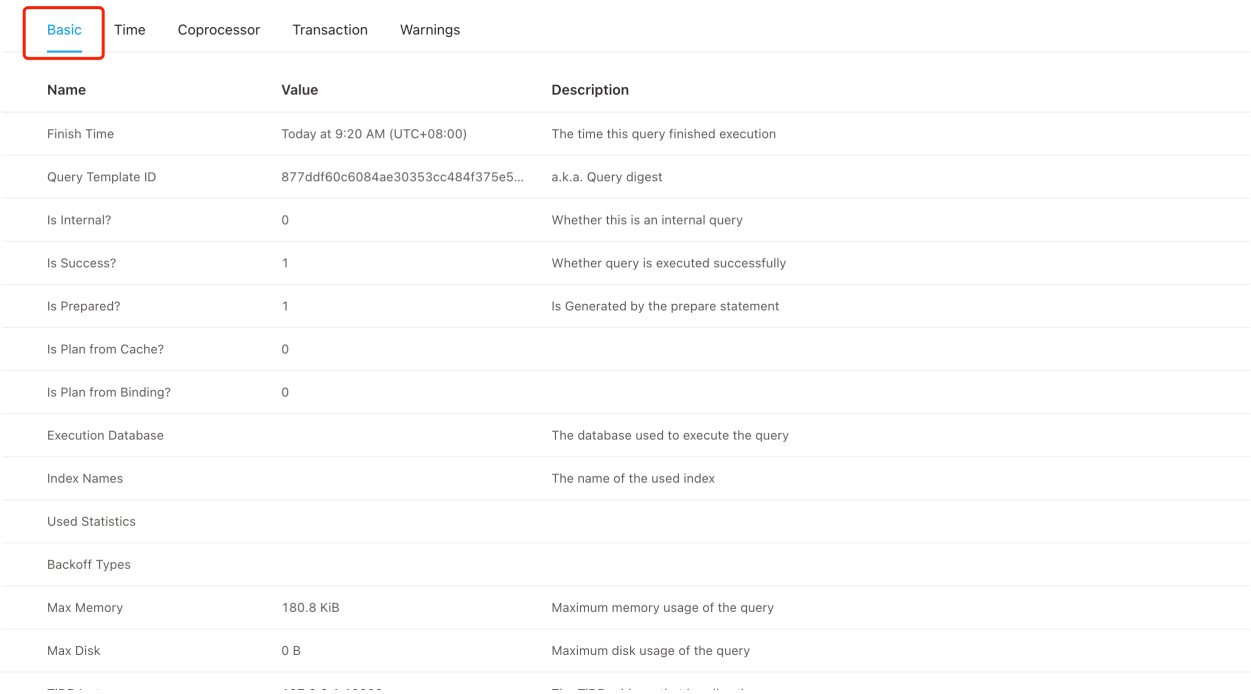
Basic tab

The basic information of a SQL execution includes the table names, index name, execution count, and total latency. The **Description** column provides detailed description of each field.



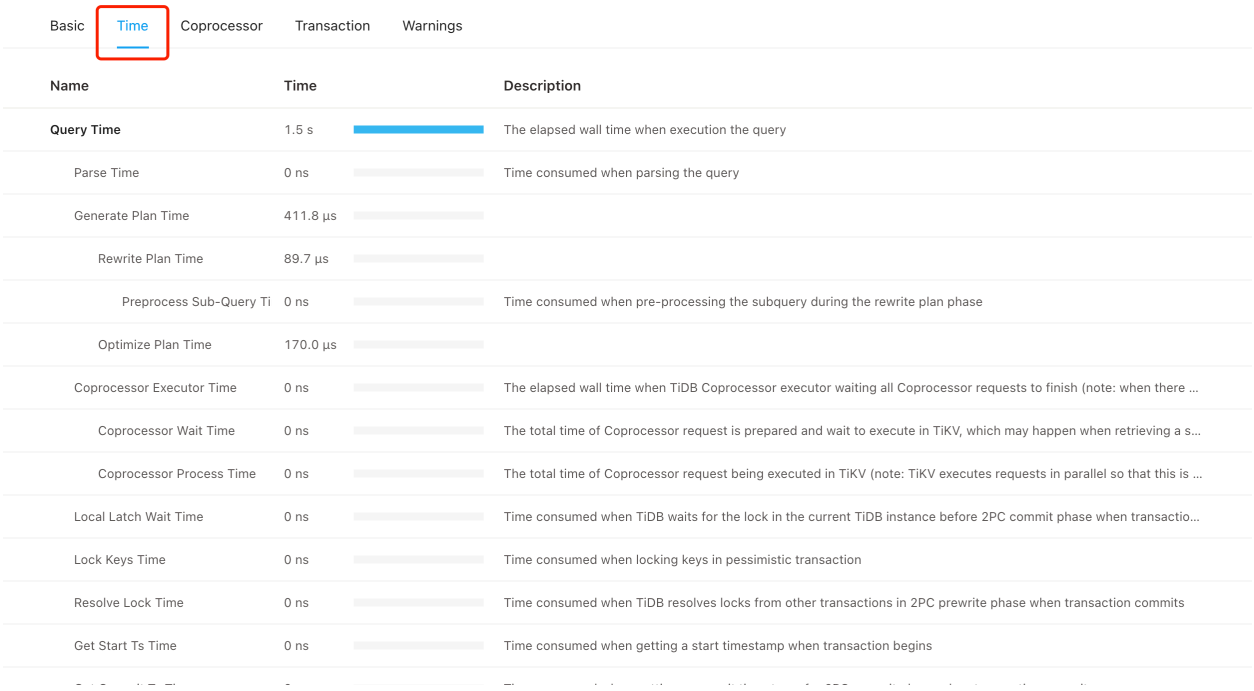


Figure 517: Basic information

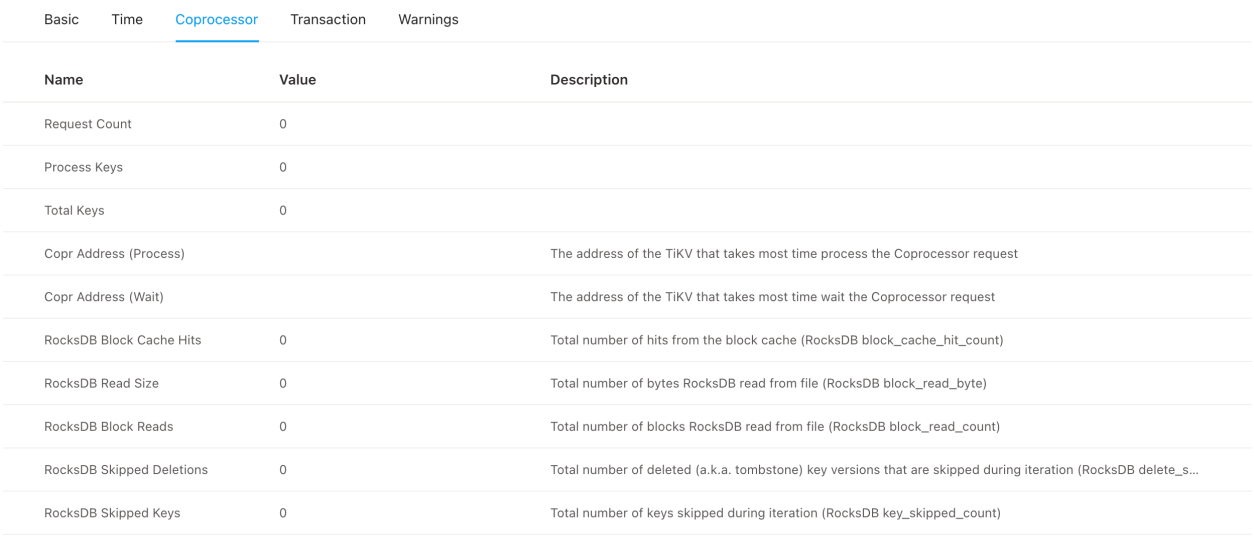
Time tab

Click the **Time** tab, and you can see how long each stage of the execution plan lasts.

> **Note:**
>
> Because some operations might be performed in parallel within a single SQL statement, the cumulative duration of each stage might exceed the actual execution time of the SQL statement.



Basic | Time | Coprocessor | Transaction | Warnings

Name	Time	Description
Query Time	1.5 s	The elapsed wall time when execution the query
Parse Time	0 ns	Time consumed when parsing the query
Generate Plan Time	411.8 µs	
Rewrite Plan Time	89.7 µs	
Preprocess Sub-Query Ti	0 ns	Time consumed when pre-processing the subquery during the rewrite plan phase
Optimize Plan Time	170.0 µs	
Coprocessor Executor Time	0 ns	The elapsed wall time when TiDB Coprocessor executor waiting all Coprocessor requests to finish (note: when there ...
Coprocessor Wait Time	0 ns	The total time of Coprocessor request is prepared and wait to execute in TiKV, which may happen when retrieving a s...
Coprocessor Process Time	0 ns	The total time of Coprocessor request being executed in TiKV (note: TiKV executes requests in parallel so that this is ...
Local Latch Wait Time	0 ns	Time consumed when TiDB waits for the lock in the current TiDB instance before 2PC commit phase when transactio...
Lock Keys Time	0 ns	Time consumed when locking keys in pessimistic transaction
Resolve Lock Time	0 ns	Time consumed when TiDB resolves locks from other transactions in 2PC prewrite phase when transaction commits
Get Start Ts Time	0 ns	Time consumed when getting a start timestamp when transaction begins

Figure 518: Execution time

Coprocessor tab

Click the **Coprocessor** tab, and you can see information related to Coprocessor read.

Basic | Time | Coprocessor | Transaction | Warnings

Name	Value	Description
Request Count	0	
Process Keys	0	
Total Keys	0	
Copr Address (Process)		The address of the TiKV that takes most time process the Coprocessor request
Copr Address (Wait)		The address of the TiKV that takes most time wait the Coprocessor request
RocksDB Block Cache Hits	0	Total number of hits from the block cache (RocksDB block_cache_hit_count)
RocksDB Read Size	0	Total number of bytes RocksDB read from file (RocksDB block_read_byte)
RocksDB Block Reads	0	Total number of blocks RocksDB read from file (RocksDB block_read_count)
RocksDB Skipped Deletions	0	Total number of deleted (a.k.a. tombstone) key versions that are skipped during iteration (RocksDB delete_s...
RocksDB Skipped Keys	0	Total number of keys skipped during iteration (RocksDB key_skipped_count)

Figure 519: Coprocessor read

Transaction tab

Click the **Transaction** tab, and you can see information related to execution plans and transactions, such as the average number of written keys or the maximum number of written keys.

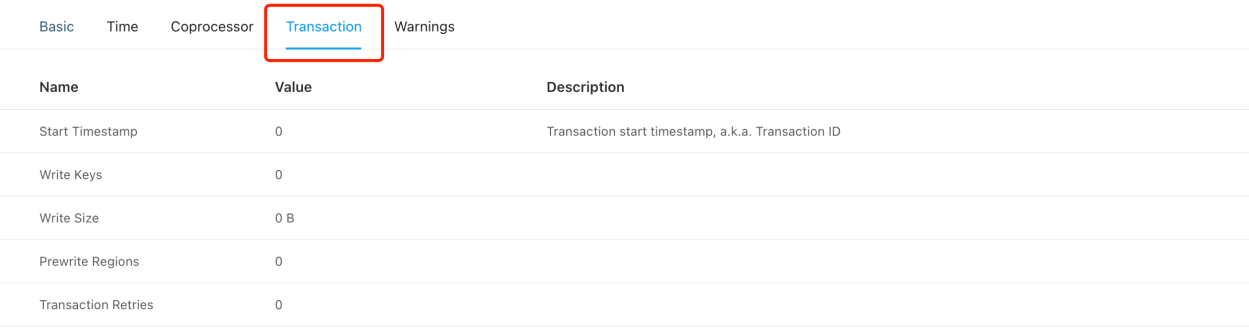


Figure 520: Transaction

14.14.1.11 Cluster Diagnostics

14.14.1.11.1 TiDB Dashboard Cluster Diagnostics Page

The cluster diagnostics feature in TiDB Dashboard diagnoses the problems that might exist in a cluster within a specified time range, and summarizes the diagnostic results and the cluster-related load monitoring information into a diagnostic report. This diagnostic report is in the form of a web page. You can browse the page offline and circulate this page link after saving the page from a browser.

> **Note:**
>
> The cluster diagnostics feature depends on Prometheus deployed in the cluster. For details about how to deploy this monitoring component, see the TiUP deployment document. If no monitoring component is deployed in the cluster, the generated diagnostic report will indicate a failure.

Access the page

You can use one of the following methods to access the cluster diagnostics page:

- After logging in to TiDB Dashboard, click **Cluster Diagnostics** in the left navigation menu.

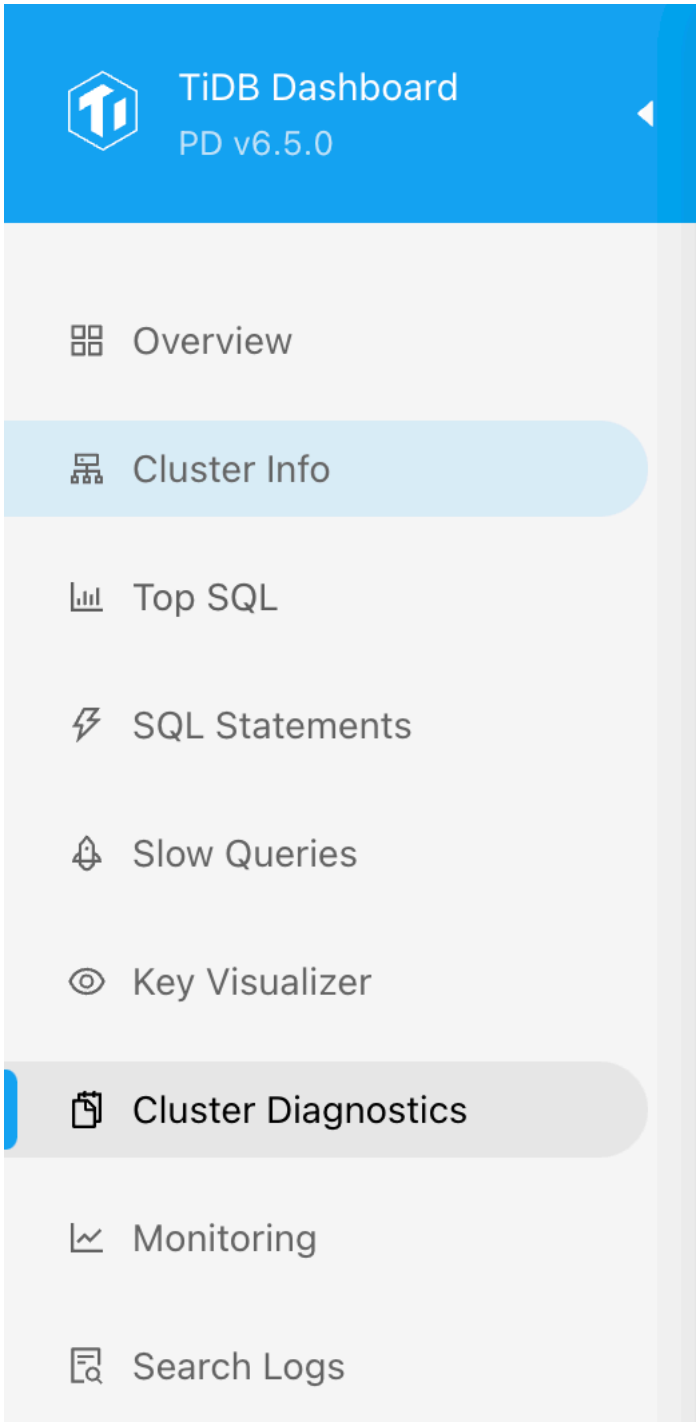

Figure 521: Access Cluster Diagnostics page

- Visit `http://127.0.0.1:2379/dashboard/#/diagnose` in your browser. Replace `127.0.0.1:2379` with the actual PD address and port number.

Generate diagnostic report

To diagnose a cluster within a specified time range and check the cluster load, you can take the following steps to generate a diagnostic report:

1. Set the **Range Start Time**, such as `2022-05-21 14:40:00`.
2. Set the **Range Duration**, such as `10 min`.
3. Click **Start**.

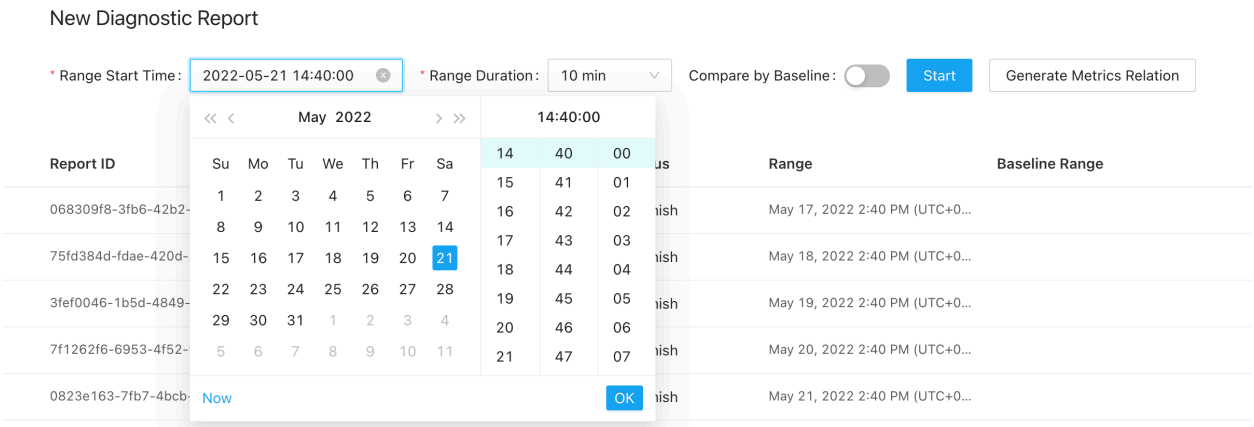

Figure 522: Generate diagnostic report

> **Note:**
>
> It is recommended that the **Range Duration** of the report is between 1 minute and 60 minutes. This **Range Duration** cannot exceed 60 minutes.

The preceding steps generate a diagnostic report for the time range from `2022-05-21 14:40:00` to `2022-05-21 14:50:00`. After clicking **Start**, you can see the interface below. **Progress** is the progress bar of the diagnostic report. After the report is generated, click **View Full Report**.

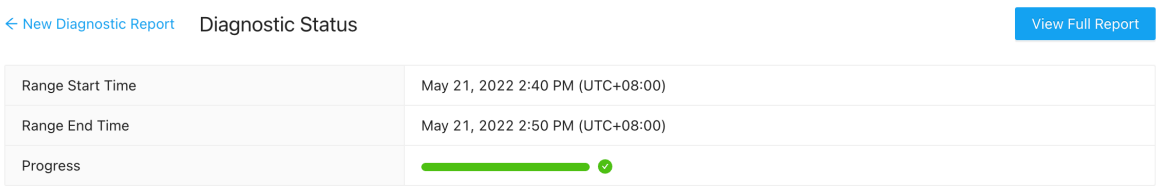

Figure 523: Report progress

Generate comparison report

If a system exception occurs at a certain point, for example, QPS jitter or higher latency, a diagnostic report can be generated. Particularly, this report compares the system in the abnormal time range with the system in the normal time range. For example:

- Abnormal time range: `2022-05-21 14:40:00-2022-05-21 14:45:00`. Within this time range, the system is abnormal.
- Normal time range: `2022-05-21 14:30:00 - 2022-05-21 14:35:00`. Within this time range, the system is normal.

You can take the following steps to generate a comparison report for the preceding two time ranges:

1. Set the **Range Start Time**, which is the start time of the range in which the system becomes abnormal, such as `2022-05-21 14:40:00`.
2. Set the **Range Duration**. Generally, this duration is the duration of system anomalies, such as 5 minutes.
3. Enable **Compare by Baseline**.
4. Set the **Baseline Range Start Time**, which is the start time of the range (to be compared with) in which the system is normal, such as `2022-05-21 14:30:00`.
5. Click **Start**.

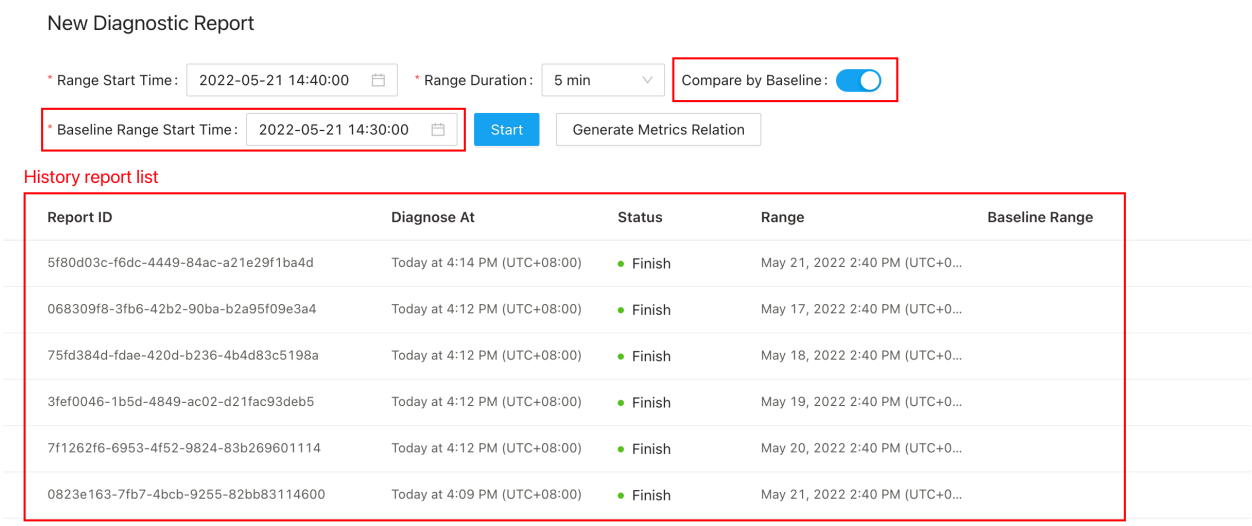

Figure 524: Generate comparison report

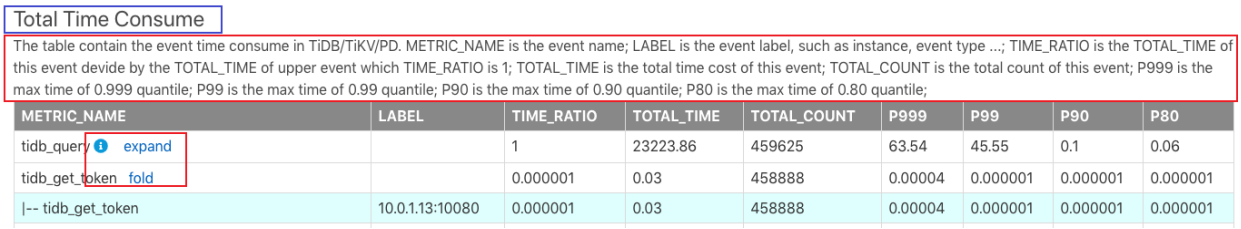
Then wait for the report to be generated and click **View Full Report**.

In addition, the historical diagnostic report is displayed in the list on the main page of the diagnostic report. You can click to view these historical reports directly.

14.14.1.11.2 TiDB Dashboard Diagnostic Report



This document introduces the content of the diagnostic report and viewing tips. To access the cluster diagnostic page and generate reports, see TiDB Dashboard Cluster Diagnostics Page.

View report

The diagnostic report consists of the following parts:

- Basic information: Includes the time range of the diagnostic report, hardware information of the cluster, the version information of cluster topology.
- Diagnostic information: Shows the results of automatic diagnostics.
- Load information: Includes CPU, memory and other load information of the server, TiDB, PD, or TiKV.
- Overview information: Includes the consumed time and error information of each TiDB, PD, or TiKV module.
- TiDB/PD/TiKV monitoring information: Includes monitoring information of each component.
- Configuration information: Includes configuration information of each component.

An example of the diagnostic report is as follows:

Total Time Consume

The table contain the event time consume in TiDB/TiKV/PD. METRIC_NAME is the event name; LABEL is the event label, such as instance, event type ...; TIME_RATIO is the TOTAL_TIME of this event devide by the TOTAL_TIME of upper event which TIME_RATIO is 1; TOTAL_TIME is the total time cost of this event; TOTAL_COUNT is the total count of this event; P999 is the max time of 0.999 quantile; P99 is the max time of 0.99 quantile; P90 is the max time of 0.90 quantile; P80 is the max time of 0.80 quantile;

METRIC_NAME	LABEL	TIME_RATIO	TOTAL_TIME	TOTAL_COUNT	P999	P99	P90	P80
tidb_query expand		1	23223.86	459625	63.54	45.55	0.1	0.06
tidb_get_token fold		0.000001	0.03	458888	0.00004	0.000001	0.000001	0.000001
|-- tidb_get_token	10.0.1.13:10080	0.000001	0.03	458888	0.00004	0.000001	0.000001	0.000001

Figure 525: Sample report

In the image above, **Total Time Consume** in the top blue box is the report name. The information in the red box below explains the content of this report and the meaning of each field in the report.

In this report, some small buttons are described as follows:

- **i** icon: You can move your mouse to the **i** icon to see the explanatory note of the row.
- **expand**: Click **expand** to see details about this monitoring metric. For example, the detailed information of `tidb_get_token` in the image above includes the monitoring information of each TiDB instance's latency.
- **collapse**: Contrary to **expand**, the button is used to fold detailed monitoring information.

All monitoring metrics basically correspond to those on the TiDB Grafana monitoring dashboard. After a module is found to be abnormal, you can view more monitoring information on the TiDB Grafana.

In addition, the `TOTAL_TIME` and `TOTAL_COUNT` metrics in this report are monitoring data read from Prometheus, so calculation inaccuracy might exits in their statistics.

Each part of this report is introduced as follows.

Basic information

Diagnostics Time Range

The time range for generating the diagnostics report includes the start time and end time.

Report Time Range

START_TIME	END_TIME
2020-05-21 06:40:00	2020-05-21 06:50:00

Figure 526: Report time range

Cluster Hardware Info

Cluster Hardware Info includes information such as CPU, memory, and disk of each server in the cluster.

Cluster Hardware

HOST	INSTANCE	CPU_CORES	MEMORY (GB)	DISK (GB)	UPTIME (DAY)
10.0.1.14	tiflash*1	20/40	125.64	nvme01: 498.638	2.9132028513567314
10.0.1.11	pd*1	20/40	125.64	sda1: 965.834	2.921851028772416
10.0.1.12	tikv*1	20/40	125.64	nvme0n1: 122.78 sda1: 965.834	2.9197623066052247
10.0.1.13	tidb*1	20/40	125.64	sda1: 498.638	2.917983893669314

Figure 527: Cluster hardware report

The fields in the table above are described as follows:

- `HOST`: The IP address of the server.
- `INSTANCE`: The number of instances deployed on the server. For example, `pd * 1` means that this server has 1 PD instance deployed; `tidb * 2 pd * 1` means that this server has 2 TiDB instances and 1 PD instance deployed.
- `CPU_CORES`: Indicates the number of CPU cores (physical cores or logical cores) of the server.
- `MEMORY`: Indicates the memory size of the server. The unit is GB.
- `DISK`: Indicates the server disk size. The unit is GB.
- `UPTIME`: The uptime of the server. The unit is day.

Cluster Topology Info

The `Cluster Info` table shows the cluster topology information. The information in this table are from TiDB information_schema.cluster_info system table.

Cluster Info

TYPE	INSTANCE	STATUS_ADDRESS	VERSION	GIT_HASH	START_TIME	UPTIME
pd	10.0.1.11:2379	10.0.1.11:2379	4.1.0-alpha	a80b99ef0d70807d106bdc1b7c6e97a118679c7e	2020-05-18T13:47:01Z	65h40m54.520385474s

Figure 528: Cluster info

The fields in the table above are described as follows:

- `TYPE`: The node type.
- `INSTANCE`: The instance address(es), which is a string in the `IP:PORT` format.
- `STATUS_ADDRESS`: The HTTP API service address.
- `VERSION`: The semantic version number of the corresponding node.
- `GIT_HASH`: Git Commit Hash when compiling the node version, which is used to identify whether the two nodes are absolutely the consistent version.
- `START_TIME`: The start time of the corresponding node.
- `UPTIME`: The uptime of the corresponding node.

Diagnostic information

TiDB has built-in automatic diagnostic results. For the description of each field, see information_schema.inspection-result system table.

Load Info

Node Load Info

The `Node Load Info` table shows the load information of the server node, including the average value (AVG), maximum value (MAX), minimum value (MIN) of the following metrics of the server within the time range:

- CPU usage (the maximum value is `100%`)
- Memory usage
- Disk I/O usage
- Disk write latency
- Disk read latency
- Disk read bytes per second
- Disk write bytes per second

- The number of bytes received by the node network per minute
- The number of bytes sent from the node network per minute
- The number of TCP connections in use by the node
- The number of all TCP connections of the node

Node Load Info

METRIC_NAME	instance	AVG	MAX	MIN
node_cpu_usage expand		40.42%	99.6%	6.98%
node_mem_usage expand		66.9%	96.28%	33.65%

node_tcp_in_use expand		19	47	5
node_tcp_connections expand		30	61	6

Figure 529: Server Load Info report

Instance CPU Usage

The `Instance CPU Usage` table shows the average value (AVG), maximum value (MAX), and minimum value (MIN) of the CPU usage of each TiDB/PD/TiKV process. The maximum CPU usage of the process is `100% * the number of CPU logical cores`.

INSTANCE	JOB	AVG	MAX	MIN
172.16.5.40:10089	tidb	1891%	1906%	1878%
172.16.5.40:22151	tikv	517%	571%	459%
172.16.5.40:20151	tikv	498%	562%	444%
172.16.5.40:23151	tikv	352%	399%	311%
172.16.5.40:24799	pd	39%	45%	36%

Figure 530: Instance CPU Usage report

Instance Memory Usage

The `Instance Memory Usage` table shows the average value (AVG), maximum value (MAX), and minimum value (MIN) of memory bytes occupied by each TiDB/PD/TiKV process.

INSTANCE	JOB	AVG	MAX	MIN
172.16.5.40:20151	tikv	9.562 GB	9.605 GB	9.523 GB
172.16.5.40:23151	tikv	9.528 GB	9.574 GB	9.496 GB
172.16.5.40:22151	tikv	9.433 GB	9.498 GB	9.345 GB
172.16.5.40:10089	tidb	904.500 MB	911.660 MB	894.336 MB
172.16.5.40:24799	pd	61.089 MB	61.270 MB	60.980 MB

Figure 531: Instance memory usage report

TiKV Thread CPU Usage

The `TiKV Thread CPU Usage` table shows the average value (AVG), maximum value (MAX) and minimum value (MIN) of CPU usage of each module thread in TiKV. The maximum CPU usage of the process is `100% * the thread count of the corresponding configuration`.

TiKV Thread CPU Usage

METRIC_NAME	INSTANCE	AVG	MAX	MIN	CONFIG_KEY	CURRENT_CONFIG_VALUE
grpc expand		14.83%	16%	12.96%		
schedule worker fold		8.76%	9.47%	7.56%

Figure 532: TiKV Thread CPU Usage report

In the table above,

- `CONFIG_KEY`: The relevant thread configuration of the corresponding module.
- `CURRENT_CONFIG_VALUE`: The current value of the configuration when the report is generated.

Note:

`CURRENT_CONFIG_VALUE` is the value when the report is generated, not the value within the time range of this report. Currently, some configuration values of historical time cannot be obtained.

`TiDB/PD Goroutines Count`

The `TiDB/PD Goroutines Count` table shows the average value (AVG), maximum value (MAX), and minimum value (MIN) of the number of TiDB or PD goroutines. If the number of goroutines exceeds 2,000, the concurrency of the process is too high, which affects the overall request latency.

INSTANCE	JOB	AVG	MAX	MIN
172.16.5.40:10089	tidb	1434.33	1473	1394
172.16.5.40:24799	pd	157	157	157

Figure 533: TiDB/PD goroutines count report

Overview information

Time Consumed by Each Component

The `Time Consumed by Each Component` table shows the monitored consumed time and the time ratio of TiDB, PD, TiKV modules in the cluster. The default time unit is seconds. You can use this table to quickly locate which modules consume more time.

METRIC_NAME	LABEL	TIME_RATIO	TOTAL_TIME	TOTAL_COUNT	P999	P99	P90	P80

Figure 534: Time Consume report

The fields in columns of the table above are described as follows:

- `METRIC_NAME`: The name of the monitoring metric.
- `Label`: The label information for the monitoring metric. Click **expand** to view more detailed monitoring information of each label for a metric.
- `TIME_RATIO`: The ratio of the total time consumed by this monitoring metric to the total time of the monitoring row where `TIME_RATIO` is `1`. For example, the total

consumed time by `kv_request` is `1.65` (namely, `38325.58/23223.86`) times that of `tidb_query`. Because KV requests are executed concurrently, the total time of all KV requests might exceed the total query (`tidb_query`) execution time.

- `TOTAL_TIME`: The total time consumed by this monitoring metric.
- `TOTAL_COUNT`: The total number of times this monitoring metric is executed.
- `P999`: The maximum P999 time of this monitoring metric.
- `P99`: The maximum P99 time of this monitoring metric.
- `P90`: The maximum P90 time of this monitoring metric.
- `P80`: The maximum P80 time of this monitoring metric.

The following image shows the relationship of time consumption of the related modules in the monitoring metrics above.

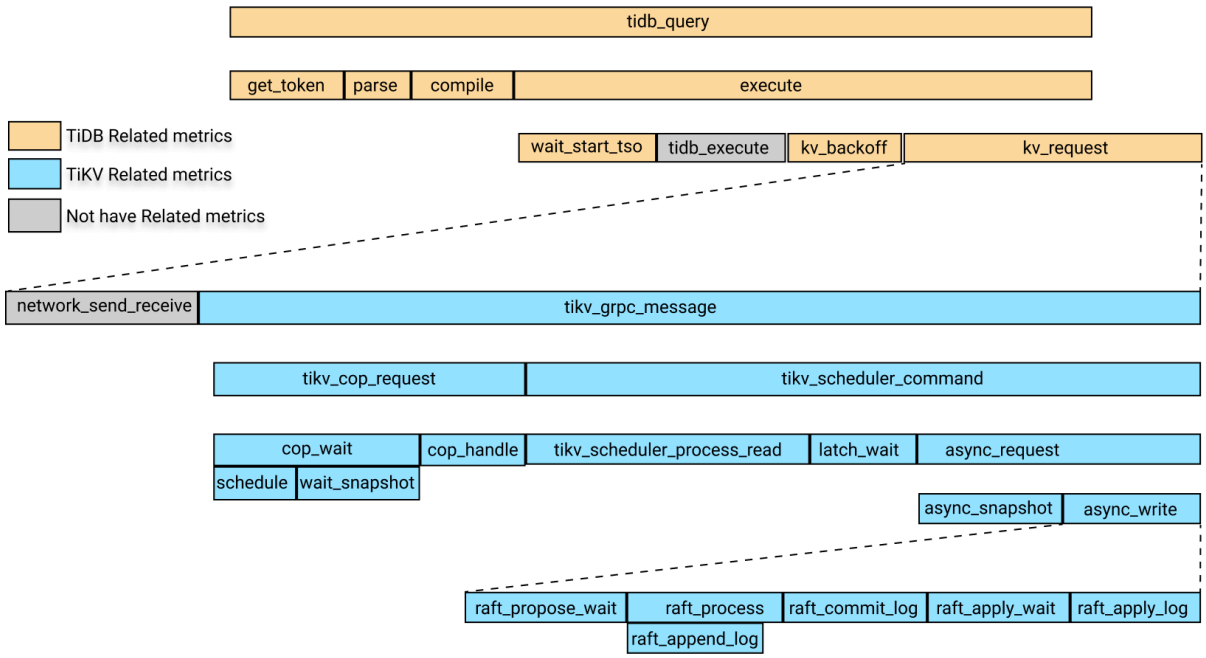

Figure 535: Time-consumption relationship of each module

In the image above, yellow boxes are the TiDB-related monitoring metrics.Blue boxes are TiKV-related monitoring metrics, and gray boxes temporarily do not correspond to specific monitoring metrics.

In the image above, the time consumption of `tidb_query` includes the following four parts:

- `get_token`
- `parse`
- `compile`

- `execute`

The `execute` time includes the following parts:

- `wait_start_tso`
- The execution time at the TiDB layer, which is currently not monitored
- KV request time
- `KV_backoff` time, which is the time for backoff after the KV request fails

Among the parts above, the KV request time includes the following parts:

- The time consumed by the network sending and receiving of requests. Currently, there is no monitoring metric for this item. You can subtract the time of `tikv_grpc_message` from the KV request time to roughly estimate this item.
- `tikv_grpc_message` time consumption.

Among the parts above, `tikv_grpc_message` time consumption includes the following parts:

- Coprocessor request time consumption, which refers to processing the COP type requests. This time consumption includes the following parts:
  - `tikv_cop_wait`: The time consumed by request queue.
  - `Coprocessor handle`: The time consumed to process Coprocessor requests.
- `tikv_scheduler_command` time consumption, which includes the following parts:
  - `tikv_scheduler_processing_read`: The time consumed to process read requests.
  - The time consumed to get snapshot in `tikv_storage_async_request` (snapshot is the label for this monitoring metric).
  - Time consumed to process write requests. This time consumption includes the following parts:
    - `tikv_scheduler_latch_wait`: The time consumed to wait for latch.
    - The time consumption of writes in `tikv_storage_async_request` (write is the label for this monitoring metric).

Among the above metrics, The time consumption of writes in `tikv_storage_async_request` refers to the time consumption of writing Raft KVs, including the following parts:

- `tikv_raft_propose_wait`
- `tikv_raft_process`, which mainly includes `tikv_raft_append_log`
- `tikv_raft_commit_log`

- `tikv_raft_apply_wait`
- `tikv_raft_apply_log`

You can use `TOTAL_TIME`, the P999 time, and the P99 time to determine which modules consume longer time according to the relationship between the time consumptions described above, and then look at the related monitoring metrics.

Note:

Because the Raft KVs writes might be processed in one batch, using `TOTAL_TIME` to measure the time consumed by each module is inapplicable to monitoring metrics related to Raft KV writes, specifically, `tikv_raft_process`, `tikv_raft_append_log`, `tikv_raft_commit_log`, `tikv_raft_apply_wait`, and `tikv_raft_apply_log`. In this situation, it is more reasonable to compare the time consumption of each module with the time of P999 and P99.

The reason is that if there are 10 asynchronous write requests, Raft KVs internally pack 10 requests into a batch execution, and the execution time is 1 second. Therefore, the execution time of each request is 1 second, and the total time of 10 requests is 10 seconds, but the total time for Raft KV processing is 1 second. If you use `TOTAL_TIME` to measure the consumed time, you might not understand where the remaining 9 seconds are spent. You can also see the difference between the monitoring metric of Raft KV and other previous monitoring metrics from the total number of requests (`TOTAL_COUNT`).

Errors Occurred in Each Component

The `Errors Occurred in Each Component` table shows the total number of errors in TiDB and TiKV, such as the failure to write binlog, `tikv server is busy`, `TiKV channel full`, `tikv write stall`. You can see the row comments for the specific meaning of each error.

METRIC_NAME	LABEL	TOTAL_COUNT
tidb_binlog_error_total_count		0
tidb_handshake_error_total_count		0

Figure 536: Errors Occurred in Each Component report

Specific TiDB/PD/TiKV monitoring information

This part includes more specific monitoring information of TiDB, PD, or TiKV.

TiDB-related monitoring information

Time Consumed by TiDB Component

This table shows the time consumed by each TiDB module and the ratio of each time consumption, which is similar to the `time consume` table in the overview, but the label information of this table are more detailed.

TiDB Server Connections

This table shows the number of client connections for each TiDB instance.

TiDB Transaction

This table shows transaction-related monitoring metrics.

METRIC_NAME	LABEL	TOTAL_VALUE	TOTAL_COUNT	P999	P99	P90	P80
tidb_transaction_retry_num		0	0	0	0	0	0
tidb_transaction_statement_num expand		6854588	6852371	4	4	3	2
tidb_txn_region_num expand		1070770	706887	3	2	2	2
tidb_txn_kv_write_num expand		513386	181312	234	2	2	2
tidb_txn_kv_write_size expand		266.772 MB	181296	116.913 KB	1.996 KB	1.905 KB	1.805 KB
tidb_load_safepoint_total_num expand		16					
tidb_lock_resolver_total_num expand		420514					

Figure 537: Transaction report

- `TOTAL_VALUE`: The sum of all values (SUM) during the report time range.
- `TOTAL_COUNT`: The total number of occurrences of this monitoring metric.
- `P999`: The maximum P999 value of this monitoring metric.
- `P99`: The maximum P99 value of this monitoring metric.
- `P90`: The maximum P90 value of this monitoring metric.
- `P80`: The maximum P80 value of this monitoring metric.

Example:

In the table above, within the report time range, `tidb_txn_kv_write_size`: a total of about 181,296 transactions of KV writes, and the total KV write size is 266.772 MB, of which the maximum P999, P99, P90, P80 values for a single transaction of KV writes are 116.913 KB, 1.996 KB, 1.905 KB, and 1.805 KB.

DDL Owner

MIN_TIME	DDL OWNER
2020-05-21 14:40:00	10.0.1.13:10080

Figure 538: TiDB DDL Owner Report

The table above shows that from `2020-05-21 14:40:00`, the cluster's `DDL OWNER` is at the `10.0.1.13:10080` node. If the owner changes, multiple rows of data exist in the table above, where the `Min_Time` column indicates the minimum time of the corresponding known owner.

> **Note:**
>
> If the owner information is empty, it does not mean that no owner exists in this period of time. Because in this situation, the DDL owner is determined based on the monitoring information of `ddl_worker`, it might be that `ddl_worker` has not done any DDL job in this period of time, causing the owner information to be empty.

Other monitoring tables in TiDB are as follows:

- Statistics Info: Shows related monitoring metrics of TiDB statistical information.
- Top 10 Slow Query: Shows the Top 10 slow query information in the report time range.
- Top 10 Slow Query Group By Digest: Shows the Top 10 slow query information in the report time range, which is aggregated according to the SQL fingerprint.

- Slow Query With Diff Plan: The SQL statement whose execution plan changes within the report time range.

PD related monitoring information

The tables related to the monitoring information of PD modules are as follows:

- `Time Consumed by PD Component`: The time consumed by the monitoring metrics of related modules in PD.
- `Blance Leader/Region`: The monitoring information of `balance-region` and `balance leader` occurred in the cluster within the report time range, such as the number of leaders that are scheduled out from `tikv_note_1` or the number of leaders that are scheduled in.
- `Cluster Status`: The cluster status information, including total number of TiKV nodes, total cluster storage capacity, the number of Regions, and the number of offline TiKV nodes.
- `Store Status`: Record the status information of each TiKV node, including Region score, leader score, and the number of Regions/leaders.
- `Etcd Status`: etcd related information in PD.

TiKV related monitoring information

The tables related to the monitoring information of TiKV modules are as follows:

- `Time Consumed by TiKV Component`: The time consumed by related modules in TiKV.
- `Time Consumed by RocksDB`: The time consumed by RocksDB in TiKV.
- `TiKV Error`: The error information related to each module in TiKV.
- `TiKV Engine Size`: The size of stored data of column families on each node in TiKV.
- `Coprocessor Info`: Monitoring information related to the Coprocessor module in TiKV.
- `Raft Info`: Monitoring information of the Raft module in TiKV.
- `Snapshot Info`: Snapshot related monitoring information in TiKV.
- `GC Info`: Garbage Collection (GC) related monitoring information in TiKV.
- `Cache Hit`: The hit rate information of each cache of RocksDB in TiKV.

Configuration information

In the configuration information, the configuration values of some modules are shown within the report time range. But the historical values of some other configurations of these modules cannot be obtained, so the shown values of these configurations are the current (when the report is generated) values .

Within the report time range, the following tables include items whose values are configured at the start time of the report time range:

- `Scheduler Initial Config`: The initial value of PD scheduling-related configuration at the report's start time.
- `TiDB GC Initial Config`: The initial value of TiDB GC related-configuration at the report's start time
- `TiKV RocksDB Initial Config`: The initial value of TiKV RocksDB-related configuration at the report's start time
- `TiKV RaftStore Initial Config`: The initial value of TiKV RaftStore-related configuration at the report's start time

Within the report time range, if some configurations have been modified, the following tables include records of some configurations that have been modified:

- `Scheduler Config Change History`
- `TiDB GC Config Change History`
- `TiKV RocksDB Config Change History`
- `TiKV RaftStore Config Change History`

Example:

APPROXIMATE_CHANGE_TIME	CONFIG_ITEM	VALUE
2020-05-22T20:00:00+08:00	leader-schedule-limit	4
2020-05-22T20:07:00+08:00	leader-schedule-limit	8

Figure 539: Scheduler Config Change History report

The table above shows that the `leader-schedule-limit` configuration parameter has been modified within the report time range:

- `2020-05-22T20:00:00+08:00`: At the start time of the report, the configuration value of `leader-schedule-limit` is `4`, which does not mean that the configuration has been modified, but that at the start time in the report time range, its configuration value is `4`.
- `2020-05-22T20:07:00+08:00`: The `leader-schedule-limit` configuration value is `8` ↪ , which indicates that the value of this configuration has been modified around `2020-05-22T20:07:00+08:00`.

The following tables show the current configuration of TiDB, PD, and TiKV at the time when the report is generated:

- `TiDB's Current Config`
- `PD's Current Config`
- `TiKV's Current Config`

Comparison report

You can generate a comparison report for two time ranges. The report content is the same as the report for a single time range, except that a comparison column is added to show the difference between the two time ranges. The following sections introduce some unique tables in the comparison report and how to view the comparison report.

First, the `Compare Report Time Range` report in the basic information shows the two time ranges for comparison:

Compare Report Time Range

T1.START_TIME	T1.END_TIME	T2.START_TIME	T2.END_TIME
2020-05-21 06:30:00	2020-05-21 06:35:00	2020-05-21 06:40:00	2020-05-21 06:45:00

Figure 540: Compare Report Time Range report

In the table above, `t1` is the normal time range, or the reference time range. `t2` is the abnormal time range.

Tables related to slow queries are shown as follows:

- `Slow Queries In Time Range t2`: Shows slow queries that only appear in `t2` but not during `t1`.
- `Top 10 slow query in time range t1`: The Top 10 slow queries during `t1`.
- `Top 10 slow query in time range t2`: The Top 10 slow queries during `t2`.

DIFF_RATIO introduction

This section introduces `DIFF_RATIO` using the `Instance CPU Usage` table as an example.

Instance CPU Usage

INSTANCE	JOB	t1.AVG	t1.MAX	t1.MIN	t2.AVG	t2.MAX	t2.MIN	AVG_DIFF_RATIO	MAX_DIFF_RATIO	MIN_DIFF_RATIO
172.16.5.40:10089	tidb	410%	410%	410%	1240%	1240%	1240%	2.02	2.02	2.02
172.16.5.40:20151	tikv	221%	221%	221%	617%	617%	617%	1.79	1.79	1.79
172.16.5.40:20379	pd	82%	82%	82%	78%	78%	78%	-0.05	-0.05	-0.05

Figure 541: Compare Instance CPU Usage report

- `t1.AVG`, `t1.MAX`, `t1.Min` are the average value, maximum value, and minimum value of CPU usage in the `t1`.
- `t2.AVG`, `t2.MAX`, and `t2.Min` are the average value, maximum value, and minimum value of CPU usage during `t2`.
- `AVG_DIFF_RATIO` is `DIFF_RATIO` of the average values during `t1` and `t2`.
- `MAX_DIFF_RATIO` is `DIFF_RATIO` of the maximum values during `t1` and `t2`.
- `MIN_DIFF_RATIO` is `DIFF_RATIO` of the minimum values during `t1` and `t2`.

`DIFF_RATIO`: Indicates the difference value between the two time ranges. It has the following values:

- If the monitoring metric has a value only within `t2` and has no value within `t1`, the value of `DIFF_RATIO` is `1`.
- If the monitoring metric has a value only within `t1`, and has no value within `t2` time range, the value of `DIFF_RATIO` is `-1`.
- If the value of `t2` is greater than that of `t1`, then `DIFF_RATIO = (t2.value / t1.value)-1`
- If the value of `t2` is smaller than that of `t1`, then `DIFF_RATIO = 1-(t1.value / t2.value)`

For example, in the table above, the average CPU usage of the `tidb` node in `t2` is 2.02 times higher than that in `t1`, which is `2.02 = 1240/410-1`.

Maximum Different Item table

The `Maximum Different Item` table compares the monitoring metrics of two time ranges, and sorts them according to the difference of the monitoring metrics. Using this table, you can quickly find out which monitoring metric has the biggest difference in the two time ranges. See the following example:

Maximum Different Item

The maximum different metrics between two time ranges.

TABLE	METRIC_NAME	LABEL	MAX_DIFF	t1.VALUE	t2.VALUE	VALUE_TYPE

TiDB, tidb_time_consume	Schema load	172.16.5.40:10089	37.50	0.02	0.77	TOTAL_TIME
overview, total_time_consume	Schema load	172.16.5.40:10089	30.25	0.008	0.25	P999

Figure 542: Maximum Different Item table

- `Table`: Indicates this monitoring metric comes from which table in the comparison report. For example, `TiKV, coprocessor_info` indicates the `coprocessor_info` table in the TiKV component.
- `METRIC_NAME`: The monitoring metric name. Click `expand` to view the comparison of different labels of metrics.
- `LABEL`: The label corresponding to the monitoring metric. For example, the monitoring metric of `TiKV Coprocessor scan` has 2 labels, namely `instance`, `req`, `tag`, `sql_type` ↪ , which are the TiKV address, request type, operation type and operation column family.
- `MAX_DIFF`: Difference value, which is the `DIFF_RATIO` calculation of `t1.VALUE` and

`t2.VALUE`.

From the table above, you can see the `t2` time range has much more Coprocessor requests than the `t1` time range, and the SQL parsing time of TiDB in `t2` is much longer.

14.14.1.11.3 Locate Problems Using Diagnostic Report of TiDB Dashboard

This document introduces how to locate problems using diagnostic report of TiDB Dashboard.

Comparison diagnostics

This section demonstrates how to use the comparison diagnostic feature to diagnose QPS jitter or latency increase caused by large queries or writes.

Example 1

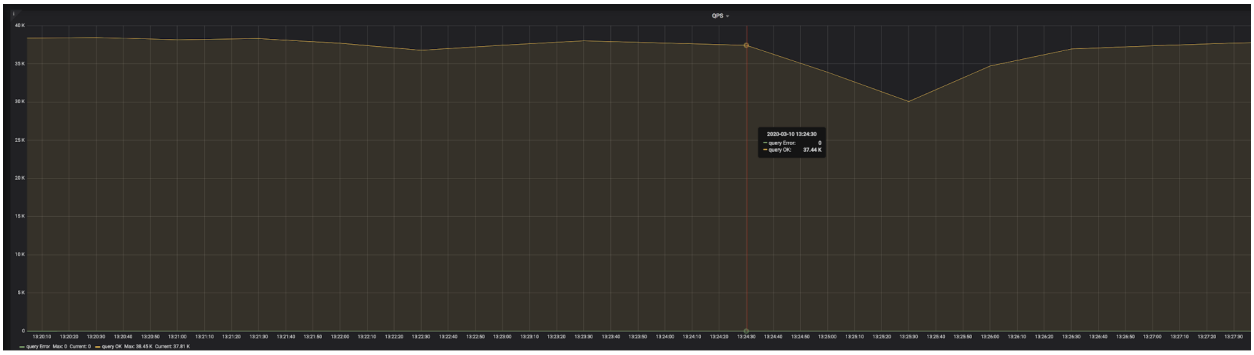

Figure 543: QPS example

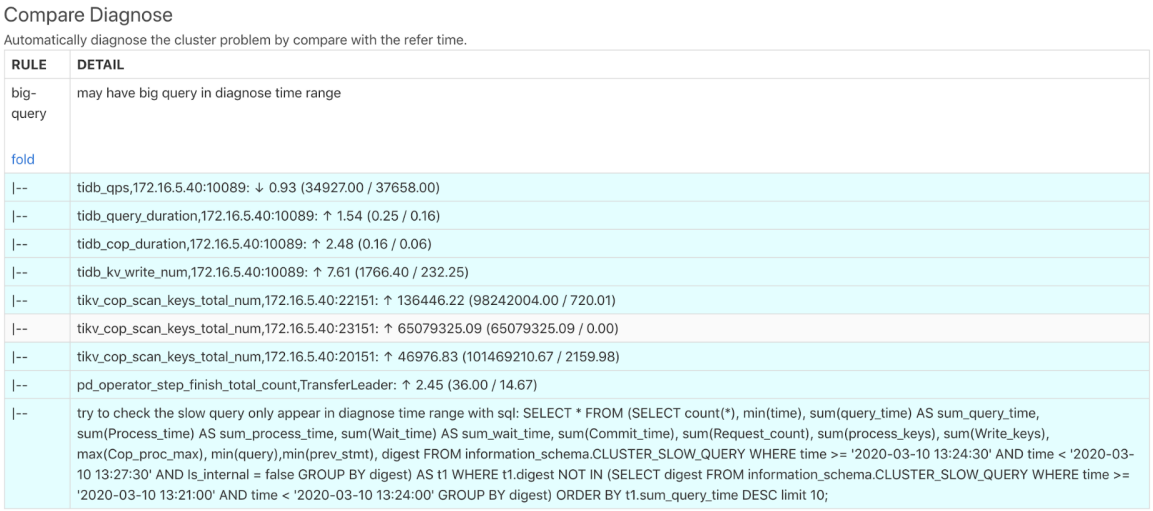
The result of a `go-ycsb` pressure test is shown in the image above. You can see that at `2020-03-10 13:24:30`, QPS suddenly began to decrease. After 3 minutes, QPS began to return to normal. You can use diagnostic report of TiDB Dashboard to find out the cause.



Generate a report that compares the system in the following two time ranges:

T1: `2020-03-10 13:21:00` to `2020-03-10 13:23:00`. In this range, the system is normal, which is called a reference range.

T2: `2020-03-10 13:24:30` to `2020-03-10 13:27:30`. In this range, QPS began to decrease.

Because the impact range of jitter is 3 minutes, the two time ranges above are both 3 minutes. Because some monitored average values are used for comparison during diagnostics, too long a range will cause the difference of average values to be insignificant, and then the problem cannot be accurately located.

After the report is generated, you can view this report on the **Compare Diagnose** page.

Compare Diagnose

Automatically diagnose the cluster problem by compare with the refer time.

RULE	DETAIL
big-query fold	may have big query in diagnose time range
|--	tidb_qps,172.16.5.40:10089: ↓ 0.93 (34927.00 / 37658.00)
|--	tidb_query_duration,172.16.5.40:10089: ↑ 1.54 (0.25 / 0.16)
|--	tidb_cop_duration,172.16.5.40:10089: ↑ 2.48 (0.16 / 0.06)
|--	tidb_kv_write_num,172.16.5.40:10089: ↑ 7.61 (1766.40 / 232.25)
|--	tikv_cop_scan_keys_total_num,172.16.5.40:22151: ↑ 136446.22 (98242004.00 / 720.01)
|--	tikv_cop_scan_keys_total_num,172.16.5.40:23151: ↑ 65079325.09 (65079325.09 / 0.00)
|--	tikv_cop_scan_keys_total_num,172.16.5.40:20151: ↑ 46976.83 (101469210.67 / 2159.98)
|--	pd_operator_step_finish_total_count,TransferLeader: ↑ 2.45 (36.00 / 14.67)
|--	try to check the slow query only appear in diagnose time range with sql: SELECT * FROM (SELECT count(*), min(time), sum(query_time) AS sum_query_time, sum(Process_time) AS sum_process_time, sum(Wait_time) AS sum_wait_time, sum(Commit_time), sum(Request_count), sum(process_keys), sum(Write_keys), max(Cop_proc_max), min(query),min(prev_stmt), digest FROM information_schema.CLUSTER_SLOW_QUERY WHERE time >= '2020-03-10 13:24:30' AND time < '2020-03-10 13:27:30' AND Is_internal = false GROUP BY digest) AS t1 WHERE t1.digest NOT IN (SELECT digest FROM information_schema.CLUSTER_SLOW_QUERY WHERE time >= '2020-03-10 13:21:00' AND time < '2020-03-10 13:24:00' GROUP BY digest) ORDER BY t1.sum_query_time DESC limit 10;

Figure 544: Comparison diagnostics

The diagnostic results above show that big queries might exist during the diagnostic time. Each **DETAIL** in the report above is described as follows:

- `tidb_qps`: QPS decreased by 0.93 times.
- `tidb_query_duration`: P999 query latency increased by 1.54 times.
- `tidb_cop_duration`: The processing latency of P999 coprocessor requests increased by 2.48 times.
- `tidb_kv_write_num`: The number written KVs in the P999 TiDB transaction increased by 7.61 times.
- `tikv_cop_scan_keys_total_nun`: The number of keys/values scanned by the TiKV Coprocessor has greatly improved on 3 TiKV instances.
- In `pd_operator_step_finish_total_count`, the number of transferred leaders increases by 2.45 times, which means that the scheduling in the abnormal time range is higher than that in the normal time range.
- The report indicates that there might be slow queries and indicates that you can use SQL statements to query slow queries. The execution result of the SQL statements are as follows:

```
SELECT * FROM (SELECT count(*), min(time), sum(query_time) AS sum_query_
    ↪ time, sum(Process_time) AS sum_process_time, sum(Wait_time) AS sum_
    ↪ wait_time, sum(Commit_time), sum(Request_count), sum(process_keys),
    ↪ sum(Write_keys), max(Cop_proc_max), min(query),min(prev_stmt), digest
    ↪  FROM information_schema.CLUSTER_SLOW_QUERY WHERE time >= '2020-03-10
    ↪  13:24:30' AND time < '2020-03-10 13:27:30' AND Is_internal = false
    ↪ GROUP BY digest) AS t1 WHERE t1.digest NOT IN (SELECT digest FROM
    ↪ information_schema.CLUSTER_SLOW_QUERY WHERE time >= '2020-03-10
```

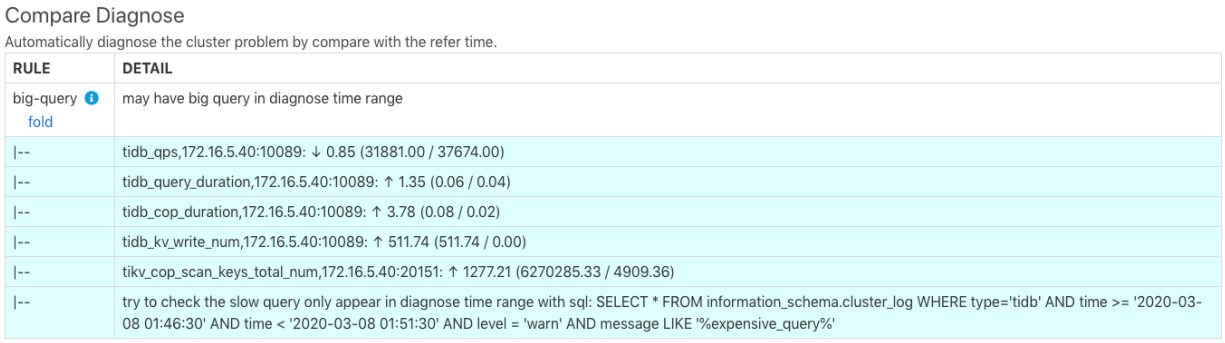
```
    ↪ 13:21:00' AND time < '2020-03-10 13:24:00' GROUP BY digest) ORDER BY
    ↪ t1.sum_query_time DESC limit 10\G
***************************[ 1. row ]***************************
count(*)          | 196
min(time)         | 2020-03-10 13:24:30.204326
sum_query_time    | 46.878509117
sum_process_time | 265.924
sum_wait_time     | 8.308
sum(Commit_time) | 0.926820886
sum(Request_count) | 6035
sum(process_keys) | 201453000
sum(Write_keys)  | 274500
max(Cop_proc_max) | 0.263
min(query)        | delete from test.tcs2 limit 5000;
min(prev_stmt)    |
digest            | 24
    ↪ bd6d8a9b238086c9b8c3d240ad4ef32f79ce94cf5a468c0b8fe1eb5f8d03df
```

From the result above, you can see that from `13:24:30`, there is a large write of batch deletion, which has been executed 196 times in total, each time deleting 5,000 rows of data, in a total duration of 46.8 seconds.

Example 2

If a large query has not been executed, the query is not recorded in the slow log. In this situation, this large query can still be diagnosed. See the following example:

Figure 545: QPS results



The result of another `go-ycsb` pressure test is shown in the image above. You can see that at `2020-03-08 01:46:30`, QPS suddenly began to drop and did not recover.

Generate a report that compares the system in the following two time ranges:

T1: `2020-03-08 01:36:00` to `2020-03-08 01:41:00`. In this range, the system is normal, which is called a reference range.

T2: `2020-03-08 01:46:30` to `2020-03-08 01:51:30`. In this range, QPS began to decrease.

After the report is generated, you can view this report on the **Compare Diagnose** page.

Compare Diagnose

Automatically diagnose the cluster problem by compare with the refer time.

RULE	DETAIL
big-query fold	may have big query in diagnose time range
|--	tidb_qps,172.16.5.40:10089: ↓ 0.85 (31881.00 / 37674.00)
|--	tidb_query_duration,172.16.5.40:10089: ↑ 1.35 (0.06 / 0.04)
|--	tidb_cop_duration,172.16.5.40:10089: ↑ 3.78 (0.08 / 0.02)
|--	tidb_kv_write_num,172.16.5.40:10089: ↑ 511.74 (511.74 / 0.00)
|--	tikv_cop_scan_keys_total_num,172.16.5.40:20151: ↑ 1277.21 (6270285.33 / 4909.36)

```

The query result above shows that on this `172.16.5.40:4009` TiDB instance, at `2020/03/08 01:47:35.846` there is an expensive query that has been executed for 60

seconds, but the execution has not yet been finished. This query is a join of Cartesian products.

Locate problems using comparison diagnostic report

Because the diagnostics might be wrong, using a comparison report might help DBAs locate problems more quickly. See the following example.

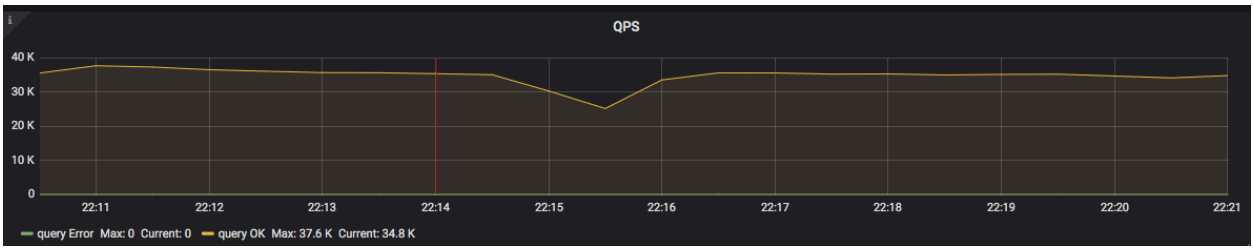

Figure 547: QPS results

The result of a `go-ycsb` pressure test is shown in the image above. You can see that at `2020-05-22 22:14:00`, QPS suddenly began to decrease. After 3 minutes, QPS began to return to normal. You can use the comparison diagnostic report of TiDB Dashboard to find out the cause.

Generate a report that compares the system in the following two time ranges:

T1: `2020-05-22 22:11:00` to `2020-05-22 22:14:00`. In this range, the system is normal, which is called a reference range.

T2: `2020-05-22 22:14:00 2020-05-22 22:17:00`. In this range, QPS began to decrease.

After generating the comparison report, check the **Max diff item** report. This report compares the monitoring items of the two time ranges above and sorts them according to the difference of the monitoring items. The result of this table is as follows:

Maximum Different Item

The maximum different metrics between two time ranges.

TABLE	METRIC_NAME	LABEL	MAX_DIFF	t1.VALUE	t2.VALUE	VALUE_TYPE

overview, total_time_consume Expand	KV request	Cop	244.29	0.66	161.89	TOTAL_TIME

Figure 548: Comparison results

From the result above, you can see that the Coprocessor requests in T2 are much more than those in T1. It might be that some large queries appear in T2 that bring more load.

In fact, during the entire time range from T1 to T2, the `go-ycsb` pressure test is running. Then 20 `tpch` queries are running during T2. So it is the `tpch` queries that cause many Coprocessor requests.

If such a large query whose execution time exceeds the threshold of slow log is recorded in the slow log. You can check the `Slow Queries In Time Range t2` report to see whether there is any slow query. However, some queries in T1 might become slow queries in T2, because in T2, other loads cause their executions to slow down.

14.14.1.12 TiDB Dashboard Monitoring Page

On the monitoring page, you can view the Performance Overview dashboard, a performance analysis and tuning tool introduced in TiDB v6.1.0. With the Performance Overview dashboard, you can analyze performance efficiently, and confirm whether the bottleneck of user response time is in the database. If the bottleneck is in the database, you can identify the bottleneck inside the database, with database time overview, workload profile and SQL latency breakdown. For details, see Performance Analysis and Tuning.

14.14.1.12.1 Access the page

Log in to TiDB dashboard and click **Monitoring** from the left navigation bar. The Performance Overview dashboard is displayed.

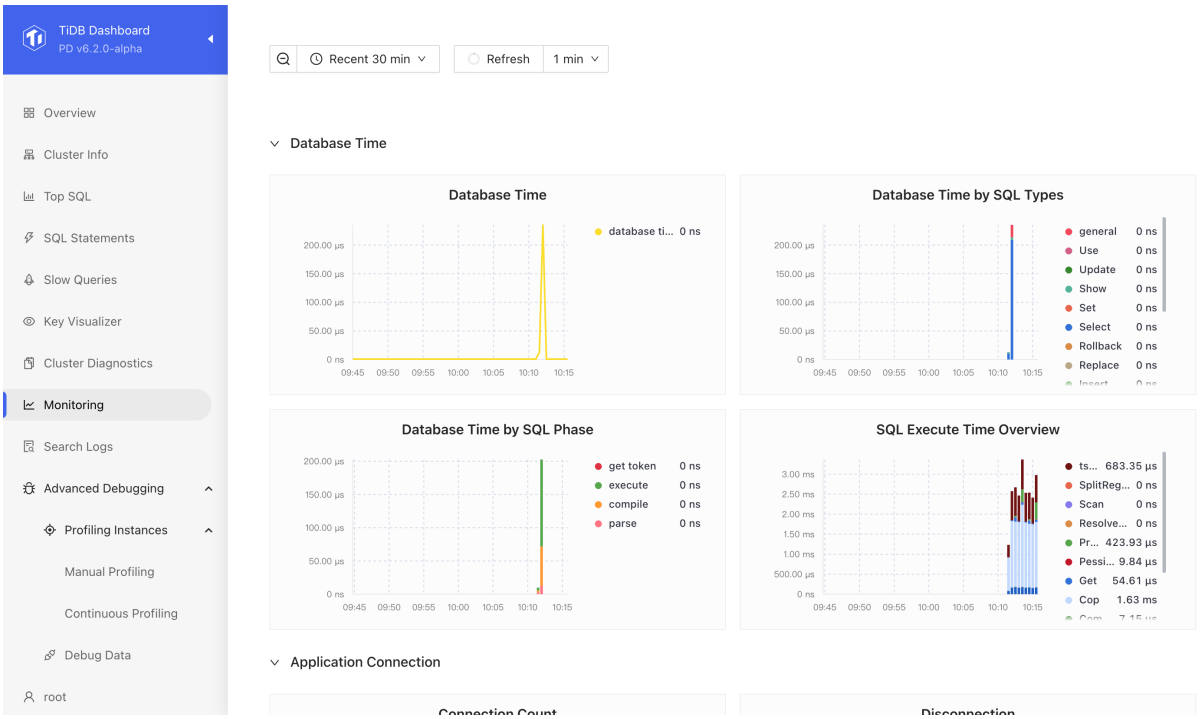

Figure 549: Monitoring page

If the TiDB cluster is deployed using TiUP, you can also view the Performance Overview dashboard on Grafana. In this deployment mode, the monitoring system (Prometheus & Grafana) is deployed at the same time. For more information, see TiDB Monitoring Framework Overview.

Figure 550: performance overview

14.14.1.12.2 Key Metrics on Performance Overview

The Performance Overview dashboard orchestrates the metrics of TiDB, PD, and TiKV, and presents each of them in the following sections:

- Overview: Database time and SQL execution time summary. By checking different colors in the overview, you can quickly identify the database workload profile and the performance bottleneck.
- Load profile: Key metrics and resource usage, including database QPS, connection information, the MySQL command types the application interacts with TiDB, database internal TSO and KV request OPS, and resource usage of the TiKV and TiDB.
- Top-down latency breakdown: Query latency versus connection idle time ratio, query latency breakdown, TSO/KV request latency during execution, breakdown of write latency within TiKV.

The following sections illustrate the metrics on the Performance Overview dashboard.

Database Time by SQL Type

- database time: Total database time per second
- sql_type: Database time consumed by each type of SQL statements per second

Database Time by SQL Phase

- database time: Total database time per second
- get token/parse/compile/execute: Database time consumed in four SQL processing phases

The SQL execution phase is in green and other phases are in red on general. If non-green areas are large, it means much database time is consumed in other phases than the execution phase and further cause analysis is required.

SQL Execute Time Overview

- execute time: Database time consumed during SQL execution per second
- tso_wait: Concurrent TSO waiting time per second during SQL execution
- kv request type: Time waiting for each KV request type per second during SQL execution. The total KV request wait time might exceed SQL execution time, because KV requests are concurrent.

Green metrics stand for common KV write requests (such as prewrite and commit), blue metrics stand for common read requests, and metrics in other colors stand for unexpected situations which you need to pay attention to. For example, pessimistic lock KV requests are marked red and TSO waiting is marked dark brown.

If non-blue or non-green areas are large, it means there is a bottleneck during SQL execution. For example:

- If serious lock conflicts occur, the red area will take a large proportion.
- If excessive time is consumed in waiting TSO, the dark brown area will take a large proportion.

QPS

Number of SQL statements executed per second in all TiDB instances, collected by type: such as `SELECT`, `INSERT`, and `UPDATE`

CPS By Type

Number of commands processed by all TiDB instances per second based on type

Queries Using Plan Cache OPS

Number of queries using plan cache per second in all TiDB instances

KV/TSO Request OPS

- kv request total: Total number of KV requests per second in all TiDB instances
- kv request by type: Number of KV requests per second in all TiDB instances based on such types as `Get`, `Prewrite`, and `Commit`
- tso - cmd: Number of gRPC requests per second that TiDB sends to PD in all TiDB instances; each gRPC request contains a batch of TSO requests
- tso - request: Number of TSO requests per second in all TiDB instances

Generally, `tso - request` divided by `tso - cmd` is the average size of TSO request batches per second.

Connection Count

- total: Number of connections to all TiDB instances
- active connections: Number of active connections to all TiDB instances
- Number of connections to each TiDB instance

TiDB CPU

- avg: Average CPU utilization across all TiDB instances
- delta: Maximum CPU utilization of all TiDB instances minus minimum CPU utilization of all TiDB instances
- max: Maximum CPU utilization across all TiDB instances

TiKV CPU/IO MBps

- CPU-Avg: Average CPU utilization of all TiKV instances
- CPU-Delta: Maximum CPU utilization of all TiKV instances minus minimum CPU utilization of all TiKV instances

- CPU-MAX: Maximum CPU utilization among all TiKV instances
- IO-Avg: Average MBps of all TiKV instances
- IO-Delt: Maximum MBps of all TiKV instances minus minimum MBps of all TiKV instances
- IO-MAX: Maximum MBps of all TiKV instances

Duration

- Duration: Execution time
    - The duration from receiving a request from the client to TiDB till TiDB executing the request and returning the result to the client. In general, client requests are sent in the form of SQL statements; however, this duration can include the execution time of commands such as `COM_PING`, `COM_SLEEP`, `COM_STMT_FETCH`, and `COM_SEND_LONG_DATA`.
    - TiDB supports Multi-Query, which means the client can send multiple SQL statements at one time, such as `select 1; select 1; select 1;`. In this case, the total execution time of this query includes the execution time of all SQL statements.
- avg: Average time to execute all requests
- 99: P99 duration to execute all requests
- avg by type: Average time to execute all requests in all TiDB instances, collected by type: `SELECT`, `INSERT`, and `UPDATE`

Connection Idle Duration

Connection Idle Duration indicates the duration of a connection being idle.

- avg-in-txn: Average connection idle duration when the connection is within a transaction
- avg-not-in-txn: Average connection idle duration when the connection is not within a transaction
- 99-in-txn: P99 connection idle duration when the connection is within a transaction
- 99-not-in-txn: P99 connection idle duration when the connection is not within a transaction

Parse Duration, Compile Duration, and Execute Duration

- Parse Duration: Time consumed in parsing SQL statements
- Compile Duration: Time consumed in compiling the parsed SQL AST to execution plans
- Execution Duration: Time consumed in executing execution plans of SQL statements

All these three metrics include the average duration and the 99th percentile duration in all TiDB instances.

Avg TiDB KV Request Duration

Average time consumed in executing KV requests in all TiDB instances based on the type, including `Get`, `Prewrite`, and `Commit`.

Avg TiKV GRPC Duration

Average time consumed in executing gRPC requests in all TiKV instances based on the type, including `kv_get`, `kv_prewrite`, and `kv_commit`.

PD TSO Wait/RPC Duration

- wait - avg: Average time in waiting for PD to return TSO in all TiDB instances
- rpc - avg: Average time from sending TSO requests to PD to receiving TSO in all TiDB instances
- wait - 99: P99 time in waiting for PD to return TSO in all TiDB instances
- rpc - 99: P99 time from sending TSO requests to PD to receiving TSO in all TiDB instances

Storage Async Write Duration, Store Duration, and Apply Duration

- Storage Async Write Duration: Time consumed in asynchronous write
- Store Duration: Time consumed in store loop during asynchronously write
- Apply Duration: Time consumed in apply loop during asynchronously write

All these three metrics include the average duration and P99 duration in all TiKV instances.

Average storage async write duration = Average store duration + Average apply duration

Append Log Duration, Commit Log Duration, and Apply Log Duration

- Append Log Duration: Time consumed by Raft to append logs
- Commit Log Duration: Time consumed by Raft to commit logs
- Apply Log Duration: Time consumed by Raft to apply logs

All these three metrics include the average duration and P99 duration in all TiKV instances.

14.14.1.13 TiDB Dashboard Log Search Page

On the log search page of TiDB Dashboard, you can search logs of all nodes, preview the search result and download logs.

14.14.1.13.1 Access the page

After logging in to TiDB Dashboard, you can click **Search Logs** to enter this log search homepage.

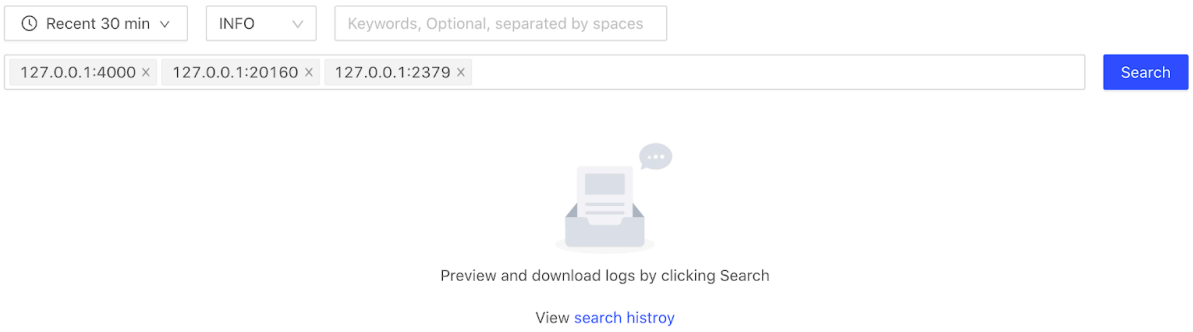

Figure 551: Log Search Page

This page provides the following search parameters:

- Time range: Specifies the time range of logs to search. The default value is the recent 30 minutes.
- Log level: Specifies the minimum log level. All logs above this log level are searched. The default value is the `INFO`.
- Keywords: The parameter is optional and its value can be any legal string. Multiple keywords are separated by a space. Regular expressions are supported (case-insensitive).
- Components: Selects the cluster components to search, which are multi-select and non-empty. By default, all components are selected.

After clicking the **Search** button, you enter the detail page of the search results.

14.14.1.13.2 Page of search result

The following image shows the page of the search results.

Figure 552: Search result

This page consists of the following three areas:

- Parameter options (area 1 in the image above): These options are the same as the parameter options on the search homepage. You can re-select the parameters in the boxes and start a new search.
- Progress (area 2 in the image above): The current search progress is shown on the right side of this page, including the log search status and statistics of each node.
- Search results (area 3 in the image above):
    - Time: The time at which the log is generated. The time zone is the same as the time zone of the front-end user.
    - Level: log level.
    - Component: Shows the component name and its address.
    - Log: The body part of each log record, excluding the log time and log level. Logs that are too long are automatically truncated. Click a row to expand the full content. The full log can show up to 512 characters.

Note:

At most 500 search results can be previewed on this page. You can get the complete search results by downloading them.

Search progress

In the search progress area, a search on a node is called a search task. A search task might have the following statuses:

- Running: After starting the search, all tasks enter the **Running** status.
- Success: After the task is completed, it automatically enters the **Success** status. At this time, the logs have been cached in the local disk where the Dashboard backend is located, and can be provided to the frontend to download.
- Failed: When you cancel the search task, or the task exits with an error, the task enters the **Failed** status. When the task fails, the local temporary files are automatically cleaned.

The search progress area has the following three control buttons:

- **Download Selected**: Click this button to download logs of the selected components (only the completed ones can be selected), and you will get a tar file. Unzip this tar file to get one or more zip files (each component corresponds to a zip file). Unzip the zip file(s) to get the log text file.
- **Cancel**: Click this button to cancel all running tasks. You can click this button only when there are running tasks.
- **Retry**: Click this button to retry all failed tasks. You can click this button only when there are failed tasks and no running tasks.

14.14.1.13.3 Search history list

Click the **View search history** link on the log search homepage to enter page of search history list:

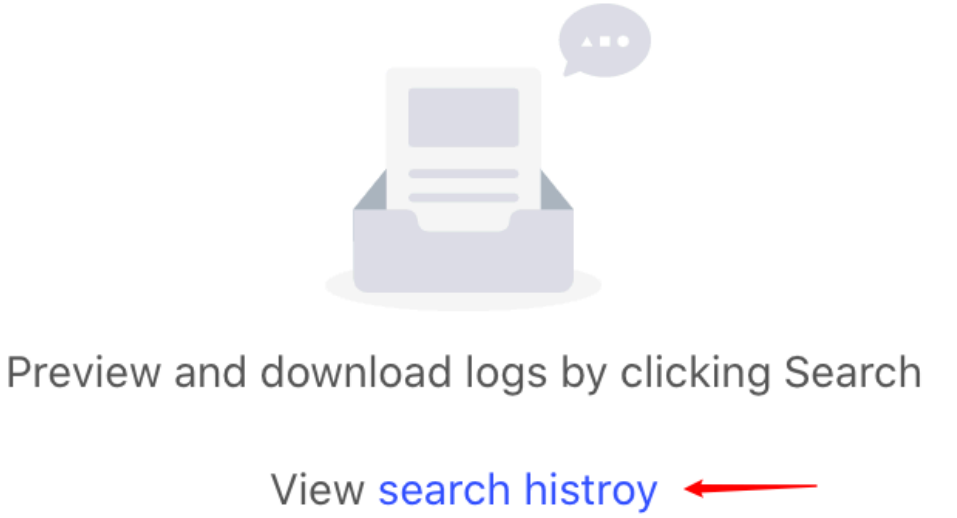

Figure 553: Search history entry

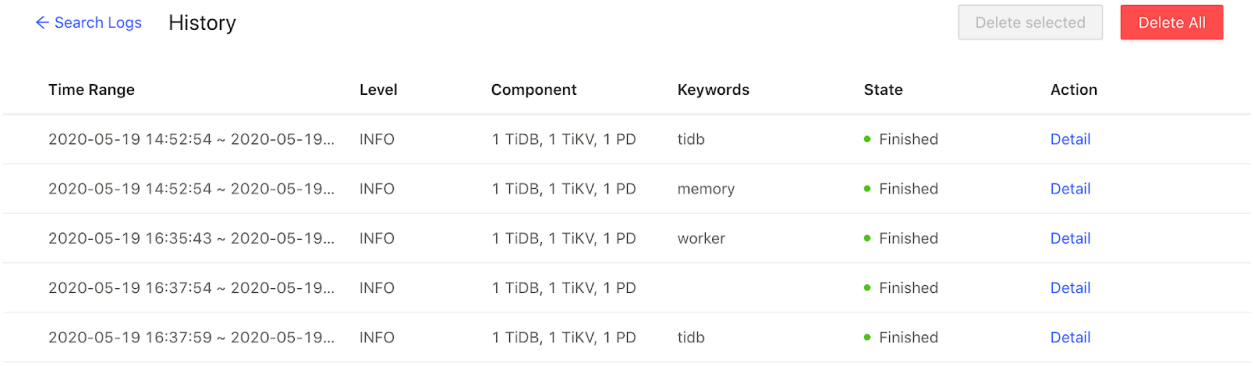

Figure 554: Search history list

The history list shows the time range, log level, components, keywords, and search status of each search log. Click the **Detail** link in the **Action** column to see the search result details:

You can delete the search history that you no longer need. Click **Delete All** in the upper right corner, or select the rows to be deleted and then click **Delete selected** to delete the history:

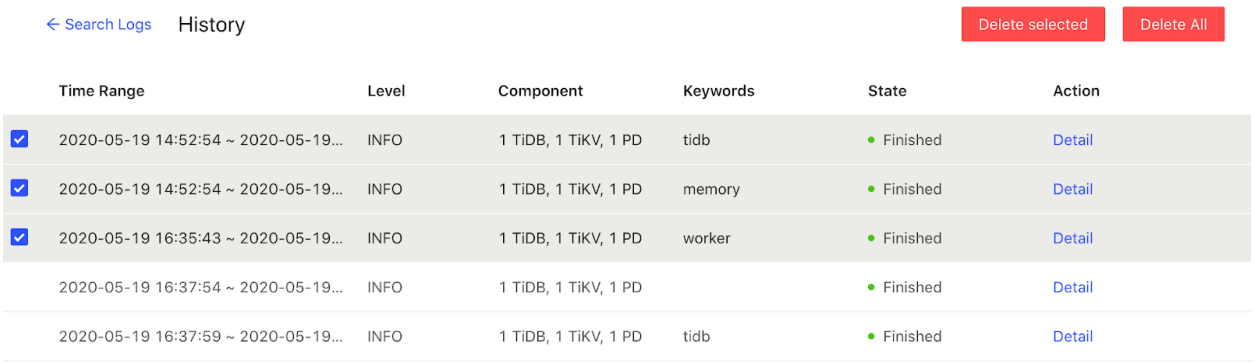

Figure 555: Delete search history

14.14.1.14 TiDB Dashboard Resource Manager Page

To implement resource isolation using the Resource Control feature, cluster administrators can create resource groups and set quotas for each group. Before resource planning, you need to know the overall capacity of the cluster. This document helps you view the information about resource control, so you can estimate the cluster capacity before resource planning and allocate resources more effectively.

14.14.1.14.1 Access the page

You can use one of the following two methods to access the Resource Manager page:

- After logging in to TiDB Dashboard, click **Resource Manager** in the left navigation menu.
- Visit http://127.0.0.1:2379/dashboard/#/resource_manager in your browser. Replace `127.0.0.1:2379` with the actual PD instance address and port.

14.14.1.14.2 Resource Manager page

The following figure shows the Resource Manager details page:

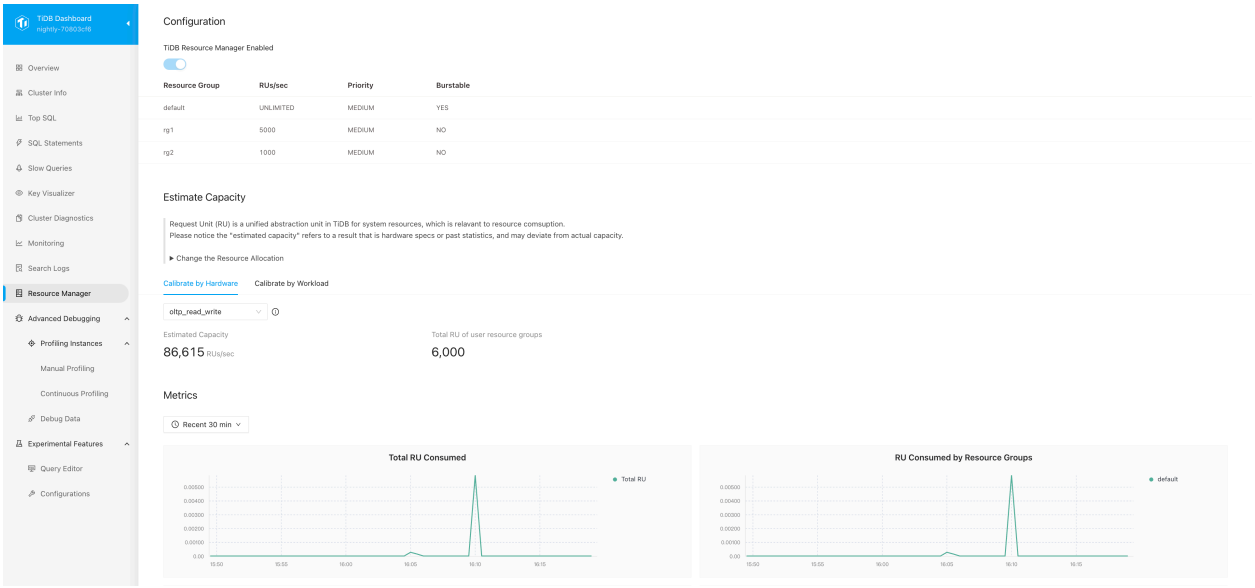

Figure 556: TiDB Dashboard: Resource Manager

The Resource Manager page contains the following three sections:

- Configuration: This section displays the data obtained from the `RESOURCE_GROUPS` ↪ table of TiDB. It contains the information about all resource groups. For more information, see `RESOURCE_GROUPS`.
- Estimate Capacity: Before resource planning, you need to know the overall capacity of the cluster. You can use one of the following methods:
  - Estimate capacity based on actual workload
  - Estimate capacity based on hardware deployment
- Metrics: By observing the metrics on the panels, you can understand the current overall resource consumption status of the cluster.

14.14.1.14.3 Estimate Capacity

Before resource planning, you need to know the overall capacity of the cluster. TiDB provides two methods to estimate the capacity of Request Unit (RU) in the current cluster:

- Estimate capacity based on hardware deployment

  TiDB accepts the following workload types:

  - `tpcc`: applies to workloads with heavy data write. It is estimated based on a workload model similar to `TPC-C`.

- `oltp_write_only`: applies to workloads with heavy data write. It is estimated based on a workload model similar to `sysbench oltp_write_only`.
- `oltp_read_write`: applies to workloads with even data read and write. It is estimated based on a workload model similar to `sysbench oltp_read_write`.
- `oltp_read_only`: applies to workloads with heavy data read. It is estimated based on a workload model similar to `sysbench oltp_read_only`.

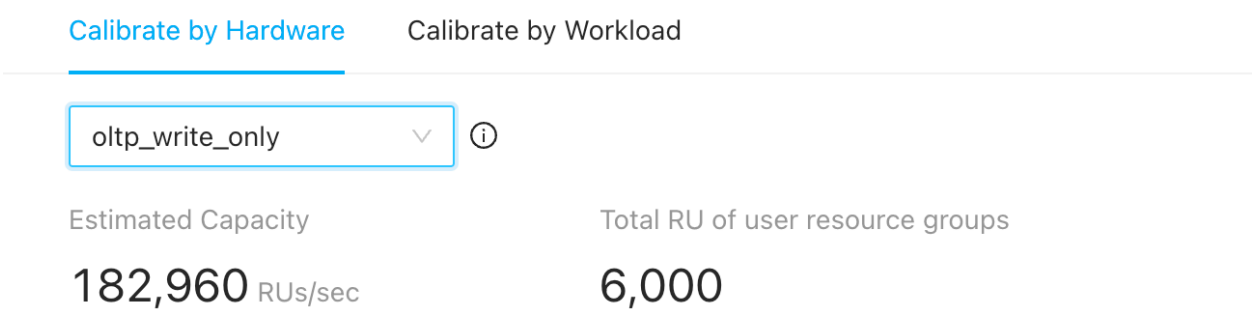

Figure 557: Calibrate by Hardware

```
The **Total RU of user resource groups** represents the total amount of RU
    ↪ for all user resource groups, excluding the `default` resource group.
    ↪  If this value is less than the estimated capacity, the system
    ↪ triggers an alert. By default, the system allocates unlimited usage
    ↪ to the predefined `default` resource group. When all users belong to
    ↪ the `default` resource group, resources are allocated in the same way
    ↪  as when resource control is disabled.
```

- Estimate capacity based on actual workload

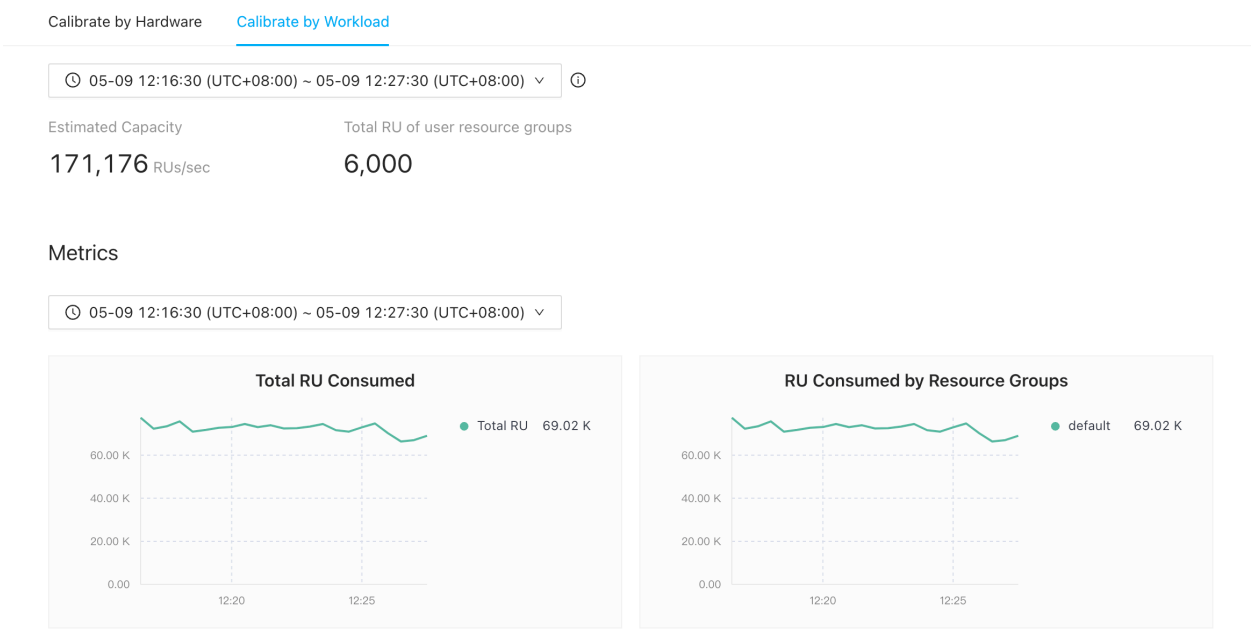

Figure 558: Calibrate by Workload

You can select a time range for estimation within the range of 10 minutes to 24 hours. The time zone used is the same as that of the front-end user.

- When the time window range does not fall between 10 minutes and 24 hours, the following error is displayed `ERROR 1105 (HY000): the duration of calibration is too short, which could lead to inaccurate output. Please make the duration between 10m0s and 24h0m0s`.
- The monitoring metrics for the capacity estimation based on the actual workload feature include `tikv_cpu_quota`, `tidb_server_maxprocs`, `resource_manager_resource_unit`, and `process_cpu_usage`. If the CPU quota monitoring data is empty, there will be an error with the corresponding monitoring metric name, for example, `Error 1105 (HY000): There is no CPU quota metrics, metrics 'tikv_cpu_quota' is empty`.
- If the workload in the time window is too low, or the `resource_manager_resource_unit` and `process_cpu_usage` monitoring data is missing, an error will be reported `Error 1105 (HY000): The workload in selected time window is too low, with which TiDB is unable to reach a capacity estimation; please select another time window with higher workload, or calibrate resource by hardware instead`. In addition, because TiKV does not monitor CPU utilization on macOS, it does not support capacity estimation based on the actual workload, and will also report this error.

You can select an appropriate time range using **CPU Usage** in the Metrics section.

14.14.1.14.4 Metrics

By observing the metrics on the panels, you can understand the current overall resource consumption status of the cluster. The monitoring metrics and their meanings are as follows:

- Total RU Consumed: The total consumption of Request Units counted in real time.
- RU Consumed by Resource Groups: The number of Request Units consumed by resource groups in real time.
- TiDB
  - CPU Quota: The maximum CPU usage of TiDB.
  - CPU Usage: The total CPU usage of all TiDB instances.
- TiKV
  - CPU Quota: The maximum CPU usage of TiKV.
  - CPU Usage: The total CPU usage of all TiKV instances.
  - IO MBps: The total I/O throughput of all TiKV instances.

14.14.1.15 Instance Profiling

14.14.1.15.1 TiDB Dashboard Instance Profiling - Manual Profiling

> **Note:**
>
> This feature is designed for database experts. For non-expert users, it is recommended to use this feature under the guidance of PingCAP technical supports.

Manual Profiling allows users to collect current performance data **on demand** for each TiDB, TiKV, PD and TiFlash instances with a single click. The collected performance data can be visualized as FlameGraph or DAG.

With these performance data, experts can analyze current resource consumption details like instance's CPU and memory, to help pinpoint sophisticated ongoing performance problems, such as high CPU overhead, high memory usage, and process stalls.

After initiates the profiling, TiDB Dashboard collects current performance data for a period of time (30 seconds by default). Therefore this feature can only be used to analyze ongoing problems that the cluster is facing now and has no significant effect on historical problems. If you want to collect and analyze performance data **at any time**, see Continuous Profiling.

Supported performance data

The following performance data are currently supported:

- CPU: The CPU overhead of each internal function on TiDB, TiKV, PD and TiFlash instances

> The CPU overhead of TiKV and TiFlash instances is currently not supported in ARM architecture.

- Heap: The memory consumption of each internal function on TiDB, TiKV, and PD instances

> Starting from v7.5, TiDB supports the TiKV Heap Profile. The Perl dependency is required in the running environment of TiDB Dashboard. Otherwise an error will occur.

- Mutex: The mutex contention states on TiDB and PD instances
- Goroutine: The running state and call stack of all goroutines on TiDB and PD instances

Access the page

You can access the instance profiling page using either of the following methods:

- After logging in to TiDB Dashboard, click **Advanced Debugging** > **Profiling Instances** > **Manual Profiling** in the left navigation menu.

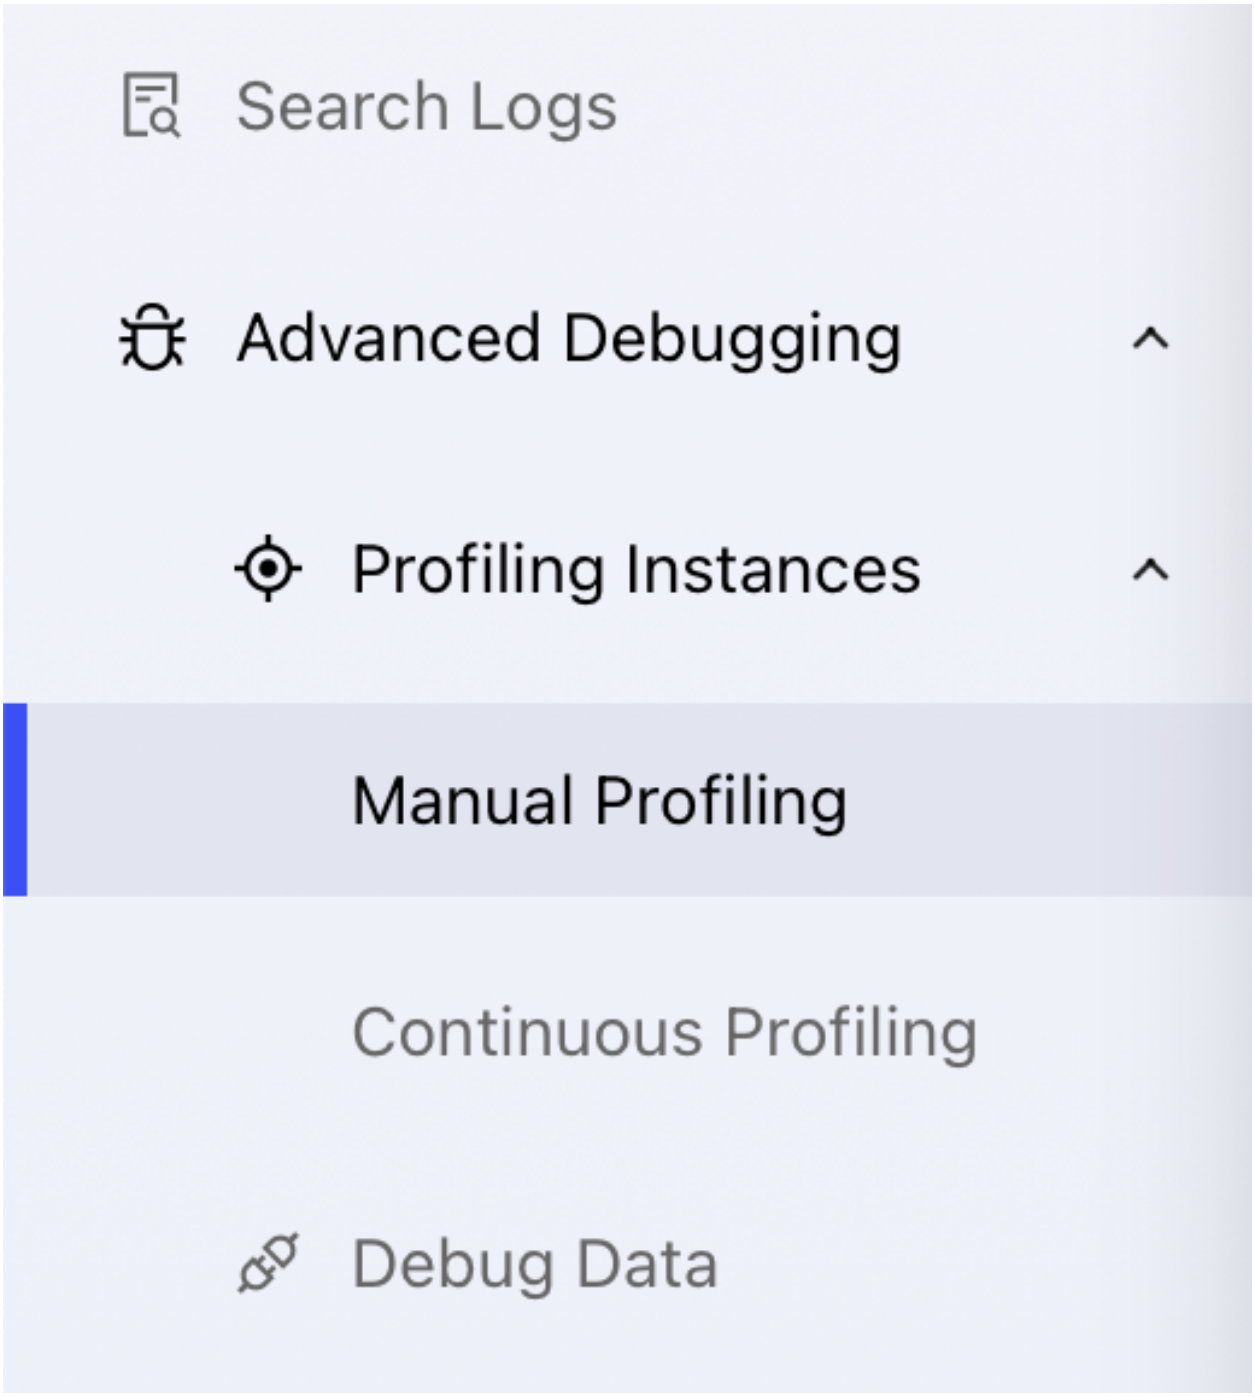

Figure 559: Access instance profiling page

- Visit http://127.0.0.1:2379/dashboard/#/instance_profiling in your browser. Replace `127.0.0.1:2379` with the actual PD instance address and port.

Start Profiling

In the instance profiling page, choose at least one target instance and click **Start Profiling** to start the instance profiling.

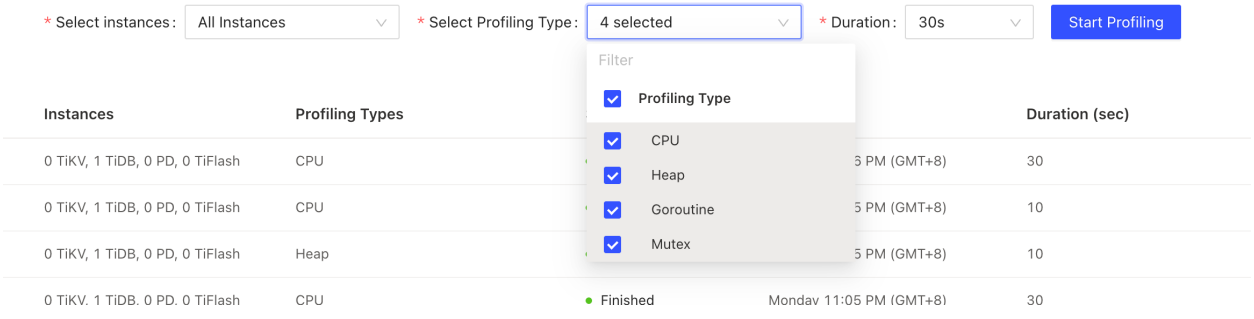

Figure 560: Start instance profiling

You can modify the profiling duration before starting the profiling. This duration is determined by the time needed for the profiling, which is 30 seconds by default. The 30-second duration takes 30 seconds to complete.

Manual Profiling cannot be initiated on clusters that have Continuous Profiling enabled. To view the performance data at the current moment, click on the most recent profiling result in the Continuous Profiling page.

View profiling status

After a profiling is started, you can view the profiling status and progress in real time.

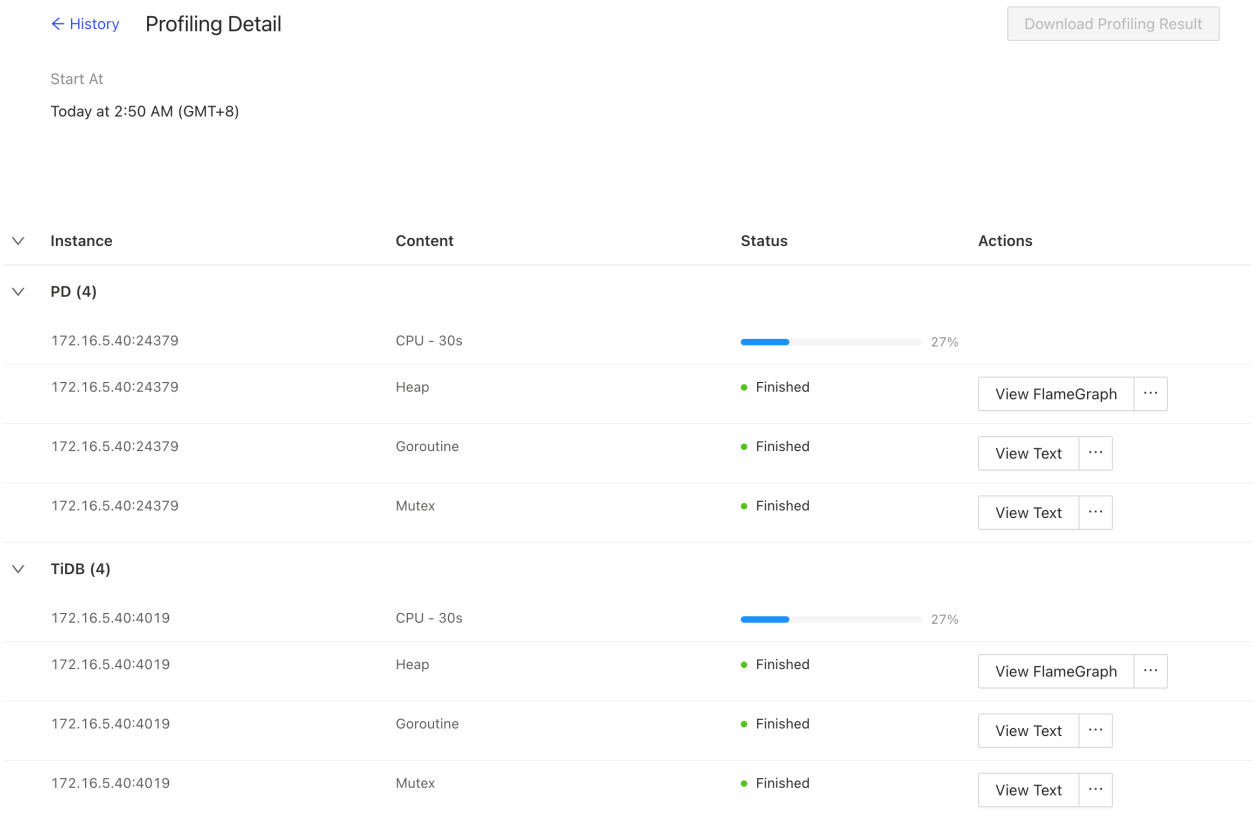

Figure 561: Profiling detail

The profiling runs in the background. Refreshing or exiting the current page does not stop the profiling task that is running.

Download performance data

After the profiling of all instances is completed, you can click **Download Profiling Result** in the upper right corner to download all performance data.

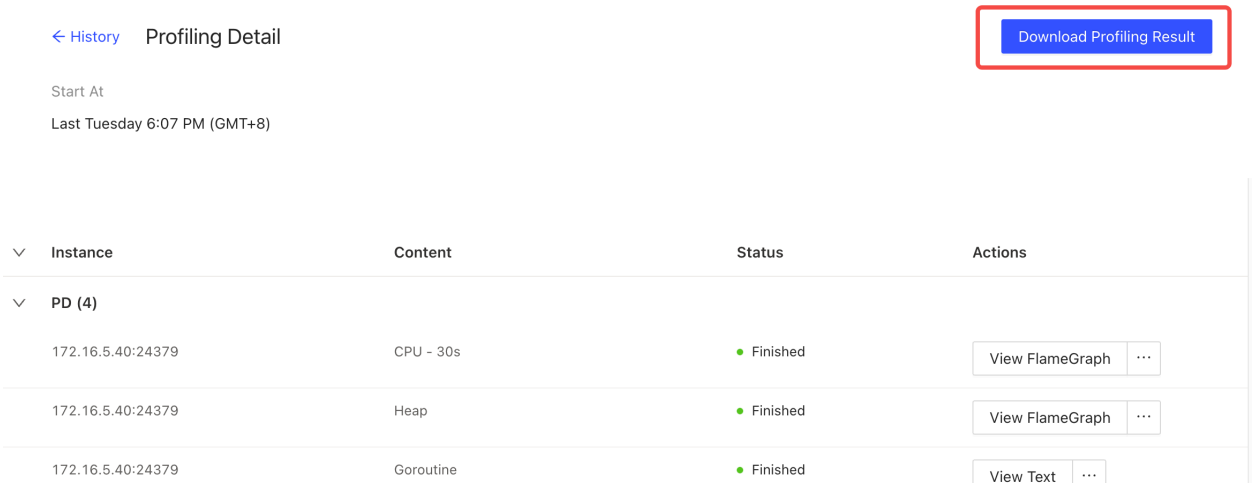

Figure 562: Download profiling result

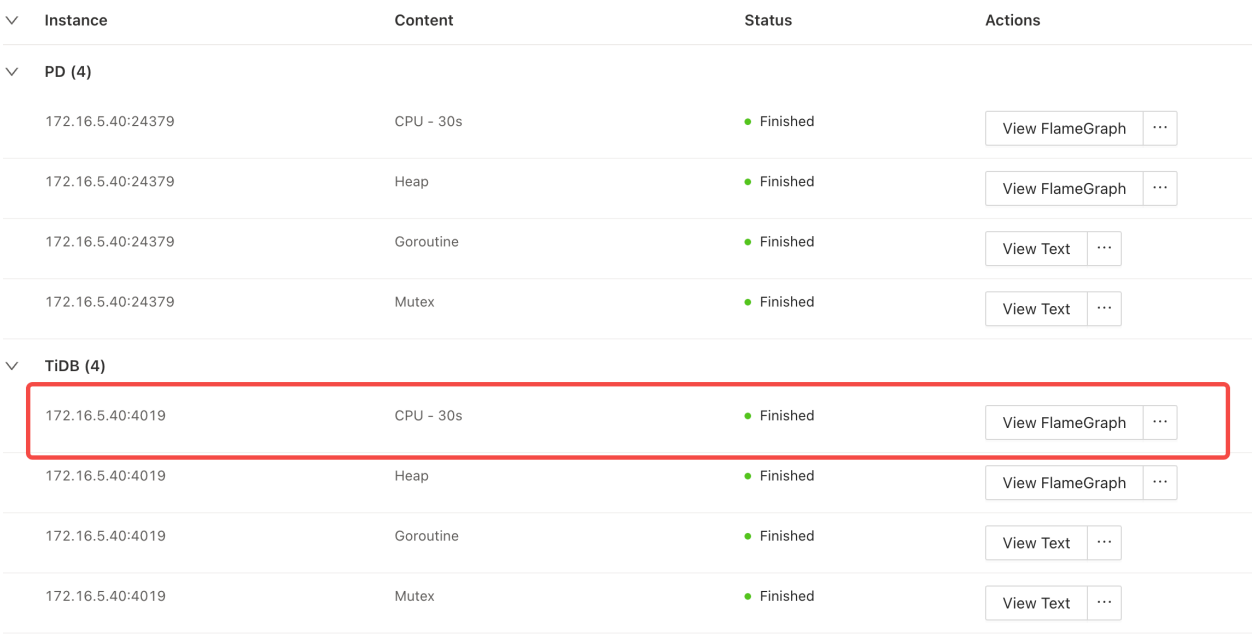
You can also click an individual instance in the table to view its profiling result. Alternatively, you can hover on … to download raw data.



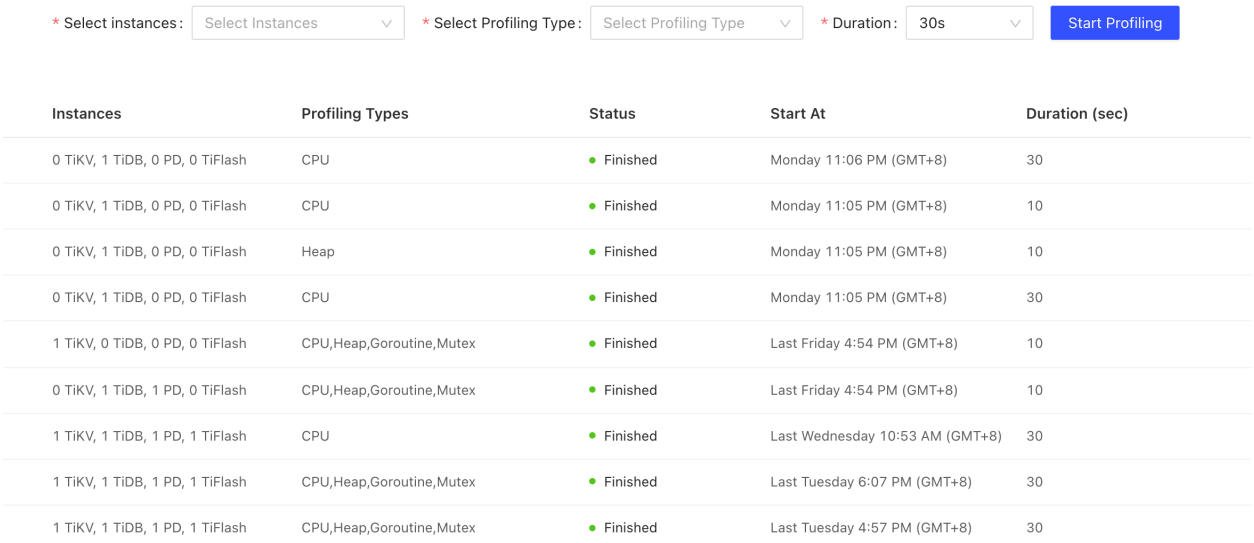


Figure 563: Single instance result

View profiling history

The on-demand profiling history is listed on the page. Click a row to view details.

Instances	Profiling Types	Status	Start At	Duration (sec)
0 TiKV, 1 TiDB, 0 PD, 0 TiFlash	CPU	Finished	Monday 11:06 PM (GMT+8)	30
0 TiKV, 1 TiDB, 0 PD, 0 TiFlash	CPU	Finished	Monday 11:05 PM (GMT+8)	10
0 TiKV, 1 TiDB, 0 PD, 0 TiFlash	Heap	Finished	Monday 11:05 PM (GMT+8)	10
0 TiKV, 1 TiDB, 0 PD, 0 TiFlash	CPU	Finished	Monday 11:05 PM (GMT+8)	30
1 TiKV, 0 TiDB, 0 PD, 0 TiFlash	CPU,Heap,Goroutine,Mutex	Finished	Last Friday 4:54 PM (GMT+8)	10
0 TiKV, 1 TiDB, 1 PD, 0 TiFlash	CPU,Heap,Goroutine,Mutex	Finished	Last Friday 4:54 PM (GMT+8)	10

1 TiKV, 1 TiDB, 1 PD, 1 TiFlash	CPU,Heap,Goroutine,Mutex	Finished	Last Tuesday 6:07 PM (GMT+8)	30
1 TiKV, 1 TiDB, 1 PD, 1 TiFlash	CPU,Heap,Goroutine,Mutex	Finished	Last Tuesday 4:57 PM (GMT+8)	30

Figure 564: View profiling history

For detailed operations on the profiling status page, see View Profiling Status.

14.14.1.15.2 TiDB Dashboard Instance Profiling - Continuous Profiling

> **Note:**
>
> This feature is designed for database experts. For non-expert users, it is recommended to use this feature under the guidance of PingCAP technical supports.

Continuous Profiling allows collecting performance data **continuously** from each TiDB, TiKV and PD instance. The collected performance data can be visualized as FlameGraph or DAG.

With these performance data, experts can analyze resource consumption details like instance's CPU and memory, to help pinpoint sophisticated performance problems at any time, such as high CPU overhead, high memory usage, process stalls, and so on. Even for problems cannot be reproduced, experts can dig deep into the problem by viewing the historical performance data collected at that moment. In this way, MTTR can be reduced effectively.

Compare with Manual Profiling

Continuous Profiling is an enhanced feature of Manual Profiling. They can be both used to collect and analyze different kinds of performance data for each instance. Differences between them are as follows:

- Manual Profiling only collects performance data for a short period of time (for example, 30 seconds) at the moment you initiate the profiling, while Continuous Profiling collects data continuously when it is enabled.
- Manual Profiling can only be used to analyze current occurring problems, while Continuous Profiling can be used to analyze both the current and historical problems.
- Manual Profiling allows to collect specific performance data for specific instances, while Continuous Profiling collects all performance data for all instances.
- Continuous Profiling stores more performance data, therefore it takes up more disk space.

Supported performance data

All performance data in Manual Profiling is collected.

- CPU: The CPU overhead of each internal function on TiDB, TiKV, TiFlash, and PD instances
- Heap: The memory consumption of each internal function on TiDB, TiKV, and PD instances
- Mutex: The mutex contention states on TiDB and PD instances
- Goroutine: The running state and call stack of all goroutines on TiDB and PD instances

Access the page

You can access the Continuous Profiling page using either of the following methods:

- After logging in to TiDB Dashboard, click **Advanced Debugging** > **Profiling Instances** > **Continuous Profiling** in the left navigation menu.

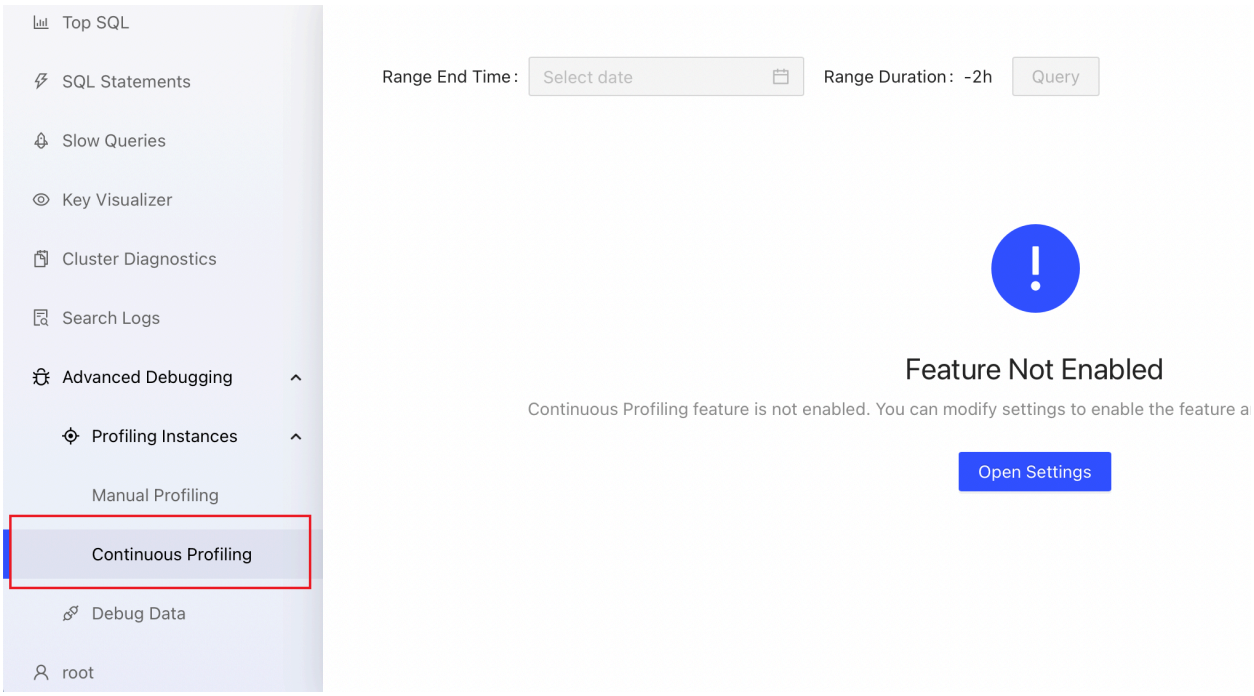

Figure 565: Access page

- Visit http://127.0.0.1:2379/dashboard/#/continuous_profiling in your browser. Replace `127.0.0.1:2379` with the actual PD instance address and port.

Enable Continuous Profiling

> **Note:**
>
> To use Continuous Profiling, your cluster should be deployed or upgraded with a recent version of TiUP (v1.9.0 or above) or TiDB Operator (v1.3.0 or above). If your cluster was upgraded using an earlier version of TiUP or TiDB Operator, see FAQ for instructions.

After enabling Continuous Profiling, you can have performance data continuously collected in the background without keeping the web pages always active. Data collected can be kept for a certain period of time and expired data is automatically cleared.

To enable this feature:

1. Visit the Continuous Profiling page.
2. Click **Open Settings**. In the **Settings** area on the right, switch **Enable Feature** on, and modify the default value of **Retention Duration** if necessary.

3. Click **Save**.

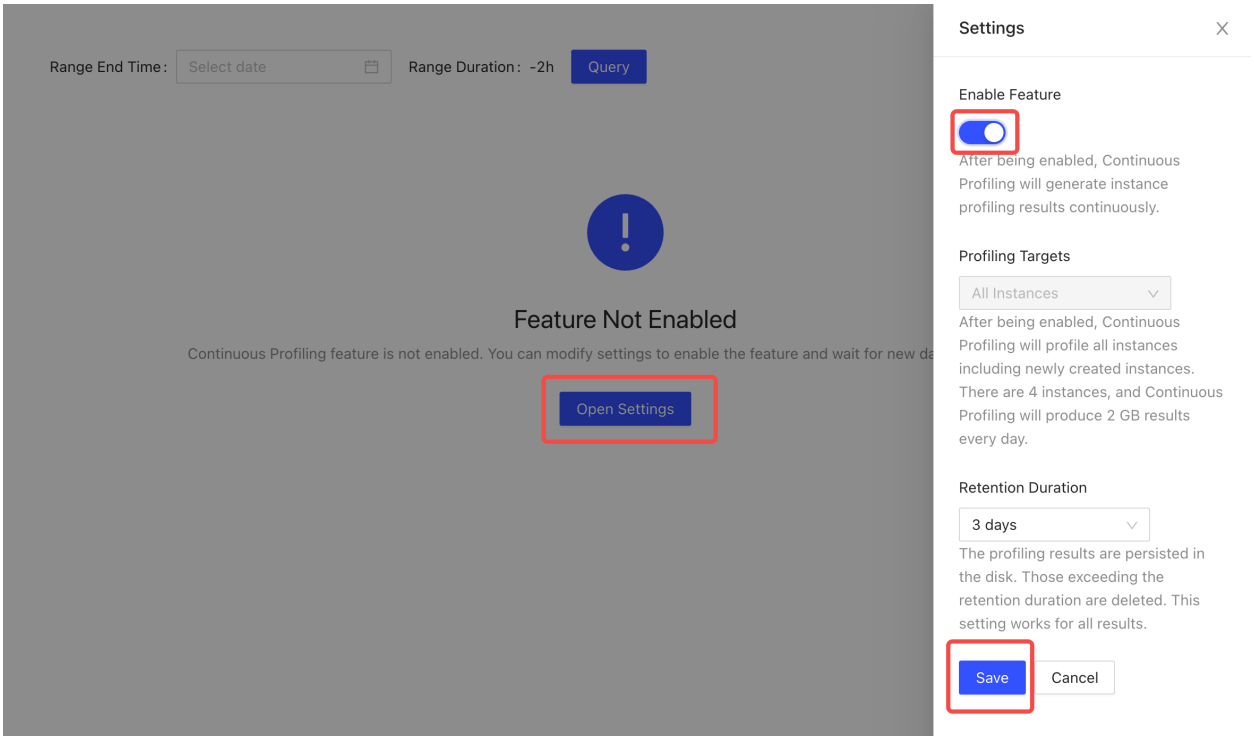

Figure 566: Enable feature

View current performance data

Manual Profiling cannot be initiated on clusters that have Continuous Profiling enabled. To view the performance data at the current moment, just click on the most recent profiling result.

View historical performance data

On the list page, you can see all performance data collected since the enabling of this feature.

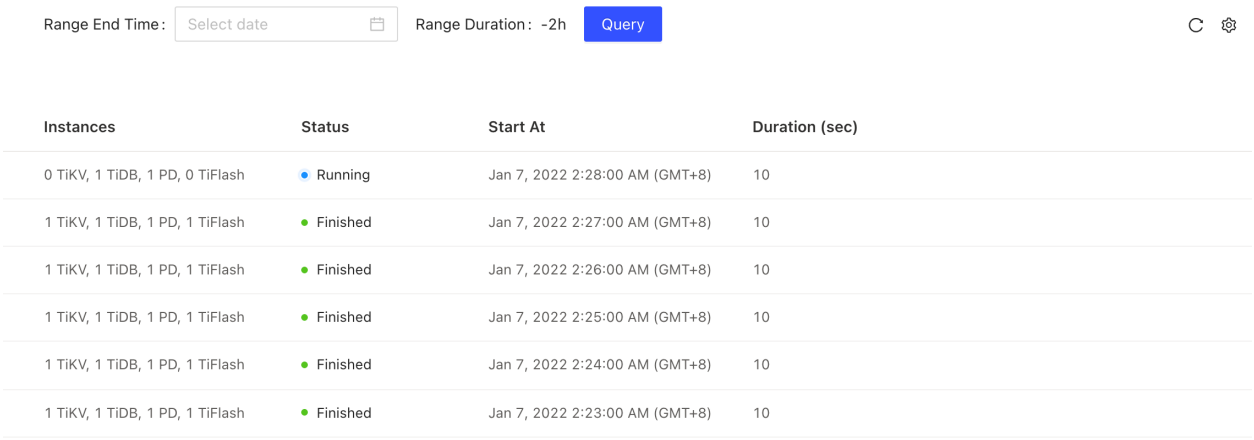

Figure 567: History results

Download performance data

On the profiling result page, you can click **Download Profiling Result** in the upper-right corner to download all profiling results.

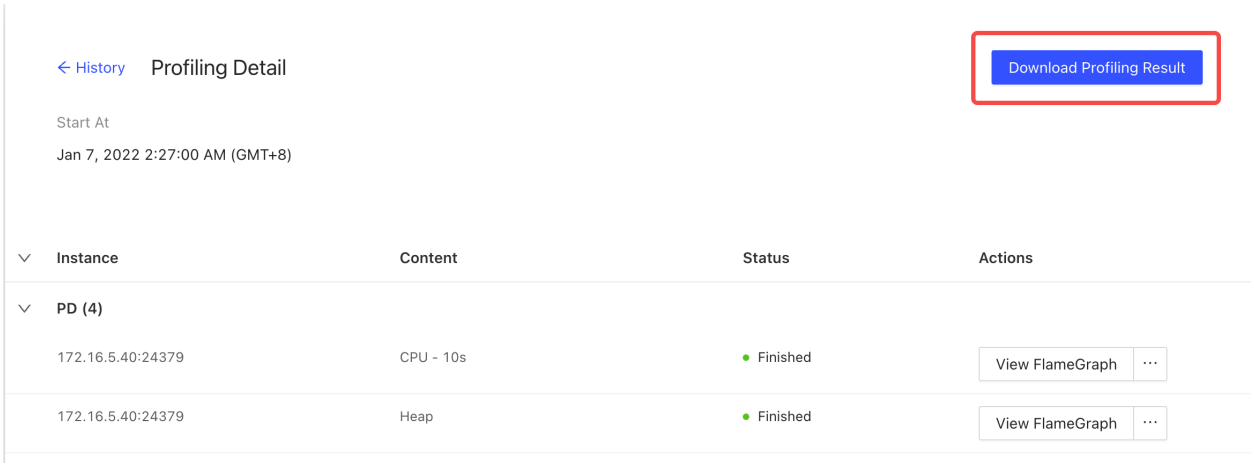

Figure 568: Download profiling result

You can also click an individual instance in the table to view its profiling result. Alternatively, you can hover on … to download raw data.

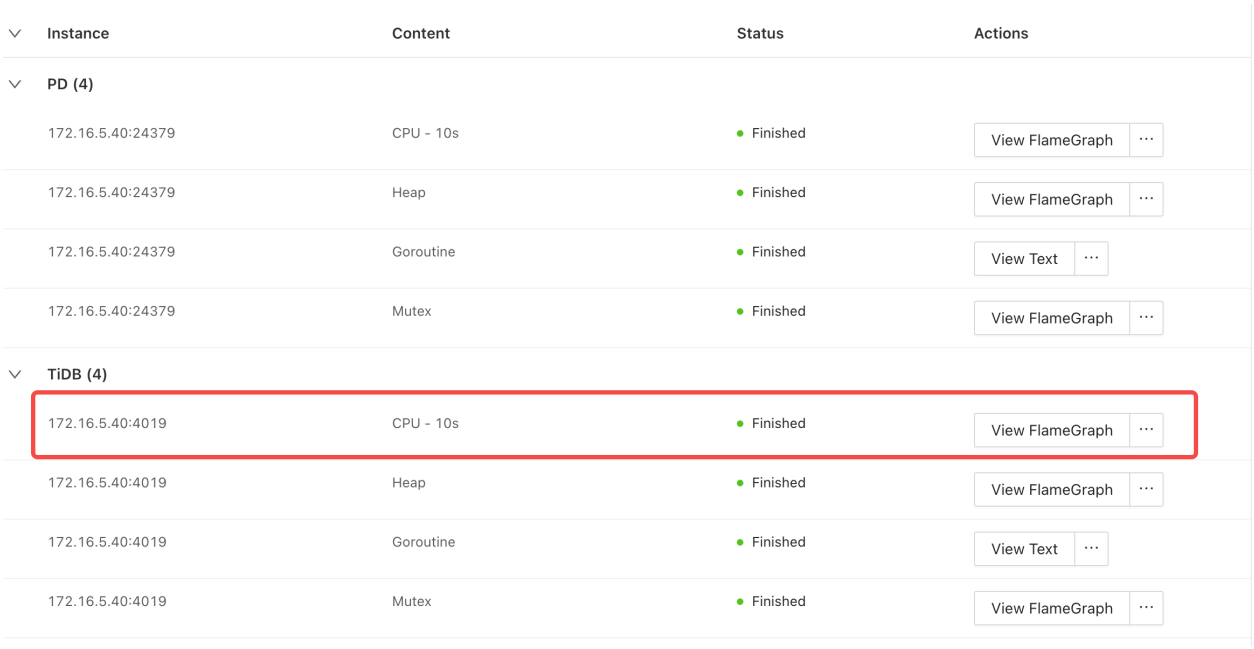

Figure 569: View profiling result

Disable Continuous Profiling

1. Visit the Continuous Profiling page.
2. Click the gear icon in the upper right corner to open the settings page. Switch **Enable Feature** off.
3. Click **Save**.
4. In the popped-up dialog box, click **Disable**.

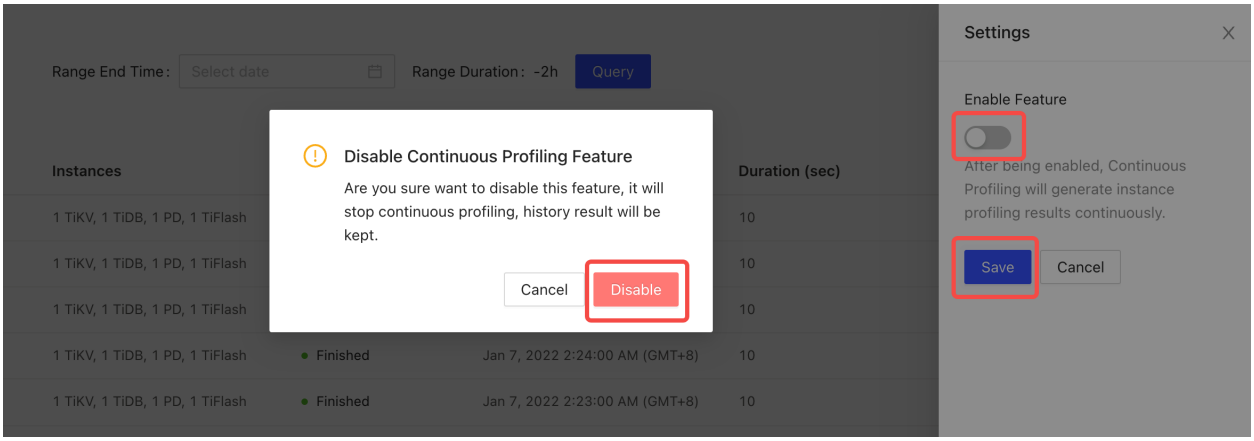

Figure 570: Disable feature

Frequently asked questions

1. Continuous Profiling cannot be enabled and the UI displays "required component NgMonitoring is not started".

See TiDB Dashboard FAQ.

2. Will performance be affected after enabling Continuous Profiling?

According to our benchmark, the average performance impact is less than 1% when the feature is enabled.

3. What is the status of this feature?

It is now a generally available (GA) feature and can be used in production environments.

14.14.1.16 Session Management and Configuration

14.14.1.16.1 Share TiDB Dashboard Sessions

You can share the current session of the TiDB Dashboard to other users so that they can access and operate the TiDB Dashboard without entering the user password.

Steps for the inviter

1. Sign into TiDB Dashboard.
2. Click the username in the left sidebar to access the configuration page.
3. Click **Share Current Session**.

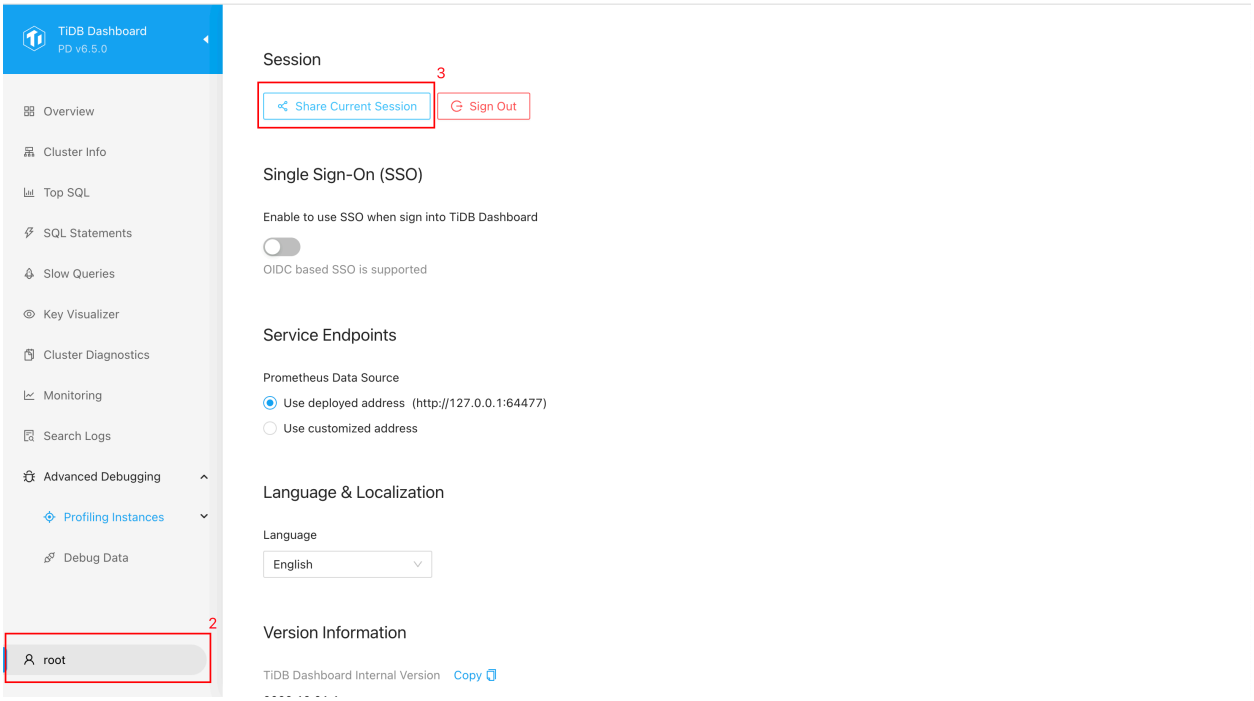

Figure 571: Sample Step

> **Note:**
>
> For security reasons, the shared session cannot be shared again.

4. Adjust sharing settings in the popup dialog:

- Expire in: How long the shared session will be effective. Signing out of the current session does not affect the effective time of the shared session.
- Share as read-only privilege: The shared session only permits read operations but not write operations (such as modifying configurations).

5. Click **Generate Authorization Code**.

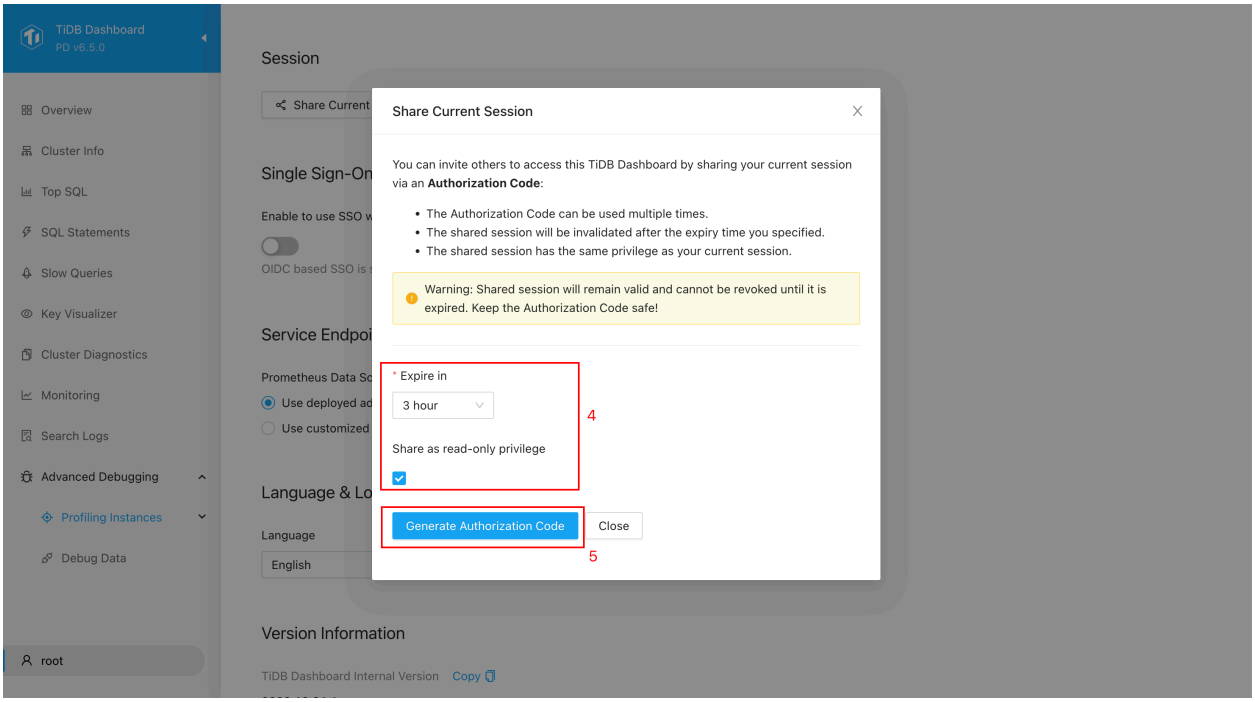

Figure 572: Sample Step

6. Provide the generated **Authorization Code** to the user to whom you want to share the session.

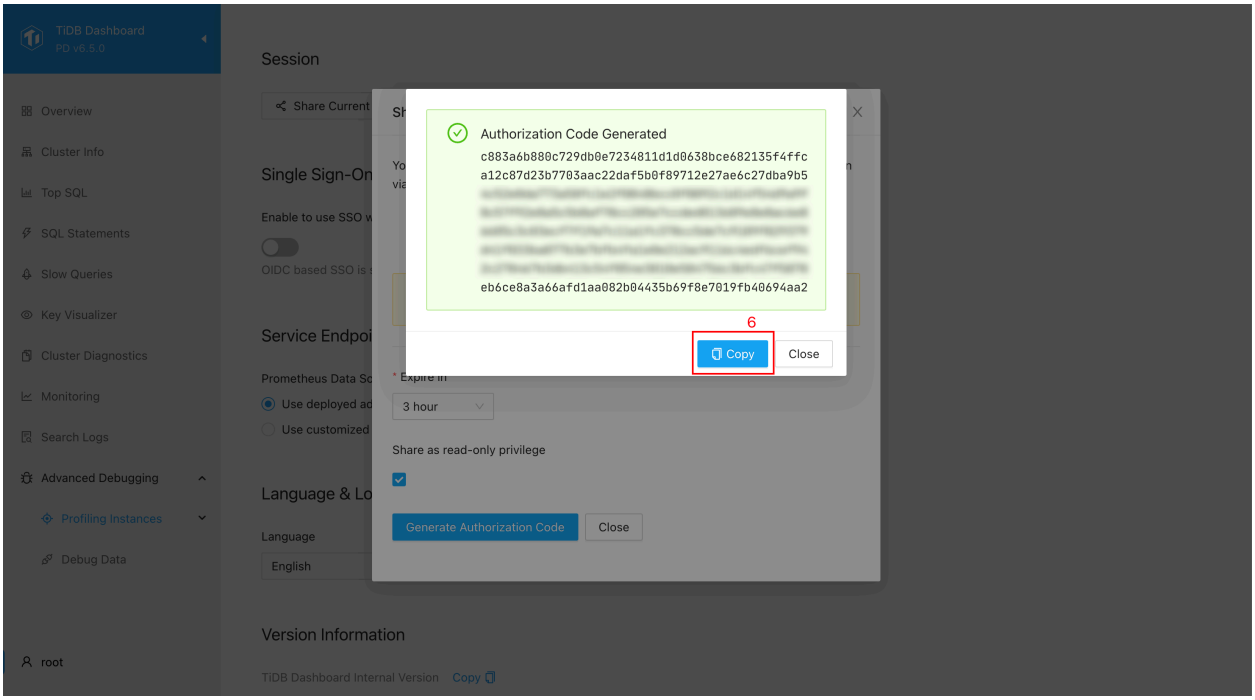

Figure 573: Sample Step

> **Warning:**
>
> Keep your authorization code secure and do not send it to anyone who is untrusted. Otherwise, they will be able to access and operate TiDB Dashboard without your authorization.

Steps for the invitee

1. On the sign-in page of TiDB Dashboard, click **Use Alternative Authentication**.

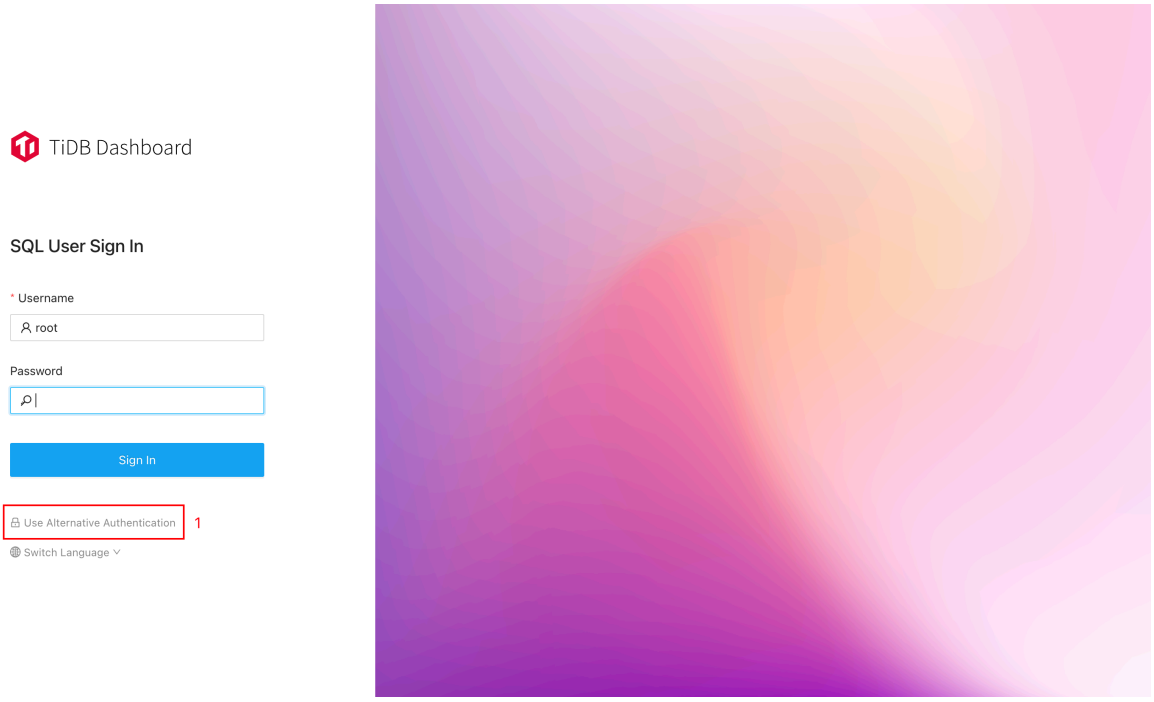

Figure 574: Sample Step

2. Click **Authorization Code** to use it to sign in.

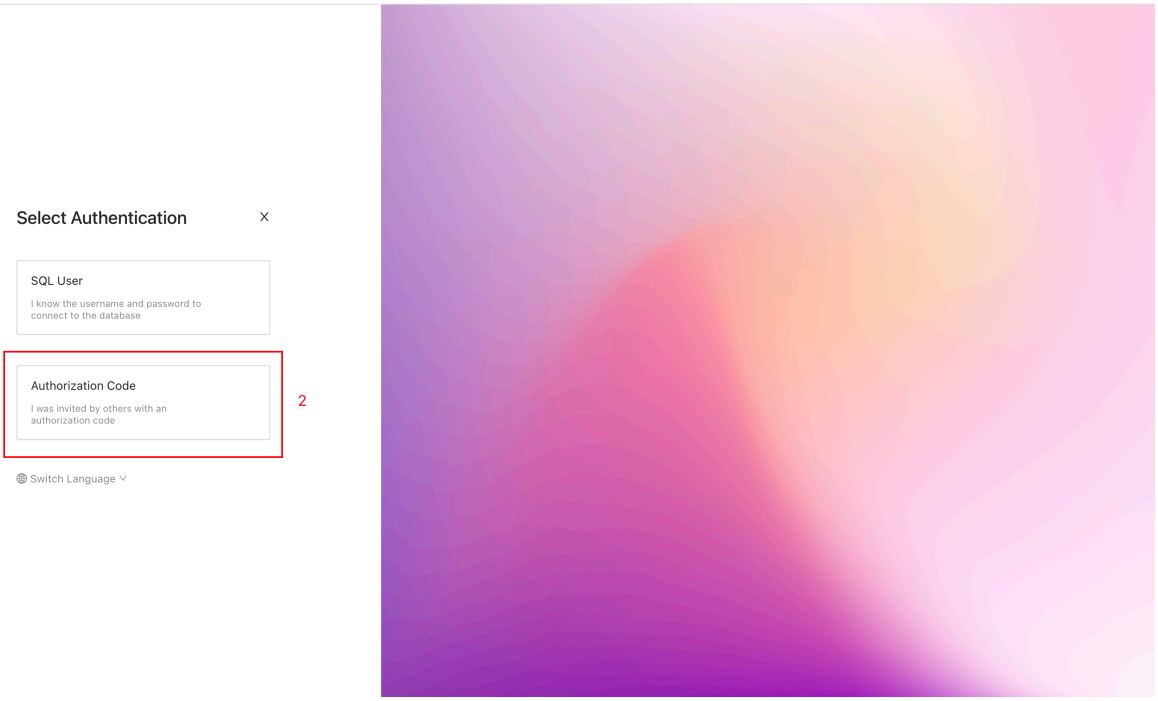

Figure 575: Sample Step

3. Enter the authorization code you have received from the inviter.
4. Click **Sign In**.

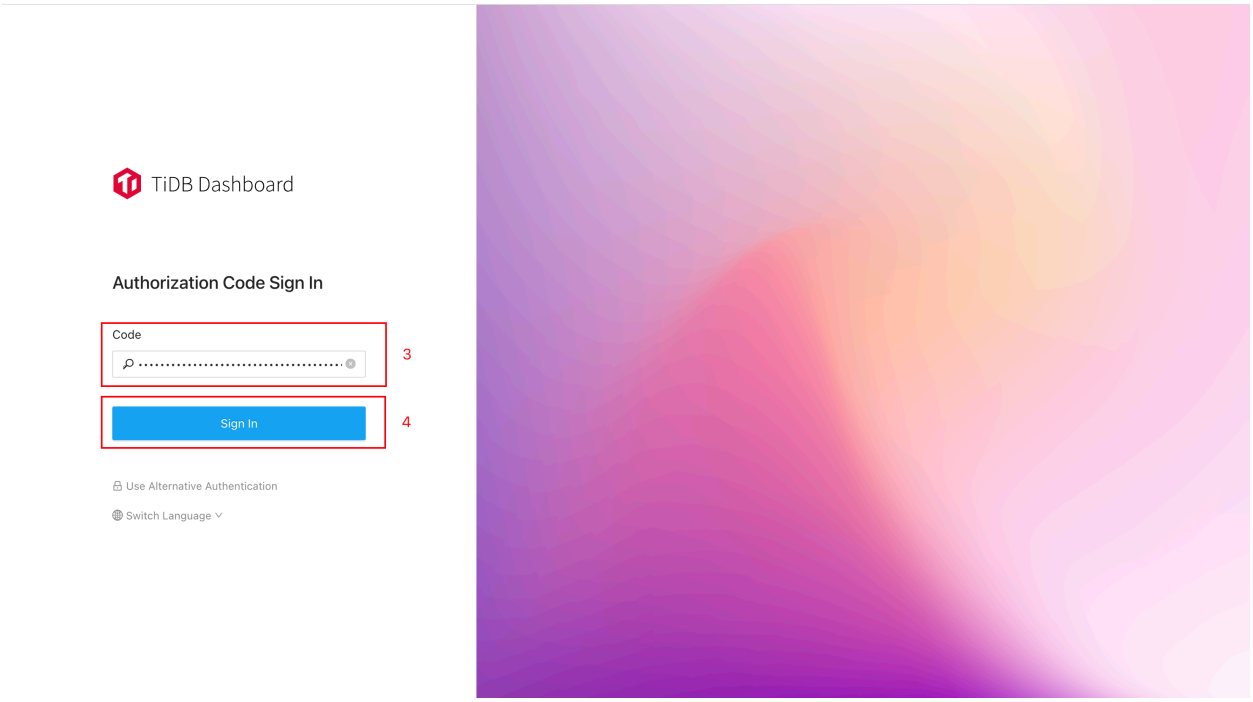

Figure 576: Sample Step

14.14.1.16.2 Configure SSO for TiDB Dashboard

TiDB Dashboard supports OIDC-based Single Sign-On (SSO). After enabling the SSO feature of TiDB Dashboard, the configured SSO service is used for your sign-in authentication and then you can access TiDB Dashboard without entering the SQL user password.

Configure OIDC SSO

Enable SSO

1. Sign into TiDB Dashboard.
2. Click the username in the left sidebar to access the configuration page.
3. In the **Single Sign-On** section, select **Enable to use SSO when sign into TiDB Dashboard**.
4. Fill the **OIDC Client ID** and the **OIDC Discovery URL** fields in the form.

   Generally, you can obtain the two fields from the SSO service provider:

- OIDC Client ID is also called OIDC Token Issuer.
- OIDC Discovery URL is also called OIDC Token Audience.

5. Click **Authorize Impersonation** and input the SQL password.

   TiDB Dashboard will store this SQL password and use it to impersonate a normal SQL sign-in after an SSO sign-in is finished.

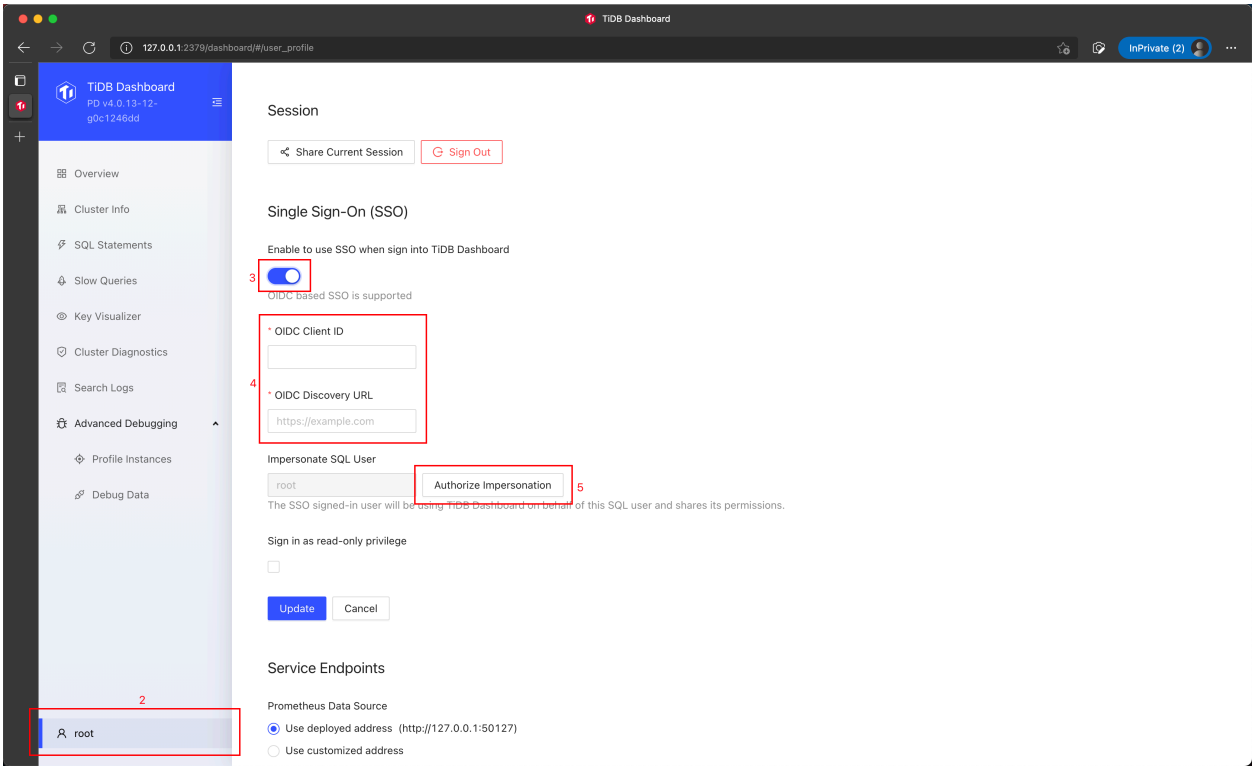

Figure 577: Sample Step

> **Note:**
>
> The password you have entered will be encrypted and stored. The SSO sign-in will fail after the password of the SQL user is changed. In this case, you can re-enter the password to bring SSO back.

6. Click **Authorize and Save**.

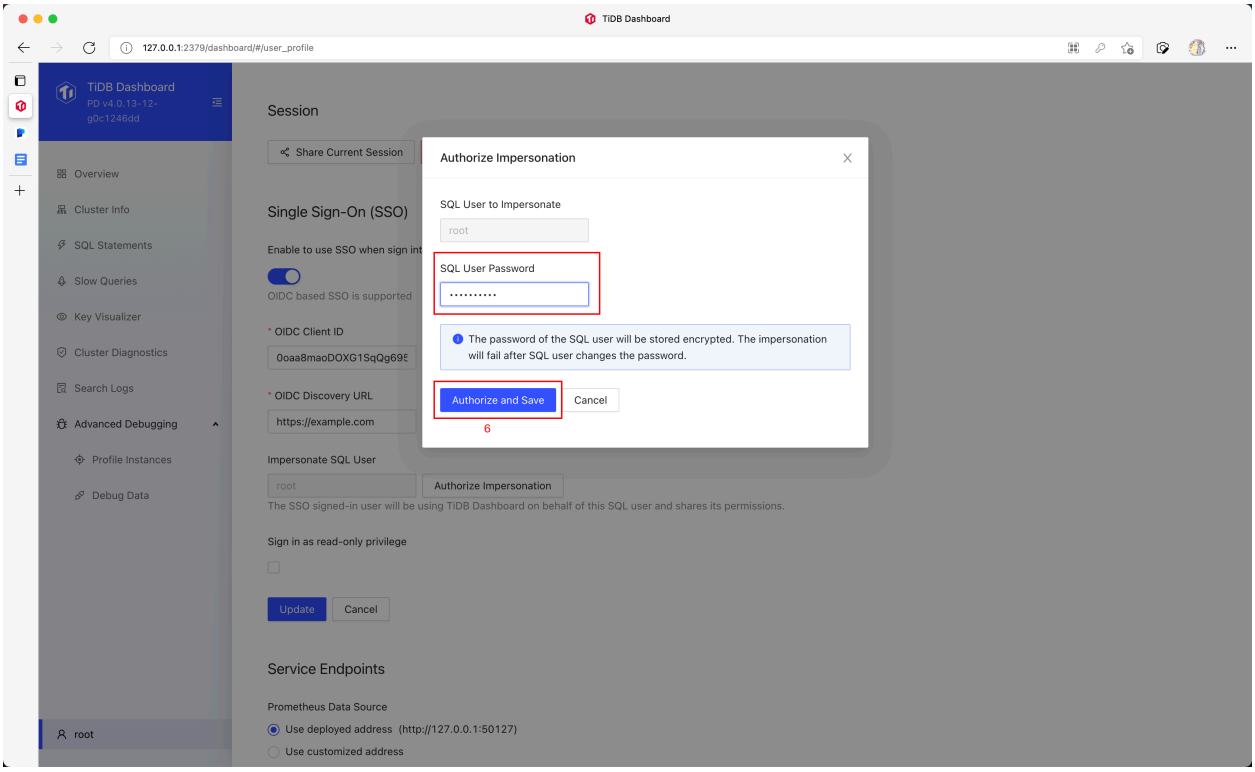

Figure 578: Sample Step

7. Click **Update** (Update) to save the configuration.

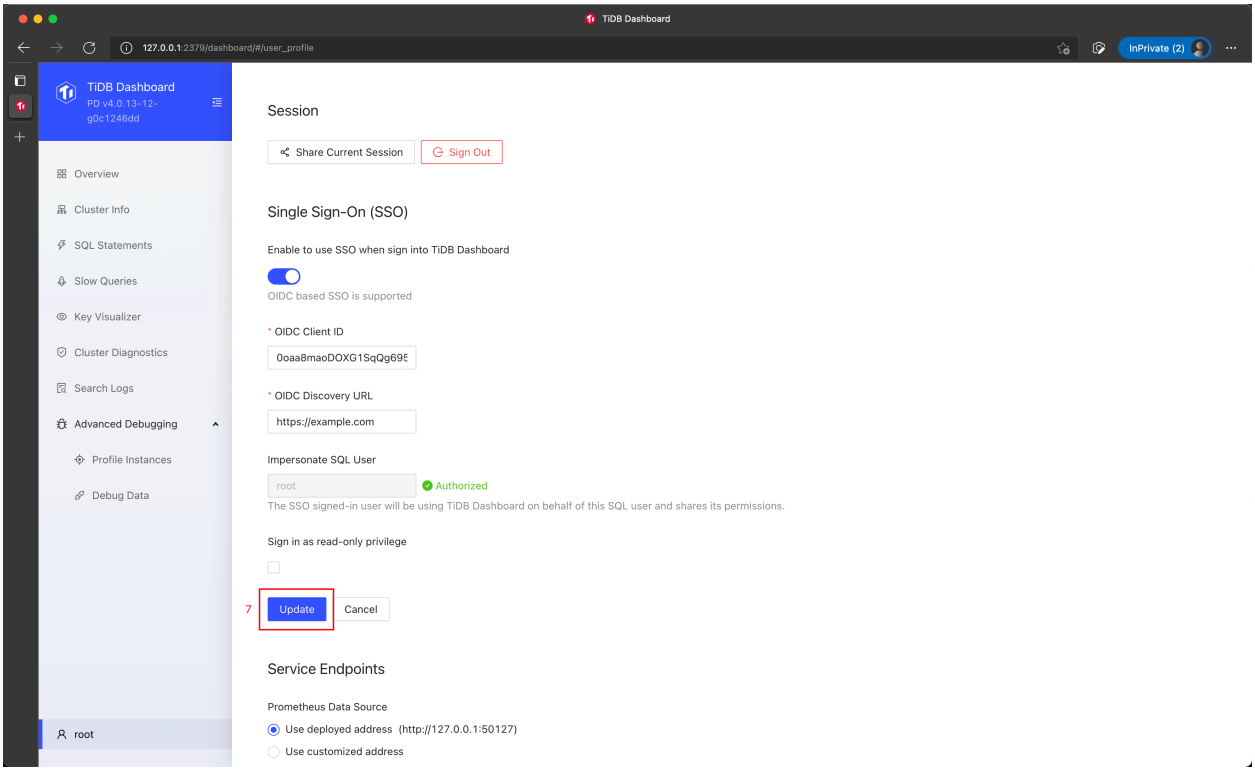

Figure 579: Sample Step

Now SSO sign-in has been enabled for TiDB Dashboard.

> **Note:**
>
> For security reasons, some SSO services require additional configuration for the SSO service, such as the trusted sign-in and sign-out URIs. Refer to the documentation of the SSO service for further information.

Disable SSO

You can disable the SSO, which will completely erase the stored SQL password:

1. Sign into TiDB Dashboard.
2. Click the username in the left sidebar to access the configuration page.
3. In the **Single Sign-On** section, deselect **Enable to use SSO when sign into TiDB Dashboard**.

4. Click **Update** (Update) to save the configuration.

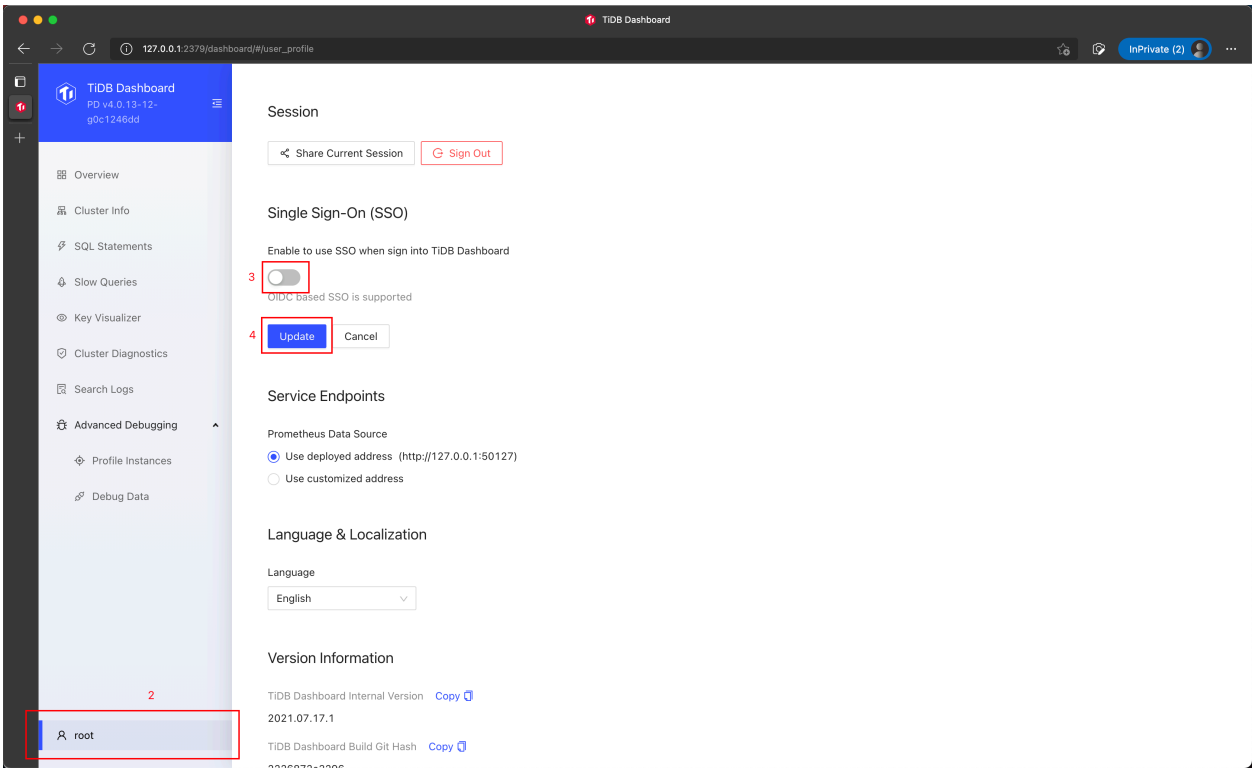

Figure 580: Sample Step

Re-enter the password after a password change

The SSO sign-in will fail once the password of the SQL user is changed. In this case, you can bring back the SSO sign-in by re-entering the SQL password:

1. Sign into TiDB Dashboard.
2. Click the username in the left sidebar to access the configuration page.
3. In the **Single Sign-On** section, Click **Authorize Impersonation** and input the updated SQL password.

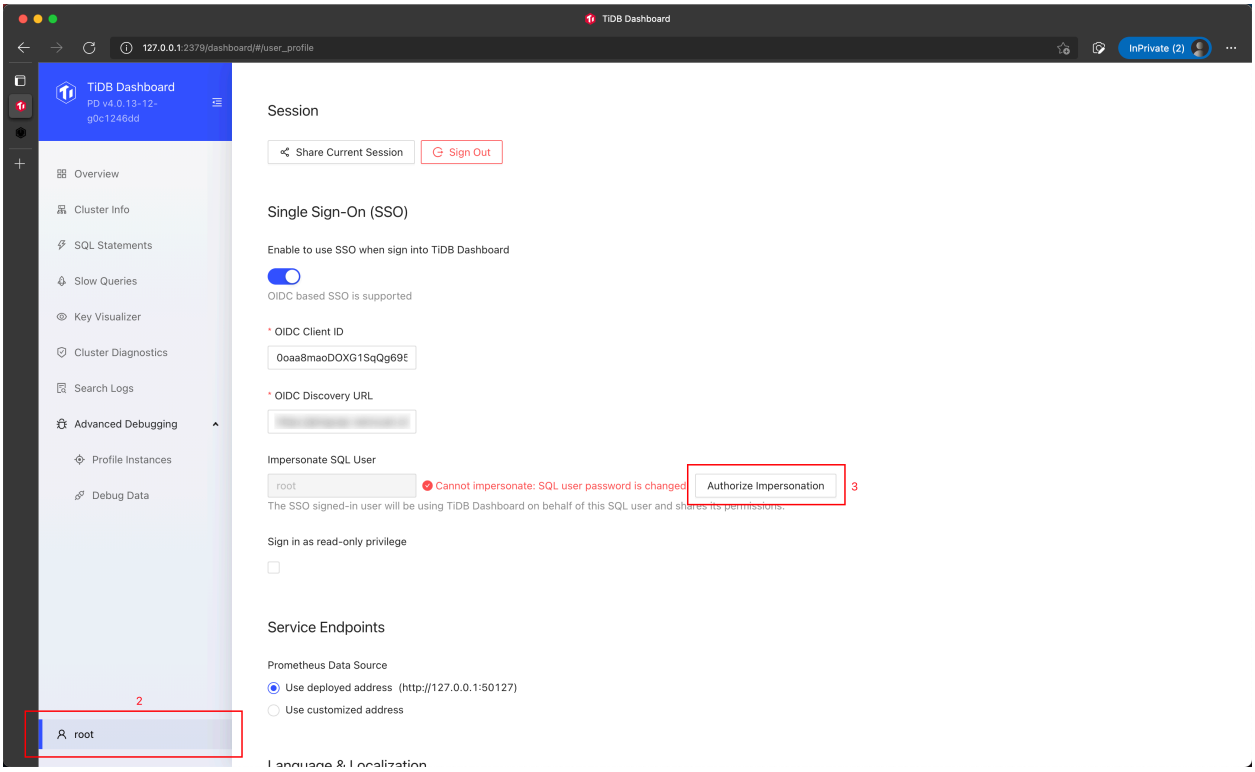

Figure 581: Sample Step

4. Click **Authorize and Save**.

Sign in via SSO

Once SSO is configured for TiDB Dashboard, you can sign in via SSO by taking following steps:

1. In the sign-in page of TiDB Dashboard, click **Sign in via Company Account**.

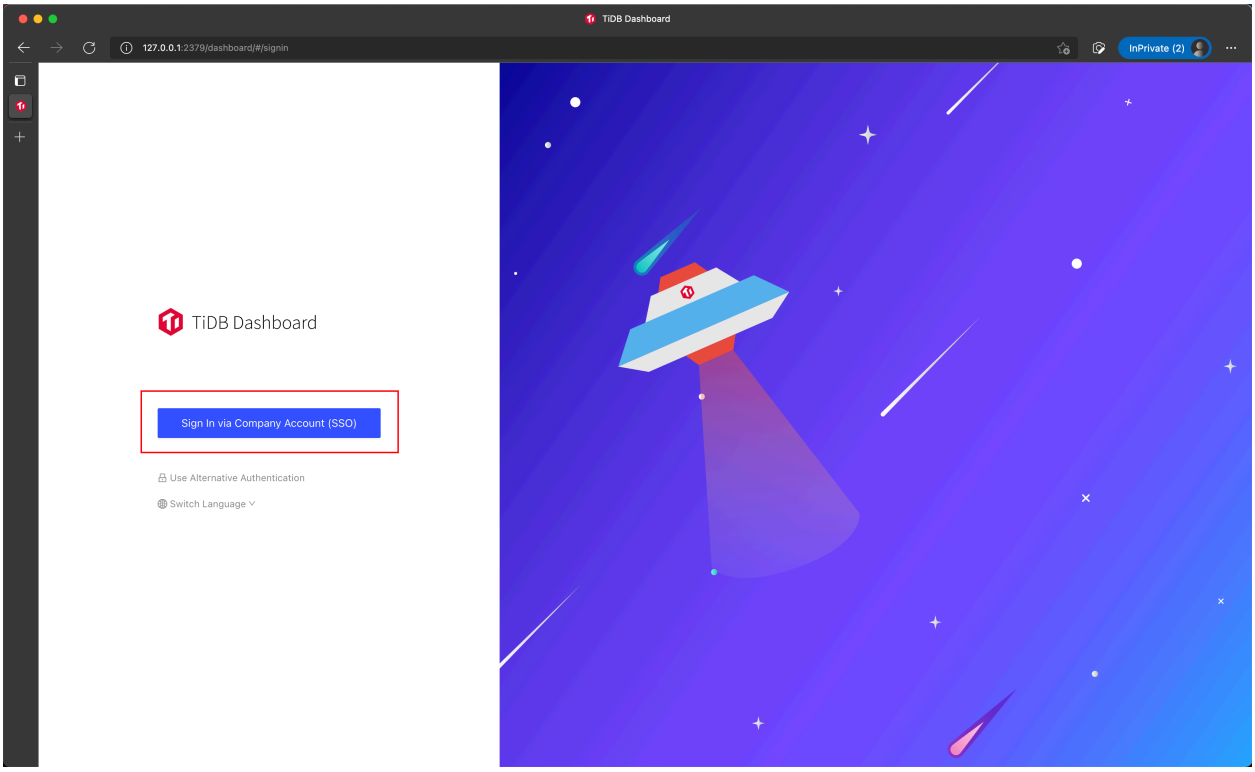

Figure 582: Sample Step

2. Sign into the system with SSO service configured.
3. You are redirected back to TiDB Dashboard to finish the sign-in.

Example 1: Use Okta for TiDB Dashboard SSO sign-in

Okta is an OIDC SSO identity service, which is compatible with the SSO feature of TiDB Dashboard. The steps below demonstrate how to configure Okta and TiDB Dashboard so that Okta can be used as the TiDB Dashboard SSO provider.

Step 1: Configure Okta

First, create an Okta Application Integration to integrate SSO.

1. Access the Okta administration site.
2. Navigate from the left sidebar **Applications** > **Applications**.
3. Click **Create App Integration**.

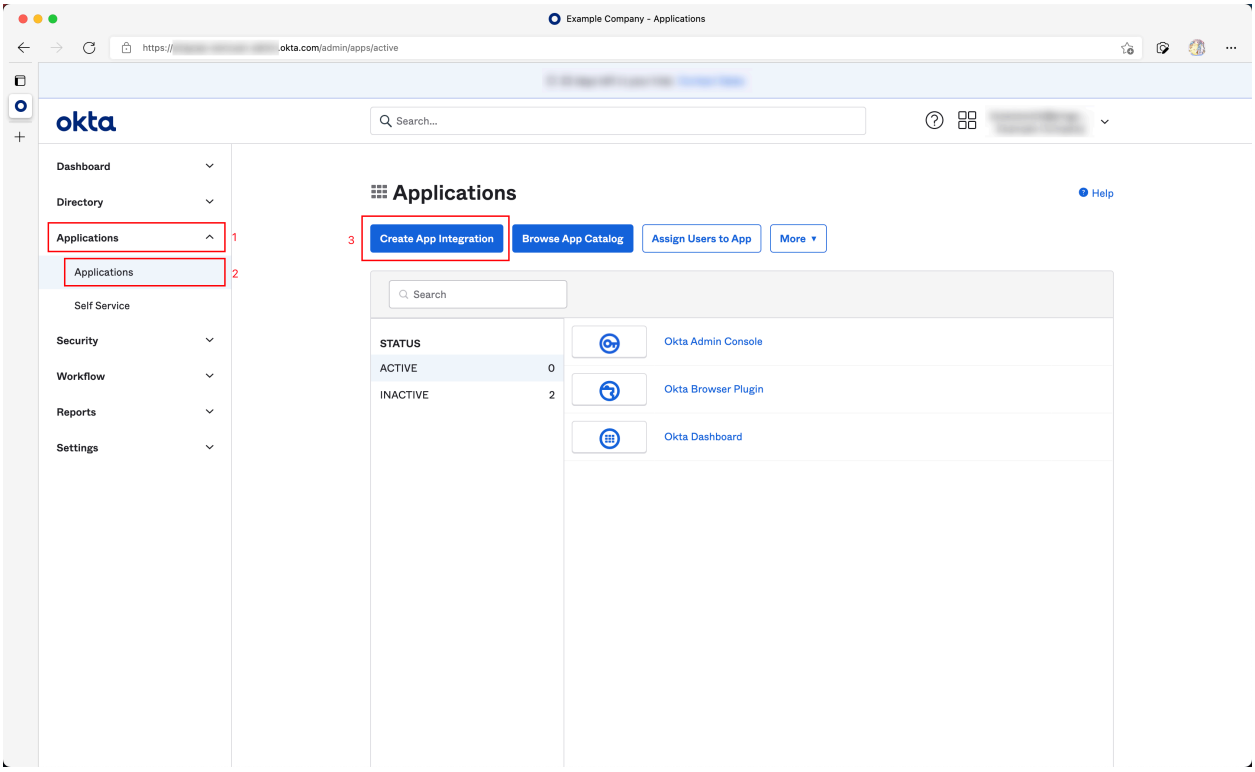

Figure 583: Sample Step

4. In the popped up dialog, choose **OIDC - OpenID Connect** in **Sign-in method**.
5. Choose **Single-Page Application** in **Application Type**.
6. Click the **Next** button.

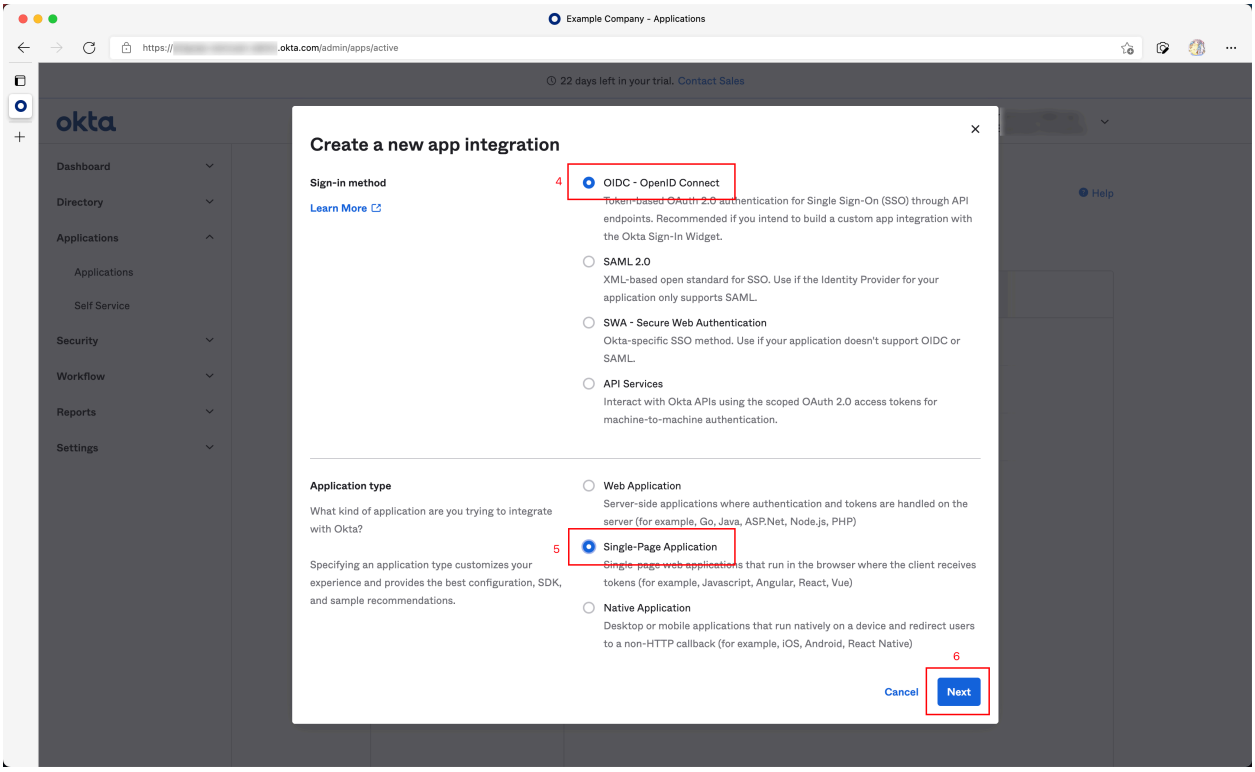

Figure 584: Sample Step

7. Fill **Sign-in redirect URIs** as follows:

```
http://DASHBOARD_IP:PORT/dashboard/?sso_callback=1
```

Substitute `DASHBOARD_IP:PORT` with the actual domain (or IP address) and port that you use to access the TiDB Dashboard in the browser.

8. Fill **Sign-out redirect URIs** as follows:

```
http://DASHBOARD_IP:PORT/dashboard/
```

Similarly, substitute `DASHBOARD_IP:PORT` with the actual domain (or IP address) and port.

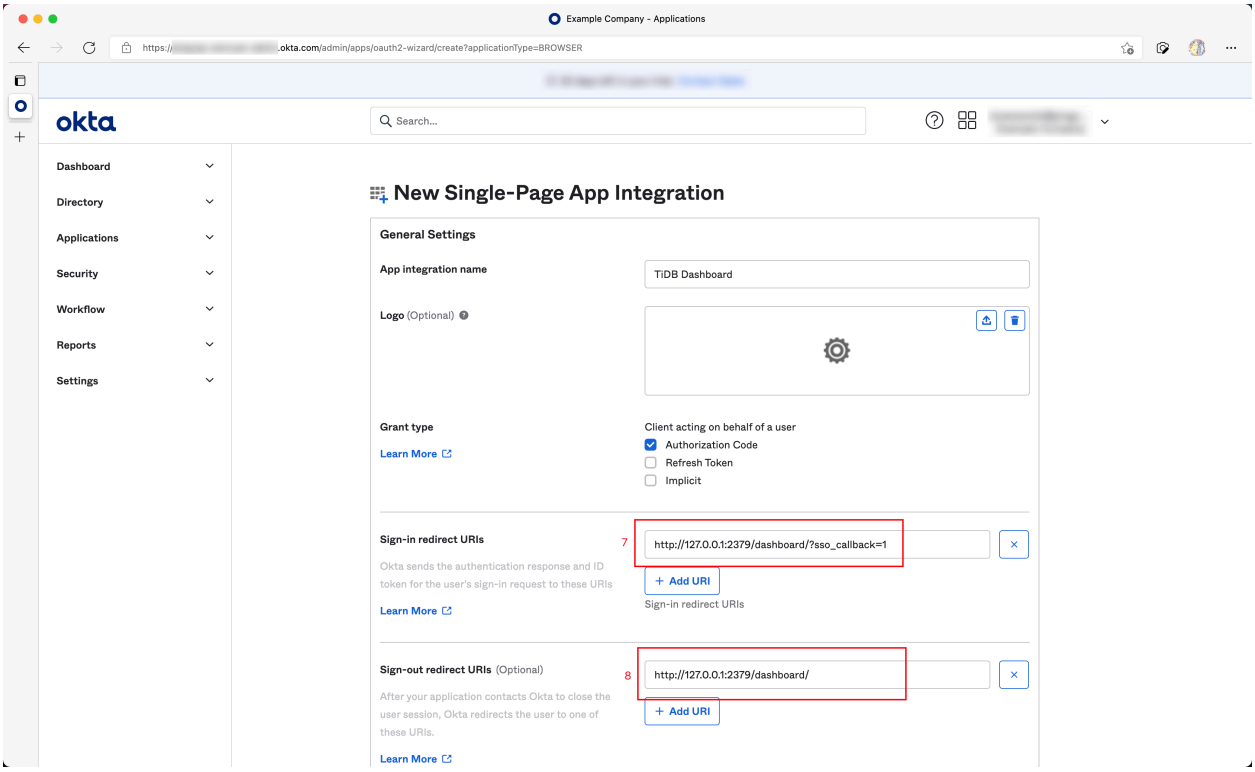

Figure 585: Sample Step

9. Configure what type of users in your organization is allowed for SSO sign-in in the **Assignments** field, and then click **Save** to save the configuration.

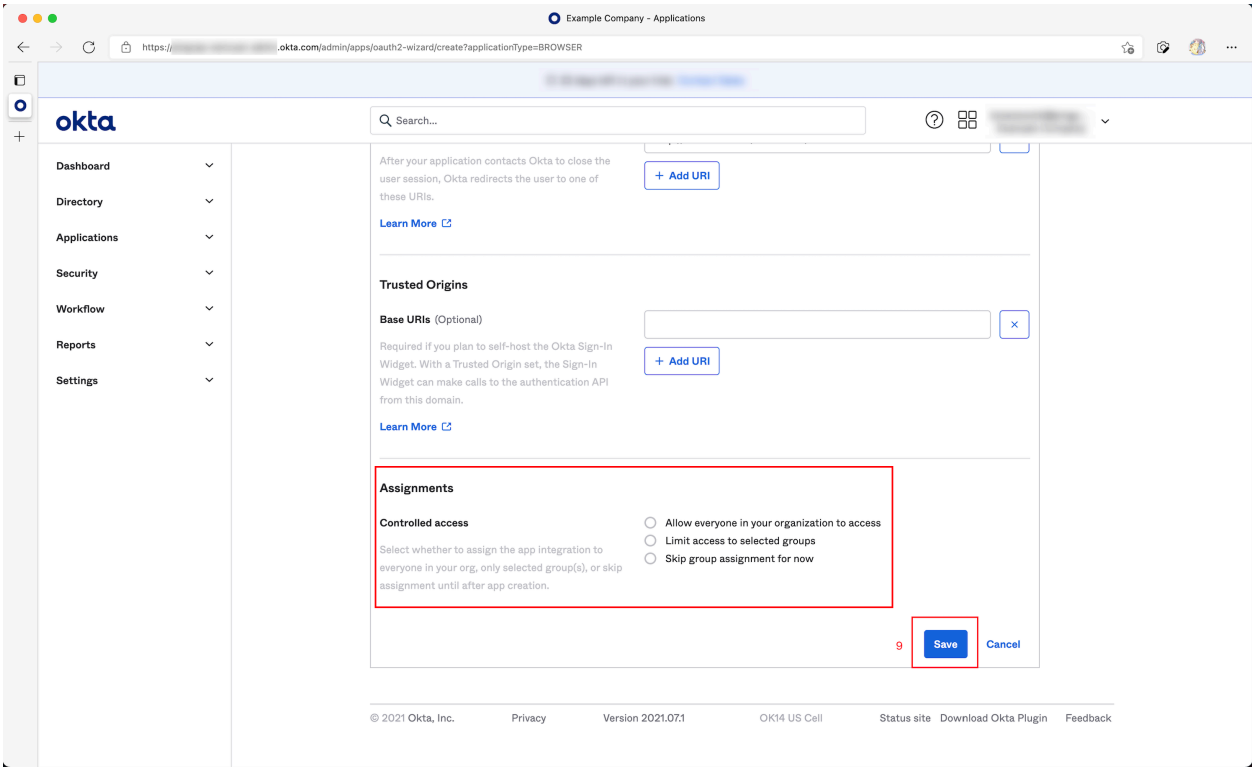

Figure 586: Sample Step

Step 2: Obtain OIDC information and fill in TiDB Dashboard

1. In the Application Integration just created in Okta, click **Sign On**.

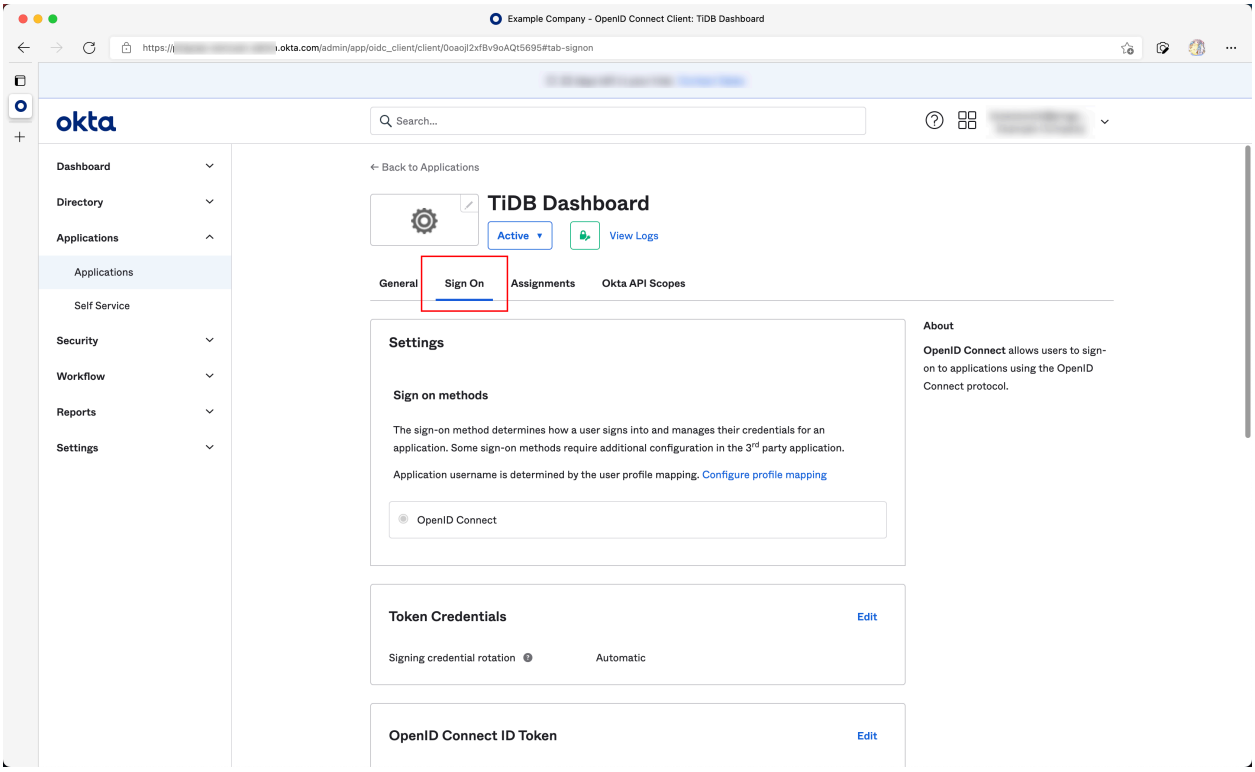

Figure 587: Sample Step 1

2. Copy values of the **Issuer** and **Audience** fields from the **OpenID Connect ID Token** section.

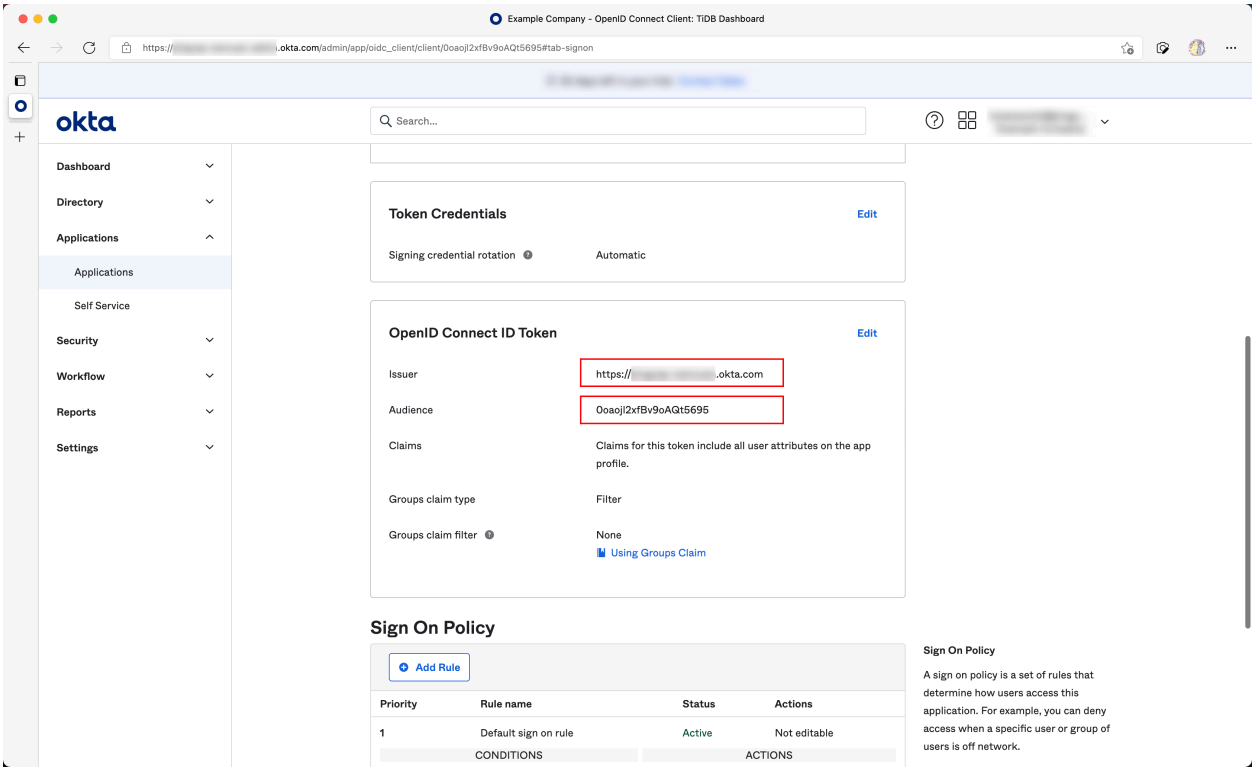

Figure 588: Sample Step 2

3. Open the TiDB Dashboard configuration page, fill **OIDC Client ID** with **Issuer** obtained from the last step and fill **OIDC Discovery URL** with **Audience**. Then finish the authorization and save the configuration. For example:

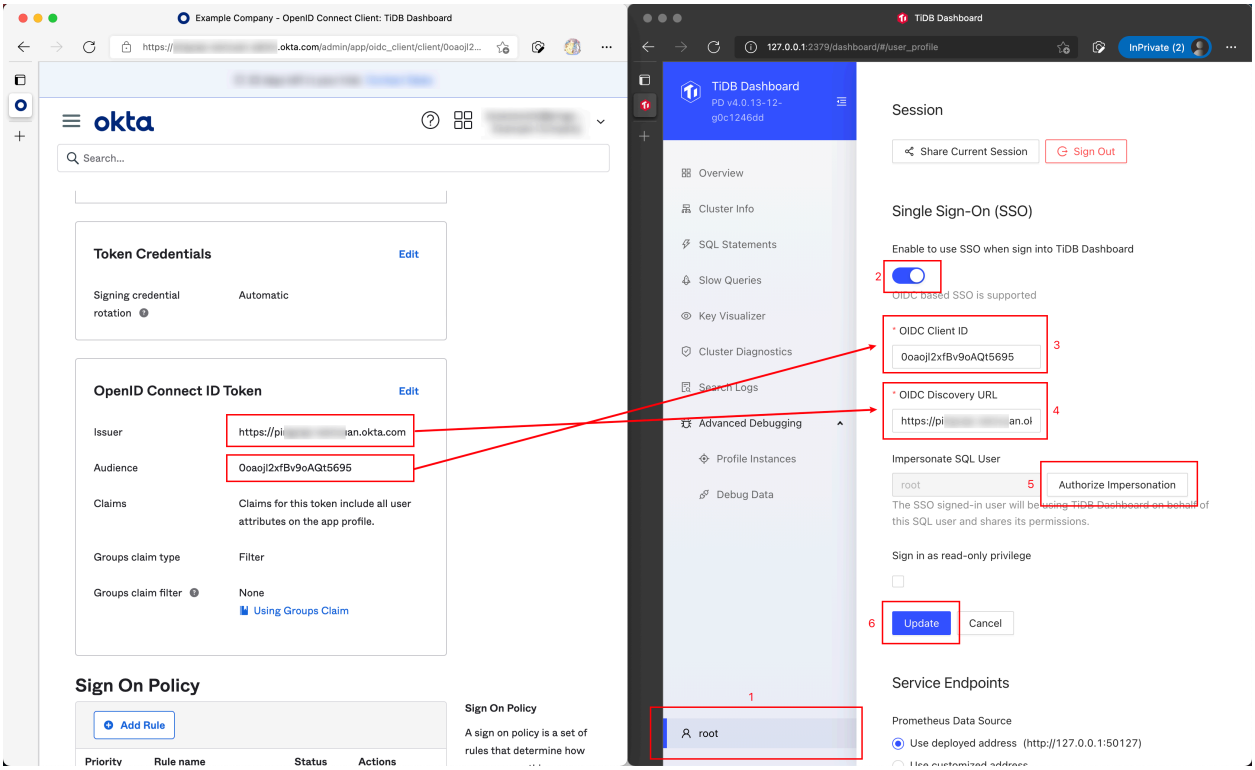

Figure 589: Sample Step 3

Now TiDB Dashboard has been configured to use Okta SSO for sign-in.

Example 2: Use Auth0 for TiDB Dashboard SSO sign-in

Similar to Okta, Auth0 also provides OIDC SSO identity service. The following steps describe how to configure Auth0 and TiDB Dashboard so that Auth0 can be used as the TiDB Dashboard SSO provider.

Step 1: Configure Auth0

1. Access the Auth0 administration site.
2. Navigate on the left sidebar **Applications** > **Applications**.
3. Click **Create App Integration**.

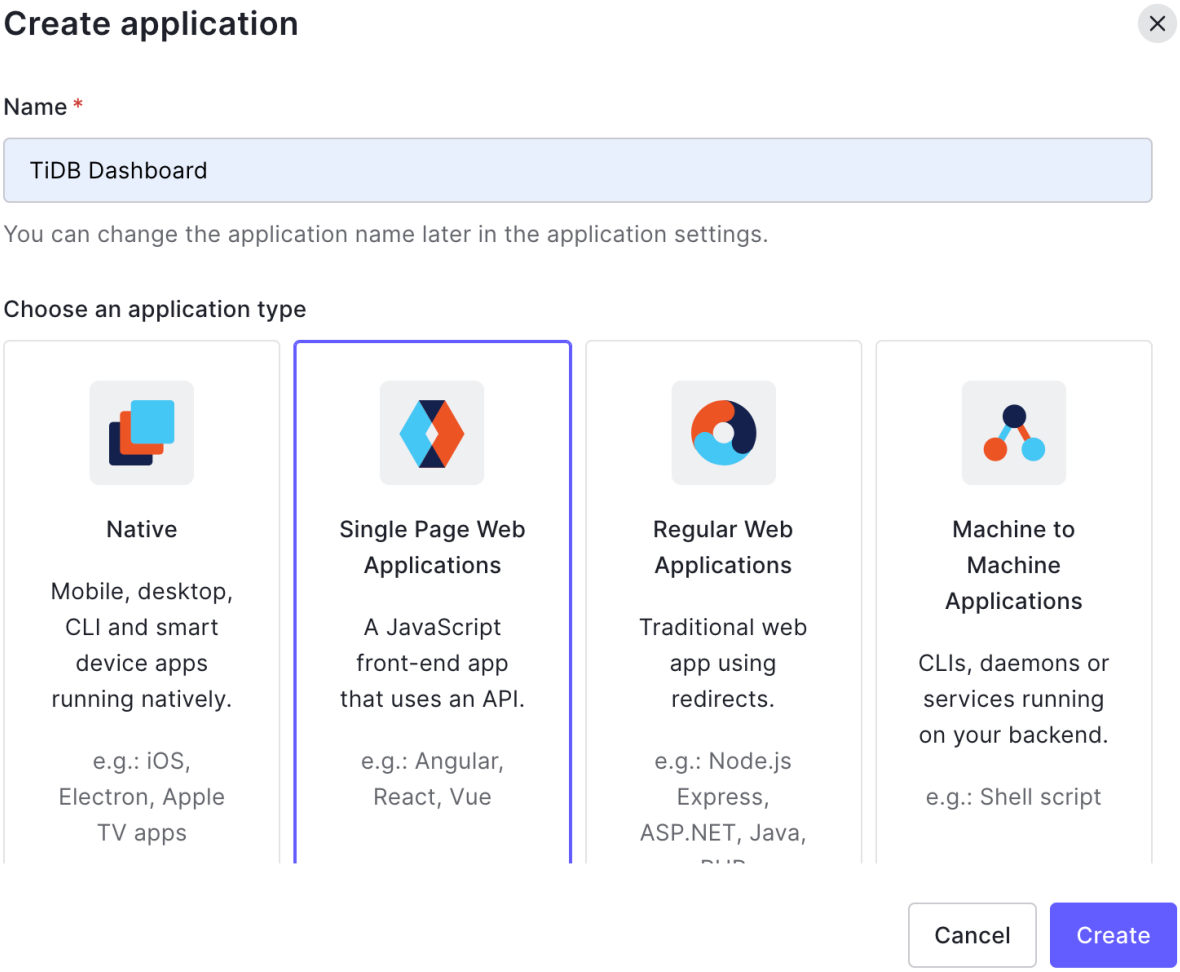

Figure 590: Create Application

In the popped-up dialog, fill **Name**, for example, "TiDB Dashboard". Choose **Single Page Web Applications** in **Choose an application type**. Click **Create**.

4. Click **Settings**.

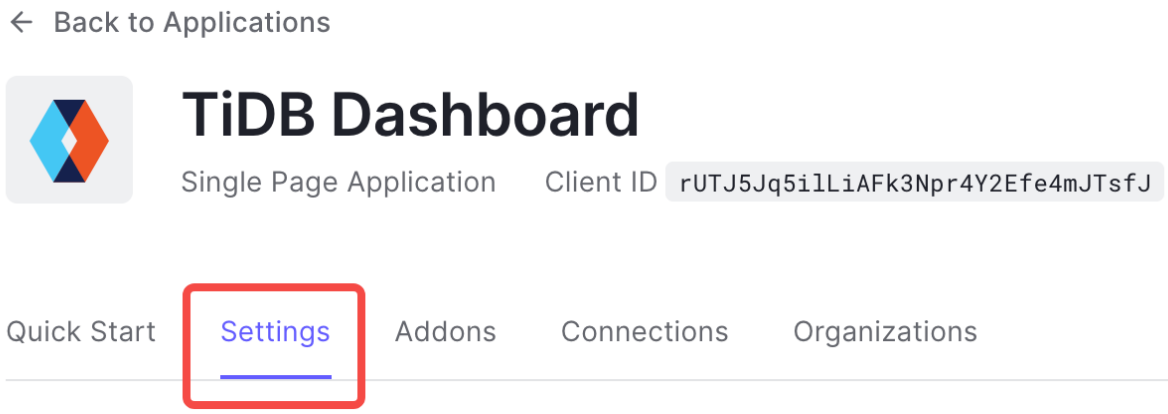

Figure 591: Settings

5. Fill **Allowed Callback URLs** as follows:

```
http://DASHBOARD_IP:PORT/dashboard/?sso_callback=1
```

   Replace `DASHBOARD_IP:PORT` with the actual domain (or IP address) and port that you use to access the TiDB Dashboard in your browser.

6. Fill **Allowed Logout URLs** as follows:

```
http://DASHBOARD_IP:PORT/dashboard/
```

   Similarly, replace `DASHBOARD_IP:PORT` with the actual domain (or IP address) and port.

Allowed Callback URLs

http://localhost:3001/dashboard/?sso_callback=1,
http://127.0.0.1:2379/dashboard/?sso_callback

After the user authenticates we will only call back to any of these URLs. You can specify multiple valid URLs by comma-separating them (typically to handle different environments like QA or testing). Make sure to specify the protocol (`https://`) otherwise the callback may fail in some cases. With the exception of custom URI schemes for native clients, all callbacks should use protocol `https://`. You can use Organization URL parameters in these URLs.

Allowed Logout URLs

http://localhost:3001/dashboard/,
http://127.0.0.1:2379/dashboard/

A set of URLs that are valid to redirect to after logout from Auth0. After a user logs out from Auth0 you can redirect them with the `returnTo` query parameter. The URL that you use in `returnTo` must be listed here. You can specify multiple valid URLs by comma-separating them. You can use the star symbol as a wildcard for subdomains (`*.google.com`). Query strings and hash information are not taken into account when validating these URLs. Read more about this at https://auth0.com/docs/login/logout

Figure 592: Settings

7. Keep the default values for other settings and click **Save Changes**.

Step 2: Obtain OIDC information and fill in TiDB Dashboard

1. Fill **OIDC Client ID** of TiDB Dashboard with **Client ID** in **Basic Information** under the **Settings** tab of Auth0.
2. Fill **OIDC Discovery URL** with the **Domain** field value prefixed with `https://` and suffixed with `/`, for example, `https://example.us.auth0.com/`. Complete

authorization and save the configuration.

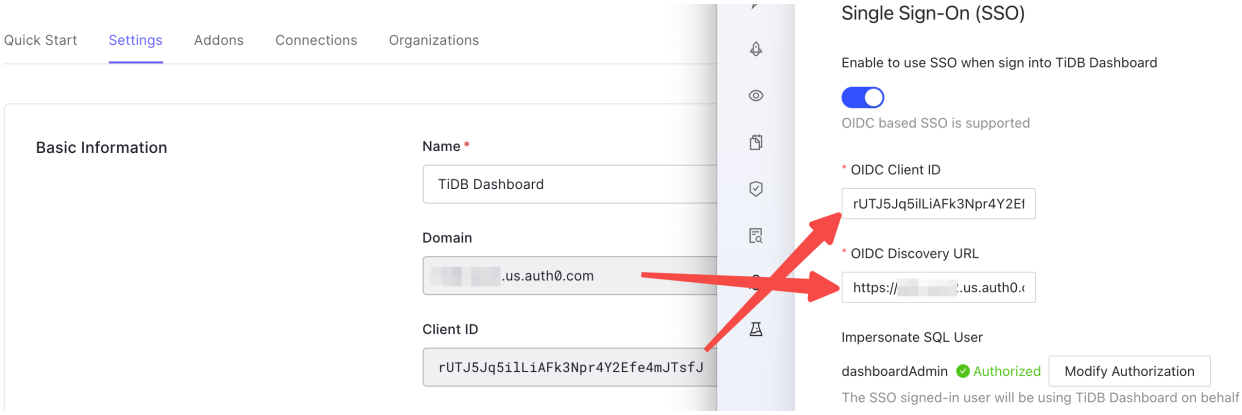

Figure 593: Settings

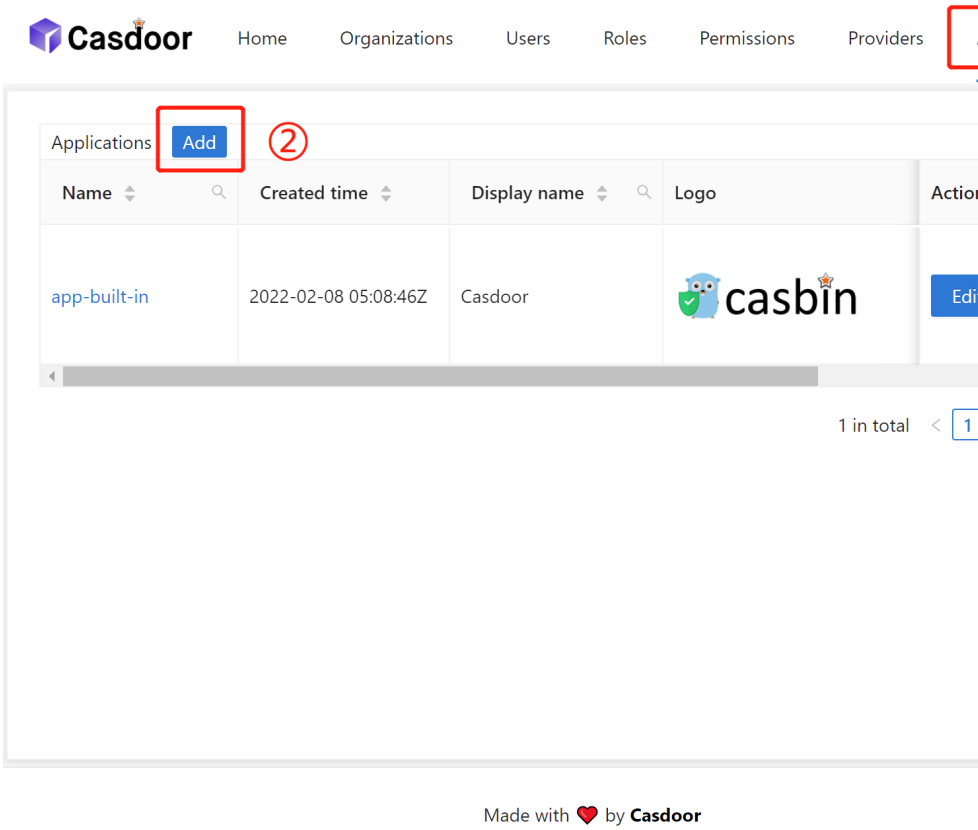

Now TiDB Dashboard has been configured to use Auth0 SSO for sign-in.

Example 3: Use Casdoor for TiDB Dashboard SSO sign-in

Casdoor is an open-source SSO platform that can be deployed in your own hosts. It is compatible with the SSO feature of TiDB Dashboard. The following steps describe how to configure Casdoor and TiDB Dashboard so that Casdoor can be used as the TiDB Dashboard SSO provider.

Step 1: Configure Casdoor

1. Deploy and access the Casdoor administration site.
2. Navigate from the top sidebar **Applications**.

3. Click **Applications - Add**.
4. Fill **Name** and **Display name**, for example, **TiDB Dashboard**.
5. Add **Redirect URLs** as follows:

```
http://DASHBOARD_IP:PORT/dashboard/?sso_callback=1
```

Replace `DASHBOARD_IP:PORT` with the actual domain (or IP address) and port that you use to access the TiDB Dashboard in your browser.

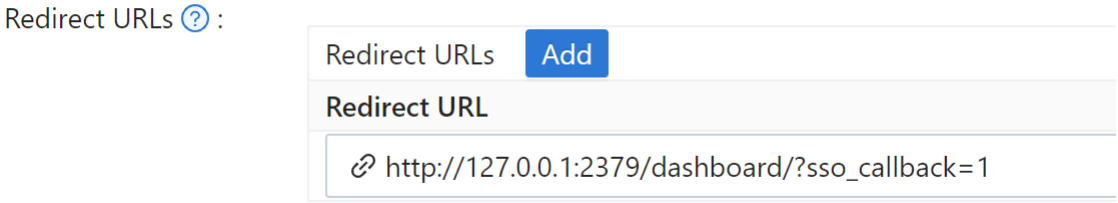

Figure 594: Settings

6. Keep the default values for other settings and click **Save & Exit**.
7. Save the **Client ID** seen on the page.

Step 2: Obtain OIDC information and fill in TiDB Dashboard

1. Fill **OIDC Client ID** of TiDB dashboard with **Client ID** saved in the previous step.
2. Fill **OIDC Discovery URL** with the **Domain** field value prefixed with `https://` ↪ and suffixed with `/`, for example, `https://casdoor.example.com/`. Complete authorization and save the configuration.

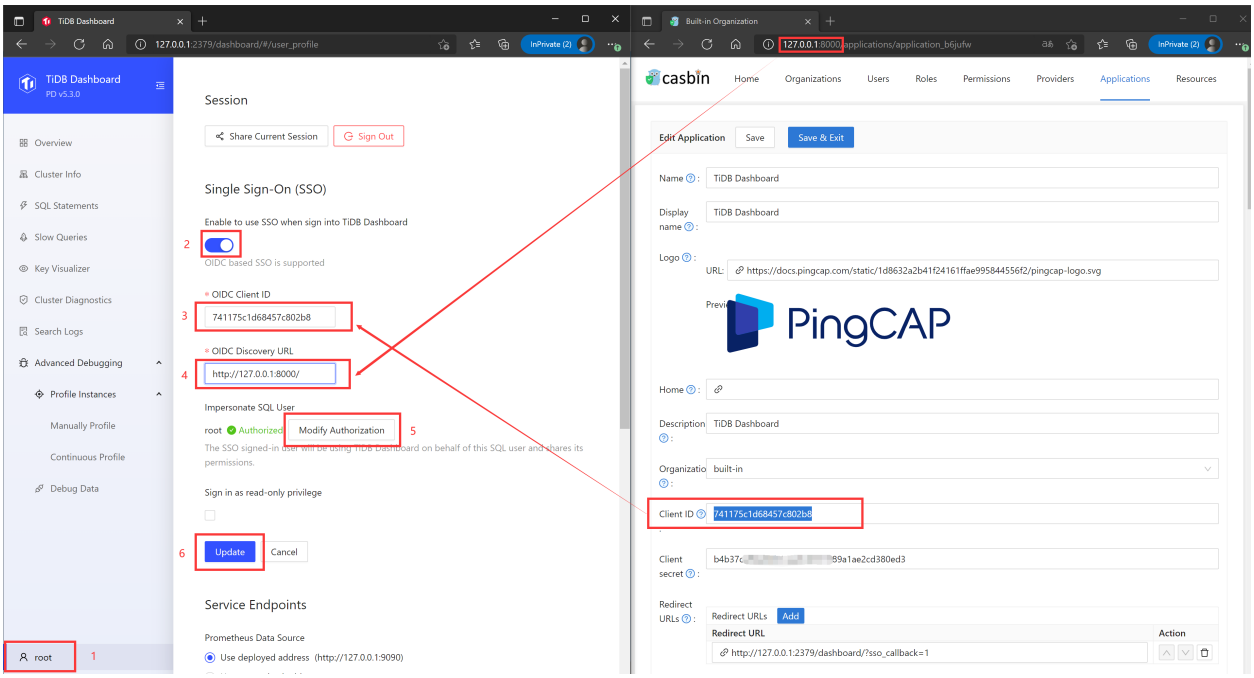

Figure 595: Settings

Now TiDB Dashboard has been configured to use Casdoor SSO for sign-in.

14.14.1.17 TiDB Dashboard FAQs

This document summarizes the frequently asked questions (FAQs) and answers about TiDB Dashboard. If a problem cannot be located or persists after you perform as instructed, get support from PingCAP or the community.

14.14.1.17.1 Access-related FAQ

When the firewall or reverse proxy is configured, I am redirected to an internal address other than TiDB Dashboard

When multiple Placement Driver (PD) instances are deployed in a cluster, only one of the PD instances actually runs the TiDB Dashboard service. If you access other PD instances instead of this one, your browser redirects you to another address. If the firewall

or reverse proxy is not properly configured for accessing TiDB Dashboard, when you visit the Dashboard, you might be redirected to an internal address that is protected by the firewall or reverse proxy.

- See TiDB Dashboard Multi-PD Instance Deployment to learn the working principle of TiDB Dashboard with multiple PD instances.
- See Use TiDB Dashboard through a Reverse Proxy to learn how to correctly configure a reverse proxy.
- See Secure TiDB Dashboard to learn how to correctly configure the firewall.

When TiDB Dashboard is deployed with dual network interface cards (NICs), TiDB Dashboard cannot be accessed using another NIC

For security reasons, TiDB Dashboard on PD only monitors the IP addresses specified during deployment (that is, it only listens on one NIC), not on `0.0.0.0`. Therefore, when multiple NICs are installed on the host, you cannot access TiDB Dashboard using another NIC.

If you have deployed TiDB using the `tiup cluster` or `tiup playground` command, currently this problem cannot be solved. It is recommended that you use a reverse proxy to safely expose TiDB Dashboard to another NIC. For details, see Use TiDB Dashboard behind a Reverse Proxy.

14.14.1.17.2 UI-related FAQ

A `prometheus_not_found` error is shown in **QPS** and **Latency** sections on the Overview page

The **QPS** and **Latency** sections on the **Overview** page require a cluster with Prometheus deployed. Otherwise, the error is shown. You can solve this problem by deploying a Prometheus instance in the cluster.

If you still encounter this problem when the Prometheus instance has been deployed, the possible reason is that your deployment tool is out of date (TiUP or TiDB Operator), and your tool does not automatically report metrics addresses, which makes TiDB Dashboard unable to query metrics. You can upgrade you deployment tool to the latest version and try again.

If your deployment tool is TiUP, take the following steps to solve this problem. For other deployment tools, refer to the corresponding documents of those tools.

1. Upgrade TiUP and TiUP Cluster:

```
tiup update --self
tiup update cluster --force
```

2. After the upgrade, when a new cluster is deployed with Prometheus instances, the metrics can be displayed normally.

3. After the upgrade, for an existing cluster, you can restart this cluster to report the metrics addresses. Replace `CLUSTER_NAME` with the actual cluster name:

```
tiup cluster start CLUSTER_NAME
```

Even if the cluster has been started, still execute this command. This command does not affect the normal application in the cluster, but refreshes and reports the metrics addresses, so that the monitoring metrics can be displayed normally in TiDB Dashboard.

An `invalid connection` error is shown on the **Slow Queries** page

The possible reason is that you have enabled the Prepared Plan Cache feature of TiDB. As an experimental feature, when enabled, Prepared Plan Cache might not function properly in specific TiDB versions, which could cause this problem in TiDB Dashboard (and other applications). You can disable Prepared Plan Cache by setting the system variable `tidb_enable_prepared_plan_cache = OFF`.

A `required component NgMonitoring is not started` error is shown

NgMonitoring is an advanced monitoring component built in TiDB clusters of v5.4.0 and later versions to support TiDB Dashboard features such as **Continuous Profiling** and **Top SQL**. NgMonitoring is automatically deployed when you deploy or upgrade a cluster with a newer version of TiUP. For clusters deployed using TiDB Operator, you can deploy NgMonitoring manually by referring to Enable Continuous Profiling.

If the web page shows `required component NgMonitoring is not started`, you can troubleshoot the deployment issue as follows:

Clusters Deployed using TiUP

Step 1. Check versions

1. Check the TiUP cluster version. NgMonitoring is deployed only when TiUP is v1.9.0 or later.

```
tiup cluster --version
```

The command output shows the TiUP version. For example:

```
tiup version 1.9.0 tiup
Go Version: go1.17.2
Git Ref: v1.9.0
```

2. If the TiUP cluster version is earlier than v1.9.0, upgrade TiUP and TiUP cluster to the latest version:

```
tiup update --all
```

Step 2. Add the ng_port configuration item on the control machine by using TiUP. Then reload Prometheus.

1. Open the cluster configuration file in editing mode:

```
tiup cluster edit-config ${cluster-name}
```

2. Under `monitoring_servers`, add the `ng_port:12020` parameter:

```
monitoring_servers:
- host: 172.16.6.6
  ng_port: 12020
```

3. Reload Prometheus:

```
tiup cluster reload ${cluster-name} --role prometheus
```

If the error message is still prompted after performing steps above, get support from PingCAP or the community.

Clusters Deployed using TiDB Operator

Deploy the NgMonitoring component by following instructions in the Enable Continuous Profiling section in TiDB Operator documentation.

Clusters Started using TiUP Playground

When starting the cluster, TiUP Playground (>= v1.8.0) automatically starts the NgMonitoring component. To update TiUP Playground to the latest version, run the following command:

```
tiup update --self
tiup update playground
```

An `unknown field` error is shown on the **Slow Queries** page

If the `unknown field` error appears on the **Slow Queries** page after the cluster upgrade, the error is related to a compatibility issue caused by the difference between TiDB Dashboard server fields (which might be updated) and user preferences fields (which are in the browser cache). This issue has been fixed. If your cluster is earlier than v5.0.3 or v4.0.14, perform the following steps to clear your browser cache:

1. Open TiDB Dashboard page.
2. Open Developer Tools. Different browsers have different ways of opening Developer Tools. After clicking the **Menu Bar**:
    - Firefox: **Menu** > **Web Developer** > **Toggle Tools**, or **Tools** > **Web Developer** > **Toggle Tools**.
    - Chrome: **More tools** > **Developer tools**.

- Safari: **Develop** > **Show Web Inspector**. If you can't see the **Develop** menu, go to **Safari** > **Preferences** > **Advanced**, and check the **Show Develop** menu in menu bar checkbox.

In the following example, Chrome is used.

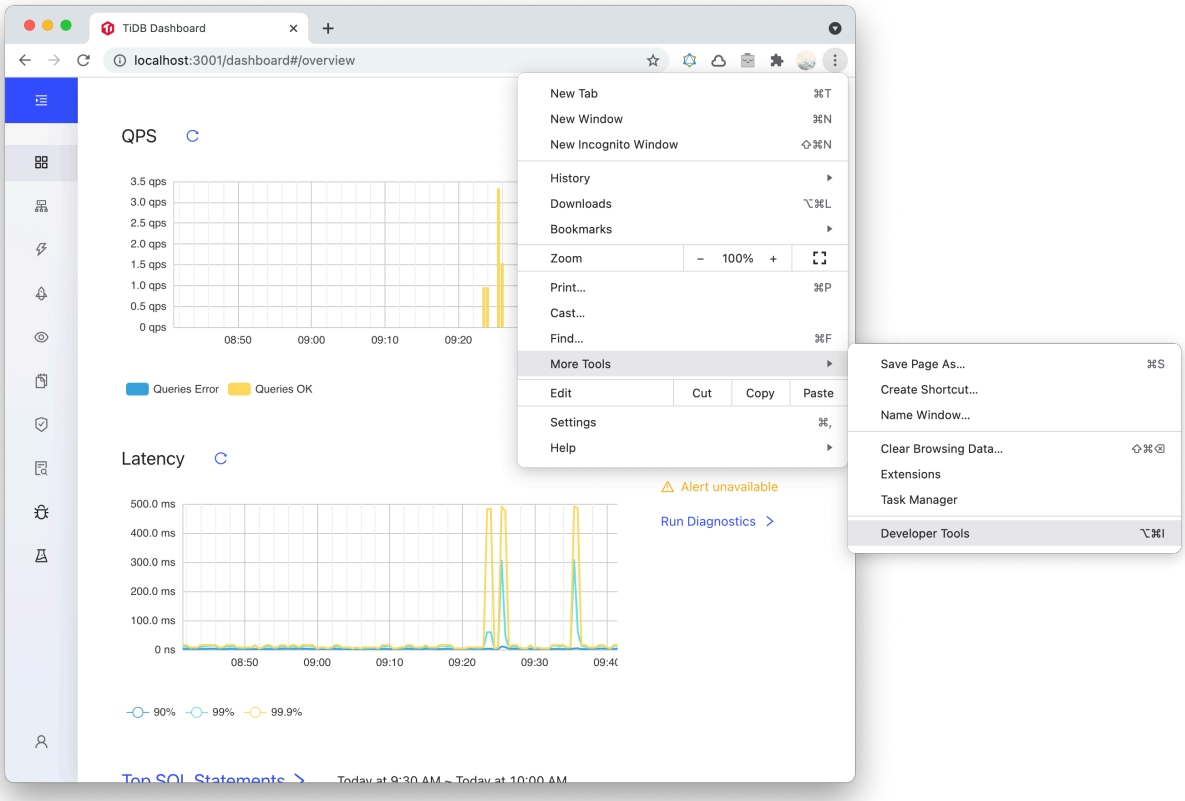

Figure 596: Opening DevTools from Chrome's main menu

3. Select the **Application** panel, expand the **Local Storage** menu and select the **TiDB Dashboard page domain**. Click the **Clear All** button.

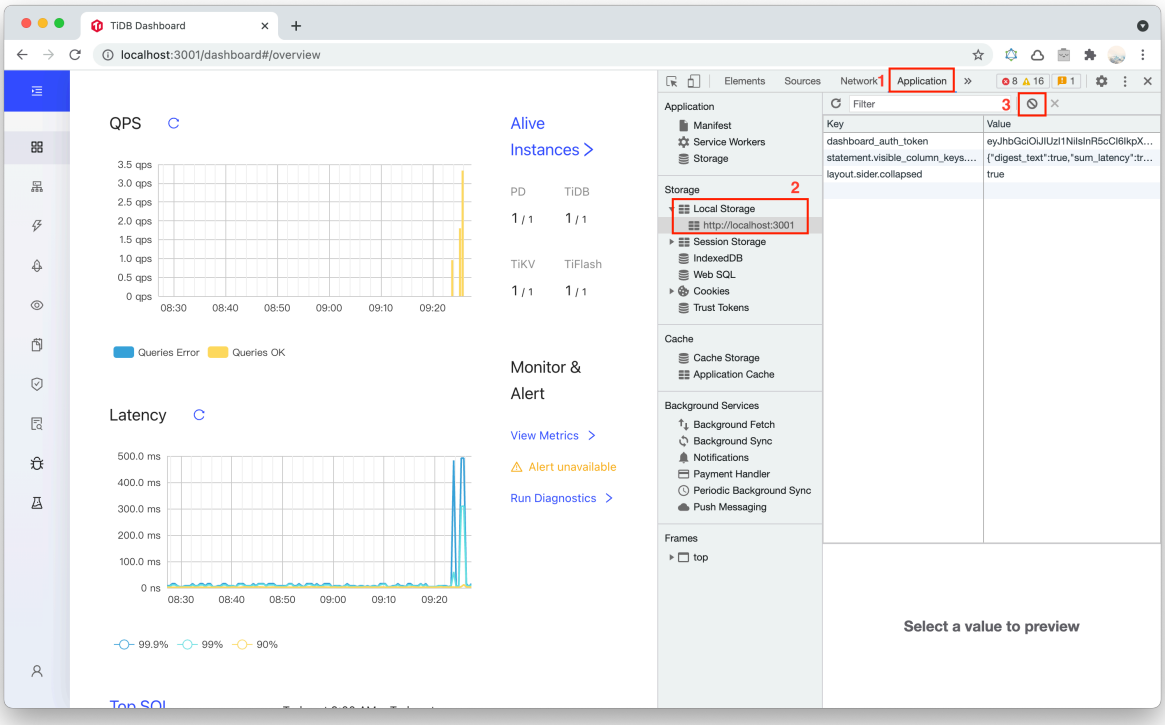

Figure 597: Clear the Local Storage

14.15 Telemetry

When the telemetry is enabled, TiDB, TiUP and TiDB Dashboard collect usage information and share the information with PingCAP to help understand how to improve the product. For example, this usage information helps prioritize new features.

Note:

- Starting from February 20, 2023, the telemetry feature is disabled by default in new versions of TiDB and TiDB Dashboard, including v6.6.0, and usage information is not collected and shared with PingCAP. Before upgrading to these versions, if the cluster uses the default telemetry configuration, the telemetry feature is disabled after the upgrade. See TiDB Release Timeline for the specific version.
- Starting from v1.11.3, the telemetry feature is disabled by default in newly deployed TiUP, and usage information is not collected. If you upgrade from a TiUP version earlier than v1.11.3 to v1.11.3 or a later

version, the telemetry feature keeps the same status as before the upgrade.

14.15.1 What is shared?

The following sections describe the shared usage information in detail for each component. The usage details that get shared might change over time. These changes (if any) will be announced in release notes.

Note:

In **ALL** cases, user data stored in the TiDB cluster will **NOT** be shared. You can also refer to PingCAP Privacy Policy.

14.15.1.1 TiDB

When the telemetry collection feature is enabled in TiDB, the TiDB cluster collects usage details on a 6-hour basis. These usage details include but are not limited to:

- A randomly generated telemetry ID.
- Deployment characteristics, such as the size of hardware (CPU, memory, disk), TiDB components versions, OS name.
- The status of query requests in the system, such as the number of query requests and the duration.
- Component usage, for example, whether the Async Commit feature is in use or not.
- Pseudonymized IP address of the TiDB telemetry data sender.

To view the full content of the usage information shared to PingCAP, execute the following SQL statement:

```
ADMIN SHOW TELEMETRY;
```

14.15.1.2 TiDB Dashboard

When the telemetry collection feature is enabled for TiDB Dashboard, usage details of the TiDB Dashboard web UI will be shared, including (but not limited to):

- A randomly generated telemetry ID.

- User operation information, such as the name of the TiDB Dashboard web page accessed by the user.
- Browser and OS information, such as browser name, OS name, and screen resolution.

To view the full content of the usage information shared to PingCAP, use the Network Activity Inspector of Chrome DevTools or the Network Monitor of Firefox Developer Tools.

14.15.1.3 TiUP

When the telemetry collection feature is enabled in TiUP, usage details of TiUP will be shared, including (but not limited to):

- A randomly generated telemetry ID.
- Execution status of TiUP commands, such as whether the execution is successful and the execution duration.
- Deployment characteristics, such as the size of hardware, TiDB components versions, and deployment configuration names that have been modified.

To view the full content of the usage information shared to PingCAP, set the `TIUP_CLUSTER_DEBUG=enable` environment variable when executing the TiUP command. For example:

```
TIUP_CLUSTER_DEBUG=enable tiup cluster list
```

14.15.1.4 TiSpark

> **Note:**
>
> Starting from v3.0.3, the telemetry collection is disabled by default in TiSpark, and usage information is not collected and shared with PingCAP.

When the telemetry collection feature is enabled for TiSpark, the Spark module will share the usage details of TiSpark, including (but not limited to):

- A randomly generated telemetry ID.
- Some configuration information of TiSpark, such as the read engine and whether streaming read is enabled.
- Cluster deployment information, such as the machine hardware information, OS information, and component version number of the node where TiSpark is located.

You can view TiSpark usage information that is collected in Spark logs. You can set the Spark log level to INFO or lower, for example:

```
cat {spark.log} | grep Telemetry report | tail -n 1
```

14.15.2 Disable telemetry

14.15.2.1 Disable TiDB telemetry at deployment

When the telemetry is enabled in existing TiDB clusters, you can configure `enable-telemetry = false` on each TiDB instance to disable the TiDB telemetry collection on that instance, which does not take effect until you restart the cluster.

Detailed steps to disable telemetry in different deployment tools are listed below.

Binary deployment

Create a configuration file `tidb_config.toml` with the following content:

```
enable-telemetry = false
```

Specify the `--config=tidb_config.toml` command-line parameter when starting TiDB for the configuration file above to take effect.

See TiDB Configuration Options and TiDB Configuration File for details.

Deployment using TiUP Playground

Create a configuration file `tidb_config.toml` with the following content:

```
enable-telemetry = false
```

When starting TiUP Playground, specify the `--db.config tidb_config.toml` command-line parameter for the configuration file above to take effect. For example:

```
tiup playground --db.config tidb_config.toml
```

See Quickly Deploy a Local TiDB Cluster for details.

Deployment using TiUP Cluster

Modify the deployment topology file `topology.yaml` to add the following content:

```
server_configs:
  tidb:
    enable-telemetry: false
```

Deployment on Kubernetes via TiDB Operator

Configure `spec.tidb.config.enable-telemetry: false` in `tidb-cluster.yaml` or TidbCluster Custom Resource.

See Deploy TiDB Operator on Kubernetes for details.

> **Note:**
>
> This configuration item requires TiDB Operator v1.1.3 or later to take effect.

14.15.2.2 Disable TiDB telemetry for deployed TiDB clusters

In existing TiDB clusters, you can also modify the system variable `tidb_enable_telemetry` to dynamically disable the TiDB telemetry collection:

```
SET GLOBAL tidb_enable_telemetry = 0;
```

> **Note:**
>
> When you disable telemetry, the configuration file has a higher priority over system variable. That is, after telemetry collection is disabled by the configuration file, the value of the system variable will be ignored.

14.15.2.3 Disable TiDB Dashboard telemetry

Configure `dashboard.enable-telemetry = false` to disable the TiDB Dashboard telemetry collection on all PD instances. You need to restart the running clusters for the configuration to take effect.

Detailed steps to disable telemetry for different deployment tools are listed below.

Binary deployment

Create a configuration file `pd_config.toml` with the following content:

```
[dashboard]
enable-telemetry = false
```

Specify the `--config=pd_config.toml` command-line parameter when starting PD to take effect.

See PD Configuration Flags and PD Configuration File for details.

Deployment using TiUP Playground

Create a configuration file `pd_config.toml` with the following content:

```
[dashboard]
enable-telemetry = false
```

When starting TiUP Playground, specify the `--pd.config pd_config.toml` command-line parameter to take effect, for example:

```
tiup playground --pd.config pd_config.toml
```

See Quickly Deploy a Local TiDB Cluster for details.

Deployment using TiUP Cluster

Modify the deployment topology file `topology.yaml` to add the following content:

```
server_configs:
  pd:
    dashboard.enable-telemetry: false
```

Deployment on Kubernetes via TiDB Operator

Configure `spec.pd.config.dashboard.enable-telemetry: false` in `tidb-cluster.yaml` or TidbCluster Custom Resource.

See Deploy TiDB Operator on Kubernetes for details.

> **Note:**
>
> This configuration item requires TiDB Operator v1.1.3 or later to take effect.

14.15.2.4 Disable TiUP telemetry

To disable the TiUP telemetry collection, execute the following command:

```
tiup telemetry disable
```

14.15.3 Check telemetry status

For TiDB telemetry, execute the following SQL statement to check the telemetry status:

```
ADMIN SHOW TELEMETRY;
```

If the `DATA_PREVIEW` column in the execution result is empty, TiDB telemetry is disabled. If not, TiDB telemetry is enabled. You can also check when the usage information was shared previously according to the `LAST_STATUS` column and whether the sharing was successful or not.

For TiUP telemetry, execute the following command to check the telemetry status:

```
tiup telemetry status
```

14.15.4 Compliance

To meet compliance requirements in different countries or regions, the usage information is sent to servers located in different countries according to the IP address of the sender machine:

- For IP addresses from the Chinese mainland, usage information is sent to and stored on cloud servers in the Chinese mainland.

- For IP addresses from outside of the Chinese mainland, usage information is sent to and stored on cloud servers in the US.

See PingCAP Privacy Policy for details.

14.16 Error Codes and Troubleshooting

This document describes the problems encountered during the use of TiDB and provides the solutions.

14.16.1 Error codes

TiDB is compatible with the error codes in MySQL, and in most cases returns the same error code as MySQL. For a list of error codes for MySQL, see MySQL 8.0 Error Message Reference. In addition, TiDB has the following unique error codes:

> **Note:**
>
> Some error codes stand for internal errors. Normally, TiDB handles the error rather than return it to the user, so some error codes are not listed here.
>
> If you encounter an error code that is not listed here, get support from PingCAP or the community.

- Error Number: 8001

  The memory used by the request exceeds the threshold limit for the TiDB memory usage.

  Increase the memory limit for a single SQL statement by configuring the system variable `tidb_mem_quota_query`.

- Error Number: 8002

  To guarantee consistency, a transaction with the `SELECT FOR UPDATE` statement cannot be retried when it encounters a commit conflict. TiDB rolls back the transaction and returns this error.

  The application can safely retry the whole transaction.

- Error Number: 8003

  If the data in a row is not consistent with the index when executing the `ADMIN CHECK TABLE` command, TiDB returns this error. This error is commonly seen when you check the data corruption in the table.

  You can get support from PingCAP or the community.

- Error Number: 8004

  A single transaction is too large.

  See the error message `transaction too large` for the cause and solution.

- Error Number: 8005

  The complete error message: `ERROR 8005 (HY000): Write Conflict, txnStartTS is stale`

  Transactions in TiDB encounter write conflicts. Check your application logic and retry the write operation.

- Error Number: 8018

  When you reload a plugin, if the plugin has not been loaded before, this error is returned.

  You can execute an initial load of the plugin.

- Error Number: 8019

  The version of the plugin that is being reloaded is different from the previous version. Therefore, the plugin cannot be reloaded, and this error is returned.

  You can reload the plugin by ensuring that the plugin version is the same as the previous one.

- Error Number: 8020

  When the table is locked, if you perform a write operation on the table, this error is returned.

  Unlock the table and retry the write operation.

- Error Number: 8021

  When the key to be read from TiKV does not exist, this error is returned. This error is used internally, and the external result is an empty read.

- Error Number: 8022

  The transaction commit fails and has been rolled back.

  The application can safely retry the whole transaction.

- Error Number: 8023

  If you set an empty value when writing the transaction cache, this error is returned. This error is used and dealt with internally, and is not returned to the application.

- Error Number: 8024

  Invalid transactions. If TiDB finds that no transaction ID (Start Timestamp) is obtained for the transaction that is being executed, which means this transaction is invalid, this error is returned.

Usually this error does not occur. If you encounter this error, get support from PingCAP or the community.

- Error Number: 8025

  The single Key-Value pair being written is too large. The largest single Key-Value pair supported in TiDB is 6 MB by default.

  If a pair exceeds this limit, you need to properly adjust the `txn-entry-size-limit` configuration value to relax the limit.

- Error Number: 8026

  The interface function being used has not been implemented. This error is only used internally, and is not returned to the application.

- Error Number: 8027

  The table schema version is outdated. TiDB applies schema changes online. When the table schema version of the TiDB server is earlier than that of the entire system, this error is returned if you execute a SQL statement.

  When this error occurs, check the network between the TiDB server and the PD Leader.

- Error Number: 8028

  Since v6.3.0, TiDB introduces the Metadata lock feature. When the metadata lock is disabled and a transaction is executed, the transaction cannot recognize the table schema changes. Therefore, when the transaction is committed, TiDB checks the table schema related to the transaction. If the related table schema has been changed during the execution, the transaction commit fails with this error. At this time, the application can safely retry the whole transaction.

  When the metadata lock is enabled not in the Read Committed isolation level, if a lossy column type change occurs on a table (for example, changing from `INT` to `CHAR` is lossy, and changing from `TINYINT` to `INT` is not lossy because overwriting data is not required) from a transaction start to access the table for the first time, then the query fails while the transaction will not roll back automatically. You can continue to execute other statements and decide whether to roll back or commit the transaction.

- Error Number: 8029

  This error occurs when numeric conversion within the database encounters an error. This error is only used internally and is converted to a specific type of error for external applications.

- Error Number: 8030

  After an unsigned positive integer is converted to a signed integer, it exceeds the maximum value and displays as a negative integer. This error mostly occurs in the alert message.

- Error Number: 8031

  When being converted to an unsigned integer, a negative integer is converted to a positive integer. This error mostly occurs in the alert message.

- Error Number: 8032

  Invalid `year` format is used. `year` only accepts 1, 2 or 4 digits.

- Error Number: 8033

  Invalid `year` value is used. The valid range of `year` is (1901, 2155).

- Error Number: 8037

  Invalid `mode` format is used in the `week` function. `mode` must be 1 digit within [0, 7].

- Error Number: 8038

  The field fails to obtain the default value. This error is usually used internally, and is converted to a specific type of error for external applications.

- Error Number: 8040

  Unsupported operations are performed. For example, you perform a table locking operation on a view or a sequence.

- Error Number: 8047

  The value of the system variable is not supported. This error usually occurs in the alarm information when the user sets a variable value that is not supported in the database.

- Error Number: 8048

  An unsupported database isolation level is set.

  If you cannot modify the codes because you are using a third-party tool or framework, consider using `tidb_skip_isolation_level_check` to bypass this check.

  ```
  set @@tidb_skip_isolation_level_check = 1;
  ```

- Error Number: 8050

  An unsupported privilege type is set.

  See Privileges required for TiDB operations for the solution.

- Error Number: 8051

  Unknown data type is encountered when TiDB parses the Exec argument list sent by the client.

  If you encounter this error, check the client. If the client is normal, get support from PingCAP or the community.

- Error Number: 8052

  The serial number of the data packet from the client is incorrect.

  If you encounter this error, check the client. If the client is normal, get support from PingCAP or the community.

- Error Number: 8055

  The current snapshot is too old. The data may have been garbage collected. You can increase the value of `tidb_gc_life_time` to avoid this problem. TiDB automatically reserves data for long-running transactions. Usually this error does not occur.

  See garbage collection overview and garbage collection configuration.

- Error Number: 8059

  The auto-random ID is exhausted and cannot be allocated. There is no way to recover from such errors currently. It is recommended to use bigint when using the auto random feature to obtain the maximum number of assignment. And try to avoid manually assigning values to the auto random column.

  See auto random for reference.

- Error Number: 8060

  Invalid auto-incrementing offset. Check the values of `auto_increment_increment` and `auto_increment_offset`.

- Error Number: 8061

  Unsupported SQL Hint.

  See Optimizer Hints to check and modify the SQL Hint.

- Error Number: 8062

  An invalid token is used in SQL Hint. It conflicts with reserved words in SQL Hint.

  See Optimizer Hints to check and modify the SQL Hint.

- Error Number: 8063

  The limited memory usage set in SQL Hint exceeds the upper limit of the system. The setting in SQL Hint is ignored.

  See Optimizer Hints to check and modify the SQL Hint.

- Error Number: 8064

  It fails to parse SQL Hint.

  See Optimizer Hints to check and modify the SQL Hint.

- Error Number: 8065

  An invalid integer is used in SQL Hint.

  See Optimizer Hints to check and modify the SQL Hint.

- Error Number: 8066

  The second parameter in the `JSON_OBJECTAGG` function is invalid.

- Error Number: 8101

  The format of plugin ID is incorrect.

  The correct format is `[name]-[version]`, and no `-` is allowed in `name` and `version`.

- Error Number: 8102

  Unable to read the plugin definition information.

  Check the configuration related to the plugin.

- Error Number: 8103

  The plugin name is incorrect.

  Check the configuration of the plugin.

- Error Number: 8104

  The plugin version does not match.

  Check the configuration of the plugin.

- Error Number: 8105

  The plugin is repeatedly loaded.

- Error Number: 8106

  The plugin defines a system variable whose name does not begin with the plugin name.

  Contact the developer of the plugin to modify, or get support from PingCAP or the community.

- Error Number: 8107

  The loaded plugin does not specify a version, or the specified version is too low.

  Check the configuration of the plugin.

- Error Number: 8108

  Unsupported execution plan type. This error is an internal error.

  If you encounter this error, get support from PingCAP or the community.

- Error Number: 8109

  The specified index cannot be found when the index is analyzed.

- Error Number: 8110

  The Cartesian product operation cannot be executed.

  Set `cross-join` in the configuration to `true`.

- Error Number: 8111

  When executing the `EXECUTE` statement, the corresponding `Prepare` statement cannot be found.

- Error Number: 8112

  The number of parameters in the `EXECUTE` statement is not consistent with the `Prepare` statement.

- Error Number: 8113

  The table schema related in the `EXECUTE` statement has changed after the `Prepare` statement is executed.

- Error Number: 8115

  It is not supported to prepare multiple lines of statements.

- Error Number: 8116

  It is not supported to prepare DDL statements.

- Error Number: 8120

  The `start tso` of transactions cannot be obtained.

  Check the state/monitor/log of the PD server and the network between the TiDB server and the PD server.

- Error Number: 8121

  Privilege check fails.

  Check the privilege configuration of the database.

- Error Number: 8122

  No corresponding table name is found, given the specified wild cards.

- Error Number: 8123

  An SQL query with aggregate functions returns non-aggregated columns, which violates the `only_full_group_by` mode.

  Modify the SQL statement or disable the `only_full_group_by` mode.

- Error Number: 8129

  TiDB does not yet support JSON objects with the key length >= 65536.

- Error Number: 8130

  The complete error message: `ERROR 8130 (HY000): client has multi-statement capability disabled`

This error might occur after you upgrade from an earlier version of TiDB. To reduce the impact of SQL injection attacks, TiDB now prevents multiple queries from being executed in the same `COM_QUERY` call by default.

The system variable `tidb_multi_statement_mode` can be used to control this behavior.

- Error Number: 8138

  The transaction attempts to write an incorrect row value. For more information, see Troubleshoot Inconsistency Between Data and Indexes.

- Error Number: 8139

  The transaction attempts to write a row whose handle is inconsistent with that in the index. For more information, see Troubleshoot Inconsistency Between Data and Indexes.

- Error Number: 8140

The transaction attempts to write a row whose data is inconsistent with the index data. For more information, see Troubleshoot Inconsistency Between Data and Indexes.

- Error Number: 8141

  When a transaction is being committed, the existence assertion of a key fails. For more information,see Troubleshoot Inconsistency Between Data and Indexes.

- Error Number: 8143

  During the execution of a non-transactional DML statement, if a batch fails, the statement is stopped. For more information, see Non-transactional DML statements.

- Error Number: 8147

  When `tidb_constraint_check_in_place_pessimistic` is set to `OFF`, to ensure the correctness of transactions, any errors in the SQL statement execution might cause TiDB to return this `8147` error and abort the current transaction. For specific causes of the error, refer to the error message. For more information, see Constraints.

- Error Number: 8154

  Currently `LOAD DATA` does not support importing data locally from TiDB server. You can specify `LOCAL` to import from client, or upload data to S3 or GCS and then import it. See `LOAD DATA`.

- Error Number: 8156

  The provided path cannot be empty. You need to set a correct path before the import.

- Error Number: 8157

  The provided file format is unsupported. For the supported formats, see `IMPORT INTO`.

- Error Number: 8158

  The provided path is invalid. Refer to the specific error message for actions. For Amazon S3 or GCS path settings, see URI Formats of External Storage Services.

- Error Number: 8159

  TiDB cannot access the provided Amazon S3 or GCS path. Make sure that the specified S3 or GCS bucket exists and that you have provided the correct Access Key and Secret Access Key for TiDB to access the corresponding bucket.

- Error Number: 8160

  Failed to read the data files. Refer to the specific error message for actions.

- Error Number: 8162

  There is an error in the statement. Refer to the specific error message for actions.

- Error Number: 8163

  The provided option is unknown. For supported options, see `IMPORT INTO`.

- Error Number: 8164

  The provided option value is invalid. For valid values, see `IMPORT INTO`.

- Error Number: 8165

  Duplicate options are specified. Each option can only be specified once.

- Error Number: 8166

  Certain options can only be used in specific conditions. Refer to the specific error message for actions. For supported options, see `IMPORT INTO`.

- Error Number: 8170

  The specified job does not exist.

- Error Number: 8171

  The current operation cannot be performed for the current job status. Refer to the specific error message for actions.

- Error Number: 8173

  When executing `IMPORT INTO`, TiDB checks the current environment, such as checking if the downstream table is empty. Refer to the specific error message for actions.

- Error Number: 8200

  The DDL syntax is not yet supported.

  See compatibility of MySQL DDL for reference.

- Error Number: 8214

  The DDL operation is terminated by the `admin cancel` operation.

- Error Number: 8215

  `ADMIN REPAIR TABLE` fails.

  If you encounter this error, get support from PingCAP or the community.

- Error Number: 8216

  The usage of the `AUTO_RANDOM` columns is incorrect.

  See `AUTO_RANDOM` to modify.

- Error Number: 8223

  This error occurs when detecting that the data is not consistent with the index.

  If you encounter this error, get support from PingCAP or the community.

- Error Number: 8224

  The DDL job cannot be found.

  Check whether the job id specified by the `restore` operation exists.

- Error Number: 8225

  The DDL operation is completed and cannot be canceled.

- Error Number: 8226

  The DDL operation is almost completed and cannot be canceled.

- Error Number: 8227

  Unsupported options are used when creating Sequence.

  See Sequence documentation to find the list of the supported options.

- Error Number: 8228

  Unsupported types are specified when using `SETVAL` on Sequence.

  See Sequence documentation to find the example of the function.

- Error Number: 8229

  The transaction exceeds the survival time.

  Commit or roll back the current transaction, and start a new transaction.

- Error Number: 8230

  TiDB currently does not support using Sequence as the default value on newly added columns, and reports this error if you use it.

- Error Number: 8248

  The resource group already exists. This error is returned when a resource group is repeatedly created.

- Error Number: 8249

  The resource group does not exist. This error is returned when you modify or bind a resource group that does not exist. See Create a resource group.

- Error Number: 8250

  The complete error message is as follows:

  ```
  ERROR 8250 (HY000): Resource control feature is disabled. Run "SET
  ↪ GLOBAL tidb_enable_resource_control='on'" to enable the feature
  ```

  This error is returned when you try to use the resource control feature but it is not enabled. You can turn on the global variable `tidb_enable_resource_control` to enable resource control.

- Error Number: 8251

  The `Resource Control` component is initialized upon TiDB startup. The associated configuration is fetched from the `Resource Manager` on the server side of `Resource
  ↪ Control`. This error is returned if there is an error during this process.

- Error Number: 8252

  The complete error message is as follows:

  ```
  ERROR 8252 (HY000): Exceeded resource group quota limitation
  ```

  This error is returned when the attempted consumption exceeds the resource group limit. This error is usually caused by a single transaction that is too large or too many concurrent transactions. You need to adjust the transaction size or reduce the number of concurrent clients.

- Error Number: 8253

  The query stops because it meets the condition of a runaway query. See Runaway Queries.

- Error Number: 8254

  The query stops because it meets the quarantined watch condition of a runaway query. See Runaway Queries.

- Error Number: 8260

  DDL operations cannot be paused by `ADMIN PAUSE`.

- Error Number: 8261

  DDL operations cannot be resumed by `ADMIN RESUME`.

- Error Number: 8262

  DDL is paused by `ADMIN PAUSE` and cannot be paused again.

- Error Number: 8263

  This DDL cannot be executed under a specific BDR role. Make sure that the cluster is in bidirectional replication. If the cluster is not in bidirectional replication, you can use `ADMIN UNSET BDR ROLE;` to make DDL normal.

- Error Number: 9001

  The complete error message: `ERROR 9001 (HY000): PD server timeout`

  The PD request timed out.

  Check the status, monitoring data and log of the PD server, and the network between the TiDB server and the PD server.

- Error Number: 9002

  The complete error message: `ERROR 9002 (HY000): TiKV server timeout`

  The TiKV request timed out.

  Check the status, monitoring data and log of the TiKV server, and the network between the TiDB server and the TiKV server.

- Error Number: 9003

  The complete error message: `ERROR 9003 (HY000): TiKV Server is Busy`

  The TiKV server is busy and this usually occurs when the workload is too high.

  Check the status, monitoring data, and log of the TiKV server.

- Error Number: 9004

  The complete error message: `ERROR 9004 (HY000): Resolve Lock Timeout`

  A lock resolving timeout. This error occurs when a large number of transactional conflicts exist in the database.

  Check the application code to see whether lock contention exists in the database.

- Error Number: 9005

  The complete error message: `ERROR 9005 (HY000): Region is unavailable`

  The accessed Region or a certain Raft Group is not available, with possible reasons such as insufficient replicas. This error usually occurs when the TiKV server is busy or the TiKV node is down.

  Check the status, monitoring data and log of the TiKV server.

- Error Number: 9006

  The complete error message: `ERROR 9006 (HY000): GC life time is shorter than transaction duration`

The interval of `GC Life Time` is too short. The data that should have been read by long transactions might be deleted. You can adjust `tidb_gc_life_time` using the following command:

```
SET GLOBAL tidb_gc_life_time = '30m';
```

> **Note:**
> "30m" means only cleaning up the data generated 30 minutes ago, which might consume some extra storage space.

- Error Number: 9500

  A single transaction is too large.

  See the error message `transaction too large` for the solution.

- Error Number: 9007

  The error message starts with `ERROR 9007 (HY000): Write conflict`.

  If the error message contains `reason=LazyUniquenessCheck`, it means that the transaction is pessimistic, `@@tidb_constraint_check_in_place_pessimistic=OFF` is set, and a write conflict occurs on a unique index for the application. In this case, successful execution of the pessimistic transaction is not guaranteed. You can retry the transaction from the application, or set the variable to `ON` to avoid the error.

- Error Number: 9008

  Too many requests are sent to TiKV at the same time. The number exceeds limit.

  Increase `tidb_store_limit` or set it to `0` to remove the limit on the traffic of requests.

- Error Number: 9010

  TiKV cannot process this raft log.

  Check the state/monitor/log of the TiKV server.

- Error Number: 9012

  The TiFlash request timed out.

  Check the state/monitor/log of the TiFlash server and the network between the TiDB server and TiFlash server.

- Error Number: 9013

  The TiFlash server is busy and this usually occurs when the workload is too high.

  Check the state/monitor/log of the TiFlash server.

14.16.1.1 MySQL native error messages

- Error Number: 2013 (HY000)

  The complete error message: `ERROR 2013 (HY000): Lost connection to MySQL server during query`

  You can handle this error as follows:

  - Check whether panic is in the log.
  - Check whether OOM exists in dmesg using `dmesg -T | grep -i oom`.
  - A long time of no access might also lead to this error. It is usually caused by TCP timeout. If TCP is not used for a long time, the operating system kills it.

- Error Number: 1105 (HY000)

  The complete error message: `ERROR 1105 (HY000): other error: unknown error Wire Error(InvalidEnumValue(4004))`

  This error usually occurs when the version of TiDB does not match with that of TiKV. To avoid version mismatch, upgrade all components when you upgrade the version.

- Error Number: 1148 (42000)

  The complete error message: `ERROR 1148 (42000): the used command is not allowed with this TiDB version`

  When you execute the `LOAD DATA LOCAL` statement but the MySQL client does not allow executing this statement (the value of the `local_infile` option is 0), this error occurs.

  The solution is to use the `--local-infile=1` option when you start the MySQL client. For example, run the command `mysql --local-infile=1 -u root -h 127.0.0.1 -P 4000`. The default value of `local-infile` varies in different versions of the MySQL client. Therefore, you need to configure it in specific MySQL clients.

- Error Number: 9001 (HY000)

  The complete error message: `ERROR 9001 (HY000): PD server timeout start timestamp may fall behind safe point`

  This error occurs when TiDB fails to access PD. A worker in the TiDB background continuously queries the safepoint from PD and reports this error if it fails to query within 100s. Generally, it is because the disk on PD is slow and busy or the network failed between TiDB and PD. For the details of common errors, see Error Number and Fault Diagnosis.

- TiDB log error message: EOF error

  When the client or proxy disconnects from TiDB, TiDB does not immediately notice the disconnection. Instead, TiDB notices the disconnection only when it begins to return data to the connection. At this time, the log prints an EOF error.

14.16.2 Troubleshooting

See the troubleshooting and FAQ documents.

14.17 Table Filter

The TiDB migration tools operate on all the databases by default, but oftentimes only a subset is needed. For example, you only want to work with the schemas in the form of `foo*` and `bar*` and nothing else.

Since TiDB 4.0, all TiDB migration tools share a common filter syntax to define subsets. This document describes how to use the table filter feature.

14.17.1 Usage

14.17.1.1 CLI

Table filters can be applied to the tools using multiple `-f` or `--filter` command line parameters. Each filter is in the form of `db.table`, where each part can be a wildcard (further explained in the next section). The following lists the example usage.

- BR:

```
./br backup full -f 'foo*.*' -f 'bar*.*' -s 'local:///tmp/backup'
```

```
./br restore full -f 'foo*.*' -f 'bar*.*' -s 'local:///tmp/backup'
```

- Dumpling:

```
./dumpling -f 'foo*.*' -f 'bar*.*' -P 3306 -o /tmp/data/
```

- TiDB Lightning:

```
./tidb-lightning -f 'foo*.*' -f 'bar*.*' -d /tmp/data/ --backend tidb
```

14.17.1.2 TOML configuration files

Table filters in TOML files are specified as array of strings. The following lists the example usage.

- TiDB Lightning:

```
[mydumper]
filter = ['foo*.*', 'bar*.*']
```

- TiCDC:

```
[filter]
rules = ['foo*.*', 'bar*.*']

[[sink.dispatchers]]
matcher = ['db1.*', 'db2.*', 'db3.*']
dispatcher = 'ts'
```

14.17.2 Syntax

14.17.2.1 Plain table names

Each table filter rule consists of a "schema pattern" and a "table pattern", separated by a dot (`.`). Tables whose fully-qualified name matches the rules are accepted.

```
db1.tbl1
db2.tbl2
db3.tbl3
```

A plain name must only consist of valid identifier characters, such as:

- digits (`0` to `9`)
- letters (`a` to `z`, `A` to `Z`)
- `$`
- `_`
- non ASCII characters (U+0080 to U+10FFFF)

All other ASCII characters are reserved. Some punctuations have special meanings, as described in the next section.

14.17.2.2 Wildcards

Each part of the name can be a wildcard symbol described in fnmatch(3):

- `*` — matches zero or more characters
- `?` — matches one character
- `[a-z]` — matches one character between "a" and "z" inclusively
- `[!a-z]` — matches one character except "a" to "z".

```
db[0-9].tbl[0-9a-f][0-9a-f]
data.*
*.backup_*
```

"Character" here means a Unicode code point, such as:

- U+00E9 (é) is 1 character.
- U+0065 U+0301 (é) are 2 characters.
- U+1F926 U+1F3FF U+200D U+2640 U+FE0F (🤦🏿‍♀️) are 5 characters.

14.17.2.3 File import

To import a file as the filter rule, include an `@` at the beginning of the rule to specify the file name. The table filter parser treats each line of the imported file as additional filter rules.

For example, if a file `config/filter.txt` has the following content:

```
employees.*
*.WorkOrder
```

the following two invocations are equivalent:

```
./dumpling -f '@config/filter.txt'
./dumpling -f 'employees.*' -f '*.WorkOrder'
```

A filter file cannot further import another file.

14.17.2.4 Comments and blank lines

Inside a filter file, leading and trailing white-spaces of every line are trimmed. Furthermore, blank lines (empty strings) are ignored.

A leading `#` marks a comment and is ignored. `#` not at start of line is considered syntax error.

```
## this line is a comment
db.table  # but this part is not comment and may cause error
```

14.17.2.5 Exclusion

An `!` at the beginning of the rule means the pattern after it is used to exclude tables from being processed. This effectively turns the filter into a block list.

```
*.*
#^ note: must add the *.* to include all tables first
!*.Password
!employees.salaries
```

14.17.2.6 Escape character

To turn a special character into an identifier character, precede it with a backslash `\`.

```
db\.with\.dots.*
```

For simplicity and future compatibility, the following sequences are prohibited:

- `\` at the end of the line after trimming whitespaces (use `[ ]` to match a literal whitespace at the end).
- `\` followed by any ASCII alphanumeric character (`[0-9a-zA-Z]`). In particular, C-like escape sequences like `\0`, `\r`, `\n` and `\t` currently are meaningless.

14.17.2.7 Quoted identifier

Besides `\`, special characters can also be suppressed by quoting using `"` or `` ` ``.

```
"db.with.dots"."tbl\1"
`db.with.dots`.`tbl\2`
```

The quotation mark can be included within an identifier by doubling itself.

```
"foo""bar".`foo``bar`
## equivalent to:
foo\"bar.foo\`bar
```

Quoted identifiers cannot span multiple lines.

It is invalid to partially quote an identifier:

```
"this is "invalid*.*
```

14.17.2.8 Regular expression

In case very complex rules are needed, each pattern can be written as a regular expression delimited with `/`:

```
/^db\d{2,}$/./^tbl\d{2,}$/
```

These regular expressions use the Go dialect. The pattern is matched if the identifier contains a substring matching the regular expression. For instance, `/b/` matches `db01`.

> **Note:**
>
> Every `/` in the regular expression must be escaped as `\/`, including inside `[⋯]`. You cannot place an unescaped `/` between `\Q⋯\E`.

14.17.3 Multiple rules

When a table name matches none of the rules in the filter list, the default behavior is to ignore such unmatched tables.

To build a block list, an explicit `*.*` must be used as the first rule, otherwise all tables will be excluded.

```
## every table will be filtered out
./dumpling -f '!*.Password'

## only the "Password" table is filtered out, the rest are included.
./dumpling -f '*.*' -f '!*.Password'
```

In a filter list, if a table name matches multiple patterns, the last match decides the outcome. For instance:

```
## rule 1
employees.*
## rule 2
!*.dep*
## rule 3
*.departments
```

The filtered outcome is as follows:

Table name	Rule 1	Rule 2	Rule 3	Outcome
irrelevant.table				Default (reject)
employees.employees				Rule 1 (accept)
employees.dept_emp				Rule 2 (reject)
employees.departments				Rule 3 (accept)
else.departments				Rule 3 (accept)

Note:

In TiDB tools, the system schemas are always excluded in the default configuration. The system schemas are:

- `INFORMATION_SCHEMA`
- `PERFORMANCE_SCHEMA`
- `METRICS_SCHEMA`
- `INSPECTION_SCHEMA`
- `mysql`
- `sys`

14.18 Schedule Replicas by Topology Labels

> **Note:**
>
> TiDB v5.3.0 introduces Placement Rules in SQL. This offers a more convenient way to configure the placement of tables and partitions. Placement Rules in SQL might replace placement configuration with PD in future releases.

To improve the high availability and disaster recovery capability of TiDB clusters, it is recommended that TiKV nodes are physically scattered as much as possible. For example, TiKV nodes can be distributed on different racks or even in different data centers. According to the topology information of TiKV, the PD scheduler automatically performs scheduling at the background to isolate each replica of a Region as much as possible, which maximizes the capability of disaster recovery.

To make this mechanism effective, you need to properly configure TiKV and PD so that the topology information of the cluster, especially the TiKV location information, is reported to PD during deployment. Before you begin, see Deploy TiDB Using TiUP first.

14.18.1 Configure `labels` for TiKV, TiFlash, and TiDB

You can configure `labels` for TiKV, TiFlash, and TiDB based on the cluster topology.

14.18.1.1 Configure a cluster using TiUP (recommended)

When using TiUP to deploy a cluster, you can configure the TiKV location in the initialization configuration file. TiUP will generate the corresponding configuration files for TiDB, TiKV, PD, and TiFlash during deployment.

In the following example, a two-layer topology of `zone/host` is defined. The TiDB nodes, TiKV nodes, and TiFlash nodes of the cluster are distributed among three zones, z1, z2, and z3.

- In each zone, there are two hosts that have TiDB instances deployed, and each host has a separate TiDB instance deployed.
- In each zone, there are two hosts that have TiKV instances deployed. In z1, each host has two TiKV instances deployed. In z2 and z3, each host has a separate TiKV instance deployed.
- In each zone, there are two hosts that have TiFlash instances deployed, and each host has a separate TiFlash instance deployed.

In the following example, `tidb-host-machine-n` represents the IP address of the `n`th TiDB node, `tikv-host-machine-n` represents the IP address of the `n`th TiKV node, and `tiflash-host-machine-n` represents the IP address of the `n`th TiFlash node.

```
server_configs:
  pd:
    replication.location-labels: ["zone", "host"]
tidb_servers:

        zone: z3
        host: tiflash-host-machine-6
```

For details, see Geo-distributed Deployment topology.

Note:

If you have not configured `replication.location-labels` in the configuration file, when you deploy a cluster using this topology file, an error might

occur. It is recommended that you confirm `replication.location-labels` is configured in the configuration file before deploying a cluster.

14.18.1.2 Configure a cluster using command lines or configuration files

14.18.1.2.1 Configure `labels` for TiKV and TiFlash

You can use the command-line flag or set the TiKV or TiFlash configuration file to bind some attributes in the form of key-value pairs. These attributes are called `labels`. After TiKV and TiFlash are started, they report their `labels` to PD so users can identify the location of TiKV and TiFlash nodes.

Assume that the topology has four layers: zone > data center (dc) > rack > host, and you can use these labels (zone, dc, rack, host) to set location of the TiKV and TiFlash. To set labels for TiKV and TiFlash, you can use one of the following methods:

- Use the command-line flag to start a TiKV instance:

```
tikv-server --labels zone=<zone>,dc=<dc>,rack=<rack>,host=<host>
```

- Configure in the TiKV configuration file:

```
[server]
[server.labels]
zone = "<zone>"
dc = "<dc>"
rack = "<rack>"
host = "<host>"
```

To set labels for TiFlash, you can use the `tiflash-learner.toml` file, which is the configuration file of tiflash-proxy:

```
[server]
[server.labels]
zone = "<zone>"
dc = "<dc>"
rack = "<rack>"
host = "<host>"
```

14.18.1.2.2 (Optional) Configure `labels` for TiDB

When Follower read is enabled, if you want TiDB to prefer to read data from the same region, you need to configure `labels` for TiDB nodes.

You can set `labels` for TiDB using the configuration file:

```
[labels]
zone = "<zone>"
dc = "<dc>"
rack = "<rack>"
host = "<host>"
```

Note:

Currently, TiDB depends on the `zone` label to match and select replicas that are in the same region. To use this feature, you need to include `zone` when configuring `location-labels` for PD, and configure `zone` when configuring `labels` for TiDB, TiKV, and TiFlash. For more details, see Configure `labels` for TiKV and TiFlash.

14.18.2 Configure `location-labels` for PD

According to the description above, the label can be any key-value pair used to describe TiKV attributes. But PD cannot identify the location-related labels and the layer relationship of these labels. Therefore, you need to make the following configuration for PD to understand the TiKV node topology.

Defined as an array of strings, `location-labels` is the configuration for PD. Each item of this configuration corresponds to the key of TiKV `labels`. Besides, the sequence of each key represents the layer relationship of different labels (the isolation levels decrease from left to right).

You can customize the value of `location-labels`, such as `zone`, `rack`, or `host`, because the configuration does not have default values. Also, this configuration has **no** restriction in the number of label levels (not mandatory for 3 levels) as long as they match with TiKV server labels.

Note:

- To make configurations take effect, you must configure `location-labels` for PD and `labels` for TiKV at the same time. Otherwise, PD does not perform scheduling according to the topology.

- If you use Placement Rules in SQL, you only need to configure `labels` for TiKV. Currently, Placement Rules in SQL is incompatible with the `location-labels` configuration of PD and ignores this configuration. It is not recommended to use `location-labels` and Placement Rules in SQL at the same time; otherwise, unexpected results might occur.

To configure `location-labels`, choose one of the following methods according to your cluster situation:

- If the PD cluster is not initialized, configure `location-labels` in the PD configuration file:

```
[replication]
location-labels = ["zone", "rack", "host"]
```

- If the PD cluster is already initialized, use the pd-ctl tool to make online changes:

```
pd-ctl config set location-labels zone,rack,host
```

14.18.3 Configure `isolation-level` for PD

If `location-labels` has been configured, you can further enhance the topological isolation requirements on TiKV clusters by configuring `isolation-level` in the PD configuration file.

Assume that you have made a three-layer cluster topology by configuring `location-labels` according to the instructions above: zone -> rack -> host, you can configure the `isolation-level` to `zone` as follows:

```
[replication]
isolation-level = "zone"
```

If the PD cluster is already initialized, you need to use the pd-ctl tool to make online changes:

```
pd-ctl config set isolation-level zone
```

The `location-level` configuration is an array of strings, which needs to correspond to a key of `location-labels`. This parameter limits the minimum and mandatory isolation level requirements on TiKV topology clusters.

Note:

`isolation-level` is empty by default, which means there is no mandatory restriction on the isolation level. To set it, you need to configure `location-labels` for PD and ensure that the value of `isolation-level` is one of `location-labels` names.

14.18.4 PD schedules based on topology label

PD schedules replicas according to the label layer to make sure that different replicas of the same data are scattered as much as possible.

Take the topology in the previous section as an example.

Assume that the number of cluster replicas is 3 (`max-replicas=3`). Because there are 3 zones in total, PD ensures that the 3 replicas of each Region are respectively placed in z1, z2, and z3. In this way, the TiDB cluster is still available when one zone fails.

Then, assume that the number of cluster replicas is 5 (`max-replicas=5`). Because there are only 3 zones in total, PD cannot guarantee the isolation of each replica at the zone level. In this situation, the PD scheduler will ensure replica isolation at the host level. In other words, multiple replicas of a Region might be distributed in the same zone but not on the same host.

In the case of the 5-replica configuration, if z3 fails or is isolated as a whole, and cannot be recovered after a period of time (controlled by `max-store-down-time`), PD will make up the 5 replicas through scheduling. At this time, only 4 hosts are available. This means that host-level isolation cannot be guaranteed and that multiple replicas might be scheduled to the same host. But if the `isolation-level` value is set to `zone` instead of being left empty, this specifies the minimum physical isolation requirements for Region replicas. That is to say, PD will ensure that replicas of the same Region are scattered among different zones. PD will not perform corresponding scheduling even if following this isolation restriction does not meet the requirement of `max-replicas` for multiple replicas.

If the `isolation-level` setting is set to `zone`, this specifies the minimum isolation requirement for Region replicas at the physical level. In this case, PD will always guarantee that replicas of the same Region are distributed across different zones. Even if following this isolation restriction would not meet the multi-replica requirements of `max-replicas`, PD will not schedule accordingly. Taking a TiKV cluster distributed across three data zones (z1, z2, and z3) as an example, if each Region requires three replicas, PD distributes the three replicas of the same Region to these three data zones respectively. If a power outage occurs in z1 and cannot be recovered after a period of time (30 minutes by default, controlled by `max-store-down-time`), PD determines that the Region replicas in z1 are no longer available. However, because `isolation-level` is set to `zone`, PD needs to strictly guarantee that different replicas of the same Region will not be scheduled to the same data zone. Because both z2 and z3 already have replicas, PD will not perform any scheduling

under the minimum isolation level restriction of `isolation-level`, even if there are only two replicas at this moment.

Similarly, when `isolation-level` is set to `rack`, the minimum isolation level applies to different racks in the same data center. With this configuration, the isolation at the zone layer is guaranteed first if possible. When the isolation at the zone level cannot be guaranteed, PD tries to avoid scheduling different replicas to the same rack in the same zone. The scheduling works similarly when `isolation-level` is set to `host` where PD first guarantees the isolation level of rack, and then the level of host.

In summary, PD maximizes the disaster recovery of the cluster according to the current topology. Therefore, if you want to achieve a certain level of disaster recovery, deploy more machines on different sites according to the topology than the number of `max-replicas`. TiDB also provides mandatory configuration items such as `isolation-level` for you to more flexibly control the topological isolation level of data according to different scenarios.

14.19 URI Formats of External Storage Services

This document describes the URI formats of external storage services, including Amazon S3, GCS, and Azure Blob Storage.

The basic format of the URI is as follows:

```
[scheme]://[host]/[path]?[parameters]
```

14.20 Amazon S3 URI format

- `scheme`: `s3`
- `host`: `bucket name`
- `parameters`:
    - `access-key`: Specifies the access key.
    - `secret-access-key`: Specifies the secret access key.
    - `session-token`: Specifies the temporary session token. BR does not support this parameter yet.
    - `use-accelerate-endpoint`: Specifies whether to use the accelerate endpoint on Amazon S3 (defaults to `false`).
    - `endpoint`: Specifies the URL of custom endpoint for S3-compatible services (for example, `<https://s3.example.com/>`).
    - `force-path-style`: Use path style access rather than virtual hosted style access (defaults to `true`).
    - `storage-class`: Specifies the storage class of the uploaded objects (for example, `STANDARD` or `STANDARD_IA`).
    - `sse`: Specifies the server-side encryption algorithm used to encrypt the uploaded objects (value options: ‘`,AES256, oraws:kms`‘).

- `sse-kms-key-id`: Specifies the KMS ID if `sse` is set to `aws:kms`.
- `acl`: Specifies the canned ACL of the uploaded objects (for example, `private` or `authenticated-read`).
- `role-arn`: When you need to access Amazon S3 data from a third party using a specified IAM role, you can specify the corresponding Amazon Resource Name (ARN) of the IAM role with the `role-arn` URL query parameter, such as `arn:aws :iam::888888888888:role/my-role`. For more information about using an IAM role to access Amazon S3 data from a third party, see AWS documentation.
- `external-id`: When you access Amazon S3 data from a third party, you might need to specify a correct external ID to assume the IAM role. In this case, you can use this `external-id` URL query parameter to specify the external ID and make sure that you can assume the IAM role. An external ID is an arbitrary string provided by the third party together with the IAM role ARN to access the Amazon S3 data. Providing an external ID is optional when assuming an IAM role, which means if the third party does not require an external ID for the IAM role, you can assume the IAM role and access the corresponding Amazon S3 data without providing this parameter.

The following is an example of an Amazon S3 URI for TiDB Lightning and BR. In this example, you need to specify a specific file path `testfolder`.

```
s3://external/testfolder?access-key=${access-key}&secret-access-key=${secret
    ↪ -access-key}
```

The following is an example of an Amazon S3 URI for TiCDC `sink-uri`.

```
tiup cdc:v7.5.0 cli changefeed create \
    --server=http://172.16.201.18:8300 \
    --sink-uri="s3://cdc?endpoint=http://10.240.0.38:9000&access-key=${
        ↪ access-key}&secret-access-key=${secret-access-key}" \
    --changefeed-id="cdcTest" \
    --config=cdc_csv.toml
```

The following is an example of an Amazon S3 URI for `IMPORT INTO`. In this example, you need to specify a specific filename `test.csv`.

```
s3://external/test.csv?access-key=${access-key}&secret-access-key=${secret-
    ↪ access-key}
```

14.21 GCS URI format

- `scheme`: `gcs` or `gs`
- `host`: `bucket name`
- `parameters`:

- `credentials-file`: Specifies the path to the credentials JSON file on the migration tool node.
- `storage-class`: Specifies the storage class of the uploaded objects (for example, `STANDARD` or `COLDLINE`)
- `predefined-acl`: Specifies the predefined ACL of the uploaded objects (for example, `private` or `project-private`)

The following is an example of a GCS URI for TiDB Lightning and BR. In this example, you need to specify a specific file path `testfolder`.

```
gcs://external/testfolder?credentials-file=${credentials-file-path}
```

The following is an example of a GCS URI for `IMPORT INTO`. In this example, you need to specify a specific filename `test.csv`.

```
gcs://external/test.csv?credentials-file=${credentials-file-path}
```

14.22 Azure Blob Storage URI format

- `scheme`: `azure` or `azblob`
- `host`: `container name`
- `parameters`:
  - `account-name`: Specifies the account name of the storage.
  - `account-key`: Specifies the access key.
  - `sas-token`: Specifies the shared access signature (SAS) token.
  - `access-tier`: Specifies the access tier of the uploaded objects, for example, `Hot` ↪ , `Cool`, or `Archive`. The default value is the default access tier of the storage account.
  - `encryption-scope`: Specifies the encryption scope for server-side encryption.
  - `encryption-key`: Specifies the encryption key for server-side encryption, which uses the AES256 encryption algorithm.

The following is an example of an Azure Blob Storage URI for BR. In this example, you need to specify a specific file path `testfolder`.

```
azure://external/testfolder?account-name=${account-name}&account-key=${
    ↪ account-key}
```

15 FAQs

15.2 TiDB Architecture FAQs

This document lists the Most Frequently Asked Questions about TiDB.

15.2.1 TiDB introduction and architecture

15.2.1.1 What is TiDB?

TiDB is an open-source distributed SQL database that supports Hybrid Transactional and Analytical Processing (HTAP) workloads. It is MySQL compatible and features horizontal scalability, strong consistency, and high availability. The goal of TiDB is to provide

users with a one-stop database solution that covers OLTP (Online Transactional Processing), OLAP (Online Analytical Processing), and HTAP services. TiDB is suitable for various use cases that require high availability and strong consistency with large-scale data.

15.2.1.2 What is TiDB's architecture?

The TiDB cluster has three components: the TiDB server, the PD (Placement Driver) server, and the TiKV server. For more details, see TiDB architecture, TiDB storage, TiDB computing, and TiDB scheduling.

15.2.1.3 Is TiDB based on MySQL?

No. TiDB supports MySQL syntax and protocol, but it is a new open source database that is developed and maintained by PingCAP, Inc.

15.2.1.4 What is the respective responsibility of TiDB, TiKV and PD (Placement Driver)?

- TiDB works as the SQL computing layer, mainly responsible for parsing SQL, specifying query plan, and generating executor.
- TiKV works as a distributed Key-Value storage engine, used to store the real data. In short, TiKV is the storage engine of TiDB.
- PD works as the cluster manager of TiDB, which manages TiKV metadata, allocates timestamps, and makes decisions for data placement and load balancing.

15.2.1.5 Is it easy to use TiDB?

Yes, it is. When all the required services are started, you can use TiDB as easily as a MySQL server. You can replace MySQL with TiDB to power your applications without changing a single line of code in most cases. You can also manage TiDB using the popular MySQL management tools.

15.2.1.6 How is TiDB compatible with MySQL?

Currently, TiDB supports the majority of MySQL 8.0 syntax, but does not support triggers, stored procedures, and user-defined functions. For more details, see Compatibility with MySQL.

15.2.1.7 Does TiDB support distributed transactions?

Yes. TiDB distributes transactions across your cluster, whether it is a few nodes in a single location or many nodes across multiple data centers.

Inspired by Google's Percolator, the transaction model in TiDB is mainly a two-phase commit protocol with some practical optimizations. This model relies on a timestamp allocator to assign the monotone increasing timestamp for each transaction, so conflicts can be detected. PD works as the timestamp allocator in a TiDB cluster.

15.2.1.8 What programming language can I use to work with TiDB?

Any language supported by MySQL client or driver.

15.2.1.9 Can I use other Key-Value storage engines with TiDB?

Yes. In addition to TiKV, TiDB supports standalone storage engines such as UniStore and MockTiKV. Note that in later TiDB releases, MockTiKV might NO LONGER be supported.

To check all TiDB-supported storage engines, use the following command:

```
./bin/tidb-server -h
```

The output is as follows:

```
Usage of ./bin/tidb-server:
  -L string
        log level: info, debug, warn, error, fatal (default "info")
  -P string
        tidb server port (default "4000")
  -V    print version information and exit (default false)
.........
  -store string
        registered store name, [tikv, mocktikv, unistore] (default "unistore
            ↪ ")
  ......
```

15.2.1.10 In addition to the TiDB documentation, are there any other ways to acquire TiDB knowledge?

- TiDB documentation: the most important and timely way to get TiDB related knowledge.
- TiDB blogs: learn technical articles, product insights, and case studies.
- PingCAP Education: take online courses and certification programs.

15.2.1.11 What is the length limit for the TiDB user name?

32 characters at most.

15.2.1.12 What are the limits on the number of columns and row size in TiDB?

- The maximum number of columns in TiDB defaults to 1017. You can adjust the number up to 4096.

- The maximum size of a single row defaults to 6 MB. You can increase the number up to 120 MB.

For more information, see TiDB Limitations.

15.2.1.13 Does TiDB support XA?

No. The JDBC driver of TiDB is MySQL Connector/J. When using Atomikos, set the data source to `type="com.mysql.jdbc.jdbc2.optional.MysqlXADataSource"`. TiDB does not support the connection with MySQL JDBC XADataSource. MySQL JDBC XADataSource only works for MySQL (for example, using DML to modify the `redo` log).

After you configure the two data sources of Atomikos, set the JDBC drives to XA. When Atomikos operates TM and RM (DB), Atomikos sends the command including XA to the JDBC layer. Taking MySQL for an example, when XA is enabled in the JDBC layer, JDBC will send a series of XA logic operations to InnoDB, including using DML to change the `redo` log. This is the operation of the two-phase commit. The current TiDB version does not support the upper application layer JTA/XA and does not parse XA operations sent by Atomikos.

As a standalone database, MySQL can only implement across-database transactions using XA; while TiDB supports distributed transactions using Google Percolator transaction model and its performance stability is higher than XA, so TiDB does not support JTA/XA and there is no need for TiDB to support XA.

15.2.1.14 How could TiDB support high concurrent `INSERT` or `UPDATE` operations to the columnar storage engine (TiFlash) without hurting performance?

- TiFlash introduces a special structure named DeltaTree to process the modification of the columnar engine.
- TiFlash acts as the learner role in a Raft group, so it does not vote for the log commit or writes. This means that DML operations do not have to wait for the acknowledgment of TiFlash, which is why TiFlash does not slow down the OLTP performance. In addition, TiFlash and TiKV work in separate instances, so they do not affect each other.

15.2.1.15 What kind of consistency does TiFlash provide?

TiFlash maintains strong data consistency by default. The raft learner process updates the data. There is also a TSO check to ensure the data in queries is fully consistent with the transaction. For more information, see Asynchronous replication and Consistency.

15.2.2 TiDB techniques

15.2.2.1 TiKV for data storage

See TiDB Internal (I) - Data Storage.

15.2.2.2 TiDB for data computing

See TiDB Internal (II) - Computing.

15.2.2.3 PD for scheduling

See TiDB Internal (III) - Scheduling.

15.3 SQL FAQs

This document summarizes the FAQs related to SQL operations in TiDB.

15.3.1 Does TiDB support the secondary key?

Yes. You can have the `NOT NULL` constraint on a non-primary key column with a unique secondary index. In this case, the column works as a secondary key.

15.3.2 How does TiDB perform when executing DDL operations on a large table?

DDL operations of TiDB on large tables are usually not an issue. TiDB supports online DDL operations, and these DDL operations do not block DML operations.

For some DDL operations such as adding columns, deleting columns or dropping indexes, TiDB can perform these operations quickly.

For some heavy DDL operations such as adding indexes, TiDB needs to backfill data, which takes a longer time (depending on the size of the table) and consumes additional resources. The impact on online traffic is tunable. TiDB can do the backfill with multiple threads, and the resource consumed can be set by the following system variables:

- `tidb_ddl_reorg_worker_cnt`
- `tidb_ddl_reorg_priority`
- `tidb_ddl_error_count_limit`
- `tidb_ddl_reorg_batch_size`

15.3.3 How to choose the right query plan? Do I need to use hints? Or can I use hints?

TiDB includes a cost-based optimizer. In most cases, the optimizer chooses the optimal query plan for you. If the optimizer does not work well, you can still use optimizer hints to intervene with the optimizer.

In addition, you can also use the SQL binding to fix the query plan for a particular SQL statement.

15.3.4 How to prevent the execution of a particular SQL statement?

You can create SQL bindings with the `MAX_EXECUTION_TIME` hint to limit the execution time of a particular statement to a small value (for example, 1ms). In this way, the statement is terminated automatically by the threshold.

For example, to prevent the execution of `SELECT * FROM t1, t2 WHERE t1.id = t2.id`, you can use the following SQL binding to limit the execution time of the statement to 1ms:

```
CREATE GLOBAL BINDING for
    SELECT * FROM t1, t2 WHERE t1.id = t2.id
USING
    SELECT /*+ MAX_EXECUTION_TIME(1) */ * FROM t1, t2 WHERE t1.id = t2.id;
```

> **Note:**
>
> The precision of `MAX_EXECUTION_TIME` is roughly 100ms. Before TiDB terminates the SQL statement, the tasks in TiKV might be started. To reduce the TiKV resource consumption in such case, it is recommended to set `tidb_enable_paging` to `ON`.

Dropping this SQL binding will remove the limit.

```
DROP GLOBAL BINDING for
    SELECT * FROM t1, t2 WHERE t1.id = t2.id;
```

15.3.5 What are the MySQL variables that TiDB is compatible with?

See System Variables.

15.3.6 The order of results is different from MySQL when `ORDER BY` is omitted

It is not a bug. The default order of records depends on various situations without any guarantee of consistency.

The order of results in MySQL might appear stable because queries are executed in a single thread. However, it is common that query plans can change when upgrading to new versions. It is recommended to use `ORDER BY` whenever an order of results is desired.

The reference can be found in ISO/IEC 9075:1992, Database Language SQL- July 30, 1992, which states as follows:

> If an `<order by clause>` is not specified, then the table specified by the `<cursor specification>` is T and the ordering of rows in T is implementation-dependent.

In the following two queries, both results are considered legal:

```
> select * from t;
+------+------+
| a    | b    |
+------+------+
|    1 |    1 |
|    2 |    2 |
+------+------+
2 rows in set (0.00 sec)
```

```
> select * from t; -- the order of results is not guaranteed
+------+------+
| a    | b    |
+------+------+
|    2 |    2 |
|    1 |    1 |
+------+------+
2 rows in set (0.00 sec)
```

If the list of columns used in the `ORDER BY` is non-unique, the statement is also considered non-deterministic. In the following example, the column `a` has duplicate values. Thus, only `ORDER BY a, b` is guaranteed deterministic:

```
> select * from t order by a;
+------+------+
| a    | b    |
+------+------+
|    1 |    1 |
|    2 |    1 |
|    2 |    2 |
+------+------+
3 rows in set (0.00 sec)
```

In the following statement, the order of column `a` is guaranteed, but the order of `b` is not guaranteed.

```
> select * from t order by a;
+------+------+
```

```
| a    | b    |
+------+------+
|    1 |    1 |
|    2 |    2 |
|    2 |    1 |
+------+------+
3 rows in set (0.00 sec)
```

In TiDB, you can also use the system variable `tidb_enable_ordered_result_mode` to sort the final output result automatically.

15.3.7 Does TiDB support `SELECT FOR UPDATE`?

Yes. When using pessimistic locking (the default since TiDB v3.0.8) the `SELECT FOR UPDATE` execution behaves similar to MySQL.

When using optimistic locking, `SELECT FOR UPDATE` does not lock data when the transaction is started, but checks conflicts when the transaction is committed. If the check reveals conflicts, the committing transaction rolls back.

For details, see description of the `SELECT` syntax elements.

15.3.8 Can the codec of TiDB guarantee that the UTF-8 string is memcomparable? Is there any coding suggestion if our key needs to support UTF-8?

TiDB uses the UTF-8 character set by default and currently only supports UTF-8. The string of TiDB uses the memcomparable format.

15.3.9 What is the maximum number of statements in a transaction?

The maximum number of statements in a transaction is 5000 by default.

In the optimistic transaction mode, When transaction retry is enabled, the default upper limit is 5000. You can adjust the limit by using the `stmt-count-limit` parameter.

15.3.10 Why does the auto-increment ID of the later inserted data is smaller than that of the earlier inserted data in TiDB?

The auto-increment ID feature in TiDB is only guaranteed to be automatically incremental and unique but is not guaranteed to be allocated sequentially. Currently, TiDB is allocating IDs in batches. If data is inserted into multiple TiDB servers simultaneously, the allocated IDs are not sequential. When multiple threads concurrently insert data to multiple `tidb-server` instances, the auto-increment ID of the later inserted data might be smaller. TiDB allows specifying `AUTO_INCREMENT` for the integer field, but allows only

one AUTO_INCREMENT field in a single table. For details, see Auto-increment ID and the AUTO_INCREMENT attribute.

15.3.11 How do I modify the sql_mode in TiDB?

TiDB supports modifying the sql_mode system variables on a SESSION or GLOBAL basis.

- Changes to GLOBAL scoped variables propagate to the rest servers of the cluster and persist across restarts. This means that you do not need to change the sql_mode value on each TiDB server.
- Changes to SESSION scoped variables only affect the current client session. After restarting a server, the changes are lost.

15.3.12 Error: java.sql.BatchUpdateException:statement count 5001 exceeds the transaction limitation while using Sqoop to write data into TiDB in batches

In Sqoop, --batch means committing 100 statements in each batch, but by default each statement contains 100 SQL statements. So, 100 * 100 = 10000 SQL statements, which exceeds 5000, the maximum number of statements allowed in a single TiDB transaction.

Two solutions:

- Add the -Dsqoop.export.records.per.statement=10 option as follows:

```
sqoop export \
    -Dsqoop.export.records.per.statement=10 \
    --connect jdbc:mysql://mysql.example.com/sqoop \
    --username sqoop ${user} \
    --password ${passwd} \
    --table ${tab_name} \
    --export-dir ${dir} \
    --batch
```

- You can also increase the limited number of statements in a single TiDB transaction, but this will consume more memory. For details, see Limitations on SQL statements.

15.3.13 Does TiDB have a function like the Flashback Query in Oracle? Does it support DDL?

Yes, it does. And it supports DDL as well. For details, see Read Historical Data Using the AS OF TIMESTAMP Clause.

15.3.14 Does TiDB release space immediately after deleting data?

None of the `DELETE`, `TRUNCATE` and `DROP` operations release data immediately. For the `TRUNCATE` and `DROP` operations, after the TiDB GC (Garbage Collection) time (10 minutes by default), the data is deleted and the space is released. For the `DELETE` operations, the data is deleted but the space is not immediately released until the compaction is performed.

15.3.15 Why does the query speed get slow after data is deleted?

Deleting a large amount of data leaves a lot of useless keys, affecting the query efficiency. To solve the problem, you can use the Region Merge feature. For details, see the deleting data section in TiDB Best Practices.

15.3.16 What should I do if it is slow to reclaim storage space after deleting data?

Because TiDB uses multi-version concurrency control (MVCC), when the old data is overwritten with new data, the old data is not replaced but retained along with the new data. Timestamps are used to identify the data version. Deleting data does not immediately reclaim space. Garbage collection is delayed so that concurrent transactions are able to see earlier versions of rows. This can be configured via the `tidb_gc_life_time` (default: `10m0s`) system variable.

15.3.17 Does `SHOW PROCESSLIST` display the system process ID?

The display content of TiDB `SHOW PROCESSLIST` is almost the same as that of MySQL `SHOW PROCESSLIST`. TiDB `SHOW PROCESSLIST` does not display the system process ID. The ID that it displays is the current session ID. The differences between TiDB `SHOW PROCESSLIST` and MySQL `SHOW PROCESSLIST` are as follows:

- As TiDB is a distributed database, the `tidb-server` instance is a stateless engine for parsing and executing the SQL statements (for details, see TiDB architecture). `SHOW PROCESSLIST` displays the session list executed in the `tidb-server` instance that the user logs in to from the MySQL client, not the list of all the sessions running in the cluster. But MySQL is a standalone database and its `SHOW PROCESSLIST` displays all the SQL statements executed in MySQL.
- The `State` column in TiDB is not continually updated during query execution. Because TiDB supports parallel query, each statement might be in multiple *states* at once, and so it is difficult to simplify to a single value.

15.3.18 How to control or change the execution priority of SQL commits?

TiDB supports changing the priority on a global or individual statement basis. Priority has the following meaning:

- `HIGH_PRIORITY`: this statement has a high priority, that is, TiDB gives priority to this statement and executes it first.
- `LOW_PRIORITY`: this statement has a low priority, that is, TiDB reduces the priority of this statement during the execution period.
- `DELAYED`: this statement has normal priority and is the same as the `NO_PRIORITY` setting for `tidb_force_priority`.

> **Note:**
>
> Starting from v6.6.0, TiDB supports Resource Control. You can use this feature to execute SQL statements with different priorities in different resource groups. By configuring proper quotas and priorities for these resource groups, you can gain better scheduling control for SQL statements with different priorities. When resource control is enabled, statement priority will no longer take effect. It is recommended that you use Resource Control to manage resource usage for different SQL statements.

You can combine the above two parameters with the DML of TiDB to use them. For example:

1. Adjust the priority by writing SQL statements in the database:

```
SELECT HIGH_PRIORITY | LOW_PRIORITY | DELAYED COUNT(*) FROM table_name
    ↪ ;
INSERT HIGH_PRIORITY | LOW_PRIORITY | DELAYED INTO table_name insert_
    ↪ values;
DELETE HIGH_PRIORITY | LOW_PRIORITY | DELAYED FROM table_name;
UPDATE HIGH_PRIORITY | LOW_PRIORITY | DELAYED table_reference SET
    ↪ assignment_list WHERE where_condition;
REPLACE HIGH_PRIORITY | LOW_PRIORITY | DELAYED INTO table_name;
```

2. The full table scan statement automatically adjusts itself to a low priority. `ANALYZE` has a low priority by default.

15.3.19 What's the trigger strategy for `auto analyze` in TiDB?

When the number of rows in a table or a single partition of a partitioned table reaches 1000, and the ratio (the number of modified rows / the current total number of rows) of the table or partition is larger than `tidb_auto_analyze_ratio`, the `ANALYZE` statement is automatically triggered.

The default value of the `tidb_auto_analyze_ratio` system variable is `0.5`, indicating that this feature is enabled by default. It is not recommended to set the value of `tidb_auto_analyze_ratio` to be larger than or equal to `pseudo-estimate-ratio` (the default value is `0.8`), otherwise the optimizer might use pseudo statistics. TiDB v5.3.0 introduces the `tidb_enable_pseudo_for_outdated_stats` variable, and when you set it to `OFF`, pseudo statistics are not used even if the statistics are outdated.

To disable `auto analyze`, use the system variable `tidb_enable_auto_analyze`.

15.3.20 Can I use optimizer hints to override the optimizer behavior?

TiDB supports multiple ways to override the default query optimizer behavior, including hints and SQL Plan Management. The basic usage is similar to MySQL, with several TiDB specific extensions:

```
SELECT column_name FROM table_name USE INDEX ( index_name ) WHERE where_
    ↪ condition;
```

15.3.21 DDL Execution

This section lists issues related to DDL statement execution. For detailed explanations on the DDL execution principles, see Execution Principles and Best Practices of DDL Statements.

15.3.21.1 How long does it take to perform various DDL operations?

Assume that DDL operations are not blocked, each TiDB server can update the schema version normally, and the DDL Owner node is running normally. In this case, the estimated time for various DDL operations is as follows:

DDL Operation Type	Estimated Time
Reorg DDL, such as `ADD INDEX`, `MODIFY COLUMN` (Reorg type data changes)	Depends on the amount of data, system load, and DDL parameter settings.

DDL Operation Type	Estimated Time
General DDL (DDL types other than Reorg), such as `CREATE DATABASE`, `CREATE TABLE`, `DROP DATABASE`, `DROP TABLE`, `TRUNCATE TABLE`, `ALTER TABLE ADD`, `ALTER TABLE DROP`, `MODIFY COLUMN` (only changes metadata), `DROP INDEX`	About 1 second

> **Note:**
>
> The above is estimated time for the operations. The actual time might be different.

15.3.21.2 Possible reasons why DDL execution is slow

- In a user session, if there is a non-auto-commit DML statement before a DDL statement, and if the commit operation of the non-auto-commit DML statement is slow, it

will cause the DDL statement to execute slowly. That is, TiDB commits the uncommitted DML statement before executing the DDL statement.

- When multiple DDL statements are executed together, the execution of the later DDL statements might be slower because they might need to wait in queue. Queuing scenarios include:

    - The same type of DDL statements need to be queued. For example, both `CREATE TABLE` and `CREATE DATABASE` are general DDL statements, so when both operations are executed at the same time, they need to be queued. Starting from TiDB v6.2.0, parallel DDL statements are supported, but to avoid DDL execution using too many TiDB computing resources, there is also a concurrency limit. Queuing occurs when DDL exceeds the concurrency limit.
    - The DDL operations performed on the same table have a dependency relationship between them. The later DDL statement needs to wait for the previous DDL operation to complete.

- After the cluster is started normally, the execution time of the first DDL operation might be relatively long because the DDL module is electing the DDL Owner.

- TiDB is terminated, which causes TiDB to not able to communicate with PD normally (including power-off situations). Or TiDB is terminated by the `kill -9` command, which causes TiDB to not timely clear the registration data from PD.

- A communication problem occurs between a certain TiDB node in the cluster and PD or TiKV, which makes TiDB not able to obtain the latest version information in time.

15.3.21.3 What triggers the `Information schema is changed` error?

When executing SQL statements, TiDB determines the schema version of an object based on the isolation level and processes the SQL statement accordingly. TiDB also supports online asynchronous DDL changes. When you execute DML statements, there might be DDL statements being executed at the same time, and you need to ensure that each SQL statement is executed on the same schema. Therefore, when executing DML, if a DDL operation is ongoing, TiDB might report an `Information schema is changed` error.

Starting from v6.4.0, TiDB has implemented a metadata lock mechanism, which allows the coordinated execution of DML statements and DDL schema changes, and avoids most `Information schema is changed` errors.

Now, there are still a few causes for this error reporting:

- Cause 1: Some tables involved in the DML operation are the same tables involved in the ongoing DDL operation. To check the ongoing DDL operations, use the `ADMIN SHOW DDL` statement.

- Cause 2: The DML operation goes on for a long time. During this period, many DDL statements have been executed, which causes more than 1024 `schema` version changes. You can modify this default value by modifying the `tidb_max_delta_schema_count` variable.
- Cause 3: The TiDB server that accepts the DML request is not able to load `schema information` for a long time (possibly caused by the connection failure between TiDB and PD or TiKV). During this period, many DDL statements have been executed, which causes more than 100 `schema` version changes.
- Cause 4: After TiDB restarts and before the first DDL operation is executed, the DML operation is executed and then encounters the first DDL operation (which means before the first DDL operation is executed, the transaction corresponding to the DML is started. And after the first `schema` version of the DDL is changed, the transaction corresponding to the DML is committed), this DML operation reports this error.

In the preceding causes, only Cause 1 is related to tables. Cause 1 and Cause 2 do not impact the application, as the related DML operations retry after failure. For cause 3, you need to check the network between TiDB and TiKV/PD.

Note:

- Currently, TiDB does not cache all the `schema` version changes.
- For each DDL operation, the number of `schema` version changes is the same with the number of corresponding `schema state` version changes.
- Different DDL operations cause different number of `schema` version changes. For example, the `CREATE TABLE` statement causes one `schema` version change while the `ADD COLUMN` statement causes four.

15.3.21.4 What are the causes of the "Information schema is out of date" error?

Before TiDB v6.5.0, when executing a DML statement, if TiDB fails to load the latest schema within a DDL lease (45s by default), the `Information schema is out of date` error might occur. Possible causes are:

- The TiDB instance that executed this DML was killed, and the transaction execution corresponding to this DML statement took longer than a DDL lease. When the transaction was committed, the error occurred.
- TiDB failed to connect to PD or TiKV while executing this DML statement. As a result, TiDB failed to load schema within a DDL lease or disconnected from PD due to the keepalive setting.

15.3.21.5 Error is reported when executing DDL statements under high concurrency?

When you execute DDL statements (such as creating tables in batches) under high concurrency, a very few of these statements might fail because of key conflicts during the concurrent execution.

It is recommended to keep the number of concurrent DDL statements under 20. Otherwise, you need to retry the failed statements from the client.

15.3.21.6 Why is DDL execution blocked?

Before TiDB v6.2.0, TiDB allocates DDL statements to two first-in-first-out queues based on the type of DDL statements. More specifically, Reorg DDLs go to the Reorg queue and General DDLs go to the general queue. Because of the first-in-first-out limitation and the need for serial execution of DDL statements on the same table, multiple DDL statements might be blocked during execution.

For example, consider the following DDL statements:

- DDL 1: `CREATE INDEX idx on t(a int);`
- DDL 2: `ALTER TABLE t ADD COLUMN b int;`
- DDL 3: `CREATE TABLE t1(a int);`

Due to the limitation of the first-in-first-out queue, DDL 3 must wait for DDL 2 to execute. Also, because DDL statements on the same table need to be executed in serial, DDL 2 must wait for DDL 1 to execute. Therefore, DDL 3 needs to wait for DDL 1 to be executed first, even if they operate on different tables.

Starting from TiDB v6.2.0, the TiDB DDL module uses a concurrent framework. In the concurrent framework, there is no longer the limitation of the first-in-first-out queue. Instead, TiDB picks up the DDL task that can be executed from all DDL tasks. Additionally, the number of Reorg workers has been expanded, approximately to `CPU/4` per node. This allows TiDB to build indexes for multiple tables simultaneously in the concurrent framework.

Whether your cluster is a new cluster or an upgraded cluster from an earlier version, TiDB automatically uses the concurrent framework in TiDB v6.2 and later versions. You do not need to make manual adjustments.

15.3.21.7 Identify the cause of stuck DDL execution

1. Eliminate other reasons that make the DDL statement execution slow.
2. Use one of the following methods to identify the DDL Owner node:
    - Use `curl http://{TiDBIP}:10080/info/all` to obtain the owner of the current cluster.
    - View the owner during a specific time period from the monitoring dashboard **DDL** > **DDL META OPM**.

- If the owner does not exist, try manually triggering owner election with: `curl -X POST http://{TiDBIP}:10080/ddl/owner/resign`.
- If the owner exists, export the Goroutine stack and check for the possible stuck location.

15.3.22 SQL optimization

15.3.22.1 TiDB execution plan description

See Understand the Query Execution Plan.

15.3.22.2 Statistics collection

See Introduction to Statistics.

15.3.22.3 How to optimize `select count(1)`?

The `count(1)` statement counts the total number of rows in a table. Improving the degree of concurrency can significantly improve the speed. To modify the concurrency, refer to the `tidb_distsql_scan_concurrency` document. But it also depends on the CPU and I/O resources. TiDB accesses TiKV in every query. When the amount of data is small, all MySQL is in memory, and TiDB needs to conduct a network access.

Recommendations:

- Improve the hardware configuration. See Software and Hardware Requirements.
- Improve the concurrency. The default value is 10. You can improve it to 50 and have a try. But usually the improvement is 2-4 times of the default value.
- Test the `count` in the case of large amount of data.
- Optimize the TiKV configuration. See Tune TiKV Thread Performance and Tune TiKV Memory Performance.
- Enable the Coprocessor Cache.

15.3.22.4 How to view the progress of the current DDL job?

You can use `ADMIN SHOW DDL` to view the progress of the current DDL job. The operation is as follows:

```
ADMIN SHOW DDL;
```

```
*************************** 1. row ***************************
  SCHEMA_VER: 140
      OWNER: 1a1c4174-0fcd-4ba0-add9-12d08c4077dc
RUNNING_JOBS: ID:121, Type:add index, State:running, SchemaState:write
    ↪ reorganization, SchemaID:1, TableID:118, RowCount:77312, ArgLen:0,
    ↪ start time: 2018-12-05 16:26:10.652 +0800 CST, Err:<nil>, ErrCount:0,
    ↪  SnapshotVersion:404749908941733890
     SELF_ID: 1a1c4174-0fcd-4ba0-add9-12d08c4077dc
```

From the above results, you can get that the `ADD INDEX` operation is currently being processed. You can also get from the `RowCount` field of the `RUNNING_JOBS` column that now the `ADD INDEX` operation has added 77312 rows of indexes.

15.3.22.5 How to view the DDL job?

- `ADMIN SHOW DDL`: to view the running DDL job
- `ADMIN SHOW DDL JOBS`: to view all the results in the current DDL job queue (including tasks that are running and waiting to run) and the last ten results in the completed DDL job queue
- `ADMIN SHOW DDL JOBS QUERIES 'job_id' [, 'job_id'] ...`: to view the original SQL statement of the DDL task corresponding to the `job_id`; the `job_id` only searches the running DDL job and the last ten results in the DDL history job queue.

15.3.22.6 Does TiDB support CBO (Cost-Based Optimization)? If yes, to what extent?

Yes. TiDB uses the cost-based optimizer. The cost model and statistics are constantly optimized. TiDB also supports join algorithms like hash join and sort-merge join.

15.3.22.7 How to determine whether I need to execute `analyze` on a table?

View the `Healthy` field using `SHOW STATS_HEALTHY` and generally you need to execute `ANALYZE` on a table when the field value is smaller than 60.

15.3.22.8 What is the ID rule when a query plan is presented as a tree? What is the execution order for this tree?

No rule exists for these IDs but the IDs are unique. When IDs are generated, a counter works and adds one when one plan is generated. The execution order has nothing to do with the ID. The whole query plan is a tree and the execution process starts from the root node and the data is returned to the upper level continuously. For details about the query plan, see Understanding the TiDB Query Execution Plan.

15.3.22.9 In the TiDB query plan, `cop` tasks are in the same root. Are they executed concurrently?

Currently the computing tasks of TiDB belong to two different types of tasks: `cop task` and `root task`.

`cop task` is the computing task which is pushed down to the KV end for distributed execution; `root task` is the computing task for single point execution on the TiDB end.

Generally the input data of `root task` comes from `cop task`; when `root task` processes data, `cop task` of TiKV can processes data at the same time and waits for the pull of `root task` of TiDB. Therefore, `cop` tasks can be considered as executed concurrently

with `root task`; but their data has an upstream and downstream relationship. During the execution process, they are executed concurrently during some time. For example, the first `cop task` is processing the data in [100, 200] and the second `cop task` is processing the data in [1, 100]. For details, see Understanding the TiDB Query Plan.

15.3.23 Database optimization

15.3.23.1 Edit TiDB options

See The TiDB Command Options.

15.3.23.2 How to avoid hotspot issues and achieve load balancing? Is hot partition or range an issue in TiDB?

To learn the scenarios that cause hotspots, refer to common hotpots. The following TiDB features are designed to help you solve hotspot issues:

- The `SHARD_ROW_ID_BITS` attribute. After setting this attribute, row IDs are scattered and written into multiple Regions, which can alleviate the write hotspot issue.
- The `AUTO_RANDOM` attribute, which helps resolve hotspots brought by auto-increment primary keys.
- Coprocessor Cache, for read hotspots on small tables.
- Load Base Split, for hotspots caused by unbalanced access between Regions, such as full table scans for small tables.
- Cached tables, for frequently accessed but rarely updated small hotspot tables.

If you have a performance issue caused by hotspot, refer to Troubleshoot Hotspot Issues to get it resolved.

15.3.23.3 Tune TiKV performance

See Tune TiKV Thread Performance and Tune TiKV Memory Performance.

15.4 TiDB Deployment FAQs

This document summarizes the FAQs related to TiDB deployment.

15.4.1 Software and hardware requirements

15.4.1.1 What operating systems does TiDB support?

For the TiDB-supported operating systems, see Software and Hardware Recommendations.

15.4.1.2 What is the recommended hardware configuration for a TiDB cluster in the development, test, or production environment?

You can deploy and run TiDB on the 64-bit generic hardware server platform in the Intel x86-64 architecture or on the hardware server platform in the ARM architecture. For the requirements and recommendations about server hardware configuration for development, test, and production environments, see Software and Hardware Recommendations - Server recommendations.

15.4.1.3 What's the purposes of 2 network cards of 10 gigabit?

As a distributed cluster, TiDB has a high demand on time, especially for PD, because PD needs to distribute unique timestamps. If the time in the PD servers is not consistent, it takes longer waiting time when switching the PD server. The bond of two network cards guarantees the stability of data transmission, and 10 gigabit guarantees the transmission speed. Gigabit network cards are prone to meet bottlenecks, therefore it is strongly recommended to use 10 gigabit network cards.

15.4.1.4 Is it feasible if we don't use RAID for SSD?

If the resources are adequate, it is recommended to use RAID 10 for SSD. If the resources are inadequate, it is acceptable not to use RAID for SSD.

15.4.1.5 What's the recommended configuration of TiDB components?

- TiDB has a high requirement on CPU and memory. If you need to enable TiDB Binlog, the local disk space should be increased based on the service volume estimation and the time requirement for the GC operation. But the SSD disk is not a must.
- PD stores the cluster metadata and has frequent Read and Write requests. It demands a high I/O disk. A disk of low performance will affect the performance of the whole cluster. It is recommended to use SSD disks. In addition, a larger number of Regions has a higher requirement on CPU and memory.
- TiKV has a high requirement on CPU, memory and disk. It is required to use SSD.

For details, see Software and Hardware Recommendations.

15.4.2 Installation and deployment

For the production environment, it is recommended to use TiUP to deploy your TiDB cluster. See Deploy a TiDB Cluster Using TiUP.

15.4.2.1 Why the modified `toml` configuration for TiKV/PD does not take effect?

You need to set the `--config` parameter in TiKV/PD to make the `toml` configuration effective. TiKV/PD does not read the configuration by default. Currently, this issue only occurs when deploying using Binary. For TiKV, edit the configuration and restart the service. For PD, the configuration file is only read when PD is started for the first time, after which you can modify the configuration using pd-ctl. For details, see PD Control User Guide.

15.4.2.2 Should I deploy the TiDB monitoring framework (Prometheus + Grafana) on a standalone machine or on multiple machines? What is the recommended CPU and memory?

The monitoring machine is recommended to use standalone deployment. It is recommended to use an 8 core CPU with 16 GB+ memory and a 500 GB+ hard disk.

15.4.2.3 Why the monitor cannot display all metrics?

Check the time difference between the machine time of the monitor and the time within the cluster. If it is large, you can correct the time and the monitor will display all the metrics.

15.4.2.4 What is the function of supervise/svc/svstat service?

- supervise: the daemon process, to manage the processes
- svc: to start and stop the service
- svstat: to check the process status

15.4.2.5 Description of inventory.ini variables

Variable	Description
`cluster` ↪ `_` ↪ `name` ↪	the name of a cluster, adjustable
`tidb` ↪ `_` ↪ `version` ↪	the version of TiDB

Variable	Description
`deployment_method`	the method of deployment, binary by default, Docker optional
`process_supervision`	the supervision way of processes, systemd by default, supervise optional
`timezone`	the timezone of the managed node, adjustable, `Asia/Shanghai` by default, used with the `set_timezone` variable

Variable	Description
set_ ↪ timezone ↪	to edit the time-zone of the man-aged node, True by default; False means closing
enable ↪ _ ↪ elk ↪	currently not sup-ported
enable ↪ _ ↪ firewalld ↪	to enable the firewall, closed by default
enable ↪ _ ↪ ntpd ↪	to monitor the NTP service of the man-aged node, True by default; do not close it

Variable	Description
`machine_benchmark`	to monitor the disk IOPS of the managed node, True by default; do not close it
`set_hostname`	to edit the hostname of the managed node based on the IP, False by default

Variable	Description
`enable_binlog`	whether to deploy Pump and enable the binlog, False by default, dependent on the Kafka cluster; see the `zookeeper_addrs` variable
`zookeeper_addrs`	the ZooKeeper address of the binlog Kafka cluster

Variable	Description
`enable_slow_query_log`	to record the slow query log of TiDB into a single file: ({{ deploy_dir }}/log/tidb_slow_que False by default, to record it into the TiDB log

Variable	Description
`deploy_without_tidb`	the Key-Value mode, deploy only PD, TiKV and the monitoring service, not TiDB; set the IP of the tidb_servers host group to null in the `inventory.ini` file

15.4.2.6 How to separately record the slow query log in TiDB? How to locate the slow query SQL statement?

1. The slow query definition for TiDB is in the TiDB configuration file. The `tidb_slow_log_threshold: 300` parameter is used to configure the threshold value of the slow query (unit: millisecond).
2. If a slow query occurs, you can locate the `tidb-server` instance where the slow query is and the slow query time point using Grafana and find the SQL statement information recorded in the log on the corresponding node.
3. In addition to the log, you can also view the slow query using the `ADMIN SHOW SLOW` command. For details, see `ADMIN SHOW SLOW` command.

15.4.2.7 How to add the `label` configuration if `label` of TiKV was not configured when I deployed the TiDB cluster for the first time?

The configuration of TiDB `label` is related to the cluster deployment architecture. It is important and is the basis for PD to execute global management and scheduling. If you did not configure `label` when deploying the cluster previously, you should adjust the deployment structure by manually adding the `location-labels` information using the PD management tool `pd-ctl`, for example, `config set location-labels "zone,rack,host"` (you should configure it based on the practical `label` level name).

For the usage of `pd-ctl`, see PD Control User Guide.

15.4.2.8 Why does the `dd` command for the disk test use the `oflag=direct` option?

The Direct mode wraps the Write request into the I/O command and sends this command to the disk to bypass the file system cache and directly test the real I/O Read/Write performance of the disk.

15.4.2.9 How to use the `fio` command to test the disk performance of the TiKV instance?

- Random Read test:

```
./fio -ioengine=psync -bs=32k -fdatasync=1 -thread -rw=randread -size
    ↪ =10G -filename=fio_randread_test.txt -name='fio randread test' -
    ↪ iodepth=4 -runtime=60 -numjobs=4 -group_reporting --output-format
    ↪ =json --output=fio_randread_result.json
```

- The mix test of sequential Write and random Read:

```
./fio -ioengine=psync -bs=32k -fdatasync=1 -thread -rw=randrw -
    ↪ percentage_random=100,0 -size=10G -filename=fio_randread_write_
    ↪ test.txt -name='fio mixed randread and sequential write test' -
    ↪ iodepth=4 -runtime=60 -numjobs=4 -group_reporting --output-format
    ↪ =json --output=fio_randread_write_test.json
```

15.4.3 What public cloud vendors are currently supported by TiDB?

TiDB supports deployment on Google Cloud GKE, AWS EKS, and Alibaba Cloud ACK.

In addition, TiDB is currently available on JD Cloud and UCloud.

15.5 Migration FAQs

This document summarizes the frequently asked questions (FAQs) related to TiDB data migration.

For the frequently asked questions about migration-related tools, click the corresponding links in the list below:

- Backup & Restore FAQs
- TiDB Binlog FAQ
- TiDB Lightning FAQs
- TiDB Data Migration (DM) FAQs
- TiCDC FAQs

15.5.1 Full data export and import

15.5.1.1 How to migrate an application running on MySQL to TiDB?

Because TiDB supports most MySQL syntax, generally you can migrate your applications to TiDB without changing a single line of code in most cases.

15.5.1.2 Data import and export is slow, and many retries and EOF errors appear in the log of each component without other errors

If no other logical errors occur, retries and EOF errors might be caused by network issues. It is recommended to first use tools to check the network connectivity. In the following example, iperf is used for troubleshooting:

- Execute the following command on the server-side node where the retries and EOF errors occur:

```
iperf3 -s
```

- Execute the following command on the client-side node where the retries and EOF errors occur:

```
iperf3 -c <server-IP>
```

The following example is the output of a client node with a good network connection:

```
$ iperf3 -c 192.168.196.58
Connecting to host 192.168.196.58, port 5201
[  5] local 192.168.196.150 port 55397 connected to 192.168.196.58 port 5201
[ ID] Interval           Transfer     Bitrate
[  5]   0.00-1.00  sec  18.0 MBytes  150 Mbits/sec
[  5]   1.00-2.00  sec  20.8 MBytes  175 Mbits/sec
[  5]   2.00-3.00  sec  18.2 MBytes  153 Mbits/sec
[  5]   3.00-4.00  sec  22.5 MBytes  188 Mbits/sec
[  5]   4.00-5.00  sec  22.4 MBytes  188 Mbits/sec
[  5]   5.00-6.00  sec  22.8 MBytes  191 Mbits/sec
[  5]   6.00-7.00  sec  20.8 MBytes  174 Mbits/sec
[  5]   7.00-8.00  sec  20.1 MBytes  168 Mbits/sec
[  5]   8.00-9.00  sec  20.8 MBytes  175 Mbits/sec
[  5]   9.00-10.00 sec  21.8 MBytes  183 Mbits/sec
```

```
- - - - - - - - - - - - - - - - - - - - - - - - -
[ ID] Interval           Transfer     Bitrate
[  5]   0.00-10.00 sec  208 MBytes  175 Mbits/sec                  sender
[  5]   0.00-10.00 sec  208 MBytes  174 Mbits/sec                  receiver

iperf Done.
```

If the output shows low network bandwidth and high bandwidth fluctuations, a large number of retries and EOF errors might appear in each component log. In this case, you need to consult your network service provider to improve the network quality.

If the output of each metric looks good, try to update each component. If the problem persists after the updating, get support from PingCAP or the community.

15.5.1.3 If I accidentally import the MySQL user table into TiDB, or forget the password and cannot log in, how to deal with it?

Restart the TiDB service, add the `-skip-grant-table=true` parameter in the configuration file. Log into the cluster without password and recreate the user, or recreate the `mysql.user` table. For the specific table schema, search the official documentation.

15.5.1.4 How to export the data in TiDB?

You can use the following methods to export the data in TiDB:

- Export data using Dumpling. For more information, see Dumpling documentation.
- Export data using mysqldump and the `WHERE` clause.
- Use the MySQL client to export the results of `select` to a file.

15.5.1.5 How to migrate from DB2 or Oracle to TiDB?

To migrate all the data or migrate incrementally from DB2 or Oracle to TiDB, see the following solution:

- Use the official migration tool of Oracle, such as OGG, Gateway, CDC (Change Data Capture).
- Develop a program for importing and exporting data.
- Export Spool as text file, and import data using Load infile.
- Use a third-party data migration tool.

Currently, it is recommended to use OGG.

15.5.1.6 Error: `java.sql.BatchUpdateException:statement count 5001 exceeds the transaction limitation` while using Sqoop to write data into TiDB in `batches`

In Sqoop, `--batch` means committing 100 `statements` in each batch, but by default each `statement` contains 100 SQL statements. So, 100 * 100 = 10000 SQL statements, which exceeds 5000, the maximum number of statements allowed in a single TiDB transaction.

Two solutions:

- Add the `-Dsqoop.export.records.per.statement=10` option as follows:

```
sqoop export \
    -Dsqoop.export.records.per.statement=10 \
    --connect jdbc:mysql://mysql.example.com/sqoop \
    --username sqoop ${user} \
    --password ${passwd} \
    --table ${tab_name} \
    --export-dir ${dir} \
    --batch
```

- You can also increase the limited number of statements in a single TiDB transaction, but this will consume more memory.

15.5.1.7 Why does Dumpling return `The local disk space is insufficient` error or cause the upstream database to run out of memory when exporting a table?

This issue might have the following causes:

- The database's primary keys are not evenly distributed (for example, when you enable `SHARD_ROW_ID_BITS`).
- The upstream database is TiDB and the exported table is a partitioned table.

For the above cases, Dumpling splits excessively large data chunk for the export and sends queries with excessively large results. To address the issue, you can get the latest version of Dumpling.

15.5.1.8 Does TiDB have a function like the Flashback Query in Oracle? Does it support DDL?

Yes, it does. And it supports DDL as well. For details, see how TiDB reads data from history versions.

15.5.2 Migrate the data online

15.5.2.1 Is there a current solution to replicating data from TiDB to other databases like HBase and Elasticsearch?

No. Currently, the data replication depends on the application itself.

15.5.3 Migrate the traffic

15.5.3.1 How to migrate the traffic quickly?

It is recommended to migrate application data from MySQL to TiDB using TiDB Data Migration tool. You can migrate the read and write traffic in batches by editing the network configuration as needed. Deploy a stable network LB (such as HAproxy, LVS, F5, and DNS) on the upper layer, in order to implement seamless migration by directly editing the network configuration.

15.5.3.2 Is there a limit for the total write and read capacity in TiDB?

The total read capacity has no limit. You can increase the read capacity by adding more TiDB servers. Generally the write capacity has no limit as well. You can increase the write capacity by adding more TiKV nodes.

15.5.3.3 The error message `transaction too large` is displayed

Due to the limitation of the underlying storage engine, each key-value entry (one row) in TiDB should be no more than 6MB. You can adjust the `txn-entry-size-limit` configuration value up to 120MB.

Distributed transactions need two-phase commit and the bottom layer performs the Raft replication. If a transaction is very large, the commit process would be quite slow and the write conflict is more likely to occur. Moreover, the rollback of a failed transaction leads to an unnecessary performance penalty. To avoid these problems, we limit the total size of key-value entries to no more than 100MB in a transaction by default. If you need larger transactions, modify the value of `txn-total-size-limit` in the TiDB configuration file. The maximum value of this configuration item is up to 10G. The actual limitation is also affected by the physical memory of the machine.

There are similar limits on Google Cloud Spanner.

15.5.3.4 How to import data in batches?

When you import data, insert in batches and keep the number of rows within 10,000 for each batch.

15.5.3.5 Does TiDB release space immediately after deleting data?

None of the `DELETE`, `TRUNCATE` and `DROP` operations release data immediately. For the `TRUNCATE` and `DROP` operations, after the TiDB GC (Garbage Collection) time (10 minutes by default), the data is deleted and the space is released. For the `DELETE` operation, the data is deleted but the space is not released according to TiDB GC. When subsequent data is written into RocksDB and executes `COMPACT`, the space is reused.

15.5.3.6 Can I execute DDL operations on the target table when loading data?

No. None of the DDL operations can be executed on the target table when you load data, otherwise the data fails to be loaded.

15.5.3.7 Does TiDB support the `replace into` syntax?

Yes.

15.5.3.8 Why does the query speed getting slow after deleting data?

Deleting a large amount of data leaves a lot of useless keys, affecting the query efficiency. The Region Merge feature can solve this problem. For more details, see the deleting data section in TiDB Best Practices.

15.5.3.9 What is the most efficient way of deleting data?

When deleting a large amount of data, it is recommended to use `Delete from t where xx limit 5000;`. It deletes through the loop and uses `Affected Rows == 0` as a condition to end the loop, so as not to exceed the limit of transaction size. With the prerequisite of meeting business filtering logic, it is recommended to add a strong filter index column or directly use the primary key to select the range, such as `id >= 5000*n+m and id < 5000*(n+1)+m`.

If the amount of data that needs to be deleted at a time is very large, this loop method will get slower and slower because each deletion traverses backward. After deleting the previous data, lots of deleted flags remain for a short period (then all will be processed by Garbage Collection) and influence the following Delete statement. If possible, it is recommended to refine the Where condition. See details in TiDB Best Practices.

15.5.3.10 How to improve the data loading speed in TiDB?

- The TiDB Lightning tool is developed for distributed data import. It should be noted that the data import process does not perform a complete transaction process for performance reasons. Therefore, the ACID constraint of the data being imported during the import process cannot be guaranteed. The ACID constraint of the imported data can only be guaranteed after the entire import process ends. Therefore, the

applicable scenarios mainly include importing new data (such as a new table or a new index) or the full backup and restoring (truncate the original table and then import data).
- Data loading in TiDB is related to the status of disks and the whole cluster. When loading data, pay attention to metrics like the disk usage rate of the host, TiClient Error, Backoff, Thread CPU and so on. You can analyze the bottlenecks using these metrics.

15.6 Upgrade and After Upgrade FAQs

This document introduces some FAQs and their solutions when or after you upgrade TiDB.

15.6.1 Upgrade FAQs

This section lists some FAQs and their solutions when you upgrade TiDB.

15.6.1.1 What are the effects of rolling updates?

When you apply rolling updates to the TiDB services, the running application is affected to varying degrees. Therefore, it is not recommended that you perform a rolling update during business peak hours. You need to configure the minimum cluster topology (TiDB * 2, PD * 3, TiKV * 3). If the Pump or Drainer service is involved in the cluster, it is recommended to stop Drainer before rolling updates. When you upgrade TiDB, Pump is also upgraded.

15.6.1.2 Can I upgrade the TiDB cluster during the DDL execution?

- If the TiDB version before upgrade is earlier than v7.1.0:
    - **DO NOT** upgrade a TiDB cluster when a DDL statement is being executed in the cluster (usually for the time-consuming DDL statements such as `ADD INDEX` and the column type changes). Before the upgrade, it is recommended to use the `ADMIN SHOW DDL` command to check whether the TiDB cluster has an ongoing DDL job. If the cluster has a DDL job, to upgrade the cluster, wait until the DDL execution is finished or use the `ADMIN CANCEL DDL` command to cancel the DDL job before you upgrade the cluster.
    - During the cluster upgrade, **DO NOT** execute any DDL statement. Otherwise, the issue of undefined behavior might occur.
- If the TiDB version before upgrade is v7.1.0 or later:
    - You do not need to follow the restrictions of upgrading from an earlier version to v7.1.0. That is, TiDB can receive user DDL tasks during the upgrade. For details, refer to TiDB Smooth Upgrade.

15.6.1.3 How to upgrade TiDB using the binary?

It is not recommended to upgrade TiDB using the binary. Instead, it is recommended to upgrade TiDB using TiUP or upgrade a TiDB cluster on Kubernetes, which ensures both version consistency and compatibility.

15.6.2 After upgrade FAQs

This section lists some FAQs and their solutions after you upgrade TiDB.

15.6.2.1 The character set (charset) errors when executing DDL operations

In v2.1.0 and earlier versions (including all versions of v2.0), the character set of TiDB is UTF-8 by default. But starting from v2.1.1, the default character set has been changed into UTF8MB4.

If you explicitly specify the charset of a newly created table as UTF-8 in v2.1.0 or earlier versions, then you might fail to execute DDL operations after upgrading TiDB to v2.1.1.

To avoid this issue, you need to pay attention to:

- Before v2.1.3, TiDB does not support modifying the charset of the column. Therefore, when you execute DDL operations, you need to make sure that the charset of the new column is consistent with that of the original column.
- Before v2.1.3, even if the charset of the column is different from that of the table, `show create table` does not show the charset of the column. But as shown in the following example, you can view it by obtaining the metadata of the table through the HTTP API.

15.6.2.1.1 `unsupported modify column charset utf8mb4 not match origin utf8`

- Before upgrading, the following operations are executed in v2.1.0 and earlier versions.

```
create table t(a varchar(10)) charset=utf8;
```

```
Query OK, 0 rows affected
Time: 0.106s
```

```
show create table t;
```

```
+-------+-------------------------------------------------------+
| Table | Create Table                                          |
+-------+-------------------------------------------------------+
| t     | CREATE TABLE `t` (                                    |
```

```
|       |   `a` varchar(10) DEFAULT NULL                    |
|       | ) ENGINE=InnoDB DEFAULT CHARSET=utf8 COLLATE=utf8_bin |
+-------+-----------------------------------------------------+
1 row in set
Time: 0.006s
```

- After upgrading, the following error is reported in v2.1.1 and v2.1.2 but there is no such error in v2.1.3 and the later versions.

```
alter table t change column a a varchar(20);
```

```
ERROR 1105 (HY000): unsupported modify column charset utf8mb4 not match
    ↪  origin utf8
```

Solution:

You can explicitly specify the column charset as the same with the original charset.

```
alter table t change column a a varchar(22) character set utf8;
```

- According to Point #1, if you do not specify the column charset, UTF8MB4 is used by default, so you need to specify the column charset to make it consistent with the original one.
- According to Point #2, you can obtain the metadata of the table through the HTTP API, and find the column charset by searching the column name and the keyword "Charset".

```
curl "http://$IP:10080/schema/test/t" | python -m json.tool
```

A python tool is used here to format JSON, which is not required and only for the convenience to add the comments.

```
{
    "ShardRowIDBits": 0,
    "auto_inc_id": 0,
    "charset": "utf8", # The charset of the table.
    "collate": "",
    "cols": [          # The relevant information about the columns.
        {
            ...
            "id": 1,
            "name": {
                "L": "a",
                "O": "a"  # The column name.
            },
```

```
            "offset": 0,
            "origin_default": null,
            "state": 5,
            "type": {
                "Charset": "utf8", # The charset of column a.
                "Collate": "utf8_bin",
                "Decimal": 0,
                "Elems": null,
                "Flag": 0,
                "Flen": 10,
                "Tp": 15
            }
        }
    ],
    ...
}
```

15.6.2.1.2 unsupported modify charset from utf8mb4 to utf8

- Before upgrading, the following operations are executed in v2.1.1 and v2.1.2.

```
create table t(a varchar(10)) charset=utf8;
```

```
Query OK, 0 rows affected
Time: 0.109s
```

```
show create table t;
```

```
+-------+-------------------------------------------------------+
| Table | Create Table                                          |
+-------+-------------------------------------------------------+
| t     | CREATE TABLE `t` (                                    |
|       |   `a` varchar(10) DEFAULT NULL                        |
|       | ) ENGINE=InnoDB DEFAULT CHARSET=utf8 COLLATE=utf8_bin |
+-------+-------------------------------------------------------+
```

In the above example, `show create table` only shows the charset of the table, but the charset of the column is actually UTF8MB4, which can be confirmed by obtaining the schema through the HTTP API. However, when a new table is created, the charset of the column should stay consistent with that of the table. This bug has been fixed in v2.1.3.

- After upgrading, the following operations are executed in v2.1.3 and the later versions.

```
show create table t;
```

```
+-------+-------------------------------------------------------------------+
    ↪
| Table | Create Table                                                      |
+-------+-------------------------------------------------------------------+
    ↪
| t     | CREATE TABLE `t` (                                                |
|       |   `a` varchar(10) CHARSET utf8mb4 COLLATE utf8mb4_bin DEFAULT
    ↪ NULL |
|       | ) ENGINE=InnoDB DEFAULT CHARSET=utf8 COLLATE=utf8_bin             |
+-------+-------------------------------------------------------------------+
    ↪
1 row in set
Time: 0.007s
```

```
alter table t change column a a varchar(20);
```

```
ERROR 1105 (HY000): unsupported modify charset from utf8mb4 to utf8
```

Solution:

- Starting from v2.1.3, TiDB supports modifying the charsets of the column and the table, so it is recommended to modify the table charset into UTF8MB4.

```
alter table t convert to character set utf8mb4;
```

- You can also specify the column charset as done in Issue #1, making it stay consistent with the original column charset (UTF8MB4).

```
alter table t change column a a varchar(20) character set utf8mb4;
```

15.6.2.1.3 ERROR 1366 (HY000): incorrect utf8 value f09f8c80( ) for column a

In TiDB v2.1.1 and earlier versions, if the charset is UTF-8, there is no UTF-8 Unicode encoding check on the inserted 4-byte data. But in v2.1.2 and the later versions, this check is added.

- Before upgrading, the following operations are executed in v2.1.1 and earlier versions.

```
create table t(a varchar(100) charset utf8);
```

```
Query OK, 0 rows affected
```

```
insert t values (unhex('f09f8c80'));
```

```
Query OK, 1 row affected
```

- After upgrading, the following error is reported in v2.1.2 and the later versions.

```
insert t values (unhex('f09f8c80'));
```

```
ERROR 1366 (HY000): incorrect utf8 value f09f8c80( ) for column a
```

Solution:

- In v2.1.2: this version does not support modifying the column charset, so you have to skip the UTF-8 check.

```
set @@session.tidb_skip_utf8_check=1;
```

```
Query OK, 0 rows affected
```

```
insert t values (unhex('f09f8c80'));
```

```
Query OK, 1 row affected
```

- In v2.1.3 and the later versions: it is recommended to modify the column charset into UTF8MB4. Or you can set `tidb_skip_utf8_check` to skip the UTF-8 check. But if you skip the check, you might fail to replicate data from TiDB to MySQL because MySQL executes the check.

```
alter table t change column a a varchar(100) character set utf8mb4;
```

```
Query OK, 0 rows affected
```

```
insert t values (unhex('f09f8c80'));
```

```
Query OK, 1 row affected
```

Specifically, you can use the variable `tidb_skip_utf8_check` to skip the legal UTF-8 and UTF8MB4 check on the data. But if you skip the check, you might fail to replicate the data from TiDB to MySQL because MySQL executes the check.

If you only want to skip the UTF-8 check, you can set `tidb_check_mb4_value_in_utf8`. This variable is added to the `config.toml` file in v2.1.3, and you can modify `check-mb4-value-in-utf8` in the configuration file and then restart the cluster to enable it.

Starting from v2.1.5, you can set `tidb_check_mb4_value_in_utf8` through the HTTP API and the session variable:

- HTTP API (the HTTP API can be enabled only on a single server)
  - To enable HTTP API:

```
curl -X POST -d "check_mb4_value_in_utf8=1" http://{TiDBIP
    ↪ }:10080/settings
```

  - To disable HTTP API:

```
curl -X POST -d "check_mb4_value_in_utf8=0" http://{TiDBIP
    ↪ }:10080/settings
```

- Session variable
  - To enable session variable:

```
set @@session.tidb_check_mb4_value_in_utf8 = 1;
```

  - To disable session variable:

```
set @@session.tidb_check_mb4_value_in_utf8 = 0;
```

15.7 TiDB Monitoring FAQs

This document summarizes the FAQs related to TiDB monitoring.

- For details of Prometheus monitoring framework, see Overview of the Monitoring Framework.
- For details of key metrics of monitoring, see Key Metrics.

15.7.1 Is there a better way of monitoring the key metrics?

The monitoring system of TiDB consists of Prometheus and Grafana. From the dashboard in Grafana, you can monitor various running metrics of TiDB which include the monitoring metrics of system resources, of client connection and SQL operation, of internal communication and Region scheduling. With these metrics, the database administrator can better understand the system running status, running bottlenecks and so on. In the practice of monitoring these metrics, we list the key metrics of each TiDB component. Generally you only need to pay attention to these common metrics. For details, see official documentation.

15.7.2 The Prometheus monitoring data is deleted every 15 days by default. Could I set it to two months or delete the monitoring data manually?

Yes. Find the startup script on the machine where Prometheus is started, edit the startup parameter and restart Prometheus.

```
--storage.tsdb.retention="60d"
```

15.7.3 Region Health monitor

In TiDB 2.0, Region health is monitored in the PD metric monitoring page, in which the `Region Health` monitoring item shows the statistics of all the Region replica status. `miss` means shortage of replicas and `extra` means the extra replica exists. In addition, `Region Health` also shows the isolation level by `label`. `level-1` means the Region replicas are isolated physically in the first `label` level. All the Regions are in `level-0` when `location label` is not configured.

15.7.4 What is the meaning of `selectsimplefull` in Statement Count monitor?

It means full table scan but the table might be a small system table.

15.7.5 What is the difference between `QPS` and `Statement OPS` in the monitor?

The `QPS` statistics is about all the SQL statements, including `use database`, `load data`, `begin`, `commit`, `set`, `show`, `insert` and `select`.

The `Statement OPS` statistics is only about applications related SQL statements, including `select`, `update` and `insert`, therefore the `Statement OPS` statistics matches the applications better.

15.8 TiDB Cluster Management FAQs

This document summarizes the FAQs related to TiDB cluster management.

15.8.1 Daily management

This section describes common problems you might encounter during daily cluster management, their causes, and solutions.

15.8.1.1 How to log into TiDB?

You can log into TiDB like logging into MySQL. For example:

```
mysql -h 127.0.0.1 -uroot -P4000
```

15.8.1.2 How to modify the system variables in TiDB?

Similar to MySQL, TiDB includes static and solid parameters. You can directly modify static parameters using `SET GLOBAL xxx = n`, but the new value of a parameter is only effective within the life cycle in this instance.

15.8.1.3 Where and what are the data directories in TiDB (TiKV)?

TiKV data is located in the `--data-dir`, which include four directories of backup, db, raft, and snap, used to store backup, data, Raft data, and mirror data respectively.

15.8.1.4 What are the system tables in TiDB?

Similar to MySQL, TiDB includes system tables as well, used to store the information required by the server when it runs. See TiDB system table.

15.8.1.5 Where are the TiDB/PD/TiKV logs?

By default, TiDB/PD/TiKV outputs standard error in the logs. If a log file is specified by `--log-file` during the startup, the log is output to the specified file and executes rotation daily.

15.8.1.6 How to safely stop TiDB?

- If a load balancer is running (recommended): Stop the load balancer and execute the SQL statement `SHUTDOWN`. Then TiDB waits for a period as specified by `graceful-wait-before-shutdown` until all sessions are terminated. Then TiDB stops running.
- If no load balancer is running: Execute the `SHUTDOWN` statement. Then TiDB components are gracefully stopped.

15.8.1.7 Can `kill` be executed in TiDB?

- Kill DML statements:

  First use `information_schema.cluster_processlist` to find TiDB instance address and session ID, and then run the kill command.

  TiDB v6.1.0 introduces the Global Kill feature (controlled by the `enable-global-kill` configuration, which is enabled by default). If Global Kill is enabled, just execute `kill session_id`.

  If the TiDB version is earlier than v6.1.0, or the Global Kill feature is not enabled, `kill session_id` does not take effect by default. To terminate a DML statement, you should connect the client directly to the TiDB instance that is executing the DML statement and then execute the `kill tidb session_id` statement. If the client connects to another TiDB instance or there is a proxy between the client and the TiDB cluster, the `kill tidb session_id` statement might be routed to another TiDB instance, which might incorrectly terminate another session. For details, see `KILL`.

- Kill DDL statements: First use `admin show ddl jobs` to find the ID of the DDL job you need to terminate, and then run `admin cancel ddl jobs 'job_id' [, 'job_id'] ...`. For more details, see the `ADMIN` statement.

15.8.1.8 Does TiDB support session timeout?

TiDB currently supports the following timeouts: `wait_timeout`, `interactive_timeout`, and `tidb_idle_transaction_timeout`.

15.8.1.9 What is the TiDB version management strategy?

For details about TiDB version management, see TiDB versioning.

15.8.1.10 How about the operating cost of deploying and maintaining a TiDB cluster?

TiDB provides a few features and tools, with which you can manage the clusters easily at a low cost:

- For maintenance operations, TiUP works as the package manager, which simplifies the deployment, scaling, upgrade, and other maintenance tasks.
- For monitoring, the TiDB monitoring framework uses Prometheus to store the monitoring and performance metrics, and uses Grafana to visualize these metrics. Dozens of built-in panels are available with hundreds of metrics.
- For troubleshooting, the TiDB Troubleshooting Map summarizes common issues of the TiDB server and other components. You can use this map to diagnose and resolve issues when you encounter related problems.

15.8.1.11 What's the difference between various TiDB master versions?

The TiDB community is highly active. The engineers have been keeping optimizing features and fixing bugs. Therefore, the TiDB version is updated quite fast. If you want to keep informed of the latest version, see TiDB Release Timeline.

It is recommended to deploy TiDB using TiUP or using TiDB Operator. TiDB has a unified management of the version number. You can view the version number using one of the following methods:

- `select tidb_version()`
- `tidb-server -V`

15.8.1.12 Is there a graphical deployment tool for TiDB?

Currently no.

15.8.1.13 How to scale out a TiDB cluster?

You can scale out your TiDB cluster without interrupting the online services.

- If your cluster is deployed using TiUP, refer to Scale a TiDB Cluster Using TiUP.
- If your cluster is deployed using TiDB Operator on Kubernetes, refer to Manually Scale TiDB on Kubernetes.

15.8.1.14 How to scale TiDB horizontally?

As your business grows, your database might face the following three bottlenecks:

- Lack of storage resources which means that the disk space is not enough.
- Lack of computing resources such as high CPU occupancy.
- Not enough write and read capacity.

You can scale TiDB as your business grows.

- If the disk space is not enough, you can increase the capacity simply by adding more TiKV nodes. When the new node is started, PD will migrate the data from other nodes to the new node automatically.
- If the computing resources are not enough, check the CPU consumption situation first before adding more TiDB nodes or TiKV nodes. When a TiDB node is added, you can configure it in the Load Balancer.
- If the capacity is not enough, you can add both TiDB nodes and TiKV nodes.

15.8.1.15 If Percolator uses distributed locks and the crash client keeps the lock, will the lock not be released?

For more details, see Percolator and TiDB Transaction Algorithm in Chinese.

15.8.1.16 Why does TiDB use gRPC instead of Thrift? Is it because Google uses it?

Not really. We need some good features of gRPC, such as flow control, encryption and streaming.

15.8.1.17 What does the 92 indicate in `like(bindo.customers.name, jason%, 92)`?

The 92 indicates the escape character, which is ASCII 92 by default.

15.8.1.18 Why does the data length shown by `information_schema.tables.data_length` differ from the store size on the TiKV monitoring panel?

Two reasons:

- The two results are calculated in different ways. `information_schema.tables.data_length` is an estimated value by calculating the averaged length of each row, while the store size on the TiKV monitoring panel sums up the length of the data files (the SST files of RocksDB) in a single TiKV instance.

- `information_schema.tables.data_length` is a logical value, while the store size is a physical value. The redundant data generated by multiple versions of the transaction is not included in the logical value, while the redundant data is compressed by TiKV in the physical value.

15.8.1.19 Why does the transaction not use the Async Commit or the one-phase commit feature?

In the following situations, even you have enabled the Async Commit feature and the one-phase commit feature using the system variables, TiDB will not use these features:

- If you have enabled TiDB Binlog, restricted by the implementation of TiDB Binlog, TiDB does not use the Async Commit or one-phase commit feature.
- TiDB uses the Async Commit or one-phase commit features only when no more than 256 key-value pairs are written in the transaction and the total size of keys is no more than 4 KB. This is because, for transactions with a large amount of data to write, using Async Commit cannot greatly improve the performance.

15.8.2 PD management

This section describes common problems you may encounter during PD management, their causes, and solutions.

15.8.2.1 The `TiKV cluster is not bootstrapped` message is displayed when I access PD

Most of the APIs of PD are available only when the TiKV cluster is initialized. This message is displayed if PD is accessed when PD is started while TiKV is not started when a new cluster is deployed. If this message is displayed, start the TiKV cluster. When TiKV is initialized, PD is accessible.

15.8.2.2 The `etcd cluster ID mismatch` message is displayed when starting PD

This is because the `--initial-cluster` in the PD startup parameter contains a member that doesn't belong to this cluster. To solve this problem, check the corresponding cluster of each member, remove the wrong member, and then restart PD.

15.8.2.3 The `[PD:encryption:ErrEncryptionNewMasterKey]fail to get encryption key from file /root/path/file%!(EXTRA string=open /root/path/file: permission denied)` message is displayed when enabling encryption at rest for PD

Encryption at rest does not support storing the key file in the `root` directory or its subdirectories. Even if you grant read permissions, the same error occurs. To resolve this issue, store the key file in a location outside the `root` directory.

15.8.2.4 What's the maximum tolerance for time synchronization error of PD?

PD can tolerate any synchronization error, but a larger error value means a larger gap between the timestamp allocated by the PD and the physical time, which will affect functions such as read of historical versions.

15.8.2.5 How does the client connection find PD?

The client connection can only access the cluster through TiDB. TiDB connects PD and TiKV. PD and TiKV are transparent to the client. When TiDB connects to any PD, the PD tells TiDB who is the current leader. If this PD is not the leader, TiDB reconnects to the leader PD.

15.8.2.6 What is the relationship between each status (Up, Disconnect, Offline, Down, Tombstone) of a TiKV store?

For the relationship between each status, refer to Relationship between each status of a TiKV store.

You can use PD Control to check the status information of a TiKV store.

15.8.2.7 What is the difference between the `leader-schedule-limit` and `region-schedule-limit` scheduling parameters in PD?

- The `leader-schedule-limit` scheduling parameter is used to balance the Leader number of different TiKV servers, affecting the load of query processing.
- The `region-schedule-limit` scheduling parameter is used to balance the replica number of different TiKV servers, affecting the data amount of different nodes.

15.8.2.8 Is the number of replicas in each region configurable? If yes, how to configure it?

Yes. Currently, you can only update the global number of replicas. When started for the first time, PD reads the configuration file (conf/pd.yml) and uses the max-replicas configuration in it. If you want to update the number later, use the pd-ctl configuration command `config set max-replicas $num` and view the enabled configuration using `config show all`. The updating does not affect the applications and is configured in the background.

Make sure that the total number of TiKV instances is always greater than or equal to the number of replicas you set. For example, 3 replicas need 3 TiKV instances at least. Additional storage requirements need to be estimated before increasing the number of replicas. For more information about pd-ctl, see PD Control User Guide.

15.8.2.9 How to check the health status of the whole cluster when lacking command line cluster management tools?

You can determine the general status of the cluster using the pd-ctl tool. For detailed cluster status, you need to use the monitor to determine.

15.8.2.10 How to delete the monitoring data of a cluster node that is offline?

The offline node usually indicates the TiKV node. You can determine whether the offline process is finished by the pd-ctl or the monitor. After the node is offline, perform the following steps:

1. Manually stop the relevant services on the offline node.
2. Delete the `node_exporter` data of the corresponding node from the Prometheus configuration file.

15.8.3 TiDB server management

This section describes common problems you may encounter during TiDB server management, their causes, and solutions.

15.8.3.1 How to set the `lease` parameter in TiDB?

The lease parameter (`--lease=60`) is set from the command line when starting a TiDB server. The value of the lease parameter impacts the Database Schema Changes (DDL) speed of the current session. In the testing environments, you can set the value to 1s for to speed up the testing cycle. But in the production environments, it is recommended to set the value to minutes (for example, 60) to ensure the DDL safety.

15.8.3.2 What is the processing time of a DDL operation?

The processing time is different for different scenarios. Generally, you can consider the following three scenarios:

1. The `Add Index` operation with a relatively small number of rows in the corresponding data table: about 3s
2. The `Add Index` operation with a relatively large number of rows in the corresponding data table: the processing time depends on the specific number of rows and the QPS at that time (the `Add Index` operation has a lower priority than ordinary SQL operations)
3. Other DDL operations: about 1s

If the TiDB server instance that receives the DDL request is the same TiDB server instance that the DDL owner is in, the first and third scenarios above may cost only dozens to hundreds of milliseconds.

15.8.3.3 Why it is very slow to run DDL statements sometimes?

Possible reasons:

- If you run multiple DDL statements together, the last few DDL statements might run slowly. This is because the DDL statements are executed serially in the TiDB cluster.
- After you start the cluster successfully, the first DDL operation may take a longer time to run, usually around 30s. This is because the TiDB cluster is electing the leader that processes DDL statements.
- The processing time of DDL statements in the first ten minutes after starting TiDB would be much longer than the normal case if you meet the following conditions: 1) TiDB cannot communicate with PD as usual when you are stopping TiDB (including the case of power failure); 2) TiDB fails to clean up the registration data from PD in time because TiDB is stopped by the `kill -9` command. If you run DDL statements during this period, for the state change of each DDL, you need to wait for 2 * lease (lease = 45s).
- If a communication issue occurs between a TiDB server and a PD server in the cluster, the TiDB server cannot get or update the version information from the PD server in time. In this case, you need to wait for 2 * lease for the state processing of each DDL.

15.8.3.4 Can I use S3 as the backend storage engine in TiDB?

No. Currently, TiDB only supports the distributed storage engine and the Goleveldb/RocksDB/BoltDB engine.

15.8.3.5 Can the `Information_schema` support more real information?

As part of MySQL compatibility, TiDB supports a number of `INFORMATION_SCHEMA` ↪ tables. Many of these tables also have a corresponding SHOW command. For more information, see Information Schema.

15.8.3.6 What's the explanation of the TiDB Backoff type scenario?

In the communication process between the TiDB server and the TiKV server, the `Server` ↪ `is busy` or `backoff.maxsleep 20000ms` log message is displayed when processing a large volume of data. This is because the system is busy while the TiKV server processes data. At this time, usually you can view that the TiKV host resources usage rate is high. If this occurs, you can increase the server capacity according to the resources usage.

15.8.3.7 What is the main reason of TiDB TiClient type?

The TiClient Region Error indicator describes the error types and metrics that appear when the TiDB server as a client accesses the TiKV server through the KV interface to perform data operations. The error types include `not_leader` and `stale_epoch`. These errors occur when the TiDB server manipulates the Region leader data according to its own cache information, the Region leader has migrated, or the current TiKV Region information

and the routing information of the TiDB cache are inconsistent. Generally, in this case, the TiDB server will automatically retrieve the latest routing data from PD and redo the previous operation.

15.8.3.8 What's the maximum number of concurrent connections that TiDB supports?

By default, there is no limit on the maximum number of connections per TiDB server. If needed, you can limit the maximum number of connections by setting `instance.max_connections` in the `config.toml` file, or changing the value of the system variable `max_connections`. If too large concurrency leads to an increase of response time, it is recommended to increase the capacity by adding TiDB nodes.

15.8.3.9 How to view the creation time of a table?

The `create_time` of tables in the `information_schema` is the creation time.

15.8.3.10 What is the meaning of `EXPENSIVE_QUERY` in the TiDB log?

When TiDB is executing a SQL statement, the query will be `EXPENSIVE_QUERY` if each operator is estimated to process over 10,000 rows. You can modify the `tidb-server` configuration parameter to adjust the threshold and then restart the `tidb-server`.

15.8.3.11 How do I estimate the size of a table in TiDB?

To estimate the size of a table in TiDB, you can use the following query statement.

```
SELECT
  db_name,
  table_name,
  ROUND(SUM(total_size / cnt), 2) Approximate_Size,
  ROUND(
    SUM(
      total_size / cnt / (
        SELECT
          ROUND(AVG(value), 2)
        FROM
          METRICS_SCHEMA.store_size_amplification
        WHERE
          value > 0
      )
    ),
    2
  ) Disk_Size
FROM
  (
```

```
    SELECT
      db_name,
      table_name,
      region_id,
      SUM(Approximate_Size) total_size,
      COUNT(*) cnt
    FROM
      information_schema.TIKV_REGION_STATUS
    WHERE
      db_name = @dbname
      AND table_name IN (@table_name)
    GROUP BY
      db_name,
      table_name,
      region_id
  ) tabinfo
GROUP BY
  db_name,
  table_name;
```

When using the above statement, you need to fill in and replace the following fields in the statement as appropriate.

- `@dbname`: the name of the database.
- `@table_name`: the name of the target table.

In addition, in the above statement:

- `store_size_amplification` indicates the average of the cluster compression ratio. In addition to using `SELECT * FROM METRICS_SCHEMA.store_size_amplification;` to query this information, you can also check the **Size amplification** metric for each node on the **Grafana Monitoring PD - statistics balance** panel. The average of the cluster compression ratio is the average of the Size amplification for all nodes.
- `Approximate_Size` indicates the size of the table in a replica before compression. Note that this is an approximate value, not an accurate one.
- `Disk_Size` indicates the size of the table after compression. This is an approximate value and can be calculated according to `Approximate_Size` and `store_size` ↪ `_amplification`.

15.8.4 TiKV server management

This section describes common problems you might encounter during TiKV server management, their causes, and solutions.

15.8.4.1 How to specify the location of data for compliance or multi-tenant applications?

You can use Placement Rules to specify the location of data for compliance or multi-tenant applications.

Placement Rules in SQL is designed to control the attributes of any continuous data range, such as the number of replicas, the Raft role, the placement location, and the key ranges in which the rules take effect.

15.8.4.2 What is the recommended number of replicas in the TiKV cluster? Is it better to keep the minimum number for high availability?

3 replicas for each Region is sufficient for a testing environment. However, you should never operate a TiKV cluster with under 3 nodes in a production scenario. Depending on infrastructure, workload, and resiliency needs, you may wish to increase this number. It is worth noting that the higher the copy, the lower the performance, but the higher the security.

15.8.4.3 The `cluster ID mismatch` message is displayed when starting TiKV

This is because the cluster ID stored in local TiKV is different from the cluster ID specified by PD. When a new PD cluster is deployed, PD generates random cluster IDs. TiKV gets the cluster ID from PD and stores the cluster ID locally when it is initialized. The next time when TiKV is started, it checks the local cluster ID with the cluster ID in PD. If the cluster IDs don't match, the `cluster ID mismatch` message is displayed and TiKV exits.

If you previously deploy a PD cluster, but then you remove the PD data and deploy a new PD cluster, this error occurs because TiKV uses the old data to connect to the new PD cluster.

15.8.4.4 The `duplicated store address` message is displayed when starting TiKV

This is because the address in the startup parameter has been registered in the PD cluster by other TiKVs. Common conditions that cause this error: There is no data folder in the path specified by TiKV `--data-dir` (no update –data-dir after deleting or moving), restart the TiKV with the previous parameters.Please try store delete function of pd-ctl, delete the previous store, and then restart TiKV.

15.8.4.5 TiKV primary node and secondary node use the same compression algorithm, why the results are different?

Currently, some files of TiKV primary node have a higher compression rate, which depends on the underlying data distribution and RocksDB implementation. It is normal that the data size fluctuates occasionally. The underlying storage engine adjusts data as needed.

15.8.4.6 What are the features of TiKV block cache?

TiKV implements the Column Family (CF) feature of RocksDB. By default, the KV data is eventually stored in the 3 CFs (default, write and lock) within RocksDB.

- The default CF stores real data and the corresponding parameter is in `[rocksdb.defaultcf]`.
- The write CF stores the data version information (MVCC) and index-related data, and the corresponding parameter is in `[rocksdb.writecf]`.
- The lock CF stores the lock information and the system uses the default parameter.
- The Raft RocksDB instance stores Raft logs. The default CF mainly stores Raft logs and the corresponding parameter is in `[raftdb.defaultcf]`.
- All CFs have a shared block-cache to cache data blocks and improve RocksDB read speed. The size of block-cache is controlled by the `block-cache-size` parameter. A larger value of the parameter means more hot data can be cached and is more favorable to read operation. At the same time, it consumes more system memory.
- Each CF has an individual write-buffer and the size is controlled by the `write-buffer-size` parameter.

15.8.4.7 Why is the TiKV channel full?

- The Raftstore thread is too slow or blocked by I/O. You can view the CPU usage status of Raftstore.
- TiKV is too busy (such as CPU and disk I/O) and cannot manage to handle it.

15.8.4.8 Why does TiKV frequently switch Region leader?

- Network problem results in the communication stuck among nodes. You can check Report failures monitoring.
- The node of the original main Leader is stuck, resulting in failure to reach out to the Follower in time.
- Raftstore thread stuck.

15.8.4.9 If a node is down, will the service be affected? If yes, how long?

TiKV uses Raft to replicate data among multiple replicas (by default 3 replicas for each Region). If one replica goes wrong, the other replicas can guarantee data safety. Based on the Raft protocol, if a single leader fails as the node goes down, a follower in another node is soon elected as the Region leader after a maximum of 2 * lease time (lease time is 10 seconds).

15.8.4.10 What are the TiKV scenarios that take up high I/O, memory, CPU, and exceed the parameter configuration?

Writing or reading a large volume of data in TiKV takes up high I/O, memory and CPU. Executing very complex queries costs a lot of memory and CPU resources, such as the scenario that generates large intermediate result sets.

15.8.4.11 Does TiKV support SAS/SATA disks or mixed deployment of SSD/SAS disks?

No. For OLTP scenarios, TiDB requires high I/O disks for data access and operation. As a distributed database with strong consistency, TiDB has some write amplification such as replica replication and bottom layer storage compaction. Therefore, it is recommended to use NVMe SSD as the storage disks in TiDB best practices. Mixed deployment of TiKV and PD is not supported.

15.8.4.12 Is the Range of the Key data table divided before data access?

No. It differs from the table splitting rules of MySQL. In TiKV, the table Range is dynamically split based on the size of Region.

15.8.4.13 How does Region split?

Region is not divided in advance, but it follows a Region split mechanism. When the Region size exceeds the value of the `region-max-size` or `region-max-keys` parameters, split is triggered. After the split, the information is reported to PD.

15.8.4.14 Does TiKV have the `innodb_flush_log_trx_commit` parameter like MySQL, to guarantee the security of data?

Yes. Currently, the standalone storage engine uses two RocksDB instances. One instance is used to store the raft-log. When the `sync-log` parameter in TiKV is set to true, each commit is mandatorily flushed to the raft-log. If a crash occurs, you can restore the KV data using the raft-log.

15.8.4.15 What is the recommended server configuration for WAL storage, such as SSD, RAID level, cache strategy of RAID card, NUMA configuration, file system, I/O scheduling strategy of the operating system?

WAL belongs to ordered writing, and currently, we do not apply a unique configuration to it. Recommended configuration is as follows:

- SSD
- RAID 10 preferred
- Cache strategy of RAID card and I/O scheduling strategy of the operating system: currently no specific best practices; you can use the default configuration in Linux 7 or later

- NUMA: no specific suggestion; for memory allocation strategy, you can use `interleave = all`
- File system: ext4

15.8.4.16 How is the write performance in the most strict data available mode (`sync-log = true`)?

Generally, enabling `sync-log` reduces about 30% of the performance. For write performance when `sync-log` is set to `false`, see Performance test result for TiDB using Sysbench.

15.8.4.17 Can Raft + multiple replicas in the TiKV architecture achieve absolute data safety? Is it necessary to apply the most strict mode (`sync-log = true`) to a standalone storage?

Data is redundantly replicated between TiKV nodes using the Raft Consensus Algorithm to ensure recoverability should a node failure occur. Only when the data has been written into more than 50% of the replicas will the application return ACK (two out of three nodes). However, theoretically, two nodes might crash. Therefore, except for scenarios with less strict requirement on data safety but extreme requirement on performance, it is strongly recommended that you enable the `sync-log` mode.

As an alternative to using `sync-log`, you may also consider having five replicas instead of three in your Raft group. This would allow for the failure of two replicas, while still providing data safety.

For a standalone TiKV node, it is still recommended to enable the `sync-log` mode. Otherwise, the last write might be lost in case of a node failure.

15.8.4.18 Since TiKV uses the Raft protocol, multiple network roundtrips occur during data writing. What is the actual write delay?

Theoretically, TiDB has a write delay of 4 more network roundtrips than standalone databases.

15.8.4.19 Does TiDB have an InnoDB memcached plugin like MySQL which can directly use the KV interface and does not need the independent cache?

TiKV supports calling the interface separately. Theoretically, you can take an instance as the cache. Because TiDB is a distributed relational database, we do not support TiKV separately.

15.8.4.20 What is the Coprocessor component used for?

- Reduce the data transmission between TiDB and TiKV
- Make full use of the distributed computing resources of TiKV to execute computing pushdown.

15.8.4.21 The error message `IO error: No space left on device While appending to file` is displayed

This is because the disk space is not enough. You need to add nodes or enlarge the disk space.

15.8.4.22 Why does the OOM (Out of Memory) error occur frequently in TiKV?

The memory usage of TiKV mainly comes from the block-cache of RocksDB, which is 40% of the system memory size by default. When the OOM error occurs frequently in TiKV, you should check whether the value of `block-cache-size` is set too high. In addition, when multiple TiKV instances are deployed on a single machine, you need to explicitly configure the parameter to prevent multiple instances from using too much system memory that results in the OOM error.

15.8.4.23 Can both TiDB data and RawKV data be stored in the same TiKV cluster?

It depends on your TiDB version and whether TiKV API V2 is enabled (`storage.api-version = 2`).

- If your TiDB version is v6.1.0 or later and TiKV API V2 is enabled, TiDB data and RawKV data can be stored in the same TiKV cluster.
- Otherwise, the answer is no because the key format of TiDB data (or data created using the transactional API) is incompatible with data created using the RawKV API (or data from other RawKV-based services).

15.8.5 TiDB testing

This section describes common problems you might encounter during TiDB testing, their causes, and solutions.

15.8.5.1 What is the performance test result for TiDB using Sysbench?

At the beginning, many users tend to do a benchmark test or a comparison test between TiDB and MySQL. We have also done a similar official test and find the test result is consistent at large, although the test data has some bias. Because the architecture of TiDB differs greatly from MySQL, it is hard to find a benchmark point. The suggestions are as follows:

- Do not spend too much time on the benchmark test. Pay more attention to the difference of scenarios using TiDB.
- See Performance test result for TiDB using Sysbench.

15.8.5.2 What's the relationship between the TiDB cluster capacity (QPS) and the number of nodes? How does TiDB compare to MySQL?

- Within 10 nodes, the relationship between TiDB write capacity (Insert TPS) and the number of nodes is roughly 40% linear increase. Because MySQL uses single-node write, its write capacity cannot be scaled.
- In MySQL, the read capacity can be increased by adding secondary database, but the write capacity cannot be increased except using sharding, which has many problems.
- In TiDB, both the read and write capacity can be easily increased by adding more nodes.

15.8.5.3 The performance test of MySQL and TiDB by our DBA shows that the performance of a standalone TiDB is not as good as MySQL

TiDB is designed for scenarios where sharding is used because the capacity of a MySQL standalone is limited, and where strong consistency and complete distributed transactions are required. One of the advantages of TiDB is pushing down computing to the storage nodes to execute concurrent computing.

TiDB is not suitable for tables of small size (such as below ten million level), because its strength in concurrency cannot be shown with a small size of data and limited Regions. A typical example is the counter table, in which records of a few lines are updated high frequently. In TiDB, these lines become several Key-Value pairs in the storage engine, and then settle into a Region located on a single node. The overhead of background replication to guarantee strong consistency and operations from TiDB to TiKV leads to a poorer performance than a MySQL standalone.

15.8.6 Backup and restoration

This section describes common problems you may encounter during backup and restoration, their causes, and solutions.

15.8.6.1 How to back up data in TiDB?

Currently, for the backup of a large volume of data (more than 1 TB), the preferred method is using Backup & Restore (BR). Otherwise, the recommended tool is Dumpling. Although the official MySQL tool `mysqldump` is also supported in TiDB to back up and restore data, its performance is no better than BR and it needs much more time to back up and restore large volumes of data.

For more FAQs about BR, see BR FAQs.

15.8.6.2 How is the speed of backup and restore?

When BR is used to perform backup and restore tasks, the backup is processed at about 40 MB/s per TiKV instance, and restore is processed at about 100 MB/s per TiKV instance.

15.9 High Availability FAQs

This document summarizes the FAQs related to high availability of TiDB.

15.9.1 How is TiDB strongly consistent?

Data is redundantly replicated between TiKV nodes using the Raft consensus algorithm to ensure recoverability when a node failure occurs.

At the bottom layer, TiKV uses a model of replication log + State Machine to replicate data. For the write requests, the data is written to a Leader and the Leader then replicates the command to its Followers in the form of log. When the majority of nodes in the cluster receive this log, this log is committed and can be applied into the State Machine.

15.9.2 What's the recommended solution for the deployment of three geo-distributed data centers?

The architecture of TiDB guarantees that it fully supports geo-distribution and multi-activeness. Your data and applications are always-on. All the outages are transparent to your applications and your data can recover automatically. The operation depends on the network latency and stability. It is recommended to keep the latency within 5ms. Currently, TiDB already has similar use cases. For details, see Three Data Centers in Two Cities Deployment.

15.10 High Reliability FAQs

This document summarizes the FAQs related to high reliability of TiDB.

15.10.1 Does TiDB support data encryption?

Yes. To encrypt data in the network traffic, you can enable TLS between TiDB clients and servers. To encrypt data in the storage engine, you can enable transparent data encryption (TDE).

15.10.2 Does TiDB support modifying the MySQL version string of the server to a specific one that is required by the security vulnerability scanning tool?

- Since v3.0.8, TiDB supports modifying the version string of the server by modifying `server-version` in the configuration file.
- Since v4.0, if you deploy TiDB using TiUP, you can also specify the proper version string by executing `tiup cluster edit-config <cluster-name>` to edit the following section:

```
server_configs:
  tidb:
    server-version: 'YOUR_VERSION_STRING'
```

Then, use the `tiup cluster reload <cluster-name> -R tidb` command to make the preceding modification effective to avoid the failure of security vulnerability scan.

15.10.3 What authentication protocols does TiDB support? What's the process?

Like MySQL, TiDB supports the SASL protocol for user login authentication and password processing.

When the client connects to TiDB, the challenge-response authentication mode starts. The process is as follows:

1. The client connects to the server.
2. The server sends a random string challenge to the client.
3. The client sends the username and response to the server.
4. The server verifies the response.

15.10.4 How to modify the user password and privilege?

To modify the user password in TiDB, it is recommended to use `ALTER USER` (for example, `ALTER USER 'test'@'localhost' IDENTIFIED BY 'mypass';`), not `UPDATE mysql.user` which might lead to the condition that the password in other nodes is not refreshed timely.

It is recommended to use the official standard statements when modifying the user password and privilege. For details, see TiDB user account management.

15.11 Backup & Restore FAQs

This document lists the frequently asked questions (FAQs) and the solutions of TiDB Backup & Restore (BR).

15.11.1 What should I do to quickly recover data after mistakenly deleting or updating data?

TiDB v6.4.0 introduces the flashback feature. You can use this feature to quickly recover data within the GC time to a specified point in time. Therefore, if misoperations occur, you can use this feature to recover data. For details, see Flashback Cluster and Flashback Database.

15.11.2 In TiDB v5.4.0 and later versions, when backup tasks are performed on the cluster under a heavy workload, why does the speed of backup tasks become slow?

Starting from TiDB v5.4.0, BR introduces the auto-tune feature for backup tasks. For clusters in v5.4.0 or later versions, this feature is enabled by default. When the cluster workload is heavy, the feature limits the resources used by backup tasks to reduce the impact on the online cluster. For more information, refer to Backup Auto-Tune.

TiKV supports dynamically configuring the auto-tune feature. You can enable or disable the feature by the following methods without restarting your cluster:

- Disable auto-tune: Set the TiKV configuration item `backup.enable-auto-tune` to `false`.
- Enable auto-tune: Set `backup.enable-auto-tune` to `true`. For clusters upgraded from v5.3.x to v5.4.0 or later versions, the auto-tune feature is disabled by default. You need to manually enable it.

To use `tikv-ctl` to enable or disable auto-tune, refer to Use auto-tune.

In addition, auto-tune reduces the default number of threads used by backup tasks. For details, see `backup.num-threads`](/tikv-configuration-file.md#num-threads-1). Therefore, on the Grafana Dashboard, the speed, CPU usage, and I/O resource utilization used by backup tasks are lower than those of versions earlier than v5.4.0. Before v5.4.0, the default value of `backup.num-threads` was `CPU * 0.75`, that is, the number of threads used by backup tasks makes up 75% of the logical CPU cores. The maximum value of it was `32` ↪ . Starting from v5.4.0, the default value of this configuration item is `CPU * 0.5`, and its maximum value is `8`.

When you perform backup tasks on an offline cluster, to speed up the backup, you can modify the value of `backup.num-threads` to a larger number using `tikv-ctl`.

15.11.3 PITR issues

15.11.3.1 What is the difference between PITR and cluster flashback?

From the perspective of use cases, PITR is usually used to restore the data of a cluster to a specified point in time when the cluster is completely out of service or the data is corrupted and cannot be recovered using other solutions. To use PITR, you need a new cluster for data recovery. The cluster flashback feature is specifically designed for the data error scenarios caused by user mis-operations or other factors, which allows you to restore the data of a cluster in-place to the latest timestamp before the data errors occur.

In most cases, flashback is a better recovery solution than PITR for data errors caused by human mistakes, as it has a much shorter RPO (close to zero) and RTO. However, when a cluster is completely unavailable, because flashback cannot run at this time, PITR is the only solution to recover the cluster in this case. Therefore, PITR is always a must-have solution when you develop database disaster recovery strategies, even though it has a longer RPO (up to 5 minutes) and RTO than flashback.

15.11.3.2 When the upstream database imports data using TiDB Lightning in the physical import mode, the log backup feature becomes unavailable. Why?

Currently, the log backup feature is not fully adapted to TiDB Lightning. Therefore, data imported in the physical mode of TiDB Lightning cannot be backed up into log data

In upstream clusters where you create log backup tasks, avoid using the TiDB Lightning physical mode to import data. Instead, you can use TiDB Lightning logical mode. If you do need to use the physical mode, perform a snapshot backup after the import is complete, so that PITR can be restored to the time point after the snapshot backup.

15.11.3.3 The cluster has recovered from the network partition failure, but the checkpoint of the log backup task progress still does not resume. Why?

Issue: #13126

After a network partition failure in the cluster, the backup task cannot continue backing up logs. After a certain retry time, the task will be set to `ERROR` state. At this point, the backup task has stopped.

To resolve this issue, you need to manually execute the `br log resume` command to resume the log backup task.

15.11.4 After restoring a downstream cluster using the `br restore point` command, data cannot be accessed from TiFlash. What should I do?

Currently, PITR does not support writing data directly to TiFlash during the restore phase. Instead, br command-line tool executes the `ALTER TABLE table_name SET TIFLASH REPLICA ***` DDL to replicate the data. Therefore, TiFlash replicas are not available immediately after PITR completes data restore. Instead, you need to wait for a certain period of time for the data to be replicated from TiKV nodes. To check the replication progress, check the `progress` information in the `INFORMATION_SCHEMA.tiflash_replica` table.

15.11.4.1 What should I do if the `status` of a log backup task becomes `ERROR`?

During a log backup task, the task status becomes `ERROR` if it fails and cannot be recovered after retrying. The following is an example:

```
br log status --pd x.x.x.x:2379

  Total 1 Tasks.
> #1 <
                  name: task1
                status:  ERROR
                 start: 2022-07-25 13:49:02.868 +0000
                   end: 2090-11-18 14:07:45.624 +0000
```

```
              storage: s3://tmp/br-log-backup0ef49055-5198-4be3-beab-
                 ↪ d382a2189efb/Log
           speed(est.): 0.00 ops/s
     checkpoint[global]: 2022-07-25 14:46:50.118 +0000; gap=11h31m29s
        error[store=1]: KV:LogBackup:RaftReq
error-happen-at[store=1]: 2022-07-25 14:54:44.467 +0000; gap=11h23m35s
  error-message[store=1]: retry time exceeds: and error failed to get
     ↪ initial snapshot: failed to get the snapshot (region_id = 94812):
     ↪ Error during requesting raftstore: message: "read index not ready,
     ↪ reason can not read index due to merge, region 94812" read_index_not
     ↪ _ready { reason: "can not read index due to merge" region_id: 94812
     ↪ }: failed to get initial snapshot: failed to get the snapshot (
     ↪ region_id = 94812): Error during requesting raftstore: message: "
     ↪ read index not ready, reason can not read index due to merge, region
     ↪  94812" read_index_not_ready { reason: "can not read index due to
     ↪ merge" region_id: 94812 }: failed to get initial snapshot: failed to
     ↪  get the snapshot (region_id = 94812): Error during requesting
     ↪ raftstore: message: "read index not ready, reason can not read index
     ↪  due to merge, region 94812" read_index_not_ready { reason: "can not
     ↪  read index due to merge" region_id: 94812 }
```

To address this problem, check the error message for the cause and perform as instructed. After the problem is addressed, run the following command to resume the task:

```
br log resume --task-name=task1 --pd x.x.x.x:2379
```

After the backup task is resumed, you can check the status using `br log status`. The backup task continues when the task status becomes `NORMAL`.

```
  Total 1 Tasks.
> #1 <
              name: task1
            status:  NORMAL
             start: 2022-07-25 13:49:02.868 +0000
               end: 2090-11-18 14:07:45.624 +0000
           storage: s3://tmp/br-log-backup0ef49055-5198-4be3-beab-
              ↪ d382a2189efb/Log
        speed(est.): 15509.75 ops/s
checkpoint[global]: 2022-07-25 14:46:50.118 +0000; gap=6m28s
```

Note:

This feature backs up multiple versions of data. When a long backup task fails and the status becomes `ERROR`, the checkpoint data of this task is set as

> a `safe point`, and the data of the `safe point` will not be garbage collected within 24 hours. Therefore, the backup task continues from the last checkpoint after resuming the error. If the task fails for more than 24 hours and the last checkpoint data has been garbage collected, an error will be reported when you resume the task. In this case, you can only run the `br log stop` command to stop the task first and then start a new backup task.

15.11.4.2 What should I do if the error message `ErrBackupGCSafepointExceeded` is returned when using the `br log resume` command to resume a suspended task?

```
Error: failed to check gc safePoint, checkpoint ts 433177834291200000: GC
    ↪ safepoint 433193092308795392 exceed TS 433177834291200000: [BR:Backup
    ↪ :ErrBackupGCSafepointExceeded]backup GC safepoint exceeded
```

After you pause a log backup task, to prevent the MVCC data from being garbage collected, the pausing task program sets the current checkpoint as the service safepoint automatically. This ensures that the MVCC data generated within 24 hours can remain. If the MVCC data of the backup checkpoint has been generated for more than 24 hours, the data of the checkpoint will be garbage collected, and the backup task is unable to resume.

To address this problem, delete the current task using `br log stop`, and then create a log backup task using `br log start`. At the same time, you can perform a full backup for subsequent PITR.

15.11.5 Feature compatibility issues

15.11.5.1 Why does data restored using br command-line tool cannot be replicated to the upstream cluster of TiCDC or Drainer?

- **The data restored using BR cannot be replicated to the downstream**. This is because BR directly imports SST files but the downstream cluster currently cannot obtain these files from the upstream.
- Before v4.0.3, DDL jobs generated during the restore might cause unexpected DDL executions in TiCDC/Drainer. Therefore, if you need to perform restore on the upstream cluster of TiCDC/Drainer, add all tables restored using br command-line tool to the TiCDC/Drainer block list.

You can use `filter.rules` to configure the block list for TiCDC and use `syncer.ignore-table` to configure the block list for Drainer.

15.11.5.2 Why is `new_collation_enabled` mismatch reported during restore?

Since TiDB v6.0.0, the default value of `new_collations_enabled_on_first_bootstrap` has changed from `false` to `true`. BR backs up the `new_collation_enabled` configuration in the `mysql.tidb` table of the upstream cluster and then checks whether the value of this configuration is consistent between the upstream and downstream clusters. If the value is consistent, BR safely restores the data backed up in the upstream cluster to the downstream cluster. If the value is inconsistent, BR does not perform the data restore and reports an error.

Suppose that you have backed up the data in a TiDB cluster of an earlier version of v6.0.0, and you want to restore this data to a TiDB cluster of v6.0.0 or later versions. In this situation, you need to manually check whether the value of `new_collations_enabled_on_first_bootstrap` is consistent between the upstream and downstream clusters:

- If the value is consistent, you can add `--check-requirements=false` to the restore command to skip this configuration check.
- If the value is inconsistent, and you forcibly perform the restore, BR reports a data validation error.

15.11.5.3 Why does an error occur when I restore placement rules to a cluster?

Before v6.0.0, BR does not support placement rules. Starting from v6.0.0, BR supports placement rules and introduces a command-line option `--with-tidb-placement-mode=strict/ignore` to control the backup and restore mode of placement rules. With the default value `strict`, BR imports and validates placement rules, but ignores all placement rules when the value is `ignore`.

15.11.6 Data restore issues

15.11.6.1 What should I do to handle the `Io(Os...)` error?

Almost all of these problems are system call errors that occur when TiKV writes data to the disk, for example, `Io(Os {code: 13, kind: PermissionDenied...})` or `Io(Os {code: 2, kind: NotFound...})`.

To address such problems, first check the mounting method and the file system of the backup directory, and try to back up data to another folder or another hard disk.

For example, you might encounter the `Code: 22(invalid argument)` error when backing up data to the network disk built by `samba`.

15.11.6.2 What should I do to handle the `rpc error: code = Unavailable desc =...` error occurred in restore?

This error might occur when the capacity of the cluster to restore is insufficient. You can further confirm the cause by checking the monitoring metrics of this cluster or the TiKV log.

To handle this issue, you can try to scale out the cluster resources, reduce the concurrency during restore, and enable the `RATE_LIMIT` option.

15.11.6.3 What should I do if the restore fails with the error message `the entry too large, the max entry size is 6291456, the size of data is 7690800`?

You can try to reduce the number of tables to be created in a batch by setting `--ddl-batch-size` to `128` or a smaller value.

When using BR to restore the backup data with the value of `--ddl-batch-size` greater than `1`, TiDB writes a DDL job of table creation to the DDL jobs queue that is maintained by TiKV. At this time, the total size of all tables schema sent by TiDB at one time should not exceed 6 MB, because the maximum value of job messages is `6 MB` by default (it is **not recommended** to modify this value. For details, see `txn-entry-size-limit` and `raft-entry-max-size`). Therefore, if you set `--ddl-batch-size` to an excessively large value, the schema size of the tables sent by TiDB in a batch at one time exceeds the specified value, which causes BR to report the `entry too large, the max entry size is 6291456, the size of data is 7690800` error.

15.11.6.4 Where are the backed up files stored when I use `local` storage?

> **Note:**
>
> If no Network File System (NFS) is mounted to a BR or TiKV node, or if you use external storage that supports Amazon S3, GCS, or Azure Blob Storage protocols, the data backed up by BR is generated at each TiKV node.**Note that this is not the recommended way to deploy BR**, because the backup data are scattered in the local file system of each node. Collecting the backup data might result in data redundancy and operation and maintenance problems. Meanwhile, if you restore data directly before collecting the backup data, you will encounter the `SST file not found` error.

When you use local storage, `backupmeta` is generated on the node where BR is running, and backup files are generated on the Leader nodes of each Region.

15.11.6.5 What should I do if the error message `could not read local://...:download sst failed` is returned during data restore?

When you restore data, each node must have access to **all** backup files (SST files). By default, if `local` storage is used, you cannot restore data because the backup files are scattered among different nodes. Therefore, you have to copy the backup file of each TiKV node to the other TiKV nodes. **It is recommended that you store backup data to Amazon S3, Google Cloud Storage (GCS), Azure Blob Storage, or NFS**.

15.11.6.6 What should I do to handle the `Permission denied` or `No such file or directory` error, even if I have tried to run `br` using root in vain?

You need to confirm whether TiKV has access to the backup directory. To back up data, confirm whether TiKV has the write permission. To restore data, confirm whether it has the read permission.

During the backup operation, if the storage medium is the local disk or a network file system (NFS), make sure that the user to start `br` and the user to start TiKV are consistent (if `br` and TiKV are on different machines, the users' UIDs must be consistent). Otherwise, the `Permission denied` issue might occur.

Running `br` as the `root` user might fail due to the disk permission, because the backup files (SST files) are saved by TiKV.

> **Note:**
>
> You might encounter the same problem during data restore. When the SST files are read for the first time, the read permission is verified. The execution duration of DDL suggests that there might be a long interval between checking the permission and running `br`. You might receive the error message `Permission denied` after waiting for a long time.

Therefore, it is recommended to check the permission before data restore according to the following steps:

1. Run the Linux command for process query:

```
ps aux | grep tikv-server
```

The output is as follows:

```
tidb_ouo 9235 10.9 3.8 2019248 622776 ?  Ssl  08:28  1:12 bin/tikv-
    ↪ server --addr 0.0.0.0:20162 --advertise-addr 172.16.6.118:20162
    ↪ --status-addr 0.0.0.0:20188 --advertise-status-addr
    ↪ 172.16.6.118:20188 --pd 172.16.6.118:2379 --data-dir /home/user1/
    ↪ tidb-data/tikv-20162 --config conf/tikv.toml --log-file /home/
    ↪ user1/tidb-deploy/tikv-20162/log/tikv.log
tidb_ouo 9236 9.8  3.8 2048940 631136 ?   Ssl  08:28  1:05 bin/tikv-
    ↪ server --addr 0.0.0.0:20161 --advertise-addr 172.16.6.118:20161
    ↪ --status-addr 0.0.0.0:20189 --advertise-status-addr
    ↪ 172.16.6.118:20189 --pd 172.16.6.118:2379 --data-dir /home/user1/
    ↪ tidb-data/tikv-20161 --config conf/tikv.toml --log-file /home/
    ↪ user1/tidb-deploy/tikv-20161/log/tikv.log
```

Or you can run the following command:

```
ps aux | grep tikv-server | awk '{print $1}'
```

The output is as follows:

```
tidb_ouo
tidb_ouo
```

2. Query the startup information of the cluster using the `tiup` command:

```
tiup cluster list
```

The output is as follows:

```
[root@Copy-of-VM-EE-CentOS76-v1 br]# tiup cluster list
Starting component `cluster`: /root/.tiup/components/cluster/v1.5.2/
    ↪ tiup-cluster list
Name         User     Version Path
    ↪                                        PrivateKey
----         ----     ------- ----
    ↪                                        ----------
tidb_cluster tidb_ouo v5.0.2 /root/.tiup/storage/cluster/clusters/tidb_
    ↪ cluster /root/.tiup/storage/cluster/clusters/tidb_cluster/ssh/id_
    ↪ rsa
```

3. Check the permission for the backup directory. For example, `backup` is for backup data storage:

```
ls -al backup
```

The output is as follows:

```
[root@Copy-of-VM-EE-CentOS76-v1 user1]# ls -al backup
total 0
drwxr-xr-x 2 root root 6 Jun 28 17:48 .
drwxr-xr-x 11 root root 310 Jul 4 10:35 ..
```

From the output of step 2, you can find that the `tikv-server` instance is started by the user `tidb_ouo`. But the user `tidb_ouo` does not have the write permission for `backup`. Therefore, the backup fails.

15.11.6.7 Why are tables in the `mysql` schema not restored?

Starting from BR v5.1.0, when you perform a full backup, BR backs up the **tables in the `mysql` schema**. Before BR v6.2.0, under default configuration, BR only restores user data, but does not restore tables in the **`mysql` schema**.

To restore a table created by the user in the `mysql` schema (not system tables), you can explicitly include the table using table filters. The following example shows how to restore the `mysql.usertable` table when BR performs a normal restore.

```
br restore full -f '*.*' -f '!mysql.*' -f 'mysql.usertable' -s $external_
    ↪ storage_url --with-sys-table
```

In the preceding command,

- `-f '*.*'` is used to override the default rules
- `-f '!mysql.*'` instructs BR not to restore tables in `mysql` unless otherwise stated.
- `-f 'mysql.usertable'` indicates that `mysql.usertable` should be restored.

If you only need to restore `mysql.usertable`, run the following command:

```
br restore full -f 'mysql.usertable' -s $external_storage_url --with-sys-
    ↪ table
```

Note that even if you configures table filter, **BR does not restore the following system tables**:

- Statistics tables (`mysql.stat_*`). But statistics can be restored. See Back up statistics.
- System variable tables (`mysql.tidb`, `mysql.global_variables`)
- Other system tables

15.11.6.8 How to deal with the error of `cannot find rewrite rule` during restoration?

Examine whether there are tables in the restoration cluster sharing the same name as other tables in the backup data but having inconsistent structures. In most cases, this issue is caused by missing indexes in the tables of the restoration cluster. A recommended approach is to delete such tables in the restoration cluster first and then retry restoration.

15.11.7 Other things you may want to know about backup and restore

15.11.7.1 What is the size of the backup data? Are there replicas of the backup?

During data backup, backup files are generated on the Leader nodes of each Region. The size of the backup is equal to the data size, with no redundant replicas. Therefore, the total data size is approximately the total number of TiKV data divided by the number of replicas.

However, if you want to restore data from local storage, the number of replicas is equal to that of the TiKV nodes, because each TiKV must have access to all backup files.

15.11.7.2 Why is the disk usage shown on the monitoring node inconsistent after backup or restore using BR?

This inconsistency is caused by the fact that the data compression rate used in backup is different from the default rate used in restore. If the checksum succeeds, you can ignore this issue.

15.11.7.3 After BR restores the backup data, do I need to execute the `ANALYZE` statement on the table to update the statistics of TiDB on the tables and indexes?

BR does not back up statistics (except in v4.0.9). Therefore, after restoring the backup data, you need to manually execute `ANALYZE TABLE` or wait for TiDB to automatically execute `ANALYZE`.

In v4.0.9, BR backs up statistics by default, which consumes too much memory. To ensure that the backup process goes well, the backup for statistics is disabled by default starting from v4.0.10.

If you do not execute `ANALYZE` on the table, TiDB will fail to select the optimal execution plan due to inaccurate statistics. If query performance is not a key concern, you can ignore `ANALYZE`.

15.11.7.4 Can I start multiple restore tasks at the same time to restore the data of a single cluster?

It is strongly not recommended to start multiple restore tasks at the same time to restore the data of a single cluster for the following reasons:

- When BR restores data, it modifies some global configurations of PD. Therefore, if you start multiple restore tasks for data restore at the same time, these configurations might be mistakenly overwritten and cause abnormal cluster status.
- BR consumes a lot of cluster resources to restore data, so in fact, running restore tasks in parallel improves the restore speed only to a limited extent.
- There has been no test for running multiple restore tasks in parallel for data restore, so it is not guaranteed to succeed.

15.11.7.5 Does BR back up the `SHARD_ROW_ID_BITS` and `PRE_SPLIT_REGIONS` information of a table? Does the restored table have multiple Regions?

Yes. BR backs up the `SHARD_ROW_ID_BITS` and `PRE_SPLIT_REGIONS` information of a table. The data of the restored table is also split into multiple Regions.

15.11.8 If the recovery process is interrupted, is it necessary to delete the already recovered data and start the recovery again?

No, it is not necessary. Starting from v7.1.0, BR supports resuming data from a breakpoint. If the recovery is interrupted due to unexpected circumstances, simply restart the

recovery task, and it will resume from where it left off.

15.11.9 After the recovery is complete, can I delete a specific table and then recover it again?

Yes, after deleting a specific table, you can recover it again. But note that, you can only recover tables that are deleted using the `DROP TABLE` or `TRUNCATE TABLE` statement, not the `DELETE FROM` statement. This is because `DELETE FROM` only updates the MVCC version to mark the data to be deleted, and the actual data deletion occurs after GC.

15.11.9.1 Why does BR take a lot of memory when restoring statistics information?

Before v7.6.0, the statistics data backed up by BR is stored together with the table information and loaded into memory during recovery. Therefore, when the backup statistics data is very large, BR needs to occupy a large amount of memory.

Starting from v7.6.0, the backup statistics is stored in a specific file separately. BR does not load statistic data of any table until BR starts to restore the table, which saves memory.

16 Release Notes

16.1 TiDB Release Notes

16.1.1 8.0

- 8.0.0-DMR: 2024-03-29

16.1.2 7.6

- 7.6.0-DMR: 2024-01-25

16.1.3 7.5

- 7.5.3: 2024-08-05
- 7.5.2: 2024-06-13
- 7.5.1: 2024-02-29

16.3 TiDB Versioning

It is recommended to always upgrade to the latest patch release of your release series.

TiDB offers two release series:

- Long-Term Support Releases
- Development Milestone Releases (introduced in TiDB v6.0.0)

To learn about the support policy for major releases of TiDB, see TiDB Release Support Policy.

16.3.1 Release versioning

TiDB versioning has the form of `X.Y.Z`. `X.Y` represents a release series.

- Since TiDB 1.0, `X` increments every year. Each `X` release introduces new features and improvements.
- `Y` increments from 0. Each `Y` release introduces new features and improvements.
- In the first release of a release series, `Z` is set to 0 by default. For patch releases, `Z` increments from 1.

For the versioning system of TiDB v5.0.0 and earlier versions, refer to Historical versioning.

16.3.2 Long-Term Support releases

Long-Term Support (LTS) versions are released approximately every six months and introduce new features, improvements, bug fixes and security vulnerability fixes.

LTS releases are versioned as `X.Y.Z`. `Z` defaults to 0.

Example versions:

- 6.1.0
- 5.4.0

During the lifecycle of LTS, patch releases are made available on demand. Patch releases contain bug fixes and security vulnerability fixes, and do not introduce new features.

Patch releases are versioned as `X.Y.Z`. `X.Y` is consistent with the corresponding LTS versioning. The patch number `Z` increments from 1.

Example version:

- 6.1.1

v5.1.0, v5.2.0, v5.3.0, v5.4.0 were released only two months after their preceding releases, but all four releases are LTS and provide patch releases.

16.3.3 Development Milestone Releases

Development Milestone Releases (DMR) are released approximately every two months that do not contain LTS. DMR versions introduce new features, improvements and bug fixes. TiDB does not provide patch releases based on DMR, and any related bugs are fixed in the subsequent release series.

DMRs are versioned as `X.Y.Z`. `Z` defaults to 0. A `-DMR` suffix is appended to the version number.

Example version:

- 6.0.0-DMR

16.3.4 Versioning of TiDB ecosystem tools

Some TiDB tools are released together with the TiDB server and use the same version numbering system, such as TiDB Lightning. Some TiDB tools are released separately from the TiDB server and use their own version numbering system, such as TiUP and TiDB Operator.

16.3.5 Historical versioning (deprecated)

16.3.5.1 General Availability releases

General Availability (GA) releases are stable versions of the current release series of TiDB. GA versions are released after Release Candidate (RC) versions. GA can be used in production environments.

Example versions:

- 1.0
- 2.1 GA
- 5.0 GA

16.3.5.2 Release Candidate releases

Release Candidate (RC) releases introduce new features and improvements. RC versions are significantly more stable than Beta versions. RC can be used for early testing, but are not suitable for production.

Example versions:

- RC1
- 2.0-RC1
- 3.0.0-rc.1

16.3.5.3 Beta releases

Beta releases introduces new features and improvements. Beta versions are greatly improved over Alpha versions and have eliminated critical bugs, but still contain some bugs. Beta releases are available for users to test the latest features.

Example versions:

- 1.1 Beta
- 2.1 Beta
- 4.0.0-beta.1

16.3.5.4 Alpha releases

Alpha releases are internal releases for testing and introduce new features and improvements. Alpha releases are the initial versions of the current release series. Alpha releases might have some bugs and are available for users to test the latest features.

Example version:

- 1.1 Alpha

16.4 TiDB Installation Packages

Before deploying TiUP offline, you need to download the binary packages of TiDB as described in Prepare the TiUP offline component package.

TiDB binary packages are available in amd64 and arm64 architectures. In either architecture, TiDB provides two binary packages: `TiDB-community-server` and `TiDB-community-toolkit`.

The `TiDB-community-server` package contains the following contents.

Content	Change history
tidb-{version}-linux-{arch}.tar.gz	
tikv-{version}-linux-{arch}.tar.gz	
tiflash-{version}-linux-{arch}.tar.gz	
pd-{version}-linux-{arch}.tar.gz

16.5 v8.0

16.5.1 TiDB 8.0.0 Release Notes

Release date: March 29, 2024

TiDB version: 8.0.0

Quick access: Quick start

8.0.0 introduces the following key features and improvements:

```
<th>Category</th>
<th>Feature/Enhancement</th>
<th>Description</th>
```

```
<td rowspan="4">Scalability and Performance</td>
<td><a href="https://docs.pingcap.com/tidb/v8.0/pd-microservices">
   ↪ Disaggregation of PD to improve scalability (experimental)</a> </td>
<td>Placement Driver (PD) contains multiple critical modules to ensure the
   ↪ normal operation of TiDB clusters. As the workload of a cluster
   ↪ increases, the resource consumption of each module in PD also
   ↪ increases, causing mutual interference between these modules and
   ↪ ultimately affecting the overall service quality of the cluster.
   ↪ Starting from v8.0.0, TiDB addresses this issue by splitting the TSO
```

```
    ↪ and scheduling modules in PD into independently deployable
    ↪ microservices. This can significantly reduce the mutual interference
    ↪ between modules as the cluster scales. With this architecture, much
    ↪ larger clusters with much larger workloads are now possible.</td>
```

```
<td><a href="https://docs.pingcap.com/tidb/v8.0/system-variables#tidb_dml_
    ↪ type-new-in-v800">Bulk DML for much larger transactions (experimental
    ↪ )</a></td>
<td>Large batch DML jobs, such as extensive cleanup jobs, joins, or
    ↪ aggregations, can consume a significant amount of memory and have
    ↪ previously been limited at very large scales. Bulk DML (<code>tidb_
    ↪ dml_type = "bulk"</code>) is a new DML type for handling large batch
    ↪ DML tasks more efficiently while providing transaction guarantees and
    ↪  mitigating OOM issues. This feature differs from import, load, and
    ↪ restore operations when used for data loading.</td>
```

```
<td><a href="https://docs.pingcap.com/tidb/v8.0/br-snapshot-guide#restore-
    ↪ cluster-snapshots">Acceleration of cluster snapshot restore speed (GA
    ↪ ) </a></td>
<td>With this feature, BR can fully leverage the scale advantage of a
    ↪ cluster, enabling all TiKV nodes in the cluster to participate in the
    ↪  preparation step of data restores. This feature can significantly
    ↪ improve the restore speed of large datasets in large-scale clusters.
    ↪ Real-world tests show that this feature can saturate the download
    ↪ bandwidth, with the download speed improving by 8 to 10 times, and
    ↪ the end-to-end restore speed improving by approximately 1.5 to 3
    ↪ times.</td>
```

```
<td>Enhance the stability of caching the schema information when there is a
    ↪ massive number of tables (experimental)</td>
<td>SaaS companies using TiDB as the system of record for their multi-tenant
    ↪  applications often need to store a substantial number of tables. In
    ↪ previous versions, handling table counts in the order of a million or
    ↪  more was feasible, but it had the potential to degrade the overall
    ↪ user experience. TiDB v8.0.0 improves the situation by implementing a
    ↪  <a href="https://docs.pingcap.com/tidb/v8.0/system-variables#tidb_
    ↪ enable_auto_analyze_priority_queue-new-in-v800">priority queue</a>
    ↪ for <code>auto analyze</code>, making the process less rigid and
    ↪ enhancing stability across a wider array of tables.</td>
```

```
<td rowspan="1">DB Operations and Observability</td>
<td>Support monitoring index usage statistics </td>
<td>Proper index design is a crucial prerequisite to maintaining database
    ↪ performance. TiDB v8.0.0 introduces the <a href="https://docs.pingcap
    ↪ .com/tidb/v8.0/information-schema-tidb-index-usage"><code>INFORMATION
```

```
    ↪ _SCHEMA.TIDB_INDEX_USAGE</code></a> table and the <a href="https://
    ↪ docs.pingcap.com/tidb/v8.0/sys-schema-unused-indexes"><code>sys.
    ↪ schema_unused_indexes</code></a> view to provide usage statistics of
    ↪ indexes. This feature helps you assess the efficiency of indexes in
    ↪ the database and optimize the index design.</td>
```

```
<td rowspan="2">Data Migration</td>
<td>TiCDC adds support for <a href="https://docs.pingcap.com/tidb/v8.0/ticdc
    ↪ -simple-protocol">the Simple protocol</a> </td>
<td>TiCDC introduces a new protocol, the Simple protocol. This protocol
    ↪ provides in-band schema tracking capabilities by embedding table
    ↪ schema information in DDL and BOOTSTRAP events.</td>
```

```
<td>TiCDC adds support for <a href="https://docs.pingcap.com/tidb/v8.0/ticdc
    ↪ -debezium">the Debezium format protocol</a> </td>
<td>TiCDC introduces a new protocol, the Debezium protocol. TiCDC can now
    ↪ publish data change events to a Kafka sink using a protocol that
    ↪ generates Debezium style messages.</td>
```

16.5.1.1 Feature details

16.5.1.1.1 Scalability

- PD supports the microservice mode (experimental) #5766 @binshi-bing

  Starting from v8.0.0, PD supports the microservice mode. This mode splits the timestamp allocation and cluster scheduling functions of PD into separate microservices that can be deployed independently, thereby enhancing performance scalability for PD and addressing performance bottlenecks of PD in large-scale clusters.

  - `tso` microservice: provides monotonically increasing timestamp allocation for the entire cluster.
  - `scheduling` microservice: provides scheduling functions for the entire cluster, including but not limited to load balancing, hot spot handling, replica repair, and replica placement.

Each microservice is deployed as an independent process. If you configure more than one replica for a microservice, the microservice automatically implements a primary-secondary fault-tolerant mode to ensure high availability and reliability of the service.

```
Currently, PD microservices can only be deployed using TiDB Operator. It is
    ↪ recommended to consider this mode when PD becomes a significant
    ↪ performance bottleneck that cannot be resolved by scaling up.

For more information, see [documentation](#pd-microservices).
```

- Enhance the usability of the Titan engine #16245 @Connor1996
    - Enable the shared cache for Titan blob files and RocksDB block files by default (`shared-blob-cache` defaults to `true`), eliminating the need to configure `blob-cache-size` separately.
    - Support dynamically modifying `min-blob-size`, `blob-file-compression`, and `discardable-ratio` to improve performance and flexibility when using the Titan engine.

For more information, see documentation.

16.5.1.1.2 Performance

- BR improves snapshot restore speed (GA) #50701 @3pointer @Leavrth

Starting from TiDB v8.0.0, the acceleration of snapshot restore speed is now generally available (GA) and enabled by default. BR improves the snapshot restore speed significantly by implementing various optimizations such as adopting the coarse-grained Region scattering algorithm, creating databases and tables in batches, reducing the mutual impact between SST file downloads and ingest operations, and accelerating the restore of table statistics. According to test results from real-world cases, the data restore speed of a single TiKV node stabilizes at 1.2 GiB/s, and 100 TiB of data can be restored within one hour.

This means that even in high-load environments, BR can fully utilize the resources of each TiKV node, significantly reducing database restore time, enhancing the availability and reliability of databases, and reducing downtime and business losses caused by data loss or system failures. Note that the increase in restore speed is attributed to the parallel execution of a large number of goroutines, which can result in significant memory consumption, especially when there are many tables or Regions. It is recommended to use machines with higher memory capacity to run the BR client. If the memory capacity of the machine is limited, it is recommended to use a finer-grained Region scattering algorithm. In addition, because the coarse-grained Region scattering algorithm might consume a significant amount of external storage bandwidth, you need to avoid any impact on other applications due to insufficient external bandwidth.

For more information, see documentation.

- Support pushing down the following functions to TiFlash #50975 #50485 @yibin87 @windtalker
    - `CAST(DECIMAL AS DOUBLE)`
    - `POWER()`

For more information, see documentation.

- The parallel HashAgg algorithm of TiDB supports disk spill (experimental) #35637 @xzhangxian1008

  In earlier versions of TiDB, the concurrency algorithm of the HashAgg operator does not support disk spill. If the execution plan of a SQL statement contains the parallel HashAgg operator, all the data for that SQL statement can only be processed in memory. Consequently, TiDB has to process a large amount of data in memory. When the data size exceeds the memory limit, TiDB can only choose the non-parallel algorithm, which does not leverage concurrency for performance improvement.

  In v8.0.0, the parallel HashAgg algorithm of TiDB supports disk spill. Under any parallel conditions, the HashAgg operator can automatically trigger data spill based on memory usage, thus balancing performance and data throughput. Currently, as an experimental feature, TiDB introduces the `tidb_enable_parallel_hashagg_spill` variable to control whether to enable the parallel HashAgg algorithm that supports disk spill. When this variable is `ON`, it means enabled. This variable will be deprecated after the feature is generally available in a future release.

  For more information, see documentation.

- Introduce the priority queue for automatic statistics collection #50132 @hi-rustin

  Maintaining optimizer statistics up-to-date is the key to stabilizing database performance. Most users rely on the automatic statistics collection provided by TiDB to collect the latest statistics. Automatic statistics collection checks the status of statistics for all objects, and adds unhealthy objects to a queue for sequential collections. In previous versions, the order is random, which could result in excessive waits for more worthy candidates to be updated, causing potential performance regressions.

  Starting from v8.0.0, automatic statistics collection dynamically sets priorities for objects in combination with a variety of conditions to ensure that more deserving candidates are processed in priority, such as newly created indexes and partitioned tables with definition changes. Additionally, TiDB prioritizes tables with lower health scores, placing them at the top of the queue. This enhancement makes the order of collection more reasonable, and reduces performance problems caused by outdated statistics, therefore improving database stability.

  For more information, see documentation.

- Remove some limitations on execution plan cache #49161 @mjonss @qw4990

  TiDB supports plan cache, which can effectively reduce the latency of OLTP systems and is important for performance. In v8.0.0, TiDB removes several limitations on plan cache. Execution plans with the following items can be cached now:

  - Partitioned tables
  - Generated columns, including objects that depend on generated columns (such as multi-valued indexes)

This enhancement extends the use cases of plan cache and improves the overall database performance in complex scenarios.

```
For more information, see [documentation](#sql-prepared-execution-plan-cache
    ↪ ).
```

- Optimizer enhances support for multi-valued indexes #47759 #46539 @Arenatlx @time-and-fate

  TiDB v6.6.0 introduces multi-value indexes to improve query performance for JSON data types. In v8.0.0, the optimizer enhances its support for multi-valued indexes and can correctly identify and utilize them to optimize queries in complex scenarios.

  - The optimizer collects statistics on multi-valued indexes and decides execution plans with the statistics. If several multi-value indexes can be selected by a SQL statement, the optimizer can identify the one with lower cost.
  - When using `OR` to connect multiple `member of` conditions, the optimizer can match an effective index partial path for each DNF item (a `member of` condition) and combine these paths using Union to form an `Index Merge`. This achieves more efficient condition filtering and data fetch.

  For more information, see documentation.

- Support configuring the update interval for low-precision TSO #51081 @Tema

  The low-precision TSO feature in TiDB uses regularly updated TSO as the transaction timestamp. In scenarios where reading outdated data is acceptable, this feature reduces the overhead of obtaining TSO for small read-only transactions by sacrificing real-time performance and improves the ability of high-concurrency reads.

  Before v8.0.0, the TSO update interval of low-precision TSO feature is fixed and cannot be adjusted according to actual application requirements. In v8.0.0, TiDB introduces the system variable `tidb_low_resolution_tso_update_interval` to control the TSO update interval. This feature takes effect only when the low-precision TSO feature is enabled.

  For more information, see documentation.

16.5.1.1.3 Availability

- The proxy component TiProxy becomes generally available (GA) #413 @djshow832 @xhebox

  TiDB v7.6.0 introduces the proxy component TiProxy as an experimental feature. TiProxy is the official proxy component of TiDB, located between the client and TiDB server. It provides load balancing and connection persistence functions for TiDB, making the workload of the TiDB cluster more balanced and not affecting user access to the database during maintenance operations.

In v8.0.0, TiProxy becomes generally available and enhances the automatic generation of signature certificates and monitoring functions.

The usage scenarios of TiProxy are as follows:

- During maintenance operations such as rolling restarts, rolling upgrades, and scaling-in in a TiDB cluster, changes occur in the TiDB servers which result in interruptions in connections between clients and the TiDB servers. By using TiProxy, connections can be smoothly migrated to other TiDB servers during these maintenance operations so that clients are not affected.
- Client connections to a TiDB server cannot be dynamically migrated to other TiDB servers. When the workload of multiple TiDB servers is unbalanced, it might result in a situation where the overall cluster resources are sufficient, but certain TiDB servers experience resource exhaustion leading to a significant increase in latency. To address this issue, TiProxy provides dynamic migration for connection, which allows connections to be migrated from one TiDB server to another without any impact on the clients, thereby achieving load balancing for the TiDB cluster.

TiProxy has been integrated into TiUP, TiDB Operator, and TiDB Dashboard, making it easy to configure, deploy, and maintain.

```
For more information, see [documentation](#tiproxy-overview).
```

16.5.1.1.4 SQL

- Support a new DML type for handling a large amount of data (experimental) #50215 @ekexium

  Before v8.0.0, TiDB stores all transaction data in memory before committing. When processing a large amount of data, the memory required for transactions becomes a bottleneck that limits the transaction size that TiDB can handle. Although TiDB introduces non-transactional DML to attempt to solve the transaction size limitation by splitting SQL statements, this feature has various limitations and does not provide an ideal experience in actual scenarios.

  Starting from v8.0.0, TiDB supports a DML type for handling a large amount of data. This DML type writes data to TiKV in a timely manner during execution, avoiding the continuous storage of all transaction data in memory, and thus supports handling a large amount of data that exceeds the memory limit. This DML type ensures transaction integrity and uses the same syntax as standard DML. `INSERT`, `UPDATE`, `REPLACE`, and `DELETE` statements can use this new DML type to execute large-scale DML operations.

  This DML type is implemented by the Pipelined DML feature and only takes effect on statements with auto-commit enabled. You can control whether to enable this DML type by setting the system variable `tidb_dml_type`.

  For more information, see documentation.

- Support using some expressions to set default column values when creating a table (experimental) #50936 @zimulala

  Before v8.0.0, when you create a table, the default value of a column is limited to strings, numbers, and dates. Starting from v8.0.0, you can use some expressions as the default column values. For example, you can set the default value of a column to `UUID()`. This feature helps you meet more diverse requirements.

  For more information, see documentation.

- Support the `div_precision_increment` system variable #51501 @yibin87

  MySQL 8.0 supports the variable `div_precision_increment`, which specifies the number of digits by which to increase the scale of the result of a division operation performed using the `/` operator. Before v8.0.0, TiDB does not support this variable, and division is performed to 4 decimal places. Starting from v8.0.0, TiDB supports this variable. You can specify the number of digits by which to increase the scale of the result of a division operation as desired.

  For more information, see documentation.

16.5.1.1.5 DB operations

- PITR supports Amazon S3 Object Lock #51184 @RidRisR

  Amazon S3 Object Lock can help prevent backup data from accidental or intentional deletion during a specified retention period, enhancing the security and integrity of data. Starting from v6.3.0, BR supports Amazon S3 Object Lock for snapshot backups, adding an additional layer of security for full backups. Starting from v8.0.0, PITR also supports Amazon S3 Object Lock. Whether for full backups or log data backups, the Object Lock feature ensures more reliable data protection, further strengthening the security of data backup and recovery and meeting regulatory requirements.

  For more information, see documentation.

- Support making invisible indexes visible at the session level #50653 @hawkingrei

  By default, the optimizer does not select invisible indexes. This mechanism is usually used to evaluate whether to delete an index. If there is uncertainty about the potential performance impact of deleting an index, you have the option to set the index to invisible temporarily and promptly restore it to visible when needed.

  Starting from v8.0.0, you can set the session-level system variable `tidb_opt_use_invisible_indexes` to `ON` to make the current session aware of invisible indexes. With this feature, you can create a new index and test its performance by making the index visible first, and then modifying the system variable in the current session for testing without affecting other sessions. This improvement enhances the safety of SQL tuning and helps to improve the stability of production databases.

  For more information, see documentation.

- Support writing general logs to a separate file #51248 @Defined2014

  The general log is a MySQL-compatible feature that logs all executed SQL statements to help diagnose issues. TiDB also supports this feature. You can enable it by setting the variable `tidb_general_log`. However, in previous versions, the content of general logs can only be written to the TiDB instance log along with other information, which is inconvenient for users who need to keep logs for a long time.

  Starting from v8.0.0, you can write the general log to a specified file by setting the configuration item `log.general-log-file` to a valid filename. The general log follows the same rotation and retention policies as the instance log.

  In addition, to reduce the disk space occupied by historical log files, TiDB v8.0.0 introduces a native log compression option. You can set the configuration item `log.file.compression` to `gzip` to automatically compress rotated logs using the `gzip` format.

  For more information, see documentation.

16.5.1.1.6 Observability

- Support monitoring index usage statistics #49830 @YangKeao

  Proper index design is a crucial prerequisite to maintaining database performance. TiDB v8.0.0 introduces the `INFORMATION_SCHEMA.TIDB_INDEX_USAGE` table, which records the statistics of all indexes on the current TiDB node, including the following information:

  - The cumulative execution count of statements that scan the index
  - The total number of rows scanned when accessing the index
  - The selectivity distribution when scanning the index
  - The time of the most recent access to the index

With this information, you can identify indexes that are not used by the optimizer and indexes with poor selectivity, thereby optimizing index design to improve database performance.

```
Additionally, TiDB v8.0.0 introduces a view [`sys.schema_unused_indexes`](#`
    ↪ schema_unused_indexes`), which is compatible with MySQL. This view
    ↪ shows indexes that have not been used since the last start of TiDB
    ↪ instances. For clusters upgraded from versions earlier than v8.0.0,
    ↪ the `sys` schema and the views are not created automatically. You can
    ↪  manually create them by referring to [`sys.schema_unused_indexes`](#
    ↪ manually-create-the-schema_unused_indexes-view).

For more information, see [documentation](#tidb_index_usage).
```

16.5.1.1.7 Security

- TiKV encryption at rest supports Google Key Management Service (Cloud KMS) (experimental) #8906 @glorv

  TiKV ensures data security by encrypting stored data using the encryption at rest technique. The core of encryption at rest for security is key management. Starting from v8.0.0, you can manage the master key of TiKV using Google Cloud KMS to establish encryption-at-rest capabilities based on Cloud KMS, thereby enhancing the security of user data.

  To enable encryption at rest based on Google Cloud KMS, you need to create a key on Google Cloud and then configure the `[security.encryption.master-key]` section in the TiKV configuration file.

  For more information, see documentation.

- Enhance TiDB log desensitization #51306 @xhebox

  The enhancement of TiDB log desensitization is based on marking SQL text information in log files, facilitating the safe display of sensitive data when users view the logs. You can control whether to desensitize log information to enable secure use of TiDB logs in different scenarios, enhancing the security and flexibility of using log desensitization. To use this feature, set the system variable `tidb_redact_log` to `MARKER`. This marks the SQL text in TiDB logs. When you view the logs, sensitive data is securely displayed based on the markers, thus protecting the log information.

  For more information, see documentation.

16.5.1.1.8 Data migration

- TiCDC adds support for the Simple protocol #9898 @3AceShowHand

  TiCDC introduces a new protocol, the Simple protocol. This protocol provides in-band schema tracking capabilities by embedding table schema information in DDL and BOOTSTRAP events.

  For more information, see documentation.

- TiCDC adds support for the Debezium format protocol #1799 @breezewish

  TiCDC can now publish data change events to a Kafka sink using a protocol that generates event messages in a Debezium style format. This helps to simplify the migration from MySQL to TiDB for users who are currently using Debezium to pull data from MySQL for downstream processing.

  For more information, see documentation.

- DM supports using a user-provided secret key to encrypt and decrypt passwords of source and target databases #9492 @D3Hunter

In earlier versions, DM uses a built-in fixed secret key with relatively low security. Starting from v8.0.0, you can upload and specify a secret key file for encrypting and decrypting passwords of upstream and downstream databases. In addition, you can replace the secret key file as needed to enhance data security.

For more information, see documentation.

- Supports the `IMPORT INTO ... FROM SELECT` syntax to enhance the `IMPORT INTO` functionality (experimental) #49883 @D3Hunter

  In earlier TiDB versions, importing query results into a target table could only be done using the `INSERT INTO ... SELECT` statement, which is relatively inefficient in some large dataset scenarios. Starting from v8.0.0, TiDB enables you to use `IMPORT INTO ... FROM SELECT` to import the results of a `SELECT` query into an empty TiDB target table, which achieves up to 8 times the performance of `INSERT INTO ... SELECT` and significantly reduces the import time.

  In addition, you can use `IMPORT INTO ... FROM SELECT` to import historical data queried with `AS OF TIMESTAMP`.

For more information, see documentation.

- TiDB Lightning simplifies conflict resolution strategies and supports handling conflicting data using the `replace` strategy (experimental) #51036 @lyzx2001

  In earlier versions, TiDB Lightning has one data conflict resolution strategy for the logical import mode and two data conflict resolution strategies for the physical import mode, which are not easy to understand and configure.

  Starting from v8.0.0, TiDB Lightning deprecates the old version of conflict detection strategy for the physical import mode, enables you to control the conflict detection strategy for both logical and physical import modes via the `conflict.strategy` parameter, and simplifies the configuration of this parameter. In addition, in the physical import mode, the `replace` strategy now supports retaining the latest data and overwriting the old data when the import detects data with primary key or unique key conflicts.

  For more information, see documentation.

- Global Sort becomes generally available (GA), improving the performance and stability of `IMPORT INTO` significantly #45719 @lance6716

  Before v7.4.0, when executing `IMPORT INTO` tasks using the Distributed eXecution Framework (DXF), TiDB only locally sorts part of the data before importing it into TiKV due to limited local storage space. This results in significant overlap of the imported data in TiKV, requiring TiKV to perform additional compaction operations during import and affecting the TiKV performance and stability.

  With the Global Sort experimental feature introduced in v7.4.0, TiDB can temporarily store the data to be imported in an external storage (such as Amazon S3) for global

sorting before importing it into TiKV, which eliminates the need for TiKV compaction operations during import. In v8.0.0, Global Sort becomes GA. This feature reduces the resource consumption of TiKV and significantly improves the performance and stability of `IMPORT INTO`. If you enable the Global Sort, each `IMPORT INTO` task supports importing data within 40 TiB.

For more information, see documentation.

16.5.1.2 Compatibility changes

> **Note:**
>
> This section provides compatibility changes you need to know when you upgrade from v7.6.0 to the current version (v8.0.0). If you are upgrading from v7.5.0 or earlier versions to the current version, you might also need to check the compatibility changes introduced in intermediate versions.

- Upgrade the default Prometheus version deployed by TiUP from 2.27.1 to 2.49.1.
- Upgrade the default Grafana version deployed by TiUP from 7.5.11 to 7.5.17.
- Remove witness-related schedulers that are not GA but are enabled by default #7765 @rleungx

16.5.1.2.1 Behavior changes

- Prohibit setting `require_secure_transport` to `ON` in Security Enhanced Mode (SEM) to prevent potential connectivity issues for users. #47665 @tiancaiamao
- DM removes the fixed secret key for encryption and decryption and enables you to customize a secret key for encryption and decryption. If encrypted passwords are used in data source configurations and migration task configurations before the upgrade, you need to refer to the upgrade steps in Customize a Secret Key for DM Encryption and Decryption for additional operations. #9492 @D3Hunter
- Before v8.0.0, after enabling the acceleration of `ADD INDEX` and `CREATE INDEX` (`tidb_ddl_enable_fast_reorg = ON`), the encoded index key ingests data to TiKV with a fixed concurrency of `16`, which cannot be dynamically adjusted according to the downstream TiKV capacity. Starting from v8.0.0, you can adjust the concurrency using the `tidb_ddl_reorg_worker_cnt` system variable. The default value is `4`. Compared with the previous default value of `16`, the new default value reduces performance when ingesting indexed key-value pairs. You can adjust this system variable based on the workload of your cluster.

16.5.1.2.2 MySQL compatibility

- The `KEY` partition type supports statements with an empty list of partition fields, which is consistent with the behavior of MySQL.

16.5.1.2.3 System variables

Variable name	Change type	Description

Variable name	Change type	Description

tidb_disable_txn_auto_retry	Deprecated	Starting from v8.0.0, this system variable is deprecated, and TiDB no longer supports automatic retries of optimistic transactions. It is recommended to use the Pessimistic transaction mode. If you encounter optimistic transaction conflicts, you can cap-

Variable name	Change type	Description
`tidb_↪ ddl_↪ version↪`	Renamed	Controls whether to enable TiDB DDL V2. Starting from v8.0.0, this variable is renamed to `tidb_↪ enable↪ _↪ fast↪ _↪ create↪ _↪ table↪` to better reflect its purpose.

Variable name	Change type	Description
tidb_ ↪ enable ↪ _ ↪ collect ↪ _ ↪ execution ↪ _ ↪ info	Modified	Adds a control to whether to record the usage statistics of indexes. The default value is ON.

Variable name	Change type	Description
tidb_ ↪ redact ↪ _log	Modified	Controls how to handle user information in SAL text when logging TiDB logs and slow logs. The value options are OFF (indicating not processing user information in the log) and ON (indicating hiding user information in the log). To provide a richer way of processing user infor-

Variable name	Change type	Description
`div_precision_increment`	Newly added	Controls the number of digits by which to increase the scale of the result of a division operation performed using the / operator. This variable is the same as MySQL.

Variable name	Change type	Description
tidb_ ↪ dml_ ↪ type	Newly added	Controls the execution mode of DML statements. The value options are " ↪ standard ↪ " and "bulk" ↪ .

Variable name	Change type	Description
tidb_enable_auto_analyze_priority_queue	Newly added	Controls whether to enable the priority queue to schedule the tasks of automatically collecting statistics. When this variable is enabled, TiDB prioritizes collecting statistics for the tables that most need statistics.

Variable name	Change type	Description
tidb_enable_parallel_hashagg_spill	Newly added	Controls whether TiDB supports disk spill for the parallel HashAgg algorithm. When it is `ON`, disk spill can be triggered for the parallel HashAgg algorithm. This variable will be deprecated when this feature is generally available in a future release.

Variable name	Change type	Description
tidb_enable_fast_create_table	Newly added	Controls whether to enable TiDB Accelerates Table Creation. Set the value to ON to enable it and OFF to disable it. The default value is ON. When this variable is enabled, TiDB accelerates table creation by using CREATE TABLE .

Variable name	Change type	Description
tidb_load_binding_timeout	Newly added	Controls the timeout of loading bindings. If the execution time of loading bindings exceeds this value, the loading will stop.
tidb_low_resolution_tso_update_interval	Newly added	Controls the interval for updating TiDB cache timestamp.

Variable name	Change type	Description
tidb_ ↪ opt_ ↪ ordering ↪ _ ↪ index ↪ _ ↪ selectivity ↪ _ ↪ ratio ↪	Newly added	Controls the estimated number of rows for an index that matches the SQL statement ORDER ↪ BY when there are ORDER ↪ BY and LIMIT clauses in a SQL statement, but some filter conditions not covered by the index. The default value is -1, which means to disable

Variable name	Change type	Description
tidb_ ↪ opt_ ↪ use_ ↪ invisible ↪ _ ↪ indexes ↪	Newly added	Controls whether the optimizer can select invisible indexes for query optimization in the current session. When the variable is set to ON, the optimizer can select invisible indexes for query optimization in the session.

Variable name	Change type	Description
tidb_schema_cache_size	Newly added	Controls the upper limit of memory that can be used for caching the schema information to avoid occupying too much memory. When this feature is enabled, the LRU algorithm is used to cache the required tables, effectively reducing the memory occupied by the schema

Variable name	Change type	Description

16.5.1.2.4 Configuration file parameters

Configuration file	Configuration parameter	Change type	Description
TiDB	`instance` ↪ `.` ↪ `tidb` ↪ `_` ↪ `enable` ↪ `_` ↪ `collect` ↪ `_` ↪ `execution` ↪ `_` ↪ `info`	Modified	Adds a control to whether to record the usage statistics of indexes. The default value is `true`.
TiDB	`tls-` ↪ `version` ↪	Modified	This parameter no longer supports `"TLSv1` ↪ `.0"` and `"TLSv1` ↪ `.1"`. Now it only supports `"TLSv1` ↪ `.2"` and `"TLSv1` ↪ `.3"`.

Configuration file	Configuration parameter	Change type	Description
TiDB	`log.` ↪ `file` ↪ `.` ↪ `compression` ↪	Newly added	Specifies the compression format of the polling log. The default value is null, which means that the polling log is not compressed.
TiDB	`log.` ↪ `general` ↪ `-log` ↪ `-` ↪ `file`	Newly added	Specifies the file to save the general log to. The default is null, which means that the general log will be written to the instance file.

Configuration file	Configuration parameter	Change type	Description
TiDB	`tikv-` ↪ `client` ↪ `.` ↪ `enable` ↪ `-` ↪ `replica` ↪ `-` ↪ `selector` ↪ `-v2`	Newly added	Controls whether to use the new version of the Region replica selector when sending RPC requests to TiKV. The default value is `true`.
TiKV	`log-` ↪ `backup` ↪ `.` ↪ `initial` ↪ `-` ↪ `scan` ↪ `-` ↪ `rate` ↪ `-` ↪ `limit` ↪	Modified	Adds a limit of `1MiB` as the minimum value.

Configuration file	Configuration parameter	Change type	Description
TiKV	`raftstore` ↪ `.` ↪ `store` ↪ `-io-` ↪ `pool` ↪ `-` ↪ `size`	Modified	Changes the default value from `0` to `1` to improve TiKV performance, meaning that the size of the StoreWriter thread pool now defaults to `1`.

Configuration file	Configuration parameter	Change type	Description
TiKV	`rocksdb` ↪ `.` ↪ `defaultcf` ↪ `.` ↪ `titan` ↪ `.` ↪ `blob` ↪ `-` ↪ `cache` ↪ `-` ↪ `size`	Modified	Starting from v8.0.0, TiKV introduces the `shared-` ↪ `blob` ↪ `-` ↪ `cache` ↪ configuration item and enables it by default, so there is no need to set `blob-` ↪ `cache` ↪ `-` ↪ `size` separately. The configuration of `blob-` ↪ `cache` ↪ `-` ↪ `size` only takes effect when `shared-` ↪ `blob` ↪ `-` ↪ `cache` ↪ is set to `false`.

Configuration file	Configuration parameter	Change type	Description
TiKV	`security` ↪ `.` ↪ `encryption` ↪ `.` ↪ `master` ↪ `-key` ↪ `.` ↪ `vendor` ↪	Modified	Adds `gcp` as an available type for the service provider.
TiKV	`rocksdb` ↪ `.` ↪ `defaultcf` ↪ `.` ↪ `titan` ↪ `.` ↪ `shared` ↪ `-` ↪ `blob` ↪ `-` ↪ `cache` ↪	Newly added	Controls whether to enable the shared cache for Titan blob files and RocksDB block files. The default value is `true`.

Configuration file	Configuration parameter	Change type	Description
TiKV	security ↪ . ↪ encryption ↪ . ↪ master ↪ -key ↪ .gcp ↪ . ↪ credential ↪ - ↪ file ↪ - ↪ path	Newly added	Specifies the path to the Google Cloud authentication credentials file when security ↪ . ↪ encryption ↪ . ↪ master ↪ -key ↪ . ↪ vendor ↪ is gcp.

Configuration file	Configuration parameter	Change type	Description
TiDB Lightning	`tikv-importer.duplicate-resolution`	Deprecated	Controls whether to detect and resolve unique key conflicts in physical import mode. Starting from v8.0.0, it is replaced by `conflict.strategy`.

Configuration file	Configuration parameter	Change type	Description
TiDB Lightning	`conflict` ↪ `.` ↪ `precheck` ↪ `-` ↪ `conflict` ↪ `-` ↪ `before` ↪ `-` ↪ `import` ↪	Newly added	Controls whether to enable preprocess conflict detection, which checks conflicts in data before importing it to TiDB. The default value of this parameter is `false`, which means that TiDB Lightning only checks conflicts after the data import. This parameter can be used only in the physical import mode (`tikv-` ↪ `importer` ↪ `.`

Configuration file	Configuration parameter	Change type	Description
TiDB Lightning	`logical` ↪ `-` ↪ `import` ↪ `-` ↪ `batch` ↪ `-` ↪ `rows`	Newly added	Controls the maximum number of rows inserted per transaction in the logical import mode. The default value is 65536 rows.

Configuration file	Configuration parameter	Change type	Description
TiDB Lightning	`logical` ↪ `-` ↪ `import` ↪ `-` ↪ `batch` ↪ `-` ↪ `size`	Newly added	Controls the maximum size of each SQL query executed on the downstream TiDB server in the logical import mode. The default value is `"96KiB"`. The unit can be KB, KiB, MB, or MiB.

Configuration file	Configuration parameter	Change type	Description
Data Migration	`secret-key-path`	Newly added	Specifies the file path of the secret key, which is used to encrypt and decrypt upstream and downstream passwords. The file must contain a 64-character hexadecimal AES-256 secret key.

Configuration file	Configuration parameter	Change type	Description
TiCDC	debezium ↪ - ↪ disable ↪ - ↪ schema ↪	Newly added	Controls whether to disable the output of schema information. This parameter only takes effect when the sink type is MQ and the output protocol is Debezium.

TiCDC | tls-certificate-file | Newly added | Specifies the path to the encrypted certificate file on the client, which is required when Pulsar enables TLS encrypted transmission. |
TiCDC | tls-key-file-path | Newly added | Specifies the path to the encrypted private key on the client, which is required when Pulsar enables TLS encrypted transmission. |

16.5.1.2.5 System tables

- Add new system tables INFORMATION_SCHEMA.TIDB_INDEX_USAGE and INFORMATION ↪ _SCHEMA.CLUSTER_TIDB_INDEX_USAGE to record index usage statistics on TiDB nodes.
- Add a new system schema sys and a new view sys.schema_unused_indexes, which records indexes that have not been used since the last start of TiDB.

16.5.1.3 Deprecated features

- Starting from v8.0.0, the `tidb_disable_txn_auto_retry` system variable is deprecated, and TiDB no longer supports automatic retries of optimistic transactions. As an alternative, when encountering optimistic transaction conflicts, you can capture the error and retry transactions in your application, or use the Pessimistic transaction mode instead.
- Starting from v8.0.0, TiDB no longer supports the TLSv1.0 and TLSv1.1 protocols. You must upgrade TLS to TLSv1.2 or TLSv1.3.
- Starting from v8.0.0, TiDB Lightning deprecates the old version of conflict detection strategy for the physical import mode, and enables you to control the conflict detection strategy for both logical and physical import modes via the `conflict.strategy` parameter. The `duplicate-resolution` parameter for the old version of conflict detection will be removed in a future release.
- It is planned to redesign the auto-evolution of execution plan bindings in subsequent releases, and the related variables and behavior will change.

16.5.1.4 Improvements

- TiDB
    - Improve the performance of executing the `CREATE TABLE` DDL statement by 10 times and support linear scalability #50052 @GMHDBJD
    - Support submitting 16 `IMPORT INTO ... FROM FILE` tasks simultaneously, facilitating bulk data import into target tables and significantly improving the efficiency and performance of importing data files #49008 @D3Hunter
    - Improve the performance of spilling data to disk for the `Sort` operator #47733 @xzhangxian1008
    - Support canceling queries during spilling data to disk, which optimizes the exit mechanism of the data spill feature #50511 @wshwsh12
    - Support using an index that matches partial conditions to construct Index Join when processing table join queries with multiple equal conditions #47233 @winoros
    - Enhance the capability of Index Merge to identify sorting requirements in queries and select indexes that meet the sorting requirements #48359 @AilinKid
    - When the `Apply` operator is not executed concurrently, TiDB enables you to view the name of the operator that blocks the concurrency by executing `SHOW WARNINGS` #50256 @hawkingrei
    - Optimize the index selection for `point get` queries by selecting the most optimal index for queries when all indexes support `point get` queries #50184 @elsa0520
    - Temporarily adjust the priority of statistics synchronously loading tasks to high to avoid widespread timeouts during TiKV high loads, as these timeouts might result in statistics not being loaded #50332 @winoros
    - When the `PREPARE` statement fails to hit the execution plan cache, TiDB enables you to view the reason by executing `SHOW WARNINGS` #50407 @hawkingrei
    - Improve the accuracy of query estimation information when the same row of data is updated multiple times #47523 @terry1purcell

- Index Merge supports embedding multi-value indexes and `OR` operators in `AND` predicates #51778 @time-and-fate
- When `force-init-stats` is set to `true`, TiDB waits for statistics initialization to finish before providing services during TiDB startup. This setting no longer blocks the startup of HTTP servers, which enables users to continue monitoring #50854 @hawkingrei
- MemoryTracker can track the memory usage of the `IndexLookup` operator #45901 @solotzg
- MemoryTracker can track the memory usage of the `MemTableReaderExec` operator #51456 @wshwsh12
- Support loading Regions in batch from PD to speed up the conversion process from the KV range to Regions when querying large tables #51326 @SeaRise
- Optimize the query performance of the system tables `INFORMATION_SCHEMA.TABLES`, `INFORMATION_SCHEMA.STATISTICS`, `INFORMATION_SCHEMA.KEY_COLUMN_USAGE`, and `INFORMATION_SCHEMA.REFERENTIAL_CONSTRAINTS`. Compared with earlier versions, the performance has been improved by up to 100 times. #50305 @ywqzzy

- TiKV

    - Enhance TSO verification and detection to improve the robustness of the cluster TSO when the configuration or operation is improper #16545 @cfzjywxk
    - Optimize the logic of cleaning up pessimistic locks to improve the processing performance of uncommitted transactions #16158 @cfzjywxk
    - Introduce unified health control for TiKV to reduce the impact of abnormal single TiKV node on cluster access performance. You can disable this optimization by setting `tikv-client.enable-replica-selector-v2` to `false`. #16297 #1104 #1167 @MyonKeminta @zyguan @crazycs520
    - The PD client uses the metadata storage interface to replace the previous global configuration interface #14484 @HuSharp
    - Enhance the scanning performance by determining the data loading behavior through write cf stats #16245 @Connor1996
    - Check the latest heartbeat for nodes being deleted and voters being demoted during the Raft conf change process to ensure that this behavior does not make the Region inaccessible #15799 @tonyxuqqi
    - Add Flush and BufferBatchGet interfaces for Pipelined DML #16291 @ekexium
    - Add monitoring and alerting for cgroup CPU and memory limits #16392 @pingandb
    - Add CPU monitoring for Region workers and snapshot generation workers #16562 @Connor1996
    - Add slow logs for peer and store messages #16600 @Connor1996

- PD

    - Enhance the service discovery capability of the PD client to improve its high availability and load balancing #7576 @CabinfeverB

- Enhance the retry mechanism of the PD client #7673 @JmPotato
- Add monitoring and alerting for cgroup CPU and memory limits #7716 #7918 @pingandb @rleungx
- Improve the performance and high availability when using etcd watch #7738 #7724 #7689 @lhy1024
- Add more monitoring metrics for heartbeat to better analyze performance bottlenecks #7868 @nolouch
- Reduce the impact of the etcd leader on the PD leader #7499 @JmPotato @HuSharp
- Enhance the detection mechanism for unhealthy etcd nodes #7730 @JmPotato @HuSharp
- Optimize the output of GC safepoint in pd-ctl #7767 @nolouch
- Support dynamic modification of the historical window configuration in the hotspot scheduler #7877 @lhy1024
- Reduce the lock contention issue in creating operators #7837 @Leavrth
- Adjust GRPC configurations to improve availability #7821 @rleungx

- TiFlash

  - Support using non-constant values for the `json_path` argument in the `JSON_EXTRACT()` function #8510 @SeaRise
  - Support the `JSON_LENGTH(json, path)` function #8711 @SeaRise

- Tools

  - Backup & Restore (BR)

    - Introduce a new restore parameter `--load-stats` for the `br` command-line tool, which controls whether to restore statistics #50568 @Leavrth
    - Introduce a new restore parameter `--tikv-max-restore-concurrency` for the `br` command-line tool, which controls the maximum number of download and ingest files for each TiKV node. This parameter also controls the memory consumption of a BR node by controlling the maximum length of the job queue. #51621 @3pointer
    - Enhance restore performance by enabling the coarse-grained Region scatter algorithm to adaptively obtain concurrent parameters #50701 @3pointer
    - Display the `log` command in the command-line help information of `br` #50927 @RidRisR
    - Support pre-allocating Table ID during the restore process to maximize the reuse of Table ID and improve restore performance #51736 @Leavrth
    - Disable the GC memory limit tuner feature within TiDB when using BR to avoid OOM issues #51078 @Leavrth
    - Improve the speed of merging SST files during data restore by using a more efficient algorithm #50613 @Leavrth
    - Support creating databases in batch during data restore #50767 @Leavrth

    - Print the information of the slowest Region that affects global checkpoint advancement in logs and metrics during log backups #51046 @YuJuncen
    - Improve the table creation performance of the `RESTORE` statement in scenarios with large datasets #48301 @Leavrth
  - TiCDC
    - Optimize the memory consumption of `RowChangedEvent` to reduce memory consumption when TiCDC replicates data #10386 @lidezhu
    - Verify that the start-ts parameter is valid when creating and resuming a changefeed task #10499 @3AceShowHand
  - TiDB Data Migration (DM)
    - In a MariaDB primary-secondary replication scenario, where the migration path is: MariaDB primary instance -> MariaDB secondary instance -> DM -> TiDB, when `gtid_strict_mode = off` and the GTID of the MariaDB secondary instance is not strictly incrementing (for example, there is data writing to the MariaDB secondary instance), the DM task will report an error `less than global checkpoint position`. Starting from v8.0.0, TiDB is compatible with this scenario and data can be migrated downstream normally. #10741 @okJiang
  - TiDB Lightning
    - Support configuring the maximum number of rows in a batch in logical import mode using `logical-import-batch-rows` #46607 @kennytm
    - TiDB Lightning reports an error when the space of TiFlash is insufficient #50324 @okJiang

16.5.1.5 Bug fixes

- TiDB
  - Fix the issue that `auto analyze` is triggered multiple times when there is no data change #51775 @hi-rustin
  - Fix the issue that the `auto analyze` concurrency is set incorrectly #51749 @hawkingrei
  - Fix the issue of index inconsistency caused by adding multiple indexes using a single SQL statement #51746 @tangenta
  - Fix the `Column ... in from clause is ambiguous` error that might occur when a query uses `NATURAL JOIN` #32044 @AilinKid
  - Fix the issue of wrong query results due to TiDB incorrectly eliminating constant values in `group by` #38756 @hi-rustin
  - Fix the issue that the `LEADING` hint does not take effect in `UNION ALL` statements #50067 @hawkingrei
  - Fix the issue that `BIT` type columns might cause query errors due to decode failures when they are involved in calculations of some functions #49566 #50850 #50855 @jiyfhust

- Fix the issue that TiDB might panic when performing a rolling upgrade using `tiup cluster upgrade/start` due to an interaction issue with PD #50152 @zimulala
- Fix the issue that executing `UNIQUE` index lookup with an `ORDER BY` clause might cause an error #49920 @jackysp
- Fix the issue that TiDB returns wrong query results when processing `ENUM` or `SET` types by constant propagation #49440 @winoros
- Fix the issue that TiDB might panic when a query contains the Apply operator and the `fatal error: concurrent map writes` error occurs #50347 @SeaRise
- Fix the issue that the control of `SET_VAR` for variables of the string type might become invalid #50507 @qw4990
- Fix the issue that the `SYSDATE()` function incorrectly uses the time in the plan cache when `tidb_sysdate_is_now` is set to `1` #49299 @hawkingrei
- Fix the issue that when executing the `CREATE GLOBAL BINDING` statement, if the schema name is in uppercase, the binding does not take effect #50646 @qw4990
- Fix the issue that `Index Path` selects duplicated indexes #50496 @AilinKid
- Fix the issue that `PLAN REPLAYER` fails to load bindings when the `CREATE GLOBAL BINDING` statement contains `IN()` #43192 @King-Dylan
- Fix the issue that when multiple `analyze` tasks fail, the failure reasons are not recorded correctly #50481 @hi-rustin
- Fix the issue that `tidb_stats_load_sync_wait` does not take effect #50872 @jiyfhust
- Fix the issue that `max_execute_time` settings at multiple levels interfere with each other #50914 @jiyfhust
- Fix the issue of thread safety caused by concurrent updating of statistics #50835 @hi-rustin
- Fix the issue that executing `auto analyze` on a partition table might cause TiDB to panic #51187 @hi-rustin
- Fix the issue that SQL bindings might not work when `IN()` in a SQL statement contains a different number of values #51222 @hawkingrei
- Fix the issue that TiDB cannot correctly convert the type of a system variable in an expression #43527 @hi-rustin
- Fix the issue that TiDB does not listen to the corresponding port when `force-init-stats` is configured #51473 @hawkingrei
- Fix the issue that in `determinate` mode (`tidb_opt_objective='determinate'`), if a query does not contain predicates, statistics might not be loaded #48257 @time-and-fate
- Fix the issue that the `init-stats` process might cause TiDB to panic and the `load stats` process to quit #51581 @hawkingrei
- Fix the issue that the query result is incorrect when the `IN()` predicate contains `NULL` #51560 @winoros
- Fix the issue that blocked DDL statements are not displayed in the MDL View when a DDL task involves multiple tables #47743 @wjhuang2016
- Fix the issue that the `processed_rows` of the `ANALYZE` task on a table might exceed the total number of rows in that table #50632 @hawkingrei

- Fix the goroutine leak issue that might occur when the `HashJoin` operator fails to spill to disk #50841 @wshwsh12
- Fix the goroutine leak issue that occurs when the memory usage of CTE queries exceed limits #50337 @guo-shaoge
- Fix the `Can't find column ...` error that might occur when aggregate functions are used for group calculations #50926 @qw4990
- Fix the issue that DDL operations such as renaming tables are stuck when the `CREATE TABLE` statement contains specific partitions or constraints #50972 @lcwangchao
- Fix the issue that the monitoring metric `tidb_statistics_auto_analyze_total` on Grafana is not displayed as an integer #51051 @hawkingrei
- Fix the issue that the `tidb_gogc_tuner_threshold` system variable is not adjusted accordingly after the `tidb_server_memory_limit` variable is modified #48180 @hawkingrei
- Fix the issue that the `index out of range` error might occur when a query involves JOIN operations #42588 @AilinKid
- Fix the issue that getting the default value of a column returns an error if the column default value is dropped #50043 #51324 @crazycs520
- Fix the issue that wrong results might be returned when TiFlash late materialization processes associated columns #49241 #51204 @Lloyd-Pottiger
- Fix the issue that the `LIKE()` function might return wrong results when processing binary collation inputs #50393 @yibin87
- Fix the issue that the `JSON_LENGTH()` function returns wrong results when the second parameter is `NULL` #50931 @SeaRise
- Fix the issue that `CAST(AS DATETIME)` might lose time precision under certain circumstances #49555 @SeaRise
- Fix the issue that parallel `Apply` might generate incorrect results when the table has a clustered index #51372 @guo-shaoge
- Fix the issue that `ALTER TABLE ... COMPACT TIFLASH REPLICA` might incorrectly end when the primary key type is `VARCHAR` #51810 @breezewish
- Fix the issue that the check on the `NULL` value of the `DEFAULT NULL` attribute is incorrect when exchanging partitioned tables using the `EXCHANGE PARTITION` statement #47167 @jiyfhust
- Fix the issue that the partition table definition might cause wrong behavior when using a non-UTF8 character set #49251 @YangKeao
- Fix the issue that incorrect default values are displayed in the `INFORMATION_SCHEMA.VARIABLES_INFO` table for some system variables #49461 @jiyfhust
- Fix the issue that no error is reported when empty strings are used as database names in some cases #45873 @yoshikipom
- Fix the issue that the `SPLIT TABLE ... INDEX` statement might cause TiDB to panic #50177 @Defined2014
- Fix the issue that querying a partitioned table of `KeyPartition` type might cause an error #50206 #51313 #51196 @time-and-fate @jiyfhust @mjonss
- Fix the issue that querying a Hash partitioned table might produce incorrect results #50427 @Defined2014

- Fix the issue that opentracing does not work correctly #50508 @Defined2014
- Fix the issue that the error message is not complete when `ALTER INSTANCE RELOAD TLS` reports an error #50699 @dveeden
- Fix the issue that the `AUTO_INCREMENT` attribute causes non-consecutive IDs due to unnecessary transaction conflicts when assigning auto-increment IDs #50819 @tiancaiamao
- Fix the issue of incomplete stack information in TiDB logs for some errors #50849 @tiancaiamao
- Fix the issue of excessive memory usage in some queries when the number in the `LIMIT` clause is too large #51188 @Defined2014
- Fix the issue that the TTL feature causes data hotspots due to incorrect data range splitting in some cases #51527 @lcwangchao
- Fix the issue that the `SET` statement does not take effect when it appears on the first line of an explicit transaction #51387 @YangKeao
- Fix the issue that querying JSON of `BINARY` type might cause an error in some cases #51547 @YangKeao
- Fix the issue that TTL does not handle the transition for daylight saving time adjustments correctly when calculating expiration times #51675 @lcwangchao
- Fix the issue that the `SURVIVAL_PREFERENCES` attribute might not appear in the output of the `SHOW CREATE PLACEMENT POLICY` statement under certain conditions #51699 @lcwangchao
- Fix the issue that the configuration file does not take effect when it contains an invalid configuration item #51399 @Defined2014

- TiKV

    - Fix the issue that enabling `tidb_enable_row_level_checksum` might cause TiKV to panic #16371 @cfzjywxk
    - Fix the issue that hibernated Regions are not promptly awakened in exceptional circumstances #16368 @LykxSassinator
    - Fix the issue that the entire Region becomes unavailable when one replica is offline, by checking the last heartbeat time of all replicas of the Region before taking a node offline #16465 @tonyxuqqi
    - Fix the issue that JSON integers greater than the maximum `INT64` value but less than the maximum `UINT64` value are parsed as `FLOAT64` by TiKV, resulting in inconsistency with TiDB #16512 @YangKeao
    - Fix the issue that the monitoring metric `tikv_unified_read_pool_thread_count` has no data in some cases #16629 @YuJuncen

- PD

    - Fix the issue that data race occurs when the `MergeLabels` function is called #7535 @lhy1024
    - Fix the issue that there is no output when the `evict-leader-scheduler` interface is called #7672 @CabinfeverB

- Fix the issue that the PD monitoring item `learner-peer-count` does not synchronize the old value after a leader switch #7728 @CabinfeverB
- Fix the memory leak issue that occurs when `watch etcd` is not turned off correctly #7807 @rleungx
- Fix the issue that some TSO logs do not print the error cause #7496 @CabinfeverB
- Fix the issue that there are unexpected negative monitoring metrics after restart #4489 @lhy1024
- Fix the issue that the Leader lease expires later than the log time #7700 @CabinfeverB
- Fix the issue that TiDB panics when TLS switches between TiDB (the PD client) and PD are inconsistent #7900 #7902 #7916 @CabinfeverB
- Fix the issue that Goroutine leaks when it is not closed properly #7782 @HuSharp
- Fix the issue that pd-ctl cannot remove a scheduler that contains special characters #7798 @JmPotato
- Fix the issue that the PD client might be blocked when obtaining TSO #7864 @CabinfeverB

- TiFlash

  - Fix the issue that TiFlash might panic due to unstable network connections with PD during replica migration #8323 @JaySon-Huang
  - Fix the issue that the memory usage increases significantly due to slow queries #8564 @JinheLin
  - Fix the issue that removing and then re-adding TiFlash replicas might lead to data corruption in TiFlash #8695 @JaySon-Huang
  - Fix the issue that TiFlash replica data might be accidentally deleted after performing point-in-time recovery (PITR) or executing `FLASHBACK CLUSTER TO`, which might result in data anomalies #8777 @JaySon-Huang
  - Fix the issue that TiFlash panics after executing `ALTER TABLE ... MODIFY ↪ COLUMN ... NOT NULL`, which changes nullable columns to non-nullable #8419 @JaySon-Huang
  - Fix the issue that in the disaggregated storage and compute architecture, queries might be permanently blocked after network isolation #8806 @JinheLin
  - Fix the issue that in the disaggregated storage and compute architecture, TiFlash might panic during shutdown #8837 @JaySon-Huang
  - Fix the issue that TiFlash might crash due to data race in case of remote reads #8685 @solotzg
  - Fix the issue that the `CAST(AS JSON)` function does not de-duplicate the JSON object key #8712 @SeaRise
  - Fix the issue that the `ENUM` column might cause TiFlash to crash during chunk encoding #8674 @yibin87

- Tools

  - Backup & Restore (BR)

- Fix the issue that the log backup checkpoint gets stuck when a Region is split or merged immediately after it becomes a leader #16469 @YuJuncen
- Fix the issue that TiKV panics when a full backup fails to find a peer in some extreme cases #16394 @Leavrth
- Fix the issue that log backup gets stuck after changing the TiKV IP address on the same node #50445 @3pointer
- Fix the issue that BR cannot retry when encountering an error while reading file content from S3 #49942 @Leavrth
- Fix the issue that when resuming from a checkpoint after data restore fails, an error `the target cluster is not fresh` occurs #50232 @Leavrth
- Fix the issue that stopping a log backup task causes TiDB to crash #50839 @YuJuncen
- Fix the issue that data restore is slowed down due to absence of a leader on a TiKV node #50566 @Leavrth
- Fix the issue that full restore still requires the target cluster to be empty after the `--filter` option is specified #51009 @3pointer

- TiCDC
  - Fix the issue that the file sequence number generated by the storage service might not increment correctly when using the storage sink #10352 @CharlesCheung96
  - Fix the issue that TiCDC returns the `ErrChangeFeedAlreadyExists` error when concurrently creating multiple changefeeds #10430 @CharlesCheung96
  - Fix the issue that after filtering out `add table partition` events is configured in `ignore-event`, TiCDC does not replicate other types of DML changes for related partitions to the downstream #10524 @CharlesCheung96
  - Fix the issue that the changefeed reports an error after `TRUNCATE PARTITION` is executed on the upstream table #10522 @sdojjy
  - Fix the issue that `snapshot lost caused by GC` is not reported in time when resuming a changefeed and the `checkpoint-ts` of the changefeed is smaller than the GC safepoint of TiDB #10463 @sdojjy
  - Fix the issue that TiCDC fails to validate `TIMESTAMP` type checksum due to time zone mismatch after data integrity validation for single-row data is enabled #10573 @3AceShowHand
  - Fix the issue that the Syncpoint table might be incorrectly replicated #10576 @asddongmen
  - Fix the issue that OAuth2.0, TLS, and mTLS cannot be enabled properly when using Apache Pulsar as the downstream #10602 @asddongmen
  - Fix the issue that a changefeed might get stuck when TiKV upgrades, restarts, or evicts a leader #10584 @asddongmen
  - Fix the issue that data is written to a wrong CSV file due to wrong BarrierTS in scenarios where DDL statements are executed frequently #10668 @lidezhu
  - Fix the issue that data race in the KV client causes TiCDC to panic #10718 @asddongmen
  - Fix the issue TiCDC panics when scheduling table replication tasks #10613

@CharlesCheung96

- TiDB Data Migration (DM)
  - Fix the issue that data is lost when the upstream primary key is of binary type #10672 @GMHDBJD
- TiDB Lightning
  - Fix the performance regression issue caused by checking TiKV space #43636 @lance6716
  - Fix the issue that TiDB Lightning reports an error when encountering invalid symbolic link files during file scanning #49423 @lance6716
  - Fix the issue that TiDB Lightning fails to correctly parse date values containing `0` when `NO_ZERO_IN_DATE` is not included in `sql_mode` #50757 @GMHDBJD

16.6 v7.6

16.6.1 TiDB 7.6.0 Release Notes

Release date: January 25, 2024

TiDB version: 7.6.0

Quick access: Quick start

7.6.0 introduces the following key features and improvements:

```
<th>Category</th>
<th>Feature/Enhancement</th>
<th>Description</th>
```

```
<td rowspan="4">Scalability and Performance</td>
<td><a href="https://docs.pingcap.com/tidb/v7.6/sql-plan-management#cross-
   ↪ database-binding">Cross-database SQL binding</a></td>
<td>When managing hundreds of databases with the same schema, it is often
   ↪ necessary to apply SQL bindings across these databases. For example,
   ↪ in SaaS or PaaS data platforms, each user typically operates separate
   ↪  databases with the same schema and runs similar SQL queries on them.
   ↪  In this case, it is impractical to bind SQL for each database one by
   ↪  one. TiDB v7.6.0 introduces cross-database SQL bindings that enable
   ↪ matching bindings across all schema-equivalent databases.</td>
```

```
<td><a href="https://docs.pingcap.com/tidb/v7.6/br-snapshot-guide#restore-
   ↪ cluster-snapshots">Achieve up to 10 times faster for snapshot restore
   ↪  (experimental)</a></td>
<td>BR v7.6.0 introduces an experimental coarse-grained Region scatter
   ↪ algorithm to accelerate snapshot restores for clusters. In clusters
   ↪ with many TiKV nodes, this algorithm significantly improves cluster
   ↪ resource efficiency by more evenly distributing load across nodes and
   ↪  better utilizing per-node network bandwidth. In several real-world
   ↪ cases, this improvement accelerates restore process by about up to 10
   ↪  times.</td>
```

```
<td><a href="https://docs.pingcap.com/tidb/v7.6/ddl-v2">Achieve up to 10
   ↪ times faster for creating tables in batch (experimental)</a></td>
<td>With the implementation of the new DDL architecture in v7.6.0, the
   ↪ performance of batch table creation has witnessed a remarkable
   ↪ improvement, up to 10 times faster. This substantial enhancement
   ↪ drastically reduces the time needed for creating numerous tables.
   ↪ This acceleration is particularly noteworthy in SaaS scenarios, where
   ↪  the prevalence of high volumes of tables, ranging from tens to
   ↪ hundreds of thousands, is a common challenge.</td>
```

```
<td><a href="https://docs.pingcap.com/tidb/v7.6/tune-region-performance#use-
   ↪ the-active-pd-follower-feature-to-enhance-the-scalability-of-pds-
   ↪ region-information-query-service">Use Active PD Followers to enhance
   ↪ PD's Region information query service (experimental)</a></td>
<td>TiDB v7.6.0 introduces an experimental feature "Active PD Follower",
   ↪ which allows PD followers to provide Region information query
   ↪ services. This feature improves the capability of the PD cluster to
   ↪ handle <code>GetRegion</code> and <code>ScanRegions</code> requests
```

```
    ↪ in clusters with a large number of TiDB nodes and Regions, thereby
    ↪ reducing the CPU pressure on the PD leader.</td>
```

```
<td rowspan="2">Reliability and Availability</td>
<td><a href="https://docs.pingcap.com/tidb/v7.6/tiproxy-overview">Support
    ↪ TiProxy (experimental)</a></td>
<td>Full support for the TiProxy service, easily deployable via deployment
    ↪ tooling, to manage and maintain connections to TiDB so that they live
    ↪  through rolling restarts, upgrades, or scaling events.</td>
```

```
<td><a href="https://docs.pingcap.com/tidb/v7.6/dm-compatibility-catalog">
    ↪ Data Migration (DM) officially supports MySQL 8.0 (GA)</a></td>
<td>Previously, using DM to migrate data from MySQL 8.0 is an experimental
    ↪ feature and is not available for production environments. TiDB v7.6.0
    ↪  enhances the stability and compatibility of this feature to help you
    ↪  smoothly and quickly migrate data from MySQL 8.0 to TiDB in
    ↪ production environments. In v7.6.0, this feature becomes generally
    ↪ available (GA).</td>
```

16.6.1.1 Feature details

16.6.1.1.1 Scalability

- Use the Active PD Follower feature to enhance the scalability of PD's Region information query service (experimental) #7431 @CabinfeverB

  In a TiDB cluster with a large number of Regions, the PD leader might experience high CPU load due to the increased overhead of handling heartbeats and scheduling tasks. If the cluster has many TiDB instances, and there is a high concurrency of requests for Region information, the CPU pressure on the PD leader increases further and might cause PD services to become unavailable.

  To ensure high availability, TiDB v7.6.0 supports using the Active PD Follower feature to enhance the scalability of PD's Region information query service. You can enable the Active PD Follower feature by setting the system variable `pd_enable_follower_handle_region` to `ON`. After this feature is enabled, TiDB evenly distributes Region information requests to all PD servers, and PD followers can also handle Region requests, thereby reducing the CPU pressure on the PD leader.

  For more information, see documentation.

16.6.1.1.2 Performance

- BR improves snapshot restore speed by up to 10 times (experimental) #33937 #49886 @3pointer

As a TiDB cluster scales up, it becomes increasingly crucial to quickly restore the cluster from failures to minimize business downtime. Before v7.6.0, the Region scattering algorithm is a primary bottleneck in performance restoration. In v7.6.0, BR optimizes the Region scattering algorithm, which quickly splits the restore task into a large number of small tasks and scatters them to all TiKV nodes in batches. The new parallel recovery algorithm fully utilizes the resources of each TiKV node, thereby achieving a rapid parallel recovery. In several real-world cases, the snapshot restore speed of the cluster is improved by about 10 times in large-scale Region scenarios.

The new coarse-grained Region scatter algorithm is experimental. To use it, you can configure the `--granularity="coarse-grained"` parameter in the `br` command. For example:

```
br restore full \
--pd "${PDIP}:2379" \
--storage "s3://${Bucket}/${Folder}" \
--s3.region "${region}" \
--granularity "coarse-grained" \
--send-credentials-to-tikv=true \
--log-file restorefull.log
```

For more information, see documentation.

- The Titan engine is enabled by default #16245 @Connor1996 @v01dstar @tonyxuqqi

  To better support TiDB wide table write scenarios, especially with support for JSON, starting from TiDB v7.6.0, the Titan engine is enabled by default. The Titan engine automatically segregates large values exceeding 32 KB from RocksDB's LSM Tree, and stores them separately in Titan to optimize the handling of large values. The Titan engine is completely compatible with RocksDB features utilized by TiKV. This strategic shift not only diminishes write amplification effect, but also enhances performance in write, update, and point-query scenarios involving large values. Additionally, in Range Scan scenarios, the Titan engine's optimization has resulted in performance comparable to that of RocksDB in the default configuration.

  This configuration change remains compatible with earlier versions. For existing TiDB clusters, when upgrading to TiDB v7.6.0 or a later version, the Titan engine is disabled by default. You have the flexibility to manually enable or disable the Titan engine based on your specific requirements.

  For more information, see documentation.

- Support pushing down the following string functions to TiKV #48170 @gengliqi

  - `LOWER()`
  - `UPPER()`

For more information, see documentation.

- Support pushing down the following JSON functions to TiFlash #48350 #48986 #48994 #49345 #49392 @SeaRise @yibin87

    - `JSON_UNQUOTE()`
    - `JSON_ARRAY()`
    - `JSON_DEPTH()`
    - `JSON_VALID()`
    - `JSON_KEYS()`
    - `JSON_CONTAINS_PATH()`

  For more information, see documentation.

- Improve the performance of creating tables by 10 times (experimental) #49752 @gmhdbjd

  In previous versions, when migrating tens of thousands of tables from the upstream database to TiDB, it is time-consuming and inefficient for TiDB to create these tables. Starting from v7.6.0, TiDB introduces a new TiDB DDL V2 architecture. You can enable it by configuring the system variable `tidb_ddl_version`. Compared with previous versions, the new version of the DDL improves the performance of creating batch tables by 10 times, and significantly reduces time for creating tables.

  For more information, see documentation.

- Support periodic full compaction (experimental) #12729 afeinberg

  Starting from v7.6.0, TiDB supports periodic full compaction for TiKV. This feature serves as an enhancement to Garbage Collection (GC) to eliminate redundant data versions. In scenarios where application activity shows obvious peaks and valleys, you can use this feature to perform data compaction during idle periods to improve the performance during peak periods.

  You can set the specific times that TiKV initiates periodic full compaction by configuring the TiKV configuration item `periodic-full-compact-start-times` and limit the maximum CPU usage rate for TiKV periodic full compaction by configuring `periodic-full-compact-start-max-cpu`. The default value of `periodic-full-compact-start-max-cpu` is 10%, which means that periodic full compaction is triggered only when the CPU utilization of TiKV is lower than 10%, thereby reducing the impact on application traffic.

  For more information, see documentation.

16.6.1.1.3 Reliability

- Cross-database execution plan binding #48875 @qw4990

  When running SaaS services on TiDB, it is common practice to store data for each tenant in separate databases for easier data maintenance and management. This results

in hundreds of databases with the same table and index definitions, and similar SQL statements. In such scenario, when you create an execution plan binding for a SQL statement, this binding usually applies to the SQL statements in other databases as well.

For this scenario, TiDB v7.6.0 introduces the cross-database binding feature, which supports binding the same execution plan to SQL statements with the same schema, even if they are in different databases. When creating a cross-database binding, you need to use the wildcard `*` to represent the database name, as shown in the following example. After the binding is created, regardless of which database the tables `t1` and `t2` are in, TiDB will try to use this binding to generate an execution plan for any SQL statement with the same schema, which saves your effort to create a binding for each database.

```
CREATE GLOBAL BINDING FOR
USING
    SELECT /*+ merge_join(t1, t2) */ t1.id, t2.amount
    FROM *.t1, *.t2
    WHERE t1.id = t2.id;
```

In addition, cross-database binding can effectively mitigate SQL performance issues caused by uneven distribution and rapid changes in user data and workload. SaaS providers can use cross-database binding to fix execution plans validated by users with large data volumes, thereby fixing execution plans for all users. For SaaS providers, this feature provides significant convenience and experience improvements.

Due to the system overhead (less than 1%) introduced by cross-database binding, TiDB disables this feature by default. To use cross-database binding, you need to first enable the `tidb_opt_enable_fuzzy_binding` system variable.

For more information, see documentation.

16.6.1.1.4 Availability

- Support the proxy component TiProxy (experimental) #413 @djshow832 @xhebox

  TiProxy is the official proxy component of TiDB, located between the client and TiDB server. It provides load balancing and connection persistence functions for TiDB, making the workload of the TiDB cluster more balanced and not affecting user access to the database during maintenance operations.

  - During maintenance operations such as rolling restarts, rolling upgrades, and scaling-in in a TiDB cluster, changes occur in the TiDB servers which result in interruptions in connections between clients and the TiDB servers. By using TiProxy, connections can be smoothly migrated to other TiDB servers during these maintenance operations so that clients are not affected.

- Client connections to a TiDB server cannot be dynamically migrated to other TiDB servers. When the workload of multiple TiDB servers is unbalanced, it might result in a situation where the overall cluster resources are sufficient, but certain TiDB servers experience resource exhaustion leading to a significant increase in latency. To address this issue, TiProxy provides dynamic migration for connection, which allows connections to be migrated from one TiDB server to another without any impact on the clients, thereby achieving load balancing for the TiDB cluster.

TiProxy has been integrated into TiUP, TiDB Operator, and TiDB Dashboard, making it easy to configure, deploy and maintain.

```
For more information, see [documentation](#tiproxy-overview).
```

16.6.1.1.5 SQL

- `LOAD DATA` supports explicit transactions and rollbacks #49079 @ekexium

  Compared with MySQL, the transactional behavior of the `LOAD DATA` statement varies in different TiDB versions before v7.6.0, so you might need to make additional adjustments when using this statement. Specifically, before v4.0.0, `LOAD DATA` commits every 20000 rows. From v4.0.0 to v6.6.0, TiDB commits all rows in one transaction by default and also supports committing every fixed number of rows by setting the `tidb_dml_batch_size` system variable. Starting from v7.0.0, `tidb_dml_batch_size` no longer takes effect on `LOAD DATA` and TiDB commits all rows in one transaction.

  Starting from v7.6.0, TiDB processes `LOAD DATA` in transactions in the same way as other DML statements, especially in the same way as MySQL. The `LOAD DATA` statement in a transaction no longer automatically commits the current transaction or starts a new transaction. Moreover, you can explicitly commit or roll back the `LOAD DATA` statement in a transaction. Additionally, the `LOAD DATA` statement is affected by the TiDB transaction mode setting (optimistic or pessimistic transaction). These improvements simplify the migration process from MySQL to TiDB and offer a more unified and controllable experience for data import.

  For more information, see documentation.

16.6.1.1.6 DB operations

- `FLASHBACK CLUSTER` supports specifying a precise TSO #48372 @BornChanger

  In TiDB v7.6.0, the flashback feature is more powerful and precise. It not only supports rolling back a cluster to a specified historical timestamp but also enables you to specify a precise recovery TSO using `FLASHBACK CLUSTER TO TSO`, thereby increasing flexibility in data recovery. For example, you can use this feature with TiCDC.

After pausing data replication and conducting pre-online read-write tests in your downstream TiDB cluster, this feature allows the cluster to gracefully and quickly roll back to the paused TSO and continue to replicate data using TiCDC. This streamlines the pre-online validation process and simplifies data management.

```
FLASHBACK CLUSTER TO TSO 445494839813079041;
```

For more information, see documentation.

- Support automatically terminating long-running idle transactions #48714 @crazycs520

  In scenarios where network disconnection or application failure occurs, `COMMIT /ROLLBACK` statements might fail to be transmitted to the database. This could lead to delayed release of database locks, causing transaction lock waits and a rapid increase in database connections. Such issues are common in test environments but can also occur occasionally in production environments, and they are sometimes difficult to diagnose promptly. To avoid these issues, TiDB v7.6.0 introduces the `tidb_idle_transaction_timeout` system variable, which automatically terminates long-running idle transactions. When a user session in a transactional state remains idle for a duration exceeding the value of this variable, TiDB will terminate the database connection of the transaction and roll back it.

  For more information, see documentation.

- Simplify the syntax for creating execution plan bindings #48876 @qw4990

  TiDB v7.6.0 simplifies the syntax for creating execution plan bindings. When creating an execution plan binding, you no longer need to provide the original SQL statement. TiDB identifies the original SQL statement based on the statement with hints. This improvement enhances the convenience of creating execution plan bindings. For example:

```
CREATE GLOBAL BINDING
USING
SELECT /*+ merge_join(t1, t2) */ * FROM t1, t2 WHERE t1.id = t2.id;
```

  For more information, see documentation.

- Support dynamically modifying the size limit of a single row record in TiDB #49237 @zyguan

  Before v7.6.0, the size of a single row record in a transaction is limited by the TiDB configuration item `txn-entry-size-limit`. If the size limit is exceeded, TiDB returns the `entry too large` error. In this case, you need to manually modify the TiDB configuration file and restart TiDB to make the modification take effect. To reduce your management overhead, TiDB v7.6.0 introduces the system variable `tidb_txn_entry_size_limit`, which supports dynamically modifying the value of the `txn-entry-size-limit` configuration item. The default value of this variable is `0`, which means that TiDB uses the value of the configuration item `txn-entry-size-limit` by

default. When this variable is set to a non-zero value, TiDB limits the size of a row record in transactions to the value of this variable. This improvement enhances the flexibility for you to adjust system configurations without restarting TiDB.

For more information, see documentation.

- BR restores system tables by default, such as user data #48567 @BornChanger #49627 @Leavrth

  Starting from v5.1.0, when you back up snapshots, BR automatically backs up system tables in the `mysql` schema, but does not restore these system tables by default. In v6.2.0, BR adds the parameter `--with-sys-table` to support restoring data in some system tables, providing more flexibility in operations.

  To further reduce your management overhead and provide more intuitive default behavior, starting from v7.6.0, BR enables the parameter `--with-sys-table` by default. This means that BR restores some system tables by default during restoration, especially user account and table statistics data. This improvement makes backup and restore operations more intuitive, thereby reducing the burden of manual configuration and improving the overall operation experience.

  For more information, see documentation.

16.6.1.1.7 Observability

- Enhance observability related to resource control #49318 @glorv @bufferflies @nolouch

  As more and more users use resource groups to isolate application workloads, Resource Control provides enhanced data based on resource groups. This helps you monitor resource group workloads and settings, ensuring that you can quickly identify and accurately diagnose problems, including:

  - Slow Queries: add the resource group name, resource unit (RU) consumption, and time for waiting for resources.
  - Statement Summary Tables: add the resource group name, RU consumption, and time for waiting for resources.
  - In the system variable `tidb_last_query_info`, add a new entry `ru_consumption` to indicate the consumed RU by SQL statements. You can use this variable to get the resource consumption of the last statement in the session.
  - Add database metrics based on resource groups: QPS/TPS, execution time (P999/P99/P95), number of failures, and number of connections.
  - Add the system table `request_unit_by_group` to record the history records of daily consumed RUs of all resource groups.

For more information, see Identify Slow Queries, Statement Summary Tables, and Key Monitoring Metrics of Resource Control.

16.6.1.1.8 Data migration

- Data Migration (DM) support for migrating MySQL 8.0 becomes generally available (GA) #10405 @lyzx2001

  Previously, using DM to migrate data from MySQL 8.0 is an experimental feature and is not available for production environments. TiDB v7.6.0 enhances the stability and compatibility of this feature to help you smoothly and quickly migrate data from MySQL 8.0 to TiDB in production environments. In v7.6.0, this feature becomes generally available (GA).

  For more information, see documentation.

- TiCDC supports replicating DDL statements in bi-directional replication (BDR) mode (experimental) #10301 #48519 @okJiang @asddongmen

  Starting from v7.6.0, TiCDC supports replication of DDL statements with bi-directional replication configured. Previously, replicating DDL statements was not supported by TiCDC, so users of TiCDC's bi-directional replication had to apply DDL statements to both TiDB clusters separately. With this feature, TiCDC allows for a cluster to be assigned the `PRIMARY` BDR role, and enables the replication of DDL statements from that cluster to the downstream cluster.

  For more information, see documentation.

- TiCDC supports querying the downstream synchronization status of a changefeed #10289 @hongyunyan

  Starting from v7.6.0, TiCDC introduces a new API `GET /api/v2/changefeed/{ ↪ changefeed_id}/synced` to query the downstream synchronization status of a specified replication task (changefeed). By using this API, you can determine whether the upstream data received by TiCDC has been synchronized to the downstream system completely.

  For more information, see documentation.

- TiCDC adds support for three-character delimiters with CSV output protocol #9969 @zhangjinpeng87

  Starting from v7.6.0, you can specify the CSV output protocol delimiters as 1 to 3 characters long. With this change, you can configure TiCDC to generate file output using two-character delimiters (such as `||` or `$^`) or three-character delimiters (such as `|@|`) to separate fields in the output.

  For more information, see documentation.

16.6.1.2 Compatibility changes

Note:

This section provides compatibility changes you need to know when you upgrade from v7.5.0 to the current version (v7.6.0). If you are upgrading from v7.4.0 or earlier versions to the current version, you might also need to check the compatibility changes introduced in intermediate versions.

16.6.1.2.1 MySQL compatibility

- Before TiDB v7.6.0, the `LOAD DATA` operation commits all rows in a single transaction or commits transactions in a batch, which is slightly different from MySQL behaviors. Starting from v7.6.0, TiDB processes `LOAD DATA` in transactions in the same way as MySQL. The `LOAD DATA` statement in a transaction no longer automatically commits the current transaction or starts a new transaction. Moreover, you can explicitly commit or roll back the `LOAD DATA` statement in a transaction. Additionally, the `LOAD DATA` statement is affected by the TiDB transaction mode setting (optimistic or pessimistic transaction). #49079 @ekexium

16.6.1.2.2 System variables

Variable name	Change type	Description
`tidb_auto_analyze_partition_batch_size`	Modified	Changes the default value from `1` to `128` after further tests.

Variable name	Change type	Description
tidb_sysproc_scan_concurrency	Modified	In a large-scale cluster, the concurrency of `scan` operations can be adjusted higher to meet the needs of `ANALYZE`. Therefore, change the maximum value from 256 to 4294967295.

Variable name	Change type	Description
`tidb_analyze_distsql_scan_concurrency`	Newly added	Sets the concurrency of the `scan` operation when executing the `ANALYZE` operation. The default value is `4`.

Variable name	Change type	Description
tidb_ ↪ ddl_ ↪ version ↪	Newly added	Controls whether to enable TiDB DDL V2. Set the value to 2 to enable it and 1 to disable it. The default value is 1. When TiDB DDL V2 is enabled, DDL statements will be executed using TiDB DDL V2. The execution speed of DDL statements for creating tables is increased by 10

Variable name	Change type	Description
`tidb_enable_global_index`	Newly added	Controls whether to support creating `Global indexes` for partitioned tables. The default value is `OFF`. `Global index` is currently in the development stage. **It is not recommended to modify the value of this system variable.**

Variable name	Change type	Description
tidb_idle_transaction_timeout	Newly added	Controls the idle timeout for transactions in a user session. When a user session is in a transactional state and remains idle for a duration exceeding the value of this variable, TiDB will terminate the session. The default value 0 means unlimited.

Variable name	Change type	Description
`tidb_` ↪ `opt_` ↪ `enable` ↪ `_` ↪ `fuzzy` ↪ `_` ↪ `binding` ↪	Newly added	Controls whether to enable the cross-database binding feature. The default value `OFF` means cross-database binding is disabled.

Variable name	Change type	Description
tidb_txn_entry_size_limit	Newly added	Dynamically modifies the TiDB configuration item performance.txn-entry-size. It limits the size of a single row of data in TiDB. The default value of this variable is 0, which means that TiDB uses the value of the configuration item txn-entry-size

Variable name	Change type	Description
pd_ ↪ enable ↪ _ ↪ follower ↪ _ ↪ handle ↪ _ ↪ region ↪	Newly added	Controls whether to enable the Active PD Follower feature (experimental). When the value is `OFF`, TiDB only obtains Region information from the PD leader. When the value is `ON`, TiDB evenly distributes requests for Region information to all PD servers, and PD followers can

Variable name	Change type	Description

16.6.1.2.3 Configuration file parameters

Configuration file	Configuration parameter	Change type	Description
TiDB	`tls-version`	Modified	The default value is “”. The default supported TLS versions of TiDB are changed from `TLS1.1` or higher to `TLS1.2` or higher.

Configuration file	Configuration parameter	Change type	Description
TiKV	`blob-file-compression`	Modified	The algorithm used for compressing values in Titan, which takes value as the unit. Starting from TiDB v7.6.0, the default compression algorithm is `zstd`.

Configuration file	Configuration parameter	Change type	Description
TiKV	`rocksdb` ↪ `.` ↪ `defaultcf` ↪ `.` ↪ `titan` ↪ `.min` ↪ `-` ↪ `blob` ↪ `-` ↪ `size`	Modified	Starting from TiDB v7.6.0, the default value for new clusters is `32KB`. For existing clusters upgrading to v7.6.0, the default value `1KB` remains unchanged.

Configuration file	Configuration parameter	Change type	Description
TiKV	`rocksdb` ↪ `.` ↪ `titan` ↪ `.` ↪ `enabled` ↪	Modified	Enables or disables Titan. For v7.5.0 and earlier versions, the default value is `false`. Starting from v7.6.0, the default value is `true` for only new clusters. Existing clusters upgraded to v7.6.0 or later versions will retain the original configuration.

Configuration file	Configuration parameter	Change type	Description
TiKV	`gc.num-threads`	Newly added	When `enable-compaction-filter` is set to `false`, this parameter controls the number of GC threads. The default value is `1`.
TiKV	`raftstore.periodic-full-compact-start-times`	Newly added	Sets the specific times that TiKV initiates periodic full compaction. The default value `[]` means periodic full compaction is disabled.

Configuration file	Configuration parameter	Change type	Description
TiKV	`raftstore` ↪ `.` ↪ `periodic` ↪ `-` ↪ `full` ↪ `-` ↪ `compact` ↪ `-` ↪ `start` ↪ `-max` ↪ `-cpu`	Newly added	Limits the maximum CPU usage rate for TiKV periodic full compaction. The default value is `0.1`.
TiKV	`zstd-` ↪ `dict` ↪ `-` ↪ `size`	Newly added	Specifies the `zstd` dictionary compression size. The default value is `"0KB"`, which means to disable the `zstd` dictionary compression.

Configuration file	Configuration parameter	Change type	Description
TiFlash	`logger.level`	Modified	Changes the default value from `"debug"` to `"INFO"` to reduce the cost of logging.
TiDB Lightning	`tidb.pd-addr`	Modified	Configures the addresses of the PD Servers. Starting from v7.6.0, TiDB supports setting multiple PD addresses.

Configuration file	Configuration parameter	Change type	Description
TiDB Lightning	`block-size`	Newly added	Controls the I/O block size for sorting local files in Physical Import Mode (`backend='local'`). The default value is `16KiB`. When the disk IOPS is a bottleneck, you can increase this value to improve performance.

Configuration file	Configuration parameter	Change type	Description
BR	`--granularity`	Newly added	Uses the coarse-grained Region scatter algorithm (experimental) by specifying `--granularity="coarse-grained"`. This accelerates restore speed in large-scale Region scenarios.
TiCDC	`compression`	Newly added	Controls the behavior to compress redo log files.

Configuration file	Configuration parameter	Change type	Description
TiCDC	sink. ↪ cloud ↪ - ↪ storage ↪ - ↪ config ↪	Newly added	Sets the automatic cleanup of historical data when replicating data to object storage.

16.6.1.2.4 System tables

- Add a new system table `INFORMATION_SCHEMA.KEYWORDS` to display the information of all keywords supported by TiDB.
- In the system table `INFORMATION_SCHEMA.SLOW_QUERY`, add the following fields related to Resource Control:
  - `Resource_group`: the resource group that the statement is bound to.
  - `Request_unit_read`: the total read RUs consumed by the statement.
  - `Request_unit_write`: the total write RUs consumed by the statement.
  - `Time_queued_by_rc`: the total time that the statement waits for available resources.

16.6.1.3 Offline package changes

Starting from v7.6.0, the `TiDB-community-server` binary-package now includes `tiproxy-{version}-linux-{arch}.tar.gz`, which is the installation package for the proxy component TiProxy.

16.6.1.4 Deprecated features

- Support for the TLSv1.0 and TLSv1.1 protocols is deprecated in TiDB v7.6.0 and will be removed in v8.0.0. Please upgrade to TLSv1.2 or TLSv1.3.
- The baseline evolution feature for execution plans will be deprecated in TiDB v8.0.0. The equivalent functionality will be redesigned in the subsequent versions.
- The `tidb_disable_txn_auto_retry` system variable will be deprecated in TiDB v8.0.0. After that, TiDB will no longer support automatic retries of optimistic transactions.

16.6.1.5 Improvements

- TiDB
    - When a non-binary collation is set and the query includes `LIKE`, the optimizer generates an `IndexRangeScan` to improve the execution efficiency #48181 #49138 @time-and-fate
    - Enhance the ability to convert `OUTER JOIN` to `INNER JOIN` in specific scenarios #49616 @qw4990
    - Improve the balance of Distributed eXecution Framework (DXF) tasks in the scenario where nodes are restarted #47298 @ywqzzy
    - Support multiple accelerated `ADD INDEX` DDL tasks to be queued for execution, instead of falling back to normal `ADD INDEX` tasks #47758 @tangenta
    - Improve the compatibility of `ALTER TABLE ... ROW_FORMAT` #48754 @hawkingrei
    - Modify the `CANCEL IMPORT JOB` statement to a synchronous statement #48736 @D3Hunter
    - Improve the speed of adding indexes to empty tables #49682 @zimulala
    - When the columns of a correlated subquery are not referenced by the upper-level operator, the correlated subquery can be eliminated directly #45822 @King-Dylan
    - `EXCHANGE PARTITION` operations now trigger maintenance updates of statistics #47354 @hi-rustin
    - TiDB supports building binary files that meet the requirements of Federal Information Processing Standards (FIPS) #47948 @tiancaiamao
    - Optimize the TiDB implementation when handling some type conversions and fix related issues #47945 #47864 #47829 #47816 @YangKeao @lcwangchao
    - When obtaining the schema version, TiDB uses the KV timeout feature to read by default, reducing the impact of slow meta Region leader reads on schema version updates #48125 @cfzjywxk
- TiKV
    - Add an API endpoint `/async_tasks` for querying asynchronous tasks #15759 @YuJuncen
    - Add priority labels to gRPC monitoring to display resource group data of different priorities #49318 @bufferflies
    - Support dynamically adjusting the value of `readpool.unified.max-tasks-per-worker`, which can calculate the number of running tasks separately based on priority #16026 @glorv
    - Support dynamically adjusting the number of GC threads, with a default value of `1` #16101 @tonyxuqqi
- PD
    - Improve the availability of PD TSO during disk jitter #7377 @HuSharp
- TiFlash

- Reduce the impact of disk performance jitter on read latency #8583 @JaySon-Huang
- Reduce the impact of background GC tasks on read and write task latency #8650 @JaySon-Huang
- Support merging identical data reading operations in a storage-compute separation architecture to improve data scanning performance under high concurrency #6834 @JinheLin
- Optimize the execution performance of `SEMI JOIN` and `LEFT OUTER SEMIJOIN` when only JOIN KEY equality conditions are included in `JOIN ON` #47424 @gengliqi

- Tools

  - Backup & Restore (BR)

    - Introduce a new integration test for Point-In-Time Recovery (PITR) in the `delete range` scenario, enhancing PITR stability #47738 @Leavrth
    - Improve the table creation performance of the `RESTORE` statement in scenarios with large datasets #48301 @Leavrth
    - Refactor the BR exception handling mechanism to increase tolerance for unknown errors #47656 @3pointer

  - TiCDC

    - Improve the performance of TiCDC replicating data to object storage by increasing parallelism #10098 @CharlesCheung96
    - Support making TiCDC Canal-JSON content format compatible with the content format of the official Canal output by setting `content-compatible=true` in the `sink-uri` configuration #10106 @3AceShowHand

  - TiDB Data Migration (DM)

    - Add configurations for full data physical import to DM OpenAPI #10193 @GMHDBJD

  - TiDB Lightning

    - Support configuring multiple PD addresses to enhance stability #49515 @mittalrishabh
    - Support configuring the `block-size` parameter to control the I/O block size for sorting local files to improve performance #45037 @mittalrishabh

16.6.1.6 Bug fixes

- TiDB

  - Fix the issue that TiDB panics and reports an error `invalid memory address or nil pointer dereference` #42739 @CbcWestwolf

- Fix the TiDB node panic issue that occurs when DDL `jobID` is restored to 0 #46296 @jiyfhust
- Fix the issue that the same query plan has different `PLAN_DIGEST` values in some cases #47634 @King-Dylan
- Fix the issue that executing `UNION ALL` with the DUAL table as the first subnode might cause an error #48755 @winoros
- Fix the issue that queries containing common table expressions (CTEs) report `runtime error: index out of range [32] with length 32` when `tidb_max_chunk_size` is set to a small value #48808 @guo-shaoge
- Fix the issue of Goroutine leak when using `AUTO_ID_CACHE=1` #46324 @tiancaiamao
- Fix the issue that the result of `COUNT(INT)` calculated by MPP might be incorrect #48643 @AilinKid
- Fix the issue that executing `ALTER TABLE ... LAST PARTITION` fails when the partition column type is `DATETIME` #48814 @crazycs520
- Fix the issue that using the `_` wildcard in `LIKE` when the data contains trailing spaces can result in incorrect query results #48983 @time-and-fate
- Fix the issue that high CPU usage of TiDB occurs due to long-term memory pressure caused by `tidb_server_memory_limit` #48741 @XuHuaiyu
- Fix the issue that the query result is incorrect when an `ENUM` type column is used as the join key #48991 @winoros
- Fix the issue that queries containing CTEs unexpectedly get stuck when the memory limit is exceeded #49096 @AilinKid
- Fix the issue that TiDB server might consume a significant amount of resources when the enterprise plugin for audit logging is used #49273 @lcwangchao
- Fix the issue that the optimizer incorrectly converts TiFlash selection path to the DUAL table in specific scenarios #49285 @AilinKid
- Fix the issue that `UPDATE` or `DELETE` statements containing `WITH RECURSIVE` CTEs might produce incorrect results #48969 @winoros
- Fix the issue that a query containing the IndexHashJoin operator gets stuck when memory exceeds `tidb_mem_quota_query` #49033 @XuHuaiyu
- Fix the issue that in non-strict mode (`sql_mode = ''`), truncation during executing `INSERT` still reports an error #49369 @tiancaiamao
- Fix the issue that CTE queries might report an error `type assertion for CTEStorageMap failed` during the retry process #46522 @tiancaiamao
- Fix the issue that `LIMIT` and `ORDER BY` might be invalid in nested `UNION` queries #49377 @AilinKid
- Fix the issue that parsing invalid values of `ENUM` or `SET` types would directly cause SQL statement errors #49487 @winoros
- Fix the issue of excessive statistical error in constructing statistics caused by Golang's implicit conversion algorithm #49801 @qw4990
- Fix the issue that Daylight Saving Time is displayed incorrectly in some time zones #49586 @overvenus
- Fix the issue that tables with `AUTO_ID_CACHE=1` might lead to gRPC client leaks when there are a large number of tables #48869 @tiancaiamao

- Fix the issue that TiDB server might panic during graceful shutdown #36793 @bb7133
- Fix the issue that `ADMIN RECOVER INDEX` reports `ERROR 1105` when processing a table containing `CommonHandle` #47687 @Defined2014
- Fix the issue that specifying placement rules when executing `ALTER TABLE t PARTITION BY` reports the error `ERROR 8239` #48630 @mjonss
- Fix the issue that the `START_TIME` column type in `INFORMATION_SCHEMA.CLUSTER_INFO` is not valid #45221 @dveeden
- Fix the issue that invalid `EXTRA` column type in `INFORMATION_SCHEMA.COLUMNS` leads to the error `Data Too Long, field len 30, data len 45` #42030 @tangenta
- Fix the issue that `IN (...)` causes different plan digests in `INFORMATION_SCHEMA.STATEMENTS_SUMMARY` #33559 @King-Dylan
- Fix the issue that when converting the `TIME` type to the `YEAR` type, the returned result mixes `TIME` and the year #48557 @YangKeao
- Fix the issue that disabling `tidb_enable_collect_execution_info` causes the coprocessor cache to panic #48212 @you06
- Fix the issue that TiDB crashes when `shuffleExec` quits unexpectedly #48230 @wshwsh12
- Fix the issue that static `CALIBRATE RESOURCE` relies on the Prometheus data #49174 @glorv
- Fix the issue that when adding a large interval to a date, it returns an incorrect result. After the fix, an interval with an invalid prefix or the string `true` is treated as zero, which is consistent with MySQL 8.0 #49227 @lcwangchao
- Fix the issue that the `ROW` function incorrectly infers the `null` type and causes an unexpected error #49015 @wshwsh12
- Fix the issue that the `ILIKE` function might cause data race in some scenarios #49677 @lcwangchao
- Fix the issue that query results are incorrect due to `STREAM_AGG()` incorrectly handling CI #49902 @wshwsh12
- Fix the issue that encoding fails when converting bytes to `TIME` #47346 @wshwsh12
- Fix the issue that the behavior of the `ENFORCED` option in the `CHECK` constraint is inconsistent with MySQL 8.0 #47567 #47631 @jiyfhust
- Fix the issue that DDL statements with the `CHECK` constraint are stuck #47632 @jiyfhust
- Fix the issue that adding index fails for DDL statements due to out of memory #47862 @GMHDBJD
- Fix the issue that upgrading the cluster during executing `ADD INDEX` might cause the data to be inconsistent with the indexes #46306 @zimulala
- Fix the issue that executing `ADMIN CHECK` after updating the `tidb_mem_quota_query` system variable returns `ERROR 8175` #49258 @tangenta
- Fix the issue that when `ALTER TABLE` modifies the type of a column referenced by a foreign key, the change in `DECIMAL` precision is not reported as an error #49836 @yoshikipom

- Fix the issue that when `ALTER TABLE` modifies the type of a column referenced by a foreign key, the change in `INTEGER` length is reported as an error by mistake #47702 @yoshikipom
- Fix the issue that in some scenarios the expression index does not detect that the divisor is 0 #50053 @lcwangchao
- Mitigate the issue that TiDB nodes might encounter OOM errors when dealing with a large number of tables #50077 @zimulala
- Fix the issue that DDL gets stuck in the running state during cluster rolling restart #50073 @tangenta
- Fix the issue that results might be incorrect when accessing global indexes of partitioned tables using `PointGet` or `BatchPointGet` operators #47539 @L-maple
- Fix the issue that MPP plans might not be selected when indexes on generated columns are set as visible #47766 @AilinKid
- Fix the issue that `LIMIT` might not be pushed down to the `OR` type `Index Merge` #48588 @AilinKid
- Fix the issue that duplicate built-in rows might exist in the `mysql.bind_info` table after BR import #46527 @qw4990
- Fix the issue that statistics for partitioned tables are not updated as expected after partitions are dropped #48182 @hi-rustin
- Fix the issue that errors might be returned during the concurrent merging of global statistics for partitioned tables #48713 @hawkingrei
- Fix the issue that query results might be incorrect when the `LIKE` operator is used for index range scans on a column with PADDING SPACE #48821 @time-and-fate
- Fix the issue that generated columns might trigger concurrent read and write on memory and result in data race #44919 @tangenta
- Fix the issue that `ANALYZE TABLE` might still collect Top1 statistics even when `WITH 0 TOPN` (indicating not collecting topN statistics) is specified #49080 @hawkingrei
- Fix the issue that illegal optimizer hints might cause valid hints to be ineffective #49308 @hawkingrei
- Fix the issue that statistics for Hash partitioned tables are not correspondingly updated when you add, drop, reorganize, or `TRUNCATE` partitions #48235 #48233 #48226 #48231 @hi-rustin
- Fix the issue that after the time window for automatic statistics updates is configured, statistics might still be updated outside that time window #49552 @hawkingrei
- Fix the issue that old statistics are not automatically deleted when a partitioned table is converted to a non-partitioned table #49547 @hi-rustin
- Fix the issue that old statistics are not automatically deleted when you clear data from a non-partitioned table using `TRUNCATE TABLE` #49663 @hi-rustin
- Fix the issue that enforced sorting might become ineffective when a query uses optimizer hints (such as `STREAM_AGG()`) that enforce sorting and its execution plan contains `IndexMerge` #49605 @AilinKid
- Fix the issue that histogram statistics might not be parsed into readable strings

when the histogram boundary contains `NULL` #49823 @AilinKid
- Fix the issue that executing queries containing the `GROUP_CONCAT(ORDER BY)` syntax might return errors #49986 @AilinKid
- Fix the issue that `UPDATE`, `DELETE`, and `INSERT` statements return overflow errors instead of warnings when the `SQL_MODE` is not strict #49137 @YangKeao
- Fix the issue that data cannot be inserted when a table has a composite index consisting of multi-valued indexes and non-binary type strings #49680 @YangKeao
- Fix the issue that `LIMIT` in multi-level nested `UNION` queries might become ineffective #49874 @Defined2014
- Fix the issue that querying partitioned tables with the `BETWEEN ... AND ...` condition returns incorrect results #49842 @Defined2014
- Fix the issue that hints cannot be used in `REPLACE INTO` statements #34325 @YangKeao
- Fix the issue that TiDB might select the wrong partition when querying Hash partitioned tables #50044 @Defined2014
- Fix the connection error that occurs when you use MariaDB Connector/J with compression enabled #49845 @onlyacat

- TiKV

  - Fix the issue that the damaged SST files might spread to other TiKV nodes and cause TiKV to panic #15986 @Connor1996
  - Fix the issue that Online Unsafe Recovery cannot handle merge abort #15580 @v01dstar
  - Fix the issue that the joint state of DR Auto-Sync might time out when scaling out #15817 @Connor1996
  - Fix the issue that `blob-run-mode` in Titan cannot be updated online #15978 @tonyxuqqi
  - Fix the issue that Resolved TS might be blocked for two hours #11847 #15520 #39130 @overvenus
  - Fix the issue that Flashback might get stuck when encountering `notLeader` or `regionNotFound` #15712 @HuSharp
  - Fix the issue that if TiKV runs extremely slowly, it might panic after Region merge #16111 @overvenus
  - Fix the issue that TiKV cannot read in-memory pessimistic locks when GC scans expired locks #15066 @cfzjywxk
  - Fix the issue that the blob file size in Titan monitoring is incorrect #15971 @Connor1996
  - Fix the issue that replicating large tables using TiCDC might cause TiKV to OOM #16035 @overvenus
  - Fix the issue that TiDB and TiKV might produce inconsistent results when processing `DECIMAL` arithmetic multiplication truncation #16268 @solotzg
  - Fix the issue that `cast_duration_as_time` might return incorrect results #16211 @gengliqi

- Fix the issue that TiKV converts the time zone incorrectly for Brazil and Egypt #16220 @overvenus
- Fix the issue that TiKV might panic when gRPC threads are checking `is_shutdown` #16236 @pingyu

- PD

  - Fix the issue that the etcd health check in PD does not remove expired addresses #7226 @iosmanthus
  - Fix the issue that when PD leader is transferred and there is a network partition between the new leader and the PD client, the PD client fails to update the information of the leader #7416 @CabinfeverB
  - Fix some security issues by upgrading the version of Gin Web Framework from v1.8.1 to v1.9.1 #7438 @niubell
  - Fix the issue that the orphan peer is deleted when the number of replicas does not meet the requirements #7584 @bufferflies

- TiFlash

  - Fix the issue of memory leak when TiFlash encounters memory limitation during query #8447 @JinheLin
  - Fix the issue that data of TiFlash replicas would still be garbage collected after executing `FLASHBACK DATABASE` #8450 @JaySon-Huang
  - Fix the issue that the memory usage increases significantly due to slow queries #8564 @JinheLin
  - Fix the issue that some TiFlash replica data cannot be recovered through `RECOVER TABLE` or `FLASHBACK TABLE` in scenarios with frequent execution of `CREATE TABLE` and `DROP TABLE` #1664 @JaySon-Huang
  - Fix the issue that query results are incorrect when querying with filtering conditions like `ColumnRef in (Literal, Func...)` #8631 @Lloyd-Pottiger
  - Fix the TiFlash panic issue when TiFlash encounters conflicts during concurrent DDL execution #8578 @JaySon-Huang
  - Fix the issue that TiFlash might not be able to select the GC owner of object storage data under the disaggregated storage and compute architecture #8519 @JaySon-Huang
  - Fix the issue that the `lowerUTF8` and `upperUTF8` functions do not allow characters in different cases to occupy different bytes #8484 @gengliqi
  - Fix the issue that TiFlash incorrectly handles `ENUM` when the `ENUM` value is 0 #8311 @solotzg
  - Fix the incompatibility issue in the `INET_NTOA()` expression #8211 @solotzg
  - Fix the potential OOM issue that might occur when scanning multiple partitioned tables during stream read #8505 @gengliqi
  - Fix the issue that short queries executed successfully print excessive info logs #8592 @windtalker
  - Fix the issue that TiFlash might crash when it is stopped #8550 @guo-shaoge

- Fix the random invalid memory access issue that might occur with `GREATEST` or `LEAST` functions containing constant string parameters #8604 @windtalker

- Tools

  - Backup & Restore (BR)

    - Fix the issue that BR generates incorrect URIs for external storage files #48452 @3AceShowHand
    - Fix the issue that the log backup task can start but does not work properly if failing to connect to PD during task initialization #16056 @YuJuncen
    - Fix the issue that the log backup task might encounter memory leak and fail to run properly after startup #16070 @YuJuncen
    - Fix the issue that inserting data into the system table `mysql.gc_delete_range` during the PITR process returns an error #49346 @Leavrth
    - Fix the issue that the `Unsupported collation` error is reported when you restore data from backups of an old version #49466 @3pointer
    - Fix the issue that permissions are not updated timely after user tables are recovered through snapshots in certain scenarios #49394 @Leavrth

  - TiCDC

    - Fix the issue that the `WHERE` clause does not use the primary key as a condition when replicating `DELETE` statements in certain scenarios #9812 @asddongmen
    - Fix the issue that the TiCDC server might panic when replicating data to an object storage service #10137 @sdojjy
    - Fix the potential data race issue during `kv-client` initialization #10095 @3AceShowHand
    - Fix the issue that TiCDC mistakenly closes the connection with TiKV in certain special scenarios #10239 @hicqu
    - Fix the issue that TiCDC server might panic when executing lossy DDL statements in upstream #9739 @hicqu
    - Fix the issue that `checkpoint-ts` might get stuck when TiCDC replicates data to downstream MySQL #10334 @zhangjinpeng87

  - TiDB Data Migration (DM)

    - Fix the issue that DM encounters "event type truncate not valid" error that causes the upgrade to fail #10282 @GMHDBJD
    - Fix the performance degradation issue when replicating data in GTID mode #9676 @feran-morgan-pingcap
    - Fix the issue that a migration task error occurs when the downstream table structure contains `shard_row_id_bits` #10308 @GMHDBJD

16.6.1.7 Contributors

We would like to thank the following contributors from the TiDB community:

16.7 v7.5

16.7.1 TiDB 7.5.3 Release Notes

Release date: August 5, 2024

TiDB version: 7.5.3

Quick access: Quick start | Production deployment

16.7.1.1 Compatibility changes

- Add a new system table `INFORMATION_SCHEMA.KEYWORDS` to display the information of all keywords supported by TiDB #48801 @dveeden

16.7.1.2 Improvements

- TiDB
    - By batch deleting TiFlash placement rules, improve the processing speed of data GC after performing the `TRUNCATE` or `DROP` operation on partitioned tables #54068 @Lloyd-Pottiger
- TiFlash

- Mitigate the issue that TiFlash might panic due to updating certificates after TLS is enabled #8535 @windtalker
- Reduce lock conflicts under highly concurrent data read operations and optimize short query performance #9125 @JinheLin

- Tools

  - Backup & Restore (BR)

    - Except for the `br log restore` subcommand, all other `br log` subcommands support skipping the loading of the TiDB `domain` data structure to reduce memory consumption #52088 @Leavrth
    - Support automatically abandoning log backup tasks when encountering a large checkpoint lag, to avoid prolonged blocking GC and potential cluster issues #50803 @RidRisR
    - Increase the number of retries for failures caused by DNS errors #53029 @YuJuncen
    - Add PITR integration test cases to cover compatibility testing for log backup and adding index acceleration #51987 @Leavrth
    - Increase the number of retries for failures caused by the absence of a leader in a Region #54017 @Leavrth
    - Support setting Alibaba Cloud access credentials through environment variables #45551 @RidRisR

  - TiCDC

    - Support directly outputting raw events when the downstream is a Message Queue (MQ) or cloud storage #11211 @CharlesCheung96

16.7.1.3 Bug fixes

- TiDB

  - Fix the issue that loading index statistics might cause memory leaks #54022 @hi-rustin
  - Fix the issue that the `UPDATE` operation can cause TiDB OOM in multi-table scenarios #53742 @hawkingrei
  - Fix the issue that indirect placeholder `?` references in a `GROUP BY` statement cannot find columns #53872 @qw4990
  - Fix the issue that the `LENGTH()` condition is unexpectedly removed when the collation is `utf8_bin` or `utf8mb4_bin` #53730 @elsa0520
  - Fix the issue that inserting an overlarge number in scientific notation returns a warning instead of an error, making it consistent with MySQL #47787 @qw4990
  - Fix the issue that recursive CTE queries might result in invalid pointers #54449 @hawkingrei
  - Fix the issue that statistics collection does not update the `stats_history` table when encountering duplicate primary keys #47539 @Defined2014

- Fix the issue that when queries contain non-correlated subqueries and `LIMIT` clauses, column pruning might be incomplete, resulting in a less optimal plan #54213 @qw4990
- Fix the issue of abnormally high memory usage caused by `memTracker` not being detached when the `HashJoin` or `IndexLookUp` operator is the driven side sub-node of the `Apply` operator #54005 @XuHuaiyu
- Fix the issue that the recursive CTE operator incorrectly tracks memory usage #54181 @guo-shaoge
- Fix the issue that the memory used by transactions might be tracked multiple times #53984 @ekexium
- Fix the issue that using `SHOW WARNINGS;` to obtain warnings might cause a panic #48756 @xhebox
- Fix the issue that updating an `UNSIGNED` type of field to `-1` returns `null` instead of `0` when `sql_mode=''` #47816 @lcwangchao
- Fix the issue that the `TIMESTAMPADD()` function goes into an infinite loop when the first argument is `month` and the second argument is negative #54908 @xzhangxian1008
- Fix the issue that the Connection Count monitoring metric in Grafana is incorrect when some connections exit before the handshake is complete #54428 @YangKeao
- Fix the issue that the Connection Count of each resource group is incorrect when using TiProxy and resource groups #54545 @YangKeao
- Fix the issue that executing `CREATE OR REPLACE VIEW` concurrently might result in the `table doesn't exist` error #53673 @tangenta
- Fix the issue that TiDB might return incorrect query results when you query tables with virtual columns in transactions that involve data modification operations #53951 @qw4990
- Fix the issue that executing the `SELECT DISTINCT CAST(col AS DECIMAL), CAST(col AS SIGNED)FROM ...` query might return incorrect results #53726 @hawkingrei
- Fix the issue of incorrect WARNINGS information when using Optimizer Hints #53767 @hawkingrei
- Fix the issue that the illegal column type `DECIMAL(0,0)` can be created in some cases #53779 @tangenta
- Fix the issue that the `memory_quota` hint might not work in subqueries #53834 @qw4990
- Fix the issue that JSON-related functions return errors inconsistent with MySQL in some cases #53799 @dveeden
- Fix the issue that improper use of metadata locks might lead to writing anomalous data when using the plan cache under certain circumstances #53634 @zimulala
- Fix the issue that certain filter conditions in queries might cause the planner module to report an `invalid memory address or nil pointer dereference` error #53582 #53580 #53594 #53603 @YangKeao
- Fix the issue that after a statement within a transaction is killed by OOM, if TiDB continues to execute the next statement within the same transaction, you might get an error `Trying to start aggressive locking while it's`

↪ `already started` and a panic occurs #53540 @MyonKeminta
- Fix the issue that executing `ALTER TABLE ... REMOVE PARTITIONING` might cause data loss #53385 @mjonss
- Fix the issue that `PREPARE/EXECUTE` statements with the `CONV` expression containing a `?` argument might result in incorrect query results when executed multiple times #53505 @qw4990
- Fix the issue that TiDB fails to reject unauthenticated user connections in some cases when using the `auth_socket` authentication plugin #54031 @lcwangchao
- Fix the issue that the query latency of stale reads increases, caused by information schema cache misses #53428 @crazycs520
- Fix the issue that the `STATE` field in the `INFORMATION_SCHEMA.TIDB_TRX` table is empty due to the `size` of the `STATE` field not being defined #53026 @cfzjywxk
- Fix the issue that the `tidb_enable_async_merge_global_stats` and `tidb_` ↪ `analyze_partition_concurrency` system variables do not take effect during automatic statistics collection #53972 @hi-rustin
- Fix the issue that using `CURRENT_DATE()` as the default value for a column results in incorrect query results #53746 @tangenta
- Fix the issue of reusing wrong point get plans for `SELECT ... FOR UPDATE` #54652 @qw4990

- TiKV

  - Fix the issue that setting the gRPC message compression method via `grpc-` ↪ `compression-type` does not take effect on messages sent from TiKV to TiDB #17176 @ekexium
  - Fix the issue that highly concurrent Coprocessor requests might cause TiKV OOM #16653 @overvenus
  - Fix the issue that CDC and log-backup do not limit the timeout of `check_leader` using the `advance-ts-interval` configuration, causing the `resolved_ts` lag to be too large when TiKV restarts normally in some cases #17107 @MyonKeminta
  - Fix the issue that TiKV might repeatedly panic when applying a corrupted Raft data snapshot #15292 @LykxSassinator

- PD

  - Fix the issue that slots are not fully deleted in a resource group client, which causes the number of the allocated tokens to be less than the specified value #7346 @guo-shaoge
  - Fix the issue that a resource group encounters quota limits when requesting tokens for more than 500 ms #8349 @nolouch
  - Fix the data race issue of resource groups #8267 @HuSharp
  - Fix the data race issue that PD encounters during operator checks #8263 @lhy1024
  - Fix the issue that deleted nodes still appear in the candidate connection list in etcd client #8286 @JmPotato

- Fix the issue that setting the TiKV configuration item `coprocessor.region-split-size` to a value less than 1 MiB causes PD panic #8323 @JmPotato
- Fix the issue that the encryption manager is not initialized before use #8384 @releungx
- Fix the issue that PD logs are not fully redacted when the PD configuration item `security.redact-info-log` is enabled #8419 @releungx
- Fix the issue that no error is reported when binding a role to a resource group #54417 @JmPotato

- TiFlash

  - Fix the issue that a large number of duplicate rows might be read in FastScan mode after importing data via BR or TiDB Lightning #9118 @JinheLin
  - Fix the issue that the `SUBSTRING_INDEX()` function might cause TiFlash to crash in some corner cases #9116 @wshwsh12
  - Fix the issue that setting the SSL certificate configuration to an empty string in TiFlash incorrectly enables TLS and causes TiFlash to fail to start #9235 @JaySon-Huang
  - Fix the issue that some queries might report a column type mismatch error after late materialization is enabled #9175 @JinheLin
  - Fix the issue that queries with virtual generated columns might return incorrect results after late materialization is enabled #9188 @JinheLin
  - Fix the issue that TiFlash might panic after executing `RENAME TABLE ... TO ...` on a partitioned table with empty partitions across databases #9132 @JaySon-Huang
  - Fix the issue that TiFlash might panic when a database is deleted shortly after creation #9266 @JaySon-Huang

- Tools

  - Backup & Restore (BR)

    - Fix the issue that log backup might be paused after the advancer owner migration #53561 @RidRisR
    - Fix the issue that BR fails to correctly identify errors due to multiple nested retries during the restore process #54053 @RidRisR
    - Fix the inefficiency issue in scanning DDL jobs during incremental backups #54139 @3pointer
    - Fix the issue that the backup performance during checkpoint backups is affected due to interruptions in seeking Region leaders #17168 @Leavrth
    - Fix the issue that after pausing, stopping, and rebuilding the log backup task, the task status is normal, but the checkpoint does not advance #53047 @RidRisR
    - Fix the issue that DDLs requiring backfilling, such as `ADD INDEX` and `MODIFY COLUMN`, might not be correctly recovered during incremental restore #54426 @3pointer

- TiCDC
  - Fix the issue that the checksum is not correctly set to `0` after splitting `UPDATE` events #11402 @3AceShowHand
  - Fix the issue that the Processor module might get stuck when the downstream Kafka is inaccessible #11340 @asddongmen
- Dumpling
  - Fix the issue that Dumpling reports an error when exporting tables and views at the same time #53682 @tangenta

16.7.2 TiDB 7.5.2 Release Notes

Release date: June 13, 2024

TiDB version: 7.5.2

Quick access: Quick start | Production deployment

16.7.2.1 Compatibility changes

- Add a TiKV configuration item `track-and-verify-wals-in-manifest` for RocksDB, which helps you investigate possible corruption of Write Ahead Log (WAL) #16549 @v01dstar
- Must set the line terminator when using TiDB Lightning `strict-format` or `SPLIT_FILE` to import CSV files #37338 @lance6716
- Add the `sink.open.output-old-value` configuration item for TiCDC Open Protocol to control whether to output the value before the update to the downstream #10916 @sdojjy
- In earlier versions, when processing a transaction containing `UPDATE` changes, if the primary key or non-null unique index value is modified in an `UPDATE` event, TiCDC splits this event into `DELETE` and `INSERT` events. Starting from v7.5.2, when using the MySQL sink, TiCDC splits an `UPDATE` event into `DELETE` and `INSERT` events if the transaction `commitTS` for the `UPDATE` change is less than TiCDC `thresholdTS` (which is the current timestamp fetched from PD when TiCDC starts replicating the corresponding table to the downstream). This behavior change addresses the issue of downstream data inconsistencies caused by the potentially incorrect order of `UPDATE` events received by TiCDC, which can lead to an incorrect order of split `DELETE` and `INSERT` events. For more information, see documentation. #10918 @lidezhu

16.7.2.2 Improvements

- TiDB
  - Optimize the issue that the `ANALYZE` statement blocks the metadata lock #47475 @wjhuang2016

- Improve the MySQL compatibility of expression default values displayed in the output of `SHOW CREATE TABLE` #52939 @CbcWestwolf
- Enhance the handling of DNF items that are always `false` by directly ignoring such filter conditions, thus avoiding unnecessary full table scans #40997 @hi-rustin
- Optimize the statistics for the execution process of the TiFlash `TableScan` operator in `EXPLAIN ANALYZE` #51727 @JinheLin
- Remove stores without Regions during MPP load balancing #52313 @xzhangxian1008
- Support loading Regions in batch from PD to speed up the conversion process from the KV range to Regions when querying large tables #51326 @SeaRise
- On the `Resource Control` monitoring page, add a new panel `RU(Max)` to show the maximum RU consumption rate for each resource group #49318 @nolouch
- Improve sync load performance to reduce latency in loading statistics #52994 hawkingrei
- Increase concurrency of statistics initialization to speed up startup #52466 #52102 #52553 hawkingrei

- TiKV

  - Adjust the log level of coprocessor errors from `warn` to `debug` to reduce unnecessary logs of the cluster #15881 @cfzjywxk
  - Add monitoring metrics for the queue time for processing CDC events to facilitate troubleshooting downstream CDC event latency issues #16282 @hicqu
  - Avoid performing IO operations on snapshot files in raftstore threads to improve TiKV stability #16564 @Connor1996
  - Add slow logs for peer and store messages #16600 @Connor1996
  - When TiKV detects the existence of corrupted SST files, it logs the specific reasons for the corruption #16308 @overvenus
  - Remove unnecessary async blocks to reduce memory usage #16540 @overvenus
  - Accelerate the shutdown speed of TiKV #16680 @LykxSassinator

- PD

  - Upgrade the etcd version to v3.4.30 #7904 @JmPotato
  - Add the monitoring metric for the maximum Request Unit (RU) per second #7908 @nolouch

- TiFlash

  - Mitigate the issue that TiFlash might panic due to updating certificates after TLS is enabled #8535 @windtalker

- Tools

  - Backup & Restore (BR)

    - BR cleans up empty SST files during data recovery #16005 @Leavrth

- Add PITR integration test cases to cover compatibility testing for log backup and adding index acceleration #51987 @Leavrth
- Enhance the tolerance of log backup to merge operations. When encountering a reasonably long merge operation, log backup tasks are less likely to enter the error state #16554 @YuJuncen
- Improve the table creation performance of the `RESTORE` statement in scenarios with large datasets #48301 @Leavrth
- Support pre-allocating Table ID during the restore process to maximize the reuse of Table ID and improve restore performance #51736 @Leavrth
- Remove the invalid verification for active DDL jobs when log backup starts #52733 @Leavrth
- Remove an outdated compatibility check when using Google Cloud Storage (GCS) as the external storage #50533 @lance6716
- Increase the number of retries for failures caused by DNS errors #53029 @YuJuncen

- TiCDC
  - Improve memory stability during data recovery using redo logs to reduce the probability of OOM #10900 @CharlesCheung96
  - Significantly improve the stability of data replication in transaction conflict scenarios, with up to 10 times performance improvement #10896 @CharlesCheung96
  - Enable the PD client forwarding function to make TiCDC more stable during network isolation between TiCDC and the PD leader #10849 @asddongmen
  - Improve the initialization speed of replication tasks #11124 @asddongmen
  - Initialize replication tasks asynchronously to reduce initialization time for the processor and owner #10845 @sdojjy
  - Detect the Kafka cluster version automatically to improve compatibility with Kafka #10852 @wk989898

16.7.2.3 Bug fixes

- TiDB
  - Fix the issue of inconsistent data indexes caused by concurrent DML operations when adding a unique index #52914 @wjhuang2016
  - Fix the issue of inconsistent data indexes caused by adding indexes with multi-schema changes on partitioned tables #52080 @tangenta
  - Fix the issue of inconsistent data indexes caused by adding multi-valued indexes #51162 @ywqzzy
  - Fix the issue that DDL operations get stuck due to network problems #47060 @wjhuang2016
  - Fix the issue that TiDB might report an error due to GC when loading statistics at startup #53592 @you06

- Fix the issue that TiDB might send requests to unready TiKV nodes #50758 @zyguan
- Fix the issue that Stale Read might miss after a TiKV rolling restart #52193 @zyguan
- Fix the issue that data race might occur during KV request retries, leading to TiDB panics #51921 @zyguan
- Fix the issue that TiDB might panic when parsing index data #47115 @zyguan
- Fix the issue that TiDB might panic when the JOIN condition contains an implicit type conversion #46556 @qw4990
- Fix the issue that comparing a column of `YEAR` type with an unsigned integer that is out of range causes incorrect results #50235 @qw4990
- Fix the issue that subqueries in an `UPDATE` list might cause TiDB to panic #52687 @winoros
- Fix the overflow issue of the `Longlong` type in predicates #45783 @hawkingrei
- Fix the issue that `SELECT INTO OUTFILE` does not work when clustered indexes are used as predicates #42093 @qw4990
- Fix the issue that the TopN operator might be pushed down incorrectly #37986 @qw4990
- Fix the issue that an empty projection causes TiDB to panic #49109 @winoros
- Fix the issue that Index Merge incorrectly pushes partial limit down when index plans are kept ordered #52947 @AilinKid
- Fix the issue that using a view does not work in recursive CTE #49721 @hawkingrei
- Fix the issue that unstable unique IDs of columns might cause the `UPDATE` statement to return errors #53236 @winoros
- Fix the issue that TiDB panics when executing the `SHOW ERRORS` statement with a predicate that is always `true` #46962 @elsa0520
- Fix the issue that the `final` AggMode and the `non-final` AggMode cannot coexist in Massively Parallel Processing (MPP) #51362 @AilinKid
- Fix the issue that a wrong TableDual plan causes empty query results #50051 @onlyacat
- Fix the issue that TiDB might panic when initializing statistics after enabling both `lite-init-stats` and `concurrently-init-stats` #52223 @hawkingrei
- Fix the issue that `NO_JOIN` hints do not work with `CREATE BINDING` #52813 @qw4990
- Fix the issue that subqueries included in the `ALL` function might cause incorrect results #52755 @hawkingrei
- Fix the issue that `VAR_SAMP()` cannot be used as a window function #52933 @hi-rustin
- Fix the issue that column pruning without using shallow copies of slices might cause TiDB to panic #52768 @winoros
- Fix the issue that adding a unique index might cause TiDB to panic #52312 @wjhuang2016
- Fix the issue that the TiDB server is marked as health before the initialization is complete #51596 @shenqidebaozi

- Fix the issue that the type returned by the `IFNULL` function is inconsistent with MySQL #51765 @YangKeao
- Fix the issue that parallel `Apply` might generate incorrect results when the table has a clustered index #51372 @guo-shaoge
- Fix the issue that query results might be incorrect when the `HAVING` clause in a subquery contains correlated columns #51107 @hawkingrei
- Fix the issue that querying the `TIDB_HOT_REGIONS` table might incorrectly return `INFORMATION_SCHEMA` tables #50810 @Defined2014
- Fix the issue that automatic statistics collection is triggered before the initialization of statistics finishes #52346 @hi-rustin
- Fix the issue that AutoID Leader change might cause the value of the auto-increment column to decrease in the case of `AUTO_ID_CACHE=1` #52600 @tiancaiamao
- Fix the issue that query results might be incorrect when you use Common Table Expressions (CTE) to access partitioned tables with missing statistics #51873 @qw4990
- Fix the incorrect calculation and display of the number of connections (Connection Count) on the TiDB Dashboard Monitoring page #51889 @YangKeao
- Fix the issue that DDL operations get stuck when restoring a table with the foreign key #51838 @YangKeao
- Fix the issue that getting the default value of a column returns an error if the column default value is dropped #50043 #51324 @crazycs520
- Fix the issue that TiDB does not listen to the corresponding port when `force-init-stats` is configured #51473 @hawkingrei
- Fix the issue that the query result is incorrect when the `IN()` predicate contains `NULL` #51560 @winoros
- Fix the issue that the TiDB synchronously loading statistics mechanism retries to load empty statistics indefinitely and prints the `fail to get stats version for this histogram` log #52657 @hawkingrei
- Fix the issue that `EXCHANGE PARTITION` incorrectly processes foreign keys #51807 @YangKeao
- Fix the issue that `LIMIT` might not be pushed down to the `OR` type `Index Merge` #48588 @AilinKid
- Fix the incorrect result of the TopN operator in correlated subqueries #52777 @yibin87
- Fix the issue that the `CPS by type` metric displays incorrect values #52605 @nolouch
- Fix the issue that the `EXPLAIN` statement might display incorrect column IDs in the result when statistics for certain columns are not fully loaded #52207 @time-and-fate
- Fix the issue that expressions containing different collations might cause the query to panic when the new framework for collations is disabled #52772 @wjhuang2016
- Fix the issue that executing SQL statements containing tables with multi-valued indexes might return the `Can't find a proper physical plan for this query` error #49438 @qw4990

- Fix the issue that TiDB cannot correctly convert the type of a system variable in an expression #43527 @hi-rustin
- Fix the issue that executing `INSERT IGNORE` might result in inconsistency between the unique index and the data #51784 @wjhuang2016
- Fix the issue that automatic statistics collection gets stuck after an OOM error occurs #51993 @hi-rustin
- Fix the issue that TiDB might crash when `tidb_mem_quota_analyze` is enabled and the memory used by updating statistics exceeds the limit #52601 @hawkingrei
- Fix the issue that `max_execute_time` settings at multiple levels interfere with each other #50914 @jiyfhust
- Fix the issue of index inconsistency caused by adding multiple indexes using a single SQL statement #51746 @tangenta
- Fix the issue that the Window function might panic when there is a related subquery in it #42734 @hi-rustin
- Fix the issue that TiDB crashes when `shuffleExec` quits unexpectedly #48230 @wshwsh12
- Fix the issue that the status gets stuck when rolling back the partition DDL tasks #51090 @jiyfhust
- Fix the issue that querying JSON of `BINARY` type might cause an error in some cases #51547 @YangKeao
- Fix the issue that adding indexes to large tables fails after enabling the Distributed eXecution Framework (DXF) #52640 @tangenta
- Fix the issue that the TTL feature causes data hotspots due to incorrect data range splitting in some cases #51527 @lcwangchao
- Fix the issue that `ALTER TABLE ... COMPACT TIFLASH REPLICA` might incorrectly end when the primary key type is `VARCHAR` #51810 @breezewish
- Fix the issue of inconsistent data indexes caused by cluster upgrade during adding indexes #52411 @tangenta
- Fix the performance regression issue caused by disabling predicate pushdown in TableDual #50614 @time-and-fate
- Fix the issue that the TiDB server adds a label via the HTTP interface and returns success, but does not take effect #51427 @you06
- Fix the issue that adding indexes in the ingest mode might cause inconsistent data index in some corner cases #51954 @lance6716
- Fix the issue that the `init-stats` process might cause TiDB to panic and the `load stats` process to quit #51581 @hawkingrei
- Fix the issue that the configuration file does not take effect when it contains an invalid configuration item #51399 @Defined2014
- Fix the issue that query execution using MPP might lead to incorrect query results when a SQL statement contains `JOIN` and the `SELECT` list in the statement contains only constants #50358 @yibin87
- Fix the issue that in `determinate` mode (`tidb_opt_objective='determinate'` ↪), if a query does not contain predicates, statistics might not be loaded #48257 @time-and-fate
- Fix the issue that the `SURVIVAL_PREFERENCES` attribute might not appear in the

output of the `SHOW CREATE PLACEMENT POLICY` statement under certain conditions #51699 @lcwangchao
- Fix the issue that IndexJoin produces duplicate rows when calculating hash values in the Left Outer Anti Semi type #52902 @yibin87
- Fix the issue that the `TIMESTAMPADD()` function returns incorrect results #41052 @xzhangxian1008
- Fix the issue that data conversion from the `FLOAT` type to the `UNSIGNED` type returns incorrect results #41736 @guo-shaoge
- Fix the issue that the `TRUNCATE()` function returns incorrect results when its second argument is a large negative number #52978 @yibin87
- Fix the issue that duplicated panel IDs in Grafana might cause abnormal display #51556 @D3Hunter
- Fix the issue that TiDB unexpectedly restarts when logging gRPC errors #51301 @guo-shaoge
- Fix the issue that TiDB loading statistics during startup might cause OOM #52219 @hawkingrei
- Fix the issue that the TTL job for a table does not stop after the table is deleted #51540 @YangKeao

- TiKV

  - Fix the issue that `thread_id` values are incorrectly displayed as `0x5` in TiKV logs #16398 @overvenus
  - Fix the issue of unstable test cases, ensuring that each test uses an independent temporary directory to avoid online configuration changes affecting other test cases #16871 @glorv
  - Fix the issue that TiKV might panic during the conversion from Binary to JSON #16616 @YangKeao
  - Fix the issue that the output of the `raft region` command in tikv-ctl does not include the Region status information #17037 @glorv
  - Fix the issue that slow `check-leader` operations on one TiKV node cause `resolved-ts` on other TiKV nodes to fail to advance normally #15999 @crazycs520
  - Fix the issue that after the process of destroying Peer is interrupted by applying snapshots, it does not resume even after applying snapshots is complete #16561 @tonyxuqqi
  - Fix the issue that the decimal part of the `DECIMAL` type is incorrect in some cases #16913 @gengliqi
  - Fix the issue that the `CONV()` function in queries might overflow during numeric system conversion, leading to TiKV panic #16969 @gengliqi
  - Fix the issue that TiKV converts the time zone incorrectly for Brazil and Egypt #16220 @overvenus
  - Fix the issue that the monitoring metric `tikv_unified_read_pool_thread_count` has no data in some cases #16629 @YuJuncen

- Fix the issue that inactive Write Ahead Logs (WALs) in RocksDB might corrupt data #16705 @Connor1996
- Fix the issue that resolve-ts is blocked when a stale Region peer ignores the GC message #16504 @crazycs520
- Fix the issue that during the execution of an optimistic transaction, if other transactions initiate the resolving lock operation on it, there is a small chance that the atomicity of the transaction might be broken if the transaction's primary key has data that was previously committed in Async Commit or 1PC mode #16620 @MyonKeminta

- PD

  - Fix the issue of connection panic after fault recovery in the TiDB network partition #7926 @CabinfeverB
  - Fix the issue that scheduling might be incorrectly paused after online data recovery #8095 @JmPotato
  - Fix the issue that the CPS By Type monitoring types display incorrectly after enabling resource groups #52605 @nolouch
  - Fix the issue that changing the log level via the configuration file does not take effect #8117 @rleungx
  - Fix the issue that a large number of retries occur when canceling resource groups queries #8217 @nolouch
  - Fix the issue that `ALTER PLACEMENT POLICY` cannot modify the placement policy #52257 #51712 @jiyfhust
  - Fix the issue that down peers might not recover when using Placement Rules #7808 @rleungx
  - Fix the issue that manually transferring the PD leader might fail #8225 @HuSharp
  - Fix the issue that the scheduling of write hotspots might break placement policy constraints #7848 @lhy1024
  - Fix the issue that slots are not fully deleted in a resource group client, which causes the number of the allocated tokens to be less than the specified value #7346 @guo-shaoge
  - Fix the issue that the scaling progress is not correctly displayed #7726 @CabinfeverB
  - Fix the issue that the Leader fails to transfer when you switch it between two deployed data centers #7992 @TonsnakeLin
  - Fix the issue that the `Filter target` monitoring metric for PD does not provide scatter range information #8125 @HuSharp
  - Fix the issue that the query result of `SHOW CONFIG` includes the deprecated configuration item `trace-region-flow` #7917 @rleungx

- TiFlash

  - Fix the issue that in the disaggregated storage and compute architecture, null values might be incorrectly returned in queries after adding non-null columns in

DDL operations #9084 @Lloyd-Pottiger
- Fix the issue of query timeout when executing queries on partitioned tables that contains the empty partition #9024 @JinheLin
- Fix the issue that in the disaggregated storage and compute architecture, TiFlash might panic when the compute node process is stopped #8860 @guo-shaoge
- Fix the issue that querying generated columns returns an error #8787 @guo-shaoge
- Fix the issue that TiFlash metadata might become corrupted and cause the process to panic when upgrading a cluster from a version earlier than v6.5.0 to v6.5.0 or later #9039 @JaySon-Huang
- Fix the issue that the `ENUM` column might cause TiFlash to crash during chunk encoding #8674 @yibin87
- Fix incorrect `local_region_num` values in logs #8895 @JaySon-Huang
- Fix the issue that in the disaggregated storage and compute architecture, TiFlash might panic during shutdown #8837 @JaySon-Huang
- Fix the issue that TiFlash might return transiently incorrect results in high-concurrency read scenarios #8845 @JinheLin
- Fix the issue that in the disaggregated storage and compute architecture, the disk `used_size` metric displayed in Grafana is incorrect after you modify the value of the `storage.remote.cache.capacity` configuration item for TiFlash compute nodes #8920 @JinheLin
- Fix the issue that in the disaggregated storage and compute architecture, queries might be permanently blocked after network isolation #8806 @JinheLin
- Fix the issue that TiFlash might panic when you insert data to columns with invalid default values in non-strict `sql_mode` #8803 @Lloyd-Pottiger

- Tools

    - Backup & Restore (BR)

        - Fix a rare issue that special event timing might cause the data loss in log backup #16739 @YuJuncen
        - Fix the issue that too many logs are printed when a full backup fails #51572 @Leavrth
        - Fix the issue that a PD connection failure could cause the TiDB instance where the log backup advancer owner is located to panic #52597 @YuJuncen
        - Fix the issue that the global checkpoint of log backup is advanced ahead of the actual backup file write point due to TiKV restart, which might cause a small amount of backup data loss #16809 @YuJuncen
        - Fix the issue that TiKV might panic when resuming a paused log backup task with unstable network connections to PD #17020 @YuJuncen
        - Fix an unstable test case #52547 @Leavrth
        - Fix the issue that the Region fetched from PD does not have a Leader when restoring data using BR or importing data using TiDB Lightning in physical import mode #51124 #50501 @Leavrth

- Fix the issue that TiKV panics when a full backup fails to find a peer in some extreme cases #16394 @Leavrth
- Fix the issue that removing a log backup task after it is paused does not immediately restore the GC safepoint #52082 @3pointer
- Fix the unstable test case `TestClearCache` #50743 @3pointer
- Fix the issue that BR fails to restore a transactional KV cluster due to an empty `EndKey` #52574 @3pointer
- Fix the issue that the transfer of PD leaders might cause BR to panic when restoring data #53724 @Leavrth
- Fix the issue that BR could not back up the `AUTO_RANDOM` ID allocation progress in a union clustered index that contains an `AUTO_RANDOM` column #52255 @Leavrth

- TiCDC
  - Fix the issue that high latency in the PD disk I/O causes severe latency in data replication #9054 @asddongmen
  - Fix the issue that calling the API (`/api/v2/owner/resign`) that evicts the TiCDC owner node causes the TiCDC task to restart unexpectedly #10781 @sdojjy
  - Fix the issue that data is written to a wrong CSV file due to wrong BarrierTS in scenarios where DDL statements are executed frequently #10668 @lidezhu
  - Fix the issue that TiCDC fails to validate `TIMESTAMP` type checksum due to time zone mismatch after data integrity validation for single-row data is enabled #10573 @3AceShowHand
  - Fix the issue that a changefeed with eventual consistency enabled might fail when the object storage sink encounters a temporary failure #10710 @CharlesCheung96
  - Fix the issue that `DROP PRIMARY KEY` and `DROP UNIQUE KEY` statements are not replicated correctly #10890 @asddongmen
  - Fix the issue TiCDC panics when scheduling table replication tasks #10613 @CharlesCheung96
  - Fix the issue that when the downstream Pulsar is stopped, removing the changefeed causes the normal TiCDC process to get stuck, which causes other changefeed processes to get stuck #10629 @asddongmen
  - Fix the issue that restarting PD might cause the TiCDC node to restart with an error #10799 @3AceShowHand
  - Fix the issue that the old value part of `open-protocol` incorrectly outputs the default value according to the `STRING` type instead of its actual type #10803 @3AceShowHand
  - Fix the issue that the default value of `TIMEZONE` type is not set according to the correct time zone #10931 @3AceShowHand
  - Fix the issue that TiCDC fails to execute the `Exchange Partition ... With Validation` DDL downstream after it is written upstream, causing the changefeed to get stuck #10859 @hongyunyan
  - Fix the issue that data race in the KV client causes TiCDC to panic #10718

@asddongmen
    - Fix the issue that updating the primary key or the unique key in upstream might cause data inconsistency between upstream and downstream #10918 @lidezhu
- TiDB Data Migration (DM)
    - Fix the connection blocking issue by upgrading `go-mysql` #11041 @D3Hunter
    - Fix the issue that data is lost when the upstream primary key is of binary type #10672 @GMHDBJD
- TiDB Lightning
    - Fix the issue that TiDB Lightning might fail to import data when EBS BR is running #49517 @mittalrishabh
    - Fix the issue that TiDB Lightning reports `no database selected` during data import due to incompatible SQL statements in the source files #51800 @lance6716
    - Fix the issue that killing the PD Leader causes TiDB Lightning to report the `invalid store ID 0` error during data import #50501 @Leavrth
    - Fix the issue that TiDB Lightning panics when importing an empty table of Parquet format #52518 @kennytm

16.7.3 TiDB 7.5.1 Release Notes

Release date: February 29, 2024

TiDB version: 7.5.1

Quick access: Quick start | Production deployment

16.7.3.1 Compatibility changes

- Prohibit setting `require_secure_transport` to `ON` in Security Enhanced Mode (SEM) to prevent potential connectivity issues for users #47665 @tiancaiamao
- To reduce the overhead of log printing, TiFlash changes the default value of `logger.level` from `"debug"` to `"info"` #8641 @JaySon-Huang
- Introduce the TiKV configuration item `gc.num-threads` to set the number of GC threads when `enable-compaction-filter` is `false` #16101 @tonyxuqqi
- TiCDC Changefeed introduces the following new configuration items:
    - `compression`: enables you to configure the compression behavior of redo log files #10176 @sdojjy
    - `sink.cloud-storage-config`: enables you to set the automatic cleanup of historical data when replicating data to object storage #10109 @CharlesCheung96
    - `consistent.flush-concurrency`: enables you to set the concurrency for uploading a single redo file #10226 @sdojjy

16.7.3.2 Improvements

- TiDB
    - Use `tikv_client_read_timeout` during the DDL schema reload process to reduce the impact of Meta Region Leader read unavailability on the cluster #48124 @cfzjywxk
    - Enhance observability related to resource control #49318 @glorv @bufferflies @nolouch

      As more and more users use resource groups to isolate application workloads, Resource Control provides enhanced data based on resource groups. This helps you monitor resource group workloads and settings, ensuring that you can quickly identify and accurately diagnose problems, including:

        - Slow Queries: add the resource group name, resource unit (RU) consumption, and time for waiting for resources.
        - Statement Summary Tables: add the resource group name, RU consumption, and time for waiting for resources.
        - In the system variable `tidb_last_query_info`, add a new entry `ru_consumption` to indicate the consumed RU by SQL statements. You can use this variable to get the resource consumption of the last statement in the session.
        - Add database metrics based on resource groups: QPS/TPS, execution time (P999/P99/P95), number of failures, and number of connections.
    - Modify the `CANCEL IMPORT JOB` statement to a synchronous statement #48736 @D3Hunter
    - Support the `FLASHBACK CLUSTER TO TSO` syntax #48372 @BornChanger
    - Optimize the TiDB implementation when handling some type conversions and fix related issues #47945 #47864 #47829 #47816 @YangKeao @lcwangchao
    - When a non-binary collation is set and the query includes `LIKE`, the optimizer generates an `IndexRangeScan` to improve the execution efficiency #48181 #49138 @time-and-fate
    - Enhance the ability to convert `OUTER JOIN` to `INNER JOIN` in specific scenarios #49616 @qw4990
    - Support multiple accelerated `ADD INDEX` DDL tasks to be queued for execution, instead of falling back to normal `ADD INDEX` tasks #47758 @tangenta
    - Improve the speed of adding indexes to empty tables #49682 @zimulala
- TiKV
    - Enhance the slow store detection algorithm by improving its sensitivity and reducing the false-positive rate, especially in intensive read and write load scenarios #15909 @LykxSassinator

- TiFlash
    - Improve the calculation method for Request Unit (RU) to make RU values more stable #8391 @guo-shaoge
    - Reduce the impact of disk performance jitter on read latency #8583 @JaySon-Huang
    - Reduce the impact of background GC tasks on read and write task latency #8650 @JaySon-Huang
- Tools
    - Backup & Restore (BR)
        - Improve the speed of merging SST files during data restore by using a more efficient algorithm #50613 @Leavrth
        - Support creating databases in batch during data restore #50767 @Leavrth
        - Support ingesting SST files in batch during data restore #16267 @3pointer
        - Print the information of the slowest Region that affects global checkpoint advancement in logs and metrics during log backups #51046 @YuJuncen
        - Improve the table creation performance of the `RESTORE` statement in scenarios with large datasets #48301 @Leavrth
        - BR can pause Region merging by setting the `merge-schedule-limit` configuration to `0` #7148 @BornChanger
        - Refactor the BR exception handling mechanism to increase tolerance for unknown errors #47656 @3pointer
    - TiCDC
        - Support searching TiCDC logs in the TiDB Dashboard #10263 @CharlesCheung96
        - Support querying the downstream synchronization status of a changefeed, which helps you determine whether the upstream data changes received by TiCDC have been synchronized to the downstream system completely #10289 @hongyunyan
        - Improve the performance of TiCDC replicating data to object storage by increasing parallelism #10098 @CharlesCheung96
    - TiDB Lightning
        - Improve the performance of `ALTER TABLE` when importing a large number of small tables #50105 @D3Hunter

16.7.3.3 Bug fixes

- TiDB
    - Fix the issue that setting the system variable `tidb_service_scope` does not take effect #49245 @ywqzzy

- Fix the issue that the communication protocol cannot handle packets larger than or equal to 16 MB when compression is enabled #47157 #47161 @dveeden
- Fix the issue that the `approx_percentile` function might cause TiDB panic #40463 @xzhangxian1008
- Fix the issue that TiDB might implicitly insert the `from_binary` function when the argument of a string function is a `NULL` constant, causing some expressions unable to be pushed down to TiFlash #49526 @YangKeao
- Fix the goroutine leak issue that might occur when the `HashJoin` operator fails to spill to disk #50841 @wshwsh12
- Fix the issue that `BIT` type columns might cause query errors due to decode failures when they are involved in calculations of some functions #49566 #50850 #50855 @jiyfhust
- Fix the goroutine leak issue that occurs when the memory usage of CTE queries exceed limits #50337 @guo-shaoge
- Fix the issue that wrong results might be returned when TiFlash late materialization processes associated columns #49241 #51204 @Lloyd-Pottiger
- Fix the issue that the background job thread of TiDB might panic when TiDB records historical statistics #49076 @hawkingrei
- Fix the error that might occur when TiDB merges histograms of global statistics for partitioned tables #49023 @hawkingrei
- Fix the issue that the historical statistics of the `stats_meta` table are not updated after a partition is dropped #49334 @hi-rustin
- Fix the issue of incorrect query results caused by multi-valued indexes mistakenly selected as the `Index Join` probe side #50382 @AilinKid
- Fix the issue that the `USE_INDEX_MERGE` hint does not take effect on multi-valued indexes #50553 @AilinKid
- Fix the issue that users might get errors when querying the `INFORMATION_SCHEMA` ↪ `.ANALYZE_STATUS` system table #48835 @hi-rustin
- Fix the issue of wrong query results due to TiDB incorrectly eliminating constant values in `group by` #38756 @hi-rustin
- Fix the issue that the `processed_rows` of the `ANALYZE` task on a table might exceed the total number of rows in that table #50632 @hawkingrei
- Fix the issue that TiDB might panic when using the `EXECUTE` statement to execute `PREPARE STMT` after the `tidb_enable_prepared_plan_cache` system variable is enabled and then disabled #49344 @qw4990
- Fix the `Column ... in from clause is ambiguous` error that might occur when a query uses `NATURAL JOIN` #32044 @AilinKid
- Fix the issue that using a multi-valued index to access an empty JSON array might return incorrect results #50125 @YangKeao
- Fix the `Can't find column ...` error that might occur when aggregate functions are used for group calculations #50926 @qw4990
- Fix the issue that the control of `SET_VAR` for variables of the string type might become invalid #50507 @qw4990
- Fix the issue that high CPU usage of TiDB occurs due to long-term memory pressure caused by `tidb_server_memory_limit` #48741 @XuHuaiyu

- Fix the issue that the completion times of two DDL tasks with dependencies are incorrectly sequenced #49498 @tangenta
- Fix the issue that illegal optimizer hints might cause valid hints to be ineffective #49308 @hawkingrei
- Fix the issue that DDL statements with the `CHECK` constraint are stuck #47632 @jiyfhust
- Fix the issue that the behavior of the `ENFORCED` option in the `CHECK` constraint is inconsistent with MySQL 8.0 #47567 #47631 @jiyfhust
- Fix the issue that CTE queries might report an error `type assertion for CTEStorageMap failed` during the retry process #46522 @tiancaiamao
- Fix the issue that the `DELETE` and `UPDATE` statements using index lookup might report an error when `tidb_multi_statement_mode` mode is enabled #50012 @tangenta
- Fix the issue that `UPDATE` or `DELETE` statements containing `WITH RECURSIVE` CTEs might produce incorrect results #48969 @winoros
- Fix the issue that the optimizer incorrectly converts TiFlash selection path to the DUAL table in specific scenarios #49285 @AilinKid
- Fix the issue that the same query plan has different `PLAN_DIGEST` values in some cases #47634 @King-Dylan
- Fix the issue that after the time window for automatic statistics updates is configured, statistics might still be updated outside that time window #49552 @hawkingrei
- Fix the issue that the query result is incorrect when an `ENUM` type column is used as the join key #48991 @winoros
- Fix the issue that executing `UNIQUE` index lookup with an `ORDER BY` clause might cause an error #49920 @jackysp
- Fix the issue that `LIMIT` in multi-level nested `UNION` queries might become ineffective #49874 @Defined2014
- Fix the issue that the result of `COUNT(INT)` calculated by MPP might be incorrect #48643 @AilinKid
- Fix the issue that parsing invalid values of `ENUM` or `SET` types would directly cause SQL statement errors #49487 @winoros
- Fix the issue that TiDB panics and reports an error `invalid memory address or nil pointer dereference` #42739 @CbcWestwolf
- Fix the issue that executing `UNION ALL` with the DUAL table as the first subnode might cause an error #48755 @winoros
- Fix the issue that common hints do not take effect in `UNION ALL` statements #50068 @hawkingrei
- Fix the issue that TiDB server might panic during graceful shutdown #36793 @bb7133
- Fix the issue that Daylight Saving Time is displayed incorrectly in some time zones #49586 @overvenus
- Fix the issue that static `CALIBRATE RESOURCE` relies on the Prometheus data #49174 @glorv
- Fix the issue that hints cannot be used in `REPLACE INTO` statements #34325

@YangKeao

- Fix the issue that executing queries containing the `GROUP_CONCAT(ORDER BY)` syntax might return errors #49986 @AilinKid
- Fix the issue that TiDB server might consume a significant amount of resources when the enterprise plugin for audit logging is used #49273 @lcwangchao
- Fix the issue that using old interfaces might cause inconsistent metadata for tables #49751 @hawkingrei
- Fix the issue that disabling `tidb_enable_collect_execution_info` causes the coprocessor cache to panic #48212 @you06
- Fix the issue that executing `ALTER TABLE ... LAST PARTITION` fails when the partition column type is `DATETIME` #48814 @crazycs520
- Fix the issue that the `COMMIT` or `ROLLBACK` operation executed through `COM_STMT_EXECUTE` fails to terminate transactions that have timed out #49151 @zyguan
- Fix the issue that histogram statistics might not be parsed into readable strings when the histogram boundary contains `NULL` #49823 @AilinKid
- Fix the issue that queries containing common table expressions (CTEs) unexpectedly get stuck when the memory limit is exceeded #49096 @AilinKid
- Fix the issue that data is inconsistent under the TiDB Distributed eXecution Framework (DXF) when executing `ADD INDEX` after the DDL Owner is network isolated #49773 @tangenta
- Fix the issue that the auto-increment ID allocation reports an error due to concurrent conflicts when using an auto-increment column with `AUTO_ID_CACHE=1` #50519 @tiancaiamao
- Fix the issue that TiDB might panic when a query contains the Apply operator and the `fatal error: concurrent map writes` error occurs #50347 @SeaRise
- Fix the TiDB node panic issue that occurs when DDL `jobID` is restored to 0 #46296 @jiyfhust
- Fix the issue that query results are incorrect due to `STREAM_AGG()` incorrectly handling CI #49902 @wshwsh12
- Mitigate the issue that TiDB nodes might encounter OOM errors when dealing with a large number of tables or partitions #50077 @zimulala
- Fix the issue that the `LEADING` hint does not take effect in `UNION ALL` statements #50067 @hawkingrei
- Fix the issue that `LIMIT` and `OPRDERBY` might be invalid in nested `UNION` queries #49377 @AilinKid
- Fix the issue that a query containing the IndexHashJoin operator gets stuck when memory exceeds `tidb_mem_quota_query` #49033 @XuHuaiyu
- Fix the issue that TiDB returns wrong query results when processing `ENUM` or `SET` types by constant propagation #49440 @winoros
- Fix the issue that executing `SELECT INTO OUTFILE` using the `PREPARE` method incorrectly returns a success message instead of an error #49166 @qw4990
- Fix the issue that enforced sorting might become ineffective when a query uses optimizer hints (such as `STREAM_AGG()`) that enforce sorting and its execution plan contains `IndexMerge` #49605 @AilinKid
- Fix the issue that tables with `AUTO_ID_CACHE=1` might lead to gRPC client leaks

when there are a large number of tables #48869 @tiancaiamao
- Fix the issue that in non-strict mode (`sql_mode = ''`), truncation during executing `INSERT` still reports an error #49369 @tiancaiamao
- Fix the issue that using the `_` wildcard in `LIKE` when the data contains trailing spaces can result in incorrect query results #48983 @time-and-fate
- Fix the issue that executing `ADMIN CHECK` after updating the `tidb_mem_quota_query` system variable returns `ERROR 8175` #49258 @tangenta
- Fix the issue of excessive statistical error in constructing statistics caused by Golang's implicit conversion algorithm #49801 @qw4990
- Fix the issue that queries containing CTEs report `runtime error: index out of range [32] with length 32` when `tidb_max_chunk_size` is set to a small value #48808 @guo-shaoge

- TiKV

  - Fix the issue that enabling `tidb_enable_row_level_checksum` might cause TiKV to panic #16371 @cfzjywxk
  - Fix the issue that TiKV might panic when gRPC threads are checking `is_shutdown` #16236 @pingyu
  - Fix the issue that TiKV converts the time zone incorrectly for Brazil and Egypt #16220 @overvenus
  - Fix the issue that `blob-run-mode` in Titan cannot be updated online #15978 @tonyxuqqi
  - Fix the issue that TiDB and TiKV might produce inconsistent results when processing `DECIMAL` arithmetic multiplication truncation #16268 @solotzg
  - Fix the issue that Flashback might get stuck when encountering `notLeader` or `regionNotFound` #15712 @HuSharp
  - Fix the issue that damaged SST files might be spread to other TiKV nodes #15986 @Connor1996
  - Fix the issue that if TiKV runs extremely slowly, it might panic after Region merge #16111 @overvenus
  - Fix the issue that the joint state of DR Auto-Sync might time out when scaling out #15817 @Connor1996
  - Fix the issue that Resolved TS might be blocked for two hours #11847 #15520 #39130 @overvenus
  - Fix the issue that `cast_duration_as_time` might return incorrect results #16211 @gengliqi
  - Fix the issue that TiKV hangs in corner cases (for example, when disk I/O operations are blocked), which affects availability #16368 @LykxSassinator

- PD

  - Fix the issue that querying resource groups in batch might cause PD to panic #7206 @nolouch
  - Fix the issue that PD cannot read resource limitations when it is started with `systemd` #7628 @bufferflies

- Fix the issue that continuous jitter in PD disk latency might cause PD to fail to select a new leader #7251 @HuSharp
- Fix the issue that a network partition in PD might cause scheduling not to be started immediately #7016 @HuSharp
- Fix the issue that the PD monitoring item `learner-peer-count` does not synchronize the old value after a leader switch #7728 @CabinfeverB
- Fix the issue that when PD leader is transferred and there is a network partition between the new leader and the PD client, the PD client fails to update the information of the leader #7416 @CabinfeverB
- Fix some security issues by upgrading the version of Gin Web Framework from v1.8.1 to v1.9.1 #7438 @niubell
- Fix the issue that the orphan peer is deleted when the number of replicas does not meet the requirements #7584 @bufferflies
- Fix the issue that querying a Region without a leader using `pd-ctl` might cause PD to panic #7630 @rleungx

- TiFlash

  - Fix the issue that TiFlash might panic due to unstable network connections with PD during replica migration #8323 @JaySon-Huang
  - Fix the issue that removing and then re-adding TiFlash replicas might lead to data corruption in TiFlash #8695 @JaySon-Huang
  - Fix a potential issue that `FLASHBACK TABLE` or `RECOVER TABLE` might fail to recover data of some TiFlash replicas if `DROP TABLE` is executed immediately after data insertion #8395 @JaySon-Huang
  - Fix incorrect display of maximum percentile time for some panels in Grafana #8076 @JaySon-Huang
  - Fix the issue that TiFlash might crash during remote reads #8685 @guo-shaoge
  - Fix the issue that TiFlash incorrectly handles `ENUM` when the `ENUM` value is 0 #8311 @solotzg
  - Fix the issue that short queries executed successfully print excessive info logs #8592 @windtalker
  - Fix the issue that the memory usage increases significantly due to slow queries #8564 @JinheLin
  - Fix the issue that the `lowerUTF8` and `upperUTF8` functions do not allow characters in different cases to occupy different bytes #8484 @gengliqi
  - Fix the potential OOM issue that might occur when scanning multiple partitioned tables during stream read #8505 @gengliqi
  - Fix the issue of memory leak when TiFlash encounters memory limitation during query #8447 @JinheLin
  - Fix the TiFlash panic issue when TiFlash encounters conflicts during concurrent DDL execution #8578 @JaySon-Huang
  - Fix the issue that TiFlash panics after executing `ALTER TABLE ... MODIFY ↪ COLUMN ... NOT NULL`, which changes nullable columns to non-nullable #8419 @JaySon-Huang

- Fix the issue that query results are incorrect when querying with filtering conditions like `ColumnRef in (Literal, Func...)` #8631 @Lloyd-Pottiger
- Fix the issue that data of TiFlash replicas would still be garbage collected after executing `FLASHBACK DATABASE` #8450 @JaySon-Huang
- Fix the issue that TiFlash might not be able to select the GC owner of object storage data under the disaggregated storage and compute architecture #8519 @JaySon-Huang
- Fix the random invalid memory access issue that might occur with `GREATEST` or `LEAST` functions containing constant string parameters #8604 @windtalker
- Fix the issue that TiFlash replica data might be accidentally deleted after performing point-in-time recovery (PITR) or executing `FLASHBACK CLUSTER TO`, which might result in data anomalies #8777 @JaySon-Huang
- Fix the issue that TiFlash Anti Semi Join might return incorrect results when the join includes non-equivalent conditions #8791 @windtalker

- Tools

  - Backup & Restore (BR)

    - Fix the issue that data restore is slowed down due to absence of a leader on a TiKV node #50566 @Leavrth
    - Fix the issue that full restore still requires the target cluster to be empty after the `--filter` option is specified #51009 @3pointer
    - Fix the issue that when resuming from a checkpoint after data restore fails, an error `the target cluster is not fresh` occurs #50232 @Leavrth
    - Fix the issue that stopping a log backup task causes TiDB to crash #50839 @YuJuncen
    - Fix the issue that the `Unsupported collation` error is reported when you restore data from backups of an old version #49466 @3pointer
    - Fix the issue that the log backup task can start but does not work properly if failing to connect to PD during task initialization #16056 @YuJuncen
    - Fix the issue that BR generates incorrect URIs for external storage files #48452 @3AceShowHand
    - Fix the issue that log backup gets stuck after changing the TiKV IP address on the same node #50445 @3pointer
    - Fix the issue that BR cannot retry when encountering an error while reading file content from S3 #49942 @Leavrth

  - TiCDC

    - Fix the issue that the sink module fails to restart correctly after encountering an error when Syncpoint is enabled (`enable-sync-point = true`) #10091 @hicqu
    - Fix the issue that the file sequence number generated by the storage service might not increment correctly when using the storage sink #10352 @CharlesCheung96

- Fix the issue that the Syncpoint table might be incorrectly replicated #10576 @asddongmen
- Fix the issue that OAuth2.0, TLS, and mTLS cannot be enabled properly when using Apache Pulsar as the downstream #10602 @asddongmen
- Fix the issue that TiCDC returns the `ErrChangeFeedAlreadyExists` error when concurrently creating multiple changefeeds #10430 @CharlesCheung96
- Fix the issue that the changefeed `resolved ts` does not advance in extreme cases #10157 @sdojjy
- Fix the issue that TiCDC mistakenly closes the connection with TiKV in certain special scenarios #10239 @hicqu
- Fix the issue that the TiCDC server might panic when replicating data to an object storage service #10137 @sdojjy
- Fix the issue that the changefeed reports an error after `TRUNCATE PARTITION` is executed on the upstream table #10522 @sdojjy
- Fix the issue that after filtering out `add table partition` events is configured in `ignore-event`, TiCDC does not replicate other types of DML changes for related partitions to the downstream #10524 @CharlesCheung96
- Fix the potential data race issue during `kv-client` initialization #10095 @3AceShowHand

- TiDB Data Migration (DM)
  - Fix the issue that a migration task error occurs when the downstream table structure contains `shard_row_id_bits` #10308 @GMHDBJD
  - Fix the issue that DM encounters "event type truncate not valid" error that causes the upgrade to fail #10282 @GMHDBJD

16.7.4 TiDB 7.5.0 Release Notes

Release date: December 1, 2023

TiDB version: 7.5.0

Quick access: Quick start | Production deployment

TiDB 7.5.0 is a Long-Term Support Release (LTS).

Compared with the previous LTS 7.1.0, 7.5.0 includes new features, improvements, and bug fixes released in 7.2.0-DMR, 7.3.0-DMR, and 7.4.0-DMR. When you upgrade from 7.1.x to 7.5.0, you can download the TiDB Release Notes PDF to view all release notes between the two LTS versions. The following table lists some highlights from 7.2.0 to 7.5.0:

```
<th>Category</th>
<th>Feature</th>
<th>Description</th>
```

```
<td>Scalability and Performance</td>
<td>Support running multiple <code>ADD INDEX</code> statements in parallel</
    ↪ td>
```

```
<td>This feature allows for concurrent jobs to add multiple indexes for a
   ↪ single table. Previously, it would take the time of X plus the time
   ↪ of Y to execute two <code>ADD INDEX</code> statements simultaneously
   ↪ (X and Y). With this feature, adding two indexes X and Y in one SQL
   ↪ can be concurrently executed, and the total execution time of DDL is
   ↪ significantly reduced. Especially in scenarios with wide tables,
   ↪ internal test data shows that performance can be improved by up to
   ↪ 94%.</td>
```

```
<td rowspan="3">Reliability and Availability</td>
<td>Optimize <a href="https://docs.pingcap.com/tidb/v7.5/tidb-global-sort"
   ↪ target="_blank">Global Sort</a> (experimental, introduced in v7.4.0)
   ↪ </td>
<td>TiDB v7.1.0 introduced the <a href="https://docs.pingcap.com/tidb/v7.5/
   ↪ tidb-distributed-execution-framework" target="_blank">Distributed
   ↪ eXecution Framework (DXF)</a>. For tasks that take advantage of this
   ↪ framework, v7.4 introduces global sorting to eliminate the
   ↪ unnecessary I/O, CPU, and memory spikes caused by temporarily out-of-
   ↪ order data during data re-organization tasks. The global sorting
   ↪ takes advantage of external shared object storage (Amazon S3 in this
   ↪ first iteration) to store intermediary files during the job, adding
   ↪ flexibility and cost savings. Operations like <code>ADD INDEX</code>
   ↪ and <code>IMPORT INTO</code> will be faster, more resilient, more
   ↪ stable, more flexible, and cost less to run.</td>
```

```
<td><a href="https://docs.pingcap.com/tidb/v7.5/tidb-resource-control#manage
   ↪ -background-tasks" target="_blank">Resource control for background
   ↪ tasks</a> (experimental, introduced in v7.4.0)</td>
<td>In v7.1.0, the <a href="https://docs.pingcap.com/tidb/v7.5/tidb-resource
   ↪ -control" target="_blank">Resource Control</a> feature was introduced
   ↪  to mitigate resource and storage access interference between
   ↪ workloads. TiDB v7.4.0 applied this control to the priority of
   ↪ background tasks as well. In v7.4.0, Resource Control now identifies
   ↪ and manages the priority of background task execution, such as auto-
   ↪ analyze, Backup & Restore, bulk load with TiDB Lightning, and online
   ↪ DDL. In future releases, this control will eventually apply to all
   ↪ background tasks.</td>
```

```
<td>Resource control for <a href="https://docs.pingcap.com/tidb/v7.5/tidb-
   ↪ resource-control#manage-queries-that-consume-more-resources-than-
   ↪ expected-runaway-queries"> managing runaway queries</a> (experimental
   ↪ , introduced in v7.2.0)</td>
<td><a href="https://docs.pingcap.com/tidb/v7.5/tidb-resource-control"
   ↪ target="_blank">Resource Control</a> is a framework for resource-
   ↪ isolating workloads by Resource Groups, but it makes no calls on how
```

```
    ↪ individual queries affect work inside of each group. TiDB v7.2.0
    ↪ introduces "runaway queries control" to let you control how TiDB
    ↪ identifies and treats these queries per Resource Group. Depending on
    ↪ needs, long running queries might be terminated or throttled, and the
    ↪  queries can be identified by exact SQL text, SQL digests or their
    ↪ plan digests, for better generalization. In v7.3.0, TiDB enables you
    ↪ to proactively watch for known bad queries, similar to a SQL
    ↪ blocklist at the database level.</td>
```

```
<td>SQL</td>
<td>MySQL 8.0 compatibility (introduced in v7.4.0)</td>
<td>In MySQL 8.0, the default character set is utf8mb4, and the default
    ↪ collation of utf8mb4 is <code>utf8mb4_0900_ai_ci</code>. TiDB v7.4.0
    ↪ adding support for this enhances compatibility with MySQL 8.0 so that
    ↪  migrations and replications from MySQL 8.0 databases with the
    ↪ default collation are now much smoother.</td>
```

```
<td rowspan="4">DB Operations and Observability</td>
<td>TiDB Lightning's physical import mode integrated into TiDB with <a href
    ↪ ="https://docs.pingcap.com/tidb/v7.5/sql-statement-import-into"><code
    ↪ >IMPORT INTO</code></a> (GA)</td>
<td>Before v7.2.0, to import data based on the file system, you needed to
    ↪ install <a href="https://docs.pingcap.com/tidb/v7.5/tidb-lightning-
    ↪ overview">TiDB Lightning</a> and used its physical import mode. Now,
    ↪ the same capability is integrated into the <code>IMPORT INTO</code>
    ↪ statement so you can use this statement to quickly import data
    ↪ without installing any additional tool. This statement also supports
    ↪ the <a href="https://docs.pingcap.com/tidb/v7.5/tidb-distributed-
    ↪ execution-framework" target="_blank">Distributed eXecution Framework
    ↪ (DXF)</a> for parallel import, which improves import efficiency
    ↪ during large-scale imports.</td>
```

```
<td>Specify <a href="https://docs.pingcap.com/tidb/v7.5/system-variables#
    ↪ tidb_service_scope-new-in-v740" target="_blank">the respective TiDB
    ↪ nodes</a> to execute the <code>ADD INDEX</code> and <code>IMPORT INTO
    ↪ </code> SQL statements (GA)</td>
<td>You have the flexibility to specify whether to execute <code>ADD INDEX</
    ↪ code> or <code>IMPORT INTO</code> SQL statements on some of the
    ↪ existing TiDB nodes or newly added TiDB nodes. This approach enables
    ↪ resource isolation from the rest of the TiDB nodes, preventing any
    ↪ impact on business operations while ensuring optimal performance for
    ↪ executing the preceding SQL statements. In v7.5.0, this feature
    ↪ becomes generally available (GA).</td>
```

```
<td>DDL supports <a href="https://docs.pingcap.com/tidb/v7.5/ddl-
    ↪ introduction#ddl-related-commands">pause and resume operations</a> (
    ↪ GA)</td>
<td>Adding indexes can be big resource consumers and can affect online
    ↪ traffic. Even when throttled in a Resource Group or isolated to
    ↪ labeled nodes, there may still be a need to suspend these jobs in
    ↪ emergencies. As of v7.2.0, TiDB now natively supports suspending any
    ↪ number of these background jobs at once, freeing up needed resources
    ↪ while avoiding having to cancel and restart the jobs.</td>
```

```
<td>TiDB Dashboard supports heap profiling for TiKV<a href="https://docs.
    ↪ pingcap.com/tidb/v7.5/dashboard-profiling" target="_blank"></a></td>
<td>Previously, addressing TiKV OOM or high memory usage issues typically
    ↪ required manual execution of <code>jeprof</code> to generate a heap
    ↪ profile in the instance environment. Starting from v7.5.0, TiKV
    ↪ enables remote processing of heap profiles. You can now directly
    ↪ access the flame graph and call graph of heap profile. This feature
    ↪ provides the same simple and easy-to-use experience as Go heap
    ↪ profiling.</td>
```

16.7.4.1 Feature details

16.7.4.1.1 Scalability

- Support designating and isolating TiDB nodes to distributedly execute `ADD INDEX` or `IMPORT INTO` tasks when the Distributed eXecution Framework (DXF) is enabled #46258 @ywqzzy

  Executing `ADD INDEX` or `IMPORT INTO` tasks in parallel in a resource-intensive cluster can consume a large amount of TiDB node resources, which can lead to cluster performance degradation. To avoid performance impact on existing services, v7.4.0 introduces the system variable `tidb_service_scope` as an experimental feature to control the service scope of each TiDB node under the TiDB Distributed eXecution Framework (DXF). You can select several existing TiDB nodes or set the TiDB service scope for new TiDB nodes, and all distributedly executed `ADD INDEX` and `IMPORT INTO` tasks only run on these nodes. In v7.5.0, this feature becomes generally available (GA).

  For more information, see documentation.

16.7.4.1.2 Performance

- The TiDB Distributed eXecution Framework (DXF) becomes generally available (GA), improving the performance and stability of `ADD INDEX` and `IMPORT INTO` tasks in parallel execution #45719 @wjhuang2016

The DXF introduced in v7.1.0 has become GA. In versions before TiDB v7.1.0, only one TiDB node can execute DDL tasks at the same time. Starting from v7.1.0, multiple TiDB nodes can execute the same DDL task in parallel under the DXF. Starting from v7.2.0, the DXF supports multiple TiDB nodes to execute the same `IMPORT INTO` task in parallel, thereby better utilizing the resources of the TiDB cluster and significantly improving the performance of DDL and `IMPORT INTO` tasks. In addition, you can also increase TiDB nodes to linearly improve the performance of these tasks.

To use the DXF, set `tidb_enable_dist_task` value to `ON`.

```
SET GLOBAL tidb_enable_dist_task = ON;
```

For more information, see documentation.

- Improve the performance of adding multiple indexes in a single SQL statement #41602 @tangenta

  Before v7.5.0, when you add multiple indexes (`ADD INDEX`) in a single SQL statement, the performance was similar to adding multiple indexes using separate SQL statements. Starting from v7.5.0, the performance of adding multiple indexes in a single SQL statement is significantly improved. Especially in scenarios with wide tables, internal test data shows that performance can be improved by up to 94%.

16.7.4.1.3 DB operations

- DDL jobs support pause and resume operations (GA) #18015 @godouxm

  The pause and resume operations for DDL jobs introduced in v7.2.0 become generally available (GA). These operations let you pause resource-intensive DDL jobs (such as creating indexes) to save resources and minimize the impact on online traffic. When resources permit, you can seamlessly resume DDL jobs without canceling and restarting them. This feature improves resource utilization, enhances user experience, and simplifies the schema change process.

  You can pause and resume multiple DDL jobs using `ADMIN PAUSE DDL JOBS` or `ADMIN RESUME DDL JOBS`:

```
ADMIN PAUSE DDL JOBS 1,2;
ADMIN RESUME DDL JOBS 1,2;
```

  For more information, see documentation.

- BR supports backing up and restoring statistics #48008 @Leavrth

  Starting from TiDB v7.5.0, the br command-line tool introduces the `--ignore-stats` parameter to back up and restore database statistics. When you set this parameter to `false`, the br command-line tool supports backing up and restoring statistics of columns, indexes, and tables. In this case, you do not need to manually run the statistics collection task for the TiDB database restored from the backup, or wait for the

completion of automatic collection tasks. This feature simplifies database maintenance work and improves query performance.

For more information, see documentation.

16.7.4.1.4 Observability

- TiDB Dashboard supports heap profiling for TiKV #15927 @Connor1996

  Previously, addressing TiKV OOM or high memory usage issues typically required manual execution of `jeprof` to generate a heap profile in the instance environment. Starting from v7.5.0, TiKV enables remote processing of heap profiles. You can now directly access the flame graph and call graph of heap profile. This feature provides the same simple and easy-to-use experience as Go heap profiling.

  For more information, see documentation.

16.7.4.1.5 Data migration

- Support the `IMPORT INTO` SQL statement (GA) #46704 @D3Hunter

  In v7.5.0, the `IMPORT INTO` SQL statement becomes generally available (GA). This statement integrates the Physical Import Mode capability of TiDB Lightning and allows you to quickly import data in formats such as CSV, SQL, and PARQUET into an empty table in TiDB. This import method eliminates the need for a separate deployment and management of TiDB Lightning, thereby reducing the complexity of data import and greatly improving import efficiency.

  For more information, see documentation.

- Data Migration (DM) supports blocking incompatible (data-consistency-corrupting) DDL changes #9692 @GMHDBJD

  Before v7.5.0, the DM Binlog Filter feature can only migrate or filter specified events, and the granularity is relatively coarse. For example, it can only filter large granularity of DDL events such as `ALTER`. This method is limited in some scenarios. For example, the application allows `ADD COLUMN` but not `DROP COLUMN`, but they are both filtered by `ALTER` events in the earlier DM versions.

  To address such issues, v7.5.0 refines the granularity of the supported DDL events, such as support filtering `MODIFY COLUMN` (modify the column data type), `DROP COLUMN`, and other fine-grained DDL events that lead to data loss, truncation of data, and loss of precision. You can configure it as needed. This feature also supports blocking incompatible DDL changes and reporting errors for such changes, so that you can intervene manually in time to avoid impacting downstream application data.

  For more information, see documentation.

- Support real-time checkpoint updates for continuous data validation #8463 @lichunzhu

  Before v7.5.0, the continuous data validation feature ensures the data consistency during replication from DM to downstream. This serves as the basis for cutting over business traffic from the upstream database to TiDB. However, due to various factors such as replication delay and waiting for re-validation of inconsistent data, the continuous validation checkpoint must be refreshed every few minutes. This is unacceptable for some business scenarios where the cutover time is limited to tens of seconds.

  With the introduction of real-time updating of checkpoint for continuous data validation, you can now provide the binlog position from the upstream database. Once the continuous validation program detects this binlog position in memory, it immediately refreshes the checkpoint instead of refreshing it every few minutes. Therefore, you can quickly perform cut-off operations based on this immediately updated checkpoint.

  For more information, see documentation.

16.7.4.2 Compatibility changes

> **Note:**
>
> This section provides compatibility changes you need to know when you upgrade from v7.4.0 to the current version (v7.5.0). If you are upgrading from v7.3.0 or earlier versions to the current version, you might also need to check the compatibility changes introduced in intermediate versions.

16.7.4.2.1 System variables

Variable name	Change type	Description
tidb_enable_fast_analyze	Deprecated	Controls whether to enable the statistics `Fast Analyze` feature. This feature is deprecated in v7.5.0.
tidb_analyze_partition_concurrency	Modified	Changes the default value from `1` to `2` after further tests.
tidb_build_stats_concurrency	Modified	Changes the default value from `4` to `2` after further tests.

Variable name	Change type	Description
tidb_ ↪ merge ↪ _ ↪ partition ↪ _ ↪ stats ↪ _ ↪ concurrency ↪	Modified	This system variable takes effect starting from v7.5.0. It specifies the concurrency of merging statistics for a partitioned table when TiDB analyzes the partitioned table.
tidb_ ↪ build ↪ _ ↪ sampling ↪ _ ↪ stats ↪ _ ↪ concurrency ↪	Newly added	Controls the sampling concurrency of the `ANALYZE` ↪ process.

Variable name	Change type	Description
tidb_ ↪ enable ↪ _ ↪ async ↪ _ ↪ merge ↪ _ ↪ global ↪ _ ↪ stats ↪	Newly added	This variable is used by TiDB to merge statistics asynchronously to avoid OOM issues.
tidb_ ↪ gogc ↪ _ ↪ tuner ↪ _max ↪ _ ↪ value ↪	Newly added	Controls the maximum value of GOGC that the GOGC Tuner can adjust.
tidb_ ↪ gogc ↪ _ ↪ tuner ↪ _min ↪ _ ↪ value ↪	Newly added	Controls the minimum value of GOGC that the GOGC Tuner can adjust.

16.7.4.2.2 Configuration file parameters

Configuration file	Configuration parameter	Change type	Description
TiDB	`tikv-` ↪ `client` ↪ `.` ↪ `copr` ↪ `-req` ↪ `-` ↪ `timeout` ↪	Newly added	Sets the timeout of a single Coprocessor request.
TiKV	`raftstore` ↪ `.` ↪ `inspect` ↪ `-` ↪ `interval` ↪	Modified	Changes the default value from `500ms` to `100ms` after optimizing the algorithm to improve the sensitivity of slow node detection.

Configuration file	Configuration parameter	Change type	Description
TiKV	`raftstore` ↪ `.` ↪ `region` ↪ `-` ↪ `compact` ↪ `-min` ↪ `-` ↪ `redundant` ↪ `-` ↪ `rows`	Modified	Sets the number of redundant MVCC rows required to trigger RocksDB compaction. Starting from v7.5.0, this configuration item takes effect for the `"raft-` ↪ `kv"` storage engine.

Configuration file	Configuration parameter	Change type	Description
TiKV	`raftstore` ↪ `.` ↪ `region` ↪ `-` ↪ `compact` ↪ `-` ↪ `redundant` ↪ `-` ↪ `rows` ↪ `-` ↪ `percent` ↪	Modified	Sets the percentage of redundant MVCC rows required to trigger RocksDB compaction. Starting from v7.5.0, this configuration item takes effect for the `"raft-` ↪ `kv"` storage engine.

Configuration file	Configuration parameter	Change type	Description
TiKV	raftstore ↪ . ↪ evict ↪ - ↪ cache ↪ -on- ↪ memory ↪ - ↪ ratio ↪	Newly added	When the memory usage of TiKV exceeds 90% of the system available memory, and the memory occupied by Raft entry cache exceeds the evict- ↪ cache ↪ -on- ↪ memory ↪ - ↪ ratio ↪ of used memory, TiKV evicts the Raft entry cache.

Configuration file	Configuration parameter	Change type	Description
TiKV	`memory.` ↪ `enable` ↪ `-` ↪ `heap` ↪ `-` ↪ `profiling` ↪	Newly added	Controls whether to enable Heap Profiling to track the memory usage of TiKV.
TiKV	`memory.` ↪ `profiling` ↪ `-` ↪ `sample` ↪ `-per` ↪ `-` ↪ `bytes` ↪	Newly added	Specifies the amount of data sampled by Heap Profiling each time, rounding up to the nearest power of 2.

Configuration file	Configuration parameter	Change type	Description
BR	`--ignore-stats`	Newly added	Controls whether to back up and restore database statistics. When you set this parameter to `false`, the br command-line tool supports backing up and restoring statistics of columns, indexes, and tables.

Configuration file	Configuration parameter	Change type	Description
TiCDC	`case-sensitive`	Modified	Changes the default value from `true` to `false` after further tests, which means that the table names and database names in the TiCDC configuration file are case-insensitive by default.

Configuration file	Configuration parameter	Change type	Description
